ARTS and SCIENCES:

EXPLAINING

Not only the TERMS of ART, but the ARTS Themselves.

VOL. II.

BY

JOHN HARRIS, D. D. late Secretary to the Royal Society, and Chaplain to the Lord High-Chancellor of GREAT BRITAIN.

The SECOND EDITION.

LONDON:

Printed for D. Brown, J. Walthoe, J. Knapton, B. and S. Tooke, D. MIDWINTER, B. COWSE, T. WARD, E. SYMON, E. VALENTINE, and J. CLARK. MDCCXXIII.

BIBLIOTHECA REGIA.
MONACENSIS

TO THE

RIGHT HONOURABLE WILLIAM Lord COWPER,

Baron of WINGHAM,

AND

Lord High-Chancellor GREAT BRITAIN.

My Lord,

HE great Honour and Advantage which the former Volume of this Work received from the Patronage of His Royal Highness, the late Prince

George of Denmark, encourages me to Dedicate This to Your Lordship; as I am also oblig'd in Duty and Gratitude to do, for the many Favours I have receiv'd from You; and especially for the great Honour and Happiness of having been so long known, and so near to You: For this, my Lord, will save me from Vol. II.

A 2

DEDICATION.

the Fate of those Dedicators, who attempt Characters above Panegyrick: The Publick Part of Your Lordship's all the World knows and admires; and tho' I see every Day That which renders Your Lordship the Instruction, as well as the Delight of all that have the Honour of Your Conversation, yet I can no more describe it, than I dare attempt it: I shall therefore, my Lord, entirely forbear; fearing as much doing Violence to Your Modesty, as Injustice to Your Merit.

I am,

My LORD,

Your Lordship's

Most Dutiful, and

Most Humble Servant,

JOHN HARRIS.

THE

INTRODUCTION.

HE Design of an INTRODUCTION to a Book, being to lead the Reader into it, and to acquaint him what it contains; I shall observe that Method here.

He is therefore to understand, that when I first began this Work, I foresaw the Design could not be accomplish'd in One Volume; but however, I

thought it more proper to Publish one Volume first, than to deser Printing any thing at all of it till the Whole was sinished: For as it is easy to see, that new Matter will continually occur in a Design of this Nature, and, consequently, that there can be no such thing as a Perfect Book of this Kind; so I thought it better to send out an Imperfect one than none, and to afford some Help to Mens Improvement in Philosophy and Mathematical Studies, rather than leave them to stay four or sive Years for a more Compleat one. And the unprejudiced Part of the Learned World have been so kind, as to take my Endeavours as I meant them; and by taking off almost Two Impressions of the former Volume, and numerously subscribing to this, make me shope, the Pains I have taken, and the Time I have employed this Way, may be of some Use and Benesit to Mankind, and to the Improvement of Solid and Substantial Philosophy.

In this Second Volume, as I promised both in the Preface to the First, and also in the Proposals for This, the Matter is entirely New, and without any Repetition, that I know of, of any thing in the Former; and that shall be my Method, if ever I Publish any thing fur-

ther in this Way.

The Reader will find here many. Parts of Natural Philosophy and Anatomy largely treated of, which were either but just nam'd, as it were, or entirely omitted in the former: As in particular, the Affair of Animal Secretion; into which Dr. Keil's Book on that Subject, publish'd since my Account was printed, will let you yet further; Discourses on Thunder, a Vacuum, Vapours, Water; with a large Account of Sound, Echoes; the Transmutation of Bodies into one another; the Nature of Light and Colours, the Rays of Light, the Double Refraction found in the Island Chyrstal; Elasticity, Electricity, the Cohesion of the Parts of Bodies, &c.

And in Natural History, I have here given Schemes of Birds, Fishes, Insects, Quadrupeds, Roots of Plants, &c. by which they

are ranged and distributed into their proper Orders.

Here are also inserted pretty large Accounts of the Ear, Stomach, Spleen, Skin, Vena Porta, Lungs, Gall, and Respiration, and of the New Theory of Generation; with Descriptions of the Lymphæduds and Glands, and two very fine and large Copper Plates of the Veins and Arteries of a Human Body, which were drawn from the Original Tables, presented by that great Promoter of Useful Learning, John Evelyn of Deptford, Esq; to the Royal Society of London.

You have here also a further Account of that most amazing Property, the Attraction of the Particles of Matter one towards another, first discover'd by that Incomparable Mathematician and Philosopher Sir Isaac Newton; who by the wonderful Discoveries he hath made about the Nature of Light and Colours, hath open'd a New World in Natural Philosophy, as by his Method of Fluxions, &c. he had before done in Mathematicks, Mechanicks and Astronomy; and hath sufficiently thewn, that what he said in his Presace to his Principia Philos. Math. in these Words: Multa me movent ut non nihil suspicer catera Natura Phanomena, ex viribus quibusdam pendere posse, quibus Corporum particula, per Causas nondum cognitas, vel in se mutuo impelluntur, & secundum Figuras regulares coharent, vel ab invicem sugartur & recedunt, was what he very well knew then, tho' express'd with that Caution and Modesty, as is so peculiar to that Excellent Man.

This was printed in the Year 1687. and the Queries at the End of his Opticks, and especially as since enlarged by him in the Latin Translation of it, do sufficiently shew his Thoughts to have been long ago employ'd on this most useful Subject; and from whence those Propositions took their Rise, which those Ingenious and Industrious Brothers the Keils, have publish'd about this Affair of Attraction: But however, to do the Illustrious Author yet surther Justice, I have, with his Leave, at the End of this Introduction, printed a Latin Paper of his De Acido, with a Translation of my own; and which, tho' never publish'd before, was given by him to a Friend, as long since as the Year 1692, and which I wish had come to my Hands sooner, to have been inserted in this Lexicon under the proper Head, Acids.

And give me Leave here further to inform the Reader, That there is now printing a Latin Mathematical Treatise or two of Sir Isaac Newton's, which were written many Years ago, and which by their Date will sufficiently determine, whether the New Methods of Fluxion's were known first to him, or Mr. G. Leibnitz. But to go on: In this Second Part, I have been very full and particular in Astronomy; having not only from Mr. Hayes's Excellent Book of Fluxions given

a snort

a short System of the New Astronomy, but have also from the Ingenious and Learned Mr. Halley, Savilian Professor of Geometry in the University of Oxford, inserted a Synopsis of the Doctrine of Comets; and from the Prelections of Mr. Whiston, Mathematick Professor of the University of Cambridge, such Astronomical Tables as are necessary for Calculation, illustrating largely the Uses of them, with proper Examples, in the most useful Astronomical Problems, and in the Calculation of Solar and Lunar Eclipses, and in those of the Satellites of Jupiter, &c.

And because I would have these Two Volumes to serve as a Kind of small Mathematical Library, and prevent in some measure the Necessity and Charge of buying many Books on these Subjects; I have also, as I design'd at first, given you in this Volume very good Tables of Logarithms, Sines, Tangents and Secants, with a full Account of the Nature, Use and Application of them; so that nothing will be wanting here to compleat Trigonometry, both Plain and Sperical, and the Practice of it in Navigation, Dialling and Astronomy,

O٠c.

I have here also given a full and clear Account of the Nature, Construction and Uses of all the Lines which are usually drawn on any Mathematical Instruments, Rules, Scales, &c. and how to use those Instruments, on which they are drawn, in the several Parts of

Practical Mathematicks for which they were design'd.

And I have here and there inserted such useful Tables for the Calculation of Interest, Annuities, Purchases, Reversions, &c. as I found most easily and readily subservient to those Uses. And because of the very many and excellent Uses of the Table of Incomposite Numbers, and its being printed no where but in Brancker's Algebra, an obscure Book, and out of Print; I have here given it you entire, and, I believe, correct; being desirous to prevent so useful a Table from being lost, or buried in Obscurity.

Here is also an Account of the Method of Levelling, in order to drain Marshes, Fens or Moratles, or to convey Water from one Place

to another.

An Account of the Rise, Invention and Progress of the Art of Printing; with a Description of the Tools and Instruments subservient thereunto.

I have added also a farther Account of the Phanomena of Prisins and the Rainbow; with a short System of Opticks from Sir Ijaac Nenton; and many Improvements in Microscopes and Telescopes; the Art of Perspective, and the Methods of Projective, Restactive and Refractive Dialling.

In Mechanicks, besides the Account of the Five Powers and Demonstrations of the Nature and Principles of that Science, here

are many things added about Centres of Gravity and Oscillation, the Resistance of Mediums, with the Description and Uses of all such Mechanical Instruments, Tools and Engines, as are used in Architecture, Fortification, Gunnery, or any Mathematical Arts and Sciences.

In Geometry, here are great additional Improvements; as two Treatises of the Order and Quadrature of Curves, written by the Incomparable Sir Isaac Newton; a Treatise of Conick Sections, translated from the Posthumous Book of the Marquis de L'Hospitall, with many other Things relating to the Properties of Curves, scatter'd up and down under particular Words; such as Cycloid, Helicoid, Retrogression of Curves, Transcendental Quantities, &c. Here are also added many new Things in Arithmetick and Algebra, and in the Doctrine of Fluxions; as about Alternations, Combinations, the Laws of Chance in Play, Infinite Series, and Political Arithmetick; and about the Roots of Equations, Renewing of Leases, Reversions, &c.

I have also here given a large Account of the Ways of Finding, Dressing, Melting, &c. of all the several Ores from whence our Metals are taken; describing also the Works, Engines, Tools and Terms of Art used by Miners; as also the Ways of making Salt, Allum, Coperas, Vitriol, and such like Mineral Productions.

In Musick, here is given an Account of the Nature and Grounds of Harmony from Dr. Holder, and a new short System of Musick by

the Ingenious Mr. Perk.

In Navigation I have added many things; as the Way of finding and allowing for the setting of Currents; an Account of the Power of the Winds on the Sails of Ships, and of the Signals used at Sea, both by Day and Night, in Sailing, and in an Engagement; together with a new Traverse Table, and its Use and Application: And at the End, you will find two very accurate Cuts of the Inside and of the Rigging of a First Rate Man of War; with the several Parts describ'd, and referr'd to by proper Letters and Numbers.

I have also inserted Tables of the Sun's Place, Right Ascension, and Declination; together with a Catalogue of the Right Ascension, Declination, Longitude and Latitude of about sifty of the principal Stars, which Mr. Hodgson supplied me with; as also a Table of the Longitude and Latitude of the most eminent Places on the Globe; all which will be very useful in Astronomy, Navigation and Dialling.

I have added also a Copper Plate, describing a new Hydrostatical Balance, which is very ready and expeditious to find the Specifick

Gravity of Bodies, as is there snewn.

I have

H

0

I have here, under the Word Microscope, given the Reader the Figure, Nature, Use and Advantages of Mr. Wilson's Glasses of that Kind, which I could only just mention in the Introduction to my former Volume, and which I think my self oblig'd again to say, are the most ready, commodious, and universally useful, of any Microscope Lever feet.

scopes, I ever saw.

And that I might do further Justice to our Excellent Mathematical Instrument-Maker Mr. John Rowley, in Johnson's-Court in Fleet-street, I have given the Reader a Plate of a New Sextant lately made by his most accurate Hand, for the Observatory now building in Trinity-College in Cambridge; and which for its universal Use, far exceeds any Astronomical Instrument ever yet made; as you will easily perceive by the Description of it, which I have added to the Figure.

I have only one thing more to acquaint the Reader, and that is, That the ingenious and Accurate Mr. Derham, Rector of Upminster in Kent, and Fellow of the Royal Society, hath lately obtain'd from Florence an Account of the Measures and Weights used there: And we find by Mensuration and Tryal, that the Florentine Semibroccio, or Half-Brace, is in Length 11.475 of our Inches, or in Foot-Measure. 956 of our Foot: And the Florentine Ounce is 17 Peny-weight, 12 Grains, and three Fourths of a Grain Troy-weight.

The following Paper of Sir Isaac Newton's is excellently well worth the Philosophical Reader's most serious and repeated Perusal; for it contains in it the Reason of the Ways and Manner of all Chymical Operations, and indeed of almost all the Physical Qualities, by which Natural Bodies, by their small Particles, act one upon another.

Vol. II. B DE

$\mathbf{D} \cdot \mathbf{E}$

NATURA ACIDORUM.

Is. NEWTON.

A Cidorum particula sunt Aqueis Crassiores, & propterea minus Volatiles, at Terrestribus multo subtiliores & propterea multo minus sixe. Vi magna attrastrota pollent, & in hac vi consistit earum Activitas, qua & corpora dissolvunt & Organa sensuam agitant & pungunt. Media sunt Natura inter Aquam & Corpora, & Utraque attrabunt. Per vim suam attrastivem congregantur circum particulas corporum seu Lapideas seu Metallicas iisq; undiq; adherent artissime, ut ab iis dem deinceps per Distillationem vel sublimationem vix possint separari, Attratte vero & undique congregate, elevant, disjungunt & discutiunt particulas corporum ab invicem, id est corpora dissolvunt; & per vim Attractionis quaruunt in particulas commovent sicidum & sic calorem excitant, particulasq; nonnullas adeo discutiunt ut in Aerem convertant & sic Bullas generant. Et hac est Ratio Dissolutionis & Fermentationis; Acidum verà attrabendo Aquam equé ac Terram efficit ut particulæ dissolutæ prompte misceantur cum aqua eique innatent ad modum salium. Et quem admodum Globus terra per vim Gravitatis attrahendo aquam sorniis quam Corpora leviora, efficit ut leviora ascendant in Aquâ, & sugiant de Terrâ. Sic particula Salium attrahendo Aquam fugant se mutuo & ab invicem quam maxime recedendo, per Aquam totam expanduntur.

Particule Salis Alkali ex Terreis & Acidis similiter Unitis constant; sed he Acide vi maxima Attractiva pollent ut per ignem non separentur à Sale; utq; Metalla dissoluta præcipitant attrahendo ab ipsis particulas Acidas quibus dissolvebantur.

Si particula Acida in minori proportione cum Terrestribus jungantur, ha tam artte resinentur à Terrestribus, ut ab ils supprimi ac occultari videantur. Neg, enim sensum jam-pungunt neg; attrahunt aquam. Jed corpora dulcia & qua cum aqua agre miscentur, hoc est pinguia, componant, ut si in Mercurio dulci, Sulphure communi, Luna Connea & Cupro quodi Mercurius Sublimatus corrosa. Ab Acidi vero sic suppressi vi attractiva sit ut pinguia Corporibus prope Universis adhareant & flammam facile concipiant, si modo Acidum calesactum inveniat alia Cor-pora in sumo accensorum qua fortius attrabat quam propria. Sed & Acidum in Suppurcis supprassum fortius attrahendo particulas aliorum corporum (scilicet Terreas) quam proprias, Fermentationem lentam & Naturalem ciet & fovet usq; ad Putrefactionem Compositi.

Qua Putrefactio sita est in eo quod Acida Fermentationem diu foventes tandem in intersiitia minima & prima Compositionis partes interjacentia sese insinuant, intim q, iis partibus Unita

mixtionen Novam efficiunt non amovendam nec cum priore commutandam.

Cogitationes Variæ ejusdem.

Flamma est Fumus Candens; differtque à Fumo ut Ferrum rubens ab ignito sed non rubente. Calor est Agitatio Partium quaqua versum.

Nibil est absoluté quiescens secundum partes suas & ideo frigidum, præter atomos, vacui sci-

Terra augetur, Aquâ in eam conversa, & omnia in aquam (vi ignis) reduci possunt.
Nitrum abit distillatione magnam partem in Spiritum Acidum, relieva terra, quia Acidum
Nitri attrabit I blegma, & idcirco simul ascendunt constituunta, Spiritum: at nitrum Carbone accensum magnum partem abit in Sal Tartari, quia ignis eo modo applicatus partes Acidi & Terre in sese impingit fortiusq; unit.

Spiritus ardentes sunt Olea cum Phlegmate per Fermentationem Unita. Anctura Cochinella cum Spiritu Vini fasta in aqua magnam molem immissa, parva licet dosi, totam aquam inficit : Sc. quia particule Cochinelle magis attrahuntur ab aquâ quam à se mutuo.

Aqua non habet magnum vim dissolvendi quia pauco Acido gaudet. Acidum enim dicimus quod multum attrabit & attrabitur, videmus nempe ea que in aqua solvuntur lente & sinc Effervescentia solvi, at ubi est attractio fortis & particula menstrui undiq; attrahuntur à purticula Metalli, vel potius particula metalli undiq; attrabitur à particulis menstrui, hæ illam aliripiunt & circumsistunt, hoc est metallum corrodunt : He eadem particule sensorio applicate ejus partes eodem modo divellunt doloremy, inferunt; à quo Acida appellantur, reliefa scilicct terrâ Subtili cui adharebant ob majorem attrastionem ad liquidum lingua, &c. In

In omni Solutione per Menstruumparticula solvenda magis attrahuntur a partibus Menstru quam à se mutuo.

In omni Fermentatione est Acidum suppressum quod coagulat pracipitando.

Oleam cum nimis magna mole phlegmatis intime mixtum, sit Salinum quiddam & sic Acetum constituit, hic etiam Tartari seu Terra admissa habenda est ratio.

Mercurius attrahitur id est corroditur ab Acidis & sicut pondere Obstructiones tollit ita vi at-

tradrice Acida infringit.

Mercurius est Volatilis & facile elevatur calore quia ejus particula ultima Compositionis sunt parva & facile separantur separataq; sese sugant; ut sit in particulis Vaporis, suidorumg, rare-

Aqua cum primi non potest quia ejus particula jamjam se tangunt. Et si se tangerent partieula Aeris (nam Aer comprimi potest, quia institut a nondum se tangunt) Aer evaderet in Marmor. Seq. ex Prop. 23. Lib. 2. Princ. Philosoph.

Aurum particulas habet se mutuo trahentes; minimarum summe vocentur prime Compositionis, harum summarum summe secunde Compositionis, &c.

Potest Mercurius, potest Aqua Regia poros pervadere, qui particulas ultime Compositionis

interjacent at non alios.

Si posset menstruum alios illos pervadere vel si auri partes primæ & secundæ Compositionis possent separari sieret Aurum, vel Fluidum, vel saltem magis malleabile. Si Aurum fermen-

tescerë posset in aliud quodvis corpus posset transformari.

Visciditas est vel solum defectus fluiditatis, que sita est in partium parvitate & separabilitate (intellige partes ultime Compositionis) vel defectus lubricitatis seu levioris partes unius supra alias labi impediens. Hujus visciditatis Acidum sape causa est; sape Spiritus alius lubricus terra junttus, ut oleum Terebimbina capiti suo Mortuo redditum su tenax.

Ratio cur Charta Oleo in unita Transitum Oleo non Aqua concedat est quia Aqua Oleo non mis-

cetur sed fugatur ab eo.

Cum Acida partes, minores scilicet, aliquid dissolvant, id faciunt, quia partem rei solvenda includunt undig; utpote Majorem quâlibet Acidi partium.

Some Thoughts about the NATURE of ACIDS; By Sir Isaac Newton.

THE Particles of Acids are of a Size groffer than those of Water, and therefore less volatile; but much smaller than those of Earth, and therefore much less fix'd than they. They are endued with a great Attractive Force; in which Force their Activity confifts; and thereby also they affect and stimulate the Organ of Taste, and dissolve such Bodies as they can come at. They are of a middle Nature, between Water and Terrestrial Bodies, and attract the Particles of both.

By this attractive Force they get about the Particles of Bodies, whether they be of a metallick or stony Nature, and adhere to them most closely on all sides; so that they can scarce be separated from them by Distillation or Sublimation. When they are attracted and gather'd somether about the Particles of Bodies, they raise, disjoin and shake them one from ano-

ther; that is, they diffolve those Bodies.

Vol. II.

By their attractive Force also, by which they rush towards the Particles of Bodies, they move the Fluid, and excite Heat; and they shake a sunder some Particles, so much as to turn them into Air, and generate Bubbles: And this is the Reason of Dissolution, and all violent Tennermation; and in all Fermentation there is an Acid latent or suppress'd, which coagulates in Precipitation.

Acids also, by attracting Water as much as they do the Particles of Bodies, occasion that the afficient Particles do seadily mingle with Water, or swim or float in it, after the manner of Sales.

And as this Clobe of Earth, by the Force of Gravity, attracting Water more strongly than it doth lighter Bodies, causes those lighter Bodies to ascend in the Water, and to go upwards from the Earth: So the Particles of Salts, by attracting the Water, do mutually avoid and recede from one another as far as they can, and so are diffused throughout the whole Water.

The Particles of Sal Alkali, do confift of Earthy and Acid united together, after the same manner: But these Acids have so great an Attractive Force, that they can't be separated from the Salt by Fire; they do also precipitate the Particles of Metals dissolved in Mensirua, by attracting from them the Acid Particles, which before had dissolved them, and kept them sufpended in the Menstruum.

If B 2

If these Acid Particles be join'd with Earthy ones, in but a small Quantity, they are so closely retain'd by them, as to be quite suppress'd and hidden as it were by them; so that they neither stimulate the Organ of Sense, nor attract Water, but compose Bodies which are not Acid, i. e. Fat and Fusible Bodies, such as are Mercurius dulcis, Common Brimstone, Luna Cornea, and Copper corroded by Mercury Sublimate.

From the Attractive Force in these Acid Particles thus suppress'd, arises that universal Property of almost all fat Bodies, that they adhere or stick to others, and are easily inflammable, if the heated Acid Particles meet with other Particles of Bodies in Fume, which the Acid attracts more strongly than it doth the Particles to which it is united. And thus the Acid that lies suppress'd in sulphureous Bodies, by more strongly attracting the Particles of other Bodies (Earthy ones for Instance) than its own, promotes a gentle Fermentation, produces and cherishes Natural Heat, and carries it on so far sometimes, as to the Putteraction of the Compound: Which Putteraction or arises hence, That the Acid Particles which have a long while kept up the Fermentation, do at long run insinuate themselves into the least Interstices that lie between the Particles of the first Composition, and so intimately uniting with those very Particles, do produce a new Mixture or Compound, which cannot fall back again into the same Form.

Note, The Paper hitherto describ'd, seems to have been a continued Discourse; but what follows are short Minutes of Thoughts relating to the same Subject.

Nitre, in Distillation, leaving its Earthy Part behind, turns most of it into an Acid Spirit: because the Acid of the Nitre attracts the Phlegm, and therefore they ascend together, and

constitute a Spirit. But Nitre, kindled with a Coal, turns chiefly into a Salt of Tartar; because the Fire applied this Way, drives the Acid and Earthy Parts towards, and makes them impinge on, and more strongly unite one with another.

The Reason why Water hath no great dissolving Force, is, because there is but a small Quantity of Acid in it: For whatever doth strongly attract, and is strongly attracted, may be called an Acid: And such things as are dissolved in Water, we see, become so, easily, without any Effervescence: but where the Attraction is strong, and the Particles of the Menstruum are every where attracted by those of the Metal, or rather, where the Particles of the Metal are every way attracted by those of the Menstruum; then the Particles of the Menstruum environ those of the Metal, tear them to pieces, and dissolve it.

So when these Acid Particles are applied to the Tongue, or to any excoriated Part of the Body, leaving the subtil Earth in which they were before, they rush into the Liquid of the

Sensory, tear and disjoint its Parts, and cause a painful Sensation.

Mercury is attracted, and therefore corroded by Acids; and as it opens Obstructions by its great Weight, so it breaks and obtunds the Power of Acids (in the Body) by its attractive Force.

All Bodies have Particles which do mutually attract one another: the Sums of the least of which may be called Particles of the first Composition; and the Collections or Aggregates arising from the Primary Sums, or the Sums of these Sums, may be called Particles of the

second Composition, &c.

Mercury and Aqua Regis can pervade those Pores of Gold or Tin, which lye between the Particles of its last Composition; but they can't get any further into it; for if any Menstruum could do that, or if the Particles of the first, or perhaps of the second Composition of Gold could be separated; that Metal might be made to become a Fluid, or at least more soft. if Gold could be brought once to ferment and putrify, it might be turn'd into any other Body

And so of Tin, or any other Bodies; as common Nourishment is turn'd into the Bodies of Animals and Vegetables.

N. B. The small Difference which there is between this Translation and the Latin above, was its being taken from another Copy a little different from this Latin Paper. And having been Supervised and approved by the Illustrious. Author, I have not alter'd it since. enter (f. 1975) (1976)

Constitution of the second of

LEXICON TECHNICUM.

OR, AN

Universal English DICTIONARY

Arts and Sciences.

VOL. II.

ABA

ABC

BACUS. Besides the former Account of the Abacus, I find that Mauclerc, in the Ionick Order, designs what the Workmen call an O. G. with a Fillet over it for the Abacus: Which Fillet is half the Breadth of the O.G. and he calls it the Fillet of the Abacus. In the Corinthian Order, he describes the Abacus as a seventh Part of the whole Capital. Palladio calls the Plinth about the Boultin (or Eckinus) the Abacus: Which from its Form, faith he, is commonly called Dado, or the Dye; and this is; of the whole heighth of the Capital.

Scamozzi calls a certain Hollow or Casement, which is the Capital of the Pedestal of the Tuscan

Order, by this Name Abacus.

ABASE, in the Sea Language, is to Lower or Take in. To Abase the Flag, is to take in the Flag.

ABBACY, is the Government of a Religious House, with the Revenues and Persons subject to an Abbat.

ABBAT, is a Spiritual Lord, having the Rule of Religious Houses according to our Common Law. Some Abbats in England were called Mitred Abbats; and such were exempted from the Juri diaion of the Diocesan, having Episcopal Authority themselves within their Limits, and were also Lords of Parliament. These were sometimes call'd Abats Sovereign, and Abbats General. The other Abbats were subject to the Diocesan in all Spiritual Government. These were also Lords Priors, which had exempt Juristion, and were Lords of Parliament. Of these Lords Abbats and Priors, Six Film Coke faith there were 20 that sat in Par-Sir Edw. Coke saith there were 29 that sat in Par-

liament, 27 Abbats and 2 Priors. But sometimes their Number was varied, there being but 25 Abbats and 2 Priors in a Pailiament held in the 20 Rich. 2

ABREUVOIRS, are the Intervals or Spaces between the Stones, or the Joints where the Mortar lies in any Pillar, Wall, or Building.

ACCORD, according to the Modern (French)

Account of Musick, is the Production, Mixture and Relation of two Sounds; of which the one is Grave, and the other Acute. They make two Kinds of Accord; those which are pleasant and agreeable, and which they call Consonances; and the as are harth and unpleasant, which are call'd Differences. Which Cas in Vol I. Dissonances. Which see in Vol. I.

ACERIDES, is a Plaister made without Wax, such as that call'd Emplastrum Norimbergense.

ACTION Civil, is that which tends only to the

Recovery of what is due to any one by Contract, Egc. as if a Man feek by Action to recover a Sum of Money formerly lent.

ACTION Penal, is that which aims at some Penalty or Punishment in the Party sued, whether Corporal or Pecuniary; as in the Action Legis Ac-

quilie in the Civil Law, and in the Common Law in Case of Appeals for Murder.

ACTION Prejudicial or Preparatory, is that which grows from some Doubt in the Principal; as suppose a Man sue a younger Brother for Land descended from his Father, and its objected that he is a Bastard, the Bastard must be first tried; that is call'd Attio Prejudicalis, because it must be first judg'd or determin'd.

ACTION

ACTION Amcestrel, is in opposition to Personal, being that which a Man hath by some Right descending from his Ancestors: This is either Deoi-

ACTOR, is sometimes used for a Proctor of Advocate in Civil Courts or Causes. Actor dominicus was also the Term formerly for the Lord's Bailey or Attorney. Actor Ecclesia was sometimes the Foreign Term for the Actor Villa was the Stew-

ard or Head Bailey of a Town or Village.

ADDICTIO in Diem, in the Civil Law, is an Agreement between Buyer and Seller, that the Seller may Contract with any other Person who will offer a better Price, before a certain Day.

ADDITION, is the Term in our Common Law for the Title which is given to any Person besides his Christian and Sirname, in order to

distinguish him by his Degree, Estate, Mystery, Trade, Place of Abode, &c.
And tis particularly provid by the Stat. 1 H. 5. 6. 5. that in Suit of Action where Process of Utlars lies, such Additions shall be given to the Name of the Defendant; and that Writs not having such Additions shall Abate, if the Defendant take Exceptions thereunto.

ADVANCE Fosse, is a Ditch of Water round the Esplanade or Glasis of a Place, to prevent its being furprised by the Besiegers: But of late this Work hath been desus d, because as foon as the Enemy could drain it, it was a Trench ready made for the Advantage of the Bessegers.

ADVOCATIONE Decimarum, is a Writ that lies for the Claim of a fourth Part, or upward, of

the Tithes belonging to any Church.

ADVOWEE or AVOWEE, in Latin Advoca-Presentation to a Benefice; and the Avowee Paramount was the highest Patron, or the King. By

the Statute of Provisors, 25 E. 3.

ADVOWSON of a Religious House; as the Builders and Endowers of a Church were the Patrons of it, so those that Founded any Religious House, had the Advanson or Patronage of it. Sometimes the Patron had the fole Nomination of the Prelate, Abbet or Prior, either by Investiture (or Delivery of a Pastoral Stass) or by direct Pre-feutation to the Diocelan. And if a free Election was left to the Religious, yet a Conge destire, or License of Election, was first to be obtained of the Patron, and the Person Elected was confirmed by Patron; and the Person Elected was confirm'd by him. If the Founder's Family was extinct, the Patronage of the Convent went to the Lord of the Mannor.

ADZ, is an Instrument whose Blade is made thin and something bending, and hath not its Edge parallel to its Handle, as the Axe and Hatchet hath, but placed athwart to it. It is ground to a Basil on the Inside to its outer Edge. Its general Use is to take off thin Chips of Timber or Boards, and fuch Irregularities as the Axe can't come at, and where a Plane, the rank Set, will not make rid-dance enough. 'Tis much us'd in taking off the dance enough. Irregularities of Floors when they are pinned and framed together; and fometimes on Polls framed apright, and ranged in with other Work framed

to them, where the Edge of the Axo can't come.

ÆSTUARY, is an Arm of the Sea running up a good way into the Land, like the Briffel Chan-

ncl, 55c.
AGE, in the Common Law, is that particular Time which enables a Person to do that, which

before he could not do for want of Age: Thus at 14 Years a Man is said to be at the Age of Discre-from, and at 21, at sull Age. At 12 Years of Age a Man may take the Oath of Allegiance at a Leet; at 14 he may confent to marry, and in Sociage chuse his Guardian; at 15 he is of Age for the Lord to have Aid pur fuir fitz Chivalier, and may be fwom so keep the King's Peace; at 12 he is bound to Appearance before the Sheriffs and Coroner for

Enquiry after Robberies.

A Woman might heretofore at 7 Years of Age, her Father being the Lord, distrain his Tenants for And pur fill Marier, and at those Years consent to marry, saith Bracton. At 9 Years she is dowable; for then, or within half a Year after (Fleta, lin. 9. 6-22. Lit. Lib. 1. c. 5.) she is able promereri dotenzes virum suffinere: But this Bracton limits to 2. Years. At 12 she is able to ratify and confirm a former Consent given to Matrimony; at 14 she is able to receive her Lands into her own Hands, and shall be out of Ward, if the be at that Age at her Ancestor's Death; at 16 she shall be out of Ward, tho' she was under 14 at the Death of her Ancestor; at 21 the is able to alienate her Lands and Tenements.

AGOGICE, is the Art of making Images or Figures in Metals, when Wax is us'd to effect or fur-

ther the Design.

AIDE, in the Law, hath feveral Significations; fornetimes 'tis the fame with Subfidy; tometimes a Protestation due from Tenants to their Lords. This Word is also us'd in matter of Pleading for a Petition made in Court, for the calling in of the Help from another that hath an Interest in the Cause in Question. Thus a Tenant for Term of Life, by Courtesy, Tenant in Tail after Possibility of Issue extinct, for Term of Years, at Will, by Elegit or by Statute Merchant, being impleaded touching her Estate, may pray in Aid of him in the Reversion; that is, desire the Court that he may be called in by Writ, to alledge what he thinks good for the Maintenance both of her Right and his own; but this Course hath been disus'd. If a King's Tenant holding in Chief be demanded a Rent of a common Person, he may pray in Aid of the King; and so may a City or Burgh, having a Fee Farm of the Crown, when any thing is demanded against them belonging thereunto.

AIR, the admirable Sir Isaac Newton, in the Obfervations mention'd in the 2d Book of his Opticks by considering the Colour'd Rings made by Compressing two Prisms, or two Object Glasses of large Telescopes together, comes to a Calculation of the Thickness of the Air contain'd between the Prisma and Object Glasses in such a State of Compression; and at last he seems (he saith) to gather this Rule, That the Thickness of the Air is proportionable to the Secant of an Angle, whose Sine is a certain mean Proportional between the Sines of Incidence and Refraction. And that mean Proportional, fo far as by the Measure he took could be determin'd. he found was the first of 106 Arithmetical Mean Proportionals between those Sines accounted from the greater of the Sines (i. e.) from the Sine of Refraction, when the Refraction is made out of the Glass into the Plate of Air; or from the Sine of Incidence, when the Refraction is made out of the Plate of Air into Glass. And in Observation 14. Page 18. He faith that the Thickness of the Air between the Glasses there, where the Rings are suc-Ceffively made by the Limits of the 7 Colours, Red, Orange, Yellow, Green, Blue, Indico and Violet, in order; are to one another as the Cube Roots of

the Squares of the eight Lengths of a Musical Chord which Sound the Notes in an Eighth, Sol, la, fa, Sol, la, mi, fa, Sol: That is as the Cube Roots of the Squares of the Numbers 1, $\frac{1}{2}$, $\frac{1}{4}$,

And according to his most accurate Observations, the Thickness of the thinned Air, which between two Glasses exhibited the most Luminous Parts of the first six Rings of Colours, were TT 178000 178000 178000 178000 Parts of an Inch.

'Tis highly probable that True and Permanent Air is made by Fermentation, (faith the fame Author) and Rarefraction of Bodies that are of a very fixt Nature: Those Particles flying and avoiding one another with the greatest Force at a Distance, which when very near, attract and adhere to one another with the greatest Violence.

The Particles therefore of true and permanent Air, being Extracted from the Densest and most six'd Bodies, will be Denser and Crasser than those of Vapour; and from hence it is likely, may be Heavier also than those, and that the Parts of a Humid Atmosphere may be Lighter than those of a dry one, as in Fact it appears to be; by the rifing of the Mercury in dry Weather, and by Clouds and Vapours rising into and floating in our Atmo-Spherical Air. And he very justly thinks that the Rarefraction and Condensation of the Air cannot be accounted for from the Spring or Elastick Forms of the Particles, without a Supposition that they are endued with some Centrifugal Force or Power by which they Fly and avoid one another, and the Dense Bodies from whence they are Extracted. See Attraction

And that this Repelling Force, which is the Caufe of Filtration and of the Ascent of Water in small Capillary Tubes to much greater Heights than the Surface of the Water in the open Vessel, in which they are placed. The Air within the Tubes being amuch rarer than in more open Spaces, and by that speans not pressing so much on the Surface of the Water within the Tubes as without. And this And this Account Dr. Hook had hinted at long ago. Sir If. did in his admirable Prin. Philo. Mathem. Prop. 23. P. 201. long ago demonstrate, That Particles endeavouring to recede from or avoid one another with Forces reciprocally proportional to the Distance between their Centers, will compose an Elastick Fluid whose Density shall be proportionable to its Compression, and from such a Property all the Appearances of our Air may be very well accounted for. And I think much better than from the Supposition of its Particles being Spires contorted into Spheres, through whose Interstices the Rays of Light may freely pass, &c. tho' this be very ingenious: But I think can never folve the prodigions Rarefraction of this most useful Fluid.

AIRS Resistance: See Resistance.
AIRS Weight, in Proportion to the same Bulk of Water, seems pretty nicely determin'd by an Experiment lately made before the Royal Society by the ingenious Mr. Hauksbee (See Phil Trans.

N. 305.) to be nearly 885 to 1.

ALARM Poft, is the Ground appointed to each Regiment by the Quarter-Masser-General, for them to march to in Case of an Alarm; in a Garrison 'tis the Place where every Regiment is order'd

to draw up in on all Occasions.

ALBULA. This Word is used somerimes for a Spot in the Eye, and then seems so be the same with Albugo: But in the Plural Albula, fignifies

such very astringent Mineral Waters as have a great deal of Allum in them, and are chiefly used externally for Cleansing and Healing of Wounds and Ulcers.

ALCOLA, is sometimes used for Aptha, and sometimes signisses a Tartarous Sediment in Urine, and from hence Urine is sometimes call'd Alcolita.

ALGEBRA, besides the Authors mention'd in the Account of this Science under this Word in Vol. I. those that please to have a thorough infight into this wonderful and useful Art, may confult the following Authors,

imbridge. 1707. ALGEBRAIC-Curve, in Geometry, is of fuch a Nature, that its Abscisse or intercepted Diameters bear always the same Proportion to their Re-spective Ordinates. Thus if the Product of any Abscissa multiplied into one and the same determinate Quantity be always equal to the Square of its corresponding Ordinate; then if that determinate Quantity be call'd p, the Abscilla x and the Ordinate; the Expression of the Nature of the Curve by way of Equation will be p = yy, where p is the Parameter or Latus Resum of the Figure; Curve by way of Equation will be p x: and the Curve is the common Apollonian Parabola; and because the two indeterminate or flowing Quantities α and y, do here denote firait Lines; therefore the Curve is call'd an Algebraick or Geametrick Curve. And 'tis plain that the Number of such Curves must be infinite; because there may be an Infinity of Proportions or Relations between the Ordinates and the Abscissa. But

But when the Nature of any Curve is expressed by an Equation, wherein one of the indeterminate or flowing Quantities represents a Curve Line; then that Curve is call'd a Transcendental Curve, and if the Curve which enters the Equation be Geometrical, or a Curve, as they call it, of the first Kind or Degree; then the transcendent Curve is call'd a Curve of the second Kind or Degree: And when the Curve which enters the Equation represents a Curve of the second Kind or Degree; then the Transcendental Curve is call'd one of the Third

Kind; and so on infinitely.

ALLUM-Works, Allum is made of a Stone of Sea-weed and Urine. The Stone is found in most of the Hills between Scarborough and the River of Tees in the County of York, and also near Preston in Lancasbire; 'tis of a blueish Colour, and will cleave like Cornish Slate. The Mine which lies deep in the Earth and is pretty well moistned with Springs is the best. The dry Mine is not good, and too much Moissure cankers and corrupts the Stone, making it nitrous. In this Mine are found feveral Veins of Stone call'd Doggers, of the same Colour but not so good. Here are found those alfo which are commonly call'd Snake-Stones. For the more convenient working of the Mine which fometimes lies 20 Yards under the Surface or Cap of the Earth (which must be taken off and barrow'd away) they begin their Work on the Declivity of a Hill, where they may be also well furnish'd with Water. They dig down the Mine by Stages, to fave Carriage, and so throw it down near the Places where they calcine it. The Mine before it is calcin'd, being expos'd to the Air will moulder into Pieces, and yield a Liquor whereof Copperas may be made: But being calcin'd it's fit for Allum; as long as it continues in the Earth, or in Water, it remains an hard Stone. Sometimes a single by the iffue out of the Side of the Mine, which by the natural Allum. The remains an hard Stone. Sometimes a Liquor will Sun's Heat is turn'd into natural Allum. The Mine is calcin'd with Cinders of New Castle Coal, Woods and Furzes; he Fire made about two Foot and thick, two Yards broad, and ten Yards long. Betwixt every Fire are Stops made with wet rubbish; so that any one or more of them may be kindled, without Prejudice to the rest. After, there are 8 or 10 Yards Thickness of broken Mine laid on this Fewel, and 5 or 6 of them so covered; then they begin to kindle the Fires, and as the Fires rise towards the Top, they still lay on fresh Mine: So that to what Height you can raise the Heap, which is oftentimes about 20 Yards, the Fire without any farther Help of Fewel, will burn to the Top stronger than at the first kindling, so long as any Sulphur remains in the Stones.

In calcining these Stones, the Wind many times does hurt, by forcing the Fire too quickly through the Mine, leaving it black and half burnt; and in others, burning the Mine too much, leaving it red. But where the Fire passes softly and of its own Accord, it leaves the Mine whole, which yields the best and greatest Quantity of Liquor.

The Mine thus calcin'd is put into Pits of Water supported with Frames of Wood, and ramm'd on all Sides with Clay; They are about ten Yards long, 5 broad, and 5 deep, and set with a Current that turneth the Liquor into a Receptory, from whence its pumpt into another Pit or Mine. So that every Pit of Liquor, before it comes to boiling, is pumpt into four several Pits of Mine; and every Pit of Mine is steeped in four several

Liquors before it be thrown away, and the dast Pi being always of the fresh Mine.

This Mine thus steeped in each of the several Liquors 24 Hours, or there abouts, is of course four Days in passing the sour several Pits from whence the Liquors pass to the boiling-House.

whence the Liquors pass to the boiling-House.

The Water, or Virgin Liquor often gains in the first Pit, two Pounds Weight; in the second it increases to five Pounds, in the third to eight Pounds, and in the last Pit which is always fresh Mine to twelve Founds; and so in Proportion according to the Goodness of the Mine, and its being well calcin'd. For sometimes the Liquors passing the four several Pits, will not be increas'd to above six or seven Pounds Weight, and at other times above twelve Pounds; seldom holding a constant Weight one Week together: Yet many times Liquor of seven or eight Pounds Weight produces more Allum than that of ten or twelve Pounds Weight, either through the Badness of the Mine, or its being ill calcin'd, which is the usual Reafon.

And if by passing the weak Liquor thro' another Pit of fresh Mine, you bring it to be ten or twelve Pounds Weight, yet you shall make less Allum with it, than when it was but eight Pounds Weight. For what it gains from the last Pit of Mine will be most Nitre and Slam, which possons the good Liquors, and disorders the whole House, till the Slam be wrought off.

That which they call Slam, is first perceived by the Redness of the Liquor when it comes from the Pit, occasion'd either by the Badness of the Mine, or more usually its being over or under calcin'd, which in the Settler sinks to the Bottom, and there becomes a muddy Substance, and of a dark Colour. That Liquor which comes whitest from the

Pits is the best.

When a Work is first begun, they make Allum of the Liquor only that comes from the Pits of Mine, without any other Ingredients. and so might continue, but that it would spend so much Liquor as not to quit Cost.

Kelp is made of a Sea-weed call'd Tangle, such as comes to London in Oyster Barrels. It grows on Rocks by the Sea-side, between high and low Water Mark. Being dry'd it will burn and run like Pitch; when cold and hard, 'tis beaten to Ashes, steeped in Water, and the Lees drawn off to two Pound Weight or thereabouts.

Because the Country People who furnish the Work with Urine, do sometimes mingle it with Sea-Water, which cannot be discover'd by Weight, they try it, by putting some of it to the boiling Liquor; For then if the Urine be Genuine it will work like Yeast put to Beer or Ale; but if mingled, it will stir no more than so much Water.

They observe that the best Urine for that Purpose, is such as comes from poor labouring People

who drink but little strong Drink.

The boiling Pans are made of Lead, nine Feet long, five broad, and two ½ deep, fet upon Iron Plates about two Inches thick; which Pans are commonly new Cast, and the Plates repair'd five times in two Years.

When the Work is begun, and Allum once made, then they fave the Liquor which comes from the Allum, or wherein it shoots, which they call the Methers, with this they fill? of the Boilers, and put in 3 of the fresh Liquor which comes from the Pits. Being thus fill d up with cold Liquor, the Fires having been never drawn out, it will boil

again in less than two Hours time. And in every two Hours time the Liquor will waste four Inches, and the Boilers are fill'd up again with Green Liquor.

The Liquor if good, in the boiling, will be greafy, as it were, at the Top: If Nitrous, it will be thick, muddy and red. In boiling 24 Hours it will be 36 Pound Weight. Then is put into the Boiler about an Hogshead of the Lees of Kelp, of about two Penny Weight, which will reduce the whole Boiler to about 27 Pound Weight.

If the Liquor be good, as soon as the Kelp Lees are put into the Boiler, they will work like Yeast put to Beer. But if it be Nitrous, the Kelp Lees will stir it but very little; and in that Case the Workmen must put in more and stronger Lees.

Presently after the Kelp Lees are put into the Boiler, all the Liquor together is drawn into a Settler, as big as the Boiler and made of Lead, in which it stands about two Hours, and in that time most of the Nitre and Slam sink to the bottom.

This Separation is made by the help of the Kelp Lees, for when the whole Boiler consists of Green Liquor drawn from the Pits, it is of power strong enough to cast off the Slam and the Nitre; but when the Mothers are us'd, the Kelp Lees are needful to make the said Separation.

Next the faid Liquor is scooped out of the Settler into a Cooler, made of Deal Boards, and ramm'd with Clay. Into this is put 20 Gallons, or more of the Urine, according to the Goodness or Badness of the Liquor, for when the Liquor is Red and Nitrous, the more Urine is required.

In the Cooler, the Liquor in temperate Weather flands four Days; the second Day the Allum begins to strike, gather and harden about the Sides, and at the bottom of the Cooler.

If the Liquor should stand above four Days,

then it would turn to Copperas.

The Use of the Urine is as well to cast off the Slam, as to keep the Kelp Lees from hardning the Allum too much.

In hot Weather the Liquor will be a Day longger in cooling, and the Allum in gathering, than in temperate Weather. But in Frost, the Allum shoots or strikes too soon, not giving time for the Nitre and Slam to sink to the bottom, whereby they are mingl'd with the Allum. This produces double the Quantity, but being foul 'tis consumed in washing.

When the Liquor hath stood four Day in the Cooler, than that call'd *Mother*, is scooped into a Cistern, the *Allum* remaining on the Sides and Bottom; and from thence the Mothers are Pumpt back into the Boilers again: So that every five Days the Liquor is boil'd again, until it evaporate or turn into *Allum* or *Slam*.

The Allum taken from the Sides and Bottom of the Cooler, is put into a Cistern and washed with Water, that they use for the same Purpose; being about 12 Pound Weight, after which it is Roached as follows.

Being washed, it is put into another Pan with a Quantity of Water, where it Melrs and Boils a little; then 'tis scooped into a great Cask, where it commonly stays 10 Days, and is then sit to take down for the Market.

The Liquors are weigh'd by Tro, Weight; so that half a Pint of Liquor must weigh more than so much Water, by so many Penny Weight. From Phil. Trans. N. 142.

Vol. IL

ALMAN Furnace or Almond, as some write its is a Furnace us'd by Refiners, and by them call'd the Sweep: By it all sorts of Metals are separated from Cinders, parts of melting Pots, Tests, Bricks and all other harder Bodies; which must first be beaten to Powder, before they are put into the Furnace.

This Furnace is about fix Foot High, four Wide and two Thick, made of Brick, having a hole in the midst at the top, eight Inches over, and growing narrow towards the Bottom, whereon the forepart ends in a small hole environed with a Semicircle of Iron, to keep the melted Metal; about the middle of the Back there is another hole to receive the Nose of a great pair of Bellows.

When the Furnace is Annealed with Charcoal and hot, they throw two or three Shovels of Coal to one of the foremention'd powder'd Stuff, and so proceed during the whole Work, which continues without Intermission three Days and Nights.

After eight or ten Hours the Metal begins to run; and when the Receiver below is pretty full, they lade it out with an Iron Ladle, and cast it into Sows, in Hollows, or Forms made with Albes.

ALMONER, is an Officer in a King's or Prince's House, whose Business is to distribute Alms to the Poor; he hath Forfeiture of all *Deodands* and the Goods of *Felons de se*, which he is to dispose of to the Poor. *Terms de Lay* 39.

ALNAGER, Aulnager; properly one that meafureth Cloth by the Ell, the doing of which is Alnage. He is a publick sworn Officer of the King, who either by himself or his Deputy, looks to the Affize of Woollen Cloth throughout the Kingdom, and to the Seals for that purpose ordain'd. Now there are three Officers belonging to this Affair, the Searcher, the Measurer, and the Alnager; which last is now become the Collector of the Subsidy granted to the Crown by several Statutes.

ALOOF, is a Sea Term, fignifying as much as keep your Luff; being a Word of Command from him that Conns, to the Man at the Helm to keep the Ship near the Wind, when she Sails upon a Quarter Wind.

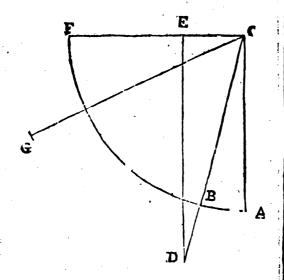

ALOPEX, is by some Writers, a Term us'd for the Muscle Psoas.

ALTITUDE of the Eye in Perspective; See Height. Vol. II.

ALTITUDE

ALTITUDE of the Sun. To find it readily at any time without a Quadrant or such like Instrument.

On any plain Place erect a Pin or Wire perpendicularly as in the point C: From which point, you had before with 60 of a Line of Chords, described the Quadrantal Arch AF, make CE equal to the Heigth of the Pin or Wire, and through E

draw ED parallel to CA, and make it equal to CG the Length of the Shadow. Then will a Ruler laid from C to D, intersect the Quadrant in B, and BA is the Arch of the Sun's Altitude, when measur'd on the Line of Chords.

ALVUS, is the lower Belly; but in a medical Sense is sometimes us'd rather for the State and Condition of the Intestines and their Contents. If the Patient be too Laxative, they call it Alvus Liquida or Fluida: if he be too Costive, Alvus dura; and when he is so in a very great Degree, Alvus adstricta.

AMABYR, or Anwabyr, was the old Custom of the Pretium virginitatis Domino Solvendum. Henry Fasted Arundel, by Deed dated 31 Aug. 3, 4. of Phil. and Mar. released this Custom to his Tenants by the Name of the Custom of Amabyr and Cherage.

AMAASA, are such Pieces of Glass as are us'd in Enammelling, and are sometimes call'd Encausta; by some Smalta and Terra Saracenica.

AMARACINON, is a very precious Ointment prepared with rich Oyls and highly Aromatick Spices.

AMBIGENAL Hyperbola, is an Hyperbola which hath one of its infinite Legs inscrib'd in it, and the other circumscrib'd about it.

AMERCEMENT. 'Dr Kennet, in the Glossary at the End of his Parochial Antiquities, shews that Amerciamentumis a pecuniary Punishment impos'd upon Offenders a la mercie, at the Mercy of the Court; and therefore in our Law is frequently call'd Miseri cordia, and there is this stated Disserence between Fines and Amercemens; Fines are Punishments certain and determin'd by some Statute; but Anercements are Arbitrary Impositions proportion'd to the Fault, at the Discretion of the Court.

AMETHYSTA, are such Medicines as will preserve Men from being soon inebriated with Wine or strong Liquor. Bruno.

AMMONION, is by some Writers us'd for Collyrium. Which see.

AMPHORA, was anciently a Measure of Capacity, sometimes call'd use "mor, and was of 2 Sorts; the Italian Amphora, which Galen saith, held 72 Pound of Water: The Attick Amphora, which was larger, and was call'd unge of See Weights and Measures.

ANALEMMA, when all the whole Furniture of this kind of Projection is drawn on a latge Plate of Brass or Wood; with an *Horizon* and *Carfor* fitted to it; then that Instrument is call'd an *Analemma*; and is indeed a very useful one. For by it may readily and universally be found, such things as these:

1. Having the Pole's Height and Day of the Month; to find the time of the Sun's Rifing and Setting, and confequently the Length of Day and Night any where.

Count the Latitude from the polar Point where all the Elliptical Meridians meet either N or S, as suppose 49 deg. and bring the Fiducial Edge of the Horizon to that degree of Latitude in the Limb, and mark where the Horizon cuts the Parallel for that Day; as suppose April 20. or when the Sun enters into &. Observe also which of the Hour Circles that point of Intersection is nearest to; and that will give you the Time of the Sun's Rising, in this Case about five or a little after; and therefore it will Set as much before 7. The time of its Setting being doubled gives the Length of the Day; and that of its Rising doubled, gives the Length of the Night.

II. To find the Length of the longest Day in any
Latitude.

Bring the moveable Horizon to the Pole's Height in the Limb as before; and then mark the Point where it cuts the Parallels of 50 or v3; (according as your Latitude is North or South) and then observe which of the Hour Circles is nearest to that Point of Intersection as before.

III. Having the Latitude, Sun's Place, and Altitude, to find the Hour of the Day.

Bring the Horizon to the Latitude, suppose as before 49 deg. N. and the Sun's Place being on of of and his Aktitude observed by a Quadrant or otherwise 18 deg. Then since the Degrees of the Cursor denote the several Parallels of Aktitude, move the Cursor till 18 deg. on it, will just cut the Parallel of on of or April 20. for then that Hour Circle, which (as before) is next the Point of Intersection, will shew the time of the Day, which in this Instance will be either seven in the Morning or sive in the Asternoon. And this will give the Hour very well, except between 11 and 12, and 12 and 1, where the Hour Circles run a little too close to shew it exactly.

How to find the Sun's Declination, Right Ascenfion, Altitude, Azinmth and Hour, &c. by a ready and easy Projection of part of the Analenma; you will find under these Words.

ANALYSIS of Infinites. Se Fluxions and Ge-

ANCESTOR. The Law distinguishes between Ancestor and Predecessor, the former being applied to a Natural Person; as AB and his Ancestor;

the latter to a Body Politick or Corporate; as a Bithop and his Predeceffors.

Tho' the Word Antecessor, whence Ancestor is deriv'd, is not applied to the Ancestor of a Family, but to the Prepossessor of an Estate, or a Predecessor in Office. Ancestrel Homage, is such Homage as hath been perform'd by our Ancestors.

ANCHORS, in Architecture, is a certain Kind of Carving, in the Form of an Anchor or Arrow Head, which is placed by way of Ornament to the Boultins of Capitals of the Tuscan, Dorick and lonick Orders; and also to the Boultins of Bed Mouldings, of the Dorick, lonick and Corinthian The Anchors and Eggs being placed Cornishes.

alternately.

ANCIENT Demesse or Demays, is a certain Tenure whereby all Manors belonging to the Crown in St. Edward's or William the Conqueror's Time were held. The Numbers and Names, &c. of such Manors were entred by the Conqueror, in a Book call'd Dooms day Book, and now remaining in the Exchequer; so that such Lands as by that Book appear'd to have belong'd to the Crown at that Time, are call'd Ancient Demesne. Tenants in Ancient Demesne are of two Sorts; one that hold their Lands frankly by Charter, the other by Copy of Court-Roll, or by the Verge at the Will of the Lord, according to the Custom of the Manor. The Advantages of this Tenure are, 1. That Tenants holding by Charter cannot be rightfully impleaded out of their Manor; and when they are, they may abate the Writ by pleading the Tenure. 2. They are free from Toll for all things relating to their Livelihood and Huf-bandry: Nor can they be impannell'd upon any Inquest.

ANCONY, is the Term in the Iron Works for Bloom, wrought into the Figure of a flat Iron Bar of about three Foot long, with two square rough Knobs, one at each End, which are after-

wards to be wrought at the Chafery. See Iron.
ANGARIA, was formerly the Word for any troublesome or vexatious Duty or Service paid by

the Tenant to the Lord.

ANGEL, the Name of a Gold Coin in England, which seems to be so call'd from the Figure of an Angel impress'd upon it: Its Value in 1 H.6. was 6 s. 8 d. in 1 H. 8. 7 s. 6 d. in 34 H. 8. 8 s. in 6 Ed. 6. 10s. and the half Angel, or as it was fometimes call'd the Angelet, was the Moiety of

Chron. Preciof.

ANGLE of Inclination of the Plane of a Planet's or Comet's Orbit to that of the Ecliptick, is the Angle made by the Intersection of the Planes of the Orbits. For the Orbits of the Planes nets are by no means all in the same Plane, but diversely inclined to one another and to the Orbit of the Earth; which is taken for the Standard, and is call'd the Plane of the Ecliptick, in the N. Aftronomy. And to this Plane the Planes of the Primary Planets Orbits are thus inclin'd. The Angle of Saturn's Orbit with the Earth's Orbit is 2°. 30'. that of Jupiter is 1°. 20'. that of Mars a little less than 2 Degrees; that of Venus a little more than 3°. 20'. and that of Mercury almost 7°.00'.

ANGUINEAL Hyperbola, is one of an Eel-like Figure, which cuts its Asymptote with contrary Flexions, and is produced both ways with contrary

Legs. See Curves.

ANGULAR Motion, in Astronomy, is the Increase of the Distance between any two Planets &c. revolving round any Body as the Centre of Vol. II.

their Motion; and is express'd by two Right Lines drawn from the said Centre to the Revolving Bodies, which will open wider, and consequently grow greater, as the Revolving Bodies pait farther

and farther from one another.

ANIMAL Secretion, is that Action in an Animal Body, whereby, by means of the Glands, all proper Separations of Particles proper to be fecerned or feparated from the Blood are made, throughout its whole Course of Circulation. How these Secretions are every where made in the Body, its of very great Use to understand; and some of our Modern Physicians, who have apply'd themselves to consider the wonderful Machine of a H man Body Geometrically and Mechanically, have made great Advances this way; such as Borelli, Bellini, Baglivi, Pitcairne, Cherne, Wainwright, &c. from whom you have the following Account of this important Affair.

The Nature of Secretions in general depends upon these three Things. (1.) The different Diameter of the Orifice of the Secretory Duct; for thereby all Particles, whose Diameters are greater than those of the Ducts, must be excluded; and it may be concluded, that any Peccant or Morbifick Matter may be evacuated therefore by any of the Glands, provided that their Orifices be but sufficiently enlarg'd, together with the Diameters of the

Secretory Ducts.

(2.) The different Angle which the Secretory Dust makes with the Trunk of the Artery. For all Fluids press the Sides of the containing Vessels in a Direction perpendicular to its Sides; and this is evident in the Pulsation of the Arteries, since 'tis to that Pressure that this Pulsation is owing. It is likewise evident, that the Blood is urg'd forward by the Force of the Heart; so that this Motion of Secretion must be compounded of both these Motions. Now this Lateral Pressure is greater when the Velocity of the Longitudinal Motion is so too; but yet 'tis not in the Proportion of this Velocity. For the Lateral Pressure is considerable, even when the Fluid is at rest; being then in Proportion to the Specifick Gravity of the Fluid. And in a Fluid, like the Blood in the Arteries, which is urg'd by a Longitudinal Direction, this Lateral Pressure is in a Compound Proportion of both: From whence it will follow, that if two Particles of equal Diameters, but of unequal Specifick Gra-vity do arrive, with the same Velocity, at an Ori-fice capable of admitting them, yet they will not both enter it and pass, because their Motion of Direction is different. So that this Diversity in the Angles, which these Ducks make with the Trunk of the Artery, seems altogether necessary to account for the possible Diversities of Secernsd Fluids, even supposing their Diameters and Figures to be the same: For no doubt the Blood is a Heterogeneous Fluid, and contains Parts of very different Specifick Gravities, Cohasions and Densities; whereas the separated Fluid must be Homogeneous, in order to perform the uniform Functions of Life.

(3.) The different Velocities with which the Blood arrives at the Orifices of these Secretory Ducts. For since the Secretions are made in Form of a Fluid, no possible Reason can be assign'd, why since Animals have a soft loose Texture and Union of the Solid Parts, and why one Part of the Body is of # tender, loose, easily separable Texture, and others of an harder, firmer, and more close Coha-fion; but this different Velocity of the Blood, at the Orifices of the Secretory Dulls. And tho' the Diver-

Diversity of the Diameters of these Ducts, is certainly that which is of the greatest Moment in this Affair of Secretion; yet'tis impossible to account for the Similarity of the Secerned Fluids from one to Heterogeneous, as the Blood is from this alone: Since all Particles of never so different Kinds and Natures will be indifferently separated there, if their Diameters are less than those of the Secretory Duffs, and their Direction right.

Again, more particularly from what the abovemention'd Authors have deliver'd, such Propositions

as these may be establish'd.

I. That of an Heterogeneous Fluid at rest in the Body, and equally press'd, the most Liquid Part must be forc'd out first. II. That of such an Heterogeneous Fluid as the Blood, when it flagnates, its heavy Parts will precipitate, and its light be elevated; and all will take place according to their Specifick Gravities. And when it doth not flagnate, the Separation of the heavy Parts from the light, will be in Proportion to the Slowness of the Motion of the Fluid. III. The red Fibrous Part of the Blood on its Stagnation retires to its Centre, and forces the Serum to the Sides of the Vessel which contains them; and from these two Propositions it will follow, that the flower the Blood's Motion is, the more Serum will be separated from it, ceteris paribus. IV. The most viscid Parts of the Serum are the highest, viz. such as are separated in the Glands of the Nose, Mouth, Palate, Windpipe, Stomach, Guts, &c. because these swim in Water, which is lighter than Serum. V. Fluids resist the Motion of such Bodies most, whose Surfaces are greater in Proportion to their Solidities, or whose Specifick Gravities are the least. Wherefore the most viscid Part of the Serum must be the least Susceptible of Motion, or must be moved with the greatest Difficulty through the Arteries. VI. A Fluid fore'd thro' a Concave Cylinder (and much more fo thro' a Concave Cone) moves with greater Celerity at the Axis than at the Sides. This Baglivi faith, he hath observ'd in the Arteries of Frogs. Wherefore the lightest Parts being least susceptible of Motion, will be forc'd to the Sides of the Arteries where there is the least Motion: So that where there is the least Motion, there will the lightest or most viscid Part of the Serum be separated: and from hence it will follow also, That the Viscidity of the separated Fluid will be reciprocally as the Celerity of the Blood at the Orifice of the feparating Canal. Again, Since Bellini hath prov'd that the Velocity of the Blood, at the Orifice of the Secretory Duct, is as the Number of Plications, Folds or Turns in the complicated Artery (Prop. 40. de Motu Cordis,) therefore the Viscidity of the Secerned Matter, will be also as the Number of Phcations in the complicated Actery. VII. When the Motion of the Blood is too flow, the most Serous Part is thrown on those Arteries which are the smallest, most complicated, or at the greatest Di-struce from the Heart. VIII. The Intestines in an Animal are a Gland, and the Lasteals are the Secretory Vessels. IX. The Orifices of the Excretory Vessels of any Gland are Circular, because all the Vessels of the Body, in which the Blood or other Fluids move, are either hollow Cylinders or Cones: for the Pressure of a Fluid being always Normal to the Sides of the containing Vessel, and being at equal Distances from the Centre, the Sides must be every where equally distracted, viz. a Section perpendicular to the Axis of the

Vessel must be a Circle, and therefore the Vessel must be either of a Cylindrick or Conical Figure. Now from hence it will follow, that the Orifices of Secretory Ducts of different Glands, differing not in Figure but only in Magnitude; The Fluids separated in different Glands, will differ only in De-grees of Cohesion and Fluidity. X. The Relaxed Coat of any Gland increases the Viscidity of the Secerned Matter, vice versa. The Reason of which is, that the Matter will grow much more Viscid by staying longer in the Gland, the thin Parts being evaporated by the Heat of the Body. XI. Such Glands, whose Compounding Arteries are most complicated, secern the most Viscid Matter from the Blood; for in these Arteries, the Resistance being greater than in strait ones, the Motion of the Blood must be slower in Proportion to the Number of their Plications; and where the Blood runs slowest, its Viscidity will be greatest, &c. XII. The Quantity of Fluid Matter separated in any Gland, is in Compound Proportion of the Quantity of the Blood; its Celerity at the Orifices of the Excretory Vessels, and the Wideness of those Orifices directly, and the Viscidity of the Blood reciprocally. XIII. An increased Quantity of Bl od increases the Fluid Secretions, in a Proportion greater than the Viscid; and a decreas d Quantity will lessen the Fluid Secretions more than the Viscid. XIV. An increas'd Celerity of the Blood's Motion increases the Fluid Secretion more than the Visitid, & vice versa. XV. An Universal Enlargement of the Orifices of all the Glands increases the Fluid Secretions, &c. & vice versa. XVI. An increas'd Viscidity of the Blood decreaseth the Fluid Secretions more than the Viscid: & vice versa, an increas'd Fluidity increaseth the Fluid Secretion more than the Viscid ones. See Dr. Moreland's Letter to Dr. Mead about the Secretions in an Animal Body, Philof. Trans. N. 283. See also an Account of the Nature of Animal Secretion, by Franciscus Spolatus, in the Leipsick Acts of Nov. 1687.

ANNIVERSARY, was called by our Forefathers, a Year-Day and a Mind-Day, i. e. a Memorial-Day; and is properly the yearly Return of the Day of the Death of any Person: And this Day the Religious registred in their Obitual or Martyrology, and annually observed in Gratitude to their Founders and Benelactors.

ANNUALIA. The Learned Author of the Chron. Precinsum saith, that these were such Oblations as were made by the Relations of deceas'd. Persons on the Day of their Deaths every Year: Which Day our Forefathers called the Year's-Day or Year's-Mind; and on it Mass was celebrated with very great Solemnity.

ANNUITY: For the Recovery of an Annuity no Action lies, but only a Writ of Amuity against

the Grantor, his Heir, or Successors.

ANNULETS in Architecture, this signifies 2 narrow flat Moulding, which is common to other Parts of a Column, the Bases, & c. as well as the Capital. And 'tis the same Member which sometimes is called a Fillet, a Listelle, a Coinsture, a Supercitium, Liste, Tince, Square, and Rabit.

ANT £, the same with Antes.

ANTIPÆGMENTS, in Architecture, are the Ornaments or Garnithings in Carved Work which are set on Architraves, whether of Wood or Stone

ANTIPATHY, is properly an Affection of a contrary Nature to another; and therefore what we do in a very high Degree dislike, or have an AverAversion against, we say we have an Antipathy to. Tis easy to see that this may have place in the Affections and Passions of Mankind; but whether there be any such thing in the Properties of Natural Bodies, has been questioned; and I think, as Dr. Hook hath long since observed, the Effects which some have thought owing to some secret Antipathies

in the Natures of Things, ought rather to be afcribed to an *Incongruity:* See Congruity.

ANTIQUE, is a Word much used by Architests, Sculptors, and Painters; and by it they mean all the ancient Pieces of Architecture, Sculpture, and Painting, from the Time of Alexander the Great, to the Irruption of the Goths; as also Intaglias within that Time: All which they call Antique; and whatever is done in Imitation of the great Masters of that Age, they say is after the Antique Manner

APERTIONS, in Architecture, are the Openings in any Buildings; such as Doors, Windows, Stair-cases, Chimneys, Outlets or Inlets for Light,

Smoak, 69c.

APHRODITARIUM, is a dry Medicine made of an equal Weight of Frankincense, Pomegranate, Ceruss, Meal, and Scales of Brass; and Galen calls a kind of Collyrium by this Name.

APHROGEDA, is Milk beat into an entire Froth, and was a Medicine used by Galen.

APRON, is a piece of Lead which laps over or covers the Vent or Touch-hole of a great Gun.

APPETITUS Caninus, is an Inordinate extravagant Hunger, to the Degree of a Disease, so that Men come to devour every thing like Dogs, attended with a Lienteria usually, or some such 'Cœliacal Flux, by which it is distinguish'd from βυλιμία: 'Tis called sometimes Phagedana.

APPROPRIATION, is the granting a Parochial Church, or the great Tithes and better Profits, ad Propries usus, to the proper Use of some religious House, to enjoy for ever: Whence it was

call'd Perpetuum Beneficium.

ARCHES, are part of the inward Support of any Superstructure, and they are either Circular, Elliptical or Streight. Of the Circular Arches some are exactly Semi-circular, as the Arches of Bridges, &cfc. some are such as the Workmen call Skeen or Scheme, which are flatter Arches, less than a Semi-circle. Some Circular Arches are such as those in our Gothick Buildings, di Tarzo &cf di quarto acuto, as the kalians call them, or as we say of the third and fourth Point. Because they consist of two Arches of a Circle (meeting in an Angle at the Top) and drawn from the Division of a Chord into three or four, or more Parts at pleasure. Eliptical Arches were formerly much us'd instead of Mantle-Trees in Chimneys: They had a Key-stone, and Chaptrels or Imposts, and consisted of two Hanses and a Scheme. Strait Arches are us'd over Windows and Doors, & c. having plain strait Edges both upper and under; these Edges are parallel, but both the Ends and Joints do all point towards a certain Centre. They are now usually about a Brick and a half thick, which when rubbed is abour 12 Inches. The Workmencall the levelling End of this Arch the Skew-back; and the level Joints' between the Courses of Bricks in the Arch, they call the Sommering.

ARCHES, the Judge of the Court of the Ar-

ches is call'd the Dean of the Arches, or the Official of the Arches Court, &c. with this Officialty is commonly joined a peculiar Jurisdiction of 13 Parishes in London, term'd a Doanery, and exempt from

the Authority of the Bilhop of London, and belonging to the Archbilhop of Canterbury: Or which the Parish of Bow is one, and the Principal, because the Court is kept there. Others think he was first call'd the Dean of the Arches, because the Official to the Archbishop being many times employ'd abroad in Embassies for the King and Realm, the Dean of the Arches was his Substitute in this Court, and by that means the Names became confounded. The Jurisdiction of this Judge is ordinary and extendeth it self through the whole Province of Canterbury, so that on any Appeal made, he forthwith, and without any farther Examination of the Cause, fends out his Citation to the Appellee, and his Inhibition to the Judge from whom the Appeal was made. Vid. Histor. de Antiq. Eccles. Britan. and

4. part of Instit. Folio 337. 60c.

ARCH-DEACON, being only a Person chose out of those Deacons which were originally the Attendants on, and Servants to the Bishop in Spiritual Affairs, at first was a Person employ'd by the Bishop in more servile Uses, and he always was in Sub-servience to the Urbans or Rural Deans of Christianity; to whom Arch Deacons were as much inferior, as their Order of Deacon was to that of Priest. Till by the Advantages of a Personal Attendance on the Bishop, and a Delegation to examine and report some Causes, and a Commission to visit some remoter Parts of a Diocese, their Power and Dignity was advanc'd above the Arch-Presbyter or Dean. Dr. Kennet's Glossary. Tis now allow'd, that Arch-Deacons have a Power, not only to Visit, but to Suspend, Excommunicate, and in many places to prove Wills, and in some to Institute to Benefices. Tis one part of the Arch-Deacon's Office to Induct all Clerks into their Benefices within his Jurisdiction, and by the A& of Uniformity he is now obliged to be in Priest's Or-

ARCUALIA Offa, are the Bones of the Sinciput; and according to Barthol. were the Offa Temporum. And the Coronal Sature, is by some Writers call'd also Arcualis.

AREC.

ARM

AREOMETER, besides that mention'd in Vol.1. are some also hung round the Tops, and these are Mr. Homberg of Paris hath invented a new Instrument of this Kind, which is described in Phil. Trans. N. 262. Thus, A is a Glass-Bottle or Matrass with so slender a Neck, that a Drop of Water takes up in it about five or six Lines, or so an Inch. Near that Neck is a small Capillary Tube D, about six Inches long, and Parallel to the Neck.

When the Vessel is filled, the Liquor is poured in at the Mouth B (which is widen'd to receive a Tunnel) till it run out at D; that is, till it rise in the Neck to the Mark C, by which means you have always the same Bulk or Quantity of Liquor; and consequently, can easily tell when different Liquors fill it which make median ferent Liquors fill it, which weighs most, or is most intensively heavy. But some Regard is to be had to the Season of the Year and Degree of Heat and Cold in the Weather: For some Liquors will rarify with Heat, and condense with cold; and accordingly take up more or less Room, See the Memoirs of the French Academy of Sciences for the Year 1699

ARIETUM Levatio, an Old Sportive Exercise, frequently forbidden in our Episcopal Synods and Constitutions, and seems to have been the same with the Quintane or Quintal, as Dr. Kennet See his Paroc. Antiquities.

ARMINGS, in a Ship, are the same with Wift-cloaths, which are Red-cloaths hung about the out-fides of the Ship's upper Works fore and aft, and before the Cubbridge Heads; and there as in the Adult.

call'd Top Armings.

ARQUEBUSS a Croc, is a Sort of small Fort
Arms, carries a Ball of about 3! Ounces, and is now us'd only in Old Castile, and in some Garisons of the French.

ARTERIA Bronchialis, is a small Artery (described by Mr. Ruysh) which in the Lungs creeps along upon the Branches of the Trachea, or the Bronchia.

ARTERIES and VEINS.

A Description of the Veins and Arteries of a Human Body in the two Plates annexed, as presented to the Royal Society in London, by that Generous Promoter of all useful Learning, John Evelyn, late of Say's Court in Deptford, Esq; and explained and illustrated by that accurate Anatomist and Surgeon, Mr. William Cowper.

HESE * Figures are closely drawn after the Original Schemes, and

I am apt to flatter my felf they will be acceptable to the inquisitive. It is some Satisfaction, that I find the Arteries here so agreeable to a Figure which I drew and published not long since, from the Arteries of a Fetus in-jected with Wax. But this Figure of the Veins differs so much from any extant, as would incline one to suspect all of the Subject hitherto published are fictitious, not excepting even those of Vefalius. But first of the Arteries.

That the Arteries are the Vessels which convey Blood from the Heart to all Parts of the Body, is well known; and we see by Fig. the 1st, that the common Practice of Nature in distributing these Vessels, to supply the Parts with Blood, is from the next adjacent Trunk, till their ascending and descending Trunks become Conical, as well as their collateral Branches: Not that all the Trunks and Ramifications of Arteries are uniform, and become Conical in the same manner; nor do all of them pass directly to the Parts to which they convey Blood; nor do all Parts receive Arteries

from the neighbouring Trunks.

The Trunks of the Carotid, Vertebral and Splenick Arteries are not only contorted in their Progress, in the Adult; but the Diameters of their Bores are variously dilated in divers Parts of them, especially where they are contorted; but as these Dilatations of their Trunks are caus'd by the Resistance the Blood meets with at those Angles of Inflection; so those Enlargements of them afterwards contribute to retard the Protrusion of the Blood to the Extremities of those Arteries: Hence it is, That as the Arteries of the Fatus are not contorted in such Acute Angles as in full grown Bodies, so their Trunks are more Conical, and not here and there dilated in divers Parts of them,

The

The Trunk of the Splenick Artery has a straight Progress in the Fatus and in Infants; but in the Adult I have hitherto constantly found it very much contorted, as is express'd in

Fig. 1, 2, 3.

The peculiar Contrivances of the Spermatick Arteries of Quadrapeds as well as Men, shew a conflant Design in Nature of taking off that Velocity with which the Blood would otherwise pass thro' the Glands of the Testes: It seems to be for this End that the Testes of most Animals (especially Men and Quadrupeds) hang out of the Cavities of their Abdomens, that the Canals of their Blood Vessels may be lengthened: For the Spermatick Arteries (contrary to all others) arise from their Great Trunk, at a far greater Distance from the Testes than the Arteries of any other Part of the Body. Nor would the Testes (which are such necessary Organs) have been thus exposed to external Injuries, if the End of Nature in lengthening their Blood Vessels had not been very considerable. Belides this lengthening of the Spermatick Arteries, we find Nature still contriving other Impediments to check the Current of the Blood in those Parts, it seems for this End that the Spermatick Arteries are lessen'd at their Original from the Trunk of the Arteria Magna in Men, and that the Spermatick Arteries of Quadrupeds are so much contorted before they reach their Tri-

The principal Inducement of Nature in making use of these different Contrivances in the Sperenatick Arteries of Men and Quadrupeds seems

to be,

That if the Human Spermatick Arteries were contorted, as in Quadrupeds, before they reach their Testes, the Apertures in the Abdominal Muscles of Man must be much larger than they now are, and would frequently let the Intestines defcend into the Scrotum; which we know nevertheless often happens: Such Ruptures (as they are call'd) are not so incident to Quadrupeds, tho' the Passages for their Spermatick Vessels (through their Abdominal Muscles) are much wider than in Men, because the Position of the Trunks of their Bod es is Horizontal, and their Intestines therefore cannot press on the Processes of the Peritonami, as in Men, who are erect.

Besides these Artifices in disposing the Trunks of Arteries, I doubt not much more will be detected by the inquilitive: In the mean time, I shall, at present, pursue the Thread, and describe the Extremities of the Acteries, with their Communications with the Veins, and afterwards produce some Instances of the Art of Nature in conveying the refluent Blood to the

After the Circulation of the Blood through the Heart, Lungs, and large Blood Vessels, was demon-Grated by Dr. Harvey, it was only guess'd how the Extremities of the Arteries transmitted the Blood to the Veins, till Mr. Lewenhoeck's Micro/copes had discovered the Continuation of the Extremities of tho'e Vessels in Fish, Frogs, 53c. which is now commonly shown by Microscopes made by other Hands: Yet there are not wanting those, who doubt of the like Continuations of the Extremitics of Arteries and Vains in human Bodies and Quidrupeds; fince those Animals it has hitherto been seen in (to any Satisfaction, as Mr. Lewenboeck confesses) have been either such Fi/b, or of the Amphibious Kind, that have but one Ventriele in their Hearts, and their Blood actually cold, except in Bats, in which it appears very obscurely: Add to this, that the Blood in those Creatures does not circulate with such Rapidity as in Animals whose Hearts have Two Ventricles. For all Animals that have Biventrous Hearts, the Vessels of the rest of the Body return their blood to the Heart in equal Time and Quantity with those of the Lungs, notwithstanding the Inequality of their Courfe.

This Difference in the principal Organs of the Girculation of the Blood in those Creatures (on which only these Experiments have been hitherto made) mov'd me to make some, on Animals whose Organs differ only from the Human in their gross Figure, and not in their intlmate Structure: For this End I took a young Cat, about ten or twelve Days old, and fastned it to a Board as in Vivesection; and making an Incision thro' the Linea Alba, the Omentum and Intestines were extruded, then causing the Creature to be so held (on the Board) under a large double Microscope, where a flat Glass for receiving of Objects was placed Horizontally, on which I expanded the Omentum or Caul, (a Light being placed underneath) I saw the Globules of the Blood move very swiftly in the small Vessels, which are only to be seen in the most transparent Parts of the Membranes of its Omentum; but the Motion of the Blood foon abated, and its Globules were withdrawn from the Extremities of its Blood Vessels; and in a little time became stagnant in their larger Branches.

This Appearance of the Continuation of the Extremities of the Arteries with the Veins, while the Blood was moving in them, in the Omentum or Caul, is express'd by Fig. 4. A A shews the Trunks of the Arteries, B B the Veins, which were distinguishable by contrary Currents of the Globules of the Blood in each Vessel. C C C shews the branching of the Extremities of the Arteries and Veins, that no longer associate with each other, but are united, as here express'd. ter I had seen this, I attempted to shew the like to several Friends, but did not always succeed so well as when Mr. Chambers and Mr. Buckeridge favoured me with their Presence, at a time when I happened to have a young lean Doz, that was not large; in whose Omentum we saw it very well; but by the Affistance of an Instrument I had prepared to expand the Mesentery, we all saw it there much better, that Part having not only larger and clearer Spaces than the Omentum, but its Blood Vessels are distributed more regular, as appears by Fig. the 5th, where the same Letters of Reference

serve as above.

Those who will entertain themselves in viewing the transparent Parts of living Creatures with Microscopes, will find that the Extremities of their Arteries and Veins are not all equally lessen'd, tho' united. In the Tail of the Lacerta Aquatica, Tadpols, and in most Fish (I have examin'd) i have frequently observ'd several Communications between the Arteries and Veins; in which more than two Globules of Blood have pass'd abreast: And in the same Area I have seen some of those Communications fo small, as that but one Globule could pass, and that very slowly before the other. young Fish, particularly in Grigs, I have frequently observed a Communicant Branch, so very small as that one Globule of Blood only has passed it in two or three Seconds of a Minute: At other times I have found considerable Intervals in pasfing of one Globule in such a Communicant Branch, even half a Minute, a whole Minute, and once in two or three Minutes I have seen one Globule of Blood only pass in a particular Tract.

The prompt passing of Liquors injected by the Splenick Arteries, to the Veins, shews the Communications between those Vessels are more open than the Arteries and Veins of other Parts, of which I have elsewhere spoken.

Liquors also injected into the Pulmonick Arteries pass to their Veins, tho not altogether so free-

ly as in the Spleen.

On viewing the Extremities of the Pulmonick Blood-Vessels in a living Frog with my Microfcope, I found their Communications much larger than those that I had before seen in the Membrane between the Toes and in the Feet of the same Creature. Nor can we reasonably doubt of the like patent Communications of the Arteries and Veins of Human Lungs and those of Quadrupeds, when we consider the Blood of their Lungs must return to the Heart in equal Time and Quantity, with that of all the Parts of the Body belides, as before noted. Hence it appears, the Bronchial Blood Vessels (first taken Notice of by the accurate Ruysch) are absolutely necessary, else the Parts of the Lungs could not receive Nourishment; nor could the Glands of the Bronchia separate their Liquor, if they were supplied with Blood from the Pulmonick Blood Vessels which is so quickly dispatched thro' the Lungs.

On viewing the Membrane that is between the Toes of one of the hinder Feet of a living Frog. after I had frequently taken hold of the same Leg of that Creature, to apply it to the Microscope, I found that Membrane very transparent, and without any Motion of the Globules of the Blood in it, as if the Part had been dead; but while I was looking on it, it was, I confess, not a little entertaining to see the Globules creep into it by Degrees, and at length the Blood move in all the Branches of its Veins and Arteries as before when no Violence had been offered to the Part: while the Blood is thus leisurely creeping through the Vessels, you may plainly see its Globules compress'd into Oval Figures, which are made more or less oblong, by the Resistance those Globules meet with, by the Contraction of the Sides of the Vessels they pass through; and this I have more than once observed in the Tails of the Water Newts or Lizzards: But on examining the Blood of these Creatures with a Microscope, and comparing it with the Human Blood, I found the Globules of the Lizzard's Blood more incline to an oval Figure, and were as big again as the Globules of Human Blood, and that of a small Fish; which I in like Manner viewed at the same Time. It is not unlikely a sudden Retrocession of Blood, from the Extremities of its Vessels often happens, and its Circulation in the same Vessels is afterwards carried on without any Impediment; as on some Passions of the Mind, Deliquiums by the Effusion of Blood, or otherwise. But if the Blood is once become stagnant in its Vessels, (especially the Arteries) the Part is in no small Danger of a Mortification, unless its neighbouring Vessels, which enjoy the Motion of the Blood, drive on the stagnant Blood, and it escape by the Sides of the Vessels that retain'd it. Experience affures us, that in Bruises when the Blood is extravalated, it goes off either by Transcolation, or

else causes an Abscess; for there's little Reason (in my Opinion) to suspect any of the stagnant Globules of the Blood will be fit to re-unite with the Circulating Mass. But that the Blood after Stagnation in its Vessels will sometimes pass their Sides, appear'd to me from the following Experiment.

On viewing the Melentery of a Dog when living, in which I had before feen the Blood paffing the Extremities of the Arteries and Veins, I consider'd how to preserve the Blood in its Vessels that I might afterwards at any Time see it in their Extremities when stagnant: For this End I caus'd several Parts of the Mesentery to be tied on as many Pieces of small round Pill-Boxes, cur transversly like little Hoops; on which, Portions of the Mesentery were extended like the Head of a Drum; and on viewing them afterwards with my Microscope, I found the Extremities and Branches of the Blood Vessels charged with Blood, which before appeared in Motion; some of which Parts of the Mesentery I still keep by me. On laying one of these Parts of the Mesentery (thus expanded) in Water, the stagnant Blood in its Vessels disappear'd; but on just immersing another of those Pieces in Water, I could with my naked Eye fee the stagnant Blood diffused in the Interstices of the Blood Vessels, and between the Membranes of the Mesentery: Hence it sevident, the Blood may pass the Sides of its Vessels after Stagnation in 'em; but whether its Globules are broken, or what Figure renders them fit to pass those Pores that are in the Sides of the Vessels, I leave to the inquisitive; but we must return to our Tables, and first of that of the System of the Vena Cava.

As the Arteries are known to export the Blood, fo the Veins carry it back again to the Heart; but having already described their Extremities, we come next to the large Trunks of the Veins; and here, as in the Arteries, we find the common Practice of Nature, in disposing the Branches of Veins to discharge the refluent Blood into the next adjacent Trunk, and so on to the Heart. As the Arteries afford Abundance of Instances of Checks given to the Velocity of the Current of the Blood through several Parts, so the Veins supply us with as many Artifices to affish its regular Return to the Heart, as well as to favour those Contrivances in

the Arteries.

The Trunks of the Carotid, Vertebral and Splenick Arteries are not only variously contorted, but are also here and there dilated. The Beginnings of the internal Jugulars. have a Bulbons Cavity (Fig. 7. H, H,) which are Diverticuli to the refluent Blood in the Sinus's of the Dura Mater, lest it should descend too fast into the Jugulars. The like has been also taken notice of by Dr. Lower in the Vertebral Sinus's. The Splenick Vein has divers Cells opening into it near its Extremities in human Bodies, but in Quadrupeds the Cells open into the Trunks of their Splenick Veins.

The Spermatick Veins do more than equal the Length of the Arteries of the Testes in Men; their various Divisions and several Inosculations, and their Valves, are admirably contrivit to suspend the Weight of the Blood, in order to discharge it into the larger Trunks of the Veins; and were it not that the resuent Blood from the Testes is a Pondus to the insuent Blood from the Arteries, and still lesses its current in the Testes, these Spermatick Veins, like those of other Parts, might have discharged their Blood into the next adjacent Trunk.

Who can avoid Surprize at the Art of Nature, in contriving the Veins that bring Part of the Refluent Blood from the lower Parts of the Body? when they consider the Necessity of placing the Human Heart, as well as that of most Quadrupeds, so far from the Centre of the Bedy towards its upper Part? It is for that End necessary the large Trunks of the Veins and Arteries should not associate each other; for if all the Blood sent to the lower Parts, by the descending Trunk of the Aorta, should return to the Heart again by one single Trunk (as it is fent out from thence) the Weight of so much Blood in the ascending Trunk of the Vena Cava, (Fig. 6. C, C, A) (for so its lower Trunk is call'd) would oppose the Force the Heart could give it from the Arteries, and hinder its Ascent; For this Reason the Vena Azygos (Fig. 6, b.) or fine pari, is contriv'd to convey the Blood fent to the Muscles of the Back and Thoraz into the descending Trunk of the Vena Cava, (ib. B. A.) above the Heart: Hence 'tis evident, more Blood comes into the Heart by the descending, or upper Trunk of the Vena Cava, (Fig. ib. B, A.) than passes out by the ascending Trunks of the Aorta. Nor does this Quantity of Blood convey'd to the Heart by the superior Trunk of the Cava, seem without some other Design in Nature, besides transporting it thither to free the inferior Trunk from its Weight: But perhaps it was necessary so much Blood should be ready there to joyn with the Chyle, (Fig. 6. +) for its better Mixture, before it reaches the right Auricle of the Heart.

I might here add the Descripition of a peculiar Valve, I lately discovered in the lower Trunk of the Vena Cava, near the right Auricle of the Heart; but the annex'd Figures have taken up too much Room in those Copper Plates to insert it: For the same Reason, the Figures of some Contrivances in the Arteries here mention'd, particularly the Spermaticks, are omitted: This being what occurr'd to my Thoughts at present on this Subject, which is not to be found (at least not commonly) in the Books of Anatomy: The greatest Part of which have been added to these Papers, on their lying by me since the Graver began the Figures.

The Explications of the Figures.

F I G. 1.

R Epresents the Trunks and large Branches of the Arteries, dissected from an Adult Hu-man Body, when displayed and dried; as they are now to be seen in the Repository of the Royal So-

1. The Trunk of the Aorta cut from the Basis

of the Heart.

2. That Part of it, whence the Coronary Arte-

ry of the Heart does arise.

3. That Part of the Arteria magna, where the Canalis Arteriosus of the Fatus terminates; which in an Adult becomes a Ligament. Vid. Fig. 2, 3. Vol. II.

That Part of the Axillary-Arteries, by some called the Subclavian Arteries.

5. The left Carotid Artery (in this Subject it feems) arising from a common Trunk with the right Caretid and Axillary Arteries, as in some

Quadrupeds.

6. The left Cervical Artery, in this Subject arising from the Trunk of the Arteria Magna, as express'd in a Figure given by Bergerus in the A7a Eruditorum An. 1698. pag. 295. But in all the human Bodies in which I have hitherto examined these Arteries, I have constantly found them as express'd Fig. 2.6.6.

7. The Arteries that carry Blood to the lower Parts of the Face, Tongue, adjacent Muscles and

Glands.

- 8. The Trunk of the Temporal Artery, springing from the Carotid, and parting with Branches to the Parotid Gland 9, and Temples 10, and Parts

11. The Occiputal Arteries.
12. The Arteries that convey Blood to the Fauces, Gargareon, and adjacent Muscles.

13. The Trunk of the Carotid Artery cut off, before it is Contorted in passing the Skull.

14. The Trunk of the Artery of the Arm parting with Branches to the adjacent Muscles and

Parts.

* That Part of this Artery which is sometimes
and makes an Aneurisina, prick'd in letting Blood, and makes an Aneurifina, in which Case this Trunk of the Artery must be bared and firmly tyed above the Aneurisma; and if it afterwards happens (as it has been frequently known) that the Flux of Blood to the Ansurisma in the Artery is not very much abated, tho' the Artery has been tyed above; the Operator in that Case must make another Ligature on the Trunk of the Artery below its Aneurisma: These Collateral Communications of the Trunk of the Artery at the bending of the Cubit, preserve the Circulation of the Blood in the Cubit and Hand, tho' the Trunk is totally compress'd both above and below; and the same Trunk afterwards divided between those Ligatures. Hence it is, if one Ligature made above the Wound in the Artery is not fufficient, but the Blood still pours out from below; the Patient will sooner recover the Action and Strength of the Muscles of the Cubit, than those in whom the upper Ligature proves sufficient; the Reason of which is obvious to any who consider that the Communicant Branches must be larger where the lower Ligature is required, than when the superior Ligature only is sufficient. These communicant Branches (as I have seen them in some Subjects) are here mark'd out in prick'd Lines, vid. the Figure.

While these Papers were lying by me, the two following Instances happen'd, in which the Communications of the large Trunks of the Arteries of the Cubit and Arm were remarkable. The first was

A Boy of thirteen Years, who, about three Weeks before I saw him, received a Wound near the middle of the Cubit in which the Trunk of the Artery (mark'd in the Fig. †) was divided. Surgeon who was first call'd, had frequently bound up the Wound, and put a Stop to the several discharges of Blood (which they told me did not amount to less than 6 or 7 Quarts at Times) but not without a Compress on the Trunk of the Artery above the Wound. On another impetuous Flux

Flux was I call'd; but seeing no small Quantity of Blood discharged, I was contented to let the Wound be bound up, in the same Manner as it had been done before; omitting the Compress on the Trunk of the Artery above, and adding a Piece of Deal-board, on which the Hand and Cubit were fastened, to prevent any Motions of those Parts, as well as the Fingers; Three Days after, the Applications were taken off, and little or no Blood appear'd; but two or three Hours were scarce e lapsed e're I was alarm'd with Notice of a fresh Flux. The By-standers being instructed in that Case, to compress the Trunk of the Artery above the Cubit, they had thereby prevented no small Essusion of Blood, which must otherwise have happen'd; his Surgeon being out of the Way, I laid the Trunk of the Artery bare above the Wound as expeditionfly as I could, being forced more than once to let loose the Compress above to discover its Orifice by the Flux of Blood. I passed a Needle with strong waxed Thread under the Artery, and made a Ligature on its Trunk, which lay concealed in the Interstice of the Musculus Flexor Digitorum, and the Musculus Ulnaris Flexor Carpi; but notwithstanding this Ligature on the Trunk of the Artery above the Wound, the Blood still slow'd from the lower Trunk of the Divided Artery; yet the Velocity of its Current was so much abated, that it seem'd like Blood flowing from a Vein. I left the Wound with a Digestive, and the Part without hard Bandage; it being now five Weeks since, I hear the Wound is almost cicatriz'd. The Learned Dr. Harris was present at the other Operation, by which the Communications of the large Trunks of the Arte-

ries of the Arm were very evident.

A Boy about eight Years of Age, who came to Town with an Aneurisma of the left Arm, upon bleeding six Weeks before. The Tumour was indeed very large in Proportion to so small an Arm. After laying the Aneurisma or Tumour bare, and making a Ligature on the Superior Trunk of the Artery (in the annex'd Fig. *...) I found, on loosening the Compress on the superior Trunk of the Artery, very little Abatement of the Pulsation of the Aneurisma; I then passed a Ligature in like manner on the Trunk of the Artery below the Tumour; but notwithstanding, the Pulfation continued, tho' much abated. I then discovered another Trunk of the Artery, arising from the lower Part of the Tumow, on which also I made another Ligature, and the Pulsation was then taken off. However, on cutting off the Surface of the Cyftis or dilated Artery, and clearing it of the coagulated Blood, which was foon stopped with a common Astringent, I left the Part without any other Ligature or hard Bandage. It is now eighthen Days since the Operation, the Ligatures on the Arteries are all come off, and the Pulsation of the Artery of the Wrist begins to be very manifest, nor does any Symptom appear that threatens Success.

15. The Division of the Trunk of the Artery of the Arm below the Flexure at the Cubit.

16. The external Artery of the Cubit, which makes the Pulse, that is commonly felt near the

17. The Arteries of the Hand and Fingers.

18. The Mammary Artery.

F I G. 2.

- THE Trunks and some of the Ramications of the Arteries of an adult human Body fill'd with Wax, to show the Variety in Na-ture, and supply the Defects of the former Figure.
- 1. The Aorta cut off at the Basis of the Heart.
- A. The three semilunary Valves as they appear when the Heart is in Diastole, and hinder the Blood coming back from the Arteries into the left Ventricle of the Heart.
- B. A Portion of the Trunk of the Arteria Pulmonalis. b, b. its Division before it passes to the
- right and left Lobes of the Lungs.

 C. The descending Trunk of the Arteria Mag-
 - D. D. The internal Mammary Arteries.
- 2. The Trunk of the Coronary, cut off.
 3. The Ligamentum Arteriosum. Which in the Fatus is the Canalis Arteriosus, and conveys Blood from the Palmonick Artery to the great Artery
 - 4 The Trunk of the subclavian Artery.

 - 5. 5. The Carotids.
 6. 6. The Vertebrals.
 - 7. 7. The Arteries which pass to the lower

Parts of the Face, Tongue, adjacent Muscles and

The Trunks of the Temporal Arteries arising from the Carotids, giving Branches to Parotid Glands (9. 9.) and the Temples (10.10.) &c.
11. 11. The Occiputal Arteries.

12. The Arteries of the Fauces, Gargareon,

13. 13. The Contortions of the Carotid Arteries, as they pass the Basis of the Skull: These Trunks of the Carotid Arteries in Dogs (like those I guess of most Quadrupeds) are very much contorted before they reach the Basis of the Skull: On filling these Vessels of that Animal with Wax, I found those Branches of them which pass to the Brain, first clipping the hinder Parts of the lower Jaw, immediately under its condiloide Processes; where those Ateries are received in two Sinus's of that Bone, which Simus's may also be seen in the Jaw-bones of other Quadrupeds, but not in human Bodies.

14. 14. Those Parts of their Trunks that pass by each Side of the Sella Turcica, whence divers small Branches arise, and help to compose the Rete Mirabile; which is more conspicuous in Quadru-

peds than in human Bodies.

.15. 15. The Contortions of the Vertebral Arteries, where we find their Trunks confiderably dilated.

16. The vertebral Arteries, as they ascend on the Medulla Oblongata towards the Annular Protuberance or Pons Varoli.

17. 17. The communicant Branches of the Vertebral and Carotid Arteries.

18. 18: The Atteries of the Brain displayed.

F I G. 3.

Chuse to place this Figure on the Copper Plates of one of the Trunks of the Arteries of the Tibia (dissected from the Leg after Amputation) rather than the following Diffich, which I find written on the Original Table of this Scheme of the Arteries.

Pulsificus Sanguis de Cordis Ventre sinistro. Funditur ut Corpus nutriat bisce viis.

Before I explain the Letters of Reference of this third Figure, it will be necessary to let you know that Mr. Stringer was in his fixty seventh Year when this Artery was taken from him, and near twenty Years before lost the Use of both his Legs; and in that time he had been so persecuted with Convussions in them, that neither Leg was free a quarter of an Hour together, whether sleeping or waking. At length one of his little Toes mortified, which was taken off by Mr. Coldwyer, an expert Surgeon of Salisbury; not long after more Toes of the same Foot followed the like Fate: The Convulsions following that Leg Aronger and quicker: That Part of the Foot next the Toes became tumid and inflam'd, the Tumon cer passed by the Side of one of the Metatarfan Vol. II.

Bones; the Extremity of which Bone (whence the Toe was taken off) lying bare. In this Condition 1 found the left Foot and Leg of this Gentleman, when I had the Honour to wait on him, by Co.nmand of the Right Honourable the present Earl of Shaftsbury, he living in the Neighbourhood of that Noble Peer in Wiltshire; where I met with Mr. Goldwyer above-mention'd; and finding the Leg very chilly, the Necessity of parting with it was too evident; which Mr. Stringer suffer'd with extraordinary Fortitude, He not so much as expressing the least Outcry during the Operation, tho' the Part did not want the most exquisite Sense of feeling: On the Abscission (which was about five or fix Inches below the Knee) it was unexpected by me, I must confess, to see so little Blood spouting from the Arteries. The Stump being bound up, and committed to the Hands of two or three Servants, a less Number not being sufficient to hold it, by Reason such strong convulsive Motions purfued the Part on the Operation. I was very desirous to examine the Arteries of the amputated Leg, having before discovered the Cause of a Mortification of the Arm of a young Gentlewoman, who dy'd not long after an Amputation of the Part, tho the Gangreen d'd not appear to reach near the Place where the Abscission was made: (i. e. below the ending of the Musculus Deltoides.) In which Case, I found the Sides of the Trunk of the Artery of the Arm so thicken'd, that the Diameter of its Borg was contrasted to less than a third Part, and would scarce admit a common Probe to pass it, vid. Fig. G. H. I. When I had found the Ends of the Arteries in the Leg above-mention'd, I endeavour'd to pass my Probe into one of them, but meeting with some Opposition, I suspected I had mistaken the Veinfor the Artery, and that the Valves oppo-fed the passing of the Probe that Way: but on surther Diffection I clear'd the Trunks of both those Blood Vessels, and found the Veins in their natural State; but the Sides of the Arteries were grown Bony or Stony; having clear'd two of their Trunks, I left one of them at Salifbary, the other I brought to Town, and is here figur'd.

A. The upper Part of the Artery cut off in the

Amputation of the Leg; from A to
B. The Trunk of the Artery distended and dry'd to thew its Canal.

C. That Part of the Trunk of the Artery which was so contracted by the Putrefaction or Offification, that a Probe would not pass its Canal; from C to

D. The Trunk of the Artery opened and expanded.

E, E. The Putrefactions or Offifications in the Sides of the Artery.

F, F. Their Specks in the lower Part of the Artery, not so large as in the upper Part, and placed at greater Distances.

a, a, ege. The Branches arising from the Trunk of the Arrery.

G. A Proportion of the Trunk of the Artery of the Arm above mention'd.

H. The S des of the Artery very much thickned, whereby the Diameter of its Canalis was so much diminished that the Probe

I. Would not pass it.

The Offisications in the Coats of Arteries have been frequently observ'd, especially in their large I runks within the Cavities of the Thorace and Ab. domen; but I don't remember the like has been ma-D 2

ken notice of in the Limbs; or that such Impediments in their Canals have been found the Cause of Mortifications of particular Parts, as in the Instance above-mentioned; tho I doubt not, but the like has often happen'd in aged People, especially where we find the Progress of the Gangreen not very swift, and its Beginning from no external Cause; the Consequences of which are commonly found satal. When the Arteries of one Leg (or of any other Limb) are so affected, we may well suspect the like in those of other Parts; which probably happened in the Instance I now mention'd; for tho' no Gangreen came on the Stump, yet the other Foot and Toes began to mortify about fix Weeks after the Amputation, as did the Parts about the Hips, which were compress'd in lying or fitting before he expired.

FIG. 4.

C, C, The Mesenterick Branches which are continued from the Intestines.

b, The Trunk of the Vena Pancreatica, which receives Branches also from the Duodenum.

c, c, The Vena Gastrica dextra Coronaria Superior.

D, The Superior Coronary Vein of the Stomach of the left Side.

E, The inferior Coronary Branch of the Sto-

mach of the right Side, and

F, The same Coronary Vein of the lest Side removed from their proper Situations; from these two last are continued the Vena Epiplocia Superior dextra 1, and the sinistra 2, with the Media 3.
G, The Vein call'd Vas Breve.

H, The Vena Hemorrhoidalis arising from the Restum and Amus, in this Subject emptying it self into the left Mesenterick Branch; but in other Bodies (and particularly in a Preparation of these Veins, which I have now by me) I find this Trunk of the Hamorr boid Veinsending in the Ramus Sple-

The Length of the Trunk of this Hæmorrhoid Vein, and its Progress under the Intestines, renders it liable to be compress'd, and its refluent Blood retarded; whence its Branches in the Inteflinum Rectum and Anus, become distended with Blood, and cause the Hamorrhoides Caca and A. porta; which are frequently attended with Aposthumations in the Anus and Parts adjacent; which Disorders are the more incident, not only because these Hæmorrhoid Veins (like the rest of the Bran-

ches of the Vena Porta) are without Valves, and the Blood has an ascending Progress in them, as also that the long Trunk (H) is not only expo ed to the Compressions made by the Intestines in both Sexes: But particularly the Uterus in Women in time of Gestation, especially near the Birth, so compresses this Trunk, that 'tis no wonder we find Women more afflished with the Hamorrhoids at that time, than at any other. Nor are the lliack Veins and the Lympheduct that accompany them, without being exposed to the like Incumbrance in Women with Child, whence the Veins of Legs and Thighs become Varicose, and those Limbs are so frequently swoln, which in a late Instance I was acquainted with, when the Intumescence proved so great, that at Length the Ab-dominal Teguments were vasily extended; but the Gentlewoman recovered (beyond the Expectation of some) on the happy Delivery of two large Children.

ARTHROSIS, or Articulation; amongst the Writers of Anatomy is divided into (1) Diarthrosis or De-articulation, which is a more loose Articulation of the Bones where there is a manifest natural Motion of one Bone on the other; in which it differs from the (2) Synarthrofis or Coarticulation, which is a much closer Jundure, and where there is no fuch natural apparent Motion of one Joint on the other. (3) Ginglymus, where each Bone receives into its Sinus the Proc sus of the other; as in the Articulation of the Ulna, Tibia, Humerus, 55 Offa Femorum.

ARYTENOIDÆUS Minor, is a Muscle which

runs on the Surface of the Arytanoidus Major, arifing from that Part of one of the Cartilagines Arytanidai, next the Cricoides on one Side, and terminating in that Part of the other Arytanoideal Cartilage, which is farthest from the Cricoides on the other Side. Its Use is to assist the other Muscle of this Name in its Action, which is much strengthen'd by this manifest Decussation of the Fibres.

ASAPHATUM, is a Kind of Impetigo, Serpigo,

or running Itch.

ASHLAR, is the Work-Men's Term for common or free Stone, as it comes out of the Quar-

ASPECT Double, is a Term in painting, us'd for a fingle Figure representing two or more different Objects; which is caused either by a Change of the Polition of the Eye, or by angular Glasses,

ASSEMBLY, in the Military Art, is the second. Beat of a Drum before a March; on hearing this, the Soldiers strike their Tents, and roll them up; and then stand to their Arms. The third beating is called the March, as the first is called the General.

ASSISA magna, was a more folemn Trial by a Jury of 12 or more Knights, to give their Verdict in a Cause prosecuted per Brevs de Resto; i. e. where the Dispute lies not about the bare Possession, but of the Right and Property; in this distinguithed from the Assis a parva or minor, where the Question is only of Possession, in which the Jury were 12 ordinary Legal or Freemen return'd by the Sheriff.

ASSISÆ Judicium, is the Judgment of the Court given against the Plaintiff of Defendant for Default.

ASTROLABE, this Planisphere considered as a Projection of the Sphere is of two Kinds. The first is a Projection of the Sphere on the Plane of

the Equinoctial in the Stereographick Way, the Eye being supposed to be placed in the Pole of the World. The other Astrolabe is of Gemma Friaccounted from the Noon of one natural Day, or sus ; which supposes the Eye in the Point of the Interjection of the Equator and Horizon, projecting or Midnight of the next natural Day.

The Uses of the Astronomical Tables, in the Calculation of Eclipses, &c.

Before I shew you the Method of the Calculation of the exact Time of the Eclipses of the Sun and Moon, it will be proper to premise these Observations by way of Lemmata; as Mr. Whiston hath done in his Pralect. Astronom.

1. That there is this great Difference between an Eclipse of the Sun and of the Moon; Thata Lunar Eclipse is the same entirely, from what Part of the Earth soever it be look'd upon, and doth not receive any Alteration from the divers Polition of Places on the Surface of the Earth; for where there is a real Loss or Deprivation of Light, 'tis all one if you look upon it from the Equator, or from the Poles; for the Beginning, End, and Quantity of the Eclipse of the Moon depends on real Causes, and not only on the different Position of the Observer. But in the Sun the Case is quite otherwise: A So-lar Eclipse is not any real Deprivation or Loss of Light in him; 'tis only a local Interruption of the Sun's Light to some particular Places, occasioned by the Interposition of the Moon's Body. For in such Parts of the Earth as have the Centre of the Moon's Body interposed between them, and the Centre of the Sun, there may be had a Total Solar Eclipse; whereas in Regions lying at some Distance side-ways from thence, the Eclipse may be only Partial; and if they lye very remote, they may not see the Sun eclipsed at all. And therefore Lunar Eclipses are of the greatest Use in the finding the Longitude of Places, the Observation

of those of the Sun being useless for that Purpose.

2. There are, universally considered, more Solar than Lunar Eclipses, but there are more of the Moon in any one particular Place; for fince the Earth's Disk is much greater than the Disk of its Shadow feen at the Moon, it must needs be that the Penumbra of the Moon shall fall oftner into the broader Disk of the Earth while the Sun is eclipsed, than the narrower Moon can into the narrower Disk of the Earth's Shadow while she is eclipsed. But since the Eclipses of the Moon will be all observable in the same Place, as often as she is never so little above the Horizon of that Place; whereas such of the Sun only will be vifible any where, as happen when the Moon is interposed between that particular Place and the Sun: Tis easily seen, that in particular Places Lu-

nar Eclipses must be most frequent.
3. Total Eclipses of the Sun are very rare; so that if you consider them with regard to any particular Place, you will hardly have above two or three in the Compass of an hundred Years. The Reason of which is, that the Vertex or Point of the Conical Shadow of the Moon's Body doth fall beyond the Earth's Surface, and sometimes doth not quite reach it: Nor is that strange, when we take notice, that the Moon's apparent Diameter doth so little exceed that of the Sun, that it can't totally cover or obscure it, but only in some very Rare, Total, and Central Eclipses;

nor in every Central one neither; for if no Eclipse happen when the Sun is in his Perigaum, and the Moon in her Apogaum, the apparent Diameter of the Sun will exceed the Lunar one; and so the Eclipse will appear annular, or the Shadow of the Moon will be environed with a Ring of Light

4. The Moon is never eclipfed by the very Shadow of the Earth it felf, but only by that of the Earth's Atmosphere. This was a Proposition per-fectly unknown to the Ancients, but is sufficiently pparent and manifest from the Consideration of

lefraction.

For those Rays of Light which are next the Earth enter into its Atmosphere, and then go out of it again: But while they do thus pass out of a Rarer Medium into a Denser, they must by the known Laws of Refraction tend towards the Perpendicular; nor can it be otherwise when they go out of the Atmosphere again, for then they will recede from the Perpendicular; and as well in the former Case as in the latter, the Perpendicular being changed, they are inclined the same way; that is, towards the Axis. And from this double Refraction, when brought to Calculation, it appears that those Rays of the Sun, which pass near the Earth, are so inflected, as to concur in a Point long before they reach to the Distance the Moon is placed at.

5. In Lunar Eclipses, the Consideration of Parallaxes and Refractions hath no Place; but in Solar ones, tho' there be not much regard had to the latter, there must be the greatest to the former. The Reason whereof is, that with regard to Refraction and Parallax, the Shadow of the Earth, in the same Place of the Lunar Transit, is affected after the same manner as the Moon her felf would be in passing thro' it, and so produces no Difference in the Calculation. And in like manner in Solar Eclipses, the Refraction of either the Solar or Lunar Light, at the same Elevation above the Earth's Horizon, is still one and the same; (as by late Observation hath been ascertained) as if both Luminaries had been at the

same Distance from the Earth.

But with respect to the Parallax, the Case is to be deemed far otherwise: The Sun's Parallax, whether Horizontal, or in any Degree of Alti-tude, being much less than that of the Moon; and therefore must be accurately considered in the

Calculation of Solar Eclipses.
6. The middle Time of Eclipses is not the very Moment of the Full or New Moon, but in or near that Place, where a Perpendicular let fall from the Centre of the Sun, or of the Shadow of the Earth to the Lunar Orbit, doth intersect it. For since the Direction of the Lunar Orbit is diverse from the Direction of the Ecliptick, making with it an Angle of at least five Degrees; and al so since the exact Time of the full and new Moon's

Digitized by Google

is, by Consent of all Astronomers, observed to be in a Plane, not Normal to the Moon's Orbit, but to the Ecliptick, the nearest Approach of the Centres, which is the very middle Moment of the Eclipse, can't happen in the exact New or Full Moon; but a little before or after, according to the Moon's Latitude, and the Position of the Nodes, and in a Plane Normal to the Plane of the Lunar Orbit, and not to that of the

Ecliptick.
7. The Investigation and Calculation of Solar Eclipses is much more difficult than that of the Lunar ones, because the Parallaxes of the Sun and Moon are so very different; and also that in the Time of a Solar Eclipse, according as the Altitude of the Luminaries above the Horizon is greater or less, they are very much changed; and during all the Time of the Eclipse, are mutable and variable. Besides the divers Positions of the Ecliptick in different Horizons, whether you consider the Places of the Luminaries, as to Latitude or Longitude, do every where occasion no small Inequalities.

These Things premised, I proceed to the Calculation of Eclipses, beginning with those of the Moon. And the first Work is, To find the Time of the mean and true Syzzies. Which is done

thus: 1. Out of the Table of the mean Motions of the Moon from the Sun, (which you will find amongst the other Astronomical Tables in this Vol.) write down the proper Numbers for their Time fought, from the Columns of the Radical Year, the Intermediate Year, Month, &c. and then add them all into one Sum, which Sum subtract from an entire Circle or 12 Signs; and the remaining Numbers, either by themselves, if you seek the Conjunction, or with the Addition of a Semicircle (or six Signs) if you desire the Time of the Opposition, being turned into Time, will give the exact middle Moment of the Conjunction or Opposition sought. That is, if you first sub-duct that Number which is next less than the given Number, and which is to be taken out of the Table of the mean Motions proper for Days, out of the said given Number, and then seek for the Remainder in the same Table for the Hours, and subtract the Number there next less out of it, repeating the same Process also for Minutes, Seconds, Esc Then will the Day, with its annexed Hours, Minutes, Seconds, &c. of the mean Time of the Syzygy fought, be most accurately determined. Unless indeed it be Leap-Year; for then the Day next less than it, with its proper Minutes, Seconds, &c. will be the exact Time of the Conjunction or Opposition required.

And having thus got the equable or mean Time of the mean Syzygies, both the middle and true Time of the true Syzygies may be thus found.

Time of the true Syzygies may be thus found.
2. The next Work is to find the Sun's Longitude, or his true Place in the Ecliptick for the

Time given. Which is done thus:

Seek the Time given in the left Hand Column of the Table of the Earth's mean Motions, and that not only for the Radical, but also for the Intermediate Years, with the Month, Day, Hour, Minute and Second: Write all these down in their Order, with the Tabular Numbers corresponding to them (which are called the mean Motion of the Earth and of the Perihelion) in a double Order, so that you may preserve distinctly, not

only the Signs, but also the Degrees and Minutes, and even the Seconds, as they shall occur.

Then add into one Sum, all the mean Motions of the Earth, of the Radix, of the Intermediate Years, of the Month, Day, Hour, Minute and Second, in order to obtain the Earth's mean Place, (or Sun's, if reckon'd in directly opposite Parts of the Ecliptick.) Then add the mean Motions of the Perihelion (taken from both the Tables) after the same manner together, that its middle Place also may be had for the Time given.

Next, subduct the Place or Longitude of the Perihelion before found, from the Earth's mean Place, and the Remainder will be the Earth's mean Anomaly; which is the Basis and Foundation of all the succeeding Operations.

Then you may next gain the Coequate Anomaly of the Earth, or the true Place of the Earth, with regard to the Centre of the Sun: Thus, from the Table of the Equations of the Earth's Orbit, in which the Difference between the True and Mean Motions of the Earth are always given, seek the middle Anomaly of the Earth above found, on the Left Hand, if it be within the first signs; but on the Right, if it be in the fix latter Signs; and find by the Rule of Proportion, the Quantity of the Equation answering thereunto; that is, not only that which the Table gives in whole Degrees, but also what corresponds to the Miuntes and Seconds of the mean Anomaly; as by the Rule of Three 'tis easy to do: Then will this entire Equation, deducted in the former fix Signs from the mean Motion of the Earth, and added to it in the latter six, give the Earth's true Place; and that most exactly, if the Time at first given were the mean Time: But if, as it is most usual, it were the Vulgar and Apparent, the Numbers found as above, must be corrected by the Equation of Time. Thus

of Time: Thus, Consult the first Table of the Equation of the apparent Time, (or that which is made for the Ecliptick Figure of the Earth's Orbit among these Tables, N. 1.) and there seek the Earth's mean Anomaly, either in the right or left Hand Column, (as above shewn) and write down thence the corresponding Temporary Equation, either to be added or subducted according as is there directed: Next go to the latter Table of Equation, or that which depends on the Inclination of the Equator and Ecliptick, and entring the Sun's Place in the Ediptick, either at the Top or Bottom; against it, you have that proper Equation, either to be added or subtracted as occasion requires. And thus having gotten these two Equations, if they are both to be added, or both subtracted, the absolute Equation will be their Sum; but if they are different, it will be their Difference: And this absolute Equation will help us to investigate the Sun's Place at any given apparent Time, tho' at present it is done only as to the middle Time. For if out of the Table of the Earth's Horary Motion, accounted with respect to the mean Anomaly, you find (by the Rule of Proportion) the Earth's Motion corresponding to this absolute Equation, and add it to, or subtract it from, as occasion requires from the Sun's true Place before found; what refults, will be the Sun's correct Place in the Ecliptick for the Time given. An Example will make all this plain.

Surpose

To find the Moon's true Place in the Heavens.

Suppose you would have the Sun's Place in the Ecliptick for October 25. at one Hour, five Minutes, and thirty Seconds Afternoon, in the Year

of Christ 1668 past.

Note 1. That the Radix's of the mean Motions in Elamstead's Tables, are accommodated to the Meridian of London, and deduced from the Noon of the Day immediately preceding the Kalands of January; and therefore, every Leap-Year, a Day must be added to the Time given; and since the Year before us in this Question was Leap-

Year, and the Month given October is at a diffrance from February, (and it will be the same in all Months after the last of February) you must reckon the Time, not the 25th but the 26th of October. Look then into the Table of the Earth's mean Motions for the Year 1661. (which is the next preceding Radix) where you find the Sun's Place to be 9 Signs, 20 Degrees, 25 Minutes, and 42 Seconds, and the Perihelion to be 35.70.6.50".

Make a little Table, and write all things down

thus:

What is the Sun's Place OEt. 25. 30. p. m. In the apparent Time A. D. 1668? Perihelion's Motion. Sun's Motion. 20 25 18 0 1661. 48 29 50 11 5 41 Biffed. 02. 26. 24 42 28 Hour 1. I 2 Min. 5. 42 31 Sum of all, and the Place of the Pe-Seconds 30 14 29 45 for 2 Circles. Sum of all Deduct For the Sun's mean Motion. Remains 29 Deduct 4I 31 Being the Place of the Perihelion. 48 Which is the mean Anomaly. Remains 14 7 Again from 45 I The mean Motion. 29 Subduct The proper Equation found as above. 32 The Sun's Place. Remains 12 57 44 Subtract again The proportionable Parts to be subtracted, as above shewn. For the Sun's corrected Place. 12 04

And thus may the Sun's Place be truly calculated for any Time affign'd.

To find the Moon's true Place in the Heavens.

IN order by these Tables to calculate truly the Place of the Moon, which is much more intricate and troublesome than the former; it will be proper previously to remember these Particulars about her Motion.

1. That her very mean Motion it self is subject to some Variation; and according to the various Distance of the Earth from the Sun, which is called its Anomaly, (and belongs to the Moon as well as the Earth) is sometimes compleated quicker and sometimes slower: So that her middle menstrual Motion is a little swifter in the Aphelia, and a little slower in the Peribelia.

2. Besides, the Motions of the Moon her self and of the Aposaum, (such as we had in the Sun) here is to be considered peculiarly, the Retrograde Motion of the Nodes of the Lunar Orbit; and this Motion is to be added, where the former Motions were to be subtracted from the Place of the Radix, and vice versā.

3. The very Motion it self of these Nodes is unequable; so that according to the different Position of the Line of the Nodes of the Moon's Orbit, with regard to the Sun, the Quantity of its Velocity is various and mutable, and therefore this Inequality must be equated before the Calculation can go on well.

4. The Eccentricity of the Moon's Orbit is subject to the greatest Inequality; for in the same Position of the monthly Lunation, when the Linea Apsidum is in the Syzygies, the Eccentricity is much greater than when its in the Quadratures: For the Moon doth not revolve in an Ellipse, whose Figure is given in Specie, but in one perpetually changing, and whose Form is much more oblong in the Syzygies than in the Quadratures, when she comes nearer to a circular Figure: And this Inequality or continual Variation of her Excentricity, and which can scarce be accurately determined.

Digitized by Google

The Uses of the Astronomical Tables.

nar Calculations.

5. The Motion of the Apfis is as unequal, if not more so, than that of the Excentricity; sometimes Stationary, sometimes Progressive, and sometimes

Retrograde.

6. The Moon in every Month moves faster in the Syzygies, than she doth in her Quadratures; and this Variation also must be equated, before the Calculation of the Moon's Motions can fucceed well.

7. The Angle of Inclination of the Plane of her Orbit to that of the Ecliptick is also continually changing; and this too must be brought to an E-quation, before the Place of this every way variable Planet can be exactly calculated. See Sir Isaac

Newton's Theory of the Moon, in Vol. I.

The'e Things being premised, let us attempt to calculate the Moon's true Place in the Heavens for

any given Moment of Time.

1. First, the Sun's true Place, his mean Anomaby, both the proper Parts of their corresponding Equation, and the Absolute Equation thence arifing, must be found by the Method above described, without which the Lunar Calculations will not be exact: For the Lunar Inequalities depend chiefly upon the Sun's Place; and without his mean Anomaly, the mean Motions of the Moon, and her other compound and irregular Motions, cannot be adjusted. And indeed unless both these are had, the absolute Equation of Time can't be obtained; which yet is so very necessary to be known, that nothing can be done without it: For the given apparent Time must first, by Means of this Equation, be reduced to the mean Time; the mean Motions in the Tables being accommodated to that, and not to the apparent

2. From the Tables of the mean Motions of the Moon, of the Apogee, and of the Node, take out the mean Place of the Radixes in their several Columns; and then from the following Tables, write out also the mean Motions of the Moon and of the Apogee, for the proper Years elapsed from the Radix, and of the Month, Day, Hour, Minute and Second, placing them in Order, in two Columns (one for the Moon, another for the Apogee) and adding them up severally into one Sum, as you see in the Example annexed to these Directions. By which means you will gain the mean Place of both the Moon and the Apogee for the mean Time given. It was said before, that the Radical Place not only of the Moon and Apogee. but also of the Node, was to be placed in the first Series; but in the others, the intermediate mean Motions of the Node were designedly omitted: For altho' those intermediate mean Motions, answering to the Year's distance from the Radical, and to the Month, Days, Hours and Minutes, are to to be taken out as was done in the rest; and moreover to be collected into one Sum, as well as the Radical ones; yet because the Motion of the Nodes (contrary to all the rest) is always Retrograde, the intermediate Numbers are to be subducted from, not added to the Radical, in order by the Difference to find the true Place of the afcending Node at the Time given. And having thus gotten the mean Places of the Moon, Apogee and Node, the next Work is,

3. To find their true Places. In order to which, let the Numbers answering to the Sun's mean Ano-

mined, causes a very considerable Difficulty in Lu- maly before found, be taken out of the Table of the Physical Parts, to be added to, or taken from the Moon's mean Motion; and if the Anomaly be-less by fix Signs than the mean Motion of the Moon, let those Numbers be added to; but if it be greater by fix Signs, let them be subtracted from the mean Motion of the Moon, and then you will gain her correct mean Motion.

To gain the true Place of the Apogee, subtract its mean Motion or Place from the Sun's true Place the Remainder will be what they call the Annual Argument: Which thus found, you must take out of the Table of the Equation of the Moon's Apogee, &c. the Equation corresponding to this annual Argument; and this either added to, or subtracted from (according as the Table directs) the middle Place of the Apogee will, by the Sum or Difference accordingly, give the trus one for

the Time given. 4. Out of the same Table take the Excentricity of the Moon's Orbit for the Time given; and if it be less than the mean Excentricity (in the Head of the next Table) subtract it thence; if greater, take the mean Excentricity from it, re-ferving the Difference for other Astronomical

5. That you may gain the Moon's Place yet nearer to the true, subduct the true Place of the Apogee of the Lunar Orbit from the correct mean Motion of the Moon (found in Art. 3.) and note the remaining Numbers, for they will shew you the mean Anomaly of the Moon: Which as foon as you have obtained, carry to the Table of the Equations of the Moon's Centre, and thence making a Proportion when there is occasion for it) take out two Equations, as well that which belongs to the mean Excentricity, as that which answers to the greatest, if the Excentricity before found be one of the greater; or that which answers to the least, if the former Excentricity be one of the lesser; and find the Difference of these two Equations, by carefully subtracting the lesser from the greater. This being rightly done, you may by the Rule of Three thus find the Parts proportional. Say, as the Difference between the great-est or least Excentricity, and the mean one, is to the Difference of the two Equations last found:: So is the Difference between the mean and the true Excentricity, to the proportionable Parts sought. Which being thus found, if they are either added to, or subducted from, as occasion requires, the mean Equation; the Sum or Difference will give the true Equation of the Lunar Orbit, to be added to, or taken from the Moori's mean correct Place, according as the Title directs, and by this means you will obtain the Moon's equated Place. And yet with all this Pains, you have not gotten the Moon's Place ultimately correct; bue only such a Place-of her, as is supposed to be with-out the Business of Reflection or Variation, (and also setting aside the Consideration of Latitude) a Matter perfectly unknown to the Ancients both in Name and Nature. But you must go farther thus:

6. Subtract the Sun's true Place from this equated Place of the Moon, and the Difference will be the Distance of the Moon from the Sun, but yet not exactly true. Wherefore out of the Table of the Variation of the Moon, take the Numbers answering to this Difference or Distance between the Sun and Moon, and they will give the true Quantity of the Variation, as the last and consummate

Equation.

To find the Moon's true Place in the Heavens.

Which Equation if it be added to, Equation. or taken from the Moon's equated Place, according as Occasion requires, the Sum or Difference will give you what hath been so long sought, The true Place of the Moon in her proper Orbit. next thing to be done, is to gain her true Place, with Respect to the Ecliptick, both in Longitude and Latitude. In Order to which,

7. Substract the mean Place of the Node (which was before found) from the true Place of the Sun; the Remainder is the Sun's Distance from the Node, which having gotten out of the Table of the Equations of the Node, take the Equation proper to the Distance, which being added or substracted according to the Title of the Table, will give the true Place of the Node for the Time given. And because not only the Equation of the Node, but even the mutable Inclination of the Limit, or of the Plane of the Moon's Orbit to the Ecliptick, is Proportional to this Distance; take also from the same Table, the various Inclination of the Limit, or the Numbers expressing the Excess above the least Inclination (five Degrees) out of the proper Column; that so having gained the true Place of the Moon's Node, and the Equation of the Limit, you may the better obtain the Moon's Longitude

and Latitude for the Time given.
8. Take then this true Place of the Node, from the true Place of the Moon in her proper Orbit, before determined, the Remainder is what they call the Argument of Latitude: And out of the Table of the Reduction and Excess of the Inclination of the Orbit, take the proper Number correfponding to such Reduction or Excess: And fav by the Rule of Three, As the greatest Increment of the Limit (in Minutes of Degree) is to the Excess given; so is the present Increment of the Inclination of the Limit (viz. above five Degrees) to the Parts Proportional required; which Parts thus found, added to the simple Redustion, shall give a Redu-Etion true and perfest, which being after the Manner of an Equation, added to, or taken from the Moon's true Place in her proper Orbit; will give her Longitude, or her true Place in the Ecliptick.

o. And this Longitude of the Moon being ob-

tained, you must thus proceed to seek her Latitude.
From the Table of the Moon's Latitude, which not only stews her simple Latitude, (supposing the least Inclination to be of five Degrees only) but also the Parts Proportional to be added to it, when 'tis near a third of a Degree or 18 Minutes more, Out of this Table I say, take her simple Latitude answering to the Moon's Argument of

Latitude, with the Parts Proportional to be added to it, and then say by the Rule of Proportion, As the greatest Increment of these Minutes, is to the present Increment: : so is the Excess of the Inclination of the Orbit above the least Inclination before found, to the Parts Proportional; and those added to the *simple Latitude* of the Moon, will give her true Latitude from the Ecliptick.

And these Directions are sufficient for finding the Moon's true Place, both in her proper Orbit, and in the Ecliptick; and both as to Longitude and Latitude, at least according to Horrox's Theory. But there are yet behind some other Enquiries of no contemptible Consideration, which must be purfued to compleat the true Theory of this every way changeable Planet. As first, to find the Quantity of the Moon's Horizontal Parallax for any Time affigned. 2. Her apparent Diameter. 3. Her true Horary Motion in either Syzgy; and the Knowledge of these, is very necessary for the exact Calculation of the Eclipses of the Luminaries.

Wherefore let us next go on thus.

10. To find the true Horary Motion of the Moon in either of the Syzgies, out of the Table of the Moon's Horary Motions correspondent to the mean Anamoly, take out the proper Numbers when the Eccentricity is greatest and least, and note the Difference; then seek the true Eccentricity of the Moon's Orbit, in the very Moment of the Syzgy (according as directed in Number 5 above) and observe well the Difference between that, and the least Eccentricity of all; then work thus according to the Rule of Proportion. As the Difference between the greatest and the least Eccentricity, is to the Difference of the Horary Motions now found :: so is the Difference between the present and the least Eccentricity, to the Parts Proportional; which Parts so found, if added to the Horary Motion corresponding to the least Eccentricity, when it less than the Horary Motion belonging to the greater Eccentricity, or fubstracted when 'tis greater; will give the true Horary Motion of the Moon, both with regard to the Sun, and also to the Ecliptick, in the very Moment of the Syzgies. And from this, taking the Horary Motion of the Sun (above found) you will have the Horary Motion of the Moon from the Sun.

And when thus the Reason and Method of finding the Moon's Horary Motion is known, that of determining her Horizontal Parallaves, and apparent Diameters will be so too, the Reason of

both being one and the same.

The Calculation of Eclipses.

I N order to make the Nature of Eclipses, their several Phænomena, and the Calculation of the Times of their Appearances more clear and intelligible, it may be useful (with Mr. Whi-fon) to premise these following Preparatory Propositions.

1. That the Moon is a Body perfectly Opake, having no Manner of Light of her own, nor a Power of transmitting the Light she receives from

2. That the Earth and Moon are both Bodies very little, in Comparison with the Bulk of the Sun, as appears from their several Diameters: That of the Sun being about half a Degree; whereas that of the Earth is not above a Third of a Minute, and that of the Moon scarcely a Fourth of the Diameter of the Earth, if they were both to be seen from the Sun.

3. Wherefore the Figure of the Shadow in both a Solar and Lunar Eclipse must be conical, and ter-

minating in a Point.

The Mucro or Vertex of this Cone of Shadow in either Eclipse, falls short of any of the other

Planets; which therefore can never be concerned in these Desiciencies of Light.
5. Were the Plane of the Lunar Orbit coincident with that of the Ecliptick, there would be a total and central Eclipse of each Luminary in every Sudation; and the Lunar Eclipses would be vifible all over those Parts of the Earth, whose Horizon she is above: But the Solar Eclipse only to those Parts of the Earth directly opposite to the Sun and Moon at that Moment, which is the very Moment of the Syzgy: And consequently to determine these Eclipses then, we need only calcuculate that.

6. But because there is for the most Part, an Inclination, or Angle of a little more than five Degrees, made between those two Planes; it will be plain that Eclipses can only happen at those Full and New Moons, in which she is in or near the Nodes, or the Points of Intersection of the two Orbits: And this happens usually in every Lunation. Wherefore were the Lunar Nodes immoveable (with respect to the Sun) there would be even now, an Eclipse of each Luminary, in every Synodical Month.

7. And because for the producing an Eclipse, not only the Access of the Moon to the Nodes is necessary, but also such an Access as shall happen at the time of any of the Syzgies, or at either New or Full Moon, 'tis plain, that the Elcipses of the Luminaries can only happen at those Times of the Year, in which the Syzgies are in or near

the Nodes.

8. Wherefore there will be, for the most Part, four notable Eclipses, or such as shall be visible and conspicuous to some or other of the Inhabitants of the Earth, every Year. Two Solar, and two Lumar. For since for many Days together, the Sun's Place is once in every Year, but a little distant from the Northern Node: and then after about a Fortnight, (for the same Time) as near to the Southern Node of the Moon, there must happen (generally) two Syzgies, during each of these Accesses of the Sun to the Node, and consequently at each Syzgy, there must be an Eclipse.

Having thus in Part prepared the Way for the

Calculation of Eclipses by these Preliminary Considerations; the Work it self will follow by De-

grees. And first in Order,

To cal culate an Eclipse of the Moon.

Y O U must proceed thus, To find the Time of the mean and true Syzgies.

1. From the Table of the mean Motion of the Moon from the Sun, take out the proper Numbers for the radical Year, and the present Year, and Month, and writing them down, add them up into one Sum; which Sum take out from an entire Circle or 12 Signs: Then if you feek for the Conjunction, the remaining Numbers alone, or with the Addition of fix Signs or half a Circle if you want the Opposition, being turned into Time, will give you the mean Moment of the Conjunction or Opposition sought; that is, if first you deduct (out of the next Table of the mean Motion for Days) the Number which is next less than the given one, from that given Number; and so do also out of the Columns for Hours, Mimutes, Seconds, 69c. for then the Day with its Hours, Minutes, Seconds, 69c. fo found shall be the accurate mean Time of the mean Syzgies,

provided it be not Leap-Year: For if it be, you must take the Year that is next less with its Months, Days, Hours, Minutes, Seconds, & co. adjusted as before.

And thus having got the mean or equable Time of the mean Syzgy, you may by the following Method, find the mean and true Time of the true

2. First find the Longitude of the Sun in the Ecliptick, and of the Moon in her Orbit, as hath been before shewn: Then if the Places of the Sun and Moon agree in Longitude exactly, which very rarely happens; or if they are diametrically opposite, then both the mean and true Syzgies do both happen at the same Moment of Time: But if, as it will most Times happen, they be not the same, the Difference between them must be noted, and turned into Time, in order to find the true Syzgies, thus.

Write

To determine the Duration and the Time, &c.

3. Write down the true Horary Motion of the Sun, corresponding to the mean Anomaly (found above) and from the same Tables do the same by the Moon; then substract the Sun's Horary Motion from the Moon's, the remaining Numbers will shew the Horary Motion of the Moon from the Sun, or what she gains in one Hour. Then fay by the Rule of Three, As the Motion of one Hour, is to that one Hour, or to 6c Minures in Time:: so is the Difference of Longitudes, or the Distance of the Sun from the Moon, to the Interval or Space between the mean and true Syzygy; which Space of Time, if the Moon hath not yet overtaken the Sun, must be added to the mean time of the Syzygy; but if she be gone pass'd him, it must be taken from the mean Syzygy, and the Sum or Difference will be the true Syzygy, to a Moment.

But two Things must here be noted, that this Matter may be truly understood. (1.) That the Moon's mean Anomaly should not be entred in the Table of the Horary Motions, till 'tis first augmented by half its Distance from the Sun, if the Moon have not yet overtaken him; but if she hath, then the Anomaly must be lessen'd as much. For fince the Reason of bringing the Anomaly to that Table, is only to shew with what Velocity the Moon hath attained, or will attain her Distance from the Sun; 'tis plain her Horary Motion is to be taken neither in the Beginning nor End of that Interval, when it may be quicker or flower, but when 'tis at a mean in the middle. (2.) The Interval between the mean and true Syzygy, feldom exceeds 12 Hours, never 14, as by Aftronomical

Computations is apparent.

4. Having thus found the mean Time of the true Syzygy, the true Place of the Sun in the Ecliptick, and of the Moon in her Orbit, must be found to the sun in the Ecliptick and of the Moon in her Orbit, must be found to the sun of the Moon in her Orbit, must be found to the sun of t (as above directed) corresponding thereunto, to-gether with the Moon's true Latitude from the Ecliptick agreeable to the Moment of the true Sy-

2ygy, as hath been already shewn. Then
5. From the mean Time thus found, an Equation may be formed to find the Apparent thus; Get
(as is above shewn) the absolute Equation of Time, either adjectitious or ablatitious by help of the Sun's mean Anomaly; and contrary to its Title, add it to,

if it be ablatitious, or substract from, if adjestitious, the mean Time now found: By which means the apparent Time of the true Syzygies will be gained.

6. Having thus obtained the true Moment of apparent Time of the true Conjunction and Opposition, there are yet two things more to be done, before we can advance any farther; i.e. to know the Moment of the apparent Time, in which the Centres of the Luminaries are at their leaft Distance, and at what Moment of the same Time

the Syzygies happen in the Ecliptick.

There is usually a great Difference between the nearest Approach of their Centres, and the Moment of the full or new Moon, and therefore between those Moments of Time, and the Time of the true Syzygy in the Moon's Orbit, accounting from the Beginning of Aries. For the Time of the Ecliptical full or new Moon, in a Plane Normal to the Ecliptick: The Time of the nearest Approach of their Centres, in a Plane nearly Normal to the Lunar Orbit: The Apparent Time of the Syzygy in the Lunar Orbit, whiere the Arches drawn from the Beginning of Aries, to the Centres of the Sun and Moon, are equal, is observed to happen in a Plane Normal, neither to the Ecliptick, nor the Moon's Orbit, but in an intermediate one between both. The half therefore of the Excess or Defect of the least Distance of their Centres in the Ecliptical Syzygy, is nearly equal to the Difference between the Time of the full or new Moon in the Lunar Orbit, and that in the Ecliptical Orbit, and consequently to the least Disserence of their Centres, and this balf Difference is called the Reduction; which if taken from the Time of the true Syzygy, accounted from the Beginning of Aries, will give the Moment of the Ecliptical Syzygy; if added to it, the Moment of the nearest Approach of their Centres.

To get this Reduction by the Astronomical Tables, note the true Horary Motion of the Moon from the Sun (or Earth) in the Front of the Table, and in the Column under it, and over-against the Argument of Latitude placed in the Side, you will find the Reduction sought, to be used, as is just

now shewn.

To determine the Time and the Duration, and other Circumstances of the Eclipses of the Luminaries: The first and chief Thing to be done, is to find the least Distance of their Centres.

FOR whether there will be any Eclipse or not; and if one, what its Quantity, Duration, & c. will be, can only be known this Way.

Now this least Distance is always equal to the Moon's Latitude, in the apparent Time of the Syzygy, in her proper Orbit. This Latitude therefore, at the Time of the Opposition in a Lunar Eclipse must be first sought, as hath been above shewn: And then the next Work will be, to calculate the Magnitude or Semidiameter of Vol. 11.

the Earth's Shadow, in the Place of its Transit over the Moon.

Which being compared with the least Distance of their Centres, will account for the chief Phæ-

nomena of Lunar Eclipses. As for Instance,
1. If from the Sum of the Sun's and Moon's Horizontal Parallaxes, you take the apparent Semidiameter of the Sun; the Difference will be the apparent Semidiameter of the Earth's Shadow, in the Place of its Transit over the Moon, as is N 2 plain

The Uses of the Astronomical Tables.

Plain from the Diagram of Hipparchus (vid. Whifon Astronom, p. 62.) Wherefore the Horizontal Parallaxes of the Sun and Moon, for the several Degrees of the Anomaly, being given from the Astronomical Tables, and also the apparent Semidiameters; it will be easy to determine the Magnitude of the Earth's Shadow.

2. The apparent Semidiameter of the Shadow being thus found, add to it the apparent Semidia-meter of the Moon: If their Sum exceed the least Distance of the Centres before found, there will be at least a Partial Lunar Eclipse. But if it be less than the least Distance between the Centres, the Moon will not be at all obscured by the Ter-

restrial Shadow.

3. Next substract the apparent Semidiameter of the Moon, from that of the Shadow: And if the D fference be equal to the faid leaft Central Distance, there will be a total Eclipse of the Moon but fine mora, as they say, that is, the Moon will begin to emerge out of the Shadow, as soon as ever she is totally obscured. If this Difference be less than the Distance aforesaid, only some Parts of the Moon's Body will be covered: But if it be greater, the Eclipse will not only be total, but cum mora; that is, the Body of the Moon will remain perfectly covered for some time.

4. In order to find the Quantity of the Eclipse, especially in Partial ones, (which Quantity is commonly estimated by Digits and 60th Parts of Digits; for the Moors of Digits; for the Moors of Digits; for the Moors of Digits and to be desired to be a supposed to be desired. divided into 12 Parts or Digits, and each Digit into 60 equal Parts) From the Sum of the apparent Semidiameters of the Shadow, and of the Moon, substract the least Distance of the Centres, and then the Difference or Remainder, reduced to Digits by the Rule of Proportion, will give the Quantity of the Eclipse: Therefore say, As the Measure of the Lunar Semidiameter in Degrees and Parts is the Come in Digits we that is 60 so shall that Parts is the same in Digits: that is 60, so shall that Difference which answers to the Quantity of Obscuration in Degrees and Parts, be to the same, accounted in Digits and Parts.

5. To find the Angle of Incidence, proceed thus; As the Sum of the apparent Semidiameters of the Shadow, and of the Moon, is to Radius: : so is the least Distance between their Centres, to the Cosine of the Angle of Incidence, which there-

of the Exit. But fince in total Eclipses, not only these two Angles of Incidence and Exit, but also that of total Immersion and Emersion is to be considered, you must next proceed to find it. Which this Proportion gives,

6. As the Difference of the apparent Semidia-meters of the Shadow and of the Moon, is to Radius: so is the least Distance of the Centres to the Cosine of the Angle of Immersion. Wherefore the Quantity of the Eclip'e being known, you will have the Angle of Incidence and Immer-

7. To find the Mora or Time of the Duration of

a Lunar Eclipse.

Say, As Radius to the Sine of the Angle of Incidence: : so is the Sum of the apparent Semi-diameters of the Shadow and of the Moon, to the Semi-mera, or half the Duration of the Eclipse.

8. To find the Duration of the absolute Dark-ness in a total Lunar Eclipse.

Say, As Radius to the Sine of the Angle of Immersion:: so is the Difference of the apparent Semidiameters of the Shadow and Moon to the Motion of the Semi-mora, or the Duration of absolute Darkness. I say the Motion of the Semi-mora, because the Motion of the Moon during that Space of Time, or the Line that she describes during this Semi-mora, or half Space of Time in which the absolute Darkness continues, is rather meant, than the Mora or Space of Time it self. But if you would have it expressed in Time; fay, As the Horary Motion of the Moon from the Sun, is to an Hour or 60 Minutes in Time:: fo is the Motion of the Semi-mora in the absolute Darkness, to the half Time of its continuance: And thus the middle Moment of the Eclipse is found.

9. To find the Moment of the Beginning and End

of a Lunar Eclipfe.

From or to the middle Moment of the Eclipse, take or add the Semi-duration, and you must have the Reginning and End. And if from or to the middle Moment you take or add the Semi-mora of absolute Darkness, you will have the Beginning and End of that Darkness.

And thus have you a Calculation of a Lunar Eclipse, not very difficult, if compared with that of a Solar one, and free from the Trouble of Pafore will be found; as also, its Equal, the Angle I rallaxes and Refractions. An Example follows.

A Calcu-

A Calculation of the Moon's Place for April 5. 1707. at 1^h. 46^m. p. m.

To Calculate the Eclipse of the Sun.

this Eclipse of the Sun is improperly so call'd, and may with much more Justness take the Name which some of our Modern Astronomers have given it, when they call it an Eclipfe of the Earth; for so in reality it is, the Sun by no means being deprived of his Light, but only some Parts of our Earth lose theirs, by being within the Shadow of the Moon's Rody, when it happens to be interested. the Moon's Body, when it happens to be interposed between them and the Sun.

To illustrate this the better, let us suppose the Earth for a Time deprived of its diurnal Rotation round its Axis, while the Moon freely revolves round us. And suppose the Moon to be in the very Nodes, and so without any Latitude: Then 'tis plane of the Centre of the Moon, being in the Plane of the Ecliptick, directly inter-posed betwen the Centres of the Sun and Earth, will occasion a Central Eclipse of the Sun, to fuch People as inhabit the Earth's Equator; which will be total, if in that Place the apparent Diameter of the Moon exceed that of the Sun, but if it fall short of it, as is most usual, then the Eclipse will be annular.

2. But if at the Time of the Eclipse, the

Moon be not in the very Node, but a little Di- More's Mathematicks. Vol. I.

I N order to which, let it be premised, 1. That stance from it; then the Centre of the Moon's Shadow will not describe the Ecliptick, nor any

great Circle on the Earth, but a leffer Circle, or a Chord of a great Circle in the Plane of the Disk.

3. The Figure of the true Line or Path, which the Centre of the Penumbra and Shadow describes on the Spherical Surface of the Feather. scribes on the Spherical Surface of the Earth, is not exactly Circular, but a Portion of a Curve more or less regular, according to the Motion of the Earth and the obliquity of its In-

4. The Moon's true Parallax, to be estimated in a Vertical Circle, here puts on the form of other Parallaxes, and makes a Difference, not only in a Vertical Circle, but even in those of Longitude and Latitude; So that on this Account, the apparent Longitude and Latitude of the Moon, do very much vary, and render the exact Calculation of Solar Eclipses very difficult.

5. However there hath been a Geometrical Method found out by Sir Christopher Wren, Mr. Flam-sted and Mr. Halley, to avoid this tedious and precarious way of Parallactick Calculation, and of delineating a Solar Eelipse by Scale and Compass. See Flamsted's Dottrine of the Sphere, in Sir Jonas

To determine the Moment of the Beginning and Ending, and the Duration of a Solar Eclipse.

1. FROM the Moon's Horizontal Parallax, fubstract the Solar, the Remainder will be the Semidiameter of the Sun's Disk. Then collect into one Sum, the Horizontal Semidiameters of the Sun and Moon, which Sum will be equal to the Semidiameter of the whole Penumbra of the Moon, from whence a Solar Edication the Moon, from whence a Solar Eclipse

arifes,
2. To the Semidiameter of the Disk, add that of the *Penumbra*; and if the Moon's Latitude at the Moment of the true Conjunction in her proper Orbit be less than that Sum; there will be, somewhere on the Earth, an Eclipse of the Sun: But if it be greater; there will be no Eclipse at all. And if the Moon's Latitude be, alone, less than the Semidiameter of the Disk, then the Centre of the Shadow will fall upon the Earth, and so cause somewhere a Central Solar Eclipse, but if it be greater, there will be only a Partial one.

3. From the Semidiameter of the Earth's Disk, take that of the *Penumbra*, and Note the Remainder carefully; for if the Latitude of the Moon, in the Time of the Syzygy in her proper Orbit, be *lefs* than such Remainder; then will the whole *Penumbra*, at the middle Moment of the Eclipse, be confined within the Circumference of the Earth's Disk; but if otherwise, it will not be so. And if by Multiplication, you reduce all these Quantities to Seconds, you will have the Angles of Incidence as they are call'd; that is, the Distances of the Points where the Penumbra touches the Disk in its Ingress and Egress; and also the Point where, in the middle Time between both, the Centre of the Penumbra enters into, and goes our of the Disk.

For these Distances being given in Angles, from the Velocity of the Monthly Motion of the Moon from the Sun, there may, by the Rule of Three, be found the Space of Time proper to each Distance; that is, the whole Duration of the Eclipse will be given, and of the absolute Darkness, and also the Time of the Mora of the Penumbra within the Earth's Disk, as will appear

4. From the Latitude of the Moon at the Time of the Conjunction in her own Orbit (which, as hath been said above, is the same with the least Distance of the Centres so often mentioned) you

To determine the Moment of the Beginning and Ending of a Solar Eclipse.

may find these Angles of Incidence, of the Immersion and Emersion of the Centre, by these

As the Sum of the Semidiameters of the Terrestrial Disk, and of the Penumbra, is to Radius: so is the Moon's Latitude, or the least Distance of their Centres, to the Cosine of the Angle of Incidence: And then,

As the Semidiameter of the Earth's Disk is to Radius:: so is the Moon's Latitude, to the Cosine of the Angle of the Immersion of the Centre of

the Penumbra. And

As the Difference between the Semidiameters of the Terrestrial Disk, and of the Penumbra, is to Radius:: so is the Moon's Latirude, to the Cosine of the Angle of the total Immersion.

And fince in the Egress of the Penumbra, the Angles are equal to those in the Ingress, the same

Numbers will express both.

5. Having thus gained the Cosine of these Angles, and consequently, the Angles themselves; you must next investigate the Motion of the Moon corresponding to each of the Angles respectively. By saying,

As Radius is to the Sine of the Angle of Incidence:: so is the Sum of the Semidiameters of the Penumbra and the Earth's Disk, to the Motion of half the Duration of the whole Eclipse;

As Radius to the Sine of the Angle of Immerfion of the Centre :: so is the Semidiameter of the Disk, to the Motion of half the Duration of Cen-

tral Eclipses. And again,

As Radius to the Sine of the Angle of total Immersion:: so is the Difference between the Semidiameters of the Disk and Penumbra, to the Motion of half the Mora, or continuance of the Penumbra within the Disk.

6. And when the Motions are thus found, you may gain the corresponding Times by this Analogy: As the horary Motion of the Moon from the Sun, is to one Hour, or 60 Minutes: : so is the Motion of half the Duration, (whether belonging to the Angle of Incidence, to the Angle of the Immersion of the Centre, or to the Angle of the whole Immersion) to the Space of Time corresponding to each Motion respectively.

And having thus gained these Intervals of Time; if you add them to, or take them from, the mid-dle Moment of the Eclipse, you will obtain the Moment of Time, in which is the Beginning and End of the Eclipse Central or other; the Beginning and End of the Mora of the Centre of the Penumbra universally, for that Place where you are, or for the Meridian of that Place for which your Tables were calculated; which Time, by the Confideration of the Difference of Meridians or Longitudes of Places, may eafily be accommodated to any other Place.

And thus may the general *Phenomena* of Solar Eclipses be accounted for and calculated. Their more particular Affections may be obtained from the following Considerations, and Methods of Investigation. But let us premise,

1. That in that very Place, where the Penumbra first touches and enters the Earth's Disk, the Inhabitants will see the Beginning of the Eclipsc, in the uppermost Point of the Sun's vertical Diameter, or in the upper Extremity of the Limb. (2.) In that Place where the Centre of the Penumbra enters the Earth's Disk, the Spectators

will see a Central Eclipse of the Sun. (3:) But in that Place where the whole Penumbra is first received or contained within the Disk, there the End of the Eclipses will be observed, at the lower End of the Sun's vertical Diameter. (4.) Where the Path of the Centre of the Penumbra, in the Meridian Circle intersects the Earth's Axis; and where it intersects the Axis of the Ecliptick in the Nonogesimal Degree, or the Point that is most elevated above the Horizon, there a Central Eclipse will be visible. (5.) In that Place where the Penumbra begins to emerge out of the Earth's Disk, the Eclipse will begin in the Western Luminary, in the nadir Point of his vertical Diameter: (6.) In that Place where the Centre of the Penumbra goes out of the Limb, a total Eclipse will be visible in the Sun in the West.

7. But where the Centre of the Penumbra goes out of the Disk, there will be the perfect End of the Eclipse, which will go off in the Zenith Point

of the Sun's vertical Diameter.

These are the general Phenomena of Solar Eclipses; only you may observe, that by Reason the Menstrual Motion is swifter than the Diurnal, they will always begin from the West, and so will proceed on from West to East, during the whole Time of the Eclipse.

Before I quite leave this Affair, it will be pro-per and useful to acquaint the Reader briefly with Mr. Flamstede's late invented Method of representing Solar Eclipses by a Geometrical Construction, because 'tis free from all the Embarasment of Parallaxes, and in some Cases hath the Advantage of

Suppose then a Plane to touch the Moon's Orbit. and which shall be posited so as that it shall be at right Angles to the Line which corrects the Centres of the Sun and Moon; and that through this Plane, innumerable right Lines be drawn from the Centre of the Sun, to any Circles upon the Earth's Surface, then will these Lines so drawn, project the terrestrial Sphere, and its Circles on that Plane; fo that an Eye placed in the Sun, would observe the Earth and its Annual and Diurnal Motion, as if all were transacted in that Plane: Just as we who live on this Earth, observe the Sun and Moon, and their various Motions and Changes, as if performed in Circles of the Sphere projected on a Plane.

From such a Projection therefore of the Earth's Spherical Surface, there will arise in that Plane a Circle for a Base, which will be nearly equal to a great Circle on the Earth, and which is called the Earth's Disk, and will be every where Normal to the Plane of the Ecliptick. From its Centre, suppose a right Line drawn both ways, representing the Earth's Axis, and which according to the different Seasons of the Year, will be variously inclined to the Plane of the Ecliptick, which will be represented by one of the Diameters of the Disk; for the Parallelism of the Earth's Axis, by reason of its various Position to the aforcsaid Plane, will make three unequal Angles. Let there be imagined also in the same Plane, innumerable Eclipses to be described by the Diurnal Motion or Rotation of any Point on the Earth's Superficies, these will be the Elliptical Paths of the several Vertexes, as they are called; by each of these, the Situation of any particular Place is determined, and distinguished from all other in this given Plane. Whence, it will follow, that

The Uses of the Astronomical Tables.

if in Solar Eclipses, you can (within the Plane of this Disk) find the Lines and Paths which the Moon her self touches or describes; you may find also the very Places on our Earth which will be then eclipsed by the Interposition of the Moon's

Having then gained by the Precepts above given, the least Distance between the Centres of the Earth (or of the Disk) and of the Penumbra, and the Distance of this Line of the least Distance, from the Axis of the Ecliptick, described or drawn on the Plane aforesaid; let there be drawn thereto, in the Plane of the Disk a perpendicular from the Point of that least Distance, that Line will shew the Path of the Centre of the Penumbra, as it transits the Disk; of which you have a Calculation above given, with regard to the Angles of Incidence, of the Immersion of the Centre, and of the total Immersion. In this right Line, or in this Path of the Centre of the Penunbra, note the Hours of your Meridian, with the Quaras above by Calculation; and let the Hours, &c. also be noted in the Elliptick Path of your particular Place, which must be delineated in this Plane; so that each Hour, and each particular particular hours and each particular part of every Hour may determine the very part of every Hour, may determine the very Point where your Place described by that Ellipsis, is at that Moment of Time. And having thus given these Moments of Time in the Restilinear tellites of Jupiter, See Jupiter in Vol. II.

Path of the Centre of the Penumbra, and in the Elliptick Path of your particular Place, you may by Scale and Compass construct the Phænomena of the Eclipse, as they will appear in your particular Place; thus, Take from the same Scale of equal Parts, by which you drew all the rest, the Semi-diameter of the Penumbra, and moving one Point of the Compasses along the Path of the Penumbra, direct the other towards the Path of the Place. If you find it will not reach to it so as to touch it wou may conclude there will be no Eclipse of it, you may conclude there will be no Eclipse of the Sun in your particular Place; but if it doth either touch it, or reach over it, there will be an Eclipse; a Partial only, if it touch; a Total one, if it reach over the Elliptick Path; the beginning of which Eclipse will be at that Hour, or part of an Hour, where the Compasses Legs being carried along both Paths, do mark out the same Time in each Path: In like manner, the middle of the Eclipse will be found to be at that Moment of Time, which the Legs of the Compasses (being ters, Minutes, & c. (if there' be occasion) corresponding to the Phanomena of the Eclipse, found
Parallel to the Axis of the Ecliptick in your particular Place,) will be at that Moment of Time, which shall be markt out both in the Paths of the Penumbra, and in the Path of your particular Place. See farther in Mr. Flamstede's Dostrine of

A Table of the Latitudes of many of the most Eminent Places on the Earth; together with their Differences of Meridians in Time and of Longitude in Degrees, accounted from the Meridian of Her Majesty's Royal Observatory at Greenwich, near London.

Note, Those Places Markt thus * having been determined by Celestial Observations; the rest have been corrected by their help.

Note, That those Places against which the S is placed in the Column of Latitudes, are South of the Equator; and all the other North.

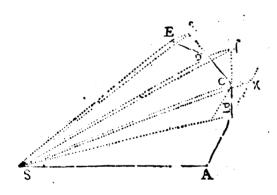

ASTRO-

ASTRONOMY, in order to prepare the Way for the right understanding of this noble Science, as it now stands in the Writings of the modern Astronomers, who have revived and demonstrated the Ancient Pythagorean System of the World: And besides those necessary Precognita of the Doctrine of the Sphere, its Projection in Plano, and the Spherick Trigonometry (which every one ought to know that will pursue this Study;) I shall here (from Mr. Hayes's Fluxions, p. 291, &&c.) give you such Physical and M chanical Propositions, as will qualify you to obtain a sufficient Knowledge of the Doctrine contained in the present Books of Astronomy.

PROP. I.

The Area's which Bodies (suppose any Planets or Comets) revolving about an immoveable Center, (as suppose the Sun in S) describe by the Rays drawn to the same, are Proportional to the Times of Description, and are all in the same immoveble Plain.

Let the Time be divided into equal Parts, and suppose in one of them, a Body describes the Space AB (by a Power which it has to move in the right Line Ax from A towards x) in the next Moment of Time, if nothing hindred, it would move from B to x, describing the Line Bx equal to AB, so

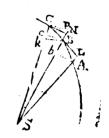

that drawing the Rays AS, BS, xS to the immoveable Center S, the Areas ASB and BSx described, would be equal: But when the Body comes to B, let a Force in S attract the fame, and by one fingle but strong Impulse, make the Body deviate from the right Line Bx, and move in the right Line BC; draw x C Parallel to BS, interfecting B C in C, then at the End of the second Moment of Time, the Body will be found in C, in the same Plain with the Triangle A S B; join SC and the Triangle SBC, because of the Patallels SB and Cx, will be equal to the Triangle SBx, and consequently it will also be equal to the Triangle SAB: In like Manner, if the Central Force (or Vis Centripeta) act successively in C, D, &c. and make the Body in successive Moments of Time describe the Lines CD, DE, &c. they will be in the same Plain, and the Triangle SCD will be equal to the Triangle SBC, and SDE will be equal to SCD = SBC. Whence it is manifest that the Body revolving about an immoveable Center in an immoveable Plain, describes equal Areas in equal Times; and by Composition, the Area SACS is to the Area SAES, as the Time which the Body takes to describe that, is to the Time it takes to describe this. Vol. II.

Let the Number of the Triangles be increased and their Breadth diminished in infinitum, then the Perimeter ABCDE will be a Curve Line, and consequently the Vis Centripeta which perpetually draws back the Body from off the Tangenr of this Curve, acts continually; and the Areas SACS, SAES Proportional to the Times of their Description, will also in this Case be Proportional to the same Times. Q. E. D.

CON ECTARY I.

If a Body or Planet revolving in the Curve ABC, be attracted by a Central Force in , or gravitate to-

wards the Sun there; and if the Body describe the infinitely little Portions of the Curve AB and BC in equal Times, then the infinite little Triangles ASB, BSC will be equal; and if on the Center S, and with the Radii SA, SB, the little Arches Ab, Bc, be described, then the Triangle SAB or $SAb = \frac{1}{1}SA \times Ab$, and the Triangle SBC is =

 $\frac{1}{1}SB \times Bc$; therefore it is, $\frac{1}{2}SA$: $\frac{1}{2}SB$:: SA: SB:: SB

DEFINITION I.

The Center of Attraction is that Point to which the revolving or moving Body is attracted or impelled by the Force or Impetus of Gravity; thus the Sun is such in the respect of the primary Planets, and the Earth in respect of the Moon.

DEF. II.

Paracentric Motion of Impetus is so much as the revolving Body approaches nearer to, or recedes farther from the Center of Attraction; thus if S be the Center of Attraction, and if a Body in A move to B, then SB - SA = Bb, is called the Paracentric Motion of that Body.

DEF. III.

Circular Velocity of a Body is measured by the Arch of a Circle; thus if a Body in \mathcal{A} move to B_i or b_i its Circular Velocity is measured by the Arch of the Circle \mathcal{A} b describe on the Center of Attraction, and the Circular Velocity of a Body moving from B to C is measured by the Circular Arch B C.

DEF. IV.

Conatus Excussorius is measured by a Line let fall from a Point infinitely near to another Point, Perpendicular to a Line drawn to touch the Curve in that other Point: whence it is manifest that the Conatus Excussorius Circulationis, or Conatus Centrisqus may be expressed by BN the versed Sine of the Angle of Circulation CSN (or by ck, because the Difference between the Radii SC, SB is incomparably little) for the versed Sine is equal to a Tangent drawn to the other End of the Arch.

O 2

DEF.

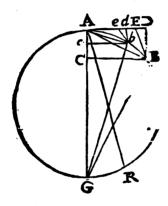

DEFIN. V.

Solicitatio Paracentrica Gravitatis vel Levitatis, or the Paracentric Solicitation of Gravity or Levity, is express'd by the right Line A L, drawn from the Point A, Parallel to the Ray SB (infinitely near S A) until it intersect the Tangent B L.

LEMMA L

The versed Sines of infinitely little Arches are in a duplicate Ratio of the Chords of the said Arches.

Let the right Line AD touch the Circle AB G in A, then D A B is the Angle of Contact; Let In A, then D A B is the Angle or Contact; Let AB be an infinitely little Arch, AB the Chord, and AC the versed Sign thereof, I say AC or BD is as the Square of AB; that is, if another infinitely little Arch Ab be taken, then the versed Sine Ac (or bd): Versed Sine AC (or BD):: Abq: ABq.

Draw the Diameter AG, and draw the Lines GB, Gb; then by the Property of the Circle, we have $ABq = AC \times AG$ and $Abq = AG \times AC$; whence it is, $ABq:Abq:AC \times AG:AC \times A$

to the Arches AB, Ab, and consequently the Verto the Arches AB, Ab, and consequently the ver-fed Sines AC, Ac, or the Subtenses of the Angle of Contact BD, bd, are in a duplicate Ratio of the conterminal Arches AB, Ab. And if the Lines BE, be, subtend the Angle of Contact DAB, and be Parallel to any Line (less than the Disperses AC) draws wishing the Circle

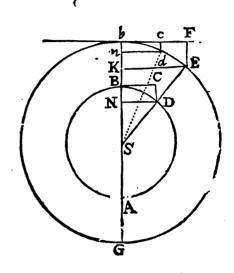

than the Diameter AG) drawn within the Circle, as AR, then the Lines BE, be, will be as the Squares of the conterminal Arches AB, Ab, for BD: bd:: BE: be:: ABq: Abq.

COROLLARY.

The Subtenses of the Angles of Contact of Curves, whose Curvature in the Point of Contact Difference between them is incomparably little) are as the Arches, therefore the Conatus Centri-are in a duplicate Ratio of the conterminal Arches. fugi are in a duplicate Ratio of the Velocities.

LEMMA II.

In unequal Circles ABD, GbE, if the infininitely little Arches BD, bd be equal, then the versed Sines BN, bn of these Arches will be reciprocally Proportional to the Radii SB, Sb.

Produce SD unto E, and draw E F Parallel to Sb, and draw the Lines DN, EK, dn perpendicular to SB.

Then it is, b K: B N: :Sb:SB. And bn:bK::bdq:bEq.

But $b E = \frac{Sb}{SB}BD$.

Therefore, $bn:BN::Sb \times BDq:\frac{Sbq}{SR}BDq$.

That is, $b n : B N :: \frac{b d q}{S b} : \frac{B D q}{S B}$

And fup- bd = BD

We have bn: BN:: SB: Sb. Q. E. D.

PROP. II.

The Conatus Centrifugi (or Vires Centripetz) of Bodies revolving in equal Circles, with an equable Motion, are in a duplicate Ratio of their Velocities.

The Conatus Centrifugus is equal to the versed Sine of the Angle of Circulation, and the versed Sines of Arches infinitely little are in a duplicate Ratio of the Chords of those Arches; that is, in a duplicate Ratio of the Arches themselves, and is the same with that of some Circle (or when the the Velocities (the times being supposed equal)

CONSECTARY I.

If two Bodies B, b, revolve in unequal Circles, ABD, GbE, and describe the Areas SBD, Sbd; then the Conatus Contrifugi (or Vires Contripeta) DC, dc, will be in a Ratio compounded of the duplicate Ratio of the Velocities directly, and the simple Ratio of the Radii inversely.

For if the Radii be equal, the Conatus Centrifugi are as the Squares of the Velocities; and if the Velocities be equal, the Conatus Centrifugi are reciprocally as the Radii; therefore if neither the Radii nor the Velocities be equal, the Conatus Contrifugi are in a Ratio compounded of the Rationes of the Squares of the Velocities directly, and of the Radii inversely.

This Corollary is demonstrated more universally, in one of the Steps of the Second Lemma; for it is there, $bn:BN::\frac{bdq}{Sb}:\frac{BDq}{SB}$

CONSECTARY II.

And if the Bodies B, b, describe the equal Areas BSD and bSd in equal times (that is, if $SB \times BD = Sb \times bd$, then bd:BD::SB:Sd) then the Velocities BD and bd will be reciprocally as the Radii, and the Squares of the Velocities will be as the Squares of the Radii inversely, whence the proportion $bn:BN::\frac{bd}{Sb}:\frac{dq}{Sb}:\frac{BD}{SB}:\frac{BD}{SB}:\frac{SB}{$

CONSECTARY III.

If the Velocities be directly as the Radii, then the periodic Times will be equal, and the Analogy $bn:BN::\frac{bdq}{Sb}:\frac{BDq}{SB}$ will become bn:BN::Sb:SB; that is, the Conatus Centrifugi are proportional to the Radii.

CONSECTARY IV.

If the Bodies B, b, describe the Arches B D, b d in equal Times, then the periodic Time of b will be to the periodic Time of B, as $\frac{S}{b}\frac{b}{d}$ is to $\frac{S}{B}\frac{B}{D}$; because the Times are directly as the Spaces and reciprocally as the Velocities; and because b n: B N (:: d c: D C): $\frac{b}{S}\frac{d}{D}\frac{q}{d}$: $\frac{B}{S}\frac{D}{D}\frac{q}{d}$: $\frac{S}{B}\frac{D}{D}\frac{q}{q}$: (Multiplying by S B \times S b) $\frac{S}{B}\frac{B}{D}\frac{S}{Q}$: $\frac{S}{B}\frac{B}{D}\frac{S}{Q}$: $\frac{S}{B}\frac{B}{D}\frac{S}{Q}$. Therefore the Vires Centripeta are in a Ratio compounded of the Rationes of the Radii directly, and the Spaces of the periodic Times inversely.

CONSECTARY V.

And if the Squares of the periodic Times be as

the Radii, that is, if $\frac{Sbq}{bdb}$: $\frac{SBq}{BDq}$:: Sb:SB, then it will be $b\pi:BN::\frac{Sb\times SBq}{BDq}:\frac{SB\times Sbq}{bdq}$:: (by substitution) $Sb\times SB:Sb\times SB$; that is, the Vires Contripota are equal; and because $\frac{Sb}{bdq}$ = $\frac{SB}{BDq}$, therefore $\sqrt{Sb}:\sqrt{SB::bd:BD}$; that is, the Velocities are in a Subduplicate Ratio of the Radii. Et vice versa.

CONSECTARY VI.

And if the Squares of the periodic Times be as the Squares of the Radii, that is, if $\begin{array}{c} Sb \ q \\ b \ d \end{array}$: $\begin{array}{c} SBq \\ BDq \end{array}$: $\begin{array}{c} Sbq : SBq \\ BDq \end{array}$: $\begin{array}{c} Sbq : SBq \\ Sbq : SBq \end{array}$ then it will be $\begin{array}{c} Sbq : Sbq : SBq \\ BDq \end{array}$: $\begin{array}{c} Sbq : Sbq \\ BDq \end{array}$: (by substitution) $\begin{array}{c} Sbq : S$

CONSECTARY VII.

SCHOLIUM.

And because it is found by Observation, that the Squares of the periodic Times of Planets, are as the Cubes of their Distance from the Sun; and that in equal Times they describe equal Areas about the Sun: Therefore it is manifest, that the Sun is the Centre of all the Planetary Motions; and that the Vis Centripeta (or Force of Gravity) of one Planet, is to the Vis Centripeta of another Planet, as the Square of this Planet's Distance from the Sun, is to the Square of that Planet's Distance from the Sun.

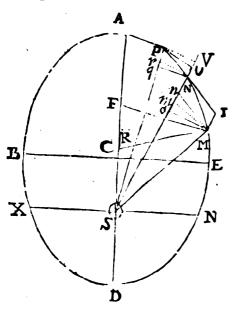

It is also evident that those Planets which are nearest the Sun move swiftest, for the Velocity of one Planet is to the Velocity of another Planet, as the Distance of this Planet from the Sun is to a mean Proportional between the Distances of this and that Planet from the Sun.

PROP.

PROP. III.

If the Area which a Body, revolving about an immoveable Center, describes by Rays drawn to the said Centre, be proportional to the Times of Description, the Elementum or infinitely little Increment or Decrement of the Paracentric Impetus is equal to the Difference or Sum of the Paracentric Solicitation (Solicitation of Gravity, or the Impression made by the Astion of Gravity or Levity, or any such like Cause) and twice the Conatus Centrifugus, viz. to the Sum, if it be the Solicitation of Levity; or to the Difference, if the Paracentric Solicitation arise from the Astion of Gravity.

From the Points P and M, draw the Lines P v, Mo perpendicular to SN; then because the Triangles P S N, N S M are equal, (the times being supposed equal) therefore (because

the Base S N is common to both) the Altitudes Pv, Mo are equal; take Nn = LM, and draw Mn parallel to LN; then the Triangles PN v, M no will be equal and fimilar, and PN = M n, and N v = o n; again in the Right Line SN (produced if need be) take SV = SP, and Sm=SM, then is NV the Difference between the Radii SP, and SN, and Mm is the Difference between the Radii SN and SM; now NV is = $(Nv) \cdot no + Vv$; and Nm is = Nn + no = om, therefore NV - Nm = Vv + mo - Nn = to the differentio-differential differential diffe tial, or infinitely little Increment or Decrement of the Paracentric Velocity, = 2 m o - N n (because V v and m o, the versed Sines of two Angles and Radii, whose Difference is incomparably little, are equal.) Now the Difference between the Radii SP, SN, and SN, SM, expresses the Paracentric Velocity, and their Difference again is the infinitely little Increment or Decrement of the said Paracentric Velocity; and mo or Vv is equal to the Conatus Centrifugus Circulationis, and Nn is = to the Solicitation of Gravity; therefore the Elementum of the Paracentric Velocity is equal to the Difference between twice the Conatus Centrifugus (2 mo) and the simple Solicitation of Gravity (Nn) or (which may be proved in like manner) to the Sum of twice the Conatus Centrifugus, and the simple Solicitation of Levity.

CONSECTARY I.

Hence it appears, that if the Solicitation of Gravity prevail, then NV-Nm will be Negative, that is, Nm will be greater than NV, and the descensive Paracentric Velocity increases, and the ascensive decreases. But if twice the Conatus Centrifugus prevail, then NV-Nm will be positive, and the ascensive Paracentric Velocity increases, and the descensive decreases.

CONSECTARY II.

If the Elementum, or infinitely little Increment or Decrement of the Paracentric Velocity be given, the Solicitation of Gravity or Levity may be found; for the Conatus Centrifugus is always given, (by Conf. 2. Prop. 2.) it being constantly in a triplicate Reciprocal Ratio of the Radii.

PROP. IV.

The Angles which a Planet describes about the Sun, in equal Times, are reciprocally in a duplicate Ratio of the Radii.

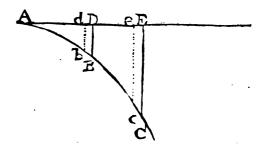

The Circular Velocities are in a Ratio compounded of the Rationes of the Angles and Radii, jointly; therefore the Angles are in a Ration compounded of the direct Ratio of the Circular Velocities, and the reciprocal Ratio of the Radii: But because in equal Times the Areas are equal, (Conf. 2. Prop. 2.) therefore the Circular Velocities are reciprocally as the Radii, and confequently the Angles are reciprocally in a duplicate Ratio of the Radii.

And such are the apparent Diurnal Motions of the Planets observed from the Sun (for Days, in such Cases, are Parts of Time little enough, especially in Planets more remote from the Sun) which are almost reciprocally as the Squares of their Distances from the Sun; so that a Planet, in a given Element of Time, describes but the fourth Part of that Angle, which it would describe at half its present Distance from the Sun.

LEMMA III.

The Spaces which a Body describes in the beginning of its Descent, are in a duplicate Ratio of the Times.

Let the Right Line A E be divided into an infinite Number of equal Parts d D, e E, & c. representing equal Moments of Time; and draw

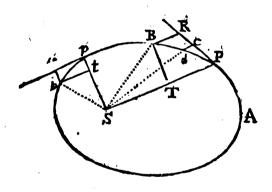

the Ordinates BD, EC, &c. proportional to the Velocities of the heavy Body, at the end of the Times represented by AD, and AE, and describe the Curve ABC. Now because the Space which a Body describes, is proportional to the Time of Description, and the Velocity jointly;

Body describes in the Moment of Time Dd, is proportional to the Restangle Db; and the Space which the same heavy Body describes in the Moment of Time Ee, is proportional to the Restangle Ee: Whence the Space which the Body describes in the Time AD, is to the Space it describes in the Time AD, is to the Space it describes in the Time AE, as the Curvilineal Space ADB, is to the Curvilineal Space AEC, but when the Body begins to descend, the Ordinates DB, EC are indefinitely near the Point A; in which Case the trilineal Figures ADB, AEB become restilineal similar Triangles, the indefinitely little Portions AB, BC being in the same streight Line. Now the Areas of similar Triangles are in a duplicate Ratio of the Homologous Sides; that is, the Area ABD: Area AEC: ADG: AEG therefore the Spaces which a heavy Body describes in the Beginning of its Descent, are in a duplicate Ratio of the Times. AEC:

PROP. V. Problem I.

If a heavy Body revolving in the Periphery of a Curve, about an immoveable Centre, describe Areas proportional to the Times; 'tis required to find the Law of the Vis Centripeta tending to the said Centre.

Suppose a Body P to be projected in the Line P R from P towards R, and let the Body at the same Time be attracted by a Force in S, so

that by a Motion compounded of the projectile and attractive Forces, it describe the Curve A P p; and let the Line P R touch the said Curve in P; draw S P, and assume any Point B in the Curve indefinitely near P; and draw B R parallel to S P, and B T perpendicular to S P; assume another Point p in the Curve; and draw S p, the Tangent p r and r b parallel, and b t perpendicular to S b, and suppose the Body describes the Arches P d; p b in equal Times; and draw d c parallel to S P: Then the Ratio of the Lineola Nascens B R to the Lineola Nascens b r, is compounded of the Rationes of B R to d c, and of d c to b r: But (Lem. 1. and Cor.) B R is to d c, as the Square of the Arch PB, is to the Square of the Arch P d; and because the Arches P B, P d are indefinitely little, they are proportional to the Triangles PSB, PSd; (Lemma 2.) that is, they are proportional to the Times the Body takes to describe them, or to the Times which the Body takes to describe the Arches P B, p b, and consequently B R is to d c, as the Square of the Time which the Body takes to describe the Arches P B, is to the Square of the Time it takes to describe the Arch P b;

again, because Pd and pb are supposed to be described in equal Times, therefore dc is to br, as the Vis Contripcta in P is to the Vis Contripcta in p; whence it is evident that B R is to br in a Ratio compounded of the Rationes of the Squares of the Times in which the Arches PB, pb are described, and of the Vis Contripcta in P to the Vis Contripcta in p; that is, (because the Times of describing the Arches PB, pb, are proportional to the Triangles PSB, pSb, or to the Rectangles $SP \times BT$, $Sp \times bt$.)

BR: br::V × SPq × BTq: v × Spq × btql

And by division BR

SPq × BTq: Spq × btq

V:v.

Or Spq × btq : SPq × BTq ::V:v:

That is, the Vis Contripeta in P is as the Solid SPq × BTq

BR

hriefly demonstrated

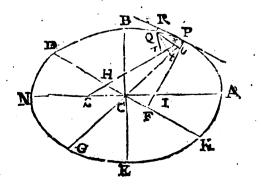

This may be more briefly demonstrated thus: If the Times be equal, B R is as the Vis Centripeta; and if the Vis Centripeta be given, then BR (Prop. 1. Lem. 3.) is as the Square of the Times; and if neither the Times nor the Vis Centripeta be equal, then BR is (supposing $V \stackrel{.}{=}$ to the Vis Centripeta in P, and T = to the Time of Description) as VT, therefore V is as $\frac{BR}{T}$; and because the Time is as the Area PSB, or as the Rectangle $SP \times BT$, therefore V is as $\frac{BR}{SPq \times BTq}$ directly, or as $\frac{SPq \times BTq}{BR}$ inversely. Q. E. D:

COROLL ART.

Hence if any Figure, as A P p, be given, and the Point S, to which the Vis Contripeta tends; then the Value of the Solid $\frac{S P q \times B T q}{B R}$ may be determined from the Nature of the Figure; and consequently the Law of the Vis Contripeta, which is reciprocally as the said Solid, may be found.

PROP. VI. Problem II.

If a Body revolve in the Periphery of an Ellipsis; its required to find the Law of the Vis Centripeta, tending to the Focus of the Ellipsis.

Let ABD be the Elipsis, and S the Focus to which the Vis Centripeta tends. Draw the Axis

AN; and AN, the Conjugate Diameter BE; draw the Line PR touching the Curve in any Point (P) and draw the Diameter P G, the Conjugate Diameter DK, PF perpendicular to DK, and Qv parallel to PR: Draw SP intersecting DK in H, and intersecting Qv in x; and draw QR parallel to SP. Then (Hayes, Art. 51.) PH = AC; draw QT perpendicular to SP; and suppose the Parameter of the Axis $\left(\frac{2 B C}{A C}\right)^{q}$

 $L \times QR: L \times Pv:: QR: Pv:: Px: Pv:: PH: PC:: AC: PC.$

 $L \times Pv :: Gv \times Pv :: L : Gv.$

 $Gv \times Pv : Qvq : : CPq : CDq$

And because Qv q is = Qx q, when Q is infinitely near P. Therefore, Qxq(=Qvq):QTq:: (by fimilar Triangles) <math>HPq(=ACq):PFq:: (Hayes, Art. 6c.) CDq:CBq.And multiplying the respective Terms of these Analogies into one another there will arise this:

Analogies into one another, there will arise this; L X & R: QTq :: L X AC X CP q: Gv X CBq X CP Viz. $L \times QR: QTq: :2 BCq \times CPq: Gv \times BQC \times CP$. $L \times QR : QTq :: 2 PC : Gv.$

But when the Point Q is indefinitely near P, then 2PC = Gv

Whence $L \times Q R = Q T q$.

And multiplying both fides of the Equation by S $\frac{Pq}{QR}$, we shall have $L \times SPq = \frac{SPq \times QTq}{QR}$.

(Cor. Prop. V.) Therefore the Vis Centripeta is reciprocally as $L \times SPq$; and because L is a determinate Quantity, therefore the Vis Centripetais reciprocally as the Square of (S P) the Distance of the Body in P from the Centre of Attraction S. Q. E. I.

GOROLLARY I.

The Parament of the Axis (L) is equal to. Q7 q QR

COROLLARY II.

If the Centre of Attraction S, and the adjacent Vertex N, be suppos'd immovable, and if the other Foci I approach nearer and nearer to S, and at last coincide with the same, then the Body will revolve in the Periphery of a Circle, and the Law of the Vis Centripeta will be the same as in the Ellipsis.

COROLLARY III.

If the Vertex's A and N be given, and if the Focus I coincide with A, and the Focus S coincide with N, then the Ellipsis A PN will become a fireight Line coinciding with the Diameter AN, and the Body will move in the fame, without any Attraction from without the Line.

. COROLLARY IV.

If the Vertex N, and the Focus of the Ellip-fis, or Centre of Attraction S be given; and if the other Focus I be at an infinite Distance from S, then the Ellipsis NPA will degenerate into a Ī.,

Parabola, and the Vis Centripeta in P will be as the Square of the Distance NP inversively.

COROLLARY V.

The same things being suppos'd, if the Focus 1 be at more than an infinite Distance from S; that is, if it full on the contrary Side of N in respect of S, then the Body will move in the Curve of an Hyperbola, and the Vis Centripeta will be reciprocally as the Square of the Distance from the Focus S.

COROLLARY VI.

If the Focus I and the Vertex A be given; and if the Centre of Attraction S be suppos'd at an infinite Distance from 1, then the Curve AP will be a Parabola, and the Vis Centripeta will be the same in every Point of the Curve; and contrarily, if a Body moving at first in a streight Line, be attracted to a Centre at an infinite Distance from the same, then that Body will move in the Curve of a Parabola, and the Centre of Attraction will be in the Axis of the Parabola, at an infinite Distance from the Vertex.

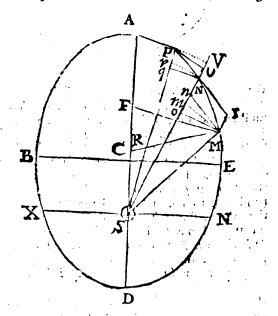

SCHOLIUM.

It may be observ'd that the Paracentric Solicitation of Gravity, and the Vis Centripeta, are Terms signifying the same thing.

PROP. VII.

The Solicitation of Gravity, or Vis Centripeta of a Planet, is to the Conatus Centrifugus of the same Planet, as its present Distance from the Sun is to 1 the Parameter of the Planetary Ellipsis.

Suppose S M = D, and L = to the Parameter of the Axis; and let $t \times L$ be a constant Plane equal to twice the Elementary Triangle

MSN: Then the Arch Mm is $=\frac{t \times L}{D}$, and $M m q \text{ is} = \frac{t^2 \times L^2}{D^2}$, and $m o = \frac{M m q}{2 S M} = \frac{1}{2 S M}$ - = to the Conatus Centrifugus.

Again,

Agair, the Solicitation of Gravity is as D_2 inversely, or as \overline{Mm} , or $\frac{t^2 \times L^2}{D^2}$ directly, or as (dividing by the invariable Quantity $\frac{1}{2}$ L) $\frac{2 \times t^2 \times L}{D^2}$ directly. Whence 'tis evident that the Solicitation of Gravity is in the Conatus Centrifugus, as $\frac{2 \times t^2 \times L}{D^2}$ is to $\frac{t}{2} \times \frac{L^2}{D^3}$, or as D is to $\frac{t}{4}D$; and because 'L is an invariable Quantity, the Rationes of the Solicitation of Gravity to the Conatus Contrifugus are proportionable to the Distances of the Planet from the Sun.

PROP. VIII.

The greatest Ascensive or Decensive paracentrick Velocity of a Planet, is when the Distance of the Planet from the Sun is equal to \(\frac{1}{2}\) of the Parameter of the Axis of the Ellipsis.

Draw S W perpendicular to the Axis AD, I say the greatest Paracentrick Velocity is in W or X. For the Solicitation of Gravity is to the Conatus Contribugus, as D is to $\frac{1}{4}$ L; and the Solicitation of Gravity is to twice the Conatus Contribugus, as D is to $\frac{1}{2}$ L; and because SW = D is $= \frac{1}{2}$ L, therefore in the Point W(or X) the Solicitation of Gravity, is equal to twice the Conatus Contribugus and (by Prop. 3.) consequently the Fluxion of the Paracentrick Velocity is = 0: Whence it is evident, that if on S as a Centre, a Circle be describ'd with a Radius $= \frac{1}{2}$ the Parameter of the Axis, it will cut the Orbit of the Planet in two Points W and X, in which the greatest Paracentrick Velocity happens.

COROLLART

The Conatus Centrifugus of receding from the Sun, is always less than the Solicitation of Gravity; for the Solicitation of Gravity is always to the Conatus Centrifugus, as the Distance of the Planet from the Focus is to ‡ part of the Parameter of the Axis; and in the Ellipsis, the Distance of a Planet from the Focus, is always greater than ‡ part of the Parameter of the Axis. Therefore, 50c.

PROP. IX.

The Impetus which a Planet acquires (during the whole time of its Motion) by the continued Attraction of the Sun, are proportional to the Angles of Circulation; that is, as the Angles of apparent Motion from the Sun.

I say, That Impetus which a Planet acquires, as it moves from A to P, is to the Impetus which it acquires, moving from A to M, as the Angle ASP is to the Angle ASM: For the Increments of those Angles (Prop. 4.) are reciprocally as the Squares of the Radii or Distances; that is (Cor. Prop. 5.) as the Solicitations or Impressions of Gravity: Therefore the Sum of these is proportional to the Sum of those; that is, the Sum of all the Impetus or Impressions of Gravity acquir'd from A to P, is to the Sum of all the Impressions of Gravity acquir'd from A to M, as the Angle at ASP is to the Angle ASM.

Vol. II.

GOROLLARY.

Hence in the Point W (in which an Ordinate to the Axis drawn through the Focus S, inter east the Ellipsis) the *Impetus* which a Planet hath acquired fince it descended from the Aphelion, is equal to half the *Impetus* acquir'd from the Aphelion to the Perihelion; and in the said Point W, the Distance of the Planet from the Sun is $=\frac{1}{2}$, the Parameter of the Axis of the Figure.

And the Impetus which a Planer, describing any Arch of its Orbit, acquires, is to the Impetus acquired in a Semi-revolution, as the Angle of apparent Motion is to two right Angles; the Impetus here meant is that impressed by Gravity or Attraction, simply considered by themselves, the contrary Impetus arising from the Conatus Centrifugus not being considered.

PROP. X.

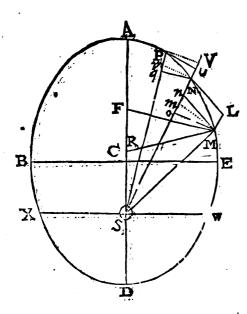

To explain the Motion of a Planet through the whole Revolution; and to show how a Planet approaches to, and again recedes from the Sun, Alternis Vicibus.

If a Planet be at its greatest Digression from the Sun, or in the Aphelion A, the Conatus Centrifugus and the Solicitation of Gravity, are less than if it were nearer to the Sun. But at that Diffance, viz. in the Aphelion A, the Solicitation of Gra-vity is greater than twice the Conatus Centrifugui, (because S A, the Distance of the Aphelion from the Sun, is greater than $\frac{1}{2}$ the Parameter S(W) therefore the Planet will descend towards the Sun in the Curve Line APMD, and (Prop. 3.) the descensive Impetus will continually increase, as in heavy accelerated Bodies, so long as the Solicitation of Gravity is stronger than twice the Conatus Centrifugus: For the descensive Paracentrick Motion increases, as long as the Solicitation of Gravity is greater than twice the Conatus Centuifugus; and therefore the descensive Paracentrick Motion will increase (although the infinitely little Increment of the Paracentrick Motion decrease at the same time) until the Planet arrive at W, in which Point the Solicitation of Gravity is equal to twice the Conatus Centrifugus; and consequently the Paracentrick Velocity is greatest at W, when the Distance of the Planet from the Sun is equal to 1 the Parameter of the Orbit: Afterwards, although the Planet continues to approach nearer and nearer to the Sun, until it come to D, yet the Paracentrick Velocity decreases; for the Solicitation of Gravity is to twice the Conatus Centrifugus, as the Distance of the Planet from the Sun, is to ! the Parameter of the Orbit; and consequently, all the while the Planet is in describing the Portion of the Orbit WD X, twice the Conatus Centrifugus is greater than the Solicitation of Gravity; and from W to D the Paracentrick Velocity decreases; which it continues to do, until the Centrifugal Impressions collected into one, from the Aphelion A, preci ely destroy all the Impressions of Gravity collected into one, from the Aphelion A, or until the Centrifugal Impetus be equal to the Centripetite Impetus. Now this happens in the Perihelion D, where the Paracentrick Velocity vanishes, and in which the Conatus Centrifugus and Solicitation of Gravity are equal and contrary, so that the Planet cannot approach nearer the Sun than it is in this Point D.

Afterwards, the Motion being continu'd: As the Planet hath hitherto approached to, so now it begins to recede from the Sun in the Focus S, and endeavours to move from D by X rowards A. For twice the Conatus Centrifugus, which began to exceed the Solicitation of Gravity in W, continues to prevail from D to X; and therefore, seeing the Planet begins to move (as it were anew) from D to X, the former contrary Impetus (mutually de-flroying each other) the Centrifugal Paracentrick Velocity increases from D to X, but the increment thereof, or the impression decreases, until the Planet arrive in X, where the Solicitation of Gravity is equal to twice the Conatus Centrifugus; therefore the greatest Centrifugal Paracentrick Velocity is in X; from X to A, the Solicitation of Gravity prevails above twice the Conatus Centrifugus; and consequently, the Centrifugal Paracentrick Velocity decreases, until the Planet arrive in the Aphelion A, in which point the Conatus Centrifugus and Solicitation of Gravity become equal and contrary, and confequently mutually destroy each other: And thus the Planet returns to A, from whence it departed, and begins and finishes new Revolutions succesfively, and without Interruption.

CONSECTARY L

Hence we have fix remarkable Points in the Elliptic Orbit of a Planet, viz. four obvious, A the Aphelion, D the Perihelion; E and B the mean Distances (for SB or SE is $=\frac{1}{2}$ the transverse Axis AD, and consequently an Arithmetical Mean between S A and S D, the greatest and least Di-

gression of a Planet from the Sun) and two more, viz. W and X, being the Extremities of the Parameter of the Orbit applied to the Axis in the Focus S, which Points happen in the greatest ascensive or descensive Paracentrick Velocity.

CONSECTARY IL

The Impetus which a Planet acquires by the Action of Gravity from A to W is equal to half the Impetus which it acquires in its descent from meter of the Axis of the Figure L (Prop. 6. Cor. 1.)

A to D, and the Impetus acquir'd from A to Wis = to that acquir'd from W to D; for the Impetus are proportional to the Angles of apparent Motion, and the Angles A S W and WSD are right An-

CONSECTARY III.

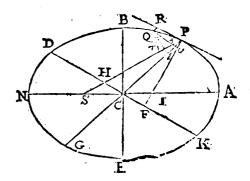

Hence to determine the Species of the Planetary Ellipsis; the Focus of the Ellipsis S is given; and the Point A where the Planet is when the Sun begins to attract it, being supposed at the greatest Distance of the Planet from the Sun, the remoter Vertex of the Ellipsis is also given, and the proportion between the Solicitation of Gravity, or Force of Gravity, wherewith the Sun begins to attract the Planet in A, and the Conatus Centrifugus in the fame Point A being known; the principal Parameter of the Orbit WX, or an Ordinate applied to the Axis in the Focus S, may be found. For SA (given) is to SW ($=\frac{1}{2}$ the Parameter of the Orbit) as the Force of Attraction in A is to a surface of the Orbit) as the Force of Attraction in A is to a surface of the Orbit). Orbit) as the Force of Attraction in A is to twice the Conatus Centrifugus, and if the Parameter be substracted from S A, the greatest Distance of the Planet from the Sun, the remainder will be to S.A. as S A is to SD; therefore AD the transverse Axis of the Ellipsis is also given: Whence the Planetary Ellipsis may be describ'd.

CONSECTARY IV.

A Planet will describe a Circle when the Solicitation of Gravity, and twice the Conatus Centrifugus are equal at the Beginning of the Attraction; for in that Case they will remain equal, there being no Cause to make the Planet approach neares to, or recede farther from the Centre of Attraction about which it revolves; but when in the Beginning the Force of Attraction and twice the Conatus Centrifugus are unequal (provided the simple Conatus Centrifugus be always less than the Attra-ction) then the said Planet will describe an Ellipsis; and if the Force of Attraction prevail, the Point where the Motion begins, is the Aphelion; or if twice the Conatus Centrifugus prevail, then the faid Point is the Perihelion.

PROP. XI.

If several Bodies rovolve round a common Centre, and if the Vires Centripetæ be reciprocally as the Squares of their Distances from that Centre, then in Ellipses, the Squares of the periodic Times will be as the Cubes of the transverse Axes of the Ellipses.

Reassume the Symbols in Prop. 6. then the Para-

 $=\frac{QTq}{QR}$, when the Point Q is infinitely near

P, and if the Times be equal, then Q R is directly as the Vis Contripeta, or reciprocally as (the Square of the Distance) SPq; therefore L is as $QTq \times SPq$; that is, the Latus Rossum (L) is as the Square of the Area $QT \times SP$; and the Area $QT \times SP$, or $\frac{1}{2}QT \times SP$ is in the subduplicate Ratio of the Parameter (L)And if the periodic Times be equal, the Areas of the Ellipses, are in a subduplicate Ratio of the

of the Ellipses, are in a subduplicate Ratio of the Parameters; and if the Parameters be equal, the Areas are proportional to the periodic Times; and if neither the Parameters nor the periodic Times be equal, then the Areas of the Ellipses are in a Ratio compounded of a subduplicate Ratio of the Parameters, and the simple Ratio of the periodic Times; therefore the periodic Times are in a Ratio compounded of the direct Ratio of the Areas, and the reciprocal subduplicate Ratio of the Parameters. Now the Areas of unequal Ellipses, are (Art. 105. Hayes No 4.) in a subduplicate Ratio of the Parameters, and the subduplicate Ratio of the Cubes of the transverse Axis jointly. Therefore the periodic Times are in a Ratio compounded of the subduplicate Ratio of the Parameters directly, the subduplicate Ratio of the Cubes of the transverse Axes directly, and the subduplicate Ratio of the Parameters inversely; that is, the periodic Times are in a subduplicate Ratio of the Cubes of the transverse Axes, and consequently the Squares of the periodic Times are proportional to the Cubes of the transverse Axes. Q. E. D.

COROLLARY.

The Squares of the periodic Times of Bodies revolving in Ellipses, are as the Cubes of their Distances from the (Focus of the Figure or) Centre of Attraction.

ATHENATORIUM, in Chymistry, is a thick Glass Cover (or Head) fixt to a Cucurbite in some Kinds of Sublimations

ATMOSPHERE. From what hath been shewn in Vol. 1. under this Word, it appears to be plainly impossible to account for so great a Rarefaction and Conderfation as is discovered to be in the Atmospherical Ait, without the Supposition of the Parricles of Matter being endued with a Rep. U.ng Vol. II.

or Levitating Force, whereby they mutually avoid one another, till they come within the Distance where the attractive Force begins. See Attraction. For as the Learned Mr. Halley observes, at the close of his Proposition about the Heights of the mercurial Cylinder, at any Elevation above the Earthy Surface. See Phil. Trans. N. 187. It seems a very bard Question, that the Texture or Composition of Parts can be capable of so great an Expansion and Contraction as is found to be in the Air, and can scarce be accounted for, from comparing it to Wooll,

or such like Spungy Bodies.
ATTAINTED, in the common Law is used particularly for fuch as are found guilty of some Crime or Offence, especially Felony or Trea on !
But a Man is also said to be attainted of Diffeism. West. 1. c. 24. and 36. and 3. Ed. 1. A Man is attainted two Ways; by Appearants or by Process. Attainder by Appearance, is either by Confession, Battel, or by Verdict. Attainder by Confession is when a Man pleads Guilty, and doth not put him-felf upon his Country for Tryal. A Man is attainted by Battel, when being appealed by another, and chusing the Combat rather than the Jury, he is vanquisht; and he is attainted by Verdict when he is found Guilty by a Jury.

ATTAINDER by Process, is otherwise called Attainder by Default or Vilary, and is where a Person slieth and is not found, after he hath been three Times publickly called in the Country, and

at last is Outlawed by Default.

ATTENDANT, in Law is used in this Sense, for one that oweth a Duty or Service to another; or after a fort dependeth upon another. v. gr. There is a Lord, Meine and Tenant. The Tenant holdeth of the Meine by a Penny, the Meine holdeth over by two Pence. The Meine releaseth to the Tenant like Printe he hash in the Lord and the Tenant all the Right he hath in the Land, and the Tenant dies: Then shall his Wife be endowed of the Land, and be Axendant to the Heir of the third part of the Penny, and the third part of the two Pence, for she shall be endued of the best part of the Possession of her Husband. They say also, that where the Wife is endowed by the Guardian she shall be Attendant to her Heir at his full Age

ATTITUDES, in Painting or Sculpture, are the proper Postures that the Figure should be placed in, so as agreeably to answer the Defign of the

Piece.

ATTRACTION. Sir Isaac Newton at the end of the Latin Edition of his excellent Book of Opticks, Qu. 22. shews that of those Bodies which are of the same Nature, Kind, and Virtue, by how much less any Body is than another, the greater is its attractive Force, in proportion to its Magnitude. Thus 'tis found that the Magnetick A traction is stronger in a small Loadstone, in proportion to its Weight, than in a larger: For the Particles of fmall Magnets, being nearer one to another, can more easily combine or join their Forces into one. Wherefore the Rays of Light, being the least of all Bodies that we know, must needs have the greatest and strongest attractive Force; and how very strongly those Particles do attract, may be collected by the following Calculation. The Attra-Elion of a Ray of Light, with regard to the Quantity of its Matter, is to the Gravity which any projected Body hath, in proportion to the Quantity of Matter in that Body :: in a Ratio compounded of the Velocity of a Ray of Light, to the Velocity of that projected Body, and of the Flex-

ure or Curvature of the Line which the Ray deferibes in the place of its Refraction, to the Curvature or Flexure of the Line which the faid projected Body describes. That is, supposing the Inclination of the Ray, to the refracting Surface be the fame with that of the Horizon. And from this Proposition he Calculates that the Attraction than the Force of Gravity on the Earth's Surface, according to the Quantity of matter in each; and supposing Light to come from the Sun thither in about seven or eight Minutes. And in the very roint of Contact of the Rays, their attracting Force may be yet much greater.

Now such a prodigious Force of Attraction in the Rays of Light cannot but have wonderful Effects in those Particles of Matter, with which they are joyned in the Composition of Bodies; and must cause that those Particles attract one another, and that they are moved variously among them-

Tis very probable therefore that the fmall Particles of Bodies have certain Virtues, Powers or Forces, by which at a small Distance they may act not only on the Rays of Light to Refract, Reflect or Inflect them, but also mutually on one another, in order to produe most of the Phanomena in Nature. 'Tis very well known that some Bodies do thus act on one another by the Attractions of Gravity, Magnetisim and Electricity: And these Examples shew what the Reason and Order of Nature is, and make it very probable that there may be yet some other Attractions, for Nature is very uniform and agreeable to it self.

Now the Attractions of Gravity, Magnetismand Electricity, extend themselves to considerable Distances, and therefore are commonly observed and taken notice of by every one. But 'tis very possible that there may be many others also, which are contain'd in such narrow Limits, and performed within such a little Distance, as yet to have escaped

all our Observations.

For when Salt of Tartar runs per deliquium or, dissolves into an Oil as the Chymists call it, 'tis very probable that it is occasion'd by some Attraction which is mutual between the Particles of the Salt, and those of Water, which rove up and down in the Air in the Form of Vapour; and the Reason why common Salt, Nitre and Vitriol, don't run thus per deliquium, is because they are without any fuch Attractions; and when Salt of Tartar hath drawn as much Water out of the Air as its Quantity will bear, it draws no more, because when it's Saturated, the Attraction is at end. It must be also from its attractive Force, that the Water thus imbibed by the Salt, cannot be separated from it in Distillation, but by a very violent Heat; whereas, Water will usually distill off with a very easy Hear, from other things. 'Tis much the same thing with Oil of Vitriol, which till it is Saturated with it, attrass the Moissure of the Air in very considerable Quantity, and afterwards parts with it with great Difficulty. And when Oyl of Vitriol and Water being mingled together in the same Vessel, grow so hor, as it is known they will do, it appears plainly by that Heat, that a very great Motion is excited in the Particles of the two Liquors; and from that Motion it appears that their Particles in mingling Coalesce with a great Force and Impetulioty, and consequently attrast or gravitate towards one another with an accelerated Motion. Thus

also when Aqua fortis, Spirit of Vitriol or Nitre, or any other corrofive Menstruum dissolves Filings of Iron or any other Metal with Heat and Ebullition; 'tis plain that the Acid Particles of the Menstruum attract and rush upon those of the Metal with a very great Force, enter into their Pores with violence, and disjoyn or separate the small Corpuscles of which the Metal is composed, one from another; tho' the Particles of the Acid Menstruum are drawn off at first when they are made by a moderate Heat, yet after their Union they with the Parts of the Metal, cannot be drawn off as yet by Distillation, but by a most intense and violent Heat.

When Spirit of Vitriol poured upon common Salt or Nitre, makes an Ebullition and Coalesces with the Salt; and when after this, if the Compost be distilled, a Spirit of Salt or Nitre will be drawn off much easier than without such a Mixture; it shews plainly that the Fixt Alkali of the Salt Attracts the Acid Spirit of the Vitriol much more strongly than it doth its own Spirit, and because it cannot detain them both, it parts with its own Spirit freely. When Oil of Vitriol is distill'd from an freely. When Oil of Vitriol is distill'd from an equal Weight of Nitre, and from both is drawn off a Compound Spirit of Nitre, and that Spirit is poured upon half its Weight of Oil of Cloves, of Caraway-Seed, or any ponderous Oil distill'd from vegetable or animal Bodies, or upon Oil of Turpentine, mix'd with a little Balfam of Sulphur to thicken it; when in any of these Mixtures an actual Flame will be produc'd, 'tis apparent that the Particles of the Spirit and Oil must rush towards one another with a strong accelerated Motion, and struggle and fight with a most violent Force and Impetus. 'Tis the same thing when that compound Spirit is poured upon well rectified Spirit of Wins, for a Flame will immediately arise on their Mixture. The Pulvis fulminans, as they call it, which is compos'd of Sulphur, Nitre and Salt of Tartar, goes off with a more quick and violent Explosion then even Gun-powder it self. The Acid Spirits of the Sulphur and the Nitre rushing together with such Violence, that all the Parts of the Powder are rarified, as it were, at once and all together.

Thus also common crude and impure Brimftone it self, if it be powder'd and mingled with an equal Weight of Filings of Iron or Steel, and with a little Water be made up into thick Paste, like Dough, the Sulphur will act so upon the Iron, that in five or fix Hours time, the Mass will grow so hot as not to bear handling, and at last will plainly burn and emit a Flame. Now from all these Experiments, and from the Consideration of the great Quantity of Sulphur that there is in the Earth, and of the great Heat of the inner Parts of it, from the hot Springs, the burning Volcanos, the Fire Damps and burning Exhalations that are found in the Bowels of the Earth; from the Considerations of Earthquakes, Whirlwinds, and the wonderful Convulsions that the Sea is sometimes put into; we may understand, That the Particles of Bodies, before at Rost (and 'tis the same thing also in all Fermentations, & (5)c.) may be and are pur into most violent Motions, by some Principle of very great Force and Activity, which yet doth not difcover it self till the Parts approach and come very near one another; but that they do then attract one another with great Force and Rapidity, and thereby produce their wonderful Effects.

Again, when Oil of Tartar per deliquium is poured upon the Solution of any Metal, there is a Precipitation of the Metalline Particles produc'd,

which all fall down to the Bottom of the Vessel; From whence it appears, That the Particles of the Liquor are more strongly attracted by those of the Oil of Tartar than by those of the Metal, and by that Attraction are precipitated down from the Liquor: So also when a Solution of Iron in Aqua Fortis will dissolve Cadmia, and precipitate its Iron; or when a Solution of Copper will dissolve Iron, and let gothe Copper (fee depart) &c. this seems to prove plainly, that the Acid Particles are more strongly attracted by those of the Metal that they dissolve, than by those of that which is let go. When we find that those Menal which is let go. struums which will dissolve one Kind of Metal or mix'd Body, won't touch another, it must be attributed to the Attraction that there is between the Particles in some Cases, and there being no such in the other. And in the general it is owing to this Principle, that Heat, according to Aristotle's Definition of it, doth congregate or gather together homogeneous Things, and separate those which are of a different Nature: After this he shews how on this Principle, and by the Help of Chymical Analyses, to come to the Knowledge of what Kind of Parts natural Bodies are composed.

The Reason why Drops of Water, or other li-

quid Body usually put on a spherical Form, he saith, is also from the mutual Attraction of their Parts; after the same Manner as the Earth and Seas make one round Body by the mutual Attracti-

on or Gravitati n of their Parts.

And because when Metals are dissolv'd in Acids, they attract but a small Portion of the Menstruum to them, therefore he concludes, that their Force of Attraction extends but a very little Way. And as in Algebra, when affirmative Quantities vanish and terminate, their negative begin: So in Me-chanicks, where Attrastion ceases to exert it self, a Kind of repelling Force should succeed; and that there is in Nature such a Force, seems to follow from the Reflection and Inflection of the Rays of Light; for in both these Cases, the Rays are repelled from Bodies without the immediate Contact of the reflecting or infletting Body. And the same Thing seems concludable from the Emission of Light; for a Ray of it, as soon as it is shaken out of the lucent Body by the vibrating Motion of its Parts, and is got without the Sphere of its Attraction, is propelled with a very great Degree of Velocity; and the same Force which in Reslection serves to repel the Ray, now serves to emit

The Production of Air and Vapours doth also shew, that there is a repelling Force; for those Particles which are forced out of the Bodies by Heat or Fermentation, as foon as ever they are out of the Sphere of the Attraction of these Bodies, do immediately recede from it, and from another with a great Force, and do avoid coming together again; so that sometimes they take up above a Million of Times the Space which they did before, when they were in the Form of a Dense Body, which is so very great a Contraction and Expansion as is hardly conceivable, if the Particles of the Air be only elaftical, ramose and coiled up one within another, like the Tendrels of Vines, or Springs of Watches, as some have imagin'd: Nor indeed, will any other Hypothesis account for this wonderful Phænomenon, but this of their being endu'd with a repelling Force, by which they mutually avoid one another, as well as the Bodies from whence they at first came.

ATTRIBUTIVE Justice: See Justice. AVERCORN, was anciently a referred Rent in Corn paid to Religious Houles by their Tenants or

Farmers.

AVOIR DU POIS, in French fignifies to be of just Weight; but in Law 'tis taken in two Senses, for a peculiar Kind of Weight of sixteen Ounces to the Pound, and thereby distinguish'd from Troy. Weight, whose Pound hath but twelve Ounces: And also such Merchandize and Goods as are weighed by this Weight, and not by Troy Weight, as Pitch, Tarr, Rosin, Wax, Flesh, Tallow, Cheese, Soap, Hemp, Flax, Coppper, Tin, Lead, Steel, Iron, &c. Mr. Ward saith, he found that I Pound Avoir du pois was exactly 14 Ounces, 11 Peny-Weights, 15 + Grains Troy: And he faith; he can find no Law for the Introduction of this Weight, nor at what Time it came into Uses which it feems to have done only by Custom.
See Weights in Vol. I.

AURELIA, is a Term used by the Natural Historians for the first apparent Change of the Eruca of any Insect: Tis the same with what

some Writers call Nympha.

AURISCALPIÚM' is an Instrument to clean

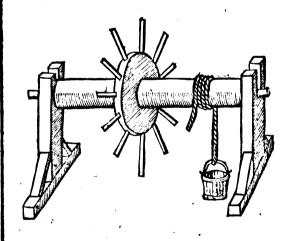

AURORA Borealis is a white Pyramidal Glade of Light, which Dr. Childry, Mr. Cassini and Mr. Derham have mentioned as appearing like the Tail of a Comet in the Northern Hemisphere of the fix'd Stars.

AUXILIUM ad filium Militem faciendum & ad filiam maritandam, was a Writ formerly directed to every County, where the King or other Lord had Tenants, to levy of them a reasonable Aid to-wards the knighting of his Son, and Marriage of his Daughter; but this is now utterly taken away by a Statute made 12 Car. 2. c. 24.

AXIS in Peritrochio. See its Desc

See its Description in

Vol. L

In this Instrument, and all such like, (as all Crane-wheels, Mill-wheels, &c. the Vis Matrix, which is to sustain or lift up any Weight, need only be to such Weight as the Perimeter of the Axis A B is to that of the Tympanum or Peritrochium C D; and then there will be an Aquilibrium.

From the Fabrick of the Engine, 'tis plain, that the Weight Wis at every Revolution of the Axis rais'd so much, as is the Girt of the Axis; and consequently the larger the Axis, the quicker rises the Weight (with a Proportionable Power) but yet the harder: and the less the Axis is, the slower rises the Weight, but the easier.

Whetefote

Wherefore if the Weight be to the Power, as the Perimeter of the Peritrochium is to the Perimeter of the Axis, then will the Velocity of the Power to that of the Weight, be as the Weight to the Power; and consequently the Moment of the Power will be equal to that of the Weight. Wherefore 'tis plain, that the greater the Perimeter or outermost Wall, the longer the Stick or Lever DC: Or on the other, the lesser the Diameter of the Axis, the easier will the same Force move the Weight assigned.

AYDE, in Law, is where a particular Proprietor is impleaded, and not being able to defend the Thing for which he is so impleaded, he prayeth syde of some better able: which is done two Ways, 1. In a Plea real, and Tenens petit auxilium de A B sine quo respondere non potest. 2. In a Plea personal, and then the Defendant, petit auxilium

ad manutenendum Exitum.

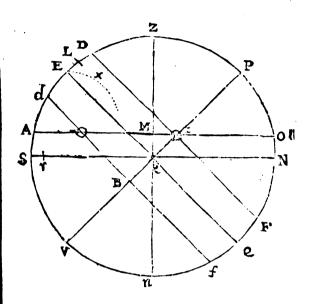

AYEL is a Writ which lies where the Grand-father (called by our common Lawyers Besayel, it should be Besayeul) was seized in his Demesne, as of Fee of any Lands and Tenements in Fee Simple, the Day that he died, and a Stranger abaseth and entereth the same Day, and dispossesseth the

ASIAMENTA, Easements, in Grants of Conveyance and Demise did include any Liberty of Passage, Hich-way, Water-course, or other customary Benefit for the Ease and Accommodation of the Owners or Inhabitants of any House, or the

Tenants of any Land. Kennet's Glossary.

AZIMUTH of the Sun. To find it-readily by projecting Part of the Analemma, having the Latitude of the Place, and the Sun's Declination and Altitude: With 60 of the Chords draw the Circle PEZ for the Solstitial Colure or Meridian of their Place, and cross it in the Center with the 2 Lines Z n and S N, at right Angles to another for the Azimuth of E and N, and for the Horizon of the Place. Set the Latitude from N to P, fo shall P be the Pole of the World: and fet it also from the Zenith in Z to E, and draw E CQ for the Equinoctial, draw also P U for its Axis. Then

to D, and from Q to F, if it be North Declination; or from E to d, and from Q to f, if it be South, and draw the respective Parallel to the Equinoctial DF, or df: Then set the Sun's Altitude from S to A, and from N to O, and draw

the Parallel to the Horizon, A O, where this Interfects, the Parallel of Declination will be the Reprcfentation of the Sun's Place, as at 1 in Summer, or @ 2 in Summer. Fit then the Sector to the Radius AM, and MO, or M o 1, or M o 2 thall be to that Radius, the Sine of the Sun's Azimuth from the East or West Southwards, according to the Time of either Before or Afternoon.

If no Sector be at Hand, you may measure the Azimuth on the Chords to the Radius of the Diagram thus; Set M A from the Center C to r in CS, on which Point r, as a Center, with the Extent MO 2 strike above the Arch x; for then a Ruler laid from C the Center, just to touch the Convexity of the Arch x, will cut the Limb in L, and then L S measur'd on the Chords, will from the Chords set the Sun's Declinitian from E I give you the Degrees of the Azimuth.

BAR

ABYLONISH Hours. The Babylonians, Persians, and Syrians, 500, accounted their 24 Hours of the natural Day to begin from Sun-rising, and to continue till the Sun tetting of the next Day. Wherefore Hours thus accounted, and thus put in (as is column) among the Furniture of Dials, are in Dialling called the Babylanish Hours.

BACK and Bottom Nails, are such as are made with flat Shanks that they may hold fast, and yet not open the Grain of the Wood. They are used for nailing Boards together for Coolers, for Gutters to fave Water under the Eaves of a House, or for any Vessel made with Planks or Boards, and

design'd to hold the Liquors.

BALDACHIN, in Architecture, is a Building in Form of a Canopy or Crown supported by Pillars, often serving for the Covering of an Altar. Some also call the Shell over a Door by this Name and pronounce it Baldaquin.

BALLISTERS, are a Row of small Pillars which support a Rail. They are sometimes called Bannisters, and are placed on Stairs, and in the Front of Galleries, Balconies, &c.

BANK, is a Carpenter's Term for a Piece of Firwood unflit from 4 to 10 Inches Square, and of

any Length.

BANNERET, was anciently a Knight made in the Field with the Ceremony of cutting off the Point of his Standard, and making it as it were a Banner. And this was accounted so Honourable a Knighthood, that they were allowed to display their Arms in the Field in the King's Presence as Barons do. They were next to Barons in Dignity. Henry VIIth made divers Bannerets upon the Cornish Rebellion, A.D. 1495: See Selden's Titles of Honour, Camden's Britannia, Sir Tho. Smith, Lib. de Rep. Angl. c. 18. BARBICAN, is a Term in Architecture taken

from the French, and signifies any Outwork be-

longing to a great Building.

BARCO-Longo, is a small, low, long, sharp built Vessel without a Deck, going with Oars and

Sails; much used in Spain.

BARGAIN and Sale, in Law, is a Contract made of Mannors, Lands, Tenements, Hereditaments, and other things, transferring the Property thereof from the Bargainer to the Bargainee. The Author of the new Terms of the Law faith, it ought to be for Money, &c. and that the Fee-simple passeth thereby, though it be not said in the Deed, To have and to hold, the Land to him and his Hoirs; and though there be no Livery & Seifm made by the Vender, so it be by Deed, indorsed, fealed, and enrolled either in the County where the Land lies, or within one of the Courts of Record at Westminster, and this within 6 Months after the Date of the Deed: According to 27 H.8. c. 16.

BARK, or Barque, is a Vessel with 3 Masts, viz. Main-mast, Fore-mast, and Mizen-mast, and carrying usually about 200 Tuns.

BAROMETER. In Phil. Tran. N. 292. there is a pretty Experiment of Mr. Hawksbee, to shew the Cause of the Descent of the Mercury in the Barometer in Storms, to be the collateral Pressure or Current of Wind on the Surface of the stagnant

Mercury in the Ciffern, which abates the Force of the Perpendicular Pressure, or the usual Gravity of the erect Column of Air, equal in Base to the Orisice of the Tube.

BAROMETER Portable, is one that can be fasely and conveniently carried about from Place to Place, without the Danger of spilling the Mercury out of the Cistern, or letting the Air get in at the Bottom of the Tube, or of the Mercury included in the Tube, breaking the Top of it off by the Motion it will be put into by being carried from one Place to another. You may prevent the two former Inconveniencies by tying fome gentle Leather fast over the Brim of the Cistern, which must be of Glass or close grained Wood; and must have a Neck or Hollow round the Outlide of the Brim to tie on the Cover of Leather. And the last may be remedied, by either a way to screw or squeeze the included Mercury quite up to the Top of the Tube, so that the Tubein its Carriage from Place to Place shall be always full; or else by pinching the Head of the Tube at about an Inch from the Top, so as to make it there have a very narrow Neck, not so big as a Straw: By which Means the Force of the Mercury striking against the Top, will be very much bridled, and there-fore the Tube secured from having its Top broken

BARON hath divers Significations: First, 'Tis used for a Degree of Nobility next to a Viscount. Some of our Historians say, that soon after the Conquest, all Barons came to Parliament, and sat as Peers in the upper House of course; but they being then very numerous, it grew an Order and a Custom, that none should come, but such as the King thought fit to Call by Writ, which Writ ran then, pro hac vice tantum. But this State of the Nobility being very precarious, and depending sole-ly on the Prince's Pleasure, they at length got a surer hold, and obtained of the King Letters Patents; and these were called Barons by Patent or Creation, whose Posterity are now Lords of Parliament. And Cowel saith, there are nevertheless Barons by Writ, as well as by Letters Patents; and that those are distinguished from these by having their own Sirnames annexed to the Title of Lord: whereas Barons by Patent are named by their Baronies. The Original of Barons by Writ, Cam-den refers to Henry 2. and Barons by Patent or Creation commenced in the Time of Rich 2. To these Segar (Norroy) adds a third Kind of Baron, which he calls Baron by Tenure; and fuch are the Lords the Bishops, who, by virtue of Baronies annexed to their Bishopricks, sit in the upper House and are called Lords Spiritual.

BARON is also an Officer; as Baron of the Exchequer, of which the Principal is called Lord Chief Baron, and three others in that Court are

his Assistants.

There are also Barons of the Cinque Ports, which are two Members of the House of Commons chofen at each Port, and at the two Ancient Towns of Winchelfea and Rye.

BARON is also used for the Husband in Relation to the Wife; which two in Law, are called

Baron and Fine.

The

The Chief Magistrates also of the City of London, before they had a Lord Mayor, were called

Ever fince the Reign of William the Conqueror, the Bishops hold their Temporaries per Baroniam; and by that are obliged to attend the King in Parliament.

Sir W. Temple, in his Essay on Heroick Virtue, says, that Baronies were originally the larger Shares of the Lands of conquer'd Countries, which the Northern Invaders (such as the Goths, & c.) used to divide among their Generals and Chief Commanders; as the smaller Shares divided amongst the Soldiers were called Feuda or Fees; and he guesses the Word Baron to be of Northern Original.

BASIL is the floping Edge of a Chiffel, or of the Iron of a Plane used in Joinery.

BATCHELOURS, i. e. Basse Chevaliers, were Anciently a lower or inferior Sort of Knights, as distinguished from Barons and Bannerets, which then were reckoned the Chief or Superior Knights. And now our lower Order of Knights which are inferior to Baronets, are called Knights Batche-lours. And so in our Universities, there is an Academical Degree of Batchelours, (who have the Title of Sir) and which is inferior to that of Masters and Doctors.

BATTEN is the Workmens Name for a scantling of wooden Stuff from two or four Inches broad, and about an Inch thick; the Length is pretty considerable, but undetermined as to Num-

bers

BEAD, in Architecture, is a Moulding which in the Corinthian and Roman Orders is cut and carved into short Embossements, which look like Beads born in Necklaces: And sometimes an

Aftragal is thus carved.

A Bead plain is sometimes set also on the Edge of each Fascia of an Architrane. Its Convexity is usually about a Quarter of a Circle, and differs from a *Boultine* only in not being fo large. Bead is often placed on the lining Board of a Door-Case, and on the upper Edges of skirting Boards.

BEAM, in any Building, is a Piece of Timber lying across it, and into which the Feet of the principal Rafters are framed. No Building hath less than two of these Beams, viz. one at each Head; and into these Beams the Girders of the Garret Floor are framed; and if it be a Timber Building, into them the *Teazle Tenons* of the Posts are also framed. These *Teazle Tennons* stand at right-Angles to those which are made on the Posts to go into the Raisons, and the Relish or Cheats of these Teazle Tennons stand up within an 1. Inch of the Top of the Raison; and then the Beam is cauked down (which is all one as Dove-tailing across) till the Cheeks of the Mortices in the Beam conjoin with those of the Teazle Tennon on the Pofts

BEARER, in Architecture, is a Post or Brick Wall, which is trimmed up between the two Ends of a Piece of Timber to shorten its bearing, or to prevent its bearing with the whole Weight at the Ends only

BEAUPLEADER is, in common Law, a Writ upon the Statute of Malridge for not fair Pleading ; and this lies where the Sheriff, or other Bay-lift in his Court, will take a Fine of the Party, Plaintiff or Defendant, for that he pleaded not fairly.

BEDMOULDING, in Architecture, is a Term used by the Workmen for those Members in a Cornish, which are placed below the Coronet or Crown; and now-a-days a Bedmoulding usually consists of these 4 Members, 1. an O-----G. 2. a List, 3. a large Boultine, and 4thly, under the Coronet another List.

BEDRIP, Bedrepe, was the Customary Service which inferior Tenants formerly paid to their Lords, in cutting down their Corn, or doing any

Work or Labour in the Field.

BENDS, in a Ship, are the same with the Wailes or Wales, which are the outmost Timbers of a Ship on which the Men fet their Feet in climbing up: They are reckoned from the Water the first, second, and third Bend or Wail. They help much to strengthen the Ship, and have the Beams Knees and Foot hooks bolted into them.

BENEPED: They say at Sea a Ship is benepped, when it being a Nepe-Tide, the Water doth not flow high enough to bring her off from the Ground,

out of the Dock, over the Bar, &c.
BENEFICES. All Church Preferments, except Bishopricks, are by some called Benefices: Vid. Godolph. c. 18. And all Benefices are by the Canonists sometimes called Dignities. But we now apply the Word Dignity to Bishopricks, Deaneries and Archdeaconries, and as some will have it to Prebends.

BENEFICES are either Parsonages, Vicarages,

Parsonages, are Churches endowed with Glebe, Manse, Tythes, and all other Duties payable by the Parishioners.

Vicarages, are Benefices which were created for the Maintenance of such Clergymen as served in Churches, where some or all the Tythes were impropriated. At first the Vicar was a meer Curate; but by Degrees some of them got a settled Maintenance distinct from the Impropriator, which consisted of a Manse and Glebe, and some Portions of Tythes usually; but in some Places only a Pension from the Impropriator. And these are what the Law calls perpetual Vicars, or Vicars endowed.

Donatives, are such as being exempt from the

lurisdiction of the Ordinary are visitable only of the King or other Secular Patron, who puts his Clerk into Possession of the Benefice, by Virtue of an Instrument under Hand and Seal, without any Inflitution or Induction, and without any Examina-tion by the Ordinary. But the Clerk is obliged to subscribe the *Declarations*, and to take the Oaths enjoined by 14. c. 2. and 1. W. and M. the former before the Bishop in whose Diocess the Donative lies, and the latter before the Patron, faith Watfon. And if it be a Benefice with Cure, he is also bound to subscribe the 39 Articles before the Bishop, to read the Common-Prayer, and to make the same Declaration as other Incumbents do.

BENEFICIO primo Ecclesiastico habendo, is z. Writ drected from the Queen to the Chancellor or Lord Keeper, to bestow the Benefit that first shall fall in the Queen's Gift, above or under such Value, on this or that particular Man.

BENÉVOLENCE is used both in our Statutes

and Chronicles, for a voluntary Gratuity given by

the Subjects to the Sovereign.

BESANTINE was a Piece of Money coined by the Western Emperors at Byzantium or Constantinople, and was of two Sorts, Gold and Silver, formerly both Current in England: The Silver Bejantine was the Value of two Shillings, and the Gold

was of the Weight of a Ducket, as Chaucer seems

Kennek's Glossary. to represent.

BENEFICIUM Cedendarum Astionum, is the Right which one Surety hath who is fued for the whole Debt, to force the Creditor by Exception to assign over his Assign against the rest of the Sureties, or else he shall not force that one to pay the Debt.

BENEFICIUM Divisionis, in the Civil Law, is a Right by which the Creditor shall be forced, by way of Exception, to fue each Surety for their Share and Proportion, especially when the rest of the Sureties are under the Jurisdiction of the same

Judge, and able to pay.

BENEFICIUM Ordinis sive Excussionis, in the Civil Law, is a Right by which the Surety can by way of Exception force the Creditor to sue the principal Debtor, before he shall recover against him as the Surety, except the Surety was given judicially in a Cause depending.

BIRDS, are either Land-fowl or Water-fowl: Of Land fowl, some have crooked Beaks and Talons; and of these some are Carniverous and Rapacious, being call'd Birds of Prey; some Frugiverous, and these are called by the general Name of Parrots. Of Birds of Prey some are Diurnal, preying in the Day Time; and of these they reckon a greater and lesser Sort: The greater are either of a more bold and generous Nature, as the Eagle Kind; or of a more cowardly and fluggish, as the Vulture: The lesser Diurnal Birds of Prey, in Latin are called Accipitres, the Hawk Kind; and these are either of a more bold and generous Nature, and are wont to be reclaimed and manned for fowling, and are called Hawks; which our Falconers distinguish into Long-winged, as the Falcon, Lanner, Esc. whose Wings reach almost as far as the End of their Train; and short-winged, as the Goshawk and Sparrow Hawk, whose Wings, when closed, fall much thort of the End of their Trains. Those of the Hawk Kind which are of a Nature more cowardly and fluggish, or else indocile, are neglected by our Fakoners, and so live at large; and of these also there is a greater Sort, as the Buzzard Kind, and a lesser, as the Butcher-Bird or Shrike (about as big as a Black-bird, and found in England). The Bird of Paradife, which is exotick.

Of Birds of Prey with crooked Beak and Talons, some are Nocturnal, as the Owl kind, which fly and prey by Night; and these are either horned or eared, as the Eagle-Owl and Horn-Owl, &c. or without Horns, as the Brown Owl, Grey-Owl, &c.

There is a fort of Land-Birds with crooked Beak and Talons which is called Frugiverous, because though they do sometime eat Flesh, and so are of the Carnivorous and Rapacious Kind, yet they eat Fruits too; and these are known by the general Name of Parrots, and are distinguished into three Sorts according to their bigness, the greatest Size being called Maccaws; the middle fized, and most common, Parrots and Popinjays; and the least fort Parrakeets; and all this Kind make use of their Beak in climbing, and move the upper

Land-Birds that have their Bill and Claws more Arait, are distinguished into three Sizes. The greatest Kind are such as by reason of the Bulk of their Bodies, and smallness of their Wings cannot fly at all; these are Exotick Birds of a singular Nature, such as the Offrich, the Coffinary, and the Dodo. The middle sized Kind are divided by their Bills into such as have large, thick, strong, and

Vol. II.

long ones; some of which feed promiscuously on Fleth, Insects, and Fruits, as the Crow Kind, which are wholly black; and the Pie Kind, which are party coloured: Some feed on Fish only, as the King's-fisher; and some on Insects only, as the Wood-pecker. And into such as have a smaller and a shorter Bill, whose Flesh is either white, as the Poultry Kind; or blackish, as the Pigeon and Thrush Kind. The least siz'd Kind of Land-Birds with straight Bills and Claws, are called small Birds; and these are of two kinds, viz. soft beaked, which have slender, straight, and pretty longish Bills most of them, and feed chiefly upon Infects; or bard beaked, which have thick and hard Bills, and feed mostly on Seeds,

Water fowl, are either such as frequent Waters and watry Places to feek their Food; and these are all cloven-footed, and generally havelong Legs, and those naked or bare of Feathers for a good way above the Knees, that they may the more conveniently wade in Waters. Of these they reckon two Kinds; a greater, as the Crane, Jabiru, &c. and a lesfer which are either Pisciporous, feeding on Fish, as the Horon, Spoon-bill, Stork, &c. or Mulfuckers and Infectivorous: Of which some have very long Bills, which are sometimes crooked, as in the Curlew and Whimbrell; and sometimes straight, as in the Woodcock and Godwitt. Others have middle siz'd Bills, as the Sea-pie and Red Ibank, &c. and a third fort have short Bills, as the Lapwing and Ploner. Those are reckoned short Bills which exceed not an Inch and $\frac{1}{2}$; middle fiz'd are between two Inches $\frac{1}{3}$ and $\frac{1}{2}$; and long Bills above two Inches $\frac{1}{2}$

There is another Kind of Water-fowl which swim in the Water; some of which, as the Moor-hen and Coot, &c. are cloven fucted, but most are whole footed: And of these some few havevery long Legs, as the Flammant, the Avosetta, and Corrira, (see Willoughby, Part 2. & 2) but mostly they are /hort leg'd: Of which some few have but three Toes on each Foot, as the Penguin, Razor-bill, &cc. but generally they have four Toes on each Foot; and these either all connected together by intervening Membranes, as in the Pelican, Soland Goofe, &c. or more usually with the back Toe loofe: And this Kind are either narrow bill'd, or broad bill'd; those with narrow Bills have them either blunt and hooked at the Tip, of which fort some are ferrate, as in the Diver-kind, and some not toothed, as in the Puffin; or sharp pointed or straighter, of which fort some have long Wings, as the Gull Kind; and some shorter, as those Diving Birds called Donckers. Those with broad Bills may be divided into the Goofe Kind, which are larger, and the Duck Kind which are smaller; and these latter into She Ducks, or River or Plash Ducks. Most Water-Fowls have a fhort Tail; and none of this Kind have their Feet disposed like Parrots and Woodpeckers, that have two Toes forward and two backward, none having more than one back Toe, and some none at all.

BINDING Joysts, in Architecture, are those Joysts in any Floor into which the Trimmers of the Stair-Cases and Chimney-Ways are framed; and these should be stronger than common

Joysts.

BISHOP. The whole Process of the Creation of a Bithop, according to the English Law, is thus. On the Vacancy of any See, the Dean and Chapter are to certify the King thereof in Chancery, and to request his Leave to chuse another Bishop. The King, when he pleases, sends his Conge de Estires

Estire, or Leave to elect to the Dean and Chapter, nominating the Perion whom he thinks fit to have The Dean and Chapter are obliged within twenty Days after the Receipt of this Conge de Estire to make the Election, which being accepted by the Ferson elected, is certified both to the King and the Archbishop of the Province. On this the King grants his Royal Assent under the Great Seal, directed to the Archbishop, together with a Mandate to Confirm and Confecrate him. The Archbithop gives a Commission to his Vicar General to proceed to Confirmation, which is a long formal Process, of which the most observable Parts are two, viz. a Citation of all such as have any Objections against the Rishop Elect, to appear before them and offer them; and then a Deduction of all that has past in relation to the Election and the Royal Assent; the Particulars whereof are exhibited by the Proctor of the Dean and Chapter to the Vicar General. After this the Oaths of Supremacy, Simony, and Canonical Obedience are taken by the Bithop Elest; on which Sentence is read, and subscribed by the Vicar General, whereby the Election is ratified and decreed to be good. Next to this follows the Confectation, which is performed by the Archbishop and two other Bishops: Then the Archbishop sends a Mandate to his own Archdeacon, to install the Bishop in that Cathedral Church which belongs to his See; and this is oftnest done by Proxy. And the publick Notary there present, records the whole Process in an Authentick Instrument to be kept to Posterity; and after this the new Bishop is introduced to the King to do Homage. On his Confecration the Bishop hath a Right to his Temporaltics, but he cannot sue for them till his Consecration be certified by the Archbithop; but the King may grant the Bithop his Temporalties immediately after his Confirmation. By his Confirmation he is instated in the Jurisdiction of his Diocese, so as to excommunicate and certify it; and therefore the Power of the Guardian of the Spiritualties ceases from that Time forward. Clergyman's Vade Mecum.

BISSEXTILE. To prevent all Ambiguity which may arise on the Account of the Intercalation of a Day every fourth Year, 'tis appointed by the Statute de Anno Bissextili, 21. H. 3. that the Day increasing in the Leap-Year, and that next before,

shall be accounted but as one Day.

BLACKNESS. The Incomparable Sir Iface Newton in his Opticks, shews, That for the Production of Black Colours, the Corpuscles must be Less than any of those which exhibit other Colours, because at greater Sizes of the component Partieles, there is too much Light reflected to constitute this Colour; but if they be a little less than is requisite to reflect the White and very faint Blue of the first Order: (Vid. Book 2. Obj. 4.17, and 18.) they will reflect so little Light as to appear intensely Bluck, and yet may perhaps reflect it variously to and fro within them so long, till it happen to be stiffed and lost: by which means they will appear Black in all Positions of the Eye without any Transparency.

And from hence it appears why Fire, and that yet more subtle Dissolver Patrefaction, by dividing the Particles of Substances, turn them Black: Why small Quantities of black Substances impart their Colour very freely and intenfely to other Substances to which they are applied; the minute Particles of these, by reason of their very great Number, easily over spreading the gross Particles | Glossary.

of others. Hence also it appears, why Glass ground very elaborately with Sand on a Copper: Plate, till it beswell polithed, makes the Sand, together with what by rubbing is worn off from the Glass and Copper, become very black: And why black Substances do soonest of all others become hot in the Sun's Light, and burn; (which Effect may proceed partly from the Multitude of Refractions in a little Room, and partly from the easy Commotions of so very small Particles:) And also why Blacks are usually a little inclined to a bluish Colour; for that they are so, may be seen by illuminating white Paper by Light reflected from black Substances, where the Paper will usually appear of a bluish White; and the Reason is, that Black borders on the obscure Blue of the first Order of Colours describ'd in the above-mention'd 18th Obfervation, and therefore reflects more Rays of that Colour than of any other.

Tis necessary also to the Production of Blackness in any Bodies, that the Rays be stopt, retain'd, and lost in them; and these conceive Heat (by means of a burning Glass, &c.) more easily than other Bodies, because the Light which falls upon them is not reslected outwards, but enters the Bodies, and is often reflected and refracted in them

till it be stifled and lost.

BLOOD-RED Heat, is the last Degree of Heat given by Smiths to their Iron in the Forge, and is used only when Iron hath already its Form and Size, but wants a little Hammering to smooth it; and that is done with the Face of the Hand-Hammer with light flat Blows.

BLOOM, in the Iron Works, is a four-square Miss of Iron about two Foot long, brought from a Loop into that Form at the Fintry, and under

the Hammer: See Iron.

BLOWING Houses, in the Tin Miner's Language are the Furnaces where the Tin Ore (after it hath passed the Stamping Mill, and is throughly washed and separated from the Parts not Metalline, which they call the Causalty; and after it hath been again dry, and hath passed the Cruzing Mill) is melted and then cast.

BOMBARDEERS are Men employ'd to fire Bombs or Shells out of Mortars. They drive the Fusee, fix the Shell, load and fire. They work also with the Fire-workers on all sorts of Fire-

BOMB-KETCH is a small Vessel built and strengthned with large Beams for the use of Mortars at Sea.

BONNY, the Miner's Term for a distinct Bed of Ore that communicates with no Vein. See

Squat and Tin.

BORDAGE and Board-half-penny is a Fee or Duty paid in Markets and Fairs for Boards and

Tables, Booths and Standings.

BORDARII are often mention'd in the Doomsday Book, and were distinct from the Servi and Villany, and seems to have been of a less Servile Condition: For these had a Bord, i. e. a Cottage with a small Parcel of Land allowed them, on Condition they should supply the Lord with Poultry and Eggs, 650. Hence, BORDLODE was the Farm or Quantity of Food

which they paid by this Tenure: And the small

Estates so held, called

BORDI.ANDS, which therefore are such Demeasines as Lords kept in their Hands, for the Maintenance of the Board or Table. Kennet's

BOTTOMRY is borrowing or lending Money on the Credit of a Ship or Vessel's safe Voyage.

BOULTINE in Architecture is the Workmens Term for a Convex Moulding, whose Convexity is just 4 of a Circle: Tis plac'd next below the Plints, in the Tuscan and Doric Capital.

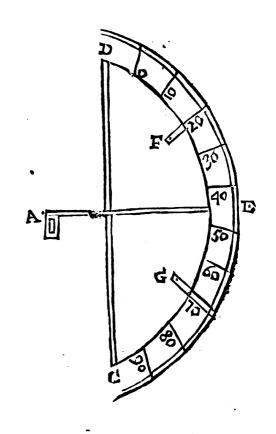

BOW is an Instrument which hath been sometimes used at Sea, consisting of only one large Arch of 90 Degrees, well and truly graduated, Three Vanes, and a Shank or Staff, as you see in

the Figure annexed:

Where DEC is the Arch, AE the Staff or Shank passing the Arch at 45 Degrees inmost, but in some in 50° or 55°. F is the Shade Vane, G the Sight Vane, and AB the Horizon Vane.

To take the Sun's Altitude by it.

By the Handle C hold the Bow upright, and move the Sight Vane G up and down, still looking through the Sight till you see the Shade of the

upper Part of the Shade Vane upon the Slit of the Horizon Vane; and that at the same Time you see also the Horizon through the Slit of the Horizon Vane: In doing of which, if you see the Sky and not the Horizon, then draw the Sight Vane a little lower down towards C, but if you see the Sea and not the Horizon, then slide it a little upwards.

If it be the Meridian Altitude that is to be obferved, you must wait and make Observation as
oft as you think sit, till at last you begin to see
the Sea instead of the Horizon. Then desist; and
the Differences between the Degrees and Minutes
cut by the Sight Vane, and those cut by the upper
Edge of the Shade Vane, is the Distance of the
Sun's upper Limb from the Horizon, from which
if you substract 16 Minutes, which is the Sun's
Semi-diameter, the Remainder will be the Distance of the Sun's Centre from the Horizon, allowing for the Refraction: And you need not
substract above 8 or 10 instead of 16 Minutes for
the Sun's Semi-diameter, when a Ship-board, since
you must allow for the Height of your Eye above
the Level of the Water.

To observe the Height of a Star.

Place the Sight Vane at A, and the Horizon Vane at G, and looking through the Sight Vane at A, move the Vane F higher or lower, till you can see the Star at the Horizon, through the Horizon Vane at G: So shall the Degrees and Minutes between the two Vanes F and G be the Altitude of the Star fought.

To take the Distance between two Stars.

Place the Sight Vane at A, and the Horizon Vane at G, as in the last Practice, and look through the Vane at A, moving the Vane F still to and fro, till you can see the one Star through the Vane G, and the other by the Vane F, for then will the Distance between those 2 Vanes F and G, be the Distance in Degrees and Minutes of the 2 Stars requered.

BOWGE, or rather Bouch, of Court, was formerly an Allowance of Diet or Belly, Provision, from the King or Superior Lords to their Knights, Esquires and other Retinue, that attended them in

any Expedition. Kennet's Glossary.
BOWLING BRIDLES in a Ship, are the Ropes by which the Bow-lines are fastned to the Leech of the Sail.

BOW-SPRIT-LADDERS, are Ladders in a Ship made fast at the Beak Head over the Bowsprit, to get upon it when there is Occasion.

BRACE in Architecture, is a Piece of Timber framed in with Bevil Joynts, and is used to keep, the Building from swerving either Way: When a Brace is framed into the Kinglesses or principal

Rafters, 'tis called by some a Strut.

BRACKETS in Gunnery are the Cheeks of the Carriage of a Mortar: They are made of strong Planks of Wood, of near a Semi-circular Form, and bound round with thick Iron Plates; they are fix'd to the Bed by four Bolts, which are called Bed bolts; they rife up on each Side of the Mortar, and ferve to keep her at an Elevation, by the Means of some strong Iron Bolts (called Bracket-bolts) which go through these Cheeks or Brackets.

BRADS, are Nails used in Building, having no spreading Heads as other Nails have: Of these fome are called foyners Brads, and are for hard Wainscot; others Batten Brads, and are for soft Wainscot; aud some Bill Brads or Quarter Heads, which are us'd when a Floor is laid in haft, or for shallow Joysts which are Subject to warp.

BRAKE in a Ship, is the Term for the Handle

of a Pump.

BRASS is a Metal made out of a Mixture of Copper and Lapis Calaminaris (which is usually called Calamine). This Stone is dug out of several Mines in the West of England (as about Mendipp, &c.) about 20 Foot deep. It is burnt or calcined in an Oven or Kiln made red hot, then ground to Powder, and sifted as fine as Flour; then mix'd with ground Charcoal, because the Calamine is apt to be clammy, to clod, and so is not cassly incorporable. Then they put about 7 st of Calamine into a melting Pot, holding about a Galland and management of the case of the c lon, and uppermost about 5 th of Copper. The Calamine must be mix'd with as many Coals as will fill the Pot. This is let down with Tongs into a wind Furnace 8 Foot deep, and remains there 11 Hours; for they cast not off above twice in 24 Hours. One Furnace holds 8 Pots. After melting

it is cast into Plates or Lumps. 45 th of Coude Calamine produces 30 lb burnt or calcined. They use Brass Sbruff sometimes instead of so much Copper; but that cannot always be procured in Quantities, being only a Collection of Pieces of old Brass.

The best Brass Guns are made of malleable Metal, and cannot be made of pure Copper or Brass; but it is necessary to put in courser Metals to make it run close and sounder, such as Lead and Pot-metal. Bell-metal being Copper and Tin, and Pot-metal Copper and Lead. About 20 tt of Lead is usually put into 100 to of Pot-Metal, but about 6 it is sufficient to put into a 100 to of Gun Metal.

The Calamine Stones were hereto ore fetch'd from Poland, but are now exported from us by the Dutch.

The Manusacture of Brass was privately kept in Germany for many hundreds of Years, wherein many thousands are employ'd, and all were maintain'd, some having thereby rais'd themselves

to great Estates. Phil. Trans. N. 200 and 200. BRAZING is a Kind of soldering of Iron, when the Work is so thin that it will not bear Welding, they lay small Pieces of Brass on the Places that are to be brazed, and strew a little Powder of Glass upon it to make the Brass run, and give it an Heat in the Forge till they find that the Brass is run, and then they take it out and let it cool.

BREASTS, in Women and other Females, are of a Substance confisting of a great Number of oval Glands, lying in a great Quantity of Fat: Their excretory Ducts approach the Nipple, join and unite together, till at last they form seven, eight, or more small Pipes call'd Tubuli Lastiferi, which have seven cross Canals, by which they communicate with one another, that if any of them be stopp'd, the Milk which was brought to it might not stagnate, but pass through by the other Pipes, which all terminate in the Extremity of the Nipple.

The Nipple is a spongeous Substance, made of two Orders of Fibres: the smallest make a fine Net-work within the largest Spaces of the Network of the bigger Fibres. Through it pass the Tubuli Lastiferi, which grow smaller and smaller to their Extremities, that the Milk might not run out, but when the Breasts are full, or upon Suction; It has an exquisite Sense, and a small Erection

when it is handled.

The Arteries and Veins of the Breasts are Branches of the Subclavian and Intercostal. They have Nerves from the Vertebral Pairs, and from the fixth Pair of the Brain.

The Use of the Breasts is to separate the Milk for the Nourishment of the Fatus. The Arteries which terminate in the Glands, which compose the Substance of the Breasts, bring the Blood pregnate with a Child which has received its last Perfection by its Circulation through the Lungs; this Chyle being separated by the Glands of the Breasts, runs through the Tabuli Lastiferi upon the Suction of the Child.

The Breasts in Men are very small; they are chiefly for Ornament. I have seen some Men

who have had milk in them. Keil.

BREDEWITE was anciently a Fine, Penalty or Amercement in Default in the due Assize of Bread: And K. Henry Il. granted, among other Things, to the Tenants of the Honour of Walling-

ford, Oxon, That they should be Quieti de Brede-

BREST is a Term in Architecture, used by some for that Member or Column which is called the

Thorus or Tore.

BREST Summers, in a Timber Building, are the Pieces in the outward Parts of any Building, and in the middle Floors, (not in the Garret, nor in the Ground Floor) into which the Girders are

framed.

BRICKS. The several Kinds of Bricks used in Architecture are these: 1. Compass, Bricks, which are of a Circular Form, and are used in steyning of Wells. 2. Concave or hollow Bricks, being on one Side flat like a common Brick, but on the other hallowed: They are used to convey Water. 3. Cogging Bricks are used to make the indented Work under the Coping of Walls built of great Bricks. 4. Coping Bricks, which are formed on Purpose for coping of Walls. 5. Dutch or Flemish Bricks, used to pave Yards and Stables, and for Soap-Boylers Fatts, and for Cisterns. 6. Clinkers are such Bricks which are glazed by the Heat of the Fire in the making. 7. Feather-edg'd Bricks are like the common Statute Bricks, only they are thinner on one Edge than on the other, and are used to pen up the Brick Pannels in Timber Buildings. 8. Didoron, was a Brick used by the Ancients of 1 ½ Foot, or two Spans long, (whence the Name) and one Foot broad. This was the smallest Sort of Bricks used by the Greeks in their private Houses, for there was a large Sort in Use in their publick Edifices, which they called, 9. Pentadoron, which was 3 Foot 9 Inches long, and 1 Foot broad. 10. Samel or Sandal Bricks, are such as lie outmost in a Kiln or Clamp, and consequently are soft and useless, as not being thoroughly burnt. 11. Great Bricks are 12 Inches long, 6 broad, and 3 thick. The Weight of one about of them 15000 Pound. Their Use is to build Fence Walls, together with, 12. Pilaster or Buttress Bricks, which are of the same Dimensions with them, only they have a Norch at one End of half the Breadth of the Brick. Their Use is to bind the Work at the Pilasters of Fence Walls, which are built of great Bricks. 13. Paving Bricks or Tiles, these are of several Sizes in seve-13. Paving ral Counties or Places. 14. Place Bricks are fuch as are made in a Place made on Purpose for them near the Building they are to be used in. Statute or small common Bricks: These ought to be 9 Inches long, 4½ broad, and 2½ thick; 100 of these usually usighs about 550 Pound, and consequently 1000, 5500 Pound, and about 407 in Number are a Tun Weight. These are commonly used in paving of Cellars, Hearths, Sinks, \$50. 30 or 32, if true Measure, will pave a Yard Square, and 330 will pave a Square of 100 Foot, laid in 12 but if laid edge-wise, they must be double in Number.

Bricks are burnt either in a Kiln or a Clamp: Those that are burnt in a Kiln, are first set or placed in it, and then the Kiln being covered with Pieces of Bricks, they first put in some great or cord Wood to dry the Ware with a gentle Fire, which is continued till the Ware is pretty dry which they know by the Colour of the Smoaks turning from a whitish dark to a black transparent Smoak: then they put in no more Wood, but proceed to burn the Bricks with Bush, Rurze Straw, Heath, Brake or Fern Faggots, having sirst

damm'd up the Mouth of the Kiln with their Shinlog as they call it (which is Pieces of Bricks piled up one on another, and then closed up with wet Brick Earth instead of Mortar) only leaving just Room to put in a Faggot. They then continue to put in more and more Faggots, till they make the Kiln and its Arches look white with Heat, and that the Fire begins to appear at the Top of the Kiln. Then they begin to slacken the Fire for about half an Hour or an Hour, and so let all cool by Degrees. The Ware will be burnit usually in about 48 Hours. But now-a-days about London, they usually burn Bricks in Clamps, which are built of the Bricks to be burnt, fomething after the Manner of the Arches in Kilns, viz. with a Vacancy between each Brick's Breadth, &c. for the Fire to play through; but with this Duference that instead of arching, they truss or span it over, by making the Bricks project one over another on both Sides the Place for the Wood and Coals to lie in, till they meet, and are bonded by the Bricks, at the Top which closes all up. The Place for the Fuel is carried up strait on both Sides, till about 3 Foot high, then they fill it almost with Wood, and over that lay a Covering of Sca-coal; and then they over-span the Arch: But they strew Sea-coal also over at the Clamp, betwixt all the Rows of Bricks, then they fire the Wood, and then the Coal, and when all is burnt out, they conclude the Bricks burnt enough. Builder's Dicti-

BRIDGE of Communication, is a Bridge made over a River, by which two Armies or Forts which are separated by that River, have a free Commu-

nication one with another.

BRIGADE Major, is an Officer appointed by the Brigadeer to affift him in the Management and Ordering of his Brigade, and he there acts as a Major General does in an Army.

BRINGERS up, in a Battalion, are the whole last Rank of Men in it, or the last Man in every

File.

BUDDLE, is the Word in the Works for dreffing Tin Ore, for a Tye of Boards or Slate about 4
Foot deep, 6 long, and 3 over, wherein stands a
Man with a Shovel in his Hand (called a Trambling
Shovel, as this is also called the Trambling Buddle)
bare-footed, to cast up the Ore about an Inch
thick, on a long square Board placed just before
him, and as high as his Middle, which is called the
Buddle Board: There are several of these Buddles
in which the Ore is still trambled over again and
again, till it be at last so well wash'd, as to become
what they call black Tin, which is compleatly ready for the blowing House.

BUILDING. There are some good Rules and

Directions about Building which are given in Moxon's Mechanick Exercises, and other Books of that kind, which 'tis very proper every Gentleman shou'd be acquained with, that he may not be cheated or imposed upon by his Workmen: And those are such as these; First with Respect to the Foundation, Care ought to be taken, that after the Cellars are dug, if there be any, or if none, after the Trenches are dug, in which the Walls are to stand, to try all the Foundations either by a Crow, a Rammer, or which is best, with a Borer, such as Well Diggers, Miners, &c. use, whether they are throughly sound, and are sit to bear the Weight

that is to be laid upon them. If the Foundation

be not very loose, it may be cured by ramming in

grea

great Stones with an heavy Rammer, the Stones being placed close together, about a Foot wider on each Side of the Trench than the Breadth of the Wall is to be; but if it be so loose that this will not do, you must get good Pieces of Oak, whose Length must be the Breadth of the Trench, or about 2 Foot longer than the Breadth of the Wall, and these should be laid a cross the Foundation, about a Foot asunder, and being well ramm'd down, lay long Planks upon them, which must be pinn'd down to them: and if this be not sufficient, Piles of a much greater Length must be driven down so deep, till they touch good Ground, and then strong Planks pinn'd down to their Tops, EGC. If the Foundation be faulty only in Patches, there may Arches be turned over the insufficient Places, which will take off the Weight from bearing upon them. And sometimes it may be proper to use inverted Arches.

The Foundation being well secured, the next Care is to see that the Walls be all made of the same Thickness as they are in the Design; for which Purpose there should be Numbers to ex-

press their Thickness in the Draught.

The Walls also must be well wrought aud bounded as they call it: In order to which the Mortar must be well made of good well burnt Lime and sharp Sand; the usual Proportion is a Load of Sand of 36 Bushels to a Hundred of Lime of 25 Bushels, or a Bushel of Lime to one and an half of Sand; but when the Sand is not very sharp, there must be a greater Proportion of it to the Lime.

In flacking of Lime, Care should be taken, that though it be wetted every where a little, yet it be not over-wetted; and every Layer or Bed of Lime should be covered with Sand to keep in the Steam, that it may not sly away, but be forced to mix it self with the Sand; and this will make the Mortar much stronger. The Mortar also must be well beaten with a Beater three or four times over before it is used, that the Knots of the Lime may be all broken, and the Lime and Sand mingled very well together: And it will be still better, if after the first beating, it be let lie three or four Days, audthen let it be beat well over again when 'tis used.

If the Bricks are laid in very hot dry Weather, and it be some small Piece of Work which you would have very strong, it will be worth while to dip every Brick as 'tis laid in a Pan of Water; and it will be of good Use in great Work to throw Water on the Walls, after the Bricks are laid, by a Wirtenburgh Syphon, or some such Way. And the Walls also should be covered in Summer Time, to keep them from drying too hastily, as well as in Winter Time from Rain, Snow, or Frost, which last is a great Enemy to all Kinds of Mortar, especially to that which hath been newly wetted.

Let the Workmen also in doing up the Walls, not carry any one above three Foot high, before the next adjoining Wall is brought up equal with it, that so they may join together, and make good

Bond in the Work.

In the middle of Walls, Care should be taken that Joint is not laid on Joint, at least as seldom as may be, that good Bond may be made there as well as on the Outsides.

When Timber is laid on Brick-Work, as Torfels for Mantle Trees, or Lintels for Windows, Templets for Girders, Egc. let it be always laid in Loan, for that is a great Preserver of Timber, which Mortar will eat and corrode: The same thing should be done with the Ends of Joists and

Girders, some Workmen dawb their End with Pirch, to preserve them from the Mortar.

BULL, perhaps from Brain Confilium, is an Infrument so called, granted by the Bishop of Rome, and sealed with a Seal of Lead, containing in it his Arbitrary Decrees, Command, or other Astions. By the Statute of 28. H.8. c. 16. it was enacted, that all Bulls, Briefs, Faculties, and Dispensations, of whatever Name or Nature, had or obtained from Rome, should be woid. Matt. Paris, A. D.: 1237. describes the Seal of the Bull to be a Cross in the middle, with St. Paul on the Righr, and St. Peter on the lest Hand.

BURNING Glasses. In Philos. Transat. N. 40. there is an Account of one S. Setalla at Millan who was causing a burning Glass to be made of 7 Foot in Diameter, and he pretends to make it burn at

the Distance of 50 Palm or 33 Foot.

And in N. 188. there is mention of a burning Concave which was made at Lusace in Germany of near 3 Leipsick Ells in Diameter, which exceeds the great one at Paris by 3 of an Ell. This was made of a Copper Plate, scarce twice so thick as the Back of a common Knife, and so may easily be moved from Place to Place, and ordered for Use; and the Workmanship of it may, by the Contrivances I have invented (saith the German) be easily, and in a little Time, performed by one Man. The Polish hereof is very good, and represents by distinct Reslexions, all those Appearances which arise from the Concave Figure thereof.

The Force of this Speculum is incredible: For. 1.a Piece of Wood put in the Focus (which is 2 Ells off) Flames in a Moment, so as a fresh Wind can hardly put it out. Water applied in an Earthen Vessel presently boils. 3. A Piece of Lead or Tin 3 Inches thick melts away in Drops, and in 2 or Minutes time will be melted quite through. 4. A Plate of Iron or Steel is presently red hot, and foon after hath a Hole burnt through it. I have made 3 such Holes in a Plate in 6 Minutes time. 5. Copper and Silver, and the like, applied to the Focus melt; I tried with a Rix Dollar: And the Iron aforesaid will run in 5 or 6 Minutes. 6. Slate at first is red hot, but in a few Minutes turns into a fine fort of black Glass, of which, if any Part be taken in the Tongs, and drawn out, it runs into Glass Threads. 7. Tiles and Earthen Pot-shreads, in a little time melt into Glass, as also doth Pumica Stone into a very white one: A Piece of a very strong Crucible runs into Glass in 8 Minutes. I have seen Bones turn into Glass of an Opaque Kind, and a Clod of Earth into Greenish Glass. These Experiments were made in Argust and Sep-

Dr. Hook proposed to the Society, that one might be made after this Manner, of many Feet in Diameter for a small Price; being hammered out of a Copper Plate, and tinn'd over with a Mixture of Tin, Lead, and Tin-glass, which is found to bear a very good Polish.

The Uses of such a Speculum would be very many, and perhaps its Effects wonderful, there being no other Heat in the World any thing like that of the Sun's Rays, whose Weight and Fineness are not possible to be equalled by any common Fire; yet the Moon's Rays, though the Light was augmented by the Glass, gave no Manner of Heat.

augmented by the Glass, gave no Manner of Heat.
Mr. Tichirnhaus is said to have made Convex
Burning Glasses of 3 or 4 Foot Diameter, and
whose Focus is 12 Feet distant, and of 1½ Inch in
Diameter; and to make this Focus yet stronger,

he contracts it by a second Lens, placed parallel to, and at a due Distance from the first, and then the Focus is but of 8 Lines in Diameter. This Glass in a Moment vitrifies Tiles, Slates, Pumice Stones, Dutch Ware, and Talk. It melts Sulphur, Pitch, and all Rosins under Water; any Metal exposed to it in little Lumps upon a Coal, melts in a Moment, and Iron sparkles as in a Smith's Forge. All Metals vitrify on a Piece of China Plate, if it be not so thin as to melt it self; and Gold in vitrifying receives a Purple Colour: Histoire de l' Aca-

The Linum Vivum or Asbestos would be vitrissed by this Glass, even in January, in about 10 Minutes Time: Vid. Ast. Erud. Leips. April. 1688.

The Incomparable Sir Isaac Newton presented a Burning Glass to the Royal Society of London.

whereof he is the most worthy President, consist-ing of seven Concave Glasses, and so placed, as that all their Foci join in one Physical Point. Each

Glass is about 11 ½ Inches in Diameter; six of them are placed round the seventh, to which they are all contiguous, and they compose a kind of Segment of a Sphere, whose Subtense is about 34 ½ Inches. The Central Glass lies about an Inch lower or farther in than the rest. The common Focus is about 22 ½ Inches distant, and of about an Inch in Diameter. It vitrifies Brick or Tile in a Moment, and in about half a Minute melts Gold.

If another round of Concaves were added about these seven, perhaps it would outdo any thing we

have an Account of.

BUTMENTS, in Architecture, are the Mason and Bricklayer's Term for those Supports or Props, on or against which the Feet of Arches rest. Also little Places taken out of the Yard of the Ground-Plot of a House, for a Buttery, Scullery, & are sometimes called Butments.

NADE, in the Book of Rates is us'd for a certain determinate Number of some kinds of Fith; as a Cade of Herrings is 500, of Sprats is 1000

CALCAGE, Calcagium, was a Tax or Contribution formerly paid by the neighbouring Inhabitants, towards the making and repairing of com-mon High-ways, Cause-ways and Roads; as

CALCEARUM Operationes, were the Work and Labour of this Kind done by the inferior fervile Tenants; and from this it was a Privilege to be free.

CALCULUS differentialis; J. Barnoulli in the Leipsick Acts for Jan. 1691. owns that our famous Dr. Barrow had given some Specimens of this Method above 10 Years before that Date in his Geometrical Leaures, and of which, all his Apparatus of Propositions there contain'd are so many Examples. He acknowledges also, that Mr. Leibnitz's Method of this Calculus differentialis is founded on Dr. Barrow's, and differs from it only in Notation and some compendious Abridgments. And in this Discourse Mr. Bernoulli gives some Specimens of the Use of this Calculus, in the Dimension of the Parabolick Spiral, and of the Flexures and Evolutions of Curves in general.

See on this Subject Mr. L' Hospital, Mr. Nei-

wintis's Analysis Infinitor.

CAMBER Beam, in Architecture, is a Beam or Piece of Timber cut hollow or arching in the Middle: They are us'd in Plat-forms, Church Leads, 60°c. and are very proper where ever is oc-casion for long Beams, being much bringer than flat Beams of the same size; for being laid with the hollow Side downwards, and having good Butments at the Ends, they ferve for a kind of Arch.

CANON, in the Ecclesiastical Law, was originally a Book wherein the Religious of every Convent had a fair Transcript of the Rules of their Order: These were often read over to them as the r Local Statutes, and therefrom were called Regula,

and Canon their Rule.

CANON in Musick; Ptolemy rejecting the Aristoxenian Way of measuring the Intervals in Mufick by the Magnitude of a Tone (which they suppose to be formed by the Difference between a Diapente and Diatesfaron) thought that Musical Intervals should be distinguish'd according to the Ratio's or Proportions which the Sounds terminating those Intervals bare one to another, when consider'd according to their Degree of being Acute or Grave, which was also before Aristoxenus, the old Pythagorick Way. Ptolenny there ore made the Diapason to consist in a double Ratio, the Diapente in a Sesquialteral, the Diatessaron in a Sequitertion, and the Tone it self (by which the Diapente and Diatessaron differ) in a Sesquioctave; and all the other Intervals according to the Proportion of the Sounds that terminate them. Wherefore taking as Canon (as 'tis call'd) a determinate Line of any Length, he show this Canon is to be cut accordingly, so that it may represent the respective Intervals; and this Method answers exactly to Experiment in the different Lengths of Musical Chords. And from this Canon, Ptolenry and his Matter of his second Element.

Followers have been called Canonici, as those of Aristozenus were called Musici.

There is a Tract called Sectio Canonis attributed. but falfly, to Exclid; and which you will find at the End of his Works, in the Oxford Edition.

CANTALIVERS, in Architecture, are a Kind of Modilions, only those are plain, but these are carved. They are much the same with Cartouzes, and are set as Modilions are, under the Corona of

the Cornish of a Building.

CAPIAS Conductos ad Proficisendum, is a Writ that lies for taking up such Men as having receiv'd Presi-money to serve the King, slink away, and come not in time. 'Tis an original Writ directed to the Serjeant at Arms, having included a Clause of Assistance.

CARACT is not any certain Weight or Quantity, but the 1 Part of any Quantity of Weight. And the Minters and Goldsmiths divide it into 4 Parts, which they call Grains of a Caract; and one of these they subdivide in Halves and Quarters.

CARKE feems formerly to have been the Word for a certain Quantity of Wool, whereof Thirty

made a Sarpler, 27. H. 8.c. 2. CAPSULATE Plants are such as have a Tetrapetalous regular Flower confisting of four distinct Petala in each Flower, and which bear their Seeds in short Capfula; by which they are distinguish'd from the Siliquesa, which bear their Seed in long Cases or Capsula Seminales, and are the other Branch of this Genus of Plants.

CAPSQUARES, in Gunnery, are those strong Plates of Iron which come over the Trunnions of a Gun, and keep her in the Carriage. They are fastned by Hinges to the Prize Plate, that it may lift up and down; it forms a Part of an Arch in the Middle, to receive a third Part of the Thick-ness of the Trunnions, for $\frac{1}{2}$ of them are let into the Carriage, and the other End is sastened by two Iron Wedges, which are called the Fore-locks

and Keys.
CAPTION, when a Commission is executed, the Commissioners Names subscribed and return'd,

that is called a Caption.

CARCASE of a House, in Architesture, are the Partitions, Floors, Rafters, &c. made by the Carpenter.

CARTESIAN System of the World.

Mr. Des Cartes, in order to account for the Celestial Appearances, supposes the Matter of the World to have been at first divided by Almighty God, into innumerable little equal Parts, each endow'd with an equal Degree of Motion, both about its own Centre and separately, so as that this Matter constituted a Fluid. He suppos'd also that several Collections of this Matter, were en-dow'd with a Motion about different Points, as common Centres, which Points were placed at equal Distances: so as that the Mitter round them compos'd different Vertices, as he calls them. He supposes also, that the first Particles of Matter by those intestine Motions were rendred or ground of a spherical Figure, and so did compose Globules of several Magnitudes: And there he calls the

But

But the very small Particles which, by the aforesaid Motions, were ground and rubb'd off from the first Particles of Matter, and driven vi-olently many different Ways, made up a new Matter, which he calls his first Element. And seeing that there would be more of this first Element, than was sufficient to fill the Vacuities between the Globules of the fecond Element, he supposes that the remaining Part would be driven towards the Centre by the circular Motion of these Globules, which did for that Reason recede from it; and this Matter being there amassed into a Sphere, would in the Centre of every Vortex produce a Body like the Sun: which Sun being thus form'd, and moving about its own Axis with the common Matter of the Vortex, would necessarily throw out some Parts of its Matter, through the Vacuities of the Globules of the second Element constituting the Vortex, and this especially at such Places as are farthest from its Poles, receiving at the same Time in by these Poles as much as it loses in its Equatorial Parts, or about the Equator: And by this Means it would be able to carry round with it those Globules that are nearest, with the greater Velocity, and the remoter with less. And by this Means those Globules which are nearest the Centre of the Sun must be least; because were they greater or equal, they would by Reason of their Velocity have a greater centrifugal Force and recede from the Centre. And if it should happen that any of these Sun-like Bodies in the Centres of the several Vortices, should be so incrustated and weakened, as to be carried about in the Vortex of the true Sun; if it were of less Solidity, or less Motion than the Globules towards the Extremity of the Solar Vortex, then it would descend towards the Sun, till it met with Globules of the same Solidity, and capable of the same Degree of Motion with it self; and then being fix'd there, it would be for ever after carried about by the Motion of the Vortex, without either approaching any nearer to, or receding from the Sun, and so become a Planet.

Supposing then all this, we are next to imagine that our Siftem was at first divided into several Vortices, in the Centre of each of which was a lucid Spherical Body; and that some of these being gradually incrustated, were swallowed up by others which were larger and more powerful, till at last they were all destroyed and swallowed up by the biggest Solar Vortex, except some few which were thrown off in right Lines from one Vortex to another, and so became Comets. from hence it appears, that those Planets which are nearest the Sun are less solid: That is also Des Cartes's Reason why we see always the same Face of the Moon; because the Hemisphere which is opposite to the Sun and the Earth is somewhat more solid than the other: Because also the Matter of the first Element which makes up the Body of the Sun, moves with greater Velocity the Parts of the Vortex, and the Bodies swimming in it, than those that are remoter: Therefore those Planets which are nearer to the Sun, must finish their Periods Cooner than those which are more remote from him. And the Reason why the Planets revolve round their Axis, is, because according to this Hypothesis, they were lucid, Sun-like, and revolving Bodies before.

But notwithstanding all this fine Romance, it is (First,) certain that a Vorten produced by the Revolution of a Sphere about ite Axis, must be propagated in infinitum, if nothing hinder it: And that Fluid, for of themselves they would describe a Curve-line, are moved by Vol. II.

therefore, fince there must be as many Vortices as there are fix'd Stars, one Vortex would certainly run into another, and every Particle would be acted by a Motion compounded of the Motion of all the central Spheres; which is abfurd and contrary to that Constancy, Limitation and Unifor-mity which is observed in the *Phanomena* of the Heavenly Bodies.

2. Since the Motion and Parts of the Vortices nearest the Centre, is swifter than that of the more remote, they must press upon the exterior Parts, and thereby perpetually impart some Part of their Motion to them; and therefore those interior Parts of the Vortex will be continually leffening fome Part of their Motion, which never being reflored, these Parts must still move slower and slower by Degrees, till at last all the Motion will be quite destroyed.

. According to this Hypothesis, each Planet is of the same Density with the Parts of the Vortex in which it swims, being govern'd by the same Laws of Motions, and is, as it were, only some concreted Parts of the Vortex. But the Times of the Periodical Motion of Bodies carried about by a Vortex, are in a duplicate Ratio of their Distances from their Centre; as the incomparable Sir Isaac Newton hath demonstrated in Sect. IX. of his Whereas the Squares of the Times of the Periodical Revolutions of the Planets are as the Cubes of their mean Distance from the Centre, or from the Sun: Wherefore the Planets cannot be carried about by a Vortex.

4. If a Vortex run out in Infinitum, then would a Body carried round by it certainly describe a perfect Circle, unless something solid did hinder it; and therefore the greater Distance there were between those folid Bounds, or the larger the Bason be which contains the Vortex, in respect of the Orbit of the Body carried about in it, the nearer would this Orbit be to a Circle; that is, the Excentricity of the Planets nearest the Sun, would be less than that of those which are more remote: But the direct contrary to this is true in Fact, the Eccentricity of Mercury being greater

than that of Saturn,

5. A Body carried about in a Vortex of the same Density with it, would necessarily describe a Circle, to whose Plane the Axis of the central Body producing the Circulation of the Fluid, would be perpendicular: And yet there is not one Planet to the Plane of whose Orbit the Sun's Axis is perpendicular.

6. The Comets have their Orbits, not only oblique to, but sometimes at right Angles, with the Plane of the Ecliptick; sometimes the Course of these Comets is diametrically opposite to that of the Sun: They persevere in their Motion without any Change: By Lines drawn from them to the Sun, they describe equal Areas in equal Times; and sometimes they enter into the Vortex of the Sun. All which is impossible, if the Solar Vortex moved round forcibly enough to carry these vast Bodies of the Planets along with it

Mr. Leibnitz hath indeed a little altered and mended this Hypothesis of Des Cartes; he hath accommodated it better to the Celestial Phænomena, and made it more agreeable to the Rules of Geometry

feribe

scribe right Lines, and nothing (hesaith) but the Fluid concurs to turn them out of the Way.

Secondly, He endeavours to shew, that every Planet is carried about by a Motion compounded of two other Motions; viz. the Harmonical Circulation of the deferent Fluid, and the Paracentrical Motion of Access to, or Recess from the Sun.

The Planets by a Radius from the Sun describe Areas proportional to their Times; now the Fluid that carries the Planets, must of Necessity circulate so as to produce this Effect; which cannot be done otherwise than by supposing innumerable concentrical Orbits of exceeding Thinness to make up the Vortex; every one of which, hath its own proper Way of Circulation, viz. Those Orbs which are nearest the Sun move fastest, and the Velocities of the Circulations are every where reciprocally proportional to the Distances of the respective Orbs from the Sun, which will necesfarily make the Planet to describe equal Areas in equal Times, let it be in any Part of the Vortex. For these Areas are in a compounded Ratio of their Radii or Distances from the Sun, and in a reciprocal one of the Arches or Lengths of the Circulation, which in this Case will make a Proportion of Equality: And this Law of Circulation of the Vortex, he calls Harmonical.

The Paracentrick Motion is compounded of two others, that is, the Excussory Impression of the Harmonick Circulation, whereby all Bodies moving in a Curve, endeavour to recede from the Centre by the Tangent; and the Attraction of the Sun, or the Planets Gravitation towards him. And this, Mr. Leibnitz is of Opinion, arises from an Impulse communicated by the circulating Fluid. Now fince the Planets move in Ellipses, in one of whose Foci the Sun is placed, and by Lines drawn from him do describe equal Areas in equal Times, which no other Law of a circulating Fluid, but the Harmonick Circulation can account for, we must find out a Law for the Paracentrick Motion that may make the Orbits elliptical. The excuffory Impression of the circulating Fluid, would throw off the Planet from the Centre by the Tangent, wherefore the Attraction of the Sun or the Gravitation of the Planets towards it, must be sufficient to destroy that Effect; and besides, to make them move in elliptick Orbits, which cannot be brought about, unless this Attraction or Gravitation be reciprocally as the Squares of the Distances from the Focus: And this is the Sum of Mr. Leibnitz's Improvement of this Hypothe-

But this Account must be false for these Reasons; First, Because the Comets, as hath been said before, have their Orbits, some of them very oblique too; nay, sometimes at right Angles with the Plane or the Ecliptick, and their Courses are sometimes quite contrary to those of the Planets. Now these Comets describing about the Sun Areas proportionable to the Times, must also according to their Motion be carried about by an harmonically circulating Fluid: But then we shall have Vortices moving contrary to Vortices, which is very absurd.

2. In equable Motions, the Times are always directly as the Spaces, and reciprocally as the Velocities, but in a circular Motion, the Spaces in one Revolution are as the Radii; and in an harmonical Circulation, the Velocities are reciprocally as the Radii, and therefore the Periodical Times of

a Fluid circulating harmonically are in a duplicate Proportion of the Radii: whereas the Periodical Times of the Planets are in sesquiplate Proportion of their Distances from the Centre, or of their Radii, and consequently the Planets cannot be carried by an harmonically circulating Fluid.

It may, perhaps, be alledged here, that this harmonical Circulationis not continued from Mercury to Saturn, but isinterrupted, and reaches only from the Perihelian of Mercury to his Aphelian, and is there again interrupted, and so on through the whole System of the Planets; but this would produce a Deformity, which is very unlike the simple uniform Measures of Nature every where else. And besides, the Comets moving forward in the Zodiack, pass through all these imaginary Chasins and Interstices, and yet move in the same Manner as if they were carried by a Fluid circulating harmonically, according to some uniform Law; neither do their Appearances give any Ground to suspect such Interruptions as these. Vid Dr. Cheyne Phil. Prin. of Natural Religion.

CARTILAGO Scutiformis, is one of the 5 Cartilages of the Larynx; tis called in Greek Supondice because of its Figure. It makes that Protuberance in the fore-part of the Larynx called Pomum Adami. It is about one Inch broad, but not so long, being Concave within, and Convex without. Its four Angles have each a small Production; the two upper, which are longer, are tied to the Horns of the Os Hyoides; and the two lower to the second Cartilage, which is called Cricoides or Annularis, from its being like a Ring.

CARTONS, in Painting, are the most perfect Sort of Drawings on Paper, which are subservent to great Works, that must be throughly finished; all Sketches, Drawings, Models, and all other Works being Preparatory only, and to be reduced to Cartons. This Way was practifed by Michael Angelo and Raphael Urbin, Soc. the Cartons at Hampton Court being the Work of Raphael.

They are sometimes made by measuring the Heighth and Breadth of the Place where the Painting is design'd to stand; and then by dividing that Space into Squares, and one afterwards of the same Dimensions on Paper; they draw on the latter the Subject of their Story or Design, transferring it afterward from the Carton to the Wall, by painting it there in Oil, 60°c.

ing it there in Oil, 63c.

But some great and experienc'd Masters will be able to do all this without the Help of the Grate, as they call it; that is, the Division of the Space or Table into Squares, tho, after all, 'tis a good se-

CARTOUCH, is a Case of Wood about 3 Inches thick at the Bottom, girt round about with Marlin, and holding about 48 Musket Balls, besides 6 or 8 Iron Balls of a Pound Weight. Tis fired out of a Hobit, as they call it, that is, a small Mortar; and is very proper for defending a Pass.

CARTOUZES, in Architecture, are much the fame with *Modilions*, only these are set under the Cornish in Wainscotting, and those under the Cornish at the Eves of a House. Some Workmen call them *Dentils* or Teeth.

call them Dentils or Teeth.

CARUCATE, from Caruca, and the French Carui, a Plough, was the Ancient Plough Land; and fignified as much Arable Land as could be tilled with one Plough in a Year. This in Rich. 1. Reign, was computed at 60 Acres, but 'twas afterwards varied; and the Measure of a Carucate was different according to Time and Place.

CASE-

CASE HARDENING, is a Way of making the Outfide of Iron hard. And 'tis used sometimes by File-Cutters, when they make Course Files for Cheapness; and formerly most Rasps were Case-bardened. Gunsmiths also use it to harden the Barrels of Guns; and for Tobacco Boxes, Cane Heads, Buttons, &c. 'Tis done thus: They take Hoofs or Horns of Kine, dry them in an Oven, and powder them, then put an equal Quantity of Bay Salt to it, and mingle both together with stale Urine or Whitewine Vinegar. Some of this Mixture they lay upon Loam, and wrap it about the Iron, putting also more Loam over all. Then lay it upon the Hearth of the Forge to dry and harden; and when 'tis dry and hard they put it into the Fire, and blow till they give the whole Lump a blood red Heat, but no greater. Then 'tis taken out and quenched, and at last the Case-hardened Iron is taken out of the Case.

CASEMENT, the same with Cavetto, in Architecture, is a hollow Moulding; some say 1/4, some

of a Circle in Compass.

CASSINE, in the Military Language, is a Farm House, where a Number of Soldies have posted themselves, in order to make a Stand against

the Approaches of an Enemy.

CASTELLORUM Operatio, was formerly Service of Work and Labour to be done by inferior Tenants for the Repair or Building of Castles. To this some came in Person, and others contributed, and it was one of the three necessary Taxes from which few Persons were exempted.

CASTING of Drapery, is a Term in Painting, fignifying a free, easy, genteel, negligent way of cloathing any Figure: and when the Drapery is so

managed, they say 'tis well Cast. CAVAZON, in Architecture, is the digging or hallowing away of the Earth from the Foundation of a Building. Palladio faith it ought to be 1 of the whole Height of the whole Building

CAVETTO, in Architecture, is a hollow Moulding of about or of a Circle in Compass.

CAUKING, in Architecture, signisses Dove-

CAULICOLI are, in Architecture, the little carved Scrolls which are under the Abacus in the

Corinthian Capital.

CASUALTY, is the Tin-miner's Words for the Earth, a Stony Matter which is by washing in the Stomping Mills, &c. separated from the Tin Ore, before tis dried and goes to the Crazing Mill. CAZERN: See Casern.

CEMENT, in Architecture, is a strong binding Mortar. 'Tis used to cement Bricks together for some Kinds of Moulding; to make a Block of Bricks for the carving of Scrolls, Capitals, & c. Tis of two Sorts: The bot Cement, which is common, is made by putting to a Pound of Rozin and a Quarter of a Pound of Bees Wax, half an Ounce of fine Brick-Dust, and as much Powder of Chalk; and boiling all together in a Pipkin, Egc. for about 4 of an Hour, stirring it all the while; then let it stand 4 or 5 Minutes, and 'tis sit for

The Brick to be cemented must be heated in or by the Fire, and rubb'd one upon another like Boards in glewing. The cold Cement is less common, and is thus made.

Grate half a Pound of old Cheshire Cheese, well pared, very small, and to it in a Pot put half a Pint of Milk, and so let it stand all Night; Vol. II.

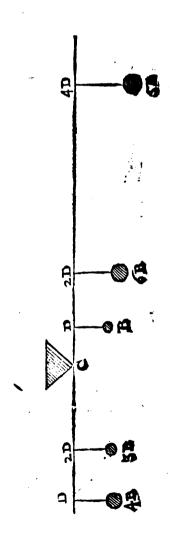

the next Morning put it into a Tray, & c. With the Cheese and Milk, put half a Pound of very fine powdered and fifted quick Lime, and stir all well together with a Trowel, breaking the Knots of the Cheese if any remain; and then add the Whites of 12 or 14 Eggs, which incorporate well with the Mixture, and then it will be fit for Uie: It you would have it reddish, colour it with a little very

fine Powder of Bricks.

CENTRE of Attraction, in the New Astronomy, is that Point to which the revolving Planet or Comet is impelled or attracted by the Force or Impetus of Gravity. Thus the Sun is such a Cen-Impetus of Gravity. tre of Attraction with regard to all the Primary Planets, and as they themselves are toward their

Secondary ones, or Satellites, if they have any.

CENTRE of Gravity. The Confideration of the Centre of Gravity is one of the Noblest Speculations in Geometry; and fince the New Methods have been in Use, such Advancements in it have been made, that hardly much more is to be expected: For the whole Business of the Investigation of Centres of Gravity is now reduced to one General Proposition, which depends on a few simple Mechanical Principles, such as these:

Balance, as that their Masses be reciprocally Proportional to their Distances from C the Point of Suspension, then they will be in Equilibrio, as is the known Case of the Libra, (see Libra:) That is, if D represent the Distance of the Weight B, and 3 D that of 4 B, and 2 D that of 6 B, all from the Point of Suspension C; then will the Weights 4 B and 6 B be in Equilibrio, because 3 B: 6 B: 2 D: 3 D.

2. The Moment of any Weight is = to the-Rectangle under its Velocity, and the Quantity of Matter in the same. V. gr. The Moment of 6B is $= 6B \times 2D$ (2D I say, for the Velocities are as the Distances from C) = 12BD.

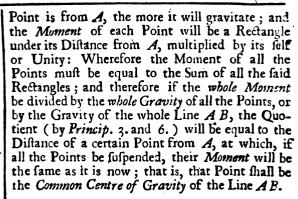

3. And if the Moment and Weight (ot Quantity of Matter) be given, the Distance of the Point of Application from C the Point of Suspension will be found, by dividing the Moment by the Weight. Thus, if the Moment of the Weight 6 B be 12 B D, (as in Principle 2.) then the Distance of the Point of Application from C will be $\frac{12 B D}{c B} = 2 D$.

4. If several Bodies be suspended on each Side the Point C, then multiply every Weight by its respective Distance from the Center of Suspension C: And then if the Sum of all the Resangles on one Side, be equal to the Sum of all those on the other, the Weights or Bodies will be in Aquilibrio: if they are not equal, that Side will preponderate, whose Sum is the greater. Thus, v. gr. the Sum of all the Restangles on the Right Hand C is 18 B D: I say, + 18 B D (supposing + to signify towards the Right Hand, and — towards the Left; and the Sum of all the Restangles on the Left of C, will be — 33 B D: Whence it is evident, that the Preponderancy is toward the Left Hand, and is equal to — 15 B D, which therefore is the Moment of all the Weights.

5. The Moment then of all the Weights being in this Case — 13 BD, and the Sum of all the Weights 19 BD; 'tis plain, if you divide the former by the latter, the Quotient $\frac{1}{15}$ D will be (by Princip. 3.) equal to the Distance of the Common Centre of Gravity of all the Weights from the Point C.

6. When the Weights, B, 6 B, and 5 B, hang all on the same Side of C, the Sum of their Momnets is = 33 B D, as the Sum of the Weights is 12 B. Wherefore one Weight = 12 B, and hung at \(\frac{3}{12}\) D distant from C, will gravitate in the same Manner as the separate Weights did before at their respective Distances: That is, the said Point is the Common Centre of Gravity of those Weights, since it is that Point in which all their Forces unite; and whereat, if they were all jointly suspended, they would produce the same Effect as before they did separately.

7. Let the Line AB be suspended at A, and suppose it divided into an infinite Number of heavy Points; 'tis then plain, that the farther any

8. If a Line, Plane, or Solid, be biffected so by a Line or Plane, as that all the Parts in one Segment be equal to the respective Parts in the other, and also equi-distant from the said Line or Plane; its then clear, that the Center of Gravity of all such Figures, must be in that Line or Plane. And from hence it naturally follows,

Prop. General, That to find the Centre of Gravity of any Line, Plane or Solid, you must imagine Lines to consist of an infinite Number of Points, Planes of an infinite Number of Lines, and Solids of an infinite Number of Planes or Surfaces; and then that all these are sufpended to the same Arm of a Balance common to them all: And let the Point of Suspension be as in A, at the Fnd or Extreme of the said Line in the Edge of the Surface, or in the Surface of the Solid; and then find the Sum of the Moments of all those Points; which Sum divide by the Sum of the Weights, or the Weight of all the Parts, and the Quotient will be the Distance of the Center of Gravity, or the Line, Plane or Solid, from the Point or Axis of Suspension. The Practice of all which in particular Instances, see in Hayes's Fluxions, p. 261, &c.

CENTRES of Gravity. 'Tis plain that the Centre of Gravity of a Circle, and of a Sphere or Globe (supposing the Matter truly Homogeneous all over them) will be their Centre of Magnitude; the Centre of Gravity of all Parallelograms will be in the Point of Intersection of the two Diagonals; and the Centre of Gravity of all solid Parallelograms or Parallelopipeds will be in the same Point of the Plane of Gravity, i.e. in the Point found to be the common Intersection of the two Diagonals of that Plane which cuts the Solid into two Triangular Prisms, and consequently is easily found. The Centre of Gravity of all Planes of Triangles, is in the Point of Intersection of two Right Lines bissecting any two of their Angles; and of all folid Triangles or Triangular Prisms it will be in the middle Point of the Diameter of Gravity: And that Diameter is found by the common Inter-fection of two Planes, each of which biffects one Angle of the Top and Base, and consequently of all the Triangles of which the Prism may be conceived to be composed.

If the Prism be of a Quadrilateral, or any other more compounded Form, the thing will be more difficult, because the Centre of Cravity will lie at a proportionable Distance from the Centre of Gravity of all the Triangular Prisms, that the Multiangular Solid can be divided into. But tho' this be a little more troublesome, 'tis by no Means impossible, any more than to find the Centres of

Gravity of Cones, Pyramids, &c. for which you have Rules enough in Stephinus, Lib. 2. Elem. Stat. and in many other Authors.

CENTRE of an Hyperbola, or an Ellipsis. In these Curves, and in the opposite Sections of Hyperbola's, all the Diameters terminated in the Section (or in the opposite Sections) do naturally bissect one another in one and the same Point, which Point is called the Centre. And this Point in the Ellipses is within the Figure, but in the Hyperbola without, being there the Middle of the

Latus Transversum.

CENTRE of Oscillation. That Point of any Figure where all the Forces are united, is but one, (supposing the Figure to revolve round a Point or Axis) and confequently only one fingle Pendulum can be made, whose Vibiations (the Forces in both being equal) shall be Isochronical to those of the whole Solid; and because that Point in the Figure wherein all the Forces are so united, determines the Length of the simple Isochronical Pendulum, and is that wherein all the Figure is supposed to be contracted with all the Forces, while it vibrates, therefore 'tis called the Centre of Oscillation; and since the Centres of Percussion and Oscillation in every Figure are the same, the way of Investigation of both must be the same: See Centre of Percussion.

CENTRE of Percussion of a Body in Motion,

is that Point wherein all the Forces of that Body are considered as united in one; so that the Force of Percussion in that Point, is greater than any where else; so that the Centre of Percussion is the same with respect to the Forces, as that of Gravity

is in respect of the Weights.

In calculating the Centres of Gravity, we suppose the Figures to be simply suspended to a Point or Axis: But in order to calculate the Centres of Percussion, the Figures are supposed to be actually revolving about a Point or Axis; and as there the simple Momenta are considered, here they are confidered also with the Velocity super-added. And as the Sum of all the simple Momenta on each side the Centre of Gravity are equal, so here the Sum of all the Forces on every side the Centre of Percussion must be equal; and therefore, as the Centre of Gravity is found by dividing the Sum of all the Moments, by the Sum of all the Weights; so to find the Centre of Percussion, you must divide the Sum of all the Restangles under all the Momenta, and their respective Velocities, by the Sum of all the Moments:

See more of this in Hayes's Fluxions, P. 281.

CENTRIFUGAL Force. All moving Bodies endeavour after a rectilinear Motion, because that is the easiest, shortest, and most simple. Whenever therefore they move in any Curve, there must be something that draws them from their rectilinear Motion, and detains them in the Orbit. Whenever this Force, which is called Gentripetal, ceases, which attracts them towards a Centre, the moving Body wou'd strait go off in a Tangent to the Curve in that very Point, and so wou'd get still farther and farther from the Centre or Focus of its former curvilinear Motion: And that Endeavour to fly off in the Tangent, is the Centrifugal Force. The Effect of this Force is such, that if a moving Body were to describe a Circle, it wou'd cause it to describe the largest possible, because a great Circle is less curved, and differs less from a right Line than a small one: A moving Body therefore will fuffer more Violence of Attraction, and confequently will exert more of its Centrifugal Force

when it describes a less Circle, than in a greater. It is much the same in other Curves as in the Circle; for every Curve may be considered as com-posed of an Infinity of Arks of infinitely small Circles, all described by different Radii; and so, that where the Curve harh the greatest Curvature, there it is composed of such Arks as are Portions of the least Circles, or which are described by the shortest Radii. A Body therefore moving in a Curve, doth every Moment endeavour by the Centrifugal Force to get of from a Point which is the Centre of the Ark of an infinitely small Circle then described. And this Endeavour is so much the greater, by how much the Ark of the infinitely small Circle is the Portion of a lesser Circle; so that in one and the same Curve, the Centrifugal Force of the revolving Body may vary according to the different Points of the Curve in which it may at any time be. It may be therefore, that in a Curve where the Force of Gravity in the describing Body is continually variable, the Centrifugal Force may also continually vary in the same manner, and so, that one may also supply the Defect, or abate for the Excess of the other, and confequently the Effe t be every where equal to the abfolute Gravity of the revolving Body. And this as a Problem, viz. To find such a Curve in a vertical Plane, hath been proposed by Mr. Bernoulli of Groningen. Vid. Hist. de l' Academ. Royal, P. 82. for the Year 1700

CENTRUM Phonicum, CENTRUM Phonacampticum } See Echo.

CENTRY-BOX, the same with the Gueritte, only the former is of Wood, and the latter of Stone. It is made to fave the Centry from Injuries of Weather. In a Fortification they are usually placed on the Flank'd Angles of the Bastions, on those of the Shoulder, and sometimes in the Middle of the Curtin.

CERT Money, quasi Certa Moneta, was the Head-Money or common Fine paid by the Resiants and Tenants of several Mannors to their Lords. In some ancient Records this is call'd Certum Lete.

CERUSSE. In Phil. Trans. N. 137 there is this Account of the way of making Cerusse. Pigs of clean and fost Lead are cast into thin Plates, Yard long and fix Inches broad; these are rolled round so as the Surfaces no where meet to touch, for where they do no Cerusse grows. Each of these is put into a Pot just capable of holding one, and upheld by a little Bar from the Bottom, that it come not to touch the Vinegar which is put into each Pot to effect the Conversion. Twenty of these abreast are put into a square Bed of new Horse-Dung; and each Pot is covered with a Plate of Lead, and then over that with Boards as close as can well be. This repeated four times makes one Heap as'tis called, containing 1600 Pots.

After three Weeks the Pots are taken up, the Plates unrolled, laid on Boards, and beaten with a Battledore, till all the Flakes come off, which, if good, are thick, hard, and weighty. The'e Flikes are ground with Water betwen Milstones to almost an impalpable Fineness; after which 'tis moulded into several Parcels, and exposed to the Sun to dry, till it become hard and fit for use.

'Tis observed that some Pots will yield thick

and good Flakes, while others alike ordered and fet by them, without any possible Distinction of Disadvantage, vield sew, small, or none at all. Sometimes the Porsare taken up all dry, and sometimes they prove best; sometimes they are taken up wet. The Plates that cover the Pots yield tetter and thicker Flakes than do the Rolls within; and the Outsides next to the Planks bigger and better than the Insides next to the Rolls, and to the

Spirits which first rise from the Vinegar.

CESSION, is one manner of an Ecclesiastical Renefices becoming void. By the Canon Law, it a Clerk have one Living, though under 8 Pound per Annum Value, and takes a Second of what Value soever, the former is void without a Dispensation; that is, 'tis void de Jure, sed non de Fasto. But by Statute, if a Clerk have one Benefice of 8 Pound per Annum, or upwards, and takes another of any Value whatloever with Cure of Souls, and without Dispensation, the former Living is ipso fa Eto, void: And this kind of Voidance of a Living is called Coffion. And what is called Coffion in other Benefices, is called Creation in relation to a Bishoprick; for if an Incumbent be made a Bithop, his Benefice is faid to be void by Crea-

CESSION, in the Civil Law, is putting another

Person, who therefore is called the

CESSIONARY, into the Place and Right of the true and proper Creditor, in any Case. This

is called also Subrogation.

CESSOR, in Law, is one that ceafeth or neglccleth fo long to perform some Duty belonging to him, as that by this his Cesie or Ceasing, he incurs the Danger of the Law, and hath, or may have, the Writ Cessavit (see Vol. I.) brought against him. him. And where it is said in their Terms, the Tenant Ceffeth without any more Words, it is to be understood, the Tenant ceaseth to do by his Lands or Tenement.

CHAFERY, is the Term for one of the Forges in an Iron-work, (fee Iron.) The other is called

the Finery

CHAFE WAX, is an Officer belonging to the Lord High Chancellor, who fits the Wax for the Scaling of Writs, and such other Instruments as are by his Order made to be sent out.

CHALCOGRAPHY, is the Art of Engraving,

Scalpture, & gc. CHAMBERLAIN, from the French Chambellan, i. e. Cubicularius vel Prafectus Cubiculi, is used in divers Senses in our Chronicles, and old Books of Laws and Statutes: As the Lord Great (hamberlain of England, Lord Chamberlain of the King's House, the King's Chamberlain, 13 E. 1. 6.41, 17 R. 2.6.16. To whose Office it apperc. 41. 17 R. 2. c. 16. taineth to look to the King's Chambers and Wardrobe, and to govern the Under-Servants and Officers there. There is also a Chamberlain of any of the King's Courts; as Chamberlain of the Exchequer, 51 H. 3. Stat. 5. 13 E. 3.11. 14 E.3.14. 26 H. 8.2. There is a Chamberlain of North Wales, of Chester, of the City of London: This Officer is commonly the Receiver of all Rents and Revenues belonging to the City whereof he is Chamberlain. When there is no Prince of Wiles and Earl of Chester, the Chamberlain of Chester hath the Receipt and Return of all Writs coming thither out of any of the King's Courts.

In the Exchequer there be two Officers of this Name, who were wont to keep a Controulment of the Pells of Receipt and Exitus; and kept certain Keys of the Treasury and Records. They kept also the Keys of that Treasury where the Leagues of the King's Predecessors, and divers

ancient Books, as Dooms day Book, and the black

Book of the Exchequer, remain.

CHAMPION, in the Common Law, is used no less for him that trieth a Combat in his own Cause, than for him that fighteth in the Quarrel or Place

of another: And according to Bracton and some others, it is used for one that holdeth by Serjeantry, or some such Service, of another. There is also an

Officer now called,

CHAMPION of the King, who is at a Coronation, while the King is at Dinner, to ride armed, Cap-a-pee, into Westminster-Hall, and by a Herald make a Challenge, That if any l'erson thall deny the King's Title to the Crown, he is thereby ready to defend it: Which done, the Kings drinks to him, and sends him a gilt Cup with a Cover, full

of Winc, which he hath for his Fee.
CHANCELLOR, is a Title given in our Kingdom, to him that is the chief Man for matter of Justice (in private Causes especially) next to the Prince: For whereas all other Justices are tied by the Law, and may not swerve from it in Judg-ment; the Chancellor hath in this the King's absolute Power to moderate and temper the written Law, subjecting himself only to the Law of Nature and Conscience, and ordering all things juxta Aguum 69 Bonum. And therefore Stamford, in his Preregative, c. 20. p. 65. faith, that the Chancellor hath two Powers, one Absolute and the other Ordinary; meaning, that though by his ordinary Power, in some Cases he must observe the Form of Proceeding, as the other ordinary Judges do; yet that in his absolute Power he is not limited by the written Law, but by Conscience and Equity, according to the Circumstances of the Matter in question. This high Officer now bears their Title of Lord High Chancellor of Great-Britain. But there are others that bear this Name of Chancellor,

CHANCELLOR of the Exchequer; who sits in the Court and Exchequer Chamber, and with the rest of the Court ordereth things to the King's best Benefit. He is always in Commission with the Lord Treasurer for the letting of Crown Lands, Egc. and hath by the Privy Scal from the King. Power with others, to compound for Forscitures of Bonds upon penal Statutes; and his Power extends to the First-Fruits Office, &c. CHANCELLOR of the Dutchy of Lancaster,

is an Officer in that Court principally to judge and determine all Controversies between the King and his Tenants about the Dutchy Land, and otherwise to direct all the King's Affairs belonging to that

Court.

CHANCERY, is a Court of Equity and Conscience, moderating the Rigors of other Courts, and is not tied strictly to the Letter of the Law. The Officers in it are, The Lord Chancellor, or Keeper of the Great Seal: Twelve Masters of Chancery, whereof some are always Sitting in their turn on the Bench, as Assistants. The six Clerks, who have under them about 90 Clerks, in the Nature of Attorneys in the Court; two chief Examiners, who have each of them several Clerks. One chief Register, who usually hath four or five Deputies. The Clerk of the Crown. The Warden of the Fleet, the Uther, Serjeant at Arms, and Cryer of the Court. The Cursitors and their Clerks of the Petty Bag. The Clerk of the Appeals, of the Faculties, Parents, Presentations, Difinission, Licenses to alienate, Injunctions, Enrollments, Protections, Subpanas, and of the Affidavits, &c. The Sealer, Chafe-wax, &c.

CHAPEL, is of two forts; either adjoining to a Church, as a Parcel of the same, which Men of Worth hold; ut ibidem Familiaria Sepulchra sibi constituant; or else separate from the Mother Church, where the Parish is wide; and is usually called a Chapel of Ease, because built for the Ease of such Parishioners as dwell too far from the Church. Sometimes this is served by a Curate, provided at the Charge of the Rector, and sometimes at Theirs that have Benefit by it, according to Custom or Composition. And some of these latter Chapels which have a Maintenance perpetual by some Lands charitably bestowed on them, or otherwise, without the Charge of the Rector of

the Church, are called Free-Chapels.

CHAPTER, Capitulum; in the Canon and Common Law, is either Congregatio Clericorum in Ecclesia Cathedrali, regulari vel Collegiata; or Locus in quo fiunt communes tractatus Collegiato-rum. Cowel. These Chapters arose thus; in ancient Times the Bishops had their Clergy residing with them in their Cathedrals, to assist them in the Performance of facred Offices, and in the Government and Discipline of the Church. And even after Parochial Settlements were made, there were still a Body of Clergymen, which continued with the Bishop at his Church; and were indeed his Family, and maintained out of his Income. After the Monastic Life grew into Request and Reputation, many Bishops chose to have Monks rather than Seculars to reside with them and attend them in their Cathedrals. And these Bodies of either Monasticks or Seculars, had the same Privilege of chusing the Bishop and being his Council, which the whole Clergy of the Diocese had before. But by degrees, their Dependance upon the Bishop and Relation to him grew less and less; and when they had distinct Parcels of the Bishop's Estate assigned for their Maintenance, at last the Bishop had little more left than the Power of visiting them. And on the other hand, these capitular Bodies did by degrees also lose their Privi-leges; particularly that of chusing the Bishop, for which the Kings of England had a long, Struggle with the Pope, but at last Henry 8. got this Power vested in the Crown, and now the Dean and Chapter have only the Shadow of it.

The same Prince did also eject the Monks out of these Cathedrals, and placed Secular Canons in their Room. And those whom he thus regulated are called Deans and Chapters of the new Foundation: As are Canterbury, Winchester, Worcester, Ely, Carlisse, Durham, Rochester and Norwich; and of such sort are the Chapters of the sive new Sees of Peterburgh, Oxford, Gloucester and Bristol, to which may be added Westminster; tho this last Bishoprick is now sunk, and the Monastery turned into a Collegiate Church by Queen Elizabeth.

CHAPTRELS, in Architecture, are the same with Imposts, and signify those Parts on which the Feet of Arches stand. Their height or thickness ought to be equal to the breadth of the lower Part of the Key Stone.

CHARGED CYLINDER is that Part of the Chace of a great Gun where the Powder and Ball

are placed.

CHARGE of Lead is 36 Pigs, and each Pig contains fix Stone, wanting two Pound; i.e. every Stone (here) is twelve Pound.

CHARTER, in Law, is a written Evidence of any Thing done between Man and Man: And sometimes Charters are called Charters of the King, and when the King passeth any Grant to any Perion, Body Politick, & J. to excuse a Man from being impanelled on a Jury: Charters of Purdon, whereby Men are forgiven Felonies, & J.

CHARTER-LAND is such Land as a Man holds by *Charter*, i. e. by Deed or Evidence in Writing; and this is otherwise called *Free-hold*

CHARTS used at Sea, are either the Plain or Mercator's Charts, as 'tis usually called, though it should indeed be rather called Wright's Chart. See the Word Plain Chart and Mercator, in Vol. I.

CHATTELS, Catalla, is a Word which came to us from the Normans, who called all moveable Goods by this Name, the contrary was called Fief, or as we now call it Fee: But now in our Law, Chattels are all Sorts of Goods moveable and immoveable, except such as are in the Nature of Free-hold or Parcel thereof. They reckon Chattels also to be either personal or real. The Former are such as either do belong immediately to the Person of a Man, as his Horse, Sword, &&c. or such Things as being injuriously withheld from him, a Man hath no way to recover but by personal Action. But Chattels real do not appertain to the Person, but to some other thing by way of Dependance, as a Box with Charters of Land, Apples upon a Tree, &&c. Such things also as necessarily issue out of some immoveable Thing to a Person, as a Lease or Rent for Years, they call a Chattel real. Also to hold at Will, is a Chattel real.

CHAUNTRY is a Church or Chapel endowed with Lands or other yearly Revenue, for the Maintenance (formerly) of one or more Priests daily saying or singing Mass for the Souls of the Donors, and such others as they shall appoint.

CHEMICE, the Art of casting Figures in Me-

CHEST-ROPE in a Ship, is the same with the Guest or Gist-Rope, and is added to the Boat-Rope, when the Boat is towed at the Stern of the Ship, to keep her from Shearing; i. e. from swinging to and fro.

CHILIADS are the Tables of Logarithms, and fo called because they were at first divided into Thousands. Thus in the Year 1624. Mr. Briggs publish'd a Table of Logarithms for 20 Chiliads of absolute Numbers, and again for 10 Chiliads more, and then for one more, that is, for 31 Chiliads. The Book is called Arithmetica Logarithmica.

A. D. 1628. Adrian Viacq publish'd this again with a Supplement (according to Mr. Briggs's Direction) of the Chiliads before admitted; in all making up 101 Chiliads.

CHINALRY, in our Law, fignifies a Tenure of Land by Knight's Service, or by Obligation to perform some Martial or Military Office to the Lord.

CHISSELS used in Joynery and Carpentry are of several Kinds; as 1. The Former, which is used first of all before the Paring Chissel, and just after the Work is scrib'd, and a little without the scribed Strokes and with its Basil outwards.

the scribed Strokes, and with its Basil outwards.

2. The Paring Chillel hath a very fine and smooth Edge, and its used to pare off, or smooth the Irregularities which the Former makes. This is not struck with the Mallet as the Former is, but pressed with the Shoulder of the Workman, who

holds the Chiffel between the Fore and Little Finger of his right Hand, and with the two middle Fingers clutched upon it.

3. The Skew Former, which is a Chissel used for cleansing acute Angles by the Point or Corner of its narrow Edge, and where the Angles of other

Chissels cannot come.

4. The Mortess Chissel is narrow, but very thick and strong to endure hard Blows with the Mallet, and 'tis ground to a very broad Bafil; its Use is to cut deep square Holes in the Wood, which are called Mortesses: These are of several Sizes, according as the Breadth of the Mortesses

5. The Gough is a Chissel with a round Edge, one fize of which serves to prepare the way for an Augre; and others to cut such Wood as is to be tounded or hollowed, 85c.

6. Sosket Chissels are such as are chiefly used by Carpenters, and have their Shank made with a hollow Socket at the top, to receive a strong wooden Sprig made to fit into that Socket, with a square Shoulder above it; which makes them very strong to bear the heavy Blows of the Mallet: They distinguish these Socket Chissels according to the Breadth of the Blade, and call them half Inch, three quarter Inch Chissels, Inch and half, two Inch, and three Inch Chiffels.

7. The Ripping Chissel is a Socket Chissel about an Inch broad, and having a blunt Edge with no Basil to it; its Use is to rip and tear two Pieces of Wood fastned together from one another, by forcing in the blunt Edge between the two

CHORDS. On all plain Scales, and particularly on the Sector, there is a Line drawn called the Line of Chords, whose Uses are very numerous; as,

1. To measure the Quantity of an Angle plain

With 60 of the Chords, and one Foot of the Compasses in the Vertex of the Angle, strike an Arch between the Legs of the Angle, and then taking that Arch in the Compasses, and applying the Length of the Chord which subtends it to the same Lines of Chords, you will find the Quantity of the Angle by the Numbers there placed.

2. By the Chords on the Sector to divide any Circle into its proper Degrees, and to measure the Quantity of an Arch of a given Circle.

Apply over the Radius of the Circle between 60 and 60 in the Lines of Chords, and then if you take out the parallel Chords of one Degree, & c. and apply them to the Circumference of the Circle given, they shall divide it into its proper Degrees: And the Degrees of any Arch shall be known by entering the Distance between its Extremities in the Sector, parallel to the Radius between 60 and 60; or by so applying it into the Sector, that it fall on the same Numbers on each Leg.

3. To divide the Circumference of a Circle into any Number of equal Parts, or to inscribe any regular Figure in a Circle.

Divide 360 by the Number of equal Parts required, or by the Number of the Sides of the regular Polygon, and the Quotient will be a Num-

ber of Degrees, whose Chord apply'd round the Circumference will divide it as requir'd. As if you would divide any Circle into 32 equal Parts; fet the Sector to the Radius, and then dividing 360 by 32, the Quotient is 11°, 15': The Chord of which taken off parallelly, will divide the Circle into 32 equal Parts; or into the Points of the Mariner's Compass.

CHOREPISCOPI were anciently Rural Bishops delegated by the prime Diocesan; but their Authority became restrained by some Councils, and this very Office by Degrees abolish'd; after whom the Rural Deans were so commissioned to exercise Episcopal Jurisdiction, till inhibited by Pope Alex-ander III. and the Council of Tours.

CHRISM was anciently (in times of Popery) a Confection of Oil and sweet Balsam, which was confectated by the Bishop, and used in Baptism; Confirmation, Extreme Unction, 867c.

CHRISOM, Chrismale, was the Face-cloth or Piece of Linen laid over the Child's Head when it was baptized: Whence in our Weekly Bills of Mortality, fuch Children as die in the Month are

called Chrisonis

CHOROIDES is the fourth Coat of the Eye, lying under the Selerotick; it hath many little Glands which separate a black Liquor, which tinges the Inside thereof; otherwise of a white Colour, in order to hinder the reslected Light from disturbing or confounding the Pictures of Objects from being truly represented on the Retina. This Coat hath a hole before, which is called the Pupilla, which serves to admit Light and Colours into the Eye

CHRONOLOGY, Authors on this Subject are I. Bap. Riccioli Chronologia Reformata. 2 Tom.

Bonon. 1669.

Guil. Beveregii Institutiones Chronologica. Mar. Boxbornii Chronologia. Sethi Calvisii Opus Chronologicum. Alftedii Thefaurus Chronoligicus. Mastini Chronolog. Theses & Tabula. Helvici Chronologia. Jos. Scaliger de Emendatione **T**emporum.

Stranchii Chronolog.
CHRYSALIS, a Term used by the modern Writers of the natural History of Insects, for the same with Nympha, which see. Indeed the Word, as well as Aurelia used in the same Sense, seems to imply a peculiar Yellow or golden Colour in the Nympha; but this is purely accidental, and is by no means found in all Nympha: Though fome confine this Word Chrysalis to the Nympha of Butterflies and Moths only. See Swammer dam Hift.

Inject general. Sect. 2.
CHURCH-SCOT, Payment or Contribution: by the Latin Writers was frequently called *Prinzitia* Seminum, because it was at first a Quantity of Corn paid to the Priest on St. Martin's Day as the first Fruirs of Harvest: This was enjoyn'd by the Laws of King Ina, c. 4. and by Canute, c. 10. but after this, it came to signify a Reserve of Corn Rent paid to the Secular Priests, or to the Religious; and sometimes was taken in so general a Sense, as to include Poultry or any other Provision that was paid in kind to the Religious. that was paid in kind to the Religious.

CHYROGRAPHUM, in the Saxon Times, fignified any publick Instrument of Conveyance attested by Witnesses: This the Normans called

To prevent Frauds and Concealments, they made their Deeds of mutual Covenant in a Script and Rescript, or in a Part and Counter-Part, upon the same Sheet of Paper or Parchment; and in the middle, between the two Copies, they draw the Capital Letters of the Alphabet, or sometimes the Word Syngraphies in the like great Letters; and then talliated or cut the faid Sheet afunder in an indented Manner, which being deliver'd to the two Parties concerned, were proved Authentick by matching with or answering to one another, like our present Indentures, or like Tallies in Wood. And when this prudent Custom had for some time prevail'd, the Word Chirographum was appropriated to such bipartite Writings.

CIMA, in Architecture, is a moulding somewhat resembling an S. Vitruvius makes it of two Quarter Circles join'd together. Our Workmen

call it an O---G-

in Architecture, is what our Workmencall an O - G-- with CIMATIUM, the Hollow downwards, 'tis part of the Ornament of the Dorick Capital; it stands just above the Square, and hath a Fillet over it.

CIRCLE. Its Quadrature, or the squaring of the Circle. This according to Mr. Leibnitz's 7. Philos. Collect. may be understood as twofold; viz. either by Calculation, or by Linear Constru-Zion: And each of these may be either perfectly exact, or else almost so, or pretty near. Of these, that which is done by accurate or exact Calculation may be called the Analytical Way, as that which is done by exact Linear Construction is the Geometrical Way; that which is done by pretty near but not exact Calculation, may be called the Approach; and that by a Construction, only pretty near, may be called the Mechanical

Way.

The Approaches have been further carried on by

Hunganius: and others have

given several Mechanical Ways

The accurate Geometrical Construction may be had, by which not only an entire Circle may be measured or squared, but any Section or Arch of it also: Indeed this is by an exact and ordinate Motion, but it is in those that they call transcendental Curves; which, faith Leibnitz, are errone-oully accounted Mechanical, for they are as Geometrical as those which are commonly so esteem'd. Though indeed they are not all Algebraical, nor can they be reduced to Algebraick Equations of certain Degrees, because they have Degrees proper to themselves; and though not Algebraical, are yet Analytical.

The Analytick Quadrature may be again subdivided into three Kinds, the Analytical Transcendent, the Algebraical, and the Arithmetical.

The Analytical Transcendent is to be obtain'd, amongst others, by Equations of Degrees Indefinite, hitherto consider'd by; as if Xx + X be = 30, and X be sought, it will be sound to be 3, be-

cause 3 + 3 + 3 = 27 + 3 = 30.

The Algebraical is done by Vulgar, though irrational Vulgar, or by the Roots of common Equations; which for the general Quadrature of the Circle, or its Sectors, is indeed impossible.

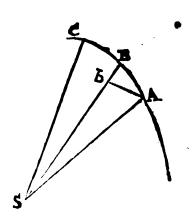

There remains therefore the Arithmetical Way, which is perform'd by certain Series exhibiting the Quantity of the Circle exact, by a Progression of Terms (first) Rational; such as I shall here propound.

Vol. II.

I have found (saith he) that if the Square of the Diameter be put 1, i.e. one, the Area of the Circle will be --- ; +--ナナ・テー that is, diminishing the entire Square of the Diameter by a third Part (that it may not be too big); and then again, because hereby too much is taken away, augment it one fifth, and then diminish it by one seventh; and so on continually in that alternate Order of the Signs, and the natural Order of the odd Numbers.

CIRCULAR-LINES, in Mathematicks, are fuch straight Lines as are divided from the Divisions made in the Arch of a Circle; fuch as Sines, Tangents, Secants, &c. an Account of the Construction of which you have under the Word Scale

CIRCULAR-VELOCITY is a Term in the new Astronomy, signifying that Velocity of any Planet or revolving Body which is measured by

the Arch of a Circle; as suppose by Ab described on the Centre of Attraction S: and the circular Velocity of a Body moving from B to C, is mea-

fur'd by the Ark B C.

CIRCUMSCRIBED Hyperbola is one that cuts its own Asymptotes, and contains the Parts cut off

within its own proper Space. See Curves.
CIRCUMSTANCES are such Things, which tho' they are not essential to any Action, do yet some Way affect it. And they reckon that some Circumstances are purely *Physical*, which don't connect any moral Good or Evil with an Action; such as killing a Man with a Right or Left Hand, &c. And others, they account properly Mural, because they do really influence our Actions, and render them more Good or Evil than they would be without fuch Circumstances. And the Writers of Ethicks sum them all up in this one Verse;

Quis, quid, nbi, quibus auxilis, cur, quomodo, quando. Vid. Whitley's Ethicks, p. 13.

CIVIL Law. The Civil Law is not received at this Day in any one Nation without some Addition or Alteration, for sometimes the Feudal Law is mixt with it, or general or particular Customs; and often Ordinances and Statutes cut off a great Part of it.

In Turkey the Justinian Greek Code is only used. In Italy the Canon Law and Customs have excluded a good Part of it. In Venice, Custom hath almost an absolute Government. In the Milanese, the Fendal Law and particular Customs bear sway. In Naples and Sivily the Constitutions

and Laws of the Lombards are said to prevail. In Germany and Holland the Civil Law is esteemed to be the Municipal Law; but yet many Parts of it are there grown obsolete; and others are alter'd either by the Canon Law, or a different Usage. In Friezeland it is observ'd with more strictness. But in the Northen Parts of Germany, the Jus Saxonicum, Lubecense or Culmense is preferred before it. In Denmark and Sweden it hath scarce any Authority at all. In France only a Part of it is received, and that Part is in some Places as a customary Law; and in those Provinces nearest to Italy the Municipal written Law. In criminal Causes the Civil Law is more regarded in France, but the manner of Trial is regulated by Ordinances and Edicts. The Civil Law in Spain and Portugal is corrected by the Ins Regium and Cu-flom. In Scotland the Statutes of the Sederunt, Part of the Regia Majestaiis, and their Customs,

controul the Civil Law.

CLAMP-NAILS, are such Nails as are used to fasten on Glamps in building and repairing of

CLAMPD. When a piece of Board is fitted with the Grain to the End of another piece of Board across the Grain, the former Board is said to be clamp'd. And thus are the Ends of Tables usually clamp'd, to keep them from warping or

casting.

CLARO-OBSCURO, is a Term in Painting; and signifies the Art of distributing Lights and particular as well on particular Shadows advantageously, as well on particular Objects as on a Picture in general. On particular Objects tis necessary to give them an agreeable Roundness, and a particular Relieve; and in the Picture in general, to expose the Objects with Pleasure to the View of the Spectators, by giving the Eye an Occasion to rest; which is best done by an happy Distribution of great Lights and Shadows, which by their Opposition set off one another.

CLASP-NAILS, are such whose Heads are brought into a little Compass, so that they will fink into the Wood, and when drove home, let a

Smoothing Plane go over them.

CLENCH-NAILS, are fuch as will drive without splitting the Boards, and draw without break-They are used by Boat and Barge Builders; and are proper for any Building with Boards that must be taken down again: For fine Work they

are made with Clasp-heads.

CLEPSYDRA. In the Memoirs of the French Royal Academy for April 1699, there is an Account by Mr. Varignon, of a General and GeometrickMethod to make Clepyfydra or Water-Clocks with any kind of given Veilels, and with any given Orifices for the Water to issue out at, and accoxding to any given Velocity of the Water's Descent.

CLERK. This Word did anciently fignify a Secular Priest, in Contradistinction to a Religious or a Regular. But by Degrees it came to be in general attributed to every Scholar, and at last was common to every Scribe and Notary; and hence so many of our Law Officers have the Title of Clerk.

CLINCH-BOLTS in a Ship, are such as are clinched with a rivering Hammer at those Ends

which come through.

CLOSE-FIGHTS, are, aboard a Ship, such Bulk-heads as are in a close Fight put up fore and aft in the Ship, for the Men to stand behind them

fecure, and fire upon the Enemy; and if the Ship

is boarded, to scour or clear the Decks.
CLOVE, is a Weight of Cheese containing the 32d Part of the Weight; and so is 8 Pound by 9 H. 6. c. 8.

CLOUTS, are thin Plates of Iron nailed on that Part of the Axle-Tree of a Gun-Carriage which comes through the Nave, through which the

Lins-pin goes.
CLOUT-NAILS, are fuch as are commonly used for nailing on of Clouts (or Plates of Iron) to the Axle-Trees of Carriages; and arc proper to

fasten any Iron to Wood.

COCCYGÆUS, is a Muscle of the Os Coccygis, arising Tendino Carnous from the acute Process of the Os Ischium, between the Ligament that reaches from thence to the Os Sacrum, and one of the Heads of the Gemini; from a narrow Beginning it gradually dilates its self into a thin fleshy Belly, interspersed with some tendinous Fibres. It is inferted into the whole Length of the Os Coccyzis, laterally.

Its use is to draw that inwards or forwards after the Excretion of hardned Faces, & C. This Muscle was first discover'd by Dr. Douglis; See his

Myogr. Comp. Specim.

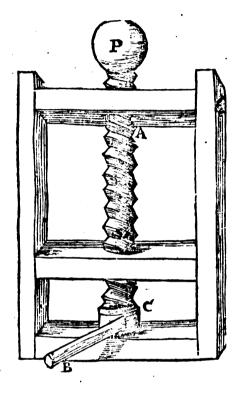

COCKET, is a Seal appertaining to the King's Custom-House: And also a Scroll of Parchment fealed and delivered by the Officers of the Custom-House to Merchants, as a Warrant that their Merchandize be Customed. This Word is used also in the Statutes of Bread and Ale, made 15 H. where there is mentioned Cocket Bread, among several other kinds: And it seems to have been hard Sea-Bisket, which perhaps had then some Cocket Mark or Seal; or else was so called from its being designed for the use of the Cock-swains or Seamen.

COCKS, aboard a Ship, are little square Pieces of Brass with Holes in them, and put into Wooden Shivers, to keep them from splitting and galling by the Pins of the Blocks in which they move.

COCK-WATER, is a Stream of Water brought in a Trough through a long Pole, in order to wath out the Sand of the Tin-Ore into the Launder, while it is bruifing in the Coffer of a Stamping. Mill: See Tin.

COCHLEA.

COCHLEA, is one of the Mechanical Powers, confisting of a Cylinder sulcated or hollowed in a Spiral manner, and moving or turning in a Box or Nut, cut so as to answer to it exactly. Now the Power or Force of this Engine may be thus estimated: Suppose in the Figure annexed the Weight P to be raised by the Turn of the Male Screw CA, by means of the Handle or Lever BC. Tis plain that in one Revolution of the Cylinder AC, the Weight can be raised no more than is the Distance between any of the two adjoining Leaves of the Screw; and that the Power moves as far as is

the Compass of one Revolution: That is, the way of the Power to that of the Weight in the same time, is as the Ambit of the Power in one Revolution of the Cylinder, to the Distance between any two contiguous Leaves of the Screw. Where-fore the Celerity of the Power to that of the Weight will be in the same Ratio. And consequently, if you apply a Power, which shall be to the Weight to be raised, as the way of that Power in each Revolution, shall be to the aforesaid Diflance between any two next adjoining Leaves of the Screw; the Power shall be in aquilibrio with the Weight, and therefore being increased never so little more shall raise it. This Power is plainly a Combination of the Lever and the Axis in Peritrochio together.

CODICIL, is a Schedule or Supplement to a Will or other Writing. Tis used as an Addition to a Testament, when any thing is omitted which the Testator would add, explain, alter, or retract; and is of the same Nature with a Testament, but that it is without an Executor: So that a Codicil is a less folemn Will of one that dies either Testate or Intestate, without the Appointment of an Heir. Testate, when he that made his Codicil, hath either before or afterwards made his Testament, on which that Codicil depends, as to which it refers. Intestate, when one leaves behind him only a Codicil without a Testament, wherein he gives Legacies only to be paid by the

Vol. II.

Heir at Law, and not by any Heir instituted by a Will or Testament. Codicils first came in use in the time of Augustus. A Codicil as well as a Will may be either written or nuncupative. Institute of

Imp. or Civil Law.

COFFER is a long square Box of the firmest Timber, about 3 Foot long, and 1 1 Foot broad, wherein Tin Ore is broken to Pieces in a stamping

Mill. See Tin.

COFFERER of the King or Queen's Hou'ehold, is a principal Officer in the Court, next under the Comptroller; that in the Counting-House and elsewhere at other Times, hath a special Charge and Overlight of other Officers of the House for their good Demeanor and Carriage in their Offices, to all which he pays their Wages. Vid. 39.

COHÆSION of the Parts of Matter. Sir Isaac Newton at the end of the Latin Edition of his admirable Opticks, concludes from the Coherence of the Parts of hard and solid Bodies, that their Particles do attract one another by a certain Force, which acts most intensely when the Particles touch one another. At some little Distance it produces those Chymical Effects or Operations, which you will find an account of under the Word Attraction, and which doth not extend to remoter Distances, 29 far at least as Sense can determine; and indeed tis hardly possible to account for the Firmness and Solidity of many Bodies, which have either a vast number of Pores, or Meatus in them, and consequently whose Particles canhot touch one another with their whole Surfaces, without supposing that those Particles be either strongly compress together, or do strongly attract one another. But it doth not seem reasonable to attribute this Cohassion of the Parts of Matter to any Pressure of the Ether, as some have imagined; because there is no certain Experiment of the Existence of any such thing as their Ather, nor if there were, would it be effectual to solve this Phanomenon, any more than it is for many others, which they account for only by this means. But this mutual Attraction of the Particles of Matter within such very narrow Bounds and Limits, which feem to be as much the Law of Nature, as Gravity, & c. will fairly account for this hitherto Inexplicable Phanmenon. Dr. Cheyne takes into Consideration the plainness of the Surfaces of the cohering Parts of Matter, in order to account for this Property; which indeed feems a necessary requisite. He thinks we may suppose some of the primary Atoms of Matter of which Bodies are constituted, to be terminated with plain Surfaces on all Sides. And fuch produce Bodies of the strictest and firmest Cohesion; others may be terminated partly with Curve, as well as partly with plain Surfaces, and these com-bined may produce Bodies of a middle Degree of Cohesion; and such as have Surfaces entirely Curve may produce Fluids, 85%. But this will not do alone, for though it will bring Bodies to immediate Contact, it will not keep them there, nor hinder them from being separated by any Force, how small seever: And the Fluids which surround our Globe, as the Particles of Light and Air, will get in between the Surfaces of Bodies when they are at any Distance greater than the Diameters of the. constituent Particles of those Fluids, and so by their lateral Pressure will destroy the Efficacy of that attractive Force by which Bodies cohere. For fince Light and Bodies act mutually one upon another; and that the Particles of Air endeavour

to recede one from another (fee Air and Light) they will render that part of Attraction whereby Bodies cohere, altogether insensible at any Distance greater than the length of the Diameters of the Particles of these Fluids: So that the Force by which Bodies cohere, cannot act but at very small Distances, and certainly is much greater in immediate Contact, than at any Distance how

COLAPTICE, is the Art of Carving or Cutting the Refemblances and Figures of Natural Things in Stone. The Term for the Artist here is

Lithoxos.

COLD. It hath been observ'd by Mr. Geoffroy (in a Discourse which he read before the French Royal Academy of Sciences, and which is mentioned in Phil. Trans. N. 274.) that a Mixture of the greatest Part of all the several Kinds of Salts, in many Liquors is accompanied with a fensible degree of Coldness, notwithstanding the violent Fermentations which such Mixtures do sometimes produce. As indeed the Learned and Ingenious Dr. Slare had before Experimented (fee Phil. Tranf. N. 150.) in a Mixture of an Acid Menstruum, and the Volatile Spirit of human Blood. Mr. Geoffroy found that pouring but half an Ounce of Sal Armoniac into three Ounces of Spirit of Vitriol, though a very violent Fermentation ensued, yet the Spirit of Wine in the included Thermometer descended three Inches and a half.

COLDSHIRE Iron, is fuch as is brittle when it

is cold. See Iron.

COLLATION, is the bestowing of a Living on a Clerk by an Archbishop or Bishop, when that Living is the Bishop's or Archbishop's own Gift: But when the Living is in the Gift of another, the Bishop is said to give the Clerk Institution into it on the Patrons Prefentation, and the Arch-deacon gives him Induction into it on the Bishops Mandate,

as well from the Collation as Institution.
COLLATIONE Heremitagii, isa Writ whereby the King confers the keeping of a Hermitage

upon a Cleik.
COLLEGIATE Churches, are Churches built and endowed for a Body Corporate, of a Dean or other President and Secular Priests; as Canons or Prebendaries in the said Church. Such as are with us, Westminster, Windsor, Rippon, Wolverhamp-ton, Southwel, Manchester, &c. None of these Collegiate Churches are Episcopal Sees or Cathe-

COLLUM Minus Uteri, is the Cavity of the Womb next its internal Orifice, where it is more contracted than it is at the Bottom.

COLONNADE, in Architecture, is a Range of

Pillars running quite round a Building, and standing within the Walls of it.

COLOUR, in a Law Sense, is a Plea that is probable, though in truth falle; and hath this End, to draw the Trial of the Cause from the Jury

to the Judge

COLOUR of Office, is always used in the Law in an ill Sense, signifying some ill Act done under Countenance of an Office; and so 'tis opposed to Virtute Officii, which is always taken in the best Sense; and implies a Man's doing a right and just

Thing under the Execution of his Office.
COLOUR. It hath been observed, that transparent Substances, as Glass, Water, Air, 69c. when made very thin by being blown into Bubbles, or otherwise formed into Plates, do exhibit various Colours according to their various Thinnels, al-

though at a greater Thickness they appear very clear and colourless. About these Sir I ac Newton, in his Opticks, Book 2. made many excellent About these Sir Isaac New-Observations serving to illustrate and demonstrates the Theory of Colours.

As, 1. By compressing two Prisms hard together, so that their Sides, which by chance were a little Convex, might somewhere south; he found the place where they touch'd to become absolutely transparent, as if they had been there but one continued piece of Glass: For when the Light fell so obliquely on the Air, between them in other Places as to be all reflected, it seemed in the place of Contact to be all transmitted, insomuch that when look'd upon, it appear'd like a little dark Spot, and when look'd through, it seem'd like a hole in that Air which was formed into a thin Plate by being compressed between the Glasses; and through that hole all Objects that were beyond it might be seen distinctly, which could not be seen at all through other Parts of the Glasses where the Air was interjacent. By pressing the Prisms hard together, this Spot would become confiderably broader.

2. When the Plate of Air, by turning the Prisms about their common Axis, became so little inclined to the incident Rays, that some of them began to be transmitted, there arose many slender Arks of Colours in it, which increased by continuing the Motion of those Prisms, and bended more and more about the faid transparent Spot, till they were compleated into Circles or Rings encompasfing it, and afterwards continually grew more and more contracted. These Arks at their first Appearance were of a Violet and Blue, and between were White Arks of Circles, which presently, by continuing the Motion of the Prisms, became a little tinged in their inner Limbs with Red and Yellow, and to their outward Limbs the Blue was adjacent. The Motion of the Prisms round their Axis being continued, these Colours contracted more and more thrinking towards the Whiteness on either Side of it, till at last they totally vanished into it, and then the Circles in those Partsappeared black and white, without any other Colours intermixed; but by farther moving the Prisms, the Colours would emerge out of the Whiteness again.

In his 4th Observation he considered more nicely the Order of the Colours arising out of the white Circles, according as the Rays became less and less inclined to the Plate of Air; and by using two Object Glasses of pretty long Telescopes, he observed the Succession and Quantity of the Colours to be thus: Next to the Pellucid Central Spot succeeded blue, white, yellow and red; the blue was so small that he could not discern it in the Circles made by the Prisms, nor could he well distinguish any violet in it; but the yellow and red were pretty copious, and feem'd about as much in extent as the white, and four or five times more than the blue. The next Circuit or Order of Colours succeeding and compassing these, were violet, blue, green, yellow and red; and these were all copious and vivid, except the green, which was very little in Quantity, and very faint and dilate. Of the other four the Violet was the least in extent, and the blue less than the yellow and red. The third Circuit or Order was purple, blue, green, yellow and red; in which the purple feemed more reddiff than the violet

Violet in the former Circuit; and the Green much more conspicuous, and as vivid and copious as any Colour there but the Yellow; but the Red began to look saded, and very much inclining to Purple. After this succeeded a fourth Circuit or Order of Green and Red: The Green was very copious and lively, inclining on one Side to Blue, on the other to Yellow. But here was neither Violet, Blue, nor Yellow, and the Red was imperfect and dirty. Also the succeeding Colours became more and more imperfect and dilute, till after three or four Revolutious they ended in perfect Whiteness.

In Observation the 5th and 6th he determines the Thickness of the Air lying between the Glasses, by which each Colour was produced: And in the 7th gives a Table of it in all the Obliquities of the Angle of Incidence: (See Air.) In the 9th he shews, that the Air between the two Object Glasses exhibited Rings of Colours, as well by transmitting Light, as by reflecting it; which he sound by looking through the Glasses. But the Central Spot was now White, and the Colours opposite to those made by Resexion in the former Cases; i. e. those Parts of the Glass, were now Black, which before were White, of vice versa; and those which were then Red were now Blue; which were then Yellow, were now Violet, soc.

In the Tenth he found, that by wetting the Object Glasses a little at the Edges, the Water crept slowly in between them, whereby the Circles became less, and the Colours more faint; and he found the Diameters of the coloured Circles made now by Water to those before made by Air, to be about seven to eight; and that if any other Medium, more or less dense than Water, be compressed between the Glasses, their Intervals at the Rings caused thereby, will be to those made by Air, as the Sines measuring the Refraction made out of that Medium into Air.

In the 12th he found, that by viewing these Rings in a darkened Room, they became more visible and distinct, and appear'd in a greater Number.

In the 13th Observation he found, that when the Prism was made to turn round its Axis, so that all the Colours might successively fall on that Part of the Paper which he saw by Reflection from that Part of the Glasses where the Circles appeared, so that all the Colours might be successively reflected from the Circles to the Eye, while it was held immoveable; he found, I say, that the Circles which the Red Light made, were manifestly bigger than those made by the Blue and Violet; and it was pleasant to see them gradually swell and contract, according as the Colour of the Light was changed: And in the 14th Observation, he. found then the Contraction or Dilatation of the Colours was swiftest in the Red, and slowest in the Violet, and in the intermediate Colours had intermediate Degrees of Celerity: and he gives you the Proportions in Numbers; and he shews also, that the Thickness of the Air between the Glasses there where the Ring is successively made by the Limits of the five principal Colours (Red, Yellow, Green, Blue, Violet) in order, are to one another very nearly, as the fix Lengths of a Chord which found the Notes in a fixth Major fol, la, mi,

Then in Observation 15, he manifestly shews the Origin of these Rings; for he found that these Rings in the preceding Observation, were not of various Colours like those made in the open Air, but appeared all over of that Prismatick Colour only with which they were illuminated; and by projecting the Prismatick Colours immediately upon the Glasses, he found that the Light which sell on the dark Spaces which were between the coloured Rings, was transmitted through the Glasses without any Variation of Colour; for on a white Paper placed behind, it would paint Rings of the same Colour with those which were resected, and of the Bigness of their immediate Spaces: so that its plain, That the Air between the Glasses, according to its various Thickness, is disposed in some Places to research, and inothers to transmit the Light of any one Colour; and in the same Place to research that of one Colour, where it transmits that of anos ther.

In Observation 16. he found, that the Squares of the Diameters of these Rings were in Arithmetical Progression. In Observation 17 and 18, he considers the Phænomena arising from the Colours seen in Bubbles of Water, made tenacious by a little Soap; and in the 19th he collects the Thickness of the Water requisite to exhibit one and the same Colour at several Obliquities, and expresses their Proportions in a Table: And in the 21st Observation he shews, by Help of Observation 10. and 16. the Thickness which Plates of Muscony Glass, Water, or any other Substances, have, at at any Colour exhibited by them.

Sir Isaac Newton, in the 22d Observation of his Second Book of Opticks, found, that a thin transparent Body, which is denser than its ambient Medium, exhibits more brisk and vivid Colours than that which is so much rarer: as he particularly observed in the Air and Glass: for blowing Glass very thin at a Lamp Furnace, those Plates encompassed with Air, did exhibit much more vivid Colours than those of Air made thin between two Glasses: Vid. Observ. 1. and 4.

And he shews farther, that since by his 10th Observation, the Thickness of Air to the Thickness of Water, which between the same Glasses exhibited the same Colour, was as 4 to 3; and since it appears (by the 21st Observation) that the Colours of thin Bodies are not varied by varying the Ambient Medium; therefore the Thickness of a Bubble of Water exhibiting any Colour, will be \$\frac{1}{4}\$ of the Thickness of Air producing the same Colour. And so according to Observation 21. the Thickness of a Plate of Glass, whose Refraction of the mean Refrangible Ray is measured by the Proportion of the Sines of 31 to 20, may be \$\frac{1}{2}\$ of the Thickness of Air producing the same Colours, and the like

of other Mediums. And on these Grounds the excellent Author gives a Table, wherein the Thickness of Air, Water and Glass, at which each Colour is most intense and specifick, is expressed in Parts of an Inch, divided into 100,000 equal Parts. And by means of this Table, he shews how to conjecture at the Bigness of the Parts of Natural Bodies by their Colours.

In the 24th Observation he takes Notice of something very odd and surprizing; and that is, that Bubbles of Water, or of Glass, and Plates of Muscovy Glass, which are not quite thin enough to represent the various Colours above-mentioned, yet when look'd on through a Prism, should appear adorn'd with Rings or Wavings; whereas a Prism usually makes Objects appear coloured only where they are terminated with Shadows, or have Parts unequally luminous: And the Reason of this he explains largely at p. 42, 43, 55c. of Book the 2d, Part the 2d. And from the whole he effectually proves those Properties of Light above discovered to be connate with the Rays and immutable; and consequently that all the Productions and Appearances of Colours in the World, are derived not from any Physical Change caused in the Light by Refraction or Reflexion, but only from the various Mixtures or Separations of Rays by virtue of their different Refrangibility or Reflexibility. And in this Respect the Science of Colours becomes a Speculation as truly Mathematical as any other Part of Opticks, so far as they depend upon the Nature of Light, and are not produced or altered by the Power of Imagination, or by striking or pressing the Edges.

Then in the following Part of the Second Book he confiders the Phanomena of the permanent Colours of Natural Bodies; and the Analogy between them, and the Colours of thin transparent Plates: And having before shewn, That Bodies appear of divers Colours, according as they are disposed to reflect most copiously the Rays originally endued with these Colours; he proceeds to examine their Constitutions, and to shew the Reason of their thus reslecting some Rays more copiously than others; which he doth in the following Propositions.

PROP. I.

Those Superficies of transparent Bodies reflect the greatest Quantity of Light, which have the greatest refracting Power: That is, which intercede Mediums which differ most in their refractive Densities. And in the Consines of equally refracting Mediums there is no Reslexion.

PROP. II.

The least Particles of almost all Natural Bodies ore in some Measure transparent; and the Opacity of those Bodies ariseth from the Multitude of Research caused in their internal Parts.

PROP. III.

Between the Parts of opake and coloured Bodies are many Spaces, either empty, or replenish'd with Mediums of other D'nsities; as Water between the tinging Corpuscles with which any Liquor is impregnated; Air between the Aqueous Globules that constitute Clouds or Miss: And for the most part

Spaces void of both Air and Water, but yet perhaps not void of all Substance, between the Parts of bard Bodies.

PROP. IV.

The Parts of Bodies and their Interstices, must not be less than of some definite Bigness, to render them coloured and opake.

PROP. V.

The transparent Parts of Bodies, according to their several sizes, must reflect Rays of one Colour, and transmit those of another, on the same Grounds that thin Plates or Bubbles do reflect or transmit those Rays. And this I take to be the Ground of all Colours.

For if a thinn'd or plated Body, which being of an even thickness, appears all over of an uniform Colour, should be slit into Threads, or broken into Fragments of the same thickness with the Plate; I see no Reason why every Thread or Fragment should not keep its Colour, and consequently, why an heap of those Threads or Fragments should not constitute a Mass of Powder of the same Colour which the Plate exhibited before it was broken.

And the Parts of all natural Bodies being like so many Fragments of a Plate, must on the same Grounds exhibit the same Colours; and that they do so, will appear by the Affinity of their Properties. The finely coloured Feathers of some Birds, and particularly those of Peacocks Tails, do in the very same Part of the Feather appear of several Colours in several Positions of the Eye, after the very same manner that thin Plates were found to do in the 7th and 19th Observations; and there-fore arise from the thinness of the transparent Parts of the Feathers; that is, from the Slender-ness of the very fine Hairs, or Capillamenta, which grow out of the sides of the grosser lateral Branches or Fibres of those Feathers. And to the same Purpose it is, that the Webs of some Spiders, by being spun very fine, have appeared coloured, as fome have observed; and that the coloured Fibres of some Silks, by varying the Position of the Eye, do vary their Colour: Also the Colours of Silks, Cloaths, and other Substances which Water or Oyl can intimately penetrate, become more faint and ob cure by being immerged in these Liquors, and recover their Vigor again by drying, much after the manner of the thin Bodies mentioned in the 10th and 12th Observations. Leaf Gold, some forts of painted Glass, the Infusion of Lignum Nephriticum, and some other Substances; reflect one Colour and transmit another, like thin Bodies in the 9th and 20th Observations: And some of those coloured Powders which Painters use, may have their Colours a little changed, by being very elaborately and finely ground. Where I see not what can be justly pretended for those Changes, besides the breaking of their Parts into less Parts by that contrition, after the same manner that the Colour of a thin Plate is changed by varying its thickness. For which Reason also it is, that the coloured Flowers of Plants and Vegetables, by being bruised, usually become more transparent than before, or at least in some Degree or other change their Colours. Nor is it much less to this Purpose, that by mixing divers Liquors, very odd and remarkable Productions of Colours may be

effected;

effected; of which no Cause can be more obvious and rational, than that the saline Corpuscles of one Liquor, do variously act upon or unite with the tinging Corpuscles of another, so as to make them swell or shrink, (whereby not only their Bulk, but their Density also may be changed;) or to divide them into smaller Corpuscles, (whereby a coloured Liquor may become transparent;) or to make many of them associate into one Cluster, whereby two transparent Liquors may compose a colour'd one. For we see how apt those saline Menstruums are to penetrate and dissolve Substances to which they are applied, and some of them precipitate what others dissolve.

In like manner if we consider the various Phænomena of the Atmosphere, we may observe, that when Vapours are raised, they hinder not the Transparency of the Air, being divided into Parts too small to cause any Reflexion in their Superficies. But when, in order to compose Drops of Rain, they begin to coalesce, and to constitute Globules of all intermedial Sizes, those Globules, when they become of a convenient Size to reslect some Colours and transmit others, may constitute Clouds of various Colours according to their Sizes. And I see not what can be rationally conceived in so transparent a Substance as Water for the Production of these Colours, besides the various Sizes of its Fluid and Globular Particles.

PROP. VI.

The Parts of Bodies on which their Colours depend, are denser than the Medium which pervades their Interstices.

This appears by confidering that the Colour of a Body depends not only on the Rays which are incident perpendicularly on its Parts, but on those also which are incident at all other Angles: And that according to the 7th Observation, a very little Variation of Obliquity will change the reflected Colour, where the thin Body or small Particle is rarer than the ambient Medium, insomuch that fuch a small Particle will at diversely oblique Incidences reflect all forts of Colours in so great a Variety, that the Colour resulting from them all, confusedly reflected from a heap of such Particles, must rather be white or grey than any other Colour, or at best it must be but a very impersect and dirty Colour: Whereas if the thin Body or small Particle be much denser than the ambient Medium, the Colours, according to the 19th Observation, are so little changed by the Variation of Obliquity, that Rays which are reflected least obliquely, may predominate over the rest so much, as to cause a heap of Particles to appear very intenfely of their Colour. It conduces also something to confirm this Prop. that according to Observation 22. the Colours exhibited by the denser thin Body within the rarer, are more brisk than those exhibited by the rarer within the more denser.

PROP. VII.

The Bigness of the component Parts of Natural Bodies may be conjectured by their Colours.

For fince the Parts of these Bodies, by Prop. 5. do most properly exhibit the same Colours with a Plate of equal thickness, provided they have the same refractive density; and since their Parts seem

for the most part to have much the same density with Water or Glass, as by many Circumstances is obvious to collect; to determine the Sizes of these Parts, you need only have recourse to the preceding Table where the thickness of Water or Glass exhibiting any Colour is express'd. Thus, if it were desired to know the Diameter of a Corpuscle, which being of equal density with Glass, shall reflect green of the third Order; (and what the meaning of these Orders are, I have explained above under Sir Isaac's 4th Observation:) The Number in the Table will be $16\frac{1}{4}$, which shews it to be $\frac{16\frac{1}{4}}{100000}$ Parts of an Inch. And from that 4th and his 18th Observation, he gathers these Particulars.

- 1. That Scarlets, and other Reds, Oranges and Tellows, if they be pure and intense, are most probably of the second Order: Those of the first and third also may be pretty good, only the yellow of the first Order is faint, and the orange and red of the third Order have a great Mixture of blue and violet.
- 2. There may be good Greens of the fourth Order, but the purest are of the third. And of this Order the green of all Vegetables seems to be, partly because of the Intensenses of their Colours; and also that when they wither, some of them turn to a greenish yellow, others to a more perfect yellow or orange, or perhaps to red, passing first through all the aforesaid intermediate Colours. Which Changes seem to be effected by the exhaling of the Moisture, which may leave the tinging Corpuscles more dense, and something also augmented by the Accretion of the oily and earthy Part of that Moisture. Now the green is without doubt of the same Order with those Colours into which it changes, because the Changes are gradual; and these Colours, though usually not very full, yet are often too full and lively to be of the fourth Order.
- 3. Blues and Purples may be either of the second or third Order, but the best are of the third. Thus the Colour of Violets seems to be of that Order, because their Syrup by Acid Liquors turns red, and by Urinous and Alkalizate turns green. For since its the Nature of Acids to dissolve and attenuate, and of Alkalies to precipitate and incrassate; if the purple Colour of the Syrup was of the second Order; an Acid Liquor, by attenuating its tinging Corpuscles, would change it to a red of the first Order, and an Alkali, by incrassating them, would change it to a green of the second Order: Which red and green, especially the green, seem too impersect to be the Colours produced by these Changes. But if the said purple be supposed to be of the third Order, its change to red of the second, and green of the third, may without any Inconveniency be allowed.

ency be allowed.

If there be any Body of a deeper and less reddish purple than that of Violets, 'tis probable its Colour is that of the second Order.'

The Blue of the first Order, though very faint and little, may possibly be the Colour of some Substances; and particularly the Azure Colour of the Sky seems to be of this Order. For all Vapours, when they begin to condense and coalesce into small Parcels, become first of that bigness whereby such an Azure must be reflected, before

they can constitute Clouds of others Colours. And so this being the first Colour which Vapours begin to reslect, it ought to be the Colour of the sinest and most transparent Skiesin which Vapours are not arrived to that Grossness requisite to reslect other Colours, as we find it by Experience.

4. Whiteness, if most intense and luminous, is that of the first Order; if less strong and luminous, it a Mixture of the Colours of several Orders. Of this last kind he takes the Whiteness of Each. Froth, Paper, Linen, and most white Substances to be; and of the former that of white Metals. For fince the densest of Metals (Gold) if foliated, is transparent, and that all Metals become transparent by being dissolved in Menstruums, or by being vitrified, the Opacity of white Metals ariseth not from this Density alone: They being less dense than Gold, would be more transparent than it, did not some other Cause concur with their Density to make them Opake. And this Cause he takes to be such a Bigness of their Particles as fits them to reflect the white of the first Order: For if they be of other Thicknesses, they must rested other Colours, as is manifest by the Colours which appear upon hot Steel in tempering it, and sometimes upon the Surface of melted Metals in the Skin or Scoria which arises upon them in their cooling. And as the white of the first Order is strongest which can be made by Plates of transparent Substances, so it ought to be stronger in the denser Substances of Metals than in the rarer of Air, Water and Glass. Nor doth he see but that Metallick Substances of such a Thickness as may fit them to resset the white of the first Order, may by reason of their great Density (according to Prop. 1.) reflect all the Light incident upon them, and so be as opake and splendent as 'tis possible for any Body to be. Gold or Copper mix'd with less than half their Weight of Silver, Tin or Regulus of Antimony, either in Fusion or amalgamated with a very little Mercury, become white; which shews both that the Particles of white Metals have much more Superficies, and so are smaller than those of Gold and Copper; and also that they are so opake as not to suffer the Particles of Gold or Copper to shine through them: Nor is it to be doubted but that the Colours of Gold and Copper are of the second Order, or of the third, and therefore the Particles of white Metals cannot be much bigger than is requisite to make them reflect the white of the first Order. The Volatility of Mercury argues that they are not much bigger, nor may they be much lefs, lest they lose their Opacity, and become either transparent as they do when attenuated by Vitrification, or by Solution in Menstruums; or black as they do when ground smaller, by rubbing Silver, Tin, or Lead on other Substances to draw black Lines. The first and only Colour which white Metals take by grinding their Parti-cles smaller is black; and therefore their white ought to be that which borders upon the black Spot in the Centre of the Rings of Colours mentioned in the preceding Observation; that is, the white of the first Order: But if you would hence gather the Bigness of Metallick Particles, you must allow for their Density. For were Mercury transparent, its Denfity is such, that the Sine of Incidence upon it (by Sir Isaac Newton's Computation) would be to the Sine of its Refracting, as 71 to 30, or as 7 to 2. And therefore the Thickness of

its Particles, that they may exhibit the same Colours with those of Bubbles of Water, ought to be less than the thickness of the Skin of those Bubbles in the Ratio of 2 to 7.

in the Ratio of 2 to 7.

Whence 'tis possible, that the Particles may be as little as the Particles of some transparent and volatile Fluids, and yet resset the white of the first

Order.

5. For the Production of Blackness ('he shews) that the Corpuscles must be less than any of those which exhibit any other Colours, because at all greater sizes of Particles there is too much Light reflected to constitute this Colour: But it they be supposed a little less than is requisite to reslect the white and very faint blue of the first Order, they will, according to Observation 4, 8, 17, and 18, reflect so very little as to appear intensely black; and yet may perhaps variously refract it to and fro within themselves so long, until it happen to be stifled and lost, by which means they will appear black in all Politions of the Eye Chout any Transparence. And from hence may be understood why Fire, and that more subtle Dissolver Putrefaction, by dividing the Particles of Substances, turn them to black: Why small Quantities of black Substances impart their Colour very freely and intenfely to other Substances to which they are applied, the minute Particles of these, by reason of their very great Number, eafily overspreading the gross Particles of others: Why Glass, ground very elaborately with Sand on a Copper Plate till it be well polished, makes the Sand, together with what is worn off from the Glass and Copper, become very black: Why black Substances do soonest of all others become hot in the Sun's Light, and burn; which Effect may proceed partly from the Multitude of Refractions in a little Room, and partly from the easy Commotion of so very small Particles:) And why Blacks are usually inclined a little to a bluish Colour; for that they are so, may be seen by illuminating white Paper by Light re-slected from black Substances, when the Paper will usually appear of a bluish white: And the reason is, because black borders on the obscure blue of the first Order in the 18th Observation, and therefore reflects more Rays of that Colour than any

The Sensations of different Colours seem to arise from hence, That several sorts of Rays do make Vibrations of several Bignesses, which, according to their Magnitudes, do excite Sensations of several Colours; much after the manner that the Vibrations of the Air, according to their several Bignesses, do excite Sensations of different Sounds. And in particular 'tis probable, that the most refrangible Rays excite the shortest Vibrations, and so produce the sensation of a deep violet Colour; and that the least refrangible Rays excite the largest Vibrations, and so produce the Sensation of a deep Red: And that the several intermediate Sorts of Rays do excite Vibrations of several intermediate Bignesses, and thereby produce the Sensations of the several intermediate Colours.

And 'tis probable also, that the Harmony and Discord of Colours (for some Colours, as that of Gold, Yellow, and Indico, are agreeable to the Eyes, and some not) arise from the Proportions of these Vibrations propagated through the Fibres of the Optick Nerves into the Brain, just as the Harmony and Discord of Sounds arises from the Vi-

brations

brations of the Air: See Newton's Opticks, at the End.

He thews also there at the 21st Query, That to the Production of all the Varieties of Colours, and the various Degrees of Refrangibility of the Rays of Light, there is nothing more necessary than that the Rays of Light be small Bodies or Particles of different Magnitudes. The least Size of which constitute a deep Violet Colour; as being the most dark and languid of all others, and as being most turned out of their way by the Action of refracting Surfaces upon them. And the other Sizes of the Rays of Light, according as they increase in Magnitude, do exhibit stronger and brighter Colours, as Blue, Green, Yellow and Red; and are, in Proportion to their Bigness, less and less capable of being refracted, or turned out of their Way.

COLOURS. Dr. Hook, in his Oper. Post. p. 54. from the Apparition of Colours in the Triangular or Hexangular Stiria of Crystal, where a lovely Variety of Colours is produc'd, in a way different quite from that which Nature takes in the Generation of Colours in other Bodics, as in Flowers, Blood, Metals, &c. he concludes, that all other Hypotheses of Colours are overhe concludes, thrown, and that nothing besides a Refraction, which is considerable enough to obliquate the Pulse of Light, is necessary for the Production of Co-

Lours

COMBARONS are the Fellow-Barons or Commonalty of the Cinque-Ports, of the two ancient Towns, and their Members. The Members that represent them in the House of Commons, are

called Barons of the Cinque-Ports.

COMBINATION of Quantities is defined by Mr. Strode, in his Treatise on this Subject, printed, London, 1678. to be the many several Ways one may take any Number of Quantities, without having any respect to their Places.

Col. Thornycroft's Treatife of Combinations from Phil. Trans. N. 299. in which the whole Affair of Combinations and Alternations is improved and compleated.

And First, He premises,

That as in the Notation of Powers, a a a a bbbcc is defign'd by a4 b3 c2, and universally p times the Position of c, by ap, soc. so in things expos'd likewise, (unless where 'tis propos'd they should be all different) which Indices, as they have here no relation to Powers, but express only the Occurrences of those Things to which they respectively belong, I therefore call Indices of Occurrences.

2dly, That as often as I shall hereafter mention the Combination and Alternations of the ps qs rs or s, (which confider'd by themselves are capable of no Variation) I mean, of those things whose In-

dices they are.

3dly, That m is generally put for the whole Number of things expos'd, whether all different or not, i. e. equal to the Sum of their Indices; and n for such a Number of them as each Combination and Alternation must consist of, (unless presuppos'd equal); which explains what is hereafter meant by the Combinations and Alternations of m things taken n and n, or of m things taken m and m; and the like Expression, by whatever Symbols the Number of things out of which the Combinations and Alternations are to be made, or of which they are to confift, may be defign'd. Vol. II.

Lenma I.

If in a right Line, at any Distances, be plac'd any number of Things, a b c d, &5 c. the Number of the Intervals, a b, b c, c d, &5 c. terminated each by two adjacent Things, is one less than the Number of Things.

For whereas every Interval is terminated by two adjacent Things, if to any Number of Things be added one Thing more, one Interval only is there-by added. Q. E. D.

Lemma II.

The Number of the Alternations of m Things a b c d, & c. different each from other, taken m and m, is m times the Number of the Alternations of m-1 Things a b c, taken m-1 and

For (by Lemma I.) the last Letter d, besides the Position it hath, may have m-2 Positions, viz. in the Intervals which are between m-1 Things abc; but it may also have one more, for it may be put first of all, it may therefore have m Positions; and those in all the different Orders, whereof m-1 Things are capable, which being all the possible Positions of d, in all the Varieties of a b c, is all the Variety whereof the whole Number of things exposed a b c d, &c. is capable. Q. E. D.

Lemma III.

The Number of the Alternations of m things a b c d, &c. different each from other, taken m and m, is equal to $m \times m - 1 \times m \ m - 2 \times m$

3 × m—4, &c. continu'd to m places.
For let m O express the Number of the Alternations of m things different each from other.

- 1 O, of m-1 things, and the like.

Tis evident, that if m = 1, it will be m O = 1; for there can be but one Order of one thing. And if m be greater than Unity, then it will be (by Lem. 2.) $m \ O = m \times m - 1 \ O = m \times m - 1$ $m - 1 \times m - 2 \ O = m \times m - 1 \times m - 2$ $\times m - 30 =$, 65c. till we have an Equation confishing of m places; i. e. $= m \times m - 1 \times m = m \times m + m = m \times$ m-2 x m-3 x, &c. continu'd to m places. Q. E. D.

Lemma IV.

If m w express the Number of the Alternations of m things ap, bp, cp, dp, eq, fr, EGc. taken m and m; and a the Number of pr, g the Number of qr, g the Number of rr, it will be,

77 × =

4 x m x 5 x, &c. continu'd to m places. I × m - 2 × m -

p×p-1 ×p-2 ×, egc. a × q×q-1 ×, egc. b × r ×r-1 ×, egc. y each Series continued to p, q, r, Ge. places respectively.

For the Number of the Alternations of any Number of things, however divided into Parts, is produc'd by a continual Multiplication of the Alternations of those things amongst themselves respectively, which compose each Part, into the Number of their Alternations one amongst the other; i. e. in the present Case (the several Occurrences being supposed to compose the several Parts, and Part in both Cases, are different from the rest of consequently the Number of the Alternations of the things expos'd; i.e. by Lem. 3.

the things composing each Part equal to Unity) m = to the Number of the Alternations of the things composing the Parts one amongst the other; but the Number of their Alternations one amongst the other, is the same in this Case, as if the things expos'd, being all different, were divided into the fame Parts; for the things which compose each

and n, are produc'd by the Alternations of the

composing the Parts one amongst the other: And therefore the Number of those to the Number of

these = to the Number of the Alternations of m things taken m and m, the Indices of whose Occur-

ther m confist of things all different or not; and

Theorem.

Demon-

Digitized by Google

Demonstration.

First then tis evident, that those Combinations, which are in different Forms, differ from each other.

Again, Tis evident that the Combinations of m things, as a, b, c, d, e, f, f, g, h, i, e, c. (the Indices simply consider'd) taken n and n, in a Form wherein are p_i , q_i , r_i , shall be equal to the Number of the Combinations of the p_i , which are in the things expos'd, taken a and a, multipli-ed into the Number of the Combinations of the q taken g and e, multiply'd into the Number of the Combinations of the r' taken γ and γ .

But because p, and all lesser Indices, are comprehended in every Index which is greater than themselves, therefore is A = to the Number of p, which are in the things expos'd; and for the same Reason would B = the Number of the q', and Cthe Number of r^i : But the Number of the p^i , which are in every Form of Combination, is $\equiv a$; therefore is B - a = to the Number of q': Also because the Number of ps and qs together, which are in every Form of Combination, wherein there are q', is $= a + \beta = b$; therefore is C - b = 1 in any of those Combinations shall be

to the Number of r', and so on, how many soever were the different Indices in any Form of Combination.

But (by Lem. 5.) the Number of the Combinations of the p, which are in the things expos'd, whose Number is A, taken a and a, is $= \frac{A \times A - 1 \times A - 2}{\alpha \times \alpha - 1 \times \alpha - 2}, \text{ so } c. \text{ continu'd to } \alpha \text{ pla-}$ ces; and the Number of the Combinations of the q', whose Number is $B \rightarrow z$, taken ϵ and ϵ , is $\frac{B \rightarrow \alpha \times B - \alpha \rightarrow 1 \times B - \alpha - 2}{\epsilon \times \epsilon - 1 \times \epsilon - 2}, \quad \text{Sc. con}$ tinu'd to & places; and the Number of the Combinations of the r^s , whose Number is C-b, taken γ_* and γ_* is $=\frac{C-b\times C-b-1}{2}$, $\epsilon_0 c$. continu'd to γ places. Q. E. D.

But every Combination in one and the fame Form, affords the same Number of Alternations: Therefore the Number of Alternations in any one Form, is so many times the Number of Combinations, as is the Number of Alternations in any one of these Combinations.

But (by Lem. 4.) the Number of Alternations.

2 × # --3×n-4×n-5×n-6×, esc. continu'd to n places.

 $p \times p - 1 \times p - 2 \times \text{, egc.} \quad a \times q \times q - x \text{, egc.} \quad c \times t \times r - 1 \times \text{, egc.} \quad \gamma \times \text{, each Series continued to}$ $p, q, r, \text{ egc. places respectively.} \quad Q. E. D.$

Now to make an Application of this General more generally demonstrated; I say, ule to those particular Cases which have already If n=m, there can be but one Form of Com-Rule to those particular Cases which have already been consider'd by others, and which are contain'd bination, and but one Combination in that in our 3d, 4th, 5th and 6th Lemma's, and by us Form; and therefore the Number of Alternati-

 $m \times m - 1 \times m - 2 \times m - 3 \times m - 4 \times$, Esc. continu'd to m places.

places respectively; i. e. (if p=1) = $m \times m - 1 \times m - 2 \times m - 3 \times m - 4 \times$, so c. continued to m places, which are the Cases of the 4th and

3d Lemma's.

But if the things expos'd are all different, and n be less than m, which is the Case of the 5th and 6th Lemma's, then also can there be but one Form of Combination, and it will be A = m and a = n, and the whole Number of Combinations

= n, and the whole remarks $\frac{A \times A - I \times A - 2 \times, 6 \circ c}{a \times a - I \times a - \times 2, 6 \circ c}$ = $\frac{m \times m - I \times m - 2 \times, 6 \circ c}{a \times a - I \times m - 2 \times, 6 \circ c}$ each Series $n \times n - 1 \times n - 2 \times$, Efc. continued to n places, and therefore the Number of Alternations = $m + m - 1 \times m - \times 2$, 55°c. continued to n places.

But fully to illustrate this Theorem, which, as delivered in general, may feem somewhat too abstracted to be commonly understood, I shall subjoin one short Example.

Example.

Let the things exposed be a a a b b b c c, or according to our way of Notation, a^3 , b^3 , c^4 ; 'tis requir'd to find the Number of their Combinations and Alternations taken 4 and 4.

pxp-1x, &c. | 2 x q x q-1 x, &c. | 6 x r x, &c. | 7 x, &c. each Series to p, 9, r, &c. Then (because in the things expos'd there is no one thing occurs more than thrice, nor more than three things different from each other) will all the Forms of Combination, which the things expos'd

$$Viz. \left\{ \begin{array}{cc} 3 & 1 \\ 2 & 2 \\ 2 & 1 & 1 \end{array} \right\}$$
Then

are capable of, be these,

In the first Form will p = 3, q = 1, a = 1, c = 1, A=2, B=3, In the 2d Form will p=2, a=2, a=2, A=3, —. In the 3d Form will p=2, q=1, $\alpha=1$, $\zeta=2$,

The Number of Combinations in the First Form $= \frac{A}{\alpha} \times \frac{B-z}{\ell} = \frac{2}{1} \times \frac{2}{1} = \frac{2}{4}$ The Number of Combinations in the Second Form = $\frac{A \times A - 1}{a \times a - 1} = \frac{2 \times 2}{2 \times 1}$ The Number of Combinations in the Third Form $=\frac{A}{\alpha} \times \frac{B-\alpha \times B-\alpha-1}{\beta \times C-1} = \frac{2\times I}{2\times I} = 3$ And the whole Number of Combinations = 10

Also the Number of Alternations:

In the First Form =
$$4 \times \frac{n \times n - 1 \times n - 2 \times n - 3}{p \times p - 1 \times p - 2|^{\alpha} \times q^{\beta}} = 4 \times \frac{4 \times 3 \times 2 \times 1}{3 \times 2 \times 1|1 \times} = 4 \times 4 = 16$$

In the Second Form = $3 \times \frac{n \times n - 1 \times n - 2 \times n - 3}{p \times p - 1|^{\alpha}} = 4 \times \frac{4 \times 3 \times 2 \times 1}{2 \times 1|2} = 3 \times 6 = 18$

In the Third Form = $3 \times \frac{n \times n - 1 \times n - 2 \times n - 3}{p \times p - 1|^{\alpha} \times q^{\beta}} = 3 \times \frac{4 \times 3 \times 2 \times 1}{2 \times 1|1 \times 12} = 3 \times 12 = 36$

And the whole Number of Alternations = 70

Many are the Properties of this Theorem, in common with others; as, To find the Uncia of a Multinominal rais'd to any integer Power: To raise an infinite Series to an integer Power, though of an interrupted Order, without introducing any thing immaterial, or which must afterwards be expung'd; and many others. But then so many Terms of the Series must be taken in at first, as shall serve to the Purposes of the intended Approximation, otherwise as often as it shall fall short of that, the Operation must be began de nevo.

Many likewise are the Properties peculiar to this Theorem, and great Variety of Problems might be fram'd; and I scruple not to say, many may occur in Practice, which are solvable by this, and no

other Method whatever. Hence may be found the Number of all Words whereof the 24 Letters are capable, from one Letter in each Word, to any Number of Letters gi-

Hence may be found the Number of all Num-

bers, to any given Number of Places, which may be produced from any Number of Figures given.

Hence also the Compass of a Musical Instrument being given, the Time and Number of the Bars, whereof each Tune shall consist, the Numbers of Tunes may be found which that Instend bers of Tunes may be found, which that Instrument is capable of

To give an Instance of the prodigious Variety that there is in Musick, I have calculated the Numthat there is in Munck, I have calculated the Number of Tunes in common Time, confissing of eight Bars each, which may be play'd on an Instrument of one Note Compass only; and it is this, viz. 27584.270157.013570.368586.999728.299176. whereas the Changes on 24 Bells is but 620448. 401733.239439.360000.which is but 425333.239439.360000.which is but 425333.239439.360000.which is but 425333.239439.360000.which is but 425333.239439.360000.which is but 425333.339439.360000.which is but 425333.339439.360000.which is but 4253333.339439.360000.which is but 4253333.339439.360000.which is but 42533333.339439.360000.which is but 425333333333. his Algebra demonstrates, could not be dispatch'd in 31557. 600000. 00000 Years. If then the Instrument were of as many Notes

Compass as any Instrument now in Use, how prodigiously must the Number of Tunes be increas'd; the Calculation of which (though much more intricate and operase) would be equally attainable by our Theorem.

See Cassini's Dissertation in the COMETS. Memoirs of the French Academy of Sciences, 1699. In the AR. Erud. Lipf. May 1682. there is a way of finding the Distance of a Comet from the Earth, by P. M. Kavina, Mathematick Professor of Faenza: And another in December, 1685. by G. S. D. whereby the Comet's Distance from the Earth is found, without any Change of Place or Station of the Observator, or taking any Altitudes or Azimuths,

Gattus de Cometis. Jac. Bernouilli Conamen Novi Systematis Come-

Dissertation sur le Nature des Cometes, per M. Petit.

Mr. Edmund Halley, Savilian Professor of Geometry in Oxon, and F. R. S. his. Synopsis of the Astronomy of Comets is as follows:

The ancient Egyptians and Chaldeans, (if we may credit Diodorus Siculus) by a long Course of Observations, were able to predict the Apparitions of Comets. But since they are also said, by the Help of the same Arts, to have prognosticated Earthquakes and Tempers; 'tis past all doubt, that their Knowledge in these Matters was the Result rather of mere Astrological Calculation, than of any Astronomical Theories of the Caelestial Motions. And the Greeks, who were the Conquerors of both those People, scarce found any other Sort of Learning amongst them than this; so that 'tis to the Greeks themselves as the Inventors (and especially to the great Hipparchus) that we owe this Aftronomy, which is now improved to such a heighth. But yet amongst these, the Opinion of Ariftotle (who wou'd have Comets to be nothing else but sublunary Vapours, or airy Meteors) prevail'd so far, that this most difficult Part of the Astronomical Science lay altogether neglected; for no body thought it worth while to take notice of, or write about the wandring un-certain Motions of what they effected Vapours floating in the Æther; whence it came to pass, that nothing certain concerning the Motion of Comets can be found transmitted from them to us.

But Seneca the Philosopher, having consider'd the Phenomena of two remarkable Comers of his Time, made no Scruple to place them amongh the Colestial Bodies, believing them to be Stars of equal Duration with the World, though he owns their Motions to be govern'd by Laws, not as then known or found out. And at last (which was no untrue or vain Prediction) he foretels, That there should be Ages some time hereafter, to whom Time and Diligence shou'd unfold all these Mysteries; and who shou'd wonder that the

Ancients

Ancients could be ignorant of them, after some lucky Interpreter of Nature had shewn in what Parts of the Heavens the Comets wander'd, what and how great they were. Yet almost all the Astronomers differ'd from this Opinion of Seneca; neither. did Seneca himself think sit to set down those Phenomena of the Motion, by which he was enabled to maintain his Opinion, nor the Times of those Appearances which might be of use to Posterity, in order to the Determining these Things. And indeed, upon the turning over very many Histories of Comets, I find nothing at all that can be of Service in this Assair, before A. D. 1327. at which Time Nicephorus Gregoras, a Constantinopolitan Historian and Astronomer, did pretty accurately describe the Path of a Comet amongst the fix'd Stars, but was too lax as to the Account of the Time; so that this most doubtful and uncertain Comet only deserves to be inserted in our Catalogue for the Sake of its appearing near 400 Years ago.

Then the next of our Comets was in the Year 1472 which being the swiftest of all, and nearest to the Earth, was observed by Regionnentanus, This Comet (so frightful upon the Account both of the Magnitude of its Body and the Tail) mov'd Forty Degrees of a great Circle in the Heavens in the Space of one Day; and was the first of which any proper Observations are come down to us. But all those that consider'd Comets until the Time of Tycho Brahe (that great Restorer of Astronomy) believ'd them to be below the Moon, and so took but little Notice of them, reckoning them

not other than Vapours.

But in the Year 1577, (Tycho seriously pursuing the Study of Stars, and having gotten large Instruments for the performing Cælestial Mensurations, with far greater Care and Certainty than the Ancients could over hope for) there appear'd a very remarkable Comet; to the Observation of which, Tycho vigorously apply'd himself, and found by many just and faithful Trials, that it had not a Diurnal Parallax that was at all perceptible; and consequently was not only no aereal Vapour, but also much higher than the Moon; nay, might be plac'd amongst the Planets for any Thing that appear'd to the contrary: The cavilling Opposition made by some of the Schoolmen in the mean Time being to no purpose.

Next to Tycho came the Sagacious Kepler. He having the Advantage of Tycho's Labours and Obfervations, found out the true Physical System of the World, and vastly improv'd the Astronomical

Science.

For he demonstrated that the Planets perform their Revolutions in Elliptick Orbits whose Planes pass through the Center of the Sun, observing this Law, That the Areas (of the Elliptick Sestorstaken at the Centre of the Sun, which he proved to be in the common Focus of the sellipses) are always proportional to the Times in which the correspondent king elliptical Arches are describ'd. He discover'd also, That the Distances of the Planets from the Sun are in the Sesquialteral Ratio of the Periodical Times, self.

or (which is all one) That the Cubes of the Distances are as the Squares of the Times. This great Astronomer had the Opportunity of observing two Comets, one of which was a very remarkable one. And from the Observations of these (which afforded sufficient Indications of an Annual Parallax) he concluded, That the Comets miv'd freely through the Planetary Orbs with a Motion not much different from a Restilinear one; but of what Kind he could not then precisely determine.

Next, Hevelius (a noble Emulator of Tycho Brahe) following in Kelper's Steps, embraced the same Hypothesis of the Rectilinear Mation of Comets, himself accurately observing many of them; yet he complain'd, that his Calculations did not agree to the Matter of Fact in the Heavens: And was aware, That the Path of a Comet was bent into a Curve Line towards the Sun. At length came that prodigious Comet of the Year 1680. which defeending, as it were, from an infinite Distance perfendicularly towards the Sun, arose from him.

again with as great a Velocity.

This Comet, which was seen for four Months continually) by the very remarkable and peculiar Curvity of its Orbit (above all others) gave the fittest Occasion for investigating the Theory of their Motion. And the Royal Observatories of Paris and Greenwich having been for some Time sounded and committed to the Care of most excellent Astronomers, the apparent Motion of this Comet was most accurately (perhaps as far as human Skill could go) observed by Messieurs Cassini and Flame

steed.

Not long after, that great Geometrician, the illustrious Sir Isaac Newton, writing his Mathematical Principles of Natural Philosophy, demonstrated not only that what Kepler had found, did necessarily obtain in the Planetary System, but also that all the Phenomena of Comets would naturally sollow from the same Principles; which he abundantly illustrated by the Example of the aforesaid Comet of the Year 168c. shewing, at the same Time, a Method of Delineating the Orbits of Comets Geometrically; wherein he (not without the highest Admiration of all Men) solv'd a Problem, whose Intricacy render'd it worthy of himself. This Comet he prov'd to move round the Sun in a Parabolical Orb, and to describe Area's (taken at the Center of the Sun) proportional to the Times.

Wherefore (following the Steps of so great a Man) I have attempted to bring the same Method to Arithmetical Calculation; and that with desired Success. For having Collected all the Observations of Comets I could, I fram'd this Table, the Result of a prodeious deal of Calculation; which, though but small in Bulk, will be no unacceptable Present to Astronomers. For these Numbers are capable of representing all that has been yet observed about the Motion of Comets by the Help of the following general Table; in the making of which I spar'd no Labour, that it might come forth perfect, as a Thing consecrated to Posserity, and to last as long as Astronomy it

The Astronomical Elements of the Metions in a Parabelick Qrb of all the Comets that have been bitherte duly observed

								<u> </u>			

The Construction and Use of the General Table.

As the Planets move in Elliptical Orbs, so do the Comets in *Parabolick* ones, having the Sun in their common *Focus*, and describe equal *Area's* in equal *Times*. But now because all *Parabola's* are similar to one another, therefore if any determinate Part of the Area of a given Parabola be divided into any Number of Parts at Liberty, there will be a like Division made in all Parabola's, under the same Angles, and the Distances will be proportional: And consequently this one Table of ours will serve for all Comets. Now, the manner of the Calculation of this Table is thus: In the or the Calculation of this lable is thus: In the Fig. let S be the Sun, POC the Orbit of a Comet, P the Perihelion, O the Place where the Comet is 90 gr. distant from the Sun, C any other Place. Draw the Right Lines C P, C S, and make S T, S R equal to C S; and then having drawn the Right Lines C R, C T, (whereof the one is a Tangent, and the other a Perpendicular to the Cuttor) let fall C O perpendicular to the Aris. the Curve) let fall CQ perpendicular to the Axis PSR.

Now, any Area, as COP'S, being given, 'tis requir'd to find the Angle CSP, and the Distance CS. From the Nature of the Parabola RQ is ever $=\frac{1}{3}$ the Parameter of the Axis, and confequently if the Parameter be put =2, then RQ =1. Let CQ=z; then PQ shall $=\frac{1}{3}zz$, and the Parabolick Segment $COP=\frac{1}{13}zzz$. Roots of these Equations $z^3+3z=0.04:0.08:0$, 12:0, 16, 5%. be successively extracted, there will be obtained for many z or Ordinates CQ remains the Triangle CSP will $=\frac{1}{3}z$, and so the Mixtilineal Area $COPS=\frac{1}{13}z^3+\frac{1}{4}z=a$, wherefore resolving into 100 Parts. And in like manner is the Calculus quently if the Parameter be put = 2, then RQ = 1. Let CQ = z; then PQ fhall = $\frac{1}{2}zz$, and the Parabolick Segment $COP = \frac{1}{12}zzz$. But the Triangle CSP will = $\frac{1}{4}z$, and so the Mixtilineal Area $COPS = \frac{1}{12}z^2 + \frac{1}{4}z = a$,

this Cubical Equation, z or the Ordinate CQ will be known. Now, let the Area OPS be propos'd to be divided into 100 Parts; this Area is is of

to be continued beyond the Place O. Now the Root of this Equation (fince R Q is equal I) is the Tabular Tangent of the Angle CR Q, or $\frac{1}{2}$ the Angle CS P, and fo the Angle CS P is given. And RC, the Secant of the fame Angle CR Q, is a mean Proportional between RQ or Unity; and RT, which is the double of SC, as is plain from the Conicks. But if SP be put = I, and fo the Latus Rectum = 4, (as in our Table) then RT will be the Diffance fought, viz. the double of SC in the former Parabola. After this manner therefore I compos'd the foregoing Table, which ferves to represent the Motions of all Comets: For hitherto there has been none observed, but comes within the Laws of the Parabola.

It remains now, that we give the Rules for the Calculation, and shew the way of determining the Place of a Comet seen, by those Numbers. The Velocity of a Comet moving in a Parabola, is every where to the Velocity of a Planet describing a Circle about the Sun, at the same Distance from the Sun, as 12 to 1, as appears from Cor. 7. Prop. 16. Lib. 1. of the Princip. Phil. Nat. Math. If therefore a Comet in its Peribelium were supposed to be as far distant from the Sun as the Earth is, then the Diurnal Area which the Comet wou'd describe, would be to the Diurnal Area of the Earth, as $\sqrt{2}$ to 1. And consequently, the Time of the Annual Revolution, is to the Time in which such a Comet wou'd describe a Quadrant of its Orbit from the Perihelium, as 314159, & c. (that is, the Area of the Circle) to 14159. Therefore the Comet would describe that Quadrant in 109 Days 14 Hours, 46 Minutes, and so that Parabolick Area (analogous to the Area POS) being divided into 100 Parts, to each Day there would be allotted 0912280 of those Parts; the Log. of which, viz. 9.960128, is to be kept for continual Use. But then the Times in which a Comet, at a greater or les's Distance, would describe similar Quadrants, are as the Times of the Revolutions in Circles, that is, in the S squiplicate Ratio of the Distances: And so the Diurnal Area's, estimated in Centesi-mal Parts of the Quadrant & which Parts we put for Measures of the mean Motion, like Degrees) are in each in the Subsesquialteral Proportion of the Distance from the Sun in the Perihelion.

These necessary things premis'd, let it be propos'd to compute the apparent Place of any one of the mention'd Comets for any given Time. Therefore,

- 1. Let the Sun's Place be had, and the Log. of its Distance from the Earth.
- 2. Let the Difference between the Time of the Perihelion, and the Time given, be gotten in Days and Decimal Parts of Days. To the Log. of this Number let there be added the conflant Log. 9.960128, and the Complement Arithmetical of the 3 of the Log. of the Distance in the Perihelium from the Sun: The Sum will be the Log. of the mean Motion, to be sought in the first Column of the General Table.
- 3. With the mean Motion let there be taken the correspondent Angle from the Perihelium, in the Table, and the Log, for the Distance from the Sun: Then in Comets that are direct, add, and in retrograde ones, substract, if the Time be after the Perihelium, the Angle thus found, to or from the Place of the Per tihelium; on in direct Comets substract, and in re-

trograde ones aild, if the Time be before the Perihelium, the foresaid Angle to or from the Place of the Perihelium; and so we shall have the Place of the Comets in its Orbit. And to the Log. found for the Distance, let there be added the Log. of the Distance in the Perihelium, and the Sum will be the Log. of the true Distance of the Comet from the Sun.

4. The Place of the Node, together with the Place of the Comet in its Orbit, being given, let the Diffance of the Comet from the Node be found; then the Inclination of the Plane being given, there will be given also (from the common Rules of Trigonometry) the Comet's Place reduced to the Ecliptick, the Inclination or Heliocentrick Latitude, and the Log. of the curtate Distance.

5. From these things given (by the very same Rules that we find the Planet's Place from the Sun's Place and Distance given) we may obtain the Apparent or Geocentrick Place of the Comet, together with the Apparent Latitude. And this it may be worth while to illustrate by an Example or two.

Example I.

Let it be required to find the Place of the Comet of the Year 1663, March the 1d, 7h, 00', P. M. London. That is, 96d, 19h, 8', after the Perihelium, which happened Novemb. 2, 11h, 52.

At the Instant of Time specified in the first Example, 'twas observed (at London) that the Comet applied to the fecond Star of Aries; so that it was found to be 9' more Northerly, and 3' to the East, according to Mr. Hook's Observation. But at that of the Second Example, I my self (near London, with the same Instruments whereby I formerly observed the Southern Constellations) found the Place of the Comet to be 5, 5°. 11 1. and 28°. 52'. North Latitude, which agreed exactly with the Observation made at Greenwich almost the very same Moment.

As for the Comet of the Year 1680, which came almost to the very Sun it self (being in its Perihelion, not above f of the Semidiameter of the Sun distant from the Surface of it) since the Latus Rethum is so very small, could hardly be contained within the Limits of the General Table, because of the excessive Velocity of the Moan Motion. Therefore in this Comet the best way is (after the mean Motion is found) to get from thence (by the Help of the foregoing Equation $z^3 + \frac{1}{2}z = \frac{1}{12}$ of the mean Motion) the Tangent of half the Angle from the Perihelion, together with the Log. for the Destance from the Sun. Which things being given, we are to proceed by the same Rules as in the rest.

After this manner therefore the Astronomical Reader may examine these Numbers, which I have calculated with all imaginable Care from the Obfervations I have met with. And I have not thought fit to make them publick before they have been duly examin'd, and made as accurate as twas possible, by the Study of many Years. I have published this Specimen of Cometical Astronomy, as a Prodromus of a designed suture Work; lest happening to die, these Papers might be lost, which every Man is not capable to retrieve, by reason of the great Difficulty of the Calculation.

·Vol. II.

Now it they not be amiss to put the Reader in mind, That our Five first Comers (the Third and Fourth observed by Peter Apian, the Fifth by Paulus Fabricius) as also the Tenth seen by Mastles, if I mistake not, in the Year 1586, are not so certain as the rest; for the Observations were made neither with fit Instruments, nor due Care, and upon that Account are difagreeing with themselves, and can by no means be reconcild with a regular Computation. The Comet which appear'd in the Year 1684, was only taken notice of by Blanchimes, who observed at Rome: And the last, which appeared in the Year 1698, was seen only by those at Paris, who determined its Course in a very un-common way. This Comet was very obscure; and although it moved swift, and came near enough our Earth, yet we, who were whit to be curious enough in these Matters, saw nothing of it. For want of Observations, I have lest out of the foregoing Catalogue, those two remarkable Comets which have appear'd in this our Age, one in Noveniber, in the Year 1689, the other in February, in the Year 1702. For they directing their Couries towards the Southern Parts of the World, and being scarce conspicuous here in Europe, met with no Observers capable of the Business. But if any one shall bring from India, or the Southern Parts, an accurate Series of requifite Observations, I will willingly fall to work again, and undergo the Fatique of representing their Orbits in Numbers, as I have done the rest.

By comparing together the Accounts of the Motions of these Comets, 'tis apparent their Orbits are disposed in no manner of Order; nor can they, as the Planets are, be moved indifferently every way, as well retrograde as direct: From whence it is clear, they are not carried about or moved in Vortices. Moreover, the Distances in their Periheliums are sometimes greater, sometimes less; which makes me suspess there may be a far greater Number of them, which moving in Regions more remote from the Sun, become very obscure; and

wanting Tails, pass by us unseen.

Hitherto I have considered the Orbits of Comets as exactly Parabolick; upon which Supposi-tion it would follow, that Comets being impell'd towards the Sun by a Centripetal Force, descend as from Spaces infinitely distant, and by their Falls acquire such a Velocity, as that they may again run off into the remotest Parts of the Universe, moving upwards with such a perpetual Tendency, as never to return again to the Sun. But fince they appear frequently enough, and fince none of them can be found to move with an Hyperbolick Motion, or a Motion swifter than what the Conset might acquire by its Gravity to the Sun, 'tis highly probable they rather move in very Excentrick Orbits, and make their Returns after long Periods of Time: For so their Number will be determinate, and perhaps not so very great. Besides, the Space between the Sun and the fix'd Stars is so immense, that there is room enough for a Comet to revolve, though the Period of its Revolution be vafily long. Now the Latus Rectum of an Ellipsis, is to the Latus Rectum of a Parabola, which has the same Distance in its Perihelium, as the Distance in the Aphelium in the Ellipsis, is to the whole Axis of the Ellips; and the Velocities are in a subduplicate Ratio of the same : Wherefore in every Excentreck Orbit, this Ratio comes very near to a Ratio of Equality; and the very small Difference which happens on account of the greater Velocity in the Parabole

rabola, is easily compensated in determining the Situation of the Orbit. The principal Use therefore of this Table of the Elements of their Motions, and that which induced me to construct it, is, That whenever a new Comet shall appear, we may be able to know, by comparing together the Elements, whether it be any of those which has appeared before, and consequently to determine its Period and the Axis of its Orbit, and to foretell its Return. And indeed there are many Things which Apian observed in the Year 1531. was the same with that which Kepler and Longomontanus took Notice of and described in the Year 1607. and which I my felf have feen return, and observed in the Year 1682. All the Elements agree, and nothing seems to contradict this my Opinion, besides the Inequality of the Periodick Revolutions: Which Inequality is not so great neither, as that it may not be owing to Physical Causes: For the Motion of Saturn is so disturbed by the rest of the Planets, especially Jupiter, that the Periodick Time of that Planet is uncertain for some whole Days together. How much more therefore will a Comet be subject to such like Errors, which rises almost four times higher than Saturn, and whose Velocity, though increased but a very little, would be sufficient to change its Orbit from an Elliptical to a Parabolical one. This, moreover, confirms me in my Opinion of its being the same; that in the Year 1456. in the Summer Time, a Comet was seen passing retrograde between the Earth and the Sun, much after the same manner: Which, shough no Body made Observations upon it, yet from its Period, and the Manner of its Transit, I cannot think different from those I have just now mention'd. Hence I dare venture to foretel, That it will return again in the Year 1758. And, if it should then return, we shall have no Reason to doubt but the rest must return too: Therefore Astronomers have a large Field to exercise them-selves in for many Ages, before they will be able to know the Number of these many and great Bodies revolving about the common Center of the Sun; and reduce their Motions to certain Rules. I thought indeed that the Comet which appear'd in the Year 1532. might be the same with that obferv'd by Hevelius in the Year 1661. But Apian's Observations, which are the only ones we have concerning the first of these Comets, are too rude and unskilfull for any thing of Certainty to be drawn from them in so nice a Matter. I design to treat of all these things in a larger Volume, and contribute my utmost for the Promotion of this Part of Astronomy, if it shall please God to conti-aue my Life and Health.

In the mean time, those that defire to know how to construct Geometrically the Orb of a Comet by three accurate Observations given, may find it at the End of the Third Book of Sir Isacc Newton's Principles of Natural Philosophy, entituled De Systemate Mundi, in the Words of its Renowned Inventor. Which have since been more fully explained by my very worthy Collegue Dr. Gregory, in his Learned Work of Afronomia Physica & Geometrica.

One thing more perhaps it may not be improper

or unpleasant to advertise the Astronomical Reader, That some of these Comets have their Nodes so very near the Annual Orb of the Earth, that if it shall so happen, that the Earth be found in the Parts of her Orb next the Node of a Comet, whilst the Comet passes by; as the apparent Mo-

tion of the Comet will be incredibly swift, so its Parallax will become very sensible; and the Proportion thereof to that of the Sun will be given. Wherefore such Transits of Comets do afford us the very best Means, though they seldom happen to determine the Distance of the Sun and Earth: Which hitherto has only been attempted by Mars in his Opposition to the Sun, or else Venus in Perigao; whose Parallaxes, though triple to that of the Sun, are scarce any ways to be perceived by our Instruments; whence we are still in great Uncertainty in that Assair. This Use of Comets was the ingenious Thought of that Excellent Geometrician Mr. Nicolas Facio. Now the Comet of 1472. had a Parallax above twenty times greater than the Sun's. And if the Comet of 1618. had come down, about the Middle of March, to his descending Node; or if that of 1618, had arrived a little fooner at its ascending Node, they would have been yet much nearer the Earth, and consequently have had more notable Parallaxes. But hitherto none has threaten'd the Earth with a nearer Appulse than that of 1680. For by Calculation I find, that Novemb. 11°. 1 h. 6'. P. M. that Comet was not above the Semidiameter of the Sun to the Northwards of the Way of the Earth. At which Time, had the Earth been there, the Comet would have had a Parallax equal to that of the Moon, as I take it. This is spoken to Astronomers: But what might be the Consequences of so near an Appulse, or of a Contact; or lastly, of a Shock of the Celestial Bodies (which is by no means impossible to come to pass) I leave to be discuss'd by the Studious of Physical

COMMENDAM. Before the Reformation, it was common for the Ordinary to grant a Sequestra-tion of a Living (especially if in his own Gifr, or lapsed to him) for six Months Time: And such a Sequestration was called Commenda-Semestris. And this was the only Commendam that the Canon Law approved of: tho' Commendams for a longer Time, and even for Life, were all along used. A Bishop, now, is only capable of holding a Benefice, or other inferior Dignity, by this Title of Commendam; which he doth by License from the Archbishop of Canterbury, or from the King in Chancery. But the Bithop can't hold any Living in Commendam without the Patron's Confent; as Watfon faith, c. 18. p. 141. In Case of a Commendam, no Institution is necessary; and a Bishop may be Licenfed to hold a Living in his own Gift by these Words: Authoritate sua propria capere, so apprebendere absquere Institutione, Inductione, Collatione, &c.

COMMISURA Craffioris Norvi amulta is a Medullary Process in the Brain, connecting together the Corpora Striata, or the Tips of the Crura

Medulla oblongata.

COMMUNICATION. Lines of Communication in the Art of Fortification, are Trenches made to continue and preserve a safe Correspondence between two Forts or Posts; or at a Siege, between two Approaches, that they may relieve one another on Occasion.

COMPARTITION, in Architecture, is the useful and graceful Distribution of the whole Ground-plot of an Edifice, into Rooms of Office,

of Reception, or Entertainment.

COMPARTMENT, in Architecture, is a particular Square, or other figured Space (for an Infeription, & c.) mark'd out in some ornamental Part of a Building. - COM-

Metius Lib. V. Doetrin. Sp. COMPERTORIUM, is a Judicial Inquest in the Civil Law, made by Delegates, to find out and relate the Truth of a Cause.

COMPOSITION of Motion. If a Body as b, be impelled or drawn by three different Forces, in the three different Directions, b a, b c, and b d, fo

that it yield to none of them, but continue in aqui-Libro: Then will those three Powers or Forces be to one another, as three right Lines drawn parallel to those Lines expressing the three different Directions, and terminated by their mutual Concourses. Let be represent the Force by which the Body b is impelled from b to a; then will the same right Line be represent also the contrary equal Force, by which it is impelled from b to e. But by what hath been faid before in Composition of Motion, the force be is resolvable into the two Forces acting according to the two Directions, bd, and bc, to which the other impelling from b to e, is as b e to b d, and b c or d e, respectively. So likewise two Forces acting without the Directions bd, bc, and being equipollent to the Force acting without the Direction be, from b to e; will be to the Force acting according to the Direction be from b to e, as bd, bc to bd; and therefore the Forces acting in the Directions bd, bc, and equipollent to the Force acting in the Direction be, are to the Force acting in the Direction, as bd, bc, or de to be:

Vol. II.

That is, if a Body be unged by three different equipollent Powers in the Directions, ba, bd, and b c, these three Forces shall be to one another, as b e, b d, and d e, respectively. Q. E. D. And this single Proposition is the Foundation of all the Me-

chanicks, as hath been often shewn by Geometers. COMPOSITION of Quantities, with respect to the Doctrine of Combinations, in the joining in any Number of Given Quantities, Letters or. Figures, one Row with another Row of the same, or with two or three, or more other Rows. See Combination.

COMPOSITION in Painting, comprehends two Parts, Invention and Disposition; one of which finds out (by the means of History) proper Objects for a Picture; and the other places them aright: the just Mixture of which two Things, according to a true Oeconomy, is properly Composition.

CONATUS Centrifugus: This is sometimes called the Conatus Excussorius, and is always expressed by the versed Sine of the Angle of Circulation, and these Conatus Centrifugi of Bodies revolving in equal Circles, with an equable Motion, are in a duplicate Ratio, or as the Squares of their Velocities. But if the Bodies revolve in unequal Circles, their Conatus Centrifugi will be in a Ratio, compounded of the Ratio of the Squares of the Velocities direlly, and the Simple Ratio of the Radii of those Circles Inversty. If the Body describe equal Areas in equal Times (as is the Case of the Planets which revolve in Ellipses round the Sun) then the Conatus Centrifugi will be reciprocally as the Cubes

of the Radii.
CONATUS Excussorius. See Conatus Centri-

CONGENERES Musculi; are such Muscles in an Animal Body, as serve together to produce the same Motion; and they are so called, because they

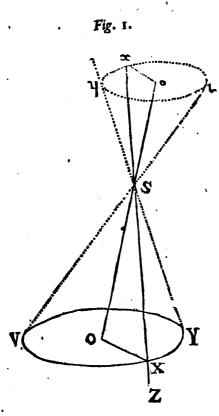

assist one another in their Action.

CONGRUITY: That there is such a Property as Congruity in the Particles of several Fluids, is plain from these and such like Instances: Quickfilver will Rick to Gold, Silver, Tin, Lead, Efc. and unite with them; but will roll off from Wood, Stone, Glass, &oc. and Water that will wet Salt and dissolve it, will slip off from Tallow, egc. without adhering to it; as it will from a dufty Surface, and from the Feathers of Water-Fowls. Two Drops of Water, or of Mercury, will, on Contact, immediately join and coalesce: But Oil of Tartar poured on Quickfilver, and Spirit of Wine . on that Oil, and Oil of Turpentine on that, and Air over all; tho' these are stopp'd in a Bottle, and shaked never so long, they will by no means continue mingled, but will separate and keep distinct. Whether the Cause of this *Incongruity* be not, that the Particles of the Fluids cannot be brought fo near to one another, as to come within the Sphere of one another's Attraction; and why they cannot be brought to do fo by shaking, are Enquiries worth pursuing. The Ingenious Dr. Hook calls worth pursuing. The Ingenious Dr. Hook calls Congruity both a Tenacious and Attractive Power, in which he's certainly right; but perhaps what he takes to be the Effects of Congruity, is the Cause of it.

CONICK SECTIONS. I thought fit to give the Reader here a Translation of L'Hospital's Sixth Book of Conicks; wherein he will see how the Sections and their primary Properties are deduced from the Cone it felf, without the tedious Number of Lemmas, which some have premised about a Line cut Harmonically; whose Demonstrations alone, are more than all these Propositions, and not so natural nor easy neither.

DEFINITIONS.

1. If an Infinite right Line, as xSZ, having one Part of it, as S, fix d there as in an immoveable Point, plac'd above the Plane of the Circle VXT;

be supposed to move round the Circumserence of the said Circle; the Revolution of this Line x S X Z, will produce or form what we call a Conick Surface; and if the Line be continued each way beyond the immoveable Point S, it will generate two Conick Surfaces, which are called Opposts.

II. The fix'd Point S, is called the Vertex of either Surface.

III. The O. VXT, is called the Base of the Cone VXTS; and the O n x y S, the Base of the Opposite Cone.

IV. For the Solid contain'd under the Base VXI, and that *Conick Surface* which is generated by the Motion of the Line SX, is called a *Cone*.

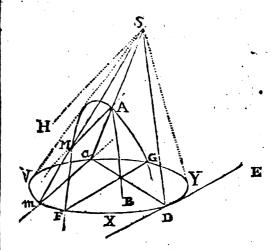

V. The Right Line S X, drawn from the Vertex to any Point in the Periphery of the Base, is called the Side (because 'tis one of the Sides of the Δ , which will be formed by cutting the Cone thro' the Vertex, and by the Axis.)

VI. The Line SO, drawn from the Centre of the Circle of the Base thro' the Vertex, is called the Axis.

VII. A Right Cone, is that whose Axis is Normal to the Plane of its Base; but if it be not so, its called a Scalene Cone.

VIII. If a Conick Surface be cut by a Plane, which doth not pass thro its Vertex, as FAG; and which also is not parallel to the Plane of the Base,

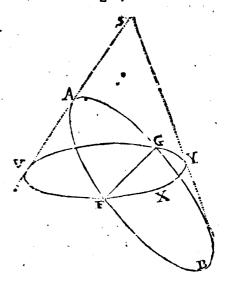

Fig. 2.

(for then a Circle will be produced, which though truly a Conick Section, is not here consider'd) the Curve Line formed by the Intersection of the Plane FAG, with the Conick Surface, is called a Conick Section.

1X. If thro the Vertex S, a Plane be drawn parallel to any Conick Section, the Infinite Right

Fig. 3.

Line DE, which is the common Sedion of that Plane, with the Plane of the Base, is called the Direction.

X. A Conick Section FAG, is called a Parabola, when the Directrix DE touches the Circle of the Base of the Cone (as in Fig. 2.); an Ellipsis, when the Directrix falls all without the Cone; and an Hyperbola when the Directrix cuts the Circle of Base.

But in this last Case, if the Plane of the Conick Sestion be produced, it must cut the apposite Conick Surface; and there will form another Conick Sestion, which is called Opposite, and both together are called Opposite Sestions, or Opposite Hyperbola's, as FAG and KNH, in Fig. 4.

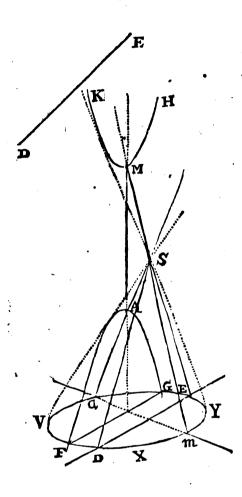

X!. If

XI. If a Line be drawn in the Plane of any Conick-Sections, fo that it meet it only in one Point, and being produced both ways, enters not at all into the Section, but falls all entirely without, that Line is called a Tangent in that Point.

CONSECTARIES.

I. In the Parabola, all the Sides of the Cone (vid. Def. 5.) being produced infinitely, must necessarily cut its Plane, except the Side SD, drawn

Fig. 4.

from the Vertex S to the Point D, where the Direttrix touches the Base; because no other Side but that can be in the Plane D S E, which is parallel to the Section; and that all the others cut it in the Point S: Whence it is plain, that the Parabola will be extended infinitely, and can never return into it self.

II. In the Ellipsis, all the Sides of the Cone, when produced, must cut the Plane of the Section; because the Plane S D E, which is parallel to it, is cut by all of them in the Point S, (Fig. 3.) Whence this Section must include a Space, and return into it self.

III. In the Hyperbola and the Opposite Sections, all the Sides of the Cone (but S.D., S.E., drawn from the Vertex to the Points D. E., where the Directrix cuts the Base) being infinitely produced both ways from the Vertex S, must cut the Planes of the Opposite Sections: Because there are no other but those two Sides, which can fall in the Plane

SDE which is parallel to the Sections; and also

because all the others cut it in the Point S.

The Sides of the Portion SDVE form the Points of the Hyperbola FAG; and those of the Portion S D Y E being produced on the other Side of the Vertex S, form the Points of the opposite Sections K M H.

And from hence tis clear, That the appointe Hyperbola's are extended infinitely, and can no more return into themselves than the Parabolick Section.

Theozem I. PROP. I.

If the two opposite Conick Surfaces be cut, by a Plane passing through the Vertex, as Sam (in Fig. 4.) the Intersection of that Plane, with the two Surfaces, will make two Right Lines Sa, Sm, which may be supposed to be infinitely produced each way from S.

For let a m be the Common Section of this Plane with that of the Base: Tis plain it will cut the Periphery of the Base in the two Points a and m, because the Plane Sam is supposed to fall within the Cone. Wherefore the Sides Sa and Sm being produced each way from S, must be the two common Sections of the intersecting Plane Sam, with the opposite Conick Surfaces: As appears from the manner of their Generation in Def. 1. Q. E. D.

CONSECTARIES. •

I. As that Part of the Line am joining the two Points a, m, in the Periphery of the Base, falls within the Base, and all the rest of it, if produced, falls without; so it follows, that if the Plane Sam, be supposed exfinitely extended all round S, that Part of it only which is contained within the Legs of the Angle a Sm, and its Vertical one be-yond S, will fall within the two opposite Conick Surfaces, and all the rest of it without them.

II. From whence it follows, That if you join any two Points, as A M, in a Conick Section, (Fig. 2.) it will be all contained within the Section; and all Parts of it, when produced either way, will fall without it: For drawing from the Vertex S two Lines, as Sm, Sa, and supposing them to determine such a Plane as above, 'tis plain the Line AM will fall all within the Less of the Angle a S m, Egc.

III. Wherefore any Line passing through the Vertex S, and parallel to such a Line as AM drawn within the Section, will fall withour the Conick Surface; and will meet the Plane of the Base produced without the Circumserence of the Rase of the Cone.

IV. It follows also, (from Confest. I.) That any two Points, one in each of the opposite Hyperbola's, (Fig. 4.) being joined by a Right Line, as AM, that Line will be wholly without and between the op-posite Sections; but infinitely produced each way, will be ever after entirely within the Oppolite Hyperbola's: For drawing through S the Lines S a, Sm, passing through the Points A, M, and supposing them to determine a Plane, extended every way from S, &c. it is evident, that that Part of the Plane which is contained within the Legs of the Angle S A, S M, where the Line A M falls, is comprehended between those two Surfaces; and that Part of the same Plane which is contained between the Productions of the Line AM, from A and M each way, will fall all of it within the opposite Hyperbola's.

V. From the 2d and 4th Confestaries it will follow, that a Right Line can't cut a Conick Section, or the opposite Hyperbola's, in more than two Points.

PROP. II.

If either of the opposite Conick Surfaces be cut by a Plane as 0 ux y, (see Fig. 1.) which is parallel so the Base OVXY, the Section will be a Circle, whose Centre shall be in 0, the Point where that Plane cuts the Axis produced as far as is necessary beyond S:

For in the Base, drawing any where a Radius OX; and from the Vertex S the Side SX; which produced, shall meet the Plane ouxy in x; the Lines OX and ox will be parallel: And the Plane SOX being produced into the opposite Cone beyond S, the Δ 's SOX and Sox will be equal; and therefore 'twill always be that SO:OX::So:Sx. But the two first Terms being always the same, the 4th Term Sx can't change its Length, let the Point x fall where it will: Wherefore the Curve x y is a Circle.

PROP. III.

If in the Plane of a Parabola, as FAG (Fig. 2.) you draw from any Point, as A, within the Cone, an infinite Right Line, as AB, parallel to the Side SD: I fay, that Line shall always be within the Section; and though infinitely produced towards B, can never cut the Parabolick Circumference any more.

For drawing, or supposing to pass through the Vertex S and the Line AB, a Plane, as S AB; that will, by its Intersection with the Conick Surface form two Sides; one of which shall always be the Line SD, (because AB is parallel to it) and the other the Line Sa, which passes through the Point A. But the Plane DSa, contained between the Sides SD, Sa, produced infinitely from D and a, will all fall within the Surface of the Cone (by Conf. I. Prop. I.) Wherefore the Line AB, which is always within that Plane, and is parallel to the Side SD, will fall all of it within the Parabola, and can cut its Circumserence no where but in B.

PROP. IV.

A Line drawn in the Parabola F A G, from any Point, as A, within the Cone, and not parallel to the Side S D, will, if produced, meet the Parabola in another Point, as M. (See Fig. 2.)

For if you suppose a Mane to pass along that Line and the Vertex S, as S A M, that will be all of it within the Conick Surface, and can't pass by the Side S D: Whence it follows, that this Plane will form, by its cutting the Surface of the Cone, the two Sides S a and S m, (see Prop. I.) one of which, S a, passes through the Point A; and the other, S m, is by no means parallel to the

Plane of the Section; (for by the Nature of it, only the Side S D is fo, (fee Def. X.) Wherefore the Side S m produced, must cut the Plane of the Parabola in the Point M; through which the Line A M passes, which is formed by the Intersection of the Plane a S m with that of the Parabola. But 'tis plain, that this Point M is one of the Points of the Parabola FAG, because 'tis both in the Plane of the Section, and also in the Surface of the Cone: Wherefore, 65°C.

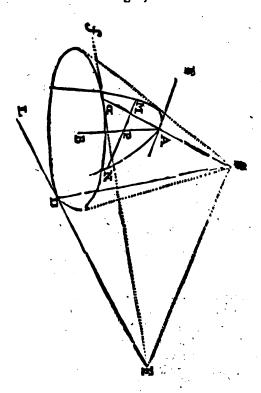

PROP. V. Probl. I.

Through a Point given, as A, in any Conick Section, to draw a Tangent, as AF, to the Curve.

Having drawn through the given Point A, and the Vertex of the Cone, as S, a Right Line, as S A, cutting the Base in a; and then to the Periphery of the Base in the same Point a, a Tangent, as E a F. The Line F A made by the common Section of the Plane S E, a f; (produced, if necessary, beyond the Vertex S) with the Plane of the Section, shall be the Tangent required.

For fince the Tangent E a f is entirely without the Base, but only in the Point a, it follows, that the Plane SE a f, infinitely produced above or be-

Fig. 5.

low S, can cut the opposite Canick Surface no where but in the Line Sa, produced also infinitely either way; and that all the rest of that Plane will be without those Surfaces. Wherefore the Line AF, made by the Intersection of that Plane with that of the Section, can interfere with neither of those Surfaces but only in the Point A, where the Line Sa cuts the Plane of the Section: Wherefore 'tis a true Tangent to the Curve in that Point.

CONSECTARIES.

I. As there can be but one Tangent to the Periphery of the Base in the Point a, so there can be

but one to the Point A drawn in any of the Conick Sections.

II. Whence arises the way of drawing a Tan-gent, as A P parallel; a Right Line, as M N, given in Polition in the Plane of any Conick Section;

or in the two opposite Sections.

For having drawn through the Vertex S a parallel to MN, as SE, that will either meet with the Directrix in some Point, as E, or be parallel to it; because that Line SE may be parallel to the Plane of the Section, and consequently may fall in the Plane SDE. If it cut it in any Point, as E, falling without the Base of the Cone; then drawing from the Point E, to the Periphery of the Base, the Tangent E a f; 'tis plain, that the Plane S E a f will make, by its Intersection with the Plane of the Section, a Tangent, as A F, which shall be parallel to the Line M N; because the two Sections A F, S E, of the parallel Planes M A N, S F D, being cur by the Tangent Plane S E a f S E D; being cut by the Tangent Plane, S E af must be parallel to one mother, as well as S E and

III. The same things being supposed, as in the preceding Confectary, and Fig. 4. it will follow, 1. That in the Parabola this Problem will be impossible, when the Line MN is in a parallel Position to the Side SD; drawing thro the Point Dwhere the Directrix touches the Periphery of the Base, for then the Points E and D will be co-incident; and thro' that Point D, no Tangent but D E can be drawn: And as the Plane which passes the Vertex S and the Directrix E D, is parallel to the Plane of the Section (by Def. 9.) by its Intersection with the Plane of the Parabola, no Tangent can be formed. But when the Line given in Position is not parallel to the Side S.D., a Tangent, as A.F., may always be drawn parallel to it; for then the Point E falling without the Circular Base of the Cone. of the Cone, two Tangents, as E a f and EDL, may always be drawn from that Point to the Circumference of that Circle; of which one, EDL, will co-incide with the Directrix; and the other, E a f, will find by the Intersection of the Plane SE a f with that of the Parabola, a Tangent, as AF, which shall answer the Problem.

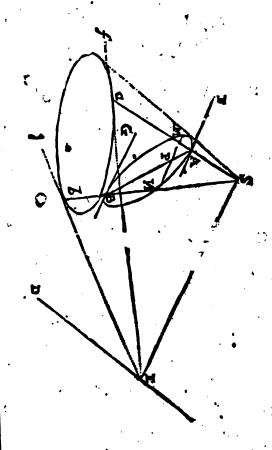

Tis the same thing when the Line SE is paral-

lel to the Directrix, for then the Tangent E a f will always be parallel to the Directrix: And as there is but one Tangent that can be drawn parallel to it, because the Directrix it self touches the Base of the Point IP, it follows, that a Tangent may

be drawn, Esc.

2. In the Ellipfis, there may always be drawn two Tangents, A F, GB, parallel to the Right

Fig. 6.

Line M N, given in Polition, and confequently to one another.

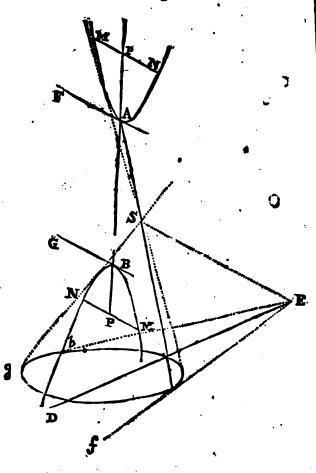

For here all the Points of the Directrix D E fall without the Base of the Cone; and therefore you may always draw from the Point E, two Tangents; Baf, and Ebg to the Circle of the Base; and these will serve, by the Intersection of the Planes SB a f, and SB b g, with the Plane of the Section on two Tangents, AF and BG, which will arrswer the Problem.

Tis the same thing when the Line S E is parallel to the Directrix, for then instead of the Tangents E a f, E b g, going from the Point E in that Directrix, you need only draw two parallel Tangents;

which is always possible.

In the Hyperbola and opposite Sections, the Problem becomes impossible, when the Point E falls within the Circular Base of the Cone; because

Fig. 7.

hen no Tangent can be drawn to that Point of the lase. But when it falls without, you may always fraw two Tangents, A F and AB, parallel to the Line M.N given in Position: For the Directrix D. E, cutting the Base, you may always draw from the Point E two Tangents, as E a f, and E b g to the Base; and which falling on each Side of the Directrix, will make, by the intersection of the Directrix, will make, by the intersection of the Directrix. of the Planes SE af, SE b g, with the Planes of the Sections, two Tangents AF and BG, which will answer the Problem.

And 'tis the same, when the Line S B is paral-lel to the Directrix D E: for then instead of the two Tangents, E a f and E b o, you need only draw two Tangents parallel to the Directrix; which

is always possible.

And here Note, that in this Case the two paral-lel Tangents A F and B G, will always belong to the opposite Sections, and never to the same, which is plain; because the two Tangents, E aj and Ebg, drawn to the Base, fall on each Side the Directrix.

IV. From the last Consectary, it follows, 1. That in the Parabola or Hyperbola, you cannot draw two Tangents which shall be parallel one to another: But in the Ellipsis and in the opposite Sections; one Tangent being given in Polition (as

fuppose A F); you may always draw another, as G B parallel to it: (See Fig. 6, 7.)

2. When the Line M N, given in Position, is terminated by the Section; you may always

parallel to it; and in the Ellipsis and opposite Hyperbola's, two Tangents, as AF and BC; because the Line S E drawn from the Vertex, paratlel to M N, will cut the Plane of the Base produced somewhere without the Circle, or else be parallel

D*efinitio* ns

XII. In the Parabola (vid. Fig. 5.) a Line, as A B drawn from any Point, as A parallel to the Side S.D, which passes through the Point D, where the Directrix touches the Baie, is called a Diameter; and the Point A its Orgine.

XIII. In the Ellipsis and Opposite Hyperbola's, (Fig. 6, 7.) a Right Line, as AB, conecting the Points of Contact of the two parallel Tangents, A Fand BG, is called a Diameter; the Points A and B, its Extremities.

XIV. A Line, as MD, drawn thro' any Point, as P_0 of the Diameter AB produced, if there be occasion (Fig. 5, 6, 7.) terminated by the Section in the two Points M N, and also parallel to the Tangent AF, which passes thro A, the Orgine of the Diameter in the Parabola, or by one or other of the Extremities of it in the Ellipsis, or Opposite Hyperbola's; that Line is said to be an entire Ordinate to the Diameter A B, being continued on each Side the Point P, tho its half, as PM or PN, is usually called an Ordinate.

XV. And when the Ordinates are at Right Angles with any Diameter, that Diameter is then called the Axis.

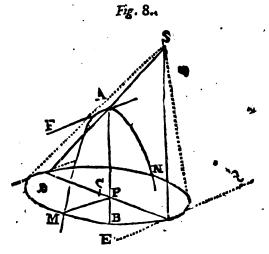

CONSECTARIES.

I. From Def. 12. it follows, that in the Parabels all the Diameters must be parallel one to another; because they are all so to the Side SD.

II. And that from one Point in that Section, there can go but one Diameter; for thro' one Point, there can be but one parallel drawn to any Line given in Polition, as S D is.

PROP. VII. Problem II.

A Diameter, as AB, an Ordinate, PM, in any Conick Section, to describe the Figure.

Thro' the ordinate P M, describe any Plane draw in the Parabola one Tangent, which may be whatever, so it be but different from the Plane, APM,

APM. Then from the Point P, in that Plane draw to PM the infinite Part Pa, and taking in that Line Pa, any Point as C for a Centre, with

the Radius CM describe a Circle, and 'tis done.

1. When the Section is to a Parabola, draw, from one of the Points, a or D, where the Circle of the Base cuts the Part Pa (viz. a) thro' the Orgine of the Diameter, the Right Line a A, which shall meet in the Point S, another Line, as S D drawn parallel to AB; and then suppose a Conick Surface described, whose Vertex is the Point S, and its Base the Circle D M a G. I say, that it will form, by its Intersection with the Plane AP M, the Parabola M A N required.

For having drawn parallel to MN, and through the Points D and a, the Right Lines ED and fa; its clear, those Lines will be Tangents, because they are parallel to MP, which is

But the Place SDE passing thro' S, the Vertex of the Cone, and thro' the Tangent DE, is paralel to the Plane APM; because SD parallel AP, and DE parallel MP: Wherefore the Section MAN, made by the Plane APM in the Conick Surface, will be a Parabola, whose Diameter is

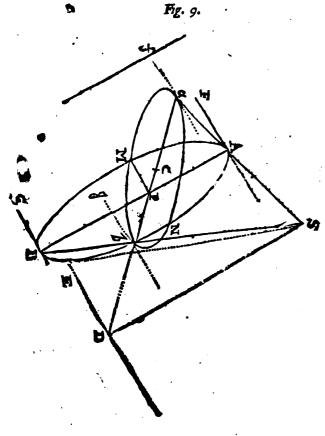

A B.

The Tangent Plane also, Saf, some in the Plane APM (by Prop. 5.) a Tangent, as AF, which is parallel to MN, as being the common Section of the two Planes Saf, APM, which pass by the Parallels af, PM, and consequently (by Def. 14.) the Right Line PM, is an Ordinate to the Diameter AB. Diameter AB.

2. When the Section is to be an Ellipsis or Hy-

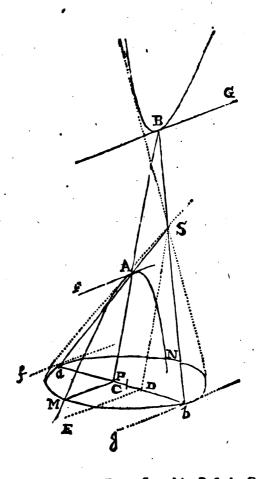

perbola.

Draw thro' the Point ab, where the infinite P a cuts the Circle; and through the Extremes of the Diameter A, B, the two Right Lines, a A and B b, they will meet in the Point S, from whence a Conick Surface may be described, whose

Vol. II.

Fig. 10.

Vertex may be that Point S, and its Base the Circle a Mb N. Then, I say, that the Plane APM shall form, in this Conick Surface, the Section M A N required.

For drawing S D parallel to the Diameter of the Section AB, and meeting a b the Diameter of the Base, in the Point D thro that Point, and also thro' a and b, draw the Parallels D E, af, and b g to PM: Then 'ris apparent, that the Plane S D E shall be parallel to APM; and that D E

(by Def. 9.) shall be the Directriz.

But in the Ellipsis, the Point D falls without the Diameter a b produced beyond the D, because the Diameter of the Section A B falls within the Angle a S b made by the Sides of the Cone a S and S b. But in the Hyperbola the Point D falls within the Circle of the Base, because then the Diameter A B falls within a S B; which is the Angle lying on the Side of the Angle a S b. Whence it follows, that (according to Def. 10.) the Section M A N, will in the former Case be an Elliosis, and in the latter, an Heterbola.

Ellipsis, and in the latter, an Hyperbola.

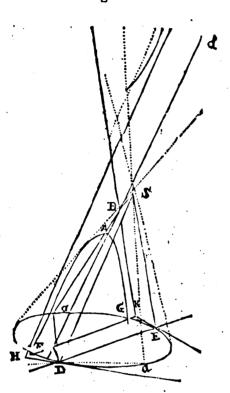

The Tangent A F passing thro' A, the Extremity of the Diameter A B; being the common Section of the Tangent Plane S a f, and the Interfeeting Plane APM, which paffes thro' the Parallel of and PM, will be parallel to the Ordinate PM; and for the fame Reason also, the Tangens BG will be parallel to PM, for that is the common Section of the Tangent Plane S b g, and the Secant Plane AMP, which pass by the two Paralhele b g and PM, small be parallel to PM. Where-fore the Line AB (by Dof. 13, 14.) is a Piameter, whole Ordinancis P.M. It

It may happen in the Ellipsis, that the Line Aa and bB may be parallel to one another; but there can be but only one Point in the Line ab for C the Centre of the Circle of the Base.

DEFINITION XVI.

If thro' the Point D and E in the Hyperbola, where the Directrix cuts the Base of the Cone, you draw the Tangents D H and E K; and thro' the

Fig. 11.

Vertex S, and those Tangents, you draw two Planes, SD H and SE K; which shall cut the Surface of the Cone in the Right Line C H and C K infinitely produced: Then are those Lines, CH and C K, called Assurptions.

CONSECTARY L

If thro' any Point of Contact of the Base of the Cone, as D, you draw thro' the Vertex S, the Side or Right Line D S, infinitely produced: Tis then plain, that the Tangent Plane, SDH, can have nothing common with the opposite Conick Surfaces, but the Side S D, because the Points of the Tangent D Hfall without the Periphery of the Base of the Cone, but only D. But the Plane SDE passing thro' the Vertex S, and the Directrix DE, being parallel to the Planes of the opposite Sections; the common Sections, S D and C H of those Planes, with the same Plane SDH, must be parallel to one another: And therefore the Assymp ptote C H must fall entirely without and between their opposite Conick Surfaces; and consequently must leave the opposite Hyperbolas on each Side entirely, without ever touching them or meeting with them. And the same thing may be shewn of the other Assumptotes CK: But as two Assumptotes CH, CK, are formed by the Plane SDH, SEK, which fall on each Side of the same Conick Surface, and its opposite; it follows, that all the

Points of the Hyperbola F A G are contained within the Angle H C K; and all Points of the opposite Section within its vertically opposite Angle.

. PROP. VII.

If thro' any Point, as B, in the Assymptote C K, you draw a Line, as B A parallel to the other Assymptote C H; I say, that it shall intersect one of the opposite Hyperbolas in one only Point as A: and being produced infinitely, will be always within it.

See Fig. 12.

For, fince the Lines B A and SD are parallel to C H, they must be so to one another, and so are both in the same Plane; which Plane will enter within the two Conick Surfaces, because it paties by one of their Sides S D, and makes an Angle with the Tangent Plane S D H.

The Plane of the Parallels, B A, SD, will form in the two Conick Surfaces, two Sides; of which, one is SD, and the other the Side Sa, which must necessarily cut the Line BA, in some Point, as A; because it lies in the Plane which passes thro' the Parallels SD, AB; and which enters SD in S

Parallels S D, AB; and which enters S D in S. Wherefore, because the Point A is found at the same Time in one of the Conick Surfaces, and in the Plane of the Hyperbola's, it must be in one of those Hyperbola. And since the Line B A being infinitely produced on the Side of the Point A, falls entirely in the Plane D Sa, contained between the Sides D S, Sa; therefore the Point A will be in the Hyperbola F AG, and in the vertically opposite one ASD, when it belongs to the opposite Hyperbola: 'Tis apparent, it must always fall within one of the two Conick Surfaces; and con equently within the Hyperbola also, which is contained in the Section. Q. E. D.

CONSECTARY.

From hence 'tis plain, that between the Hyperbola F A G, and its Assymptote C H, no Line can be drawn parallel to that Assymptote.

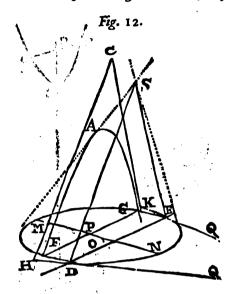

But as the Line A B divides the Hyperbola, which it cuts into two indefinite Portions, of which one must fall entirely within the Space contained between the two Parallels B A and C H; it follows, that the lesser CB becomes, the more or farther the Point A will get into that Space, and this still more and more, till CB become less than any Quantity: That is, the Hyperbola and its Assymptote will approach still nearer and nearer towards one another; so that their Distance will be less than any assignable Length, and yet can never meet, by Cor. 1. of Def. 16.

PROP.

PROP. VIII. Problem.

CH and CK, the Assymptotes of an Hyperbola, FAG, being given, and any Point in the Curve, as F, to describe the Hyperbola.

Having drawn through the given Point F any Right Line, as HK, cutting the Assymptotes, make a Plane to pass through that Line, any how

(so it be different from the Plane of the Assymptotes HCK) in which Plane draw through P the middle Point in HK an infinite Perpendicular, as MN. Then on any Point of it, as O, as a Centre, and with the Radius OF, describe the Circle FMN. Then draw through the Points H and K two Tangents to the Circle; and through their Points of Contast D, E draw DS, ES, parallel to the given Assymptotes CH and CK. These will meet in a Point, as S; from which, as from a Vertex, if you describe a Conick Surface, whose Base shall be the Circle FMN; I say, this Conick Surface shall, by the Intersection of the Plane HCK, form the Hyperbola FAG; which was required.

For,

1. 'Tis clear, from the Property of the Circle, That the Chord FG is biffected in the Point P, by the Diameter MN, which is perpendicular to it. Wherefore fince PH = PK (by the Confruction) FH must be = GK, and GH = FK; and confequently GH * HF = FK * KG.

2. From the Circle also it follows, That GH *

2. From the Circle also it follows, That $GH \times HF = \overline{HD^2}$, and $FK \times KG = \overline{KE^2}$; and confequently HD = KE.

3. If the Tangents HD and KE are produced, till they meet in the Point Q, DQ will be = EQ.

Wherefore DQ:EQ::HD:KE.

Whence it will follow, That the Line DE joining the two Points of Contact, is parallel to the Line HK; and the Plane SDE to the Plane CHK: And therefore the Line DE is the Directrix, (by Def. IX.) And as it cuts the Base in two Points, the Section FAG will be an Hyperbola, by Def. X.

Vol. II.

Tis plain also, That this Hyperbola must pass through the Point F, since that Point is common both to the Conick Surface, and to the Plane HCK, which is that of the Hyperbola: and that Hyperbola shall have the Lines CH, CK for its Assymptotes, because they are the common Sections of the Tangent Planes SDH, SEK, with the Plane of the Hyperbola, (Def. XV.)

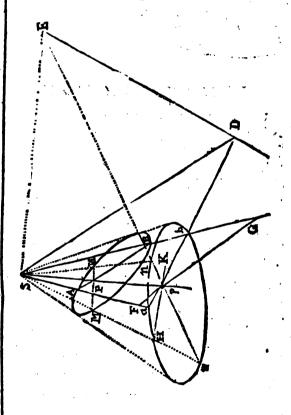

When it happens that the Tangents DH, EK

When it happens that the Tangents DH, EK are parallel, then will also the Lines DE, HK be parallel.

PROP. IX.

If two Right Lines, as M N, A B, terminate within any Conick Section, or within the opposite Sections, do intersect each other in a Point, at P; and if they be parallel to any two other Right Lines, as S E, S D, which are given in Position: I say, the Rectangle M P N is to that of A P B, always in a given Ratio; or the Ratio between these Rectangles will always be the same, let the Lines M N, A B, lie where they are.

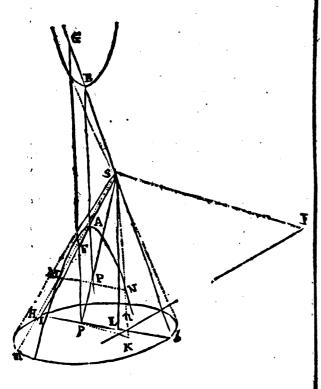

Fig. 13.

 \mathbf{X}

Fig. 14.

Fig. 14. ,

DEMONSTRATION.

Drawing thro' the parallels SE, MN, and SD, AB, two Planes, their Intersection with the Plane of the Base, will form the two Right Lines Enm, Dba; and in the Conick Surface, the Sides SMm, SNn, SAa, SBb: And their common Intersection will be the Line SPp, which meets the Plane of the Base in the Point p, being the Intersection of the two Lines, Em and Da. Thro' that Point p then, and in the Plane SMN, draw the Line HK parallel to MN, and in the Plane SAB, draw FG parallel to AB.

Then the similar Triangles SPM, SpH, SPN, SpK, SPA, SpF, SPB, SpG; will give these Proportions: That the []MPN, []HpK:: $SP^2SP^2::[]APB$, []FpG. Also the []MPA, []APB::[]HpK[]Fpg: But the Ratio of the []HpK to []FpG, is compounded of two Ratio's of []HpK to []FpG, is compounded of []MpX to []FpG, is compounded of []MpX to []FpG, is compounded of []MpX to []FpG, is compounded of []MpX to []FpG, is compounded of []MpX to []FpG, is compounded of []MpX to []FpG, is compounded of []MpX to []FpG, is compounded of []MpX to []FpG, is compounded of []MpX to [

a $p \times p b$ to $Fp \times p G$. But because of the similar Triangles, Hp m, SEm, and Kpn, SEn: It will be Hp, mp: SEm E, and p K, pn: SE, En.

And then multiplying the Antecedents and Confequents of those Ratio's, $Hp \times p K$, $mp \times p n$: $SE^2 mE \times E n$.

It may be proved also from the Similarity of the Triangles F p a, S D a, and G p b, S D b: That $ap \times pb$, $Fp \times pG :: aD \times Db : SD^2$.

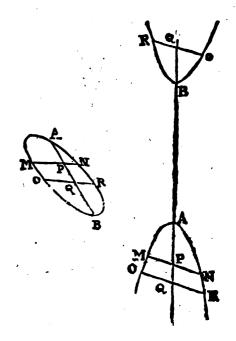

Tis evident therefore, That the Ratio of $PM \times P$

Tis evident therefore, That the Ratio of $PM \times PN$ to $AP \times PB$, is compounded of two Ratio's of SE^2 to $mE \times nE$, and of $aD \times Db$ to SD^2 : Which by the Property of the Circle (which Figure the Base of the Cone makes) will remain always the same, let the Lines MN, AB, lie how they will, because the Points do not change: Wherefore the Reclangle APB, is always in a given Ratio. Q. E. D.

CONSECTARY.

Hence you see, that if in any Conick Section, or in the opposite Sections, there be two Right Lines, MN, OR, parallel one to another; and cutting

Fig. 15, 16.

a third Line, AB, which is also terminated within the Section; it will always be [] MPN [] OQR:: [] APB, [] AQB.

PROP. X.

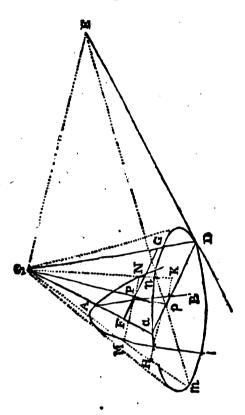

If thro' any Point, as A, of a Parabola or Hyperbola M A N, a Right Line, as A B be drawn parallel to the Side of the Cone S D; (that is, being drawn in the Parabola thro' the Point D, where the Directrix touches the Base; and in the Hyperbola thro' one of the two Points where the Directrix cuts the Base): And suppose thro' any Point, as P, in that Line A B, a Right Line M N be drawn parallel to the Line S E, given in Position, and terminated by that Section, or the opposite Section: Suppose also another Right Line, F G, drawn parallel to the Line D a, the common Section of the Plane S A B with that of the Base, and terminated by the Sides S a, S D: Then, I say, the Ratio of the Rectangle F P x P G, or F P G is given, i.e. it will be always the same, wherever the Point P be taken in the Line A B.

BEMON.

DEMONSTRATION.

Thro' the Parallel SE, MN, suppose a Plane to be drawn, that will form with the Base of the Cone, the Right Line Enm, in the Conick Sur-

Fig. 17.

face, the Sides SMm, SNn, and in the Plane S Da; the Line SPp, which meets the Base in the Point P, where the Lines EM, DA, intersect each other. Then thro'that, in the Plane SMN, I draw the Line HK parallel to MN.

This being supposed, the Similar Triangles SPM, SpH, SPN, SPK, SPE, Spa, SPG, SPD will give us these Propositions.

MPN, [] HpK::SP'Sp':: [] FPG, apD; or (by the Property of the Circle)

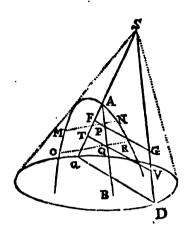

Mpn.
Also the MPN, FPG: Hpk, mpn. But the Ratio of [] Hpk to the [] mpn, is compounded of the two Ratio's of Hp to pm, and of pk to pn: That is, (because of the Similar Triangles, Hpm, SEm, and Kpn, SEN) of the two Ratio's of SE to Em, and of SE to En; and confequently HpK, mpn, or MPN, FPG::SE' 🗍 mEn.

And then, because the Point E varies not, in what Place soever the Point p be taken; and since all the Emn are equal, by the Property of the Circle; it will follow, that the Rectangle MPN must be to [] FPG in a given Ratio. Q.E.D.

CONSECTARY.

Hence the evident, that if thro' any Point, as A of an Hyperbola or Parabola, MAN, if in the latter, a Diameter, as AB; or in the former, a

Fig. 18.

Parallel to one of the Assymptotes, as AB, be drawn, and that thro' any two Points, a PQ, in that Line AB, two Parallels, MN, OR, be drawn and terminated by that Section, or by the opposite Sections; it will always be []MPN, []OQR:AP, AQ.

For drawing the Plane SAB, forming by its

Intersection with the Conick Surface, the two Sides SD, Sa: of which, the Side SD, (if the Section be a Parabola) passes thro the Point D; where the Directrix touches the Base; and if it be an Hyperbola, thro' one of the two Points where it cuts it: And drawing also, in the Plane SDa, through the Points P, Q, the Right Lines FG, TV, parallel to Da: Tis plain, in the precedent Proposition, that [MPN, FPG::OQR, TQV]; and then alternately, [MPN, OQR, ::FPG, TQV]. But the Parts PG, QV, are equal to one another; because the Lines AB, SD, are parallel: And moreover, [] MPN, OQR, ::FP, TQ, ::AP, AQ; by reason of the Similar Triangles, APF, and AQT. Wherefore [] MPN, must be to [] OQR:: AP, AQ. Q. E. D.

After this, the Noble Author, because a Cylinder is a Solid less compounded than a Cone; for it hath all its Sides parallel one to another, instead of their terminating in a Point, as they do in the Cone; thinks fit to confider the Ellipsis as a Cylindrick Section, and from thence demonstrates the Properties of its Diameters, as also those of the Parabola and Hyperbola.

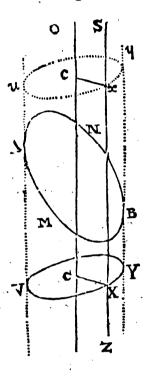

In order to which, he premises these Definitions.

Of the Ellipsis in Particular.

DEFINITIONS.

XVII. If an Infinite Right Line, as Sz, which is without the Plane of the Circle VXY, be moved with one of its Points X, quite round the Circum-

Fig. 19.

terence of that Circle, and keeps always parallel to it self, till it come again to the Place or Point whence it set out; then the Convex Surface, described by the Motion of that Line, is called a Cylindrick Surface.

XVIII. The Describent Line S Z, in any kind of Position of its Motion round the Circumference of the Dirigent Circle, is always called the Side.

XIX. The Circle VXY, is called the Base.

XX. The Infinite Line CO, drawn from the Centre of the Base C, and parallel to the Sides, is called the Axis.

XXI. The Infinite Solid, comprehended under the Pase VXY and the Cylindrick Surface, is called a Cylinder.

XXII. If the Cylinder be cut by a Plane, neither parallel to its Sides, nor to the Plane of the Base, the Curve Line AMBN, formed by the Intersection of that Plane with the Cylindrick Surface, is called a Cylindrick Session.

PROP. XI.

If a Cylinder be cut by a Plane, (see Fig. 147.) as uxv, parallel to the Plane of its Base VXY; the Section uxy, shall be a Circle, whose Centre shill be the Point c, where that Plane intersects the Avis: and its Radius shall be the Right Line cx = CX, the Radius of the Base.

DÊMUNSTRATION.

For having drawn through any Point x, of the Section u x y, a Side, as x X, of the Cylindrick Surface that shall be parallel to the Axis Cc; (by Def. 20.) wherefore a Plane may be made to pass through these two Lines, which by its Interection with the two parallel Planes CVXY; and cnx y will form the two Right Lines; Cx and cx parallel to one another; and which also might be equal to one another, because they are terminated by the two parallel and equal Lines, Cc and Xx.

But as this must always be the Case in what

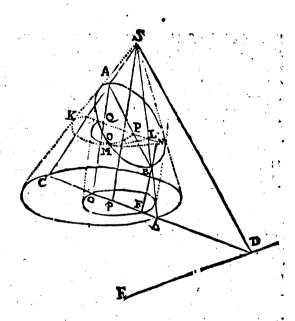

But as this must always be the Case in what Foint soever of the Section $u \times y$, x be taken: It will follow, that the Lines $c \times x$, drawn from the Point c, to all the Points x, of the Section $u \times y$, are equal to all the Radii, $C \times X$, of the Base; (i. e.) the Section $u \times y$, must be the Circumference of a Circle, whose Centre is c, where the Plane $u \times y$ cuts the Axis of the Cylinder, and its Radius is $c \times x$, a Line $x = C \times x$, the Radius of the Base. $x = C \times x$.

PROP. XII.

Every Ellipsis may be considered as a Cylindrick Section.

Having in the Base of any Cone, where an Ellipsis is formed, drawn the Diameter ab, which shall be at Right Angles in the Point D with the

Fig. 20.

Directrix DE: Let there be drawn also in the Comck Surface, the Sides Sa, Sb, meeting the. Plane of the Ellipsis in the Points A and B, and draw also in the parallel Planes AMB, SDE the Right Lines AB, SD.

Then taking DF, a mean proportional between aD and Db; and drawing to SF, the Parallels AG, BH: Let a Circle be described on the Plane of the Base, whose Radius shall be GH; and on that Circle let a Cylindrick Surface be formed, whose Sides shall be AG, BH.

This done, I say, that if through any Point, as P, in the Line AB, you draw a Parallel to the Directrix

retiriz DE, which shall cut the Conick Surface

in M, and the Cylindrick in O.

Those Two Points, M and O, will be co-incident. For making a Plane to pass thro' that Parallel P M, which shall be itself parallel to the Plane of the Two Bases, both of the Cone and Cylinder; it will form, by its Intersection of the Conick Surface, the Circle K M L, (by Brop. 2.) whose Centre will be the common Section of that Plane, with the Axis of the Cone; and in the Cylindrick Surface, another Circle, QMR, (by the Precedent) whose Centre will be the common Section of the fame Plane Sab (by Def. 6.) passes thro' the Axis of the Cone; and the Plane AGHB, (which is co-incident with the Plane Sab) passes thro' the Cylinder, (by Def. 20) and consequently the Lines KL and QR, which are the common Sections of those Two Planes, with the Plane parallel to the Base, and which passes thro' the Line P O, or PM, will be the Diameter of the Two Circles; and that Line PO M, shall be Normal to those Diameters, because 'tis parallel to DE, which (by the Construction) is Normal to a b, and also to G H, which must be coincident with a b, to which the Diameters KL and QR, (which also must be coincident) are parallel.

Moreover, the Lines AB, SD, being formed by the Intersection of the same Plane, Sab, with two others which are parallel, (and with the Plane SDE, and that of the Ellipsis) must be parallel to

one another.

Which being well understood, it will follow: That in the Cone, because of the Circle KML, you will have $PM = \prod KPL$, and because of the Similar Triangles APK, SDa, and PBL, SDb; you will have those Proportions: AP, PK: SD, aD, and BB, BL: SD, aD, whence it will follow, $AP \times PB$, AB,

 $RP \times PL$ (or PM^2) :: $SD^2 a D \times Db$.

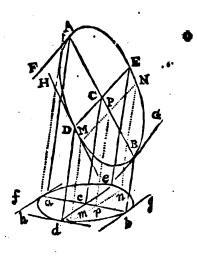

2. In the Cylinder, because of the Circle QOR, $PO^2 = []QPR$, and from the Similar Triangles, APQ, SDF, and PBR, SDF; these Proportions will arise, AP, QP, :: SD, DF, and PB, PR, :: SD, DF: Whence it will sollow, that AP, PB, $QP \times QR$ (or PO^2) :: SD^2 , DF^2 , (or $Da \times Db$). Wherefore, $PM^2 = PO^2$: and therefore MP = PO, and consequents $=PO^{1}$; and therefore MP=PO, and consequently the Points M and O will be coincident: And because this will always be the Case in what Part soever of the Line AB, the Point P be taken; it will follow, that the Plane of the Ellipsis meets or cuts the Conick and Cylindrick Surfaces in the same Points; and therefore the Ellipsis may always be considered as a Cylindrick Section.

PROP. XIII.

. All the Diameters of the Ellipsis pass thro' one only Point: Which is that where the Plane of the Ellipsis cuts or intersetts the Axis of the Cylinder, and do there bifest one another: And conversely, all Right Lines passing thro' that Point, and terminated at each End by the Ellipsis, are bisetted in that Point, and are also Diameters of the Ellipsi fis.

They call that Point the Centre of the Ellipis. 1. Let AB be any Diameter whatfoever; so let C be the Point where the Plane of the Eliph

Fig. 21.

interfects the Axis of the Cylinder. If you draw the Lines Aa, Bb, parallel to the Axis Cc, 'tis plain (by Def. 20.) that they will be the Sides of the Cylindrick Surface; and that the two Planes, PAa, GBb, passing thro' those Lines, and thro' the Tangents A F, BG, (which according to the Definition of the Diameter, will be parallel to one another) must be parallel, and must touch the Cylindrick Surface in the Sides Aa, Bb. From whence it follows, that those two Planes will form in the Plane of the Base, the two Lines af, bg, parallel to each other, and Tangents to the Base in the Points a, b; where the Sides A a, B b, interfe& it.

Now from the Elements of Geometry's plain, that the Line ab, which connects the Points of the Contact of the two parallel Tangents; af, bc, in any Circle, must pass thro' its Centre c. Wherefore the Plane Aab B will pass aro' the Axis of the Cylindrick; and the Line AB, which is the Intersection of the Plane with that of the Ellipsis, must pass thro' the Point C, where that Axis intersects the Plane of the Ellipsis.

Again, he reason of the Parallel As C and by

Again, by reason of the Parallels At, Cc, Bb, tis plain, that the Diameter of the Ellipsis AB, is divided into two equal Parts, or bisected in C; because the Diameter of the Circle of the Base ab, is bisected in its Centre c, which was the first

thing to be prov'd.

2. If thro' the Extremities of any Line, as AB. passing thro' C, where the Plane of the Ellipsis cuts the Axis Cc of a Cylinder, you draw the Aa, Bb, parallel to that Axis, tis plain, from Def. 17.) that they will be the Sides of that Cylinder; and that the Plane AabB, must pass thro' its Axis. Whence you see, that the Line Ab, which is the common Section of the Plane, and of the Plane of the Ba'e, passes thro'c the Centre of the Base; and also that it is cut into two equal Parts, the Line AB must also be bisected in C

Again, the Tangents af, bg, which pass thro the Extremities of the Diameter a b, being parallel; the Tangent Planes $f \, a \, A$, $c \, b \, B$, must be parallel also; and will form in the Plane of the Ellipsis two parallel Lines, Ac, BG, which shall be Tangeats so that Curve in the extreme Points

A, B, of the Line AB; wherefore that Line will be a Diameter.

Which was the Second Point to be prov'd.

CONSECTARY.

Hence its evident, that through any one Point given in the Plane of an Ellipsis different from its Centin there can one only Diameter be drawn:

PROP. XIV.

Every Ordinate MPN (See Fig. 149.) of an Elliplis is bijected in the Point P, by the Dianeter A B. and converfly.

If a Right Line, as MPN, terminated within an Ellipsis, and not passing thro' its Centre C, is bested in the Point by a Diameter, as AB, it thall be true Ordinate on each Side of that Dia-

Having drawn thro' the Points A, B, M, N, the Sides Aa, Bb, Mm, Nn, parallel to Cc the Axis of the Cylinder, and intersecting the Plane of the Base in the Points a, b, m, n; the Line Pp, which is the common Intersection of the two Planes AabB, MmnN, will be parallel to the Sides of the Cylinder; because all those Sides are parallel to one another. The Plane A a b B also must pass thro' Cc the Axis of the Cylinder, because the Diameter AB passes thro' the Point C, where that Axis intersects the Plane of the Ellipsis, and consequently it will form in the Plane of the Rase a Line, as a b, which will pass through the Centre c, i. e. which will be a Diameter.

This being supposed:

1. Because by the Hypothesis the Line MPN is an entire Ordinate to the Diameter AB, it will be parallel to the Tangents AF, BG, which pass thro' the Ends of that Diameter; and confequently the Tangent Blanes, FAa, GBb, will be parallel to the Plane MmnN; wherefore the three Lines, formed by those three Planes, by their Inresection with the Plane of the Base, as af, bg, and mn, must also be parallel; and consequently the hane mn will be Normal to the Diameter ab, the name m n will be Normal to the Diameter a b, and therefore will be bifected by it in the Point p; wherefore, because of the Parallels Mn, Pp, Nn, it will follow, that the Line MN must also be bifected in the Point P,

2. And then, as to the Converse, if you draw in the Plane of the Ellipsis, the two Tangents, AF, BG, (Cor. 4. Prop. 5.) parallel to MN, and then from the Points of the Contact, the Diameter AB. 'Tis plain (from Def. 12, 14.) that

meter A B. Tis plain, (from Def. 13, 14.) that from the Right Line M N, will be an entire Ordinate to that Dameter, and consequently will be

hisected in P by that Diameter.

But as there can but one Diameter, be drawn thro' P, (by the Precedent) it will follow, That if a Line, as M N, terminated within any Ellipse, and not passing thro its Centre, be bisected in B, by a Diameter AB, it shall be a true entire Ordinate to that Diameter.

PROP. XV.

If in an Ellipsis there be two Diameters, AB, DE, (See Fig. 149.) and one of them, as DE, be parallel to the Tangents AF, BG, which pass thro the Extremities of the other A.B.

I say, that the Diameter AB, shall be parallel to the Tangents which pass thro' the Extremities of the Diameter DE.

Note, In this Case the Diameter AB, and DE, are called Conjugate one to another.

Having drawn thro' the Points A, B, D, E, the Sides Aa, Bb, Dd, and Ee, of the Cylinder, which cuts the Plane of the Base in the Points a, b, d, e: The Planes AabB, Dde E, will pass thro' the Axis of the Cylinder, because the Lines AB and DE are Diameters of the Ellipsis; and consequently they will form in the Plane of the Base, the two Diameters ab de But the Tangent the two Diameters a b, de. But the Tangent Plane FAa, being parallel to the Plane DdeE, will form in the Plane of the Base a Tangent, as af, parallel to the Diameter de; which Diameter also will be Normal to the Diameter ab.

If then, thro' one of the Extremities d, of the Diameter de, you draw a Tangent to the Circle, as db, that will be parallel to ab, and the Plane h dD, to the Plane Aab B. Wherefore the h d D, to the Plane A a b B. Wherefore the common Sections of those two Planes, with the Plane of the Ellipsis, i.e. the Tangent DH, and the Diameter AB, must also be parallel one to

another.

The same thing may be proved with regard to the Tangent that passes thro' the other End E, or of the Diameter DE.

Wherefore the Proposition is proved.

CONSECTARIES

I. From hence 'tis plain, that if there be two Conjugate Diameters in an Ellipsis, as AB, DE; the two Planes which pass thro' those Diameters, and thro' the Axis of the Cylinder, will form in the Plane of the Base two Diameters, ab, de, which thall be Normal one to another.

II. It follows also from this Proposition, that if thro' any Point, as P, of a Diameter, as AB, in an Ellipsis, you draw an entire Ordinate, as MPN, that shall be parallel to the Conjugate Diameter DE; and you will have (by Confest Prop.9.) these Propositions; $MP \times PN$, (or PM^2): $DC \times CE$, (or CD):: $AP \times PB$. $AC \times CB$, (or AC^2) and that will give us PM^2 . $AP \times PD$:: DC^2 . $\frac{DC^2}{(\text{or } DE^2)} \frac{AC^2}{(\text{or } AB)}$: That is, the

Square of any Semi-Ordinate to the Diameter, that is, MP is to the Rectangle APB under the Parts of that Diameter: : as the Square of the Conjugate Diameter DE, is to the Square of the Diameter AB.

PROP

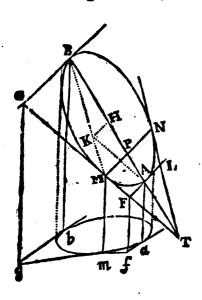

PROP. XVI.

If thro' any Point, as Min an Elipsis A MB, and Tangent FMG be drawn, which in the Points GF, shall intersect any two parallel Tangents, as AB, BG; Isay, FM, MG:: AF, BG.

For, drawing thro' the Points of Contact, A, B, M, the Sides A a, B b, Mm, of the Cylinder; and thro' these Sides, and the Tangents AF, BG, FG, drawing the Planes FA a, GBb, FM m,

Fig. 22.

or G M m: Tis plain, that Ff, Go, the common Sections of the first two Planes with the third, must be both parallel one to another, and to the Sides of the Cylinder. For the two Planes, F M m, FA a, passing thro' the Sides M m, A a, which are parallel, will have their common Section Ff, parallel to those Sides; and for the same Reason Go, the common Section of the two Planes G B b and G M m, will be parallel to the Sides B b, M m. Moreover, the Line a f, b g, which from the parallel Tangent Planes Fa, G B b, with that of the Base being parallel: The Parts f m, mo, of the third Tangent formed in the Plane of the Base, by the third Tangent Plane F M m, or G M m, must be (by the property of the Circle) parallel to the Tangents a f, b o, vid. f m parallel f a, and mo parallel o b.

Which being supposed, by reason of the Right Lines A a, Ff, Mm, G o, Bb, and AF, BB, and af, bo, which are respectively parallel to one another, you will have.

another, you will have,

FM, MG:: fm. or fa, mo, or gb:: FA,
GB. Q. E. D.

CONSECTARIES.

I. If thro' the Points of Contact A, B, of the two parallel Tangents AF, BG, a Diameter, as AB be drawn, which shall intersect in the Point T, another Tangent, as FMG; and if an Ordinate, as MP, be drawn to that Diameter; 'tis plain, that AP, PB:: FM, MG:: AF, BG:: AT, BT. And also that PB—AP, BP:: BT—AT, (or BA) BT.

Vol. IL.

II. From hence the following manner of drawning to the Point M in an Ellipsis, a Tangent, as M T, is taken, when the Diameter A B is given, with the Position of its Ordinates.

From one of the Ends B, of the Diameter AB, to give a Point M, let the Right Line BM be drawn: And then having drawn the Ordinate MP to the Diameter AB, and taken in that Diameter towards the Point P, a Part, as PH = PA, draw HK parallel to PM, which shall intersect the Line MmK; thro' which Point, and the other End of the Diameter A, drawing AK, and then MT parallel to it; that Line MT shall be the parallel required.

For on account of the Parallels MP, HK, and AK, MT; you will have BP, DH, or PA:: BM, MK:: TB, TA.

III. If in an Ellipsis there be two Tangents, as

MT, NT, which meet in the Point T.

I say, the Diameter AB, passing thro' the Point P, the middle of the Line MN, joining those two Tangents in their Points of Contact; shall pass also thro' T, their Point of Intersection.

For, PN is an Ordinate to the Diameter AB, as well as PM; and consequently the (by Cor.1.) Tangents MT, NT, must so meet or intersect the Diameter in a Point, as T; that PB—AP, PB: AB, BT, that is, in the same Point.

IV. If to the Point of Contact, M, N, of two Tangents to the Ellipsis, a Right Line, as MN be drawn, and that it have a third Tangent, as FAL parallel to it: I say, that FA, AL, the Parts of that third Tangent taken between its Points of Contact A; and the two former Tangents will be equal one to another.

For, drawing thro' the Points of Contact A, the Diameter AB: 'Tis plain, the Line M N will be an entire Ordinate to that Diameter, because it is parallel to the vertical Tangent FL; and therefore also it must be bisected in P, and (by Cor. 3.) will pass thro' T, the Point of Intersection of the two Tangents M F, NL; or will be parallel to them (by Prop. 15.) when the Line M N is a Diameter.

But 'tis plain in both Cases, that FL will be bleected in A, by the Diameter AB; because MN is so bisected in the Point P, by the same Diameter.

Of the Parabola and Hyperbola, particulally.

PROP. XVII.

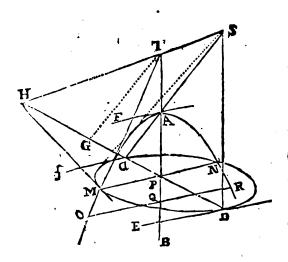

In the Parabola, every entire Ordinate (as MP N) to a Diameter, as A B, is bifested by that I is meter in the Point P, and vice versa.

Y

For

For having made an Elliptick Plane which shall pass thro' the Line MN, that will form with the

Tangent Plane S D E, parallel to the parabolick Plane, a Tangent, as D E parallel to MN.

Again, the Plane S A F, drawn thro' S the Vertex of the Cone, and thro' the Tangent A F, which passes thro' A, the Vertex of the Diameter A B, will form in the Elliptick Plane, a Tangent, as f a; and the Line D a jointly, the Points of Contact of the two Tangents D E, A f, will pass thro' tact of the two Tangents DE, af, will pass thro' the Point P, because the Diameter AB is parallel to the Tangent Side S D.

This supposed,

Because by the Hypothesis AF and MN, are parallel, (vid Def. 14.) it will follow, that the Tangent af, which is the common Section of two Planes passing thro' those Lines, will be parallel to M N, and consequently to D E. Whence it appears, that the Line D a (by Dest. 13.) joining the Points of Contact of the two parallel Tangents D E, a f, is a Diameter of the Ellipsis; and also that the Line M N, which is parallel to those Tangents, and terminated by the Ellipsis shall be Tangents, and terminated by the Ellipsis, shall be (by Prop. 14.) bisected in the Point P.

The Converse will thus appear.

Draw in the Parabolick Plane, the Tangent AF (by Cor. 4. of Prop. 5.) parallel to the Line MN; and thuo' the Point and Contact A, a Diameter, as AB, the Line MN will be an Ordinate rightly apply'd (by Defi 14.) and consequently must be bisected in P.

And because there is but one only Diameter that can pass thro' that middle Point P; AB must be it, (by Def 15.) and in the following Corollary.

CONSECTARY.

Hence 'tis evident, that if thro' any two Points Prence its evident, that it thro any two Points P, Q, of a Diameter AB, two entire Ordinates, MPN, OQR, be drawn; you will always have this Proportion: (by Confett. Prop. X.) That $MP \times PN$, or PM^2 . $OQ \times QR$ (or OQ^2) :: AP, AQ; that is, the Square of any two Ordinates, as of MP, QO, to any Diameter, as AB, are always as the Abcissa or intercepted Parts of that Diameter. APof that Diameter, AP, AQ.

PROP. XVIII.

(See Fig. 23.)

If thro' M any Point in a Parabola, you draw an Ordinate MP, to any Diameter AB, and also a Tangent MP, meeting in T, that Diameter produced beyond the Vertex A; I say, A P will always be equal to A.T.

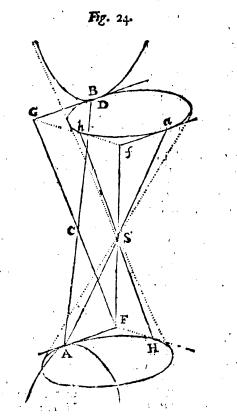

The same thing being supposed, as in the last Proposition: Let there be also drawn thro'S the Vertex of the Cone, and the Line MT, a Tangent Plane STM, which will form in the Elliptick Plane, the Tangent M H, which will cut the Diameter of the Ellipsis u D, in a certain Point as H, thro' which the Line S U passes: And lastly, let the Right Line TG be drawn parallel to SA.

This being well understood, you will have (by Cor. 1. Prop. 16.) D H, Ha:: DP, Pa, and alternately DH, DP:: Ha, Pa. But by reason of the parallel Lines AB, SD, and SA, TG: Tis plain, that DHDP:: SHST:: HaGa, wherefore Ha, Pa:: Ha, Ga; and consequently Pa =Ga; and therefore AP=AT. Q. E. D.

PROP. XIX.

In the opposite Hyperbola's, every Diameter, as A'B, passeth thro'C, the Point of Intersection of the Assymptotes, and is there cut into two equal Parts, and vice versa; that Point is called the Centre.

Let HSb be one of the two common Sections of a Plane parallel to the Hyperbolick Plane, and the two opposite Conick Surfaces, and let the

Assymptote FG be formed by the Intersection of the Plane of the Hyperbola, with that which touches the two Surfaces HSb.

Let

Let there be drawn thro' the parallel Tangents A F, B G, which pass thro' the Ends of the Diameter AB, and intersect the Assymptote FG in the Paires FG. the Points F, G, two parallel Elliptick Planes; and those will form with the Tangent Plane which passes thro the Side HSb, the parallel Tangents FH, and Gbf; and in the Tangent Plane SAF,

the parallel Tangents, Af, af.

This proportion being made, the parallel Lines This proportion being made, the parallel Lines FH, Gh, being contained between the two other parallels FG, Hh, will be equal. And the fimilar Triangles, SHf, Shf, and SFA, Sfa, will give HF, hf:: Sf, sf:: FA, fa; and also HF, FA:: hf, hf:: hf: =CB: That is, the Assymptote FG, bisects the Diameter AB in C.

The same thing may be proved of the other Assumptote, that it shall passalso thro'C, the middle of the Diameter AB; from whence 'tis apparent, That the Diameter AB passes thro' C the Centre of the two Assymptotes, and is there bisected.

Let there be then a Line, as AB, which passing thro' C the Intersection of the Assymptotes, shall intersect the opposite Hyperbola's in the Points AB. If then you draw thro' the Point A, the Tangent AF, and to the opposite Hyperbola, a Tangent DG, (by Conset 4. Prop. 5.) parallel to AF; 'tis plain, that since the Line AD may be proved to be a Diameter, it will pass thro' C, the Point of the Intersection of the Assymptotes. It must be co-incident then will AB, which (by the Hypotheses) passes thro' the same two Points, A, C; wherefore the Line AB is a Diameter, and is bisected in C.

CONSECTARY.

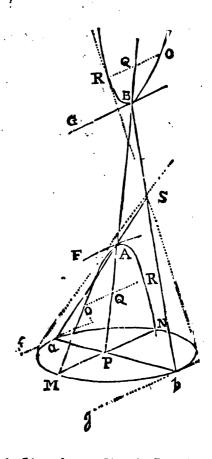

Hence you see that from any Point given within an Hyperbola, there can be but one only Diameter drawn; because no other Line can pass through that Point, and thro' the Centre.

PROP. XX.

In the opposite Hyperbola's, every entire Ordinate
MPN, is bisected in P, by its proper Diameter A B; and vice versa.

Having made an Elliptick Plane to pass thro' the Line M N, it will form in the two Tangent Planes, SAR, SBG2, the Tangents a f, b o.

Fig. 25.

And the Line ab connecting the Points of Contact of those two Tangents, being the common Section of the Elliptick Plane of the Plane S A B, will pass thro' the Point P.

But because by the Hypothesis, the two Lines AF, MN are parallel; it follows, That the Line af, which is the common Section of two Planes passing thro' these two Lines, will be parallel to M N.

For the same Reason, the Tangent bg, which is the common Section of the Elliptick Plane, and of the Tangent Plane S B G, which two Planes do pass thro' the two parallels MN, BG, will be parallel to M N.

The Tangents then, a f, b g, will be parallel one to another; from whence it will follow, that the Line ab (by Def. 13.) is a Diameter of the Ellipsis; and also that the Line MN (by Prop. 14.) is bisected in the Point P.

And to prove the Converse;

Draw in the Plane of the Hyperbola, two Tangents, as AF, BG, (by Cor. 4. of Prop. 5.) parallel to the Line MN, terminated within the Hyperbola: And then, having drawn thro' their Points of Contact, the Diameter; 'tis plain (from Def. 14.) that the Diameter will have the Line M N an entire Ordinate rightly apply'd, and that it shall bisect it in P. But as there can be but one Diameter pass thro' that Point (by Cor. of Prop. 20.); it will follow, that if a Line, as MN terminated in Pby a Diameter AB; it must be an entire Ordinate, and rightly applied in that Point.

CONSECTART.

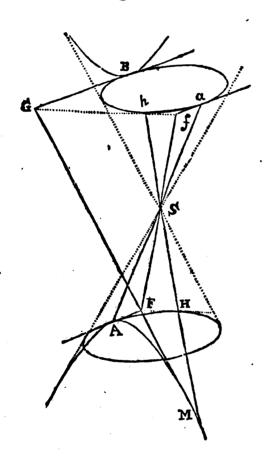

Hence 'tis apparent, that if you rightly apply two entire Ordinates MPN, and OQR, to one and the same Diameter; it will always be (by Consett. Prop. 9.) $MP \times PN$, (or PM^2) $OQ \times QR$ (or OQ^2):: $AP \times PB$, $AQ \times QB$.

PROP. XXI.

If thro' any Point M in an Hyperbola, a Tangent M F G be drawn, intersecting two other parallel Tangents, A F, B G, in the Points F G; 1 say, that M F, M G: A F, B G.

Drawing two elliptick and parallel Planes, which shal' pass thro' the Tangents AF, BG, they will form in this Tangent Plane SMG, two Tangents

Fig. 26.

. HF, bG, which will be parallel; and the Elliptick Plane passing thro' BG, will form in the Tangent Plane SAF, a Tangent af, which will intersect the Tangent bg in the Point f, where the Line SF cuts the Elliptick Plane.

This being laid down or supposed: The Tangents of RG, will be parallel because each is so we had

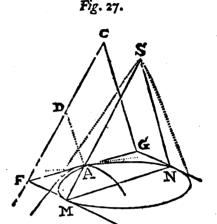

This being laid down or supposed: The Tangents af, BG, will be parallel, because each is so to the Tangent AF. And therefore (by Confest from Def. 15.) you will have BG, Gh:: af, fh, (and because of the similar Triangles Shf, SHF; and Shf, Shf::

N. B. Tis evident, That from this Prop. the fame Corollaries may be drawn, as are in the Ellipsis (from Prop. 16.): And therefore there is no need to expose them at length here.

PROP. XXII.

If a Right Line F G, terminated between the Assumption of an Hyperbola, touch the Curve in a Point at A, it will always be bised in that Point.

Let there be drawn thro' S the Vertex of the Cone, and thro' the two Assymptotes CF, CG, two Planes touching the Conick Surface. (See

Def. 16.) in the Sides SM, SN, where the Plane MSN, parallel to the Hyperbolick Plane, interfects it.

Let there be supposed drawn also an Elliptick Plane, passing thro the Right Line FG; this will form in the two Tangent Planes, two Tangents MF, MG; and in the Plane MSN, a Right Line MN parallel to FG; and connecting the Points of Contact of the two Tangents.

This supposed, 'tis apparent, that the Line FG (by Confect. 4. Prop. 16.) is bisected in A; because it touches both the Ellipsis, and the Hyperbola in that Point.

CONSECTARIES.

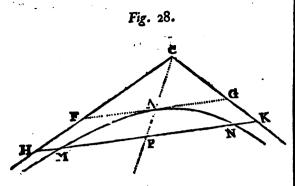

I. As there can be but one Line FG, which passing thro' a given Point A, within any Angle FCG, and terminated by its Legs, can be bisected in that Point: It follows, that if a Right Line FG, terminated by the Assymptotes of an Hyperbola meet the Curve in a Point, as A, and be there bisected, it will be a Tangent to the Hyperbola in that Point.

II. Hence tis evident, that to draw through a Point given, as A, in an Hyperbola, whose Assymptotes C F, C G, are given, a Tangent, as F A G; you need only draw A D parallel to one of the Assymptotes C G, and terminated by the other; and having then taken D F = to C D, draw the Line F A G, for that shall be the Tangent required.

For, by reason of the similar Triangles FCG, and FDA; the Line FG must be bisected in A, because CF, (by the Construction) is so in D.

III. IP

III. If any two Points MN, within an Hyperbola, be joined by a Right Line, as M M, interfeeting the Assymptotes in the Points HK: Then

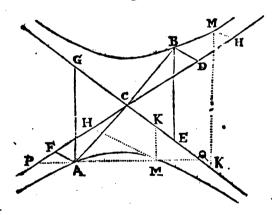

will the two Lines MH, NK, being the Parts of MN, lying between the Curve and its Af-

symptotes, he always equal.

For having drawn thro' P, in the middle Point of MN, a Diameter, as CP, and thro' the Point A, where that Diameter meets the Curve, a Line, as FG parallel to MN, and terminated by the Assymptotes; 'tis plain, that that Line TG, FG, (by Prop. 20.) will be a true Tangent in the Point A, and consequently will be bisected in that Point (by this Prop. 22.) Whence tis clear, from the Similar Triangles CAF, CPH, and CAG, CPK; that PH = PK, and consequently (because MN is bisected) MH = NK. Q.E.D.

IV. If thro' any Point, as A, in an Hyperbola, two Right Lines, AF, AG, be drawn and terminated by its Assymptotes; and if from any other Point, as M, in the same Hyperbola, or its Opposite, you draw two other Right Lines MH, MK terminated also by its Assymptotes, and parallel to the two former AF, AG.

I say, the Rectangle FAG, will always be

equal to the Rectangle HMK.

1. When the Points AM, fall in one and the fame Hyperbola, having drawn a Right Line joining the two Points A, M, and cutting the Assymptotes in P and Q; the Similar Triangles PAF, PMH, and QMK, QAG, will give these Proportions: AF, MH:: AP, MP, (by Cor. 3.):: MQ: AQ:: MK: AG; and then multiplying the Extremes and Means, you have $FA \times AG = HM \times MK$

2. When the Points A, M, fall in the two opposite Hyperbola's; having drawn thro' the given

Point A, and the Centre C, the Diameter A B, and also the two Right Lines BD, BE, parallel to AF, AG, and terminated by the same Assymptotes; its evident, that the Triangles CAF, CBD, and CAG, CBE, being not only Similar by a CaG, CBD, and CAG, CBC, contains a cont lar, but also respectively equal one to another, because CA = CB, (by Prop. 19.) Therefore BDAF, and BE = AG, and consequently BD $BE = FA \times AG$. But from the former $\times B E = F A \times A G$. But from the former Case, $KM \times MH = DB \times BE$; wherefore now also FA * AG = KM * HM.

CONICK Surface. Let the Side of a right Cone be call'd a, the Radius of its Base r: Then by what is provid under the word Pyramid, the Area of the Convex Surface of the Cone is $=\frac{1}{2}$ the Periphery of the Base multiplied into the Side of the Cone. That is, Since 2r = to the Diameter, and 2re = to the Periphery, it will be expressed by rea. And from hence it will be easy to deduce that noble Proposition of Archimedes: That a Cirtle whose Area is equal to the Convex Surface of the Cone, will have its Radius a mean Proportional between the Side of the Cone and the Radius of the Base. For since : ar is such a mean Proportional between a and r; if you suppose that to be the Radius of the Circle required, its Diameter will be $2\sqrt{ra}$ and its Periphery $2\sqrt{rae}$; and by multiplying the Periphery $2\sqrt{re}$ into $\frac{1}{2}\sqrt{ra}$, the half Radius, the Area will be rea, the very same with that of the Surface of the Cone.

Q.E.D.

The Surface of a right Cone may be easily had

Paline of the Circle of the Base; for as that Radius is to its Periphery, so will the Radii of the other Circles up to the Vertex be to their respective Peripheries. But all those Radii are the Elements of a right Angle Triangle, whose Altitude and Base are given, and consequently its Area is known: Wherefore as any one Radius to its Periphery, so will the Area of the Triangle, which is the Sum of all, be to the Sum or Aggregate of all the Peripheries, i.e. to the whole Conick Surface, which therefore will be known.

Conick Surface, is the Convex Surface of a Cone without its Base, and this is formed by the Motion of a right Line fix'd in a Point above and below moved round the Periphery of a Circle.

CONJUGATE Diameters, in respect of one another in the Ellipsis, are such as are parallel to Tangents meeting the Curve in each others Ver-

CONSISTORY, is the Court Christian, or Spi-rual Court. This was held formerly in the Name ritual Court. of the Cathedral Church, or in some Chapel, Isle, or Portico belonging to it, in which the Bishop presided, and had some of his Clergy for Assessors and Assistants: But this Consistory Court is now, half by the Bishop's Chancellor or Commissary, and by Archdeacons or their Officials.

CONSTITUENT Particles of any Natural

Body, are those small Particles of which it is composed. See Particles.

CONSTITUM, in the Civil Law, is a Promise for a Debt upon a Nude Covenant, without Stipulation.

CONSTRUCTION of Equation, an easy way of constructing Cubic and Biquadratick Equations without the Parabola, communicated by the Ingenious J. P. M. A.

In order to this Method of Construction, I consider each Side of the Equation, as the Product of two Multipliers, the one of two Dimensions, the orher of one, (each Term in a Cubick Equation being supposed of three Dimensions.) E. G. In this Equation $x \times x + p \times x = n$; I confider it as in this Form $x \times x \times x + p = n = b^2 \times c$, (b) being taken at pleasure for any Number whose Square is less than n divided by b b gives c.) Or else in this Form, $xx + px \times x = n = b^2 \times c$; either of which Forms may be made use of, as seems less for Construction. And because x is yet unknown, and must be taken by guess, I put z instead of z the Multiplier of two Dimensions, and y for x in the other of one Dimension; and then the former Equation will fland thus $z \times y + p$ $=b^2 \times c$; or (the other way,) $zz + pz \times y =$ $b^2 \times c$. In both which Forms, the given Quantity $b^2 \times c = n$, is the same as in the first Equation, and consequently the Result or Value of the other Terms is the same also.

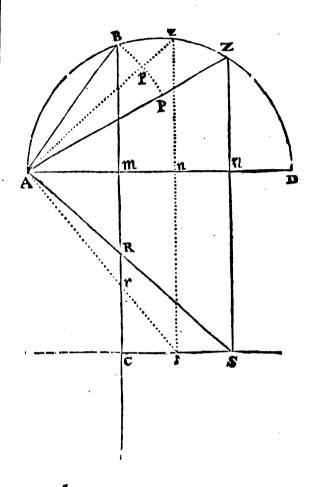

The Design then, of this Method is, by taking a Number or Line by guess (suppose 2) to reprefent x in one of the Multipliers of the given Equation, to find another Number or Line (y) which shall represent x in the other Multiplier; and then if z and y be not equal, to bring them by Tryals to Equality, which in most Cases, is easily done, observing their Difference and the Nature of the Scheme or Figure.

Before I give Examples, I will premise this Lemma, which shews the Ground and Demonstration

of this way of Construction.

Let AB D, be a Semi-circle on the Diameter AD, AB and AZ, two Subtenses drawn at plea-fure from the end of the Diameter A, from B and Z are drawn the infinite Lines B Cand Z S perpen-

Fig. 1.

dicular to AD, BC intersecting it in m, and ZS in n; from A draw the Line AS intersecting BC in R, and ZS in S; I say, that ABq: AZq::

For (by the Nature of a Circle) $DA \times mA =$ A B q, and D $A \times n A = AZq$; then D $A \times m A$: D $A \times n A$: m A : m A : m R : n S; that is,

ABq: AZq::mR:nS.

Multiply the extreme and middle Terms, and 'tis $ABq \times nS = AZq \times nR$; if therefore we suppose AB = b, nS = c, AZ = to the Square Root of the Multiplier of two Dimensions (in 2 Cubick Equation reduc'd into the Form above directed) then will m R be equal to the other Multiplier of one Division. So in the first Form above, $(zz \times y + p = b^2 \times c)$ if AZ = z, then is mR= y + p, and in the Second Form $zz + pz \times y$ $=b^2 \times c$, if $AZ = \sqrt{zz + pz}$, then is mR = y, and if y = z, then z = x in the given Equa-

Example I.

Suppose I would construct this Cubick Equation $x \times x - 4xx = 72$, or $x \times x - p \times x = n$. I take 16, as a convenient Square Number, (which I call bb) and therewith I divide 72; the Quotient Quotient is $4\frac{1}{5}$ which I call c, $[\frac{n}{bb} = c]$, and bbc = n = 72] I deduce also the other side of the Equation into two Multipliers (as above) and then its $zz \times 4 - p = 72 = 16 \times 4\frac{1}{12}$, which is the first Form of Construction.

I describe a Semicircle ABD, (See Fig. 1.) of a convenient bigness for my Scale of equal Parts, (which here, for this Figure, is of 24 in an Inch, 10 of which parts make an Unite or 1.) and having drawn the Diameter AD, I take 4 (Units or large Divisions) off the Scale, and draw the Chord AB = 4 = b; from B I draw the infinite Line BC, perpendiculiar to AD, and intersecting it in

I take $4\frac{1}{4}$ (=c) off the Scale, and fet that Diffance with the Compasses from m to C, and thro'

For the first Tryal I consider that the Root x must be bigger than 4 or p, (else the Negative Term -4 xx, wou'd take away more than xxx, and so the given Quantity wou'd be Negative;) therefore taking 4 (= p) from the Scale, with Center A, and Radius Ap = 4, I describe the little Arch Pp; and then (at x = 2) intersecting the Arch x = 2 intersecting the Arch x = 2 intersecting the Arch x = 2 intersecting the Arch x = 2 intersecting the Arch x = 2 intersecting the Arch x = 2 intersecting it in x = 2 por x = 2 and intersecting it in x = 2 perpendicular to x = 2 and intersecting it in x = 2 perpendicular to x = 2 intersecting it in x = 2 perpendicular to x = 2 perpendicular to x = 2 perpendicular to x = 2 perpendicular to x = 2 perpendicular to x = 2 perpendicular to x = 2 perpendicular to x = 2 perpendicular to x = 2 perpendicular to x = 2 perpendicular to x = 2 perpendicular than the Line x = 2 perpendicular than the Line x = 2 perpendicular than the Line x = 2 perpendicular than the Line x = 2 perpendicular than the Line x = 2 perpendicular than the Line x = 2 perpendicular than the Line x = 2 perpendicular to x = 2 perpendicular than the Line x = 2 perpendicular than the Line x = 2 perpendicular to x = 2

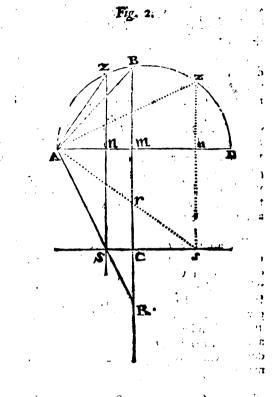

After the same manner I try another z, which the view of the Scheme will now direct me to limit, till I find AZ, which Answers the demand. For making AZ = z, then is $PZ \in z - 4$ = MR (= y - 4) consequently Z = y = z, z taking from the Scale, is equal to 6, the Root

fought.

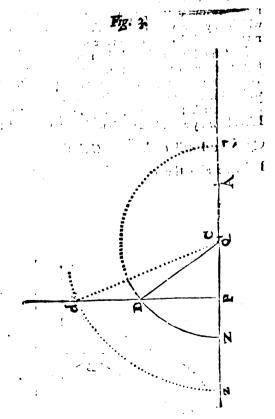

The fame Conclusion would follow if I had inverted the Order of proceeding, and had begun with Mr, and thereby found Az (in a first tryal,) for in this Case I must have taken a Line for y (by guess) and made mr = y - p, and then having drawn AS intersecting mC in r, and CS in S. Also SZ parallel to BC, touching the Semicircle in z, I draw Az which will be equal to z; so is the Line pz = z - p, which ought to be equal to mr; but not being so, another Trial must be made.

EXAMPLE II.

In the Semicircle ABDI draw the Chord ABDI draw the Chord ABDI and ADI and ADI and ADI are ADI and ADI are ADI.

I find $\sqrt{zz-pz+qq}$ by Fig. 3. where AP = p = 3, and is bisected in C. $PQ = q = \sqrt{2}$ = 14. Pd is perpendicular to PA, Az, AZ,

So. are Lines taken by guess for z. z d, ZD, so. are Arches of Circles drawn with Centre C and Radius Cz, CZ, &c. So are Pd, PD, &c. =

For continuing the Arch ZD (for Instance) to ζ in the Diameter; ZA ($=P\zeta$) =z. PZ=zp. Therefore $PD (= \sqrt{P \zeta \times PZ}) =$ $\sqrt{z \times z - p} = \sqrt{zz - pz}$, And PQ being = q. DQq. (=DPq + PQq) = zz - pz+ 99. therefore $DQ = \sqrt{zz-pz+qq}$.

Having found $dQ = \sqrt{zz - pz + qq}$; I draw Az (See Fig. 2.) -dQ, and then (as in the former Example) find $mr = \gamma$, which being much less than z (or Az, Fig.3.) I find that I have err'd in my Supposition of z. And considering that (See Fig. 3.) the bigger Az is, the bigger will dQ be also, and consequently mr the less; I try again with a lesser z, and at last find, that making AZ(Fig. 3.) = z, DQ will be $\sqrt{zz-pz+pq}$, to which I make AZ (Fig. 2.) equal, and thereby find mR = y = z, which is therefore the Root, and the Scale shews the Number to be 6 = x.

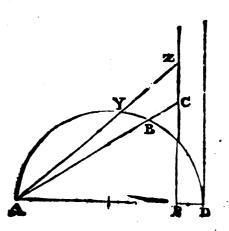

For another Example, may be proposed the doubling of the Cube; that is, having the Root or Side of a Cube given, to find another Line whose Cube shall be double the former Cube. In this Case, let AB (Fig. 1.) be the Side of the given Cube; mC = 2AB, Az = z, the sought Root taken by gues, by which finding mr (as above) if mr = Az, then is Az the Root of the double Cube sought; else another Trial must be made

ABQ: Azq::mr:nS=mc=2AB theref. $AB \times ABq = 2 AB$, cub. $Azq \times mr =$ Az cub. (when Az = mr.)

Several things might be added conducing to a more ready determining of the Root fought; which any one who shall think fit to make trial, may himself observe and make use of.

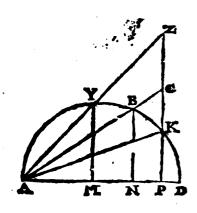

By something alike Method may Biquadratick Equations be constructed also, and if the lowest Term be wanting, as easily as a Cubick. Of which I'll here give you an Instance. Suppose this Biquadratick Equation $x^4 + px^3 + q^2x^2 = n$ I divide n by a less Square Number, suppose b' the

Quotient I call CC, $\frac{\pi}{bb} = CC$, then $\pi = b$, C. I divide also the other Side of the Equation in-

to two Multipliers, viz. $x^2 \times 2x^2 + px + qq$ $b^2 \times C^2$, whence $x \times \sqrt{x^2 + px + qq} = b \times \overline{C}$. Or, Substituting y and z for x (as I do in Cubes) while z is unknown) $q \times \sqrt{zz + pz + qq} =$ I take z by guess, and therewith find $\sqrt{zz+pz+qq}$ (as is done in the Second Example of Cubick Equations.) In a convenient Semicircle ABD, I apply the Chord AB = b, and producing it, make AC = c, [but if b be greater than c, I make AB = c and AC = b.] Thorough C I draw Z CP perpendicular to AD, and applying $AZ = \sqrt{zz + px + qq}$, so is the intercepted Chord AT = y, and if y = z, then is either equal to x, the Root fought. Else Trial must be made with another x.

I might have taken the Biquadratick Root of a, and then b-c, to which the Diameter AD must have been equal; the Demonstration depends on this, that $AT \times AZ = AB \times AC$, which I thus prove, (having drawn AK to the intersection of

ZP with the Semicircle) ABq: AKq:: (An: $AP::) AB: AC: AB \times AC = AKq$. By a like Reafon $ATq:AK::(AM:AP::) AT: AZ: AT \times AZ = AKq = AB \times AC$. The fame Method will hold for compleat Biquation in the same of the same

draticks, but will be too operose.

See Mr. Halley's Confirmation of Cubicks and Biquadraticks, in Phil. Trans. No. 188, 190. As also Bernoulli's Animadversions on the Cartesian Geometry, in the Act. Erud. Lip. 1. for June 1688. And his True Geometrical Confiruation of Solid,

and more than Solid Problems by Right Lines and Circles only, for the Month of Sept. 1689.

Dr. Gregory, in his Preface to his Excellent Oxford Euclid in G. L. shews that all Quadratick Equations may be constructed from the 58 and 59 of Euclides Data.

CONTRARY Flexion and Retrogression of Curves, when a Curve Line as AFK (Vid. Hay's

Fluxions, pag. 153.)
CONTRARY Legg'd Hyperbola, is an Hyperbola, so called by Sir Isaac Newton, because its Legs are convex towards contrary Parts, and run contrary ways. See Curves.

CONTRASTE, is a French Term used in Painting and Sculpture, and fignifies the due placing of the different Objects and Parts of the Figures; and produces that Variety which is so pleasing in the Attitudes, as if in a Groupe of three Figures, one stand out forward, the other backward, and the third appear to the middle between them, they ûy,

fay 'tis well Contrasted: So they say also, that to render the Attitudes of Figures agreeable and just, they must be natural and active, varied in their Actions, and Contrasted in their Members: So that for Figures to be well Contrasted, is for them to be lively, and to express the Motion proper to the Design of the whole piece, or of any particular Grouppe

CONVERGING Hyperbola, is one whose Concave Legs bend in towards one another, and run

both the same way. See Curves.

Converging Series, is a Method of Approximation still nearer and nearer towards the true Root of any Number or Equation, even tho' it be impossible to find any such true Roots in Numbers.

See Approximation and Square Roots in Vol. I.
COPPERAS. The way of making Copperas is as follows; Copperas Stones, which some call Gold Scones, are found on the Sea-shore in Essex, Hamp-Ibire, and so Westword. There are great Quantities in the Clifts, but not so good as those on the Shore, where the Tides Ebb and Flow over them.

The best of them are of a bright shining Silver Colour; the next, such as are of a Rusty deep Yellow; the worst are such as have Gravel and Dirt

in them, of a fadder Umber Colour.

In the midst of these Stones are sometimes found the shells of Cockles, and other small Shell-Fishes small pieces of the Planks of Ships, and pieces of Sea-mal

In order to the making of Copperas, they make Beds according as the Ground will permit; those at Deptford are about 100 Foot long, and 15 Foot broad at the Top, and 12 Foot deep, shelving all

the way to the Bottom.

They ram the Bed very well, first with strong Clay, and then with the Rubbish of Chalk, where-by the Liquor which drains out of the Dissolution of the Stones, is convey'd into a Wooden Shallow Trough, laid in the middle of the Bed, and covered with a Board; being also boarded on all sides, and laid lower at one End than the other, whereby the Liquor is convey'd into a Cistern under the Boiling House.

When the Beds are indifferently well dryed, they lay on the Stones about two Foot thick.

These Stones will be five or six Years before they yield any confiderable Quantity of Liquor; and before that, the Liqour which they yield is but

They ripen by the Sun and Rain; yet Experience proves, that watering the Stones, although with Water prepared by lying in the Sun, and poured thro' very small holes of a Watering pot, doth retard the Work.

In time, these Stones turn into a kind of Vitriolick Earth, which would swell and ferment like

Leavened Dough.

When the Bed is come to Perfection, then once in four Years they refresh it, by laying new Stones

on the Top.
When they make a new Bed, they take a good Quantity of the old fermented Earth, and mingle it with new Stones, whereby the Work is haftned. Thus the old Earth never becomes useless.

The Cistern before-mentioned, is made of strong Oaken Boards, well joined and calked. at Deptford will contain 700 Tun of Liquor. Great care is taken, that the Liquor doth not drain thro' the Beds, or out of the Cistern. The best way to prevent the same, is to divide the Cistern Vol. 11.

in the middle, by Oaken Boards calked as before; whereby one of them may be mended in case of a

The more Rain falls, the more but the weaker will be the Liquor: The goodness whereof is tried by Weights prepared for that purpose. Four-teen-penny Weight is rich; or an Egg being put into the Liquor, the higher it swims above the Liquor, the stronger it is. Sometimes the Egg will swim near half above the Liquor.

Within one Minute after an Egg is put in, the ambient Liquor will boil and froth; and in three

Minutes the Shell will be quite worn off.

A drop of this Liquor falling on the Manufactures of Hemp, Flax, or Cotton Wooll, will presently burn a hole thro' it. As also in Woollen and Leather.

Out of the aforesaid Cistern, the Liquor is pumped into a Boiler of Lead, about 8 Foot Square, containing about 12 Tuns, which is thus ordered. First, they lay long Pieces of Cast Iron, 12 Inches Square, as long as the Breadth of the Boiler, about 12 Inches one from another, and 24 Inches above the Surface of the Fire. Then Cross-wise they lay ordinary flat Iron Bars as close as they can lie, the Sides being made up with Brick-work. In the middle of the Bottom of this Boiler is laid a Trough of Lead, wherein they put at first 100 Pound Weight of old Iron.

The Fewel for boiling is New-Caftle Coals. By degrees, in the boiling, they put in more Iron, amounting in all to 1500 pound Weight in a boiling. As the Liquor wastes in boiling, they pump in fresh Liquor into the Boiler: Whereby, and by a Defect in ordering the Fire, they were wont to be above 20 Days before it was enough; when that is, they try, by taking up a small Quantity of Liquor into a shallow Earthen Pan, and observing how foon it will gather and crust about the Sides thereof. But now of late, by the Ingenious Contrivance of Sir Nicholas Crifp, the Work is much facilitated. For at his Work at Deptord, they boil off three Boilers of ordinary Liquor in one Week; which is done, first by ordering the Furnace so, as that the heat is convey'd to all Parts of the Bottom and Sides of the Furnace.

Then, whereas they were wont to pump cold Liquor into the Boiler to supply the waste in boiling, whereby the Boiler was checked sometimes to Hours. Sir Nicholas hath now a Vessel of Lead, which he calls a Heater, placed at the end of the Boiler, and a little higher, supported by Bars of Iron as before, and fill'd wirh Liquor, which, by a Conveyance of Heat from the Furnace, is kept near Boiling-hot; and so continually supplies the waste of the Boiler, without hindring the boiling. Thirdly, by putting due Proportions of Iron from time to time, in the Boiler; as soon as they perceive the Liquor to boil flowly, they put in more Iron, which will foon quicken it. Besides, if they do not continually supply the boiling Liquor with Iron, the Copperas will gather to the Bottom of the Boiler and melt it; and so it will do if the Liquor be not presently drawn off from the Boiler

into a Cooler, so soon as it is enough.

The Cooler is oblong, 20 Foot long, 9 Foot over at the top, 5 Foot deep, taper'd towards rhe Bottom, made of Terras. Into this they let the Liquor run fo foon as it is boil'd enough. The Copperas herein will be gathering or shooting 14 or 15 Days, and gathers as much on the fides as in the Bottom; so. above 5 Inches thick. Some put Bushes into the Cooler, about which the Copperas will gather: But at Deptford they make no use of any.

That which sticks to the Sides and to the Bushes, is of a bright Green; that in the Bottom, of a foul

and dirty Colour.

In the end of 14 Days, they convey the Liquor into another Cooler, and reserve it to be boil'd

again with new Liquor.

The Copperas they shovel on a Floor adjoining: So that the Liquor may drain from it into a Cooler.

The Steam, which comes from the boiling, is of

an Acrimonious smell.

Copperas may be boiled without Iron, but with Difficulty; without it, the Boiler will be in danger of melting.

Sometimes in stirring the Earth upon the Beds, they find pieces of Copperas produc'd by lying in

the Sun.

CORBETT, in Architecture, is a short piece of Timber placed in a Wall, with its end sticking out 6 or 8 Inches, as occasion serves. The under Part of the end thus sticking out, is sometimes cut into the Form of a Boultin, sometimes of an O--G--, and sometimes of a Face, &c. according to the Workman's Fancy; the upper Side being plain and flat. These Corbets are usually placed for Strength's Sake, immediately under the Semigirders of a Plat-form, and sometimes under the Ends of Camber Beams; in which latter Case they are commonly placed a Foot or two below the Beam, and have a piece of Timber standing upright, close to the Wall, from the Corbet to the Beam.

Corbets, also is a Term used by some Architects, for the hollow Nicks in Walls, which are left for

Images or Figures, or Statues to stand in.

CORNAGE, in our Law fignifies a kind of grand Sergeantry; the Service of which Tenure is to blow a Horn, when an Invasion of a Northern Enemy is perceived: And by this many hold Land in the Northern-Parts about the Wall, i. e. the old Piets Wall.

CORNEA Tunica. The Figure of it is of a greater Convexity than the rest of the Globe of the Eye; and it consists of several Laminz, which are nourished by so small Blood Vessels, as to obstruct very little of the Light; 'tis of a very exquisite Sense, that on any light touch, the Tears may be squeez'd out of the Lachrimal Glands, to wash it and clean it.

CORONA, in Anatomy, is that Edge of the Glans of the Penis, where the Preputium be-

CORONARE Filios, Theancient Villains were forbidden Coronare Filios, that is, to let their Sons receive their first Preparatory Tonsure, or to begin to be ordained Priests; because after that they are Freemen, and can be by their Lords no longer claimed as Servants in Villenage.

CORPORA Pyramidalia, when the Blood hath discharg'd it self of the Seed into the Testicles, it returns by the Veins, which rifing in several Branches from the Testes, tends towards the Abdomen in the Production of the Peritoneum, the same way the Arteries came down. In their Progress, their Branches frequently inosculate and divide again, till they come near the Abdomen, and then they all unite in one Trunk; and therefore because of their Shape are called Corpora Pyramidalia.

CORPORAL of a Ship, is an Officer that hath the Charge of fetting the Watches and Centries, and relieving them; and who feesthat all the Soldiers and Sailors keep their Arms neat and clean; he teaches them also how to use them, and hath a Mate under him.

CORPUSCLES. The admirable Sir Isaac Nonton shews a way of guessing with great accuracy, at the Sizes of the component Corpuscles or Particles of which Bodies are constituted, in the second Book of his Opticks, pag. 3. See more of this under the Word Colour and Particles.

CORSNED, in the Saxon, is Ordeal Bread, Panis Conjuratus: For the Saxons had a Superstitious way of purging themselves of an Accusation, by taking a piece of Bread and eating it with solemn Oaths and Execuations, that it might prove their Poison, &c. if they were guilty; which way of speaking is retain'd in some Places to this Day, especially in Kent.

CORVUS, was a Machine invented by the Romans, in the time of their Conquests of Sicily, when they first engaged the Carthaginian Fleet, and was framed (as Polybius describes it, Lib. 1.)

after this manner.

On the Prow of their Ships they exected a round piece of Timber about 11 Foot in Diameter, and 12 Feet in Length, on the top of which was a Block or Pulley; round this piece of Timber was a Plat-form of Boards 4 Feet in Length, and about 18 Foot long, well framed and fastned with Iron: The Entrance was long ways, and it was moveable round the aforesaid upright piece of Timber, and could also be hoisted up and down within 6 Foot of the top; about this Frame was a fort of Parapet Knee high, which was defended with upright Bars of Iron, sharp at the Ends, and towards the top there was a Ring, by the help of which and a Pulley or Tackle, it was hoisted and lowered at Pleasure: With this moveable Gallery they Boarded the Enemies Ships (when they did not lie Side by Side) sometimes on their Bow, and sometimes in the after Part of the Ship; the Soldiers keeping the Boss of their Bucklers level with the top of the Parapet, &c. and by the Means of this new Engine, got the Day of the Carthaginiens, in their first Sea Fight with them, tho the Enemy were long before well skill'd in Naval Affairs, and the Romans perfectly raw and unskill'd.

COTLAND, is Land held by a Cottager.

whether in Soccage or Villenage.

COUCH, is a Term in Painting, fignifying the ground Bed, or Basis on which any Colour lies, and is distinguish'd from the Field, which is always Horizontal and upon the Flat; whereas the Couch may be upright or vertical, and in any other Po-

COVING-Cornish, in Architecture, is such a Cornish that hath a great Casement or Hollow in it, which is commonly lathed and plaistred upon Compass Sprockets or Brackets; also when Houses are built projecting out over the Ground-Plot, and then turn'd with a Semi-arch of Timber, which is lathed and plaistred, they call that Coving-

COURT-Christian, or Ecclesiastical, is so call'd in Opposition to the Civil Court, or Lay Court, or Curia Domini Regis: These Courts of Christianity were not only held by the Bishops in Synods, and the Arch-Deacons and Chancellors in Confistories: But they were also the Rural Chapters where the Rural

Rural Dean or Dean of Christianity presided, and the Clergy were Affessors and Affistants. Kennet's Glossary

CRASIN-Mill; See Craze-Mill.

CRAYONS, are Pencils of feveral Colours made purposely to paint withal: They are chiefly used in Portraicts; and Pictures done after this way of Painting, are faid to be done with Gray.

CRAZE-Mill, or Grazing Mill, is a Mill (in all refpects like a Grift Mill to Grind Corn) and is fo call'd by the Tin Miners, who use it to Grindtheir Tin, which is yet too great, after Trambling; and then its Trambled only; See Tin.

CRIMEN Ambitus, is getting into Publick OF fices by Bribing with Money or other Gifts, orthy Canvasing with Intreaties; as the Civilians De-

fine it.

Crimen Falsi, in the Civil Law, is a fraudulent Suppression or Imitation of Truth to the Prejudice of another; so that the Commission of this Crime confilts in three points, Corruption of Truth, Deceit, and Damage to another.

Crimen fraudata ennona, is the abusing Markets by raising the Price of Victuals unreasonably, by

Forestalling, Monopolizing, &c.

Crimen Peculatus, (a Pecore, Cattle, in which
Riches consisted before the use of Money) in the Civil Law, is the Crime of Stealing the Publick Treasure, or Cheating in the publick Accounts. And much of the same Nature is what they call,

Crimen Residui, which is applying the publick Money to other Uses and Purposes than those the Government orders and appoints, or else not ap-

plying to any Use at all.

CROOTES, is a Substance found about the Oar in the Lead Mines in Mendip, being a mealy,

white, foft Stone matted with Oar.

CROSS-Multiplication, is a Kind of Multipli-cation much used by Workmen in measuring their Work; and 'tis so call'd because they multiply across, Feet by Inches, &c.

As suppose it were required to multiply 5 Foot, 3 Inches and 6 Parts, or 4, of an Inch, by 2 Foot, 4 Inches and 6 Parts. They fet the Number down

thus:

Vol. II,

F. In. Pa. 5:3:6 2:4:6

12::6:9:9

Then say, twice 5 Feet is 10 Feet, which they write down first of all, as you 10:: see under Feet. Twice 3 Inches is 6 Inches-Twice 6 Parts is 1 whole Inch-Then working with 4, 4 times 31:8: 5 Feet is 20 Inches. Four times 3 Inches give 12 ? Primes, or one Inch Four times 6 Parts or Primes give 24 Seconds or 12th of the 12th of an Inch, which : 2 : makes two Twelfths. Six times 5 Feet gives 30 Inches—: 2:6: Six times 3 Inches is 18 Parts —: :1: - : : 1 : 6 Seco. Six times 6 Parts produce 36 : 3 Seco. thirds or 12ths of a Second, which makes.

And this Method they are very fond of (tho' it: very absord in Reality; for to multiply Inchesby Feet, & c. i.e. a thing of one Name or Denomination by another, is Nonfense;) and I believe they generally use it because of its Dispatch.

CROSS-Staff. The Description and Use of

this Instrument is as follows:

The Staff is usually above 3 Foot long, having sides fquare to one another about i an Inch over; and each is graduated like a Line of Tangents, and to every Side belongs a peculiar Crosspiece. The Staff may be divided either by a Table of Natural Tangents, or Geometrically by the Divisions in the Quadrant of a Circle. Then the Half of the Cross-pièce being supposed Radius, the Graduation on the Staff will be the Natural Co-Tangents of the half Arches.

The Uses of this Instrument are, to take the Altitude of the Sun, or of a Star; to take the Diflance between two Stars, or of any Star from the Moon, E3c. and 'tis us'd by some to take Distan-

ces by Land.

To observe the Altitude of the Sun or Stars.

There are four Crosses belonging to the Staff, one called the Toncrofs, which belongs to that Side where the Graduation begins 3 deg. andends with 10 deg. another called the Thirty-crof's, belonging to that Side of the Staff where the Divisions begin with 10, and end with 30 deg. The Third is the Sixty-orofs, which belongs to that Side where the Degrees begin at 20, and end at 60 deg. And the last is called the Ninety-cross, belonging to that Side where the Graduations begin at 30, and end at 90 deg

Now, according as you can guess the Sun's Altitude to be, you must use the proper Cross: If the Altitude be under 10 deg. use the Ten-cross; if under 30, use the Thirty-cross; if under 60, the Sixty-cross; but if above that, use the Ninety-

cross.

And the: Way of observing is thus: Having fitted on your proper Cross, place the flat End of, the Staff to the Outside of your Eye, and as near to your Eye as you can: Then look at the Sun, or Star, with the upper End of the Crofs, and at the Horizon with the lower End, moving or fliding the Cross to and fro till you can do this exactly; for then the Degrees and Minutes cut by the inner Edge of the Cross, on the proper Side of the Stuff for that Cro's, will give you the present Altitude of the Sun or Star.

Unless it be hazy and thick Weather, the Observation can hardly be made without Prejudice to the Eye: To prevent which, some put a coloured Glass on the Top of the Cross; and then they observe the upper Limb of the Sun, and subfiract

his Semidiameter from the Altitude.

There is a Way also of making a backward Observation of the Sun's Altitude with the Cross-Staff, as thus: Fix a Horizontal Vane on the Eve-End of the Staff, and a Shoe of Brass to the End of any of the Four Crosses, which will serve inflead of a Sight Vane. Having done this, and firted the Cross on upon the Staff, turn your Back to the Sun, and looking through the Slit in the Brass Shoe, lift up or down the End of the Staff, till the Shadow made by the upper End of the Cross fall on the Slit in the Horizon Vane, and that likewise at the same time you can see the Horizon through the Horizontal Vane at the End of the Brais; then will the Degrees cut on the proper Side of the Staff, be the Sun's Altitude required.

To observe the Distance between Two Stars; or the Moon's Distance from a Star.

Place the flat End of the Staff to the Edge, as in the First Observation, and looking to both Ends of the Cross, draw it to and fro, till the Ends will cut the Two Stars, or one the Moon, and the other the Star; then will the Cross cut the Distance between those Objects on the proper Side of the Staff.

Because there may be a Mistake in placing the Staff to the Eye, take this Rule to know when it is right: Put the Sixty-cross on 30 Degrees on its proper Side of the Staff, and likewise the Ninetycross on 30 Degrees on its outside; and then when, by moving the Staff higher or lower, you have placed it so, that you can see the upper End of the Two Crosses in one and the same right Line, and the Two lower Ends in another, the Staff is

placed right.
CROWNS of Colours, are certain coloured Rings which like Halo's appear, but of the Colours of the Rainbow, and at a less Distance than the common Halo's, about the Body of the Sun or Moon. These Sir Isaac Newton, in his Opt. Book 2: p.4: shews to be made by the Suns shining in a fair Day, or the Moon in a clear Night, through a thin Cloud of Globules of Water or Hail, all of the same bigness: And according as the Globules are bigger or lesser, the Diameters of these Crowns, or Rings, will be larger or smaller; and the more equal these Globules are to one another, the more Crowns of Colours will appear; and the Colours will be the more lively.

CROWN-Post, is a Post which in some Buildings stands upright in the middle, between two principal Rafters; and from it there go Strutts or Braces to the middle of each Rafter. This is also by some called the King piece, and the Jozgle-

CRUCIFORM Hyperbola, is a Curve by that Name; which is so called by Sir Isaac Newton, be-

cause it cuts its Conjugate cross-wise.

CRYPTOGRAPHY, called also Steganography, is the Art of secret Writing: On which subject many Books have been publish'd; as, by the Abbot Trithemius, in his Steganographia, Francf. 1608. 4ta. by Gustavus Selenus, in 9 Books in Fol. printed at Luneburgh, 1624. cum Fig. by Schottus, in his Schola Steganographica. Bithop Wilkin's Secret and Swift Mellenger.
CUBICAL Paraboloid. See Paraboloid and

CUL-PRIT, are Words used by the Clerk of the Arraignments, when a Person is indicted for a Criminal Matter. For after the Indictment is read in Court (which is the Crown's Charge) against the Prisoner at the Bar, he is put upon his Plea, or asked, Art thou Guilty, or not Guilty? If he pleads or answers, not Guilty, there is next a Replication from the Crown, by continuing the Charge of Guilt upon him, according to the Tenour of the Indicament; which is express'd by pronouncing the Words Cul-Prit: Cul being an Abbreviation of the Latin Word Culpabilis, Guilty; and Prift, or Prit, (now Pret) is the old French Word for Ready. From these two Assertions therefore of the Clerk of the Arraignment, that

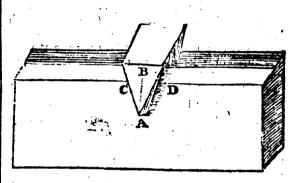

the Prisoner is Culp, or guilty of the Crime charged on him, and that the Crown is Prit or reads to prove it upon him; this Word Cul-Prit is deri-

And that this is the true Explanation of the Terms Cul-Prit, is evident from the Form of the Entry of the Record of the Trial when drawn up at large; which, as to the Replication pronounced by the Clerk, as aforesaid, in the Words Cul and Prit, run thus: Et Predictus A. (the Clerk) pro Domina Regina dicit, Quod Predict. B. (the Prisoner) est Culpabili, &cc. Et bac paratus est verisi-

care, &c.
CULVERTAIL, the same with Dovetail;

which see.

CUNEUS. The Wedge, one of the five Mechanical Powers, is in the Form of a Prism, whose Top and Sides are Parallelograms, but its Ends Isosceles Triangles; whose Altitude is called the Altitude of the Wedge, as the Base of each said Triangle is the Thickness of the Wedge. The right Line connecting the Vertices of the Two Triangles, is called the Edge; as the Parallelogram which joins their Bases, is called its Dorsun; or Back.

The Power of this Engine is easily estimated; and is (when directly applied to the Top or Dorsum of the Wedge) to the Resistance to be overcome, as the Thickness of the Wedge is to its Al. titude. In the Figure, BA is the way of Power, and CD the way of the Impediment or Resistance: So that while the Wedge is driven down into the Wood, 69c. by its whole Altitude, the Wood is di-vided by the entire Thickness of the Wedge, and this every where proportionably, as follows from the Nature of a Triangular Figure. Wherefore a Wedge, whose Thickness is to its Altitude or Length in a little greater Proportion, than as the Power applied is to the Resistance or Tenacity of

the Wood, will cleave or d vide it.

CUNETTE, See Cuvette.

CUPULO, in Architecture is an Arched Room or Turret standing on the very Top of a Dome or great Building, in Form either Circular or Polygonal; some call it a Lanthorn.

CURATOR, in the Civil Law, is a Person regularly appointed to take care of another; as suppole of a Minor, by his Consent from 24 Years of Age, to 35; on the Determination of a Trial at Law, where the Magistrate may appoint a Curator for the Minor. The Magistrate also might appoint a Curator for a Madman, a Prodigal, Deaf or Dumb Person, as also for the Estates of Debtors,

and of Persons dying without Heirs.
CURIA, a Word used formerly indifferent Senfes. . Sometimes it fignified the Perfons or Feudatory Tenants, who did their Suit and Scivice at the

Court of the Lord.

Some-

Sometimes it signified a House, as Curia Canomicorum, the Convent or Conventional House. Curia Persona Ecclesia, the Parsonage House. And sometimes it was used for the Service it self, of coming to the Court of the Lord; Curie ad-Dr. Kennet.

CURRENTS, are certain Progressive Motions of the Water of the Sea in several Places, either quite down to the Bottom, or to a certain determinate Depth; by which a Ship may happen to be carried forward more swiftly, or retarded in her Course, according to the Direction or Setting of the Current in, with, or against the Course or Way

of the Ship

The first thing therefore to be known, is, which way the Current sets; and if its Motion be swift, great and strong, this will be best discovered by keeping an exact Account of the Ships Way both outward and homeward, according to the best Method of what the Seamen call their Dead Reckoning, being very curious in observing the way the Ship makes by the Log-line; for 'tis not the correef Account, but the Dead Reckoning, that must here assist you, Therefore you must be very careful to observe how the Ship goes by it, when you Sail near the Meridian, how she is drawn from her Course: As also, when she is steered directly East and IVest, take good Notice whether she alter her Latitude.

As for those Guesses, by the Ripplings of the Water, and by the driving of Froth, Esc. along Shore, when you are in fight of it, they will be of little use. But the most usual and the most useful way of observing the setting of a Current is thus:

When there is a smooth Sea, and not much Wind, heave out the Boat, with three or four Hands in her, together with a Compass, a Log-line, and Half-minute Glass, with also a Line or small Warp of about an Hundred Fathoms long; to the End of which Line fasten a Triangular Piece of Board, as a b c, and to one of the Angles fasten

a good heavy Piece of Lead to fink it. Some use instead of this Board a Kettle tied by the Bail, (which may do tolerably well).

When you are off from the Ship, cast over your Board or Kettle, letting it sink at least 60 Fathom; and if you have Line enough, let it down 100 or 120 Fathom: Then belaying the Line fast about her Stern, it will bring her up, and make her ride as if the

were at an Anchor. Then cast over your Log, turn up the Glass, and as you veer out the Log-line, set the Drift of the Log with your Compass: So shall you know whether there be any Current or no; and if any, how it sets; as also the Rate of its driving. Only remember to add always to the Drift, if the Line she ride be of 60 Fathom, † Part; if of 80 Fathom, †; if of 100 Fathom, the ! Part, 50 c. of the Drift more, for the Drift of the Boat; for though the Boat may seem to ride or lie still, yet she is found by Experience to drive at the same Time.

N. B. Whether these Allowances be the very Truth, or not, I cannot say: They are said to agree with Experience, and therefore may be us'd till better Observations of these things may be made. Only this is certain, That the bigger the Board and Weight is that the Boat is to ride by, the less will

be her Drift. Sir J. Moor's Navig.

If a Current fet exactly with the same Direction, as is the Course of the Ship, then it must augment her Motion forward in Proportion to the Velocity of the Drift.

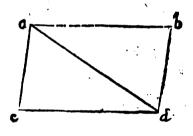

As if a Ship sail N. N. E. 20 Miles, in a Corrent fetting the same way, and in the same times 8 Miles, her true Course will be N. N.E. 28 Miles in the fame time.

But if the Corrent set directly against the Ship's Course, it will abate of her Motion forward in Proportion to the Velocity of the Drift.

As if a Ship said N. E. 49 Miles in a Current; setting S. W. 10 Miles in the same time; the Ship's Course or Distance run in that time will be but 39 Miles. So if a Ship sail N. E. 49 Miles in a certain time, in a Current that sets S. W. 59 Miles in the same time; her true Course will be S. W. 10 Miles; that is, she will fall aftern 10 Miles in that time.

But if a Ship fail a-cross any Current, her Motion will be compounded with that of the Current; and her Velocity augmented, or retarded proportionably to the Angle of her Direction, with that of the Direction of the Current; according as she

goes in Part with it or against it...
As suppose the Ship's Course were from a to c, and the fetting of the Current from a to b; the Ship will, by the Composition of those two Moti-

ons be carried from a to d in the Diagonal a d .

See Composition of Motion.

Wherefore if a Ship sails N. E. 110 Miles, in a Current which sets S. W. 30 Miles in the same time, and her true Course and Distance sailed be requird, you may proceed thus:

1 ft. Geometrically.

1. Set off .4 Points from N. towards E. and draw A Cequal to 110 Miles.

2. From C draw C B, parallel to the Line N.N.E. and equal to 30 Miles.

3. Draw A B, which will be the Ship's true Course; to find which

Trigonometrically.

In the Triangle A B C, there is AC 110
7 at C 22 30
R C 20
Sect. 4. Given

A+CBC: AC-BC::t, 1/(A+B:t,1/B-A, i.e. As the Sum of A C and B C 140 2.1461280 2.1461280

To their Difference 80 So is the Tangent of 789 45°

4.9030900 10.7013382

To the Tangent of 70 49 10.458 2002 Now 78° 45' - 70° 49' = 7° 56' = 4 C A B. Hence it appears that her true Course is NE 7º 56 Eafterly.

But for her Distance it will be by Case 1. Sect. 4. s, LA: BC::s, LC: AB. i.e.

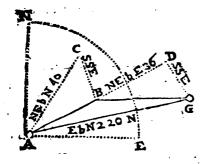

As the Sine of the Angle at A 70, 96' 9.1399445

To the Drift of the Current B C 30 1.4771212 So is the Sine of the Angle at C 22 30'-9.5828397

To the Distance run 83, 2 Miles

Ex. 2. If a Ship from the Latitude 36° 30° S Se ils NE b N 40 Miles, then NE b E 36 Miles, in a Current that fets SSE 20 Miles in the time that the Ship sails 38 Miles, and it be required to find the direct Course and Distance between the Ship and her first Place, as also the Latitude the Ship is in.

1st. Having constructed it, as in the former.

In the Triangle A CB, are

Given $\begin{cases} AC & 40 \\ L & at & C & 56^{\circ}, 15^{\circ} \end{cases}$ To find AB, and the Angles at A and B.

It will be, by Case the 4th of Sell. the 4th.

 $AC+BC:AC-CB::t,\frac{1}{2}LA+LB:t,\frac{1}{2}LB$

As the Sum of A Cand B C 61, 05 1.7856857

To their Difference 18, 95 So is the Tangent of 612, 52;

1.2776092 10.2720432

To the Tangent of 30, 08!

9.7639667

Now, 61°, 52'' - 30°, $08\frac{1}{2}' = 31°$, 44' = 4 C AB; therefore the Ship's first Course is N. E. by E. 9°, 14', Eastwardly.

For the Distance, it will be, by Case the 1st of

Sec. the 4th,

s, CAB: CB::s, ACB: AB; that is, As the Sine of the LCAB 318, 44' 9.7209581

To CB the Drift of the Current 21,05 1.3232521 So is the Sine of the Lat C 56°, 15'. 9.9198464

To the Distance run, 23, 28.

2. In the Triangle B D G, are given BD 36 Lat B 789, 45' To find BD and the L_FDBG and D G B. PG 18, 95

Wherefore, As the Sum of B D and DG 54, 95 1.7399677

To their Difference 17, 05 So is the Tangent of 500, 27

1.2317244 10.0856980

To the Tangent of 25°, 42'

9·5774547

Hence the Angle DBC, will be found 290, 55'; wherefore the Ship's second Course is E. by N. 7°, 25'. Eastwardly, and consequently the Angle ABG = 159°, 19'.

But for BG, the Distance run, it will be As the Sine of the Ang. BDG 29°, 55. 9.6978747

To DG the Drift of the Current, 18, 95 1.2776092 So is the Sine of the Angle BDG 78°, 45 9.991 5739

To BG the Distance run, 37, 27 1.5713090 3. In the Triangle ABG, are

AB 33, 28 Whence must be Given \(\begin{pmatrix} AB & 33, 28 & \ AB & 159°, 19' \\ B & 37, 27 & \end{pmatrix} \text{ Mond \$LBAG\$ and \$AG\$, and twill bey As the Sum of \$AB\$ and \$B & 70, 55 \quad 10.8484970

c.6009**7**29 9.2612203

To the Tangent of 000, 36'

8.0136962

Hence the Angle B A G is 100, 56, and consequently the bearing of the Ship from her first Port is E. by N. 20, 20'. Northerly; and for the Distance it will be,

As the Sine of the Angle BAG 100, 56'. 9.278991 E

To the Distance run BG 37, 27 1.5713090 So is the Sine of the LAB G 1490, 19'. 95480240

To the Distance between the Ship and \ 1.8403419 her Port 69, 24 Now for the Difference of Latitude, it will be as the Radius 10.000000

To the Distance sail'd, 69, 24 1.2403571 So is the Co-Sine of the Course, 760,25' 9.3708079

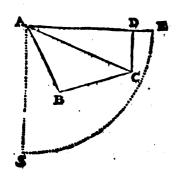

To the Difference of Latitude 16, 26 1.2111650

Hence, because she sail'd from a? South Latitude From the Latitude she sail'd from 36°, 30'—Sly Take the Difference of Lat. made 16;'——Nly – Nly Remains the Lat. the Ship is in 36°, 133'-

Admit a Ship, from a certain Head-line, in the Latitude of 34°, co'. North, fails S. E. by S. 24 Miles in 6 Hours, in a Current that fets between the North and the East; and then the Cape is found to bear W. N. W. and the Ship to be in the Lat. of 33°, 45'. North. I demand the Setting and Drift of the Current?

Geometrically.

1. Set off 3 Points from Stowards E, and-draw the Line A B equal to 24 Miles.

2. Set off two Points from E towards S, and draw the Line AC.

3. At the Distance of 15 Miles, equal to the Disterence of Latitude, draw a parallel to AE, till it intersect AC as in C.

4. From the Intersection C, draw C D parallel to AS; also the Line B C the Drift and Setting of the Current,

To find which Arithmetically.

In the Triangle ADC, Right-angled at D, are Given $\{DC : 5, 20'\}$ to find ACWherefore SLA : DC : R:AC; that is,

As the Sine of the Angle at A 22°, 30' 9.5828397

To the Difference of Latitude 15
So is the Radius

1.1760912

To the Distance run 39, 2

1.5932515

Again, In the Triangle ABC, are $\begin{cases}
AB & 24 \\
LA & 33^{\circ}, 45'
\end{cases}$ to find $\begin{cases}
LC \\
BC \\
LB
\end{cases}$ Wherefore,

AB + AC: AC - AB :: t\(\frac{1}{2}\)\(\beta\) B + LC

As the Sum of the Sum of the Sides \(\begin{align*}

\begi

To their Difference 15°, 2'
So is the Tangent of 73°, 07‡

1.1818436
10.5180608

To the Tangent of 389, 241' 98991873

Which added to 73°, 07;', gives 111°, 32'. the Angle at B. And hence the Current will be found to fet E. by N. 00°; 58' Northerly.

For BC, the Drift of the Current, it will be, s, LB: AC:: s, LA: BC; that is, As the Sine of the Ang. at B 1110, 32' 9.9685783

To AC the Distance run 39°, 2'. 1.5932515 So is the Sine of the Ang. at A 33°, 45'. 9.7447390

To BC the Drift of the Current in 6 \\ \text{13694122} \\ \text{And confequently it fets at the Rate of 3°, 9'.} \\ \text{Miles an Hour.}

Several other Questions might be propos'd relating to Currents, but these being throughly understood, are sufficient for the Purpose.

CURSOR, is a Piece or little Ruler or Label of Brass being divided like a Line of Sines, and sliding in a Groove or Notch along the middle of another Label or Ruler, representing the Horizon, and always at Right Angles to it: 'Tis used in the Analomma, which see.

CURVATURE of a Line, is the peculiar manner of its bending or Flexure, whereby it becomes a Curve of such peculiar Properties. Thus the Curvature of the Circle is such, that all Points of the Periphery are equally distant from one Point within, call'd the Centre. The Curvatures of different Circles are to one another reciprocally as their Radii.

CURVE, generating the Solid of least Resistance, See Solid.

CURVES. The incomparable Sir Isac Newton gives this following Enumeration of Geometrical Lines of the Third or Cubick Order; in which you have an admirable account of many Species of Curves which exceed the Conick-Sections, for they go no higher than the Quadratick or Second Order.

The Orders of Geometrick Lines.

1. GEOMETRICK-LINES, are best distinguished into Classes, Genders or Orders, according to the Number of the Dimensions of an Equation, expressing the relation between the Ordinates and the Abscisse; or which is much at one, according by the Number of Points in which they may be cut to a Right Line. Wherefore, a Line of the First Order will be only a Right Line: Those of the First cond or Quadratick Order, will be the Circle and the Conick-Sections; and those of the Third or Cubick Order, will be the Cubical and Nelian Parabola's, the Cission of the Antients, and the rest as below enumerated. But a Curve of the First Gender (because a Right Line can't be reckoned among the Curves) is the same with a Line of the Second Order; and a Curve of the Second Order; and a Line of an Instintesimal Order, is that which a Right Line may cut in infinite Points, as the Spiral, Cycloid, the Quadratrix, and every Line generated by the infinite Revolutions of a Radius or Rota.

2. The chief Properties of the Conick-Sections are every where treated of by Geometers; and of the same Nature are the Properties of the Curves of the Second Gender, and of the rest, as from the following Enumeration of their Principal Properties will appear.

a. For if any right and parallel Lines be drawn and terminated on both Sides by one and the same Gonick Sellion; and a Right Line bisesting any

two of them shall bisect all the rest; and therefore such a Line is called the Diameter of the Figure; and all the Right Lines so bisected, are called Ordinate Applicates to that Diameter, and the Point of Concourse to all the Diameters is called the Centre of the Figure; as the Intersection of the Curve and of the Diameter, is called the Vertex, and that Diameter the Axisto which the Ordinates are Normally applied. And so in Curves of the Second Gender, if any two right and parallel Lines are drawn occurring to the Curves in three Points; a right Line which shall so cut those Parallels, that the Sum of two Parts terminated at the Curve on one Side of the intersecting Line, shall be equal to the third Part terminated at the Curve on the other Side; this Line shall cut, after the same manner, all others parallel to these, and occurring to the Curve in three Points; that is, shall so cut them, that the Sum of the two Parts on one Side of it, shall be equal to the third Part on the other.

And therefore these three Parts, one of which is thus every where equal to the Sum of the other two, may be called Ordinate Applicates also: And the intersecting Line to which the Ordinates are applied, may be called the Diameter; the Intersection of the Diameter and the Curve, may be called the Vertex, and the Point of Concourse of called the Vertex, the Centre.

any two Diameters, the Centre.

And if the Diameter be Normal to the Ordinates, it may be called the Axis; and that Point where all the Diameters terminate, the General Contre.

'Assimptates and their Properties.

4. The Hyperbola of the first Gender has two Assymptotes, that of the second, three; that of the third, sour; and it can have no more, and so of the rest. And as the Parts of any Right Line lying between the Conical Hyperbola and its two Assymptotes are every where equal; so in the Hyperbola of the Second Gender, if any Right Line be drawn, cutting both the Curve and its three Assymptotes in three Points, the Sum of the two Parts of that Right Line being drawn the same way from any two Assymptotes to two Points of the Curve, will be equal to the third Part drawn a contrary way from the third Assymptote, to a third Point of the Curve.

Latera Transversa & Recta.

5. And as in Non Parabolick Conick Sections, the Square of the Ordinate Applicate, that is, the Rectangle under the Ordinates, drawn at contrary Sides of the Diameter, is to the Rectangle of the Parts of the Diameter, which are terminated at the Vertex's of the Ellipsis or Hyperbola, as a certain given Line, which is called the Latus Rectum, is to that Part of the Diameter which lies between the Vertex's, and is called the Latus Transversum: So in Non Parabolick Curves of the second Gender, a Parallelopiped under the three Ordinate Applicates, is to a Parallelopiped, under the Parts of the Diameter terminated at the Ordinates, and the three Vertex's of the Figure in a certain given Ratio; in which Ratio, if you take three Right Lines to the three Parts of a Diameter situated between the Vertex's of the Figure, one answering to another; then these three Right Lines may be called the Latera Resta of the Figure, and the Parts of the Diameter between the Vertices, the Latera Transversa. And as in the Conick

Parabola, having to one and the same Diameter, but one only Vertex, the Rectangle under the Ordinates is equal to that under the Part of the Diameter cut off between the Ordinates and the Vertex, and a certain Line called the Latus Rectum: So in the Curves of the second Gender, which have but two Vertex's to the same Diameter; the Parallelopiped under three Ordinates, is equal to the Parallelopiped under the two Parts of the Diameter cut off between the Ordinates and those two Vertexes, and a given Right Line, which therefore may be called the Latus Rectum.

The Ratio of the Restangles under the Segments of Parallels.

Lastly, As in the Conick Sections when two Parallels terminated on each side at the Curve, are cut by two other Parallels terminated on each side by the Curve, the first being cut by the third, and the second by the fourth; as here the Rectangle under the Parts of the first, is to the Rectangle under the Parts of the first, is to the Rectangle under the Parts of the second, is to that under the Parts of the second, is to that under the Parts of the Fourth: So when four such Right Lines occur to a Curve of the second Gender, each one in three Points; then shall the Parallelopiped under the Parts of the first Right Line, be to that under the Parts of the third; and as the Parallelopiped under the Parts of the second Line, unto that under the Parts of the Fourth.

Hyperbolick and Parabolick Legs.

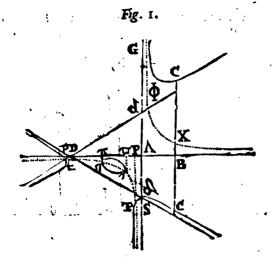

All the Legs of Curves of the second and higher Genders, as well as of the first, infinitely drawn out, will be of the Hyperbolick or Parabolick Gender; and I call that an Hyperbolick Leg, which infinitely approaches to some Assymptote; and that a Parabolick one, which hath no Assymptote. And these Legs are best known from the Tangents: For if the Point of Contact be at an infinite Distance, the Tangent of an Hyperbolick Leg will coincide with the Assymptote, and the Tangent of a Parabolick Leg will recede in infinitum, will vanish and no where be found. Wherefore the Assymptote of any Leg is found, by feeking the Tangent to that Leg at a Point infinitely distant : And the Course, Place or Way of an infinite Leg, is found by feek-ing the Polition of any Right Line, which is parallel to the Tangent where the Point of Contact goes off in infinitum: For this Right Line is directed towards the same way with the infinite Leg.

The Reduction of all Curves of the second Gender, to four Cases of Equations.

CASE I.

All Lines of the first, third, fifth and seventh Order, and so of any one, proceeding in the Order of the odd Numbers, have at least two Legs or Sides proceeding on ad infinitum, and towards contrary ways. And all Lines of the third Order have two such Legs or Sides running out contrary ways, and towards which no other of their infinite Legs (except in the Cartesian Parabola) do tend. If the Legs are of the Hyperbolick Gender, let GAS be their Assymptote; and to it let the parabel CBc be drawn, terminated (if possible) at both Ends at the Curve. Let this parallel be bi-

fected in X; and then will the Place of that Point

X be the Conical Hyperbola X o, one of whose Assymptotes is AS: Let its other Assymptote be AB; then the Equation by which the Relation between the Ordinate BC and the Abscissa AB is determined, if AB be put = x and BC = y, will always be in this Form, $xyy + ey = ax^2 + bxx + cx + d$, where the Terms e, a, b, c, and d, denote given Quantities, affected with their Signs + and -; of which any one may be wanting, so the Figure, through their Desect, don't turn into a Conick Section. And this Conical Hyperbola may coincide with its Assymptotes, that is, the Point X may come to be in the Line AB, and then the Term + ey will be wanting.

CASE IL

9. But if the Right Line C B c cannot be terminated both ways at the Curve, but will occur to the Curve only in one Point, then draw any Line in a given Position, which shall cut the Assymptote A S in A; as also any other Right Line, as B C, parallel to the Assymptote, and meeting the Curve in the Point C: And then the Equation by which the Relation between the Ordinate B C and the Abscissa A B is determined, will alway put on this Form, $xy = ax^3 + bxx + cx + d$.

CASE III.

10. But if the opposite Legs are of the Parabolick, Gender, draw the Right Line CBc, terminated at both Ends, if it's possible, at the Curve; and running according to the Course of the Legs, which bissect in B: Then shall the Place of B be a Right Line. Let that Right Line be AB, terminated at any given Point, as A; and then the Equation by which the Relation between the Ordinate BC and the Abscissa AB is determined, will always be in this Form, $yy = ax^2 + bxx + cx + d$

CASÈ W.

11. But if the Right Line C Bc meet the Curve but in one Point, and therefore can't be terminated at the Curve at both Ends; let the Point where it occurs to the Curve be C; and let that Right Line at the Point B, fall on any other Right Line given in Position, as AB, and terminated at any given Point, as A: Then will the Equation, by which Vol. II.

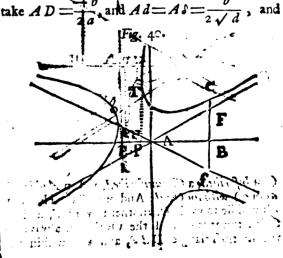

the Relation between the Ordinate B C and the Abscissa A β is determined, always be in this Form, $yy = ax^3 + bxx + cx + d$.

The Names of the Forms.

12. In the Enumeration of Curves of there Cases, we call that an inscribed Hyperbola, which lies entirely within the Angle of the Assymptotes, like the Conical Hyperbola; and that a Circumforibed one, which cuts the Assymptotes, and contains the Parts cut off within its own proper Space; and that an Ambigenial one, which hath one of its infinite Legs inscribing it, and the other circumscribing it. I call that a Converging one, whose concave Legs bend inwards towards one another, and turn both the same way; but that I call a Diverging one, whose Legs turn their Convexities towards each other, and tend towards quite contrary ways. I call that Hyperbola contrary leg'd, whose Legs are Convex towards contrary Parts, and run infinitely on towards contrary ways; and that a Conchoidal one, which is applied to its Assymptore with its Concave Vertex and diverging Legs; and that an Anguinealor Eel-like one, which cuts its Affinptote with contrary Flexions, and is produced both ways into contrary Legs. I call that a Cruciform or Cross-leks one, which cuts its Conjugate crosswise; and that Nodato, which by returning round into, desussates it self. I call that Cuspidate, whose two Parts meet and terminate in the Angle of Contact; and that Punctate, whose Oval Conjugate is infinitely small, or a Point: And that Hyperbola I call Pare, which, by the Impossibility of its two Roots, is without any Oval Node, Spike or Conjugate Point. And in the same Sense I devioininate a Parabola alfo, to be Converging, Biverging, con trary leg'd, Cruciform, Nodate, Cufpidate, Pun-

Of the redundant Hyperbola and its Affinptotes!

13. In the first Case, if the Term dx be Affirmative, then the Figure will be a tripple Hyperbola with six Hyperbolical Legs, which will run on infinitely by the three Assymptotes, of which nose are parallel, two Legs towards each Assymptote, and towards contrary Parts; and these Assymptotes, if the Term $b \times x$ be not wanting in the Equation, will mutually intersect each other in three Points, forming thereby the Triangle $D d \cdot s$. But if the Term $b \times x$ (see Fig. 1.) be wanting, they will all converge to the same Point. In the former Case

join

join D d, D s; so shall AD, D d, and D s, be the three Assymptotes. In the latter Case, draw any Ordinate, as BC, in which, both ways produced, take, on each Side, BF and Bf equal to one another, and in the same Ratio with AB that Wa hath to I; and then joining AF, Af; AB, AF, and AF, shall be three Assymptotes. And this kind of Hyperbola I call redundant, because it exceeds the Conick Sections in the Number of its Hyperbolick Legs.

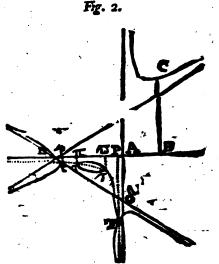

Of the Diameter of this Hyperbola, and the Polition of its infinite Legs.

14. In every redundant Hyperbola, if neither the Term ey be wanting, nor bb—4 a c equal to + a e \(\lambda \cdot

Nine redundant Hyperbola's, having no Diameter, but three Assumptions, which form a Triangle.

15. If the redundant Hyperbola have no Diameter, let the four Roots or Values of x in this Equation $ax^{4} + bx^{3} + cxx + dx + \frac{1}{4}ee^{-x}$ 0, be fought: And suppose them to be AP, Ax, and Ap. Let the Ordinates PT, x, x, and pt, be erected, and those shall touch the Curve in the Points T, τ , τ , and by that Contact shall give the Limits of the Curve, by which its Species will be discovered.

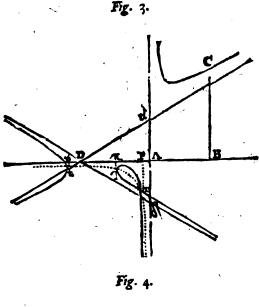

For if all the Roots AP, A = 0, A = 0, (see Fig. 1.) are real, having the same Sign, and are anequal; the Curve consists of three Hyperbola's,

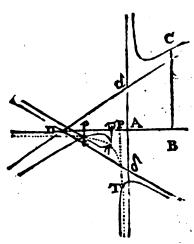

(an Inscribed, a Circumscribed, and an Ambigenial one) with an Oval: And one of the Hyperboa's will lie towards D, another towards d, and the third towards S; and the Oval will always lie within the Triangle D d S, and also within the

middle Limits 1 and τ , where it will be touch'd by the Ordinates τ 1 and σ τ . And this is the First Species.

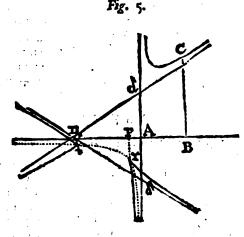

But if either the two greatest Roots, $A\pi$, Ap; or the two least, AP, $A\pi$, are equal to one ano-

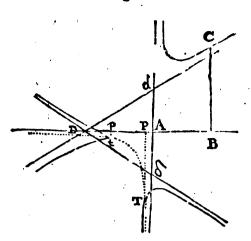

ther, and have the same Sign with the other two; then the Oval and Circumscribed Hyperbola will join with one another, the Points of Contact 7 and t, or T and τ , co-inciding; and the Legs of the Hyperbola decustating one another, will be continued in the Oval, and make the Nodate Figure. The Second Species;

If the three greatest of the Roots, A p, $A \pi$, $A \pi$; or the three least, $A \pi$, $A \pi$, A R, are equal

Fyr.

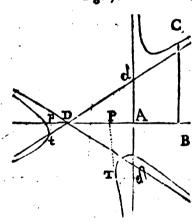

Fig. 6.

to one another, the *Nodus* will be turned into a very sharp *Cuspis*; for the two Legs of the circumfcribed Hyperbola's will then concur in the Angle of Contact, and not be produced further. And this is the Third Species;

If the two middle Roots Ar and Ar are equal, the Points of Contact τ and γ will be coin-

Fig. 7.

cident; wherefore the Oval will vanish into a Point, and the Figure will consist of three Hyperbola's, an inscribed, a Greumscribed, and an Ambigenial one, with a Conjugate Point: Which makes a Fourth Species.

If two of the Roots are impossible, and the other two unequal, and of the same Sign, (for they (See Fig. 7.))

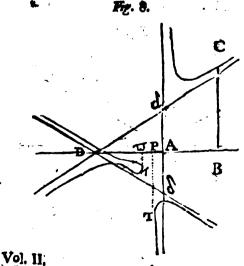

Fig. 13.

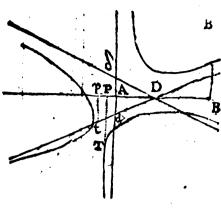

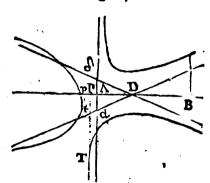

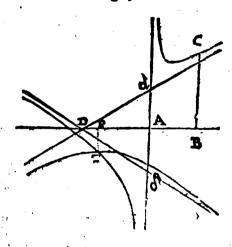

Fig. 14.

can't have contrary Signs); there will be three pure Hyperbola's, without any Oval, Node, Ca/p, or Point Conjugats; and these Hyperbola's will either lie at the Sides or the Angles of the Triangle made by the Assymptotes: Which makes a Fifth or Sixth Species.

If two of the Roots are equal, and the other two either impossible or real, with Signs contra-

Fig. 9.

Az 2

Fig.

Fig. 10.

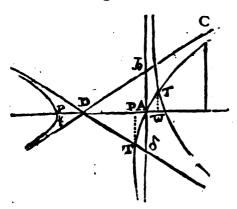

Fig. 15.

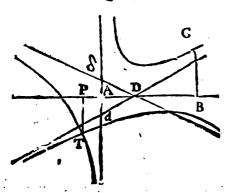

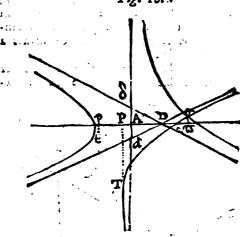

Fig. 16. N

ry to those of the equal Roots; the Cruciform Figure will be produced: For two of the Hyperboal's will decussate one another; and that either at the Vertex of the Triangle made by the Assymptotes, or at its Base; and these two are the Seventh and Fighth Species.

and Eighth Species.

Lastly, If all the Roots are impossible, or if they are all real and unequal, and two of them are Affirmative and two Negative; then there will be two Hyperbola's at the opposite Angles of the two Assymptotes, with an Anguineal or Serpentine Hyperbola about the third Assymptote. Which is the Ninth Species.

Fig. 11.

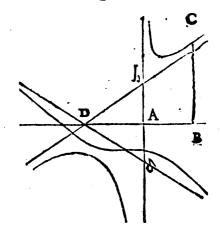

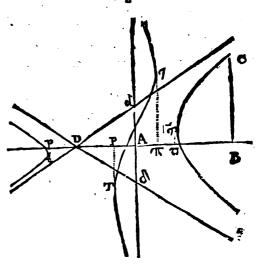

Fig. 12

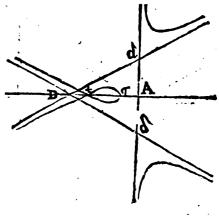

And these areall the possible Cases of the Roots; for if any two Roots are equal to one another, and the other two are equal also, the Figure will become a Conick Section with a Right Line.

Twelve redundant Hyperbola's with one only Diamater.

16. If the redundant Hyperbola have one only Diameter, let it be the Abscissa AB; and in the Equation $ax^3 + bxx + cx + d = 0$, seek that three Values of x, or the three Roots. Then,

If those Roots are all real, and have the same Sign, the Figure shall consist of an Out lying

Fig. 17.

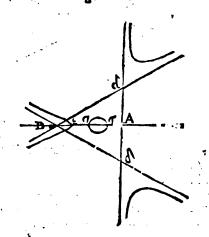

within

within the Triangle D d s, and of three Hyperbo-la's as its Angles, viz. one circumscribed at the Angle D, and the other two inscribed at d and s; and this makes a Tenth Species.

If the two great Roots are equal, and the third of the same Sign with them, the Legs of

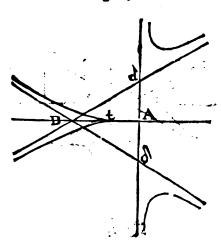

Fig. 18.

the Hyperbola lying towards D, will decuffate one another in the Form of a *Node*, by reason of the Contact of the *Oval*. Which is the *Eleventh* Species.

If the three Roots are equal, the Hyperbola be-

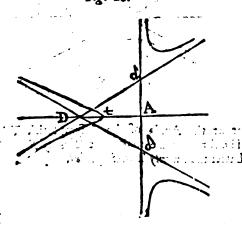

comes Culpidate, without any Oval. the Twelfth Species. Which is

If the two least Roots are equal, and the third of the same Sign with them, then the Oval va-

nishes into a Point. Which makes a Thirtseath

In the four last Species, the Hyperbola lying towards D contains its Assymptote within it; but

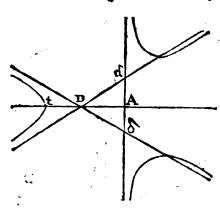

the other two are themselves contained within the

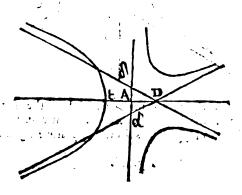

Assymptotes.

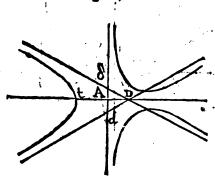

If two of the Roots are impossible, then there without any Oval. will be three pure Hyperbola's, without any Oval,

(See Fig. 20.)

Fig. 21.

Decussion, or Caspis. And there are four Cases of this Species, viz. a Fourteenth, if the circumscribed Hyperbolic towards D, and a Fifteenth, if the infaith I Unaphala lie towards D. if the inscribed Hyperbola lie towards D, a Sixteenth, if the circumscribed Hyperbola lie under the Base $D \cdot S$ of the Triangle $D \cdot S$, and a Seven-teenth, when the inscribed Hyperbola lies under the same Base.

If two Roots are equal, and the third of a different Sign from them, the Figure will be Cruci-form; for two of the three Hyperbola's will decuffate one another, either at the volume.

Base of the Triangle made by the Assymptotes.

Which fate one another, either at the Vertex, or at the

Which two Species are the Eighteenth and Nine-teenth.

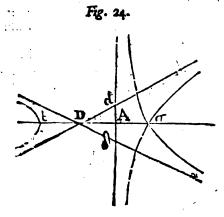

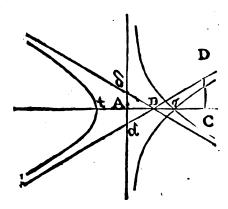

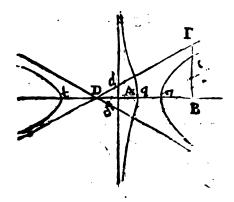

Fig. 25.

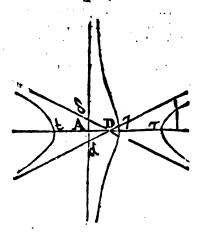

If two Roots are unequal, and of the same Sign, and the Third be of a different one, there will be two Hyperbola's in the opposite Angles of

Fig. 26.

Eig. 27.

the two Assymptotes, with an intermediate Conchoidal one. And this Conchoidal Hyperbola will either lie on the same Side of its Assymptote that the Assymptotick Triangle doth, or contrarily: And these two Cases constitute two other Species, which are the Twentieth and Twenty first.

Two redundant Hyperbola's with three Diameters,

17. The redundant Hyperbola which hath three Diameters, confits of three Hyperbola's lying within the Allymptotes, and that eigher at the Sides,

Fig. 28.

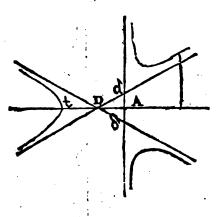

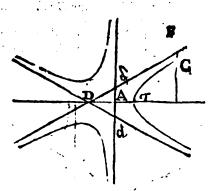

Fig. 29.

or at the Angle of the Assumptotick Triangle, The former Case makes the Twenty Second, this Latter the Twenty Third Species. Nine redundant, Hyperbola's with three Affymptotes, converging towards one common Point.

18. If the three Affymptotes do interfect one another in one common Point, the 5th and 6th Species will be changed into a Twenty Fourth, the Seventh

Fig. 30.

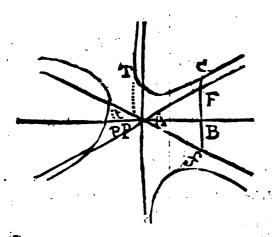

Fig. 21.

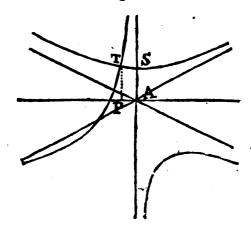

Fig. 32.

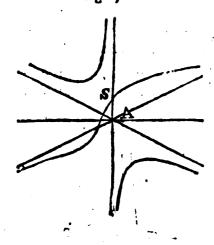

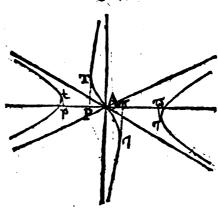

Fig. 37

and Eighth into a Twenty Fifth, and the Ninth into a Twenty Sixth Species, where the Anguinsal doth not pals through the Concourse of the Assymptote, and into a Twenty Seventh, where it doth so; in which Case the Terms b and d are wanting, and the Concourse of the Asymptotes is the Centre of the Figure, equally distant from all its opposite Parts. And these sour Species have no Diameter.

The Fourteenth and Sixteenth Species may be changed also into a Twenty Eighth Species, and the Fifteenth and Seventeenth into a Twenty Nintb.

Fig. 34.

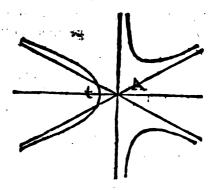

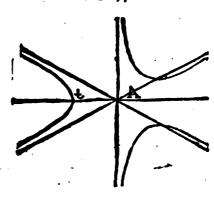

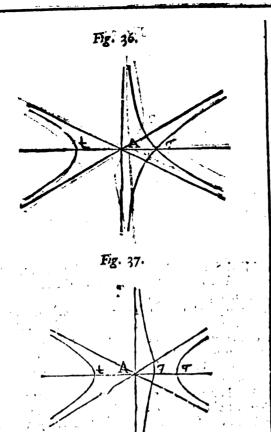

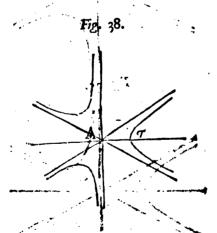

Fig. 35.

The Eighteenth and Mineteenth into a Thirtieth, and the Twentieth and Twenty First into a Thirty First. And all these Species have but one only Diameter. And finally, the Twenty Second and Twenty Third Species, may be changed into a Thirty Second, which hath three Diameters passing through the Point of Concourse of the Assymptotes.

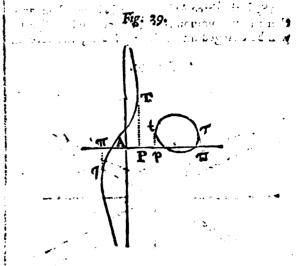

All which Changes will be easily understood, if you suppose the Assymptotick Triangle to be diminished till it vanish into a Point.

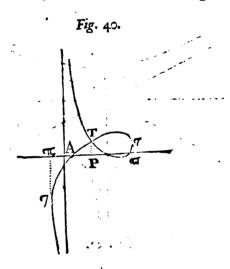

Six deficient Hyperbola's, having no Diameter.

19. If, in the first Case of the Equations, the Term ax^3 be Negative, the Figure will be a deficient Hyperbola, having one only Assymptote, and only two Hyperbolick Legs running out infinitely towards the Side of the Assymptote, but quite contrary ways; and this Assymptote is the first and principal Ordinate AG. If the Term ey be not wanting, the Figure will have no Diameter; but if it be wanting, it will have but one: In the former Case the Species are thus enumerated:

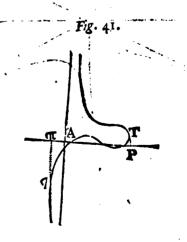

neal Hyperbola approaching towards the common Assymptote by a contrary Flexion, and with a Conjugate Oval. Which makes the Thirty Third Species. If the two middle Roots AP and Ap be equal one to another, then the Oval and the Anguineal

will be joined, decustating one another in the Form of a Node. And this is the Thirty Fourth

If three of the Roots are equal, the Node will be changed into a most Acute Cuspis in the Ver-

tex of the Anguineal. And this constitutes a Thirty Fifth Species.

If of the three Roots, having the same Sign, the two greatest, Ap and $A\pi$, are equal to one another; then the Oval vanishes into a Point. Which makes a Thirty first Species. (See Fig. 42.)

Which makes a Thirty fixth Species. (See Fig. 43.) If any two Roots are imaginary, there will remain the Anguineal alone, and this Pure, without any Oval, Decussation, Cuspis, or Conjugate Point.

Fig. 42.

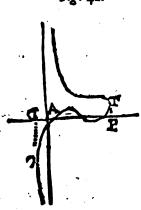

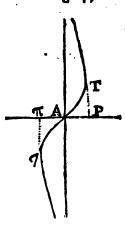

Fig. 43.

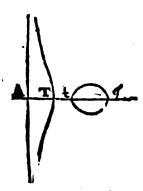

If the Anguineal don't pass through the Point A, it makes the Thirty seventh Species; but if it doth pass through A, (as it will do when the Terms b and d are wanting) then that Point will be the Centre of the Figure, bisecting all Right Lines drawn through it, and terminated both ways by the Curve. And this is a Thirty eighth Species.

Seven defective Hyperbola's, having a Diameter.

20. In the other Case, where the Term σ y is wanting, and consequently the Figure hath a Diameter, if all the Roots A T, A t A τ , of the

Fig. 45.

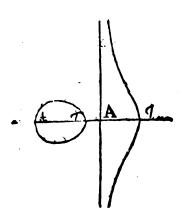

· Vol. IL

Equation $a x^3 + b x x + c x + d$, are real, unequal, and of the same Sign; then the Figure will be a Gonchoidal Hyperbola, with an Oval on its convex Side. And this is a Thirty ninth Species.

If two of the Roots are equal, and of the same Sign, but the Third with a contrary Sign, the Oval

Fig. 44.

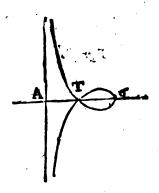

will lie on the Concave Side of the Conchoided.

Hyperbola. And this makes a Fortieth Species.

If the two leffer Roots A T, At, are equal, and the third A_T , be of the same Sign with them,

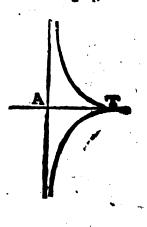

Fig. 46.

then the Oval and the Conchoidal will be joined, decusiating one another like a Node. Which is a Forty first Species.

If the three Roots are equal, the Nodus will be changed into a Cuspis, and the Figure will be the

Fig. 47.

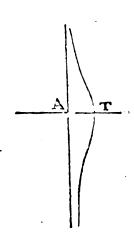

Bb

Cifford of the Ancients. And this makes a Forty. fecond Species.

If the two greater Roots are equal, and the Third of the same Sign with them, then the Con-

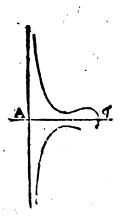

Fig. 49.

choidal Hyperbola, will have a Conjugate Point at its Convexity. Which is a Fortythird Species. If two of the Roots are equal, and the Third have a contrary Sign; the Conchoidal Hyperbola will then have a Conjugate Point at its Concavity. Which makes a Forty fourth Species.

If two of the Roots are impossible, there will be a pure Conchoidal without either Oval, Node,

Fig. 48.

Cusp, or Conjugate Point. And this is a Forty fifth Species. (See Fig. 49.)

Seven Parabolick Hyperbola's, baving no Diameter.

21. If in the first Case of the Equations, the Term a x^3 be wanting, but the b b x be not wanting; then the Figure will be a Parabolick Hyperbola, having two Hyperbolick Legs to one Assumption of the Sign. If the Term a be not wanting, the Figure will have no Diameter; but if it be wanting, it will have one only: In the former Case the Species will be these.

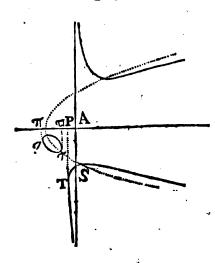

If the three Roots AP, $A\pi$, $A\pi$, of this Equation $bx^3 + cx^2 + dx + \frac{ee}{4} = 0$, be unequal, and have the same Sign, the Figure will confist of an Oval, and of two other Curves, which

·Ł

are partly Hyperbolical, and partly Parabolical; that is, the Parabolick Legs, by being continually

CUU

Fig. 50.

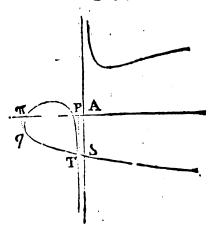

drawn out, are joined with the Hyperbolical Lege which are next to them. And this is the Forty first Species.

fixth Species.

If the two leffer Roots are equal, and the Third of the same Sign with them; then will the Oval,

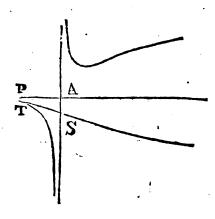

Fig. 51:

and one of those Hyperbola Parabolick Curves be joined, and intersect one another in the Form of a Node. Which is the Forty seventh Species.

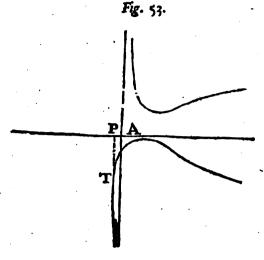

If the three Roots are equal, the Node will turn

Fig. 52.

into a Cusp. Which makes a Forty eighth Species.

If the two greatest Roots are equal, and the Third hath the same Sign with them, the Oval

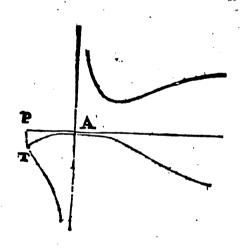

will vanish into a Conjugate Point. Which is the

Forty ninth Species.

If two of the Roots are impossible, the two
Hyperbola Parabolick Curves will remain pure, (See Fig. 53.)

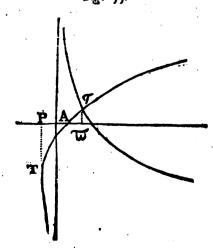

without any Oval, Decussation, Cusp, or Conjugate Point. And this will make a Fiftieth Species.

If two of the Roots be equal, and the Third

have a contrary Sign to them, then the Hyperbola

Fig. 55.

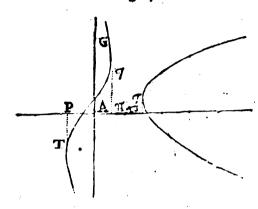

Yol. IÌ.

Parabolick Curves will be joined, decussaring one another in the Form of a Cross. And this is the

Fifty first Species.

If the two Roots are unequal, and of the same Sign, and the Third have a contrary Sign, the Figure will become an Angineal Hyperbola about the

Fig. 56.

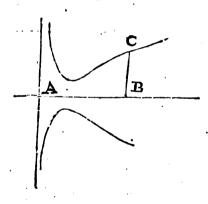

Assymptote AG, together with a Conjugate Parabola. And this will be a Fifty second Species.

Four Parabolick Hyperbola's which have a Diameter.

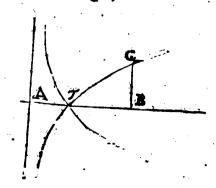

22. In the other Case, where the Term øy is wanting, and the Figure hath a Diameter, if the two Roots of this Equation bxx + cx + d = 0

Fig. 57.,

are impossible, there will be two Hyperbola Parabolick Figures equally distant from the Diameter AB, and one on one Side, and the other on the other, which will constitute a Fifty third Species. If the two Roots of this Equation be impossible, the Hyperbola Parabolick Figures will join, and

Fig. 58.

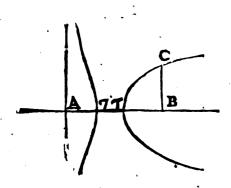

Bb 2

in milest

intersect one another in the Form of a Cross. And this will be a Fifty fourth Species.

If the Roots are equal, and have the same Sign, there will be a Conchoidal Hyperbola with a Para-

Fig. 59.

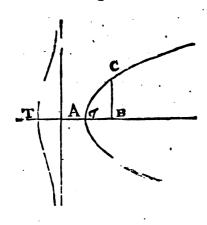

bola on the same Side of the Assymptote. And

this makes a Fifty fifth Species.

If the Roots have contrary Signs, there will be a Conchoidal Hyperbola on one Side of the Assymp-

Fig. 60.

tote, and a Parabola on the other. And this makes 2 Fifty sixth Species.

Four Hyperbolisms of the Hyperbola.

23. Whenever in the first Case of the Equations, the Term axi and bxx are both wanting, the Figure will be a Hyperbolism of some Conick

Section I call that the Hyperbolism of a Figure, when the Ordinate comes out by dividing the Rectangle under the Ordinate of that Figure and a given Right Line, by the common Abscissa. By this means a Right Line is changed into a Conick Section, and every Conick Section into some one of those Figures which I here call the Hyperbolisms of the Conick Sections. For the Equation for the Figure, of which we now speak, viz. x yy + ey = cx + d, gives the Ordinate $y = e + \sqrt{ee + 4dx + 4cxx}$; which is gene-

rated by dividing the Rectangle under the Ord. of the Conick Section, $\frac{e \times \sqrt{ee + dx + 4c \times x}}{}$

and a given Right Line m, by the common Abseissa x. Whence it is plain, that the Figure pro-

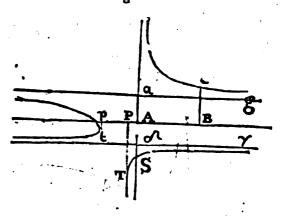

duced will be the Hyperbolism of an Hyperbola, Ellipsis or Parabola, according as the Term c x is Affirmative or Negative, or quite wanting.

The Hyperbolism of an Hyperbola hath three Assymptotes, of which one is the first and principal Ordinate A d, the other two are Parallels to the Abscissa AB, and equidistant from it on each Side

In the principal Ordinate A d, take A d, A s equal both ways to the Quantity $\checkmark : c$; and thro' the Point d and s, draw dg, s as Assymptotes, parallel to the Abscissa A B.

When the Term e_j is not wanting, the Figure hath no Diameter. In this Case, if AP and Ap, the two Roots of the Equation $c \times x + d \times z$ $+\frac{e e}{l} = 0$, are real and unequal (for equal they cannot be, unless the Figure be a Conick Section;) then will the Figure consist of three Hyperbola's opposite to one another; of which, one lies be-

Fig. 61.

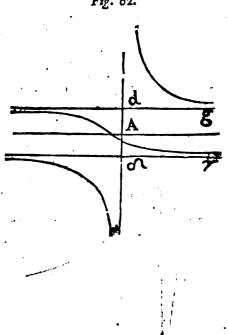

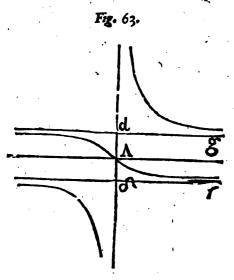

tween the parallel Assymptotes, and the other two without them. And this is a Fifty fenenth Species.

If the two Roots are impossible, there will be

two opposite Hyperbola's without the parallel Asspmptotes, and an Hyperbolical Anguineal within them. This Figure is of two Species; for it hath

Fig. 62.

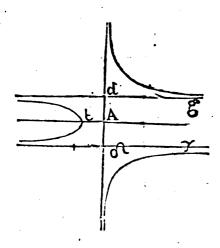

no Centre when the Term d is not wanting, but if d be wanting, the Point A is its Centre. The former of these makes a Pifty eighth, the latter a Fifty ninth Species.

Fifty ninth Species.

But if the Term ey is wanting, the Figure will confift of three opposite Hyperbola's, of which one will lie between the parallel Assymptotes, and

Fig. 64.

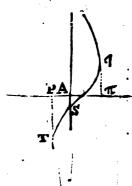

the other two without, as in the 54th Species: And besides this, it will have a Diameter, which is the Absciss A B. And this constitutes a Sixtieth Species.

Three Hyperbolisms of the Ellipse.

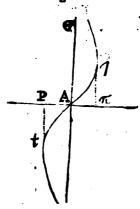

24. The Hyperbolism of an Ellipsis is determined by this Equation xyy + ey = cx + d; and hath only one Assymptote, which is the principal Ordinate Ad. If the Term ey be not wanting, the Figure will be an Anguineal Hyperbola without any Diameter, and even without any Centre, if the Term d be not wanting. Which makes the Sixty first Species.

But if the Term d be wanting, the Figure will have a Centre without any Diameter, which will

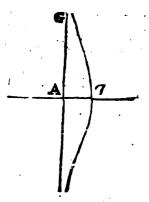

Fig. 66.

be the Point A. And this makes a Sixty Second Species.

And if the Term ey be wanting, and not id, the Figure will be a Conchoidal Hyperbola to the

Fig. 67.

Affymptote AG, and will have a Diameter without any Centre, that is, the Abscissa AB. Which makes a Sixty third Species.

Two Hyperbolisms of the Parabola.

25. The Hyperbolism of a Parabola is determined by this Equation xyy + ey = d; and hath two Assymptotes, the Abscissa AB, and the first and principal Ordinate AG. But the Hyperbola's in this Figure are two, not lying in the opposite Angles of the Assymptote, but in the contiguous or adjoining ones, and that on each Side the Abscissa

Fig. 68.

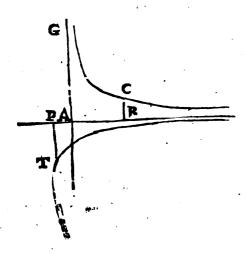

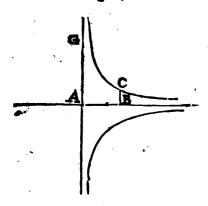

Fig. 69.

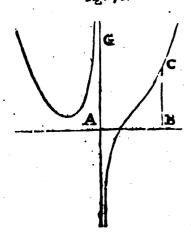

A B; and even without any Diameter, if the Term s y be there, but with one if that be wanting. Which two Species are the Sixty fourth and Sixty fifth.

A Trident.

26 In the fecond Case of the Equation there is $xy = ax^3 + bx + cx + d$: And the Figure in this Case will have four infinite Legs, of which

Fig. 76.

two are Hyperbola's about the Assymptote A G tending towards contrary Parts, and two converging Parabola's, and, with the former, making as

it were the Figure of a Trident. And this Figure is that Parabola by which Des Cartes constructed Equations of fix Dimensions. This therefore is the Sixty sixth Species.

· Five Diverging Parabola's.

27. In the third Case the Equation was $yy = ax^3 + bx + cx + d$; and designs a Parabola, whose Legs diverge from one another, and run our infinitely contrary ways. The Abscissa A B is its Diameter, and its five Species are these:

If, of the Equation $ax^3 + bxx + cx + d$ = 0, all the Roots $A\tau$, AT, At, are real and unequal; . en the Figure is a diverging Parabola

Fig. 70.

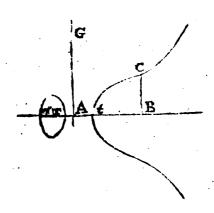

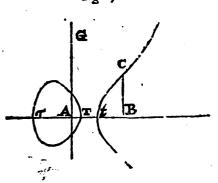

Fig. 71.

of the Form of a Bell, with an Oval as its Vertex. And this makes a Sixty seventh Species.

If two of the Roots are equal, a Parabola will be formed, either Nodated by touching an Oval,

Fig. 72.

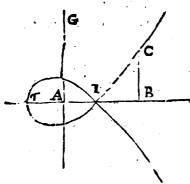

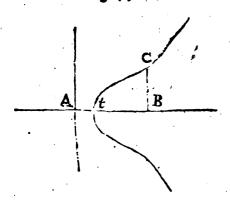

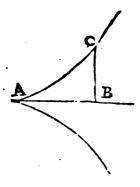

Fig. 73.

or Punctate, by having the Oval infinitely finall. Which two Species are the Sisty eighth and Sixty ninth.

If three of the Roots are equal, the Parabola will be Guspidate at the Vertex. And this is the

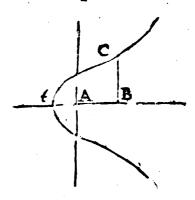

Fig. 75.

Neilian Parabola, commonly called Semi-cubical. Which makes the Seventieth Species.

If two of the Roots are impossible, there will (See Fig. 73.)

Fig. 76.

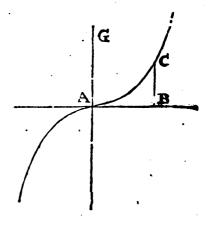

be a pute Patabola of a Bell-like Form. And this makes the Seventy first Species.

The Cubical Parabola.

28. In the fourth Case, let the Equation be y = ax + bx + cx + d; then will it denote

Fig. 77:

the Cubical Parabola with contrary turn'd Legs. And this makes up, or completes the Number of the Species of these Curves, to be in all Seventy two.

Of the Genesis of Curves by Shadows.

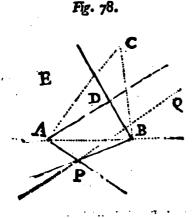

29. If the Shadows of Figures are projected on an infinite Plane illuminated from a lucid Point, the Shadows of the Conick Sections will always be Conick Sections; those of the Curves of the Second Gender, will always be Curves of the Second Gender; and the Shadows of Curves of the Third Gender, will themselves be of the same Gender, and so on in infinitum. And as a Circle, by the Projection of its Shade, generates all the Conick Sections; so will the five diverging Parabola's spoken of in ch. 28. by their Shadows generate and exhibit all Curves of the Second Gender; and so some more simple curves of other Genders may be found, which, by the Projection of their Shadows from a lucid Point upon a Plane, shall form all other Curves of the same Kinds.

Of the double Points of Curves.

30. I said above, that Curves of the Second Gender might be cut by a Right Line in three Points; but two of those Points are sometimes coincident. As when the Right Line passes by an Oval infinitely small, or by the Concourse of two Parts of a Curve mutually interfecting each other, or running together into a Cuspis. And if at any time all the Right Lines tending the same way with the infinite Leg of any Curve, docut it in one only Point, (as happens in the Ordinate of the Cartesian, and in the Cubical Parabola, and in the Right Lines which are parallel to the Abscissa of the Hyperbolisms of Hyperbola's and Parabola's;) then you are to conceive that those Right Lines pass through two other Points of the Curve (as I may say) placed at an infinite Distance; and these two co-incident Intersections, whether they be at a finite or an infinite Distance, I call the double Point. And such Curves as have this double Point, may be described by the following Theoremś.

Theorems for the Organical Description of Curves.

31. Theor. I. If two Angles, as P A D and PBD, whose Magnitude is given, be turned round the Foles A and B, given also in Position; and their Legs AP, BP, by their Point of Concourse

P, describe a Conick Section passing thro' their Poles A and B; except when that Right Line happens to pass through either of the Poles A or B; or when the Angles BAD and ABD vanish together into nothing; for in such Cases the Point will describe a Right Line.

II. If the first Legs AP, BP, by their Point of Concourse P, do describe a Conick Section pasfing through the Pole A; then will the two other Legs AD, BD, by their Point of Concourse D, describe a Curve of the Second Gender, passing through the other Pole B, and having a double Point in the first Pole A, through which the Conick Sections, except when the Angles B AD, ABD, vanish both away together; for then the Point D will describe another Conick Section passing through the Pole A.

III. But if the Conick Section which the Point P describes, pass through neither the Pole A, nor B; then the Point D will describe a Curve of the Second or Third Gender, having a double Point;

and that double Point will be in the Concourse of the describent Legs AD and B D, when the Angles B A P, AB P vanish together: And the Curve described, will be one of the Second Gender, if the Angles B AD, AB D vanish together, otherwise 'twill be one of the Third Kind, and then it will have two other double Points in the Poles A and B.

The Description of the Conick Section by five given Points.

22. A Conick Section is determined by having five of its Points given; and may be thus described by them: Let the five Points be A, B, C, D, and E; join any three of them together, as suppose A, B and C, and form the Triangle ABC, and suppose any two of its Angles, as CAB and CBA, to revolve round their Vertices A and B; and when C, the Intersection of the Legs AC, BC, is successively applied to the other two Points D, E, let the Intersection of the other Legs AB and BA, fall in the Point P and Q. Let also the Line PQ be drawn, and infinitely produced; and let the moveable Angles be for turned round, that the Interaction of the Legs AP and BP, may describe the Right Line PQ: And then will the Intersection of the two other Legs, C, describe the proposed Conick Section, by Theor. I.

The Description of Curves of the Second Gender baving a double Point, by Jeven given Points.

33. All Curves of the Second Gender which have a double Point, are determined from their feven given Points, of which one is that double Point. And by means of those Points they may be thus described: Let there be given any seven Points of the Curve to be described, as A, B, C, D, E, F, and G, of which A is the double Point. Join A with any two other Points, as suppose B and C; and then let both the Angles C AB, and also either of the other two Angles of the Triangle ABC (as the Angle ABC) revolve round the two Vertexes A and B. And when the Point of Concourse C, of the Legs AC, BC, is successively applied to the four remaining Points D, E, E, and C, let the Concourse C. D, E, F, and G; let the Concourse of the two other Legs A B and B A, fall in the four Points P, Q, R, S. Through these four Points, and the fifth Point A, describe a Conick Section; and let the aforesaid A poles C A B and C B. A G results the aforesaid Angles C A B and C B A, so revolve, that the Point of Concourse of the Legs A P, P B, may describe that Conick Section: Then shall the Point of Concourse of the other Legs A C, B C, describe the Curve proposed, by Theor.

If instead of the Point C, the Right Line B C be given in Position, and which shall touch the Curve to be described in B; then the Lines AD, AP, will be coincident; and instead of the Angle D AP, there will be a Right Line revolving round the Pole A.

If the donble Point A be infinitely distant, the Right Line will perpetually tend with a Direction towards that Point, and will be carried with a parallel Motion, while the Angle ABC revolves about the Pole B.

These Curves may also be described after another manner, by the Third Theorem; but 'tis enough to shew you the most simple way of their Description.

After

After the same Method may Curves of the Third, Fourth, and yet higher Genders, be describ'd; not at all indeed, but such as by some commodious Ratio may be describ'd by local Motion: For how commodiously, to describe some Curves of the Second or higher Genders, when they have no Common Point, is a Problem that must be reckoned amongst the more difficult ones.

The Construction of Equations by the Description of Curves.

The Use of Curves in Geometry u, that by their Intersections Problems may be solved. Let an Equation be proposed to be constructed having Nine Dimensions, as $x^9 + b x^7 + c x^6 + d x^5 + c x^4 + f x^5 + g x x + b x + k = 0$; where b, c, +m d, &c. signify any given or known Co-efficients, adsected with the Signs + and -. Let an Equation to a Cubical Parabola $x^3 = y$ be assumed:

adjected with the Signs + and -. Let an Equation to a Cubical Parabola $x^3 = y$ be affumed: Then will the former Equation, putting y for x^3 , fland thus, $y^3 + b xyy + cyy + dxxy + cxy + my + fx^3 + gxx + bx + k = 0$, be an Equation to another Curve of the Second Gender, where m or f may either be wanting or affum'd at pleasure. And by the Descriptions of these Curves and their Intersections, there will be found the Roots of the Equation at first given to be confiructed.

Note, 'Tis enough to describe the Cubical Parabola once.

It the Equation to be constructed, by reason of the two last Terms h x and k being wanting, is depressed to seven Dimensions; the other Curve, by expunging m, will have a Double Point in the Beginning of the Abscissa, and therefore may easily be described as above.

If the Equation to be conftructed hath the three last Terms $g \times x + h \times + k$ wanting, and therefore is but of fix Dimensions, the other Curve, expunging f, will become a Conick-Section.

And if the fix last Terms being wanting, the Curve be reduced to three Dimensions, its Construction will fall in with Dr. Wallin's, by the Cubical Parabola and a Right Line.

Equations may also be constructed by the Hyperbolism of a Parabola with a Diameter. Suppose this Equation of nine Dimensions, and wanting its last Term save one, were to be constructed, a + $c \times x + d \times^3 + e \times^4 + f \times^5 + g \times^6 + b \times^7 +$

 $kx^2 + lx^9 = 0$. Let there be an Equation affumed to that Hyperbolium; thus, xxy = 1;

and substituting y for $\frac{1}{x}$ the Equation to be

conftructed will be changed into this Form, $ay^3 + cyy + dxyy + cy + fxy + mxxy + g + bx + kxx + lx^4 = 0$, which denotes a Curve of the fecond Gender, by whose Description the Problem may be solved, and of the Quantities m and g, either may be wanting or assumed at pleasure.

at pleasure.

By the Cubical Parabola and Curves of the Third Genders, all Equations may be constructed not exceeding twelve Dimensions; and by the same Parabola, and a Curve of the Fourth Gender, all Equations not exceeding fisteen Dimensions, and to on infinitely. And these Curves of the third, fourth, and superior Genders, may al-Vol. II.

ways be describ'd by finding their Points by plain Geometry.

As if this Equation were to be conftructed, $x^{x^2} + a x^{10} + b x^9 + c x^8 + d x^7 + e x^6 + f x^5 + g x^4 + b x^3 + i x x + k x + l = 0$, and the Cubical Parabola be supposed to be described; let the Equation for that Cubical Parabola be $x = y^3$: Wherefore substituting y for x^2 , the Equation will put on this Form,

$$y^{4} + ayy^{3} + cxxy + fxxy + ixx = 0$$

+ $b + dx + gx + kx$
+ $e + b + l$

Which is an Equation to a Curve of the Third Gender, by whose Description the Problem may be solved. And this Curve may be described by finding its Points by plain Geometry, because the indeterminate Quantities relate not to above Two Dimensions.

In the Memoires of the French Academy of Sciences for the Year 1699, there is a Method for finding the Curves, which Bodies rifing towards, or alcending from the Horizon, will describe, let the Ratio of the Time of the Descent or the Ascent, and the Acceleration or Retardation be what it will. Communicated by Mr. Varignon.

CUSPIDATED Hyperbola, is a kind of Hyperbola whose Two Parts concur and terminate in the Angle of Contact.

CUSTUMARIUS, was an inferior Tenant in Soccage or Villenage, who, by Custom, is obliged to pay such and such Service of Work and Labour for his Lord. Dr. Kennet.

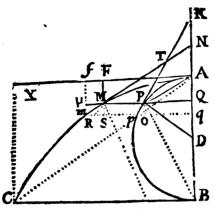

CUTTER of the Tallies, is an Officer in the Exchequer, that provideth Wood for the Tallies, and cuts the Sum paid upon them, and then casteth the same into the Court to be written upon.

CYCLOID. Besides the Segment of the Semicycloidal Space, first found quadrable by Sir Christopher Wren, and afterwards by Mr. Huygens, and also the Trilinear Part of it, which is plainly so; Dr. Wallis, in Phil. Tranf. N. 217. P. 111. produces, from his Tracts de Cycloide and de Morn, some other Portions of the Cycloid which are capable of being squared. And the same Excellent Author, in N. 229. P. 561. shews, That this Figure of the Cycloid was confidered long before the Time of Mersennus and Gallileo, tho' not throughly understood 'till this present Age: For in the Math. Works of Bovillus, publish'd at several times between 1501. and 1510. the Curve which we now call the Cycloid, was then confider'd; and yet not first by Bovillus neither, for Cardinal Cusanus, as appears by an Antient Manuscript of his Works, transla ed by J. Scoblant in the Year 1451. 'had taken it into Consideration besore. Indeed the Figure, both in the Manuscript, and in the Basil Edition of his Works, is ill drawn; but being correcled by the Cardinal's own Words, it plainly represents the Modern Cycloid.

In Philef. Trans. N. 94. you have a Demonstration of the Synchronism of the Vibrations made in a Cycloid; that is, of a Pendulum of a due Length, vibrating between Two Cycloids: For such a Pendulum will move in a Cycloid, and consequently its Vibrations will be Synchronal.

To investigate the Area's of Cycloidal Spaces.

Let A M C be a Vulgar Semi-cycloid, and the Generating Circle A P B from any Point in the Ordinate, v. g. Q. Draw Q M parallel to the Base B C, cutting the Periphery of the Circle in

P; make the Parallelogram A F M Q, and draw f m infinitely near F M, cutting Q M produc'd in μ , and the Curve in m. Put A B := 2 r, A Q = F M = x, $\mu m = x$, Q P = r; then (by the Property of the Circle) 2 r x - x x = r.

Whence
$$r \times - \times x = jj$$
, and $j = \frac{r \times - \times x}{j}$

And because the Triangles $DP \mathcal{Q}$, pPO are similar, therefore PQ(r): Dp(r)::PO(x)

 $P p = \frac{r \dot{x}}{r}$. Now it is the Nature of the Vulgar

Cycloid, that the Arch AP + the Right Sine of that Arch P are equal to $\mathcal{D}M$: Therefore it is manifest, that the Fluxion of the Ordinate of the Cycloid $\mathcal{D}M$, viz. MS, is equal to the Aggregate of the Fluxions of the Arch AP, and the Right Sine P \mathcal{D} ; that is, mS = Pp +

$$p_0 = \frac{r\dot{x} - x\dot{x}}{y} + \frac{r\dot{x}}{y} = \frac{2r\dot{x} - x\dot{x}}{\sqrt{rx - x}}, \text{ and}$$

consequently the Rectangle $F\mu$ is equal to $FM \times$

consequently the Received
$$= \frac{2r \times x - x \times x}{\sqrt{2r \times - x \times x}} = \frac{2r \times x - x \times x}{\sqrt{2r \times - x \times x}}$$

 $x\sqrt{2rx-xx}$ to the Fluxion of the Area AMF. But the Fluxion of the Portion of the Circle $APQ=x\sqrt{2rx-xx}$; therefore the Area AMF and the corresponding Portion of the Circle APQ are always equal.

CONSECTARY I.

The Parallelogram AC is equal to the Semi-periphery $APB \times AB =$ Four times the Semi-circle APBA, and the Complement of the Cycloidal Space AMCB to the Parallelogram, viz. AMCX is equal to the Semi-circle APBA; therefore the Area of the Semi-cycloidal Space AMCB, is equal to three times the Area of the Semi-circle APBA.

CONSECTART II.

The Cycloidal Space AMCB, is to the Circumscrib'd Parallelogram AC, 25 3 is to 4.

CONSECTARY III.

The Space comprehended between the Chord AC, and the Curve AMC, is equal to the Area of the Semi-circle APB. For AMCB is equal to $\frac{1}{2}$ Parallelogram AC, and the Triangle ACB is equal to $\frac{1}{4}$ Parallelogram AC; therefore the Space AMCA is equal to $\frac{1}{4}$ Parallelogram AC, which is equal to the Area of the Semi-circle APB, and the Space AMCA is equal to the

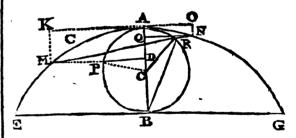

CONSECTART IV.

Though the Quadrature of the whole Cycloidal Space, or any indefinite Portion thereof, depends on the Quadrature of the Circle; yet an infinite Number of Segments of the Vulgar Cycloid, may be squard without supposing the same.

Let E A G be a Vulgar Cycloid, the Bale E G, and A B the Axis, and the generating Circle A P B. I say, if the Point 2 be taken at pleasure in the Axis A B, and if C D be taken equal to A 2 and the Ordinates D M, 2 N, and the Line M N connecting their Extremities be drawn, the Segment of the Cycloid M E N M = Rectangle Triangle P B D + Rectangle Triangle R B 2.

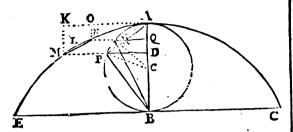

Draw O A X parallel to the Base, and N Q, M K parallel to the Axis AB, and draw the Radij C P, C R.

First, If the Ordinates D M 2 N be on the contrary Sides of the Axis A B, then the Segment Me M N is equal to the Trapezium MKON — Trilineal Figures A K M and A O N. Now

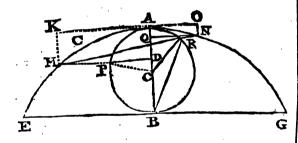

the Trapezium M K O N is $= \frac{1}{2} M K + \frac{1}{2} N O \times KO = (because NO is = A 2 = C D, and <math>KM = AD) \frac{1}{2} CA \times K O = \frac{1}{2} CA \times A K + \frac{1}{4} CA \times AO$. And by the Property of the Cycloid, $\frac{1}{2} AC \times A K$ is $= \frac{1}{2} CA \times A \text{ch} AP + PD$ = Sector ACP + Triangle BCP = Sector ABP. In like manner it may be demonstrated, that $\frac{1}{2} CA \times AO$ is = Sector ABR; therefore the Trapezium MKON is equal to Two Sectors PBA = RBA. But, by the known Property of the Cycloid, the Trilineal Figure AKM is equal to the Segment of the Circle ADP, and the Trilineal Figure AON is equal to the Segment ADP, and the Trilineal Figures AKM, AON be subtracted, and if from the Sectors ADP, ADN be subtracted, and if from the Sectors ADP, ADR be subtracted, there will remain the Segment of the Cycloid ADR be subtracted, there will remain the Segment of the Cycloid ADR be subtracted, there will remain the Segment of the Cycloid ADR be subtracted, there will remain the Segment of the Cycloid ADR be subtracted, there will remain the Segment of the Cycloid ADR be subtracted, there will remain the Segment of the Cycloid ADR be subtracted, there will remain the Segment of the Cycloid ADR be secondly,

Secondly, But if the Ordinates QN, DM be on the same Side of the Axis AB, then the Segment of the Cycloid Me NM = Trapezium MKON+ Trilineal Figure AON - Trilineat Figure AKM. Now the Trapezium MKON $= \frac{1}{2} M K + \frac{1}{2} O N \times O K = \frac{1}{2} C A \times A K - \frac{1}{2} C A \times A O = \text{Sector } P B A - \text{Sector } R B A$

therefore if we substitute the Circular Segments ADP, AQR in the place of the Trilineal Spaces AKM, AON, we shall have the Cycloidal Segment MeNM := Sector PBA - Sector RBA + Segment <math>AQR - Segment ADP := Rectangle Triangle <math>PDB - Rectangle Triangle PBRO

5. If the Points D and Q coincide, then it is manifest that BD or $BQ = \frac{\pi}{4}BC$, and the Chord MN is perpendicular to the Axis AB, and the Segment Me ANM will be equal to

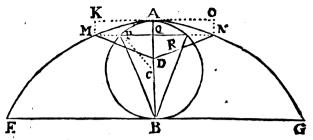

an Equilateral Triangle inscrib'd in the Generating Circle, and Space MPBAM will be equal to three times the Area of the Triangle CP B. Which was first discover'd by the Excellent Mr. Hugens.

6. But if the Point D fall in the Center, then Q will be in A, and the Segment Me N M will degenerate into that which the Celebrated Mr. Leibnitz first squar'd, without having Recourse to the Area of the Circle. And the laid Segment MeNM will be equal to the Rectangular Triangle P B D = 1 the Square of the Radius.

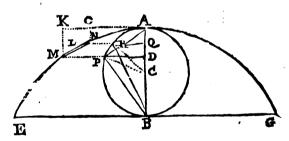

7. And to square an infinite Number of Sectors of the Cycloid: Assume any Point, Q, in the Axis AB; and draw the Ordinate MQN, and take CD = AQ; and draw the Lines DM, DN: Then, I say, the Sector of the Cycloid DMAND is equal to the Isosceles Triangle PBR. For the Sector of the Cycloid DMAD is equal to the Trapezium DMKAD—Trilineal Figure AKM. But the Trapezium DMKA is===DQ+AQ×AK==AC×AK= $\frac{\pi}{4}$ AC × Arch AP+PQ=to the Sector PBA,

Segment APQ; therefore the Sector of the Cyloid DMAD is equal to the Triangle

PBQ; and consequently the Sector of the Cycloid DMAND is equal to the Isosceles Triangle B P R.

8. And as we have thus squar'd an infinite Number of Cycloidal Segments and Sectors, so an infinite Number of Cycloidal Zones, (viz. Spaces comprehended between the Portion of the Curve MN, the Portion of the Axis QD, and the Ordinates QN, DM) may be squar'd from the same Principles: For if we consider that the External Space AKM is equal to the Segment of the Circle A P D, and that A P = MP, we may find the Value of any Cycloidal Space in Rectilineal Figures and Circular Segments; and therefore if it be requir'd that the said Cycloidal Space shou'd be squarable, it is plain that those Terms which confift of circular Segments, must destroy one another, and consequently be put =0; from which Supposition the Quantities which were assum'd at first may easily be determin'd. Ex. gr. Let it be requir'd to determine the Right Lines CQ, CD in the Axis AC, so that the Cycloidal Zone DMNQ be squarable. Suppose AC = a, CQ = x, CD = z, QR = p, DP = q, AR or NR = u, AP or MP = e; then the Sector A C R = 1 au, and the Sector A C P

 $=\frac{1}{2}ac$, and consequently the Segment A Q R, or the Figure AON, is $=ACR-CQR=\frac{1}{2}au-\frac{\pi}{2}px$; and the Segment ADP, or the Figure AKM, is $=ACP-CPD=\frac{\pi}{2}ac$ $\frac{1}{2}qz$. But the Cycloidal Segment A Q N is = QO - AON = QO - AQR = AQX $QR + RN - AQR = AQ \times QR + AR AQR = a - x \times p + u - \frac{1}{2}au + \frac{7}{2}px = ap - \frac{7}{2}px + \frac{1}{2}au - xu.$ And in like manner the other Segment ADM

 $= aq - \frac{1}{2}q \chi + \frac{1}{2}ac - \chi c.$ And consequently the Zone DMNQ = ADM

 $- AQN is = aq - \frac{1}{2}qz - ap + \frac{1}{2}px + \frac{1}{2}ac - zc - \frac{1}{2}au + xu.$ Whence it appears, that the Four first Members consist of Recilineal Figures only, and that

and the Trilineal Figure A K M is equal to the the other Terms affected with u and c, hinder the Vol. II.

Zone from being squarable. Whence it is evident, that if we suppose the Terms affected with u and c mutually to destroy one another, then the Cycloidal Zone DMNQ will be $= aq - \frac{1}{2}qz - ap + \frac{\pi}{2}px$. And the remaining Terms must be = 0, that is, $\frac{\pi}{2}ac - zc - \frac{\pi}{2}au + zc = 0$; and if we suppose the Ratio of c to u be given (they is as one Number is as constant.) be given (that is, as one Number is to another, that so one Arch being given, the other may be constructed Geometrically) we may destroy the Quantities c and u, and find the Relation between z and x. V. gr. If it be u: c:: I: 2, then the Equation $\frac{1}{2}ac - zc - \frac{1}{2}au + xu = 0$, becomes $a - 2z - \frac{1}{2}a + x = 0$; and consequently $z = \frac{a+2x}{4}$. And if u:c::1

:3, then $z = \frac{2a+2x}{6}$; or if it be u: c::

1: 4, then $z = \frac{3a + 2x}{8}$, &c. in the same

Progression. And to find the Value of z in other Terms; if we suppose $C \ Q$ the Sine Complement of the Arch AR to be given, then CD the Sine Complement of Double, Triple, Quadruple, &c. that Arch may be found by common Algebra. There-

fore if c be = 2 u, then $z = \frac{2 xx - 4a}{4}$; if c

$$= 3 u, \text{ then } \zeta = \frac{4 x^3 - 3 a a x}{a a}; \text{ or if } c =$$

4 u, then $z = \frac{8x^4 - 8aaxx + a^4}{a^4}$, &c. and comparing these Values of z with those formerly found, we may find the Value of x in any Sup-

position. V.g. If c be = 2 u, then $z = \frac{a+2x}{a}$

$$= \frac{2 \times x - a^a}{a}; \text{ and consequently } 8 \times x + 2 \times a \times a$$

$$= 5 \times a \text{. Whence } x \text{ is } = \frac{1}{2} \cdot a + \sqrt{\frac{1}{2} \cdot a \cdot a + \frac{1}{2} \cdot \frac{1}{2} \cdot a \cdot a}$$

= 5 a a. Whence x is = 1 a + 1 1 a a + 37 a a

 $= \frac{1}{8}a + \sqrt{\frac{21}{64}}aa = \frac{1}{8}a + \frac{1}{8}a\sqrt{41}.$ Hence it is manifest, that if CQ be taken = $\frac{1}{8}a + \frac{1}{8}a\sqrt{41}$. And if the Ordinate QN be applied to the Axis in the Point Q, and if the Arch RP be taken = AR, and the Ordinate MPD be drawn; then the Cycloidal Zone DMNQ will be $= aq - \frac{1}{2}q - ap + \frac{1}{2}px$ = the Recilineal Triangles $CAP + DAP - \frac{1}{2}q - \frac{1}{2}$ CAR-AQR.

And thus an infinite Numbers of Cycloidal Zones may be determin'd, which admit of a Quadrature, when the Proportion between the Arches AR, RP is express'd in given Numbers.

If the Curve Line A M D be a simple Semi-cycloid, whose Base BD is equal to the Semi-periphery of the Generating Circle BEA. Tis required to find the Value of the Ray of the Evoluta M C.

Suppose AP = x, PM = y, the Arch AE= n, and the Diameter AB = 2a; then, by the Property of the Circle, PE is $= \sqrt{2 ax - xx}$ and by the Property of the Cycl. y=u+\sqrt{24x-xx}; therefore $y = u + \frac{ax - xx}{\sqrt{2ax - xx}}$: But u equal

$$\frac{ax}{\sqrt{2ax-xx}}, \text{ therefore } y = \frac{2ax-xx}{\sqrt{2ax-xx}} = \frac{x}{x} \times \frac{2a-x}{\sqrt{2ax-xx}} = \frac{x}{\sqrt{x} \times \sqrt{2a-x}} = \frac{x}{\sqrt{x} \times \sqrt{x}} = \frac{x}{\sqrt{x} \times \sqrt{x}} = \frac{x}{\sqrt{x} \times \sqrt{x}} = \frac{x}{\sqrt{x} \times \sqrt{x}} = \frac{x}{\sqrt{x} \times \sqrt{x}} = \frac{x}{\sqrt{x} \times \sqrt{x}} = \frac{x}{\sqrt{x} \times \sqrt{x}} = \frac{x}{\sqrt{x} \times \sqrt{x}} = \frac{x}{\sqrt{x}} = \frac{x$$

(dividing by $\sqrt{2 a - x}$) $x \times \frac{\sqrt{2 a - x}}{x}$; whence $y = (\text{supposing } x \text{ invariable}) \frac{-a x^2 \sqrt{x}}{x x \sqrt{2a - x}} =$ $\frac{-ax^2}{x\sqrt{2ax-xx}}$; and substituting this Value in the General Theorem $\frac{x^2+y^2\sqrt{x^2+y^2}}{x^2+y^2}$, or $\frac{x^2+y^2|^{\frac{1}{2}}}{x}$ we shall have (because $y=x\sqrt{\frac{2a-x}{x}}$) $\frac{\frac{2 \cdot 4 \cdot x^{2}}{x}}{\frac{x}{x}} = \frac{\sqrt{\frac{8 \cdot a^{3} \cdot x^{6}}{x^{3}}}}{\frac{x^{3}}{x}} = \frac{\sqrt{\frac{8 \cdot a^{3} \cdot x^{6}}{x^{3}}} \times x \sqrt{2ax - xx}}{a \cdot x^{3}}$ $\frac{\sqrt{\frac{8 \ a^{3}}{x^{5}}} \times x \sqrt{2ax - x_{x}}}{\sqrt{\frac{16 \ a^{4} x^{5} - 8 \ a^{5} x^{4}}{x^{3}}} = \frac{\sqrt{\frac{16 \ a^{4} x^{5} - 8 \ a^{5} x^{4}}{x^{3}}}$ $2\sqrt{444-24x} = MC = (2\sqrt{EPq + PBq})$ = 2EB) = 2MG, because MC perpendicular to the Curve in the Point M is parallel to

the Chord B E. CONSECTARY L

If x be supposed = 0, then is $AN = 2\sqrt{4.44}$ = 4.4 = 10 the Ray of the Evoluta in the Vertex A; aud if we suppose x = 2 a, then MC $=2\sqrt{444-444}=0$; that is, the Ray of the Evoluta in D, is equal to nothing; and in A it is equal to twice the Diameter of the generating Circle; and hence 'tis evident, that the E-voluta begins in D and ends in N, so that B N is = B A.

CONSECTART II.

The Evoluta DCN is a Semi-cycloid equal to the given Semi-cycloid DMA: Compleat the Parallelogram BS, and on the Diameter DS describe the Semi-circle DIS, and draw DI parallel to MC parallel to EB; then is the Angle BDI = EBD, and consequently the Arches DI, BE are equal; but EB = MG = GC; therefore GC = DI, and if IC be drawn, it will be equal and parallel to DG. Now by the Nature of the Cycloid DG = Arch BB = Arch DI; therefore IC is = Arch DI, and consequently the Evoluta DCN is a Semi-cycloid, whose Base is SN = ½ the Periphery of the Generating Circle DIS; that is, the Evoluta is equal to the given Cycloid, and the same with it, only placed in a contrary Position.

CONSECTARY III.

The Length of the Curve of the Cycloid DCN is = 2 A B (= twice the Diameter of the Generating Circle) and any Portion of the Cycloid, as DC, is = 2 CG = 2 DI = twice the corresponding Chord in the Generating Circle.

Another Solution.

The Length of the Ray of the Evoluta MC may be determined without any Calculation,

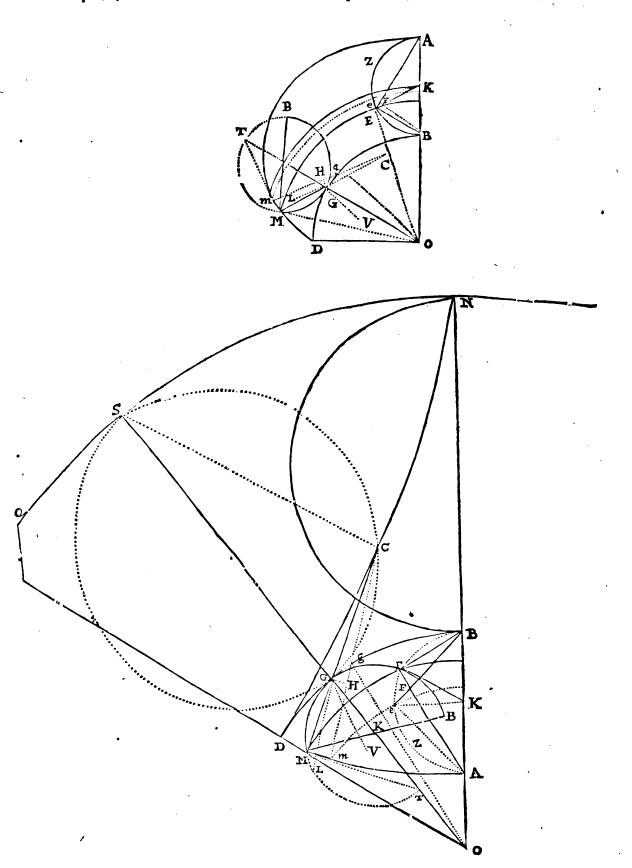

3

thus: Draw another Perpendicular, mC, infinitely near the former, and another Ordinate me parallel to ME, and another Chord Be; and on the Centers C and B describe the little Arches GH, EF; then the Rectangular Triangles GHg, EFe will be similar and equal; for Gg is Ee (because EFE or EFE and EFE and EFE and EFE or EFE or EFE and EFE and EFE and EFE and EFE and EFE and EFE and EFE and EFE and EFE and EFE are also equal; therefore the Radii EFE are also equal; therefore the Radii EFE are also equal, and consequently EFE are Evoluta EFE are evident, that the Ray of the Evoluta EFE is EFE are evident, that the Ray of the Evoluta EFE is EFE are twice the Choard EFE and EFE are also expressed as EFE.

CONSECTARY.

We have proved before, that the Area of the Cycloid is triple the Area of the Generating Circle: This Truth may be proved from other Principles, as thus; the Space MGgm, or the Trapezium MGHm (the Difference being incomparably little) is $=\frac{1}{2}\frac{Mm+\frac{1}{2}GH}\times MG$ $=\frac{1}{2}EF\times BE$; that is, the Trepezium MGgm is = three times the Sector EBF or EBe; therefore the Sum of all the Trapezia, $vi\chi$. the Cycloidal Space MGBA is equal to three times the Sum of all the Triangles, $vi\chi$. the Circular Space $BE\chi A$; and the whole Cycloidal Space AMDBA is = thrice the Area of the Semi-circle AEBA.

If the Curve AMD be a Semi-cyloid describ'd by the Revolution of the Semi-circle AEB, on the Periphery of another immovable Circle BDG. 's is requir'd to describe the Evoluta of the said Curve.

The Movable or Generating Circle may be supposed to move either on the Convex or Concave Side of the Periphery of the immovable cave Side of the Periphery of the immovable concess the Base BD in G, and the describing Point

Point A, is in M, in the Curve of the Cycloid; then, from the Genesis of the Curve, I inser,

1. The Arch GM is \Longrightarrow Arch GD, and the Arch GD of the movable Circle is equal to the Arch GB of the immovable Circle.

2. MG is perpendicular to the Curve A MD; for if we consider the Semi-circumference MGB, or AEB, and the Base BGD, as being compos'd of an infinite Number of little streight Lines, and every one is one, equal to the corresponding one in the other, 'twill be manifest, that the Semi-cycloid AMD is compos'd of an infinite Number of Circular Arches, which have for their Centers all the Points of Contact G successively, and are all describ'd by the same Point M.

3. If on O, the Center of the immovable Circle, the Concentrick Arch ME be described, then the Arches of the movable Circle, viz. MG, and EB will be equal, and also the Chords MG and EB, and the Angles OGM, OBE will be equal between themselves; for in the Triangles OKM, OKE, the three Sides of the one are equal to the three Sides of the other respectively; therefore the Angles MKO is EKO, and the Arch EE and the Chord EE and EE are EE and EE and EE are EE and EE and EE and EE are EE and EE are EE and EE and EE are EE and EE

Having drawn the Radii OG, Og, K, E, K, e, suppose OG or OB = b, KE = a, tis evident that the Angle EBe is = OBe - OBE (or OBE - OBe) = OGm - OGM (or OGM - OGm) = (having drawn GL, GV parallel to Cm, Og) LGM = OGV = GCH = GOg; therefore the Angle GCH is = Angle EBe + GOg. Now the Arches Gg, EE being equal, it is, GOg: EKe or 2EBF: KE (a): OG(b); and consequently the Angle GOg is $= \frac{2a}{b}EBF$, and GCH is = (EBF) + GOg $= \frac{b+2a}{b}EBF$; therefore GCH: EBF (:: AE: CG):: $\frac{b+2a}{b}$: I, and consequently the unknown Quantity CG is $= \frac{b}{b-2a}$ = BE: Which gives this

CONSTRUCTION.

Say, As $OA(b \pm 2a) : OA(b) : : BE$ or MG:GC; then the Point C will be in the Evoluta requir'd.

CONSECTARY I.

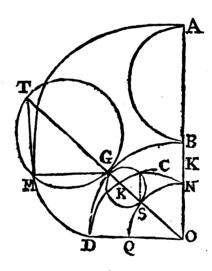

The Evoluta begins in the Point D, and touches the Base BGD in D; for the Chord GM (the Third Term in the Analogy) vanishes in that Point.

CONSECTART II.

The Evoluta D C N terminates in the Point N, so that then $O A : O B :: A B : B N :: O A <math>\pm A B (\pm O B) : O B + B N (= O N)$; that is, O A, O B, O N are continually proportional.

CONSECTARY III.

If the Arch of the Circle N S Q be described on the Center O, I say the Evoluta D C N may be describ'd by the Revolution of the movable Circle G C S (whose Diameter is G S = B N) about the immovable Circle N S Q; that is, the Evoluta D C N is a Semi-cycloid, similar to the given Semi-cycloid A M D (because the Diameter)

ters AB, B N of the movable Circles, are proportional to the Radii of the immovable Circles OB, ON; for AB:OB:BN:ON) and in an inverted Position, having its Vertex in D; for suppose the Diameters of the movable Circles to be in OT (drawn at pleasure from the Center O) it will pass through the Points of Contact S and G; then if we say, AB or TG:BN or GS:MG:GC, the Point C will be in the Evoluta, (by Construction) and in the Circumference of the Circle GCS (Prop. 31. Elem. 3. Prop. 6. Elem. 6.) because the Angle GMT being a Right Angle, the Angle GCS is also; and because MGT = CGS, therefore the Arch TM (GCC) GCC0 GCC1 GCC2 GCC3 is therefore the Arch GCC3 GCC3 GCC4 GCC5 GCC

CONSECTART IV.

Hence 'tis evident, that the Portion of the Curve of the Cycloid DC is = Right Line CM, and consequently that DC: Tang. GC::AB +BN:BN::OB+ON:ON; that is, the Sum (or Difference) of both Diameters (of the movable and immovable Circles) is to the Semi-diameter of the immovable Circle, as DC

And because it is AM: Tang. TM:: OA + OB: OB; therefore in the Vulgar Cycloid, AM: Tang. TM:: 2:1.

CONSECTARY V.

The Trapezium MGHm is $=\frac{1}{2}GH+\frac{1}{2}Mm$ $\times MG$; but CG ($=\frac{b}{b\pm2.4}MG$: CM($=\frac{2b\pm2.4}{b\pm2.4}MG$):: GH: $Mm=\frac{2b\pm2.4}{b}GH$; therefore (because) GH is =EF, and MG=EB) MGHm is $=\frac{3}{2}\frac{b\pm2.4}{b}\times EF\times EB$;

that is, the Trapezium MGHm: corresponding Triang. $EBF:: 3b \pm 2a:b$. And because the Proportion universally obtains, 'tis evident, that the Cycloidal Space MGBAM (See Fig. 2. in Page the last but one) (comprehended under the Right Lines MG, AB, the Base GB, and the Portion of the Curve AM) is to the corresponding Segment of the moveable Circle BEZAB, as $3b \pm 2a$ is to b; and the whole Cycloidal Space AMDBA is to the Area of the Semi-circle AEBA, as $3b \pm 2a$ is to b.

CONSECTARY VI.

If we imagine OB, the Radius of the immovable Circle, to become infinite, the Arch AGD will become a streight Line, and the Curve AMD will be the Vulgar Cycloid; and in this Case AB, the Diameter of the movable Circle, is = 0, in respect of that of the immoveable Circle: Whence, 1. because $b \pm 2a$ is = b, it is MG:GC:b:b:b; that is, MG is = GC, and consequently if BN be taken = AB, and NS be drawn parallel to BD, the Evoluta DCN will be generated by the Revolution of a Circle (on the Base NS) whose Diameter is = AN.

2. The Portion of the Cycloid AM, is to the corresponding Chord of the Circle AE:2b:b; this is evident from G. 4. of Hayes's Fluxions.

3. The Space MGBA is to the Segment BEZA C:3b:b; which is also evident from G. 5. of the same Book.

CONSECTARY VII.

The Length of the Semi-cycloidal Curve is proportional to the Rectangle B K O, if the Semi-diameter of the immovable Circle be the same. Let B A be the Diameter of one, and B A the Diameter of another movable Circle; and let O B be the Radius of the immoveable Circle common to both: Then, by §. 4.

OB: OA + OB:: AB: AMD;

And OB: Oa + OB :: aB: amd;

And by Proportion of OA + OB: Oa + OB: Equality and Div. BX AMD: AB × Amd

That is, 2 OK: 2 ok:: AB × AMD: AB × amd

Whence OK × AB: ok × AB:: AMD: Amd;

And dividing by 2, BKO: BkO:: AMD: amd.
Q. E. D.

CONSECTARY VIII.

Because the Arches GD, GM are always equal between themselves, it follows that the Angle DOG: Ang. GKM: GK: OG; therefore if the Point D (where the Cycloid begins) the Radii OG, GK, and the Point of Contact G be given, the Position of the Point M, which describes the Cycloid, is found by drawing the Ray KM; so that GK: GO:: DOG: GKM; and all the Points of the Curve AMD may be determin'd Geometrically, when the Proportion between the Radii OG, GK can be express'd in Numbers; and consequently, in that Case, this Cycloid is a Geometrical Curve, and the said Creloid is a Transcendent (or Mechanick) Curve, when the Relation of OG to OC cannot be express'd by any finite Number of Terms.

CONSECTARY IX.

If in Concentrick Spheres similar Cycloids be describ'd, their Perimeters will be proportional to the Semi-diameters of the said Spheres.

CONSECTARY X.

And because the Length of the Curve of the Cycloid AMD is proportional to the Rectangle BKO, 'tis plain, that in Vulgar Cycloids the Curve is proportional to the Diameter of the Generating Circle.

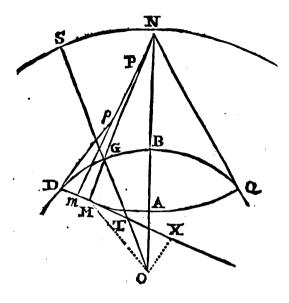

SCHOLIUM.

By help of such Principles as these, the Great Sir Isaac Newton has advanced several wonderful Conclusions concerning the more exast measuring of Time by Pendulums: As for Instance,

- 1. If within the Globe BGD the Cycloid DAQ be described, being bisected in A, and terminating in the Surface of the Globe in D and Q, and if OA be produced (bisecting DQ in B) unto N, so that OA, OB, ON := and the Globe NS be described on the Center O, and the Semicycloids ND, NQ be described within the said Globe; then a Periodulum suspended to the Point N, and equal to NA, will vibrate in the Cycloid DAQ, the same being described by the Evolution of the Cycloidal Checks ND, NQ. And thus a Pendulum may be made to vibrate in any such given Cycloid.
- 2. If the said Pendulum vibrate in the Cycloid DAQ by the sole Force of its own Gravity, and if the Force of Gravity in every Point of the Curve DAD be as its Distance from the Center O, then the Vibrations (equal or unequal) of the Pendulum, will be performed in equal times.

Let MT touch the Cycloid in M, and draw O X perpendicular to MX; then, because the Force

Force of Gravity is as O M, it may be resolved into the Parts O X, M X. Now tis evident, that the Force O X, being parallel to the Thread P M, has no other Effect but to diftend the same, and is

totally destroyed by its Resistance; therefore the Force MX only accelerates the Motion of the Pendulum M in the Cycloid, and the Acceleration of she Pendulum in the Cycloid is always proportional to this Accelerating Porce. Now the Triangles OXT, MGT are similar, and OT and GT are invariable Quantities; therefore MX is always proportional to MT, and MT is proportional to the Curve of the Cycloid MA: Therefore if two Pendulums NPM, NPm be demitted from M, m at the same Instant of Time, they they will be accelerated in proportion to the Arches M A, m A, they have to describe; and consequently the Portion of the Curve which they describe in the Beginning of their Motion, will be proportional to the Arches MA, mA; and the Portions yet to be described, or the accelerating Forces, will be proportional to the said Arches M A, m A. Whence its manifest, that the Portions to be describ'd, being always in the same Proportion of MA to mA, must vanish at the same time; that is, the Pendulums demitted from M, m, at the same Instant of Time, and descending in the Curve MA, mA, by the Force of their own Gravity, will arrive in the Point A together. And again, If we suppose the Pendules to ascend from Atowards 2, with the Velocities which they have acquir'd m A, they will then be retarded every where, whereby the same Forces which accelerated their Motions before, and consequently the Velocities of the Pendulum's ascending and descending in the same Arches, will be the same, and the Arches themselves will be describ'd in the same time; whence it appears, that the whole Vibrations, as well as the Semi-vibrations, will always be scochronal.

And if O, the Center of Attraction, be suppoled at an infinite Distance from B, then the Curve DA 2 (in which the Pendulum vibrates) will be a Vulgar Cycloid, and the Force of Grawill be a valgar Cycloid, and the Force of Gravity will always be the same in all Places of the Curve. And the Vibrations in this also will be Rochronal, for DB \mathcal{Q} will become a streight Line, and GT and MO will be parallel to BA; whence, if MO be a determinate Quantity, and Vol. II.

OG g, their Sum will be equal to two Right Angles) = GKg + GOg.

Now if we suppose OG = b, KG = a, GM, or Gm = r, and GI or Ig = q, then it will be, i. OG : GK :: GKg : GOg, and OG(b) : OG + GK(= OK = a + b) :: GKg : OG + GK = a + b)

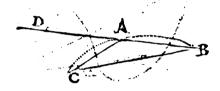

represent the Force of Gravity, then M X, or MT, or MA, will represent the accelerating Force in the Cycloid, &c. Ergo,

The same Excellent Person has enrich'd this Theo. ry with many more sublime Discoveries, which, for Brevity's sake, I omit; this being sufficient to give the unacquainted Reader a Taste of the Usefulness of the Doctrine concerning the Rectification of the Curves.

LEMMA.

In every Triangle BAC, if the Angles ABC, ACB, and CAD the Complement of the Obtuse Angles CAB to two Right Angles, be infinitely little; I say, they are proportional to their opposite Sides A C, A B, B C.

For if a Circle be circumscrib'd about the Triangle ABC, the Arches AC, AB, BAC, which measure double the said Angles, will be infinitely little also, and consequently they will be equal to heir Chords or Subtendents.

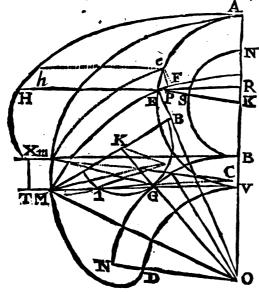

And if the Sides AC, AB, BC of the Triangle ABC be finite Quantities, 'tis plain that then the circumscrib'd Circle must be infinitely great, that so the Arches AB, AC, may be infinitely little in respect of the whole Circumserence.

PROP. XIII.

If A M D be a Semi-cycloid describ'd by the Semi-circle BSN, revolving on the immovable Arch BG N, so that the Evoluta or Arches BG, BG be always equal to one another; and if A, the Point which describes the Curve, be in the Diameter B N, within or without the Periphery of the movable Circle: 'The requir'd to investigate the Value of the Ray of the Evoluta M C.

Imagine another Perpendicular mg infinitely near MG, intersecting MG, produced in C, the Point requir'd. Draw the Right Line Gm, and Foint required. Draw the Right Line G m, and take G g on the movable Circle = G g on the immovable Circle, (fee the following Fig.) and draw the Lines M g, I g, K g, O g. Now if we consider the little Arches G g, G g is perpendicular to the Radii K g, O g, then 'tis manifest that the little Arch G g of the movable Circle falling the Arch G g of the immovable Circle, the Point M will fall on m, so that the Triangle C M g will exactly cover the Triangle C M g: Whence it is evident, that the Angle M G m is = g G git is evident, that the Angle M G m is = g G g, = (because, adding to both the same Angles K G g. OGg, their Sum will be equal to two Right

GKg+GOg or gGg or MGm= G Kg. 2. Ig: MI:: GMg: MGI, and by Composition Ig + MI or MG(r): Ig(q):: GMg + MgI or $GIg = \frac{1}{3}GKg: GMg$ or $Gmg = \frac{q}{2r} GKg$. 3. M C m or M G m, M G m $-Gmg\left(\frac{2ar+2br-bq}{2br}GKg\right):Gmg$

$$\left(\frac{q}{2r}GKg\right)::Gm(r):GC:=\frac{bqr}{2ar+2br-bq},$$
and consequently the Ray of the Evoluta MC is

$$=\frac{2 \operatorname{arr} + 2 \operatorname{brr}}{2 \operatorname{ar} + 2 \operatorname{br} - \operatorname{b} \operatorname{q}}.$$

And if we suppose O G (b) the Radius of the immovable Circle, to become infinite, the Circumference BGN will become a streight Line, and the Terms 2 arrand 2 ar will vanish in respect of the others, and the Value of the Ray

of the Evoluta MC will be
$$=\frac{2brr}{2br-bq} = \frac{2rr}{2r-q}$$

CONSECTART

Hence to find the Area of the Cycloidal Space MCB, the Quadrature of the Circle being supposed, because Sectors of Circles are in a Ratio compounded of the Duplicate Ratio of the Radii and the simple Ratio of their included Angles;

it is, Angle G
$$Mg\left(\frac{g}{2r}GKg\right)$$
: Angle MGm

 $\left(\frac{a+b}{b} G Kg\right)$: the little Triangle (or Sector) MGg (whose Base is Gg m the movable Circle) : to the little Triangle or Sector G Mm. Whence

the Sector GM m is
$$=\frac{2r}{q} \times \frac{a+b}{b} M G g =$$

(inpposing
$$MI = s$$
, and consequently $r = s + n$) = $\frac{2a + 2b}{b}MGg + \frac{2as + 2bs}{bq}MGg$.

the Ratio of the Angle G Kg to the Angle G Mg. consequently the little Triangle MGg is $=\frac{r q}{2 a a}$ KGg, and substituting this Value in place of the Triangle M Gg in $\frac{2as+2b}{bq} \times M$ Gg, we shall have the Sector G M $m = \frac{2a+2b}{b} M$ Gg $+\frac{a+b\times sr}{aab}$ KGg; but by the Property of the Circle, $GM \times MI(sr) = BM \times MN =$ (supposing K N := c) c = c - a a, which is an invariable Quantity, and is always the same in whatfoever Point of the Curve the describing Point M be found; whence G M m + M G g or m G g, that is, the Trapezium $GMmg = \frac{2 + 3b}{L}$ $M G g + \frac{a + b \times c c - a a}{a \cdot b} KGg$. Now because G Mmg is the Fluxion of the Cycloidal Space MGB A and MGg, that of the Circular Space MGB (comprehended between the Right Lines MB, MG, and the Arch BG) and KGg, that of the Sector K B G; it is manifest that the Cycloidal Space M G B A is $= \frac{2a + 3b}{b} M G B$ $+\frac{a+b\times c\,c-a\,a}{}\times KGB.$ Q.E.I.

LEMMA II.

The same things being supposed, if on the Center K, with the Radius KA, the Semi-circle AEV be described; and if on the Center O, with any Radius between O V and O A, the Arch E M be describ'd, and the Radius K S E be drawn; I Say, the Arch E M: Arch S N:: O E: O B.

Suppose the movable Circle BS N to come into the Position BG N, then the Point A which describes the Curve will be in M. Connect the Centers of the Generating Circles with the Line OK, which will pass through the Point of Contact G; then 'tis evident that the Triangle MOK' and EOK are equal and fimilar, because the Sides of one are equal to the respective Sides of the other; therefore the Angles MKO, EOK are equal, and the Arches that measure those Angles, viz. G N, BS, and their Complements to two Right Angles BG, SN, are also equal. And because the Angles MOK and EOK are equal, therefore the Angle MOE is = Angle GOB, and Arch EM: Arch GB:: OE, the Radius of that: OB the Radius of this. But it has been demonstrated that the inferior Arch G B == superior Arch G B is = S N; therefore the Arch E M : Arch S N :: O E : B B. Q. E. D.

CONSECTARY.

If the Radius OB be supposed infinite, then tis evident that the Right Lines OB and OE will be Parallels, and the Concentrick Arches VD, Now the little Triangle or Sector KGg is to the little Triangle MGg, in a Ratio compounded of the Square of KG to the Square of MG, and MG, and MG, and MG, and MG are MG and MG and MG and MG and MG and MG and MG and

Whence the Arch EM: EH :: | are equal. 0 E : 0 B.

SCHOLIUM.

The Semi-cycloid A H T, into which the other Semi-cycloid AMD degenerates, when the Radius O B is infinite, is the same with that generated by the Revolution of the Semi-circle BSN on the Right Line BX, the describing Point A being in the Diameter BN produc'd.

PROP. XIV.

The same things being supposed, let it be required to investigate the Area of the Cycloidal Space AEM, comprehended under the Arches A E, E M, and the Portion of the Cycloid A M.

Imagine another Concentrick Arch ME infinitely near to the Arch E M, and eb parallel and infinitely near to EH, and the Lines EF and EP perpendicular to the Arch ME and the Right Line EH (produced if need be); then are the Angles F E e, O E K equal, because each added to the Angle K E F makes a Right Angle, and the Angle PE e is = Complement of OKE to Two Right Angles, because P E e + e E K + KER is = to Two Right Angles = KER + $E \times R + E \times R$; therefore the Sine of the Angle F E e is to the Sine of the Angle P E e, as the Sine of the Angle $O \times E$: That is,

Fe: Pe:: OK: OE;

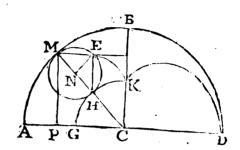

And by the Corol. EM:EH::OE:OB.

Therefore FexEM: PexEH::OK:OB.

And because the infinitely little Spaces EMme, EHbe are equal to the Products or Rectangles Fe X E M, Pe X E H respectively, and the said

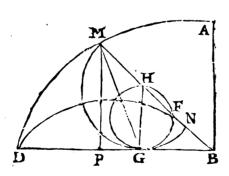

one another, that is, the Space E Mme is always to the corresponding Space EHbe, as OK is to OB; 'tis plain that the Sum of all the EMme is to the Sum of all the EH be, that is, the Space A ME is to the Space A E H, as O K is to OB.

I shall only add further, as to this Figure of the Cycloid; That, if a Caustick Curve, as AFK, were to be drawn to a Semi-circle, as AMD, whose Diameter is AD, and its Centre C: And when the Rays of Incidence, as PM, are supposed to be perpendicular to the Diameter AD:

Then the Caustick AFK will be a Semi-Cycloid; which will be described by the Revolu-tion of the Little Circle MFH on the Periphery, or the Base KHG. For the Circle MFH is described on half MC, as on a Diameter; and the Angle C M F is equal to C M P, which is equal to HC K: And confequently the Angle HNF is equal to twice HC K. Therefore the Arch HF is equal to the Arch HK; and the Curve KFA must be a Semi-cycloid, whose Beginning is in K, and its Vertex in A.

Let the Vulgar Semi-cycloid AMD be given, and described by the Revolution of the Semicircle NGM on the Right Line BD: And let the Rays of Incidence PM, be parallel to the Axis AB: 'Tis required to draw a Caustick by Re-Rectangles are always in the same Proportion to flexion to the said Semi-cycloid A MD.

Because MG is $=\frac{\pi}{2}$ the Ray of the Evoluta, and GP perpendicular to PM: Therefore MF $=\frac{1}{2}a=PM$. Whence if GF be drawn perpendicular to the reflected Ray MF, the Point F will be in the Curve required.

If the Rays HM, HG, be drawn from H, the Center of the generating Circle, to the de-scribing Point M, and the Point of Contact G; 'tis evident that HG will be perpendicular to the Caustick DFB is a Cycloid, and describ'd by BD; and that the Angle GMH = MGH the Revolution of the Circle GFH on the Right = GMP; whence it appears, that the reflected Line BD. Q. E. D.

Ray MF passes through the Centre H. Now the Circle whose Diameter is G H passes also through the Point F; because G F H is a Right-Angle: And therefore the Arches G N, and half G F, which measure the Angle G HN, are proportionable to the Diameters MN, GH, of their respective Circles: And consequently the Arch G F = Arch GN = GB. Whence it is manifest, that

DAN

DEA

AKIR, by the Statute of 23 H. 3. de com-positione Ponderum, &c. was a Number of Ten Hides, as a Last was of 20 Dakirs: But fince, by 1 Jac. 33. 2 Last of Hides is 12

DAMNUM, did formerly fignifie the Bounds or Limits of a Man's private Property or Juris-diction; as is plain by Bratton, lib. 2. de Coron. c. 37. And perhaps our Word Dam, for a Boundary or Confinement came from hence.

DAMPS, in Mines, are noxious Exhalations, which in some Mines have proved very suffocating, and otherwise fatal to the Workmen. They reckon sour Sorts of Damps.

The First is the most ordinary; they know when 'tis coming, by the Flame of their Candles becoming orbicular, and by the Flames lessening by degrees, 'till at last it quite go out; as also by their Shortness and Difficulty of Breathing. Those that escape Swooning, seldom suffer any great Harm by it; but such as swoon away, tho' they mils of downright Suffocation, are on their first Recovery tormented with very violent Convultions. Their Way of Cure is to lay the Person down on the Earth in a prone Posture, with a Hole dug in the Ground under his Mouth; if this fail, they fill him full of good Ale; and

if that won't do, they conclude him desperate.

2. The Pease-Bloom Damp, which is so called from its Smell; this Damp they say always comes in the Summer Time, and it hath not been known to be Moreal. The Miners in the Peake of Derby fancy it arises there from the Multitude of Red Trefoil Flowers, called by them Hony-Juckles, with which the Lime-stone Meadows of the Peake do much abound. Perhaps the Smell of this gives

timely Notice to get out of the Way.
3. The Third is the most Pestilential and the most Strange of all, if what they say of it be true: They which pretend to have seen it, (for its visible they say) do thus describe it: In the highest Part of the Roof of those Passages in a Mine which branch out from the main Grove, they see a round Thing hanging about as big as a Foot-ball, covered with a Skin of the Thickness and Colour of a Cobweb: If this Bagg by a Splinter, or any other Accident, become broken, the Damp immediately flyes out and suffocates all the Company: The Workmen, by Help of a Stick and a long Rope, have a Way of breaking this at a Distance; and when they have done this, they purific the Place well with Fire: And they will have it, that it gathers from the Steam of their Bodies and Candles, ascends up into the highest Part of the Vault, and there condenses, and in Time bath a Film grows over it, and then corrupts and becomes Pestilential.

The Fourth is the Fulminating or Fire-Damp, whose Vapour being touch'd by the Flame of the Candles, presently takes fire, and hath all the Effects of Lightning or fired Gunpowder. These are found frequently in the Coal-Mines, and sometimes, the rarely, in the Lead ones.

DANEGELT, or Geld, was a Tribute which the Danes, on their frequent incursions imposed upon the English as the Arbitrary Terms of Peace and Departure. It was first imposed as a continual yearly Tax upon the whole Nation under so there are Two Ways of Creating these Deans.

K. Ethelred, A. D. 991. Alfred and Ingulgh report, that King Edward the Confessor remitted and abrogated this Tax: But William the Conqueror, tho' he would not re-induce the Annual Payment, yer he ordered the raising of it, as often as the Necessities of Invasion or Expedition did require: And it was severely exacted and augmented by William Rufus. In the Reign of Hen. L it was computed amongst the King's standing Revenues: But K. Stephen, upon his Coronation-Day, promised that Danegels should be for ever remitted; from which Time some date the Expiration of this Tax. But it seems rather to have continued upon extraordinary Occasions, 'till it was abrogated by Time; or swallowed in Tillage and Parliamentary Impositions. The Laws of Edward the Consessor, c. 11. rate this Tax at 12 d. on even ry Hide: Henry Huns computes it at 2 s. on each Hide; and John Brampton at 3 d. on a Bovate or Oxgange. And no doubt it varied according to the different Exigencies on which it was levied. Dr. Kennet's Gloffary.

DANGER, Dangerium, in some Places called Lief-Silver and Lef-Silver, was formerly a Payment of Money made by the Forest Tenants to their Lords, that they might have Leave to plow and fow in Time of Pannage or Mast-seeding.

DARREINE, in the Common Law, seems to be a Corruption from the French Dernier, i. e.

Last; for 'tis now used in that Sense, in DARREINE, Continuance: And DARREINE, Presentment.

DATIRE Tutelage, is a Term in the Civil Law, for such a Tutelage of a Minor as is appointed by the Magistrate either Ex Officio, or by Petition, when a Guardian by Will, or by Law, is not al.

ready provided.

DAY, in our Common Law, is sometimes used for the Day of Appearance in Court, either Originally or on Affignation; and sometimes for

the Return of Writs. Thus

DAYES in Bank, are Days set down by Statute or Order of Court, when Writs shall be return'd, or when the Party shall appear on the Service of the Writ. They say also, That if a Person be dismifted without Day, he is finally discharged the Court.

DAYWERC of Land, was anciently as much could be plowed up in one Day's Work or as could be plowed up in one Day's Work or Journey, as the Farmers in some Places still

call it.

DAZE, is one of the Weeds, as they call them, which are found in our Tin Mines; 'tis a kind of glittering Stone enduring the Fire; and is of different Colours, as White, Black and Yellow. It seems to be a Spar.

DEAN. Originally the Decanus, was so called, because he was an Ecclesiastical Magistrate, which had Jurisdiction and Power over Ten Canons at least. He is next under the Bishop, and ordinarily Chief of the Chapter in a Cathedral Church.

As there are Two Foundations of Cathedral Churches, the Old and the New, (the New being those which Henry the Eighth founded on the Suppression of the Abbots and Priors, and turned their Convents into Dean and Chapter;) For those of the Old Foundation, are brought to their Dignity much like a Bishop: The Prince first sending out his Conge d' Estire to the Chapter; the Chapter there chusing, the King yielding his Royal Assent, and the Bishop confirming him, and giving his Mandate to install him.

Those of the New Foundation are installed by a shorter Courie; only by the King's Letters Patent, without either Election or Confirmation.

The Word Dean is also apply'd to divers that are the Chief of some peculiar Churches or Chapels; as Dean of the King's Chapel, of Paul's, of Westminster, of the Arches, of Battel, of Boking, &c.

DEAN Rural, or Urban, call'd Decanus Christianitatis, was formerly an Ecclesiastical Person, who had the District of ten Churches either in the Country or City, within which he exercised a useful Jurisdiction. These Rural Deans were sometimes called Archipresbyteri, and at first were both in Order and Authority above the Archdeacons. Theywere elected by the Clergy, and bytheir Votes again deposed; but afterwards they were appointed and remov'd at the Discretion of the Bishop: And hence they were called Decani Temporarii, to distinguish them from the Cathedral Deans, who were called Decani perpetui.

DEADS, in the Tin-Miners Language, are such Parcels of common loose Mould or Earth lying above the Shelf, as usually contain the Shoad, which they find when they are training a Load. They call also that part of the Shelf which contains no Oar or Metal, but encloseth the Load as a Wall between two Rocks, by this Name. See Tin.

In the Mendip Lead-Mines; when a Vein of Oar breaks off abruptly in an Earth, they call it a Deading-Bed; and Earth without an Oar they call Dead Earth.

DEAD Ropes in a Ship, are such as are not running, i. e. which do not run in any Block.

DECIMAL Scales, (Vide Leybourne's Curfu, p. 1.74.) are in the General any Scales that are divided Decimally. But for the expediting of Decimal Arithmetick, there are in use some Scales of Money, Weights, Measures, which are made from Tables bearing those Names, and serve readily, by Inspection only, to shew you the Decimal Fraction which properly belongs to any part of Money, Weight, or Measure, &c. These Scales are usually placed on a square Ruler, and are about Nine in Number:

1. One of English Coin, 2 Shillings being the

Integer. 2. Troy Weight, 2 Peny-weight being the Integer.

3. Averdupois Great Weight, 28 lb. being the Integer.

4. Averdupois Little Weight, 16 og or 1 lb. being the Integer.

5. Liquid Measure, 36 Gallons being the In-

6. Dry Measure, 8 Bushels being the Integer. - 7. Long Measure, one Ell or Yard being the

Integer. 8. Foot Measure, where 12 Inches is the Integer. And,

2. 9. Time and Motion, where one Hour, Mi-

nute, &c. may be the Integer.

To every one of these there is joined another Division, or part of a Division, answers to it in sured on the Chords.

the adjacent Decimal Scale: And consequently it will very readily shew you what Decimal Fraction answers to any Part of Money, Weight, Time, Measure, &c. as well as it will give the Value of any Decimal Fraction in the Corre-fponding Parts of any Integer. Thus if in the Money Scale you take out any Part of a Shillings, as suppose 8 Pence 3 Farthings, you will find the Corresponding Decimal to be .364. Or if in the Decimal Scale contiguous to it, you would know what Part of 2 Shillings answers to this Decimal Fraction .771, you will find the Corresponding Point in the Money Scale to be 18 Pence 2 Farings. And so for the rest.

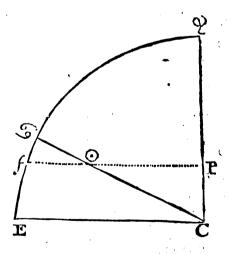

DECINERS, or Decenniers, or Definers. De-

cennarii, in our Old Law, where such as had the Jurisdiction over 10 Friburghs for keeping the King's Peace; and the Limits or Compass of their Jurisdiction was called a Decenna, saith Braction, Lib. 3. Tract. 2. Cap. 15. In the Saxons Times, these teems to have had large Authority, taking Cognisance of Causes within their Circuit, and redreffing Wrongs by way of Judgment. In latter Times, the Word came to fignifie such an one, as by Oath of Loyalty to his Prince was settled in the Combination or Society of such a Dozein; and a Dozein seems then to be extended as iar as a Leet, because in Leets only this Oath is administred by the Steward, and taken by all from 12 Years old and upward that dwell with-

Leets. DECK Nails, are such as are used for fastening Decks of Ships, doubling of Shipping, and for Floors laid with Planks: They are of two Sorts, Dye-headed and Clasp-headed. Their Sizes are from 4 to 9 Inches.

in the Leet. Now there are no Decenniers, but

DECLINATION of the Sun. To find it readily by Projection of Part of the Analemma; having his Place in the Ecliptic, and his greatost

Declination: Draw E C for the Equinoctial, and P C for the Azimuth of East and West, and with 60 Deg. of the Chords sweep the Ark EP. Set 23 Deg. 30 Min. the Sun's greatest Declination, from E to 5, and draw 5 C for one Quadrant of the Ecliptic. Set the Sine of the Sun's Longitude, or Distance from the next Equinoctial Point from C to in the Ecliptic C 5, being, Decimal Scale, divided into 100 or 1000 equal suppose. 42 Deg. then will the nearest Distance from © to EC, be the Sine of the Sun's present any of the Nine Scales, you may easily see what

DECRE-

tion that the Emperor pronounces, upon hearing a particular Cause between Plaintiff and Defendant.

DECRETALS, are a Volume of the Canon Law, containing the Decree of fundry Popes; or else a Digest of the Canons of all the Councils pertaining to one Matter and under one Head.

DEDI, is a Warranty in Law to the Feoffee and his Heirs; as if it be said in a Feofiment, A. B. has given and granted, &c. they call it a War-

ranty

DEEMSTERS, are a kind of Judges in the Isle of Man, chosen from among and by themselves, who without Process, Writing, or Charge, decide all Controversies there.

DEFAULT, is a Neglect or Omission of Appearance before a Court of Justice, for which Judgment may be given against the Defaulter.

DEFEND, in our Ancient Laws and Statutes, fignified to prohibit and forbid: Leg. Edw. Confess. c. 37. and 5 R. 2. c. 7. And in this Sense Chaucer allo ules it.

DEFERENTIA Vasa. See Vasa Deferentia. DEFICIENT Hyperbola, is a Curve of that Name, having but one Asymptote, and only two Hyperbolick Legs running out infinitely towards the Side of the Asymptote, but contrary Ways.

ays. See Curves.
DEFLECTION of the Rayes of Light, is a Property which Dr. Hook observed 1674, and read an Account of it before the Royal Society, March 18. the same Year. He saith, he found it different both from Reflection and Refraction, and that it was made towards the Surface of the opacous Body perpendicularly. This is the same Property which Sir Isaac Newton calls Inflection; of which, see an Account under that Word.

DEFORCEMENT, in the Law Sense, is with-holding Lands or Tenements by force from Wherefore a the Right Owner.

DEFORCEOR, is he that overcometh and

cafteth a Person out by Force.

DEFORCIATIO, is a Distraint or Seizure of Goods for Satisfaction of a Lawful Debt. In Alfizes and Trials formerly, the Claimer or Plaintiff was called Querens, and the Possessor or Defendant was called Deforcians: Tho' indeed the Original Sense of the Verb Deforciare is to keep Possession ones self, or to turn another out of his by Violence and Force.

DEGRADING, or, as it has sometimes been writter, Difgrading, is the Punishment of a Clerk, that being deliver'd to his Ordinary, can't purge himself of the Offence whereof he was convicted by the Jury; and it is the Privation of him from those Holy Orders which he had, as of Deacon, Priest, &c.

Formerly also Knights have been degraded.

Scc 18 E. 2.

In the Common Law also there are two Sorts of Degrading; one Summars, by Word only; the other Solemn, by divesting the Party degraded of those Ornaments and Rites, which are the Enfigns of his Order and Degree. See. 13 Car. 2. c. 1

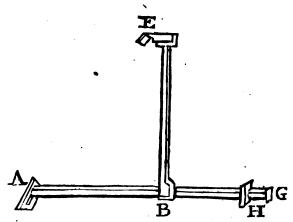

DEGREE of a great Circle, on the Surface of The Earth (supposing it be of a Spherical Figure) is 69 English Miles and 288 Yards; as appears by the Concurrent Mensurations, nearly, of Mr. Norwood and the French Mathematicians. The French make a Degree 365184 Feet English,

DECREE, in the Civil Law, is a Determina- and Mr. Norwood 367196, the Difference being only 597 Yards, or 1791 Feet: And from hence, the Circumference of the Earth will be 24899 English Miles.

DÉLEGATION, in the Civil Law is a kind of Novation, whereby a Debtor appoints one that is Debtor to him, to answer a Creditor in his Place

DEMANDANT, is the Plantiff in a real Action, and so called because he demandeth Lands, &c.

DEMICROSS, is an Instrument, used by the Dutch to take the Sun's Altitude, or that of a Star at Sea; but 'tis not used by us, but the Cross-staff or Fore-staff supplies its Place. The Demicross is of this Figure;

The Staff AG is graduated easily, being only a Line of whole Tangents, whose Radius is EB, the Length of the Cross-piece or Transum: It hath three Vanes; a Horizon-Vane, as A; a Sight-Vane, as H; and the Shade-Vane, as E.
When the Vanes are on the Staff and Cross.

piece, to take the Sun's Altitude, hold the Instrument with the Transum as upright as you can, and looking through the Sight-Vane, as H, look for the Horizon through the Slit in the Horizon-Vane, and then slide the Cros-piece or Transum to and fro, 'till you cause the Shade of the Vane at E to sall at the same Time upon the Slit of the Horizon-Vane also at A; then are the Degrees cut on the Staff by the Edge of the Croispiece, the Sun's Altitude required. But to take the Height of a Star; you must remove the Horizon-Vane A, and put it on the End G, and transfer the Sight-Vane H to A; then holding up the Instrument upright, as before, looking through the Sight-Vane, see for the Horizon through the Horizon-Vane, and for the Star by the Shade-Vane, sliding the Transum to and fro, 'till the Horizon and Star are both seen by their respective Vanes, and then the Transum will cut the Degrees of the Star's Altitude on the Staff, allowing about & or 10 Minutes for your Height above the Level of the Water, as must be done in all such Cases.

DENARII de Caritate, were the Pentecostals or Whitlun-Farthings, being anciently customary Oblations made to the Cathedral Church at the Time of Pentecost, when the Parish Priests and their People used to go visit the Mother Church. In process of Time this voluntary Oblation came to be claimed as a settled Due, and was charged on the Parish Priest, and it is now annually paid to the Bishop in some Dioceses.

DENARIUS. See Penny.

DE deoneranda pro Rata Portionis, is a Writ that lieth where one is distrained for a Rent that ought to be paid by others proportionably with him.

DEPARTURE, in Navigation, is the Easting or Westing of a Ship with respect to the Meridian it departed or fail'd from. Or 'tis the difference of Longitude (either East or West) between the present Meridian the Ship is under, and that where the last Reckoning or Observation was made: This Departure, any where but under the Equator, must be accounted according to the Number of Miles in a Degree proper to the Parallel the Shipis under. See Mercator's Sailing.

DEPOSITUM, in the Civil Law, is a Contract of the Law of Nations, by which a Thing is committed to the Custody of one to be kept,

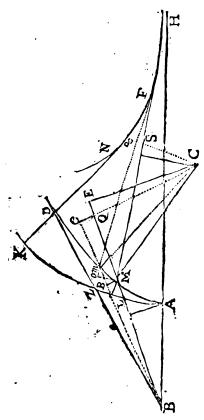

without any Reward, on Condition to be returned truly again on Demand.

DERELICKS, in the Civil Law, are such as are wilfully thrown away and abandoned by

the Owners.

DESIGN, in Painting or Sculpture, is the Expression of the Images or Ideas that the Painter hath conceiv'd in his Mind on the Picture, &c. and it is Good, when the Author has a good Gusto and correct Judgment: This is the Basis and Foundation of all other Parts, and may be compared to the Stile of a correct Writer. But the Painters call Designs chiefly such Draughts as they usually express on Paper, in order to the Performance of some considerable Piece of Work: A feint impersect Defign is usually call'd a Sketch.

DIACAUSTICK Curve, or the Caustick by Refraction. If you imagine an infinite Number of Rayes, BA, BM, BD, &c. issuing from the

same Luninary Point B, to be resracted from or to the Perpendicular M C, at the Curve A M D; and fo that C E, the Sines of the Angles of Incidence C M E, be always to C G, the Sines of the refracted Angles C M G, in a given

Ratio; then the Curve Line HFN, which touches all the refracted Rays, is called the Dias caustick, or Caustick by Refraction. How to find these Causticks by Refraction to all Sorts of Curves. see Hayer's Fluxions, p. 243, &c. where also the Doctrine of the Foci of Spherical Glasses of all Sorts, exposed either to diverging, converging, or Parallel Rayes, is deduced from the Principles of the Caustick Curves. Vid. p. 249. Of the Relation of this Diacaustick Curve to the Evoluta, see a Discourse of Mr. James Barnoulli in the

Leipfick Acts of May, 1693.
DIACENTROS, is a Word used by Kepler, to fignify the shortest Diameter of the Elliptical

Orbit of any Planet.
DIAGLYPHICE, is the Art of Cutting, or otherwise making hollow or concave Figures in Metals; such as Seals and Intaglias's

DIALLING. Some Authors on this Subject are, J. Bapt. Benedicti, de Re Gnomonica.

Kercheri, Ars magna Lucis & Umbra. Rom. 1646.

Fale's Art of Dialling.

Wells's Art of Shadows. 8ve.

DIALLING in a Mine, which they call also plumming, is using a Compass (which they call a Dial) and a long Line, to know which Way the Load or Vein of Oar inclines, or where to link an Airshafe, or to bring an Adit to a defired Place. See the Manner of it under the Word Tin.

DIALLING Lines or Scales, are such graduated Lines as being placed on Rulers or the Edges of Quadrants, and other such like Instruments, are defigned to expedite the Constitution of all Kind of Dials.

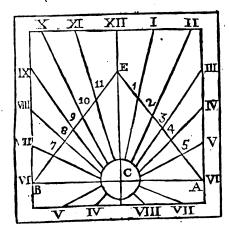

These Lines are,

1. A Scale of fix Hours; which is only a dou-ble Tangent, or 2 Lines of Tangents, each of 45 Deg. set together in the Middle, and equal to the whole Line of Sines, with the Declinations set against the Meridian Altitudes, in the Latitude of London, suppose, or whatever Place else it is made for. The Radius of which Line of Sines, is equal to the Dialling Scale of fix Hours.

2. A Line of Latitudes; which is fitted to the Hour Scale, and is made by this Canon: As Rad.: to the Chord of 90 Deg. :: So are the Tangents of each respective Degree of the Line of Latitudes . to the Tangents of other Aiks. And then the natural Sines of those Arks are the Numbers, which taken from a Diagonal Scale of equal Parts, shall graduate the Divisions of the Line of Latitudes

to any Radius.

The Line of Hours and Latitudes is general for pricking down all Dials with Centres: As suppose. 1. an Horizontal Dial for the Latitude of London, 51 Deg. 30 Min. Draw C E for the Hour Line of 12, and cross it at Right Angles with AB. Then out of the Scales of Latitudes fer off C Band C A each equal to 51 Deg. 30 Min. or the Stile's Height. Then take the whole Scale of fix Hours, and let it from A to E, and from B to E, dividing those two Lines A E and BE with the CompaiCompasses accordingly; as you see in the Figure :

Then Lines drawn from C, the Center of the Dial, through those Points 1, 2, 3, 4, 5, and 11, 10, 9, 8, 7, &c. shall be the true Hour Lines. And this is a very ready and easy way to describe the Hour Lines on any Plane.

See Collin's Sector on a Quadrant.

The other Scales are particular, and give the several Requisites for all upright declining Dials by Inspection.

They are these:

3. A Line of Chords.

4. A Line for the Substile's Distance from the Meridian.

5. A Line for the Stile's Height.

6. A Line of the Angle of 12 and 6.
7. A Line of Inclination of Meridians.
When these are placed all together on a Ruler

in order as they should be;
Count the Plane's Declination in the Line of
Chords, and then a Square laid over it will inzersect all the other Lines in their proper Points : Or you may open the Compasses to the Planes Declivation in the Chords, and then that Distance will find all the rest in the other Scales. Suppose a Plane decline 35 Deg. from the Meridian, then all the Requilites by these Scales will be

Journa thus.		Min.
The Substile's Distance from the Meridian	24	30
The Stile's Height	30	38
The Inclination of Meridians	41.	.49
The Angle of 12 and 6	84	,10

All which previous Requisites being found, the Dial may be drawn easily and readily by applying in the Hour Scale by the Help of the Line of Latitudes and the Substilar Line, as Collins shows how to do in his Sector on a Quadrant, p. 268. or by any other Method of describing Hour Lines on a given Plane.

DIAMETER of Gravity, in any Surface, Body, or Solid, is that Right Line in which the Center

of Gravity is placed.
DIHELIOS, in the Elliptical Astronomy, is that Ordinate of the Ellipsis which passes through that Focus in which the Sun is supposed to be

placed. Kepler.
DILAPIDATION, is a wasteful destroying, or letting of Buildings run to Ruin and Decay for want of Reparation, 13 Eliz. c. 13. And the Vol. II.

1

shall be employ'd in the Repair of the same Houses.

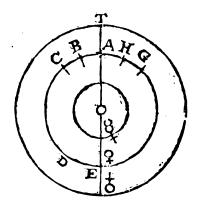

DILVING, is a Word used in the dressing of Tin Oar; and means, taking the Forehead of what is in the 2d Buddle after the 2d Trambling, and putting it into a Canvals Sieve, to shake it lustily about in a large Tub of Water, so that the Filth goes over the Rim of the Sieve, leaving the Black Tin behind. See Tin, Buddle, and Trambling

DIAZEUTICK Tone, in the Antient Greek Musick, was that which disjoin'd two Fourths, one on each Side of it, and which being join'd to either, made a Fifth. This was in their Musick that from Mese to Paramese; that is, in our Musick, from A to B, supposing Mi to stand in Bfabmi, which is accounted its natural Polition. They allowed to this Diazeutick Tone, which is our La, Mi, the Proportion of 9, to 3, as being the unalterable Difference of Diapente and Diatessoron, or of the Fifth and Fourth.

DICASTRICK Muscles, sometimes called Bia

ventres, are such as have a double Belly.
DIMISSORY Letters. When a Candidate for Holy Orders hath a Title in one Diocese, and is to be ordain'd in another, the proper Diocesan gives his Letters Dimissory directed to some other Bishop, giving Leave that the Bearer may be ordain'd to such a Cure within bis District.

DIRECT Motion of a Planet. To any Eye placed at the Earth's Surface, Venus and Mercury, which move round the Sun in lesser Orbits than it doth, will sometimes appear direct, and sometimes Stationary and Retrograde.

For let the Earth be at T, moving round the Sun in the Orbit T & from West to East. Let ACDF be the Orbit of & revolving the same Way, but performing its Revolution in a shorter Time. It will then be plain, that when Venus is in that Part of her Orbit expressed in the Figure by DEF, and which is most remote from the Earth, supposed to be in T, I say, Venus will then appear to move forward directly, according to the Order of Signs, or in Consequentia, as the Aftronomers speak, and so is said to be Direst. And when she comes to such a Position, in respect of the Sun and Earth, as to be in G; then while she moves from G to H, she will feem to move with equal Celerity with the Sun, for then she tends directly towards the Earth: Nor can the appear to have any other Motion, than as if her Orbit were carry'd by the Sun mo-ving towards the East. Therefore now the will Money recover'd for Dilapidations, by 14 Eliz.11. appear to move flower than before, but still she

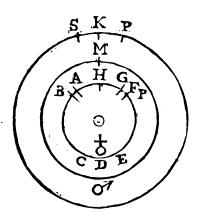

will be direct. But when the gets beyond H towards A, and then to B, the in reality moving swifter than the Earth, (because nearer to the Sun) she will pass by between the Earth and the Sun; and therefore to an Eye placed at the Earth must appear to change her Place among the fix'd Stars, but yet contrary to the usual Order of the Signs: That is, she will appear to move in Antecedentia, and so is said to be Retrograde; tho', if viewed from the Sun, the would always appear to move Direct. And in the Part of the Orbit about H, she will appear Stationary, as they call it, because then Right Lines drawn from the Sun to the Earth and Her, will appear to be parallel to one another for a confiderable Time. Allo after her Retrogradation, and before she be-gins to Direct again, we will be again Stationary, as about B; and then she is said to be Stationar, towards her Direction, as before the was so towards her Retrogradation.

And 'tis the lame Cale, with respect to the Earth consider'd, as moving on in her Orbit; for the Directions, Stations, and Retrogadations, above describ'd, and referred to Venus, will after the same manner appear to belong to the Earth; in the several Parts of her Orbit, to an Eye placed in Venus, or on the Surface of some Superior

Planet.

And from what has been here said, it appears, that Venus will appear Retrograde when she is nearest to the Earth, and consequently then also appears bigger; and on the other hand, will be Direct, and appear leaft, when she is remotest from

After much the same manner will the Phænomena of the Directions of the Stations and Retrogradations of the superior Planets be accounted for by the following Figure:

Let M & be the Orbit of one of the Superiors, suppose of Mars; let AC & G be the Orbit of the Earth, and nearer to the Sun than that of Mars; let that Planet be supposed at M, and the Earth in that Part of her Orbit design'd by the Letter A: Then will Mars appear Stationary, and that towards his Direction; because the Right Lines drawn from Mars, and from the Earth to the Sun, will for a while appear to be Parallel, altho' if Mars were seen from the Sun, his Motion would then appear to be Progressive, as at other Times. And while the Earth moves from A towards B, C, D, E, and F, to G, Mars will appear to move forward directly among the fixed Stars, for a double Reason; both because it is in reality carry'd about the Sun in Consequentia; and also because the Earth is carry'd the same

way in the opposite Simicircle, and about the same Centre. Mars therefore being now most remote from the Earth, will appear to be direct. But the Earth coming at length to G, and Mars being supposed to be in M, (which in process of Time will come to pass) then he will appear Stationary again, and now towards his Retrograda-tion, for he will appear Retrogade in his Motion from G to A.

And the very same Phænomena must happen to Jupiter and Saturn; only the Retrogradations of Saturn will be more frequent than those of Jupiter, and his than those of Mars: Because the Earth will oftner follow, overtake, and get between Saturn and the Sun, than he will between Jupiter and him; and oftner also between Jupiter and the Sun, than between Mars and him.
DISCONTINUANCE, in the Common Law,

fignifies the same as an Interruption or Breaking

off; and is of two Kinds, either

DISCONTINUANCE of Possession; the Ffect of which is, that Man may not enter on his own Lands or Tenements alienated, what soever his Right be to them, of his own self, or by his own Anthority; but must bring his Writ, and seek to recover Possession by Law. Or it is

DISCONTINUANCE of Plea or Process; the Effect of which is, that the Instant is lost, and may not be regain'd, but by a new Writ to begin the Suit afresh; for to be discontinued, and to be put sine die, signifies to be dismissed the Court

finally.

DISGRADING. See Degrading.

DISPARAGEMENT, in the Law Sense is used especially for matching an Heir in Marriage un-

der his or her Degree, or against Decency.

DISPAUPERED. When any Person, by reason of his Poverty, attested by his own Oath of not being worth 51. (his Debts being paid) is admitted to sue in Forma Pauperis; if afterwards, before the Suit be ended, the same Party have any Lands or Personal Estate sallen to him; or that the Court, where the Suit depends, think fit for that or any other Reason to take away that Privilege from him, he is then said to be Dispanpered, i. e. put out of the Capacity of suing any longer in Forma Pauperis.

DISPENSATION of a Law, is a Thing di-

ftinct from the Equity of it, or from an equitable Conftruction of it: For Equip is only the Correction of a Law that is too Universal or General; but a Dispensation suspends the Obligation of the Law itself. A Dispensation therefore must be from the Legislative Power, and should be but very

rarely and sparingly used.

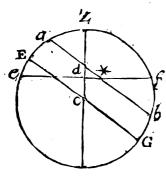

DISTANCE of Places on the Earth, are easily found by the Analemma. Thus:

Having the Longitudes and Latiudes of any two

Places on the Earth; to find their Distance.

Let London be one Place at Z, and let the other be in 20 Deg. Latitude North, and whose Difference of Longitude from London is 82 Deg. 30 Min. East. Take from the Chords Z E = 51 Deg. 30 Min. and draw E C 2 for the Equator; and to it, at 20 Deg. Distance draw a b for the Paral-lel of the other Place: Then from b, where the Meridian of London intersects that Parallel, set b* = 82 Deg. 30 Min. the Difference of Longitude, and that will find the Point * in the Parallel representing the Place. Thro' * at Right Angles to Zc, draw ed, croffing the Vertical Circle in d; measure e d on the Sines, it will be aabout

bout 20 Deg. whose Complement 70 Deg. is the Places Distance from London, or Z. Multiply 70 by 70, you have 4900 Miles, the Distance required.

DISTANCE of the Eye, in Perspective, is a Line drawn from the Foot of the Line of Altitude of the Eye, to the Point where a Line drawn

at Right Angles to it will intersect the Object.
DISTRIBUTIVE Justice. See Justice.
DIVERGING Hyperbola, is one whose Legs turn their Convexities towards one another, and run towards quite contrary Ways. See Curves.

DIURNAL Parallax of the Sun. See Parallax, and Sun

DOCKET, in the Law Sense, is a Brief in Wrising. It hath been formerly written Dogget; and seems then to have been some small Piece of Paper or Parchment, containing the Effect of a larger Writing.

DOG-DRAW, is one of the four Kinds of an Apparent Deprehention of an Offender against Venison in the Forest: And it is, when a Man hath stricken or wounded a Deer, &c. by shooting at him with a Cross-Bow or Long-Bow, or otherwise, and is found with a Hound or other Dog drawing after him to receive the same. See

Manwood's Forest-Laws, c. 18. N. 9.

DOGGER, is a small Ship built after the Dutch Fashion with a narrow Stern, and commonly but

one Mast. See 31 Ed. 3. Stat. 3. c. 1.

DOG-NAILS, are such as are used for fastening Hinges.

DOM-BOC. See Domes-day Book. DOMES-DAY Book. When King Alfred divided his Kingdom into Counties, Hundreds, and Tithings, he had an Inquisition taken of the several Districts, which were digested into a Regifter, which was called Dom. Boc; ie. the Judicial or Judgment Book, reposited in the Church of Winchester, and thence call'd the Winchester-Book, to which King Edward, Sen. seems to refer in the first Chapter of his Laws. The General Survey taken afterwards by William the Conqueror was after this Precedent of King Alfred, and seems but a Corruption of, or rather an Addition to, the same Name, Dom-Boc into Domes-day Book: And it implying no more than Doom-Book, or a Register from which Sentence might be given in the Tenure of Estates; (whence by Latin Writers 'tis called Liber Judicialis) 'tis a trifling Etymology to derive the Word from either Domus Dei, or Domes-day, that is, the final Day of Judgment. And it is not improper to observe (because no. Notice hath yet been taken of so small a Matter) that the Addition of Dez, or Day, in forming Dooms-day Book from Dom-Boc, doth not augment the Sense of the Word, but only doubles and confirms it. For the Word Day, in all Idioms, fignifies Judgment: And in the North, to this Day,

a Daysman is an Arbitrator, Umpire, or Judge; and so 'ris translated in our English Bible, in 30b. ix. 33. Domes-day Book therefore is no more than the Book of Judicial Verditt, Decretory Sentence, or Dooming of Judgment. Kennet's Paroch. Antiq. in

DORMANT Tree, is a Word used in Architecture, by some Workmen, sor a great Beam lying a-cross the House; which is usually called

DORMER, in Architecture, is a Window made in the Roof of an House, and it stands upon the Rafters

DONATIVES. See Benefices.

DOUBLE Quarrel, is a Complaint made by any Clerk or other to the Archbishop of the Province against an inserior Ordinary, for his delaying of Justice in some Cause Ecclesiastical; as to give Sentence, to institute a Clerk presented, Sc. The Effect whereof is, That the Archbishop taking Knowledge of the Delay, directs his Letters, under his Authentick Seal, to all and fingular Clerks in his Province, thereby Commanding and Authorizing them, and every of them, to admonish the said Ordinary, within a certain Number of Days (viz. 9.) to do the Justice required; or otherwise to cite him to appear besore him or his Official, at a Day in the said Letters prefixed, and there to alledge the Cause of his said Delay. And lastly, to intimate to the Ordinary, That if he neither perform the Thing enjoyned, nor appear at the Day assign'd, he himself will, without further Delay, proceed to perform the Justice required. And this seems to take its Name of Duplex Querela, from its being most times made both against the Judge and him at whole Petition Justice is delayed. Camel's In-

DOUBLE Aspect, a Term in Painting. See

Aspect Double.

DOUBLE Point. When all the Right Lines tending the same Way, with the Infinite Leg of any Curve, do cut it in one only Point (as happens in the Ordinates of the Cartesian, and in the Cubical Parabola, and in the Right Lines, which are parallel to the Abscisse of Hyperbolism-Hyperbola's and Parabola's) then you are to conceive, that those Right Lines pass thro' two other Points of the Curve (as I may say) placed at an Infinite Distance. And those Coincident Interasections, whether they be at a Finite or at an Infinite Distance, Sir Isaac Newton calls the Double Point: And how such Curves as have a Double Point are describ'd, see under Curves.

DOUBLING the Cape or a Point of Land, in Navigation, fignifies to come up with it, pass by it,

and so to leave it behind the Ship.

DOVETAILING, in Architecture, is a Way of fastening Boards or Timber together, by letting one Piece into another indentedly, with a Dovetail Joint, or with a Joynt in the Form of a Dove's Tail.

DRAGON Beams, in Architecture, are two strong Braces, or Struts, which stand under a Breast Summer, and meet in an Angle on the Shoulder

of the King-piece.

DRAGGS, in a Ship, are by the Seamen accounted whatever hangs over the Ship in the Sea, or is towed after the Ship in the Water, &c. Such

as Cloches, a Boat, &c.
DRAUGHT-Hooks, are large Iron Hooks fixt on the Checks of a Cannon Carriage, two on E e 2

each Side, one near the Trunion Hole, and the other at the Train. Large Guns have Draughthooks near the middle Transum, to which are fix'd the Chains which serve to ease the Shasts of the

Limbers on a March.

DRAW-Bridges, are made after feveral Fa-fhions, but the most common are made with Plyers twice the Length of the Gate, and a Foot in Diameter: The inner Square is travers'd with a St. Andrew's Cross, which serves for a Counterpoile, and the Chains which hang from the other Extremities of the Plyers, to lift up or let down the Bridge, are of Iron or Brass.

DRENCHES, or Drenges (Lat. Drengi) some ancient MS. fay, were Tenants in Capite: Such as at the Conquest being put out of their Estates, were afterwards reftor'd by King William, because they being Owners thereof, were neither against him by their Persons or Councils. Co. on Lit. Fo. 6. lays, these Drenches are Free Tenants of a

Manor.

DRENGAGE, was the Tenure by which the Drenches held their Lands.

DRIFT WAY of a Ship, the same with Lee-

DUCTILITY. Captain Halley, in Philosoph, Trans. N. 194, gives this further Account of the extreme Ductility, and exceeding Minuteness of the Patts of Gold. Tis evident, that Gravity is in all Bodies proportional to the Quantity of Matter in each; this is known by undoubted Experiment, so that there is no such Thing as a Propension of some more, others less, towards the Barth's Centre, fince the Impediment of the Air being remov'd, all Bodies descend, be they never so loose or compact in Texture, with equal Velocity. It follows therefore, that there is 7 times as much Matter in a Piece of Gold, as in one of Glass of the same Magnitude, (their specifick Gravities being as 7 to 1 nearly) and consequently, that at least 6 Parts in 7 of the Bulk of the Glass must be, Pore or Vacuity. This some Favourers of the Atomical Philosophy have endeavour'd to solve, by supposing the Primary or Constituent Atoms of Gold to be much larger than those of other Bodies, and consequently the Pores fewer. In order to examine this, he inform'd himself by the

Wire-drawers, that every best Double-gilt Wire was made out of Cylindrick Ingots of Silver, four Inches in Circumference, and 28 Inches long, weighing 16 lb. Troy. To gild these, they befrow 402. of Gold; that is, to every 4802. of Silver, one of Gold. They inform'd him also, that two Yards of superfine Wire weighs just one Grain. Hence at first Sight it appear'd, that the Length of 98 Yards of Wire is in Weight 49 Grains, and that a fingle Grain of Gold covers the said 98 Yards; and further, that the 10000th Part of a Grain is above one 3d of an Inch in Length, (or longer than a Barley Corn) which Length may actually be divided into 10 Parts, and consequently the 100000th Part of a Grain of Gold be visible without a Microscope: And by reason of the Specifick Gravities of the Metals, viz. Silver 10 1 and Gold 18 1; he found the Diameter of such Wire to be Takth Park of an Inch, and its Circumference Isid Part of an Inch; but the Gold did not exceed in Thickness TITISOOTH Part of an Inch. Whence it may be concluded, that the Cube of an hundredth Part of an Inch would contain above 2433000000 (or the Cube of 1345) such Atoms. And yet rho' the Gold be firetch'd to such a prodigious Degree as is here demonstrated, it still shews itself of to even and united a Texture, as not to let the white Colour of the Silver that lies under it appear even by a Miscroscope) thro' any the least Porcs. Which argues, that even in this exceeding Thin, ness, very many of those Atoms may still lie one over the other.

DULEDGE, in Gunnery, is a Peg of Wood, which joyns the Ends of the 6 Fellows, which form the Round of the Wheel of a Gun-Carriage; and the Joint is strengthen'd on the Out-side of the Wheel by a strong Place of Iron call'd the Duledge

Plate

DUPLEX Querela. See Double Quarrel. DUPLICATE, is used by Crompton for Second Letters Patents granted by the Lord Chancellor in a Case wherein he had formerly done the same, and was therefore thought void. But any Transcript or Copy of a Writing may be call'd a Duplicate.

EALDER-

EAR

E ALDERMAN, was a Title among the Saxons, of the same Import as Earl among the Danes, and fignified an Elder or Statesman; fuch an one as the Romans call'd Senator: And to this Day we use the Word Alderman in the same Sense for an Affociate to the Chief Officer in the Common Council of any Town or City, and sometimes for the Chief Officer himself.

EAR. The former Account (in Vol. L) of this Curious Organ not being so satisfactory as I could wish it, I have here inserted Dr. Keill's

Anatomy of the Ear.

The Ear is divided into the External and Inter-The External Ear (whose Parts have already been describ'd) is composed of the Skin, a Cartilage, and a little Fat. The Skin of this Part is thin and smooth, it slicks close to the Cartilage by means of a fine Membrane. lage is in that Part of the External Ear call'd the Pinna; and the Fat in that Part call'd the Lobe. The Vessels of the External Ear, are Arteries from the Carotidale Veins, which go to the Jugulares, and the Nerves from the Portio Dura, and second Pair of the Neck.

The External Ear is tied to the Os Petrofum by a strong Ligament, which comes from the Back-side of the Pinna. Though the Ear has but a very obscure Motion, yet it has two Muscles: The first arises from the Outside of the Frontal Muscle, where it joins the Crotaphise, and is inferted into the Upper and Back-part of the Pinna. second arises from the upper and foremost Part of the Processus Mamillaris, and is inserted into the middle and back Part of the Concha. The first should draw the Ear upwards, and the second downwards and backwards; but the continual binding of our Ears when young, deprives us of their Ule. The Ule of the External Ear is to gather the Sounds, and to carry them to the Internal. Its Inequalities and Circles do moderate the Violence of the Air.

The Internal Ear begins at the Conduit which goes from the Middle of the Concha to the Tympanum : it is call'd Meatus Auditorius. It is cartilaginous from the Coneba till within a little of the Tympanum, where it is bony; yet this Cartilage goes not compleatly round, for towards the Temple its Edges do not meet by above a Line. The Passage is crooked, running first upwards and then downwards to the Tympanum. It is covered within by a pretty thick Membrane. Betwixt this Membrane and the Cartilage, especially where it is slit, there are a great Number of little Glands, whose Execretory Chanels piercing this Membrane, carry a yellow fort of Excrement into the Meatus, which hinders Infects or any other

thing to enter the Ear.

At the further Extremity of this Conduit, there is a thin transparent Membrane stretch'd out like the Head of a Drum, upon a bony Circle, which wants about half a Line of being compleat. The Handle of the Malleolus is tied to this Membrane, which it draws somewhat in-wards, making it a little Concave towards the Meatus Auditorius: And there tuns a small Twig of a Nerve from the fifth Pair upon its Infide, call'd Chorda Tympani; for the Membrane it self is called Tympanum.

EAR

Behind this Membrane there is a pretty large Cavity called the Barrel; it is about three or four Lines deep, and five or fix wide. It is lined with a fine Membrane, on which there are several Veins and Arteries. It is always full of a purulent Matter in Children. In this Cavity there are four small Bones, of which,

The first is the Malleolus, or Hammer, so called because of its Shape. Its Head has on its lower Side two Protuberances, and a Cavity whereby its joyned to the Incus by Ginglymus: Its Handle, which is pretty long and small, is fastened to the Tympanum. Near its Head it has two small Processes, and it is moved by three

The first is called the Externus; it arises from the upper and external Side of the Meatus Auditorius, and is inserted into the upper and longer Process of the Malleolus, which it draws outwards. This is necessary when Sounds are too great, which might break the Tympanum.

The Second is the Obliques; it lies in the External Part of the Conduit which goes to the Palate, and entring the Barrel, it is contained in a Sinusofity of the Bone by the upper Edge of the Tympanum, and is inferted into the stender Process of the Hammer, assisting the former Muscle

in its Action.

The Third is the Internus, which arises from the Extremity of the bony Part of the Conduit which leads to the Fauces, and lies in a Sinus of the Os Petrofum, till it passes over a little Rising of the Bone at the Fenestra Ovalis, to be inserted into the posterior Part of the Handle of the Malleolus. This Muscle, by pulling the Hammer inwards, distends the Tympanum.

The Second small Bone is call'd Incus, the An-

vil: It has a Head, and two Legs. Its Head has a Protuberance, and two Cavities, whereby it is articulated with the Hammer; the shorter of its Legs is tied to the Side of that Conduit which goes to the Processus Mamillaris, and its longer Leg to the Head of the Third Bone, called, The Stapes or Stirrop, because of its Resem-

blance. 'Tis of a Triangular Figure, being made of two Branches set upon a flat Basis, which stands upon the Foramen Ovale. The Space between the two Branches is fill'd up by a fine transparent Membrane; the Union of the two Branches is called the Head of the Stirrop, in which there is a small Cavity, in which lies the Fourth Bone. There is a small Muscle which arises out of a small Canal in the bottom of the Barrel, and which is inserted into the Head of the Stirrop.

The Os Orbiculare, which is a very small Bone, being Convex on that Side which is received in the Cavity of the Head of the Stirrop, and hollow on the other Side, where it receives the long Leg of the Anvil, which is only joyned to the Stirrop by means of this Fourth Bone.

Befides these Bones, there are several Holes in Barrel. The First is in its Fore-part nearest the Barrel. the Tympanum. It is the Entry to the Sinus in the Mammillary Process. The Second is the Orifice of a Conduit, which opens behind the Palate of the Mouth. The Beginning of this Conduit is bony; and its Extremity, which is near the Dulva, Vulva, is membranous. Part of the Air which we breath, enters by this Conduir into the Ear. The Third and Fourth are in the Internal Process of the Os Petrosum. The one is called Fenestra Ovalis; the Basis of the Stirrop stands upon it; it is the Entry to the Vestibulum. The other is called Fenestra Rosunda; it is covered by a fine Membrane, inchased in a Rist of this Hole; it leads to the Cochlea.

The Vestibulum is a Cavity in the Os Petrosum, behind the Fenestra Ovalis; it is covered with a fine Membrane: In it open the Semi-circular Pipes of the Labyrinth. The upper Turning of the Cochlea, and the Auditory Nerve, pierces in-

to it also.

The Labyrinth is made of three Semi-circular Pipes excavated in the Os Petrosum; they open by five Orifices into the Vestibulum. That which is called the Superior Pipe, joins one of its Extremities with one of the Extremities of that which is call'd the Inserior Pipe; and these two Extremities open by one Orifice, but the middle Pipe opens at each End by it self into the Vestibulum.

The last Cavity of the Ear is the Cochlea; it resembles a Snail's Shell. Its Canal, which winds in a Spiral Line, is divided in two, the Upper and Lower, by a thin Lamina Spiralis. The Edge of this Lamina is membranous, where there are several Holes, through which Twigs of the Auditory Nerve pass from the one Canal to the other. The Upper Canal opens into the Vestibulum, and the Lower into the Barrel, by the Fenestra Rotunda.

The Vessels of the Internal Ear are Arteries and Veins from the Internal Carotides and Jugulars. The Nervus Auditorius enters by the Hole in the Internal Process of the Os Petrosum. It consists of two Bundles, of which one is hard, the other soft. Its Portio Mollis is distributed through all the Cochlea and Labyrinth, and the Portio Dura is bestowed on the External Patts

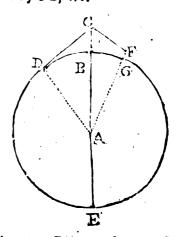

about the Ear.

Sounds being gather'd by the External Ear, pass through the Meatus Auditorius, and beat upon the Tympanum, which moves the four little Bones in the Barrel. In like Manner as it is beat by the External Air; these little Bones move the Internal Air which is in the Barrel and Vestibulum: which Internal Air makes an Impression upon the Auditory Nerve in the Labyrinth and Cochlea, accordingly as it is moved by the little Bones in the Barrel. So that, according to the various Resractions of the External Air, the Internal Air makes various Impressions upon the Auditory Nerve, the immediate Organ of Hearing: These different Impressions represent different Sounds.

See Maria Valtalva de Aure Humana Trastatu. EARL, anciently was the Title given to such as were Associates to the King in his Councils or Martial Expeditions; as Comes was to those who followed the Magistrates of Rome, as their Deputies to execute their Offices for them; and this Title died always with the Man. The old Way of making Earls was only Cincturam Gladii Comitatus, without any formal Method of Creation. But William the Conqueror, saith Cambden, gave this Dignity in Fee to his Nobles, annexing it to this or that County, and allotting them a Proportion of Money, arising from the Prince's Profits, for the Pleadings and Forseitures of the Province: Now, and long since, Earls are made by the

Kings of England, by their Charters; but without any Authority over any County, and without any Profit arifing from thence, but some Annual Stipend out of the Exchequer for Honour's Sake. The Solemnity of their Creation you may find at large in Stow's Annals. Their Place is next after a Marquis, and before a Viscount.

EARTH. There have been several Methods thought of to find the Magnitude of the Earth: As, 1. To find its Diameter, by baving the Height of some very eminent Mountain, and the Length of a Visual Ray, that shall be a Tangent to the Earth's Surface at some considerable Distance from the Top of the Hill: For the Square of such a Tangent being (by 35 E. 3.) equal to the Rectangle, under the whole Line made by the Earth's Diameter, and the Height of the Mountain together, if you divide DCA by CB, i.e.

the Square of the Distance, from the Top of the Hill to the Earth's Surface, by the Hill's Height, the Quotient will be the Line C E, (viz.) the Aggregate of the Earth's Diameter and the Mountain's Height; the latter of which being given, the former is so.

2. Let a Spectator on the Top of a high Hill, as at C, with an Inftrument, take the Angle DCB; which may best be done by the Help of the Sun or Moon's being in the Horizon; for that Way the Horizon will be the most accurately determin'd. Then the Length of the Tangent CD, being some-how known, in the Right angled DCA, the Line DA = to the Earth's Semidiameter may easily be drawn, and its Length sound by Calculation.

3. The Angle DCA being taken, and the Mountain's Height CB known; the Earth's Radius BA may be had without knowing the Diftance CD: For in the $\triangle DCA$ all the Angles are known, and the Length BC is only the Excess of the Secant CA above the Radius BA or AD; wherefore by the Tables of Sines, Tangents, and Secants, the Radius AD will be known.

There is also another way a-kin to these, of finding a Part of the Circumference of a great Circle on the Earth, by having the Altitude of two high Mountains, and their Distance from each other. But none of these Ways can be depended upon, tho' they are built upon Geometrical Principles, and are great Instances of the due Thought and Penetration of the Inventers; because there will be so many unavoidable Dissipulties in the different Refraction of the Atmosphere, in taking the exact Height of the Mountains, or the Distance of their Tops from the Earth's Surface in D, that there can nothing certain be determin'd from hence.

The best Method therefore to gain this Point, is that which Mr. Norwood here in England, and Mr. Picart in France, proceeded in; which was to measure the Distance, in Miles, or rather in Yards or Feet, between two Places situate under the same Meridian, and at least a Degree one from another; that so the Number of Miles contain'd in one Degree of a great Circle of the Earth, being exactly known, the Earth's Circumference will be easily had by only multiplying those Miles by 360. And this the French Mathematicians feem to have done so nicely, that hardly any thing more exact is to be expected. They make the Ambit of the Earth to be 123249600 Paris Feet; that is, nearly, 131630573 English

Whence Feet, or 24930 of our Statute Miles. Whence the Diameter must be 41899310 English Feet, and nearly 7935 Statute Miles.
EARTH. Dr. Hook, in Op. Post. p. 467. saith,

that the Semidiameter of the Earth, from the most accurate Observations that ever were made, is 3962 3 Statute Miles; or more exactly

209235003 Statute Feet.

Since 'tis known that the Orbit of the Earth is Elliptical, and that its Motion round the Sun is flowest in the Aphelion, and swiftest in the Peribelion; the Consequence is, that the Places of the Earth's Aphelion and Perihelion may be found by Observation of her slowest or swiftest Motion. And the Places of these Aspides, as they are called, may be found also by the Sun's Apparent Diameter; which will be least when the Earth is in her Aphelion, and greatest in the Perihelion: But their being some Difficulty in measuring this accurately, the former Way of finding the Place of the Earth's Absides is the best.

The Motion of the Earth's Aphelion is only

Apparent, and not Real; but it answers to the Procession of the Equinoxes, which is annually

about 50 Seconds.

EARTH. In the Year 1679, an Experiment being suggested to try, whether the Earth moved with a Diurnal Motion or not, by the Fall of a Body from a confiderable Height, alledging it would fall to the East of a true Perpendicular: Dr. Hook read before the R. Society a Discourse on that Subject, wherein he endeavoured to explain what Curve the falling Body would describe; and in particular, he afferted, that the Fall of the Body would not be directly East, but to the South-East, and more to the South than the East. And on several Trials made, the Ball did always fall to the South-East. Hook's Life, in

Op. Post. p. 22.

EARTH. If you suppose an heavy Body to descend 15 Feet in the first Second of Time, Mr. Keill faith, it follows by Calculation, (See Exam. of Burnet's Theory, p. 117, 118.) That the Force of Gravity, to the Centrifugal Force, in a Body placed at the Equator of our Earth :: is as 289 to 1. So that by the Centrifugal Force arising from the Earth's Rotation, any Body placed in the Equator will lose a 289th Part of its weight which it would have were the Earth at Rest.

And fince there is no Centrifugal Force at the Poles, a Body there weighs 289 th. which, at the

Equator would weigh but 288 tb.

And p. 123. He thews; That on our Earth, the Decrease of Gravity, in going from the Pole towards the Equator, is always as the Square of the Cosine of the Latitude.

EARTH. According to Sir Isaac Newton's

doth, in every Annual Revolution of the Earth round the Sun, swice incline towards the Ecliptic, and twice return to its former Polition; and on this Nutation of the Earth's Axis depends the Recession of the Equinoctial Points; and, as Mr. Flamstead thinks, the Annual Parallel of the fixed Stars.

The Annual Regression of the Earth's Nodes. is about 50 Seconds, and the Nutation of her

Axis, about 42 Thirds.

EARTH. Dr. Gregory, Astron. Phys. & Geom.
p. 76. That by reason of the Figure of the Earth, the Equinoctial Points do recede; and that the Axis of the Earth, in every one of its Annual Revolutions round the Sun, doth twice change its Inclination to the Ecliptic, and as often return again to its former Inclination of 66 Deg. and half.

EASEL-Pieces, in Painting, are such small Pieces, either Portraits or Landskips, which are painted on the Easel; (the Frame on which the Painter places his strain'd Canvass) and are so called to diftinguish them from larger Pictures, which are drawn on Cielings, Roofs, or the Walls of Rooms.

EASEMENT, (Aissumentum) in the Law, is a Service which one Neighbour hath of another, by Charter or Prescription, without Profit; as a Way through his Cround, a Sink, &c. and

this, in the Civil Law, is called Servicus Predii:

EAVESLATH, in Architecture, is a thick scather-edg'd Board, nail'd round the Eaves of a House, for the lowermost Tiles, Slate, or Shin-

gles to rest upon.

EBDOMADARIUS, was formerly an Officer, so called in Cathedral Churches, appointed Weekly to supervise the Regular Performance of Divine Service, and other Duties of the Choir; and at the Beginning of each Week he drew up a Bill (which was called Tabula) of the Respective Persons attending the Service of the Choir, and of their Duties allotted them; and those Persons which were entered in this Bill were called Intabulati.

ECCENTRICITY of the Earth, in the new Aftronomy, is the Distance between the Focus and the Centre of the Earth's Elliptick Orbit: How to find which, Mr. Whifton shews, p. 90. of his Prelect. Aftron. from the Apparent Motion of the Sun, compared with the two Extreams of the Apsides. For fince the True Velocity of the Earth in her Aphelion and Perihelion is in a Reciprocal Ratio of her Distances from the Sun; and that the Apparent and Angular Velocity is in a duplicate Ratio of her Distances reciprocally; from the Apparent Difference of these two Velocities, the Difference of the Distances, or the double Eccentricity, will easily be known. The Eccentricity of the whole Distance is, at a mean, about a 60th Part, or, more accurately, \(\frac{3486}{10000} \).

ECHO. Dr. Plot, in his Natural History of Oxfordshire, Cap. 1. distinguishes Echoes into such as are, 1. Single, which return the Voice but once; and of these, some may be called Tonical; because they will not return the Voice but when modulated into some peculiar Musical Note: And others Polyfyllabical; because they will return many Syllables, Words, and Sentences; and sometimes a whole Hexameter Verse.

2. Manifold or Tautological, which return Syllables and Words the same oftentimes repeated.

In the Polysyllabical and Articulate Echoes, the Place where the Speaker stands is called the Cen-Principles, Lib. 3. Prop. 21. The Axis of the Earth | trum Phonicum; and the Object or Place that returns the Voice is called the Centrum Phonocamp-He saith, he experienced what Blancanus writes in his Echometria, Theor. 5. That no one Syllable can be distinctly and clearly returned under the Distance of 24 Geometrical Paces, or 120 Feet. But by some Experiments I have made, I judge that Distance to be too large, as well as that of Mersenus, of 69 Feet, to be too little : And perhaps some Places may return the Voice fooner, and some later, than others; which it would be worth while to try, where there is a Convenience of measuring perpendicularly from the Centrum Phonocampticum. When I was about 16 Years of Age, having Dr. Plot's Book to direct me, I remember well, that I found an Echo, whole Centrum Phonicum was on the North Side of Shipley Church in the Wild of Suffex; and which would repeat distinctly these Words, in the Night;

> Os Homini sublime dedit, Calumque tueri Juffit & Ereflos----

especially, if you spoke the first Syllable very strong, and all the rest pretty fast. I measured then also the Distance very accurately, but the Papers are lost, and I can pronounce nothing certainly about them; but only that it was much the finest and most distinct Echo that ever I tried; tho' I tried the famous one at Woodstock several

Times, after I went to Oxford.

ECLIPSE of the Sun. In order to observe an Eclipse of the Sun accurately, Mr. Flamsted directs to cast the Species of the Sun through a good Telescope, of a tolerable Length, on an extended Paper behind the Eye-Glas; and so far as that the said Species may appear at least 6 Inches over. And then to divide both the Periphery of a Circle, equal to that, and drawn on the Paper, into 560 gr. for the better observing the Cusps of each Phasis; and also the Diameter into Digits, and their Parts, by Concentrick Circles, for measuring the Quantity of the obscured Parts. When you look at an Eclipse of the Sun, the best and readiest way to save the Eye, is to take a Piece of plain Looking-glass Plate, and black one side of it over the Flame of a Candle; and then look through it at the Sun. And if you use a Telescope, such a black'd Glass must be between your Eye and the Eye-glass.

To determine the Moment of the Immersion, Duration, and other Requisites of a Solar Eclipse: Vid. Whiston's Pralett. Astron. p. 160. and of a Lu-

nar, p. 150. ECLIPSES. 'Tis now discovered, that Lunar Ecliples do not arise from the Interposition of the Earth's Body between 1 and her, but only from the Interpolition of her Atmosphere.

Of which, and all the Phanomena of Eclipses,

fee Whiston's Pralett. Astron. p. 135.
EDICT, in the Civil Law, is any thing that the Emperor establishes of his own Accord, that it may be generally observed by every Subject. And this differs both from a Decree, or a Pragmatick Sanction

ELASTICITY. The Cause of the Elasticity of Fluids, such as our Air, may easily be acounted for, from their Particles being all endowed with a Centrifugal Force, like what Sir Isaac Newton mentions in Prop. 23. lib. 2. of his Excellent Principia. And to solve the Springiness or Elasticity of solid and firm Bodies, we must have Recourse to another universal Law of Nature, Attraction; by which the Parts of solid and firm

Bodies are caused to cohere together. therefore hard Bodies are either bent or fruck, fo that the Component Particles are a little moved from one another, but not quite disjoined and broken off, nor separated so far as to be out of the Power of that Attracting Force, by which they cohere together; they certainly will, on the Cessation of the external Violence, spring back with a very great Velocity to their former natural State: Supposing, as I said before, that the Particles are not separated by the Flexure, or the Shock, so far from one another, as that the Atoms of any foreign Fluid can get in between them, and hinder the Attractive Force; for then, as soon as ever the separating Force ceases, the Attractive will act, and bring them back to their former State.

ELECTION, in Numbers, with Regard to Combinations, is the several Ways of taking any Number of Quantities given, without having respect to their Places. Thus the Quantities a, b, c, may be taken 7 Ways; as abc, ab, ac, be, and a, b, c.

See Schooten in his Miscellanea; and Strode of Combinations. See also the Word Combination.

ELECTRICITY. In Phil. Tran. N. 308, there is an Account of an Experiment made before the R. S. at Gresham College, touching the extraordinary Electricity of Glass, produceable by a smart Attrition of it, with some odd Phænomena thereon depending: As, that Moistness will at any Time hinder the Electrical Attraction: That the Interposition of the finest Lawn or Muslin between the Body heated by rubbing, and the Light Bodies to be attracted, will deprive it of all Electrical Force: That when the Electrick Body (which was a Tube of Glassof 11 in Dia 1 meter, and 30 in Length) became hottest by the greatest Rubbing, it sent forth Effluvia that might sensibly be felt to strike against your Face, when the Tube was held near it: That exhausting the Tube of Air by the Pump, did almost total-ly deprive it of its Electrical Force, tho rubb'd never so much, &c. All which Experiments I have often made myself, and find to be very truly related there. 'Tis observable, that on rubbing the Tube in the Dark, a Light would be produced; which was greater when the Tube was exhausted of Air, and then seem'd to be all within the Tube; and when another Hand, or ones Finger was held near the Tube in the dark, a Light was seen to break from it, with a snapping Noise like that of a green Leaf in the Fire, but not so smart and loud.

He got also a Cylindrical Glass, and caused it by the Contrivance of a Wheel to be briskly turned round in an Horizontal Position: When this Glass, being exhausted of Air, was turn'd round its Axis, a confiderable Light would be produced, by the Attrition of ones Hand on the Outside; and when the Air was let in, it was surprising to see, that on the Application of ones Finger towards the Glass, a vigorous Light would be produced, which began at the Finger first, and seem'd to gravitate on it, and was sensibly to be felt there, at half an Inch distance from the revolving Glass. And this Purple Light was visible, even by Day, or in the Light. Mr. Hawksbee contrived also, that some loose Threads should be fasten'd at one End to a Circle of Wire, which was fasten'd at Right Angles to the Axis of the Glass, and within it; and then we observ'd several times, that when the Glass was swiftly moved round, and, by that means, strongly rubbed and heated, all those loose Threads would stand upright, and point directly towards the Axis of the revolving

He afterwards fix'd the Lower Ends of Threads into a Circle of Cork, which was placed at Right Angles to the Axis as before, but the upper Ends of the Thread hang loose; but as soon as the Glass was turn'd round as before, rubbed and warmed, the Threads would stand up an End in the same Plane with the Circle they were fastened to; and would point directly from the Axis towards the inward Surface of the Glass; unless when moved by the Application of ones Finger without; which would, surprisingly, make them bend and point towards it.

To describe this Figure readily ELLIPSIS. by means of the Sector, see Analemma, Vol. 1.

EMBER-WEEKS, are those Weeks in which the Ember-Days fall. In the Laws of K. Alfred, c. 39. and in those of Canute, c. 16. they are called Imbren, i. e. Circular Days; from whence they are corrupted into Ember-Days: And by the Canonists they are called, Quatuor Anni Tempora, the Four Cardinal Seasons on which the Circle of the Year turns: They are the Wednesday, Friday, and Saturday, after Quadragesima Sunday; after Whitsunday; after Holy-rood Day, in September; and after Sti Lucy's Day, in December: Which four Times answer well enough to the four Quarters of the Year, Spring, Summer, Autumn, and Winter. And Mr. Somner thinks, they were Fasts instituted to beg God's Blessing on the Fruits of the Earth. These Ember-Weeks are now chiefly taken notice of on the Account of the Ordinations of Priests and Deacons; because the Canon now appoints the Sundays next succeeding the Ember-Week, for the Solemn Times of Ordination. Tho' the Bishops, if they please, may ordain on any Sunday or Holyday. EMBRACERY, is the Offence of an Embra-

ceur ; to pre-instruct the Jury.

EMBRE, or Embring-Days, are those by the Antients call'd Quatuor Tempora, and are of great Antiquity in the Church; being observed on the Wednesday, Friday, and Saturday next after Quadragesima Sunday, Whitsundy, Holy-Rood Day,
in September, and St. Lucy's Day, in December,
2 & Bdward VI. c. 19.

EMENDATIO, in the Law, is the Power of

amending and correcting Abuses according to

stated Rules and Measures: As,

EMENDATIO Panni, is the Power of Aulnage, or Ulnage, or looking to the Affize of Cloth, that it be of the just Ell, or due Measure. EMENDATIO Panis & Cervisiae, is the Affize

of Bread and Beer; or the Power of supervising and correcting the Weights and Measures belong-

ing to them. EMETICKS. Dr. Cheyne, in his Book of Fevers, says, the Action of vomiting by a Medicine is produced thus: The Particles of the Vomitory, by wedging themselves into the Orifices of the Emissaries of the Glands which are placed adjacent to the Surface of the Stomach, do Dilate the same (which by some extrinsical Cause had been contracted) and after the same Manner do Diffolve (at least in some Degree) the Cohesion of the Stagnant Morbifick Matter, rendring it more fluid, and consequently, making its Resistance less. Now the natural and constant Action of the Glands being Secretion; and the Impediment (by the Dilatation of the Orifice, and the Attenua-

Vol. II.

made less than the natural Momentum of the Glands, the Matter must necessarily slow into the Cavity of the Stomack, till it be heap'd up in such a Quantity (which not being to be done in an Instant, must require some Time) as is sufficient (by the united Loathsomness, and the Vis Stimulans of the Emetick) to villicate and force the Fibres of the Stomach, Abdomen, and Diaphragm (by the Communication of the Nerves of the First with the two last) into a violent Contraction, and thereby, throw all out by the Oesophagus; and this makes all quiet for a while, till a new and sufficient Quantity be excerned from these Glands to reproduce the aforesaid Contraction. And thus there happens a Fit of Vomiting and Quiet alternately, till either all the Morbifick Matter be thrown out, or the Force of the Emerick is so dilated, that it is no longer able to elicit the Morbifick Matter from the Glands. And the Strong Contraction in so many Muscles and Muscular Canals as are at work in the Action of Vomiting, and the Violent Concussion which is produced over the whole Body, by a Power which, by just Computation, is not inferior to that of 26000 th. Weight, may, and often does take away the Obstructions in many other Canals besides those which are adjacent to the Stomach and Gullet; as we may plainly see by those vast Sweats which plentiful Fits of Vomiting occasion. Emeticks and purgative Medicines differ only in this, that the Particles of the latter do not immediately vellicate the Fibres of the Stomach, dilate the Orifices, and attenuate the Matter contain'd in the Glands of the Stomach, but act gently, and affift the natural Motion of Di-gestion, and so are carried down into the Intestines; and how they operate there, see under Purgatives.

EMINENTIAL Equation, is a Term used by the Algebrists in their Investigation of the Areas of Curvilineal Figures; and is so called, because 'tis an Artificial Equation, which contains another Equation eminently. See Hayes's Fluxions,

p. 97, &c. EMISSARY of a Gland, is the common Conduit, Canal, or Pelvis, in Which all the little Secretory Canals of a Gland do terminate. See Gland and Animal Secretion

EMPHYTEUSIS, in the Civil Law, is a Contract made by Consent, but created by the Roman Law, and not the Law of Nations; by which Houles or Lands are given, to be possess'd for ever, upon Condition that the Lands shall be improved, and that a small yearly Rent shall be paid to the Proprietor. The Tenant is call'd,

EMPHYTEATA, because of his being under an Obligation of planting and improving the Land.

EMPTIO-Venditio, in the Civil Law, is that Contract, by Consent only, which we call Buying and Selling, whereby the Seller is bound to deliver the Goods, and the Buyer to pay the Price for them, according to the Bargain. EMPYREUMA, is that Tast and Smell of Fire,

which some Things, too hastily distill'd, retain.

ENCAUSTICE, is the Art of Enameling. ENCHESON, is a French Word often used in our Law-Books; and feems to fignify, the Occasion, Reason, or Cause of any Thing's being done

ENCOLAPTICE is the Art of making Plates of Brass, and cutting in the Figures or Letters for tion of the Fluid) being taken away, or at least | Monumental Inscriptions and Laws.

ENGINE

ENGINE for Rowing Ships: The Figure of this Engine being omitted in Vol. I. is here added.

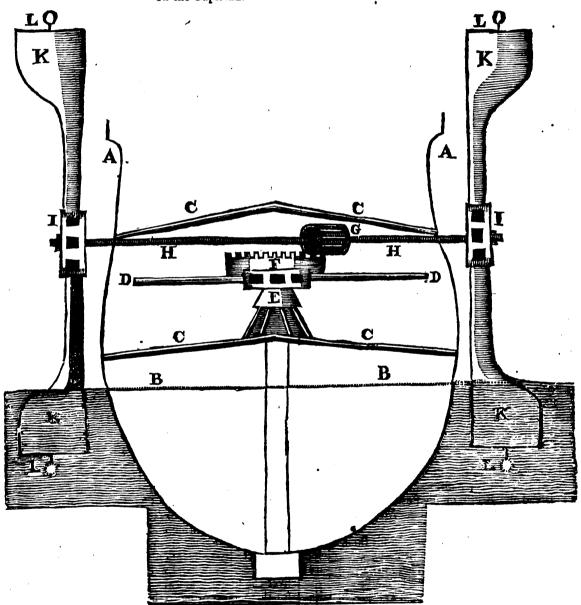

Description.

- B. The Water Line.
- C. The Decks.

- D. The Capstand Barrs.

 E. The Capstand.

 F. A Wheel on the Drumhead of the Capstand.
- G. A Trundle-head on the Wheel.
- H. An Iron Bar going through the Trundle-head, and thorough the Sides of the Ship.
- I. Two Drum-heads like those on the Capstand.
- The Line the Ship makes. | K. Paddles, of which Six, or Eight on each Side the Ship, are with Ease Fixed and Unfixed into the said Drum-heads.
 - L. A Piece of Iron, to which a Luff-Tacle may be Fix'd, to lift those that are too Heavy for Mens Strength, round each of which, by taking half Turns with a Cord, you make a Com-pleat Wheel on each Side the Vessel.

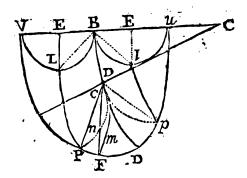

fignifying to be an Englishman: For in the Time of the Danes, if a Man were privily flain or murdered, it was accounted Fracigena, which Word then comprehended every Alien, until Englecers was provid, that is, 'till it was made manifest that he was an Englishman. Vid. Braston, Lib. 3. Trast. 2. Cap. 15. Fol. 134. But there being many Abuses and Troubles about this Engle-

ENGLECERY, Engleceria, is an old Word | cerr, it was taken away by 14 E. III. cap. 4.

ENURE, in the Law Sense, signifies to take Place, or Effect, or to be Available. As a Re-lease shall Enure by way of Extinguishment;

Convex

Convex or Concave Part of another Circle; which Part of this other Circle is call'd the Base of the Epicycloid; as in this Figure, DB is the Base of

the Epicycloid; V its Vertex; VB its Axis; DPV half of the Exterior Epicycloid; made by the Revolution of the Semicircle V L B, (which is called the Generant) along the Convex Side of the Base DB: As DP U is the Interior Epicycloid, formed by the Generant's revolving along the Concave Side of the Bale.

How a Portion of this Epicycloid is squarable, fee Phil. Tranf. N. 217. by Mr. Caswell, and in Phil. Tranf. N. 218. you have a general Propo-fiction for measuring the Areas of all Cycloids and Epicycloids. How to find the Evoluta to this kind of Curve, as also to find the Areas of Cycloidal and Epicycloidal Spaces. See Hayes's

Fluxions, p. 210, &c. EPISCOPALE Onus. See Episcopalia.

EPISCOPALIA, are Synodials, Pentecostals, and other Customary Payments, from the Clergy to their Diocesan Bishop; which Dues were for-merly collected by the Rural Deans, by them transmitted to the Bishop.

These Customary Impositions were called Onu Episcopale, and were by special Privilege remitted to those free Chapels as were built on the Demesne of the King, and exempt from Episcopal

Jurildiction.

EQUATED Bodies. On Gunter's Sector there are sometimes placed two Lines, answering one another, and called, The Lines of Equated Bodies: They lie between the Lines of Solids and Superficies, and are noted with the Letters D, I,C, S, O, T, for Dodecahedron, Icosihedron, Cube, Sphere, Octahedron, and Tetrahedron.

Their Uses may be these;
The Diameter of a Sphere being given, to find the Sides of the 5 Regular Bodies, leverally, equal to that Sphere.

2. The Side of any of the Bodies being given, to find the Diameter of the Sphere, and the Sides of the other Bodies, which shall be severally to

the first Body given.

If the Sphere be first given, take its Diameter, and apply it over in the Sector in the Points S, S: If any of the other Bodies be first given, apply the Side of it over in its proper Points: So Parallels taken from between the Points of the other Bodies, shall be the Sides of those Bodies, equal feverally to the first Body given.

EQUATIONS. Captain Halley in Philosoph.

Trans. N. 190. p. 38. gives an Account of the Number of Roots in Cubick and Biquadratick Equations, together with their Signs and Limits. Vol. II.

traction of all Roots out of them without any previous Reduction.

In N. 309, there is an Analytical, Geometri-cal, Mechanical, and Universal Method for the Resolution of Cubick and Biquadratick Equations, by Mr. 3. Colson. And an Analytical Resolution of some Equations of the 3, 4, 5, 7, 9, and Superior Powers; and so on Infinitely, in Finite Terms, and in such a Method as Cardan used for

Dr. Gregory, in the Preface to his excellent Oxford Euclide, in G. L. shews, that from the 86th and 87th Proposition of Euclides Data, even Biquadratick Equations, where the 2d and 4th Terms are wanting, may be refolv'd. As all Quadratick Equations may be, by the 84th and 85th Propositions of the same Data.

EQUES Auratus, is used to fignify a Knight, which is called Auratus, because antiently none but Knights might guild or beautify their Armour, or other Habiliments of War, with Gold. However, in Law, this Term is not used; but instead of it Miles, and sometimes Chevalier.

EQUILATERAL Hyperbola. If the Transverse Diameter of any Hyperbola be equal to its Parameter, then all the other Diameters will also be equal to their Parameters: And such an Hyperbola as is this, is called an Equilateral, whose A-symptotes do always intersect each other at Right

Angles in the Center.

EQUITY, is of two Sorts, and those of contrary Effects; for the one doth abridge and take from the Letter of the Law; and the other doth

enlarge and add thereto.

*The first is thus defined; 'Tis the Correction of the Law made generally in that Part wherein it fails; which is a Correction much used in our Law: As suppose an Act made, That whosever does such a Thing, shall be a Felon, and suffer Death: Yet if a Madman, or an Infant, who hath no Discretion, do the same, he shall neither be a Felon, nor suffer Death.

The other Equity is defined, to be an Extenfion of the Words of the Law to Causes unexpress'd, yet having the same Reason; so that when one Thing is enacted, all other Things are so too, that are of the like Degree: As the Statute, which ordains, that in Action of Debt against Executors, he that doth appear by Distress shall answer, doth extend by Equity to Administrators; for such of them as shall appear first by Distress, thall answer by Equity of the said Act: Quia sunt in Equali genere. Cow. Interpret.

EQUIVOCAL Generation. There is scarce

any thing feems more to countenance Equivocal Generation, than the Production of Worms, &c. in the Bodies of Animals; and yet Mr. Ander, in his Discourse de la Generation de Vers dans le Corps de l' Homme Paris, in 8vo. 1700. shews, that they breed there by a Seed which finds Entrance some how into our Bodies; and in particular, he shews, that the Ciron, or Hand-Worm, issues perfectly from its Egg, and after that grows infen-fibly. He judges that the Eggs of small Infects enter our Bodies by the Air we breathe, and in our Food; and that they are hatch'd there, only when they find an agreeable Heat and Disposition of the Humours and Parts.

Dr. George Garden hath observ'd; See Phil. Tran. N. 237. that the Bearers, or Bearing Buds of Fruit-Trees, are full of Asperites, and not so And in N. 210, he gives a Method for the Ex- mooth in their Bark as the other Parts of the Vol. II.

Ff 2

Tree

Tree; and that if after Harvest you look on these with a common Microscope, you will find the Cavities there full of Eggs of an oblong Figure. and of a Citron Colour; especially, in such Years, and in those Trees, where the Caterpillers have been numerous. From whence he concludes, that we should not say Insects are bred out of Corruption equivocally, and not ex Ovis, only because we cannot discern the particular Manner

of their Propagation. See Insects.

Mr. Ray faith, it feems to him to be most probable, that there is no such Thing as Spontaneous or Equivocal Generation; but that all Insects are the Natural Issue of Parents of the same Species with themselves. Fr. Redi, in his Book de Gener. de g'l Insetti, bath, I think, cleared up this Point, and shew'd there is no Generation of Animals ex Materia Putrida. And Dr. Lister hath given an Account of the Insects bred in the By-Fruits and Excrescencies of Vegetables, in Phil. Tran. N. 71,

Mr. Willoughby accounts for the Ichneumon Wasps, and the Manner of their laying their Eggs in the Bodies of other Infects; as of Caterpillers, &c. Phil. Trans. N. 76.

Dr. Lister, in Phil. Trans. N. 83. harh refuted the vulgar Notion, that Horle-hairs thrown into Water will become animated Bodies; and shews, that the Appearances of that Kind are Hair-Worms actually bred in the Bodies of other Infects, as of the Common Black Beetle, &c.

ERRANT, in our Law, is the same as Itinerant, being attributed to Judges that go the Cir-

cuit; and to Bailiffs at large.

ESCAMBIO, is a Licence granted to one, for the making over a Bill of Exchange to another, at Sea, Reg. Orig. Fol. 194. For by the Statute of 3 R. 2. c. 2. no Merchant ought to exchange or return Money beyond Sea, without the King's License.

ESCAPE, fignifies, in the Civil Law, a violent or Privy Evalion out of some lawful Re-

Araint

ESNECY, Æsnecia, in the Law, is a Prerogative given to the eldest Co-partner, to chuse first, after the Inheritance is divided.

ESPICURNANTIA, is the Office of Spigur-

nel, or Sealer of the King's Writs.
ESQUIRE, in French Escuier, i. e. Scutiger, was originally such an one, as attending a Knight in Time of War, did carry his Shield. But now it signifies a Gentleman, or one that beareth Arms as a Testimony of his Nobility or Gentry; and is a meer Title of Dignity, next to and below a Knight. They who claim this Title now are, all the younger Sons of Noblemen; the Four Equires of the King's Body; the eldest Sons of all Barons, Knights of the Bath, and Knights Batchelors; those that serve the King in any worthipful Calling; fuch as created Esquires by the King with a Collar of SS's of Silver: The Chief of some Families are also Esquires by Prescription: Those that bear any superior Office in the Common-wealth, as a Justice of Peace, while in Commission, and Utter Barristers, &c.

ESSAY Hatch, is the Miners Term for a little Trench or Hole, which they dig to search for

Shoad, or Oar. See Tin.

ESSENTIAL Oils of Vegetables, are, according to the Chymists, such are drawn from the Plant in a Limbeck, by the Help of Water.

ESTERLING. The same with Sterling. ESTORERS. The same with Hase Bote, or House Bote : Which see.

ESTRANGERS, in the Law, are sometimes taken for such as are not Privies or Parties to the levying of a Fine, or making of a Deed; and sometimes for those that are born beyond the

ESTRAY, fignifies any Tame Beaft found within any Lordship, and not own'd by any Man; in which Case, being cried, according to Law, in the Market adjoining, if it be not claimed by the Owner in a Year and a Day, it

is the Lord's of the Soil.

EVENINGS, was formerly the Delivery, at Night or Even, of a certain Portion of Grais or Corn to a Customary Tenant, who performs his wonted Service of Mowing or Reaping for his Lord, and at the End of his Day's Work, did use to receive such a Quantity of Grass or Corn to carry Home with him, as a Gratuity or Encouragement for his bounden Service. Kennet's Pa-

roch. Antiq.
EVICTION, in the Civil Law, is a Recovery of the Title to any thing fold by a Stran-

EVOLUTA. See in Involute and Evolute Fi-

gures, in Vol. I.

EVOLUTION. The Equable Evolution of the Periphery of a Circle, or any other Curve, is such a gradual Approach of the Circumserence to Rectitude, as that all its Parts do meet together, and equally evolve or unbend; so that the same Line becomes successively a less Ark of a reciprocally greater Circle, till at last they turn in-to a strait Line.

In Philos. Trans. N. 260. p. 445. you have a new Quadratrix to the Circle, found by this Means, being the Curve described by the Equable

Evolution of its Periphery.
EUSTACHIAN Tube. The same with the

Aqueductus Tallopii. See Tuba Eustachiana. EXACTION Secular, was any Sort of Tax or Imposition formerly paid by servile and feudato-

ry Tenants.
EXCEPTION, in the Law, is a Stop or Stay to an Action; being used in the Civil and Common Law both alike, and in both divided into

Dilatory and Peremptory.

EXCLUSIONS. The Method of Exclusions is Way of coming at the Solution of Problems (in numerical Cases) by previously ejecting or excluding out of our Consideration, such Numbers as are of no Use in solving the Question; and whereby consequently the Process may be regularly and judiciously abbreviated.

An Account of which Method, Mr. Frenicle gives, in the Ouvrages de Mathematique, &c. in

Fol. Paris,

ol. Paris, 1693. EXHIBITION, was anciently an Allowance for Mear and Drink, such as the Religious Appropriators made to the poor depending Vicar. And this Word is still retained in the Colleges of Oxford and Cambridge, in nearly the same Sense.

EX OFFICIO. By a Branch of a Statute of I Eliz. 1. The Queen, by her Letters Patents, might authorise any Persons, &c. to administer an Oath Ex Officio; whereby the supposed Offender was forced to confeis, accuse, or clear him-self of any Criminal Matter, &c. But this Branch, relating to the said Oath, is repeal'd by Star. 17 Car. 1. c. 11.

EXPLE-

EXPLETORY Justice. See Justice. EXPONENTIAL Curves, are such as partake both of the Nature of Algebraick and Transcendent ones. They partake of the former, because they confift of a Finite Number of Terms, tho' those Terms themselves are Indeterminate: And they are in some measure Transcendental, because they cannot be Algebraically constructed.

EXPONENTIAL Equations, are such as Sir Isaac Newton calls Geometrice Irrationals; they are

sometimes also call'd Transcendental.

EXPONENTIAL Quantities, are such whose Exponents are indeterminate, variable, or flowing Quantities; and the Quantities are of several Degrees and Orders. When the Exponent is a Degrees and Orders. When the Exponent is a fimple indeterminate Quantity, 'tis called an Exponential of the first or lowest Degree.

When the Exponent it self is an Exponential of the first Degree, then the Quantity is an Expo-

nential of the second Degree, &c.

Thus zi is an Exponential of the first Degree; because the Quantity y is a simple flowing Quan-

tity. But 30 is an Exponential Quantity of the fecond Degree; because y is an Exponential of

the first Degree. So also zy is an Exponential of the Third Degree; the Expotent yx being one of the second.

See D. Bernoulli's Trastatus de principiis Calculi

Exponentialis: And Craig's Correction also of a Mistake in it; in Phil. Trans. N. 245. p. 374.

Hayes Fluxions, p. 306. Where are Rules to find the Fluxions of Logarithms and of Powers, when the Exponents are Flowing Quantities. As also how to conftruct Exponential Curves, and to determine their Tangents.

EXPROMISSOR, in the Civil Law, is one that discharges the first Debtor, and takes the

Burden upon himself.

EXTEND. To extend, in a Legal Sense, fignifies the valuing of Lands and Tenements of one bound by Statute, &c. and hath forseited his Bond to such an indifferent Rate, as that, by I are now not supposed to be such.

the yearly Rent, the Obligator may in time be

fully paid his Debt.

EXTREMITIES of the Figures in Painting, are the Head, Hands, and Feet; and these should be drawn with more Nicety and Exactness, ot more terminated than other Parts; and must help, by that Means, to render the Action more

expressive.

EYE. Dr. Hook in his Posthumous Works, p. 12. faith, That the discerning Power of the Eye, is not capable of making Distinction of Parts, when they are smaller than the small Pores of Wood; which he found by this Experiment: By a convenient Lens, he brought the Object so near the Eye, that the crossing of the Rays in the Eye was about the middle Space between the visible Side of the Object and the Bottom of his Eye; from whence it followed, that the Picture of the visible Part of the Object was as big as the Thing represented; and the Eye being then at most but capable of seeing or distinguishing those Pores; it follows, that if the Cause of that Distinction be from the Ends of the Filaments of the Optic Nerve, as Descartes ingeniously supposes, the Filaments can't be smaller than the Microscopical Pores of Wood; and that the Eye is uncapable of distinguishing the Parts of any Object that are smaller than those: So that any Object being so far remov'd from the Eye, as that its Picture on the Retina shall be less than a Microscopical Pore, will become invisible; at least if it be but of a dull Radiation; for if it be of a bright one, (as the Stars are) the whole Filament is moved by having one Part of it powerfully acted on; and so we have a Sensation of the Object the same as if it were much bigger. And this seems to be the Reason, why the Stars appear to our naked Eye many thousand Times bigger than they really are, and even as big as thro' a long Telescope, And p. 13, he saith, that if by the Help of Glasses, the Eye can be made capable of collecting a much greater Quantity of Rays from a Point, and make them meet in the Retina, 'tis not improbable, but that a much greater Number of Bodies may be discovered to be Radiant, which

F. By Statute 5 & 6 E. 6. cap. 4. 'tis enacted, That whoever shall maliciously strike any Person with a Weapon in the Church or Churchyard, or draw it there, with an Intent to ftrike, shall have one of his Ears cut off; or if he have no Ears, shall be burnt on the Cheek with an F; that he may be known for a common Fighter or Fray-maker

FABRICK Lands, are Lands given to the Rebuilding, Repair, or Maintenance of Cathedrals, and other Churches, and mentioned in the Act of Oblivion, 12 Car. 2. c. 8. Formerly every one almost gave by his Will something, more or less, to the Fabrick of the Cathedral, or his Parish Church, and these were called Fabrick Lands; and

by the Saxons, Timber Lands.

FACE prolong'd, in Fortification, is that Part of the Line of Defence Razant which lies between the Angle of the Shoulder and the Curtain; or tis the Line of Defence Razant diminished by the

Length of a Face.

FACIA's, in Architecture, as the Workmen call it, (for it should be spelt Fascia,) are nothing but broad Lifts or Fillers, and are commonly made in Architraves, and in the Corners of Pedestals. In Brick Buildings, they call the Jut-tings-out of the Bricks over the Windows in all Stories but the highest, by this Name; these are fometimes plain, and fometimes moulded; and this moulding it only a Scima Reversa, or an O ... G ... at the Bottom, and above this are two plain Courses of Bricks, then an Astragal, and last of all, a Bouleine; which the Workmen call a Bouleil.

FACK, in a Ship, is any one round of a Cable when it is quoiled up out of the Way.

FAGGOT, in Times of Popery here was a Badge worn on the Sleeve of the Upper Garment of fuch Persons as had recanted and abjured what the Powers that then were, did call Heresy; which was put on after the poor Wretches had carried a Faggot, by way of Penance, to some appointed Place of Solemnity. And sometimes they interpreted the leaving off this Badge of the Faggot to be a Sign of Apostacy.

FALDAGE, Faldagium, is a Privilege which antiently several Lords reserved to themselves of fetting up Folds for Sheep in any Fields within their Manors, the better to manure them; and this not only with their own, but their Tenants Sheep, which they called Sella Falda. This Faldage in some Places they call a Fold Courfe, or Free-fold; and in some old Charters 'tis called Foldsoca, i. e. Libertas Faldæ or Faldagii.

FALDFEY, or Faldfee, was a Composition paid some Cuttomary Tenants antiently, that they might have Liberty to fold their Sheep apon their

own Ground.

FARDEL of Land, according to some Writers, is the 4th Part of a Yard Land; but Noy, in his Complete Lawyer, p. 57. saith, two Fardels of Land make a Nook, and four Nooks a Yard Land.

FARDING, or Farthing of Gold, seems to have been a Coin uled in antient Times, containing in value the 4th Part of a Noble, viz. Twenty-pence in Silver: In Weight, the 6th

Shillings in Silver. This Word is used 9 H. 5. c. 7. and there appears to have been a Coin as well as the Noble and Half Noble.

FARDING-deal, or Farundel of Land, was the 4th Part of an Acre.

FAST-Country. A Term used by the Tin-Miners, and fignifies the same with Shelf; which

FASTING Men, Homines babentes. Term which some will have to signify Men of Repute and Substance: But 'tis more probable, that by it was meant rather Pledges, Sureties, or Bondsmen; which, according to the Saxon Custom, were fast bound to answer for one anothers peaceable Behaviour.

FAUSBRAYE. See False Braye.

FEATHER Edg'd, is a Term used by Workmen for such Boards as are thicker on one Edge

or Side than on the other.

FELLOWS, in Fortification, are six Pieces of Wood, each of which form an Arch of a Circle; and these, joined all together by Duledges, make an entire Circle; and these, with 12 Spokes, make the Wheel of a Gun Carriage. Their Thickness is usually the Diameter of the Ball of the Gun they serve for, and their Breadth something

FEODARY, Feodatorious, was formerly the Title for the Seneschal or Prime Steward, who received Aids, Reliefs, Herriots, &c. and such

Customary Fees due to any Lord.
FIBRES. There are other Divisions and Distinctions of Fibres, besides those two mentioned in Vol. I. For, according to some Authors, there are in an Animal Body, Carnous, Membranous, Cartaliginous, Tendinous, Ossens, and Nervous Fibres, according to the Matter of which they con-fift. The Carnous Fibres, of which the Flesh is composed, are vascular and hollow, being full of little Cells: They are called Fibremotices, because they are the chief Organs of Muscular Motion.

There is a Difference also among Fibres, as to their Situation and Course. For those that run lengthwise in Right Lines, are called Strait Fibres: Those that run about some Part, as those do that form Sphinter Muscles, are call'd Circular. Those Fibres which cross Strait ones at Right An. gles are called Transverse; but those which inter-

lect them at any other Angles, Oblique Fibres.

FIDE Juffor, in the Civil Law, is the same with Repromissor, Adpromissor, Sponsor, Prades, and Vades; That is, a Surety, or one that obliges himself in the same Contract with a Principal,

for the greater Security of the Creditor or Stipulator.
FIELD-Colours, are small Flags about a Foot and half Square, which are carried along with the Quarter-master-General, for marking out the Ground for the several Squadrons and Battalions of an Army.

FIELD-Pieces, are small Cannon which are usually carried along with an Army in the Field; such as 3 Pounders, Minions, Sakers, 6 Pounders, Demi-Culverins, and 12 Pounders; and these being small and light, are easily carried.

FIELD-Staff, is a Staff carried by the Gunners; 'tis about the Length of an Halbert, with a Speer Part of an Ounce of Gold, that is, of five at the End, which, on each Side, hath Ears screw'd on like the Cock of a Match-lock; and in these, the Gunners screw in Lighted Matches when they are on Command. And this is call'd Arming the Field-Staffs.

FIFE Rails, in a Ship, are those that are plac'd on Banisters on each Side of the Top of the Poop, and so along with Hances or Falls they reach down to the Quarter-Deck, and to the Stair of the Gangway.

FIGURE. The Rectangle under any Diameter and its proper Parameter, is, in the Ellipsis and Hyperbola, called the Figure of that Diame-

r. De la Hire, Lat. Con. p. 47, 48.
FINERY, is the Name of one of the Fires in Forges in an Iron-work. See Iron. At the Finery, by the Working of the Hammer, they bring the Iron into what they call Blooms and

FIRE. See Light. There is an Account of the Generation of Fire, by Mr. Malbranche, in the Fr. Memoirs for the Year 1699, which is ingenious enough; but it seems to depend entirely on the Hypothesis of Descartes. In the same Book, Mr. Amontons shews a Method of making the Force of Fire supply that of Men or Horses in

Engines, p. 112. FIRE-Master, in our Train of Artillery, is an Officer that gives the Directions and the Proportions of the Ingredients for all the Compositions of Fire-Works, whether for Service in War, or for Rejoycings and Recreations. His Orders are given to the Fire-Workers and Bombardeers, who

are obliged to execute them.

FIRE-Workers, are subordinate Officers to the Fire-Masters, but they command the Bombardeers: They receive the Orders from the Fire-Masters, and see that the Bombardeers execute them.

FIRME, the same with a Farm, or Land and Tenements hired at a certain Rate. But it antiently fignified the Reception and Entertainment of the King, or any other Lord and his Retinue; and frequently in the Doomsday Book, a Condition of Tenute was pro firma per unum diem, or pro firma per unum noctem : And fo, because in the Saxon, and part of the Norman, Times, the Rent of Lands was paid in Provisions, Firma signified the Profits and Rent of an Estate: But Henry II. for better Convenience, alter'd this Custom into an Equivalent of Money; which Pecuniary Rent

was still call'd Firma Regis,
FIRST-Fruits, Primitia, are the Profits of every Benefice for one Year, given before the Reformation to the Pope; but by 26 H. VIII. c. 3. translated to the Crown: And by that Act, he which enters on any Spiritual Living before he pays or compounds for it, on Conviction, for-feits the double Value thereof. Every Clerk therefore, before his Induction, (or soon atter,) should go himself with one Friend of the City of London, Inns of Courts, or Parts adjacent, or send two such Friends for him, to the First Fruits Office, and there enter into Bond to pay the First Fruits of his Benefice within two Years next ensuing, at sour equal Half-yearly Payments. Only one Tenth of the whole Yearly Sum mention'd in the Queen's Books to be deducted; becanse that must be paid by itself the first Year. Formerly four Bonds were given for the four feveral Payments; but by Statute 2 and 3 of Her

The Successor is chargeable with Arrears of Tenths due from his Predecessor; and consequently, by 27 H. VIII. c. 8. is impower'd to distrain his Predecessor's Goods, being upon the Benefice, and hath likewise a good Action at Law, against him, or his Executors.

FISH-Block, in a Ship, is the Block which is

hung in a Norch at the End of the David, and ferves to hawle up the Fluke of the Anchor to the

Ship's Row.

FISHES. Rondeletius distinguishes Fishes, from the Places where they are found, into Sea Fish, River Fish, and Lake or Pond Fish; and of these he makes some other Subdivisions. But Mr. Wila loughby saith rightly, That Fishes are much better divided by Aristotle into these three Kinds, Cetaceous, Cartilaginous, and Spinous.
The Cetaceous Kind (which are sometimes

therefore call'd the Bella Marina) have Lungs and Breath like Quadrupeds, they copulate also like them, conceive and bring forth their Young alive, whom they suckle with their Milk.

The Cartilaginous Sorr, are produc'd from large Eggs like Birds, which are excluded the Womb also like those of Birds.

The Spinous Kind, are also Oviparous, but their Eggs are smaller, and they have Spine up and

down in their Flesh to strengthen it.

But he thinks it would be yet more proper to divide Fishes into the Cetaceom Kind, or such as breath with Lungs, and into such as breath with And then, to subdivide those that breath with Gills, not into Cartilaginous and Spinous, but into Viviparous and Oviparous.

The Viviparous Kind, that breath with Gills, he subdivides into Long, such as the Gales, and Canes or Sharks, and Dig. Fish: And the Broad Kind; such as the Pastinaca, Raja, Squatina, &c. all whose Subdivisions he gives in his Chapter of

Cartilaginous Fishes in general.

The Oviparous Kind, that breath with Gills, are the most numerous; and these he subdivides into fuch as are what we usually call Flat Fish; and such as swim with their Backs upright, or at Right Angles to the Horizon.

The Plain or Flat Fish Kind, called usually Plani Spinosi, are either Quadrati, as the Rhombi and Pafferes; or Longinfculi, as the Sole &.

Such as swim with their Backs erect; are either Long and Smooth, and without Scales, as the Eel Kind; or Shorter and less Smooth: And these have either but one Pair of Fins at their Gills, which are call'd Orbes and Congeneres; or else another Pair of Fins also on their Bellies. And this latter Kind he divides into two others; 1. Such as have no Prickly Fins on their Backs, but Soft and Flexile ones. 2. Such as have Prickly Fins upon their Backs.

Those Fishes which have only Soft and Flexile Fins on their Backs, may be divided into such as have Three, Two, or but One single Fin there. No Fish but the Aselli have Three Fins on their Backs.

Fishes with Two Fins on their Backs, are either the Truttaceous or Trout Kind, or the Gobionite,

or Loch or Gudgeon Kind.

Fishes with but one foft Back Fin, are of three Sorts; the first Kind have one long continued Fin from Head to Tail, as the Hipparus of Rondelesius, &c. the second have this Fin, but hort, and present Majesty, but one Bond only is appointed to be given; and the Rates of all Benefices, according to the Queen's Books, are declared unaltoplaced just in the Middle of their Back; and these Carp, Tench, &c.

Such Fishes as have Prickly Fins on their Backs, are of two Kinds:

1. Such as have Two prickly Fins on their Backs; and in these the Anterior Radii of their Fins are always prickly: Or,

2. Such as have but one prickly Fin there.

Mr. Willoughby gives us this Catalogue of our English Fishes.

1. Of the Long Cartilaginous Kind; are the 1. Canis Curcharius, or Lamia, the White Shark.

2. Galeus Glaucus Rondeletii, the Blue Shark.

3. Canis Galeus Rondeletii; called a Tope in Cornwal.

4. Galeas acanthias sive Spinax, the prickled Dog or Hound Fish.

5. Galeus seu Mustela lavis, the smooth or unprickled Hound Fish.

6. Catulus major, vulg. Canicula Aristotelu, the Rough Hound; in Cornwal, the Bounce.

7. Catulus minor, the leffer Hound Fish or Morgay.

2. Of the Plain Cartilaginous Kind; are the

1. Raja levis undulata, the Skate or Flare.

Raja Clavata, the Thornback.
 Raja Aspera Nostras, the White-borse.

4. Squatinu, the Angel or Monk-Fish.

5. Rana Piscatrix, the Toad Fish or Sea-Devil.

3. Of the plane Spinous Kind; are the

1. Rhombus Maximus Aspero Squammosus, the Turbot or Brett.

2. Rhombus non acculeatus squammosus; in Cornwal call'd the Lug-alefe.

3. Paffer Bellonii, the Place.

4. Passer Asper sive Squammosus, the Dab. 5. Passer Fluviatilis sive Amphibius, the Flounder, Fluke, or Butt.

6. Hippoglossus Rondeletii, the Holy-Butt; call'd in the North the Turbot.

7. Buglossus or Solea, the Sole.

4. Of the Eel Kind; we have,

1. Lampetra major, the Lamprey, or Lamprey Eel.

2. Lampetra parva and Fluviatilis, the Lampern.

3. Anguilla, the Common Eel.

4. Conger, the Conger or Sea Eel.

5. Ammodytes Gesneri, the Sand Eel or Launce.

6. Gunnellus Cornubiensis, the Butter Fish.

7. Mustela vulgaris Rondel, the Sea Loach or Whistle-Fish.

8. Mustela Fluviatili, the Eel Pout, or Turbou.

9. Lupus Marinus, the Wolf Fish, or Sea Wolf.

10. Alauda non cristata, the Sea Lark; called in Cornwal Mulgranoc and Bulcard. 11. Alauda Christata, the Crested Sea Lark.

12. Liparis Rondeletii. 13. Gobio Fluviatilis, the Bull-head or Millersthumb.

14. Scorpana Bellonii Similis, the Dutch-Pots. Hog; the Cornish Boys call it Father-Lasher.

5. Of the Kind of Fithes wanting the Belly Pair of Fins; we have,

I. Mola Salviani, the Sun Fish.

2. Acus Aristotelis, Species major. 3. Acus Aristotelis congener, the Sea Adder.

4. Xiphias, seu Gladius piscis, the Sword Fish.

6. Of the non Spinous Kind of Fishes, with 3 unprickly foft Fins on their Backs; we have,

1. Asellus oulgaris major, the Cod-fish, or Kaling.

2. The Whiting Pollack.

3. Asellus Niger, the Colefish, or Rawling Pollack.

4. Asellus Lucus, the Bib or Blinds.

5. Asinus Antiquorum (Turn.) the Haddock.

6. Asellus mollis major, the Whiting.

7. Of the non Spinous Kind, with only 2 foft Fins on their Backs; are found with us,

1. Merlucius, the Hake.

2. Afellus longus, the Ling:

3. Thynnus, see Thunnut; the Tunny, or Spanish Mackrel.

4. Scomber, the Mackrel.

5. Thymallus, the Gragling, or Umber.

6. Albula Salmoni Similis, the Guinnard.

7. Albula Harengi formis, the Schelley.

8. Salmo, the Salmon.

9. Salmulus, the Samlett, or Branlin.

10. Salmo Grifeus, the Gray

11. Trutta Salmonata, the Salmon Trout.

12. Trutta Lacustru, the Scurf, or Bull Trout.

13. Trutta Fluviatilis duum generum, the Trout.

14. Umbia Minor Gefn, the Red Charr, or Welsh Torgoch.

15. Carpio Lacu Benaci, the Guilt or Guilt Charr.

16. Eperlanus seu Violæ, the Smelt.

17. Golius Niger, the Rock Fish or Sea Gudgeon.
18. Lumpus Anglorum, the Lump or Sea Owl.

19. Cataphractus Schonfeldis, in the West of England, a Dog.

8. Of the non Spinous Kind, with only I Fin on the Back; we have,

1. Harengus, the Herring.

2. Harengus minor, the Pilchard, called also Calchis.

3. Encrassicholus, the Anchoris.

4. Alosa seu Clupea, the Shad or Mother of Herrings.

5. Sardina, the Sprat or Sparling; which is nothing else but the Fætus of a Herring

6. Acus Vulgaris, the Garr-Fish, or Horm-Fish.

7. Sturio; the Sturgeon.

8. Lucius, the Pike or Pickrel.

9. Cyprinus, the Carp.

10. Cyprinus Latus, the Bream, or Bruma.

11. Tinca, the Tench.

12. Orfus Germanorum, the Rudd, Oerve, or Nerfling.

13. Capico, seu Cephalus, the Chub or Chevin.

14. Barbus, the Barbel.

15. Leuciscus, the Dace or Dare.

16. Rutilus, seu Rubellas, the Roach.

17. Alburnus, the Bleak or Bley.

18. Gobius Fluviatilis, the Gudgeon.

19. Bobises Fluviatilis barbatula, the Loche. 20. Varias, seu Phoxinus levis, the Pink or

The last Twelve of these are called by us (Malacostomi) Leather-mouthed Fishes; because they have no Teeth in their Jaws, but only deep down in their Mouths.

9. Of the Spinous Kind with 2 Fins on their Back, of which the Foremost is aculeate; we have,

Minnow.

1. Lupus, the Basse.
2. Mugil, the Mullet.

3. Gurcardus Piscis, the Gray Garnard.

4. Hirundo Aldrovandi, the Tub-Fish.

5. Cuculus Aldrovandi, the Red Garnard, or Rotches.

6. Lyra prior Rondel, the Piper.

7. Mullus major, the Sur-Mullet.

8. Draco, sive Araneus Plinii, the Spider.

9. Frachurus, the Scud.

10. Perca Fluviatilis, the Perch.

11. Faber Piscis, the Dorge.

10. Of

- to. Of the Aculeat Kind, with only one Fin on the Back, whose Radii are some prickly, and some soft; we have,
 - 1. Aurata, the Gilt-bead, or Gilt-poll.

2. Pagrus, the Bream

3. Turdus vulg. the Old Wife or Wrass.

4. Perca Fluviatilis minor, seu auratu, the Ruff. 5. Piscis Aculeatus vulgaris, seu pungitius A-berti, the Common Prickle-Back, or Sharp-

ling, or Banstickle. 6. Pisch aculeatus minor, the lesser Prickle-Back.

- 11. Of the Cetaceous Kind, we account only,
 - 1. Balana Britannica Antiquorum; which now feems to be gone from our Seas, and we fearce know what kind of Fish it was.

2. Balana vulg. Rondel, the Whale, which is fometimes found ftranded on our Coasts; or rambles up our Rivers.

the Dolphin, very 3. Delphinus Antiquorum,

rarely, but sometimes seen here.

4. Phocana, the Porpuss, call'd by Schonfeld, the Northern Dolphin.

FITS of easy Reflection of the Rays of Light; so Sir Isaac Newton, in his Opticks, calls the Dilposition of the Rays to be reflected at any Time; and their Disposition to be transmitted, he calls,

FITS of easy Transmission: And the Space it passes between every Return and the next Return, he calls the Interval of its Fits. Opt. Book II. See Light.

P. 3. See Ligue.
FIXED Stars. The Phoenomena's that have been ofety'd by Aftronomers about the Fix'd Stars

are thefe:

r. That they all, together also with the Planets, or Erratick Stars, and all the Celeftial Bodies, do appear every Day to rise and set; and to move with a Circular Motion from East to West; the Plains also of these Diurnal Circular Revolutions being at Right Angles to the Earth's Axis, or Parallel to the Equator.

All which is fairly and eafily accounted for, by supposing our Earth to revolve round its own Axis in 24 Hours, from West to East. But the Eye of the Spectator moving together with the Earth, that must appear to him immovable; as a Ship doth to those that are in it, till by Observation and Judgment they come to find it otherwise.

Provebimur Portu, Calique ac Astra recedunt.

2. It hath been observ'd of the Fix'd Stars, that befides the former apparent Motion round the Earth in 24 Hours, they also seem to have an. other which is quite contrary to that; for they appear to change their Longitude, or Distance from the Beginning of Aries, forward according to the Order of the Signs, or to move in Confequentia by a flow Motion of about a Degree in 70 Years. So that those Stars which in Hipparchus, nay even in Ptolemy's Time, were in Aries, are now found to be in Taurus; and so on all round the Zodiack.

As to which, we must consider that the Terminus à quo, or Point from whence this slow Motion is propagated, being the Vernal Equinoctial Point, or the Eastern Intersection of the Equinoctial and Ecliptick; till it can be determin'd whether this Point be fix'd or moveable, it cannot be Vol. II.

known whether the Stars move from that, or that Point from them: And indeed the latter is much more probable, when we compare with this what certainly happens in other Instances in the Heavens. For 'tis well known now, that the Nodes of the Orbits of the secondary Planets, or the Points of their Intersection with the Ecliptick, do shift and change, and go a little backward, or move in Antecedentia; as is very evident in the Nodes of the Lunar Orbit: Why may it not be so then with the Nodes of the Earth's Orbit? The Pracession therefore of the Terrestrial Equinoxes may serve to account for this Motion of the Fix'd Stars, fince the Quantity will be found the same in both. For from the Newtonian Principles, it appears, the Terrestrial Nodes should go backward, after the Rate of about 50 Seconds every Year; and just so much the Fix'd Stars have been observ'd to move forward

every Year.
3. It hath never been observ'd, that the Fix'd Stars have changed their Latitude, though, as be-

fore, they annually do their Longitude.

Which is a difficult Thing to account for without the New Astronomy. For allowing the for-mer Motion of the Fix'd Stars, how can they all, and always, keep the same Distance from the Ecliptick? 'Tis true, the Celestial Orbits are all found to be in immovable Plains, but those Plains are different, and do intersect each other with different Angles; nor is there any two of the Primary Planets, whose Orbits are in the same Plain. If therefore these Stars had any such Motion, as that seeming one of Longitude, 'tis very likely that their Orbits would be posited with respect to some one great and peculiar Plain, and which should be inclin'd in a peculiar Manner to the Plains of the other Orbits, so as that their Orbits would intersect the Ecliptick, and the Orbits of the Planets; but fince there is no fuch Thing observed, itis likely, that Motion of Longitude belongs not to the Stars, but to the Nodes of the Earth's Orbit, as has before been But allowing that Recession of the ihewn. Earth's Nodes, 'tis evident why the Stars should have (or appear to have) a Motion in Longitude, but none in Latitude; because that Recession of the Terrestrial Nodes happens without any Change of the Earth's Annual Motion as to the Plain of the Ecliptick; for if the Stars themselves are immovable, and the Earth's Orbit (or the Ecliptick) be always an immovable Plain, there can be no such Thing as any Change in the Latitude of the Stars.

The Diameters of the Fix'd Stars are very small, scarcely sensible even in the largest Telescopes, seen through which, they appear but like Lucid Points, and without any of those adsciti-

tions Rays which ftrike the naked Eye.

5. The Fix'd Stars have no Diurnal Parallax, but, as hath lately been discover'd by Dr. Hook and Mr. Flamstead, a small Annual one; and consequently their Distance must be immensely great. In order to guels at which, Mr. Hugens supposes the Dog. Star, Syrius, to be about the Bignels of our Sun; and then considers how remote our Sun must be placed, before his Diameter would appear as little as that of Syrim: And on the whole, he concludes, that Syrius and the nearest Fix'd Stars, cannot be less distant than 15000000000 of our Miles from the Earth, which is 27000 times as far off as our Sun is from us.

And by that Annual Parallex which hath been ound to belong to the fix'd Stars, and is about 47 Seconds, they conclude, that they are diftant from us about 9000 times the Radius of the Magnus Orbis, i. e. 9000 times as far off as the Sun; or about 500000000000 Miles.

6. The Milky Way is a circular Tract in the

Heavens, extending over a very confiderable Part of them; and is so call'd, because it looks white and brighter than any other Part of the Sky. And this, by the Telescope is discover'd to be a Congeries of very small Stars, which are singly in-

conspicuous to the naked Eye.

7. There are above 1000 Stars which are visible to the naked Eye; but the Telescope hath discover'd about 20 times as many more: And the larger and better those Glasses are, the more are still discover'd.

8. The Light of the Fix'd Stars is much more ftrong and vivid than that of the Planets, tho their apparent Diameters are much less; because the Stars, like the Sun, shine by their own Native Light, but the Planets only by Reslection

from the Sun.

The Fix'd Stars are observ'd to twinkle much more than the Planets: because their ap parent Diameters being very insensibly small, the least Atom or Particle of Matter floating in our Atmosphere will hinder (for a Moment) the Stars being entirely visible. As the gross Smoak of a Chimney will do by the Planets themselves, which in such a Case will twinkle.

That there are Changes and Alterations among the Fix'd Stars, hath appear'd by the Observa-

tions of our Modern Aftronomers.

In Phil. Trans. N. 73. there is an Account that S. Mentanari found two Stars of the 2d Magnitude wanting in the Navis, in the Year 1668, April 10. which were certainly visible before. And that he had made many such Observations of

Stars of less Note.

Cassini hath discover'd also many new Stars: One of the 4th, and two of the 5th Light, in Cassiopeia; two others in Eridanus; and four to-wards the Artick Pole, which he is sure were not visible formerly. He takes Notice also of several in Bayer's Catalogue, which do now disappear. Hevelius, in 1666, found a new Star in Pettore Cyg. ni. And Don. Anthelme, a Carthusian at Dyon another in the Head of that Constellation. And this both he and Mr. Cassini observ'd to be twice in great Splendor, and as often diminishing.

Bullialdus observ'd the new Star in the Neck of the Whale, to be very different in his Magnitudes at different Times. And Hevelius observes the same Thing of another Star in the same Con-

Rellation.

From all which Observations, and many others might be produc'd, 'tis plain, there are very great Changes and Alterations amongst even the

Fixed Stars themselves.

And if that noble Conjecture of our Modern Astronomers be true, that each Fix'd Star is a Sun to some System of Planets moving round him, as we do round the Sun, there must needs be terrible Changes in those Planetary Worlds; and those probably both Conflagrations and Deluges. Of this, see more in Whiston's Astronomy,

from their vast Distance, and their affecting out Eyes with so strong and vivid a Light; which they could not do, if they were not actually blazing Fires: And that they are so, the Disappearance of some Stars, which have formerly been visible, and the Appearance of new ones, doth much confirm.

And the incomparable Sir If. Newton, in the Latin Edition of his Opticks by Mr. Clark, hath, to p. 83. added this Note; by which we may conclude the Fixed Stars to be at an immense Di-

stance from us.

" That the Fixed Stars, by reason of their im-" mense Distance, are to be look'd upon as Points, (unless fo far as their Light is dilated by Refraction) is plain from hence: That when by the Moon's Appulles to them they are eclipsed or cover'd by her Body, their Light doth nor, like that of the Planets in the like Case, va. nish or disappear gradually, but at once and all together; and when they emerge again out of the Eclipse, they don't become visible by degrees, but, as it were, inflantaneously, or at " least in the Space of 1 or 2 Seconds.

Besides what hath been said in the former Vol. and above, Dr. Cheyne adds this further Guess at the Immensity of the Distance of the Fix'd Stars.

Tho' we on this Globe approach nearer to some of them about 24000 Diameters of the Earth, i. e. about 188304000 Miles (of 5000 Foot in a Mile) at one time of the Year than we do at another; yet their Parallax, if any at all, is scarcely then sensible, which it must be, if they were

at an estimable Distance from us.

Mr. Hurgens computes, that the Distance of the Sun, to that of the nearest Fix'd Star, is as I to 27664. That is, (allowing the Distance of the Sun to be 12000 Diameters of the Earth, and a Diameter to be 7846 Miles, according to the best Calculations) the Distance of the nearest Fix'd Star from us, is at least 2404520928000 Miles; which is so great, that if a Cannon Ball (going all the Way with the same Velocity it hath when it parts from the Mouth of the Gun) would scarce arrive there in 700000 Years.

In Philos. Trans. N. 202. there is a Method of finding the Parallax of the Fix'd Stars, which Dr. Wallis acquaints Mr. Molyneux with; but

both those Persons are since dead.

FIXITY. To the Production of this Property of Fixity, there is necessary chiefly a Supposition of the Particles attracting one another, within a certain Distance, with a very violent Force; or elle they could never keep together, when preis'd by a violent Heat; which yet we find the Particles of some fix'd Bodies will do. See Cobesion.

FLAME-beat. The same with a White-beat;

FLAT-pointed Nails, are of two Sorts, the longer are used in Shipping, and are very proper to hold where you cannot clench; the shorter are fortified with Points to drive into Oak, and are used to draw Sheathing-Boards to, &c.

FLAW, at Sea, fignifies a suddain Gust of Wind, which sometimes also the Seamen call a Squale. FLEXION and Retrogressian of Eurves. Sco

Contrary Flexion.

FLIGHT. In melting the Lead-Oar in the Works in Mendip, there is a Substance flies away Dr. Hook, Op. Possibum. p. 109. gives very pro-bable Reasons why the Fix'd Stars should be of the same Nature with the Sun; which are drawn

Works in Mendip, there is a Substance sites away
in the Smoak, which they call therefore the Flight.

They find it sweetish upon their Lips, if their Fathere is a Substance sites away
in the Smoak, which they call therefore the Flight.

They find it sweetish upon their Lips, if their Fathere is a Substance sites away
in the Smoak, which they call therefore the Flights.

They find it sweetish upon their Lips, if their Fathe same Nature with the Sun; which are drawn they avoid all they can. This falling on the Grass, kills Cattle that feed there; and being gather'd and carried Home, kills Rats and Mice in their Houses. That which falls on the Sand, they gather and melt (upon a Flag-bearth) into Shot and Sheet Lead.

FLORENS, were Gold Coins in the 18th of our Edw. III. of the Value of 6 Shillings. Cambden saith, they were so called, because made by Florentines: And Fabian saith, they were not of so fine Gold as the Nobles and balf Nobles of that

Prince.

But what is most observable, is, that Fabian calls the Floren a Penny, val. 6s. 8d. the half Floren an Halfpenny, val. 3s. 4d. the Quarter Floren a Farthing, val. 1s. 8d. And these Words you will often meet with in old Histories and Accounts, applied to several Coins, as Rials and Angels, &c. where you are to understand, by Denarius the whole, by Obolus the half, and by Quadrans the 4th Part or Farthing. Chr. Preciolum P. 22.

By Indenture of the Mint, in 18 Edw. III. every Pound Weight of old Standard Gold was to be coined into 50 Florences, to be current at 6 Shillings a-piece; all which made, in Tale, fifteen Pounds: Or into a proportionable Number of half or quarter Florences. Cowel's Interpreter.

FLUIDITY. Besides what hath been said of this Quality in the former Vol. I must add here, That the Corpuscular Philosophy, before Sir Is. Newton's wonderful Improvement of it, did not go to the Bottom of this Matter; for it gave no Account of the Cause of the chief Condition requisite to constitute a Fluid Body, viz, the various Motions and Agitations of its Particles. But this may be in a good Measure accounted for, if you suppose it to be one of the Primary Laws of Nature, that as all Particles of Matter do attract one another when they come within a certain Di-ftance, so, at all greater Distances from one another, they do fly away from, and avoid one another. For then, though their common Gravity may keep them together in a Mass, together (it may be sometimes) with the Pressure of other Bodies upon them; yet their continual Endeavour to avoid one another fingly and the adventitious Impulies of Light, Heat, or other external Causes, may make the Particles of Fluids continually move round about one another, and fo produce this Quality. It is, indeed, a Difficulty I cannot yet get over, to account for the Particles of Fluids always keeping at such a Distance from one another, as not to come within the Sphere of one another's Attraction. The Fabrick and Constitution of that fluid Body of Water is wonderful and amazing, that a Body so very rare as that is, and which has such a vast Over-proportion of Pore, or interspersed Vacuity, to solid Matter, should yet be perfectly incompressible by the greatest Force. And yet this Fluid is easily reducible into that firm, transparent, friable Body, which we call Ice; by being only exposed to a certain Degree of Cold. One would think here, that though the Particles of Water cannot come near enough to attract each other, yet the in ervening Frigorifick Matter doth, by being mingled per minima with them, strongly attract them, and is itself also strongly attracted by them, and sowedges or fixes all the Mass into a firm solid Body: Which solid Body loses its Solidity again, when by Hear the Vinculum is folv'd, and Vol. IL.

these Frigorisick Particles are disjon'd from those of the Water, and are forc'd to fly out of it. And perhaps just thus doth the Fumes of Lead six Quicksilver.

When a firm solid Body, such as a Metal, is by Heat reduc'd into a Fluid; doth nor the Fire disjoin and separate its constituent Particles, which mutual Attraction caused to cohere before, and keep them at such a Distance from each other, as that they are without the Sphere of one another's Attraction as long as that violent Motion lasts? And don't they, when that is over, and the Heat is slown out, come nearer to, attract one another, and coalesce again?

As therefore the Caule of Cohesion of the Parts of solid Bodies appears plainly to be their mutual Attraction; so the chief Cause of Fluidity seems to be a contrary Motion impressed on the Particles of Fluids, by which they avoid and fly one another as soon as they come at, and as long as they keep at such a Distance from each

Other.

'Tis observ'd also in all Fluids, that the Direction of their Pressure against the Vessels that contain them, is in Lines perpendicular to the Sides of such Vessels; which Property being the necessary Result of the Particles of any Fluids being spherical, it shews that the Parts of all Fluids are so, or of a Figure very nearly approaching thereunto. For Fluids in an Animal Body, see Glands in Vol. II.

FLUTES, in Architecture, are the Hollows made in the Body of a Column or Pillar, and which then is said to be Fluted. The Dorick, Ionick, Corinthian and Composite Columns, are usually fluted all along the Body of the Pillar, from the Base to the Capital. Each Column hath 24 Flutes, and each Flute is hallowed in exactly a quarter of a Circle. In the Dorick Column the Flutes join together without any Interspace; but in the Ionick, Corinthian and Composite Orders, there runs a List between every two Flutes,

FLUXIONS. This general Method of finding the Fluxions of all Powers and Roots, I had from the Honourable Fr. Robarres, Esquire.

If a Quantity gradually increases or decreases, its immediate Increment or Decrement is called its Fluxion.

Or the Fluxion of a Quantity is its Increase or Decrease indefinitely small.

Let a Quantity x be put into Fluxion, whereby it becomes $xx \pm x(x)$ representing an Increment or Decrement indefinitely little, being called the Fluxion of x).

Now the Fluxion of all the Powers, and of all the Roots of x, may be found by this general Rule:

As x + x contains the simple Quantity and its Fluxion; so the Square, Cube, Sc. and the Square Root, Cube Root, Sc. of x + x must contain the respective Powers or Roots of x with its Fluxion respectively.

its Fluxion respectively.

And consequently, if the Flowing Quantity be respectively substracted, the Fluxion only must remain.

 Pluxion of $x \times x$ is $x + x \times 2 \times x + x \times + x \times x$ -xxx = 3xxx + 3xxx + xxx.

But fince xx, Part of the Fluxion of xx, is infinitely (maller than 2 x x, whereby it can make no sensible Change in that Quantity, it may be laid aside as of no Value.

And for the same Reason, 3 xxx + xxx may be left out of the Fluxion of xxx; fo that their remains only

$$2xx$$
. for the Fluxion of $\begin{cases} xx \\ xxx \end{cases}$

Thus also the Fluxion of \sqrt{x} is $\sqrt{x} + x$

 $-\sqrt{x} = 2\sqrt{x}$; which will be evident, by only extracting the square Root of x + x according to the common Method, thus;

$$x + \dot{x} \left(\sqrt{x} + \frac{\dot{x}}{2\sqrt{x}} \right)$$

$$2 \sqrt{x} + \dot{x}$$

$$\frac{\dot{x}}{6} \qquad \frac{\dot{x}\dot{x}}{4x}$$

The Fluxion of
$$\begin{vmatrix}
\dot{x} \\
\dot{x}
\end{vmatrix} = \begin{cases}
\frac{\dot{x}}{3\sqrt{x}} \\
\frac{2xx}{3\sqrt{x}xx}
\end{cases}$$

$$\begin{vmatrix}

\dot{x}$$

So that $\sqrt{x+x}$ is equal to $\sqrt{x+\frac{x}{2\sqrt{x}}}$ \sqrt{x} , which is equal to $\frac{x}{2\sqrt{x}}$ the Fluxion of \sqrt{x} , as above.

Indeed $\sqrt{x} + \frac{x}{2\sqrt{x}}$ is the true Root of $x + \frac{1}{x} + \frac{x}{4} = \frac{x}{x}$ as the Operation shews, and consequently somewhat bigger than the Root of $x + \dot{x}$. But $\frac{xx}{x4}$ being indefinitely less than what is annex'd to the Difference between $x + \dot{x} + \frac{x x}{4 x}$ and $x + \dot{x}$, may be confider'd as of no Value. Wherefore $\sqrt{x} + \frac{x}{2\sqrt{x}}$

may be taken for the true Root of x + x.

Authors Names who have written of Fluxions: D. Bernoulli Tractatus de Principiis Calculi Exponentialis.

FLYBOAT, is a large Vessel with a broad Bow; used by Merchants in the Coasting Trade. Some of these will carry 800 Tun of Goods.

FLYERS, is the Workmens Term in Architecture for Stairs that go strait, and don't wind round; nor are the Steps tapering, but the fore and back Part of each Stair and the Ends are respectively parallel to one another. So that if one Flight don't carry you to your design'd Height, there is a broad half Space; and then you fly again with Steps every where of the same Breadth and Length, as before.

FLYING Bridges, in Fortification, are made of two small Bridges laid one upon the other, fo that the uppermost, by the means of Ropes and Pullies, is forc'd forwards 'till the End of it join to the Place design'd.

FOCUS. Dr. Hook, Op. Post hum. p. 122, very well

accounts for the Reason of the great Effect of Burning Glasses, thus: Suppose there be one, either Concave or Convex, of a Foot in Diameter; this will constipate or crowd together all the Rays of the Sun, which fell before on the Area of a Circle 12 Inches in Diameter, into the Compass of i of an Inch. The Area's then of the two Circles will be as 9216 to 1; and consequently, the Heat of the Lesser, to the Heat of the Greater, will be reciprocally as 9216 to 1: That is, the Heat in the Focus will exceed the Sun's common Heat at that time 9216 Times. And this will have an Effect, as great as the direct Rays of the Sun would have on a Body plac'd at one 96th Part of the Distance of the Earth from the Sun, or on a Planet that should move round the Sun, at but a very little more than a Diameter of the Sun's Distance from him, or that would never appear further from him than about 36 Minutes.

FODDER, or Fother of Lead, is a Weight containing eight Piggs; every Pigg three Stone and an half. In the Book of Rates, a Fodder of Lead is said to be 2000 p. Weight; at the Mines, it is 22 Hundred; and among the Plumbers,

at London, it is but 19 1 Hundred.

FOETUS. The Fæsus is almost of an Oval Figure, whilst it lies in the Womb: For its Head hangs down with its Chin on its Breaft; its Back is round; with its Arms it embraceth its Knees, which are drawn up to its Belly; and its Heels are close to its Buttocks; its Head is upwards, and its Face is towards the Mother's Belly. But about the 9th Month, in the Humane Fœtus, the Head, which was specifically lighter than any other Part, becomes specifically heavier; its Bulk bearing a much smaller Proportion to its Substance than it did before; and consequently it must now tumble and sink down in that Liquor in which it swam, as it were, besore: So its Head falls down, its Feet get up, and its Face turns towards the Mother's Back. But because 'tis then in an irksom, tho' proper, Posture for its Exit, the Motion it makes for Relief gives frequent and great Pains to the Mother; which cause a Contraction of the Womb, for the Expulsion of the Fatus. When it happens to present it self in any other Posture, it should be

carefully put back again; and, if possible, turn'd the right Way by the Midwise: But if that can't be done, it should be drawn out by the Feet.

FOLIATE. In Phil. Trans. N. 245. there is Way, communicated by Sir Rob. Southwell, of The Mixfoliating the Globe Looking-glasses. ture is of Quickfilver and Marchasite of Silver of each 3 Ounces; Tin and Lead, of each half an Ounce. These two first thrown on the Marchasite, and last of all the Quicksilver. Stir them well together over the Fire; but they must be taken off it, and be towards cooling, before the Quickfilver is put to them. When you use When you use it, the Glas should be well heated, and very dry: But it will do also when 'tis cold, but best when the Glass is heated.

This is a little odly express'd: But I suppose 'ris meant, that the Marchasite should be powder'd, the Lead and Tin melted and poured upon it, and then all well stirred and mixed together while in Fusion; and afterwards, when 'tis almost cold, the 3 Ounces of Mercury put to it to

make the Amalgam.

FOLK-Land, was the Terra vulgi; the Land of the Common People who had no Estate therein; but held the same under such Rents and Services as were accustomed or agreed, at the Will only of their Lord the Thane; and therefore their Bargain was not put in Writing, as that about the Boc-Land was, but was accounted Pradium Rufti-

cum & Ignobile.

FOLKMOTE, was the general Word for a Popular Convention of all the Inhabitants of any Place; which if it were of those of a City or Town, it was called a Burgh-more; but if of all the Free Tenants of a County, 'twas called a Schire-mote. In Towns and Burghs, this solemn Affembly was made by the Sound of a Bell call'd the Mothell. In the County Folk-mote, all Knights and Free Tenants did their Fealty to the King, and elected their annual Sheriff for-merly, (on the 1st of Ollober) before the King nominated. But after that, (about the Time of Edward II.) the City Folk-more was changed into the Common-Council, and the County Folkmote into the Sheriffs Turn and Affifes. The Word Folk-mote had also sometimes a less Extent, signifying only the Affembly of the Tenants to a Court Leet or Baron of their Lord.

FOOT-Bank, or a Banquette, in Fortification, is a small Step of Earth on which the Soldiers

stand to fire over the Parapet.

FOOT-gelde, was an antient Amerciament for not cutting out the Balls of the Feet of great Dogs in the Forest; which was done for preventing their running after the King's Deer; and was called Expediation.

FORAMEN Arteria Dura Matris, is a Hole in the Cranium, which allows a Passage for the

Artery belonging to the Dura Mater.

FORAMEN Lacerum, in the 3d Hole in the
Os Pharoides, by which the 3d Pair of Nerves

pals out of the Cranium.

FORE-Staff, is an Instrument used at Sea to take the Sun's Alritude, or the Heighth of the Moon, or any Star in the Night; and 'tis so call'd, because when 'tis used, your Face is to the Object: Whereas in the Use of the Back-staff, or David's Quadrant, the Back of the Observer is towards the Sun. The Fore-staff is the same with them by 4, the Denominator; for then a Quothe Cross-Staff: Which you will find fully detrient of the same Value will arise, (for 4) 60 s. scrib'd in this Vol. under that Word.

FORMELLA, was a Weight of Lead, which in 51 H. 3. A. D. 1267. is said to contain six Petra, except 2 lb. Each Petra contain'd 12 lb. and each Pound contain'd the Weight of 25 Shillings.

FORNICATION, is formetimes used in Architecture, to fignify Arching or Vaulting.
FORTIFICATION. Writers on this Subject.

FORTINGLES, the same with Farthingdell;

i. e. the 5th Part of an Acre, Penny, &c. FORTITUDE, is that Virtue which enables us to persevere in doing well, notwithstanding a-ny Dangers, Obstacles or Difficulties we may meet with in the Performance of what we know to be our Duty.

FOSSA, is, according to some Anatomists, the Term for the Middle Part of the Corvix, or Hinder Part of an Humane Neck. The Upper Part being called Lophia, and the Lower Epims.

FOSSATORUM Operatio, was antiently the Service of Work and Labour done by Inhabitants and adjoining Tenants for Repair and Maintenance of the Ditches round the City or Town, for which some compounded, paying a Duty called Fossagium.

FOTMEL, in Old Times, was a Weight of Lead containing Ten Stone, or, at that time, Seventy Pounds; as appears from the Cartul. St. Albani, MS. in the Cotton Library.

FOUCADE, the same with Fougade.
FOUNDAY, is a Word used in the Iron Works, for the Space of fix Days; in which time they usually make about 8 Tun of Iron.

FOURNEAU, is the Powder Chamber, or the

Chamber of a Mine, which holds the Powder in Barrels or Sacks, (usually about 1000 lb. Weight) which by means of the Saucidge is fired, and so

the Mine is sprung.
FRACTIONS. Besides the common one, given in Vol. I. there is also another Notion of a Fraction; which is very necessary to be understood, beause it will be of use to shew the Reason of many of the vulgar Rules and Operations in Thus suppose # of 201. or of a Fractions. Pound Sterling, were the Fraction; this Fraction, instead of three quarters of one Pound, may be consider'd as a fourth Part of three Pounds: That is, by taking as many of the Integers as the Numerator expresses, (viz. 3.) and dividing (15 s.) And this shews you the Reason of that manner of Expression which is used by Geometers and Algebraifts about Fractions; who read

-, thus, a divided by b.

FRACTIONS Decimal. See Decimal. FRACTIONS Sexagesimal. See Sexagesimal. FRACTIONS in Algebra. A Fraction is a broken Number or Quantity, expressing the Parts of some Integer. It consists of two Parts, with a Line of Separation placed between them. Of which, that above the Line is called the Numerator, because it Enumerates or tells you how many of the Parts of the Integer the Fraction contains: And that below the Line is call'd the Denominator; because it Denominates or expresses the Nature of the Parts the Integer is supposed to be divided into. Thus,

Suppose a = 3 and b = 4, then will $\frac{a}{b}$ or $\frac{3}{4}$ be

a Fraction, expressing, that some Interger being divided into 4 Parts or Quarters, there is taken 3

of them, or 3 Quarters.

A Fraction is either Proper, when the Numerator is less than the Denominator, as $\frac{3}{4}$: Or Improper, when the Numerator is equal to it, or greater: As $\frac{4}{4}$ or $\frac{4}{3}$ are Improper Fractions; because one expresses the whole Integer, and the other more than the Integer; however tis often of good Use to express Quantities after this Way.

The Operations about Algebraick Fractions, or Fractions exprest by Letters, are much of the same Nature with those in common Arithmetick.

I. All Fractions ought first to be reduc'd to their lowest Terms; which is done by dividing both Numerator and Denominator, by their greatest common Devisor; that is, the greatest Quantity which can divide both. For then the Quotient will be a Fraction of the same Value as the former, but in the smallest Terms that can be. Thus

 $\frac{344}{64}$, by dividing both Parts by 34, will be brought

down to $\frac{a}{2}$ or $\frac{1}{2}a$. And $\frac{4a^2}{6a^4}$ being divided by its

greatest Common Divisor 2 44, will be reduc'd

to $\frac{2aa}{3}$

$$\begin{array}{c} 47)3677 \\ 47)4b7+16d7 \end{array} \left(-\frac{97}{b+46} \right)$$

And this may most times be done by Inspection, by casting out of both Numerator and Denominator such Letters as are multiplied into both of

them'; as in these Examples.

But such greatest Common Devisor may be found in all Cases where the Eye cannot readily discover it, by dividing the Denominator by the Numerator, and the last Devisor by the Remainder, if any be; and so on, 'till there come to remain nothing: And then that last Devisor is the greatest Common Measure. But if Unity, or 1, remain at last, then the Fraction was in its lowest Terms at sirst, and cannot be reduc'd to any smaller Terms. This Practice is the same as in Vulgar Fractions; and you have an Example of it in Species in Ward's Algebra, Chap. 4.

II. To reduce any Integer, as b or a + c, to the Form of an Improper Fraction, draw the Line of Separation, and under it write 1, then it will fland $\frac{b}{1}$ or $\frac{a+c}{1}$, which, the in the Form of Fractions, are not alter'd, because r neither Mul-

tiplies nor Divides.

If a Denominator, as d, were given: First Multiply the given Integer by such Denominator, and then write the Denominator under the Product.

$$\frac{db}{d} = b$$
, and $\frac{da + dc}{d} = a + c$.

III. To reduce Fractions of different Denominators, to others of the same Value that shall have a Common Denominator; (which Opera-tion must always precede Addition and Substraction in Fractions.) You must first bring the Fractions down as low as you can; (by Rule 1.) then Multiply a-cross the Numerator of the first into the Denominator of the second, for a new Numerator of the first Fraction; then the Numerator of the second into the Denominator of the first, for a new Numerator for the second Fraction; and lastly, Multiply the Denominators one into another, for a Common

Denominator. Thus, let $\frac{a+b}{d}$ and $\frac{bb}{f}$ be given,

and they will by this Rule be reduced to $\frac{fa+fb}{dx}$,

and $\frac{dbb}{df}$; Fractions in Value equal to the for-

The Reason of which is plain; for each Fraction is Multiplied and Divided by the same Quantity or Letter, and therefore must retain the same Value as before, tho' reduc'd to another Form:

$$\frac{4}{6}$$
 $\frac{3}{4}$ $\frac{16}{24}$ $\frac{18}{24}$

For every Fraction being Multiplied by Multiplying its Numerator, but Divided by Dividing it; and being also Multiplied by Dividing the

Denominator, and divided by Multiplying it:

It follows, That each Fraction will gain as much by the Multiplication of its Numerator, as it loses by the Multiplication of its Denominator. And, Vice versa, in case of Division, by one and the same Quantity.

If there are more than two Fractions, every Numerator must be Multiplied continually into all the Denominators but its own; and the Denominators one into another continually for a

new Denominator. E. gr. $\frac{a}{x}$, $\frac{b}{r}$, $\frac{c}{x}$, will be

reduc'd to this Form $\frac{ayz}{xyz}$, $\frac{bzx}{yzx}$, $\frac{cyx}{zyx}$, which are

Fractions of the same Value as the former (as is apparent by ejecting the Common Letters) but reduc'd to a Common Denominator.

IV. And when this is once understood, Addition and Substraction in Fractions are perform'd by only Adding or Substracting the Numerators, and Subscribing the Common Denominator before

If the Fractions $\frac{a+b}{d} \frac{bb}{f}$, were to be Added or Substracted; they will stand, when reduc'd (by Rule 3.) in this form, $\frac{fa+fb+fb}{df}$. or $\frac{f + fb - fbb}{df}$: The former of which is the Sum, the latter the Difference, of the two given Fradions.

V. Multiplication in Fractions, is persorm'd by Multiplying the Numerators into one another for a new Numerator, and the Denominators for a new Denominator, the Fractions having been first reduced to their lowest Terms.

$$\frac{a}{b} \times \frac{d}{c} = \frac{da}{bc}$$
, and $\frac{a+b}{c} \times \frac{a-b}{d} = \frac{aa-bb}{cd}$.

Hence, if any Fraction be Multiplied by the Denominator, or by some Integer the same with it, the Numerator is the Product. As 44

$$\times$$
 $b = a a$, for $\frac{a a}{b} \times \frac{b}{1} = \frac{a a b}{b}$; which,

casting off the Common Letters in both Parts,

leaves a a.

Also, if any Fraction be to be Multiplied by some Letter or Letters that are found in every Member of the Denominator, the Multiplication may be made only by ejecting such Letters out of the Denominator: As $\frac{ab}{cd}$ Multiplied

by
$$d = to \frac{ab}{c}$$
.

VI. Division in Fractions, is perform'd (after Reduction, according to Rule 3.) by Multiplying the Numerator of the Dividend by the Denominator of the Devisor, for a Numerator; and the Denominator of the Dividend by the Numerator of the Divisor, for a new Denominator: As in Vulgar Fractions. Thus,

$$\frac{a}{b}$$
) $\frac{d}{c}$ $\left(\frac{b}{a}\frac{d}{c}\right)$

 $\frac{a}{b} \qquad \frac{d}{c} \qquad \left(\frac{b d}{a c}\right)$ The Reason of which is plain, from what was said above, That a Fraction is Divided by Multiplying its Denominator. Thus,

$$\left(\frac{3}{4}\right)\frac{12}{16}\left(\frac{48}{48}=1\right)$$

For to divide 18 by 2, is to seek how often 3, the Numerator of the Devisor, is in 18 , which is done by Multiplying 16 by 3, and the Answer is $\frac{2}{4}$: But then again, because $\frac{3}{4}$ is but $\frac{3}{4}$ of 3, it will be contain'd in 18 4 times oftner than 3 is; and thesefore, in order to bring it to a Par, Divide the Value of that Praction by Multiplying its Denominator by 12, and the Product 48 will be the Numerator of the Quotient.

But if it happen that the Fractions have a Common Denominator, then cast off that, and divide one Numerator by the other.

$$\left(\frac{a}{b}\right)\frac{c}{b}\left(=\frac{c}{a}\right)$$
 and $\left(\frac{b}{a}\right)\frac{b}{a}\left(=b\right)$.

For Fractions having a Common Denominator, are as their Numerators

VII. A Mixt Quantity or Number, is that which is part Integer, and part Fraction. $a + \frac{b}{a}$: Such Quantities are reduc'd to the form of improper Fractions, by first Multiplying the Integral Part by the Denominator of the Fractional Part; then adding the Numerator to it, and subscribing the Denominator under all. Thus, the former Quantity $aa + \frac{b}{c}$ is Reduc'd

to this improper Fraction
$$\frac{c \cdot a \cdot a + b}{c}$$
.

Every improper Fraction is Reduc'd back again into its equivalent Mixt Number or Integer, by dividing the Numerator by the Denominator.

Thus,
$$\frac{c \cdot a \cdot a + b}{c}$$
 divided by c, quotes $a \cdot a + \frac{b}{c}$

FRAISING of a Batallion, is to line the Mus-ketiers all round with Pikes, in case of their be-

ing charg'd by a Body of Horse.
FRANKPLEDGE, Franciplegium visus Franciplegii, was the Antient Custom for the Freemen of England, at 14 Years of Age, to find Surety for their Truth and Fidelity to the King, and good Behaviour to their Fellow Subjects. This Surety, among the Saxons, was taken in their Friborg, Lath, or Tithing-Court; and after the Norman Conquest, it was call'd Frankpledge, and was continu'd in the Court-Leet of Royal Jurisdiction to be held annually on the Feast of St. Mi... chael by Magne Charta.

So that to have Visum Franciplegii, View of Frankpledge, was no more than to have the Privilege of holding a Court Leet; and this Power was determined by Stat. 8 of Edw. II. and 1 of Edw. III. The Place of holding such Courts was, if it were fair Weather, on some open Green; but if it was bad Weather, they adjourn'd to the Mannor House, or to that of some adjoyning Te-

nt. Kennet P. Antiq.
FREEZING. The true Cause of the Congelation of Warer into Ice, seems plainly to be the Introduction of the Frigorifick Particles into the Pores or Interftices between the Particles of the Water; and by that means, getting so near to them, as to be just within the Sphere of one another's Astracting Force, (see Attraction) and then they must cohere into one solid or firm Body. But Heat afterwards separating them, and putting them into various Motions, breaks this Union, and separates the Particles so far from one another, that they get out of the Distance of the Attracting Force, and into the Verge of the Repelling Force, and then the Water reassumes its Finid Form.

Now that Cold and Freezing do arile from some Substance of a Saline Nature floating in the Air, it seems probable from hence, That all Salis, and more eminently some particular ones, when mix'd with Snow or Ice, do prodigiously encrease the Force and Effects of Cold; We see also, that all Saline Bodies do produce a Stiffnels and Rigidity in the Parts of those Bodies into which they enter. Microscopical Observations upon Salts inform us, That the Figures of some Salts, before they shoot into Masses, are thin double-wedg'd like Particles, which have abundance of Surface in Respect to their Solidity, (which is the Reason why they swim in Water when once raised in it, specifically heavier). These small Points or the Salt getting into the Pores of the Water, whereby also they are in some measure suspended in the Winter Time (when the Heat of the Sun is not ordinarily strong enough to dissolve the Salts into a Fluid, to break their Points, and to keep them in perpetual Motion) being less disturb'd are more at Liberty to approach one another, and by shooting into Chrystals of the Form above-mentioned, do, by both their Extremities, infinitate themselves into the Pores of Water, and by that Means freeze it into a solid Form. And we see, that the Dimensions of Water see increas'd by Freezing, its Particles being kept at some Di-stance one from another by the Intervention of the Frigorific Matter.

But besides this, there are many little Volumes, or small Parcels of Air, included at several Distances, both in the Pores of the Watry Particles, and in the Interstices formed by their Spherical Figures. Now by the Infinuation of these Chrystals, the Volumes of Air are driven our of the Watry Particles, and many of them uniting, form larger Volumes, which thereby have a greater Force to expand themselves than when dispers'd, and so both enlarge the Dimensions, and lessen the specifick Gravity, of Water thus congeal'd into Ice. And hence, saith Dr. Cheyne, (from whom this last Account) we may guess at the Manner, how Water, impregnated with Salts, Sulphers, or Earths, which are not eafily dissolvable, may

form itself into Metals, Minerals, Gums, and other Fossils; the Parts of these Mixtures becoming a Cement to the Particles, of Water, or getting into their Pores, change them into these different ibstances. Phil. Prin. of Nat. Rel. p. 66. FRESCO. Painting in Fresco is thus perform'd: Substances.

The Colours are ground with Lime-Water, Milk, or Whey, and temper'd or mix'd together in Pots, as in Size Colouring. The Plaister is The Plaister is made of the Powder of old rubbish Stones mixt with burnt Flints or Lime, and Water; but the Salt of the Lime must be wash'd out, by often pouring on fresh Water; and to make the Plai-ster stick the better, they drive in Stumps of Horse-nails, about 6 Inches asunder. With this Horse-nails, about 6 Inches asunder. With this Plaister the Wall is to be laid thick, and then it must be let dry; and afterwards a new Layer of Plaister is put of the Thickness of an Half-Crown; and the Colours must be wrought with a quick free Hand whilst it is wet, for there is no altering of it after it is dry. This Way of is no altering of it after it is dry. This Way of Painting was in most antient Use among the Greeks, and from them came to the Romans, with whom it was famous. Raphael Urbin, and Julio Romano, were eminent this Way: There being three Chambers in the Vatican of their doing, yet in being

FRICTION, is a Word used often among Mechanicians, or the Writers on Mechanicks, for the Resistance which arises to the Motion of the Parts of any Engine from the Matter of the Wheels, &c. rubbing against one another, or

against any other Body.

Of the Resistance arising from Friction of the Parts of an Engine one against another, Mr. Amontons hath a large Discourse, which is printed in the Memoires de l'Academ. Royale des Sciences, for the Year 1699. where he makes several Experiments, gives Rules to find and calculate Tables of this Relistance arising from jection constitutes this Furniture; some are Great,

Friction, and of that which is the Refult of the Rigidity of Chords used in Pulleys, &c.

FRIGAT, is a Ship of War, usually of two Decks, light built, and defign'd for swift Sailing. When it hath but one Deck, and consequently

is of a smaller Size, they call her a Light Frigat.

FRIGATOON, is a Venetian Vessel, commonly used in the Adriatick: She is built with a square Stern, without any Fore-mast; having only a

Main-mast, Missen-mast, and Bow-sprit.
FRUGIVOROUS Birds, according to Mr. Willoughby, are the Parrot-Kind, which tho' they have a crooked Beak and Talons, and therefore do belong in general to the Birds of Prey, being Rapacious and Cornivorous; yet because they eat Fruit too, I suppose, he distinguishes them from the rest by this Title. See Birds.

FRUMGYLD, was the old Saxon Term for the first Payment made to the Kindred of a slain Person, in Recompence of his Murder.

FURNACE Almond. In the smelting of Silver Oar, and clearing it from the Lead, they use a Furnace which they call an Almond Furnace; in which they melt the Slaggs or Refuse of the Litharge, without pounding or stamping it, and with Charcoal only.

FURNACE of Affay, is used in the Smelting-Houses of Silver Oar; and is to try the Value of the Silver, or what Proportion it bears to the Lead: Which they know by weighing the Pieces cut off from every Bar, and then melting them anew, and after the Lead is separated, weighing the remaining Silver. See Silver, in this Vol.

FURNITURE of Dials. As on all Sorts of Dial Plains, Serait Lines may be describ'd, which by the Shadow of a Stile, or a Line parallel to the Earth's Axis, will shew the true Hour of the Day: So by the Shadow of an Apex, Nodus, or one determinate Point in that Axis or Stile, on the Plane of the Dial, may many useful and curious Astronomical Conclusions be describ'd or shewn: And all these taken together, are call'd the Furniture of Dials.

Such as.

1. The Parallels of the Sun's Diurnal Motion; shewing every Day what Degree of the Ecliptic the Sun is in; or, if less Accuracy be thought enough, what Sight of the Zodiac.

2. The Length of the Day and Night; or, The Proportion of the Sun's Diurnal to his No Burnal

Arch, throughout the Year.

3. The Time of the Year; shewing, by the Shadow of the Axis, both the Month and Day.

4. The Sun's Almaoanters, or, Parallels of Altisude; shewing the Sun's Altitude above the Horizon, and the Proportion of Shadows.
5. The Azimuths, or Vertical Circles; shewing

what Azimuth or Point of the Compais the Sun

is upon it all Times of the Day.

6. The Babylonish, Italian, Jewish (or Unequal) Hours; together with the Meridians or Horizons of any Particular and Remote Places; and many other Things, &c. I purposely omit to mention the Planetary Hours, the Circles of Position, &c. in order to Astrological Fooleries; because, I hope, at this Time of Day, they are of no Esteem with any Persons of Mathematical Skill, or in-deed of common Sense and Understanding.

as the Azimuths or Vertical Circles, the Meridians or Hour Circles, and the Circles of Longitude of the Sun or Stars; and these on all Sorts of Dial-Planes will be strait Lines: And if the Planes on which such great Circles are described, are parallel to such great Circles in the Heavens as they are designed to represent, then will those straight Lines be all parallel to one another.

But if the Dial-Plane be perpendicular to any

But if the Dial-Plane be perpendicular to any of those corresponding great Circles in the Heavens, then the ftraight Lines so projected on the Plane, will meet in the Centre at Equal Angles.

But if the Plane lie oblique to any of those great Circles in the Heavens, the projected fraight Lines will still meet in one Centre upon

the Plane, but at Unequal Angles.

All lesser Circles of the Sphere, (such as are, she Parallels of the Sun's Declination or Course, and all Almacanters, or Parallels of Altitude) being projected on a Plane, become Conick Sections, i. e. either Ellipses, Parabola's, or Hyperbola's; except when these lesser Circles are projected on such Planes as do lie parallels of Declination, when they happen to be drawn on a Plane, lying parallel to the Equinoctial, for then they will be perfect Circles, which are Sections of a Cone parallel to its Base. So also, if the Almacanters, or Parallels of Altitude, be describ'd on a Plane parallel to the Horizon, they will become persect Circles.

It may be of Use to remark also, That all Dial-Planes in any Latitude, and however posited in that Latitude, whether Direct, Declining, Inclining, or Reclining, or both Declining and Inclining, or Declining together, are, in some Part or other of the Earth, Horizontal Planes: and the Height of the Stile is equal to the Latitude of the Place wherein it is an Horizontal Plane; and the Substile of the Dial is the Meridian of that Place; and the Difference of Longitude of that Plane, shews

how much to the East or West the Place lies from that wherein it is an Horizontal Plane.

Whence it must. sollow, that if you draw, for any Declining-Reclining Plane, or any other Dial-Plane, a good Dial with Hours and Quarters; and much more if you draw it to Minutes, &c. and then, on the same Plane, with Red Ink, &c. draw an Horizontal Dial for the Latitude of that Place, which is equal to the Stile's Height in the former Declining-Reclining, &c. Plane; and letting the Substile be the Hour-Line of 12 to it, draw all the other Hours, Quarters, &c. from thence; and then on that Horizontal Dial draw also the proper Furniture: When you have done this, I say, if you can expunge the Hour-Lines of the Horizontal Dial, the Furniture of that Horizontal Dial will be the true Furniture for the Declining-Reclining, &c. be it never so irregular, supposing it have but a Centre.

As to the Description of this Furniture on all-Kinds of Dial-Planes, you will find large and sull Directions in Wells's Art of Shadows, Hollwell's and Leybourn's Dialling, &c. And the sull Demonstration of the whole Matter, Christopher Cluvius gives us in his Gnomonicks. See also Gaspar Schottus's Cursus Mathematicus, Book 14. of Ho-

rography

FURRING, in Architecture, is making good the Rafters-Feet in the Cornish: That is, when Rafters are cut with a Knee, these Furrings, or Furrs, are Pieces that go straight along with the Raster from the Top of the Knee to the Cornish. Also when Rasters are rotten, or suck hollow in the Middle, there are Pieces cut thickest in the middle, and tapering towards each End, which are nailed upon them to make them straight; and such Pieces are call'd Furrs, and the putting them on, Furring the Rasters.

FUST, is a Term in Architecture for the Shaft of a Column, from the Astragal to the Capital.

GABELL, Gabella, Gabellum, the same with Vectigal in old Writers, hath the same Signification as Gabelle in French: And for the better understanding of Antient Records, Statutes, Charters &c. you should know, that Gabel, or Gavel, Gablum, Gabellum, Gabellettum, Galbellettum, and Gavillettum, do all fignify a Rent, Custom, Duty, or Service, yielded or done to the King, or some other Lord: and Dr. Cowell seems to have judg'd right, that Gablum is to be distinguish'd from a Rent or Payment made, or a Contract or Bargain; and hath only Relation to such a Payment or Service as was imposed by the Power and will of the Lord.

GABEL-End of a House, is the Upright Triangular End, from the Cornish or Eaves, to the

Top of its Roof.

GAGE, in Joinery, is an Instrument made to strike a Line truly parallel to the straight Side of any Board or Piece of Stuff. Its chief Ule is for gaging of Tenents true to fit into Mortisses, and for gaging Stuff of an equal Thickness. It is made of an oval piece of Wood, fitted on upon a square Stick, to slide up and down stiffly thereon, and with a Tooth in the End of a Staff, to score or strike a Line upon the Stuff at any Distance, according to the Distance of the Oval from it. GAGE-Point. See Gauge-Point.

GAGER Deliverance. See Wage.

GAIN, in Architecture, is the Workmen's Term for the Bevilling Shoulder of the Joist or other Timber. 'Tis used also for the lapping off the End of the Joist, &c. upon a Trimmer or Girder; when the Thickness of the Shoulder is cut into the Trimmer also, and bevilling upwards that it may just receive the Gain; and so the Joist and Trimmer lie even and level with their Surface. This way of working is used in Floors and Hearths.

GAINAGIUM, or Wainagium, fignifies all manner of Plough-Tackle, or Infiruments used in Husbandry, without any Respect to Gain, or Profit. For as Magna Charta provides, That the Knight and Freeholder shall be americal Salva Contenemento suo, and the Merchant Salva Mercandisà sui; so the Villain Countryman, or Plowman, was to be fined or amerced for his Offences. but still Salvo Guinagio suo, i. e. Saving all bis Plow-Geers, and necessary Implements of Husbandry: For he was not to be fined to as to be ruined and undone, by taking from him the necessary Means of Life.

GALEASSE, is a large low-built heavy Vesfel, using Sails and Oars: It hath three Masts, and those not to be lowered, as they are in a Galley. They have three Tire of Guns in the Head, and usually two Tire in the Stern. In two Dutch Prints that I have of a Galeasse, there are 25 Oars of a Side; and I'm told, there is about 6 or 7 Men to an Oar.

GALEONS, were formerly the French Ships of War; but now the Word is only used amongst the Spaniards and Italians. And the Spaniards do now call only those Ships Galeons, which are sent annually to La Vera Cruse, or other Places, in the West-Indies, to fetch home Bullion.

GALL. Dr. Keil shews, An. Secret. p. 36. That the Gall or Bile, being to be mixed with the

Chyle, as it comes out of the Stomach into the Duodenum, could be no where so conveniently secerned from the Blood, as where the Liver is placed, had also all the Branches of the Celiack Arteries, carry'd all the Blood to the Liver, from which the Gall was to be separated: It is evident, considering the Nearness of the Liver to the Heart, and the Intestine Motion of the Blood. that so viscid a Secretion, as the Gall is, could never have been separated by any Gland in that Place. In this Case therefore, Nature is forced to alter her constant Method of sending the Blood to all Parts of the Body by the Arteries; and here the forms a Vein, (which is no Branch of the Cava, as all other Veins are) and by it the fends the Blood from the Branches of the Mesenterick and Celiack Arteries, (after having passed through all the Intestines, Stomach, Spleen, Caul, and Pancreas) to the Liver. By which extraordinary Contrivance, the Blood is brought a great way about, before it arrive at the Liver; and its Celerity is extremely diminish'd: So that all the Corpu. cles which are to form the Gall, may have sufficient Time to attract one another, and to unite, before they come to their secerning Vessel. And thus the Use of the Vena Porta is found out.

And moreover he computes, that fince 4 Branch of the Mesenterick Artery is to its corresponding Branch of the Porta, as 9 to 25; therefore the Blood in the Branches of the Porta moves above 177 times flower than it does in the Trunk of the Melenterick Artery; and this only on the Account of the Increase of the Diameters of

the Vessels.

Thus Nature provides for the forming of the Gall, in that Blood which passes through the Mesenterick Artery. Next he enquires what Care is taken about that which is convey'd by the Celiack Artery to the Liver. For it feems it was necessary to send a larger Quantity of Blood thither, than could be disposed of through the Intestines. Part of the Blood of the Celiack Artery is spread upon the Stomach and Caul, and its Velocity diminished, as we have seen in the Intestines: But still all the Blood which those Parts could receive, was not sufficient for the Liver; and there was no room for the Division and Expiating of the Vessels through such a large Space as the Mesentery, and the long Tract of the Guts. And therefore here Nature bath a new Contri-vance to abate the Velocity of the Blook, (to which the Intestine Motion is always proportional); which is, by empting the Blood entirely out of the Vessels, into a large spongy Bowel, the Spleen; which seems to be a Cistern produced for that very Intent and Purpole. And the Cir-cumference of the Celiack Artery being half an Inch, or .5 its Square is .25: And therefore the Square of the Splenick, which is a Branch of it, cannot be above .18. Now the Dimersions of the Spleen are fix Inches long, 3 or 4 in Breadth, and 2 in Thickness. He makes therefore this easy Supposition, That it is a Cylinder of 2 Inches Diameter. Wherefore the Square of its Circumference being 36, the Blood must move above 200 Times flower in it, than in the Beginning of the Splenick Artery; and is longer before it gets to the Liver, than that which passes through all the Intestines.

From all this Art and Contrivance, it is an evident Demonstration, that the Intent of Nature was to diminish the Velocity of the Blood; and that such a flow Motion is absolutely ne-cessary for the secerning of the Bile in the Liver.

The Particles which compose the Gall, he shews, bear a very small Proportion to the rest of the Blood; as is evident from that great Quantity of Blood which is carry'd to the Liver, and the small Quantity of Bile which is separated from it. In a large Dog, whose Dullus Choledostius was near as big as a Man's, I could never gather above two Drams in an Hour. Now there is thrown into the Aorta every Hour about 4000 Ounces of Blood; and it appears by the Proportions of the Arteries, that the Mesenzerick and Celiack are to the rest, as 1 to 8. And therefore 500 Ounces of Blood are carry'd every Hour to the Liver. And fince only two Drams of Gall are separated from it, the Blood must be to the Blood, at least as 2000 is to 1.

'Tis by Reason of this small Proportion of the Bile to the Blood, that it was so necessary to allow so much Time for the Attraction of the Particles

which form the Bile.

From this Contrivance also of the Aorta, the Bile receives another Advantage, not less considerable than the Diminution of the Velocity of the Blood: And that is, the Blood passing thro's for many different Parts before it comes to the Liver, parts with the greatest Share of its Lympha. By which means, the Particles composing the Bile approaching nearer towards one another, are by their mutual Attraction sooner united.

And the Confideration of these two Contrivances does highly (he thinks) confirm the Truth of his Theory of Animal Secretion. For the Di-minution of the Velocity of the Blood, and the Substraction of the Lympha, can agree in no other End, than the uniting the Particles of the

Bile.

GALLEHALPENS, were formerly a Genoa Coin, brought into England by the Merchants of that City; who trading hither in Galleys, lived commonly in a Lane near Tower-street, call'd from them Galley-Lane; and they landed their Goeds at a Place in Thames-street, call'd Galley-Key; and they traded with their own small Silver Coin, which our People call'd Gallehalpence. But these, together with two kinds of Coin, call'd Suskins and Dockins, were forbidden by the Statute of 3 H. V. 1. See Stow's Survey of London.

p. 137.
GALLERY of a Mine, is any Branch of it carried on towards any Place. For the Bessegers, and the Besieged, do carry each of them Galleries or Branches under Ground, in search of one another's Mines, which often meet and destroy one

another.

GALLEY, is a low-built Ship, using both Sails and Oars. Usually they have only a Mainmast and a Fore-mast, which may be struck for lowered at pleasure. 'Tis said, their Length is nsually about 130 Feet, and their middle Breadth about 18, and the Length of the Oar is about 36 Feet, and about 4 or 5 Men to an Oar. They are of Service only in the Mediterranean, and such still quiet Seas. These were like the Roman Li-burnica. See my Introduction to the Bibliotheca Navigantium & Itinerantium, about the Antient Sbipping. Vol. II.

GALLIOT, is a small Galley, or a Sort of Brigantine, built very slight, and design'd for Chase. She hath but one Mast, and can both fail and row. She usually carries two or three Pedrero's, and hath 16 or 20 Oars: Some call the Bomb-Ketches Galliots.

GAMING. For the Laws of Chance in

Games. See Play.

GARBLER of Spices, is an Officer of great Antiquity in the City of London, who may enter into any Shop, Warehouse, &c. to view and fearch Drugs, Spices, &c. and to Garble the same, that is, to make them clean from any Garbles or Dust. See 21 Jac. I. c. 19.

GARSUMME, (Gersuma, a Spelm. Gloss.) a Fine or Amerciament often used in Doomsday

Book.

GARTER. The most Noble Order of the Garter, is an Order of Knighthood first instituted by our famous King Edmard III. 1350. and inferior to none in the World; confisting of 26 Nobles, or Persons of even yet higher Degree; i. e. Sovereign Princes, Kings, and Emperors; whereof the King or Queen of England is the Sovereign; and the rest are stilled. The Companyations of the Order Sea Compiler. Associated Associated Sea. panions of the Order. See Cambden, Assemble, &c. GARTER, is also the Title of the Principal

King at Arms among our English Heralds. The Office was created by Hen. V. See Stow, p. 581.

and Stat. 14. Car. II. c. 33.
GAVELL-BREAD, Corn-Rent, or Provision of Bread, referred from the Tenant to be paid in Kind.

GAVELCESTER, Sextarius Vestigalu, was a certain Measure of Ale, to be paid by way of Rent: It appears to be the same with Tokester, which hath sometimes been corruptly written Colcester; as perhaps in Selden's Desertation, an-nexed to Fleta, c. 8.

GAVELLERTH, Gavelhere. The Duty of Work of plowing so much Earth or Ground, done by the Customary Tenant for his Lord:

GAVEL-MEDE, was the Duty of mowing Grass, or cutting Meadow Land, required by the Lord from his Customary Tenant: So,

GAVEL REP, or Bedreap, was the Duty of Reaping at the Bid or Command of the Lord. GAVELLING-Men. Tenants which paid a

reserved Rent, besides some Customary Duties to

be done by them.

GAUGE-Point of a solid Measure, is the Diameter of a Circle, whose Area is equal to the solid Content of the same Measure. Thus the Solidity of a Wine Gallon being 231 Cubick Inches, (according to Winchester Measure;) If you conceive a Circle to contain so many Inches, the Diameter of it will be 17.15; and that will be the Gauge-Point of Wine-Measure. And an Ale-Gallon containing 288 Cubick Inches; by the same Rule, the Gauge-Point of Ale Measure will be found to be 19.15.

And after the same manner may the Gauge-

Point of any Foreign Measure be discover'd.

And from hence may be deduced, by way of Consequence, that when the Diameter of a Cylinder in Inches is equal to the Gauge-Point of any Measure (given likewise in Inches;) every Inch, in Length thereof, will contain an Integer of the same Measure, V. gr. In a Cylinder whose Diameter is 17.15 Inches, every Inch in Height contains one entire Gallon in Wine Measure; Hh 2

and in another, whose Diameter is 19.15, every made Dr. Harver conclude, that the Blood had Inch in Length contains one Ale Gallon.

GAUGER, is an Officer of the King's Excife, whole Business it is to examine all Casks of Beer, Wine, Oil, Honey, Butter, &c. and to give them a Mark of Allowance, (which is a Circle burnt with an Iron) before they be fold in any Place of this Office. See 27 E. III. c. 8. 4 R. II. c. 1. 18 H. VI. 17. 23 H. VI. 10. 1 R. III. 13.

28 H. VIII. 14. and last of all, 12 Car. II. c. 4. GAUGING. On this Subject, the following

Authors may be consulted:

Stereometrical Propositions, variously applicable, but particularly intended for Gauging: By Robert Anderson. Lond. 1668. 800.

Gauging Promoted; being an Appendix to the former Book. Lond. 1669.

Smith's Practical Gauging. Jones's Guide to the young Gauger. Kepleri Stercometria Nova. Mayne's Practical Gauger. Hunt's Practical Gauging. Newton's Gauging. Everard's Gauging.

GELD, the same with Gild, or Guild.

GEMOTE, is an old Saxon Term for what we now call a Court: Tis often used in the Laws

of Edward the Confessor.

GENERAL. When an Army is preparing to march, the Drums beat a peculiar Sound, in order to acquaint the whole Army, that they should all get ready to march: And this Notice by the

Drum, they call Beating the General.
GENERALE, the Single Commons, or Ordinary Provision, of the Religious in Convents, was formerly call'd by this Term Generale, as being their General Allowance; and so distinguish'd from their Pillantia, or Pittances, which, on exrraordinary Occasions, were added as Over Commons.

GENERAL Issue. See Issue.
GENERATION. As to what the Moderns, from their Discoveries by Microscopes, have advanc'd on this Subject, you will find by comparing the Observations and Discoveries of Dr. Harvey, S. Malpighii, Dr. de Graaf, and M. Leeuwenhoek, with one another: And these Three Things seem to me very probable. 1. That Ani. mals are ex Animalculo, 2. That the Animalcules are originally in Semine Marium, & non in Famini. 3. That they can never come Forward, nor be Formed into Animals of the respective Kind, without the Ovs in Famini.

The First of these seems probable from these 3 Observations; 1. That some such Thing has been so often observed by Malpighiu in the Cicatricula of an Egg before Incubation, as the Rudiments of an Animal in the Shape of a Tadpole; as may be seen in his First, and in his repeated Observations de Formatione Pulli in Ovo. 2. The sudden Appearance and Displaying of all the Parts, after Incubation, makes it probable, that they are not then actually formed out of a Fluid, but that the Stamina of them have been formerly there Existent, and are now expanded. The first Part of the Chick which is discover'd with the Naked Eye is, you know, the Punctum Saliens, and that not till Three Days and Nights of Incubation be past: And then on the Fifth Day the Rudiments of the Head and Body do appear. This

a Being before any other Part of the Body, and that from it all the Organs of the Parus were both formed and nourished; but by Malpighius's Observations, we find that the Parts are then only so far extended, as to be made visible to the Naked Eye, and that they were actually Exi-ftent before, and discernable by Glasses. After an Incubation of 30 Hours, are to be feen the Head. the Eyes, and the Carina, with the Vertebra, distinct, and the Hears. After 40 Hours its Pulle is visible, and all the other Parts more distinct, which cannot be discern'd by the Naked Eye before the Beginning of the Fifth Day; from whence it seems very probable that even the so early Discovery of those Parts of the Fatus by the Microscope, is not the discerning of Parts newly form'd, but only more dilated and extended by receiving of Nutriment from the Colliquamentum; so that they seem all to have been actually existent before the Incubation of the Hen. And What Swammardam has discover'd in the Transmutation of Insects, gives no small Light to this, whilst he makes appear in the Explanation of the 13th Table of the General History of Insects, that in those large Eruca's which feed upon Cabbage, if they be taken about the Time they retire to be transform'd into Aurelia's, and plunged often in warm Water to make a Rupture of the Outer Skin, you will discern, through the Transparency of their Second Membrane, all the Parts of the Buttersty, the Trunk, Wings, Feelers, &c. folded up : But, that after the Eruca is changed into an Aurelia, none of these Paris can be discern'd, they are so drench'd with Moisture, though they be there actually formed.

Another Consideration is from the Analogy, which we may suppose between Plants and Animals. All Vegetables, we see, do proceed ex Plantula, the Seeds of Vegetables being nothing else but little Plants of the same kind solded up in Coats and Membranes; and from hence we may probably conjecture, that so curiously an organized Creature, as an Animal, is not the sudden Product of a Fluid, or Colliquamentum, but does much rather proceed from an Animalcule of the fame kind, and has all its little Members folded up according to their several Joints and Plicatures, which are afterwards enlarg'd and diftended, as we see in Plants. Now though this Consideration alone may seem not to bear much Weight, yet being join'd to the two former, they do mu-tually strengthen each other. And indeed all the Laws of Motion which are as yet discover'd, can give but a very lame Account of the forming of a Plant or Animal. We see how wretchedly Des Cartes came off, when he began to apply them to this Subject. They are formed by Laws yet unknown to Mankind; and it seems most probable, that the Stamina of all the Plants and Animals that have been, or ever shall be in the World, have been formed ab Origine Mundi, by the Almighty Creator within the First of each respective Kind. And he who considers the Nature of Vision, that it does not give us the true Magnitude, but the Proportion of Things, and that what seems to our Naked Eye but a Point, may truly be made up of as many Parts as seem to us be in the whole visible World, will not think this an absurd or

impossible Thing.

But the Second Thing which later Discoveries have made probable is, that these Animalcules are

originally in Semine Marium, & non in Famini: :
And this I collect from these Considerations:

I. That there are innumerable Animalcula in Semine Masculino Omnium Animalium. M. Leeuwenbock has made this so evident by so many Observations, that I do not in the least question the Truth of the Thing.

2. The Observing of the Rudiments of the Fatus in Eggs, which have been Facundated by the Male, and the seeing no such Thing in those which are not Facundated, as appears from Malpigbius his Observations, makes it very probable, that these Rudiments proceeded originally from

the Male, and not from the Female.

3. The Resemblance between the Rudiments of the Fatus in Ova, both Before and Aster Incubation, and the Animalcule, makes it very probable, that they are One and the Same. The same Shape and Figure which M. Leeuwenhoek gives us of the Animalcule, Malpighius likewise gives us of the Rudiments of the Fatus, both before and after Incubation; yea, and even the Fatus's of Animals do appear so at first to the Naket Eye; so that Dr. Harvey does acknowledge, that all Animals, even the most Perfest, are Begotten of a Worm.

4. This gives a Rational Account of Many Fatus's at One Birth, especially that of the Countess of Holland; and how, at least, a Whole Cluster of Eggs in a Hen are Facundated by One Coition

of the Male.

5. This gives a New Light, as it were, to the First Prophecy concerning the Messiah, that the Seed of the Woman shall bruise the Head of the Serpent: All the rest of Mankind being thus most

properly and truly the Seed of the Man.

6. The Analogy I have already mention'd, which we may rationally suppose between the Manner of the Propagation of Plants and Animals, does likewise make this probable. Every Herb and Tree bears its Seed after its Kind; which Seed is nothing else but a Little Plant of the same Kind, which being thrown into the Earth, as into its Uterus, spreads forth its Roots, and receives its Nourishment, but has its Form within it self; and we may rationally conjecture some such Analogy in the Propagation of Animals.

The Third Particular, which later Discoveries make propable, is, That Animals cannot be Formed of these Animalcula without the Ova in Faminis, which are necessary for supplying them with proper Nutriment; and this, these Considerations seem to evince. I. It is probable that an Animalcule cannot come forward if it do not fall into a proper Nidus. This we see in the Cicatricula in Eggs, and tho' a Million of them should fall into One Egg, none of them would come forward, but what were in the Centre of the Cicatricula; and perhaps the Nidus, necessary for their Formation, is so proportioned to their Bulk, that it can hardly contain more than One Animalcule; and this may be the Reason why there are so sew Monsters. This we see is absolutely necessary in Oviparis; and the only Difference which seems to be between them and the Vivipara in this Matter, is in this, That in the latter the Ova are properly nothing more but the Cicatricula, with its Colliquamentum, so that the Fætus must spread forth its Roots into the Uterus to receive its Nourishment; but the Eggs in Oviparis may be properly termed

an Uterus in relation to the Fatus; for they contain not only the Cicatricula with its Amnion and Colliquamentum, which is the immediate Nouristment of the Fatus, but also the Materials which are to be converted into that Colliquamentum; so that the Fatus spreads forth its Roots no farther than into the White and Yolk of the Egg, from whence it derives all its Nouristment. Now that an Animalcule cannot come forward without some such proper Nidus, M. Leeuwenhoek will not readily deny; for if there were nothing needful but their being thrown into the Uterus, I do not see why many Hundreds of them should not come forward at once, at least whilst scatter'd in so large a Field.

Now, 2. That this Cicatricula is not originally in Utero, seems evident from the frequent Conceptions which have been found extra Uterum: Such as the Child which continued 26 Years in the Woman of Tholouse's Belly; and the Little Fatus found in the Abdomen of Mad. de S. Mere, together with the Testicle .torn, and full of Clotted Blood; such also seem to be the Fatus in the Abdomen of the Woman of Copenhagen, mentioned in the Nouvelles des Lettres, for Sept. 85. all the Members of which were easily to be felt thro' the Skin of the Belly, and which she had carried in her Belly for four Years: And the seven Years Gravidation related by Dr. Cole. Now granting once the Necessity of a Proper Nidus, for the Formation of an Animalcule into the Animal of its respective Kind, these Observations make it probable, that the Testes are the Ovaria appropriated for this Use; for though the Animalcules coming thither in such Cases, may seem to be extraordinary, and that usually the Impregnation is in Utero, yet it may be collected from hence, that the Cicatricula or Ova to be Impregnated, are in Testibus Famineis; for if it were not so, the accidental coming of Animalcules thither, could not make them come forward more than in any other Part of the Body, since they cannot be Formed and Nourished without a Proper Nidus.

But, 3. It is acknowledg'd by all, that the

But, 3. It is acknowledged by all, that the Fætus in Utero, for some considerable Time after Conception, has no Connexion with the Womb; that it sits wholly loose to it, and is persectly a Little Round Egg with the Fætus in the Midst, which sends forth its Umbilical Vessels by Degrees, and at last lays hold on the Uterus. Now from hence it seems evident, that the Cicatricula, which is the Fountain of the Amimalcule's Nourishment, does not sprout from the Uterus, but has its Origine elsewhere, and falls in thither as into a sit Soil, from whence it may draw Nutriment for the Growth of the Fætus; else it cannot be easily imagined how it should not have an Immediate Connexion with the Uterus from the Time of

Conception.

If you joyn all these Three Considerations together, viz. that an Animalcule cannot come forward without a Proper Nidus, or Cicatricula;
that there have been frequent Fatus's extra Uterum; and that they have no Adhesion to the Uterus for a considerable Time after Conception; they
seem to make it evident, that Animals cannot be
Formed ex Animalculis without the Ova in Faminis. To all these I shall subjoyn the Proposal
of an Experimentum Crucis, which may seem to
determine whether the Testes Faminea be truly the
Ovaria: viz. Open the Abdomen of the Females
of some Kinds, and cut out these Testicles, and

this will determine whether they be absolutely necessary for the Formation of Animals.

It is indeed difficult to conceive, how these Eggs should be Impregnated per Semen Maris, both because there is no Connexion between the Tube and the Ovary for its Transmission; and for that Dr. Harvey could never discover any thing of it But as to the last, M. Leeuwenhoek has cleared that Difficulty, by the Discovery of innumerable Animalcula Seminis Maris in Cornutus Vteri, and those living a considerable time And as to the former, we may eiafter Coition. ther suppose that there is such an Inflation of the Tuba, or Cornua Uteri, tempore Coitionis, as makes them Embrace the Ovaria, and such an Approach of the Uterus and its Cornua, as that it may eafily transmit the Seed into the Ovary: Or else, that the Ova are Impregnated by the Animalcules after they descend into the Vierus, and not in the Ovary. The former seems probable for this Reason, that at least a whole Cluster of Eggs in a Hen will be Facundated by One Tread of the Cock; now this Facundation seems to be in the Vitellary, and not in the Uterus, as the Eggs pass along from Day to Day: For it can hardly be supposed that the Animalcules should subsist so long, being scatter'd loosely in the Uterus, as to wait there, for many Days, for the Facundation of the Eggs as they pass along. The latter Conjecture has this to strengthen it; That the Animalcules are found to live a considerable Time in the Vterus, and that if they should Impregnate the Ova in the Ovary it self, the Fatus would encrease so fast, that the Ova could not pass through the Tuba Vieri, but would either burst the Ovary, or fall down into the Abdomen from the Orifices of the Tube; and that from hence proceed those extraordinary Conceptions, in Abdomine extra Uterum.

But M. Leeuwenhoek, to weaken this Consideration about the Conception's being like unto an Ovum in the Womb, proposes a Parallel between the e Animalcules and Insects, and infinuates, that as the Latter cast their Skins, and appear of another Shape, so the Other, which at first seem like Tadpoles, may cast their Outer Skin, and then be Round; and that this may be the Occasion of the Round Figure of the Conception in the Womb. To this it may be replied, That according to M. Leeuwenhoek's own Sentiment, the Animalcules cannot come forward, if they do not find the Punaum or proper Place for their Nourishment, to which it seems they must have some Adhesion. Now the Conception in Viviparis is not fastened unto the Womb for many Days, nor does Adhere to any Point of it; so that it seems this Roundish Body is not the Animalcule thus changed after having cast an outer Skin, but is rather the Cicatricula, or little Egg, into which the Animalcle has enter'd as its Punctum, or Place of Nourishment; else I do not see why they should not be Adhering to the Womb from the First Conception; or why (as I have faid) many Hundreds of them are not Conceived and Formed together. GENITURA. See Seed.

GENTLEMAN, is derived from the French Gentil, i. e. Honestus, vel Honesto loco natus; and the Saxon Word Man: So that it fignifies a Man well born. So the Italians call such Persons Gentil Huomoni: And the Spaniards keep the Meaning, when they call a Gentleman Hidalgo, or Hijo d'algo; i.e. the Son of some Man, or of some Man of Note or Reckoning. Under this Name

with usare comprised all above Yeomen; so that Noblemen may truly be call'd Gentlemen. But by the Course and Custom of England, Nobility is either Greater or Less, Upper or Lower. The Greater contains all from Knights upwards; the Leffer all from Barons downwards: As Smith saith, Cap. 21. de Republ. Anglic.

GEOMETRY Abstruse. See Transcendentals. GEORGE Noble, was a Piece of Gold, current in 1 Hen. VIII. at Six Shillings and Eightpence. At which Time, by Indenture with the Mint, one Pound of Gold (in Weight) was to be coined into Eighty one George Nobles.

GIRDERS, in Architecture, are the largest Pieces of Timber in a Floor: Their Ends are ulually fastened into the Summers or Brest-Summers, and the Joists are framed in at one End to the Girders. No Girder should lie less than to Inches into the Wall, and their Ends should be laid in Lome, &c

GLANDS. All Secretions in an Animal Body are made by Glands, and a Gland is nothing but the Convolution or various Folding of the small Arteries, whose last Branch must be Cylindrical. This Cylindrical Artery, in its Windings, sends out several little Ducts or Se-I Particles, of a lesser Diameter than that of the

cretory Vessels of equal Diameters, which some-times unite in one common Pore, sometimes run into a common Bason. This Structure is evident in all the larger Glands, such as the Intestines, with their Secretory Ducks, the Lasteals, the Testicles, and some of the Conglobate Glands, and may be seen in all the rest, if they happen to be Obstructed, and so swell to become visible; and therefore the same may reasonably be concluded of all Glands in general. There are small Branchings of Nerves passing all over the Coats of the Arteries, and seem to be designed principally for their Spiral Contortion, that the Blood may be the more easily propagated through them.

A Conglobate Gland is a little smooth Body wrapt up in a fine Skin, by which it is separated from all other Parts, only admitting a Nerve and Artery to pass in, and giving way to a Vein and Excretory Canal to pass out: Of this Sort, are the Glands of the Brain, the Labial Glands, and

the Testes.

A Conglomerate Gland is composed of many little Conglobate Glands all tied together, and wrapt up in one common Tunicle or Membrane. Sometimes all their Execretory Ducts unite and make up one common Pipe, thro' which the Liquor of all of them runs, as the Pancreas and the Parotides do. Sometimes the Ducks uniting, form several Pipes, which only communicate with one another by cross Channels; and such are the Breasts. Others again have several Pipes without any Communication with one another, of which Sort are the Glandula Lachrymales, and the Prostaea. And a fourth Sort is, when each little Gland hath its own Excretory Duck, thro' which it transmits its Liquor to a common Bason, as in the Kidneys.

As to the Manner how the several Fluids, after they are form'd in the Blood, are separated from it in the Glands; it depends (as Dr. Keil shews, An. Secret, p. 82.) entirely on the Figure and Structure of the Glands, which therefore must first be determined. As Truth, when plain and evident, doth of itself dispel all false Opinions; So the true Structure of the Glands being once demonstra. ted, there will be no Occasion to refute the Dostrine of Ferments, not the Hypothesis of Tubes differing as to the Figures of their Orifices; both which have several Times been demonstrated to be false.

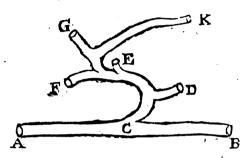

That the Glands are nothing but Convolutions of small Arteries, the greatest and most accurate Anatomists of this Age, Malpighi, Bellini, and Nuch, have discover'd. And indeed, that all the Vessels of the Body, in which the Liquors are continually moving, can have no other than a Cylindrical or Conical Form, is demonstrable from the Nature of Fluids, whose Pressure is always prependicular to the Sides of the Vessel containing them, and equal at equal Heights of the Fluid. If therefore the Sides of the Vessels are soft, and equally yielding every where, (as are all the Tubes in the Body of a Fætus) they must, by the Pressure of their contained Fluid, be equally every where diftended; and consequently the Section of such a Vessel, perpendicular to its Axis, must be a Circle; and therefore the Vessel must be either a Concave Cone or Cylinder, or at least such a Figure whole Transverse Section, normal to the Axis, must be a Circle.

The Circular Orifices therefore of the Glands can only differ in Magnitude; and all Sorts of

Digitized by Google

Orifice of the Gland, may enter it: So that without some further Contrivance, that Fluid which contains the biggest Particles, must likewise consist of all the Particles of all the other Secretions; neither could any Fluid thicker than the Blood be separated from it, because of the great Proportion of the Aqueous Fluid, whose Particles being vastly smaller than any other, and invisible to the best Microscopes, must enter all the Glands, and be mix'd with the secenced Fluid.

Now how this Inconvenience may be prevented, and how the Particles of any Size may either be separated by themselves, or with any affigned Portion of the Aqueous Fluid, or of other lesser Particles, I shall endeavour to shew.

Suppose then AB to be a small evanescent Artery, and that the Particles of the least Size were

to be separated from the rest.

From the Side of the Artery must arise the Gland or Tube C K, whose Orifice at C is such as is capable of admitting only Particles of the least Size, together with the Aqueous Fluid: These therefore will be separated from all the other Particles of the Blood, and the Tube C K being a Cylinder, they will pass to its surther End K, which is supposed to be the Excretory Duct of the Gland.

If the Quantity of the Aqueous Fluid, separated with the least Particles, must be diminish'd, that such a Fluid as is requisite may pass through the Excretory Duck K, from the Tube C K; you must imagine, that several other smaller Canals go out, as at D, E, F, and G, whose Orifices are so small, that they admit no other Particles, besides those of the Aqueous Fluid, to pass through them; and therefore as the least Particles, together with the Aqueous Fluid, pass along the Tube C K, the Aqueous Fluid must constantly be diminished; and the Quantity of the least Particles still remaining, they can pass no where but through the Excretory Duck at K: And this Diminution of the Aqueous Fluid will always be according to the Number of the Canals, D, E, F, G, that is, in Proportion to the Length of the Tube C K. And therefore, according as the Gland is longer or shorter, so the more or less Aqueous Fluid will pass through the Orifice of the Excretory Duck at K; and consequently, the secreted Fluid, on this Account, be Thicker or Thin.

If the Particles of a middle Size, between the biggest and the least, are to be drawn off from the rest of the Blood: Let the Orifice at the Gland C be just so big as to admit those Particles, and not any other of a larger Size. These Particles therefore, with the Aqueous Fluid, and all better Particles, will pass through the Orifice C; but if the Canals D, E, F, G, are big enough to receive all the other Particles, and too little to admit those that are to be separated, it is evident, that

those Particles must arrive at the Excretory Duck K, with what Proportion of Lesser Particles is

required.

And thus we see how any Sort of Particles may be drawn off, either by themselves, or mixed with any others, in any Proportion: And this is done in the most simple manner, only by Arteries; for C K is only a smaller Artery, either Straight, Spiral, or otherwise contorted, and D, E, F, and G, are again Arteries smaller than it; and if any of these are so smaller than it; and if any of these are so smaller than it; and if any of serum, they will constitute Lymphatick Vessels. From whence it is, that we find Lymphadults arising in great Numbers from those Glands that separate thick Humours; as from the Tessicles, Liver, &c.

GLANDULÆ Miliares. See Miliares, and

Skin.

GLANDULÆ Myrtiformes, are the Contrachions of the Fibres of the broken Hymen, upon the first Coition.

GLANDULÆ Schacea, are a large Number of Glands which lie under the Skin of the Auricula of the Ear; and which, because they separate a greasy Matter, like Tallow or Schum, their sirft Discoverer Valsalva, in his Book of the Ear, calls by this Name. This Schum being carried to the Surface of the Skin, he saith, hardens there, and turns into a scaly greasy Substance, not unlike that of Bran. Perhaps they are such Glands as those that secrete the Scurf and Dandruff that arises from combing the Head.

GLASS Drops, or Bubbles, sometimes called Prince Ruperi's Drops; are small Parcels of coarse green Glass, taken out of the Pot in Fusion at the End of an Iron Pipe; and being exceeding hor, are let fall or dropt from thence into a Vessel of Cold Water, and so lie there 'till they are sensibly cold. These exhibit a very surprising Phanomenon, viz. as soon as you break off the least Bit from the Stem of it, or pecked End, the whole Bulk of the Drop slies to pieces with a brisk Noise, and some of the Pieces will be as small as Dust. Dr. Hook, in his Micrographia, hath a particular

Differtation upon this Subject.

GLOBULES, are such small Particles of Matter as are of a Globular or Spherical Figure: As the Red Particles of the Blood which swim in the transparent Serum, which are easily discoverable by the Microscope; and 'tis pleasant to see how these Blood-Globules, whenever they come within a due Distance, do astrast one another, and unite like Spheres of Quicksilver; and by this Means the Blood separates into two Parts; one of which is the Coagulation this Way of the Red Parts of it, and the other is the Serum. Now the Serum consists of a great Number of Corpuscles or small Particles (but they are not all Spherical nor Globular, like the Red Globules of the Blood) and these of various Figures and Magnitudes, and swimming in a Limpid Fluid. And these Serous Particles don't unite with, nor attract one another as the former did, 'till some Part of the Fluid in which they swim hath been evaporated by Heat; but then they do (and form a Coagulum) as the Blood Globules did. So that the Power of Attraction is greater in the Red Globules, than in the Particles of the Serum.

GLYPHICE, is a Part of Sculpture, being the

GLYPHICE, is a Part of Sculpture, being the Art of Cutting, Carving, or Casting, the Images and Resemblances of natural Things in Metals.

GOLD

GRA

GOLD Mines. In Phil. Trans. N. 58. Dr. Edw. Brown gives the following Account of the Gold Mines in Hungary. Among the 7 Mine Towns in Hungary, (which are not far from one another, viz. Chremnitz, Schemnitz, Newfol, Coningsberg, Bochantz, Libeten, and Tiln) Chremnizt is the richest in Gold. They have also at present, Gold Mines at Bochantz and Coningsberg ; and they report in that Country, that there hath been for-merly a rich Gold Mine at Glass-Histen, but loft fince that Bethlem Gabor over-ran those Parts, when the Undertakers stopped up the Mine and fled.

They have worked in the Gold Mine at Chremnitz 900 Years. This Mine is divers English Miles in Length, and about 160 Fathoms Deep. Many Veins of the Ore run to the North, and to the East. They work also towards One, Two, and Three of the Clock, as they speak; for the Miners direct themselves under Ground by a Compass, not of 32 Points (such as is used at Sea), but by one of 24; which they divide, as we do the Hours of the Day, into twice Twelve. Of the Gold Ore, some is White, and some Black, Red, or Yellow: That with Black Spots in White is efteem'd the best, as also the Ore which lieth next to the Black Veins. This Ore is not rich enough to fuffer any Proof in small Parcels, like that in other Mines, whereby to know what Proportion of Metal is contain'd in it; but they pound a very great Quantity thereof, and wash it in a little River, which runs nigh the Town. The whole River being divided, and admitted into divers Cuts, runs over the Ore continually, and so washeth away the Earthy Parts from the Metalline: And from a clear River above the Town, by its running through so many Works, and over so much pounded Ore, it becomes below the Town a Dark-yellow Stream, of the Colour of the Earth of those Hills.

There have been Pieces of pure Gold found in the Mine; some of which I have seen in the Emperor's Treasury, and in the Elector of Saxony's Repository; one Piece as broad as the Palm of my Hand, and others less, and upon a White Scone many Pieces of pure Gold; but these are

The common Yellow Earth of the Country near Chremnitz, although it be not esteem'd Ore, affords some Gold: And in one Place I saw a great Part of an Hill digg'd away, which hath been cast into the Works, washed and wrought in the same Manner as pounded Ore with considerable Profit.

Some Passages in this Mine, cut through the Rock, and long disused, have grown up again; and I observed the Sides of some, which had been formerly wide enough to carry their Ore through, to approach each other, so as we passed with disficulty. This happens in moist Places. The Pasfages unite not from the Top to the Bottom, but from one Side to another.

There is Vieriol in this Mine, White, Red, Blue, and Green; and also Vitriol Waters. There is a Substance found which sticks to the Gold Ore, of small pointed Parts like Needles, called by them Antimony of Gold. There are Christals found here, and some sincured Tellow.

The Miners will not allow any Quickfilver or Brimstone to have been found here; yet in the lately mention'd Antimony of Gold, there is evidently Sulphar, as I perceived by busning. The Mr. Johnson, in his Grammatical Commentaries:

Vol. II.

I i That

Quickfilver Mine, mentioned in the Answer to Kercher's Inquiries, Mund. Subter. is an Hungarian Mile, or 7 English Miles distant from Chremnitz, and is not wrought in at present.

There is a Vitriol Mine in these Hills near the Gold Mine; the Earth or Ore of it is Reddish, and sometimes Greenish. This Earth is insused in Water, and after 3 Days, the Water is poured off, and boiled 7 Days in a Leaden Vessel, till it comes to a thick granulated whitish Substance, which is afterwards reduced to a Calx in an Oven, and serveth in the making Aquafortis, or the Separa-

ting Water used at Schemnitz.
They have divers Ways of taking the Gold out of its Ore; by burning the Ore; by melting; by adding Silver Ore, and other Minerals, Sand, and Lead, as they find the Ore fluid or fix'd.

But without Lead they proceed thus:

They break and pound the Ore in Water, very

fine; they wash it often, and lay it in Powder upon Cloths, and by the gentle oblique descending of the Water over it, and their continual ftirring it, the earthy, clayish, and lighter Parts, are washed away, while the heavier and metalline remain in the Cloths; these Cloths are afterwards washed clean in several Tubs, and the Water, after some settling, poured off from its Sediment; which Sediment is again wash'd, and stirred up in several Vessels and Troughs, 'till at length they sprinkle Quicksilver upon it, and knead it well together for an Hour, and then washing it again in a wooden Vessel, after the separating of much of it which the Quickfilver touches not; by striking this Vessel against their Leg, they bring the Gold and Quick silver together, in an Amalgama, to one Corner of it. From this Amalgama they strain as much of the Quickfilver as they can through coarse Cloths first, and then through fine; then they put the Mais re-

that it may become purer. Concerning Cranach-Gold, I cannot learn that there is any such Gold, or Place where Gold is digg'd in Hungary; but in Germany I think there is, for Agrigola mentions such a Place as Golde-Cranacum, and another called Golde-Crona.

maining upon a perforated Plate, which they fet

over a deep Pan placed in the Earth, in the Bottom of which Pan they also put Quick-silver:

This Pan they cover, and lute the Cover well, and then making a Charcoal Fire upon it, they drive down the Quick-silver, yet remaining in the

Gold, to the rest in the Bottom of the Pan; then taking out the Gold, they cast it into the Fire,

For the exceeding Minuteness of the Constituent Particles of Gold, see Dustility.

GOTHICK Manner of Building, was unhappily brought into Ule, after the Irruption of those barbarous Nations, the Goths and Vandals, &c. from the North, and the Moors and Arabs, from the South and East, into the civiliz'd. World. These rude People demolish'd what they could of the antient Greek and Roman Architecture, and instead of those admirable and regular Orders and Manner of Building, introduced a licentious and fantastical Manner, which, tho' sometimes adorn'd with expensive Carvings, and costly, the lamentable, Imagery, is without any of that august Beauty, and just Symmetry, which the Fabricks of the Antients entertain us

That it is the Art of expressing the Relations of Things | Plane, have its Line of Gravity C P falling within Construction, with due Accent in Speaking, and Orthography in Writing, according to the Custom of those whose Language we learn.

GRAND Days, are those in every Term so-lemnly kept in the Inns of Court and Chancery; viz. In Easter Term, Ascension Day; in Trinity
Term, St. John Baptist's Day; In Michaelmas
Term, All-Saints Day (and of late, All-Souls
Day); and in Hillary Term, the Feast of the Purification of our Lady, commonly called Candle. mas Day. These are Dies non Juridici, no Court

GRAND Gusto, is a Term used by Painters, to express, that in a Picture there is something very great and extraordinary, to surprise, please, and instruct. Where this is found, they say the Painter was a Man of the Grand Gusto, or Goût: And they use the Words Sublime and Marvellous, when they speak of a Picture, in much the same

GRAPPLINGS The same with Grapnels. See

that Word in Vol. I.

GRAS-Hearth, was formerly the Customary Service for all the inferior Tenants to bring their Plows, and do one Day's Work for the Lord,

within four Days after Michaelmas.
GRAVITY. Dr. Gregory, in the Preface to his Excellent Aftronomy, thews, that the ancient Astronomers knew that the Heavenly Bodies gravitated towards one another, and were kept in their Orbits by the Force of Gravity. And that when Democrisus, Metrodorus, and Diogenes, and afterwards Anaxagoras, Archelaus, and Eurypides, maintain'd the Sun and Stars to be great Globes of Stone or Metal heated red hot; they meant by it, that they were heavy Bodies of such a Density, and heated to such a Degree, as to enable them to retain their Fire and Heat for the Purpoles they were defigned.

Anaximenes said, the Fix'd Stars were of a Fiery Nature, but had Bodies of an Earthy Nature moving round them, which we can't see as we can them. And this Opinion he had from Anaximander, and he from Thales Milesius; who was the first of the Ionick Sect of Philosophers; among whom this was a received Notion. It got also into the Italian Philosophy; for those of that Sect maintain'd each Star to be a World, and to have Earths or Planets moving round it, in the infinite Mundum Space; and in particular, that the Moon was an Earth like ours, and inhabited by some fine Sorts of living Creatures.

In the Leipsick Acts of May, 1690, there is a Discourse about the Cause of Gravity, by Mr. Leibnitz, together with a Defence of his Opinion of

the true Laws of Nature against the Cartesians.
GRAVITY, its Center, is a Point in every heavy Body, through which any Plane whatever being drawn, will divide the Body into two Parts of equal Weight.

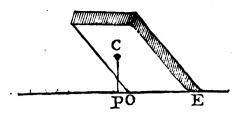

And the Plane so dividing the Body into two Parts, equal in Weight to each other, is call'd

the Plane of Gravity.

And every Line in this Plane which passes thro' the Centre of Gravity, is call'd the Diameter, or Line of Gravitation, Propension, and (by some) Inniction.

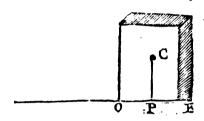

The Line of Direction of Gravity, or Line of Gravity, is perpendicular from the Center of Gravity to the Horizon.

If a Body, being placed upon an Horizontal

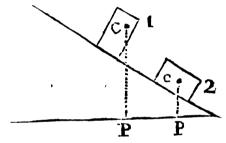

out its Base OE; then that Body must fall down, and will fall on that Side where the Perpendicular C P falls.

But if that Line CP falls any where within O E, the Base or Foot on which the Body stands,

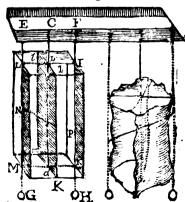

the Body will rest there without Danger of falling. And if a Body be placed on an Inclined Plane, and CP the Line of Gravity, as in N. 1. falls

without the Base, it will tumble over; when it falls within, as in N. 2. it will only Aide down.

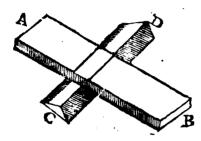

Of the Mathematical Way of finding Centers of Gravity. See Centers of Gravity, in Vol. II.

I shall here, from Sturmius, give you a good Mechanical or Practical Way for finding the Center of Gravity of Regular or Irregular Solids; by which also the Plane of Gravity, and the Diameter of Gravity, may be determined. Apply to the Solid suspended by a Rope, as C D, on both Sides of it, the Perpendiculars EG, and FH, fo that they may touch in the Lines IK, LM, which should be mark'd out with Chalk, &c. and then be joined above and below by the Transverse Perpendiculars IL, KM, so that one of the Planes of Gravity, IK, ML, may be gained: Also having turned the Solid about,

find out, after the same Manner, another such Plane of Gravity, li, km, which will cut the former above in D, and below in d; and then the Diameter of Gravity D d will be had. Then hang the Solid transversly, and the same Way find another Diameter of Gravity N P, which will cut the former in O, the Centre of Gravity fought.

And in some Cases, there may be yet used a more Compendious Way; viz. Lay the given Solid AB on the fine Edge CD, of any Hypomochlion, turning and moving it about 'till it will rest there in Equilibria; then will that Plane, in the Body or Solid which answers perpendicularly to the Edge of the Hypomochlion, be one of the Planes of Gravity: Then find out such another,

by poining the Solid another Way oblique to the former, so will their common Section be one of the Diameters of Gravity: Laftly, roll the Solid into another Polition, and then repeat the former Way of finding another Plane and Diameter of Gravity; so shall the Intersection of this Diameter of Gravity with the former be the Centre of Gravity sought.

GREAT Circle-Sailing, is conducting a Ship

(if it be possible) in the Arch of a great Circle, which passes thro the Zenith of the two Places from whence and to which she is bound. But this from Method is not practicable at Sea, tho' the nearer a Ship can keep to it, the better. See Sir Jonas Moor's Navigation.

GREE, from the French Word Gre, fignifies in our Law, Contentment or Satisfallion. Thus in 2 R. II. c. 15. to make Gree to the Parties, is to give them Contentment or Satisfaction for an Offence done to them. So in 25 E.III. c. 19. 'Tis appointed that Judgment shall be put in Dispense, 'till Gree be made to the King of his Debt. Hence

Agree, Agreement. &c.
GREGARIOUS Birds, are such as do not live solitarily, but affociate in Flights or Coveys, a great many together in Company.

GREUT, is the Miners Word for the Earthy Part of what they dig up, and which hath no Mine or Oar in it, but is peculiar to each particular Load, i. e. such a Load hath such a coloured Greut. The common Earth, which is the loose Mold above the Shelf, in which find the Shoad, they call Deads.
GROOVE, is the Shaft or Passage into the

Lead Mines, and by which they draw up their

GROSSE. Formerly a Villain in Grofs, was such a servile Person as was not appendant or annex'd to the Land or Mannor, and to go along with the Tenure as an Appurtenance of it; but was, like the other Personal Goods and Chattles of his Lord, at his Lord's free Pleasure and Dis-

posal. And thus Advouson in Gross, is distinguish'd

from Advouson Appendant.
GROTESQUE, or Grotesca Work, is the same with what is sometimes call'd Antick; being 4 confus'd Composure of Figures of different Na-tures, Sexes, &c. and usually of such Fancies as are not any where really existing in Rerum Natura

GROUND Plates, in Architecture, are the outermost Pieces of Timber lying on or near the Ground, and framed into one another with Mortesses and Tennons: In these also are Mortesses made to receive the Tennons of the Joists, the Summer, and Girders; and sometimes the Trim-mers for the Stair-Case and Chimney-Way, and

the Binding Joifts.

GROUPPE, in Painting or Sculpture, is a Knot or separate Collection of Figures, which appear to have some plain Connexion with, or Relation to one another, by the Defign of the Piece

GUARD, in the Military Art, fignifies a Duty or Service paid by the Soldiers, to secure the Army or Place from the Surprizes and Efforts of the Enemy; and of this there are several Kinds: As, t. The Main Guard; which is that from whence all other Guards are detatch'd: Those who are to mount the Guard, meet at the respective Captains Quarters, and are carried from thence to the Parade; where, after the Whole Guard is drawn up, the Small Guards are detach'd for the Posts and Magazines; and then the Subaltern Officers throw Lots for their Guards; and are commanded by the Captain of the Main Guard. 2. Advance Guard, is that Party of Horse or Foot which march before a Body, to give Notice of approaching Danger. When an Army is upon their March, the Grand Guards which should mount that Day, serve as Advance Guards to the Army. That small Body also of 12 or 16 Horse, which are posted under a Corporal or Quarter-master before the Grand Guard of a Camp, are called the Advance Guard. 3. Grand Guard, are 3 or 4 Squadrons of Horse commanded by a Field Officer, and posted before the Camp, on the Right and Lest Wing, towards the Enemy, for the Security of the Camp. 4. In a Camp also every Battalion posts a small Guard, commanded by a Subaltern Officer, about 100 Yards before its Front; and this is called the Quarter Guard. As, 5. That this is called the Quarter Guard. As, 5. small Guard of Foot which a Regiment of Horse mounts in the Front of the Regiment, under a Corporal, is call'd the Standard Guard. There is also, 6. The Picquet Guard, which is a good Number of Horse and Foot, which keep themselves always in a Readiness in a case of an Alarm: The Horse are saddled, and the Riders booted, all the while; and the Foot draw up at the Head of the Battalion at the Beating of the Taston; but afterwards return to their Tents, where they are in a readiness to march upon any sudden Alarm. This Guard is to make Resistance, in case of an Attack, 'till the Army can get

ready.

GUARDIAN of the Spiritualities, is he that collects the Spiritualities of any Bishoprick during the Vacancy of that See. The Dean and Chapter of Canterbury are Guardians of the Spiritualities for the whole Diocese and Province, during the Vacancy of that Archbishoprick.

GUERITE,

GUERITE, in Fortification, is a small Tower of Wood or Stone, plac'd usually on the Point of a Bastion, or on the Angles of the Shoulder, to hold a Centinel, who is to take care of the

Dirch. and to watch out against Surprizes.

GULE of August, is the Day of St. Peter ad Vincules, celebrated formerly and now on the first of August. See Hospinion de Origine Festo-

rum, Fol. 85.

GUN-Powder. The wonderful Explosion of this mischievous Composition (when it is kindled) seems to arise from hence: That the Sulphur and Coal-dust being Bodies very quickly set on Fire, they do very swiftly accend the Nitre; whose Spirit being thereby rarised, breaks out with a violent Explosion, like the heated Vapour of Water out of an Æolipile. The Sulphur also being of a volatile Nature, is itself also converted into Vapour, and so encreases the Explosion; and that Part of it which is of an Acid Nature, see that Spirit which they call Oil of Sulphur (as that Spirit which they call Oil of Sulphur per Campanam) upon the Accention, breaks out, and entring into the fix'd Body of the Nitre, loosens and lets out its latent Spirit also, hereby producing a yet much greater Fermentation and Heat.

And if you mingle Salt of Tartar with Gun-Powder, and let that Mixture be gradually heated 'till it come to take Fire, the Explosion will become much more quick and violent; and this can arise from no other Cause than from the Action of the Vapour of the Gun-Powder on the Salt of Tartar. By what Means the small Particles of Bodies do act upon one another with this Immense Violence, you will find under the

Word Attraction.

GUN-Room, in a Ship, is the Appartment under the Great Cabin; where the Master Gunner and his Crew rendezvous, get ready their Cartridges, &c. and do all Things belonging to their

GUNTERS Line. Designing in this Volume, the Description and Use of the common Scales, Rules and other Mathematical Instruments; I shall now give you the Constitution and Use of this Famous Line. Provide a Ruler of any Metal, Wood, &c. that is proper, of any Length, (the larger the better) and according to the defigned Length of your Line of Numbers, divide a Line of the same Length into 10000 equal Parts; and then having Recourse to a Table of Logarithms, take off from the said Scale the Artificial or Logarithmic Numbers answering to the Division of your intended Line, (omitting the Index or Characteristick) and these Distances will graduate your Line of Numbers, and divide it into its Primes, Tenths, Centesms, &c.

For the first eminent Nine unequal Parts, which have the Nine Digits annex'd, are call'd Primes; and the Subdivisions of those into Ten lesser Parts are called Tenths; each Tenth is divided, or supposed to be so, into Centesms; and those Centesms into Millains, as Mr. Wingate calls them. Numeration therefore, as they call it, on the Line will be very easy; and you may know readily how to find the Point expressing any Number of not above 4 Places on it. Suppose the Number were 4867; The Figure 4, on the Line, expresses the Place of 4000; thence accounting 8 Tenths further to the Right Hand, you will have the Place of 4800; and in the next Tenth, reckoning forward fix Subdivisions, you

will have the proper Point for 4860; and then in the next Cente/m, taking or gueffing at 7, (and Practice will make this easy) you will find the

Point (nearly) for 4867.

But if your Number had been but of 3 Places, as 486; then the Digit Figure 4 on the Line would only have represented 400. And if it had been but of two Places, or a fingle Figure, the Figure 4 on the Line would have been 40, or barely 4 Unites accordingly. 'Tis plain also, that any Decimal Fractions and Unfixt Numbers will be represented on the Line as easy as Whole Numbers, Regard being only had to the Point or Line of Separation.

PROBLEM I.

Two Numbers being given, to find a Third or Fourth Geometrical Proportion.

The Line being nothing but a Series of Logarithms or Artificial Numbers in an Arithmetical Proportion; 'tis plain, if the Compasses be ex-tended from the first Term to the second, the same Distance will reach from the 3d to the 4th, from the 4th to the 5th, and so on continually; only you must turn the Leg sorward when a greater Term is required, and backward, or towards the Less Hand, when the proportional Term required is to be less; as common Sense will direct. Thus if the Two Numbers had been 10 and 12, the Third Proportional forward would be 14.4, and backward 8.3, &c. Sothat all Questions in any Practical Art, where such kind of Proportionals are requir'd, may, you see easily, be wrought by the Gunters Line.

PROBLEM IL

To multiply or divide one Number by another.

Since in all Multiplication, As I is to the One Factor :: So is the Other, to the Product. fince in all Division, as the Devisor is to Unity :: So is the Dividend to the Quotient. Either of these Rules may be easily wrought by the Line of Numbers, fince 'tis only finding a 4th Proportional to Three Terms given. The Extent of the Compasses therefore, from 1 to the Multi-plier, will reach forward in Whole Numbers from the Multiplicand to the Product: And the Extent from the Divisor to Unity, will reach from the Dividend to the Quotient. If either or both Numbers be Decimal Fractions, the Nature of the Product or Quotient must be determined by the Rules given about managing of such Fractions; but the same Figures will be found by the Line, let the Nature or Value of the Numbers be what it will. N. B. How many Places must be in the Product or in the Quotient, may be discovered easily by the Rules of Common Arithmetick, and consequently to what Exactness you must endeavour to go in the

PROBLEM III.

Three Numbers being given, to find a Fourth in a Duplicate Ratio or Proportion.

This relates to the Proportion of Surfaces and Area's, which, when Similar Figures, are in a Duplicate

Duplicate Ratio of their Homologous Sides'. Let the Diameter of a Circle be 14 Inches, and its Area 154; What is the Area of a Circle, whose Diameter is 28?

Extend the Compasses from 14 to 28; that Extent will reach from 154 to 308, and thence to

616, the Area requir'd.

PROBLEM IV.

To three Numbers given, to find a Fourth in a Triplicate Proportion.

This relates to Solids, and their Proportion to Lines.

Let the Diameter of an Iron Bullet be 4 Inches, and its Weight 9 th. What will a Bullet weigh, whose Diameter is as much more; viz. 8 Inches?

The Extent of the Compasses from 4 to 8, applied to 9, and turn'd three Times, will at last fall on 72, the Weight sought.

PROBLEM V.

To find a Mean Proportional between any Two Numbers given: As suppose between 8 and 32.

Extend the Compasses from 8 in the Left Hand Part of the Line, to 32 in the Right, and then bisect that Distance; the half shall reach either from 8 to 16 forward, or from 32 to 16 backward.

PROBLEM VI.

To find Two or more Mean Proportionals between two Numbers given.

Divide the Distance between the two Numbers into a Number of equal Parts, which shall exceed the Means required by one; (as if 2 are required into 3, if 3 are required into 4, &c.) So shall the Feet of the Compasses, when turned from either of the Numbers towards the other, mark out the middle Proportionals required.

PROBLEM VII.

To Extract the Square Root of any Number.

Biffect the Distance between 1 on the Scale, and the Point which represents the Number; and the Half being set from 1, will give the Point representing the Root.

PROBLEM VIII.

For the Cubick Root, or that of any Higher Power.

You must Divide the Distance on the Line between 1 and the given Number, into as many equal Parts as the Index of the Power expresses; and one of those Parts set from 1, on the Line, will find the Point representing the Root requir'd. Thus if the Cubick Root of 1728 were requir'd: Divide the Distance between 1 and 1728 into three equal Parts, (3 being the Index of the Cube or Third Power) and one of those set from 1 forward, will find 12 the Root sought.

N. B. Only observe to Point the Number whose Root is to be Extracted (as in Extraction of Roots in Common Arithmetick) and then, if the last Point fall on the first Figure of the Number, the former Way of accounting on the Line will do: But if the last Point fall on the second Figure or Place in the Number (reckoning from the Left Hand towards the Right;) then account the whole Length of the first Line of Numbers in, and carry the Account on in the Second: As suppose the Root of 36 were requir'd; begin to take the 36 from the first 1 on the Lest Hand in the Line, and account the 36 on in the second Line; and then half that Distance being sent from the first 1, will reach to 6, the Root in either the first or second Line. So also if the Square Root of 1440 had been fought: Account the whole first Line for your first 1000; and then the 440 on in the Tenths between the second 1 and 2: So will half the Distance between the first 1 and that Point, reach from 1 to near 38 in either Line.

PROBLÉM IX.

For the Use of the Line in Trigonometry; See that Word.

The Use in Superficial Measure.

PROBLEM X.

Having the Diameter of a Circle, to find the Circumference.

Extend the Compasses from 1 to the Number expressing the Diameter; and then the same Extent will reach from 3.142 to the Circumference.

PROBLEM XI.

Having the Diameter, to find the Superficial Content.

The Extent, as before, from 1 to the Diameter being found, fet it twice from the Point of .7854 on the Line, and then it will reach to the Number expressing the Area.

PROBLEM XII.

The Breadth of a Relangle being given in Inch-Measure, and the Length in Foot-Measure, to find the Area in Feet.

Exrend the Compasses from 12 on the Line to the Breadth in Inches; and that will reach from the Length in Feet, to the Area in Square Feet.

PROBLEM XIII.

The Length and Breadth being given in Foot-Meafure, to find the Area in Tards.

The Extent from 9 to the Breadth, will reach from the Length to the Area in Yards.

PRO.

PROBLEM XIV.

To find the Area in single Perches.

The Extent from 16.5, to the Breadth, will reach from the Length to the Content in Perches : And the Extent from 160 to the Breadth, will reach from the Length to the Content in Acres, &c.

The Use in Solid Measure.

PROBLEM XV.

The Depth and Breadth of a Right-angled Parallelo piped being given in Inch-Measure, and the Length in Foot-Measure, to find the Content in Fees.

The Extent from 12 to the Breadth and Depth in Inches, being twice repeated from the Length in Feet, will reach to the Content in Feet. If the Parallelopiped be Oblique-angled, you must find a Mean Proportional between the Breadth and Depth: And then the Extent from 12 to the Mean Proportional being twice repeated from the Length in Feet, will reach to the Consens in Feet.

PROBLEM XVI.

To find the Solidity of a Cylinder, whose Base and Length is given.

The Extent from 1 to the Base, will reach from the Length to the Solid Consent.

PROBLEM XVII.

Having the Diameter of a Sphere, to find its Surface and Solidity.

The Extent from 1 to the Diameter, repeat twice from the Point of 3.142, and that will reach to the Number expressing the Surface: And if you repeat the Extent from 1 to the Diameter, three times from .5238 on the Line, that will reach to the Solid Content requir'd.

Its Use in Interest and Annuities.

PROBLEM XVIII.

To find what any Sum will encrease at 6 per Cent. Interest upon Interest, if forborn a certain Time. Suppose 273 l. for 5 Years.

Extend the Compasses from 100 to 106, and then repeat that Distance five times from 273, so will the Point at last fall on 402.1, or 402 1. 2 s. which is the Principal and Interest requir'd.

PROBLEM XIX.

A Sum of Money being due for a Time to come, to know what 'tis worth in ready Money.

This is the Reverse of the Last.

PROBLEM XX.

A Yearly Rent or Annuity being forborn for a Term of Years, to find what she Arrears will amouns to, at the Rate proposed.

As suppose a Rent or Annuity of 12 l. per Ann. were forborn sixteen Years; What will the Arrears amount to at the Rate of 8 l. per Cent. Intereft?

First find the Principal answering to 12 1. by saying, If 8 l. hath 100 l. for its Principal, what will 12 l. have? Answer, 150 l. Then I find (by Probl. 18.) that 150 l. being forborn fixteen Years, amounts, at 8 l. per Cent. to 513.9, or 513 l. 18 s. Out of which deducting 150 l. the Principal answering to the Annuity given, there remains 363 l. 18 s. the Sum of all the Arrears required.

PROBLEM XXL

To apow what Annual Rent or Annuity is worth in Ready Money.

Find (by the Precedent) the Value of the Arrears at the End of the Term proposed; and then (by Probl. 19.) what those Arrears are worth in Ready Money; and that will be the requir'd Price or Value of the proposed Rent or Annuity; v. gr. I find the Arrears of 12 l. per Ann. at fix-teen Years end, and at 8 l. per Cent. amount to 363 l. 18 s. And I find (by the 19th Probl.) than the faid Sum is worth in Ready Money 106 l. 4 s. and consequently I conclude, that the Lease or Annuity proposed is worth in ready Money (af-

ter 8 l. per Cent.) 106 l. 4 s.

If the Term of the Annuity don't commence presently, but suppose at five Years hence or to come, then you must find what the Arrears for all that Time are worth in ready Money; that is, what they are worth, when forborn in this Instance for twenty one Years. The Answer is, 72 l. 6 s.
GUTS: See Intestines.

GUY Rope: See Guy, in Vol. I.
GWAIF, the same with Waif; i.e. such
Goods as Felons when pursued, cast down and leave in the High-Way; which become a For-feiture to the King or Lord of the Mannor, unless the Right Owner legally claim them within a Year and a Day.

HABEN-

ABENTES Homines, Fasting-Men; as they are call'd in a Charter of Cenulph King of the Mercians, Anno 821. Du Fresne will have these to be no more than Divites, Rich Men: But no doubt the Word implies a ftricter Sence; and fignified either the King's Guard or Retinue, which were at the King's Pleasure to be Feasting-Men, or plentisully entertained at the Houses of his Tenants: On rather, thole Old Servants which were commended to the Religious by the King; and so fastned on them for Corrodies, or Maintenance for Life. Some think that they were only Pledges and Sureties, or Friburghs; which under their Chief or Principal Tything Man, were to keep the King's Peace, and to be accountable for the Breach of it.

HABITATION, in the Civil Law, is the Term for one of the Perfonal Services, by which a Man hath a Right to live in the House of another without Prejudice to the Propriety.

HADBOTE, was a Recompence made for the Violation of Holy Orders, or Violence offer'd to Persons in them.

HAIL. Dr. Wallis in a Letter from Oxon to the Secretary of the Royal Society, and printed in the Transactions, observes that Hail is very often an Attendant on Thunder and Lightning; (of which, see Thunder in this Volume.) And tis well known, that in our artificial Congelations, a mixture of Snow and Nitre, or even common Salt, will caule a very sudden Congelation of Water. Now the same in the Clouds may cause Hail-Stones; and the rather, because not only in fome prodigiously great, but also in common Hail-Stones there seems somewhat like Snow rather than Ice, in the midst of them. And as to those very large Hail-Stones, weighing \(\frac{1}{2}\) or \(\frac{1}{4}\) of a Pound; by the violence of their Fall tis manifest they must have descended from a great Height: And tho' perhaps in their first Concretion, or Congelation, their Bulk might be but of the moderate Size of common Hail, yet in their long Descent, if the Medium, through which they sell were alike inclined to Congelation, they might receive a great Accession to their Bulk, by, perhaps, many of them coalescing and incorporating into one; as in that strange Shower of Hail in December 1672. whereof their hung on the Trees a great deal in the form of Icicles, of a Foot or more in length.

HAILWORKFOLK; i. e. Holy Work-folk, or People who hold Lands for the Service of Repairing or Defending some Church or Sepulchre: For which pious Labours they were excused formerly from Feudal and Military Services.

HALF-Bloom, is the Term for a round Mass of Metal, which comes out of the Finery in all Iron-Work: See Iron. HALF-Tangent-Lines: See Scale.

HALF-Tongue, or Party-Jury, is a Jury empanell'd in a Cause where a Stranger is a Party; whereof the one Part consists of Denizens, the other Half of Strangers: And the same is used in Pleas, where one Party is a Denizen, the other a Stranger. This way of Tryal was first Enacted by a Statute of Edward III.

HALLAGE, is a Fee due for Cloths brought for fale to Blackwell-Hall in London; and also the Toll that is due to the Lord of a Fair or Market, for such goods as are vended in the Common Hall of the Place.

HALO. Mr. Huygens (vid. Philosoph. Trans. N. 60.) endeavours to account for the Appearance of Halo's, or Circles round the Sun, thus: That they are formed by small round Grains of a kind of Hail made up of two parts; one of which is opake and inclosed in the other, which is transparent; and the same way he accounts for the Parhelia; only there he imagines that the Icy Grains are of an oblong Figure, and rounding at the Ends like Cylinders with round convex Tops. Where some of these Cylinders are in an erect Position, the Circle they form will be white, and is caused by the Reflexion of the Rays of the Sun on the Surface of these Cylinders. He proceeds afterwards to account for the colour'd Halo's and Parhelia from the same Hypothesis, and produces an Experiment of a Glass Cylinder of a Foot long, and having within an Opake Kernel (which was a Cylinder of Wood) and the ambient Space was filled with Water: Which Cylinder being exposed to the Sun, and the Eye disposed in proper places, the several successive Reslexions and Refractions necessary to produce such Effects did

plainly appear.

HALY-MOTE (alias Healge-mote) a Word
retain'd in Herefordshire to this Day for a Court-Warren. It may fignifie a Convention of Citizens in their Court Hall; or, a Holy or Ecclesi-

aftical Court. Cewel's Interpr.

HAMBLING, or Hamelling of Dogs, is the same, in the Laws of the Forest, as Expeditating: And Manwood saith, Canutus, in Can. 1. calls the Lawing of Dogs, Genuscissio, Ham-string-

HAMMER. Besides the Sledges, or large Hammers used by Smiths, there is, 1. The Hand-Hannmer, which is us'd by the Smith at the Forge with one Hand. Its edge is call'd the Pen; and the other part of the Head the Face; and the Hole for the Handle is call'd the Eye. 2. The Riverting-Hammer, chiefly us'd for rivetting or fetting straight cold Iron; or for crooking of small Work; but 'tis seldom us'd at the Forge. For the Smith's larger Hammers, see Sledge.

HAMPER: See Hanaper.

HAMSOKEN, Haimsuken, Homesoken, is the Term in Scotland for the Crime of him that violently Affaulteth a Man in his own House: And our antient Records call Burglary Hamsocne.

HANAPER: See Clerk of the Hanaper. HANCES (in a Ship) are Falls or Descents

of the Fife-Rails, which are placed on Banisters on the Poop, Quarter-Deck, &c. down to the

HANCES in Architecture are the Ends of Elliptical Arches; and these are the Arks of smaller Circles than the Scheme or middle Part of the Arch.

HANDBOROW, is a Surety, a Manual Pledge; i. e. an Inferior Undertaker; as Headborow is a Superior or Chief Instrument. Spelman. HAND-

HANDGRITH, was antiently the Word for Peace or Protection given by the King with his own Hand.

HAND-HABEND, is a Thief taken with the Goods in his Hand, or upon him, as we say.

HANGWITE, according to Rastal, was a Liberty granted to a Man whereby he was quit of a Felon or Thief, hang'd without Judgment, or

escap'd out of Custody

HANSE, is an old Goebick Word, fignifying a Society of Merchants combin'd together for the good Usage and safe Passage of Merchandize from Kingdom to Kingdom. This Society was, and in part is yet, endow'd with many large Privileges of Princes respectively within their Territories. It had four principal Seats or States, where the Almain or German Merchants, being the Erectors of this Society, had an especial House; One of which was here in London; and call'd Gild-Hald a Teutonicorum, or among us vulgarly the Steel-Yard, or Still-Yard.

HAPPE, from the French Happer, to Snatch or Catch, is a Term used in our Law. As to Happe the Possession of a Deed Pole. Littleton, As to Fol. 8. To Happe the Rents; as if Partition be made between two Parcenors, and more Land be allow'd to one than to the other: And she that hath most of the Land charges it to the other, and the Happeth a Rent, the shall remain an Affize without Specialty. Comel.

fize without Specialty. Cowel.

HARMONY. Dr. Holder in his Discourse on this Subject, saith, That when the Sonorous Body is constituted of Parts solid or tense, regular and fit to receive and express the Tremulous Motion of Sound, equally and swiftly, it will then render a certain even Harmonical Tone or Tune.

The Tune of any Note is constituted by the Measure and Proportion of the Vibrations of the Sonorous Body; i. e. of the Velocity of those Vibrations in their Recourses.

For the more frequent the Vibrations are, the acuter will be the Tune; and the flower or fewer they are in the same Time, the graver is the Tune.

So that any given Note of a Tune n made by one certain Measure of Velocity of Vibration; viz. Such a certain Number of Courses and Recourses (i. e. forward or backward Vibrations) of any Chord or String in such a certain Space of Time, doth constitute such a determinate Tune: And all such Sounds as are Unisons, let them come from Voice, Bell, Pipe, or String, are made with

Vibrations all equal to one another.

The Continuance also of the Sound in the same Tune, to the End, (as in Strings of Wire, which being once struck will hold their Sound long in the same Note) depends upon the Equality of Time of the Vibrations from the greatest Range till they come to cease: As is the known Property of Pendulums: And a Mufical String struck, is like a Double Pendulum, moving upon two Centres, the Nut and the Bridge, and vibrating with its greatest Range in the middle of its Length, and the Vibrations equal, even to the last; which must make it keep the same Tune as long as it sounds. And because it doth plainly keep the same Tune to the last, the Vibrations are equal.

The Measures of Swiftness of Vibrations of the String or Chord, as hath been said above, constitutes and determines the Tune, as to the Acutemess and Graveness of the Note which it sounds:

and the lengthning or shortning of the String under the same Tension, determines the Measure of the Vibrations which it makes. And thus Harmony comes under Mathematical Calculations of Proportions; as to the Length of the Chords, the Measure of the Time in Vibrations, and of the Interval of tuned Sounds. As the Length of one String is to another (if of the same Matter, Thickness and Tension) so is the Measure of the Time of their Vibrations. As the Time of the Vibration of one String to another, so is the Interval or Space of Acutenels or Gravenels of the Tune of that one, to the Tune of the other: And consequently, as the Length is, so is the determinate Time, caterin paribu. These Vibrations impress a Motion of Undulation or Trembling in the Air, as far as the Motion extends, of the same Measure with the Vibrations.

And if the Motions made by different Chords are so commensurate that they mix and unite, and bear the same Course altogether, alternately or frequently: Then the Sounds of these different Chords, thus mixing, will calmly pass the Medium, and arrive at the Ear as one Sound, or nearly the same; and so do evenly, smoothly, and with pleasure strike the Ear; which produces what they call a Consonancy; and from the Want of such an agreeable Mixture, Dissonances do a-

And as the more frequent Mixture or Coincidence of Vibrations render the Concords generally so much the more persect; so the less there is of Mixture, the greater and more harsh will the

Discord be

From all which 'tis easie to see the Reason why Concords are agreeable and pleasing to the Ear which is because they unite in their Morions often; at least in every fixth Course of Vibration; as is apparent from the Musical Ratio's by which they are constituted, which are all contain'd within that Number of 6.

Thus the Agreement between two or more Unisons or Chords of the same Length, &c. is because the Vibrations of such Sounds are equal to Time and Measure, and do joyn and unite in

every Course and Recourse.

If the String A be double in length to B (I proceed according to the usual Division of the Monochord) i. e. as to 2 to 1. Then the Vibrations of B will be duple to those of A, or twice as swift: And consequently if these Strings are struck together, their Vibrations will unite alternately; viz. at every Course crossing at the Recourse, and give the Sound of the Oldave to one another.

If the Length of A to that of B, be as 3 to 2: Then reciprocally their Vibrations will be as 2 to 3; and their Sounds will concord in a Fifth; their Motions uniting after every second Recourse; i. e. at every other, or third Course.

If A be to B, as 4 to 3, they found a Fourth together, and their Vibrations unite after every

third Recourse, or at every fourth Course. If the Length of A be to that of B, as 5 to 4, they found a Ditone or Third Major; and their Motions unite after every fourth Recourfe, or at every fifth Course.

If A be to B, as 6 to 5, then they found a Tribemitone or Third Minor; uniting their Vibrations after every fifth Recourse, and at every fixth Course, Gc.

And

And thus by the frequency of their being mix'd and united, the Harmony of joyn'd Concords in Musick is found so very sweet and pleasing; the Remoter being also combined by their Relation to other Concords besides the Unison. The sixth to other Concords besides the Unison. Major, which is 5 to 3, is within the compass of Ratio's between 1 and 6: But the leffer Sixth (8 to 5) is beyond it; but is the Complement of 6 to 5, to an Octave; and makes a better Concord by its Combinations with the Octave and Fourth from the Unifon; having the Relation of a Third Minor to one, and of a Third Major to the other, and their Vibrations uniting accordingly. The Sixth Major bath the same Ad-

HARO, Harron, is an Outery, or a Hue-2nd-Cry after Felons and Malefactors: See the Original of this Custom; de Haro among the Normans in La Coustume de Normandie par Mr. H. Basnage, Vol. 1. p. 104. Perhaps, hence our English Word to be Har'd, i. e. Frighted; and Harasi'd, Tired,

ಆಂ.

HATCH, a Term in Mining: See Essay-Hatch. Hatch is also us'd for a Cross-Board that lies a-thwart the Pass, sto hinder the Ore from tumbling all at once into the Coffer of a

Stamping-Mill.

HATCHING, is a Term us'd in the Art of Drawing or Defigning in Black and White; and by it is understood a manner of Shadowing by a continual Series, or Succession of many Lines shorter, or longer; closer or more separate; oblique, or direct, according as the Work requires, to render it more or less enlighten'd.

HAW, is a small Quantity of Land, and usually such as lies near a House: As a Hemp-Haw or Plat, a Bean-Haw: And some old Manuscripts say that Haw is the same with Mansio, a Dwel-

ling-House, as in Doomsday-Book, &c. HEADS, is a Term us'd by Builders for those kind of Tiles which they use to lay at the Eaves of a House; being the full breadth of a Common Tile, and but half a Tile in length.

HEAD-BOROW, fignifies him that is Chief of the Frank-Pledge, and him that had the principal Government of them within his own Pledge. And as he was call'd Head-Borow, so he was also call'd Burrow-Head, Bursholder (now Bosholder.)
Third-Borow, Tything-Man, Chief-Pledge, and
Borow-Elder, according to the diversity of Speech
in divers places. This Officer is now usually call'd a Constable.

HEAD-PENCE, or Head-Silver, was former. ly an Exaction of 40 l. or more, collected by the Sheriff of Northumberland of the Inhabitants of that County every Third and Fourth Years; without any Account made to the King. But by 23 H. VI. c. 7. this was clearly abolish'd for

HEART. Authors which have treated about this Muscle are chiefly Lower de Corde, Bellini de Motu Cordis, and Borelli de Motu inimalium; who accounts that the Force of the Compression of the Heart to squeeze out the Blood into the Arteries, is equal to that of 3000 Pound weight; and that 350 Pound weight of Blood passes thro' the Heart every Hour: See Dr. Keil's Animal Secretion, p. 88. where you have a good Attempt to estimate the Quantity of the Blood in an Human Body, its Velocity, &c.
Vol. II.

HEAT. Great Bodies are capable of preserving Heat for a long while; their Parts mutually increasing one another's Heat. And it may be. that a very great dense and fix'd Body, when heated beyond such a degree, may emit Light so copiously, that by such Emission, and by the Reaction of its Light, and by the Researchion of the Rays within its hidden Measus, it may come to grow still hotter and hotter, as deriving more Degrees of Heat by those ways, than it can of Cold by any other: And by this means it may come to attain-a Heat, like that of the For the Sun and the fix'd Stars feem only vast Globes of Earth vehemently heated; and whose Heat is preserved by their great Magnitude, and by the mutual Action and Re-action that there is between them and the Light which they emit.

And their Paris are preserved from evaporating in Flame and Fume, not only by the great Fixity of their Nature; but also by the mighty Weight and Density of the Atmosphere which environ them, which press them every way with a great Nisus, and condense their Vapours and Exhalations, whenever they are emitted.

For we see that Water, but moderately heated. will boil with violence when the Pressure of our Atmosphere is taken off in the Exhausted Recei-

And a Mixture of Tin and Lead, being plac'd on a red-hot Iron in vacuo, will emit copious Fumes, and even some Flame, which yet in our Air will scarce visibly smoke. Vid. Qu. 11. New-

ton. Opt. p. 296. Edit. Lat.

Hear conduces very much to the Fluidity of Bodies, by lessening the Tenacity of their Parts; for it renders many Bodies fluid, which other wise are not so; and increases the Fluidity of Tenacious Liquors, as of Oyl, Balsam, Honey, &c. and by the same reasons lessens their Resisting Force of Water; which it must do, it that Base arise shields from the Austrian and if that Force arise chiefly from the Attrition or Tenacity of its Parts; and consequently it doth not arise from thence, but from the Vis Inertia Materiæ

HEBBER-THEF, was formerly the Privilege of having the Goods of a Thief, and the Tryal

of him within such a Liberty.

HEBDOMADIUS, was formerly that Canon or Prebendary in a Cathedral Church, which had the peculiar Care of the Choir, and the Of-

ficers of it, for his own Week.

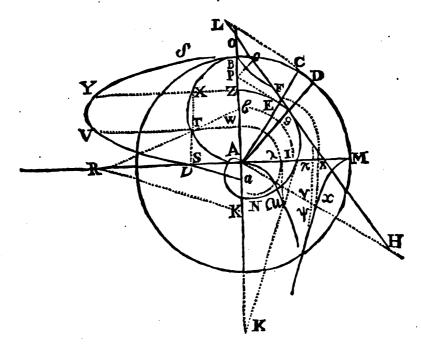

HEDAGIUM, from Heda, a Hythe, Port or Wharf; was formerly the Term for the Toll or Custom paid at the Hythe or Wharf, &c. for Landing Merchandize, Goods, &c. From which Toll or Customary Duties, Exemptions were fometimes granted by the Sovereign to some particular Persons and Societies.

HEIGHT, or Alitude of the Eye in Perspective, is its Height or Elevation above the Horizontal Plane; and it is measured by a Perpendicular let fall from the Eye to that Plane.

HELICOLD Parabola, or the Parabolick Spi-ral, is a Curve which arises from the Supposition of the Axis of the common Apollonian Parabola's, being bent round into the Periphery of a Cir-

verge towards the Centre of the said Circle. The Tangent, Area, Length, and Flexure of this Spiral Curve is investigated by Mr. 3. Bernoulli, according to the Method of the Differential Cal. cle, and is a Line then passing through the Ex-tremities of the Ordinates, which do now con-Lips. for Jan. 1691. Thus,

Suppose the Axis of the common Parabola to be Let also CL, AH, be drawn perpendicular to bent into the Periphery of the Circle BDM (in AC; and let CD be an infinitely small Arch Fig. above;) Then the Curve BFGNA, which passes through the Extremities of the Ordinates CF, DG (which converge towards the Centre of the Circle A) is what is called the Helicoid, or Spiral Parabola, or the Parabolick Spiral. And in order to the Investigation of its Tangent, Area, Length, and Flexure; He supposes AB = r, BDMB = c. The Arch BC = x, CF = y.

on part of the Circumference, similar to, and concentrick with, the little Arch G. E.

The Nature of the Curve is l = y (where l flands for the Parameter of the Parabola.)

Whence, in this Calculus, dx being the Fluxion of x, and dy the Fluxion of t, &c. (See the Marquis l Hospital Analyt. des Instimment petits.) l dx = 2 y dy; and dy : dx :: l : 2 y.

AD: AG:: DC: GE

 $r: r-y:: dx: \frac{r dx - y dx}{r};$ First then for the Tangent. It will be FE: EG FA AH

FE: EG FA AH FC CL And $dy: \frac{r dx - \gamma dx}{r} :: r - y: \frac{dx \times r - y^2}{r dy} :: y: \frac{ry dx - yy dx}{r dy}$

To make a particular Application of the General Expression to the Curve proposed; instead of dy and dx, substitute their Proportional and 21;

Then will $AH = \frac{2j^2 - ryj + 2rrj}{lr} = (fub$ flituting lx for yy) $\frac{2xy}{x} + \frac{2ry}{t} - 4x$; and $CL = \frac{2r\gamma\gamma - 2\gamma^2}{lr} = 2x \frac{-2x\gamma}{r}$. The greatest AH (CL) will be found, if its Differentials $\frac{6\gamma\gamma d\gamma - 8r\gamma d\gamma + 2rr d\gamma}{lr}$ (or $\frac{4r\gamma d\gamma - 6\gamma\gamma d\gamma}{lr}$ the Differentials of CL) be put = 0: Whence arises $y = \frac{1}{8} r (\frac{2}{8} r;)$ and COROLLARY.

If the Parameter $\frac{l=rr}{c}$, viz. that the Applicate answering to the whole Circumserence be the Radius it self (as in the present Fig.) then the greatest A H or C L will = $\frac{8}{27}$ c.

The greatest Angle made by the Ordinate and Tangent, viz. A F H, or C F L, is found, by putting the Ratio $\frac{CL}{CF}$, or $\frac{2ry-2yy}{lr}$ equal a

Maximum; that is, its Differential 2rdy-yydy be put = 0: Whence arries $r = \frac{1}{2}$. Whence we have $r = \frac{8 r r}{2 r} = 0$. Whence we have $r = \frac{1}{2}$ consequently the greatest ΔH (CL) = $\frac{8 r r}{2 r} = 0$. But more particularly in the the Hypothesis of $l = \frac{rr}{c}$, we have $x = \frac{yy}{l} = \begin{vmatrix} :AS (=\sqrt{ry-yy}) ::AK (=\sqrt{ry-yy}) \\ :AR = \frac{ry-yy}{l} \end{vmatrix}$. $(\frac{c}{r}) = \frac{1}{4}c$, and $\frac{CL}{CF} = \frac{c}{2r}$

COROLLARY.

If IK touches the Curve in the Point I (where it intersects the Radius AM) and cuts the Diameter BAK produced in K; then shall AK = the Periphery.

Next,

2. For the Area: 'Tis DC + GE X & DG $= CDGE: Or \frac{2rdx - ydx}{r} \times \frac{1}{2} , =$ $\frac{2rydx-yydx}{2r}=\text{(fubflituting }\frac{2ydy}{4}\text{ in-}$ flead of dx) $\frac{2yydy}{l} = \frac{y^3dy}{lr}$. The Integral of which is $2 \frac{y^2}{3l} - \frac{y^4}{4l3}$, or $\frac{1}{4}xy - \frac{lxx}{4r}$; which is equal to the Curvilineal Space BFGDCB. Wherefore putting j = r, we shall find the whole Space B A N G F B C D M B = $\frac{5 r^3}{12 l}$; that is,

in the Case of $l = \frac{rr}{r}$, 'tis = $\frac{r}{12} rc$. And fince the whole Circle B D M B is $=\frac{1}{2}rc = \frac{6}{15}rc$; the aforesaid Space shall be to the Circle as 5: 6: And therefore the remaining Space B A N G B A will $= \frac{1}{6}$ of the Circle.

Again, Thirdly, For the Length of the Curve. $FG^{q} = FE^{q} + EG^{q} = dy^{q} + dx^{q}$ $\times \frac{rr \leftarrow 2rq - yy}{rr} = (\text{fubflituting } \frac{2y dy}{l},$

inflead of dx) $\frac{rrll+4rryy-8ry^3+4y^4}{rrll}dy^7$.

Hence $FG = dy \times \sqrt{\frac{rrll + 4rryy - 8ry^2 + 4y^4}{rrll}};$

The Integral of which, could it be exhibited, would give the Length of the Curve BFG: Which Rectification may yet be thus express'd. On the Diameter AB describe the Semi-circle ATXB, and let Aa be cut off = l; then drawing any indefinite Perpendiculars WV, ZT, equidiffant from A and B, and cutting the Periphery of the Semi-circle in TandX, let the Right Line AS, and let KR be parallel to Sa, and the Right Line $R\beta$ be drawn to the Centre of the Semicircle; equal to which cut off the Right Lines WV, ZT; Then shall the Points V, T, be at the Curve γVTJ ; which is of such a Nature, that the Abscissa BZ = DG, and the Space BZTJB divided by $AB = \frac{1}{2}AB$ gives a Right Line the Curve BEG

$$AR = AS = WT = ZX = \sqrt{BZ \times ZA} = \sqrt{y \times r - y} = \sqrt{ry - y}; \text{ and } Aa (=1)$$

$$: AS (= \sqrt{r_1 - \gamma_2}) :: AK (= \sqrt{r_2 - \gamma_2})$$
$$: AR = \frac{r_2 - \gamma_2}{\sqrt{r_2 - \gamma_2}}.$$

Wherefore, $ZY (=WV = R\beta = \sqrt{A\beta^{q} + AR^{q}})$ $= \sqrt{\frac{1}{4}rr + rryy - 2ry^3 + y^4}$: Whence

a Portion of the Space 2y + B, of the Breadth $dy = dy \sqrt{\frac{rrll + 4rryy - 8ry^2 + 4y^4}{l}}$;

And this divided by $A \beta = \frac{\pi}{2} r$, gives $d\gamma$ $\sqrt{\frac{rrll+4rr\eta\eta-8r\gamma^{3}+4\gamma^{4}}{rrll}}=FG.$

And consequently the whole Space Z TAB divided by $\frac{\pi}{2}$ r is equal the Portion of the Curve-Line B F G. Q. E. D.

COROLLART.

Taking BZ, AW, equal to one another; if on the Centre A, and with the Radii AZ, $A\beta$, AW, we describe Arches cutting the Curve in the Points G, I, N, (Note bere, The middle Inter-fection I, in the Case of the present Figure, falls in the Radius A M) the Portions of the Curve B G and AN, GI and NI, as also BGI and ANI, are equal to one another. Whence it plain, that even those Curves that don't admit of a Rectification, yet some times have Dissimilar. Parts equal to one another.

When I had fignified this to my Brother, he presently observ'd, That the Nature of almost any Spiral being express'd by an Algebraical Equation, another Geometrical Curve may be affign'd equal to it. For on the Centre A, with the Radia AF and AG; describing the Arches $F\rho$, $G\pi$, if the Curve $M\psi$ be imagin d such, that $r\psi$, the Difference of the Ordinates ρx , $\pi \downarrow$, be equal to the Arch EG: Then, because of $\nu x = \pi \rho = EF$, and $\nu \downarrow = EG$, and the Angles $\downarrow \nu x$, FEG, Right ones; also ψx shall be equal FG; and compounding, the whole Portion of the Curve $M \psi$ the whole Portion of the Spiral B G. Now to find the Nature of the Curve M 4, we need on-

ly substitute (in the Quantity $\frac{r dx - y dx}{x}$, which always expresses EG or $\Rightarrow \downarrow$) the Value of dx, which in our Curve is $\frac{2y}{l}$; which produces

 $\frac{2 \ j \ d \ j}{l} - \frac{2 \ j \ j \ d \ j}{r \ l}$, the Integral of which $\frac{y \ y}{l}$

of the Semi-Circle in 1 and 3, act also A/S, and the Semi-Circle in 1 and 3, and the Right Line R/S be drawn, and joining S/a, take A/K = A/S, and let K/R be parallel to S/a, and the Right Line R/S be drawn to the Centre of the Semi-circle; equal to which cut off the Right Lines W/V, χT ; Then shall the Points V, T, be at the Curve γ V/T/S; which is of such a Nature, that the Abscissa B/Z = D/G, and the Space B/Z T/S/B divided by A/B (=\frac{1}{2}A/B) gives a Right Line = the Curve B/FG.

Demonstration.

Demonstration. $AK = AS = WT = \chi X = \sqrt{B\chi \times \chi A} = \sqrt{B\chi \times \chi A} = \sqrt{\chi \times \chi \times \chi} = \sqrt{\chi \times \chi} = \sqrt{\chi \times \chi} = \sqrt{\chi \times \chi} = \sqrt{\chi \times \chi} = \sqrt{\chi \times \chi} = \sqrt{\chi \times \chi} = \sqrt{$

described at the Centre A, and upon the Axis AK; whose Parameter is a Fourth Proportional to the Periphery, Diameter, and Radius of the Circle B D'M, then shall both the Curve Lines, and the Spaces comprehended under them, be equal, viz. Taking any Point A in the Right Line AM; if to this be applied the Right Line A µ, cutting the Parabola in μ , and the Arch λ N concentrical to the Periphery of the Circle BM, be drawn cutting the Spiral in N; then the Portion of the Spiral Line AN shall ever be equal the Portion of the Parabolick Line $A\mu$; and the Space AN comprehended between the Right Line AN and the Spiral, shall equal the Parabolick Space A & u A. Which wonderful Agreement of the Spiral and Parabola we afterwards found Dr. Willis had observed before ; who relates, that Roberval and Hobbs contended about the first Discovery of it; as if two Persons, at a distance both in point of Place and Time, might not be led by their own Genius's to one and the same Invention.

4. For the Flexure of the Curve. That the Curve must have a Point of contrary Flexion, is evident; for because the Periphery B C differs but insensibly from a Right Line, for some space beyond the Vertex B, it follows from the Nature of the Parabola, that the Curve must be concave towards the Circumference in the Parts next the Vertex, and concave towards the Centre in the rest. If G, e. gr. be the Point of contrary Flexion, then AO, the Segment of the Radius, intercepted between the Centre and the Tangent, sintercepted between the Centre and the Tangent, sintercepted between the Centre and the Tangent, so the Secant of the Arch BD = 1, and the Tangent = t: Then we have the following Proportions; Viz. r: r-y (= AG):: t

\[\frac{t r-y}{r} \left(= GP \right) \cdots \frac{t r-y}{r} \left(= AP \right) \]

Again, GE: EF:: PG:P2

\[\frac{r dx-y dx}{r} \cdots \frac{t r-ty}{r} \cdots \frac{t dy}{dx} \]

Lastly; AF:P2::AO:PO (= AO - AP)

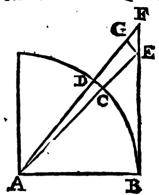

\[\frac{t dy}{dx} :: M:M - \frac{t r-y}{r} \cdots \frac{t dy}{r} \]

Whence we shall find

$$M = \frac{rrsdx - 2rsydx + ssydx}{rrdx - rydx - redy}; \text{ and}$$
Subfituting $\frac{ldx}{2y}$ for dy , and dividing by dx , we have $M = \frac{2rrsy - 4rsyy + 2sy^2}{2rry - 2ryy - rls}$. And therefore the Differential of this is to be equal to nothing; but the Differential of a Fraction is $= 0$, when its Terms, multiplied into the Alternate Differentials, are equal: For the Differential of the Fraction $\frac{y}{x}$ is $\frac{1}{x^2} \frac{dy + y dx}{x^2}$; and conquently if it be $= 0$; then also shall $\frac{1}{x^2} \frac{dy + y dx}{x^2}$ and which Rule we shall come to an Equation of fixteen Members $\frac{1}{x^2}$ and condens on an Equation of fix-

teen Members; in order to the Reduction of which, let it be observed, viz. That the Differential of an Arch is in a given Ratio to the Dif-

ferential of the Tangent and Secant; for It is to the Differential of the Tangent, As the Square of the Radius To the Square of the Secant: And It is to the Differential of the Secant, As the Square of the Radius to the Rectangle under the Tangent and Secant. For in the Quadrant ABD,

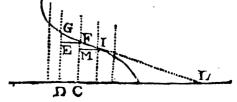

dx: dt:: DC: EF:: DC: GE+GF; $GE+GF: EF:: AD (=AB): AG+AB; AG+AB: AF:: AB^{q} (=rr): AF^{q}$ (=ss.) Wherefore, $dt=\frac{ssdx}{rr}=$ (in the prefent Case) $\frac{2ssydy}{lrr}$.

Again, dx:ds::DC:GF::DC:GE+EF; GE+GF:GF::AD(=AB):AG+AB; AG+AB:BF::AB! (=rr): $AF\times FB$ (=rs) Wherefore $ds=\frac{st\,dx}{rr}$

= $\frac{2 s t y dy}{l r r}$: And substituting these Values in the Equation instead of ds and dt, as also ss - rr instead of tt, there will come forth another Equation, which may be divided by st dy; so that the Symbols s, t, d, y, will be quite out, and only the Powers of the unknown y remain. The Equation then will be $y^6 - 3 r y^5 + 3 r r y^4 - r^3 y^3 + \frac{3}{4} r r l l y y - r^3 l l y + \frac{1}{4} r^4 l l = 0$; which may be still further divided by r - y, and so the Equation be reduced to this, $y^5 - 2 r y^4 + r r y^5 + \frac{1}{4} r r l l y - \frac{1}{4} r^3 l l = 0$: The Root of which will shew the Point of Contrary Flexure;

which in the Case of $l = \frac{rr}{c}$, is very nearly obtain'd by drawing the Ray AC, so that the Applicate CF be $\frac{1}{6}r$, or the Arch $BC = \frac{1}{26}c = 10$ Gr.

This Method for finding the Points of Contrary Flexure in Curves, seeming very tedious, and not so natural, in that it makes use of Symbols that are superfluous, and do afterwards vanish out of the Equation; gave us occasion to find a shorter and easier Way for doing the same, and that thus: I conceive the Point of Contrary Flexion as falling in that Point of the Curve, where two contiguous infinitely small Particles are imagin'd to lie in directum with one another: As, ex. gr. FG, FI, the

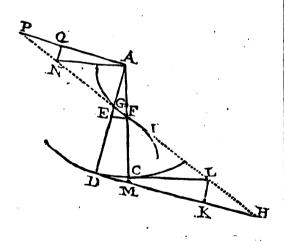

rest being bent upwards on one hand, and downwards on the other. It follows from bence.

1. That in Curves whose Axes are perpendicular, and whose Ordinates are parallel to one another, the Acute Angles EGF, MFI, or DGL, CFL, are equal, and either the greatest or the least of all those that the Ordinates make with the Curve on the one fide and the other, according as the Portion of the Curve (that is) at the Parts of these Angles, falls either with or with-

out them. From whence the Ratio $\frac{DG}{DL} (= \frac{y}{t})$ is either a Maximum or Mininum; and consequently (by what was shewn above) j: d = t dj. But since every where t dy = y dx (as is evident in all Curves) therefore shall dt = dx, viz. The Differential of the Part of the Axis between the Ordinate and the Tangent, equal to the Dif-ferential of the Abscissa: Which is also thus ma-nises: Because GF, FI, lie in directum, the Tangents GL, FL, shall cut the Axis in the same Point L; and, consequently, the Differential of the Abscissa DC, will also be the Difference of DL and CL.

The Celebrated Author of the Differ. Calculus, has given another Theorem for this (in the Acta,) Viz. Since the Triangles EGF, MFI, (becaule of the equal Angles EGF, MFI,) are fimilar; it follows. That if EF, MI, that is the dx, are equal, also EG, MF, or the dy, shall be equal too; and, consequently, ddy = 0.

2. In the Curves whose Applicates tend to some common Point or Centre A. The Angle EGF

=GAF+GFA=DAC+CFL: Whence, fince CL is the Tangent of the Angle CFL to the Radius CF, and DH the Tangent of the Angle gle DGH to the Radius DG, the Difference of the Right Lines, CL, DH, shall be equal to the Difference of the Tangents of the two Angles, that differ by the Angle DAC; one of which is to the Radius CF, and the other to the Radius DG. For tho' the Difference of the Radii EG vanishes in comparison of the whole Radius or Tangent; yet 'tis not to be neglected, if compared with their Differences.

Let AC = r; DC = dx; CF = r; CL = r;

 $=\frac{y\,dx}{2}$ an Arch, that is the Measure of the Angle DAC, with the Radius CF. This Arch (by Seft. 4.) Is to the Difference of the Tangents, in the Duplicate Ratio of the Radius to the Secant. Wherefore $FC^q (= yy): FL^q (= yy + zz)$:: The Arch found $\frac{y\,dx}{r}$: $\frac{yy\,dx + tt\,dx}{r}$ the Difference of two Tangents, each to the Radius C F. To which if we add $E F = \frac{rd x - y dx}{r}$ (which Is to EG, As DH To DG, or CL to C F, or Tangent to Radius) the Aggregate will be $\frac{ry dx + r r d^x}{ry}$, or $dx + \frac{r r dx}{ry}$, the Difference of two Tangents, the one of which agrees to the Radius DG, that is the Difference of the Right Lines CL, DH (= r;) and therefore $dt = dx + \frac{t \cdot t \, dx}{r \, y}.$

The same is more clearly shewn thus. On the Centre C, with the Radius CL, describe the Arch LK: For then the Angle ACL + LCK= AMH = ADM + DAC = ACL + DAC, and fo LCK = DAC. (Note, ThatCM is neglected here, and the Points C and M esteem'd as co incident; since CM is infinitely less than the Differentials DC, LK, EG, which are infinitely small themselves.) Whence, AC (=r) $: CD(=dx) :: CL(=t) : \frac{t dx}{r} = L K$ Again, GD(=r) : DH(=t) :: LK(=t) $\frac{t d x}{r} : \frac{t t d x}{r y} = K, H.$ Wherefore dt (= D H + C L = D H + C L = D C + K H =) $dx + \frac{t \cdot t \cdot dx}{r \cdot r}$

COROLLART.

If r be Infinite; that is, If C A, D A, be parallel, then $\frac{t \cdot t \cdot dx}{x}$ will vanish, and dt = dx, as above.

My Brother, instead of the Ratio $\frac{GD}{DH}$ or $\frac{GA}{AP}$, affumes $\frac{GE}{EF}$, putting AF = j, AP = i, EF $= d\chi$; and so finds $dt = \frac{d\chi c}{dy q}$. Which Theorems well deserve notice, upon the account of

their Universality. For a particular Application of this to the Parabolick Spiral: Because C L (= t, Fig. preced.) was

found before $=\frac{2rry-2y^2}{lr}$, then shall ds=

 $\frac{4ry\,dy-6y\,dy}{lr}; \text{ and fince } dx=\frac{2x\,dy}{l};$ substituting the Values of et, dt, e, dx, and

dividing by dy; and reducing the Equation, we shall find $y^2 - 2ry^4 + rry^3 + \frac{1}{4}rrlly - \frac{1}{4}rrlly$ $\frac{1}{4}r^2 // = 0$, as before.

and consequently, $FL = \sqrt{yy + t}$. Also, 5. The highest Point of the Curve above the Radi-Let it be AC (=r): DC (= dx): CF (=y): us BA, is found by making AO (sound before) In-

finite; viz. $\frac{2rrsy-4rsyy+2sys}{2rry-2ry-r/t} = In-$

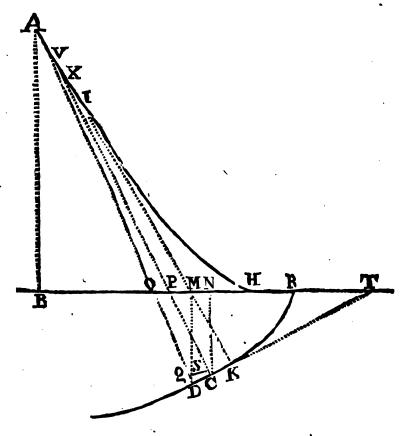

finite, or 2rry - 2ryy - r/t = 0; or inflead of y subflictuting $\sqrt{/x}$, we have $2r \sqrt{/x} - 2/x - lt = 0$: Or in the Case of l = 1

$$\frac{rr}{c}$$
, $2\sqrt{cx-2x} = i$. Which Equation

cannot be Geometrically resolv'd, upon the account of the inexplicable Ratio of the Arch to the Tangent. But the Point sought may be found Mechanically near the Truth, thus, by counting 70°.
12'. from B towards M. I Note here, by the By, That it may be demonstrated from hence, that an Indefinite Quadrature of the Circle, and in general the Redification of any Geometrical Recurrent Curve, is impossible: For if this were posfible, there wou'd be given the Relation between the Curve and the Ordinate or Abscissa: And fince the Relation of these to one another, as alleriphery of a Circle, then all the Normals, DA, so to the Tangent, is supposed to be given; also CA, KA, &c. will meet in one common Point

the Relation of the Curve to the Tangent would be given too. Wherefore, if the Equation that expresses this Relation, be duly compared with the other $2\sqrt{cx-2x}=t$, according to the Laws of Algebra, in order to fling out one of the Indeterminates, x or t: There wou'd then come forth another Equation of a certain and definite Degree; the Roots of which (which can never be more than the Equation has Dimensions) wou'd determine all the highest Points of our Curve. But this is impossible; for this Spiral, if it be continued, will wind about the Radius AB with an infinite Number of Gyres and Turnings, in each of which there is some one highest Point; and therefore the Number of those Points is Infinite.

6. Of the Evolution of Curves. If DC be the

A (the Centre) and will each of them be equal to a constant Right Line (the Radius.) But if DC be any other Curve, the said Perpendiculars will be indeterminate, and will interfect one another into many different Points, A, V, X, I; which all joyn'd make a new Curve; the Nature of which is now to be Investigated.

Let the Curve proposed be RCD, its Axis RB, Abscissa's RN, RM, Ordinates NC, MD, Tangent DCT. Let RN = m; CN = p; Ni = q. Whence, TN: NC:: NC: NP

$$q: p:: p: \frac{pp}{q} = MO;$$
Also, NC: NP (= MO):: \$D: \$2
$$p: \frac{pp}{q} :: dp: \frac{pdp}{q} : Far-$$

A (the Centre) and will each of them be equal to a constant Right Line (the Radius.) But if DC be any other Curve, the said Perpendiculars will be indeterminate, and will intersect one another into many different Points,
$$A, V, X, I$$
; which all joyn'd make a new Curve; the Nature of which is now to be Investigated.

Let the Curve proposed be RCD ; its Axis RB , $Abscissar RN$, RM , Ordinates NC , MD , $Tangent DCT$. Let $RN = m$; $CN = p$; $Nt = q$.

Whence, $TN : NC :: NC : NP$
 $q : p :: p : \frac{pp}{q} = MO$;

Also, $NC : NP (= MO) :: SD : SD$
 $p : \frac{pp}{q} :: dp : \frac{pdp}{q}$; Far.

 $p : \frac{pp}{q} :: dp : \frac{pdp}{q}$; Far.

 $p : \frac{pp}{q} :: dp : \frac{pdp}{q}$; Far.

 $p : \frac{pp}{q} :: dp : \frac{pdp}{q}$; Far.

: C. A.
:
$$pdq + qdm \times \sqrt{pp + qq}$$
.
 $pdq - pdp$

7. Application to the Parabola. If RCD be a Parabola, whose Parameter = l, so that lm =p p, then l dm = 2 p dp, and $dm = \frac{2 p dp}{l}$, and q=2m. Substituting these in the Value of CA, we shall find $CA = \frac{11+4pp\sqrt{11+4pp}}{2}$; that is, fince $PN = \frac{1}{2}l$, and $PC = \sqrt{\frac{1}{4}ll + pp}$, $C \land will = \frac{P C_3}{P N^2}$, that is a Fourth Proportional to PN and PC.

8. To find the Nature of the Curve AVX (form'd by the Interfections of the Perpendiculars DA, CA,) with respect to the Axis RB. Cut off $RH = \frac{\pi}{4}I$ = PN, and put HB = y, and BA = z, and then AB + NC : AC ::

$$\chi + p: \frac{ll + 4pp \sqrt{ll + 4pp}}{2ll} ::$$

$$NC: CP;$$

$$p: \sqrt{\frac{1}{4}ll + pp}; \text{ and } \frac{VZ}{4} \text{ will } = 2p^{3}.$$

$$Again, NC: AB :: PN: PB;$$

$$p: \chi :: \frac{1}{2}l: \frac{l\chi}{2p}; \text{ but } y = 1$$

$$HB = PB + PH = PB + NR = \frac{l\chi}{2p} + \frac{pp}{l}, \text{ or } 2p^{3} (= \frac{ll\chi}{2}) = 2ply - ll\chi; \text{ that is,}$$

$$\frac{3l\chi}{4y} = p, \text{ and } 4p^{3} (= ll\chi) \frac{27l^{3}\chi^{3}}{16y^{3}}; \text{ that is,}$$

$$\frac{3l\chi}{4y} = 27l\chi\chi.$$

Farther, because A D, A C, are perpendicular to the Curve DC, and the Particle DC is infinitely small; therefore shall AD = AC = AV+ VC; but (because of the same Reason) VC= VX+XK, and XK=XI+, &c. And therefore AD=AV+VX+XI, &c. = Curve AIH+HR. And fince the Curve AIH arises from the Intersections of the Indistant Perpendiculars D A, C V, K X, it follows, that they are Tangents to it in the same Points, and, consequently, that the Curve RKD is that Curve which is described by the Evolution of the Curve HIA. From whence are manifest, at first view, all that Hugenius and others have publish'd about Booluta's, as also the excellent Discoveries of Tschirnhausius and Leibnitz, about the Curves formed by the Reflex'd Rays.

HELISPHERICAL Line, is the Rhumb Line in Navigation; and is so call'd because on the Globe it winds round the Pole spirally, and still comes nearer and nearer to it, but can't terminate

. HEM. The Ovens wherein the Lapis Cala. minaris, or Calamine, is baked, have a Hearth made on one side of the Oven, divided from the Oven it self by a Partition open at the Top, by which the Flame passes over, and so heats and

bakes the Calamine. This Partition is called the

HEMITONE, in Musick, was what we now call an Half Note.

HERALD, with us fignifies an Officer at Arms, whose Business it is to denounce War, to Proclaim Peace, or otherwise to be employ'd by the Sovereign in Martial Messages and other Businesses. The French call him Herault; quasi Herus aleus. But Verstegan will derive the Word from two Dutch words, viz. Here, exercitus, and Healt, Pugil magnanimus; as if he should be so called, as being Champion of the Army. The Romans called Men of this Office in the Plural Feciales. With us they are the Judges and Examiners of Gentlemen's Arms: They Marshal all the Solemnities at the Coronation of Princes; formerly manag'd Combats, &c.

The Three Chief Heralds with Us are called Kings at Arms: The Principal of which is Garter, created by Henry V. His Office is to attend Knights of the Garter at their Instalments, or other Solemnities; To Marshal the Funerals of all the greater Nobility, as Princes, Dukes, Marsmisse Facility Viscourses and Record

quisses, Earls, Viscounts, and Barons.

The next Herald is Clarencieux, Ordain'd by Edw. IV. for his gaining the Dukedom of Clarence: His Office is to Marshal and Dispose the Funerals of all the leffer Nobility; as of all Knights and Esquires on this Side Trent.

The Third is called Norroy, or North Roy; whose Office is the same on the North Side of Trent as that of Clarencieux is on the South

Side.

Besides these there are Six others, which are properly called Heralds, according to their Originals, as they were Created to attend Dukes, &c. in their Martial Expeditions; as York, Lan-caster, Somerset, Richmond, Chester and Windsor.

There also are four others call'd Marshals, or Pursuivants at Arms, reckon'd after a manner in the Number of Heralds, and do commonly fucceed in the Place of Herald when they die, &c. and these are call'd Blue-Mantle, Rouge Cross, Rouge Dragon, and Port-Cullis.

HERBENGER, or Harbinger, is an Officer in the King or Queen's House, who allotteth the Noblemen and those of the Houshold their

Lodgings.

HERETICO Comburendo : See Haretico, &c. HERIOT, was originally a Proportion of Horse and Armour according to the Quality of the Deceas'd: This was settled by the Laws of K. Canutus, cap. 69. and is still (usually) the best Riding Horse of which a Tenant dies posses'd. HERIOT Custom, was when a Tenant for

Life was by Custom oblig'd to such a Payment at his Death; which Payment to be made not only by the next Heir in Blood, but by any the next Successor. In Abbeys of Royal Patronage, at the Death or Cession of the Abbot, his Cup and Horse were paid as an Heriot to the King. Those also who held in Bondage and Villenage paid Heriots. The Religious Appropriators referv'd the Live Heriots (i. e. such as were paid in Cattle) to themselves, and allow'd the inanimate ones of small value to the Vicar: And some Appropriators had a Heriot from the Vicar when he died. Kennet's Gloffary.

HERIOT

HERIOT Service, was a Reserve by Charter or other Conveyance, and made one Condition of the Tenure of Estates in Fee Simple; which

is now for the most part extinguish'd.

HERMITAGE, strictly signified a Convent of Hermits or Friars Minors, who, under the Institution and Discipline of Sr. Paul, inhabited Deferts and solitary Places. But this name at last came to be attributed to any one Religious Cell, built and endow'd in some private and recluse Place, and then annex'd to some larger Abbey,

of which the Prelate or Governour was called Hermita. Dr. Kennet's Glossary.

HERMITAN, is the Name of a dry North and North-Easterly Wind, usually, which blows on the Coast of Guinea in Africk; but sometimes is blows also from other Doines.

it blows also from other Points.

HERMITORIUN, is the Oratory or Chappel

belonging to an Hermitage.

HETERODROMUS, in Staticks, is the Term for the common Vellis or Leaver, which hath the Hypomochlion placed below the Power and the Weight: And where the Weight is elevated by the descent of the Power, & vise versa. (Sce the Fig. in Homodromus.)

The Dung fork and Prong are Leavers of this kind, whole Hypomochlion is usually the Knee of the Workman: And all Pincers, Sheers, Sciffars, Cutting-Knives fasten'd to Blocks are double.

HETERODROMOUS Leavers. The Wheel, Windlass, Capstand, Crane, &c. are perpetual Heserodromous Leavers: As are also the outermost Wheels of all Wind and Water-Mills, and all Cog-Wheels, &c.

HETERODROMUS Vellis, in Mechanicks, when the Weight to be rais'd by a Leaver is placed beyond the Hypomochlion or Fulcrum, and so moves a contrary way to the Power, viz. is rais'd when that descends, and descends when that rifes.

HEYBOTE, or Haybote, was antiently the Saxon Term for the Liberty granted to a Tenant for cutting so much Under-wood, Bushes, &c. as was necessary for Mending and Maintaining the Hedges or Fences belonging to his Land.

HIDAGE, was a Royal Aid or Tribute rais'd in such a Proportion on every Hide of Land: William the Conqueror imposed Six Shillings on every Hide; and William Rufus Four Shillings; and K. Henry I. Three Shillings. When the Lord paid Hidage to the King, the Tenants paid a Proportion to the Lord of the Mannor.

King Ethelred, when the Danes landed at Sandwich, rais'd this Hidage so, that every 310 Hides of Land found an arm'd Ship; and every 8

Hides found a Jack and a Saddle.

HIDE of Land, or Plough-Land, was as much as one Plow could Cultivate in a Year; for the Quantity was never expressly determin'd: Some call it 60, some 80, and some 100 Acres. One Hide of Land at Chesterton in the 15th of Hen. II. contain'd 64 Acres: And in the 35th of Hen. III. the yearly Value of a Hide of Land at Blechefdon in Oxfordshire was Forty Shillings. Kennet's Paroch. Antiq.

Bede calls it Familiam, implying by it, that it, was as much as wou'd maintain a Family.

The Distribution of England by Hides of Land is very antient: Mention being made of it in the Laws of King Ina, eap. 14. And Henry I. to which there was a fet Form Marry his Daughter, had Three Shillings from icrib'd by the Feudatory Laws.

This Tax was call'd His every Hide of Land.

dage: See Hidage.
HIP-Roof, in Architecture, is such a Roof as hath neither Gable-Heads, Shread-Heads, nor Ferkin-Heads: (By which is meant such Heads as are both Gable and Hip at the same End; that is, Gable as far as the Cott or Beam, and then their over short Hips, which shut up with their Tops to the Tops of a pair of Rasters, call'd Singlers by the Country Workmen.) For a Hip-Roof hath Rafters as long, and with the Angles at the Foot, Sc. at the Ends of Buildings, as it hath on the Sides: And the Feet of the Rafters on the Ends of such Buildings as have Hip-Roofs, stand on the same Plane, viz. parallel to the Horizon, and at the same Height from the Foundation with the Rafters at the Sides of the Roofs. These Hip-Roofs some call Italian Roofs.

HIPS, in Architecture, are those Pieces of Timber which are at the Corners of a Roof: They are a good deal longer than the Rafters, because of their oblique Position; for they are The Country Workmen level at every Angle. call them Corners; and by some they are call'd Principal Rassers, by others Sleepers. As Rasters have four plain Sides, these have usually five.

HOBELERS, were formerly a fort of Light-Horse-Men, which rode on small nimble Horses, and with only light Armour on; so that they were fit, (like our Dragoons) for any expeditious Service: At length they became ty'd by their Tenure, to maintain a little light Nag, for giving expeditious Notice of any Invafion or Danger: See 18 Edw. III. c. 7. 25 Edw. III. c. 5, 8. and Cambd. Britan.

HOBITS, are a fort of small Mortars from 6 to 8 Inches Diameter: Their Carriages are like those of Guns, only much shorter. They are very good for Annoying the Enemy at a distance with small Bombs, which they will throw two or three Miles: Or in keeping of a Pass, being

loaded with Cartouches.

HODOMETRICAL Method of finding the Longitude at Sea, is that of the Computation of the Measure of the Way of a Ship between place and place; i. e. of observing the several Rhumbs or Lines in which the Ship saileth; and what Way the hath made, or how many Leagues and parts

of a League she hath run.
HOGENHINE, was formerly the Term for one that coming Guest-wife to an Inn or House, lay there the third Night: After which he was accounted one of the Family; and the Hoft was answerable for his Breach of the King's Peace. In the Laws of K Edward, set forth by Lambert, he is call'd Agenbine; and often in other places

Third-Night Awnchine.

HOKE-Day, was the Tuesday Fortnight after Easter-Day; and was antiently celebrated with Sports and Rejoycings, in Memory of many of the Danes being kill'd on that Day, and the rest expell'd the Kingdom. This was done A. D. 1002. in the Reign of K. Ethelred.

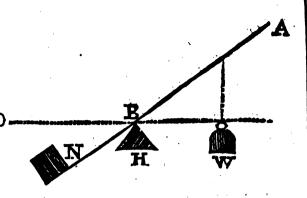

HOKE-Tuesday-Money, was a Duty paid by the Tenants to their Landlord, to have leave to

celebrate the Hoke-Day.

HOMAGIUM Reddere, was renouncing Homage, when a Vassal made a solemn Declaration of disowning and desying his Lord; for which there was a fet Form and Method pre-

HOMO-

HOMODROMUS, is a Term in Staticks for a Leaver, as AB; one of whose Ends, B

is fixed on the Obex or Hypomoclion H: And the other End A, is applied to the Moving of the Weight W, which hangs or lies somewhere in the middle, between the Hypomoclion H, and the Power in A. Here the Weight moves the same way with the Power: Whence this kind of Vettis takes its Name of Homodromus. Whereas, in the other Leaver, the Weight N is raised up by means of the Obex or Hypomoclion H; while the Power at A, the other End of the Leaver, descends; and therefore this is called Hererodromus. Of this Homodromus kind of Leavers, are the Rudders and Oars of Ships and Boats; as also their Masts.

HONOR, is used for the nobler fort of Seigniories, whereon other Inferior Lordships and Mannors do depend, by performance of Customs and Services to those that are Lords over them: And it seems as if none were Honors originally, but such as belong'd to the King, tho' given af-serwards in Fee to Noblemen. The Manner of Creating these Honors may in part be collected from the Statutes 34 H. VIII. o. 5. where Hampton-Court is made an Honor: And 33 H VIII. e. 37, 38. where Grafton and Ampthill are made Honors. There are many other Honors in England; see 37 H. VIII. e. 18, &c.!

HONOR-Courts, as are held

within the abovemention'd Honors.

HONORARY Services, are such as are incident to Grand Sergeantry, and annexed usually to Some Honor

HOOK-Pins, are taper Iron Pins, with an hook Head; and are used to pin the Frame of a Floor or Roof together, by being put in through the Pin-holes in the Mortesses and Tennons, whilst it is framing or fitting into its due Position: As foon as which is done, these Hook-Pins are ftruck out, and 'tis pinn'd up fast with Wooden

HORIZONTAL-Line in Dialling, is a Line drawn on any Plane parallel to the Horizon. It is drawn on an Eject or Reclining Plane by a

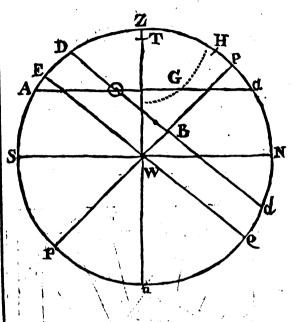

Level; or by applying a Quadrant to the Edge of a Ruler 10, as that the String and Phunmet shall cut oo. or 90 Degrees in the Limb.

HOSPITALLERS, were the Krights of a Religious Order; so call'd, because they builded an Hospital at Jerufalem, wherein Pilgrims were received. To these, when the Templers were suppress'd by the Council of Vienne in France, P. Clement transferr'd that Order. Their chief P. Clement transferr'd that Order. Their chief Abode is now at Make, and they are call'd Knights Vol. II.

of Malta. All the Lands and Goods of such as were here in England were given to the Crown:

See 32 H. VIII. c. 34.

HOUR of the Day: To find this readily by Projection of part of the Analemma, proceed thus: With 60 of the Chords draw the Circle Z S n N for the Meridian of your Place: Then

having given you, as you must have, the Latitude of your Place, and the Sun's Declination and Altitude, set the first of these three from N to P; so is P, the Pole of the World, draw P W; for the Axis. Set next the Latit. also from Z to E, and draw E W Z for the Equinoctial. Then fet the Sun's Declination from E to B, and from 2 to d, when is North, as here; but on the lower Side of BZ when its South; and draw the Parallel of Declination Dd: Then fet the Sun's Altitude from S to A, and from N to a, draw Aa for the Almacanter or Parallel of the Sun's Altitude at the Time. The common Intersection of these two Parallels in O, will give you the Sun's Place in the Heavens at that Time. And, consequently, setting the Sector to the Radius D B, B will be the Sine of the Hour from 6, either in the Morning or Afternoon. If a Sector be not at Hand, you may find the Hour by your Chords, thus; Set the Extent B D from W to T; on which Point T, as a Centre, with the Extent B . (the parallel Sine of the Hour from 6) Arike the Arch G; for then a Ruler laid from W just to touch the Convexity of the Arch G, will cut the Limb in H. Then HN measured on the Chords, will give the Degrees of the Hour from 6, which must be turned into Time.

HOUR-Scale: On one of the Edges of Colin a Quadrant there is usually an Hour-Scale (as on the other Edge is a Line of Latitudes) which is no other than a Double Tangent, or two Lines of Tangents, each of 45 Degrees, fet together in the middle; and so might, if there were need, be continued in Infinitum.

"And on the other Face of this Quadrant there is allo an Hour-Scale of another kind; being 62 Degrees of a Line of Sines, whose Radius is made equal to half the Secant of the Latitude (being fitted for London) to the Common Radius L 1 of

of the Sines. Against it, and running by it, is a prick'd Line of Declinations: To the Sun's greateft Declination is also a Portion of the Line of Sines, whose Radius is equal to the Sine of the Latitude of London, taken out of the other part of the Scale.

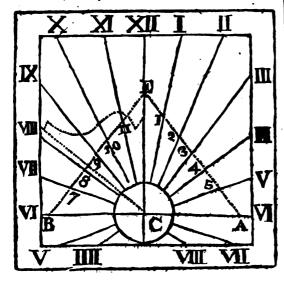

These Hour-Scales (especially the former) may be put on any Ruler, Sector, &c. and will serve

for these Ules.

The first Hour Scale, or Double Tangent, is a Scale of Six Hours; and by help of the Line of Laritudes (which should always be placed by it) will serve very readily and universally to prick down all Dyals that have Centres; after this manner.

I. To draw on Horizoneal, or a Direct Erect South Dyal.

Draw first the Right-Line CE for the Hour-Line of 12, and cross it in C (which will be the Cen-

tre of the Dyal) with the Perpendicular B A: Then from the Scale of Latitudes take off the Latitude of the Place for an Horizontal (or the conce will be co-Latitude, for a Direct South and Vertical) nearly 3 M Dyal, and fet it with your Compasses each way from C to A and B: Then take with your faid Scale

Competer the whole Hour-Scale, and festing the End of it at A and B, and its Beginning at E, transfer it, and all its Divitions (or such as you shall have occasion for at least) on each Side from A to E, and from B to E, making the Isosceles Triangle BEA: Then Numbring the Divisions with the proper Hours, as you see in the Figure, Right Lines drawn from C, through those Hours, Halves, or Quarters in the prick'd Lines AE and BE, shall be the true Hour-Lines of the Dyal: And to the Dyal you may give what Form or Figure you please.

II. To draw an upright Declining Dyal.

Suppose for the Latitude of London 51°. 30°. and declining Eastwards 25°. You must first, either by Calculation, or by Collin's Dialling-Scales, &c. find the Requisites of your Decli-

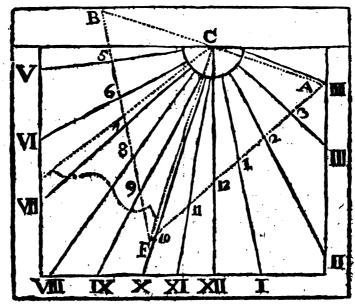

ning Dyal; which will be thefe:
The Substiles Distance from the 2 18. 34. Meridian will be

The Angle of the Hour-Lines of 12 and 6 will be
The Angle of the Inclination of

Meridians will be

And the Styles Height will be an

Angle of
Being thus prepared, you may then draw the
Line VIII, II, as the true Horizontal Line of gles, the Line XII C for the Meridian. Next make the Angle FC XII equal to 18°. 34'. the Substile's Distance from the Meridian; and by the Chords prick off FC for the Substile. To which in C, the Centre of the Dyal, draw the Perpendiquiar BA: Then make CA and CB equal to the Style's Height 34°. 19'. (taking it in your Compasses from the Line of Latitudes;) And then apply the whole Scale of Hours (as before in the Horizontal Dyal) on each fide C F, from A to F, and from B to F. Next get the Difference between 30°. 47'. the proper Inclination of Meridians, and the next Hours Distance from the Meridian that is less than that Angle; which in this Case is 10, or 30° from 12. This Differonce will be found here to be 47'. or, in Time, nearly 3 Minutes. The fitting the Scale of Hours, was before taught from A to B; count upon the

Heir

Hour.	Min.	_		
0	3	> From F to <	10	7
1	3		11	-1
2	3		12	ļ
3	3		I	
4	3		2	1
5	3.		3	3

And make Points at the Terminations with a Pin or Pen: And draw Lines from those Points to the Centre C; they shall be the true Hour-Lines on this Side the Substile.

Again, Fitting in the Scale of Hours from B to F, count from the End at B, the former Arks of Time.

Hour. Min. 3

And make Points at the Terminations, as before; through which draw Lines to the Centre, and they shall be the Hour-Lines on the other Side the Substile.

The like must be done for the Halves, Quarters, &c. getting the Difference between the Half-hour next less (in this Example 22° 30'.) under the Ark called the Inclination of Meridians, the Difference is 1°. 17'. (in Time nearly 33'.) to be continually augmented an Hour at a time, and so prick'd off as before was done for the Whole Hours.

If the Scale of Hours reach above the Plane, as in this Case at B; so that BC cannot be prick'd down: Then may an Angle be laid down on the upper Side of the Substile, equal to FC A on the under Side, and thereby the Scale of Hours laid in its true Situation, baving first found the Point F on the under Side.

The Stile may be easily laid down by the Chords, or a Protractor. And if your Scales are large and carefully made, as this is one of the easiest, so 'tis as exact a Way of Drawing Dials as any whatfoever.

HOUSEBOTE, the same with Estovers, or an Allowance of necessary Timber out of the Lord's Wood, for the Repair and Support of a

House or Tenement.

HOWKER, or Houce, is a Vessel much used by the Dutch; built something like a Pink,

They carry from 50 to 200 Tun: And with a small number of Hands will go to the East-Indies. They Tack foon and short; will Sail well, and lie near the Wind; and will live almost in any Sea.

HULKS, are large Vessels, having their Gun-Decks from 113 to 150 Foot long, and from 31 to 40 Foot broad. They will carry from 400 to 1001 Tons. But their chiefest Use is for set-tine in Mass into Ships, and the like. Though ting in Masts into Ships, and the like. antiently the Word Hulka seems to signific a small

HUNDRED, is a Part of a Shire or County, properly so called, because it contained Ten Decenna or Tythings: And either because at first there were an Hundred Families in each Hundred; or else that the Hundred found a hundred Men for the King's Wars. These Hundreds were first Ordain'd by King Alfred, the 29th King of the West Saxons; and he took the way of doing it from Germany; where Centa, or Centeua, is a Jurisdiction over an hundred Towns. Hence you see the Original of Hundreds,

which still keep the name, and remain, in some fort, the same, as to their Service in several respects: But their Jurisdiction is transferr'd to the County Court; some sew excepted, which have been by Privilege annex'd to the Crown, or granted to some Great Subject, and so remain still in the nature of a Franchise: And this hath been ever fince the Statute of 14 Edw. III. 1. c. 9. whereby these Hundred-Courts, formerly Farm'd out by the Sheriffs to other Men, were reduc'd all, or most of them, to the County-Court; and so remain at present. Where-ever therefore we meet with the Word Hundred-Court now, it fignifies some Franchise, where the Sheriff does not intermeddle by his ordinary Authority, unless when they of the Hundred refuse to do their

HUNDRED-Courts, were held antiently by the Hundredarius, or Chief Constable, of every Hundred, for better support of his Office. These, Courts were held in some Places once in three Weeks, and in others once a Month. And by Stat. 14 Ed. III. these Hundred-Courss were reduc'd to the County-Courts; tho' in some sew Hun-

dreds the Old Franchises are still remaining, HUNDREDERS, are Men Empanelled, or fit to be Empanelled, on a Jury, upon a Contro-versie; and who dwell in the Hundred where the Land in question lies. Bur

HUNDREDARIUS, the Hundreder, is he that hath the Jurisdiction of a Hundred, and who holdeth the Hundred-Court. And sometimes tis used for the Baily of the Hundred.

HUNDREDI Seda, was the Payment of personal Attendance, ordering Suit and Service at the Hundred-Court

HUNDREDUS Affirmatus, was the Profits of an Hundred-Court, Firmed or Farmed out for a

flanding Rent.

HURRICAN, is a most surious and dreadful

which the Caribbe-Islands and Storm of Wind, which the Caribbe-Islands and some other Parts of the Indies are subject to: Its Extent and Continuance is but small, but its Violence prodigious.

HUSE-BOTE, was formerly the Liberty a Tenant had to cut as much Wood on the Premisses as was necessary for the Support and Repair of the Farm-House and adjoyning Buildings. This is now call'd Estovers, Estoverium. HYDE-LAND: See Hide-Land.

HYDRO. LI2

HYDROSTATICKS. Weights which force out of the same Tube equal Quantities of the same Fluid, are to one another as the Squares of the Times in which the Fluid is forc'd out: But if the Times are equal in which the same Quantity of the Fluid is forc'd out thro' unequal Tubes; then the Powers are reciprocally as the Orifices of the Tubes: And therefore Powers which thrust out the same Quantity of a Fluid through unequal Tubes, are to one another in a reciprocal Proportion, compounded of the Squares of the Times, and of the Orifices of the Tubes.

HYDROSTATICAL-BALLANCE. A Description of an Hydrostatical-Ballance, for finding the Specifick Gravities of Liquids and Solids with ease and accuracy. By F. Hawks-bee, in Vine-Office-Court in Fleet-Street.

For LIQUIDS.

a a, a a, is the Foot to which the upright Piece or prop'd bb, bb is to be (crew'd: (See Fig. 1.) To the upper End of this upright Piece is fastned a double Cheek of Steel, c c, c c, on which the Beam d d, d d is suspended. To one End of this Beam put on the General Scale, express d by ee, ee, ee. At the other End of it, hang on the other Scale, which is a very thin and light one, and is only express'd on the Ballance by the Characters of ff.
To the Loop at Bottom of it, is to be suspended by its Hair, and the Bottle gg, gg. Thus pre-pared, the Bottle being plung'd into the Glass of Water, bb, bh, the Beam will form an Horizon. tal Polition: But if it happen something too light, or too ponderous (for all Waters have not the same Specifick Gravity, nor at all times) it must be adjusted by putting Weights on the lightest End, till brought to an Equilibrium. These Weights, in the Experiment, are to be taken no notice at all of. And by an Experiment, by and by to be mention'd, I found two Grains to be the greatest Variation, between the Weight of a Bulk of Water, equal to 574 Grains, at the greatest Degree of Heat in this Climate to the Freezing Point. And thus you may find the Specifick Gravities of all manner of Liquids, in comparison to their like Bulk of Common Water: For the Bottle will fink down in lighter, and be buoy'd up in beavier Fluids; and the Grains or Part of Grains, which must be put into one of the Scales, to reduce the Beam to an Horizontal Position, will shew the Difference of the Specifick Gravity.

For SOLIDS.

The General Scale e e remains in its Place: But instead of the Scale ff must be suspended the Brais Piece, represented by the Figure ii, ii. (See Fig. 2.) To the Loop, at the Bottom of which, must the Glass Bucket kk, kk be suspended by its Hair, which then becomes a Ballance to the other End. Into this Bucket must be put the Solid (what ever it be) whose Specifick Gravity you would find, or whose Weight you have a mind to compare with that of the like Bulk of Water: And having ballanc'd it by Weights at the other End, take it out of the Bucket, and plunge the Bucket empty into the

Slit on the Brass piece ii, a Notch being cut in't to receive it; the Bucket then in the Water will be in aquilibrio with the General Scale ee; the Dish 11 being the Weight of a Bulk of Water equal to the Solidity of the Bucket: But if it chances to vary a little, you must reduce it as before. Then putting the Solid Body into the Bucket (having first well wetted it all over in Water; and it be irregular, take care that no Air lodges in any part of it) then you will foon find what it has loft of its Weight, in comparison to what it weigh'd in the Air: And by the Difference of which Weights, divide the Weight first found, which exactly gives you its Proportion to the like Bulk of Water: See Specifick Gravity in Vol. I. Where the Reason of this Practice is shewn: What is here design'd being only the Use of a commodious Ballance for such kind of Hydrostatical Experiments.

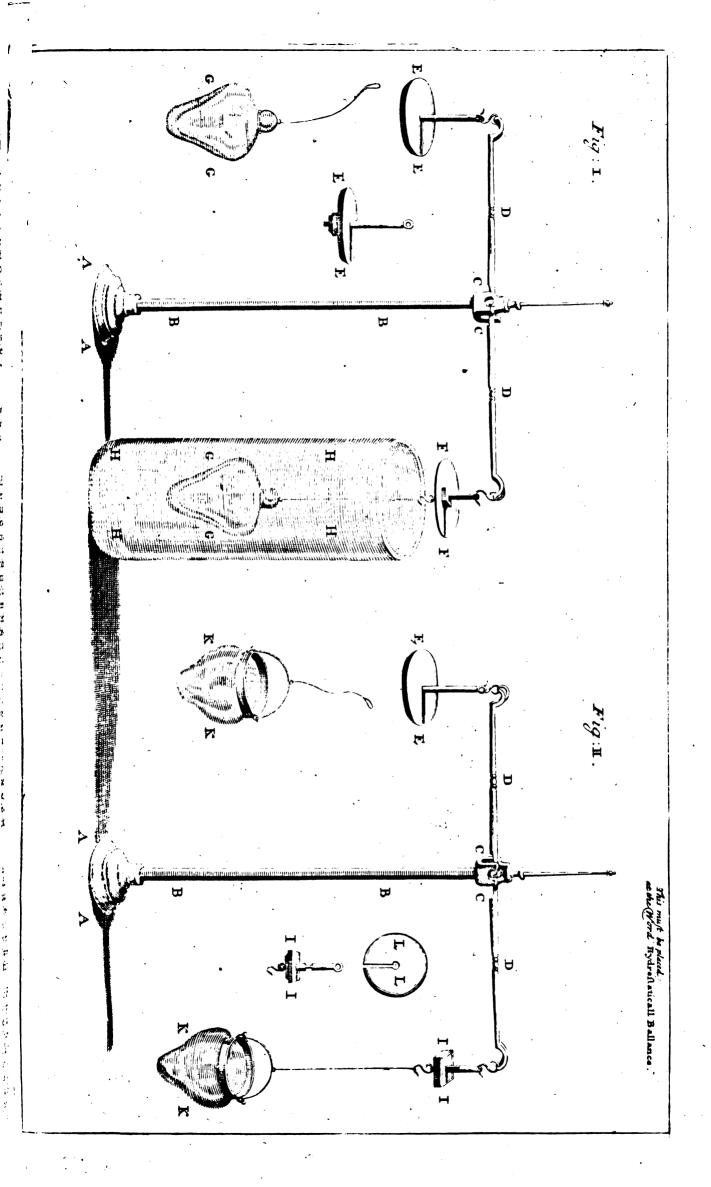

An Experiment, touching the different Densities of common Water, from the greatest Degree of Heat in this Climate to the Freezing Point; observed by a Thermometer. By Mr. Hawksbee.

I took about a Quart of Common Water, and gave it a pretty considerable degree of Heat over the Fire: Then putting it into a convenient Glass together with my Thermometer, where the Spirit foon arose into the small Ball a-top, and continued to remain there till the Water began to a. bate of its Heat; by which Time the Spirit in the Thermometer became of an equal degree of Temerature with the Water in which it was plac'd. When the Spirit has descended to 130 Degrees above the Freezing Point, (which is the greatest Height it has been observed in this Climate) I began my Observations, and found that the Bulk of Water, equal to that of the Bottle I weigh'd in't, in that State, was equal to 574 Grains, at 80 Degrees above the Freezing Point, the Bulk of Water, equal to the Bottle, then weigh'd & of a Grain more than before: At 32 Degrees above the pre-mention'd Point, the like Bulk of Water equal to the Bottel, was again increased 4 of a Grain; at the Freezing Point it weigh'd about 5 of a Grain more: in all about 2 Grains, from 130 Degrees above the Freezing Point, to the same Point: Which to me seems very considerable, and ought to be observed by those, who at different Seasons, have occasion to find the Specifick Gravities of Liquids and Solids.

HYPERBOLA. In Philof. Transact. N. 34. you have a Quadrature of the Hyperbola by the Ld. Viscount Brouncker, by a Series founded on what Dr. Wallis hath demonstrated in his Arith. of Infinites, Prop. 87, 88, 89, &c. And in Philos. Transact. N. 306. by a New Quadratrix, invented by the Ingenious Mr. J. Perks, of Great Swinford in Worcestershire; together with the Constru-

HYPERBOLICAL Cylindroid, is a Solid Figure, whole Generation is given by Sir Christoph. Wren, in Philosoph. Transact. N. 48. There are two opposite Hyperbola, join'd by the Axis Trans-versus; and thro' the Center there is a Right Line drawn at Right-Angles to that Axis Transversus; and about that, as an Axis, the Hyperbolæ are supposed to revolve: By which Revolution a Bo-Water. Then putting the Brass Dish 11, by its dy will be generated, which he calls an Hyperbo-

Digitized by Google

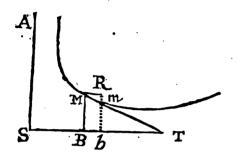

lick Cylindroid; and whole Bales, and all Sections parallel to them will be Circles. And in N. 53. of the Transactions, he applies it to the Grinding of Hyperbolical Glasses, and saith, they must be either form'd this way, or not at all.

HYPERBOLI-FORM Figures, are such Curves as approach in their Properties to the Nature of the Hyperbola; and are call'd also Hyperboloids.

The Method of drawing Tangents to Hyperboliform Figures.

Let AS, ST, represent the Assymptotes of the Equilateral Hyperbola Mm; then will S be the Centre of the opposite Sections. Draw the Or-

dinate MB, and another infinitely near, as mb. Let p be the Parameter of the Figure, let SB=x, and MB = y : Rm = y, and Bb = x. And let it be required to draw MT, a true Tangent to the Curve in the Point M, suppose all done, as in the Figure: Then will the Triangles MBT, and MRm be fimilar; and therefore $\hat{j}: x:: y: \frac{xy}{x} (= BT.)$ Now the proper Equation for the Curve is |pp=xy|; wherefore their Fluxions will be

And dividing by x, it will be $\frac{xy}{x} = \frac{y}{x}$. But from the Ordinate's continual decrease as the Ab-

scissa increases, the (=BT,) must be , you have B T =

CAROL. I.

When the Value of the Sub-tangent BT comes out negative; then the Point T will fall, as here, on the contrary Side of the Ordinate, with regard to S, the beginning of x. But when it comes out positive, the Point T will be on the contrary Side; as in the Parabola.

COROL. II.

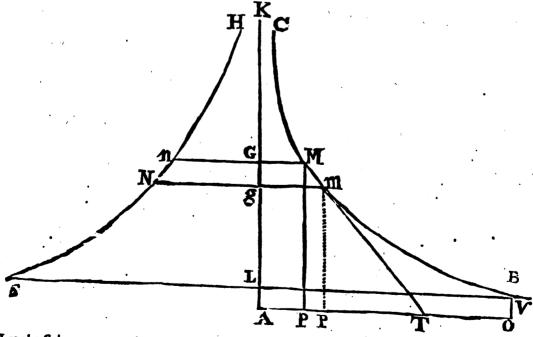

If you suppose the Parameter $= r_i$ and m to be a Negative Number; then $j^m = x$ is an Expression for all Hyperboli-form Figures; and universally the Length of the Sub-tangent BT.

$$\left(=\frac{xy}{y}\right) = \text{(because } y = x \text{ and consequent-}$$

$$\text{ly } m \ y^{m-1} \ y = x \text{) I say,} = \text{to } m \ y^m = \text{(bec. } y^m = x \text{) to } m \ x; \text{ that is, } To \text{ the Exponent of the Power of the Ordinate multiplied into the Abscissa.}$$

To Investigate the Area's of all forts of Hyperboli-form Figures.

In the following Figure, let the Curve CM m B equal, viz, o = xy + yx; or xy = -yx; be an Hyperboloid; AK and AO the Asymptotes:

Let the Sub-tangent P T be called t, and the Ordinate P M = y. The General Equation for such Curves being $r^m = x$; and the Expression for the Sub-tangent P T being m x, as above. Let G n,

Then will t j = y x. And the Rectangles NIGn=17, will always be equal to the Re-Sub-tangent P T being m x, as above. Let G n, changle P R m p = y x: And if this be always in the Figure, be always taken equal to P T: done, the Figure $K \land O B C$ infinite towards K C. ty = (because t = mx) all the mxy. But supposing the Figure KAOBC - b; and the inscribed Rectangle LBOA = d) then will the Figure K LBC = b - d =all the x y (because IR = x, and RM = y.) Whence all the Re-Changles mxy =all the yx = b, are to all the x = b - d, as m is to 1. And by Division m: m-1::b:n; That is, the Figure KAOBC: Is to the inscribed Rectangle: As the Exponent of the Power of the Ordinate m: Is to the same Exponent less 1.

COROLLART.

terminate towards K, may be measured: But within of 6 Columns.

will be equal to Figure K L S H, equal to all the if m = 1, then the second Term in the Analogy ij = (because t = mx) all the mxj. But supposing the Figure K AOBC - b; and the inscribed Rectangle LBOA = d) then will the Figure K AOBC is infinite towards K; and infinitely great in respect of the Rectangle LO. But if be less than I, that Space KAOBC will be more than infinite.

Thus in the common Apollonian Hyperbola,

whose Equation is y = x; or (supposing a the Parameter = 1) aa = xy; it appears that m-1 = 0; and consequently, it appears that the Proportion between the Rectangle L O, and the said infinite Space is infinitely great: See more of this in Hayes's Fluxions, p. 61, Sc.

HYPETHRE, in the Antient Architecture, was two Ranks of Pillars all about, and ten at If m be greater than 1; then the Space, inde- each Face, of any Temple, &c. with a Peristile

TACK

ACK, in a Ship, is that Plag which is hoisted up at the Sprit-Sail-Top-Mast-Head.

J JACTIVUS, Jatious, a Latin Word, fignifying in the Law, him that lofeth by Default: Placitum Juam neglexerit, & Jactivus exinde remansit. Formul. Solenn.

JAM, or Jamb, is in the Language of our Lead Miners in Mendip, a thick Bed of Stone, which hinders their Work when they are pursuing the

Veins of Oar.

ICH DIEN, the Motto under the Arms of the Prince of Wales; which Sir H. Spelman judges to be in Saxon Ic Thien; the Saxon D with a traverse Stroke being the same with Tb; and fignified I Serve, or am a Servant. As the Saxon King's Ministerial Lords were called Thiens.

IDEA'S. Our Observation employ'd, either about External Objects, or about the Internal Operation of our Minds, perceived and reflected only by our selves; is that which supplies our Understanding (saith Mr. Locks) with all the Materials of Thinking. These Two are the Great Fountains of Knowledge from whence all the Idea's, Notions, Phantasms, Species, &c. which we have,

or can naturally have, do spring and arise.

1. Our Senses, being conversant about particular Sensible Objects, do convey into the Mind several distinct Perceptions of things: And this way we gain the Idea's of Tallow, White, Heat, Cold, Soft, Hard, Bister, Sweet, and all those which we properly call Sensible Qualities; and this Great Source of most of the Idea's we have, depending wholly on our Senses, and derived by them to the Understanding, is called Sensation.

The other Fountain from which Experience furnishes the Understanding with Idea's, is the Perception of the Operation of our own Minds within us, as it is employed about the Idea's it hath before gotten by Sensation: Which Operations, when we come to Reflect and Confider on, our Understanding thereby becomes furnish'd with another Set of Idea's, which could not be had from things without; and such is Percopsion, Thinking Doubeing, Believing, Reasoning, Knowing, Willing, So. and all the different Actions of our Minds; Which we being conscious of, and obferving in our selves, do from these receive into our Understandings, as distinct Idea's, as we do from Bodies affecting our Senses. This is a kind of Insernal Senfation; is called very properly, by Mr. Lock Reflection: And thefe two, Senfation and Reflection, he takes to be the only Originals from whence all out Idea's take their Beginnings.

And so far the Mind or Understanding is meetly passive; and cannot choose whether it will have
these Beginnings or Materials of Knowledge or
nor. The Objects of Sense will obtunde their I.
dea's upon our Minds; and the Operations of our
Minds will not let us be without some (at least obscure) Notions of them. No one can be wholly
ignorant of what he doth when he Thinks: And
as the Mind is forced to receive Impressions from
without, so it cannot avoid the Perception of those
Idea's that are annex'd to them.

Of Idea's, some (as we should carefully observe) are Simple, and others Complex. All those Idea's that come into our Minds by Sensation, are of the former kind: And tho' the Qualities in Bodies that affect our Senses are in the Things themselves, so united and blended, that there is no Separation nor Distance between them; yet the Idea's they produce in the Mind enter by the Senses simple and unmix'd. Some Idea's come into our Minds only by one Sance, which is peculiarly adapted to receive them: As the Idea's of all Colours are received only by the Eye; all Sounds and Tones by the Ear, &c. Heas, Cold, and Solidity, by the Touch.

Other Idea's we gain by more than one Sence; as of Space, Extension, Figure, Rest, and Motion: For these make forcible Impressions both on the

Eyes and Touch.

There are other Simple Idea's, which convey themselves into the Mind by all the ways of Sen-sasion and Restection; as Pleasure, Pain, Power, Existence, Unity, and Succession; and these are all, or, at least, the most considerable of those Simple Idea's which the Mind hath; and out of which is made all its other Knowledge.

To understand the Nature of these Simple Idea's the better, and to discourse of them intelligibly, it will be convenient to diftinguish them as they are Idea's or Perceptions in our Minds, and as they are Modifications in the Bodies that cause such Perceptions in us; that so we may not think (as perhaps is usually done) that they are exactly the Images and Resemblances of something inherent in the Subject: For most of those of tion are in the Mind no more the Likeness of something existing without us, than the Names that stand for them, are the Likeness of our Idea's. But here the Qualities in Bodies, which produce these Idea's in our Minds, must be distinguished into Primary and Secondary. Primary Qualities are such as are utterly inseparable from the Body, in what State soever it be; such as the Sence constantly finds in every Particle of Matter; which are Solidity, Extension, Figure, Motion, Rest, and Num Secondary Qualities are such as are in reality Nothing in the Objects themselves, but only Powers to produce various Sensations in us by their Primary Qualities; i.e. by the Bulk, Figure, Texture, and Motion of their Insensible Parts, as Colours, Sounds, Tasts, &c. Now the Idea's of Primary Qualities are, in some sence, Resemblances of them, and their Patterns do really exist in the Bodies themselves; but the Idea's produced in us by these Secondary Qualities have no Resemblance of them at all. There is nothing like our Idea's existing in the Bodies themselves: They are in the Bodies, we denominate from them only a Power to produce those Sensations in us: And what is Sweet, Blue, or Warm in Idea, is but the certain Bulk, Figure, and Motion of the infensible Parts in the Bodies themselves, which we call so.

There are several Faculties which the Mind bath of managing these Simple Idea's, which are very well worth our Observation; as that of Discerning duly, and rightly Distinguishing one from another: In this confists the Accuracy of Judg-

ment, and the avoiding all Confusions and Mi-

- 2. That of Comparing them one with another, in respect of Extent, Degree, Time, Place, or any other Circumstances of Relation or Dependance one on another.
- 3. The Faculty of Compounding or putting together the Simple Idea's received by Sensation or Reflexion, in order to make Complex ones.
- 4. When Children, by repeated Sensations, have got some Idea's fix'd in their Memories, they, by degrees, begin to learn the Use of Signs; and when they can speak articulately, they make use of Words to signific their Idea's to others: And the Use of Words being to stand as outward Marks of our Internal Idea's; and those Idea's being taken from particular things, if every particular Idea that we take in should have a particular Name, Names must grow endless. To prevent this, the Mind, by,
- 5. Another Faculty, can make the Particular Idea's received from such Objects, to become General: Which is done by considering them as they are in the Mind such Appearances, separate from all other Existences, and the Circumstances of real Existence; such as Time, Place, or any other concomitant Idea's; and this is called Abstraction; whereby Idea's taken from particular Things, become general Representatives of all of that kind; and their Names, general Names applicable to whatever exists conformable to such Abstract Idea's. Thus the same Colour being observed to Day in Chalk or Snow, which the Mind Yesterday received from Milk or Cerusse; it considers that Appearance alone; makes it a Representative of all of that kind; and having given it the name of Whiteness, it by that sound signifies the same Quality wheresoever to be met with or imagined. And thus Universals, whether Idea's or Terms, are made.

From the Power which the Mind hath of combining thus, comparing, and separating or abstracting its Simple Idea's, which come into it by Sensation and Restation, all Complex Idea's are form'd; and, as before in the Perception of Idea's, the Understanding was passive, so here 'tis active; exerting the Power it hath in the several Acts and Faculties above-mention'd, in order to stame Compounded Idea's.

All Complex Idea's, tho' their Number be infinite, and Variety endless, may be, as it seems, all reduc'd to these three Heads, viz. Modes, Substances and Relations.

Modes are such Complex Idea's, which however compounded, are not supposed to exist by themselves, but are considered as Dependancies on, or Affections of Substances: Such are the Idea's fignified by the Words Triangle, Gratisude, Mursher, Gc. and these Modes, as Mr. Locke calls them, are of two sorts:

t. Such as are only Variations, or different Combinations, of the same Simple Idea, without the Mixture of any other; as a Dozen, a Score, Sc. and these may be called Simple Modes.

2. There are others compounded of Simple Idea's of several kinds put together to make one Complex one; as Beauty, Thest, &c.

Substances have their Idea's such Combinations of Simple Idea's, as are taken to represent distinct particular things subsisting by themselves; in which the supposed, or confused Idea of Substance, such as it is, is always the First and Chief.

Relations, are a fort of Complex Idea's arising from the Consideration and Comparison of one Idea with another. Of these, some depend only on the Equality or Excess of the same Simple Idea in several Subjects; and these Mr. Locke thinks may be called Proportional Relations; fuch 28 equal, more, bigger, sweeter, &c. Another Occasion of comparing things together, is the Circumstances of their Origin or Beginning; and this being not afterwards to be altered, make the Relations depending thereon as lasting as the Subjects to which they belong: These are Natural Relations, such as Father, Brother, Uncle, Cousims, &c. There are also Relations by Institution, as Prince and People, General and Army, &c. Mo_ ral Relations, are the Conformity or Disagree. ment of Men's free Actions to Laws and Rules, whether Divine of Human.

It may be considered also surther about our Idea's, that some are clear and distinct; others obscure and consused. Our Simple Idea's are clear, when they continue such as the Objects represent them to us, when our Organs of Sensation are in a good Tone and Order; when our Memories resain them, and can produce and present them to the Mind when ever it hath occasion to consider them: And if along with this the Mind sees that these Simple Idea's are severally different one from another, and each single one from all the rest; then they are distinct also as well as clear: And the contrary to this will occasion Obscurisy and Consusion.

IDENTITY: The Idea's of Identity and Diversity come into our Minds by the Power it hath of comparing the very Beings of Things; whereby confidering any thing, as existing in any determined Time and Place, we compare it with it self existing at another time; and accordingly pronounce it to be the same or diverse. When we fee any thing to be in any Place in any Instant of Time, we are sure (be the thing what it will) that it is that very thing, and not another: For what ever is another thing, must at that same time exist in another place, how like so ever it may be in all other respects. And in this confifts Identity; when the Idea's it is attributed to, vary not at all from what they were that moment, wherein we confider'd their former Existence, and to which we compare the present: for never finding nor conceiving it possible, that two things of the same kind should exist in the same place at the same time, we rightly conclude, that whatever exists any where at any time, excludes all of the same kind, and is there it self alone. When therefore we demand, Whether any thing be the fame or not? Italways refers to some thing that existed at such a time in such a place, which, 'twas certain, at that infant, was the same with it self and no other. From whence it f ollows, that one thing can't have two Beginnings

of Existence, nor two things one; it being imposfible for two things of the same kind, to be or exist in the same instant, in the very same place; or one and the same thing in divers places. Whatever therefore had one Beginning is the same thing; and that which had a different Beginning in Time and Place from that, is not the same with that, but different from it.

We seem to have Idea's but of three sorts of Substances, GOD, Finite Intelligences or Spirits, and Bodies. Of GOD, 'tis demonstrable that He is without Beginning, Eternal, Unalterable, and Omnipresent; wherefore of His Identity there

can be no doubt.

Finite Spirits having had each its determinate Time and Place of Beginning to exist; the Relation to that Time and Place, will always determine to each of them its Identity, as long

as it exists.

And the same will hold of Bodies: And in every Particle of Matter, to which no Addition or Substraction of Matter being made, it is the same. And though these three sorts of Substances do not exclude one another out of the same Place; yet we cannot conceive but that they must necessarily each of them exclude any other of the same kind, out of the same Place; or else the Notions and Names of Identity and Diversity would be in vain; and there could be no such Distinction of Substances, or any thing else from one another. Thus, v. gr. if two Bodies or Particles of Matter could be in the same place at the same time; then take them, great or little, they must be one and the same; nay, thus all Bodies must be one and the

'Tis plain then that the so much disputed Principium Individuations is Existence it self; which determines a Being of any fort to a particular Time and Place, incommunicable to two Beings

of the same kind.

And here it will do well to distinguish between dead and unactive Lumps of Matter, and such Bodies as those endow'd with Vegetable or Animal Life. If you consider one of the former kinds of Bodies; if it confift only of one, or a determinate Number of many Atoms, any way combined together; while that one continues without mixture with others; or while the many exist, united together in the same Mass, it will still be the same Body; but if one Atom be taken away, or any new one added, it is no longer the same Mass, or the same Body. But in the State of Living Creatures, their I. dentity depends not on a Mass of the same Particles, but on something else; for in them the Variation of great Parcels of Matter alters not the Identity. An Oak growing from a Plant to a great Tree; and a Child growing to an Adult Person, are still the same; tho' in both Cases there be a manisest Change of Parts: For here 'tis such a peculiar Disposition and Organization of Parts in one coherent Body, and partaking of one common Life, that constitutes their Identity; and as long as that continues, it will be the same Oak or Man. And so it is in a Watch; as long as the Mechanism of it continues the same, and it goes and answers the End of its Organization, its the same Watch, tho many Particles of Matter continually rub off and wear away. 'Tis clear therefore wherein confifts the *Identity* of any Animal or Vegetable. Vol. II.

But there is another fort of Identity, which hath not been improperly called Personal; which I think Mr. Lock truly determines to consist in the Sameness of a Rational Being: Since by Person we understand an Intelligent Being, having Reason and Reflection: And fince there is a Consciousness which always accompanies Thinking; it is that which makes every one to be that, which he calls bimfelf, thereby diftinguishing him from all other Beings that think, and give him his Personal Iden-See Essay of Human Understanding, Book 2. Ch. 2

JEWISH Hours, are the 24 Hours of the Day, accounted from Sun-fetting to Sun-fetting again, much after the manner as the Italians do now.

IKEMILDESTREET, one of the four old Roman Ways in England: See Watting street in Vol. II. It was called Stratum Icenorum, because it took its Beginning from the Iceni, which were those that inhabited Suffolk, Norfolk, and Cam-

bridgesbire.
1LLEVIABLE, is what cannot or may not be levied: And therefore Nibil is a Word set upon a

Debt that is Illeviable.

IMPARSONEE, in the Law, or a Parson Imparsonee, is one that is Inducted into the Possession of a Benefice. And Dyer saith, a Dean and Chapter are Parsons Imparsonees of a Benefice ap-

propriate to them.

IMPEACHMENT of Waste, Impetitio vasti from French Empeschment, Impedimentum, signi-sies in Law a Restraint from committing Waste on Lands and Tenements. And thus he that hath a Lease without Impeachment of Waste, hath by it a Property or Interest given him in the House and Trees, and may make Waste in them, without being Impeached for it; that is, without being question'd or demanded any Recompence for the Waste done.

IMPLEAD, in our Law, fignifies to Sue, Ar-

rest or Prosecute by Course of Law.
IMPOST, is the Tax which the Crown receives for Merchandize brought into any Haven within its Dominions, or from Foreign Parts. 31 Eliz. 5. and thus it may be distinguished from Custom; which is rather the Profit which the Queen makes of Wares exported: But they are

frequently used promiscuously.

IMPOSTS in Architecture, are what are some times called Chaptrels, being the Parts on which the Feet of Arches stand: Or the Capitals of Pilasters that support Arches. These Imposts conform to their proper Orders: The Tuscan hath a Plinth only: The Dorick two Faces and a Round: The Ioniek a Plancere or Cavity between the two Faces; with, some times, carved Mouldings; as the Corinthian and Composite have their Freises. But the Sallies of the Imposts must not exceed the Body of the Pilaster. Sometimes the Entablature of the Order serves for the Impost of the Arch; and this looks very great and stately.

IMPROPRIATION, is the Word for the Profirs of an Ecclesiastical Benefice, being in the Hands of a Lay-Man: As Appropriation is the Term, when 'tis in the Hands of a Bishop, College, or Religious House. Tho' these two Words are now often used promiscuously. It is said there are 3849 Impropriations in England.

Cowel's Interpreter.

IN

IN Alto & Imo; the same with Alto & Baffo; which see.

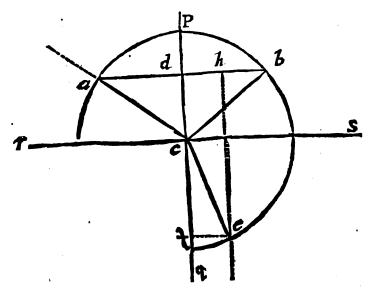

INCIDENCE. Sir Isaac Newton, in his Of eicks, Printed fince the first Edition of this Book, faith, That the Sine of Incidence is either accurately, or very nearly, in a given Ratio to the Sine of Refraction: (And the Angles of Incidence, Reflexion, and Refraction, are all in one and the same Plane.) Wherefore if that Proportion be known in any one Inclination of the Incident Ray, 'tis known in all; and thereby the Refraction in all Cases of Incidence on the same Refracting Body may be determin'd. Thus, if the Refraction be made out of Air into Water, the Sine of Incidence of the Red Light Is to the Sine of the Refraction, As 4 To 3. If out of Air into Glass, the Sines are As 17 To 11. In Light of other Colours the Sines have indeed other Proportions; but the Difference is so little, that it need seldom be confider'd.

To illustrate all this, Sir If. Newton, Opt. p. 5. gives this Example:

Let r s be the Surface of the Still Water, c the

the Air from a in the Line ac, is reflected or refracted: I would know whither this Ray shall go after such Reflexion or Refraction.

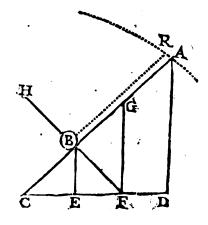

On the Surface of the Water rs, and in the Point c, I erect the Perpendicular c p, and produce it downwards to q. Knowing therefore that the Ray after Reflexion or Refraction will be found somewhere in the Plane of the Angle of Incidence a c p produced: I let fall the Sine of that Angle (viz. a d) on the Perpendicular p c; and then if the Reflected Ray be fought, I produce a d to b, fo that d b := a d, and draw c b, which shall be the Reslected Ray, because the Angle of Reflexion and its Sine, are equal to the Angle and Sine of Incidence, as they ought to be. But if the Refracted Ray had been fought, I produce a d to b; so that db may be to a d, As the Sine of Refraction To that of Incidence; i. e. As 3 To 4. Then with the Radius a c, describing the Circle abe, and in the Plane acp, I draw the Line be parallel to pq, and curing the Circumference in e: Then drawing e e, that shall be the Refracted Ray. For if e f be let fall perpendicularly on the Point of Incidence, in which any Ray coming in Line pq, it shall be the Sine of the Angle of Re-

fraction of the Ray ce; and this Sine is equal dh, and consequently in proportion to the Sine of the Angle of Incidence ad, As 3 To 4.

INCIDENT, in the Law, fignifies a thing necessarily depending upon another, as more principal. Thus a Court Baron is so Incident to a Mannor, and a Court of Pie-Powdre, that they cannot be severed in a Grant of a Mannor or Fair,

but must go along with it.
INCLINED Plane. If a Body, as B, be partly supported by the Inclined Plane A C, and partly

by the Power R acting on a Direction parallel to the Plane AC. Then that Power R: Is to the Body or Weight B:: As the Sine of the Angle of the Plane's Inclination ACB: Is to the Radius CA. CD, AD, GF, ED, and HF, being drawn as in the Figure. The Body B will be sustain'd as it were by three Forces or Powers, all acting according to different Directions, and in Æquilibrio to one another. The First of which is the Force of Gravity; expressed by BE perpendicular to the Horizon CD. The Second, the Power R, according to the Direction B R parallel to the Plane A C. And the Third is supply'd by the Resistance or Contranitence of the Plane A C; and is express'd by BH perpendicular thereunto. For Action and Re-action being equal, and one acting directly contrary to the other; the Plane which is pressed by the Body or Weight B, according to the Direction of the Perpendicular H B. must act on that Body by a contrary Direction. viz. that of FB or BH. And fince these three Powers are all mutually in Aquilibrio, and that the Body B is sustained by them, 'tis plain (when G F is drawn perpendicular to C D, or parallel to B E) that the Force of Gravity will be expressed

by GF; and that the Power R: To the Power of Gravity :: Will be as GB: To GF: But in the Right-angled Triangle CFG (FB being a Perpendicular to the Base CG) BG: GF::GF: GC; and as FG: GC::AD:AC: (by Similar Triangles;) wherefore the Power R: Is to the Force of Gravity:: As AD: To AC; or as the Sine of the Angle of Inclination to the Radius. 2. E. D.

COROLLARY I.

Wherefore the Force by which any heavy Body wou'd descend on any Inclined Plane to the Force of the Descent in the Perpendicular, is as the Sine of the Angle of the Plane's Inclination to the Radius.

COROLLARY II.

Frome hence also it follows, that the Inclination of the Plane may be so little, that the greatest Weight may be sustain'd on it by the least

For Practice therefore, Let the Weight of any Body be W, and P the Power wanted to sustain it on an Inclined Plane.

I say, by this Theorem, R: W:: S Incl.: P. That is, As Radius is to the Weight:: So is the Sine of the Angle of the Plane's Inclination to the Horizon: To the Power fought. The three first of which are given: Wherefore the Fourth is known. Trigon. Calculation. E. G. Let a Body weigh 9999 Pound; What Power will sustain it from descending on a Plane inclined to the Horizon with an Angle of 34 Degrees? Answer, 5590 Pound weight.

See the Work.

R = 10.

Weight 9999. 3.999957 $S, L Incl. = 34^{\circ}. 9.747562$

Z - R = 3.747419 = 5590 Ferd.

INCOMBUSTIBLE Cloth, is a fort of very odd Linen, made from a Stone in the form of a Talk; and call'd Lapis Ammanthus and Asbesto's, Alumen Plumosum, Polia, Corsbides, Sparta Polia, &c. 'Tis sound in many Places in China, Isaly, and Wales; and I have had a very clean fort, which would part into pretty long Threads, which was found in Scotland. The Incombustible Cloth made from this Mineral, is called Linum Vivum, Linum Fossile, Linum Indicum, Creticum, Cypricum, Se. from the Places where 'tis found. This was of such efteem among the Ancients, as to be rank'd (as Dr. Plos tells us) with the most precious Pearls: And in China a piece of it but 23# Inches long was valued at 80 Tale, i. e. 36 l. 13 s. 4 d. Pliny tells us exprelly, and of his own Knowledge, That Napkins of this Cloth being taken foul from the Table at a great Feast, where he was a Guest, were cast into the Fire, and by that means came out fairer and cleaner than if they had been wash'd in Water. Marco Antonio Castagna, Superintendent of some Mines in Italy, saith (in Phil. Trans. N. 72.) that causing a kind of Paper to be made of some of the Amianthus which he found there;

consumed than Plates of the hardest and most solid Metal; which would have scaled off in Flakes Mr. Edward Lloyd also, with a much less Heat. in Numb. 166. gives an Account of some that he found in Wales, which remain'd in the Fire above a Quarter of an Hour without any Signs of being confumed.

But in two Trials which were made before the Royal Society of a Piece of this Cloth of a Foot long, and half a Foot broad, and weighing about an Ounce and half; it was found to lose in a strong Fire, where it continued for several Minutes, above a Dram of its Weight at a time.

Of this Cloth, as Pliny informs us, Shrouds were anciently made, and used at Royal Obsequies, to wrap up the Corps in, that the Ashes of their Bodies might be preserved distinct from those of the Wood, which constituted the Funeral Pile. And we are assured, that the Princes of Tartary ule it for the same purpose to this Day. And some of the antient Indian Brachmans are said to have made themselves Cloaths of it. They tell us also, that the Wicks for the Antients Perpetual Lamps (if there were any such thing) were made of the Threads of this Alumen Plumosum, or Asbeston.

Marcus Paulus Venetus acquaints us, That one Curficar a Turk, a Superintendent of the Mines in the Tartarian Province of Chinchinthalas, affured him that they first dried this Mineral (sound there in a certain Mountain) in the Sun; then pounded it in a Brass Mortar, to separate the Earthy part from it; and that asterwards it was also washed from all remaining Filth; and then was spun into Threads like Wool, and afterwards woven into Cloth; which, said he, when spotted or foul they cleanse by throwing it into the Fire for an Hour's time, whence it comes out unhurt, and as white as Snow

INCOMPOSITE Numbers, are the same with those Euclid calls Prime Numbers. In Dr. Pell's Edition of Brancker's Algebra, there is a Table, as it's there called, of Incomposite Numbers, less than 100000; tho' it contains far more Composite than Incomposite Numbers: For it doth not only give an orderly Enumeration of all Odd Numbers which are not Composite; but it shews also that none of the rest are so. This Table being of very great use, I have here placed. It hath 21 Columns throughout; whereof the first contains 40 Odd Numbers in their natural Order. The following Columns are diftinguished on their Tops, by their Numbers, in their natural Order; as o, 1, 2, 3, &c. and so on to 99999. These Top Numbers are Hundreds; and the 40 Marginal Numbers are Unites adhering to those Hundreds. A Line running from any of the Marginal, as be calls them (or Numbers in the first Column) across the Page, shews in any intermediate Column, the Place of the Number made up of the Top Number and that Marginal. In every such place of Concourse, you shall either find the Letter p, or some Prime Number less than 317. If p be there, it shews the Number to be a Prime or Incomposite. The whole Table consists of 50 Pages, or so many several Tables, number'd: In some one of which, if any Number be less than 100000. and do end either in 1, 3, 7, or 9, you may find its Place; and then see whether it be a Prime or not. If it be not a Prime, but Composite, you will show find in 1, 2 Division. Then for inflances will there find its least Divisor. Thus for instance, it would abide longer in the Fire without being in Table I. where the Lin'd mark'd with the Marginal Marginal 67, crosses the Column which hath 16 at the Top, there you find the Letter p, which shews you that 1667 is a Prime or Incomposite Number. But where that Line crosses the next Column, you find 3, which shews you that 1767 is not a Prime but Composite Number; and that 3 is its least Divisor. So also in Table XXV. you see that 49031, 49033, and 49037 are all Prime or Incomposite Numbers: But 49039 is a Composite, and 19 is its least Divisor.

It will oftentimes be of very great use to have, as you may have here, a compleat orderly Enumeration of all Prime or Incomposite Numbers between 0, and 100.000, without any mixture of Composites; as the p's in these Tables will give you, leaving out 9, 21, &c. and all other Composites. 'Tis true that 2 and 3 are Incomposite Numbers, as well as 1 and 3; but they are not put into the Tables, because no other Incomposite Numbers can terminate in them: For if any Number end in 12, it may be halved; if in 5, it may be divided by 5.

If to each of these Primes you set the Briggi-

If to each of these Primes you set the Briggian Logarithm, you may find the Logarithm for all the rest of the Numbers in the first Hundred Chiliads, by addition of the Logarithms of their Incomposite Factors.

In perplex'd Questions in Algebra it is oftentimes necessary to be able to determine how many aliquot Parts and Divisors any proposed Quantity or Number may have, for which Purpose these Tables are of excellent use.

Every Aliquot Part of a Number is one of its just Divisors; but the greatest Divisor being equal to the whole Dividend, cannot be called a Part.

to the whole Dividend, cannot be called a Part.

If you have the least Divisor of any Number in these Tables of Incomposites, you may find all its other Incomposites Co-efficients.

For if the Divisor end in 1 or 9, and have a such an one you have at the Bolack Stroke under it, in the Dividend's place in Tables of Incomposite Numbers.

the Tables; or if the Divisor end in 3 or 7, and have such a Stroke over it in the Dividend's place; then the Dividend is the Square of an Incomposite, and consequently the Quotient is given, being equal to the Divisor.

If the least Divisor hath no such Stroke by it, let it divide the Number proposed; so shall the Quotient be the greatest Aliquot Pare of that Dividend. Then seek that Quotient it self also in the Tables; if you find it there marked with p, it is a Prime or Incomposite, and you can proceed no surther; your Enquiry is at an end.

Thus the Number 53191 is found in Table XXVII. with its smallest Divisor 43; and being divided by that 43, the Quotient is 1237. And in Table I. finding 1237 to be a Prime Number, I proceed no further.

But had the Number been 93611, you will find in Table XLVII. that 7 is its least Divisor; and that the Quotient will be 13373. This stands in Table VII. with 43 for its least Divisor, and the Quotient will be 311; which in Table I. I find to be an Incomposite: I conclude therefore, that the prime Co-efficients of 93611 ate 7, 43, and 311.

If you divide any Odd Number by all the Primes in order, beginning with 3: Then the first Divisor that finds a Quotient without Fraction, is the least Divisor that Dividend can have. If no such Divisor sind an Integer Quotient, before the Quotient becomes less than the Divisor, you may pronounce your Dividend to be Incomposite; and that that last Divisor is greater than the Square Root also of the Dividend.

Frequent occasion of dividing by Incomposites requires a Tariffa of as many Primes as shall be needful; but for resolving of Numbers less than 100000, it sufficeth if it be extended to 313. And such an one you have at the Beginning of these Tables of Incomposite Numbers.

INDEFEISIBLE, in our Law, fignifies what cannot be defeated or made void : As a Good

and Indefeisible Estate.

INDEMNITIES. When a Church is Approriate to an Abbey or College, then the Arch-Deacon loseth his Induction Money for ever: In Recompence whereof he shall have yearly out of the Church so appropriate One or Two Shillings, more or less, for a Penfion, as was agreed at the Time of the Appropriating. And this Pension is call'd an Indemnity.

INDIVISUM, in our Law, is used for that which two Persons hold in common, Kitchin, fol. 241. in these Words; Partition.

He holds pro Indiviso, &c.

INDORSEMENT, is any thing written on the Back of a Deed or Instrument; as a Condition, written on the Back of an Obligation, is

commonly call'd an Indorsement.
INDUCTION. When a C When a Clerk is Instituted into a Benefice, he is to exhibit his Mandate from the Bishop to the Arch Deacon, or other Person to whom it is directed; and hath a Right chereby to be Industed into his Living: And if he be refused Industion, he hath a Remedy both in the Ecclesiastical Court, and also an Action of the Case in the Common Law, against the Arch-Deacon. If the Industor, or Person to be Inducted, be kept out of the Church or House by Lay-Men, the Writ de Vi Laich lies for the Clerk; which is directed out of the Chancery to the Sheriff of the County, to remove the Force, &c. If another Clergyman, presented by the same Patron, keep Possession, a Spoliation is grantable out of the Spiritual Court; whereby the Tithes, &c. shall be sequestred till the Right be determined.

The Arch-Deacon rarely Inducts a Clerk by himself in Person, but issues out a Warrant to all Clerks and Letter'd Persons within the Arch-Deaconry, impowering any of them to do it in his stead. The usual Form and Manner of Industion is, for the Industor to take the Clerk by the Hand, and then to lay it on the Key of the Church, which must be then in the Door, and to say; By Virtue of this Instrument, which is the Arch-Deacon's Warrant, I Indust you into the Real, Assual, and Corporal Possession of the Restory or Vicarage of A. with all its Fruits, Prosits, Members, and Appurtements. This done, he opens the Door, and putte the Clerk in Possession of the Church, and thuts the Door upon him; who, after he hath tolled a Bell (if there be any) comes out, and desires the Industry to indorse a Certificate of his Industion on the Arch-Deacon's Warrant, and that all present will fignify it under their Hands.

If the Church Key cannot be had, 'tis sufficient that the Clerk lay hold of the Ring of the Door, and within the time limited read the Common-Prayer and Thirty Nine Articles in the Church Porch. If there be no Church, he may lay his Hand on the Wall or Fence of the Church-Yard, &c. there being no necessity of Niceness as to the Form of Industion; only that he must have Witness that he was truly possels'd of it. Within two Months after this, the Clerk must read the Thirty Nine Articles, and all the Service of the Day both at Morning and Evening Prayers; and declare his Affent and Consent; and he must then also read the Bishop's English Cortificate, in which

who must Sign that they heard him do it, and be ready to attest it vive voce, if required: And within three Months after Industion he must take also the Abjuration Oath at the Quarter-Sessions,

or in some one of the Courts in Westminster.

INFANGETHEF, is a Liberty granted from the King to some Lords of Manors, to try all Thieves, which are their Tenants, within their

own Courts.

INFERIOR Planets, are Mercury and Venus, fo. called, because they are next the Sun, the Centre of the Planetary System. An Account of their Motion and Phanomena to an Eye placed at the Earth is as follows.

1. The Periodical Times of their Motion thro' the Ecliptic are plainly equal; which is contra-ry to what appears in the Motion of the Superior Planets: And their Progress through the Ecliptic is measured by the Motion of the Sun; so that if the apparent Motions of the Sun, Venus, and Mircury, be confidered for many Years together, they will appear to run through the Zodiac in an equal Space of Time.

The Reason of this Diversity between the Supe-

rior and Inferior Planets is not from any real Diference in their Motions, but arifes folely from the different Polition of this Earth which we inhabit.

All the Planets are circulated round the Sun in one and the same Ratio; the more distant requiring a longer time for their Revolution, than those which are more near. Thus the Earth being farther from the Sun than Venus, is a longer time in moving round him; and Venus than Mercury: And to an Eye placed in the Sun the Motions of the Inferior and Superior Planets would appear alike uniform and proportionable to their Distance. But to an Eye at the Earth, as the Superiors, containing our Orbit within theirs, will appear to move sometimes flower, and sometimes swifter; now to be stationary, and now re-trograde; so the Motions of the Inferiors will appear to depend upon the Motion of the Sun, to whom they are so nearly joined as it were; and to us, that are in an Orbit so far without them, will appear to be equal to the Motion of that Great Luminary.

1. The San, Venus and Mercury, fingly confidered, are each affected with such an Inequality of Motion, that it is very rare for them all three, or indeed for any two of them, to agree in the same Degree of Velocity.

Indeed, if Venus and Mercury had no Motion of their own round the Sun, but kept an invariable Position with regard to him, it were reasonable to suppose, that they should move on almost equably, as the Sun doth. But fince that apparent Motion, with which they annually run through the Zodiac, is derived from a double Fountain, viz. from their own proper Motion round the Sun, which is not very unequable in it self; and from the Position of the Earth, which is continually various and changeable, in an Orbit that is without theirs; 'tis not strange that each of the Inferior Planets should appear to move unequally, and to go sometimes slower, and sometimes faster, by turns.

3. Although the Periodic Times of Venus and Mercury in the Ecliptic through the Course of also read the Billop's Congular, in which is the Declaration of his Conformity; and of all the Year are thus accurately equal to one anthis he must have two or three good Witnesses; other; yet the Periodic Times of Venus, if reckon'd T t

from any one present Position to the Sun, to a like subsequent one, if compared with the Periodic Times of Mercury in a like Position, will appear to be of a much longer Length.

For this Inequality of the Periodic Times, ac-

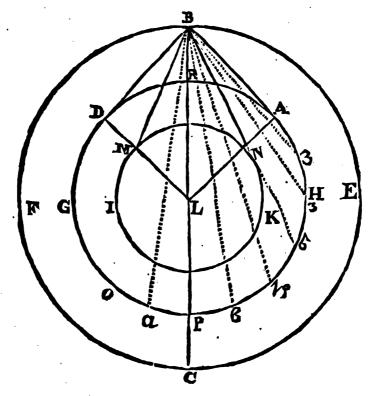

cording to the unequal Distance from the Sun, is agreeable to the established Law of the Heavenly Bodies: For Venus is nearer to the Sun than the Earth, and Mercury than Venus. Wherefore the Earth, and Mercury than Venus. Wherefore the Periodic Times of Venus, confidered in themselves, and with regard to the fix'd Stars, are not a little shorter than those of the Earth; and those of Mercury shorter than the Periodic Times of Venus. And though these Motions should be considered by a Spectatorat the Earth, he would find in them the same Inequality: For the Motion of Mercury

will be sooner, and oftner more fwift, than that of the Earth; and therefore their Periodic Times must be unequal.

4. These Inferior Planets are never either in Opposition or in Quadrature to the Sun; but always more near to him, than to occasion those Phenomena: For Mercury goes no farther from the Sun than about 28 Degrees, and Venus not above 48 Degrees; sometimes to the Eastward, and sometimes to the Westward. That neither of these Planets can come to be in Quadrature, much less in Opposition to the Sun, will be plain from the following Scheme.

Let the Circle BFCE be the Earth's Annual

Orbit; ADGH the Orbit of Venus; and NMK

that of Mercury. The greatest Elongation of Venus from the Sun is determined by the Acute Angle LBA, made by the Line BL drawn from the Sun to the Earth, and the Line BA, which is a Tangent, to the Orbit of Venus. In like manner the Acute Angle LBN will determine the greatest Elongation of Mercury from the Sun. the Quantity of these Angles, in a Proportion affign'd, may be had from the Semidiameters of the Orbits being found by Observation, and by Tri-gonometrical Calculation: Or, indeed, they will be discovered by Observation of the greatest Elongations themselves.

5. Our Modern Astronomers have observ'd, That Venus appears bigger when she begins to recede from the Sun towards the East, and when she is yet but a little distance from him; but, on the contrary, that she appears less in her Approach towards the Sun, and when she comes pretty near him: Whereas, when she recedes from the Sun towards the West, then she appears less; but when she approaches towards him again, she again appears larger. And the same things have I seen: But when she comes into the Position D,

been observed of Mercury, by the use of long and good Telescopes.

These Phenomena have quite overturn'd the Ptolemaic System of the Heavens, and may be accounted for thus: Since all the Planets, as well as the Earth, are Opake, Scabrous, and Spherical Bodies, reflecting every way from them the Rays of the Sun falling upon them; 'tis plain, that that Hemisphere of any Planet only, which is turned towards the Sun, will be enlightened; the other Half of it remaining in Darkness. And, fince also an Observer here can only see that Half or Hemisphere of any Planet, which is obverted, or turned towards the Earth, where he stands; if it be confidered what Part of Venus is enlighten'd by the Sun in her different Position or Situation towards him, and what Part is seen by an Eye at the Earth in its Annual Orbit BFCE; (See the preceding Fig.) it will be plain that Venus must appear least to us when she is in R; because, tho' she be then the most near to us possible, yet her obscure Hemisphere being towards us, there will be but very little of her enlighten'd part

then some part of her illuminated Disk will be turned towards the Eye in B; but a much greater part of her obscure or dark Hemisphere. And fince she is of a Spherical Figure, which to a distant Eye appears as a Plane, 'tis clear that the illuminated part of her Disk must appear in the form of Horns, turned from the Sun, or towards the West. And this is her Appearance when Venus is our Morning-Star, as she is commonly called. But this Planet moving on in her Orbit to G, very near one half of her illuminated Disk will become visible to the Eye at B; and, consequently, she will then appear in the form of an When she comes into the Position Half-Moon. O, more than half of her enlighten'd Hemisphere will be visible, and so she will appear Gibbose: And when she arrives at that part of her Orbit which P defigns, to an Eye at B, as before, she will appear, as we say of the Moon, at Full; that is, all her illuminated Disk will be visible. The same kinds of Phases Venus will put on, as she moves forward in her Orbit through Q, H, A; that is, in Q she will be Gibbose; in H like an Half-Moon; in A horned again; but her Horns will be turned a contrary way to what they were in D; that is, now to the Eastward, but still from the Sun: And this is her Appearance when she is the Evening-Star.

The same kinds of Phanomena belong to Mercury; respect being had to his particular Orbit and Period of his Revolution.

But here we must take care that we be not deceived by the general Confideration of her Phases only, so as to think that Venus will always appear brightest and largest in P, or in Q or O. The Appearance which Venus may seem to have in her Opposition, as it may be called in P, will be quite altered by her coming as near as she can to the Sun: And as to the Places O and Q, tho' Venus will shine with near a full Face ; yet she will be then so far from the Earth, that her Difsance from us will more than compensate for the Quantity of her Light: Wherefore you may expect to see her appear most bright and splendid when she is in D or A. For suppose her to move from Q to H; then will some part of her lucid Hemisphere be turned from us in B, and so cannot be seen; and yet the remaining luminous part comes still nearer to the Earth: And fince her Shining, or apparent Light, increases in a Duplicate Ratio, or as the Square of her Distance from us diminishes, her Light will be much more increased by her Approach to the Earth, than it will be lessened by our leeing less of her illuminated Disk. So also suppose her to move from H to A, or yet farther on ; here still the Quantity of her illuminated part decreases, but the duplicate Increase of her Approach to the Earth will yet But between A make her Splendour increase. and R, the Decrease of her visible Light will be greater than what her Access towards the Earth can compensate; and so her Light will continually diminish more and more, fill she will set Heliacally, and so become invisible. Thus also Heliacally, and so become invisible. while the Planet is moving from P towards Q. her Approach towards the Earth in B is inconsiderable, in comparison of the Parts of her illuminated Disk, which will be turned away from us; and, consequently, she will appear more obscurely in Q than she will in P: But between Q and H, and so towards A, her Approach to the Earth will Vol. II.

very much increase her Splendor, tho' less and less of her lucid Disk become still visible. And from the whole it is plain, that while she is moving in the Arch HA; the will appear brightest and largest.

6. The greatest Elongations of Venus, whether towards the East or West, are unequal, and must be express'd by an unequal Number of Degrees. And the same thing is also true of Mercury

This Phenomenon hath a double Original or Cause; for it depends on the Excentricity of the Orbits both of Venus and of the Earth. the Distance LA (in the former Fig.) of Venus from the Sun; or if LB, the Distance of the Earth from the Sun, be unequal; it cannot be, but that the Angle LBA, in the Triangle LBA, which is called the greatest Elongation, must al-so be unequal: And indeed both those Lines are subject to such an Inequality.

7. The same Directions, Stations, and Retrogradations, which we observe in the Course of the Superior Planets, are found to belong to these Inferiors; and with the same Circumstances of

Change.

For suppose the Earth, as before, in B, and immoveable there, and the Planet in P; itis then plain, that while the Planet moves Easterly from P to Q, to an Eye placed in B, it must appear Dires, or to move in Consequentia, as they speak; that is, according to the Order of the Signs: And so it will appear to do till it come to A. But yet, because the Arches P B, B y, I e, e Z, are equal; but the Angles that they subtend at B, are unequal; therefore the Planet will appear to move unequally through those Arches: For it will feem to move swiftest about P, and still slower and slower, the nearer it comes to A: And there it will begin to appear Stationary, or not to move at all: And while it runs over the Arch AR, it will meet with the former Lines $B \zeta$, $B \epsilon$, B J, $B \gamma$, and therefore must appear to be Retrograde, or to move backward, or in Antecedentia, as the Term is; that is, contrary to the Order of the Signs. Which apparent Retrograde Motion will continue till the Planet come to D; and then it will begin to be, or rather appear to be, Stationary again; and so on, as be-

And should you suppose the Earth, as it is, moving in the Orbit BFCE; when the Planet moves faster than the Earth, it will even then appear to be Direct; when at an equal Pace with it, Stationary; and when flower than it, it will appear Retrograde, as before; tho' the Times and Places of these Directions, Stations, and Retrogradations will not be the same, as if the Earth indeed flood still: As will be easily understood by a little Confideration of the Figure above; or by what is said on this Head under the Words Superior Planets in this Vol. II.

8. The Planes of the Orbits of the Inferior Planets being inclined to that of the Ecliptick, the same Phenomena will arise from thence in kind, as in the same Case of the Superiors; only it is worth taking notice of, that the Plane of the Orbit of Mercury making an Angle with that of the Ecliptick of very near 7 Degrees, he hath the greatest Latitude of any of the Planets; and there-Tt 2 fore fore will be subject to the greatest Anomalies of

9. It is sometimes, but rarely, observ'd of these two Inferior Planets, That their Bodies being interposed between us and the Sun, they appear like spots in the Plane of his Disk.

And 'tis plain, that this will happen whenever their Conjunction with the Sun falls on, or near either of the Nodes of their Orbits: Just as the Moon appears to eclipse or hide part of the Sun's Face, when her Conjunction happens in or near the Nodes of her Orbit.

INFINITEL'Y Infinite Fractions. In Phil. Collect. N. 3. Dr. Rihood proves that Infinitely Infinite Fractions, or all the Powers of Fractions, whole Numerator is 1, are all of them together equal to Unity, or to an Unite.

The Demonstration is Short and Universal. And from hence he deduces, by way of Corollary, that there are not only Infinite Progressions, or Progressions in Infinitum; but also, infinitely further than one kind of Infinity. That these Infinitely Infinite Progressions are not withstanding computable and aggregable into one Sum; and that not only into a Finite Sum, but into one so small, as to be less than any assignable Number. That of Infinite Quantities, some are equal, others unequal: That one Infinite Quantity may be equal to two, three, or more Quantities, whether Infinite or Finite.

INFINITE Series. In Vol. I. I have shewn that this Method of Infinite Series took its Rise from the Arithmetick of Infinites, and hath been pursued with wonderful Sagacity and Penetration by several of our Excellent Modern Algebraists. The Use of this Method in the Extraction of Roots I have, in some measure, shewn in the former Volume, from the Ingenious Mr. Ralphson and Mr. Ward: What here follows is more Universal; and is from Parsons's and Wastell's Arithmetick.

-A= to the Absolute Numb. in any Equation. n= to the Exponent of the highest Power. Let x =to Root or Quantity fought. N =any known Number taken at pleasure. n = an unknown Number.

1, p, q, r, s, &c. = to the respective Coefficients of the given Equation.

Then will N + n = x; and $x = x \times x^n = p \times x^{n-1} = q \times x^{n-2} = r \times x^{n-3}$ $x = x \times x^n = x$, represent any Equation whatfoever.

And because N + n is supposed equal to x, such a General Equation may be thus expressed:

$$rac{1}{1} imes \overline{N+n}^n = p imes \overline{N+n}^{n-1} = q imes$$
 the fame Signs, and the others the Dividend, but with contrary Signs, as being to be transpos'd to the other fide of the Equation: Therefore first,

But to bring this into a Series, it is necessary sirst to prove, That every Power raised from a Binomial, (without regarding the Co-efficients) confists, or is composed of two Ranks or Series of Powers; one increasing from ""-", or 1, to ",

and the other decreasing from N" to N"-1 or 1; and each Member in one is multiplied into its corresponding Member in the other respectively; as may appear thus:

$$\overline{N + n^{2}} = \begin{cases}
NN \\
Nn \\
nn
\end{cases} = \begin{cases}
N^{n} \times n^{n-n} & \text{or i.} \\
N^{n-1} \times n^{n-n} & \text{twice} \\
N^{n-n} \times n^{n}
\end{cases}$$

Again,

$$\frac{1}{N+n^{3}} = \begin{cases}
\frac{NNN}{3NNn} & \frac{N^{n} \times n^{n-n}}{N^{n-2} \times n^{n-2}} \\
\frac{N^{n-2} \times n^{n-2}}{N^{n-2} \times n^{n}} & \text{thrice} \\
\frac{N^{n-2} \times n^{n-2}}{N^{n-2} \times n^{n}} & \text{thrice}
\end{cases}$$

And so it will always be ad Infinitum. Q. E. D. Hence these two Corollaries.

That the Co-efficient of the second Term in any Power raised from a Binomial, is always = n the Exponent of the highest Power.

That the Root or Side of n" the unknown Quantity is always multiplied into the second Term of the known.

Now from the latter, it is evident we are (in this Case) but to make use of the two first Members of the Power of such Binomial; and by the first we may express the Co-efficient of the second Term, by n the Exponent of the Power: Therefore the former Equation will now stand thus;

Now to find the Value of n, or the unknown Quantity, it is plain, that those Members into which it is multiplied, will be the Divisor with the same Signs, and the others the Dividend, but

$$n = \frac{A \pm i \times N^{n} \pm p \times N^{n-1} \pm q \times N^{n-2} \pm r \times N^{n-3}, \, \, \mathfrak{S}_{c}.}{i \times_{n} N^{n-1} \pm p \times_{n-1} N^{n-2} \pm q \times_{n-2} N^{n-3} \pm r \times_{n-3} N^{n-4}, \, \, \mathfrak{S}_{c}.}$$

Whic**h**

Which Theorem exhibits all possible particular ones, for extracting of Roots, according to the first fort of Mr. Ralphson's; agreeing exactly with them, as will be found on Tryal; always remembring that the Signs in the Dividend must be

contrary to those in the Equation, and in the Divisor the same respectively.

But N+n=x: Therefore secondly.

$$x = \frac{A \pm 1 \times_{n-1} N^{n} \pm p \times_{n-2} N^{n-1} \pm q \times_{n-3} N^{n-2} \pm r \times_{n-3} N^{n-3}, \&c.}{1 \times_{n} N^{n-1} \pm p \times_{n-1} N^{n-2} \pm q \times_{n-2} N^{n-3} \pm r \times_{n-3} N^{n-4}, \&c.}$$

Which gives us all those of the second fort univerfally: But in this Case the Signs both in the Dividend and Divisor will be the same as in the given Equation respectively: As likewise it may be proper to take notice, that if any Term be wanting in the Equation, the same must be omitted in either Theorem respectively.

duce any particular Theorem, for finding the Root happens (which always will, except where the of any given Equation; we need only confider, last Term is wanting) the Theorem is determined.

that $N^{n-n} = r$, or $\frac{N^n}{r^n} = r$, that Unity will neither multiply nor divide; as also that = 0, or N'' = 0, and any Quantity, Now from either of these rwo Generals, to de- multiply'd into o, is = 0; and when either Case

Therefore,

By the first General Theorem, By the second General Theor. Suppose any Equation, as - N 2 $x^2 = A$ · N* $\|$ find " $x' \pm px = A$

And after the same manner for any Equation whatfoever.

Thus having the particular Theorem, the Ap plication in either Case is as follows:

Let N be any Number taken at Pleasure, as be-

T be = Theorem, in which N must always be of its last Value found.

Then the Process will be of the

First General Theorem.

N the 1st. $\pm T = N$ the 2d. Then N the 2d. $\pm T = N$ the 3d. Then N the 3d. $\pm T = N$ the 4th. Then N the 4th. $\pm T = N$ the 5th, &c.

T = N the 2d. Then T = N the 3d. Then T = N the 4th. Then T = N the 5th, &c.

Second General Theorem.

the true Root fought, if it have one: But if it be a Surd; then the Value of N will proceed into an Infinite Series, but may be profecuted near-er the Truth than any affignable: Which Series, to be added to, or subtracted from the last Value each Operation, will proceed in Number of Places, in a Geometrical Progression; whose first Term is

Some of which Values of N will terminate in 11, and Ratio = 2, Viz. First 2, then 2, then 4,

then 8, then 16, then 32, &c. Places.
It is likewise observable, That the first Geneof N, (as it shall be affected with - or -) until N be = x fought. So the last converges by N itfelf, whose Value, at each Operation, shall grow nearer and nearer, until it be == to x fought.

We may also take notice, that though N be assumed never so far from the true Root, yet it will converge to it by renewing the Operation. But the Work may be much shortned, in case we point the given Equation (if it will admit of it) both in the absolute Number and Coefficients, according to their respective Degrees of Adsection: And take first 1, then 2, then 4, &c. of those Points, (from the first) each Operation: For it is evident, the Coefficients increase in their Powers, as the highest unknown Term decreases; therefore the absolute Number is of the same Power with the highest unknown Quantity.

One Instance may be sufficient to explain it: Suppose therefore this Cubic Equation were to be pointed;

Viz.
$$xxx + 25xx + 836x = 53297$$

Or $xxx + pxx + qx = A$.

Then it would be xxx + 25xx + 836x = 53297For the absolute Numb. is a Cube and are pointed Co efficients q a Square p a Lateral accordingly.

And the like Method for any other Equation, where it will admit of it.

Now to apply this last, we are to take the First Operation xxx + 2xx + 8x = 53Second Operation xxx + 25xx + 836x = 53297

And consequently the Value of the Coefficients as well as the absolute Number alters, so long as there are Punctations.

But by a few Numerical Operations, the said Notification, as well as the Method of the Process of each Theorem, will be further illustrated: Therefore,

1. Suppose xx = 2 = A. Seek x by the first General Theorem.

Then
$$n = \frac{A - A^2}{2N} = T$$
, and take $N = 1$;

Therefore I + T (=,5) = 1,5 = N the 2d. :: 1,5 - T (=-,083) = 1,417 = N the 3d. :: 1,417 - T (=-,002783) = 1,414217 = N the 4th.

: 1,414217 - T (= -, 000003437622) = 1,414213562378 = N the 5th = x.

2. Suppose xx = 2 = A. Seek x by the second General Theorem.

Then $x = \frac{A + N^2}{2N} = T$, and take N = 1, as be-

Therefore T = 1,5 = N the 2d. : T = 1,416 = N the 3d.

: T = 1,414215 = N the 4th. : T = 1,414213562373 = N the 5th.

By which it is evident; First, That both Theorems amount to the same thing; the Difference being only in the last Figure, which would be corrected the next Operation. Secondly, That x will proceed into an infinite Series, if a Surd. Thirdly, That each Operation gives double the Number of Figures of the last.

3. Suppose $x \times x = 2839,8241 = 1$. Seek x by Theorem 1.

Then
$$n = \frac{A - N^4}{3 N^3} = T$$
, and take $N = 10$.

Therefore 10 -T(=-3)=7=N the 2d. $\therefore 7+T(=+4)=7,4=N$ the 3d. $\therefore 7-T(=-1)=7,3=x$, the true Biquidratick Root fought.

4. Suppose xxxx = 2839,824t = 1, as before. Seek x by the second Theorem.

Then
$$x = \frac{A+3N^4}{4N^4} = T$$
, and take $N = 5$.

Therefore T = 5,6 = N the 2d. : T = 8,2 = N the 3d. : T = 7,4 = N the 4th.

: T = 7,3 = N the 5th = x = true Root

From which two last Examples it appears; First, That either Theorem will find the true Root, if it have one. Secondly, That it matters not, whether N be taken above or below the Root, nor how far from it.

5. Suppose
$$xx + 587x = 987459$$
 or $xx + px = A$. Seek x by Theor. 1. (i. e.) $n = \frac{A - N^2 - pN}{2N + p}$
= T.

Because of the Punctations we are to take,

1. Operation
$$xx + 5x = 98$$

2. $xx + 58x = 9874$
3. $xx + 587x = 987459$ And suppose $N = 8$.

Therefore 8 - T (= -, 2) = 78 = N the 2d. $\therefore 78 - T (= -3,4) = 746 = N$ the 3d. $\therefore 746 - T (= -3,34) = 742,66 = N$ the

 $T_{742,66} - T (=-,012689) = 742,647311 = x \text{ fought.}$

6. Suppose xx - 20x = 53482, or xx - px = A. Seek x by the second General Theorem.

Then
$$x = \frac{A+N^2}{2N-p} = T$$
, and take $N = 250$.

Therefore T = 241 = N the 2d.

.: T = 241,4 = N the 3d. .: T = 241,475 = N the 4th. .: T = 241,477860 = N the 5th. = xfought.

From these two last it is plain; First, That there is no absolute Necessity for Punctation. Secondly, That Punctation does nevertheles soorten the Work, where it can be done.

But

But I hope I have said enough to make the whole Matter, as well as the Manner, of Proceeding plain and easy to the meanest Capacity: And tho' I have given Numerical Examples no farther than an affested Quadratic, yet 'tis the same to any Degree of Power or Affection whatsoever; regard being had to its proper and particular Theorem.deduc'd from either of the general ones.

Theorem, deduc'd from either of the general ones. INFINITESIMALS, (18 some Writers call them) are such Quantities as are supposed to be infinitely small.

INFLECTION.

INFLEXION of the Rays of Light. Sir Isaac Newton, in his Excellent Opticks, Book 3. makes these Experiments and Observations on this surprizing Phanomenon.

- 1. That in a well darken'd Room, a Hole, whose Diameter was 25 of an Inch, being made with a Pin in a Plate of Lead, to let in the Sun's Rays; he found that the Shadows of Hairs, Threads, Pins, Straws, &c. placed in that Beam of Light, were very considerably broader than they ought to be, if the Rays of Light bad passed on by those Bodies in Right Lines: And for Instance, that the Hair of a Man's Head, whose Breadth was about the 280th part of an Inch, did, at the distance of 12 Foot from the Hole, and 4 Inches from the Hair, cast a Shadow which was a 60th part of an Inch broad, or four times its own Breadth; at 2 Foot from the Hair, the Shadow was ten times as broad as the Hair; and at the distance of 10 Foot, it was 35 times as broad. And he found, that it was not material, whether the Hair was encompassed with Air, or with any other pellucid Substance: For if the Hair were placed between polished Glasses, with Water between them, the Shadows were all one; as were also the Shadows of Scratches made on the Surface of polished Plates of Glass, and of the Veins of such Glasses: And therefore the great Breadth of these Shadows must arise from some other Cause than the Refraction of the Air. It is plain also from this Experiment, that the Rays are bent, and turned aside, in passing by the Hair, &c. and that the Hair acts on the Rays of Light at a good distance as they pass by it. And he shews, that the Action is strongest on the Rays which pass by at the least Distances, and grows weaker as the Rays are further from it.
- 2. He observed that the Shadows of all Bodies in this Light were border'd with 3 parallel Fringes of colour'd Light; whereof that next the Shadow was luminous. It was difficult to distinguish the Colours, unless the Light pass'd very obliquely on a white Paper, and then they exhibited Colours in this Order from the Shadows, wz. Violet, Indico, Pale-blue; Green, Yellow, Red; Blue, Yellow, Red; Pale-blue, Pale-yellow, Pale-red.

3. He took accurately the Measures of these Fringes, which he there gives in a Table.

And in the 4th Observation he shews, That the Breadth of the Fringes (when cast obliquely on a smooth white Body) seem'd to be in the Progression of the Numbers, $1 \checkmark 1$, $4 \end{cases}$; and their Intervals in the same Proportion with them; i. c. the Fringes and their Intervals together to be in the continued Progression of $1 - \sqrt{\frac{1}{2}}$, $\sqrt{\frac{1}{2}}$, or thereabouts.

- 5. The Sun shining into a darkened Room thro' a Hole tof an Inch broad, at 2 or 3 Foot from it, he placed a Sheet of Pastboard, black'd well all over; and which had in the middle a Hole about tof an Inch square for the Light to pass through. Behind the Hole, on the Pastboard, he sastened with Pitch the Blade of a sharp Knife, to intercept some part of the Light which passed through the Hole. Both Pastboard and Knife were placed perpendicular to the Rays of Light. Then placing the Pastboard so that all the Light fell upon the Hole in it, and part of it on the Blade of the Knife there placed, while the other Part went by the Edge; he let that part which passed by, fall on a white Paper, 2 or 3 Foot beyond the Knife; and there saw 2 Streams of faint Light shoot out both ways from the Beam of Light into the Shadows, like the Tails of Comets. Their whole Length, measured upon the Paper at the distance of 3 Foot from the Knife, was about 6 or 8 Inches; so that they subtended an Angle at the Edge of a Knife of about 12 Degrees.
- their Edges were parallel and look'd towards one another; so that a Beam of Light might fall on both, and some of it pass through between them. And when the Distance between their Edges was about the 400th part of an Inch in breadth, the Stream of Light that passed through parted in the Middle, and left a Shadow between the two Parts: And this Shadow was so black and dark, that all the Light which passed between the Knives, seem'd to be bent and turned aside to the one hand or the other. As the Knives approach'd, the Shadow between the Streams of Light grew still broader; till at last, on their Contact, the whole Light vanished. Hence I gather (saith he) that the Light which is lest bent, and goes to the inner Ends of the Streams, passes by the Edges of the Knives at the greatest distance: And this Distance, when the Shadow begins to appear between the Streams, is about the 800th part of an Inch: And the Light, which passes by the Edges at less Distances, is more bent, and goes to those Streams which are further from the direct Light.
- 7. The Fringes above thentioned also appear'd in this Experiment. And he gathers from this and the former Observation, that the Light of the first Fringe passed by the Edge of its Knise at a Distance greater than the 800th part of an Inch; and the Light of the two or three Fringes at still greater Distances; and consequently, that the Rays, which caused the Areams of Light, passed nearer to the Knives Edges than any other.
- 8. Two Knives, whose Edges were ground truly strait, were placed so (by sticking their Points into a Board, with their Edges towards one another) as to make an Angle of above 1°. 54. Here thro'a Hole, the 42d part of an Inch wide, the Beam of Light was let into the dark Room 3 which made the Fringe appear, at the distance of 10 or 15 Foot from the Hole, and on a Ruler held obliquely, at the distance of half an Inch from the Knives, parallel to the Edges of the Shadows, and without growing sensibly broader till they met in Angles equal so that made by the Edges

Edges of the Knives, where they met and join'd without croffing. But when the Ruler was plac'd at a much greater distance, the Fringes grew broader as they approached, and after meeting cross'd one another, and then grew yet much broader.

9. From hence he concludes, That the Distances at which the Fringes pass by the Knives are not increased nor altered by the Approach of the Knives; but that the Angles, in which the Rays are there bent, are much increased by that Approach: And also, that the Edge of the Knife, which is nearest any Ray, determines which way the Ray. shall be bent, and the other Knife increases the Flexure. In observing,

10. He found, that when the Fringes of the Shadows of the Knives fell perpendicularly on a Paper at a great distance from the Knives, they were in the form of Hyperbola's.

11. When he placed a Prism at the Hole (made with a small Pin) to refract the Light, he found that the Shadows of all Bodies held in the colour'd Light between the Prism and the Wall were bordered with Fringes of the Colour of that Light only in which they were held: And also, that the Fringes in the Red Light were largest, and those in the Violet, least. Wherefore, the Rays, which made these Fringes in the Red Light, pass'd by the Hair at a greater distance, than those which made the like Fringes in the Violet : And consequently the Hair, in causing these Fringes, alls alke on the Red Light, or least refrangible Rays, at a greater distance; and on the Violet, or most refrangible Rays, at a less distance; and by those Assistance disposed the Red Light into larger, and the Violet into smaller, and the Lights of intermediate Colours into Fringes of intermediate Rinnesses, anithant changing the Colour of any forth Bignesses, without changing the Colour of any sort of Light. When therefore the Hair, in the first of Light. and second Observation, being held in the common white Light of the Sun, cast a Shadow border'd with three Fringes of colour'd Light; those Colours ('tis plain) did not arise from any new Modifications impress'd on the Rays of Light by the Hair, but only from the various Inflections whereby the several sorts of Rays were separated from one another; which before Separation, by the Mixture of their Colours, compoled the White Bean of the Sun's Light; but, whenever separated, compose Lights of the several Colours which they are originally disposed to exhibit. And this mightily confirms his Doctrine and Theory of Colours, as indeed all kinds of Experiments and Confiderations do. See Colours.

These wonderful Properties of the Infiction of the Rays of Light are caused by a Body acting at a distance on the Rays; and yet this Action of Infiction is the stronger, the less such distance is: So that perhaps the Attraction which causes it don't exert its Sphere of Activity beyond such a distance. The Rays of Light also themselves, as they differ in Refrangibility, are diversly inficted, and separated into those three Fringes of Colours mention'd by Sir Is. Newton in his excellent Opnicks, Lib. 3. and before observed by Grimalius to arise from any small Bodies, such as Hairs, Wires, &c. placed in the Sun's Rays, let into a well darkned Room, by a very small Hole,

made only by the Point of a Needle in a Plate of Metal. And these Fimbrie, or colour'd Fringes, seem to be made by a kind of undulatory Motion or Inflection of the Rays, as they come near the Extremities of Bodies, the three different Colours of the Fringes arising from three such different Inflections.

INGENUITAS Regni, was formerly used to fignify the Freeholders, or Commonalty of the Kingdom, which were called Ingenui, Liberi, and Legales Homines: But the Word was not restrained only to Plebeians; fince in the Reign of Hen. I. it was given to the Chief Barons.

INGENUOUS, in the Civil Law Sense, is one that was born of a Woman that was made Free any time after his Conception, and before his Birth.

IN Groffe, is a Term in Law for what belongs to the Person of any Lord, and not to the Manor, Lands, Sec. as a Villain in Groffe, an Advow-som in Groffe. &c.

fon in Grosse, &cc.

INHOC, the same antiently with what is now in the North called an Intock; and in Oxfordsbire, a Hitchin, or Hitching; being an Out-part or Corner of some common Field plow'd up and sow'd (usually with Oats or Tares) and sometimes senced off with a dry Foot Hedge, and within that Year in which the rest of the Field lies fallow. It seems to be derived from in, within, and Hoke, a Corner.

INLAND, is an old Word found in Doems day and other old Books, and fignified that Part of any Land or Manor which lay next to the Mansion-House, and which was used by the Lord himself; whence it was called Terra Dominicalis, Demes in opposition to Utland or Outland, which was in Tenancy. These Inlands the Feudists call Terras Curtas, ac intra Curtem, Court Lands, or such as were appropriated to the Court or House of the Lord. So

INLANTAL, Inland or Demeine, was oppofed to Delantal, or Out-land, or Land-Tenanted.

fed to Delantal, or Out-land, or Land-Tenanted.

INMATES, are such Persons as are admitted (for their Money) to live in the same House with, and which go in at the same Door, jointly with others to whom the House belongeth; and which are not able also to maintain themselves. These are inquirable in a Court-Leet. See Kischin, Fol. 45.

Fol. 45.
INNATE IDEAS. Taking the Word Idea in the largest and most extensive Sense (see Ideas in Vol. II.) for whatsoever is the Object of our Understanding when we think; whether it be Phantasm, Notion, Species, &c. or whatever it is, the Mind can be employ'd about in Thinking.

ing.

The excellent Mr. Locke, in his most useful Essay on Human Understanding, hath plainly proved there are not any such things as Innate Ideas or Principles: Tho' some Writers will needs have such primary Notions, as have been called notal eviral, to be as it were Characters stampt on the Mind of Man, which the Soul receives in its very first Being, and brings into the World with it.

That which hath led Men into this Mistake, feems to have been, First, a Notion of the mighty Advantage of such Innate Ideas for the due Direction and Regulation of the Human Mind; and therefore 'tis reasonable to suppose our Gra-

cious Creator Thould have furnished the Nascent Mind with them: And, fecondly, that there are many Truths to which we pay so early and speedy an Assent, that they seem to be Innate, and interwoven as it were in our very Natures, and Hampt and impress'd originally on our Minds.

To the former 'tis easy to answer; That, if the fame Advantages will accrue to the Human Mind, from having a Power given it by God, by Study and Thought easily to gain such Notion or Principles; there is then no need of suppofing them Innate: And if this Power can and doth exert it self early and easily, and enables us to affent to the Truth of such neight Notions and Principles, as soon as ever the Terms expresfing them are understood, 'tis much more easy and natural to suppose the Power of obtaining them innate, than the Propositions and Notions themselves. Our Author might have thought it enough to Resute this Doctrine; by shewing (as he admirably and clearly doth) how we may attain to all the Knowledge we have, barely by the use of our natural Faculties, and without the help of any imnate Impressions: For it seems as unreasonable to attribute Truths to be owing to the Impressions of Nature and innate Characters, which we find we can gain by the Exercise of our Faculties; as to suppose those Colours to be muste in our Eyes; which on opening our Eyelids will be painted there from external Objects, by the Operation and Action of Light.

But because some prejudicate Notions have

long prevail'd per contra, and which one can hardly oppose without Censure, he gives us the Reasons at large, that made him doubt of the Truth of that received Opinion; which are in

fhort fuch as thefe.

That should they argue that there are certain Principles both speculative and prastical, which are universally agreed on by all Mankind: This doth not prove them innate, were it true in Fact, if another way can be assign'd how Men may come to such an universal Agreement in the

things they confent to.

But indeed there are none such, to which all Mankind give an universal Consent. If you take the Speculative Principles into view; such as, What soever is, is: "Tis impossible any thing should be and not be at the same time, &c. Though these have a settled Reputation as Musical and deserhave a settled Reputation as Maxims; and deservedly; yet are they so far from having an universal Affent from Mankind, that a great Part of it doth not so much as know them: As all Children and Idiots, and indeed every one that is not used to internal Reflexion, and abstratted Reasonings. But these have Souls; and these Souls have these Impressions, it seems, stampt upon them; only the Stamp cannot be seen; the Impression is there, but 'tis invisible; the Notion is there, but they don't know it; the Proposition is there, but the Mind is ignorant of its Truth! 'Tis plain therefore, 'is there to no purpose! Wherefore, he that hath a right Notion of the Wildom of GOD, will conclude it is not there at all.

If it be said, These innate Principles lie dormant and invisible there, till the Soul comes to the use of Reason; 'tis plain they were there before to no purpose: And if it be fully made appear, that the Exercise of our Reasoning Faculty will help us to them another way; 'tis highly probable they are

never so impressed, and innate, at all.

Vol. II.

And if our reasoning Faculties, assenting to the Truth of these Principles, as soon as we understand the Words they are express'd in; be an Argument that they are innate; it will prove too much: For it will conclude all other Propositions to be so too; which we consent to as soon as we understand the Terms: Such as two and two make four, &c. A Square is not a Circle; Redness is not Sweetness, &c. and ten thousand such others; to whole Truth the Mind, at first proposing, affects.

whole Truth the Mind, at first proposing, assents. Besides, no Proposition can be innate, unless their Terms are innate; or those Ideas which those Terms express. And as no one ever said that Words and Terms are innate; so in the whole Course of his Book Mr. Lock shews, how and after what manner both Simple, Compounded, and Abstract Ideas come into the Mind: And he shews, that the Notion of Principles being innate, came probably from hence: That there being abundance of plain and obvious Truths, to which the Mind pays a ready Allent as foon as the Terms that express them are understood, it was a much easier and shorter way for Men to suppose them innate there, than to trouble themselves about the Way and Manner of their coming into the Mind from without, by Observation and Expe-

INORDINATE Proportion, is where the Or-

der of the Terms are disturbed.

INSCRIBED Bodies: On Gunter's Sellor, are sometimes placed two Lines answering one another, and called the Lines of Inscribed Bodies, and are easily known there by the Letters D, S, I, C, O, T, which fignify the Dodecabedron, Sphere; Icossibedron, Cube, Ostabedron, and Tetrabedron.

The Uses of these Lines may be these.

- 1. The Radius of a Sphere being given, to find the Sides of the Five Regular Bodies inscribed
- 2. The Side of any of the Five Regular Bodies given, to find the Radius of the Circumfcribing Sphere.

If the Sphere be first given, apply its Radius over in the Points S, S, on each Leg of the Sector.

If any of the other Bodies be first given, apply its Side over between its proper Letters; so the Parallel taken between the Points of the other Bodies, shall be the Sides of those Bodies, and may be inscribed in the Sphere, whose Radius is the Distance between S and S.

INSCRIBED Hyperbola, is such an one as lies entirely within the Angle of its Assymptotes; as

the Conical Hyperbola doth.
INSECTIVOROUS Animals, are such as feed

on Insects: See Birds.

INSECTS, a kind of living Creatures so called by Aristosle and Pliny; because of their having certain Incisure, Cuttings or Indentings, in and about their Bodies. The Greeks called them Ersona. The Judicious, Mr. Ray-in his Methodus Insectorum thus distinguishes the several Kinds of

Insetts are (1.) either 'Auslaubeowla, or such as do not change their Form; Or, (2.) Merapospiinera; such as do really change their Form.

Thole

Those that do not change their Form are either (1.) "Arosa without Feet, or (2.) Pedata with Feet; and of these there are some Kinds that call their Skins.

Insies without Feet are either Terrestrial, or Land Infests, or Aquatick.

Terrestrial Insetts are either such as are produced on the Land, or in the Earth; and not in the Water; as the Lumbrici Terriftres; which are either of the larger fort, and are called Dew-Worms; or of a smaller fize: And of these there are Red and Green, with Yellow Tails: Which last are

commonly called Gilt-Tails.

Or such as are found in the Bowels of Animals: And of these some are found in the Intestines of Men; as (1.) the Lumbrici Teretes; (2.) Lumbrici Lati, which are called also Tania. (3.) Cueurbitini, which some will have to be only the Fragments of the Tania: (See Nich. Andri M. D. De Variis Vermium Speciebus.) (4.) The Ascarides, which are chiefly found in the Rettum.

Those Worms that are found in the Intestines of Beasts are of two sorts, the Oblongi and Pellu-eidi, of the thickness of a Horse-Hair; and therefore called Vermiculi Seriformes: And the Breves and Crassiores, which often are found in Horses, and are called the Bosss.

To this Genus of Terrestrial Insetts many Natural Historians refer Snails, whether with or without Shells.

Water Infests without Feet, not changing Form, are either of the

Greater fort, which have a peculiar way of moving, by first fixing their Head to the Ground, and then drawing up their Tail towards it, &c. Of these some are Teretes, round and smooth; of which are three forts; As the Medicinal Hirudines, or Leaches; the common Black-Horse-Leaches, and the Asp colour'd Sea-Leaches: But there is also a sort of this kind that is smaller and flatter, which is found sticking to Stones in the Bottoms of little Brooks.

Lesser sort, which have a different way of crawling or moving from the former. These also are either Round or Flat: Of the Round sort there is one that is Black, with two small Horns on its Head; and is found sticking to wet Stones in the watery Tops of Hills: And another, which is Red, of about a Fingers's length, with a Forceps at the Tail, found at the Bottom of Fish-Ponds and stagnant Waters.

The Flat fort are very small and thin, and are called Flukes; being sometimes found in Waters, and sometimes in the Branches of the Porus

Bilarius in Sheep.

Insects not changing Form, and having Feet, are either (1.) Hexapoda, with fix Feet; (2.) Octapoda, with eight Feet; (3.) with fourteen Feet; (4.) Polypoda, with many Feet.

Those that have but fix Feet are either,

1. Terrestrial; and these of a Larger kind; As (1.) The Yellowish Infect found in rotten decaying Oaks; (2.) The Black one on the Ground, called by Mouffet, Vermivorous; (3.) The Black one li- | Colour, found in Houses.

ving under Ground, with a Forceps at the Tail; (4.) A White fort, with square black Spots on its Back; (5.) The Farinarum, bred in Meal, of a whitish Colour.

Smaller fort: Some of which are found about the Bodies of Animals; As (1.) the Gmex, or Wall-Louse, of a stinking Smell; (2.) Rianus, the Tick; (3.) Pediculus, the Common Louse; (4.) Pediculus ferus seu Inguinalis, the Crab Louse; (5.) Pulex the Flea; of all which there are various kinds.

Others are not troublesome to Animals; 24 (1.) One that in Bignels and Figure resembles a Louse, but is very nimble and swift, and is found in Books and rotten Wood; (2.) Another there is with a very long Body, and a forcipitated Tail; (3.) The Black Infect, found often in the Flowers of the Chelidonium; (4.) A Subterra-neous fort, a little whitish; (5.) One that skips

like a Grashopper, but is much less.

2. Aquatick. As (1.) the Pediculus Marinus Grands, which adheres to Fishes; (2.) The Squilla Fluviatilis, with a Pyramidal Tail, and two Hairs, or Bristles at the End.

Insects not changing Form, and having eight Feet, are either with a Tail, as the Scorpion; or without, as the Spider; of which some spin no Web, have but two Eyes, and very long Legs, as the

Opilio, or the Shepherd.

Some do spin a Web; and of these they count three sorts: (1.) The Aranea Colcestrensis Abdomine tumido, subrotundo & elato; (2.) The Spider with the Thorax, or middle Part of its Body, as big as the Abdomen; (3.) The Spider with the long Abdomen, found among Reeds, Rushes,

2. The Ricini Octopodes, which are some more flat and compress'd; as the rambling Ticks that run o'er the Bodies of Animals, but don't fasten; and some more round and thick, which do ad-

here to the Skin. 3. The Syrones or Mites.

Insects not changing Form, and with fourteen Feet, and therefore by Mr. Ray called Teggapeguases narosia, are the Afelli: Of which there are three forts: As,

I. The Sea-Afellus; the longest and largest of all; living amongst the Rocks.

2. Asellus Lividus; which rolls itself up into a Ball. The Common Wood-Lice, Sows or Chess

Buggs.

Asellus Asininus, with a forked Tail, not rolling itself up. To this Species may be added the Afellus Marinus Figure breviorn, rolling itself up; (2.) Asellus Aquarum dulcium, with long Legs, and two Briftles on its Tail; (3.) Pulex Aquaticus, both in Fresh and Salt Water; (4.) Pediculus Aquaticus, which fastens upon Fish.

Insects not changing Form, with twenty-four Feet. These have the eight Fore-Feet lesser, and the sixteen Hinder ones larger. There are two kinds of them observ'd, both with long Bodies, one larger, and of an obscure Colour, among Rocks by the Sea-fides; the other of a Silver

There

There is a Kind with thirty Feet, of an oblong Shape, Chesnut Colour, and full flattish Body, usually lying under Logs and Trunks of Trees. 'Tis very agile and swift.

Insects not changing Form, with many Feet (called aroxivered) are some on Land; and either roundish in Body, with all their Legs rising out of the middle of the Belly (nearly) as the Julus; or more flat and compress'd, with their Legs not rifing as before from a Point in the middle of their Body, but growing along on the Sides; as the Scolopendra. And some of this Kind are

Aquatick; of which Mr. Ray makes three Differences: (1.) the Corniso Luggs, used for Baits in catching Fish, with 38 Legs, and a smooth roundish Body; (2.) The Scolopendra Marina, Corpore plano; (3.) Animalculum Bicorpor, or rather Bicaudatum, lying in the Clefts of Stones under the Salt Water.

Infects which do really undergo a Change of their Form are called Melapogospera; of which Swammerdam hath given the best Account: Tho' he shews that this Word is improperly used, fince there is by no means any real Transformation, but only an Explication of the Parts of the Animal, latent before in Miniature (as it were in the Ovum or Nympha, like the Plant in the Seed) and an Encrease of all the Parts by proper Degrees.

The first Species of Transmutation or Change (which Swammerdam makes the second) is Instantaneous; there being no sensible Rest or Stop between the Old and the New Form: And the Infects of this Order don't lose their Motion at the Time that they shift the Pellicula, at least not to Appearance. And Swammerdam describes the second Order of Change to be, when the Vermiculus (leaving the former Shape of the Nympha, with which it appeared in the Egg, and sub-fifted without Food) now beginning to feed, hath its Members or Parts visibly increased, and stretched out, and takes the Form of a new Nympha, which is not without Motion; and from thence becomes a Flying Insect. Of this fort are,

1. The Libella, or Perla, which are produced from an Insect of fix Feet, (vid. Mouffet, p. 322.) who takes it for the Pulex Marinus, as in the preceding Page he calls it the Locusta Aquatica. Out of the Crustaceous Skin, or Husk, of this Insect, the Libella breaks by a Fiffure, which begins between the Eyes, and is continued to the Roots of the Wings, and is there join'd to the Lateral

Fiffures.

2. The Cimices Silvestres, whose Characteristick Marks (according to Willoughby) are (1.) A long Proboscis, not spiral, but strait; (2.) Their uper Wings to the middle are thick, and like Leather; thence to the Ends thin and membranous; (3.) There is the Figure of St. Andrew's Cross on their Backs.

3. The Locusta; which Willdughby refers to the Insecta Αμεθαμόρφωτα.

4. The Grylli Campestres.
5. The Grylli Domestici, or Crickets.
6. The Gryllo Talpa, Mole Cricket.

The Cicada, or Grashopper.

8. The Blatta, according to Swammerdam.
9. The Tipule Aquatice, which run very swiftly on the Surface of the Water, and have a Vol. II.

Sting in their Mouths like the Cimices or Ticks. 10. The Scorpius Aquaticus, with a Sting also in its Mouth.

11. The Musca Aquatica; called by Androvan-

dus, Apes Amphibia. 12. The Hemerobius, or Ephemera, or Diaria, of Swammerdam.

13. The Forficula, or Auricularia. fet, p. 175.

The Second Species of Transmutation includes fuch Infells as undergo a double Metamorphofis, or Change of Shape.

I. Into a Chrysalis, or something analogous to

.. Into a Flying Infest.

These Kinds of Insects, a while before their Change, lie quite still without Food or changing Place; and in respect of their Wings are

1. Κωλεύπτερα, or Vaginipennia, as the Scarabai,

Beetles.
2. 'Aγίλυτες; whose Wings are open and expanded: And the Wings of these are either Farinaceous, as the Papiliones, &t. or Membranous, as the Apes, Musica, &c. and these are either Δίπτερα, with two Wings, or Τετράπτερα, with

four Wings.

The Scarabei may be divided (1.) In respect of their Horns, into the Nasicornis, Bucerota and Cervus Volans, or Taurus. (2.) In respect of their Antenna, they are of many kinds; of which the most eminent are those called Capricorni.
(3.) With regard to their Motion, as the Saltatrices. (4.) With regard to their Colour, as Cantharides.

To the Beetle Kind may be referred the

Cicindela, or Glow-Worm: The Staphylinus, called by Willoughby husineheomte-

Proscarabaus, or Oyl-Eeetle; so called from its emitting from its Joints a kind of Oyl, on its be-

ing pressed or squeezed.

The Anelytra, with farinaceous or mealy Wings, are called Papiliones, Butter flies; and these are either Diurnal, or Nosturnal, or the Pha-

The Specifick Distinction of the Diurnal is, that they always fettle with their Wings erect; are produced from an angulous Aurelia, and have their Antenna Studded (Clavata.) Of these there are about 50 kinds observed in England.

The Nosturnal Butterflies, or the Phalana, are vastly numerous; and cannot very clearly be methodized. But for Memory and Distinction's

fake they may be divided into,

1. The Geometrigense, which come from the Eruca, (called Geometra, from the manner of its Walk, which is Ansatini, by curling up its Back like the Handle of a Cup, &c.) with 8 or 10 Feet.

2. Such as come from Eruca, with 14 Feet. Of this Kind, which is very numerous, there hath been distinguished the Phalana Fasciata; whose Wings are in Patches or Area's of different Co-lours. Phalana Lineata, whose Wings are mar-Phalena Punctata; ked with transverse Lines. whose Wings are mark'd with one or more Points. And these excepted, all the others are distinguished into greater and lesser, and of a mid-dle size between both. One of the larger Kinds may be distinguish'd also by their inner Wings running out beyond the upper, when they fit or U u z

rest: And another by the Appearance of the Figure of Eyes upon the Wings: And a third, by their long Tails and narrow sharp Wings; which by some are called Phalene Predatrices, or Acceptatine.

The Anelytra, with membranous Wings, are Bees, Flies, Wasps, Bombylii, Crabrones, &c. And to this Kind the Culex Vulgaris (vid, Swammerdam, p. 95. Hist. Insects) or Gnat is referr'd; as also

the Formica, or Ant.

And hither must be referr'd such Water Insects as are cover'd by a Theca; according to the Observations of Willoughby. And these have either

1. An immoveable Theca, or Case, which is fixed to the Stones; and this Case is either of a round Figure, or of one more compressed and flat.

2. A moveable portable Theca; and these are commonly called Phryganea.

And this Theca is either,

1. Strait; and that either composed of Straws and little Festuca, lying parallel one to another; of which there are two kinds; a Greater, where the Festuca are two Inches long; and a Lesser, which is very common, and are called Straw-Worms: Or else the Festuca lie transversely, and are shorter; having sometimes pieces of Shells and Stones intermix'd with them. Others, whose Cases are strait also, have no Festuca; but always either Sand or Gravel. And of these, some have the Theca round, and are called Cod-Baits: Others are stat and compressed.

2. Crooked or Herned; which run tapering. Of these Mr. Ray reckons sour kinds; a greater and lesser Black fort, and a greater and lesser Ash-

colour'd one.

These all produce Flies with large Wings, like Butter-flies.

The Third Species of Transmutation is a fimple Change from a Vermiculus to a flying Insect; but yet with a sensible destine, Rest or Stop, between one Form and the other.

This Change Swammerdam thus describes:

"The Vermicle, excluded from the Egg, gets
Nourishment, by little and little, from without; and under that first Skin or Covering hath
its Members increased by degrees; not slipping
it, or putting it off, as other Vermiculi do when
they change into Numphe, but assuming the
Figure of a Numpha in it; For a time 'tis quite
motionless, till the superfluous Moisture is evaporated, and then in a few Days recovers its
Motion again; and then casting off this Skin,
which is as it were double, it becomes a Fie."

Of this Kind are our Flesh-Flies; and all the Nympha Vermifurmes; the Vespa Ichneumones, &c.

As to the Generation of Insects, Dr. George Gorden, in Philos. Transact. No. 237. from the Observations he had made about the true Origin of Caterpillars, concludes very well; (1.) That we ought not to believe that any Insects are bred of Corruption, and not ex Que, only because we cannot discorn the particular Manner of their Propagation; because there are and may be more full Discoveries made of that Kind accidentally, where the Process is not visible to the naked Eye. (2.) The Female Insects of all Kinds of Flies and Butter-slies do put their Spawn near

those Places where the Eruca's, which are hatched out of them, are to have their Food. '(3.) There is a kind of Gluten, by which the Female fastens her Eggs to the bearing Buds of Trees, &c. so that the Rains cannot wash them off. (4.) These Eggs will not be hurt by the greatest Frost.

Mr. Andry, in his Book De la Generation de Vers dans le Corps de l'Homme, Paris 8vo. 1700. takes notice, that the Ancients were mistaken in denying that Infests did breath, on the Account of their wanting Lungs: For modern Observations do convince us, that Insects have a greater Number of Lungs than other Animals. The Ancients thought also that Infests had no Blood, because many of them had no red Liquor like our Blood: But 'tis not the Colour, but the Use of the Liquor that is to be regarded. They of the Liquor that is to be regarded. believed also that Insets had no Hearts; whereas our Microscopes do now discover, that when Infects have several Lungs, they have also several Hearts; and in particular 'tis found that Silk-Worms have a continued Chain of Hearts, from the Head almost to the very Extremity of the Tail. And 'tis this Number of Hearts and Lungs that occasion those Insects to give Signs of Life a long while after they are divided into several He observes also that 'tis wrong to call Parts. Insects imperfect Animals, since they want no Parts either necessary or convenient for their use, and to render them compleat in their Kind.

Mr. Poupart affirms that the Earth-Worms and Round-tail'd Worms, which are found in the Intestines of Men and Horses, &c. also Snails and Horse-Leaches, are Hermophradites; but that such Worms as become Flies, and Silk-Worms, are not so, being of no Sex, but are Nests sull of real Animals, which we see in time come out with Wings. Histoire de l'Acadam. Royale des Sciences Anneé 1699.

INSINUATION of a Will, in the Civil, Law, fignifies the first Production of it, or the leaving it Penes Registrum, in order to his Pro-

INSTALLMENT, is a Settlement or fure Placing of any Person in his proper Place: See 20 Car. 2. Car. 2. Tis sometimes consounded in the Law with Abatement: The Word is chiefly used for the Induction of a Dean, Prehendary, or other Ecclesiastical Dignitary, into the Possession of his Stall, or Proper Seat, in the Cathedral Church

Church to which he belongs. 'Tis sometimes called Installation.

INSTAURUM, is used in old Deeds for a Stock of Cattle; and was commonly taken for the whole Stock upon a Farm; as Cattle, Waggons, Ploughs, and all other Implements of Husbandry. So Instaurum Ecclesia was used for the Books, Vestments, and Utensils belonging to a Church. And Instaurate Terra was Land ready stock'd with all things necessary for the Use of the Farmer. Instauratio is often used in this Sense by our old Historians and M.S.

INSTITUTION, is the Act of the Bishop, or one Commissioned to Act for him; whereby any Clerk is invested with the Spiritualities of a

Rectory or Vicarige.

The Clerk kneels down before the Bishop while he pronounces the Words of Institution, (Institute to Rectorem Ecclesia de A. B. cum Cura Animarum, & accipe Curam tuam & meam) and the Clerk holds the written Instrument, with the Episcopal Seal annexed, in his Hand during the Ceremony. But the Clerk must have Induction after this, without which be hath no Right to his Temporalities, if the Benefice be not a Donative.

Before the Clerk is Instituted, he must subscribe the 39 Articles of Religion, in the Presence of the Ordinary (or his Substitute:) And the Ordinary is not bound to Offer them, but the Clerk is to offer to Subscribe them; and he must Subscribe them without Reserve, Exception or Qualification, or else his Institution is ipso facto void and null; and the Church is still vacant.

At the same time the Ordinary requires the Clerk to subscribe the other 2 Articles mention'd in Can. 26. about the King's Supremacy, and

the Lawfulness and Use of the Liturgy.

The Clerk must also, before Institution, subscribe to that Part of the Declaration enjoin'd by the Act of Uniformity, 14 Car. 2. c. 4. Viz. I will conform to the Liturgy of England as by Law establish'd.

Before Institution he must also take the Oaths mention'd in the first Statute of William and Mary, c. 8. instead of the former Oaths of Allegiance and Supremacy, required by Stat. 1 Eliz. c. 1.

And then he must take the Oath against Simony, enjoin'd by Cam. 40. and the Oath of Canonical Obedience. All this before Institution.

And he is to have Certificates given him of his subscribing the Declaration, contain'd in the Act of Uniformity, in English, in a distinct Instrument, under the Hand and Seal of the Bishop; and of his other Subscriptions and Oaths in Latin.

The Clerk ought to have, by all means, Witnesses of his Institution, his taking the Oaths, making Subscriptions, &r. and therefore he should defire some present to write their Names on the Back of his Instruments; and make Mimorandums who they are, and where they live.

The Church, by Institution, is full, against all Persons but the King; and the Clerk by it may enser upon the Glebe, and take the Tithes; but he cannot Lett or Grant them; nor Sus for

them, if they are refused to be paid.

After Institution the Clerk is to receive a written Mandate from the Ordinary to the Arch-Deacon, or other proper Person, in order to his Induction; which see.

INSTRUMENTS. Besides the several useful Instruments, both Mathematical and Mechanical, which are described under their proper Names in this Volume and the former; I have at the End of this Volume given you the Figures and Descriptions of some others, which are not only very Curious and Accurate, but in a great measure also New and Non-descript.

INSULATA Columna, in Architecture, is a Pillar which stands alone, like an Island, as it were, in the vast Ocean of the Air. Evelyn's

Parallel.

INSULT, is a Word used in the Military Art, for attacking any Post with open Force, without using Trenches, Saps, or any common Approaches. 'Tis usual to Insuls thus the Countersfearp of any Place, that they may not give the Enemy time to fire their Mines, which they have prepared.

INSUPER, is a Word used by the Auditors of the Exchequer: In their Accounts they say, Somuch remains Insuper to such an Accountant: That is, So much remains due on such an Ac-

count.

INTAGLIO'S, are Precious Stones engraved with Heads of Great Men, or Inscriptions, &c.

fuch as are often fet in Rings, or Seals.

INTER Canem & Lupum, was an Expression formerly used for Twilight. In the North this is called in some places Day-light's Gate; and in others, betwixt Hank and Buzzard. In Herefordsbire 'tis called corruptly the Muck-Shade, i. e. Mock-Shade.

INTERDICT, was a Censure formerly inflicted by Bishops or Ordinaries in Times of Popery; forbidding all Sacraments and Divine Offices (except Baptism to Children, and the Sacrament of the Eucharist, and Extream Unction at the Point of Death) to be performed within any Parish, Town, Country, or Nation; and sometimes they prohibited them within such Places to be present at Divine Service in any other Place. This Censure was commonly insticted on a Pretence that the Privileges of the Church had been violated by the Lords, Magistrates, or Princes of any Place or Nation. In the Reign of our King John this Kingdom lay under a Papal Interdict for above six Years together: It began A.D. 1208. In our Common Law the Word

INTERDICTION is used also in the same Sense as in the Canon Law; where 'tis design'd to be Censura Ecclesiastica prohibens administrationem divinorum: And thus 'tis used 24 H. 8. c. 72. INTEREST. Besides the Ways of Com-

INTEREST. Besides the Ways of Computing Interest, both Simple and Compound, which you will find in Vol. I. I shall here give you another very plain, easy and ready Method, of Computing all Simple Interest and Discount; as also the Way to find the Amount or present Value of any Sum of Money; or of any Annuity, or other Yearly Payment, &c. for any Term, not exceeding an Hundred Years: And this from the Accurate and Useful Tables of Mr. John Smart, of the Town-Clerk's Office in London. And in order to this, the following Table of Shillings, Pence and Farthings, reduc'd to the Decimal Parts of a Pound, are previously necessary.

SITIETTES,

SHILLINGS, PENCE, and FARTHINGS, reduc'd to the Decimal Parts of a POUND.

s. d. Parts of a Pound. s. d. Decimal Parts of a Pound. s. d. Decimal Parts of a Pound. s. d. Decimal Parts of a Pound. s. d. Decimal Parts of a Pound. s. d. Decimal Parts of a Pound. s. d. Examples of the Use of the preceding Table.

What Decimal Part of a Pound is 7 d.? Look in the Table for 7 d. and even with it you will find .029167, which is the Decimal required.

What Decimal Part of a Pound is 17 s. 6 d.? You will find the Decimal of 17 s. to be .85, and the Decimal of 6 d. to be .025; which added, makes .875, and answers the Question.

What is the Value of this Decimal .09375 in Shillings, Pence and Farthings?

Look in the Table, and you will find it to be

1 s. 10 d. $\frac{1}{3}$.

Note, If you cannot find in the Table the exact Decimal fought for, take that which is nearest to it, and you can never err above half a Farthing.

Knowing thus the Use of these Decimal Tables, all the Bufiness of Simple Interest will very easily be understood and dispatch'd as followeth:

Simple Interest.

The Yearly Interest of any Sum of Money is had, by only multiplying the Principal Sum by the Hundredth part of the Rate of Interest: For the Product in Decimals is the true Answer.

Examples.

1. What is the Interest of 75 Pounds for one Year, at the Rate of 6 l. per Cent.?

75 = Principal.

.06 = the Hundredth part of 61.

1. is. d. 4.50 the Product; which is 4 10 00

2. What

2. What is the Yearly Interest of 157 l. 17 s. 6 d. at 5 l. per Cent.?

157.875 is the Decimal for 157 l. 17 s. 6 d.

7.89375 which is the Decimal answering to 7 l. 17 s. 10 \(\frac{1}{2}\) d. the Interest of 157 l. 17 s. 6 d. for one Year at 5 l. per Cent.

And so for any other Rate or Sum whatsoever.

When thus the Interest for one Year is found, divide it by 365; the Quotient will be the Interest for one Day.

Thus or being the Interest of one Pound for one Year; if you Divide that Decimal by 365 (continuing the Work as long as you please) you will have .00002739726028, &c. —— for a Quotient; which will be the Interest of one Pound for one Day; and at one per Cept.

Then will this Decimal .000027, &c. found as above; if you multiply it continually by the Principal, the Number of Days, and the Rate of Interest, become of itself an Interest Table for any Sum of Money, for any Time, and at any Rate.

Example.

What is the Interest of 150 l. for 365 Days, at 6 l. per Cent.?

:	.00002739	726028
-	4109589	04200 365
J	50000000	33000

9,0000000198000 Which Decimal gives the Answer near enough for any Use; to be 9 Pounds.

By the same Rule .02 Divided by 365, will give in the Quotient the Interest of one Pound for one Day, at a per Cost. and .03 Divided by 365, will do the same at 3 per Cent. And thus these Numbers following were found.

The Interest of one Pound for one Day, at all Rates, from 1, to 10 per Cent.

At 1 l. per Cent. is .000027397260 Sec. as above.

2 .000054794512
3 .000082191781
4 .00013698630
6 .000164383561
7 .000191780822
8 .000219178082
9 .000246575342
10 .000273972603

And when thus the Interest of one Pound for one Day, and at any Rate, is found; Then that Interest multiplied by 2, 3, 4, 5, 6, 7, 8, and 9, 8°c. gives the Interest of any Sum of Money, at the same Rate.

Take an Example at 3 l. per Cent.

And then 'tis easy to find, that the Interest of 11. being, as before, .500082, .c. That of

Because moving the Point of Separation still one Place nearer to the Lest Hand, multiplies any Decimal by 10, 100, 1000, &c. as is shewn under Decimals.

And thus the following Tables of Daily Inte-

The Reason of the Stars above, set to some of the Numbers, is only to shew that in the Contraction of a Decimal Fraction to sewer places, is is proper to add one to the last Figure retain'd, when the next Figure to it, which is omitted, exceeded 5.

INTEREST

INTEREST for One Day, at 3, 4, 5, and 6 Pound per Cent.

per Annum.

				At 5 l. per (1	Cent. per An.

The Use of the preceding Tables.

When the Interest of any Sum of Money is required for any Number of Days, multiply the Principal Sum by the Number of Days; and the Interest of that Product for one Day answers the Question.

For, the Interest of one Pound for one hundred Days, is equal to the Interest of one hundred

Pounds for one Day.

Example.

What is the Interest of 2651. for 438 Days, at 6 l. per Cent. per Ann.?

265 l. Multiply'd by 438, (the Number of Days) the Product will be 116070 l. the Interest of which Sum take out of the Table of 6 l. per Cent. thus;

The Interest for one Day of 100000 is 16.4384 10000 is 1.6438 6000 is .9863 70 is .0115

Principal 116070 Int. 19.0800

Answer 191. 1 s. 7 4 d.

And thus, by these Tables, the Interest of any Sum of Money, for any Time, and at any Rate of Interest, from 3 l. to 10 l. per Cent. per Ann. is readily found.

For the more easy finding the Number of Days, from any one time given, to any other, the following Table is made.

The Number of Days from any Day in any one Month, to the same Day in any other Month.

```
From January Febru. March April May June July August Septem. Octob. Novem Decem.

```

This Table shews the Number of Days, from any Day in any one Month, to the same Day in any other Month; as from the 1st, 5th, 10th, or 20th of May, to the 1st, 5th, 10th, or 20th of Nevember, is 184 Days: Which is thus known.

I find May at the Head of one of the Columns; and looking down that Column, I find

November, and even with it 184.

But if the Question is from the 5th of May, to the 10th of November, I must add 5; and the Number of Days will be 189. On the contrary, if it be demanded from the 10th of May, to the 5th of November, 5 must be subtracted, and the Number will be 179. And thus any Number of Days, not exceeding a Year, are found by Inspection.

If the Time exceed a Year; as from the 10th of May 1706, to the 10th of November 1707, add 365 to the Number found in the Table, and

the Answer will be 549 Days.

And as you may thus very easily, and accurately enough, solve all Questions and Cases of Simple Interest; so he next shews how to find the Discount of any Sum of Money for any Time, and at any Rute of Interest, thus.

1. To find the Annual Discount of one Pound, at 1 l. per Cent. Divide .01 by 1.01. If at 2 per Cent. Divide .02 by 1.02. At 3 per Cent. Divide .03 by 1.03, &c. and the Quotients will be the several Discounts required.

Thus the Discount of one Pound for one Year

1per Cent. .009900990099 2 - - .0196078431373 - - .029126213592 4 - - .038461538462 - - .047619047619 6 — — .056603773585 7 - - .065420560748 8 — — .074074074 - .082568807339 10 - - .09090909090909

And then the Discount of 1 l. being multiply'd by any Principal Sum, the Product will be the Annual Discount of that Principal.

Example.

What is the Discount of 100 l. at 6 l. per Cent. per Annum?

No. 5660, &c. being the Discount of 11. for one Year, at the Rate of 6 per Cent. as above; that multiplied by 1001. will produce 5.5660377, &c. Which Decimal being reduced, gives us 51.13s. 2 1d. and no more: And therefore that is to be look'd upon as the true Discount of 1001. at 61. per Cent. for one Year.

And yet nothing is more common, than to allow 6!. for the Discount of 100!. for a Year, at 6!. per Cent. But he that doth so, certainly wrongs himself: For he ought to receive so much Money as, at 6!. per Cent. Interest, will amount to 100!. in one Year, which less than 94!. 63. 9 \frac{1}{2} d.

will not do.

The several Discounts of 11, for one Year (as above) and at the aforesaid Rates, being divided by 365, will give the Discounts for one Day, at the same Rates; Viz.

The Discount for one Day at

1 l. per Cent000027126000
2000053720118
3000079797845
4000105374078
5000130463144
6000155078832
7000179234413
8 — .000202942669
9000226215911
10 :000249066002

And when thus the Discount of one Pound for one Day, and at any Rate, is found; if you multiply that by 2, 3, 4, 5, 6, &c. it will give the Discount of any Sum of Money whatsoever at the same Rate.

Examples at 3 per Cent.

The Discount for one Day of

```
11. - is - .000079797845

2 - - .000159595691

3 - .000239393536

4 - .000319191382

5 - .000478787073

7 - .000558584918

8 - .000638382764

19 - .0007979784555

100 - .007979784546

1000 - .079797845458

Ec.
```

And after this manner the following Tables of Discount are framed.

Vol. II.

Xx2

The Use of the preceding Tables.

When the Discount of any Sum of Money is required for any Number of Days, multiply the principal Sum by the Number of Days, and the Discount of that Product for one Day answers the Question.

Example.

What is the Discount of 265 l. for 438 Days, at 61. per Cent. per Annum?

265 l. Multiplied by 438, (the Number of Days) the Product will be 116070 l. the Discount of which Sum take out of the Table of 61. per Cent. thus;

```
The Discount for one Day of 100000 is 15.5079
                             10000 is 1.5508
                              6000 is
                                        .9305
                                70 is
                                        .0109
```

Principal 116070. Dif. 18.0001

Answer 181.

And thus by these Tables, the Discount of any Sum of Money, for any Time, and at any Rate, from 3 l. to 10 l. per Cent. per Ann. is found readily.

Compound Interest.

The Amount of any Sum of Money in any Number of Years, at Compound Interest, will be always had by the continued Multiplication of the Principal by 1.03, if the Rate of Interest be 3 l. per Cent. by 1.04, if 4 l. per Cent. by 1.06, if the Rate be 61. per Cent. &c.

```
So I.
                                     [1.03
                                                                     ist Year,
   1.03
                                      1.0609
                                                                     .2d Year,
            Multiply'd by 103, the 1.092727
   1.0600
  1.092727 Amount (at 31. per 1.127509 At the End of the 4th Year, 1.125509 Cent.) will be
                                     1.159274
                                                                     5th Year,
  J.I 59274
                                      1.194052
                                                                     6th Year,
  1.194052
                                     1.229874
                                                                    7th Year.
```

And thus Table the First, following, of the Amount of 1 !. is form'd.

The Present Value of any Sum of Money, payable at the End of any Number, is found by the Reverse of the former Method; viz. by the con- rest, is 3, 4, 5 or 6 l. per Cent.

```
.970874
                                                                           rst Year,
970874
                                    .942596
                                                                           2d Year,
942596 Divided by 103; the
                                   .915142
                                                                           3d Year,
.915142 present Value (at 31.4
888487 per Cent.) will be
                                   .888487 > Payable at the End of the 4th Year,
                                    .862509
                                                                           5th Year,
862609
                                    .837484
                                                                           oth Year,
1837484
                                   .813092
                                                                          , 7th Year.
```

And thus the Second of the following Tables may be form'd.

The Amount of any Annaity or other yearly Third Yearly Paym. 1.

Payment, in any Number of Years, at 3 l. per

Cent. per Ann. Compound Interest, will be found

3.6 thus:

Multiply the first yearly Payment by 1.03 (when as in this Case, the Rate of Interest is 31. per Cent. otherwise by 1.06, &c. whatever that be) and to the Product add the fecond Yearly Payment; which Addition will give the Amount in two Years: Multiply that Amount again by 1.03, 1.06, &c. and to the Product add the third yearly Payment; which Addition will give the Amount in three Years, &c.

Example of 1 l. per Ann. at 3 l. per Cent.

First yearly Payment 11. the Amount in 1 Year. Multiplied by 1.03

1.03 Second Yearly Paym. 1. Multiplied by 2.0909

3.0909 Amount in 3 Years. Multiplied by -- 1.03

3.183627 Fourth Yearly Paym. 1.

4.183627 Amount in 4 Years,

And thus the Third Table following is constructed.

The present Value of any Annuity, or other Yearly Payment, to continue any Number of Years, is thus found.

Find the present Value of that yearly Sum payable at the End of 1, 2, 3, 4, or 5, &c. Years by Division; as is above directed; the first of which Values will be the present Value of that Annuity, or Yearly Payment for one Year: The first and second of those Values ad-2.03 Amount in 2 Years, ded together, will be the present Value for two Years: The first, second, and third, so added, will give the Value for three Years, &c.

Ex.im-

Example of 11. per Ann. at 31. per Cent.

I find the present Value of 1 /. payable at the End of several Years, to be, as here under express'd.

Then the present Value of i l. per Ann. at 3 l. per Cens.

And thus the Fourth Table following is Form'd and Composed...

TABLĚ

TABLE I.

The Amount of One Pound in any Number of Years not exceeding 100, at the several Rates of 3, 4, 5, 6, 7, 8, 9, and 10 l. per Cent. per Ann. Compound Interest.

The

The Use of the preceding Tables.

The Amount or present Value of any Sum of Money, for any Number of Years, not exceeding 100, at any of the aforesaid Rates of Interest, is thus found:

Look in the first or second Table for the Number of Years, and even with that Number, under the Rate of Interest, is the Amount or pre-fent Value of 1 l. which Amount or present Value so found, being multiply'd by the principal Sum, the Product is the Amount or present Value requir'd.

After the same manner, the Amount or pre-fent Value of any Annuity, or other yearly Payment, is found by the third or fourth Table.

Examples.

Quest 1. What will 125 l. amount unto in 15 Years, at 5 l. per Cent. per Ann. Compound Inte-

In Table I. even with 15 Years, and under 51. per Cent. I find the Amount 2.078928 of 1 l. to be Which multiply'd by the Principal - - 125

The Product will be - - - 259.866, &c.

Answ. 259 l. 175. 4 d.

Quest. 2. What is the present Value of 2591. 17s. 4d. to be paid at the End of 15 Years, discounting at the Rate of 51. per Cent. per. Ann. Compound Interest?

In Table II. even with 15 Years, and under 5 l. per Cent. I find the present >.481017 Value of 11. to be

Which multiply'd by the Prin-

The Product will be -125.000, &c.

Answ. 125 l.

Quest. 3. What will 151. per Ann. amount unto in 21 Years, at 81. per Cent. per Ann. Compound Interest?

In Table III. even with 21 Years, and under 81. per Cent. I find the >50.422921 Amount of 1 l. per Ann. to be Which multiply'd by - -

The Product will be - -: -756.343815

Answ. 7561.65. 10 d.

Quest. 4. What is the present Value of 15 l. per Ann. for 21 Years to come, at 81. per Cent. per Ann. Compound Interest?

In Table IV. even with 21 Years, and under 81. per Cent. I find the 10.016805present Value of 11. per Ann. to be Which multiply'd by

The Product will be 150.252075

 $An \int w$, 150l. 5s. $0\frac{1}{3}d$.

Quest. 5. What will 1501. 5 s. 0 1 d. amount unto in 21 Years, at 81. per Cent. per Ann. Compound Interest?

In Table I. even with 21 Years, and). under 81. per Cent. I find the Amount >5.033834 of 11. to be

Which multiply'd by I 50.252

The Product will be - - -756.343, &c.

Answ. 756 l. 6 s. 10 l d.

Which Answer is the same with that given to the third Question, and shews the Agreement of the Tables one with the other.

Quest. 6. One baving the Lease of an Estate, Value 60 l. per Ann. more than the reserv'd Rent, 12 Years to come, would know what Sum ought to be paid, to add 28 Years to the Term, and thereby make it 40 Years to come, computing at the Rate of 61. per Cent. per Ann. Compound Interest?

I find in Tab.IV. the present Value > of 1 l. per Ann. for 40 Years to come, > 15.046297

of 1 l. per Ann. 101 40 101.

at 6 l. per Cent. per Ann. to be
I find in the same Table the Value

for 12 Years to come, 8.383844 at the same Rate, to be

> 6.662453 The Difference is - -Which multiply'd by -

> The Product will be - - 399.747180

Answ. 399 l. 145. 11 4d.

Quest. 7. A has the Possession of an Estate of 1001. per Ann. 15 Years to come, B has the Reversion of the same Estate for ever, after the Expiration of the said 15 Years. It is demanded, What is the present Value of A's Term of 15 Years? And, What the present Value of B's Reversion, computing at the Rate of 51. per Cent. per Ann. Compound interest? interest?

I find in the last Line of Table I find in the last some the Fee IV. under 5 l. per Cent. the Fee 2000. Simple of 11. per Ann. to be worth) 201. which multiply'd by 100, the Product is

I find in the same Table, the Value of 1 l. per Ann. 15 Years to come, at the same Rate, to be 10.379658; which multiply'd by 100, the Pro->1037**.965**8 duct is

> The Difference is 962.0342

Answ.1037 1. 19 s. 3 d. the Possess. 15 Ys. tocome. 9621. 01. 8 td. the Revers. after the said (15 Years. 2000 l. - - the Fee Simple.

Quest. 8. For a Lease of certain Profits for seven Years, A makes two Offers, either to pay 1501. as a Fine, and 300l. per Ann. or 1700l. Fine, wishout any Rent. B bids 650l. Fine, and 200l. per Ann. And C 2001. Fine, and 4051. per Ann.

The Question is, which is the best Offer, and what the Difference, computing at the Rate of 51. per Cent. per Ann. Compound Interest?

The Amount of 11. in 7 Years

1. s. d. at 51. per Cent. (in Table I.) multiply'd by 1501. is
The Amount of 11. per Ann. in

7 Years, at 5 l. per Cent. (in Table \$2442 12 00! III.) multiply'd by 300l. is

Therefore A's first Offer, at the \$2653 13 04

The Amount of 1 l. in 7 Years, at 5 l. per Cent. multiply'd by 2392 01 05 amount to in the same time

The Amount of 1 l. in 7 Years,

at 5 l. per Cens. multiply'd by

650 l. is

The Amount of 1 l. per Ann in

7 Years, at 5 l. per Cens. multiply'd

1628 08 00's

by 200 l. is

Therefore B's Offer, at the End 3 co o4

The Amount of 1 l. in 7 Years,

at 5 l. per Cent. multiply'd by

200 l. is

The Amount of i l. per Ann. in 7 Years, at 5 l. per Cent. multiply'd 3297 10 03 by 405 l. is

Therefore C's Offer, at the End 3578 18 08

The Amounts of the said Offers, at the End of the said Term, being thus known, look (in Tab. II.) for the present Value of 1 l. payable at the End of 7 Years, at 5 l. per Cent. which will be found to be .710682. Which said Value being multiply'd by the said several Amounts, the Products will be the present Value of the said several Offers, Viz.

l. s. d.
The present Value of A's 1st will be 1885 18 23
A's 2d 1700 00 00
B's - 1807 05 06
C's - 2543 09 08

Therefore the present Value of what Coffers is more than As 1st. 657 11 05
A's 2d. 843 09 08
B's - - 786 04 02

Which answers the Question.

Or thus;

A's 1st Offer is 300 l. per Ann. l. s. d. the present Value of which, for 7 1735 03 06 Years, at 5 l. per Cent. is

And a Fine of — 150 00 00

1885 18 93

A's 2d Offer is 2 Pine of 1700 00 00

Vol. II.

B's Offer is 200 l. per Ann, the present Value of which, for 7 1137 05 06 Years, at 5 l. per Cent. is

And a Fine of - 650 00 00

C's Offer is 405 l. per Cent. the

present Value of which, for 7

Years, at 5 l. per Cent. is

And a Fine of — 200 00 00

2543 09 08

Therefore C's is more than A's 1st 657 11 05
A's 2d 843 09 08
B's - 736 04 02

Quest. 9. A gives 1550l. for an Annuity of 100l. per Ann. for 99 Years. B put; 1550l. out at Interest. It is required to know, which will amount to the greatest Sum, at the End of the said 99 Years, at the Rate of 61. per Cent. per Ann. Compound Interest?

The Amount of 1 l. per Ann.

1. s. d.

in 99 Years, at 6 l. per Cent. (in 531827 03 06

Tab. III.) multiply'd by 100/l. is

The Amount of 1 l. in 00

The Amount of 1 l. in 99 Years, at 6l. per Cent. (in Tab, I.) 495149 05 51 multiply'd by 1550l. is

Therefore A's 100 l. per Ann.
will amount to more than B's 35677 18 of

Which answers the Question.

If the present Value of that Difference is required, find the present Value of 1 l. payable at the End of 99 Years, at 6 l. per Cent. (in Table II.) which multiply'd by the Difference, the Product will be the present Value thereof, viz. 111 l. 9 s. 2 d.

The prefent Value of the Difference is likewife thus found:

Pind the present Value of 1 l.

per Ann. for 99 Years to come
at 6 l. per Cent. (in Tab. IV.)

which multiply'd by 100 l. the

Product will be

1661 09 02

Which is the present Value of 1001. per Ann. for 99 Years, at 61. per Cent.

And from which subtract 1550 00 00

There will remain _____ III 09 0

Which is the present Value of the Difference.

Or thus:

The Interest of B's 1550 l. at 61, per Cent. is 93 l. per Ann. Therefore A receives 7 l. per Ann. more than B.

The present Value of 7!. per Am. for 99 Years to come, at 6!. It 6 06 6 per Cons. is

The present Value of 15501. to? 4 16 10 be paid at the End of 99 Years, is S

Therefore the present Value of } iri 09 03 the Difference, is

After the same manner, most other useful Questions in Compound Interest, are easily answerd.

INTERTIES in a Building, are those small Pieces of Timber that lie horizontally between the Sommers; or between them and the Sell or Realon.

INTERVAL of the Fits of easy Reflexion, and of easy Transmission of the Rays of Light, is the Spaces between every Return of the Fit,

and the next Return.

These Intervals Sir If. Newton shews how to colleft, and thence to determine whether the Rays shall be reflected or transmitted at their subsequent Incidence on any pellucid Medium. (See Light, &c. and Newton's Opticks, Book 2. Part 3.)

INTESTINES, are a long and large Pipe, which by feveral Turnings and Windings reaches from the Pylorus to the Anus: They are knit all along the Edge of a Membrane call'd the Mesentery, and are usually fix times as long as the Body to which they belong; that so the Chyle, which escapes the Lacteals of one of the Guts, may be taken up by those in the next. They have three Coats, of which the inmost is made up of short Fibres bound together by fine Blood-Vessels, and disposed as those of the Stomach: For the Length of a Fibre is the Thickness of the This Coat being much larger than the other, lies in Wrinkles or Plaits, which are call'd Valvula Conniventes. It hash also a great Number of little Glands, which in the small Guts lie in Clusters every where, but where they are knit to Liquor for the diluting of the thick Chyle, that it may the more easily enter the small Orifices of the Lacteals. The second Coat is made up of two Orders of Muscular Fibres, one running Araight, according to the Length of the Guts; the other goes round, describing rather a spiral than a circular Line. By the successive Motion of these two Orders of the Fibres, the Guts are in a continual Undulation; which is called the Vermicular or Peristaftick Motion of the Intestines. The third and external Coat is common, and comes from the Peritoneum.

The Intestines, the properly but one continued Pipe, yet are divided into fix Parts; three thin and small, and three thick and great. The thin and small are the Duodenum, the Jejunum, and Henn. Thick and great Gues are the Cecson, Colon, and Redum: See those Words.

INTESTINE Motion of the Parts of Fluids. Where the attracting Corpuscles of any Fluid are elastick, they must necessarily produce an Intestine Motion; and this greater or lesser, according to the Degrees of their Elasticity and attractive Forces.

For two elastick Particles, after meeting, will fly from one another (abstracting from the Resistance of the Medium) with the same Degree of Velocity that they met together with. (See Ela-flicity.) But when in leaping back from one another they approach other Particles, their Velocity will be encreased.

INTRENCHMENTS, are all Sorts of Works made to fortify any Post against an Enemy; There is usually a Ditch with a Parapet, or Rows of Fascines loaded with Earth, Gabions, Sand-Bags, or Hogsheads filled with Earth to cover the Men from the Fire.

INVADIATIONES, was a Term formerly used in the Law for Mortgages and Pledges: And

so Invadiare, was to Mortgage Land.

INVENTION, in Painting, Sculpture, & is the Art of finding out proper Objects for a Picture, by the Help of History or ancient Fables, &c.

INVENTIONES, was the Term formerly for what is now call'd Treasure-Trove, viz. Money or Goods found by any Person, and not challeng'd by any Owner: Which therefore by Common Law was due to the King (whence that old Rhyme used to this Day in many Countries by the Children, W bo bes loft? I have found,

In the King's Holy Ground.) And King Edw. I. we find, granted to the Barons of the Ports, Inventiones fuas per Mare & Terras,

INVERSE Method of Fluxions, is the Method of finding the Flowing Quantity from the Fluxion given; and is the same with what the foreign Mathematicians call the Calculus Integralis: On which Subject there is a Treatise publish'd in French by Mr. Carré, A.D. 1700, Printed at Paris.

Some call it Summatory Arithmetick; and the Reason and Foundation of it Mr. Hayes shews in

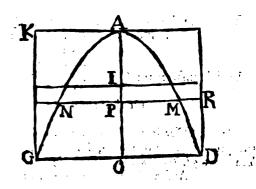

his Book of Flaxions.

He had, in Prop. 2. of his fourth Section, been shewing how to investigate the Area's of Hyperboliform Figures: And in Cor. 3. of that Proposition, he shews that 'tie manifest, that any Parabola, or the Complement of any Parabola, to the circumscribed Parallelogram; or an Hyperbola being given: And supposing the Ordinate (See Fig. 2. an-wer'd) PM = y; the Absciffa AP = x; PR = OD = b; the Axis OA = c: That all the PR, or b's are: to all the PM, or y's:: as m = 1: is

And if it be required to find what Proportion all the b's, advanced to any Power s, has to all the y's advanced to the same Power ", it may be

thus investigated.

Suppose the new Curve NG to be described, so that PN be always equal or proportional to PM or y", then it is manifest that the Sum of

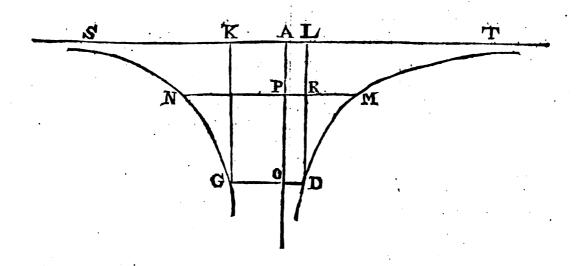

all the j' is equal to the Sum of all the PN, or to the curvilineal Space OAGN: And because y" is always equal or proportional to PN, and PN becomes equal to OG, at the same time

Digitized by Google

that y" becomes equal to b'' = OD|''; 'tis like-

that to investigate the Proportion of all the y" to wise manifest, that the Sum of all the b^n is equal all the b^n is the same thing as to investigate the or proportional to the Sum of all the OG, or the Parallelogram AOGK. Whence it appears, the Parallelogram AOGK. Which may be done

thus: In Paraboloids and Hyperboloids, the General Equation expressing the Nature of such Curves is y''' = x, and consequently y'' = xNow suppose y'' = z, then $z = x^m$, and z^m x", which is an Equation, expressing the Nature of a Parabolitorm, or Hyperboliform Curve.

Let the faid Curve be ANG, and AP = x, AO = c, PN = z, and OG = d. Then (Hayes, Sect. 3. Art. 90.) $\frac{m}{n} \pm 1 : \frac{m}{n} : (m \pm n : m)$ all the d: to all the z. And because z was put equal to y"; therefore when z or PN becomes OG or d, then y" becomes b"; and consequently d is = b^n ; therefore $m = n : m : S : b' : S : \overline{b}''$

Hence we may easily deduce the 64th Prop. Arith. Infinit. first discovered by the Learned Dr. Wallis.

CONSECTARY I.

1. For we found before $z = x^m$, and it is also $m:m+n::1:1+\frac{n}{m}::y^n:b^n$. in the direct Series, and $1:1-\frac{\pi}{m}:$ all the y'': all the b''. in the Negative Series. Whence it is evident, that if the Exponent of the Power of the intercepted Diameter x, be taken for the Index of the Series, it will be as I is to the Power of the intercepted Diameter or Index of the Series (because Vol. II.

z = y'' = x'''; and consequently, x''' represents y" in the Dimension requir'd) increas'd by Unity ; fo are all the y'' to all the b''.

CONSECTARY, II.

2. Hitherto we have found the Proportion of all the y", or (multiplying both by the Fluxion x) $y^n x$ to all the $b^n x$, their absolute Value may be found thus: It was by the preceding Corollary, $m: m \rightarrow n:$ all the zx: all the dx; that is, so is the Space AOGN, to the Rectangle AOGK = dc: Therefore $\frac{m dc}{m = n}$ = all the $z \stackrel{\sim}{x} = S : y'' \stackrel{\sim}{x}$, (because z = y''.) But b'' = d; Therefore $S: y^n : = \frac{m d c}{m - n}$ I cb"

CONSECTARY III.

3. And if we suppose the Index $\Rightarrow \frac{n}{m} = \Rightarrow \mu_{\bullet}$ then the Value of all the y" x is $=\frac{1 c b^n}{1 = u}$; and again, If in the Place of b" we substitute c + "(because $y'' = x^{\frac{1}{m}}$, that is, when y becomes $= b_{s}$

and x = c, $c = b^{\mu} = c^{+\mu}$) we shall have all the $y^{\mu} \dot{x} = \frac{c^{1+\mu}}{1-\mu}$.

CONSECTARY IV.

4°. Hence Mercator's Lem. Prop. 16. Logarithmotechn. may be deduced, upon which the Learned Dr. Gregory's Geometrical Exercise chiefly depends. For because all the y^* x are = all the $x^{\pm \mu}$ x, it is evident, that (rejecting the invariable Quantities, if there be any) all the $x^{\pm \mu}$ x $=\frac{c^1 \pm \mu}{1 \pm \mu}$ (by putting the greatest x=c) $=\frac{c^1 \pm \mu}{1 \pm \mu}$ Whence we have the Demonstration of the fundamental Rule in Summatory Arithmetick, to find the flowing Quantity of a given Fluxion.

CONSECTARY V.

be divided into an infinite Number of x, the Sum of all the Rectangles contain'd under any Power of the Absciffi x, and all the x respectively, that is, the Sum of all the $x \to \mu$ x, or the Flowing Quantity, whereof $x \to \mu$ x is the Fluxion, is equal to $\frac{c \to \mu}{1 \to \mu} = \frac{x \to \mu + 1}{1 \to \mu + 1} = \text{to the Power}$ of x increased by Unity, and divided by the new Exponent. And seeing the Thread of my Discourse has led me on to this Head, I shall infish more at large on the same in the next.

PROP. I.

To find the flowing Quantity of any Fluxion.

The summing up of Infinites, or finding the Sum of all the Fluxions of an unknown Quantity, or the finding the Flowing Quantity from its Fluxion given, is not less difficult in many Cases, than the Reverse is easy. I shall begin with the easiest Examples, and proceed gradually to those that are more intricate and difficult.

Example I.

Let it be required to find the flowing Quantity of this Fluxion aax, or aax^0x ; to the Index of the flowing Quantity add 1, and then we have $aax^{0+1}x$; divide this by the fluxionary Letter x, and by the new Index 0+1, or 1, the Quotient aax is the flowing Quantity of the given Fluxion.

Example II.

Let it be required to find the flowing Quantity of ayx + axy; the flowing Quantity of the first Member ayx is = axy; and that of the second Member axy is = axy: Whence it is plain, that the flowing Quantity of ayx + axy is = axy.

Example III.

Let it be required to find the flowing Quantity of $3 \times x \times x$; increase the Index of the flowing Quantity x by 1, and then we have $3 \times^2 x$, which divide by the new Index 3, and by the fluxionary Letter x, then the Quotient $= \frac{3 \times^2 x}{3 \times x} = x^2$ is the flowing Quantity of the given Fluxion.

And Universally;

If it be requir'd to find the flowing Quantity of $m x^{m-1} x$, increase the *Index* of the flowing Quantity x by 1, and then we have $m x^{m} x$, which divide by the new *Index* m, and by the fluxionary Letter x, and there will arise x^{m} for the flowing Quantity requir'd.

Example IV.

Let it be requir'd to find the flowing Quantity of $\frac{a \cdot x}{x \cdot x}$; the Fluxion (Hayes, Art. 16.) express'd by the other way of Notation, is $a \cdot x^{-2} \cdot x$, and the flowing Quantity thereof is $-a \cdot x^{-1} = \frac{-a}{x}$. Thus the Flowing Quantity of $\frac{a \cdot x \cdot x}{x^{\frac{3}{2}}} = \frac{a \cdot x}{x^{\frac{1}{2}}} = a \cdot x^{-\frac{1}{2}} \cdot x \text{ is } = 2 \cdot a \cdot x^{\frac{1}{2}}.$

Example V.

Let it be required to find the flowing Quantity of $\frac{-3x}{x^4} = -3x^{-4}x$. To the *Index* of the Power of the flowing Quantity add 1, and divide by the new Exponent, and by x, the Quotient is $= x^{-3} = \frac{1}{x^4}$ = the flowing Quantity required.

Example VI.

Let it be required to find the flowing Quantity of $\frac{x^2 x}{\sqrt{rx}}$; this Fluxion may be express'd thus, $r^{-\frac{\pi}{2}} \times x^{\frac{1}{2}} x$, and then the flowing Quantity thereof is $\frac{1}{5} r^{-\frac{1}{2}} x^{\frac{5}{2}} = \frac{2\sqrt[3]{x^5}}{5\sqrt{r}}$.

Example VII.

The flowing Quantity of $x \sqrt{2rx}$, or $x \times \sqrt{2r^2}$ is $\frac{1}{2} \times \sqrt{2r}$, $x^{\frac{1}{2}} = \frac{1}{2} \sqrt{2rx \times x}$, and the flowing Quantity of $x \sqrt{2rx - xx}$ is found by reducing $\sqrt{2rx - xx}$ to an infinite Series, and multiplying the same by x, and then finding the flowing Quantity of every Term.

Example VIII.

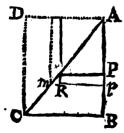

To find the Fluent of $a \times \sqrt{a \times - a a}$. In fuch Cases where the Fluxion is affected with a Vinculum, we must consider whether the fluxional Quantity, standing before the Radical Sign, be the Fluxion of the simple or compound Quantity under the Vinculum, for in such Cases the Fluent may be found by the General Rule.

Thus in this Example I observe, that $a \times is$ the Fluxion of $a \times -a a$, and therefore the Fluent of $a \times \sqrt{a \times -a a}$ or $a \times \times \overline{a \times -a a}$ is $\frac{1}{2} \times \overline{a \times -a a}$ $= \frac{2a \times -2aa}{3} \sqrt{a \times -a a}$.

In like manner the Fluent of $\frac{rx - xx}{2rx - xx^{\frac{1}{2}}}, \text{ or } \frac{2rx - xx^{\frac{1}{2}}}{2rx - xx^{\frac{1}{2}}}, \text{ or } \frac{2rx - 2xx \times \frac{1}{2}}{2rx - xx^{\frac{1}{2}}}, \text{ will be found (if to the Exponent } \frac{4}{2}, \text{ and by the fluxionary Quantity } \frac{2rx - 2xx}{2rx - 2xx}$ to be $\sqrt{2rx - xx}$.

These Rules may be demonstrated by Industion also; and because that Method, by particular Instances, may serve to give the Reader a clearer Notion of Summatory Arithmetick, I shall explain the same in the following Examples.

1. In the Rectangular Triangle ABC: Suppose AB = a, BC = b, AP = x, Pp = x, PM = y; then the Equation of the Triangle is

 $y = \frac{bx}{a}$, and the infinitely little Parallelogram Mp = to the Fluxion of the Triangle, is = yx

= (by Substitution) $\frac{b \times x}{a}$: And the flowing Quantity is $\frac{b \times x}{2a}$ = (putting $y = \frac{b \times x}{a}$) $\frac{x \cdot y}{2}$. it remains to be proved that the Sum of all the $y \times is = \frac{x \cdot y}{2}$.

Compleat the Parallelogram ABCD, then it is evident that the Triangle ABC is equal to the Sum of all the yx, and the Triangle ADC is equal to the Sum of all the xy. But both these Triangles are equal to the Parallelogram, and each is equal to $\frac{1}{2}$ the Parallelogram, and the Parallelogram is equal to xy; therefore all the $yx = \frac{xy}{2}$ = Triangle ABC.

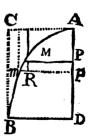

2. Let AMB be a Parabola, AP = x, PM = y, the Parameter = 1, then the Equation of the Curve is $x^m = y$, and the Fluxion of the Parabolick Space, viz. $MP = yx = x^m x$. Now it is evident, that the Sum of all those Parallelograms is equal to the Parabolick Space AMBD. And the flowing Quantity of $x^m x$ is $\frac{m}{m+1}x^{m+1} = \left(\text{putting } y \text{ for } x^m\right) \frac{m}{m+1}x$, which we must prove to be equal to the Sum of all the yx.

Compleat the Parallelogram ADBC, then it is manifest that the Space AMBD is equal to all the $y\dot{x}$, and the Space AMBC is equal to all the $x\dot{y}$. But by the Method of Tangents it is $\dot{y}:\dot{x}::y:t$; and $t\dot{y}=y\dot{x}$, and in the Parabola t=mx; ergo $y\dot{x}=mx\dot{y}$.

Whence
$$I = \frac{m x y}{y \dot{x}}$$
,

And $\frac{I}{m} = \frac{x \dot{y}}{y \dot{x}}$,

Adding I to each Side $\begin{cases} \frac{I}{m} + I = \frac{x \dot{y}}{y \dot{x}} + I \end{cases}$

That is
$$\frac{m+1}{m} = \frac{xy+yx}{yx}$$
.

Whence

Whence

$$m: m + 1::S: y : S: x y + S: y : ;$$
But
$$S: x y + S: y : = x y.$$
Therefore

 $m: m + 1::S: y \times : \times y$; And consequently

$$\frac{m}{m+1} \times xy = S: yx. \quad Q. \text{ E. D.}$$

And besides the Examples I have produced, there are others which occur, to which these Rules cannot be immediately applied; and that the Reader may not be at too great a Loss in such Cases, I shall endeavour to assist bim in that Particular. But first, It will be necessary to premise this.

LEMMA.

If a Binomial be to be rais'd to any Power, g. v. m, (which represents any Number, whole or broken, positive or negative) then the *Uncie* or Numbers presix'd to the several Terms are,

$$1 \times \frac{m-0}{1} \cdot 1 \times \frac{m-0}{1} \cdot \times \frac{m-1}{2} \cdot 1 \times \frac{m-0}{1} \cdot \times \frac{m-1}{2} \times \frac{m-1}{2} \times \frac{m-2}{3} \times \mathcal{E}_{c.} \text{ respectively.}$$

And if P + PQ represent the Quantity to be raised to the given Power; P the first Term, and Q the rest, divided by that first Term, and

 $\frac{m}{n}$ the Exponent of that Root or Dimension,

Then
A
B
$$\frac{m}{P+PQ^{n}} = P^{\frac{m}{n}} + \frac{m}{n} AQ + C$$

$$+ \frac{m-n}{2n} BQ + \frac{m-2n}{3n} CQ, \&c.$$

For Instance, if it be required to extract the fquare Root of rr - xx; that is, to raise (the Word raise being used indifferently for involving or evolving any Binomial) the Binomial rr - xx to the Power or Dimension, whose Exponent is $\frac{1}{2}$, then P = rr, $Q = \frac{-xx}{rr}$, m = 1, and n = 2; and consequently, $rr - x x | \frac{1}{2} = r - \frac{xx}{2r} - \frac{x^4}{8r^3}$ $-\frac{x^6}{16 r^5} - \frac{5 x^8}{128 r^7} -, \, \, \&c.$

Let it be required to raise the Binomial a +x to the Power whose Exponent is m, or let m be the Index of the Root of the Binomial, which is to be extracted. Then, P = a, $Q = \frac{x}{a}$,

fore
$$a + x|^m$$
 is $= a^m + ma^{m-1} x + m \times \frac{m-1}{2} \times a^m - 2x^2 + m \times \frac{m-1}{2} \times \frac{m-2}{3}$

$$a^{m-3} x^{5} + m \times \frac{m-1}{2} \times \frac{m-2}{3} \times \frac{m-3}{4}$$

$$a^{m-4} x^{4}, e^{n}c.$$

By the same Method any Trinomial, Quadrinomial, &c. or Infinito-nomial may be raised to any given Power, v. g. To raise the Infinite-nomial $a + bz + cz^2 + dz^3 + , &c.$ to the Power, whose Exponent is m. In the preceding Binomial Theorem,

Instead of x put bz+cz2+dz3, 80c. , and instead of x2 substitute b2+c2+d23, &c. 2 Then it is manifest that a+bz+cz +dz, &c. is $= a^m + ma^{m-1} \times \overline{bz + cz^2 + dz^3}, \mathfrak{Soc.}^{\dagger} + m$ $\times \frac{m-1}{a^{m-2}} \times \frac{bz+cz^2+dz^3}{bz+cz^2+dz^3} + m$ $\times \frac{m-1}{2} \times \frac{m-2}{3} \times a^{m-3} \times \overline{bz+cz^2+dz^3, \Theta c.}$ $+ m \times \frac{m-1}{2} \times \frac{m-2}{3} \times \frac{m-3}{4} \times a^{m-4}$ $\times \overline{bz+cz^2+dz^3}, \, \mathcal{C}_{c.}|^4 +, \, \mathcal{C}_{c.}$

Example I.

Let it be required to find the flowing Quantity of this Fluxion x $\sqrt{rr-xx}$. Reduce $\sqrt{rr-xx}$ to an (Hayes's Art. 93.) Infinite Series, and then $\frac{x^4}{rr - xx|^2} \text{ is } = r - \frac{xx}{2r} - \frac{x^4}{8r^3} - \frac{x^6}{16r^5}$ $-\frac{5x^2}{128r^7}$ —, &c. And consequently, x $\sqrt{rr-xx}$ is $= r\dot{x} - \frac{x^2\dot{x}}{2r} - \frac{x^4\dot{x}}{8r^3} - \frac{x^6\dot{x}}{16r^5}$ $\frac{5x^{2}x}{128r^{7}}$ —, &c. And finding the flowing Quantity of every Term of this Series, then the Sum of all the $x\sqrt{rr-xx}$ is $= rx - \frac{x^3}{6r} - \frac{x^5}{40r^2}$ $\frac{x^7}{112 r^5} - \frac{5 x^9}{1152 r^7} -, \&c. Q. E. I.$

Example II.

It is required to find the flowing Quantity of It is evident from the (Hayes's Art. 16.) Notation of Powers, that $\frac{rr}{r+x}$ is $= rr \times$ $\overline{r+x}$ But $\overline{r+x}$ is = (Hayes's Art. and $\frac{m}{n} = (n \text{ in this Case being} = 1) m; \text{ there.} 93.) <math>r^{-1} - \frac{x}{r} + \frac{xx}{r^2} - \frac{x^2}{r^4} + \frac$ confeconsequently $\frac{rr}{r+x}$ or $rr \times \overline{r+x}|^{-1}$ is = r $-x + \frac{xx}{r} - \frac{x^{2}}{r^{2}} +, \quad e. \quad and \quad \frac{rrx}{r+x}$ is = $rx - xx + \frac{x^{2}x}{r} - \frac{x^{2}x}{r^{4}} +, \quad e. \quad and \text{ the flowing Quantity of } \frac{rrx}{r+x}$ is $= rx - \frac{xx}{2} + \frac{x^{3}}{3r} - \frac{x^{4}}{4r^{2}} +, \quad e. \quad Q. \quad E. \quad I.$

And if we divide the Series (Examp. 1.) by $rr - xx|^{\frac{1}{2}}$ reduced to an infinite Series, and multiply the Divifor by the Quotient, we shall have $rx - \frac{x^2}{6r} - \frac{x^5}{40r^3} - \frac{x^7}{112r^5} - \frac{5x^9}{1152r^7}$ Sec. $\Rightarrow x + \frac{2x^3}{6r^2} + \frac{32x^5}{123r^4}$, Sec. $rr - xx|^{\frac{1}{2}}$

SCHOLIUM

And in general, If the given Fluxion confifts of Universal Exponents and Coefficients, reduce the Part under the Vinculum to an infinite Series, which multiply by the Part before the Vinculum, and find the flowing Quantity of every Term; Lastly, divide this last Series or the Fluent by the Part under the radical Sign affected, with any the most convenient Exponent, and multiply the said Part under the said Exponent by the said Quotient; so shall you have a Series expressing the Fluent of the given Fluxion, and readily shewing when and whether the Series confists of a finite Number of Terms or not.

The Fluent of a Fluxion involving furd Quantities, may be investigated after another manner, which is sometimes preferable by much to the former: The Principles of this Method are,

- 1. Reduce the given Fluxion to its simplest Terms.
- 2. Assume a new Equation adsected with indetermined Coefficients; so that reducing the same to Fluxions, the Terms of this may be compared with those of the given Fluxion, in order to determine the unknown Coefficients.
- 3. Having determined the assumed Coefficients, substitute their respective Values in the assumed Equation, and you have the Fluent of the given Fluxion.

Since this Method deserves the Reader's Consideration, I shall endeavour fully to explain the same;

and that I may not be misunderstood, I sball begins with some easy Examples.

Example I.

Let it be required to find the Fluent of ax $\sqrt{ax-aa}$, the Fluxion reduced to its simplest Terms is $ax \times ax-aa|^{\frac{1}{2}}$. Now suppose the Fluent of this Fluxion to be $A \times \overline{aa-aa|^{\frac{1}{2}}}$, then it is evident, that the Fluxion of this Fluent must be equal to the given Fluxion, i.e. $\frac{1}{2}$ $A \times ax \times \overline{ax-aa|^{\frac{1}{2}}}$ is $= a \times x \cdot \overline{ax-aa|^{\frac{1}{2}}}$. Therefore (dividing by $ax-aa|^{\frac{1}{2}}$) $\frac{1}{2}$ $A \times ax = ax$, and $A = \frac{1}{4}$. Having thus found the true Value of the indeterminate Coefficient A ($wx \cdot \frac{1}{2}$) in the assumed Equation, substitute the same in place of A, and then we have $\frac{1}{4} \times \overline{ax-aa}$ equal to the Fluent of the given Fluxion.

Example II.

To find the Fluent of $\frac{rx-xx}{\sqrt{2rx-xx}}$, this Fluxion is expressed thus, $rx-xx \times 2rx-xx$ | Suppose the Fluent thereof to be $A \times 2rx-xx$ | Then the Fluxion of this Quantity is $\frac{1}{x}A \times \frac{1}{2rx-2xx} \times \frac{1}{x} \times \frac{1}{x} = \frac{1}{x} \times \frac{1}$

Example III.

To find the Fluent of $dx' \times x + fx''$. Affirme an Equation with indeterminate Coefficients, so that reducing the same to Fluxions, the Terms thereof may be compared with those of the given Fluxion. Let the said Equation be Adx' - x + 1 + Bdx' - 2x + 1 + Cdx' - 2x + 1,

Sec. $\times e + fx'' = S: dx' \times \times e + fx''$

Then.

$$r - n + 1 \times Adx' - n \times + r - 2n + 1 \times Bdx' - 2n \times + r - 3n + 1 \times Cdx' - n \times + r - 2n + 1 \times Cdx' - n \times + r - 2n + 1 \times Cdx' - n \times + r \times + r \times Cdx' - n \times + r$$

Whence, supposing $\frac{1}{p} = m + 1$, and putting x = 1.

$$\overline{r-n+1} \times Adx^{r-n} + \overline{r-2n+1} \times Bdx^{r-2n} + \overline{r-3n+1} \times Cdx^{r-2n}, \Theta_{c}.$$

$$\times e + fx^{n} + \frac{1}{p} \times n \times Adf \times x^{r} + \frac{1}{p} \times n \times Bdfx^{r-n} + \frac{1}{p} \times n \times Cdfx^{r-2n}, \Theta_{c}.$$

$$\times e + fx^{n} + \frac{1}{p} \times n \times Cdfx^{r-2n} + \frac{1}{p} \times n \times Cdfx^{r-2n}, \Theta_{c}.$$

$$\times e + fx^{n} + \frac{1}{p} \times n \times Cdfx^{r-2n} + \frac{1}{p} \times n \times Cdfx^{r-2n} + \frac{1}{p} \times n \times Cdfx^{r-2n}$$

Which being order'd, we have

$$p \times r - n + 1 \times Adf$$

$$+ p \times r - n + 1 \times Ade$$

$$+ p \times r - 2n + 1 \times Bdf$$

$$+ p \times r - 2n + 1 \times Bdf$$

$$+ p \times r - 2n + 1 \times Bdf$$

$$+ p \times r - 2n + 1 \times Cdf$$

$$+ p \times r - 2n + 1 \times Cdf$$

$$+ p \times r - 2n + 1 \times Bdf$$

$$+ p \times r - 2n + 1 \times Cdf$$

$$+ p \times r - 2n + 1 \times Cdf$$

$$+ p \times r - 2n + 1 \times Bdf$$

$$+ p \times r - 2n + 1 \times Cdf$$

$$+ p \times r - 2n + 1 \times Bdf$$

$$+ p \times r - 2n + 1 \times Cdf$$

$$+ p \times r - 2n + 1 \times Bdf$$

$$+ p \times r - 2n + 1 \times Cdf$$

$$+ p \times r - 2n + 1 \times Bdf$$

$$+ p \times r - 2n + 1 \times Cdf$$

$$+ p \times r - 2n + 1 \times Cdf$$

$$+ p \times r - 2n + 1 \times Cdf$$

$$+ p \times r - 2n + 1 \times Cdf$$

$$+ p \times r - 2n + 1 \times Cdf$$

$$+ p \times r - 2n + 1 \times Cdf$$

$$+ p \times r - 2n + 1 \times Cdf$$

$$+ p \times r - 2n + 1 \times Cdf$$

$$+ p \times r - 2n + 1 \times Cdf$$

$$+ p \times r - 2n + 1 \times Cdf$$

$$+ p \times r - 2n + 1 \times Cdf$$

$$+ p \times r - 2n + 1 \times Cdf$$

$$+ p \times r - 2n + 1 \times Cdf$$

$$+ p \times r - 2n + 1 \times Cdf$$

$$+ p \times r - 2n + 1 \times Cdf$$

$$+ p \times r - 2n + 1 \times Cdf$$

$$+ p \times r - 2n + 1 \times Cdf$$

$$+ p \times r - 2n + 1 \times Cdf$$

$$+ p \times r - 2n + 1 \times Cdf$$

$$+ p \times r - 2n + 1 \times Cdf$$

$$+ p \times r - 2n + 1 \times Cdf$$

$$+ p \times r - 2n + 1 \times Cdf$$

$$+ p \times r - 2n + 1 \times Cdf$$

$$+ p \times r - 2n + 1 \times Cdf$$

$$+ p \times r - 2n + 1 \times Cdf$$

$$+ p \times r - 2n + 1 \times Cdf$$

$$+ p \times r - 2n + 1 \times Cdf$$

$$+ p \times r - 2n + 1 \times Cdf$$

$$+ p \times r - 2n + 1 \times Cdf$$

$$+ p \times r - 2n + 1 \times Cdf$$

$$+ p \times r - 2n + 1 \times Cdf$$

$$+ p \times r - 2n + 1 \times Cdf$$

$$+ p \times r - 2n + 1 \times Cdf$$

$$+ p \times r - 2n + 1 \times Cdf$$

$$+ p \times r - 2n + 1 \times Cdf$$

$$+ p \times r - 2n + 1 \times Cdf$$

$$+ p \times r - 2n + 1 \times Cdf$$

$$+ p \times r - 2n + 1 \times Cdf$$

$$+ p \times r - 2n + 1 \times Cdf$$

$$+ p \times r - 2n + 1 \times Cdf$$

$$+ p \times r - 2n + 1 \times Cdf$$

$$+ p \times r - 2n + 1 \times Cdf$$

$$+ p \times r - 2n + 1 \times Cdf$$

$$+ p \times r - 2n + 1 \times Cdf$$

$$+ p \times r - 2n + 1 \times Cdf$$

$$+ p \times r - 2n + 1 \times Cdf$$

$$+ p \times r - 2n + 1 \times Cdf$$

$$+ p \times r - 2n + 1 \times Cdf$$

$$+ p \times r - 2n + 1 \times Cdf$$

$$+ p \times r - 2n + 1 \times Cdf$$

$$+ p \times r - 2n + 1 \times Cdf$$

$$+ p \times r - 2n + 1 \times Cdf$$

$$+ p \times r - 2n + 1 \times Cdf$$

$$+ p \times r - 2n + 1 \times Cdf$$

$$+ p \times r - 2n + 1 \times Cdf$$

$$+ p \times r - 2n + 1 \times Cdf$$

$$+ p \times r - 2n + 1 \times Cdf$$

$$+ p \times r - 2n + 1 \times Cdf$$

$$+ p \times r - 2n + 1 \times Cdf$$

$$+ p \times r - 2n + 1 \times Cdf$$

$$+ p \times r - 2n + 1 \times Cdf$$

$$+ p \times r - 2n + 1 \times Cdf$$

$$+ p \times r - 2n + 1 \times Cdf$$

$$+ p \times r - 2n + 1 \times Cdf$$

$$+ p \times r - 2n + 1 \times Cdf$$

From which Equation the unknown Coefficient A, B, C, &c. may be determined in this manner;

$$p \times r - n + 1 \times Adf + n \times Adf = pd$$
And dividing by pd,
$$r - n + 1 \times Af + \frac{1}{p} \times n \times Af = 1,$$
Subflitting $m + 1$ for $\frac{1}{p}$,
$$r - n + 1 \times Af + m + 1 \times n \times Af = 1.$$

Whence $A = \frac{1}{r - n + 1 \times f + mn + n \times f} = \frac{1}{mn + r + 1 \times f}$

Secondly,

 $p \times \overline{r-n+1} \times Ade + p \times \overline{r-2n+1} \times Bdf + n \times Bdf = 0$,

And by Transposition, Division and Restitution.

Whence
$$B = \frac{n - r - 1 \times Ae}{r - 2n + 1 \times f + mn + n \times f} = \frac{n - r - 1 \times Ae}{mn + r - n + 1 \times f}$$

In like manner

$$C = \frac{\frac{2n-r-1 \times B_c}{mn+r-2n1 \times f}},$$

Whence it is evident that $Adx^{n-1} + Bdx^{n-2} + Cdx^{n-2} + Cd$

$$\frac{\times x^{r-2n+1} + \frac{d}{mn+r+1 \times f} \times x^{r-n+1} \times \frac{n-r-1 \times de}{mn+r-n+1 \times f} \times \frac{n-r-1 \times de}{mn$$

In which it may be observed, That the Exponents of the Terms of the Indeterminate Series $\begin{vmatrix} confist \\ r+1 \end{vmatrix}$ before the Radical Sign may be taken different from those above, provided that the Exponent of the first Term be not less than r-q-1, and that the following Exponents proceed regularly:

That the Exponents of the Terms before the Radical Sign may be continually increased or decreased by n; for in either Case the Terms of the Fluxion of this assumed Equation will become homologous to those of the given Fluxion : That when the Exponents increase regularly by , the Fluent will consist of a finite Number of Terms, when $\frac{r+1+m\pi}{n}$ is equal to a positive whole Number: And that when the Exponests decrease regularly by a, the Fluent will Fluent, we shall have

 $\frac{r+r}{z}$ is equal to a positive whole Number.

This General Theorem may eafily be applied to find the Fluent of any given Fluxion included

in the General one $dx' \times x \times \frac{1}{x} + \int x^{n} |$.

To find the Fluent of a x x ax - aa! the same equal to the General Fluxion, viz.

$$dx' x \times e + fx'' = ax \times \overline{ax - aa}^{\frac{1}{2}}$$
.
Then $d = a$, $f = 0$, $f = a$, $n = 1$, $m = \frac{a}{2}$, $e = -aa$; and if we substitute the said particular Values of d , r , f , n , m , e in the General Fluent, we shall have

$$\frac{d}{mn+r+1\times f} \times x^{r-n+1} + \frac{d}{mn+r+1\times f} \times \frac{n-r-1\times de}{mn+r-n+1\times f} \times x^{r-2n+1} + \frac{d}{mn+r+1\times f} \times \frac{n-r-1\times de}{mn+r-n+1\times f} \times \frac{2n-r-1\times de}{mn+r-2n+1\times f} \times x^{r-2+1} + \mathcal{S}_{c.} \times \frac{n-r-1\times de}{nn+r-n+1\times f} \times \frac{2n-r-1\times de}{mn+r-2n+1\times f} \times x^{r-2+1} + \mathcal{S}_{c.} \times \frac{1}{e+fx^{n}} = \frac{a}{\frac{1}{2}+1\times a} \times x^{n-1+1} \times \frac{1}{2} \times \frac{1$$

I have bitherto explained the General Methods of finding the Fluent of any Fluxion by help of Series's, and therefore shall not farther insist on these or other Methods invented for the same Purpose, but refer the Reader (who desires to have a fuller Account of them) to a late Learned Treatife, writ by that excellent Analyft G. Cheyne, M. D. and entitled Fluxionum Methodus Inversa.

Since the Business of Infinite Series is sometimes tedious and too perplex'd, several other particular Methods have been invented to find the slowing Quantity of a Fluxion. It shall suffice, in this Place, to give the Reader an Idea of them, which will become more plain and familiar by several other Examples, to be seen in their proper Places.

Example I.

Let it be required to find the Flowing Quantity of x \sqrt{2 r x - x x}. On the Center C, with

the Radius CB = r, describe the Semi-circle AMB, and suppose AP = x; then is PB = Vol. II.

2r = x, and $MP = \sqrt{2rx - xx}$, and $Pp \Rightarrow$ x; therefore the Fluxion of the Area, viz. the Parallelogram Mp is $= x\sqrt{2rx-xx}$, and consequently the Sum of all the $x\sqrt{2rx-xx}$, that is, the Flowing Quantity of the given Fluxion is equal to the Semi-segment AMP.

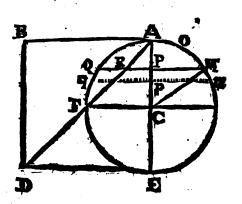

Example II.

Let it be required to find the Flowing Quantity of $\frac{r \times x}{2\sqrt{2r \times - x}}$. . Draw the Lines AM, Am, infinitely near each other, MP, mp, perpendicular to the Diameter AB, and MR perpendicular to Am; then by the Property of the Circle AM = Varx, and Rm the Fluxion thereof is Varz Now because the Triangles APM, MRm, are (the Angles AMP and MmR standing on equal Arches of the Circle) fimilar, it is PM ($\sqrt{2rx-xx}$): AP(x):: Rm $\sqrt{2rx} \times \sqrt{2rx - xx}$ and consequently the infinitely little Sector MAR $= \frac{1}{2}AR \times MR \text{ is} = \frac{r \times x}{2\sqrt{2r \times - x \times x}}$ given Fluxion: Whence it is evident that the Segment

Segment AOMA is the flowing Quantity of the given Fluxion.

Example III.

Let it be required to find the flowing Quantity of this Fluxion xx X 2 \sqrt{2rx-

the Center C, with the Radius CA = r, describe the Circle $\triangle FEM$; and suppose = x, PP = x, PE = 2r - x, the Circumference $\triangle FEM = c$; then, I say, that the Sum of all the xx $\times 2\sqrt{2rx-xx}$ is $=\frac{crr}{2}$.

Demonstration.

Let the Circle AFEM be the Base of an upright Cylinder, and the Parallelogram ABDE the Section of the Cylinder thro' its Axis, AB the Height of the Cylinder is equal to AE the Diameter of the Base. Draw the Diagonal AD, then a Plane passing through AD, and perpendicular than AD, and perpendicular than AD, and perpendicular than AD. lar to the Plane BE, will divide the Cylinder in two equal Parts, and cut off the Semi-quadrantal Ungula ADE. Now the Fluxion of this Ungula is equal to the Parallelogram Qm, multiplied into its Height PR or AP (because the Angle RAP is equal to 45° .) = xx x 2 \sqrt{2 rx --- xx; and consequently the Sum of all the $x \times x \times 2 \sqrt{2rx - xx}$ is (when AP becomes equal to AE, or $x \Rightarrow 2r$) equal to the Semi-quadrantal Ungula $ADE = \frac{rrc}{2}$. Q. E. I.

And thus innumerable Instances might be assign'd, to affift its in finding the flowing Quantity of any Muxion, without baving immediate Recourse to an Infusite Series.

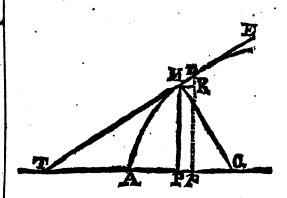

INVERSE Method of Tangents, is the Method of finding an Equation to express the Nature of a Curve in an Equation, express'd in the namest Terms. This depends on the Problem of find ing the fluent or flowing Quantity, by having the Rluxion given (of which fee the Inverse Method of Fluxions above given.) And the Art, of doing it Mr. Hayes (in Fluxions, p. 48.) shews after this manner.

At Page 33. he had shewn how to deduce Universal Rules for drawing Tangents to all forts of Geometrical Curves, when the given Equation expresses the Relation between the Ordinate and the intercepted Diameter. And therefore he states his 16th Proposition thus:

An Equation expressing the Value of the Subtangent of any Curve, in the nearest Terms being given: Tis requir'd to find the Equation expressing the Nature of the Curve.

t. What I mean by the nearest Terms will be

best explain'd by an Example. Suppose PT = s, AP = x, PM = y, MT = s, and let the Equation expressing the Nature of

the Curve be $y^2 + ayy = x^2 + bxx$; Then the Sub-tangent TP will be z = (Hayes, Sect. 10.

Art. 61.) $\frac{3y^3 + 2ayy}{3xx + 2bx}$. Now I call these Terms,

expressing the Value of the Sub-tangent, the nearest, because they immediately flow from the Equation of the Curve: But if this Value of the Sub-tangent be changed, by applying the Equation of the Curve; v.g. If we put $3y^2 = 3x^2 + 3bxx$

- 3a yy; and confequently:
$$=\frac{3x^2+3bxx-ayy}{3xx+2bx}$$
, fuch I call Remote Terms.

Now if the Value of the Sub-tangent be express'd in the nearest Terms, the Equation of the

Curve may be investigated in this manner.

Let the Curve (Hayes, Fig. Art. 77.) AMme
be described, and draw MT to touch the Curve in M; then suppose the Abscissa AP == x; the Ordinate PM = y, Pp = x, Rm = y; then because the Triangles mRM, MPT are similar;

therefore mR(y):RM(x)::PM(y):PT

 $=\frac{yx}{x}$. Put this Value of the Sub-tangent equal

to its Value given in the nearest Terms; clear the Equation of the Fractions, and find the flowing Quantity of each Term; so have you the Equation of the Curve.

Example I.

Let it be required to find the Equation of the Curve AMm, the Value of the Sub-tangent PT

being $=\frac{2ys}{3rr}$. The Sub-tangent PT is =

 $\frac{y \times}{y} = (e \times Hyp.) \frac{2y^3}{3rr}; \text{ therefore } 3rry \times = 2y \cdot y,$

and 3rrx = 2y'y: And substituting x for x,

and y for y: 3rrx Dzy3, and (dividing 3rrx by 1 the Exponent of x, and dividing 2 y2 by 3 the Exponent of y) $3rrx = \frac{1}{2}y^3$, and $9rrx = \frac{1}{2}y^3$, which divided by 2, we have $\frac{1}{2}rrx = y^3$, the Equation expressing the Nature of the Curve

Example II.

Let it be required to find the Property of the Curve AMm, the Sub-tangent PT being =

The Sub tangent P T is $=\frac{yx}{x}$ = (by Supposition) $\frac{2yy}{r}$; and therefore ryx = 2yyy, and rx= 2 yy, and (substituting x for x, and y for y) $r \times \square 2 y y$, and consequently (dividing $r \times$ by the Exponent of x, and 2 y y by 2 the Exponent of y) $r \times \square y y$, which shews that the Ourve of Mm is a Parabola.

Example III.

Let it be required to find the Property of the Curve AMm, the Value of the Sub-tangent PT being = $\frac{3y^3 + 2byy}{3xx + 2xx}$

The Sub-tangent PT is $=\frac{y \times x}{y} = \frac{3y^3 + 2byy}{5xx + 24x}$. Therefore $3 \times \times \times + 2 \times \times = 3 \cdot 3^2 y + 2 \cdot b \cdot y \cdot y$

But because this Method depends on that Problem, to find the Flowing Quantity of any Fluxions, with which the Reader is yet supposed to be unacquainted, I shall desist from prosecuting the same any further at present, and content my self to deduce the Solution of the present Proposition from the (Hages, Art. 61.) fixth preceding; this being nothing else but the Reverse of that.

That we may be able to proceed with the greater Certainty in this Enquiry, it will be neceffiry to observe from the forecited Place:

- 1º. The Sub-tangent s is always of one Dimension, and is express'd by a Fraction.
- 20. When the Value of the Sub tangent 16 expressed in the nearest Terms, then the Numerator of the Fraction confids only of those Terms wherein the Ordinate 9, (or the Tangent 5) is found.
- 3°. And if all the Terms of the Equation of the Curve be simple Terms, then the intercepted Diameter x never occurs in the Numerator; por the Ordinate y, Tangent s, or Curve z, in the Denominator.

Vol. II.

- . But if the Equation of the Curve contain mix'd Terms, then both-x, x, s and y may be found in both parts of the Fraction; but with this Condition, That the Fraction being reduced to an Equation, and all the Terms of the Equation being brought over to one fide, and every : changed into x, and every sinto z, every mix'd Term will be found as often as there are variable Quantities in the same. And the Coefficients, or prefixed Numbers, will be equal or proportional to the respective Exponents of the Powers of the variable Quantities.
- 5°. Whence it follows, that the Signs of the Terms, wherein the same variable Quantities occur, are the same, after a due Division by the prefix'd Numbers (or rather by the Exponents of the variable Quantities.)

Hence to resolve the Problem concerning the

Inverse Meshod of Tangents.

- 1°. Change every s into x, and every s into z (denoting the Curve) and transpose all the Terms to one fide of the Equation, and diligently observe whether all the Terms are Simple, or some Simple and others Mixt.
- 20. If all the Terms be Simp.e, divide every Term by the Exponent of the Intermediate or Flowing Quantity in the fame; so have you the Equation expressing the Nature of the Curve.
- 3°. And if there be any mixt Terms, then obferve (Hayes, Sect. 4, 5. Art. 78.) and let every Term containing the same variable Quantities be divided by the Exponent of the Power to which the respective Flowing Quantities are advanced, so that the same Term result from every such Division, and be as often found in the Equation as it has Flowing Quantities.
- 4º. Retain only one of those mixt Terms which occur more than once in the Equation, and mamage the other simple Terms according to Hages, Sect. 2. and there will arise an Equation expresfing the Nature of the Curve.

Example I.

Suppose: = $\frac{g_1 + ayg - bbg}{x + ax + bb}$; then (by Rule 1.) changing t into x, and transposing all the Terms to one fide of the Equation, we have $x^3 + a \times x + bb \times - y^2 - ayy + bby; and because all the Terms are simple Terms, there-$

fore (2.) $\frac{1}{7}x + \frac{1}{7}axx + bbx - \frac{1}{7}y^3 - \frac{1}{7}ayy + bby = 0$, which is an Equation expressing the Nature of the Curve, as was required.

Example II.

Let the Value of the Sub tangent be := $\frac{3y^3+2uyy-zxyy-xxy}{3xx+2xy+yy}$, then we have (by 1.) $3x^3 + 2yxx + yyx - 3y^3 - 2ayy + 2xyy + xxy$, and because we have the A a 2 mixt mixt Terms 2 y x x and yx x, also yyx, and 2 yyx each repeated twice, according to the Number of the flowing Quantities; therefore if one of them be divided by the Exponent of x, and the other by the Exponent of y, (3.) there will arise $y \times x$ $+ y y \times$ (by 4.) and dividing the simple Terms by the Exponents of the flowing Quantities in each respectively, the Equation expressing the Nature of the Curve will be x3 + yxx + yyx $-y_1 - ayy = 0.$

Example III.

And the Method is the same if the Curve z enter into the Value of the Sub-tangent, v.g. suppose 6ay122+4ay125+aay4 - yxx21-2yxx225 2 y x 23

change every s into x, and every s into z; and transpose all the Terms over to the same Side of the Equation, and then we have 2 yz3xx+yxxz1 + 3 yxxz1 - 6 ay1z2 - 4 ay1zz - a ay2. Wherein the Term yxxz1, containing three

flowing Quantities, is found thrice, and the Term ay: zz, containing two, is found twice: And because those mixt Terms being divided by the respective Exponents of the Powers of the flowing Quantities, the same Quotient always results; it is plain, that the Value of the Sub-tangent is given in the nearest Terms; and therefore the Equation expressing the Nature of the Curve will be $yz^3x^2 - 2ay^3zz - 2ay^4 = 0$: Or adding any determinate Quantity bb; $yz^3x^2 - 2ay^3zz$ $-1aay^4+bb=0.$

Hence it appears that a determinate Quantity may be added to the Equation of the Curve; which is plain from the direct Method of Tangents; because then when we investigate the Value of the Sub-tangent, all the Terms confishing of invariable Quantities are rejected and vanish: And this is sometimes absolutely necessary, v.g.

Suppose $s = \frac{-xy}{2x+y}$: then we have 2xx+yx + xy; and consequently xx+xy=0: And because this Equation has no true Root, therefore we must add a determinate Quantity, and then the Equation of the Curve may be xx +xy

COROLLARY.

Hence, if the Value of the Subnormal (Fig. Hayes, Art. 82.) P Q be given, the Property of the Curve may be found. For the Triangles QMP, MTP are fimilar; therefore QP: PM:: PM: PT;

and if PQ be = q, then $s = \frac{yy}{q}$. Whence the Equation of the Curve may easily be (Hayes, Art. 78, 79.) found.

The Property of the Curve may be investigated otherwise, thus: The Triangles mR M, QP M,

are fimilar; therefore MR (x): Rm (y):: PM $(y): PQ = \frac{yy}{x}$, and putting this equal to the

Value of the Subnormal given, the Property of the Curve may be (Hayes, Art. 77.) found.

Example,

Suppose $PQ = \frac{aax}{2yy}$; then is $\frac{yy}{x} = \frac{aax}{2yy}$, and

 $aaxx = 2y^3y$; and (substituting x for x, and y for y) $aaxx ext{ } ext{$

that the Curve AMm is a Parabola.

INVEST. To Invest, in the Law, fignifies to give Possession: And the Action of doing this, which is attended in different Places with different Ceremonies, Forms and Customs, is called

INVESTITURE.

INVOYCE, 12 Car. 2. c. 34. is a Particular of the Value, Custom and Charges of any Goods sent by a Merchant in another Man's Ship, and confign'd to a Factor or Correspondent in another Country

JOBENT Nails, are a smaller sort, commonly used to nail thin Plates of Iron to Wood.

JOINT-Tenants, are such as come to, and hold Lands or Tenements by one Title pro Indi-

viso, or without Partition.

These are distinguish'd from Sole, or Several Tenants; from Parceners, and from Tenants in Common: And anciently they were called Participes, and not Heredes: And these must jointly implead, and jointly be impleaded; which Property is common to them and to Coparceners. But Joint-Tenants have a fole Property of Survivorship, which Co-parceners have not: For if there be two or three Joint-Tenants, and one hath Issue and dies, then he, or those Joint-Tenants that survive, shall have the whole by Survivorship.

JOISTS, in Architecture, are such Pieces of Timber as are framed into the Girders and Summers, and on which the Boards of the Floor are

JOYNDER, in Law, is the coupling or joining of two Persons in one Action or Suit against another.

JOYSTS. See JOISTS. IRON. In the Forest of Dean in Gloucesterfoire, the best Iron Ore is of a bluish Colour, and is called Brush Ore: But this being melted alone produces a Metal very short and brittle: To remedy which Inconvenience they make use of Cynder, which is found in great Quantity where any old Works have been in that County: For in former Times, their Bellows being moved only by Hand, their Furnaces produced a Fire much less intense, than those they now employ: So that formerly they melted down only the principal Part of the Ore, rejecting the rest as useless. This Resule is the Cynder; which being mingled with the Ore in a due Quantity, gives it that excellent Temper of Toughness, for which this Iron is preferred before any brought from abroad.

The Ore is first calcined in Kilns, like ordinary Lime Kilns, which they fill up to the Top with Coal and Ore, S.S.S. Then putting Fire to the Bottom, they let it burn till the Coal be wasted. This is done without Fusion of the Metal, and serves to consume the more drossy Part of the Ore, and to make it friable. From hence they carry it to the Furnaces, which are built of Brick or Stone, about 24 Foot square on the Outside,

Outside, and near 30 Foot in Height. Within they are not above 8 or 10 Foot over in the middle, and the Top and Bottom have a yet narrower Compass; so they are almost of the Shape of an Egg. Behind the Furnace are placed two very large Pair of Bellows, whose Noses meet at a little Hole near the Bottom. These are compressed together by certain Buttons placed on the Axis

of a very large Oversbot Wheel.

The Furnaces are at first filled with Ore and Cynder, intermix'd with Fuel, which in these Works is always of Charcoal, laying them hollow at the Bottom, that they may the more easily take Fire. But after they are once kindled, the Materials run together into a hard Cake or Lump, which is sustain'd by the Fashion of the Furnace; and through this the Metal, as it melts, trickles down into the Receivers, where there is a Passage open, by which they clear away the Scum and Dross. Before this lies a great Bed of Sand, wherein they make Furrows of what Fashion they please, into which they let their Metal; which is made so very fluent by the Violence of the Fire, that it continues boiling for a good while. The Furnaces are kept at work Day and Night for many Months, still supplying the Waste of the Fuel and other Materials with fresh, pour'd in at the Top.

From these Furnaces they bring their Sows and Pigs of Irons (as they call them) to their Forges. These Forges are of two forts, tho' standing together under the same Roof: And one they call Finery, the other their Chafery. Both of them are on Hearths, on which they place great Heaps of Sea-Coal, and behind them Bellows, like the former, but not near so large. Into their Finery they first put the Pigs of Iron, placing three or four of them together behind the Fire, with a little of one End thrust into it; where softning by Degrees, they stir and work them with long Bars of Iron, till the Metal runs together into a round Mass or Lump, which they call an Half Bloom: This they take out, and giving it a few Strokes with their Sledges, they carry it to a great weighty Hammer, raised by the Motion of a Water-Wheel; where applying it dextroufly to the Blows, they presently beat it out into a thick short Square: This they put into the Finery again; and heating it red hot, they work it out under the same Hammer, till it comes to be in the Shape of a Bar in the middle, but with two square Knobs on the Ends. Last of all, they give it other Heats in the Chafery, and more Workings under the Hammer, till they have brought their Iron into Bars of several Shapes and Sizes. If they omit any one Process, it will be sure to want something of its Toughness, which they esteem its Perfection.

For the Backs of Chimneys, Hearths of Ovens, or the like, they take the melted Metal out of the Receivers in great Ladles, and pour it into Moulds of fine Sand. Philos. Trans. No 137.

At Miliborpe in Lancasbire they have several Sorts of Iron-Stone, some of it making Coldsbire-Iron; that is, such as is brittle when it is cold. Another fort makes Redsbire, which is such as is apt to break if it be hammer'd when't is of a dark red Heat; and therefore they are never melted down but in Mixture, and so they yield an indifferent good sort of Iron. They have of late made it much better than before, by melting the Sow-Metal over again, as likewise by using Turf and Charcoal; whereas formerly the Fuel was only Charcoal.

They first burn the Iron-Stone, and then for every seventeen Baskets of this burnt Stone they put in one of Lime Stone, unburnt, to make it melt freely and cast the Cynder, which they always take off from the melted Iron, before they let it run.

The Bottom of the Furnace is about two Yards square, and so rises perpendicularly for a Yard or more, which is also lined within with a Wall of the best Fire-stone, to keep off the Force of the Fire from the Walls of the Furnace. The Bellows, which are very large, and moved by Water, enter about the middle of the Focus: The rest of the Furnace is raised above this six or seven Yards square-wise, but tapering; so that the top Hole, where they throw in the Mine and Fuel, is but half a Yard square. When they find it to have subsided about a Yard and Quarter,

they fill the Furnace again.

Their Forge is much like that of a common Blacksmith's, about one Yard and half over, and of the same Height. The Hearth is all of Sow-Iron, much of the Shape of a Broad-brim'd Hat, with the Crown downwards. The hollow Place they fill and heap up with Charcoal, and lay the Oré (first broken into Pieces as big as a Pigeon's Egg) all round about the Charcoal on the flat Hearth, to bake it as it were, or neal it; thrusting it by little and little into the Hollow, and keep blowing for twelve Hours. Then they pull out a Stopple at the Bottom of the Wall, and out comes all the Glassy Cynder, being very liquid, leaving the Iron, which is never in a perfect Fufion, in a Lump at the Bottom: This they take out with great Tongs, and turn it under heavy. Hammers moved by Water, which at the same time beat off, or rather squeeze out the fluid Scorie or Dross, and after several Heats form it into Bars. They use no Lime-Stone, or any thing else, to promote the Flux. They get about 100 Pound Weight of Metal at one Melting, out of about three times as much Ore.

The Iron Mine in Suffex lies from four Foot deep to forty and upwards. There are several sorts of Mine, some hard, some gentle, some rich, some poor, some sine, some coarser. The Iron Masters mix different sorts of Mine together, otherwise it will not melt to so good an Advantage.

When the Mine is brought in, they take Small-coal, and lay a Row of that and a Row of Mine alternately, S. S. S. one above another; and fetting the Coals on Fire, therewith burn the Ore. This is done to mollify it, that so it may be broken in small Pieces, otherwise it would not melt in the Furnace, but come away whole: Normust it be over burnt; for then it will loop, as they call it, that is, run together in a Mass.

After 'tis burnt, 'tis beat into small Pieces with

After 'tis burnt, 'tis beat into small Pieces with an Iron Sledge, and then put into the Furnace, which is before charged with Coals, on the Top of which it is cast, where it melts and falls down into the Hearth in about twelve Hours more or less, and then 'tis run into a Sow.

This Hearth is made of Sand-Stone, as also its Sides round to the Height of about a Yard; and then the rest of the Furnace is lined up to the

Top with Brick.

When they begin upon a new Furnace, they put Fire for a Day or two before they begin to blow: Then they blow gently, and increase by Degrees, till they come to the Height in ten Weeks or more.

Every

Every fix Days they call a Founday, in which time they make 8 Ton of Iron; that is, if you divide the whole Sum of Iron they make by the Founday; or at first they make hels in a Founday, at laft more.

The Hearth, by the Force of the Fire cominarlly blown, grows wider and wider; so that if at first it contains so much as will make a Sow of 600 or 700 Pound Weight, at last it will contain so much as will make a Sow of 2000 Pound. The leffer Pieces of 1000 Pound, and under, they

Of twenty four Load of Coals, they expect eight Ton of Sows. To every Load of Coals, which confilts of eleven Quarters, they put a

Load of Mine, containing eighteen Bushels.

A Hearth, it made of good Stone, will ordinatily last forty Foundays or Weeks; during which time the Fire is never let go out. They never blow twice on one Hearth, tho' they go upon it but five or fix Foundays. The Cynder, like Stum, swims upon the melted Metal in the Hearth, and is let out once or twice before a Sow is caft.

The Manner of Working Iron at the Forge or Hammer.

In every Forge there are two Fires at least, which, as before is observed, are called, one the

Finery, and the other the Chafery.

At the Finery, by the Working of the Hammer, they bring it into Blooms and Anconies, thus: They roll the Sow at first into the Fire, and then melt off a Piece of about & of a hundred Pound Weight; which, as foon as 'tis broken off, they call a Loop. This Loop they take out with their Shingling Tongs, and beat it with Iron Sledges on an Iron Plate near the Fire, that so it may not fall in Pieces, but be in a Capacity to be carried under the Hammer; where it is beat very gently at first, only to draw Cynders and Dross out of the Matter: But afterwards they let out or draw more Water, and so by degrees beat it thicker and stronger, till they bring it to a Bloom; which is a four-square Mass, about two Foot long. This Operation they call Shingling the Loop. This done, they immediately return it to the Finery again; and after two or three Heats, and Working, they bring it to an Ancony, whose Figure is in the middle a Bar of about three Foot long, and of the Shape they intend the whole Bar shall be made of; but at both Ends is a square Piece left rough, to be wrought at the Chafery

Note, At the Finery three Load of the biggest Coals go to the making of one Tun of hom. At the Chafery they only draw out the two Ends suitable to what was drawn out at the Fi-

mery in the middle, and so finish the Bar. Note, One Load of smaller Coals draws out a

Tun of Iron at the Chafery.

At the Finery, they expect that one Man and a Boy should make two Tun of Iron in a Week; and at the Chafery, that two Men should take up, that is, make or work five or fix Tun in a Week.

One thing is remarkable here: They fay, That if into the Hearth where they work the Iron Sows (whether the Finery or the Chafery) you cast on the Iron a piece of Brass, it will hinder the Metal from Working, caufing it to spatter about

lo, that it cannot be wrought into a folid Piece.

Ray's Collect. of English Words, at the End. IRREGULARITY, in the Canon-Law, figmifies an Impediment, which will hinder a Per-son's going into Holy Orders, as being a Bestard, Maimed, Consensing to a Murder, &c.

IRREPLEVIABLE, in the Common-Law, fignifies what may not be Replevied, or let at

large, upon Sureties.

ISOCHRONAL LINE, is that in which a heavy Body is supposed to descend without any Acceleration. And the Excellent G.G. Leibnitz, in the AB. Erud. Lips. for Febr. 1689. hath a Discourse on this Subject; in which he shews, That an heavy Body, with a Degree of Velocity acquired by the Descent from any Height, may descend from the same Point, by an infinite Number of Isochronal-Curves, and which are all of the same Species, differing from one another only in the Magnitude of their Parameters; such as are all the Quadrato-Cubical Paraboloids, and consequently fimilar to one another.

He shews also there how to find a Line, in which a heavy Body descending shall recede uniformly from a given Point, or approach uni-

formly to it.
ISTHMUS, in Anatomy, is a Passage in that part of the Medulla Oblongata of the Brain, which lies between the Cerebrum and Cerebellum, and which reaches from the place called the Anus to the fourth Ventricle. The Upper Part or Cover of this Conduit or Passage, which is betwixt the Testes and the foremost Vermicular Process of. the Cerebellum, and to which two it is tied at its two Ends, and to the Processes that come from the Cerebellium to the Testes, at its Sides, is called Valenta Major: It is of a Medullary Substance; and its Use is to keep the Lympha from falling out above the Nerves in the Basis of the Skull.

ITALIAN Hours, are the 24 Hours of the Natural-Day, accounted on from the Sun-setting of one Day, to the same time again the next Day, as 'tis the Custom in Italy to do at this day,

and as the Jews did of old.

JUPITER. The Calculation of the Ecliples of Jupiter's Satellites, being a thing of great Use for determining the Longitude of Places on the Earth, I judg'd it necessary to insert the Manner and Method of it here, from Mr. Whiston's Prelectiones Astronomica, p. 219.

He takes for an Example an Eclipse of the first Satellite; because, both those Excellent Astronomers, Cassini and Halley, have shewn how to calculate that by proper Tables; and that the same Method will serve to find the Eclipses of the other Satellites of this Planet.

And he observes that these Cassinian Tables are formed after a new and accurate Method, and will give the Moment of the Eclipses in as new

and accurate a Way.

It is supposed there, That the Periodick Time of this first Satellite is precisely one 2448th Part of the Periodick Time of Jupiter from one A-phelion to another. Whence the Equations of the Jovial Orbit being turn'd in Minutes of Time, and adapted to those particular Revolutions of the Satellites, will make good the principal Parts of the Equation of these Eclipses. 'Tis to be observed also, that these Tables suppose the Aphelion of Jupiter to be in the Beginning of the 9th Degree of Libra; and that the Orbit of the Satellite is so little distant from the Plane of the Orbit of Jupiter, or also of the Ecliptick, that the Differences thence arising may usually not be taken notice of. Note also, That in the accurate Calculation of these Eclipses, there is need of another Equation, according to the various Position of the Earth to Jupiter. Which Resti-Position of the Earth to Jupiter. tution of the Position, suppose the Opposition of the Sun and Jupiter, contains 2252 Periods of this Satellite.

The first Observer of this Equation, Mr. Romer, afferts, That 'tis in its greatest Quantity 22 Minutes of Time; but Cassini saith it don't exceed 14 Minutes and 10 Seconds. The Cause of this Equation is the successive Propagation or Motion of Light; which is by no means instantaneous. And from this Fountain the Equations of the 225 Revolutions of the second Satellite, being respectively adapted, do compleat the second Parts of these Eclipses. But a little Table may also be added, shewing the Half-Stay of the Satellite in the Shadow of Jupiter, accommodated to the former Periods of 2448. For as Jupiter accedes to the Sun, the Shadow increases; and as he recedes from the Sun, it decreases. But this Equation is so inconsiderable, that it may most safely be omitted. There is added also, as there ought, a Tablet, shewing the Half Duration of the Satellite in the Shadow of Jupiter, according to the different Position of the Satellite with respect to the Nodes and Limits: For tho, as was said above, the Angle of the Inclination of the Plane of the Satellite's Orbit be not great, 'tis yet something: And therefore about the Nodes of the Orbit, the Immersion will be more direct and deep in the Shidow, than about the Limits: And these Tables, together with the common

one of the Equation of Time, and no other, according to Mr. Halley's Judgment, are to be used in the Calculation of the Eclipses of this Satellite.

In order to Calculation then;

1. From the Table of the Epoche of the Revolutions of the first Satellite to the Shadow of Jupiter (which you will find amongst the Astronomical Tables, under those Words in this Vol. 2.) find first the Year in the left Hand Column, and then write down the Numbers that stand against it, expressing the Days, Hours, Minutes, and Seconds of the Revolution; and also those in the other two Columns, N° 1, N° 2. Under these Numbers place also in their proper Order (from the next Table) those which belong to the Month and Day affign'd, with those also in the little Columns, N° 1, N° 2. And then add them all severally, as they stand in order, into one Sum. Then will the first of those Sums shew the middle Moment of the middle of the Eclipse: The second serves for the first Equation: The third finds the second Equation; that is, if you write down also in every Leap-Year, and in the Months of January and February, the Day next after the given one, instead of the given Day, with its Equations: For the Table accommodated, as it should be, to the greater Part of the Leap-Year; can't serve without Correction for the former Part of the Mar, before the interposed Leap-Year Day.

2. If the Number placed in the former Column, and appointed for the former Equation, be less than 1224 (the half of the greatest 2448) that greatest Number itself also, if it be needful, being, as the entire Circle, first omitted, go to the next following Table agreeing to that Equation, and add the Equation there placed to the middle Time of the Eclipse before found. If the Sum exceed the half of the greatest Number, subtract the Equation corresponding to it from the middle Time of the Eclipse: Then will the Sum in the former Case, and the Difference in the latter, give you the Time of the middle of

the Eclipse equated the first Time.

3. If the Number placed in the latter Column, and either increased by the eleventh Part of the former Equation, where the first Equation was found by Subtraction; or lessen'd by it, where it was gain'd by Addition; be less than 113, the half of the greatest Number 225.4 (that greatest also itself, where 'tis necessary, being quite rejected); Then take that very Number, or if it be greater than the same half, its Compliment to the greatest Number, and apply it to find the second Equation; and add the proper corresponding Numbers, taken out of the Table, to the first Equated Time of the middle of the Eclipse. So shall the Sum of both be the true Moment of the middle of the Eclipse. From which Moment of Time, if you subtract the Half Duration of the same Eclipse (taken easily out of the next following Table) you will have the Moment of the Immersion; if you add it to that Time, you will have the Moment of the Emersion, and both duly accommodated to the mean Time of the Eclipse.

And these sew Rules and Operations are sully sufficient for the Calculation of these Eclipses; only I shall add an Example to make all plain

and clear.

The Sum will be 26 20 49 51 p.m. for the Time of the next Emersion.

Which Eclipse being also invisible, add to the last Sum another Revolution.

D. H. 26 20 49 51 1 18 28 36

28 15 18 27 p. m. which will be the Time of the next visible Emersion of the Satellite in the Meridian of London.

And thus may the Times of the Eclipses of the Satellites of Supiter be calculated with great Exactness for the Meridian of any particular Place, and Tables made of them for any Time to come. And wherever, under any other Meridian, the exact Moment of the Eclipse of a Satellite can, by a good Telescope, be observed; the Time of its happening sooner or later than the Tables shew it will do, at London (suppose, or for any other Meridian) will shew how much the Meridian of the Observer is distant either East or West from the Meridian of London: That is, the Difference of the Longitude between these two Places will be known.

JURIDICAL Days, the same with Cours-Days.

JURISDICTION, is a Dignity which a Man has conferr'd on him to do Justice in Cases of Complaint made before him. Of this there are two Kinds; one, which a Man hath by reason of his Fee, of doing Right in all Plaints relating to his Fee, by Vertue thereof. The other is collated by a Prince to a Bailiff; which in a large Sense may fignify all such as have Commission from the Prince to give Judgment in any Case.

JUS Honorarium, or the Edists of the Pressors, was a Part of the written Roman Laws, and was what the Pressors, and such kind of Magistrates,

did propose by the Consent of the People.

JUS Retralles five Retrovendendi, in the Civil Law, is an Agreement between Buyer and Seller, that the latter and his Heirs may buy back the Goods or Wares again before any other.

JUSTICE. The Virtue of Justice is either Universal or Particular. General or Universal Justice is a constant giving to every one his Due; and this hath for its Object all Laws, both Di-Particular Justice, is a convine and Humane. flant Will and Defire of giving every one his Due, according to particular Agreement, or the Laws of Civil Society. Particular Justice, as 'tis exercised in Commerce, is usually called Commutative, and sometimes Expletory Justice, being directed without any Regard to the different Conditions of Men, but observes the simple Proportion, and is wholly bent on the Value or Price of Things, or what is really and justly due. But if you consider Particular Justice, as it is exercised in Governing, or in Beneficence, it is called Distributive or Attributive Justice; and is concern'd in the appointing of Rewards and Punishments, according to the several Conditions, Stations and Qualities of Men, according as they are more or less good or bad, useful or prejudicial, worthy or unworthy. And when there are many Claimers for Rewards, it observes a Comparative Proportion.

JUSTICE of the Hundred, was formerly the same with the Dominus Hundredi; called also Centurio, Centenarius, and Aldermannus.

JUSTICES of Labourers, were Justices heretofore appointed to redress the Frowardness of Labourers, that would either be Idle, or have unreasonable Wages.

reasonable Wages.

JUSTICES of the Pavillion, are certain Judges of a Pie-Powder Court, of a most transcendent Jurisdiction; anciently authorized by the Bishop of Winchester, at a Fair held on St. Giles's Hill, near that City, by Virtue of Letters Patents granted from King Edw. IV. See the Patents at large in Prynn's Animadv. on 4 Instit. fol. 191.

JUSTICES of the Peace, are they that are appointed by the King's Commission to preserve the Peace of the Country where they dwell. Of these some are made of the Quorum; because some Business of Importance cannot be dispatch'd (see Quorum) without the Presence or Assent of them, or one of them.

The Office and Power of the Justices of the Peace is very large and various, being founded on several Statutes; of which, see Fitzberbert, Lambert, Crompton, and in Smith de Repub. Aulor. lib. 2. cap. 9. They were called

Guard ans of the Peace till the 36 Edw. 3. cap. 12. where they are stilled Justices. Those that live in, and are Members of Towns, Corporations,

JUSTICE SEAT, is the highest Court that is held in a Forest, and before the Lord Chief Juflice in Eyre of the Forest, upon Warning given forty Days before; and then the Judgments are always given, and the Fines fet for Offences, that were presented at the Courts of Attachments, and the Offenders indicted at the Swain-Motes: See Manuood's Forest Law, C. 24.

Justices appointed by Edward the first, on great Disorders arising in the Kingdom, while he was absent in the Scotch and French Wars. Their Office was to make inquisition throughout the Realm, by the Verdict of substantial Juries, upon all Officers, as Mayors, Sheriffs, Bailiffs, &c. for their Breach or Neglect of Duty, in not punishing Bribery, Extortion, &c. 'Tis most likely they received their Name from a Bafton, or Stuff, that was the Badge of their Office, as it is of a Mareschal of France: And whoever was brought before them was Traile à Baston, traditus ad Bucu-JUSTICES of Traile Baston, were a kind of lum, brought to the Staff of Justice.

KAL

ALENDÆ, were formerly Rural Chapters, or Conventions of the Rural Dean and Parochial Clergy; so called, because they were held on the Kalends, or first Days of every Month; as at first every three Weeks: At last these Conventions came to be held only once a Quarter; and by Degrees have been wholly intermitted, to the great Decay of good Discipline. Parochial Antiquities, p. 640.

KALENDAR Month, is mentioned in 16 Car. a. cap. 7. and confifts of 30, or 31 Days (except February, which never hath more than 28 Days, excepting Leap-Year, and then has 29) twelve of which being those mentioned in the Kalendar, make a Year; which hence is vulgarly express'd in the Singular Number, and called a Twelve Month; But when in the Plural Number we say Twelve Months, then it shall be accounted a Month

of Weeks, which is but 28 Days.
KALENDAR. There is in Use still in Staffordsbire, among the common People, a very peculiar Kind of perpetual Kalendar or Almanack, Dr. Plott, in his Natural History of that County, describes very accurately, and proves to be of Danish Invention, and no doubt brought in when the Danes had the Government of this Kingdom.

It is called there the Cloce, I suppose from its Form and Matter, being usually made of a Piece of Wood, squared into sour plane Sides, and with a Ring on the upper End of it, to hang it on a

Nail somewhere in the House.

There is some Diversity in the Form of them, some being more persect than others. The sollowing Figure, which I borrow from D. Plott, represents the Common or Family Clogg, where each Angle of the Square Stick, with one half of each of the flat Sides belonging to it, is express'd; and this is the most clear and intelligible Form

it can well appear in, upon a Flat.

On each of the four Sides are three Months, the Number of the Days being represented by the Notches; That which begins every Month having a patulous Stroke turn'd up from it: Every seventh Notch, being also of a larger Size, stands for Sunday, which seems to shew that the Cycle of the Sun or Dominical Letters, are here committed to Memory; the Sundays and other Days here being fix'd.

Over against many of the Notches, whether great or small, there are placed on the left Hand Vol. II.

KAL

several Marks or Symbols, denoting the Golden Number, or Cycle of the Moon; which Number, if under 5, is represented by so many Points; but if it be 5, then a Line is drawn from the Norch, or Day to which it belongs, with a Hook returned back against the Course of the Line; which feems to be design'd to represent V the Roman Letter for 5.
If the Golden Number be above 5 and under 10,

then 'tis mark'd out by the former hooked Line for j; and with the Addition of as many Points as make up the Number design'd, As if it be 8, there

when the Colden Number is 10, there is a Cross on the Notch to represent X; And if it be above, and under 15, 'tis express'd by Points as before; And if above 15, by the cross Stroke, Points, and a hook Line for V: When 'tis 19, the Line issuing from the Notch for the Day, hath two resulting Crosses, or Strokes, as is plain from the patulous Crosses, or Strokes, as is plain from the

following Figure.

And these Numbers are not set so wildly and confusedly against the Days of the Month, as at first Sight may appear, but in a Method and Order; whether you consider them as they immediately precede and follow one another, or the Distance interceding each Figure, or the Value, or Denomination; for every following Number is made by adding 8 to the preceding; and every preceding one, by adding 11 to the following one; still casting away 19, the whole Cycle, when the Addition shall exceed it. Thus to 3, which stands against January 1, add 8, it makes 11; which stands against the third Day of the Month; to which add 8 again, and it makes 19; whence 8 itself comes to be the following Figure, and 16 the next: On the contrary , if to 16 you add 11, it makes 27; whence deducting 19, there remains 8, the Number above it; and

And for the Distances of the Numbers of the same Denomination, 'eis to be noted that they stand asunder either 30 or 29 Days, inter-changeably. Thus after 3, which stands overagainst the 1st of January, at 30 Days Distance you will find 3 again at the 30th of the same Month; and from thence, at 20 Days Distance, you will have 3 again fet to the tst of Narch; and at the last of March, at 30 Days Distance, 3

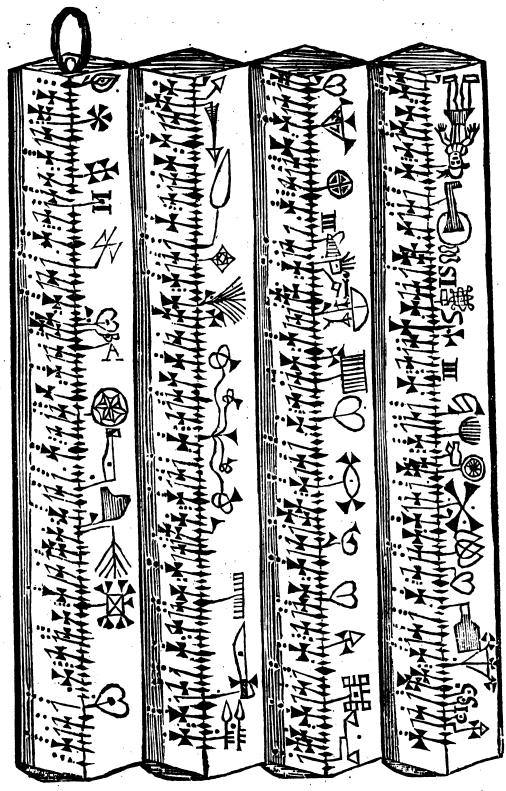

again, &s.

Note, 3 stands against the 1st of January, be- ! cause 3 was the Golden Number, when the Fathers of the Nicens Council settled the Time for the Observation of Easter. See Plot, in Loc. cit.

On the Right Hand, and issuing from the Notches, are several Inscriptions and Figures, Hieroglyphically representing the Festival Days, by some Actions, Offices, or Endowments of the Saints; or else the Work or Sport in fashion at the Time of the Year.

Thus from the Notch of January 13. being St. Hillary's Day, issues a Cross, the Badge of a

Bishop. From the 1st of March an Harp for St. David. Against June 29. St. Peter's Dry, you have his Keys: And against St. Crispin's Day a Pair of Shoes. Against Jan. 25. St. Paul's Day there is an Ax: And against June 24. a Sword for St. John Baptist. On Aug. 10th a Gridiron for St. Lawrence. So a Wheel for St. Katherine, a Star for Epiphany, a True-Lover's-Knot for St. Valentine's Day, &c. And against Christmas-Day is the old Wassbailling, or Carousing-Horn, that the Danes used to make merry withal at that

The Use of this Clogg is chiefly to find by Moons, and the Moveable Feasts; and the Immove the Prime or Golden Number the Ecclesiastical New able Feasts by the Symbols on the Right Hand. KANT-

KANT-Rref, was used anciently in Wales for the Government of an Hundred Towns; under which were so many Commots, which the Welch call Cummwd, and signifies Provinces or Regio, and confisted of twelve Manors or Circuits, and two Townships.

KARITE, or Carite, was the Word used formerly by the Religious for their best Conventual Drink, or Strong Beer; because in this they drank their Poculum Caritatis, or Grace Cup: Which Grace-Cup itself was sometimes called by

the Name of Karite or Carite.

KEELS or Keyles, were a kind of Long-Boats, of great Antiquity, and mentioned 23 H. 8. 18. Spelman faith they were those in which the Saxons invaded England.

KELP, what it is, and how made, see under

Allum Works in this Vol.

KERF, is the Notch or Slit that is made by the Saw between two Pieces of Wood, when they are sawing asunder.
KERNELLATUS, anciently fignified Embat-

zelled or Crenelled, i. e. Fortified : And

KERNELLARE Domum, was to build a House with such Walls and Towers; which to be allow'd to do, was a Favour commonly granted by our Kings after the Demolishments of the Caftles.

KEYSTONE in an Arch, is placed at the Top or Vertex of Elliptical or fuch-like flat Arches, to

bind the Sweeps of the Arch together.
KIDNEYS. The Kidneys in Man are always two in Number, one on each Side, being nearly of the Figure of the French or Kidney Beans; which latter Name they take from being like the Kidneys.

The Length of the human Kidney is between four and five Fingers Breadth. They are about two Fingers Breadth in Thickness, and three over. The Right Kidney is fituated under the Liver; the left under the Spleen.

In a Fætus their external Subfrance is divided in a formula laboration of the specific of

into several Lobes join'd together, which in adult Persons become more close; wherefore in such their Surface is equal and smooth. They have two Membranes; one Common from the Perisoneum, the other Proper. Usually they are cover'd with a good deal of Fat; their Colour is of a dark Red.

There are several Lymphatic Vessels observed in the Kidneys, which discharge themselves into Pecquet's Repository: The Veins go into the Vena Const. The Arteries come from the Artes.

Cava: The Arteries come from the Aorta

Those Veins and Arteries are called Emulgents: They come out from the Kidneys in their hollow Sides (which lie nearest to the Cava and Aorta) included in one common Capfula, and are divided into several Branches, which surround the Pelvis. These Branches are again sub-divided into an Infinity of other leffer ones, which go to the external Parts of the Kidneys, where they inosculate, and form a kind of Net; from which their Extremities coming, terminate al-fo in Infinity of Glands, which are all very Imall.

These Glands are in Figure roundish, and they compose the outer Substance of the Kidneys, which is half a Finger thick. From each of them there goes a long small Tube; and the Collection of these Tubes compose the innermost Substance of the Kidneys.

As these Tubules approach the Pelvis, they gather together in little Bundles; whose Extremities piercing the Membrane of the Pelvis, form those little Protuberances on the Inside of the Pelvis, or Cavity in the middle of the Kidney, which are called the Papille.

This Cavity, or Pelvis, is form'd by the Dilatation of the Ureters: It sends out several Ramifications, which divide the Urinary Tubes into Bundles, and which make a fort of Capiula to

the Blood Vessels.

I'he Use of the Kidneys is to separate the Urine from the Blood; which by the Motion of the Heart and Arteries is thrust into the Emulgent Branches, which carry it to the little Glands; by whose Means the Serosity being separated, is received by the Orifice of the little Tubes, which go from those Glands to the Pelvis; from whence it runs by the Ureters into the Bladder.

The Blood which was carried into the Glands, its Particles being too gross to enter into the small excretory Tubes, is brought back from the Kidneys by the Emulgent Veins, to be mingled with the other Venal Blood in the Cava.

The Description of the Ureters, Vesica Urinaria, Glandule Renales, &c. you will find in their pro-

per Places.

Dr. Keil, in his Animal Secretion, pag. 33-judges that the Kidneys are placed so near the Heart as they are, because Salts are Corpuscles, which are strongly attracted, and have a most close Union with the Fluid of Water: For tho' the Lungs may divide the Particles of Salt one from another, yet still they firmly adhere to the aqueous Humour in which they swim; and therefore they may likewise at first be drawn off: And he thinks that the Kidneys could not well have been placed at a greater Distance, to have separated such a Quantity of Urine as they now do; and that not only on the account of the great Quantities of Blood they receive where they are; but likewise, if they had a more distant Situation, other Particles must have united with the Salts and aqueous Particles (as even in their present Station some terrestrial Particles do) and consequently the Urine could not have been distilled luch as it is now, or at least but in

a small Quantity.
KING-PIECE in any Building, is a Piece of Timber standing upright in the middle between two principal Rafters, and having Strutts or Braces going from it to the middle of each Rafter-KINGS at Arms: See Heralds in this Vol.

KING-SILVER, is properly that Money due to the King or Queen in the Court of Common-Pleas pro Licentia concordandi, in respect of a Licence then granted to any Man for passing a Fine.
KINTAL, is a Weight in Merchandile, usual-

ly of about an hundred Pounds, but something more or less, according to the different Customs

of different Nations.

KNAVE, is an old faxon Word for a Man-Servant, and is so used in 14 E. 3. Sat. 1. c. 3. and Verstegan thinks it comes from the Duch Cnaps, which fignifies the same Thing. Cnaps in Same also is a Male-Child or Boy; and in this Sense a Knave-Child hath been frequently used formerly in Contradistinction to a Girl; and in this Sense Wickliff uses the Word in his Translation of Enod. 1.16. and other Places of the Bible. KNEVELS, B B b 2

KNEVELS, the same with Kevels.

KNIGHT, Miles, from the Saxon Cnite, fignifies with us a Person that beareth Arms, and who for Valour and Martial Conduct is by the Sovereign, or his Authority, fingled from the ordinary fort of Gentlemen, and raised to a higher Step or Dignity. This among almost all Nations takes his Name from the Horse, because they used to serve in War on Horseback. Thus the Komans called them Equites; the Italian Word is Cavallieri; the French, Chevaliers; the Germans, Reyters; the Spaniards, Gavallares, &c. It appears by the Stat. I E. 2. c. 1. That formerly a Gentleman having a full Knights-Fee, and holding his Land by Knight-Service, might be urged by Distress to procure himself to be made Knight when he came to full Age: But by 17 Car. 1. 20. no Man can be compelled to take that Order on him. The Manner of making Knights, Cambden, in his Brisannia, shortly expresses in these Words: Nostri vero Temporibus qui Equestrem Dignitatem suscipit, flexis genibus edusto Gladio leviter in humero percu-titur; Princeps hu Verbu Gallicè effatur: Son Chevalier au nom de Dieu.

KNIGHTS Bannerets: See Bannerets in this

Vol.

KNIGHTS of the Bath, are an Order of Knights made within the Lists of the Bath, and girded with a Sword in the Ceremony of their Creation. They are spoken of in 8 Edw. 4. c. 2. For their Antiquity and Manner of Creation, see Dugdale's Description of Worcestersbire. They take Place of Knights Batchelors, and come after Ba-

KNIGHTS-FEE, is so much Inheritance as is fufficient yearly to maintain a Knight with convenient Revenue; which in H. IIId's Time was 15 Pounds, Cambd. Brit. p. 111. But Sir Tho. Smith, in his Repub. Anglor. lib. 1. c. 18. rateth it at 40 Pounds. And in 1 E. 2. c. 1. it appears that such as had 20 Pound in Fee, or for Term of Life, might be compelled to be Knights; but this is now repealed by 17 Car. 1. Stow in his Annals saith, "There were in England at the Time of the Conquest 60211 (others say 60215) "Knights-Fees; whereof the Religious Houses, before their Suppression, were posses'd of 28015." Some say a Knight's-Fee contained 8,

others 12 Plough-lands, or 600 Acres.

KNIGHTS of the Garter, are an Order first created by King Edw. III. after the Acquisition

of many great and glorious Victories. He fought out of his own Kingdom, and all over Christendom, for a Number of most excellent and noble Persons, to each of which he gave a blue Garter deck'd with Gold, Pearls, and precious Stones, with 2 Buckle of Gold, to be worn only on the left Leg; a Kirtle, Crown, Cloak, Chaperon, a Collar, and other stately and magnificent. Apparel. The Number was 26, of which the King and his Successors were ordain'd Sovereigns, and the others Companions, or Brethren of the most Noble Order of the Garter.

This most Honourable Society is now a College or Corporation; having a Common Seal belonging to it; having, besides the Sovereign, which is Guardian of the Order, and who governs it by himself, or Deputy; and besides the 25 Companions, or Knights of the Garter, 14 Secular Canons, that are Priests, or must be within a Year after their Admission; 13 Vicars, which must also be Pricits; and 26 poor Knights, that have no other Subsistence or Means of Living but the Allowance of this Order. The Bishop of Winton, for the Time being, is called Prelate of the Garter; the Bishop of Sarum, Chancellor of the Garter; the Dean of Windsor, Register of the Garter. The Principal King at Arms is called Garter, who is to manage and marshal their Solemnities at all Installations and annual Feasts. The User of the Garter is also User of the Black-Rod. By Order of King Charles I. all the Companions of the Garter are to wear on the left Side of their upper Garment the Cross of England, encircled with the Garter and Mosto, and with Rays of Silver issaing from thence every way like a Star; whence 'tis usually called the Star and

KNIGHT-Marshal, is an Officer in the King's House, having Jurisdiction and Cognizance of any Transgression within the King's House and Verge; as also of Contracts made there, where-

of one of the House is Party.

KNIGHTEN Gyld, was anciently a Guild in London, confisting of nineteen Knights, founded by King Edgar; who gave then a Portion of waste Ground, lying without the Walls of the City, which is now called Port-Soken-Ward. S.ow's

KNOCKING Mill, is the same with a Stamping Mill, which see, and also the Word Tin.

LAB

LABEL, in the Law, is a narrow Slip of Paper or Parchment affixed to a Deed or Writing, in order to hold the appending Seal: So also any Paper, annex'd by way of Addition or Explication to any Will or Testament, is called a Label or Codicil.

LACERTA, is a Word used in Doomsday-Book,

and fignifies a Fathom.

LACHES, in the Law sense, seems to signify Slackness or Negligence, as appears from Littleton, Fel. 403 and 726, where Laches of Entry is nothing else but a Negle& of the Heir to enter; and so perhaps comes from our English Word to Lack; unless from the French Lascher or Lasche.

LACHRYMATORIES, were small Earthen Vessels, wherein the Tears of the weeping Friends that survived, were reposited and buried with the Ashes and Urns of the Dead.

LADA, is a Lade or Lath, from the Saxon Lathian, signifies an Assembly or Court of Justice; and from hence the annual Court at Dym-Church, by Romney-Marsh in Kent, for the Election of a Bailiff and other Officers, is call'd Dym-Church-Lath to this Day.

LADA, from the Saxon Ladian, also signifies a Purgation by Trial; and in the Laws of King Ethelred there is frequent Mention of the Lada

Simplex, Triplex, and Plena.

LAFORDSWICK, in the old Saxon, is the betraying of, or Infidelity to a Lord and Master. Tis mentioned in the Liws of Canutus, c. 61. and those of Henry I. c. 13.

LAGA, is a Word used for Law in Magna Charta: And hence comes Dane Lage, Saxon Lage,

Mercen Lage, &c. as also LAGEDAYUM or Lagb-day, that is, a Lawday, or Day of open Court : Hence also a Lages-Man is Home Legalis; and this Word Lage-Man is frequently used in Doomsday-Book, and in the Laws of Edward the Confessor.

LAGEN, Lagena, in ancient Times was a Measure containing six Sextarii. Vid. Fleta, 1. 2. c.

8, 9. and Charta Ed. 3. m. 25. n. 82.

LAGON or Lagan, is a parcel of Goods thrown out of a Ship in a Storm, &c. and because they would else sink, they are fastened to a Buoy or Cork, in order to be found again. If the Ship be wreck'd, the Goods are called Lagan or Ligan, quafi d Ligando: and so long as they continue in she Sea they belong to the Admiral; but when cast ashore they become a Wreck, and belong to him

that hath the Wreck, as appears in Co. l. 5. fo. 106.
LAHSLITE, Las slite, Lagbslite, is used in the
Laws of Hen. I. c. 13. for a Transgression of the Law; and sometimes for the Punishment there-

unto belonging

LAMMAS-DAY, quafi Lamb-mas, is our first of August; and on this Day the Tenants which formerly held Lands of the Cathedral Church in York, were bound by their Tenure to bring a Lamb afive into the Church at High-mass.

LAND-BOC, was anciently a Charter or Deed, whereby Lands or Tenements were given or held.

LAND-CHEAP, was an old customary Fine quid either in Cattle or Money at every Alienation of Land, lying in some peculiar Manor, or Liberty of some Burgh. This Custom yet remains in Malden in Effex.

LAND GABLE or Gavel, was anciently a Tax or Rent issuing out of Land: 'Tis called in Doomsday Census Pradialis; and Spelman faith, it was a Penny for every House, being, as we now speak,

a kind of Quit-Rent or Ground-Rent.

LANDIRECTA, in the Saxons Time, were fuch Services and Duties as were laid on those that held Land. These were three Obligations, which from their Number were called Trineda Necessit.u, and were Expedition, Burgh-bote, and Brig-bote. These were not called Servitia, because not Feodal Services arising from the Condition of the Owners; but by this Name Landiresta, Rights that charged the very Land, whether possess by Churchman or Layman.

LAND-TENANT, in the Law, is he that actually possesses the Land, and who hath it in his manual Occupation. The same with Terre-

Tenant.

LANO-NIGER, was a kind of base Coin in

Use about the Time of Edw. I.

LAPSE, is the Omission of a Patron to prefent to a Church within fix Months after voidable; on which Neglect, Title is given to the Ordinary to Collute to the faid Church.

LASHITE, was a common Forfeiture in the time of the Danes; it was 12 Ores, each Ore was about 6 d. Sterling. Vid. Selden Hist. Tythes. Tho' some say, the Ore was in Value about 16 Pence, and that 15 of them made the Libra or Pound.

LAST, in general fignifies a Burden, and particularly a certain Weight or Measure: As a Last of Pitch, Tar, or Ashes, is 14 Barrels; a Last of Hides or Skins is 12 Dozen; a Last of Codfish is 12 Barrels; a Last of Herrings is 20 Cades, or ten Thousand; a Last of Corn is 10 Quarters; a Last of Wool is 12 Sacks; a Last of Leather is 20 Dickers, and every Dicker is 10 Skins; a Last of unpack'd Herrings is 18 Barrels.

LAST, in the Marshes of the East of Kent; also is a Court held by 24 Jurats, and summoned by the two Bailiffs thereof, wherein they make Orders, lay and levy Taxes, &c. for the Preser-

vation of the Marshes.

LASTAGE or Lestage, is a Custom exacted in some Fairs and Markets, to carry Things where one will, saith Rastall; but sometimes 'tis taken also for the Balast of a Ship; and, as some say; its properly a Custom paid for Wares sold by the Last.

LAST-HEYRE, is he to whom the Land comes by Escheat, for want of lawful Heirs; which is sometimes the Lord of whom the Land is held;

and sometimes the King

LATCHES, in a Ship, are the same with

Laskets.

LATHE (Lastium) is a great part of a County or Shire, containing three or four Hundreds, as in Kent and Suffex. Whence the

LATHE REEVE, or Leid grede, or Tything-Reeve, was an Officer in the Saxon Government, who had Authority over the third Part of the Country, Country, or over three or more Hundreds or Wapentakes; whose Territory was called a Tithing, or a Leid or Leithen. Perhaps the Ridings in York sbire are so called corruptly from Tithings or Tridings, as 'tis sometimes written. Matters that could not be determined in the Hundred Court, were brought to the Trithing, where the principal Men of three or more Hundreds, being affembled by the Authority of the Lath Reeve or Trithing Reeve, did decide and determine it; but if they did not, it went further to the County Court.

LATITUDE of a Place, is found at Sea by having the Sun's or any Star's Declination (by the Tables) and his Meridian Altitude; and that is found by a Quadrant or Aftrolabe. Now from the Horizon to the Zenith being 90°; if from 90° you take the Sun's Meridian Altitude, the Remainder will be the Sun's Distance from the Zenith. When therefore by Observation the Sun's Meridian Altitude is found, you are to consider whether the Sun hath any Declination or not: If he hath none, but moves in the Equinoctial that Day, then the Elevation of the Equator will be equal to his Meridian Altitude; and confequently his Meridian Altitude is the Co-Latitude: Subduct therefore that from 90, the Re-mainder is the Latitude of the Place, which will be North, if the Sun be on the South Part of the Meridian, and South when the Sun comes to the North of the Meridian. 'Tis the same thing with any Star in the Equator. When the Sun or Star hath any Declination, the Zenith Di-stance with that will give the Latitude; for if the Meridian Altitude and Declination be both the same way, i.e. both North or both South, the Difference between them will be the Latitude of the Place, or the Pole's Height: Only observe, that if the Zenith Distance exceed the Declination, the contrary Pole will be elevated. V. gr. If the Declination be 23°. 30'. N. and the Zenith Distance 8°. 30'. N. the Latitude will be 15°. N. But if the Zenith Distance be 71°. 30'. S. and the Declination 20°. S. the Difference will be 30' = to the Latitude, as before; only it will be North, because the Zenith Distance exceeds the Declination. If the Declination be North, and the Meridian Altitude South, or vice versa, i. e. one contrary to the other, then the Sum of the Declination and the Zenith Distance is the Latitude of the Place. Indeed sometimes the Sun or Star may have two Meridian Altitudes; as when the Altitude and Declination being the same way, the latter exceeds the former; and then the Sum of the Co-declination and the Meridian Altitude is the Height of the Pole towards which the Declination is. And you must observe, that whether the Meridian Altitude be North or South, if that and the Co-declination together be less than 180°. the Sun or Star will have two Meridian Altitudes in 24 Hours.

LATROCINIUM, in fome old Charters, is used for the Liberty of Infang-thief, or the Privilege of adjudging and executing Thieves.

LATTA, is a Lathe or Tithing. LAUDIMIUM, in the Civil Law, is the 50th Part of the Value of Land or Houses paid by the Proprietor to the new Temant, by way of Emphyteuse, as an Acknowledgment upon Investitures, or for being put into Possession.

LAUDUM, was formerly used for an Arbitration or decifive Sentence of any chosen Judge

or Arbitrator.

LAUNDER, is a Trench cut in the Floor 8 Foot long and 10 Foot over, with a Turf for a Stopper at one End, to let the Water (which comes along with the bruifed Ore from the Coffer of a stamping Mill in the Tin-works) run away while the Ore finks to the bottom. See Tin.

LAURETS, were pieces of Gold coined in the Year 1619, with the King's Head laureated on them. There was a 20s. Piece marked with xx; one of 10s. marked x, and one of 5 s. marked v.

LAW. In England our Laws have been variable. (1.) We had the Laws of Molmutius, which were translated out of British into English by Gildu; of which there some remain in our present Laws. Vid. Mag. Chart. c. i. and 14.
(2.) There was the Merchen Lage, mentioned

in Cambden's Bris. and Polyd. Hift. Anglia, lib. 5.

(3.) West-Saxon-Lage.
(4.) Dane-Lage; all which were reduced into one Body by Edward the Confessor.

At present the Law of England is divided into ' three Parts.

(1.) The Common Law, which is the most ancient and general

(2.) Statutes, or Alls of Parliament.

(3.) Particular Customs. C. on L. fol. 15. LAW hath also a special Signification, sometimes implying that which is Lawful with us, and not elsewhere, as Tenant by Courtefy of England, 13 E. I. 3.

To Wage Law (Vadiare Legem) is to put in Security: To make Law (facere Legem) at a Day affigned: And to make Law, is to make Oath that he owes not the Debt challenged at his Hands; as also to bring with him so many Men as the Court shall affign, to avow upon their Oath, that they believe in their Consciences he hath sworn truly.

And this Law is used in Actions of Debt without Specialty; as also, where a Man coming to the Court after such a Time, that his Tenements have been seized for Default, shall deny himself to have been summoned.

LAW of Arms, Jus Militare, is the allowed Rules and Precepts concerning War; to make and observe Leagues and Truces, to punish Of-

fenders in Camps, &r.

LAW of Merchants, Lex Mercatoria, is a Privilege or special Law, differing from the Common Law of England, proper to Merchants, and summary in Proceedings. Vid. 27 E. 3. Stat. 8, 9, 19, 20. 13 E. 1. Stat 3. Cook on Littleton, fol. 182.

LAW Spiritual, is the Ecclesiastical Law, allowed by the Laws of this Realm, so far as it is not contrary to the Common-Law, nor the Statutes and Customs of the Realm. According to this the Ordinary or other Ecclefiastic Judges do proceed in Caufes within their Cognizance. Cook on Littleton, fol. 344

This was called the Law Christian, and the Court the Court Christian; and the Rural Dean, who was Judge or President of the Court within his own Diffeict, was called hence Decanus Christianitatis; and in Contradistinction to this, the Common-Law was by some called Lex Mundana, Terrena, &c.

LAW of the Staple, is the same with the Law

of Merchants,

LAW of Marque, (see Reprisals.) This Word is used 27 E. 3. Stat. 2. c. 22. and comes from the German Word March, which is a Bound or Limit and those who are driven to Reprisals, are forced to take the Ship and Goods of the Injurer, fince they cannot meet him at Home to have ordi-

nary Justice: LAW-day, is otherwise called the View of Frank Pledge or Court-Leet; and is used for the County Court, I E. 4. c. 2. and indeed the Lage-day or Law Day, formerly was any Day of open Court; and was commonly used for the more solemn

Courts of a County or Hundred.

LAW-less Court. On King's Hill at Rochford in

Essex on Wednesday Morning next after Michaelmusday, at Cock-crowing, is held a Court so called, because 'tis held at a lawless or unlawful Hour: They whisper, and have no Candle, nor any Pen and Ink, but only a Coal: And he that owes Suit or Service and appears not, forfeits double every Hour he is missing. This Court belongs to the Honor of Raleigh, and to the Earl of Warwick.

LAWES, are round Heaps of Stone, being a kind of rude Monument for the Dead. They are so called on the Borders between England and

Scotland.

LAYMAN, among the Painters, is a Statue of Wood, whose Joints are so made, that it may be put into any Posture; and its chiefest Use is for the casting and adjusting of Draperies for the cloathing of Figures.

LEA of Yarn. By Stat. 22, 23 Car. 2, c. — a Lea of Yarn at Kidderminster is appointed to contain 200 Threads, on a Reel which is four Yards about. LEAD. The Lead Mines in Somersetsbire are

at Mendip, which is a Place all mountainous, but the Hills are of unequal Heights; 'tis barren and cold, and in some Places rocky: the Ridges of the Hills run confusedly, but most East and West, and not many parallel one with another. Surface is heathy, ferny and furzy; it feeds Sheep all the Year, and young Beafts, Horses and Colts at Spring and Fall. The Soil is red and stony, but no way Clairy, Marley or Chalkey. The Stones are either of the Nature of Firestones or Lime-stones. The Trees have their Tops burnt, and their Leaves and their Outsides discoloured and scorched with the Wind; and they grow to no confiderable Bigness. Stones which are wash'd out by the Brooks and Springs are reddish and ponderous. The Country is more troubled with Thunder and Lightning, Storms, nocturnal Lights and fiery Meteors, than other Parts of the County

When they have gotten the Ore, they bear it small, then wash it clean in a running Stream, and then fift it in Iron Rudders, after which they make an Hearth or Furnace either of Clay or Fire-stone, which they fet in the Ground, and upon it build their Fire which is lighted with Charcoal, and conrinued with young oaken Gadds: Tis blown with Bellows by Men's treading upon them, and after the Fire is lighted, and the Fire-place hot, they throw their Lead Ore upon the Wood which melts down into the Furnace; and then with an Iron Ladle, they take it out, and on Sand cast it into what Form they please. Phil. Trans. N° 28.

In Phil. Trans. N° 39, you have this further

The Veins of Lead have been found to run up into the Roots of Trees without apparently altering them. White, yellow, and mix'd Earth, are Leaders to the Country or Place where the Ore lies; and changeable Colours do always encourage their Hopes. Sometimes they dig 12 Fathom deep before they meet with any Stones; other while when

a flony Reak is at top, they meet Ore just under the Swerd or Surface of the Grass: which Ore hath gone down 40 Fathom. A black Stone is an ill Sign, and leads to Jam, as they call it, that is, a thick Bed of Stone that hinders their Work; a grey, clear, and dry one they account the best, They seldom meet with any Damps. If in finking they come to wet moorish Earth, they expect a Jam, and to be closed up with Rocks. Their Nearness to the Ore they guess by short brittle Clay; for they don't think or find a tough Clay to be leading, as they call it; that is, directing towards Ore.

Sometimes the Ore lies Shale or shallow, and then it is 14 or 20 Fathom, more or less, before they hit it. They follow a Vein inclining to some

Depth, when it runs away in little flat Binns.
When the Stones part it, then they find a Vein again. Their Draughts are 14 or 16 Fathom, till they come to a Stone, where they cast a Side-Draught, called a Cut. Then they fink plumb again 4 or 5 Cuts one under another; They find Ore at 50 Fathom. Their best Reaks are North and South; East and West are good, the not so deep. The Groove is 4 Foot long and 2; Foot broad, till they meet with Stone, and then they carry it as The Groove is supported by Timber; they can. a Piece as big as one's Arm will support 10 Tun of Earth. The Timber there lasts long; they have known it lie 200 Years, and after that it will serve in new Works; it is tough and black, and being exposed a few Days to the Sun and Wind grows so hard that an Ax will scarce cut it.

For the supply of Air, they have Boxes of Elm, exactly closed, of about 6 Inches in the Clear, by which they carry it down 20 Fathom and more; but when they come at Ore, and need an Air-shaft, they fink it 4 or 5 Fathom distant, of the same Fashion with a Groove, to draw as well Ore as Air.

They make use of leathern Bags, holding 8 or 9 Gallons a piece, to free them from Water, which are drawn up with Ropes. If they find a Swallet, they drive an Adit upon a level till it is dry. If they cannot cut the Rock, they use Fire to anneal it, laying on Wood and Coal, and contriving the Fire so that they can leave the Mine before Operation begins; and they find it dangerous to enter again before it be quite cleared of the Smoak, which hath killed fome.

Their Beetles, Axes, and Wedges, &c, unless so hardened as to make a deep Impression on the Head of an Anvil, are not fit for their Use; and yet they sometimes break them in an Hour; others last three or sour Days, as it happens. They work in Frocks and Wastcoats, by Candle-light (of Tallow) 14 or 15 to the Pound, each of which lasts three Hours, if they have Air enough. Vein being lost, they drive two or three Fathom in the Breast, as the Nature of the Earth directs They hand out their Materials in Elm Buckets drawn by Ropes; the Buckets hold about a Gallon. Their Ladders are of Ropes,

The Ore sometimes runs in a Vein, and sometimes is dispersed in Banks; it lies often between Rocks: Some of it is hard, some milder. Many times they have branched Ore in the Spar, the Ore there is a Spar and Chalk, and another Substance which they call Crootes, which is a meally white Stone matted with Ore, and foft. The Spar is white, transparent and brittle like Glass, The Chalk white, and heavier than any Glass,

Digitized by Google

The Vein lies between the Coats and is of d fferent Breadths; it breaks off sometimes abruptly in the Earth, which they call a deading Bed; and after a Fathom or two may come again to keep the same Point. It terminates sometimes in a Rock called a Fire-flone, and sometimes in a dead Earth, Clayie without either Croote or Spar. The clearest and hardest Ore is the best, of which 36 hundred Weight makes about a Tun of Lead.

The Hearth for melting the Ore is about 5 Foot high, set on Timber, to be turned about as a Wind-mill, to avoid the Smoak on a shifting Wind; it holds half a Bushel of Ore and Coal: There is a Sink on the side of the Hearth into which the Lead runs, and it holds about 11 Hundred. They have a Bar to stir the Fire, a Shovel to throw it up, and a Ladle heated red hot to cast out the melted Metal. Once melting is enough, and the best, which is the heaviest, melts first. There is a Flight (as they call it) or Steam in the Smoak, which falliing on the Grass, poisons those Cattle that eat of it. The Workmen find the Taste of it (when the Smoak flies in their Faces) to be sweet upon their Lips; brought home and laid in their Houses it kills Kats and Mice. What of this Flight falls upon the Sand, they gather up to melt on a Flag-Hearth, and make Shot and Sheet Lead of it.

LEAD, at Sea, fignifies a Plummet of that Metal of about a Foot long, and fix or seven pound Weight, which is hung at the End of a long String to found the Depth of the Sea withal: Therefore their Word is, Heave the Lead, that is, found the Depth of the Water, to know whether it be

fafe for the Ship to venture in any further or not. LEAD-NAILS, are such as are commonly used to nail down Lead, Leather, or Canvas to hard $\mathbf{Wood}.$

LEDGERS, are long Pieces of Timber fasten-ed horizontally to the Poles in the Scaffolds belonging to any Wall or Building, on which the

outermost Ends of the Putlogs do rest.

LEE WAY, of a Ship at Sea, is the Angle made by the Line on which the Ship should run, according to her Course or the Point of the Comas steered upon, and the real Line of the Ship's Way; for all Ships are apt to fall a little to Lee-ward or to make some Lee-way. Wherefore in casting up the Log board, something must always be allowed for Lee-way; and they give such Rules as these, s. If the Ship be upon a Wind you must allow one Point for Lee-way. 2. If the Wind blow hard, so that you are forced to take in one Top-sail, allow two Points for the Lee-way. 3. If it blow so hard that both Top-sails must be taken in, and the Sea runs high, then allow three Points for the Lee-way. 4. If her Fore-fail being furled, she Try under a Main-sail and Mizzen, she will make her Way four Points before the 5. If she Try with a Main-sail only, she will make her Way near three Points before the Beam. But, 6. If under a Mizzen only, she will make her Way about two Points before the Beam.

LEGACY, Legatum, is usually any particular Thing given in a last Will and Testament; for if the whole Estate be so given, 'tis Hereditas. But in the Ecclesiastical Sense it was formerly a Soul-Seat, or a Legacy given to the Church, or ac-customed Mortuary.

LEGION. In the time of the Romans first War in Sicily, Polybius, lib. 1. faith, that the Roman Le-

terward L. Æmylius and C. Ailius Coff. their Legion (in the great Preparations they made against the Gauls) confisted of 5200 Foot and 300 Horse.

After this, some Time before the Battel at Can na, the Roman Legion had in it 5000 Foot and 300 Horse, to which was added an equal Number of Latin Auxiliary Foot, and for the most part thrice the Number of Horse. Polyb. lib. 3.

LEVANT, in Geography, is properly the Eastern Side of any Continent or Country, or that on which the Sun rifes. But now with our Seamen it signifies the Mediterranean Sea, and especially the Eistern Part of it; and our Trade thi-ther is called the Levant Trade; and a Wind that blows from thence out of the Streights Mouth is

called a Levant Wind. LEVEL: In Phil. Transaff. No 141. there is an Account of a new Level by Mr. Butterfield, which he saith is done by a Tube with Glasses, and a Thread hanging between four Points, with a Weight in a Box; so contrived, that as soon as the Instrument is set down, you have the Point of Horizon with a great deal of Exactness; and he said he was then making another which plaid on the Point of a Diamond. But I have never heard any thing of this fince, and Mr. Butterfield, Instrument-Maker to the French King is now dead.

In Phil. Trans. N° 74. p. 2217, is an Account of a Book, then publishing, about the Art of Levelling by Mr. Mariette; but whether it was ever actually published, I know not. Capt. Halley, Geometry Professor at Oxford, from his Observations of the Height of the Mercury in the Barometer, at the Top and Bottom of Snowden Hill in Wales (where at the Top it funk three Inches eight Tenths lower than its Height at the Foot of the Hill) concludes, that one of our new portable Barometers, would be accurate enough to take the Levels for bringing Water from distant Places, and would be much less subject to Error than the common Levels, there being 11 of an Inch for every 30 Yards; which may be divided into many Parts evidently. See Phil. Transall. No 229. And Mr. Derham, by Observations of this nature made at the Foot and Top of the Monument, allows - of an Inch to 82 Foot of perpendicular Ascent, when the Mercury standeth at 30 Inches.

There is a Book written on the Subject of Levelling by Mr. De la Hire, but I have not seen it. And there is a Description of a new levelling Instrument, by Mr. Couplet, in the French Memoirs for 1699

LEVELLING, is the Art of finding a true horizontal Line, or the Difference of Alcent or Descent between any two Places, in order to drain Moors, Marshes, and Morasses, &c. or to convey Water from Place to Place. The Instruments made Use of you will find under the Word Level in Vol. I. and Pendulous Level in Vol II

The Method of proceeding in the Art of Levelling is, or may be much the same, let the Instrument be the common Water Level, that of Spiris of Wine, or the new Pendulous one. The most commodious and expeditious Way is to provide two Station Staves of square Deal, like Rulers, about 8 or 10 Foot in Length. Let every Foot be divided into 10 Parts, and each of those into 10 more; so each small Division will be the 100th part of a Foot. On each of these Staves there must be a Vane to slide up and down, and with a Screw gion consisted of 4000 Foot and 300 Horse; af- in the back Part to fasten it to any Height on the

Staff. The fore-fide of the Vane or Sight should be painted white, or covered with white Paper, with a black Line drawn across it lengthways. Having then two Affistants to hold these Staves upright, and to slide the Sights up and down, supposing you were to find the Difference of the Heights of any two Places, as of A and B: If one Station will do, place the Level in the middle between the Places, and having by the Bubble or otherwise set it truly Horizontal, look back to the first place, till your Assistant sliding the Vane up and down for you there on the Staff, you can fee the black Line thereon cut or covered by the cross Hair in the Telescope; and then ler him mark the Height of that black Line above the Ground on the Divisions on the Staff. Then turn the Telescope about and look towards your other Affistant at B, till you can see the Black Line on the Vane or Sight on his Staff coinciding with the cross Hair in the Telescope; and let himalso note how high his Black Line is above the Ground: If his Number be the same with the former, the Places are on a level, or of the same Height; otherwise that where the greatest Number is, is the highest; and the Difference between the Numbers shews how much

But if the Places are so far asunder, or have Obstacles interposing, that you can't do it at one Station, as is usually the Case; then you must do it at as few more than one as you can; and you must keep an Account of the Numbers on the Staves at all your Stations, putting the Back Station in one Column, and the Fore Station in another, with a Column for the Number of their Stations in the middle; in this, or such like Form.

1	Back ^{d.}	Sr.	Forwd.

Where all the Back Stations make together 6.27. or fix Foot and .27 of a Foot, and all the Fore Stations make 8.84. or 8 Feet and .84 of a Foot; and the Difference between those two Numbers being 2.77 . or 2 Feet .77 of a Foot, is the Excess in height of the last place above the first.

N. B. In levelling of Rivers, you must set the Black Line of the Sight in the first Backward, and in their last

Fore Station, just to the Edge of the Water: And then you may take the Intermediate Stations, any where, a Mile off from the River, &c. in the Meadow adjoining, for it will all come

LEVITATION, is a Word I've met with no where but in Dr. Hook's Opera Posthuma; and he means by it a Property directly contrary to that of Gravitation towards the Sun: And in his Discourse of Comers, p. 168, he faith he hath by many Obfervations discovered, that tho' there be a Descent of the Steams from the Nucleus of the Comet towards the Sun, yet they also quickly returned and went contrary and opposite to the Sun, and that fometimes to a prodigious Extent. And, perhaps where the Power or Force of Gravitation ceases, some such contrary Force may begin: Of which there feem to be many Instances in the Gravitations or Attractions of the Particles of Matter toward one another. (See Attraction.) This Force in Vol. II.

fuch Cases Sir If. Newton calls Vis Repellens; and it appears plainly to be one of the Laws of Nature, or a Branch of the Will of our Creator in the Material World; and without it I think there can be no possible Account of Rarefaction, and some other Phanomena of Nature. Dr. Hook, p. 170. takes notice also, that there is as vast an Acceleration in the Motion of Levitating Bodies, as there is in Gravitating ones.

LIBERA, anciently fignified a Livery or Delivery of so much Grass or Corn to a Customary Tenant, who cuts down or prepares the faid Grass or Corn, and receives some Part or small Portion

of it as a Reward or Gratuity.
LIBERTAS Ecclesiastica, was the usual Phrase in our old Writings to express Church Liberty and Ecclesiastical Immunities. At first this was only the Right of Investiture; but afterwards it grew very great, extending so far under some weak Governments as to a Pretence of Exemption of the Persons and Possessions of the Clergy

from the Civil Power and Jurisdiction.
LIBERTINE, in the Civil Law, is a Person who is manumifed, and made free from Bondage,

to which he was born. LIBRA. See Pound.

LIBRA, a Mechanick Power. See Balance in Vol. 1

LIBRATA Terra, was anciently a Quantity of Land containing 4 Ox-gangs, and every Ox-

gang 15 Acres.
LIGENTIA Transfretandi, is a Writ or Warrant directed to the Keepers of the Ports, willing them to let some pass quietly beyond Sea, who have formerly obtained the King's Licence there-

LIGHT. In the French Memoirs of the Academy of Sciences, A. D. 1699, there are some Reflections about the Nature of Light and Colours; and of the Generation of Fire, by Mr. Malebranche; in which he endeavours to support his Notion before communicated in his Recherches de la Verite, and in his Metaphysicks, viz. That Light and Colours do confist only in the various Pulses or Vibrations of the Ethereal or Subtile Matter.

Dr. Hook, in his Op. Posthuma, p. 54. considering the exceeding Hardness of a Diamond, and its wonderful Property of emitting Light or shining in the Dark, upon being rubbed or struck, thinks that there is this one Effential Property necessiry only to the Existence of Light, viz. a very quick vibrative Motion; for in this Experiment there is neither Combustion nor Flame, as in Fire; nor Moisture and Putrefaction, as in Fish, Plesh of Veal, rotten Wood, &c. nor a Motion of the Animal Spirits, (which some think to be the Cause of the Light in Glo-worms, the Eyes of Cats, &c.) effentially necessary to the Production of this Quality.

The same Author thinks that Aristotle's Definition of Light, pas esir n erseyeia Te Diapares, That it is the inworking of the Diaphanous Body, or of the Medium, or the Internal Action of the Pellucid or Transparent Body, is the Light of which we are fenfible, or which moves our Eye: So that he makes Light in the Luminous Body to be a peculiar Motion of it, which the Lucid Body can communicate to the Transparent Medium, or to such a Body as is fit to propagate it. And Light in the Eye is this Motion impressed on it; by which the Soul becomes sensible of it.

Ccc

P. 114. The Doctor afferts, That the Power or Force of Light decreases in a quadruplicate Ratio of the Distances reciprocally taken, or as the squared Squares of the Distances reciprocally; and con-fequently the Effect of Light, or the Motion it causes in other Bodies, will be in subduplicate Proportion of the Powers; and therefore only in duplicate Proportion of the Distances reciprocally taken.

118. The Length of the Strokes of the Pulles of Light are in duplicate Proportion of the Distances reciprocally. P. 121. Suppose then that the Length of the Pulse from the Centre outwards at the Body of the Sun should be one Inch, the Length of the Pulse of Light here with us would not be the 1000000th part of the thickness of a Hair: and yet is that amazing Organ, the Eye, fo wisely contrived, as that the Strength of the Pulse, which was destroyed by so vast a Distance, is reflored again to a good part of its first Power; for as in diverging Rays, the Length of the Pulse decreases in a duplicate Ratio of the Distance; so in converging Rays, it increases in that Ratio,

and in a contrary Order.

I had before, in Vol. I. shewn from Sir If. Newton, that Light is propagated in Time; and he then supposed about 10 Minutes were taken up in its Passage from the Sun to us: But in his Opticks he determines this Matter more accurately. Romer first, and after him others, had observed that the Eclipfes of Jupiter's Satellites happen about 7 or 8 Minutes sooner than they ought to do by the Tables, when the Earth is interpoled between the Sun and that Planet; but as much later, when the Earth is beyond the Sun in respect of Jupiter: the Reason of which is, that the Light of the Satellites hath farther to go in the latter Case, than in the former, by the Diameter of the Earth's Orbit. Some Inequalities of Time indeed may arise from the Eccentricities of the Orbits of the Satellites; but these can't answer in all the Satellites, and at all times, to the Position and Distance of the Earth from the Sun. The mean Motion of Jupiter's Sarellites is also swifter in his Descent from his Aphelium to his Peribelium, than in his Ascent in the other half of his Orb. But this Inequality hath no respect to the Position of the Earth, and in the three Interior Satellites is insensible; as he found by Computation from the Theory of their Gravity.

After this Sir Isaac advances this Proposition, which is the 12th of Part 3. of the 2d Book of

his Opticks, viz.

Every Ray of Light in its Passage thro' any refracting Substance is put into a certain Transferst Constitution or State, which in the Progress of the Ray returns at equal Intervals, and disposes the Ray at every Return to be easily transmitted thro' the next refracting Surface, and between the Returns to be easily reflected by it. This is manifest from his 5, 9, 12 and 15th Observations. Whence it appears, that one and the same fort of Rays, at equal Angles of Incidence on any thin transparent Plate, is alternately reflected and transmitted for many Successions, according as the Thickness of the Plate increases in Arithmetical Progression of the Numbers 0, 1, 2, 3, 4, 5, 6, 7, 8, &c. (See Colours.) And this alternate Reflection and Transmission, he found by his 24th Observation, continues for above 100 Viciflitudes; nay, as he proves afterwards, to many thousands; being propagated from one Surface of a Glass Plate to another, tho' the Thickness of the Plate be ! of an Inch and more. So that this

Alternation seems to be propagated from every refracting Surface to all Distances without End or Limitation. He shews also, that this alternate Reflection and Refraction depends on both the Surfaces of every thin Plate, because it depends on their Distance; but that it is performed at the second Surface. It is also influenced by some Action or Disposition propagated from the first to the second; because otherwise at the second it would not depend on the first: And this Action or Disposition, in its Propagation, intermits and returns by equal Intervals. What kind of Action or Disposition this is; whether it confist in a vibrating or a circulating Motion of the Ray, or of the Medium, or something else, the Author does not inquire: But he allows those, that are averse to all new Discoveries which they can't explain by Hypotheles, at present to suppose, That as Stones by falling upon Water put it into an undulating Motion, and all Bodies by Percussion excite Vibrations in the Air; so the Rays of Light, by impinging on any refracting or reflecting Surface, excite Vibrations in the refracting or reflecting Medium; and by so doing do agitate the folid Parts of the refracting or reflecting Body, and by that Agitation cause the Body to grow warm or hot: That the Vibrations thus excited are propagated in the refracting or reflecting Medism or Substance, much after the manner that Vibrations are propagated in the Air for caufing Sound; and that they move faster than the Rays, fo as to overtake them; and that when any Ray is in that part of the Vibration which conspires with its Motion, it easily breaks thro' a refracting Substance; but when it is in a contrary part of the Vibration, which impedes its Motion, it is eafily reflected; and consequently, that every Ray is successively disposed to be easily reflected or transmitted by every Vibration which overtakes it. Whether this Hypothesis be true or false he doth not consider at present, contenting himself with the Certainty of the Fact, That he hath discovered the Rays of Light by some Cause or other to be thus alternately disposed to be reflected or refrac-ted for many Vicissitudes. The Returns of this Disposition of any Ray to be reflected, he calls Fits of easy Reflection; and those of its Disposition to be transmitted, he calls Fits of easy Transmission; and the Space it puts between every Return and the next Return, he calls the Intervals of its Fits. Then at Prop. 13. he shews, that the Reason why the Surface of all thick transparent Bodies reflect part of the Light incident on them, and refract the rest, is that some Rays at their Incidence are in Fits of easy Reflection, and others in Fits of easy Transmission. This appears from his 24th Observation; where the Light reflected by thin Plates of Glass and Air, which to the naked Eye appeared evenly white all over, did thro' a Prism appear waved with many Successions of Light and Darkness, made by alternate Fits of easy Reflection and easy Transmission; the Prism se-vering and distinguishing the Waves of which the white Light was composed.

And hence 'tis plain, Light is in its Fits of easy Reflection and easy Transmission before its Incidence on any transparent Body: And probably it is put into such Fits at its first Emission from Luminous Bodies, and continues in them during all its Progress. For these Fits are of a lasting Nature; as appears by what he proves elsewhere.

. He supposes here the Transparent Bodies to be thick; because if the Thickness of the Body be much less than the Interval of the Fits of easy Reslection and easy Transmission of the Rays, the Body loseth its reslecting Power. For if the Rays, which at their entring into the Body are put into Fits of easy Transmission, arrive at the farthest Surface of the Body, before they be out of those Fits, they must be transmitted. And this is the Reason why Bubbles of Water lose their reslecting Power when they grow very thin, and why all Opake Bodies, when reduced into very small Parts, become Transparent.

He shews also, that those Surfaces of Transparent Bodies, which, if the Rays be in a Fit of Refraction, do refractit most strongly, if the Ray be in a Fit of Resection, do reslect it most easily.

After this he gives several other curious Propofitions; from whence he shews, that 'tis easy to collect the Intervals of the Fits of easy Reflection and easy Transmission of any forts of Rays refracted in any Angle into any Medium, and thence to know, whether the Rays shall be reflected or transmitted at their subsequent Incidence

on any Pellucid Medium.

By the Experiments and Observation about the Inflection of the Rays of Light (See Inflection) he makes it plain, that Bodies act on Lighe at a diffance, and by that Action bend the Rays of it; and that this Action is strongest at the least distance. He shews also, that Rays which differ in Refrangibility differ also in Flexibility; and by their different Inflections it is that they are separated one from another, so far as after Separation to make the three Fringes of Colours mentioned in those Experiments: And'tisprobable the Rays of Light, in passing by the Edges and Sides of Bodies, are bent several times backwards and forwards with a Motion like that of an Eel; and that the faid Ecoloured Fringes of Light arise from three such Bendings. 'Tis probable also that the Rays of Light which fall upon Bodies, and by that means are reflected or refracted, begin to bend before they arrive at the Bodies; and that Light is reflected, refracted and inflected, by one and the same Principle acting variously in various Circumstances.

Tis probable also, that Bodies and Light act mutually on one another: Bodies upon Light, in emitting, reflecting, refracting and instecting it; and Light on Bodies, by hearing them, and putting their Parts into a vibrating Motion, wherein

Heat confifts.

All fix'd Bodies, when heared beyond a certain degree, do emit Light and foine; and this Shining and Emission of Light is probably caused by the vibrating Motions of the Parts; and all Bodies abounding with Earthy Particles, and especially when they are sulphureous, when their Parts are sufficiently agitated, do emit Light; whether this Agitation be caused by Attrition, by Percussion, by Putrefaction, or a vital Motion in an Animal Body, &c. or any other way. Thus the Seawater shines in a Storm; Quickssor when shaken in Vacuo; a Cat's Back, or a Horse's Neok, rubb'd by the Hand in the dark; Wood, Flesh and Fish, when putrissed.

The same admirable Author, in the new Queries annexed to the Lasin Edition of his Opticks, thinks it probable, that there are yet some other congenite Properties of the Rays of Light besides those above described; one of which the Refraction of that

Vol. II.

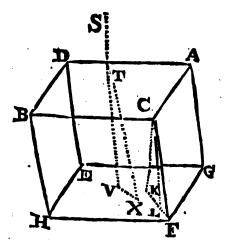

strange Body Island Chrystal acquaints us with. This was first taken notice of by Erasmus Bartholinus, but afterwards more accurately described by Huzens in his Book of Light, written in French. This Chrystal is a pellucid and field Stone, equalling Rock Chrystal or clear Water in Transparence; 'twill bear being white hot in the Fire, and after that will lose its Transparence: By a very violent Heat it's reduced to a Calx, but will not melt nor run: Being macerated for a Day or two in Water, it also loses its natural Politure on rubbing, it discovers an Electrick Quality, and with Aqua foreis makes an Ebullition. It seems to be a kind of Talk. If a piece of this Chrystal be laid on the Leaf of a Book, each Letter seen thro' the Chrystal, by a kind of double Reflection, appears double: And if any Ray of Light fall on any of its Surfaces, either perpendicularly or obliquely, it is always divided by a double Refraction into two Rays; each of which is of the same Colour with the Incident Ray, and they appear equal to one another as to the Quality of Light. One of these two Refractions is conformable to the known Laws of Opticks; viz. That the Sine of the Incidence out of Air into the Chrystal is to the Sine of Refraction: as 5 is to 3. But the other, which may be called the Unusual Refraction, is made thus: Let ADBC be the Surface of the Refracting Chrystal, C the greatest solid Angle belonging to that Surface: Let GEHF be the oppolite Surface, to which the Line CK is perpendicular: This Perpendicular with the Line CF representing the extream Edge of the Chrystal contain an Angle of 198. 3'. Join KF; in which take KL so, that the Angle KCL may be of 60. 40'. but the Angle LCF of 120. 23'. This being done, let the Line ST represent any Incident Ray of Light in the Point T; let TV be the refracted Ray; and what that is may be found by the given Ratio of the Sines of 5 to 3, according to the common Laws of Opticks. Then draw VX parallel and equal to KL, and so possed that it may lie the same way towards V, as L doth in respect of K. Join TX; and that Line TX shall be the unusual Refracted Ray, being carried by the new Refraction from T to X. If then the Incident Ray ST fall also perpendicularly on the Refracting Surface, those two Rays TV, and TX, into which by Refraction it is divided, will become parallel to the two Lines CK and CL: and the other Ray will be transinitted perpendicularly, according to the common Laws of Opticks; and the other (wz. TX) diverging by this unusual Refraction from the Perpendicular, will make with it the Angle VTX of about 6 degr. as is found by Experience.

And hence the Plane T' V X, and fuch like simi-

And hence the Plane T V X, and such like similar Planes, which are parallel to the Plane CFK, may be called the Planes of Perpendicular Refraction; and that Part, Side or Place towards which the Lines K L and V X tend, and which are drawn from the Points K. and V. may be called the Part, Place, or Side of Unusual Refraction.

Ccc 2

ln

In like manner Rock Chrystal hath a double Refraction; but the Difference between the two Refractions is less and less conspicuous, than in

the Island Chrystal.

When the Ray ST, which falling on the first Surface of the Island Chrystal, is divided into the two Rays TV, and TX; and those two Rays come to the latter Surface of the faid Chrystal; then the Ray T X, which in the first Superficies is refracted in the unusual Ratio, will be again refracted entire with the same unusual Ratio, so that these two Rays will emerge out of the second Surface in Lines parallel to the first incident Ray ST. For the same will happen also as to the Ray TV, which being refracted in the first Surface with the usual Ratio, will also be again refracted at the second with the usual Ratio

And if of two pieces of Island Chrystal, one be so placed after another, that all the Surfaces of the latter be respectively parallel to those of the former: Now also those Rays, which in the first Surface of the first Chrystal were refracted with the usual Ratio, shall in all the latter Surfaces be refracted with the same ufual Ratio; and those Rays, which in the first Surface of the former Chrystal were refracted with the unufual Ratio, shall in all the latter Surfaces be refracted with the unusual Ratio: And the same thing will come to pass when the Surface of the two Chrystals are inclined one to another, so their Planes of Perpendicular Refrac-

tion be but parallel.

There is therefore some congenite Difference in the Rays of Light, that occasions, as in this Experiment, some of them to be refracted in the usual Ratio always, and others always in the unusual Ratio; for if it were not congenite, but did arise from some new Modifications impressed on the Rays in the first Refraction, then that would be changed by the same kind of new Mod fications in the three following Refractions. But no such thing happens: But the Property continues always the same, and hath the very same Effect in the Rays in all those Refractions: Wherefore this unusual Refraction must depend on some congenite Property in the Rays of Light. And 'tis very well worth while to enquire, whether there may not be other such, as yet unobserved and unknown.

For one would suspect that there are divers Sides of the Rays of Light, and those endued with divers congenite Properties: For if the Planes of Perpendicular Refraction of the second piece of Chrystal be placed at Right Angles with the Planes of

Perpendicular Refraction of the first Chrystal; then will the Rays, which in their Projection thro' the first Chrystal were refracted with the ufual Ratio, in passing thro' the second be refracted with the unusual Rasio; and those Rays, which in passing thro' the first Chrystal were refracted with the unufual Ratio, shall in passing thro' the second be refracted with the ufual Ratio. Wherefore there are not two divers kinds of Rays in their own Nature different ; of which one sortare always and in all Positions refracted with the nsual, and others with the unusual Ratio: But these two kinds of Rays, as mentioned in the last Experiment, did only differ in this, that the Rays, according to their different Position, did with their different Sides respect the Place, Region or Side of unusual Refraction in the Chrystal: For in the present Experiment, one and the same Ray is re-fracted one way with the usual, the other way with the unufual Ratio, according to the Position of its Sides to those of the Chrystal. If the same Sides of any Ray look towards the same Parts of each Chrystal, then will that Ray be refracted with one and the Same Ratio in each Chrystal; but if that Side of the Ray, which is turned towards the Place of unusual Refraction in the former Chry-flal, be distant 90°. from that Side of the same Ray which looks towards the Place of unusual Refraction of the second Chrystal (which may be done, by so turning the second Chrystal, that it shall look towards the former Chrystal, and consequently the Rays of Light themselves in different Polition) that Ray will now be refracted in different Ratio's in the different Chrystals. So that you may determine, whether the Rays, which fall on the second Chrystal, will be refracted in the usual or unusual Ratio. And for this there is nothing more required, than that the second Chrystal be so turned about, that its Place or Region of muusual Refraction be accordingly posited on this or that Side of the Ray

Wherefore every Ray may be confidered as having four Sides; two of which being directly opposite to one another, cause that the Ray be always refracted in the unusual Ratio, whenever either of those Sides is turned towards the Side or Piace of unusual Refraction in the Chrystal: But the other two Sides, as often as either of them is turned towards the Side of unusual Refraction in the Chrystal, do yet cause the Ray to be refracted with the usual Ratio. The two former Sides of the Ray therefore may be called the Sides of unusual, the two latter of usual Refraction. And because these Dis-positions were in the Rays before they fell on the 2d, 3d, and 4th Surface of the 2 Chrystals, nor were they at all changed by the Refraction of the Rays in their Passage thro' those Surfaces, but the Rays were refracted by one and the same Law in every one of the four Surfaces, it seems that these Dispositions are properly congenite to the Rays of Light, and were not at all changed by the first Refraction; but that it is on the account of these Disposetions in the Rays, that they were refracted in their Incidence on the first Surface of the first Chrystal, some in the usual, and some in the unusual Katio, according as their Sides of usual or unusual Refraction at that time respected the Sides or Place of unusual Refraction in that Chrystal.

All the Rays of Light therefore have two opposite Sides, in which the Property is congenite, on which the unusual Refraction depends; and the

other two Sides are without any fuch Property. And it requires yet further to be considered, whether there be not even other Properties of Light, by which the Sides of the Rays differ, and are distinguished from one another.

After this he shews, that in an Oblique Incidence of the Rays upon the first Chrystal, the same Difference between them appears, as when they fall

perpendicularly to the former Properties. From the whole therefore may be very justly concluded, That all those Hypotheses are falle and

precarious which have been yet advanced, in order to explain the Phanomena of Light by new Modifications of the Rays; for they do not depend on any such Modifications, but on congenite and immable Properties, effentially inherent in the Rays.

And equally erroneous also are those Hypotheses, which attempt to explain the Phenomena of Light by any Pressure or Pulse impressed upon the fluid Medium by Motion; for these at long run depend upon the new and different Modifications of the Rays, and so fall in with the other.

But further, if Light confisted only in a Pressure upon the Medison, it must be either without any local Mosion; and then 'tis impossible to account for the Agitation and Heat produced in Bodies by the Refraction and Reflection of the Rays: Or if it be supposed to consist in Motion propagated to all Distances in an Instant, to that must be required an infinite Force acting every Moment, and in each lucid Particle. But did Light consist in a Pressure or a Motion propagated thro' a fluid Medium, whether it propagated instantaneously, or in time, it could not be done in Right Lines, but must inflect back upon itself in a Shadow; for Pressure or Mesion in a fluid Mediam, whenever it meets with any Obstacle which may impede Part of its Motion, cannot be propagated in Right Lines, but must be inflected back towards itself, and disused every way throughout the quiescent Mediam which lies beyond the Obstacle.

The Force of Gravity tends downwards; and yet the Preffure of the Parts of Water, which arises only from the Force of Gravity, tends with an equable Force every way, and is propagated with equal Ease by crooked Lines as by strair. Waves, on the Surface of Water, where they fall on the Surface of any large Obstacle, inflect back upon themselves, and are dilated and diffused gradually in the quiescent Water lying beyond that Obstacle. The Waves, Vibrations, or Pulses of Air, in which Sounds confist, are manifestly inflected, tho' not so much as those of Water; for the Sound of a Bell, or of a great Gun, can be heard over a Hill, interposed between the Ear and Eye, and founding Body: And we find that Sound is propagated as easily by crooked as strait Tubes; whereas Light is never observed to move in curve Lines, nor to be inflected back so as to shadow itself. Indeed there is a kind of Inflection of the Rays of Light, as hath been before mentioned; but that is not ad Umbram, but a contrary way, and is only found in a Ray's passing by and very near the extream Edge of some Body; and then as soon as it is past the Body, it

goes on frait again.

The Rays of Light are therefore certainly little Particles, actually emitted from the Lucent Body, and refratted by some Attrattion, by which Light, and the Podies on which it falls, do mutually act by their Attrastion, or some other Force, do excite upon one another; for such Particles or Cor- certain Vibrations in the Bodies on which they

puscles thro' uniform Mediums will be transmitted in right Lines without any Inflection in Umbram, as we find the Rays of Light are: They may have also divers Properties, and which they may preserve immutable in their own Passages thro' divers Mediums; which agrees with the Nature of the Rays of Light. Pellucid Bodies ass upon the Rays of Light at some Distance, when they refract, reflect and inflect them; and the Rays of Light reciprocally act upon them, at some little Distance also, by agitating and heating their Particles. And this Alion and Re allion, which is performed at some Distance, is mighty like what we call the Force of Attraction, or Gravity, in other Bodies. And if the Cause of Refraction be the Attraction of the Rays, he shews in his admirable Principia, that the Sines of Incidence must be so the Sines of Refraction in a given Ratio; as in Fact we find the thing to be. The Rays of Light, in passing out of Glass into a Vacuum, are inflected towards the Glass, and, if they fall too obliquely, will revert back again to the Glass, and be totally refletted. Now the Cause of this Reflection cannot be attributed to any Resillance of the Void or Vacuum, but entirely to some Force or Power in the Glass, which attracts or draws back again the Rays as they are passing into the Vacuum. And this appears from hence, That if you wet the posterior Surface of the Glass with Water, Oil, or liquid and clear Honey, or with a Solution of Quickfilver; then the Rays, which would otherwise have been reflected, will pass into and thro' that Liquor. Which plainly shews, that the Rays are not reflected till they come to that posterior Surface of the Glass, nor till they begin to go out of it too. But if at their going out they full into any of the aforesaid Liquors, they will then not be refletted, but go on in their former Course; the Reason of which is, that the Attraction of the Glass is counter-balanced by the Attraction of the Parts of the Liquor which adhere to its Surface. And this appears yet plainer in the Experiment of two Glass Prisms, or the Object Glasses of two long Telescopes, one of which shall be plane (on one side), the other a little convex, and then compressing them so that they do neither quite touch one another throughout, and yet have their Surfaces very near; for then that Light which falls on the hinder Surface of the first Glass, and in that Place where the Glasses are not distant one from another above of an Inch, will be totally transmitted thro' that Surface and the interjected Air or Vacuity, and will enter into the second Glass (as he shews in his 1st, 4th, and 8th Observations of the first Part of his 2d Book of his Opticks). But if the second Glass be moved a little farther off, then the Light, coming out of the hinder Surface of the first Glass into that Air or Vacuum, will be turned back again towards the Glass, and reflected. Wherefore 'tis plain, that the Rays are drawn back by some Force that is inherent in the first Glass, since there is nothing else that can occasion it.

To account also for that odd Phanemenon of the Rays of Light, which he calls their Fits of easy Transmission and Restettion, he judges that there is nothing more required, than that the Rays should be very small Corpuscles of Matter, which either act; which Vibrations, being faifter than the Motion of the Rays, do successively outstrip or get before them, and so agitate them as alternately to increase or diminish their Velocity; and there-fore produce those Eits in the Rays of Light.

And he thinks it very likely, that the Unafual Refrattion, discovered to be in the Island Chrystal above mentioned, is caused by some Attracting Force, which is inherent in certain Sides of the Rays and of the Particles of the Chrystal. For if there were not some such Force or Virtue in some Part of the Chrystal, and not in the others, in order to differt and bend the Rays towards the Sides or Parts of Unusual Refraction, it could not be, that the Rays, which fall perpendicularly upon the Chrystal, should both in their Ingress and Egress be so refracted one way rather than another, as that they should also perpendicularly emerge by a now contrary Polition of the Place or Region of Unusual Refraction in the Surface of the second Chrystal; the Chrystal plainly acting upon the Rays after they have passed thro' it, and are got into the Air, or into a Vacuum.

And because the Chrystal, by that Force, doth not act on the Rays, but when the proper corre-founding Sides of the Rays of Light are turned towards the Places or Parts of Unnjual Refraction in the Chrystal, it appears that there is also some Force or Virtue in the Sides of the Rays themfelves, corresponding to that Force inherent in those Parts of the Chrystal, almost after the same manner as the two Poles of the Magnet answer to Which Virtue in the Magnet, as one another. it is capable of being increased and diminished, and is hot any where to be found but in the Magnet and in Iron; so this Virtue of the refracting Rays which fall perpendicularly upon it, is greater in the Island than in the Rock Chrystal, and is as

yet found no where else.

Not that he thinks this Virtue to be Magnetical; for it seems to be of a different Nature. But let it be what it will, it can scarce be conceived that the Rays of Light, unless they be allowed to be really Corpuscles or Particles of Matter, can have any fuch permanent Force in two of their Sides, and not have any fuch thing, at the fame time, in their two other; and this without any regard to the Position with which they respect the

Space or Medium thro' which they pais.

And yet tho' Light be certainly a Body, it is almost impossible to conceive the Smallness of its Corpuscles. But however, that they are exceeding minute, may be gathered from thele Confiderations: (1.) That they freely pervade all transparent Bodies, such as Chrystal, Glass, several Pebbles and Gems; and almost all Fluids, but Mercury; and pals where no other Fluid, how thin foever, can enter; and yet no Eye hath ever been able to discover the constituent Particles of the grossell Fluid. (2.) It may be propagated from innumerable different Luminous Bodies, without any confiderable Opposition to one another, as Dr. theyne shows by this Experiment: Suppose a Plate of Metal, having at the top the smallest Hole that can be made, were erected perpendicularly on an Horizontal Plane, and that about it were set innumerable Luminous Objects of about the same Height with the Plate, at an ordinary Diffance from it; then will the Light, proceeding from every one of these Objects, be propagated thro' this small Hole, without interfering. This will appear by applying a dark Object, in

a strait Line, against the luminous Body; for the Light of this Body will thro' the Hole be received upon the dark Body. Now it is impossible that so many different Streams of Light could be transmitted thro' so small a Hole, were not the Particles of Light extreamly little. To which may be added, (3.) That if they were not very minute Corpuscles, their amazing Velocity is such, that they would pierce thro all Kinds of solid Bodies almost as easily as they do Vacuities; whereas we see the Rays of Light to be regularly reflected from some Bodies. (4.) We find also that innumerable different Spheres of Light may be propagated from their several luminous Centres within our Horizon, without interfering. How many Millions of Candles and Flambeaus, sending all out their Tides of Light, is it possible for the Eye to see together, without their being confounded one with another? Which shews both the exceeding Smallness of the Particles of Light, and also the Largeness of the Vacuities between the Particles of Air and other Bodier.

How extreamly swift the Particles of Light move, may be gathered from the Experiment of Mr. Romer; wherein he finds that the Rays of Light pass from the Sun to us in about 10 Minutes of Time : And Mr. Hugens hath proved in his Cosmotheores, that a Bullet discharged from the Mouth of a Cannon, and not abating of its first Velocity, would be 25 Years before it reach the Sun. Now the Via percurfa being the fame in both, the Velocities will be reciprocally as the Times; that is, the Velocity of Light to that of a Cannon-Bullet, will be to that of a Cannon-Bullet, perfifting in its greatest Swiftness, as 25 Years to 10 Minutes; or as 1314700 is to one, nearly: So that the Motion of Light is above a Million of times swifter

than that of a Cannon Ball.

Moreover, the Distance between the Sun and Earth is at least 12000 Diameters of the Earth; but suppose it but 10000, then will Light run 1000 Diameters in a Minute, or 16; Diameters in a Second; that is, at least 130000 Miles in one Second; which is Motion almost incredibly and really amazingly swift. But the extraordinary Effects of Light and Heat feem to require all this; and we see how powerfully it acts (being congregated) on the most compact solid Bodies; and we never find any Abatement of its Force arising from a Diminution of its Velocity.

See Mr. Hanksbee's Experiments about the Production of Light in Vacuo by the Attrition of Bodies, in Phil. Trans. No 304, and in No 307; and by the Effluvia of one Glass falling on another in

Motion, Phil. Trans. No 309, 310.

LIGHTS. Ships of War are in the Night-time very well distinguished by the Lights that they hang out; for in a Fleet the Admiral carries three Lights on the Poop, and one on the Main-Top; the Vice-Admiral hath two on his Poop, and one on his Main-Top; the Rear-Admiral hath but one on his Poop, and one on his Main-Top; the Vice-Admiral of each particular Squadron bath only two on his Poop, but none on his Main-Top; the Rear-Admiral of each Squadron hath only one on his Poop. But when the whole Fleet carry their Lights, then the Rear-Admiral is distinguished by carrying two Lights, the one hoisted a Yard above the other, on the Ensign-Staff; and in case of foul Weather and a dark Night, every Ship must carry a Light.

LIGULA,

LIGULA, in our Latin Law fignifies a Copy, Exemplification, or Transcript of any Court Roll or Deed.

LIMBERS, in Gunnery, are a kind of Train joined to the Carriage of a Cannon upon a March. It is composed of two Shafts wide enough to receive a Horse between them (which Horse is called the Filles Horse.) These Shafts are joined by two Bars of Wood and a Bolt of Iron at the end, and have a pair of small Wheels: On the Axletree rifes a firong Iron Spike, on which the Train of the Carriage is put upon a March: But when a Gun is on Action, these Limbers are run out behind her.

LINE of the True Place of a Planet, is a right

Apparent of a Planet, is a right

Line drawn from Exe of the Spectator thro' the

Planet, and continued as far as the fixed Stars.

LINE of Measures, in the Stereographick Projection of the Sphere in Plano, is that Line in which the Plane of a great Circle, perpendicular to the Plane of the Projection and that oblique Circle which is to be projected, interfects the Plane of the Projection. Or it is the common Section of a Plane passing thro' the Eye Point, and thro' the Centre of the Primitive, and at right Angles, to any oblique Circle which is to be projected, and in which the Centre and Pole of such Circle will be found.

Line of Direction, of the Earth's Axis in the Pythagorean System of Astronomy, is the Line connecting the two Poles of the Ecliptick, and of the Equator, when they are projected on the Plane of the former.

LINE of the Section, in Perspective, is the Intersection or Contact of the Plane to be projected

with the Glass or Diaphanous Plane.

LINE of Lines, on the Sector, is a Scale of equal Parts on each Leg, and running from the Centre. This is divided actually into 100 equal Parts, and sometimes into more, when the Instrument is large. There are only the Figures 1, 2, 3 4, 5, 6, 7, 8, 9, 10, placed on the Lines; and therefore they sometimes stand for themselves alone, and sometimes fignify ten times, or an hundred, or a thousand times themselves, according as the Matter shall require.

The Uses of the Line of Lines. I. To increase or diminish a Line of any given Length, according to any Ratio required.

Suppose the Line were of Inches in length; apply it into the Sector by way of parallel Entrance, so that each Foot of the Compasses stand in 6 1 in Line of Lines, and then let the Sector be kept at that Angle. Then if you wou'd have it increased in the Proportion of 9 to 6; 5 or diminished in the Proportion of 2; to 6; 8c. let the Sector lie, and take with the Compas the parallel Distances between those Points of 9! and 91; or of 2? and 2?, in the Line of Lines of each Leg, and that will give you the Length required.

2. To divide a given Line into any Number of Parts; as suppose into 9.

Apply the Line over from g to g in the Line of Lines; and keeping the Sector of that Angle, take the Distance between 1 and 1, and that will be 4 Part of the Line.

3. To find what Proportion two or more Lines bear to one another.

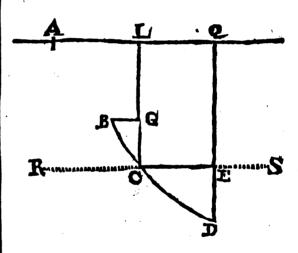

Apply the greater of greatest over from 10 to 10 at the ends of Lines; and then taking any of the other, and applying it over parallel to the former, it will mark out such Numbers as shall express its Proportion to the greatest Line: as suppose the Compasses pointed to 30 and 30; then will the greatest Line be to it as 100 i is to 30. &c.

4. To work Proportions with the Sector, proceed just as you do in finding a 3d or 4th Proportional to 2 or 3 Lines given Geometrically. See Proportion, Vol. I.

LINEA Celerrimi Descensus, is that Curve which a Body would describe in its Descent, if it moved the swiftest possible: The Investigation of which was first, I think, proposed as a Problem by Mr. John Bernoulli, and hath been solved by his Brother James, and several others; and very easily thus, by Mr. John Craig, in Phil. Trans. N. 268.

Suppose BC, CD, two infinitely small Parts of the Curve fought: Then, fince the Nature of the Curve is to be such, that the Descent of the Bo-

dy from B to D,

after its Fall from the Horizontal Line AQ, is to be in the least time possible; we must find in the Line RS (drawn parallel to AQ so, that the Differences between any two Ordinates to the Curve, as of GC, DE, may be equal) a Point

in which this must happen.

Now the Velocity of the Body in the Point C is = V: LC; and its Velocity in the Point D, as BC

:QD. Wherefore (V:LC) is=to the Time of the Descent thro' BC, as $\frac{1}{\sqrt{1000}} = 100$ to the Time of the Descent thro' CD. by Prop. 54. Newson, Princ. Wherefore the Point C must be such, as BC CD

that $\frac{BC}{\sqrt{:LC}} + \frac{CD}{\sqrt{:QD}}$ must be a Minimum, or the least possible. Suppose then the Points B and D to be fix'd; let GC (=DE) = m : LC = b, and QD = p; all invariable Quantities: and let the flowing Quantities BG = n : and CE = a.

Wherefore
$$\frac{\sqrt{:m^2 + n^2}}{\sqrt{:b}} + \frac{\sqrt{:m^2 + n^2}}{\sqrt{:p}} = \text{to a}$$

Mini-

Minimum. And consequently $+\frac{zz}{p_{\overline{z}}\sqrt{m^2+z^2}}=0. \quad \text{But } \dot{n}=-\dot{z} \text{ (because)}$ u + z = to an invariable Quantity.) Wherefore $\frac{u}{b \frac{1}{2} \sqrt{m^2 + u^2}} = \frac{z}{p \frac{1}{2} \sqrt{m^2 + z^2}}$: Wherefore 'tis plain that $\frac{u}{b \frac{1}{2} \sqrt{m^2 + u^2}} = \text{to an invariable}$ Quantity. Let then the Abscissa A L = x; the Ordinate LC = y: And therefore BG = x. GC = y. $BC = \sqrt{xx}$ and let a be any invariable Line. Then will $\frac{x}{y! \cancel{V}: xx + yy} = \frac{1}{\sqrt{a}}$ Wherefore $x\sqrt{a} = y \times V \dot{x} \dot{x} + \dot{y}\dot{y}$. But in

every Curve x is to Vxx + yy, as the Subtangent to the Tangent: Wherefore the Nature of this Curve is such, that the Subtangent is to the Tangent as \sqrt{a} , is to the \sqrt{y} , which is known to be the Property of the Cycloid; where the Tangent is parallel to the Chord of a Conterminous Ark in the generating Circle, whose Diameter is a, and its Vertex downward.

LINES of Superficies or Surfaces. See Surfaces.
LINES of Chords. See Chords.

LINES of Tangents. See Tangents. LINES of Secants. See Secants.

LINSTOCK, is a short Staff of Wood about 3 Foot long, having at one End a piece of Iron divided into 2 Branches, each of which hath a Notch to hold a piece of Match, and a Screw to fasten it there. The other End of the Staff is shod also with Iron, and pointed to stick into the Ground. Tis used by the Gunners in string Cannon.

LIQUID, is a Word used by the Civilians in this Sense, for a Thing's being apparently proved, as they say: A Creditor would be injur'd, should a Debr which is clearly due be stop'd, on the Pretence of another Debt that is not Liquid, or

apparently proved.

LIQUIDUM Nervorum, is that Juice or Fluid which Nerves carry in their Canals, and is

- usually called the Nervous Juice. LIVER. See Hepar.

LOAD, is the Miners Word, especially in the

Tin Mines, for a Vein of Ore.

LOCAL Colours, in Painting, are such as are natural and proper for each particular Object in a Picture; and they are so called to distinguish them from the Claro-Obscuro: Which see.

LOCATIO-Conductio, in the Civil Law, is a Contract of the Law of Nations, whereby the Use of a Thing, or the Service and Labour of a Person, is gained for some Time for a certain Reward.

LOCUS Resolutus, according to Pappus's Account of it in Libr. 700 Mathem. Coll. is, That it is a proper peculiar Matter, after the common Constitution of the Elements of Geometry, contrived for such Persons as would obtain a ready and easy Method of solving such Problems as shall be proposed to them. (See Resolution in Vol. I.) On this Subject Euclide, Apollonius Pegaus, Erasof-

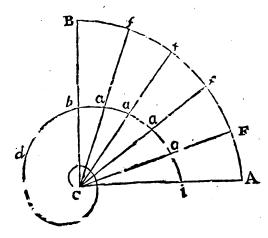

sbenes and Aristaus Senior, are the only Writers among the ancient Geometers. Euclide's Tracts are Datorum Liber Unus; Locorum ad Superficiem Duo; Porismatum Tres. Apollonius, de Settione Rationis (lately put out at Oxon by Mr. Halley) Libri Duo: De Sestione Spatii Libri Duo; Tastionum Libri Duo: Inclinationum Duo; Planorum Locorum Duo: Conicorum Offo. Of Aristaus, there were Locorum Solidorum Libri Quinque. And of Eratosthenes, Duo Libri de Medietatibus

There are two Kinds, faith Pappus, of this Refolution; one, where bare Truth in Theory only is pursued; which therefore he calls the Contemplative Method or Theoretic: and the other, where we investigate something which we propose to have done; and this is called the Problematic Method. What this Resolution or Analysis of the Ancients was, you may see in the Learned Mr. Halley's Edition of Apollonius de Settione Rationis abovementioned; and a good Attempt towards its Restitution in a Modern Spanish Author, Hugo de Omerique, his Analysis Geometrica, printed at Cales 1698.

LODEMANAGE, was anciently the Term for the Hire of a Pilot, when he conducted a Ship from Place to Place.

LODE-SHIP, was formerly the Name of a

fmall fishing Vessel. Vid. 31 E. 3. Stat. 3. c. 2. LOGARITHMICK-spiral, is a Curve generated by the equable Motion of the Radius of a Circle thro' equal Arks of the Circumference; while at the same time a Point in that Radius is supposed to move from the Ark towards the Centre, with a Retardation of Motion in a Geometric Proportion. As suppose there be a Quadrant of a Circle, as BCA, and any equal Divisions in the Ark, as AF = Ff = ff, &c. with 5 corresponding Radii, suppose as CA, CF, Cf, &c.

whole Parts or Portions 61, Ca, Ca, &c. are Geometrically proportional; then if a Line, as I, a, a, b, d, C, be drawn thro' those Points, it will be the Logarithmick-Spiral. Vid. Guido Grand. Theo-

rem. Hugen. Cap. 1.

LOGARITHMS. The Learned and Ingenious Mr. Halley, Savilian Professor of Geometry in Oxon. and F. R.S. hath in Phil. Transact. N' 216. and fince that, in Sherwin's Mathematical Tables, published a most compendious and easy Method of constructing the Logarithms; and this exemplified and demonstrated from the Nature of Numbers, without any regard to the Hyperbola, or any other Curves: Together with a speedy Method of finding the Number answering to any given Logarithm. See the Preface to Sherwin's Math. Tables, p. 14, &c.

A

TABLE

O F

LOGARITHMS

For Numbers increasing orderly from I to 10000, with their Differences.

Wherehy the Logarithm of any Number under 10000 may be readily taken.

The End of the Table of PROPORTIONAL PARTS.

AN

CCOUNT

OFTHE

Origine, Nature, Construction, Uses.

AND

Application of the preceeding TABLES

OF

IT R

HE Invention of the Logarithms is justly esteemed one of the most useful Discoveries in the Art of Numbers, and accordingly has had an universal Reception and Applause. And the great Geometricians of this Age have not been wanting to cultivate this Subject, with all the Accuracy and Subtilty as a Matter of that Consequence doth require; and they have demonstrated several very admirable Properties of these Artificial Numbers, which have render'd their Construction much more facile, than by those operose Methods, at fift used by their truly Noble Inventer, the Lord Neper; and our Worthy Country-Man Mr. Briggs.

But some Account however of the first Invention of these most useful Tables, 'tis proper to in-

troduce here.

Logarithms (saith Dr. Wallis in his Algebra) were first of all invented, without any Example be-fore him that I know of, by John Neper, Baron of Merchiston in Scotland, and by him published at Edinburgh, A. D. 1614. and soon after by him-felf (with the Assistance of Henry Briggs, Pro-fessor of Geometry, first at London in Gresham-College, and afterwards at Oxford) reduced to a better Form and perfected.

The Invention was greedily embraced (and defervedly) by Learned Men.

Mr. Briggs upon the first Publication of it, was fo pleased with it, that he presently repaired into Scotland, to consult the Author's Advice about it, and be assistant to him in the perfecting of it, and in calculating Tables for it; which was a Work of great Labour, as well as subtile Invention.

And it was embraced and promoted abroad by Benjamin Ursinus, John Kepler, Adrian Ulacq, Petrus Cragerus, and others.

And at home, by Henry Gellibrand, who perfected the Trigonometria Britannica, which Mr. Briggs

began, but died before he had finished it.

So that in a short time it became generally known, and greedily embraced in all Parts, as of unspeakable Advantage; especially for Ease and Expedition in Trigonometrical Calculations. Vol. II.

In the former Volume I have briefly shewn the Nature and Construction of Logarithms in general, which therefore I shall not repeat here; but go on with their History, and the several Improvements which have been made in this Science, some

of which are only barely hinted at there.

A. D. 1614. The Lord Neper published the first Tables of Canon, or Natural and Artificial Sines for each Degree and Minute of the Qua-

drant.

And whereas it was at his Choice to give to what Number he pleased the Logarithm o, and whether to proceed by Way of Increase or Decrease, he chose to make o the Logarithm of the whole Sine 10000000, that so the Multiplication or Division by the whole Sine (frequent in Trigonometrical Calculation) might be dispatched without Trouble, requiring here but the Addition or Subtraction of o

And because the Use of lesser Sines and Numbers less than the Radius or whole Sine, were likely to be of more frequent Use, than Tangents, Secants, and other Numbers greater than the Radius; he chose to give to those lesser Numbers Affirmative Logarithms (increasing the Logarithms from 0, as the Sines decrease) which he calls A-bundants: And consequently Negative Logarithms (which he calls Defectives) to greater Numbers. Designing those by +, these by

And by this means he directs how the Table of Sincs (with the Differences there inferted) may ferve also for a Table of Tangents, and of Secants; so that this Canon is a compleat Canon, of Natural Sines, and of Logarithmical Sines, Tan-

gents, and Secants.

He shews also how this Table may be applied to the Logarithms of Absolute Numbers; but becanse with some Trouble, he reserves the fuller Account hereof to a farther Treatife.

In the Year 1619, the Lord Neper being then dead, the same was again published by his Son Robert Neper; with some posthumous Treatises of his Father concerning the Construction of this Logarithmical Canon, and concerning his De-

Digitized by Google

fign (after Communication had with Mr. Briggs) of changing the Form of his Logarithms, making e, to be the Logarithm of 1, (of which he had before given Notice in the Preface to his Rabdologia, published in the Year 1617;) and concerning some things pertaining to Trigonometry; with some Lucubrations of Mr. Briggs on the

same Subject.

But the Lord Neper being dead the whole Work was devolved on Mr. Briggs, who (according to their joint Advice) making the Logarithm of 1 to be 0; and of 10, 100, 1000, &c. to be 1, 2, 3, &c. which he calls Indices, or Characteristicks, and which we may repute as Integer Numbers, with fourteen Cyphers annexed, and esteem or value as so many Places, or Decimal Fractions, below the Place of Units, or of the Characteri-ftick: And between these he sets the intermediate Logarithm for the Intermediate Numbers.

And consequently the Logarithm of 1 being 0, the Logarithm of Fractions less than 1, or of Numbers intermediate, between 1 and 0, must be Negative Numbers, or Numbers less than o, which he calls Defective Logarithms, denoted by

(the Note of Negative) prefix'd.

Now these Desective Logarithms may be two ways expressed; either so as that the Note of Negation shall affect the whole Logarithm, or so as to affect only the Characteristick, (leaving the Rest of the Logarithm to be understood as Af-

firmative.)

As for Example; The Fraction 3, or (which is equivalent) 0.375. This Fraction supposeth the Numerator 3 to be divided by the Denominator 8, which in Logarithms, is to be performed by Subtracting the Logarithm of 8, from that of 3, and the Remainder will be the Logarithm of 3, which will be then the Negative Number, -0.4259687.

Or thus; For as much as the Logarithm of 375, (supposing it to be an Integer Number) is 2. 5740313, And the depressing this to the First, Second or Third, or farther Place of Decimal Fractions, doth (without altering the Figures) divide the Value by 10, 100, 1000, &c. which in Logarithms is done by subtracting 1, 2, 3, &c. from the Characteristick, or Place of Integers (1, 2, 3, &c. in that Place being the Logarithms of 10, 100, 1000, &c.) such Alteration of the Value (the Figures remaining) is done by altering the Characteristick of the Logarithm, without varying the other Figures, in this Manner:

> Log. 3750=3. 5740313 375 = 2.574031337|5=1.57403133|75 = 0.5740313Log. Log. $0_{1375} = 1.5740313$ Log. 0|0375=2. 5740313

Which two Forms, tho' they seem different, and fome may rather chuse the one, some the other; or in some Cases the one, and in some Cases the other; yet they are in Substance and Value the

For, by sudducting the lower Number same. from the upper.

$$\begin{array}{r}
-1. & 0000000 \\
+0. & 5740313
\end{array}$$
is = -0. 4259687

And every one is left to his Liberty whether of the two Ways (or what other Equivalent there-

unto) he shall please to use.

In this Method Mr. Briggs hath calculated a Table of Logarithms (publifiled in the Year 1624) for 20 Chiliads of Absolute Numbers (from 1 to 20,000;) and again for 10 more (from 90,000 to 100,000) and one Chiliad supernumerary (viz. the Hundred and First Chiliad) that is, 31 Chiliads in all.

Before which is prefix'd a large Account of the Nature and Construction of the Logarithmical Canon, and the Uses thereof; and directing how to supply the intermediate Chiliads, which are here wanting. The whole intituled Arithmetica Logarithmica.

The same was again published in 1628, by Adrian Ulacq (or Flack) with a Supplement (as Mr. Briggs directed) of the Chiliads before omitted; that is, in all of 100 Chiliads, with one

Supernumerary.

But in shorter Numbers extended but to 10 Places below that of the Integers, or Characteri-And he subjoins also a Logarithmical Canon of Sines, Tangents, and Secants (for Degrees and Minutes of the Quadrant) of as many Places.

Mr. Briggs proceeded to calculate a Trigonometrical Canon, Logarithmical, suited to that for Absolute Numbers to the Logarithms extending (as in that other) to 14 Places besides the Characteristick. And having before calculated a Table of Natural Sines, Tangents, and Secants (for Degrees and Centesms of Degrees) in Number extending to 15 Places, he fitted thereunto a Canon of Logarithmical Sines, and Tangents (because those of Secants might be spared;) and a Treatise prefixed concerning the Construction thereof, with other Things pertinent thereunto: intending a further Treatife concerning the Use of it.

But dying before this last was finished, or the rest published, Mr. Henry Gellibrand supplied this latter, and published the whole with the Title of Trigonometria Britannica, in the Year 1633. To which is subjoin'd another Canon of Logarithmical Sines, and Tangents, by Adrian Olacq, for Degrees, Minutes, and Tenth Seconds, extending (as his former did) to 10 Places besides the Characteristick; and Mr. Briggs 20 Chiliads for Logarithms of Absolute Numbers.

So that the whole Doctrine of Logarithms was by this time sufficiently perfected, with convenient Canons or Tables fitted thereunto in large Numbers: Of which also Petrus Cragerus gives an Account in the Preface to his Trigonometria Logarithmica, Printed in the Year 1634, with his Lo-

garithmical Tables, but in short Numbers.

And the Table of Logarithms above-mentioned, (for 100 Chiliads of Absolute Numbers, and of Sines and Tangents to Degrees and Centesms) were the same Year (1633) contracted, into a lesser Form and more manageable (but in shorter Numbers, the former not extending to above 7

Places, beside the Characterifick, but the latter to 10) by Nathanael Row; with Directions for the Use of them (in Trigonometry, Geometry, Astronomy, Geography, and Navigation) by Edmund Wingate.

In the mean time, Benjamin Ursinus, did also publish Tables of Logarithms in the Year 1618; and Claudius Batschius about the same Time, or soon after. And again Benjamin Ursinus in the Year 1625, in his Trigonometria; and Johannes Keplerus also in the Year 1624, in his Chilias Logarithmorum (which he applies also to his Rudolphine Tables, published in 1627;) and Claudius Batschius about the same Time, or soon after: And Georgius Ludovicus Frobenius in the Year 1634, (and perhaps some others.)

But all or most of them in short Numbers, and conformable to the Lord Neper's first Design; not to that Form which upon second Thoughts he and Mr. Briggs agreed upon as most Eligible, and which hath since been received in common Pra-

ctice.

Thus far Dr. Wallis: What follows is the easie and compendious Method of Mr. Edm. Halley, Savilian Professor of Geometry in Oxon, for constructing Logarithms; which was mentioned in the former Volume.

The Invention, saith that excellent Geometer, of the Logarithms, is justly esteemed one of the most useful Discoveries in the Art of Numbers, and accordingly has had an universal Reception and Applause: And the great Geometricians of this Age have not been wanting to cultivate this Subject, with all the Accuracy and Subtilty which a Matter of that Consequence doth require; and they have demonstrated several very admirable Properties of these artificial Numbers, which have rendred their Construction much more facile, than by those operose Methods, at first used by their truly noble Inventor, the Lord Neper, and our worthy Country-man Mr. Briggs.

But notwithstanding all their Endeavours, I find very sew of those, who make constant Use of Logarithms to have attained an Adequate Nothin of them; to know how to make or examine them, or to understand the Extent of the Use of them; contenting themselves with the Tables of them, as they find them, without daring to question them, or caring to know how to Rectify them, should they be found amis; being I suppose under the Apprehension of some great Difficulty

herein.

For the Sake of fuch, the following Tract is principally intended, but not without hopes however, to produce something that may be acceptable to the most knowing in these Matters.

But first, it may be requisite to premise a Desinition of Logarithms, in order to render the ensuing Discourse more clear; the rather because the Old one Numerorum proportionalium aqui-differentes comites, seems too scanty to define them fully.

They may much more properly be said to be Numeri Rationum exponentes: Wherein we consider Ratio as a Quantitas sui generis, beginning from the Ratio of Equality, or 1 to 1 = 0; being Affirmative when the Ratio is Increasing, as of Unity to a greater Number, but Negative when Decreasing: And these Ratios we suppose to be measured by the Number of Ratiunculæ contained instead of 1 — ed in each.

Now these Ratiunculæ, are so to be understood,

as in a continual Scale of Proportions, infinite in Number between the two Terms of the Ratio; which infinite Number of mean Proportionals is to that infinite Number of the like equal Ratiunculae, between any other two Terms: as the Logarithm of one Ratio, is to the Logarithm of the other: Thus, if there be supposed between 1 and 10, an infinite Scale of mean-Proportionals, whose Number is 100000, &c. in infinitum; between 1, and 2, there shall be 30102, &c. of such Proportionals, and between 1 and 3, there will be 47712, &c. of them; which Numbers therefore are the Logarithms of the Rationes of 1, to 10, 1, to 2, and 1, to 3; and not so properly to be call'd the Logarithms of 10, 2, and 3.

But if instead of supposing the Logarithms composed of a Number of equal Ratiuncule, proportional to each Ratio; we shall take the Ratio of Unity to any Number, to consist always of the same infinite Number of Rassuncula; their Magnitude in this Case, will be as their Number in the former. Wherefore, if between Unity and any Number proposed, there be taken an Infinity of mean Proportionals, the infinitely little Augment or Decrement of the first of those Means from Unity will be a Ratiunculæ; that is, the Momentum or Fluxion of the Ratio of Unity to the faid Number: And seeing that in these continual Proportionals all the Ratiunculæ are equal; their Summ, or the whole Ratio, will be as the faid Momentum is directly; that is, the Logarithm of each Ratio, will be as the Fluxion thereof. Wherefore if the Root of any infinite Power be extracted out of any Number, the Differentiala of the said Root from Unity, shall be as the Logarithm of that Number.

So that Logarithms thus produced may be of as many Forms as you please, to assume infinite Indices of the Power whose Root you seek: As if the Index be supposed 100000, So. infinitely; the Roots shall be the Logarithms invented by the Lord Neper; but if the said Index were 2302585, So. Mr. Briggs's Logarithms would immediately be produced. And if you please to stop at any Number of Figures, and not to continue them on, it will suffice to assume an Index of a Figure or two more, than your intended Logarithm is to have; as Mr. Briggs did, who, to have his Logarithms true to 14, places by continual Extraction of the Square Root, at last came to have the Root of the 140737488355328th Power; but how operose that Extraction was, will easily be judged by whoso shall undertake to examine his Calculus.

Now though the Notion of an infinite Power may seem very strange; and (to those that know the Difficulty of the Extraction of the Roots of high Powers) perhaps imprasticable; yet by the Help of that admirable Invention of Six Isaac Newton, whereby he determines the Uncia, or Numbers prefixed to the Members composing Powers (on which chiefly depends the Doctring of Series) the Infinity of the Index contributes to render the Expression much more easie: For if the infinite Power to be resolved be put (after Sir Isaac

Newton's Method)
$$\frac{1}{m}$$
 or $\frac{1}{m}$ or $\frac{1}{m}$ $\frac{1}{m}$ instead of 1 $+$ $\frac{1}{m}$ $+$

 $1-6m+11m^2-6m^3$ (which is the Root when m is Finite) becomes $-q - \frac{1}{2m}q^2 + \frac{1}{3m}q^3 + \frac{1}{4m}q^4 + \frac{1}{4m}$ -q5, &c. m2, being Infinite, and consequently whatever is divided thereby vanishing. Hence it follows that — Multiplied into $q - \frac{1}{3} q^4 - \frac{1}{3} q^3$ - 4 94 + 191, &c. is the Augment of the First of our mean Proportionals between Unity and 1+q, and is therefore the Logarithm of the Ratio of 1, to 1 + q; and whereas the Infinite Index m, may be taken at Pleasure; the several Scales of Logarithms to fuch Indices will be as -; or reciprocally as the Indices. And if the Index be taken 10000, &c. as in the Case of Neper's Logarithms;

Again, if the Logarithm of a Decreasing Ratio be fought, the Infinite Roos of 1-q, or is $1 - \frac{1}{q} - \frac{1}{q^2} - \frac{1}{q^3} - \frac{1}{q^4} \frac{1}{5m}q^5 - \frac{1}{6m}q^6$ &c. whence the Decrement of the First of our infinite Number of Proportionals will be — into $q + \frac{1}{2}q^2 + \frac{1}{3}q^3 + \frac{1}{4}q^4 + \frac{1}{4}q^5$ $+\frac{1}{2}q^6$, &c. which therefore will be as the Logarithm of the Ratio of Unity to 1-q.

they will be simple $q - \frac{1}{2}q + \frac{1}{3}q^3 - \frac{1}{4}q^4 + \frac{1}{4}$

1 gi - 1 g6, &c.

But if m, be put 10000, &c. then the said Logarithm will be $q + \frac{1}{2}q^2 + \frac{1}{3}q^3 + \frac{1}{4}q^4 + \frac{1}{5}q^5 + \frac{1}{6}q^6$, &c. Hence, the Terms of any Ratio be-—, or the Difference diviing and b, q becomes ded by the lesser Term, when it's an Increasing Ratio; - when 'tis Decreasing, or as b to a. Whence the Logarithm of the same Ratio may be doubly expressed; for putting x, for the Difference of the Terms a, and b, it will be either $-\frac{1}{m} \times \frac{1}{b}$

But if the Ratio of a to b, be supposed to be divided into two Parts, viz. into the Ratio of a, to the Arithmetical Mean between the Terms, and the Ratio of the said Arithmetical Mean to the other Term b; then will the Summ of the Logarithms of those two Rationes be the Logarithm of

the Ratio of a to b; and substituting -- in-

stead of ----, the said Arithmetical Mean,

the Logarithms of those Rationes will be by the foregoing Rule;

foregoing Rule;

$$\frac{1}{m} \frac{x}{x^{2}} + \frac{x^{3}}{47} + \frac{x^{4}}{47} + \frac{x^{5}}{57^{5}} + \frac{x^{6}}{47^{6}} + \frac{x^{6}}{77^{7}} + \frac{x^{6}}{47^{6}} + \frac{x^{6}}{77^{7}} + \frac{x^{6}}{47^{6}} + \frac{x^{6}}{77^{7}} + \frac{x^{6}}{47^{6}} + \frac{x^{6}}{47^{6}} + \frac{x^{6}}{47^{6}} + \frac{x^{6}}{47^{6}} + \frac{x^{6}}{47^{6}} + \frac{x^{6}}{47^{6}} + \frac{x^{6}}{47^{6}} + \frac{x^{6}}{47^{6}} + \frac{x^{6}}{47^{6}} + \frac{x^{6}}{47^{6}} + \frac{x^{6}}{47^{6}} + \frac{x^{6}}{47^{6}} + \frac{x^{6}}{47^{6}} + \frac{x^{6}}{47^{7}} +$$

be the Logarithm of the Ratio of a to b; whose Difference is x, and Summ z. And this Series converges twice as swift as the former, and therefore is more proper for the Practice of making of Logarithms: Which if performed, is with that Expedition; that whereas x, the Difference, is but the Hundredth-part of the Summ, the first

Step --- fuffices to seven Places of the Loga-

rithm, and the second Step to Twelve. But if Briggs's first twenty Chiliads of Logarithms be supposed to be made, as he hath very carefully computed them, to fourteen Places; the first Step above is capable to give the Logarithm of any intermediate Number, true to all the Places of those Tables.

After the same Manner may the Difference of the said two Logarithms be very fitly applied to find the Log. of Prime Numbers, having the Logarithms of the two next Numbers above and below them: For the Difference of the Ratio of a, to 17, and,

of $\frac{\pi}{a}$ to b, is the Ratio of a b, to $\frac{\pi^2}{a}$; and half

of that Ratio is that of \sqrt{a} b, to $\frac{1}{a}$; or of the

Geometrical Mean to the Arithmetical. And consequently the Logarithm thereof will be the half Difference of the Logarithms of thole Rationes

$$\frac{1}{m} \frac{xx}{2 \cdot 7 \cdot 7} + \frac{x^4}{4 \cdot 7} + \frac{x^6}{6 \cdot 7} + \frac{x^8}{8 \cdot 7}, \, \text{Cc.}$$

Which is a Theorem of good Dispatch to find the

Logarithm of $\frac{3}{2}$.

But the same is yet much more advantageously performed, by a Rule derived from the foregoing;

and beyond which in my Opinion, Nothing better can be hoped. For the Rasio of ab, to $\frac{?^2}{4}$, or $\frac{ab}{4}$ $\frac{bb}{4}$ $\frac{ab}{4}$ $\frac{bb}{4}$ $\frac{ab}{4}$ $\frac{bb}{4}$ $\frac{ab}{4}$ $\frac{bb}{4}$ $\frac{ab}{4}$ $\frac{bb}{4}$ $\frac{ab}{4}$ $\frac{bb}{4}$ $\frac{ab}{4}$ $\frac{bb}{4}$ $\frac{ab}{4}$ $\frac{bb}{4}$ $\frac{ab}{4}$ $\frac{ab}{4}$ $\frac{bb}{4}$ $\frac{ab}{4}$ \frac{ab}

Here note, that — is all along applied to adapt

these Rules to all Sorts of Logarithms. If m be 10000, Sc. it may be neglected, and you will have Neper's Logarithms, as was hinted before; but if you desire Briggs's Logarithms, which are now generally received, you must divide your Series by

2.30258, 50929, 94045, 68401, 79914, 54684, 36420, 76011, 01488, 62877, 29760, 33328:

Or, multiply it by the Reciprocal thereof, Viz.

0.43429, 44819, 03251, 82765, 11289, 18916, 60508, 22943, 97005, 80366, 65661, 14454.

But to save so operose a Multiplication (which is more than all the rest of the Work)it's expedient to divide this Multiplicator by the Powers of x, or y, continually ; according to the Direction of the Theorem; Especially where x is Small and Integer, reserving the proper Quotes to be added together, when you have produced your Logarithm to as many Figures as you desire, of which Method I will give you a Specimen.

If the Curiosity of any Gentleman, that has Leisure, would prompt him to undertake to do the Logarithms of all Prime Numbers, under 100000 to 25 or 30 Figures, I dare assure him that the Facility of this Method will invite him thereto; nor can any Thing more easy be desired. And to encourage him, I here give the Logarithms of the first Prime Numbers under 20 to 60 Places, computed by the accurate Penn of Mr. Abraham Sharp (from whose Industry and Capacity) the World may expect in Time great Performances, as they were communicated to me by our common Friend Mr. Euclid Speidall.

N. Log.
2 0.30102, 99956, 63981, 19521, 37388, 94724, 49302, 67681, 89881, 46210, 85413, 10427

7 0.84509, 80400, 14256, 83071, 22162, 58592, 63619, 34835, 72396, 32396, 54065, 03635

11 1.04139, 26851, 58225, 04075, 01999, 71243, 02424, 17067, 02190, 46645, 30945, 96539

13 1.11394, 33523, 06836, 76920, 65051, 57942, 32843, 08197, 29188, 38706, 82718, 01191

1.23044, 89213, 78273, 91854, 01698, 94328, 33703, 00075, 67378, 42504, 63973, 80368

19 1.27875, 36009, 52828, 96153, 63334, 75756, 92931, 79511, 29337, 39449, 75989, 06819.

The next Prime Number is 23, which I will take for an Example of the foregoing Doctrine; and by the first Rules the Logarithm of the Ratio of 22 to 23, will be found to be either

As likewise that of the Ratio of 23 to 24, by, a like Process.

$$\frac{1}{23} - \frac{1}{1058} + \frac{1}{36501} - \frac{1}{1119364} + \frac{1}{32181715}, &c.$$
or $\frac{1}{24} + \frac{1}{1152} + \frac{1}{41472} + \frac{1}{1327104} + \frac{1}{39813120}$

And this is the Refult of the Doctrine of Mercasor, as improved by the Learned Dr. Wallis.

But by the second Theorem, viz, $\frac{2x}{7} + \frac{2x^3}{7} + \frac{2x^5}{7}$, 3c. The same Logarithms are obtained by sewer Steps; To wit.

$$\frac{2}{-45} + \frac{2}{273375} + \frac{2}{922640625} + \frac{2}{2615686171875}, 6c.$$

$$\frac{2}{47} + \frac{2}{311469} + \frac{2}{1146725035} + \frac{2}{3546361843241}$$

$$\mathcal{C}_{c}.$$

Which was invented and demonstrated in the Hyperbolick Spaces analogous to the Logarithms.

by the Excellent Mr. James Gregory, in his Exercitationes Geometricæ; and fince further profecuted by the aforesaid Mr. Speidall, in a late Treatise, in English, by him published on this Subject. But the Demonstration, as I conceive, was never till now perfected, without the Consideration of the Hyperbola, which is a Matter purely Arithmetical, as this is, cannot so properly be applied. But what follows, I think I may justly claim as my own, viz. That the Logarithm of the Ratio of the Geometrical Mean to the Arithmetical between 22 and 24, or of $\sqrt{528}$ to 23, will be found to be either,

$$\frac{1}{1058} + \frac{1}{1119364} + \frac{1}{888215334} + \frac{1}{626487882248}, &c. or, & \frac{1}{1057} + \frac{1}{1057}$$

All these Series being to be multipled into 0.4342944819, &c. if you design to make the Logarithm of Briggs. But with great Advantage with Respect of the Work, the said 4342944819, &c. is divided by 1057, and the Quotient thereof again divided by three Times the Square of 1057, and that Quotient again by f of that Square, and that Quotient by thereof, &c. till you have as many Figures of the Logarithm as you desire. As for Example, the Logarithm of the Geometrical Mean between 22 and 24, is found by the Logarithms of 2, 3, and 11 to be

1.3613!696126690612945009172669805 41087462810146814347315886368 12258521544181829460074 6583235184376175 4208829765

Summ 1 . 36172783601759287886777711225117

From the Logarithm given to find what Ratio it

Which is the Logarithm of 23, to 32 Places, and obtained by five Divisions only, with very small Divisors; all which is much less Work, than simply multiplying the Series into the said Multiplicator 43429, Sc.

Before I pass on to the Converse of this Problem, or to shew how to find the Number appertaining to a Logarithm assigned, it will be requisite to advertise the Reader, that there is a small Mistake in the aforesaid Mr. James Gregory's Vera Quadratura Circuli, and Hyperbola, published at Padua, Anno 1667, wherein he applies his Quadrature of the Hyperbola, to the making of the Logarithms: In p. 43. he gives the Computation of the Lord Neper's Logarithm of 10. to 25 Places, and finds it 2302585092994045624017870, instead of 2302585092994045684017991; erring in the eighteenth Figure, as I was assured upon my own Examination of the Number I here give you, and by Comparison thereof, with the same wrought by another Hand, agreeing therewith to 57 of the 60 Places.

Being desirous to be satisfied how this Difference arose, I took no small Trouble of Examining Mr. Gregory's Work; and at length sound that in the inscribed Polygon of 512 Sides in the eighteenth Figure was a 0, instead of 9, which being rectified, and the subsequent Work corrected therefrom, the Result did agree to a Unit with our Number. And this I propose not to cavil at an easy Mistake in managing of so vast Numbers, especially by a Hand that has so well deserved of the Mathematical Sciences; but to shew the exact Co-incidence of two so very differing Methods to make Logarithms, which might otherwise have been questioned.

m⁵

L⁵, &c. will be any infinite Index when the garithm what it will.

expresses, is a Problem, that has not been so much considered as the Former, but which is solved with the like Ease, and Demonstrated by a like Process, from the same general Theorem of Sir Isaac Newton: For as the Logarithm of the Ratio of 1, to 1+q, was proved to be 1+q $\frac{1}{n-1}$, and that of the Ratio of 1, to 1-q, to be $1-1-q^{\frac{1}{m}}$: So the Legarithm which we will from henceforth call L, being given 1+L, will be equal to $\overline{1+g}$ in the one Case; and 1-L, will be equal to $1 - q|^{n}$, in the other: Consequently $\overline{1+L|_{-}^{\frac{1}{m}}}$ will be equal to 1+q, and $\overline{1-L|_{-}^{\frac{1}{m}}}$ to 1-q; that is, according to Sir Isaac Newton's faid Rule, 1 + m L + - L2 + - L3 + $-L^4 + - L^5$, C_c , will be equal to 1 + q, and $I - mL + \frac{m^2}{2}L^2 - \frac{m^3}{2}L^3 + \frac{m^4}{2}L^4 - \frac{m^4}{2}L^4$ LI, \mathfrak{C}_c will be equal to 1-q:m, being any infinite Index whatsoever; which is a full and general Proposition from the Logarithm given to find the Number, be the Species of Lo-

But

But if Neper's Logarithm be given the Multi-plication by m is faved (which Multiplication is indeed no other than reducing the other Species to his) and the Series will be more simple, Viz.

ries especially in great Numbers converges so slowly, that it were to be wished to be contracted.

If one Term of the Ratio, whereof L is the Logarithm, be given, the other Term will be had easily by the same Rule: For if L were Neper's Logarithm of the Ratio of a the lesser to b the greater Term ; b would be the Product of a into

$$\frac{L^{2}}{1 + L - \frac{L^{3}}{2} + \frac{L^{3}}{6}}, &c. = a + aL - \frac{aL^{3}}{2}$$

$$+ \frac{aL^{3}}{6}, &c. & But if b were given, a would be$$

$$bL^{3}$$

equal
$$b = bL + \frac{bL^2}{2} - \frac{bL^3}{6}$$
, &c. Whence by

the help of the Chiliads, the Number appertaining to any Logarithm, will be exactly had to the utmost Extent of the Tables. If you seek the nearest, next Logarithm, whether greater or lesser, and call its Number a, if lesser, or b if greater; then the given L, and the Difference thereof from the said nearest Logarithm you call 1; it will follow that the Logarithm L, answering to the Num-

ber, will be either a into
$$1 - l + \frac{l}{2} + \frac{l}{4} +$$

Series will converge the swifter. And if the first 20000 Logarithms be given to fourteen Places, there is rarely Occasion for the three sirst Steps of this Series, to find the Number to as many Places. But as for Ulacq's great Canon of 100000 Logarithms, which is made but to ten Places; there is scarce ever need for more than the first Step a + al, or a + m a l, in one Case; or else b - bl, or b m bl in the other, to have the Number true, to as many Figures as these Logarithms consist of.

· If future Industry shall ever produce Logarithmick Tables to many more Places than now we have; the aforesaid Theorems will be of more Use to deduce the correspondent natural Numbers to all the Places thereof.

In Order to make the first Chiliad to serve all Uses, I was desirous to contract this Series, wherein all the Powers of l are present, into one; wherein each alternate Power might be wanting, but found ir neither fo simple or uniform as the other; yet the first Step thereof is, I conceive, most commodious for Practice, and with all exact enough

for Numbers not exceeding fourteen Places, such as are Mr. Briggs's large Tables of Logarithms; and therefore I recommend it to common Use.

It is thus;
$$a + \frac{al}{1 - \frac{l}{2}}$$
, or $b - \frac{bl}{1 + \frac{l}{2}}$, will be

the Number answering to the Logarithm given, differing from the Truth by half the third Step of the former Series. But that which renders it yet more eligible, is that with equal Facility, it serves for Briggs's, or any other fort of Logarithms, with the only Variation of Writing, instead of 1,

the only Variation of Writing,
$$\frac{1}{m}$$
 instead of 1,

a l

that is $a + \frac{a}{1} - \frac{1}{2}$, and $b - \frac{b}{1} - \frac{1}{2}$, or $\frac{1}{m} - \frac{1}{2}$
 $\frac{1}{m} b - \frac{1b}{2}$

and $\frac{1}{m} + \frac{1}{2}$, which are easily resolved into Analogies. Viz.

logies, Viz.

As 43429, $\Im c. - \frac{1}{1}$: to 43429 $+ \frac{1}{4}$:: so is a to the Number sought. Or, As 43429, Sc. $+\frac{1}{2}$: to 43429 $-\frac{1}{2}$:: so is b to the Number sought.

If more Steps of this Series be defired it will be found as follows.

$$a + \frac{al}{1 - \frac{l}{5}} - \frac{\frac{1}{15}al^5}{1 - l} + \frac{\frac{1}{15}al^5}{1 - 2l}, \ \&c. \ As$$

may easily be demonstrated by working out the Divisions in each Step, and collecting the Quotes, whose Summ will be found to agree with our former Series,

Thus, I hope, I have cleared up the Doctrine of Logarithms, and shewn their Construction and Use independent from the Hyperbola, whose Affections have hitherto been made Use of for this purpose; tho this be a Matter purely Arithmetical, nor properly demonstrable from the Principles of Geometry; nor have I been obliged to have Recourse to the Method of Indivisibles, or the Arithmetick of Infinities; the whole being no other than an easy Corollary to Sir Isaac Newton's General Theorem for forming Roots and Powers.

How easily and compendiously Logarithms may be made according to this Method of Mr. Halley's, as also from the Quadrature of the Hyperbola; the Reader may be fully fatisfy'd from Mr. Hen. Sherwin's Introduction to his Excellent Mathematical Tables, Lond. 1705. where also is a Method for computing the natural Sine, Tangent, or Secant of any Arch, immediately from having only the Length of the Arch given, &c.

Some further Uses of the Logarithms not mentioned in Vol. I.

1. To find the Arithmetical Complement of a Logarithm.

Suppose 2.5065050 Begin at the Left-hand & Its Compt. Arith. 7.49349410 write down under it the Complement of each Figure to 9, but of the last to 10.

N. B.

N B. This is all one with subducting the Loga- Arithmetical Complements, will answer the End rithm from 10. 0000000. And its frequently of as truly as subtracting the Logarithms themselves. good Use to take the Complement Arithmetical of a Logarithm instead of the Logarithm it self; especially when there are Two or more Logarithms in had this Question about Interest. any Case to be subtracted : For then adding their

As suppose in the double Rule of Three, you

What is the Interest of 5173 l. for 321 Days at 6 l. per Centum?

Write down first the Arith. Comp. of the Logarithm of 100 = 8.000000 Next under it the Arith. Comp. of the Logarithm of 365 = 7.4377071 The Logarithm of The Logarithm of the Principal 5173 = 3.7137425 321 = 2.5065050The Logarithm of the Days

The Summ of all is the Answer = 2.4361058

For rejecting the first 2 in the Characteristick you will find the Number answering to the Logarithm 2.4361058 to be 272 l. 964. and Reason will direct you where to make your Decimal Points in the Numder 272964; for the Interest in that Time can't be so much as 2729 l. nor so little as 27 1. As well as the Rule determines that Number to confift of 3 Places of Integers, whose Characteristick is 2.

Therefore the remaining Figures .964 are a Decimal of a Pound, expressing something more than 19 Shillings.

2. And indeed all Questions of Interest are very eafily and expeditiously answered by the Logarithms.

As suppose; At 6 l. per Cent. what is the Interest of 15 l. 7 s. 6 d. for 12 Years?

Write down first the Logarithm of 1.06 which expresses = 0.0253058 the Rate of Interest.

Which Logarithm multiplied by 12 makes = 0.303669**6** Then write down the Logarithm of the Principal, Viz. of the Decimal 15. 875 = 1.2007137

The Summ of which Two last Logarithms added into one Summ = 1.5043833

> which is a Logarithm answering to the absolute Number, a Decimal expressing 31 l. 18 s. 10 d. $\frac{1}{2}$ q. nearly.

3. It will be very necessary rightly to understand the Use of the Tables of Logarithms with Numbers from 1 to 10, to be 10 or 100, from regard to Decimal Fractions. For the Rule for finding the Logarithm of a Fraction being; To fubtract the Logarithm of the Denominator, from the Logarithm of the Numerator, and to take the Remainder as the Logarithm of the Fraction required : That Logarithm of the Remainder, must always be the Logarithm of a Decimal Fraction, whose Value is the same with that of a Vulgar Fraction proposed.

Wherefore the most natural, easy, and useful Way to find the Logarithm of a Fraction is this:

Suppose the Index of the Logarithms of all 10 to 100, to be 11 or 101, from 100 to 1000, to be 12 or 102, from 1000 to 10000, to be 13 or 103, and so upwards: This being allowed, the Index of the Logarithm of a Number, one Place below Unity must be 9, or 99; if two Places below Unity, it must be 8, or 98; if three Places below Unity, it must be 7, or 97; if sour Places below Unity, then the Index must be 6, or 96; the Latter of these Ways is often convenient to distinguish the Index of a whole Number, from that of a Decimal Fraction, and often necessary when the Power of the Root of a Decimal Fraation is required.

Example, The Logarithm of \(\frac{1}{4} \) is found thus: 3 Log. 0.4771213

From which Subtract the Denominator, 4 Log. 0.6020600 From which Subtract the Denominator,

The Remainder is the Logarithm of .75 Log. -9.8750613

Note, That the Denominator of a proper Fraction, is always greater than its Numerator; so that supposing the Index of the Logarithm of 3, to be 10, or 100, the Index of the Remainder will be 9, or 99, (that is one Place below Unity) and the Rest of the Logarithms, except the Index, is found in the Table of Logarithms to an-Iwer to 75, 750, 7500, 075, 75, or any other

Number, whose two significant Figures are 75, and those which follow or preced, all Cyphers. It was the former of these Ways by which Mr. Briggs and Mr. Gunter made the Characteristicks of their Tables of Logarithmetick Sines, and Tangents; where it may be noted, when the natural Sine or Tangent, is a Decimal Fraction only, the Index is under 10; but where it is a mixt Num-

Digitized by Google

ber, there the Index is 10, or more: For Example, The Natural Tangent of 5 Degrees is .0874887, the Artificial 8. 9419518; and the Natural Tangent of 85 Degrees, 11.430052, the Artificial is 11, 0580482.

But it is needless to use these new Indices, except some Term given ot sought, be less than an 4. To find the Logarithm of a Mixt Number.

Reduce the Number given into an Improper Fraction, then subtract the Logarithm of the Denominator, from the Logarithm of the Numerator, the Remainder is the Logarithm fought.

Example, Let 42 be the Mixt Number given; this reduced to an Improper Fraction is 17.

The Logarithm of the Numerator, viz. 57, is 1. 7558748 The Logarithm of the Denominator, viz. 12, is 1. 0791812

The Loarithm of $4\frac{2}{13}$, = $4\frac{75}{100}$, whose Logarithm is 0. 6766936

If the Fraction annexed be a Decimal, teek for in the whole Number to which it belongs; which it as if it were a whole Number, observing to is further illustrated by the adjoyning Table, prefix to its Logarithm a suitable Index; which where the Logarithms, except the Index, are the always is an Unit less than the Number of Places, same in these Eight Examples.

The Index of the Logarithm of 47500 is 4, because the Absolute Number consists of 5 Places, for the same Reason in 475, the Index of its Logarithm is 2, in 47.5 it is 1; but the Index of a Proper Decimal Fraction is so many Units as the Cyphers before it wants of 9, or 99; so the Index of .0475 is 8, or 98, and of .00475 is 7,

Numbers. Logarithms. 47500 1 4. 6766936 4750 6766936 6766936 475 6766936 47.5 0. 6766936 4.75 9.6766936 8.6766936 .475 | 99, or, .0475 | 98, or, 8.6766936 .00475 | 97, or, 7.6766936

Of raising Powers by Logarithms.

Multiply the Logarithm of the Number given by she Index of the Power required, the Product will be the Logarithm of the Power Sought: So the Logarithm of $32 = 1.5051500 \times 3 = 45154500$, the Logarithm of 32768, which is the Cube of 32.

In the Multiplication, or Raising of Powers, viz. Squaring, or Cubing, &c. of any Decimal Fraction by Logarithms; the Index of the Logarithm of the Product or Power, must consist of so many Units, as the Number of Cyphers inter-cepted between the Place of Units, and the first fignificant Figure in the natural Number wants of 9, 99, 999, &c. only to the Index of the Logarithm of the Power (i. e. the Square, or Cube, &c.) there will be such a Figure presix'd as wants an Unit of the Index of that Power, or Number, by which the Logarithm was multiplied: For

Example, Let the Cube of .009 be required; the Logarithm of .009 is 7. 9542425 × 3 = 23. 8627275 = .00000729, the Cube of .009, and the Index of the Logarithm of the Power, or Product is 3; therefore 6 Cyphers must preced the first fignificant Figure of the natural Number; and 2, is prefix'd fince the Index or Number multiplying was 3. But when the Number of Cyphers, preceeding the fignificant Figures of the Power or Product exceeds 10, its necesfary to admit another Figure into the Index of the Logarithm, and make it the Complement to a Hundred: As suppose the 6 Power, or the

Cubo - Cube of the Sine of o-1 be requir'd its Logarithm in the Table is 4637261; but in Vol. IL

this Case must be 96. 4637261, which multiplied by 6, the Index of the Power proposed, becomes 578. 7823566, whose Index being 78, subtracted from 99, leaves 21 for the Number of Cyphers, that must preceed the first Figure of the natural Number or Power, which is gures preceeding the Index, as the Result of the Multiplication is 5, less by an Unit than the Number multiplying, being 6, the Index of the

This suggests a certain Rule for Extracting the Roots of Fractions by the Logarithms; Viz. Prefix a Figure to the Index of the Logarithm of the Number whose Root is to be Extracted, less by an Unit than the Index proper to the Root required, which is to be the Divisor; then Divide the whole Logarithm together with its Index whose Logarithm is 78. 7823566, be demanded; prefix 6—1, i. e. 5 to its Index, it is then 573. 7823566; which being divided by 6, the Index proper to the Root fought, the Quotient is 96. 4637261, whose natural Number is .0002908882; 3 Cyphers preceding the first Figure, because the Index 96, wants so much of 99. But when the Root of an absolute Number 199. ber is required, there needs no Figure to be pre-fixed to the Index of its Logarithm; fince it is always supposed, that the Index of the Power (which must be the Divisor) preceeds it. Ex. Gr. If the Cube-Root of 6751269, whose Logarithm is 6. 82993854, be required; it is an Kkk

indifferent Thing, whether 3, the Index of the Root to be Extracted, be prefixed or not, fince that alters Nothing: For 3)36. 82993854(Quotes 12. 2764618, the Logarithm of 189, the Cube-Root fought.

Another Method to Raise any Powor of a Decimal Fraction.

Multiply the Arithmetick Complement of the Logarithm of the Fraction given by the Index of the Power required, the Arithmetick Complement of the Product is the Logarithm of the Power fought: For inftance the .625 Power of .0032 is found to be .0275879.

.0032 Logarithm 7. 5051500 Arithmetick Complement 2. 4948500 Multiply by .625

> 124742500 49897000 149691000

Product 15592812500

Its Arithmetick Complement 8.4407187500

Note, That so many Cyphers must the Logarithm of .0275879, preceed the Fraction as the Index of its Logarithm wants Units of 9, or 99, which in this Example is one, and in the next 15, quired.

being always the same Number with the Index of the Product.

Again, Let the 6. 25 Power of .0032 be fought: The Logarithm of .0032 (as before) is 7. 5051500, and its Arithmetick Complement 2. 4948500 x 6. 25 = 15. 5928125, its Arithmetick Complement is 84. 4071875, which answers to .00000, 00000, 25538, which is the 6. 25 Power of .0032.

To extract any Root of a Decimal Fraction.

Divide the Arithmetical Complement of the Logarithm of the Fraction given, by the Index of the Root required, the Arithmetical Complement of the Root fought: For inftance, let the .625 Root of .0275879 be required, its Logarithm is 8.4407188, and its Arithmetical Complement = 1.5592812 Divided by .625, the Quotient is 2.4948500, and its Arithmetick Complement is 7.5051500 the Logarithm of .0032, which is the Root required.

Again, Let the 6. 25 Root of .00000, 00000, 00000, 25538 be required, its Logarithm is 84. 4071875, and its Arithmetick Complement is 15. 5928125, Divided by 6. 25, the Quotient is 2. 4948500, and its Arithmetick Complement is 7. 5051500, the Logarithm of .0032 the Root required.

LOGISTICA Lines, is that which is otherwife called the Logarithmick Line; where the Ordinates apply'd in equal Parts of the Axis are in Geometrical Proportion.

LOGISTICK Spiral. See Logarithmich

LONGITUDE of a Place, is only the Distance counted in the Equator between its Meridian, and the first; or indeed between that and any other: It may be found by the Difference of Time between the coming of any Point in the Heavens first to one Meridian and then to the other. For every 15° of the Equator answering to an Hour in Time, one Degree of it being 4 Minutes of Time, and one Minute of a Degree there being 4 Seconds of Time; and 15 Minutes one Minute of Time. The Difference of Time being mrned into Degrees will truly give the Longitude, or Vice Verso. Hence several Ways have been thought of to find the Longirude at Sea; the great Desideratum of the Art of Navigation. As by the Eclipse of the Moon, her Transis over or Appulse to any eminent fix'd Star; the Eclipses of Jupiter's Satellites, &c. which are all true in Theory, and may be practifed a-shore with the greatest Exactness. For the Time of any one of these Phanomena being truly calculated for the Meridian of London (suppose, or any other:) And Tables may be easily made of all of them, which the Navigator may carry to Sea with him. If then he could but observe the Time of the Eclipse or Transit at Sea with accurate Exactness, the Difference of Time of the Eclipse happening to him sooner or later than at London, would give him the exact Longitude of the Place of the Ship either East or West from the Meridian of London. But the Misfortune is, such an Observation of an Eclipse, and the exact Time of the Impression or Emersion of the desicient Body into or out of the Shadow, is not to be made without Telescopes of fuch a Length as the Metion of the Ship will not ermir to be used at Sea. Tho, by the by, if Ships were sent with good Instruments and Men that know how to use them, to do this at all the Capea and Head-lands of the World, it would be a Thing of the greatest Use; and by settling the Longitude of all those Places, would cut all long Voyages into many short ones, and afford means of continually rectifying the dead Reckoning at Sea. But to return: Others being fully satisfied of the Improductableness of the Method of Eclipses for finding the Longitude at Sea; have happily thought of doing it by a Clock of Watch: Which if indeed it could be made to go right all the Time of a long Voyage, would infallibly give the Longitude at any Time when the true Hour of the Day or Night could be had under any Meridian or in any Place of the Earth: For the Clock going true for the Meridian it was first fer at, will shew the true Hour exactly in that Place, and then the true Hour being found by the Sun or Stars in the Place where the Ship is, the Difference between that and the Clock's Hour, will be the Difference of Meridians in Time, or Longitude in Degrees. But no such Movement hath ever yet been made, and I fear scarce ever will, which will keep going, and going true in all Climates, and especially in some of the Southern ones; where the Dews are so great as to rust the Parts of it, and so retard, if not Rop its Motion enfrom the Motion of the Ship, Because I believe that may be obviated, and a Movement made to go true notwithstanding that, as perhaps the World may see in some Time, there being now some very ingenious and skillful Heads and Hands employing themselves that Way. But in the mean while, I judge the best Way would be to depend on the Movement only for 24 Hours; for if it will go true for so long by the Motion of the fix'd Stars, it may be rectifyed every Day to the Stars or Sun's Hour; and so will show the Difference of Longitude the Ship hath gained in that Time. How the Seamen find their Departure of Longitude by Trigonometrical Calculation, you will find in Plain and Mercators Sailing.

LOOP, in the Iron Works at the Forge; is the Term for about 4 of C. Ib. of Iron which is melted and broken off from a Sow in the Fire of the Pinery, and at last is brought into a Bloom. This

Work they call Shingling the Loop.
LOOP-HOLES, are Holes made in the Comings of the Hatches of Ships, and in their Bulkheads, to fire Muskets thro' in a close Fight; and the same are they in the covert Defences of all Fortifications.

LOPHIA, a Term in Anatomy, for the upper Part of the Cervix, or back Part of a Humane

LOQUELA fine dle, was formerly the Term for an Inparlance or a Respite in Law; or for a Demur to an Indefinite Time.

LOT, or Lotbe, is every thirteenth Dish of Lead in the Derby-shire Mine, which is a Duty

paid to the King

LOURGULARY, is a Word in Statute pro Stratis Lond. printed A. D. 1573. Art. 43. and then fignified, casting any corrupt Thing into it, to spoil or poyson the Water.

LUCRATIVE Interest, in the Civil Law, is fuch as is paid where there hath been no Advantage made by the Debtor, and no Delay nor Deceit in him. This is condemned by both the Civil and Canon Law.

LUNDRESS, did formerly fignify a Silver Penny; or a Sterling or Easterling in a restrained Sente, and was so called, because coined only at: London and not at the Country Mints.

LUNE or Lunula. In Phil. Trans. N. 265. you have a Way to find the Dimensions of the Solids, which will be formed by the Revolution of the Lunes of Hippocrates of Scio, by Mr. Abr. de

LUNGS. These Organs of Respiration are seated in the middle of the Cavity of the Thorax; and divided into two Lobes by the Mediastinum, of which, the left is ordinarily subdivided into 2 The Figure of both Lobes together resemble the Foot of an Ox or Cow, being a little concave between the 2 Lobes, where they embrace the Heart; and behind, wherethey lie upon the Vertebra: But before, where they touch the Sternum and Ribs, they are Convex.

The Colour of the Lungs in a Fatus is of a pale Red; but after the Air hath once entred into them they lose their Red, and remain always pale; yet' in adult Persons, they are often variegated with

the one and the other,

They are tied to the Sternum by the Mediasti-num before, and to the Vereebra by the Plura behind, when it rifes from the Vertebræ to the Heart, airely, I don't mention the Inconvenience arising by the Vena and Arteria Pulmonaris; and some-Kkk 2

times to the Pleura, where it covers the Ribs, particularly in the left Side, and especially after

Pleurily.

The Lobes of the Longs are covered with a double Membrane; of which the External is a Production of the Pleura; and the Internal, not only covers immediately the Subfance of the Longs has in inner Longing fill up the Interffices. Lungs, but its inner Lumina fill up the Interftices which are below the Bunches of the small Lobes with little veneular Cells: The fine Capillary Blood-Vessels are so thick upon this Membrane, that it seems to be Nothing but a Net-work of Veins and Arteries.

The Substance of the Lungs is composed of an infinite Number of little Lobes of various Figures and Magnitudes; but their Surfaces are so adapted to one another, as to leave but very few, and

those small Interstices.

These Lobes are disposed like so many Bunches of Grapes upon the Sides of the Bronchia. little Lobe contains within its own proper Membrane an infinite Number of little orbicular Vei-Sels, which leave small Interstices between them; and which are full of small Membranes, like shole which tie the Lobes together.

The Extremities of the Branches of the Windpipe open into the Cavities of Vesicles, which are probably formed by its Membranes; but the Capillary Blood-veffels are only spread upon the Vescles like a Net, with frequent and large Inoscu-

lations.

The Vessels which enter the Lungs are the Traches or Aspera Arteria, by which we draw in and expire Air: And the Arteria Pulmonalis, which comes from the Right Ventricle, and the Vena Pul-menalis, whose Trunk opens into the left Anricle of the Heart: Each of these divides into two Branches, for the two great Lobes of the Lungs, where they are subdivided into as many Branches as there are little Lobes or Vesicles in the Lungs. Whete-ever there is a Branch of the Trachaa, there is also a Branch of the Vein and Artery, and the Trachas is always in the middle.

On the Branches of the Trachaa (which they call the Bronchi or Bronchia) runs a small Artery called by Ruysh, Arteria Bronchialis, and a small Vein, which Somnichellius calls Vena Pneus The Artery comes from the Aorta, the Vein from

the Subclavian.

The Blood in the Arteria Pulmenalis being of the Nature of Venal Blood, and all Secretion being performed in the Arteries, the Nourishment for the Lungs must be brought by the Arteria Bronchialis: And there is the same Contrivance for the Nourishment of the Liver.

Upon the Bronchia, even to their minutest Ramifications, run likewise the fine Thread of the

eight Pair of Nerves.

Besides these, the Lungs have also Lympherich; which discharge themselves into the Thoracick Du&; but they are smaller, and make more frequent Inolculations, almost than any other.
This is the Passage of the Vessels thro the Lungs;

but because the Trachaa hath a particular Stru-Aure, it demands a particular Examination.

The Traches then, or Aspers Arteris, is a Canal fitnated in the first part of the Neck, before the Oesophagus; its upper End is called Larynx, from whence it descends to the 4th Versebra of the Back, where it divides and enters the Lungs; this Canal is made of Annular Cartilages, at imall

and equal Diftances from one another: And these grow smaller fill as they approach the Lungs; and those of the Bronebi are so close to one another, that in Expiration, the second enters with the first, and the third with the second, and so the following always enters into the preceeding

Betwixt the Larynx and the Lungs, these Cartilages make not compleat Rings; but their hinder Parr, which is contiguous to the Oefopbegus, is membranous, that they may the better contract, dilate, and give Way to the Aliments, as they go down the Osfophagus. But the Carrilages of the Bronchi are compleatly Annular; yet their Capillary Branches have no Cartilages; but instead of them fmall circular Ligaments which are at pretty large Distances from one another. The use of the Carrilages is to keep the Passage for the Air always open; but in the Capillary Bronehi, they would hinder the subsiding of the Vessels.

These Cartilages are tied together by two Memranes, the one Exernal the other Internal. External is composed of circular Fibres, and covers the whole Trachas externally, The Internal is of exquisite Sense, and it covers the Cartilages internally. It is composed of three distinct Membranes: The first is woven of two Orders of Fibres; those of the first of which are Longitudinal, for the shortning of the Traches, and these make the Cartilages approach to and enter one another. The other Order is of Circular Fibres, for the contracting the Cartilages. When these two Orders of Fibres act, they help, with the External Membrane, in Expiration, in Coughing, and in altering the Tone and Notes of our Voice.
The fecond Membrane is altogether Glandulous,

and the Excretory Vessels of those Glands open into the Cavity of the Trachea, in order to moisten its Cavity by a Liquor which they separate; and to defend it from the Acrimony of the Air.

The third and last Membrane is a Net-work of Veins, Arteries and Nerves: The Veins are Branches of the Cava; the Arteries of the Caraci-

des; and the Nerves of the Recurrent.

From the Structure of the Lungs thus described, Dr. Piecairn bath deduced Mechanically the great effect, they by means of the Air produce upon the Blood. For while the Fasts is in the Womb, the Venicles of the Lungs lying flat one upon another, compress all the Capillary Blood-vessels which are spread upon them; but as soon as it is born and alive, the Air rushes into the empty Branches of the Traches, and blows up the Vencles into their Spherical Figures; by which Means, the Pressure or Compression being taken off from the Bloodvefiels, and they equally expanded with the Lungs, all the Blood hath a free Passage thro' the Pulmonary Artery. But when the Air is thrust out again by the Contraction of the Cavity of the Thorax, it being a fluid Body, compresses the Vesicles and Blood-vessels upon them every where equally. By which Compression the red Globules of the Blood, which thro their lanquid Motion in the Veins, were grown too dry to circulate in the fine Ca-pillary Vessels, are broken and divided again in the Serum, and the Blood made fit for Nutrition and Secretion.

This Pressure of the Air upon the Blood-vessels, Dr. Keil saith, he hath demonstrated to be equal to 100 lb. weight; and in Coughing or Crying,

it may exceed 400 lb.

But

But the these are the necessary Consequents of Respiration, yet several Experimens incline him to think, that some Particles of the Air must likewise enter the Blood-vessels, and mix with the Blood in the Lungs.

For, first, he saith he is assured, from repeated Experiments, that Air will escape the Pores of any Number of Bladders, when compressed only by the Weight of the Water, into which it is sunk; and therefore the Pressure of 100 lb. Weight in ordinary Respiration, must thrust some Particles

of it into the Blood-vessels.

2. The Honourable Mr. Boyle, in his New Pnoumatical Experiments, shews us, That Animals cannot live when shut up in common Air, tho' by a Gauge he hath sound it to retain its wonted Prefure; and tho' the Receiver hath been immersed in Water cooled with a Solution of Sal Armoniae. The same Experiments assure us, That Animals will live longer when shut up in compress'd Air than in common Air, and that when they are dying in the common Air, they may be revived by

preffing in more fresh Air.

3. It may be demonstrated, (saith the same Dr. Keil) That the Difference between the Gravity of the Air in the City, and that of the Country, (which can be but very small, upon the Account of the Effluvia, as the Barometer shews it to be) can never be the Cause of that Difficulty of Breathing, which some have in the one and not in the other; for they are not near so sensible of the different Gravities of the Air in the same Place, as they are of a much smaller Difference in two distinct and remote Places, where the Contents of the Air are different.

The Lungs are composed of an infinite Number of little Lobes, of different Figures and Magnitudes, but yet so joyned as to leave but small Vacuities behind them. Each Lobe consists of an Infinity of small Spherical Vesicula formed by the Coats of the small Branches of the Trachas; so that they may be confidered, when blown up, as so many fine Tubes ending in fine hollow Spheres. On the Sides of these Vesicala, the Blood-vessels are spread in a fine Net-work: But before the Fasus is brought to light, these Vesicula lie flat on one another, and by their Pressure on the Bloodwessels hinder its Passage thro them; but as soon as the Fatus enjoys the Benefit of the Air, that doth by its Weight and elastick Force, rush in thro' the Pipes of the Trachas into these Vesicula and blows them up; whereby they stand erect on the Trunks of those like Wind-pipes, and give a free Passage to the Blood thro these Vessels spread upon their Sides. And when by the Weight of the Thorax, and the Acts of its Muscles, together with those of the Abdomen and Diaphragma, this Ela-flick Fluid, the Air, is thrust out of those Vesseula thro' the Traches in Expiration, these Veficula pressing one against another, and the elastick Fluid acting on their Sides, and consequently on the Blood-Vessels thereon spread, separate the Globules of the Blood from one another, render it more capable of Circulation, in the narrow Pas. fages of the Capillary Vessels.

And there seems to be a yet more considerable Use of this Natural Function behind; which is, so form shose Blastick Globules of which the Blood principally consists. It is undoubted Fact and Observation, that the Blood consists of a Lympha, which is the common Vehicle, several Salts, Ra-

mensa of a thick Confistence (which is probably the unformed Part of the Chyle and Aliment) and these Globules of which we are now speaking, tho fometimes they are of different Colours, as White, Blue, Parple : This any one may discover with an ordinary Microscope. Now tis certain that these Globules may be burft, as in Obstructions; and all exhausted, as in violent Hamorrhages, and yet be all recovered and recruited again; wherefore they must be formed, formewhere in the Body, from the Chyle. And fince tis certain that they are nor folid Particles, as appears both by Ocular Inspection and Truth; also that they do actually change their Globular Figures into those of Oblong Spharoides, as they move thro' the Capillary Vessels; as therefore from their Colour, and from their being coagulated by Acids, and having their Figures destroyed; it is highly probable, that they may be listle Bubbles blown from the viscid Pars of the Chyle, by the Force of some more subtle elastick Aura. Now no Place in the Body can afford this elastick Fluid, but the Lungs ; and this may be the Reason why the Chyle enters into chose swo Voins only, which are just returning into the Heart immediately to be fent into the Lungs. For fince in our gross Element of Air, there is always lodged a finer Elastick Fluid, which is the principal Agent in all the subtle Effects commonly ascribed to the other: tho' the groffer Element cannor, yet this finer Fluid, (by the vast Force used in Expiration) may be thrust in thro the Sides of these Vesicula, to the Blood-vessels. And fince these Blood Globules must be generated somewhere, and that there is no Place in the Body, this subtle elastick Fluid can be squeezed thro with sufficient Force to get into the Blood thre' the Sides of the Blood-veffels, but in the Lungs: 'tis very probable these Globules are these formed, after this manner. The viscous Part of the Chyle being by the shortest and safest Course possible brought into the returning Part of the Blood, is sent from the right Venericle of the Heart to the Lungs, and is spread upon the Sides of the Vesicula thereof in little fine Tubes: this fine fluid Elastick being squeezed, in the Act of Expiration, thro' a Pore, continued thro' the Veficle of the Lungs and the Side of the Bloodvessels, is forced into the viscous Part of the Chyle now running by in the Serum, and by its perpendicular Pressure on the Sides of that Cavity it forms, produces a little small Bubble, of a determinate Magnitude and Thickness of Shell, from whence is hath its Colour : After this, by the Force of the succeeding Fluid, this little Bubble is broken off from the Pore, and carried along the Arrery; and the Cohesion of the Parts of the Shell of this Bubble being greater than the Force from without, whereby the thin Serum acts upon it, it is preserved in its Figure in all the various Morions of the compound Fluid of the Blood. And if it happen that these little Bubbles should be burst (as they most certainly are by 1000 Canses) whenever they come, to the Lungs they are new formed again; whereby the Circulation is render'd conftant and uniform. For mould these Bubbles be all destroy de there must of Necessity rise a general Obstruction in all the Capillary Arteries. An Instance of the Fermation of such kind of little Bubbles a Mixture of Oyl and Vinegar affords, for that look'd on thro a Microscope, appears to be nothing but an Infinity of such like little Bubbles, formed by the Immission of the Air and Vinegar into little Shells

of Oyl. Vid. Cheyne's Phil. Princip. of Natural

Religion, p. 214.

LUNI-SOLAR Tear, in Chronology, is a Period made by multiplying the Cycle of the Moon (or 19) into that of the Sun, which is 28; which is 532: and in this space of Time 'twas thought, the Sun and Moon would come to be together again exactly.

LUSHBURG, 2 was a base Sort of Coin LUSHBOROW, 3 used in the Days of King Edw. III. which was coined beyond Sea to counterfeit the English Money; wherefore by a Statute in 25 Ed. 3. c. 2. it was made Treason for any one designedly to bring them into the Kingdom.

LUTHERNS, a sort of Windows in the Roof

of a House. See Dormers.

LYE under the Sea, is the Mariners Term for a Ship, which having her Helm lash'd fast a-Lee, lies so a-Hull, that the Sea breaks upon her Bow, or Broadside.

LYEF-YELD or Leff-Silver, was formerly a small Fine or pecuniary Composition, paid by the Customary Tenant to his Lord, for Leave to plow

LYMPHEDUCTS, are slender pellucid Tubes, whose Cavities are contracted at small and unequal Distances by two opposite Semi-lunar Valves, which permit a thin and transparent Liquor to pass through them towards the Heart, but which are shut up like Flood-gates on its returning. They rise in all Parts of the Body, but after what Manner needs no great Dispute; for without Doubt all the Liquids in the Body, excepting the Chyle, are separated from the Blood in the sine Capillary Vessels by a different Pipe from the common Chanel in which the rest of the Blood runs: But whether this Pipe be longer or no longer than the Thickness of the Coat of the Blood-vessel, whether

it be visible or invisible, it is fill a Gland whilst it fusfers some Parts of the Blood to pass thro' it, denying a Passage to others. Now the Glands that separate the Lympha are of the smallest kind, being invisible to the finest Microscopes ; but their Excretory Ducts, the Lymphasick Vessels, unite with one another, and grow larger as they approach the Heart; yet they do not open into one common Channel, as the Veins do; for sometimes we find 2 or 3 more Lymphæducksrunning one by another, which only communicate by short intermediate Ducts, or which unite and immediately divide again. In their Progress they always touch at one or two conglobate or veficular Glands, into which they discharge their Lympha. Sometimes the whole Lymphæduct opens at several Places into the Glands, and sometimes it sends in only two or three Branches whilst the main Trunk passes over and joyns the Lymphæducks arising from the opposite Side of the Glands, exporting again the Lympha to their common Receptacles. The Glands of the Abdomen which receive the Lymphæducts from all the Parts which it contains, as likewise from the lower Extremities, are the Glau-dula Inguinales, Sacra, Lumbares, Mesenterica, and Hepatica; all which fend out new Lymphaducts which pour their Lympha into the Receptaculum Chyli, as those of the Cheft, Head and Arms do into the Ductus Thoracicus, Jugular and Sub-clavian Veins. The Defign of the Lymphæducts emtying themselves into the conglobate Glands feems to be, that the flow Lympha may receive a new Velocity from the Elastick Compression of the Fibrous Cells of those Glands, whose Fabrick resembles that of the Spleen; and therefore they are improperly called Glands, because they separate no Liquor from the Blood. Set Keill's Anatomy. p. 52.

MAG

MACE-GRIEF, alias Macegreffe, Machearii; are such as willingly and knowingly buy or sell stollen Flesh.

MAGAZINE or Arfenal, is the Place in Fortified Towns, &c. where all forts of Stores are kept, and where Carpenters, Wheel-Wrights, Smiths, &c. are employed in making all things needful to furnish out a Train of Artillery.

MAGBOTE, was formerly a Recompence made in Money, or otherwise, for slaying or murdering one's Kinsman; for sometimes the Corporal Punishments in such Cases due were transmuted into Pecuniary Fines; when the Friends or Relations of the Party slain, were so content. Leg.

Relations of the Party slain, were so content. Leg. Canuti Regis T. 1, c. 2.

MAGNETISM. See Mr. Derham's Experiments and Reasonings on this Subject in Phil. Trans. N. 304. where he acquaints us, That he found (as Grimaldi and De la Hire had in Part done before) that a Piece of very well touched I ron Wire would, upon being bent round into a Ring, or coil'd round upon a Stick, Sc. most times quite loseits Verticity, and always have it much diminished thereby, But yet that if the whole

MAG

length of the Wire were not entirely bent, so that the Ends of it, tho' but for the length of one tends of an Inch, were less thrait; then the Vertue would not be destroyed in those Parts or Ends; tho' it would every where else. He found also, on repeated tryals, that tho coyling or bending the Wire as abovelaid, would always in the Day-time diminish and most times destroy the Verticity of a touch'd Wire; yet it would not do it in the Evenings: And he saith, he knows very well, that the Orb of the Activity of Magnets is larger or less at different times; which is confirmed by what is sound in Fact to be true of our noble large Load-stone which is kept in the Repository at Gressam College; for that will keep a Key or other Piece of Iron suspended to another, sometimes, at the Distance of 8 or 10 Foot from it; but at other Times, not beyond the Distance of sour Foot.

He found also, that swifting the Wire would considerably diminish, and sometimes destroy the Verticity; which in some Tryals made: on twisted Wire, was so confused and disordered; that he found by drawing one of the Poles of a Louidsone along near the Sides of the Wire, in some Placesit would

Digitized by Google

attract, in others repell, and so attract and repell all along the Wire; and he fancy'd in some places, that one side of the Wire would be attracted and

the other repelled by one and the same Pole.

After this he try'd what fplitting or cleaving the Wire would do; and in particular, whether split Wires would have the same Properties as Load. stones cut asunder, and he found the Phanomena of this Experiment very odd; for sometimes the Poles of the Wire so split would be quite changed; so that the South Pole would become the North, in all Respects: Sometimes one half of the Wire would retain its Magnetism which it had before its splitting, and the other half would have it

quite changed, &c.

He observed also one thing to be very surprizing in these split Wires; which was, That laying one, or the other Side of the Half uppermost, would cause a great Alteration in its Tendency or Aversion to the Poles of the Magnet: But if you lay the contrary fide of that half uppermost, the same End shall be attracted by one and repelled by the other Pole, In other Pieces where the Ends are regularly attracted or repelled, only in an inverted Order (as if new touched) if it lay with the round fide uppermost at that time, and be then turned upside down, viz. the flat cleft side uppermost; it is ten to one, he saith, that one of the Ends is either attracted by both the Poles, or repelled by both; or else attracted and repelled by one, and

in Hesitation by the other.

He touched a Wire from End to End with only one Pole of the Magnet; which gave it so vigorous a Vertue, that he is almost of Opinion, 'sis the best Way of touching; the Consequence was, that the End where he began always turned contrary to the Pole that touched it: He then touched the same Wire (and others likewise) with the other Pole of the same Magnet, from the same End, and then that End turned the contrary Way. For Instance, mark one end of the Wire for the North End, and touch that Wire by drawing the North Pole of the Magnet divers times along the Wire from the North to the South End: This Wire so touched shall have a vigorous Verticity; but the North End shall stand South. But if you touch that or another Wire, (for it is all one, the latter Touch destroying the former) by drawing the North Pole of the Magnet from the South to the North End of the Wire, then this North End will turn North: And so it will be if you touch with the Southern Pole from the North to the South.

He found also, that if he touc'd an Iron Wire exactly in the Middle with but one Pole of the Loadstone, without drawing it backwards or forwards, in that Place would be the Pole of the Wire; and the two Ends would be the contrary Pole of the Wire, and were accordingly repelled or attracted by the Poles of the Magnet; and the middle, and about an Inch more on each fide, was attracted only by the Pole that touched it.

MAILE, was anciently a Kind of Money, as fome think; for Mailes were Half pence in Henry the Fifth's Time; being the half of the Silver Sterling or Penny: But more largely it seems to have been any Proportion of Grain, or any other Rens. This latter in the North is called Black-mail. See Black-mail in Val. I.

MAIN BODY, of Troops in an Army, is that which marches between the Advance and the Rear

Guard; and in a Camp, that which lies between the two Wings

MALETENT, or Maletolse; in the Statute called the Confirmation of the Liberties, 25 Ed. 1'c. 7. is interpreted to be a Toll of 40 s. for every Sack of Wooll; and in the Statute de Tallagio non concedendo in the 36th Year of the same King Edw. 1. sis appointed, that Nothing for hereafter shall be taken of Sacks of Wooll, under the Pretence of Maletent. It seems to come from maliem Felo-

MAL-VOISIN, was formerly the Name of a warlike Engine used in battering of Walls to cast Stones, &c. It was so called, because it was an ill or dangerous Neighbour.

MAN-BOTE, was formerly a Recompence for Homicide, or a pecuniary Compensation for kil-

ling a Man.

MANCA, was formerly a square Piece of Gold, commonly valued at 30 Pence; and Mancusa was as much as a Mark of Silver. See Canute's Laws. Twas called Mancusa, quasi Manu cusa.

MANCUSA. See Manca.

MANCIPLE, a Caterer; there was anciently an Officer in the Temple called by this Name. now the Steward. And the Name and Office is retained still in our Colleges, in both our Univer-

MANNER; besides what hath been said about Manner, I must take notice that they say in Archi-testure, That an Order Heroically and Giganti-cally designed; where the Division of the principal Members is put into a few Parts; but those having all a bold and ample Relievo, is after the Grand Manner. As for Example, in a Corniche, if the Gola or Cimatium of the Corona; the Coping, the Modillions or Dentelli make a noble Appearance by the Gracefulness of their Projectures; and that we see none of that ordinary Confusion which results from those little Cavities, quarter Rounds of the Astragal, and such little Ornaments as produce no effect in great and massy Works, and which do impertinently justle out the graceful and principal Members; then will the Manner of this Corniche appear folemn and great, and approve it self to be performed after La Grand Maniere. In Mr. Evelyn's Parallel of Ancient and Modern Architecture, Chap. 5. p. 25. you have a fine Draught of this Grand Manner, in an ancient Dorick Pillar which was found at Albano, joining to the Church of St. Mary near Rome.

MANSE, is a Parsonage or Vicarage-House for the Incumbent to live in, and was originally, and is now, an essential Part of the Endowment of a Parish-Church, together with the Glebe and

MANUALIA Beneficia, were formerly such daily Distributions or Portions of Meat and Drink, as were allotted to the Petty Canons and other Members of Cathedral Churches for their ordinary Sublistence

MANUMISSION, is the Term for making a Slave or a Bondman free: You have the Form of this as it was used in the Conquerour's Time, in Lambers's Apharouia, Fol. 126. The Terms of the Law make two Kinds of Manumission; one expressed, and the other implied. That expressed was by Deed, or Publick Declaration: That implyed was when the Lord made an Obligation for Payment of Money to his Villain at a certain Day; or fued him when he might enter without Suit;

or when he granted him an Annuity or Leased Land to him for Years, or for Life, &c.

MANU-OPERA, are stollen Goods taken up-

on a Thief apprehended in the Fact.

MANU-PASTUS, in the Law Dialect is often used for a Domestick Servant, one sed as it were by the Hand of his Master.

MANU-PES, is used in the Charter of Richard the Third for a Foot of full and legal length.

MANU-PRISOR, one who was Bail-pledge or

Security for another Person.

MANUS, was anciently used both for an Oath and him that took it. If a Man swore alone in the Court, he was faid to do it propria manu; but if he brought 3 or more Witnesses to MARCHET Mulieris, the same with MerMARCHETA chetum. swear for him, he was said tertia manu jurare.

MARCHES, are now the Bounds between England and Wales, or England and Scotland; and the Marches of Scotland are divided into West and Middle Marches. The Word Marches is used also in Stat. 24. H. 8. 12. for the Borders of the King's Dominions in general, as being derived from the Germ. March, which fignifies a Bound or Limit; and those Noblemen who lived near these Marches are frequently in our Statutes called Marchers,

MARITAGIUM habere, fignified formerly to have the free Disposal of an Heires in Marriage, which was a Favour granted by the King, who was the Guardian of all Wards or Heirs in Mi-

mority, to some special Favourite or Friend.

MARITAGIUM Liberum, Frank Marriage;
was when a Baron, Knight, or Free-holder granted such a Part of his Estate with a Daughter to her Husband, and the Heirs of his Body, to hold without any Homage or Service to the Donor.

MARK, the Saxons called it Mancus, Mancusa, and Mearc; and among them it contained 30 Pence, which of their Money was fix Shillings. Tis not certain when the Mark came to be valued as at 13 s. 4 d. But M. Paris, in the Life of Guarinus Abbot of St. Albans, tells us, that a Mark (A. D. 1194.) was of this precise Value. Since the Conquest there was never any Coin of this Name struck, as appears; but probably there might be fuch before in the Saxons Time, and with some Markor Stamp upon it, as may be concluded from the Word Mark. Stow in his Annals, p. 32, and 691, saith, a Mark of Gold was eight Ounces, twelve Mark of Gold Troy was 200 l. of English Money; after which Rate each Mark weighed 16 l. 13 s. 4 d.

Skene de Verb. fignif. saith, a Mark signifies an Ounce Weight, whereof the Drachm is the eighth Part, as the Ounce is the eighth of the Mark.

MARQUESS is now a Title of Honour next MARQUESS before an Earl, and next after a Duke. The Name seems to be derived from the Germ. March, a Bound or Limit; and therefore was as much as Custos Limitis, or Comes sibi Prafectus Limitis. Among the old Britains it was the Custom, and after them of the Saxons, to give the Title of Reguli to all the Lords that had the custody and charges of their Marches or Bounds; as Selden shews in his Mare Clausum, Lib. 2. c. 19. But in Richard 2. his Time, the Title of Marquesses instead of Lords Marches came to be given to such as were Governours of the Marches.

MARS. Mr. Flamstead and Cassini have by accurate Observation found the Horizontal Parallax

of this Planet to be about 25 Seconds, and certainly not greater; a large Account of the Method of observing and finding which, you will find under the Word Sun in this Vol.

MARTYROLOGY, was anciently a Register kept in the Religious Houses, wherein they set down the Donations of their Benefactors, and the Day of their Deaths, that so on each Anniversary they might commemorate and pray for them: therefore several Benefactors made this a Condition in their Charters. Kennet's Paroch Antiq.

MASSES, in Painting, are the large Parts of a

Picture containing the great Lights and Shadows.

MASTER of the Mint: In the second Year of H. 6. that was the Title of him that now is called the Warden of the Mint, whose Office it is to receive the Silver and Bullion that comes to the Mint to be coined, and to take Care thereof.

MASTER of the Court of Wards and Liveries; was the chief Officer and Judge of that Court of Wards, kept the Seal of it, and was named and assigned by the King. But this Court and all its Officers, Members, Power, and Appurtenances, is taken away by a Statute made the 12th of Car.

MASTER of the Horse, hath the Rule and Charge of the King's Stable: This Officer is very honourable, and usually a Nobleman, is men-

tioned in 39 Eliz. 7. and 1 E. 6. 5.

MASTER of the Posts, was an Officer of the King's Court that had the appointing, placing and displacing of all such as provided Post-Horses to carry the King's Messages and other Business. Ho also was to pay them their Wages, &c. This Officer is mentioned in 2 Ed. 6. 3. but now by a Statute made 12 Car. 2. c. 34. he is appointed by the King's Letters Patent, with Rates and Rules prescribed in the said Act.

MASTER of the Armory, is an Officer mentioned 39 Eliz. c. 7. and hath the Care of the King's Armour in any standing Armories; with Power of putting in and out all inferior Offi-

MASTER of the Jewel House, is mentioned in 39 Eliz. c. 7. and is an Officer of the King's Household of great Credit; being allowed Bouge of Court, that is, Diet for himself and the Clerks of the Office, and hath a Lodging in the Court. He hath Charge of all the Gold and Silver Plateused at the King's Table, or belonging to any Officer of Account attending the Court; and of all Plate remaining in the Tower of London, as also of Chains and loose Jewels not fixed to any Gar-

MASTER of the Household. This Officer is called Grand Master, &c. and Lord Steward of the King's Household in 32 H. 8. 39. And in the first of Q. M. and ever fince he is called Lord Steward, &c. and under him there is a principal Officer called by this Name of the Master of the Household.

MASTER of the Ordnance, mentioned in 39 Eliz. 7. and is a great Officer, to whose Care all the

King's Ordnance and Artillery is committed.

MASTER of the Faculties, is an Officer under the Archbishop of Canterbury, who grants Licenses and Dispensations; he is mentioned in the Statute of laying Impositions at Law of 22, 23. Car. 2.

MASTER of the Wordrobe, is a great Officer at Court; having his Habitation or Dwelling-House belonging to that Office, called the Wardrobe near

Puddle-wherf in London. He hath the charge and custody of all former Kings and Queens Robes remaining in the Tower of London, and of all Arras and Tapestry Hangings, Bedding, Se. and the Charge and Delivery our of all Scarlet Liveries belonging to the King or Queen. He is mentioned in 39 Bliz. 7.

MATERIA Subsilis, in the Cartefian Philoso-

phy is what is produced by the grinding or rub-bing one against another of the Particles of the second Elements; and so these compose what he calls his first Element. See Cartesian Syst. of the

World in this 2d Vol.

MATRICULA, anciently was the Word for a Register. Thus in the Church there was the Masericula Clericorum, which was a In or Catalogue is appointed, that every round Bushel with a plain
of the officiating Cleri, and Matricula Paupeand even Bottom, being made 18 Inches and wide of the officiating Cless, and Matricula Paupe and even Bottom, being made 18 Inches and wide sum, a Catalogue of the Poor to be received: and shroughout, and 8 Inches deep, shall be officiened a Vol. II.

to this Day being Registred as a Member in the University of Oxon is called Marticulation. MATROSSES, are Soldiers in the Train of

Artillery, next below the Gunners: Their Duty is to affift the Gunners in Travetting, Spunging, Firing and Loading of Guns, &c. They carry Fire-locks, and march along with the Store-Wag-

MAUND, was anciently a Measure of Gapacity with us, being a kind of great Basket or Hamper containing 8 Bales, or 2 Fatts. See the Book of Rates, Fel. 3.

MAXY, is the Timminors Term for a Weed, as they call it, of the Marchafus kind, from whence Maxy seems to be a Corruption. When the Hood or Vein of Oar degenerates into this or any thing

else that is not Tin, they calling Weed With us)

MEASURES of Capacity of Thele (with us) both liquid and dry, were first made from Trey Weight. See 9 H.3. 51 H.3. 12 H.7. Su wherein it is enacted, that eight Pound Trey Weight of Wheat, gathered from the middle of the Ear, and well dried, should make one Gallon of Wine Manfure, and that there should be but one Measure for Wine, Ale, and Corn throughout the Kingdoil. See 14 Ed. 3. and 15 Rich. 2. Bur Custom in rinte bath prevailed against this, having altered Meafures as well as Weighes; no other but Troj Preight being appointed by our Laws to be used. (See 14 and 17 of Ed. 73.) we having now three different Measures; viz one for Wine, one for Ale and Beer, and one for Corn. See the Table of them under Meesures, Vol. I. i... 1

Only let me add further from Mr. John Ward's Arithmetick. p. 34. That the the common Wine Gallon sealed at Guild-Hall in London, by which all Wines, Brandies, Spirits, Strong-waters, Mead. Perry, Sider, Vinegar, Oyl, Honey, &c. ate meafured and fold, is supposed to contain 231 Cubick Inches; and from thence, the Tierce will contain 9702 Cub. Inch. the Hogshead 14553, the Punchion 19404, the Butt or Pipe 29106, and the Tun 58212. Yet it hath been accurately experimented, that the Wine Gallon at Guild-Hall doth hold but 224 Cubick Inches; as indeed Dr. Wybard had before taken Notice of in his Tallametry, p. 289. Bur yet in May 25, 1688, when an Experiment was made for the Lord Mayor of London and the Commissioners of the Excise, in Confirmation of the Truth of the Account above, of the Capacity of the Standard Gallon; viz. that it is but 224 Cub. Inches: yet it was then thought fir to continue the common supposed Convents of 231 Cub. Inches for the Wine Gallon, and that all Computation in Gauging should be made from thence; and so I suppose it yet stands.

The Beer and Ale Gallon is larger than the Wine Gallon, in Proportion to the Excess of the common Pound Averdupois above the true Pound Troy: that is, as 12. 231 :: 10 1413 to 2811, which is very near the Cubick Inches in the Ale Gallon. The Ale Quart contains 70+ Cubick Inches; the Gallon will be 282.

Dry Measure seems to stand still in Proportion to the old Wine Gallon of 224 Cub. Inches. common received Content of the Corn Gallon being 272.4. for as 12. 14. 18: 3 224. 272 1. and legal Winchester Bushel, according to the Standard in his Majesty's Exchequer! Now a Vessel thus made will contain 2150.42 Cubick Inches; and consequently the Corn Gallon can be but 2684 Cub. Inches.

MECHANICAL Philosophy, was that which the most ancient of the Phanician and Greek Philo-- Sophers have adhered to for the Explication of the Phænomena of Nature; and these made use oriiginally of no other Principles, than the Confideration of Empty Space, the Dollvine of Atoms, and in particular, the Gravitation of Bodies. These fit lently attributed the Cause of Gravity to something which was plainly distinct from Matter; and this Cause our most modern Natural Philosophers, in their Enquiries into Nature, did by no means take (into: Confideration. They have happily avoided vaitning at any Hypothefis to explain the Phenomena of natural Effects, and leaving the Philosophy of Canfer to Metaphysicks, they have rightly considered that it is the chief End, Design, and Businest of Natural Philosophy to consider Effects; and by reasoning upon them and their various Rhunomena, to proceed regularly at last to the Gauses of Things; and especially to the Knowledge of the First Causa. And certain it is, that all true Progress and Proficiency in this Kind of Natural Whilesophy, if it don't immediately lead us to the Knowledge of the First Cause, yet will surely bring ine still nearer and nearer to it; and therefore is a most noble, exedient, and valuable Study. MEMBRETTO, in Architecture, is the Italian Term for a Pilasser, that bears up an Arch. These are often stuted, but not with above 7 or 9 Channels. They are frequently used to adorn Door-Cases, Gallery Fronts, and Chimney-Pieces, and to bear, up the Cornisses and Freezes in Wain-scot.

MEMORY. Dr. Hook, in his Op. Possbum. p. 139, 140, &c. supposes Memory to be as much an Organ as the Eye, Ear, Nose, &c. and to have its Situation some where near the Place where the Nerves from the other Senses concur and meet; and he thinks, that the Memory being both improveable and impairable, appears from thence to be plainly Organical; and that it is a Kind of Repository of Ideas formed partly by our Senses; and chiefly by the Soul her self.

MENSALIA were such Personages or Livings MENSALS as were united formerly to the Tables of Religious Houses; and therefore are by

Canonists called mensal Benefices.
