MERCHEN-LAGE; was one of those 3 Laws out of which W. the Conquerer framed our Common Laws, with a Mixture of the Laws of Normand; and was the Law of the Mercians when they governed a third Part of this Land; for it was divided in the Year 1016. See Cambden's Britannia. 2.04.

nia, p. 94.

MERCHETUM, Merchet, in Scotch Marchet, was anciently a Commutation of Money or Cattle given to the Lord to buy off that old impious Custom of the Lord's lying the first Night with the Bridal Daughter of a Tenant; and after it was used for the Fine or Composition which the Tenants paid to have leave to marry their Daughters: Also no Baron or military Tenant could marry his sole Daughter or Heir, without Licence from the King pro maritanda Filia:

from the King pro maritanda Filia:

MERCURIAL Phosphorus, is a Light arising from the shaking of Mercury in Vacuo; of which see several Experiments in Philos. Trans. N. 303. See Phosphorus.

MERCURY, is the Term the Chymists gave and is now generally used for that ponderous Fluid, Quick-filver: The Texture of which feems to confift of exceeding small, smooth, solid, spherical or spheroidical Partieles ; because Mercury in never so small a Quantity, is by no means transparent, but opake, and will let none of the Rays of Light pass thro' its Pores: And therefore since 'tis probable that Light passes not through the folid Parts of transparent Bodies, but only thro their Pores, tis plain, if the Particles of Mercury be Spherical (as it appears those of all Fluids are) then their Diameters cannot be much greater than those of the Rays of Light; for the Interstices between the Particles are as the Cubes of the Diameters of the Globules by whose meeting they are formed; and therefore seeing Light cannot pass thro these Interstices, it it plain, that the Diameters of the Corpuscles of Mercury cannot be much greater than those of Light: And if these Particles

should be oval or spheroidical, their shortest Diameters must be of the Length of those of the Par-

ticles of Light, or not much greater.

The Solidity of the Corpuscles of Mercury, and the Smallness of the Interstices lest between them, accounts for the wonderful specifick Gravity of Mercury, above all other Fluids; and the exceeding Smallness of its Parts, for its easie Ascent by

MERIDIAN Line, is a Line of ready Use in Practical Navigation. 'Tis always placed on the Foot, or 2 Foot Gunter's Scales, and sometimes on the Side of Gunter's Sector, (and on the Cross-Staff, &c.) and continued to its whole Length. Tis divided unequally towards 87 degr. (whereof 70 gr. are about one half) in such manner as the Meridian in Mercator's Chart is divided and numbred.

It's Uses are many: For, 1. It serves them to graduate à Sea Chart according to the true Projection. 2. Being joined with a Line of Chords, it serves for the Protraction and Resolution of such Rightlined Triangles as are concerned in Latitude, Longitude, Rhumb, and Distance in the Practice of Sailing; as Mr. Gunter shews, p. 15. of his Book of the Cross-Staff; as also in pricking the Churt truly at Sea.

MESOLABIUM, See Renati Tran. Flusii Mesolabium ; cui accessis pars altera de Analysi & Mis-

lanea. Leodii Eburonum, 1668. 410. MESSENGER of the Exchequer: The four Pursuivants in that Court are called by this Name and their Duty and Office is to attend the Lord Treasurer, and to carry his Letters, Precepts, &c. MESSUAGE, is a Dwelling-House, with some

Land affigned for its Use; and by this Name a Garden, Shop, Mill, Chamber or Cellar may pass, Saith Plowden, Fol. 169. In Scotland it is what we call the Mannor-House, the principal Dwelling-

House within any Barony.

METALS Lines: On Gunter's Sector are sometimes placed two Lines called the Lines of Metals; they are noted with the Characters of the 7 Metals, O, C, Q, h, 2, d, and 2; and their Use is to give the Proportions between the several Metals in their Magnitudes and Weight, and by them such Problems as these are solved.

1. In Bodies of the same Figure of different Metals, by the Magnitude of one given, to find the Magnitude of the rest.

Take the Magnitude given out of the Lines of Solids, and open the Sector till it be appiled right in its proper Points; then will the Parallels taken between the corresponding Points of the other Metals, and measured on the Solids, give their several Magnitudes.

s. In Bodies of different Metal, but equal Magnitude, having the Weight of one, to find that

This Probl. is the Converse of the former, but nor in direct but reciprocal Proportion; apply the Weight given, taken out of the Lines of Solids into the Sector in its proper Points belonging to the Metals of the other Body, so the Parallel taken from the Point's belonging to the Body given, and measured in the Lines of Solids, shall give the Weight of the Body required,

3. A Body being given of any one Meral, suppose a Sphere of Lead of 16 d, and whose Diambeer is a (let d and a fignify any Magnitudes on Lengths) to make another like it and of squal Weight, but of another Metal, as Suppose Iron.

Take out the Diameter a, and apply it in the Lines of Metals in the Points of h belonging ed lead; then will the Parallel between the proper Points in &, be the Diameter of the Iroff Sphere required : And this compared with the other Diameter in the Line of Solids, will give 23 dl. for the Magnitude of the Body required,

4. A Sphere of Lead being given, whose Diameter is a, to make another Sphere of any other, as of Iron, whose Weight shall be determined; v. gv. that shall weigh thrice as much;

Apply the Diameter a over in the proper Points of h; and then the Parallel between the proper Points of & will give the Length of the Diamerer of an equal Sphere of Iron; and this tripled will be the Diameter required.

See Webster's Metallographia. Lond: 1670.

Alonso Barba's Art of Metals, Englished by the E. of Sandwich. Part 1. 8c 2. in 8vo. 1674. Sir John Bettus's Fleta minor; or, the Laws of Art and Nature, in knowing, judging, finding refining, &c. the Body of confined Metals. Georgius Agricola de Re metallica. Fol.

METOPS; the same with Metopa. METTESHIP, Metteschep, Mettenscep, feems to have been anciently a Fine or Penalty paid by the Tenant to his Lord for his Neglect or Omiffion of doing his customary Service. Perhaps ir should be written Mittenscep from the Saxon Mit-ten, to measure, and teap, Goods or Chattels. MICROGRAPHY, is the Description of the

Parts and Properties of fuch very small Objects as are only discernable by Means of the Microscope. On this Subject the late Dr. Hook hath written defignedly in his Micrography, as hath also Dr. Popter; and Leuenhoeck in 2 Vol. in Quarto, Lat. in which, as well as scattered up and down in many other Books written on other Subjects, a very noble Treasure of useful Discoveries is to be found.

and all made by means of the Microscope:
MICROMETER. In Philof. Trans. N. 25, you have from Mr. Richard Townley, an Account of the Micrometer invented by Mr. Gascoigne; and by this Instrument he found the Moon's Distance and Parallax from two Observations of her meridional and horizontal Diameter, before Mr. Auzout took this matter into Consideration: Which Micrometer Mr. Townley had, and is described by Dr. Hook, in Phil. Tranf. N. 29. and the manner how it is to be applied to a Telescope shewed. And Mr. Flamstead in N. 96. faith, that by the Micrometer and a Telescope of but 14 Foot he could take the Diameters of the Planets and their Diffances from the fixed Stars, to a Second almost. This Instrument is now brought to very great Perfection and ready use by our excellent Math. Instrument-maker Mr. John Rowley, under St. Dunftan's Church in Fleetstreer. Set its Use in finding the Sun's Horizontal Parallax, under the Word Sun in this Volume.

LIIz

MICRO.

MICROSCOPE: By those excellent Observations and Experiments which the admirable Sir If. Newson hath made on Colours, he flews Ways to conjecture very accurately of the Sizes of the component Particles of Bodies by their Colours; and in the Description of those, he tells us, (Book 2. Pars 3. p. 64.) he hath been the more particular, because it is not impossible but that Microscopes may (if not done already) at length be improved to that Perfection, as to discover the Particles of Bodies on which their Colours depend. For, saith he, if those Inftruments are or, can be so far improved, as with sufficient Distinctness to represent Objects five or six hundred Times bigger than at a FootDistance they appear to the naked Eye, I should hope that we might be able to discover some of the greatest of these Corpuscles; and by one which would magnifie 3 or 4 Thousand Times, perhaps they might all be discovered, but those which produce Blackness. And if this could be attain'd to, (viz. by Glasses to discover the constituent Paricles of Bodies) he fears it would be the utmost Improvement of the Sense of Seeing; for it seems impossible to see the most secret and noble Works of Nature within the Corpuscles, because of the Transparency of these Corpuscles.
The same Gentleman in Philos. Trans. N. 88.

from the Difference he had found between compounded and simple Colours, takes Occasion to communicate a Way for the Improvement of Microscopes by Refraction; viz. by illuminating the Object in a darkened Room with Light of any convenient Colour not too much compounded; by which Means the Microscope will with Distinct sess bear a deeper Charge and a larger Aperture.

And in N. 80, he saith, that he hath sometimes thought of making a Microscope which should have, instead of an Object Glass, a Resteding Piece of Metal. For these Instruments seem as capable of Improvements as Telescopes; and perhaps more, because but one Piece of restecting Metal is requisite in them; as is plain from this Fi-

gure; where A B represents the Object Metal, C D the Eye-Glass, F their common Focus, and O

the other Forus of the Metal in which the Object is placed.

The Description and Use of Mr. Wilson's Sett of Pocket-Microscopes, &c. mentioned in the Preface of Vol. I.

This Sett of Microscopes has Nine different Magnifying-Glasses; Eight of which may be used with two different Instruments, for the better applying them to various Objects: One of these Instruments is represented Fig. I. A A A, and is made of Ivory, it hath 3 thin Brass Plates, E E, and a Spring of Steel H within it; to one of the thin Plates of Brass is fixed a Piece of Leather F, with a small Furrow G.... both in the Leather and Brass to which it is affixed: In one End of this Instrument there is a long Screw, D, with a Contex-Glass C, placed in the End of it: In the other End there is a hollow Screw, o o; wherein any of the Magnifying-Glasses M, are screwed when they are to be made use of The 2 different Magnification of the true Distance of the Magnifying-Glasses M, are screwed when they are to be made use of the 2 different Magnification of the magnifying of the Magnifying-Glasses M, are screwed when they are to be made use of the 2 different Magnification of the true Distance of the Magnifying-Glasses M, are screwed when the strength of the Magnifying-Glasses M, are screwed when the strength of the other than

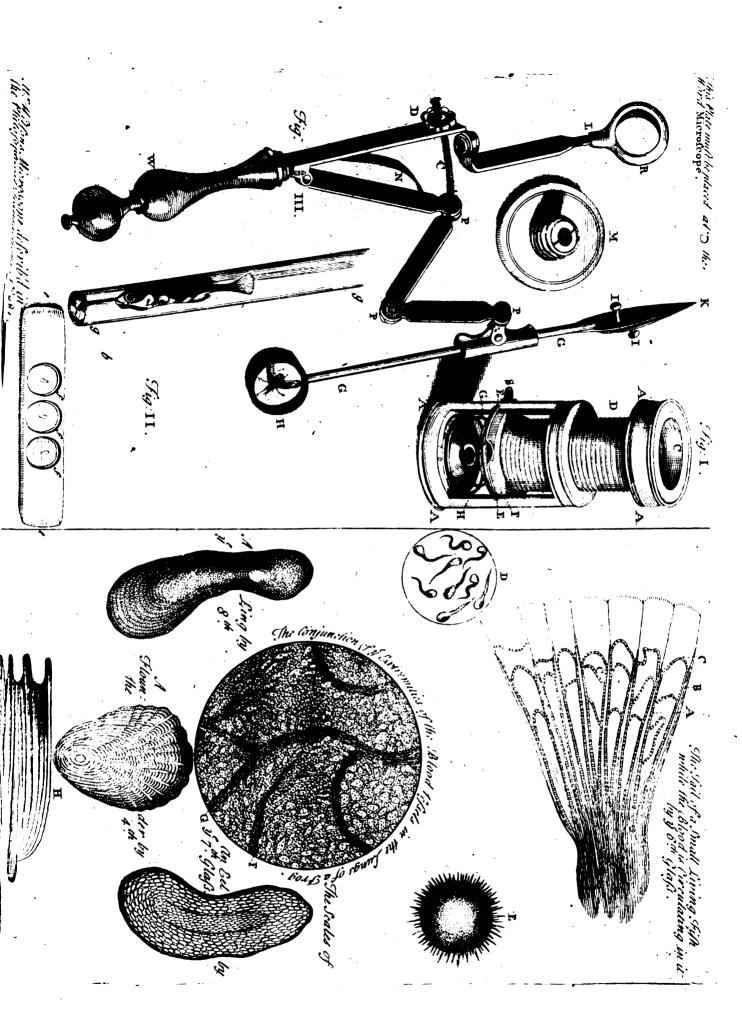

nifying-Glasses are all set in Ivory, 8 of which are set in the manner expressed at M. The greatest Magnisser is marked upon the Ivory wherein it is set with N° 1, the next N° 2, and so on till N° 8. The 9th Glass is not marked, but set in the Manner of a little Barrel Box of Ivory, as in Fig. IL

e e A flat Piece of Ivory, whereof there are 8 belonging to this Sett of Microscopes, (tho' any one who has a Mind to keep a Register of Objects may have as many of them as he pleases) in each of which there are three Holes f f f, wherein three or more Objects are placed between two thin Glasses, or Talks, when to be used with the greater Magnisiers.

The other Instrument Fig. III. is made of Brass or Prince's Metal, with Joints P P P, to turn eafily any Way with a small Pair of Tongs GG, which open at the Points K, by pressing together the two Heads of the Pins I I for taking up of Objects: At the other End of these Tongs GG, is screwed on a round Piece of black Wood H, with a Piece of Ivory let into it, for placing Opake Objects on, according to their Difference of Colour,

Upon the End L there is a Screw, into which the Glass set in the Barrel Box may be screwed; when the others are to be used, there is a Ring R of Brass to be screwed on the End L, into which Ring all the other Glasses M, may be screwed: So when any Object is taken up in the Points of the Tongs K, or laid upon the other End H, it may very easily (as one who sees the Instrument will perceive) be applied to the true Distance of any of the Glasses M, by the Help of the Joints P PP, and by means of the Screw C, with the Wheel D, Fig. III. which will bring the Object to the Exactness of the Centre or true Distance, being regulated by a Spring N.

The Use of the first mention'd Instrument, Fig. I. A A A A is thus: Take one of your flat Pieces of Ivory cc, or Sliders, (if you please to call them 10) and flide it in betwixt the two thin Plates of Brass E E, in the Body of the Microscope; so that the Object you intend to look upon be just in the middle, remarking that you put that Side of the Plate e e, where the Ring is, farthest from your Eye: Then you are to screw into oo, (the hollow Screw in the End of the Body of your Micro-scope) the 3d, 4th, 5th, 6th, or 7th Magnifying Glass M; which being done, while you are looking through your Magnifying. Glass upon the Object, you are to screw in or out, the long Screw D, Fig. I. in the other End of the Body of your Microscope, till you bring your Object into the true Distance, which you will know by seeing the Object clearly and distinctly: But seeing that in the greater Magnifiers you can see but a small Part of the Object. viz. the Legs or Claws of a Flea; while you are looking upon any Part of the Object, if ye take hold of the End of the Plate or Slider, e e, whereon the Object lies, and move it gently, you may see the whole Object successively, or any Part of the Object you please; and if that Part of the Object you design to look upon be out of the true Distance, remember your End Screw D, Fig. I. can always bring it in, by screw-After

After this manner may be seen all transparent Objects, Dust, Liquids, Chrystals of Salt, small Insects, such as Fleas, Mites, &c. If they be Insects, such as Fleas, Mites, &c. If they be Insects that will creep away, or such Objects as one insend to keep, they may be placed between the two Register-Olasses f. For by taking out (with the Point of a Penknise or small Plyers) the Ring that keeps in the Glass f, where the Object lies shee will fall out of themselves; so you may lay the Object between the two hollow sides of them, and put the Ring in as it was before: But if the Object be Dust or Liquids, a small Drop of the Liquid, or a little of the Dust laid on the outside of the Glass f, and applied as before, will be seen very easily.

As to the First, Second, and Third Magnifying-Classes, being marked with a upon the Ivory wherein they are set, they are only to be used with those Plates or Sliders that are also marked with a wherein the Objects are placed between two thin Talks, because the Thickness of the Glasses in the other Plates or Sliders, hinder the Object from approaching to the Centre or true Distance of these greater Magnifiers. But the manner of using them is the same with the former. Only remember to be careful when you put in or pull out the Plate or Slider e e, whereon the Object lies, or move it from one Object to another, not to let it rub your Magnifying-Glass, which is done by unscrewing a little the End Screw D, Fig. I. when ye put in or pull out your Plate, or move it from one Object to another.

For seeing the CIRCULATION of the BLOOD at the Extremities of the Arteries and Veins, in the transparent Parts of Fishes, Eels, &c. There are two Glass Tubes, the one bigger, and the other lesser, is express at g, wherein the Fish is to be put; when these Tubes are to be used, you are to unscrew the End Screw D, Fig. I. in the Body of the Microscope, until the Tube g g, can be received easily into that little Cavity G of the Brass-Plate, sastened to the Leather F, under the other two thin Plates of Brass E E: When the Tail of your Fish lies star to the Glass Tube, set it opposite to your Magnifying-Glass, and by screwing in or out your End Screw D, Fig. I. as is said before, you may easily bring it to the true Distance, and see the Blood circulate with great Pleasure.

If you would see the Blood circulate in a Prog's Foot, chuse such a Frog as will just go into your Tube, then with a little Stick, &c. expand the Minder Foot of the Frog, and apply it close to the Side of the Tube, observing that no Part of the Erog hinders the Light coming on its Foot, and when you have it at the just Distance, by Means of the Screw D, Fig. I. as abovesaid, you will see the rapid Motion of the Blood in its Vessels, which are very numerous in the transparent thin Membrane that's between the Frog's Toes: For this Object the 4th and 5th Magnifiers will do very well; bur you may see the Circulation in the Tails of Water-News with the 6th and 7th Glass, by reason the Globules of the Blood of those News are as big again as the Globules of the Blood of Frogs or small Fish, as has been taken Notice of in N. 280 of the Philosophical Transations, Page 1184.

N. B. The Circulation cannot be so well seen by the First, Second, and Third Magnissers, because the Thickness of the Glass wherein the Fish lies, hinders the Approximation of the Object from the true Focus of the Glass.

S, Fig. I. is a little Ivory Screw, upon which the Handles of the Brass Infrument W, Fig. 111. may be screwed, and serve for a Handle to this Ivory one also.

The Glass, placed in the Manner of a Barrel Box, Fig. II. is only to be used when the Brass Instrument (or in your Hand) being the least Magnisser, for greater Objects, such as Flics and common Insects, &c. A Hole being made in the Side of this Box, Fig. II. whereby it may be screwed on the Point L, Fig. III. of the Brass Instrument, remembring to put the End b next to your Eye, and the other to the Object; so if you take up an Insect in the Point of the Tongs K, or lay any opake Object on H the other End, you may approach them to the true Distance by means of the Joints and Screws spoken of before C, D, P, N, Fig. Ibid.

In the viewing of Objetts, one ought to be careful not to hinder the Light from falling upon them, by the Hat, Peruke, or any other Thing, especially when they are to look upon opake Objects: For nothing can be seen with the best of Glasses, unless the Object be in a due Distance, with a sufficient Light.

The best Lights for the Plates or Sliders, where the Object lies between the two Glasses, is a clear Sky-light, or where the Sun shines on any white thing, or the Reslection of the Light from a Looking-glass. The Light of a Candle is likewise good for the viewing of very small Objects, though it be a little uneasy to those who are not practised in Microscopes to find out the Light of the Candle.

By what is here said, it's hop'd that the Use of this Microscope, easy of its self, will be much easier to those that use it; yet it cannot be doubted of this, as of all other Instruments of this Nature, but that Usus plura docebie.

For the Conveniency of those who would Draw, or make any Sketches or Designs after Microscopical Objects, they may also have a Pedestal to fix the two Instruments above described, and make them stationary to any convenient Light. This Pedestal may be plac'd on a Table, &c. and after the Object and Light are fixed, as many Persons as please may view the Object, without any Trouble or Difficulty in stading the Light.

The rest of the annexed Figures were drawn by this Microscope from several Objects.

A the Artery, B, the Vein, C their communicant Canal, by which the Blood is seen passing from the former to the latter, in the Tail of the Fish, express d at gg.

D the Animalcula in Semine masculino, by the first Glass,

E one

MON

E one of the Farina of the Flower of Mallows, which magnified is the Area represented at D.

If the Branch of an Artery, G that of a Vein: The intermediate Spaces shew the Manner they communicate unto one another, in the Sides of the Lungs of Frogs, News, &c.

H one of the Feathers of a Moth's Wing.

MIDDLE Latitude, in Navigation, is half the Summ of any two given Latitudes; as suppose the two Latitudes were 50° 30', and 45°. 20', the middle Latitude will be 47°. 55.

There is a Method of working the leveral Cases of Sailing by Middle Latitude, which nearly agrees with Mercator's or Wright's way; and it is performed without the Table of Meridional Parts, either by the Tables of Logarithms or by Gunter's Scales. Of this Method you have a short Synopsis

in Mr. Jones's Navigation, p. 71.
MID-SHIP-MEN, are Officers aboard a Ship, whose Station when they are on Duty, is some on the Quarter-Deck, others on the Poop, &c. Their Business is to mind the Braces, to look out, and to give about the Word of Command from the Carrain and other superior Officers. They do also assist on all Occasions both in sailing the Ship, and in storing and rummaging the Hold. They are usually Gentlemen, who having served their Time as Voluntiers, are now upon their Preferment.

MILIARES Glandula, are those very small and infinitely numerous Glands which secern the Sweat and the Matter that exsudes in insensible Perspiration. See Skin.

MILLAINS, according to Mr. Wingate, are the third Subdivision of the Primes in Gunter's Line, and express the 1000th Parts of such Primes.

MINIUM or Read Lead. Mr. Ray at the End of his Collect. of Engl. Words, gives this Account of the making of Minium. First they take Lead and waste it in an Oven or Furnace; by bringing it to a Substance almost like Liebarge, and by stirring about with an Iron Rake or Hoe. Then they take it out and grind it with two Pair of Stones, which deliver it from one to another; and there is a Mill which moves at once fix Pair of these Stones. When 'tis thus reduced to a Powder, they wash it, and then put it into an Oven or Reverberatory Furnace, where by continual stirring with a Rake or Hoe of Iron, it comes to its Colour in 2 or 3 Days. But the Fire must not be violent, for then it will clod and change Colour. The Iron Rake is hung or poised by a Hook, else it would be too heavy to be moved by one Man.

MINT, is the Place where the King or Queen's Coin is formed, be it of Gold or Silver: The chief Mint of England is in the Tower of London; of which the present Officers are (1.) The Warden, who is the chief, and is to receive the Bullion, and oversee all the other Officers. (2.) The Master Worker, who receives the Bullion from the Warden, causes it to be melted and delivered to the Moniers, and takes it from them again when coined. (3.) Comptroller, who is to fee that the Money be made to the just Assize, and to oversee and controll the Officers, if the Money be not as it ought to be. (4.) The Assay Master, who weighs the Silver and Gold, and sees whether it be Standard. (5.) The Auditor, who takes all the Accounts. (6.) The Surveyor of the Melting, who is to see the Silver cast out, and that it be not alter'd after it's deliver'd to the Melter; which is after the Affay-Mafter hath made Trial of it. (7.) The Clerk of the Irons, who is to see that the Iron be clean and fit to work with. (8.) The Graver, who graveth the Dies and Stamps for the Coinage of the Money. (9.) The Melters, who melt the Bullion before it comes to coining. (10.) The Blankbers, who anneal, boil, and cleanse the Money. (11.) The Porters, who keep the Gate of the Mint. (12.) The Provost of the Mint, who provides for all the Moniers, and oversees them. And lastly, The Moniers, some of which shear the Money, some forge it, and some stamp or coin it, and some round it and mill it.

MITRE, in Architecture, is the Workmens Term for an Angle that is just 45 Degrees, or half a right one; and if it be a Quarter of a Right Angle, they call it a Half Mitre: And they have an Instrument made to this Angle which they call the Mitre Square, with which they strike Mitre Lines on their Quarters or Battens; and for Dispatch they have a Mitre Box, as they call it, which is made of two Pieces of Wood, each about an Inch thick, and one is nalled upright upon the Edge of the other; the upper Piece hath the Mitre Lines struck upon it on both Sides, and a Kerf to direct the Saw in cutting the Mitre Joints readily, by only applying the Piece into this Box.

MITRED Abbots, were formerly Governours

of luch Religious Houses, as had obtained from Rome the Privilege of wearing the Mitre, Ring, Crosser, and Gloves of a Bishop. It hath been a vulgar Error, that these Mitred Abbots were all the same with those Conventual Prelates who were fummoned to Parliament as Spiritual Lords; but some of those summoned to Parliament were not mitred; and some that were mitred were not summoned; the Summons to Parliament not any way depending on their Mitres, but on their receiving their Temporals from the King. Cowel's Inter-

preter

MITTA, was anciently a Saxon Measure containing 16 Bushels.

MIXT Tythes. See Tythes.

MOAT; the Brink of the Moat next the Rampart in any Fortification, is called the Scarp, and

the opposite one the Counterscarp.

MODEL, is an original Pattern which any Workman proposes to imitate; 'tis variously made of Wood, Stone, Plaster, &c. and should be (in Architecture, for Instance) made by a Scale, where an Inch or half an Inch represents a Foot, for the more exact compleating of the Design.

MOLMUTAN or Molmutin Laws, were the Laws of Dunwallo Molmutius, fixteenth King of the Britains; they were famous here till the Time of William the Conqueror. Molmutius was the first that published Laws in Britain; and these Laws, with those of Queen Mercia, are published

in Latin by Gildas, out of the British Tongue.

MONIERS. See Mint.

MONOCHORD. See the accurate Division of the Monochord, in Phil. Trans. N. 238. by Dr. Wallis.

MONOPOLIZERS, are such Persons as combine together to engrois, and to raise the Price of :Goods

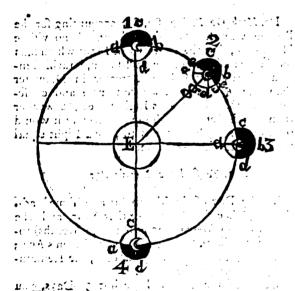

MONSOONS, are shifting Trade Winds in the E. Indian Ocean, which blows periodically, fome

for half a Year one way, others but for 3 Months, and then shift and blow for 6 or 3 Months directly contrary.

Iy contrary.

MOON. The Reason why the Calways shews the same Face towards us, is because she revolves because the revolves because the revolves because the revolves and the Axis in the Time of her Periodical Month.

For if in moving in her Orbit round the Earth . The did nor do so, but that the Horizon of the Disk ab kept always parallel to it self in all Positions, tis plain, that as the Moon moves on in her Orbit, enew Parts of the former dark Hemisphere will beigin to be enlighted (or rendred visible to us;) as appears plain from the Figure annexed. For sup--pose the Moon to have moved in her Orbit from to 2, and that her Diameter a b keeps parallel to its self in its first Situation; then her visible "Memisphere will be, not as before a d b, but e g f: and when she comes into Position 3, her visible Hemisphere will be c = d, instead of a = db, as at Arft : And laftly, when the Moon is at 4, her vifible Hemisphere will be a e b, which in the first Position was totally invisible. And this can't be otherwife, if the Moon in her Revolution round -the Earth, don't also revolve round her own Axis in the same exact Space of Time: But if you suppose her so to turn round her Axis, that the Diaemeter a b shall always be in a Normal Position to the Line E (; as in the 2d and 3d Politions e f. Motion round her Axis, always shew the same Face to you, as in Fact (abstracting from her Vi-brations, So) sho really doth.

The annual Regression of the Moon's Nodes is 25 Dregrees, and the Nutation of her Orbit about 20 Minutes.

The Phanomena of the Moon, on which, as Foundations, the Lunar Aftronomy is built, are fuch are these

1. That the Moon moves daily from West to East, and almost in the same Line with the Earth, or nearly in the Ecliptick.

For all the Secondary Planets describe lesser Orbits round their Primary, as they do round the Sun; and the Plains of their Orbits are not very different from that of the Ecliptick, and these Secondary Planets do also move the same Way as the Primary ones.

m the same Plane of the Ecliptick, deviating sometimes a little to the North, and sometimes to the South; as is apparent from her Meridian Affitudes. The Plane of her Orbit being inclined to that of the Ecliptick, and intersecting it in two Points, which are called the Moon's Noder.

3. The Phases of the Moon are continually changing; sometimes the cannot be seen at all, then the appears horned, bisected, gibbous, and at last round or full: And to on again in an inverse Order.

For being a spherical opake Body, and receiving all her Light from the Sun; tho he will always illuminate one Hemisphere of her, yet in the New-moon, when that Hemisphere is entirely turned from you, and her Body between the Sun and their Eye, tis impossible for her to appear visible: But as soon as by her Motion forward in her Orbit, Part of that Hemisphere comes to be obverted to the Earth, she will begin to appear falcated or with Horns of Light, and when she is got to be 90 degr. from the Sun, she will shew just one half of her illuminated Hemisphere, &c.

4. The Eclipse of the Sun happens only at the New-moon; the not at every one; and that of the Moon only when she is at the Full, the not at every Full-moon; as is plain from the Reason and Nature of Eclipses.

s. That obscure Part of the Moon's Body which the Sun's Rays do not illuminate, when she is Horned or Gibbous, or even in a Solar Eclipse, is not totally invisible, but appears with a reddish dirty coloured Light; and that Light seems to come to the Moon by Reslection from the Earth.

For when the Moon is at New to us, the Earth is at Full to the Lunar Inhabitants; and the Light of the Earth being about 15 times greater than that of the Moon, and the Moon so little as not to obscure above a 20th Part of the Earth, the Light from the Earth may easily be supposed to render her a little visible in even solar Eclipses.

6. The Eclipses of the Sun and Moon don't happen always in the same Places in the Zodiack, but in others moving still gradually backward, or in Antecedentia.

The Reason of which is, that the Moon's Orbit is different from that of the Ecliptick, intersecting it but in one Line, whose extreme Points are called the Nodes, and which Nodes do annually move backward or in Antecedentia. But the Eclipses cannot happen but when the two Luminaries are in or near these Nodes swherefore, &c.

7. There is a very sensible Difference in the apparent Length of the Moon's Diameter, at different Times.

For the Moon's Orbit being Elliptical, her Dilftance from the Earth will be very different, as fine is in different Parts of that Ellipsis; and 'tis found that her apparent Diameter is nearly reciprocally proportional to her Distance, which Distance is both greatest and least in the Syzygies, because the Excentricity of the Ellipsis is there greatest.

8. The apparent Motion of the Moon is not always equal, but greater and less by Turns, and

that very sensibly.

Which Phænomenon arises from several Causes concurring together. The first Cause of which is some Inequality even in the mean Motions of the Moon; for in the Barth's Peribelia the Moon is carried something slower than in the Aphelia.

The next Cause is the Elliptick Figure of the Lunar Orbit, from whence the Moon must move faster in her Perigaum than in her Apogaum; as

is the Case of all the Planets.

A 3d Cause, is the continual changing of the Excentricity of the Moon's Orbit; from whence must arise a greater Difference of her Velocity in her Perigaa, and of her Tardity in her Apogaa in the Syzygies of the Apfes than in the Quadra-

To all which we may add, that the Moon's Motion it self is a little retarded from the Syzygies to the Quadratures, and then accelerated a little again from thence to the Syzygies, in every Lunar Month.

9. The monthly Motion of the Moon in the Eeliptick is swiftest (caseris paribus) when she is in the Syzygies, and flowest when she is in her Quadratures to the Sun,

The Reason of which is to be had, not from a ny System of Astronomy, but from the Physical

Principles of the Newtonian Philosophy.

to. That Place where the Moon appears leaf and where her Motion is flowest, doth not keep always in the same Degree of the Ecliptick, but moves sensibly forward, or in Consequentia.

For the her Appraum go forward in the Syzy-gies, and backward in the Quadratures, yet because the former Motion is near twice as swift as the latter, the Excessin the whole Revolution of the Apfes must be forward, and consequently the Apogaum will move on in Consequencia, as by Observation 'tis found it really doth.

11. The Latitude of the Moon is moveable or changeable, being sometimes greater and sometimes leffer (according to the various Political of her Orbir to the Sun) even in the same Degree of proper

Longitude.

This Difference of Latitude arises from the varions Inclination of the Plane of the Moon's Orbit to that of the Enliptick. For, as was said above, there is an Inequality even in that Inclination; when the Line of the Nodes is in the Syzygies, the Angle of the Inclination is greatest, and least when that Line is in the Quadratures, and of a mean Quantity in the intermediate Positions.

12. The Moon's Orbit is more or less circular according to its various Polition in Respect of the

Sun.

And so it must be, since as was shown above, be Excentricity of her Orbit is greater when the Line of the Aples is in the Syzygies, than when it is in the Quadratures, by almost half the least Excentricity.

13. The Motion of the Moon is very unequal. and diffigular to its folf, whether you consider it in different Parts of the same Month, or in the Past for the Year before. similar Parts of different Months.

Nor is this strange, if you consider she various and dissimilar Mutations above-mentioned.

14. The Light of the Moon reflected to us is so weak, that even in the Full-moon, it will by no Burning-Glass be brought to afford the looft

Degree of Hear.
The Rays of Light have their Force decreased (at leaft) as the Square of their Diftance; an confequently the Force of the Sun's Rays reflected to us from the Moon, to those that come to as directly, is decreased, at least in the Proportion of the Square of the Moon's Distance from the Earth, to the Square of the Moon's Semi-diameper; and by Calculation it will be found, that the Light of the Moon brought hither, will be in Force but the fifty thousandth Part of that which comes hither directly from the Sun.

15. The same Face of the Moon nearly, is al-

ways turned towards the Earth.

The Reason of which is, that the turns round her own Axis, in the Time of her mentiquel Motion round the Earth, as I have demonstrated as above.

16. And yet there are some Librations, of this Face, so that some more Eastern and Western Parts of it, and sometimes some more Northern and Southern do alternately appear.

The Reason and Cause of which libratory Motion, Sir If. Newton, I think, first discovered ar

communicated.

Dr. Hook, Op. Post. p. 80, 31 accounting for the Reason why the Moon's Light affords no visible Heat, saith, that the Quantity of Light which falls on the Hemisphere of the Full-moon, is rarified into a Sphere about 288 times greater in Diameter than the C before it arrive to us; and confe-quently, that the Moon's Light is 104368 weaker than the Light of the Sung Wherefore it would require 104368 Full-moons to give a Light equal to that of the Sun at Noon.

1. To find the Moon's Age.

To the Day of the Month (at any Time) add the Epath (see that Word) for that Year, and the Months from March (including both Months) together, the Sum, if under 30, is the Moon's Age 3 if above 30, subtract thirty out of it, the Remainder is the Age of the Moon.

N. B. If the Month have but 30 Days, you

must subtract: but 29 instead of 30.

Example, May 26, 1708,

Epact 18 Days in May 26 Months from March 3

> 47 Deduct --- go

The Moon's Age 17 Days.

If the Time proposed had been between Jan. 1? and March the first, you must have used the B.

 $\prod_{i \in \mathcal{I}} \sum_{j \in \mathcal{I}_i} 1_{i \in \mathcal{I}_j}$

MOO

2. To find the Moon's being upon the Meridian or or Southing.

Multiply her Age by 4, and divide the Product by 5, the Quotient will give the Hours, and the Remainder multiplied by 12 will give the Minutes, when the Moon is less than 15 Days old; but when more than that, you must subduct 15, and work with the Remainder, as before.

Moon's Age 17 Days.
Deduct 15

Multiply by 4

Divide by 5) 8 (1 hour, 36 m.

Multiply by 12

36 Minutes.

3. To find the Time of the Moon's Shining.

Mustiply her Age by 48, and divide the Product by 60; the Quotient shall be the Hours, and the Remainder the Minutes: That is, if the Moon be under 15 Days old; but if above, subtract the Time of her Shining, found as above, from 24 Hours, the Remainder will be the Time of her Shining in the Morning.

Example. May 26. 1708.

4. To find how many Signs and Degrees the Moon is departed from the Sun fince her last Conjunction with him, or fince the last New-moon.

Double the Moon's Age, and divide the Product by 5, the Quorient is the Signs, and the Remainder (multipled by 6) are the Degrees.

Example. May 26. 1708.

The Moon's Age 17 Days.

2

5) 34 (6 Signs.

30

Remains 4

Multiply by 6

Therefore the Moon is gone from 24 Degrees. the Sun 6 Signs, and 24 Degrees.
Vol. II.

MOON's Parallax. There are two Ways of finding the Moon's Parallax.

1. From the Astronomical Tables, the Moon's Place must be accurately had for the Moment of the Observation; and then you must find by Calculation and by the Tables of Restractions, how many Degrees and Minutes the Centre of the (is elevated above the Rational Horizon. At the same Time also exactly, by a large Astronomical Quadrant, Sextant, &c. adjusted with Telescopical Sights. &c. the Elevation of the Moon's Centre aabove the Horizon of the Observer must be taken in Degrees and Minutes. The Difference between those two Astitudes will be the Parallax of the Moon at the Moment of the Observation, and for that particular Place of the Moon; which being found, the Horizontal Parallax may be had by this Analogy; As the Cosine of the Moon's Astitude to Radius: so is the Quantity of the present Parallax, to the Moon's Horizontal Parallax.

rallax, to the Moon's Horizontal Parallax.
2. Without Aftronomical Calculation, the Moon's Parallax may be thus found: Let her Dia meter be accurately taken by a good Telescope and Micrometer, when she is on or near the Meridian, and when near the Horizon, the same Night; the meridian apparent Diameter will be the greatest; the Difference of these two apparent Diameters, being given, in the same Night, you may determine the entire Difference between the Horizontal and Vertical Diameter by the former Ana-And from this Difference, which is proportional to the Earth's Semi-diameter, both the Moon's Distance and her Parallax may be found by an easie Calculation. And by the best Observation, the Moon's mean Horizontal Parallax hath been found to be about 57 Minutes, and consequently her mean Distance from the Earth about 60 Semi-diameters of the Earth; or about 24000 Miles English.

MOORS: The Lords Bayliss in the Isle of

MOORS: The Lords Bayliffs in the Isle of Man are called by this Name; their Office is to summon the Courts for the several Sheadings.

MORAL Philosophy, or moral Discipline, is what is usually called Ethicks in the Schools, being a practical Science which explains the Nature and Reason of, and withal teaches and instructs us how to acquire that Felicity or Happiness which is agreeable to Humane Nature.

MORAL Adions or Ads, are such as render the Rational and Free Agent good or evil, and consequently rewardable and punishable, because he doth them.

MORESK-Work or Morisho-Work, is a kind of Antick-work in Painting or Sculpture, after the Manner of the Moors, confifting of several Grotesco's.

MORSUS Diaboli, is the Term which some Anatomists give to the outer Ends (i.e. those next the Ovaria) of the Tuba Fallopiana; because their Edges there appear jagged and torn.

MORTARS of Mr. Coehorn, are made of Hammer'd Iron of about 4 Inches Diameter at the Bore, ten Inches and a half long, and nine Inches in the Chase. They are fixed at an Elevation of 45°. on a Block of Oak of about 20 Inches long, and 10½ broad, and about 4 thick. These like Hand-Mortars, throw Hand-Grenadoes. They are used chiefly in the bottom of the Trenches, where they are placed about a Yard Distance one from another, having each a Soldier to attend it; and there is an Officer to every 40 or 50 of them.

M m m

They fire sometimes 60 or 70 of these together, which throw their Shells into the Covertway, &c, and make a very terrible Slaughter.

MORTISE or Mortaife, is the Workmens Word in Architecture for the Hole made in one Piece of Timber to receive the Tennon of ano-

MORTMAIN Statute: There was a Statute made in 7 Ed. 1. de Terris in manum mortuam mon ponendis; to restrain the Donation of any Lands or Tenements to Religious or pious Uses, where they lay in a Dead Hand, without Succession or due Service to the Lord and the King. After which Statute the Lands so given away were forfeited to the King, if the immediate Lord of the Fee made not his Claim within a Year after such Alienation.

When the King by special Licence dispensed with the Statute of Mortmain, there was a previous Inquisition ad quod Dampnum, and a Return upon Oath that it would be no Prejudice to the This Law Dignity and Revenues of the Crown. of giving is now relaxed by Stat. 39 Eliz. c. 5. Lands to Hospitals; and by 14 of Car. II. c. 9. a-bout purchasing Lands and Tenements for the

Poor within London and Westminster.

MOSAIC Work, is corruptly so called; it should be Musaick; in Latin musicum Opus, and sometimes tis called also Pavimenta Tesselata.

MOTION: From the first of Sir If. Newton's three Laws of Motion or Nature mentioned under this Word Motion in Vol. I. by way of Corollary may be inferred, (1.) That no Particle of Matter, or any Combination of fuch (that is, no Body whatever) can either move of it self, or alter the Direction of its Motion, because 'tis entirely pasfive and indifferent as to Motion or Rest; so that neither Motion or Rest are essential to Matter. (2.) Tis plain also from hence, that naturally of it self, no Body can ever move in a Curve Line; for fince all Motion is originally and naturally rectilinear, itis impossible that any Body can move in a Curve or Line that is not strait of it self; because then it must of it self continually alter the Direction of its Motion, which cannot be, by the former Corollary; wherefore the Motion of the Heavenly Bodies in Circles or Ellipses cannot be accounted for by the natural Laws of Motion; but it is owing to the Will of the great Creator that they are kept in their Orbits by an attractive Force.

From the second of the three Laws of Motion, it follows, that all Effects will always be proportional to their Adequate Causes; and thus if any Degree of any Force will produce any Degree of Motion, a double Degree of the same Force will produce a double Degree of Motion, a Triple, a Triple, and so on in any Ratio whatsoever. And this Motion must proceed on in the same Dire-Ction with that of the moving Force, because tis from That only that the Motion arises; and Bodies once in Motion, cannot change their Directi-

on of themselves.

And if a Body be already in Morion, the Morion arising from a Force impress'd, if it be in the same Direction with that of the former Motion, it will increase it in Proportion to its Power; but if it be impress'd in a contrary Direction, it destroys the former Motion either totally or in part, that is, equal to the Force of the Impression. And when it hath a Direction any way oblique to that of the Multiplicand, which you begin with.

the former Motion, it is either added to, or subtracted from it, according as a Motion arising from a Composition of those two, is determined

MOUNT-EGG; after Tin from the burnt Ore is melted down and remelted, there will sometimes remain a different Slugg in the Bottom of the Float, this they call Mount-Egg; and the of a Tin Colour, yet is of an Iron Nature, as hath been

found by applying a Magnes to it.

MUD-SUCKERS, Limifuga, are a Sort of Water-Fowl which suck out of the Mud of Channels, Ge. some oily Juice or Slime with which they are nourished; hence they are always delicate Flesh, and their very Guts uncleansed from the Excrements are usually eaten, as those of Woodcocks, &c. These Mudsuckers have therefore very long Bills, and broad near the Tip.

MULIER, a Term used in our Common Law: some think to be a Corruption either from the Latin Melior, or the French Meilieur, and fignifies the Lawful Issue preferred before an elder Brother born out of Marrimony. Others will have it to be derived, quasi ex muliere natus & non ex concu bina; and so they use the Word Filius mulieratus, in Opposition to a Bastard; and in this Sense the Scotch also use the Word, and therefore this last Etymology is most probable.

MULTA or Multura Episcopi, was formerly a Fine or Mulct paid to the King, that a Bishop might have Power to make his last Will and Testament; as also to have the Probate of other

Mens, and the granting Administrations.

MULTIPLICATION: It often happens that tis needless to express at large all the Figures of the Product, especially where the Factors have each many Places of Decimal Parts; and therefore the following Compendium is as useful as

tis curious.

Suppose 3.141592 were to be multiplied by 52.7438; and that a Product which should have 4 Places of Decimals, would be enough for the present Purpose. First write down the Multiplicand, and fet the Place of Unites in the Multiplier under that Figure of the Multiplicand, whose Place you intend to keep in the Product. let 3.141592 be the Multiplicand, and you would have but 4 Places of Decimals in the Product; place therefore 2, the Place of Units in the Muleiplier, under 5 the 4th Place of Decimals in the Multiplicand. Thus, 3.141592

After this place all	8347.25	
the other Figures of	157 0796	
the Multiplier in a	62832	
contrary Order; viz.	2 1991	
the 5 Tens in 52 to	1257	
the Right-hand in the	94	
Place of Unites, and	25	
all the Decimal Parts		
to the Left-hand as	160 6000	

165.6995 you see in the Example. Then in multiplying begin always

The Product with 4 places of Decimals only.

at the Figure in the Multiplicand that stands over the Figure you multiply by; fetting down the first Figure of each particular Product, directly underneath one another, only you must have Regard to the Increase which would have arisen out of the multiplication of the two next Figures, which stand to the Right Hand of that Figure in

Thus

Thus, say 5 times 9 is 45, and one which would arise from 5 multiplying 2, makes 46; therefore write down 6 and go on as in common Multipli-

Then with the next Figure 2, fay twice 5 is 10; which with the Increase that would arise from 2 multiplying 9; will be nearly two Tens to be put down instead of the Cypher. Then say, twice 1 is 2, and one to be added from the twice 5 is 3; therefore write down 3, and go on as usually.

Next go on with 7, and fay, 7 times 1 is 7, but from the Confideration of 7 being multiplied into the two Figures 5 and 9, which stand to the Right Hand of the 1, there will be 4 to be added; so 7 and 4 make 11, write down 1 and carry 1, &c.

Another Example will make all plain. Let 257.356 be to be multiplied by 76.48, and the Product to be entirely confisting of Integers wirhout Decimal Parts.

First write down the Multiplicand, and then fer 6, the Place of Units, in the Multiplier under 7 the Place of Units in the Multiplicand (because you are to have no Decimal Parts) and write down the other Figures in a contrary Order, as above di-

84.67 180 15 1544 1 03 19682 The Product

257.356

clear of Fractions.

rected; proceeding also with each single Figure, as is there taught.

MULTONES Auri, were formerly Pieces of , Gold Coin imprest with the Figure of a Sheep or Lamb (perhaps the Agaus Dei) from whence they had this Name, Males being then used for a Sheep, as Mutto and Mato was also, whence our Word Maston. This Coin was more common in France; but that it was sometimes used also in England, appears by a Patent of 33 Ed. 1.

MUNDICK, is a Marchasite sound in the Tinmines, of a Colour white, yellow, or green. sometimes call it maxy; it seems to be a Kind of Sulphur, because Fire only separates it from the Tin, and it evaporates into Smoke. The mundick Ore is eafily known by its brown fad-coloured glittering, and by its foon colouring your Fingers. Some fay this nourishes the Tin, and yet they say also, where much Mundick is found there is little or no Tin; and 'tis certain, that if there be any Mundick left in melting the Tin, it makes it thick and cruddy, as they speak; that is, it is not so ductile as otherwise it would be.

MUNIONS, in Architecture, are the fhort upright Posts or Bars that divide the several Lights in a Window Frame.

MUSCLE; a Muscle is only a Bundle of Fibres, which being closely compacted at each End, make the two Tendons, each of which is inserted into fome fixt Parts of the Body. Every one of these Fibres confifts of a prodigious Number of lesser Fibrilla, which are so many very stender elastick Canals bound about by small transverse parallel Threads, which divide these hollow Fibrillæ into fo many elastick Cyftes or Vesiculæ, which are orbicular, being formed of two concave Segments of a Sphere. Into every one of these Vesiculæ, an Artery, Vein, or Nerve enter; the first to bring

and carry back the Blood; the last to carry thither the Liquidum Nervorum or Nervous Juice, which mingling in the Veficula, with the Blood, doth very probably (it having an acid Taste, and therefore confifting of Particles which are pointed and fo qualified to prick and break the Globules of the Blood) let out the imprisoned elastick Air which before was contained in the Globules, into those little Vesicula, whereby the elastick Cells of the Fibres will be blown up, and thereby their Longitudinal Diameters, from Cell to Cell straitned; and this must contract the Length of the whole Fibre, and so move that Organ, to which one of the Tendons is fixt. This, saith Dr. Cheyne, Phil. Prin. Natural Religion, p. 221. is undoubtedly the true manner of muscular Motion.

He thinks also, that the broken Shells of these Globules are carried back by the Veins to the Lungs to be new formed; which is the Reason that muscular Motion is so constantly and uniformly performed, as long as the Blood Globules and A-

nimal Spirits are in sufficient Plenty.

MUSCULUS Tube novus Valfalva vel Palaco-Salpingeus, a Muscle arising broad and rendinous from the Edge of all the lunated Part of the Os Palati, several of its Fibres being spread upon the Membrane that covers the Foramen Narium, then growing into a small thin Tendon, it is reflected about the Hook-like Process of the inner Ala of the Processus Pteregoidaus internus, and is inserted carnons into all the membranous, fleshly, and cartilaginous Parts of the Tube. Its Use is to di-late and keep open this Channel. Myogr. compa-

rata Specim, p. 47.
MUSCULUS Auricula Anterior, is a new (5th) Muscle of the Auxicle, and added to the four before discovered by Cusserius, by the Discoverer of it

Valsalva in his Treatise of the Ear.

It arises from the investing Membrane of the Temporal Muscle, above that Part of the Zygoma which proceeds from the Os Temporis; thence running strait down, it parts into two; one of which is inserted to the Fore Part of the upper Cavity of the Concha; and the other a little higher, into the Fore Part of the Cavity of the Scapha. He describes there also two new Muscles more, which from their Situation he gives these Names to.

MUSCULUS Tragi, and but in lean ema-MUSCULUS Anti-Tragius ciated Bodies he

owns there are not to be feed.

MUSICK. What follows is a brief Account of the Elements of Musick, communicated by the ingenious Mr. John Porks.

The Thing confidered in Musick is Harmonical Sound, or Sound so manageable, as to please the

Ear and Fancy of the Hearers.

The Sense of Sound is caused in us by the trembling motion of the Air, excited by the Per-cussion of some solid Body, as a Bell, String, Pipe, &c.

This Trembling of the Air is quick or flow. according to the Impression given by the Voice or Instrument. The quicker the Trembling is, the more acute and sharp is the Sound; and the slower,

the more grave and flar,

The same Degree of Quickness of the Trembling or Pulses of the Air being continued, the same Sound or Note is continued also. Hence a founding String keeping the same Note to the last, the greatest to the least Ranges of its motion.

The shews, that its Vibrations are in equal Time from

The shorter a musical String is, cateris paribus, the quicker are its Vibrations, and the more acute its Note: And, contrariwise, the longer a String is, the more slow are its Vibrations, and the more grave its Note.

Hence the Proportions of the Degrees of Acuteness and Gravity of Notes are computed from the Divisions of a Monochord, or strained musical String.

The Proportion of Quickness in the Vibrations of two Strings, and also of the Pulses of the Air excited thereby, is Reciprocal or Counter to the Lengths of the Strings; so swice the Length gives (cateris paribus) balf the Quickness of Pulses (or balf the Number of Pulses in the same time,) If the Lengths are as 3 to 2, the Velocity of Pulses is as 2 to 3, &c. Hence the Relation or Proportion of musical Notes is determined as follows.

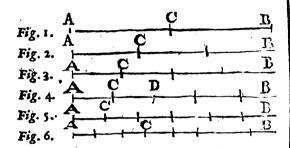

Fig. 1. Let AB represent a musical String (suppose a Bass Viol) strained so as to give a clear Sound. Let it be divided into two equal Parts at C. Stop the String at C, and the Part CB (being struck) will sound an OBave or Eighth to the Note of the whole String AB when unstopt. CB is in length to AB as 1 to 2; and the Vibrations of CB to those of AB (in the same Time) as 2 to 1. Hence the Proportion of an OBave or Diapason is Dupla, Double, 2 to 1.

Fig. 2. Let the String A B be divided into three equal Parts, of which A C is one. If the String be ftop'd in C, the Part C B will found a Fifth to the Note of the whole String. C B is to A B (in length) as 2 to 3, and the Vibrations of C B are to those of A B as 3 to 2 in Quickness. Hence the Proportion between the two Notes of a Fifth (Diapente) is Sesquialtera, 3 to 2.

Fig. 3. Let A C be a Quarter of the whole String A B. Stop in C, and the Part C B will found a Fourth to the Note of the whole String A B. Hence the Proportion between the Notes of a Fourth (Diatessaron) is Sesquitertia, 4 to 3.

Fig. 4. Let A C be a Fifth Part of the String A B. Stop in C, so will C B sound a Greater Third to the Note of the whole String A B. The Proportion therefore of the Notes of a Greater or Sharp Third is Sesquiquarta, 5 to 4.

Fig. 5. Let A C be the fixth Part of A B. Stop in C, so will C B sound a Lesser or Flat Third to A B, whose Proportion is therefore Sesquiquinta, 6 to 5.

If D B (Fig. 4) be \$\frac{2}{3}\$ of A B, B D will found a Greater Sixtb to A B.

• If C B (Fig. 6.) be f of A B, C D will found a Lesser Sixeb to AB.

From'what hath been said it follows, that

When two Notes in any of the precedent Proportions one to another, are founded together; their Sounds are agreeable and pleafing to the Ear, and are therefore called Concords. Of these the Eighth and Fifth are called Persest Concords; Thirds and Sixths are called Impersest Concords: The Fourth (anciently accounted a Concord) is by modern Musicians accounted a Discord to the Bass in Consort-Musick, as wanting a Fifth under to compleat the Harmony.

The above-mentioned are all the Simple Concords that the Ear allows of. If the Proportion between any two Notes be compounded of the Proportion of an Ostave with that of any other Concord, it retains the Name and Nature of the added Concord. So a Tenth, that is, an Eight and Third, is accounted but a Third; and so of the rest.

All other Proportions between 2 Notes founding together produce Discords, or Sounds harsh and unpleasing to the Ear, the Coincidencies of the Pulses being too remote one from the other.

By this it appears, that Commensurability in the Quickness of the Vibrations is necessary to Concordance; and the smaller the Numbers are that express the Proportion of the Pulses in the same Time, or the nearer their Coincidencies, the more persest is the Harmony. And consequently if their Pulses be of Incommensurable Velocities, the Discord will be in the bigbest Degree harsh and displeasing.

From this Account of Concords and Discords may a Reason be given of several Phænomena of Sounds, as particularly why two Strings of a Bass Viol that are Unisons or Ottaves one to the other, if one be struck, the other will tremble so as to be sensibly perceived if a small Bit of Paper be laid on it. For the String that is struck putting the Air into a certain Degree of trembling, which being the same, or next Degree of proportional Quickness to that of the unstruck String, sets it a trembling also. This Experiment, (and others of like Nature) Dr. Holder very well illustrates by the Instance of a Pendulum, which if you blow into Motion, and continue to blow unisonmly as it begins to go from you, it may be continued in Motion as long as you please; but if you blow irregularly (sometimes as it goes and sometimes as it comes) its Motion will be check'd, and at last cease.

Being once in a Room where was a Bass Viol, and striking one of the Strings, a loose Quarry of Glass in the Window jarr'd every Time that String was struck, which it would not do upon striking any of the other discording Strings. The Reason of which seem to be, that the Times of the Vibrations of the loose Quarry were equal (or in near Concordance) to those of the String.

Concordance) to those of the String.

From the foregoing Proportions may those of all other musical Intervals be computed by Compounding or Dividing. I'll give a few Instances, and for more refer to Dr. Holder's Grounds and

Principles of Harmony, where all Things are more

fully treated of.

Let it be required to find what Proportion the extreme Notes will have of Fourth and Fifth added together. The Proportion of the Notes of a Fifth is express'd by 3, that of a Fourth by 4: Compound these Proportions, so $\frac{1}{2} \times \frac{3}{4} = \frac{1}{6} = \frac{3}{4}$, which is the Proportion of an Offave: Whence it appears that a Fourth and Fifth added together make an Eighth. Again, to find the Difference between a Fifth and a Fourth; Divide by \(\frac{1}{2} \) \(\fr

To find the Difference between a Greater Sixth and a Fifth; Divide; (the Proportion of a Greater Sixth) by ? (that of a Fifth) it gives \$\frac{1}{2} \cdot \frac{1}{2}

To find the Difference of a Fourth and Greater Third, Divide $\frac{4}{3}$ by $\frac{7}{4}$ [$\frac{7}{4}$] it gives $\frac{16}{15}$, which is therefore the Proportion of a Semi-sone (or lesser gradual Interval) by which a greater Sharp Key.

Third and Fourth differ. In like manner may other Intervals be compared.

In a gradual Series of 8 Notes, there are contained 5 Tones, (or whole Notes) 3 Greater and 2 Lesser, and 2 Semi-tones (or half Notes) whose Order among themselves is different according to

The Key is the Principal or Fundamental Note. of a Tune, to which the rest have proper Resairons, and with which the Bass always concludes:

The Key is called Flat or Sharp, not as to the Key-Note it self, but with Respect to the Third, Sixth, and Seventh above it. A Flat Key is that which hath above it (and reckoning from the Key). a Lesser Third, Sixth and Seventh; and a Sharp-Key is that which hath a Greater Third, Sixth and Seventh; the 2d, 4th, and 5th being the same Intervals in both Keys.

The annexed Figures shew how a String is to be divided to express the Notes in a Flat or

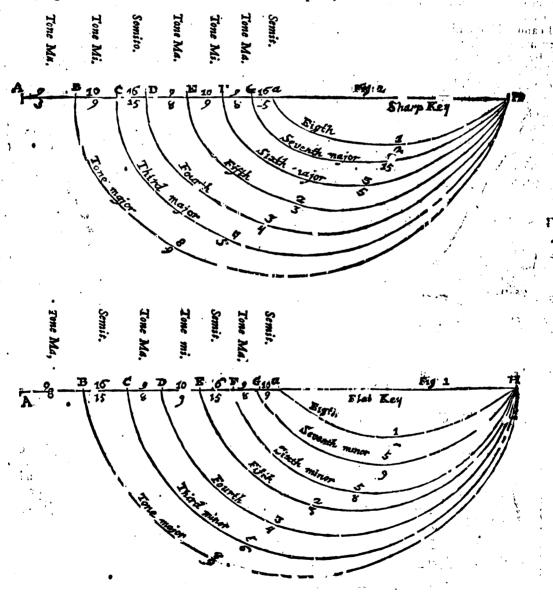

Fig. 1. A H is the whole String, whose Sound one to another, and also of the Length of Strings gives the Key-Note; B, C, D, &c. shew the Diffrom these Divisions to H: So is standing bevisions (or Stops) to express the Notes of a Flat tween D and E, shews, that DH is to E H as

The Numbers set to each little Part of the Line,

10 to 9; and so of the rest.

Upon the Arched Lines is express'd the Relation shew the Proportions of the next immediate Notes of the several Notes to the Key, and also of the founding founding Part to the whole String. So E H is 3 of a whole String, and founds a Fifth to the Key. In like manner Fig. 2. shews the Divisions in a

Sharp Key.

Suppose A H (Fig. 1.) be a Line 24 Inches long, then will A B be 23 Inches; A C 4 Inches, A D 6 Inches, A E 8 Inches, A F 9, A G 10 3 Inches,

A 2 12 Inches.

To express the Notes of a Sharp Key, let A H (Fig. 2.) be a Line 24 Inches long, then is A B 2 Inches, A C 4 Inches, A D 6 Inches, A E 8 Inches, A F 9 A G 11 A G 12 Inches.

If a middle fiz'd Gut-ftring be ftrained over a

Line thus divided at about a fifth Part of an Inch Distance from the Line, the Divisions mark'd in the Line will shew where to stop the String so as to express the several Notes.

Above and below the Eighth the Notes ascend and descend in the same order repeated, and therefore all Eights are called by the same Names, and (in the Gamus) figned with the same Letters of the

I cannot here omit two Observations that have been made relating to what has been faid: first by Sir Isaac Newton in his Treatise of Light and Colours, where confidering the Colours produced by the Sun's Light passing through a Triangular Glass Prism, and measuring the Space that each of the feven Colours (Red, Orange, Yellow, Green, Blue, Indico, Violet) take up, he found the Divisions of the whole Length of the coloured Image, to be the same with that of a Monochord into the Tones and Semitones of an Ollave. See pag. 92. of his Opeicks

The other Observation is concerning the Proportions of the Notes in a full Close upon an Organ or Harpsichord, viz. That they are as the Numbers 1, 2, 3, 4, 5, 6, in order, beginning from the as is here prick'd Bass, down.

All the Notes commonly used in Musick are compriz'd in their Order in a Scale which is call'd

The GAMUT.

Sometimes Ledger Lines are added above and

below, as Occasion requires.

In the first Column are fer the Names by which the Keys. or Notes, are commonly called, as Gamut, Aro, &c. In the second Column are set the 7 Letters belonging to the several Lines and Spaces. The third Column contains the Cliffs, and shews how many Degrees, or Notes, they are one above or below the other; which being known, the other Degrees of Distance are easily computed.

Five of these Lines, with their Spaces, are commonly sufficient for the pricking of a Tune; therefore is the whole Scale divided into 3 Systems or Staves, compassed in by arched Lines. Of these the lower 5 belong to the Bass, and are distinguish'd by this Mark Z upon the Line of F. The uppermost 5 Lines contains the Treble Part, which hath for its Cliff or Gs upon the Line of G. The Tenor, or middle Part, hath for its Cliff this Mark 其 upon the Line of C, which only is its proper Line, the other 4 being borrowed from the Treble and Bass.

Of Sol-faing, and Tuning Notes when prick'd down.

In learning to fing, it is necessary that the Notes Names, Places, and Difference in Sound from each other be well known, and a Habit got (by Practice) of naming and turning them right at Sight.

The Names in Use are but these 4 Monosyllables, fol, la, mi, fa; which yet must (and has been) own'd incongruous; for seven distinct Notes should certainly have as many Notes to distinguish them by. I shall therefore, after I have given a short Account of the Use of those Names. propose another way of naming the Notes in Singing, which I judge (and have found by Experience) to be better.

In order to Sol-fa a Tune, (that is, to name and tune the Notes right) the Place of mi must be sirst known, which is B in the Scale, as being the next Note above three Tones immediately succeeding each other. In case of Flats (b) and Sharp (\$\frac{1}{2}\$) the Place of mi is found as in this Table.

When
$$\begin{cases} F \text{ is} \\ F \text{ and } C \text{ are} \\ F G & C \text{ are} \end{cases}$$
 Sharp, mi stands in $\begin{cases} F \\ C \\ G \end{cases}$

The Place of mi being known, you ascend above mi by fa, sol, la, fa, sol, la; and descend below mi by la, sol, fa, la, sol, fa, calling all Eights by the same Name.

Mi in B. fa sol la fa sol la mi. Sol la fa sol la mi Mi in A. la fa sol la mi fa sol la fa sol la mi.

1,11

I'll now propose the other way of naming the Notes, that I mention'd before.

The seven musical Notes being express d in the Gamus by the 7 sirst Letters of the Alphabet, A. B, C, D, E, F, G; let these Letters be their Names whereby to express them in Singing. Only, for better Sound's sake, and to accommodate them to the Variations by Flass and Sharps, let A and E be call'd lA and lE. Let F be called Fà (with a broader Sound as in the Word Fall.) G and C are to be pronounc'd Ge and Ce; so will the 7 Names be IA, B, Ce, D, lE, Fà, Ge. When A and E are mark'd to be flat at the Beginning of the Staff of Lines, let them be called mA and mE; when B is Flat call it Be, as in the Word Benefit. When F is mark'd to be a Sharp, let it be call'd Fa, as in the Word Fatal. When C is Sharp call it Cee (its proper Name.) In like manner, when G is Sharp) let it be called Gee, not Ge.

By this means the proper Letter expressing each Note is preserv'd, and also a Provision made for Variation of the Name, according as the Note is varied to Flat or Sharp.

ing and a second second second second second second second second second second second second second second se

To fing a Tune true according as it is prick'd, is best and soonest learnt by the Assistance of one skill'd in Musick; but where such cannot be had, a Person who has naturally a Musical Ear and Fancy, may, (by the Method 1 shall here direct) attain to a competent Skill in Plain-Song, at least. In order to which, I shall only suppose that he can sing the Tune of Six Bells, which (with us in England, where that Number of Bells is so common) is no great Thing to suppose in a capable Learner.

There being in every Octave six Tones and two Semitones, (as has been shewn) it is necessary to true Singing, that these Tones and Semitones should keep their proper Places. In Order therefore to know and distinguish Tones and Semitones, the Learner must observe, that in the Tune of Six Bells, the Third and Fourth Notes (or Bells) are distant a Semitone; all the rest are distant (each from its next) by a Tone. A good Ear will easily observe the Third and Fourth Notes to be nearer Sound than the rest.

To apply the Tune of Six Bells to Notes prick'd.
in the Treble Cliff.

In this Example (consisting of 3 Bars or Divisions) you have in the first Bar the Notes of Six Bells, beginning at the Leger-line above the Staff, which is the Place of A, (according to the Order in the Gamue.) Begin with your Voice pretty high (that you may after reach the lower Notes in the other Bars) and sing 3 or 4 times distinctly the first six Notes, calling them 1, 2, 3, 4, 5, 6. Then call them by their proper Names, (set under the Staff) IA, Ge, Fa, IE, D, Ce; singing them in the same Tune that you did the Numbers 1, 2, 3, 4, 5, 6.

2, 3, 4, 5, 6.

Proceed to the second Bar, but first sing your former six Notes once or twice over, holding out the Note IB a little longer than the rest; then repeating only the three last Notes of the sirst Six, begin at IE in the second Bar, and sing IE, D, Ce, B, IA, Ge, in the Tune of Six Bells, keeping the three sirst Notes of this Six in the same Tune with the three last of the former Six. So are you led gradually one Note above an Oslave. If you stop at the lower IA, (one Note short of the last 6, you'will have a compleat Oslave from IA above to IA below, which is the Order of Notes in a Flat Key.

If your Voice will reach another six Notes, you may, in the Third Bar, repeat the two last Notes of the foregoing Six, and sing 1A, Ge, Fa, 1E, D, Ce, in the Tune of Six Bells.

In the 4th Bar, having fung the 6 Notes 1B, D, Ce, B, 1A, Ge, in the Tune of 6 Bells several times, try to sing them backward, as in the 5th Bar, Ge, 1A, B, Ce, D, 1E; which with a little heed may easily be done, as may also the other Six, beginning at 1A in the 6th Bar.

Here note, 1. That the Tune of Six Bells may

Here note, 1. That the Tune of Six Bells may begin either at IA or IE, and no where else without altering the Property by Flats or Sharps, of which anon. 2. That the two Semitones lie, one between B and Ce, and the other between IE and Fa.

The

The same Directions will serve for the following Notes set in the Bass Cliff, and therefore I shall only set down the Notes.

1, 2, 3, 4, 5, 6. 1, 2, 3, 4, 5, 6.

1A, Ge, Fâ, lE, D, Ce. lE, D, Ce, B, lA, Ge.

lA,

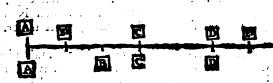

When Flats or Sharps (b, #) are fet at the Beginning of the Staff by the Cliff, they alter the Places for beginning the 6 Notes, by removing the Semisones (one or both) from their original Places; the Flat [b] removing its Notes a Semisone lower; and the Sharp [#] removing then a Semisone higher. When there are no Flats and Sharps, the Tune of Six Bells begins at IB and IA only; in other Cases as follows.

When \{ Be is flat \\ Be and m B are flat \} begin the \{ IA& D. \\ Tune of \{ Ge & D. \\ mA, Be& mB are flat \} \} \text{6 Bells at } \} \| Ge&Ce.

When { Fa is sharp begin the B& IE. When { Fa and C are sharp } Tune of B& Fa. 6 Bells at C & Fa.

An Example when B and E are flat.

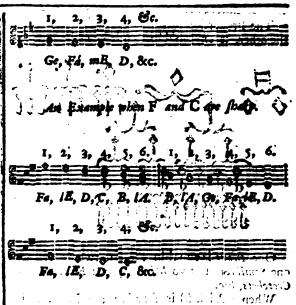

It may be a good Way to give Learners a Notion of the Alterations made by Flats and Sharps; in the Diftances of the Notes, to divide a Line into 12 equal Parts (which will do for this Purpose, tho in Strictness they should not be all equal) as the Line A a is here divided. Provide 8 little square Papers with these 8 Letters, A, B,C, D, E, E, G, a, upon each, one; and place them as on the underside of the Figure, which shews their natural Order, and the Places of the Semisenes between B and C, and between E and F. Suppose I should now see the Order of the Tones and Seminanes when B and E are signed flat in the Staff thus, to do this, I remove the Papers mark'd with B and E, one Degree (answering to

mark'd with B and E, one Degree (answering to a Semitane) lower, or nearer to A; and then the Papers will stand in Order as above the Line, and the two Semitones are now between A, B, and D, E. In case of Sharps, the Letter design'd to be sharp must be removed one Degree (or twelfth Part) higher, or nearer to a.

Thus may all the Varieties be represented to the Eye, and the Reason of beginning the Six Notes as is directed, be also understood.

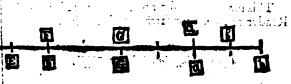

Of the Quantity of Notes as to Time.

Besides the giving to Notes their right Tune Vol. IL.

By the Table above, and shele two Estamples, may be understood how to place the Six Notes in any other Case of Flats and Sharps, or in other Cliffs. The Semitones in all Cases, he between the 3d and 4th Notes of the Six.

See more, with Application to Pfalmedi, in a Treatife called, A New and Eafy Method to learn to Sing by Book; Printed for W. Regers in Fleetftrees.

(according to their Places in the Staff of 5 Lines) Regard is also to be had to the Length or Short-ness of Time they are expressed in, which is known by the Figure or Shape of the Character by which they are pricked on the Lines.

The Names and Figures of the usual Notes in Respect of Time, and their correspondent Rests are as follow:

Breve, Semibreve, Minim, Cresbet, Quever, Semiquever,

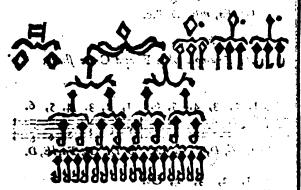

The Strokes or Marks set after each Note are called Rests or Pauses, and denote a Ceasing or Intermission of the Sound for the Time of the Notes they are join'd to.

Nas

The

The Proportion of the foregoing Notes, one to

One Breve is equal in Time to two Semibreves; one Semibreve to two Minams; one Minim to two Crotchets, &c.

When a Prick (.) is set after any Note, it increaces he Quantity ball as much more. So (3') is coyal in Time to () a Semibreve and Minim. A prick'd Minim (學!) is equal in Time to (字!) a Minim and Crotchet.

If the Words one, two, three, four be pronounced in a reading Tenor, the Time of promouncing cash Syllablemay be accounted the Meafure or Time of one Crasthes; and confequently, one, the, gives the Lime of a Minim; one, two, three, of a prick'd Minim; one, two, three, four, of a Semibreve.

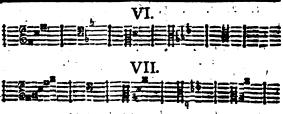

This may suffice for an Entrance, referring the Reader to Books for farther Information.

Of Singing in different Cliffs.

The Difference of Cliffs is what doth perplex Learners. They who can fing in the Treble Cliff, are at a Loss when they come to the Tener or Bajs Cliffs: I will therefore here give a Table, where-in all the usual Cliffs (or Positions of them) are so compar'd and order d, that he who can sing readily in one Cliff, may fing in any other in the Table.

A Table whereby all the usual Cliffs may be reduced to any one Cliff desired.

This Table, confifting of 7 Staves or Classes, contains in each Class all those (usual) Cliffs wherein the Semitones lie in the same Places of the Staff; and confequently what is prick'd in any Cliff, may be sung (or play'd) as if it were prick'd in any other Cliff of the same Class.

E. G. Suppose a Person hath learnt to sing in the Treble Cliff only, and would fing Notes prick'd in the Tenor Cliff on the middle Line with F#, thus let him look for this Cliff in the Table and he will find it in the second Class, where, at the Beginning is that is, the Treble Cliff with B flat. If he therefore fing the Notes as if they were in the Treble Cliff with B flat, he'll fing them as true as if he had understood the Tenor Cliff.

Ge, lA, B, Ce, D, lE, Fa, Ge. Examp Fà, Ge, IA, Be, Ce, D, IE, Fa.

In this Example, the Cliff at the Beginning of the Staff, is that to which the Notes are prick'd, and the Names (as in the Tenor Cliff) are fet above them. At the End is fet the Treble Cliff, in which the Notes may be fung, and their Names (as accounted in the Trable Cliff) as feet under.

Dr. Wallis, in Phil. Transact. N. 243. takes into Confideration the strange Reports we have of the Power of the ancient Musick; and the he judges they are in a great Degree Hyperbolical, if nor Pabulous; yet he thinks too that some Account may be given of the great Effects it's faid to have had, from these Considerations.

1. That Musick was then, if not new, a rare Thing; which the Rusticks, on whom it is reported to have had mighty Effects, had scarce even heard before; and on fuch, a little Musick will do great Feats; as we find at this Day a Fiddle or a Bagpipe hath at a Country Morice-Dance.

2. Their Musiek was much more Simple and Plain than ours now: They had no Conforts of 2, 3, 4, of more Voices or Parts; but one fingle Voice or Instrument a-part; which to a rude East is much more taking than compounded Musick 2 That not exceeding their Capacity, whereas This confounds them quite, and is by no means diffinguishable by them, so as to affect them with the Harmony of its Parts.

3. Musick, with the Ancients, was of, a much larger Extent than what we now call by that Name: for Poetry and Dancing (i. e. comely Motion) were then accounted Parts of Mufick when it had arriv'd to some Degree of Perfection. And we see that Verse of it self alone, if in good Measure, and moving Words, and this fet to a Musical Tune, sung by a decent agreeable Voice, accompanied with fost Instrumental Musick only, if with any; i. e. fuch as doth not drown or obscure the emphatical Expressions (like what we call Resistative Musick. tho' I doubt not more justly managed ; for I hope

the same Tone did not serve with them for making Love, Fighting, and delivering Letters) will work strangely upon the Bar, and move all the Affections suitable to the Tune and Ditty, especially if attended with a Gesture and Action suitable; for we see that fuitable Adien alone doth on the Stage, give great Life and Force to Words; and therefore all this together might eafily operate very ftrongly on the Fancies and Affections of ordinary People not used to such kind of Treatments: For if the deliberate reading of a Romance, (when well penn'd) will produce Mirth, Tears, Joy, Grief, Piry, Wrath or Indignation, suitable to the respective Intents of it, much more would it do, if accompanied with all these Attendants.

4. If it be ask'd, why may not all this be done now? I answer, no doubt it may: If the Address be made in proper Words, emphatically spoken, and in just Measures, with moving Arguments, pronounced by an agreeable Voice, and attended with a decent Gesture, and not drown'd by too much Musick, or over acted by apparent Affecta-

5. We should understand also, that the usual Design of what we now call Musick is very different from that of the Ancients; for that which we call fo, was but with them the Harmonick, i.e. but one Part of their whole Musick, which confifted of Words, Verse, Voice, Tune, Instrument,

and Acting.

6. When Musick arriv'd to good Perfection, it was applied by the Ancients to the exciting this or that particular Affection, Passion, or Temper of Mind the Tunes and Measures being suitably adapred to such Designs, whereas those are now almost quite neglected in our present Musick; the chief Design being now to please the Ear, when by a sweet Mixture of different Parts and Voices, with just Cadences and Concords intermix'd, a grateful Sound is produced: But this only the Judicious Musician, or one a good while used to fuch Compositions and Performances can distin-

gnish,
7. Tis true, that even this Compound Musick admits of different Characters; some is more brisk and airy, others more solemn and grave, as the different Subjects do require. But that which is most proper to excite particular Passions or Dispolitions, is such as is more Simple and Uncompounded; such as a Nurse's languid Tone sulling her Babe to Sleep, or a continued Tale (as in Ireland) or reading in an even Tone; or the loft Murmur of a little Rivulet running upon Gravel or Pibbles inducing a quiet Repose to the Spirits: and on the other Hand, the Briskness of a Jig, &c. on a Violin exciting to Dance; for these are more operative for such Ends than elaborate Composi-

tions of full Mulick.

The same excellent Author in N. 249. hath a judicious Discourse about the Impersection of that noble Instrument an Organ; where he observes, That each Pipe is designed to express a distinct Sound at such a Pitch, or at such a determinate Degree of Gravity or Acuteness, i. e. as it is now called of Flames or Sharpness; and the Relative or Comparative Consideration of the two or more fuch Sounds or Degrees of Flatness or Sharpness is the Ground of what we call Concord and Difcord; that is, a soft or harsh Coincidence. Concerning which there was among the ancient Greeks two Sects of Mulicians; the Aristoxenian and Py-

shagerean: But both agreed thus far, that Diaseffaren and Diapente do together make up Diapafon i.e. a Fourth and a Fifth make up an Bighth. And the Difference of these two, of a 4th and a 5th they agreed to call a Tone; which we now call a whele Note. Such is that in our present Musick of la mi; for la, fa, sol, la, or mi, fa, sol, la, is a perfect 4th, and la, fa, sol, la, mi, or la, mi, fa, fol, la, is a perfect Fifth. The Difference of which is la, mi; and this the Greeks called the Diagentick Tone, which disjoins two Fourths on each Side of it; and being added to either of them, makes a Fifth; which was That, in their Musick from Mese to Paramese, or in Ours from A to B, supposing mi to stand in B fa B mi, which is accounted its natural Position.

Now in order to this Aristoxenus and his Followers took that of a 4th, as a known Interval, by the Judgment of the Ear, and that of a Fifth likewise, and consequently that of an Offave, as the Aggregate of both, and that of a Tone as the Difference of those two. And this of a Tone (as a known Interval) they took as a common Measure by which they estimated other Intervals: And accordingly they accounted a Fourth to contain two Tones and \(\frac{1}{4}\), a Fifth three Tones and \(\frac{1}{2}\), and confequently an Eighth fix Tones, or five Tones and two half Tones; and at this Rate our practical Musicians talk of Notes and balf Notes at this Day; supposing an Ollave to consist of twelve half Notes.

But Pythagoras and those that follow'd him, not taking the Ear alone to be a competent Judge in a Case so nice, chose to distinguish these, not by equal Intervals but by due Proportions. And this is followed by Zarline, Kepler, Curees, and other Writers on Speculative Musick, in this and the last Age. Accordingly they accounted an Offave to be, when the Degree of Gravity or Acuteness of one Sound to another is double, or as 2 to 1. That of a 5th when tis Sefquialteral, or as 3 to 2. That of a 4th; when 'tis Sesquitertian, or as 4 to 3; accounting that the sweetest Proportion which is exprest in the smallest Numbers; and therefore next to an Unison they accounted the Odave, or of 2 to 1. Then that of a 5th, or of 3 to 2, and then that of a 4th, of of 4 to 3. And thus that of a 4th and 5th do together make an 8th, for $4 \times \frac{1}{2} = \frac{1}{4} = \frac{1}{4} = 2$: Or the Proportion of 4 to 3, compounded with that of 3 to 2 is the same with that of 4 to 2 or 2 to 1, and consequently the Difference of these two, which is that of a Tone or full Note, is that of 9 to 8: for \$)1(= + : Or if out of the Proportion of 3 to 2 you take that of 4 to 3, the Refult is that of 9 to 8. Now according to this Computation tisplain, that an Office is something less than 6 full Notes; for as hath been demonstrated by Euclid, and some others fince, the Proportion of 9 to 8 being 6 times compounded is something more than that of 2 to 1,1 for $+ \times + \times + \times + \times + \times + \times + = \frac{1}{12} + \frac{1}{12} + \frac{1}{12}$ which is more than $\frac{13}{12} + \frac{1}{12} + \frac{$ allowed to the Diazentick Tone, la, mi, the full Proportion of 9 to 8, as the unalterable Difference between the Fifth and the Fourth. All the Difficulty was how the remaining Fourth, viz. mi, fa, fol, la, should be divided into three Parts, so as to answer pretty near the Aristoxenians two Tones and an half; and might all together make up the Proportion of 4 to 3, which is that of a Diatessaron or Fourth.

Nnn 2

Many

Many Attempts were made to this Purpose, and according to these, they gave Names to the different Kinds of Musick, viz. the Diatonick, Chromatick, and Enharmonick, with the several Species or lesser Distinctions under these Generals.

The first was that of Euclid, (which obtained generally for many Ages) and which allows to fa, fol, and to fol, la, the full Proportion of 9 to 8; and therefore to fa, fol, la, which we now call the greater Third, that of 81 to 64; for + x = 11, and consequently to that of mi, fa (which is the Remainder to a Fourth) that of 256 to 243; for 34)4(256 i. e. if out of the Proportion of 4 to 3, we take that of 81 to 64, the Result is that of 256 to 243. To this they gave the Name of λείμμα, that is, the Remainder (over and above two Tones.) But in common Discourse, when we don't aim at speaking exactly, nor desire to be so understood, tis usual to call it an Hemitone or half Note, as being very near it; and the other two whole Notes: And this is what Ptolemy calls Diatonum Ditonum, (or the Diatonick Kind with two full Tones.) Against this it is objected, That the Numbers of 81 to 64, are too great for that of a Ditone or greater Third; which is not harsh to the Ear, but is rather sweeter than that of a single Tone, whose Proportion is that of 9 to 8. And in that of 256 to 243 the Numbers are yet greater much; whereas there are many Proportions (as $\frac{1}{2}$, $\frac{2}{7}$, $\frac{3}{7}$) in smaller Numbers than that of 9 to 8, of which in this Division there is no Notice taken, and consequently this Division is not the most convenient.

To rectify this, there is another Division thought more convenient; which is Ptolemy's Diatonum Intensum, of the Distonick Kind, but more Intense or Acute than the other; and this instead of two full Tones for fa, sol, la, assigns what we now call a Greater and a Lesser Tone; and this seems to have been more followed by the nicer Musicians of this and the last Age. To fa, sol, they assign the Proportion of 9 to 8, which is their greater Tone, and to sol, la, that of 10 to 9, which they call the lesser Tone; and therefore to fa, la, the Disone or greater Third, that of 5 to 4; for \(\frac{1}{2} \times \frac{1}{2}

Omitting to speak of the other Ways of Divifion, this is what we now call an Hemitone or half Note in mi, fa: is that of the greater Tone in fa, fol; and that of the leffer Tone in fol, la. Only with this Addition, That each of these

Only with this Addition, That each of thele Tones is now, on Occasion, by Flats and Sharps divided into Hemistones or half Notes; which answers to what the Greeks called the Change of Mood; and which is now done by removing mi to another Key, viz. $\frac{2}{3} = \frac{1}{12} = \frac{1}{12} \times \frac{1}$

This by the Help of Flats and Sharps, as they are now called, (dividing each whole Note by its greater or 'leffer into two balf Notes, or such as we call so.) The whole Oflave is divided into 12 Parts or Intervals, contained in an Organ between 13 Pipes; and these are commonly called Hemitones or balf Notes: Not that each is precisely an half Note, but somewhat near it, and so called. I say by Flats and Sharps, because sometimes one and sometimes the other is used: As for Instance, a Flat in D or a Sharp in C, do either of them denote a midling Sound (tho not precisely in the

middle) between D and C, flatter than D, and sharper than C.

According to this, supposing mi to stand in Bfa B mi (which is accounted its natural Place) the Sound of each Pipe is to bear these Proportions one to another, viz.

And so in each Offave successively following: And if the Pipes in each Offave be fitted to Sounds in these Proportions of Gravity and Acuteness, it will be supposed according to this Hypothesis, to be perfectly proportioned.

But instead of these successive Proportions for each Hemisone, it hath been sound necessary (if I do not mistake the Practice) so to order the 13 Pipes containing the 12 Intervals or Hemisones, as that their Sounds, as to Gravity and Acuteness, shall be in continual Proportion (that is, each to its next sollowing in one and the same Proportion) which altogether shall compleat that of the Osave or Diapason, or as 2 to 1, whereby it comes to pass, that each Pipe doth not express its proper Sound, but very near it, tho something varying from it: And this they call Bearing, which is somewhat of Impersection in this noble Instrument the Organ, the Top of all.

It may be ask'd, Why may not the Pipes be so ordered as to have their Sounds in just Proportion as well as their Bearing?

I answer, it might very well be so, if all Mufick were composed to the same Key, or as the Greeks call it, the same Mode; as for Instance, if in all Compositions, mi were always in B fa B mi, then the Pipes might be ordered in fuch Propor. tions as I have now defign'd. But Mufical Compositions are made in great Variety of Modes, or with great Diversity of the Pitch. Mi, is not always placed in B fa B mi, but sometimes in B la mi, sometimes in A la mi re, &c. And indeed there is no one of these B Pipes but may be made the Seat of mi; and if they were exactly to any one of these Cases, they would be quite out of Order for all the rest. As for Instance. if mi be removed from B fa B mi (by a Flat in b) to E la mi, instead of the Proportions but now designed. they must be thus ordered.

Where it is manifest, that the Removal of mi doth quite alter the whole Series of the Proportions. And the same would again happen if mi be removed from E to A, by another Flat in E: and again if removed from A to D, and so perpetually. But the Hemitones being made all equal, they do indifferently answer all the Positions of mi (tho not exactly to any) yet nearer to some than to others;

others; whence it is that the same Tune stands better in one Key than in another.

Nor can this ever be remedied, but only in Part, by making the Imperfection something less by the Interpolition of quarter or baif quarter Notes, &c. for it hath been long fince demonstrated, that there is no such thing as a just Hemitone practicable in Musick (and the like holds for the Division of a Tone into any other Number of equal Parts) for supposing the Proportion of a Full Note or Tone to be for as 9 to 8; that of the half Note must be, as .v. 9. to the .v. 8, that is, as 3 to the $\sqrt{.8}$. or 3 to 2 $\sqrt{.2}$, which are incommenturable Quantities: and that of a Quarter Note will be as 4/. 9. to 4/. 8, which is yet more incommensurable. And the like for any other Number of equal Parts; which therefore will never fall; in with the Proportions of Number to Number.

So that this can never be perfectly adjusted for all Keys, without something of Bearing, by multiplying the Pipes. Unless for every Key, or for every different Place of mi there be a different Set of Pipes, of which this or that is to be used, according as (in the Composition) mi is supposed to be in this or that Place. Which wast Number of Pipes for every Octave, would greatly encrease the Charge, and after all, make the whole impracti-

cable.

MUTUUM, in the Civil Law, is a Loan simply so called; or a Contract introduced by the Law of Nations, in which a Thing that confifts in Weight, (as suppose Bullion) in Number, as Money: or in Measure, as Corn, Wine, Oil, &c. is given to another upon Condition that he shall return another Thing of the same Quantity, Nature, and Value, upon Demand.

So that this is a Contsact without Reward, and admits, properly speaking, of no Recompence. And therefore where Use and Interest is agreed on, they arise from some distinct particular Argu-

ment, or by Custom of the Country.

NAT

NAMATION, is the same as Distreyning or taking a Distress; and in Scotland 'tis used for Impounding.

NASALIS or Rhinaus, is a Pair of proper Muscles belonging to the Cartilaginous Part of the Nose; it arises fleshy from the Extremity of the Os Nasi and adjacent Part of the Os Maxillare, and is inserted into all the Cartilages of the Ala; its Use is to open and dilate the Nostrils, by putting that outwards.

NATIVO habendo, was a Writ that lay to the Sheriff, for a Lord, whose Villain claimed for his Inheritance, run from him, for the apprehending

and restoring him to his Lord again.

NATURAL History, is a Description of any of the natural Products of the Earth, Water or Air, such as Beasts, Birds, Fishes, Metals, Minerals, Fossiles, together with such Phanomena as at any time appear in the Material World; such as Meteors. ජිද

NATURE. Besides the three Senses of this Word mentioned in Vol. I. it is sometimes used for this vast Machine of the Universe, the wise Production of Almighty God, consisting of a great Number of leffer Machines, every one of which is adjusted by the same Wisdom in Number, Weight and Measure.

Laws of Nature, fignify those Laws of Motion by which natural Bodies are governed in all their Actions upon one another, and which they inviolably observe in all the Changes that happen in

the natural State of Things. An Account of these Laws see in Motion.

Sir Isaac Newton at the End of his excellent Opticks, (Lat. Edit.) observes, That Universal Nature is very Simple and Uniform in its Operations. All the Motions of the heavenly Bodies are caused by that Astracting Force, Impulse or Power which we call Gravitation; and which is mutual amongst all those Bodies. All the lesser Motions of the Particles or Corpuscles of Matter whereby Bodies act on one another, are effected also, by some attracting and repelling Force; which is mutual and re-

ciprocal amongst them.

The Visinereia, is a Principle purely passive, by which Bodies persist in their State of Rest or Motion, whereby they receive Motion from others equalor proportionable to the moving Force; and whereby they refift as much as they are refifted. But from this Principle alone there never could have been any such Thing as Motion, any where in the Universe. There is a Necessity of supposing some other Principle to be the Origin of Motion, and its Constitution too: For from the various Compositions of two Motions, its plain that there cannot be always the same Quantity of Motion in the World, for if two Globes, connected together by a stender Thread, be supposed to revolve with an uniform Motion round their common Centre of Gravity; and at the same Time that Centre should move on Uniformity also in a Right Line coincident with the Plane of the Globes Orbits: Then will the Summ of the Motions of those two Globes, whenever they happen to be both in the Right Line described by the common Centre of Gravity, be greater than the Summ of their Motions can be, when they are in a Line at Right Angles to that. By which Instance 'tis apparent, That Motion is producible and destructible. But from the Tenacity and Astricion of the Particles of Fluid Bodies, and the Imbecility of the Elastick Force in solid Bodies, we may conclude, that the course of Nature tends more to the Destruction than the Production of Motion; and indeed it is continually decreasing, for Bodies that are either so perfectly bard, or throughly soft, as to have no Elasticity, cannot be reverberated back from one a nother, and from their Impenetrability only it would follow that their Motion would stop, and terminate. If therefore there were any such things as the Imaginary Vortexes of Des Cartes, their Motion must be continually decreasing, and at last must quite cease. Since therefore Motion is thus continually decreasing in the Universe, we must have Recourse to some active Principles, to increase and preserve it; viz. to such as the Cause of Gravity and Fermentation: By the former of which the Planets and Comets perpetually move in their Orbits, and Bodies by descending gain a great Velocity or large Quantity of Motion; and by the latter, the Heart and Blood of Animals is preseryed in Motion and Warmth: The internal Parts of the Earth are perpetually getting Heat, many Bodies burn and shine, Volcanoes and Earthquakes are produced, and the Sun it self preserves his Light and Heat, and warms and cherishes all Things: For we find very little Motion in the World (except what is voluntary in free Agents) but what depends on these active Causes.

So that after well confidering and undestanding these Things, our admirable Author, (whose Piery and Goodness is as eminent as his profound Mathematick Learning and Penetration into Universal Nature) concludes, that our perfectly good, most wise, and Almighty Creator, did in the Beginning of the World, create Matter so as that its original Particles, from whence all corporeal Natures were to arise, were folid, firm, impenetrable, perfectly passive and moveadle; and that they were made of such Magnitudes and Figures, and endued with such Properties, and in that Number and Quantity as was proportionable to the Space in which they were afterwards to move, in order to the most effectual obtaining of those Ends and

Purposes for which they were created.

And these original primary Particles being perfectly solid, must be much more hard and firm than any Bodies that can be made out of them with Pores, hidden Meetuses, or Vacuities interspersed; that is, so perfectly hard and firm, that they can never be worn away or diminished; for tis not reasonable to suppose that there should be any Force or Power in the ordinary Course of Nature, that can divide that into more Parts, which God in the first Creation of Things, hath made ons. As long therefore as these original Particles remain entire, there may for ever be Bodies made or composed of them; which shall have the far e Nature and Texture: But if these can be broken, worn away, or diminished, then the Nature of corporeal Things which is dependent on these in a te be changed. Earth and Water composed of eather fuch Particles as have been worn or broken, or of their Fragments, could not have at this D v, the same Nature and Texture, that original Earth and Water which was composed of these Particles when they were found and entire. Wherefore that the Nature of Things should last, and their Natural Course continue the same; all the Changes made in Bodies must arise only from the various Separations, new Conjunctions and Motions of these original Particles. For mix'd or compounded Bodies are broken or destroyed, not by the breaking to Pieces of their folid original Particles, but by separating them one from another, and disposing them in those Places where they touch'd one another but in a little Part of their Surface. And these Original Particles, seem not only to have in them the Vis Inertia and all those Passive Laws of Motion which necessarily arise from thence; but receive also Motion continually from certain Active Principles; viz. such as Gravity the Caufe of Fermencation and of the Cobesion of the Parts of Matter. And these Principles are not to be considered as occult Qualities which are seigned to arise from the Specifick Forms of Things, but as the Universal Laws of Nature by which Things them-selves are formed. For that there are really such Principles; the various Phænomena of Nature do demonstrate, tho' what their Causes are hath not yet been explained: For to affert that the several Species of Things are endued with Specifick Occule Qualities, by which they have a certain Force or Power in acting, is in Reality to say Nothing. But from the Phænomena of Nature to derive two or three general Principles of Motion; and from thence to explain how the Properties and Actions of all Corporeal Things may be deduced from those Principles, would be a very great Progress in Natural Philosophy, although the Causes of those Principles should be yet undiscovered.

Lond 1670, in 800. Mp. Boyle's Tract about the Redintegration of Sale Patra.

NOBLE; there both not been any Piece of Gold (or Silver) of this Name coined with us fince 9 H. 5. They were first coined by E. 3. 1344.

The Noble contained 80 Pence; its half, which was then colled Objected its 4th Barr the Own. was then called Obelus 40 d, its 4th Part the Quadrans or Farthing in these Days 20 d, NOCTURNAL. There are several Sorts of

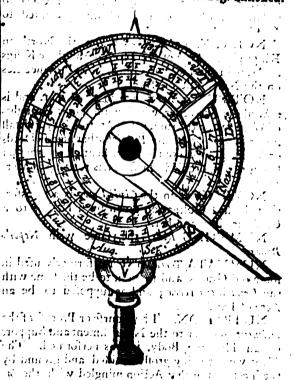

Nocturnals, of which some may be Projections of the Sphere; such as the Hemispheres or Plani-spheres on the Plane of the Equinoctial; but the Scamen ule only two, and the Manner of using either is the same. One of them is fitted for the Pole-Star and the first of the Guards of the Little Bear; and the other for the Pole-Star and the Guards or Pointers (as some call them) of the Great Bear.

The Instrument confists of three Parts or Pieces; the largest of which hath a Handle to hold it by when you would observe; and opposite to the Handle there is a small Tooth or Point, which (if it be made for the Little Bear) stands against the 25th of April; but if for the Great Bear, against the 17th of February; which are the Times of the Year when those Stars come to the Meridian at 12 at Night. On this bigger Part or Piecethen are two Circles described; the outermost hath the Months and their Days, and the innermost hath the 24 Hours of a Natural Day; on the backfide of this Piece also are the 32 Points of the Compass designed, and marked with their initial Letters.

The second Part of the Nocturnal hath two Circles described on it; of which the outermost is divided into 29 1 equal Parts, for the Days of the Moon's Age; and in the innermost into 24 Hours; And at the Beginning of the Days of the Moon's Age, and at XII, there is a Tooth to be

fet to the Day of the Months in the upper Part.

The third Part is an Index with a Fiducial Edge issuing from the Centre; and must be so long, that a good Part of it may extend beyond the outermost or biggest Piece. These three Parts are so ordered, that by Means of a small hollow Brass Socket they are made to move about the Centre of the Instruments. See the Fig. annexed.

The Hes of this Intrument are;

1. To find the Hour of the Night.

To do which, fet the Tooth to the middle Parc of the Day of the Month, and then turning the foreside of the Instrument towards you, Hold it up towards the North, and incline the upper Part toward you, till thro' the Hole in the Middle you can see the Pole-Star; there hold it fast, and turn the long Index about, till by its Edge you can see either the first of the Guards of the Little Bear, or the Pointers of the Great Bear, (according as the Instrument is made) and then shall the Edge of

the Index or Ruler, in the innermost Circle of the middle Part shew you the true Hour of the Night.

2. To find on what Point of the Compass the

This will appear on the backfide of the Nocturnal, after you have found the Hour of the Night, as above; for the Index will be on the same Point of the Compais as the Guards really are.

3. To find at what Hour the Meon will be full South on any Day of her Age.

Seek the Moon's Age in the outermost Circle of the middle Piece, and then right against it in the innermost Piece, is the Hour required.

Thus if the Moon be 11 Days old, you will find she will be on the Meridian at 8 Hours

48 min.

NODATED Hyperbola: So Sir IJ. Newton calls a peculiar kind of Hyperbola, which by turning round decussates or crosses it self. See Curves.

NOMINATION; this Word as well by the Canonifts as common Lawyers, is used for a Power that a Man hath by vertue of a Mannor or otherwise, of appointing or naming a Clerk to a Patron of a Benefice, to be by him presented to the Ordinary

NUTRITION. The Course or Process of the Aliment in order to the Nourishment and Support of an Humane Body, is thus performed. The Meat we eat being groffy davided and ground by the Teeth, is in that Action mingled with the Salive, which helps to ferment and dilute it. Thence thro the Oesophagus or Gullet by the Constriction of its Fibres 'tis thrust down into the Stomach; where being further softened and swell'd by the Inices contained in the Glands of the Stomach, its Parts are farther broken and the intimate Cohefion

A continuo de la continuo del continuo del continuo de la continuo del continuo del continuo de la continuo del continuo d

estal of.

of them destroyed, and they divided one from 2nother, by the perpetual Motion of the Coats of the Stomach and by the Muscles of the Midrif and Abdomen. By this Pressure also of the Sides of the Stomach upon the contained Aliment, that is thrust down into the Intestines; at its Entry into which it is mix'd with the Bile and Pancreatick Juice, the one to sweeten, the other to dilute the Chyle. By the Peristaltick Vermicular Motion of the Guts, (arifing from the Alternate Action of their Spiral and Longitudinal Pibres) and by the Pressure of the Draphragm, and the Muscles of the Abdomen, the groffer Parts of the Chyle are derived downwards to be thrust out of the Body; while the finer are squeezed into the narrow Orifices of the Lasteal Veint, which opens into the Intestines; from whence in slender Channels they are carried into the Glands of the Mesentery; where they receive a fine thin Lympha from the Lymphatick Dulls, which further dilates it and focurs its containing Vessels; which Vessels going from those Melenterick Glands unite into larger Channels, and those into still larger, and at last pass directly into the common Receptacle of the Chyle; which is a kind of Bason formed for it in the Union of these Ladeal'and Lymphatick Vessels. From thence in one Duct it ascends into the Thorax, and sometimes dividing about the Heart, it immediately unites again, and creeping along the Gullet, it passes on to the left Subclavian Vein, where in one or two Months it pours in its Contents, and there mixes with the poor Venal Blood returning from all Parts of the Body. And thus doth the Blood receive its Supply and Noue rishment.

But if you take Nutrition in the Sense which some do, of the Blood nourithing the several Parts of the Body: Then will that kind of Nutrition be performed by a Secretory Duck arising from the Termination of an Artery, and carrying a fuirable Portion of the Blood to every Part to be nourish ed; so that every Point of the Body must be the Termination of a Secretary Dust thro which a pro-

20 21.

per Part of the Blood is brought in order to sup-ply that Part of the Body. NYMPHA, in such Insects as undergo a Transformation, is the very first Change of the Eruca, or of the Vermiculus Prior, or Maggot; or indeed, as Swammerdam hath proved (in his Hift. Infell. general.) rather the Growth and Increase of the Eru-ta, whereby the Figures of the succeeding Animal is beginning to be expressed by the Explication of its Members, which before lay involved up in the Bruce (like a Plant in its Seed;) so that in Reality it is only the Animal under that imperfect Form is called the Nympha, the Word being taken from Arifotle in his Hift. Anim. Lib. v. c. 19: where he uses it for the first Rudiment of an Insect. This Nympha is sometimes called Chrysalis, sometimes Aurelia, and sometimes Necydalus; all which Terms fignify the same Thing. spirit ;

and the second of the second o

Control of the Contro

The Seven Ansiphones or Alternate Hymns of Seven Verses, &c. sung by the Choire in the Time of Advent, was formerly called O, from their Beginning with such an Exclamation.

OATH, in the Law-Sense, is an Affirmation or Denial by any Christian of a Thing lawful and honest, before one or more that have Authority to give the same; for the Advancement of Truth and Right, calling Almighty God to witness that his Testimony is true. Tis called sometime his Cor-Testimony is true. Tis called sometime bis Corporal Oath, because he toucheth with his Hand some part of the Holy Scripture of the New Testament, and most usually of the Four Gospels (whence the Phrase for lawful swearing is Sacro-(antiis Tattis Evangeliis.)

OBEDIENTIA, was anciently used as a Term for Rent; but in the Common Law 'Tis taken for an Office, or for the Administration of an Office;

and thereupon

OBEDIENTALES, is used in the Provincial Conftitutions for those that have the Execution of

any Office under their Superiors.

OBIT, fignifies an Office for the Dead or a Funeral Solemnity: The Anniversary of any Person's Death was also called an Obis. And in Religious

Houses, &c. they had formerly an OBITUARY, which was a Register or Calendar wherein they enter'd the Obits or Obitual

Days of their Founders or Benefactors.

OBLATA; were formerly Gifts made (tho properly Offerings) to the King by any of his Subjects; and were so carefully taken Notice of by K. John and Hen. 3. that they were enter'd in the Fine Rolls under this Name of Oblata.

OBLATE; were the Consecrated Wafers or Hofts distributed to the Communicants in the Mass or Sacrament of the Altar; and sometimes

the customary Treats in Religious Houses have been called by this Name of Oblata.

OBLATIONS of the Alter, were customary Offerings from the Parishioners to their Priest, which were solemnly laid upon the Altar; of which the Mass or Sacrament Offerings were usually Three-pence at Christmas, Two-pence at Easter, and a Penny at the two other principal The customary Duesalso for Sacramentalia or Christian Offices, were comprehended under this Title; and also all little Summs for saying Masses for the Souls of Persons deceased.

OBLATIONES Funerales, were the Soul Scene or Offerings to expiate the Omissions or Defaults of the Party deceased in paying Tythes or other Ecclesiastical Dues: At sirst this was an Oblation at the Funeral, and was often the best Horse of the Defunct, led before the Corps, and delivered at the Church-Gate or Grave, for the Use of

the Parish-Priest.

To this Custom we owe the Original of Mor-If the Corps were buried any where else, tnaries. the Offerings were due to the Parish-Priest where

the Party died.

At the Burial of the Dead, it was a Custom for the furviving Friends to offer liberally at the Altar, for the pious Use of the Priest, and the good Estate of the Soul departed; and the Reliques of Vol. II.

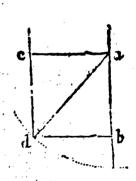

this superstitious Custom do still remain in North Wales, where at the Rails of the Communion-Table, there is a Tablet or flat Board fixed, to receive the Money, which at most Funerals is offered by the surviving Friends, according to their own Ability and that of the Deceased. Dr. Ken-

net's Gloffary

OBLIGATION, by the Civilians, is defined to be a Cause of Altion, and a legal Bond or Tie which compells by Action to give or to do according to the Roman Law. And they divide Obligations into Natural, Civil, and Mix'd: a natural Obligation is what arises only from meer natural Equity; and this they diftinguish into Bf. fedual and Ineffedual: The former of which, tho there is not Ground enough for Action by the Reman Law, yet may bar by Plea and Exception; but the latter hath no Affistance from any positive Law, but consists meerly in the Conscience or Pleasure of the Party. A pure Civil Obligation owes its Original or Birth to the Strictness of a positive Law, without Natural Equity. A Mix'd Obligation is a Legal Bond, having its Strength both from Natural and Civil Laws.

OBLIQUE Force, is that whose Line of Direction is not at Right Angles with the Body on whom it is imprest. The Ratio which such an Oblique Force to move a Body, bears to a Direct or Perpendicular Force, will by this Diagram be easily understood to be always as the Sine of the Angle of Incidence is to the Radius. Let a b be the

Side of any Body on which an Oblique Force falls, with the Direction da; draw d c at Right Angles to db, a Perdendicular let fall from d to the Body to be moved, and make a d the Radius of a Circle. Tis plain, that the Oblique Force da, by the Laws of Composition and Refolution of Motions will be resolved into the two

Forces de and db, of which de being parallel to a b, hath no Energy or Force to move that Body; and consequently db expresses all the Power of the Stroke or Impulse upon the Body to be moved. But db is the Right Sine of the Angle of Incidence dab; wherefore the Oblique Force da, to one falling perpendicularly is as the Sine of the Angle of Incidence to Radius. Q. B. D.
OBLIQUITY of the Ecliptick. 'Tis well

known that the Plane of the Terrestrial Equator is inclined to that of the Ecliptick in an Angle of 23 Degr. 30 Min. or rather more accurately 23°. 29! And this Angle (allowing for a very small Nutation of the Earth's Axis, which tho' neceffarily deducible from the Principles of the Newtonian Astronomy, need not here be considered) hath always yet continued the same : As any one may find if they will on the two Solftitial Days observe the Sun's Meridian Altitudes, and then freeing them from Refractions, Parallax, &c. Ŏ o o

fubrrace the Winter from the Summer Altitude; for then half the Difference between them will be found to be 23°.29'. the Quantity of the Angle of the Inclination or Obliquity of the Ecliptick to the Plane of the Equator.

OBOLUS, the now taken to fignify our Half-penny, anciently fignified the Half Noble. The Noble or Floren being called a Penny, and its quarter part a Farebing: And indeed in the old Histories and Accounts of Coin, you are to underfland by the Word Denarius, the whole Com, be it Angel, Rial, &c. and by Obolus its half; and by

Quadrans its fourth part.

OBSERVATION. The Seamen call an Ob-Servation the raking the Sun or any Stars Meridian Altitude, in order thereby to find their Latitude; and how they do this you will find under that Word: And they call finding the Latitude by the

Name of Warking an Observation.

OCCIPITO-Frontalis, is a Muscle of the Skin of the Occiput and Os Frontalis, which is usually called Occipitalis; it arises fleshy from the transverse Line of the Occiput, opposite to part of the Superior Termination of the Mastaidaus, and part of the Beginning of the Trapezius next it, and then tendinous from the rest of the Line backwards, arifing after the same Manner on the other fide: from thence it goes strait up, and soon becoming all tendinous, it covers the two Parieparal Museles, its outer Edge being fastened to the Os Jugale on each Side. This broad Tendon near the Coronal Suture grows fleshy, and descends with streight Fibres as low as the Musculi Orbiculares. It is inserted into the Skin at the Eyebrows having fent down between them a narrow fleshy Slip or Elongation which is continued over the Offa Nasi, as far as its Cartilaginous Patts, where its Fibres run off on each Side, and terminate in the Skin above the Musculus Nusi proprius When this Digrastick Muscle, which covers all the upper Part of the Scull like, a Cap, acts, it pulls the Skin of the Head backwards, and at the same time draws up and wrinkles that of the Forehead. and is antagoniz'd by the Corrugator.

OCCUPANCY, in the Civil Law, is the Pos. session of such things as at present belong to no private Person, but however are capable to be made so; as by seizing or taking of Spoils in War, of things wild by Nature, as Birds and Beats for Game, &c. or by finding things before undiscovered, or truly lost, or lost by their proper-

OCCUPIERS of Walling, are certain annual. Officers in the Cheshire Salt-works, who see Right: done between Lord and Tenant, and all Persons concerned; they appoint also how many Houses shall work at a Time, &c. and order a Cryer to proclaim the Time of kindling the Fires, Ge.

OCEAN, is the vast Collection or Union of all the Seas which compais round the whole Earth, and in which the two great Continents of Europe, Afia, and Africa on one fide of the Northern, and Southern America on the other, are but like two large Islands. This great and universal Ocean, is sometimes by Geographers divided into 3 Parts; as 1. The Atlantick and European Ocean, lying between Part of Europe Africa, and America. 2. The Indian Ocean, lying between Africa, the E. Indian Islands, and New Holland. 3. The great South Sea

or the Pacifick Ocean, which lies between the Philippine Islands, China, Japan, and New Holland, on the West, and the Coast of America on the East. Sometimes also with Regard to Europe, they call that the Hyperborean Ocean which encloses it on the North; and that which encloses it on the West, the Western Ocean. That Sea which encloses Asia, on the North and East is often called the Tartarean, and sometimes the Chinese Ocean; and on the South Asia is bounded by three Seas. which are called the Indian, Persian, and Arabian Also the great Sea on the East of Africa, Ocean. is called the Oriental Ocean, as is also that vast Sea which encloses America on the East.

OCTAVES, in old English the Uta's were eight Days after any eminent Festival; and such Festivals are enumerated in the Laws of Edward

the Confessor.

OCTO Tales. See Tales.

ODIO and Atia, was an old Writ mentioned in the Statute of Westminster 1. and made 3 E. 1. cap. 11. It was directed to the Sheriff, to enquire whether a Man committed to Prison for a Suspicion of Murder, be committed on just Cause, or only upon Malice : If the latter were the Cause, then another Writ came to the Sheriff to Bail him. But now this Course is taken away by 28 E. 3.

OECONOMICUS, was formerly used for the Executor of a last Will and Testament, as the Perfon who had the Oeconomy or Fiduciary Difpo-

sal of the Deceased's Goods.

OFFERTORIUM, formerly was used for a Piece of Silk or fine Linnen, to receive and wrap up the Oblations or occasional Offering in any

OGEE, Ogive, and as it is often written O-G- is a fort of Moulding in Architecture, confifting of a Round and a Hollow. Vitruvius makes it two quarter Circles. Scamozzi and some others, make the Arches flatter. Tis almost in the Form of an S, and is the same with what Vitruvius calls Cima. Cima reversa is an O - Gwith the Hollow downwards, as some define ir.

OLERON Laws, are so called, because made when King Richard I. was there (i. e. at Oleron, an Island in the Bay of Aquitain in France) they

have Respect to Maritime Affairs. OPACITY. Sir Is. Newton. O

OPACITY. Sir If. Newton, Opticks, Book 2. shews that the Opacity of all Bodies arifeth from the Multitude of Reflections caused in their Internal Parts: And he shews also, that between the Parts of the epake and coloured Bodies, there are many Spaces either empty or replenished with Mediums of other Densities; and he shews the true or principal Cause of Opacity to be this Discontinuity of their Parts; because some opake continuity of their Parts; because some opake Bodies become transparent by filling their Pores. with any Substance of equal or almost equal Den-sity with their Parts. Thus Paper dipp din Water or Oil, the Oculus Mundi Stone steep'd in Water, Linnen Cloth oil'd or varnished, and many other Substances soaked in such Liquors as will inti-mately pervade their little Pores, become by that Means more transparent than otherwise; as on the contrary, the most transparent Substances may, by evacuating their Pores or separating their Parts, be render'd sufficiently opake; as Salts or wet Paper, or the Oculus Mundi Stone by being dried, Horn by being scrap'd, Glass by being pouder'd or flaw'd, Water by being form'd into small Bubbles.

Bubbles either alone in the Form of Froth, or by shaking it together with Oil of Turpentine, or some other convenient Liquor with which it will

not perfectly incorporate.

Bur however, to render Bodies opake and coloured, their Interstices must not be less than of some definite Bigness; for the most opacous Bodies that are, if their Parts be subtilly divided (as when Metals are dissolved in acid Menstruums) become perfectly transparent. And on this ground it appears, why Water, Glass, Salt, and some Stones are transparent, for they are as full of Pores and Interstices as the Bodies are; but yet their Parts and Interstices are too small to cause Reslections in their common Surfaces: Wherefore white Metals become opake not from their Consity alone, but from their Parts being of such a bigness as sits them to reflect the White of the first Order. And as he shews, that the White of the first Order is the strongest which can be made by Plates of transparent Substances, so it ought to be stronger in the denser Substances of Metals than in the rarer ones of Air, Water and Glass. And he thinks that metallick Substances of such a Thickness as may fit them to reflect the White of the first Order der, may by reason of their great Density reslect all the Light incident upon them, and so be as opake and splendent as 'tis possible for any Body to be. See Colours. See Colours.

OPENING of the Trenches; is the first breaking Ground of the Besiegers, in order to carry on their Attacks against the Town. The Difference between this and carrying on the Trenches, is, that this is only the Beginning of the Trenches, is, that this is only the Beginning of the Trenches. It is begun by a small Foss or Ditch which the Pioneers make in the Night on their Knees, usually about a Musket-shot from the Place, but if there be no hollow nor rising Ground to savour them, they begin farther off. This small Foss is afterwards enlarged by the next Pioneers which come behind the first; and so 'tis dug deeper by Degrees till it be about 12 Foot broad and 5 Foot deep. The Earth that is dug out is thrown up as they go along; and serves them for a Parapet to save them from the Fire of the Town. The Place where the Trenches are opened, is called the End of the Trench.

OPPOSITE Sections. If a Cone be cut by a Plane through its Vertex, and afterwards by a fecond Plane parallel to the former, this latter Plane produced through the opposite Cone, will there make the opposite Sections. See Conick Sections.

OPTICK Pyramid, is made by Rays coming from the several Angles of the superficial Base of

A E

any Object, and united in a Point in the Eye of the Spectator. Thus if ABC DE be the Base of the Eye in O, the Oprick Pyramid OABCDE O. And when the Base is a Right-Line, as suppose AE or CD, then the Triangle OAE or OCD is called the

OPTICK Triangle, as the Angle AOE or COD, is called the Optick Angle.

OPTICKS, taken properly and simply, is that Science which teaches the Properties of Direct Vision; but in a larger Sense it may comprehend

the whole Doctrine of Light and Goloure, and all the Phænomena of visible Objects. In this large Sense our incomparable Sir Is. Newton calls his Book of Light and Colours, Opticks; and from thence the following Brief Introduction to this Science is taken.

DEPINITIONS

BEFFN. I.

By the Rays of Light I understand iss least Parss, and those as well successive in the same Lines an contemporary in several Lines. For it is manifest that Light consists of Parts both successive and contemporary; because in the same place you may stop that which comes one Moment, and let pass that which comes presently after; and in the same time you may stop it in any one place, and let is pass in any other. For that Part of Light, which is stopt cannot be the same with that which is let pass. The least Light, or part of Light, which may be stopt alone without the rest of the Light, or propagated alone, or do or suffer any thing alone, which the rest of the Light doth not or suffers not, I call a Ray of Light.

DEFIN. IL

Refrangibility of the Rays of Light; is their Difposition to be refracted or turned out of shair Why in
passing out of one transparent Body or Medium into
another. And a greater or toss Refrangibility of
Rays, is their Disposition to be turned mule or less
out of their Way in like Incidences on the same Modium. Mathematicians usually consider the Rays
of Light to be Lines reaching from the luminous
Body to the Body illuminated, and the Refraction
of those Rays to be the bending or breaking of
those Lines in their passing out of one Medium into another. And thus may Rays and Refractions
be considered, if Light be propagated in an Instana
But by an Argument taken from the Aquations of
the times of the Eclipses of Jupiter's Satellises it
seems that Light is propagated in time, spending
in its passage from the Sun to us about seven Minutes of Time: And therefore I have chosen to
define Rays and Refractions in such general terms
as may agree to Light in both Cases.

DEFINITIII. TO SERVE

Reflexibility of Rays, is their Disposition to be turned back into the same Medium from any other Medium upon whose Surface they fall. And Rays are more or less reflexible, which are turned back more or less easily. As if Light pass out of Glass into Air, and by being inclined more and more to the common Surface of the Glass and Air, begins at length to be totally reflected by that Surface 5 those sorts of Rays which at like Incidencies are reflected most copiously, or by inclining the Rays begin soonest to be totally reflected, are most reflexible.

DEFIN. IV.

The Angle of Incidence, is that Angle which the Line described by the incident Rays contains with the Perpendicular to the resteding or refracting Surface at the Point of Incidence.

0002

DE.

DEFIN. V.

The Angle of Reflexion or Refraction, is the Angle which the Line described by the restlected or refracted Ray contained with the Perpendicular to the restlecting or refracting Surface at the Roint of Incidence.

DEFIN. VI.

The Sines of Incidence, Reflexion, and Refraction, were she Sines of the Angles of Incidence, Reflexion, and Refraction.

DEFIN. VII.

Who dright mbose Reys are all alike Refrangible, I wall Simple, Hamageneal and Similar; and that whose Regrangible than others, I wall a companied, Hateregoneal, and Diffinitar. The former digits it call Homogeneal, not because I would affirm it form all respects; but because the Rays which agine in Refrangibility, agree at least in all chose their other Properties, which I consider in the following Discourse.

DEFIN. VIII.

The Coleurs of Homogeneal Lights, I call Primaty, Homogeneal and Simple; and those of Heterogeneal Lights, Heterogeneal and Compound. For these are always compounded of the Colours of Homogeneal Lights; as will appear in the following Discounter

AXIOMS.

1 ada rol

a multiple

AX. I.

The Angles of Incidence, Reflexion, and Refrac-

AX. IL

The Augh of Reflexion is equal to the Angle of Incidence.

AX. III.

If the refracted Ray be returned directly back to the Point of Incidence, it shall be refracted into the Line before described by the Incident Ray.

AX. IV.

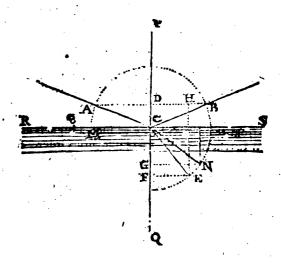

Refraction out of the rarer Medium into the denfer, is made towards the Perpendicular; that is, so that the Angle of Refraction be less than the Angle of Incidence.

A X. V.

The Sine of Incidence is either accurately or very nearly in a given Ratio to the Sine of Refraction.

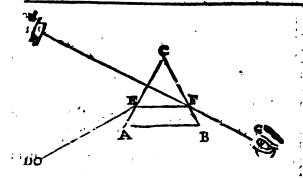

Whence if that Proportion be known in any one Inclination of the incident Ray, 'tis known in all the Inclinations, and thereby the Refraction in all Cases of Incidence on the same refracting Body may be determined. Thus if the Refraction be made out of Air into Water, the Sine of Incidence

of the red Light is to the Sine of its Refraction as 4 to 3. If out of Air into Glass, the Sines are as 17 to 11. In Light of other Colours the Sines have other Proportions; but the Difference is folittle, that it need seldom be considered.

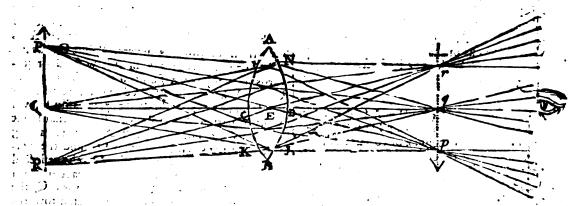

Suppose therefore, that R S represents the Sur-face of stagnating Water, and C is elepoint of Incidence in which any Ray coming in the Air from A in the Line A C is reflected or refracted, and 4 would know whether this Ray should go after Reflexion or Refraction: I erect upon the Surface of the Water from the point of Incidence the Perpendicular C P and produce it downwards to Q, and conclude by the first Axiom, that the Ray after Research and Refraction, shall be found some where in the Plane of the Angle of Incidence ACP produced. I let fall therefore upon the Perpendicular CP the Sine of Incidence AD; and if the reflected Ray be defired, I produce A D to B, so that D B be equal to A D, and draw C B. For this Line CB shall be the reflected Ray; the Angle of Reflection B C P and its Sine B D being equal to the Angle and Sine of Incidence, as they ought to be by the second Axiom. But if the refracted Ray be desired, I produce A D to H, & that DH may be to AD as the Sine of Refraction to the Sine of Incidence, that is, as 3 to 4; and about the Center C and in the Plane A C P with the Radius C A describing a Circle ABE I draw parallel to the Perpendicular CPQ, the Line HE cutting the Circumference in E, and joyning CE, this Line CE shall be the Line of the refracted Ray. For if EF be let fall perpendicularly on the Line PQ, this Line BF shall be the Sine of Refraction of the Ray CB, the Angle of Refraction being E C Q; and this Sine E F is equal to DH, and consequently in Proportion to the Sine of Incidence A D as 3 to 4.

In like Manner, if there be a Prism of Glass (that is, a Glass bounded with two equal and parallel Triangular Ends, and three plane and well polished Sides, which meet in three parallel Lines running from the three Angles of the one End, to the three Angles of the other End) and if the Refraction of the Light in passing cross this Prism de desired.

transverily to its three Parallel Lines or Edges, as 11 to 17, by the third Axiom.

there where the Light passeth through it, and let DE be the Ray incident upon the first side of the Pritm AC where the Light goes into the Glass; And by putting the Proportion of the Sine of Incidence to the Sine of Refraction as 17 to 11 find E f the first refracted Ray, Then taking this Ray for the Incident Ray upon the fecond fide of the Glass B C where Light goes out, find the next refracted Ray F G by putting the Proportion of the Sine of Incidence to the Sine of Refraction as 11 to 17. For if the Sine of Refraction as 17 to 11, the Sine of Incidence out of Class be to the Sine of Refraction as 17 to 11, the Sine of Incidence out of Class into Air to 11, the Sine of Incidence out of Glassinto Air Let A B C represent a Plane cutting this Prism must on the contrary be to the Sine of Refraction

Much after the same Manner, if ACBD re-Much after the same Manner, if AUBD represent a Glass spherically convex on both Sides be a reflecting or re-Spectacle-glais, or an Object-glass of a Telescope) and it be required to know how Light falling upon it from any lucid Point Q shall be refracted, let Q M represent a Ray falling upon any point M of its first spherical Surface A C B, and by esecting a Perpendicular to the Glass, at the point M, find the first refracted Ray M N by the Proportion of the Sines 17 to 11. Let that Ray in going out of the Glass be incident upon N, and then find the second refracted Ray N y by the Proportion of the Sines 11 to 17. And after the same Manner may the Refraction be found when the Lens is convex on one side, and plane or concave on the other, or concave on both Sides.

A X. VI.

Homogeneal Rays which flow from several Points of any Object, and fall almost perpendicularly on any reflecting or refracting Plane or Spherical Surface, Shall afterwards diverge from so many other Points, or be parattel to so many other Lines, or converge to so many other Points; either accurately or without any sensible Error. And the same thing will happen, if the Rays be resteded or refraded successively by two or three or more Plane or Spherical Surfaces.

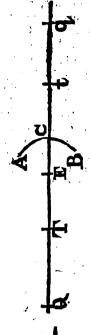

The Point from which Rays diverge, or the which they converge, may be called their Floud. And the Focus of the incident Rays being given, that of the refracted or reflected ones may be found by finding the Refraction of any two Rays, as 42 bove; or more readily thus,

the Focus of the inci-dent Rays, and Q q C a Perpendicular to that Plane. And if this

a Perpendicular to that Plane. And if this Perpendicular be produced to 4, to that 9 C be equal to Q C, the Point 9 thall be the Focus of the reflected Rays. Or if 4 C be taken on the lame fide of the Plane with Q C and in proportion to Q C as the Sine of Incidence to the Sine of Refraction, the point 4 thall be the Focus of the refracted Rays.

any Sphere whose Center is E. Bisect any Radius thereof (suppose E.C) in T, and if n that Radius on the same Stde the point I you take the Points Q and q, so that TQ. TE, and Dy be continual proportionals, and the point Q be the Focus of the incident Rays, the point Q shall be the Focus of the reflected ones.

Case 3. Let BCB be the refracting Surface of any Sphere whose Center is E. In any Radius thereof E C produced both faces. ways take E T and C r severally in fuch Proportion to that Radius as the leffer of the Sines of Incidence and Refraction hath to the difference of those Sines. And then if in the same Line you find any two Points Q and q, so that TQ be to E T as E to t q, taking t q the contrary way from which T Q lieth from T, and if the Point Q be the Focus of any incident Rays, the Point q shall be the Focus of the refracted ones.

And by the same means the Focus of the Rays after two or more Reflexions or Refractions may be

found. 🗧

Case 4. Let A C B D be 2ny refracting Lens, ipherically convex or concave or plane fracted Rays found as above, when the incident Rays on both sides the Lens are parallel to the same Axis; and upon the Diameter Ff bisected in E, describe a Circle. Suppose now that any Point Q be the Focus of any incident Rays. take sq in such proportion to E as E or TE hath to TQ. Let * g lie the contrary way from * which T Q doth from

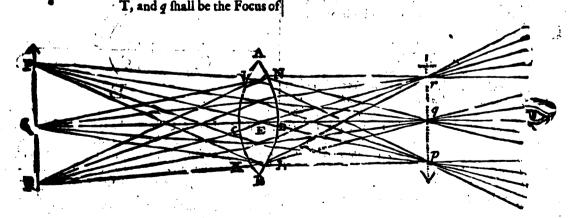

the refracted Rays without any sensible Error, provided the Point Q be not so remote from the Axis, nor the Lens so broad as to make any of the Rays fall too obliquely on the refracting Sur-

And by the like Operations may the reflecting or refracting Surfaces be found when the two Foci are given, and thereby a Lens be formed, which shall make the Rays flow towards or from what place you please.

So then the Meaning of this Axiom is, that if Rays fall upon any plane or spherical Surface or Lens, and before their Incidence flow from or towards any Point Q, they shall after Reflection or Refraction flow from or towards the Point q found by the foregoing Rules. And if the incident Rays flow from or towards several Points Q, the reflected or refracted Rays shall flow from or towards so many other. Points q sound by the same Rules. Whether the resected and resracted Rays flow from or towards the Point q, is cafily known by the Situation of that Point. For if that Point be on the same side of the reflecting or refracting on either side, and let C D Surface or Lens with the Point Q, and the inciwhich cuts both its Surfaces flow towards the Point Q, the reflected flow towards the Point q and the refracted from it; and if the incident Rays flow towards Q, the reflected flow from q, and the refracted towards Spheres,) and in this Axis let F and f be the Foci of the refracted Rays found as about

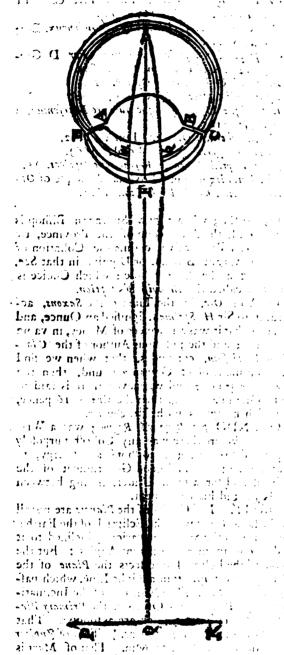

A X. VII.

Where-ever the Rays which come from all the Points of any Object meet again in so many Points Draw Q E cutting the said after they have been made to converge by Reflexion Circle in T and t, and therein or Refraction, there they will make a Picture of the Object upon any white Body on which they fall.

So if P R represent any Object without Doors, Light there to fall upon it: The Picture of that and A B be a Lens placed at a Hole in the Window-shut of a dark Chamber, whereby the Rays per Shape and Colours. For as the Light which that come from any Point Q of that Object are made to converge and meet again in the point q; and if a Sheet of white Paper be held at q for the of the Object, will go to so many other correspondent frondens

spondent Points p and r (as is manifest by the fixth Axiom;) so that every Point of the Object shall illuminate a correspondent Point of the Picture, and thereby make a Picture like the Object in Shape and Colour, this only excepted that the Picture shall be inverted. And this is the Reason of that vulgar Experiment of casting the Species of Objects from abroad upon a Wall or Sheet of white Paper in a dark Room.

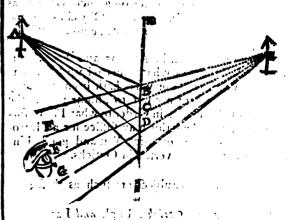

In like manner when a Man views any Object POR, the Light which comes from the several Points of the Object is so refracted by the transpal rent Skins and Humours of the Eye, (that is, by the outward Coar E F G called the Tunica Cornels, and by the criffalline Humour AB which is beyond the Rupil, m k) as to converge and meet again at so many Points in the Bottom of the Eye; and there to paint the Picture of the Object upon that Skin (called the Tunica Retina) with which the Bottom of the Eye is covered. For Anatomics, when they have taken of from the Roman the Bottom of the Eye is covered. For Anatoling-glass m n, it shall appear, not in its proper mists, when they have taken off from the Bottom of the Eye that outward and most thick Coat call any Rays A B, A C, A D, which slow from one led the Dura Mater, can then see through the thinled the Dura Mater, can then fee through the thin-

mer Coats the Pictures of Objects lively painted thereon. And these Pictures propagated by Motion along the Fibres of the Optick Nerves into the Brain, are the Cause of Vision. For accordingly, as these Pictures are perfect or imperfect, the Object is seen perfectly or imperfectly. If the Eye be tinged with any Colour (as in the Disease of the Jaundice) so as to tinge the Pictures in the Bottom of the Eye with that Colour, then all Objects appear tinged with the same Colour. If the Humours of the Eye by old Age decay, so as by shrinking to make the Cornea and Coas of the Cry-Stalline Humour grow flatter than before, the Light will not be refracted enough, and for Want of a sufficient Refraction will not converge to the Bottom of the Eye, but to some Place beyond it, and by Consequence paint in the Bottom of the Eye a confused Picture, and according to the Indistinct ness of this Picture the Object will appear confu-This is the Reason of the Decay of Sight in old Men, and shews why their Sight is mended by Spectacles. For those Convex-glasses supply the Defect of Plumpness in the Eye, and by encreasing the Refraction, make the Rays converge sooner, so as to convene distinctly at the Bottom of the Eye, if the Glass have a due Degree of Convexity. And the contrary happens in short-sighted Men whose Eyes are to plump. For the Re-fraction being now too great, the Rays converge and convene in the Eyes before they come at the Bottom; and therefore the Picture made in the Bottom, and the Vision caused thereby, will not be distinct, unless the Object be brought so near the Eye, as that the Place where the converging Rays convene may be removed to the Bottom, or that the Plumpness of the Eye be taken off, and the Refractions diminished by a Concave-glass of a due-Degree of Concavity; or lastly, that by Age the Eye grow flatter till it come to a due Figure: For short-fighted Men see remote Objects best in Old Age, and therefore they are accounted to have the most lasting Eyes.

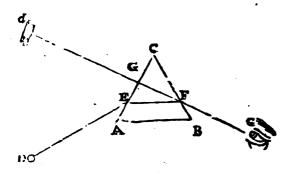

A X. VIII.

An Object feen by Reflection, or Refraction, appears in that Plate from whence the Rays after their lafe Reflection or Refraction diverge in falling on the Speciator's Eye.

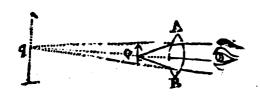

If the Object A be feen by Reflexion of a Look-Reflexion

Reflection made in the Points B, C, D, diverge in going from the Glass to E, F, G, where they are incident on the Spectator's Eyes. For these Rays do make the same Picture in the Bottom of the Eyes as if they had come from the Object really placed at a, without the Interpolition of the Looking-glass; and all Vision is made according to the Place and Shape of that Picture.

In like Manner the Object D seen through a Prism appears not in its proper place D, but is thence translated to some other place d situated in the last refracted Ray F G drawn backward from F to d.

And so the Object Q seen through the Lens AB, appears at the Place 4 from whence the Rays diverge in passing from the Lens to the Eye. Now it is to be noted, that the Image of the Object at q is so much bigger or lesser than the Object it self at Q, as the Distance of the Image at q from the Lens A B is bigger or less than the Distance of the Object at Q from the same Lens. And if the Object be seen through two or more such Convex or Concave-glasses, every Glass shall make a new Image, and the Object shall appear in the Place and of the Bigness of the last Image. Which Confideration unfolds the Theory of Microscopes and Telescopes. For that Theory consists in almost Nothing else but the describing such Glasses as shall make the last Image of any Object as distinct and large and luminous as it can conveniently be

I have now given in Axioms and their Explications the Summ of what hitherto hath been treated of in Opricks. For what hath been generally agreed on I content my self to assume under the Notion of Principles, in Order to what I have further to write. And this may suffice for an Intro-duction to Readers of quick Wit and good Understanding not yet versed in Opticks.

Authors on this Subject are such as these;

OPTION; when a new Suffragan Bishop is consecrated, the Archbishop of the Province, by a customary Prerogative, claims the Collation of the first vacant Benefice or Dignity in that See, according as he shall choose; which Choice is

sicks in Att. Erud. Lipft Jun. 1682.

therefore called the Archeiste's Option.

ORA or Ore, in the Lithe of the Saxons, according to Sir H. Spelman, lignified an Ounce, and he saith, that it was also apiece of Money, in value 16 pence; and the judicious Author of the C bro-nicon Pretiosum, concludes, that when we find Mention made of 12 Orgein a Pound, then the Ora is 20 pence; and whenever there is said to be 15 Oræ in a pound, then the Ora is 16 pence, in which he agrees with Mr. Somner.

ORANDO pro Rege of Regno; was a Writ formerly (before there was any Collect purposely appointed,) requiring the Bishops and Clergy, to pray for the peace and good Government of the Realm, and for a good Understanding between

the King and his Parliantest. ORBIT. The Orbits of the Planets are not all in the same Plane with the Ecliptick of the Earth's Orbit round the Sun; but variously inclined to it and to one another at different Angles: But the Plane of the Ecliptick interfects the Plane of the Orbit of every Planes in a Right Line, which pafses thro' the Sun. The Quantities of the Inclinations of the Planes of the Orbits of the Primary Planets to that of the Ecliptick are as follows. of Saturn is an Angle of 2 Degr. 1. That of Jupiter is an Angle of 1 Degr. 20 Min. That of Mars is almost 2 Degr. Venus is a little more than 3 Deg. 20'. And that of Mercury is a little more than 7.

Degr.
ORDEAL, was the old Judicial Custom of proving the Guili, or attesting the Innocence of parties accused; chiefly by Water or Hot Iron. deal was simply call'd Judicium, in Opposition to Bellum, which was Duel or Combat Fight, the other customary purgation. Neither of these Tri-als were taken away by William the Conquerour, as Sir W. Temple afferts. Ordeal might be undergone by Servants or Deputies in the Cause and Name of their Masters; especially of those Lords who were Bishops and Ecclesiastical Men. Dr. Kennett's

Kennet's Glossary at the End of his Parochial An-

ORDINANCE of the Forest, is a Statute made about Forest Causes in the Thirty Fourth

Year of Edw. I. See Assize.
ORDINATE Figures (in Geometry) are the fame with Regular ones; that is, they are Equi-

lateral and Equiangular.

ORDONANCE, in Painting or Sculpture, is the just and elegant Composition of the whole Piece by a proper, natural, and agreeable Difposition of the Figures, so as to answer the De-

fign of the History.

ORGANICAL Description of Curves, is the Method of Describing them on a Plane by the Regular Motion of a Point. See some excellent short Theorems for this, invented by Sir If. Newson, under the Word Curves.

ORIGINALIA, is the Term for Records or Transcripts sent out of the Chancery into the Lord Treasurer's Remembrancer's Office in the Exchequer: These are distinguished from Recorda, which fignify the Judgments and Pleadings in Suits try'd before the Barons of that Court.

OSTINEÆ, so some Anatomists call the Entrance into the Cavity of, or the Mouth of the Matrix, where it joins the upper End of the Vagina, and makes a little Protuberance in the Form of

OVARIA: The Ovaria in Women are about half as big as the Testicles in Men; their Surface is smooth and equal in Virgins, but in Women of Years unequal and wrinkled. They are covered with a proper Membrane, which sticks close to their Substance, and with another common from the Peritonaum, which covers also the Spermatick Vessels. The Substance of the Ovaria is composed of Fibres and Membranes, which leave little Spa-

ces, in which there are several small Vesicles, round, full of Water, and which when boiled, harden like the Whites of Eggs; they have each of them two proper Membranes, on which there are several small Twigs of Veins, Arteries and Neryes. These Vesicles are called Eggs. The Ovaria have Nerves also from the Intercostals, and Lymphaticks, which discharge themselves into the common

Receptacle of the Chyle.

OVOLO or Echinus, in Architecture, is a part of the Ornaments or Mouldings of the Cornish of a Pillar; which in the Tuscan and Dorick Orders is turned like a Scima or Cymatium, and is substituted for the Support of the Corona; in the Dorick Order it usually hath a slender Regula above it, and in the Corinthian both above and below too. where it is likewise carved and adorned with a broad Welt like a Plinth.

OUSTER la main, in a legal Sense, denotes a Judgment given tor him that sued or traversed a Monstrans le Droit; and is indeed a Delivery out of the King's Hands; for when it appeareth on the Matter discussed, that the King hath no Right or Title to the Thing seized, then Judgment shall be given in the Chancery, that the King's Hand be amoved, and thereon an Amoveas Manum or Ouster la main shall be awarded to the Escheator; which is as much as if Judgment were given that he should have his Land again. Now, all Wardships, Liveries, Primier Seisins, and Ouster la mains are taken away by 12 Car. 2. c. 24,

OUTFANGETHEF, was a Privilege granted to some Lords of Mannors from the Crown, to try Foreigners or Strangers apprehended for Theft within their own Fee.

O YES, is a Corruption from the French Oyez ! hear ye! being the Form used by our Criers in Courts, &c. to make Proclamation of any Thing.

P. A. I

PACK of Wool, is a determinate Quantity of 17 Entresiens sur les Vies & sur les Ouvrages des plus Stone and two Pound Weight, being a common Horse Load.

PACTUM Commissorium, in the Civil Law, is an Agreement between Buyer and Seller, but on this Condition, that if the Price contracted for be not paid before a certain Day, that then the Bargain shall be void.

PAINTING. Books treating of this Art, and of the Eminent Artists, are as follow.

An Idea of the Perfection of Painting: Originally written in French by Rowland Treart, Sieur de Cambray, and rendred English by J. Evelyn, Esq; F. R. S. Lond. 1668. 8vo.

A General Idea of the Art of Painting, and a Relation of 7 Conferences held at Paris in the Ac-cademy Royal for the Improvements of the Arts of Painting and Sculpture.

Optique de Portraiture & Peinture, contenant la Perspettive Speculaire & Pratique Accomplic. &c. per Gregoire Huret de l' Academ. Royale de Peinture & Sculpture, a Paris. 1670. Fol. Vol. II.

PAL

Excellens Peintres Anciens & Modern, per M. Felibien.

PALATO-Salpingaus, a Muicle of the Tuba Eustachyana. See Musculus Tuba Novus.

PALATO-Staphilinus, is a Muscle of the Vvula, arising fleshy from the middle of the Os Palati, near its juncture with its Fellow of the other Side, and running strait forwards, it is inserted near the Extremity of their duplicated glandulous Membrane called the Gargareon: Its Use is to pull it forwards and downwards. Dr. Domglas,

Myogr. Comp. Spec.
PALLIFICATION, in Architecture, is the Pileing the Ground-work, or strengthning it with Piles or Timber driven into the Ground, when they build upon a Moist or Marshy Soil. Builders Dictionary

PALLISADES turning, are an Invention of Mr. Coehorn's, for in Order to preserve the Pallisades of the Parapet from the Besiegers Shot; he orders them so, that as many of them as stand in the length of a Rod, or in about 10 Foot, turn up Ppp

and down like a Trap; so that they are not in Sight of the Enemy, but only just when they bring on their Attack; and yet are always ready to do the proper Service of Pallisades.

PALLS, Pallia, were Vestures made of Lambs Wool (25. H. 8.20.) about 8 Fingers broad, and with two Labells hanging down before and behind: These the Pope gives or sends to Archbi-shops and Metropolitans, who wear them about their Necks at the Altar above their Ornaments. We retain something of the Figure of it, in what the Heralds call a Cross Pall.

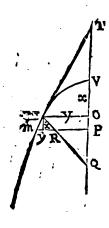

PANEL; some say is a little Part of any Thing; others, as Spelman, say it signifies a Schedule or little Page; which seems truest, for hence comes our Law Word to Empennel a Jury, i. e. to write the Names in a Pannel or Schedule of such Jurors as the Sheriff returns to pass upon any Trial.

PANNAGE, Pannagium; fignified formerly both the running and feeding of Hogs within a Forest, and also the Price that was paid for their so running. Pannagium Liberum, or Free Panmage, was a Liberty of free running for Swine within the Limits of such Forests or Woods; and was sometimes a Privilege granted to some private Persons, and to several Religious Houses. If this Parmage were not duely paid, there was a Process from the Exchequer and a Destraine by the Sheriff. The Title of Pannage was sometimes alienated from the Parish Priest to the Appropria-Dr. Kennet's Paroch. Antiq.

PAPILLÆ Pyramidales, are the Extremities of all the Nerves of the Skin, and serve more immediately for the Sense of Feeding and Touching; about them there is a Web of Nerves and other Vessels all covered with a Mucous Substance, to moisten them and keep them in good Order. Under these Papilla Pyramidales lie the Glandula Miliares, which see. See also the word Skin.

PAR, in Exchange of Money, is a certain Number of Pieces of the Coin of one Country, which contain in them an equal Quantity of Silver to that in another Number of Pieces of the Coin of another Country. v. g. Suppose 36 Shillings of Holland to have just as much Silver in them as 20 Shillings English; then Bills of Exchange drawn from England to Holland at the rate of 36 Shillings Dutch for each Pound Sterling is decording to Par.

PARABOLA. To draw a Tangent to the Parabola in a Point affign'd.

Let the Point affigned be

M, and the Parameter p.

Then the Equation expressing the Nature of the

Curve is |px=yy|

Suppose the Tangent found and all Things drawn

as in the Figure,
Tis required to determine the Subtangent TO; now the \triangle 's m R M and M O T being fimilar, let the former be noted with its proper Fluxionary Letters, and then this Proportion will arise;

y:x::y:=0 T). and the Equation of the Curve being px=yy the Fluxion (px=2yy)and dividing all by p; $\frac{2yy}{2} = x$, and substituting instead of x, in the Quantity = OT, you will find that $\frac{277}{p}$ = is also equal to OT. Then substituting px instead of yy, you will have 22 or 2x = 0 T: That is, in the common Parabela, The Subtangent is always = to twice the Abscissa.

N. B. In any Parabola if the Parameter be sup-posed = 1. and m be the Index of the Power of J. and a positive Number, whole or broken, then will | m=x | express the Nature of all Parabola's:

The Subtangent TO in the Parabola being equal to 2x: and $\square MO = (yy) = px$. by Reason of the similar Triangles MOT and MOQ : OT

 $(=2x) \cdot y :: y \cdot \frac{yy}{2x} = 0 Q$, and then putting

for yy its equal px it will be $\frac{px}{2x} = 0$ or $\frac{p}{x} = 0$

which gives you a very temarkable Property of the common Parabola: viz. That the Sub-normal, as the Line OQ is called, is always equal to half the Parameter of the Axis, and consequently a stand-

ing Quantity.

Wherefore 'tis a very ready Way to draw a Tangent to the Parabola, to fet off half p from O the Foot of any Ordinate downwards in the Axis, and from Q, draw MQ: And to it at Right Angles MT: For that shall be the Tangent required.

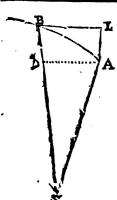

PARABOLICK Spiral. See Helicoid Parabela. PARABOLOIDS, are Paraboliform Curves in Geometry; whose Ordinates are supposed to be in a Subtriplicate, Subquadruplicate, &c. Ratio of their respective Abscissa; and putting & for the Abscissa, y for the Ordinate, and p for the Parameter, the Equation for the Cubical Paraboloid will be In the Biquadrical Paraboloid, the Cube of the Parameter into the Abscissa is equal to the Biquadrate of the Ordinate; that is, px=y+: and so of other Paraboloids ad infinitum.

But there is also another Species of the Parabeloids; v. gr. 1. Suppose the Parameter multiply'd into the Square of the Abscissa to be equal to the Cube of the Ordinate; that is, pxx=y3. Then the Curve is called a Semicubical Paraboloid. And,

2. When px3=y4. then 'tis called a Semi-biquadratical Paraboloid.

PARACENTRICK Motion of Impetus, is a Term in the New Astronomy, for so much as the Revolving Planet approaches nearer to, or recedes farther from the Sun, or Centre of Attraction.

Thus

Thus if a Planet in A move to B, then is SB. bB, the Paracentrick Motion of that Planet.

Hayes. p. 293. PARACENTRICK Sellicitation of Gravity, or Levisy (which is all one with the Vis Centripeta) is in Astronomy expressed! by the Line A L drawn, from the Point A parallel to the Ray SB (infinitely near S A) until it intersect the Tangent B L.

PARADIGRAMMATICE, is the Art of making all forts of Figures in Plaister. The Artists in this are called Gypfochi:

PARALLAX, in the Leipfick Acts for October, 1685, there is an Account of the Cassinian Method of finding the Parallaxes and Distances of the Planets from the Earth; practifed at Rome by the Abbot Fran, Blanchinus,

PARALLAX Diurnal of the Sun. How to

find it, see under Sun in this Vol.

PARALLEL Sailing in Navigation, is failing under a Parallel of Latitude: of this there are but 3 Cases. 1. Given Departure and Distance. Required Latiende.

The Canon is, As Diff. of Longitude to Rad. :: so is Distance, to Coine of the Latitude.

2. Given Diff. of Longitude between two places under the same Parallel; nequired their Distance.

The Canon is, As Rad. to Diff. Longitude:: fo is the Cosine of Lat. to Distance.

3. Having the Distance between two places in the same Latitude, required their Difference of Longitude.

The Canon is, As the Co-sine of Lat. to Distance :: so is Rad. to Diff. Longitude.

PARASTÆ, in Architecture, are the same with Pilasters; the Italians call them Membretti.

PARCEL-makers, are two Officers in the Exchequer that make the parcels of the Escheators Accompts, wherein they charge them with every thing they have levied for the King's Use within the Time of their Office, and deliver the same to one of their Auditors of the Court, to make an Accompt with the Escheator thereof.

Practice of the Exchequer, p. 99.
PARCELLING of the Seam of a Ship, is afterit is caulked, to lay over it a narrow piece of Canvas, and then pouring on it hot Pitch and

PARGETING or Parging, is the Workmens Word for plaistering of Walls.

PARHBLII and Parbelia, or such Phanomena as we call Mock-Suns, are the Representations of the Face or Figure of the True Sun, by way of Reflection in the Clouds.

PARLIAMENT, comes from parler to Speak, and Ment, Mind, in Fr. And the Writ which fummons our Parliament runs, ad consulendum, &c. de arduis Regni Negotiis. And therefore fignifies a Tolemn Conference of all the Estates of the Kingdoin, summoned together by the King or Queen's

Authority to treat of the weighty Affairs of the The ancient Britains seem to have had Realm. no such Assemblies; but that the Saxons had something like it, appears from King Ina's Laws, who flourish'd An. 712. W. the Conqueror divided the Land amongst his Followers, in such manner, that every one should hold of him in Capite; and these distributed part thereof among their Friends and Servants; who for the same owed them Suis and Service in their Courts. The chief of these were called Barons, who thrice every Year affembled at the King's Court, viz. at Christmas, Easter, and Whisfontide: and then the King was wont to come amongst them in his Royal Robes, and with his Crown on his Head, to consult about the publick Affairs of the Kingdom. But some say, this ancient Custom was changed by H. I. who in the 16th Year of his Reign, summoned the Commons to the great Council at Salisbury. Comell's Interpréter

PARODICAL Degrees in an Equation in Algebra, are the several Regular Terms in a Quadratick, Cubick, Biquadratick Equation, &c. the Indexes of whose Powers ascend or descend orderly in an Arithmetical Progression, as $7 \times 37^{2}m + 7r$ S is a Cubick Equation where no Term is wanting; but having all its Parodick Degrees the Indexes of the Terms regularly descending thus, 2, 3, 1, 0,

PARTICLES, are the very small parts of which any natural Body is supposed to be compounded; and these are often called the constituene or component Particles of any Natural Body. That these are almost infinitely small, the continual Effluvia which some Bodies do continually emit, and this without any sensible Diminution of their Bulk or Weight, as well as some other Experiments and Observations do plainly shew. But how to make any Conjecture at the several Sizes of these component Particles of Bodies, whether they are all equal in Bulk, or which are greater, and how much they are so, than others, is what Philosophers have hardly yet had Data or Discoveries enough to determine. But the wonderful Sir Isaac Newten, in his excellent Book of Opticks, hath opened a Door into this new World, and hath given some very good Rules whereby to guess at the Bigness of the Component Parts of Natural Bodies. For he having thewn in Prop. 5. Book 2. Part 3. That the transparent parts of all Bodies do most probably exhibit the same Colours with thin plates of Glass, or thin Bubbles of Water, and on the same Grounds; provided they are of the same Thickness and of the same Density with them. And fince their Parts seem for the most part to have the same Density with Water or Glass, as by many Circumstances its obvious to collect. To determine the Sizes of those Parts, you need only have Recourse to the Tables in the aforesaid Book for this purpose, in which the Thickness of Water or Glass exhibiting any Colour is express'd. Thus if it be desired to know the Diameter of a Corpuscle, which being of equal Density with Glass, shall reflect Green of the 3d Order, (as he diftinguishes it) by looking into the Table, you will

15, find that the Number 164 stews it to be-

parts of an Inch. In the general he proves also, That the Parts of Bodics on which their Colours depend are denser than the Medium, which pervades their Interstices. Prop. 6. B. 2. part 3.

Ppp 2

He shews also at the End of his Latin Opticks, That the Component Particles of all Bodies must be hard or solid, or else Fluid Bodies could not congeal; which its certain that Water, Oyl, Vinegar, and Spirit or Oyl of Vitriol will do by Cold; Quickfilver by the Fumes of Lead; Spirit of Nitre and Quicksilver together by dissolving the Mercury, and then evaporating the Flegm: Spirit of Wine, or Urine, by first well dephlegmating them, and then mixing them together, and the Spirit of Urine and of Salt, by subliming them together to make Sal Armoniack. Nay, the very Particles or Rays of Light seems to be hard Bodies, otherwise they could not in their different Sides have different Properties, as he hath shewn that they have (see Light.) Hardness therefore ought to be accounted as the Property of all simple Matter in the Universe; for all Bodies which we know, are either hard, or may be made fo. And if there are many hard Bodies, as we know is the Case of most, that have Pores interspersed, or Meatus placed between their Particles; those Particles themselves that are devoid of any such Vacuiries must needs be much harder.

'Tis probable that the most small Particles of Matter do attract one another, and adhere together with the greatest Force; and that these may combine into larger Particles, whose attracting Force is weaker; and many of these latter cohering together may form yet greater Particles of Bodics, whose attracting Force shall be yet weaker. And so on by a continual Series, 'till you come to the greatest of those Particles, on which the Chymical Operations, and the Colour's of Bodies depend (see Attraction and Colour) and these cohering into Masses may form Bodies of sufficient Magnitude

to become perceptible by Sense.

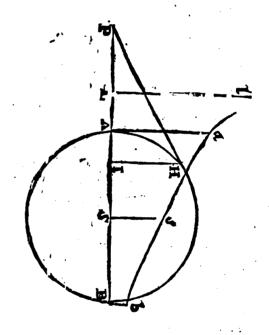

It hath been discovered of late by the wonderful Sir Isaac Newton, Mr. 3. Keil of Oxon, and such others as have proceeded on his Principles, That there is a Power in Nature, by which each Particle of Matter attracts every other Particle with a Force that increaseth in a greater Proportion than that by which the Squares of the Distance decrease; viz in a Reciprocal Triplicate, or Quadruplicate Ratio of the Distances. For, were it not so, the Attraction of these small Particles would not be much greater at the Point of Contact, than at some determinate Distance from it; as is evident in the Case of the Gravity of greater Bodies, whose power of Attraction is only reciprocally as the Square of the Distance; for we find that Bodies are of the same Weight, when at the Earth's Surface, or when at 100 Feet Distance. But when a little Salt is dissolved in a large Quantity of Water, there is no Attraction of the Particles towards one another, till by evapora-ting part of the Water, they are brought within a due Distance; and then they presently run to-wards one another, unite, and form Chrystals, whose Parts have a strong Cohesion. (See Astra-&tion in this Vol.)

Tis plain also, that the attractive Force in these Particles is (cæteris paribus) proportionable to their Solidity; for it must be compounded of the Summs of all the Parts of each Particle, and those parts will be most numerous in such Particles as are most solid; i. e. in such as have sewest and least Pores or Interstices between their Parts. For Particles or Corpuscles may be so compounded, that the most solid and compact Particles may constitute the lightest Corpuscle: That is, if the interspersed

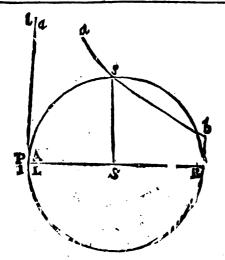

Vacuities between the Particles of Matter be large, so that sew of them may be diffused thro' a large Space. And such a Corpuscle, tho' consisting of Parts endued with a strong attractive Power, may yet be specifically lighter than another, which may consist of Particles not so solid, but yet much closer put together.

And because this Natural Philosophy of Particles is of the greatest Use to be fully understood, I shall here give you (from Dr. Keil's Book of Animal Secretion; &c.) some further Propositions about this matter. I say then, That if any Particles of Matter attrast each other with a Force that is in a Triplicate or yet greater Reciprocal Proportion of their Distances: The Force by which a Corpuscle is drawn to a Body, made up of such attrastive Particles, is infinitely greater at the Contact, or extreamly nearer it, than at any determined Distance from it.

Suppose the Sphere AH B composed of Particles that attract any Particle, as P, with a Force reci-

procally proportionable to the Cubes of their Diftances. Draw the Tangent PH, and from H let fall the Perpendicular HI: Biffect PI in L, and raise the Perpendiculars IL, Aa, Ss, Bb; and make Ss=SI. Then with the Asymptotes LB, LI thro's describe the Hyperbola bsa; and then the Area a ABb— \(\Pi \geq AS \times SI;\) will represent the Attraction of the Corpuscle P by Prop. 81. of Sir Isaac Newton's Princip. But when the Corpuscle P comes to touch the Sphere in A, then the Points P, L, A, I and H will all coincide; and Aa becomes the Asymptote of the Hyperbola, and the Area a ABb becomes infinite; and the Rectangle 2 AS \times SI being finite, the Area a ABb—2 AS \times SI, will be infinite; and consequently the Force by which the Corpuscle P is attracted by the Sphere, when it touches it in A, will be likewise infinite.

If the Sphere consists of Particles that attract in a quadruplicate Proportion of their Distances reciprocally, the Force by which a Corpuscle will be drawn to the Sphere will be $\frac{1}{PS^3 \times PI}$. But when the Corpuscle comes to touch the Sphere, PI becomes =0, and consequently whatever is divided by it becomes infinite, and therefore the attractive Force at the Point of Contact being proportional to $\frac{1}{PS^3 \times PI}$, will be infinite.

Prop. IV. If a Body confifts of Particles attracting with a Force that is in a reciprocal Proportion to the Cubes of the Distances, or in a greater; and if this Force is not infinitely greater than the Force of Gravity at the Point of Contact, or extreamly near it, at any determined Distance from the Point of Contact, it must be infinitely less than the Force of Gravity.

This is clear by the last Proposition: For in that Case, the Force of Attraction in a Corpuscle removed from the Contact is infinitely less than at the Contact it is not infinitely greater than the Force of Gravity by the Supposition: therefore the Force, by which a Particle removed at a determined Distance from the attracting Body is attracted, is infinitely less than the Force of Gravity.

Prop. V. The Force, by which the Particles of Matter attract each other, when extremely near the Contact, is not infinitely greater than the Force of Gravity.

This is evident; because in the strongest Cohesion of Particles touching one another, we find that the Weight of some Bodies will pull the Particles assunder, tho' that Body may be prodigiously greater and heavier than the Particles united. Sir Isaac Newson calculates from the Instection of the Rays of Light, that this Force near the Contact is 10000 0000 0000 0000 greater than the Force of Gravity.

Corol. Particles removed at a determined Diftance from the Body attracting, are not acted upon by it; because this Force must then vanish, or which is the same Thing, be infinitely less than the Force of Gravity.

Prov. VI. A large Particle attracts not more firongly than a small one at the same Solidity, but a

Diversity of Figures causes different Degrees of Attra-Rion in Particles, that are otherwise the same.

This attractive Power acts only on such Particles as are extremely near; and therefore of a large Particle, the remotest parts conduce Nothing to-Attraction: And for the same Reason the attractive Force varies, according as the Particles are Cones, Cylinders, Cubes, or Spheres: And, cateris paribus, a Spherical Particle has the strongest attractive Power.

Prop. VII. If Particles swimming in a Fluid, attract one another more strongly than they do the Particles of the Fluid, the Force, by which they come to each other, will be that by which their attractive Force, exceeds the attracting Force of the Fluid.

For the Particles of the Fluid, that lie directly between the attracting Particles, being more present than the other ambient Particles; they will from the Nature of Fluidity, with that Excess of Pressure, drive the other Particles out of their Places, and make way for the attracting Particles to come together.

Prop. VIII. If Particles swimming in a Fluid are more attracted by the Fluid, than by one another, they will recede from one another, with a Force that will be equal to the Difference of their mutual Astraction, and the Attraction of the Fluid.

For the Ambient Particles of the Fluid attracting more strongly, will with their Excess of Force draw the other Particles to themselves and make them to recede from one another.

Prop. IX. The Force, by which Particles attracting one another cohere, is greater, cæteris paribus, where the Contact is greater.

For the Parts that are farther remov'd from the Contact, conduce Nothing to the Force of the Cohesion; and a greater Power must be requisite to separate two Particles, which cohere in two Points, than two Particles which cohere only in one Point, if the Degree of Cohesion be equal in each Point. Thus two polithed Marble-stones (suppose a Foot square) adhere more strongly than any other two Bodies of a Foot square, which are not so solid, but have more Pores and Interstices between their Parts, and which will not receive so good a polish, by which the parts come to a close contact with one another.

Prop. X. If the attracting Corpuscles are elastick, they must necessarily produce an intestine Motion, greater or lesser, according to the Degrees of their Elasticity and attractive Forces.

For after meeting they will fly from one another with the same Degree of Velocity (abating the Resistance of the Medium) that they met together with; but when they approach other Particles in their Resilition, their Velocity must increase, because they are afresh attracted, and therefore meeting a second time, they will recede with a greater Velocity than they did at their first Concursion: And so their Velocities will be increased by every Concursion and Resilition, which must necessarily produce a sensible intestine Motion; and the stronger their attractive Force, and the greater their Elasticity, their Concursions and Resilitions will be the more sensible.

Prop. XL

Prop. XI. Particles attracting one another in a Fluid, moving either with a swift or slow progressive Motion, attract one another just the same, as if the Fluid was at rest, if all the Particles move equally; but an unequal Velocity of the Particles does migh-

tily disturb their Attractions.

The Particles do all by Hypothesis move equally, and consequently the progressive Motion of the Fluid does not alter their Distances, that is to say, it does not repel them from one another; and consequently they must attract one another with the same Facility as if the Fluid was at rest. But if some Particles move faster than others, some must change their Position in Respect to each other, and those parts, which by the force of Attraction would have come together, will by this unequal Motion be carried from one another. Thus Salts Motion be carried from one another. do not christallize, nor the terrestrial Particles of Urine attract one another, and unite, till the Water, in which they are dissolved, is almost cold; and the intestine Motion of its Particles, caused by hear, is quieted.

Mr. 3, Keil of Oxford in Phil. Transact. N. 315. advances these other Theorems about the small Particles of Matter.

- 1. That the least Particle of Matter assignable, may so fill any large assigned Space, that the Diameters of the Pores, Interstices, or Meatus between its Parts may be all less than any given Right Line; or, so that all the Parts of such a Particle, shall be nearer to each other than any given Right Line. See his Lesture De Divisibilitate Materia, in his Lectiones Physica.
- 2. Two Bodies may be assigned or given equal in Bulk, but yet any how unequal in Specifick Gravity, or in the Quantity of Matter in each; (o that the Summs of the Pores or Meatus in each, shall be nearly equal.

V. gr. Let there be a Cubick Inch of Gold and another of Air: Tho' the Quantity of Matter in the former may be 20000 Times as great as that in the latter : Yet the Vacuities in the Gold, may be to those in the Air, as 999999 to 1000000; i. t.

very nearly equal.

3. Those Particles which constitute Water, Air, or any other Fluid, (if they touch one another) are not absolutely solid; but are compounded of other Particles, which do contain within them many Pores or

And he thinks that such Particles of Matter as are the least of all others, and which are perfectly solid and devoid of all interspersed Vacuities, may be called The First or Primary component Particles of Matter, or Particles of the first Composition.

Such Moleculæ as are compounded by the Coalescence of any of these first Particles (only) may be called Particles of the 2d Composition. fuch Moles as are compounded of these second Moleculæ by several of them coalescing rogether may be called Particles of the third Composition: And so on till you come to Particles out of which the last Composition of Bodies is mude, and into which they are primarily disolved.

4. If a Particle of Matter touch any Body, the Force with which it tends toward the Body, or by which it adheres to it, is proportionable to the Quantity of the Contast, for such Particles as lie remote long and flender Cylinder.

from the Place of Contact add Nothing to the Cohesion.

And therefore according to the several Degrees or Quantities of the Consact of Particles, there will arise several Degrees of the Firmness or Cohesion of Bodies. And the greatest Force or Degree of Cohesion, will be when the Surfaces of the cohering Particles are perfectly plane; for there the Force by which any Corpuscie adheres to another, will (cateris Paribus) be as the Parts of the Superficies which do adhere to, or touch one another.

And from hence, and I believe hence only, can that hitherto difficult Problem, about the Cause of the Cohesion of the Parts of Matter in solid

and firm Bodies be solved.

5. Those Corpuscles or Particles of Matter are most easily separable one from another, whose Contacts with other Particles are fewest and least; as will be the Case of exceeding Particles of a Spherical Figure.

And from hence, and hence only, can the True

and Primary Reason of Fluidity arise.

6. If the Texture of a Body be such, that its Particles of the last Composition (see Prop. 3.) can be moved a little from their primary State of Cohesion or Contact by some external Force (such as the Weight and Compressure, or the Stroke or Shock of some other Body.) But yet so as that the Particles of the Body don't by this Pressure or Stroke, run into any new Contacts or Cohesions; Then, I say, they will recover again their former Contacts, by the Power of Attraction, or by a Force that will make them tend towards one another: And consequently, such a Body, will, after the Pressure or Stroke, recover again its former Figure and Position of its Particles.

And this is the Reason of the Elasticity of Bodies.

7. But if the Texture of a Body be such, that when its Particles are by some external Force removed from their former Contacts and Cohesions, they go immediately into others of the same Degree; that Body cannot recover its former Figure and Position of Parts.

And this is the Texture of fuch Bodies as are soft, and herein the Reason of their Softness con-

8. As Particles which are perfectly folid will attract one another the most strongly; and as in all other Particles the Power of their Attraction is proportionable to their Density or Solidity; so that the attractive Forces of even Particles persectly Dense or

Solid, depend much upon their Figures.

For if a small Particle of Matter be supposed to be formed into an indefinitely small Plate or Lamina, of a Figure perfectly circular; and if another Particle of Matter be supposed to be in a Right Line passing thro' the Centre of that Plate, and at Right Angles to its Plane: Then if you suppose that Particle to be distant from the circular Plate a tenth Part of the Radius of that Circle; I say, the Force by which that Corpuscle is attracted by the Plate is 30 Times less than if the attracting Matter had coalesced into a Spherical Figure: So that the Virtue of the whole Particle had been diffused, as it were from one Physical Point.

But yet this circular Plate will more strongly attract the Particle than any other Particle of the same Weight with it, that shall be formed into a

9. Salts

PAR

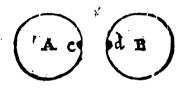

9. Salts are Bodies, whose Particles of the last Composition are endowed with a very great attractive Force: But yet between those Particles, there are very many Pores or Meatus, which are pervious to the Particles of the last Composition of Water; which aqueous Particles being strongly attracted by the Saline ones, do rush towards them with an Impetuosity, do disjoyn their mutual Contact, and dissolve their Cohesion.

10. A Body specifically beavier than Water, may have its Magnitude so diminished, that it shall be suspended by or swim in Water, and not descend by its own Weight.

And this is the Reason that the small Particles of Salts and Metals will swim in such Menstruums

as will dissolve those Metals, &c.

10. Greater Bodies attract one another with a less Force than lesser ones do.

For the Force with which the Bodies A and B attract one another, exerts it self only in those Particles which are near one to another, the remote ones having no such Force; wherefore there is no greater attractive Force required to move the Bodies A and B towards one another, than to move c and d. But the Velocity of Bodies moved by the same Force, are reciprocally proportional to those Bodies: Wherefore the Velocity by which A tends towards B, will be to the Velocity with which the Particle c, apart from the Body, tends towards B: as the Particle c to the Body A; much less therefore is the Velocity of the Body, than that of c would be, if it were separated from it.

From hence it comes to pass, that the Motion of the greater Bodies is naturally so slow and gentle, that 'tis usually impeded by an ambient Fluid or other Bodies round about them. But in lesser Bodies, this attractive Force is very active and vigorous, and is the Cause of a great many noble

Effects.

12. Two Particles of Matter, tho' they do not touch, may yet come so near one to another, as that their mutual attractive Force shall much exceed the Force of Gravity.

13. If a Particle placed in a Fluid be equally attracted every where by all the ambient Particles of the Fluid, no Motion of the Particle will arise from thence: But if it be attracted by some Particles more, and by others less, it will move that way where the Attraction is greatest, and the Motion produced will be answerable to the Inequality of the Attraction; (i.e.) it will be greater where there is a greater Inequality, and lesser where there is less.

14. If a Body be placed in a Fluid, and its Particles do more attract the Particles of the Fluid, than the Particles of the Fluid do one another; and if there be also in that Body any Pores or Meatus, pervious to the Particles of the Fluid; then the Particles

of the Fluid will soon diffuse themselves through those Meatus: And if the Cohesion or Connection of the parts of the Body be not so strong, but that it may be surmounted by the Impetus of the Particles of the Fluid rushing upon it, and every way into its Fores; there will arise from thence a Dissolution of that Body.

And from hence you may see the Reason of the Dissolution of Bodies in Menstruums: In order to which, Three Things are always necessary.

1. That the Particles of the Body to be dissolved do more strongly attract those of the Menstruum, than those of the Menstruum do one another.

2. That the Bodies have Pores pervious to the

Particles of the Menstruum.

3. That the Cohesion of the Constituent Particles of the Body be not so strong, but that it may be broken by the violent Action of the Particles of the Menstruums upon it.

15. If Particles mutually attracting each other do also mutually touch one another, no Motion can arise; for they can come no nearer to each other: But if they are separated from one another a very small Distance, a Motion must arise from their mutual Attraction. Tho if they are farther from one another than thus they cannot attract one another more than they will the Particles of the Fluid in which they are, and so no Motion also will be produced.

From these Principles all the Phanomena of Fermentation, and of all Effervescences do proceed. And from hence you may see the Reason why Oyl of Vitriol when mingled with a little Water, hath so great an Effervescence and Ebullition: For by the Infusion of the Water, the Saline Particles are a little disjoined from their mutual Contact; but since they do much more attract one another than

they do the Particles of the Water, and since they are not every way equally attracted, a considerable

Motion must from thence arise.

And from hence also you may see the Reason why so great an Ebullition arises from putting Filings of Steel or Iron into the former Mixture of Oyl of Virriol with a little Water; for the Particles of the Steel have a very great Degree of Elasticity, and from thence a strong Resection must arise. And from hence also tis that some Menstruums act with a greater Force, and will sooner dissolve Metals, when mingled with a little Water, than when pure and without such Mixture.

other have no Elasticity, then they are not reslected back from one another, but will form Congeries, Moleculas, Aggregates or Lumps of Particles; from whence what we call a Coagulation arises: And if these Lumps exceed in Specifick Gravity that of the Fluid, and are large enough, a Precipitation will succeed, Tho' a Precipitation may also arise from the specifick Gravity of the Menstruum in which the Particles swim, its being diminished or increased.

17. If the Figure of Particles mutually attracting each other, when swimming in a Fluid be such, that there is a greater attracting Force in some of their given Parts than in others, as also a greater Contact there; then those Particles will coalesce into Bodies having given Figures; and this way all Chrystallizations arise; and you may by Geometry determine the Figures of the Component Particles from having the Figure of the Chrystals given.

18. If between two Particles of a Fluid, another shall interpose, whose two opposite Faces or Sides have very great attractive Forces; this interposing Particle will glew or fasten the other two to its self; and when this is done throughout the whole Fluid, that Fluid will be frozen or turned into Ice.

19. If a Body of some Bulk emit a large Quantity of Effluvia, and the Particles of such Effluvia bave a very great attracting Force, then will these Effluvia, when they come near any lesser or lighter Body, by their attracting Force, surmount the Gravity of those Bodies, and list them up to the Bodies from whence they slow: And since the Effluvia are much more copious and thick at lesser Distances from the emittent Body, than at greater; the light Body will be attracted by still more and more dense Effluvia, and at last be brought to adhere to the emittent Body.

And this way most of the Phenomena of Elecericity may be solved.

PARTING, is one of the Refiners Ways to scparate Gold and Silver; 'tis done by Aqua fortis, which how to make, and the whole Manner of the Operation, see under Resining.

PARTY Jury. See Half Tongue.

PASCHA Clausum, is the Octaves of Easter or Low-Sunday, which closes or concludes that Solemnity; and die (tali) post Paschia Clausum, is a Date in some of our old Deeds; and the first Statute of Westminster is said to have been made Landesmain de la Close de Pasche, i. e. The Munday after Easter-Week.

PASNAGE, or Pannage, was anciently used in a double Sense for the running or feeding of Swine within a Forest, and for the Price or Rate of it. If the Pasnage were not duly paid, there was a Process from the Exchequer, and a Distress by the Sheriff. Dr. Kennes.

PASS, a Frame of Boards confisting of 2 or 3 Bottom Boards, and two Side ones, fet slope-wise, thro' which the Ore slides down into the Coffer of the Stamping-Mill for the Tin-works, is called by the Workmen the Pass.

PASSAGE, Passagium, 'twas a Tribute or Toll paid by Passengers or Travellers for the Repair or Maintenance of some Road or Passage.

PAVIMENTA Teffellata. See Teffellata.

PAY, the Seamen say, Pay more Cable, that is, let out more Cable; and pay cheap, that is, at the turning the Anchor out of the Boat, to turn it over-board faster.

PECTEN, in Anatomy, is the same with the Regio Pubis, or lower part of the Hypogastrium.

PEDIMENT, in Architecture, is a Triangular Frame with Cornish raised over the Front of a House, and sometimes over Doors, &c.

PEERS, in Architecture, are a kind of Pilasters or Buttresses, for Support, Strength, and sometimes Ornament.

PEERS, Pares, in our Common Law, are those that are empannelled on an Inquest upon any Man for the convicting or clearing him of any Offence for which he is call'd in question; and the Reason thereof is, because is the Course and Custom of our Nation, that every one shall be sried by his Peers or Equals. The Word is used also for the Nobility of this Realm, and Lords of the Parliament, who tho' distinguished as to degrees of Nobility, yet are equal in all publick Actions, as in

Votes of Parliament, in patting Trials on Noble-

PENNY, Denarius, was the first coined piece of Silver we have any account of; and for many Years the only one. In the Reign of H. 1. there were Half-pence. A Penny was so much the whole of the current Coin of the Kingdom, that Denarius signified the same thing with Nummus or Money. Dr. Hicks in his Dissertatio Epistolaris, p. 109. saith, that the Anglo-Saxons had but one Silver Coin amongst them, and that was a Penny; and Cambden and Spelman, and most of our good Antiquaries agree in this. The old Penny before 1279 was struck with a double Cross, so that it might easily be broken in the middle, or into sour Quarters; and so made into Half-pence or Farthings, saith Mr. Stow; on which it was then ordered, that Half-pence and Farthings should be made or coined round, as the Penny was before. The Penny was called Sterling, which see.

The Penny was called Sterling, which see.
PENNY-Weight, sormerly every Pound contained 12 Ounces, and each Ounce was divided
inty 20 parts, called Twenty-penny-weight; for
then Twenty-penny-weight weighed an Ounce:
and tho the Penny-weight be altered, the Deno-

mination still continues.

PENSA; formerly there were three ways of paying a Pound of Money into the Exchequer.

1. Payment of a Pound de Numero, which was just 20 Shillings in Tale.

2. Payment of a Pound ad Scalum, which was 6 d. over and above the 20 s.

3. Ad Pensam, which was paying the full Weight of 12 Ounces.

PENTECOSTALS, were, and are still in some few Dioceses, Whitson-Contributions paid to the Bishops, of which probably the first Occasion were certain pious Oblations made to the Cathedral Church at Pentecost or Whitsonside. They were also made by the Parisbioners to their Parisb Priest, and sometimes by inferior Churches or Parisbes to their Mother-Church. These Parisb Pentecostals were called Whitson-Farthings, and their Sum was divided into sour parts, of which one went to the Priest, one to the Poor, one towards the Repair of the Parisb-Church, and one to the Bishop. See Seephens of Procurations and Pentecostals, and Dr. Kennet's Parachial Antiquities in Glossary.

PERCH, Percica, is an English Measure of 16 Foot and a half in Length, called also a Pole and Rod. Forty such Perches in Length, and four in Breadth, make what we call an Acre of Ground. This is the common Statute-Perch; but in some Counties in England its Length is different; as in Staffordshire it is 24 Foot, in the Forest of Sherwood 25 Foot. In Herefordshire, tho' a Perch of Walling be but 16½ Feet, yet a Perch of Ditching is 20 Feet: In the Forest of Canke 'tis 25; in the Forest of Clarendon 20. Skene de verborum signisicatione sub. verb. Perticata Terra, saith, Particata Terra is a Roud of Land. There are also some other Measures mentioned which are now out of use. He saith three Feer and one Inch make an Elne; fix Elnes make a Fall; which he faith is the common lineal Measure. Six Elnes long and fix broad make a Square, and Superficial Fall of Land measured; and 'tis to be understood, he saith, that a Raip, a Rodand a Lineal Fall of Measure, are all one; only a Rod is a Staff or Polo of Wood, and a Raip is made of Tow or Hemp. Also ten Falls in Length and four in Breadth make an Acre: This is the Measure of Scotland.

PERI-

PERICARDIUM. Dr. Keil in An. Secretion, p. 32, 33. shews, that the Liquor in the Pericardium is the most fluid of any that is separated from the Blood; because the Particles of it unite first, and are secreted first; and those Particles which unite first will have the greatest attractive Force; and such must have their Corpuscles of a most spherical Figure, and must be most solid; so that their Contact will be the least that can be.

PERIOPHTHALMIUM, is a thin Skin which Birds can draw over their Eyes to defend them, without shutting their Eye-lids. The same with

the Membrana Nistitans.

PERISTERNA, in Anatomy, are the lateral

parts of the Thorax,

PERITONÆUM: The external Surface of this fost thin Membrane is unequal where it adheres to the transverse Muscles; the internal is very smooth. It hath a Number of small Glands which separate a Liquor which supplies the Intestines, and facilitates their Motion; and when these Glands are obstructed the Peritonaum grows thick, as in seve-The Peritonaum is a double Membrane, containing in its Duplicature the Umbilical Vessels, the Bladder; Ureters, Kidneys, and Spermatick Vessels, to all which it gives a Membrane, as also to the Liver, Spleen, Stomach, Intestines and Womb.

Its external Lamina hath two Productions, like to two Sheaths, which pass thro' the Rings of the oblique and transverse Muscles in the Groin, for the passage of the Spermatick Vessels in Men; and for the round Ligaments of the Womb in Women. These Productions being come to the Testicles in Men, dilate and form the Tunica Vaginalis. The Internal Lamina, which is very thin here, having accompanied the external Productions a little way, cleaves close to the Spermatick Vessels and round Ligaments of the Womb. The Peritoneum hath Veins and Arteries from the Phrenice, the Mammillary, the Epigastrick, and often from the Spermaticks. Its Nerves are of those which are distributed in the Muscles of the Abdomen; it hath likewisea sew Lymphaticks which discharge themselves into the Iliack Glands. By the Elasticity of its Fibres it easily dilates and contracts in Respiration, and in Conceptions. If it breaks it causes a Rupture either in the Navel or Groin. Its Use is to contain the Bowels of the Abdomen, and to give to each of them an outer Coat.

PERMUTATION of Quantities. See Varia-

tion and Combination.

PERNANCY: Taking or receiving Tythes in Pernancy, is taking such as are or may be paid in

PERPETUAL Motion; by this Term ought to be meant an uninterrupted Communication of the same Degree of Motion from one part of Matter to another, in a Circle, (or such like Curve returning into itself) so that the same Quantity of Matter shall return perpetually undiminished upon the first Mover: And perhaps if Men had rightly under-Rood that this is the true meaning of a perpetual Motion, abundance of Expence both of Money and Reputation might have been saved by the vain Pretenders to this piece of impossible Mechanism. For fince by the second Law of Nature or Motion, (see Motion) The Changes made in the Motions of Bodies are always proportional to the impress'd moving

Force, and are produced in the same Direction with it,

no Motion can be communicated to any Engine or

Perpendicular to the Base of the Table, as o q.

Machine greater than that of the first Force impressed; and therefore fince on our Earth, all Mossons are performed in a Fluid which refifts them, it must of Necessity retard them; and consequently a considerable Quantity of the Motion must be spent upon the resisting Medium; so that 'tis impossible the same Quantity of it can return undiminish'd on the first mover; which yet is absolutely necessary for the Continuance of the same Motion perpetually. Besides, in no Engine or Machine whatspever, can all Friction be avoided, there being in Nature no fuch thing as exact Smoothness or perfect Congrui-The manner of the Cohesion of the Parts of Bodies, the small Proportion the solid matter bears to the Vacuities between them, and the Nature of those constituent Particles not admitting it; wherefore this Frittion will also tensibly in time diminish the impressed or communicated Force, so tis nor possible the Mosson can be perpetual; which Effect can indeed never follow, unless the communicated Force be so much greater than the generating Force, as to recompense the Diminution made therein by all these Causes, in order to the Motion's returning undiminished upon the sirst Mover. But nil dat quod non habet, the generating Force cannot communicate a greater Degree of Motion, that it hath it felf, and consequently, the perpetual Motion is demonstratively impossible.

Besides, it being certain that a Body cannot move constantly in any Orbit with the same Degree of Motion from one fingle Impulse; fince that Degree of Motion and Velocity ariling from fuch a fingle Impulse, must by that means continually decrease, and so at last be quite spent and extinct : From hence it will follow also, that there can be no perpetual Motion in any Engine from one single Impulse ; for this Motion, that it may return again upon the first Mover, must be propagated in an Orbit; and consequently must by Degrees

cease and stop.

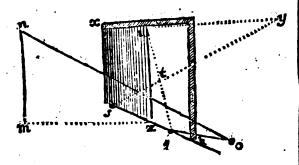

Per Qua Servitia, in Law, is a Writ Judicial issuing from the Note of a Fine, and lieth for Cognisee of a Mannor, Seigniory, Chief Rent or other Services; to compel him that is a Tenant of the Land at the Time of the Note of the Fine levied, to attorn unto him.

PERQUISITE, in the Law-fense, is any thing gotten by a Person's own Industry, or purchased with his own Money, different from that which descends to him from his Father or Ancestors:

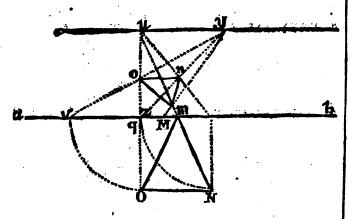

PERQUISITES of Court, are such Profits as grow to a Lord of a Mannor by Virtue of his Court-Baron, over and above the yearly certain Profits of his Land; as Fines of Copybolds, Herriots, Amerciaments, Waifes, Strayes, &c.

PERSONAL Services. See Services. PERSPECTIVE: The Foundation or Ground of Perspective, may be thus conceived. Suppose there be a Point, as o, which is seen by the Eye at n (whose Height above the Horizon is n m) thro' the Glass or transparent Plane $x \neq k$, which in Perspective is called the Table: And it be required to find the true Representation of this Point in Perspective; from m the point of the Horizon perpendicularly under the Eye at n draw at Right Angles to n m (the height of the Eye) the Line m 7; at 7 in the Table erect the Perpendicular 7 u equal to n m, and at Right Angles to it, from the Q:9 q

and draw the Line qu. Take q s = to q o, draw s y cutting uq in the point s, so is s the point required.

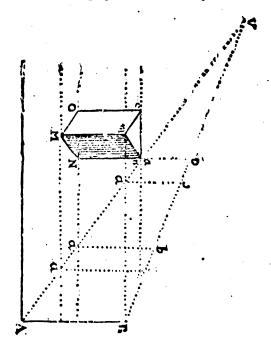

On this Foundation is the primary Rule of all Perspellive built, and all its Practices established, v. gr. Suppose an Equilateral Triangle (as mn o) or any other Geometrical Plane Figure were to be represented in Perspettive. Between the Eye and the Triangle draw somewhere the Right-line a b, which they call the Fundamental Line; then draw z v representing the perpendicular Distance of the Eye above that Line, be it what it will, and thro o draw, at Right Angles to z u, or parallel to a b, the Horizontal Line vy; then will the Plane lying between those Parallels represent the Table or Trans parent Plane. Then in order to find the perspe-CtivePoint for e, one of the Angles of the Triangle omn, draw og perpendicular to the Fundamental Line a b, and make q s equal to q o. Take u yequal to u z, and then from y draw sy; draw also vq, whose intersection with q s will find the point o, which will be the true Representation of o in Perspedive; proceed after the same manner with the Points M and N, and drawing the Lines on, in m, mo, the Triangle o n m will be the true Representation of the Triangle M NO. And thus proceeding with the Angular Points of any Figure, whether regular or irregular, you may draw any thing truly in *Perspettive*; only in Practice, se-veral compendious Methods will arise, which every one will discover on frequent Tryals.

And if the Scenographick Appearance of any Solid were to be represented, as suppose of a Triangular Prism whose Base is the Triangle M N O in the second Figure; you need only find the upper Surface of it after the same way as you found the lower or the Base, and then joining the corresponding Points by Right-Lines you will have the true Representation of the Solid in Perspective.

So that the Work is the same as before, only you take a new Fundamental Line, as much higher than the former, as is the Altitude of that Solid whose Scenographick Representation you would delineate.

But there is yet a more commodious Way of doing this, as follows; Having found, as above, the Baie; or Ichnographick Plane in no;

Let Perpendiculars be erected to the Fundamental Line, from the three angular points, which will express the Altitudes of those Points. But because these Altitudes, tho equal to one another in the Body or Solid it self, will appear unequal in the Scenographick View, for those that are further off will appear less, and the nearer, larger.

Their true proportionable Heights may be thus determined: Any where in the Fundamental Line let AB be erected perpendicularly equal to the true Altitude (or if the Figure hath different Altitudes, let them all be transferred into the Perpendicular AB) and from the points A and B (and from all the points of intermediate Altitudes, (if there be any fuch) draw Right Lines to the Eye point in V. or to any point in the Horizontal Line: Those Lines AV and VB will conftitute a Triangle with A B, within which all the Points of Altitude will be contained. Thro' the points o, n, and m, draw parallels to the Fundamental Line, as you see, and from the points a, a, a, erect Perpendiculars to those Parallels, and where they intersect the two Lines AV and BV; as in the points a, a, a, and b, b, b, &c, they will determine the apparent Height of the Solid in that Scenographick Position to the Eye at V. And in practice these Parallels and Perpendiculars are to be easily described by the Help of a good Drawing-Board or Table fitted for this purpole, and others of this Nature.

PESA, Pensa, Pisa; is a Wey or Weigh, or a certain Weight or Measure of Cheese and Wooll, containing formerly 256 Pounds.

PESAGE, is a Duty paid for weighing of Merchandize and other Wares, to a certain common Weigher, whom they called Pefarius.

PETER-Pence, called also Hearth-pence, Rome Scot, and in the North Ream Pence; was a Levy of a Penny on every House wherein there were 30 Pence viva pecunia, to be collected and sent to Reme: This at first tho' only a Contribution, at last pass'd into a standing Tax; one half of it went for Alms to the English School at Rome, and the other half to the Pope's Use.

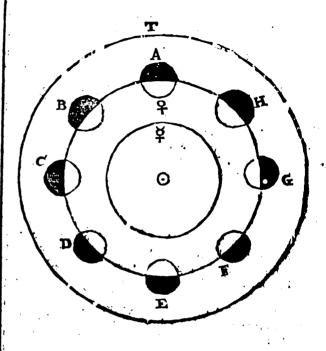

It was at first given by King Ina, and confirm'd by Offa and Ethelwolph; established by the Laws of Canate, Edward the Confessor, William the Conquerous, and Henry I. Twas collected by the Bishops, who employed the Rural Deans and Archdeacons to receive it. The whole Summ was by Pope Gregory stated at 200 l. 26 s. In the Year 1365, King Edward the Third first forbad the Payment of this Duty to the Pope; but the Custom some returned again, and continued till the Reign of Henry the Eighth, when Polydore Virgil was employed here as the Pope's Receiver-General. No Place nor Religious House was exempt from this Imposition, but only the Abby of St. Albans.

PETIT-Sergeanty: To hold Lands or Tenements in Petit-Sergeanty, is to hold them of the Crown, by yielding the Sovereign a Knife, Buckler, Arrow, or a Bow without a String, or other like Service at the Will of the first Feosfer; and there belongs neither Ward, Marriage nor Relief: No one can hold Land in Grand or Petit-Sergeanty, but of the Crown. See Stat. of Car. 2.

PHALANX, among the Macedonians, was an oblong square close Battle of Pikemen, consisting of 16 File, and 500 in Front, as Polybius saith; and the Soldiers stood so close together, that the Pikes of the 5th Rank extended 3 Foot beyond the Front of the Battle.

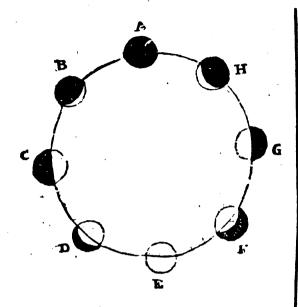

PHASES of the Planets: Since all the Planets as well as the Earth are spherical, orake, and scabrous Bodies, they must reflect every way the Sun's Rays which fall upon them; and it will follow also from hence, that one half of every Planet, or

that Hemisphere which is turned towards the Sun, will be illuminated by him, and the other Hemisphere at that Time must remain in Darkness. And further, since its that Hemisphere of any Planet, which is considered by any Observator:

The eight little Circles represent the different Phases of Venus, as they will appear to an Bye placed in T on the Earth, while she moves round in her Othir ACEG about the Sun. It will be plant then, that when Venus is in A, and the Earth at T; she being then most retrograde, (see the Word Direct in this Vol.) will least of all appear to us, because her obscure Hemisphere is entirely obverted towards us. And if she happen to be then in either of the Nodes, i. e. in the Plane of the Ecliptick, she will appear like a Spot in the Body of the Sun.

But when she gets surther to B (the Eye being still supposed to be in T) she will still be retrograde, but some small part of her illuminated Disk will be visible; and she will appear with illuminated Horns which will be turned from the Sun, of towards the West. When she comes to C, one half of her illuminated Disk will be visible to an Eye in T, and then she will appear like an Half-Moon; in D she will be gibbous, and in E at sull. And the same Phases she will put on as she moves in the other Semicircle from E to Alagain, only the illuminated Horns will be turned a contrary Way; as appears by the second Figure, where all the several Phases are delineated.

And the same kind of Phases must happen to Mercury in the several parts of the Orbit, Regard being had to the Figure of it, and the Time of his Periodical Revolution sound the Sun.

PHILTRATION. See Filtration.

PHOSPHORUS; by Order of, and before the Royal Society at London, Mr. Hawksbee made several Experiments on the Phosphorus, about its Production and Propagation of Light in vacue; and it plainly appeared from them, that the removing the common Air did very sensibly encrease its Light. And by the Experiments made by the same Person on the Mercurial Phosphorus, and mentioned in Phil. Trans. N. 303. it is also manifest, that the Mercury when strongly agitated in the common Air would exhibit in a darkned Room some Sparks of Light, yet that a very sensible and eminent De-gree of it might be produced by shaking it in proper Glasses in Vacuo.

Bernouli, Professor of Math. at Groningen, made an easy portable Mercurial Phosphorus after this Manner: In a clean neat Viol he included about five or fix Ounces of well purified clean Quickfilver; and then evacuating the Viol of Air by applying to an Air-Pump, it would, when shook strongly in the Dark, appear all bright and luminous, so as that one might distinguish the Faces of the Spe-

ctators.

PHYSICKS, or Natural Philosophy. The most eminent Books on this Subject which will give the Reader a true and useful Knowledge of Nature, are these:

Sir Is. Newson's Principia Philosoph. Naturalis Mąthematica.

Ejusdem Optice : sive de Lumine & Coloribus. Borellus de Motionibus & Gravitate pendentibus. -De vi percussionis.

Whilis Mechanicks, sive Liber de Motu Trastatus Geometricus.

Hon, Fabri Dialogi Physici. Lugd. Galliarum. 1669. 8vo. Mr. Boyle's Physical Pieces.

Keil's Introductio ad Veram Physicam. Ditton's Laws of Nature and Motion.

Cheyne's Philosophical Principles of Natural Re-

All Dr. Hook's Tracts printed while he was living, and his Opera Posthuma.

Philosoph, Transactions.

And Collections. A&a Eruditorum Lipfia.

PIAZZA's, or as our Vulgar frequently call them Piaches, are in the Italian the same as our Cloysters.

PICAGE, from the Latin Pica, was a Custom or Duty paid at Fairs and Markets for breaking the Ground and pitching up of Stalls and Standings; and this Profit of Picage was usually given or granted in Charters for holding a Fair or Market,

PIEDROIT, in Architecture, is a Square Pil-

PILÆ, in Architecture, and their Quadra's and Tables (as we yet see them in ancient Altars and Monuments) were imploy'd for Inscriptions; but if shorter and more massy, they serve for Arches of Bridges and for Buttresses to solid Work. Evelyn's Parallel.

PINK, is a Vessel used at Sea masted and rigged like other Ships, but only site is built with a round Stern, the Bends and Ribs compassing so as that her Sides buldge out very much; wherefore these Pinks are difficult to be boarded, and also are made to carry greater Burdens than others, They are often used for Store-Ships, and Hospital-Ships, in the Fleet.

PINNACE, is a small Vessel, with a Square Stern, going with Sails and Oars, and carrying three Masts; and is used as a Scout for Intelligence, and for Landing of Men, &c. also one of the Boats belonging to a great Man of War, which serves to carry the Officers to and from the Shoar, is called the Pinnace.

PISCI-

PISCIVOROUS Animals, are such as feed on See Birds

PITCH, is a Word used by Architects and Builders in these Senses. Sometime Paving is called Pitching: But usually they understand by it the Angle which a Gable-end, and consequently the whole Roof of a Building is set to. If the Length of each Rafter be? of the Breadth of the Building, then they say that Roof is of a True Pisch: But if the Rafters are longer, they say 'tis a bigb or sharp piech'd Roof; if shorter, they call it a low or flat pisch'd Roof.

PLACE Apparent of a Planet, is a point in the Starry Heaven which is found by a Right-Line passing from the Spectator's Eye on the Earth's Surface, and terminated at the other End amongst the fixed Stars. In the Figure under the Word Parallax in Vol. I. If A be the Centre of the Earth, and B a point on its Surface; let (represent the Moon, then will G be her true and H her appa-

rent Place in the Starry Heaven.

PLACE True of a Planet, in Astronomy, is that point amongst the fix'd Stars which is found by imagining a Right Line to be drawn from the Earth's Centre thro' the Planet, and terminated at

the other End in the Starry Heaven.
PLACE Geometrick. The Ancients called their Locus or Place, dranu wiro, i. e. Rosolutus, and the Order of their Writings about it, according to Pappus, is this, (1.) Euclidis Datorum, Lib. 1. (2.) Apollonii xó y v aralouñs, or de Rationis Sectione, Libri 2. (3.) The same Author's xosiv aralouñs, of the Section of a Space, 2 Books. (4.) His two Books of Tactiones (\$\times\alpha\operation{\text{col}}{\text{col}}\) (5.) Euclide his 3 Books of Porismata. (6.) Apollonius his revoceur, or of Inclinations, Book 2. (7.) The same Writer's two Books of Loca plana, Town omwider. (8.) His eight Books of Conicks. (9.) Aristaus his five Books Town segen, or of Solid Places. (10.) Euclide his two Books of Places ad Superficiem. (11.) Eratosthenes's two Books de Medietatibus. Of all which only Euclid's Data, and four Books of Apollonius his Conicks, are left now in Being.

Lond. 1693. 410.

PLANE, is an Instrument used in Joinery, to make Boards plane, try, and smooth, or in order to joint or frame them together, &c. These are of several Names and Sorts according to the several Uses; as, 1. The Pere-plane, which is a long Plane, and used first of all before either Smoothplane or Jointer. The Edge of the Iron of this Plane is not ground streight, but rising with a Convex Arch in the middle of it, that its Edge may bear to be set the Ranker, for its Use is to take off the Irregularities of the Scust as soon as may be, in order to prepare it for the Smoothing-plane, or Jointer. If the Stuff be free and from, that is, even tempered all over, you may then fet the Plane so rank as that you may take off a Shaving of the Thickness of an old Shilling; but if it be hard or curling, you can't take off one thicker than an old Groat. 2. The Smoothing-plane, is a short small Plane, whose Iron is set very fine, and its use is to take off the Irregularities of the Foreplane, or those which it hath left. 3. The Jointer is a Plane longer than the Fore-plane, and hath its Sole perfectly strait from End to End ; it comes after the Fore-plane and Smoothing-plane, and is defign'd to shoot an Edge of a Board perfectly

ftreight in order to jointing, as also Boards of any Thickness; for 'tis used to Try, as they call it, that is, smooth Tables with, whether large or small; wherefore its Iron must be set very fine, little above an Hair's breadth above the Sole of the Plane, and the length of the Edge of it exactly strait, or parallel to the Plane of the Sole or Bottom of the Plane. 4. The Strike-Block is a Plane made as true as the Jointer, and like it, only shorter; being used to shoot a short Joint, which it doth more handily and readily than the long Join-Tis used also for framing and fitting the oints of Misres and Bevels, but then the piece of Wood is drawn by Hand over the Plane several Times till tis shot true. 5. The Rabbet Plate is used to cut part of the upper Edge of a Board strait or square down into the Stuff, so that the Edge of another Board cut down after the same manner may fit and join in with it on the Square; and when two Boards are thus cut away, this lap-ping over is called Rabbering. The Rabber-plane is sometimes used also to strike a Pascia, in a piece of Moulding. The Iron of this Plane is full as broad as the Stock is thick (usually about an Inch) that the Angles of the Edge may cut down exactly strait; and it delivers its Shavings at the Side and not out of a Mouth at the Top, like other Planes.

6. The Plow, is a narrow Rabbet-plane, with the Addition of two Staves with Shoulders to them, and on the Bottom of the Shoulders a Fence: Its use is to plow a narrow square Groove on the Edge of any Board, of any proper Depth. 7. Mouldingplunes, of which are several kinds, as the Round Plane, the Hollow, the O-G-, the Snipes Bill, &c. and these of several Sizes, as from half an Inch to an Inch and half. When these Planes are used on soft Wood, as Deal, Pear-Tree, Maple; &c. the Iron is set to an Angle of 45 Degr. with the Sole or Base of the Plane; but if it be very hard Wood, as Box, Ebeny, Lignum Vitæ, &c. it is let to 80 Deg. and sometimes quite uprights There is also tome difference in the grinding of the Basil or the Slope of the Edge of the Iron of the Plane; for in working on hard Wood this is ground to an Angle of about 18 or 20 Deg. but in soft Wood, not to one above 12 Degrees; for the more acute the Basil is, the better and smoother the Iron cuts, but the more obtuse and thicker it is, the stronger is the Edge to cut upon hard Work.

PLANE of the Projection, in the Astronomical Perspective, or Stereographick Projection, is a Plane which passes thro' the Centre of the Sphere, the being supposed the Pole of or in a Point in the Axis of that Plane, and 90 Degr. above it or the Surface of the Sphere; thus, if the Eye be in the Zenith or Nadir Points, the Horizon will be a Plane on which the Circles of the Sphere may be projected Steteographically: And from hence it will follow, that all great Circles of the Sphere passing thro the Eye-point, must be at Right Angles to the Plane of the Projection, because they pass thro' its Poles. See Spherick Geometry, or Pro-

jection in Vol. I.

PI ANETS. The Motions of the fix Primary Square of the Times of their peroidical Revolutions are as the Cubes of their Distances from the Sun: And the same thing is found by all Astrono-

tners to be true, with Regard to the Motions of the Secondary Planets or Satellises round their primary bnes. Greg. Astron. p. 26, 27.

The

The Forces with which the Primary Planets are continually drawn from a Rectilineal Motion, and by that Means are retained in their Orbits, are reciprocally as the Squares of their Distances from the Centre of the Sun. Id. p. 33.

The Forces with which the Secondary Planets are retained in their Orbits, are reciprocally as the Squares of their Distances from the Centres of their

Primary Planets about whom they revolve. p. 34.

The Nodes and Apfides of all the Planetary Orbirs are at rest and do not move progressively.

P. 55.
The Planets and Comits are retained in their Orbits by the Force of Gravity; the same Law prevailing thro' all the Solar Sistem. p. 57.

If a Primary Planet revolving round the Sun as its Centre carry round with him a Sarellite which revolves also round the Planet; the Motion of this Satellite will be accelerated all the while it is moving from the Quadratures to the Syzygies, and retarded all the while it is moving from the Syzigies to the Quadratures: So that it will move faster near either its Conjunction or Opposition, and slower near the Quadratures. The Figure of its Orbit will al-so be more Curvilineal in the Quadratures than in the Syzygies, and consequently the Satellite will be or recede farther from the Primary Planer, in the Quadratures than in the Syzygies, so as that the Orbit will be an Ellipsis, whose Centre is the Primary Planer, and whose greater Axis lies at Right Angles to a Line drawn from the Sun; and the lesser Axis is coincident with that Line. This Dr. Gregory demonstrates in his Astron. p. 282, &c.

But if the Orbit of the Satellite Planer, inftead of being a Circle be an Ellipsis, in whose Focus the Primary Planet is supposed to be placed, then will the greater Axis of this Elliptical Orbit, twice advance forward, viz. in the 2 Quadratures, and twice recede backward, viz. in the 2 Syzygies, of every Revolution of the Satellite round the Pla-

net. p. 298.

In each Revolution of the Satellite round the Planet the Apsides will, for the most part, advance more forwards than they recede backwards, and by the Excess of this Progression, will move in

Consequentia.

PLASTICE, or the Plastick Art, is the Art of making Figures of Men, Birds, Beasts, Fishes, Planers, &c. in Clay, &c. The Workmen are called Plasta. It differs from Carving, because here the Figures are made by Addition usually, but in Carving always by Subtraction of what is super-It is now with us chiefly used in Fretwork Ceilings; but the Italians apply it to the Mantlings of Chimneys with great Figures.

PLAY. The Laws of Chance or the Proporti-

on of Hazard in Play or Gaming is a Thing Mathematically computable, &c. For the it be usually very uncertain in any Game depending on Chance, who shall win; yet it may, in most Cases, be determined who hath the better of the lay, and what Advantage one hath above the other; (which if Gentlemen knew and confidered, they would not, perhaps, venture their Money with Sharpers, and fuch Wretches as make it their whole Bufiness to know and remember the Odds in Gaming, as well as to practice most infamous Ways of Cheating by false. Dice, slight of Hand, &c. But, I proceed to an easy Instance; tho' whether a Man shall throw 6 with one Die the first time be uncertain, yet how much it is against him, or how impropable that he doth not, may easily be determined. So likewise if another and I play at Tables or Back-Gammon, 3 up, and I am the first one; tho' it be uncertain, and can't be determined Mathematically who shall win; yet by those Principles I can demonstrate what the Advantage is on . my Side, and how much the Value of my Expe-Charion or Chance exceeds his.

A vast Variety of Questions about these Things will arise in Play, amongst two or more Gamesters ; in Order to the Determination of which, this must

be premised as a Principle.

That the Value of any one's Chance or Expectation of Winning, is what would purchase the like Chance, Advantage or Expediation in a just or equal

Thus if a Person should, unknown to me, hide in one Hand 7's, and in the other 3's, tho it be impossible for me to be certain which Number is in which Hand; yet I'm sure 'tis an Advantage to me to have the Choice of which Hand I will take; and (as I shall shew below) this Advantage is worth five Shillings.

In order to which, I lay down this Propo-

Proposition I.

Where there is an equal Chance for a=3 s. and h=7 s. the Value of my Expectation is $\frac{a+b}{a+b}$; or half the Summ of a and b.,

To investigate the truth of which Proposition; suppose I would seek what the value of my Expechation is in this Case, let it in the Analytick way, of Enquiry, be called x.

Then, by the general Axiom or Principle, If I had x, I were able in a fair and equal Game to

purchase such an Expectation again.

Suppose therefore I play with another on these Terms, that each of us thall Stake down a, and, that the Winner shall give a to the Loser: I say this is just and fair, and that I have an equal Chance, either to get a, if I lose the Game, or to have 2x-a (that is, both the Stakes, inbducting 4) if I win. Now to make it an equal Game, this 2x-a must be =b, wherefore transposing aand dividing by 2, you will have this Equation x=a+b, which gives x fought.

Thus in Numbers, If I have an equal Chance of getting 3 s. or 7 s. then by this Proposition my Expectation or Interest is worth 5's. and 'ris certain, that having 5 s. I may have the same Chance ; for if I play with another, and each of us Stake 5 s. with this Condition, that the Gainer shall pay the Loser 3 s. This is an equal Way of Gaming; and tis plain, That I have an entire Chance to get or receive 3 s. if I lose, or 7 s. if I win.

That is, if a Man will give me the Choice of 7 s. in one of his Hands, and 3 s. in the other,

'tis as good as giving me 5 s.

Proposition II.

Where there it an equal Chance of a, b, or c, the value of my Expectation is $\frac{a+b+c}{3}$, or one third of the Sum of a, b, and c.

Let x (as before) be the Value of my Expectation; then must x be such, that I can purchase with it the same Expectation in a just and equal Game. Suppose the Conditions of the Game were, that of three Gamesters each of us stake down x, and I agree with one of them, to give him b if I win, and he doth the same by me; with the other I agree to give c, if I win; and he doth the same with me: I say, this is fair and equal Play; for here I have an equal Chance to get b, if the first win, c if the second win; or 3x-b-c (that is, all the Stakes, deducting b and c) if I win my self. Now to make the Game equal, 3x-b-c must be equal to a, wherefore x=a+b+c 3And so on; if there had been an equal Chance for four Things as a+b+c+d, the Value of my Expectation will a=a+b+c+d.

Proposition III.

Let the Number of Chances by which 13 (=a) may happen to me, be p=3, and the Number of Chances by which b=8, falls to me be q=2, and supposing all the Chances to happen with an equal Facility; then, I say, the Value of my Expectation is $\frac{pa+qb}{p+q}$; that is, in Words, The Quotient arising from the Summ of the Products of both the Numbers a and b, when multiply'd into their Respective Chances p and q, and then divided by the Summ of those two Chances. To prove which,

Suppose as before my Expectation to be x: If I have x, I shall be able to purchase with it the same Expectation again in an equal Game. For this I may take in as many Persons to play with me as make up the Number of p-1-q; of which every one must stake x, Therefore the whole Stake will be px+qx, and every one plays with equal hopes of wioning.

With as many of my Fellow-Gamesters as the Number q stands for, I bargain one by one, that which of them soever wins shall give me b; and if I win, I will do so by them. Then with the rest of the Gamesters, whose Number is p-1 (that is, all the remaining Gamesters but those express by q, and my self) I bargain, that whoever of them gains the Seakes shall give me a, and I agree to do so by them, if I win. 'Tis plain, that this is fair Play, no Man being injured. And in this Case I have q, Expectation to gain b; and p-1 Expectation to win a: And I Expectation (viz. If I win my self) to gain px+qx-bq-ap+a; for if I win I must give b to each of the q Gamesters, and a to each of the p-1 Players; which makes 6b+pa-a; if therefore qx-bx-ba-ap+a were equal to a, I should have p Expectations of a; since just now I had p-1 Expectations of it) and q Expectations of b; and so I should come just to my sirst Expectation; wherefore putting

px+qx-bq-ap+a=a. By Reduction x=ap+bqQ. E. 3.

In Numbers, If I have 3 Chances for 13, and 2 Chances for 8, I say by this Rule my Expectation is worth 11.

For $13 \times 3 = 39$. and $8 \times 2 = 16$. and 39 + 16 = 55, and 55 - 65 = 11.

And if I have 11, I can easily shew that I may come to this Expectation: For, suppose I play with 4 others, each of which, as well as I, stakes 11; with two of these I bargain, that whoever of us wins shall-give the others 8 a-piece; and then with the other 2, I agree, that the Winner shall give to the 2 Losets of us 13 a-piece. Then its plain, I have 2 Expectations to get 8, and 3 Expectations to get 13 (viz. if either I or any of the other two win) for in this Case I gain all the Stakes which make 55; out of which I must give the first two 8 a-piece, and the other two 18 a-piece, and so there remains 13 for my self.

To apply these things to the ordinary Cases of Play.

1. Suppose he that come first to Three be up, or wins the Stake between two Gamesters: And let me be swo and he but one; Query, What is my Advantage? Or, if we leave off Play, what is my just Share of the Stakes?

The first Consideration here is, how much each of us wants to be up; as suppose we play 3 up, and he be I and I 2; or if we play, first come to 20, and he be 18 and I 19 Games; in both these Cases he wants 2 of being up and I want but one; The Question is, what Advantage I have of the Lay? or what Proportion or the Stakes is due to me if we should now leave off.

To find which, let us see what would happen if the Game went on: If I get the next Game, or End, I am up, and win the Stakes; which suppose you call a=8, but if he win 2, then he will be up as well as I, and so both our Lots are equal; and if we should then divide, each of our Shares will be 4 or \frac{1}{3}a.

But before we play that Game, if I am two and he but one, the Hazard, which of us shall win that Game, being equal, I have an equal Chance to get the whole Stake or the half; that is, a or 4; for if I win the Game I have a, and if he win, my just share of the Stake is 14.

Since therefore, before I begin this Game, I have an equal Chance to gain a or ½a, the Value of my Expectation (by Prop. I.) is half the Sum of both

those Chances (i. e.) $\frac{a+\frac{1}{1}a}{2} = \frac{3}{4}a = 6$. Now if I have due to me as my Share, he can have but due to him as his Proportion, so that if we play'd for 8 Pieces, and would draw Stakes when I am two and he but one, and if three be up, I must have 6 Pieces and he but 2 Pieces, and the Odds on my side is Three to One.

Another way thus; in

Case 1. The Descriencies being 3; the Sett must be up in two Ends; wherefore take the Members of the 2d Power of a+b, and distribute them thus: Because A wants but one of up, let all the Members, where there is one a or more, with their Uncia be collected for A, and all where there's two b's (or bb and above) for B.

For

1 5 4	For B.	1
For A.	1 1 66 1	Wherefore A's odds to B
2 ab		is 3 to 1.
11 2 1	1 1	j

Or by simple Subtraction only, Let the Stake of each be 32 s. then if A wins the next Game he is up and hath the whole or 64 Shillings; but if B wins it, their Shares will be equal. A there might have said, If B will leave off let him give me the 32 Shillings. which I am fure of, tho he should win the next Game; and fince he will not venture for the other 32 s. let us divide it fairly between us; so A must have 16 s. more, which will make his Share in the whole 48 Shillings, and he must have only 16 Shillings.

Tis the same odds, i. e. 3 to 1, that a Man throws not Pile twice together with one Piece, as that he throws two Piles the first throw with two

Pieces. For reckoning each Face of the Piece of Money for a Chance, like the Face of a Dye, 'tis plain, of the 4 Chances on the two Pieces, there is only smo Piles for him, whereas there is 2 Crosses, one Pile and one Cross, and one Cross and one Pile against him; each Piece having two Faces) that is, there is one for him and 3 against him.

Case 2. Suppose I want but one Game of up,

and my Fellow-Player 3.

I consider the State of our Case, if either my self or he gain the next Game. If I win it I am up, and to have the Stake a; if he win it, he will then want two of being up, as I want but one. And then I shall be in the same State as was supposed in the Case before this; and my Share of the Stakes, if we should divide fairly, is a; wherefore before I threw I had an equal Chance for a or 14, and therefore (by Proposition I.) my Expectation

is worth $\frac{1}{4} = \frac{7}{4} = \frac{7}{4}$: But if my Proportion of

Expectation be 3a, his can be but 1a; and therefore my Odds is as 7 to 1.

Otherwise thus,

The Deficiencies being 4, the Sett must be up at 3 Games End: Then take the Members of the third Power of A+B and distribute them thus:

For
$$A$$
, For B , $1b^3$ Wherefore the Odds is as 7 to 1.

Here also by common Subtraction 'tis plain; That if A wins the Game he hath 64 s. but if B twins it, they are in the Condition mentioned in Case 1. That is, there is then 48 s. due to A; wherefore he might say, Give me that 48 s. that is due to me (for I'm sure of it whether I win or lose the next Game) and if you will leave off and not hazard the other 16 s. let us divide them equally; give me 8 s. more, which makes my Share 64 s. leaving yours but 8 s. wherefore A's Advantage was 7 to 1.

Case 3. By this Method of Calculation you will find, that if I want but one of being up and he 4, the Odds on my Side is 15 to 1;

Case 4. Suppose I want 2 and he 3 Games of bei

Then if I win the next, I shall want but one and he three. This State of the Sett is worth \(\frac{7}{4}a \) by the last Case; but if he win, then each of us will want 2, and io our Chance is equal, and there is 14 due to each of us; wherefore I have an equal Chance to gain 7 a or 1 a: But 2 a+1 a

wherefore, if we were to divide the Stakes justly, there is eleven 16ths due to me, and consequently but 5 Sixteenths due to him; wherefore I much have eleven parts of the Stake, and he but five.

Otherwise thus;

Let. A want 2 of up, and B want 3.

The Deficiencies 2+3 being 5, the Sett must

be up in one Game less; viz. 4.

1 take therefore the 4th Power of the Binomial

A+B, viz. a+ 4a3b+6a2b2+4b3a+b4, and distribute it thus;

Let all the Members where there are two a's be collected for A, and all those where there are three b's for B.

A. 1a ⁴ . 4a ³ b 6a ² b ²	B. 4b³a 1b4	in the fhe
11	5	as

Then adding all the Uncia each Collection together ey will give the Chances and ew the Odds of A's winning being up before B, to be 11 to 5.

And so on Universally.

As in Case the next, where A wants two and B wants four of up.

The Deficiencies being 6, the Sett will be up in one Game less, viz. 5. Taking therefore the Uncia of the 5th Power of a+b you will have

for A. 1a ⁵ 5a ⁴ b 10a ³ b 10a ² b	16' B on 5ab4	
in all 26.	in all 6.	

Wherefore the Odds is 26 to 6, or 13 to 3.

This Method by the Uncia of a Binomial was communicated to me by the Honourable Francis Roberts, Elq;

Case 5. Suppose I want 2 and he 4.

If I win next I shall want but one and he will still want four; but if I lose the nextGame, I shall want 2 and he 3; wherefore by Case 3, 4. I have an equal hazard of gaining 1/2 or 1/6, and this by Prop. I. is worth 1/3 ; wherefore his Share is but and therefore the Odds on my Side is 13 to 3.

N. B. Wherefore he that wants but 2 of up, when the other wants 4, is in a better State than he who wants but one when the other wants but two (as in Case 1. for his Expectation then is but 3 or 12a, whereas now tis 18a.

To carry this a little farther, Suppose 3 Men at play, and let the first and second want but one

Game of up; and the third want two.

To find the value of the Share of the first (in Case of a Division of the Stakes) you must consider what will happen if either he or any of the two other gain the first Game. If the first win he gets the Stake a, if the second win the first hath Nothing; but if the third win, each would want a Game; so that is each Man's Share:
Where

LA

Wherefore the first Man hath one Expectation to gain a, one to get nothing, and one for 1/4; which by Prop. II. is 4+0+3a =3a. But the second Man's Expectation was as good as that of the first, for he wanted also but one of up; wherefore his also is of 4: But 44+4=;a, and consequently the Third's Share can be but ; a; wherefore the Stakes being divided into 9 parts, the two first Men must have

4 a-piece, and the third must have one. And after this manner you may proceed with any Number of Players; of which some want more and some less of the Setts of Games. If you go about to investigate any one's Share, you must confider what would be due to him, if either he or any one Gamester should win the next Game; and then, adding all their Shares, and dividing the Sum by the Number of the Gamesters, the Quotient will be the Share you seek.

Proposition IV. Problem.

To find at how many Throws one may under-

take to throw 6 with one Dye?

Case 1. If I undertake to throw fix the first time tis plain there is but one Chance for me and 5 against me. Let the Stake therefore be a, then shall I have one Expectation to gain a, and 5 to gain a + 5 nothing,

Nothing; wherefore by Prop. II.-

(for 5 times Nothing is Nothing) = ta, is the Value of that Expectation, and consequently my Antagonist must have 'a; wherefore he ought to lay me 5 to 1.

Case 2. If I undertake to throw 6 at 2 Throws

with one Dye, my Chance may thus be found;
If I throw 6 the first time, I have my Stake; if I do not, I have but one throw remaining; which (by Case 1.) is $=\frac{1}{6}a$; wherefore there are five Chances for my gaining ta, and but one for a;

which (by Prop. II.) $\frac{=a+\frac{5}{6}a}{6} = \frac{1}{16}a$, the Chances

against me then give my Fellow Gamester 354, and consequently, that I don't throw 6 at two Throws, is 25 to 11.

Case 3. By the same Method of Calculation you will find that I don't throw 6 at three times is 125 to 91, a little more than 4 to 3.

Case 4. That I do throw it at 4 times is 671 to 625, a little more than an even Wager.

Case 5. That I do it at 5 times, is 4651 to 3125, viz. almost 3 to 2.

Case 6. That I do it at 6 times, is 31031 to

15625, almost 2 to 1.

The Solution of this Problem and of the following one I had also from the Honourable Fr.

Roberts, Eiq; Thus, In how many times, with a fingle Dye, may

one undertake to cast Six?

The Chances of one Dye being 6, I make 6 the Numerator of a Fraction, and the Chances against my throwing 6 being 5, I make that the Denominator; and by Consequence, the Denominator subducted from the Numerator leaves the Chances which are for me. Vol. II.

Now I say, that the Number of Throws required must be the Index of that Power of ; which makes the Numerator at least double to the Denominator; for by that Means the Chances a gainst me being subducted, a Majority will remain

Wherefore at 4 Throws I have something the Advantage: And so you may proceed on as far as you please.

Problems of this Nature are very expeditionfly folved by the Logarithms, as in this Example.

In how many times, with fix Dice, may one

undertake to throw all Sixes?

All the Chances on 6 Dice being the 6th Power of 6; that is, 46656, let x be the Number of Throws required.

Now without the Logarithms, (which folve this in a few Minutes) a Man's Life would scarce serve to go thro' the Operation; for $\frac{46656}{46655}$ must be raised up to the 32335th Power, which would make a Row of Figures almost a Quarter of a Mile in Length.

Proposition V. Problem.

To find at how many times one may throw 12 with only two Dice.

Case. 1. 'Tis plain, the first Throw, the Castor hath but one Way to throw it, and 35 Throws to miss it; wherefore by Prop. II. his Expectation is but 3 d.

Case 2. He that undertakes it at twice, if he throw 12 the first time gains a; if not, he hath but one Throw more for it; and that is worth but 164, by the former Case; wherefore there is but one Chance for him for 12 at the first Throw, and 35 Chances against him: So that he hath Chance for a and 35 for 16a, which by Prop. II.

is worth $\frac{71}{1296}a$, and there will be against him

 $\frac{22}{1296}$ which is above 16 to 1.

Omitting then the Chances of doing it at three Throws, let us find the Hazark or Odds of doing it at 4 Throws.

If he that undertakes to throw 12 at 4 Throws do it the first or second Throw, then he hath a; if not, there remains two other Throws against Rrr

him; which by the former Case are worth $\frac{1}{1296}a$.

But for the same Reason in his two first Throws, he hath 71 Chances for a, against 1225 Chances which will lose it; wherefore at first he hath 71

Chances for a, and 1225 which give him 1296 a;

which by the 2d Proposition is worth $\frac{1500625}{1679610}$ a.

And thus if you pursue all the Cases (saith the ingenious Author of the Laws of Chance, p. 38, 39.) you will find that he that undertakes to throw 12 with two Dice at 24 Throws, has some Disadvantage of the Lay, as he that engages to do it at 25, hath some Advantage.

Proposition VI.

After the same manner may be found, that you may undertake to throw two Sixes at ten Throws of one Dye, or with one Throw of ten Dice.

Proposition VII.

If I play with another but one Throw with two Dice, to that if 7 comes up I win the Stake, if 10 he gains it; what is the Odds, and how much of the Stakes would belong to me if we draw?

Of the 36 Chances on the two Dice, there are 6 which will give me 7, 3 which give me 10, and consequently 27 other Chances which give me neither, and which equals the Game; in which Case there is due to each of us 1 a; but if none of the 27 should happen, I have 6 Chances to gain a and 3 by which I may get Nothing; which, by Prop. II. is $\frac{3}{4}a$ in Value. So I have 27 Chances for half a and 9 Chances for $\frac{3}{4}a$, which (by Prop. II.) $=\frac{1}{2}\frac{1}{4}a$ for me, and $\frac{1}{2}\frac{1}{4}a$ for him.

Prop. VIII.

If I were playing with another, by turns, with two Dice, so that if I throw 7 I win, and if he throw 6 he wins, and he hath the first Throw; What is the Proportion of my Hazard to his?

Suppose I call the Value of my Hazard x, then

if the Stakes be a, his Hazard will be a-x.

Then whenever tis his Turn to throw, my Hazard is x; but when it is my Turn, the Value of

my Hazard is greater.

Suppose I then call it y. Now because of 36 Throws on two Dice, there are 5 which will give him 6, and 31 which bring it again to my turn to throw; I have 5 Chances for nothing and 31 for y, which (by Prop. III.) is worth \(\frac{3}{3}\tau_1\tau_2\). But at first I supposed my Hazzard to be x, where fore \(\frac{3}{3}\tau_2\) = x, wherefore $\frac{3}{3}$ $\dot{x} = y$. I supposed likewise when it was my Turn to throw, that the Value of my Hazard was y: But then I have 6 Chances which give me 7, and consequently the Stake; and 30 which give my Antagonist the Dice; that is, make my Hazard worth x. So I have 6 Chances for a, and 30 for x; which by Prop. 3. is worth but by the Supposition, that is $= 1 = \frac{1}{3} \frac{c}{4}x$, and $x=\frac{1}{6}i^{2}a$, which is the Value of my Hazard;

wherefore his must be 300, and consequently my Chance to his is as 31 to 30.

In the Book above-mentioned, called The Laws of Chance, you will find the Advantages and Difadvantages of the several Chances at Hazard, Raffling, Whist, &c. this Way computed.

Proposition IX. Probl.

To find in any Number of Games the Value of the First.

Suppose A and B play so that he that wins the first 9 Games shall have the Stakes, and A hath won one of the 9 already; if they leave off, how much of B's Money is due to A.

To find this, take the first 8 even Numbers, 2, 4, 6, 8, 10, 12, 14, 16, and multiply them continually, that is, the first by the second, and then the Product arising thence multiply by the third, &c. Take also the first 8 odd Numbers, and do so by them. The Product of the even Numbers will be a Denominator, and that of the odd ones a Numerator of a Fraction; which Fraction will express the Quantity of B's Money due to A on his winning the first of the 9 Games.

Suppose only 4 Games up, of which A is one: Take the three first even Numbers, as 2, 4, 6, and multiply them continually, they will make 48; the three first Numbers 1, 3, 5, so multiply'd make 15: Therefore there is due in this Case to A, 15, or 15 of B's Money; wherefore, if each had staked 16 Shillings, there would be a Crown due to A besides his own Stake of 16 Shillings.

Proposition X. Probl.

To find the Value of his Hazard who undertakes at the First Throw to cast Doublets with any assigned Number of Dice.

In two Dice, 'tis plain, that to avoid Doublets,' every one of the Six different Throws of the first Dye, can only be combined with Five of the Second; because one of the Six is of the same kind, and therefore will make Doublets.

For the same Reason, the 30 Throws of 2 Dice which are not Doublets, can only be combined with four Throws of a third Dye, and with but 3 Throws of a fourth Dye.

Wherefore in General this will be the Series. 6×5×4×3×2×1×0, &c. 6x6x6x6x6x6x6, &c.

The Under Series is the Summ of all the Chances; and the Upper, the Number of Changes against him who underrakes to throw Doublets.

Each Series must be continued to so many Terms, as are the Number of Dice. V. gr. If one should undertake to throw Doublets, the first Throw with four Dice, his Adversary's Hazard is $\frac{5\times5\times4\times3}{6\times6\times6\times6} = \frac{360}{1296} = \frac{5}{18}$, and he hath $\frac{1}{12}$: So that 'tis 13 to 5 that he throws Doublets the first time with 4 Dice.

In

In Seven Dice, 'tis easie to see the Chances against the Undertaker are nothing, because then there must necessarily be Doublets.

Proposition XI.

If I have p Chances for a; q Chances for b; and r Chances for c: I say, my Expectation is worth ap+bq-tcr $\frac{1}{p+q+r}$, that is, in Numbers, suppofing p=2. a=3. q=4. 5=b. 1=r. c=9; the Value of my Hazard is $\frac{2\times 3+4\times 5+1\times 9}{7}=5$. For call my Expectation x, then x must be such, having it, I am able to purchase as good a Hazard again, in a just and equal Game. Suppose the Law of the Play were this, that I playing with fo many others, as with my felf, make up the Number p+q+t; with as many of them as the Number p represents, I make this Bargain, that whoever wins shall give me a, and I will do so to each if I win: With those represented by the Number q, I bargain to have b if any of them win, and to give b to each of them if I win my felf; and with the rest of the Players, whose Number is r--1, I agree to give or to receive c after the same Manner. Now all being in an equal Probability to gain, I have p Chances to get a, q Chances for b, and r—1 Chances to get c, and one Chance, i. e. when I win my felf, to get px+qx+tx-ap-bq-rc+c. which if it be supposed as a Chances of a Chances equal to c then I have p Chances for a, q Chances for b, and r Chances for c (for just now I had r-1 Chances for it) therefore if px + qx - rx - ap - bqap+bq+cr as it ought -rc+c=c: Then is x: to be.

By this Theorem all the Chances at Hazzard may easily be calculated. Vid. Laws of Chance, p. 87.

PLEAS of the Sword. Placita ad Gladium. In 2 H. 3. Ranulph the 3d. Earl of Chefter granted to his Barons of Cheftire an ample Charter of Liberties; Exceptis Placitis ad Gladium suum pertinentibus. The Reason of which was, that William the Conqueror gave the Earldom of Chester to his Kinsman Hugh (commonly called Eupus) Ancestor to this Earl Ranulph, Tenere ita Libere per Gladium, sicut ipse Rex Willbelmus tenuit Angliam per Coronam. And consonant hereunto, in all Indictments for Felony, Murder, &c. in that Conty Palatine, the Form was anciently, Contra Pacem Domini Comitis, Gladium & Dignitates suas.

PLEBANIA, Ecclefia plebanianis, is a Mother-Church which hath one or more subordinate Cha-

pels.

PLEBANUS, was sometimes the Title of a Rural Dean, because the Deanaries were formerly affixed to the Plebanie, or chief Morber Churches within such a District, which at first was usually Ten Parishes: Sometimes it seems to have been used for a Parish-Priest of such a large Mother-Church as was exempt from the Jurisdiction of the Ordinary, and therefore he had the Authority of a Rural Dean committed to him by the Archbishop, to whom the Church was immediately subjects:

PLEBISCITUM, in the Roman Law, was whatever was enacted by the Common People, at the Request of the Tribune, or some other plebeian Magistrate.

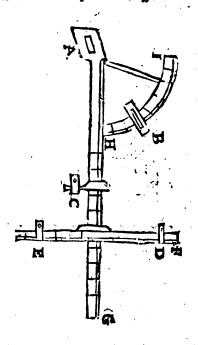

PLEURA, is a double Membrane, which covers all the inward Cavity of the Thorax; it arises from the Versebra of the Back, and ascends on each fide upon the Ribs, to the middle of the Sternum. It is fixed to the Periosteum of the Ribs, and to the internal intercostal Muscles, and it covers the Midriff. Its Side towards the Cavity is smooth and equal, but that which is fixed to the

Ribs is rough.

PLOW, an ancient Instrument, tho' now not much used at Sea, mentioned in the former Volume; and its Description is thus given by Sir 30-

nas Moor in his Navigation.

There is first, a Staff, as A L G, on which a small Arch, as H I, and a Cross, as E F, are fitted together with three Vanes, as A an Horizontal Vane, B a Shade Vane, and C a Sight Vane, which is moveable upon the Staff.

In order to make an Observation of the Sun's Altitude with this Instrument, you must fit on the Horizon-Vane, and then you may place the Shade Vane to any Degree of Altitude in the Divisions of the Arch, so it exceed not the Altitude to be observed, nor be above 10 Degrees (which a little Practice will soon enable you to guess readily at :) for in both these Cases the Divisions on the Staff are descient. Then put on the Sight-Vane, hold up the Instrument, and turn the Back of the Arch to the Sun, and move the Sight-Vane on the Staff backwards and forwards, till the Shade of the upper Edge of the Shade-Vane sall on the upper part of the Slit of the Horizon-Vane; and that at the same time, looking thro the Sight-Vane, you can see the Horizon thro the Horizon-Vane; for then will the Summ of the Degrees on the Arch and on the Staff be the Altitude, allowing for the Height above the Horizon and for Refraction, For the Height above the Horizon they usually allow 6 or 8 Inches.

PLOW-Land, Carucata, was formerly as much arable Land as one Plow could plough up in one R r r z

This in the Beginning of the Reign of Rich. I. was accounted at 60 Acres; and in the 9th of Rich. I. 100 Acres is allowed for a Plow-Land. And this Measure was very different ac-

cording to Time and Place.
PNEUMATICAL Experiments, are such as are made in the exhausted Receiver of the Air Pump, in order to discover the several Properties of the Air and its Influence on other Bodies. Of these you may find great Variety in Mr. Boyle's Works, and in the Philosophical Transactions; and those made with great Accuracy and Care.
PNEUMONICA Vena. See Vena Pneumonica,

POCKET of Wooll, is the Quantity of half a

Sack. 3 Instit. Fol. 96.
POINTS of the Compass. See Compass and

POLEINE, was a kind of Shoe with a picked Point turned up at the Toe: These first came into Fashion in the Reign of William Rufus, and by degrees came to be of that excessive Length, that in Richard the Second's Time, they were ty'd up to the Knees with Silver or Gold Chains, according to the Dignity of the Wearer. They were forbidden by Edward the Fourth, in the fifth Year of his Reign, under a great Penalty, to be worn so very long; but they were not quite disu-fed till the Reign of Henry the Eighth.

POLITICAL Arithmetick, is the Application of Arithmetical Calculations to the Extent and Value of Lands, Number of People, Publick Revenues, Taxes, Trade, Commerce, Manufactures, or whatever relates to the Power, Strength, Riches, &c. of any Nation or Common-wealth. Of this Nature several Discourses have been published; as Sir William Petty's Political Arithmetick, Grant's Observations on the Bills of Mortality; Capt. Haley's on those of Breslaw in Silefia; Dr. Davenane's Discourses of Trade, &c. From these kinds of Inquiries and Computations, Sir William Petty hath advanced, that the Land of Holland and Zealand is not above 1000000 of Acres, whereas that of France is above 80,000000, and yet those Places are near a third part as rich and as strong. That the Rents of Lands in Holland to those of Prairie, are about 7 or 8 to 1. That the People of Amsterdam are 3 of those of Paris, or London, which don't differ, he faith, a-Bove a 20th part from one another. That the Value of the Shipping of Europe is about 2 Millions of Tuns; of which the English have 500000, the Dutch 9000000, the French 1000000, the Hamburghers, Dunes, Swedes, and Dantzickers, have 2500000, and Spain, Purtugal, and Italy, &c. about as much. The Value of the Goods exported from France into all the Parts is supposed Officially to what is feely into Burgland alone Quadruple to what is fent into England alone, and confequently in all about 5000000. What is exported out of Holland into England, is worth 2000000; and what is exported thence into all the World, is 18000000. The Money yearly raifed by the French King (in Peace) is about 6. Millions Sterling; and all Holland and Zealand pay about 2100000 l. and all the Provinces together about 3000000. That the People of England are about 6000000; their Expence at 71. in Butter, Cheese, and Milk, he thinks, is about per Annum 2 Head, 42000000. The Rent of the 2,500000. The Value of the Wooll yearly shorn, Lands about 8 Millions, and the Profits of the about 2,000000: Of Horses yearly bred, about Personal Estate as much. The Profits of all the 250000. Of the Flesh yearly spent as Food, a-

Labour of the People 26000000. In Ireland the People amount to about 12 Hundred Thousand. The Corn spent in England, at 5 s. per Bushel Wheat, and half a Crown Barley, is worth Ten Millions per Annum. The Navy of England (then) required 36000 Men to man it; other Trade of Shipping about 48000 Men to manage it. In France, to manage the Shipping Trade, he reckons then but 15000 Men. The whole People of France he accounts about 13000000 and an half; and those of England, Scotland, and Ireland, all together, to be 9 Millions and an half. In the King of England's Dominions are about 20000 Church-men; and in France above 270000. In our whole Dominions above 40000 Seamen, in France not above 10000. In England, Scotland, and Ireland, and all other Dominions belonging to us, there was then about 60000 Tun of Shipping; which is worth about 4 Millions and a half of Money. The Sea-Line round England, Scotland and Ireland, and the adjacent Islands, is about 3800 Miles

In the whole World about 300,000000 of People, and not above 80 Millions with whom the English and Dutch have Commerce. The Value of the Commodities traded for in the whole, nor above 45000000. The Manufactures of England in the whole, exported from England, amount to about 5000000 per Ann. Lead, I'm, and Coals, 500000 l. per Ann. The Value of the French Commodities (then) brought into England, did not ex-ceed 1200000 l. per Ann. The whole Cash of England in current Money was then about 6000000 la and at 6000000 of Souls, allowing each to spend 7 l. per Ann. the whole Expence will be 420000000, that is, about 800000 l. a Week. The Rent of Houses in England was then about 4000000 l. per

Annum.

Dr. Davenant also in his Discourses on the publick Revenues and Balance of Trade of England, shews the great Use of Political Arithmetick in all the Considerations about the Revenues and the Management of our Trade; he gives some good Reasons why Sir William Petty's Number abovementioned are not entirely to be rely'd upon, and therefore advanced others of his own, which are founded upon and supported by the Observations of the ingenious and industrious Mr. Gregery King. Some of the Particulars of which, that are most useful, are these: That the Land of England is 39 Millions of Acres. The Number of People, according to this Account, is now an bout 5545000 Souls, they increasing about 9000, every Year, Allowances being made for Plagues, Sc. Wars, Shipping, and the Plantations. The People of London he reckons at 530000. Those People of Landon he reckons at 530000. in the other Cities and Market Towns in England, at 870,000, and those in the Villages and Hamlets at 4100000. The yearly Rent-of the Land he accounts to be 10,000000. That of the Houses and Buildings:2,000000 l. per Ann. The Produce of all kinds of Grain he reckons to be worth 9,075000 l; in a Year of moderate Plenty. The Rent of the Corn Land annually 2,000000 l. and the neat Produce above 9,000000. The Rent of the Pasture Meadows, Woods, Forests, Commons, Heaths, &c. 7,000000. The Annual Produce by Cattle,

bout 3,350000. Of the Tallow and Hides about 600000. Of the Hay yearly confumed by Horfes, about 1,300000; of Hay confumed by other Cattle, 1,000000.

Of the Timber yearly felled for Building 500000 l. Of the Wood yearly spent in Firing. &c. about 500,000 l. The Land of England to its Inhabitants is now about 7. Acres per Head. The Value of the Wheat, Rye and Barley necessary for the Sustenance of England amounts to at least 6,000000 of Pounds Sterling per An. The Value of the Woollen Manufacture made here The is about 8,000000 l. per Ann. and our Exports of all Finds of the Wollen Manufacture do amount to above 2,000000 l. per An. The annual Income of England on which the whole People live and subsist, and out of which Taxes of all kinds are paid, is now fince the War about 43,000000l. That of France 81,000000, and that of Holland 18,250000 l. &c,

The Ingenious Capt. Halley, Geometry Profesfor in Oxon, hath made a very exact Estimate of the Degrees of the Mortality of Mankind, drawn from curious Tables of the Births and Burials at the City of Breslaw, the Capital of Silesia, with an Attempt to ascertain the Price of Annuities upon Lives from thence. This is Published in Philos. Trans. N. And in the Miscellanea Curiofa, Vol. I. From a Table which he hath there calculated he derives the following Uses. 1. To find the Proportion of Men able to bear Arms in any Multitude; which he reckons from 18 to 56 Years old; and accounts about 2 of the whole. 2. To shew the differing Degrees of Mortality (or rather of Vitality) in all Ages; by which Means he finds the Odds there is, that any Person of any Age dorh not die in a Year's Time, or before he attain such an Age. 3. Toshew at what Number of Years, itis an even Lay that a Person of any Age shall die ; and finds for Instance, that in an even Lay, that a Man of 30 Years of Age lives between 27 and 28 Years 4. To regulate the Price of Infurance upon Lives: And, 5. The Valuation of Annuities on Lives. 6. How to value two or three Lives after the same Manner. from the whole he makes two very good Observations. 1. How unjustly we complain of the Shortness of our Lives, for it appears, one Half of those that are born don't live above 17 Years. 2. That the Growth and Increase of Mankind is not so much stinted by any Thing in the Nature of the Species, as it is from the curious Difficulty most People make of venturing on the State of Marriage. And therefore Celibacy ought to be every Way discouraged by all wife Governments; and those who have numerous Families of Children, to be countenanced and encouraged by good Laws, (i. e.) such as the Jus Trium Liberorum, among the Romans, &c. See on this Subject also Grant's Observations on the Bills of Mortality; who reckons that there are 39000 fquare Miles of Land in England.

That in England and Wales there are 460000

That the People of London are about 640000; one fourteenth of the People of England.

That England and Wales are about 10,000 Parishes.

In Dublin (then) 30000 People.

That there are 25 Millions of Acres in England and Wales, viz. about 4 Acres to every Head.

That but 64 out of 100 of the Children born are living at 6 Years old.

That but 40 of 100 are alive at 16 Years End. But 25 out of 100 at 26 Years End. But 16 out of 100 at 36 Years End. But 6 out of 100 at 46 Years End. But 6 out of 100 at 56 Years End. But 3 out of 100 at 60 Years End. But I out of 100 at 76 Years End. That London doubles itself in about 64 Years.

Sir William Petty also in his Discourse about Duplicate Proportion, tells us, that 'tis found by Experience, That there are more Persons living between 16 and 26 than of any other Age : And laying down that as a Supposition: He infers, That the Square Roots of every Number of Mens Ages under 16, (whose Root is 4) shews the Proportion of the Probability of such Person's reaching the Age of 70 Years. v. gr. Tis 4 Times more likely that one of 16 Years of Age lives to be 70, than a Child of 1 Year old. Tis thrice as probable, That one of 9 Years lives to 70, as such a new-born Child,

That the Odds is 5 to 4, that one of 25 dies be-

fore one of 16 Years

That tis, 6 to 5 (still as the Square Roots of the Ages) that one of 36 Years old dies before one of but 25 Years of Age. And so on according to any declining Age to 70; compared with 4.6: Which is nearly the Root of 21, the Law Age.

The above-mentioned Mr. Halley, in his Observations on the Breslaw Bills of Mortality, saith; That 'tis 80 to 1, a Person of 25 Years of Age doth not die in a Year.

That 'tis 5 ½ to one, a Man of 40 lives 7 Years ; and that one of 30 may reasonably expect to live

27 or 28 Years.

And so great a Difference is there between the Life of Man at different Ages; that tis 100 to 1, one of 20 lives out a Year; and but 38 to 1, that one of 50 doth so. Whence, and from some other Observations, with great Pains he computed the following Table, shewing the Value of Annuities for every 5th Year of Life to the 70th.

A Table of the Value of Annuities

Age.	Years P	urchafe.
5	13	. 28 ⁻ . 40 · 44
15	13	· 33 · 78
25 30 35 40 45	12 11 11 10	27 72 12 57 91
50 55 60 65 70	9 · 8 · 7 · 6 ·	21 51 60 54 32

POLLARDS

POLLARDS, were formerly a kind of Spurious Com used in England, but these, as also Cro-tards, Staldings, Eagles, Leaonies, and Steepings have been long fince disused. See Matt. West. in Anno. 1299. p. 413. 2 Inft. fol. 577. and Plowden,

fol. 469.

PONTON: The late invented Ponton is a Boat of Tin or rather Latten, eight Yards long and two broad, having a large Ring at each Corner: When the Army marches it is laid on a Carriage, and drawn by five Horses. Each Boat hath an Anchor, and Cable, and Baulks, and Chefis belonging to it, The Baulks are seven Yards long and about five or fix Inches square: The Chefts are Boards joined together by Wooden Bars about a Yard broad and full there are given when these Pontons are to be used, they are slipp'd into the Water, and placed about two Yards asunder, having a strong Rope running through the Rings, which is fastened on each Side the River you would pass over, to a Tree, Stake, &c. The Baulks or Beams are laid across the Boats at a due Distance, and the Chests upon them; and these are joined close to make a Bridge, over which Foot, Horse, and even a Train of Artille-

ry may pass.
PORES. Sir If. Newton in his Opticks shews, that Bodies are much more rare and porous than is commonly believed. Water is 19 times lighter and consequently rarer than Gold; and Gold is so rare as very readily and without the last Opposition to transmit the Magnetick Effluvia, and easily to admit Quick-silver into its Pores, and to let Water pass through it; for a Concave Sphere of Gold hath, when filled with Water and solder'd up, upon pressing with great Force, let the Water squeeze through it, and stand all over its outfide in multitudes of small Drops like Dew, without bursting or cracking the Gold, as he was informed by an Eye-witness. Whence we may conclude, that Gold bath more Pores than folid Pares, and by Consequence, that Water hath above 40 Times more Pores than Parts. And he that shall find out an Hypothesis to solve how Water can be thus rare, and yet not be capable of Compression by Force, may doubtless by the same Hypothesis make Gold and Water, and all other Bodies, as

much rarer as he pleases.

So that Light may find a ready Passage thro' transparent Substances, there being open and free Space sufficient for such a Passage. We find that the Magnet transmits its Vertue without any senfible Diminution or Alteration, through all cold Bodies that are not Magnetick, as Gold, Silver, Brass, Glass, Water, &c. The gravitating Power of the Sun (if you will explain it Mechanically) is transmitted entire through all the vast Planetary Bodies, so that with an equable Force it acts thro' all their Parts, even to their very Centres; i.e. according to the Quantity of Matter in each Part. The Rays of Light, let'em be either Bodies actually coming to us from the Sun, or only Motions or Impressions upon the Medium, move in Right-Lines, and are hardly ever, unless by great Chance, reflected back again in the same Right-Line after their Impingence on Objects; and yet we see that Light is transmitted to the greatest Distances thro Pellucid Bodies, and that in Right-Lines. Now how Bodies should have Pores sufficient for these

of all Bodies arise from their Particles being of fuch a determinate Size or Magnitude: (See Cotours.) Wherefore if we conceive those Particles to be so disposed, as that there is as much of Porosity or Space interspersed between them as the Quantity of these Particles amounts to. And in like Manner, if you suppose these Particles to be composed of others much less, and that these have as much interspersed Vacuity as their Quantity amounts to; and so on till at last you come to solid Particles without any Pores: Then if in any Body there be 3 (for Instance) of these Sizes of Particles, and that the last be of the folid or least Sort; that Body will have 7 Times as much Vacuity as Solid Matter. If you suppose 4 such Degrees or Sizes of Particles, and that the last and least be solid; the Body will have 15 Times as much Pores as Solidity. If you imagine any Body to have 5 such Degrees or Sizes of Particles, it will have 31 Times as much Space as Solidity interspersed: And if it have 6 such Sizes of Particles as before, it will have 63 Times as much Vacuity as Solid Matter, and fo on. And perhaps in the wonderful Confirmation and Fabrick of Natural Bodies there may be other Proportions of Space to Matter to us wholly unknown, whence tis pofsible there may be yet far greater Quantities of Va-cuity interspersed in Bodies.

PORTA or Vena Porta: Dt. Keil in Animal Secretion, p. 36, 37, &c. thinks that he hath found out the true Use of this Vein, (of which you have a large Description in Vol. I. under Vena Porta) which is, that the Bile being to be mixed with the Chyle as it comes out of the Stomach into the Duo. denum, could no where be so conveniently secerned from the Blood, as where the Liver is placed: But if all the Branches of the Caliack Artery carried all the Blood to the Liver, from which the Gall was to be separated; it is evident, considering the nearness of the Liver to the Heart, and the intestine Motion of the Blood, that so viscid a Secretion as the Gall is, could never have been formed in the Blood, and confequently could never have been secreted by any Gland in that Place. In this Case Nature is forced to alter her constant Method of sending the Blood to all the Parts of the Body by the Arteries. Here she forms a Vein, (which is no Branch of the Cava, as all the others are) and by it she sends the Blood from the Branches of the Mesenterick and Cæliack Arteries, (after it hath passed thro' all the Intestines, Stomach, Spleen, Call, and Pancreas) to the Liver. By this extraordinary Contrivance the Blood is brought a great way about before it arrives at the Liver; and its Celerity is extremely diminished; so that all the Corpuscles which are to form the Bile, may have sufficient Time to attract one another, and unite before they come to the secerning Vessel.
And thus, saith he, have we found out the true
Use of the Porta; which he confirms afterwards,
by shewing what Nature doth further in Prosecution of the same Design; in increasing the Cavities of all the Arteries as they divide, and that as the Trunk of the Mesenterick Artery bears a lesser Proportion to its Branches than the Aorea does to its Branches; so the Branches of the Mesentericke Artery are likewise less in Proportion to their Conjugate Veins than the Aorta is to the Vena Cavd. Essects is hard to conceive, but yet not impossible. The descending Trunk of the Aorta below the E-For Sir Is. Newton hath shewn, That the Colours mulgents is to the Vena Cava at the same Place,

as 324 1s to 441. But a Branch of the Mesenterick Artery is to its corresponding Branch of the Porta as 9 to 25: And therefore the Blood in the Branches of the Porta moves above 177 Times Slower than it does in the Trunk of the Mesenterick Artery, and then only upon the Account of the Increase of the Diameters of the Vessels. So necessary is it to abate the Rapid Intestine Motion of the Blood, which would otherwise hinder the Coalescence of the Particles for the Formation of the Ball,

PORTABLE Barometer. See Barometer,

PORTFIRE, is a Composition of Meal, Powder, Sulphur and Salt-Petre drove into a Case of Paper, but not very hard; 'tis about 9 or to Inches long, and is used to fire Guns and Mor-

tars instead of Match.

PORTREVE, is the Title for the Chief Magistrate in some Sea-Coast Towns: And Cambden in his Bris. faith, the Chief Magistrate of London was so called in William the Conqueror's Time, as appears by a Charter of his to this City. In Richard the First's Time, the City was governed by two Bailiss appointed by the King; but presently after King John granted them a Mayor for their yearly Magistrate.

PORTIFORIUM, was formerly an Enfign or Banner, which was provided in all Cathedral and most Parochial Churches, to be solemnly carried

in the Front of any Procession.

PORTMANNIMOTE, sometimes hath been nsed for Portmote, which see

PORTMOTE, is a Convention or Meeting of the Inhabitants of a Port or Burgh, in which some Customary Duties were anciently paid to the Lord of the Fee.

PORT-NAILS, are such Nails as are used to

fasten the Hinges to the Ports of Ships.

PORTOISE, aboard a Ship, is the same with Portlast, or the Gunwale; and as they say the Yard is down a Portlast, when it lies down on the Deck, so for a Ship to ride a Portoise, is to ride with her Tards a Portlast, or struck down on the Deck.

PORTRAITS, is the Painters Word for Pictures of Men and Women (either Heads, or greater Lengths) drawn from the Life; and the Word is used to distinguish this kind of Face-Painting (as it is often called) from History-Painting.

PORTSOKNE, the Soke or Liberties of any Port; i. e. City or Town.
POST, in the Art Military, is used for any sort of Ground or Place, whether fortified or not, where aBody of Men can make aStand, fortify themselves, or be in a Condition to fight an Enemy; and therefore they say the Post was relieved, the Post was quitted, the Post was taken Sword in Hand, Sc. A Spot of Ground seized by a Party to secure the Front of an Army and to cover the Posts that are behind, they call an Advanced Post: And the Advance Guard or the Right of the 2 Lines of an Arniy, &c. they call the Post of Honour.

POSTNATI, are such as were born in Scotland after the Descent of that Crown to K. James 1. And it was resolved in the 7th Year of that King's Reign by all the Judges, that such Persons are no Aliens in England. But the Ante-Nati or such as were born in Scotland before that Time, were

Aliens as to the Time of their Birth.

POUND, Libra, contains 12 Ounces; and tho' now it fignify 20 s. when applied to Money, which is but the 3d part of a Pound in Weight, yet it is

because 20 s. did heretofore (with us) weigh a full PoundTroy or 12 Ounces, each of these Ounces contained so many Solidi or Shillings, and so many Denarii or Pence, as they who govern'd the Money Matters thought fit, sometimes more, sometimes fewer. The old Saxon Pound did contain 48 Shillings, and each Shilling contained 5 d. so that the Libra Anglo-Saxonica contained 240 d. When the Pound was reduced tis hard to tell exactly, but in W.the Conqueror's time it contained 20s. sometimes the Pound was composed of 12 Ounces or Orx, and then the Ora was 20 d. and sometimes of 15 Ounces or Ora, and then the Ora was 16d. But tho' either of these may be taken for the Shilling, yet generally it was 20 d. and this was the Value of the Ounce in the Libra Denariorum and the Libra Sterlingorum, which are the same. See Chro. Presciosum.

POWER of the County, See Posse Comitatus in

Vol. 1.

POWERS Mechanick, of these there are 5 usually accounted, the Lever, the Balance, the Wedge, or inclined Plane, Screen and the Pulley. About these Powers (the Nature of which you will see under those Words, or the Latin Names) there are some Universal Laws agreed on, which it would be well for Mechanicks, Engine-Makers, &c. to have in Readiness in their Minds, lest some such impossible Whims as the Perpetual Motion, &c. should get Possession of their Heads.

RULE I.

The Moving Forces or Powers are to the Weight to be moved, reciprocally, as the Space passed by the Weight, is to that passed by the Power.

Thus in the Windlace Axis in Peritrochio, &c. the Circle or Part of fuch a Periphery, which the Power moves, is to the Periphery of the Axis of the Cy-linder reciprocally as the Weight to the Power.

And in Pulleys tis plain that the Ropes are shortened in Proportion to the Elevation of the Weights.

RULE II.

The Power or moving Force, and the Weight are reciprocally proportional to their Velocities.

RULE III.

The same Force which can lift (ex. gr.) 100 lb. the height of 2 Feet; will raise 200 lb. the height but of one Foot,

PRAGMATICK Sandion, is a Term in the Civil Law for a Letter written to a Corporation, or any Publick Body, by the Emperour, in answer to their Request to enquire or know the Law of him. But if this Letter be sent only to particular Persons who have consulted him in the like Case,

tis called a Rescript.
PRÆAMBLE, Proæmium, in the Law-sense, is the Beginning of an Act of Parliament, &c. and as it were a Key, to open the Intent of the Makers of the Acts, and the Mischies design'd to be pre-

vented or remedied by the same.

PREBEND. See Prebend, in Vol. 1. PREMUNIENTES, are Writs sent to every particular Bishop to come to Parliament, Pramunientes, or warning him to bring with him the Deans and Arch-Deacons within his Diocess, one Proctor for each Chapter, and two for the Clergy of his Diocess. PRE:

PRECARIA, the same which Bedrep, Binddagg or bidendag, a days Work; which the Tenants of some Manners are bound by their Tenure to do for their Lord in Harvest: See the great Book of the Customs of the Abbey of Battel, Tit. Apeldarbam. fol. 60.

PRECEPTORIE, or Commanderie. As the larger Monasteries had formerly their remote Country Cells which were Subordinate to the Motherhouse of Religion; so the Knights Templars and Hospitalars sent part of their Fraternity to some country Cell, which was govern'd by a Person whom they called a Praceptor or Commander: And thence the Place was called a Praceptorie or Commandrie: and all these were Subject to the Prime Body, who had their Principal Seats in London. Kennet's Paroch. Antiqu. Sixteen of these Præceptories we have the Names of; viz. Creffing Temple, Balshall, Shengay, Newland, Yevely, Wicham, Temple-Brue, Wallington, Rothely, Ovennington, Temple-Combe, Trebigh, Ribstan, Mount St. John, Temple-New Sum, and Temple-Church.

PRECIPE quod Reddat, is a Writ of a great Diversity-both in its form and use: For which See Ingressus and Entry. This form is extended as well to a Writ of Right as to other Writs of Entry or Possession. Tis called sometimes a Writ of Right

Close as a

PRECIPE in Capite, where it issueth for the Tenants holding of the King in Chief as of his Crown, and not of him, as of any Honour, Castle or Mannor. Sometimes also 'ris called a Writ of Right Patent, as when it issues out of the Chancery Patent; i.e. open to any Lords Court for any of his Tenants deforc'd against the Deforcer, and must be determined there.

PRECONTRACT, is a Contract (usually understood of Marriage) which was made before a-nother Contract, and consequently as far as 'tis contrary to and inconfistent with, annuls the latter.

PRE-EMPTION, was formerly allowed to the Crowns Purveyor, to have the first buying of all Corn, other Provisions, &c. before others. See 12 Car. c. 24

paid on Suing out the Writ of Covenant.

PREMUNIRE. See PRÆMUNIRE.

PREPOSITUS Viue, some will have to be the Constable of a Town, or Petit Constable. Tisalso sometimes used for a Reeve: For others say in our Old Records, it fignifies the Reeve or Bailiff of the Lord of the Mannor who is sometimes called Serviens Ville. But by the Laws of K. Henry. I. the Lord answered for the Town where he was Resident: Where he was not present his Deputy or Seneschal was responsible if he were a Baron. But if neither of them could be present, then the Prapositus & quatuor de unaqua; villa, the Reeve and 4 of the most Substantial Inhabitants were

Summoned in.
PRESBYTERIUM, the Presbytery; The Choir or Chancel of a Church; so called because that Place was appropriated to the Bishops and Priests; and other Clergy, while the Laity were confined to the Nave and Body of the Church, Cowel's In-

PRESIDENT, in a Legal Sense, is the Crowns Lieutenant in a Province or Function: As the president of Wales, York, Berwick; of the King's Council, &c.

PRESSURE; by this Word some Philosophers,

addicted to the Cartelian Hypothelis, mean a kind of Motion which is impressed upon and propagated through a Fluid Medium. And by this they would explain all the Phænomena of Light and Colours, as well as of many other Effects; by certain new Modifications which do there happen to the Rays of Light, as they are usually called. But as our Excellent Sir If. Newton shews, (p. 307 of the Latin Edition of his Opticks) this is a Mistake.

For if Light (for Instance) consisted only in Pressure, propagated without Actual Motion, it could not therefore agitate and warm such Bodies as Reflect and Refract it: And if it consisted in an Instantaneous Motion, or one propagated to all Distances in an Instant; as some have advanced; there would be required an Infinite vis or Force, to produce that Motion, every Moment, in every Lucent Particle. And if Light confifted either in Pressure, or in Motion propagated in a Fluid Medium, whether instantaneously or in Time, it must from thence come to pass, that it should inflect itself in umbram. For Pressure or Motion in a Fluid Medium cannot be propagated in Right Lines, beyond any Obstacle which shall hinder any Part of the Motion; but will inflect and diffuse it self every Way into those Parts of the Quiescent Medium which lie beyond the said Obstacle.

Thus the Force of Gravity tends downward, but the Pressure, which arises from that Force of Gravity tends every Way with an Equable Force: And with equal Ease and Force, is propagated in Crooked Lines as in Straight. Waves on the Surface of Water while they slide by the Sides of any Large Obstacle, do inflect, dilate and diffuse themselves by Degrees, into the Quiescent Water lying beyond the Obstacle. The Waves, Pulses, or Vibrations of our Air in which Sounds confift, do manifestly inflect themselves, tho' not so much as the Waves of Water; for the Sound of a Bell or of a Cannon. can be heard over a Hill, which intercepts the Sonorous Object from our Sight: And Sounds will be propagated as easily thro' Crooked Tubes, as thro'. Straight: But Light is never observed to go in Curve Lines nor to inslect it self in Umbram. For PRE-FINE, (in Law) is that Fine which is the fixed Stars do immediately disappear on the Interpolition of any of the Planets, as well as some Parts of the Suns Body, by the Interposition of the Moon, Venus or Mercury.

PREST Money, from the French Prest, ready; is Money given to Soldiers when they are Prest: And binds such as receive it to be ready at Com-

mand at all Times appointed by their Officers.

PREST Sail: A Ship at Sea is faid to carry a Prest Sail, when she carries all that she can possibly Croud: Which is sometimes done in giving Chase to an Enemy: But 'tis a dangerous Experiment and ought not to be tryed often, lest a Ship should over-set, or bring her Masts by the Board, in which latter Case she will become a Prey to the Enemy

PRESTATION Money, was according to some, a Sum of Money paid by the Arch-Deacons to the Bishops annually pro Exteriori Jurisdictione:. But others say it was a Subsidium Charitativum, which in reasonable Causes a Bishop might require

of his Clergy

PRETENSED Right or Title: Jus Pratensum; where one is in Possession of Lands or Tenements, and another who is out, claims it and sues for it. Here the Pretensed Right or Title, is said to be in: him who doth thus Claim or Sue.

PREVA-

where an Informer colludes with the Defendant,

and so makes only a seigned Prosecution.

PREVENTER Rope, in a Ship, is a small Rope used to secure the Ties, so that if one Part should break, the other may not run thro' the Ram-head.

See Ropes in Vol. I.
PRICK-Posts, in a Building, are such as are framed into the Breast-Summers between the principal Posts for strengthning the Carcale of the

PRIDIAL Services. See Services.

PRIMAGE, is a Duty due to the Mariners and Sailors for the loading of any Ship at the letting forth from any Haven. Anno 32. H. 8. c. 14. which in some Places is a Penny in the Pound: In others Sixpence for every Pack or Bayl, &c. according to the Custom of the Place.

PRIMES, are the first larger Divisions of the fingle Number on Gunter's Line of Proportion, whose next Subdivisions are called Tenths, &c.

See Line of Proportion.
PRIMÆ VIÆ. See Viæ Primæ.

PRIMITIÆ, First-Fruits: In our Law, the Profits, after Avoidance, of every spiritual Living as rated in the King's Books, for one Year,

PRINCIPAL Posts, in any wooden Building, are the Corner Posts, which are tennanted into the Ground Plates below, and the raising Plates above,

i. e. into the Beams of the Roof.
PRINTING. There is a Dispute between the Towns of Harlem in Holland, and Mentz in Germany, about the Invention of this noble Art.

The Harlemers say, that Laurenzs Janzs Koster of Harlem, was the first Inventer of Printing, A. D. 1430. But that at first he used only wooden Blocks or Plates, (like those used in China and some other Eastern Countries, where that kind of Printing hath been much longer in Use, and perhaps gave the first Hint to our Manner of Printing now in Use;) tho after some Time he lest those off, and cut single Letters in Steel, which he sunk into Copper Matrices, and fitting them into Iron Molds, cast single Letters of Metal in these Matrices.

They say also, that his Companion 3chn Guttenburgh Role his Tools away while he was at Church, and with them went to Mentz in Germany; where setting his stolen Instruments to work, he claim'd the first Invention of this Art before Koster did his.

To prove this, they say that one Rabbi Joseph, a Jew, in his Chronicle, mentions a printed Book that he saw at Venice in the Year 5288, according to the Jewish Account, and of ours, 1428, as may

be feen in Pet. Scriverius.

But notwithstanding all this, and also what they say further of a Book entituled De Spiegel, which they shew printed at Harlem in Dutch and Latin, tho without Date; but they pretend it to be the first that ever was printed: Notwithstanding this, says Moxon, Guttenburgh of Mentz is more generally taken for the Inventer of Printing, than Koster of Harlem.

Dr. Wallis saith, this Are was first invented about the Year 1450, and was practifed in Germany immediately, but whether first at Mentz or Harlem, he determines not. He saith the Book which bears the Repute of being the first that ever was printed, is Tully's Offices; which was printed in the Year 1465 or 1466; for the Copy of it in the Bodleian Library in Oxon, difagrees a Year with that in the

PREVARICATION, In the Civil Law, is the Bodleian Library, is a Note written which mentions one Johannes Faustus, as Coadjutor to Guttenburgh, as also Peter Scheffer, on the same-Account ; and this Scheffer, Job. Arnoldus in Libello de Chalcographia Inventione, makes the Inven-ter of the Matrices. These three work'd together a while, and then parted.

There is also another Note written in a later.

Hand, in the said Look, which refers the first Inven-Year above-mentioned by Dr. Wallis, viz. 1460.

Next to these two Places of Ment? and Harlem,

it seems to have been practifed first ar our Univerfity of Oxon in England: For K. H. 6, and Thomas-Bouchier, then A. B. of Canterbury, fent Wm. Turner, Master of the Robe, and Wm. Caxton, Merchant of London, over to Harlem to learn this Art. who privately prevailed with one Frederic Corfeles, (an Under Workman) for a Sum of Money to come over hither; who did so, and at Oxford set up the Art of Printing, before it was used any where else, except in Mentz and Harlem. And there is a Treatise, said to be of S. Ferom, (because found in his Works) but in Reality of Ruffinus on the Creed, printed at Oxon in a broad Octavo, in the Year 1468, which is but 3 Years after the Edition of Tully's Offices at Menez; and perhaps is one of the first Books printed on Paper, for that of Tully was on Vellum. Soon after this, Caxton (who first brought ir, as is supposed, to Oxford) promoted it to London; which Baker in his Chronicle saith was about 1471: But Moxon in his Art of Printing saith, he had not seen any Books printed at London before 1480; about which Time ir was received in Italy, Germany, Gc.

In Philof. Transactions, N. 288, and 310, there is this further Account of the Rife and Progress of

the Art of Printing.

Boxhornius Schrevelius, and other Authors fay, That Koster could not, nor did he in Fact print so large a Book as the Speculum Salutis, without gradual Improvements; and his first Essays were on small and loose Leaves of Paper before he attempted whole Books.

In the Bodleian Library at Oxford, are two Books, and in that of Bennes Coll. in Cambridge is another very ancient printed Book, printed only on one Side of the Paper; the whole wrought, or cast on Wood, nor set or composed with Printing Letter, and printed with Writing-Ink; which do sufficiently shew that they were done when this Art was in its Infancy, and are very probably the Work of Koster; but they are without Date or Printer's Name.

Koster had an Assistant whose Name was John Fust, or as some write him Faust or Faustus; from whom he took an Oath of Secrecy, as Schrevelius rells us, but Fust ran away with Kofter's Tools and Materials, and in some time fet up a Printing- Press at Ment 7. where he was affifted by his Servant John Scheffer, a young Man of a good Genius, and who after-wards married his Daughter, and became his Part-They rell a Story also of Fust's going to Paris, but whether before or after he settled at Menez, is uncertain, and offering there a great number of printed Bibles to Sale, as if they were Manuscripts: But the French considering the Number of these Books, and their exact Conformity one to another throughout the whole, to a Line, a Word, a Letter, nay even to a Point, and that the best of Book-wri-Library of C. C. College there. In that Book in rers could not be thus exact, forc'd the Secret out of Vol. II.

S f f him.

him, by either actually indicting him for a Magician, or threatning him at least so to do; and this 'tis said gave Rise to the Story of Dr. Fau-

And 'tis probable about this Time many printed Books were fold up and down for Manuscripes.

Tis not certain in what Year Fust and Scheffer began first to work at Menez. But Schrevelius saith, Faustus (as he calls him) printed Alexandri Doctrinale eum Petri Hispani Tractatibus, A. D. And Lamberius in Comment. de Biblioth. Caf. Lib. 2. p. 988. saith, that he brought from Inspruck to the Imperial Library at Vienna, 2 Psalser printed on Parchment by Fust and Scheffer, 1457. And soon after this Date many Books were printed, which are still in Being: as the Durandus in the Library of Basil, printed 1458. Johannis Johannensis Catholicon, in his Majesty's Library, printed 1460. The Latin Bible of 1462 in the French King's Library, all before the Tully's Offices abovementioned; which was not printed till 1465 or 1466. The first Book printed here in England, was the Ruffinus, printed at Oxford 1468, as was faid before. But they practifed the Art earlier in other Countries; and in particular, it was used at Rome in the Palace of Maximi, A. D. 1455, by Conrad. Sweynheim, and Arnold Pannartz, both Germans, and who continued Printers there many Years after, as Martellinus in his Roma Sacra affirms.

Some think that Paper, (made of Linnen Rags) was first made at Basil, by some Greeks, who sled out of their Country after Constantinople was sackt, A. D. 1452; and this in Imitation of the Cotton Paper used in the Levant. Certain it is the Cotton Paper hath been of very ancient use in the East; there being in the Bodleian Library an Arabick Manuscript (among those the University bought of Dr. Huntingdon) written in the 427th year of the Hegira, which is A. D. 1049, on this Paper; and some there are without Dates, which seem older.
And as for the Linnen-Rag-Paper, it must be

much older than 1452; for in the Archives of the Library of the Dean and Chapter of Canterbury, there is an Inventory, on our Paper, of the Goods of Henry Prior of Christ's Church there, that is in the 20th Year of Edw. 3. which is A. D. 1346. and in the Cotton Library are several Writings, on our Pa-

per, as high at least as the 15th of Edw. 3.

Some think the Rolling-Press was invented by Lipsius; but there is a printed Book in the Bod-leian Library, (placed Laud. p. 138.) being a Misfale secundum usum Eccles. Herbipolensis, (i. e. Wurezburgh) in Germany. At the Beginning of this Book is an Instrument of Rodulfusthe A.B. of this Church, containing the Reasons of the Publication of this Missale, and instead of a Seal, there is annexed a Print engraven of the Arms of the See, &c. very finely done (for that Time, for twas before Durer) and on which are evident Marks of the Pressure by the Plate, with some Touches of Ink at the Edges, &c. which all that have seen it judge to be plain Marks of its being done or wrought off in a Rolling-Prefs. And there are sufficient Reasons to prove that this Book is as ancient as 1481.

Mr. Bagford thinks we had not the first Hint of Printing from the Chineles, of whom we had no Knowledge hardly, when this Art was invented:

to be, that Caids are as old as H. 6. nothing feems to give a better Hint to the Invention of Printing than Card-making, as is evident by the first Specimen of Printing at Harlem; and by those Books above-mentioned in the Bodleian Library, and

that of Bennet-College in Cambridge.

The cutting of the Molds or Blocks for making our Playing Cards, is after the same Manner as that of the old Books first printed at Harlem. They lay a Sheet of wet or moift Paper on the Form or Block, being first lightly brushed over with Inkmade of Lamp-Black mixt with Starch and Water. Then they rub it off with a round List with their Hand, which is done with great Expedition. They colour the Court Cards by the help of several Patterns or Stanefiles, as they call them; being Card-Paper cut thro' with a Penknise for every Colour, as Red, &c. (for at the first Printing, the Card hath only a meer Out-line.) These Patterns are painted with Oil-Colours to keep them from wearing out by the Brushes; for they lay it upon the Pi-Aure, and by sliding a Brush that is full and loose over the Pattern, it fixes the Colour into the cut Holes, and leaves it on the Print that is to be a Card; and so they go thro' with all the Colours on the Cards: This very probably was the Way of their first printing at Harlem, as might have been discovered before this, if they had consider'd that the Great Letters in our old MSS. (of 900 Years old) are done by the Illuminators, after this

of Card-making.

The next Form of Printing in Harlem was by cutting whole Forms in Wood from MSS. exactly written, and without Pictures. Such perhaps was the Donatus, which might bear Date about 1450; some say, 1440. This appears plain, saith Mr. Bagford, from Copy Books which we have seen printed at Rome, Venice, Switzerland, and England,

as high as 1500.

The third way of Printing was with fingle Types made of Wood; but who invented this is not known; it was at first esteemed so great a Rarity, that the Printers carried about their Lettets in Bags at their Backs, and got Money at great Mens Houses by printing the Names of the Family, Epitaphs, Songs, and other small Pamphlets.

The fourth Improvement of this noble Art was the Invention of Single Types made of Metal: which is owing to Peter Scheffer, above-mentioned, first Servant, and then Son-in-law to Faustus, who work'd at Mentz. Sometimes you have the Names of these two Men printed at the End of their Books, and sometimes not; sometimes with Dates as high as the Year 1457, and as low as 1490.

As for John Guttenburgh, who by many Authors is said to be the first Inventor of Printing, we cannot find one Book with his Name and Printing.

As the first Harlem Printing was only a Book with Pictures, and the Impression taken off with a List coiled up, as our Card-makers do now use; so when they came to use single Types, they made use of stronger Paper, with Vellum and Parchment, and then the Press was first used; tho afterwards much improved; as was their Printing-Ink.

Rolling-Press-Printing was not used in England till K. James I. and then brought hither from Ant-

werp by our industrious John Speed.
As to the Art or Practice of Printing it self, its so useful to the Common-wealth of Learning, to But rather from Old Medals, Seals, &c. and the have it better understood by Authors and Editors Letters on them. But if it be certain, as it seems of Books than it usually is, that I shall here give a full but succinct Account of the whole Matter from M1. Moxon's Mechanick Exercises of Printing; and from what I could collect from my own Observation, or get by Information.

The principal Officer in this Affair is called the

Master Printer: Who contrives or finds a Room or Rooms, for setting up what they call a Printing House; or who furnishes a proper Place, with all Tools and Instruments used in Printing.

And first he must consider what Number of Preffes and Cafes he shall want that his Room may be proportionate to his Number. They usually allow about 7 Foot square on the Floor, for each Press : And for every Frame of Cases, which holds 2 pair of Cases, viz. a pair of Roman and a pair of Italick, five Foot in Length and 41 in Breadth; tho they contain but 2 Foot and 9 Inches: But then Room enough will be left to pass freely between the Frames.

The Cases, must be so placed that the Light may fall to the left Hand of the Compositor; or else his Hand will interpose between the Light and his Eyes, and so shadow or obscure the Letter he is to take up.

The Presses also must be so placed as that the Light may fall from a Window right before the

Form and Tympan.

The Correcting Stone, or Stones must also stand against a good Light; and as near as can be in the Middle of the Room, if there be but one, that the several Compositors, may come the better to it.

In some Corner of the Room with a Sink under it, must the Lee Trough and Rinsing Trough be placed; or in some other Place if there be Room

The Distributing Frame, stands also pretty near the Middle of the Room; and round about the Sides Nest Frames may be placed to hold the Cases, that lie out of present Use; and the Letter Boards, with Forms fet on them; that both the Cases and the Forms, may be the better secured from running

Having thus contrived his Room or Rooms to the best Advantage; it is to be next furnished with its proper Materials as Letter, Cases, Presses, Chases,

&c. of which next in Order.

The Printer must be provided with a good Fount as they call it, or Found of Letter, and of all Bodies: For most Printing Houses have all these that Fellow, except the two first: And the Dutch (and I believe the French of late) have several other Bodies, and we have one more, which is sometimes used in England which they call a Small Pica: But this differs but little from the Pica.

These Bodies, are commonly cast with a Roman, Italick, and sometimes an English Face: But the Printer hath also some Bodies with Hebrew, Syriack, Greek, and with the Musick Face: As also Changes Markensical Chamical Alexandrical Characters Mathematical, Chymical, Algebraical, &c. The following Table shews the Names and Sizes of these several Bodies: Or what Number of each Body is contained in a Foot.

Two Lined English	33	
Great Cannon	L 175	ر ال

In the Choice of his Letter, a Printer hath great Scope to shew his Judgment and Skill as to their Shape, &c. and I think in the whole, the Preference must be given to the Dutch Types or Letters: But be their Shape what it will, the Letters must be deep cut, that they may print clear, last longer, and be less subject to entertain Picks. They must also be deep sunk in the Matrices, lest the Bottom Line of a Page should Beard; and the Beard must also be well cut off by the Letter Founder.

There must be provided also Brass Rules of about 16 Inches long; for the Compositor to cut into such Lengths as his Work requires: These Rules must be exactly Letter bigh; for if they are much to high they cut thro the Paper, Tympans, and Blankers: And if but a little so, their Shoulder or Beard will print black; and they will also bear the Platten off the Letters that stand near them, so that those Letters will not Print at all; and if they be too Low, then the Rules themselves will not Print. These Rules must also be straight all their whole Length: Their Edges of equal Breadth and neither too thick nor too thin: and the Brass should be very well Planished, that it may be Stiff and Strong.

Of Cases.

What they call a pair of Cases is an Upper and Lower one: They are usually both of equal Length, Breadth and Depth: viz. 2 Foot 9 Inches long, one Foot 4 Inches; broad, and about one Inch deep besides the bottom Board. These Cases are encompassed about with a Frame about 4 of an Inch broad; that the Ends of the several Partitions may be let into the Substance of the Frame: but the hithermost Side of the Frame is about 1 Inch higher than the other Sides, that when either the Galley, or another pair of Cases are set upon them, the Bottom edge of the Galley, or of these Cases may stop against that higher Frame and not slide off. Both upper and Lower Case have a thick Partition about fof an Inch broad; but the Divisions for the several Boxes of the Upper and Lower Cases are not alike: For each half of the length of the Upper Case is divided into 7 equal Parts, and its Breadth into 7 also; so that the whole makes 49 Boxes. But the 2 half Lengths of the Lower Case are divided each into 8 equal Parts, and its Breadth into 7: And yet not throughout so neither, but the Lower Case hath 4 several Sizes of Boxes.

These Cases should be placed in good substantial Frames; which should be so placed with an easy Declivity, that the Compositor may the better

see and come at his Letters.

Of the Galley.

These Galleys are of different Sizes according to the Page to be composed. They are commonly made of 2 Flat wainscot Boards each of ; or ; of an Inch in Thickness: The uppermost to slide in Groovesof the Frame close down to the undermost. The 3 Sides of the Frame are fixed fast and square down on the upper Plain of the undermost Board, to stand about i of the height of the Letter above the Superficies of the Slice.

The Sides of the Frame must be broad enough to admit of a pretty many good strong Oaken Pins along the Sides, to be drove hard into the bottom Board, and almost quite through the Sides of the Frame, that the Frame may be firmly fixt to it;

but they must not be glewed; because the Compositor may have formetimes Occasion to wer the Page in the Galley.

Of the Correcting Stone.

This Stone is made of Marble, Parbeck, or any other Stone that may be made flat and smooth: It should be capacious enough to hold two Chases or more; that the Compositor on Occasion, may set some Pages by on it ready to Impose, the two Chases lie on the Stone: So that it may be about 2 Foot broad and 4½ Feet long. It must be placed on a strong Frame like a Table about 3 Foot one Inch from the Ground or Floor.

Of Letter Boards and Paper Boards.

1 etter Boards, are to lay the Letters on, and are oblong Squares; about 2 Foot long, 18 Inch. broad and 1 an ‡ Inch thick: These should be madestrong, and clampt on the under side within about 4 Inches of either Bnd with Pieces of about 2 Inches square as well to keep them from warping, as that the Compositors may easily take them to remove them. Paper Boards are only to set Heaps of Paper on, and to press the Paper with.

Of Furniture, Such as

Head flicks, &c. must be made of dry Wainscot that they may not shrink when the Form stand by; they are Quadrate High, Straight, and of an even Thickness all their Length: and both these and Side flicks are called Rigles, if they are not at ove an Inch in Thickness.

Side-flicks, and Foot-flicks, are of the same height with the Head-slicks; the latter serving to determine the Breadth, at Bottom and Top; as the Side-slicks do the length of each Page.

Gutter-sticks, are used to set between Pages, on either Side the Crosses, as in 8205. 12mos. 16mos. and Forms upwards.

There are Quoins also used to lock up the Forms, or wedge them so close together (with a Mallet and Shooting-stick) both on the Sides and Head and Foot of the Page, that every Letter bearing hard against every other Letter, the whole Form may Rise, as you will see hereafter. The Shooting-stick, should be of Box, and is of a wedge-like Shape and of about 6 Inches long.

There is also a Dressing-block, usually made of Pear Tree, about 3 Inches square and an Inch high; its use is by being run over the Face of the Form, and gently knockt there with the Head of the Shooting-stick, to press down such Letters, as may happen to stand higher than the rest.

Of the Composing Stick.

This is made of a thin Iron Plate, about to Inches longand doubledup square so as that the bottommay be; Inch and; broad, and the Back about an entire Inch broad. At the further End of the Iron Plate so doubled up, is soldered on an Iron Head which must stand square to the Bottom, about the thickness of a Long-Primmer: But all its outer Edges are basil'd and filed away into a moulding. About 2 Inches from this Head and in the Bottom, is begun a Row of round Holes about an Inch as funder to receive the Shank of the Male Scr. w, that Screws the

fliding Measures fast down to the Bottom: So as these sliding Measures may be set nearer or further from the Head, as the measure of the Page requires.

In the Figure annexed a is the Head of the Composing Stick, bb the Bottom, cc the Back, d the Lower Sliding Measure or Check, e the Upper Sliding Measure or Check, ff the Male Screw, g the Female Screw.

The Lower sliding Measure is a pretty thick Iron Plate, as broad as the Inside of the Bottom; about 4 Inches in length: And in its Middle is a Groove, quite thro' it, within about half an Inch of each End, to receive the Shank of the Screw.

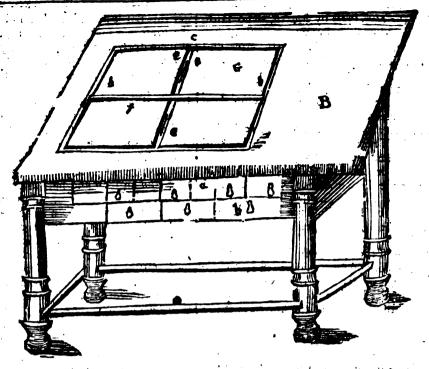

On the fore End of this Plate stands square another Iron Head about a Brevier thick, and reaching as high as the Top of the Back. The Upper sliding Measure is made just like the Lower, only tof an Inch Shorter. Between these 2 sliding Measures, they can compose Marginal Notes to any Breadth.

The Compositor uses a Bodkin of Steel of about 2 Inches in length from the Shauk of the Handle: the Handle is of soft Wood; that when 'tis knockt on the Face of any single Letter, which happens to stand too high, it may not batter it.

Of Chases.

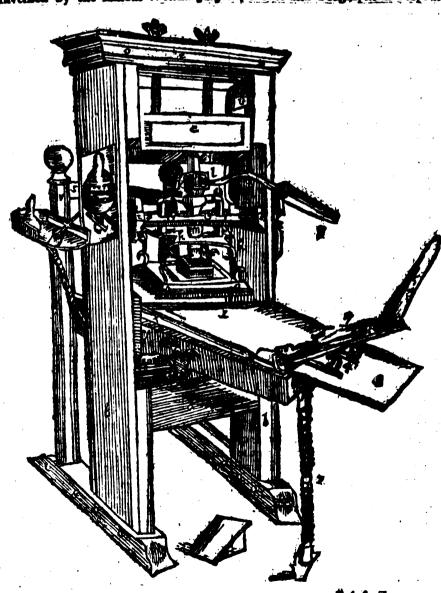

These are Iron Frames about 22 Inches long, 18 broad, and I Inch and I thick, and the breadth of the Iron on every Side is I of an Inch usually, but it should be an entire Inch: All the Sidesmust be truly square to one another; that when 'tis laid on the Correding Stone, it may lie truly flat, and the out and inside must be filed straight and smooth. Each Chase hath 2 Crosses belonging to it: One Shorter than the other; they are square to one another and are called the Short and the Long Cross. They have at each End a male Dove-tail filed bevil-way from the under to the upperfide of the Cross, so that the underside of the Dove-tail is narrower than the upper: These Male-dove-tails, are fitted into Female ones, filed in the Infide of the Chase; and which are also wider on the upper Side of the Chase, than on the under, that the upper Side of the Cross may not fall thro' the lower Side. The Short-Cross is thus dove-tailed into the Middle of the 2 long Sides of the Chase; and the Long Cross into the Middle of the 2 other Sides. The Shore Cross is moveable also in the Chase about 3 Inches from the Middle. The Middle of these 2 Cross ses, are filed or notched half Way thro, one on its upper, the other on its under Side, that they may be let into one another, and in the Middle between the 2 Edges of the upper Side of the Short Cross are made 2 Grooves parallel to the 2 Sides of the Crofs, beginning at about 2 Inches from each End: They are i an Inch deep all the Way, and about ; of an Inch broad, that the Points may fall into them. The Short Cross is about 3 of an Inch thick; and the Long about half as much.

See their Figure as they lie on the Correcting-stone.

Of the Press.

The Princing Press, whose Figure is here annexfor his good and great Printing, but also for his ed, was invented by the famous Willem James Globes and Geographical Maps and Charts.

Tie

Tis called the New Press by Moxon, who saith, it was (in 1683) but little known in England, but generally used in Holland, and is much better and more commodious than the common Printing-Press.

an, Represent its Feet, which are 2 Feet 9 Inches 1 long, 5 deep, and 6 broad, having their Outsides truly square.

bb. Are the Cheeks, which are 5 Foot to Inches long besides the Tenons of the Top and Bottom, 8 Inches broad, and 4 and a half thick.

d, Is a Plank called the Winter, which is in Length besides the Tenons, a Foot 9 Inches 1, in Breadth 8 Inches, and its Depth 9 Inches.

c, Is the Cap, or Top of all the Press, being 3 Foot and 1 Inch long, 41 Inches deep, and 91 In-

ches broad.

e, Is the Head of the Press; whose length, besides the Tenons, is 1 Foot 9\frac{1}{4} Inches, Breadth 8\frac{1}{4} Inches, and Depth 8 Inches. Its Top, Bottom, and hind Sides are all square; but the Foresides of the an Inch over the Range of the Foresides of the Cheeks: In which Projecture is cut a Table with an hollow Moulding, about it 2 Inches distant from all the Sides of the Foreside of the Head; its Tcnons are 3 Inches broad, and are cut down at eie dand made fit to Mortices in the Cheeks, that may flide right, and yet play in them.

In the Under-side of the Head is cut a Hole about 4 Inches square, and 31 deep, into which a Brass Nut is fitted, for the Worm to play in.

i, Is Part of the Worm below the Head; the

upper Part being hid in the Brass Nut.

f, k, l, m, n, Is the whole Spindle.

f, Is the Till, a Board about an Inch thick, one
Foot 94 long besides the Tenons, its Breadth 8 Inches; in its middle is a round Hole for the Shank. of the Spindle, and at 74 Inches from each End is a square Hole for the Hose to pass thro'

gg, Are the Hofe, being upright Irons of 3 of an Inch square, and at each End have male Schews on Their lower Ends are fastened into the Hose-books, and their upper Ends into the Garters or Curts, which is a round Hoo placed over the flat Neck of the Shank of the Spinke.

bbbb, are the Hose-books, or the Hooks on the Hose the Platten hangs on; they proceed from 2 Branches of an Iron Hoop encompassing the lower End of the Spindle, on either Corner of the Branch.

k, l, Is the Eye of the Spindle, as m is its Shank, and n its Toe; the Spindle's Length in all is 16. Inches, the Length of the Cylinder the Worm is cut

on is 34 Inches, and its Diameter 24. Hose; this is usually made of bearen Plank 2 Inches and a half thick, 14 long, and 9 broad; its Sides are tied square; and its under side exactly

plain and smooth.

In the middle of its upper side is let in and fastned an Iron Plate called the Platten-Plate, & of an Inch thick, 6 Inches long, and 4 broad; in the middle of this Plate is made a square Iron Frame of about halfan Inch high, and as much broad; into which is fitted the Stud of the Platten-pan, so as it may stand steddy. This Stud is about an Inch thick, and then spreads wider and wider to the Top, where 'tis two Inches and a half.

Is the Bar, in length about 2 foot 8 Inches, 'tis faitned strongly with a Nut and Screw into the Bye of the Spindle. About 4 Inches from the Shoulder this Bar is bowed with an obtuse Angle, that the Press-man may the more easily and readily catch at it, to draw its wooden Handle q within its reach.

rr, Are the Hink-posts, which stand at a Foot Distance from the hind sides of the Cheeks; they are 3 Foot 4 Inches long besides the Tenons, and 4 Inches thick, and square every way. These hind Posts have lix Rails sitted to them, and marked sta and called the Hind-Rails.

t, Are the Wedges of the Till f uu, The Mortices of the Cheeks bb.

xxxx, y, Express the Carriage; whose Plank is of Elm an Inch and half thick, 4 Foot long, and I Foot 8 Inches & broad. On this Plank at its fore end is firmly nailed down a square Frame 2 Foot 4 Inches long, I Foot to Inches broad, and the Thickness of its sides 2. Inches square. This is called the Coffin, and is marked with the Figure (1) in the Plate, and in it the Scone is bedded.

(1) On each of the 4 Corners of the Coffin is let in and fastned down a square Iron Plate, with return-sides about 6 Inches long, each side 1 8th of

an Inch thich, and 2 1 qr. broad.

Behind this Coffin is nailed on to its Outside a Quarter, of about 3 Inches longer than the Breadth of the Coffin; it hath all its sides 2 Inches over, and 3 of them square: But its upper side is hollowed round to a Groove or Gutter (2) an inch and half oyer. This Gutter is so nail'd on, that its hitlier End standing about an inch higher than its further End the Water that descends from the Tympan (5) falling into ir, is carried on the further fide of the Coffin by the Declivity of the further End of the Gutter (2,) and so keeps the Plank of the Carriage near and clean, and preserves it from rotting. Parallel to the outward sides of the hinder part of the Plank of the Carriage at 3 inches distant on either side, is nailed two Female Dove-tail Grooves, into which is fitted so as to slide two Male Dovetails made on the two Feet of the Gallows (4) on which the Tympan rests.

At 3 inches from the hinder Rail of the Coffin in the middle of the Plank is cut a Hole of 4 inches square, and on the hither and further side of this Hole is fastned down a Stud of Wood, one on each side, and in the middle of these two Studs is a round Hole of about an Inch over, to receive the two Iron Pins of a wooden Rowler, or Barrel, with a Shoulder on each fide of it to contain so much of

the Girt as shall be rolled upon it.

The Tympan (5) is a square Frame having 3 of its Sides Wood and one of Iron. 'Tis 2 foot 8 Inches wide, 2 foot 2 inches long, and the Breadth of the wooden sides an Inch and half, and the depth one inch on its hinder end; at the 2 Corners is rivited an iron Match Joint, to be pinned on to another half Joint, fastned on the hind Rail of the Coffin. The fore end of the Tympan is of Iron, with a square Socket at either End for the wooden Ends of the Tympan to fit and fasten into; on the outer Edge of this Iron about an inch and half from its Ends are made 2 iron half Joints, to contain a Pin, which entring this, and a Match balf Joint, made on the Frisket, (6,) serves for a Frisket to move truly upon. In the middle of each long Rail of the Tympan is a Hole half an Inch square, for the square Shanks of the Point Screws, (7,8) to fit into. Within this Tympan, which may be called the Outer, is another called the Inner Tympan, which is fitted exactly to it, and gaged by an iron Pin, and an iron Turning-Clasp.

I hope

Figure a little Intelligible, and to give a general Idea of the Printing Press; but no words can postic a very surprizing thing to see how very quick sibly explain it so well, as once seeing of it work is performed; and how in an instant he will do.

I shall omit describing the manner of making the Types or several sorts of Letters, used in Printing but wholoever hath a mind to fatisfy himself further may consult Mr. Moxon's book of Printing, where he will find the whole affair very largely and

plainly described.

I shall only add something further about the Rules and Methods of Distributing and Composing. After the Press-man hath wrought off as many Sheets from a Form, as he is appointed; he first washes the Form, and brings it to a place which they call the Rinfing Trough, and rears it a little assope on one end of the Chase; for when 'tis so placed the Face of the Letter is less liable to damage, and the Form stands in a proper position for the Compositor to rear a Letter Board against the Back- let, placing the first line close and upright against side of it; by which he raises it up, and then sets the lower Ledge of the Galley. Letter Board, and Form both a little assope in the Rinfing Trough. Next with his Mallet and Shooting-flick he opens or Uplocks (as they call it) the Quoins and Form: and then the Furniture; viz. the Head sticks, the Inner Side sticks, and Gutter-sticks, if the Form have any, that he may have the more Room to open the Letter in order to its receiving the water the more plentifully: which is thrown on it by dish fulls to Rinse and Clean it, and the Face of the letter is rubbed with the Fingers, and shook so that the water may get between the Letters to clean them; and this is done till the water thrown and rubbed on, runs away quite clear and colourless. Then he thrusts the Letter and Furniture close up together again that the letter may not Squabble, as they call it, that is, break and fall atunder: after it hath flood a while to dry; he carries Letter Board, Form and all to the Diffributing frame: and there he strips it of its Furniture, Quarter by Quarter, taking out the Quoins, &c. and then with his Distributing stick or Riglet, he takes up out of the Form as many Lines of Letter as he be folded into an orderly Succession. And the can, and turning their Face towards him, he carries them to his Case, and taking out the Letters &c. one by one, but very quick and nimbly, he distributes each of them to its proper Box in the Case. Then he proceeds to take off and Distribute another parcel, and so goes on till he hath done, or till his Case is full.

They usually choose to distribute their Letter over Night, that they may have a Dry Case to work on in the morning, for wet Letters are less easy to take up, and beades the Lye makes their fin-

gers fore.

The Compositor next sets himself to the Composing work: and here he must first Determine his Meafure; to which he fits his Composing stick (above

Having fitted bis Measure, he Places the Galley on his upper Case on the Right hand, and placing in it may lie in the same Range with the Head-line his Copy before him, he reads 5 or fix words or of the Metal, &c. so that all the lines in the Proof such a part of it as he can keep in his mind, and coincide or range right with the respective ones then spells it over Letter by Letter, taking up the in the Metal; by running his eye along easily the proper Letters out of their respective Boxes in the several Places, or Lines in the Proof, where the Case: he sets a Space between every word till they come to the end of the Line; but there none. He holds his stick in his left hand, and with his Thumb gently presses the Letters close to the cheek, keeping Vol. II.

I hope this Description may serve to make the it secure, tight and close together, as with his righthand he puts them into the Stick successively. And ipells, resolves upon, and takes out the several let-

ters which compose his work, and supply his stick. Having composed one Line; it it ends with a word, or a Syllable and a Division, and just fill the Moafure, then it needs no more Justifying as they call it, the Stick being duly filled; but if the Line conclude not so, then he puts a Space more between every word, or at least so many as will fill up the measure pretty Stiff, or justify the Line. And here he takes care that his Letter don't Hang, as they call it, i. e. Stand a Skew.

After he hath thus composed one Line, he begins another, and so goes on till his Stick be full: and when it is so, he empties it, laying it down on his Lower Case, and by means of a Rigles of just the length of the Line, he claps it down into the Gal-

As he Sets or compoles this first stick of Letter, so he goes on till his page is out, remembring after the last line of every Page to set a Direction; that is, he sets a Line of Quadrats and at the End of it the first word of the next Page, or if the word be very long and the Line very short, two Syllables, or sometimes but one, of that word. And when 'tis the first Page of a Sheet, he sets a Signature as 'they call it (i.e.) A for the first Sheet, B for the Second, &c. And so successively till he come to W which is always skipt, because the Larin Alphabet hath no fuch Letter.

When our Compositor hath got a full Page in his Galley, he next ties it up fast together with a Packthread, or Gord, according to the bigness of his Letter and Page, and then carries it to the Correcting stone, and here all the Pages which belong to a sheer, with the Chase and Furniture about them, are duly placed, or Imposed as they call it: that is, so disposed or ordered, as that when the Sheet comes to be wrought off at the Press, all the Pages may different volumes of Folios, Quartos, Octavos, and Twelves, are all diverfly Imposed.

Correction.

In Correcting Faults, if there be but a few of them, and these East ones, the Compositor gathers the Corrections in his Srick, beginning at the bottom of every Page and so scending: because when he is Correcting, the corrections of the Top of the Page stand the first in the Stick, and therefore are readiest to his hand.

But if there be many and considerable Faults, he brings the Lower Case to the Correcting Stone, and takes his Corrections as he uses them. described) by loosening the screw, and Sliding the he unlocks the Form, but keeps the Quoins pretty Cheeks nearer to or further from its head. tight up, least his Letter should hang or squabble: and there folding the Proof, so that the Head-line of the Metal, &c. so that all the lines in the Proof

If there be a Long word or more than one left Ttt

Smile

3

out, the Compositor is usually forced to over-run, here he marks Scoff out thus Sanga as they call it: i. e. he must put so much of the forepart of the Line, into the Line above it; or so much of the hinder part of the line into the next Line under it, as will make Room for what is left mark A, where it is Left out, for a

If much be left out, he must over-run many lines either backwards or forwards, or both, till he come to a Break; and when he comes thither if it be not Gotten in, as their word is, then he is forced to Drive out a Line: and sometimes to get in that Line, he is forced to over run the next Page backwards or forwards, till that Line can come in.

The Quite contrary Process must be take, if he happen instead of Leaving out, to set any thing swice over: for if it be but little he must take it out, then Drive out his Matter: But if it be as much as two or three Lines, &c. Then he must over-run as two or three Lines, &c. Then he must over-run the next Page, or more, and sometimes the whole Lest Hand Margin of the Page: Sheet, till it be Driven out.

After all this Correcting there is, or always should be a Revise, to see that the Faults are truly mended; and if not, to have them Re Correlled, by unlocking either the whole Form, or only that Quarter of it where the faults are, &c.

And because 'tis a Thing very useful for all Authors, and Correctors of Printing presses to be acquainted with, I shall conclude this Account of Printing with proper directions for both.

And first the Author should well examine his Copy before it go to the Press; and Point and Mark it so, as that the Compession may know what words to Set in English, Italick, Capitals, &c. For his Italick words, he should draw a line under them Thus: for English words two Lines Thus: and for

Capitals a Line of Points Thus, or else a Line with Red Ink. If there are no Proper Breaks made in the Copy; the Author must supply them by a Crotchet [Thus, before the word he would have begin his new Paragraph.

And every Author, if he can possibly, our of a due regard to his own Reputation, which else may much suffer, or at least as much as he can, will cor rect the Sheets of his Book himself; that is, look them over, after the Printers Corrector hath mended the Common Typographick Faults: And whether it be the Author himself, or some other Corrector, that hath this Care upon him, the way of correcting Faults so as they may be mended by the Compositor is after this manner.

When one Letter is put instead of another, as in this word The for The; he dashes out the wrong

Letter thus the, and Writes the Letser it should be on the Right Hand Margin of the Page, right against the same Line, and makes a Dash behind it, as you may see in the Mar-

If two or three, or more Words in the same Line have Faults in them as in these Words, Potienge a c peg førce; where first an o is See instead of a, e instead of c, t instead of r, and c instead of o. These he marks in an orderly succession towards the Right Hand, against the same Line, as you may see in the Margin.

But if one word be set instead of another, as Scoff instead of Smile, Smile,

and writes Smile, as in the Margin.

If a Word or Words, or Letter or Point be Left out, he makes this mark of Infertion, and Writes in the Margin what must come in.

If a Space be Left out, he makes the former mark of Infertion where it should come in, and makes this mark # in the Margin.

If a whole Sentence be Left out, too long to be Writ in the Margin, he makes the mark of Insertion where it is Left out, and only Writes (Out) in the Margin. If the Sen-(Out) tence Left out be not very long, he But if it be too large to be Writ in the Margin, or under the Page, he Writes in the Margin, See the Co-(See the Copy)

If a Word or Sentence be See twice, as Him Him, he marks out one Him thus Him, and makes this mark & in the Margin, for Dele, to take out.

If a Letter be turned thus & he dashes it out as you see, and makes this mark in the Margin.

If Words are Transposed, that is, if one Word fland in another Words place, as, no I love Swearing, and it should be, I love no Swearing; he marks this Fauls thus, no I love Swearing, and makes this mark & in the Margin. The like mark he makes in Matter and Mergin if two Letters are Transpos'd.

If a Space or an m or n Quadrate, Gc. flick up and Prine Black, as tween these words, he marks in the

Margin thus, If a Word be Set in Roman Letter

instead of Italick or English Letter, he dashes the Word underneath thus, and Writes Ital. or Eng. in Ital | Eng | the Margin.

In like manner, if a fingle Letter or more Letters be Set in Roman Letter, and it should be Italick or English Letter; or if in English or Ita-lick, and it should be Roman Letter, he dashes the Letter or Letters thus underneath, and writes Ital. Rom. Ital | Rom | Eng or Eng. in the Margin: Or if Lower Case Letters be Set instead of Capitals, he dashes them underneath, Capt |

and Writes Capt. in the Margin. Having Read the Matter of the Proof he examines again if the Form be right Impos'd, for though he before turn'd the Pages in the Proof as he read them according to their orderly places, yet he will scarce trust to that alone, but again examines them on purpose, and distinctly, which he does not only by the Direction Word, but by examining the whole Sentence the Direction comes in, both at the end of the Page, and the beginning of the next Page.

He examines that all the Signatures are right, and all the Titles and Folio's.

If the Work be large Forms and small Letter, he has a second, and sometimes a third Proof, which he Reads as the first,

After the Second or Third Proof he has a Revise which is also a Proof sheet: He examines in this Revise Fault by Fault, if all the Faults he markt in the last Proof were carefully mended by the Compositor; if not, he marks them in the Revise,

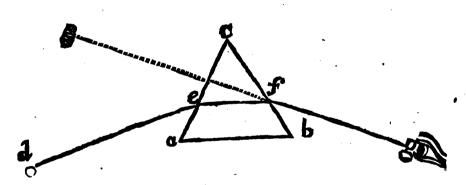

PRINTS. The Original of Prints or Cutts, as we sometimes call them, was this; in the Year 1460, one Maso Finiguerra, a Goldsmith of Flo rence, graved his Plate; and then casting some of Colours you have a great variety of Experiments it in melted Brimstone, he perceived, that what made with such Glasses, by the Incomparable Sir came out of the Mold was markt with the same Is. Newton; and from whence, in a good measure, Prints as his Plate, by the Black which the Sulphur he hath established his Demonstrative Theory of came out of the Mold was markt with the same had taken from the Graving: after this he tried to Light and Colours; a large account of which you do as much on Silver Plates with wet paper, by may find in his Opeicks. rolling it smoothly with a Roller, and this succeeded. This Novelty tempted Baccio Baldini, passing thro such a Pris a Goldsmith of the same City, to attempt the fame thing, which he did with Success; ingraving made by a Plane passing transversely to three paseveral Plates of Sandro Boticello's Invention and rallel Lines or Edges, then when the Light passeth was then at Rome, ser about engraving some of first side of the Prism a c, where the Light goes his own Pieces. This knowledge getting into Flan-into the Glass: Then by putting the Line of Inciders, Martin of Antwerp, a famous Painter, graved abundance of Plates of his own Invention, and sent several Prints into Italy, which were markt in this Volume) of the first refracted Ray; then thus, M.C. After him the Famous Albert Durer taking this Ray for the Incident Ray on the second appear'd and gave the world a vast number of side of the Glass be, where the Light goes out, Prints, both in wood, and copper. About this find the next refracted Ray fg; by putting the time one Hugo de Carpi, an Italian Painter of no great Capacity, but of a ready Invention, found the next refracted Ray fg; by putting the great Capacity, but of a ready Invention, found the next refracted Ray fg; by putting the great Capacity, but of a ready Invention, found the next refracted Ray; then taking this Ray for the Incident Ray on the second second Ray fg; by putting the second Ray fg; by putting th great Capacity, but of a ready Invention, found ction as 11 to 17; for if the Line of Incidence out a way, by means of several Plates of wood, out of Air into Glass be to that of Refraction as to make Prints resemble Designs of Claro-Obscuro: and some Years after the Invention of Etching was discovered, which was soon made use of by Parmeggiano.

PRISAGE, is the Custom or Share that belongs to the Queen, out of such Merchandice as is taken at Sea by way of lawful Prize,

PRISM: A Glass bounded with two equal and parallel Triangular Ends, and three plane and well-polished Sides, which meet in 3 Parallel Lines. running from the 3 Angles of one End, to those of the other, is called a Prism; and is used in Opticks to make many noble and curious Experiments about Light and Colours; for the Rays of the Sun falling upon it at a certain Angle, do transmit thro it a Spectrum or Appearance, colour'd like the Iris or Rain bow in the Heavens. Under the word

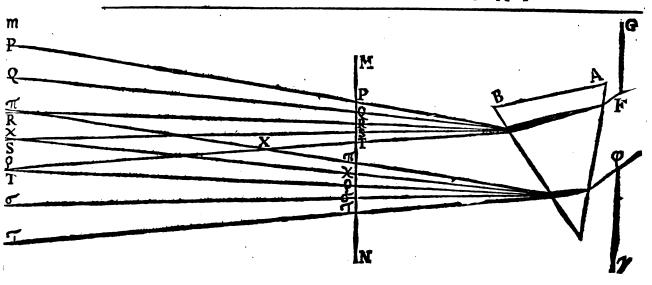

How to find the Refraction of a Ray of Light passing thro' such a Prism, the same Author shews thus: Let a b c represent the Section of this Prism Design; and upon this Andrew Mantegna, who thro' it; and let de be the Ray incident on the dence to the Line of Refraction as 17 to 11: Find (by the Direction given under the word Incidence 17 to 11, the Line of Incidence back again, out of

Glass into Air, must be as 11 to 17,

The same admirable Author, Opicks, p. 121, by his most accurate Experiments, to explain the shows, how by the Properties of Light discovered Phanomena of Colours made by Prisms; thus,

Let

brought into a darkned Room, by the Hole Fo, almost as broad as the Prism; and let m n be a White Paper on which the refracted Light is cast: And These Colours ought to appear were the Sun's suppose the most refrangible or deepest Violet Rays to fall on the Space P , the left refrangible or deepest Red Ray on the Space T7; the middle fort, between the Indico and Blue Rays, on the Space $Q\chi$; the middle fort of the Green Rays on the Space R_g ; the middle fort between the Yellow and Orange Rays on the Space Se; and the other intermediate forts on intermediate Spaces. For so the Spaces on which the several sorts adequately fall, will, by reason of the different Refrangibility of these sorts be one lower than the other. Now if the Paper mn be so near the Prism that the Spaces P t and A do not interfere with one another, the distance be tween them T will be illuminated by all the forts of Rays in that Proportion to one another which they have at their very first coming out of the Prilm, and consequently, will be White. But the Spaces PT and 20 on either hand, will not be illuminated by them at all, and therefore will appear coloured; and particularly at P, where the outmost Violet Rays fall alone, the Colour must be the deepest Violet. At Q where the Violet and Indico Rays are mix'd, it must be a Violet inclining much to Indico. At R, where the Violet, Indico, Blue, and one half of the Green Raysare mix'd, their Colours must by the Constitution Colours, ought, by the same Rule, to compound a faint Blue, verging more to Green than Indico. And in the progress from S to T this Blue will grow more and more faint and dilute; till at T, where all the Colours begin to be mix'd, it ends in Whiteness.

So again on the other fide of the White at T, where the least refrangible or utmost Red Rays are alone, the Colour must be the deepest Red. At σ , the Mixture of Red and Orange will compound a Red inclining to Orange. At e, the Mixture of Red, Orange, Yellow, and one half of the Green, must compound a middle Colour be tween Yellow and Orange. At x, the mixture of all Colours but Violet and Indico, will compound a faint Yellow, verging more to Green than Orange: and this Yellow will grow more faint uncovered may be confidered, as a kind of Cuneus

Let a b c be a Prism refracting the Sun's Light, and dilute continually, in its progress from x to a

Light persectly White; but because it inclines to Yellow, the excess of the Yellow Rays, wherewith it is tinged, being mix'd with the faint Blue between S and T, will draw it to a faint Green. And so the Colours in order from P to Tought to be Violet, Indico, Blue, very faint Green, White, faint Yellow, Orange, Red: Thus it is by computation, and they that please to view the Colours made by a Prilm will find it so in Nature

These are the Colours on both sides the White, when the Paper is held between the Prism and the Point & where the Colours meet, the Interjacent White vanishes: For if the Paper be held still farther off from the Prism, the most refrangible and least refrangible Rays will be least in the middle of the Light, and the rest of the Rays which are found there, will by mixture, produce a fuller Green than before; also the Yellow and the Blue will now become less compounded, and by conse-

quence, more intense than before.

And if thro a Prism you view a White Object encompassed with Black or Darkness, the reason of the Colours appearing on the Edges is much the same. If a Black Object be encompassed with a White one, the Colours arising from seeing it thro a Prism, are to be derived from the Light of the on of Problem 2. in pag. 114) compound a middle White one, spreading into the Regions of the Colour between Indico and Blue. At S, where Black; and therefore they will appear in a conall the Rays are mix'd, the Red and Orange, thin trary order. And its the same when an Object is viewed, whose Parts are some of them less or more luminous than others: For in the Borders of the more or less luminous parts, Colours ought always, on the same Principles, to arise from the excels of the Light of the more luminous, and to be of the some kind as if the darker parts were Black, but yet to be more faint and dilute.

And what is thus faid of the Colours which are exhibited by Prisms, may easily be applied to those Colours which the Glasses of Telescopes and Microscopes, or even the Humours of the Eye produce: For if the Object Glass of a Telescope be thicker in one part than another; or if one half of the Glass, or one half of the Pupil of the Eye, be covered by any Opake Body, then that Object Glass, or its half; or the half of the Eye which is

Digitized by Google

with curved Sides. And every Glass, or Pellucid Cuneus (or Wedge) will produce the same effect as a Prism, by refracting the Rays of Light as they are transmitted thro' it.

PROCURATIONS, are a Pecuniary Sum or Composition paid by the Parish Priest to an Ordinary or some other Ecclesiastical Judge, as an Archdescon, &c. to commute for the Provision or Entertainment which was otherwise to have been procured for him; which Entertainment was called a Procuration

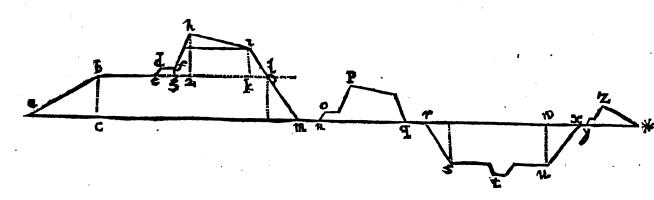

PROCURATOR, is used for one that gathereth the Fruits of a Benefice for another man; 3 R.2 Stat. 1. cap. 3. as Procuracy was the word for the Inftrument impowering him to do it. In the West of England, such Persons are called Proctors to Faussebray, Foss, Covert-way and Esplenade. this day. Cowel.

PRODES Homes: This is a Title often given in our old Books to the Barons or other Military Tenants, who were called to the King's Council; and was no more than Homines discreti & fideles.

PROFER, Profrum vel Proferum; is the Time appointed for the Accounts of Sheriffs, and other Officers in the Exchequer; which is twice a Year.

An. 51 H. 3. 5. In another Sense Profer also signifies the Officer or Endeavourer to proceed in any Action by any Man concerned so to do.

PROFILE, in Fortification, is the Representa-tion of the Height, Depth and Thickness of any Work; and suppose the Work cut perpendicularly down from Top to Bottom; as in the Figure annexed, where you have the Profile of a Rampart,

a b 1 m is the Solidity of the Rampart, a m its Lines, Furniture of Dials, &c. on any kind of Bale; b 1 its Top; b c its perpendicular Height; a b its inward Talus or Slope; I m its outward Talus or Slope; be is the Terre-plain; el is the Bale of the Paraper, e d its Banques; fb is the in ward Talus of the Parapet, il the outward one, bi its upper one; b2 is the inward Height of the Parapet, ik the ontward Height; I the Cordon; nopq represents a Faussebray with its Banquet, Sc. q r is Liziere or Berm; r s t u x is the Fois or Ditch; rs the Scarp; uy the Counterscarp; t the Lunette; wu the Depth of the Ditch; x, the Covert-way; x 7 * the Parapet and Glacis of the Covert-way; 7 the Height of the Barnquet and Parapet of the Covert-way; * the Basis of the Glacis; * the Slope of the from the middle Point in the Arch, to the Diame-Glacis

PROFRE Vicecomitis. Tho' the certain Debet of the Sheriff could not be known before the finishing his Accounts, yet it seems there was anciently an Estimate what this constant Charge of the Annual Revenue amounted to, and what the confrant Allowances amounted to according to a Medium; and those Summs were paid into the Exchequer at the Return of the Writ of Summons of the Pipe; and they were and are to this day cal led by this Name Profre Vicecomitis. But altho thele Profess are paid, yet if on conclusion of the Sheriffs Accounts, and after the Allowances and Discharges had by him, it appears that he be in Surplusage, or that he be charged with more than if you hold the Edge of the Ruler to the fix'd indeed he could receive, he hath his Profess paid Point, and also apply the Point of the Edge of the or allowed to him again.

PROJECTIVE Dialling, is the way of Draw-

Surface whatfoever, without any regard had to the Situation of those Surfaces, either as to Declination, Re- or Inclination. This curious and in many Cases most useful manner of Dialling, seems to have been the Invention of our Mr. Sam. Foster, formerly Astronomy Professor in Gresham College. Something of this was printed in his Posthumous Miscellanies 1659, and more added by Mr. Leybourn (in his Dialling) from a Manuscript which Mr. Foster left behind him.

In order to perform this manner of Projective Dialling after Mr. Foster's way, there is necessary a Semicircle divided into two Quadrants, whose Divisions must begin, and be numbred both ways ter; which Diameter must be made to receive a Ruler into a Grove made in it, so as that the Semicircle may slide easily along it, and be fastened by a Scrue any where upon it: It will be convenient to have two or more of these Rulers of different Lengths. You may see the Fig. of this Semicircle and Ruler in Leybourn's Diading, p. 198. But there is no difficulty in understanding the use of it at all; and a Quadrant, divided on both fides, may very well supply the place of the Semicircle.

The General Use of this Instrument is; Upon a

Line drawn any where, to project an Altitude or De-pression, above or below the Horizon, from a fix'd Point placed at a distance from that Line.

The manner of doing which is very easie; For Ruler to the Line given, removing it higher or lower (as occasion requires) till the Thread and Plummet of the Semicircle or Quadrant fall on the ing, by a method of Projection, the true Hour- degr. of Altitude or Depression intended; for then the Ruler lies at the Altitude or Depth, and so right Line : this right Line so drawn, shall repreprojects it from the fix'd Point into a Line, as was defigned.

Two General and Easie ways to project Hour Lines on all Surfaces, Concave, Convex, &c. Inclining, Reclining or Declining.

1. Let a Gnomon, being first sharpened into a Point, be shaped and fastued in such wise, that it no way hinder either the draught of the Horizonral Line, or the Point of the Shadow from having free accels to the Dial at all times of the Year.

2. Draw an Horizontal Line, by help of your Semicircle in a true Level both in regard of it felf, and also to the Point of the Gnomon, through the whole Superficies on which the Dial is to be de-Or having two Points in the same Level with the Point of the Gnomon, project it upon your Superficies, if it be a rugged one. And it the Superficies be more than one, or if any of them be very much inclined toward the Horizon, or else be very rugged, or far remote from the Gnomon to that it will not at all, or not to well, receive an Horizontal Line upon it, you may Either fet up some Board, or such like Object, upon which for a rime you are to inscribe the Horizontal Line, and by help of which the Hours were to be projected upon the Superficies; Or else (which perhaps will be better) you may extend a Thred in the Air (it matters por which way, nor whether from the Gnomon towards the Sun, or from the Sun: whether stretcht out in one length, or with returns, so long as it lieth justly parallel, in every Point of it, to the Horizon, and in the same Level with the Point of the Gnomon:) which being fixed in this manner, will very well supply the use of the Horizontal Line: or the Horizontal Line may be partly Thred, and partly drawn upon the Superficies, as occasion shall be. And upon it may any Point be transferred, and figned out by flip-ping knots of Thred tied upon it.

3. Upon the Superficies of the Dial, observe the Point of the Shadow of the Gnomon (making a mark at it) and the Sun's Altitude, both of them

at the same instant of time.

4. By the Altitude observed, compute the Azi

muth of the Sun from the Meridian.

5. The same Azimuth must be transferred unto or projected upon, the Horizontal Line by help of a Perpendicular Thred, covering to your fight (as it hangeth down) the Points of the Gnomon and Shadow both together; and at the same view cut-ting through the Horizontal Line: observe then punctually where it cuts through the same Line, for that same Section being signed thereon, shall be the Azimuth projected into the Horizontal Line.

6. Let any kind of Board or Past-board be now applied to the Point of the Gnomon; io, as that it may be staid, either upon the Horizontal Line (where it may to be conveniently) or at least to placed toward the Horizontal Line, that it may have a just respect unto it, and in that posture may have some stay for the edge of it to rest upon, that after it is furnished with such necessary Lines as must be drawn upon it, it may be placed in its former just posture without any Impeachment Upon this plain so placed, let the Point of the Gno mon be figned, which may be called the Center; and from this Center to the Sign of the Azimuth

sent upon the Board or Past board; the same Azimuth which was before computed.

7. Then taking away the same Plain, draw upon it the Meridian or Line of 12; extending it from the Center besore noted, at the true Angle that it hath from the Azimuth before computed and described, and also toward the true Coast of the World. And let it be extended on both sides the Center if need be.

8. To the Meridian so pitched upon the Patt-board, draw (from the Center) the Lines of an Horizontal Dial made to the Latitude wherein

you are.

9. Then again, let the plain Board or Pastboard be applied to its former situation, the Center of the Horizontal Dial resting upon the Point of the Gnomon, and every thing else answering to the same just posture that it had at the sirst. Which done, let a Thred be fixed in the Center of the Horizontal Dial, by help whereof you may transfer every Hour from the Past-board into the Horizontal Line. Let every Hour be therein noted (by fixing marks upon the Horizontal Line where it is drawn, or by flipping Knois upon the Thred, where a Thred Horizontal Line is used) especially mark out the Hour of 12: For which (if it chance to run belides the Superficies) some kind of Object (whereon the Horizontal Line is also to be drawn) or an Horizontal Thred must be fastned, that may receive it, till such time as your Dial be finished.

10. After all this, take your Plain away (for there will now be no more need of it) and conje-Cture whereabout the Axis of the World would pass from the Point of the Gnomon to the Poles of the World, for into that place is the Meridian to be projected. Which that it may be done more commodiously, if no object stand in the way that will receive it, you must place one there, it matters not whether above or below the Gnomon, chuse that which is most convenient: Or, a Thred laid assope in the Meridian justly as it ought, will serve as well as may be. If then you hold up a perpendicular Thred, so that by your Eye you may see the Point of the Gnomon, and also the Point of 13 in the Horizontal Line, both together, the same Thred so hanging, shall shew where the Meridian is to be drawn. Or, you may extend a Thred from the Point of the Gnomon to the Point of 12 in the Horizontal Line, which Thred shall represent the Line of 12: And staying your Thred there, close to it, hang up two perpendicular Threds at a good distance, so shall the same two Threds, give you the track of the Meridian Line.

11. The next Work will be to project one of the Poles of the World (that namely, which lies the same way that this projected Meridian doth from the Point of the Gnomon) into this Meridian. And this is done by elevating or depressing your Semicircle, from the Point of the Gnomon towards the Meridian Line, according to the Latitude of your Place; for so will the Ruler of the Semicircle, or a Thred extended along by it, Sign out the very Pole Point. If now you extend a Thred from this Pole Point, to the Point of the Gnomon, the same shall represent the Axis of the World.

12. Last of all; by these helps, all the Hours may easily be projected. For if the Eye do lay, or project, this Thred or Axis upon each Point of before prejected into the Horizontal Line, draw a those Hours that were inserted before into the Horizontal

Point upon the Axis, each one of those Projections shall represent upon your Dial, each of the Hours required, and will shew upon every Object that stands in the way, where the Hours are to be drawn. Or, where convenient room is wanting to place the Eye, so as it may make this Projection; there may two Threds be used for the same purpose, one whereof must be fastned to the Point of the Gnomon, the other to the Pole defigned in the Meridian Line. Then stretching one of the Threds to any of the Points noted in the Horizontal Line, and holding it there, you may take the other, and extend it to the Superficies, so as it may closely pass by the first Thred, by which Work you may make as many Points upon your Superficies as you please, thro' which each Hour is to be drawn. Having thus traced the way before hand, you may afterward draw the Hour without any difficulty, be the Superficies never so irregular. Among which Lines, the Shadow of the Point of the Gnomon, as it creepeth along, will shew the Time of the Day.

If a Point be affigned upon any Superficies Flat or Curved, one, or more, wherein the Hour-Lines ftyle, and measure from it the elevation of the Axis and Axis shall concur, how to project the Hours above the Plain. But if the Dial be described upto that Point, and to set up an Axis after the ordinary manner to give Shadow to them without any knowledge how the Dial standeth, in respect either of the Declination or Inclination.

1. To the Point affigned (upon any fide of it)

by direction of your Semicircle or other Level, firetch out an Horizontal Thred, serving for the Horizontal Line: this Horizontal Line need not be one direct Line, but may be turned at one or more Angles, provided that it lie totally in the Superficies of the Horizon.

- 2. With a perpendicular Thred held up, project the Sun into the affigned Point, and into the Horizontal Thred, and tie a little mark of Thred upon the same Horizontal, through which the Shadow cutteth. At the same instant also, take the Sun's Altitude.
- 3. By the Altitude taken, find out the Azimuth; This Azimuth, what ever it be, is represented by the knot.
- 4. Apply a Past-board to the Assigned Point, and hold it stat that it may answer to the Horizontal Thred also, and upon this Past-board, protract your Azimuth by a Thred extended from the Point affigned for the Center, to the mark upon the Horizontal Thred. This done,

5. By help of that Azimuth upon your Paftboard, protract the Meridian Line, observing the true Coast, and quantity of the Angle from the A-2imuth: and to the Meridian describe an Horizontal Dial.

- 6. Applying the Past board to its place again, all things standing right as before, project all the Hours in the Horizontal Thred from off the Pastboard, and set marks upon the same for the Points of each several Hour, which marks may be little ject to an Apex. moveable Knots to slip to and fro upon the same Thred.
- 7. Project the Meridian Point by a perpendicular Thred upon some object into that place whereabouts you imagine the Axis of the World would pass, above or below from the Point assigned for the Center.
- 8. With your Semicircle elevated or depressed

rizontal Line, the Axis upon an Hour Point, or agthe Center, according to your Latitude project the Pole of the World.

9. Extend a Thred from the Point affigned for the Center to the Poles of the World, which shall

represent the Axis.

101 By the Point upon the Horizontal Thred, and this Axis (either by your Eye, laying the Axis to the Hour points, or laying the Hour knots to the Axis) you may project all the Hours and draw them; Or else you may let the Axis alone, and content your self with the Pole point projected into the Meridian, for if from the Point assigned to be the Center or meeting of the Hours and Axis, you extend a Thred to each Hours-point in the Horizontal Line, and do repose (with your Eye) the same Thred upon the Pole-point, then shall the Shadow of the Thred give you that Hour-line, and do so in all the rest.

11. Your Thred or Axis lying in its true fituation, you may eafily fit an Axis to the same po-sture. If your Dial be described upon a plain Superficies, you may then (by one fide of a Nominal Square, applied to a Thred or Axis, and the other fide lying upon the Plain) find out the subon a curved Superficies, you must be content to fet up your Axis by the direction of the Thred

12. This Point assigned for the Center, being a Point of the Axis, is as it were the Apex of the Gnomon, unto which all the Work is projected. But if it be required to set up an Axis to such & Superficies, upon which the Axis and Hours will not meet in any tolerable manner, because perhaps the Axis may be but of very small elevation above the Superficies, and yet an Axis is required: in this cale, ser up any Point (of Wire, or such like) of such distance from the Superficies, as that the Axis and Hours may be distinct: And through that Point let it be required to make the Axis pais, you have no more to do but only to project to this Point, as before, by letting the Shadow of a perpendicular Thred pass through that Point, and no ting the same upon your Horizontal Thred, and counting that end of the Wire as your Center, proceed as before, for the Thred that lies to project the Hours is a pattern for the Axis.

This way is as general as the former, serving to project the Hours upon many Superficies, be they plain or curved, and however situate whether contiguous, or separate, and that without any laborious inquisition of any of their Situations, in respect of Inclination or Declination. If you will put in that Furniture which is usual, you must make some Mark (Notch, or Button) upon your Axis, unto which (as representing the Center of the World) by help of your Semicircle you are to project the Altitudes of such great or lesser Circles as you intend to insert; as hereafter shall be taught.

The 12 Propositions in the first way were to pro-

These 12 Propositions answerable in the second

way are to project to an Axis.

And after this method it will be easie, and often very useful and curious, to Project a Dial from a small Hole made in a Pane or Quarry of Glass; (the rest of the Glass being covered) or which is better, a Plate of Tin with a round Hole of † of 8. With your Semicircle elevated or depressed an Inch in Diameter, being put in the room of a (as it shall be required) from the Point assigned for Pane of Glass) for the Sun thining thro' that Hole.

(1) Apply an Horizontal Dial in a true Horizontal Position, so that its Centre lie in that of the Aure, was a Rank or Row of 4 Columns only, Hole in the Pane; and then by a Thred fixed at and whole Station was in the Front of a Temple, one end of the Centre of the Dial, and laid over fuccessively, every Hour, Half Hour, Quarter, Gc. find corresponding Points in the Sides of the Room a Country without the Limits of Italy, and gained where thole Hour-Lines intersect them: Then to their Subjection by the Sword. But with us (2) The Twelve a Clock Line being an Azimuth the word is most commonly used for the Circuit also as well as an Hour Line, you may by a String of an Archbishop's Juridiction; and in some of and Plummet brought just to touch that Thred our Statutes 'tis used for a County.
when strained over the 12 2 Clock Hour Line, PROVISION, in the Canon Law, is used for transfer that Meridian Line up to the Ceiling or down on the Floor, as you shall find occasion. Ecclesiastical Living. by the Pope, before the In(3.) Next in this Meridian Line find another cumbent be dead. Tis called also Gracia Expessa-Point, (by help of a Thred elevation to a proper tiva, and Mandatum de Providendo.

Height (in degrees) by means of a Quadrant) PROVISIONS: The Acts to restrain the exor-Height (in degrees) by means of a Quadrant) Reversed) Axis of the Earth; and therefore if you fix a Thred in one or both of these Points (or rather Poles) and extend it or move it along by the fide of the other Thred, as it is brought succeffively over every Hour Line on the Horizontal Dial (in whose Centre, as well as in that of the Hole it is fixed) and as it is extended to the corresponding Hour Points before found in the Room: I fay, that moveable String shall any where on the Ceiling or on the Floor, trace out any Hour Line which the Horizontal Thred shall successively represent.

And this Method of Projective Dialling, will And this excellent Mechanick way of Dialling or drawing Hour Lines on any Plane how lates the Weights and Measures, and the Price of integular soever as to Surface or Situation. Under the Plane where you intend to make a Dial, draw a true Level or Horizontal Line, and then to it set the Weights and Measures, and the Price of PROVOST Ma shal in the Royal Navy, who a true Level or Horizontal Line, and then to it set the Weights and Measures, and the Price of PROVOST Ma shal in the Royal Navy, who have the content of the Prisoners taken at Sea. 13 Care direct us into this excellent Mechanick way of horizontally, a Scaffold or Frame of Boards, greater or lesser, according to the designed Bigness of the Dial. Next, by some good Dial, Clock, E-quinoctial Ring. &c. get exactly the true Hour of the Day, and set your Minute Watch to it Then place a good Horizontal Dial for the Latitude of the Place and which hath a fine String fastened in its Centre, on your Level Plane or Scaffold, and the Sun fhining, turn it about till it shew the true Hour of the Day there. Then fix it; and by the motion of your Thred over every Hour, Half, Quarter, &c. you may eafily project them all into your Plane or Place defigned for the Dial.

PROLATE Spheroid, is a Solid produced by the Revolution of a Semi Ellipsis about its longer Diameter; but if a Solid be formed by the Rethis Figure is the Earth we inhabit, and perhaps all the Planets are so too, having their Equatorial

Diameter longer than their Polar.

PROMONTORY, is an Hill or High Land running out into the Sea: The Extremity of which towards the Sea, is usually called a Cape or an Headland.

PROPORTIONAL Scales, sometimes also called Logarithmetical; are only the Artificial Num-

will cast a bright Spot of Light into the Room, and advantage of Multiplying, Dividing, Extrace-Suppose then such a Hose to be the Nodus, or Point ing Roots, &c. by the means of Compasses, or by of the Top of the Perpendicular Style of any Dial, Sliding Rules; and they are only so many Lines of you may draw one or more Dials, (each side or Numbers, as they are called by Mr. Gunter. (See part of the Room being a different Plane) after Gunter's Line.) But make Single, Double, Triple, or Quadruple; beyond which they seldom go. PROSTYLE, in the ancient Greek Archite-

or other great Building.
PROVINCE, was used among the Remans for

the providing of a Bishop or any other Person, an

from which, a Line or Thred extended to the Hole bitant abuse of Arbitrary Power, made in the Parin the Window may represent either the Direct (or liament at Oxford, 1258, were called Provisions; because they provided against the King's Absolute Will and Pleasure.

PROVISO, in the Sea Phrase, for a Ship to Moor a Proviso, is for her to have one Anchor out, and also a Hawser ashore, and so she is moored with her Head to the Shore with two Cables.

PROVISOR, is he that sues to Rome for a Pro-

vision; which fee.

PROVOST Marshal, of an Army, is one appointed to secure Deserters, and all other Criminals: He is to go often abroad round the Army, to hinder the Soldiers from Pillaging: 'Tis part of his Office to indite Offenders, and to execute the

PRUDENCE, is by the Writers of Ethicks defined to be a Habit of the Mind, by which a Man-judges and determines truly how he should act and proceed, what he should do or avoid, in all things relating to his Temporal or Eternal Advan-

tage, to as to render himself happy here and here-

PRYAN Tin, is a fort of Tin that is found mix'd with a Gravelly Earth, sometimes White, but usually Red; 'tis not half so good as the other

which is made out of Stone.

PTOLEMAICK System of the Heavens, was that invented by Ptolemy; in which he supposes. the Earth immoveable any way in the Centre of the Universe, round about which the Moon first moves in a Circle; next her Mercury, then Venus: volution of a Semi-Ellipsis about its shorter Dia-meter; 'tis then called an Oblate Spheroid: And of this Figure is the Earth we inhabit, and perhaps diack from West to East. Above Saturn he places the Sphere of the fix'd Stars, which he supposes to move flowly also from East to West, on the Poles of the Ecliptick. While the fix'd Stars themselves, and all the Planets, move from East to West on the Poles of the Equator, in the space of a Natural Day or 24 Hours. This Vulgar System of Astronomy, (in which I omit to mention the Epi-cycles and Deferents, &c. with which they enbers or Logarithms placed on Lines, for the ease deavoured to solve the Phanomena which did al-

most all of them contradict this Scheme) was plainly overturned and refuted as foon as ever the use of the Telescope acquainted us with the Pha fes of Venus and Mercury; for from thence it was apparent, that their Orbits included the Sun, and therefore by degrees it came to be quite disused, Rope must and consequently I shall say no more of it.

PULLET, in a Ship, is a little Room within her Hold, in which the Piggs of Lead, or such like weighty things are put, that the Ship may be well

ballasted in a little Room.

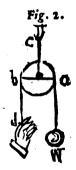

PULLEY, is a compounded Mechanick Power, confisting of one or more Shivers or Rundles with proper Blocks, &c. to raise up any Weight, &c. and this Instrument so fitted is called Trochlea or the Pulley; and at Sea with Ropes, &c. fitted so to it, it is called a Tackle.

Fig. 1.

In every Pulley, from the Position and Number of the Shivers, you may know how much the Weight W is diminished, by making the V. Motrix, or Power, to be to the Weight: as 1 to the Number of the parts of the Rope going up and down.

Only this you must ob-ferve, that it is the lower Pulleys, or Blocks with Shivers, that give any Force to the Motion; for if a Weight hang on any upper Pulley or Shiver. it will require a Power to sustain it that shall be fully equal

to the Weight.

Thus if a Weight hang as in the Position a W, it would certainly fall, if a Force or Power equal to it did not hold the Rope b d.

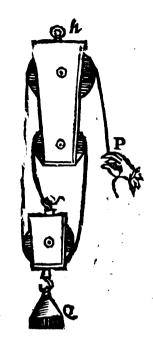

And all upper Shivers being every where of the same Nature, none of them can conduce any thing towards easing the Power or lightening the Weight; but they only ferve for the Convenience of the Motion.

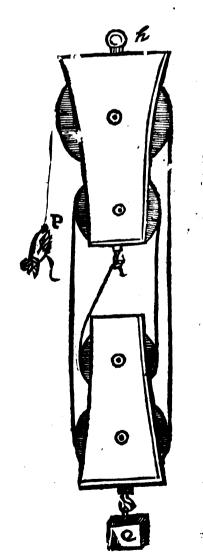

But if you suppose the Weight W (as in Fig. 1.) to be sustained by the Hook b, above the Block a b, then 'tis plain that the Hook b will sustain just half the Weight, and therefore the Power at P need be but equal to half the Weight W; for 'tis all one as if the Weight were hung to the middle of a Balance or Libra a b, whole equal Arms were upheld by two several Strings, as ba and Pb.

Tis also apparent in Fig. 1. That in order to raise the Weight W, the Height of one Foot, each part of the Rope, viz. h a and Pp; (accounting downwards from the Hook b) must be made a Foot shorter, i. e. the Power must move two Feer, in order to raile the Weight but one: Wherefore in this Engine, the way of the Power is double to that of the Weight; and therefore their Celericies will also be in the same Ratio; wherefore if the Power he to the Weight as 1: to 2, its Moment will be equal to that of the Weight, one fourth of the Weight, &c. and so will sustain the Weight. Vol. II.

If the Weight be sustained by 3 surns of the Rope, and be made to ascend one Foot (as in

Fig. 3.) then each Part, or Turn, or Fall of the shortened 1 Foot (reckoning as before from the Hook at b) and this cannot done unless the Power in P move three Feet: Here therefore the way of the Power is triple to that of the Weight, as is also its Celerity; wherefore if the Power be to the Weight as 1 to 3, or one third of it, it will sustain the Weight.

And so on in the 4th Fig. the Power P must be

The

The Pully is a Wheel not only turning round its Axis, but made to, that at the same time tis drawn up by a Rope or Cord that goes round it: This may be considered as a perpetual Homodro-mous Lever or Vedis; for the Cord which is put over the Wheel AFC being fattned at one End at D, and the other End at E being drawn or beld by some Power, so that the Weight suspended

from the middle of the Wheel AFC, be kept in Equilibrio; 'is then plain, that the moving Force is apply'd to the lower Pulley or Shiver in A, one of the Extremes of the Lever A C, the other Extreme C rising on the fix'd Rope or Chord DC as on an Hypomochlion Tis plain also, that the Weight F is suspended from the middle Point B, and consequently as A C, the distance of the moving Force from the Hypomochlion, to BC, the distance of the Point of Suspension of the Weight from the same

(that is, as 2 to 1): : so is reciprocally (from the Nature of the Lever) the Weight F to the Force fustaining it in E; and consequently one under-Pulley takes off always half the Weight, or raises double the Weight with the same Power or

But if the Pulley be fix'd above only, it affords no help towards lifting up the Weight more easily;

for here the moving Force in E must be equal to the Weight in W, because the Hypomochlion in this case is in the middle at B; and consequently the Weight and Power equidiftant from it, as in the Balance.

The upper Pulleys or Shivers then are of no other use but to facilitate the Motion of this Rope by their Volubility and apt Position.

So that to estimate the Power of the Combination of never so many Shivers or Pulleys put to-

Number of the lower Shivers, or of the Cords which pass over them without considering the upper ones, and they will give you the Multiple of the Weight to be raised this way; in comparison of what could be raised without any such help by the same Power.

So the Force of 50lb. in a Pulley with two lower Shivers will raile four times as much, viz

If the Force of 50 lb. and the Weight 200 lb be both given, and the Number of Shivers be required, 'tis plain you must divide 200 by 50; that is, the Weight by the Power, and the Quotient will be 4, the Number of Ropes, and the half of that is the Number of lower Shivers,

If the Weight, suppose 1000 lb. be given, and the Number of Pulleys or Ropes, suppose 4; then divide the Weight by the Pulleys, and the Quotient is the Power of Force required; viz. 250 lb. And this Method of proceeding will give you the Desiderata in any Combination of Pulleys, and in any Conjugation of many Combinarions.

PULMONES. See Lungs in Vol. II.

PULVINATA, in Architecture, is the Term

for a Freeze, which swells out like a Pillow.
PUMPS, in a Ship are of several sorts, as the Chain Pumps which are used in great Ships; and thele go with more ease than others, yield more Water, and are easily mended. Bare Pumps, are small ones made of a Cane or a piece of Wood bored thro, and are used to pump Beer or Water out of the Caske. Bur-Pumps, are used by the Dutch, who have them by their Ships fides. In these there is a long Staff with a Bur at the end like a Gunner's Spunge, to pump up the Bildgewater: Thele are also called Bildge Pumps.

PUNCHINS, in Architecture, are short pieces of Timber, placed to support some considerable Weight: They commonly stand upright between the Posts, and are shorter and slighter than either the Principal Posts or Prick Posts. Those that stand on each side of a Door are called Door Pun-

PUNCTATED Hyperbola, is an Hyperbola whose Oval Conjugate is infinitely small, that is, a See Curves.

PUNCTUM. See Point.
PUNCTUM Formatum seu Generatum; in Conicks, is a Point determined by the Intersection of a Right-Line drawn thro the Vertex of a Cone to a point in the Plane of the Base, with the Plane that constitutes the Conick Section. See De la Hire's

Latin Conicks, p. 15. 16. PUNCTUM ex Comparatione, is either Focus in an Ellipsis and Hyperbola; and it was so called by Apollonius, because the Rectangles under the Segment of the Transverse Diameter in the Ellipfis, and under that and the Distance between the Vertex and Focus in the Hyperbola, are equal to part of what he calls the Figure.

PUNCTUM Lineans; is that point of the generating Circle, which in the Formation of either Simple Cycloids or Epicycloids, produces any pare of a Cycloidal Line. See Epicycloid.

PUNITORY Interest, is a Term in the Civil Law, for such Interest of Money as is given for

Delay, or Breach of Trust.
PURE Hyperbola, is one which by the Impossibility of its 2 Roots is without any Oval, Node, Spike, or Conjugate Point. See Curves ...

PURGATIVE Medicines; the manner of their Operation is very well accounted for by Dr. Cheyne in his Book of Fevers, thus: Purgative Medicines being received into the Stomach by the Mouth, their Particles do there vellicate or stimulate the Fibres of the Stomach, and thereby encrease the Digestive Faculty; i. e. bring the Muscular Fibres of the Stomach, and the Muscles of the Abdomen and Diaphragm into more frequent Contractions than ordinary, till they are admitted into the Inte-fines; the Fibres and Glands of which being more sensible than those of the Stomach (whose Parts, by the frequent rough Contacts of one against another, and of the gross Bodies which are often thrown into it, are as it were deadned) they eafily move and bring them into frequent forcible Contractions; whereby these Glands are squeezed, and so emit a Fluid which lubricates the Passages: And this mixing with the Fæculent Matter of the Intestines (which is rendred stuid by the same active and stimulating Quality of the Purgative Medicine) renders it more fluid; by which, and

by the uncommon Contractions of the Intestines, it pattes more easily and plentifully into the Re-Elum Intestinum, and is thence ejected by Stool. Thus gentle and easie Purges act, and do only cleanse the Intestines, sew of their Particles entring in by the Lacteal Veins and so affecting the Blood: But in violent Purgatives, the stimulating Particles are mixed with the Blood, and produce there many times very great effects by occasioning unnatural Fermentations, by separating the natural Cohe fions of the Liquors of the Body; and also by vellicating the Spiral Fibres of the Veins and Arteries, bring those into more forcible Contractions, and thereby accelerate the Motion of the Blood; all which may sometimes have a good and sometimes a bad effect.

PURLINS, in Architecture, are those Pieces of Timber which lie across the Rasters on the Inside, to keep them from finking in the middle of their

PURPARS, a Purparty, is that part or share of

an Estate, which being held in Common by Copartners, is by Partition allotted to any one of them

PUTLOGS, are short pieces of Timber (about 7 Foot long) used in Building Scaffolds; they lie at Right-Angles to the Wall with one of their Ends resting upon the Ledgers or Poles which lie parallel to the side of the Wall of the Building.

PYRAMIDALES Papilla. See Papilla Pyra-

PYRAMIDOID, is what is fometimes called a Parabolick Spindle; and is a solid Figure formed by the Revolution of a Parabola round its Base or greatest Ordinate; and if you consider it according to the method of Indivisibles, you may conceive its Solidity to confift of an infinite series of Circles whose Diameters are all parallel to the Axis of the Revolving Parabola

PYTHAGORICK Tetrattys, was a Point, a Line, a Surface, and a Solid.

QUA

QUADRAGATA Terra; a Team of Land: or which may be tilled with 4 Horses.

QUADRAGESIMA, is the first Sunday in Lent, and so called, because 'tis about the fortieth Day before Eafter; and on the same account the three preceding Sundays are called Quinquagesima, Sexa-

gesima, and Septuagesima

QUADRAGESIMALS: In Popish Times 'twas the Custom for People to visit their Mother Church on Midlent Sunday, and to make their Offerings ar the High Altar. And the like kind of Superstitions Devotion was also used in Wnitson week: But as the Processions and Oblations at Whitsonside were sometimes commuted for a rated Payment of Pentecostals or Whitson Farthings; so these were changed into a Customary Payment, and were called Quadragesimals, Denarii Quadragesimales; and sometimes Letare Jerusalem, because that Hymn was sung on Midlent Sunday. The Custom of Mothering, as 'cis called in many places in England, is still retained, being that of vifiting Parents on Midlent Sunday; and it feems to be called Mothering from the Respect thus in old Time paid to the Mother Church. And the Epistle of Ga lat. 4. 21. is still retained on Midlent Sunday, which began Jerusalem mater omnium, &c. tho' the occasion of it is forgotten.

QUADRANS, the fourth part of a Penny, or a Farthing; for before the Reign of Edw. 1. our smallest Coin was a Penny, called then Steeling; and it was stamp'd with a Cross or Traverse Stroke, so that it might on occasion be cut easily or broken into Halves or Quarters: But to avoid the Fraud of unequal division of the Penny, this King Edw. 1. coined Half-pence and Farthings in round distinct

Pieces.

eces. Matt. West. in Anno 1279. QUADRANT of Davis. See Back staff. QUADRANTATA Terra, the sounth part of an Acre.

QUADRAT: To Quadrat a Piece of Ordnance, is to see whether it is duly placed in its Carriage, and that the Wheels be of an equal Height. composed of Parts extreamly small, but as generated Vol. II.

QUA

QUADRATRIX of the Hyperbola: There is a new Curve lately invented by Mr. J. Perks of Great Swinford in Worcester shire, for the Quadrature of the Hyperbola; of which see an Account in Phil. Trans. N. 306.

QUADRATURE Lines, or Lines of Quadrature; are two Lines placed usually, or at least sometimes, on Mr. Gunter's Sector, and eafily known there, by being mark'd with the Letter Q, and the Figures 5, 6, 7, 8, 9, 10; of which Q fignifies the fide of a Square, and the other Figures the fides of Polygons of 5; 6, 7, &c. Sides. S. there stands for the Semi-diameter of a Circle, and 90 for a Line equal to 90 Degr. in the Circumference

Their Uses are readily (tho' not exactly) These:

1. To make a Square equal to a given Circle.

Open the Sector to the Radius of the given Circle by applying it over in the Point S, S, and then the Parallel Diffance between the Points Q Q. is the fide of the Square required.

2. To make a Circle equal to a given Square.

Apply the fide of the Square over in Q.Q. so will the Parallel Distance between S, S. be the Radius of the Circle fought.

3. To reduce a Square, or a Circle, into a Pentagon or other regular Polygon equal to it.

Take the Side of the Square, or Radius of the Circle given, and apply it over in its proper Points, and then the Parallel Distances between the Points of any of the other Polygons, shall be the Sides of thole Regular Figures.

QUADRATURE of Curves, by Sir If. New-

I don't here consider Mathematical Quantities as 3 U 3

of Parts, but by a continual motion of Points. Surfaces are generated by the motion of Lines, Solids by the motion of Surfaces, Angles by the Rotation of their Legs, Time by a continual flux, and so in the rest. These Geneses are founded upon Nature, and are every Day seen in the motion

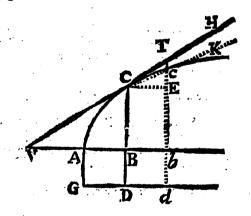

And after this manner the Ancients by carrying moveable right Lines along immoveable ones in a Normal Polition or Situation, have taught us the

Geneles of Rectangles.

Therefore considering that Quantities, encreafing, in equal times, and generated by this encreafing, are greater or less, according as their Velocity by which they encrease, and are generated, is greater or less; I endeavoured after a Method of determining the Quantities from the Velocities of their Motions, or Increments, by which they are generated; and by calling the Velocities of the Motions, or of the Augments, by the Name of Fuxions, and the generated Quantities Fluents, I (in the Year 1665 and 1666) did, by degrees, the generated Solid ABC will be as the generated Soli light upon the Method of Fuxions, which I here make use of in the Quadrature of Curves.

Fluxions are very nearly as the Augments of the Fluents, generated in equal, but infinitely small parts of Time; and to speak exactly, are in the Prime Ratio of the naicent Augments: but they may be expounded by any Lines that are proportional to em. As if the Areas ABC, ABDG be described by the Ordinates BC, BD, moving with an uniform motion along the Base AB, the Fluxions of these Areas will be to one another as the describent Ordinates BC and BD, and may be expounded by those Ordinates; for those Ordinates are in the same Proportion as the Nascent

Augments of the Areas.

Let the Ordinare B.C move out of its place BC into any new one bc: Compleat the Parallelogram BCEb, and let the right Line VTH be drawn which may touch the Curve C and meet bc and B A produced in T and V; and then the just now generated Augments of the Abscissa AB, the Ordinate BC, and the Curve Line ACc, will be Bb, Ec, and Cc; and the Sides of the Triangle CET, are in the Prime Ratio of these Nascent Augments, and therefore the Fluxions of AB, BC and AC are as the Sides CE, ET, and CT of the Triangle CET, and may be expounded by those Sides, or, which is much at one, by the Sides of the Triangle VBC similar to it.

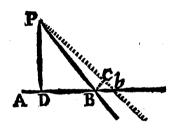

'Tis the same thing if the Fluxions be taken in the ultimate Ratio of the Evanescent Parts. Draw

by a continual motion. Lines are described, and the Right Line Cc, and produce the same to K. by describing are generated, not by any apposition Let the Ordinate bc return into its former place BC, and the Points C and c coming together, the Right Line C K co-incides with the Tangent C H, and the Evanescent Triangle C E a in its ultimate form becomes fimilar to the Triangle C ET, and its Evanescent Sides C E, E c and C c will be ultimately to one another as are C E, E T and C T the Sides of the other Triangle CET, and therefore the Fluxions of the Lines AB, BC and AC are in the same Ratio. If the Points C and c be at any small distance from one another, then will CK be at a small distance from the Tangent cH. At soon as the Right Line CK coincides with the Tangent CH, and the ultimate Ratio's of the Lines CE, Ec and Cd be found, the Points C and c ought to come together and exactly to coincide. For Errours, tho' never so small, are not to be neglected in Mathematicks.

> By the same way of arguing, if a Circle described on the Centre B with the Radius BC, be drawn with an uniform motion along the Abscissa AB, and at Right Angles to it, the Fluxion of ting Circle, and the Fluxion of its Surface will be as the Perimeter of that Circle and the Fluxion of the Curve Line AC conjointly. For in what time the Solid ABC is generated by drawing the Circle along the Abscissa AB, in the same time its Surface is generated by drawing the Perimeter of that Circle along the Curve A C.

Of this Method take the following Examples.

Let the Right Line PB revolving about the given Pole P cut the Right Line A B given in Position; the Proportions of the Fluxions of the Right Line A B and P B is required.

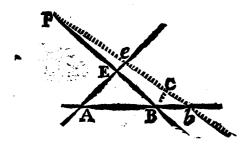

Let the Right Line P B go out of its place P B into a new one Pb: In the Line Pb take PC equal to PB, and draw PD to AB for that the Angle bPD may be equal to the Angle bPC; and then from the Similarity of the Triangles bBC, bPD, the Augment Bb, will be to the Augment Cb as Pb is to Db.

Now let P b return into its former place P B, that those Augments may vanish, and the ultimate Ratio of the Evanescent Augments, that is, the ultimate Ratio of Pb to Db will be the same as that of PB to DB, the Angle being right; and therefore the Fluxion of AB is to the Fluxion of

PB in this Ratio.

Let the Right Line PB revolving about the given P Pole cut AB and AE two other Right Lines given in Position in B and E; 'tis required to find the Proportion of the Fluxions of those Right Lines AB and AE.

Let

Let the revolving Line P B move out of its place PB into a new one Pb, cutting AB, AE into the Points b and E, and draw BC parallel to AE, meeting Pb in C; then Bb will be to BC as Ab is to Ae; and BC to Ee as $Ab \times PB$, to $Ae \times PE$. Now let the Right Line Pb return the sum of th into its former place P B, and the Evanescent Augment Bb will be to the Evanescent Augment Be as $AB \times PB$ is to $AE \times PE$, and therefore in this Ratio is the Fluxion of the Right Line AB to the Fluxion of the Right Line A E.

Hence if the revolving Right Line PB cut any Curve Lines given in polition in the Points B and E, and the moveable Right Lines AB, AE touch those Curves in B and E, the Points of Section; the Fluxion of the Curve which the Right Line AB touches, will be to the Fluxion of the Curve which the Right Line A E touches, as A B×P B is to A E×P E. The fame thing will happen if the Right Line P B always touch any Curve given in Polition in the moveable Point P.

Let the Quantity x from uniformly, and let the Fluxion of x^n be to be found. In the same time that the Quantity x by flowing becomes x + o, the Quantity x^n with become $x + o \mid n$, that is, by the Method of Infinite Series's $x^n + no$ $x^{n-1}+\frac{nn-n}{2}$ 00 $x^{n-2}+\mathcal{G}c$. and the Augments o and 2 00x1-2 +, Scare to one another as 1

and $nz^{n-1} + \frac{nn-n}{2} \circ ox^{n-2} +$, c. Now let those Augments vanish, and their ultimate Ratio will be the Ratio of 1 to nxn-1; and therefore the Fluxion of the Quantity x is to the Fluxion of the Quan-

tity xn as I to nxn-1.

By like ways of arguing, and by the method of Prime and Ultimate Ratio's, may be gathered the Fluxions of Lines, whether Right or Crooked in all cases whatsoever, as also the Fluxions of Surfaces, Angles and other Quantities. In Finite Quantities so to frame a Calculus, and thus to investigate the Prime and Ultimate Ratio's of Nascent or Evanescent Finite Quantities, is agreeable to the Geometry of the Ancients; and I was willing to shew, that in the Method of Fluxions there's no need of introducing Figures infinitely small into Geometry. For this Analysis may be performed in any Figures whatsoever, whether finite or infinitely small, so they are but imagined to be similar to the Evanescent Figures; as also in Figures which may be reckoned as infinitely small, if you

do but proceed cautiously.

From the Fluxions to find the Fluents is the more difficult Problem, and the 1st step of the So-Intion of it is equivalent to the Quadrature of Curves; concerning which I have formerly written the following Tract.

A Treatise of the Quadrature of Curves.

I consider indetermined Quantities as encreasing or decreasing by a perpetual motion, that is, as flowing encreasingly or decreasingly; and I reprelent em by the Letters 2, 7, x, v, and I mark their Fluxions or their Celerities by which they encrease by the same Letters with Points over 'em thus, z, y, x, v. There are likewise Fluxions of Fluxions, or Mutations more or less swift, which may be called the Second Fluxions of z, y, x, v, and may be marked thus, z, y, z, v; and the First Fluxions of these, or the Third Fluxions of z, y, z, v, thus, z, y, z, v; the Fourth thus z, y, z, v, &c. And as z, y, z, v, and these are Fluxions of the Quantities z, z, z, z, z, and these Fluxions of the Quantities x_1, y_2, x_3, v_4 , and these Fluxions of the Quantities, x_2, y_3, x_4, v_5 . So these Quantities may be considered as Fluxions of others, which I shall mark thus, z, y, x, v; and these as Fluxions of others z, z, z, v, and these as Fluxions of others 7, 7, x, v. Wherefore 7, 7, 7, 7, 7, 7, 7, &c. represent a Series of Quantities, in which every subsequent one is the Fluxion of the precedent, and any preceding one is a flowing Quantity or a Fluent, which has for its Fluxion that which follows it.

Of the like nature is this Seties Jaz "77, $\sqrt{a\chi}$ — $z\chi$; as also this Series, 42 + 22 42 + 23 42 + 22 42 + 23 42 + 23 42 + 24

And it is to be observed, that any preceding Quantity in these Series's is as the Area of a Curvilineal Figure, whose Ordinate Applicate apply'd at Right Angles is the flowing Quantity; and

its Abscissa z: as √ az - zz is the Area of a Curve whose Ordinate Applicate is $\sqrt{az-zz}$ and the Abscissa z.

The defign of all this will be apparent from the following Propositions.

Prop. 1. Prob. 1.

Having given an Equation involving any number of fluent or flowing Quantities, to find their Fluxions.

Solution

Multiply every Term of the Equation by the Index of the Power of each flowing Quantity contained in that Term, and in each Multiplication change the Root of the Power into its Fluxion; and then the Aggregate of all the Products' under their proper Signs will be the new Equation.

Expli-

Explication.

Let a, b, c, d, &c. be determined and immutable Quantities, and let any Equation be proposed containing the fluid or flowing Quantities z, y, &c. as $x^2 - xyy + aaz - b^2 = 0$. First let the Terms be multiply d by the Indexes of the Powers of x, and in each Multiplication, instead of the Root or Side of the Power, or instead of x of one dimension only, write x, and the Summ of the Products will be $3xx^2 - xyy$. Let the same be done by y, and you will have -2xyy: Do the same by z, and there will be produced aaz. Let the Summ of the Products be put equal to z and you will have the Equation z be z and z be z and z be z and z be z and z be z and z be z and z be z be z and z be z and z be z be z and z be z be z and z be z be z and z be z be z be z be z and z be z be z be z by z and z be z be z be z by z and z be z be z by

Demonstration.

For let o be a Quantity extreamly small, and let 0.7, 0.7, 0.8, be the Moments of the Quantities 2.7, 3.7, 3.7; that is, the momentaneous synchronal Increments. And if the flowing Quantities are now 3.7, and 3.7, these after a moment of time being augmented by their Increments 3.7, 3.7, 3.7, which being substituted in the first Equation instead of 3.7, and 3.7, give this Equation, 3.7 and 3.7 and 3.7 give this Equation, 3.7 and

A more full Explication of the same thing.

After the same manner, if the Equation were $x^2 - xyy + aa \sqrt{ax - yy} - b^2 = 0$, there would be produced $3x^2x - xyy - 2xyy + aa \sqrt{ax - y} = 0$; where, if you wou'd take away the Fluxion $\sqrt{ax - yy}$, put $\sqrt{ax - yy} = z$, and then will ax - xyy =

And by the same Operation, you may proceed to Second Fluxions, Third Fluxions, and so on: Let the Equation $\chi y^2 - \chi^4 + a^4$ be o, then it will be made by the first Operation, $zy: +3zyy^2 - 4\zeta z^3 - c$, by the Second Operatation $zy: +6\zeta yy_2 + 3zyy_2 + 6\zeta y^2 - 4\zeta z^3 - c$; and by the Third, $zy: +9zyy: +9z: +2\zeta z^2z^2 - c$; and by the Third, $zy: +9zyy: +9z: +2\zeta z^2z^2 - c$; and zy: +3zyy: +

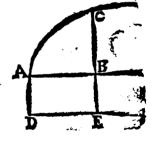

But when we thus proceed to Second and Third Fluxions, 3c. it is convenient to confider some Quantity as flowing uniformly; and for its first Fluxion to write 1; but for the second and following ones o. Let the Equation be $z^{j2} - z^{j} + a^{j} = 0$, as above; and let z flow uniformly, and let its Fluxion be Unity; and then by the first Operation it will become $y^{j2} + 3zy^{j2} - 4z^{j2} = 0$, by the Second $6y^{j2} + 3zy^{j2} + 6zy^{j2} - 12z^{j2} = 0$, by the Third $9y^{j2} + 18y^{j2} + 3zy^{j2} + 18z^{j2} + 6z^{j2} - 24z = 0$. But in Equations of this kind we must conceive,

But in Equations of this kind we must conceive, that the Fluxions in each of the Terms are of the same Order, that is, that they are all either of the first Order j, χ , or all of the Second γ , γ^2 , γ^2 , γ^2 , γ^2 , or all of the Third, γ , γ^2 , γ^2 , γ^2 , γ^2 , γ^2 , γ^2 , γ^2 , γ^2 , γ^2 , &c. And when the thing happens otherwise, the Order is to be compleated by the supposed Fluxions of a Quantity flowing uniformly; and then the last Equation, by compleating the third Order, becomes $9\chi \gamma \gamma^2 + 18\chi \gamma^2 \gamma + 3\chi \gamma \gamma^2 + 18\chi \gamma \gamma \gamma + 6\chi \gamma^2 - 24\chi \chi^2 = 0$.

Prop. 2. Prob. 3.

To find the Curves that are Quadrable.

Let ABC be the Figure, whose Area is to be found; BC an Ordinate apply'd at Right Angles, and AB the Abscissa. Produce CB to E that BE may be—I, and compleat the Parallelogram ABED; and the Fluxions of the Areas ABC,

ABED will be as BC and BE: Therefore take any Equation by which the Relation of the Areas may be determined, and thence will be given the relation of the Ordinates BC and BE, (by Proposition 1.) Q. E. D.

position 1.) Q. E. D.

We shall give Examples of this thing in the two following Propositions.

Prop. 3. Theor. 1.

Demonstration.

For if z^{θ} $R^{\lambda} = v$, then by the first Prop. will $\theta z z^{\theta-1}$ $R^{\lambda} + \lambda z^{\theta}$ R $R^{\lambda-1} = v$. Instead of R^{λ} in the first term of the Equation, and z^{θ} in the second, write R $R^{\lambda-1}$ and $z^{\theta-1}$, and then the Equation will become $\theta z R + \lambda z R$ into $z^{\theta-1}$ $R^{\lambda-1} = v$. But R was taken equal to $E + fz n + gz^{-1} + fz z^{\eta} + fz z^{\eta}$. Sc. and consequently (by Prop. 1.) $R = nfz z^{\eta-1} + 2ngz z^{2\eta-1} + fz z^{\eta} + fz z^$

then will θ , $+\theta$ $+f\chi^n$ $+\theta$ $+2\lambda_n e^{\chi^n}$ $+3\lambda_n b^{\chi^n}$ +Sc. into zen Rhal be wBC. Q. E. D.

Prop. 4. Theor. 2.

If for the Abscissa AB be put z, for $e+fz^n+gz^{2n}+$, &c. be put R, and S for $k+lz^n+mz^{2n}+$ &c. Let the Area of the Curve be $z^0R^\lambda S^\mu$; then the Ordinate Applicate B C will be =

This is demonstrated after the same manner as the former Proposition.

Prop. 5. Theor. 3.

into $a+bz^n+cz^{2n}+dz^{2n}+8c$. and let $a+bz^n+cz^{2n}+dz^{2n}+8c$. and let $a+bz^n+cz^{2n}+dz^{2n}+8c$. Then $a+bz^n+cz^{2n}+dz^{2n}+8c$. Then $a+bz^n+cz^{2n}+dz^{2n}+8c$. Then $a+bz^n+cz^{2n}+dz^{2n}+8c$. Then $a+bz^n+cz^{2n}+dz^{2n}+8c$. In the latter Case =r. and r+x=S. S+x=1.1+x=v, &c. Then the Area will be 28 R multiply'd into $\frac{1}{re}$ $\frac{\frac{1}{n}b \cdot SfA}{r+1,e} z_0 + \frac{\frac{1}{n}C - \frac{e}{r}fB - \frac{e}{r}A}{r+2,e} z_2 + \frac{\frac{1}{n}d - \frac{e}{r}fC - \frac{e}{r}ZB - \frac{e}{r}A}{r-3,e}$ $73^{3} + \frac{-\frac{1}{2}fD - \frac{1}{2}gC - \frac{1}{2}hB}{r+4}$, &c. where A, B, r+4, e. c. denote the whole given Co-efficients of each Term in the Series with their Signs + and -, viz. A denotes the Co-efficient of the first Term 34, B the Co-efficient of the second Term -SfA, C the Co-efficient of the third Term $\frac{-\frac{1}{1}fB-igA}{r+2, e}$, and so on.

Demonstration.

According to Prop. Third.

Let the Ordinates of the Curves be, and their AZO RA 2. ... $\theta + \eta$, $eBz_{1} + \frac{1}{4} \frac{\partial + \eta}{\partial \eta} fBz_{2}$ +0+n 1 N B 234, &c. 3: + 0+2n, eCz²ⁿ +0 +2nfCz³ⁿ, &c. C70+2, RX D78+3"R eDz3*, &c.

ply'd into $\chi^{\theta-1} R^{\lambda-1}$, the Sum of the Areas $z^{\theta} R_{\lambda}$ into $A + Bz^{\eta} + C\chi^{2\eta} + D\chi^{3\eta} + &c.$ will be equal to the Area of a Curve which has that for an Ordinate. Therefore let the Corresponding Terms of the Ordinate be equal; and then a will become = 0:A, $\frac{0}{\lambda n} \int_{-\lambda n}^{\lambda} \int_{-\lambda n}^{0} \int_{-\lambda n}^{0} \int_{-\lambda n}^{\lambda} \int_{-\lambda n}^{0} \int_{-\lambda$ e C, &c. and thence $\frac{a}{\theta e} = A$. $\frac{b - \theta + 2\lambda n}{\theta + n}$. - 10 + 2 x 11 8 A - 10 + 11 + x 11 FB

Now put $\frac{\theta}{n}$ r. $r+\lambda=S$. $S,+\lambda=t$, &c. and in the Area z^0 $R^{\lambda} \times A + Bz^{\mu} + Cz^{2\mu} + Dz^{3\mu}$, &c. write the values of ABC found above, and there will come out the propos'd Series. Q. E. D.

And it is to be observed, that every Ordinate is resolved into a Series two ways: For the Index m may either be Affirmative or Negative. Let an Ordinate be proposed 3k-133

77/k7-123-mz4 this may If z be put for the Abscissa of the Curve AB, and R be put for $\frac{1}{2} + \frac{1}{$ a=-1. b=0. C=3k. e=m. f=-1, g=0. b=1. =_1.0-1=/.0=2,r=-2.S=__1¹: -1. Each of these Cases must be try'd; and if either of the Series be broken off and terminated, the Terms at length growing different, the Area of the Curve will be had in Finite Terms. So in the former Case of this Example, by writing in the Series the Values of a, b, c, e, f, g, b, a, b, r, s, e, v, all the Terms except the first vanish. ad infinitum, and the Area of the Curve becomes 2 k-122 1-m23. And this Area, by reason of the negative Sign, adjoyns to the Abscissa produced beyond the Ordinate. For every Affirmative Area adjoyns to both the Abscissa and Ordinate, but a Negative one falls on the contrary parts of the Ordinate, and adjoyns to the Abscissa produced, the Sign of the Ordinate remaining. By this means one of the Series, and sometimes both, is always terminated and finite; if the Curve can be squared Geometrically.

But if the Curve don't admit of such a Quadrature, both Series will be continued in infinitum, and one of 'em will converge and give the Area by approximation, except where r (by reason of the infinite Area) is either nothing or an Integer Number and Negative, or where $\frac{7}{e}$ is equal to Unity. If $\frac{7}{e}$ be less than Unity, that Series will converge in which the Index , is affirmative; but if greater than Unity, the other Series will converge. In one Case the Area adjoyns to the Abscissa drawn as far as the Ordinate, in the other Case it adjoyns to it produced beyond the Ordinate.

Note farther, that if the Ordinate be a Rectangle under the Rational Factor Q and the Surd irreducible Factor Rr, and the Side R of the Surd Fa-ctor does not divide the Rational Factor Q; then A-I will be = ; and R = I=R*: but if the Side R of the Surd Factor divide the Rational Factor And if the Sum of the Ordinates be put equal once, $\lambda = 1$ will be +1 and -1 and -1 to the Ordinate -1 by -1 cz²ⁿ -1 de -1 kc. multi- if it divide it twice, -1 will be -1 and $R^{\lambda} = R^{\pi+2}$: If thrice, $\lambda = 1$ will be $= \pi + 3$ and $R^{\lambda-1} = R^{\pi+3}$, and so on, $\mathfrak{C}c$.

If the Ordinate be a rational irreducible Fraction whole Denominator is composed of two or more Terms; the Denominator is to be resolved into all its first Divisors. And if there be any Divisor which has never another equal to it, the Curve is not Quadrable. But if there be two or more Divisors equal, one of them must be thrown away, and ftill there will be two others or more, which are equal amongst themselves and unequal to the former; one of these also must be rejected, and so of all others that are equal, if there still be more; then the Divisor that is lest, or the Product under all the Divisors which are lest, if there be more, must be put instead of R and Rthe reciprocal of the Square of R for Ra-', except where that Product is a Square, or a Cube, or a Biquadrate, &c. in which case the Side of it is to be put instead of R. and the Index of the Power 2, 3, of 4, taken negatively instead of A; and the Ordinate must be reduced to the Denominator R', R', R', or R', &c.

Let the Ordinate be 25 + 24 - 823 because this Fraction is irreducible, and the Divifors of the Denominator are equal, viz. z-1, z-1, z-1, z-1, z+2, & z+2, 1 reject one Divisor of either magnitude, and the product of the remaining $\chi = 1, \chi = 1$, $\chi = 2$, which is $\chi^3 = 2\pi + 2$. I put instead of R; and the Reciprocal of the Square of R which is $\frac{1}{R^2}$ or R^{-2} instead of Rx.1. Afterwards I reduce the Ordinate to the Denominator R2 or R1-A, and it becomes -921+823 $\frac{z^{2}-9z^{4}+8z^{3}}{z^{3}-3z^{4}+2|z^{2}}$, that is, $\frac{z^{3}\times8\cdot9z^{4}+z^{3}\times2\cdot3z+z^{3}|\cdot\cdot2}{z^{4}-3z^{4}+2|z^{4}}$. And thence is a=8. b=-9. C=0. d=-1, &c. B=2. f=-3. g=0. b=1. A=1=-2. A=1. a=1. b=1. a=1. b=1. a=1. b=1. a=1. b=1. a=these being put in the Series, the Area comes out 34+2; all the Terms in the Series, except the first, vanishing.

If lastly, the Ordinate be an irreducible Fraction, whose Denominator is a Product under the Rational Factor Q, and the Surd irreducible Factor R, you must find all the first Divisors of the Side R, and reject one Divisor of each magnitude; and by those Divisors that remain, if there be any, multiply the Rational Factor Q; and if that Product be equal to the Side R, or any

Power of that Side whose Index is an Integer Number; let that Index be m, and a-I will be $-\pi$ -m and $R^{\lambda} = R^{\pi-m}$, so that if the Ordinare be $\frac{3q^3-q^4x+9q^2xx-qqx^3-6gx^4}{qq-xx^3}$, because the Side R of the Surd Factor or $q3+qqx-qxx-x^3$ has the Divisors q+x, q+x, q-x, which are of two Magnitudes, I reject one Divisor of each Magnitude, and multiply the rational Factor q+x by the Divisor that is left q+x. And beqq - xx by the Divisor that is left q + x. And because the Product $q_3 + qqx - qxx - x_3$ is equal to the Side R, I put m = 1. and thence, since π is $\frac{1}{2}$, A-1 becomes = 4. Therefore I reduce the Ordinate to the Denominator R-4, and tis made $z_0 \times 2q^6 + 2q^5x + 8q^4xx + 8q^3x^3 \cdot 7qqx^4 \cdot 6qx^5 \times q^3 + qq$ $x - x^4 = \frac{4}{3}$. from whence a is $= 3q^6$. $b = 2q^5$, &c. $e=q^3 \cdot f = qq$, &c. $\theta = 1 = 0$. $\theta = 1 = 1$. $\lambda = -\frac{1}{4}$. r=1. $S=\frac{1}{4}.$ s=0. and these Values be. ing put in the Series, the Area comes out $\sqrt{43+aax-axx-x^2}$, all the Terms in the whole Series after the third, vanishing,

Prop. 6 Theor A.

If the Abscissa A B of a Curve be z, and R be be put in the room of $e + fz^n + gz^{2n} + bz^{2n} + bc$, &c. and S in the room of $k + lz^n + mz^{2n} + nz^{2n}$, &c. then let the Ordinate Applicate be $z^{\theta \cdot 1} R^{\lambda \cdot 1} S^{\mu \cdot 1}$ multiply'd into $a + bz^{\mu} + Cz^{2\mu} + dz^{3\mu}$, &c. if there be the Rectangles of the Terms e, f, g, b, &c. and k, l,

And if the numeral Co-efficients of thole Reckangles be respectively,

$$\vec{r} = \vec{r}$$
, $\vec{r} + \lambda = S$. $\vec{S} + \lambda = t$. $t + \lambda = v$. &c. $\vec{r} + \mu = \dot{S}$. $\vec{S} + = \dot{t}$. $t + \mu = \dot{v}$. $v + \mu = \ddot{w}$. &c. $\vec{S} + \mu = \ddot{v}$. $\vec{v} + \mu = \ddot{w}$. $\vec{v} + \mu = \ddot{v}$. $\vec{v} + \mu = \ddot{v}$. $\vec{v} + \mu = \ddot{v}$. $\vec{v} + \mu = \ddot{v}$. $\vec{v} + \mu = \ddot{v}$. $\vec{v} + \mu = \ddot{v}$. $\vec{v} + \mu = \ddot{v}$. $\vec{v} + \mu = \ddot{v}$. $\vec{v} + \mu = \ddot{v}$. $\vec{v} + \mu = \ddot{v}$. $\vec{v} + \mu = \ddot{v}$. $\vec{v} + \mu = \ddot{v}$. $\vec{v} + \mu = \ddot{v}$.

The Area of the Curve will be

$$z^{0} R^{\lambda} S^{\mu} \text{ into } \frac{\frac{1}{r}a}{\frac{1}{r+1}} + \frac{\frac{1}{r}b}{\frac{1}{r+1}} \cdot \frac{s}{e^{i}} - \frac{1}{r+1} \cdot \frac{f}{e^{i}} + \frac{g}{r+2} \cdot \frac{e^{i}}{r+2} \cdot \frac{g}{r+2} \cdot \frac{e^{i}}{r+2} \cdot \frac{g}{r+2}$$

first Term, with its Sign | or -, B the given Terms 4, b, c, &c. e, f, g, &c. k. l, m, &c. one or

Where A denotes the given Co-efficient of the Co efficient of the fecond Term, C the given

more may be wanting. This Proposition is demonstrated after the manner of the former, and what was observed there takes place here also. But the Series of such Propositions as these run on ad infinitum, and the Progression of the Series is evident.

Prop. 7. Thear. 5.

If R be put instead of $e + /\chi_0 + g\chi^{2n}$, &cc. as above, and in the Ordinate of any Curve $\chi \theta + m\sigma R^{n} + \tau$ there remain the given Quantities θ , n, e, f, g, &cc. and instead of σ and τ be put any Integer Numbers successively, and if the Area of the G curves be given which are defined. one of these Curves be given, which are denoted by innumerable Ordinates coming out in these forms, if the Ordinates be Binomials in the Vinculum of the Root, or if the Areas of two of those Curves be given; if the Ordinates be Trinomials in the Vinculum of the Root, or the Areas of three of those Curves; if the Ordinates are Quadrinomials in the Vinculum of the Root, and so on infinitely: I say, that the Areas of all these Curves will be given. For Nomes I here take all the Terms in the Vinculum of the Root, as well defi-cient as entire, the Indexes of whose Powers are in an Arithmetical Progression. So the Ordinate 44-4x3+x4 by reason of the two different Terms between 44 and ax3 ought to be reckoned a Quinquenomial. But $\sqrt{44+x4}$ is a Binomial, and a Trinomial, seeing the Progression now proceeds by greater differences. This Proposition is thus demonstrated.

Cafe 1:

Let the Ordinates of two Curves be pzg-1Rx-1

Let the Ordinates of two Curves be $p\chi^{6+1}R^{3-1}$ and $q\chi^{6+1}R^{3-1}$, and their Areas $p\Lambda$ and qR, R being the Trinomial Quantity $e+f\chi^{n}+g\chi^{2n}$. And by Prop. 3. fince $\chi^{6}R^{3}$ is the Area of a Curve whose Ordinate is $\theta:\frac{1}{2}\frac{1}{N}\frac{1}{N}f\chi^{n}+\frac{1}{2}\frac{1}{N}\frac{1}{N}g\chi^{2n}$ multiply'd into $\chi^{6-1}R^{3-1}$, subduct the former Ordinates and Areas from this latter Ordinate and Area, and there will remain 0 + 0 + 0 = 0 there will remain 0 + 0 + 0 = 0 there will remain 0 + 0 + 0 = 0 multiply'd into $z^{\theta-1}$ $R^{\lambda-1}$ the new Ordinate of the Curve; and z^{θ} R^{μ} —pA—qB its Area. Put θe —p, and $\theta + \lambda u f$ = q and the Ordinate will be found +2An 87²ⁿ multiply'd into 28-1 RA-1, and the Area 30 Rh—0eA— f B—A n f B. Divide both by 05+2 Ang, and call the Area that will come out C, and taking r at pleasure, r C will be the Area of a Curve whose Ordinate is $r \neq 0$ + $a^{n-1} R^{n-1}$. And after the same manner that from the Areas p A and q B we find the Area r C agreeing to the Ordinate rzo x 21-1 R. 1, we may from the Areas q B and rC find a fourth Area, as S D, agreeing to the Ordinate $S_{\zeta_0}^{0+3n-1}$ $R^{\lambda-1}$, and so on infinitely. And from the Areas B and A there is a like Ratio of Progression towards a contrary part. If any of the Tetms θ , $\theta + \lambda u$, and $\theta + \lambda x u$ be wanting, and break off the Series, assume the Area p A in the beginning of one Progression, and the Area q B in the beginning of the other and from the forms A the beginning of the other, and from these two Areas will be given all the Areas in both Progressions. Vol. II.

And on the contrary, from any two other Areas affumed, one may go back by an Analysis to the Areas A and B, so that from these two Areas given, all the rest may be given likewise. Q. E. D. This is the case of those Curves where 0 the Index of z is encreased or diminished by a perpetual addition or subduction of the Quantity n. The other is the case of those Curves where the Index a is encreased or diminished by Unites.

Cafe 2.

If the Ordinates $p\chi^{0-1}$ R^{λ} and $q\chi^{0}+r^{-1}$ R^{λ} , whose corresponding Areas are p A and q B, be multiply d by R, or $e+f\chi r-f\chi r^{2}$, and afterwards be a gain divided by R, they become $pe + pfz^n + pg\chi^{2n}$ $\chi \zeta^{\theta-1}$ R^{\lambda-1}, and $qe\chi^n + qf\chi^{2n} + qg\chi^{2n}\chi \chi^{2+1}$ R^{\lambda-1}. And by the 3d **Prop.** $a\chi^{\theta}$ R^{\lambda} is the Area of a Curve whose Ordinate is 0 so + 0 afz" + 0 agz" multiply'd into ze-1 Rx-1, and bze-1-Rx is the Area of a

Curve whose Ordinate is the bfz-1-1 bfz-1-1 bgz-3" 十22月 + >1 multiply'd into $z^{\theta-1} R^{\lambda-1}$. The Summ of these 4 Areas is $pA+qB+az^{\theta}R+bz^{\theta}+aR^{\lambda}$, and the Summ of their corresponding Ordinates.

If the First, Third and Fourth Term be separ rately put equal to nothing; by the first Term, $\theta = -pe$ will be made 0 = 0 = -pe, by the Fourth $-\theta = -pe$ and by the Third (striking out p and q) $\frac{2ag}{f}$ = b. From whence the fecond Term becomes Anaff—4Anage, and therefore the Summ of the four Ordinates is Anaff-4Anage 23++1 RA-1, and the Summ of fo many corresponding Areas is az 0 Rh + 245 z 0 + 1 Rh 0 $aA = \frac{2b+2u+4\lambda n}{f} agB$. Divide these Summs by $\frac{\lambda n eff - 4\lambda n ege}{\lambda n}$, and if the latter Quote be called D; D will be the Area of a Curve whose Ordinate is the first Quote 20+1-1R. And after the same way by putting all the Terms of the Ordinate except the first equal to nothing, the Area of a Curve may be found whose Ordinate is ze-1RA-1. Let that Area be called C, the same way that the Areas C and D are found from the Areas A and B, two other E and F may be found from C and D, agreeing to the Ordinates x6-1 RA-2 and x6+x-1RA-2, and so on in infinitum: And by a contrary Analysis one may proceed back again from the Areas E and F to the Areas C and D, and thence to

the Areas A and B, and others which follow in $[x^{\theta-1}]$ into $e+fx^{n}+gx^{2n}+8cc$, by affurning any Therefore if the Index a be onthe Progression. created or diminished by a continual addition or Quantity for s, and putting = S and z = x, change subduction of Unities; and of the Areas, corresponding to the Ordinates coming out in these be $\frac{y}{y} = \frac{y\theta - y}{y}$ into $\frac{y}{y} = \frac{y\theta - y}{y}$ into $\frac{y}{y} = \frac{y}{y} + \frac{y\theta - y}{y}$ into $\frac{y}{y} = \frac{y}{y} + \frac{y\theta - y}{y}$ into $\frac{y}{y} = \frac{y}{y} + \frac{y\theta - y}{y}$ into $\frac{y}{y} = \frac{y}{y} + \frac{y\theta - y}{y}$ into $\frac{y}{y} = \frac{y}{y} + \frac{y\theta - y}{y}$ into $\frac{y}{y} = \frac{y}{y} + \frac{y\theta - y}{y}$ into $\frac{y}{y} = \frac{y}{y} + \frac{y\theta - y}{y}$ into $\frac{y}{y} = \frac{y}{y} + \frac{y}{$ thers are given in infinitum. Q. E. D.

Cafe 3.

And by these two Cases conjoined, if both the Index 8 be any how increased or diminished by the continual addition or subduction of n; and the Index A, by the perpetual addition or sub-duction of Unity, the Areas corresponding to the several arising Ordinates, will be given.

And by a like encrease, if the Ordinate be expressed by 4 Nomes in the Radical Vinculum, and 3 of the Areas are given; or if it be express'd by 5 Nomes and 4 of the Areas given, and so on: All the Areas will be given which can be generated by adding or subducting the Number , to or from the Index 0; or Unity, to or from the Index A And 'tis the same case with Curves whose Ordinates are expressed by Binomials and one Area of those which are not Quadrable Geometrically, is

Pres. 8. Theor. 6.

If for $e + fz_n + gzz_n + 8cc$, and $k + fz_n + mzz_n + 8cc$.

you put R and S as before, and in the Ordinate of any Curve 20+ no Rx++SM+v the given Quantities \emptyset , n, λ , μ , e, f, g, k, l, m, &c. semain; and that for σ , τ , and ν , any Integer Numbers be successively written, and if the Areas of two of the Curves are given which are demoted by the Ordinates so arising, if the Quantities R and S are Binomials; or if the Areas of three of the Curves be given, if A and S consist conjointly of 5 Nomes; or if she Areas of 5 Curves be given, when S and R consist jointly of fix Nomes, &c. and so on in infinitum: I say, the Areas of all the Curves will be given.

The Demonstration is like that of the former Proposition.

Prop. 9. Theor. 7.

The Areas of these Curves are equal to one another whose Ordinates are as the Fluxions of the Abscissa.

For the Rectangles under the Ordinates and the Fluxions of the Abscissa are equal, and the Fluxions of the Areas are as those Rectangles.

Corol. 1.

If any Relation between the Abscissa of two Curves be assumed, and thence (by Prop. 1.) the Relation between the Fluxions of the Abscissa be fought, and the Ordinates be supposed reciprocally proportionable to the Fluxions; then innumerable Curves may be found, whose Areas shall be mutually equal to one another.

Corol. 2:

Prop. 10. Prob. 3:

To find the most simple Figures with which any Curve may be Geometrically compared, whose Ordinate Applicate y, by an Equation not affected, is determined from having the Abscissa z given.

Cafe I.

Let the Ordinate be azd-1, and then the Area will be $\frac{\pi}{4}a\xi^{\theta}$, as will easily be collected from Prop. 9. by putting b=c=c=d=f=g=b and c=t.

Cafe 2.

Let the Ordinate be $az^{0.1} \times fz^n + gz^{2n} + &c.$ | $\lambda \cdot 1$ then if the Curve can be compared Geometrically with Realilineal Figures, it may be squared by Prop. 5. by putting b = o = c = d. If not, let it be changed into another Curve equal to it, whose Ordinate shall be $\frac{a}{\theta} \times \frac{\theta - \eta}{\pi} \times e + fx + gx^2 + &c.$ by Cor.2. Prop 9. Then if out of the Index of the Dignities -1 (by Prop. 7.) you reject the Unities till those Dignities become the least possible, you will then come to the most simple Figures that can be by this means collected. Then every one of these, (by Cor. 5. Prop. 9.) gives another which is sometimes yet more fimple. And from these, by Prop. 3. and Cor. 9. and 10. of Prop. 9. compared one with another, some yet more simple Figures come out.

Cafe 3.

Let the Ordinate be zer x a+bz*+cz2*+&c. xe+fzv+gzzv+&c.|x-1, then will this Figure, if squarable, be squared by Prop. 5. But if not, then the Ordinate must be distinguished into the Parts, v0 1 × 4 × e + fz" + gz2" + &c. | 1, z1 × bz" $\times e + f z^n - g z^{2n} + &c \rightarrow 1$, &c. and by Case s. the most simple Figures are to be found with which the Figures corresponding in those Parts may be compared; for then the Areas of the Figures corresponding to those Parts, and connected with their proper Signs + and -, will compose the whole Area fought.

Caje 4.

Let the Ordinate be $z^{n} \times a + bz^{n} + cz^{2n} + &c$. whose Ordinate is $x^9 \times a + bx^{olo}$. And observe, Prop. 9. changed into a more simple one, and then that the former Ordinate grows more simple, by compared with the most simple Figures according Vol. II.

If the Ordinate confist of different Parts, then the several Parts are to be esteemed as the Ordinates of so many different Curves, and those Curves, as many as are Quadrable, are to be squared, and their Ordinates subducted from that of the whole Curve.

Corol. 1.

Hence every Curve whole Ordinate is the Square Root of its affected Equation, may be compared with the most simple Figures, whether Rectilineal or Curvilineal. For that Root always confifts of two Parts, which considered severally, are not affected Roots of Equations. Let the Equation be proposed aay) + 22))=243) + 2x3y - 24 its Root when extract. ed will be $y = \frac{43 + 23 + a\sqrt{44 + 223 - 24}}{4}$ whose ra-44+22 tional part $\frac{a^3+z^3}{4a+zz}$ and its Surd or Irrational Part a 1/44 + 2423 - 24 are the Ordinates of Curves that

ed by any affected Equation, which by Cor. 7.

The Forms of the

to Prop 8. and Cor. 6, 9, and 10, of Prop. 9 as Prop. 9. doth not go into an Equation not affect-was done in Case 2 and 3. ed, is either, if squarable at all, squared by this Proposition, or else is compared with the most simple Figures possible. And by this means is every Curve squared, whose Equation consists of three Terms; for if that Equation be affected, tis changed into one not so by Cor. 7. Prop. 9, and then by Cor. 2. and 5. of Prop. 9. passing into a most simple one, either gives the Quadrature of the Figure, if it be squarable, or a most simple Curve, with whom it may be compared.

Corol. 3.

And every Curve whose Ordinate is determined by any adfected Equation, which by Cor. 8. of Prop. 9. passes into a Quadratick affected Equation; is either squared by this Prop. and its sinst Corollary, if quadrable at all, or else is compared with the most simple Figures, and with which it admits a Geometrical Collegion admits a Geometrical Collation.

Scholium:

When Eigures are to be squared, it will be too troublesome always to have recourse to these General Rules: wherefore it is better once to fquare the most simple and useful Figures, and then to keep Tables of such Quadratures, to which to have recourse whenever such a kind of Curve is to be squared. Of this kind are the two following Tables in which a denotes the Absolute and ing Tables; in which z denotes the Abscissa, y the Restangular Ordinate, e the Area of the Curve to be squared, and d, e, f, g, b and g represent given Quantities with their Signs + and —.

In the First Table, in the Numerators of the Form, may be continued both ways in infinitum; viz. In the First Table, in the Numerators of the Areas of the 3d. and 4th. Form the Numeral Coefficients of the Initial Terms (2,-4, 16,-96, 868, &c.) are generated by multiplying the Numbers - 2, -4, -6, -8, -10, &c. into one another continually; and the Co-efficients of the subsequent Terms are divided from the Initial ones, by multiplying them gradually. In the Third Form, by $-\frac{3}{4}$, $-\frac{7}{6}$, $-\frac{7}{6}$, $-\frac{7}{6}$, $-\frac{7}{6}$, $-\frac{7}{6}$, $-\frac{7}{6}$, $-\frac{7}{6}$, $-\frac{7}{6}$, $-\frac{7}{6}$, $-\frac{7}{6}$, $-\frac{7}{6}$, and in the Fourth $-\frac{7}{8}$, $-\frac{7}{8}$, $\frac{9}{10}$, 6c and the Co efficients of the Denominators, 3, 15, 105, &c. are produced by multiplying the Numbers, 1, 3.

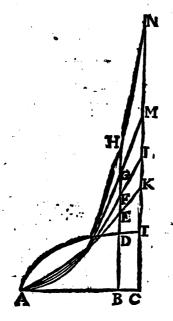

the Sign of the Number n: So, for instance, the Curve $\frac{d}{\sqrt{e-1/\chi^n}} \to \text{becomes} \frac{a}{z_{\frac{1}{2}n} + 1} \sqrt{fe\chi_n}.$

Prop. 9. Theor. 8.

Let ADIC be any Curve having its Ableissa AB=2 and its Ordinate BD=7; and let ABKC be another Curve whose Ordinate BE is equal to the Area of the former ADB divided by Unity; and let AFLC be a Third Curve, whose Ordinate BE 5, 7, 9, &c. into one another continually.

But in the Second Table, the Series of the B divided by I; and let AGMC be a Fourth Curves of the First, Second, Fisth, Sixth, Ninth and Tenth Form, are found by Division alone; and of the AFB of the Third divided by Unity; and let AHNC nate BF, is equal to the Area of the Second A

AHNC be a Fifth Curve whose Ordinate BH is equal to the Area of the Fourth AGB divided by Unity, and so on in infinitum. And let A, B, C, D, E, &c: be the Areas of the Curves whose Ordinates are y, zy, z'y, z'y, z'y, &c. and whose common Abscissa is z.

Let any Abscissa AC=t be given, and let BC=t-z=x, and let P, Q, R, S, T, &c. be the Areas of Curves having for their Ordinates y, xy, x^2y , x^2y , &c. and their common Abscissa z.

Let all these Areas rerminate at the whole given Abscissa AC, and at the Ordinate given in Posttien and infinitely produced CI: And then shall the first of the Areas thus posited, ADIC be=A-=P: The Second ABKC=\$A-B=Q. The Third AFLC=\$\frac{ttA-2tB+C}{2}=\frac{1}{2}R\]. The Fourth AGMC=\$\frac{t3A-3ttB+3tC-D}{6}=\frac{1}{6}S\]. The Fifth AHNC=\$\frac{t4A+t3B+6ttC-4tD+E}{24}=\frac{1}{2}T\].

Corol.

Whence if the Curves, whose Ordinates are y, zy, z'y, z'y, &c. or y, xy, x'y, x'y, &c. are squarable, the Curves ADIC, AEKC, AFLC, AGMC, &c. will also be squared; and the Ordinates BE, BF, BG, BH, will be proportionable to the Acreas of the Curves.

Scholium.

That the Fluxions of Flowing Quantities may be considered as First, Second, Third, Fourth Fluxions, &c. hath been said above: And these Fluxions are as the Terms of infinitely converging Series. Thus, suppose z^n a Flowing Quautity, and that by flowing it become z + o|v, then may it be resolv'd into this Converging Series $z^n + v \cdot c z^{n-1} + \frac{un-u}{2} o o z^{n-2} + \frac{u^2-3un+2u}{6} o^3 z^{n-3} + &c.$ In which Series the first Term z^n is the Flowing Quantity it self; the Second oz^{n-1} shall be the first Increment or the first

Difference, to which considered as just Nascens, the first Fluxion is proportional. The Third Term $\frac{nn-n}{2}$ oz n-2 will be the Second Increment or Difference to which considered as now Nascent, the Second Fluxion is proportional. The Fourth Term $\frac{n^2-3nn-1-2n}{6}$ of 2^{n-3} shall be the Fluents third Increment or Difference, and to which as Nascent, the Third Fluxion is proportional, Se. and so on infinitely.

These Fluxions may be expounded by BD, BE, BF, BG, BH, &c. considered as the Ordinates of Curves. As if the Ordinate BE (ADB) be a Fluent or flowing Quantity, the first Fluxion will be as the Ordinate BD: If BF be the Fluent (AEB) the first Fluxion of it shall be as the Ordinate BE, and the second as the Ordinate BE. If BH (AGB) be the Flowing Quantity, its Fluxions, considered as First, Second, Third and Fourth, shall be respectively as the Ordinates BG, BF, BE, and BD. (See the last Figure.)

Hence, in Equations which involve only two unknown Quantities, of which one is a Quantity uniformly flowing, and the other is any Fluxion of another Flowing Quantity. That other Fluent may be found by the Quadrature of Curves: Let its Fluxion be expounded or expressed by BD; and if this be the first Fluxion, seek the Area ADB BEXI: If it be the Second Fluxion, let the Area ABB BFXI be sought; if it be the Third Fluxion, let the Area AFB BCXI be sought; and the Area, when sound, shall be the Exponent of the Flowing Quantity sought.

And also in Equations which involve a Fluent and its first Fluxion without any other Fluent; or two Fluxions of the same Fluent; suppose the First and Second, the Second and Third, the Third and Fourth, Go. still without any other Fluent, then the Fluents may be found by the Method of the Quadrasure of Curves.

Let the Equation be aav = av + vv; supposing v = BE and $\dot{v} = BD$, z = AB and $\dot{z} = 1$. This Equation, by compleating the Dimensions of the Fluxions will become aav = avz + vvz, aav + vv = z. Suppose then v to flow uniformly, and let its Fluxion be $\dot{v} = 1$, then shall aa = z; and by squaring the Curve whose Ordinate is aa = zv + vv scisson be v = zv + vv. Suppose the zv + vv =

Again, let the Equation be $aa v = a \cdot + vv$, and let v be = BF, v = BE, v = BD, and z = AB:

Then by the Relation between v and v or BD and BE, the Relation between AB and BE will be found as in the Example above: after which, by this Relation may the Relation between AB and BF be found, if the Curve AEB be squared.

Such Equations as involve three unknown Quantities may fometimes be reduced to such as involve only two Unknown Quantities; in which Cases the Fluents will be found from the Fluxions,

Cerol. 2.

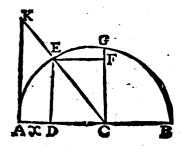

If n be supposed equal to any Term in the sollowing Series, 1, 2, 3, 4, 5, 6, 7, Se. Every Curve whose Ordinate is $\frac{x-n}{\sqrt{dx-x}}$ will be squared by this Series, and come out in finite Terms.

If m be equal to any Term in this Series, o, 1,

2, 3, 4, 5, 6, 7, $\Im c$. Every Curve whose Ordinate into $\frac{x^m}{\sqrt{dx-xx}}$ depends upon the Quadrature of the &c. = P.

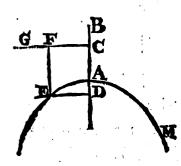

Circle: But if the Ordinate be $\frac{x^m}{\sqrt{dx+xx}}$, on that of the Hyperbola: And if on the Centre C, with the Diameter AB=d, the Circle AEB be described; and AD be made =x, and DE erecated at

Right-angles, and C E drawn: Then will the Se-

Acc divided by $\frac{d}{8}$, be equal to the Area of the Curve whose Ordinate is $\frac{x^2}{\sqrt{dx-xx}}$; after the same Manner if on the Centre C, and the Trans.

verse Axis AB=d, an Equilateral Hyperbola be described; as AE: Let AD=x and DE erected Normally, and CE drawn: Then shall the Se-

ACE divided by $\frac{d}{8}$ be equal to the Area of into $\frac{m-1}{m-6}$, &congle c the Curve whose Ordinate is $\frac{x_0}{\sqrt{dx-4xx}}$.

Corol. 4.

If m be supposed equal to any Term not included within the former Limits; The Curve whose Ordinate shall be, $\frac{x^m}{\sqrt{dx-1}-xx}$ can neither be squared. Vol. II.

red exactly, nor doth it depend on either the Circle or the Hyperbola; but yet is reducible to some more Simple Curve.

Theorem 3.

If A be the Area of a Curve, whose Abscissa is x, and Ordinate $x^m \sqrt{xx} - xx$; Let B be the Area of a Curve, whose Abscissa is the same x, and its Ordinate $x^{m-2n} \sqrt{rr} - xx$; and suppose $\sqrt{rr} - xx = y$. Then shall A be equal to $r^{2n}B$ into $\frac{m-1}{m-2}$ into $\frac{m-2}{m-2}$ into $\frac{m-2}{m-2}$ into $\frac{m-2}{m-2}$ $\frac{m-2}{m-2}$ $\frac{m-1}{m-2}$ $\frac{m-1}{m-2}$ $\frac{m-1}{m-2}$ into $\frac{m-3}{m-2}$ $\frac{m-2}{m-2}$ into $\frac{m-3}{m-2}$ $\frac{m-3}{m-2}$ into $\frac{m-3}{m-2}$ $\frac{m-2}{m-2}$ into $\frac{m-3}{m-2}$ $\frac{m-3}{m-2}$ into $\frac{m-3}{m-2}$

Corol v?

If m be equal to any Term of the following Series 1, 3, 5, 7, 9, &c. The Quadrature of the Curve, whose Ordinate is $x = \sqrt{rr + xx}$ will come out finite, and be expressed by the Theorem.

Cord. 2

If w be equal to any Term in this Series 2, 3, 4, 5.6. So. The Curve whose Ordinate is x 20 VIII will be exactly squared by this Theorem.

Corol. 3

If m be expounded by any Term different from those above mentioned; the Curve whose Ordinate is x \(\sqrt{rr} \frac{1}{4}xx \) is neither exactly quadrable, nor dependant on the Circle or Hyperbola; but yet is reducible to a more Simple Form.

Theorem 4.

If A be the Area of a Curve whole Ablcissa is x,

and its Ordinate $\sqrt{rr-xx}$: Let B be the Area of

another; whole Ablcissa x is the same with the

former; but its Ordinate $\sqrt{rr-xx}$: Then I say, $A = r^{2n} \text{ B into } \frac{m-1}{m} \text{ into } \frac{m-3}{m-4}$ $\frac{m-7}{m-6}, \text{ Sc.} = P.$ $\frac{1}{m} \frac{m-1}{m-2} \text{ into } \frac{m-1}{m-2} \text{ secs } y = -8.$ $\frac{r^4}{m-6} \text{ into } \frac{m-1}{m} \text{ into } \frac{m-3}{m-2} \text{ into } \frac{m-3}{m-4}$ $\frac{r^6}{m-6} \text{ into } \frac{m-1}{m} \text{ into } \frac{m-3}{m-2} \text{ into } \frac{m-3}{m-4}$ $\frac{r^6}{m-6} \text{ into } \frac{m-1}{m} \text{ into } \frac{m-3}{m-2} \text{ into } \frac{m-3}{m-4}$

Corol. I.

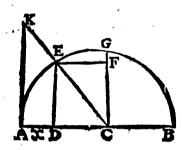

If m be equal to any Term of this Series 1, 3, 5, 7, 9, &c. the Curve whole Ordinate is will be found by this Theorem in finite Terms.

Corol. 2.

If n be equal to any Term in the following Series 1, 2, 3, 4, 5, 6, Se. The Curve whose Ordinate is is exactly quadrable by this Theorem.

Corol. 3.

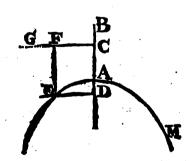

If m be equal to any Term of this Series o, 2, 4, 6, 8, 10, &c. The Quadrature of the Curve whose Ordinate is $\frac{x}{\sqrt{r_1-x_2}}$ depends upon the Quadrature of the Circle: For if from the Cen-

tre C a Circle AEG be described with the Radius CA = r; let CD be taken equal to x, and DE erected Normally in D; join CE. Then will the Sector C A E divided by Err, be equal to the

Area of the Curve, whose Ordinate is $\frac{x}{\sqrt{r_r - x_x}}$

And after the same manner, if to the Centre C and Semi-Transverse Axis Ca=r, an Equilateral

Hyperbola be described as EAM; let FC be drawn at Right-angles to AC, and equal x; then draw FE parallel to the Axis CA, till it meet the Hyperbola in E, and join E G: I say, the Hyper-

bolick Sector ACE divided by is equal to the

Area of the Curve whole Ordinate is

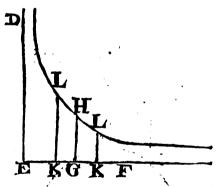

Corol. 4.

If m be expounded by any other Term different from any of the Preceeding ones; Then will the Curve whose Ordinate is be neither exactly squarable, nor dependant on the Circle, or Hyperbola; but yet is reducible to a more Simple Form.

Theorem 5.

Let A be the Area of the Curve whose Abscissa is x, and its Ordinate $\frac{x^m}{d-x}$, and let B be the Area of another Curve, having the same Abscissa x, and whose Ordinate is $\frac{x^{m-n}}{d-x}$; Then shall the Arez, $A = d_n B$ if the Ordinate be $\frac{x^{-1}}{d+x}$; Then the Area, $\frac{dx^{m-1} + ddx^{m-2}}{m-1}, &c. + d B.$

If m be equal to any Term in the following Series 0, 1, 2, 3, 4, 5, 6, &c. The Quadrature of the Curve, whose Ordinate is $\frac{x^m}{d+x}$, depends upon the Quadrature of the Hyperbola.

For drawing DE, EF at Right-angles, let EG be taken equal to d; and let GH be drawn Normal and Equal to EF. Then between the Alymptotes DE, EF, let an Hyperbola be described passing throw H; and taking GK = x, towards E in the first Case, and towards F in the latter let the Ordinary F. latter, let the Ordinate KL be drawn: Them shall the Area HGKL divided by dd be equal to the Area of the Curve, whose Ordinate is And from hence, supposing the Quadra-1+x. rure of the Hyperbola, will the Solid, generated by the Revolution of the Portion of a Ciffoid round the Diameter of the Generating Circle, be

given in Finite Terms.

as above. Let there be this Equation a-bx"= exy"y + dy2"y y. Suppose y , and it will stand a-bx=exv +dv v. This Equation, by squaring the Curve whole Abscissa is x and Ordinate v. gives the Area v; and the other Equation yay=v, by working backward to the Fluents, will give n+1 >1+1=v: whence the Fluent; is found, and from hence, and even in such Equations as involve Three unknown Quantities and which cannot be reduced to others which involve but two, the Fluents may sometimes be found by the Quadrature of Curves.

Let there be this Equation ax + bx | = rex -1y + sexry y-1-/yy: and let x=1. Then will the latter part rexr-1y: + sexryy:-1-fyy: by finding the Fluents in the Inverte Method, will become $ex^{rys} - \frac{f}{f+1}y^s + 1$; which therefore is as the Area of a Curve whose Abscissa is x and its Ordinate $ax^m + bx^n | r$, and from thence the Fluent y will be given.

Let there be an Equation, $x \times ax^m + bx^n|_{P} =$ $\sqrt{\frac{e+r_0}{e+r_0}}$, then the Fluent, whose Fluxion is x = xax - + bx P shall be as the Area of a Curve whose Absciss a and its Ordinate $ax^m + bx^n | l^n$; Also Ablchia is x and its Ordinate $ax^m + bx^n|l|$; Allo of that generating Circle; as the Summ of the double the Fluent, whose Fluxion is $\sqrt{e+fy_n}$ shall be as Motus Circularis, is to the Velocity of that Motus the Area of a Curve whose Abscissa is y, and its Ordinate $\frac{dy^{n-1}}{\sqrt{e+f}}$; that is (in Case 1, by Form 4. in Table 1.) as the Area $\frac{2d}{nf}\sqrt{e+f}n$. Let there. fore $\frac{2d}{af}\sqrt{e+fj^n}$ be equal to the Area of a Curve Math. at Groningen. whole Abscissa is x and Ordinate ax + bx 1, and

you will have the Fluent y. And observe, that every Fluent wich is collected from the First Fluxion may be increased or diminished by any Quantity that is not a Fluent: That which arises from a Second Fluxion may be augmented or lessened by any Quantity that hath no Second Fluxion: That which arises from a Third Fluxion may be encreased or diminished by any Quantity having no Third Fluxion; and so on infinitely.

After the Fluents are obtained from the Fluxions, if there be any doubt about the Truth of the Conclusion, the Fluxions of the Fluents found may be again gained, and compared with the Fluxions at first proposed; for if they then come out equal to those, you may suppose the Conclusion right; but if they are not thus equal, the Fluents must be corrected till they come out to. For both the Fluent may be assumed at pleasure, and that assumption may be corrected by putting the Fluxion of the Fluent so assumed equal to the Fluxion proposed, and then comparing the Homologous Terms among themselves.

In Phil. Trans. 252 p. 708. You have a Method for the Quadrature of Figures, Geometrically irrational; by Mr. 3. Craig.

See also, the same Author's Methodus Figurarum Lineis reclis & Curvis comprehensarum Quadraturas Vol. II. determinandi. Lond. 1685, 4°. And his Additions to it, in Philos. Trans. N. 235.

See also his Tractatus Mathematicus de Figurarum Curvilinearum Quadraturis & Locis Geometricis.

Lond. 1693, 4°.
Vera Circuli & Hyperbola Quadratura in propria sua Proportionis specie inventa & demonstrata, per

Jac. Gregory, Patavii, 4.

Le Grand & Fameux Probleme de la Quadrature du Circle resolu Geometriquement par le Circle & la Ligne Droite, per M. Mallement de Messange. Paris, 1686. 12mo. See Phil. Transaction, N. 185. where this Book is refuted by Cluverius, M. D. R. S. S.

De Quadratura Circuli, &c. per T. H.bbs. This Book Dr. Wallis hath twice refuted.

In Philof. Collett. N. 7. you have Mr. Leibnitz's Method for the Quadrature of the Circle.

In Philof. Tranf. N. 196. you will find Dr. Wallis's Quadrature of the Testudo veliformis. And in N. 207. the same thing is solved by Dr. Gregory. Mr. Caswell Aftr. Profess. of Oxford allo in Philos. Trans. N. 217. gives a Quadrature of a Portion of the Epicycloid; and after this, in the next Transactio. Mr. Halley, Savilian Professor of Geometry in Oxon, advances a general Propolition for measuring all Cycloids and Epicycloids; which is this, That the Area of any Cycloid or Epicycloid, whether Primary, Contracted or Prolate, is to the Area of the generating Circles and the Areas of the Parts generated in the formation of those Curves, are to the Areas of the Segment Circularis.

In Philos. Transatt. N. 245. Mr. Craig gives us the Quadrature of the Logarithmick Curve.

In the Memoires de L' Academie des Sciences, there is (in the Year 1699) a Quadrature of the Infinity of Segments, Sectors and other Spaces in the Vulgar Cycloid by Mr. Bernoulli, Professor of

In the All. Erud. Lipfie for Ollob. 1683, you have a Method by Mr. Tschirnhause, of determining either the Quadrature of any Geometrical Figures, or the Impossibility of the same. And in May, 1684, he published in the same ABa another Papet concerning the Quadrature of Curvilinear Figures.

In Phil. Trans. N. 284, there is a Specimen of a general Method for determining the Quadra-

cures of Figures, by Mr. 3. Craig. And in N. 278. one of Mr. de Moivre for the squaring of some kinds of Curves, or reducing them to more simple ones. Thus, Let A be the Area of a Curve whole Abscissa is x, and its Ordinate Applicate xm/dx-xx. Let B be the Area of a Curve whose Abscissa is the same as that of the former, but its Ordinate x - Jdx-xx; Ler $\sqrt{dx-xx}=y$, then shall A be=diB into $\frac{2m+1}{2m+4}$ into $\frac{2m-1}{2m+2}$ into $\frac{2m-3}{2m}$ into $\frac{2m-5}{2m-2}$ into, $\Im c = P$. $\frac{1}{m+2} x^{\frac{1}{m+1}} y^{\frac{3}{2}} = -2 \left[\frac{d}{m+1} \operatorname{into} \frac{2m+1}{2m+4} x^{\frac{1}{m}-2} y^{\frac{3}{2}} \right]$ $R = -\frac{dd}{m} \operatorname{into} \frac{2m+1}{2m+4} \operatorname{into} \frac{2m-1}{2m+2} x^{\frac{1}{m}-3} y^{\frac{3}{2}} = -S.$ $-\frac{d^{3}}{m-1} \operatorname{intC} \frac{2m+1}{2m+4} \times \frac{2m-1}{2m+2} \times \frac{2m-3}{2m} \times \frac{2m-3}{2m} = T_{1} & \text{where}$ Where observe,

1. That n is supposed to be an Integer and Affirmative Number.

2. That the Quantity do B in the Series defign'd by P is to be multiplied into as many of the Terms as there are Unites in n.

3. That so many following Series design'd by -Q, -R, -S, -T, &c. may be taken as there are Unites in n.

Which to illustrate by an Example or two.

If n=1, then I say $A=d^nB$ into $\frac{2m+1}{2m+4}$ $\frac{1}{m+2}$ $x^{m-1}y^2$. And if n=2, then $A=d^nB$ into $\frac{2m+1}{2m+4}$ into $\frac{2m-2}{2m+2} - \frac{1}{m+2}x^{m-1}y^3 - \frac{d}{m+1}$ into $\frac{2m-1}{2m+4}$ into $x^{m-2}y^3$.

4. If y be equal to $\sqrt{dx-xx}$; Then A will be =Q-R+S-T, &c. +P.

Corol. 1

If m be put equal to any Term in the following Series— $\frac{1}{2}$, $\frac{1}{2}$, $\frac{1}{2}$, $\frac{1}{2}$, $\frac{1}{2}$, $\frac{2}{3}$, $\frac{9}{4}$, &c. The Quadrature of the Curve, whose Ordinate is $x^m \sqrt{dx - xx}$, or $x^m \sqrt{dx + xx}$, comes out finite and is exhibited by our Series; which that we may shew by an Example: Let the Area of the Curve, whose Ordinate is $x - \frac{1}{2} \sqrt{dx - xx}$ be to be investigated: Imagine this Curve to be compared with another, whose Ordinate is $x - \frac{3}{2} \sqrt{dx - xx}$. Because in this Case n = 1. Therefore

A=d B into $\frac{2m+1}{2m+4} + \frac{1}{m+2}x^{m-1}y^3$: But $m = \frac{1}{2}$: wherefore 2m+1 = 0; and therefore $A = \frac{1}{m+2}x^{m-1}y^3 = -\frac{2y^3}{3\sqrt{xxx}}$

Here it is observable that the Area, thus found, sometimes falls short of, and sometimes exceeds the true Area, by a given Quantity: And to know such Defett or Excess, the Area thus found is to be supposed encreased or diminished by a given Quantity as q; and then supposing x=0, let the Area so increased or diminished, be supposed equal to Nothing; and so in the present Case q will be sound equal to $\frac{2}{3} d\sqrt{d}$: And therefore, $A=\frac{3}{3} d\sqrt{d} \frac{2}{3} \sqrt{x^2}$.

Corol. 2.

If n be supposed equal to any Term in the sollowing Series, 3, 4, 6, 7, &c. The Quadrature of the Curve, whose Ordinate is $x = \sqrt{dx - xx}$; or $x = \sqrt{dx + xx}$, becomes finite; and will be exhibited by our Series. Thus for instance; let the Area of a Curve, whose Ordin. is $x = \sqrt{dx - xx}$, be sought.

Imagine it to be compared with the Area of a Circle, which call A. Then shall m=0, n=3; and consequently A=P=Q=R=S: But since the Quantity 2m, in the Denominator of the third Term, by which d^*B is multiplied, is infinitely small, or rather nothing; the Quantity designed by P, will be infinite; and for the same reason, the Quantity expressed by—S, is infinite

also; and therefore the Quantities A, -2, -R, will vanish: Wherefore P=S; and the Equation divided by $\frac{2m+1}{2m+4}$ into $\frac{2m-1}{2m+2}$ becomes d^nB into $\frac{2m-2}{2m} = \frac{dd}{m}x^{m-3}y^2$: or dB into $\frac{2m-3}{2}$ = $ddx^{m-3}y^3$; and putting o and 3, instead of m and n; it will come out thus, dB into $\frac{1}{2}$ = $\frac{y^2}{x^2}$, or $B=\frac{2}{3}\frac{y^2}{x^3}$.

Corol. 3.

If m be supposed equal to any Term of the following Series -2, -1, 0, 1, 2, 3, 4, 5, &c. The Quadrature of the Curve whose Ordinate is $x^m \sqrt{dx-xx}$ depends upon the Quadrature of the Circle: But the Area of the Curve whose Ordinate is $x^m \sqrt{dx-xx}$ depends upon the Quadrature of the Hyperbola; and the Relation of that Curve to either the Circle, or Hyperbola will be exhibited in the Series, and in Finite Terms.

Corol. A.

If m be explained by any other Term different from those above mentioned: Then the Curve whose Ordinate is $x^m \sqrt{dx + xx}$, can neither be exactly squared, nor doth it depend on either the Circle of the Hyperbola: But yet it may be reduced to a more Simple Curve by our Series.

Theorem 2.

Let A be the Area of a Curve whole Absciffa is x, and ordinate $\frac{x^m}{\sqrt{dx-xx}}$. And Let B be the Area of a Curve whole Absciffa is also x; but its Ordinate is $\frac{x^{m-n}}{\sqrt{dx-xx}}$. Let $\sqrt{dx-xx}=y$:

Then shall $A=d^nB$ into $\frac{2m-1}{2m}$ into $\frac{2m-3}{2m-2}$ into $\frac{2m-5}{2m-4}$ into $\frac{2m-7}{2m-6}$, &c. =P. $\left[-\frac{\pi}{m}x^{m-1}y=-Q\right]$. $\frac{d}{m-1}$ into $\frac{2m-1}{2m}$ into $\frac{2m-3}{2m-2}x^{m-3}y=-S$. $-\frac{d}{m-3}$ into $\frac{2m-1}{2m}$ into $\frac{2m-3}{2m-2}$ into $\frac{2m-5}{2m-4}$ into $\frac{2m-1}{2m}$ into $\frac{2m-3}{2m-2}$ into $\frac{2m-5}{2m-4}$

N. B. The Observations made above on Theorem 1, will be of Use here also.

Corol. I.

If m be supposed equal to any Term in this Series $\frac{1}{2}$, $\frac{3}{2}$, $\frac{5}{2}$, $\frac{7}{2}$, $\frac{9}{2}$, 6q. Then the Quadrature of the Curve whose Ordinate is $\frac{x^m}{\sqrt{dx-1}-xx}$ will be sinite, and will be exhibited by this Series.

Corol. 2.

QUESTA, was the Term for an Indulgence or Remission of Penance, exposed to Sale by the Popes; who by this notorious Cheat got great Summs: The Retailers of these Indulgences, were called Quastuarii, and I believe Quastionarii, vid. Matt. West. in Anno, 1279.
OUANTITAS Acceleratrix of any Vis or Firce,

is the Measure of the Velocity generated in a gia

ven Time, by that Force.

QUANTITY of Motion: Sir If. Newton in his Principia, shews that this, which is found by taking the Summ of Motions tending the fame Way, on their Difference, if they tend towards contrary Parts; is not at all changed by the Action of Bo-

For Altion and Re-altion are always equal and contrary, by his Third Law of Nature: And therefore by the Second Law, must make Equal Mutations in Motions towards contrary Parts.

If therefore the Motions tend the same Way, whatever is added to the proceeding Body, or that struck forward, is subducted from the following Body; so that the Summ of the Motions will be the same as before. If the Bodies meer, there will be an Equal Subduction of the Motion of either: And therefore the Difference of the Motions made towards the contrary Parts, will remain the same.

As suppose a Spherical Body A, to be thrice as great as the Spherical one B; and let A have Two Degrees of Velocity any way, and let B follow it in the same right Line with Ten Degrees of Velocity: So that the Motion of A, to that of B, will be at ix (3×2) to Ten. Wherefore the Summ of the Motions of both of them will be 6 1 10, or fixteen Parts. Now after B hath overtaken A, and ftruck against it, if A gain by the Stroke any Degree of Motion, as suppose 3, 4 or 5 Parts; B must lose as much: And therefore after the Concourse, A will move on accordingly with 5 or 11; and B will follow with 7. 6, or 5 Parts: So that the Summ of the Motions of both, will be still 16 as at first before the Concourse, or Shock.

But if the Body A be supposed to gain by the Stroke 9, 10, 11, or 12 Parts of Motion; and therefore to move forward with 15, 16, 17, or 18 Parts, after the Concourse: Then will the Body B, by losing just so many Degrees as A gains, either move forward, with one Part, having loft 9; or will be perfectly at reft, losing all its 10 Degrees of Velocity; or lastly will move back. wards with one or two Parts of Motion: So much being deducted out of the 11, or 12 Parts of the Progressive Motion, or forwards. And thus the Summs of the Motions the same Way forward; as 15 + 1, or 16 + 0. And the Differences of the Motions contrary Ways; as 17 - 1, or 18 - 2; will always be the same, viz. = 16 Parts, as before Concourse and Reflexion. And the Motions with which Bodies go on after Reflection being known, the Velocity of Each may be found; by had six Parts of Motion before the Reflection, and 18 afterwards; and the Velocity of two Parts before the Reflection: Its Velocity after the Reflexion will be found to be Six; by faying, as the is a Return made by the Sheriff on a Wise dire Motion of fix Parts before the Reflection, to That

QUARREL, in the Law is Quarela, à quarendo: And it extends not only to Actions personal, but also to mixe; and the Plaintiff is then cal led Quarens: And in most of the Writs it is said, Quaritur: So that if a Man release all Quarrels, (ones Deed being taken most strongly against ones self) it is as beneficial as all Actions; for by it all Actions Personal and Real are released.

Cowell's Interp.

QUARENTINE, is a Benefit allowed by the
Law of England, to the Widow of one dying fei zed of Land; and whereby She may challenge to stay in his Capital Messuage, or Chief Mansion-House (so it be not a Castle) for 40 Days after his Decease; and if She be molested by the Heir at Law, or any other; She may claim a Writ De

Quarentina habenda.

QUARENTINE also fignifies a Furlong, from the French Quarente, Forty: Becaule 'tis a Quan tiry of Land containing 40 Perches. Tis used also for that Space of forty Days, wherein any Person coming from Foreign Parts, and infected with the Plague, is not permitted to Land, or come on Shore, till that Term is expired.

QUARTER-Sessions, is a Court held by the Justices of Peace in every County, once in every Quarter of the Year. How far the Jurisdiction thereof extends: See Lamb. Eirin. Lib. 4. and Smith de Republ. Anglic. Lib. 2. c. 19. The Hold-Smith de Republ. Anglic. Lib. 2. c. 19. ing these Sessions was first Ordained by the Sta-

tute of 25 Ed. III. Statut. 1. c. 18.

QUARTER-Woeeling, in the Military Art, is turning the Front of a Body of Men round where the Flank was. If it be done to the Right, the Man in the Right-angle keeps his Ground, and faces about while the Rest wheel.

QUARTER-Wind, at Sea, is such a Wind as

comes in abaft the Main-mast Shrouds, even with

the Quarter of the Ship.

QUARTERS, (in Architecture) are those slight upright Pieces of Timber which are placed between the Punchions and Posts, they are used to

Lath upon.

QUASI-Modo Sunday, is that called Low Sunday. or the Next after Easter; so called from the first Words of the Introit, or Hymn, for Mass on that Day; it occurs often in the Date of Old Records -Charta Gilberti Prioris de Eynsham Priori de Sher-burn dat. Postridie Festi Quasi-Modo Geniti: And this Solemn Time is in some Old Deeds expressed only thus, Q. M. G. by the Initial Letters of the Words, Quasi Modo Geniti.

QUEEN-Gold, Aurum Regina, is a Royal Revenue belonging to every Queen of England, during her Marriage to the King, both by Law, Cufrom and Prescription; and payable by divers Persons in England and Ireland (on divers Grants from the Crown) by way of Fine or Oblation, amounting to Ten Marks or upwards, viz. one full Tenth-part above the Entire Fine; as Ten Pounds on every Hundred Pound Fine, on Pardons, Contracts and Agreements: This becomes a Real Debt to the Queen Confort by the Name of Aurum Regina.

of 18 afterwards: So is the Velocity of two Parts Account of by Dr. Pope in Phil. Trans. N. 2. Thus: before, to that of Six afterwards.

It is found in the Mines of Friuli, a Territory belonging to the Venetians, about a Days Journey and a half from Goritia Northwards; and at a Place called Idria, fituated on a Valley of the Julian Alps. They have been for 160 Years inbject to the Emperour, and all the People speak Sclavonian. In going thither we travell'd several Hours thro some of the finest Woods I ever saw; full of Firs, Oaks, and Beeches of an Extraordinary Thickness, Straitness and Height. like others in the Alps, is built all of Wood but the Church; and one House, in which the Over-seer of these Mines lived. The Valley and the Mountains too, out of which the Mercury was dug, were of a pleasant Verdure, which they attributed to the Moisture of the Mercury. The best and greatest of their Mines, we went into, is dedicated to St. Barbara; as the other Mines are to other Saints.

> At the Beginning of the Entrance, the Way was not difficult, nor the Descent great; but in many Places you cannot stand upright; this way of going down holds not long, before you descend by Perpendicular Ladders, all the way down; and the Bottom, where there are several Lanes cut out in the Mountains, is lined and propt with several great Pieces of Firr-Ttees as thick as they can be let: They dig the Mineral with Pick Axes, following the Veins: Tis for the most part hard as a Stone, but more weighty; of a Liver Colour, or that of Crocus Metallorum. There is also some soft Earth in which you plainly see the Mercury in little Particles. Besides this, there are often sound in the Mines round Stones like Flints, of several Bignesses; very like those Balls of Hair, which I have seen in England taken out of the Stomachs of Oxen. There are also several Marchasites, and Stones, which seem to have Specks of Gold in them; but on trial they say, they can find none. Some of these Stones are very ponderous, and well impregnated with Mercury: But others are light

having little or none in them.

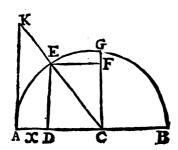

The manner of getting the Mercury is this: They take of the Earth, brought up in Buckets, and put it into a Sieve, whose bottom is made of Wires at so great a Distance, that you may put your Finger between them; 'tis carried to a stream of Running Water, and washed as long as any thing will pass through the Sieve. That Earth which passeth not, is laid aside upon an Heap; that which passeth, is reserved in a Hole, and is taken up again, and put into a fecond Sieve; and fo on to about 10 or 12 Sieves proportionably less. It often happens in the First Hole, that there is Mercury at the bottom; but towards the farther End, where the Intervals of the Wire are less, it's found in very great Proportion. The Waste Water is so much impregnated with Mercury, that it cureth ltches and other fordid Ulcers. The Earth laid aside, is Pounded, and the same Operation repeated. The fine small Earth, that remains after this, and out of which they can wash no more Mercury, is put into Iron Retorts, and the Fire forces the Mercury into the Receivers: The Officer unluted feveral of them; and I observed in all that he first poured out Perfest Mercury, and after that came a Black Dust, which being Wetted with Water, dis-QUICK-Silver: The Way and Manner how this They take the Caput Moreum and Pound it, and strangely Fluid Mineral is gained; you have a good Renew the Operation. There are 16 Furnaces for

Theorem 6.

its Ordin, be $\frac{x^{m+2n}}{rr+xx}$. I fay its Area $A = \frac{x^{m+1}}{m-1}$ $-\frac{rrx^{m+3}}{m-3} + \frac{r^4x^{-5}}{m-5}$, &c. $\frac{1}{4} r^{2n} B$.

Corollary.

If m be equal to any Term in this Series o, 2. 4, 6, 8, &c. The Quadrature of the Curve, whose Ordinate is $\frac{x^n}{r + xx}$, depends upon the Rectification of the Circular Arch. For if with the Radius

CA = r, and on the Centre C, the Circle AEGbe described: Let the Tangent C K be erected equal to x, and join C K meeting the Periphery in E. Then I say that A E divided by rr, shall be equal to the Area of the Curve whose Ordinate is X0 17+xx

A General Corollary to all the 6 Theorems.

Every Mechanick Curve ,whose Quadrature depends on any of the infinitely many Curves, whose Ordinates put on any of the following Forms, viz.

$$x^m \sqrt{dx+xx}$$
; $\sqrt{dx+xx}$; $x^m \sqrt{rr+xx}$; $x^m \sqrt{rr+xx}$; $x^m = x^m$

Suppose the Cube of the Circular Arch corre sponding to any Versed sine be made the Ordinate of the Curve, whose Abscissa shall be that very Verled-fine: The Area of the Curve is required to be investigated.

Let the Abscissa be x, the circular Arch v; the Fluxion of the Area is vix; Let the Area be vix -q. Then $v^3x + 3v^2vx - q = v^3x$; where fore $q = 3 v^2 v x$: But $v = \frac{dx}{2\sqrt{dx-xx}}$; there fore $q = \frac{3 dv^2 x x}{2\sqrt{dx-ux}}$: but by Theorem 2. $\frac{x}{\sqrt{dx-xx}}$ fore $\frac{3}{2} \frac{dv^2 x x}{\sqrt{dx-ux}}$: but by Theorem 2. $\frac{x}{\sqrt{dx-xx}}$ fore $\frac{3}{2} \frac{dv^2 x x}{\sqrt{dx-ux}}$: but by Theorem 2. $\frac{x}{\sqrt{dx-xx}}$ foreign $\frac{3}{2} \frac{dv^2 x x}{\sqrt{dx-ux}}$: but by Theorem 2. $\frac{x}{\sqrt{dx-xx}}$ foreign $\frac{3}{2} \frac{dv^2 x}{\sqrt{dx-ux}}$: but by Theorem 2. $\frac{x}{\sqrt{dx-xx}}$ foreign $\frac{3}{2} \frac{dv^2 x}{\sqrt{dx-ux}}$: but by Theorem 2. $\frac{x}{\sqrt{dx-xx}}$ foreign $\frac{3}{2} \frac{dv^2 x}{\sqrt{dx-ux}}$: but by Theorem 2. $\frac{x}{\sqrt{dx-xx}}$ foreign $\frac{3}{2} \frac{dv^2 x}{\sqrt{dx-ux}}$: but by Theorem 2. $\frac{x}{\sqrt{dx-xx}}$ foreign $\frac{3}{2} \frac{dv^2 x}{\sqrt{dx-ux}}$: but by Theorem 2. $\frac{x}{\sqrt{dx-xx}}$ foreign $\frac{3}{2} \frac{dv^2 x}{\sqrt{dx-ux}}$: but by Theorem 2. $\frac{x}{\sqrt{dx-xx}}$ foreign $\frac{3}{2} \frac{dv^2 x}{\sqrt{dx-ux}}$: but by Theorem 2. $\frac{x}{\sqrt{dx-xx}}$ foreign $\frac{3}{2} \frac{dv^2 x}{\sqrt{dx-xx}}$
Let A be the Area of the Curve whose Abscissa is x, and Ordinate
$$\frac{x^m}{rr+xx}$$
; Let B be the Area of another Curve whose Abscissa is the same x: Let another Curve whose Abscissa is the same x: Let $\frac{x^{m+2n}}{rr+xx}$. I say its Area $A = \frac{x^{m+1}}{m-1}$ its Ordin, be $\frac{x^{m+2n}}{rr+xx}$. I say its Area $A = \frac{x^{m+1}}{m-1}$ its Ordin, be $\frac{x^{m+2n}}{rr+xx}$. I say its Area $A = \frac{x^{m+1}}{m-1}$ and therefore $\frac{1}{2}dv^2y$. Let this Quantity be $\frac{3}{2}dv^2y$ and therefore $\frac{3}{2}dv^2y$. Then $\frac{3}{2}dv^2y + 3dvvy - r = \frac{1}{2}dv^2y$. And therefore $r = 3dvuy = \frac{3}{2}ddvx$. Let $r = \frac{1}{2}ddvx - s$. Then $\frac{1}{2}ddvx - \frac{1}{2}ddvx \frac{1}{2}dvx - \frac{1}{2}d$

And because of Solids generated by the Rotation of Curves, the Surface is generated the same way; the Longitude of Curves, and all their Centres of Gravity, do depend on the Quadratures of Curves: These will easily be computed if they depend on the aforefaid Curves.

QUADRUPEDS, are perfect hairy Viviparous Animals, having but four Feet. And these Animals according to Mr. Ray in his Synopsis Animalium are thus divided.

Into such as are Hoofed (Ungulata;) or Clamed,

or Digitate (Unguiculata,) (I.) The Hoofed Animals with four Feet, are either Whole Hoofed; Solidipeda, Moriogana, Moruza, Solidungula: As, The Horfe, As, the Onager, or Wild As: The Mule and the Zebra of Africa, or the fine striped Indian or African Ass, almost like a Mule in Form and Stature.

Of this Whole Hoofed Kind, Ariftotle has observed; that no one bath two Horns, (he might have

faid any) no one hath the Talus or Aftragalus; nor have the Males any appearance of Breafts.

(2.) Cloven-footed; and that either into Two Divisions only: As the Alagas or Bifulcate Kind, which are again subdivious into such as are which are again subdivided into such as are

1. Ruminant, Mugund Corla, i. e. Such as Chew the Cud; and their either have hollow and perpetual Horns as the Ox, Sheep, and Goat Kind: Or Decidaous, as the Hare and Deer Kind; which usually shed

their Horns annually. (See Ruminant in this Vol.)
Of the Bull Kind, they reckoned these: The common Bos; of which the Male is Taurus, the Female Vacca: (2) The German Urus, Urochs or Aurochs, (3) The Bison, (4) The Bonasus, (5) The Bubalus, or Busalo, (6) The Bos Africanus of Bellonius; Obs. 1. 2. c. 50. which he takes to be the Bubalus of the Ancients.

Of the Sheep Kind; besides the common Sort; they reckon, (2) The Arabian Ovis Laticauda, whose Tails sometimes are of 301. Weight: (3) The Ovis Strepficeros Cretica Bellonii: (4) The Ovis A-fricana, with short Hairs instead of Wool. (5) The

Gazella Africana. (7) The Capra Sylvestrin Africa-na Grimmii. (8) The Capra Mambrina or Syriaca of Gosner. (9) The Buselaphus or Moschelaphus Casi. (10) The Tragelaphus Cais, in Gesner. in Gefner.

(1) The Tragelaphus Bellonii.
Of the Hars or Deer Kind: As, (1) The Cervus, "Exact, the Red Deer. (2) The Cervus Players on Bellonis. ceros or Palmatus; the Fallow Deer. (3) Alce or the Elk. (4) Rangifer, the Rain Deer. (5) The Axis Plinii, according to Bellonius. (6) The Caprea Plimii. (7) The Cuguacu-esc and Cuguacu-zapara of Marcgrave. (8) The Caprea Groenlandica.

2. Of the Cloven-footed Animals into Two Parts

only, and which do not chew the Cud: There is only, and which do not chew the Cud: There is only the Hog and Swine Kind; and under this Head, befides the common Swine; they reckon.

(2) The Wild Boar or Swine. (3) The Porcus Guineensis Marcgravii. (4) The Porcus Indicus, called Babyroussa. (5) The Tajaca or Aper Mexicanus Moschiferus of Dr. Tyson, called by Marcgrave Tajaca Cunigoara; by others Quaubtla Cosmalt and Quapizot; and by Acosta and some others, Zaino. See a most accurate Description of this Animal, in Philos. Trans. N. 182.

Philof. Trans. N. 153.

3. There are some Four-footed Animals whose Hoof is cloven into Four Divisions; and these seem to be not Ruminant s As the Rhinoceros, the Hippipotamus, the Tapijerete of Brasile, the Capy-Bara of Brasile, the Animal Moschiferum.

II. Clawed or Digitate (Unquieulata) Four-footed Animals. Of this kind there is one Sort whose Claws are not divided or separated, but adhering one to another, covered with one common Skin, but with obtuse Nails sticking out round the Margin of the Foot; as the Elephant, which is anomalem, and not clearly referrable to this Kind, or that of Cloven footed Quadrupeds.

(2) There is another Species of this Digitate Kind of Quadrupeds, which hath only two Clams, as that of Camels; and tho these have no Horns they do both Ruminate; and have also the four

Stomachs of Horned Ruminant Animals.

Of the Camel, or Dromedary, there are two Sorts; one having but one Bunch on the Back, the other two. To this Kind belongs the Peruvian Glama, which some have reckoned among the Sheep kind. As also the Pacos, the Oon Indica or Peruviana vu.-

go, much less than the Glama.

3. A third Species of this Unguiculate Kind of Quadrupeds includes such Animals as the Greeks called, such and 'Artemburgea; which have the Foot divided into many Clams with broad Nails on them: As the Ape and Monkey Kind. Of these some have no Tails, and are called Simia or Apes. Others have Tails, and are called Mon.-Reys, Cercopitheci; and such as have either long or thort Tails, if they are of a large Size, are called Papiones or Baboons. There are great Numbers and Varieties of this Species of Quadrupeds; of which Varieties of this Species of Quadrupeds; of which Naturalists have described these. (1) The Ourang-Outang, or Homo Sylvestris of Dr. Thon, described by him in a particular Discourse. (2) The Guariza of Brasile, Marcgravis. (3) The Cagus of Brasile, greater and lesser. (3) The Cay of the same Region, described by Lerius. (5) The Caitaia of the same Country. (9) The Cercopithecus Angoleosis major. (7) The Cercopithecus Barbatus Guimeensis, 2 or 3 Sorts of it. (8) The Cercopithecus mon Rarbatus Cluss. (9) Cercopithecus Clus, called the same Country. (9) The Carcopiebecus Angolensis major. (7) The Cercopiebecus Barbatus Guineensis, 2 or 3 Sorts of it. (8) The Cercopiebecus Barbatus Guineensis, 2 or 3 Sorts of it. (8) The Cercopiebecus Clus. called Sagouin; and, if Apes and Monkeys have their Sagouin; and, if Apes and Monkeys have their Snouts very prominent like Dogs, they are called Councershali. Cynocephali.

4. A fourth Species of this Unguiculate Kind of Quadrupeds is, when though the Claws are many, yet they are not covered at the Ends with broad flat Nails, like Monkeys or Apes; but are rather like the Talons of Hawks, Gc. Crooked and Sharp-pointed. And these in respect of their Teeth may be divided into such as have many Dentes Primores, aut Incisores, (i. e. cutting Teeth) in each Jaw; of which there are two Sorts, a Greater, which either have a short round Head, as the Cat kind; or a longish Snout as the Dogkind; or a Leffer Sore; having a long slender Body with very short Legs, as the Weafel or Vermine Kind. There are some of this Species of Quadrupeds, which have only Two large remarkable Teeth in each Jaw: and thele are of the Hare Kind, and

live only upon Herbs, Grass, &c.

Of the Cat kind of Quadrupeds they reckon to be (1) The Lion, (2) The Tiger, (3) The Pardalis, whose Male is Pardus, Female Panthera, the Leonist Control of the Cat pard. (4) The Lupus Cervarius or Lynn. (5) The Catus Pardus or Cat-a-mountain. (6) The common

Cat. (7) The Bear.

Of the Dog-kind they account, (1) The Wolf,
(2) Lupus Aureus the Jackall, (3) The common Dog. Of which kind they enumerate; (1) The Mastive, (2) The Canis Venation Graius or Gracus; or according to some Scoticus, the Grey bound.
(4) The Graius Hybernicus or Irish Grey-bound. (4) The Conis Venaticus Sagax, Indagator, Sestator ferarum, Sc. the Hound. (5) The Canis Venaticus Hispanicus or aviarius: The Spaniel for Land or Water. (6) The Vertagus or Tumbler. (7) The Ganis Ottung O, Domesticus, the House-Jog. (8) The Canis Melitaus or Lap dog. (9) The Canis Getulus or Islandicus; the Sbock: And of all these Sorts there are many Varieties of Mongrels and Hebridous Breeds.

Another Sort of the Dog-kind is (4) The Fon.
(5) The Animal Ziberbicum, the Civet-Cat, as 'tis corruptly called; but by its Teeth and Snout is plainly of the Dog-Tribe. (6) The American Co-ati, or Rackoon or Rattoon. (7) The Yzquiepate. (8) The Carigueya, Maritucaca, Carigoy, Ropoza, Or Possum, (9) The Taxus, or Meles. The Badger, Grey, or Pate (in the North) (10) The Lutra or Otter. (11) The Phoca or Sea Calf, or Seale. (12) The Equus Marinus, or Morfe, or See-Horfe, mis staken by some for the Hippopotamus. The Dutch call him IValras; the Danes and Islanders, Rosma-(13) Manati seu Vacca Marina; the Sea-

Of the Vermin or Weefel-kind of Quadrupeds, is first, The Mustela vulgaris the Weesel; in Yorksbire, Foumart Or Fitcher, (Janin) (2) Viverra Indica, called Quel and Quirpele; and another Sort called Mungo and Mungathia of a reddish Grey. (2) The Mustela, the Ermine or Swar, if white; and the Mustela Sylvestris, the Ferret. (4) Putorius, the Pole-cat, (5) Martes, Foyns (whence our word, a Gown of Foins) the Marten or Martle. (6) Mustela Zi-bellina, the Sable. (7) The Genetia. (8) The Ichneumon Bellonii.

Of the Hare Kind of Quadrupeds, are first Lepus, the common Hare: (2) Cuniculus, the Rab-

All the Mercury got without the use of Fire, whether by Washing, or found in the Mines (for in the Digging some, the Particles get together, fo that in some places you might take up two or three Spoonfuls of pure Mercury) is called by them Virgin Mercury, and efteemed above the rest. The Officer told me, that making an Amalgama of Gold and Virgin Mercury, and putting it to the Fire, that which Common Mercury would not do.

The Engines for drawing the Water, are all moved by Water, brought thither in no Chargeable Aquedust from a Mountain 3 Miles distant. The Water Pumps from the bottom of the Mine by 52 Pumps, 26 on a side, is contrived to move other

Wheels, for several other Purposes.

The Labourers (being 280 always employed) work for a Julio a Day, which is not above 6 or 7 pence, and Endure not long: For although 70000 or 80000 Florins yearly; but now they None stay under ground above 6 Hours; all of Cost him not above 28000. They produced them in time (fome later, fome sooner) become

this Uic, each of them carrying 24 Resorts; in all Paralytick, and die Hestick. We saw a Man who had not been in the Mines for above balf a Year before, so full of Mercury, that putting a piece of Bra/s in his Mouse, or rubbing it in his Fingers, it immediately became as White, as if he had rubbed Mercury upon it. Those also that Work upon the Back-side of Looking Glasses, are very

Subject to the Palfer.

They convey their Wood thus. About 4 Miles from the Mines on the fides of Two Mountains, Mercury would carry away all the Gold with it, they cut down the Trees, and draw them into the Interjacent Valley. Higher up in the same Valley they make a Lock or Dam; when the Water is ready to run over it, they open the Flood-Gates, and the Water carries all the Trees impetuously to Idria, where the Bridge is built very strong, and at very Oblique Angles to the Stream, on purpose to stop them, and throw them on shore near the Mines

Those Mines heretofore. Cost the Emperor

Anno 1661.	Anno 1662.	Anno 1663.
O dinary Mercury. 198481 Virgin Mercury. 6194	7. 225066 9612	#. 244119 11862
in all 204675	234678	255981

compassed with Hills on all sides. A River of the same Name runs by it, and proves sufficient upon plentiful Rains to convey down the Firi-Trees and other Wood required in the Service of the Mines: And to this End there is an handsome Work of Piles made sloaping athwart the River (after the same manner as I observed in Newfol in Upper Hungary, cross the River Gran) to stop the Trees.

The Entrance into these Mines is not high, or upon an Hill, but in that Town it self. The

The Virgin Quick-filver, which they call Jung. fram, is that which discovers it self without the Gold Mines: And very much carried away Southhelp of Fire. Sometimes it is plainly feen in the Ore, or falls down in Drops, and sometimes Streams out in good quantity; as about Seven Tears ago it ran out of the Earth at first in a Stream as small as a Thread, and afterwards as big as a Pack-together in Barrels, the Quick-filver being nrit made thread, but ceased in 3 or 4 Days. That also is up in double Leather: And in another House accounted Virgin Quick-silver, which is separated as much Ore as can be distilled in 2 Years, except only by Water

Plain Quick-silver they obtain by Fire out of the Ore, and out of the Cinnabar of Mercury, which they dig out of this Mine. The Ore of this Mine is of a Dark Colour, mixed with Red.

The Quick filver Ore of this Mine ordinarily

contains half, and sometimes ? of Quick filver. I went into the Mine by the Pit of St. Agatha. and came up again by that of St. Barbara, descending and ascending by Ladders. I ascended at one of 639 Staves, or 89 Fathoms. It has been Glow-worms, which put into Papers, gave a dimm wrought 200 Years, about the same space of time Light like Candles in Lanthorns; and the Air also Vol. II.

2. The Town of Idria in the County of Gorisia with Newfol Mine, but comes much thort in time of and Province of Friuli, is leated low, and en- the Silver Mine at Schemnitz; and much shorter yes

of the notable Lead Mines in Upper Carinsbia.

In a Laboratory, where the Quick-filver is separated by Fire, I saw an Heap of 16000 Resorts of Iron; every one of which cofts a Crown at the best Hand from the Iron Furnaces in Carinthia. There are 800 Resorts, and as many Recipients, employed together, in drawing over the Quicksilver in 16 Furnaces; 50 in each Furnace, 25 of 2 fide; 12 above, and 13 below of each fide.

June 12. 1669, when I was there, they carried out 40 Saumes of Quick filver into Foreign Parts, deepest part of the Mine from the Entrance, is be- each Saume containing 315 pound Weight, to the tween 120 and 130 Fashoms. as far as Cremnitz in Hungary, for the Use of the ward; for they are not far from the Sonting, or Ly/onzo, a confiderable River, which runs into the Gulf of Trieste in the Adriatick Sea.

In the Castle, I saw 3000 Saumes of Quick silver together in Barrels, the Quick-silver being first made they have great Plenty of Rain to bring down the

The Country is well stored with stately Firs; Larches, Pines, Pinasters, Picea's, and that nobly crisped and well grain'd kind of Acer, whereof Viols and Violins are made: Whereof there is also Plenty in the Country of Salszburg and Care miola.

Travelling sometimes in the Night, we had continually about us a great number of large

was full of Flaming Files, affording some delight in our Old Synods and Episcopal Constitutions.

The way to this Place from Croatia I found difficult; and coming from it to Aidofebini and Weight of Lead, Iron and common Metals, of Croatia, I passed over Swartzenburg, or the Black usually an Hundred Pounds; at Six-score to the Mountain, from whence I descended to Miles in a Hundred. Rocky Country, and far more Stony than the

Craw, or Campus lapidsfus, in Provence.

find Pure Quick filver, running in small Grains like Pearls; the Juice of which Plant being expressed, Folk stone, &c. and exposed to the Air of a Clear Night, there

Knights Fee. QUINQUAGESIMA; See Quadragefima.

QUINTAL, or Quintan, was an old Sportive Exercise, practifed utually at Weddings, and was in the Ground, on the Top of which was a slender Beam turning round on a Spindle: At one of whose Ends was a Sloap or flat Board; and at the other a Bag of Sand or Dirt. And the Sport was with a long Staff or wooden Launce to ride a of Ground whether Square or Oblong, taken out Tilt at the Board, and to be either so skilful or of a Corner, or any Place else of a Ground-plat, lucky to escape the Blow which the Sand Bagg to make a Court or Yard, &c. would be likely to give the Runner at this Quin- QUOINS are the Stones and Bricks placed in would be likely to give the Runner at this Onin-tan, by the turning round of the Beam. This the Corner of any Building; and if any stick feems to have been the same with that Sport called without the Brick-work (their Edges being CyArietum Levatio, which is frequently prohibited pher'd off) they are called Rasick Quoins.

Cennet Par. Antiquities.

QUINTAL, also was formerly used for a

QUINQUE Portus, the Cinque or Five Ports of the Kingdom of England, were so called formerly In the Valley of Lance, which runs between the Mountains of Turin, grows a Plant like Mountains of Turin, grows a Plant like Poronicum, (so also called by the Inhabitants and Botanists,) near the Rosts whereof you may chester, and Rye; and several other Places which are called their Members; as Seaford, Feversham,

These had formerly, and have still, great Priwill be found as much Mercury, as there is lost of Juice.

vileges allowed them on the account of finding the King a certain Number of Ships of War, on occasion: The Numbers of which are these. Ha-QUIETUS, was formerly a Writ of Discharge strong is bound to find twenty one Ships, each granted to those Barons and Knights, who personally attended the King in his Wars, or any Fois to find Five Ships, with 24 Men and a Boy in reign Expedition; by which they were exempted each. Hithe also must find Five Ships, and in from the Claim of Scutage, or a Tax on every each 21 Men and a Boy. Dover is to find 21 Ships, in each 21 Men and a Boy. Sandwich should find Five Ships, each carrying 21 Men and a Boy. The Ships and Boys are 57. The Men 1188. The Service, which the Barons of these Cinque-Ports either so dangerous or ludicrous as to be forbid often by Ecclesiastical Authority; The manner of their own Charges for fifteen Days, and to set out it was thus: A Post was erected perpendicularly to those Places withher they are to go, and to stay as long as the King pleases, at his Charge, See Somner's Treatise of Rom. Forts and Ports in Kent

QUIRK, is a Term in Architecture for a Piece of Ground whether Square or Oblong, taken out

RAF

ACHAT, Rachetum, from the French Racheter,

used for Liberi-Homines; and Spelman thinks it to

be what Bracha calls Rade-knights.

RADIAL Curves are Curves of the Spiral kind, RAIN-BOW. In order yet further to explain whose Ordinates, if they may be so called, do all the Phanomena of the Rain-bow; Sir Isaac Nameon terminate in the Centre of the including Circle, in his Excellent Treatife of Opticks, p. 126. adand appear like so many Radis or Semi diameters of that including Circle. See Spiral.

RADMAN is a word often used in Dooms-day, and seems to be the same with Rade-knight or Radknight. Others think it comes from Read, Counsel, and then Read man, is a Counsellor.

RAFTERS, in any Building, are those Pieces of Timber, which stand by pairs upon the Reason, meet in an Angle at the Top, and help to compose scatter into Drops, and fall like Rain; for the Sun the Roof of a Building: They should not stand on these Drops certainly causes the Bow to appear farther than 12 Inches from one another.

RAI

RAGEMAN, is a Statute so called, of Justices ACHAT, Rachetum, from the French Racheter, to redeem, was formerly used for the same as affigned by K. Edw. 1. and his Counsel, to go a Theff-boote, viz. the Compensation or Redemption of a Thief, Skene de verb. signif.

RADECHENISTORS in Dooms day book, is Years next before Michaelmas, in the fourth Year of his Reign. Cowel.

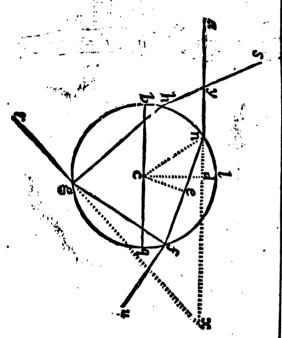

vances this Proposition.

By the Properties of Light (discovered by his Net Experiments) to explain the Colours of the Run-bow.

This Bow never appears but where it rains in the Sun-shine; and it may be artificially made by sponting out Water, which by breaking alost shall to an Eye duly posited to the artificial Rain, and

the Sun. And hence it is now agreed, that this Bow is made by the Refraction of the Sun's Light in Drops of falling Rain. This was understood by some of the Ancients, and of late more fully difcovered and explained, by Anton de Dominis, A. Bp. of Spalato in Libro de Radiis visus & lucis; Printed at Venice, A. D. 1611. and written above 20 Years before. He shews there, how the Interior Bow is made in round Drops of Rain by a Refraction of the Sun's Light, and one Reflexion between them; and the Exterior by two Refractions and two Sorts of Reflexions between them in each Drop of Water: And he proves his Explications by Experiments made with a Phial full of Water; and with Globes of Glass filled with Water, and placed in the Sun, to make the Colours of the two Bows appear in them. The same Explication Des Cartes hath pursued in his Meteors, and mended that of the Exterior Bow. But fince they understood not the true Origin of Colours, its necessary to pursue it here a little further.

For understanding therefore how the Bow is made, let a Drop of Rain or any other Spherical Transparent Body be represented by the Sphere

b n f o described with the Centre c, and Radius on, and let a n be one of the Sun's Rays incident upon it at n, and thence refracted to f; where let it either go out of the Sphere by refraction to npon it at m, and thence refracted to f; where let by Computation the greatest Angle 4 xr will be it either go out of the Sphere by refraction to found 42° 2', and the least Angle 4 y 150° 57'. And wards u, or be restlected to g; and at g let it eitin the most refrangible Rays, the Sines 1 and r, b; and at b let it go out by Refraction towards s, greatest Angle a x r will be found to be 40° 17°; cutting the Incident Ray in j: Produce an and rg and the least Angle a j : 54° 7'.

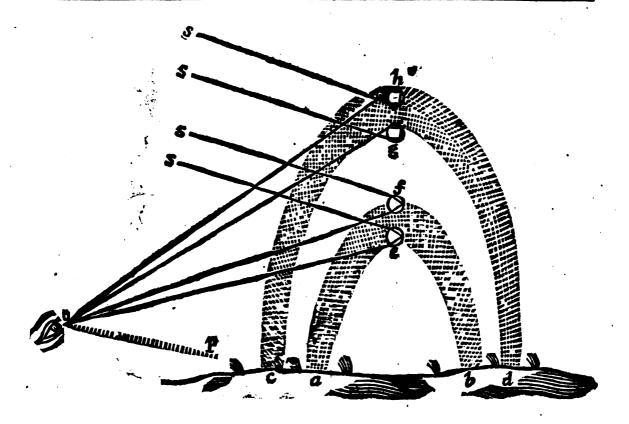

till they meet in x; and on ax and n f let fall the Perpendiculars c d and ce; and produce c d till it fall on the Circumference at /; parallel to the Incident Ray draw the Diameter bq, and let the Line of Incidence out of Air into Water be to the Line of Refraction, as I to'r. Now if you suppose the Point of Incidence n, to move from the Point b continually till it come to l, the Arch q will first increase and then decrease, and so will the Angle axr, which the Rays an and gr contain: And the Arch qf, and Angle axr will be biggest when nd is to en: as $\sqrt{11-rr}$ is to Also the Angle a j j, which the Rays an and b s contain, will first decrease and then increase, and grow less, when m d is to en :: VII Jar: In which case we will be tond:: as 3 r to , and fo the Angle which the next emergent Rays. viz. 1 after 3 Reflexions, contains with the incident Ray an, will come to its limit when nd is to en:: 45 V 11-rr is to J19 rr; and nend:: as 4 r to 1, and the Angle with the Raynext after the emergent, (i. e. the Ray emergent after 4 Reflexions) contains with the Incident Ray, will come to its Limit when n d is to cn:: as $\sqrt{11-rr}$ is to $\sqrt{24} rr$; in which Case n e will be to n d:: as 57 to 1; and so on infinitely: The Numbers 3, 8, 15, 24, &c. being gathered by continual Addition of the Terms of the Arithmetick Progression 3, 5, 7, 9, &c. The Truth of all which Mathematicians will easily examine.

Now it is to be observed, that as when the Sun comes to his Tropicks, the Days increase and decrease but a very little for a great while together; so when by increasing the Distance cd, these Angles come to their Limits, they vary their Quantity but very little for some time together; and therefore a far greater Number of the Rays which fall upon all the Points n, in the Quadrant bl, shall emerge in the Limits of these Angles, than in any other Inclinations. And tis to be observed farther, that the Rays which differ in Refrangibility will have different Limits of their Angles of Emergence, and consequently according to their different Degrees of Refrangibility, emerge most copiously in different Angles, and being separate from one another, appear each in their proper Colours. And what these Angles are, may be easily gathered from the foregoing Theorem, by Computation.

For in the least refrangible Rays the Sines 1 and r (as was found above) are 108 and 81, and thence ther go out by Refraction at r, or be reflected to are 109 and \$1; and thence by Computation the

٦.. آيا.

Supposing now then o be the Spectator's Eye, Sense with the deepest Red in that Region. And and op a line drawn parallel to the Sun's Rays, the Angle s b o being equal to p o b = 54° 7', shall of, og, ob, and be illuminated by the Sun's Rays so, sf, sg, sb: The Angle soo being equal to the Angle poe = 40° 17', shall be the greatest Angle in which the most retrangible Rays can after one Reflexion be refracted to the Eye: And therefore all the Drops in the Line os, shall send the most refrangible Rays most copiously to the Eye, and thereby strike the Senses with the deepest violet Colour in that Region. And in like manner the Angle s fo being = to the Angle po f = 42° 2'.
Thall be the greatest in which the least refrangible Rays after one Reflexion can emerge out of the Drops; and that these Rays shall come most copioully to the Eye from the Drops in the Line of and frike the Senies with the deepest red Colour in that Region. And by the same Argument, the Rays which have intermediate Degrees of Refrangibility, shall come most copiously from Drops between e and f, and so strike the Senses with the intermediate Colours, in the Order which their Degrees of Refrangibility require: i. e. in the Progress from e to f, or from the Infide of the Bow to the Outside in this Order; Violet, Indico, Blue, Green, Yellow, Orange, Red. But the Violet, by the mixture of the white Light of the Clouds, will appear faint, and incline to a Purple.

Again, the Angle sgo being equal to the Angle pog, or 50° 52', shall be the least Angle in which the then least refrangible Rays can, after 2 Reflexions, emerge out of the Drops; and that the least confirmed, by the known Experiment of hanging refrangible Rays shall come most copiously to the up in the Sun-shine a Glass-globe filled with Wa-

and let poo, pof, pog, and pob, be Angles of do 17': 42° 2': 50° 57', and 54° 7' respectively; and these Angles turned about their common fide op, shall with their other sides oe, of, og, and ob, describe the Verges of 2 Rain-bows af be, and ob, describe the Verges of 2 Rain-bows af be, and cbdg: For if e, f, g, b, be Drops placed any where in the Conical Superficies described by oe, and be illuminated by the Sun's Rays. in the Regions between g and b, shall strike the Senses with the intermediate Colours, in the Order which their Degrees of Refrangibility require, (i. e.) in the Progress from g to b, or from the intide of the Bow to the outer, in this Order: Red, Orange, Yellow, Green, Blue, Indico, Violet. And fince these 4 Lines e, of, og, ob, may be simated any where in the above-mentioned Conical Surface, what is faid of the Drops and Colours in these Lines, is to be understood of the Drops and Colours every where in these Superficies.

Thus shall there be made two Bows of Colours, an interior and stronger, by one Reslexion in the Orops, and an exterior and fainter by two; for the Light becomes fainter by every Reflexion: And their Colours shall lie in a contrary Order to one another, the Red of both Bows bordering upon the Space gf, which is between the Bows.

The Breadth of the interior Bow foe, measured a-cross the Colours shall be 1° 45', and the breadth of the exterior gob, shall be 3° 10'; and the Distance between gof, shall be 8° 5'. The greatest Semidiameter of the innermost, (i.e.) the Angle p of being 42° 2'; and the least Semidiameter of the outermost p o g being 50° 57'. These are the Measures of the Bows, supposing the Sun to be a Point; but by the breadth of his Body, the breadth of the Bows will be increased, and their Distance decreased by half a Degree.

This Explication of the Rain-bow is yet farther Eye from the Drops in the Line og, and ftrike the ter; and then viewing it in such a Posture, that

the Rays which come from the Globe to the Eye may contain with the Sun's Rays an Angle of either 42 or 50 Degrees: For if the Angle be about 42 or 43 Degrees, the Spectator suppose at o (in the preced. Fig.) shall see a full red Colour in that fide of the Globe which is opposed to the Sun, as is represented at f. And if that Angle become less (suppose by depressing the Globe to e) there will appear other Colours, Yellow, Green and Blue successively, in the same side of the Globe. But if the Angle be made about 50 Degrees, (as suppose by lifting up the Globe to g,) there will appear a red Colour in that fide of the Globe which is towards the Sun: And if the Angle be made greater, (suppose by lifting up the Globe to b) the Red will turn successively to the other Colours, Yellow, Green, Blue, &c. The same thing may be done (as the Author tried) letting the Globe rest, and only raising and depressing the Eye, or moving it 10, as to make the Angle of a just Magnitude.

RAINS: Our Seamen call that Track of the Sea to the Northwards of the Equator betw. 4 and 10 Degrees of Latitude, and lying between the Meridian of Capa Verde, and that of the Eastermost Islands of the same Name, or of the Capa Verde Islands, they call this Track the Rains: Because there are almost continual Calms, constant Rains, and Thunder and Lightning to a strange Degree there; and the Winds, when they do ever blow, are only small uncertain Gusts, and shift about all round the Compass; so that Ships are sometimes here detained a long while, and can make but very little way.

RANDEZVOUS, in a Military Sense, is a Place appointed by the General of an Army, for all the Forces to meet on a Day appointed; let what Weather, &c. happen that will.

RANK, in a Military Sense is the Order or firait Line made by the Soldiers of a Battalion, or Squadron drawn up fide by fide, Doubling of Ranks is puring two into one

is putting two into one.

RAPACIOUS Animals, are in general such as live upon Prey: And its a general Division of Birds, into such as are Rapacious and Carnivorous, and such as are Frugivorous. The Characteristick notes of Birds of Prey are; that they have a great Head and a short Neck, hooked, strong and sharp poin ted Beak and Talons, sitted for ravine and tearing of Flesh; strong and brawny Thighs for striking down their Prey: A bread thick sleshy Tongue like that of a humane Creature; 12 Feathers in their Train; and 14 slag Feathers in each Wing. The two Appendices, or blind Guts, are always very short; They have a Membranous Stomach, and not a Musculous one or a Gizard, such as Birds have that live on Grain: They are very sharp-sighted, and are not Gregarious, but Solitary generally speaking, though Vultures will sly 50 or 60 in a Company.

RAPHA, in Anatomy, is a Ridge or Line which runs along the Under side of the Penis, and reaching from the Franum to the Anus, divides the Scrotum and Perinaum in two. This line is not usually cut in the Grand Operation of cutting for the Stone, because tis both harder than the rest of the Skin there-abouts, and also because you must then cut upon the Interstices of the Muscles, which will make the Ro-union the more difficult.

RATE of a Ship of War is its distinction as to Bigness and Capacity; and this is usually accounted by the Length and Breadth of the Gun-deck, the Number of Tuns they contain, and the Number of Men and Guns they carry. For such Men of War as have their Gun-decks from 159 to 174 Feet in length, and from 44 to 50 Foot broad! That contain from 1313 to 1882 Tuns, that have from 706 to 800 Men, and carry from 96 to 110 Guns: We reckon of the First Rate.

Second Rate Ships, have their Gun-decks from 153 to 165 Feet long; and from 41 to 46 broad: Contain from 1086 to 1482 Tuns; and carry from 524 to 640 Men. and from 81 to 640 Men.

Third Rases have their Gun-decks from 142 to 158 Feet in length; from 37 to 42 Foot broad: They contain from 871 to 1262 Tuns; carry from 389 to 476 Men, and from 64 to 80 Guns.

Fourth Rates are in length on the Gun-deck from 118 to 146 Foot, and from 29 to 38 broad: They contain from 448 to 915 Tuns; carry from 226 to 346 Men; and from 48 to 60 Guns.

Fifth Rates have their Gun-decks from 100 to 120 Foot long, and from 29 to 31 Feet broad: Contain from 259 to 542 Tuns; carry from 145 to 190 Men; and from 26 to 44 Guns

to 190 Men; and from 26 to 44 Guns.

Sixth Rates have their Gun-decks from 87 to 95
Foot long, and from 22 to 25 Foot broad: They
contain from 152 to 256 Tuns; carry from 50 to
110 Men, and from 16 to 24 Guns.

Our New-built Ships are much larger, as well as better, than the Old ones of the same Rase; and that is the Reason of the double Numbers all along; the larger of which express the Proportions of the New-built Ships.

RATION, is now in the Army, a word in use for a certain Proportion of Ammunition-Bread or Forrage distributed to every Man in the Army, as his Portion for such a Time.

RAVISHMENT de Garde was a Writ that formerly lay for the Guardian by Knighes Service, or in Soccage, against him that took away from him the Body of his Ward.

RAYS of Light with Regard to Opticks, are by Sir Is. Newton considered, as the last Parts of that wonderful Fluid; and that as well such as are successive in the same Lines as contemporary in several Lines: For 'tis manifest that Light consists of Parts both successive and contemporary; because in the same place you may stop that which comes one moment, and let pass that which comes presently after, and in the same Time you may stop it in any one place, and let it pass in another. Wherefore the least Light, or part of Light, which may be stopt alone without the rest of the Light; or propagated alone, or do or suffer any thing alone, which the rest of the Light does not, or suffers not, he calls a Ray of Light.

The Mathematicians indeed usually consider the Rays of Light to be Lines reaching from the luminous Body to that illuminated; which were just if Light were propagated in an instant, as some have supposed: But the Observations of the Eclipses of Jupiter's Satellites made first by Mr. Romer, do shew that 'tis propagated in Time, and in particular that it takes up about 7 Minutes in moving from the Sun to the Earth.

The

The incomparable Sir If. Newton in his Opt. Book 2. Part 3. p. 65. After having premiled p. 50. that those Surfaces of transparent Bodies reflect the greatest Quantity of Light, which have the greatest Refracting Power; and also that in the Confines of equally refracting Mediums there is no Reflexion; and at pag. 45. That the Transparent parts of Bodies according to their feveral Sizes must reflect Rays of one Colour, and transmit those of another on the same Grounds, that thin Plates or Bubbles do transmit or reflect those Rays; which he takes to be the ground of all their Colours : proceeds, in the Eighth Proposition, to enquire into the Cause of the Rays of Lights being reflected, and he shews that the Cause of Reflexion is not the impinging of Light on the folld or impervious Parts of Bodies as hath commonly been believed, as appears from the following Confiderations.

(1.) That in the Passage of Light out of Glass into Air, there is a Reflexion as strong as in its Passage out of Air into Glass, and rather something stronger, and much stronger than in its Passage out of Glass into Water: And it seems not probable that Air should have more restecting Parts than Water or Glass. But if that could be supposed it would not do, because the Reslexion is as firong or fironger when the Air is drawn away from the Glass (as suppose in the exhausted Receiver of Mr. Boyle's Air-pump) as when it is adja-

cent to it.

(2) If Light in its Passage from Glass to Air be incident more obliquely than at an Angle of 40 or 41 gr. it is wholly reflected; but if less obliquely, it is in a great Measure transmitted. Now it is not to be imagined that Light at one Degree of Obliquity should meet with Poresenough in the Air to transmit the greatest Part of it, and at another Degree of Obliquity should meet with nothing but Parts to reflect it wholly; especially considering that in its Passage out of Air into Glass, how obliquely scever it falls, it finds Pores enough in the Glais to transmit the greatest Part of it. If it be said. that it is not reflected by the Air but by the utmost Superficial Parts of the Glass; there is still the same Difficulty: Besider, that such a Supposition is un-intelligible, and will also appear to be false by applying Water behind some part of the Glass instead of Air. For so in a convenient Obliquity of the Rays, as suppose of 45 or 46 gr. at which they are all reflected where the Air is adjacent to the Glass, they shall be in a great Meafure transmitted where the Water is adjacent to it: Which argues, that their Reflexion or Transmission depends on the Constitution of the Air and Water behind the Glass, and not on the firiking of the Rays upon the Parts of the Glais.

(3.) If the Colours made by a Prism placed at the Entrance of a Beam of Light into a darkned Room, be successively cast on a second Prism placed at a greater Distance from the former, in such manner that they are all alike incident upon it; the second Prism may be so inclined to the Incident Rays, that those which are of a blue Colour shall all be reflected by it, and yet those of a red Colour pretty copiously transmitted. Now if the Reflexion be caused by the Parts of Air and Light at a distance, he shews in another Place. Glass, how comes the Blue, at the same Obliquity of Incidence, wholly to impinge on those Parts so pinging on the solid Parts of Bodies but by simpinging on the solid Parts of Bodies but by some as to be all reflected, and yet the Red sind Pores other Principle, its probable that these Rays which gnough to be in a great Measure transmitted?

(4.) Where 2 Glasses touch one another, as he shews in the first Observation, there is no sensible Reflexion, yet why fhould not the Rays of Light impinge on the Parts of Glass, as much when contiguous to other Glass, as when so to Air?

(5.) When the Top of a Bubble of Water in Obs. 17. at last began to grow very thin, there was so very little Light reslected from it, that it appeared intensely black; and yet round about where the Water was thicker, the Reflexion was so strong as to make the Water to appear very

Nor is it only at the least Thickness of Bubbles and thin Plates that there is no manifest Reslexion, but at many others continually greater and greater: For he found (in Obier. 15.) that Rays of the same Colour were by turns transmitted at one Thickness, and reflected at another, for an indeterminate Number of Successions; and yet in the Surface of the thinned Body, where it is of any one Thickness, there are as many Parts for the Rays to impinge on, as where it is of any other Thickness.

(6.) If Reflexion were caused by the Parts of reflecting Bodies, it would be impossible for this Plates or Bubbles at the same place to restect the Rays of one Colour and transmit those of another, as by the 13 and 15 Observations tis plain they do: For it is not to be imagined that at one Place the Rays which (for inftance) exhibit a Blue, should have the Fortune to dash upon the Paris; and those which exhibit a Red should fall upon the Pores of the Body: And then at another Place, where the Body is either a little thicker or thinner; that on the contrary, the Blue should fall on

its Pores, and the Red upon its Pares polished.

(7) Were the Rays of Light reflected by impinging on the folid Parts of Bodies, their Reflexions from these Bodies could not be so regular as they are. For in polishing with Sand, Glass, Putty, or Tripoly; it is not to be imagined that those Substances can by grating and fretting the Glass, bring all its least Particles to an accurate Polish, so that all their Surfaces shall be truly plane or truly spherical, and look all the same way, so as together to compose one even Surface. The smaller indeed the Particles of these Substances are, the smaller will the scratches be, by which they continually fret and wear away the Glass until it be polished: But be they never so small they can wear away the Glass no otherwise than by grating and scratching it, and breaking off the Protuberances; and they polish it no otherwise than by bringing its roughness to a very fine Grain, so that the Scratchings upon it become too small to be vifible. And then if Light were reflected by impinging upon the folid Parts of the Glass, it would be scattered as much by the most polished Glass as by the roughest: Wherefore it remains a Problem, how Glass polished by freeting Substances can reflect Light so regularly as it doth; and this can't well be solved, unless the Reslexion of the Ray be effected, not by a fingle Point of the re-flecting Body, but by some Power of the Body which is evenly diffused all over its Surface, and by which it acts upon the Ray without immediate contact, for that the Parts of Bodies do act on do impinge on the folid Parts of Bodies, are not

reflected but stifted and lost in the Bodies; for otherwife two Sorts of Reflexions must be allowed. Should all the Rays be reflected which impinge on the Internal Parts of Water or Chrystal, there Substances would rather have a cloudy, than a transparent Colour. To make Bodies look black many of the Rays must be stopt, retained and lost in them, and it feems not probable that any Rays can be stopt and stifled in them, which do not impinge on their Parts. After this he shews in Prop. 9. That Bodies reflect and refract Light by one and the same Power variously exercised in various Circumstances; as appears from several Consideracumstances; as appears from several Considera-tions. 1. Because when Light goes out of Glass into Air, as obliquely as it can possibly do, if its Incidence be made still more oblique, it becomes totally reflected; for the Power of the Glass after it hath tefracted the Light as obliquely as is posfible, if the Incidence become still more oblique, becomes too strong to let any of its Rays go thro' and consequently cause a Total Reflexion. 2. Because Light is alternately reflected and transmitted by thin Plates of Glass for many Successions, according as the Thickness of the Glass increases in Arithmetical Progression; for here the Thickness of the Glais determines whether the Power by which Glass acts upon Light, shall cause it to be reflected, or permit it to be transmitted. And, 3. Because those Surfaces of Transparent Bodies, which have the greatest refracting Power, reflect the greatest Quantity of Light, as was shewn in the first Proposition.

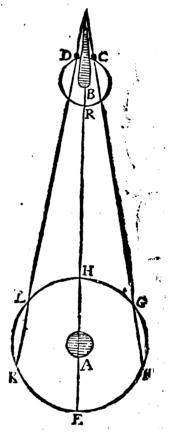

And in the Latin Edition of his Opticks towards the End, under the 21st Query, he shews that the Cause of Reflexion and Refraction both, is only the Attraction of the Part of the Body acting upon the Rays of Light at a little diftance, as they pass our of, or thro the Surface of the Glass. (See Light.) For as the Rays pass out of Glass into a Vacuum they are always inflected towards the Glass; and if they fall on the Vacuum too obliquely, they will return again to the Glass, and be totally reflected. Now this Phænomenon can't be attributed to the Resistance of the Vacuum, (which is nothing) but must be attributed to some force in the Glass, which reduces or draws back the Rays after they are gotten out of the Glass into the Vacuum. For if the hinder Surface of the Glass be covered with clear Water, Oil, pellucid and liquid Honey, a Solution of sublimate, &c. Then the Rays which otherwise would have reflected, will pass into that Liquor. And this shews plainly that the Rays are not reflected, till after they have pass'd the hinder Surface of the Glass, or are beginning to go out of it. For if as they are going out, they fall into any of the Liquors above-mentioned, they then go on in the Course they were in before: because the Attraction of the Glass is balanced by the Attraction of the Parts of the Liquor.

And this appears yet plainer, by the Compression of two Prisms, or Object Glasses of a long Telescope, together, when one is plain, and the other a little Convex; for then they will neither exactly touch, not yet be at any considerable distance one from another, as it may be not above the part of an Inch.

For then the Rays which, at passing out of the neous, would see the Imme hinder Surface of the first Glass, would have been into the Shadow at the same reflected and turn again to it, if the Distance of Time, as another would do it the 2° Glass had been considerable, will now all it would be the same thing on readily in that part, pass through the Second regard to the Points K and L.

Prism or Object Glass, just as if there were a hole thro'it. See Sir Is. News. Observ. 1. 4. and 8th. of Part 1. Book 2. of his Opticks.

It hath been discovered by that Excellent Danish Astronomer, Mr Romer: that tho' the Motion of the Rays of Light coming from us to the Sun be amazingly swift, yet it is by no means instantaneous. And the Velocity of that Motion may be thus determined in the Figure annexed; let the Circle HLKEFG represent the Earths annual Orbit, described by its Revolution round the Sun, which suppose placed in A. Let the Point B represent the Planet Jupiter, casting a Shadow backwards towards those Parts which lie behind him in respect to the Sun. Let the little Circle DRC denote the Orbit of any one of the Satellites of Jupiter, revolving round that Planet placed in B. And let the Chord GF be in length equal to the Semi-diameter of the Earth's annual Orbit AE, of AH: As let also LK be, on the other hand.

All this supposed, 'tis plain that those Immersions of Jupiter's Satellites into his Shadow, and those only which happen from their Conjunction to their Opposition with that Planet, can be visible to the Inhabitants of the Earth, which live within the Semi-circle H G F E: And those Emersions out of his Shadow, and those only which happen from the Satellites Opposition to their Conjunction with Jupiter again, can be visible to such as live under the Semi-circle H L K E: Because the Interposition of the Body of Jupiter, hinders both from being visible. 'Tis apparent also, that an Observer placed in F, if the Motion of Light were instantaneous, would see the Immersion of a Satellite into the Shadow at the same Moment of absolute Time, as another would do if placed in G; and it would be the same thing on the other side with regard to the Points K and L.

But if the Propagation of Light take up any fensible Time, 'tis plain that the Observers posited in Gand L, being nearer to Jupiter by an entire Semidiameter of the Magnus Orbis, than those in F, and K; must needs see the Immersions and Emerfions a little sooner than those can do; and from the Space of Time which is proportionable to that Semi diameter of the Earth's Annual Orbit, may Estimation be made of the Velocity of the Rays of Light; and so the thing is in Fact: For whenever the Earth is in that part of its Orbit which is nearest to Jupiser, the Immersions of the Satellises into his Shadow do anticipate the mean Time which they should happen in, according to Cal culation; as when the Earth is in the opposite Parts of the Orbit, they do really appear later than by Calculation they should do. And so they will appear later to an Observer placed in F, than to one placed in G; and the Emersions later to one in K, than to one in L: As Mr. Romer first found, and is now agreed on by all Aftronomers. There was indeed some doubt about this matter started by Cassini; but our Accurate Mr. Halley Savilian Professor of Geometry at Oxford, bath cleared up all the Difficulty; and demonstrated that this Progreffive Motion of the Rays of Light, to such a Distance, and in such a given Time, is absolutely nece flary to account for the Phenomena of the Eclipses of the Satellites of Jupiter. And as to the Time, or with what determinate Velocity the Rays move, Mr. Romer judged that it required about Eleven Minutes of an Hour, for the Light reflected from Jupiter, to move the length of the Chord FG in the Figure above; or the Distance of the Semi-diameter of the Earth's annual Orbit: But this, by Cassini's more accurate Observations, feems to be much lessened, for according to him it can't be above 7 Minutes and 5 Seconds. Suppose then it be reckoned at 9 Minutes, which is the Medium between Romer's Eleven, and Cassini's Then will the Motion of Light be so prodigious swift, as to move about Eighty Millions of Miles in 9 Minutes: That is 8888888 Miles in a Minute; and 148148 Miles in a Second; and 74074 Miles in half a Second, or while you can pronounce One, Two, distinctly.

A Motion, tho not instantaneous, as no one can

be; yet so wonderfully swift, that the Motion of a Bullet from the Mouth of a Cannon, (or any such like Velocity of a Body projected,) is like the creeping of a Snail, the Motion of the Leggs of the Ignavus, or the imperceptible Pace of the Hand of a Clock, when compared with it: Nay, the Mozion of the Earth it self in the Annual Orbit, which yet is pretty swift, (viz. at the Rate of 31 English Miles in a Second) is not the Ten Thousandth part

of the Velocity of the Rays of Light.

From which very surprising Proposition, the Ingenious Mr. Whiston deduces these Corollaries.

- 1. That the Eclipses of the Sun, Moon, or Sarellites of Jupiter, do not happen at the same moment of Time, that they appear to us to do.
- 2. That the more remote any Planets are from its, the longer will be the Distance between the stant from the sirve and apparent Time of their Eclipses: Thus, Line. Sometime tho the Moon's Eclipses will appear to us to be the Reserve-Line. mearly at the fame Time, at which they really REAR. Rank, happen; yet those of the Sun must appear later, when drawn up.

those of the Satellites of Jupiter, later yer; and thole of Saturn's Satellites, latest of all.

- 3. The apparent Places of the Sun, and the Planets in the Heavens, are not their true and real ones at any Time of Oblervation.
- 4. Supposing the Distance of the fixed S:ars from us to be so immensely great, as we have all the reason in the World to conclude it to be; and to which the Distance of the Sun from us hardly bears any sensible Proportion; 'tis plain that the Light of the fixed Stars cannot come to us in many Hours, nor in many Days nor Weeks; perhaps, not in some Months Time. So that, as that Excellent Mathematician the Honourable Mr. Francis Roberts, was once in Discourse suggesting to me; if the Author of Nature should please to annihilate Sprius, or any other fixed Star; it might be 3 Months Time before we should miss him, and find his Place vacant in the Heavens.

REACTION: See Repulse.
BEACTION; The Naturalists say, that Reaction is directly contrary and equal to Action, in Bodies. Or the mutual Actions of two Bodies striking one against another are exactly equal, but made with contrary Directions. Or yet in other words by the Action and Reaction of Bodies one on another, there are produced equal Changes in each; and those Changes are impressed towards (directly) contrary Parts, or ways. This rowards (directly) constary Paris, or ways. This will be best understood by Instances: For, whatever Body presses or draws another, is equally pressed or drawn by it again. If any one press a stone with his Finger, his Finger is as much pressed by the Stone: If a Horse by a Rope, Gr. draw a Stone, the Horse shall equally be drawn by the Stone; for the Rope being stretched both ways, endeavours to relax it self again, and by that means will draw the Horse towards the Stone; and will as much binder the Progression of the Horse, as it forwards the Procession of the Stone. If any Body lighting against another doth by its force any way change its Motion; it self will undergo the same Change in its own proper Motion, but towards contrary Parts, from the Reaction of that Body, and the Equality of its mutual Pression. By these Actions are produced equal Changes, not indeed of the Velocisies, but of the Mosions of Bodies; (i.e. in such Bodies as have no Impediment any other way) for the Changes of their Velocities, being made towards contrary Parts, (because the Motions are equally changed) are reciprocally proportional to the Bodies them-(elves

REAFFORESTED is used, where a Forest hath been Disafforested, and then made a Forest a-gain: As the Forest of Dean, by 20 Car. 2.

REAP-Towel, or Rip-Towel, was formerly a Gratuity or Reward given to Customary Tenents, when they had reaped their Lord's Corn.

REAR-Half-Files, are the 3 hindermost Ranks of a Battalion when it is drawn up 6 deep.

REAR-Line of an Army encamped; second Line: this lies about 400 or 500 Yards distant from the first Line, which is called the Front-Line Sometimes there is a Third, which is called

REAR. Rank, is the last Rank of a Battallion

REA-

REASON or Reson, and, as some seem to write it more truly, Raising Pieces, are those Pieces of Timber which lie under the Beams on the Brick or Timber in the Side of a House.

REASONABLE-Aid, was a Duty claimed by the Lord of Fee of his Tenants, holding in Soccage or Knights Service to marry his Daughter, or

to make his Son Knight.

REBATE, is a Difference between a certain Quantity of Money, due at a certain Day, and the present Value or Worth of it; or in other words, how much less a Man ought to pay, who pays at the present, a Summ of Money not due till a certain Number of Years, &c. are expired. On this fee an Act both from Equity and a Mathematical Calculus in the Acta Eruditorum Lipfia, from October. 1683, by G. G. Leibnicz.

REBELLIOUS Assembly, is a gathering toge ther of Twelve or more Persons, intending or go ing about, practiting or putting in Ure unlawfully, and of their own Authority, to change any Laws, Statutes, &c. to destroy Enclosures, break down Banks of Fish ponds, &c. unlawfully to ger common; to destroy Deer in Parks, Coneys in Warrens, Doves in Dove Houses, Fish in Ponds. to burn Stacks of Corn, or to abate Rents or Prizes of Victuals, &c. See Ch. 1. Mar. 12. and 1

Eliz. 17.

REBELLUM in some of our old Charters significant on the control of the nifies the same as a Rejoinder, Replication, or

Answer in a Court of Equity.

RECEIVER is commonly used in the Civil Law in an ill Sense, for one that receives stolen Goods, and conceals them; but when annexed to other Words, 'tis used in a very good one; as

RECEIVER of the Fines, which is an Officer that receives the Money of all fuch as compound with the Crown upon an Original Writ in the

Court of Chancery. There is also the RECEIVER General of the Dutchy of Lancaster, which gathers in all Fines, Forseitures, Asses-

ments, &c. within that Dutchy.

RECEPTACLE of the Chile, was known and described by Bartbolomæus Eustachius many Years before the Discovery of the Lacteal Veins, vid.

Koil's Anatom. p. 47, 48. In living Bodies this
Receptacle is easily found, but with greater difficulty in such as are dead. It lies about the de scending Trunk of the great Artery, between the Celiack and Emulgent Arteries, surrounded by several Lymphatick Glands, which are called Glandula Lumbares, which discharge their Lympha into it. It appears to be only a large Bag formed by the Union of the second Order of Lacteals, and many Lymphæducts which open into it; it will contain about an Ounce of Water. Sometimes in Brutes as well as in Men, it is divided into two or three Parts, which at last unite into one Duck a-

bout the Bigness of a Goose-quill.

RECLINATION of a Piane, is the Number of Degrees which any Dial Plane lies or falls backward from the Zenith. This is found easily by the means of long Rules, and a Quadrant; for having drawn an Horizontal Line on the Plane, by a Level or Quadrant, and to it another Line at therefore CD Right-angles, to which apply a Ruler so, that one End of it may hang over or reach beyond the Plane: Then will a Quadrant applied to the under Edge of that Ruler, shew you the Degrees and Minutes of the Plane's Reclination; accounting

Vol. II.

from that Side of the Quadrant that is contiguous to the Edge of the Ruler.

RECLUSE, is one that by reason of his or her Order in Religion is thut up, and cannot ftir out

of a Cloyster, &c. See Liesleson, Sect. 434. RECOGNITIO is the Impannel of a Jury or the Inquest of 12 or more legal Men, who were therefore called Recognitores. So, habere Recognitionem, was to have a Trial or Verdict of Jurors; for Liberty of which a Fine was formerly paid to the King. Recognitio Nova Affic, is a new Trial. RECTA Directrix, is a Line in Conicks made

by the mutual Intersection of the Vertical Plane, with the Plane of the Base. De la Hire.

RECTA Prisa Regn, was formerly a Right the King claimed of taking out of every Ship laden with Wines, One Butt or Pipe, before the Mast, and Another behind it, as a Custom or Duty due to the Crown. K. Edw. 1. in his Charter of Primiles and Another behind it, as a Custom or Duty due to the Crown. vileges to the Barons of the Cinque Ports, among other things, discharges them particularly from this

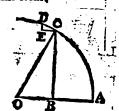

RECTATIO, was a word formerly used for a Claim of Right; or an Appeal to the Law, for the recovery of such a Claimed Right. So also the

Word.

RECTITUDO was then used for a Right or Legal Due; and Oblations and Tithes were called Rectitudines Dei.

RECTIFICATION of Curves. To what hath been said on this Point under Restissing in Vol. 1. and under Cycloid in Vol. 2. twill be proper to add, what the ingenious Mr. Moiore advances in his Illustrious Specimens of the Use and Advantages of the Doctrine of Fluxions: Where he faith, that the Redification of Curve Lines will be ob-tain'd, if we confider the Fluxion of the Curve as a Hypothenuse of a Rectangular Triangle, whose fides are the Fluxions of the Ordinate and Abscisse. But in the Expression of this Hypothenuse, care must be taken that only one of the Fluxions be remaining, as also only one of the indeterminate Quantities, viz. that whose Fluxion is retain'd. Some Examples will render this clear,

The right Sine CB being given, to find the Arch A C. Let AB=x. CB=y. OA r. GE the Fluxion of the Abscisse, ED the Fluxion of the Ordinate, CD the Fluxion of the Arch CA. From the Property of the Circle 21x

-xx=yy, whence 21x 2xx = 277, and there-But C D1 = 11 + xx = And confequently

If rr - yy be thrown into an infinite Series, and

the several Members of it be multiplied into .r ,, and then the flowing Quantity of each be taken, we shall have the length of the Arch A C. After the same manner, giving the versed Sine, the same Arch may be found. For reluming the Equation

found above 2rx - 2xx = 277, we have y =

$$\frac{rr \times x - 2rx \times x + x^2 \times x}{x^2 + x^2 \times x} = \frac{1}{x^2 + x^2}$$

7 r x x -- 2r x x x + x x x x -, that is, (reducing

all to the same Denominator, and expunging . . .

contradictory Terms) ----, whence CD

and consequently the length of the **丰 7.** ×

, J2rx-xx Arch AC may be easily found from what is said

already. The Fluxion of the Curve Line is sometimes more easily found by comparing the two similar Triangles CED, CBO, for this Proportion arises.

CB: CO:: CD, that is for the Circle $\sqrt{2rx-xx}$

:+:: x: r x √2r—xx

The Curve of the Cycloid may be determin'd by the same Method too. Let ALK be a Semi-Cycloid, whose generating Circle is ADL. Having any point as B in the Diameter AL, draw

BI parallel to the Base LK meeting the Peripheus of the Circle in the point D; compleat the Rectangle AEIB, and draw PH parallel to EI and infinitely near toit, as also BI cutting FH in G, and the Curve AK in H. Put AL = d. AB (= El) = x. GH =x. It is known that the right Line BG is every where equal to the Summ of the Arch AD and the right Sine BD: whence 'tis manifest, that the Fluxion I G is also the Aggregate of the Fluxions of the Arch AD and the right Sine BD. But the Fluxion of the Arch AD was found =

and the Fluxion of the right Sine

BD will be found to be dx = 2xx therefore IG

$$2\sqrt{dx-xz}$$

= dx - xx and therefore I H? (= I G! +

$$\sqrt{dx-xx}$$

 $GH_1) = ddxx - dxxx$; from whence IH =

$$\frac{x\sqrt{dd}-dx}{\sqrt{dx-xx}} = \frac{x\sqrt{d}=d}{\sqrt{dx}} = \frac{x\sqrt{d}}{\sqrt{dx}} = \frac$$

quently AI = $2dx = 2\sqrt{dx} = 2AD$. This Conclusion may also be very easily deduc'd from the known Property of the Tangent. For fince the little part of it, as I H, is always parallel to the Chord AD, the Triangles IGH, ABD are similar, whence AB: AD:: GH: IH, that is, x: \dx::

$$x: x \sqrt{dx}$$
, therefore IH $= x \sqrt{dx} = \frac{\frac{1}{3} - \frac{1}{2}}{x}$. By

the help of the Fluxion IH also, we may investigate the Area of the Cycloid. The Fluxion of the

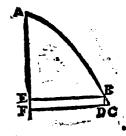

Area AEI, is the Rectangle EIG =
$$dxx - x^2x$$

But the Fluxion of the Portion ABD is the same; therefore the Area AEI and the correspondent Portion (of the Circle) ABD, are always equal.

Let AB be the Curve of the Parabola, whose Axis is AF, Parameter a; let AE = x, E B = y, A B = z,

$$BD = \dot{x}$$
, $DC = \dot{y}$, BC

The Equation expressing the Nature of the

Parabola, being ax = yy, we have ax = 2yy, whence x=2yy; but BCi=BDi+CDi,

that is
$$77 = xx + yy = \frac{4y^2 y^2}{11} + yy = \frac{4y^2 y^2}{11}$$

 47^2 yy + aay y, and therefore $z = y \sqrt{47^2 + 46}$

$$= y \sqrt{y^2 + \frac{1}{4}aa}.$$
 If now by this Expression

Curve AB will easily be known It appears far? ther, that giving an Hyperbolical Space, this Curve

is also given, and vice versa. For 1 a z = y See Court of Requests, in Vol. 1.

 $\sqrt{r^2 + \frac{1}{4}} aa$, and consequently $\frac{1}{2} az$ is the Space

whole Fluxion is $y = \sqrt{y^2 + \frac{1}{4}} aa$. But such a Space is no other than the Exteriour (Equilateral) Hyperbola A B E G, whose Semi-axis A B $= \frac{1}{2} a$, its Abscisse AE = y, and its Ordinate EG =

For the Mensuration of a Surface described by the Conversion of a Curve round its Axis; we are to assume for the Fluxion of it, a Cylindrick Superficies, whose Altitude is the Fluxion of the Curve, and whole distance from the Axis is the Ordinate Applicate corresponding to that Fluxion. Ex. gr. Let AC be the Arch of a Circle, which turning round the Axis AD, generates a spherical Superficies, which we would measure. Now DC the Fluxion of the Arch is already found to be =

, which if we multiply by the Peri-

 $\sqrt{2rx-xx}$

 $\sqrt{2rx-xx}$ (putting — the Ratio of the

Circumference to the Radius) we shall have ex for the Fluxion of the spherical Superficies, and consequently that Superficies it self, is ex.

RECTUM, was used formerly for a Trial Commune Restum was a Trial at Law; or in common Courte of Law: And Stare ad Rellum, was to fland Trial.

REDUNDANT Hyperbola is one so called, because it exceeds the Conical Sections, in the Number of its Hyperbolical Legs; being a Triple Hyperbola with fix Hyperbolical Legs: See

RED Book of the Exchequer is a MS. Vol. of several Miscellany Treatises, in the keeping of the Queen's Remembrancer in that Office; in it are the Number of the Hides of Land, in many Counties, before the Conquest, &c. See Bp. Nicholfon's Hift. Library.

RED seer, when a Piece of Iron in a Smith's Fire of his Forge is heated too much, it will R-dfeer, as they call it, that is, break or crack under the Hammer, while it is working between hot and cold. Some call this Red shire.

RE-Extent in the Law, is a Second Extend made on Lands or Tenements, on a Complaint made that the former Extent was partially performed.

REEVE of a Church is the Guardian of it; or the Church Warden; as Shire Reeve is the Sheriff or Guardian of a County; and Port Reeve the Warden of a Port, or Haven.

REFECTORY was that Place in a Monastery where the Monks, Friars, Nuns, &c. usually Di ne d'and Supped.

REFERENDARY, Referendarius, was a Term insed by the Old Saxons, as appears by Grants and Charters, for such a Person as a Master of Requests was to the King or Queen, amongst us before the Vol. 11. Court of Requests was taken away by 16.17. Car. 1.

REFINING is the Art of separating all other Bodies from Gold and Silver, and this is performed four Ways.

The End of Refining is the Separation of all other Bodies from Gold and Silver, which is performed 4 ways, viz. by Parting; by the Tel; by the Almond Furnace or the Sweep; and by Mercury. 1. Parting is done with the Aqua-fortis. Some Refiners, to make the Aqua fortis, take Salt Peter 3 pound, and Dantzick (not Ba-glish) Vitriol 2 pound (for the English Vitriol makes a weaker Water, and Dirty Colour'd Verditer, and wholly spoils it.) After they are well Bruised and Mixed in a Mortar, they Distill 100 pound of the Materials, put into a Cast-Iron Pot, after this manner.

Build a Furnace 2 Yards high or more; and at the top place in your Iron Pot: To which fit a Head of Earth, like the Head of a large Distillation for Chymical Oyls, which must have a large Belly, branching it self out 8 Inches from the Iron phery belonging to the Radius BC, that is, by Pos, into 3 Branches; one whereof in the midft comes directly straight forward, two other Lateral ones come Obliquely: All which Branches are 4 or 5 Inches hollow in Diameter, and 5 or 6 long. To these Branches are fitted Glass Bodies, Narrow and Hollow at both Ends, Large and Globous in the Midst. These must be exceedingly well Lated on with Colcothar, Rags, Flour and Whites of Eggs. To the first Glass Body is Lated on another Glass, of the same Figure and Size, and in order 8. alike in all, till they come to the Receiver, which is an Ordinary Gallon Glass. All These Rows of Glasses lie on Boards shelving from the Hedd to the Receiver. The two Upper Receivers or Glass Bodies need Exceeding good Luting, for the rest Ordinary Lute will serve.

The Luce is made of good Lome, some Horfedung, and a little Colcothar; although the two former do well.

A little Fire and that of Newcastle Coals does the Work. And you need never Break or Unlute any of the Receivers; but the Lowermost.

The Aqua foreis being Distilled off, is put into a large Earthen Pot, and there is added of Fine Sil. ver, one or two Penny weight (which is called Fixes) to every Pound of Aqua-forris, which within 4 bours, will purge it from all Dirt and Impusrity, and make it fit for Parting, which is thus

If their Silver Gilt be Fine enough for Wire, they only Melt it in a Wind Furnace, and Caft it, Melted, into a large Tub of Water, that they may have it in small Pieces; but if it be but Standard, they first Fine it on the Test. These small Pieces taken from the Water, being well Dryed, are put into a Glass Faper-fashion'd, a Foot High, and inches at the Borrom; and then the Glaffes are Charged with Aqua-fortis about 2 thirds of it, and fet in a Range of Iron covered 2 Inches deep with

Sand, and a Gentle Charcoal Fire is made under it.
Small Bubbles will foon arife, and the Warer
allo run over. If 10, they rake off the Glasses, and hold them till it doth Defervescere, or elle pour out some of it into a Vessel which is at Hand.

If Lead be Mixed with it, they cannot keep it from Running over.

When

this Ebullition, it will Rife no more.

Quantity of Copper contained in it.

If the Water Boil over, 'twill Penetrate the

Bricks and Wood.

They commonly let it stand a Night on the Iron-Range, with a gentle Heat under it, and in the Morning softly pour off the Water impregnated with all the Silver; all the Gold lying like black Dirt at the bottom; which being washed out is put into small Parting glasses, and set over the Sand with their Conduit Water for an bour, and then the Water poured off. This is repeated 5 or 6 times, to Separate the Salt from the Gold, which is now fit to be melted, and cast into Ingots,

To regain the Silver, they have large Round Washing Bowls, lined within with melted Rosin and Pitch (for otherwise the Water would eat the Wood, and penetrate the fides of the Bond) covered with Copper Plates 10 Inches long, 6 wide, and Half or more thick. Into which Bowls they pour good store of Water (the more, the better the Verditer) and then the Silver Water, which working on the lofter Metal of Copper, leaves all the Silver in most fine Sand at the Bottom, and Sides of the Bowl, and Plates of Copper; which being taken out, is Washed, Dryed and Melted for

If any Brass or Shroffe Metal be in the Plates, they gather very little of the Silver; the Latter

mixing with the Silver.

With the Copper-water, poured off from the Sil-They ver, and Whiting, Verditer is made thus. put into a Tub a Hundred Pound weight of Whising, and thereon pour the Copper-water, and fir them together every Day, for some Hours toge-ther. And when the Water grows pale, they take it out, and let by for farther Use, and pour on more of the Green Water; and so continue till the Verditer be made; which being taken our, is laid on large Pieces of Chalk in the Sun, 'till it be dry for the Market.

The Water mention'd to be taken from the Verditer, is put into a Copper, and boiled till it comes to the Thickness of Water-Gruel, now principally confisting of Salt-Peter deduced, (most of the Spirit of Visriol being gone with the Copper into the Verditer,) a Dish full whereof being put into the other Materials for Aqua-fortis, is Re-distilled, and makes a Double-water, almost Twice as

good as that without it.

2. By the Test, all Metals are separated from Silver, except Gold, because they swim over it, when they are all melted together.

The Test is thus made. They have an Iron Mould, Oval, and two Inches Deep. At the Bottom hereof are 3 Arches of Iron, set at Equal Distances, 2 Fingers wide, if the great Diameter of it be 14 Inches long; and so proportionable in Greater or Lesser Tests. This Cavity they fill with fine Powder of Bone-Ashes, moistened with Lixivium, made with Soup-Ashes. Some use Cakes of Pot-Ashes, or other Ashes well cleansed, and so pressed well together with a Muller, that it be comes very close and smooth at the Top. There is left above, a Cavity in the Midst of it, to contain the melted Silver. This Cavity is made greatest in the Middle; for the Bone-Ashes come up a small Channel in that End, which is most re lows.

When the Water hath been once Quieted from mote from the Blaft, for the Running off of the Baser Metals, and so is made Declive to the Cen-The Greenne's of the Water, manifesteth the ter of the Test, where its not above half an Inch deep

The Test thus made, is fet Annealing 24 Hours, and then 'tis fet in a Chimney a Yard High, parallel almost to the Nose of a great Pair of Bellows; and then therein is put the Silver. Which being covered all over with Billets of Barked Oak, the Blast begins, and continues all the while strongly. The Lead, purify'd from all Silver, (which they call the Soap of Metals) first put in, melts down with the Silver, and then the Lead and Copper swim at the Top, and run over the Toft. Whose Motion the Refiner helps with a long Rod of Iron drawn along the Surface of the Silver towards the fore mention'd Slie; and often ftirring all the Metal, that the Impurer may the better rise; and by continuing this Course, Sepa-ration is made in 2 or 3 Hours.

The greatest part of the Lead slies away in

If the Lead be gone before all the Copper, 'twill rise in small Red siery Bubbles; and then they say the Metal Drives, and must add more Lead. The force of the Blast drives the Higher Metals to the lower fide of the Test, and helps its running

When the Silver is fully Fined, it looks like most pure Quick-filver; and then they take off their Sogs and let it Cool. In the Cooling, the Silver will frequently from the Middle, spring up in small Rays, and fall down again. If moist Silver be put into that which is melted, twill spring into the Fire.

A good Test will serve two or three Firings. So soon as the Silver will hold together, they take it out of the Test, and beat it on an Anvil into a round Figure, for the Melting Pot; which being set in a Wind Furnace, surrounded with Coal, and covered with an Iron-Cap that no Charcoal fall into it, is then melted.

If any Drofs or Filth be in the Melting-Pot, they throw in some Tincal, which gathers the Drofs together, that it may be separated from it.

These Melting Pots are never Burned, but only Dryed, and last a whole Day, if they be not suffered to Cool; but if they once Cool, they infallibly Crack.

3. In the Almond Furnace or Sweep, all forts of Metals are separated from Cinders, parts of melting Pots, Tests, Brick, and all other harder Bodies; which must be first beaten into small Pieces with a

Hammer on an Iron Plate.

Those which stick but superficially to the Sil ver, they Wash off thus; they have a Wooden round Instrument 2 Foot wide, somewhat hollow in the Middle, with a Handle on each side. On this they put the Materials, and hold them in a Tub of Water below the Surface, and so waving it to and fro, all the lighter and loofer matter is separated from the Metal.

The Furnace is 6 feet High, 4 feet Wide, and 2 feet Thick, made of Brick; having a Hole in the Midst, at the Top 8 Inches over, growing Nar-rower towards the Bottom of it, where on the Fore-part, it ends in a small Hole, environed with a Semi-circle of Iron, to keep the Molten Metal. About the Middle of the Back, there is another parallel to the Circumference of the Mould; only Hole to receive the Nose of a great Pair of Bel-

When

and Hor, they throw two or three Shovels of Coal. to one of the fore-mention'd Stuff, and so pro- the reflected Axis. ceed during the whole Work, which continues three Days and Nights, without Intermission. After Eight or Ten Hours the Metal begins to run; and when the Receiver below is pretty full, they lade it out with an Iron Ladle, and cast it into Sows in Cavities, or Forms, made with Ashes.

They frequently stop the Passage Hole with Cinders to keep in the Heat; and when they think a Quantity of Metal is melted, they Unstop the Hole

to pals it off.

If the Stuff be hard to Flux, they throw in some Slag (which is the Recrement of Iron) to give it Fusion.

A stinking blue Smoak proceeds from the Furnace, and all By standers put on the Colour of Dead

To get the Silver from those Metals, and to Re-

no other Art than that of the Teft.

4. By Quick filver the Filings of Gold and Silver are separated from Dust, &c. This Dust is put into a Hand Mill with Quick silver, and being continually Turned upon that and the Metals, an Amalgama is made of them, and Fair Water poured in, carries off the Dust as it runs out again by a small Quill.

This Amalgama is put into an Iron, with a Bolthead set into the Fire, having a long Iron Neck 3 Feet long, to which is fitted a Receiver. The Fire Distills off the Mercury into the Receiver, and the Gold and Silver remains in the Bolt bead.

Hour lines, Azimuths, Parallels of Declination, or of Altitude, &c. and all the Furniture of Dials; on such Places as the Suns direct Rays can never in the reversed Axis defired. come to directly, but only by the help of some reflecting Surface; as suppose on the Ceiling of a Room, Se where the Beams may be reflected by a piece of Looking Glass placed on the Board. Stool or Transome of a Window; or other convenient place: And this may be done either by a Glass placed Horizontally, or at oblique Angles to the Horizon.

1. If the Glais be placed Horizontally, you may, by the following Method, upon any Wall or Ceiling of a Room, where that Glass can reflect a Spot of Light, draw erue Hour Lines, Furniture, &c. tho' the Surface be never so irregular, as convex, concave, or of any form whatfoever.

First, draw on Past board or other Material, or get made in Brass an Horizontal Dial for the La-

titude proposed.

Then by the help of the Azimuth, or at the time when the Sun is in the Meridian; or by knowing the true Hour of Day, whereby may be drawn several Lines on the Ceiling, Floor, and Wall of the Room; so as in respect of the Central of the Classic C tre of the Glass they may be in the true Meridiancircle of the World: For if right Lines were extended from the Centre of the said Glass by any Point, though elevated in any of those Lines so drawn, it would be directly in the Meridian circle of the World.

Now all reflective Dialling is performed from that Principle in Opicks, which is, That the Angle lower at pleasure, till it, as formerly, touch the said of Incidence is equal to the Angle of Restetion. And same Hour Thread, and mark again where about as any direct Dial may be made by help of a Point on the Wall or Ceiling, the End of the said Thread.

When the Funace is Annealed with Charcoal found in the direct Axis, so may any reflected Dial be also made by help of any Point found in

> And in regard the reflected Axis for the most part will fall above the Horizon of the Glass without the Window, so that no Point there can be fixed, therefore a Point must be found in the said reflected Axis continued below the Horizontal of the said Glass, until it touch the Ground or Floor of the Room in some part of the Meridian formerly drawn, which Point will be the Point in the reversed Axis desired, and may be found, as followeth.

One End of the Thred being fixed at or in the Centre of the said Glass, move the other End thereof in the Meridian formerly drawn below the said Glass, until the said reversed Axis be depressed below the Horizon, as the direct Axis was elevated above the Horizon, which may be done To get the Silver from those Metals, and to Re- by applying the Side or Edge of a Quadrant to the fine their Copper from the Liebarge, they now use Thred, and moving the End thereof to and fro in the said Meridian, until the Thred with a Plummet cut the same Degree as the Pole is above the Horizontal Glass, and then that Point where the End of the Thred toucheth the Meridian either on the Floor or Wall of the Room, is the Point in the reflected reverled Axis sought for.

Now if the reverled Axis cannot be drawn from the Glass by reason of the jetting of the Window or other impediment, that Point in the reverse Axis may be found by a Line parallel thereto, by fixing one End of it on the Glass, and the other End in the Meridian, so as that it may be parallel to the Floor or Wall in which the reverled Axis point will fall, and find the Axis point from that REFLECTED Dialling is the Art of describing other End of the Lath: so if the same Distance be set from that Point backward in the Meridian on the Floor, as is the Lath, the Point will be found

Thus having found a Point in the reflected reversed Axis; it is not hard, by help whereof and the Horizontal Dial, to draw the reflected Hourlines on any Celling or Wall, be it never so concave or convex.

To do which; First note, that all straight Lines in any projection or any Plane, do always represent great Circles in the Sphere, such are all the

Hour lines.

Place the Centre of this Horizontal Dial in the Centre of the Glass, the Hour lines of the said Dial being horizontal; and the Meridian of the World, which may be done by Plumb lines, let fall from the Meridian on the Ceiling: Then fix the End of a Thread or Silk in the said Centre of the Dial or Glass, and draw it directly over any Hour line on the Dial which you intend to draw at the further side of the Room, and there let one hold or fasten that Thread with a small Nail.

Then in the Point formerly found on the reverled Axis on the Floor, fix another Thread there (as formerly was done in the Centre of the Dial) then take that Thread, and make it just touch the Thread (on the Hour line of the Horizontal Dial extended) in any Point thereof, it matters not where abouts, and mark where the End of that Thread toucheth the Wall or Ceiling, and there make some Mark or Point.

Then again move the same Thread higher or

Digitized by Google

REF

also toucheth. In like manner may be found more Points at pleasure, but any two will be sufficient for the projecting or drawing any Hour-line on Line. any Plane, how irregular soever. For if you move bring the said Thread directly between your Eye and the Points formerly found, you may project thereby as many Points as you please at every Angle of the Wall or Ceiling, whereby the reflected Hour-line may be exactly drawn.

Again, in like manner remove the said Thread fastned in the Centre of the Horizontal Dial, (which also is the Centre of the Glass) on any other Hour-line desired to be drawn, and as before fasten the other End of the Thread, by a small Nail, or otherwise at the further Side of the Room, but so that the said Thread may lie just on the Hour-line proposed to be drawn on the Horizontal Dial. Then (as besore) take the Thread fastened in the Point on the reflected Axis, and bring it to touch the Thread of the Hour line in any part thereof, and mark where the End of that Thread toucheth the said Wall or Ceiling: Then again (as before) move the said Thread so, as that it only touch the said Thread of the Hour line in any other part thereof, and also mark where the End of that Thread toucheth the said Wall or Ceiling: So is there found two Points on the Wall red, by help of which two Points the whole Hourline may be drawn; for if (as before) a Thread be so situated, that it may interpose between the Eye and the said two Points found, you may make many Points at pleasure, whereunto the said Thread may also interpose, which for more Conveniency may be made at every Angle or bending of the Wall or Ceiling, be they never so many: So that if Lines be drawn from Point to point, that said reflected Hour-line will be also exactly drawn.

In like manner may the Hour-lines be drawn fo, that the Reflex or Spot of the Sun from the said Horizontal Glass situated in the said Window (as before) shining amongst the said re-flected Hour-lines drawn on the Wall or Ceiling, will exactly thew the Honr of the Day defired.

żon.

To draw the Equator and Tropicks on any Wall or Ceiling to any Horizontal reflecting Glass.

1. To draw the reflected Aquator or Equinoctial line on the Wall or Ceiling, which represents a great Circle.

Glass, and move the End thereof to and fro in the Meridian line drawn on the Ceiling, until by help of a Quadrant the said Thread be elevated equal to the Complement of the Latitude, (which will Thread falls; then on that Point and the said Meridian line on the Ceiling erect a perpendicular Line, which Line may be continued on any Plane whatfoever, and is the reflected Equinoctial-line defired.

Note that all great Circles are right Lines, and are always drawn or projected from a right

a Thread, and also your Eye to and fro, until you 2. To draw the Tropicks. Note, that all Parallels of Declination are lesser Circles, and are Conick Se-

> First, make or take out of some Book a Table of the Sun's Altitude for each Hour of the Day calculated for the Place of the Latitude proposed, take the Thread fixed in the Centre of the Glass, and by applying one Side of a Quadrant to the faid Thread, and moving one End of it to and fro in the Hour-line proposed, elevate the said Thread answerable to the Suns height in that Hour, when he is in that Tropick you desire to draw, and mark where the End of that Thread so elevated toucheth in that Hour-line proposed. So may you in like manner find a several Point in each Hourline for the Suns height in that Tropick, whereby a Line may be drawn on the Wall or Ceiling from Point to point formerly made in the said Hourlines, which is the Tropick defired.
>
> In like manner may any Parallel of Declination

be drawn: If there be first calculated a Table of the Sun's Altitude at all Hours of the Day, when or Ceiling, being in the reflected Hour line desi-the Sun hath any Declination proposed, whereby may be drawn either the Parallels of the Sun's place, or the Parallels of the Length of the Day.

> To draw the Paralle's of Declination to any refletted Glass mist easily, by help of a Trigon first made on Past-board or other Material.

Fix the Trigon to the reflected reversed Axis, so that the Centre of the Trigon may be in the Centre of the Glass, then will the Equinoctial on the Trigon be perpendicular to the said Axis: Then take the Thread fixed in the Centre of the Glass, and lay it along either of the Tropicks, or other Parallels of Declination required, which is drawn on the said Trigon, which Thread must be continued so, that the End thereof may touch any Hour-line, and on that Hour line mark the Point of Touch, the Thread being fill laid on the same Now if Lines be drawn round about the said Parallel of Declination on the Trigon: In the same Room, equal to the Horizon of the said Glass, it manner find a Point in each Hour line. Lastly, will shew when the Sun is in or near the Hori-draw a Line by those Points so found, which will be the Tropick-line or other Parallel of Declination, as the Thread was laid on, on the Trigon.

> To draw the Azimuth-lines on any Wall or Ceiling to any Horizontal reflecting Glass. Note, that all Azimuths are great Circles.

First, find a Vertible point, either above to the Zenith, or below to the Nadir of the Glass (by Take the Thread fixed in the Centre of the some called a Perpendicular or Plumb-line) and mark in what Point it cuts the Floor of the Room, which Point I call the reflected Vertical-point, wherein the End of a Thread is to be fixed: For by a Point found in the reflected Axis of the Hobe always perpendicular to the reversed Axis) rizon the Azimuths may be drawn, as by a Point marking in the Meridian where the end of that found in the reflected Axis of the Equinocial the Hour-lines may be drawn:
Then on Past-board or other Material draw the

Points of the Compass or other Degrees, and fix the Centre thereof in the Centre of the Glass, and the Meridian thereof in the Meridian of the World,

as was shewn in arawing the Hour-lines, being

careful to place it Horizontal.

Then take the Thread fixed in the place of the Glass, and draw it over any Azimuth, which is defired to be drawn, and at the further fide of the Room fasten that Thread with a small Nail as it was in drawing the reflected Hour-lines: Then take the Thread whose End is fastened in the said reflected Vertical-point, and bring that Thread fo as just to touch the said Horizontal Thread, and augment it, until the End thereof touch the Wall or Ceiling, and there make a Mark or Point. In like manner, move the taid Thread, whose End is fasten'd in the said Vertical point, higher or lower at pleasure, till as formerly it touch the said Horizontal Thread, and mark again where-abouts the End thereof toucheth the faid Wall or Ceiling: Now by help of these two Points found in the reflected Azimuth-line, the whole Azimuth Ceiling, and there make a Mark or line may be drawn; for if (as before in drawing there one Point found on the Wall the Hour-lines) a Thread be so situated, that it the respected Horizon of the World. may interpose between the Eye and the said two Points, you may make many Points at pleasure to which the faid Thread so situated may also interpose, which may be made at every Angle or bending of the Wall or Ceiling (as before) whereby the reflected Az muth line defired may be drawn. In like manner may the other reflected Azimuth lines be drawn.

Also there may be Lines drawn parallel to the Horizon round about the Room, by help of the Thread fixed in the Centre of the Glass, and a

Thus have I showed the drawing of a reflected Dial from an Horizontal Glass, with all the usual Furnisure thereon, though the Wall or Place on which it n to be drawn, be never so gilbous or irregular, or in what shape seever.

Now the Glass may be exactly situated Horizontal, if you draw a reflected Parallel for the present Day, and know also the true Hour, and so place the Glass, that the Spot or Reflex of the Sun may fall thereon on the Ceiling, for there is no way by an Instrument to do it, the Glass is so fmall.

2. If the Glass be placed obliquely, and not parallel to the Horizon, it will recline with some Angle from the Zenith, and then to draw the reflected Dial true, these two Things are principally to be confidered.

- 1. The Reflected Horizon.
- 2. The Refletted Meridian.

Note the Horizon and Meridian are two great Circles.

1. To draw the reflected Horizon according to the Situation of any reclining Glass whatsvever.

First, let two Pieces of nealed Wire be fastened on the Window on each side of the said Glass, the Plummet be in the direct Meridian of the World Ends thereof being without the Room in the Air, with the Centre of the Glass. Then (as before) at whose Ends let there be fastened a Thread which tie a Thread cross the Room, in such sort that may be pulled straight at pleasure, by bending of from or by some part of the said Thread both the

of each Wire be exactly Horizontal with the Centre of the Glass, which may be tried by a Quadrant: Then I tie a String or Thread cross the Room, in such a Sort that I may from most part of the Thread lee the reflecting Glass, and therein the said Horizontal Thread without the Room: Then on the said Thread cross the Room, I tie a slipping Knor to move to and fro at pleasure, which Knot I move to and fro on the said Thread, until by looking in the said Glass I find from my Eye the said Knot and part of the Horizontal Thread without, all as it were in a right Line, the one interpoling the fight of the other. Then being careful to keep the Knot in that polition, fasten one End of a Thread in the place of the Centre of the reclining reflecting Glais, and bring that Thread to, as just to touch the aforesaid Knor, augmenting that Thread, until the End thereof touch the Wall or Ceiling, and there make a Mark or Point; so is there one Point found on the Wall or Ceiling in Then I begin again, and remove the position of that Thread (which went overthwart the Room) either higher or lower at pleasure, still having regard that I may from the most part of the said Thread see the reflecting Glass, and therein the same Horizontal Thread without the Room. Then, as before, I move the said Knot on the said Thread to and fro. until (as before) by looking in the faid Glass ${f I}$ find from my Eye the faid Knot, and part of the Horizontal Thread both in one right Line, the one Thread fixed in the Centre of the Glass, and a interposing the sight of the other; and by the said Quadrant for the Elevation thereof, which will Knot I bring the Thread, whose End is sastened shew the Sun's Altitude at any appearance there-lin the Centre of the said Glass, and keeping it just to touch the said Knot, I continue it, until the End thereof touch the Wall or Ceiling, as before, and there I make another Mark or Point; so is there two Points found in the said reflected Horizon on the Wall or Ceiling. By which said two Points, if a Thread (as before) be so situated, that it may interpose between the Eye and the laid two Points, there may be many Points to be in the same Interposition of the Thread, which (as before) may be made at every bending or Angle of the Wall or Ceiling, whereby the refler Ged Horizon defired may be drawn, by drawing a Line from point to point round about the Room; which will be the true reflected Horizon according to the Situation of the Glass.

> 2. To draw the Reflected Meridian, according to the Situation of any Reclining Glass whatsoever.

First take a Lath or thin Piece of Wood of any convenient Length at pleasure, as some one and an half, or two Foot long, and at each End thereof make a Hole, the one to hang a Thread or Plummet, and the other is to put a small Nail therein to fasten it in some part of the Window over the Centre of the Glais, so that the Thread and Plummer may hang without the Room: Then by help of the Sun's Azimuth you may draw the Meridianline. (as before) as if the Glass were horizontal, and move the Lath with the Thread and Plummet at the End of it to and fro, until the Thread and the Wire, then bend those Wires upward or reclining Glass and the Thread to which the Plum-downward, until the Thread fastened at the End met is fastened may be seen at one Time: Then

(as before) on the said Thread, which crosses the Room, I tie a slipping Knor, which I move to and fro on the said String, until by looking in the said Glass I find from my Eye the said Knot and some part of the perpendicular Thread without, all as it were in one right Line, the one shadowing or interpoling the fight of the other; being then very careful to keep that Knot in the same Postion, then take the Thread (the End whereof being fastned in the said Centre of the Glass) and bringing it just to touch the said Knot, I augment that Thread, until the End thereof touch the said Wall or Ceiling, and the said Thread also touch the Knot, as before: Then in that place where the End of the said Thread toucheth the Wall or Ceiling, I make a Mark, which Mark or Point will be directed in the restected Meridian of the World, according to the Situation of that Then again I remove that Thread, (over-Glass. thwart the Room) on which the said Knot is, either higher or lower than it formerly was, at pleafure, still having regard that from some part of the said Thread within, you may see both the reclining Glass and the perpendicular Thread without at one Time; and (as before) move the said slipping Knot on the said Thread, until by looking in the said reclining Glass, you see the said Knot and some part of the perpendicular Thread without in one right Line, so as the one shadows or hinders the fight of the other, (as before) which Knot then must not be removed from its Situation; then take that Thread (whose End is fastened in the Glass) and bring it to touch that Knot, the End of the faid Thread being continued to touch the Wall or Ceiling: so is that Point of Touch on Meridian of the World. So is there two Points found in the said reflected Meridian on the Wall or Ceiling; by which, if a Thread (as before) be so situated, that it may interpose between the Eye and the said two Points, many Points thereby in the faid reflected Meridian may be made at every Bending or Angle of the Wall or Ceiling, whereby the reflected Meridian defired may be drawn, by drawing a Line from Point to point obliquely in the Room, which will be the true re-flected Meridian of the World, according to the Situation of that Glass.

Now this reflected Horizon and Meridian being first drawn, they will be of great use in drawing the Hour-Lines, together with all the Furniture that possibly can be drawn on any Dial.

To draw the Reflected Hour-Lines to any Reclining Glass on any Plane whatsoever, that the Sun will be reflected on: By belp of an ordinary Horizontal Dial for that Latitude.

First, extend several Threads from the Centre of the Glass to the extremity of the reflected Horizon in the Room (which for more Conveniency and Use may be the several Hour-lines, and may also serve as a Bed to situate the Horizontal Dial on the reflected Horizon) having regard to fituate the Centre of the Dial on the Centre of the Glass, and the Meridian of that Dial on the re-

fastened in the Centre of the Glass, and move the other End thereof to and fro in the reflected Meridian under the reflected Horizon, until by help of a Quadrant the said Thread is found to be depressed under the reflected Horizon, equal to the Latitude of the place, and where the End of the said Thread intersects or meets the reflected Meridian either on the Floor or Wall, that Point is the reflected reversed Axis, as was required. In which Point fasten one End of a Thread, which Thread will be of great use in drawing the reflected Hour-lines on any Wall or Ceiling whatfoever. Now if this Thread, whose End is fastened in a Point on the reflected reversed Axis, be taken and brought to touch any part of any one of the Threads of the Hour-lines (produced to and fastened in the reflected Horizon) the faid Thread being continued so, as the End thereof may touch the Wall or Ceiling, and also any part of the said Thread touch the Hour-line or Thread proposed; that Point on the Wall or Ceiling is in the reflected Hour line desired to be drawn: Also the other Point in the same reflected Hour-line may be found; if the said Thread, whose End is fastened in the reflected Axis, be brought to touch some other part of the same Hour-thread proposed; so that when (as before) the End of the said Thread toucheth the Wall or Ceiling, some part of that Thread may also touch the Hour-line defired, which Point or Touch on the Wall or Ceiling, is also another Point in the said reflected. Hour line desired. By which two Points so found (as before) the reflected Hour-line may be drawn by a Thread, projecting from those Points from the Eye, as it was formerly directed in drawthe Ceiling another Point found in the reflected ing the reflected Hour-lines to an Horizontal

> To draw the Reflected Equinoctial line, and also the Tropicks on any Wall or Ceiling, to any Reclining Reflecting Glass.

1. To draw the Reflected Equincctial-line on the Wall or Ceiling.

Take that Thread, whose End is fastened in the Centre of the reclining Glass, and move the other End thereof to and fro in the said reflected Meridian formerly drawn, until (by help of a Quadrant) the said Thread is elevated above the reflected Horizon formerly drawn, equal to the Complement of the Latitude, (which as before will be always perpendicular to the reversed Axis) and make a Point in the said reslected Meridian, where the End of the said Thread toucheth; then on that Point and the said reflected Meridian on the Ceiling, raise a perpendicular Line, which is the reflected Equinoctial line desired.

2. To draw the Reflected Tropicks, or other Parallels of Declination.

First, (as before) make or take out of some Book or Table of the Sun's Altitude for each Hour of the Day, calculated for the Place of Latitude proposed, when the Sun is in either of the Tropicks, or other parallel of Declination: Then take that Thread, whose End is fastened in the Centre flected Meridian of the World: Then to find the of the Glass, move the other End thereof to and Point in the reflected reversed Axis on the Floor of fro in the Hour-line proposed, until by applying the Room: Take a Thread, one End thereof being one side of a Quadrant to the said Thread you

find the faid Thread elevated above the reflected Horizon answerable to the Sun's height in that Hour proposed, when he is in that Tropick or Degree of Declination proposed. Which Altitude required will be found in the foresaid Table for that End calculated, which said Thread being of the Elevation above the reflected Horizon, as the said Table directeth: Then mark where the End of the Thread (so elevated) toucheth the Wall or Ceiling in that Hour line: So is one Point found the Horizon: Hence the reflected Vertical-point, in the reflected Parallel of Declination defired to whereby the reflected Azimuth-lines are drawn, be drawn. In like manner, find in the said Table in the same Parallel or Degree of Declination what Altitude the Sun hath at the next Hour, and elevate the laid Thread, whole End is fastened in the Centre of the Glass, equal to the Sun's Altitude in that Hour above the faid reflected Horizon, by help of the faid Quadrant, and where the other End of the said Thread salleth in the Hour-line proposed, make another Mark or Point. And so in like manner make the Points (belonging to that Parallel of Declination) in the remaining Hourlines, according to the several Altitudes found in the said Table of Altitudes: Then drawing by hand a Line to pass through those several Points so found as before, which Line is the reflected Parallel of the Sun's Declination desired. In like Declination, which may have respect to the Sun's place, or the Length of the Day, as shall be de

To draw the Said reflected Tropicks, or other Parallels of Declination, without any Tables cal culated, only by belp of a Trigon first made on Past board, or other Material. Note, that all Parallels are leffer Circles.

First (as formerly is shewed in drawing the Parallels of Declination to a reflecting Horizontal Glass) fasten the Trigon on the reflected reversed Axis, so that the Centre of the Trigon may be in the Centre of the Glais, then also will the Equi-noctial on the Trigon be perpendicular to the said reflected reversed Axis: Then take the Thread fixed in the Centre of the said Glass (which is also in the Centre of the Trigon) and lay it upon that Parallel of Declination, drawn on the faid Trigon, whose reflected Parallel is required to be drawn on the Plane or Ceiling: Then move the Trigon, the Thread lying on the said Parallel, until the End of the said Thread touch any Hour-line on the said Wall or Ceiling, in which Point of Touch on that Hour-line make a Mark, so will that Point be in the reflected Parallel of Declination desired. In like manner, move the said Trigon, still keeping the Thread on the same Parallel. until the End of that Thread touch another Hourline on the said Plane or Ceiling, and there also make another Mark. And so in like manner find a Point in each Hour-line, through which that re flected Parallel must pass; then drawing a Line to pass through those several Points on the said Plane two Points being found will be sufficient. or Ceiling, which Line is the reflected Parallel of the Sun's Declination defired.

In like manner may be drawn any other reflected Parallel of Declination required.

To draw the Reflected Azimuth lines to any Reclining Glass, or any Plane whatsoever that the Sun-beams will be reflected on. Here nose that Azimuths are great Circles.

First, know that the reflected Vertica!-point in the Axis of the reflected Horizon, will always be found in the reflected Meridian. And look how many Degrees the reflected Horizon differs from the direct Horizon, so many must the restected Axis of the Horizon differ from the direct Axis of may be thus found.

Take that Thread whose End is fixed in the Centre of the Glass, and move the other End thereof to and fro in the reflected Meridian, until by applying one Side of a Quadrant thereto, you find the said Thread depressed just 90 Degrees, or perpendicular under the reflected Horizon; then make a Mark or Point where the other End of the faid Thread toucheth the faid reflected Mcridian on the Wall, Ground or Floor of the Room, which Point so found, is the reflected Verticalpoint desired, in which Point fasten one End of a Thread:

Then on Past-board or other Material draw the Points of the Compass or other Degrees, placing the Centre thereof in the Centre of the Glass, and manner may be drawn all or any other Parallel of the Meridian thereof in the reflected Meridian of Declination, which may have respect to the Sun's the World, which said Past-board must be also situated in the reflected Horizon just as the Horizontal Dial was formerly directed to be fituated for drawing the reflected Hour-lines: And as the Threads from the Centre fastened in the reflected Horizon were also the Hour-lines on the Horizontal Dial, whereby the reflected Hour-lines were drawn: So now the Threads from the Centre fastened in the reflected Horizon may be the Horizontal Azimuth-lines, whereby the reflected Azimuth-lines may be drawn: Or if that Thread, which is fastened in the Centre of the Glasse drawn exactly over any Azimuth-line, the End whereof being fastened by a Nail or other Means in the reflected Horizon on the other Side of the Room. there may several Points be found in the Wall or Ceiling, through which the reflected Azimuth-line

must pass, as followeth: Take that Thread, one End of which is fastened in the said Vertical-point, and bring it just to touch the Azimuth-thread formerly fastened, and continue it until the End thereof touch the Wall or Ceiling, (and also the Thread it self touch the said Azimuth it self, as before) in which Point of Touch on the Wall or Ceiling make a Mark, thro which Point that reflected Azimuth-line must pass. Then move the faid String fastened in the said Vertical-point, so that it may just touch the said. Thread again, but in another place: Then as before continue that Thread, until the End thereof touch the Wall or Ceiling again, as before, and there make another Mark, through which the faid reflected Azimuth-line must also pass: In like manner may more Points be found for your further Guide, in drawing that Azimuth-line. But

To draw any Reflected Line by any two Points gia ven over any Plane whatsoever, without projecting by the Eye.

Fasten two Threads in the place of the Centre of the said reclining Glass, drawing the said Threads

Threads straight, fastening each of the other Ends in the two reflected Azimuth-points formerly found on the Wall or Ceiling. Then fittuate a Thread cross or thwart the Room, so as it may cross those other Threads from the Centre, near at right Angles, and also just touch both of them in that Situation. By which faid Thread crois the Room may any Number of Points in the said restected Azimuth line to be drawn, be found at pleasure: For if the End of another Thread be also fastened in the Centre of the said Glass, making the other End thereof to touch the Wall or Ceiling, but so that it may also just touch the said Thread, which is fastened cross the Room, which Point of Touch on the said Wall or Ceiling is another Point in the said reflected Azimuth-line required to be drawn. In like manner may more Points be found at every Angle or Bending of the Wall or Ceiling for the exacter drawing the reflected Azimuth-line required, which doth find Points, whereby is drawn the same restected Azimuth-line (or other Lines) as was formerly done by a Thread to fituated, that it may interpose between the Eye and any two Points assigned on the Wall or Ceiling.

In like manner, if the Thread fastened on the further Side of the Room were removed to another Azimuth-line on the faid Past-board, and then fasten it again on the further Side of the Room (as before) you may by help of the said Thread, sastened in the said Vertical point, find several Points on the Wall or Ceiling, thro' which that Azimuth-line will pass: So may you either by this or the former way draw what Azimuth-lines you please, either in Points of the Mariner's Compass or Degrees, as you please, by drawing it first on Past-board, as before is directed.

And note generally, that such Relation the point found on the Floor or Ground in the reflected reverled Axis, hath to the Hour-line drawn on the Horizontal Dial, in drawing the reflected Hourlines. The same hath the teflected Vertical-point drawn on the Past-board in the drawing the reflected Azimuth-lines.

To draw the Reflected Parallels of the Sun's Altitude, or Proportions of Shadows to any Reclining Glass on any Plane whatsoever, that the Sunbeams be reflected on. Here note, that Parallels of Altitude are lesser Circles, therefore are not represented by a Right-line.

First, know generally that what respect the Parallels of Declination have to Hour-lines, such have the Parallels of Altitude to the Azimuths.

For if one End of a Thread be fastened in the muth-line, until the said Thread be elevated any Latitude defired.

Number of Degrees proposed above the reflected Horizon (the Elevation of which Thread being found, by applying a Quadrant thereto) and making a Mark or Point where the End of the said Thread toucheth the said reflected Azimuth drawn on the Wall or Ceiling, that Point so found is the Point through which that Almicanter or reflected Parallel of the Sun's Altitude must pais.

In like manner, remove the other End of the said Thread fastened in the Centre of the Glass to another reflected Azimuth-line, and (as before) move it higher or lower, until by applying the Edge of a Quadrant to that Thread, you find the said Thread above the reflected Horizon on the same Number of Degrees first proposed, and at the End of the said Thread in that reflected Azimuthline drawn on the Wall or Ceiling, I make ancther Mark or Point, through which the same reflected Almicanter or Parallel of Altitude must also pass: And so in like manner I find a Point on each reflected Azimuth-line, through which the same Parallel of Altitude must pass. Then drawing by hand a Line to pass through these several Points so found, as before, that Line is the reflected Parallel of the Sun's Altitude proposed. In like manner may be drawn all the other Parallels of Altitude defired, which will shew the Sun's Altitude or the Proportion of any Shadow to its Altitude, at any Appearance of the Sun's Reflexion thereon.

To draw the Jewish or old Unequal Hour-lines to any Reclining Glass on any Plane whatsoever that the Sun-beams will be reflected on. Here note, that the Jewish Hour-lines are great Circles.

First, (by the Rules formerly given) draw two reflected Parallels of Declination of 16 deg. 55', the one being near the Summer, and the other near the Winter-Tropicks: For when the Sun hath found on the Floor or Ground, to the Azimuths that Declination, the Day is 15 Hours long in the Summer, and 9 in the Winter: Then (as is for merly directed) fituate a Thread just between the Eye, and those three Points in the said reflected Dial, as is expressed in the insuing Table, so may you thereby draw all or any of those Jewish Hourlines defired, which will at any Appearance of the Spot by the Reflex of the Glais amongst those Hour-lines, shew how many of the Equal Hours is past since Sun-rising, as was defired. Now in this Latitude of 51 deg. 30'. If the Parallels of the Sun's Declination be drawn, both when the Day is 9 and 15 Hours long, that is, when it is 16 deg. 55', any of those Jewish Hour-lines will intersect the common Hour-lines, either upon the Place of the Centre of the reclining Glais, and the Hours, Half-hours, or Quarters. And such a Deother End moved to and fro in any reflected Azi- clination may be found, that it shall so do in any

Reflec_i

REFLECTING Telescope. See Telescope. REFLECTION, is a Power the Human Mind hath of perceiving its own Operations, within it felf, when it is employed about the Ideas it bath before gotten by Sensation; which Operations, when we come to reflect and consider on them, do furnish our Understanding with a great Num ber of Ideas, which could not be had by bare Senfation, of things without us: Such as Perception Thinking, Believing, Doubting, Rasoning, Knowing, Willing, &c. and all the differing Actions of the Mind.

REFLECTION in the Pythagorean or Copernican System is the Distance of the Pole from the Horizon of the Disk; which is the same thing as the Sun's Declination in the Ptolemaick Hypothe-

REFLEXIBILITY of the Rays of Light is their Disposition to be turned back into the same Medium, from any other Medium on whose Surface they fall; and therefore those Rays are more or less reflexible, which are returned back more or

less easily.

As if Light pass out of Glass into Air, and by being enclined more and more to the common Surface of the Glass and Air, begins at length to be totally reflected by that Surface; those Sorts of Rays which at like Incidences are reflected most copiously; or by inclining the Rays begin soonest to be totally reflected, are most reflexible. Newton's Opticks, p. 2.

There is the same constant Relation between Colour and Reflexibility: Light of a violet Colour being in like Circumstances reslected at least Thickness of any Plate or Bubble; (see Obs. 13, in passing thro' the Atmosphere, from the highest 14, and 15, compared with 4 or 18th) The red and rarest Part of it down to the lowest and den-Rays at the greatest Thicknesses; and the intermediate Colours at intermediate Thicknesses: So that the coloretick Properties of the Rays must be connate with them, and immutable.

reduce a Body of Men either by disbanding the Island Chrystal, vulgar Glass, (i.e. Sand melted Whole, or only breaking a Part, and retaining the

Transparent Fluid: As thus,
If you stick up a Piu or Stick, or assign any Point in any Concave, Bowl, or Dish, to shew the Hour, and make that the Centre of your Horizontal Dial; (tee Reflected Dialling) afligning the the rest of the Hour-line also on the Edges of the Bowl, and taking away the Horizontal Dial, elevate a String, or Thread from the End of the said Pin fastened thereto over the Meridian Line, equal Thread to cast a Shadow on any Hour point for-merly mark'd out on the Edges of the Bowl, that Shade in the Bowl is the true Hour-line; and if any confiderable Variation. the Bowl be full of Water, &c. When this is done,

of the Top of the Pin, but when filled again with the same Liquor.

REFRACTION, Sir If. Newton in his Opticks 56, 57, 58. On this Natural Supposition that Bodies refract Light by alling upon its Rays in Lines perpendicular to their Surfaces, demonstrates: That the Sine of Incidence of every Ray of Light considered apart, is to its Sine of Refraction in a given Ratio. See Incidence. Ratio.

And as he shews that the Sun's Light consists of Rays of different Degrees of Refrangibility; so p. 61. he proves that the Difference of the Refraction of the least Refrangible and most Refrangible Rays is about the 27 1 Part of the whole Refraction of the mean refrangible Rays; and that in some Refractions, the Refraction of the least to that of the most refrangible Rays, is very near-

ly as 27 to 28.

Then in Book 2. Part 3. He demonstrates that Bodies reflect and refract Light by one and the same Power variously exercised in various Circumstances, (see Reslexion) and then he comes to this Proposition; That if Light be swifter in Bodies than in vacuo, in the Proportion of the Sines which measure the Refraction of those Bodies, then the Forces of the Bodies to reflect and refract Light, are very nearly proportional to the Den-lities of the same Bodies; excepting that uncuous and sulphureous Bodies refract more than others of the same Density. Of this at p. 73. he gives a Table, and compares the refracting Power of many Bodies with that of the Air.

And the Retraction of the Air is determined by that of the Atmosphere observed by Astronomers, and he shews that the whole Refraction of Light sest, is equal to the Refraction it would suffer, in passing at like Obliquity out of a Vacuum immediately into Air of equal Density, with that in the

lowest Part of the Atmosphere.

REFORM, to reform in a Military Sense is to one of a Pseudo Topaz, a Selenitis, Rock Chrystal, duce a Rody of Man sither by debending the together) and Glass of Antimony; which are ter-Rest, or sometimes by incorporating them in other Regiments. So that a

REFORMED Officer is one whose Troop or by fermentation) the these Substances be very difwhole or half Pay, doing Duty in the Regiment. their refracting Powers almost in the same Ratio to one another as their Densities are: Excepting REFRACTED Dials are such as shew the true that the Refraction of that strange Substance, island Chrystal, is a little greater than the Rest. particularly Air, which is 3400 Times rarer than the Pseudo Topaz, and 4200 Times rarer than Glass of Antimony, hath, notwithstanding its Rarity, the same refracting Power in respect of its Density, which those two very dense Substances have in re-Meridian Line on the Edges of the Bowl, point out spect of theirs; excepting so far as those two differ one from another.

Again, the Refraction of Camphire, Oil Olive, Line feed Oil, Spirits of Turpentine, Amber, which to the Latitude or Elevation of the Pole of the are fat sulphureous Bodies; and a Diamond, Place: Then with a Candle, or by bringing the (which probably is an Unctuous Substance coagulared) have their refractive Powers in proportion to one another as their Densities; without

But the refractive Power of these Unauous Boit will never them the true Hour by the Shadow dies is 2 cr 3 Times greater in respect of their 4 B 2

Densities, than the refractive Powers of the for- of their way (in Observat. 24 of his Opticks) in

mer Substances in respect of theirs.

Water hath a refractive Power in a middle Degree between those two Sorts of Substances, and probably is of a middle Nature; for out of it grow all vegetable and animal Substances, which consist as well of sulphureous, fat and inflamable lours, having proportionably intermediate Degrees of Refrangibility.

Salts and Visiols have refractive Powers in a REGAL Piffes are Whales and Sturgeons, An. 1.

middle Degree between thole of earthy Substances and Water; and accordingly are composed of those two Sorts of Substances; for by Distillation

and Rectification of their Spirits,

Spirits of Wine have a refractive Power in middle Degree between those of Water and oily Substances; and accordingly seems to be composed of both, united by Fermentation: The Water, by means of some Saline Spirits with which it is impregnated, dissolving the Oil, and volatilizing it by the Action; for Spirit of Wine is inflamable by means of its oily Parts; and being diffilled often from Salt of Tartar, grows by every Distillation more and more aqueous and flegmatick.

So that it seems rational to attribute the Refra-Rive Power of all Bodies chiefly, if not wholly, to the fulphureous Parts with which they abound. For it's probable that all Bodies abound more or less with Sulphurs. And as Light congregated by a Burning Glass, acts most upon sulphurous Bodies, to turn them into the Fire and Flame; so, since all Action is mutual, Sulphurs ought to act most upon Light: And that the Action between Light and Bodies is mutual, appears from hence, that the densest Bodies which refract and reflect Light most strongly, grow hot-test in the Summer Sun, by the Action of the refracted or reslected Light.

At the End of his Latin Edition of the Opticks under Query 21. He shews that the Cause of Refraction (and Reflexion both) is the Attraction of the Parts of the refracting Body, acting at a little distance, upon the Rays of Light as they

pass thro' it.

And because the Particles which compose the Island Chrystal (see Light) do all act by a consi milar Ratio, on the Rays of Light in order to produce that Unusual Refraction, which is observed in that odd Body: Therefore 'is probable that those Particles in the forming the Parts of that Chrystal, were not only disposed themselves in certain Order, so that their Extremities all looking the same way, they did concrete into regular Fi gures; but also that their Sides, that is such as were homogeneal as to their attracting Forces, by a kind of Polar Virtue or Polarity, were all turned the

The same Excellent Author shews Optic. Lat. p. 316. That having demonstrated in his Principia; that if Refraction were caused by the Attraction of the Rays of Light; the Sine of the Angle of Incidence must be to That of the refracted Angle always in a given Ratio; and this being by repeated Experience found to be true in Fact: tis then plain that Attraction is the Cause of the

Rays of Light.

REFRANGIBILITY. of the Rays of Light, Sir, Is. Newton defines to be their Disposition to be re frattea, or eurned out of their way, in passing out of one Transparent Body or Medium into ano ther; and a greater or less Refrangibility of Rays at the Time when it was first delivered.

like Incidences on the same Medium

He shews also that there is constant Relation betwen Colours and Refrangibility: The most refrangible Rays being of a violet Colour; the leaft refrangible Red; and those of intermediate Co-

REHABILIATION Anno 25: H. 8. cap. 21: was one of those Exactions mentioned in that. Statute to be claimed heretofore by the Pope in England; and seems to signifie a Bull or Breve, for re-inabling a spiritual Person to exercise his

Function, that was formerly disabled.

RE INFORCED Ring of a Cannon, is that which is next after the Trunnions, between them and the Vens, and the Re-inforced part of a Gun, is from the Bale Ring to the Re inforced Ring. This part is made thicker in Metal than any other

part of the Piece.

RELATION in the Law sense is the same as Fillio Juris, to make a Nullity of a thing from the beginning (for a certain Intent) which had Essence, Vide Co. Lib. 3 fol. 28. Butler and Baker's Case; but more plainly thus: Relation is where, in confideration of Law two Times, or other things are confidered so, as if they were all one; and by this the thing subsequent is said to take its Este & by Relation, at the Time proceeding. As if A deliver a Writing to B, to be delivered to C, as the Deed of A, when C has paid a Summ of Money. Here when the Money is paid, and the Writing delivered; this shall be taken as the Deed of A, And fo their Disposition to be turned more or less out Bills of Parliament, to which the Queen assents

of Force from the first Day of the Session.

RELIEF, Relevamen, (in Doomsday Relevation And this being understood Relevium) was a certain Summ of Money, which the Tenant holding by Knights Service, Grand Sergeanty, or other Tenure, for which Homage to any other Rate of Interest. or Regal Service is due; or by Soccage, for As to the Nature of the following Tables, they which no Homage is duely paid to his Lord at his differ a little from Mr. Acroids, in the Rate of Interance, Mag. Cart. c. 2. and 38. E. 1. Stat. 1. tereft for which they are calculated. Entrance, Mag. Cart. c. 2. and 30. E. 1. State 1. Skene de Verbor. Saith Relief was given by the Tenant or Vassal that was of perfect Age, after the expiring of his Wardship, to the Superior Lord, of whom he held his Lands in Knight Service: That is by Ward and Relief; for by payment thereof he Relieves, and as it were relevat, raiseth up again his Lands after they were sunk into his Superiors Hand by Reason of Wardship, &c. his Superiors Hand, by Reason of Wardship, &c. See also 12 Car. 2. c. 24.

RELIEF, Relevium, was a Fine formerly paid to the King by every one that came to the Inheritance of Land held in Capite, or Military Service, to Relieve, or as it were to redeem their E. state, and to hold Possession of it. At first it consisted in Horses and Arms, till by the Assis of Arms in 27 Hemy 2. every Man's Armour was preserved for his Heir, and the Relief payable in Money, of which the fixt Rates were determined

lying such Relief, and for obtaining by that means Possession of such Estate.

Some Customary and Servile Tenants paid a Relief for renewing of a Tenure, on the Death of the last Possessor. Kenner's Paroch. Antiquit.

RENEWING of Leases and Lives, &cc. (See also Reversions) Tho' there be Variety of Tables extent for computing Interest and Annuities; (in this Vol.) yet till the little Book of Tables for Renewing and Purchasing College and Church Leases, was published at Cambridge, (and recommended by the Famous Sir Is. Newson) there was a Defect in this Affair. But there the Tables are not only easie and commodious, and their Construction clear; but the Ground and Reasons of Renewing, are given, from the Construction and Use of a little Table of Reversions; which you will find inferred here with its Use and Application under the word Reversion.

I have therefore given you the following, plain and easie Tables of Renewing, from the said Book; by the Use of which the Renewing of Leases or Lives, will become a clear, facile and intelligible

Thing.

And altho' these Tables are only for Leases of 21, 20, 40, and 10 Years; yet by the Table of Reversions above mentioned, other Tables of Renewing of Leases for any Number of Years under 41, may be made; as by this Example will ap-

pear.

Suppose in a Lease of 31 Years, I would renew 7 Years lapted; allowing 6 l. per Cent. peofit. To do this, I take the Summ of the Reversions for 7 Years from 31 upwards (from the Table of Reversions) accounting 31 as 1; which Summ is 11.7 s. 7 d. 0 q. or according to the way of accounting in the following Tables; 1

on the last Day of Parliament shall Relate, and be purchase; and that is the Fine to be paid for renewing the 7 Years lapsed, and which was sought.

And this being understood it will not be difficult to do the like for any other Number of Years, either in this or any other Lease; and according

but one Years Value, at 11 le 11 s. 8 d, 4, 10 per Cent. The Reason of which is, because the Rate of Interest is greater: But when the Rate of Interest lesser, then the Fine is greater.

Thus at 10 l. per Cent. The Fine for renewing 7 Years lapled, is 1 Years, 1 Quarters, and 1 Weeks Value: But at 8 l. per Cent. the Fine for renewing 17 Years lapsed, is above 1 Year and 3 Quarters Value; and at 6 per Cent. the Fine is 2 Years and almost an half Value.

So in the Table for renewing a Lease of 20 RELIEFS were payable also not only to the King as Supreme Lord, but to all Barons and Knights by those Tenants who held under them by Military Service. Relevate was the word for paying such Relief, and tor obtaining by that means the means are the service whereas in his, it is 1 l. 3 s. 8 d. That is one Year and above two Months Value by Military Service. Relevate was the word for paying such Relief, and tor obtaining by that means the service was the service where the service was the service was the service was the service where the service was the se ter, because the Rite of Interest is less, as was said above

> And that this is Right, will appear, if you consider that the Tables for Renewing of Leases, consist of the Summs of the Tables of Reversion, or Decrease

Money.

For tis apparent that the greater the Rate of Interest is, the greater is the Decrease of Money in the Reversion: And consequently the lesser are the Summs of those Reversions; which are the Fines for Renewing: An Example will make this very plain.

If you look into the Table of Reversions, you will find: That 1 l. or 20 s. in 40 Years, decreales to a Pence Half penny at 12 l. per Cent. compound Interest; and at 10 l. per Cent. it decreases to 5 Pence Farthing in 40 Years: Now the Summ of these Reversions for 7 Years, accounting 40 as 1; 39 28 2, &c. is but 2 s. 1 d. 2 q. But at 10 per Cent. the Summ for 7 Years is 4 s. 2 d. 3 q. which Summs are the Fines for renewing 7 Years lapsed in a Lease of 40 Years, at the Rates of 12, and 10 per Cent.

From whence tis clear and plain, that the leffer the Rate of Interest is, the greater must be the Fine for renewing: And the greater that Rate is, the leffer must be the Fine: And consequently the Difference between these Tables and Æcroids ariles only from the different Rate of Interest, for

which they were calculated.

The following Tables for renewing and purchafing of Leases, do shew the Value in Years, Quara ters, Months, and Decimal Parts of a Month, accounting 3 Months to a Quarter, and that a Month is divided into Ten parts. And tho this way of Division be not quite so exact, as if it were express in Decimals of Pounds, Shillings, Pence, &c. Yer 'tis more familiar and commodious, and the Year, 2 Quarters, 1 Month, and 5 Decimal parts Difference is very inconfiderable, for it will never be above a Decimal of a Month over or under the true Value, which in these Considerations is not to be regarded. And therefore when a Fine is required of any Person, either for renewing or purchasing of a Lease, the Tables will shew exactly enough what Rate of Interest is allowed: And so if any one would give or take a Fine according to any Rate of Interest proposed, they may do it near enough by the Tables.

At 1 l. per An. Rent, the Divisions by these Tables will be 5 s. per Quarter, 1 s. 8 d. per Month, and a Decimal of a Month 2 d. And because there are 4 Weeks in a Month it will be 5 d. per Week; five Decimals of a Month therefore make 10 d. which are equal to 2 Weeks, and 3 Decimals of a Month are but 1 Penny above a Week; so that 'tis easie to turn the Decimal parts of a Month into Weeks.

And these Kind of Numbers will be easily added or suftracted as in these 2 Examples.

Suppose I were to these 2 Fines,	add	γ. 3	Q. 2 3	M. I	d. p 6 7
	Summ	6	2	0	3

ADDITION.

I say 7 and 6 makes 13 Decimals, 10 of which making a Month, I write 3 and carry 1; 1 I carried and 2 Months makes 3 Months; wherefore I write a Cypher, and carry 1 Quarter, &c.

And this being understood, Substraction will also be easie, as in this Instance.

If from You take	· 3	Q. 2 3	<i>M</i> . I I	d. p. 6 7
Remains-	 	2	2	9

The first Table which offers it self for Renewshews the Values in Years, Quarters, Months, and to 14

Decimal parts of a Month, as all the Rest do : the First part of this Table is calculated at 111. 111. 8 d. $\frac{1}{4}$, $\frac{1}{1}$, per Cent. per An. Compound Interest, so that the Fine for Renewing 7 Years Lapsed, or the present Worth of 7 Years in Reversion, not to begin till 14 are expired, is exactly one Years Value; which Fine, and consequently Rate of Interest, Bishops, Deans and Chapters, Heads and Fellows of most Colleges in both Universities, do observe in Letting and Renewing of their Leases; but at other Rates of Interest, the Fine for Renewing 7 Years lapsed, the Table shews as followeth, viz.

The Fine for Renewing 7 Years Lapled

The next Table is for the Term of 20 Years, the First part thereof is calculated according to the Rate of about 12 l. 6 s. per Cent. per Ann. so that I Years value is the Worth of 7 Years lapsed, or plain, I shall give one Example: As suppose, I am Reversion; which Fine, and consequently Rate to find the Value of 4 of the 7 Years in Reversion in this Lease; then according to the Rule given in Years; but at other Rates of Interest: The Fine the Lease of 21 Years, I do thus; because 4 wants for Renewing 7 Years lapsed in this Lease of 20 3 of 7, I take the Value of 3 Years in Reversion, from the Value of 7 in Reversion, the Remainder is the Value of the 4 Years required.

The Fine for Renewing 7 Years lapled.

The Years in effe may be valued as a Lease of so many Years, or their Value may be sound, by subtracting the Value of the Years lapsed, from the Value of the whole Lease, as was directed because the last of the Years. fore in the Lease of 21 Years.

is the Value of the 4 Years required.

The Value of 7 Years in Reversion at 61. per Cent.

The Value of 3 Years at the same Rate is Which subtract Remains

This Remainder being given for a Fine will make up this Lease to 17 Years, that is 4 added to 13.

A Table for the Renewing of any Number of Years lapfed in a Lease for 20 Years.

SHE I

run out in a Leale for 40 Years, what must I give to make up this Leafe again, according to those several Rates of Interest fignified by the Table? That is, What must I give for 14 Years in Reversion, after 26 in esse? Or, What's the present Worth of 14 Years, beginning 26 Years hence? Worth of 14 Years, beginning 26 Years hence? For answer I find by the Table that the Fine for Renewing 14 Years lapsed.

The Value of some of the Years in Reversion, may be found in this Lease, by the same Rules that they were found by in the foregoing Leases; as if it were required to find the Value of the 14 Years in Reversion in this Lease of 40 Years, then because 6 wants 8 of 14, 1 take the Value of 8 Years in Reversion from the Value of 14 in Reversion, and the Remainder is the Value of 14 in Reversion, and the Remainder is the Value of the 6 Years required which will make the 1. s. d. lue of the 6 Years required, which will make the

10 p. c. is 1 3 0 4 per Ann.

The Verse in Communication of the communica

The Years in effe are valued as before directed in the other Leales; as if there be 4 Years run out in this Lease of 10 Years, then there are 6 Years in esse, whose Value are as a Lease of 6 Years, &c.

The next Table is for the Reduction of the Values given in Years, Quarters, Months, and Decimal Parts of a Month, into Pounds, Shillings, and Pence, the Use of it is very plain and easie, as by Example will appear.

Example.

Suppose the Fine for renewing any Number of Years lapsed, in any Lease to be 6 7. 2 9. 2 m. 4 d.p. and the yearly Rent 55 l. What is this Fine in Pounds, Shillings, and Pence? Then by the Table I find

:		l.	S.	d
	under 2 Quarters	25	00	c
against 50 /	under 2 Months	8	06	1 8
	under 4 Dec. parts	1	13	4
1 '	Cunder 2 Quarters	2	Io	
against 5 1.	Sunder 2 Months	Q	16	8
	Lunder 4 Dec. parts	0,	03	4
	.	-		-

- -- Summ of all is Then for the 6 years Value I (ay, 6 times 55 h is 330 l. which added to 38 h 10 s. o d. the Summ 330 00 368 00

Which is the Value reduced into Pounds, Shillings, and Pence required.

The way of purchasing by Lives was common-Book: Example, suppose there bothree Lives upequal, there is another way which is more agreeable to Reason, and it is this, viz. for every Life to decrease one Year, as if one Life be reckoned as a Lease for ro Years, then two will be as a the Table tor purchasing of Lives sheweth.

So if you reckon one Life as a Lease of 9 Years, 3 Lives 11 Years, 1 Quarter, 2 Months, and 6 De-

cimal parts Purchase, &c.
So if one single Life be reckoned as a Lease of

their Lives upon an Estate should die, to take in others to make up the Number again, is done by Years lapsed in the same Lease, and if three are the Table of Reversions at the Beginning of the dead I must reckon 24 lapsed: So at 61. per Cens. Vol II.

ly to reckon one Life as a Lease of 7 Years, two on an Estate, which at 7 Years Purchase for the Lives as a Lease of 14 Years, and three Lives as a Lease of 21 Years: But this way seeming Unand as a Lease of 27 Years, at 7 l. per Cens. and first Life, are valued at almost 12 Years Purchase, and as a Lease of 27 Years, at 7 l. per Cens. and if one of those Persons should die, what must be given to make up the Number again? Then I-lay, one Life which is dead was as a Lease of 10 Years, and therefore to take in a New Life, I Lease of 19, and three as a Lease of 27 Years, &c. may reckon 10 Years of the 27 lapled, and for so that at 7 l. per Cent. one Life is reckoned worth take as it were a Fine for renewing 10 Years. a little above 7 Years Purchase, two Lives 10 lapsed in a Lease of 27 Years: now to find this Years, 1 Quarter, and 1 Month's Purchase, &c. as Fine, I take the Summ of the Reversions for 10 Fine, I take the Summ of the Reversions for 10 Years in the Table under 7 l. per Cent. counting 27 as 1, 26 as 2, and 25 as 3, &c. And fo I find then two will be as a Lease of 17, three as a Lease the Summ to be 21. 41. 5 d. 29. that is two of 24. 30. as is evident by the Table; and one Life will be worth above 6 Years and 2 Quarters I may take for renewing or taking in a New Life; Purchase, 2 Lives 9 Years and 3 Quarters Purchase, 10 if two Lives be dead I may reckon 19 Years the Summ to be 21. 41. 5 d. 29. that is two: Years, and almost one Quarters Purchase, which lo if two Lives be dead I may reckon 19 Years lapfed in a Lease of 27 Years, and find the Summ. of the Reversions for 19 Years, for a Fine for ta-So if one fingle Life be reckoned as a Lease of 12 Years, then two will be as a Lease of 23, three as a Lease of 33 Years, &c. so that at 6 per Cent. one Life is worth above 8 Years and a Quarters Purchase, two Lives above 12 Years and a Quarters Purchase, &c. as the Table shews.

Now suppose any of those Persons which have their Lives upon an Estate should die, to take in 10 Years, if two Lives are dead I must reckon as a Lease of their Lives upon an Estate should die, to take in 10 Years, if two Lives are dead I must reckon as

Cccc 2

A Table for the Purchasing of Lives.

Number	Word Cent	hat hat		are per	Number	Numbir	WOI!	•	7 l.	pe:	Number	ber	Cent		hey :	are per

reckoning one Life as a Lease of 12 Years, three Lives are as a Lease of 33 Years, and so if one of thus: Suppose a Landlord would make a Lease these Lives be dead. I may reckon 12 Years lap of Land up to 40 Years, wherein his Tenant hash fed in a Lease of 33 Years, if two Lives are dead, I may reckon 23 Years lapsed in the same Lease, and begin at 33 to summ the Reversions, under 61, per Cent. because the Lives are valued according to the same Rate of Interest. This being understood, it will not be difficult to do the like for any other Number of Lives, and at other Rates of Interest, and Number of Years for one Life; for you may by the Table for purchasing of Leases, &c. make Tables for purchasing of Lives according to what Rate of Interest you think is most convenient; as suppose you reckon one Life as a Lease of 10 Years, and you would have 5 l. per Cent. profit, then that will be worth 7 Years and almost 3 Quarters Purchase, but at 8 l. per Cent, it is worth but 6 Years and almost 3 Quarters Purchale, &c.

The Table for purchasing is calculated for several Rates of Interest, that so the Purchaser may use that which is most convenient for him, as, in purchasing of Free-hold Land, 51. per Cent. may be enough, but for Copy hold or Leases of Land 6 1. per Cent. for Leases of Land and good Houses 8 1. per Cent. and for Leales of ordinary Houses 101, or 121. per Cent.

The Use of the Table is very plain and casie, as by Example will appear, viz.

Example.

What is a Lease or Annuity of 20 Years worth at 5, 6, 8, 10, or 12 per Cent. per Annum?

T.Q.M.D.p.	l.	s. d.
## \$\frac{1}{6} \f	249 229 196 170 149	3 4 6 8 6 8 3 4

To increase the Number of Years in a Lease 10 Years to come, what is it worth? Then I say,

A Lease for 4 Years at 6 per Cens. is worth 20 Years at the same Rate are worth Which subtract The Remainder is

Which is the Fine to be given to make the Lease up to 40 Years.

To buy a Lease which is not to begin until your old Lease is out; as thus, suppose a Man's Lease is out within 4 Years, and he defires to have a New Lease of 21 Years, to begin when his 4 Years are out, what is this Lease worth in ready Money?

For Answer, I add 4 Years which is the Time he hath in his old Leate, and 21 together, the Summ is 25, then I find she Worth of these 25 Years, and subtract from it the Value of the Years, the Remainder is the Value of the faid Lease in ready Money.

7. Q. M. D. p. A Lease for 25 Years at 6 l. pe Cent. is worth The 4 Years at the same Rate are worth, Which Subtract The Remainder is the Value of the Leafe in ready Money required,

A Table shewing how many Years, Quarters, Months, and Decimal Parts of a Months Purchase, any Annuity or Lease of any Land or House is worth, according to several Rates of Interest, viz. according to 5, 6, 8, 10 and 12 per Cent.

by Example will appear.

The first is this, suppose 30 l. be put out for 20 Years, what will it amount unto in that time at 6 per Cent. Compound Interest?

Then I look against 20 Years, and find under the Increase of 11. &c. 31. 4s. 2d. which shews that I l. in 20 Years time will increase to 3 l. 45 2 d. which I multiply by 30 thus,

		l.	s.	d.	
30 times 3 1. is		90		0	
30 times 4 s. is		6	0	0	
30 times 2 d. is	•	0	5	0	
	Summ	96	5	0	_

That is, 30 l. in 20 Years time at 6 per Cent. Compound Interest, will amount to 96 l. 5 s. o d.

The Use of the Second is thus, What will an Annuity of 30 l. forborn 20 Years amount to in gain. that time? Then for Answer I look against 20 RE Years, and under the Value of 11. Annuity, &c. I find 361. 155. 8 d. which 361. 155. 8 d. is the Value of 11. Annuity forborn 20 Years, then I multiply 36 le 15 s. 8 d. by 30 l. thus,

3.71		. <i>1.</i>	5.	d.
30' times 36 /. is		1080	00	0
30 times 15 s. is		22	10	0
30 times 8 d. is		1	00	0
	Summ	1103	10	- !
•	-			_

That is, 36 l. Annuity forborn 20 Years will at the End of that Term amount to 1103 l. 10 s. o d

The Use of the third Table is thus, suppose a Gentleman hath 300 l. by him, with which he's willing to purchase an Annuity for 20 Years. What Annuity will that purchase at 6 per Centum? For Answer, I look against 20 Years, and find under Woat Annuity 1 l. ready Money, &c. 1 s. 8 d. 3 q. which shews that I l. ready Money will purchale an Annuity of 1 s. 8 d 3 q. for 20 Years, which I multiply by 300 l. thus,

	 ,	s.	d.	
300 Shillings are	35	00	ο.	:
300 times 8 d. is	10	00	0	
300 times 3 q. is	´ co	18	9	,
n en de vers de la la la la la la la la la la la la la		╼		
Sur	n m 25	18	9.	

That is, 300 l. ready Money will purchase an Annuity of 25 l. 18 s. 9 d. for 20 Years at 6 per

RENTS of Assis were the certain and deter-

were to called, because they were affiled, and made The Use of these Tables aforegoing is easie, as certain; and so distinguished from Reddicus Mobiles, or such variable Rents as did rise and fall, like the Corn-rent now referved to Colleges.

RENTS Refolute, are accounted among the Fee Farm-Rents, to be fold by the Statutes of 22 Car. 2. c. 6. And are such Rents or Tenths as were anciently payable to the Crown from the Lands of Abbies, and Religious Houses: And after their Diffolution, tho' the Lands were demited to others, yet the Rents were still Reserved, and made payable to the Crown.

REPELLING Force: That there is such a thing in Nature, see Attraction towards the End.

REPLEVISH, Signifies in our Law the letting any one to Main Prife, upon Surety, 3 E. 1. 11.
REPOSE, is a Term in Painting, fignifying the Place where the Masses, or great Lights and Shadows are affembled: And this being well under-thood hinders the Confusion of Objects; suffering not the View to be contracted altogether, but so proceed gradually and successively without Diíturbance.

REPOSITION of the Forest, was an Act whereby certain Forest Lands being made Purlion upon View; were on a Second View laid to the Forest a-gain. Menwood, ph. 1. p. 178.

REP Silver. The Ancient Servile Tenants were

bound to reap their Lord's Cera: But to be acquitted from this Duty, they iometimes paid an Acknowledgment or Composition in Money, which Money was called by this Name of Rep-Silver.

REPULSE or Reaction. It is one of the Laws of Nature, (Sir IJ. Newton's third) that Requ'se or Realtion is always equal to Impulse or Action. That is, the Action of two Bodies one upon another, is always equal, but with a contrary Direction: in other words, the same Force with which one Body strikes upon another, is returned back by that other on it, and the Forces are impressed with Directions directly contrary. Thus if one Body press or draw another, its just as much prest or drawn by it: If a Man press a Stone with his Hand, the Stone equally presses his Hand; if a Horse draw forward any Weight by a Rope, the Weight equally draws back the Horse: for the Rope being equally stretch'd both ways, acts upon both equally: So 'tis in all Blows and Strokes, the thing struck (suppose with a Hammer) strikes the Hammer with equal Force. The Iron draws the Hammer with equal Force. Load stone as much as the Load stone draws it; as will appear by Experiment, if you make them both flote in Water. Thus also in the Descent of heavy Bodies the Stone attracts the Earth, as much as the Earth the Stone; or the Earth gravitates as, much towards the Stone, as it doth towards the Earth. For the Motions produced by both these Gravitations are equal in both: Only the Stone being very inconsiderable in respect of the Bulk of the Earth, the Velocity of the Earth towards the Stone must be so too, and consequently insensible, in comparison of the Motion of the Stone rowards And so it is Universally, in all the Actions of Bodies: For if one Body act on another, and change its Motion any manner of way, that other Body will make the same Change in the Motion of this Body, but with a contrary Direction: So that by these Actions there are made equal Chanmined Rents of Ancient Tenants, and were paid ges, not of the Velocities but of the Motion: For in a set Quantity of Money or Provisions: They the Changes made on the Velocities in contrary DirectiDirections, are in a Reciprocal Proportion to the needs be another Sort of Resistance, if the Pores

REQUESTS, See Court of Requests in Vol. 1 the Emperour in answer to particular Persons who enquire the Law of him: But it it be sent to a Santtion

RESEISER, is taking (or resuming) of Lands again into the Hands of the King, whereof a gencral Livery, or Ouster le Maine, was formerly misfued, contrary to the Order and Form of Law: Stanif. Prerog. 26. sec Resumption.

The in-RESISTENCE of a Fluid Medium, comparable Sir Is. Newson ar the End of the Lat. Edit. of his Opticks, Qs. 20. saith that the Resistence of Fluid Mediums arises partly from the Assistion of the Parts of the Medium; and partly from the Vis Inertia Materia, or Inactivity of Matter. And supposing a Body to be perfectly spherical, the Resistence arising from the Former of these two, or from the Attrition of the Parts of the Medium, is as the Rectangle under the Diameter, and the Velocity with which the Body moves. But the Reliftence ariting from the Vis Inertia, is as the Square of that Product. And by this difference may the two Kinds of Relistence in all Me diums be distinguished: And since the Kinds are shus diftinct, it will appear that the Refistence of Bodies which are of a proper Magnitude and Velocity, whether they move in Air, Water, Quick-filver, or in any other Fluid, will almost all arile from the Vis Inertie of the Parts of the Fluid.

smaller Particles, and those also to be rendred more equally dense with Water, they could not have a smooth and slippery. But that Part which arises much less Resistence than it: If they were as from the Vis Inertia answers in Proportion to the Denfity of the Matter, and can neither be diminished by dividing the Matter into smaller Parti cles, nor by any other Means, than by the Dimi-

nution of the Density it self.

Whence it is, that Denfity of Fluid Mediums becomes very nearly proportionable to the Resistence.

Medium, would lose above half of its Motion, before it could move 3 of its own Diameters in length. And Density, as Water, Spirit of Wine, Oil of Turage and such like here. pentine, warm Oil of Olives, and such like, have very little difference also as to the Force of Resi frence. Water being 13 or 18 Times lighter, and confequently rarer than Quick-silver, hath its Resistence less than that of Mercury in the same Proportion, as he tried by the Experiment of Pendulums swimming in those two Fluids. The common of the Planets and Comets. That Fistitious Sub-Air such as we usually breath in, is about 8 or 9 he found the Resistence in Air to be less in that tion of the Phanumena of Nature; since the Mo-Ratio, by the same Kind of Trials. And in a tions of the Planets and Comers may be much thinner and rarer Air, the Refistence must still be better explained without by the Laws of Gravity; less; till at last in the Thoughts of all, it will grow and Gravity it self hath never yet been well ac-insensible. A Feather in the exhausted Receiver counted for by that Subtile Matter. In Reality, descends with equal Celerity as a Stone or a Piece that Subele Matter can only serve to obstruct and of Lead, the in the open Air it find a very great difturb the Motions of the Heavenly Bodies, and Refiftence to its Descent: And by all the Experi if there were any such thing would destroy and ments he could make he found the Refistence of all overthrow the Course and Order of Nature. And Fluid Mediums to depend only on their Density if you suppose it interspersed also within the and a little on their Tenacity: But there must bidden Pores and Measus of Bodies, it will do no-

of all Fluids were filled with another, yet more Subtle Matter or Fluid. Now if the Relistence in the Exhausted Receiver of the Air-Pump, should RESCRIPT in the Civil Law, is a Letter of be only a 100 Times less than in the common Air, it would be a Million of Times less than that of Quick-filver: But it is certainly much less than Corporation or any Publick Body of Men who that, and much less yet in the Celeftial Spaces or have consulted him, then they call it a Pragmatick Regions at 2 or 300 Miles in height above our Earth. For the Honourable Mr. Boyle hath shewn that Air may be rarified in Glass Vessels to above 1 0000 Times its natural State, and the Celestial Regions must be much more empty of Air, than any Space which we can here evacuate by an Air-Pump: Because since our Air is here compressed by the weight of the Incumbent Atmosphere, and its Density proportionable to that compressing Power; it will follow by Calculation, that the Air, at 7 Miles above the Earth's Surface will be 4 Times as rare, as here; at the Distance of 14 Miles 16 Times as rare; and so on in the same Ratio: So that at the Distance of 210 Miles from the Earth, the Air will be 10000000000000000000 or 10 Millions of Millions of Millions of Times thinner or rarer than 'tis here.

We find that Heat conduces much towards the Fluidity of many Bodies, by diminishing their Tenacity; for it tenders many Bodies (as all Metals and some Minerals) Fluid, which are not naturally so; and it increases the Fluidity of Tenacious Liquors, such as Oil, Balsams, Honey, and by that Means diminishes the Power of their Resistence. And yet it doth not much diminish the Resistence of Water; which it must certainly do if any considerable Degree of the Resistence of that Fluid arose from the Astricion or Tenacity For that Part of the Resistance of any Medium of its Particles. And therefore we may fairly con-which arises from Friction, Attrition, or Tenaci-clude that the Resistance of Water arises chiefly ty of the Particles of the Fluid, may be diminished from the Vis Increise of its Matter. And conseed, by supposing the matter to be divided into quently, if the Celestial Regions or Spaces, were dense as Quick silver, they would have a Resstence near as great as that: And if they were perfectly and completely dense, or full of Matter without any Pores or Vacuities at all interspersed, they would have a much greater Resistence than Quick-silver. A Globe perfettly folid, in such a tile Matter therefore with which some have filled hundred Times lighter, and rarer than Water, and the Heavens, is by no means useful for the Soluthing there but stop and obstruct the Kibrating Motions of the Particles of Matter, in which their Heat and all their Energy and Active Power confifts. And as it is of no use but to do Mischief, fo there are no good Reasons at all to induce us to believe the Existence of any such thing as a Materia Subtilis in their Sense.

RESISTANCE of the Air to the Motion of Projects, In Phil. Trans. N. 186. There is the Meafure of this given very largely and accurately by Dr. Wallis: He lays down at first this Lemma. That the Resistance of Bodies is proportional to their Celerity; and then branches out into all the particular Varieties that can well be imagined, and at last computing different Mediums one with another, he concludes their different Resistances to be as their Specifick Gravities, obstructed from the Viscidity of the Particles of some Fluids: And also that the Specifically Heavier Project once in motion (being equally iwift with another that is lighter, Gc.) will move through the same Mediium more strongly in proportion to its greater Intensive or Specifick Gravity.

In the Acta Eruditorum Lipsia for July 1684, Mr.G.G. Leibnitz proposes some New Demonstrations about the Resistances of Solid Bodies; which

are very Geometrical and Curious.

And in the Leipsick Acts for January 1689. Ho reduces his Thoughts on this Subject into a Differtation. Entitled, A Discourse concerning the Resistance of Mediums, and the Motion of Projects in resisting Mediums.

As to the Geometrical Considerations of the Refistance of Bodies of different Figures in one and the same Medium: Mr. James Bernouli in the Asta Lipsia for May 1693. gives these Rules.

1. If an Isoceles Triangle be moved in the Fluid according to the Direction of a Line which is Normal to its Base; First with the Vertex foremost; and then with its Base; the Resistances will be of the Leggs, and as the Square of the Base, and as the Summ of the Leggs.

2. The Refistance of a Square moved according to the Direction of its Side, and of its Diagonal, is as the Diagonal to the Side.

3. The Relistance of a Circular Segment (less 'than a Semi-circle) carried in a Ditection perpendicular to its Basis, when it goes with the Base foremost, and when with its Vertex foremost (the same Direction and Celerity continuing, which is all along supposed) is as the Square of the Diaof the Segment.

Cor. Hence the Resistances of a Semi-circle when its Base, and when its Vertex goes foremost, are to one another in a Sesquialteral Ratio.

4. A Parabola moving in the Direction of its Axis, with its Basis, and then its Vertex foremost, hath its Resistances, as the Tangent to an Arch of a Circle whose Diameter is equal to the Parameter, and the Tangent equal to half the Basis of the Parabola.

5. The Refistances of an Hyperbola, or a Semi-Ellipsis; when the Base and when the Vertex goes

Axis, and Latus Rectum; is to the Transverse Axis: So is the Square of the Latus Rectum, to the Square of the Diameter of a certain Circle, in which Circle apply a Tangent equal to half the Basis of the Hyperbola or Ellipsis. Then say again, as the Summ and Difference of the Axis and Parameter, is to the Parameter; so is the aforesaid Tangent to another Right-line. And further, as the Summ (or Difference) of the Axis and Parameter, is to the Axis: So is the circular Ark corresponding to the aforesaid Tangent, to another Arch. This done, the Resistances will be as the Tangent to the Summ (or Difference) of the Right-line thus found, and that Ark last menti-

6. In General, the Resistances of any Figure whatsoever going now with its Base foremost, and then with its Vertex, are as the Figures of the Ba-fis to the Summ of all the Cubes of the Elementa of the Basis divided by the Squares of the Elementa of the Curve-line.

All which Rules he thinks may be of Use in the Fabrick or Construction of Ships, and in perfecting the Art of Navigation universally. As also for determining the Figures of the Bobs of Pendulums for Clocks.

RESPECTU Computi Vice-Comitis habendo : Is a Writ for the Respiting a Sherist's Accounts, on just Occasion delivered to the Treasurer and the Barons of the Exchequer. Regist. fol. 139 & 179.

RESPIRATION. How such Globules of the Blood as by uniting together in the Veins, from others too large for any Secretion, and are therefore necessarily afterwards broken on the Lungs by the Force of Respiration, Dr. Keil shews in his Animal Secretion, p. 24, &c. And to estimate the Force by which the Air is thrust out of the Lungs in Exspiration he took a thin Hog's Bladder which he could eafily blow up with the Breath of one Exspiration; and having moistened it, that it might neither resist the Air in blowing up, nor the Weights which were laid upon it : Hefix'da finall Tube, whose Diameter was The part of an Inch, to the Neck of the Bladder; and then filling the Bladder with Air, he put a Weight of 216. 42. on the Top of it: And repeating the Experiment feveral Times he found that this Weight squeezed all the Air out of the Bladder, through the small Tube in the Space of 25 Vibrations of a Pendulum, fwinging Seconds, and by a Calculation which he meter, to the same less; of the Square of the Base there gives, he found the Force by which the Air is forced out of the Lungs at every Exipiration to beequal to 100 lb. Weight: And therefore, Action and Reaction being Equal, the Pressure of the Air upon the Lungs every Expiration must be equal to the Pressure of 100 lb. Weight. That is, suppoling the Gravity of the Air to be always the same, and the Diameter of the Trachaa the same also in every Exspiration. But since we find by the Barometer, that there is 3 Inches difference between the greatest and the leastGravity of the Air, which is the Tenth-part of its greatest Gravity; there must be likewise the Difference of 10 lb. Weight in its Pressure upon the Lungs at one Time more than at another. He thinks no one can doubt but that this Pressure of the Air on the Lungs in the Summ (or Difference) of the Transverse Blood, and to dissolve all the Cohesions they might Vol. II. foremost, may be thus computed: Let it be, as breathing, is sufficient to break the Globules of the

contractin their Circulation through the Veins and Arteries. And when the Blood is thus dissolved and thrown out by the Heart into the Aorta; tis evident that the Re-union of the Particles requires more or less Time, according to their several Attractive Powers, even though they all moved with the same Velocity, and in the same Direction.

But neither doth this happen, for a Fluid moves through a Cylinder or Conical Vessel (such as the Arteries are) with a greater Velocity at the Axis, than at the Sides. And again, the Blood is thrust into the Aorta, by the whole Force of the Heart: And Fluids when they are pressed, pressundequaque; by which means the Arteries are dilated, and the Blood moves not only forwards, but likewise presses perpendicular on the Sides of the Arteries: And as the Sides of the Arteries (being Elastick) return, they press the Blood from them every way, which must produce an Intestine Motion, and so hinder the Attraction of the Particles; and by this frequent and strong Cohesion of the Particles of the Blood against the Sides of the great Arteries, the Cohesions of the Particles, if any of them happen to unité, will be immediately dissolved.
Again, this Intestine Motion must greatly increase
on the Account that many of the Particles of the Blood are Elastick: For by this Resistance of the Sides of the Vessels, they must necessarily hit one against another, and being Elastick, reflect from one another, and so increase the Intestine Motion of the Blood.

On this Intestine Motion of the Blood its Heat depends; which therefore is every where proportional to the Impetus of the Particles against the Sides of the Vessels; supposing the Elasticity of the Particles every-where the same. But the Impetus of the Particles against the Sides of the Vessels decreases, as the Summ of the Cavities of the Vessels increases: And consequently where the Summ of the Cavities of the Vessels is greatest, there the Intestine Motion of the Blood is least, and the Attractive Power of the Particles (cateris pa-

ribus) is greatest.

RESTITUTIO in Integrum, is a Writ of Refitution to put a Person into Re-possession of such Lands and Tenements, as whereof he had been

wrongfullly differzed.

RETENTION, is a Faculty of the Human Mind, whereby in Order to a farther Progress in Knowledge it keeps or retains those Simple Ideas, which it before received by Sensation or Resection; and this is done two ways. First by keeping the Idea, which is brought into the Mind, for some Time actually in view, which is called Contemplation: And Secondly, by Reviving again in our Minds those Ideas, which after imprinting have disappeared, or have been as it were laid out of sight: And this we do, when we conceive Heat or Light, Yellow, or Sweet, the Object in which those Qualities are, being removed: And this is called Memory; which is as it were the common Store-houseot all our Ideas. And our Ideas being nothing but Astual Perceptions in the Mind, which cease to be any thing, when there is no Perception of them; This Laying up of our Ideas in the Repository of the Memory, signifies no more than this: That the Mind hath a Power in many Cases, to revive Perceptions which it once had, with this Additional Perception annexed to them, That it hath had them before. And in this sense it is, that

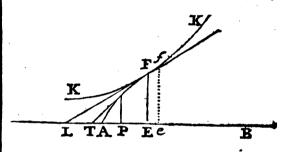

our Ideas are faid tobe in our Memory; when indeed they are actually no where: But only there is an Ability in the Mind, when it will to revive them again; and as it were paint them a-new on it felf.

RETRAXIT; in the Law, (so called from being the Estectual Word in the Entry,) is where the Plaintist or Desendant comes into Court; and declares he hath with-drawn his Suit, and will proceed no surther; and this is a Bar of all other Actions of a like or inserior Nature. The Disserence between a Retraxit and a Non suit, is that the former supposes the Plaintist or Desendant to be actually present in Court; whereas a Non-suit is upon a Demand made, when he should appear, and he makes default. A Retraxit also is a Bar, but not a Non-suit; for then he may commence a New Action of the like Nature.

RETROGRADATION of a Planet. See an Account of the Reason of this Phænomenon, un-

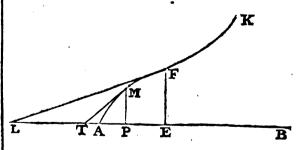

der the word Direct. in Vol. II.

RETROGRESSION of Curves: The fame with what is otherwise called contrary Flexion; and is thus? when a Curve-line AFK is partly

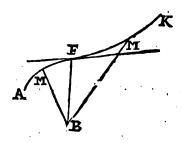

Concave and partly Convex, in respect of the Right-line A B, or in respect of the determinate Point B; the Point F which separates the Concave part of the Curve from the Convex, or which is the end of the one, and the beginning of the other, is called the Point of contrary Flexion, when the Curve is continu'd from F towards the same side as before. But when the Curve is continu'd backwards towards A, then F is call'd the Point of Retrogression.

179. If we suppose the Ordinate P M to move from A-towards B, and consider the various As-

fections of the Fluxions thereof, as it moves along, it will be an easie matter to determine the Point of contrary Flexion or Retrogression.

pository of the Memory, signifies no more than this: That the Mind hath a Power in many Cases, Curve-line AMK; and let the Ordinate PM, EF to revive Perceptions which it once had, with this Additional Perception annexed to them, That it hath had them before. And in this sense it is, that

Intercepted Diameter encreases continually, and the Portion of the Diameter AT Intercepted between the Tangent MT, and A the beginning of the Abscissa increases also, till the point P arrive at E, and afterwards decreases again; and hence 'tis plain, that the Portion of the Sub-tangent AT becomes a Maximum, when the points P and M fall in E and F.

180. But when the Curve AMF is continu'd backwards from F towards A, then the Sub-tangent AT increases continually; but the intercepted Diameter increases only, until the point T arrive in L, or until the Ordinate PM co-incides with EF; and atterwards it decreases again.

Hence to find a general Form which shall serve to Investigate the Points of contrary Flexion and Retrogression.

Suppose $AE = \alpha$, $EF = \gamma$; then is AL = 0

-011US 5 and the Fluxion thereof -

be = o, and by Transposition, and Division

(by x, supposing x an Invariable Quantity)

Infinity; and multiplying by and dividing by

-y, we have y = 0, or *Infinity*: which for the future will ferve for a General Form to find the points (F) of contrary Flexion and Retrogression; for the Nature of the Curve AFK being given, it

Fluxion of that Value (supposing *, to be Inva-

riable) we shall have the Value of y in x2, which being put equal to nothing or Infinity, will serve in either of these Suppositions, to find such a Value of AE, that the Ordinate EF shall intersect the Curve AFK in F the point of contrary Flexi- gative in F, the point of Inflexion or Retrogressia on or Retrogression.

181. The point A the beginning of x may be

so situated, that AL shall be:

Vol. II.

- x, and that AL or AE may be a mini-

mum instead of being a maximum, but because the consequence is still the same, and that this can create no difficulty, it shall be sufficient to observe,

That AL can never be =x+-; for when

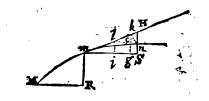

the point T falls on the other side of P in respect

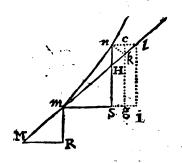

of the beginning of x, then the Value of - will

be Negative, and consequently, the Value of .

- will be Positive, and therefore in such a Case

182. The point of contrary Flexion or Retrogreffion may be found otherwise, in this manner:

we find the Value of 7 in x, and again find the It is evident that if x be supposed invariable, and that the Ordinate y be a flowing Quantity, then S n is less than SH or R m, when the Curve is Concave towards the Axis: and S n is greater than SH or R m, when the Curve is Convex towards the Axis. Whence it follows, that the Va-

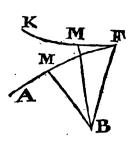

lue of H n or n from being Positive becomes Ne

on; that is y is = 0, or Infinity.

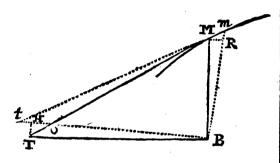

183. And if the Curve AFK respect a single point B, then draw the Ordinates BM, BF, BM, instead all concurring in the given point B. Then if you draw any Ordinate as BM, and the Tangent MT

D d d d 2

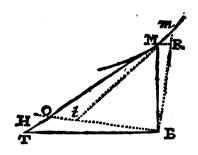

inter-

intersecting BT perpendicular to BM in T, and if the point m be taken infinitely near to M, and the Ordinate BM, Bt a perpendicular thereto, and the Tangenr mt be drawn; 'tis evident (if we suppose the Ordinate BM to increase as it comes to Bm) that in F the concave part of the Curve, Bt surpasses BO, (o being the point where MT intersects Bt) and in the part of the Curve which is Convex towards B, Bt is less than BO; whence 'tis manifest that in F the point of contrary Flexion or Retrogression, the Value of Ot passes from being Positive to be Negative.

184. These things being premis'd: If on the Center B, and with the Radii BT, BM, the little Arches TH, MR be describ'd; then the Triangles

MRm, MBT and THO are fimilar, and the little Sectors BMR, BTH are also similar; whence

(fuppofing EM = y, MR = \dot{x} , RM = \dot{y} ,) m R

$$(y): RM(x)::BM(y):BT = -\frac{yx}{2}$$

$$:: MR_{j}(x): TH = \frac{x^{j}}{y}:: TH \left(\frac{x}{y}\right)^{j}$$

And if we take the Fluxion of BT $\left(\begin{array}{c} y \dot{x} \\ - \end{array}\right)$

supposing & to be an Invariable Quantity, then is

$$Bt - BT = Ht = \frac{y \times - y \times y}{\text{and OH}}$$

 $Ht = \frac{x^3 + x - y xy}{1 + x - y xy}$ Now because in the

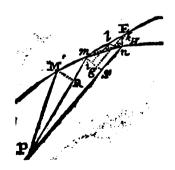

point of contrary Plexion or Retrogression, O t is either =0, or Infinity, therefore in the said point

$$x^3 + y^3 \times -y \times y$$
 is $= 0$, or Infinity, and multi-

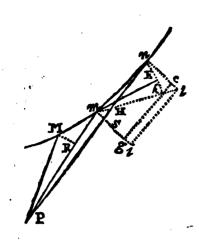

plying by y^2 , and dividing by x, we have $x^2 + y^2 - y = 0$, or Infinity; whence if the Nature of the Curve A FK be given, then the Value of y may be found in x, and the Value of y in x^2 ; and if the faid Values be substituted in the general Form, there will remain one unknown Quan-

tity (x) and the Equation thus cleared, will ferve to find such a Value of BF, that setting one foot of your Compasses in B, and with the other, at the distance BF, describing a Circle, it will cut the Curve in F, the Point of contrary Flexion or Retrogression; which was required to be done.

185. And to determine the said points another way, it must be observed, that in the Concave Part, the Angle P m E, is greater than the Angle P m n, and contrarily, in the Convex Part, the

Angle P m E is less than P m n, and consequently that the Angle P m E — P m n = E m n, or the Arch E n, from being Positive becomes Negative in F the point of contrary Flexion or Retrogression. And taking x for an invariable Quan-

tity, the right angled Triangles H m S, Hin k are fimilar; therefore Hm (=z): mS(x): H n (-j) : nk = --j; and here it must be observed, that H n is Negative, because while B m (1) Increases, m R (1) Decreases. Now because the Sectors P m S, m E k are similar, it is Bm(y):mS(x)::mE(z):Ek=-; and therefore E k + k n is =

21) because of the right angled Triangle m S n, x'+y'-y, which passes from being Positive to be Negative, in the point of contrary Flexion or Retrogression.

And if we suppose y to be Infinite, then the Terms x2, and y2 vanish, and are equal to nothing in respect of yy, and consequently the form $x^2 + y^2 - yy = 0$, or Infinity, will become -77=0, or Infinity, that is to say, dividing by first case; and this ought to be so, because the Ordinates BM, BF, BM are then parallel to one another.

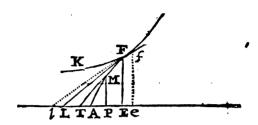

Confectary 1.

186. When 9=0, then tis evident that the Fluxion of AL is nothing in respect of x the Fluxion of AE; and that the two Tangents FL, fL being infinitely near each other, ought to make but one streight Line fF L.

Consestary 2.

And when y = Infinity, then the Fluxion of AL ought to be infinitely great in comparison of that of AE, or which is the same thing, the Flu-

xion of AE (or x) is infinitely little in respect of that of AE; and consequently we may draw

two Tangents FL, Fl, to the same point F, comprehending the infinitely little Angle L F f.

Consectary 3.

In like manner, when $x^2 + y^2 - yy = 0$, 'tis evident that, ot ought to be equal to nothing in respect of MR; and consequently, that the two Pangents MT, mt, infinitely near each other, must Co-incide, when the point M is the same with the point of contrary Flexion or Retrogression.

Confectary 4.

And when $x^2 + y^2 - yy = Infinity$, then o t is infinite in respect of MR, or which is the same thing, MR is infinitely little in comparison of at, shall have $a^2 - yy$, or (substituting $a^2 + y^2$ for and consequently the Points M and m must Coincide; that is when the Point M is the Point of Inflexion or Retrogression, we may draw two Tangents through M, comprehending an Angle infinitely little.

Confectary 5.

Hence it is evident also, that the Line which touches the Curve in the Point of contrary Flexion or Retrogression, being prolonged, touches and cuts the Curve A F K in one and the same Point,

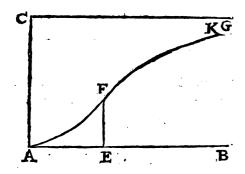

If the Curve-line AFK begiven, and its Diame-ter AB; and if the Relation of the Abscilla AE (x) to the Ordinate EF(y) be expressed by this Equation a x x = x x y + a a y; 'tis requir'd to find the Value of AE, so that the corresponding Ordinate E F shall interfest the Curve AFK in the Point of contrary Hearton F.

187. The Equation Curve is
$$y = \frac{x + x}{x + ax}$$
 and

and taking the Fluxion of this QuanQuantity, and supposing & invariable, and putting the said Second Fluxion equal to nothing; we

have 2 e3 x2 x x x + a a2 8 a3 x2 x2 x x + a a

= 0, and multiplying by $x x + a a^{2}$, and dividing by $2a^3 x^2 \times x x + aa$, we have x x + aa -4xx = 0. And 3xx = aa, that is x (AE) $= a\sqrt{\frac{1}{3}}$.

If we substitute i a a in place of x x in the Equation of the Curve y = , then y= $z = \pm a = EF$; so that we may determine the |z = z + - z|, and consequently z = z + - zPoint of Inflexion F, without supposing the Curve AFK to be described.

If AC be drawn parallel to the Ordinate E.F. and equal to the given Line a, and if CG be drawn parallel to AB, it will be an Affymptote to the Curve AFK. For if we suppose x to be infinite, then the Equation of the Curve y - will become $y = \frac{a \times x}{-} = a$, fo that the Ordinate of the Curve E F cannot be = a = A C, before the Abscissa A E be infinite.

Corollary.

188. If the Equation of the Curve be y- $-\frac{2}{3} \times x$, and p =(supposing x invariable)

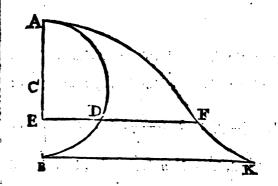

= 0. Then $= 6 x^2$ is = 0; which because it makes nothing for the Resolution of the Question, therefore I put

ty; whence the Denominator 25 V x - ar is = and confequently, the unknown Quantity x (AE) have bx - ar - br = 0, and by Transposition is $= a_{c}$

Prop. 2.

If AFKbea protracted Semi-cycloid whose BaseBK is longer than the Semi-circumference of the generating Circle ADB, whose Centre is C;'tis requir'd to find the Point E in the Diameter AB, so that the Ordinate EF shall cut the Semi-cycloid in F the Point of contrary Flexion.

189. Suppose the known Quantities ADB = 4, BK=b, AB=2r, and the unknown Quanti-

ties $A \to x$, ED = x, the Arch AD = u; and EF=1; then by the Property of the Cycloid

by the Property of the Circle z = $\sqrt{2r}$ and consequently, z= ix 2,

- and 🐱

tuting for z and y their respective Values, we

have y =

and the Fluxion there-

of (fuppposing x invariable) is, y = 0

2rx — xx x 🗸 2rx — xx

-=0, whence brx-arr

 $-ib^{-1}b^{-1} \times x^2$ is = 0, and dividing by $x^2 \times r$, we

$$bx = ar + br$$
, and $x = r + \frac{ar}{b}$, and confe-

quently
$$C = \frac{ar}{b}$$
.

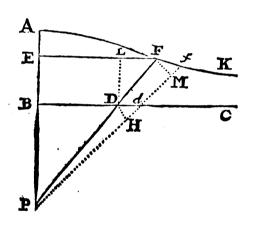

Hence'tis manifest, that to have a Point of contrary Flexion F, b must be greater than a; for if b, be less than a, then CE would exceed CB.

Prop. 3.

Let it be requir'd to find F the Point of contrary Flexion in Nichomedes's Conchoid A F K.

190. Let BC be the Assymptote, and P the Pole of the Conchoid; then the Property of the Conchoid is, that if you draw straight Lines from the Pole P to the Curve AFK, as PF, PA, then the Segments between the Assymptote and the Curve v. g. AB, DF are always equal to a given Line a.

Draw PA perpendicular, and FE parallel to BC, and suppose the known Quantities AB=FD=a; BP=b; and the unknown Quantities BE=x, EF=j, and draw DL parallel to BA, then because the Triangles DLF, PEF,

are fimilar; it is DL(*): LF($\sqrt{aa-*x}$)

$$:: PE(b+x): FE = y = \frac{b+x\sqrt{aa-xx}}{aa-xx}$$

and confequently $y = \frac{x^3 x + aabx}{}$. And $y = \frac{}{}$

2 a b -- a a x 3 -- 3 a a b x x x x = 0, whence

44x1-x1 x 1/44-x2

by Reduction there will arise $x^2 + 3bxx - 2$ aab = 0, and one of the Values of the Root x

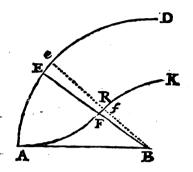

will be = PF, which was required.

If a be = b, the preceeding Equation will be changed into this other, x + 3 a x - 2 a = 0, which being divided by x + a the Quotient is x x + 2 a x - 2 a = 0, and confequently x is = a + 4 3 a a.

Prop. 4.

Let AED be an Arch of a Circle, and B its Center, and let the Property of the Curve-line AFK be fuch, that drawing any Ray BFE at pleafure, the Square of FE be equal to the Rectangle comprehended under the Arch AE and a given Right-line a. 'Tis requir'd to find the Point (F) of contrary Flexion.

191. Suppose the Arch AE=z, the Radius BA=r, and the Ordinate BF=y; then by the Property of the Curve a z=rr-2ry+yy, and

consequently $z = \frac{2yy - 2ry}{} = Ee$; and be

cause the Sectors B E e, B F R are similar, it is

BE
$$(r)$$
: BF (j) :: Ee $\left(\frac{2jj-2rj}{r}\right)$

$$FR = \frac{2}{4} = \frac{2}{9} =$$

thereof (supposing * invariable) is 47 j=24 j= +2777-2477=0. And consequently j

Values of x^2 and y in the general Theorem $y = x^2 + y^2$, there will arise this Equation

y—a which by Reduction, is 4 y — 12 r y + 12 r r y

 $-4r^3yy + 3rraay - 2r^3aa = 0$. And one of the Values of the Root y will be = BF required.

Scholium 1.

That the Curve AFK, which we may call a Parabolical Spiral, has a Point of contrary Flexion, may easily appear.

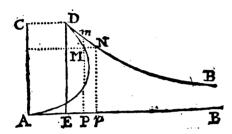

For the Circumference AED not differing fenfibly near A, from the Tangent in A, its plain from

must be concave towards that Tangent, and that afterwards the Curvature of the Circumference about its Centre becoming more and more sensible, the faid Curve must be concave towards the said Centre B.

Scholium 2.

The Points of Retrogression of Curves may be found by help of first Fluxions in this manner,

192. If the Curve AMDB be fuch that the Ordinates PM m intersect the same in two Points M and m, then that Curve must have a Point of Re-

trogression, viz. the Point D; and to determine the same it must be observ'd that if (the Abscissa) who supposed invariable, then the Fluxion of the Ordinate (when it is greatest) which passes thro' the Point of Retrogression D, is equal to nothing; whence we may find the Value of A E the Abscissa corresponding to the same.

RETURNS of a Trênch in Fortification, are the Turnings and Windings which runs from the Lines of the Trench, and are, as near as can be, parallel to the Place attacked, to avoid being enfiladed.

REVE alias Gereve, fignifies with us the Bailiff of a Franchise or Mannor, especially in the Western Parts of England: Hence Sire-Reve or Sheriff.

REVEILLE. For the Drum to beat the Reveille in any Army, is to give notice that 'tis Day-break, and that the Soldiers should rise, and the Centries forbear challenging.

REVERSIONS, or Estates in Reversion. In the little Book of Tables for Renewing and Purchasing College and Church-Leases, Printed at Cambridge 1700, and recommended by Sir Is. Newton.

There is also shew'd the Construction and Use of the following Table of Reversions, which is calculated for several Rates of Interest. The Table flews the Decrease of 1 l. yearly, according to the said several Rates; or which is the same thing, it shews you what one Pound due at the End of any Number of Years to come (not exceeding 40, which is the longest Term such Lands can be leased for) is now worth in Ready Money at 5, 6, 7, 8, 10, and 12 per Cent. per Ann.

And first, What is 1 l. due a Tear hence, worth in Ready Money now?

The Rule is this: Let 100 L with the Interest of a Year added to it, be the first Term in the Rule of Three; 100 l. the Second, and 1 l. the Third. (For as 100 l. with its Interest going on to the End of the Year, is to a bare 100 l. then

from the Nature of the Parabola, that the Curve due: So must 1 1. with its growing Interest, be to the Decrease of I l. at the Years End. (Then at 61. and 101. per Cent. the Work will stand

As 106. 100:: 1. .94339 or 18s. 10d. \(\frac{1}{4}\).

From whence it appears that 1 l. in a Years Time at 61. per Cent. decreases to 18 s. 10 d. + and at 10 l. per Cent. to 18 s. 2 d. So that 18 s. 10 d. 4 Ready Money isworth 20 s. to be paid a Year hence at 6 l. per Cent. and 18 s. 2 d. Ready Money is worth 20s. to be paid a Year hence at 10l. per Cent. And reckoning thus by a continual Geometrical Proportion decreasing, it comes to pass that 20 s. to be paid 21 Years, hence, is worth but 5 s. 10 d. \(\frac{1}{2}\) Ready Money. That is, 5 s. 10 d. \(\frac{1}{2}\) paid now, will in 21 Years at 6 l. per Cent. per Ann. compl. Interesting to just 20 s. But at 10 l. per Cent. 20 s. in 21 Years decreases to 2 s. 8 d. \(\frac{1}{2}\) So that at the Rate: of Interest 2 s. 8 d. 1 to be paid now, will amount to 20 s. in 21 Years Time.

In order therefore to renew a Leafe of 21 Years that hath but one Year lapsed, at the Rate of 104! per Cent. 1 look into the Table of Reversions below, and under the Rate of Interest mentioned, and right against 21 Years in the common Angle of meeting, I have 2 s. 8 d. 1, which is the Fine to be paid to renew one Year lapsed in the said Leafe, and supposing the Rent to be il. per Ann. for it is 21 Yearse're the Lease is compleated; in which Time the Fine of 2s. 8d. : will amount to 20 s. and therefore by paying that Fine, the Lease may fairly be made up again.

Supposeagain there be two Years lapsed in such Lease, allowing the same Rate of Interest. Looking into the following Table of Reversions I find 20 s. to be paid 20 Years hence, i is now worth in Ready Money 2 s. II d. \frac{1}{2}, add this Summ to the former of 2 s. 8 d. \frac{1}{2}, and their Summ which is 5 s. 8 d. is the Fine to be paid to make the Leafe to 21 Years again, supposing the Rent to

Suppose an, Estate in Fee-Simple, whose teal Value is 100 l. But that it is Mortgaged, or Leased our for 20 Years: What is the Reversion of it worth now, at 6 l. per Cent. Interest?

By the Table of Reversions I find 1 l. to be paid 20 Years hence, is worth but 6 s. 2 d. 1/4, and multiplying that by 100, I find,

•	l.	5.	đ.
100 times of s. is	30	CO	0
100 times 2 d. or 200 d. makes	•	10	O
And 100 times $\frac{3}{4}$, or 300 q . makes		્	. 3
Summ		<u>.</u>	
Summ	j٠	4	11

Wherefore 31 l. 2 s. 11 d. is the true present Value of 100 l. to be paid 20 Years hence.

How to value the Reversion of any Lease or Annuity: See in the Renewing of Leafes.

A Table of Reversions shewing what 1 l. due any Number of Years hence, under 41 is worth in ready Money at 5. 6, 7, 8, 10, and 12 l. per Cent.

RIGLET

ly certain Servitors, which held their Land by ferving their Lord on Horse-back; or attending him in his Progress or Travels on the Road.

ROME-Scot was formerly here an annual Tribute of a Penny for every Family, and paid to Rome at the Feast of St Peter ad Vincula, being

the First of August.

Cambden tells us it was first granted by Offa; but others attribute its Original to Ina, King of the West Saxons; who being in Pilgrimage at Rome, A. D. 725. gave it as an Alms. It amounted to three hundred Marks and one Noble yearly. Of this Mark of Slavery to Rome, our Ancestors frequently complained as a Burden and Scandal to the English Nation! It was first for bidden to be paid by Edw. 3. Tho' before complained of in Parliament as a Grievance in K. John's Time, This Payment was abrogated 25 A. D. 1206. H. 8. 25. But servilely restored again 1 and 2 as is plain from the following Table, where the Phil. and Mary; and at last utterly abolished, Numbers are so removed without their Letters, 1 Eliz. 1.

ROOT Binomial: To raise (easily) a Binomial Root up to any Power assign'd.

Suppose a + b. (1.) If it be a - b 't is called a Residual; and the Powers of such a Residual will be the same with the like Powers railed from a Binomial (affirmative) as a + b; except, that as the Signs of the Powers of a Binomial are all affirmative: Those of the Residual have the Signs - alternately annexed to every other Term; as will easily appear from multiplying a -b by it felf, and then the Square so found by the Root again, &c.

2. The Indexes of the Powers of the Leading Quantity, or First Name a, in all the Powers of the Binomial a + b do continually decrease, and that in an Arithmetical Progression; asthole of b, the other Names do after the same Manner encrease.

So that if the Indexes of the Powers of a + bonly were required, when that Binomial is to be raised up to the seventh Power, you will easily perceive that it must stand thus.

 $a^7 + a^6b + a^5b^2 + a^4.b^3 + a^3b^4 + a^3b^5 + ab^6 + b^7.$ young Mathematicians Guide, p. 157, 158.

3. Where 'tis easy to observe that the first and last Term are pure Powers of the single Quanti-Row of the Table above, and prefix them to the ties a and b, and are both of the same Height: several and proper Letters in the 7th Power of a+b, As also that the Summ of the Indexes of any two Letters joined together in any of the Intermediate ral Uncia, and it will stand thus; Terms, do always make up the Index of the highest Power.

4. The next Work therefore is only to find the

RIGLET, is any square, stat, thin, Piece of Wood, like those which are designed to make the Frames of small Pictures of; which are so called, and then removing the said Power, when 'tis so before they are Molded. before they are Molded.

RINÆUS, a Muscle of the Nose, otherwise ther to the Right or Left-hand. Thus aa + 2ab called Nasalis; which see

ROD Knights. alias Rad-Knights were ancienttound by joining to a + b each Letter of a + b, and removing the Powers to the Right or Lefthand thus; a joined to a makes a a; a joined to b makes a b; and b joined to a makes another ab; and b joined to b makes bb; and it will

fland thus; aa + ab + bb or aa + 2ab + bb. Now

from hence it will follow, (3) That the Unciæof the second Term in any such Power will always be the Summ of so many Units added together (more 1.) as there hath been Multiplications of the First Root; which will always be determined by the Index of the first Term in the Power!

And because the Uncia of all the Intermediate Terms are only removed along with their Letters; it also follows, that if they are added together, their respective Summs, must produce the true Unciae of the intermediate Terms in the new raised Power,

7 are the 2 Uncia of a + b and a + b. I These added in the Order as they 15 stand, produce the next Rank.

7 The Uncia of the Square, and these added again produce the next Rank or Uncia of the Cube, &c.

Unciæ of the Cube.

The Uncia of the Biquai \ drate.

1) The Unciæ of the fifth 5 10 10 5 Power. 5 10 10 5

The Uncia of the 1 fixth Power. б 15 20 15 б I 1 6 15 20 15 6

The Uncie of the 7 21 35 35 21 7 feventh Power, and so on, as Mr. Ward hath well observed in his

If therefore you take the Numbers in the last you will compleat all the Terms with their feve-

 $a^{7} + 7a^{6}b + 21a^{5}b^{5} + 35a^{6}b^{7} + 35a^{7}b^{6} + 21a^{7}b^{5} + 7ab^{6} + b^{7}$

Uncia; which may be done by confidering,

(1) That the Uncia of every fingle Letter, and of every fingle Power, how high foever it be, is an Unit, or (1), which neither multiples nor divides. Binomial, are a Series of Units, whose Summ (2) That all the Powers of any Binomial are native every where the Uncia of the second Term; are a Series of Units and that the Uncia of the second Term; are a Series of Units and that the Uncia of the second Term; are a Series of Units are a Series of Units. turally raised by multiplying the Preceeding Power and that the Uncia of the second Term, are a Seinto the Original Root: Which in Algebraick Multies of Numbers in natural Arithmetical Progres-Gggg

fion; as 1,2,3,4,5,6,7, &c. Whose Summ is every where the *Uncia* of the next Superior Power in the Third Term, &c. He deduces this General Rule for finding the Uncia of any Power of a

Binomial, Viz.

Multiply the Index of the First Letter of any Term into its own Uncia, and divide the Product by the Number of Terms to that Place, and the Question will be the Uncia of the next Subceeding Term, forward. Thus in the last Example,

1. The Index of a7 (the First Term) will be the Uncia for 7 as b, the Second Term.

2. Then
$$\frac{7 \times 6}{2}$$
 = 21. That is the Index of a^{6} in

the Second Term multiplied by its Uncia 7; and the Product 42, divided by 2, the Number of Terms to that Place, quotes 21, the Uncia of the

Term, and $\frac{35 \times 4}{4}$ = 35, will be the Uncia of the

4 You may observe here that the Uncia do increase, only 'till the Indeces of the Two Letters become equal, or change Places; and then the Rest of the *Uncia* do decrease, as the former increased: So that 'tis enough to find the *Uncia* of half the Number of Terms in any Power, and then

the Rest may be easily prefixed.

And when all this is considered, the Value and Expeditiousness of that Short Theorem of Sir Isaac Newton, for finding the Uncia of a Binomial, will

be understood and admired, Viz.

Suppose m the Exponent of any Power: Then

will
$$1 \times \frac{m-0}{1} \times \frac{m-2}{2} \times \frac{m-3}{3}$$

will $1 \times \frac{m-5}{1} \times \frac{m-6}{3} \times \frac{m-6}{3}$

Discoveries to see the Light.

Not long since (viz. A. D. 1690.) that excellent Person M. Joseph Raphson, F. R. S. Publish'dhis U. niverfal Analysis of Equations, and illustrated his Method by plenty of Examples; by all which he has given Indications of a Mathematical Genius, from which the greatest things may be expected.

By this Example, M. de Lagney, an Ingenious Professor of Mathemanicks at Paris, was encou-

As, Suppose you would have the *Unciæ* for the 7th Power of a+b. Then m=7, and by the

Theorem 1 x
$$\frac{m-0}{1}$$
 = 7 will be the *Uncia*,

and that
$$7 \times \frac{m-1}{2} = 21$$
 will be the *Uncia* for

Also that
$$35 \times \frac{m-3}{4} = 35$$
 will be the *Uncia* of makes

And the Root of the 5th Power as $+b$, here

the Uncia of the two Remaining Terms must be 21, 7, and 1.

A New, Exact and Easie Method, of finding the Roots of any Equations generally, and that without any previous Reduction. By Mr. Edm. Halley, Geometry Professor at Oxford.

The principal Use of the Analytick Art, is to bring Mathematical Problems to Equations, and to exhibit those Equations in the most simple Terms that can be. But this Art would juftly feem in some degree desective, and not sufficient-ly Analytical, if there were not some Methods, by the help of which, the Roots (be they Lines or Numbers) might be gotten from the Equations that are found, and so the Problems in that re-spect be solved. The Ancients scarce knew any thing in these Matters, beyond Quadratick Equations. And what they writ of the Geometrick Conftruction of solid Problems, by the help of the Parabola, Ciffoid, or any other Curve, were only particular things defign'd for some particular Ca-les. But as to Numerical End S But as to Numerical Extraction, there is every where a protound Silence; so that whatever we perform now in this kind, is entirely owing to the Inventions of the Moderns.

And first of all, that great Discoverer and Reftorer of the Modern Algebra, Francis Vieta, about 100 Years fince, thew'd a general Method for extracting the Roots of any Equation, which he publish'd under the Title of, A Numerical Refolution of Powers, &c. Harriot, Oughtred, and others, as well of our own Country, as Foreigners, ought to acknowledge what soever they have written upon this Subject, as taken from Vieta. But what the Sagacity of Sir Is. Newton's Genius has perform'd in this Business, we may rather conjecture (than be fully assur'd of) from that short Specimen given by Dr. Wallis in the 94th. Chapter of his Algebra. And we must be forc'd to expect it, 'till his great Modesty shall yield to the Interaction of his briends, and suffer these arrives of his briends. treaties of his Friends, and suffer those curious Discoveries to see the Light.

By this Example, M. de Lagney, an Ingenious Professor of Mathemanicks at Paris, was encourag'd to attempt the same Argument, but he being almost altogether taken up in extracting the Roots of pure Powers (especially the Cubick) adds but little about assected Equations, and that pret-ty much perplex'd too, and not sufficiently demonstrated. Yet he gives two very compendious Rules for the Approximation of a Cubical Root; and that $7 \times \frac{m-1}{2}$ = 21 will be the *Uncia* for Ex. gr. that the fide of the Cube aa + b, is be-

and that
$$7 \times \frac{}{2} = 21$$
 will be the *Uncia* for the Fourth Term. Ex. gr. that the fide of the Cube $a \cdot a \cdot a + b$, tween

$$\frac{m-2}{3} = 35$$
 will be the *Uncia* for the Fourth Term.

$$\frac{ab}{3aaa+b}, & \sqrt{\frac{1}{4}aa+b} = \frac{1}{2}a.$$

the Fifth Term; and consequently by going backwards (as in Art. 4. above) you will find that
$$\frac{1}{2}a + \sqrt{V_{\frac{1}{4}}a^{1} + b} - \frac{1}{4}a = (\text{ where note,} \\
5a + \sqrt{V_{\frac{1}{4}}a^{1} + b} - \frac{1}{4}a = (\text{ where note,} \\
5a + \sqrt{V_{\frac{1}{4}}a^{1} + b} - \frac{1}{4}a = (\text{ where note,} \\
5a + \sqrt{V_{\frac{1}{4}}a^{1} + b} - \frac{1}{4}a = (\text{ where note,} \\
5a + \sqrt{V_{\frac{1}{4}}a^{1} + b} - \frac{1}{4}a = (\text{ where note,} \\
5a + \sqrt{V_{\frac{1}{4}}a^{1} + b} - \frac{1}{4}a = (\text{ where note,} \\
5a + \sqrt{V_{\frac{1}{4}}a^{1} + b} - \frac{1}{4}a = (\text{ where note,} \\
5a + \sqrt{V_{\frac{1}{4}}a^{1} + b} - \frac{1}{4}a = (\text{ where note,} \\
5a + \sqrt{V_{\frac{1}{4}}a^{1} + b} - \frac{1}{4}a = (\text{ where note,} \\
5a + \sqrt{V_{\frac{1}{4}}a^{1} + b} - \frac{1}{4}a = (\text{ where note,} \\
5a + \sqrt{V_{\frac{1}{4}}a^{1} + b} - \frac{1}{4}a = (\text{ where note,} \\
5a + \sqrt{V_{\frac{1}{4}}a^{1} + b} - \frac{1}{4}a = (\text{ where note,} \\
5a + \sqrt{V_{\frac{1}{4}}a^{1} + b} - \frac{1}{4}a = (\text{ where note,} \\
5a + \sqrt{V_{\frac{1}{4}}a^{1} + b} - \frac{1}{4}a = (\text{ where note,} \\
5a + \sqrt{V_{\frac{1}{4}}a^{1} + b} - \frac{1}{4}a = (\text{ where note,} \\
5a + \sqrt{V_{\frac{1}{4}}a^{1} + b} - \frac{1}{4}a = (\text{ where note,} \\
5a + \sqrt{V_{\frac{1}{4}}a^{1} + b} - \frac{1}{4}a = (\text{ where note,} \\
5a + \sqrt{V_{\frac{1}{4}}a^{1} + b} - \frac{1}{4}a = (\text{ where note,} \\

5a + \sqrt{V_{\frac{1}{4}}a^{1} + b} - \frac{1}{4}a = (\text{ where note,} \\
5a + \sqrt{V_{\frac{1}{4}}a^{1} + b} - \frac{1}{4}a = (\text{ where note,} \\
5a + \sqrt{V_{\frac{1}{4}}a^{1} + b} - \frac{1}{4}a = (\text{ where n$$

that 'tis \(\frac{1}{4} a a \), not \(\frac{1}{2} a a \), as 'tis erroneously Printed in the French Book.). These Rules were communicated to me by a Friend, I having not seen the Book; but having by Trial found the goodness of them, and admiring the Compendium, I was willing to find out the Demonstration. Which having done, I presently found that the same Method might be accommodated to the Resolution of all forts of Equations. And I was the rather inclin'd to improve these Rules, because I saw that the whole thing might be Explain'd in a Synopsis and that by this means, at every repeated step of the Calculus, the Figures already found in the Root, would be at least Trebled, which all other ways, are increased but in an equal Number with the given ones. Now, the fore-mention'd Rules are easily demonstrated from the Genesis of the are cally demonstrated from the Genesis of the Cube, and the 5th Power. For, supposing the side of any Cube = a+e, the Cube arising from thence, is aaa+3aae+3aee+eee. And confequently, if we suppose aaa the next less Cube, to any given Non-cubick Number, then eee will be less than Unity, and the Ramaindar ato any given Non-cubick Number, then eee wind be less than Unity, and the Remainder b, will = the other Members of the Cube, 3aae + 3aee + eee. Whence rejecting eee upon the account of its smallness, we have b = 3aae + 3aee. And since aae is much greater than aee, the

quantity will not much exceed e; so that

putting $e = \frac{b}{3 a a}$ then the quantity $\frac{b}{3 a a + 3 a e}$

(to which e is nearly equal) will be found

$$= \frac{b}{3aa + 3ab} \text{ or } \frac{b}{3aa + b} \text{ that is} \frac{ab}{3aa + b}$$

And so the side of the Cube a a a + s will be

$$a + \frac{ab}{3aa + b}$$
, which is the Rational Formula of

M. de Lagney. But now, if a a a were the next greater Cubick Number to that given, the fide of the Cube a a a - b, will after the same man-

ner be found to be
$$a = \frac{ab}{3aa - b}$$
. And this eafy

and expeditious Approximation to the Cubick Root, is only (a very small matter) erroneous in point of defect, the quantity e, the Remainder of the Root thus found, coming something less than really 'tis.

As for the Irrational Formula, 'tis derived from the same Principle, viz. b = 3aae + 3aee, or

$$\frac{b}{-=ae+ee}, \text{ and fo } \sqrt{\frac{1}{4}aa+b} = \frac{1}{2}a+e, \text{ and}$$

$$\sqrt{\frac{1}{4}aa+b}+\frac{1}{2}a=a+e$$
, the Root fought.

manner, will be found to be $\frac{1}{2}a + \sqrt{\frac{1}{4}aa - b}$

And this Formula comes fomething nearer to the Scope, being erroneous in point of excefs, as the other was in defect, and is more accom-modated to the Ends of Practice, fince the Restitution of the Calculus, is nothing else but the continual Addition or Substraction of the

4 e e - according as the quantity e can Quantity be known. So that we should rather write

$$\sqrt{\frac{1}{4}a + b - eee}$$
 + $\frac{1}{2}a$, in the former case, and in

the latter,
$$\frac{1}{2}a + \sqrt{\frac{1}{4}aa + eee - b}$$
. But by either

of the two Formula's, the Figures already known in the Root to be extracted, are at least Tripled; which I conclude will be very grateful to all the Students in Arithmetick; and I congratulate the Investor months Account of his Different Inventor upon the Account of his Discovery.

But that the Use of these Rules may be the better perceiv'd, I think it proper to subjoin an Example to two. Let it be propos'd to find the fide of the double Cube, or aaq+b=2

the fide of the double Cube, or
$$aaa+b=2$$

$$b$$
Here $a=1$, and $a=\frac{1}{2}$, and fo $\frac{1}{2}+\sqrt{\frac{7}{12}}$, or 1, 26,

will be found to be the true side nearly. Now, the Cube of 1, 26, is 2, 000376, and so 0, 63 +

$$\sqrt{3969}$$
, or 0, 63 + $\sqrt{39680052}$

ab

a + ______, which is the Rational Formula of 3 aa + b

Rut now. if a a a were the next

But now. if a a a were the next

The France of the Guare Root; when as and the Extraction of the square Root; when as by the common way of working, how much pains it would have cost, the Skilful very well know. This Calculus a Man may continue as far as he pleases, by encreasing the Square by

the Addition of the Quantity _____, which Corre-

ction, in this case will give, but the encrease of Unity in the 14th Figure of the Root.

Exemp. 2. Let it be propos'd to find the fides or a Cube equal to that English Measure commonly call'd a Gallon, which contains 231 folid Ounces. The next less Cube is 216, whose side 6 = a, and the Remainder 15 = b; and so for the first Approximation, we have

is 3, 1358..., 'tis plain that 6, 358 = a + e.

Also the side of the Cube a a a - b, after the same Now, let 6, 1358 = a; and we shall have then for Vol. II.

Gggg 2

itsCube 231, 000853894712, and according to the Rule, 3,0679 + 4 9,41201041 -,000858394712

18, 4070

is most accurately equal to the side of the given Cube, which within the Space of an Hour, I determin'd by Calculation to be 6. 1357924 5966195897, which is exact in the 18th Figure, defective in the 19th. And this Formula is deservedly perferable to the Rationale, upon the Account of the great Divisor, which is not to be manag'd without a great deal of Labour; whereas the Extraction of the square Root, proceeds much more easily, as manifold Experience has taught me.

But the Rule for the Root of a pure Sursolid, or the 5th Power, is of something a higher Enquiry, and does much more perfectly yet do the business; for it does at least Quintuble the given Figures in the Root, neither is the Calculus very large or operose. Though the Author no where shews his Method of Invention, or any Demonstration, although it seems to be very much wanting, especially since all things are not right in the printed Book, which may easily deceive the Unskilful. Now the 5th power of the side a + e is composed of these Members, $a^5 + 5$ a^4 e + 10 a^3 $e^3 + 10$ a^3 $e^3 + 5$ a $e^4 + 10$ a^3 $e^3 + 10$ a^3 $e^3 + 10$ a^3 $e^3 + 10$ a^3 $e^3 + 10$ a^3 $e^3 + 10$ a^3 e^3

Whence
$$\frac{b}{5a} = a^3 e + 2 a^2 e^3 + 2 a e^3 + e^4$$
, and

adding on both fides $\frac{1}{4}a^4$, we shall have $\sqrt{\frac{1}{4}a^4+b}$

= $\sqrt{\frac{1}{4}}a^4 + a^3e + \frac{1}{2}a^2e^2 + 2ae^3 + e^4 = \frac{1}{2}aa + ae + ee$. Then fubstracting taa from both tides,

$$\frac{1}{2}a + e$$
 will $= \sqrt{\frac{1}{4}a^4 + b - \frac{1}{4}aa}$; to which if

$$\frac{1}{2}$$
 a be added, then will $a+e=\frac{1}{2}a+\sqrt{\frac{1}{4}a^2+b^2+4aa}$

= the Root of the Power $a^3 + b$. But if it had $a^3 - b$ (the quantity of a being too great) the

Rule would have been thus,
$$\frac{1}{2}a + \sqrt{\frac{1}{4}a^4b^{-\frac{1}{4}}aa}$$

and this Rule approaches wonderfully, so that there is hardly any need of Restitution.

But while I confidered these things with myself, I light upon a General Method for the Formula's of all Powers whatsoever, and (which being handsome and concise enough) I thought I would not conceal from the Publick.

These Formula's, (as well the Rational as the Irrational ones) are thus.

$$\sqrt{aa+b} = \sqrt{aa+b}$$
, or $a + \frac{ab}{2aa+\frac{1}{2}b}$.

$$\sqrt{a^{3}} + b = \frac{1}{2}a + \sqrt{\frac{1}{4}}aa + \frac{1}{3}aa + \frac{1}{3}aaa + b}$$

$$\sqrt{a^{4}} + b = \frac{1}{3}a + \sqrt{\frac{1}{3}}aa + \frac{1}{6}aa + \frac{1}{4}a^{4} + \frac{1}{2}b}$$

$$\sqrt{a^{5}} + b = \frac{3}{4}a + \sqrt{\frac{1}{16}}aa + \frac{1}{10}a^{2}} + \sqrt{\frac{1}{2}a^{4}} + \sqrt{\frac{1}{2}aa + \frac{1}{2}aa $

And so also of the other higher Powers. But if a were assumed bigger, than the Root sought (which is done with some Advantage, as often as the Power to be resolved, is much nearer the Power of the next greater whole Number, than of the next less) in this case, Mutatis Mutandis, we shall have the same Expressions of the Roots, Viz.

$$\sqrt{aa-b} = \sqrt{aa-b}$$
, or $a = \frac{ab}{2aa-\frac{1}{2}b}$.

 $\sqrt{a^2-b} = \frac{1}{2} + \sqrt{\frac{1}{4}aa - \frac{b}{3}}$, or $a = \frac{ab}{3a^3-b}$.

 $\sqrt{a^2-b} = \frac{1}{3}a + \sqrt{\frac{1}{3}aa - \frac{b}{10a^3}}$, or $a = \frac{ab}{4a-\frac{1}{2}b}$.

 $\sqrt{a^2-b} = \frac{1}{3}a + \sqrt{\frac{1}{3}aa - \frac{b}{10a^3}}$, or $a = \frac{ab}{5a^3-2b}$.

 $\sqrt{a^2-b} = \frac{1}{3}a + \sqrt{\frac{1}{3}aa - \frac{b}{15a^3}}$, or $a = \frac{ab}{7a^2-3b}$.

Aud within these two Terms, the true Root is ever found, being something nearer to the Irrational than the Rational Expression. But the quantity e found by the Irrational Formula, is always too great, as the Quotient resulting from the Rational Formula, is always too little. And consequently, if we have + b, the Irrational Formula gives the Root something greater than it should be, and the Rational something less. But contrary-wise if it be — b.

And thus much may suffice to be said concerning the Extraction of the Roots of pure Powers: which notwithstanding, for common Uses, may be had much more sailly by the help of the Logarithms. But when a Root is to be determined very accurately, and the Logarithmick Tables will not reach so far; then we must necessarily have recourse to these, or such like Methods. Farther; the Invention and Contemplation of these Formula, leading me to a certain Universal Rule, for adjected E-

quations (which I hope will be of use to all the Students in Algebra and Geometry) I was willing here to give some account of the Discovery, which I will do with all the perspecuity I can, I had given at No. 188 of the Transactions, a very eahe and general Construction of all adtected Equations, not exceeding the Biquadratick Power; from which time I had a very great desire of doing the same in Numbers. But quickly after Mr. Raphson seem'd in great Measure to have satisfied this Desire, till Mr. Lagney by what he had perform'd in his Book, intimated that the thing might be done more compendiously yet. Now, my Method is thus

Let z the Root of any Equation, be imagin'd to be compos'd of the parts a + or - e, of which let a be assum'd as near z as is possible; which is not with standing not necessary, but only commodious. Then from the Quantity a + e or a - e, let there be form'd all the Powers of z, found in the Equation, and the Numerical Co-efficients be respectively affix'd to them: Then let the Power to be resolv'd, be substracted from the Summ of the given Parts (in the first Column where e is not found) which they call the Homogeneum Comparationis, and let the difference be +b. In the next place, take the Summ of all the Co-efficients of e in the fecond Column, to which put = s.

Laftly, in the third Column let there be put down the Summ of all the Co-efficients of ee, which Summ call t. Then will the Root & stand thus

in the Rational Formula, viz. z = a +

and thus in the Irrational Formula, viz.

4+½35±4/438+ bt; which perhaps it

may be worth while to Illustrate by some Examples. And instead of an Instrument, let this Table serve, which shews the Genesis of the several Powers of a + e, and if need be, may easily be continued farther; which for its Usel may rightly call a General Analytical Speculum. The forementioned Powers wished from a continued Mainting tioned Powers arifing from a continual Multiplication by a + e = z come out thus with their adjoined Co. efficients: See the Table. But now, if it be a - e = z, the Table is compos'd of the same Members, only the odd Powers of e, as e, e', e', e are Negative, and the even Powers, as of the Co-efficients of the Square ee = t, the Summ of the Co-efficients of the Square ee = t, the Summ of the Co-efficients of $e^{t} = u$; of $e^{t} = v$ be enquir'd, all the Powers of e, will be much less than the correspondent Powers of a, and so far the first Hypothesis; all the superior ones may be rejected; and forming a new Equation, by fubfituting a+e=z, we shall have (as was faid) +b=+se+tee. The following Examples will make this more clear.

Example 1.

Let the Equation $z^4 - 3z^5 + 75z = 10000$, be propos'd. For the first Hypothesis, let a = 10, and so we have this Equation,

```
21= + a1 4 a1 e + 6 a2 e1 4 a e1 + e10
 ·dzi=-dai da e-
+cz=+cace
 + 10000
          4000 e + 600 e e
             бое —
      300
      750
   - 10000
```

+ 450 - 4015 e + 597 ee - 40 e1 + e1 = 0

The Signs + and - with respect to the Quantities e and e', are left as doubtful, 'till it be known whether e be Negative or Affirmative; which thing creates some Difficulty, fince that in Equations that have several Roots, the Hermogenea Comparationis (as they term them) are oftentimes encreased by the minute quantity a, and on the contrary, that being increased, they are diminished. But the Sign of e is determin'd from the Sign of the Quantity b. For taking away the Refolvend from the Homogeneal form'd of a; the Sign of se (and consequently of the prevailing Parts in the Composition of it) will always be contrary to the Sign of the difference b. Whence twill be plain, whether it must be +e, or -e; and consequently whether a be taken greater or less than the True Root. Now the quantity e is $=\frac{1}{2}s$

 $\frac{1}{4}$ ss — bt, when b and t have the same Sign,

but when the Signs are different, eis = 4 + ss + bs

- 責 5. But after it is found that it will be let the Powers e, e, and e', &c. in the Affirma-tive Members of the Equation be made Negative, and in the Negative be made Affirmative; that is, let them be written with the contrary Sign. On the other hand, (if it be + e) let those fore-mention'd Powers be made Affirmative in the Affirmative, and the Negative in Negative Members of the Equation.

Now we have in this Example of ours, 10450 instead of the Resolvend 10000, or b=+ 450, whence it's plain that a is taken greater than the Truth, and consequently, that 'tis -e. Hence the Equation comes to be, 10450 — 4015 e + 597 e e — 403 + e = 10000. That is, 450 — 4015 e

or
$$\frac{s}{at}$$
 $\frac{s}{4tt}$; that is in the present case,
 $\frac{2007^{\frac{1}{2}}}{4t}$ $\frac{3761406^{\frac{1}{4}}}{4t}$, from whence we have

the Root fought, 9, 886, which is near the Truth. But then substituting this for a second Supposition, there comes a + = z, most accurately o, 8862603936495 scarce exceeding the Truth

by a in the last Figure, viz. when $\sqrt{\frac{1}{2}}s+bt$

 $-\frac{1}{2}$ size. And this (if need be) may be yet much tarther verified, by fubstracting (if it be +e)

the quantity $\frac{\frac{1}{2}ue^{s} + \frac{1}{2}e^{s}}{\sqrt{\frac{1}{4}ss + tb}}$, from the Root before

found; or (if it be
$$-e$$
) by adding
$$\frac{\frac{1}{2}ue^{3}-\frac{1}{2}e^{4}}{\sqrt{\frac{1}{4}ss-tb}}$$

to that Root. Which Compendium is so much the more Valuable, in that sometimes from the first Supposition alone, but always from the second, a Man may continue the Calculus (keeping the same Co-efficients) as far as he pleases. It may be noted, that the fore-mentioned Equation, has also a Negative Root, viz. z = 10,26... which any one that has a Mind, may determine more accurately.

Example II.

Suppose $z^3 - 17z + 54z = 350$, and let a = 10. Then according to the Prescript of the Rule,

$$+z^{1} = a^{1} + 3 a^{1} e + 3 a^{2} + e^{2}$$

$$-dz^{1} = da^{1} - 2 da^{2} - da^{3}$$

$$+ cz = ca + ce$$

That is,
$$+ 1000 + 300e + 30e^{2} + e^{2}$$

 $- 1700 - 340e - 17e^{2}$
 $+ 540 + 54e$
 $- 350$

Or, — 510 + 14e + 13ee + e³ = 0. Now, fince we have — 510, it is plain, that a is affuned less than the Trnth, and consequently that e is Affirmative. And from (the Equation)

510 = 14e + 13 e³, comes e =
$$\sqrt{bt + \frac{1}{4}ss - \frac{1}{2}s}$$

$$= \frac{\sqrt{6679-7}}{\sqrt{12}}.$$
 Whence $z = 15, 7...,$ which

is too much, because of a taken wide; therefore Secondly, let a = 15, and by the like way of

Reasoning, we shall find $e = \frac{1}{2}s - \sqrt{\frac{1}{4}}ss - tb$

$$=\frac{109\frac{1}{2}-\sqrt{11710\frac{1}{2}}}{28}, \text{ and confequently } z=$$

14, 954068. If the Operation were to be repeated the third time, the Root will be found conformable to the Truth as far as the 25th Figure; but he that is contented with fewer, by writing $tb+te^3$ instead of tb, or substracting or adding

$$\frac{\frac{1}{2}e^{s}}{\sqrt{\frac{1}{4}ss+tb}}$$
 to the Root before found, will

presently obtain his End. Note, the Equation proposed, is not explicable by any other Root, because the Resolvend 350, is greater than the

Cube of
$$\frac{17}{3}$$
, or $\frac{d}{3}$.

Example III.

Let us take the Equation $z^4 - 80z^7 + 1908$ $z^5 - 14937z + 5000 = 0$, which Dr. Wallis
uses Cap. 62 of his Algebra, in the Resolution of
a very difficult Arithmetical Problem, where by
Vieta's Method he has obtain'd the Root most accurately; and Mr. Raphson brings it also as an
Example of his Method, Page 25, 26. Now this
Equation is of the Form, which may have several
Affirmative Roors, and (which increases the Difficulty) the Co-efficients are very great in respect
of the Resolvend given.

But that it may be the easier manag'd, let it be divided, and according to the known Rules of Pointing, let $-z^4 + 8z^3 - 20z^4 + 15z = 0.5$ (where the quantity z is $\frac{1}{10}$ of z in the Equation proposed) and for the first Snpposition, let a = 1. Then $+^2 - 5e - 2e^2 + 4e^3 - e^4 = 0.5$ 5 = 0; that is, $1\frac{1}{2} = 5e + 2ee$; hence e = 1

$$\frac{\sqrt{\frac{1}{4}ss+bt-\frac{1}{2}t}}{t}$$
 is $=\sqrt{37-5}$, and so $z=$

1, 27; Whence 'tis manifest that 12, 7, is near the true Root of the Equation proposed. Now Secondly, let us suppose z = 12, 7, and then according to the Directions of the Table of Powers, there arises

That is, + 298, 6559—5296 132 e + 82, 26 e + 29, 2 e = -e = 0; And so — 298, 6559 = -5296, 132 e + 82, 26 e e, whose Root e (accord-

ing to the Rule) =
$$\frac{1}{2}s - \sqrt{\frac{1}{4}ss - bt}$$
 comes to

that it may be corrected, 'tis to be confider'd that $\frac{1}{2}u e^3 - \frac{1}{2}e^4$, or is, 00000099,

And if you defire yet more Figures of the Root, from the e corrected let there be made tue?—tee=0, 43105602423..., and

$$\frac{1}{2}s - \sqrt{\frac{1}{4}}ss - bt - tue^s + te^4$$
 or which is all one,

,05644179448074402 = e; whence a + e = z the Root is most accurately 17, 75644179448 074402... as Dr. Wallis sound in the forementioned Place; where it may be observed,

that the repetition of the Calculus does ever triple the true Figures in the assumed a, which the

first Correction, or
$$\frac{\frac{1}{2} u e^3 - \frac{1}{2} e^4}{\sqrt{\frac{1}{4} s s - b t}}$$
, does quintuple;

which is also commodiously done by the Logarithms. But the other Correction after the first, does also double the Number of Figures, so that it renders the assumed altogether Seven-fold; yet the first Correction is abundantly sufficient for Arithmetical Uses, for the most part.

But as to what is faid concerning the Number of Places rightly taken in the Root, I would have it understood so, that when a isbut 1 part distant from the true Root, then the first Figure is rightly assumed; if it be within - part, then the two first Figures are rightly assumed; if within - and then the three first are so; which consequently manag'd according to our Rule, do presently become nine Figures.

It remains now that I add fomething concern-

ing our Rational Formula, viz.
$$e = \frac{s b}{s s \pm t b}$$

which seems expeditious enough, and is not much inferior to the former, fince it will triple the given Number of Places. Now having formed an Equation from a + e = z, as before, it will pre-fently appear, whether a be taken greater or less than the Truth; fince se ought always to have a Sign contrary to the Sign of the Difference of the Refolvend, and its Homogeneal produced from a. Then supposing +b+se+a-tee=o, the Divisor is ss-tb, as often as t and b have the fine Signs but it is that the when they have same Signs; but it is 33 + bt, when they have different ones. But it seems most commodious for

Practice, to write the Theorem thus, e + - fince this way the thing is done by one Mul-

tiplication and two Divisions, which otherwise would require three Multiplications, and one Division.

Let us take now one Example of this Method, from the Root (of the fore-mention'd Equation)

$$2e^{s}-e^{s}=o$$
, and fo $\frac{b}{s}-\frac{tb}{s}=e$; that is, let

it be as s to t, fo b to $\frac{50}{5}$ = 5296, 132). 298,

6559 into 82, 26 (4, 63875... wherefore the

Divisor is
$$s = \frac{tb}{s} = 5291, 49325 \dots$$
 298,

6559 (0,056441....= e, that is, to five true plied by the Circular Base: and he gives this In-Figures, added to the Root that was taken. But stance: Suppose the Ratio of a Square to the Cirthis Formula cannot be corrected, as the foregoing Irrational one was; and so if more Figures of the cle inscribed be as -: the Equation, expressing the

Root are defired, 'tis the best to make a new Supposition, and repeat the Calculus again: And then a new Quotient tripling the known Figures of the Root, will abundantly satisfie even the most Scrupulous.

ROOTS of Plants are, either

- Fibrous, which fend out only small Strings from the Bottom of the Plant, distinct from each other.
- 2. More thick or Gross, which have a Body thick and gross, either branched out into Subdivisions or Arms; or else sending out Fibres from it all along.

These last are either

Carnous, which are either (I. Broad and Swelling.

(2. Long and Slender, which commonly are more hard and woody.

The Broad and Swelling are I. Bulbous, which confift but of one Globe or Head, and fend out Fibres from the Bottom, and are either

Squammose, or Scaly, as Lilies or Martagon.

(Coated, which are involved in Skins or Coats, as Cepa, Hyacinthus, Allium, &c.

2. Tuberous, which are of a carnous, solid, and like-continued Consistence; and these ei-

1. Simple, with but one Globe or Head, as Rapa, Crocus, &c.

(2. Manyfold, as Asphodelus, Pæonia,&c.

Long Roots are either -1. Sarmentous (i. e.) Twiggy or Branching, which shoot or creep out transverse, or in breadth: Of these some are Geniculata, Knotty, or Jointy, as Couch-Grass, Mints,

2. Cauliformes (i.e.) Stemmy or Stalky which shoot down deep directly; though often shooting out Fibres and Strings from the great Stem; which also itself is sometimes divided or branching.

ROTATION, is a Term commonly used in Geometry for the Circumvolution, or Motion of any Surface round a fixt and immoveable Line, which is called the Axis of its Rotation. How Solids which are thus, by the Rotation of a Plane round an Axis generated, may be Measured or Cubed: The ingenious Mr. Abr. de Moivre shews very expeditiously in his Specimens of the Use of the Doctrine of Fluxions, Printed in Phil. Trans. N. and in Vol. 2. of the Miscellanea Curiosa, P. 131 thus: For the Fluxions of such Solids take the Product of the Fluxion of the Abiciffa multi-plied by the Circular Base: and he gives this In-

Nature

ter is d; is y y=dx-xx. Theref.

4 d x x'.

And the Circumscribed Cylinder is

Therefore the Portion of the Sphere is to the Circumscribed Cylinder, as $\frac{1}{2}d - \frac{1}{2}x$ to d - x.

ROTHERNAILS, or Rudder-Nails, are such as have a very full Head; and are used to fasten

the Rudder-Irons in Ships.
ROUNDNESS, The round Globular or Spherical Form, which Pebbles, Fruits, Berries, &c. are adorned with; and which Drops of Water or Quick-filver, &c. Bubbles of Air under Water or tome fuch Liquor, melted Oil, &c. do generally put on, feems to arise from the Incongruity of their Particles, with those of the ambient Fluid; which prevents them from coalescing together, and by pressing upon them, and environing them all round equally, turns them into a round Form. This feems plain, as Dr. Hook hath long ago well observed from the way of making small round Shot of several Sizes, without casting the Lead into any Molds, from Drops of Rain being formed in their falling into round Hail-stones; and med in their falling into round Hail-stones; and from a Drop of Water falling upon small Sand, or Dust, which will strait producean Artificial round Stone: And from the small round red-hot Balls (easily seen with a Microscope) which are formed by the Collision and Fusion of the Flint and Steel in striking Fire, and perhaps the Principle of Gravitation, is principally concerned in this Matter.

ROUNDS, in a Garrison, is a Night-Watch commanded by an Officer that goes round the Rampart of the Garrison, in order to listen if any thing be stirring without the Works, to see that the Centries are watchful, and upon Duty, and that all things be in good Order. In strict Garrisons, the Rounds go every quarter of an Hour, that the Rampart may be still furnished. The Centries ought to challenge at a Distance; and to test their Arms as the Rounds pass, and to let no one come near them. When the Round is near the Corps degarde, the Centry calls aloud, Who comes there? And when the Answer is The Round, he says, Stand; and then calls for the Corporal of the Guard, who draws his Sword, and calls also, Who comes there? And when 'tis answered, The Rounds; he that hath the Word must advance, and deliver the Word to the Corporal who receives it with his Sword pointed at the Giver's Breast.

ROUT, in the Law-Tense, is an Assembly of three or more Persons, who are going forcibly to commit an unlawful Act, though they do it not: For if it be done 'tis a Riot.

RUDDER of a Ship: The French Author of a late Book about the handling or working of Ships at Sea, in Chapt. 7. Proposes to demonstrate what the Angle is, which the Rudder of a

Line of Geometrick Proportion, divided first inShip ought to make with her Keel, in order to
Stay or Bear up, the soonest that is possible: And
these are marked with the p Digits, 1, 2, 3, 4, 5, 30. he faith the Tiller of a Rudder ought to make with

Nature or Property of any Circle, whose Diame-the Keel an Angle of nearly 55 Degrees. And in order that this may be precisely done, he advises to put a Cleat on the Sweep in the Gun-Room, and to dispose it so, that the Arch contain'd be-tween the Keel and Cleat may be of this Numis the Fluxion of a Portion of the Sphere; and ber of Degrees; and that the Tiller of the Rudconfequently the Portion it felf $4\frac{1}{2} dx \dot{x} - \frac{1}{3} x x x$, der ought to be some-how stopt, so that it cannot go beyond this Mark; for if it passes it, it will do more hurt than good.

> RULE-Sliding. Of this useful and ready In-strument there are several Sorts made; as one by Partidge, another by Everard, a third by Hunt: The Ground and Reason of all which is one and the same; as may be seen in the several Treatises written by the Authors above-named; to explain and shew the Use of their several Rules. I shall give you here in short the several Uses and Ad-

vantages of all of them.

Seth Partidge calls his the Double Scale of Proportion; because the Scales or Lines upon it are all Double, which are the Lines usually call'd the Ar. tificial Lines, of Numbers, Sines, and Tangents; whose Invention and Use is owing to Mr. Gunter: These you will find described, and their Nature explained in this Lexicon, under these words. On the Sides of his Double-Scale, are usually set a Line of Inches; or of Foot and Inch-measure; and there may be put a Gage-Line, a Meridian-Line, and a Scale of Equal Parts; Lines of Chords; and for Board or Timber-Measure, according as any one pleases, or his Occasions require.

Everard's and Hunt's Sliding-Rules, are thicker and squarer, so that there are two Sliding-Pieces, which can be fitted to either Face of the Rule; on one of which there are usually Two Double Lines of Numbers, made to slide against such another Double Line placed above them marked o, and a Single Line of Numbers placed below mark'd D. These in Everard's, which I shall describe, marked with B and C, and on the Back of this Sliding-Piece, is a Treble Line of Numbers marked E, together with a Line of Segments.

The other Sliding-Piece hath on one Side a Line of Artificial Sines and Tangents, to slide against two such other on the Sides; and on the other Side is another such Line of Sines, and a Line of versed Sines. Either of these Sliders are Line of versed Sines. made to fit in, on each Face of the Rule.

On one Edge or Side of the Rule, are usually placed the Natural Lines of Chords, Sines, Tangents and Secants, for Spherick Projection, with a finall Scale of Equal Parts; and one of Latitudes, Hours, and Inclination of Meridians for Dialling: As also a Line of Rumbs, and M. L. for Navigation: and on the other Side or Edge, befides Inches and Foot-Measure, is a large Scale of Equal Parts, with a Meridian Line placed by, tograduate Sea-Charfs, &c. The Uses of all which, you will find under their Names.

The first Thing to be learned on the Scale, or Rule, is how to count or number, in the several Lines of Numbers; for as for Sines, Tangents, Cc. there all is easie.

Each of these Primes is subdivided into ten other

Parts, called Tenths: And each Tenth is either divided, or supposed to be so, into 10 other Parts which may be called Centesms, or Hundredth-

In Everard's Rule, the Line D being about 11 Inches long, hath each Tenth in the first Prime, divided actually into 10 Parts. But between 2 and 4 each Tenth is divided into but five Parts; each of which there is one Fifth of an Hundred, or 20. Between 4 and the End of the Line, every Tenth is divided only into Two Parts, fo that each Part is 50, or the Half of an Hundred. You may imagine or suppose also that each Centesm is subdivided into Ten Parts; which

therefore will be Thousandths, &c.
The Figures 1, 2, 3, 4, 5, &c. by which the
Primes are diffing uished, are all Arbitrary Points; Primes are diffunguished, are an Albertally 2000 and may each of them represent so many entire Units, Tens, Hundreds, Thousands, &c. or so many Tenths, Hundredths, Thousandths, or Set 1, on the Line A, against 26, on B, and then against 68 on A, you will find the Pro-

z. Wherefore in Whole Numbers, if 1, at the beginning of the Line D fignifie an Unit: Then 2, 3, 4, and 5, &c. will also fignifie or stand for so many Units , and the Tenths, and Centesms, both be accordingly Decimal, or Centesimal Parts. It i, then represent Ten Units, then the Primes 2, 3, 4, &c. will fignifie 20, 30, or 40. If 1, stand for 10, or 100. Accordingly, the other Figures, will be 200, 300, 400; or 2000, 3000, 4000, &c.

. In Decimals, If 10 in the Line D represent 1, then each Prime reckon'd backwards towards the Left-hand, will be (1) one Tenth; and in those Primes each Tenth will be .01, and in those Tenths, each Centesm will .001, Gc. Part of

an Unit.

To explain this a little further, draw out the Sliding-piece B: Till 1, at the beginning of B, ftand exactly at 10, at the End of the Line A, for then you will have a Line of Numbers, 4 times repeated; of which let 1, at the beginning of A, standfor 1, or Unity. Then will the next 1, in the Middle of the Line A, fland for 10, and To at the End of A, or beginning of B, will represent 100, (1) in the Middle of B, will be 1000; and 10 at its End will stand for 10000.

On the contrary, if you suppose 10 at the End of the fourth Radius in B, to represent (1) then each Prime in that Fourth Radius, will be .r (one Tenth,) in the Third Radius't will be . or; as the Second .001, and in the First, .001 Parts

of an Unit.

So also 2, in the First Radius will be .0002; in the Second Radius.002, in the Third.02, and

in the Fourth .2 of an Unit.

. All which being well understood, and confidered, which a little Practice will render easie : 'twill be easie to distinguish that Point on the Line where any Number given, Integer, or Deci-mal Part, is represented. Thus you will find that the Point ag, on the Line D, represents 1895 Units; and the Point wg, represents 1715. But on a Line of this Length, you can't distinguish any Number, if it have above four Places, to any exactness: For all the Figures further will be represented at the same Point: Thus, if 189562 were required, you can have on the Rule only 1895. Vol. II.

All Numbers which after the first Figure have only Cyphers, are represented at the same Point: As 20, 200, 2000, &c. are all represented by 2. If a Number of three Places, hath a Cypher for the Middle Figure: As suppose 308; you must count 3 on the Line (at the Third Prime) and then counting no Tenths, for the last Figure 8, you must reckon 8 Centesms, or Hundredth-parts.

If two Cyphers are in the Middle of a Number of 4 Places; as suppose 4005: after 4, you must neither go on to account Tenths, nor Hundreds, but for the last Figure 5, you must reckon

to many Thoufandth-parts.

Of the Uses of the Sliding-Rule.

1. To multiply one Number by another; As,

dust 1768, on B.

You may begin with either Factor, as a Multiplicator; and the Product will have as many Places as are in both Factors; except the two first Figures exceed, or are greater than the least Factor: And then it will have one less, as in multictor: Aug. plying 68 by 14, As 1. 14 :: 68. 952.

Where the Product 952 hath but three Places; because the Figures 1 and 4 in 14, are both less than 9 and 5 in 952.

2. To multiply Decimal Fractions, or Mixt Numbers;

As 27. 8 and .8.

Make the Mixt Number, or Whole one (if such there be,) the Multiplicator; and setting it on B, against i: in A: Seek the Product towards the Left-hand against .8 on B; which will be 22 in A.

3. To divide one Number by another; as 750 by 25.

In Division, As 25. 1:: 750. 30, the Quotient.
Set 25 on B, against 1 on A; and then against
750, on B, will be 30, the Quotient upon A.

N. B. These Examples will instruct you, that at one fetting of the Rule, you do both Multiplyand Divide.

As suppose 25 a Multiplicator; set 1, on B, against 25, on A; and then against any Multipli-cand in B, you have the Product on A.

And without moving the Rule, if you suppose 25 to be a Divisor against any Dividend on A, you will have a proper Quotient in B.

4. Having, Two, Three, Four, &c. Numbers given, to find a Third, Fourth, Fifth, &c. in Geometrical Proportion to them: Let the Numbers be 2, and 4.

Set 2 in B; against 4 in A, and then you will find against 4 in B, there will be 8 in A; against 8 in B, 16 in A; against 16 in B, 32 in A, Gc. and so you may go on either torward or backward, as far as you please. 5. To Hhhh

As, suppose $\frac{6}{84}$.

Set 84 in B, against 63 in A; and then against 1 in B, you will have .75, the Decimal required.
And 'tis .75, not 75 because 'tis on the Lest-hand of Unity, or 1 in A.

6. To reduce .7625 a Decimal Fraction to the known Parts of an Integer.

First let the Decimal of a Pound be reduced to Shillings, Pence or Farthings.

Set 1 in the Middle, or 10 at the End of B, against 20 (the Shillings in a Pound) in A; and then against .7625 in B, you will have 15. 25 in A: That is 15's. 3'd.

If you would have reduced it to Pence, you must have set I in B, against 240 (the Pence in a Pound) in A, you would have had 183, the Pence in .7625

If you would have the Farthings, set 960 (the Farthings in a Pound) in B, against 1 in A, and then against the Decimal .7652 in B, you have

732, the Farthings contained in it, on A.

It .7625 were the Decimal of an Ale Barrel, Set 32 (the Gallons in a Barrel of Ale) in B, a. gainst i at the beginning of A; and then against .7625 in A, will be 24. /4. the Gallons in that Fraction.

7. To work the Rule of Three, or Three Numbers. being given to find a Fourth Proportion, either Directly or Inversely.

1. Directly.

If 6 Quarters of Malt make 18 Barrels of Beer, how much will 30 make?

Set 6 on B, to 18 on A, and then against 30 on B, you will have the Fourth Term, 9 on A.

2. Inversely.

16 8 Men can do a Peice of Work in 9 Days, in how many Days would 12 Men dispatch the fame Work?

Set 12 on A, to 8 on B; and then against 9 on A, will be 6 on B, which is the Fourth Number fought.

3. If the Question had been in how many Days could of Men have done the same Work? then 'twould have been, as 6 on B, to 8 on A:: So 9 upon B, to 12 upon A.

8. Between two Numbers given to find a mean Geometrical Proportional.

Suppose 50 and 72.
Set 50 in C, against 50 in D, and then against 72 in C, will be 60 in D, the mean required; or fet 72 on C, against 72 on D; and then against 50 on C, will be 60 on D.

9. To extract the square Root of any Number under 1000000.

of C be against 1 in D, and then will the Square

5. To reduce Vulgar Fractions to Decimals: | Root of any Number in C, be found by Inspection against it in D.

Only observe when the Number of Places in the given Number is even, i. e. when the Number consists of 2, 4, 6, or 8 Figures (being Integers) you must find it in the Second Radius of the Line C; and against it you have the Root in D: Thus against 16 in C, you will find 4 in D, against 81 in C, 9 in D.

Against 2304 in C 48 in D; and against 784996 in C, you will have 886 in D, as well as those Numbers can be expressed on the Rule: And in this Case the Root will always consist of half as many Figures as the Number given.

But if the Integers in the Number given are odd, as t, 3, 5, or 7; then it must be sought in the First Radius on C, and against it in D will be the Root sought. So bring 1 at the beginning of C, to 1 in the Middle of D; and then against 576 in C. C, will be 24 in D, and against 20736 in C, will be its Square Root 144 in D.

10. To extract the Cube-Root of any Number under 1000000000.

Apply the Triple Line of Numbers E against D, as C was in the Square Root; and then against any Numbers in E, are the corresponding Cube-Roots in D.

N. B. When the Number confifts of 1, 4, or 7 Places, you must find it in the First Radius in E.

But when it hath 2, 5, or 8 Places, it must be found in the Second Radius of E.

As if it have 3, 6, or 9 Integers, it must be found in the Third Radius.

11. Either the Diameter or Cicumference of a Circle being given to find the other.

When the Diameter is 1 Inch, Yard, Foot, &c. the Circumference is 3. 1415 of fuch Inches, Yards,

Wherefore as 1, to 3. 1415 :: So is the Diameter of any Circle to its Circumference.

Set therefore 1, on A, to 3. 1415 on B; and then against any Diameter in A, you have the corresponding Circumference in B, and vice werfa.

12. Having the Diameter to find the Area of a Circle.

Set 1 on D, to .7854 on C; and then against the Diameter in Inches on D: (Suppose 20,) you will have the Area in Square Inches, (viz. in this Case 314. 15.) on C; and so against any Diameter in D, you will have a corresponding Area in C.

13. To Three Numbers given to find a Fourth in Triplicate Proportion.

Ifa Bullet whose Diameter is 4 Inches, weigh olb. What will one of the same Matter weigh, whose Diameter is 8?

Apply the Lines C and D; so that to at the End Set 4 in A against 8 in B; and then against 9 in A you have 18 in B, against 18 in A 36 in B;

and against 36 in A 72 in B; which Third Number in continual Proportion from 18, is the Number sought, shewing the Weight of such a Bullet to be 72 lb.

, Simple Interest.

14. Given Principal, Time, and Rate, required the Amount.

What doth 15 1. 5 amount to in 12 Years Time at 6 per Centum?

Set I in A to 6 in B; and then against 12 in A, you have 72 in B; which because it was .06, will be .72 the Interest of one Pound for 12
Years at 6 per Cent. Then set .72 in B, against terest?

1 in A; and you will have against 15. 5 in A,

26. 66 the Amount in B. And so from any
For you - Three of these given, you may find the Fourth.

15. Given an Annuity, Time, and Rate; to find the Amount.

What is the Amount of an Annuity of 62 Pounds per Annum, at 6 per Cent. at 4 Years End?

- 1. Set I on B to 6 on A; and then against 62 in B will be 3. 72, the Interest of 62 1. for one
- a. Set I on B to 3. 72 in A; and then against 2 in B (viz. half the Time given) will be 7. 44, the Interest of the Annuity for half the Time
- 3. Set I on B to 7. 44 in A; and then against 3 in B (then all the given Years but one) to 22. 32 the Interest of the Annuity in A.

To which adding 248, (the Summ of the 4 Annual Payments) the Summ will be 270. 32. The whole Amount.

Compound Interest.

In Compound Interest the Respective amounts for each Respective Year, are so many Geometrick Mean Proportional Numbers.

For as 1001. at the End of the First Year is 1061. at 6 per Cent. and that is now become a Principal; and at the Second Years End will amount to 112 l. 36. and this being made a Principal will at the Third Years End amount to 119 l. 10 16; and these 4 Numbers 100. 106. 112. 36, and 119. 10 16, are in Geometrick Proportion continued.

Wherefore 'tis easie by the Rule to solve this

Problem.

16. Of any Summ of Money to find the Amount in any Time, and at any Rate of Compound Interest.

As suppose the Amount of 100 l. for 5 Years at 6 per Cent. Compound Interest.

to the First Years Amount at any Rate of Interest) and then against 100 on B, you will Vol. IL

have 112 1. 36. the Amount in Two Years; and against 112. 36. on B, will be 119 1. 10 16 on A, the Amount in Three Years; and against 119. 10 16 in B, will be 126. 247, the Amount in 4 Years. And lastly, against 126. 247 in B, you will have 133 1. 822 on A, which is the whole Amount at the Five Years End. And from it 'twill be easie to answer this Que-

17. What is a Summ worth now in Ready Money, which is due at any Time to come, and at any Rate of Interest?

As what is the present Value of 1331. 822 due Five Years hence, at 6 per Cent. Compound In-

For you need only reverse the former Practice: Ser therefore 100 on A against 100 on B; and then against 133 l. 822 on A, you will have 126. 247 on B; which is the Worth of 133. 822 at the End of the First Year: Then against that on A, you will have 119. 1016 on B, for the present Worth at the End of the Second Year; and against 110. 10 16 on A, you will have 112. 36 on B, for the Third Year; and against that Number on A, you will have 106 on B for the Fourth Year; and at last against 106 on A, you will have 1001. on B; which is the present Worth of 133 l. 822 due Five Years hence at Compound Interest of 6 per Cent.

18. What are the Arrears due on an Annuity or Rent of 9 l. per Annum, and forborn 12 Tears, at the Rate of 6 per Cent. Compound Interest?

Set 6 in A to 100 in B; and then against 9 in A will be 150 in B; which is a Principal whose Interest is 9 l. Then work as in Problem 16 above, to find the Amount of 150 l. in Twelve Years, which will be 301 l. 828; from which you must deduct 150 l. (the principal first found) and the Remainder 151. 828 answers the Question, and is the Summ of the Arrears fought.

19. What is the Ready Money worth of a Rent or Anunity of 9 l. per Annum to continue for Twelve Years only; allowing the Buyer to have 6 per Cent. for his Money, Compound Interest?

By the last Question the Arrears of a Rent of 9 l. per Ann. and forborn for Twelve Years were

151 % 828. And the present Worth of 151 l. 828. (by Quest. 17.) due at the Endof Twelve Years, is 75.1. 443. Wherefore so much may be given for an Annuity of 9 l. per Ann. to continue for Twelve Years.

N. B. If the Annuity is not to commence till after a certain Number of Years; as suppose 6 are expired: Then you must add that Term to the Twelve Years, which makes it 18. Then seck what the Arrears, of 151 l. 828 being forborn Set 100 on Bagainst 106, (or 108, &c. according Eighteen Years are now worth in Ready Money, which (by Quest. 18.) you will find 53 l. 185, which is the Answer; So that a Yearly Rent of 9 l.

Hhhh 2

to begin Six Years hence, and to continue Twelve of Latitude in Miles: : And so Sine of the Course Years, is in Ready Money worth but 531. 185; whereas if it were to commence immediately, 'twere worth 73 /. .443.

Purchastry of Annuity.

20. What Annuity, to continue Twelve Years will 300 l. buj; allowing the Bujer 6 per Centum, Compound Interest for his Purchase Money?

By Quest. 19. Ifind that 75 l. 443 will purchase 9 l. per Ann. for Twelve Years, (or you may find the Value of any other Annuity in Ready Money) and then say as the present Worther Value, is to the Annuity taken: So is the Summ proposed to the Annuity required.

Set therefore 75 l. 443 on B to 9 on A; and then against 300 L on B, will be 35 l. 776, or 35 l. 15 s. 6 d. and such an Annuity to continue Twelve Years to come, is worth now in Ready Money 300 %

21. What is the Value of a Free-hold Estate of 751. per Ann. allowing the Bujer 6 per Cent. for his Money, Compound Interest?

As the Annual Interest of 1 l. is to 1 l.:: So will the Annual Rent be to the Summ required.

Wherefore against .00 on B, set 1 on K; and then against 78 on B, you will have 1300 on A, the Value of the Estate required.

In Trigonometry.

It will be very easie to work any Cases or Questions by this Sliding-Rule, in either Plain or Spherick Triangles; of which one Instance in each will be sufficient.

Suppose the common Case in Plain Sailing.

22. Where Course and Distance are given; and Difference of Latitude and Departure are required. (See Plain-Sailing in Vol. I.)

Miles:: So Co-Sine of the Course to Difference Minutes each Point contains.

to Departure in Miles.

Bring then 90° in the Line of Sines against 108 (the Distance run) in A; and then against 50° 15' (the Co-Sine of the Course) in the said Line. of Sines, you will have you in A, the Difference of Latitude in Miles.

If you would have the Departure. Bring as before 90' in the Line of Sine against

108 in A; and against 33° 45' (the Angle of the Course) in the Sines will be 60 Miles in A, the Departure required.

Suppose 2dly. The Sun's Place in the Eeliptich to be 30° of Υ , and his greatest Declination to be 20° 30', I require his present Declination.

The Canon is, As Rad. Sine of the Sun's Lon-gitude or Diffance from γ :: So Sine of greatest Declination to Sine of the present Declination.

Set therefore 90° in the Sliding-Line of Sines against 30° in the fixt one; and then against 23° 30' in the Sliding-Line, you will find 11° 30' in the fixt Line of Sines; which is the Sun's Declination fought.

In Dialling.

23. To calculate the Horary Distances from the Meridian, in either Horizontal or particular Dials.

The Canon is, As Rad. to Tangent of 15 (one Hours Equinoctial Diftance) :: So is the Sine, or Co-Sine, of the Latitude, suppose 51° 30' of the Place, to the Tangent of the Distance fought 11° 51'.

Set 90° in the Sliding-Sine to 15° in the fixt Tangent; and then against 51° 30' in that Sine, will be 11° 51' in the Tangent.

RUMBS; Here is a Table of Rumbs or Points The Canon is, As Rad. to Distance run in of the Compass; shewing how many Degrees and

RUMB

RUMB-Scale; how the Scale of Rumbs is made, you will find under the Word Plain-Scale, in Vol. I.

How to find the Rumb between two Places by Calculation, and Geometrically, Mr. Collins shews in his Navigation, pag. 39. Thus:

As the Radius: Is to the Co-sine of the Middle Latitude :

So is the Difference of Longitude: To the whole Departure from the Meridian in the Course between the two Places proposed::

And in the Second Proportion:

As the Radius: Is to the half Summ of the Cosmes of both Latitudes::

Or rather for Geometrical Schemes.

As the Diameter: Is to the Summ of the Cofines of both Latitudes : :

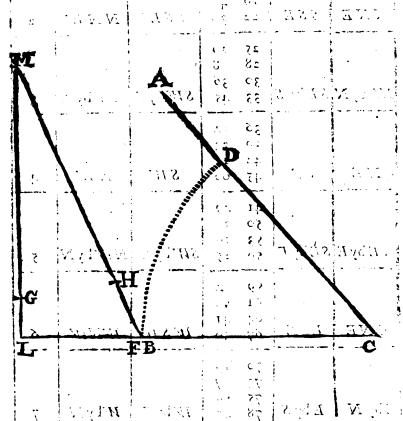

So is the Difference of Longitude: To the De-parture from the Meridian, in the Course between the two Places::

The latter Proportion of this Division, of which we make no use, is:

As the Difference of Latitude: Is to the aforesaid Departure from the Meridian: So is the Radius: To the Tangent of the Rumb::

An Example of the former Proportion.

Let the Rumb be required between Cape Fint-fire, Latitude 43 Degrees, Longitude 7 Degrees 20 Minutes, and St. Nichdlas Isle, Latitude 38 Degrees, Longitude 352 Degrees, the Middle Latitude is 40 Degrees 30 Minutes, the Complement is 40 Degrees 30 Minutes, and the Difference of Longitude is 15 Degrees 20 Minutes, or 33 Cen

Out of the leffer equal Parts, prick down 15 Deg. the greater Chord is almost 22 Degrees, the Com23 Centesms from C to L, and describe the Arch
BD with 60 Degrees of the Chords, and make it
equal to 40 Degrees 30 Minutes, and draw C D
Places, which is 6 Points and about 30 Minutes
continued further to A, from L take the nearest
Distance to A C, which is equal to L M; and Finistre West South-West, half a Degree more
make it one Leg of a Right-angled Triangle:
Make the other Leg the Difference of Latitude 5
Degrees, which prick from the Equal Parts from

If the two Places hadbeen both in the Latitude Degrees, which prick from the Equal Parts from

If the two Places had been both in the Latitude

If the two Places had been both in the Latitude

of 40 Degrees 30 Minutes, having the same Diffefaid Parts, sheweth the Distance to be 13 Degrees

30 Centesins, which allowing 20 Leagues to a

Degree, is almost 268 Leagues; with the Radi
us C B setting one Foot at M, cross the Rumb

Leagues to a Degree, is 233 Leagues and a half,

and thus we supply the want of the Scale of Lon-

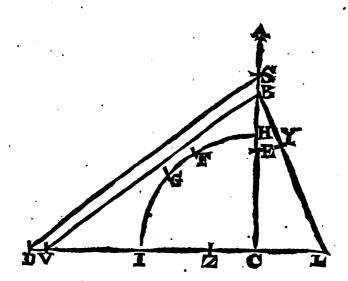

Triangle at G and H, which Extent measured on and thus we supply the want of the Scale of Lon-

gitudes, in finding the Distance of Places that Distance between the Lizard and the Bermu-bear East and West, as those that are in the same das. Mr. Norwood in his Sea-man's Practice, p. Latitude must needs do.

An Example of the latter Proportion.

Let it be required to find the true Rumb and be 55 Degrees.

110, maketh the Latitude of the Lizard to be 50 Degrees, and of the Bermudas 32 Degrees 25 Minutes, or 32 Degrees 41 Centerms, and the Difference of Longitude between these Places to

Draw the Lines A C and C D at Right-angles, the former Proportion by the middle Latitude, the now for want of room I use the lesser Chord, Rumb would have been 67 Degrees 2 Minutes and with 60 Degrees thereof I describe the Qua- from the Meridian, and the Distance 902 Leagues, drant H I, and prick the Radius from I to D, if you make C A equal to C V, then a Line so is CD the Diameter, then count both Lati- joining LA should be the Course and Distance tudes from H to F and G, the hearest Distance according to the same Longitudes and Latitudes from F to CI, is the Co-fine of Bermudas Latitude, which prick from C to E: Again, the nearest Distance from G to C I, is the Co-sine of the Lizard's Latitude, which place from C ever when two Places are laid down true at first to S, so is C S the Summ of both Co-sines; in their Rumb, Distance and Latuides on the draw D S, and prick down 55 Degrees the Difference of Longitude from C to V, out of the greatest equal Parts, and draw V B parallel to D S, so is C B the Departure from the Meridian in the Course hat making the Places of the pl in the Course between both Places, then making that one Leg of a Right-angled Triangle, prick down 17 Degrees 50 Centesms, the Difference of Globe, and how to Delineate it there, and in a Latitude between those Places out of the same Chart Mr. Collins shews in the same Book, page Equal Parts from C to L, and draw B L, which 55, and 64. represents the Course and Distance truly between the Lizard and Bermudas, and the Extent L B measured on the same Equal Parts, shews the Distance to be 44 Degrees 31 Centesms, which allowing twenty Leagues to a Degree, is 886

Then to find the Course: with 60 Degrees of Stomachs. the Chords, fetting one Foot in L, with the other make a Mark at Y and Z, then the Extent Z Y Inward. This receives the Meat flightly chewed, measured on the Chords, sheweth the Rumb to retains it a while, and then delivers it back again

laid down on the Plain Chart, and thereby the Course should be 72 Degrees 17 Minutes from the Meridian, and the Distance 1155 Leagues; how-

What the Nature of this Rumb Line is on the

RUMINANT Animals, are fuch as chow the Cud; and these are Quadrupeds, Hairy and Vi-viparous, and in general, Mr. Ray observes of them, that some have hallow and perpetual Horns; others Deciduous ones, or fuch as are shed every Year; and all the Horned Ruminant Animals have four I. The Koinia Mejan of Aristotle; be 66 Degrees 37 Minutes from the Meridian, into the Mouth, which is what we call the Cud, to which is almost 6 Points, and in this Example the Proportion doth noterr any thing from the Truth, according to Mercators Chart, whereas if you use the Honey-Comb; from its Internal Coat, being divided

divided so into Cells like Honey-Combs. 3. The 'Exro, which Er. Ray thinks hath been wrong Translated, Omasus; and therefore he would have it called the Echinus: This is so difficult to tlear, that our People throw it away, and call it the Manifold. 4. The Houses of Aristotle, by Church, Arch-Presbyters, as well as Arch-Deas. tlear, that our People throw it away, and call it the Manifold. 4. The Housest of Aristotle, by Gazacalled the Abomasus. The Stomach in Calves is that which contains the Acid Ferment, which we call the Runnet, and is used to coagulate

RUNCINUS, and Runcilus, in Doomsday-Book is used for a Load-Horse: Sumpter-Horse, or Cart-

cons; and they were called Rural-Deans. Our Diocesses are still divided into Deanries, and he who under the Bishop and Arch-Deacon, had the who under the Bishop and Arch-Deacon, had the Milk into Cheese.

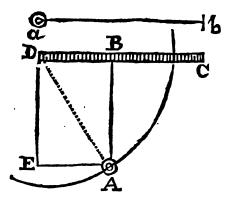

Also all Horned Ruminant Animals want the Dentes Primores, or broad Teeth in the Upper Jaw. These Kind of Animals have also that Kind of Fat which we call Suet; Sebum, \(\sigma rage, which is much harder and firmer, and less liquifiable in them, than the Adeps of other Animals. SAC or Sacha, or as some write it, Saccha and gard to a Surfaceon which it is to strike, must be Saucha (according to Minsbew) was anciently after one of these three ways, either Perpendicular,

SACK of Wool is a determinate Quantity, containing just 26 Stone, and every Stone is fourteen Pounds, by 14 E. 3. Stat. 1. c. 2. But in Scot-land a Sack is 24 Stone, and each Stone contains 16 Pounds.

SAFE Conduct, is a Secutity given by the Sove-raign under the Great Seal of the Kingdom to any Person, for his quiet coming into, or passing out of the Realm.

SAFE Pledge, is a Security given for a Man's Appearance at a Day affigned.

SAGIBARO, or perhaps Sachbaro, anciently fignified the same as Justiciarius, from Sac causa: So that Sac-baro is as much as the Cause-hearer, or the Man that hears Caufes.

SAILS and Sailing of a Ship. In order to compute the Force of the Water against a Ships Rud-Fluid Bodies, as the Air or Water, &c. as being composed of little Bodies or Particles, which

a Royalty or Privilege touching Plea, or Correction on of Trespasses of Men within a Mannor: The Saxon word, Sac, signifying as much as Causa in the Line A B be Perpendicular to it, describing Latin (whence our English Sake; for whose sake the direct Impusse of the Body A upon it; this Cic. but in the Laws of Edward the Confessor, it plain here that the Body A strikes upon it with all in Sake at and the Saxon word. is faid, Sacha eft quod si quilibet aliquem nominatim, de alique College and this Force may be called Absolute, and may be expressed by the Line AB, which the evenerit, forisfadura Probationis vel Nagationis (see evenerit) fuaerit. From some old Manuscripts, it appears also that Saka was a liberty of Holding Pleas, and Imposing Mulets and Forseitures on Transgressors in the Court of any Lordship or Man
Transgressors in the Court of any Lordship or Man
Transgressors in the Court of any Lordship or Man
Transgressors in the Court of any Lordship or Man-Transgressors in the Court of any Lordship or Man-rtis plain the Line of Motion ab will not affect the nor; though Rastal, and some others will have Sac Surface at all because it is no way opposed to it; to fignifie the Forfeiture it felf.

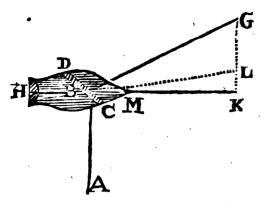

SACCUS cum Brochia, was anciently a Service or Tenure of finding a Sack and Broach for the King for theuse of his Army. Bracton, lib. 2.

But late at an occause it is no way opposed to it; to fignifie the Forfeiture it felf.

In or can the moving Body strike upon it, or touch it. (4.) If the Line of Motion AD be Oblique to the Surface DC, so that the Angle of Incidence the King for theuse of his Army. Bracton, lib. 2. Line AD, may be resolved into two Forces, viz. into AE, or DB, and into AB, (See Composition of Motion.) But the Direction or Line of Motion AE, being Parallel to the Surface DC, cannot affect it at all; fo that the whole Motion of the Body A in that Oblique manner of Striking on the Surface, will be expounded by the Perpendicular Line AB. And if DA be made the Radius of a Circle, whose Centre is at D, B A will be the Sine of the Angle of Incidence ADC, and consequently, you may conclude that the Force of a Particle of Air or Water, as A, striking against the Surface DC, which may represent either a-Sail, or the Rudder of a Ship, in the Oblique Direction AD, will be to the Perpendicular Force there, as BA is to DA:: that is, as the Sine of the Angle of Incidence is to Radius. And fince what is thus true of one Particle singly confidered, will be true of all the Particles of any Fluid Body Collectively; it will follow, that the force of the Air or Water falling Perpendicularly upon a Sail or the Rudder, to the force of the same in any Ob-lique Impingency, will be as the Square of the Radius, to the Square of the Sine of the Angle of Incidence: And consequently, that all Oblique Forces of the Wind against the Sails, or of the Water against the Rudder, will be to one another as the Squares of the Sines of the Angles of Incidence. Here is no regard had to the different Degrees of Velocity, with which the Wind or Water may impinge against the Sail or Rudder; but only of the *Position* of the Surface so struck, with regard to the Impinging Force : But when that Matter is der, Stem or Side; or the force of the Wind against her Sails, a late Author, whose Book is
Printed at Paris by the French King's express Command, and called the Theory of the handling or
Working of Ships at Sea, and lately Englished,
Sail: And it being also, saithhe, indifferent, whether you consider the Motion of a Solid in a Fluconfidered, it will be found that the different Forther you consider the Motion of a Solid in a Fluid, whose Particles are at rest, or of those Particles moving all Parallel against a Solid that is at when they act upon, or move against any Surface, do all move parallel one to another, or strike against the Surface after the same manner.

2. He

Velocities in the same Fluid Matter (as suppose confiders that the Motion of any Body, with re- Water) the different Resistances which it will receive from that Water, will be in the same Proportion as the Squares of the Velocities of that Bo-

Let H M represent a Ship, CD the Position of the Sail, AB the Course of the Wind blowing towards B. Draw BG Perpendicular to the Sail DC, and GK Perpendicular to the Line of the

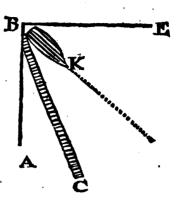

Keel produced H M K.

By what he hath said above, the Sail CD will be driven by the Wind A B, according to the Direction of the Line BG: So that if she could divide the Water every way with the same Facility, as she doth with her Head, the Ship would go directly to the Point G, along the Line BG. And if H K represent her direct Course, she would have got torward the length B K, and sideways she would have gone the Quantity G K. But as her Length is much greater than her Breadth, so she will divide the Water, or make her way in it much more difficultly with her Side, than with her Head or Stem; on which account, she will not run fideways so far as KG, but fall short of it in Proportion to the said Difficulty of dividing the Water with her Side: That is, if the Resistance The finds in paffing thro' the Water sideways, be to that of passing lengthways, suppose as 10 to 1, then will not the Ship get sideways above a 10th part of the Line G K. Wherefore if K G can be found to G L, in the Ratio of the Resistance of the Side to that of the Stem, and the Line B L be drawn, the Ship will go to the Point L, along the Line B L, in the fame time as it would have gone to G, if it could have divided the Water every way equally. This Part K L is called the Drift, or Lee-way of a Ship, and the Angle KB Lisher

Degrees of Lee-way; as the Angle AB K expreffes how near the Wind she lies. [Now from
hence it follows, saith our Author, That if we could but find the Ratio between these two Resibut rare, most, soft, and watery at the Surface. stances of a Ship's dividing the Water sidewise and lengthwise, we might determine the Line of a Shipstrue way.] But as this is very difficult to be done, from the knowledge of a Ship's Figure and Proportions, so he gives another Method, whereby he saith, it may be effected, as you may find in Art. 2. of Chap. 2.

After this he undertakes to demonstrate in Art. 3. of Chap. 4. That the best Position or Situation of a Ship, so that she may make the best Leeway, but go to Windward as much as is possible, is this: Let the Sail have what Situation it will the Ship must always be in a Line bissecting the Complement of the Winds Angle of Incidence upon the Sail. That is, let the Sail be in the Position BC, the Wind blowing from A to B, and consequently selves all manner of ways and to part and sepa-

the Angle of the Winds Incidence on the Sail ABC, therefore its Complement will be CBE; then mnst the Ship be put into the Position B K. or more in the Line B K, bisseding the Angle CBE.

And that the Angle which the Sail ought to make with the Wind or the Angle ABC, ought to be but of 24 Degrees. That being the most advantageous Situation to go to Windward the most that is possible, and in order to bring this to bear in Practice, he directs to put Marks to the Sheets, Braces and Bowlines of the lower Sails, to know when they are in their best Situation; and then, even in the Night, when the Marks of a Brace, or of a Sheet shall come to the Cleat, one may be

pretty well assured that the Sail Trims well.

SALT, Sir If. Newton shews that Salt is compounded of a dry Earth, and an Aqueous Acid joyned together by Attraction, and that Earth can't be turned into Salt, unless by the mixture of so much of an Acid, as may make it capable of a Dissolution in Water. And as it is owing to the Force of Gravity, that the Sea flows round the more denie and ponderous Globe of the Earth, so will the Principle of Attraction (see that word) occasion that the Aqueous Acid may flow round the more compact Terrestrial Particles, and so compose the Particle of Salt. For by no other way (faith he) can we account for Acid, being in place of a Mean, between Earth and common Water, in order to render Salt dissolvable in the latter. And as in the great Terraqueous Globe, the most dense Bodies will by their Gravity subside in Water, and do always tend towards the Centre of the Globe, so in os, dense, hard, dry, and earthy at the Centre, but rare, moist, soft, and watery at the Surface. And hence it appears, Salts are of so durable and lasting a nature as they are: for they can scarce be destroy'd, unless the Aqueous Parts be either drawn off by a great force, or by Putrefaction and a moderate Heat, permitted to get down into the Occult Meatus, or Pores of the Central Earthy Parts, and at last dissolve them by cutting them into fmall pieces.

If Salt in a small quantity be dissolved in a great deal of Water, the Saline Particles, tho' specifi-cally heavier, will not subside, but distuse them-selves equally throughout all the Water, and render it equally Salt in all places; which seems to shew that the Parts of the Salt do mutually recede

Tate as far as the space will permit: And this En- they take off just upon the boiling of the Pans, odeavour shews that they have some kind of Repel- therwise it boils in and spoils the Salt. The older ling Force, by which they fly from one another, or the Blood is the better, cateris paribus, when the at least are more strongly attracted by the Parts of wards the Earths Centre than the Parts of the Water; so all the Particles of Salt which swim in Water, and are less attracted by any one Particle place to the Water, which is more forcibly attra-

When a Liquor impregnated with Salt, hath its Moisture so far Evaporated by Heat, that a Pellicle, Cuticle, or little Skin appears upon its Surface, if then it beset to cool, the Salt will shoot into Chrystals, which will be of some regular Fito Chrystals, which will be of some regular Fi-gure: From whence it appears, that the Saline Particles before their Concretion, were placed in The Brine thus sufficiently Boiled and Evapothe Liquor in some certain Order, and at equal Distances or Intervals; and consequently that they did act one upon another by some kind of Force, which is equal at equal Intervals, and unequal at unequal Diftances. For the Supposition of some such Force will occasion their being disposed every where into fuch Orders; but without it they would ramble about and be dispersed, persectly irregularly in the Fluid.

In the French Memoirs of the Academy of Sci ences for the Year 1699, there is a Method, by Mr. Homberg, of finding the exact quantity of the Volatil Acid Salt that any Liquor contains.

(2) Their way of making Salt at Nant-wyche in Chesbire, is thus, (faith Mr. Ray) The Salt-spring, or as they call it the Brine-pit is near the River, and is so plentiful, that were all the Water boiled out that it will afford, it is thought it would yield Salt enough for all England.

The Brine-pits belong not all to one Lord; but fome have one Lead-walling, fome two, three, four, Ce. A Lead-walling, is the Brine of 24

Hours boiling for one House.

Two hundred and fixteen Lead-wallings. thereabouts, belong to all the Owners of the Pits. No Tradesinan, Batchellor, or Widower, can Rent more than 18 Lead-wallings.

They have 4 Sworn Officers chosen Annually, which they call Occupiers of Walling; whose Duty it is to see equal Dealing between Lord and Tenant, and all Persons concerned, to appoint how many Houses shall work at a time (which is 12 at most) to appoint a Crier (when Salt is to be made;) to make Proclamation so, that all Parties concerned may put to their Fires at the same time, and so also when they shall cease: which is, at a determinate Hour: And he that doth not leave off then hath his Salt spoiled, by throwing Dirt,

In the Town are about 50 Houses, and every House hath 4 Pans, which the Officers are to see must be all exactly of the same Measure.

The Salt Water taken out of the Brine-pit, in boiling 2 Hours 1, will be Evaporated, and boiled

up into Salt.
When the Liquor is more than luke-warm, they take Strong-ale, Bullock's-blood, an Egg-shell full, the White of one Egg, and of Ale a Pint: This Mixture is put into a Pan of 24 Gallons, or thereabouts; the Whites of Eggs, and the Blood serve then pouring Water upon it, they make a Lee or to Clarifie the Brine, by railing the Scum; which Lixivium, and the Water draining thro' the Sand,

Liquor boils too fast, they don't put in any Blood, the Water, than by one another. For as all Bodies ascend in Water, which do gravitate less tofay, will diminish their Salt; and they say, the Ale serves to harden the Corn of the Salt

After one hours boiling, the Brine will begin to of Salt, than they are by the Water it self, must Corn, or Granulate. Then they take a small quan-necessarily recede from that Particle, and give tity of clear Ale, of which they sprinkle about an Egg-shell full into the Pan, but if you put in too much Ale, it will make the Liquor boil over the Pan; a little whilebefore they put in the last Ale, they cause the Pan to boil as fast as they can; but after that very gently, till the Saltbe almost dry, For they do not Evaporate quite, ad siccitaten,

> rated, they take out the Salt and pour it into Conical Baskets (which they call Barrows) and in them let the Water drain from it an hour, moreor less, and then set it to dry in the Hot-house behind the Furnace.

A Barrow containing 6 Pecks, is fold there for 16 Pence.

Out of 2 Pans of 48 Gallons they expect 7 Pecks

of Salt, Winchester Measure.

The House in which the Salt is boiled, they call the Wyche-house; the Vessel whereinto the Brine is by Troughs conveyed from the Brine-pit, is calledthe Ship. 'Tis raised out of the Pit by a Pump. Between the Furnace and the Chimney-tunnels, which convey the Smoke, is their Hot-house, where they set their Salt to dry; along the Floor where-of run 2 Funnels from the Furnaces, almost Parallel to the Horizon, and then they arise Perpendicularly; in these the Flame and Smoak running along from the Furnaces, heat the Room by the

AtlDroitwyche in Worcestersbire, the Salt is

boiled in shallow Leaden-pans.

They first put in the Salt-water out of the Brine-pits, and then after an hours boiling they fill up the Pan with the Water that drains from the Salt let to dry in the Barrows, and after a second hours boiling, they fill up the Pans again with the same. In five hours boiling the Pan grows dry,

and then they take out the Salt.

In 24 hours they boil out 5 Pans, and then draw out the Ashes; after which they put in the Whiteof an Egg to make the Scum arise (which is partly Dust and Ashes, falling into the Pan when they are taking out the Ashes.) The Scum they take off with a Scummer, and after 4 hours they begin to take out the Salt, and once in 24 hours they take out a Cake which sticks to the bottom of the Pan, and which they call Clod-Salt, o-therwise the Pan would melt. They use there neither Blood nor Ale, and the Salt made there is extraordinary fine and white.

In Lancasbire they make Salt of Sea-Sand, thus, They pare off in dry Summer-weather, the upper part of the Sand in the Flats and Washes (which are cover'd at Full-Sea, and bare when the Tide is

out) and lay it up on great heaps.

Of this Sand they put into Troughs, bored with holes at the bottom, a sufficient quantity, and liii 2

Digitized by Google

carries the Salt with it down into Veilels placed paid at the Feast of St. Martin, by the Servile Teunderneath. As long as this Liquor is strong enough to bear an Egg, they keep pouring more Water still upon the Sand in the Troughs, but as foon as the Egg begins to fink, they cait the Sand out of the Troughs, and put in new from the

This Water thus impregnated with Salt, they boil in Leaden-pans, wherein (as above) the Wa-

ter Evaporating leaves the Salt behind.

At Newcastle, Preston-pans, in Scotland, Whitehaven in Cumberland, and other Places, they make Salt in great Plenty, by Boiling and Evaporating the Sea-water, and in the Operation they make

use of Ox's Blood, as at Nantwyche.

From Dr. Jackson's Account of the Salt-works and Springs in Cheshire, in the Philosophical Transactions, I find that now they have changed their 6 Leaden-pans into 4 Iron ones, something better than Yard square, and about 6 Inches deep; which are ser upon Iron-bars, and made up on all sides very close, to hinder the Flame or Smoke to break thro', with Clay and Bricks. Their Fewel is Staffordsbire Pit-coal. They never cover their Pans at all, during the whole time of boiling; and their Houses are like Barns, open up to the Thatch, with a Louvre-hole or two to carry off the Steam, which is fo great, that probably it would warp Boards, and ruft Nails, fo that no Timber covering would last long; what Tiles would do, no one yet hath tried there.

The Sweepings of fuch Salt as is shed and scarter'd about on the Floor, takes up withit a good deal of Dirt, and is called Grey-Salt. This fells but at half the Price of white Salt, and is only used by the Poor to Salt Cheese, Bacon, &c. Catts of Salt are made of the worst Salt, when yet wet-tish from the Pans, 'tis molded and made up with some Cummin-seed and Asses, and so baked into Lumps at the Mouths of their Ovens; they are only used in Pigeon-houses. But Loaves of Salt

are the finest of all for Table use.

At Droitwyche in Worcestersbire, they use no Blood, but only Whites of Eggs (a quarter of one White to a Gallon of Brine) to Clarify their Brine;

half a hundred Weight.

The way of making Bay-Salt in France, is described in Philosophical Transactions, N. 51, with Figures. The Water is let in from the Sea into a first and second Receptacle, and then into a third, which is called the Marish. In these Beds or Marisbes the Water is not above an Inch and halfdeep; each Bed of the Marish is 15 Foot long, and 14 Broad. When it rains much on any day, no Salt can be made in 3 or 4 days after, and then from the Fire of the opposite Bastion.

they have Stops to hinder the Sea-water from SAPHETA, in Architecture, is the Board over coming into the Marisbes. But if it rain for 5 or the top of a Window, and placed Parallel, and 6 days, they are necessitated to empty all the Water out of the Beds by a peculiar Channel, which cannot be opened but at Low-water.

The hottest Years make the most Salt, and in the hottest part of Summer, Salt is made in France even in the Night: Less Salt is made in Calm then in Windy Weather, and the West and Northwest Winds are best for that Purpose. The People draw the Salt every day, and each day more than

an hundred Pound weight.

nants to their Lord, by way of Commutation, for the Service of carrying their Lord's Salt from Market to his *Lardar*.

SALVAGE-Money, is a Recompence allowed by the Civil Law, in lieu of all Damages sustained by that Ship, that faves or rescues another which was fet upon or taken by the Enemy, or by Pi-

SALUTE, SALUS, was a Coin of Gold, Stampt by K. Henry 5. in France, after his Conquests there, it had on it the Arms of England and

France quarterly

SANCTUARY, was formerly a Place Privileged by the Prince for the Safeguard of Mens Lives that were Capital Offenders: Our ancient Kings of England, permitted the Sanctuaries to protect Traytors, Murderers, &c. if within 40 Days they acknowledged their Fault, and submitted themselves to Banishment: And during that time, if any Layman Expelled them he was Excom-municated, and a Clerk was made irregular by it. But after 40 days, no Man might relieve them. Of these there were many in England, and one more famous than therest, at St. John's at Bever may find by reading the Statutes of 26 H. 8. 13. 28 H. 8. 7. 32 H. 8. 15. 1 E. 6. 12. 2 E. 6. 2. and 33. 5 E. 6. 10. SAND-bags, in Fortification, are Bags holding

about a Cubick Foot of Sand or Earth: They are used for raising Parapets in haste, or to repair what is beaten down; they are of use when the Ground is Rocky, and affords no Earth to carry on their Approaches; because they can be easily brought on and off at pleasure: There are a lesser fort of these which hold half what the former do, which are placed upon the upper Talus of the Parapet, to cover those which are behind, and who fire thro the Embrasures, or Intervals that are between them.

SAP, in Fortification, is digging deep under the Earth, in order to pass under the Glacis, and to open a way to come under cover to the Passage of When they are got near the foot of the Moat. the Glacis, the Trench is carried on directly forand to Granulate it, they use no Ale, nor any thing else; this Salt is much whiter and better than the chefbire Salt, and a Winchester Bushelos it weighs and Mantelets upon Wheels: When they are got to the foot of the Glacis, they make Epaulments, or. Traverses on each fide to lodge a good Body of Men. The Sap is made 5 or 6 Fathom from the Saliant Angle of the Glacis, where the Men are only cover'd fideways; wherefore they lay Planks over-head with Hurdles and Earth above them. When they have forced the Enemy to quit the Cover'd Way, the Pioneers make immediately a Lodgment, and cover themselves as well as they can

opposite to the Window board at the botom.

SARPLER, otherwise called a Pocket, is a half Sack of Wooll, a Sack is 80 Tod, a Tod 2 Stone, and a Stone 14 Pounds. This in Scotland is called

Serpliath, and contains 80 Stone.
SATURN, in the Leipsick Acts for September, 1684. there is a new System of the Phænomena of Saturn and his Ring, by Mr. Gallet, and taken from the French Journals of June, 1684.

It doth not appear by any Astronomical Ob-SALT-SILVER, was one Penny, formerly fervations, that Saturn, like the other Planets, which have Satellites, revolves round his own Axis; but the contrary feems to be the Cafe. For in Jupiter and the Earth, which do turn round their Axes, the Equatorial Diameters are longer than Polar ones, or their Axes, but no such thing hat h been found in Saturn.

Each Surface of the Ring of Saturn feems to be plain and fmooth, without any fuch Mountainous Inequalities as the Earths Surface, and the Moons hath; because it is not visible, tho' Illuminated by the Sun, but only when the Eye is e-lausted some few Degrees above its Plane. "Tis Saturn with a Circular Motion; but it it be of a Solid Substance, it is not yet determined, whether it move round the Planet or not. And fince the Figure of Saturns Ring is exactly Circular, it must have no Linea Apsidum, nor any Progression of it: But because the Plane of the Ring hath a large Elevation above the Plane of the Ecliptick, viz. making with it an Angle of 31 Degrees, the Nodes will recede, but yet very flowly, according to the manner of the other Planets.

SATELLITES. Dr. Gregory, in his Exclleent Astronomy, hath demonstrated, that if a Satellite describe an Elliptick Orbit round a Planet, placed in one of the Foci of that Ellipsis; the greater Axis, or the Line of the Apfes will with an Angular Motion twice advance forwards, viz. in the 2 Syzygies, and twice recede backwards, viz. when

in Quadrature to the Sun.

And that this Force of Progression is near twice as great as that of the Recess, and therefore the Line of the Aples in every Revolution of the Satellite, will advance more forward than it recedes backward; and that by the Excess of this Progress. sion, the Apses will move in consequentia, p. 298.

If a Satellite move round a Planet in an Eccentrick Orbit, the Eccentricity will be twice changed in every Revolution, and in each Revolution will be greatest, when the Satellite as in the Syzygies with the Sun, and least when it is in the Quadratures; and will be continually encreasing from the Quadratures to the Syzygies, and decreafing from

the Syzygies to the Quadratures, p. 302.

If a Satellite revolve round a Planet in an Orbit, whose Plane is inclined to the Plane of the Orbit of the Planet round the Sun, then will the Line of the Nodes move in antecedentia, with an unequal Angular Motion; swiftest when the Nodes are in Quadrature to the Sun, after this flower, and at last when the Nodes are in the Syzygies, will be quite at rest. In the intermediate Places between the Quadratures and Syzygies, the Nodes will recede flower; and in every Revolution of the Satellite, will either be Retrograde or Stationary, becarried backward, or move in antecedentia, and in each Revolution will recede fastest, all things confidered, when the Satellite is in the Syzygies,

p. 304. The Inclination also of the Plane of the Orbit of the Satellite, to that of the Planet, will be continually changing, and will be greatest when the Nodes are in the Syzygies with the Sun, and least cateris paribus, when they are in the Quadra-

And all the Inequalities in the Motions of the Satellites will be a little greater when they are in Conjunction with the Sun, than when they are in opposition to him, p. 310.

SAW, is an Instrument very well known in the as well as its use. But they reckon these 1. The Pit-fam, which is several sorts of Saws. used to Saw Timber and Boards, and to cut off Scantlings, Quarters or Battens from any piece of Timber. The Matter to be Sawed is sometimes lain over a Pit, and sometimes on great Trusses above ground. 2. The Whip-Saw isused Trusses above ground. by Joyners, to cut off fuch pieces of Stuff as the Hand-Saw will not eafily notch thro'. 'Tis drawn minated by the Sun, but only when the Eye is elevated fome few Degrees above its Plane. Tis in order to be cut. 3. The Hand-Saw, which is either Fluid therefore like Water, or Polite, like to be used by a single Man, and usually with one like or Glass. If it be a Fluid, it moves round hand. 4. The Frame-Saw, or Bow-Saw, is a Saw with Cheeks made to it, and with a twifted Chord, and Tongue in the middle to draw the upper ends of the Cheeks closer together, that the lower ends may be farther afunder, and so strain the Saw the ftraighter. 5. The Tennon-Saw, which is a thin Saw with a Back to it, to keep it from bending. 6. The Compass-Saw, which is design'd to cut a Round, or any Compass-kerf; wherefore its Edge must be made broad, and the Back thin, and the Blade narrow, that the Back may have a wide Kerf to turn in, and so the eatier follow the Edge.

SCALES Proportional: See Proportional

Scales.

SCALE of Musick, tho' we find mention of several Distances of Musick among the Greeks, yet I rather think them to be Leaps in a fingle part, than Concords in Composition. The Distances talk'd of among the Greeks, are the Tire or Second, the Ailor or or third, the Aideoiger or fourth, the Aideoiger or fourth, the Aideoiger or fourth, cirre or fifth, and Διαπασών or eighth. But if these were defign'd to denote the Concords, they were in the wrong to place the fourth, and more so to place the fecond among them. Or if fuch were admitted, 'tisa wonder that the fixth, which is known to be a Concord, was refused. But if they were used to shew the Distances, by which a Voice may rise or fall, it is no wonder that they left out the fixth and feventh (being Distances not to be used without better Judgment and Design than those Times would admit ot) and made mention of the rest, as being common in their Musick.

The Scale of Musick among the Greeks, consifled but of fifteen Notes, or the Diftances of two Octaves, viz. The first from their ΜεσιλαμβανόμιvG, (which I suppose was the Key of their Musick,) to their Mion, and the second from their Mion or Middle Note to their Nim umg Canalur, or highest Note, by which I suppose they designed only the utmost Extent of a single Natural Voice.

And their Seven Moods, so much talk'd of, were no more than the seven different Methods of altering their Tunes, by Flats and Sharps, placed at the beginning of a Lesson; which therefore they called work own town. Besides the Names of their Notes in the upper Octave, have no Affinity with the Names in the other; whereas in Guido Aretinus his Scale of 20 Notes (tho' our modern Composers in many Parts often exceed the Scale, both above and below) and the Notes in every Octave begin with the same Letter; that we may thereby more readily compute the Concords and Discords.

SCARAGE, Scaragium, otherwise called Escherage, Shewage and Scheawing; and in a Charter of H.2. to Canterbury,'tis written Scewinga, was for-merly a kind of Toll or Custom, exacted by Her Majesties Sheriffs, &c. of Merchant Strangers for Wares

Wares, shewed or offered to Sale within their Precincts. This is now Prohibited by Statute, 19 H. 7. c. 8. But the City of London doth still retain the Cultom, Cowel's Interpreter. The Officer that Collected this Toll, was called the Scabaldue.

SCALA. William I. appointed the Arms, which before him had been usually answered in Victuals, to be converted into Money numbred, and directed the whole in every County to be charged on the Sheriff, who brought it into the Exchequer; adding, that the Sheriff should make the Payment ad Scalam, i. e. as Gervase of Tilbury expounds it, he should pay six Pence over in every Pound to make up the full Weight, and nearly the Intrinfick Value. And this was agreed on, as an easie way to remedy the defective Weight of Money, and to avoid the trouble of weighing all, Money which was brought into the Exchequer.
SCALENOUS Cones. See Cone.
SCEPPE, an old Word, omitted in our Glossa-

ries, fignifying a Bufbel.

SCENOGRAPHICK Projection, or Perspective, is the Transcription of any given Magnitude, into a Plane which interfects the projection. tick Pyramid at a proper distance: For in Projection, there is to be considered, r. The Object, or Foundation, or Ground of the Projection on, from whence the Pyramid, Cone, or Pencil of Rays go. (2.) The Eye of the Spectator, and 3 the Plane Table, or Diaphanum, which interfects the Rays, some where between the Object and the Eye: And the Representation or Appearance of the Object in that Plane, is the Projection or Per-spective of the Object. This Plane is always supfpective of the Object. This Plane is always supposed to be at Right Angles with the Horizon. And from hence it will follow, that (1.) A Point will be projected there in the Diaphanous Plane where the Optick Ray cuts it. (2.) That Right Line will be projected where the Optick Triangle and the Plane do mutually Interfect each other. That a Plane or Superficies will be represented where the Diaphanous Plane cuts the Optick. Pyramid of Rays coming from that Surface. that Representation of it called its Image.

SCHAR-Penny, Scharn-penny, and Iometimes Schorn-penny. It appears from our old Books, that formerly some Customary Tenants were obliged to pen up their Cattle at Night in the Pound or Yard of their Lord, for the benefit of their Dung, or Scearn, as is the Saxon Word. And it they did not do this, they were obliged to pay a small Compensation; which therefore was called by this name of Scharn-penny, that is, Muck-penny, or

Dung-penny.
SCHEAME, or Skeen, in Architecture, is the Workmens Word for the middle part of an Ellip-

SCHIRE-MOTE, was anciently a Solemn Meeting of all the Free Tenants and Knights in any County, to do Fealty to the King, and Elect an Annual Sheriff. See Folk-mote.

SCHIRE-WYTE, was an Annual Tax or Impofition, paid to the Sheriff of any County or Shire,

for holding the Affizes or County Courts.

SCREW,
SCRUE,
See Cochlea.

and this White being taken off with an Iron Bod-

for Shadows: This kind of Work is lasting, but being very rough, is unpleasant to the sight. Twas

used in Rome by Polidoro de Caravagio.

SCRIBING, when the Joyners would fit a piece of Board, Sc. to an irregular Surface, or any other irregular Piece: They open their stiff Iron Compasses to the greatest distance, any where between the 2 Boards, &c. and then carrying one Leg along all the irregular Indentings, &c. of one, the other Leg moving parallel to it, describes that irregular Figure on the other Board; which

being in that manner cut will fit and joyn.

SCUTAGE, all Tenants who held from the
King by Military Service, were either bound to attend Personally in Wars and Expeditions, or for default of fuch Service, to pay a Scut age or Compofition in Money, which was Levied on every Scatum Militare, or Knights Fee, and the Proportional Parts for the King's Use. And the Barons and Knights, which then paid a Scatage to the King, had a Power to Levy the same Tax on those Tenants who held from them in Military Ser-

SCUTAGIO habendo, was a Writ that lay for the King, or other Lord, against the Tenant that held by Knight-Service, to serve by himself, or else to send a sufficient Man in his Place.

SCULPTURE, may be diftinguished into three feveral Arts, each of which hath its Specifick Difference. For (faith Mr. Evelin in his History of Chaleography) besides Sculptura, as it relates to Chalcography, there is both Sculptura and Colatura; both which, according to Quintilian, differ from the first, with respect to the Matter, on or out of which any thing is wrought. For it was applied to cutting or carving in Wood or Ivory; and then was called Tomice, and the Artists Defectores; to working in Plaster, and then called PAradigrammatice, and the Artists Gypsochi; to Cutting or Carving in Stone, and then called Colaptice, and the Workmen Lithoxoi, and laftly in Metals, Glyphice. And it may be described to be an Art, which teaches us to cut or take away all that is superfluous of the subject Matter, reducing it to that Form or Body, which was designed in the

Mind of the Artist.

SCUPPER-Nails, see Scopper-holes.

SCYRE-GEMOTE, was anciently a Court held twice a Year (as the Sherists turn is now) by the Bishop of the Diocess and the Ealderman, i.e. in such Shires as had Ealderman) and by the Bishops and Sheriffs, in such as were committed to the Sheriffs that were immediate to the King; where both the Ecclesiastical and Temporal Laws

were given in Charge to the Country.

SEALER, is an Officer in Chancery, appointed by the Lord Chancellor, or Keeper of the Great Seal, to Seal the Writs and Instruments there

made in his Presence.

SECTOR, besides the Uses of the several Lines Circular and others; which you will find disper-sed under their proper Names. Some Problems may properly come in here under the general Word Sector. As i. To open the Sector to any given An-

SCRATCH-work, in Italian, Sgrafitti, was a the several pairs of Lines thereon drawn to the way of Painting in Fresco, by preparing of a black Ground, on which was placed a white Plaster; Lines on the one side, and the Line of Sines on the case of the line of Here must be noted, that 'tis one thing to open the several pairs of Lines thereon drawn to the Lines on the one side, and the Line of Sines on the and this White being taken off with an Iron Bod-kin, the Black appears thro' the Holes, and serves the Sector are close shut. So also the Line of Superficies, perficies, and the Lines of Solids make an Angle Diameter GF, then Apollonius calls such Sections

of 10°, tho' the Edges are close shut.

The Lines of Lines may be opened to a Right Angle, if the whole lateral Length be applied over between 8 and 6. Because = 8 x = 6 = 100,

ver per ween 8 and 0. Because 8 x 6 = 100, by 47. è 1. Eucild.

The Lineof Sines may be opened to a Right Angle, if the Lateral Sine of 90 be applied over Parallelly between 45°. and 45°. in the Sines, or if the Sine of 45°. be applied over in the between 30°. and 30, in the Line of Sines.

If you would open the Lines of Sines to any particular Oblique Angles, take out the Chord of

particular Oblique Angles, take out the Chord of the Angle required, and apply it over in the Semi-Radius, or at the end of the Line of Chords of 60 Degrees: V. gr. to open the Sines to an Angle of 40 Degrees, take out the Lateral Chord of 40° and to it open the Sector in the Parallel Chord of 60°. or if you apply the same Chord of 40°. over between 50 and 50 in the Line of Lines, it will open them

to the same Angle.

On the contrary, if the Sector be opened to an Angle at a venture, you may find the quantity of that Angle, thus: Take the Parallel Chord of 60°. and measure it in the Lateral Chord, and it shall there give the Angle, i.e. the Angle that those Lines of Chords are opened to: But that will be different from the Angle of the Edges of the Sector. N. B. If you can apply the Centre of a Protrator to the Centre of the Sector, you may easily and readily find the Quantity of any of these Angles

SECTA Curia, is Suit and Service done by Te-

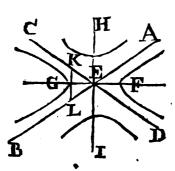

nants at the Court of their Lord.

SECTA Schirarum & Hundredorum, was the Attendance, Suit and Service done by Tenants in the County and Hundred Courts; and Quietos effe de hac Secta, was a Privilege to be exempt from

fuch Customary Service.

SECTIONS Conick, see Conick Sections. SECTIONES Sequentes, is a Term in Conicks

arising thus:

Let there be two Right Lines, as AB, CD, mutually intersecting each other in E; which Point E, is supposed to be the Common Centre of the opposite Hyperbolick Sections, F.G., H.I. and whose common Asymptotes the proposed Lines A B, C D, also are. In this particular Case, the Sections GF, and HI, are called Sectiones Sequen-tis, because they are placed following one another in the Contiguous Angles of two Intersecting

And if the determinate Diameter HG, of one of the Sectiones Sequentes (which is coincident with the supposed Indeterminate Diameter of its Opposed Indeterminate Diameter of its Opposed Indeterminate Diameter of its Opposed Indeterminate Diameter of its Opposed Indeterminate Diameter of its Opposed Indeterminate Diameter of its Opposed Indeterminate Diameter of Its Opposed Inde

Conjugate Sections.

SEGMENTS, on Gunter's Sector there are usually placed two Lines, called Lines of Segments, they are numbed with 5, 6, 7, 8. 9, 10, and lie between the Lines of Sines, and those of Superficies. They represent the Diameter of a Circle so divided into 100 parts, as that a right Line drawn thro' those Parts, and normal to the Diameter, shall cut the Circle into 2 Segments, of which the greater shall have that Proportion to the whole Circle; as the Parts cut have to 100. Their uses are

1. To divide a given Circle into two Segments, which shall have a given Ratio, which is done by opening the Sector, and applying the given Circles Diameter in the Points of 100 in these Lines; for then a Parallel taken from any Points proportional to the greater Segment required, shall give the depth of the greater Segment, accounted on a Diameter bisseding the Segment.

2. To find the Proportion between the Circle

and any given Segments of it.

Open the Sector, as before, and then take the depth of the greater Segments, and apply Parallel to the Diameter, and the Points where it fits in ex-

actly, will shew the Proportion to 100

SEEING. The Sense of Seeing is probably caused thus, the Rays of Light exhibiting all Colours; fall upon the bottom of the Eye, and there cause or excite Vibrations in the Tunica Retina: which Vibrations being communicated, or propagated a-long the Solid Fibres of the Optick Netves into the Brain, do there cause that Sensation, which we call Vision or Seeing. For because dense Bodies conserve their Heat a long while, and the Denfest, the longest time, the Vibrations of their Parts are of a lasting nature, and therefore may be pro-pagated along solid Fibresof Uniform Density toa great distance, for conveying into the Brain, the Impressions made upon all the Organs of the Sense. For that Motion which can continue long in one and the fame part of a Body, can be propagated a long way from one part to another, supposing the Body Homogeneal, so that the Motion may not be reflected, refracted, interrupted, or disordered by any unevenness of the Body. Newton's Opticks, Book 3.

The same Author renders it probable, that the Species of Objects seen with both Eyes, are united in that Place where the Optick Nerves meet and joyn, before they come into the Brain: The Fibres on the right fide of both Nerves uniting there, and after Union, going thence into the Brain in the Nerve, which ison the right fide of the Head; and the Fibres on the left fide of both Nerves uniting in the same place, and after Union going into the Brain in the Nerve, which is on the left side of the Head: And these two latter Nerves meet and unitein the Brain, in such a manner that their Fibres make but one entire Species or Picture: Half of which. viz. that on the right fide of the Senforium, comes from the right side of both Eyes, thro' the fide of both the Optick Nerves, to the Place where these Nerves meet, and from thenceon the right fide of the Head into the Brain: But the other half, viz. that on the left fide of the Senforium, comes in like manner from the left side of both Eyes. For the Optick Nerves of such Aed betwen the Asymptotes in the Point G, of the tick Nerves of such Animals as do oot look the fame. Same way with both Eyes (as of Fishes, and of the Chamælion, do not so meet and unite. If I am

rightly informed.

When a Man in the dark, presses either corner of his Eye with his Finger, and at the same time turns his Eye a contrary way, he will see a Circle of Colours, like those in the Feather of a Peacock's Tail; which variegated Circle of Colours, seems to arise from the same kind of Motions excited in the bottom of the Eye by the Pressure of the Finger, as at other times are excited there by Light for causing Vision. And when a Man by a stroke upon his Eyes sees a Flash of Light, are not the like Motions excited in the Retine by that

SEIGNOURAGE, 9 H. 5. Stat. 2. c. 1. seems to have been a Royalty or Prerogative of the Prince, whereby he challenged allowance of Gold and Silver brought into the Mass for his Exchange for Coin. Out of every Pound Weight of Gold, the King had for his Coin five Shillings, out of which he paid to the Master of the Mint for his Work, fometimes I Shilling, and fometimes 18 Pence. Upon every Pound Weight of Silver the Seignourage, answered to the King, in Edw. 3. Time was eighteen Penny-weight pondere, which about that time amounted to about a Shilling, and out of which he paid sometimes 8, sometimes 9 Pence to the Mint-master. In H. the 5th's Time the King's Seignourage for every Pound Weight of Silver was 15 Pence.

SELL, in Architecture, is the Term both for the lowest piece of Timber in a Timber-building, or for that on which the whole Superstructure is crected, and also for the bottom-pieces in a Window-frame; the former is called a Ground-sell, the

latter a Window-sell.

SEME, Summa, is an Horse-load, a Seme of

Corn is 8 Bushels,

SENESCHAL, was the Word anciently for the Chief Steward or Head Bailiff of a Baron, that kept his Courts, and managed his Demeloe-lands, and hath been the Title of the Lord High Steward, and of the Steward of the King's Houshold, &c.

SEPTUAGESIMA, is always the third Sunday before Quadragesima exclusive: from which, until the Octaves after Easter, Marriage is forbidden by the Canon-Law. It takes its name from its being

above 70 Days before Easter.

SEPTUM Medium, is properly the infide of the left Ventricle of the Heart, because its Fibres are continued with the Fibres of the opposite side of the same Ventricle; it divides the left Ventricle of the Heart from the right.

SEQUELA Cause, is the Process and depending lifue of a Cause or Trial.

SEQUELA Molendini, is owing Suit to a particular Mill, or being bound to grind Corn in that Place only; which formerly was a Duty and Service laid upon many Tenants; wherefore Concidere Sequelam Molendini, was to grant all the Toll and Profits arising from such Customary Rights.

SERGEANT; is a word diversely used in our Law, and applied to fundry Offices and Callings.

A Sergeant at Law, or of the Coif, is the greatest
Degree taken in that Profession, as that of a Dostor is in the Civil Law. As these are the most
Learned and Experienced, there is one Court approprieted to Pland in by themselves, which is the propriated to Plead in by themselves, which is the Common-pleas, where the Common Law of England is most strictly observed: But the' they have

this Court to themselves, they are not prohibited Pleading in other Conrts; where the Judges (who must be first Sergeants) call them Brothers. These Sergeants are call'd by the King's Mandate, or Writ directed to them, and commanding them, under a great Penalty, to take upon them that Degree by a Day Affigned. Out of these one is (more may be) made the King's Sergeant, to Plead for him in all Causes, especially in Treason.

SERGEANT at Arms, is an Officer appointed to attend the Person of the King, An. 7 H. 8. c. 3. to Arrest Traytors, &c. and Persons of Quality Offending, and to attend the Lord High Steward when he fits in Judgment on any Traytor, Gc. By the Stat. 13 Richard 2. c. 6. There cannot be above 30 in the Realm. Two of these by the King's Allowance attend the two Houses of Parliament. The Office of him in the House of Commons is to keep the Door, and to execute such Commands as the House shall direct, especially as to the apprehension of Offenders, &c.

Another of these attends on the Lord Chancellor or Keeper in the Chancery, and one on the Lord High Treasurer, one to attend on the Lord President of Wales, and another on the Lord President of the North. Another fort of Sergeants, are chief Officers executing feveral Functions in the King's Household; of which you may find many in Stat. 33 H. 8. c. 12. There is also an inferiour kind of Sergeants of the Mace, whereof there is a Troop in the City of London, attending the Lord May.

SERJEANTRY, was a Service formerly done for the holding of Lands, and was either Grand Serjeantry, which was fome Honourable Military Service paid only to the King; as to carry his Banner, bear his Sword, Gc. Or Petty-Serjeantry, which was some less Noble Service paid to the King, or any other Lord. Some will have Grand Serjean try, to be where a Man holds Lands of the King by Service, which he ought to perform in Person, and Petty-Serjeantry, to be where he holds his Lands of the King, to yield him Yearly some small thing towards his Wants.

SERVICE-Royal, was the Rights and Prerogatives that within such a Mannor belonged to the king if I and a fine and more growth.

King, if Lord of it; and were generally rec-koned to be these 6. 1. Power of Judicature in Mat-ters of Property. 2. Power of Life and Death in iminal Causes. 3. A Right in Ways and rays. 4. Assessments. 5. Minting of Money, Assizs of Bread, Beer, Weights and Mea-Criminal Caules.

SERVICE, (which is fometimes called Servage) is divided into Personal and Real, and into Military and Base; as also into Intrinsick and Extrinfick. IntrinsickService they reckon due to the Capital Lord of the Mannor. Service is again divided into Frank and Base, the one is termed Liberum Servitium, the other Villenagium, 'Tis also divided into Continual or Annual, and into Cafual or Accidental; the former being the Seisin of Rent, and the latter Seifin of Reliefe.

SERVICE, in a Legal Sense, is a right by which onething is subject to another thing or Per-

And of these some are,

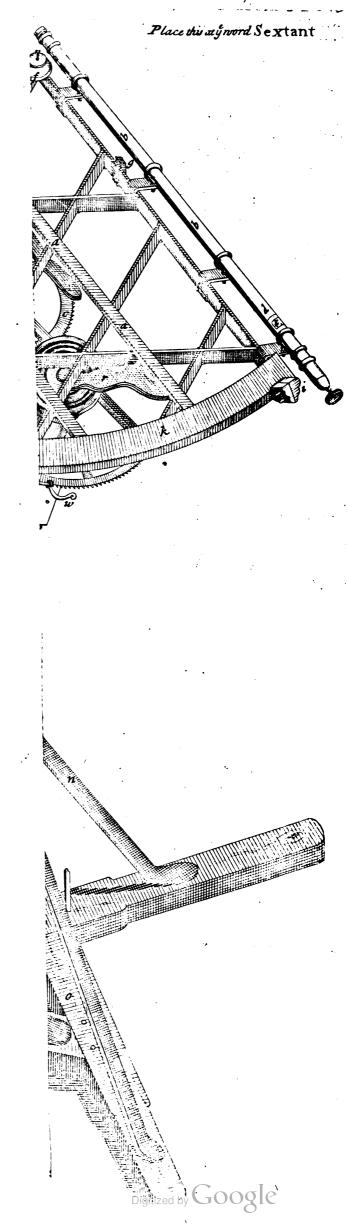

SERVICES Predial or Real, which are Rights that one Estate sometimes owes another: And these Predial Services, they reckon to be tome Rustical or Rural, such as the Right of Riding or Walking, or going with a Carriage thro' another Man's Ground &

Ground; the Right of drawing Water, or bringing it thro' his Ground, &c. And some Services gradually (by the help of a Screw) and sensibly are called Urbana, which are the Rights that are shews its Progress, to the thousandth Part of an preferred to Mens Houses, built contiguous to one Inch.

SERVICES personal, are those Services which are due from a Thing to a Person; and of these they account 3 by name, viz. Usufruct, Use and Habitation; but there are very many and various ones which have no distinct Names.

SERVITIUM Regale, Royal Service, are the Rights and Prerogatives that within such a Mannor belong to the King as Lord of it; and these are generally reckon'd 6. As, 1. Power of Judicature in Matters of Property. 2. Power of Life and Death in Cases of Felony and Murder. 3. A Right in Waifs and Strays. 4. Assessments. 5. Minting of Mony. And 6. Assigned and Beer, Weights and Measures.

All these entire Privileges were annexed to some Mannors, in their Grants from the King, and were sometimes conveyed in the Charters of Donation

to Religious Houses.

SERVITORS of Bills, are such Servants or Messengers of the Marshal of the King's-bench, as were sent abroad with Bills or Writs, to Summon Men to that Court. They are now commonly called Tip-flaves.

SESAMOIDEA Offa, the Use of these Bones, which are placed at the Articulations of the Bones of the Fingers and Toes, is that they may ferve as fo many Pullies about which the Tendons pass, at some distance from the Centre of the Articulation, whereby the Directions of the Motions of these Tendons are kept always at the same distance from the Centre of Motion of the Articulation.

SEWERS, are Passages, Canals, or Gutters to carry Water into the Sea or some River. therefore the Commissioners of the Sewers are such Persons, as by Authority under the Great Seal of England, do see Ditches and Drains in Marshes and Fenny-places, well kept and maintained for the better preserving the Grass upon the Land for feeding of Cattle, Ge. by conveying the Water off the Ground into the Sea or River.

SEXTANT. The Description of a New Sextant, lately made for the Observatory in Trinity-College, Cambridge, by Mr. John Rowley.

a a Iron Bars fet edge and flat-ways, compofing and framing the Body of the Sextant, whose Radius is five Foot.

bb Are two Tellescopes, the one fixt on the right Edge of the Sextant, from which the Divifions on the Limb are numbred, and the other moveable with the Index.

cc Two large Brass Semi-circles on the Backside of the Sextant, which by Nuts and Screws can bring the Instrument into any Position in any

Plane, Horizontal, Vertical, or Reclining.

dd The Place of the Cross-Hairs within the Tellescope, which are made to be moved (from the Out-side) for the better adjusting them to the In-Arument.

e The Revolution-Work, which proves the Index

f The Centre of the Instument, from which a Plumb-Line falling on the Line (i) at the lower End of the Right Edge of the Sextant, takes Di-

stances from the Zenith.

g Is another Centre, from which a Plum Line falling on the Line (h) takes Altitudes from the Horizon.

k Is the Brass Limb of the Instrument, being Diagonally divided into every 5 Minutes, and by proportional Parts on the Index, shews every 10

l Is a Lignum-Vita Axis, upon which the Sex-tant turns; and is made so, as to be plac'd either parallel to the Axis of the Equator, or of the Horizon.

m m Is a Contrivance by the Motion of Wheels, Nuts and Screws, so as to make the whole Sextant. move answerably to the apparent Diurnal Motion of the Heavens.

nn Three strong Iron Feet, fix'd to an Iron

Collar, to hold the aforesaid Axis (1.)

ooo Are Three Pieces of Timber, to which the Iron Feet are screw'd, and which serve to compleat the Pedestal of the Instrument.

p An Arch of Iron, which shifts the Axis (1) to its Parallelism with either the Axis of the E-

quator or Horizon.

The Limb of this Noble Instrument is very accurately divided, Diagonally, and by the way of unequal Divisions, used by Hevelius; so that the Angle may be taken either of those ways, as well as be found by the Revolution-Work.

SEXTAR of Wheat or other Corn (from Sextarius) was that quantity anciently which we now call a Quarter, containing a Bushel. In some Countries'tis called a Seame.

SHAFT, is the hollow Entrance into a Mine which is funk or dug to come at the Ore. Tin Mines, after this is funk about a Fathom, they leave a little long square Place, which is called a Shamble.

SHAMBLE, see Shaft.

SHELF, is what the Miners (especially in the Tin-Mines) call the Fast-Countrey, by which they mean an Imaginary Surface of the Earth, which at the Concussion of the Waters in the general Deluge of Noah, was never moved; and to the Shelf, they think all the Loads or Mineral Veins at first lay even and parallel; tho' after the Flood they were some elevated, some depressed, &c. And by Shelf now they mean that hard Surface or Coat of the Earth which lies under the Mold, usually about a Foot deep; for they suppose, that since the Flood the Earth hath gotten a new Coat of Vegetable Earth, or fuch as is made by the Corruption of Vegetables and Animals.

SHERIVE or Sheriff, Vice-Comes, is the Chief Officer of the King in any Shire or County, formerly the Sheriff was chosen by the People in the County-Court by Vote, as the Knights of the Shire for Parliament now are; but now the Sheriff is nominated by the King. Camden in his Kkkk

Britannia, describes this Office, and the Antiqui-ty and Authority of this Officer. See Co. Rep. lib. 18 The Hallards. 4. And Spelman's Glosfary under the word Vice-Comes. His Oath is extant in Rey. Orig. fol. 331.

SHERIFF-TOOTH, feams anciently to have 19 Mizzen Top-Maft. been a Tenure by the Service of apacy of providing Entertainment for the Sheriff at his County-ding Entertainment for the Sheriff at his County-Turns or Courts. For it appears by Ryley's Placi-ta Parliament. fol. 653. that in Derbysbire the King's Bayliffs did formerly take 6 Pence of every Extra Parliament. Sol. 125 Its Back-Stay. been a Tenure by the Service or Duty of provi- 20 Its Sails furl'd.

SHILLING, Solidus in the Latin is a word of very uncertain Signification, and differs almost in every Nation. But the word Scalling or Shilling in England, never fignified any thing but 5d. with 30 The Cross-Trees. the Saxons, and 12d. ever fince. When it first 31 The Cap. the Saxons, and 12d. ever fince. When it first went for 12d. 'tis hard to find: But there was no 12 Penny Piece of that name Goined in England till 33 Its Stay 1504 and then Stow calls them Grouss: tho' Fa-bian mentions them under the name of Shillings. In 34 H. 8. there were 12 Penny Pieces struck, 36 The Vane. but they were called Testons.

SHINGLING Tongs, are used in the Finery of an Iron-forge, to take out the Loop, in order to bring it under the Hammer into a Bloom.

SHOALD, is the Miners Term in the Tin Mines, for fuch Fragments of Ore, which by Rains, Currents of Water, &c. are torn off from the Load or Veins of Ore. These are washt down from the Mountains, and by finding of them, they guess where to look for a Load of Ore. Sometimes 'tis called Squod, sometimes Squad.

SHORT Sails, in a Man of War, are the same with the Fighting-sails, and are the Fore-sail, Mainsail, and Fore-top-sail: These are all that are used in a Fight, lest the rest should be fired or spoiled: And besides they would be troublesome to handle, and would hinder the fight and useof Arms. When a Ship gives Chase to another, if the Chase hath a mind to fight, they say, the Chase strips her self into her short or Fighting-Sails; that is, puts out her Colours in the Poop, her Flag at the Main-top, and her Streamers or Pendants at her Yard-arms; Furls her Sprit-sail, Peeks her Mizen, and Slings her Main-yard, and when the Chafer sees this, he is to prepare for an Engagement.

SIGNALS, are Signs made at Sea by the Admiral or Commander in Chief of any Squadron of Ships, either in the Day or by Night, either for Sailing or Fighting, or for the better Security of the Merchants Ships that are under the Convoy of His Majesties Men of. War. These Signals are appointed and determined by Order of the Lord High Admiral, and are a follows:

SIGNALS by Day, when Ships are at an Anchor, in weighing Anchor, Sailing, &c. When the Admiral or Commander in Chief would have the Fleet prepare for Sailing, he first looses his Fore-Top-sail, and then the whole Fleet are to do the same.

2. When he would have them Unmoor, he loofes his Main-top-sail, and fires a Gun; which in the Royal Navy is to be answered by every Flagg Ship.

3. When he would have them wergn, he rootes his Fore-top-fail, and fires a Gun, and sometimes hawls home his Sheets; the Gun is to be answered by every Flag Ship, and every Ship to get to Sail as soon as it can. If with the Leeward side, the When he would have them Weigh, he loofes

4 When the Admiral or Commander in Chief would have the Weather-most and Head-most Ships to Tack first, he hoists the Union-flag at the Foretop-mast-head, and fires a Gun, which each Flag

Ship must answer.

But if he would have the Sternmost and Leeward-most Ships to Tack first, he hoists the Union Flag at the Mizen-top-mast-head, and fires a Gun. And when he would have all the whole Fleet Tack, he hoists an Union, both on the Fore and Mizentop-mast-head, and fires a Gun.

5. When in bad Weather, he would have them Wear and bring to the other Tack, he hoists a Pender of the Control of the Cont

Kkkk 2

Head. Every Flag is to answer with the same Sig- nal.

and the Admiral would have them hear up and Sail before the Wind, he hoists his Ensign, and fires a Gun, which the Flags are to answer. And then the Leeward-most Ships are to bear up first, and to give room torthe Weather-most to Wear, and Sail before the Wind with an easie Sail, till the Admiral come a Head.

But if it should happen when the Admiral hath occasion to Wear and Sail before the Wind, that both Jack and Ensign be abroad, he will haw! down the Jack before he fires the Gun to wear, and keep it down till the Fleet is before the firing one Gun.

Wind. When they are Sailing before the Wind, and he would have them bring to with the Starboard Tacks Aboard, he hoists a Red Flag at the Flag-staff, on the Mizen-top-mast-head, and Fires a Gun; but if they are to bring too with the Larboard-tack, he hoists a Blue Flag at the same Place, and Fires a Gun. Every Ship to answer the

his Jack and Ensign, and keep it aboard till the Admiral or Commander in Chief Answer him by hoisting his; on sight of which he is to hawldown

his Enfign.

9. If any discovers Danger, he is to Tack, or bear up from it; and to aw Jack abroad from the Main-top-mast Cross-trees downward upon the Back-stay, and Fire two Guns: But if he should strike or stick fast, then besides the same Signal with his Jack, he is to keep Firing till he sees all the Fleet observe him, and endeavour to avoid the

10. When any fees a Ship or Ships more than the Fleet, he is to put abroad his Enfign, and there keep it, till the Admiral's or Commander's is out, and then to lower it as often as he fees Ships, and to fland in with them, that so the Admiral I. When the Admiral would have the Fleet to may know which way they are, and how many: Unmoor and Ride short, he hangs out 3 Lights one But if he be at such a distance that the Ensign over another in the Main-top-mast-shrouds, over can't well be discovered, he is then to lay his the constant Light in the Main-top, and fires two Head towards the Ship or Ships so descryed, and Guns, which are to be answered by the Flag-Ships; to brail up his low Sails, and continue hoisting and each private Ship hangs out a Light in the and lowering his Top-sails, and making a West with his Top-gallant-sails, till he is perceived by the Admiral.

11. When the Admiral would have the Vice-Admiral, or he that Commands in the second Post of the Fleet, to fend out Ships to Chafe, he hoifts a Light in the Main-top-mast-shrouds, and fires a Flag, Striped White and Red, on the Flag-staff, a Gun, which is to be answered by all the Flags; at the Fore-top-mass-head, and fires a Gun. But and every private Ship must hang out a Light in if he would have the Rear-Admiral do so, he then his Mizen-shroud.

vision that Ship is. When he would have them Stern-most Ships must Tack as fast as they can ; and

dant on the Enfign-staff, and fires a Gun : And Flag-staff at the Fore-top-mast-head, and fires a then the Leeward-most and Stern-most Ships are to Gun: Which Signal is to be made also by that Wear sist, and bring on the other Tack and less a Chase, till the Chasing Ship sees the Signal is to be made also by that gives by, or go on with an easie Sail till be comes a Chase, till the Chasing Ship sees the Signal is to be made also by that gives by, or go on with an easie Sail till be comes a Chase, till the Chasing Ship sees the Signal is to be made also by that

In Case of Springing a Leak, or any other 6. If they are lying by, or Sailing by a Wind, Difaster that disables their Ship from keeping Company, you are to hale up your Courses, and fire two Guns.

14. When any Ship would speak with the Admiral, he must spread an English Ensign from the Head of his Main or Fore-top-mast downwards on the Shrouds, lowering his Main or Fore-top-sail, and firing Guns till the Admiral observe him; And if any Ship perceives this, and judges that the Admiral doth not, that Ship must make the same Signal, and make the best of his way to acquaint the Admiral therewith, who will answer by

15. When the Admiral would have the Fleet to prepare to Anchor, he hoists an Ensign striped Red, Blue and White on the Ensign-staff, and fires a Gun; and every Flag-Ship makes the

sameSignal.

16. If he would have the Fleet Moor, he hoifts his Mizen -top-sail with the Clew-lines haled up,

and fires a Gun.

17. If he would have the Fleet Cut or Slip, he 8. When any Ship discovers Land, he is to hoist looses both his Top-sails, and fires two Guns; and then the Leeward Ships are to cut or flip first, to give room to the Weather-most to come to Sail

So if he would have any particular Ship to cut or flip, and to Chase to Windward, he makes the Signal for speaking with that Ship, hoists a Red Flag in the Mizen-Ihrouds, and fires a Gun: But if the Ship is to Chase to Leeward, he hoists a Blue Flag, as before.

18. If he would have the Fleet Exercise their Small Arms, he hoists a Red Flag on the Enfign-Staff, and fires a Gun; but if the great Guns, then he puts up a Pendant over the Red Flag.

SIGNALS by Night, to be observed at an An-

chor, in Weighing, Anchoring and Sailing.

1. When the Admiral would have the Fleet to the constant Light in the Main-top, and fires two Mizen-ihrouds.

N. B. All Guns fir'd for Signals in the Night must be fir'd on the same side, that they may make

no alteration in the Sound.

2. When he would have them Weigh, he hangs

hoists the same Signal on the Flag-staff at the Mizen-top-mast-head, and fires a Gun.

Lights on the Ensign-staff, one over another, above the constant Light in his Poop, and fires a Gun; which is to be answered by all the Flags: And which is to be answered by all the Flags. king with the Captain, and hoists a Red Flay in the Mizen-shrouds, and fires a Gun, But if to chase to Leeward, a Blue Flag; and takes in his.

The fame Signal is made by the Flag in whose Diagram of the Signal is made, the Deward-most and the fame Shin is When he mould have the same of Shin and Captain a

give over Chase, he hoists a White Flag on his the Stern-most Flag-Ship, after he is about upon the other other Tack, is to lead the Fleet, and him they are to follow, to avoid running thro' one another

in the dark.

4. When he is upon a Wind, and would have the Fleet Wear and bring to on the other Tack, he hoists up one Light at the Mizen-peek, and fires 3 Guns: which is to be answered by the Flag-Ships, and every private Ship must answer with one Light at the Mizen-peek. The Stern-most and Leeward-most Ships are to bear up so soon as the

Signal is made.

5. When he would have them in blowing Weather to lie a try, short, or a Hull, or with the Headfails braced to the Mast, he will shew 4 Lights of equal height, and fire 5 Guns; which are to be answered by the Flag-Ships, and then every private Ship must shew 4 Lights. And after this, if he would have them to make Sail, he then fires 10 Guns; which are to be answered by all the Flags, and then the Head-most and Weather-most Ships are to make Sail first

6. When the Fleet is Sailing large, or before the Wind, and the Admiral would have them bring too, and lie by with their Star-board Tacks. Aboard, he puts out 4 Lights in the Fore-shrouds: and fires 6 Guns; but if with the Lar-board Tacks Aboard, he fires 8 Guns, which are to be answered by the Flag-Ships, and every private Ship must shew 4 Lights. The Wind-most Ships must bring

too first.

7. Whenever the Admiral alters his Course, he fires I Gun (without altering his Lights) which is to be answered by all the Flag-ships.

8. If any Ship hath occasion to lie short, or by, after the Fleet has made Sail, he is to fire I Gun,

and shew 3 Lights in his Mizen-shrouds.

9. When any one first discovers Land or Danger, he is to shew as many Lights as he can, to fire I Gun, and to Tack, or bear away from it. And if any one happen to spring a Leak, or any be disabled from keeping company with the Fleet, he hangs out 2 Lights of equal height, and fires Guns till he is relieved by some Ship of the Fleet.

TO. If any one discovers a Fleet, he is to fire Guns, make false Fires, put one Light out on the Main-top, 3 on the Poop, to Steer after them, and to continue firing Guns, unless the Admiral call him off, by Steering another Course, and fire 2 or 3 Guns, for then he must follow the Admiral.

3 Guns, for then he must follow the Admiral.

11. When the Admiral Anchors he fires 2 Guns, a small space of Time one from the other, which are to be answered by the Flag-ships; and every

private Ship must shew 2 Lights.

12. When the Admiral would have the Fleet to Moor, he puts a Light on each Top-mast-head, and fires a Gun; which is to be answered by the Flag-ships, and every private Ship is to shew one

Light.

13. If he would have them lower their Yards and Top-masts, he hoists one Light upon his Enfign-staff, and fires one Gun; which is to be answered by the Flag-ships, and every private Ship must shew I Light. And when he would have them Hoist their Yards and Top-mast, he puts out 2 Lights, one under the other, in the Mizentop-mast-shrouds, and fires a Gun; which is to be answered by the Flag-ships, and each private Ship must show I Light in the Mizen-shrouds.

14. If any strange Ship he discovered coming into the Fleet, the next Ship is to endeavour to speak with her, and bring her to an Anchor, and not suffer her to pass thro' the Fleet. And it any one discovers a Fleet, and it blow so hard that he cannot come to give the Admiral notice timely, he is to hang out a great number of Lights, and to continue firing Gun after Gun, till the Admiral answers him with one.

15. When the Admiral would have the Fleet to Cut or Slip, he hangs out 4 Lights, one at each Main-yard-arm, and at each Fore-yard-arm, and fires 2 Guns; which are to be answered by the Flag-ships, and every private Ship is to shew one

Light.

SIGNALS used when a Fleet Sails in a Fog.

1. If the Admiral would have them weigh, he fires 10 Guns, which every Flag-ship is to answer.

a. To make them Tack, he fires 4 Guns; which are to be answered by the Flag-ships, and then the Leeward-most Ships, and Stern-most Ships must Tack first. And after they are about, to go with the same Sail they tack'd with, and not to lie by, expeding the Admiral to come a Head: And this is to avoid the Danger of running thro' one another in thick Weather.

3. When the Admital brings to, and lies with his Head-sails to the Mast; it with the Star-board Tack Aboard, he fires 6 Guns; but if with the Lar-board Tack Aboard, 8 Guns, which the Flag-Ships are to answer: And after this, if he makes Sail, he fires 10 Guns, which the Flag-ships must answer; and then the Head-most and Weather-

most Ships are to make Sail first.

4. If it grow thick and foggy Weather, the Admiral will continue Sailing with the fame Sail fet that he had before it grew toggy, and will fire a Gun every hour; which the Flag-ships must answer, and the private Ships must answer by firing of Muskets, beating of Drums, and ringing of Bells.

But if he be forced to make either more or less Sail than he had when the Fog begun, he will fire a Gun every half hour, that the Fleet may discern whether they come up with the Admiral, or fall a Stern of him; and the Flags and private Ships are

to answer, as before.

5. If any one difforers Danger which he can avoid by Tacking and standing from it; he is to make the Signal for tacking in a Fog; but if he should chance to strike and stick fast, he is to fire Gun after Gun, till he thinks the rest have avoided the Danger.

6. When the Admiral would have the Fleet to Anchor, he fires 2 Guns, which the Flags are to answer; and after he hath been half an hour at an Anchor, he will fire 2 Guns more, to be answered by the Flags, as before, that all the Fleet may

know it.

SIGNALS for calling Officers on Board the Admiral.

1. When the Admiral puts abroad a Union-Flag in the Mizen-shrouds, and fires a Gun, all the Captains are to come Aboard him: And if with the same Signal there be also a West made with the Ensign, then the Lieutenant of each Ship is to come on Board.

2. If

2. If an Enfign be put Aboard in the same Place, all the Masters of the Ships of War are to

come on Board the Admiral.

all the Flag-Officers are to come Aboard the Admiral. If the English Flags only, then a Standard in the Mizen-shrouds, and fire a Gun: If the Flags and Land General Officers, then the Admiral puts Aboard a Standard at Mizen-top-mast-head, and a Pendant at Mizen-peek, and fires a Gun.

4. It a Red Flag be hoisted in the Mizen-shrouds, and a Gun fir'd, then the Captains of his own Squadron are to come on Board the Admiral; and if with the same Signal there be also a West with the Ensign, a Lieuten ant of each Ship must go on Board.

5. It he hoists a White Flag as before, then the Vice-Admiral, or he that Commands in the fe-cond Post, and all the Captains of his Squadron are to go on Board the Admiral. If a Blue-Flag, &c. then the Rear-Admiral, and the Captains of his Squadron must come on Board; and if there be a West as before, the Lieutenants.

6. When a Standard is hoisted on the Ensign. staff, and a Gun fired, the Vice and Rear-Admirals must both come on Board the Admiral's Ship.

7. When the Admiral would speak with Captains of hisown Division, he will hoist a Pendant in the Mizen-peek, and fire a Gun; and if with the Lieutenants, a West is made with the Ensign, and the same Signal. For whenever he would speak with Lieutenants of any particular Ship, he makes the Signal for the Captain, and makes a Weft also with the Ensign.

8. When the Admiral would have all the Tenders in the Fleet come under his Stern and speak with him, he hoists a Flag, striped Tellow and White, at the Mizen-peek, and fires a Gun. But if he would speak with any particular Ships Tender, he makes a Signal for speaking with the Captain she tends upon, and a West with his Jack.

y. It all the Pinnaces and Barges are to come on Board, Manned and Armed, the Signal is a Pendant on the Flag-staff, housted on the Fore-topmast-head, and a Gun; and it he would have them Chase any Ship, Vessel, or Boat in View, he

hoists the Pendant, and fires 2 Guns.

10. The Signal for the Long-boats to come on Board him Mann'd and Armed, is the Pendant hoisted on the Flag-stass at the Mizen-top-masthead, and a Gun; and if he would have them Chase any Ship, Vessel, or Boat in open View, without coming on Board him, he hoists the Pendant, as aforefaid, and fires 2 Guns.

When the Admiral would have all the Boats in the Fleet come on Board him, Mann'd and Arm'd, he hoists a Pendant on the Flag-staff, both on the Fore-top-mast, and Mizen-top-mast-head, and fires i Gun; but if he would have them Chase, he hoists his Pendants, as before, and fires 2

11. When the Admiral would speak with the Victualler, or his Agent, he puts an English Enfign in the Mizen-top-most-shrouds; and when with him that hath charge of the Gunner's Stores, he will spread an Ensign at his Main-top-sail yard-arm.

SIGNALS for managing a Sea-fight. When the Admiral would have the Fleet form 3 It a Standard on the Flag-staff be hoisted at a Line of Battle, one Ship a head of another, the Mizen-top-mast-head, and a Gun fired, then he hoists an Union-flag at the Mizen-peek, and fires a Gun, and every Flag-ship does the same.

> But when they are to form a Line of Battle, one a breast of another, he hoists a Pendant with

the Union-flag, &c.

2. When he would have the Admiral of the White, or he that Commands in the Second Post, and his whole Squadron, to Tack, and endeavour to gain the Wind of the Enemy, he spreads a white Flag under the Flag at the Main-top-masthead, and fires a Gun; and when he would have the Vice-Admiral of the Blue do so, he doth the

same with a blue Flag.

If he would have the Vice-Admiral of the Red do so, he spreads a Red Flag from the Capon the Fore-top-mast-head, downward on the Backstay: If the Vice-Admiral of the Blue is to do so, he spreads a blue Flag, &c. and fires a Gun. If he would have the Rear-Admiral of the Red do so, he hoists a Red Flag at the Flag-staff at the Mizen-top-mast-head; it the Rear-Admiral of the White, a white Flag; if the Rear-Admiral of the Blue, a blue Flag, and under it a Pendant of the same Colour, with a Gun.

4. If he be to Leeward of the Fleet, or any part of it, and he would have them to bear down into his Wake or Grain, he hoists a blue Flag at the

Mizen-peek, and fires a Gun.
5. If he would be to Leeward of the Enemy, and his Fleet, or any part of it, be to Leeward of him; in order to bring these Ships into the Line, he bears down with a blue Flag at the Mizen-peek, under the Union-flag (which is the Signal for Battle) and fires a Gun; and then those Ships which are to Leeward of him, must endeavour to get into his Wake or Grain, according to their Station in the Line of Battle.

6. When the Fleet is Sailing before the Wind, and he would have him that Commands in the second Post, and the Ships of the Star-board Quarter to clap by the Wind, and come to the Star-board Tack, he hoists a Red Flag on the Mizen-top-mast-head; but a Blue one, if he would have Ships of the Lar-board Quarter come to the

Lar-board-tack, with a Gun.

7. If the Van are to Tack first, he spreads the Union-flag at the Flag-staff on the Fore-top-mast-head, and fires a Gun, if the Red Flag be not abroad; but if it be, then he lowers the Fore-topsails a little, and the Union-flag is spread from the Cap of the Fore-top-mast downwards; and every Flag-ship doth the same.

8. If the Rear be to Tack first, he hoists the Union-flag on the Flag-staff at the Mizen-topmast-head, and fires a Gun, which all the Flag-

ships are to answer.

9. If all the Flag-ships are to come into his Wake or Grain, he hoists a Red Flag at his Mizen. peck, and fires a Gun, and all the Flag-ships must do the same.

10. If he would have him that Commands in the fecond Post of his Squadron to make more Sail (tho' he himself shorten Sail) he hoists a white Flag on the Enlign-staff: But if he that Commands in the third Post be to do so, he hoists a Blue Flag at the same places, and fires a Gun, and all the Flag-ships must make the same Sig-

11. When ever he hoists a Red Flag on the Flagstaff at the Fore-top-mast-head, and fires a Gun, every Ship in the Fleet must use their utmost endeavour to engage the Enemy, in the Order prescribed them.

12. When he hoists a white Flag at his Mizenpeek, and fires a Gun, then all the small Frigats of his Squadron that are not of the Line of Bat-

tle, are to come under the Stern.

13. If the Fleet be Sailing by a Wind in the Line of Battle, and the Admiral would have them brace their Head-sails to the Mast, he hoists up a yellow Flag on the Flag-staff, at the Mizen-topmast-head, and fires a Gun, which the Flag-ships are to answer, and then the Ships in the Rear must brace first.

14. After this, if he would have them fall their Head-sails and stand on, he hoists a yellow Flag on the Flag-staff at the Fore-top-mast-head, and fires a Gun; which the Flag-ships must answer, and then the Ships in the Van must fall first, and stand on. If when this Signal is made, the Red Flag at the Fore-top-mast-head be abroad, he fpreads the Yellow Flag under the Red.

15. If the Fleets being near one another, the Admiral would have all our Ships to Tack together, the sooner to lie in a posture of Engaging the Enemy, he hoists a Union-flag on the Flag-staves at the Fore and Mizen-top-mast-heads,

Fleet are to do the same.

16. The Fleet being in a Line of Battle, if he would have the Ship that leads the Van, hoist, lower, set, or hawl up any of his Sails, the Admiral spreads a Yellow Flag under that at his Maintop-mast-head, and fires a Gun; which Signal the Flag-shipsare to answer, and then the Admiral will hoist, lower, set, or hawl up the Sail, which he would have the Ship that leads the Van do; which is to be answered by the Flag-ships of the Fleet.

17. When the Enemy runs, and he would have the whole Fleet follow them, he makes all the Sail he can after them himfolf, takes down the Signal for the Line of Battle, and fires 2 Guns out of his Fore-chase, which the Flag-ships answer, and then every Ship is to endeavour to come up

and fires a Gun.

19. If he would have the Red Squadron draw into a Line of Battle, one à breast of another, he puts abroad a Flag, striped Red and White on the Flag-staff, at the Main-top-mast-head, with a Pendant under it, and fires a Gun: If the white or fecond Squadron are to do so, the Flag is striped Red, White and Blue; if the Blue or third Squadron are to do so, the Flag is a Genoueze Ensign and Pendant. But if they are to draw into a Line of Battle, one a Head of another, the same Signals are made without a Pendant.

20. If they are to draw into a Line of Battle, one a Stern of another, with a large Wind, and he would have the Leaders go with the Star-board-Tacks Aboard by the Wind, he hoists a Red and White Flag at the Mizen-peek, and fires a Gun: But if they should go with the Lar-board-tacks or pounded with Charcoal only.

Aboard by the Wind, he hoists a Genoueze Flag at the same Place; which Signals must be like others, answered by the Flag-ships.

SIGNET, is one of the King's Seals, wherewith his private Letters are Sealed, and is always in the Custody of the King's Secretaries; and there are 4 Clerks of the Signet Office always attending

SILVER, of the ways of Smelting and Refining of Silver, I find these Accounts. Mr. Ray, at the end of his Catalogue of English Words about the Silver Mines in Cardigansbire

in Wales.

The Mine first beaten into small Pieces, is brought from the Mine to the Smelting-house, and there melted with black and white Coal, i. e. with Charcoal and Wood flit into small Pieces, and dried in a Kiln for that Purpose: And they use both Wood and Coal, because the Coal alone makes too violent a Fire, and the Wood alone too gentle. After the Fire is made, the Mine is cast on the Coals, and so again, Mine and Coals interchangeably. The Mine, when melted, runs down into the Sump, which is a round Pit of Stone lined with Clay within; thence 'tis laden out and cast into square Bars with smaller ends, fit to

lift and carry them by. These Bars they bring to the Resining Furnace, which is covered with a thick Cap of Stone bound about with Iron, and moveable, that so they may lift it up, and make the Test at the Bottom anew and fires a Gun, and all the Flag-ships in the (as they do at every Refining.) In the Middle of the Cap there is a Hole, in which the Bar of Silver hangs in Iron-slings above the Furnace, that so it may be let down by degrees as it melts off. Besides this Hole, they have another in the side of the Furnace, Parallel to the Horizon, and bottom'd with Iron; at which Hole they thrust in another Bar. The Test is of an Oval figure, and fits at the bottom of the Furnace. The Fire is put in by the side of the Bellows, when the Furnace is come to a true Temper of Heat, the Lead converted into Litharge, is blown off by the Bellows, the Silver fubsiding to the bottom of the Test.

As foon as all the Glut (as they call it) of Litharge is blown off, the Silver in the bottom of the Cuple or Test grows cold, and the same Degrees of Heat will not keep it melted, as before. The with, and Board the Enemy.

18. When he would have the Chase given over, fesupinto Branches (saith Mr. Ray, but I question he hoists a white Flag at the Fore-top-mast-head, his Information as to this Point.) The Test is made of Marrow-Bones, burnt to small Pieces, then powdered and made into a Past with Water. The Test is about a foot thick, laid in Iron: After the Cake of Silver is taken out, that Part of the Test which is discoloured, they mingle with new Ore to be melted; the rest they pound and

powder, and use again for another Test.

The Litharge is brought to a Reducing Furnace, and there with Charcoal only melted into Lead. The Litharge is cast upon the Charcoal in the Bing of the Furnace; and as the Charcoal burns away, and the Litharge melts, more Charcoal is thrown on, and Litherge put upon it, as at first Smelting

Another Furnace they have, which they call an Almond Furnace, in which they melt the Slugs (or Refuse of the Litharge) not stamped

The Slugs or Cynders of the first Smelting, they beat small with great Stamps, lifted up by a Wheel moved by Water, and falling down by their own Weight. First they are stamped with their own Weight. First they are stamped with dry Stamps, then sifted with an Iron-sieve in Water. That which lies at the bottom of the Sieve is returned to the Smelting-furnace, without more ado; that which swims over the Sieve is beaten with wet Stamps.

What hath pass'd thro' the Sieve, and also what after being beaten with the wet Stamps, passes thro' a fine Grate, or Strainer of Iron, goeth to the Buddle; which is a Vessel made like a shallow Tumbrel, and stands a little shelving.

On this the Matter is laid, and Water runs constantly over it, the Matter being moved to and fro with an Iron-rake; by which means the Earth and Dross being carried off by the Water, the Me-

tal remains behind.

That which is thus Buddled, they lue with a thick Hair-sieve, close wrought in a Tub of Water, rolling the Sieve about, and inclining it this way and that with their Hands: The light Part which swims at top of the Sieve, or rather over it, is returned again to the Buddle; and that which subsides goes to the Furnace to be Smelted

They have also an Assay Furnace, wherewith they try the Value of the Metal, of what Proporties the Silver: which they do tion the Lead bears to the Silver; which they do by cutting off a Piece from every Bar, and melting it in a small Cupel: First they weigh the Piece cut off, and then after the Lead is separated, the A Tun of Metal sometimes will yield 10, 15, and if rich, 20 Pound Weight of Silver.

All Lead Ore digg'd in England, hath a Proportion of Silver mixt with it; but some so lit-tle, that it will not quit cost to Refine it.

At the first Smelting they mingle several forts of Ore together, some Richer, some Poorer, else they will not melt so kindly. The Silver made here is exceeding good and fine. These fix Mountains in Cardigansbire, not far from one another, afford Silver Ore; Talabout, Geginnon, Comsomlack, Gedarren, Bromefloid and Cummer. when Mr. Ray was there, they digg'd only at Talabout.

Their Way of Digging and Collecting the Ore, was thus: They link a Perpendicular square Hole, or Shaft, the sides of which they strengthen round from top to bottom with Wood, that the Earth may not fall in. The Tranverse Pieces of Wood, they call Stemples; and on these, catching hold with their Hands and Feet, they descend without using any Rope: They dig the Ore thus, one holds a little Pique, or Punch of Iron, having a long Handle of Wood, which they call a Gad; and another with a great Iron-sledge drives it into the Vein.

The Vein of Metal runs East and West; it rises North, and dips or flopes to the South. There is a white Fluor about the Vein, which they call Spar, and a black one, which they call Blinds: This last covers the Vein of Ore; so that when it appears, they are sure to find Ore.

There are several Silver Mines at Schemuitz in

Hungary, the chiefest of which are Windschaht and Irinity. Of which Dr. Edward Brown gives us

kept open with Under-work at a great Expence. Much of this Minebeing in an Earthy Soil, its Ore is much esteemed. Diverse Veins lie North, and others run to the North-east. The blackish Ore is esteemed the best; much of it hath a mixture of a yellow shining Substance, called Marchaste; which if not in too great quantity; disposes the Ore to Fluidity, and makes it melt and run the better. There is often found growing to the Ore a red Substance, called Cinnaher; this Substance, ground with Oil, makes a Vermillion equal to, if not exceeding that Cinnabar which is made by Sublimation of Mercury and Sulphur.

An hundred Pound Weight of Ore fometimes

yields but half an Ounce, or an Ounce of Silver;

fometimes 2, 3, 4, 5 and 20 Ounces.

There is an Officer in the Works, whom they call the Probeirer or Essager, who proves the Richness of the Ore, thus: Of all forts of Ore he takes the same Quantity, and having first dried, burned, and powdred them, then he gives an equal Proportion of Lead to all, melteth and purifieth them; and then by exact Scales he takes notice of the Proportion between the Ore and the Metal contained in it, and reports it to those concerned in the great Melting-furnaces.

If the Ore be found to hold 2 Ounces and a half, or more of Silver in an 100 Pound Weight, they ordinarily melt it, without any previous Preparation by the help of Iron Stone (which, by the by. is not Iron Ore, but a Stone found thereabouts, of which the Livered-colour is the best.) Kys, (which is a fort of *Pyrites*) and *Slacken*, (a Scum or Lake taken off the Top of the Pan, into which the melted Mineral runs, and is a Substance made out of the former, melted by Fusion) which are

thrown with it into the Melting-furnace.

If the Ore be poorer, holding but 2 Ounces in 100 Pound Weight, or less: Then 'tis first pounded and wash'd, till it become richer, or hath a greater Proportion of Metal, with respect to the Ore, much of the Earthy Parts being washed away. Then 'tis thrown into the Furnace with the former Materials; and the Marchasite, which remains still with it, as finking always to the bottom with the Silver in the Walb-works, helps

to quicken the Fusion of the Ore.

Whatever is melted in the Melting-furnace, is let out thro' an hole at the bottom thereof into the Pan, which is placed in the Earth before it. And thus exposed, it immediately acquires an hard Scum, Dross, Loaf or Cake; which being taken off from the Top, the Metal remaining becomes the purer; to which is added Lead, and after some time the melted Metal is taken out. Then being again melted in the Driving furnace (as they call it) the Lead, or what elfe remains mixt with the Silver is driver off by the Blast of two great Bellows, and runs over in the form of Litharge. That which first comes over is the White, and that which is last, being longer in the Fire, is Red; the former is called Litharge of Silver, the last of Gold; but are both blown off the same Metal.

Most of this Schemnitz Silver Ore holds some Gold, which is separated from the Silver by Granulation and Dissolution in Aqua Fortis.

Hungary, the chiefest of which are Windschaht and Trinity. Of which Dr. Edward Brown gives us this Account in Philosophical Transactions, No. 58. Trinity Mines are 70 Fathom deep, built and fo as that it can't be forced from its Impuri-

ties by the violent way of Melting; tho' Lead, and even Artificial Salts or Fluxes be added: In this Case the Use of Quicksilver hath been found most advantageous. The way of applying it is

They Calcine the Ore, first broken into small pieces, in a Reverberatory Oven; but with a moderate Fire for fear of Fusion, and driving away into the Airpart of the Metal. This Calcination frees the Mineral from fuch Mixtures as would hinder the Power of the Quickfilver upon it, and also renders the Ore more tractable and pliant under the Milstone; where 'tis reduced to a fine Powder, before the Application of the Mercury upon it. For the Ore being Ground, Calcined, Powder'd, and finely fifted, they divide it into feveral heaps, and then by leffer Effays they find how much Silver is contained in each heap; where tis very ordinary to find not above 6 Ounces in 100 Pound Weight, sometimes 12; but if it arises to 18, 'tis esteemed a very rich Vein ! Yet sometimes there are great Masses found of pure Silver, which they call Virgin Metal.

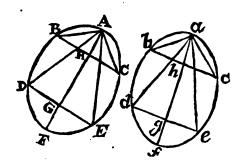

Then proportionable to the quantity of Silver in

each heap, they besprinkle them with Quicksilver, and that not all at once, but at feveral times, flir-ring the Ore up and down. If the Mercury give Signs of its being Tocado (as they call it) i. e. if it appear mortified; not in small and clear Spherical Figures (which is a good Prognostick) but in the form of long Worms, of a wan, pale, dark and Leadish Colour (which indicates that the Ore abounds with Lead, &c.) it is cured by certain Magistrals, which have for their Basis or Master Ingredient, Calcined Copper mingled with Salt.

The heaps of Ore being thus mingled with Quickfilver, are often stirred about, the better to incorporate the Mercury and Silver. They feem to have only Conjectural Signs to know when the Quickfilver hath done its Office in separating the Silver from these Heterogeneal Substances; which occasions by its uncertainty great Losses, e-specially when they Work this way on Gold. But when by the Colour of the Mercury, Coagulated by the Silver in clear Massy Lumps, they conje-dure the Work done, they wash it by means of three Veffels, standing in order, one under another: Dust of the Hoterogeneous Matter that imbody not with the Mercury, is carried away together with the Water into the other Vessels, and from thence is quite thrown out by the continual Current of the Water: While the Silver in clotted Lumps (called Pella's) is by the Weight of the Mercury carried down to the bottom of the Tubs. Then the Mercury, with the Silver is taken out of the Vessels, and diligently squeezed in strong coarse Linen-cloths, and even with Strokes of a Beetle, that the Quickfilver may be separated as much as may be from the Silver. And this Mass is afterwards reduced in Molds of the shape of the Indian Pine-apple, into a Piramidal or Conical Figure, which they call Pineas de la Plata: They are thus fashioned for the easier placing them round the edges of a great Earthen, Vessel of the form of a blind, Alembick: Round about the top of which a Fire is made, and then all the rest of the Mercury forthwith abandons the Silver and falls to the bottom; from whence its recovered and kept for the like use again.

The Silver last of all is melted down with Liga, as 'tis called, which the King of Spain allows, by which he returns to the People in Copper the fifth part, which they allow him of all the Silver. Philog. Trans. No. 41.

SIMILAR Light, according to Sir If. Newton, is such, whose Rays are all equally Refrangible; and this he calls also Simple and Homogeneal.

SIMILAR Sections in Conicks, are fuch whose Diameters make equal Angles with their Ordinates; and also wherethe Triangles ADE, ABC, nates; and also wherethe I riangles ade, abc, and the ate Similar to the Triangles ade, bc. Their Diame-Bases DE to BC; as de, bc. Their Di ters also, as AF, and a f are called Similar.

SIMPLE Light. See Homogeneal,

SINCERITY, in Ethicks, is defined to be that Virtue, Power, or Act of the Mind, by which the Will is determined to follow and perform that which the Intellect determines to be best and most proper to be done in all Cases, and to do it because it is so.

SINE-CURES, are Ecclesiastical Benefices without Cure of Souls. No Church where there is but one Incumbent, can properly be a Sine-cure: And tho' the Church being down, or the Parish being become destitute of Parishioners, the Incumbent may thereby be necessarily acquitted from the actual Performance of Publick Duty, yet he is still So that the Matter in the first and highest, being under an Obligation to do it, whenever a Church worked and stirred about with a Molinet, all the shall be built, and there are a competent number of Inhabitants. And in the mean while, if the Church be Presentative, as most such Churches are, the Incumbent is Instituted in Curam Animarum; and fuch Benefices are rather Depopulations than Sine-cures, and 'twill be proper for the new Incumbent to read the 30 Articles, and the Liturgy in the Church-yard, &c. and to do what other Incumbents usually do. But a Rectory or a Portion of it may properly be a Sine-cure, if there be a Vicar Endowed, and then it doth not come within the Statute of Pluralities of 21 H. 8. c. 13. Which declares that he Parsonage which both a Vicar declares that no Parsonage which hath a Vicar Endowed, shall be comprehended, &c. So that here no Dispensation is necessary to hold this Sinecure with a former Living. Nor need he read the Articles or Divine Service, as required by 13 Eliz. c. 12. which extends only to a Benefice with Cure. A Sine-cure Donative wants no Institution and Induction. But one Presentative must have both; especially if it consist in Glebe and Tithes, and not in a Portion of Money. But the Institution must not run in Curam Animarum, but in L111 RectoRectoriam sive Portionem Rectoria de A. B. &c. By the abovementioned Stat. 21 H. 8. not only Prebends and Rectories, with Vicarages Endowed, but Deanries and Archdeaconries are declared to be Benefices without Cure.

SINES on the Plain Scale, Gunter's Scale, and almost all Scales have a Line, called the Line of Sines. This on the Sector is double, one on each Leg, and hath there many excellent Ules; some of which are these:

1. The Radius of a Circle being known to find the Sine of any Arch or Angle.

Fit in the Radius between on and go in the Lines of Sines, and the Parallel distance between the Numbers of Degrees, answering to any Works or Angles, will give their Sines. Thus the Parallel Angles, will give their Sines. Distance between 60, 30, 45, Ge. will give the Sines of 60°, 30°. 45°. Ge. And vice versa, from the Sine given you may find the Radius, by fitting the Sine into the Sector Parallel-wife, between the Numbers expressing its Degrees. For then the Parallel Distance between 90 and 90, will be the Radius fought.

2. The Radius of a Circle being given, and any Right Line less than it, to know of what Ark it

may be the Sign.

Apply in the Radius between 90 and 90, in the Lines of Sines, and taking the Length of the Line in the Compasses, carry it Parallel to the Radius, till it fall exactly on like Sines on each fide; and the Degrees and Minutes where it fits, shall give you the Sine it represents.

SINUS, in the Dura Mater, is that ftrong and thick Membrane which covers all the Cavity of the Cranium. There are several eminent Sinus's or Chanels, which run 'between its External and Internal Membrane: Of these four principal ones are usually described; as 1. The Sinus Longitudinalis, 2 and 3 Sinus Latereles; and 4 Sines Vertebralis. (Keil, p. 133.)

SI Recognoscant, is a Writthat lies for a Creditor against his Debtor, for Money Numbred, and owned before the Sheriff in the County-court by the Debtor, to be due to the Creditor.

SIXAIN, is an ancient Order of Battle for 6 Battalions, which supposing them all in a Line, is formed thus: The 2d and 5th Battalions advance and make the Van. The 1st and 6th fall into the Rear; leaving the 3d and 4th to Form the main Body. Each Battalion should have a Squadron on its Right, and another on its Left. Any Number of Battalions which are Multiple of 6, may be drawn up by this Order, i.e. 12 Battalions may be put into 2 Sixains, and 18 Battalions into 3, &c.

SIZING, is a curious way of Drefing the Tin Ore, after it comes from the Launder of the Stamping-mill; which is by fifting it thro' an Hair-Sieve, casting back the remainder in the Sieve in-to the Tails, to be Trambled over again. See Buddle and Tin

which are enclosed in two or three Covers of a Pyramidal Figure. Between these Papilla are an infinite number of Holes, which are nothing but the Orifices of the Excretory Vessels of the Miliary Glands underneath.

Secondly, There appears a Web of Nervous Fibres, and other Vessels, differently interwoven: This is always covered with a Mucous Substance, ferving to support and moisten the Papilla Pyrami-And this is the Parenchyma, or that part of the Skin that Parchment is made of.

The third part is an infinite number of Miliary Glands, about whom there is much Fat usually: These Glands separate the Matter by Sweat and Insensible Perspiration. Each Gland receives a Nerve and Artery, and sends out a Vein, and an Excretory Duck; which last passes thro' the other two Parts to the Cuticula, in order to moisten it and the Papilla Pyramidales, lest they should be so dry as to hinder the Sense of Feeling; and also to dif-

charge that Matter out of the Body.

The use of the Skin is to cover and wrap up all the Parts of the Body, to be the Organ of Touching or Feeling, and to be the Emunctory of the whole Body. For thro'the Glandsof the Skin, pass not only such Particles of the Vessels, as decay, by reason of the continual Motion of the Blood, but likewise the greatest part of the Liquors which we drink; which having perform'd part of their Office, in conveying the Aliments into the Blood, are in the next place to dissolve the Saline and Terrestrial Particles to be carried off thro the Glands of the Skin and Kidneys. Sanctorius computes, that about 50 Ounces a Day are thus carried off thro' the Cutaneous Glands: So that if a Man's Body be supposed to weigh 160 Pound in 51 Days he may perspire a Quantity equal to the weight of his whole Body. Keil's Anato-

Above the Cutis or thick Skin of the Body lies the Cuticula or Scarf-skin, and is composed of several Plates of small Scales, which cover one another, more or less, or lie thicker, according as it is thicker in one part of the Boey than in another: Between these Scales the Excretory Duck of the Miliary-Glands of the Cutis, or thick Skin, open. Lewenhoeck reckons, that round about one Cuticular 500 fuch Ducts may lie, and that a Grain of Sand will cover 250 of these Scales: So that one Grain of Sand will cover 125000 Orifices of these little Ducts; and yet into every one of these Miliary Glands an Artery, Vein and Nerve do certainly enter. These Glands secent the Sweat, and what goes off by infensible Perspiration: And they must be very many in number, fince, Sanctorius observes, 15 Ounces of a Fluid Matter passes in 24 hours time. Next under the Scarf-Skin liethe Papilla Pyramidales, which also are prodigiously numerous, being the Extremities of all the Nerves of the Skin, and do more immediate ately serve for the Sense of Feeling, and to cond vey the Impulse received, by means of the Nerves to the Brain. About these the Nerves and all other Vessels make a fine Web, all covered over with a Mucous Substance, to moisten these Papil-SKIN. As foon as the Cuticula or Scarf-skin is feparated from the Cutic or true Skin of a humane. Dulls up to the Surface of the Scarf-skin on the Cutic or true Skin of a humane. Body, there are these three parts appear first, an which there are many Parallel Lines, and these infinite number of Papilla Pyramidales, which are tracked by others, and in each Intersection there the ends of all the Nerves of the Skin, each of is an Hair usually placed. The Scales of the

Scarf-skin defend the Orifices of the Excretory Ducts of the Miliary Glands, and hinder Objects from making too exquisite and painful an Impresfion upon the Nerves, and so to save them from External Injuries. The Skin itself is designed to External Injuries. enwrap the whole Body, and to sustain the Pa-pille Pyramidales in their Places, and the Miliasy Glands from being disordered; also to receive the Impression of external Objects, and to be the Organ of the Sense of Touching and Feeling.

SLAM; a Term used in the Alum-Works:

which fee.

SLEDGE; is a large Smith's Hammer to be used with both Hands: Of this there are two forts, The Uphand Sledge, which is used by under Workmen, when the Work is not of the largest fort: This is used with both the Hands before, and Thus, if A and B be the fides of 2 Cubes to be they seldom raise it higher than their Head. But the other, which is called the About-Sledge, and which is used for battering or drawing out the largest Work, is held by the handle with both Hands, and swung round over their Heads, at their Arms-end, to strike as hard a Blow as they can. will be equal to SI.OOP, is a Vessel of the Shallop-kind. SOFITTO, is the Italian Term in Architecture, for the Eaves of the Corona of the Capital

of a Column.

SOLIDS: there are usually placed on the Sector 2 Lines (one on each Leg) which are called by Gunter very properly, the Lines of Solids. These are graduated, either by finding 2 mean Proportionals between the whole fide, and each 1000 part of the like side, all of them cutting the same 2 Right Lines; and then the former of the 2 Lines so cut, shall contain the Divisions required. Or Apply over then 18 between 27 and 27 in the Line the Lines of Solids may be made out of the Line of Solids, and keeping the Sector at that Angle; this is the readiest way; for the Roots taken out the Lines of Equal Parts, shall give the Cubes in the Lines of Solids, c. gr. To inscribe the Place of 125 in the Line of Solids, affix 12 Cyphers to it, and then extract the Cubick Root, which will be and then extract the Cubick Root, which will be 50000; and that taken out of the Line of Lines, will find the Point of 125 in the Line of Solids, &c.

The Use of the Lines of Solids.

1. To find the Proportion between two or more

Similar Solids.

In the Sphere, in regular Parallels, and other like Bodies, whose Sides adjoining to the equal Angles are proportional; proceed thus: Take one
Root, &c. Wherefore the Line of Solids is diviof the Sides of the greater or greatest Solid, and ded first into 1000 unequal Parts: And thereopen the Sector to it in the Points of 10 and 10, in the Line of Solids: And then taking the like Sides of the lesser Solids severally, and carrying

longing to those Points, will express the Proportions to 1000; that is, the Solids will be to each other as these Numbers are to 1000

2. To Augment or 1 iminish a Solid in a given

Ratio; as suppose in that of 2 to 3.

Open the Sector to the side of the Solid given in the Points 2 of the Number given; and then keeping it at that Angle, the parallel Distance between 3 and 3, the Points of the Number required, shall give the like fide of a Solid fimilar to the former, and in the Ratio required.

3. To Add or Substract one Solid to, or from

Find the Ratio between them (by Prob. 1.) and then Add or Substract those Proportions, and accordingly augment or diminish (by the precedent.) added or substracted; I first find the Proportion of A to B to be, suppose, as 100 to 10, or as 5 to 2 3 then adding 5 to 2, it makes 7: wherefore I augment the side A, in the Ratio of 5 to 7, which will give a new side, as C, on which a Cube being made, will be equal to them both. Proceed vice versa,

4. To find 2 Mean Proportionals between 2 gi-

ven Lines; as suppose between A and D.
First find (by the Line of Lines) the Ratio between the 2 given Lines, which are the Extreams, and let that be in Numbers as 27 to 8; and then open the Line of Solids on the Sector, so that the greater Extream A, may be applied in the Points 27 and 27. Then keeping the Sector at that An-2 Means. Next, apply that Mean B over in the Line of Solids on the Points 27 and 27, and then the parallel Distance between 8 and 8 will give you C, the other Mean fought.

5. To find 2 Mean Proportionals between 2 Num-

bers given: Suppose between 27 and 8.

Reckon 27 and 8 on both fides in the Lines of Solids from the Centre. Then taking 27 from the Centre also in the Line of Lines, put it over in the Line of Solids in the Points 27 and 27. So shall the parallel Distance between 8 and 8 in that Line, reckoned in the Line of Lines from the Centre, give 18, the former of the 2 Means fought.

In the Extraction of the Cube Root, you must point from the Right-hand towards the Left, the first, and then every third Place; and then there will be as many Places in the Root, as there are fuch Points over the Cube Number given. Whereore if the Number be under 1000, the Root can consist but of one Figure. If less than 100000, it can confult but of 2 Places; and if less than fore, if the Number given be greater than 1000, the first Division of the Line, which before signified but one, will now stand for 1000, &c. as in them parallel to the former, till the Feet of the the Line of Numbers. By this means, if the last Compasses stay in like Points; the Numbers be- Point over a Cubick Number, fall on the last Fi-Ddddd

gure to the Left-hand, the Number given shall be reckoned on the Line of Solids, from 1 to 10, and the first Figure of the Root will be either 1 or 2. But if the Point fall on the last Figure but one, the Number given must be accounted in the middle of the Line of Solids, between 10 and 100, and the first Figure of the Root will be always either there is a Solution of this Problem, of finding the 3, or 4. And if the last Point stand over the last Figure but two, then the Number given shall be accounted at the end of the Line of Solids, between 100 and 100.

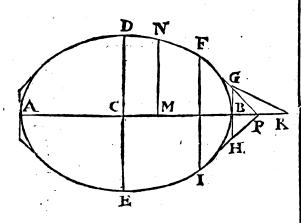

This being premised, the Extraction of the Cube Root will be easy, without opening the Sector: Set one Foot in the Sector, and extend the IA, from I towards X. other to the Point representing the Numbers. That Distance will reach in the Line of Lines

from the Center to the Root.

Thus the nearest Root of 8490000 is about 204 of 8490000 — 439 of 849000000

And the Extent from the Centre of the Line of Lines to any Number for a Root, will reach in the Solids from the Centre to the Cube.

SOLID of least Resistance, Sir Isaac Newton, in his Principia, p. 327. shews, that if

there be a Curve Figure, as DNFB, of fuch a nature, as that from any Point, as N, taken in its Circumference, a Perpendicular be let fall to the Axis, as NM: And if from a given Point, as G, the Right Line GR, be drawn parallel to a Tangent to the Curve in that Point; and also if the Axis being produced till GR cut

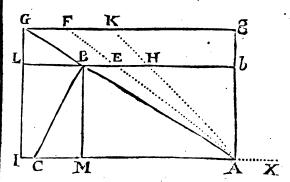

it, it then be, as MN. GR:: GR . 4BRx

Then the Solid, which may be generated by the Revolution of this Curve round its Axis AB, when moved most swiftly in a rare and elastick Medium. shall meet with less Resistance from the Medium, than any Circular Solid whatfoever, described af-ter the same manner, and whose Length and Breadth are the same.

After this, in the Year 1629, M. le Marquis de L'Hospital, produced an easy Method of finding a round Solid, which being placed in a Fluid, whose Parts are at rest, shall, when moved in that Fluid parallel to its Axis, meet with less Resistance from the Medium, than any Solid whatever, whose Length and Breadth are the same, and which shall be moved with the same Velocity.

And this he doth by finding a Curve, which revolving round its Axis, shall generate the Surface of fuch a Solid. See Memoires de l'Academ. Royale des Sciences, 1699. In the latter end of the Year 1700, Mr. John Craig sent to the Publisher of the Philosophical Transact. a Latin Letter, in which Solid of least Resistance. (See Philos. Trans. No. 268) and which is introduced by this Lemma.

To find the Ratio between the Resistance of the Right Angled Triangle AIG, and the Rectangle AIGB, circumscribing it, when each is moved in a Fluid, according to the Direction of the Line

From any Point, as B, draw the right Line BG, perpendicular to the Diagonal GA, Bb parallel to AI, and also BM normal to AI; then take in Bb, bH= CM^{*}

BC and bE=BC, and thro' the Points H, E, let the right Lines HA, EA, be produced till

they cut Gg in k and in F.

Then I fay, that the Resistance of the A AIG, is to the Resistance of the Rectangle AIG, as the Area of the Triangle AIG, is to the Area of AFg, and the Refistance in any part of the Line AG, is to the Resistance in the corresponding part of the Line Ag (suppose in AB and Ah, &c.):: as the Area AHB, to the Area AEB. The Demonstration of this depends on a general Theorem, which I did very easily deduce from the 35 Prop. of Sir Is. Newton's Princip. p.

Cor. 1. Let BG, and hg, be infinitely small Parts of the Lines AG, and Ag, and produce bB to L; then I say, that the Resistance in BG, (which let us call e) is to the Resistance in bg,

(which call E) as GL^2 is to GB^2

For e. E:: KHbg. FEbg; that is, e. E:: bg x b H. bg x b E (by the preceeding Lemma) CM. wherefore e. E :: bH. bE. (that is) e. E :: BC

BC. (by the Construction of that Lemma) wherefore e. E:: CM². BC². But CM². BC²:: GL². GB², (from the similar Triangles BMC, GLB)

wherefore e. E:: GL². GG². Q.E.D.

Cor. 2. The Resistance against the infinitely small part GB, is equal to the Cube of the Line GL, divided by the Square of the Line GB. For if all the infinitely small Parts of the Line Ag, (as bg, Ec.) be supposed equal; then the Resistance in by might be expressed by bg: that is, E=bg, and therefore E=GL. Wherefore, by Cor. 1. e. GL::

GL: GL². GB². wherefore e= Q.E.D.

Cor.

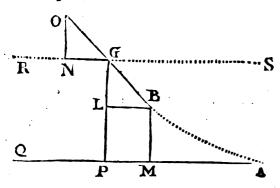

Cor. 2. Let r be Radius, and c the Circumfe rence of any Circle; I say, the Resistance against the Conical Surface, generated by the Rotation of the Lineola G B, round about A I, is equal to the Product of $\frac{c \times BM}{r}$ into $\frac{GL^3}{GB^2}$: for the Re-

fistance against that Conick Surface, is equal to all the Resistances against the Lineola G B; that is, to all the e. That is, 'tis equal to the Circumference of the Circle whose Radius is B M, multiplied by ϵ . That is, the Resistance against that Conick Surface, is equal to $\frac{c \times BM}{r} \times e$. wherefore

by Cor. 2. it is equal to $\frac{c \times BM}{r} \times \frac{GL^4}{BG^2}$ Q. E. D.

Then follows the Problem proposed, which is this:

Problem, To find the Curve, by whose Rotation round an Axis, a round Solid shall be produced, which, supposing to be moved in a Fluid, according to the Direction of the said Axis, shall suffer the least possible Resistance in that Medium.

Suppose O G, G B, two infinitely small Parts in the Curve required, by whose Rotation round the Axis A Q, the Solid of least Resistance is ge-nerated. Let B M, G B be drawn at Right Angles to AQ, and draw BL parallel to AQ, and ON parallel to BM. Tis then plain, that $c \times BM \times GL^3$ is the Resistance against the Surface generated by the Rotation of the Lincola GB, about the Axis AQ; and that $\frac{c \times GP \times ON^3}{r \times OG^2}$

is the Refistance against that generated in like manner by OG, from Cor. 3. of the preceding Lemma. Now both these Resistances taken together, must be the least possible: Wherefore

 $\frac{c \times BM \times GL}{r \times GB^{2}} + \frac{c \times GP \times ON^{2}}{r \times OG^{2}}$ - == a Minimum,

or to the least possible Resistance. And consequently in the Line R S, (which must be drawn parallel to A Q; so that O N = GL) the Point G is to be Investigated, where this will happen. And supposing O and B sixed Points, this will easily be sound by the Meshed of Maximis Sd. Minimus Sd. Minim be found by the Method de Maximis & Minimis. And producing the Calculus, it will come

 $\frac{BM \times BL}{BG^4} = \frac{GP \times NG}{OG^2}.$ at last to stand thus; -

Wherefore tis plain, that $\frac{BM \times BL}{BG^4}$ is an invari-

able Quantity. So that if the Abscissa AM, be called x, and the Ordinate BM = y, then BLwill be = x and GL = y (which in this whole Calculus, I suppose invariable) whereof BG:

 $x \times y y^*$ will be an invaria $xx \times yy$. Wherefore .

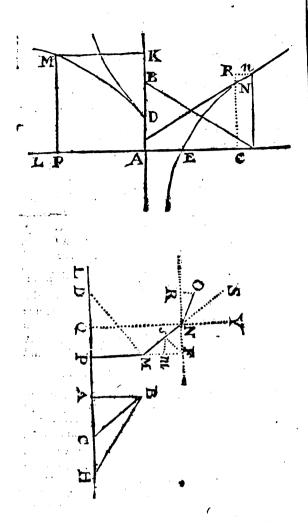

ble Quantity. Let then a be an invariable Line, and then, according to the Laws of Homogeneals, it

will be $\frac{yx}{xx \times yy^2} = \frac{a}{y^4}$ as was discovered by the famous L'Hospital, and James Bernouilli. Q.E.I. SOLID of least Resistance. The wonderful Sir Is. Newton, in his excellent Treatise, de Princip. If. Newton, in his excellent Treatile, ae Princip. Philof. Mathem. l. 2. Sect. 7. gives us, in Prop. 35. and Schol. of Lib. 2. the Property of a Curve, as DM; which being supposed to revolve about its Axis AL, shall generate a Solid, whose Re-fistance, when moved in any Fluid whose Particles are at rest, according to the Direction of the said Axis, from L to A, shall be the least possible: that is, the Solid shall meet with less Resistance from the Fluid, than any other generated by any other Curve described to the same Axis AL, and passing thro' the given Points D M.

The Excellence and Usefulness of this Problem, especially as to the Figure of the Bodies of Ships, did engage several eminent Mathematicians to consider it fully, and (because the great Author had concealed his own) to communicate several Methods of Investigation of this Curve: As the Noble Marquis de L'Hospital, Mr. John Bernouilli, Mr. J. Craig, and M. Fatio, have already done. From whence the Industrious Mr. Hayes, in his Book of Fluxions, p. 147. extracts the fol-

lowing Solution.

Dadada

To investigate the Nature of that Curve which shall generate the Solid of least Resistance.

Imagine the little Lines MN, NO to be two sides of the Infinito-lateral Polygon, which conflitutes the Curve required: Draw MP, NQ Ordinates to the Axis AL, and draw RNF Parallel to the fame Axis AL, and let OR, MF be perpendicular to RNF, and MD perpendicular to the Side MN.

Then'tis evident, that if the Right Lines MN, NF move in the Direction of the Axis from L towards A, that the Force of Resistance of the Fluid in such a Case, is equal to the Action of the Fluid moving in the same Direction from A to-Lines MN, MF, being quiescent, draw FS per-pendicular to MN, and then the Triangles FSN, FMN, PMD are similar; therefore if FN represent the Force of a Particle of the Fluid to move the Line FM, in the Direction of AL, from A towards L, then FS will represent the Force of the same Particle of the Fluid to move the Line MN in the Direction of MD, from M towards D; that is, the Force of the Particle to move M from FA towards L, is to the Force of the same Particle to move MN, from M toward D::FN:
FS::MD:DP. Again, if MD represent the Porce of the same Particle to move MN from M towards D, then DP will represent the Force of the same Particle to move MN in the Direction of DP, from P towards D; therefore the Force of the Particle of the Fluid to move MF, from A

towards L, is to the Force of the same Particle to move MN from A towards L: DM : DP : MN : FM : The Proportion between the Force of the Particle of the Fluid to move MF (or Q v) from A towards L, and the Force of the same Particle to move MN from A towards L may be sound thus: If FN represent the Force of the Particle against QN v in the Direction from A towards L, then FS will represent the Force of the same Particle against MN s in the Direction of MD; and if FS represent the Force of the Particle against MN from M towards D, then mS will represent the Force of the same Particle against MN in the Direction of AL from A towards L: therefore the Force of the Particle of the Fluid to move MF (or QN) from A towards L, is to the Force of the same Particle to move MN from A towards L, as EN is to mS, that is, as FN q is to FS a, or as MD a is to DP a.

to FSq, or as MDq is to DPq.

Whence if the given right Line AB(a) represent the Velocity of the Particles of the Fluid striking against the Right Lines MN, MF, then the Force of the same Fluid upon the Plane described by MF revolving about the Axis AL at the distance MP, and directly opposed to the Motion of the Fluid, will be as the Surface described, and Velocity jointly; that is, as a x MF x MP, whence to find (from A towards Q) the Force of the Fluid on the Surface MN; say, MN²:

FM²: Ax MF x MP.

Whence to MF x MP.

FM²: : a × M F × M P: MN²

to the Force (in the Direction of AL from A towards L) of the Fluid on the Oblique Surface deficibed by the Rotation of MN about the Axis AL; or, which is the fame thing, the Quantity

a × MF³ × MP

expressing the Resistance which

MN²,

the same Surface moving from L towards A,
suffers from the Fluid at rest. In like manner
the Resistance, which the Surface described by
NO revolving about the Axis AL, meets with
from the quiescent Fluid, may be represented by

 $\frac{a \times OR^{t} \times NQ}{\overline{NO}^{2}},$

Then 'tis evident, that if the Right Lines MN, Now if we suppose the Points MO, and the NP move in the Direction of the Axis from L towards A, that the Force of Resistance of the Fluid in such a Case, is equal to the Action of the Fluid moving in the same Direction from A towards L(and with the same Velocity.) On the said Lines MN, MF, being quiescent, draw FS per-

Let the invariable Quantities MF be = m, MP=r, OR=n, NQ=q; and the variable Quantities FN=v, and NR=z; then MN^z = mm + vv, and NOz = $nm \times zz$; therefore the Resistance which the Surface described by the Line MN meets with, viz. $\frac{a \times MF^{*} \times MP}{MN^{2}}$

is $=\frac{a+m^2 \times r}{m m + v v}$, and that which the Surface described by NO (revolving about the Axis AL)

viz. $\frac{a \times \overline{OR}^3 \times \overline{NQ}}{\overline{NO}^2}$ is $= \frac{a \times n^3 \times q}{nn + zz}$, whence And having thus discovered the Property of the Curve MD, it may be Constructed by help of the Logarithmetical Line in this manner: that the Quantity $\frac{a \times m^3 \times r}{mm + vv} + \frac{a \times n^3 \times q}{nn + x}$ ought to be a minimum, and (Art. 198.) confequently the Fluxions thereof must be = 0. Whence $\frac{2 m \cdot r \times vv}{m m + vv} = \frac{-2 n \cdot q \times zz}{n n + zz^2}.$ Now because v z + is = R F an Invariable Quantity, therefore v = -z, and confequently $\frac{m \times r \times v}{m m + v v}$ $\frac{n: \times q \times z}{zn + zz}$. Whence if A B (a) be erected Perpendicular to the Axis A L, and if the right Lines B C, B H, be drawn Parallel to the Infinitely little Sides M N, NO, it will be 4 A B × A C: BC:: BC: MP; and in like manner 4 A B * × AH: BH:::BH: NQ; for because the Triangles M F N, B A C are Similar, therefore A $C = \frac{a u}{m}$ and B $C = \frac{a \times mm + vv|_{2}^{2}}{m}$, whence $4 \text{ A B}^{\bullet} \times \text{A C}\left(\frac{4 a^{\bullet} v}{m}\right) \cdot \overrightarrow{\text{B C}^{\dagger}}\left(\frac{a^{\bullet} \times m m + v v}{m^{\bullet}}\right)$ $: BC\left(\frac{a \times mm + vv\frac{1}{2}}{m}\right): MP(r) \text{ and confe-}$ quently $\frac{r m! v}{m m + v v} = \frac{1}{4} a$. In like manner, because the Triangles OR N, BAH, are Similar, A H = $\frac{az}{n}$ and B H = $\frac{a \times nn + zz\frac{1}{2}}{n}$. Whence by the Property of the Logarithmetical Line. by the Property of the Logarithmetical Line $z: \overline{BH}(\frac{a \times n + z + z}{n}): BH^{s}(\frac{a \times n + z + z}{n}): NQ = q.$ Whence CN, therefore AP(x) is $\frac{az}{4a} = RN$, whence $\frac{az}{4a} = RN$. $\frac{qn \cdot z}{nn + zz} = \frac{z}{4}a; \text{ and consequently, } \frac{m \cdot x \cdot x \cdot v}{mm + vv} + \frac{z}{4}a \text{ Invariable Quantity } \frac{sa}{48}, \text{ and consequently,}$ n + zzthat we first found. Whence 'tis manifest; that the Nature of the

Curve MD (which being revolved about its Axis A L, generates the Solid of least Resistance) is fuch, that drawing A K Perpendicular to the Axis A L, and taking A B = a, and drawing B C parallel to any Tangent of the Curve, v. g. in the Point M, then it will always be 4 A B 2 x A C: BC': BC: MP the Ordinate paffing thro the Point M, which is the Property of the Curve that generates the Solid of least Resistance, discover'd by Sir Isaac Newton.

In the Perpendicular A K assume A B = a, and in the Axis A L produc'd, take A E = $\sqrt{\frac{1}{2}}aa$.

and through the Point E describe the Logarithmetical Line EN, and let AK be the Assymptote, and ‡ a the Sub-tangent; then take AC at pleafure, which suppose = z, and draw C N parallel to A K, until it meet the Logarithmetical Curve in N; then if A K be taken = $\frac{aa}{4z} + \frac{z}{4} + \frac{z^3}{4aa}$ and $AP = \frac{xz}{4a} + \frac{3z^4}{16a^3} - \frac{5a}{48} + CN$ (viz. + CN when AC AE and —CN when AC AE) and compleat the Parallelogram PK, I fay, the Angle M, or the Point wherein K M interfects

P M will be in the Curve requir'd.

For A C being = x, if A P = x, and P M = y, then by the Property of the Curve A K or $PM = y is = \frac{a^4 + 2aazz + z^4}{4aaz}, \text{ and confe-}$

quently, $y = \frac{1}{2}z + \frac{3zzz}{4aa}, -\frac{aaz}{4zz}$ and because B C is parallel to the Tangent in M, therefore the Triangle ABC is Similar to the little

Triangle at M, and consequently $a:z:y:\frac{zy}{a}$ $\dot{x} = \frac{z\dot{z}}{2a} - \frac{3z^2\dot{z}}{4a^4} - \frac{az}{4z}$, and the flowing Quan-

Which is the very same Equation when CN vanishes, then A P or x will vanish also, therefore C M is the Curve requir'd.
SOLSTICE: how to find the exact Times of

Solstices, see under Tropick in Vol. 1.

SOUND, Mr. Carre, of the R. Academy of Sciences at Paris, hath published this Year a Book Sur la Theorie General du Son, &c. In which he shews that Sound, when considered with relation to Body, confifts only in the Motion of the Air; but in such a Motion as is very different from the Wind. The first Motion from whence Sound comes, is produced (he thinks) by little Vibrations, or Shakings repeated, which the Parts of the Sonorous Body occasions in the Air; whereas Wind consists in a Local Motion of the Air, without Vibrations; and this he proves by several Experiments. The Motion of the Air in Winds, will act strongly on Flame, but will not affect the Ear with Sound, but on the Interpolition of some Body which may occasion some Vibrations: Whereas the Agitation of the Air in Sounds affects not Flame; for a lighted Candle put near a

Bell which hath been struck, will not have its

Flame agitated by the Sound.

He concludes also, that Sound is not produced by a total and fensible Vibration of the sonorous Body; but by insensible Vibrations of the little Parts, always helped, and sometimes occasionable by total Vibrations. Thus, when a Chord hangs loose, it will move forward and backward quick enough (when struck) without making any Sound; because thro' want of being straitly extended, each little Part can't make its Vibrations by itself, and

communicate them to the Air.

In sonorous Bodies, in the same, or of different Matter, the difference of Sound, as to Grave or 3. Whether Sounds move in the fame Time, the Acute, flows from the greater or lesser spring of same. Spaces, in all States of the Atmosphere, each l'arr, and from the more or less quickness and Heights of the Barometer? with which these Parts do bend and unbend. Two Strings or Wires, one of Gold and the other of Steel, of the same Length, Thickness, and Tension, yet will give a different Sound, viz. the Gold one more Grave, the Steel-wire one more Acute; because the Parts of the Gold are more soft and flexible, and have less Spring than those of the Iron, and therefore will have less speedy, and weaker Vibrations. But yet Sound, be it flat or sharp, is still strong or weak; and 'tis not the Strength or rates or retards the Motion of Sound?

Weakness of Sound, that renders it flat or sharp:

8. Whether Sounds have the same strong Seundarises from great Vibrations in the Air, Velocity in Summer and in Winter. and from a great Quantity of it, moved in the same time; and the weak Sound is occasioned by the just contrary. So that the Strength or Weakness of Sound, is in proportion to the Quantity of Air struck, and the Strength of the Vibrations: But Grave and Acute Sounds follow the Proportion of fwift at all the Elevations of the Gun? greater or leffer Number of the Vibrations of the Air in the same time.

The Reverend Mr. William Derham, a very industrious and useful Member of the Royal Society. in Philosophical Transactions, Nº 313. hath obliged the World with some very curious and careful Observations and Experiments about the Motion of Sound; being furnished with very good Position? Instruments, and many Advantages to make them,

which others have not been.

He observes, first, that there hath been a considerable difference in the Accounts given by good Authors, about the Velocity of the Motion of Sound. Sir If: Newton, in Princip. Lib. 2. Prop. 50. allows but 968 Feet for the l'rogress of Sound in a Second of Time.

The Hon. Mr. Fr. Roberts, Phil. Trans. No 207. 1300 Feet.

Mr. Boyle, in his Fffay on Languid and Unheeded Motion, 1200 Feet.

Dr. Walker, in Phil. Trans. No 247. 1338 Feet. Mersennus in Balistie. Prop. 39. 1474 Feet.

Flamstead and Halley, 1142 Feet.
The Florentine Academy, 1148 Feet.
The French Observ. Hist. Acad. Regie, 1172 Feet.

The Reason of this Diversity he judges to arise, (1.) From these Gentlemens using not good Pendulum Clocks ordinarily, but a String and Plummet only, of fuch a length as to swing Seconds. But this latter way can't be so exact as that by a Movement; because the Observer's Eye must first observe the Flash of the Gun, &c. fired; and then the Swing of the Pendulum, which takes up Time, and occasions much Confusion. (2.) From there not being distance enough between the Sound and the Place of Observation.

Winds, of which more below. And he judges, that the little difference there is between the three last Numbers of 1142, 1148, and 1172, arifes from there being good Pendulum Clocks made use of in these Observations, and the Distances being considerable.

After this, he proposes to answer the following

Questions:

1. How far a Sound moves in a Second of Time, and consequently in any Time assigned?
2. Whether the Report of a Gun, discharged with its Mouth towards, comes somer, than when its Muzzle is from the Observer?

4. Whether they move faster by Day, or by

Night?

- 5. Whether they move swifter with, or slower against the Wind? And how the Wind affects them ?
- 6. Whether Sounds move faster in calm or ftill, then in windy and turbulent Weather?

7. Whether a strong transverse Wind accele-

8. Whether Sounds have the fame Degree of Velocity in Summer and in Winter.

9. Whether they have the same in snowy and clear Weather?

10. Whether a great Sound and a small one have the fame Velocity?

11. Whether the Sound of a Gun move equally

12. Whether different Strengths of Gun-powder change the Motion of the Sound of the Re-

13. Whether the Velocity be the same in all Heights of the Atmosphere above the Earth?

14. Whether the Report be in the same Time, if the Piece be discharged in an Acclive or Declive

15. Whether all kinds of Sounds, as of Guns, Bells, Beetles, &c. have the same Velocity?

16. Whether Sounds be swiftest in the begin-

ning of their Motion, and slowest in the end?

17. Or whether they be not rather equable, moving equal Spaces in equal Times?

18. Whether Sound move equally fwift in all

Regions? in North, South, &c. Climates?

19. Whether Sound move in a right Line the nearest way, or whether along the Earth's Surface?

To solve these Problems, Mr. Dernam was at the trouble of getting, and had the advantage of hearing and seeing from the Tower of his Parish-Church at *Upminster* in Esc, many Muskets fired at the distance of 1,2,3, and so far as to 8 Miles; beyond which he could not hear in that woody Place, the Report of a Musket. But the the Firing of these small Arms did him much Serivce in his Design, he was much better served by the Ordnance, or great Guns, on Black-Heath; for he could from his Church aforesaid, always by Night with his naked Eye, and by Day with a Telescope, see the Flashes of the Sakers (a fort of Cannon) there fired, to exercise her Majesty's young Engineers, and hear their Report very plainly. On these he made many repeated Observations; and at last, by favour of the Board of Ordnance, And, (3.) From there being no regard had to the he got leave to have two Sakers (see that word in

Vol. 1.) to be placed one by another on the Heath, blowing directly against the Sound.

rort of each Gun, he always found to be about cannot be the same Particles of the Air or Atmo-120, or 122 half Seconds of Time. He mentions sphere, which carry both; at least they can't be both these Numbers, because the Sound of the Re-moved after the same manner. He concludes, as

Sound's Progress, when the Saker was fired to-

Question.

the feveral Muskets made any alteration in the Motion of the Sound; which is an Answer to his 11th that different Quantities or Strengths of Powder, of the Noise. Nor did he find that there was any Variety in the Time of the Motion of the Sound, der, Clouds, &c. either by Night or Day; whether it were clear or either by Night or Day; whether it were clear or In Philosophical Transactions, No. 156, you cloudy; whether it rained or snowed, whether have an Account of the Doctrine of Sounds, by the Barometer were high or low, and whether it were Summer or Winter; which folves his No. 247, of the Swiftness of Sounds, and their 3, 4, 6, 8, 9 Queries. He found also, in answer Reflections by Echoes. 3, 4, 6, 8, 9 Queries. He found also, in answer to his 15th Question, that all kinds of Sounds, as of Bells, Beetles, Muskets, &c. from the same Distance came to his Ear in the same Time.

moves just an English Mile in 94, or 9, 25 half dy, in order that they may exert their Spring or

that Sound moves the nearest way, and that it ly, that as exhausting the common Air out of a doth not creep along the Earth's curved Surface: that the Velocity of the Sound is the same in Accli- or conveying more Air into a Vessel, made on purvites and Declivites; tho' he hath not had oppor-pose for such Condensations of Air, did very sentunity of making Experiments enough to deter-sibly augment the Sound of the included Bell. mine it exactly.

From the Communications which his Friends in Italy have afforded him, he thinks the Difference of Regions or Climates, makes no difference in of Gold of the old Standard was to be coined

18th Question.

He found that very thick cloudy and fnowy 10 Shillings. In 4 Ed. 6. Soveraigns were coined Weather, did always leffen and dull the Noise made at 24 Shillings a-piece, and in 6 E. 6. at 30 Shilby the Discharge of Guns, &c. whereas in frosty lings; and also in 2 Eliz.

and clear Weather, they were much more audi
SOWNE, is a Term of Art used in the Excheand clear Weather, they were much more audi-ble, clear, and distinct, than at any other times.

By many repeated and accurately made Experiments, he discovered, that contrary Winds do in the Original French, hath Des Estreats oriens Soualways retard the Motion of Sounds, and that in venu. And such Estreats and Casualties as are not to proportion to their Strength; which is what the be remembred, run not in Demand, i.e. are not Florentine Virtuosi, and many others have formerly leviable. So now in the Exchequer they say, such been entirely mistaken in; afferting, that Contra- Estreats as the Sheriff by his Industry cannot get,

By Observations and Experiments, made with but with their Muzzles quite contrary ways; and proper Instruments, about the Velocity of the Moon the 15th of Feb. 1703 to be discharged continution of Wind, he concludes, that in the greatest ally every half Hour, from 6 in the Evening, till and most rapid Storms that ever blew, the Wind 12 at Night: There was a small Gale of Wind moves not above 60 Miles an Hour, and perhaps owing directly against the Sound.

not above 50; whereas Sounds may go above 700
The Interval between the Flash and the Re-Miles in the same time: and consequently they port always came double; the first within 120 abovesaid, that the Velocity of Sound is such, half Seconds; the second (which he takes to be that it ordinarily moves 5280 Feet, or an English an Echo from the Wind-Mill, or adjacent Houses Mile, in 9 that Seconds: And that it moves 571 on Black-Heath) within 122.

He observed no difference in the Time of the Time. But that the Winds may be a first the winds may be a firs He observed no difference in the Time of the Time. But that the Winds may so affect it, by conspiring with its Motion, as to carry it 600 Feet wards him, or from him, which answers his second in half a Second; or, by being contrary to it, to nestion.

retard it so, that it may not move more than 500

Nor did he find that any different Elevation of Feet in a half Second of Time.

SOU

He concludes with shewing the Uses that may be made of this Knowledge of the Velocity of the Problem. And to folve the 12th Query, he found Motion of Sound, in measuring the Distances of Ships at Sea from one another, or of a Ship from made no alteration in the Velocity of the Sound's Shore; of Forts and Batteries one from another. Motion; the it manifestly did so in the Strength or of any Places at Land within the hearing of the Report of a Gun; of the Distances of Thun-

SPHER**E**,

SPHERE: 1. The Surface of a Sphere is equal to the Periphery of a great Circle, multiplied by

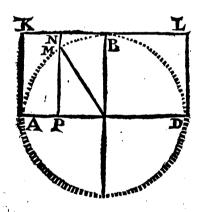

its Diameter; Hayes, p. 73.
2. The Area of any Segment of a Sphere cut off by a Plain, or by two Plains which are parallel, is to the whole Spherical Surface, as the intercepted Portion of the Diameter is to the whole Diameter. Wherefore putting r = Radius, c = Periph. and x = the intercepted Diameter; the Area of any Segment may be found by this Propor- bus

The Part of the Sphere's Surface contained between the Semi-circular Arks of any two (Great) Intersecting Circles, is to the whole Surface, as Circles is to 4 right Angles.

3. When the Diameter of any Sphere is equal to the Radius of any Circle, then the Area of that Circle will be equal to the Surface of the corre-

fponding Sphere.

4. The Convex Area of a Cylinder Circumfcribing a Sphere of the same Diameter with its own Altitude (which in this Notation will be 2 rc) is Quadruple of the Area of the Base; and confequently = to the Area of the Surface of the Sphere, and the Surface of an Hemisphere is to twice the Area of one of its great Cir-those that enter the Spleen. cles.

5. Suppose the Square A L, together with the Semi-circle A B D, to revolve round A D as an Axis; then will the Line K L generate a Cylindrick Surface = to the Hemispherical one generated by the Semi-circle (by 3.) Wherefore if any Point, as M, be affigned, and thro' it P N be drawn Normalto AD; I say, the Surface or Ring described by KN, will be equal to the Segment described by the Ark A M. For the Ring described likewise a few Lymphatick Vessels which arise from by KN, will be to the whole Cylindrick Surface the Spleen, and discharge themselves into the described by K L, as K N, K L. And the Segment made by the Revolution of the Ark A M, is to the whole Spherick Surface, as A P, A D, that is, as K N, K L. Wherefore, &c.

About the Dimensions of the Sphere and Cylinder; see Dr. Wallis in Philosophical Transact.

No. 260. p. 547.

SPIGURNEL, was anciently (Spigurnellus) he that had the Office of the Espigurnantia, or Sealing of the King's Writs. This Word Spelman and ver comes immediately from the Spleen and Du Fresne recite, without interpreting it. But it Omentum, they think that one furnishes the fecms to be taken from the Saxon, Sparrau, which fignifies to Sout up, Seal or Secure. Kennet's Gloss. in Paroch. Antiquit.

SPIRITUALITIES of a Bishop, are such Profits as arise to him from the Benefit of his Jurisdiction in his Diocess, and not as a Baron of the Parliament; fuch as those of his Visitations, Institutions, Ordinations, &c.
SPIRAL Line. See on this Subject further,

Il. Bullialdi Demonstrationes Novæ de Spirali-

SPLEEN. The Vessel which in Beasts they call the Milt, is fituated in the left Hypochondrium. under the Diaphragm, between the Ribs and the Stomach, above the left Kidney; it is tied to the Peritoneum, to the Diaphragm, and to the Omen-tum. 'Tis of a blueish or leaden Colour, of an the Angle of Inclination of the Planes of those oblong Figure, thick at the edges, and not thin as the Liver: It hath two Membranes, the External comes from the Peritoneum; the Internal Membrane is finer and thicker than the External: for if you blow into the Splenick Artery, the Air will pass thro' the one, but not the other. Its Fibres are not regularly woven, as those of other Membranes feem to be, but they come from in-numerable Points, as *Radii* from fo many Cen-tres; and the Fibres of one Point are regularly woven with the Fibres of the Points furrounding It receives Veins, Nerves and Arteries from

The Substance of the Spleen is not only kept together by its two Membranes, but also by innumerable Fibres which come from the Points of the Internal Membrane, and are inferted in the Points of the opposite side of the same Membrane; and Expansion of the Extremity of these Fibres seem

to compose the Internal Membrane.

The Spleen is composed of an infinite Number of Membranes, which form little Cells and Cavities of different Figures and Bignesses, which communicate with one another, and are always full of Blood.

At the Extremities of the Blood Vessels in the Spleen of Sheep, we find several white soft Specks,

which *Malpighius* calls *Glands*.

The Spleen hath Arteries from the Caliaca, whose Capillary Branches make frequent Inosculations upon the Membranes of the Cells. Veins, whose Extremities communicate with the Cavities of the Cells, as they come out of the Spleen, unite and make the Ramus Splenicus of the Porta, which carries the Blood from the Spleen to the Liver. These, with its Nerves, which are confiderable, from the Plexus Splenicus, are equally distributed thro' the whole Substance of the Spleen, being all included in a common Capfula. There are Lumbary Glands.

The true Use of the Spleen is yet uncertain; the Antients thought it to be the Receptacle for the melancholick Humour: some since considering that in the Spleen there are a great Number of Membranes and Fibres, and also many Nerves. have thought that the Blood is attenuated, and becomes more spirituous in the Spleen: And confidering that the most of the Blood in the Li-Oleaginous, the other the Spirituous part of the

Bile.

SPOTS,

SPOTS in the Sun: Besides what may be concluded about these Solar Spots, being no Planets revolving round the Sun's Body, as some have thought; Dr. Hooke, in his Opera Post. draws these further Conclusions: (1.) That these Bodies are either opake, and so hinder the Sun's Light from passing thro' them; or else are incombustible and dark Bodies, which will afford no Light at all for a certain time, and do, as it were, quench and deaden that part of the Sun where they rise. (2.) There appear in some Parts of the Sun's Face, also Nebula or Clouds; in some others Facule or Blazes, which give a clearer Light than the other Parts of his Body. The Spots are subject to increase and decrease, having sometimes covered a part of the Sun bigger than all Europe, and sometimes bigger than the whole Surface of the Earth. (3.) The Motion of these Spots is always from East to West, according to the Order of a Line of Sines, beginning from the Center, of which the Semi-diameter of the Sun is Radius. And this Motion appears to be in a straight Line in the beginning of June and December; when the Earth is in that part of the Plain of the Ecliptick, which cuts the Plain of the Equinoctial of the Sun's turbinated At other times the Line of their Motion is incurvated and bent into an Ellipsis; which is greatest when the Earth happens to be in those Parts of the Ecliptick, which are the extreme Limits of it, compared to the Plain of the Sun's Equinoctial: And this also is twice a Year, viz. Man is in Stabili Statione, at his Standing in the Fointhe middle between the Nodes, both Plains passers with a Cross-bow, or Long-bow, ready to shoot fing thro' the Centre of the Sun, that is, about the at a Deer; or else when he is standing close up by beginning of March and September. Whence he a Tree, &c. with Grey-hounds in a Leasth ready deduces, by undeniable Demonstration, that the Sun is of a Globular Figure, and that it moves on its own Axis from East to West: As also, that the Axis of his turbinated Motion remains fixed, and is always directed towards the same Point in the Heavens, as the Earth's Axis is found to do; as also the Axis of Jupiter and Saturn is, as far as can yet be discovered by the Spots, Satellites, and Ring of these Planets. (4.) He observes also, that there is a kind of Torrid Zone, or certain Space or Breadth on each fide the Sun's Equator towards the Poles, in which these Macule, Nobule and Facule, do Whereas, without these Limits, or appear most. in the temperate Zones (as with regard to our Earth they may be called) they appear but seldom, and never towards the Polar parts.

SQUADRON of Ships, is a Division, or part of a Fleet, commanded by a Vice or Rear Admiral, or some other Commander or Commadore, as they call it; but the Number of Ships in it is uncertain.

SQUADRON, is a Body of Horse, whose Number is not fixed; but usually is from 100 to 200 Men, according to the General's pleasure, Caracts of fine Gold, and 2 Caracts of Copper; the strength of the Army, and as occasion serves and the French and Spanish Gold are nearly of the Usually a Squadron consists of 3 Troops, each of same Standard. See Caract. 50 Men, and it never exceeds 200 Men; because a greater Number than that can't be advantageously posted, nor have room to act in narrow Ground, Woods, Marshes, Defiles, &c. The Eldest Troop

File.

To form, any Number of Men into a Square Battle, as suppose 500, extract the nearest Square Root of 500, which is in Integers 22; and that will give the Number of Men for Rank and File. There will be a Remainder of 16 Men, who may

be disposed of as the Commander thinks best.

SQUARE Battalion of Ground, is when the Ground of the Flanks is of the same extent as the Ground of the Front and Rear. To make a square Battalion of Ground; as suppose the Number were 60, multiply 60 by 3, the Number of Feet which every Man takes up in Front, the Product will be 180; divide that by 7, which is the Number of Feet each Man takes up in depth, or which is the dissance of the Ranks, the Quotient without a Fraction will be 25, whose square Root is 5; which will give the Number of Men in File. And if you divide the first given Number 60 by this Root 5, you will quote 12, which is the Number of Men in each Rank.

SQUARE Hollow, or bollow Square, in the Art

Military, is a Body of Foot drawn up with an empty space in the middle, for the Colours, Drums and Baggage, facing and covered by the Pikes every way to keep off Horse.

STABLE-STAND, is the Term for one of the four Evidences or Presumptions whereby a Man is convicted, to intend the stealing the King's Deer in the Forests. The other three are Dog-draw, Backbear, and Bloody-hand. This Stable-stand is, when a

STAKE, is the Name of a small Anvilused by Smiths; fometimes it stands on a broad Iron-foot, on the Work-Bench, to be moved up and down occasionally; and sometimes it hath a strong Iron Spike at the bottom, by which 'tis fixed to some place on the Work-Bench. Its use is to set small and cold Work Strait, by hammering it on the Stake, or to cut or punch upon with the cold Chissel, or cold Punch.

STALLAGE, was a customary Rent paid in Fairs or Markets, for the Liberty of a Stall or

Standing, by the Stallangers or the Creamers, i.e. those Traders who exposed their Goods to Sale on the faid Stalls. In Scotland they call it Stallenge; the Romans called it Siliquaticum from Siliqua, which was their first and least Weight, a kind of

Caratt of 4 Grains.
STAMPING-MILL, called also a Knocking-Mill, is a Mill used in the Tin-works to bruise the Ore small. See the Description of it under

STANDARD for Gold-Coin in England, is 12

For Silver-Coin, 11 Ounces and 2 Penny Weight of fine Silver, and 18 Penny Weight of Copper, being melted together is the true Standard, and fuch Silver is called Sterling. When either Gold takes the Right of the Squadron, and the Second the Left, and the youngest the Center. A Squadron is always drawn up 3 deep, or in 3 Ranks, with the length of a Horse between each Rank. The Standard is always in the Center of the first Rank. SQUARE Battel, or Battalion of Men, is one that hath an equal Number of Men in Rank and File.

Incomplete Standard, they call it better; if coarser, worse: and they reckon the excess or defect by Caracts, and Grains of a Caract in Gold, and by Penny-weights in Silver. And it is thus discovered: They take a small Quantity and assume that hath an equal Number of Men in Rank and melt it in a Crucible with a strong Fire, so long File. Eeeec

till the Copper, or other Allay mixed with it, be Silver, such as we now call Standard. But the burnt away. When cold, they weigh it again act word Sterling, as being a Piece of Money, geneweight, they call it fine Gold; if it hath lost all y if not always, fignifies a Penny. And as for a Weight, they call it fine Gold; if it hath lost 124 good while together there was no other Coin but part of its Weight, they call it Gold of 24 Captages, or one Caract better than Standard; if it thors, the same as Neumans, all good Standard Silvers and the called Same as Neumans. have loft $\frac{2}{24}$ parts, then 'tis 22 Caracts fine, or Standard; if it hath loft $\frac{2}{24}$ parts, 'tis called 21 Caracts fine, or I Caract worse than Standard, &c. And so they assay Silver, only they compute its bottom to the top in any Wainscot, are by the loss by Penny-weights, &c.
STANNARIES; are the Mines and Works

where (Stannum) Tin is dug and smelted; as in Cornwall, and other Places. There are several

Act of Parliament, to carry their Wool, Cloth, is made, was called Reas Credendi, or Stipulandi. Lead and Tin, &c. and such like Staple or Stand-This was the old Sense, but now with us the Word ing Commodities of this Land, in order to their Stipulation is commonly used for the Act of the Perbeing sold by the Great. These Places you will son obliged; and some say that the Word Stipufind in feveral Statutes, appointed and altered by later is common both to Debter and Creditor. the Kings of England, from the fecond Year of Edw. 3. to the fifth of Edw. 6. and what Officers rac, Professor of Medicine at Montpellier, hath by these Staples had belonging to them, you may an easy Experiment shewn, that the Force of the see in Anno 27 E. 3. Stat. 3. c. 21. The Staple Stomach alone (in Vomiting) without taking into fee in Anno 27 E. 3. Stat. 3. C. 21. The Staple Commodities of this Land, are Wool, Leather, Woolfells, Lead, Tin, Butter, Cheese and Cloth; as appears by 14 Rich. 2. c. 1. tho' fome will allow only the first five.

STAR. All Deeds, Obligations, Contracts, Releases, &c. of the Jews, were antiently called Stars, from the Hebrew Sherar, a Deed or Contract. These were sometimes written in Hebrew and La-

tin, but usually in Hebrew alone.

STAR-CHAMBER; was a Chamber at Westminster, formerly so called, from its Roof being
painted with Stars. Henry the Seventh and Eighth, painted with Stars. Henry the Seventh and Eighth, STRIÆ, are the Lists or Rays which run be-ordered by several Statutes, that the Chancellor, tween the Flutes, Channels or Striges, in Fluted affished by others there named, (vid. 3 H. 7. c. 1. Pillars. These as and 21 H. 8. c. 2.) should have Power to punish the Ionick Order. Routs, Riots, Forgeries, Embraceries, Perjuries, and provided for by the Common-Law; and for which Workmen Flutings and Grooves. They more pronues to this day

STATIONARY; how to an Eye placed at the Earth, a Planet appears to stand still or be Stationary, see under the word Direct in this Vol. 2.

TELLIONATE, in the Civil Law, is all kind of Cozenage, and Knavish Practice in Bargaining; and all forts of Frauds that have no peculiar Names in the Law. And 'tis so called from Stellio, a Lizard with great variety of Spots, and very prejudicial to Mankind.

STERLING Money; this Word seems to come, as Mr. Somner hath derived it, from the Saxon Word Steore, that is, a Rule or Standard; and therefore that Brace, which is framed into the King-Piece it fignifies that Coin or Money, which for Metal and the principal Rafters.

and Value, was to be a common Standard of all STUDDING-SAILS, in a Ship, are Bolts of Current Money. And this is the more probable, because such Money, at the coming in of the Norfub Anno 1082. Porrigam quindecem Sterilensiare fometimes also used to the Clew of the Main-um, Dr. Kennet's Glossary. Esterling in Stow is used fail, Fore-sail and Sprit-sail, when the Ship goes for a Penny-weight, signifying a Penny of fine either before the Wind, or Quartering.

ver came to be called Sterling Silver, and good Money, Sterling Money, as it is to this day.

STILES; the upright Pieces which go from the

Workmen called Stiles.
STILOBATUM, is, in Architecture, the Body

of the Pedestal of any Column.

STIPULATION, in the Civil Law, is a Con-Laws about, and Liberties granted to the Stanna-tract made by Words, and not in Writing, by asking Courts in feveral Acts of Parliament; as in the ing a Question, and receiving presently a proper time of Edw. 1. and afterwards, as abridg'd by Answer: And in this Contract the Obligation is Edw. 3. and in 17 Car. 1. c. 15.

only upon one fide, i. e. on the fide of the PromiSTAPLE, fignifies this or that Town, City of fer, who was called Reus Debendi, or Promittendi;
Place where the Merchants of England were, by as the Stipulator, or Creditor, to whom the Promife This was the old Sense, but now with us the Word

Stomach alone (in Vomiting) without taking into confideration the Muscles of the Diaphragm and Abdomen (whose force together is more than that of 248000 Pound weight) is equal to that of 12000

Pound weight.

STRAIKS, in Gunnery, are Plates of Iron of the length and breadth of one of the fix Felloes, which serve for the Round of the Wheel of a Guncarriage, and fixed on the Circumference of the Wheel with strong Nails, which are called the Straik-nails; these Straiks cover the Joints of the Felloes, and defend the Wheel.

Pillars. These are 20 in the Dorick, and 24 in

STRIGES, in Architecture, are the hollow such other Misdemeanors, as were not sufficiently Channels in the Shaft of a Column, called by our the inferior Judges are not so proper to give Corperly belong to the Ionick Order, tho' they are rection. But this Court, by 17 Car. 1. c. 10. was found sometimes in the Dorick, and often in the entirely dissolved and determined, and so conti-Corinthian and Composite. They are generally at right Angles with the Plane of the Base, but are fometimes found winding about the Pillar. Sometimes the Striges are filled up with a fwelling a third part from the Base, lying in the hollow like a Stick shot of a round form: These Mr. Evelynthinks we should call Staved or Cabled Columns.

STUCCO: Painting in Stucco was revived from the Antients by Giovanni d'Udine, a Scholar of Raphael's; he found the true Matter which the Antients made use of, which was a Composition of

Lime and Marble powder'd very fine.
STRUT, is a Term used by some Builders for

Canvas, or any Cloth that will hold Wind, extended in a fair Gale of Wind along the fide of mans, was called Sterilensis. As Orderic. Vital. the Main-sail, and boomed out with a Boom; they

STYLO-

vel Stylo-Hyoides alter, is a Muscle of the Os Hyoidos, which arises fleshy and tendinous from the Styloid Process, near the Origin of the Styloid Process, STYLO-Chondrobyoideus, near the Origin of the Stylo Pharyngaus, and runs under the Cerato-Glosses. It is inserted into the Cartilaginous Appendix of the Os Hyoides; and its Use is to affilt the Stylo-Hyoideus, in putting the Os Hyoides upwards and laterally. Dr. Douglass.

STYLO-Hyoidæus, is a Muscle of the Os Hyordes, arising by a round Tendon from near the middle of the Processus Styliformis, and is inserted in the Axis. middle of the Processus Styllsormes, and the Axis, the tendinous into the Basis of the Os Hyoides, near Point M, and PM an Ordinate to the Axis, the firs Cornu; to which also it often adheres fleshy. TP is the Sub-tangent, because it determines the Its Use is to put the Bone of the Tongue on one Point T, where the Tangent cuts the Axis produfide, and a little upwards, when both act in Con-ced beyond the Vertex of the Curve V. And the

SUBNORMAL; is a Line, determining in any Curve, the Intersection of the Perpendicular of Contact M) in the Axis V D, is called the Subto the Tangent in the Point of Contact, with the normal. And this Subnormal, in the common or Apollonium Parabola, is a determinate invariable urbane, Urbicarie vicine; were such Regions or Quantity; for its always equal to half the Para-Cities of the Roman Empire, as lay within an meter of the Axis.

Equation, some other Quantity which is really pation. equal to it, but express'd after another manner; 6UCTION; there are many Effects vulgarly and this is done, in order to find, at least, such a attributed to Suction, which, in reality, have very

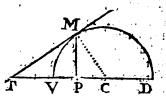

SUB-TANGENT, in any Curve, is the Line which is contiguous to it, follows it by a kind which determines the Intersection of the Tangent of Astraction, as if the Air and Water busy toin the Axis. And in any Equation if the value of gether: And others funcy that the Air moves in the Sub-tangent come out Positive, tis a fign that to the Mouth of the Sucker, and the Water moves the Point of Interfection of the Tangent and Axis, up after the Air, to prevent a Nathum, which falls on that fide of the Ordinate where the Verthey fay, Nature abbors. Whereas the rue Cause tex of the Curve hes; as in the Parabola and of this Phanomenon, is only that the Air and At-Paraboloids. But if it come out Negative, the mosphere presses with its whole weight, swiformly Point of Intersection will fall on the contrary fide on the Surface of the Ligher in the Vessel, and conof the Ordinate, in respect to the Vertex or be-ginning of the Abscissa; as in the Hyperbola, and Hyperboliform Figures.

And universally, in all Paraboliform and Hyperboliform Figures, the Sub-tangent is equal to Pipe to the same height as without, and indeed the Exponent of the Power of the Ordinate muki-little higher, because the Pressure of the Air with-

plied into the Abscissa. Thus, in the common Parabola, whose Prothe fides of the Pipe. Now when any one apperty is px = yy, the Sub-tangent is in length plies his Mouth to the upper end of the Pipe and equal to x the Abscriffa multiplied by z, the Extra fucks, his Lips so strongly enclose the Pipe, that ponent of the Power of yy, the Square of the no Air can get between them and it; and by the Ordinate; that is, its equal to twice the Ab voluntary Motion of the Spirits in the Muscles, scissa and by the former Rule for Paraboliform the Cavity of his Thorax, or Breast, is opened

the

SUB-TANGENT, in any Curve, is a Line which determines the Interfection of the Tangon

Thus, if T M be a Tangent in the Line PC, which determines the Intersection of the Perpendicular MG(to the Tangent in the Point

SUBURBICARLE Regiones, called also Subhundred Miles of Rome, and were under the Jurif-SUBROGATION, in the Civil Law, is put-diction of the Prefect of that City: Wherefore ting another Person into the Place and Right of they are sometimes called Regiones Solice, behim, that, in any Cafe, is the proper Greditor, cause in these the Governour of Rome was wont This is also called Cession. This sile to exercise his solemn Jurisdiction. This also was the antient Extent of the Power and Change SUBSTITUTION, is, in Algebra or Fluxions, was the antient Extent of the Power and Charge the putting in the room of any Quantity in an of the Bishops of Rome, before the Rapal Usur-

SUCTION; there are many Effects vulgarly proper Expression in the Equation, as shall solve different Causes. As when any one fucks Water, the Problem, or Question proposed. And in the or any other Liquor up thro's Pipe, 'tis common-Knack of doing this readily, consists the chiefest ly thought, that by that Asson the Person draws.

Business of the Operations in Pourse is the Asson to the Asson that the Water, the Asson to the Course is the Asson to the Water. fequently prevents any one part of the Water to rife higher than the other there: And if a Pipe be put in of any tolerable large Bore, and be open at both ends, the Water will rise within the in the Pipe is a little taken off by bearing against Figures, it must be taken above the Ordinate in and enlarged; by which means the Air included the Axis produced. Thus also in one of the cubical Paraboloids, where $p \times x = y \cdot y \cdot y$, the self in, and consequently cannot press so strongly length of the Sub-tangent will be 1 of the Abagainst the upper end of the Pipe, as it did before stills.

Thus, in the Figure annexed, you will see that the Cavity of the Thorax was so enlarged, and when the Weight of the whole Atmosphere kept the its Spring bent. And that Weight or Pressure being now taken off by the Lips of the Man char sucks, the Æquilibrium is destroyed, the Air gravitates on the Surface of the Water, but cannot do so on the upper Orisice of the Pipe, because the Juncture of the Lips takes it off; and the Spring of the Air included in the Thorax, being weakened Eccec 2

by the Dilatation of its Cavity, it cannot press wards its Centre. so hard against the upper Orifice of the Pipe, as its Opacity, he concludes, from the disappearing of the Water will do against the lower, and consea common Pump: The Sucker being tight, takes the Flame of a Candle, or the Radiation or hazy off entirely the Pressure of the Atmosphere on the Light about the Nucleus of a Comet, thro' which, Surface of the Water within the Barrel of the as well as thro' its Beard, the small fixed Stars Pump; and consequently the Atmosphere by its may be seen. weight must force the Water up to make the He thinks Aquilibrium. See Hydrostaticks:

SUFFRAGAN; is a titular Bishop appointed to aid and affift the Bishop of the Diocess, and by 36 H. 8. c. 14. every Bishop is empowered to elect two honest and discreet Spiritual Pastors, which shall be called Bishops Suffragans.

SULPHUR: Sir If. Newton, on very good grounds, concludes, that the common Sulphur is composed of volatile and fixed Parts, strictly adhering to one another by mutual Attraction, so it began to give Light, none can contradict it by that they will both sublime together; for by disany Observations we have on Record: For, supposolving Plowers of Sulphur in Oil of Turpentine, sing we had Observations Astronomical of 4000 and then distilling the Dissolution, 'tis found, that Sulphur confists of a thick, volatile and inflammable which are found there in nearly an equal Quan-

fame with the Oleum Sulphuris per Campanam.
SUMMATORY Calculus, according to some, from the Fluxion; and so it is the same with the Calculus Integralis. See Hayes's Fluxions.

SUMMONER, or Summonitor, an Apparitor, who is to cite in Offenders, to appear at a certain Time and Place, to answer to the Charge exhibited against them.

SUMMUM Bonum, or the chiefest Good of human Nature, is that, which, by its enjoyment, The Schools renders truly and compleatly happy. The Schools distinguish this chief Good of Man, into that which is fimply and adequately fo, and beyond which there can be no other; and into a leffer and fubordinate one, which is in some measure attainable in this imperfect State; and this last they call Fælicitas Viatorum, and the former Fælicitas Comprehenforum.

SUN: Dr. Hooke, in Opera Post. p. 89. from all his, and others Observations, thinks it reasonable to conclude, That the Superficies of the Sun is covered with an Air, or Atmosphere, or some other Fluid Body: And that this Atmosphere, tho' possibly 80 times thicker and higher than that stems) much after the manner as Iron, when heaabout our Earth; yet in comparison of the vast ted to such a degree as to be just going into Fusion
Diameter of the Solar Body, becomes wholly inby the vibrating Motion of its Parts, emits with this Atmosphere, and not the very Body of the portion of their Diameters. Sun that shines. And from hence he saith, that Sir Is. Newton hath made it probable, that the all the Phanomena of the Macula and Facula of great Comet in the Year 1680, in its Peribelion, Sun that shines. And from hence he saith, that the Sun will be folved; and that they are only went so near the Sun, as that it acquired a Heat Clouds or Smoaks in this Atmosphere.

The Sun it felf, within this Atmosphere, he concludes to be a Solid and Opacous Body, (p. 91.) from these Reasons. (1.) The Constancy of its Ro-ter, like the Planets, but heated to a very intense tation. (2.) The Fixedness of its Axis. (3.) degree, they may be many Millions of Years The Power of its Gravitation or Attraction to-

These prove its Solidity; and the Water will do against the lower, and conse-quently the Water must be forced up into the Pipe. 'Tis much the same thing in the Suction of Body were transparent as the Atmosphere is, or

He thinks the superficial Parts of the Sun, to confist of Bodies fimilar to our Nitre and Sulphur, and that these are set on fire; and consequently, that the Physical Cause of its Light, is the actual burning or fire of its superficial Parts. Nor can there be any Objection of Moment brought against this Hypothesis, from the danger of the Sun's Fire being burnt quite out in so many thousand Years as it hath been in being; for, (saith be) supposing it to have grown some Minutes less since it began to give Light, none can contradict it by any Observations we have on Record: For, suppo-Years standing, as we have none above 2000 of that kind; and allowing that the Sun's Diameter had been then observed to be as many Minutes as Oil, or of a fat Bitumen, an acid Salt, and a very had been then observed to be as many Minutes as fixed Earth, with a little Metal. The three first of it is now; yet could it not be thence concluded, that the Sun did not lose a Mile in Diameter every tity; but there is only a very small Proportion of the Year, and consequently be now 4000 Miles less last. The acid Salt being dissolved in Water, is the in Diameter than it was then. For fince his Diameter than it was then. meter is near 87 times greater than that of the SUMMATORY Calculus, according to fome, is the same with the Calculus Differentialis of then the Sun's must be 696000 Miles. Now Leibniz: but more properly Summatory Arithmetick, is the nore properly Summatory Arithmetick, is but a 174th part of that Diameter, and metick, is the Art of sinding the slowing Quantity, the sun's must be 696000 Miles. Now consequently would have diminished it but is of a Minute; which is a much less Quantity than the Antients pretended to observe to.

But, supposing they could have observed even to Seconds, yet that could not have contradicted it; because 'tis possible the Sun may have ap-proached as much nearer us as that Diminution amounts to; and for which, he faith, he could shew a Reason.

Sir Is. Newton also, in his Opticks, gives good Reasons, to suppose the Sun and fixed Stars to be great Earths, vehemently hot; whose Heat is con-served by the Greatness of their Bodies, and the mutual Action and Re-action between them and the Light which they emit; and whose Parts are kept from fuming away, not only by their Fixity, but also by the vast Weight and Density of the Atmospheres incumbent on them, and every way strongly compressing them, and condensing the Vapours and Exhalations which arise from them. The Light seems to be emitted from the Sun and fixed Stars (which probably are Suns to other Sy-stems) much after the manner as Iron, when heavisible to us, tho' assisted by the best Telescopes: Force and Violence, copious Streams of Liquid He supposes it also to look as bright as the Body of Fire all around: Great Bodies must preserve the Sun it felf, and that it is really the Shell of their Heat longest; and that, perhaps, in the Pro-

> which would not entirely go off in 50000 Years. Whence we may guess, that if the Sun and fixed Stars be only Collections of dense and solid Matwithout losing any considerable part of their Heat.

According to Caffini, the Sun's distance from the Earth is 172,800,000 Miles English.

The Phanomena of the Sun's apparent Motion round the Earth, on which the Theory of this vast Body is established, are by Astronomers observed to be thefe:

1. That the Centre of the Sun's Body moves anmually in the same Plane of the Ecliptick, and never deviates from the Line so called. Which apparent Motion of the Sun doth in re-

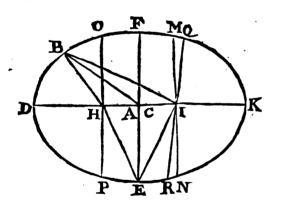

ality belong to the Earth; which being at first put into such a Motion, and with such a Direction by the Great Creator, will always continue to move after the same manner; fince here none of those

in its proper Place.
2. But the apparent Motion of the Sun in the Ecliptick is very unequal; for a little after the Vernal, and a little before the Autumnal Equinox, be is in the Mean between the Extremes of his Motion; but his Motion is most swift a little after the Winter Solstice, as 'tis always most slow a in the Equinoxial Points, the Sun appears to stay

little after the Summer one every Year.

All which arises from the Earth's revolving not in a Circle, but an Ellipsis, in one of whose Foci or Umbelici the Sun is placed. And with this Law also, that the Areas described by Lines drawn from the Earth to the Sun, shall always be equal, in equal and proportional times.

In the Figure annexed, let the Sun be in the Point I, and let the Curve FDEK be an Ellipsis, or the annual Orbit of the Earth's Centre revolving round the Sun, and represented by B.

Let the Point H be the other Focus, and C the Centre of the Ellipsis; KD its great Axis, or the Linea Apsidum; and D the Aphelion; and K the Perihelion of the Earth. FE is the lesser Axis, IC, or CH is the *Eccentricity*, or the distance between the Centre and the Foci. Let MN, or OP, right Line AB bisect the Angle HBI: Now can be obtained to any tolerable Certainty fince by Lines drawn from its Centre to the Sun, the Earth describes always Areas proportional to the Times of its Motion in the Orbit, it will de-feribe equal Areas in equal Times. But feeing the Line BI grows longer towards and at the A-phelion, and *Shorter* at and about the Perihelion, the Earth must move slower in the former, and swifter in the latter Case. And indeed the Velocity of the Earth's Course in her Orbit, will alquantity: but all that we can accurately conclude ways be in a reciprocal Ratio of her distance from it, is, that it is not so; and consequently the Sun; so that if the distance between D and I that the Distance of the Sun is vastly great.

be double to that between K and I, she will move twice as fast in the Perihelion as in the Aphe-

3. And from this Figure 'twill be apparent, that the Sun's Diameter will appear greater when the Earth is in her Perihelion, which is a little after the Winter Solstice, and less when she is in her Aphelion, which is a little after the Summer Sol-flice, as is found by Observation. And this difference in his apparent Diameter, shews also that the Earth moves, not in a Circle, but an Ellipfis round the Sun.

4. Those Places in the Ecliptick, in which these greatest Differences of the apparent Motions disturbing Forces have any Place, which render and Diameters of the Sun happen, in process of the Motion of the Moon so irregular. Of which time are changeable, and do move forward (or in consequentia) equally. For the the Aphelia and Nodes of the Planets are really at rest and immoveable; yet because of the annual Cession of the Equinoxes in antecedentia, they appear to be moved forward just the same Quantity.

about 8 Days longer in the Northern than in the

Southern half of that Circle.

For the Elliptick Orbit of the Earth will be cut unequally by a Line passing thro' the 2 Equinoctial Points: The Perihelion not being far from the Winter Solstitial Point, the Equinoctial Points will not be coincident with the longer Axis, but almost with the Latus Rectum; for in the Figure above the Line of the Equinoxes, QR is not much different from NM the Latus Rectum.

But this Inequality of the Sun's apparent Motion, is not now the same as it was in Ptolemy's Time, and is continually changing, and in pro-cess of Time the Equinoctial Points will come to be in K and D; and then there will be no difference in the time of the Sun's stay in either Segment of the Ecliptick: But after this it will encrease again, and then again decrease as now, if the Earth's annual Motion be continued.

6. And yet the Spaces or Times of the Earth's entire Revolution in her Orbir, are all equal one to another, and are what we call Years, containing each 365 Days, 5 Hours, and 49 Minutes

nearly.
7. The Angle of the Inclination of the Planes of the Ecliptick and Equator, or the Sun's greatest Declination hath been always invariably the fame,

8. The Sun's Diurnal Parallax is almost insenfible, and his Menstrual Parallax is scarce 15 Mi-

nutes of a Degree.

And this is of the greatest use in Astronomy throughly to understand; nay, of such an absolute necessity, that, without its Knowledge, neither be the Latus Rectum of the Ellipsis, and let the the Distances nor Magnitudes of the Sun or Planets,

There have been three Ways made use of by Astronomers, to find the Sun's Horizontal Pa-

1. That of the famous Hipparchus, which proceeds on the Theorem which our Mr. Horrox hath accurately described and explained, and which is exactly and geometrically certain, and would do if the Parallax of the Sun were any confiderable

Mr.

Mr. Whiston's Prelect. Astron. p. 61. where there had seen her from the Centre of the Barch. And

ler, Vendeline, and more especially by Ricciolus. This supposes that you have the exact Moment of the Time of the Half-Moon, or the Dichotomization, or Bisection of her Disk, by the Light and Shadow; and fome other things, as difficult to obtain as what you feek for: And therefore I shall tain as what you feek for: And therefore I shall Acts of October, 1685, with some sew Explica-fay no more of it, than only to refer you to tions and Corollaries. Let the Circle AFBC re-Mr. Whiston's Book, p. 66. where you have a good present the Earth's Equator, HKM the Diurnal account of this Method; because I must give you Ark of Mars, when he moves in the Equator; an account of

And this depends on a Method of determining

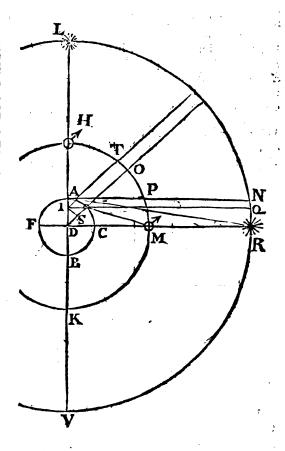

first the Parallax of Venus or Mars.

The annual Parallax of the fixed Stars, being by late Observation established, the Coperni can System is so too, and the Proportions of the Distances of all the Planets from the Sun are given. And since 'tis clear in that System, that not only Mars and Venus, but even Mercury, do sometimes come nearer to the Earth than the Sun ever doth, and consequently must have all of them a greater Parallax than the Sun at fuch times; from hence it is manifest, that if we can get the Parallax of Mars, when in opposition to the Sun, or that of Venus and Mercury, when in conjunction with him; the Sun's Parallax will be discovered. Indeed, as to Mercury, he is usually so hid in the Sun, and his Motion is yet so indetermined, that nothing certain can be established about his Paral-And the Conjunctions of Venus and the Sun are fo rare (and that time only is proper for it) that its Parallax is as yet not accurately enough determined.

There remains then Mars only, who being sometimes distant from the Earth, but half as far as the Sun; and being at fuch times, when he is in opposition to the Sun, very conspicuous and fit for Observation, is much the most sit Planet for our present Purpose. Cassini seems to have been the first that thought of, and practised this Way; but our Mr. Townley's Invention of the Micrometer hath been very serviceable to him in it, as well as of the greatest use in other Astronomical Observations. Before we describe the Method of Cassini for finding the Sun's Parallax, I must remind you, that the Parallax of Mars, for Instance, is only the difference between the apparent Place of that Planet, with respect to the Earth's which the Planet is supposed to describe in 24. Centre, and to a Point on its Surface, when the Hours round the Earth, without any regard now Planet is exactly in the Observer's Horizon; that to any other Motion. Then if you suppose this

is a short account of this Method.

2. The second way of sinding the Sun's Horiany other Planet or fixed Star. But the Method
zontal Parallax, is that which 'tis said Aristarchus
of Cassmi for sinding the Parallax of Murs (v.gr.)
hath this great Advantage in it, That it may be performed by the Observation of but one Alsenomer furnished with a good Telescope and Micrometer; fince the Part of the other may be supplied by means of the fixed Stars: Of which now take Blanchimus's Account, in the Leipsick LVR, as the Equinoctial in the Heavens, 3. A third way of finding this Horizontal Paralextended infinitely in the Region of the fix-lax of the Sun; which tho it be not fo direct, is ed Stars. Let Mars be in A, in the Plane of yet more accurate and exact than either of the Equator; then his Diurnal Revolution will be truly represented by the Motion of the Line DH, round D as a Centre, in the Plane of the Equinoctial, so as to form the Circle HMK,

Planet is exactly in the Observer's Horizon; that to any other Motion. Then if you suppose this is, you must suppose two Observers, one with his Circle to be divided into 24 equal Parts, thro' Eye at the Earth's Centre, and the other Eye at each of which a Plane shall pass at right Angles the Earth's Horizon, at the other Extremity of a to the Equator, and also thro' the Centre D; Semidiameter of the Earth, whose Position is these Planes will be the Planes of the Hour Circles. normal to that Line which connects the Earth's cles, and will also be Meridians, with respect to Centre, and that of Mars, the latter being accu-Places on the Earth. Let the right Line LHAV rately in the Horizon of that Observer, who is be one of these Planes, or the Meridian of the supposed at the Surface. And thus, for instance, Place A in the Earth's Equator, where an Obserthe Moon's Parallax may be obtained by the Obversees the Planet Mars, and the fixed Star L in servations of two Astronomers at the same Minute one and the same right Line. Now if the Star of Time, if she be Vertical to one of them, and and the Planet had only the same Diurnal Motion, Horizontal to the others because the Moon's Place they would be both topether again, at the same Horizontal to the other; because the Moon's Place they would be both together again at the same to the Vertical Observer will be the same as if he Place, or in the same right Line, at the end of 24 Hours .

Hours; and if the Diurnal Motion be supposed equable, in fix Hours the Planet and Star would be in the right Line FDMR, at right Angles with the Meridian LHD, or in the Astronomical Hour-Circle of 6. Wherefore an Eye placed at the Earth's Centre, would always see the Planet and the Star in one and the same right Line, or in conjunction together, whether in the Meridian, or any other Hour-Circle. But it can't be so to an Eye at the Earth's Surface, as suppose at A; for tho' under his proper Meridian, both the fixed Star and the Planet will appear to him in the same right Line AHL, yet in any other Meridian, as suppose that of DR, (which, in respect of the Place at A, may be confidered as the Hour-Circle of 6) Mars will appear to him in the Plane A M, but the fixed Star in the Plane AR. To him therefore Mars will either appear Retrograde, or to move in Antecedentia, or the Star to move in Consequentia, altho' in reality both are supposed to have the same Diurnal Motion. And tho' he knows that they are both at the 6 Astronomical Hour-Circle, yet Mars will appear to be past it, before the 6 Hours are expired: Because the sensible 6th Hour, with regard to the Place A, is not the Plane FDR, but APN. And the difference of Time intervening between Mars coming to the sensible Hour-Circle of 6, and the rational or real one, which may be called the Planet's Horary Parallax, is measured by the Ark of the Equator PM, which Mars by his Motion describes. And the Quantity of this Ark is equal to that of the Angle PAM, or its Alternate AMD; that is, equal to the Angle of the Earth's Semi-Diameter, when seen in Mars, and this is that Parallax of Mars which we have been Wherefore if the Ark PM be just one Degree, Mars will appear to have passed the Plane would be expired in his passing by the Meri-

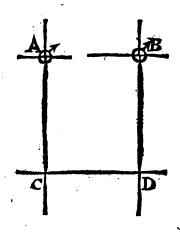

The further Mars moves from the Earth, the leffer will be the Angle of its apparent Semidiameter in Mars, and consequently the lesser will be the above-mention'd difference of Time between the Transit of the Planet by the fensible gles, will answer to the Circles of right Ascension. and rational Hour-Circle of 6.

And if his Elongation from the Earth could come to be so great as that of the fixed Stars, the Angle ARD, or its Equal NAR would then come to be so very small, as to be scarce sensi-ble; so that when the Star is in the Plane DR, it would appear in that of A N.

And by this means a fixed Star, or rather a good Pendulum Clock, made to move with the Star's Hour, will supply the Want of another Observer, in the Place represented by C; for all that an A-Aronomer there could do, is only to affure us, that he had feen Mars in the same Plane of his Meridian, or of our 6th Hour Circle, when he appears to us in another Position. But this our Clock can inform us of, by shewing us that Time after Mars hath transited our Meridian. For fince 'tis plain that the Star L, in 6 Hours after it hath passed our Meridian, will be in the Plane of the Hour Circle DR, we shall know the Star is actually in that Plane, by our Clock's shewing us, that the the transverse Hair AC; and the exact Diffe-

be imagined to pass thro' our Eye, and the Star parallel to the Earth's Axis; that Plane must be that of the sensible Hour-Circle of 6, and in which the Star must necessarily be. But Mars will ap pear to differ from this, by so many Minutes of his Parallel, as are the Number of his Parallax. Counting therefore by the Pendulum, the Seconds of Time, which intervene between the Transit of Mars, and of the fixed Star, and allowing four such Seconds for every Minute of a Degree, you will have the Quantity of the Angle MAN, or AMD, which is the Parallax of the Plane fought.

But how this difference of Time is observed, I must next shew you. In the common Focus of the Object and Eye-glasses of the Telescope you observe with, there must be placed at least 4 sine Threads,

or Hairs, intersecting one another at right Angles; and the Telescope furnished with its Micrometer, 4 Minutes of an Hour before the 6 Hours must be so moved up and down, till that fixed Star which is then nearest the Planet Mars shall appear to pass along one of the Hairs, as the Image of the Planet moves in the Telescope, as it must do, parallel to the Equator; for then the Hairs will, in that Position, be also parallel to the Equator; and the other Hairs which cross them at right An-As in the Figure annexed, where the two parallel Threads AB and CD, have 2 others, AC and BD, placed at right Angles to them, just as the Equator and all its Parallels do interfect the Meridians, or Circles of right Ascension always at right Angles; the Observer then must wait a while with his Telescope and Micrometer adjusted, till the Planet and fixed Star, being both carried together by the same apparent diurnal Mo-tion, come to one and the same Meridian: and then the exact Time of the Appearance must be noted. After 6 Astronomical Hours, the fixed Star will be come into the Plane of the 6th Hour Circle, but Mars will be got thither a little before the Star. About the Hour of 6 therefore the Telescope must be used again, and the Hairs retaining their former Position, must be brought into the Plane of the Hour Circle of 6, and there fixed. Then the exact Moment of Time must be noted when Mars appears by his diurnal Motion to move along by Time is clapfed. And because, with regard to the rence in Time also between the Planet and the fixed Stars (whose diffance is so immense) the Planet Star's coming thither afterwards, must be nicely of the fensible Hour Circle of 6 is coincident with that of the real one; if, when 6 Hours are past Parallax of Mars: which being turned into from the Star's transiting our Meridian, a Plane Parts of a Degree, as above shewed, is the Horis HoriHorizontal Parallax of the Planet requi-

By this Method, our Flamstead, and Cassini at Paris, found the Parallax of Mars to be about 25 Seconds, and certainly not more, but probably a little less.

Having thus gain'd the Parallax of Mars, let us next endeavour to obtain by it the thing at first proposed, that is, the Sun's Horizontal Parallax; which will be easily had from that of the Planet Mars. For fince at this time of Observation of the Martial Parallax, i. e. when Mars is in opposition to the Sun, the Sun must be more than twice as far distant from the Earth as the Planet Mars is, the Sun's Parallax can't be quite half so much as that of Mars, and therefore may be accounted not to be above 10 or 12 Seconds at And this agrees with the Observations of Vendeline, and those made by Cassini about the Parallax of Venus also.

Supposing then the Sun's Horizontal Parallax to be about 10 Seconds, his Distance from the Earth will be thus found: As the right Sine of 10 Seconds is to Radius, fo is the Earth's Semi-diameter in English Statute Miles, to the Sun's Distance in the same Miles; and this Way the Sun's Distance is found to be about \$1,000,000 of our Miles.

The Sun's true Diameter may also by this means

be had; for as Radius is to the Sine of the Sun's apparent Diameter, viz. 31 Minutes and a half, fo is the Sun's Distance above found to his real or true Diameter, or about 800,000 Miles Englisk.

Indeed the true Magnitude of the Sun's Body cannot be determined from hence, because that depends also on his Density, which cannot be found this way.

From this usual way of finding the Sun's Horizontal Parallax, the Astronomers draw these and fuch like Consequences:

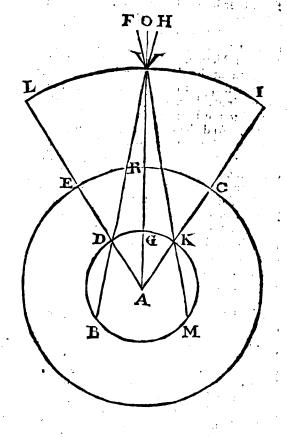

1. That it is easier to determine the annual Parallax of the fixed Stars, than the Sun's diurnal one. For fince the annual Parallax of the fixed Stars is at least quadruple of the Sun's diurnal one, as the Parallax of Mars, by whose Knowledge the folar one was found, is almost double of it; it must be better subject to Astronomical Observation, and be capable of a Determination twice as accurate.

2. In Astronomical Calculations by the Tables, this Parallax of the Sun may generally and fafely be neglected. For since it doth not arise to above

3. The Earth's Distance from the Sun being given, the Distances of the other Planets, both from the Sun and the Earth, are also given; and in the following Table you have their Distances from the Sun, their Dismeters, and the Times of their Periodical Revolution.

Mercury	'	. (32,000,0

SUPERIOR Planets, are Mars, Jupiter, and Saturn: They are so called, because they move in Orbits round the Sun, which are larger than that of our Earth, and so are above us with rea nxtn part of a Minute of Time, it will be gard to the Sun, and never can come between fcarcely confiderable; our present Astronomithe Earth and him. The Theory of the Motions cal Tables not being capable of bringing us to a greater Accuracy and Exactness.

1. That, besides their apparent Motion from East to West, which the diurnal Rotation of the Earth occasions, they appear usually to move also slowly from West to East, and to make entire Revolutions this way; as in reality they do in their Orbits round the Sun: But Mars moves faster than Jupiter, and Jupiter than Saturn, in proportion to their several Distances from the Sun.

2. But sometimes they will also to an Eye at oco our Earth, appear to move the contrary way from East to West, which was a great difficulty in the oco old Astronomy, but may easily be solved by the ooo confideration of the following Diagram; in which let A be the Sun, MGB the Orbit of the Earth, in which it moves annually from M by G, towards

B from West to East; let the Circle QRS be the immense distance, and with respect to which, the Retrogradation and Stations, &c. of the Planet are accounted. For tho' to an Eye placed in the Sun at A, the Planets would appear to move always uniformly and equally forward in their Orbs, as in reality they do; yet to an Eye placed on the a given Ratio, as suppose in the Ratio of 2 Surface of our Earth, the Phænomena will be very different, and the Planets will appear some. Take the Side of the Surface, and to it open times to be Retrograde and Stationary in their Motions, as well as at other times Direct. For, suppose the Earth at M, and Jupiter in C, while Jupiter moves from C to R, and describes the Ark C R, a part of its Orbit round the Sun in A: The Earth, because its Angular Motion is much more fwift, will describe the Ark MG; so also while fupiter describes the Ark R E; the Earth will move from G to B. Now while the Earth is defcribing the Ark M K, Jupiter will appear to be moving a little forward; but whilst the Earth moves thro' the Ark K G, Jupiter, tho' in reality still progressive or direct, will appear to be Retrograde, and to move backward from F to O. Nor can it be otherwise, while the Earth moves from G to D, and while Jupiter describes the Ark R E. But when the Earth comes towards B, then the Planet will appear a little direct again, and his apmove from G to B. Now while the Earth is de-Planet will appear a little direct again, and his apparent Progressive Motion will for a while continually encrease. And when the Earth is near K or \mathcal{D} , the Planet will appear to be Stationary in F or H. So that 'tis obvious to fee that the apparent Motion of the Planets will be very irregular and unequal, sometimes swifter, and sometimes flower, according to their Position, with respect to the Earth.

3. The Progressive Motion of every Superior Planet will be swiftest in his Conjunction with the Sun, as his Retrograde Motion will be swiftest in his Opposition. For the apparent direct Motion of the Planet in his Conjunction, arises from ces. the Sum of the Motions of the Earth and Planet then moving directly contrary one to another; and the Retrograde Motion in the Opposition arises from the greatest Excess of all the Terrestrial Motions above the Planetary, both from there being then the least Distance between the Earth and the Planet, and from the Governing the Church, without any Authority Parallelism of their Motions at that time, as is clear from the Consideration of the Figure

They are made by finding mean responsibilities to tween the two Homologous Sides, and the hundred the two Homologous Sides, and the hundred the part of such a Side, or by a Table of ses, by 25 H. 8. c. 19. the sometimes a Resquare Roots; which Roots may be taken out of view is granted. Before this Statute, the Apartle Divisions of the Lines of Lines, and they will peal from the Archbishop's Court lay to the People of t give the proper Distances from the Centre, where ple only the 10 (or 100) unequal Divisions must be pla-

The Uses of the Line of Superficies.

1. To find the Proportion between two or more Similar Superficies.

Take one of the Sides of the greater Surface, Orbit of any Superior Planet moving the same and put it over from 10 to 100, at the end of the way as the Earth. Let the Circle TV X represent the Sphere of the fixed Stars supposed at an ing Sides of the Similar Surfaces severally, and ing Sides of the Similar Surfaces severally, and carrying the Points of the Compasses so that they fall on the same Number on each Leg, they will there shew the Proportion which they bear to

2. To augment a Surface, or to diminish it in

Take the Side of the Surface, and to it open the Sector in the Points 2 and 2, in the Line of Surfaces; and, letting the Sector lie, the Distance between 5 and 5, will give you the Side of a Similar Figure, whose Area shall exceed that of the given one in the Proportion required. And proceed vice versa, for diminisbing

3. To Add together, or to Substract one from a-

nother, Similar Surfaces.

Find first the Ratio between the Surfaces by Prop. 1. and then Add or Substract the Numbers, expressing those Proportions by Prob. 2. and then augment or diminish by the precedent Pro-

4. To find the Ratio between Unlike or Non-Similar Surfaces.

First find Squares equal to those Surfaces, and then those being Similar Figures, you may easily find the Ratio they bear by Prob. 1.

SUPREMACY of the Queen within her Dominions, is declared by the 37th Article of the Church of England, by Can. 1. and 2. by Stat. 25 H. 8. c. 19, 20, 21. and by Stat. 1 Eliz. 1. to be Power of Sovereignty and Rule over all Persons born within her Majesty's Dominions and Realms, of what Estate soever they be, when the Ecclesistical or Civil (or Temporal) so ther Ecclefiaftical or Civil (or Temporal) fo as no Foreign, nor other Power, shall, or ought to bear any Superiority over them. This Su-premacy chiefly consists in the following Instan-

1. That the Archbishops of either Province cannot fummon their Bilhops and Clergy to Convocation, nor enact any Canons, without the Queen's express Consent, by 25 H. 8. c. 19. Whereas before that Act the Convocation was often called, and Laws were made by it for from the Crown.

2. In that there lies now an Appeal from the Archbishop to the Queen in Chancery; and on SUPERFICIES; they are frequently placed fuch an Appeal, a Commission under the Great Seal upon a Sector, 2 Lines (one on each Leg) which is to be directed to certain Persons, whereof com-Mr. Gunter calls very properly Lines of Superficies.

For having shewed the Ratio between the less and the Rays arising from the different Refrangigreater Refractions of the different Rays to be very nearly as 27 to 28, be faith, those that are skilled in Opticks, will easily understand, that the least circular Space, into which the Object Glasses of Telescopes can collect all forts of parallel Rays, is about the $27\frac{1}{2}$ part of half the Aperture of the Whole Aperture; and that the Focus of the most refrangi
of the Glass; or the 55th part of the whole Aperture; and that the Focus of the most refrangi
of $2\frac{2}{2}$ Inches, magnifies about 120 times with perture; and that the Focus of the most refrangi-ble Rays, is nearer to the Object Glass than the Focus of the less refrangible ones, by about 27 \(\frac{1}{2}\) part of the Distance between the Object 15 times.

and the Focus of the mean refrangible

This Tangent-Line is used also to draw the Hour-Lines on the Planes of Dials; and is com- lucid Point in the Axis of any Convex Lens, be monly known and shewn in almost all Books of made by the Refraction of the Lens to converge to Points not too remote from the Lens, the Focus of the most infrangible Rays shall be nearer to the Lens than the Focus of the least refrangible Rays. Distance of the Focus of the mean refrangible of the Sun or Stars, &c. as you will find under flow, is to the Distance between the lucid Point and the Lens very nearly.

Or. Wallis gives an Abstract of his two After this, he shews, by Experiments, made

Dr. Wallis gives an Abstract of his two After this, he shews, by Experiments, made Methods of drawing Tangents to Curves, in with very great accuracy, that the Rays of Light, Philosophical Transactions, N. 81. which are taken which differ in Refrangibility, do not all converge from his Conick Sections, and other Parts of his to the same Focus; but if they flow from a lucid Mathematical Works. And Dr. Barrow, in his Point as far from the Lens on the one fide, as their meter of the Circle in the middle Space between TARTANE; is a small Vessel, much used in these two Foci, which they illuminate when the Mediterranean, with but one Mast, and the they fall there on any Plane, perpendicular to three-cornered Sail, like a Galley; they fish with the Axis (which Circle is the least into which they can all be gathered) is about the 55th part of the Diameter of the Aperture of the Glass. So that its a wonder that Telescopes do represent Objects so distinctly. But were all the TAXERS; are two Officers chosen in Cam-Rays of Light equally refrangible, the Error bridge, to look after the true Gage of all Weights arising only from the Sphericity of the Pigures of Glasses, would be many hundred times less. And TEETH: Mr. de la Hire observes, that the Bone express by Calculation, p. 70. he proves, that the Tooth doth not grow in Adult Persons, to only the Periostium; which is a Substance very Glasses, to that arising from the different Re-

There is another Argument, (faith our excel-When a lent Author, p. 73.) which proves, that the ditpart of the Periostium is broke, and the Bone is serent Refrangibility of the Rays, is the true laid bare, the Tooth usually perishes.

Cause of the Imperfection of Telescopes. For TELESCOPES: (1.) Sir Isaac Newton, in the Errors of the Rays arising from the spherical his admirable Treatise of Opticks, p. 59. demonstrates, That the Perfection of Telescopes is impeded by the different Refrangibility of the Rays thence to make Telescopes, of various Lengths,

concludes that there can scarce be any other means of improving Telescopes by Refractions alone, befides that of increasing their Lengths; for which end the late Contrivance of Hugenius seems well accommodated. (See Philosophical Transactions, Nº. 161.) Glasses are readily manageable, and the Object-Glass being upon a strong upright Pole, becomes more steady.

Sir If. Newton, in his Opticks, p. 76, acquaints us how he polished his reflecting Metal, which he used in his restecting Telescope; and which, because it appears to be a much better way than in any common Use, I here give the Rea-

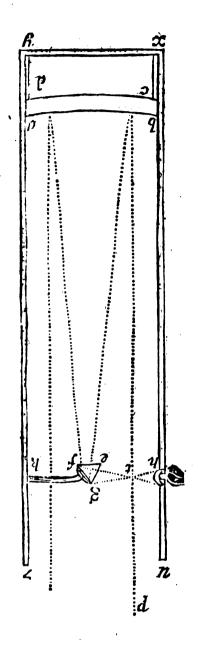

I had two round Copper-plates, each of fix Inches in Diameter, the one Convex, and the o- on the Fore-fide ab, and as much convex on the ther Concave, and ground very true one to ano- Back-fide cd, so that it be every where of an ether; on the Concave I ground the Object Metal qual thickness; for it must not be thicker on one or Concave, which was to be polished, till it fide than the other, lest it make Objects appears had taken the Figure of the Convex, and was coloured and indistinct: it must also be very ready for a Polish; then I pitch'dit over thinly, by well wrought and quickfilver'd over on the Backdropping melted Pitch upon it, and warming it, to fide: Place this Glass in the Tube v. y. z., which keep the Pitch soft, whilst I ground it with the must be made very black within. Let efg repre-Concave Copper, wetted to make it spread evenly sent a Prism of Glass or Chrystal, placed near the all over the Convex. Thus, by working it well, I other end of the Tube, in the middle of it, by made it as thin as a Groat, and after the Convex means of an Handle of Brass or Iron fgk, to was cold. I ground it again, to give it as true a Fi-whose end, made flat, it is cemented. Let this gure as I could. Then I took Putty, which I had Prism be Right-Angled at e, and the other two made very fine, by washing it from all its gross Angles exactly equal, and consequently each 45 Particles, and laying a little of this on the Pitch, Degrees. Let the Sides ef and ge be exactly Particles, and laying a little of this on the Pitch, Degrees. Let the Sides ef and ge be exactly with the Concave Copper, I ground it upon the plane and Squares, and by consequence the third Pitch, till it had done making a noise; and then on Side fg, a rectangled Parallelogram, whose the Pitch I ground the Object Metal with a brisk Length is to its Breadth in a subduplicate Pro-Motion, for about two or three Minutes, leaning portion of 2 to 1. hard upon it. Then I put fresh Putty upon the Pitch, and ground it again, till it had done making a, noise, and afterwards ground the Object-Meta upon it, as before; and this Work I repeated, till the Metal was polished, grinding the last time with all my Strength for a good while together, and frequently breathing upon the Pitch, to keep it moist, without laying on any more fresh Putty.

But because Metal is more difficult to polish than Glass, and is afterwards very apt to be spoiled by tarnishing, and besides reslects not so much Light as Glass, Quickfilver'd over, does; I pro-pound, instead of Metal, to use a Glass, ground Concave on the fore-fide, and as much Convex on the back-fide, and on the back-fide well Quickfilver'd over; the Glass also must be exactly all over of the same thickness, otherwise the Object will look coloured and indi-Hinet.

With such a Glass I tried, about five or fix Years ago, to make a Reflecting-Telescope of four Feet in length, to magnify about 150 times: And I satisfy'd myself, that there wants nothing but a good Artist to bring this Design to Perfection: For the Glass being only after the common manner of grinding Glasses for Telescopes, tho' it seem'd as good as Object-Glasses used to be, yet when it was Quickfilver'd, the Reslection discover'd innumerable Inequalities all over the Glass: And by reafon of these Inequalities, Objects appear'd indi-stinct in this Instrument. For the Errors of Refletted Rays, caused by any Inequality of the Glass, are about fix times greater than the Errors of Re-

By reason of this different Refrangibility, he fracted Rays, caused by the like Inequalities. But I however found by this Tryal, that the Reflexion on the concave fide of the Glass, which I fear'd would disturb the Vision, did really no sensible prejudice to it; and consequently, that nothing is wanting to perfect these Telescopes but good For in his Aerial Telescope, the Workmen, who can grind and polish Glasses trureadily manageable, and the Object-ly spherical. I once mended a common fourteen Foot Object-Glass confiderably, by grinding it with Pitch or Putty, and learning very easily on it in the grinding it, left the Putty should scratch it: befides, leaning too hard on the Glass in grinding it, is apt to bend it; and then the Figure cannot be truly spherical.

Sir Isaac Newton's Method of shortning Te-escopes, vid. his Opticks, p. 29. Let abde represent a Glass spherically concave on the Fore-fide ab, and as much convex on the

Let this Prism be so placed in the Tube, that the Axis of the Concave Speculum may pass thro' the middle of the square side of perpendicularly, and consequently thro' the middle of the side fg, at an Angle of 45 deg. And let the fide ef be turned towards the Speculum, and the Distance of this Prism from the Speculum be such, that the Rays of the Light pq, rs, &c. which are incident upon the Speculum in Lines parallel to the Axis all Money payable to the Queen, by Warrant from thereof, may enter the Prism at the side ef, and the Auditor of the Receipt, and make weekly be respected by the side fg, and thence go out of it and yearly Books of all Receipts and Payable 1.6.1. thro' the side g e to the Point t, which must be the ments, which they deliver to the Lord Treacommon Focus of the Speculum a b d c, and of a Plane Convex Eye-glass b, thro' which those Rays must pass to the Eye. And let the Rays at their coming out of the Glass pass thro' a small round Hole, or Aperture, made in a little Plate, Lead, Brass, or Silver, wherewith the Glass is to be covered; which Hole must be no bigger than is necessary for Light enough to pass thro': for so it raised before the Curtain, in the middle of the will render the Object distinct; the Plate in which Fos: It is of three sorts; the first is composed of a it is made, intercepting all the erroneous Part of Curtain, two Flanks and two Faces: The Ram-

the Light which comes from the Verges of the Speculum ab.

Such an Instrument well made, if it be 6 Foot long (reckoning the Length from the Speculum to the Prism, and thence to the Focus t,) will bear an Aperture of 6 Inches at the Speculum, and magnify between 2 and 300 times. But the Hole b, here limits the Aperture with more advantage, than if the Aperture were placed at the Speculum

If this Instrument be made longer or shorter, the Aperture must be in proportion, as the Cube of the square Root of the length, and the magnifying as the Aperture. But it's convenient, that the Speculum be, at least, an Inch or two broader than the Aperture; and that the Glass of the Speculum be thick, that it bend not in the working. The Prism e fg, must be no bigger than is necessary, and its backside fg must not be Quicksilver'd over; for without Quicksilver it will restect all the Light incident on it from the Speculum.

In this Instrument the Object will be Inverted, but may be erected by making the sides ef, and eg of the Prism efg, not plain but spherically Convex, that the Rays may cross as well before they come at it, as afterwards between it and the Eye-Glass.

If it be defired that the Instrument bear a larger Aperture, that may be also done, by composing the Speculum of two Glasses, with Water between them.

The reason why four Glasses in a Tele-scope represent the Object erect, Mr. Molyneux shews plainly in Philosophical Transactions, Nº 183.

Mr. Auzont saith, in Philosophical Transactions, No 4. That the Apertures of Telescopes ought to be in a Sub-duplicate Ratio of their Lengths; but this must be taken, so as to allow for the Quantity of Light which comes into the Tube; for the more Light comes in, the greater the Apperture must be, saith Dr. Hook. ibid. And Dr. Hook also doth there shew a way to make a Plane Convex-Glassof a small Sphere collect the Rays at a great Distance; but I don't find that he ever made any considerable Use of it afterwards.

Mr. De la Hire saith, in the Memoirs de l'Academie Royal des Sciences, for May 1699. That to prevent the Dew falling on the Object-Glass of Telescope in a no turnal Observation, 'tis a a Telescope in a no Turnal Observation, very good way to make a Tube of coarse brown

THRAVE of Corn, in most parts of England, confists of four Shocks; and each Shock contains fix Sheaves; but in some Places they reckon but fire, such Explosion may well follow with such twelve Sheaves to a Thrave.

value of a Groat, or the third part of a Shilling; being seemingly a Corruption from Tremissis, which was a German Coin, of the value of Four-pence. Some will have it to be a Three Shilling Piece, us, will do no mischief, or not considerable; like a but it seems a Mistake.

THUNDER and Lightning. The Phanomena of this very common, but oftentimes dreadful the Explosion be near to us, or amongst us, it

The Atmosphere about the Earth abounds with nitrous Particles of a spirituous Nature, which are every where carried along with it; besides up into the Air, which may be somewhat of the Na-Turpentine, Camphire, and almost all other com-Air. All which, if they have a fufficient Degree TENON, in Architecture, is the square end of of Heat, will catch Fire, or be turned into Flame by the nitrous Parts of the Air; as thousands of Experiments might be brought to prove. in them, will fo ferment and act one upon another, TERRA Testamentales; Lands that were held as to produce an actual Flame: which is a tree from Feodal Services, in Allodio, in Soccage, thing that hath been often found in Mines, and contiguous Air, will immediately take fire, like a Train of Gun-powder, and run from one end of those Vapours to the other, be they ever so long; Mosaick Work, made of curious small square Coal-Mines, and several other Mines. The Ac-Marbles, Bricks, or Tiles, called Teffellæ, from cention of which Vapours is so sudden, and with fuch violence and swiftness runs from one end TESTONS, or; as we commonly call them, Teto the other, as often to kill the Miners, blow up flors, from their having an Head (Testa) upon their Props, Turns, Stays, Houses, &c. and them, were in 34 H. 8. coined either here, or in produceth as prodigious Effects, as if a vast France; and Spelman saith, their value in France Quantity of Gun-powder had been fired in the was 18 d. and he doth not know but that they might. Mine. Now Lightning in the Air seems to be go for as much here. He saith it was Brass, and much of the same Nature; for the Air scontinual-cover'd over with Silver, (which perhaps gave rise by furnished with spirituous nitrous Parts; and the to the Iniquity of Plating Money.) They went Summer Heat, whenever extraordinary, raises up with us in H. 8th's time for 12 d, but in Flore, 6th's out of the Earth (and to this the subterraneal they work upon each other, and thereby begins a further Degree of Heat, which gradually encreases, till at last it arrive at a certain pitch; and then they fall upon and work on one another, producing an actual Fire and Flame, which with won-derful swiftness fires the whole Train, and so produces the Flash and Noise.

Dr. Wallis in Philof. Trans. N° 231. p. 655. faith, That Thunder and Lightning are so very like the Effects of fired Gun-powder, that we may reasonably judge they proceed from the like Causes. Now the principal Ingredients in Gunpowder, are Nitre and Sulphur, (the admission of Charcoal being chiefly to keep the Parts separate, for the better kindling of it.) So that if we suppose in the Air a convenient mixture of Nitrous and Sulphurous Vapours, and those by accident to take welve Sheaves to a Thrave.

Noise and Light, as in the firing of Gun-powder;

THRIMSA, was an old piece of Money of the and being once kindled, it will run from Place to Place, as the Vapour leads it, like as in a Train of Gun-powder, with the like Effects.

This Explosion, if high in the Air, and far from parcel of Gun-powder fired in the open Air, where nothing is near enough to be hurt by it.

TIDES: The Tides of the great Ocean being caused (as you may see in Vol. I.) by the Action or Attraction of the Moon upon it (chiefly) and because that part of the Ocean, which is directly under the Moon, will be more attracted by it trust not to any found in the River, it being unthan the rest; there the Ocean must swell or certain from whence the Water may have brought them, and the Water will run from other Parts thither.

TIGE, in Architecture, is the Shaft of a Co-

The Miners imagine, that, before the Deluge, Vapour, is manifest from the sulphureous Smell the uppermost Surface of the Mineral Veins, or that attends it, and the sultry Heat in the Air, Loads, lay parallel to the upper Surface of the which is commonly a Fore-runner of Lightning Earth; but that, in the Flood, they were moved, foon after. And that there is a nitrous Vapour loosed, and torn off; and that by the descending in it, we may reasonably judge, because we do of the Waters into the Valleys, both the Earth or not know of any Body so liable to a sudden and Grewt, and those Mineral Stones or Fragments so violent Explosion.

Grewt, and those Mineral Stones or Fragments so torn off from the Loads, (and which they call Shoad) As to the kindling of these Materials, in order to were, together with, and by the Force of the such an Explosion, I am told that a Mixture of Waters, carried beneath their proper Place, and Sulphur, and Filings of Steel, with the Admistion from some Hills, even to the bottoms of the neighbouring Valleys, and from thence by Land-Floods down into the Rivers.

On these Suppositions, they proceed thus in Trayning or pursuing of a Load: Where they suspections Mine to be, they diligently search that Waters, and other hot Springs, where Steel and Hill and Country (as they call the Place where the Mine lies) that they may the better know the Green and the Stones, when they meet them at a which are made in the Banks of Rivers, newly made by great Land-Floods, which usually are then very clean, to see whether there be any Metalline Stones in the Sides, or Bottoms; together with the Cast of the Country, as they call it, i. e. any Earth of a different Colour from the rest of the Bank. And this is a great help to them, to discover which Hill, or which fide of it to search. The Mineral Stones are discovered, either by their Weight, or their Porofity; for most Tin-Stones THYREO-STAPHILINUS, is a Muscle of are Porous, not unlike great Bones, almost e Uvula, arising sleshy from the edge of the upvery firm Stones; and Dr. Chr. Merret faith, that they are usually found betwixt two Walls of Rocks, which are commonly of an Iron Colour, of little or no Affinity with the Tin. Vid. Phil. Trans.

> Another Way they have to discover whether the Stones contain any Ore, is, what they call Vauning, which is, to powder the Stone, Clay, &c. or whatever is suspected to contain any Metal, and then placing it on a Vauning Shovel, then will the Gravel remain in the hinder part, and the Metal at the Point of the Shovel; whereby the Nature, Kind, and Quantity of the Ore is very nearly guess'd at.

them. But then they go to the fides of the Hills most suspected, where there is a convenience of But from hence only it will not follow, that bringing a little 8tteam of Water (the bigger the there should be Tides produced in Rivers and in better) and then they cut a Leat or Gurt, as they

call it, that is, a Trench about two Foot over, and no other Load or Vein, neither doth it fend forth as deep as the Shelf; and by this means turn the Water, running two or three Days, that by washing away the Earth from the Stones, it may discover the Shoad. If they find any, they conclude there is a Load in the upper part of the Hill, or at least a Squat. Then at the foot, or bottom of the Hill, they fink what they call an Pffay-batch, i.e. a Hole about fix Foot long, and four broad, and always as deep as the Shelf; and if they find no Shoad there, when they come to the Shelf, there is none to be expected: Tho' fometimes the Shoad is washed clean away, when you come within two or three Foot of the Load, which then lies so much further up in the Hill. But if they find Shoad, they are almost at a Certainty; and this is held as an infallible Rule, that the nigher the Shoad lies to the Shelf, the nigher the Load is at hand, and vice versa.

If they find no Shoad in the first Hatch, they ascend usually about twelve Fathom, and then fink another, as before; and if no Shoad appear here then they go as far on each hand side-ways, and fink there, as before. And so they ascend pro-portionably with three or more Hatches (if the Space of Ground require it) as it were in Breast, till they come to the top of the Hill. And if they find no Shoad in any of these Hatches, farewel to

But if they find any Shoad in any Hatch, then they keep their ascending Hatches from thence in a right Line; and as they draw nearer the Load, they leffen the first Proportion of twelve Fathom to fix, or yet less, as Conjecture directs them. If they find Shoad lying near the Shelf in one Hatch, and none in the next ascending, they conclude they have over-shot the Load, and then they sink nigher that Hatch, in which they last found the Shoad. Sometimes they find two different Shoads in the same Hatch, at different Depths, and then they have a Certainty of another Load above the former; and it may be in Training up to the second, Pounds, well steeled at the Points, and four-they meet with the Shoad of a third. Some Tin-square; these will last three or four Days, or a ners affirm, that the seven Loads may lie parallel one to another in the same Hill, but yet only one ders. 5. Wheelbarrows to carry the Deads and Master-Load; the other six, three on each side, being the leffer Concomitants; and so may five

lie, three are common.

Every Load hath a peculiar coloured Earth or Grewt about it, which is found also with the Shoad in a greater quantity, the nearer the Shoad lies to the Load; and so lessens by degrees to near a

A Valley may lie so, at the Feet of three several Hills, that they may find three feveral Deads, i.e. common loose Earth, in which the Shoad lay, and which is not only contiguous to the Load: This they call the Run or Cast of the Country, or of each Hill; and the Knowledge of this is very necessary, in order to surer Training of them one after another, as they lie in order, according to the foregoing Rules of Essay-Hatches; for the uppermost will direct you which Hill to begin first.

It may be, after they have trained up the Hill, they find nothing but a Bonny or Squat, which likewise have their Shoad. Their Form is about two or three Fathom long, and half as broad, few larger, and most less: These communicate with the same Breadth in all Places.

any of its own, but is entire of itself, and perhaps will go down into the Shelf, five or fix Fathom deep, and there terminate.

The Manner of their Digging the Ore, is thus:

When they have found the Load, and last Essayhatch, 'tis then called a Tin-shaft; or Tin-batch, which is funk down about a Fathom, and then is left a little long square Place, called a Shamble; and so they continue finking from Cast to Cast, (that is, as high as a Man can conveniently throw. or cast up the Ore with a Shovel) till they either find the Load to grow small, or degenerate into some fort of Weed, which are divers; as Mundick, or Maxy, corrupted from Marchasite; and this is white, yellow, and green. Daze, which is a kind of glittering Stone, enduring the Fire, of different Colours; as white, black, and yellow: Iremould, black and rusty; Caul, which is red, differing both from Mundick and Daze, or Spar, (enduring the Fire) which Marchasite will not ; Glister, which is Blood-red and Black.

Then they begin to make a Drift three Foot wide, and seven Foot high; and if the Load be not broad enough of itself, as some are scarce half a Foot, then they usually break down the Deads, or that part of the Shelf which contains no Metal, but encloseth the Load, as a Wall between two Rocks, and then they begin to rip the

Load itself.

The Instruments they use, are, 1. A Beele, or Cornish Tubber, i.e. double Points of eight or ten Pounds, sharp'ned at both ends, steeled and holed in the middle. This, in a hard Country, will last about half a Year, but must be new pointed eve-

ry fourteen Days.

2. A Sledge, flat-headed, from ten to rwenty Pound, will last about seven Years, new ordered once a Quarter. 2. Gadds, or Wedges, of two Week; and then must be new sharpened. 4. Lad-Ore out of the Drifts or Adits, to the Shambles. There are two Shovel-men, and three Beele-men, which are as many as one Drift can contain, without hindering one another. The Beele-men rip out hindering one another. the Deads and Ore, the Shovel-men carry it off, and land it, by casting it up with Shovels from one Shamble to another; unless where there is a quarter of a Mile's distance; but further than Winder with two Kechles or Buckets, one of which that, the peculiar Grewt is never found with the comes up as the other goes down.

Shoad.

It is usually observed, that the Tin Loads run

East and West, and then they constantly dip towards the North, and sometimes as much as three Foot in eight perpendicular. But in the higher Mountains of Dartmoor, there are some considerable Loads that run North and South, and

these dip to the East.

Four or five Loads may a while run parallel to one another in the same Hill, as hath been known in Hingston in Cornwall, and then turn in and meet altogether in one Hatch, and after separate

igain, and run parallel, as before.

The Breadth of Master-Loads is generally from three to seven Feet, seldom larger, unless where feveral Loads unite, and make a Knot, or fend forth Springs and Veins: But they do'nt retain

The

The Load is usually in a hard rocky Country, made up of Metal, Spars, and other Weeds, as it were all along in a continued Rock; but it hath easily meet with the Tongues so placed in the Lifmany Veins and Joints.

Fret deep from the Load, at others not at many Ore, thereby breaking it into small Sand, which

are forced to draw it up with Winders and Kee-bles, or force it up with Pumps. Some, but very few Pumps may be dry. They observe, that when The Stamping-Mill is thus contrived to go two few Pumps may be dry. Damps are sometimes enlarged by working of the Mundick with the Ore.

derprop their Drifts with Stemples and Wall-plates, placed much like a Carpenter's Square, on the one fide, and over-head.

skilful Person first fastens the end of a long Line is divided into three parts, the Fore-head, the at a known Place, and then exactly observes the Middle, and the Tail. That Ore which lies in Point at which the Needle of his Dial or Compass the Fore-head, or within one Foot and a half of the rests; and at the next Flexure, or Winding, he makes a Mark on the Line, and again notes the apart; the Middle and Tail is another Heap, which the Needle stands at this second which is accounted the worst. This latter Heap Station; and so he proceeds from turning to turning is thrown up by the *Trambling Buddle*, that is, a ing, still marking the Points and his Line, till he long square Tye of Boards, or Slate, about somes to the intended Place. Then he repeats above ground what he had done below, and his standard Man what he had done below, and his standard Man what he had done below, and his standard Man who was the Standard Shovel in his Hand,

The Manner of Dressing the Tin, is thus:

When the Ore is landed, and the greater Stone broken at the top of the Mine by the Shovel-men, 'tis three Bottom-boards, with two Side-ones, set slope-wise) in which the Ore slides down into the Coffer; but that it may not tumble down all at once, there is placed a *Hatch* nigh the lower end of the Pass, (that it is a Thwart-board to keep up the Ore.) Beneath that, comes in the Cock-water in a Trough ced between two strong broad Lones, having two not different from the first. Braces, or Thwart-pieces on each fide, to keep them steady as a Frame, with Stamper-heads, many Timbers or Guiders between them, are lift- Tin, i.e. fuch as is compleatly ready for the Blowed up, in order, by double the number of Tap-ing-house. pels (fastened to as many Arms, passing diametri-

cally to a great Beam, turned by an Over-skot Water-wheel on two Boulsters) which exactly, but any Veins and Joints.

In most Places they meet with Water at some suffering the Listers to fall with great force on the Fathoms; it runs continually thro' the Heart of is washed out by the Cock-water, thro' a Brass the Load.

When it begins to trouble us, we begin at the Bars of Iron at one end of the Coffer, into the Foot of the Hill, a Drift scarce half so big as that Launder, i.e. a Trench cut out in the Floor, eight of the Load, and work it on a Level, till we come Foot long, and ten over, and stopped at the other up to the Load. But where they have not this end with a Turf: so that the Water runs away, Convenience, or if they pass that Level, then they and the Ore finks to the bottom; which, when

The Stamping-Mill is thus contrived to go two they have Water, they never want Air sufficient Hours, or more, after they give over attending it. for Respiration, and for their Candles to burn in; There is a Tiller, or long Pole, sastened without at yet sometimes in a soft clayey Country, the Air one end to the Slew or Ponder, i.e. that loose and is so condensed, as to become in a manner a Damp, last part of the Trough, that conveys the Stream and to require an Air-Shaft for a Vent: which to the Overshot Wheel. Then, at the other end, there is tied a short Rope, with a transverse Stick at the end of it, curiously, but Trap-ways, hitched If the Country be not strong enough, they un- at both ends, under two little Pins, fastened in the Lones for that Purpose: There is another Pin set in one of the Listers, at such an exact height, as that if there be no Ore in the Coffer, to keep To know which way the Load inclines, to bring that Lifter high enough, the purposed Pin, in dean Adit, or to sink an Air-skaft in the desired Place, the Use of the Dial is needful; which they call over the Mill-wheel; so that when the Coffer is Plumming and Dialling, and is thus performed. A still Desson first sales and of a long I included into three parts, the Fore head the apart; the Middle and Tail is another Heap, which is accounted the worst. This latter Heap Dial and Line leads him, till he come exactly o-to cast up the Ore, about an Inch thick, on a long for the Place where he ended the Mine. for a long for Board, just before him, and as high as his Middle, which is called the Buddle-bead; and with the Edge of his Shovel, he dexterously cuts and divides it long-ways, in respect of himselt, about half an Inch asunder; in which little Cuts, the Water coming gently from the edge of an upper brought on Horses to the Stamping-mill, whence the plain Board, carries away the Filth, and lighter Ore is landed at the head of the Pass, (i.e. two or part of the prepared Ore first, and then the Tim immediately after, all falling down into the Bud-dle; where, with his bare Foot, he smooths it transversely, to make the Surface the plainer, that the Water, and other Heterogeneous Matter, may,

ithout lett, pass away the quicker.
When this Buddle grows full, they take it up a cut in a long Pole, which, with the Ore, falls down into the Coffer, (i.e. a long Square of the Middle and Tails, which are trambled over again: firmest Timber, three Foot-long, and one Foot and But the Fore-head of this, with the Fore-head of half over) wherein are the three usual Listers, plathe Launder, are trambled in a second Buddle, but In like manner, the Fore-head of this being likewise separated from the two other Parts, is carried to a third, or the drawweighing about thirty or forty Pound each of Iron, ing Buddle,; whose difference from the rest is only which serve to break the Ore in the said Coffer. this, thath no Tye, but only a plain sloping. These Listers, being about eight Foot long, and Board, whereon its once washed with the Trambals a Foot square, of Heart of Oak, and having as bling-shovel, and so it new names the Ore Black many Timbers or Guiders herewere them are life.

There

Ggggg

There is also another more curious way, called Sizing; that is, instead of a Drawing Buddle, they use a Hair-sieve, thro' which they sift the Ore, casting back the remainder into the Tails, and

new trambling it.

Fore-head in the second Buddle, and dilve it, (i.e. sutting it into a Canvas-fieve, in a large Tub of Water, and shaking it lustily) so that the Filth Tin behind, which is put into Hogsheads, covered and locked, till the next Blowing.

The Tails of both Budhles, after two or three Tramblings, are cast out into the first Strake or Tye (which is a Pit made purposely to receive them) and what over-small Tinesse may wash a-

way in Trambling.

There are commonly three or four of them fucceffively, which contain two forts of Tin, the one which is too finall, the other too great. The latterisnew ground in a Craze-mill (which is just like three Foot and a half broad, and fix long, and called Pryan Tin which turns upon two Iron-Pins, fastened in both ness of the other. ends, and the whole placed between two Posts; so Shovel and Water.

which makes it brittle and hard, they are necessitated to burn away the Weed in a Tin Kiln. This Kiln is four-square, and at the top hath a large Smoke. Moor-stone about six Foot long, and sour broad; The in the middle of which is a square Hole of about Fin-Ore, and sometimes on heaps; they are hard, half a Foot in Diameter: About a Foot beneath enough to cut Glass; and some of them are of a this Stone, is placed another, which is not so long transparent red, and have the Ludge of a deep by half a Foot; because it must not reach the in-Ruby. They seem to be only a fine hard Spar, nermost, or back part of the Wall, which is the The best Tin Ore is that which is in Sparks, open Place, thro' which the Flame ascends from a and next to this, that which hath bright Spar in it. leffer Place below that, where a very strong Fire of The Furnace where they melt, and from whence Furze is constantly made. The Fore-part is like a they cast their Tin, they call a Blowing-house, See common Oven; but near the back, on one fide, there also Mr. Ray's Collection of English Words.
is another little square Hole. When the Kiln is TIP-STAVES, are the Warden of the Fleet's throughly heated, the black Tin that is to be burnt, Officers, attending the Queen's Courts with a paintis laid on the Top stone, and as much of it is cast ed Staff, for taking into Custody such Persons an down by the square Hole, on the second, or Bot-from-stone, as will cover it all over, about three or Prisoners as go at large by Licence. By this Name four Inches thick. is fearching for, and pursuing a Vein of Ore.

TRAMBLING, is the Term used in dressing of Tin-Ore, for washing it very clean in Water, which is done with a Shovel, that they call a Trambling-shovel, and in a Frame of Boards, which they call a Buddle; see Buddle and Tin.
TRANSFORMATION of Curves.

The Abbot Galloys of France, having in the Year 1693, maintained, that Mr. James Gregory, and our excellent Dr. Barrow, had borrowed their affume General or Indefinite Equations, for the Lines general Propositions about the Transformation of Curves from Mr. Roberval; Dr. David Gregory, and Ordinate, the Equation I use for a Line sought, Astronomy Professor, doth in Philosophical is, a+bx+cy+exy+fxx+gyy, &c. =0. Transactions, N° 214. p.233. fully refute that Affertion, by shewing that Mr. James Gregory's Book was published at Padua, 1663; and Dr. Barrow's Lectiones Geometr. 1674. And therefore enquire the Tangent, and that which results for the Lines and Proposition of Sought. Ex. gr. putting x and y for the Lines fought. Ex. gr. putting x and y for the Abscissa. By the Equation I use for a Line sought, and Ordinate, the Equation I use for a Line sought, and ordinate, the Equation I use for a Line sought, and Ordinate, the Equation I use for a Line sought, and Ordinate, the Equation I use for a Line sought, and Ordinate, the Equation I use for a Line sought, and Ordinate, the Equation I use for a Line sought, and Ordinate, the Equation I use for a Line sought, and Ordinate, the Equation I use for a Line sought, and Ordinate, the Equation I use for a Line sought, and Ordinate, the Equation I use for a Line sought, and Ordinate, the Equation I use for a Line sought, and Ordinate, the Equation I use for a Line sought, and Ordinate, the Equation I use for a Line sought, and Ordinate, the Equation I use for the Abscissa is a superior of the Abscissa is a superior of the Abscissa is a superior of the Abscissa is a superior of the Equation I use for a Line sought, and Ordinate, the Equation I use for a Line sought, and Ordinate, the Equation I use for a Line sought, and Ordinate, the Equation I use for a Line sought, and Ordinate, the Equation I use for a Line sought, and Ordinate, the Equation I use for a Line sought, and Ordinate, the Equation I use for a Line sought, and Ordinate, the Equation I use for a Line sought, and Ordinate, the Equation I use for a Line sought, and Ordinate is a superior of I use for a Line sought, and Ordinate is a superior of I use for a Line sought, and Ordinate is a tis more than probable, that Mr. Roberval had comparing with the given Property of Tangents, I feen those Books, fince he did not die till Oct. find the Value of the assumed Letters, a,b,c, &c. 1675; and yet we find not that he makes any such And thus I define the Equation of the Line Complaint.

TRANSCENDENTAL Quantities, Mr. Leibnitz, in the Act. Erud. Lipsie, for June 1686, hath a Differtation, in which he proposes to shew the innumerable Lines may be found that will satisfy Origin and Rise of such kind of Quantities, viz. the Problem.

Sur-folid, nor of any certain Degree, but do tran-TONGUE Grafting, is a way of Grafting in Roots, thus: The Root is cut floping about an how it may be demonstrated without a Calculus, that an Algebraical Quadratrix for the Circle or Hyfmooth; then each is cleft an Inch in length also, perbola is impossible. For if such a Quadratrix less than the Graft, but it may be bigger; but 'tis of any Number of Parts of an Angle, or mean best when they are both of the same size. vid. Proportionals, is of an indefinite Degree, and Phil. Trans. Numb. 95.

Phil. Trans. Numb. 25.

About twenty-nine Years ago, faith Mr. Lewis, who communicated the Method above, I ly be proposed in Geometry (nay, and ought to flowed a Bed of Apple-kernels in March, the be reckoned amongst the most principal) and befill the law forty of these Seedfides are determinate; therefore 'tis necessary

bear two Quarters of Apples upon a Tree, and are cal, but Geometrical Curves; especially too, fince they are of much greater use than all the Lines of they stand, which cost twelve Pence a Tree, when the common Geometry (except the right Line these were Kernels. I conceive, saith he, that and Circle) and have also some very important and Properties, which are altogether capable of Geometrical Demonstration.

Des Cartes therefore was no less out in excluding these from Geometry, than the Ancients were, who neglected the Loca Solida & Linearia, as not Geo-

Now, because the Method of discovering indefinite Quadratures, or their Impossibilities, is with me but a particular Case (and indeed an entire one) of a much sublimer Problem, which I call the Inverse Method of Tangents, in which the greatest part of the whole Transcendental Geometry is contained; and which, if it could be always Algebraically folved, all that is wished for would be done; fince also I find nothing satisfactory, as yet, extant about it: I will now shew you how this may be done, as well as the Indefinite Quadrature itself.

Whereas then Algebrists used before to assume some general Letters, or Numbers for the Quantities sought, I (in these Transcendental Problems) fought.

In which Equation, sometimes there are some things which remain arbitrary, and in that Case

Ggggg 2

And

And this was the Reafon that a great many, obferving the Refult, believed the Problem not to be sufficiently determined, nor indeed possible. The fame things are also done by Series; but with respect to the Abridgment of the Calculus, I have several helps; of which, more in some other

Now, lassly, if the Comparison above-mentioned doth not proceed, I pronounce the Line fought, not to be an Algebraical, but a Transcen-

dental one.

This supposed, the next Work is to find the Species of the Transcendency; for some Transcendentals depend on the general Division or Section of a Ratio, or upon the Logarithms; others upon the Arks of a Circle; and others on more indefi-nite and compounded Enquiries.

Here therefore, besides the Symbols x and y, assume a third, as v, which denotes the Transcendental Quantity; and then of these three, I form a general Equation for the Line sought, from which I find the Tangent, (according to my Method, which proceeds even in Transcendental Quantities;) then what I find, I compare with the given Properties of the Tangents, and so discover not only the Values of a,b,c, &c. but also the particular Nature of the Transcendental Quantity

And tho' it may sometimes happen, that the se veral Transcendents are so to be made use of, and those of different Natures too from one another; also, the' there be Transcendents of Transcendents, and a Progression of these in infinitum, yet we may be satisfied with the most easy and useful one, and, for the most part, may have recourse to some peculiar Artifices for shortning the Calculus, and reducing the Problem to as simple

Terms as may be.

(in which the Property of the Tangent is always ted. given) 'tis manifest, not only how it may be And thus is the Analytical Calculus extended discovered, whether the indefinite Quadrature be to those Lines which have hitherto been exclualgebraically impossible, but also how (when this ded, for no other Cause, but that they were Impossibility is discovered) a Transcendental Quathought incapable of it.

Also Dr. Wallis's Interpolations, and i have been shewn. So that it feems, I may with ble other things are derived from hence.

As to What remains that I may also be a what remains that I may also be a what remains that I may also be a what remains that I may also be a what remains that I may also be a what remains that I may also be a what remains that I may also be a what remains that I may also be a what remains that I may also be a what remains the contract of the contract o out vanity affert, that Geometry is by this Method carried infinitely beyond the Bounds, to which Vieta and Des Cartes brought it: Since, by this means, a certain and general Analysis is established, which extends to all these Problems, which are of no certain Degree, and consequently are not comprehended within Algebraical Equations.

Again, in order to manage Transcendental Problems (wherever the Business of Tangents or Quadratures occurs) by a Calculus, there is hardly any that can be imagined shorter, more advantageous or universal, than my Differential Calculus, or Analysis of Indivisibles and Infinites (a very small Specimen of which, is contained in my Method of Tangents, formerly published.) From this Calculus may be derived all those Theorems and Problems that have been fo much admired; and this with so much ease too, that there is now no the common Geometry.

Thus, for example, in that Theorem of Dr. Barrow's, That the Sum of the Intervals between the Ordinates and Perpendiculars to the Curve, taken in, and applied to the Axis, is equal to the Semi-Quadrate of the last Ordinate

Let the Ordinate be x, the Abscissa y, the Interval between the Ordinate and Perpendicular p_3 it appears presently, by my Method, that pdy = x dx, which Differential Equation, turned into a Summatory one, makes Spdy = Sxdx. But, from what I have shewn in the Method of Tangents, $d_{\frac{1}{2}}x = x dx$, therefore contrarily, $\frac{1}{2}x = S dx x$, (for as in the vulgar Calculus, Powers and Roots are reciprocal; so in this, Sums and Differences, viz. S and d are reciprocal.) It follows therefore,

In the Notation I had rather make use of dx. and fuch like Symbols, to denote the differential Quantities, than other Letters, because that Expression dx, is a certain Modification of x: And lo by this means it comes to pass, that the Letter a alone (when 'tis necessary) together with its Powers and Differentials, enters the Calculus, and the Transcendental Relations between x and any

other are expressed.

By the same Method we may also explain the Nature of Transcendental Lines by an Equation; ex. gr. Let a be the Ark of a Circle, and x the

Versed Sine; then will $a = \frac{Sdx}{\sqrt{2x-xx}}$, and

if the Ordinate of the Cycloid be y, then will'

$$y = \sqrt{2x - wx + \frac{Sdx}{\sqrt{2x - xx}}}$$
, which Equa-

tion perfectly expresses the Relation between the Now this Method, applied to the Business of Ordinate y, and the Abstissa x; and from it all' Quadratures, or to the Invention of Quadratrices, the Properties of the Cycloid may be demonstra-

And thus is the Analytical Calculus extended

thought incapable of it.
Also Dr. Wallis's Interpolations, and innumera-

As to what remains, that I may not seem to ascribe too much to myself, or to detract too much from others, I will briefly shew what seems to me to be due to the chief Mathematicians to me to be due to the chief Mathematicians to me to be due to the chief Mathematicians to me to be due to the chief Mathematicians to me to be due to the chief Mathematicians to me to be due to the chief Mathematicians to me to be due to the chief Mathematicians to me to be due to the chief Mathematicians to me to be due to the chief Mathematicians to me to be due to the chief Mathematicians to me to be due to the chief Mathematicians to me to be due to the chief Mathematicians to me to be due to the chief Mathematicians to me to be due to the chief Mathematicans to me to be due to the chief Mathematicans to me to be due to the chief Mathematicans to me to be due to the chief Mathematicans to me to be due to the chief Mathematicans to me to be due to the chief Mathematicans to me to be due to the chief Mathematicans to me to be due to the chief Mathematicans to me to be due to the chief Mathematicans to me to be due to the chief Mathematicans to me to be due to the chief Mathematicans to me to be due to the chief Mathematicans to me to be due to the chief Mathematicans to me to the chief ticians of our Age, with respect to this kind of

Geometr First of all, Galilais and Cavallerius began to explain the most involved Met ods of Conon and Ar chimedes; but Cavallerins's Geometry of Indivisi-bles was no more than the Infancy of the Science? Greater Improvements were made yet by those three famous Persons; Mr. Fermat, in his Method de Maximis & Minimis; Des Cartes, by shewing how to express the Lines of vulgar Geometry (for he excluded the Transcendental ones) by Equations; and Gregory St. Vincent, by several noble Discoveries: to which I add Guldinus's admirable Rule about the Centre of Gravity. But all thefe stopped within certain (comparatively) narrow Bounds, which the famous Geometers, Mr. Hr. more need of their being learned and kept in Bounds, which the famous Geometers, Mr. Hrimemory, than for a Man that understands Algegens and Dr. Wallis, went beyond, opening new bra to learn a great many of the Propositions of Ways. For 'tis probable enough, that Hugens's Inventions gave rise to that of Henraet; as those of Wallis might to those of Neil and Wren, who

were the first that rectified Curve Lines, and this without any Detraction from the just Praise of these noble Discoverers. These were follow'd by Mr. James Gregory, and Dr. If: Barrow, who wonderfully increased the Science with admirable Theorems of this kind. In the mean time, Mr. Nicholas Mercator, a Holfatian, and most excellent rem being wonderfully delighted, and not knowing that the same was known to any one else, I presently invented a Triangle, which in every Curve I called the *Charasteristick Triangle*, the Qurve I called the Characteristick Triangle, the Water, which is a Salt very fluid, volatile, and Sides of which should be indivisible (or speaking tasteless, is by Heat changed into Vapour, which more properly) infinitely small or differential Quanis a kind of Air; and by Cold, into Ice, which is tities; from whence I presently, and with ease, derived a vast Copia of Theorems, part of which I found afterwards in Barrow, and the Gregories. And as yet I made no use of an Algebraical Calculus, which when I did apply, I foon after found my Anithmetical Quadrature and several other things. But, I know not how, an Algebraical Calculus did not satisfy me in this Business, and I was forced to do a great many things (that I had a mind to in the Analytick way) by long Ambages of Figures, till at last I found out the true Supplement of Algebra for Transcendental Quantities, viz. my Calculus Infinitus parvorum, which I also call the Differential, Summatory, or Tetragonistick Calculus: And, if I am not mistaken, aptly enough, the Analysis of Indivisibles and Infinites. Which Method, once difcovered, all those things which I formerly had so and sometimes of a white Precipitate, and somemuch admired in this kind, seem'd meer Play and Sport to me. For from hence I was able, not only to find out admirable Compendiums, but also to attain that most universal Method above explained; by the help of which, either Quadratrices, or any other Lines fought, whether Algebraical or Transcendental, are determined as far as is possible.

Before I conclude, I would yet add this one Caution, that in managing Differential Equations,

Such as this before mentioned, $a = \frac{1}{\sqrt{2x-\alpha x}}$

arise innumerable Transfigurations and Equipol-not Nature turn Light into Bodies, and vice versa? lencies of Figures.

TRANSCRIPT, An. 34 and 35 H. 8. c. 14. is the Copy of any Original, written again, or exemplified; as the Transcript of a Fine.

TRANSÍRE, 14 Car. 2. C. 11. is the Term given in the Custom-house to a Warrant or Pass, to let Goods be removed from place to place.
TRANSMUTATION. Sir If. Newton, at the

Mathematician, was the first that I know of, who end of his Book of Opticks, Edit. Lat. seems to be exhibited any Quadrature by an infinite Series. of opinion, That Crasse, or thick Bodies, and Which Invention that profound Geometer, Sir If. Light may be mutually converted and transmuted Newton, did not only reach by himself, but also into one another; and that all Bodies receive compleat, by an universal way; and would he make their active Force from the Particles of Light which publick the Thoughts he has yet further on this enter into their Composition. For all fixed Bo-Subject, he would certainly open new ways to us, dies, when well heated, emit Light as long as they to the great increase, and yet abridgment, of the continue so: And on the other hand, Light inter-Science. As for myself, it happened when I was yet but a Tyro in these Studies, that the sight of a its Rays fall upon the solid Particles of those Bocertain Demonstration concerning the Magnitude dies, as he shews before. There is no one Body of a spherical Substance, suddenly gave me some (saith he) which is less apt to shine than Water Light; for I saw in general, that the Figure made, But yet Water, as Mr. Boyle sound by repeated by applying the Perpendicular to the Curve, as Distillations, is capable of being transmuted into a Ordinates to the Axis (which Perpendiculars in the fixed Earth; and that Earth will be capable of Circle are the Radii) was proportional to the bearing Heat enough to be made by that means to Surface of the Solid, generated by the Rotation of emit Light, and shine as well as other Bodies. the Figure about the Axis. With which first Theo- And he thinks this mutual Transmutation of Bodies and Light into one another, to be very agreeable to the Order of Nature, which seems to delight in fuch Transmutations.

a hard, transparent, fragile Stone, easily meltable; and this Stone is convertable into Water again by Heat, as Vapour is by Cold. Earth, by Heat, becomes Fire, and by Cold is turned into Earth again. Dense Bodies, by Fermentation, are rarefied into various kinds of Air; and that Air, by Fermentation. tation also, and sometimes without it, reverts into dense Bodies again. Quick-suver sometimes puts on the form of a sluid Metal, sometimes of a hard and fragile one: Sometimes it appears in the shape of a pellucid and fragile Salt, which they call Sublimate, and fometimes in that of a pellucid; volatile, tasteless white Earth, which is called Mercurius Dulcis: Sometimes it looks like a red, opake, and volatile Earth, and then 'tis called Cinnabar: Sometimes 'tis in the form of a red, times of a fluid Salt: By Distillation it becomes a Vapour, and by Agitation in Vacuo, it shines like Fire. And yet after all these, and many other Changes, is capable of being brought back again into running Mercury. The Eggs of Infects, &c. as far as Sense can judge, are by little and little evolved, explicated, and encreased in Magnitude, and se turned into Animals: Tadpoles are turned into

Frogs; little Worms, or Maggots, into Flies.
All Birds, Beafts, Fishes, Insects, Trees, and Plants, with all their so very different Parts, grow and encrease out of Water, and aqueous and sa-line Tinctures; and on Putrefaction, all of them In Tinctures; and on Putrefaction, all of them a Man should not rashly neglect the dx on this account, that it may be neglected when the x are Moreover, Water exposed a while to the open taken as increasing uniformly: For by this means a great many have gone wrong, and precluded the Way to themselves, in not allowing the Differentials, as dx, their own Universality: Putrefaction, yields Nourishment both for Ani-So that the Progression of the x might be assumed and Plants. Now among all these many at liberty. Whereas from this one thing alone various and wonderful Transsurgurations, why should arise innumerable Transsigurations and Equipolated Same Putrefaction, all of them revert into Water, or an aqueous Liquor again. Moreover, Water exposed a while to the open Air, puts on a Tincture, which (like the Tincture means a great many have gone wrong, and precludes of Barley, macerated without boiling) in process and Putrefaction, yields Nourishment both for Ani-so that the Progression of the x might be assumed and Plants. Now among all these many at liberty. Whereas from this one thing alone various and wonderful Transsigurations, why should be a process of the proc

The

The great Objection against the practical Joists, and other pieces of Wood, with Fascines, Transmuting of a baser Metal into a nobler, seems Stones, Earth, &c. in order to fill up the Ditch, to be, that the specifick Gravities of Metals can- and to carry a Gallery over it. Also a Wall of not be altered: But in Dr. Hook's Life, before Stone or Earth, built a-cross a Work which is his Opera Posth. I find, that Dr. Hook, in 1679, is faid to have made some Experiments about the mixing of Metals; and particularly, that in a Mixture of Copper and Tin, the specifick Gravity of the Compositum was really increased; for that of the Copper was $8\frac{1}{2}$ to one, and that of the Tin but 7 17 to 13 and yet that of the Mixture was

8 to 1.
TRANSOM, in Architecture, is the piece of Timber which is framed a-cross in a Double-

Light Window.

TRANSPARENT, the opakest Bodies that are, if their Parts be fubtilly divided (as Metals when dissolved in Acids, &c.) become perfectly Matters Transparent; from whence, and from some other Reasons, Sir Is. Newton, in his Opticks, concludes, That Water, Salt, Glass, some Stones, &c. and they may be as full of Pores or Interstices between their Parts, as other Bodies; yet their Parts and Interstices are too fmall to cause Reflexions in their common Surfaces. He shews also, that the lean-Parts of all natural Bodies are in some measure transparent; and that their Opacity arises from the multitude of Reflexions caused in their inter-'Tis plain also, as he shews, that opake Substances are rendered transparent, by fil-ling their Pores with any Substance of equal, or almost equal Density with their Parts.

Thus Paper dipped in Water or Oil, the Oculus Mundi Stone steep'd in the former of those Liquors, Linnen-cloth oiled or varnished, and many other Substances soaked in such Liquors as will intimately pervade their little Pores, become more transparent by that means than they were

before

And the true Reason why all opake Bodies, when reduced into very small Parts, become transparent, is because the thickness of the Particles being much less than the Intervals of the Fits of easy Reflexion and Transmission of the Rays of Light, the Body loseth its reflecting Power; for if the Rays, which at their entring into the Body, are put into Fits of easy Transmission, arrive at the furthest Surface of the Body before they be out of those Fits, they must be trans-,mitted.

TRANSVERSALIS Pedis. Dr. Douglas, in his comparative Description of the Muscles, saith that this is only part of the Musculus accelerator Uring, arising from the Knob of the Ischium; for it is not inserted into the Cavum Ovale, or Bulb of nemies. the Urcthra, but joins in with the Accelerator, of

which it makes a second beginning.

TRAVERSE, in Fortification, is a Trench with a small Paraper, and sometimes with two, one on each fide; it serves as a Cover from the Enemy, when they come on their Flank. Sometimes 'tis covered over with Planks on the top, and is also loaded with Earth; they are of good use to stop an Enemy's way, and to prevent being enfi-laded. It is also a good Defence in a dry Ditch, when the Parapet is made on that fide next the opposite Flank. There is also a Traverse in a wet Ditch, which is made by throwing into the Foss or Ditch over against the Place where the Miner is

commanded, in order to cover the Men, is called

a Traverse.
TREASURER, is an Officer of great Trust. The Treasurer of England is a Lord by his Office, and under his Charge and Government is all the Queen's Money in the Exchequer, and also the Clerks of all Officers any way employed in collecting the Imposts, Taxes, Tributes, or other Revenues belonging to the Crown. He hath alfo, by virtue of his Office, the Nomination of all Escheators yearly throughout England; and giveth the Place of all Customers and Searchers in all the Ports of the Kingdom, with divers other

TREASURER of the Queen's Houshold, is an Officer in the Court, who is of the Privy-Council, and in the Absence of the Steward of the Queen's fuch like Substances, are Transparent, because the' Houskold, hath Power, with the Controller and Steward of the Marshalsea, without Commission, to hear and determine Treasons, Misprissons of reason, Murder, Homicide, and Bloodshed, com-

mitted within the Queen's Palace.
TRENTALS, see Tricennalia, were thirty Masses, said in so many Days for the Souls of Perions deceased; and the Offerings which were made, and the Priests for this Service, were also called Trentals.

were Trentals, or, as they were called in English, a TRICENNALIA Months Mind, because the TRIGINTALIA' Service lasted a Month, or thirty Days; in which they faid to many Masses.

TRIDENT is a Name given by Sir If: Newton to that kind of Parabola, by which Des Cartes con-structed Equations of fix Dimensions. This Figure hath four infinite Legs, of which, two are Hyperbolical, tending contrary ways, but placed about an Asymptote; and the other two are Parabolical and Converging, and which, with the other two, form the Figure of the Trident. Curves

TRIMMERS, in Architecture, are those Pieces of Timber framed at right Angles to the Joysts against the ways for Chimneys, and Well-

holes for Stairs. Build. Diction.

TRINODA Necessitas, was a three-fold necesfary Tax, or Imposition, to which all Lands were Subject in the Saxons Time, i.e. towards the Repairing of Bridges, the maintaining of Callles and Garisons, and Expeditions to repel invading E-

TRINODA Terre, was a Quantity of Land,

containing three Rods or Perches.

TRISTIS, Trista, and Tristris, was formerly an Immunity, whereby a Man was freed from his Attendance on the Lord of a Forest, and should not be compelled to hold a Dog, follow the Chace, nor to stand at a Place appointed; which, other-

wise, he might be under pain of Amerciaments.

TRONAGE, is a Toll or Custom taken for weighing of Wool, especially in open Market or Staple, by a common Beam (Trona) or legal

Standard.

TROY-WEIGHT: the Original of all Weights here in England, was a Corn of Wheat gathered to be put to the Foot of the Wall, Saucissons, from the middle of the Ear, and well dried. Of these, 32 were to make one Penny-weight, 20 Pen- the space of 24 Hours. ny-weight an Ounce, and 12 Ounces a Pound; poses to move round the but afterwards, they came to divide the Penny-her menstrual Motion: But the five other Planets, weight into 24 equal Parts, which have ever fince Saturn, Jupiter, Mars, Venus, and Mercury, he been called Grains. See Tables of Weight under supposes to revolve round the Sun in their several Weights, in Vol. I. Formerly the Moneyers did, Periods; as the Sun doth round the Earth in a and perhaps do still, subdivide the Grain thus: Year's time. But this Hypothesis is so embaras's' Ward's Introduct. to Mathemat. p. 32. TUBA-Eustachiana, is the Canal of Communi-

cation between the Mouth and the Barrel of the Bar, 'tis so called by Antonius Valsalva from its Figure, and its first Discoverer, Barthol. Eustachius.

and was what we now call a Cucking-flool.

TUNICA Vaginalis, is the first of the proper Integuments of the Testes; 'tis formed by the Dilation of the Productions of the external Mem- of the Heavenly Bodies, are much better acbrane of the Peritoneum. Its internal Superficies is smooth, its external rough: It contains the Vasa Deferentia and Preparantia; it embraces loosely

TYCHONIAN System or Hypothesis, is so called from having been advanced to solve the Phæ-ropmena of Astronomy, by the Noble Tycho Brahe. Wool, Milk, Fowls, &c. (3.) Personal Tythes, He supposes the Earth fixed and immoveable in the which are the Profits arising from the Labour, Art, Centre of the Universe, or of the Sphere of Trade, Negotiation, and Industry of Men. Great the fixed Stars; so that all the Stars and Plances, are of the Tenths of Corn, Hay, and nets, are supposed to revolve round the Earth in Wood only. All others being called Small Tythes.

The Moon also he sup poles to move round the Earth, as the Centre of Weights, in Vol. I. Formerly the Moneyers did, Periods; as the Sun doth round the Earth in a and perhaps do still, subdivide the Grain thus: Year's time. But this Hypothesis is so embaras'd and perplex'd, that it hath had sew Espousers: Droites a Mite, and 20 Mites one Grain. See Ward's Introduct. to Mathemat. p. 32. may be called Semi-Tychonian; in which, holding all things according to Tycho, they allow a Diurnal Motion to the Earth, tho' they deny an Annual one. But tho' this be a good deal more probable than TUMBREL, Tumbrellum, Turbicketum, is the Tychonian System, yet it is still so intricate and an Engine of Punishment, which ought to be in confused, and so inconsistent with Observation, every Liberty that hath view of Frank-Pledge, and the simple Uniform Laws of Nature, which for the Correction of Scolds and unquiet Women; establish the Pythagorean or Copernican Hypotheestablish the Pythagorean or Copernican Hypothesis; that I shall say no more of it, but that 'tis not worth while for any one to enquire into it, nor to invent Laws to folve it; fince all the Phenomena counted for in the other System last mentioned.

See Greg. Astron. Book I. Sect. II.
TYTHES, are of three Sorts. (1.) Pradial the whole Body of the Testicle, adhering to one Tythes, which arise wholly or chiefly from the end of the Epydidimis; and on the out-fide of it Earth; as of Corn, Hay, Underwood, Fruits, runs the Muscle called Cremaster, which see. Beasts, and other Animals pastured or sed with the

V A C

VAC

ACUUM: To what hath been said on this of different Matter, suppose one of Wood, and the Subject, under this Head in Vol. I. may other of Gold, if they had equal Diameters, be added by way of Illustration; That must have equal or the same Specifick Gravities. Since all Bodies do (by what Sir Isa. Newton aptly all this being directly contrary to all experience, calls the Vis Inertie) resist as are as they can, any Change or Alteration of their present State, whe-ther of Motion or Rest; and since this Resistance bulk for bulk, than that of Gold. The Planetary Regions in which the Heavenly

ferent Bodies is still Proportionable to the Quantity Bodies move, must need be almost devoid of all of Matter they contain: And fince also of conse-quence, if two Bodies contain equal Quantities accrue to the Planets Motions, which tho never of Matter, and move towards one another with so small, would in time be sensible, and have an contrary Directions, and equal Velocities; they effect in retarding the Motion of the Heavenly will necessarily both stop at the Point of Con-Bodies; but no such thing hath ever yet been obcourse: And Conversely, since its certain also that served or discovered, but the contrary is certain two Bodies moving thus, with contrary Directions And befides, such a thin Vapour as the Tail of a and equal Celerities, if at the Point of Concourse Comet, can move thro the Æther, as some will they do both rest, must be equally heavy: It call it, with incredible swiftness, without being plainly follows, that two Bodies, containing each dissipated or drawn from its natural Course; which an equal Quantity of Matter, must be equally is in it self a demonstration, that there must be a heavy; wherefore, were there no such thing as kind of Vacuum in those Celestial Regions. And Porosity or Vacuity, two Spheres of equal Diameters, must be a constituted on the Constitute of Matters, must be a Body so expensely the constitute of Matters and be according to the World of ter, and be equally heavy; that is, two Spheres ceedingly fluid, (that is, no Body at all) as hardly

V A P V A P

to hinder the Motion of any Body thro' it. Sir Isa. Newton shows, p. 213. of his Latin Opticks, at Paris: Or those of Mr. Townly, which, by a That if the Planetary Regions were, as the Planists long continued Series of Observations, hath sufaffert, entirely full of Matter, and without any ficiently proved, that in Lancashire, at the Foot interspersed Vacuities at all; let their Matter be of the Hills, there salls above 40 Inches of Water never so subtile and sluid, they would have a in a Year; from whence it is very obvious, that greater Resistance to any Bodies moving in them, the Sun and Wind are much more the Causes of than Mercury or Quick-tilver hath. a Medium as That, even a perfectly solid Globe must lose half its Mction, before it can move thrice the length of its own Diameter. And Globes or Spheres, such as the Planets are, would be stopt much sooner;

The feigned Romantick Subtile Matter, with no means useful to explain the Phænomena of ment was made in a Place as close from the Wind Nature: fince the Motions of the Planets and as could be well contrived. For which reason I tilis, nor I believe ever can be. And if there times as much more, without the Affistance of the were any fuch thing as that Matter, it would only Sun, which might perhaps have doubled it. By ferve to do mischief, to disturb and retard the Motions of the Heavenly Bodies, and the Order Evaporations in May, June, July, and August, and Course of Nature. And if there were any (which in each Month are nearly equal) are about such thing within the hidden Porcs and Meatus of three times as much as what evaporated in the Bodies, it would serve for no good purpose; it would only hinder and stop the vibrating Motion February, which are likewise nearly equal; March of their Parts, in which their Heat and all their and April answering nearly also to September and active Force confifts.

That Whim therefore of the Materia Subtilis,

VADIARE Duellum, was formerly to wage a Combat; that is, when any Person challenged another to decide a Controverfy by Camp-fight, or Duel, and threw down a Gauntlet, or made some such like sign of Desiance, then if the other took it up, or accepted of the Challenge, he was said Vadiare Duellum; to give and take a mutual Pledge of Fighting

VAGINALIS Tunica. See Tunica Vaginalis. VALE of a Pump, at Sea, is the Term for the Trough by which the Water runs from the Pump

along the Ship fides, to the Scupper-holes.

VAPOURS: In order to explain the Circula-tion of Vapour experimentally, Mr. Edm. Halley (See Philof. Trans. No 212.) caused an Experi-the one time, may be conceived to disappear at the other.

Sir Isa. Neveron in his Opticks, Book 2. p. 60. from the warmth of the Weather, without being thinks that the Azure Colour of the Sky, which exposed to either Sun or Wind, to be made in he takes to be a Blue, of what he calls the first great Care and Accuracy, by the Operator to the Royal Society. And having added up into one Sum, the Evaporations of the whole Year, he found that from a Surface as near as could be meafound, that from a Surface, as near as could be mea- constitute Clouds of other Colours: So that this fured, of eight Inches square, there did evaporate during the Year, 16292 Grains of Water, which is 64 Cubick Inches; and that divided by eight Inches, the Area of the Water's Surface, shews pours are not arrived to that Grossess requisite to that the Depth of Water evaporated in one Year amounts to eight Inches. But this is much too little to are from the Franciscopy of tle to answer the Experiments of the French, who

And found that it rained 10 Inches of Water in a Year And in such Evaporation, than any internal Heat or Agitation of the Water

The same Observations do likewise shew an odd. Quality in the Vapours of Water, which is that of adhering to the Surface that exhales them, which wherefore tis absolutely necessary for continuing they clothe, as it were, with a Fleece of vaporous the Motions of the Planets and Comets, that the Air; which once investing it, the Vapour rises af-Places they move in, be almost entirely devoid of terwards in much less quantity. And this was all Matter.

Thewn by the small Quantity of Water that was lost in 24 Hours time, when the Air was very still. which the Cartesians have filled the Celestial Re- from Wind, in proportion to what went away, gions, and all other Parts of the Universe, is by when there blew a strong Gale; altho' the Experi-Comets, is much better explained by Gravitation do not at all doubt (faith he) that had the Exwithout it, and the Cause and Nature of Gravity periment been made where the Wind had come hath not yet been explained by that Materia Sub-freely, it would have carried away at least three OEtober.

This Fleece of Vapour, in still Weather, hanging must be entirely banished out of our Philosophical on the Surface of the Water, is the occasion of ve-Faith; and then, along with it, will fink all those ry strange Appearances, by the Refraction of the ry strange Appearances, by the Refraction of the laid Vapours differing from that of the common plaining the Nature of the Phænomena of Light, Air, whereby every thing appears raised; Houses by the means of Pressure or the Motion of the like Steeples, Ships as on Land above the Water, and the Land raised and lifted up, as it were, from the Nature of the land raised and lifted up, as it were, from the Sea, and many times feeming to over-hang. And this may give a tolerable account of what I have heard of seeing the Cartel at High-water-time, in the Isle of Degs, from Greenwich, when none are to be seen at Low-water, (with some have and accounted to a making the second of the seco have endeavoured to explain, by supposing the Isle of Dogs to have been lifted up, by the Tide coming under it.) But the vaporous Effluria of Water having a greater degree of Refraction than the common Air, may suffice to bring those Beams down to the Eye; with which, when the Water is refined, and the Vapours subsided with it,

VA-

VARIABLE QUANTITIES, in Fluxions, are such as are supposed to be continually increafing or decreasing; and so do, by the motion of their said increase or decrease, generate Lines, Area's or Solidities.

VARIATION, or Permutation of Quantities; is the changing any Number of given Quantities, with respect to their Places. See Combination.

VASSAL, fignifies him that holds Land in Fee of his Lord, (now he is called usually a Tenant in Fee) whereof some owe Fidelity and Service,

and fuch are Vassalli Jurati.
VAVASOR, alias VALVASOR, is one that in Dignities is next to a Baron: vid. Bracton, l. 1.

c. 8. and Camden, p. 188. and Spelman's Glosfary.
VECTIS; when the Weight lies beyond the
Fulcrum or Hypomochlion with regard to the Power, then the Vectis is called Heterodromus; but when the Weight lies between the Fulcrum and the Power, so that 'tis not moved a contrary way with the Power, as in the former Case, but ascends or descends as the Power doth; then 'tis called Vettis Homodromus

VENA PNEUMONICA; is a small Vein which creeps along upon the Bronchia of the Aspera Arteria, or Trachea in the Lungs; 'tis described and so called by Sommichellius.

VENTRICULUS: the Stomach or Ventriculus is placed immediately under the Midriff; the Liver covers part of its Right-fide, and the Spleen touches it on its Left, and the Colon at its bottom; to which also the Cawl is tied. Its figure is like that of a Scotch Bag-pipe, being long, large, wide, and pretty round at the bottom, but shorter and less convex on its upper Part, where its two Orifices are. The lest Orifice is called Cardia; to it the Oesophagus is joined, and by it the Aliments enter the Stomach, where being digested, they ascend obliquely to the Pylorus or right Orifice, which is united to the first of the Intestines. At this Orifice the Tunicks of the Stomach are much thicker than they are any where else, and the inmost hath a thick and strong Duplicature in form of a Ring, which serves as a Valve to the Pylorus, when it contracts and shuts.

The Stomach is made of four Membranes or The first and inmost is made of short Fibres, which stand perpendicularly upon the Fibres of the next Coat; they are to be seen plainly towards the Pylorus. When the Stomach is distended with Meat, these Fibres become thick and short: whilst they endeavour to restore themselves by their natural Elasticity, they contract the Cavity of the Stomach, for the attrition and expulsion of the Aliments. This Coat is much larger than the rest, being full of Plaits and Wrinkles, and chiefly about the Pylorus. These Plaits retards the Chyle, that it runs not out of the Stomach before it be sufficiently digested. In this Coat there are also a great Number of small Glands, which separate a Liquor which besmears all the Cavity of the Stomach; therefore this Coat is called *Tunica Glandulosa*.

The Second is much finer and thinner; it is altogether Nervous; it is of an exquisite Sense,

and is called Nervoja.

The third is Muscular, being made of straight and circular Fibres; the straight run upon the upper part of the Stomach, between its superiour and inferiour Orifices; and the circular run obliquely from the upper part of the Stomach to the together, till the Water grows pale: Then they
H h h h h

bottom. These Fibres, by their Contraction and continual Motion, help the Attrition and Digestion of the Aliments.

The Fourth Tunicle is common; it comes

from the Peritonaum.

The Stomach receives Veins from the Porta, viz. the Gastrica, Pylorica, and Vas Breve, and Branches from the Gastroepiplois deutra & sinistra, which are accompanied with Branches of the Arteria Caliaca, all which lie immediately

under the fourth Coat of the Stomach.

The Eighth Pair of Nerves, or Par Vagum, gives two confiderable Branches to the Stomach, which descending by the sides of the Gullet, divide each into two Branches, the external and internal. The two external Branches unite in internal. one, and the internal do so likewise; both which piercing the Midriff, form, by a great Number of imall Twigs, upon the upper Orifice of the Stomach, a Plexus: and then the internal Branck spreads it self down to the bottom of the Stomach; and the external Branch spreads it self upon the infide, about the upper Orifice of the Sto-mach. This great Number of Nerves which is about the upper Orifice, renders it very fenfible, and from them also proceeds the great Sympathy be-twixt the Stomach, Head and Heart; upon which

account Van Helmont thought, that the Soul had its seat in the upper Orifice of the Stomach.

The Plexus Nervosus of the Hypochondria and Mesenterium, give several Branches to the bottom of the Stomach; therefore in Hysterick and Hypochondriack Passions, the Stomach is also

affected.

The Use of the Stomach is Digestion, which is the diffolution or separation of the Aliments into such minute Parts, as are fit to enter our Lacteal Vessels, and circulate with the Mass of Blood: Or it is the simple breaking of the Cohe-fion of all the little *Molecula*, which compose the Substances we feed upon. Now the principal Agents employed in this Action, are, first, the Saliva, the Succus of the Glands in the Stomach, and the Liquors we drink, whose chief Property is to soften the Aliments, as they are Fluids, which eafily enter the Porcs of most Bodies, and swelling them, break their most intimate Cohæsions. When the Aliments are thus prepared, their Parts are foon separated from one another, and diffolved into a Fluid, with the Liquors in the Stomach, by the continual Motion of its Side, whose Power in this Action, is, by that great Improver of the true Theory of Physick, the learned Pircairne, demonstrated to be equal to the Pressure of 12951 Pound weight: To which if we add the force of the Diaphragma, and Muscles of the Abdomen, which likewise conduce to Digestion, the Sum will amount to 261086 Pound weight. These two Actions we see more clearly in Birds, because they are performed in two Stomachs. In the first the Corn is only swelled and softened by the Liquor of its Glands, but broken and dissolved in the second, which is composed of very strong Muscles, because those of the Abdomen and Diaphragma are weak, neither do they act upon the Stomach, as in Men. Keil's Anatomy.

VERDITER, is made thus: Into an hundred Pound weight of Whiting put into a Tub, the Refiners pour their Copper Water, (see Refining) and stir them together every Day for some Hours

pour that away, and set it by for further use, and pour on more of the green Water, and so continue till the Verditer be made; which being taken out, is laid on large Pieces of Chalk in the Sun, till it be dry for the Market. The Water mentioned to be drawn or poured off from the Verditer, (which remains at the Bottom of the Tub) is put into a Copper and boiled, till it come to the thickness of Water Gruel, now consisting principally of Salt-Peter reduced, most of the Spirit of Vitriol being gone with the Copper into the Verditer; and a Dish full of this being put into the other Materials for Aqua-Fortis, is re-distilled, and makes what they call a Double Water, which is near twice as good as that made without it. Phil. Trans. No 142.

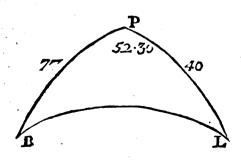

VERSED-SINE; what it is, see in Vol. I. under Trigonometry and Scale, as well as under Versed-Sine.

From the Radius or Sine of any Ark, to find

the Versed-Sine.

If the Ark be less than 90°. the Co-Sine taken out of the Radius leaves the Versed-Sine: But if the Ark be greater than a Quadrant, the Radius added to the Co-Sine, makes the Versed-Sine. By the Sector, the Distance from 90 to 30 on the Line of Sines taken laterally, is the Versed-Sine of 10°: The Distance between 90 and 70, the Versed-Sine of 20°. &c. But if the right Sine were 60° and you would have the Versed-Sine of 50° make a parallel entrance of the Sine given between 50 and 50 in the Lines of Sines; and by that means, the Distance between 90 and 90, will give the Length of the Radius: Then out of that Radius take parallelly sound the Sine of 40°. (the Co-Sine of 50°.) the Remainder will be the Versed-Sine 50°.

In Sir Jonas Moor's New System of Math. Vol. II. in the New Book of Logarithms, (and in some other Books) you have Tables of Versed-Sines, both natural and artiscial, whose Uses are very many; and especially in solving some of the most useful Cases of Spherick Triangles: As in calculating the Distances of Places on the Farth's Surface, according to the Arch of a great Circle, by having their Longitudes and Latitudes; The Distances of two Stars, by having their right Ascensions and Declinations, or their Longitudes and Latitudes; by which means, the Altitudes of two Stars not on the Meridian, or of the Sun, with the Difference of Time or Azimuth being observed, the Latitudes of Places may be sound.

As in the Spherick Triangle BPL, let the Lege BP, and PL be given, and the contained Angle BPL. To find the fide BL:

I say, as the Cube of Radius, to the Rectangle of the Sines of the Legs; so is the Square of

half the Sine of the contained Angle, to ! Difference of the Versed-Sines of the third Side, and of the Ark of Difference between the two containing sides.

Therefore, in Practice, double the Logarithmick Sine of half the Angle given, and to it add the Log. Sines of the Legs; and from the Left-hand of the Sum, strike out 3 for the Cube of the Radius, there will remain the Logarithm of half the Difference of those two Versed-Sines.

Which half Difference doubled, and added to the Versed Sine of the Difference of the Legs, gives the Versed Sine of the Side sought.

E X A M P L E.

The Log. Sine of 40°. - 9.8080675

The Log. Sine of 77°. - 9.9887239

The Log. Sine of 26°. 3- 19.2914116

The natural Sine against 39.882030 is 1227355

Whose double is ______ 2454710
The natural Versed Sine of 37°. the Difference of the Legs, is ______ 2013649

Their Sum is — 4468355

Which is the Versed-Sine of 57 deg. 53 minthe Side required or sought.

VERTICAL-PLANE, in Conicks, is a Plane passing thro' the Vertex of the Cone, and parallel to any Conick Section.

VERTICAL-LINE, in Conicks, is a right Line drawn on the Vertical-Plane, and passing thro

the Vertex of the Cone.

VERTICAL-LINE, in Dialling, is a Line on any Plane perpendicular to the Horizon; this is best found and drawn on an erect or reclining Plane, by holding up a String and heavy Plummet steadily, and then marking two Points of the Shadow of the Thread on the Plane, a good distance from one another, and then drawing a Line thro' those Marks.

Line thro' those Marks.
VIBRATING-MOTION, is a very quick and short Motion of the solid Parts of Bodies, caused by the Pulse or Stroke of some Body upon them. Thus the Rays of Light or Fire driking upon the small Particles of Bodies, do excite in them such Vibrations, and cause them to grow hot and shine. For all fixed folid Bodies when heated to a due degree, will emit Light, and shine; and Bodies which abound with earthy Particles, (as the Chymists speak) and especially sulphureous ones, do emit Light; which way soever their Parts come to be agitated into these vibrating Motions, whether by Heat, by Rubbing, by Striking, or by Putrefaction, or fome animal or vital Motion. Thus the Seaor some animal or vital Motion. Thus the Sea-Water Spines or burns, as they call it, in a Storm; Quick-silver emits a Light when shook in Vacuo: an Horse's Neck, or Cat's Back, when rubb'd with one's Hand in the dark; Wood, Flesh and Fish, when 'tis rotten and putressed: so shine Vapours arifing from putrid Waters, as the Ignes Fatui, &c. thus kindles wet Hay, &c. thus Diamonds rubb'd in the dark, emit a Light, like the Phosphorus; and thus Iron will grow hot, and burn with quick and forcible hammering on an Anvil.

Of the vibrating Motion of the Parts of folid Bodies, a good Instance also you have in Bells, or the Brims of Drinking-Glasses half full of Liquor, and then rubbed strongly with one's Finger a little

Dr. Hooke faith, he hath observed the Direction of this vibrating Motion, to be from the Center

outwards, & vice versa.

VICAR; the Priest of every Parish is called Restor, unless the Predial Tythes be impropriated; and then he is called Vicar, quasi vicem fungens Rectoris. The Vicar is called perpetual, because every Vicarage hath a constant Succession (like a Corporation) and never dies.

VICE-CHAMBERLAIN; is a great Officer in the Queen's Court, next under the Lord Chamberlain; and in his absence hath the Controul and Command of all Officers what soever, appertaining to that part of her Majesty's Houshold, which is called the Chamber, or above Stairs.

VIE prime, so the Physicians call the Stomach and Guts, accounting the whole length of the Canal which reaches from the Mouth to the

Sphinster Ani.

VIGIL; the the Civil Day begins from Midnight, yet the Ecclesiastical or Scriptural Day begins at fix in the Evening, and holds till fix in the Evening of the ensuing Day. Hence the Collect for every Sunday and Holiday (by Order of our Church) is to be read at the preceding Evening Service, or at the Vespers or Even-song at six a-tlock the Day before; from which Time the Religious Day was supposed to begin: and this first part of the Holiday, from fix a clock of the Day before, was by the Primitive Christians spent in Hymns, and other Devotions; and these being often continued till late in the Night, were thence called Vigils. Tho', by degrees, these Vigils became so enlarged, that at last all the Day preceding the Holiday, came to be called by this Name, as it is now.

VILLANIS Regis subactis reducendis, was a Writ that lay for bringing back the King's Bondmen, that had been carried away out of his Man-

nors to which they belonged.
VINCULUM, is a Term in Fluxions, implying that some compound surd Quantity is multiplied into a Fluxion, &c. Thus, in this Expresfion, $a \times \sqrt{a} \times -0$ a the Vinculum is the compound

Surd Vox--aa. which is $\times a$ into ax.

VIRGATE, or Tard-Land, was originally no more than a certain extent or compass of Ground, furrounded with fuch Bounds and Limits; and therefore the quantity was uncertain, according to the difference of Places and Customs.

VIRTUE; is a free elective and acquired Habit of the Mind, whereby we are constantly inclined to do, and do in Fact act or not act, pur-fue or avoid, according to the Rules of true Pru-

VISCOUNT, Vicecomes, Vicount, fignifies as much as Sheriff; betwixt which two Words there is no other Difference, but that the one comes from the Normans, and the other from the Saxons. See Sheriff. With us now, a Viscount or Vicount, is a Person having the next degree of Nobility be-low an Earl; and tho' it be an old Name of Ofgreater Antiquity in other Countries. See Selden's

Titles of Hon. fol. 761.
VISION: the Physical Cause of Vision scems to be, That the Rays of Light striking on the Bottom of the Eye, do there excite certain Vibrations in the *Tunica Retina*; which Vibrations being propagated as far as the Brain, by the folial Fibres of the Optick Nerves, do there cause the Sense of Seeing. For as Dense Bodies do retain their Heat longest, and that in proportion to their density, they retain it longer, as they are more dense; so the Vibrations of their Particles are of a more durable nature, than those of rarer Bodies, and therefore can be propagated to greater Distances: Wherefore the solid and dense Pibres of the Nerves, whose Matter is of an homogeneal and uniform Nature, are very proper to transmit to the Brain such Motions as are impressed on the external Organs of all our Senses. For that Motion which can preserve it self a good while, in one and the same Part of any Body, can also be propagated a great way from one Part of it to another; provided the Body be of an homogeneal Nature, and that the Motion be not reflected, refracted, interrupted, or disturbed by any Inequality in that Body.

Rays of Light therefore of divers kinds, will excite Vibrations in the Retina of different Magnitudes; and these Vibrations, according to such their different Magnitudes, will produce the Sensations of different kinds of Colours; just almost as in the Air, Vibrations of different Magnitudes produce the Sensation of different Sounds. v. gr. (as you will find under Colour) Such Rays of Light as are most Refrangible, excite the most short Vibrations, and cause the Sensation of a deep Violet Colour: While fuch Rays as are least Refrangible, do excite the longest Vibrations; and cause the Sensation of a deep Red Colour. And Rays of Light of all intermediate kinds, do excite accordingly intermediate Vibrations, and so cause the Semations of the other intermediate Colours, between the two Extremes of Violet

and Red.

VIS INERTIÆ Materiæ: This Vis Inertiæ is no where more conspicuous, than in the sudden Motion of a Vessel suil of Liquor upon a horizontal Plane; at first the Liquor seems to move with a Direction contrary to that of the Vessel, not that there is any such Motion really impress'd upon the Liquor, but that the Vis Inertiæ endeavouring to continue it in its state of Rest, the Vesfel cannot immediately communicate its Motion to the Liquor: But the Liquor perseveres in its state of Rest, whilst the Vessel moves forward, and so feems to move a contrary way. But when once the Liquor has the Motion of the Vessel communicated to it, and begins to move with a Velocity equal to that of the Vessel; if the Vessel be suddenly stop'd, the Liquor continues its Motion, and dashes over the sides of the Vessel.

The Resistance of all fluid Mediums against Bodies moving thro' them, is chiefly owing to this Vis Inertie; as you will find under Refigence

in this Vol.

VIS STIMULANS; a Term used by Dr. Cheyne in his Book of Fevers, and by some other Phy-ficians, and they understand by it such a Quality fice, 'tis a new one in Dignity, being not in use in any Fluid, whereby the Particles of it are diswith us till the time of Hen. 6. But 'tis of posed to make a real Division, or a violent Inflexion of the nervous and membranous Fibres of Hhhhha

the Body; which occasions frequent and forcible Reciprocations, Succussions, and Derivations of the Liquidum Nervorum into the Muscles and Contractile Fibres of the Canals of the Body, whereby all the involuntary Muscles are brought into violent Contractions, and the Emissaries of the Glands are squeezed. See Bellini de Urinis & Pulsibus, & de Motu Cerdis.

VISUAL-ANGLE, is the same with the Optick-Angle; which you will find under Optick Pyramid and Optick Triangle.

VITRIOL or Copperas, is made at Bricklesey in Effex, according to Mr. Ray's Account thus:

They lay the Copperas Stones (which Wormius in his Mars. c. 13. Sect. 2. faith, are chiefly found in the life of Shapey, but are indeed gathered upon the Isle of Shepey; but are indeed gather'd upon the Coasts of Kent and Suffex in many Places) on a large Bed or Floor prepared in the open Air, under-neath which there are Gutters or Troughs, dispo-fed to receive and carry away the Liquor impregnated with the Mineral to a Cistern, where it is reserved. For the Air and Weather dissolving the Stones, the falling Rain carries away along with it, the Vitriolick Juice or Salt which is dissolved there-by. This Liquor they boil in large Leaden-Pans, putting in a good quantity of old Iron: When tis fufficiently evaporated, they pour it out into large Troughs wherein it cools; and the Vitriol chrystallizes to the Sides, and to Cross-Bars of Wood, which are placed in the Troughs. The Liquor remaining after this Chrystallization, they call the Mother, which is referved to be boiled and evaporated again.

D'ormius saith, the Liquor is fix or seven Days boiling to a due confishence; and that it can be

boiled in nothing but a Leaden Vessel.

Matthiolis describes the way of making Vitriol in Italy, to be semething different from ours; for, be faith, they burn the Copperas Stones in small heaps, till the greatest Part is reduced to a Calx or Ashes, which being poudered, is mingled and agitated with Water, in large Vessels, to get out the Vitriolick Matter; then they draw off the clear Water after the groffer Matter hath subsided, and boil it to a due confistence, throwing in pieces of old Iron or Brass (according to the design of the Operator) and then put it to chrystallize in wooden Vessels.

VIVO, is the Shaft of a Column in any of the Orders of Pillars in Architecture.

UNCUTH, in Saxon is unknown, and, in the old Saxon Laws, is used for a Person that comes to an Inn, and lies but one Night: In which Case this Host was not answerable for any Offence he Should commit, whereof he was guiltless himself. But if he lay there a second Night, then he was called a Gust, Hospes; and then the Host was to answer for him, as for one of his Family. If he !tarried any longer, he was then called Agenhine, (or, as some write it, Hogenhine) and the third Night, Awnhine, that is, Familiaris: and then if the offended against the King's Peace, his Host was to fee him forth-coming; and if he could not produce him in a Month and a Day, he was obliged to fatisfy for his Offences.

UNDER-Chamberlain of the Exchequer, is an Officer there that cleaves the Tallies, and reads the same, so that the Clerk of the Pell, and the Controllers thereof, may see that the Entries be true; he also makes searches for all Records in the Treasury, and hath the Custody of the

Doomfday-Book. There are two Officers there of this Name.

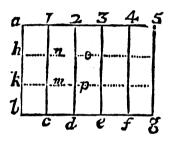

UNGULA, in Geometry, is the Section of a Cylinder cut off by a Plane, which passesobliquely thro' the Plane of the Basse, and part of the Cylindrick Surface.

Uniform Motion.

UNIFORM or equable Motion, and all its Properties, may be very well explained by the equiangular Parallelograms in this Figure. Where the Dirigent a 5 represents the Time, and the Lines a b. 1 c, 2 d, &c. the uniform or equable Velocities with which any Body is moved, in any Parts or Moments of Time. And the Parallelograms ac, c2, e, e 4, 4 g, do truly represent the Spaces described or run thro' with the Velocity ab, in the

Times a 1; 1,2; 2, 3; 3, 4; 4, 5, From the bare Confideration of which only, it

will follow;

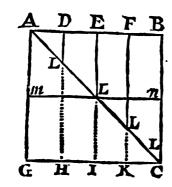

1. That the Spaces described by any Moveable, with an equable or uniform Velocity, are always as the Times.

For the Parallelograms ac, ad, &c. having all the same Altitude, must be as their Bases, bc, c d,

- 2. Or if the Times be equal, the Spaces must be as the Velocities; that is, the Parallelograms an to a m, will be as a b to a k, &c.
- 3. And from hence it will follow, that if the Spaces are as the Velocities, the Times will be equal; if as the Times, the Velocities will be equal,
- 4. Where the Spaces are equal, the Times must be reciprocally as Velocities: for the fimilar and parallel Rectangles have their Sides reciprocally proportionable; and vice versa, where the Times and Velocities are reciprocally proportionable, the Spaces must be equal.
- 5. Wherefore the Ratio's of the Spaces are always compounded of the Ratio's of the Times and Velocities: And consequently, deducting the Ratio of the Time out of that of the Velocity; or, which is all one, dividing the Space by the Time, there will result the Velocity; dividing by the Velicity, the Quotient will be the

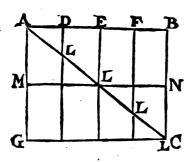

After much the same manner also may the uniform or equable Acceleration or Retardation of any Motion, be expressed very easily and clearly by Lines.

As suppose the right-lined Triangle ABC, the Side AB denotes the Time in which a Body may move from a Point of Reft, as in A; and having its Velocity continually encreasing in the uniform Ratio of the Lines DL, EL, FL, and BC; or decreasing equally back again in the same Ratio, from any determinate degree of it

in BC, to none at all in A.

In this Figure then, the Triangles ALD, ALE, ALF, and ABC, will very appointely represent the Spaces described in the several Times AD, AE, AF, and AB; and consequently the Trapezia DL, DC, &c. will represent the still aggregated Velocity, and the Spaces corresponding there-And from hence all the Laws and Affections of equable accelerated Motions will be eafily accounted for; which are fuch as these, viz.

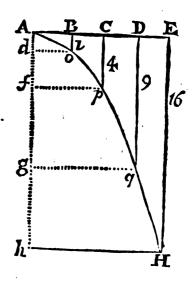

1. That the Space described at the end of the accelerated Motion, will be equal to that which would have been described by an uniform equal Motion in the same time, and with half the degree of Velocity which the accelerated Body did at last acquire: For the Triangle ACB is equal to the Square MB; each being the half of the Square GB.

That the Spaces described by the Motion of a Body, beginning from Rest, and uniformly accelerated, are as the Squares of the Times. For the Area's of the similar Triangles ADL, AEL, &c. are as the Squares of AD, AE, &c.

3. And comparing divers Motions, thus uniformly accelerated one with another, it will be plain that the Spaces run thro', will be to one another in a Compound Ratio of the Times, and of the greatest Velocities at any time acquired, (because similar Squares are in a Ratio compounded of that of their Sides.)

4. And from hence 'tis plain, that the Case of Bodies accelerating their Motion uniformly, so as that the Spaces described, shall be as the Squares of the Times, (which is the known Case of the Descent of heavy Bodies towards the Centre of the Earth) may be very well expressed by the Complement of the Semi-parabola AEH;

where the vertical Tangent AE, represents the determinate Time divided into equal Parts; and the Lines BO, CP, Dq, and EH, the several Velocities required in the several Descents. Now the Spaces described, ABO, ACP, &c. are as the Squares of the Times AB, AC, &c. that is, as the Squares of the Ordinates do, fp, gq, &c. which Squares are (by the Parabola) as the Abscissa Ad, Af, Ag, &c.

Wherefore the Velocities acquired at the end of

any Descents, will be as the Squares of the Times

in which these Descents are made.

That is, the Velocity at the end of the second Moment, or Part of Time, to the Velocity at the end of the first Moment, will be as the Square of the second to the Square of the first, or as the fourth to the first, &c.

UNION of two Churches, is a confolidating or combining them into one, which may be done by the Consent of the Bishop, Patron, and Incumbent. See Linwood's Provincials, and 37

H. 8. c. 21 as also 17 Car. 2. c. 3.

UNISONS. It hath been long fince observed, that if a Viol-String, &c. be struck with the Bow or Hand, another String on the same, or another Instrument not far from it, will (if an Unison to it) tremble at the same time of its own accord. But Dr. Wallis, in Philos. Trans. No. 134 tells us, that 'tis not the whole of the unstruck String that trembles, but the several Parts severally, according as they are Unrions to the whole, or the Parts of that String which is so struck: v. gr. If one String be an upper Octave to another, and therefore an Unison to each half of it when 'tis stopt in the middle; then I say, if the former be struck while the latter is open, the two halves only of the latter will tremble, and not the middle Point: as you may eafily try, by laying a bit of Paper lightly wrapt about the middle of the fecond String. See a Solution of this in Plot's Hift. of Oxfordsbire, by Dr. Narcissus Marsh, and of other fuch Phænomena.

UNMOOR, a Term used at Sea for a Ship that before rid, or was held by two Anchors, to begin to get them up, and prepare to weigh.

See Moor.

VOLVA,

VOLVA, the great Kepler confidering how our Earth will appear to the Inhabitants of the Moon, if there be any fuch, viz. that it will feem a large Moon to them 15 times greater than their Planet doth to us at the full, in 24 Hours time revolving round its Axis (as will be eafily difcovered by the Spots that must appear in it) but yet also fix'd like a fix'd Star in one determinate Place in the Heavens, and moving only as they appear to do 1 this being the Phænomenon of the Earth to a Lunar Spectator, (i. e. to fuch as live on that fide of the Moon, which is always turn'd towards the Earth; for those in the other Hemisphere can never see the Earth at all) he fancies that they would give it a Name fomething like that of Volva; and while they would consider their own Earth as a Vesta, an immoveable Seat or Habitation. In pursuance of this imaginary State of Things, Kepler calls the Inhabitants that live in that half of the Moon's Sphere, which is turned towards the Volva, Subvolvæ; and the others that never see the Earth, Privolve.

VOMITIVE Medicines, see Emeticks; where there is an Account of their Operation, in Vol. I.

URBICARIÆ Regiones. See Suburbicariæ. USE in the Civil Law, is one of the Personal Services, and fignifies a Right that a Man hath of using a corporeal thing belonging to another, without prejudice to the Proprietor of it: This Right is not so great as an Usinfrust; for he that hath this Right, cannot take the Profits generally, but only for his daily Use and necessary Subfistence.

Exchequer, of which fort three or four attend the chief Officers and Barons at the Court at Westminster; and Juries, Sheriffs, and all other Accountants, at the pleasure of the Court. There are also Usher's in the Queen's House, as of the Privy-Chamber, &c.

USUFRUCT, is a Petsonal Service, whereby a

Man hath a Right of using and taking all manner of Profits, of a corporeal thing belonging to another Person, so it be without diminution or prejudice to the Propriety of it; and he that hath

this Right, is called an Usufructuary.

UTAS Octava in the Law is used for the eighth Day following any Term or Feast; as the Utas of St. Michael, of St. Hillary, of St. John Baptist, &c. and any Day between the Feast and the Ostave, is said to be within the Utas. The Use of this is in Return of Writs, as appears by.

UTFANGTHEF, Fur extra captus, is an antient Privilege or Royalty granted to a Lord of a Mannor by the Sovereign, giving him a Power to punish a Thief dwelling out of his Liberty, and committing the Theft also without the same, if so be that he be taken within the Pee of that Lord.

UVEA, this is reckoned the fifth Coat of the Eye, and seems to be only the Circumserence of the Pupilla; it is composed of circular and strait Fibres, to contract and dilate according to the Strength or Weakness of the Light: for when the Light is too strong, the circular Fibres contract the Pupilla, that the Force of the Rays may not hurt the Eye; and when the Light is too weak, the strait Fibres dilate the Pupilla, to let in more USHER, Oftiarius, from the French Huissier, Rays, in order to form the Vision of Objects a Door-keeper of a Court, is an Officer in the more distinctly.

WAR

WAR

AGA, or VAGA, the same with Weigh, which see in this Vol.

WAGE, Vadiare, from the French Gager, dare Tignus, fignifies in our Law the giving Security for the Performance of any thing: As, to wage Law, is to put in Security, that you will make Law at a Day affigned; and to make Law, is to take an Oath that a Man owes not a Debt which is claimed of him, and also to bring with him so many Men as the Court should asfign, to avow on their Oaths, that they believe he fwears truly

WAGER of Law. See Law.
WARDAGE, the same with Ward-peny.
WARDECORN, is the Duty of keeping Watch and Ward, with a Horn to blow, on any occasion

of Surprize, &c. WARD-PENY, Warpen, Warthpenny, Warscot, Warth, was formerly a customary Due paid to the Sheriff; and other Officers, for maintaining abolished, lay for him who was challenged, when Watch and Ward; it was payable at the Feast of St. Martin. This customary Acknowledgment is thill paid within the Mannor of Sutton Colfield, in was bought by the Ancestors of the Ward, was

Warwick/bire; and with some Ceremonies that are as fingular as furprizing. Covel's Interp.

WARDMOTE, in London, is a Court so called, and which is kept in every Ward.

WARDEN of the Mint. See Master.

WARDS and Liveries, was a Court first erected. by King H. 8. and afterwards augmented by him with the Office of Liveries: But 'tis now absolutely taken away and abolished, by a Statute

made 12 Car. 2. cap. 24.
WARD-STAFF, was formerly the Term for a Constable's Watchman's Staff: And the Mannor of Lamborn in Essex, is held by Service of the Ward-Staff, viz. to carry a Load of Straw in a Carr, with fix Horses, two Ropes, and two Men in Harness, to watch the Ward-Staff, when it is

brought to the Town of Aibridge. WARRANTIA Custodie, is a Writ judicial; and formerly, before the Court of Wards was abolished, lay for him who was challenged, when

Digitized by Google

warranted, to be free from fuch Thraldom; and it lay against the Warranter and his Heirs.
WARRECTUM and Warresta Terra, is Land

long neglected and uncultivated; for in old Records you will find, that Tempus Warretti fignifies the Time that Land lies fallow. Warrettare

also fignifies to fallow Land.

WARREN, is a Franchise, or Place privileged, either by Prescription or Grant from the Crown, to keep Beafts and Fowl of Warren; which are Hares and Conies, Partridges and Pheafants: And if any Person be found an Offender in any such Fee-Warren, he is punishable for the same at Common-Law; and by the Statute 21 Ed. 3. a Fee-Warren may lie open, and there is no necessity of closing that in, as there is of a Park; for that ought to be seized into the Queen's hands, if it be not enclosed:

WASSEL-BOWL, was a large Cup or Bowl of Silver or Wood, wherein the Saxons at their publick Entertainments drank a Health to one another, in the Phrase Was-heal (i.e.) Health be to you. This Wasel-Bowl feems plainly to be meant by the word Vastellum, in the Lives of the Abbots of St. Albans, by M. Paris, p. 144. where he saith, Abbas solus prandebit supremus in Resectorio habens Vastellum; that is, the Abbot had set by him at the upper-end of the Table, the Wastell, or Wasfel-Bowl, to drink a Health to the Fraternity, or the Poculum Charitatis. So Cakes and White-Bread (which were commonly sopped in this Bowl) are called Wastell-Bread. And hence the Custom of going a Wasfailing, as 'tis still called and used in Suffex, and some other Places, seems to have taken its Name.

WATER. Sir If: Newton defines Water (when pure) to be a very fluid Salt, volatile, and void of all Sapor or Taste, and it seems to confist of finall finooth hard porous spherical Particles, of equal Diameters, and of equal specifick Gravities, as Dr. Cheyne observes; and also that there are between them Spaces so large, and ranged in fuch a manner, as to be pervious on all fides. Their Smoothness accounts for their sliding easily over one another's Surfaces; their Sphericity keeps them also from touching one another in more Points than one; and by both these, their Frictions in sliding over one another, are rendered the least possible. Their Hardness accounts for the Incompressibility of Water, when 'tis free from the Intermixture of Air.

The Porofity of Water is so very great, that there is at least 40 times as much Space as Matter in it; for Water is 19 times specifically lighter than Gold, and consequently rarer in the same Proportion: but Gold will, by Pressure, let Water pass through its Pores, and therefore may be supposed to have (at least) more Pores than solid Parts. Now 'tis this great Porosity of Water that accounts for its different specifick Gravity, in comparison of Mercury or other Fluids; and also why tis more easily concreted into a solid Form, by adventitious Matter in freezing, than other

Fluids are.

Dr. Cheyne observes rightly, that the Quantity of Water on this side our Globe, doth daily decrease, some part thereof being every day turn'd into Animal, Vegetable, Metalline, or Mineral Substances; which are not easily dissolved again into their component Parts; for separate a severn; near the Wrekin in Shropshire, extending itself to Anglesey in Wales. Anno 39 Elizated Particles of any Fluid, and fasten them to a c. 2. folid Body, or keep them afunder one from ano-

ther, and they are no more fluid; for to produce Fluidity, a confiderable number of fuch Particles is required. (See Fluidity in this Vol.) Most of the Liquors we know are formed by the Cohesion of Particles of different Figures, Magnitudes, Gravities, and attractive Powers, (See Attraction and Particles) swimming in pure Water, or an aqueous Fluid; which seems to be the common Basis of all. And the only Reason why there are so many forts of Water differing from one another, by different Properties, certainly is, here the Corpuscles of Salts and Minerals, with which that Element is impregnated, are equally various. Wine is only Water impregnated with Particles of Grapes, and Beer with Particles of Barley. All Spirits seem to be nothing but Water, saturated with faline or sulphureous Particles. And all Liquors are more or less fluid, according to the greater or smaller Cohesion of the Particles which swim in the aqueous Fluid; and there is hardly any Fluid without this Cohesion of Particles, not even pure Water itself; as is apparent from the Bubbles which sometimes will stand on its Surface, as well as on that of Spirits, and other Liquors. WATER-Bayliff, was an Officer in Port-Towns,

appointed for the searching of Ships, as seems from 28 H.6. c. 5. Now there is such an Officer in the City of London, who supervises and searches all Fish brought thither; and he gathers the Toll arising from the River Thames. He also attends on the Lord-Mayor, and hath the principal Care of marshalling the Guests at the Table. And he arrests Men for Debt, or other personal or criminal Matters, on the River of Thames, by Warrant of his Superiors,

WATER-Measure, is a Measure mention'd in the 22 Stat. of Car. 2. and exceeds the Winchester Measure by about 3 Gallons in a Buthel. 'Tis now used for selling of Coals in the Pool,

WATER-Ordeal, was one of the old Saxon Ways of Purgation, or Tryal of a Person's Innocence, when suspected of a Crime; 'twas called Judicium Dei, as the Fire-Ordeal was. This by Water, was, for the Person accused either to put his Hands into scalding Water, or to be thrown into some River, Pond, &c. if he escaped being burnt or scalded, or of being drowned, he was concluded innocent. This Water-Ordeal was for Churls, Bondmen, and other Rusticks: But the Fire-Ordeal was for Freemen, and Persons of better Condition.

WATER-Table, in Architecture, is a fort of Ledge left in Stone or Brick-Walls, about 18 or 20 Inches from the Ground, and there the Thick-

ness of the Wall begins to abate.

WATLING-Street, is the Name of one of the four Roman Ways, by that Nation made here in England, and by them were called Confulares, Pretorias, Militares, & Publicas. In the Laws of Edw. the Confessor, it appears that these Publick Ways, had the Privilege of the King's Peace. This of Watling-street, or otherwise Werlam-street, (see Hoveden, Part. prior. Annal. Fol. 248.) was made from Dover to London, thence to St.

Digitized by Google

The second of these Ways is called Ikemildftreet, (ab Icenis) and reached from Southampton over the River Isis, at Newbridge; thence by Cambden and Litchsfeld, and so over the Derwent by Derby, thence to Bolseover-Castle, and ends

at Tinmouth.

The third was called the Fosse, because in some Places it was never finished, but lies as a large Ditch, leading from Cornwall thro' Devensbire, by Tetbury, near Stow in the Wold, and besides Coventry to Leicester, Newark, and so to Lin-

The fourth was called Ermine, or Erminage-fireet, beginning at St. David's in Wales, and going to Southampton. See Holling shed's Chron. Vol. 1. c. 19. and Henry of Huntington, Book 1.

at the beginning.
WAVESON, is the Term for such Goods as, after Shipwreck, do appear swimming on the

WEALD, or Weld, is a Saxon Word, fignifying the woody part of a Country: As the Weald of Suffex and of Kent, in the Collect. of Statutes, 14 Car. 2. c. 6. 'Tis mif-printed, as 'tis vulgady pronounced, The Wild of Suffex, &c.

WEAR, a Term used by the Seamen for

bringing a Ship to, on a different Tack.
WEED, in the Miners Language, is the Degeneracy of a Load or Vein of fine Metal, into an useless Marchasite.

WEDGE. See Cuneus in this Vol.

WEIGH, a Term used by the Seamen, for taking up a Ship's Anchor, and getting ready to fail; which they call Weighing Anchor.
WEIGH of Cheefe, Wool, &c. Waga, alias

Vaga, is 256 Pound Weight Averdupois; for by 32 Cloves, and each Clove 8 Pound; the fome fay but 7.

WEDBEDRIP, was formerly a customary Service that inferior Tenants paid to their Lords, in cutting down their Corn, or doing other Harvest

Dutics, &c.

WEIGHTS, in use in England, are chiefly of two forts: One called Troy-Weight, having 12 Ounces in the Pound; and by this, Jewels, Silver, Gold, Corn, Bread, and all Liquors are usually weighed; and the other is called Averdupois, containing 16 Ounces in the Pound; by this all coarse drossy wastable Wares, such as Grocery, Pitch, Tar, Rosin, Wax, Tallow, Copper, Tin, Lead, Iron, &c. are weighed.

Georg. Agricola, in his Book de Ponderibus & Mensieris, calls the Pound of twelve Ounces, or the Pound Troy, Libram Medicam, which we retain in our Apothecaries Weight, (see the Table of it under Weights, in Vol. I.) and the other Pound of 16 Ounces, he calls Libram Civilem: and he faith also, that Medica & Civilis Libra Numero non Gravitate Unciarum differunt.

The Original of all our English Weights was a Corn of Wheat, gathered out of the middle of the Ear; and being well dried, 32 of these made one Penny-Weight, or were the Weight of the Penny-Sterling; twenty of these Pence or Penny-Weights, were to make an Ounce, and twelve fuch Ounces made the Pound Troy. See

51 H. 3. 31 Edw. 1. and 12 H. 7.

But in latter Times, it was thought fufficient to divide the aforefaid Penny-Weight into

mon Use; tho' the Moneyers subdivide the Grain

24 Blanks
20 Periots make 51 Periot.
Droite. 24 Droits 3 I Mite. Li Grain.

WELDING-HEAT, is a Degree of Heat which Smiths give their Iron in the Forge, when there is occasion to double up the Iron, and to weld or work in the Doublings, so that the Iron shall grow a Lump thick enough for your purpose: Tis used also when two Bars of Iron are to be joined together at the ends, to make a Length.

WEREGILD, Wergeld, Wergildus, also Were (Werræ) alone without Gild, was formerly the Price that was paid partly to the King, and partly to the Relations of the Deceased, for killing a Man; when such Crimes were not punished with Death, but with pecuniary

Mulcts.

WHEEL, in the Art Militay, is the Word of Command, when a Battalion is to alter its Front, either one way or other. If the Battalion is to wheel to the Right, the Man in the right Angle turns very flowly, and every one else moves and wheels from the Left to the Right, regarding him as the Centre; and vice versa, when they are to wheel to the Left. When a Division of Men are on a March, if the Word be, Wheel to the Right, or to the Left, then the Right or Left-hand Man keeps his ground, turning only on his Heel, and the rest of the Rank move about quick, till they make an even Line with the faid Right or Left-band Man. Squadrons of Horse wheel much after the same manner.

WHERLICOTS, were the open Chariots used here in England by Persons of Quality, before the Use of Coaches. See Stow's Survey of London, p. 70. Perhaps hence comes our Word Whirligig.

WHITE or Flame Heat, is a Degree of Heat given by Smiths to their Iron in the Forge. when it hath not yet its Form and Size, but must be forged into both; this is a less Heat than a Welding Heat: Iron in this Heat is batter'd or drawn out usually with the Pen or Edge of the Hammer; and afterwards hath the Dents of the Pen smoothed out with the Face of the Hand-Hammer.

WHITENESS. The excellent Sir If. Newton, in his late Book of Opticks, demonstrates, that Whiteness is a dissimilar Mixture of all Colours, and that the common Light of the Sun is a Mixture of Rays, endued with all those Colours; for by the multitude of those Rings of Colours, which appear in the Compression of the two Prisms, or Object-Glasses of Telescopes together, (see Observ. 3, 12, 24. Book 2. Part 1.) it is manifest, that these do so interfere and mingle with one another at last, as after 8 or 9 Revolutions, to dilate one another wholly, and constitute an even and sensibly uniform Whiteness. Wherefore it appears from hence, as well as from other Experiments, mention'd elsewhere, that Whiteness is certainly a Mixture of all Colours, and that the Light which conveys it to the Eye, is a Mixture of Rays indued with all those Colours. And he shews that Whiteness, if it be most strong and luminous, is to be reckoned of the first Order of 24 equal Parts, which came to be called Colours, but if less, to be a Mixture of the Co-Grains, being the smallest Weight now in com-lours of several Orders: Of the former sort, he

reckons

reckons White Metals; and of the latter, the Whiteness of Froth, Paper, Linen, and most other white Substances. And as the White of the first order is the strongest that can be made by Plates of transparent Substances, so it ought to be fronger in the denser Substances of Metals, than in the rarer ones of Air, Water, and Glass. Gold or Copper, mixed either by Fusion or Amalgamation, with a very little Mercury, with Silver, Tin, or Regulus of Antimony, becomes White; which shews both that the Particles of White Metals have much more Surface, and therefore are smaller, than those of Gold or Copper; and also that they are so Opake, as not to suffer the Particles of Gold or Copper to shine through them: And as he doubts not but that the Colours of Gold and Copper are of the second or third Order, therefore the Particles of White Metals can't be much bigger than is requifite to make them reflect the White of the first Order: And this he concludes also from other Observations and Experiments.

WHITE-Hart Silver, is a Mulct paid into the Exchequer out of certain Lands, in or near the Forest of White-Hart; and it hath continued ever since Henry the Third's time, who imposed it upon Thomas de Lynde, for killing a most beautiful White Hart, which the King had before purposely

spared in Hunting. Camd. Brit.

WHITSON Farthings. See Pentecostals.

WIDOW of the King, was she who after her Husband's Death, being the King's Tenant in Capite, was forced to recover her Dower by the Writ de Dote assignanda, and could not marry again without the King's Consent.

WILL. See Testament.

WINDAGE of a Gun, is the Difference between the Diameter of the Bore, and the Diameter of the Balls.

WIND. The Reverend Mr. Derham, of Upminster in Essex, and F. R. S. in a curious and
accurate Discourse about the Motion of Sound, in
Phil. Trans. No 313. takes occasion to say
something of the Velocity of the Motion of
Wind: And by many Trials he found, that the
Wind in the greatest Storm doth not move above
so or 60 English Miles in an hour: That a
common brisk Wind moves about 15 Miles in an
hour: But that the Course of many is so gentle,
as not to exceed, if they come up to, one Mile in
an hour.

WINDING-STAIRS, are such as wind round

a Newel, either Circular or Square, Close, i. e. Solid, or Open.

WOLD, Walda, is a Down, or Champaghe-Ground, Hilly, and void of Wood; as Stow in the

Wold, and Corfixold in Gloucestershire.

WORD, in an Army or a Garison, is some peculiar Word or Sentence, by which the Soldiers know and distinguish one another in the Night, &c. and by which Spies and treacherous Persons are discovered: 'Tis used also to prevent Surprizes. It is given out in an Army every Night by the General to the Lieutenant or Major-General of the Day, who gives it to the Majors of the Brigades, and they to the Adjutants, who give it first to the Field-Officers, and afterwards to a Serjeant of each Company, who carry it to the Subalterns. In Garisons 'tis given after the Gate is shut, to the Town-Major, who gives it to the Adjutants, and they to the Serjeants.

WRIT Breve, is the Queen's Precept, whereby any thing is commanded to be done touching a Suit or Action: As the Defendant or Tenant to be summoned, a Distress to be taken, a Disseisin to be redressed, &c. And these Writs are diversly divided in divers respects; some in respect of their Order or Manner of granting, are called

their Order or Manner of granting, are called WRITS Original, which are fent out for the fummoning of the Defendant in a personal, or the Tenant in a real Action, before the Suit begins; or indeed rather to begin the Suit.

WRITS Judicial, are such as are sent out by Order of that Court where the Cause depends, on Occasion after the Suit is begun. And these are distinguished from the Original Writs thus: The Teste of the Judicial Writ bears the Name of the Chief Justice of that Court whence it issues; whereas in the Teste of the Original Writ, the Queen's Name is inserted. Again also, there are

WRITS Personal and Real, Writs of Entry, Writs of Right, Writs of Privilege, &c. of which, see the New Book of Entries.

WRIT of Rebellion. See Commission of Re-

bellion

WRIT of Assistance, issues out of the Exchequer to authorize any Person, to take a Constable or other Publick Officer, to seize Goods or Merchandise uncustomed or prohibited. There is also a Writ of Assistance which issues out of the Chancery, to give a Possession.

YARD-

ARD-LAND, Virgata Terre, is a Quantity of Land, various according to the Place:

several Makes and Forms.

YEARS-MIND, See Annualia, this Vol.

At Wimbleton in Surrey 'tis accounted fifteen Acres; in other Counties 'tis twenty; in fome twenty-four, in fome thirty, and in others even four Acres. In a MS. of the Abbacy of Maimeshury, a Virgate of Land is faid to contain twenty-four Acres. This uncertain Quantity in 28 E. 1. is called a Verge of Land.

YATCHES, are Veffels with one Deck, carrying from 4 to 12 Guns, with from 20 to 40 Men; and are of Burden from 30 to 166 Tun. They draw little Water, and are used for run-ing and making short Trips, &c. They are of serving.

ZAC

ZOP

ACCO, is the Term fometimes used for the ZOPERUS, a Term is lower part of the Pedestal of a Column; and ing the same with Frieze. ZOPERUS, a Term in Architecture, fignifyis in the form of a square Brick or Tile.

THE

Description and Use

THE

BLES

Natural and Artificial Sines, Tangents, and Secants.

Minute of the Quadrant. 1. And the first thing to be done is to

know how to take out the Sine, Tangent or Secant, whether Natural or Logarithmical,

of any Degrees, or Minutes

In order to which you will find, that the Natural Numbers are always in the Left-hand Page, and the Artificial or Logarithmical on the Righthand Pages: So that for every Degree and Minute of the Quadrant, you have before you, one right against the other, the Natural and Logarithmic Sines, Tangents and Secants, with their Complements placed by them.
2. If therefore the Number of the Degrees of

any Ark or Angle given be under 45°, you must look for it at the Head of the Table; but if it exceed 45°, you will find it at the Bottom or Foot; and as in the former Cale you find the Minutes under M increasing downwards on the Left-hand of the Page; so in the latter, they begin at the Bottom of the Page on the Right-hand of it and increase upward.

Thus, if you look for 23 Degrees 13 Minutes, you will find in Page 48 of the Tahles, and its Natural Sine will be 3942093, its Natural Tangent 4289449, &c. and in the Right-hand Page its Artificial Sine will be 9.5957268, and its Logarithalling, Aftronomy, &c. all Treatiles on those Submited Tangent 9 6224015.

mical Tangent 9.6324015, ec.

But if the Degrees given had been more than 45°, as suppose 61°. 25', then you turn till you come to those Degrees at the Foot of the Table; which you will find in Page 58. 59 and there Natural Sine will be 8781222, and the Natural easie for him, by considering the Course and Pro-Tangent will be 18353999; the Logarithmick Sine portion of the Ericrease or Decrease of the Num-will be 9.9435549, and the Logarithmick Tangent bers in the Tables, as they stand near that which

from 180 if it be less than it, or from 360 when

HESE are continued to every Degree and ['tis greater than 180 ; and then feek in the Tables' for the Sine, Tangent or Secant of the Remainder. Thus 123°. 11' substracted from 180° leaves 56°. 49° whose Sine, or Tangent must be sought in the Tables, as is shewn above.

4. And when this is understood, the Inverse

Practice of finding the Degrees and Minutes answering to any Sine, Tangent or Secant given,

will be easie.

Thus suppose you would have the Degrees and Minutes answering to 7027782, a Natural Sine: you must look amongst the Natural Sines, either downward or upward, till you find the Number given, and then on the Top or Bottom you will have the Degrees; and the Minutes on the Right or Left-hand in the Column marked M accordingly; and so you will find the Degrees and Minutes answering to the Natural Sine 7027782, to be 44 yet the nearest to it is 7027741; whose Deg. and Min. are 44°. 39'. and so you must always do when you cant find the Numbers exactly; which will most times be the case.

jects do acquaint us.

N.B. There hath very great Care been taken in the Correction of these Tables and those of the Logarithms, and I believe very few Faults have you will find (reckoning the 23 upwards in the been committed; but whenever the Calculator Right-hand Column of Minutes over M) that the finds Reason to suspect the Tables, it will be very will be 10.2637307; and so for the Secants, &c. he judges faulty, either above or below it, to find 3. If you want the Natural or Artificial Sine, out nearly what Figure is wrong, and how much Tangent or Secant of any Ark greater than 50° or how little; as Experience will soon 'teach as suppose of 123°, 11' you must first substract it him.

The End of the TABLE of Versed Sines, &c.

The

The Use of the Table of Versed SINES.

THE Uses of the Table of Ver/ed Sines are too numerous to be here all treated of: I shall now only shew how by them more easily to solve some of the most useful Cases of Spherical Triangles, which alone is enough to merit their Publication. It has been a long time the Votes and Desires of many able Men in the Mathematicks, that such a Table might be collected and published, but especially of that ingenious and ancient Student Mr. John Collins, who has expressed his desire thereof more than once in his elaborate pieces, and from whom I had the Loan of some Foreign Tables, which did assist much towards the composing of these.

Prop. 1. Two sides of an Oblique Spherical Triangle, with the Angle comprehended, being given, to

find the 3d de.

As the Cube of the Radius: Is to the Restangle of the Sines of the comprehended sides, :: So is the Square of the Sine of half the contained Angle,: To half the Difference of the Versed Sines of the 3d side, And of the Arch of Difference between the two including sides.

Which is thus, double the Log Sine of half the Angle given, and thereto add the Log. Sines of the contained fides, and from the left hand of the Sum, dash out 3 for the Cube of the Radius, so rests the Leg of half the difference of those two Versed Sines.

Log. of half the difference of those two Versed Sines.

Which half difference doubled, and added to the Versed Sine of the difference of the Legs or containing sides, gives the Versed Sine of the side sought.

taining fides, gives the Versed Sine of the fide sought.

Exam. 1. In the Triangle BP L, let

Figure 5. there be given the fide BP 77° 00 l,

the fide PL 40° 00', and the contained Angle BPL 52° 30 l, to find the fide B, L

The Log. Sine 40° 00' 9.8880675

The Log. Sine of 77° 00' 9.9887239

The Log. Sine of 26° 15' _______ 19.2914116
doubled.
The Natural Sine against:: ______ 39.0882030

Is 1227355, whose double is: 2454710

Toe Natural Ver. Sine of 37° 00' 2013645

she dif. of the two sides is

The Natural Sine of 57° 53° 4468355

The Versed Sine of 57° 53 - 4468355 she fide sought.

THE Uses of the Table of Versed Sines are too numberous to be hereall treated of: I shall now only shew how by them more easily to solve some of the Complement of the contained Angle to 180 Degrees, you will find the half difference of the Wessed Sines of the two including sides to be doubled, and subbeen a long time the Votes and Desires of many attracted from the Versed Sine of the said Sum.

But instead of the second Term be taken into the Proportion, the double of the Rectangle of the Sines of the containing sides, that is, if the Log. of the Number 2 be added to the Log. of the other middle Terms, you will have the Log. of the whole difference in the last place 5 having found it, take the Natural Sine that stands against it, and add it to the Natural Versid Sine of the difference of the Legs, and the Sum is the Natural Versed Sine of the side sought.

Exam. 2. Let the two containing fides be 38° 30' and 66° 30', and the containing Angle be 20° 00'.

The log. Sine of 38° 30′ 9.7941456
The log Sine of 66° 30′ 9.5623978
The log. of the Number 2 0.3010300
The log. Sine of 15° 00′ doubled is 18.8259924

The nearest Nat. Sine against 38.8835698
660 30′ Is 77009E
38 30 W bich taken from the Nat. 1170524

Versed Sine of 28° 00′
28 00 There remains 300432

The Nat. Versed Sine of 53° 10.

and the conthe fide B, L.

The Nature, Construction, and Use of the TABLE of Difference of Latitude and Departure.

HE Table of Difference of Latitude and | From the dif. of Lat. answering to 800 Departure, is designed principally for the more exact and expeditious working of Traverses, but may be applied to the Solution of the several Cases of Plane Sailing.

It shews by Inspection the Alteration of the Latitude and Departure to every Degree, Point, and Quarter point of the Compass, for any Distance not exceeding 10000, and may be made to serve for. any greater Distance, provided it be first divided into Parts, not exceeding the Limits of the Table.

In the uprermost Rank are placed the Courses and their Complements from one Degree to 45, including the Points, Half-points, and Quarter points, which are plac'd in their properColumns between their next greatest and least Degree, and in the right and Left hand Columns are the Miles of Distance, and in the common Area the corresponding Difference of Latitude and Departure, and which are found from the Course and Distance by the Subsequent Proportion.

For the Difference of Latitude.

As the Radius, to the Sine of the Course 1.2.3. & Deg. sois the Distance run 1.2.3. & c. Miles the Difference of Latitude.

For the Departure.

As the Radius to the Co-sine of the Course 1. 2.3. &c Degrees, so is the Distance run 1. 2. 3. er. Miles to the Departure

By the Tables thus formed, no more is requisite to find the Alteration of Latitude and Departure; but to feek for the Course in the Head, and the Distance in the Side, and the Requisites in the Common Area,

A few Examples will render it very plain.

Suppose a Ship sails N.N.E. 4 Easterly 7 Miles. and the Difference of Latitude and Departure be required.

In the Column under Latitude and Departure, I feek for 2p. 3 (because the distance of the Rumb N.N.E. & E. is 2 p. from the Meridian) and in the Right hand Column for the Distance 7 Miles, and in the common Area I find 6,0041 for the Difference of Latitude, and 3.5987 for the Departure.

If the Course had been the same, and the Distance 70, it is but removing the Prick one place backwarder in the former Answers, and the thing is done So that in this Case the Difference of Latitude would be 60 041, that is 60 Miles and 704 of a Mile, and the Departure 35 987, that is 35 Miles and 38 of a Mile. In like manner, If the Distance had been 700 Miles, and the Course the same, then the Difference of Latitude would be 600.41, and the Departure 359.87.

If the Distance proposed does not confist of any Number of 10's, as suppose 753, then the proper Requifites may be thus found.

Take the dif. of Lat. answering to 700 600.41

85.77

And, say, as 100 to 53, so is 8577 the Difference 45.46, which therefore added to the Difference 45.46. rence of Latitude 600.41, answering to the Distance 700, gives 645 87, the Disterence of Latitude to the Distance 753, and Course as before, N. N. E. & E. after the same manner, and it will be as 100 to 53. So is 51.41 to 272.17, which added to 35987, gives 387.117, the Departure requi-

But the Difference of Lat. and Departure in the former Case, may be more readily found by divi ding the Distance into such Parts as may be found in the Table, and adding up the several Differences of Latitude and Departure in one Sum to find the Total: Thus,

Suppose the Course as before NNE. E. and Distance 753.

The dift of Lat. answering to 700 is , to 42.886 50 is 3 is July 3-573 The Dif. of Lat. answering to 753

After the same manner may be found,

The Departure belonging to 700 359.87 to 1.54Z

The same Difference of Latitude and Departure answering to 75, 5, by placing the Prick one place forwarder, that is, integal of 645.869, for the Difference of Latitude take 64.5869, and for the Departure, instead of 387.187: 38.7117, also by placing it two places forwarder, they lerve for the 1401 by placing of it three places forwarder

In like manner, If the Distance had been any Number greater than 1000, as suppose 86753, by diving itias in the former Example, into its component Parts 50000. 6000, 700. 50, 3, and summing up each particular difference of Latitude and Departure into one Sum, the proper Difference of Latitude and Departure will be had.

Keeping the Distance 753, as before the same difference of Latitude 645.87, and the Departure 387.117 will serve for any Course that makes an Angle with the Meridian of 23, as the NNW. 2W the SSE 3 E. or the SSW. 3 W. and the difference of Latitude in this Case would be the Departure also, the Departure would become the difference of Latitude for any Course that makes

an Angle of 5 p $\frac{1}{4}$ with the Meridian

As suppose a Ship Sails 753 Miles either NE. by E. $\frac{1}{4}$ E or N. W. by W. $\frac{1}{4}$ W. or S. E. by E. $\frac{1}{4}$ E. or S. W. by W. $\frac{1}{4}$ W. or

The Nature, Construction, and Use of the Table of Difference, &c. 120

ENEN. Se. the proper difference of Latitude the West Column; which done, add up the Coto each, or any of these will be the same with the lumns of difference of Latitude and departure, and Departure in the former Example 387.117, and the Departure in this 645.869, the same with the Alteration of the Latitude in the former

If the Course cannot be found exactly in the Table, then the difference between the differences Latitude and Departure, proper to the whole Degrees next above and below the Course must be tound, and the Proportional Increment investigated, as in the following Example.

Suppose a Ship sails North 38° 20' westerly 609 Then against 6 and under 38°, the dif. Lat is 472.81 Against 6, and under 39, the differ Lat. is 466.29

The difference to the Alteration of 1 deg. is 6.52

Therefore as 60 to 30, so is 652 to 3.26, which therefore substracted from 47.281, leaves 469.55 the difference of Latitude.

In like manner for the Departure.

Against 6, and under 380 the departure is 369 40 Against 6, and under 39 the Departure is 377.59.

which therefore added to 369.40, gives 373.495, for the departure required.

A Traverse

Admit a Ship from the Latitude of 48° 30' N. Sails NNW half W. 79 miles, then N W half W. 86, then N by E 2 E. 108, then N 48° East, 112, then E. 5° southerly 70, then East 50° Norther-

Having set down the Courses and Distances, as in the following Table, proceed to find out the dif-ference of Latitude and Departure for each (accorference of Latitude and Departure for each (accor ding to the directions already given) in the Table tion of Traveries, it would be needless to give an placing each in its proper Column, viz. If the Example of each particular Case in Plane-Sailing, Course be Northerly the difference of Latitude especially since be that is but moderately apprehenmust be placed in the North Column, if Southerly, five of what has been said, will find it not difficult in the South Column, if Easterly, the departure to do it himself, by the Directions given in Vol. 1. must be put in the East Column, if Westerly, in under the words Plain Sailing.

substract the lesser difference of Latitude from the greater, as also the leffer departure from the greater, and the Remainders will be the difference of that Latitude and departure the Ship has made.

The TABLE.

Courses	Dist	Dif.o	f Lat	Departure		
,		N	S.	E	w	
NNW, ‡W NW ‡W	79 86	69.67	1	_	37.24	
N by E 3 E	108	54.56 101.68	 	36.39	66.47	
N 48° É E 55°		74.94	6.10	83.23 69.73		
E 50° N North	8 ₄ 48	64.35 48.00		53.99		
	~		_			
	.	413.20 6.10		243•34 103.71	103.71	
Nort	 107.10		139.63	F inc		
	9		- 1		L. ing	

Hence it appears, that the Ship has departed from her first Meridian, 139.63 miles East rly, and Therefore as 60' to 30', so is 819 to 4.095, altered her Latitude 407.1 miles, which reduced hich therefore added to 369.40, gives 373.495, into degrees and minutes, makes 6° 47', which therefore added to the Latitude she came from 48° 30', because she sail'd from a North Latitude Northerly makes 55° 17', the Latitude the Ship is come into.

Entering the Table with the Difference of Latitude, thus deduced, viz. 407.01, and the Departure 139.63, I find the Course is greater than 15°, and less than 19, and the Distance greater than 400.00, and less than 500.00 and after working ly 84, then North 48; And it be required to find 400.00, and less than 500.00 and after working the Latitude the Ship is in, her direct Course and the necessary Proportion (by the reverse of the Method mode use of the first th Distance, and how much she has departed from thou made use of in the former Examples) the Course out North 18° 56' E. or E. by N. 70° 41' East down the Course and Distances, as

Julian Year.	Nocturnal Ark.	Dials.
Period.	Nodus.	Projection.
Jupiter.		Pole-Star.
К.	Northern Signs.	of the World.
Kalendar.	Nucleus.	Ecliptick.
Kalends.	Ο.	Pollux.
L	Oblique Ascension.	Procession of the Equinoxes.
Latitude of a Place.	Plane.	Primary Planets.
Star.	Angle.	Prime of the Moon.
Heliocentrick.	Sphere.	Prime Vertical Dials.
Leap-Year.	Occident.	Primum Mobile.
Leo.	Estival.	Projection of the Sphere.
Lesser Circles of the Sphere.	Hybernal.	Projective Dialling.
Libra.	Equinoctial.	Prostapheresis.
Libration.	Occidental.	Pfeudostella.
Like Arks.	Occultation	Prolomaick System.
Limit of a Planet.	Octant.	Pythagorean System.
Line of Measures.	Oction.	C
Linea Apfidum.	Olor.	Quadrant of Altitude.
Line of greater and leffer Longit.	Ophiucus.	Aftronomical.
mean Longitude.	Opposition.	
Motion.		Quadrantal Triangle.
true Motion.	Orbie Magnus	Quadratures of the Moon.
Horizontal.	Orbis Magnus.	Quartile.
TOTICOII(#1"	Orbit of a Planet.	Quintile.

R.
Rainbow.
Rational Horizon.
Real.
Receffion of Equinoxes.
Reclination of a Plane.
Reclining Dials.
Reduction.
Reflecting Dials.
Reflexion.
Reflexion of the Moon.
Refracted Dials.
Refraction Aftronomical.
Horizontal.
Regel.
Regions.

Regel.
Rigel.
Regions.
Retrocession of the Equinoxes.
Retrograde.
Retrogradation of a Planet.
Revolution.
Right Ascension of the Sun or
Moon.
Ring of Saturn.

Sagitta.
Sagittarius.
Satellite.
Infrument.

Satellites of Jupiter.
Mars.

Saturn.
Sciography.
Sciothericum Telescopium.
Scorpio.
Second.
Secondary Circle.
Planets.

Semi-quadrate. quartile. quintile. fextile.

Semita Luminosa. Sensible Horizon. Serpentarius.
Septentrional Signs.
Sefquiquadrate.
Sefquiquintile.
Sexagenary Tables.
Sexagefimal Fractions.
Sextile.
Sidereal Year.
Simple Eccentricity.
Sirius.
Solar Comet.
Cycle.
Year.

Cycle. Year. Solflice. Eflival.

Hybernal.
Solftitial Colure.
Sound.
South Direct Dia

South Direct Dials. Southern Signs. Sphere. Spots in the Sun.

Station. Stationary. Stereographick Projection.

Stile.
Style.
Substilar Line.
Succession of the Signs.
Summer Solstice.
Sun.

Sun.
Sunday-Letter.
Superior Planets.
Swift in Motion.
Sydereal Year.
Synodical Month.
Revolution.

System. Syzygy.

Taurus.
Telescopes.

Telescopical Stars.

T.

Temperate Zone.
Terraqueous Globe.
Terrettrial Globe.
Torrid Zone.
Trajectory of a Comet.
Transit of the Moon.
Triangulus Septentrionalis.
Trine Aspect.
Tropicks.
True Place.
Conjunction.
Twilight.
Tychonian System.

Variation.
Vector.
Venus.
Verled Sine.
Vertex.
Vertical Circles.
Point.
