## CYCLOPÆDIA:

OR, AN

## UNIVERSAL DICTIONARY

OF

## ARTS AND SCIENCES;

CONTAINING

AN EXPLICATION OF THE TERMS, AND AN ACCOUNT OF  
THE THINGS SIGNIFIED THEREBY,

IN THE

SEVERAL ARTS, BOTH LIBERAL AND MECHANICAL;

AND THE

SEVERAL SCIENCES, HUMAN AND DIVINE:

The Figures, Kinds, Properties, Productions, Preparations, and Uses of Things  
NATURAL AND ARTIFICIAL:

The Rise, Progress, and State of Things

ECCLESIASTICAL, CIVIL, MILITARY, AND COMMERCIAL:

With the several Systems, Sects, Opinions, &amp;c. among

PHILOSOPHERS,  
DIVINES,  
MATHEMATICIANS,PHYSICIANS,  
ANTIQUARIES,  
CRITICS, &c.*The whole intended as a Course of ancient and modern Learning.*Extracted from the best Authors, Dictionaries, Journals, Memoirs, Transactions,  
Ephemerides, &c. in several Languages.

By E. CHAMBERS, F.R.S.

*Floriferis ut apes in saltibus omnia libant,  
Omnia nos* ————— *LUCRET.*

THE FIFTH EDITION.

IN TWO VOLUMES.

VOL. II.

## UNIVERSAL DICTIONARY

OF

### ARTS AND SCIENCES.

LAB

LAB

**L**, a semi-vowel, or liquid; making the eleventh letter of the alphabet. See LETTER, and ALPHABET.

The *l* has a sweet sound, and is pronounced by applying the tongue to the palate.

Passerat observes, that *l* was frequently observed among the ancients for *b*; as in *cillibæ* for *cibillæ*: for *d*; as *alipe* for *adipe*: for *e*; as *matila* for *mutica*: for *n*; as, *arvilla* for *arvina*, *belle* for *bema*, *colligo* for *conligo*: for *r*; as *fratellus* of *frater*, *balatrones* for *baratrones*: for *s*; as *ancile*, of *am* and *caesum*, *equilio* for *equiso*: for *t*; as *equifelis* for *equisetis*, *The- lis* for *Theis*. See B T, &c.

The double *ll* is a modern contrivance, and was never used among ancient Roman authors: they wrote *alium* not *allium*, *macelum* not *macellum*, *polucere* not *pollucere*.

The double *l* of the Greeks was sometimes changed by the Romans into *li*, as in *ἐλλομα*, *salio*; *ἄλλο*, *alius*; *ὄλλον*, *folium*: *r* has also been turned into two *ll*; as, *hira*, *billa*, *sa- rare*, *satullare*, &c. and *l* into *x* or *exil*; as, *ala*, *axilla*; *mala*, *maxilla*; *velum*, *vepillum*: *d* was also used for *l*; *n* for two *ll*, and *r* for one *l*. See R, &c.

*L* is also frequently used instead of *d*, as in *Ulysses*, from the Greek *Ὀδυσσεύς*, in the Æolic dialect *Ὀδυσσῆς*. Thus also for *lautia*, we say *lautia*; for *dacrumæ*, *lacrymæ*, &c. See D. There are several people, for instance, the Chinese in Asia, the Illinois in America, &c. who cannot pronounce the *r*, but always change it into *l*. Thus when any of them have been baptized by the name of *Petrus*, *Franciscus*, &c. they always pronounce it, *Petlus*, *Flanciscus*, &c. See R.

The Spaniards and Welsh usually double the *l* at the beginning of a word, which sounds nearly the same with our *hl* or *fl*.

The figure of our *l* we borrowed from the Latins, they from the Greeks, and they again from the Hebrews, whose *lamed* is much like our *l*, excepting that the angle is somewhat more acute.

*L* was also a numeral letter among the ancients, and is still so in the Roman ciphering, signifying *fifty*; according to the verse,

*Quinquies L denos numero designat habendos.*

when a dash was added at top *L*, it stood for *fifty thousand*. *L* was used for *fifty*, as being half a *C*, which signified a hundred, and was formerly written thus *L*, which, according to Pasquier, makes two *LL*, the one upright, and the other inverted.

The French louis d'ors have a cross on them, consisting of eight *L*'s interwoven, and disposed in form of a cross. See LOUIS.

The epocha's on Greek medals are usually written with the ancient *lamda*, *L*; which, according to the tradition of the antiquaries, stand for *Λυδοῦ*, a poetical word, unknown in common speech, signifying *anno*, and which, it is probable, was more used in Egypt than Greece.

LABARUM, the banner, or standard born before the Roman emperors in the wars. See ENSIGN, and STANDARD.

The *labarum* consisted of a long lance, with a staff atop, Vol. II. N°. LXXXVIII.

crossing it at right angles; from which hung a rich streamer, of a purple colour, adorned with precious stones.

Till the time of Constantine it had an eagle painted on it, but that emperor, in lieu thereof, added a cross with a cipher expressing the name of Jesus.

Constantine chose fifty of the bravest men in his guards to bear it on their shoulders, each in his turn.—Eusebius tells us, that in the battle against Maxentius, the person who bore it being fatigued, gave it to another, and that he had no sooner parted with it, but he was killed; all the strokes he received while the *labarum* was in his charge, not being able to wound him.—The author adds, he had this miracle from the emperor's mouth.

This standard the Romans took from the Germans, Dacæ, Sarmatæ, Pannonians, &c. whom they had overcome.

The name *labarum*\* was not known before the time of Constantine; but the standard itself, in the form we have described it, abating the symbols of Christianity, was used by all the preceding emperors. See EAGLE.

\* Some derive the word from *labor*, as if this finished their labours; some from *δραβῆ*, reverence, piety; others from *λαμβάνειν*, to take; and others from *λαοῦ*, spoils.

The *labarum* has afforded ample matter for criticism, and has been discoursed of by Fuller, Alciatus, Cujas, Gyraldus, Lipsius, Meursius, Vossius, Hoffman, Valois, Du Cange, &c.

LABEL, a long, thin brass ruler, with a small sight at one end, and a centre hole at the other; commonly used with a tangent line on the edge of a circumferentor, to take altitudes, &c. See CIRCUMFERENTOR.

LABEL, in law, is a narrow slip of paper, or parchment, affixed to a deed of writing, in order to hold the appending seal.—Any paper annexed by way of addition, or explication, to any will or testament, is also called a *label*, or codicil. See CODICIL.

LABEL, in heraldry, a kind of addition to the arms of a younger brother, especially a second to distinguish him from the first or eldest. See DIFFERENCE.

The *label* is esteemed the most honourable of all differences; and is formed by a fillet usually placed in the middle, and along the chief of the coat, without touching its extremities. Its breadth ought to be a ninth part of the chief.

It is adorned with pendants somewhat like the drops under the triglyphs in the Doric freeze.—When there are above three pendants, the number must be specified in blazoning.—There are sometimes six.

LABIA, in anatomy. See the article LIPS.

Depressor LABIORUM. } See the article { DEPRESSOR.  
Elevator LABIORUM. } ELEVATOR.

LABIAL, a term in the French law, used in the same sense with *oral*. See ORAL.

LABIAL Letters, among grammarians, are those whose pronunciation is chiefly effected by the motion of the lips. See LETTER.

By which they stand contradistinguished from *palatal*, *dental*, *guttural*, &c. letters. See PALATAL, GUTTURAL, &c.

# L A C

**LABIAL Offers**, are such as are only made by word of mouth, or even by writing, where there is no valuable consideration: In courts of equity these are not regarded.

**LABIATE Flowers**, from the word *labium*, a lip, is a term applied by herbalists to such flowers as have one or two lips, some of which represent a kind of helmet or monk's hood. See FLOWER.

**LABORATORY**, or **ELABORATORY**, the chymists work-house; or the place where they perform their operations; where their furnaces are built, their vessels kept, &c. In general, the term *laboratory* is applied to any place, where physical experiments, and operations in pharmacy, chymistry, pyrotechnia, &c. are performed.

**LABORATORY** of an hospital, is a place where the chymical, &c. remedies are made up.

**LABORATORY**, in a camp, is the tent where the fireworkers and bombardiers prepare their works, drive their fuses, fix their shells, and carcasses, make quick match, &c.

**LABYRINTH**, *Λαβυρινθ*, among the ancients, was a large intricate edifice cut out into various isles, and meanders, running into each other, so as to render it difficult to get out of it.

There is mention made of four celebrated *labyrinths* among the ancients, ranked by Pliny in the number of the wonders of the world; viz. the *Cretan*, *Egyptian*, *Lemnian*, and *Italian*.

That of Crete is the most famed; it was built by Dædalus; and it was hence that Theseus made his escape by means of Ariadne's clue.

That of Egypt, according to Pliny, was the oldest of all, and was subsisting in his time, after having stood 3600 years. He says it was built by king Petefucus, or Tithoes, but Herodotus makes it the work of several kings: It stood on the banks of the lake Myris, and consisted of twelve palaces, and 1500 apartments: Mela says, *ter mille domos*.

That of Lemnos was supported by columns of wonderful beauty, there were some remains of it at the time when Pliny wrote. — That of Italy, was built by Porfenna king of Hetru-ria, for his tomb.

**LABYRINTH**, in anatomy, denotes the second cavity of the internal ear, which is formed or excavated out of the os petrosum, and is thus called, as having several windings in it. See EAR.

This cavity is divided into three parts; the first called the *vestibulum* of the *labyrinth*, because it leads into the other two.

The second comprehends three canals bent semicircularly, and thence call'd *semicircular canals*, placed on one side of the vestibulum, towards the back of the head. The third called the *cochlea*, is situate on the other side. See COCHLEA, VESTIBULUM, &c.

Dr. Vieussens observes, that the bone out of which the *labyrinth* is dug, is white, hard, and very compact; that the ethereal matter of sounds laden with impressions striking against its side, may lose little or nothing of its motion, but communicate it entire to the nerves of the ear. See HEARING, SOUND, &c.

**LAC Luna**. See the article MINERAL AGARIC.

**LACCA**, or **LAKE**, a sort of gum, or rather wax, hard, red, brittle, clear, and transparent, brought from Malabar, Bengal, and Peru, and used in dying scarlet, painting, &c.

Authors differ as to the production of this curious drug. F. Tachard, who was on the spot, tells us, that a kind of little ants fixing themselves on the branches of several trees, leave behind them a reddish moisture, which lying exposed to the air and sun, hardens in five or six days time, and becomes *lacca*. — Some imagine this is not the production of the ants, but a juice which they draw out of the tree, by making little incisions in it; and in effect, the trees where the *lacca* is found, do yield a gum; but then it is of a very different nature from the *lacca*.

The ants act here in quality of bees, and the *lacca* is their honey. They work at it eight months in the year, and the rest of the time lie by, because of the rains.

Lemery having examined the gum *lacca* chymically, judges it to be a mean mixture between a gum and a resin, more abundant in salt than oil. See GUM, &c.

To prepare the *lacca* for use, they first separate it from the branches to which it adheres, pound it in a mortar, and throw it into boiling water; and when the water is well dy'd, they pour on fresh, till such time as it will tinge no more. Part of the water thus tinged is evaporated in the sun; after which the thicken'd tincture is strain'd thro' a linnen cloth.

M. Geoffroy, examining the gum *lacca*, found it to be a kind of comb, such as the bees, and some other insects, are accusom'd to make. Upon breaking it into pieces, it appears divided into a great number of alveoli, or little cells of an uniform figure, and which plainly shew that it never ouzed from trees. These cells are not mere excrements, as some imagine, but are intended for something to be deposited in them. And accordingly are found to contain little bodies, which the first observers took for the wings or other parts of the insects that produced the *lacca*. — These little bodies are of a beautiful red colour; and when broke, make a powder

# L A C

as fine as cochineel. It is most probable these cells are destin'd to lodge the young brood, as those of the bees, and that these little carcasses are the embryo's of insects, or perhaps their skins.

These are several sorts of *lacca*; that mentioned in the last paragraph is the natural; when it is prepar'd, as in the former, those kinds of dry cells are not seen. — M. Geoffroy reckons six or seven different kinds; besides which, there are several pastes used by the painters, that go by this name, or that of *laque*. This gum boiled in water with acids, makes a beautiful red dye. See RED, COLOUR, and DYING.

**Artificial LACCA**, or **LAQUE**, is also a name given to a coloured substance, drawn from several flowers; as the yellow from the flower of the juniper, the red from the poppy, and the blue from the iris or violet.

The tinctures of these flowers are expressed by distilling them several times in aqua vitæ, or by boiling them over a stove-fire in a lixivium of pot-ashes and alum.

**Artificial lacca** is also made of Brazile wood boiled in a lixivium of the branches of the vine, adding a little cochineel, terramerita, calcin'd alum, and arsenic incorporated with the bones of the cuttle-fish pulverized, made up into little cakes, and dried.

If it be to be very red, they add the juice of citron to it; to make it brown, they add oil of tartar.

Dove-coloured or columbine *lacca*, is made with brazile of Fernambuc steeped in distilled vinegar for the space of a month, mixed with alum incorporated in cuttle-fish bone.

**LACERNA**, a thick coarse sort of military garment worn by the ancients.

The *lacerna* was a kind of cloke of woollen, only used by the men; who wore it over the toga, and when that was not on, over the tunica. — It was at first very short, but growing popular in the Roman army, was soon lengthen'd.

The *lacerna* was scarce known in Rome till the time of the civil wars and the triumvirate; then indeed it came into fashion; for the soldiers being then frequently in the city, or at the city-gates, the sight became familiar to the citizens, and they fell into the use of it; inso much that it became the common dress of the knights and senators, till the time of Valentinian and Theodosius, when the senators were prohibited the wearing of it in the city.

The *lacerna* appears to have been much the same with the *chlamys* and *birrus*. See CHLAMYS, &c.

Martial mentions *lacerna* of ten thousand sesterces price.

**LACHRYMAL**, or **LACRYMAL Gland**, in anatomy, a small oblong gland situate above the eye, near the little canthus, whence proceed two or three small ducts, which opening on the inward surface of the eye-lid, filtrate a serosity serving to moisten the ball of the eye, and facilitate its motion. See EYE.

Near the larger angle is also a little eminence, in form of a caruncle, which some have taken for another *glandula lachrymalis*, but by mistake; this being no more than the duplication of the inner membrane of the eye-lids. See CARUNCULA.

On the same side, near the lesser angle, are two little perforations, called *puncta lachrymalia*. See LACHRYMALIA Puncta.

On the same side is also a small bone, one of those of the upper jaw, sometimes called *os lachrymale*, but more usually *os unguis*. See UNGUIS.

**Fistula LACHRYMALIS**, is a fistula in the larger angle of the eye. See FISTULA.

It usually happens after an abscess formed in the sacculus lachrymalis, by means of the serosity lodg'd there; which being retain'd too long, becomes acrimonious, and occasions an ulcer, which frequently degenerates into a fistula.

**Sacculus LACHRYMALIS**. See SACCULUS, and LACHRYMALIA.

**LACHRYMALIA**, or **LACRYMALIA Puncta**, in anatomy, two little apertures in the great angle of each eye, into which an aqueo-saline pellucid humour, secreted from the blood by the glandula lachrymalis, is conveyed, and thence carried off by the lachrymal canals into a little bag called *sacculus lachrymalis*, in the canal of the nose; whence, by a pipe always open, it is carried into the cavity of the nose immediately under the lower os spongiosum. See DUCTUS, and SACCULUS.

Hence appears the reason why people, in crying, run at the nose.

This humour, separated by the glandula lachrymalis, serves to moisten and lubricate the ball of the eye, and prevent any hurtful attrition: when it is secreted in any great quantity, so as to overflow the eye-lids, it is called *tears*. See TEARS.

**LACHRYMATORIES**, or **LACRYMATORIES**, were anciently small glass or earthen vessels, wherein the tears of the weeping friends that survived were repositd, and buried with the ashes and urns of the dead. See ASHES, FUNERAL, &c.

Some of these are still seen in the cabinets of the curious.

**LAC Luna**, or *Milk of the Moon*. See the article MILK.

LACO.

# L A D

**LACONIC** *Styl.* } See the article { **STYLE**.  
**LACONICA** *Scytala*. } **SCYTALA**.  
**LACONISM**, *Λακωνισμὸς*, a short, pithy, sententious speech, in the manner of the Lacedæmonians, who were remarkable for the closeness and conciseness of their way of delivering themselves.  
**LACRYMAL**. See the article **LACHRYMAL**.  
**LACTATION**, the act of giving suck.  
The word is also applied to the time during which the mother doth that office to her young. See **ABLACTATION**.  
**LACTEALS**, or **LACTEAL** *Veins*, a kind of long slender tubes, for the conveyance of the chyle from the intestines to the common reservoir. See **CHYLE**.  
They appear to have been known to Hippocrates, Erasistratus, and Galen; but were first duly described and published by Asellius, an Italian physician in 1622, and called *lacteals*, from the liquor they contain, which resembles milk. Vid. *Dougl. Bibl. Anat.* p. 236. Ed. 1734. Their coats are so thin as to be invisible, except when distended with chyle, or lymph. They arise from all the parts of the small guts, and as they run from the sides of the guts to the glands in the mesentery, unite and form the larger branches, called *vena lactea primi generis*.—The mouths of these *lacteals*, which are open into the cavity of the guts, from whence they receive the chyle, are so small, as not to be seen by the best microscope. It was necessary they should be smaller than the finest arteries in the body, that nothing might enter to stop the circulation of the blood.  
The same extremity of the *lacteals* has likewise communication with the capillary arteries of the guts, by which they receive a lymph that dilutes, and propels the chyle forwards, and washes the *lacteals* and glands, that they might not fur, and be obstructed by the chyle's staying in them upon fasting.  
The other extremity of the *lacteals* discharges the chyle into the vesicular cells of the glands dispersed up and down the mesentery: And from those arise other *lacteals* of a larger size, which carry the chyle immediately into the receptaculum chyli, and these are called *lacteae secundi generis*.  
The *lacteal veins* have valves at proper distances, which hinder the chyle from returning back into the intestines. See **VALVE**.  
It is still doubted, whether or no the intestina crassa have any *lacteals* or not? The impossibility of human dissection proper for such an enquiry, gives no room either to affirm or deny. But the contents of the thick intestines seem not likely to afford much chyle, and therefore if there be any *lacteals*, it is probable they are very few.  
In brutes, if dissected at a reasonable time after feeding, as two or three hours, the *lacteals* appear very tumid and white; and if wounded, the chyle flows plentifully from them. But if inspected when the stomach of the animal has lain some time empty, they appear like lymphatics, visible indeed, but filled with a transparent liquor.  
That the *lacteals* have a communication with the cavities of the intestines, is demonstrated by their contents, the chyle; but how their pores are disposed to receive it, has not yet been discovered; nor is there any way known whereby to fill the *lacteals* from the cavities of the guts after death. It is probable then, their entrance into the gut is oblique, since neither wind nor liquors can pass from thence. As it is found these pores can only receive any thing in their living state, we may be allowed to imagine, that it is the peristaltic motion of the guts which disposes them in that state to receive the chyle. And this may be done by means of the circular and longitudinal fibres of the intestines still applying the internal coats of the guts to their contents, by which means its pores absorb the chyle from the excrementitious part.  
**LACTARY** *Column*. See the article **COLUMN**.  
**LACTEA** *Via*, the milky way. See the article **GALAXY**.  
**LACTIFERI** *Tubuli*. See the article **TUBULI**.  
**LACUNÆ**, among anatomists, certain excretory canals in the genital parts of women.—See *Tab. Anat. (Splanchn)* fig. 11. litt. II.  
Between the fleshy fibres of the ureters, and the membrane of the vagina, is found a whitish glandulous body, about a finger thick, running round the neck of the bladder, having a great number of excretory ducts, which de Graef calls *lacunæ*, and which terminate in the lower part of the orifice of the womb; conveying thither a slimy matter, that mixes with the seed of the male. See **GENERATION**, **CONCEPTION**, **SEED**, &c.  
**LACUNAR**, in architecture, an arched roof, or cieling; more especially the planking, or flooring over portico's, or piazza's. See **ARCH**, **VAULT**, **ROOF**, **CEILING**, &c.  
**LADANUM**, or **LABDANUM**, in pharmacy, a gummous, or a resinous matter, oozing out of the leaves of a shrub called *cistus ladanifera*, which is very common in the hot countries of the Levant, and whereof there are various kinds.  
Dioscorides says, they gather the *ladanum* by means of goats, which brouzing on the leaves of this shrub, return to the stable with their beards loaded with a fat substance, which

# L A K

the peasants take off, with a kind of combs made for that purpose. This matter they thus collect into lumps, and, as it is mixed with the goats hair, and other impurities, call it *ladanum in the beard*, or *natural ladanum*.—Others are said to draw cords over the leaves, and other parts of the shrub; and scraping off what had stuck to the cords, make up the *ladanum* into little balls.  
Tournefort assures us, that the common way of gathering the *ladanum* is, by brushing off the leaves with a sort of whip, composed of many lashes, or straps: after it is scraped off the straps, they make it into cakes of different sizes.  
*Ladanum* is used in physic, to soften, digest, deterge, attenuate, and resolve. That which is brittle, of an ash colour, sweet scented, &c. is the best.  
Pietro della Valle tells us, he was informed by the Indians, that *ladanum* is formed like dew, and falls from heaven like manna; that it is gathered on the leaves of a plant a palm and a half high; that, after gathering, they boil it, by which means it becomes soft, like wax. See **DEW**, and **MANNA**.  
**Liquid LADANUM**, more properly called *clear*, or *purified ladanum*, is a preparation of the natural *ladanum*, by melting and purifying it from the hairs, &c.  
This is sometimes sold for a sort of black amber.  
**LADING**. See the article **BILL of Lading**.  
**LADY of the Thistle**. } See { **THISTLE**.  
**Presentation of our LADY**. } { **PRESENTATION**.  
**LAGAN**\*, or **LAGON**, in our ancient sea laws, shipwrecked goods, left by the sea, lying on the sand, either ashore, or out at sea. See **WRECK**.  
\* The word seems formed from the Saxon *legan*, or *luzan*, *jacere*, to lie.—Tho' others deduce it from the Latin *ligare*, to bind; and suppose it to denote goods tied together with a buoy, or the like, to hinder their sinking to the bottom, that they may be found again.  
*Lagan*, is usually joined with *jetson*, and *flotson*. See **JETSON**, and **FLOTSON**.  
**LAGOPHTHALMIA**\*, *Λαγοφθαλμία*, a disease of the eyelids, when the upper lid is so contracted, that the eye cannot be quite shut, but remains open even in the time of sleep. See **PALPEBRÆ**.  
\* The word comes from the Greek *λαγος*, hare, and *οφθαλμὸς*, eye: this being the property of the eyes of hares.  
**LAICA** *Vi removenda*. See the article **VI**.  
**LAI** *under Metal*. See the article **METAL**.  
**LAIR**, or **LAYER**, in gardening. See the article **LAYER**.  
**LAIR**, or **LAYER**, among sportsmen, denotes a place where deer harbour by day. See **HARBOUR**.  
**LAIR**, or **LAYER of a Deer**, is the impression which the beast has made on the grass, and ground, where he has lain down, or reposed. See **HUNTING**.  
**LAIR**, among husbandmen, also denotes a place, where cattle usually rest, under some shelter; the ground being enriched by their dung.  
**LAKE**, a collection of standing water, inclosed in the cavity of some inland place, of a considerable extent, and depth. According to some authors, those only are properly called *lakes*, which receive and emit rivers. See **RIVER**.  
*Lake*, however, may be divided in four kinds; 1<sup>o</sup>. Such as neither emit nor receive rivers. 2<sup>o</sup>. Such as emit rivers without receiving any. 3<sup>o</sup>. Such as receive, without emitting any. 4<sup>o</sup>. Such as both receive, and emit rivers.  
Of the first kind, some are perennial, others temporary: the temporary owe their origin, most of them, to rain, and to the cavity, or depression of the place where they are lodged. See **RAIN**.  
In the Indies they make artificial *lakes*, which they wall about, to catch the rain in wet seasons, and preserve it for their use in the dry ones.—There are several of this kind of *lakes*, formed by the inundations of the sea and rivers, particularly the Nile, and Niger; which, when they retire within their banks, leave floods of water, which the inhabitants take care to inclose, to serve as a magazine for the ensuing months.  
The generation of perennial *lakes* may be also referred to rain, where the cavity is so deep as to receive a quantity in winter, more than the heat of the sun will exhale in summer; though it is probable many of these *lakes* have their springs at bottom, by which they are continually supplied.—To this class may be referred the turloughs, *i. e.* *terreus lacus*, or land-lakes, in Ireland, which are *lakes* one part of the year, and the rest smooth fields: At the bottom of these turloughs are found holes, through which the water springs in winter, and sinks towards summer.  
The second species of *lakes*, which emit without receiving rivers, is very numerous; they owe their origin to springs, the cavities where the spring is found not being able to contain all the waters it yields. See **SPRING**.  
The third kind, *viz.* those which receive rivers without emitting any, apparently owe their origin to those rivers which in their progress from their source falling into some ample cavity, are collected together, and form a *lake* of such dimensions, as may lose as much by exhalation as it continually

tinually receives from its springs; or to a river's flowing on a soft spongy soil, which imbibes the water, and transmits it to the neighbouring grounds.—The number of these is but small.

Of the fourth species, which both receive and emit rivers, we reckon three kinds; as the quantity of water they emit is greater, equal, or less than that they receive. If the quantity they emit be greater, it is plain they must have a spring at the bottom; if less, there must be some subterraneous ducts, or canals, or else the earth must be spongy; if it be equal, we gather, that they have neither any hidden springs, nor canals.—Of these lakes we have a great number, and those very considerable ones.

The generality of lakes consist of fresh waters, as most of those which are supplied either from some spring, far from the sea, or a river, or from the rain: some few of salt water, as those produced by the inundation of the sea, or by its immission through some duct of the earth, or that have salt springs at bottom. See UNDER-CURRENT.

Dr. Halley is of opinion, that all great perennial lakes are saline, either in a greater or less degree; and that this saltness increases with time; and on this foundation, proposes a method for determining the age of the world. See AGE, and SALTNESS.

The large lakes, wherewith the northern regions abound, serve for very good purposes, inasmuch as the warm vapours arising from them, serve for a defensive against the pinching cold of those climates.—To this it is owing, that Ireland, Scotland, &c. are less affected with frosts than much warmer countries. See COLD, FROST, VAPOUR, &c.

LAKÉ, among painters, &c. See the article LACCA.

LAMA, or LAMAS, the title of an order of priests among the western Tartars, on the frontiers of China; who are held in great veneration.

They have a grand lama, who is their high-priest, and who is the second person in the kingdom, being the next in authority to the king. He receives homage, and adoration, not only from the people, but from the neighbouring kings; none of whom are ever enthroned, without sending ambassadors to him to obtain his benediction.

The lama's are extremely superstitious, and are remarkably given to magic.

LAMB. See the article PASCAL Lamb.

LAMBATIVES, or rather LAMBITIVES, a form of medicine to be licked off the end of a liquorice-stick.

Lambatives amount to the same with *linctus's*, *lobocks*, and *eclegma's*. See LINCTUS, ECLEGMA, &c.

LAMBDOIDES, *λειτουργίδης*, in anatomy, an epithet applied to the third proper suture of the cranium, in regard it resembles the form of a Greek λ, *lambda*. See SUTURE.

For the same reason it is sometimes called *ypsiloides*, as bearing some resemblance to a Greek γ, *ypsilon*. See YPSILOIDES.

LAMELLÆ \*, little, thin plates, or laminæ, whereof the scales, and shells of fishes, &c. are composed.

\* The word is a derivative of *lamina*; and signifies as much as little *lamina*. See LAMINA.

LAMLÆ, *Λαμναι*, among the ancients, a kind of dæmons, or evil spirits, who, under the form of beautiful women are said to have devoured children. See DÆMON.

Horace makes mention of them in his *Art of Poetry*.—Some authors call them *lania*, à *laniando*.—Philostatus says, they are also called *larvæ*, or *lemures*, as if they were all the same thing.—Bochart will have the word to be Phœnician, and derives it from *למ* to devour; alledging the fable of the *lamia* came from Libya. See LEMURES.

LAMINÆ, in physiology, thin plates, or tables, whereof any thing consists; particularly the human skull, which are two, the one laid over the other. See CRANIUM, and BONE.

LAMMAS-DAY, the first of August; so called, as some will have it, because lambs then grow out of season, as being too big. Others derive it from a Saxon word, signifying *lasmass*, because on that day our fore-fathers made an offering of bread made with new wheat.

On this day, the tenants who formerly held lands of the cathedral church in York, were bound by their tenure to bring a lamb alive into the church at high-mass.

LAMP, *Λαμπά*, a sort of luminary, consisting of oil disposed with a wick in a proper vessel for burning.

The use of lighted lamps in churches, and places of devotion, is very ancient.—In the city of Fez is a mosque, wherein are nine hundred brazen lamps burning every night.—In Turkey, all the illuminations are made with lamps.—Polydore Virgil ascribes the first invention of lamps to the Egyptians; and Herodotus describes a feast of lamps held annually in Egypt.

Kircher shews the manner of preparing lamps, which shall diffuse a light so disposed, as to make the faces of those present appear black, blue, red, or of any other colour. There has been a great dispute among the learned, about the sepulchral lamps of the ancients: some maintain, they had the secret of making lamps that were inextinguishable, alledging

several that had been found burning, at the opening of tombs, fifteen or sixteen hundred years old. But others treat these relations as fables; and others think that the lamps which before were extinguished, took light afresh upon the admission of fresh air.

Dr. Plott, however, is of opinion, such perpetual lamps are things practicable, and has himself made some proposals of this kind. The *linum asbestinum*, he thinks, may do pretty well for the wick, and that *naphta*, or liquid bitumen, constantly springing into some of the coal mines, will answer for the oil. See ASBESTOS, and NAPHTA.

If the asbestos will not make a perpetual wick, he thinks there is no matter in the world that will; and argues, that the tradition of such lamps must be fabulous, or that they made them without wicks.

Such a lamp he thinks it possible to make of the bitumen springing into the coal mines at Pitchford in Shropshire; which, he says, like other liquid bitumens, will burn without a wick. Those lamps that kindle on the immission of fresh air the same author thinks might be imitated by inclosing some of the liquid phosphorus in the recipient of an air-pump; which, under those circumstances, will not shine at all; but on letting in the air into the recipient, there will possibly, says he, appear as good a perpetual lamp, as some that have been found in the sepulchres of the ancients. See PHOSPHORUS.

Cardan's LAMP, is a contrivance of the author of that name, which furnishes itself with its own oil.

It consists of a little column of brass, tin, or the like, well closed every where, excepting a small aperture at bottom, in the middle of a little gullet, or canal, where the wick is placed.

Here the oil cannot get out, but in proportion as it spends, and so opens the passage of that little aperture.

This kind of lamp was in much use some years ago; but it has several inconveniencies; as that the air gets into it by starts and gluts; and that when the air in the cavity comes to be much rarefied by heat, it drives out too much oil, so as sometimes to extinguish the lamp.

Dr. Hooke, and Mr. Boyle, have invented other lamps, that have all the conveniences of Cardan's, without the inconveniencies.—See some improvements in the doctrine of lamps, under MIRROR.

LAMPADARY, LAMPADARIUS, an officer in the ancient church of Constantinople; whose business was to see the church well lighted, and to bear a taper before the emperor, the empress, and the patriarch, when they went to church, or in procession. See TAPER.

The taper born by the lampadary before the emperor, was compassed with diverse circles of gold, in manner of crowns; those held before the empress, and patriarch, had but one.—It seems they were of emblematic use, and were intended to keep those great persons in mind, that their light was to illumine those underneath them.

There were also lampadaries in the emperor's palaces; and others in the houses of the grandees: at first, the privilege of having a lampadary, or torch-bearer, was only granted to the great officers of the crown, and the chief magistrates; but afterwards the emperor allowed it to other inferior officers, as questors, treasurers, &c.

Together with the taper, they bore before the magistrates the emperor's image, &c. And it is very probable, it was on account of this image, that they were first permitted to have a lampadary.

LAMPAS, a kind of fiery meteor, resembling a burning lamp, hence also denominated *fax ardens*. See METEOR.

LAMPAS, or LAMPERS, a kind of swelling in the palate of a horse; so called, because it is cured by burning with a lamp, or an hot iron.

The lampas is an inflammation, or tumor, in the roof of a horse's mouth, behind the nippers of the upper jaw.—It arises from abundance of blood resorting from the first furrow of the mouth, near the fore teeth, which causes that furrow to swell as high as his gatherers; it hinders the beast's feeding, and makes him let his meat fall, half chewed, out of his mouth again.

The lampas is a natural infirmity, which every horse has, first or last, and every smith can cure.

LAMPETIANS, LAMPETIANI, a sect of ancient heretics, who fell in with some of the opinions of the Arians. See AERIAN.

The founder, Lampetius, is said to have been one of the chiefs of the Marcionites. They condemned all kind of vows, particularly that of obedience, as inconsistent with the liberty of the sons of God.

LAMPROPHORUS, an appellation anciently given to the Neophytes, during the seven days that succeeded their baptism. In the ceremony of baptism, the new Christian was clothed with

with a white robe; which he wore for the week following; and was thence called *lamprophorus*, which signifies a *person wearing a shining garment*; from *λαμπρως*, shining, and *φορεω*, I carry.

The Greeks also gave this name to the day of the resurrection, in regard their houses were adorned and illuminated on that day with an infinite number of torches, as a symbol of the light which that mystery diffused in the world.

LANÆ *Petra*. See the article PETRA.

LANCE, LANCEA, a spear; an offensive weapon bore by the ancient cavaliers, in form of a half pike.

The lance consisted of three parts, the shaft, or handle, the wings, and the dart.—Pliny attributes the invention of lances to the Ætolians. Varro, and Aulus Gellius say, the word *lance* is Spanish; whence others conclude the use of this weapon was borrowed by the people of Italy from the Spaniards.—Diodorus Siculus derives it from the Gaulish, and Festus from the Greek, *λαγχη*, which signifies the same.

LANCETI, a name given by the ancient laws of England to a kind of vassals, who were obliged to work for the lord one day in a week, from Michaelmas to Autumn, either with fork, spade, or flail, at the option of the lord.

LANCETTE, a fine, small, chirurgeon's knife; streight-pointed, and two edged; used in opening veins, &c. See PHLEBOTOMY.

LAND-CHEAP, an ancient customary fine, paid either in cattle, or money, upon the alienating or selling of *land* in certain manors, or within the liberty of certain boroughs.

At Malden in Essex, a payment is still made of 13 *d.* in every mark of the purchase-money, for lands and houses sold in that town; which is called *land-cheap*.

LAND-FALL, is a sea-term, signifying to fall in with the land.

Good LAND-FALL, is when a ship makes, or sees the *land* as she expected according to her reckoning.—The contrary is called a *bad land-fall*.

LAND-GABLE, an ancient term for a tax, or rent issuing out of *land*; answering to what we now call *ground rent*.

LAND-LOCKED, a ship is said to ride *land-locked*, when she is surrounded with land, that is, is at anchor in a place where there is no point open to the sea, so that she is safe from the violence of winds, and tides.

LANDSKIP, or LANDSCAPE, the view, or prospect of a country, extended as far as the eye will carry.

LANDSKIPS, in painting, are pieces representing some champaign, or rural subject, as hills, vales, rivers, country houses, where human figures are only introduced as accidents, or circumstances.

*Landscape* painting is esteemed one of the lowest branches of painting. See PAINTING.

LANGREL SHOT, is a sort of shot sometimes used at sea, made of two bars of iron, with a joint, or shackle, in the middle; by which means it can be shortned, and so put the better into a gun; and at each end there is a half bullet, either of lead, or iron.

This shot, when discharged, flies out at length, and so does more execution among the enemy's rigging, &c.

LANGUAGE, a set of words which any people have agreed upon, whereby to communicate their thoughts to each other. See WORD.

The first principles of all *languages*, F. Buffier observes, may be reduced to expressions, signifying, first, The subject spoke of. Secondly, The thing affirmed of it. Thirdly, The cir-

cumstances of the one and the other. But as each *language* has its particular ways of denoting each of these, a *language* is only to be looked on as an assemblage of expressions, which chance or caprice has established among a certain people; just as we look on the mode of dressing, &c.—It is usage and custom is the rule of a *language*; and these hold their empire independent of reason, or any other cause: nor has reason any thing to do in *language*, unless to study or teach it, such as it is: Here then commences grammar; a just plan of which, supposes a *language* already introduced by use; and without pretending to alter or amend a tittle, only furnishes reflections, called *rules*, to which the manners of speaking used in that *language* may be reduced; which assemblage of reflections, is what we call the *grammar of that language*.—This remark may obviate an abuse introduced among grammarians, who are ever crying out, 'Usage is, in this point, opposite to grammar; or the *language* here frees itself from the rules of grammar, &c. See GRAMMAR.

It is chance then to which we owe usage, and usage that makes the rules and measures of a *language*. Usage, indeed, is somewhat dubious, and may be divided into *good* and *bad*: If it be asked, Wherein the difference between these lies? it is in this; that the one is better established, or authorized, than the other: and if it be asked, Wherein that difference of authority consists? it is answered, That in dead *languages*, that which makes the good usage is the writings of the best authors in that *language*: and if it be further questioned, Which are the best? those are allowed such, who wrote when that state was in its greatest glory. Thus the age of Augustus, being the most distinguished by great men, who then flourished, we call that *good Latin* which is conformable to the manners of speaking used by authors who wrote fifty years before, and fifty after the reign of that emperor.—As to living *languages*, the good usage, or mode, is that which obtains among the most eminent persons, whether as to quality, and authority, or as to learning, and the reputation of writing well.

With this view, M. Vaugelas defines usage of a *language*, the manner of speaking used by the soundest or best part of the court, conformably to the manner of writing among the best part of the authors of the time.—But this definition, how judicious soever, may occasion infinite doubt; for which is to be deemed the best part of the court, and of the writers? Each party, doubtless, thinks itself the best.—F. Buffier, therefore, very justly, instead of the best part, substitutes the greatest part, which brings the matter nearer to a certainty; the most numerous part being something fixed, and palpable, whereas the most sound part may be insensible, or arbitrary. There is found a constant resemblance between the genius of natural complexion of each people, and the *language* they speak.—Thus the Greeks, a polite, but voluptuous nation, had a *language* perfectly suitable, full of delicacy and sweetness.—The Romans, who seemed only born to command, had a *language* noble, nervous, and august; and their descendants, the Italians, are sunk into softness, and effeminacy, which is as visible in their *language*, as their manners.—The *language* of the Spaniards is full of that gravity, and haughtiness of air, which make the distinguishing character of that people.—The French, who have a world of vivacity, have a *language* that runs extremely brisk and lively.—And the English, who are naturally blunt, thoughtful, and of few words, have a *language* exceedingly short, concise, and sententious.

The diversity of LANGUAGES is generally allowed to have taken its rise from the confusion of Babel, both by Jews, Christians, and Mahometans: but the manner in which this diversity was effected, is still in dispute among the learned.—The question is, Whether God only expunged the remembrance of the signification of terms in those who built the tower? or, Whether he immediately inspired them with new words? Scaliger holds, that they only forgot the meaning of the words, and named one thing instead of another; though all indifferently spoke the Hebrew tongue.—Nor does Casaubon allow, that they immediately spoke different *languages*: the confusion of tongues, he thinks, might be very well effected, without introducing a multiplicity of *languages*. See Ziegra de *confusione Linguarum Babylonica ad Genes. XI.*

As to the point of antiquity, and priority among *languages*, that too has been extremely controverted.—Herodotus tells us, that in the dispute between the Egyptians and Phrygians, about the antiquity of their *languages*, Psammeticus, king of Egypt, ordered two children to be brought up, with express prohibition not to have one word pronounced before them, but to leave nature to speak of herself; and the first word they spoke happened to be *beccos*, which, in the Phrygian *language*, signifies *bread*. The Egyptians, however, were not convinced with this proof.—The Arabs dispute the point of antiquity with the Hebrews: but the Jews, jealous, even to excess, of the honour of their nation, positively insist on it, that the Hebrew tongue, such as it is found in the holy scriptures, is the primitive *language*, and that spoken by the first man.

Others maintain, that the *language* spoken by Adam is lost, and that the Hebrew, Chaldee, and Arabic, are only dialects of that original tongue. So far are they from giving the priority to the Hebrew, that they maintain Abraham spoke Chaldee before he passed the Euphrates; and that he first learned the Hebrew in the land of Canaan: so that this was not a special *language* consecrated to the people of God, but was originally the *language* of the Canaanites.

M. le Clerc is of opinion, the Hebrew is far inferior to the Greek, both in copiousness, elegancy, and perspicuity; it is dry and destitute of ornaments, insomuch that wanting expressions to vary the phrase, the same periods are perpetually returning.—The Rabbins say, it is so pure and chaste, that it has no proper names for the parts of generation, nor for those by which the excrements are discharged. See HEBREW.

The Arabic is held the most copious of all *languages*; being said to have 300 different words to express a lion, and no less than 1200 for a sword.

LANGUAGES are divided into,—original, or mother tongues; as the Hebrew, and Arabic, in the East, the Teutonic, and Slavonic in the West. See SCLAVONIC, and TEUTONIC.

Secondary, or derivative LANGUAGES, which are those formed out of a mixture of several others, as Latin, French, &c.

Kircher will have the Cophtic a mother tongue, independant of all others. See COPHTIC.

Du Jon maintains the Gothic a primitive *language*, and the mother of all the Teutonic tongues; that is, of all those spoke in the North. See RUNIC.

Some add the Basque, or Biscayan, and Bas Briton; to the number of mother tongues, imagining them to have been those of the ancient Celts, or Gauls.

Learned, or dead LANGUAGES, are those which only subsist in books, and which must be learned by the rules of grammar; as the Greek, Hebrew, Syriac, and Chaldee. See the articles HEBREW, GREEK, &c.

Raymond Lully solicited the establishment of the study of the learned *languages* a long time, in the thirteenth and fourteenth Centuries. At length, in the year 1312, pope Clement, and the council of Vienne, appointed, that in the court of Rome, and in the universities of Paris, Oxford, Bologna, and Salamanca, there should be instituted professors of each, who should have salaries from the respective courts.—The monks, however, vigorously opposed the spreading of these studies; and with so much success, that Erasmus tells us, in his time *Græce nosse suspectum, Hebraice prope hæreticum*.

Living LANGUAGES, are those still spoke in some country, or other; and which may be learned by conversation.—The most popular among these are the French, Italian, Spanish, and English: which see under their respective names, ENGLISH, FRENCH, ITALIAN, &c.

The Spaniards seem to place the nobleness, and gravity of their language, in the number of syllables, and the swelling of words; and speak less to be understood, than to be admired. Their terms are big, and sonorous, their expressions haughty, and boisterous, and pomp and ostentation run through all they say: their *language* cannot paint a thought to the life; it always magnifies it, frequently distorts it; and does nothing, if it do not exceed nature.

The Italian tongue does not swell up things to that degree, but it adorns, and embellishes them more; yet these ornaments, and embellishments, are not real beauties.—The Italian expressions, thus rich and brilliant, are like those faces covered with patch and paint, which make a fine show; but the finery is all deceit. See ITALIAN.

The French *language* (as some of their authors express themselves) is simple, without lowness; bold without indecency; elegant and florid, without affectation; harmonious, without swelling; majestic, without pride; delicate, without softness; and strong, without roughness.—Though, as to the points of strength, and majesty, the French must give way to the English; which, in these, as well as in copiousness, exceeds most of the living *languages*; as far as it comes behind some of them in smoothness, and delicacy.

Of all the modern *languages*, the French is allowed to be the most clear and fit for philosophical and critical subjects; the chastest and most reserved in its diction; the most judicious and severe in its ornaments.—Of all others, the English is said to be the most honest, open, and undesigning; it will not bear double meanings, nor can it palliate, or hide nonsense: bad sense, and good English, being things inconsistent. With all its sublimity, it is gay and pleasant on occasion; but its gaiety is still moderated, and restrained by good sense; it hates excessive ornaments; and, for the greater simplicity, would almost chuse, as some say of the French, to go naked: it never dresses more than decorum and necessity requires.

The Spanish resembles those rivers whose waters are always swelling, and always muddy, and turbulent; that never keep long within their channel, but are ever overflowing, and their overflowings ever noisy, and precipitate.—The Italian is like those pleasing rivulets that purr agreeably among the stones, and glide in meanders through meadows full of flowers.

—The French resembles one of those beautiful streams that always run briskly; but, at the same time, smoothly, and equally; without much noise, or much depth.—The English, like the Nile, preserves a majesty even in its abundance: its waters roll rapidly; notwithstanding their depth; it never roars, but when its banks are too narrow; nor overflows, without enriching the soil.

The Latin is the common mother of the three former; but the daughters have very different genius's, and inclinations.—The Spanish, a haughty dame, that piques herself on her quality, and loves excess, and extravagancy in every thing. The Italian, a coquette, full of fine airs; always appearing dressed, and taking all occasions of shewing her finery: to be admired being all she aims at. The French, an easy prude, that has her share of modesty, and discretion; but, on occasion, can lay them both aside.—The English is of a more masculine temperament: it is not only of a different family from the others, but appears of a different sex too: its virtues are those of a man: indeed, it is the product of a colder climate, and a rougher people; and its features may be somewhat coarser than those of its neighbours, but its faculties are more extensive, its conduct more ingenuous, and its views more noble. See ENGLISH, &c.

Ennius, and Cecrops, are celebrated for their knowledge of many *languages*. Mithridates, king of Pontus, understood twenty two tongues, which was the number of different people over whom he commanded; and those *languages* he knew so well, that he was able to harangue each of his people in their own tongue. It was a saying of Charles the fifth, 'That so many *languages* as a man understands, so many times he is man.' Sultan Soliman's interpreter spoke perfectly well seventeen different *languages*. But among the moderns, none have been more remarkable in this way, than Postellus; who, besides a perfect knowledge of all the dead *languages*, was so well acquainted with the living, that it is said he could have made the tour of the globe, without the use of an interpreter.

Bibliander has written of the analogy, and proportion of *languages* and letters, *De ratione communi linguarum*, in 1518. Gesner, of the difference of *languages*, in 1572. Lazius published an *Introduction to the learning of the politer languages, in a common method*, in 1548. Megissier, a scheme of forty different *languages*, and different dialects, specimens of each whereof he gives in the Lord's-prayer, in 1593. De Recoles, in his *addition to the world of Daviti*, has published the Pater-noster in all the *languages* spoken among Christians; and Mr. Chamberlayne has lately proposed to do the same in 100 *languages*, a specimen of which has been already published. Albericus Gentilis wrote of the mixture of *languages*, in 1603. And father Reinier's discourse on etymologies, is a work of the same kind. In 1613, Duret published a treasure of the history of all the *languages* in the universe: Guichart has a treatise of the etymological harmony of *languages*, published in 1619. Brerewood has given us curious enquiries into the diversities of *languages*, and religions, published in 1635.

LANGUAGE, is also used in the order of Malta, for nation.

The knights of Malta are divided into eight *languages*; three whereof are for France, viz. the *language* of Provence, of Auvergne, and of France; two for Spain, those of Castile, and Arragon; the other three are the *languages* of Italy, England, and Germany.

Each of these *languages* has its chiefs, who presides in assemblies of the *language* to which he belongs. See MALTA.

Frank LANGUAGE. } See the article { FRANK.

Hellenistic LANGUAGE. } { HELLENISTIC.

LANGUED, LANGUE, in heraldry, is applied to such animals whose tongues appear out of their mouths; being of a colour different from that of the body of the animal.

LANGUOR signifies a faintness, or relaxation of the members, arising either from a want, or decay of spirits, through indigestion, or too much exercise; or from an additional weight of fluids, caused by a diminution of the excretion by the common discharges. See LASSITUDE.

LANIGEROUS, any thing that bears wool. See WOOL, —Hence,

LANIGEROUS, or LANUGINOUS Trees, among herbalists, are those trees that bear a woolly, downy substance; as, the black, white, and trembling poplars, osters, and willows of all sorts. See LANUGO, and FREE.

LANTERN \*, or LANTHORN, a cover for a luminary, made of some transparent matter; serving to transmit the light, and, at the same time, to skreen it from the wind, and weather. See LIGHT, &c.

\* The word is deriv'd from the French *lanterne*, and that from the Latin *laterna*, of *lateo*, I am hidden; *eo quod lucem habeat interiori clausam*, in regard the light is hidden within, say Isidore, and Lambin. But according to Pezron, *laterna* comes from the Celtic *latern*; and according to Salmasius, *lantern* comes from *lato*, of *fero*, in regard it bears a lamp, or a light.

Epictetus's *lantern* is said to have been sold for 3000 drachms. That of Diogenes was held in great veneration among

# L A P

among the antients; and that of Judas is still preserved in the treasury of S. Denys, as a very curious piece of antiquity. *Lanterns* are made of glass, horn, paper, &c. formerly, they were made of the horn of a wild bull, called *urus*; which when cut into thin laminæ, Pliny tells us, was very transparent.

**Dark LANTERN**, is a *lantern* with only one opening, or light, which, too, may be closed up, when the light is to be entirely hid; and may be presented to the person one would see, without being perceived one's self.

The antients had their dark *lanterns*, but they differed from ours; they were covered with four skins, one on each side, or light, three whereof were black, and only the fourth transparent.—Cassaubon, who gives us the description, took it from a manuscript of Julius Frontinus.

These were principally used in their armies, when they were to march privately off from their enemies in the night-time.

**Fest of LANTERNS**, in China, is a celebrated feast held on the fifteenth day of the first month; so called from the infinite number of *lanterns* hung out of the houses, and streets; which, it is said, is not less than two hundred millions: inasmuch, that it rather appears a fit of madness, than of feasting. On this day are exposed *lanterns* of all prices, whereof some are said to cost 2000 crowns.—Some of their grandees retrench somewhat every day, out of their table, out of their dress, equipage, &c. to appear the more magnificent in *lanterns*. They are adorned with gilding, sculpture, painting, japanning, &c. and as to their size, it is extravagant; some are from 25 to 30 foot diameter: they represent halls, and chambers, and two or three such machines together would make handsome houses; so that in China they are able to eat, lodge, receive visits, have balls, and act plays in a *lantern*.

To illumine them, they should have bonfires; but as that would be inconvenient, they content themselves with lighting up in them an infinite number of torches, or lamps; which, at a distance, have a beautiful effect.—In these they exhibit various kinds of shews to divert the people.

Besides these enormous *lanterns*, there is a multitude of other smaller: these usually consist of six faces or lights, each about four feet high, and one and a half broad, framed in wood finely gilt and adorned; over these they stretch a fine transparent silk, curiously painted with flowers, trees, and sometimes human figures: the painting is very extraordinary, and the colours extremely bright; and when the torches are lighted, they appear highly beautiful, and surprising.

**LANTERN**, in architecture, a kind of little dome raised over a large one, or over the roof of a building, to give light, and to serve for an acroter to finish the building. See CUPOLA.

**LANTERN** is also used for a square cage of timber, with glass in it, placed over the ridge of a corridor, or a gallery between two rows of shops, to illuminate them; as that in the Royal-Exchange, London.

**Magic LANTERN**, in optics, the name of a machine, which in the dark represents various images, and spectres on a wall, or other white surface, so odd and surprising, that those who are not in the secret, think them the effects of magic. See MAGIC.

**LANUGINOUS**. See the article LANIGEROUS.

**LANUGO**, in botany, *down*; that soft, hairy, or woolly covering, which grows on the leaves, stalks, or fruit of divers plants. See LANIGEROUS.

Such is that found on the leaves of the rose campion, and on the fruit of the peach-tree.

**LAPIDARY**, **LAPIDARIUS**, an artificer who cuts precious stones. See GEM, and PRECIOUS Stone.

The art of cutting precious stones is very antient; but, like other arts, its original was very imperfect: The French have succeeded in it the best; and the *lapidaries* of Paris, who have been a corporation since the year 1290, have carried it, especially cutting of diamonds called *brilliant*s, to its last perfection.

There are various machines used in the cutting of precious stones, according to the quality of the matter to be cut: the diamond, which is extremely hard, is cut and formed on a wheel of soft steel, turned by a kind of mill, with diamond dust tempered in oil of olives; and this serves to polish them, as well as to cut them. See DIAMOND.

Oriental rubies, sapphires, and topazes, are cut and formed on a copper wheel, with oil of olives, and diamond dust: they are polished on another copper wheel, with tripoly and water. See RUBY, &c.

Emeralds, hyacinths, amethysts, garnets, agats, and other stones less hard, are cut on a leaden wheel, with smalt and water, and polished on a tin wheel with tripoly. See EMERALD, &c.

Turquois, of the old and new rock, lapis, girasol, and opal, are cut and polished on a wooden wheel with tripoly. See TURQUOIS, &c.

**LAPIDARY** is also used for a virtuoso skilled in the nature, kinds, &c. of precious stones; or a merchant who deals in them.

# L A R

In which sense, the present great Mogul is said to be one of the greatest *lapidaries* in the world.

**LAPIDARY Style**, denotes the style proper for inscriptions. See STYLE, and INSCRIPTION.

This is a kind of medium between prose and verse; the jejune and the brilliant are here equally to be avoided. Cicero has prescribed the rules of it: *Accedet oportet oratio varia, vehemens, plena spiritus. Omnium sententiarum gravitate, omnium verborum ponderibus est utendum.*

The *lapidary style*, which was lost with the antient monuments, has been retrieved, at the beginning of this age; by count Emanuel Teforo: It is now used various ways at the beginning of books; and even epistles dedicatory are composed in it, whereof we have no example among the antients.

**LAPIDESCENT**, any thing which has the faculty of petrifying, or turning bodies to a stony nature. See STONE.

Naturalists speak of a *lapidescent* principle, a *lapidescent* spirit, *lapidescent* juice, &c.

**LAPIDESCENT Waters or Springs**, are such as having stony particles dissolved, and swimming in them, do depolite the same on wood, leaves, and other bodies immersed therein; which being incruited herewith, are commonly considered as petrifications. See SPRING, and PETRIFICATION.

**LAPIDIFICATION**, in chemistry, an operation whereby any substance is converted into stone. See PETRIFICATION.

This is done by dissolving a metal, for instance, in a corrosive spirit or menstruum, and afterwards baking that dissolution into the consistence of a stone.

*Lapidification* is practised in metals, fixed salts, and salts of plants.

The term is also used for the making of artificial stones.

**LAPIS**, in the general sense. See the article STONE.

**LAPIS Asbestos**.

**LAPIS Calaminaris**.

**LAPIS Dentalis**.

**LAPIS Infernalis**, a caustic stone prepared various ways; sometimes of strong soap-lees evaporated to a driness, and the remainder kept in a glass well stoped from the air. Sometimes it is made of calcined vitriol, tartar, and sal armoniac, and boiled in quick lime water to a strong lixivium; then strained and evaporated till dry. See CAUSTIC.

**LAPIS Judaicus**. See the article JUDAICUS.

**LAPIS Lazuli**. See the article LAZULI.

**LAPIS Medicamentosus**, or the medicinal stone; is a composition of roch allum, litharge, colcothar of vitriol, Armenian bole, and vinegar; boiled to the consistence of a hard stone.—It is used to fasten the teeth, preserve the gums, heal and dry up ulcers and wounds, and is used in injections, and in compositions for sore eyes.

**LAPIS Specularis**. See the article SPECULARIS.

**LAPSARII**. See INFRA LAPSARII, SUB LAPSARII, and SUPRA LAPSARII.

**LAPSE**, a slip, or omission of a patron to present a clerk to a benefice within six months of its being void; in which case the benefice is said to be in *lapse*, and *lapsed*, and the right of presentation devolved to the ordinary. See PRESENTATION.

**LAQUEARIUS** \*, a kind of athleta among the antients, who in one hand held a *laqueus*, i. e. a sort of snare, wherewith to embarras and intangle his antagonist, and in the other a poinard to stab him. See ATHLETA.

\* The word comes from the Latin *laqueus*, a snare, or nooze.

**LAQUEUS**, in surgery, a *nooze*, or *snare*; or a kind of ligature so contrived, that when stretched by any weight, or the like, it draws up close.

Its use is to extend broken or disjointed bones, to keep them in their places, when they are set, and to bind the parts close together.

**LAR-BOARD**, the left-hand side of a ship when you stand with your face toward the head. See STARBOARD.

**LARCENY** \*, in law, is a theft of personal goods, or chattels, in the owner's absence. See THEFT.

\* The word comes from the French *larcin*, and that from the Latin *latrocinium*, theft.

In respect of the things stolen, *larceny* is either *great*, or *small*.

**Great LARCENY**, is when the things stolen, though severally, exceed the value of 12 d.

**Petty LARCENY**, is when the goods stolen, exceed not the value of 12 d.

Civilians define *larceny*, a fraudulent subtraction of another man's property, with design to appropriate it without the owner's leave.

When it is done by force, it is called a *robbery*. See ROBBERY. By the Roman law, the penalty of *simple* and *secret larceny* was the returning it twofold; and of *manifest larceny*, fourfold: *manifest larceny*, was where the criminal was taken in the fact; *simple*, where he was not. The Lacedæmonians never punished *larceny*, provided the person was not caught in the fact; but, on the contrary, it was applauded as a mark of dexterity and address.—The Circassians are said to honour it at this day; inasmuch that at their public feasts their youth

youth are not suffered to drink, if they have not performed something remarkable in that way.—Solinus tells us, that in Sardinia there was a fountain that had the virtue of discovering a person that had committed *larceny*.

**LARENTINALIA**, in antiquity, a feast held among the Romans on the 13d day of September; by some supposed to have been in honour of the Lares, but by others, with more probability, in honour of Acca Laurentia; and to have been the same with *laurentalia*. See **LAURENTALIA**.

**LARES**, among the antients, a kind of domestic genii, or divinities, worshipped in houses, and esteemed the guardians and protectors of families; supposed to reside more immediately in the chimney-corner. See **GOD**.

Plutarch distinguishes good and evil *lares*, as he had before done good and evil genii. See **GENIUS**.

There are also some public, others private *lares*.

Apuleius tells us, the domestic *lares* were no more than the souls of departed persons, who had lived well, and discharged the duties of their station; whereas those who had done otherwise, were vagabonds, wandering about and frightening people, called *larvæ*, and *lemures*. See **LEMURES**.

The *lares* were also called *penates*, and were worshipped under the figures of little marmosets, or images of wax, silver, or earthen ware. See **PENATES**.

The public *lares* were also called *compitales*, from *compitum*, a cross way; and *viales*, from *via*, a way, or publick road; as being placed at the meetings of roads, and in the highways, and esteemed the patrons and protectors of travellers. See **VIALES**.

Their private *lares* took care of particular houses and families: these they also called *præfites*, from *præsto*;

*Quod præstant oculis omnia tuta suis.* Ovid. Fast.

They gave the name *urbani*, i. e. *lares* of cities, to those who had cities under their care; and *hustili*, to those who were to keep their enemies off.—There were also *lares* of the country, called *rurales*, as appears by several antique inscriptions.

The *lares* were also genial gods, and were supposed to take care of children from their birth. It is for this reason, that when Macrobius tells us the Egyptians had four gods who presided over the births of children, viz. the *genius*, *fortune*, *love*, and *necessity*, called *præfites*; some interpret him as if he had said the Egyptians had *lares*; but there was a world of difference between the *lares* of the Romans. and the *præfites* of the Egyptians.

The antients differ extremely about the origin of the *lares*. Varro and Macrobius say they were the children of Mania; Ovid makes them the issue of Mercurius, and the naiad Lara, whom Lactantius and Aufonius call *Larunda*; Apuleius affures us, they were the posterity of the Lemures; Nigridius, according to Arnobius, made them sometimes the guardians and protectors of houses, and sometimes the same with the *Curetes* of Samothracia, which the Greeks call *Idæi dætyli*. Nor was Varro more consistent in his opinion of these gods; sometimes making them the names of heroes, and sometimes gods of the air.

T. Tatius, king of the Sabines, was the first who built a temple to the *lares*. The chimney, and fire-place in the house were particularly consecrated to them.

Tertullian tells us, the custom of worshipping the *lares* arose from this, that they antiently interred their dead in their houses; whence the credulous people took occasion to imagine their souls continued there also, and proceeded to pay them divine honours.—To this it may be added, that the custom being afterwards introduced of burying in the highways, they might hence take occasion to regard them as gods of the highways. See **COMPITALITIA**.

The victim offered to the *lares*, in the public sacrifices, was a hog: In private, they offered them wine, incense, a crown of wool, and a little of what was left at the table.—They also crowned them with flowers, particularly the violet, myrtle, and rosemary. Their symbol was a dog, which was usually represented by their side, on account of its fidelity, and the service it does to man, in watching his house. They were sometimes also represented as clothed in a dog's skin. See **PENATES**.

See further on the *lares*, in Arnobius, Lactantius, Augustin *De Civit.* Natalis Comes, Lambin on *Plaut. Aulul.* and on *Hor.* Casaubon on *Sueton.* &c.

The pantheons, or images representing several gods at once, were also called *lares*.—Harpocrates was one of these. See **PANTHEON**.

**LARGE**, a sea-term. See the article **VEERING**.

**LARGE Minion**. See the article **MINION**.

**LARMIER**, in architecture, a flat, square, massive member of the cornice, between the cymatium and the ovolo; so called from its use, which is to disperse the water, and cause it to fall at a distance from the wall, drop by drop, or as it were, by tears; *larmer*, in French, signifying a tear.—See *Tab. Architect. fig. 9. fig. 24. lit. d. fig. 28. lit. f.*

The *larmier* is also called *corona*; and in English, the *drip*. See **CORONA**, and **CORNICHE**.

**LARYNGOTOMIA**\*, an incision in the trachea, or wind-pipe between two of its annuli, or rings, in order to give passage for the breath, when there is danger of suffocation from a squinancy, or the like. See **ANGINA**, and **QUINZY**.

\* The word is Greek, *Λαρυγγτομία*, formed of *λαρυγξ*, and *τεμνω*, *seco*, I cut.

*Laryngotomy* is the same with what is otherwise called *bronchotomy*. See **BRONCHOTOMY**.

Dr. Musgrave observes, that in all medicine there is not one method that works so great a change, for the better, in so short a time. However, it is seldom practised, in regard that gap which appears on the cutting a throat, (the divided parts being then drawn towards their more fixed ends) together with the great efflux of blood, when the jugulars and carotid arteries are also wounded, create in most men a dread of the operation, and make many believe all wounds of the trachea mortal. The same author makes no scruple, however, to say, it ought to be practised in quinzies, and other dangers of suffocation from causes of a like nature with them; from an extraordinary cure which he himself had wrought in this way.

**LARYNX**, *Λαρυγξ*, in anatomy, the upper part, or head of the trachea, lying below the root of the tongue, and before the pharynx. See **TRACHEA**.

The *larynx* is one of the organs of respiration, and the principal instrument of voice. See **RESPIRATION**, &c.

Its body is almost wholly cartilaginous, and it is to be constantly open to give room for the air to pass and repass. Its figure is circular, though it jets out a little before, and is a little flattened behind, lest it should incommode the œsophagus, whereon it is placed.

The *larynx* is of different diameters, according to the different ages; in young people it is narrow; whence their voice comes to be acute; in those more advanced in years, it is more ample, which occasions their voice to be stronger and deeper. In men it is bigger than in women, for which reason mens voice is more grave than that of women.

It appears the less in women, in regard the glands situate at the bottom of the *larynx*, are bigger in women than in men. See **VOICE**.

The *larynx* moves at the time of deglutition; when the œsophagus is lowered for the reception of the food, the *larynx* raises itself to compress it, and facilitate its descent. See **DEGLUTITION**.

There are five kinds of parts belonging to the *larynx*, viz. *cartilages*, *muscles*, *membranes*, *nerves*, and *glands*.—Its cartilages are the thyroids, cricoides, arytenoides, glottis, and epiglottis, by means of which it can easily dilate and contract, shut and open itself. These form the whole body of the *larynx*, and grow dry and harden, in proportion as the person grows old, when the *larynx* sometimes appears as if it were bony.

The biggest of these is the *thyroides* or *scutiformis*, this guards the forepart, and has its name from some supposed resemblance it bears to a shield. It is of a concavo-convex square figure, the hollow part being inward, and the gibbous outward, having a little prominence in the middle called *pomum Adami*, as if some of the forbidden fruit had stuck in Adam's throat, and occasioned that swelling.

The second is called *cricoides*, or *annularis*, from its resemblance to a ring which the Turks put on their thumb for the drawing of their bows. The forepart of this is very narrow, coming under the other cartilage, but behind it is broad, thick, and strong, being, as it were, the basis of all the others.

The third and fourth are called *arytenoides*, or *guttates*, from the figure of an ewer, which these two together somewhat resemble. At the juncture of these there is a little cleft, or chink, in form of a little tongue, and for that reason called *glottis*, or *lingula*. Through this chink the air descends into the lungs, and the pituitous matter ejected by coughing, in catarrhs, is let out. It serves also for modulating the voice, and is imitated in flutes and the pipes of organs. See **GLOTTIS**.

Over the glottis lies a fifth cartilage called the *epiglottis*, which is very thin and soft, and in non-adults almost membranous, concave on the under side, and convex on the upper: It defends the entrance of the *larynx*, and hinders the liquids, which in drinking slip over it into the œsophagus, from falling into the trachea. See **EPIGLOTTIS**.

The *larynx* has seven pair of muscles, which serve to move its several cartilages, and to contract or dilate them at pleasure; two pair of them are common, the other five proper: the proper are those which have both their origination and insertion in the *larynx*; the common have only their insertion there.

Of the former kind are the cricothyroides, which moves the scutiform cartilage; the crico-arytenoides posticum, which serves, by its contraction, to draw the arytenoides cartilage, and to open the rima. The third is the arytenoides; which serves to bring the two cartilages of that name together, and to shut the rima. The fourth is the crico-arytenoides laterale, and the fifth the thyreo-arytenoides, which shuts the *larynx*.

The

The common muscles are the sternothyroides, which serve to draw down the thyroide cartilage, and the hyothyroides, which lift up that cartilage.

The *larynx* has but two membranes, the one *external*, which is a continuation of that which covers the trachea; the other *internal*, which is the same that lines the whole mouth.

It receives two branches of nerves from the recurrents, and is moistened by four large glands, two situate above, called *tonsils*; and two underneath, called *thyroidæ*. See TONSIL, &c.

The *larynx* is of very considerable use, not only in forming and modulating the voice, by the different apertures of its rima, or chink, but also in compressing the lungs to a greater or less degree, by the air: for if the internal diameter of the *larynx* had been equal to that of the trachea, the lungs could have undergone little or no compression at all; nor, consequently, without the *larynx* could we have reaped any advantage from breathing, in regard the air would not have resisted that force wherewith it is driven out in expiration, nor, consequently, could the compression have been made in the lungs, which is found necessary for the comminution of the globules of the blood, and the mixing of the two fluids, air and blood, together. See RESPIRATION.

For the action of the *larynx* in sound, see GLOTTIS, and SOUND; see also EPIGLOTTIS, TRACHEA, &c.

LASH, or LACE, in the sea language, signifies to bind, or make fast.

*Lashing* is chiefly used for binding up to the ship's side, muskets, butts of water or beer, or pieces of timber to make spare top-masts.

LASHERS, are properly those ropes only which bind fast the tackles, and the breeches of the ordnance, when they are haled, or made fast within board.

LASKING, a sea term, for going large, or veering. See VEERING.

LASSITUDE, among physicians, expresses that weariness, or heaviness of members, that proceeds from a disordered state of body, and not from exercise; either from an increase of bulk, a diminution of proper evacuation, or too great a consumption of that fluid which is necessary to maintain the force and spring of the solids, as in fevers and convulsions; or from a vitiated secretion of that juice, whereby the fibres are not supplied either in due quantity or quality.

The remedy, in the first case, is evacuation: in the latter proper diet, or such alterative medicines as influences such a secretion.

LAST, or LEST, in general, signifies the burden or load of a ship. See BURTHEN.

LAST, is also used for a certain weight and measure, which is various in various countries; though in the general, the *last* is estimated at four thousand pounds weight. See WEIGHT.

A *last* of cod-fish, white herrings, meal, and ashes for soap, is twelve barrels: Of corn, or rape-seed, ten quarters: Of gunpowder, twenty four barrels, or 2400 pounds weights: Of red herrings, twenty cades: Of hides, twelve dozen: Of leather, twenty dickers: Of pitch, or tar, fourteen barrels: Of wool, twelve sacks: Of stock-fish, a thousand: Of flax, or feathers, 1700 pounds weight.

LAST Heir, is he to whom lands come by escheat, for want of lawful heirs; which, in many cases, is the lord whereof they are held, but in others the king. See HEIR, and ESCHSAT.

LAST Will. } See the article } WILL.

Port-LAST. } PORT-LAST.

LASTAGE, or LESTAGE, according to Rastal, is a duty exacted in some fairs and markets, for carrying things bought where one will.

LASTAGE, according to another author, is properly that custom which is paid for wares sold by the *last*. See LAST.

In a law of Ric. II. *lastage* is taken for the ballast or lading of a ship. See BALLAST, &c.

LASTAGE is sometimes also used for garbage, rubbish, or such filth.

LATE Flowers. See the article FLOWERS.

LATENT Acids. See the article ACID.

LATERAL. See COLLATERAL, MULTILATERAL, and QUADRILATERAL.

LATERAL Equation, in algebra, denotes a simple equation; or an equation whose root is only of one dimension. See EQUATION.

LATERAL Palsy. } See the article } PALSY.

LATERAL Operation. } LITHOTOMY.

LATERALIS Rectus Capitis. See the article RECTUS.

LATERAN, was originally the proper name of a man, whence it descended to an antient palace in Rome, and to the buildings since erected in its place; particularly a church called *S. John of Lateran*, which is the principal see of the pope-dom. See POPE.

Councils of the LATERAN, are those held in the basilica of the *Lateran*: Of these there have been five, held in 1123, 1139, 1179, 1215, and 1513. See COUNCIL.

Canons Regular of the Congregation of the LATERAN, is a congregation of regular canons, whereof that church is the principal place, or seat.

VOL. II. N°. LXXXIX.

It is pretended, there has been an uninterrupted succession of clerks, living in community from the time of the apostles; and that a number of these were established in the *Lateran* in the time of Constantine. But the canons were not introduced till the time of Leo I. and these held the church 800 years, till the reign of Boniface, who took it from them, and placed secular canons in their room: 150 years after, the regulars were reinstated. See CANON.

A LATERE, a Latin term, used to denote the qualification of cardinals whom the pope sends as legates into foreign courts; who are called cardinals *à latere*, as being his holiness's counsellors in ordinary, and assistants. See LEGATE.

The guards of princes were heretofore called *laterones*, because always attending at their sides, *à latere*.

Du Cange, in his *Glossary*, says, there were antiently counts *à latere*, and monitors *à latere*.

LATH \*, in building, a long, thin, narrow slip of wood, nailed on the rafters of a roof, to sustain the covering.

\* These are what Festus calls *amblices*; in other Latin writers they are denominated *templa*; and by Gregory of Tours, *ligaturæ*.

*Laths* are divided into three kinds, with regard to the different woods they are made of, viz. *heart of oak laths*, *sap laths*, and *deal laths*: The two last used only for ceiling and partitioning, and the first only for tiling.—*Laths* are also distinguished, with regard to their length, into *five foot*, *four foot*, and *three foot laths*: though the statute allows but of two lengths, viz. those of five foot and of three, each of which are to be an inch and half in breadth, and half an inch in thickness.

LATHE, or LEATHE, a very useful engine for the turning of wood, ivory, metals, and other materials. See TURNING. The invention of the *lathe* is very antient: Diodorus Siculus says, the first who used it was a grandson of Dædalus, named Talus. Pliny ascribes it to Theodore of Samos, and mentions one Thericles, who rendered himself very famous by his dexterity in managing the *lathe*.

With this instrument the antients turned all kinds of vases, many whereof they enriched with figures and ornaments in basso relievo. Thus Virgil:

*Lenta quibus torno facili superaddita vitis.*

The Greek and Latin authors make frequent mention of the *lathe*; and Cicero calls the workmen who used it, *vascularii*. It was a proverb among the antients, to say a thing was formed in the *lathe*, to express its delicacy and justness.

The *Lathe* is composed of two wooden cheeks, or sides, parallel to the horizon, having a groove or opening between; perpendicular to these, are two other pieces, called *puppets*, made to slide between the cheeks, and to be fixed down at any point at pleasure. See CHEEK.

These have two points, between which the piece to be turned is sustained; the piece is turned round, backwards and forwards, by means of a string put round it, and fastened above to the end of a pliable pole, and underneath to a treadle or board moved with the foot. There is also a rest which bears up the tool, and keeps it steady.

As it is the use and application of this instrument that makes the greatest part of the art of turning, we refer the particular description thereof, as well as the manner of applying it in various works, to that head. See TURNING.

LATHE, in law. See the article LETH.

LATIAR, a feast or ceremony instituted by Tarquinius Superbus, in honour of Jupiter Latiaris, or Latialis.

Tarquin, having made a treaty of alliance with the Latins, proposed, in order for perpetuating it, to erect a common temple, where all the allies, the Romans, Latins, Hernici, Volsci, &c. should assemble themselves every year, hold a kind of fair, exchange merchandizes, feast, sacrifice, and make merry together.—Such was the institution of the *latiar*.

The founder only appointed one day for this feast; the first consuls added another to it, upon concluding the peace with the Latins; a third was added, after the people who had retired to the Mons Sacer were returned to Rome, and a fourth after appeasing the sedition raised on occasion of the consulate, in which the people would needs have a share.

These four days were called the *Latin feriæ*, and every thing done during the course of these feriæ, as feasts, sacrifices, offerings, &c. were called *latiæres*. See FERIÆ.

LATICLAVIUM, or LATUS-CLAVUS, a garment of distinction and dignity among the Romans; contradistinguished from the *angusticlavium*. See ANGUSTICLAVIUM.

The *laticlavium* was a kind of tunic, or long coat, faced with one, or two slips of purple, applied lengthwise to the two sides of the tunic.

In the *latus-clavus* these slips were pretty broad, and in the *angustus-clavus* narrower; though there is nothing about which the learned differ more, than the difference between those two habits.

There were buttons set on the *latus-clavus*, which appeared like the heads of large nails; whence some think it took its name.

The senators, prætors, and the chief magistrates of colonies and municipal cities, had a right to wear it. The robe called prætexta, was wore over the *latus-clavus*. When the

prætor pronounced sentence of death, he put off the prætexta, but retained the *latus-clavus*. See PRÆTEXTA.

**LATIN**, a dead language, first spoken in Latium, and afterwards at Rome; and still used in the Romish church, and among men of letters. See LANGUAGE.

Some authors rank the *Latin* among the number of original languages, but by mistake: it is formed principally from the Greek, and particularly the *Æolic* dialect of that tongue; though it has a great number of words which it borrowed from the languages of the Etrusci, Osci, and other antient people of Italy; and foreign commerce and wars, in course of time, added a great many more.

The *Latin* is a strong, robust language, perfectly suitable to the character of the people who spoke it. We have, still, works of every kind, admirably well written in *Latin*, though there are an infinite number lost. The *Latin* is more figurative than the English, less pliant than the French, less copious than the Greek, less pompous than the Spanish, less delicate than the Italian, but closer and more nervous than any of them.

For a while, the *Latin* tongue was confined almost wholly within the walls of Rome; nor would the Romans allow the common use of it to their neighbours, or to the nations they subdued.—Cicero observed, that, even in his time, Greek was used almost among every people, but the *Latin* only confined to a very narrow compass; *Græca leguntur in omnibus ferè gentibus, Latina suis finibus exiguis sanè continentur*. By degrees they were brought to grant the use of it as a favour; and in time became sensible of the necessity there was of its being generally understood, for the convenience of commerce; and accordingly used their utmost endeavours, that all the nations subject to their empire, should be united by one common language: so that at length they imposed that as a law, which they had before granted as a favour.

After the translation of the seat of the empire from Rome to Constantinople, the emperors of the east, being always desirous of retaining the title of Roman emperors, appointed the *Latin* to be still retained in use, both in their rescripts and edicts, as appears by the constitutions of the eastern emperors, collected in the Theodosian Code: But at length the emperors neglecting the empire of the west, abandoned all care of the *Latin* tongue, and allowed their judges to pass sentence in Greek; and accordingly, we find the emperor Justinian's *Novels* composed in Greek.

Charlemagne coming to the empire of the west, appointed the law proceedings in sovereign courts to be in *Latin*; and the notaries were to draw their acts and instruments in the same tongue: This practice continued a long time through a great part of Europe, but at length it gave way, and the French took place of the *Latin*, not only in France, but in some measure in England too; and the reason given for it was, that abundance of difficulties arose about the understanding of *Latin* terms.

The *Latin*, however, was prodigiously degenerated and corrupted, ere it came to be laid aside. The incursions of the Goths and Vandals into Italy, brought an inundation of foreign words and phrases into it; insomuch that Valla and Naude call Boethius the last *Latin* author. But that was not all; when it once got into the courts of justice, it was still worse handled; till at last being introduced amongst the monks, and become the common language of missals and breviaries, it was debauched to that degree, that it was almost become scandalous to use it.

In this condition it was found at the time of the Reformation; when Vives, Erasmus, &c. began to open the way for its recovery; since which time, monkish latinity has been declining, and all endeavours have been used to retrieve the pure language of the Augustan age.

It was said of cardinal Bembo, that he would never read the Breviary, for fear of corrupting his fine *Latin*.

**LATIN Church**, is a term used for the Romish or western church, by way of opposition to the Greek church. See CHURCH, GREEK, &c.

**LATIN Bibles.** } See the article } **BIBLE.**  
**LATIN Character.** } **CHARACTER.**

**LATISSIMUS Dorsi**, in anatomy, a muscle so called from its shape, covering almost the whole back.

It has a thin, broad, tendinous beginning, which comes from the posterior part of the spine of the ilium, from the superior spines of the os sacrum, from all the spines of the vertebrae of the loins, and from the seven lower of the thorax; it passes by the inferior angle of the scapula, from which some of its fleshy fibres sometimes arise, and is inserted with the *teres major*, by a strong and broad tendon, with which it pulls the arm downwards.

It is also called *ani sculptor*, because it carries the arm to the anus.—See *Tab. Anat. (Myol.) fig. 6. n. 28.*

**LATITAT\***, a writ, whereby all men in personal actions are called originally to the King's Bench.

\* It has this name, as supposing the defendant lurks, lies hid, and cannot be found in the county of Middlesex, to be taken by bill; but is gone to some other county, to the sheriff whereof this writ is directed.

**LATITUDE**, **LATITUDO**, in geography, the distance of a place from the equator; or an arch of the meridian intercepted between the zenith of the place and the equator.—Hence, *latitude* is either *northern* or *southern*, according as the place whose *latitude* is spoke of, is on this, or that side, of the equator.—Thus, London is said to be in 51 degrees, 32 minutes, northern *latitude*.

Circles parallel to the equator are called *parallels of latitude*, because they shew the *latitudes* of places by their intersection with the meridian. See PARALLEL.

If through the poles of the world we conceive innumerable great circles drawn, these are called *secondaries* of the equator; and by their help, the position of every point, either on earth, or in the heavens, with regard to the equinoctial (that is, the *latitude* of any point) is determined. See SECONDARY.

One of these secondaries passing through any place on the earth's surface, is called the *meridian* of that place, and on it the *latitude* of that place is measured. See MERIDIAN.

The *latitude* of a place, and the elevation of the pole of that place above the horizon, are terms used indifferently for each other, in regard the *latitude* and the elevation of the pole are always equal. See POLE, and ELEVATION.

This will appear from *Tab. Geography, fig. 5.*—where the circle HZQ represents the meridian, HO the horizon, AECQ the equator, Z the zenith, and P the pole.

Here, the *latitude* of the place, or its distance from the equator, is the arch ZÆ, and the elevation of the pole, or its distance from the horizon, the arch PO.—Now the arch PÆ between the pole and the equator, is a quadrant of a circle, and the arch ZO, from the zenith to the horizon, is likewise a quadrant. Therefore the two arches, PÆ and ZO, must be equal; and taking away the arch ZP, which is common to both, there will remain the arch ZÆ, equal to the arch PO; that is, the *latitude* of the place equal to the pole above the horizon.

Hence we have a method of measuring the circumference of the earth, or of determining the quantity of a degree on its surface; for by going directly northward or southward, till the pole be elevated one degree more or less, and then measuring that interval accurately, we shall have the number of miles in a degree of a great circle of the earth's globe. See DEGREE.

The knowledge of the *latitude* of the place is of the utmost consequence, both in geography, navigation, and astronomy: The methods of determining it, both at sea and land, are as follow:

The altitude of the pole, it has been already shewn, is always equal to the *latitude*; for which reason the *latitude* might be best found by observing the pole's height: But in regard the pole is only a mathematical point, and no ways to be observed by our senses, its height cannot be determined in the same manner as that of the sun and stars, &c. for which reason, another manner has been contrived.

In order to this, a meridian line is first drawn; the method of doing which, see under the word MERIDIAN.

Place a quadrant on this line, so as its plane may be in the plane of the meridian; then take some star near the pole, *v. gr.* the pole star, which never sets, and observe both its greatest and least altitude. See QUADRANT.

Let the greatest, *v. gr.* be SO, (*Tab. Geography, fig. 5.*) and the least SO; the half of which PS or Ps, deducted from the greatest altitude SO, or added to the least SO, will give PO, the altitude of the pole above the horizon, which is equal to the *latitude* of the place.

The *latitude* may also be found, by having the sun's, or a star's declination, and meridian altitude, taken with a quadrant or astrolabe.—The method is this:

Observe the meridian distance of the sun from the vertex or zenith, which is always the complement of his meridian altitude: and add to this the sun's declination, when the sun and the place are on the same side the equator, or subtract the declination when they are on different sides: the sum, in the former case, and the difference in the latter, will be the *latitude* required. But when the declination of the sun is greater than the *latitude* of the place, which is known from the sun's being nearer to the elevated pole than the vertex of the place is, as it frequently happens in the torrid zone; then the difference between the sun's declination, and his zenith distance, is the *latitude* of the place.

If the sun, or star, have no declination, but move in the equinoctial that day, then the elevation of the equator will be equal to his meridian altitude, and consequently his meridian altitude is the complement of the *latitude* to 90.

This latter method is best accommodated to the uses of navigation, as being practicable at sea; but the former method preferable at land.

**LATITUDE**, in astronomy, is the distance of a star or planet from the ecliptic.

Or, it is an arch of a great circle, TS (*Tab. Astron. fig. 14. n. 2.*) intercepted between the centre of the star S, and the ecliptic EL; and perpendicular thereto.

Through

# L A T

Through the poles of the ecliptic are supposed to pass an indefinite number of great circles, cutting the ecliptic at right angles, called *circles of latitude*, or secondaries of the ecliptic: By means of which, every star and point of the heavens is reduced to the ecliptic, and has its place in regard thereto determined; the *latitude* of a star being an arch of one of these secondaries, intercepted between that star and the point where it intersects the ecliptic.

In which the *latitude* differs from the *declination*, which is the distance of a star from the equator towards one of the poles of the world. See DECLINATION.

So that the geographical *latitude* is the same thing with the astronomical declination, and the astronomical *latitude* a quite different thing.

The *latitude* of a planet is an angle, as PTR, (*Tab. Astronomy*, fig. 26.) under which a planet's distance from the ecliptic PR is seen on the earth.

The sun never has any *latitude*, but the planets have: for which reason, in the common sphere the zodiac has some breadth.—The ancients only allowed six degrees on each side the ecliptic, but the moderns have extended it to nine.

According to the observation of some of the modern astronomers, the greatest *latitude* of the planets is not always the same; but Venus never exceeds 9 degrees northern *latitude*; Mercury 5 degrees; the Moon in her quadrant with the Sun 5 degrees; Saturn 2 degrees, 50 minutes; Jupiter one degree, 50 minutes; Mars 7 degrees, 31 minutes.

When they have no *latitude*, they are said to be in the *nodes* of the ecliptic, or in the intersection of their orbit with that of the sun; and in this situation it is that they eclipse, or are eclipsed by the sun. See NODE, and ECLIPSE.

*Circle of LATITUDE*, is a great circle, MST *m*, passing through the poles of the ecliptic. See CIRCLE.

*North ascending LATITUDE* of the moon, is when she proceeds from the ascending node towards her northern limit, or greatest elongation. See MOON, &c.

*North descending LATITUDE*, is when the moon returns from her northern limit to the ascending node.

*South descending LATITUDE*, is when she proceeds from the descending node to her southern limit.

*South ascending LATITUDE*, is when she returns from her southern limit to her ascending node.

And the same holds good of the other planets. See ASCENDING, and DESCENDING.

*Heliocentric LATITUDE* of a planet, is its distance from the ecliptic, such as it is seen from the sun.

This, when the planet comes to the same point of its orbit, is always the same, and unchangeable.

*Geocentric LATITUDE* of a planet, is the distance of the planet from the ecliptic, as it is seen from the earth.

This, though the planet be in the same point of its orbit, yet is not constantly the same, but alters according to the position of the earth, in respect to the planet. See HELIOCENTRIC, and GEOCENTRIC.

Dr. Halley has some considerations in the *Philosophical Transactions*, which make it probable, the *latitudes* of some of the principal fixed stars, particularly Palicium, Sirius, and Arcturus, alter in time; whence it may be argued, the rest likewise alter, though the variation may be less conspicuous in these, by reason they are supposed at a greater distance from us. See STAR.

*Parallax of LATITUDE*. } See the article { PARALLAX.  
*Refraction of LATITUDE*. } REFRACTION.

*LATITUDINARIAN*, among divines, signifies a *moderate person*, not over-closely tied to any religious opinions, but who thinks there is a breadth, or latitude, in the road to heaven; which may admit people of different persuasions. See ADIAPHORIST, TOLERATION, &c.

*LATOMIA* \*, *Λατομία*, properly signifies a *quarry*, or place whence stones are dug. See QUARRY.

\* The word comes from the Greek *λας*, stone, and *τεμνω*, I cut.

These were anciently used as goals for criminals.—Dionysius had a place of this kind dug in a rock near Syracuse, where an infinite number of people were shut up. Cicero reproaches Verres with imprisoning Roman citizens in *latomia*; so that *latomia* became a general name for a prison, and the prisoners inclosed in them were called *latomarii*.

*LATRIA*, *Λατρεία*, in theology, a religious worship, due only to God. See WORSHIP, ADORATION, &c.

The Romanists say, 'They honour God with the worship of *latria*; and the saints with the worship of *dulia*;' but the terms, however distinct, are usually confounded. See SAINT, RELIC, &c.

The worship of *latria*, besides its inner characters, has its external marks to distinguish it; the principal whereof is sacrifice, which cannot be offered to any other but God himself, as being a solemn acknowledgment, or recognition of the sovereignty of God, and our dependance on him. See SACRIFICE.

M. Daille seems to own, that some of the fathers of the fourth century allowed the distinction between *latria* and *dulia*.

# L A U

*LATUS rectum*, in conics, the same with *parameter*. See PARAMETER.

*LATUS transversum* of the hyperbola, is a right line intercepted between the vertices of the two opposite sections; or that part of the common axis, which is between the vertices of the upper and lower cone.

Such is the line ED, (*Tab. Conics*, fig. 1.) where also Dd, and Ee, may be the parameters, or *latus rectum*, belonging to the two opposite sections, DLRO, and OEOR.

To this *latus transversum* answers the longest diameter in the ellipsis; which Apollonius calls the *transverse axis*, or *diameter*. See TRANSVERSE.

*LATUS primarium*, is a right line belonging to a conic section, drawn through the vertex of the section of the cone, and within it; as the line EE, or DD, in the figure above referred to.

*LAVATORY*, or *LAVADERO*, a name given to certain places in Chili, and Peru, where gold is got out of earth by washing. See GOLD.

M. Frezier gives us the following description of the *lavatories* of Chili: they dig deep into the earth, in such places as they have reason to expect gold in; and in order to facilitate this digging, turn a stream of water upon the spot, loosening the earth as much as possible all the time, that the current may have the greater effect, and tear up the earth more strongly. When they are got to the earth they want, they turn off the stream, and dig dry.

The earth that they now get, is carried on mules, and discharged into a bason, made somewhat in the manner of a smith's bellows; into which a little rivulet of water runs with a great deal of rapidity, dissolving the parts of the earth, and carrying every thing away with it, excepting the particles of gold, which, by their great weight, precipitate to the bottom of the bason, and mix with a fine black sand, where they are almost as much hidden, as they were before in the earth.

Sometimes, they find very considerable pieces in *lavatories*, particularly pieces of twenty four ounces each.—There are several *lavatories*, where they find pepitas, or pieces of virgin gold, of a prodigious size. Among others, they tell of one that weighed 512 ounces, bought by the count de la Moncloa, viceroy of Peru.

Nine or ten leagues to the east of Coquimbo, are the *lavatories* of Andacoll, the gold whereof is twenty three carats fine.—Their work, here, always turns to great profit, excepting when the water fails them.—The natives maintain that the earth is creative, (*creatrix*) that is, it produces gold continually; because, after having been washed sixty or eighty years, they find it impregnated afresh, and draw almost as much out of it as at first.

*LAUDANUM*, a name given by the chymists to certain preparations, chiefly extracts, of opium; by reason of their excellent qualities: as who should say, *laudanum*, from *laudare*, to praise. See OPIUM.

We have divers kinds of *laudanum*; as Sydenham's *liquid laudanum*, *tartarized liquid laudanum*, &c.

*LAUDS*, *LAUDES*, the second part of the ordinary office of the Breviary, said after mattins; though heretofore it ended the office of the night. See MATTINS, and BREVIARY.

The *laudes* consist principally of psalms, hymns, &c. whence they took their name: from *laus*, *laudis*, praise.

*LAUGHTER*, an action, or passion peculiar to man. See RISIBILITY.

Authors attribute *laughter* to the fifth pair of nerves, which sending branches to the eye, ear, lips, tongue, palate, and muscles of the cheek, parts of the mouth, præcordia, &c. there hence arises a sympathy, or consent, between all these parts; so that when one of them is acted upon, the others are proportionably affected. See CONSENT.

Hence a savoury thing seen, or smelt, affects the glands, and parts of the mouth; a thing seen, or heard, that is shameful, affects the cheeks with blushes: on the contrary, if it please and tickle the fancy, it affects the præcordia, and muscles of the mouth and face with *laughter*; if it cause sadness and melancholy, it likewise affects the præcordia, and demonstrates itself by causing the glands of the eyes to emit tears.

Dr. Willis accounts for the pleasure of kissing from the same cause, the branches of this fifth pair being spread to the lips, the præcordia, and the genital parts; whence arises a sympathy between those parts.

*LAUNCH*, in the sea phrase, is to *put out*: thus they say, *launch the ship*; that is, put her out of the dock, or out of the key, &c.

*LAURA* \*, a name given to the residences of the ancient monks. See MONK.

\* The word is originally Greek *λαυρα*, where it primarily signifies *village*, *street*, or *hamlet*.

Authors cannot agree about the difference between a *laura* and a monastery: some pretend, that a *laura* was a monastery wherein there lived, at least, a thousand monks; but this is in no wise credible. The more natural opinion is, that the ancient monasteries were the same with the modern; consisting

# L A W

ing of large buildings, divided into halls, chapels, and cells possessed by the monks, each of whom had his apartment; but the *lauræ* were a kind of villages, whereof each several house was inhabited by one or two several monks at the most: so that the houses of the chartreux seem, in some measure, to represent the ancient *lauræ*, and those of the other monks, proper monasteries. See MONASTERY, CARTHUSIAN, &c.

The term *laura* was only understood of the religious places in Egypt, and the East, where their houses stood apart from each other, and were not joined by any common cloister, the monks that inhabited them only meeting in public once a week. See HERMIT, ANACHORET, &c.

LAUREATION, a term in the Scottish universities, used for the act of taking up the degree of a master of arts, to which the students are admitted after four years study in the university. See MASTER.

LAURENCE.—*Canons of S. Laurence*, an order of regular canons, so called from the monastery of S. Laurence d'Oulx in Dauphine. See CANON.

This congregation is said to have been founded by S. Benedict. It was destroyed by the Vandals, and continued uninhabited till the middle of the eleventh century. In 1057, Odo, count of Savoy, gave it to one Gerard, and his canons. This donation was confirmed in 1065, by Cunibert, bishop of Turin, who added to it above forty other churches. By which means a very considerable congregation was formed, to whom the succeeding popes, and counts of Savoy, granted a great many privileges.

It had thirty priories; the chief, who is the prior of the congregation, bears the title of provost, and exercises a spiritual jurisdiction throughout his provostship.

LAURENTIALIA\*, or LABENTALIA, called also *larentinalia*, *laurentales*, and *larentales*; feasts celebrated among the Romans on the tenth of the calends of January, or twenty third of December, in memory of Acca Laurentia, wife of the shepherd Faustulus, and nurse of Romulus and Remus.

\* Acca Laurentia, from whom the solemnity took its name, is represented as no less remarkable for the beauty of her person, than her lasciviousness: on account of which, she was nicknamed by her neighbours, *lupa*, the wolf; which is said to have given rise to the tradition of Romulus and Remus being suckled by a wolf.—She afterwards married a very rich man, who brought her great wealth; which, at her death, she left to the Roman people; in consideration whereof they performed her these honours: though others represent the feast as held in honour of Jupiter Latialis.

LAW\*, a command, or precept, coming from some superior authority, which an inferior is obliged to obey; or, more properly, a command, or mandate of some person, or power, whose precept carries with it the reason of obedience.

\* The word is formed from the Saxon *lah*, *laht*, which signifies the same.

Thus, the commands of God, with respect to men, of a city, with respect to the citizens, and universally of all powerful beings, in respect to those who cannot resist, are called their *laws*.

The nature of a *law* will be most clearly discovered, by shewing wherein it differs from *covenant*, *counsel*, and *right* or *equity*; with all which it is frequently confounded. The difference between a council and a *law*, will be best determined from the difference between counsel and command. A council is a precept, wherein the reason of obedience is taken from the thing itself prescribed; a command is a precept, wherein the reason of obedience depends on the will of the prescriber; for we cannot properly say, *sic volo*, *sic jubeo*, unless *set pro ratione voluntas*. But since in *laws* we do not obey for the sake of the thing itself, but for the sake of the person who prescribes it, a *law* is not properly a counsel, but a command. A *law* comes from a person who has a power over those whom he commands; a counsel, from him who has no such power. To do what is enjoined by a *law*, is an act of duty; what by a counsel, an act of choice, or free-will. A counsel is directed to his advantage who receives it, a *law* to his who gives it. A counsel only takes effect over those who are willing; a *law*, over those that are unwilling. Lastly, the authority of the counsellor is taken away at the discretion of him to whom the counsel is given; but the authority of the legislator is not taken away at the discretion of him on whom the *law* is imposed.

*Law* is always confounded with *covenant*, by those who take *laws* to be nothing else but *ἐκλογισμῶν*, or forms of living determined by the consent of mankind: among whom is Aristotle, who defines a *law*, 'A declaration determined by the common consent of a city, shewing in what manner things are to be done;' which is not so much the definition of a *law*, as of a *civil law*: nor yet properly of a *civil law*; for this common consent is no more than a mutual covenant, which does not oblige any person, and consequently is not any *law*, till some supreme power be constituted with a power to compel, and to make it penal to transgress it. Here then the covenant is confounded with the *law*, which leads into absurdities; for a covenant is a promise; a *law*, a command.

# L A W

In a covenant it is said, *I will do*; in a *law*, *do*. By a covenant we are obliged, (that is, we must perform according to our promise) by a *law* we are preserved under that obligation, (that is, we are forced to perform, for fear of the punishment awarded by it;) a covenant obliges by itself, a *law* preserves the obligation by force. In a covenant, therefore, we consider what is to be done ere we be obliged to do it; in a *law* we are obliged to do, in the first place, and what is to be done is determined afterwards.

*Law* is confounded with right or equity, by those who persist in doing what is permitted by the *divine law*, though prohibited by the *laws* of the country. What is prohibited by the *divine law*, cannot be permitted by the *civil law*; nor what is commanded by the *divine law*, be prohibited by the *civil law*; but what is permitted by the *divine law*, may, notwithstanding, be prohibited by the *civil law*: for the inferior *laws* have a power of restraining the liberty left the superior *laws*, though they cannot enlarge it. Now right or equity is a natural liberty, not constituted by *laws*, but free of them; for take away *laws*, and liberty is complete. This liberty is first restrained by the *natural* and the *divine law*, the rest restrained by the *civil laws*; and what remains unrestrained by the *civil law*, may be again restrained by the constitutions of particular cities, and societies. There is a great difference, therefore, between *law* and right, *lex* & *jus*; for *law* is a chain, but right, a liberty; and they differ as two contraries. See RIGHT.

*Law* may be divided, with respect to its different authors, into *divine*, and *human*.

*Divine LAW* may be considered as twofold, with respect to the two different manners in which God notifies his will to man, viz. *natural*, (or *moral*) and *positive*.

*Natural LAW* is that which he has made known to all mankind, by that innate light, called *natural reason*.

*Positive LAW*, is that which he has revealed by his prophets; as those *laws* delivered to the Jews, relating to the divine worship, and polity, which may be called *divine-civil laws*, as being peculiarly directed to that people.—Again,

*Natural law* may be divided into that *natural law* of men, which, in a peculiar sense, is called the *LAW of nature*: and the *natural law* of countries, commonly called the *LAW of nations*.—The precepts are the same in both: but because, when societies are once instituted, certain personal properties become vested in men; that *law*, which, when we speak of the duties of men severally, we call the *natural law*; when transferred to cities, or countries, we call the *law of nations*.

M. Regis says, that the *laws* of nature are the dictates of right reason, which teach every man how he is to use his natural right; and the *laws* of nations, the dictates, in like manner, of right reason, which teach every state how to act and behave themselves towards others.

*Human Laws* are all civil. See the article CIVIL.

For, according to Hobbes, the state of man, out of society, is a state of war; wherein, no one being subject to another, there can be no other *law* besides the dictates of natural reason, which is the *divine law*.

*Civil Laws* may be divided, with regard to the difference of their subject matter, into *sacred*, and *secular*.

*Sacred Laws*, are those that relate to religion; that is, to the ceremonies and worship of the Deity, and which are not prescribed by any positive divine *law*.

*Secular Laws*, are those that relate to property, &c. commonly called by the name *civil*.—Further,

*Civil laws*, considered with regard to the two offices of the legislator, viz. to judge, and to compel, may be divided into two branches; the one *distributive*, the other *vindictive*, and *penal*.

*Distributive LAW*, is that by which every man has his right; or, it is that which constitutes the rules and measure of things, whereby we know what belongs to us, and what to others; so as we may not disturb or interrupt others in the enjoyment of their own, nor be interrupted by them; and what each man may lawfully do, or not do.

*Vindictive LAW*, is that branch by which the punishments to be inflicted on those who violate the *laws*, are determined.

The distributive, and vindictive, are not two species of *laws*, but two parts of the same *law*. For if a *law* say no more than 'Whatever you catch in your net, in the sea, shall be yours,' it is in vain; for though another take from you what you have caught, it is still yours; in regard, in the state of nature, where all things are common, yours, and another's are the same thing. So that what the *law* defines to be yours, was yours before that *law*, and will be yours after it, though possessed by another.—A *law*, therefore, is but an empty sound, unless it determine the thing to be yours in such a sense, as to forbid every body else from disturbing you in the possession of it. But such prohibition will be vain, unless there be a penalty annexed to it.—A *law*, therefore, must contain both these parts, that which prohibits, and that which punishes. The first whereof, which is called *distributive*, is prohibitory, and speaks to all, the latter, called *vindictive*, or *penal*, is mandatory, and speaks only to the public officers.

officers. Whence it follows, that to all *civil laws* there is annexed a penalty, either implicitly, or explicitly: and where that punishment is not ascertained, either by writing, or by example, it is supposed to be arbitrary, and to depend on the pleasure of the legislator; for that is no *law* which may be violated impunè.

*Civil laws*, considered with regard to the different manners of promulgating them, are of two kind; *scriptæ*, and *non-scriptæ*, or *written*, and *unwritten*.

*Written Laws*, are those which require either the voice, or some other sign of the legislator's will, to become *laws*.

*Unwritten Laws*, are such as need no other promulgation besides the voice of nature, or natural reason; of which kind are all natural *laws*.

Hence it appears, that though the natural *laws* be described in the writings of philosophers, they are not therefore to be called *written laws*. Nor are the writings of lawyers, *laws*, for want of the supreme authority: nor the *responsam prudentum*, or opinions of judges, *laws*, excepting so far as they are allowed by the supreme power to pass into use; and then they are called *leges scriptæ*, written laws; not because of their use, but because of the will of the supreme power, which is argued from their passing into use.

The first principle, or *law* of nature, according to Hobbes, is self-preservation.—Thomasius will have it to be our own happiness, which falls in at last with the sentiment of Hobbes. Puffendorf maintains it to be sociality.—Valentine Alberti, the belief that we are the image of God.—Henry and Samuel Cocceius, the will of God.—Grotius, right reason.—Velthemius, the intrinsic decency, or turpitude of actions.—Strimesius and Janus, that we are to love God, ourselves, and our neighbour.

*LAW* is also applied to the several policies of states and people, or the maxims and rules they have agreed upon, or received from their magistrates, whereby to live in peace and mutual society.

The *laws* of the twelve tables, were the ancient *laws* of the Romans, for which the Decemviri were sent into Greece, and which served them for the ground-work of all their jurisprudence. See *TABLE*, and *ROMAN*.

The celebrated *laws* of the more modern days, are those of the Angli, the Werini, or Thuringi; of the Boii, or Bavarians, those of the Burgundi, Germans, Danes, and Norwegians; of the Franks, the Frisians, the Lombards, the Gothick *laws*, the Martian, or Mercian *law*; the *laws* of the Saxons, Scots, Sicilians, Visigoths; the *laws* of Oleron, the Molmutin *law*, and the Salic *law*. See *SALIC*, *SUMPTUARY*, &c.

*LAW*, *Lex*, among the first Romans, properly signified an ordinance of the people, made at the request of a magistrate, particularly a consul.

These ordinances differed from the plebiscita, and senatus-consulta, and even from other ordinances made at the request of any other magistrate beside a consul, though those too bore the name of *laws*.

Thus, though Aquilius and Falcidius were only tribunes when they made their request, yet we still say, the *Aquilian law*, the *Falcidian law*, &c.

The several *laws* of the Romans are distinguished, 1°. By the name of him at whose request they were passed; as the *Cornelian law*, the *Julian law*, &c.—2°. By the matter or subject of the *law*; and hence came the terms of *Testamentary laws*, *Judiciary laws*, *Agrarian laws*, &c. See *AGRIAN*, &c.

3°. Sometimes, by the crimes against which they were made; for instance, the *laws* touching *poisoning*, *parricides*, &c. the *laws* of *concussion*, *peculate*, &c.

The *Codex*, and *Authentice*, are the laws, and constitutions of the Roman emperors: the *Digest* is a compilation, made by the emperor Justinian's order, of the several opinions, and judgments of the most learned in the Roman *law*; to which he gave the sanction of *laws*, as appears by the epistle prefixed to the work; and it is this that properly constitutes the Roman *law*. See *CODE*, *DIGEST*, *CIVIL LAW*, &c.

The *lex talionis*, or *law of like for like*, is the most ancient, and equitable *law* in the world. It was observed by the Hebrews.

*LAW* of England, consists of three parts: 1°. The common *law*, which is the most ancient, and general *law* of the realm. See *COMMON*.

2°. Statutes, or acts of parliaments.—3°. Particular customs. See *STATUTE*, *CUSTOM*, &c.

The common *law* of England, is derived from the English, Saxons, and Danes, and was anciently divided into three parts, viz. the *Mercian law*, the *West-Saxon law*, and the *Danish law*.

Those called *Mercian laws*, are commonly said to have been composed by Martia, queen of the Britons, from whom there was a province called *provincia Merciorum*.—Many *laws* were also published by Ethelred, king of Kent, by king Ina, and Offa: but Alfred, who subdued the whole kingdom, having revived all the *laws* of his predecessors, retained those which he thought proper, and abolished the rest;

Vol. I. N° LXXXIX.

Whence he is called *Anglicarum legum conditor*; and these *laws* were called *Westsexenelaga*.

But the kingdom being afterwards subdued by the Danes, they introduced another *law*, called *Danelaga*, by which their people were governed: And they being afterwards destroyed, Edward the confessor, out of the former *laws*, composed that which we now call the *common law*; for which reason he is called by our historians, *Anglicarum legum restitutor*.

These *laws* were only general customs observed through the nation, and for that reason were called *common*; and perhaps, also, because *leges omnibus in commune reddidit*, to be observed by all, with such amendments as were afterwards to be made.

William the conqueror did not enact many new *laws*, but confirmed the old, viz. S. Edward's *laws*, and abrogated none that any way concerned compositions, or mulcts of delinquents.

The *common law* is also called *lex non scripta* (not but that we have most of them written in the old Norman dialect, but) because it cannot be made by charter, or parliament; for those are always matters of record, whereas customs are only matters of fact, and are no where but in the memory of the people, and of all *laws* must be the best for the English: for the written *laws*, made by king and parliament, are imposed upon the subjects before any probation, or trial whether they are beneficial to the nation, or agreeable to the nature of the people, except where they are first made temporary, and for their experienced usefulness afterwards made perpetual; but customs bind not till they have been tried and approved time out of mind.

Besides the *common law* of England in general, there are in several parts of it certain customs and common usages, which have the force of *common law* among those people to whose property they belong; as, *borough English*, a custom so called as not being in use out of England; where the youngest son, or, for want of sons, the youngest brother, is to inherit; the eldest being supposed to have learnt the father's trade, and the youngest the least able to shift for himself. See *BOROUGH ENGLISH*, *GAVELKIND*, &c.

Where the *common law* is silent, there we have *statute laws*, made by the several kings of England, with the advice and consent of both houses of parliament. See *STATUTE*.

Besides these, we make use of the *civil* and *canon laws* in ecclesiastical courts. See *CIVIL*, and *CANON*.

We have also *military* or *martial law*, in use among the soldiery in time of war; and *forest law*, for the regulation of forests. See *MARTIAL*, *FOREST*, &c.

*LAW* has also a more special signification, wherein it is taken for that which is lawful with us, and not elsewhere; as, 'Tenant by the courtesy of England.'

Thus, we also say, to *wage law* (*vadiare legem*) and to *make* or *do law* (*facere legem*). See *WAGE*, and *MAKE*.

When an action of debt is brought against one upon some secret agreement or contract, the defendant may *wage* his *law* if he pleases; that is, swear, and certain persons with him, that he owes the plaintiff nothing: but this is only allowed in case of the plaintiff's want of evidence, and when he cannot prove his surmise by any deed, or open act.

When one wages his *law*, he shall bring with him so many of his neighbours as the court shall assign, (Sir Edward Coke says, *eleven*) to swear with him, that they believe, in their consciences, he hath sworn truly; and these, in our *law*, are called *compurgators*; by the feudists, *sacramentales*.

The officer, to make oath, is called the *wager of law*; and when it is accomplished, it is called the *making* or *doing of law*. This custom is said to have obtained, formerly, among the Egyptians.

*LAW* of Arms, is that *law* which gives precepts how rightly to proclaim war, to make and observe leagues, to attack the enemy, and to punish offenders in the camp. See *WAR*, *ARMS*, *MARTIAL*, &c.

*LAW* of Marque, a *law* by which those who are driven to make use of it, take the goods, or shipping of the party that has done them wrong, and of whom they cannot get ordinary justice, whenever they can take them within their own bounds, or precincts. See *REPRISALS*.

LAWS of Molmutius. } See the article { MOLMUTIN LAWS.  
LAWS of Oleron. } OLERON.

# L A Y

**LAW of the Staple**, the same with **LAW Merchant**.

**LAW Merchant**, a summary sort of *law*, originally differing from the *common law*, though now adopted and become a part of the laws of the kingdom; one point of it consists in this, that if there be two joint merchants of wares, and one of them dies, his executor shall have the moiety: which is not allowed in the case of others, not merchants.

**LAW Spiritual**, is the ecclesiastical or canon *law*, allowed and authorized in this realm; so far as it is not against the common *law*, nor against the statutes and customs of the kingdom. And according to such ecclesiastical *laws*, the ordinary and other ecclesiastical judges do proceed in cases within their cognizance. See **CANON Law**.

**LAW** is also used figuratively, in speaking of the rules, or order wherein any thing is performed.

Thus we say, the *laws* of motion, the *laws* of mechanics, the *laws* of fluids, the *laws* of chance, of a game, &c. See **MOTION**, **FLUID**, **GAME**, &c.—*Laws* of friction, of resistance, of descent of bodies, &c. See **FRICTION**, **RESISTANCE**, **DESCENT**, &c.—*Laws* of elasticity, rarefaction, reflection, refraction, &c. See **ELASTICITY**, **RAREFACTION**, **REFLECTION**, **REFRACTION**, &c.

**LAWFUL**. See the article **UNLAWFUL**.

**LAWFUL Naam**. See the article **NAAM**.

**LAWING of Dogs**, a phrase used in our ancient law-writers. Thus, mastiffs must be *lawed* every three years; *Grompton Jurisd.* fol. 163. that is, three claws of the fore foot shall be cut off by the skin, or the ball of the fore foot cut out. See **EXPEDITATING**.

**LAWLESS Court**, a court held on King's-hill, at Rochford in Essex, every Wednesday morning next after Michaelmas-day, at cock-crowing; at which court they whisper, and have no candle, nor any pen and ink, but a coal: he that owes suit or service there, forfeits double his rent every hour he is missing.

This court is called *lawless*, because held at an unlawful hour, or, perhaps, *quia dicta sine lege*, because opened without any form. It is mentioned by Camden, who says, this servile attendance was imposed on the tenants, for conspiring at the like unseasonable time to raise a commotion.

**LAWLESS Man, Exlex**. See the article **OUTLAW**.

**LAXATIVE**, in medicine, is used to signify a loose state, or disposition of the body; so as to go frequently to stool.

**LAXATIVES**, or **LAXATIVE Medicines**, are such as promote that disposition, which they do by some smooth, softening quality, taking away the tenacity of the fibres, and facilitating the passage of the contents of the intestinal tube, through it; for which reason all oily substances come under this class. See **PURGATIVES**.

**LAXIOR Toga**. See the article **TOGA**.

**LAY**, the name of a kind of ancient poetry, or poem among the French; consisting of very short verses.

There were two sorts of *lays*, the *great*, and the *little*.

**Greater LAY**, was a poem consisting of twelve couplets of verses, of different measures.

**Little LAY**, was a poem consisting of sixteen or twenty verses, divided into four couplets.

These *lays* were the lyric poetry of the old French poets, who were imitated by some among the English. They were principally used on melancholy subjects, and are said to have been formed on the model of the trochaic verses of the Greek and Latin tragedies.

Father Mourgues gives us an extraordinary instance of one of these ancient *lays*, in his treatise of French poetry.

*Sur l'appui du monde  
Que fait il qu'on fonde  
D'espoir?  
Cette mer profonde,  
En debris seconde  
Fait voir  
Calme au matin, l'onde  
Et l'orage y gronde  
Le soir.*

**LAY the Land**, a sea phrase, used for sailing out of sight of land. In such cases they say, *they have laid the land*: and if another point of land exclude the sight of the former, they say, *they have shut the first land in*.

**LAY-Land**, in husbandry, denotes fallow ground, which lies untilld. See **FALLOW**, and **PLOUGHING**.

**LAY-Brother**, among the Romanists, a pious, but illiterate person, who devotes himself, in some convent, to the service of the religious. See **BROTHER**.

The *lay-brother* wears a habit different from that of the religious, nor ever enters into the choir, or the chapter. He is not in any orders, nor does he make any vow, excepting of constancy and obedience.

**LAY-Brother** is also used for an illiterate religious, who takes care of some of the temporal concerns of the convent, as the kitchen, the gate, &c.

These *lay-brothers* make the three vows of religion.

In the nunneries are also *lay-sisters*, who never enter the choir, &c. and who are only retained for the service of the convent.

# L A Z

The institution of *lay-brothers* began in the eleventh century. The persons on whom this title was conferred, were such as were too ignorant to become clerks, and who therefore applied themselves wholly to bodily labour. It seems to have taken its rise from hence, that the laity in those days had not, for the generality, the least tincture of learning; whence also those came to be called *clerks*, by way of distinction, who had studied a little, and were able to read. See **CLERK**.

**LAY-Canons**.

**LAY-Communities**.

**LAY-Corporation**.

**LAY-Patronage**.

**LAYS-side**.

**Vaunt-LAY**.

See the article { **CANON**, **COMMUNITY**, **CORPORATION**, **PATRONAGE**, **SIDE-lays**, **VAUNT-lay**.

**LAYER**, in husbandry, and gardening, a young tender shoot or twig of a plant, not far from the ground, which is bent down, and several joints or knots of it buried three or four inches under ground: the other part still remaining united with the parent tree; till having struck root below, it is cut and separated from the rest, and produces a new plant.

**LAYMAN**, a person not engaged in any order of ecclesiastics. See **CLERGY**, **SECULAR**, &c.

**LAYMAN**, among painters, a little statue or model, either of wax or wood, whose joints are so made, that it may be put into any attitude, or posture; its chief use is for the casting, and adjusting draperies, for the clothing of figures.

Some call it, after the French, *manequin*, *q. d.* a little man.

**LAZARETTO**, or **LAZAR-HOUSE**, a public building in manner of an hospital, for the reception of poor sick. See **HOSPITAL**, &c.

**LAZARETTO**, in some countries, is an edifice appointed for persons coming from places suspected of the plague, to perform quarantine in.

This is usually a large building, at a distance from any city, whose apartments stand detached from each other, &c. where ships are unladen, and their crew is laid up for forty days, more or less, according to the time and place of departure. See **QUARANTAIN**.

**S. LAZARUS**, or **LAZARO**, a military order, instituted at Jerusalem by the Christians of the West, when they became masters of the holy land, whose business was to receive pilgrims under their care, guard them on the roads, and defend them from the insults of the Mahometans.

Some say, this order was instituted in 1119. Pope Alexander IV. confirmed it by a bull in 1255, giving it the rule of S. Augustine.

The knights of this order being driven out of the holy land, part of them retired into France, and were established there under Louis III. who bestowed on them the country of Boigny near Orleans. Innocent VIII. suppressed the order of S. *Lazaro* in Italy in 1490, or rather united it to that of Malta. Leo X. re-established it in Italy in the beginning of the sixteenth century. In 1572, Gregory XIII. united it in Savoy to that of S. Maurice, just instituted by Duke Emmanuel Philibert.

In France, this order was united to that of N. D. of Mount Carmel in 1608, and had some new advantages conferred on it by the late king Louis XIV. The knights of S. *Lazarus* are allowed to marry, and yet have pensions upon benefices.

**Fathers of S. LAZARUS**, called also **LAZARITES**, a name given to certain regular clerks of a congregation instituted in France, in the seventeenth century, by M. Vincent.

They take the denomination from a house in the Faubourg of Paris. They have a seminary in Paris, called, *The seminary des bons enfans*. The vows they make are simple, and on occasion may be dispensed withal.

**LAZULI**.—*Lapis LAZULI*, a sort of precious stone, of a blue colour, veined and spotted with white, and yellow. See **STONE**.

This is the same with what is otherwise called *azure* stone, by the ancients *cyaneus*, and *caruleum*; by Mesue, the *starry* stone; by Pliny, as Dr. Woodward imagines, *sapphirus*. See **AZURE**, **SAPPHIRE**, &c.

Of the *lapis lazuli* is prepared the fine pigment called *ultra-marine*. See **ULTRAMARINE**.

To be good, it should be able to resist fire and smoke; and come out of them with new lustre.—It is found in mines of gold, silver, and copper, as also in pits of marble; which last is that generally in use.

Naturalists distinguish three kinds of *lapis*: The first called *old rock*, which is pure, smooth, a fine blue, with beautiful yellow streaks like veins of gold, which yet are frequently no more than veins of pyrites.—The second, called the *new rock*, is stuffed with common stones; its colour is weaker, and its price lower; these two kinds are brought from Persia and Siam.—The third kind is brought from the mountains of Auvergne. This is mixed with the common rock whence it is dug; it is of a pale blue, and is sprinkled with greenish spots, with veins of pyrites. This, when sufficiently charged with spots of green, is sold for the Armenian stone. See **ARMENIAN**.

The *lapis* is of some use in medicine; they prepare it by calcining

# LEA

cining and washing it several times; which done, it makes an ingredient in the famous confection of alkermes. Sometimes, in spite of all its lotions, it continues to be purgative, by reason of the vitriolic matter it contains.

LE *Roy le vent.* } See the article LE ROY.  
LE *Roy s'advisera.*

LEAD, a coarse, heavy, impure metal, of all others the softest and most fusible, when purified; called by the chemists *saturum*. See METAL.

Those who have made an analysis of *lead*, find it to contain a little mercury, some sulphur, and a great deal of bituminous earth.

*Lead* is found in various countries, but abounds particularly in England. It is found, too, in several kinds of soils, and stones, some whereof, besides, contain gold, some silver, others tin, &c.

It is melted in a furnace provided for that purpose, with a strong coal-fire upon it; as it melts, it runs thro' a canal on one side; leaving the earth, stone, and scoria, with the ashes of the coals.

It is purified by skimming it ere cold, and throwing suet and other fat bodies into it.

*Lead* is found of a lighter, or deeper colour, according as it is more or less purified; tho' some make a difference in the colour of the ore, always esteeming that most which is the whitest.

Some very able naturalists observe, that the weight of *lead* increases, either in the open air, or under ground.—Mr. Boyle observes this particularly of the *lead* of churches, which, he says, frequently grows both in bulk and weight, so as to become too ponderous for the timber that before sustained it; which some account for from the impurity, heterogeneity, and loose texture of its parts, by means whereof the particles of the air getting admission within its pores, are attracted, and easily assimilated to it. But others, who rely wholly on experience, absolutely deny the fact, as also that it is reproduced in mines before exhausted, by letting them lie long open to the air; which others assert.

*Lead* is a metal of much use; it easily melts, and mixes with gold, silver, and copper, and communicates, as they talk, its humidity to them; but not being able to endure the violence of the fire which they undergo, it retires, and carries with it all that was heterogeneous in them; so as neither gold nor silver are refined without *lead*. See REFINING.

To which it may be added, that the coarser kind of precious stones, boiled in *lead*, are thereby rendered much more brilliant.

*Lead* is much used in building, particularly for covering, gutters, pipes, and in glass-windows. For which uses, it is either cast into sheets, in a mold, or milled; which last, some have pretended is the least serviceable, not only on account of its thinness, but also because it is so exceedingly stretched in milling; that when it comes to lie in the hot sun, it is apt to shrink and crack, and consequently will not keep out the water: But this appears to be a suggestion without grounds. *Vid. Bayl. Build. Dict. Suppl. in voc.*

The *lead* used by glaziers is first cast into slender rods, twelve or fourteen inches long, called *canes*; which being afterwards drawn through their vice, comes to have a groove on either side for the panes of glass; and this they call *turned lead*.

The method of paleing or foldering *lead* for fitting on of imbossed figures, &c. is by placing the part whereon the figure is to be paled, horizontal, and strewing on it some pulverised rosin; under this they place a chafing-dish of coals, till such time as the rosin becomes reddish, and rises in pimples; then apply the figure, and rub some soft solder into the joining: when this is done, the figure will be paled on, and as firm as if it had been cast on it.

Borrichius asserts, that *lead* reverberated into minium, converted into glass, reduced into cerus, and burnt into litharge, immediately resumes its original figure, upon the dexterous application of a lixivial salt.

LEAD-works. — Mr. Glanville observes, that the smoke of the *lead-works* at Mendip in Somersetshire is a prodigious annoyance, and subjects both the workmen, and the cattle that graze about them, to a mortal disease. The trees that grow near them have their tops burnt, and their leaves and outsidings discoloured and scorched.

When the *lead* ore is dug out, they beat it small, then wash it clean in a running stream, and sift it in iron rudders. Their hearth or furnace is made of the clay or fire-stone; this they set in the ground, and on it build their fire, which they light with charcoal, continuing it with young oaken gads, blown with bellows, by mens treading on them. After the fire is lighted, and the fire-place hot, they throw their *lead* ore on the wood, which melts down into the furnace, and then with an iron ladle they take it out, and upon sand cast it into what form they please.

The mine-men sometimes find the vein run up into the roots of trees, and yet do not observe any difference between those and other trees. When the mine is near the surface, the grass is sometimes found yellow. They make no account

# LEA

of the virgula divinatoria; yet say, that when a mine is open, they may guess by it how far the vein will lead. The ore runs sometimes in a vein, sometimes dispersed in banks; it lies many times between rocks; some of it is harder, others milder; sometimes they have branched ore in the spar; about the ore is spar and caulk; and another substance, which they call *crootes*.

For the manufacture of LEAD, see the article PLUMBERY.

There are various preparations of *lead*, serving for various purposes:

LEAD *Dust*, is a preparation used by the potters; made by throwing charcoal dust into melted *lead*, and stirring them a long time together; to separate the coal again, they only wash it in water, and dry it afresh.—Its use is to give a varnish and gloss to their works.

Burnt LEAD, *plumbum ustum*, is a chemical preparation used in medicine, made of plates of *lead* melted in a pot with sulphur, and reduced by fire into a brown powder.

White LEAD, used by painters, is only thin plates of *lead* dissolved with vinegar. See WHITE LEAD and CERUSS.

Litharge of gold or silver, is only the *lead* used in purifying copper. See LITHARGE.

Red LEAD, a preparation of mineral *lead* calcin'd, and rubified; used by painters, potters, and physicians. See MINIUM. By help of chemistry, there are also drawn from *lead*, salts, balsams, oils, vinegar, a magistery, &c. disguis'd under the name of *saturum*, to amuse the ignorant.

Salt, or Sugar of LEAD, *Saccharum saturni*, is an essential salt of vinegar, incorporated with the proper substance of *lead*, or cerus dissolved in spirit of vinegar.

Balm of LEAD, or *Saturum*, is an oil drawn from the salt of *lead* by distillation, after having dissolved it in spirit of turpentine.

Magistery of LEAD, is the calx of *lead* purified and subtilized. It is made of *lead* dissolved in aqua fortis, pouring a filtrated salt water into it; whence results a magistery extremely white, which, when softened by several lotions, is mixed with pomatums for the face and complexion. See MAGISTERY.

Black LEAD, is a kind of mineral stone, of a black colour, but silver'd, and shining, found chiefly in *lead* mines, and appearing to be nothing else but *lead* not yet arriv'd at maturity; much used for pencils, or crayons for designing.—It is melted like the common *lead*.

Casting of LEAD on Cloth.

LEAD Nails. See the article NAILS.

LEADEN Bullet Moulds. See the article MOULDS.

LEAF, a part of a plant, ordinarily very thin and flat, growing in the spring, and falling off in autumn. See PLANT.

There are some plants without *leaves*, as truffles and mushrooms. See TRUFFLE, and MUSHROOM.

As to the structure of *leaves*, Dr. Grew observes, that their fibres never stand on the stalk in an even line, but always in an angular circular posture, and their vascular fibres or threads are 3, 5, or 7. The reason of which position is for the more erect growth, and the greater strength of the leaf. Another observable in the fibres of *leaves*, is their orderly position; so as in some to take in an eighth part of a circle, as in mallows, in some a tenth, but in most a twelfth.

The same author observes six several parts intended by nature for the preservation of gems; viz. *leaves*, furfoils, interfoils, stalks of *leaves*, hoods, and mantlings that cover them.

The skin or coat of the *leaves* is no more than that of the branches extended, as gold, by beating, is reduc'd into leaves.

—In the gem, the *leaves* are folded, sometimes in two, and sometimes in several plaits, somewhat after the manner of a fan. If the leaves be too thick to plait commodiously in two, and to be ranged against each other; or if they be in too small a number, and their fibres too delicate, instead of being plaited, they are roll'd up, and form either a single roll, as the *leaves* of the mountain cowslip, which are thick; or two rolls, which begin at each extremity of the leaf, and meet in the middle. — There are also some plants whose *leaves* form three rolls, as fern; several *leaves* are covered with hair of several figures, those of lavender and olive-tree have hair resembling stars. See LANUGO.

Botanists consider the *leaves* of plants, with regard to their structure, surface, figure, consistence, edges, situation and size. — With regard to their structure, *leaves* are either single, as those of the apple-tree, pear-tree, &c. or double, as those of angelica, parsley, &c.

With regard to their surface, *leaves* are either flat, as the nummularia, asarum, origany, androsæmum, brionia canadensis, &c. or hollow, as those of the onion and aphodel; or in bunches, as several kinds of kali, and house-leeks.

With regard to their consistence, *leaves* are either thin and fine, as those of S. John's-wort, and dog's grass; or thick and gross, as those of portulaca; or fleshy, as those of several kinds of house-leeks; or woolly, as those of the wool-blade.

With

# L E A

With regard to their verge, or edges, *leaves* are either cut slightly, as some species of geum, and cannabis lutea; or deep, as trefoil, &c. See DENTED VERGE.

With regard to their situation, *leaves* are either alternate, that is, rang'd alternately, as the phillyca; or opposite to each other, as the phillyrea, and some species of the rubia.

With regard to their size, *leaves* are either very big, as those of the colocasia, and sphondylium; moderate, as those of the bistort, the fig-tree; small, as those of the apple-tree, pear-tree, peach-tree; or very small, as those of mulle-pertuis, or St. John's-wort.

Annual LEAVES.

CRENATED.

DISSIMILAR.

PROCUMBENT.

SEGMENT.

SEMINAL.

VERNAL.

LEAF, is also applied to the finest and most beautiful parts of flowers. See FLOWER.

It is true, all flowers have not *leaves*, and it is sometimes difficult to determine which is to be called the *leaves*, and which the calyx of the same flower. See CALYX.

To prevent confounding the *leaves* of the flower with those of the rest of the plant; the former are called by botanists *petala*, the latter *folia*. See PETALA.

LEAVES, in architecture, are an ornament of the Corinthian capital, and thence borrowed into the Composite; consisting in the representation of a double row of *leaves* covering the vase, tympanum, or neck of the column. See CAPITAL.

These *leaves* are usually formed in imitation of those of the acanthus; sometimes of those of olive, and sometimes of laurel. See ACANTHUS.

The *leaves* are divided; each making three ranges of lesser, and are bent a-top, one third of their height.—See Tab. Archit. fig. 39. litt. CC.

LEAF-Silver. See the article SILVER.

LEAGUE\*, an extent of ground, considered lengthwise; serving to measure the distances of one place from another; and containing more or less geometrical paces, according to different usages and customs of countries.

\* The word comes from *leuca*, or *leuga*, an ancient Gaulish word, for an itinerary measure, and adopted in that sense by the Romans. — Some derive the word *leuca* from *λευκός*, white; in regard the Gauls, in imitation of the Romans, marked the spaces and distances of their roads with white stones.

A sea league is usually reckoned 3000 geometrical paces, or three English miles: the large leagues of France, are usually 3000, and in some places 3500 paces; the mean or common league is 2400 paces, and the little league 2000. Chorior observes, that the ancient Gaulish leagues were but 1500 paces.

The Spanish leagues are larger than the French, 17 Spanish leagues make a degree, or 20 French leagues, or 69  $\frac{1}{2}$  English statute miles. The leagues of Germany and Holland contain four geographical miles each.

The Persian leagues are nearly the same with the Spanish; that is, they are equivalent to four Italian miles; which comes pretty near to what Herodotus mentions of the parafanga, an ancient measure among the Persians, containing thirty stadia; eight whereof, according to Strabo, make a mile. See PARASANG.

The Persians mark their leagues by trees, as the ancient Romans did by stones, lapides; for which reason they are also called *agag*, a Turkish word signifying tree.—In Japan, the league consists of 1800 fathoms.—These are all distinguished by little hillocks, raised on purpose by the road side. See the leagues of most countries, reduced to the Roman foot, under the word MILE.

LEAGUE\* also denotes an alliance, or confederacy between princes, and states, for their mutual aid, either in attacking some common enemy, or in defending themselves. See ALLIANCE.

\* The word comes from *liga*; which, in the corrupt Latin, was used for a confederacy: Qua quis cum alio ligatur.

There have been several holy leagues entered into by the Christians against the Sarcens and infidels; called also *crusades*, or *croisades*. See CROISADE.

The LEAGUE, by way of eminence, denotes that famous one on foot in France, from the year 1576, to 1593. Its intent was to prevent the succession of Henry IV. who was of the Reformed religion, to the crown; and it ended with his abjuration of that faith.

The leaguers, or confederates, were of three kinds: the zealous leaguers aimed at the utter destruction, not only of the Huguenots, but also of the ministry. The Spanish leaguers had principally in view the transferring the crown of France to the king of Spain, or the infant his daughter. The moderate leaguers aimed only at the extirpation of Calvinism, without any alteration of the government.

LEAKAGE, the state of a vessel that leaks; that is, lets water or other liquid ouze in or out.

# L E E

LEAKAGE also denotes an allowance of 12 per cent. to merchants importing wine, out of the customs thereof; and of two barrels in 22 of ale to brewers, &c. out of the excise.

LEAP, and STEP. See the article STEP.

LEAP-YEAR\*, the same with bissextile. See BISSEXTILE.

\* It is thus called, by reason, in the common year, any fixed day of the month changes successively the day of the week; but in the leap-year, it skips or leaps over one day.

The common year hath 365 days in it, but the leap-year 366 days; and in this case February hath 29 days; which, in the common year, hath but 28.

To find the leap-year, the rule is,

Divide by 4, what's left shall be,

For leap-year 0, for past, 1, 2, or 3.

For example; Is the year 1720 a leap-year, or a common year?

4) 1720 (430

There is 0 remainder, so that it is leap-year.

LEASE, in law, a demise, or letting of lands, tenements, or hereditaments unto another for life, term of years, or at will, for a rent reserved. See RENT.

A lease is either written, called an indenture, deed poll, or lease in writing; or by word of mouth, called lease parol. See PAROL.

The party who lets a lease, is called the lessor; and the party to whom it is let, the lessee.

LEASH, or LEASE, among sportsmen, denotes three creatures of any kind; but chiefly greyhounds, foxes, bucks, and hares.

We say, a leash of greyhounds, a couple and a half of hounds.

LEATHER-Mills. } See the article { MILL.

LEATHER-Money. } COIN, and MONEY.

LEAVE and take. See the article TAKE.

LEAVEN\*, any thing that will make a body swell, and ferment. See FERMENT, and FERMENTATION.

\* The word is formed from the French *levain*, which signifies the same, of the verb *lever*, or Latin, *levare*, to rise.

Beer, ale, wine, and cyder, only work by means of the leaven in them.—Sour paste, barm, rennet, &c. are leavens used in baking bread, brewing beer, making cheese, &c. See YEST, RENNET, BAKING, &c.

LEAVER. See the article LEVER.

LECTICARIUS, an officer in the Greek church, whose business it was to bear off the bodies of those who died, and to bury them.—These were otherwise denominated *decami* and *copiata*. See DEAN, and COPIATÆ.

The Romans had two kinds of *lecticarii*, different from those of the Greeks, and who answered nearly to the office of our chairmen. See LITTER.

LECTISTERNIUM, a religious ceremony among the ancient Romans; being a festival prepared, and solemnly served up in a temple. See FEAST.

And because, according to the custom of those times, they placed beds around the tables, and set the statues of the gods on those beds, in the same manner as men sat at meals; they called the solemnity *lectisternium*, from *lectus*, bed, and *sternere*, of *sterno*, to spread, prepare.

In this ceremony the Epulones presided. See EPULO.

Calaubon has observed from a passage in the scholiast of Pindar, that the Greeks had also a sort of *lectisternium* in use.

Livy observes, that the first *lectisternium* seen in Rome, was that which held for eight days successively, in honour of Apollo, Latona, Diana, Hercules, Mercury, and Neptune; on occasion of a contagious disease which killed all their cattle, in the year of Rome 354; though Valerius Maximus mentions one before that.

LECTURES. See the article BOYLE's Lectures.

LEDGER. See the article BOOK.

LEE, a term variously used at sea; though its general use be to signify the parts towards, or opposite to the wind.—Thus the

LEE-Shore, is that on which the wind blows; so that to be under the lee of the shore, is to be close under the weather-shore, or under wind.

A LEE the Helm, signifies, put the helm to the leeward side of the ship.

Take care of the LEE Hatch, is a word of command to the man at the helm, to take care that the ship do not go to the leeward of her course.

LEE-ward Ship, is one that is not fast by the wind, or which doth not sail so near the wind, or make so good way as she should.

To lay a ship by the LEE, or to come up by the LEE, is to bring her so, that all her sails may lie flat against her masts and shrouds, and that the wind may come right upon her broad-side.

LEE-way, or LEE-ward-way of a Ship, is the angle made by the line on which the ship should run according to her course; or the point of the compass steered upon, and the real line of the ship's way.

All ships are apt to make some lee-way; so that in casting up the

the log-board, something must be allowed for *lee-way*. The ordinary rules are these :

- 1°. If the ship be upon a wind, allow one point for *lee-way*.
- 2°. If the wind blow hard, so that you are forced to take in one top-sail, allow two points for *lee-way*.
- 3°. If it blow so hard, that both top-sails must be taken in, and the sea runs high, allow three points for *lee-way*.
- 4°. If her fore-sail being furlled, she try under a main-sail, or mizzen, she will make her way four points before the beam.
- 5°. If she try with a main-sail only, she will make her way near three points before the beam.
- But, 6°. If under a mizzen only, she will make her way about two points before the beam.
- 7°. If she lie a hull, with all her sails furlled, she will make her way one point before the beam.

LEER Furnace. See the article FURNACE.

LEES\*, the grossest and thickest parts of wine, oil, and other liquors; or the sediment found at the bottom of the vessel.

\* The word comes from the French, *lie*, and that either from *limus*, mud, or from *Lyeus*, one of the surnames of Bacchus; or according to Du Cange, from *lia*, a corrupt Latin word, signifying the same.

A kind of gravelly sand is made with the *lees* of wine burnt, and prepared, used by dyers, &c. which ought to stand as a caution to people troubled with the stone, &c.

The vinegar-makers make a great trade of the *lees* of wine dried, and made into cakes, after having squeezed out the remains of the liquor in presses. See WINE, and CAPITAL.

LEET, LETA, a court held by the lord of a manor; though, in reality, it is the king's court, in whose manor soever it is held; by reason the authority thereof belongs originally to the crown, and is derived thence to other persons.

A *court-leet*, is a court of record, and enquires of all offences under high-treason; though it cannot punish many, but must certify them to the justice of assize. See COURT.

LEFT Hand. See the article HAND.

LEG, Crus. See the article LEGS.

LEGACY, LEGATUM, in the civil law, a donation by testament; answering to what in common law is called a *demise*. See DONATION, TESTAMENT, DEMISE, &c.

*Legacy* is usually defined some particular thing given by a last will, and testament; for that if a man thus dispose, or transfer his whole estate on another, it is called *hereditas*; and he to whom it is given, is called *heres*. Though, in common law, the distinction is this; that he to whom all a man's lands, and hereditaments descend by right of blood, is *heres natus*; the other, to whom it is bequeathed, is called *heres factus*. See HEIR.

LEGACY, in an ecclesiastical sense, was a soul-seat, a bequest to the church, or accustomed mortuary: which was to hold good, even though the testament itself were declared null, and invalid. See MORTUARY.

LEGALIS Homo, in law, a person who stands rectus in curia, not out-lawed, nor excommunicated, nor defamed.

And in this sense are those words so often used *probi*, & *legalis homines*.

Hence all *legality* is taken for the condition of such a man.

LEGATE, a prelate, whom the pope sends as ambassador to any sovereign prince. See EMBASSADOR, and VICE-LEGATE.

\* The term *legate* comes from that of *legatus*, which Varro derives from *legere*, to chuse; and others from *legare*, *delegare*, to send, delegate. *Wicquefort*.

There are three kinds of *legates*, viz. *legates à latere*, *legates de latere*, and *legates by office*, or *legati nati*.

Of these, the most considerable are the *legates à latere*; such are those whom the pope commissions to take his place in councils; who are thus called, in regard the pope never gives this office to any but his greatest favourites, and confidants, who are always at his side, *à latere*; that is, to the cardinals. See LATERE.

A *legate à latere*, may confer benefices without mandate, legitimate bastards to hold offices, and has a cross carried before him, as the ensign of his authority.

The *legates de latere*, are those who are not cardinals, but are yet intrusted with an apostolical legation.

*Legates by office*, *legati nati*, are those who have not any particular legation given them; but who, by virtue of their dignity, and place in the church, become *legates*. Such are the archbishops of Rheims and Arles.—But the authority of these *legates*, is much inferior to that of the *legates à latere*.

The power of a *legate* is sometimes also given without the title: some of the nuntio's are invested with it. See NUNTIO.

Court of the LEGATE. See the article COURT.

LEGATIS Tenementis. See the article TENEMENTIS.

LEGATORY, or LEGATARY, a term used in speaking

VOL. II. N°. LXXXIX.

of the government of the antient Romans: Augustus divided the provinces of the empire into consular, *legatory*, and pre-fidial.

LEGATORY Provinces were those whereof the emperor himself was governor, but where he did not reside, but administered affairs by his lieutenant, or *legatus*. See LEGATUS.

LEGATUS, among the Romans, a military office, who commanded as deputy of the chief general.

Of these there were divers kinds, viz. a *legatus* in the army under the imperator, or general, answering to our lieutenant-general; and a *legatus* in the provinces, under the proconsul, or governor.

When any considerable person, among the Roman citizens, had occasion to pass through any of the provinces, the senate gave him the title of *legatus*; that is, of envoy from the senate, to the end he might be received with the greater respect; and that the cities and towns, through which he travelled, might defray his expences.—This they call a *free legation*, libera legatio; in regard the person was not incumbered with any trust, and might lay it aside as soon as he pleased.

LEGEND, LEGENDA, was originally a book used in the old Romish churches, containing the lessons that were to be read in divine service.

Hence also the lives of saints, and martyrs came to be called *legends*; because chapters were read out of them at mattins, and in the refectories of the religious houses. See SAINT.

Golden LEGEND, is a collection of the lives of the saints, compiled by James de Varase, better known by his Latin name of *J. de Voragine*, vicar-general of the Dominicans, and afterwards archbishop of Genoa, who died in 1298.

It was received into the church with a world of applause, which it maintained for 200 years; but, in effect, is so full of ridiculous and romantic accounts, that the Romanists themselves are now generally ashamed of it.—The word *legend* itself is, on that account, come into disrepute.

LEGEND is also used to signify the words, or letters engraven about the margins, &c. of coins. See COIN.

Thus the *legend* of a French crown is, *Sit nomen domini benedictum*; that of a moidore, *In hoc signo vinces*; on those of the last emperors of Constantinople, we find *Iesus Christus Basileus Basileon*, IHS XPS NIKA, *Iesus Christus vincit*.

LEGEND is also applied to the inscriptions of medals, which serve to explain the figures, or devices thereof. See MEDAL, DEVISE, &c.

In strictness, the *legend* differs from the *inscription*; this last properly signifying words placed on the reverse of a medal, in lieu of figures.

It seems as if the antients had intended their medals should serve both as images, and as emblems; the one for the common people, and the other for persons of taste, and parts: the images to represent the faces of princes; and emblems to represent their virtues, and great actions: so that the *legend* is to be looked on as the soul of the medal, and the figures as the body.

Every medal has two *legends*; that on the front, and that on the reverse. The first, for the generality, serves only to distinguish the person by his name, titles, offices, &c. the latter is intended to express his noble and virtuous sentiments, his good deeds, and the advantages the publick has reaped by him.—This, however, does not hold universally; for sometimes we find the titles shared between both sides, and sometimes also the *legend*.

In the medals of cities, and provinces, as the head is usually the genius of the place, or at least some deity adored there; the *legend* is the name of the city, province, or deity, or of both together; and the reverse, some symbol of the city, &c. frequently without a *legend*; sometimes, with that of one of its magistrates.

The ordinary subjects of *legends*, are the virtues of princes, the honours they have received, consecrations, signal events, public monuments, deities, public vows, privileges, &c.

*Legends*, and inscriptions of medals, are either in Latin, or Greek.—The Greek character, consisting of majuscule, or capital letters, appears uniform on all the medals: no change, or alteration being found in confronting the several characters; though, it is certain, there was in the ordinary use, and pronunciation.—All we observe on medals, is sometimes a mixture of Greek and Latin letters.—The character was preserved in all its beauty, till the time of Gallienus.

From the time of Constantine, and for the space of 500 years, the Latin tongue was alone used in the *legends* of medals, even in those struck at Constantinople.—Michael began the first, whose *legend* was in Greek; and from his time the language, as well as the characters, began to alter for the worse. See CHARACTER.

LEGION\*, a kind of regiment, or body of forces, of a number whereof the Roman armies were chiefly composed.

\* The word comes from the Latin, *legere*, to chuse; because, when the *legions* were raised, they made choice of such of their youth, as were the most proper to bear arms.

## LEG

The number of foldiers, and officers, whereof the *legion* consisted, was different at different times: but it is impossible to determine the precise time, and manner of their alteration.—In the time of Romulus, each *legion* contained 3000 foot, and 300 equites, or horse: these were divided into three bodies, which made as many orders of battle.—Each body consisted of ten companies, or maniples, ranged at some distance from each other, though in the same front.—Each body had two general officers to command it, called *tribunes*; and each manipule, two centurions.

Under the consuls, the *legion* consisted of 4000 men, who made four bodies, commanded by a consul, or one of his lieutenants; and each legion had its share of cavalry, which was from two to three hundred horse.

Afterwards, in the times of Marius, these four divisions of the *legion* were united into one, and augmented; and cohorts were appointed from five to six hundred men, each under the command of a tribune.—Each cohort consisted of three companies, or maniples, each manipule of two centuries, and the *legion* was divided into ten cohorts, who made as many distinct battalions, disposed into three lines; so that the *legion*, then, consisted of five or six thousand men.

Isidore tells us, that the *legion* consisted of six thousand men, divided into sixty centuries, thirty manipules, twelve cohorts, and two hundred troops.—According to the French academy, the *legion* consisted of six thousand foot, and seven hundred twenty five horse.

The *legions* were, by far, the most considerable part of the Roman army; their number, in the time of Augustus, was thirty three; they were composed wholly of Roman citizens.—The allies formed a body of auxiliary forces.

The standard bore by the *legions* was various: at first, a wolf, in honour of that which suckled Romulus; afterwards a hog, by reason, says Festus, war is only undertaken with a view to peace, which was concluded by sacrificing a hog. Sometimes, they bore the minotaur, to remind their general that their designs were to be kept secret, and inaccessible as the minotaur in the labyrinth.—They also bore a horse, a boar, &c.—Pliny tells us, that Marius was the first who changed all these standards into eagles. See **EAGLE**.

**Square LEGION**, *Legio quadrata*, was a legion consisting of 4000 men. See **QUADRATA**.

**Domesticus LEGIONUM.** } See **DOMESTICUS**.

**Thundering LEGION.** } See **THUNDERING**.

**LEGISLATOR**, *Law-giver*; he who frames the laws of a kingdom, or state founded by him. See **LAW**.

The principal ancient *legislators* are,—Moses, *legislator* of the Hebrews; Mercurius Trismegistus, and Bocchyris, of the Egyptians; Italus, of the Oenotrians; Theseus, Draco, and Solon, of the Athenians; Zoroaster, of the Bactrians; Charondas, of the Cappadocians; and Charondas, or Phaleas, of the Carthaginians; Androdarnas, of the Calcidians; Eudoxus, of the Cnidians; Phido, of the Corinthians; Minos, of the Cretans; Pythagoras, of the Crotoniates, and most of the cities of Græcia Major; Parmenides, and Zeno, of Elea in Lucania; Zamolxis, of the Getæ; Phoroneus, of the Greeks; Bacchus, of the Indians; Saturn, of Italy; Macarius, of the isle of Lesbos; Zaleucus, of the Locrians; Nicodorus Athleta, of the city of Mutina; Hippodamia, of Miletus; Charondas, of Rheggio; Lycurgus, of the Lacedæmonians; Archytas, of Tarentum; Philolaus, of the Thebans.

At Rome, the people were in great measure their own *legislators*; though Solon may be said, in some sense, to have been their *legislator*, in regard the Decemviri, who were created for the making of laws, borrowed a great number from those of Solon. See **DECEMVIRI**, and **TABLES**.

**LEGITIMATE Delivery.** } See **DELIVERY**.

**LEGITIMATE Tertian.** } See **FEVER**.

**LEGITIMATION**, an act by which natural, or illegitimate children are rendered legitimate. See **BASTARD**, &c.

By the French law, the father and mother, by marrying, render their children, begotten before marriage, legitimate; and this is called *legitimation per subsequens matrimonium*.

The right of *legitimation*, was a thing unknown to princes till the time of Constantine; but, since his time, has been exercised by most of them. The Greek emperors invented several kinds of *legitimation*.

Anastasius put it in the power of the father to *legitimate* his natural children, by a bare adoption, provided he had no legitimate children.—But Justin, by his constitution, and Justinian, by his *Novel* 74, abolished this *legitimation*, as fearing the too easy access to *legitimation* should encourage concubinage.

In lieu of this, he established a way of *legitimation* by the emperor's letters.—This rendered bastards capable of attaining to honours, and even of succeeding to inheritances, provided the persons were *legitimated* with the consent of their father and mother; which is agreeable to the canon law.

**LEGS**, the lower extremes of the bodies of most animals, serving them for support and motion. See **ANIMAL**, and **EXTREME**.

## LEM

Some anatomists divide the foot of man into three parts, viz. the thigh, the *leg*, and the lesser foot. See **FOOT**.

In the *leg*, there are two considerable bones; the one called the *great foci*, or *tibia*; the other the *little foci*, or *fibula*. See **TIBIA**, and **FIBULA**.

The *legs* and feet of the several animals, Mr. Derham observes, are exactly conformable to the posture, make, nay, to the motion and exercises of those animals. In some they are made for strength only, in others for agility and swiftness; in some, for walking and running, in others for swimming, in others for digging, and in others for flying. In some more lax and weak, for traversing the plain land; in others stiff, and rigid, for ice and precipices. In some, shod with tough and hard hoofs, some whole, some cleft. In some the feet are composed of toes, some short, for only going, others long, to supply the place of hands; some are armed with talons, to catch and tear their prey; some with short nails, to confirm their steps in running and walking. See **NAIL**, &c.

In birds, the *legs* are curved, for their easy perching, roosting, and rest, as also to help them on the wing in taking their flight, and to be therein commodiously tucked up to to the body, so as not to obstruct their flight. In some, long, for wading, &c. See **BIRD**.

**LEGS of a Triangle**—When one side of a triangle is taken as a base, the other two are called *legs*. See **TRIANGLE**.

**Arched LEGS.**

**Hyperbolic LEGS.**

**Compasses of three LEGS.**

} See the article { **ARCHED.**

} **HYPERBOLIC.**

} **COMPASSES.**

**LEGUMEN**, or **LEGUME**, is applied, by botanists, to beans, peas, vetches, &c. otherwise called *pulse*. See **PULSE**, and **LEGUMINOUS**.

Some will have them thus called, in regard they are gathered with the hand; by which they are distinguished from corn, &c. which are mowed, or reaped: *eo quod manu legatur, & non secatur*.

Yet the ancient writers on husbandry consider corn, and even turneps, and all grains, and roots for family use, as *legumina*.

**LEGUMINOUS**, an appellation given to those plants which yield legumes, or pulse. See **LEGUMEN**.

Of this kind are most plants which grow in pods, as beans, peas, &c.

Ray ranks all plants as *leguminous*, which have a papilionaceous or butter-fly-like flower. See **PLANT**.

**LEGUMINOUS Flowers.** See the article **FLOWER**.

**LEMMA**, **AHMA**, in mathematics, denotes a previous proposition, laid down in order to clear the way for some following demonstration; and prefixed either to theorems, in order to render their demonstration less perplexed, and intricate; or to problems, to make their resolution more easy, and short. Thus, to prove a pyramid one third of a prism, or parallelepiped of the same base and height with it; the demonstration whereof in the ordinary way, is difficult, and troublesome; this *lemma* may be premised, which is proved in the rules of progression; that the sum of the series of the squares, in numbers in arithmetical progression, beginning from 0, and going on 1, 4, 9, 16, 25, 36, &c. is always subtriple of the sum of as many terms equal to the greatest; or is always one third of the greatest term multiplied by the number of terms. Thus, to find the inflection of a curve line, this *lemma* is first premised; that a tangent may be drawn to the given curve, in a given point.

So, in physics, to the demonstration of most propositions, such *lemmata* as these are necessary first to be allowed; that there is no penetration of dimensions; that all matter is divisible; and the like.—As also in the theory of medicine, that where the blood circulates, there is life, &c.

**LEMNIAN Earth**, *Terra LEMNIA*, a medicinal, astringent, sort of earth, of a fatty consistence, and reddish colour; used in the same cases as bole. See **BOLE**.

It has its name from the island of *Lemnos*, whence it is chiefly brought.

Many form it into round cakes, and impress a seal upon it; whence it is also called, *terra sigillata*. See **SIGILLATA**.

**LEMONADE**, a drink prepared of water, sugar, and citron, or lemon juice.

This factitious liquor is so popular in Paris, that it has given its name to a new established company, called *lemonadiers*.

**LEMURES**, in antiquity, *sprites* or *hobgoblins*; restless ghosts of departed persons, who return to terrify and torment the living. See **MANES**.

These are the same with *larvæ*, which the antients imagined to wander round the world, to frighten good people, and plague the bad.—For which reason, at Rome they had *lemuria*, or feasts instituted to appease the manes of the deceased.

Apuleius explains the ancient notion of manes thus: The souls of men released from the bands of the body, and freed from performing their bodily functions, become a kind of demons, or genii, formerly called *lemures*.—Of these *lemures*, those that were kind to their families, were called *lares familiares*; but those who, for their crimes, were condemned to wander continually, without meeting with any place

# LEN

place of rest, and terrified good men, and hurt the bad, are vulgarly called *larvæ*. See **LARÆ**.

An ancient commentator on Horace mentions, that the Romans wrote *lemures* for *remures*; which last word was formed from Remus, who was killed by his brother Romulus, and who returned to earth to torment him. See **LEMURIA**.

But Apuleius observes, that in the ancient Latin tongue *lemures* signifies the soul of a man separated from the body by death.

**LEMURIA**, or **LEMURALIA**, a feast solemnized at Rome on the ninth of May, to pacify the manes of the dead, or in honour of the *lemures*. See **LEMURES**.

The institution of this feast is ascribed to Romulus, who, to rid himself of the phantom of his brother Remus (whom he had ordered to be murdered) appearing always before him, ordained a feast called after his name *remuria*, or *lemuria*.

In the *lemuria*, they offered sacrifices for three nights together; during which time all the temples of the gods were shut up, nor any marriages permitted.—There were a world of ceremonies in this feast, chiefly intended to exorcise the *lemures*, and prevent their appearing, or giving any disturbance to the living.

**LENIS Spiritus**, in prosody. See the article **SPIRIT**.

**LENITIVE**, in physic, sometimes denotes a softening, resolute remedy, that moistens the parts diseased, and dissipates any sharp humour collected there.

**LENITIVE**, is more frequently used for *laxative*. See **LAXATIVE**.

**LENITIVE Electuary**, is more peculiarly used for a gentle sort of electuary, composed of senna, polypody, &c. so called, in regard it purges easily, and by resolving. See **ELECTUARY**.

**LENS**, in dioptrics, properly signifies a small, oblong glass, of the figure of a *lentil*; but is extended to any optic glass, not very thick, which either collects the rays of light into a point, in their passage through it, or disperses them farther apart, according to the laws of refraction. See **GLASS**, **LIGHT**, **RAY**, &c.

*Lens*'s have various figures; that is, are terminated by various surfaces, from which they acquire various names. Some are plane on one side, and convex on the other; others convex on both sides; both which are ordinarily called *convex lens*'s: though when we speak accurately, the former are called *plano-convex*.—Again, some are plane on one side, and concave on the other; and others are concave on both sides, which are both usually ranked among the concave *lens*'s; though, when distinguished, the former is called a *plano-concave*.—Others, again, are concave on both sides; others are concave on one side, and convex on the other; which are called *convexo-concave*, or *concavo-convex lens*'s, according as the one or the other surface is more curve, or a portion of a less sphere. See **CONVEX**, **CONCAVE**, &c.

It is to be here observed, that in every *lens* terminated in any of the forementioned manners, a right line perpendicular to the two surfaces is called the *axis* of the *lens*.—Which axis, when both surfaces are spherical, passes through both their centres; but if one of them be plane, it falls perpendicularly upon that, and goes through the centre of the other. See **AXIS**.

A *lens*, one of whose surfaces is convex, and the other concave, is called a *meniscus*; the properties of which, see under **MENISCUS**.

See also the *Theory of LENS's demonstrated* under **REFRACTION**; and the application thereof, under **MICROSCOPE**, **TELESCOPE**, **BURNING-GLASS**, **FOCUS**, &c.

Some confine *lens*'s within the diameter of five or six lines, and will have such as exceed that diameter called *lenticular glasses*.

*Lens*'s are distinguished, with regard to the manner of their preparation, into *ground*, and *blown*.

**Blown LENS's**, are little globules of glass, melted in the flame of a lamp, or taper. See **MICROSCOPE**.

But the figure of these is seldom exact; besides, that the smoke of the lamp cleaves to the surface in melting: on both which accounts, they come short of the clearness of those that are ground, or turned and polished in the lathe, in little copper basons, or dishes.—The secret is now found of making these exquisitely small, so as some of them do not exceed, in diameter, the sixth part of a line, which are found to magnify objects several millions of times.

**Manner of grinding LENS's**.—A little piece of copper is cemented to the end of the arbor of a lathe, and turned, till it form a dish, or bason of the diameter of the *lens* required.—Then a piece of clear glass is cemented on one of its flat sides, to the end of a little maundrel, with black Spanish wax; and thus ground, on the side not cemented, on a grindstone, with water, till it have nearly acquired a concave figure.—It is finished in the lathe, by turning it in the bason, with fine wet sand, or gritt-stone. The gritt must be often repeated fresh, till the *lens* appear very round; when it is come to that point, they cease to take any fresh stone, but continue to turn it in the bason, till the remains of the sand be become so fine as to have polished it.—This they perceive,

# LEN

when, upon wiping it, the image of the window of the place is seen painted on its surface; if it does not, it is wetted in water without any sand, and turned till it have got a polish.—The bason is then covered, within side, with two or three folds of linen, and the polish finished with putty, or tripoly of Venice steeped in water.—It is known to be perfectly polished, when, viewing it with a magnifier, there appear no scratches of the sand.—The cement is then broke off, and the side polished cemented, to work and grind the other, as before, till the edges of the *lens* be become sharp, and it be perfectly polished on either side.—When finished, it is washed in spirit of wine, to take off all remains of the wax.

For *convex LENS's*, the laws of their refraction, and their effects depending thereon, are as follow.—1°. A ray of light, EG, near the axis, (*Tab. Optics*, fig. 1.) and parallel thereto, striking on the plane surface of a *plano-convex lens*, directly opposite to the luminous body, after refraction concurs with the axis in the point F: and if C be the centre of the convexity, CF will be to FL, that is, the distance of the centre from the point of concurrence, or focus, will be to the distance of the centre in the convex surface, in the ratio of the refraction. See **REFRACTION**.

For the plane surface being directly opposed to the luminous body, the ray EG is perpendicular to AB, and therefore will pass unrefracted to H: thus it strikes on AHB, still parallel to the axis; and therefore coming out of a denser medium into a rarer, will meet with the axis of the *lens* in F; and so, as that CF will be to FL in the ratio of the sine of the refracted angle to the sine of the angle of inclination: as will be demonstrated under the head **REFRACTION**.

If then the refraction be out of a glass *lens* into air CF: EL: 3: 2, and therefore FL = 2 CL. That is, parallel rays, near the axis, will concur with it at the distance of the diameter.—Again, if the refraction were out of a water *lens*, i. e. out of a *plano-convex lens* filled with water, CF: EL: 4: 3, and therefore FL = 3 CL; i. e. parallel rays, near the axis, will concur with it at the distance of half the diameter. So that if a lighted candle be placed in the focus of a *plano-convex lens*, that is, in the point F, distant from the surface of the *lens* ALB, by the length of the diameter; and from the surface of the water *lens*, by half the diameter, its rays, after refraction, will become parallel. See **REFRACTION**.

2°. If the ray KI, (*Tab. Optics*, fig. 2.) near the axis of a *plano-convex lens*, and parallel thereto, strike on its convex surface AHB, after a double refraction, it will meet the axis in F; so as that HG will be to GC, and GF to FH, in the ratio of the refraction.

For the ray KI, parallel to the axis EG, by virtue of the first refraction in I, will tend to the point G, so as GH will be to GC in the ratio of the sine of the angle of inclination to the sine of the refracted angles; therefore, by virtue of the second refraction in L, it will concur with the axis in F; so as GD will be to FD in the ratio of the sine of the refracted angle, to the sine of the angle of inclination. See **REFRACTION**.

So that the semidiameter, and thickness of the *plano-convex lens*, with the ratio of refraction being given, hence arises a method of determining the focus of parallel rays striking on the convex surface. For,

Hence, if the *lens* be glass, FD = 2 CH —  $\frac{1}{2}$  HD. So that if two thirds of the thickness of the *lens* be inconsiderable (as in practice it usually happens) parallel rays meet with the axis at the distance of the diameter from the *lens*, even when they strike on the convex surface.

So that as to the place of the focus, it is the same thing whether the plane surface, or the convex one be turned to a luminary of parallel rays; though it appears, both from experience, and trigonometrical calculations, that there are more rays united in a less space, if the convex surface, than if the plane one be turned towards the sun.

If the *lens* were full of water, FD = 3 CH —  $\frac{1}{4}$  HD. Wherefore if  $\frac{1}{4}$  HD be inconsiderable, FD = 3 CH, or if  $\frac{1}{2}$  HD be inconsiderable, FH = 3 CH. Parallel, and near rays, therefore, are united at the distance of half the diameter, if the refraction be in water, even when the convex surface is opposed to the luminous body. Hence, also, arises a method of determining the focus of parallel rays striking on a *lens* convex on both sides, the two semidiameters, and the thickness of the *lens*, being given.

On these principles is founded the structure of refracting burning glasses, the sun's light, and heat, being exceedingly augmented in the focus of a *lens*, whether convex or *plano-convex*; since the rays falling parallel to the axis of the *lens*, are reduced into a much narrower compass; so that it is no wonder they burn some bodies, melt others, and produce other extraordinary phenomena. See **BURNING-GLASS**.

3°. If a luminous body be placed in a focus behind a *lens*, whether *plano-convex*, or convex on both sides; or whether equally, or unequally, the rays, after refraction, become parallel.

Hence,

# LEN

Hence, by means of a convex *lens*, or a little glass bubble full of water, a very intense light may be projected to a vast distance. See *MIRROR*.

And this furnishes us with the structure of a lamp, or lantern, to project an intense light to an immense distance: for a *lens*, convex on both sides, being placed opposite to a concave mirror, if in the common focus of both be placed a lighted candle, or wick, the rays reflected back from the mirror to the *lens* will be parallel to each other; and after refraction will converge, till they concur to the distance of the semidiameter, after which they will again diverge.—But the candle being likewise in the focus of the *lens*, the rays it throws on the *lens* will be parallel: and therefore a very intense light meeting with another equally intense, at the distance of the diameter from the *lens*, the light will be surprising; and though it afterwards decrease, yet the parallel and diverging rays going a long way together, it will be very great at a very great distance. Lanterns of this kind are of considerable service in the night-time to discover remote objects, and are used, with success, by fowlers and fishermen, to gather their prey together, in order to take them.

If it be required to have the light, at the same time, transmitted to several places, as through several streets, &c. the number of *lens*'s and mirrors is to be increased.

If the luminous body, placed in the focus, be of a larger extent, the rays flowing from points sensibly distant from each other, cannot be parallel; but will constitute several trains, or parcels of rays, parallel to each other.

3°. The images of objects, opposed in any manner to a convex *lens*, are exhibited, invertedly, in its focus.

Hence, if a paper be applied to a convex *lens*, (especially in a dark room) at the distance of its focus, the images of objects shining upon it, will be represented distinctly, and in their natural colours, thereon: nor is the focus of the sun's rays any thing else, in effect, but the image of the sun.—Hence, in solar eclipses, the sun's image, eclipsed as it is, may be burnt by a large *lens*, on a board, &c. a very entertaining phenomenon!

Hence also, if a convex *lens*, of any kind, be exposed both to nearer and remoter objects, and a paper at the same time be applied, so as to receive the images of objects distinctly, the distance of the focus from the *lens*, and thence the diameter of the convexity may be determined.

4°. If a concave mirror be so placed, as that an inverted image, formed by refraction through a *lens*, be found between the centre and the focus, or even beyond the centre, it will again be inverted by reflection, and so appear erect in the first case beyond the centre; and in the latter, between the centre and the focus. On these principles is built the camera obscura. See *CAMERA obscura*.

5°. The diameter of the image of an object delineated beyond a convex *lens*, is to the object itself in the ratio of the distance of the image to that of the object.

Since then the image of a remoter object is less distant from the *lens* than that of the nearer, the image of the more remote will be less than that of the nearer. And because the distance of the image from the *lens* is greater, if the *lens* be a segment of a greater sphere than of a less; hence the image will be greater in the former case than in the latter. The image therefore will be of such a magnitude, as it would be of, were the object to shine into a dark room through a little hole upon a wall, at the same distance from the hole, at which the focus is from the *lens*.—When an object is less distant from a *lens* than the focus of parallel rays, the distance of the image is greater than that of the object, otherwise, the distance of the image is less than that of the object; in the former case, therefore, the image is greater than the object, in the latter, less.

If the images be made greater than the objects, they will not appear distinctly; because in that case there are fewer rays which meet after refraction in the same point; whence it happens, that rays proceeding from different points of an object, terminate in the same point of an image, which is the cause of confusion.—Hence it appears, that the same aperture of a *lens* may not be admitted in every case, if we would keep off the rays which produce confusion. However, though the image is then more distinct, when no rays are admitted but those near the axis, yet for want of rays the image is apt to be dim. See *APERTURE*.

6°. If the eye be placed in the focus of a convex *lens*, an object viewed through it appears erect, and enlarged in the ratio of the distance of the object from the eye, to that of the eye from the *lens*, if it be near; but infinitely, if remote. See *MICROSCOPE*; see also *PRISM*.

For Concave *LEN*'s, their laws are as follow.—1°. If parallel rays strike on a plano-concave *lens* KL, and FC be to FB in the ratio of refraction, the rays will diverge from the axis, and the point of divergency, or dispersion, called the *virtual focus*, will be F. See *Tab. Optics*, fig. 3.

For the ray HI, parallel to the axis, is perpendicular to KL, and will therefore pass unrefracted to E. Wherefore FC being to FB in the ratio of refraction, F will be the *virtual focus*. See *REFRACTION*.

# LEN

If then the *lens* be glass,  $FB = 2 BC$ ; i. e. the *virtual focus* E will be distant from the *lens* KL by the space of the diameter 2 BC.

If the refraction be in water,  $FB = 3 BC$ ; i. e. the *virtual focus* F will be distant from the *lens* KL a diameter and a half 3 BC.

2°. If the ray AE, parallel to the axis FP, strike on a *lens* concave on both sides; and both FC be to FB, and IP to PH in the ratio of refraction; and  $FP : PH :: FB : BG$ ; G will be the point of dispersion, or the *virtual focus*. See *Tab. Optics*, fig. 4.

If therefore the refraction be in a glass *lens*, the sums of the semi-diameters CB and HI, will be to the diameter of the concavity of either, 2 HI, as the semidiameter of the other CB, to the distance of the *virtual focus* from the *lens* BG.

Hence the sun's rays striking on a concave *lens*, their light, after refraction, will be considerably weakened; so that the effect of concave *lens*'s is opposite to that of convex ones.

3°. An object viewed through a concave *lens*, appears erect, and diminished in a ratio compounded of the ratio's of the space in the axis, between the point of incidence, and the point to which an oblique ray would pass without refraction, to the space in the axis between the eye and the middle of the object; and the space in the same axis between the eye and the point of incidence, to the space between the middle of the object and the point the oblique ray would pass to without refraction.

Though the properties of *lens*'s have been here considered principally with regard to rays falling near the axis, and parallel thereto; yet the reasoning will be easily transferred to rays remoter from the axis, and falling in any direction.—

Thus we may say universally, that in a convex *lens*, all parallel rays become converging, and concur in a focus; that diverging rays either become less diverging, or run parallel, or converge; and that converging rays converge the more: All which alterations are more sensible in oblique rays, than in perpendicular ones, by reason the angles of incidence in that case are greater.

In concave *lens*'s all parallel rays become diverging; diverging rays diverge more; converging rays either converge less, or become parallel, or go out diverging: all which things hold of oblique as well as direct rays, but more sensibly in the first.

*LEN*S, or *LENTICULA*, was also the name of a kind of weight among the Romans; being the hundred and eighth part of a drachm; equal to a grain and a half. See *DRACHM*, and *GRAIN*.

*LENT*, *Quadragesima*, a time of mortification, during the space of forty days, wherein Christians are enjoined to fast, in commemoration of our Saviour's miraculous fasting so long in the desert, and by way of preparation for the feast of Easter. See *FAST*.

In the ancient Latin church, *Lent* only consisted of thirty-six days. In the ninth century, to come somewhat nearer to the miracle, several took upon them to add four days more; which in time, became a general practice; though the church of Milan is said still to take up with the ancient thirty-six.

According to S. Jerom, S. Leo, S. Augustine, and others, *Lent* must have been instituted by the apostles.—Their way of reasoning is thus: Whatever is generally received throughout the whole church, and whose institution we do not find in any council, must be esteemed to have been established by the apostles.—Now such, they say, is the fast of *Lent*. Its institution is not spoke of in any council; but many of the ancient councils, particularly that of Nice, that of Laodicea, &c. and some of the oldest fathers, particularly Tertullian, speak of it as a thing of some standing.

The Reformed, generally, hold *Lent* to be a superstitious institution, set on foot by some vain enthusiasts, who durst undertake to ape the miracle of Jesus Christ; as, in effect, it appears to have been from a passage of Irenæus, quoted by Eusebius.

Some will have it to have been first instituted by pope Telephorus, in the second century: others, who own that there was a kind of abstinence observed in the ancient church before Easter, yet contend that it was voluntary, and was never enjoined by any law, till the third century.

There was some difference between the practice of the Greek and Latin churches, as to the business of *Lent*; the Greeks beginning it a week sooner, but at the same time allowing more days of intermission than the Latins: those who held it seven weeks, did not fast on Saturdays, as those who observed it but six did.

The ancient Latin monks had three *Lents*; the grand *Lent* before Easter; another before Christmas, called the *Lent* of S. Martin; and a third after Whitunday, called the *Lent* of S. John Baptist: each of which consisted of forty days.

The Greeks, besides that before Easter, observed four others; that of the *Apostles*, of the *Assumption*, of *Christmas*, and of the *Transfiguration*: but they reduced each of them to the space of seven days.—The Jacobites added a fifth, which they call the *repentance of Nineveh*; and the Maronites a sixth, called the *exaltation of the holy cross*.

By

# LEO

By the ninth canon of the eighth council of Toledo it is ordained, 'That if any persons, without evident necessity, eat flesh in *Lent*, they shall be deprived the use of it all the rest of the year. The forty days in *Lent*, say some, are observed in remembrance of the forty days wherein the world was drowned; or, as others say, of the forty years wherein the Jews wandered in the desert; others, of the forty days allowed Nineveh for repentance; others, of the forty stripes by which malefactors were to be corrected; or, the forty days fasted by Moses at the receiving of the law; or, the forty days fasted by Elias; or, the forty days fasted by our Saviour.

**LENTIGO**, a cutaneous disorder, popularly called *freckles*. See **FRECKLES**.

**LENTIGO**, is also used by Dr. Quincy for a freckly, or scurfy eruption upon the skin; such, especially, as is common to women in the time of child-bearing.

**LENTISCUS**, the wood of an evergreen tree of the same name, of some use in physic; it is astringent and fortifying, and much used for tooth-picks.

It contains a kind of gum, or resin, much like mastic, or rather the mastic itself, or incense of Persia, so highly commended by Strabo. See **MASTIC**.

The *lentiscus* has nearly the same properties with the saunders; but has more of the turpentine in it, and sometimes passes by urine. See **SANTALUM**.

**LEO**, *Lion*, the fifth of the twelve signs of the zodiac. See **STAR**, **SIGN**, and **CONSTELLATION**.

The stars in the constellation *Leo* in Ptolemy's catalogue are 32, in Tycho's 37, in the Britannic catalogue 94; the names, places, longitudes, latitudes, and magnitudes whereof, are as follow.

**Cor LEONIS**, *Lion's Heart*, a fixed star of the first magnitude in the sign *Leo*: called also *Regulus*, *Basilicus*, &c. See **REGULUS**, &c.

**LEONINE**, in poetry, is applied to a kind of verses which rime at every hemeftic, the middle always chiming to the end. See **VERSE**, and **RIME**.

Of which kind we find several ancient hymns, epigrams, prophecies, &c.—For instance, Muretus speaking of the poetry of Lorenzo Gambara of Bresse, says,

*Brixia, vestratis merdosa volumina vatis,  
Non sunt nostrates tergert digna nates.*

The following one is from the school of Salerno:

*Ut vites poenam de potibus incipe cœnam.*

The origin of the word is somewhat obscure; Pasquier derives it from one Leoninus, or Leonius, who excelled in this way, and dedicated several pieces to pope Alexander III. Others derive it from pope Leo; and others from the beast called *lion*, by reason it is the loftiest of all verses.

M. Fauchet makes the *leonine* rime the same with what the French call the *rich*, and we the *double rime*, i. e. where two syllables have the same orthography, accentuation, and pronunciation with two others.

**LEONTICA**, feasts or sacrifices celebrated among the ancients, in honour of the sun.

They were called *leontica*, and the priests who officiated at them *leones*, in regard they represented the sun under the figure of a lion radiant, bearing a tiara, and gripping in his two fore paws the horns of a bull, who struggled in vain to disengage himself.

The critics are extremely divided about this feast; some will have it anniversary, and to have made its return not in a solar, but a lunar year; but others hold its return more frequent, and give instances where the period was not above two hundred and twenty days.

The ceremony was sometimes also called *Mithriaca*, Mithras being the name of the sun among the ancient Persians.

There was always a man sacrificed at these feasts till the time of Hadrian, who prohibited it by a law. Commodus introduced the custom afresh, after whose time it was again exploded.

**LEPIDOIDES**\*, or **LEPIDOEIDES**, in anatomy, a name of the squamous or scaly future of the cranium. See **SUTURE**.

\* The word is Greek, λεπίδοειδης formed of λεπίς, scale, and ειδος, form, figure. See **SQUAMOUS**.

**LEPROSY**\*, **LEPRA**, a foul, cutaneous disease, appearing in dry, white, thin, scurfy scabs, either over the whole body,

# LEP

or only some part of it; and usually attended with a vehement itching, and other pains.

\* The word is derived from the Greek λεπρα, which signifies the same; and that from λεπις, squama, scale.

The leprosy seems to arise from a great obstruction of perspiration; whereby the thin, saline humours, are thrown off from the blood, and arrested by the density and closeness of the cuticula. See CUTIS, and CUTICULA.

This distemper has been much more frequent in former times than at present, and much more in the hot countries of the east, particularly among the Jews, than among us; perhaps by reason the salts which, by the appointment of nature, are to be eliminated through the pores of the skin, along with the recrementitious serum their proper vehicle, are, in hot countries, conveyed in greater plenty to the surface of the body, than in these northern regions they ordinarily are; and sticking in their passage in the thin dry membrane of the cuticle, the aqueous parts, which are their vehicle, slip away from them by insensible evaporation, and leave them there to corrode and fret it, till at length, through the quantity so gathered, the membrane becomes dry, brittle, and white, which is the cause of that disquamation, or falling away in white scales: that whiteness, as well as the brittleness, proceeding merely from the quantity of these salts, which are themselves white; and when the moisture is drawn from them, being aculeated, and having insinuated themselves into the pores of the cuticle, dissolve the continuity of it by their points and edges, which, thus mortified and broken, is apt, on the least friction, to fall off, as abovementioned.

The ancients distinguished two kinds of leprosy; viz. the *lepra Græcorum*, and *lepra Arabum*: though the two seem only to have differed in degree; the symptoms of the Grecian being further heightened and aggravated in the Arabian.

**LEPRA Arabum**, is the same with what is otherwise called *elephantiasis*, by reason in this the patient's skin is rough and wrinkled like an elephant's hide. See ELEPHANTIASIS.

In the *lepra Arabum*, the skin is beset with a dry scabby crust. As in the former case the salts, being left destitute of their humidity, are not so active, and therefore affect only the cuticle; in the latter case these salts, with their vehicle, crowding faster than they can be evaporated through the pores of the skin (being still in *fluore*, and so more caustic) corrode deeper, and eat not only the cuticle, but the excretory vessels, and surface of the skin itself, which thereby spews out a liquor somewhat thicker than usual; which, when the thinnest and most aqueous parts are evaporated, are condensed into that crust or scab, which is the distinguishing character of this disease.

Galen defines the *lepra*, an effusion of thick disorderly blood, that corrupts the whole habit of the body. Avicenna calls it an *universal cancer*.

The *lepra* begins within-side, a long time before it appears without-side: It was frequent in Europe in the Xth and XIth centuries, but seems at present almost extinct; unless we allow the venereal disease to be the same with the *lepra*, as was the opinion, among many others, of the learned Pitcairn, and as has been lately endeavoured to be proved by Mr. Becket, in a discourse expressly on the subject in the *Philosophical Transactions*. See VENEREAL.

The symptoms of the ancient *lepra*, as laid down by Galen, Aretæus, Pontanus, Ægineta, Cardan, Varanda, Gordon, Pharæus, and others, are as follow: The patient's voice is hoarse, and comes rather through the nose than the mouth; the blood full of little white shining bodies, like grains of millet, which upon filtration separate themselves from it; the serum is scabious, and destitute of its natural humidity, inso-much that salt applied to it does not dissolve; it is so dry, that vinegar poured on it boils; and is so strongly bound together by little imperceptible threads, that calcined lead thrown into it swims. The face resembles a coal half extinct, unctuous, shining, and bloated, with frequent hard knobs, green at bottom, and white at top. The hair is short, stiff, and brinded, and not to be torn off without bringing away some of the rotten flesh to which it adheres; if it grows again, either on the head or chin, it is always white. Athwart the forehead run large wrinkles, or furrows, from one temple to the other; the eyes red and enflamed, and shine like those of a cat; the ears swollen and red, eaten with ulcers towards the bottom, and encompassed with little glands; the nose sunk, because of the rotting of the cartilage; the tongue dry and black, swollen, ulcerated, divided with furrows, and spotted with grains of white; the skin covered with ulcers, that die and revive on each other, or with white spots or scales like a fish; it is rough and insensible, and when cut, instead of blood, yields a sanious liquor. It arrives in time to such a degree of insensibility, that the wrist, feet, or even the large tendon, may be pierced with a needle, without the patient's feeling any pain. At last the nose, fingers, toes, and even privy members fall off entire, and by a death peculiar to each of them, anticipate that of the patient. It is added, that the body is so hot, that a fresh apple held in the hand an hour, will be dried and wrinkled, as if exposed to the sun for a week.

Matthew Prior says, that in Christendom there were fifteen

# LET

thousand hospitals for *lepers*; but the disease having been discontinued for two hundred years, the revenues of those hospitals were abused, and persons feigned themselves *lepers*, to be entitled to the provision; which occasioned their regulation in some countries, and their entire suppression in others.

In France, they were united to the order of the religious of S. Lazarus and mount Carmel in 1664, and the administration of them given to the knights of that order. See LAZARUS. In England, they have been converted to other purposes.

Formerly the causes of *lepers* were committed to the ecclesiastical tribunals; and it was prohibited to prosecute a *leper* before a lay-judge, in regard they were under the protection of the church, which separated them from the rest of the people by a ceremony still to be seen in the ancient rituals.

As to the cure, that which proved effectual in those southern countries, fails among us, where the strongest medicaments, and the most powerful mercurials, are necessary. Bathing is judged to be of good use in the *lepra*. Dogs and hares are said to be subject to this disease. Among the Indians a white man is despised, this passing with them for a mark of a *leper*.

**LEPUS**, the *Hare*, a constellation of the southern hemisphere; whose stars in Ptolemy's catalogue are 12, in that of Tycho 13, in the Britannic catalogue 19; the names, places, longitudes, latitudes, and magnitudes whereof are as follow.

Names and Situations of the Stars.	Sign.	Longitude		Latitude		Magn.

**LE ROY le veut**, words by which the royal assent is signified by the clerk of the parliament to public bills: to private bills this assent is expressed by *soit fait comme il est desire*. See ROYAL.

**LE ROY s'avisera**.—By these words to a bill, presented to the king by his parliament, are understood his absolute denial of that bill in a more civil way; and the bill thereby becomes wholly null and void. See PARLIAMENT.

**LESBIAN Cymatium**. See the article CYMATIUM.

LESSER Barons.	} See	BARON.
LESSER Bear.		BEAR.
LESSER Centaury.		CENTAURY.
LESSER Circle of a Sphere.		CIRCLE.
LESSER enharmonical Diesis.		DIESIS.
LESSER Excommunication.		EXCOMMUNICATION.
LESSER Hexachord.		HEXACHORD.

**LESSOR**, and **LESSEE**. See the article LEASE.

**LETHARGY** \*, λεθαργια, in medicine, a disease consisting of a profound drowsiness or sleepiness, wherein the patient can scarce be awaked; or, if awaked, remains stupid, without sense or memory, and presently sinks again into his former sleep.

\* The word comes from the Greek λεθη, oblivion, and αργια, numbness, laziness.

The *lethargy* is usually accompanied with a fever and delirium. Boerhaave makes the *lethargy* a gentle apoplexy, arising from the same causes, and to be known and cured in the same manner. See APOPLEXY.

Some authors distinguish the *lethargy* from the *carus*, in that this latter is without a fever, or at most is preceded with a violent one; whereas the *lethargy* is attended with a slow one. Celsus ranges the *lethargy* in the number of acute diseases, the patient usually dying on the seventh day. A *lethargy* frequently succeeds a frenzy.

**LETHE**, **LETH**, or **LATHE**, a measure or portion of lands, making one of the ancient divisions of England.

King Ælfred divided England into counties, as it stands at present; those counties he subdivided into hundreds or tithings. The hundred was a division, wherein were an hundred officers to secure the peace; the *lethe* or *lathe* comprehended three or four of these hundreds. See HUNDRED.

**LETHE** was also the jurisdiction of a viscount; or a kind of assize, held once a year in each village, about Michaelmas.—Whether this was instituted by Ælfred, or no, is a question?

**LETTER**, *Litera*, a character either in print or writing, by which any people have agreed to express one of the sounds, used

of letters  
Enoch  
drinus, Corn. Agrippa, &c. to Moses; Pomponius Mela,

the Ionians had letters before Cadmus; that at the time of the siege of Troy, the Greeks had but 16 letters, whereas the

a fresh apple held in the hand an hour, will be wrinkled, as if exposed to the sun for a week.  
Matthew Prior says, that in Christendom there were fifteen

question? writing, b  
LETTER, *Litera*, a character or mark, which any people have agreed to express one of the sounds  
use

# LET

used in conveying their thoughts to each other in speech. See CHARACTER.

*Letter* is by some defined, a simple uncompound sound of the voice, that cannot be subdivided into any more simple, and generally marked with a particular character.

But it must be owned, that, strictly speaking, a *letter* is not the sound itself, but rather the sign of a sound; for *γραμμα*, *litera*, is derived from *γραμμαι*, of *γραφο*, to write, and *litera* is formed from *litus*, the participle of *linere*, to smear, or mark: whence *obliterare* signifies to blot out. See WRITING.

Where a sign or character does not express a sound entirely simple, but one resolvable into several, it is not so properly a *letter* as an abbreviation, containing in itself as many *letters* as its power does simple sounds. This is evident in the Latin *ſ*, *x*, and the Greek *ξ*, *ψ*, *ϕ*, &c. which are composed of *et*, *ks*, *xs*, *ϕs*, *στ*, &c.

On the contrary, a simple sound, though expressed by several characters, is yet to be esteemed one *letter*; for *th*, *ph*, are single *letters*, as much as *q*, *θ*, and *f*.

The *letters* F, G, H, K, Q, X, Y, Z, were unknown to the antient Romans, as is proved by Daufquius in his *Orthography*, where he traces the origin of the several *letters*. See F, G, H, &c.

Grammarians distinguish *letters* into *vowels* and *consonants*;

# LET

into *mutes*, *diphthongs*, *liquids*, and *characteristics*. See VOWEL, CONSONANT, DIPHTHONG, &c.

The Hebrews divide their *letters* into *guttural*, as *a*, *h*, *ch*, *gn*, *aleph*, *he*, *chaph*, *hain*; *dental*; as *x*, *ts*, *r*, *zain*, *tlade*, *reth*; *labial*, as *b*, *m*, *u*, *p*, *beth*, *mem*, *vau*, *phe*; *lingual*, or those chiefly formed by the tongue, as *d*, *t*, *l*, *n*, *daleth*, *tau*, *lamed*, *nun*; and the *palatal*, as *g*, *i*, *c*, *k*, *ghimel*, *jod*, *caph*, *coph*. See GUTTURAL, DENTAL, &c.

Printers distinguish their *letters* into *capital*, majuscule, initial, or upper case *letters*, which serve for the titles of books, proper names, &c. And minuscule, *small*, or under case *letters*: which are again divided, according to their size, into *pearl*, *nonpareil*, *pica*, *great canon*, &c.—They have also their *flourished letters*, engraven on wood or metal, which take place of the illuminated *letters* of the antient manuscripts.

There are *letters* of various sizes, or bodies; each of which, again, are sometimes cast with the Roman; sometimes an Italic, and sometimes an English, or Black *letter* face. There are also bodies with Greek, Hebrew, Arabic, the music face, &c.

The most usual sizes, or bodies, with their proportions, are shewn and exemplified in the following table; where it is to be observed, that the verse answering to each is composed in the respective size or *letter*.

*Pearl.*

*Nonpareil.*

*Brevier.*

*Long Primer.*

*Small Pica.*

*Pica.*

*English.*

*Great Primer.*

*Double Pica.*

*Two lined English.*

*Great Canon.*

Which when he knew, and felt our feeble hearts,

Emboss with bale, and bitter biting grief,

Which love had launced with his deadly darts;

With wounding words, and terms of foul reproof,

He pluck'd from us all hope of due relief,

That erst us held in love of ling'ring life.

The hopeless, heartless 'gan the cunning thief

Persuade to die to stint all further strife:

To me he lent this rope, to him a rusty knife:

With which sad instrument of hasty death,

That woful lover lothing longer life.

The above sizes were all cast in the foundry of Mr. W. Caslon; a person who, though not bred to the art of letter-founding, has, by dint of genius, arrived at an excellency in it unknown hitherto in England, and which even surpasses any thing of the kind done in Holland, or elsewhere.

A set or fount of any of these sizes, includes current letters, capitals, numeral figures, points, spaces, &c. See FOUNT.

*Letters* make the first part or elements of grammar; an assemblage of these compose *syllables*, of those words, and of these sentences. See SYLLABLE, WORD, SENTENCE, &c.

The alphabet of every language consists of a certain number of these *letters*, which ought each to have a different sound, figure, and signification. See ALPHABET.

As the difference of articulate sounds was intended to express the different ideas of the mind, so one *letter* was originally intended to signify only one sound, and not as at present, to express sometimes one sound, and sometimes another; which practice has brought a great deal of confusion into the languages, and rendered the learning of the modern tongues infinitely more difficult than it would otherwise have been. This consideration, together with the poverty of all the known alphabets, and their want of some *letters* to express certain sounds by, has occasioned several attempts towards an universal alphabet, to contain an enumeration of all such single sounds or *letters*, as are used in any language. A thing of very considerable use; a specimen of which is given us by Mr. Lodwick, in the *Philosophical Transactions*.

According to Critinus, Moses invented the Hebrew *letters*, Abraham the Syriac and Chaldee; the Phœnicians those of Attica, brought into Greece by Cadmus, and thence by the Pelasgians into Italy; Nicostрата the Latin; Isā the Egyptian; and Uulfilas those of the Goths. See HEBREW, GOTHIC, &c. As to the first *letters*, what they were, who first invented them, and among what people they were first in use, there is still room to doubt; however, setting aside conjectures, and prejudice, the business of antiquity seems to lie between the Egyptians and Chinese.—Philo attributes the first invention of *letters* to Abraham; Josephus, S. Irenæus, and others, to Enoch; Bibliander, to Adam; Eusebius, Clemens Alexandrinus, Corn. Agrippa, &c. to Moses; Pomponius Mela,

Herodian, Rufus Festus, Pliny, Lucan, &c. to the Phœnicians; S. Cyprian, to Saturn; Tacitus, to the Egyptians; and some to the Ethiopians.

The Egyptian mummies, and obelisks, prove a great antiquity on the side of the hieroglyphics; but if the Chinese chronology may be credited, their characters are vastly more antient than those of the Egyptians.—The Chinese make Fohi, the first of their kings, the inventor of their *letters*, and compute him to have lived 2950 years before Christ. During all which time, they pretend to have certain and written accounts in their books.—If this holds true, their character must be older than Moses by 1400 years, and even before Menes, the first king of Egypt, by 500 years: so that the Chinese *letters* appear to be the most antient of that kind; and the book *Yekim*, said to be written by Fohi, the most antient book.

But as China is so remote, and had so little communication with these parts of the world, we may reasonably make another enquiry into the original of *letters* in the hither parts of Asia, Egypt, and Europe.—Here, indeed, the Egyptians seem to have the best title.—It is more than probable, from the obelisks, &c. that their hieroglyphics were the first manner of writing, and the original characters in these parts, as being prior to Moses; and made, at least in great measure, while the Israelites were slaves among them, and consequently not well qualified for inventions so very curious, and judicious. See HIEROGLYPHIC.

Whether Cadmus, and the Phœnicians learnt *letters* from the Egyptians, or from their nearer neighbours of Judea, and Samaria, is a question? since some of the books of the Old Testament, being written in *letters*, is more likely to have given them the hint, than the hieroglyphics of Egypt.—But when, or whereforever the Phœnicians learnt this art, it is generally agreed, that Cadmus, the son of Agenor, first brought *letters* to Greece; whence, in the following ages, they spread over the rest of Europe. See GREEK.

Rudbecks, who in his *Atlantica* claims the glory of all inventions, from all other nations, for the Swedes, maintains, that the Ionians had *letters* before Cadmus; that at the time of the siege of Troy, the Greeks had but 16 *letters*, whereas the

# LET

the Phœnicians had 22: whence he concludes, that it was not either Cadmus, or the Phœnicians, who taught this art to the Greeks.—But, in regard the antient northern nations had just 16 letters, like the Greeks, he concludes the Greeks must either have taught them to the people of the North, or have learnt them of them.—But because the form and make of the Runic letters is more artless, and coarser, than that of the Greek letters, he concludes that these last must be derived from the former; taking it as a principle, that those who derive any thing from another, polish and improve it.—He even asserts, that by the golden apples which Hercules was obliged to steal, must be understood the letters in use among the Hyperboreans. See RUNIC.

There are few things on which there has been so much written, as on the original Hebrew letters; since Origen, Eusebius Cæsariensis, S. Jerom, &c. have made it the subject of their enquiry. If they do not always go back to the beginning of the world, and the origin of letters, it is at least enquired, what were the characters made use of by Moses to transmit the law to posterity, or those used by the other historians, and prophets of the Old Testament, or even those used by the Hebrews before the Babylonian captivity?—With regard to which, there are three principal opinions: some imagine the antient Hebrew letter the same with that now in use; of this opinion are several doctors of the talmud, Postellus, Buxtorf, &c.—The second opinion is, of those who believe the Samaritan letter the more antient; which is now the more common opinion, as without doubt it is the elder: several Mischnic and Gemaric doctors, many of the rabbins, and fathers, Origen, Jerom, Eusebius, Beda, Genebrard, Ramban, Bellarmine, Scaliger, Drusius, Capella, Bibliander, Brerewood, Montanus, Walton, the two Vossius's, Bochart, and Bernard, are of this opinion.—The third is, that from the beginning there were two Hebrew characters; the one sacred, the other profane; which is the opinion of Azarias, R. de Bartenora, Postel, Buxtorf, Covingius, &c.—But this distinction of two kinds of characters seems a mere chimera.—See P. Souciet on the Samaritan medals, where he proves, that the letters in the inscriptions of those medals, are the genuine, original Hebrew characters.—See also the articles SAMARITAN, and HEBREW.

The art of joining letters to form words, and of combining the one and the other an infinite number of different ways, is a secret unknown to the Chinese. Instead of the alphabetical letters, they at first, like the Egyptians, used hieroglyphics: they painted rather than wrote; striving, by the natural images of things drawn on paper, to express and communicate their ideas to one another. To write a bird, they were obliged to paint its figure; and to signify a forest, they drew a great number of trees. A circle served for the sun, and a crescent for the moon.—But this manner of writing was not only very inconvenient, but also very imperfect. For, besides that they could but express their thoughts by halves, even that little they could express, was but very imperfectly delivered; and it was scarce possible not to be frequently deceived in it.—Further, they were under a necessity of writing large volumes to say very little matters, in regard their pictures took up a great deal of room.—To remedy these inconveniencies, they changed, by little and little, their manner of writing, making it more simple, though less natural. They even invented several characters, to express things that did not come within the reach of painting to represent; as voice, smell, thoughts, passions, and a thousand other objects that have no body, or figure.—From several simple strokes, they afterwards framed others more compound; and in this manner multiplied their letters and characters to infinity, contriving one or more for every word.

This multitude of letters seems the source of that ignorance which we find among the Chinese. Their whole lives being spent in learning their letters, they have no time to apply themselves to the study of things, but think themselves very learned when they are able to read.—There are scarce any of them that know all their letters: they think it is a great progress they have made, when, after forty or fifty years hard study, they are able to understand fifteen or twenty thousand.—But the generality of their learned men come short of this: Father le Compte is of opinion, that the greatest doctor among them never understood half of their letters well; for the whole number he reckons eighty thousand.—This is a prodigious inconvenience to foreigners, of which the missionaries in that country make loud complaints.

Among the Chinese letters, there are some now almost worn out of use, and only preserved out of respect to antiquity.—There is a second class much less antient among the former, only used in publick inscriptions.—A third, much more regular and beautiful, used in printing, and even in ordinary writing.—However, as the strokes are to be distinctly formed, they cannot be wrote with any expedition.—For this reason, they have invented a fourth kind, where the strokes being closer, and less distant from each other, allow them to be writ with more ease and readiness. And this they call the *running letter*. The Americans had no letters before the discovery of that

# LEV

country by the Spaniards.—The Acaanibas engrave their memorable events and epocha's on stones, and metals: their songs supply the rest.—In Peru, and Chili, to keep an account of their goods and chattels, and to preserve the memory of their particular affairs, the Indians have recourse to certain knots of wool, which, by the variety of their colours, and ties, serve instead of characters and writing. The knowledge of these knots, which they call *quipos*, is one of their great sciences; but which is always kept as a secret, and never revealed to the children, till the fathers think themselves at the end of their days.

Double LETTER.	} See	DOUBLE.
Final LETTER.		FINAL.

LETTER-Founders Furnace.		FURNACE.
LETTER-Founders Mould.		MOULD.

Numeral LETTERS, are those used instead of ciphers, to express numbers.

The Roman numerals are, C, D, I, L, M, V, H; which are all formed by describing a circle, and drawing two lines through it, crossing each other at right angles in the centre. See CHARACTER.

Dominical LETTER.	} See the article	DOMINICAL.
Nundinal LETTER.		NUNDINAL.

LETTER is also a writing addressed, and sent to one. See EPISTLE.

LETTER of Attorney, a writing authorizing an attorney to do some legal act in our stead; as, to give seisin of lands, to receive debts, to sue a third person, &c.

LETTER of Credit, among merchants, a letter which a merchant or banker directs to his correspondent abroad, ordering him to credit the bearer as far as a certain sum. See CREDIT.

LETTER of Exchange. See BILL, and EXCHANGE.

LETTER of License, in trade, is an instrument, or writing, granted to a man who has failed, or broke, signed and sealed by his creditors; which letter usually gives a longer time for payment, so that the debtor having such an assurance, may go about his business without fearing an arrest.

LETTERS of Mart, or Marque, are letters under the privy-seal, granted to the king's subjects; empowering them to take, by force of arms, what was formerly taken from them by the subjects of some other state, contrary to the law of mart. See MARQUE, and REPRIZAL.

LETTERS Patent, or Overt, are writings sealed with the great seal of England, whereby a man is authorized to do, or enjoy any thing, which, of himself, he could not do. See PATENT.

They are so called, by reason of their form; as being open, with the seal affixed, ready to be shewn for the confirmation of the authority given by them.

Common persons may grant letters patent; but they are rather called *patents*, than *letters patent*; yet, for distinction, those granted by the king are sometimes called *letters patent royal*.

Letters patent conclude with *teste meipso*; charters, with *hinc testibus*. See CHARTER, &c.

LETTERS of Respite, letters issued out by a prince, in favour of honest unfortunate debtors, against too rigorous creditors, whereby payment is delayed for a certain term.

The use of these letters is very antient: Cassiodorus observes, they were in use in the time of Theodoric, king of the Goths: others will have them introduced towards the end of the eleventh century, by pope Urban II. in favour of those who went on the croisades.

They are still in use in France, and some other countries: and take their name *à respirando*, because they give the debtor a breathing while. See RESPITE.

Paschal LETTERS.		PASCHAL.

LETTERED, LETRADOS, *Literati*. See LITERATI.

LEVANDIS *militum Expensis*. See the article EXPENSIS.

LEVANT, in geography, signifies any country situate to the east of us, or in the eastern side of any continent or country, or that on which the sun rises. See EAST.

LEVANT, in matters of commerce, &c. is generally restrained to the Mediterranean sea; or, rather, to the country on the eastern part of it.

Hence, our trade thither is called the *Levant trade*; and a wind that blows from thence, out of the streights-mouth, is called a *Levant wind*. See TURKEY COMPANY.

LEVANT Measures.	} See the article	MEASURE.
Bole of the LEVANT.		BOLE.

LEVANT and couchant, in law, is, when cattle have been so long in another man's ground, that they have lain down, and risen again to feed.

LEVARI *Facias*, a writ directed to the sheriff for levying a sum

sum of money on a man's lands and tenements, who has forfeited his recognizance.

LEVATIO *Arietum*. See the article *ARIETUM*.

LEVATOR, an epithet which anatomists give to several muscles, whose use is to raise, or lift up the parts to which they belong. See *ELEVATOR*.

There are *levators* of the eye-lids, of the omoplate, of the anus, of the scapula, &c.—See *Tab. Anat. (Myol.) fig. 2.*

*n. 3.*  
LEVATUM. See *TERRIS*, & *Catalis tentis ultra debilitum*.

LEUCOMA \*, in physic, a little white spot on the cornea of the eye, called by the Latins *albugo*. See *ALBUGO*.

\* The word is Greek, λευκομα, from λευκος, white.

It is occasioned by a humour gathered in this membrane; or by the scar following a wound, or by an ulcer in this part, as sometimes happens in the small-pox.

LEUCOPHLEGMATIA \*, a kind of dropsy, otherwise called *anasarca*. See *ANASARCA*.

\* The word is Greek, λευκοφλεγματια, formed from λευκος, white, and φλεγμα, pituita, phlegm.

The *leucophlegmatia* consists in a tumor, or bloating of the whole outer surface of the body, or some of its parts; white and soft, easily giving way to the touch, and preserving the impression made by the finger for some time.

It may either be owing to some disorder of the blood; which in this disease, is of a pale colour, viscid, and cold; or to an aqueous humour extravasated, and gathered together in the muscles, and the pores of the skin. See *DROPSY*.

LEVEL\*, an instrument, wherewith to draw a line parallel to the horizon, and continue it out at pleasure; and by this means to find the true level, or the difference of ascent or descent, between several places, for conveying water, draining fens, &c.

\* The word comes from the Latin, *libella*, the cross beam that forms the brachia of a balance; which, to be just, must stand horizontally.

There are several instruments of different contrivance, and matter, invented for the perfection of *levelling*; all of which, for the practice, may be reduced to these that follow.

*Air LEVEL*, that which shews the line of *level*, by means of a bubble of air inclosed with some liquor in a glass tube of an indeterminate length and thickness, whose two edges are sealed hermetically; that is, are closed with the glass itself, by heating it with the flame of a lamp, till it become soft and tractable. — When the bubble of air fixes itself at a certain mark, made exactly in the middle of the tube, the plane, or ruler whereon it is fixed, is *level*. When it is not *level*, the bubble will rise to one end.

This glass tube may be set in another of brass, having an aperture in the middle, whence the bubble of air may be observed.

The liquor wherewith the tube is filled, is ordinarily either oil of tartar, or aqua secunda; those not being liable to freeze, as common water, nor to rarefaction and condensation, as spirit of wine is.

The invention of this instrument is ascribed to M. Thevenot.

*Air LEVEL, with Sights*, is an improvement on that last described; which by the addition of more apparatus, becomes more commodious, and exact.

It consists of an *air level*, (*Tab. Surveying, fig. 4.*) about eight inches long, and seven or eight inches in diameter, set in a brass tube, with an aperture in the middle. The tubes are carried in a strong straight ruler, a foot long, at whose ends are fixed two sights exactly perpendicular to the tubes, and of an equal height, having a square hole, form'd by two fillets of brass, crossing each other at right angles, in the middle whereof is drill'd a very little hole; thro' which, a point on a *level* with the instrument is descried. — The brass tube is fasten'd on the ruler by means of two screws; one whereof, marked 4, serves to raise or depress the tube at pleasure, for bringing it towards a *level*. The top of the ball and socket, is rivetted to a little ruler that springs; one end whereof is fasten'd with screws to the great ruler, and the other end has a screw, 5, serving to raise and depress the instrument, when nearly *level*.

This instrument is yet less commodious than the following one; because, tho' the holes be ever so small, yet they will still take in too great a space to determine the point of *level* precisely.

*Air LEVEL, with Telescope Sights*.—This *level*, represented in *Tab. Surveying, fig. 5.* is like the last; with this difference, that instead of plain sights, it carries a telescope, to determine exactly a point of *level* at a good distance.

The telescope is in a little brass tube, about 15 inches long, fastened on the same rule as the *level*.—At the end of the tube of the telescope, marked 1, enters the little tube 1, carrying the eye-glass, and a hair horizontally placed in the focus of the object-glass 2; which little tube may be drawn out or pushed into the great one, for adjusting the telescope to different sights. — At the other end of the telescope is

placed the object-glass: the screw 3, is for raising or lowering the little fork carrying the hair, and making it agree with the bubble of air, when the instrument is *level*; and the screw 4, is for making the bubble of air agree with the telescope. — The whole is fitted to a ball and socket.

M. Huygens is said to have been the inventor of this *level*; which has this advantage, that it may be inverted, by turning the rule and telescope half round: and if then the hair cut the same point that it did before the turn, it is a proof the operation is just.

It may be here observed, that one may add a telescope to any kind of *level*, by applying it upon, or parallel to the base, or ruler, when there is occasion to take the *level* of remote objects.

*Foot-LEVEL*. See the article *FOOT-LEVEL*.

*Artillery Foot-LEVEL*, is in form of a square, having its two legs or branches of an equal length; at the juncture whereof is a little hole, whence hangs a thread and plummet, playing on a perpendicular line in the middle of the quadrant: it is frequently divided into 90 degrees, or rather into twice 45 degrees from the middle. See *Fig. 6. lit. F.*

This instrument may be used on other occasions, by placing the ends of its two branches on a plane; for when the thread plays perpendicularly over the middle division of the quadrant, that plain is assuredly *level*.

To use it in gunnery, place the two ends on the piece of artillery, which you may raise to any proposed height by means of the plummet, whose thread will give the degree above the *level*.

*Carpenters and Paviers LEVEL*, consists of a long ruler, in the middle whereof is fitted, at right angles, another somewhat bigger, at the top of which is fastened a line with a plummet; which, when it hangs over a fiducial line at right angles with the base, shews that the said base is horizontal.

This and the masons *level*, though very common, are esteemed the best for the practice of building, though the operations made by them can only be short.

*Gunners LEVEL*, for levelling cannons and mortars, is an instrument, represented *Tab. Surveying, fig. 8.* consisting of a triangular brass plate about four inches high, at the bottom of which is a portion of a circle divided in 45°; which number is sufficient for the highest elevation of cannons and mortars, and for giving shot the greatest range. On the centre of this segment of a circle is screwed a piece of brass, by means whereof it may be fixed or moved at pleasure. The end of this piece of brass is made so, as to serve for a plummet and index, in order to shew the different degrees of elevation of pieces of artillery.—This instrument has also a brass foot to set upon cannon or mortars, so as when those pieces are horizontal, the whole instrument will be perpendicular.

The use of this *level* is obvious; and consists in placing the foot thereof on the piece to be elevated; in such manner as that the point of the plummet may fall on the proper degree: this is what they call *levelling* the piece.

*Masons LEVEL*, is composed of three rules, so joined as to form an isosceles rectangle, somewhat like a Roman A; at the vertex whereof is fastened a thread, from which hangs a plummet, which passes over a fiducial line marked in the middle of the base, when the thing to which the *level* is applied is horizontal; but declines from the mark, when the thing is lower on one side than the other.

*Plumb, or Pendulum LEVEL*, that which shews the horizontal line, by means of another line perpendicular to that described by its plummet, or pendulum.

This instrument, represented *Tab. Surveying, fig. 6.* consists of two legs, or branches, joined together at right angles; whereof that which carries the thread and plummet, is about a foot and a half long. This thread is hung towards the top of the branch, at the point 2. The middle of the branch where the thread passes, is hollow, that so it may hang free every where but towards the bottom, where there is a little blade of silver, whereon is drawn a line perpendicular to the telescope.—The said cavity is covered by two pieces of brass, making, as it were, a kind of case, lest the wind should agitate the thread; for which reason the silver blade is covered with a glass, G, to the end that it may be seen when the thread and plummet play upon the perpendicular.—The telescope 1, is fastened to the other branch, or leg of the instrument, and is about two foot long; having a hair placed horizontally across the focus of the object-glass, which determines the point of *level*, when the string and plummet hang against the line on the silver blade.

All the accuracy of this instrument depends on the telescope's being fitted at right angles to the perpendicular.—It has a ball and socket, by which it is fastened to its foot, and is said to have been the invention of M. Picard.

*Reflecting LEVEL*, is that made by means of a pretty long surface of water, representing the same object inverted, which we see erect by the eye; so that the point where those two objects appear to meet, is in a *level* with the place where the

## LEV

surface of water is found.—This is the invention of M. Mariotte.

There is also another *reflecting level*, consisting of a mirror of steel, or the like, well polished, and placed a little before the object-glass of a telescope suspended perpendicularly.—This mirror must make an angle of 45 degrees with the telescope; in which case, the perpendicular line of the said telescope is converted into an horizontal line; which is the same with the line of *level*. The invention of this is owing to M. Cassini.

**Water LEVEL**, that which shews the horizontal line by means of a surface of water, or other liquid; founded on this principle, that water always naturally places itself level.

The most simple is made of a long wooden trough, or canal, whose sides are parallel to its base; so that being equally filled with water, the surface thereof shews the line of *level*.—This is the Chorobates of the ancients, described by Vitruvius, Lib. VIII. c. 6. See CHOROBATES.

This sort of *level* is also made with two cups fitted to the two ends of a pipe three or four foot long, about an inch in diameter; by means whereof the water communicates from the one to the other cup: and this pipe being moveable on its stand, by means of a ball and socket, when the two cups become equally full of water, their two surfaces mark the line of *level*.

This instrument, instead of cups, may also be made with two short cylinders of glass, three or four inches long, fastened to each extreme of the pipe with wax, or mastic. Into the pipe is filled some common or coloured water, which shews itself thro' the cylinders, by means whereof the line of *level* is determined; the height of the water, with respect to the center of the earth, being always the same in both cylinders. This *level* tho' very simple, is yet very commodious for levelling small distances.

**LEVEL**, of M. Huygens's Invention, consists of a telescope, *a*, (Tab. Surveying, fig. 7.) in form of a cylinder; going thro' a ferril, in which it is fasten'd by the middle.—This ferril has two flat branches, *b b*, one above, and the other below; at the ends whereof are fasten'd little moving pieces, which carry two rings, by one of which the telescope is suspended to a hook at the end of the screw 3; and by the other, a pretty heavy weight is suspended, in order to keep the telescope in equilibrio.—This weight hangs in the box 5, which is almost filled with linseed oil, oil of wallnuts, or other matter that will not easily coagulate, for more aptly setting the balance of the weight and telescope.—The instrument carries two telescopes close and very parallel to each other, the eye-glass of the one being against the object-glass of the other, that one may see each way without turning the *level*.—In the focus of the object-glass of each telescope, must a little hair be strained horizontally, to be raised and lowered as occasion requires by a little screw.—If the tube of the telescope be not found *level* when suspended, a ferril, or ring 4, is put on it, to be slid along till it fixes to a *level*.—The hook on which the instrument is hung, is fixed to a flat wooden cross; at the ends of each arm whereof there is a hook, serving to keep the telescope from too much agitation in using, or in carriage. To the said flat cross is applied another hollow cross, that serves as a case for the instrument; but the two ends are left open, that the telescope may be secured from the weather, and always in a condition to use. The foot of this instrument is a round brass plate, to which are fastened three brass ferrils, moveable by means of joints, wherein are put staves; and on this foot is placed the box.

**LEVELLING**, the art or act of finding a line parallel to the horizon, at one or more stations, in order to determine the height of one place with respect to another; for the laying grounds even, regulating descents, draining morasses, conducting waters, &c. See LEVEL.

One place is said to be higher than another, or *out of level* with it, when it is more remote from the center of the earth; and a line equally distant from the center of it in all its points, is called the *line of true level*: whence, because the earth is round, that line must be a curve, and make a part of the earth's circumference, or an arch concentric with it, as the line BCFG, Tab. Surveying, fig. 9. all the points whereof are equally distant from the center of the earth A.

But the line of sight, which the operations of levels give, is a tangent, or a right line perpendicular to the semidiameter of the earth; one extreme of which tangent being the point of contact, the other will be that of a secant drawn from the center of the earth; and the point which determines it, will be above the surface of the earth, and of the true level, as much as that secant exceeds the radius, or semidiameter of the earth.

This extremity of the tangent is said to be in the *apparent level*; as being that given by the sight; but is easily reduced to the *true level*, because we know, by trigonometry, how much each secant exceeds the radius; and because, by measuring, we have discovered the precise length of that radius.—It was for want of the knowledge of this, that the ancients were not able to reduce the apparent level to the true one; and accordingly, to prevent falling into an error, never le-

## LEV

velled above 20 feet at once, where such reduction was not necessary.

By the tables since made, it appears, that at the distance of 100 yards, the apparent level is raised above the true one about one third of a line: so that the ancients, in this respect, were more scrupulous than needed.—By means of this reduction, we are now able to *level* distances of one or two miles, at a single operation, which the ancients could not do in less than 300.

The operation of *levelling* is as follows: Suppose the height of the point A, (Tab. Surveying, fig. 10.) on the top of a mountain, above that of the point B, and at the foot thereof, required?—Place the level about the middle distance, between the two points, as in D, and staffs in A and B, and let there be persons instructed with signals for raising and lowering on the said staffs, little marks of pasteboard, or other matter. The level being placed horizontally by the bubble, &c. look towards the staff A E, and cause the mark to be raised, or lowered, till the middle, upper edge, or other most conspicuous part appear in the visual ray. Then measuring exactly the perpendicular height of the point A, above the point E, which suppose 6 feet 4 inches, set that down in your book: then turn the level horizontally about, that the eye-glass of the telescope may be still next the eye when you look the other way, (if you have only plain sights, the instrument need not be turned) and cause the person at the staff B to raise or lower his mark, till some conspicuous part of it fall in the visual ray, as at C; then measure the perpendicular height of C above B, which suppose 16 feet, 16 inches; set this also down in the book above the other number of the first observation; subtract the one from the other, the remainder will be 10 feet 4 inches, which is the difference of level between A and B, or the height of the point A above the point B.

Note, if the point D, where the instrument is fixed, be in the middle between the two points A and B, there will be no necessity for reducing the apparent level to the true level; the visual ray, in that case, being raised equally above the true level.

If it be further required to know whether there be a sufficient descent for conveying water from the spring A, to the point B, Tab. Surveying, fig. 11.—Here, in regard the distance from A to B is considerable, it is required that several operations be made. Having then chosen a proper place for the first station, as at I, set up a staff in the point A, near the spring, with a proper mark to slide up and down the staff, as L; and measure the distance from A to I, which suppose 2000 yards. Then the level being adjusted in the point I, let the mark L be raised and lowered till such time as you spy some conspicuous part of it through the telescope, or sights of the level, and measure the height A L, which suppose 13 foot 5 inches. But in regard the distance A I is 2000 yards, you must have recourse to your table for a reduction, subtracting 11 inches, which will leave the height A L, 12 feet 6 inches; and this note down in your book. Now turn the level horizontally about, so as the eye-glass of the telescope may be towards the staff at A; and fixing up another staff at H, cause the mark G to be moved up and down, till you spy some conspicuous part through the telescope, or sights. Measure the height H G, which suppose 6 yards, 4 foot, 2 inches. Measure likewise the distance of the points I H, which suppose 1300 yards; for which distance, according to the table, 4 inches 8 lines must be subtracted from the height H G, which consequently will but leave 6 yards, 3 feet, 9 inches, 4 lines, to be taken down in your book.

This done, remove the level forwards to some other eminence, as E, whence the staff H may be viewed; as also another staff at D, near the place whither the water is to be conveyed. The level being again adjusted in the point E, look back to the staff H; and managing the mark as before, the visual ray will give the point F. Measure the height H F, which suppose 11 feet, 6 inches. Measure likewise the distance H E, which suppose 1000 yards; for which distance the table gives 2 inches, 9 lines of abatement; which being taken from the height H F, there will remain 11 feet, 3 inches, 3 lines, which enter in your book. Lastly, turning the level to look at the next staff D, the visual ray will give the point D. Measure the height of D from the ground, which suppose 8 feet, 3 inches. Measure also the distance from the station E to B, which suppose 900 yards; for which distance the table gives 2 inches, 3 lines of abatement; which being taken from the height B D, there will remain 8 feet, 9 lines, which enter as before.

For the manner of entering down observations in your book, observe that when a proper place or station for the level, between the two points, has been pitched upon, you must write down the two heights observed at that station, in two different columns, viz under the first column, those observed in looking through the telescope when the eye was from the spring, or towards the point, which we may call *back-sights*; and under the second column, those observed when

# LEV

when the eye was next the spring, which we call *fore-sights*, in the manner following:

Back-sights.			Fore-sights.		
	foot.	inch. lin.		foot.	inch. lin.
First height	12	6	0	Second height	21 : 09 : 4
corrected				Fourth height	8 : 00 : 9
Third height	11	3	3		29 : 10 : 1
	23	9	3		

Having summed up the heights of each column separately, subtract the lesser from the greater, the remainder will be the difference of level between the points A and B; as in this example:

feet. inch. line.
29 : 10 : 01
23 : 09 : 03
6 : 00 : 10

—The difference of height, or level, between the points A and B.

If the distance of the two points be required, add all the distances measured, together; and dividing the difference of height by the yards of the distances, for each 200 yards you will have a descent of about 2 inches, 9 lines.

Dr. Halley suggests a new method of *levelling*, which has been put in practice by some of the French academy: this is performed wholly by means of the barometer, in which the mercury is found to be suspended to so much the less height, as the place is further remote from the center of the earth.—Hence it follows, that the different heights of the mercury, in two places, give the difference of the level. See *BAROMETER*.

Mr. Derham, from some observations he made at the top and bottom of the monument, found that the mercury fell one tenth of an inch at every 82 feet of perpendicular ascent, when the mercury was at 30 inches.—Dr. Halley allows of one tenth of an inch for every 30 yards; which, considering how accurately the barometers are now made, an inch in some of them being divided into an hundred or more parts, all very sensible, he thinks this method sufficiently exact to take the levels for the conveyance of water, and less liable to errors than the common levels.

The same author found a difference of three inches eight tenths, between the height of the mercury, at the top and bottom of Snowden hill in Wales.

For the common occasions of *levelling* to be performed without much apparatus of instruments, time, or trouble, the following method may serve.—Set a pole upright in a spring, pond, river, or other place whence water is to be brought, and mark how many feet and inches are above water.—Then set up another pole, of equal length with the other, in the place to which the water is to come. Place the center of a quadrant on the top of this last pole, the plummet hanging free; spy through the sights of the top of the pole that is in the water, and if the thread cuts any degree of the quadrant, the water may be conveyed by a pipe laid in the earth.—If you cannot see from one extreme to the other, the operation may be repeated in the manner already directed.

**LEVELLING Staves**, are instruments used in *levelling*, serving to carry the marks to be observed, and at the same time to measure the heights of those marks from the ground.

They usually consist each of two long square wooden rulers, made to slide over one another, and divided into feet, inches, &c.

**LEVER** \*, or **LEAVER**, in mechanics, an inflexible right line, supported, in a single point, on a fulcrum or prop; and used for the raising of weights: being either void of weight itself, or, at least, having such a weight as may be commodiously counter-balanced.

\* The word is form'd of the French *levier*, which signifies the same, form'd of the verb *lever*, or Latin *levare*, to raise.

The *lever* is the second, or, as others will have it, the first of those called mechanical powers, or simple machines, as being, of all others, the most simple; and is chiefly applied for raising weights to small heights. See *MECHANIC Powers*.

In a *lever* there are three things considered: The weight to be raised, or sustained, as O, (*Tab. Mechanics*, fig. 1.)—The power by which it is to be raised, or sustained, as B. And the fulcrum, or prop D, whereon the *lever* is sustained, or rather, on which it moves round, the fulcrum remaining fixed.

*Levers* are of three kinds: Sometimes the fulcrum is placed between the weight and the power, as in fig. 1. this we call a *lever of the first kind*. Sometimes, the weight is between the fulcrum and the power; which is called a *lever of the second kind*, as in fig. 2. And sometimes, the power acts between the weight and the fulcrum, as fig. 3. which is the *lever of the third kind*.

The power of the *lever* is founded on the following theorem, viz. 'That the space, or arch described by each point of a *lever*, and consequently the velocity of each point of a *lever*, is as its distance from the fulcrum, or prop.'

# LEV

From hence it follows, that the action of a power, and the resistance of the weight, increase in proportion to their distance from the fulcrum.

And hence also it follows, that a power will be able to sustain a weight, if the distance of the point in the *lever*, to which it is applied, be to the distance of the weight, as the weight to the intensity of the power; which, if it be ever so little increased, must raise the weight. See this doctrine demonstrated under the word *MECHANIC Powers*; and further illustrated under the word *BALANCE*: between which, and the *lever*, there is a great analogy; a *lever* of the first kind being a sort of stilyard to raise weights. See *STILYARD*.

The power and action of the *lever* will be fully illustrated by the following propositions.

1°. If the power applied to a *lever*, of any kind, sustain a weight, the power is to the weight in a reciprocal ratio of their distances from the fulcrum.

This is the converse of that demonstrated under the head *MECHANIC Powers*.

2°. The weight of a *lever* of the first or second kind A B, fig. 1. the distance of the center of gravity, from the fulcrum C V, and the distance of the weight, and the power A C and C B, being all given; to find the power that will sustain it.—Suppose the *lever* void of gravity, but in lieu thereof a weight hung at V; if then A C be made to C V, as the gravity of the *lever* to a fourth number, we shall have the weight which the *lever* is able to sustain; and this subtracted from the given weight, the remainder will be the weight to be sustained by the power. Let C B then be to C A, as the remaining weight to a fourth weight; and we shall have the power to be applied in B, in order to sustain the given weight with the given *lever*.

3°. The gravity of a *lever* of the first or second kind A B; the distance of its center of gravity from the fulcrum B V, the distances of the power, and the weight B C and C A, being all given; to find the weight to be sustained.—Find the part of the weight sustained by the *lever* alone, as in the former problem; in the same manner find the other part of the weight, which the power applied in B is able to sustain: and the two numbers together, the sum is the weight required.

4°. The gravity, and center of gravity F, of a *lever* of the second kind C B, with the weight G, its distance from the fulcrum C A, and from the power C B, being given; to find the power capable to sustain the weight.—Suppose the *lever* void of gravity, but in lieu thereof a weight equal thereto hung in F, the power required to sustain the *lever* alone; then find the power requisite to sustain the given weight G: add the powers together, the sum will be the power required.

5°. If a power applied to a *lever* of any kind lift a weight, the space of the first is to that of the last, as this last to a power able to sustain the same weight; whence it follows, that the gain of force is always attended with the loss of time, and vice versa.

**LEVERET**, among sportsmen, a young hare in the first year of its age. See *Hare-HUNTING*.

**LEVIGATION**, the reduction of hard and ponderous bodies, as coral, tutty, precious stones, &c. into a light, subtle powder; by grinding upon porphyry, a sea-shell, marble, stone, or the like, as painters do their colours.

*Levigation* is much used in pharmacy, and chemistry; but unless the grinding instruments be extremely hard, they will wear away, so as sometimes to double the weight of the medicine thus managed.

**LEVITE** \*, an inferior kind of minister in the Jewish tabernacle, and temple, who had the care and management of the sacred utensils.

\* The word comes from the Greek *λεβιτης*, the root of which is the name *Levi*, which was given to that patriarch by his mother Leah, from the Hebrew *לָוִי* *lavah*, to be tied, or united; Leah hoping, by the birth of this son, to be more closely link'd to her husband Jacob.

The *Levites*, in the Jewish church, were an order inferior to the priests; and answered, in some measure, to deacons in the Christian church. See *PRIEST*, and *DEACON*.

The *Levites* of the old law had no settled lands allotted them for their maintenance, but lived chiefly of the offerings made to God.—They were distributed through all the tribes, each of which gave some of their cities to the *Levites*, with grounds in their neighbourhood for the subsistence of their flocks.—According to the numeration made by Solomon, from the age of twenty, there were thirty eight thousand *levites* capable of serving: twenty four thousand of these he appointed for the daily ministry under the priests; six thousand to the inferior judges in the cities, and to decide matters relating to religion, and of no great consequence to the state; four thousand to be door-keepers, and to take care of the riches of the temple; and the rest to do the office of chanters, or singers. See *TEMPLE*, *TABERNACLE*, &c.

**LEVITY**, the privation, or want of weight in any body, when compar'd

compared with another that is heavier. See WEIGHT. In which sense, *levity* stands opposed to *gravity*. See GRAVITY.

The schools maintain, that there is such a thing as *positive* and *absolute levity*, and impute to this the rise or emergency of bodies lighter in specie than the fluids wherein they rise.

But we find by experience, that all bodies tend towards the earth, some slower, and some faster, in all fluids and mediums, whether water, air, &c.—Thus, cork is said to be lighter than gold; because under equal dimensions, the gold will sink in, and the cork swim upon water. See SPECIFIC Gravity.

Archimedes has demonstrated, that a solid body will float any where in a fluid of the same specific gravity, and that a lighter body will keep above a heavier.—The reason is, that of bodies falling towards the earth, those which have a like number of equal parts, have equal gravity; since the gravity of the whole, is the sum of the gravity of all its parts.—Now two bodies have an equal number of equal parts, if under the same dimensions there be no intervals destitute of matter; whence it follows, that as no portion of matter is so small, but that the body wherein it is contained may be wholly divided into parts equally small, there can be no reason for the descent of these, which will not equally hold for the descent of that. See DESCENT, FLUID, &c.

Hence it may be concluded, that those bodies which do not equally gravitate under the same dimensions, do not contain equal portions of matter; and therefore when we see, that a cube of gold subsides in water, at the same time that an equal bulk of cork swims upon it, it is evident, that the gold must have a greater number of equal parts of matter, under the same bulk, than the cork, or the cork must have a greater number of vacuities than the gold; and that there are also in the water a greater number of vacuities, than in gold.

Hence, we have a clear idea both of density or gravity, and of *levity*; and know, that the latter cannot, in a strict sense, be accounted any thing positive, but a mere negation, or absence of body, which determines that body to be lighter than another which contains more matter.

Dr. Hooke, it is true, seems to maintain something like a positive *levity*: which, if we mistake not, is what he means by the term *levitation*; viz. a property of bodies directly contrary to that of gravitation towards the sun.

This, he thinks, he has discovered in the streams of several comets; which, though they had a descent from the nucleus of the comet towards the sun, yet they quickly returned, and went opposite to the sun, and that to prodigious extent. See COMET, and ATMOSPHERE.

In effect, where the power of gravitation ceases, it should seem some such contrary force does begin; whereof we have instances in the phenomena of attraction.—This is what Sir Isaac Newton calls the *vis repellens*, and appears to be one of the laws of nature; without which, it would be hard to account for rarefaction, and some other appearances. See REPULSION.

*Paracentric Solicitation of LEVITY*. See PARACENTRIC.

LEVY, LEVARE, in law, signifies to gather, or collect: as, to levy money, to levy troops, &c.

LEVY sometimes also denotes to erect, or set up; as, to levy a mill.—Levy also signifies to raise, or cast up; as, to levy a ditch.

LEX, Law. See the article LAW.

LEX amissa, or *legem amittere*, in law, is understood of an infamous perjured person, who is said to lose his law; or, as Bracton has it, *non est ulterius dignus lege*. See INFAMOUS.

LEX judicialis, is properly *purgatio per judicium ferri*; sometimes called simply *judicium*. See JUDICIUM, and PURGATION.

LEX Sacramentalis, *purgatio per sacramentum*. See OATH, and PURGATION.

LEX Talionis. See the article TALIO.

LEX Terræ, the law and custom of the land; by which name it is distinguished from the civil law. See COMMON LAW.

LEGEM Terræ amittere. See the article AMITTERE.

LEXICON\*, λεξικον, the same with dictionary. See DICTIONARY.

\* The word is chiefly used in speaking of Greek dictionaries: it is deriv'd from the Greek λεξις, word, diction; of λεγω, I speak.

LIBATION, LIBATIO, a ceremony in the heathen sacrifices, wherein the priest spilt some wine, milk, or other liquor, in honour of the deity to whom the sacrifice was offered, after having first tasted it himself. See SACRIFICE.

Alexander is said to have sacrificed a bull to Neptune; and for an offering to the sea-gods, threw the golden vessel, used for the libation, into the sea.

Libations were also in use under the law of Moses, being enjoined by God in Exodus xxix, and Numbers xv.

LIBEL, *Famosus LIBELLUS*, a writing containing injuries, reproaches, or accusations against the honour, and reputation of any person, particularly of a superior, or governor. See SATYR.

Platina is of opinion, that a writing, how injurious soever it

is, cannot be called a *libel*, if the author's name be to it. Libellers, among the ancient Romans, were punished with death, but in after times they were only whipped. Augustus ranked *famosos libellos*, defamatory libels, among the crimes *læse majestatis*, of high treason.—F. Baldwin has published a comment on the imperial laws against libels. Scandalous pictures are reckoned amongst libels.

A libel, the lawyers say, may be either *in scriptis*, or *sine scriptis*: *in scriptis*, when a writing is composed, or published to another's disgrace, which may be done either *verbis aut cantilenis*; as, where this is maliciously repeated, or sung in the presence of others: or else *traditione*, when the libel, or any copy of it, is delivered out to scandalize the party.

A libel *sine scriptis*, may be twofold. 1<sup>o</sup>. *Picturis*, as to paint the party in a shameful, or ignominious manner: or, 2<sup>o</sup>. *Signis*, as to fix a gallows, or other ignominious signs, at the door of the party, or elsewhere.

The punishment of libelling in England, is putting the criminal in the pillory, whipping, fining, &c.

LIBEL also signifies the original declaration of any action in the civil law. See ACTION and DECLARATION.

LIBELLATICI, an ancient kind of apostates from Christianity, under the persecution of Decius; who, to prevent their being obliged to renounce the faith, and sacrifice to idols in public, made application to the magistrate, and abjured their faith in private; obtaining certificates of them, either by intreaty or by money\*; by which they were attested to have complied with the orders of the emperor, and were thereby sheltered from any further molestation, on account of their religion.

\* These certificates were call'd *libelli*; whence the people, who obtain'd them, came to be denominated *libellatici*.

Others, particularly the centurions of Magdebourg, are of opinion, that the *libellatici* were only such as fed the magistrates with money, to screen them from persecution, and from being obliged to renounce Christianity.

M. Tillemont retains somewhat of each opinion; he thinks the *libellatici*, applying themselves to the magistrates, bought off the sacrificing and abjuration, and obtained letters by which they were declared to have renounced Christ, and sacrificed to idols, though, in effect, they had done neither.

LIBERAL \* Arts, are such as depend more on the labour of the mind, than on that of the hand; or, that consist more in speculation, than operation; and have a greater regard to amusement and curiosity, than necessity. See ART.

\* The word comes from the Latin *liberalis*; which, among the Romans, signified a person who was not a slave, and whose will, of consequence, was not check'd by the command of any master.

Such are grammar, rhetoric, painting, sculpture, architecture, music, &c.—The liberal arts used formerly to be summed up in the following Latin verse:

*Lingua, Tropus, Ratio, Numerus, Tonus, Angulus, Astra.*  
And the mechanical arts, which, however, are innumerable, under this;

*Rus, Nemus, Arma, Faber, Vulnere, Lana, Rates.*

LIBERALIA, feasts celebrated by the ancient Romans, in honour of Liber, or Bacchus: the same with those which the Greeks called *Dionysia* and *Dionysia*. See DIONYSIA.

They took their name from *liber*, i. e. free; a title conferred on Bacchus, in memory of the liberty or freedom which he granted to the people of Boeotia; or perhaps because wine, whereof he was the reputed deity, delivers men from care, and sets their minds at ease and freedom.—Varro derives the name of this feast from *liber*, considered as a noun adjective, and signifying free; because the priests were free from their function, and eased of all care during the time of the *liberalia*. For, in effect, it was the old women who officiated in the ceremonies and sacrifices of these feasts.

LIBERANDIS Terris. See the article TERRIS.

LIBERI Tauri Libertas. See the article TAURI.

LIBERIA, a feast held among the Romans on the day whereon their children laid aside their juvenile habits, and assumed the robe called *toga libera*. See TOGA, and VIRILE.

The *liberia* were kept on the sixteenth of the calends of April; that is, the seventeenth of March.

LIBERTATES *Angliæ Custodes*. See CUSTODES.

LIBERTUS, or LIBERTINUS, among the Romans, a freed man; or a person set free from a legal servitude. See SLAVE, and MANUMISSION.

These still retained some mark of their ancient state: He who made a slave free, having a right of patronage over the *libertus*: so that if the latter failed of shewing due respect to his patron, he was restored to his servitude; and if the *libertus* died without children, his patron was his heir.

LIBERTINES, LIBERTINI, a religious sect which arose in the year 1525; whose principal tenets were, That there is but one only spirit, which is that of God: who is diffused through all things; who is and lives in all creatures; that our souls are nothing but this spirit of God: That the soul dies with the body; that sin is a mere chimæra, and only subsists in

in opinion, for that it is God that does all, both good and evil; that paradise is a dream, and held a phantom invented by priests, and religion a state-trick to keep men in awe; that spiritual regeneration only consists in stifling the remorse of conscience; repentance, in avowing to have done no evil; and that it is lawful, and even expedient, to dissemble in matters of religion. See FLORINIANS, PRISCILLIANISTS, &c.

To these they added horrible blasphemies against Jesus Christ; saying, he was nothing but a mere je ne scai quoi, composed of the spirit of God, and of the opinion of men.

These maxims occasioned their being called *Libertines*; and the word has been used in an ill sense ever since.

The *Libertini* spread principally in Holland and Brabant. Their leaders were one Quintin, a Picard, and another called Chopin, who joined with him, and became his disciple.

**LIBERTY, LIBERTAS**, is usually understood of that state wherein a man acts freely; or that power by which he determines himself voluntarily either to good or evil, to this thing or that.

In which sense *liberty* amounts to the same with *freedom*, and stands opposed to *necessity*. See FREEDOM, and NECESSITY.

*Liberty* may be defined, an active indifference of the will, to will, or not to will any thing. See WILL.

Most of the schoolmen confound *liberty* and the will together, and make one definition serve for both. They distinguish *liberty* into a great many kinds; as,

**LIBERTY of Contrariety, Contrarietatis**, which is a freedom of doing two things not only different, but contrary to each other.

**LIBERTY of Contradiction**, a power either of doing a thing, or letting it alone.

Jesus Christ had not the *liberty* of contrariety, with regard to good and evil, for he could not do evil; but he had a *liberty* of contradiction with regard to good.

Next **LIBERTY, Proxima**, is a full, absolute freedom of doing any thing.

Remote **LIBERTY**, is a *liberty* that comprehends a natural power, though embarrassed with obstacles, which it is in our power to remove, and to attain to a next *liberty*.

Thus he who has not the actual grace necessary for fulfilling his duty, but has yet the actual grace of prayer, has a next *liberty* with regard to prayer, and a remote *liberty* with regard to his duty.

Cicero defines *liberty*, the power of living after a man's own will, without any cause or impediment to oblige him to do one thing rather than another.

F. Malebranche gives us a still more philosophical definition: The will he defines to be that impression, or natural motion, which inclines towards good in the general; and by *liberty* he understands, that power which the mind has of determining this general impression towards such objects as please us; and so of directing our general inclinations to some particular things. See NATURAL Inclination.

Whence it is easy to perceive, that though all natural inclinations be voluntary, yet they are not all free; not, we mean, with a *liberty* of indifference, which includes a power of willing, or not willing; or of willing quite the contrary to that which our natural inclinations lead us to.

For, though it is voluntarily and freely that we love good in general, it being absurd to suppose we should love any thing without the will, or that the will can ever be constrained; yet we do not love it freely (in the sense just laid down) because it is not in the power of the will not to desire to be happy.

It must be observed, however, that the mind, considered as determined towards good in general, cannot divert its motion to any particular good, unless the same mind, considered as capable of ideas, have some knowledge of that particular good: That is, in plainer terms, the will is a blind power, that cannot direct itself to any thing but what the understanding represents to it: So that the power which the will has to determine its impression towards general good, or its natural inclinations, variously, consists in the power it has to command the understanding to represent some particular good.

Thus, a person, for instance, represents some dignity to himself as a good to be wished for; immediately the will desires this good; that is, the impression which the mind continually receives towards good in general, determines it to this dignity. But as that dignity is not the universal good, nor is conceived clearly and distinctly as such by the mind (for the mind cannot conceive a thing clearly which is not) the impression we have towards good in general, is not entirely exhausted by that particular good; the mind has an inclination to go further; it does not love that dignity necessarily or invincibly, and in this respect is free.

Now, its *liberty* consists in this, that not being fully convinced that this good contains in it all the good it is capable of enjoying, it may suspend its judgment and its desire.

The case is nearly the same with regard to the knowledge of truth: we love this, as we do the enjoyment of good, by a natural impression; which impression is not invincible in the latter, excepting evidence be full, and our knowledge of the object compleat. We have the same *liberty* in our false judg-

ments, that we have in our irregular appetites. See JUDGMENT, WILL, &c.

The doctrine of Pelagius, with regard to *liberty*, is built on philosophy, which does not allow us to have lost our original *liberty* of doing good. See PELAGIAN.

**LIBERTY of Conscience**, a right or power of making profession of any religion, or serving God in any manner that a man sees fit.

This seems to be a natural right: it is vigorously opposed by the generality of the Romanists, and even by many of the Reformed, though it seems as if the reformation could scarce subsist without it. See TOLERATION, and PERSECUTION.

**LIBRA, Ballance**, one of the mechanical powers. See BALANCE.

**LIBRA**, is also one of the twelve signs of the zodiac; exactly opposite to Aries; so called, because when the sun is in this sign, at the autumnal equinox, the days and nights are equal, as if weighed in a ballance.

#### Stars in the constellation Libra.

**LIBRA**, also denotes the ancient Roman pound, borrowed from the Sicilians, who called it *litra*, λίσρα. See POUND.

The *libra* was divided into twelve unciae, or ounces, equal to about ten ounces and a half of our weight.

The divisions of the *libra* were, the *uncia*, one twelfth; the *sextans*, one sixth; the *quadrans*, one fourth; the *triens*, one third; the *quincunx*, five ounces; the *semis*, six; the *septunx*, seven; the *bes*, eight; the *odrans*, nine; the *dextans*, ten; the *deunx*, eleven; lastly, the *as* weighed twelve ounces, or one *libra*. See AS.

The Roman *libra* was used in France for the proportions of their coin, till the time of Charlemagne, or perhaps till that of Philip I. in 1093; their sols being so proportioned, as that twenty of them are equal to the *libra*.

By degrees, it became a term of account, and every thing of the value of twenty sols, were called a *livre*. See LIVRE.

The Romans had also a coin called *libra*, equal to twenty denarii: though Scaliger will have it, that *libra* was, even among them, a term of account, not a coin. See POUND.

# LIB

**LIBRA** *Pensa*, in our law books, denotes a pound of money in weight. See **POUND**, and **MONEY**.

It was usual, in former days, not only to tell the money, but to weigh it; in regard many cities, lords, and bishops, having their mints, coined money, and often very bad too: for which reason, though the pound consisted of twenty shillings, they always weighed it. See **PENSA**.

**LIBRARI**, among the ancients, were a sort of copists, who transcribed in beautiful, or, at least, legible characters, what had been wrote by the notarii in notes, and abbreviatures. See **NOTE**, **NOTARY**, **CALLIGRAPHUS**, &c.

**LIBRARY**, an edifice, or apartment destined for the placing of books; or the books themselves lodged therein. See **BOOK**. Some authors refer the origin of *libraries* to the Hebrews; and observe, that the care these took for the preservation of their sacred books, and the memory of what concerned the actions of their ancestors, became an example to other nations, particularly the Egyptians. Osmanduas, king of Egypt, is said to have taken the hint first; who, according to Diodorus, had a *library* built in his palace, with this inscription over the door, *Οὐχὶς ἰστέον*. Nor were the Ptolomys, who reigned in the same country, less curious, and magnificent in books.

The scripture also speaks of a *library* of the kings of Persia, Esdras v. 17. vi. i. which some imagine to have consisted of the historians of that nation, and of memoirs of the affairs of state; but, in effect, it appears rather to have been a depository of laws, charters, and ordinances of the kings.—The Hebrew text calls it the *house of treasures*, and afterwards the *house of the rolls*, where the treasures were laid up.—We may, with more justice, call that a *library*, mentioned in the second of Esdras to have been built by Nehemiah, and in which were preserved the books of the prophets, and of David, and the letters of their kings.

The first who erected a *library* at Athens, was the tyrant Pisistratus; and yet Strabo refers the honour of it to Aristotle. That of Pisistratus was transported by Xerxes into Persia, and afterwards brought back by Seleucus Nicanor to Athens. Long after, it was plundered by Sylla, and re-established by Hadrian.—Plutarch says, that, under Eumenes, there was a *library* at Pergamus, containing 200,000 books.—Tyrannian, a celebrated grammarian, cotemporary with Pompey, had a *library* of 3000 volumes.—That of Ptolemy Philadelphus, according to A. Gellius, contained 700,000, all in rolls, burnt by Cæsar's soldiers.—Constantine, and his successors, erected a magnificent one at Constantinople; which, in the eighth century, contained 300,000 volumes, all burnt by order of Leo Isaurus: and, among the rest, one wherein the *Iliad*, and *Odyssey* were written in letters of gold, on the guts of a serpent.

The most celebrated *libraries* of ancient Rome, were the Ulpian, and the Palatin. They also boast much of the *libraries* of Paulus Æmilius, who conquered Persius; of Lucius Lucullus, of Asinius Pollio, Atticus, Julius Severus, Domitian, Serenus, Pamphilus Martyr, and the emperors Gordian and Trajan.

Anciently, every large church had its *library*; as appears by the writings of S. Jerom, Anastasius, and others. Pope Nicholas laid the first foundation of that of the Vatican, in 1450. It was destroyed by the constable Bourbon, in the sacking of Rome, and restored by pope Sixtus V. and has been considerably enriched with the ruins of that of Heidelberg, plundered by count Tilly in 1622.

One of the most compleat *libraries* in Europe, is said to be that erected at Florence by Cosmo de Medicis; over the gate whereof is wrote, *labor absque labore*. Though it is now exceeded by that of the French king; begun by Francis I. augmented by cardinal Richelieu, and compleated by M. Colbert. The emperor's *library* at Vienna, according to Lambecius, consists of 80000 volumes, and 15940 curious medals.

The *Bodleian library* at Oxford, built on the foundation of that of duke Humphry, exceeds that of any university in Europe, and even those of all the sovereigns of Europe, except the emperor's and French king's, which are each of them older by a hundred years.—It was first opened in 1602, and has since found a great number of benefactors; particularly Sir Rob. Cotton, Sir H. Savil, archbishop Laud, Sir Kenelm Digby, Mr. Allen, Dr. Pocock, Mr. Selden, and others. The Vatican, the Medicean, that of Bessarion at Venice, and those just mentioned, exceed the Bodleian in Greek manuscripts; which yet out-does them all in oriental manuscripts.

As to printed books, the Ambrosian at Milan, and that of Wolfenbuttle, are two of the most famous, and yet both inferior to the Bodleian.

The *Cotton library* consists wholly of manuscripts, particularly of such as relate to the history and antiquities of England; which, as they are now bound, make about 1000 volumes.

**LIBRATA** *Terra*, a portion of ground containing four oxgangs, and every ox-gang thirteen acres.

With us, it is so much land as is yearly worth 20 s. In Henry the third's time, he that had *quindecim libratas terra*, was to receive the order of knighthood. See **KNIGHT**, and **KNIGHTS-FEE**.

# LIE

Some say, that as money is divided into pounds, shillings, pence and farthings, the same degrees are to be observed in the division of lands; and therefore, as *quadrans* signifies a farthing, so *quadrantata* is the fourth part of an acre; *obolata* an half; *denariata*, a whole acre; *solidata*, 12 acres; and *librata*, 20 times 12 acres; i. e. 240 acres. See **FARTHINGDEAL**.

**LIBRATION**, in astronomy, an apparent irregularity in the motion of the moon, by which she seems to *librate*, or waver about her own axis; sometimes, from the east to the west; and sometimes, from the west to the east. See **MOON**.

Hence it is, that some parts in the moon's western limb, or margin, at one time, recede from the centre of the disk; and at another, move towards it: by which means, some of those parts, which were before visible, set and hide themselves in the invisible side of the moon, and afterwards become again conspicuous.

This *libration* of the moon, is owing to her equitable rotation round her own axis, and her unequal motion in the perimeter of her orbit. For if the moon moved in a circle, whose centre coincided with the centre of the earth, and turned round its axis in the precise time of its period round the earth; the plane of the same lunar meridian would always pass through the earth, and the same face of the moon would be constantly and exactly turned towards us. But since the real motion of the moon is in an ellipsis, in whose focus is the earth, and the motion of the moon about the earth is equable; or, which is the same thing, every meridian of the moon, by the rotation, describes angles proportional to the times: the plane of no one meridian will constantly pass through the earth.

**LIBRATION of the Earth**, is that motion whereby the earth is so retained in its orbit, as that its axis continues constantly parallel to the axis of the world.

This, Copernicus calls the *motion of libration*; and may be illustrated thus: Suppose a globe, with its axis parallel to that of the earth, painted on the flag of a mast, moveable on its axis, and constantly driven by an east wind, while it sails round an island; it is evident, the painted globe will be so *librated*, as that its axis will be parallel to that of the world, in every situation of the ship.

**LICENCE**, **LICENTIA**, in law, a power, or authority given to another, to do some lawful act. See **LICENTIA TE**.

A *licence* is a personal power, and cannot be transferred to another: though a *licence* may be granted to a man and his assigns.

**LICENCE** is also used, in the civil law, for a permission, or leave granted by a superior.

Justinian appointed four years to be spent in the study of the law; after which, those who had discharged this obligation, were said to have *licence*, or permission to retire from study.

**LICENCE** is also applied to the letters, or certificates taken out in universities, whether in law, physic, or divinity. See **DEGREE**.

*Licence*, in the Sorbonne, denotes a period of two years, which the batchelors are obliged to pass in assisting at acts, and disputing in them, to qualify themselves for being admitted doctors.

**Letter of LICENCE**. See the article **LETTER**.

**LICENCE to arise**, in law, *LICENTIA surgendi*, is a liberty, or space of time given by the court to a tenant, who is assigned *de malo lecti* in a real action, to rise out of his bed and go about his business. See **ESSOIN**.

**LICENCES**, in painting, are the liberties which the painter takes in dispensing with the rules of perspective, and the other laws of his art.

**Poetical LICENCE**, is the liberty which poets claim of dispensing with the ordinary rules of grammar.

Anciently, poets had much greater *licences* than are now allowed.—The Greeks, by having recourse to the several dialects of their tongue, could lengthen out a word if it were too short, or retrench something from it if it were too long.—The old poets did what they pleased with their language, and subjected it not only to all their necessities, but their caprices too.

*Et data Romanis venia est indigna poetis.*

But these became ridiculous in course of time; and the poets are now despoiled of most of their ancient privileges.

**LICENCIATE**, or **LICENTIA TE**, he who has obtained the degree of a *licence*. See **LICENCE**, and **DEGREE**.

Most of the officers of judicature in Spain, are known by no other name than that of *licenciates*.—To pass *licenciate* in the common law, civil law, or physic, they must have studied seven years; in divinity, ten.

**LICENTIA TE**, among us, is usually understood of a physician, who has a *licence* to practice, granted him by the college of physicians, or bishop of the diocese. See **COLLEGE**.

A person practising physic, without such *licence*, in case his patient dies under his hands, is guilty of felony in the eye of the law.

**LICHEN**, *Λικην*, a cutaneous distemper, otherwise called *impetigo*. See **IMPETIGO**.

**LIE**, or **LYE under the sea**.—The sailors say, a ship *lies under the sea*, when, her helm being made fast a-lee, she lies so a-hull, that the sea breaks upon her bow, or broad-side.

**LIEGE**,

**LIEGE\***, **LIGIUS**, properly signifies a *vassal*, who holds a kind of fee, that binds him in a closer obligation to his lord than other people. See **VASSAL**.

\* The term seems to be derived from the French *lier*, to bind; in regard of a ceremony used in rendering faith, or homage, which was by locking the vassal's thumb, or his hand, in that of the lord, to shew that he was fast bound by his oath of fidelity.—Cujus, Vigenere, and Bignon, chuse rather to derive the word from the same source with *leudis*, or *leodi*, loyal, faithful.—But Du Cange falls in with the opinion of those who derive it from *liti*, a kind of vassals, so firmly attached to their lord, on account of lands or fees held of him; that they were obliged to do him all manner of service, as if they were his domestics. He adds, this was formerly called *litigium servitutum*, and the person *litige*.—In this sense, the word is used *leg. Edw. cap. 29. Judæi sub tutela regis ligea debent esse*; that is, wholly under his protection.

By *liege homage*, the vassal was obliged to serve his lord towards all, and against all, excepting his father.—In which sense, the word was used in opposition to *simple homage*; which last, only obliged the vassal to pay the rights, and accustomed dues to his lord; and not to bear arms against the emperor, prince, or other superior lord: so that a *liege man* was a person wholly devoted to his lord, and entirely under his command\*.

\* *Omnibus, &c. Reginaldus rex Insularum, salutem. Sciatis quod deveni homo ligeus domini regis Angliæ Johannis, contra omnes mortales quamdiu vixerò, & inde ei fidelitatem & sacramentum præstiti, &c. M. S. penes W. Dugdale.*

But it must be observed, there were formerly two kinds of *liege homage*: the one, by which the vassal was obliged to serve his lord, against all, without exception, even his sovereign; the other, by which he was to serve him against all, except such other lords as he had formerly owed *liege homage* to. See **HOMAGE**.

In our old statutes, *lieges*, and *liege people*, are terms peculiarly appropriated to the king's subjects; as being *liges*, *ligi*, or *ligati*, obliged to pay all allegiance to him; 8 Hen. VI. 14 Hen. VIII. &c. though private persons had their *lieges* too\*.

\* *Reinaldus Dei gratia abbas Ramefis, præpositus & hominibus de Brancestre, & omnibus vicinis Francis & Anglis, salutem. Sciatis me dedisse terram Ulfe, in depedene (hodie depedale) huic Osfelino & uxori ejus Alfnice—ea conditione quod effecti sint homines liges. Lib. Ramef.*

**LIEGE Vassalage**. See the article **VASSALAGE**.

**LIENTERY\***, *Λιεντερία*, in physic, a kind of looseness, wherein the food passes so suddenly through the stomach and guts, as to be thrown out by stool, with little or no alteration.

\* The antients were of opinion, the *lientery* was owing to the too great smoothness, and slipperiness of the inside of the intestines, by which they let the food slip off before it was digested: and hence they gave it this name, which is formed from *λεῖον*, smooth, polished, and *εἰς*, intestine.

The *lientery* is generally owing either to a defect in the ferment of the stomach, or to a relaxation of the pylorus, attended with so brisk an irritation of the fibres of the stomach, that instead of retaining the aliment, it lets it pass.—Excess of drinking sometimes occasions this disease, by relaxing the stomach, and especially the pylorus, too immoderately.

**LIEUTENANT**, *locum tenens*, a deputy, or officer, who holds the place of a superior, and discharges that function in his absence, which he ought to exercise in person.

Of these, some are civil; as lords *lieutenants* of kingdoms, who are the king's viceroys, and govern in his stead; and lords *lieutenants* of counties. See **LORD**, and **COUNTY**.

But the term is most frequent among military men, among whom there is a variety of *lieutenants*.—As,

**LIEUTENANT-GENERAL**, a great officer, the next in rank to the general of an army; who, in battle, commands one of the lines, or wings; a detachment in a march, or a flying camp.—Also, a quarter at a siege, or one of the attacks—when it is his day of duty. See **GENERAL**.

In France, they have also *lieutenant-generals* of their naval forces, who command immediately under the admirals.

In Holland they have a *lieutenant-admiral*, which is the same with what we call a *vice-admiral*. See **ADMIRAL**.

**LIEUTENANT-General of the Ordnance**, is he who has the charge of the artillery, batteries, &c. under the master-general, or in his absence. See **ORDNANCE**, &c.

**LIEUTENANT-Colonel of Foot**, is the second officer in a regiment; he commands in the absence of the colonel, and in battle takes post at his colonel's left.

The dragoons have also a *lieutenant-colonel*; but the horse have not, properly, any; the first captain of the regiment supplies the office. See **COLONEL**.

**LIEUTENANT-Colonel of Horse**, being only the first captain of the regiment; who commands in the absence of the colonel, taking place of all the other captains.

**Captain LIEUTENANT**. See the article **CAPTAIN**.

**LIFE**, *Vita*, is a very ambiguous term.—For both God, and man, and a soul, and an animal, and a plant, are said to *live*: yet there is not any thing common to all these, beside a kind of active existence; which, however, is of very diffe-

rent kinds. See **ANIMAL**, **VEGETABLE**, &c.

*Life*, then, in the general, expresses a kind of active, operative existence; and is therefore conceived to consist in motion.—But, particularly,

**LIFE of Body**, *Vita Corporis*, consists in an uninterrupted motion therein.—A body, therefore, said to be *living*, must consist of various parts or members, both internal and external, so framed, and put together, as to constitute one whole. And these members must be moved, and warmed by some fluid substance, permeating the whole frame; by which heat and motion, the vital functions are to be performed.—Such are nutrition, generation, local motion, &c. See **BLOOD**, **CIRCULATION**, &c.

**LIFE of Mind**, *Vita Mentis*, is held by the Cartésians, to consist in a perpetual cogitation, or uninterrupted course of thinking; which seems likewise to have been Aristotle's meaning, when he calls the soul *ψυχὴ*; which his interpreters call *actus*: thinking being the only proper act of the mind. See **ENTELECHIA**.

But Mr. Locke endeavours to refute this principle. See **THINKING**, **SOUL**, &c.

**LIFE of Man**, *Vita Hominis*, consists in a continued communication of body and mind; or in operations, to which both the motions of the body, and ideas of the mind contribute.

Thus, e. g. the mind now thinking of something, on occasion of that thought, there arises a certain motion in the body.

—And now, again, the body moves first; which motion is followed by some thought of the mind. See **SOUL**.

In such alternate or reciprocal operation, does the *life* of man consist; considered as he is a compound of body and mind. See **SENSATION**, **MOTION**, &c.

**LIFE** is more particularly used for the duration of an animal's being; or, the space of time that passes between its birth and death. See **DEATH**, &c.

**LIFE**, is also used for the constitution; or, that principle of heat, and motion, which animates bodies, and makes them perceive, act, and grow,

In which sense, *life* is divided into *animal*, *sensitive*, and *vegetative*. See **ANIMAL**, **SENSITIVE**, &c.

**LIFE**, in a medical sense, is defined, the circulation of the blood. See **CIRCULATION**.

**Prolongation of LIFE**, is made by lord Bacon one of the three branches of medicine; the other two relating to the preservation of health, and the cure of diseases. See **MEDICINE**.

The theory of prolonging *life* he numbers among the desiderata. Some means, or indications, that seem to lead to it, he lays down as follows.

Things are preserved in two manners; either in their *identity*, or by reparation. In their *identity*, as a fly or ant in amber, a flower, or fruit, or wood, in a conservatory of snow; a dead carcass in balsams.—By *reparation*, as a flame, or a mechanical engine, &c.—To attain to the prolongation of *life*, both these methods must be used; and the human body must be preserved both as inanimates, as flame, and as mechanical instruments are preserved.

Hence arise three intentions for the prolongation of *life*: *retardation* of consumption, proper *reparation*, and *renovation* of what begins to grow old.—Consumption is occasioned by two kinds of depredation; a depredation of the innate spirit, and a depredation of the ambient air.—These may be each prevented two ways; either by rendering those agents less predatory, or by rendering the passive parts (*viz.* the juices of the body) less liable to be preyed on.—The spirit will be rendered less predatory, if either its substance be condensed, as by the use of opiates, grief, &c. or its quantity diminished, as in spare and monastic diets; or its motion calmed, as in idleness and tranquillity.—The ambient air becomes less predatory, if it be either less heated by the rays of the sun, as in cold climates, in caves, mountains, and anachorets cells; or be kept off from the body, as by a dense skin, the feathers of birds, and the use of oils and unguents, without aromatics. The juices of the body are rendered less liable to be preyed on, either by making them harder, or more moist and oily: harder, as by a coarse sharp diet, living in the cold, robust exercises, and some mineral baths: moister, as by the use of sweet foods, &c. abstaining from salts and acids; and especially by such a mixture of drink, as consists wholly of fine subtile particles, without any acrimony or acidity.

*Reparation* is performed by means of aliment: alimentation is promoted four ways; by the concoction of the viscera, so as to extrude the aliment, by exciting the exterior parts to the attraction of the aliment, as in proper exercises and frictions, and some unctions and baths; by the preparation of the food itself, so as it may more easily insinuate itself, and, in some measure, anticipate the digestion; as in various ways of dressing meats, mixing drinks, fermenting breads, and reducing the virtues of these three into one; by promoting the act of assimilation itself, as in seasonable sleep, some external application, &c.—The renovation of what begins to grow old, is performed two ways; by the inteneration of the habit of the body, as in the use of emollients, emplasters, unctions, &c. of such a nature, as do not extract, but improve;

or

or by purging off the old juices, and substituting fresh ones; as in feasonable evacuations, attenuating diets, &c.

The same author adds these three axioms: that the prolongation of life is to be expected rather from some stated diets, than either from any ordinary regimen, or any extraordinary medicines; more for operating on the spirits, and mollifying the parts, than from the manner of feeding: and this mollifying of the parts without, is to be performed by consubstantials, impriments, and occludents. See LONGEVITY.

**LIGAMENT**, in its general sense, denotes any thing that ties or binds one part to another.

In which sense the ancients applied the word to membranes, skin, flesh, veins, and arteries; as being common *ligaments*.

**LIGAMENT**, in its more proper signification, denotes a white, tough, solid, inflexible part, serving to inclose, and keep together the junctures of the body.

It has no conspicuous cavities; nor has it any sense, lest it should suffer on the moving of the bones. It is found very different, according to the different parts where it is used. It is harder than a membrane, yet softer than a cartilage: its principal use is to gird and strengthen the junctures, to prevent the dislocation of the bones, and even to fasten them together, when they have no articulation.—It also serves as a covering to the tendons, to separate them from the muscles, and to hold up the suspended entrails, lest their weight should throw them down—such are the *ligaments* of the liver, the bladder, and matrix.

*Ligaments* are of different substances; some hard, others soft, membranous, nervous, and cartilaginous; as also of different figures, and situations: some arise from bones, others from cartilages, and others from membranes.

The *ligament* is held the most terrestrial of all the parts of the body, after the bone and cartilage; being cold, dry, hard, and insensible, like them. See CARTILAGE, and BONE.

The principal *ligaments* of the body, are the cartilaginous *ligaments*, which bind the four bones of the metacarpus with the carpus. See CARPUS, and METACARPUS.

The *ligaments* of the spine are very strong, being fitted to the articulations of the vertebræ, to prevent their luxation in violent motions.—They are of two kinds; the one thick and fibrous, in form of a crescent, which bind them both at top and bottom; and the others membranous, serving to fasten them the more securely. See SPINE, and VERTEBRA.

The *ligaments* of the liver are two in number; the first called *ligamentum suspensorium*, holds it suspended to the diaphragm, penetrating into the substance of the liver, to hold it the more firmly: the latter is larger, but more lax; it comes from the external coat of the liver, and is fastened to the cartilago xiphoides.—Some add a third, which is formed out of the umbilical vessels; which, in adults, dry up, and become a *ligament*.

There are two *ligaments* belonging to the tongue; one which fastens it, by its root, to the os hyoides; and another larger, inserted into the middle and inferior part: this last is called the  *frenum*, or the bridle of the tongue.—There are also *ligaments* belonging to the spleen. See TONGUE, and SPLEEN.

The penis has a strong *ligament*, called *suspensorium penis*, from its office in holding up the penis to the ossa pubis; it arises from the fore-parts of those bones, and is fastened to the upper part of the corpora cavernosa penis: it has another *ligamentum*, which fastens the prepuce to the glans. See PENIS, PREPUCE, &c.

The uterus has four *ligaments*, two of them called *lata*, or *broad*; and two *rotunda*, or *round*, from their figures: the broad *ligaments* are membranous, arise from the processes of the peritonæum, and are fastened to the lateral parts of the bottom of the uterus, and serve to prevent it from falling down upon the neck, as sometimes happens, when these *ligaments* are too much relaxed. See MATRIX.

The round *ligaments* arise from the sides of the womb, at the place where the tubæ fallopiæ are joined to it. At their first rise they are broad; but, by degrees, as they recede farther from the womb, grow round and smooth; and, as the spermatic vessels do in men, pass betwixt the duplicature of the peritonæum, and so out of the abdomen, through the foramina of the oblique and transverse muscles of the abdomen, and running obliquely on the os pubis, terminate under the fat of the clitoris.—By the passages of these *ligaments*, women, and girls especially, are exposed to inguinal ruptures, as men are by the passages of the spermatic vessels.

The substance of the broad *ligaments* is membranous, loose, and soft; whence some have compared them to the wings of a bat, and called them *ala vespertilionum*.—The round *ligaments* are of a firmer texture, and consist of a double membrane, wrapping up in it veins, arteries, nerves, and lymphæducts, and both these and the former have been sometimes taken for muscles.—By these *ligaments* the uterus is kept so tight, that no violence of internal flatus, or humours, can raise it above its place.—See Tab. Anat. (Splanchn.) fig. 9. lit. b. b. fig. 11. lit. i. i. &c.

**LIGAMENTUM Annulare.** See ANNULAR, and WRIST.

**LIGAMENTUM Ciliare.** See CILIARE *Ligamentum*.

**LIGATURE**, in chirurgery, any thing tied about a part of the body; more especially a bandage, or fillet of cloth, or linen, serving to bind the arm, and facilitate the operation of bleeding.

**LIGATURE**, **LIGATURA**, or **LIGATIO**, denotes also the art, or manner of disposing, and applying bandages for the closing of wounds, and performing many of the operations of chirurgery.

**LIGATURE**, among mystic divines, signifies a total suspension of the superior faculties, or intellectual powers of the soul.—

They pretend, that when the soul is arrived at a perfect contemplation, she remains deprived of all her operations, and ceases to act, in order to be more ready, and prepared to receive the impulse and communications of divine grace.—

This passive state of these contemplative people they call their *ligature*.

**LIGATURE**, is also used to signify a kind of bandage, or fillet, tied round the neck, arm, leg, or other part of the bodies of men or beasts, to divert, or drive off some disease, accident, &c. See AMULET, &c.

**LIGATURE**, is also used for a state of impotency, in respect to venery, caused by some charm, or witchcraft.

Kempfer tells us of an uncommon kind of *ligature*, or knotting, in use among the people of Massacar, Java, Malaja, Siam, &c.—By this charm, or spell, a man binds up a woman, and a woman a man, so as to put it out of their power to have to do with any other person; the man being thereby rendered impotent to any other woman, and all other men impotent with respect to the woman.

Some of their philosophers pretend, that this *ligature* may be effected by the shutting of a lock, the drawing of a knot, the sticking of a knife in the wall, at the point of time wherein the priest is joining a couple together; and that a *ligature*, thus effected, may be dissolved, by the spouse's urining through a ring.—This piece of superstition is said to obtain also among the Christians of the East.

The same author tells us, that during the ceremony of marriage in Russia, he observed an old fellow lurking behind the church-door, and mumbling over a string of words, and at the same time cutting a long rod, which he held under his arm, into pieces; which, it seems, is a common practice at the marriages of great persons, and done with design to elude and counterwork any other person, that might possibly be inducing the *ligature*.

The secret of inducing a *ligature*, is delivered by the same author, as he was taught it on the spot, by one of their adepts; which, being a curiosity, we shall not scruple to add in his own words; not during to make it speak English.—*Puella amasum, vel conjux maritum ligaturus, absterget a concubitus actu, priapam, indusio—ut seminis quantum potest excipiet. Hoc probe convolutum sub limine domus suæ in terram sepeliat. Ibi quamdiu sepultum reliquerit, tamdiu ejus hasta in nullius præterquam sui (fascinantis) servitium obediens, & prius ab hoc nexu non liberabitur quam ex claustro liminis liberetur ipsam linteum. Vice versa, vir lecti sociam ligaturus, menstruatam ab eo linteum comburito; ex cineribus cum propria urina subactis, efformato figuram priapi, vel, si cineres incuncule fingenda non sufficiant, eisdem subigito cum parte terræ quam recens perminxerit. Formata iconem cautè exsiccat, siccamque asservato loco sicco, ne humorem contrahat. Quamdiu sic servaveris, omnes arcus dum ad scopum sociæ collimaverint, momento contabescunt: Ipse vero dominus—Abrumum hunc suum prius humectato, quamdiu sic manebit, tamdiu suspensio nexu priapus ipsi parebit, quin & alios quotquot fœmina properantes admiserit.*

M. Marthal mentions another form of *ligature*, which he received from a bramin at Indostan: 'If, says he, the little worm in the wood lukerara kara, be cut into two, and the one part stirs, and the other not; if the stirring part be bruised, and given with half a beetle to a man, and the other half to a woman, the charm will keep each from ever having to do with any other person.' *Philosoph. Transact.* N°. 268.

**LIGATURES**, among printers, are types consisting of two letters, or characters joined together, as *ff*, *st*, *fi*. See LETTER.

The old editions of Greek authors, are extremely full of *ligatures*; the *ligatures* of Stephens are, by much the most beautiful.

Some editions have been lately printed without any *ligatures* at all; and there was a design to explode them quite out of printing. Had this succeeded, the finest antient editions would, in time, have grown useless; and the reading of old manuscripts have been rendered almost impracticable to the learned themselves.

**LIGHT**, that sensation occasioned in the mind, by the view of luminous bodies; or that property in bodies, whereby they are fitted to excite those sensations in us. See SENSATION.

**LIGHT** is also used to denote a certain action of the luminous body, on a medium between it and the eye; by means whereof, some suppose the one to act on the other.

This they call *secondary*, or *derivative light*; to distinguish it

it from that of luminous bodies; which is called *primary*, or *immediate*.

Aristotle explains the nature of *light*, by supposing some bodies to be transparent, as air, water, ice, &c. but since, in the night-time, we do not see any thing through those bodies, he says, they are only transparent potentially; whereas, in the day, they become really and actually transparent: and since it is *light* alone that can reduce that power into act, he defines *light* to be the act of a transparent body, considered as such.—He adds, that *light* is not fire, nor is it any thing bodily, radiating from the luminous body, and transmitted through the transparent one; but the mere presence of fire, or some other luminous body, at the transparent one.

This is Aristotle's doctrine of *light*, which his followers mistaking, have foisted on him another, very different; making *light* and colours, to be qualities of the luminous and coloured bodies themselves, and, in all respects, like those sensations which they occasion in us: adding, that things lucid, or coloured, could not produce any sensations in us, unless they had something similar in themselves, since *nihil dat quod in se non habet*. See *QUALITY*.

But the sophism is apparent; for we find, that a needle, in pricking the flesh, gives us pain, which no body ever imagined to exist in the needle.—But that it is not necessary there should be any similitude between the quality of the object, and the sensation it produces, appears still more evident from a glass prism, which is found to exhibit blue, yellow, red, and other colours extremely vivid; and yet no body will say there is any thing in the glass prism like those sensations. See *PRISM*, &c.

The Cartesians have refined considerably on this notion; and own, that *light*, as it exists in the luminous body, is nothing but a power or faculty of exciting in us a very clear and vivid sensation; adding, that what is required to the perception of *light*, is, that we be so form'd, as to be capable of such sensations; that in the hidden pores of transparent bodies, there be a certain subtle matter, which, by reason of its exceeding smallness, may penetrate even glass, and yet be strong enough to shake certain capillaments at the bottom of the eye; and, lastly, that this matter be impelled by the luminous body, so as to move the organ of sight.

Primary *light*, therefore, they say, consists in a certain motion of the particles of the luminous body, whereby they are enabled to propel, every way, the *materia subtilis*, lodg'd in the pores of transparent bodies; and secondary or derivative *light*, in a conatus to a motion, or an inclination of that matter, to recede from the centre of the luminous body in right lines. See *MATERIA SUBTILIS*, and *CARTESIAN*.

Father Malebranche explains the nature of *light*, from a supposed analogy between it and sound; the latter, it is allow'd, is produced by the vibrations of the insensible parts of the sonorous body: which vibrations, if they be greater or less, that is, if they run thro' greater or less arches of the same circle, are still performed in the same time, and the sounds produced by them, only differ in a greater or less degree of strength; but if there be a greater number of vibrations, in the same time, in one sonorous body, than in another, these being closer, become of a different kind: and thus their sounds also differ, forming what we call different tones, or notes; the quick vibrations forming the acute, and the slower the grave notes. See *SOUND*, *ACUTENESS*, and *GRAVITY*.

Thus he supposes it to be with *light*, and colours: all the parts of a luminous body are in a rapid motion, which, by very quick pulses, is constantly compressing the subtle matter between the luminous body and the eye, and excites vibrations of pressure.—As these vibrations are greater, the body appears more luminous; and as they are more quick, or more slow, the body is of this, or that colour.

This hypothesis, how ingenious soever, is now deservedly discarded, since the great discoveries made by Sir Isaac Newton, on the nature of *light*.—The primary *light* they talk of, we now know, consists wholly in a certain motion of the particles of the lucid body, whereby they do not propel any fictitious matter, supposed to be lodged in the hidden pores of transparent bodies; but throw off, from the luminous body, certain very small particles, which are emitted every way with great force: and the secondary, or derivative *light* consists, not in a conatus, but a real motion of these particles, receding every way from the luminous body, in right lines, and with an incredible velocity.

For if *light* consisted in a mere pressure, or pulse, it would be propagated to all distances in the same instant of time; the contrary of which appears, from the phenomena of the eclipses of Jupiter's satellites, whose immersions, as the earth approaches towards Jupiter, are found to anticipate somewhat on the true time, and to commence sooner; and again, as the earth retires from Jupiter, their emersions, which alone in that case can be observed, happen later and later, or lose time: deviating thus, very considerably on either side, from the true time marked by the tables.

This was first observed by M. Roemer, and since by other astronomers; the reason of which, is not owing to any eccentricity; but does apparently follow from this, that the *light* of the sun, reflected from the satellites, has further to travel, ere it reaches the eye, in the one case, than in the other, by a space equal to the diameter of the earth's annual orbit. See *SATELLITES*.

*Light* therefore, like other real bodies, does not move instantaneously, but in time.—Sir Isaac Newton has shewn, past contradiction, that the *light* of the sun is near seven minutes in its passage to the earth, which is the space of 70,000,000 miles; a velocity 10,000,000 times greater than that, where-with a ball flies out of the mouth of a cannon.

Further, if *light* were not a body, but consisted in a mere pressure, or pulsion, it would never be propagated in right lines, but would be continually inflected ad umbram. Thus Sir Isaac Newton, 'A pressure on a fluid medium (*i. e.* a motion propagated by such a medium beyond any obstacle, which impedes any part of its motion) cannot be propagated in right lines, but will be always inflected and diffusing itself every way, to the quiescent medium beyond that obstacle.—The power of gravity tends downwards, but the pressure of water rising from it, tends every way with an equable force, and is propagated with equal ease, and equal strength in curves, as in straight lines.—Waves, on the surface of the water, gliding by the extremes of any very large obstacle, inflect, and dilate themselves, still diffusing, gradually, into the quiescent water beyond that obstacle.—The waves, pulses, or vibrations of the air, wherein sound consists, are manifestly inflected, though not so considerably as the waves of water; and sounds are propagated with equal ease, through crooked tubes, and through straight lines; but *light* was never known to move in any curve, nor to inflect itself ad umbram.—The rays of *light*, therefore, are small corpuscles, emitted with exceeding celerity from the luminous body.—As to the force where-with those corpuscles are emitted, so as to enable them to move at the inconceivable rate of 10,000,000 miles in a minute; hear the same great author, 'Among bodies of the same kind and virtue, by how much any one is smaller, by so much is its attractive power greater in proportion to its bulk. This power we find stronger in small magnets, than in large ones, regard being had to the difference of their weights; and the reason is, that the particles of small magnets being nearer to each other, more easily unite their forces intimately together, and act conjunctly.—For the same reason the rays of *light*, being of all other bodies the most minute, it may be expected, that their attractive powers should be, of all others, the strongest; and how strong in effect they are, may be gathered from the following rules: the attraction of a ray of *light*, according to the quantity of its matter, is, to the gravity which any projected body has, according, likewise, to the quantity of its matter, in a ratio, compounded of the velocity of the ray of *light*, to the velocity of that projected body, and of the bending, or curvature of the line, which the ray describes in the place of refraction, to the bending of the curvature, described by that projected body; provided, however, the inclination of the ray to the refracting surface, be the same with that of the projected body to the horizon. From which proportion I gather, that the attraction of the rays of *light*, is above 1,000,000,000,000,000 times greater, than the gravity of bodies on the surface of the earth, in proportion to the quantity of matter in each, if the *light* pass from the sun to the earth in the space of seven minutes. But now, as in algebra, where affirmative quantities cease, there negative ones begin; so in mechanics, where attraction ceases, there the repelling power must succeed: Therefore a ray of *light*, as soon as it is cast off from the luminous body, by the vibrating motion of its parts, and is got out of the sphere of its attraction, is propelled with an immense velocity.' See *ATTRACTION*, and *REPULSION*.

The wonderful divisibility of the parts of matter, is no where more apparent than in the minuteness of the particles of *light*: Dr. Niewentiit has computed, that an inch of candle, when converted to *light*, becomes divided into 269617040 parts, with 40 ciphers annexed; at which rate, there must issue out of it, when burning, 418,660, with 39 ciphers more, particles in the second of a minute; vastly more than a thousand times a thousand million times the number of sands the whole earth can contain; reckoning 10 inches to one foot, and that 100 sands are equal to one inch. See *Relig. Philos.* VOL. III. p. 858.

The expansion, or extension of any portion of *light*, is inconceivable: Dr. Hooke shews, it is as unlimited as the universe; proving it from the immense distance of some of the fixed stars, the *light* whereof becomes sensible to the eye, by means of a telescope; nor, adds he, is it only the great bodies of the sun or stars, that are thus able to disperse their *light* through the vast expanse of the universe; but the small

left spark of a lucid body must do the same, even the smallest globule, struck from a steel by a flint.

Dr. s'Gravensand asserts, a lucid body to be that, which emits, or gives fire a motion in right lines; and makes the difference between *light* and heat, to consist in this, That to produce the former, the fiery particles must enter the eye, in a rectilinear motion, which is not required in the latter: On the contrary, an irregular motion seems more proper for it, as appears from the rays coming directly from the sun to the tops of mountains, which have not near that effect with those in the valley, agitated with an irregular motion, by several reflections. See FIRE.

Whether or no there be always *light*, where there is fire, is disputed among authors; as also, whether or no there be any luminous body without heat; heat being a motion that may be infinitely diminished, and *light* a matter that may be infinitely rare: to which we may add, that no heat is sensible to us, unless it be more intense than that of our organs of sense. See HEAT.

Sir Isaac Newton observes, that bodies, and *light*, act mutually on one another; bodies on *light*, in emitting, reflecting, refracting, and inflecting it; and *light* on bodies, by heating them, and putting their parts into a vibrating motion, wherein heat principally consists. For all fixed bodies, he observes, when heated beyond a certain degree, do emit *light*, and shine; which shining, &c. appears to be owing to the vibrating motion of their parts; and all bodies, abounding in earthy and sulphurous particles, if sufficiently agitated, emit *light*, which way soever that agitation be effected.—Thus sea-water shines in a storm, quick-silver when shaken in vacuo, cats, or horses, when rubbed in the dark; and wood, fish, and flesh, when putrefied.

The late Mr. Hauksbee has furnished us with a great variety of instances of the artificial production of *light*, by the attrition of bodies naturally not luminous; as of amber rubbed on woollen cloth in vacuo, of glass on woollen, of glass on glass, of oyster-shells on woollen, and of woollen on woollen, all in vacuo.

On the several experiments hereof, he makes the following reflections: That different sorts of bodies afford remarkably different kinds of *light*, different both in colour and in force: That the effects of an attrition are various, according to the different preparations and managements of the bodies that are to endure it; and that bodies which have yielded a particular *light*, may be brought by friction to yield no more of that *light*.

M. Bernoulli found by experiment, that mercury amalgamated with tin, and rubbed on glass, produced a considerable *light* in the air; that gold rubbed on glass did it still in a greater degree: but that, of all others, the most exquisite *light* was that produced by the attrition of a diamond; being equally vivid with that of a burning coal briskly agitated with the bellows. See ATTRITION, and FRICTION.

Mr. Boyle tells us of a piece of shining rotten wood, which upon exhausting the air from it, was extinguished; but upon its re-admission, seemed to come to life again, and shone as before: being, no doubt, a real flame, and, like other flames, not to be preserved without air. See PHOSPHORUS.

'That the particles of *light* are attracted by those of other bodies,' is evident from innumerable experiments.—This phenomenon was first observed by Sir Isaac Newton, who found by repeated trials, that the rays of *light* in their passage near the edges of bodies, whether opaque or transparent, as pieces of metals, the edges of knives, broken glasses, &c. are diverted out of the right lines, and always inflected or bent towards those bodies. See INFLECTION, and DEFLECTION.

This action of bodies on *light*, is found to exert itself at a sensible distance, though it always increases as the distance is diminished; as appears very sensible in the passage of a ray between the edges of two thin planes at different apertures; in which there is something very peculiar; the attraction of one edge being increased as the other is brought nearer it.—The rays of *light* in their passage out of glass into vacuum, are not only inflected towards the glass, but if they fall too obliquely, will revert back again to the glass, and be totally reflected.

The cause of which reflection cannot be attributed to any resistance of the vacuum, but must be entirely owing to some force or power in the glass, which attracts or draws back the rays as they were passing into the vacuum.—And this appears farther from hence, that if you wet the posterior surface of the glass with water, oil, honey, or a solution of quick-silver, then the rays which would otherwise have been reflected, will pass into and through that liquor: which shews that the rays are not reflected till they come to that posterior surface of the glass, nor even till they begin to go out of it; for if at their going out they fall into any of the foresaid mediums, they will not then be reflected, but persist in their former course, the attraction of the glass being in this case counter-balanced by that of the liquor.

From this mutual attraction between the particles of *light* and

other bodies, arise two other grand phenomena, which we call the *reflection* and *refraction* of *light*: We know that the determination of a body in motion is changed by the interposition of another body in its way: thus *light* impinging on the surface of solid bodies, should be turned out of its course, and beaten back or reflected, so as like other falling bodies to make the angle of its reflections equal to that of incidence.—This it is found by experience *light* does; and yet the cause of this effect is different from that just now assigned: the rays of *light* are not reflected by striking on the very parts of the reflecting bodies, but by some power equally diffused throughout the whole surface of the body, whereby it acts on the *light*, either attracting or repelling it without contact: by which same power, in other circumstances, the rays are refracted; and by which also, the rays are first emitted from the luminous body; as is abundantly proved by great variety of arguments, by Sir Isaac Newton. See REFLECTION.

That great author puts it past doubt, that all those rays which are reflected, though they approach the body infinitely near, yet never touch it; and that those which do really strike on the solid parts of bodies, adhere to them, and are as it were extinguished and lost.

If it be asked, how it happens, since we ascribe the reflection of the rays to the action of the whole surface of the body without contact; how, I say, it happens that all the rays are not reflected from every surface, but while some are reflected, others pass through and are refracted? The answer given by Sir Isaac Newton is as follows:—Every ray of *light*, in its passage through any refracting surface, is put into a certain transient constitution or state, which in the progress of the ray returns at equal intervals, and disposes the ray at every return to be easily transmitted through the next refracting surface, and between the returns to be easily reflected by it: which alternation of reflection and transmission appears to be propagated from every surface, and to all distances. What kind of action or disposition this is, and whether it consists in a circulating or vibrating motion of the ray or the medium, or somewhat else, he does not enquire; but allows those who are fond of hypotheses to suppose that the rays of *light*, by impinging on any reflecting or refracting surface, excite vibrations in the reflecting or refracting medium, and by that means agitate the solid parts of the body. These vibrations, thus propagated in the medium, move faster than the rays, so as to overtake them; and when any ray is in that part of the vibration which conspires with its motion, its velocity is increased, so that it easily breaks through a refracting surface: but when it is in a contrary part of the vibration, which impedes its motion, it is easily reflected; and consequently, that every ray is successively disposed to be easily reflected or transmitted by every vibration which overtakes it. The return of which disposition of any ray to be reflected, he calls *fits of easy reflection*; and those of its disposition to be transmitted, he calls *fits of easy transmission*; and the space between the returns, *the interval of the fits*.—The reason, then, why the surface of all thick transparent bodies reflect part of the *light* incident on them, and refract the rest, is, that some rays at their incidence are in fits of easy reflection, and others of easy transmission.

For the Properties of Reflected LIGHT, see REFLECTION, MIRROR, &c.

Further, a ray of *light* passing out of one medium into another of different density, and in its passage making an oblique angle with the surface that separates the mediums, will be refracted, or turned out of its right line; by reason the rays are more strongly attracted by a denser than a rarer medium. See REFRACTION.

That these rays are not refracted by striking on the solid parts of bodies, but without any contact, by that same force wherewith they are emitted and reflected, exerting itself differently in different circumstances, is proved in great measure by the same arguments which demonstrate reflection to be performed without contact.

For the Properties, &c. of Refracted LIGHT, see REFRACTION, LENS, &c.

In island crystal is observed a kind of double refraction, very different from what we find in any other body: the rays that fall obliquely being not only dispersed, with a double refraction in one and the same surface, but even the perpendicular rays themselves are most of them divided into two beams, by means of the same double refraction; which beams are of the same colour with the incident beams, and are equal in degree of *light*, at least nearly, to each other: whence the great philosopher so often cited, takes occasion to suspect that there are in *light* some other original properties besides those hitherto described; and particularly, that the rays have different sides, endued with several original properties.

For, of these refractions, the one is performed in the usual manner, *i. e.* the sine of incidence is to that of refraction as 5 is to 3; and the other in an unusual manner: and yet the same ray is refracted sometimes in the one manner, and sometimes in the other, according to the various positions which its

its several sides have, in respect of the crystal. These dispositions, he shews, must have existed originally in the rays, without having undergone any alterations in that respect, by the crystal. See *Island CRYSTAL*.

Every ray of *light* therefore has two opposite sides, the one originally endued with a property whereon its unusual refraction depends, and the other not endued with that property. See *RAY*.

Sir Isaac Newton having observed the vividly coloured image projected on the wall of a darkened room, by the sun-beams transmitted through a prism, to be five times as long as broad; setting himself to enquire into the reason of this disproportion, was led from other experiments to the experimentum crucis; whence he discovered the cause of the phenomenon to be, that some of the rays of *light* were more refracted than others, and therefore exhibited several images of the sun under the appearance of one, extended lengthwise. See *PRISM*.

Thence he proceeded to conclude, that light itself is a heterogeneous mixture of rays differently refrangible: and hence he distinguishes *light* into two kinds, viz. that whose rays are equally refrangible, which he calls *homogeneous*, *similar*, or *uniform light*; and that whose rays are unequally refrangible, which he calls *heterogeneous light*. See *REFRANGIBILITY*; see also *HOMOGENEAL*, and *HETEROGENEOUS*.

There are but three affections of *light*, wherein he observed its rays to differ, viz. refrangibility, reflexivity, and colour; and those rays which agree in refrangibility, agree also in the other two; whence they may be well defined homogeneous, though in some other respects they may possibly be heterogeneous. See *REFLEXIBILITY*, and *REFRANGIBILITY*.

Again, the REFLEXIBILITY, and REFRACTIBILITY, he calls *homogeneous colours*; and those produced by heterogeneous *light*, *heterogeneous colours*.—These definitions laid down, he advances several propositions.

As, first, That the sun's *light* consists of rays differing by indefinite degrees of refrangibility. Secondly, That rays, which differ in refrangibility, when parted from one another, do proportionably differ in the colours which they exhibit. Thirdly, That there are as many simple and homogeneous colours, as degrees of refrangibility, for to every degree of refrangibility belongs a different colour. Fourthly, Whiteness, in all respects like that of the sun's immediate *light*, and of the usual objects of our senses, cannot be compounded of simple colours, without an indefinite variety of them; for to such a composition there are required rays endued with all the indefinite degrees of refrangibility, which infer as many simple colours. Fifthly, the rays of *light* do not act on one another in passing through the same medium. Sixthly, The rays of *light* do not suffer any alteration of their qualities from refraction, nor from the adjacent quiescent medium. Seventhly, There can no homogeneous colours be produced out of *light* by refraction, which are not commixed in it before; since refraction, as was before observed, changes not the qualities of the rays, but only separates those which have divers qualities, by means of their different refrangibility. Eighthly, The sun's *light* is an aggregate of homogeneous colours; whence homogeneous colours may be called *primitive*, or *original*. See *RAY*, &c.

We have already observed that the rays of *light* are composed of dissimilar or heterogeneous parts; some of them being in all probability greater, others less. Now the smaller the parts are, by so much the more refrangible they are, i. e. they are so much the more easily diverted out of their rectilinear course; and those parts which differ in refrangibility, (consequently in bulk) we have also observed, differ in colour.

Hence arises the whole theory of colours: Those parts, viz. which are the most refrangible, constitute violet colour; that is, the most minute particles of *light*, when separately impelled on the retina, which are thence communicated by the solid part of the optic nerve in the brain, and excite in us the sensation of violet colour, the dimmest, and most languid of all colours: and those particles, on the contrary, which are the least refrangible, constitute a ray of a red colour; i. e. the greatest particles of *light*, excite the longest vibrations in the retina, and so convey the sensation of a red colour, as being the most bright and vivid of all others. The other particles being distinguished into little rays, according to their respective magnitudes and degrees of refrangibility, excite intermediate vibrations, and so occasion sensations of the intermediate colours; in like manner as the vibrations of the air, according to their different magnitudes, excite sensation of different sounds.—The colours then of these little rays, not being any adventitious modifications of them, but connate, primitive, and necessary properties, resulting, in all probability, from their different magnitudes, must be perpetual, and immutable, not to be altered by any reflection, refraction, or other subsequent modification.

For the doctrine of the colours of *LIGHT*, see *COLOUR*.

For the manner in which *LIGHT* affects our senses, and how it contributes to vision, see *VISION*.

*LIGHT* is also used, to signify the disposition of objects, with regard to the receiving of *light*.

Thus we say, a painting is seen in its proper *light*, when its situation, with regard to the *light*, is the same with that for which it was painted.

*LIGHTS aboard Ships*. See the article *SIGNALS*.

*LIGHTS*, in architecture, denotes doors, windows, and other places, through which the air, and *light* have a passage. See *APERITION*.

In the pantheon, all the *light* comes from on high; it has no *lights* but in the dome. See *PANTHEON*.

*LIGHTS*, in painting, are those parts of a piece, which are illuminated, or, that lie open to the luminary by which the piece is supposed to be enlightened; and which, for this reason, are painted in bright vivid colours.

In which sense, *light* is opposed to *shadow*. See *SHADOW*.

*LIGHT* is also used, for the luminous body that emits it.—

There are various kinds of *lights*; *general lights*, as the air; *particular lights*, as a fire, a candle, and even the sun.

Different *lights*, have very different effects on a picture, and occasion a difference in the management of every part.—A great deal therefore depends on the painter's chusing a proper *light* for his piece to be illuminated by, and a great deal more, in the conduct of the *lights* and shadows, when the luminary is pitched upon.

The strength and relievio of a figure, as well as its gracefulness, depends entirely on the managements of the *lights*, and the joining of those to the shadows.

The *light* a figure receives, is either direct or reflected; to each of which, special regard must be had.—The doctrine of *lights*, and shadows, makes that part of painting, called *clair-obscur*. See *CLAIR-OBSCURE*.

*LIGHT-House*. See the article *PHAROS*.

*LIGHT-Horse*, an ancient term in our English customs, signifying an ordinary cavalier, or horseman lightly armed, and so as to enter a corps, or regiment; in opposition to the men at arms, who were heavily accoutred, and armed at all points. See *GUARD*, *GENDARMES*, &c.

*LIGHT Species*. See the article *SPECIES*.

*LIGHTER*, a large broad boat, or floating vessel, which goes with sails, and oars; common on the river Thames; where it is used for the carriage of timber, coals, ballast, &c.

*Lighters* are of several kinds; as,

A balast gin,	A close lighter,	A kiele,
A camel,	A hoy	An open lighter.

*LIGHTNESS*. See the article *LEVITY*.

*LIGNEA Cassia*. See the article *CASSIA*.

*LIGNUM Aloes*, or wood of Aloes.

*LIGNUM Balsami*.

*LIGNUM Cassia*.

} See { *ALOES*.  
          *BALSAM*.  
          *CASSIA*.

*LIKE Quantities*, in algebra are those which are expressed by the same letters, under the same power, or equally repeated in each quantity. See *QUANTITY*, and *SIMILAR*.

Thus 2 *b*, and 3 *b*; and 9 *ff*, and 3 *ff*, are *like quantities*; but 2 *b*, and 3 *b b*; and 9 *ff*, and 3 *ff ff*, are unlike ones, because the *quantities* have not every where the same dimensions, nor are the letters equally repeated.

*LIKE Signs*, or *Symbols*, in algebra, are when both are affirmative, or both negative. See *CHARACTER*.

If one be affirmative, and the other negative, they are unlike signs.

Thus + 64 *d*, and + 5 *d*, have like signs; but + 9 *f*, and — 7 *f*, have unlike signs.

*LIKE Figures*, in geometry, are such as have their angles equal, and the sides about those equal angles proportional. See *FIGURE*.

*LIKE Arches*, in the projection of the sphere in plano, are parts of lesser circles, containing an equal number of degrees with the corresponding arches of greater ones. See *ARCH*.

*LIKE solid Figures*, in geometry, are such as have their angles equal in number. See *SIMILAR*.

*LIMB*, *LIMBUS*, the outermost border, or graduated edge of an astrolabe, quadrant, or the like mathematical instrument. See *ASTROLABE*, *QUADRANT*, &c.

The word is also used for the primitive circle in any projection of the sphere in plano.

*LIMB*, also signifies the outermost border, or edge of the sun or moon, when the middle or disc is hid in an eclipse of either luminary. See *DISC*, *ECLIPSE*, &c.

Astronomers observe the lower and the upper *limb* of the sun, in order to find its true height, which is that of its center.

*LIMB* is also used among botanists for the outer edge, or border of plants, their leaves, and flowers.

*LIMBEC*. See the article *ALEMbic*.

*LIMBUS*, or *LIMB*, is a term in the Romish theology, used for that place where the patriarchs are supposed to have waited for the redemption of mankind, and where they imagine our Saviour continued from the time of his death, to that of his resurrection.

Du Cange says, the fathers called this place *limbus*, eo quod sit *limbus inferorum*, as being the margin or frontier of the other world.

LIMBUS

# L I M

**LIMBUS** is also used by Catholics for the place destined to receive the souls of infants, who die without baptism; who have not deserved hell, as dying in innocence; nor yet are worthy of heaven, because of the imputation of original sin. See **HELL**, **PURGATORY**, &c.

**LIME**, *calx of stone*, a white, soft, friable substance, prepared of stone, marble, free-stone, chalk, or other stony substance, by burning in a kiln. See **CALX**, **STONE**, **CALCINATION**, &c.

The great use of *lime* is in the composition of mortar for building; the fire taking away all its humidity, and opening its pores, so that it becomes easily reducible to powder, and miscible with sand. See **MORTAR**, and **SAND**.

**Quick LIME**, is that such as it comes out of the kiln, or furnace.

**Slaked LIME**, is that diluted, or drenched in water, and reserved for the making of mortar.

The best *lime*, is that made of the hardest, firmest, and whitest stones; and which is slaked at its coming out of the furnace.

Sir H. Wotton looks on it as a great error in the English, to make *lime* as they do, of refuse, and stuff without any choice; whereas the Italians, at this day, and much more the ancients, burnt their firmest stones, and even fragments of marble, where it was plentiful; which, in time, became almost marble again for its hardness, as appears in their standing theatres, &c.

We have two kinds of *lime* in common use in England; the one made of hard stone, the other of a soft, calcareous, or chalky stone; whereof the former is much the strongest.—That made of soft stone, or chalk, is fittest for plastering of ceilings and walls within doors; and that made of hard stones, for buildings, and for plastering without doors.

Good *lime* may also be made of mill-stone, not coarse and sandy, but fine and greasy; as also of all kinds of flints; though it is hard to burn them, unless in a reverberatory furnace, as being apt to run to glass.

Dieussant recommends *lime* made of sea-shells as the best; but Goldman finds fault with it, as being impatient of moisture, and therefore easily peeling off from the outsidings of walls: it is, however, the common *lime* used in the Indies.

Before the stones be thrown into the kiln, they are to be broke in pieces; otherwise the air contained in their cavities, too much expanded by the heat, makes them fly with so much violence, as to damage the kiln.—According to Alberti, and Palladio, *lime* will not be sufficiently burnt in less than sixty hours intense heat.

The marks of a well burnt *lime*, according to Alberti, are, that its weight be to that of the stone in a sesquialterate proportion; that it be, white, light, and sonorous; that when slaked, it stick to the sides of the vessel.—To which Boeckler adds, that when slaked, it send forth a copious thick smoke; and Dieussant, that it need a great deal of water to slake it. To preserve *lime* several years, shake, and work it up; dig a pit under ground, into which let it pass through a hole open at the bottom of the vessel. As soon as the pit is full, cover it up with sand, to prevent its drying; thus keeping it moist till it be used.—Boeckler gives another method: Cover a stratum of *lime* two or three foot high with another of sand of the like height; pour on water enough to slake the *lime*, but not to reduce it to dust after slaking. If the sand cleave into chinks, as the smoke ascends, cover them up, so as no vent may be given thereto.—This *lime*, he adds, kept ten or twelve years, will be like glue; and will, further, be of particular use in painting walls, as being no way prejudicial to the colours. See **MORTAR**.

*Lime* is much used by tanners, skinners, &c. in the preparation of their leather. See **TANNING**, **TAWING**, &c.

It is also of some medicinal use; being applied externally in desiccative, and epulotic medicines.

**LIME-WATER** is said to be an excellent remedy, taken internally: M. Burlet has an ample account of its effects, in the *French Memoirs*, chiefly from his own experience. But, he observes it succeeded much better in Holland, &c. than in France.—It is a powerful alterant, and like a pure alkaline water, fitted to blunt and destroy acid ferments, which are the principles of all obstructions, and the cause of most chronic diseases.—Its principal use is, in chachexies, green-sickness, dropsy, scurvy, obstructions of the liver, spleen, &c. See **WATER**.

It is made, by pouring six pounds of hot-water, on one of *quick-lime*, leaving them to soak, and macerate for the space of twenty-four hours.

**LIME-Stone**, *lapis calcarius*, is a softish stone, of a coarse grain, and being burnt in a kiln, makes an ingredient in mortar, plaster, &c. See **LIME**, **MORTAR**, &c.

**Bird-LIME**. See the article **BIRD-LIME**.

**LIMITATION of Affixe**, in law, is a certain time set down by the statute, wherein a man must alledge himself, or his ancestors to have been seized of lands sued for by writ of affize: otherwise he cannot maintain his action.

**LIMITED Problem**, is that which admits but of one solution,

# L I N

or which can only be solved one way: as, to make a circle pass through three points given, not lying in a right line; to describe an equilateral triangle on a line given, &c. See **PROBLEM**, and **DETERMINATE**.

**LIMITROPHOUS Column**. See the article **COLUMN**.

**LIMITS of a Planet**, its greatest excursions, or distances from the ecliptic. See **PLANET**.

**LIMNING**, the art of painting in water-colours. See **PAINTING**.

In which sense, *limning* stands contradistinguished from *painting*, properly so called, which is done in oil-colours.

*Limning* is much the more ancient kind of painting. Till a Flemish painter, one John van Eyck, better known by the name of John of Bruges, found out the art of painting in oil, the painters all painted in water, and in fresco, both on their walls, on wooden boards, and elsewhere.—When they made use of boards, they usually glued a fine linen cloth over them, to prevent their opening; then laid on a ground of white; lastly, they mixed up their colours with water and size, or with water and yolks of eggs, well beaten with the branches of a fig-tree, the juice whereof thus mixed with the eggs; and with this mixture they painted their pieces.

In *limning*, all the usual colours are proper enough, excepting the white made of lime, which is only used in fresco. But the azure, and ultramarine, must always be mixed up with size, or with gum, in regard the yolks of eggs give yellow colours a greenish tincture. But there are always applied two lays of hot size ere the colours, mixed even with size, are laid on: the composition made with eggs, and the juice of the fig-tree, being only used for touching up and finishing, and to prevent the necessity of having a fire always at hand to keep the size hot; yet it is certain, that the size-colours hold the best, and are accordingly always used in cartoons, &c.—This size is made of shreds of thin leather, or of parchment.

To *limn* on linen, they chuse that which is old, half worn, and close.—This they stamp with white-lead, or a fine plaster beaten up with size; which, once dry, they go over it with a layer of the same size.

The colours are all ground in water, each by itself; and in proportion, as they are required in working, are diluted with size-water.—If the yolks of eggs are desired, they dilute them with water made of equal quantities of common water and vinegar, with the yolk, white, and shell of an egg, and the ends of the little branches of a fig-tree cut small, all well beaten together in an earthen pan.

If it be desired to varnish the piece when finished, they go over it with the white of an egg well beaten, and then with varnish.—This, however, is only to preserve it from the wet: for the great advantage of *limning* consists in its being without gloss; in regard all its colours, thus void of lustre, may be seen in all kinds of lights; which colours in oil, or covered with varnish, cannot.

**LINCOLNSHIRE Plough**. See the article **PLOUGH**.

**LINCTUS**, a form of medicine, the same as *lambative*, *lobock*, and *eclegma*. See **LAMBATIVE**, **LOHOCK**, and **ECLEGMA**.

**LINE**, in geometry, a quantity extended in length only, without either breadth or thickness.

A *line* is supposed to be formed by the flux or motion of a point. See **POINT**.

There are two kinds of *lines*, viz. *right lines*, and *curve lines*. See **RIGHT**, and **CURVE**.

If the point A moves towards B, (*Tab. Geom. fig. 1.*) by its motion it describes a *line*; and this, if the point go the nearest way towards B, will be a right or straight *line*, whose definition therefore is, the nearest or shortest distance from any two points, or a *line* all whose parts tend the same way.—If the point go any way about, as in one of the *lines* A C B, or A c B, it will trace out either a crooked *line*, as the upper A c B; or else two or more straight ones, as in the lower A C B.

*Right Lines* are all of the same species; but curves are of an infinite number of different species.—We may conceive as many as there are different compound motions, or as many as there may be different ratios between their ordinates and abscissas. See **CURVE**.

*Curve Lines*, are usually divided into *geometrical*, and *mechanical*.

**Geometrical LINES**, are those which may be found exactly, and securely, in all their points. See **GEOMETRICAL**.

**Mechanical LINES** are those, some or all of whose points are not to be found precisely, but only tentatively, or nearly. See **MECHANICAL**.

Agreeably thereto, Des Cartes and his followers define *geometrical lines* those which may be expressed by an algebraic equation of a determinate degree.—Which equation is also called *locus*. See **LOCUS**.

The same persons define *mechanical lines*, those which cannot be expressed by an equation of a determinate degree.

Others, considering that those called by Des Cartes *mechanical lines*, notwithstanding their not being of a determinate degree, are not less precise, and exact, and consequently not less

less geometrical than the others; it being this precision which constitutes the geometricity of the *line*: For this reason, they chuse rather to call those *lines* which are reducible to a determinate degree, *algebraical lines*; and those which are not, *transcendental lines*. See GEOMETRICAL, ALGEBRAICAL, MECHANICAL, and TRANSCENDENTAL.

*Lines* are also divided into those of the *first order*, *second order*, *third order*, &c. See CURVE.

*Lines*, considered as to their positions, are either *parallel*, *perpendicular*, or *oblique*: the construction and properties of each whereof, see under PARALLEL, PERPENDICULAR, &c.

Euclid's second book treats mostly of *lines*, and of the effects of their being divided, and again multiplied into one another.

LINE, in geography, and navigation, is used by way of eminence for the equator, or equinoctial *line*. See EQUATOR.

The *line* in the heavens, is a circle describ'd by the sun in his course on the 21st day of March, and the 21st of September.

— The *line* on the earth, is an imaginary circle, answering to that in the heavens. — It divides the earth, from east to west, into two equal parts, and is at an equal distance from the two poles; so that those who live under the *line*, have the poles always in their horizon. See POLE.

The latitudes commence from the *line*. See LATITUDE.

The seamen use to christen their fresh men, and passengers, the first time they cut the *line*. See BAPTISM.

LINE of the *Apsides*, in astronomy, is the *line* which joins the apses; or it is the greater axis of the orbit of a planet. See APSIDES.

Fiducial LINE, the *line* or ruler which passes through the middle of an astrolabe, or the like instrument; and on which the sights are fitted: otherwise called *alhidade*, *index*, *dioptra*, and *mediclinium*. See ALHIDADE, &c.

Horizontal LINE, a *line* parallel to the horizon. See HORIZON.

Isochronal LINE. } See the article } ISOCHRONAL.  
Meridian LINE. } } MERIDIAN.

LINE of the *Nodes*, in astronomy, is the *line* which joins the nodes of the orbit of a planet; or the common section of the plane of the orbit with the plane of the ecliptic. See NODES.

Geometrical LINE, in perspective, is a right *line* drawn in any manner on the geometrical plane.

Terrestrial LINE, or *fundamental line*, in perspective, is a right *line*, wherein the geometrical plane, and that of the picture, or draught, intersect one another.

Such is the *line* N I, (Tab. Perspective, fig. 12.) formed by the intersection of the geometrical plane L M, and the perspective plane, H L.

LINE of the *Front*, in perspective, is any right *line* parallel to the terrestrial *line*.

Vertical LINE, is the common section of the vertical, and of the draught.

Visual LINE, is the *line*, or ray, imagined to pass from the object to the eye.

LINE of *Station*, in perspective, according to some writers, is the common section of the vertical and geometrical planes.

Others mean by it, the perpendicular height of the eye above the geometrical plane; others, a *line* drawn on that plane, and perpendicular to the *line* expressing the height of the eye.

Objective LINE, in perspective, is any *line* drawn on the geometrical plane, whose representation is sought for in the draught, or picture.

LINE of *Distance*. See the article DISTANCE.

Horizontal LINE, in dialling, is the common section of the horizon, and the dial plane. See HORIZONTAL.

Horary LINES, or *Hour lines*, are the common intersections of the hour circles of the sphere, with the plane of the dial. See HORARY, and HOUR LINES.

Substylar LINE, is that *line* on which the style or cock of a dial is erected, and is the representation of such an hour circle, as is perpendicular to the plane of that dial. See SUBSTYLAR.

Equinoctial LINE, in dialling, is the common intersection of the equinoctial, and the plane of the dial.

Contingent LINE. See the article CONTINGENT.

VOL. II. N° XCI.

Dialling LINES. }  
Meridian LINE. } See the article { DIALLING.  
Vertical LINE. } } MERIDIAN.  
 } } VERTICAL.

LINE of *Measures*, is used by Oughtred to denote the diameter of the primitive circle in the projection of the sphere in plano, or that *line* in which the diameter of any circle to be projected falls.

In the stereographic projection of the sphere in plano, *line of measures* is that *line* in which the plane of a great circle, perpendicular to the plane of the projection, and that oblique circle, which is to be projected, intersects the plane of the projection; or it is the common section of a plane, passing through the eye-point, and the centre of the primitive; and at right angles to any oblique circle, which is to be projected, and in which the centre and pole of such circle will be found.

LINE of *Direction*, in mechanics, is that wherein a body either actually moves, or would move, if it were not hindered. See DIRECTION.

The term is also used to signify the *line* that passes through the centre of gravity of the heavy body to the centre of the earth; which must also pass through the fulcrum, or support of the heavy body; without which it would fall.

LINE of *Gravitation of an heavy Body*, is a *line* drawn through its centre of gravity, and according to which it tends downwards. See GRAVITATION.

LINE of the *swiftest Descent of an heavy Body*, is a *line* wherein the body will fall the swiftest from one point to another: or, it is that curve which a body would describe in its descent, if it moved the swiftest possible. See DESCENT.

LINE of a *Projectile*. See the article PROJECTILE.

LINES on the *plain Scale*, are the *line* of chords, *line* of sines, *line* of tangents, *line* of secants, *line* of semi-tangents, *line* of leagues.—The construction and application whereof, see under the word SCALE, SAILING, &c.

LINES on *Gunter's Scale*, are the *line* of numbers, *line* of artificial sines, *line* of artificial tangents; *line* of artificial versed sines, *line* of artificial sines of rhumbs, *line* of artificial tangents of the meridian *line*, and *line* of equal parts. The construction and application whereof, see under the word GUNTER'S Scale.

LINES of the *Sector*, are the *line* of equal parts, or *line* of lines; *line* of chords, *line* of sines, *line* of tangents, *line* of secants, *line* of polygons, *line* of numbers, *line* of hours, *line* of latitudes, *line* of meridians, *line* of metals, *line* of solids, *line* of planes. The construction and use whereof, see under the word SECTOR.

LINE, in fortification, is sometimes taken for a ditch, bordered with its parapet; and sometimes for a row of gabions, or sacks of earth, extended lengthwise on the ground, to serve as a shelter against the enemies fire. See TRENCH, GABION, &c. When the trenches were carried on within thirty paces of the glacis, they drew two *lines*, one on the right hand, and the other on the left, for a place of arms.

Fundamental LINE, is the first *line* drawn for the plan of a place, and which shews its area.

Capital LINE, is that which is drawn from the point where the two demi-gorges meet, to the point of the bastion. See CAPITAL.

Central LINE, is that drawn from the angle of the centre, to that of the bastion.

LINE of *Defence*, is that which represents the course or flight of the bullet of any sort of fire-arms, more especially of a musket-ball, from the place where the musketeer must stand to scour, and defend the face of the bastion.

LINE of *Defence fichant*, is that drawn from the angle of the curtain to that of the opposite bastion; without touching the face of the bastion.

This must never exceed 800 feet, which they reckon the distance at which a musket-ball will due execution.

LINE of *Defence razant*, is that drawn from the point of the bastion along the face, till it come to the curtain; and shews how much of the curtain will clear or scour the face.

This is also called the *line of defence stringent*, or *flanking*.

LINE of *Approach*, or *Attack*, signifies the work which the besiegers carry on under covert, to gain the moat, and the body of the place. See APPROACH.

LINE of *Circumvallation*, is a *line* or trench cut by the besiegers, within cannon-shot of the place, which ranges round their camp, and secures its quarters against any relief to be brought the besieged. See CIRCUMVALLATION.

LINE of *Contravallation*, is a ditch bordered with a parapet, which serves to cover the besiegers on the side of the place, and to stop the sallies of the garrison. See CONTRAVALLATION.

LINES of *Communication*, are those which run from one work to another.—See Tab. Fortif. fig. 21. n. 2. &c. see also COMMUNICATION.—But

The LINE of *Communication*, more especially so called, is a continued trench, with which a circumvallation, or contravallation is surrounded; and which maintains a communication with all its forts, redoubts, and tenailles.

**LINE of the Base**, is a right line, which joins the points of the two nearest bastions.

To **LINE a work**, signifies to face it, chiefly with brick or stone: *e. gr.* to strengthen a rampart with a firm wall, or to encompass a parapet or moat with good turf, &c.

**LINE**, in the art of war, is understood of the disposition of an army, ranged in order of battle; with the front extended as far as may be, that it may not be flanked.

An army usually consists of three *lines*; the *first* is the front, van, or advance guard; the main body forms the *second*, in which is the general's post; the *third* is a reserved body, or rear guard. See **GUARD**.

It is a rule, to leave 150 paces distance between the first *line* and the second, and twice as much between the second and third, to give room for rallying.

**LINE**, or **LINE of Battle**, is also applied to the disposition of a fleet on the day of engagement; on which occasion, the vessels are usually drawn up, as much as possible, in a straight *line*, as well to gain and keep the advantage of the wind, as to run the same board.

**Ship of the LINE**, is a vessel large enough to be drawn up in the *line*, and to have a place in a sea-fight. See **SHIP**.

**LINE of Demarcation**, or **Alexandrian Line**, is a meridian passing over the mouth of the river Maragnon, and by the capes of Houmas, and Malabrigo; so called from pope Alexander VI. who, to end the disputes between the crowns of Castile and Portugal, about their boundaries, in 1493, drew an imaginary *line* on the globe, which was to terminate the pretensions of each. By which partition, the East-Indies fell to the lot of the Portuguese; and the West-Indies, then newly discovered, to the Castilians.

**LINE**, in fencing, is that of the body directly opposite to the enemy, wherein the shoulders, the right arm, and the sword ought always to be found; and wherein are also to be placed the two feet, at the distance of 18 inches from each other. In this sense, a man is said to be in his *line*, to go out of his *line*, &c.

**LINE**, in genealogy is a series or succession of relations, in various degrees, all descending from the same common father.

**Direct LINE**, is that which goes from father to son; which is the order of ascendants and descendants. See **DIRECT**.

**Collateral LINE**, is the order of those who descend from some common father related to the former, but out of the *line* of ascendants, and descendants.—In this are placed uncles, aunts, cousins, nephews, &c. See **COLLATERAL**, **ASCENDANT**, and **DESCENDANT**.

**LINE** also denotes a small French measure, containing the 12th part of an inch, or 144th part of a foot. See **INCH**, &c.

The geometricians, notwithstanding its smallness, conceive the *line* subdivided into six points.

The French *line* answers to the English *barley-corn*. See **MEASURE**.

**LINEA \* Alba**, in anatomy, the concurrence of the tendons of the oblique and transverse muscles of the abdomen; dividing the abdomen in two, in the middle. See **ABDOMEN**.

\* It is called *linea*, line, as being straight; and *alba*, from its colour, which is white.

The *linea alba* receives a twig of a nerve from the intercostals in each of its digitations or indentings, which are visible to the eye, in lean persons especially.

**LINEA Mediana**. See the article **MEDIANA**.

**LINEAL Descent**. } See the article } **DESCENT**.

**LINEAL Exegesis**. } See the article } **EXEGESIS**.

**LINEAMENT**, a fine stroke or line observed in the face, and forming the delicacy thereof; being that which preserves the resemblance, and occasions the relation of likenesses or unlikenesses to any other face.

It is by these, that physiognomists pretend to judge of the temper and manners of people. See **PHYSIOGNOMY**, and **FACE**.

**LINEAMENT** is also used by the painters for the out-line of a face. See **CONTOUR**.

**LINEANS Punctum**. See the article **PUNCTUM**.

**LINEAR Problem**, in mathematics, is that which may be solved geometrically, by the intersection of two right lines.

*E. gr.* To measure an inaccessible height by the means of two unequal sticks, &c.

This is also called a *simple problem*, and is capable but of one solution. See **PROBLEM**.

**LINEAR Numbers**, are such as have relation to length only. See **NUMBER**.

Such, *e. gr.* is a number which represents one side of a plane figure. If the plane figure be a square, the *linear number* is called a *root*.

**LINED Moat**. See the article **MOAT**.

**LINEN-Mills**.

**White LINEN**.

**Bleaching of LINEN**.

**LINGOT**, or **INGOT**. See the article **INGOT**.

**LINGUA**, in anatomy. See the article **TONGUE**.

**LINGUÆ Frænum**. } See the article } **FRÆNUM**.

**LINGUÆ Medietas**. } See the article } **MEDIETAS**.

**LINIMENT \***, **LINIMENTUM**, a form of external medicines, made of unctuous substances, to rub on any part.

\* The word comes from the Latin *linire*, to anoint gently.

The *liniment* is of a mean consistence between an oil and an unguent. See **OIL**, and **UNGUENT**.

The use of *liniments* is to soften asperities of the skin, moisten parts that need humectation, resolve the humours that afflict the patient, and give him pain.—There are various kinds of *liniments* used, according to the various occasions.

**LINSEED**, or **LINE-SEED**, a sort of grain which enters the composition of several medicines, and yields, by expression, an oil, that has most of the qualities of nut-oil, and is accordingly sometimes used in lieu thereof in painting, and to burn.

That drawn without the assistance of fire, is of much esteem in medicine, and supposed good in the cure of catarrhs, coughs, asthma's, and other diseases of the breast, &c.

**LINSTOCK**, a short staff of wood, about three foot long, having at one end a piece of iron divided into two branches, each of which has a notch to hold a piece of match, and a screw to fasten it there; the other end being also shod with iron, and pointed, to stick into the ground.—It is used by the gunners in firing cannon.

**LINTEL**, in architecture, the piece of timber which lies horizontally over door-posts, and window-jams; as well to bear the thickness of the wall over it, as bind the sides of the walls together. See **DOOR**, &c.

**LINUM Catharticum**, or *mountain-flax*, a medicinal plant, much used by common people; being a rough harsh purge, and powerful detergent, and evacuator of viscid and watery humours from the most remote lodgments; which makes some fond of it in rheumatisms: but it is only fit for robust constitutions.

**LINUM Vivum**, or *Incombustible*, a fossile, stony substance of a whitish colour and woolly texture, separable into threads, or filaments, capable of being spun, and wove into a sort of cloth, which will endure the fire without consuming. See **INCOMBUSTIBLE**.

This is the same with what is otherwise called *lapis amianthus*, or *asbestos*; sometimes, *salamander's wool*, also *linum fossile*, *linum Indicum*, *Creticum*, *Cyprium*, &c. See **ASBESTOS**.

As to the art of managing this mineral, and of spinning and weaving it, &c. the accounts we have are various.—Signior Castagnata, superintendant of some mines in Italy, gives us the art of reducing it either into a very white skin, or a very white paper, either of which resists the most violent fire. See **PAPER**.

Marco Polo, the Venetian, gives us the manufacture of the *linum*, found in the province of Chinchinthelas in Tartary, from one Curficar a Turk, superintendant of the mines of that country, as follows.—The lanuginous mineral, being first dried in the sun, is then pounded in a brass mortar, and the earthy part separated from the woolly, which is afterwards well washed from filth; being thus purified, it is spun into thread like other wool, and after wove into cloth, which, if foul or spotted, they cleanse, he says, by throwing it into the fire for an hour's time, whence it comes out unhurt as white as snow: Which very method, according to the account given us by Strabo, seems to have been used, in ordering the Cretan amianthus; with this addition, that after it was pounded, and the earthy part separated from the woolly, he says it was combed; and so does Agricola.

Signior Campani, after describing four sorts of the *linum*, whereof he had specimens in his museum; the first sent him from Corfu, the second from Siftri di Ponente, the third coarser and darker than the rest, and the fourth from the Pyreneans; and after observing, though he kept it three weeks in a glass-house fire, yet he found it unaltered, though it could not preserve a stick, wrapped in it, from the fire: he proceeds to shew the manner of spinning it, and making it into cloth, which he effected thus:—He first laid the stone in water, if warm the better, for some time to soak; then opened and divided it with his hands, that the earthy parts might fall out of it, which are whitish like chalk, and serve to bind the thready parts together. This makes the water thick, and milky. That operation he repeated six or seven times,

# L I P

times, with fresh water, opening and squeezing it again, and again, till all the heterogeneous parts were washed out, and then the flax-like parts were collected, and laid in a sieve to dry.

As to the spinning, he first shews a method discovered to him, which is thus.—Lay the *linum*, cleansed as before, between two cards, such as they card wool withal, where let it be gently carded, and then clapped in between the cards, so that some of it may hang out of the sides; then lay the cards fast on a table, or bench; take a small reel, made with a little hook at the end, and a part to turn it by, so that it may be easily turned round. This reel must be wound over, with white thread: then having a small vessel of oil ready, with which the fore-finger and thumb are constantly to be kept wet, both to preserve the skin from the corrosive quality of the stone, and to render the filaments thereof more soft and pliant; by continuing to twist about the thread on the reel in the asbestos hanging out of the cards, some of the latter will be worked up together in it; and, by little and little, the thread may, with care, be woven into a coarse sort of cloth; and, by putting it into the fire, the thread and oil will be burnt away, and the incombustible cloth remain. But finding this way, of uniting the stone with the thread, very tedious, instead of the thread, he put some flax on a distaff, and, by taking three or four filaments of the asbestos, and mixing them with the flax, he found they might be easily twisted together, and the thread thus made much more durable and strong; so that there is no need of carding, which rather breaks the filaments, than does any good: only open and separate the filaments after washing, on a table, and take them up with the flax, which is sufficient.

As to the making of paper, he says, in the washing of the stone there will remain several short pieces in the bottom of the water, of which paper may be made in the common method. See PAPER.

He concludes with the best way of preserving the cloth, or any thing made of the linen, which, by reason of its excessive dryness, is very apt to break and twist; and it consists in keeping it always well oiled, which is the only preservative. —When the cloth is put in the fire, the oil burns off, and the cloth comes out white and purified.

**LIONCELES**, in heraldry, a term for lions, when there are more than two of them born in any coat of arms, and no ordinary between them.

**LIPOTHYMIA**\*, or **LIPOPSYCHIA**, in medicine, a sudden diminution, or failure of animal and vital actions; otherwise called a  *swooning*, or *deliquium*. See **DELIQUIUM**, **SWOONING**, **SYNCOPE**, &c.

\*The word *lipothymia* comes from the Greek *λειπω*, *deficio*, and *θυμος*, *animus*; and *lipopsychia* from *λειπω*, and *ψυχη*, the soul. In the *lipothymia* the pulse is very faint; the senses both internal and external, and the animal motions, both voluntary and natural, extremely weakened, and the respiration scarce visible.

The ordinary causes of the *lipothymia*, are great losses of blood, excessive evacuations, immoderate exercise, gross hot air, such as that in the midst of crowds of people, &c.

**LIPPITUDO**, is used by Celsus, for a disease of the eyes, otherwise called *ophthalmia*. See **OPHTHALMIA**.

**LIPPITUDO**, is also used by modern writers, for a disorder popularly called *blear-eyed*; arising from a decay of the natural moisture of the eyes, which then feel dry, and appear red and angry. See **SCLEROPHTHALMIA**.

**LIPS**, *Labia*, the edge, or exterior part of the mouth; or that musculous extremity, which shuts and covers the mouth, both above and below. See **MOUTH**.

The *lips*, besides the common integuments, consists of two parts, the exterior, hard, and musculous; interior, soft, spongy, and glandulous, covered with a fine membrane, the fore and protuberant parts of which are red, and called *prolabia*.—Authors generally content themselves, with calling the substance of this part, spongy: but, in reality, it is glandulous, as appears by the scrophulous, and cancerous humours, to which it is subject.—The muscles, of which the outer parts of the *lips* consist, are either common to them with other parts, or proper; the common are the third pair of the nose, the subcutaneous, and the buccinator.

The *lips* have six pair of muscles peculiarly belonging to them, and an odd one; of these, three are peculiar to the upper and under *lip*, the other three, and the single one, are common to both *lips*: the peculiar are, the *attollens labiorum superius*, *deprimens labiorum inferius*, *attollens labiorum inferius*; the three common pair are, the *zygomaticus*, the *depressor labiorum*, the *attollens labiorum*; the odd one, *orbicularis*; which see.

All these parts are served with blood, by some branches of the carotids, which the veins carry back to the external jugulars.—Their nerves come from the fifth, sixth, and eighth pair of the head, and some from the par accessorium. The *lips* have a great share in the action of speech, and are of good use in taking the food, &c.

**LIPS**, is also applied to the two extreme parts of the pudendum muliebre; between which is the rima, or fissure of the part. These are more peculiarly called *labia pudendi*; being soft,

# L I S

oblong bodies; of a peculiar substance, not found in any other part of the body.

**LIPS** are also used, to signify the two edges of a wound.

**LIQUEFACTION**, an operation, by which a solid body is reduced into a liquid; or the action of fire or heat, on fat, and other fusible bodies, which put their parts into a mutual intestine motion.

The *liquefaction* of wax, &c. is performed by a moderate heat; that of sal tartari, by the mere moisture of the air: all salts *liquify*; sand, mixed with alkalies, becomes *liquified* by a reverberatory fire, in the making of glass. See **GLASS**. In speaking of metals, instead of *liquefaction*, we ordinarily use the word *fusion*. See **FUSION**.

**LIQUET**. See the article **NON LIQUET**.

**LIQUID**, a body which has the property of fluidity; and besides that, a peculiar quality of wetting other bodies immersed in it, arising from some configuration of its particles, which disposes them to adhere to the surfaces of bodies contiguous to them. See **FLUID**.

**LIQUORICE**, **LIQUORITIA**, called also *glycyrrhiza*, and *radix dulcis*, a sweet tasted root, of considerable use in medicine, against coughs and other disorders of the breast and lungs. The shrub which bears it, is cultivated in divers parts of England, particularly about Pontefract in Yorkshire; in some provinces of France, Spain, Germany, and Muscovy; and especially in Persia, where it thrives better than any where else; there being some on the banks of the Carafu, Kenki, and Kerniarpas, whose roots are thicker than the arm; and whose juice, in respect of strength, virtue, &c. are preferable to others.

The root of the *liquorice* plant runs, or spreads a great way in the ground, and emerging into air from place to place produces so many new stems, or plants, few of which rise above five feet high. Its leaves are thick, green, shining, half round, and glutinous; its flowers red, like the hyacinth; and its seed contained in roundish pods.

In the culture, care must be taken to have a warm, light, rich soil, or to amend it with manure: they plant it in trenches, three spits deep, in February, and March, usually in rows, at a foot distant from each other.—The parts chose for this purpose, are sets from the top of the plant, or the very top of the root; or else the runners that spread from the master-root.—In moist weather the branches may also be slipped and planted. They are taken about November, or December, after they have stood three summers in the ground; for then the *liquorice* weighs most, and will keep with less loss: not but that there is a continual diminution in this respect, from the first taking it.

New, green *liquorice* should be chose smooth, and even, about the thickness of the middle finger, ruddy without, yellowish within, easy to cut, and of an agreeable smell.

This root being boiled a long time in water, till the fluid has got a deep, yellow tincture; and the water, at length evaporated over a moderate fire; there remains a black, solid sediment, which we also call *liquorice*, or *liquorice juice*, or sometimes *Spanish juice*.

Chuse it black without side, and of a shining black within; easy to break, and of an agreeable taste.—The whitish, and yellowish *liquorice* juices are good for nought; being usually no other than compositions of sugar, starch, a little gum tragacant, and *liquorice* powder.

The native *liquorice* juice, is very sweet upon the palate, even more than sugar, or honey; and is yet accounted a great quencher of thirst: on which account Galen prescribes it in dropics. It is very balsamic, and detergent; inasmuch that there is scarce any medicinal composition for diseases of the breast, but it is an ingredient in.

**LIST**\*, in the manufactures, denotes the border of a stuff, or that which bounds its width on each side. See **CLOTH**, &c.

\*Du Cange derives the word from *licia*, which, in the age of corrupt Latin, was used for the inclosures of fields, and cities, as being antiently made with cords interlac'd; or from *listæ*, *quia campum claudabant instar listarum pannii*; as inclosing the ground after the manner that a *list* does a piece of cloth.

All cloths, and stuffs of silk, wool, or cotton, have *lists*: *lists* contribute to the goodness of the stuff, and further serve to shew their quality; which has given occasion to several regulations

Regulations relating to their matter, colour, work, &c. See DYING.

**LIT** is also used, to signify the inclosed field, or ground wherein the ancient knights held their jousts and combats.

It was so called, as being hemmed round with pales, barriers, or stakes, as with a *list*.

Some of these were double, one for each cavalier; which kept them apart, so that they could not come nearer each other than a spear's length. See **JUST**, **TURNAMENT**, **DUEL**, &c.

**LIST**, **LISTEE**, or **LISTELLO**, in architecture, called also *cin-  
ture*, *fillet*, *square*, and *reglet*; is a little square moulding, serving to crown or accompany larger mouldings; and, on occasion, to separate the flutings of columns. See **FILLET**, &c.

**LISTENING**, according to **Rohault**, consists in extending, or bracing the tympanum of the ear; and putting it into such a condition, as that it shall be the more affected by any tremulous motion of the external air. See **TYMPANUM**, **HEARING**, **ATTENTION**, &c.

**LISTENING Trumpet**. See the article **TRUMPET**.

**LITANY**\*, an old church term, applied to the processions, prayers, and supplications used for appeasing the wrath of God, averting his judgments, or procuring his mercies.

\* The word comes from the Greek *λειτουργία*, supplication; of *λειτουργώ*, I beseech—**Pezron** would go further, and derive the *λειτουργία*, or *λειτουργία*, of the Greeks, from the Celtic *lit*, feast, solemnity.

Ecclesiastic authors, and the Roman order, by the word *litany*, usually mean the people who compose the procession, and assist at it; and **du Cange** observes, that the word anciently signified *procession*. See **PROCESSION**.

**Simeon** of **Thessalonica** mentions, that in the ancient *litanies*, the people went out of the church, to denote the fall of **Adam**; and returned into it again, to shew the return of a pious soul to God, by repentance.

On occasion of a plague that ravaged **Rome**, in the year 590, pope **Gregory** appointed a *litany*, or procession, consisting of seven bands, or companies, who, marching from the several churches of the city, met at **S. Mary Major**.—The first company consisted of the clergy; the second of abbots, with their monks; the third of abbesses, with their nuns; the fourth, of children; the fifth, of lay-men; the sixth, of widows; and the seventh, of married women.—And from this general procession, that of **S. Mark**, called the *grand litany*, is judged to have taken its rise.

**LITANY**, in a modern sense, denotes a form of prayer, sung or said in churches; consisting of several periods, or articles: at the end of each whereof, is an invocation in the same terms.

**LITERAL Algebra**. } See the article } **ALGEBRA**.

**LITERAL Character**. } See the article } **CHARACTER**.

**LITERALIS Calculus**. See the article **CALCULUS**.

**LITERARY Criticism**. See the article **CRITICISM**.

**LITERATI**, *Letrados*, lettered, an epithet given to such persons among the Chinese, as are able to read, and write their language. See **CHINESE**.

The *literati* alone, are capable of being made mandarins. See **MANDARINS**.

**LITERATI**, is also the name of a particular sect, either in religion, philosophy, or politics; consisting principally of the learned men of that country; among whom it is called *Ju-kiao*, i. e. learned.

It had its rise in the year of Christ 1400; when the emperor, to awaken the native affection of the people for knowledge, which had been quite banished by the preceding civil wars among them, and to stir up emulation among the mandarins, chose out forty-two of the ablest among their doctors, to whom he gave a commission to compose a body of doctrine, agreeable to that of the ancients, which was then become the rule or standard of the learned.—The delegates applied themselves to the business, with a world of attention; but some fancy them rather to have wrested the doctrine of the ancients, to make it consist with theirs, than to have built up theirs on the model of the ancients.

They speak of the Deity, as if it were no more than mere nature, or the natural power or virtue that produces, disposes, and preserves the several parts of the universe. It is, say they, a pure, perfect principle, without beginning or end; it is the source of all things, the essence of every being; and that which determines is to be what it is.—They make God the soul of the world; say, he is diffused throughout all matter, and produces all the changes that happen there. In short, it is not easy to determine, whether they resolve God into nature, or lift up nature into God; for they ascribe to it many of those things which we attribute to God.

This doctrine, in lieu of the idolatry that prevailed before, introduced a refined kind of atheism.—The work being composed by so many persons of learning and parts, and approved by the emperor himself, was received with infinite applause by all the people.—Many were pleased with it, in regard, it seemed to subvert all religion: others approved it, because the little religion that it left them, could not give them much trouble.—And thus was formed the sect of the *Literati*; which consists of the maintainers, and adherents to this doctrine.

The court, the mandarins, and the persons of fortune and

quality, &c. are generally retainers to it; but a great part of the common people still hold to their worship of idols.

The *Literati* freely tolerate the Mahometans, because they adore, with them, the King of heaven, and Author of nature; but they bear a perfect aversion to all sects of idolaters among them; and it was once resolved to extirpate them. But the disorder this would have occasioned in the empire, prevented it: they now content themselves with condemning them, in general, as heresies; which they do solemnly every year at **Pekin**.

**LITHARGE**, a metalline substance, formed of the spume of silver, or other metals; used in the composition of plaisters, to give them a due consistence.

\* The word is Greek, *λίθαργος*, composed of *λίθος*, and *αργός*, silver.

There are two kinds of litharge, the one *natural*, the other *artificial*.

**Natural LITHARGE**, is a mineral, sometimes found in lead mines, reddish, scaly, brittle, and somewhat resembling white lead.—This *litharge* is so exceeding rare, that the shops sell none but the

**Artificial LITHARGE**; which is of two kinds, viz. that of *gold*, and that of *silver*; or rather it is the same, with this difference, that the one has undergone a greater degree of fire than the other.

Indeed naturalists are not over-well agreed what the *artificial litharge* is: some consider it as a metallic scum, raised on the surface of *lead*, when melted; after having served to purify gold, silver, or copper.

Others consider it as a metallic foot, or smoke, arising from those metals mixed with the lead used in purifying them; which sticking to the top of the chimnies of furnaces, is there formed in a kind of scales.

Lastly, others consider it as the lead itself, used in refining of those metals, and especially copper; which last opinion appears the most credible; and the rather, on account of the great quantities of these *litharges* brought from **Poland**, **Sweden**, and **Denmark**; where copper-mines are much more frequent, than those of gold and silver.—The drossy or recrementitious parts, fixing to the sides of the test, are the *litharge*; and according to the degree of calcination, become of divers shades of a red colour. The deep is called *litharge of gold*, and the paler, *litharge of silver*.

*Litharges* are desiccative, detentive, and cooling; they make the consistence of several plaisters.—The potters use them to give a beautiful gloss to their ware; and they are also used by painters, dyers, skimmers, and glaziers. When mixed with wine, they give it a bright spritely colour, but render it extremely unwholesome.

**LITHIASIS**, *Λιθιασμός*, in physic, the disease of the stone. See **STONE**, and **CALCULUS**.

**LITHOCOLLA**\*, or **LITHOCOLLUM**, a cement used by the lapidaries, to fasten their precious stones, in order for cutting them. See **CEMENT**.

\* The word comes from the Greek *λίθος*, stone, and *κόλλα*, glue.

It is composed of resin and brick-dust.—For diamonds, they use melted lead, putting them into it before it be quite cold. For other cements they mix marble-dust with strong glue; and to fasten their sparks, add the white of an egg, and pitch.

**LITHOMARGA**. See the article **MINERAL AGARIC**.

**LITHONTHRIPTICS**\*, medicines proper to dissolve the stone in the bladder, and kidneys. See **CALCULUS**, and **STONE**.

\* The word comes from the Greek *λίθος*, stone, and *θρυπτός*, I break.

**LITHOTOMY**, an operation in chirurgery, performed upon a human body, in order to extract the stone out of the bladder. See **STONE**, and **CALCULUS**.

This is performed three several ways, viz. by the small apparatus, the great apparatus, and the high apparatus.

The first, is by cutting through the perinæum near the future, on the left side, after the stone, by the fingers of the operator, has been brought to that part.—This is called *cutting upon the gripe*; but is almost disused, by reason it subjects the patient to great hazards and inconveniencies.

In the *great apparatus*, which is that ordinarily practised, after the patient is conveniently placed and bound, the operator introduces a proper instrument, through the urinary passage into the bladder, in order to search for the stone; which being found, that instrument is withdrawn, and another grooved one introduced the same way; which bulging in the perinæum, serves to direct the knife to the neck of the bladder. After the incision, a third instrument is thrust into the aperture, till it join the former that was last introduced through the urinary passage, at which time that is withdrawn, whilst this remains to guide the forceps directly into the bladder, to bring away the stone.—This way is called *cutting upon the staff*.

The third method, called also the *high operation*, first practised by **Pet. Franco**, has been since described, and strenuously pleaded

pleaded for by a chirurgical writer, Rosset, but it soon fell into oblivion; from which it was only recalled about the year 1719, by Mr. Douglass, a Surgeon of London, who collecting what scattered hints he could find relating to it, and improving them with his own observations, paved the way for its being brought into regular use, which before it never had been.—He was soon followed by Mr. Cheselden, and some others. Of 31 patients cut by them in this manner, in a few years, 25 recovered.—It is true, Mr. Cheselden has since quitted this method for the lateral operation.—Of late years, the French have begun to adopt the high operation; and M. Morand, a Surgeon of Paris, has wrote a book on the subject, chiefly taken from the English writers. See *Hist. Acad. R. Scien. an. 1728. p. 36, seqq.*

The manner of proceeding herein, is this: After the bladder is injected with a sufficient quantity of warm water, and the patient conveniently placed, the operator slowly makes an incision above the os pubis, along the linea alba, till he gets sight of the bladder, into which he directly plunges his knife, and afterwards draws out the stone.

The advantages attending this method, are, That it is performed in a very short time; that the wound easily heals; that the dilaceration of parts, frequent in the other ways, is prevented; and that there is no danger of the incontinentia urinæ.—On the other hand, it is thought to be chiefly practicable upon young persons, and such as are lean; the wound in old and fat persons being apt to mortify: moreover, if the operator be not very cautious, he may easily let out the intestines.

To these may be added the *lateral operation*, invented by Frere Jacques, a religious of the third order of S. Francis, towards the close of the last century, and practised by him with great reputation in the Franche Comte. But this reputation it lost again at Paris; which, however, did not hinder M. Rau, anatomy professor at Leyden, from undertaking to rectify what was amiss in it: in which he succeeded, inasmuch that the method is now known by his name, which has taken place of that of the first inventor. See *Hist. Acad. R. Scien. an. 1699, p. 34. item, an. 1728, p. 38.*

**LITTER**\*, *Leſtica*, a kind of vehicle born upon shafts; anciently esteemed the most easy, and genteel way of carriage.

\* Du Cange derives the word from the barbarous Latin *leſteria*, straw or bedding for beasts.—Others will rather have it come from *leſtus*, bed, there being ordinarily a quilt and a pillow to a litter; in the same manner as to a bed.

Pliny calls the *litter* the traveller's chamber; it was much in use among the Romans, among whom it was born by slaves, kept for that purpose; as it still continues to be in the East. The Roman *leſtica*, made to be born by four men, was called *tetraptorum*; that born by six, *hexaptorum*; and that born by eight, *octaptorum*.

The invention of *litters*, according to Cicero, was owing to the kings of Bithynia: in the time of Tiberius they were grown very frequent at Rome; as appears from Seneca; and even slaves themselves were born in them, though never by more than two persons, whereas men of quality had six or eight.

**LITTLE** *Bairam*. } See the article { **BAIRAM**.  
**LITTLE** *Capstan*. } **CAPSTAN**.  
**LITTLE** *Maſi*. } **MASS**.

**LITTORAL** *Shells*, among writers of natural history, are such sea-shells as are always found near the shores, and never far off in the deep. See **SHELL**.

Those which are found in the bottom of the sea, remote from the shore, are called *pelagiæ*. See **PELAGIÆ**.

**LITURGY**\*, denotes all the ceremonies in general, belonging to divine service.

\* The word comes from the Greek *λεῖτουργία*, service, public ministry; formed of *λεῖτο*, public, and *ργον*, work.

In a more restrained signification, *liturgy* is used among the Romanists to signify the mass; and among us the common-prayer. See **MASS**, &c.

All who have written on *liturgies* agree, that, in the primitive days, divine service was exceedingly simple, only clogged with a very few ceremonies, and consisting of but a small number of prayers; but, by degrees, they increased the number of external ceremonies, and added new prayers, to make the office look more awful and venerable to the people. At length things were carried to such a pitch, that a regulation became necessary; and it was found proper to put the service, and the manner of performing it, into writing; and this was what they called a *liturgy*.

*Liturgies* have been different at different times, and in different countries.—We have the *liturgy* of S. Chrysostom, that of S. Peter, of S. James, the *liturgy* of S. Basil, the Armenian *liturgy*, the *liturgy* of the Maronites, of the Coptæ, the Roman *liturgy*, the Gallican *liturgy*, the English *liturgy*, the Ambrosian *liturgy*, the Spanish and African *liturgies*, &c.

**LITUS**, in medicine, the same as *liniment*. See **LINIMENT**.

**LITUUS**, among medalists, the staff used by the augurs, made in form of a crozier. See **AUGUR**.

We frequently see it on medals, along with other pontifical

instruments.—Aulus Gellius says, it was bigger in the place where it was crooked, than elsewhere.

**LIVER**\*, a large glandulous viscous, of a red sanguine colour, situated immediately under the diaphragm, in the right hypochondrium, which it almost fills; and thence stretching itself over the right side of the stomach, towards the left hypochondrium, reaches behind the cartilago ensiformis, growing gradually thinner and narrower: It serves to purify the mass of blood, by making a secretion of the bilious humour it contains.—See *Tab. Anat. (Splanchn.) fig. 1. lit. a. b. fig. 3. lit. k. (Angeiol.) fig. 4. litt. a e e, &c. fig. 5.* See also **BILE**, and **BLOOD**.

\* Plato, and other of the ancients, fix the principle of love in the liver; whence the Latin proverb, *Cogit amare jecur*: and in this sense Horace frequently uses the word, as when he says, *Si terrere jecur quæris Idoneum*.—The Greeks from its concave figure, call'd it *ήπαρ*, vaulted, suspended; the Latins call it *jecur*, q. d. *juxta cor*, as being near the heart. The French call it *foyer*, from *foyer*, *focus*, or fire-place; agreeable to the doctrine of the ancients, who believed the blood to be boiled and prepared in it.—Erasistratus, at first, call'd it *parenchyma*, i. e. *effusion*, or *mass of blood*: and Hippocrates, by way of eminence, frequently calls it the *hypochondrium*.

The upper part of the liver is convex, and perfectly smooth; the under concave, and somewhat more uneven, having four large fissures; one, through which the umbilical ligament passes; a second on the left side, receiving the pylorus, and the beginning of the duodenum; a third on the right side, near the margin, in which the gall-bladder is lodged; and the last in the upper part, affording a passage to the vena cava.

Its figure is somewhat approaching to round, with thin edges, not altogether even, but notched in some places. Its magnitude is various in different subjects, according to the proportion of the body; though in a foetus, or very young animal, it is always larger, in proportion, than in adults.—In dogs and other animals of the quadruped kind, it is divided into several distinct lobes, but in men it is generally continued; having one small protuberance, which some account a little lobe.—It is sometimes, however, observed in men to have been divided into two or three lobes. See **LOBE**, &c.

The liver is connected to several parts, but especially to the diaphragm, to which it is fastened by a broad, thin, but strong femicircular ligament, called the *suspensory ligament*, derived from the common capsula of the porta, and gall ducts.—The continuity of this ligament being interrupted by the perforation of the vena cava, has given occasion to some anatomists to divide it into two.—It is likewise, by another strong ligament, which has its origin from the external coat of the liver, or, which amounts to the same, from the peritonæum, tied to the cartilago xiphoides; and by a third, which is formed out of the umbilical vessels, which in adults dry up, and become a ligament, it is connected to the tendons of the abdominal muscles in the linea alba at the navel.—These several ligaments serve to keep it in its due situation: besides which, it has some other connections by the blood-vessels.

The liver has a motion, though not proper to itself, but depending on that of the diaphragm; to which being very firmly connected, it must needs obey its motion; and in expiration be drawn up, and in inspiration be let down again.—It is covered with a thin smooth membrane, derived from the peritonæum, which may be separated from the substance of the liver, though not without some danger of laceration.—The substance of the liver is vascular and glandulous; which latter part is very soft and friable, and pretty easily scraped off from the vessels, to which the glands every way adhere, as it were in bunches; which has made the anatomists call the considerable ones, the *internal lobes of the liver*.

The glands adhering thus to the vessels, and constituting those lobes, are wrapped up together in proper membranes; whence this appearance of distinct lobes.—Every one of these glands, according to Malpighi, is composed of six unequal sides, or faces. They are all clothed with their proper membranes, and have each an excretory duct; several of which joining together, form little trunks, which run all along with the branches of the porta; and these again uniting, form longer trunks, which are always found full of bile, and constitute the porus bilarius; which being distributed all over the liver, receives, in the foregoing manner, the bile; which is separated by these glands, and terminating in the meatus hepaticus; and in the ductus communis, at length discharges the bile into the duodenum. See **BILE**.

Besides this discharge by the porus bilarius, which is supposed to be the great one, the liver also delivers part of its bile into the gall-bladder, by a duct, called the *cyst-hepatic duct*, first discovered by Dr. Glisson; by means whereof, there is an immediate communication between the porus bilarius and the gall-bladder; a particular description of which last part, see under the words **GALL**, **CYST-HEPATIC**, &c.

Besides these gall-vessels, which are peculiar to the liver, it abounds with blood-vessels, especially veins; whereof the porta and cava are disseminated through the whole substance of

it.—And here it is particularly remarkable of the porta, that after the manner of arteries, it shoots itself from a trunk into branches; and being at last lost in capillaries, delivers the blood into the cava, by which it is immediately reconveyed to the heart.

The porta is formed out of the concurrence of divers veins, which, meeting together, make one of the most considerable venous trunks of the body, as to its bulk; though contrary to the course of other veins, it runs not far in a trunk, but is soon distributed again by ramifications into the liver. See PORTA.

The blood conveyed into the liver by the porta, after the manner of the arteries, is received again, after having been purged of its bile in the glands of the liver, into innumerable veins, which empty themselves into the cava, and are vulgarly, though improperly, called *branches* of the cava; but ought to be esteemed the proper blood-vessels of the liver; as the emulgents are of the kidneys; and which, as all the rest do, except the pulmonary vein, empty themselves into the cava; the common channel by which the blood returns to the heart. See CAVA.

The arteries, which are called the *hepatic*, come from the right branch of the coeliac.—Dr. Glisson thinks the porta does so much the office of an artery, that no more arteries are necessary, than those which furnish nourishment to the membranes and capsula; but Dr. Drake judges, they serve for the nourishment of the whole part.—These arteries are much bigger in men, than in other animals.—Mr. Cowper had several preparations, wherein the stem of each hepatic artery was as large as a goose-quill, and the branches in the liver, every where equal in magnitude to those of the porus bilarius, which they accompany.—Dr. Drake conjectures, that in this viscous in a human body, a larger stream, and directer impetus of arterious blood, is required to drive on the venous, because of the erect posture, than in animals of an horizontal position of body. For which reason horses, &c. though of much larger size, and having much bigger livers, have these arteries much smaller than men; and not only so, but curled like the tendrils of a vine, to break the impetus, which, in that posture, is not so necessary as in the erect. See BILE.

The liver has its nerves from the hepatic plexus, formed on the right hypochondrium by the branches of the intercostal, which wrapping themselves about the arteries, make a sort of net-work; and after spreading themselves on the membrane and surface, disappear.—The lymphæducts are numerous, though not easily discernible in human subjects, for want of live dissections; but in other animals that may be dissected alive, become very conspicuous, by applying a ligature to the porta and the biliary duct.—For the use of the LIVER in the secretion of bile, see BILE.

LIVER of antimony. See the article ANTIMONY.

LIVERY, properly signifies a colour, to which a person has some particular fancy, and by which he chuses to distinguish himself and retainers, from others. See COLOUR.

*Liveries* are usually taken from fancy, or continued in families by succession.—The ancient cavaliers, at their tournaments, distinguished themselves by wearing the *liveries* of their mistresses: Thus people of quality make their domestics wear their *livery*.

Father Menestrier, in his treatise of *Carroufals*, has given a very ample account of the mixtures of colours in *liveries*. Dion tells us, that Oenomaus was the first who invented green and blue colours for the troops which, in the circus, were to represent land and sea-fights. See FACTION.

The Romish church has also her several colours and *liveries*; white, for confessors and virgins, and in times of rejoicing; black, for the dead; red, for the apostles and martyrs; blue or violet, for penitents; and green, in times of hope.

Formerly great men gave *liveries* to several, who were not of their family or servants, to engage them in their quarrels for that year; but this was prohibited by the statute 1 Hen. IV. and no man, of whatever condition, was allowed to give any *livery*, but to his domestic officers, and council learned in the law.

LIVERY, in law, also denotes the delivery of possession, to those tenants which held of the king in capite, or by knights service. See POSSESSION.

LIVERY is also used for the writ, which lies for an heir to obtain the possession, or seisin of his lands at the king's hands.

LIVERY of Seisin, is a delivery of possession of land or tenements, or things corporeal, to him who hath right, or probability of right to them. See SEISIN.

*Livery of Seisin*, is a ceremony used in the common law, in conveyance of lands, tenements, &c. where an estate in fee-simple, fee-tail, or other free-hold, shall pass; and is a testimonial of the willing departure of him who makes the *livery*, from the thing whereof *livery* is made, as well as of a willing acceptance by the other party, of all that whereof the first has divested himself.

Anciently, there were a pair of gloves, a ring, knife, ear of wheat, &c. delivered, in sign of *livery* and *seisin*. See INVESTITURE.

The usual manner of *livery of seisin* is thus.—If it be in the open field where is no house nor building, and if the estate pass by deed, one openly reads it, or declares the effect of it; and after that is sealed, the venter takes it in his hand, with a clod of earth, or a twig or bough, which he delivers to the vendee, in the name of possession, or seisin, according to the purport of the deed.—If there be a house or building on the land, the ceremony is to be done at the door of it, none being then left within; and the ring of the door is delivered to the vendee, who enters alone, shuts the door, and presently opens it again.—If it be a house without land or ground, the *livery* is made, and possession given, by delivery of the ring of the door and deed only; and where it is without deed, either of lands or tenements, there the party declares by word of mouth, before witnesses, the estate he parts with, and then delivers seisin, or possession as aforesaid: in which case the land passes as well as by deed, by virtue of the *livery of seisin*.

LIVES. See ANNUITY, and POLICY of Insurance.

LIVRE\*, a French money of account, consisting of twenty sols; each sol containing twelve deniers. See MONEY, SOL, &c.

\* The origin of the word is fetch'd hence, that anciently the Roman *libra*, or pound, was the standard by which the French money was regulated; twenty sols being made equal to the *libra*.—By degrees the *libra* became a term of account, so that any coin just worth twenty sols was a *livre*, or *libra*; and since the time of Charlemagne, all contracts have been made on the foot of this imaginary coin; tho' the sols have frequently chang'd their weight and alloy. See LIBRA.

The *livre* is of two kinds, *Tournois*, and *Paris*.

LIVRE *Tournois*, as above, contains twenty sols *Tournois*, and each sol twenty deniers *Tournois*.

LIVRE *Paris*, is twenty sols *Paris*, each sol *Paris* worth twelve deniers *Paris*, or fifteen deniers *Tournois*. So that a *livre Paris*, is equivalent to twenty five sols *Tournois*: the word *Paris* being used in opposition to *Tournois*, by reason of the rate of money, which was one fourth higher at Paris, than at Tours.

One penny sterling was equal to thirteen and a half deniers *Tournois*: so that the English pound sterling, was equal to thirteen *livres*, six sols, eight deniers of French money; while the exchange was on the foot of fifty four pence sterling, to a French crown of sixty sols *Tournois*; which was the late par between England and France:—But at present, the French crown is but equal to 27 d.  $\frac{1}{2}$  sterling, on which footing the *livre* is but equivalent to 10 d.  $\frac{1}{4}$  sterling.

There have since been pieces of gold struck, of twenty sols value, and under Henry III. in 1575, species of silver of like value: Both the one and the other were called *francs*, and thus the imaginary coin became real. See FRANC.

It appears that the Romans also had a kind of money which they called *libra*, or *libella*: which was the tenth part of their denarius; so called, because equivalent to an *as*; which, at first, weighed a *libra*, or pound of copper.—Scaliger adds, that they used *libra* as a term of account, not as a coin: *Libra erat collectio nummorum, non nummus*. See DENARIUS, AS, and POUND.

LIXIVIOUS, LIXIVUM, or LIXIVIATE, in chymistry, is understood of salts extracted from burnt vegetables, by lotion. See SALT.

*Lixivious salts*, are the fixed salts of plants, &c. extracted by calcining the plants, or reducing them to ashes; and afterwards making a *lixivium* of those ashes with water. See LIXIVUM.

Mr. Boyle observes, that the difference between *lixivious* and urinous salts, consists in this, that the former change the dissolution of sublimite in common water, into a yellow colour, which the latter do not. See URINOUS.

LIXIVUM, *Lye*, a liquor made by the infusion of wood-ashes; and which is more or less pungent and penetrating, as it is more or less impregnated with salts, and fiery particles abounding therein. See ASHES.

What is left after the evaporation of such a liquor, is called a *lixivious salt*; such as all those are, which are made by incineration. See LIXIVIOUS.

*Lixiviums* are of notable use, not only in medicine, but also in bleaching, sugar-works, &c. See BLEACHING, SUGAR, POT-ASHES, &c.

LOAD a Mortar. } See the article { MORTAR.  
Training a LOAD. } TRAINING.

LOADSTONE. See MAGNET, and DIRECTION.

LOAM, or LOME, the common superficial earth; consisting of clay, with a small admixture of sand in it. See EARTH, and CLAY.

The word, it must be observed, is used with great uncertainty; by some authors, for the black mother earth, called *mould*; by others, for a reddish earth used in building, &c. See SOIL, MOULD, &c.

LOAM is also used for a sort of mortar made of this last earth, by tempering it with mud-water, straw, &c. See MOULD, EARTH, SOIL, MORTAR, &c.

LOBBY. See the article ANTICHAMBER.

LOBE,

LOBE, Λέβη, amongst anatomists, is applied to each of the two parts whereof the lungs consist. See LUNGS.

This separation into lobes, is of use in dilating the lungs, by causing them to receive more air, and preventing their being too much squeezed, when the back is bent.—For this reason it is, that beasts, which are always inclining towards the earth, have more lobes in their lungs than men: even their liver is divided into lobes, whereas that of man is continued. See Tab. Anat. (Splanchn.) fig. 14. litt. d d, &c. see also LIVER.

LOBE is also used for the tip of the ear; which is more fat and fleshy than any other part thereof. See EAR.

Du Laurent says, that the word lobe, in this last sense, comes from the Greek λῶβη, to shame, or be ashamed: this part of the ear being said to blush, when the person is ashamed.

LOBE is also used in speaking of fruits and grains.

Thus the bean consists of two equal parts, called lobes, which compose the body thereof, and are encompassed with the outer skin.—And all other grains, even the smallest, are divided, like the bean, into two lobes, or equal parts; as Dr. Grew has shewn in his *Anatomy of Plants*. See FRUIT.

LOBULE, LOBELLUS, in anatomy, a little lobe. See LOBE.

Each lobe of the lungs is divided into several lesser lobes, or lobules, which are fastened on each side, to the largest branches of the trachea.—Each lobule consists of a great number of little round vesicles, which have all a communication with one another.—It is into these vesicles that the air enters, by the trachea in inspiration; still quitting them again in expiration. See Tab. Anat. (Splanchn.) fig. 14. litt. f f, &c. see also LUNGS, ASPERA, &c.

LOCAL, something supposed to be tied, or annexed to some particular place. See PLACE.

Thus, in law, a thing is said to be local, i. e. annexed, or fixed to the freehold.—An action of trespass for battery, &c. is transitory, not local; that is, it is not necessary, that the place where battery was committed, should be set down as material in the declaration; or if it be set down, the defendant cannot traverse it, by saying, he did not commit the battery in the place mentioned in the declaration, and so avoid the action. See BATTERY.

Chose LOCAL. See the article CHOSE.

LOCAL Customs, are those peculiar to some lordship, or other district, and not agreeable to the general customs of the country. See CUSTOM.

Trespass LOCAL. See the article TRESPASS.

LOCAL Problem, in mathematics, is such an one, as is capable of an infinite number of different solutions; by reason the point, that is to solve it, may be indifferently taken within a certain extent; *e. gr.* any where in such a line, within such a plane figure, &c. which is called a *geometrical locus*.

A local problem may be either *simple*, as when the point sought is in a right line; *plane*, as when the point sought is in the circumference of a circle; *solid*, as when the point required is in the circumference of a conic section; or, *sur-solid*, as when the point is in the perimeter of a line of a higher kind, as the geometers call it. See LOCUS.

LOCAL, or artificial Memory. See the article MEMORY.

LOCAL Colours, in paintings, are such as are natural and proper for each particular object in a picture. See COLOUR.

They are so called, to distinguish them from the *clair obscure*, which consists wholly of black and white. See CLAIR-OBSCURE.

LOCAL Motion. See the article MOTION.

LOCATION, in the civil law, an act by which any thing is let out, on rent. See RENT, LEASE, &c.

The second title of the nineteenth book of the *Digest*, is on the subject of location and conduction.—Location and conduction are relative terms, and are used as well for the action of him that lets, as for that of him who takes on that letting.

Tacit LOCATION, is, when the person who takes, continues on the premises beyond the term of his lease; which, by the civil law he is allowed to do, at least for the space of a year; on the same terms.

LOCH\*, or ЛОЧОК, in pharmacy, a composition of a middle consistence between a syrup and a soft electuary; chiefly used for diseases of the lungs.

\* The word is originally Arabic; but continues still in use among the apothecaries.

The Latins call it *linctus*, and the Greeks ἐλάσσεια, by reason the manner of taking it is by licking. See LINCTUS, and ECLEGMA.

LOCHIA, or LOCHES, Λοχία, the evacuations consequent on the delivery of a woman in child-bed.

As soon as the uterus is eased of its load, its fibres, as also those of the peritonæum, muscles of the abdomen, &c. which had been extremely distended during the last period of gestation, begin to contract themselves, and their vessels; particularly the uterus, which by this means expels the blood amassed in it.—At first pure blood is evacuated, and in considerable quantities; afterwards it is diluted, and comes out more

sparingly; at length it becomes viscid, pale, &c.—These are called the *loches*.

LOCIS *Communibus*. See the article COMMUNIBUS.

LOCK, a little instrument used for the shutting and fastening of doors, chests, &c. only to be opened by a key. See KEY. The lock is reckoned the master-piece in smithery; a great deal of art and delicacy being required in contriving and varying the wards, springs, bolts, &c. and adjusting them to the places where they are to be used, and the various occasions of using them.

From the various structure of locks, accommodated to their different intentions, they acquire various names.—Those placed on outer doors are called *stock-locks*; those on chamber doors, *spring-locks*; those on trunks, *trunk-locks*, *pad-locks*, &c.

Of these, the *spring-lock* is the most considerable, both for its frequency, and the curiosity of its structure.—Its principal parts are, the main-plate, the cover-plate, and the pin-hole: to the main-plate belong the key-hole, top-hook, cross-wards, bolt-toe or bolt-nab, drawback spring, tumbler, pin of the tumbler, and the staples; to the cover-plate belong the pin, main-ward, cross-ward, step-ward, or dap-ward; to the pin-hole belong the hook-ward, main cross-ward, shank, the pot or bread, bow-ward, and bit.

LOCULAMENTUM, in botany, denotes a cell, or partition in a seed-pod, for the seed of a plant. See SEED.

In some plants we only find one *loculamentum* in a pod; in others, two, three, or more.

LOCUS, Place, in a general sense. See the article PLACE.

LOCUS Geometricus, denotes a line, by which a local or indeterminate problem is solved. See LOCAL Problem, and GEOMETRICAL.

A locus is a line, any point of which may equally solve an indeterminate problem.

This, if a right line suffice for the construction of the equation, is called *locus ad rectam*; if a circle, *locus ad circumulum*; if a parabola, *locus ad parabolam*; if an ellipsis, *locus ad ellipsin*; and so of the rest of the conic sections.

The *loci* of such equations as are right lines, or circles, the ancients called *plain loci*; and of those that are parabolas, hyperbolas, &c. *solid loci*.

Wolffius, and other moderns, divide the *loci* more commodiously into orders, according to the number of dimensions to which the indeterminate quantities rise.—Thus, it will be a *locus of the first order*, if the equation  $x = ay : c$ . A *locus of the second* or quadrate order, if  $y^2 = ax$ , or  $y^2 = a^2 - x^2$ . &c. A *locus of the third* or cubic order, if  $y^3 = ax$ , or  $y^3 = a^2 - x^3$ , &c.

The better to continue the nature of the *locus*, suppose two unknown and variable right lines A P, P M, (Tab. Analysis, fig. 29, 30.) making any given angle A S M with each other: the one whereof, as A P, we call  $x$ , having a fixed origin in the point A, and extending itself indefinitely along a right line given in position; the other P M, which we call  $y$ , continually changing its position, but also parallel to itself. An equation only containing these two unknown quantities  $x$  and  $y$ , mixed with known ones, which expresses the relation of every variable quantity A P ( $x$ ) to its correspondent variable quantity P M ( $y$ ): the line passing through the extremities of all the values of  $y$ , i. e. through all the points M, is called a *geometrical locus*, general, and the *locus* of that equation in particular.

All equations, whose *loci* are of the first order, may be reduced to some one of the four following formula's:

$$1. y = \frac{bx}{a} \quad 2. y = \frac{bx}{a} + c \quad 3. y = \frac{bx}{a} - c \quad 4. y = c - \frac{bx}{a}$$

Where the unknown quantity  $y$  is supposed always to be freed from fractions, and the fraction that multiplies the other unknown quantity  $x$ , to be reduced to this expression  $\frac{b}{a}$ , and

all the known terms to this  $c$ .

The *locus* of the first formula being already determined: To find that of the second,  $y = \frac{bx}{a} + c$ ; in the line A P, (fig. 31.)

take  $AB = a$ , and draw  $BE = b$ ,  $AD = c$ , parallel to P M. On the same side A P, draw the line A E of an indefinite length towards E, and the indefinite straight line D M parallel to A E. I say, the line D M is the *locus* of the aforesaid equation, or formula; for if the line M P be drawn from any point M, thereof parallel to A Q, the triangles A B E, A P F, will be similar: and therefore  $AB (a) : BF (b) :: AP (x) : PF = \frac{bx}{a}$ ; and consequently  $PM (y) = PF \left(\frac{bx}{a}\right) + FM (c)$ .

$$= PF \left(\frac{bx}{a}\right) + FM (c)$$

To find the *locus* of the third form,  $y = \frac{bx}{a} - c$ , proceed

thus: Assume  $AB = a$ , (fig. 32.) and draw the right lines  $BE = b$ ,  $AD = c$ , parallel to P M, the one on one side A P, and the other on the other side; and through the points A, E, draw the right line A E of an indefinite length towards E, and through the point D, the line D M parallel to A E: I say, the

# LOC

the indefinite right line GM shall be the *locus* sought; for we shall have always  $PM(y) = EF\left(\frac{bx}{a}\right) - FMc$ .

Lastly, to find the *locus* of the fourth formula,  $y = c - \frac{bx}{a}$ ; in AP (fig. 33.) take  $AB = a$ , and draw  $BE = b$ ,  $AD = c$ , parallel to PM, the one on one side AP, and the other on the other side; and through the points A, E, draw the line AE indefinitely towards E, and through the point D draw the line DM parallel to AE. I say, DG shall be the *locus* sought; for if the line MP be drawn from any point M thereof, parallel to AQ, then we shall have always  $PM(y) = FM(c) - PF\left(\frac{bx}{a}\right)$ .

Hence it appears, that all the *loci* of the first degree are straight lines, which may be easily found, because all their equations may be reduced to some one of the foregoing formula's. All *loci* of the second degree are conic sections, viz. either the parabola, the circle, ellipsis, or hyperbola; if an equation be required to draw the conic section, which is the *locus* thereof; first draw a parabola, ellipsis, and hyperbola; so, as that the equations expressing the natures thereof, may be as compound as possible: in order to get general equations, or formula's, by examining the peculiar properties whereof we may know which of these formula's the given equation ought to have regard to; that is, which of the conic sections will be the *locus* of the proposed equation.—This known, compare all the terms of the proposed equation with the terms of the general formula of that conic section, which you have found will be the *locus* of the given equation; by which means you will find how to draw the section, which is the *locus* of the equation given.

For example; let AP (x), PM (y), be unknown, and variable straight lines, (fig. 34.) and let m, n, p, r, s, be given right lines: In the line AP take  $AB = m$ , and draw  $BE = n$ ,  $AD = r$ , parallel to PM; and through the point A draw  $AE = s$ , and through the point D, the indefinite right line DG parallel to AE. In DG take  $DC = s$ , and with CG, as a diameter, having its ordinates parallel to PM, and the line  $CH = p$ , as the parameter, describe a parabola CM: then the portion thereof, included in the angle PAD, will be the *locus* of the following general formula.

$$yy - \frac{2n}{m}xy + \frac{nn}{mm}xx - 2ry + \frac{2nr}{m}x + rr = 0.$$

$$-\frac{ep}{m}x + ps.$$

For if from any point M of that portion there be drawn the right line MP, making any angle APM with MP; the triangles ABE, APF, shall be similar; therefore  $AB(m) : AE(e) :: AP(x) : AF$  or  $DG = \frac{ex}{m}$ .

And  $AB(m) : BE(n) :: AP(x) : PF = \frac{nx}{m}$ . And consequently  $GM$  or  $PM - PF - FG = \frac{m}{y} - \frac{nx}{m}r$ , and  $CG$

or  $DG - DC = \frac{ex}{m}$ . But from the nature of the

parabola  $\overline{GM}^2 = CG \times CH$ ; which equation will become that of the general formula, by putting the literal values of those lines.

Again; if through the fixed point A you draw the indefinite right line AQ (fig. 35.) parallel to PM, and you take  $AB = m$ , and draw  $BE = n$  parallel to AP, and through the determinate points A, E, the line  $AE = s$ ; and if in AP you take  $AD = r$ , and draw the indefinite straight line DG parallel to AE, and take  $DC = s$ : this being done, if with the diameter CG, whose ordinates are parallel to AP, and parameter the line  $CH = p$ , you describe a parabola CM; the portion of this parabola contained in the angle BAP shall be the *locus* of this second equation, or formula.

$$xx - \frac{2n}{m}xy + \frac{nn}{mm}yy - 2rx + \frac{2nr}{m}y + rr = 0.$$

$$-\frac{ep}{m}y + ps$$

For if the line MQ be drawn from any point M, therein, parallel to AP; then will  $AB(m) : AE :: AQ$  or  $PM(y) : AF$  or  $DG = \frac{ey}{m}$ . And  $AB(m) :: BE(n) ::$

$AQ(y) :: QF = \frac{ny}{m}$ . And therefore  $GM$  or  $QM -$

$QF - FG = x - \frac{ny}{m} - r$ ; and  $CG$  or  $DG - DC$

$= \frac{ey}{m} - s$ . And so by the common property of the parabola,

you will have the foregoing second equation, or formula. So likewise may be found general equations, or formula's to the other conic sections.

Now if it be required to draw the parabola, which we find to be the *locus* of this proposed equation  $yy - 2ay - bx +$

# LOG

$cc = 0$ ; compare every term of the first formula with the terms of the equation, because  $yy$  in both is without fractions; and then will  $\frac{2n}{m} = 0$ , because the rectangle  $xy$  not

being in the proposed equation, the said rectangle may be esteemed as multiplied by 0; whence  $n = 0$ , and  $m = e$ ; because the line AE falling in AB, that is, in AP in the construction of the formula, the points B, E, do coincide. Therefore, destroying all the terms affected with  $\frac{n}{m}$  in the formula,

la, and substituting  $m$  for  $e$ , we shall get  $yy - 2ry - px + rr - ps = 0$ . Again, by comparing the correspondent terms  $-2ry$ , and  $-2ay$ , as also  $-px$ , and  $-bx$ , we have  $r = a$ , and  $p = b$ ; and comparing the terms wherein are neither of the unknown quantities  $x, y$ , we get  $rr + ps = cc$ , and substituting  $a$  and  $b$  for  $r$  and  $p$ , then will  $s = \frac{cc - aa}{b}$  which is a negative expression when  $a$  is greater

than  $c$ , as is here supposed. There is no need of comparing the first terms  $yy$  and  $yy$ , because they are the very same. Now the values of  $n, r, p, s$ , being thus found, the sought *locus* may be constructed by means of the construction of the formula; and after the following manner.

Because  $BE(n) = 0$ , (fig. 36.) the points B, E, do coincide, and the line AE falls in AP; therefore through the fixed point A draw the line AD ( $r$ ) =  $a$  parallel to PM, and draw DG parallel to AP, in which take  $DC = \frac{aa - cc}{b}$

$-s$ ; then with DC, as a diameter, whose ordinates are right lines parallel to PM, and parameter the line CH ( $p$ ) =  $b$ , describe a parabola: I say, the two portions OMM, RMS, thereof, contained in the angle PAO, formed by the line AP, and the line AO drawn parallel to PM, will be the *locus* of the given equation, as is easily proved. If in a given equation, whose *locus* is a parabola,  $xx$  is without a fraction; then the term of the second formula must be compared with those of the given equation.

Thus much for the method of constructing the *loci* of equations which are conic sections. If, now, an equation, whose *locus* is a conic section, be given; and the particular section whereof it is the *locus*, be required:

All the terms of the given equation being brought over to one side, so that the other be equal to 0, there will be two cases.

Case 1. When the rectangle  $xy$  is not in the given equation.

1°. If either  $yy$  or  $xx$  be in the same equation, the *locus* will be a parabola. 2°. If both  $xx$  and  $yy$  are in the equation, with the same signs, the *locus* will be an ellipsis, or a circle.

3°. If  $xx$  and  $yy$  have different signs, the *locus* will be an hyperbola, or the opposite sections regarding their diameters.

Case 2. When the rectangle  $xy$  is in the given equation. 1°.

If neither of the squares  $xx$  or  $yy$ , or only one of them, be in the same, the *locus* of it will be an hyperbola between the asymptotes. 2°. If  $yy$  and  $xx$  be therein, having different signs,

the *locus* will be an hyperbola, regarding its diameters. 3°. If both the squares  $xx$  and  $yy$  are in the equation, having the same signs, you must free the square  $yy$  from fractions; and then the *locus* will be an hyperbola, when the square of  $\frac{1}{4}$  the fraction multiplying  $xy$ , is equal to the fraction multiplying  $xx$ ; an ellipsis, or circle, when the same is less; and an hyperbola,

or the opposite sections, regarding their diameters, when greater.

LOCUSTÆ, is used by botanists for the tender extremities of the branches of trees; such as it is supposed, John the baptist fed on in the wilderness. See ACRIDOPHAGI.

Some also use *locustæ* for beards, and pendulous seeds of oats, and of the gramina paniculata; to which the name is given on account of their figure, which something resembles that of a *locust*.

LODESMAN, or LOC MAN, a pilot established for conducting vessels in and out of harbours, or up and down navigable rivers. See PILOT.

LODGMET, in military affairs, sometimes denotes an incampment made by an army. See CAMP, and ARMY.

LODGMET is more frequently used for a work cast up by the besiegers, during their approaches, in some dangerous post, which they have gained, and where it is absolutely necessary to secure themselves against the enemies fire; as in a covert-way, in a breach, the bottom of a moat, or any other part gained from the besieged.

Lodgments are made by casting up earth, or by gabions, or palisades, wool-packs, facines, mantelets, or any thing capable of covering soldiers in the place they have gained, and are determined to keep.

LOG, a sea term, signifying a small piece of timber, of a triangular figure, on board a ship; into one end whereof, a convenient quantity of lead is cast, to make it swim upright in the water: the other end being fastened to the

Log-line, a little chord, or line fastened to one end of the log, and wound round a reel, fixed for that purpose in the gallery of the ship.

This line, from the distance of about ten fathom off the log, has certain knots or divisions, which ought to be at least 50 foot from each other: though it is the common practice at sea, not to have them above 42 feet asunder. See KNOT.

# LOG

The use of the *log* and *line*, is to keep account, and make an estimate of the ship's way, or distance run; which is done by observing the length of line unwound in half a minute's time, told by a half-minute glass; for so many knots as run out in that time, so many miles the ship sails in an hour. Thus, if there be four knots veered out in half a minute, the ship is computed to run four miles an hour.

To heave the *Log*, as they call it, they throw it into the water, letting it run till it comes without the eddy of the ship's wake; then one holding a half-minute glass, turns it up just as the first knot turns off the reel (though some turn the glass as soon as the *log* touches the water.) As soon as the glass is out, the reel is stopped, and the knots run off are told, and their parts estimated.

The *log* ought to be heaved every hour, or every two hours.

The *log* is a very precarious way of computing, and must always be corrected by experience and good sense, there being a great deal of uncertainty, both in the heaving of it, in the course of the currents, and in the strength of the wind, which seldom keeps the same tenor for two hours together; which is the interval, between the times of using the *log*, in short voyages, though in longer ones they heave it every hour. Yet is this a much more exact way of computing, than any other in use; much preferable certainly to that of the Spaniards and Portuguese, who guess at the ship's way, by the running of the froth, or water by the ship's side; or to that of the Dutch, who use to heave a chip over-board, and to number the paces they walk on the deck, while the ship swims between any two marks, or bulk-heads on the side.

*Log-Board*, is a table divided into four or five columns, whereon are marked the reckoning of every day; from whence they are entered into the *log-book*, or *traverse-book*, ruled and columned just as the *log-board* is: whence it may be transcribed into the journals, and how much the ship gains in her course, be estimated daily. See JOURNAL, RECKONING, TRAVERSE, &c.

In the first column of the *log-board* is entered the hour of the day, from 1 to 12: in the second, the rhumb, or the direction of the vessel, with regard to the points of the compass: in the third, the number of knots run off the reel each time of heaving the *log*: in the fourth, the wind that blows: and in the fifth, observations made of the weather, variation of the compass, &c.

LOGARITHMIC, or *Logarithmical*, relating to logarithms. See LOGISTIC.

Thus we say, *logarithmic* arithmetic, curve, line, scale, spiral. See ARITHMETIC, &c.

LOGARITHMS\*, the indices of the ratio's of numbers one to another; or, a series of artificial numbers proceeding in arithmetical proportion, corresponding to as many others proceeding in geometrical proportion; contrived for the easing and expediting of calculation. See NUMBER, INDEX, PROPORTION, &c. see also MESOLOGARITHM.

\* The word is formed from the Greek λογος, ratio, and αριθμος, number; *q. d.* ratio of numbers.

LOGARITHMS have been usually defined *numerationum proportionalium equidifferentes comites*; but this definition Dr. Halley and Stifelius think deficient, and more accurately define them, the indices or exponents of the ratio's of numbers; ratio being considered as a quantity sui generis, beginning from the ratio of equality, or 1 to 1=0; and being affirmative when the ratio is increasing, and negative when it is decreasing. The nature and genius of *logarithms* will be easily conceived, from what follows:—A series of quantities increasing or decreasing according to the same ratio, is called a *geometrical progression*; e. gr. 1. 2. 4. 8. 16. 32. &c. A series of quantities increasing or decreasing, according to the same difference, is called an *arithmetical progression*; e. gr. 3. 6. 9. 12. 15. 18. 24. Now, if underneath the numbers proceeding in a geometrical ratio, be added as many of those proceeding in the arithmetical one; these last are called the *logarithms* of the first.

Suppose, e. gr. two progressions:

Geomet. 1. 2. 4. 8. 16. 32. 64. 128. 256. 512.

Arithmet. 0. 1. 2. 3. 4. 5. 6. 7. 8. 9.

*Logarithms.*

0 will be the *logarithm* of the first term, viz. 1; 5, of the 6th, 32; 7 the *logarithm* of the 8th, 128, &c.

The doctrine and use of *logarithms*, may be conceived from the following propositions.

1°. If the *logarithm* of unity be 0, the *logarithm* of the factum or product will be equal to the sum of the *logarithms* of the factors. —For as unity is to one of the factors, so is the other factor to the product. So that the *logarithm* of the product, is a fourth equidifferent term to the *logarithm* of unity, and those of the factors: but the *logarithm* of unity being 0, the sum of the *logarithms* of the factors must be the *logarithm* of the factum, or product, *q. e. d.*

Hence, since the factors of a square are equal to each other, i. e. a square is the factum or product of its root multiplied

VOL. II. N°. XCII.

# LOG

into itself; the *logarithm* of the square will be double the *logarithm* of the root.

In the same manner it appears, that the *logarithm* of the cube is triple; of the biquadrate, quadruple; of the fifth power, quintuple; of the sixth, sextuple, &c. of the *logarithm* of the root.

Unity, therefore, is to the exponent of the power, as the *logarithm* of the root to the *logarithm* of the power.

So that the *logarithm* of the power is had, if the *logarithm* of the root be multiplied by its exponent; and the *logarithm* of the root is had, if the *logarithm* of the power be divided by its exponent.

And hence we derive one of the great uses of *logarithms*, which is to expedite and facilitate the business of multiplication, and extraction of roots; the former of which is here performed by mere addition, and the latter by multiplication.—Thus 3, the sum of the *logarithms* 1 and 2, is the *logarithm* of 8, the product of 2 and 4.—In like manner 7, the sum of the *logarithms* 2 and 5, is the *logarithm* of 128, the product of 4 and 32.—Again, 3, the *logarithm* of the square root 8, is half the *logarithm* of 64, the square root of 64; and 2, the *logarithm* of the cube root 4, is subtriple the *logarithm* 6 of the cube root 64.

2°. If the *logarithm* of unity be 0, the *logarithm* of the quotient will be equal to the difference of the *logarithms* of the divisor and dividend.—For as the divisor is to the dividend, so is unity to the quotient; therefore the *logarithm* of the quotient is a fourth equidifferent number to the *logarithms* of the divisor, the dividend, and the *logarithm* of unity. The *logarithm* of unity, therefore, being 0, the difference of the *logarithm* of the divisor, and that of the dividend, is the *logarithm* of the quotient. *q. e. d.*

Hence appears another great advantage of *logarithms*, viz. their expediting the business of division, and performing it by a bare subtraction. E. gr. 2. the difference between 7 and 5, is the *logarithm* of the quotient 4, out of 128 by 32. In like manner, 5, the difference between 8 and 3, is the *logarithm* of the quotient 32, out of 256 by 8.

An example or two will render the use of *logarithms* in multiplication, division, &c. obvious.

Num.	Log.	Num.	Log.
Multiply 68	1.83250	Divide 816	2.91168

		Cube 729	3)2.86272(0.95424
			Cube R.

The properties of *logarithms* hitherto mentioned, and their various uses, are taken notice of by Stifelius: but come all far short of the use of *logarithms* in trigonometry, first discovered by the lord Napier.

To find the *logarithm* of any number, and to construct a canon of *logarithms* for natural numbers.—1°. Because 1. 10. 100. 1000. 10000. &c. constitute a geometrical progression, their *logarithms* may be taken at pleasure: to be able, then, to express the *logarithms* of the intermediate numbers by decimal fractions, take 0.00000000, 1.00000000, 2.00000000, 3.00000000, 4.00000000, &c.—2°. It is manifest, that for those numbers which are not contained in the scale of geometrical progression, the just *logarithms* cannot be had: yet may they be had so near the truth, that, as to matters of use, they shall be altogether as good as if strictly just.—To make this appear, suppose the *logarithm* of the number 9 were required: between 1.0000000 and 10.0000000, find a mean proportional, and between their *logarithms* 0.0000000 and 1.0000000 an equidifferent mean, which will be the *logarithm* thereof; that is, of a number exceeding three by  $\frac{1}{100000000}$ , and therefore far remote from nine. Between 3 and 10, therefore find another mean proportional, which may come somewhat nearer 9; and between the 10 and this mean another still; and so on between the numbers next above and next underneath 9, till at last you arrive at  $9 \frac{1}{100000000}$ ; which not being one millionth part from 9, its *logarithm* may, without any sensible error, be taken for that of 9 itself. Seeking then in each case for the *logarithms* of the mean proportionals, you will at last have 0.954251, which is exceedingly near the true *logarithm* of 9.—3°. If in like manner you find mean proportionals between 1.0000000 and 3.1622777, and assign convenient *logarithms* to each, you will at length have the *logarithm* of the number 2, and so of the rest.—4°. There needs not however, be so much pains taken in investigating the *logarithms* of all numbers; since those that consist of aliquot parts being divided, and others mutually multiplying each other, their *logarithms* are easily found.—Thus if the *logarithm*

# LOG

of the number 9 be bisected, we shall have the *logarithm* 0.47712125 of the number 3.

The indices, or characteristics of *logarithms*, correspond to the denominative part of the natural numbers, as the other member of the *logarithm* does, to the denominative part of the number: *i. e.* the index shews the denomination, or place of the last (or left hand) figure of the number, and consequently of all the rest.—Thus 0, affixed to a *logarithm*, denotes the last figure of the number to which the *logarithm* answers, to be nothing distant (*i. e.* is in) the place of units. The index 1 shews the last figure of its number to be distant 1 place from the place of units, *i. e.* to be in the place of tens, and consequently the number itself to be either 10, or some number between that and 100, and so of the other indices.—Hence all numbers, which have the same denominative, but not the same numerative parts, as all numbers from 1 to 10, from 10 to 100, &c. will have *logarithms*, whose indices are the same, but the other members different. Again, all numbers which have the same numerative, but not denominative part, will have different indices; but the rest of the *logarithms* the same.—If a number be purely decimal, to its *logarithm* is affixed a negative index, shewing the distance of its first significative figure, from the place of units.—Thus the *logarithm* of the decimal, 256 is 1.40824, of the decimal, 0256 is 2.40824, &c.

The first canon of *logarithms* for natural numbers, from 1 to 20000, and from 90000 to 100000, was constructed by Hen. Briggs, with the approbation of the inventor, the lord Napier, and the manner of constructing them shewn.—The chasm between 20000 and 90000, was filled up by Adrian Ulach. In the common tables we have only a canon from 1 to 10000.—There are various other methods of constructing *logarithms*, by Dr. Halley, Mr. Cotes, Dr. Brook Taylor, &c. which the reader may find in the *Philosophical Transactions*.

To find the *logarithm* for a number greater than any in the common canon, but less than 1000000.—Cut off four figures on the left of the given number, and seek the *logarithm* in the table; add as many units to the index, as there are figures remaining on the right; subtract the *logarithm* found from that next following it, in the table: then, as the difference of numbers in the canon, is to the tabular distance of the *logarithms* answering to them, so are the remaining figures of the given number to the logarithmic difference; which, if it be added to the *logarithm* before found, the sum will be the *logarithm* required. Suppose, *v. gr.* the *logarithm* of the number 92375 required. Cut off the four figures 9237, and to the characteristic of the *logarithm* corresponding to them, add an unit; then,

From the *logarith.* of the numb. 9238=3.9655780  
Subtract. *logarith.* numb. 9237=3.9655309

Remains tabular difference 471  
10—471—5  
5) 2 — 1  
235

Now to the *logarithm* 4.9655309  
Add the difference found 235

The sum is the *logarithm* required 4.9655544

To find the *logarithm* of a fraction.—Subtract the *logarithm* of the numerator, from that of the denominator, and to the remainder prefix the sign of subtraction.—Thus suppose it required to find the *logarithm* of the fraction  $\frac{7}{3}$ ,

*Logarithm* of 7=0.8450980  
*Logarithm* of 3=0.4771213

*Logarithm* of  $\frac{7}{3}$ =0.3679767

The reason of the rule is, That a fraction being the quotient of the denominator divided by the numerator; its *logarithm* must be the difference of the *logarithms* of those two; so that the numerator being subtracted from the denominator, the difference becomes negative.—Stifelius observed, that the *logarithms* of a proper fraction, must always be negative, if that of unity be 0; which is evident, a fraction being less than one.

For an improper fraction, *v. gr.*  $\frac{9}{5}$ , its numerator being greater than its denominator, its *logarithm* is had, by subtracting the *logarithm* of the latter, from that of the former.

The *logarithm* of 9=0.9542425  
*Logarithm* of 5=0.6989700

*Logarithm*  $\frac{9}{5}$ =0.2552725

In the same manner may a *logarithm* of a mixt number, as  $3\frac{2}{3}$  be found, it being first reduced into an improper fraction  $4\frac{2}{3}$ .

To find the number corresponding to a *logarithm* greater than any in the table.—First from the given *logarithm*, subtract the *logarithm* of 10, or 100, or 1000, or 10000, till you have a *logarithm* that will come within the compass of the table; find the number corresponding to this, and multiply it by 10, or 100, or 1000, or 10000, the product is the number required.

# LOG

Suppose, for instance, the number corresponding to the *logarithm* 7.7589982 be required; subtract the *logarithm* of the number 10000, which is 4.0000000, from 7.589982; the remainder is 3.7589982, the number corresponding to which is 57411100, this multiplied by 10000, the product is 574111000, the number required.

To find the number corresponding to a negative *logarithm*.—To the given negative *logarithm*, add the last *logarithm* of the table, or that of the number 10000; *i. e.* subtract the first from the second, and find the number corresponding to the remainder; this will be the numerator of the fraction, whose denominator will be 10000; *v. gr.* suppose it be required to find the fraction corresponding to the negative *logarithm* 0.3679767, subtract this from 4.0000000

The remainder is 3.6320233, the number corresponding to which is 4285714, the fraction sought therefore is  $\frac{4285714}{10000000}$ .—The reason of the rule is, that as a fraction is the quotient, arising on the division of the numerator by the denominator, unity will be to the fraction, as the denominator to the numerator; but as unity is to the fraction corresponding to the given negative *logarithm*, so is 10000 to the number corresponding to the remainder; therefore if 10000 be taken for the denominator, the number will be the numerator of the fraction required.

To find a fourth proportional to three given numbers.—Add the *logarithm* of the second to that of the third, and from the sum subtract the *logarithm* of the first; the remainder is the *logarithm* of the fourth required. *E. gr.* let the given numbers be 4.68. and 3.

*Logarithm* 68=1.8325089

*Logarithm* 3=0.4771213

Sum=2.3096302

*Logarithm* 4=0.6020600

*Logarithm* required 1.7075702

The number in the tables corresponding to which is 51.—This problem is of the utmost use in trigonometry. See TRIANGLE, and TRIGONOMETRY.

LOGIC\*, the art of thinking justly; or of making a right use of our rational faculties, in defining, dividing, and reasoning. See THINKING, REASONING, &c.

\* The word is Greek, λογικη, derived from λογος, *sermo*, discourse; in regard, thinking is only an inward, mental discourse, wherein the mind converses with itself.

Logic is also sometimes called *dialectica*; and sometimes the canonical art, as being a canon, or rule, for directing us in our reasonings. See DIALECTICA.

As, in order to think aright, it is necessary that we apprehend, judge, discourse, and dispose or methodize rightly: hence apprehension, judgment, discourse, and method, become the four fundamental articles of this art; and it is from our reflections on those operations of the mind, that logic is, or ought to be wholly drawn. See PERCEPTION, JUDGMENT, DISCOURSE, &c.

Lord Bacon divides logic into four branches, according to the ends proposed in each: for a man reasons, either to find what he seeks, or to judge of what he finds, or to retain what he judges, or to teach what he retains; whence arise so many arts of reasoning, *viz.* the art of *inquisition*, or invention; the art of *examining*, or judgment; the art of *preserving*, or of memory; and the art of *elocution*, or delivering. See MEMORY, ELOCUTION, &c.

Logic having been extremely abused, is now in some disrepute. The schools have so clogged it with barbarous terms and phrases, and have run it out so much into dry, useless subtilties, that it seems rather intended to exercise the mind in wrangling and disputation, than to assist it in thinking justly. It is true, in its original, it was rather intended as the art of caviling, than of reasoning; the Greeks, among whom it had its rise, being a people who piqued themselves mightily upon their being able to talk *ex tempore*, and to argue, by turns, on either side the question.—Hence, their dialectici, to be always furnished with arms for such rencounters, invented a set of words and terms, rather than rules and reasons, fitted for the uses of contention and dispute. See SOPHIST, DISPUTATION, SYLLOGISM, &c.

Logic, then, was only an art of words, which frequently had no meaning, but served well to hide ignorance, instead of improving knowledge; to baffle reason instead of assisting it; and to confound the truth, instead of clearing it.—Much of that heap of words, and rules, which we have borrowed from the old logic, is of little use in life; and is so far out of the common usage, that the mind does not attend to them without trouble; and finding nothing in them to reward its attention, soon discharges itself, and loses all ideas it had conceived of them.

But logic disengaged from the jargon of the schools, and reduced into a clear and intelligible method, is the art of conducting the understanding in the knowledge of things, and the discovery of truth. See TRUTH, KNOWLEDGE, &c.

From

From its proper use we gain several very considerable advantages; for 1°. The consideration of rules, incites the mind to a closer attention and application in thinking; so that we hereby become assured that we make the best use of our faculties. 2°. We hereby, more easily, and accurately discover, and point out the errors and defects in our reasoning; for the common light of reason, unassisted by logic, frequently observes an argumentation to be faulty, without being able to determine wherein the precise failure consists.—3°. By these reflections on the order and manner of the operations of the mind, we are brought to a more just and complete knowledge of the nature of our own understanding. See SOUL, UNDERSTANDING, &c.

LOGICAL Concrete. } See the article { CONCRETE.  
LOGICAL Part. } PART.

LOGISTA, the title of an officer at Athens, whose business was to receive, and pass the accounts of magistrates, when they came out of their office.

The *logistæ* were in number ten; they were elected by lot; and had ten euthyni, or auditors of accounts, under them.

LOGISTIC, or *Logarithmic line*, a curve so called, from its properties and uses, in constructing and explaining the nature of logarithms.

If the right line AX, (*Tab. Analysis, fig. 37.*) be divided into any number of equal parts, and to the points of those divisions A, P, p, &c. be drawn lines continually proportional, the points N, M, m, &c. form the *logistic*, or *logarithmic line*, or *curve*.

Here the abscissæ AP, Ap, &c. are the logarithms of the semiordinates PM, pm, &c.

Hence if  $AP=x$ ,  $Ap=v$ ,  $PM=y$ ,  $pm=z$ , and their logarithms  $y$  and  $z=ly$  and  $lz$ ;  $x$  will be  $=ly$ , and  $v=lz$ , consequently  $x:v=ly:lz$ , that is, the denominators of the ratios AN:PM, and AN:pm, are to one another, as the abscissæ AP and Ap.

Hence it follows, that there may be infinite other *logistic* lines invented, provided  $xm:vm::ly:lz$ , that any of the roots or powers, may be the logarithms of the semiordinates.

The *logistic* will never concur with the axis, except at an infinite distance, so that AX is its asymptote.

*Quadrature of the LOGISTIC.* See the article QUADRATURE.

LOGISTIC, or *logarithmic Spiral*, a line whose construction is as follows.—Divide the quadrant of a circle into any number of equal parts, in the points, P, p, p, &c. (*Tab. Analysis, fig. 22.*) and from the radii CP, Cp, Cp, &c. cutting off CM, Cm, Cm, &c. continually proportional, the points M, m, m, &c. form the *logistic spiral*.

The arches therefore AP, Ap, &c. are the logarithms of the ordinates CM, Cm, &c. whence also it follows, that there may be infinite *logistic spirals*.

LOGISTICA, or LOGISTICAL Arithmetic, a denomination sometimes given to the arithmetic of sexagesimal fractions, used by astronomers in their calculations. See SEXAGESIMAL.

It was so called from a Greek treatise of one Barlaamus Monachus, who wrote about sexagesimal multiplication very accurately, and entitled his book *Λογισμικὴ*. This author Vossius places about the year 1350, but mistakes the work for a treatise of algebra.

Shakerly, in his *Tabulæ Britannicæ*, has a table of logarithms adapted to sexagesimal fractions, which therefore he calls *logistical logarithms*; and the expeditious arithmetic of them, which is by this means obtained, and by which all the trouble of multiplication and division is saved, he calls *logistical arithmetic*. See ARITHMETIC.

LOGOGRIPIHUS\*, a kind of symbol, or riddle, proposed to students for their solution, in order to exercise and improve the mind. See ÆNIGMA.

\* The word comes from the Greek λογος, discourse, and γριππος, or γριππος, net.

The *logogriphus* usually consists in some equivocal allusion, or mutilation of words, which, literally taken, signify something different from the thing intended by it; so that it is a kind of medium, between a rebus, and proper ænigma. See REBUS, &c.

According to Kircher, *logogriphi* are a kind of canting arms: Thus a person called Leonard, who bore in his arms a lion, and nard, or spikenard; according to that father, made a *logogriphus*. *Oedip. Egypt.*

In another place, the same author defines *logogriphus* to be an ænigma, which, under one name or word, will bear various meanings, by adding or retrenching some part of it.—This kind of ænigmas is well known to the Arabs, among whom are authors who treat expressly of it.

LOHOCH. See the article LOCH.

LOINS, *lambi*, in anatomy, that part of the body about the reins; properly the lower part of the spine of the back, composed of five vertebræ, larger than those of the back, and serving them as a base; having their articulations pretty loose, that the motion of the *loins* may be more free.—See *Tab. Anat. (Osteol.) fig. 3. n. 14. fig. 7. n. 16. fig. 9. \* fig. 11.* see also SPINE, and VERTEBRÆ.

LOLLARDS\*, a religious sect which arose in Germany, about the beginning of the fourteenth century; so called from its author Walter Lollard, who began to dogmatize in 1315.

\* The monk of Canterbury derives the origin of the word *lollard* among us from *lolum*, a tare, as if the *Lollards* were the tares sown in Christ's vineyard.—Abella says; that the word *lollard* signifies *praising God*, from the German *loben*, to praise, and *Herr*, Lord; because the *Lollards* employed themselves in travelling about from place to place, singing psalms and hymns.

*Lollard*, and his followers, rejected the sacrifice of the mass, extreme unction, and penances for sin; arguing that Christ's sufferings were sufficient. He is likewise said to have set aside baptism, as a thing of no effect; and repentance, as not absolutely necessary, &c.—Lollard was burnt alive at Cologne, in 1322.

In England the followers of Wickliff were called, by way of reproach, *Lollards*, from some affinity there was between some of their tenets; though others are of opinion, that the English *Lollards* came from Germany. See WICKLIFFITE.

They were solemnly condemned by the archbishop of Canterbury, and the council of Oxford.

LONG Accent, in grammar, &c. a mark which shews that the voice is to stay some time on the vowel which it is placed over. See ACCENT.

Its figure is thus (—).

LONG Boat, is the largest and strongest boat belonging to a ship, that can be hoisted a-board of her. See BOAT.

Its use is to bring any goods, provisions, &c. to, or from the ship; or, on occasion, to land men any where, and particularly to weigh the anchor.

LONG Hand. } See { LONG HAND.  
LONG Measure. } MEASURE.  
LONG Muscles, in anatomy. } LONGUS.

LONGÆVITY, length of life. See LIFE, and AGE.

From the different *longævities* of men in the beginning of the world, after the flood, and in these ages, Mr. Derham draws a good argument, for the interposition of a divine providence.

Immediately after the creation, when the world was to be peopled by one man and woman, the ordinary age was 900 and upwards.—Immediately after the flood, when there were three persons to stock the world, their age was cut shorter, and none of those patriarchs, but Shem, arrived at 500.—In the second century we find none that reached 240: in the third, none but Terah that came to 200 years: the world, at least a part of it, by that time being so well peopled, that they had built cities, and were cantoned out into distant nations.—By degrees, as the number of people increased, their *longævity* dwindled; till it came down at length to 70 or 80 years: and there it stood, and has continued to stand ever since the time of Moses.—This is found a good medium, and by means hereof the world is neither overstocked, nor kept too thin; but life and death keep a pretty equal pace. See MORTALITY, MARRIAGE, ANNUITY, &c.

That the common duration of man's life has been the same in all ages since the world was peopled, is plain both from sacred, and profane history. To pass by others, Plato lived to 81, and was accounted an old man; and the instances of *longævity* produced by Pliny, L. 7. c. 48, as very extraordinary, may most of them be matched in modern histories; particularly in Dr. Plott's *Nat. Hist. of Oxf. and Staff.*—Among others, he tells us of twelve tenants to the same person, who made up 1000 years; to say nothing of old Parr, who lived 132 years, 9 months; or of H. Jenkins of Yorkshire, who lived 169 years; or of the countess of Desmond, or Mr. Ecklestone, both of Ireland, who each exceeded 140 years.

LONGIMETRY, the art of measuring lengths; both accessible, as roads, &c. and inaccessible, as arms of the sea, &c. See MEASURING.

*Longimetry* is a part of trigonometry, and a dependant on geometry, in the same manner as altimetry, planimetry, stereometry, &c.

The art of *longimetry*, see under the names of the instruments used in it, particularly THEODOLITE, CHAIN, &c.

LONGISSIMUS Dorsi, is a muscle of the back, which, at its beginning, is not to be distinguished from the sacro-lumbaris; arising with it from the hinder part of the os ilium, and os sacrum, and the first vertebra of the loins.

It runs upwards along the whole tract of the back, and is connected by tendons to each transverse process in its way, and ends sometimes in the first vertebra of the back, and sometimes in the first of the neck; and, as some authors say, reaches now and then to the processus mammillaris of the os petrosum.

In conjunction with some others, this helps to keep the body erect.

LONGISSIMUS Oculi. See OBLIQUUS Superior.

LONGITUDE of the Earth, is sometimes used to denote its extent from west to east; according to the direction of the equator. See EARTH.

By

By which it stands contradistinguished from *latitude of the earth*, which denotes its extent from one pole to the other. See LATITUDE.

LONGITUDE of a *Star*, in astronomy, is an arch of the ecliptic, counted from the beginning of Aries, to the place where a star's circle of *longitude* cuts the ecliptic.

The *longitude* of a star, as S, (*Tab. Astronomy*, fig. 14. n. 2.) is an arch of the ecliptic EL, comprehended between the beginning of Aries, and the circle of longitude TM, drawn through the centre of the star S.

*Longitude* stands in the same relation to the ecliptic, that *right ascension* does to the equator. See ASCENSION.

In which sense, the *longitude* of a star amounts to much the same as the star's place in the ecliptic, reckoned from the beginning of Aries; which to find, see PLACE of the *Sun*, or *Star*.

LONGITUDE of the *Sun*, or a *Star*, from the next equinoctial point, is the number of degrees and minutes they are from the beginning of Aries or Libra, either before or after them; which can never be more than an 180 degrees.

LONGITUDE of a *place*, in geography, is its distance from some first meridian: or an arch of the equator, intercepted between the meridian of the place, and the first meridian. See MERIDIAN.

LONGITUDE, in navigation, is the distance of a ship or place, east or west, from another, counted in degrees of the equator. If this distance be counted in leagues or miles, or in degrees of the meridian, and not in those proper to the parallel of latitude, it is usually called *departure*. See DEPARTURE.

To discover an exact method of finding the *longitude* at sea, is a problem that has extremely perplexed the mathematicians of these two last ages; and for the solution whereof, great rewards have been publicly offered by the English, French, Dutch, and other nations: this being the only thing wanting to render navigation perfect. Various are the attempts that authors have made for this purpose, and various the methods they have proposed; but still without success; all their schemes being found either false, precarious, impracticable, or in some way or other defective: so that the palm is still unascertained.

What most of them aim at, is a method of determining the difference of time between any two points on the earth: for, every 15 degrees of the equator answering to an hour, i. e. one degree to 4 minutes of time, and one minute of a degree to 15 seconds of time; the difference of time being known, and turned into degrees, will give the *longitude*, and vice versa. See TIME.

This, some have pretended to effect by clocks, watches, and other automata; but always in vain; no time-keeper, excepting a pendulum (which cannot be applied at sea) being sufficiently sure and exact for the purpose. See PENDULUM.

Others, with more probability, and to better purpose, search for a means to find the *longitude* in the heavens: for, if the exact times of any celestial appearance be known for two places, the difference of those times gives that of the *longitude* of those places.—Now in the ephemerides, we have the motions of the planets, and the times of all the celestial phenomena, as the beginning and ending of eclipses, conjunctions of the moon with other planets, its entrance into the ecliptic, &c. accurately calculated for some one place. Therefore if the hour and minute be known, wherein any of the same phenomena are observed in an unknown place, the difference between the hour and minute, of that place, and that other to which the tables are calculated, and consequently the difference of their meridians, and their *longitude* from each other, are known also.

Now the difficulty, here, does not consist in the exact finding of the time, which is easily had from the sun's altitude or azimuth; but the defect lies in the paucity of proper appearances, capable of being thus observed: for all slow motions (*v. gr.* that of Saturn) are at once excluded; as shewing but little difference in a considerable space of time; and it being here required, that the phenomenon be sensibly varied in two minutes time, an error of two minutes in time producing another of thirty miles in the *longitude*.—Now there are no phenomena in the heavens that have these requisites, excepting the several stages of an eclipse of the moon; her *longitude*, or place in the zodiac; her distance from the fixed stars, or appulse to them; her ingress into the ecliptic, or the points of her orbit, where that cuts the ecliptic; and the conjunction, distance, and eclipses of Jupiter's satellites.—Of each of which in their order.

1°. The method by the eclipses of the moon, is very easy, and sufficiently accurate, were there but eclipses every night.—At the moment wherein we see the beginning or middle of a lunar eclipse by a telescope, we have nothing to do but take the altitude or azimuth of some fixed star, from which the hour and minute are easily found; or without the altitude, if the star be in the meridian.—This hour and minute, therefore, thus found, and compared with that expressed in the tables, gives the *longitude*. See ECLIPSE.

2°. The moon's place in the zodiac, is a phenomenon more frequent than that of her eclipses; but then the observation

thereof is difficult, the calculus intricate and perplexed; by reason of two parallaxes; so that it is scarce practicable to any tolerable degree of accuracy.—Indeed by waiting till the moon comes into the meridian of the place, and then taking the altitude of some remarkable star, (the altitude being supposed to be first known) from this altitude, and the latitude, we shall be able to find the time pretty accurately; though it will be better to do it by some star in the meridian.—Now, the time being found, it will be easy to find what point of the ecliptic is then in the meridian, or mid-heaven.—Thus we shall have the moon's place in the zodiac, corresponding to the time of our place.—Then, in the ephemeris, we find what hour it is in the meridian of the ephemeris, when the moon is in that part of the zodiac: thus we shall have the hour and minute of the two places for the same time; the difference of which, will give the difference of *longitude*.

3°. In regard there are many times when the moon cannot be observed in the meridian, there is therefore another still more frequent phenomenon, from which the *longitude* is sought, *viz.* the moon's appulse, and recess from the fixed stars: for from thence the moon's true place may be investigated for the given time of observation.—But this method, by reason of the parallaxes, and the solution of oblique spherical triangles, and the various cases, is so very difficult and perplexed, that mariners will scarce be able to make use of it; nor does it seem necessary here to give the praxis thereof. Those, however, who are disposed to use it, will find very great help in it from a starry zodiac, published under the direction of Dr. Halley, containing all the stars to which the moon's appulse can be observed.

4°. To find the *longitude* by the moon's ingress into the ecliptic, observe the moment of that ingress: then, in the ephemeris, see what hour it is in the meridian of the ephemeris, when that ingress happens.—The difference between these times, gives the difference of *longitude*. See MOON.

5°. The phenomena of Jupiter's satellites are generally preferred to those of the moon, for finding the *longitude*; by reason the former are less liable to parallaxes, and do, further, afford a very commodious observation, in every situation of that planet above the horizon.—Their motion is very swift, and must be calculated for every hour; and for that reason are not found in the common ephemerides, but are had elsewhere. Now, to find the *longitude* by means of these satellites; with a good telescope, observe a conjunction of two of them, or of one of them with Jupiter, or any other the like appearance; and, at the same time, find the hour and minute from the meridian altitude of some star; then consulting tables of the satellites, observe the hour and minute wherein such appearance happens in the meridian of the place to which the tables are calculated.—The difference of time, as before, will give the *longitude*. See SATELLITES.

All methods which depend on the phenomena of the heavens having this one defect, that they cannot be observed at all times; and being, besides, difficult of application at sea, by reason of the motion of the ship; there are some, who, leaving the moon, and the satellites, have recourse to clocks, and other automata: which, could they be made perfectly just and regular, so as to move with the sun, without either gaining or losing, and without being affected with the change of air, and of climates, the *longitude* would be had with all the ease and accuracy imaginable; nothing more being required but to set the machine by the sun at the time of departure; and when the *longitude* of any place is desired, to find the hour and minute from the heavens, (which is done at night by the stars, and in the day by the sun;) for the difference between the time, thus observed, and that of the machine, gives the *longitude*.—But no such machine has been yet discovered: wherefore recourse has been still further had to other methods.

Mr. Whiston and Mr. Ditton have proposed a method of determining the *longitude* by the flash and report of great guns.—Sounds, it is known, move pretty equably in all their stages, whatever the sonorous body be that occasions them, or whatever the medium that conveys them. If then a mortar or great gun be exploded at a place whose *longitude* is known, the difference between the time wherein the flash (which moves, as it were, instantaneously) is seen, and the sound, which moves at the rate of four seconds in a mile, is heard, will give the distance of those places from each other; whence, if their latitudes be known, the difference of *longitude* will be likewise known. See Sound, &c.

Again, if the hour and minute of the explosion be known, (for the place where it is made) by observing the hour and minute from the sun or stars, at the place whose *longitude* is required; the difference between those times, will give the difference of *longitude*.

Again, if the said mortar be loaded with an iron shell full of combustible matter, and posited perpendicularly, it will carry the same a mile high, which will be seen near a hundred miles; if therefore neither the sound should be heard, nor the flash seen, the distance of any remote place from the place

place of the mortar, may be determined from the altitude of the shell above the horizon of the place unknown: and the distance and latitudes known, the *longitude* is easily found.

According to this scheme, it was proposed to have such mortars fixed at proper distances, and at known stations, on all the frequented coasts, islands, capes, &c. and to be exploded at certain hours, for the observation of mariners.

This method, though good in the theory, yet is found useless in the practice; as being extremely troublesome, and yet precarious.—It supposes that sounds may be heard forty, fifty, or sixty miles; of which, it is true, we have instances, but they are very rare; and, ordinarily, the report of a cannon is not heard above half so far; and sometimes much less.—It supposes, again, sound to move always with equal velocity; whereas, in fact, its velocity is increased or diminished as it moves with or against the wind.—It supposes, again, the strength of powder uniform; and that the same quantity carries the same range; the contrary whereof is known to every gunner.—We say nothing of thick cloudy nights, when no lights can be seen; nor of stormy nights, when no sound can be heard; even at inconsiderable distances.

8°. We have another method of finding the *longitude*, proposed by the same Mr. Whiston, viz. by the inclinatory, or dipping-needle: which see under the article DIPPING-Needle.

Angle of LONGITUDE.

LONGITUDE of Motion, is used by Dr. Wallis for the measure of motion, estimated according to the line of direction; on which principle, *longitude* of motion is the distance, or length, which the centre of any moving body runs through, as it moves on in a right line. See MOTION.

The same author calls the measure of any motion, estimated according to the line of direction of the vis motrix, the *altitude* of it.

Bellini also uses the terms *longitude*, and *altitude* in the same sense, in many places of his writings, which an ordinary reader finds hard to understand, for want of this interpretation. By *altitude* also, in his nineteenth proposition *de febris*, he means the thickness of the viscid matter in the blood-vessels; or the greatest length a viscid particle is extended into, from the side of the canal to its axis.

LONGITUDINAL, in anatomy, is used to signify some part or member extended in length, or posited lengthwise.

The membranes which compose the vessels, are woven out of two kinds of fibres, the one *longitudinal*, the other *circular*, cutting the *longitudinal* at right angles. See MEMBRANE.

The *longitudinal* fibres are tendinous and elastic; the *circular*, muscular and motrices, like sphincters. See FIBRE.

LONGUS, LONG, an epithet given by anatomists to a great number of muscles, hereby contradistinguished from *breves*. See BREVIS.

The second extensor of the carpus is called *longus*, in comparison of the third extensor, which is called *brevis*, short.

The *longus* has its origin in the bottom of the humerus, and lying along the radius, passes underneath the ligamentum annulare, and is inserted into the carpus.

The second of the flexors of the neck is also called the *longus*, or *longus colli*, and sometimes *rectus*.—It has its origin in the lateral part of the body of the four upper vertebræ of the back, and is inserted into the body of the four vertebræ of the neck, and sometimes into the occiput: this, in conjunction with the scalenum, bends the neck.

The third of the six muscles of the elbow, or arm, which is the first of its extensors, is also called *longus*, as being the longest of the extensors.—It has its origin on the upper side of the omoplate, near the neck, and descending by the hind part of the arm, is inserted into the olecranon by a strong aponeurosis, which is common to it and the second and third extensor of the arm.

The second muscle of the thumb, which is the first of its extensors, is also called *longus*, as being longer than another extensor of the same thumb, called *brevis*.—The *longus* proceeds from the upper and external part of the bone of the elbow, and, rising over the radius, is inserted, by a forked tendon, into the second bone of the thumb, which it extends.

One of the four muscles of the radius is also called the *longus*.—This is the first of the two supinators, and has its origin three or four fingers breadth above the outer apophysis of the humerus, whence running along the radius, it is inserted into the inner parts of its lower apophysis.—It is called *longus* with regard to the other supinator, which is called *brevis*.—These two muscles serve to turn the radius, so as the palm of the hand looks upwards; which makes the supination.

The first of the abductors of the leg is also called the *longus*, or *longus tibiæ*, and bears this title more justly than any of

the others, as being the longest muscle in the whole body.—It is also denominated *fascialis*, on account of its bearing some resemblance to a (*fascia*) swathe; and  *Sartorius*, or taylor's muscle, because it serves to bend the legs inward, as the taylor's use to have them when at work. See Tab. Anat. (Myol.) fig. 1. n. 40. fig. 2. n. 38.

LONGUS Cubiti, is a muscle, which, with others, extends the cubitus.—It arises from the inferior costa of the scapula, nigh its neck, and passing betwixt the two round muscles, descends on the back side of the humerus; where it joins with the *brevis*, and *brachieus externus*.

LOOF, or, as it is usually pronounced, LUFF, a term used in conding of a ship.—Thus,

LOOF up, is to bid the steersman keep nearer to the wind.

LOOF into an Harbour, is to sail into it close by the wind.

To spring the LOOF, or Luff, is when a ship, that was going large before the wind, is brought close by the wind.

When a ship sails on a wind, that is, on a quarter-wind, they say to the steersman, *keep your luff! veer no more! keep her to! touch the wind! have a care of the lee-latch!* All which words signify much the same thing, and bid the man at helm to keep the ship near the wind.

LOOF of a ship, denotes that part of her aloft, which lies just before the ches-trees.

Hence the guns which lie here are called *loof-pieces*.

LOOKING-Glass, a plain glass speculum, or mirror, which being impervious to the light, reflects its rays, and so exhibits the images of objects placed before it. See GLASS; SPECULUM, REFLECTION, &c.

The theory of *looking-glasses*, and the laws whereby they give the appearances of bodies, see under MIRROR.

The manner of grinding and preparing LOOKING-Glasses, is as follows:—A plate of glass is fixed to a horizontal table, and to another lesser table is fixed another plate, over the hind part of which is added a box loaded with stones, and other weights.—Over the first plate is sprinkled fine sand and water, in a sufficient quantity, for the grinding, and the second or less plate is laid on it, and thus worked this and that way, till each has planed the other's surface.—As they begin to grow smoother, finer sand is used, and at last powder of smalt.—Being thus fitted for polishing, a wooden parallelepiped, lined with tripoli earth, or burnt tin, tempered with water, is laid on the plate, and worked to and again, till the glass have got a perfect politure.

It is found extremely difficult to bring the glass to an exact plainness. Hevelius judges more art required to bring glass to a perfect plane, than to a sphere.—For polishing large plates of glass, they have a machine for the purpose.

The plates being polished, a thin blotting paper is spread on a table, and sprinkled with fine chalk; and this done, over the paper is laid a thin lamina, or leaf of tin, on which is poured mercury, which is to be equally distributed over the leaf with a hare's foot, or cotton. Over the leaf is laid a clean paper, and over that the glass-plate.—With the left hand the glass-plate is pressed down, and with the right the paper is gently drawn out; which done, the plate is covered with a thicker paper, and laden with a greater weight, that the superfluous mercury may be driven out, and the tin adhere more closely to the glass. When it is dried, the weight is removed, and the *looking-glass* is complete.

Some add an ounce of mercury, to half an ounce of marcasite, melted by the fire; and lest the mercury evaporate in smoke, pour it into cold water; and when cold, squeeze it through a cloth or leather. Some also add a quarter of an ounce of lead and tin to the marcasite, that the glass may dry the sooner. See FOLIATING.

LOOM, the weaver's frame; a machine whereby several distinct threads are wove into one piece. See WEAVING, and SHUTTLE.

Looms are of various structures, accommodated to the various kinds of materials to be wove, and the various manner of weaving them; viz. for woollens, silks, linens, cottons, cloths of gold; and other works, as tapestry, ribbands, stockings, &c. divers of which will be found under their proper heads.

Heir-LOOM, in law. See the article HEIR-LOOM.

LOOP-Holes, in the sea language, are *holes* made in the coamings of the hatches of a ship, to fire muskets through in a close fight.

LOOSE Style. See the article STYLE.

LOOSENED. See the article HOOF-loosened.

LORD\*, a title of honour attributed to those who are noble, either by birth, or creation; and vested with the dignity of a baron. See NOBILITY, and BARON.

\* The word is of Saxon origin, and primarily denotes a bread-giver, alluding to the hospitality of our ancient nobles: It is formed, according to Camden, from *hlaford*, afterwards written *loperd*; a compound of *hlaf*, bread, and *ford*, to supply, afford.

In this sense, *lord* amounts to the same with *peer* of the realm, *lord* of parliament. See PEER, and PARLIAMENT.

LORD is also applied to those so called by the courtesy of England; as, all sons of a duke, or marquis; and the eldest son of an earl.

**LORD** is also an appellation given to divers persons honourable by office; as *lord* chief justice, *lord* chancellor, *lord* of the treasury, admiralty, &c. See **JUSTICE**, **CHANCELLOR**, **TREASURY**, **ADMIRAL**, &c.

**LORD** is also a title sometimes given to an inferior person who has a fee, and consequently the homage of tenants within his manor. See **FREE** and **MANOR**.

For by his tenants he is called *lord*, and in some places, for distinction-sake, *land-lord*.

It is in this last signification that the word *lord* is principally used in our law-books; where it is divided into *lord paramount*, and *lord mesn*.

**Lrd MESN**, is he that is owner of a manor, and by virtue thereof, hath tenants holding of him in fee, and by copy of court-roll; and yet holds himself of a superior *lord*, called *lord-paramount*. See **PARAMOUNT**.

We also read of *very lord*, and *very tenant*. See **VERY**.

**Very LORD**, is he who is immediate *lord* to his tenant; and *very tenant*, he who holds immediately of that *lord*.

So that where there is *lord paramount*, *lord mesn*, and tenant, the *lord paramount* is not *very lord* to the tenant.

**LORD High-admiral** of England, is one of the great officers of the crown, whose trust and honour is so great, that it has seldom been given, except to some of the king's younger sons, or near kinsmen. See **ADMIRAL**.

To him is, by the king, intrusted the management of all maritime affairs, as well in respect of jurisdiction, as protection; with the government of the British navy; and a power to decide all controversies, and causes maritime as well civil as criminal; such as happen either on our own coasts, or beyond sea, amongst his majesty's subjects.

To him also belongs such wrecks and prizes, as are called *lagon*, *jetson*, and *shotson*; that is, goods lying on the sea floating, or cast on shoar, excepting in such royalties as are granted to other *lords* of manors, &c. with all great fishes, called *royal fish*, except whales and sturgeon; a share of prizes in time of war, and the goods of pirates and felons condemned. See **FLOSTON**, &c.

The *lord high-admiral* has under him many officers of high and low condition; some at sea, others at land; some of a military, others of a civil capacity, some judicial, others ministerial.

In his court, called *the court of admiralty*, all processes issue in his name, not the king's, as they do in all other courts; so that the dominion and jurisdiction of the sea, may justly be stiled another commonwealth, or kingdom apart, and the *lord high-admiral*, viceroy of the maritime kingdom.

He hath under him a lieutenant, who is judge of the admiralty, commonly a doctor of the civil law; the proceedings in this court, in all civil matters, being according to the civil law: but in criminal matters they proceed by a special commission from the secretary, according to the laws of England. See **ADMIRALTY**.

**LORD Privy-Seal**, has his office by patent: before the thirtieth of Henry VIII, he was generally, an ecclesiastic; since which, the office has been usually conferred on temporal peers, above the degree of barons. See **PRIVY SEAL**.

The *lord privy-seal* receiving a warrant from the signet-office, issues the privy-seal, which is an authority to the lord chancellor to pass the great seal, where the nature of the grant requires the great seal.—But privy-seals for money begin in the treasury, from whence the first warrant issues, countersigned by the lord-treasurer.—On the *lord privy seal* are attendant four clerks, who have two deputies to act for them.

**LORD Steward of the King's Household**, is the principal officer for the civil government of the king's servants below-stairs: over the officers of which he has jurisdiction. See **STEWARD**, and **HOUSEHOLD**.

He is constituted by the delivery of the white staff, which is esteemed his commission.—By virtue of his office, without any other commission, he judges of all offences committed within the court, or the verge thereof, and gives judgment according to their several deserts.

At the death of the sovereign, he breaks his staff over the grave in which the royal corps is deposited, and thereby discharges all the officers under his power.

**LORD Advocate.** } See the article { **ADVOCATE**.

**LORD High Treasurer.** } { **TREASURER**.

**LORD Chamberlain of the Household.** } See **CHAMBERLAIN**.

**LORD Great Chamberlain of England.** } { **CHANCELLOR**.

**LORD High Chancellor of England.** } { **BED-CHAMBER**.

**LORDS of the Bed-chamber.** } { **TREASURY**.

**LORDS of the Treasury.** } { **TREASURY**.

**LORDS-Lieutenants of Counties**, are officers of great distinction, appointed by the king for the managing the standing militia of the county, and all military matters therein. See **COUNTY**. They are generally of the principal nobility, and of the best interest of the county; they are to form the militia in case of a rebellion, &c. and march at the head of them, as the king shall direct. See **MILITIA**.

They have the power of commissioning colonels, majors, captains, and subaltern officers; also to present the king

with the names of deputy-lieutenants; who are to be selected from the best gentry in the county, and act in the absence of the *lords-lieutenants*.

Subservient to the *lords-lieutenants*, and deputy-lieutenants, are the justices of peace; who, according to the order they receive from them, are to issue out warrants to the high and petty-constables, &c. for military service, &c.

**LOT**, in a law sense. See the article **SCOT**.

**LOTION**, **LOTIO**, popularly called *wash*; denotes a form of medicine made up of liquid matters, chiefly used for beautifying the skin, and cleansing it from those deformities which a disordered blood sometimes throws on it; or rather, are occasioned by a preternatural secretion. For, generally speaking, those distempers of the skin, which are accounted signs of a foul blood, proceed from the natural salts thrown off by the cutaneous glands, which ought to be washed away through the kidneys; so that instead of sweetners, which are usually prescribed on these occasions, Dr. Quincy thinks the urinary discharge should be promoted, or that of the skin rectified by proper *lotions*, or ointments and frictions.

**LOTION** also denotes a remedy, holding a medium between a fomentation and a bath.

There are refreshing and somniferous *lotions* for feverish persons, made of leaves, flowers, and roots boiled, wherewith the feet and hands of the patient are washed; and after washing, wrapped up in linen steeped in the same decoction till dry.

There are *lotions* also for the head and hair, made of the ashes of vine-twigs.

**LOTION of the Philosophers**, in chemistry, is a cohobation which nature makes of what is raised up, and afterwards falls back again to the bottom of the vessel.

**LOTION**, in pharmacy, denotes a preparation of medicines, by washing them in some liquid, either made very light, so as to take away only the dregs; or sharp, so as to penetrate them, in order to clear them of some salt, or corrosive spirit, as is done to antimony, precipitates, magisteries, &c. or intended to take away some foulness, or other ill quality; or to communicate some good one. See **ABLUTION**.

**LOTTERY**, a kind of game at hazard, wherein several lots of merchandize, or sums of money, are deposited as prizes, for the benefit of the fortunate.

The design of *lotteries*, and the manner of drawing them, are too well known among us to need a description: they are very frequent in England and Holland, where they cannot be set on foot without the permission of the magistrate.—In France too, there have been several *lotteries* in favour of their hospitals.

M. le Clerc has composed a treatise of *lotteries*, wherein is shewn what is laudable, and what blameable in them.—Gregorio Leti has also a book on the subject of *lotteries*.—Father Menestrier has a treatise on the same, published in 1700; where he shews their origin, and use among the Romans.—He distinguishes several kinds of *lotteries*, and takes occasion to speak of chances, and resolves several cases of conscience relating thereto.

**LOVE.** } See the article { **PLEASURE**, and **PAIN**.

**Platonic LOVE.** } { **PLATONIC**.

**LOUIS, LEWIS, LOWIS D'OR, or LEWIDORE**, a French coin, first struck in 1640, under the reign of Louis XIII. and which has now a considerable currency. See **COIN**.

*Louis d'ors*, at first, were valued at ten livres, afterwards at eleven, and at length at twelve and fourteen. In the latter end of the reign of Louis XIV. they were risen to twenty, and in the beginning of that of Louis XV. to thirty and thirty-six, nay, forty, and upwards; with this difference, however, that in the last coinings the weight was augmented in some proportion to the price, which in the former reign, was never regarded.

On the one side of the coin is the king's head seen, with his name; and on the other, a cross composed of eight L's cantoned with crowns. The legend is, *Christus regnat, vincit, imperat*.—The reverse has been frequently changed; at present, it bears a hand of justice crossed in a saltier, with a scepter.

There are also *white LOUIS's*, or *LOUIS d'argent*; some of 120, others of sixty sols a piece, called *ecus*; and among us, *French crowns*, *half crowns*, &c.

On the one side whereof is the king's head, and on the other the French arms, with this legend, *Sit nomen Domini benedictum*. See **CROWN**.

**Knights of S. LOUIS**, is the name of a military order, instituted by Louis XIV. in 1693.

Their collar is of the same colour, and passes from left to right.—The king is their grand master.—There are in it eight great crosses, and twenty-four commanders.—The number of knights is not limited. At the time of their institution, the king charged his revenue with the fund of three hundred thousand livres, for the pensions of the commanders and knights.

**LOW Airs**, in horsemanship. See the article **AIRS**.

**LOWER Ocean**. } **OCEAN**.  
**LOWER polar Dial**. } **DIAL**.  
**LOWERING the Flag**. } **FLAG**.  
**LOWEST Region**. } **REGION**.  
**LOXODROMIC Table**. See the article **TABLE**.  
**LOXODROMICS**, the art or method of oblique sailing, by the loxodromy, or rhumb. See **SAILING**, and **RHUMB**.  
**LOXODROMY**\*, **LOXODROMIA**, the line which a ship describes in sailing on the same collateral rhumb. See **RHUMB**.  
 \* The word is Greek, form'd of  $\lambda\omicron\gamma\delta\rho\omicron\mu$ , oblique, and  $\delta\rho\omicron\mu$ , course.  
 The *loxodromy*, called also the *loxodromic line*, cuts all the meridians in the same angle, called the *loxodromic angle*. See **ANGLE**.  
**LOZENGE**\*, or **LOZANGE**, a kind of parallelogram, or quadrilateral figure, consisting of four equal and parallel lines, or sides, whose angles are not right, but whereof two opposite ones are acute, and the other two obtuse; the distance between the two obtuse ones being always equal to the length of one side. See **PARALLELOGRAM**.  
 \* Scaliger derives the word *lozenge* from *laurengia*; this figure resembling, in some respects, that of a laurel-leaf.  
 In geometry, it is ordinarily called *rhombus*; and when the sides are unequal, *rhomboides*. See **RHOMBUS**, and **RHOMBOIDES**.  
**LOZENGE**, in heraldry, is a rhombus, or figure of equal sides, but unequal angles: resembling a quarry of glass in our old windows; placed erect, point-ways.—See *Tab. Herald. fig. 69*. It is in this figure that all unmarried gentlewomen and widows bear their coats of arms; because, as some say, it was the figure of the Amazonian shield; or, as others, because it is the ancient figure of the spindle.  
 The *lozenge* differs from the *fusil*, in that the latter is narrower in the middle, and not so sharp at the ends. See **FUSIL**.  
**LOZENGE** is also a form of medicine, made into small pieces, to be held or chewed in the mouth, till they are melted or wasted: the same with what are otherwise called *trochisci*, *troches*. See **TROCHE**.  
**LUCARIA**\*, an ancient feast celebrated by the Romans.—Sext. Pompeius observes, that the *Lucaria* were solemnized in the wood, where the Romans, defeated and pursued by the Gauls, retired and concealed themselves.  
 \* The word, according to Festus, and Sext. Pompeius, comes from *lucus*, a grove, or wood.—Varro derives it from *lucē*, the ablative of the word *lux*, light, and liberty. — But the former etymology seems the more natural.  
 It was held in the month of July, in memory of the asylum they found in that wood, which was between the Tyber and the road called *Via salaria*.  
**LUCIANISTS**, or **LUCANISTS**, a religious sect, so called from Lucianus, or Lucanus, a heretic of the second century; being a disciple of Marcion, whose errors he followed; adding some new ones to them.  
 Epiphanius says, he abandoned Marcion; teaching that people ought not to marry, for fear of enriching the Creator: and yet other Authors mention, that he held this error in common with Marcion, and other Gnostics.—He denied the immortality of the soul; asserting it to be material. See **MARCIONITES**.  
 There was another sect of *Lucianists*, who appeared some time after the Arians.—They taught, that the Father had been a Father always, and that he had the name even before he begot the son; as having in him the power, or faculty of generation; and in this manner they accounted for the eternity of the Son.  
**LUCID Intervals**, the fits of lunatics, or maniacs, wherein the phrenzy leaves them in possession of their reason. See **MADNESS**, and **PHRENZY**.  
 It is said, lunatics are capable of making a will in their *lucid intervals*. See **TESTAMENT**.  
**LUCIDA Corona**, a fixed star, of the second magnitude, in the northern crown. See **CORONA Borealis**.  
**LUCIDA Lyra**, a bright star, of the first magnitude, in the constellation Lyra. See **LYRA**.  
**LUCIDUM Septum**. See the article **SEPTUM**.  
**LUCIFERIANs**, a religious sect, who adhered to the schism of Lucifer, bishop of Cagliari, in the fourth century. S. Augustine seems to intimate, that they believed the soul transmitted to the children from their fathers.—Theodoret says, that Lucifer was the author of a new error—The *Luciferians* increased mightily in Gaul, Spain, Egypt, &c.—

# LUN

The occasion of the schism was, that Lucifer would not allow any acts he had done to be abolished.—There were but two *Luciferian* bishops, but a great number of priests and deacons.—The *Luciferians* bore a peculiar aversion to the Arians.  
**LUDI Circenses**. } See the article { **CIRCENCES**.  
**LUDI Florales**. } **FLORALES**.  
**LUDICROUS Games**. See the article **GAMES**.  
**LUES**, in a general sense, is used for a disease of any kind. See **DISEASE**.  
**LUES**, in a more particular sense, is restrained to contagious and pestilential diseases. See **PLAGUE**, &c.  
**LUES**, in the more common and modern use of the word, especially when joined with *gallica*, or *venerica*, is restrained only to the French-pox. See **VENEREAL Disease**.  
**LUFF**, a sea term, the same with *loof*. See **LOOF**.  
**LULLY's Art**. See the article **ART**.  
**LUMBAGO**, pains about the loins, and the small of the back; such as precede ague-fits, and fevers.  
 They arise commonly from fulness, and acrimony; in common with a disposition to yawning, shuddering, and erratic pains in other parts; and go off with evacuation, generally by sweat, and other critical discharges of fevers.  
**LUMBAL Glands**. } See the article { **GLAND**.  
**LUMBAL Nerves**. } **NERVE**.  
**LUMBARIS**, an epithet given to those branches of the aorta, which carries the blood to the muscles of the loins. See **AORTA**, and **ARTERY**.  
**LUMBARIS**, is also applied to certain veins, which bring back the blood from the loins into the trunk of the vena cava. See **VEIN**.  
 There is also a muscle of the thigh which bears this name. See **PSOAS**.  
**LUMBRICAL**\*, **LUMBRICALIS**, an appellation given to four muscles of the hand, and as many of the feet, which act as adductors of the fingers, and toes.  
 \* The word is formed from *lumbricus*, worm; on account of their figure, and smallness, which gives them a resemblance to worms.—On which account they are also called *vermiculares*.  
**LUMBRICALES Manus**, are muscles of the hands, commonly supposed to be nothing but branches of the tendons of the perforans, which go to the inside of the first bone on each finger, and are supposed to contribute to the variety of motions with the fingers, by giving a diversion to the direct actions of the other muscles; but simply, they only serve to draw the fingers toward the thumb.—Though Mr. Cowper observes, that some of them have distinct origins; and suspects that the rest may have so too, and therefore makes them distinct muscles.  
**LUMBRICALES Pedis**, are the muscles of the foot, which arise, as in the hand, one from each tendon of the perforans, or profundus, and go to the inside of each of the lesser toes.  
**LUMINOSA Semita**. See the article **SEMITA**.  
**LUMINOUS Column**. } See the article { **COLUMN**.  
**LUMINOUS Fire**. } **FIRE**.  
**LUNA**, in astronomy, the moon. See the article **MOON**.  
**LUNA**, in the jargon of the chemists, signifies *silver*; so called from the supposed influence of the moon thereupon.  
 The medicinal virtues of this metal, Dr. Quincy says, are none at all, until it have undergone very elaborate preparations. See **SILVER**.  
**Crystals of LUNA**. } See the article { **CRYSTAL**.  
**Vitriol of LUNA**. } **VITRIOL**.  
**LUNALE Bezoardicum**. See the article **BEZOARDICUM**.  
**LUNAR**, something belonging to the moon. See **MOON**.  
**LUNAR periodical Months**, consist of twenty-seven days, seven hours, and a few minutes.  
**LUNAR synodical Months**, consist of twenty-nine days, twelve hours, and three quarters of an hour. See **LUNATION**.  
**LUNAR Years**, consist of three hundred and fifty-four days, or twelve synodical months. See **YEAR**.  
 In the first ages, the year used in all nations was *lunar*; the variety of course being more frequent in this planet, and of consequence more conspicuous, and better known to men, than those of any others.—The Romans regulated their year, in part, by the moon, even till the time of Cæsar. See **YEAR**.  
 The Jews too had their *lunar* months.—Some rabbins pretend, that the *lunar* month did not commence till the moment the moon began to appear; and that there was a law, which obliged the person who discovered her first, to go and inform the sanhedrin thereof.—Upon which the president solemnly pronounced the month begun, and notice was given of it to the people by fires lighted on the tops of mountains. But this looks somewhat chimerical.  
**LUNAR Dial**. } See the article { **DIAL**.  
**LUNAR Eclipse**. } **ECLIPSE**.  
**LUNAR Horoscope**. } **HOROSCOPE**.  
**LUNAR Rainbow**. } **RAINBOW**.

LUNATIC,

# LUN

**LUNATIC, LUNATICUS**, a person affected, or governed by the moon.—Hence epileptics were anciently called *lunatici*, in regard the paroxysms of that disease seem to be regulated by the changes of the moon. See **EPILEPSY**.

Mad people are still called *lunatics*, from an ancient opinion that they are much influenced by that planet.—A much sounder philosophy hath taught us, that there is something in it; but not in the manner the ancients imagined; nor otherwise than what the moon has in common with other heavenly bodies, occasioning various alterations in the gravity of our atmosphere, and thereby affecting human bodies. See **COMET, PLANET, &c.** see also **TIDES**.

**LUNATION**, the period or space of time between one new moon, and another. See **MOON**.

*Lunation* is also called *synodical month*; consisting of 29 days, 12 hours, and three quarters of an hour. See **MONTH, &c.** At the end of 19 years the same *lunations* always return, on the same day; but not at the same precise time of the day; there being a difference of one hour, 27 minutes, and 33 seconds: wherein the ancients were mistaken, taking the use of the golden number to be more sure and infallible than it is. See **GOLDEN NUMBER**.

It has been found since, that in 312 years and a half, the *lunations* gain a day on the beginning of the month; so that when they came to reform the calendar, the *lunations* happened in the heavens, four or five days sooner than was shewn by the golden number.—To remedy which, we now make use of the perpetual cycle of the epacts.

We take 19 epacts, which answer to a cycle of 19 years; and when at the end of 300 years the moon has gained a day, we take 19 other epacts: which is also done, when, by the omission of an intercalary day, which happens three times in 400 years, the calendar is adjusted to the sun.

Care is taken that the index of the epacts must never be changed, excepting at the conclusion of a century, when there is occasion for it, on account of the *metamptosis*, or *proemtposis*; that is, of the lunar or solar equation.—When the bissextile or intercalary day is suppressed without a lunar equation, the next following, or lower index is taken, as was done in 1700.—When there is a lunar equation, without suppressing the bissextile, the next preceding, or higher index is taken; as will be done in 2400.—When there is both an equation, and a suppression, as in 1800; or neither the one nor the other, as in 2000; the same index is retained. See **EPACT**.

**LUNE, LUNULA**, in geometry, a plane in form of a crescent, or half-moon; terminated by the circumference of two circles, that intersect each other within.

Though the quadrature of the entire circle was never yet effected, yet geometers have found out the squares of many of its parts.—The first partial quadrature was that of the *lunula* given by Hippocrates of Sicily, who, of a shipwreck'd merchant, commenced geometrician. See **CIRCLE**, and **QUADRATURE**.

Let  $AEB$  (*Tab. Geometry, fig. 8.*) be a semicircle, and  $GC = GB$ ; with the radius  $BC$  describe a quadrant  $AFB$ ; then will  $AEBFA$  be Hippocrates's *lune*.

And since  $BC^2 = 2GB^2$ , the quadrant  $AGBC$  will be equal to the semicircle  $AEB$ ; taking away therefore from each the common segment  $AFBGA$ ;  $AEBFA =$  to the triangle  $ACB = GB^2$ .

**LUNE**, in fortification. See the article **DEMI-LUNE**.

**LUNETTE**, in fortification, an enveloped counterguard, or elevation of earth, made in the middle of the foss, before the curtain, about five fathom in breadth.

*Lunettes* are usually made in ditches full of water, and serve to the same purpose as *faussebrays*, to dispute the passage of the ditch. See **FAUSSEBRAY**.

The *lunette* consists of two faces, which form a re-entering angle; and its terreplein being only twelve feet wide, is a little raised above the level of the water; having a parapet three fathom thick.

**LUNGS**, a part of the human body, composed of vessels, and membranous vesicles; serving for respiration. See **RESPIRATION**.

The Lungs are connected, above, to the fauces, by means of the trachea; and below, to the vertebræ of the thorax; and to the sternum and diaphragm, by means of the pleura.—They are divided into two great lobes, by the mediastinum, and those again into others lesser; the right sometimes into three or four, by means of some fissures running from the fore to the back edge.—The great lobes, when inflated, resemble each of them a horse's hoof in figure, but together they are liker an ox's inverted.—See *Tab. Anat. (Splanchn.) fig. 12. litt. tt. fig. 14.* see also **LOBE**, and **LOBULE**.

The substance of the *lungs* is membranous, consisting chiefly of innumerable cells or vesicles; which seem to be nothing but expansions of the membranes of the bronchia, to which they hang like grapes in clusters; so that by blowing into one of the branches of the bronchia, those cells or vesicles belonging to it, are blown up; the rest, which do not, remaining still flaccid and unaltered. See **BRONCHIA**.

# LUP

The clusters of vesicles, or cells, are called the *internal lobules*; by which name they are distinguished from the lesser lobes spoken of.—They are separated from one another by interstices, which receive the vessels; and are filled up with membranes propagated from the lobules, and lying some parallel, some angular.—These lobules discover and display themselves very exactly, if the larger trunks of the bronchia be laid open, and the lesser blown into; by which means every lobule belonging to that branch will be inflated, and rise very distinctly, and shew its extent.

The whole substance of the *lungs* is covered with a common membrane, which is divisible in two coats; the outer thin, smooth, and nervous; the inner somewhat thicker and rougher, consisting mostly of the extremities of vessels and vesicles, through the impression of which it is pitted, and resembles, in some measure, a honey-comb.—Some affirm, that in this coat are abundance of perforations or pores, so disposed, that they readily imbibe any humidity from the cavity of the thorax, but suffer nothing to escape into it: but this seems little more than fancy.

The vessels of the *lungs* are the bronchia, the pulmonary and bronchial arteries and veins, nerves and lymphatics.—Of these vessels some are *proper* and some *common*, in respect of the service they are of to the rest of the body. The *common* are the bronchia, the pulmonary artery and vein, the nerves and lymphatics; the *proper* are the bronchial artery and vein. See **BRONCHIA, BRONCHIAL, PULMONARY, &c.**

Dr. Willis, contrary to the common opinion, ascribes to the *lungs* a great number of nerves, which come from the trunk of the par vagum; and which, being distributed through the substance of the *lungs*, embrace the aerious and sanguiferous vessels. He also asserts, that the vesiculæ have muscous fibres, to enable them to exert a greater contractive force in expiration; though others deny any such fibres.—Diemerbroek observes, that the vesicles admit not only of air, but also of other grosser matters; and instances two althmatic persons which he opened; the one a stone-cutter, the vesiculæ of whose *lungs* were so stuffed with dust, that, in cutting, his knife went as if through a heap of sand; and the other a feather-driver, in whom the vesicles were full of the fine dust, or down of feathers. See **ASTHMA**.

*Polypus of the LUNGS.* See the article **POLYPUS**.

**LUNISOLAR**, in astronomy and chronology, denotes something composed of the revolution of the sun, and of that of the moon. See **REVOLUTION, PERIOD, &c.**

**LUNISOLAR Year**, is a period of years made by multiplying the cycle of the moon, which is nineteen, by that of the sun, which is twenty-eight; the product of which is five hundred thirty-two; in which space of time, those two luminaries return to the same points. See **YEAR**.

**LUNULAR Angles.** See the article **ANGLE**.

**LUPERCALIA**\*, feasts instituted in ancient Rome, in honour of the god Pan. See **FAUNS**.

\* The word comes from *Lupercal*, the name of a place under the Palatine mountain, where the sacrifices were perform'd.

The *lupercalia* were celebrated on the fifteenth of the calends of March, that is, on the fifteenth of February, or, as Ovid observes, on the third day after the ides. They are supposed to have been established by Evander.

On the morning of this feast, the *luperci*, or priests of Pan, ran naked through the streets of Rome, striking the married women they met on the hands and belly with a thong, or strap of goat's leather, which was held an omen promising them fecundity, and happy deliveries. See **LUPURCI**.

The reason of this indecent custom, in celebrating the *lupercalia*, took its rise from Romulus and Remus; for while they were assisting at this feast, a body of robbers taking hold of the occasion, plundered them of their flocks. Upon this the two brothers, and all the youth that were with them, throwing off their clothes, to be the more expedit, pursued the thieves, and recovered their prey.—This succeeded so well, that thenceforward this ceremony became a part of the *lupercalia*.

This feast was abolished in the time of Augustus, but afterwards restored, and continued to the time of the emperor Anastasius.—Baronius says, it was abolished by the pope in 496.

**LUPERCI**, a name given to the priests of the god Pan. See **LUPERCALIA**.

The *luperci* were the most ancient order of priests in Rome; they were divided into two colleges, or companies, the one called *Fabii*, and the other *Quintilii*. To these Cæsar added a third, which he called *Julii*.

Suetonius mentions the institution of this new college of *luperci*, as a thing that rendered Cæsar more odious than he was; however, it appears from the same passage of Suetonius, that this new company was not instituted by Cæsar, nor in honour of Pan, but by some friends of Cæsar, and in honour of himself.

**LUPI Crepitus.** See the article **CREPITUS**.

*Centaurus cum LUPO.* See the article **CENTAURUS**.

**LUPUS**

**LUPUS**, *Wolf*, in astronomy, a southern constellation, consisting of nineteen stars. See **STAR**, and **CONSTELLATION**.

**LURE**\*, in falconry, a piece of red leather cut in form of a bird, with two wings, stuck with feathers; and sometimes baited with a piece of flesh: wherewith to reclaim, or call back a hawk. See **RECLAIMING**, **HAWK**, and **FALCONRY**.

\* The word comes from the French *lurre*, which signifies the same; formed, according to Skinner, from the Anglo-Saxon, *leura*, traitor; according to Tripaud, from *leora*, craftiness.

**LUSTER**, or **LUSTRE**, gloss, or brightness appearing on any thing; particularly manufactures of silk, wool, or stuff.

**LUSTRE** is also used for a certain composition, or manner of giving that gloss, or brilliant.

The *lustre* of silks, in which their chief beauty consists, is given them by washing in soap, then clear water, and dipping them in alum-water cold. See **SILK**.

The *lustre* of black taffaty is given by double-brewed beer, boiled with orange or lemon juice; that of coloured taffaties with water of gourds, distilled in an alembic.

Curriers give a *lustre*, or gloss to their leather, several ways, according to the colour to be illustrated. — For blacks, the first *lustre* is with juice of barberries; the second with gum arabic, ale, vinegar, and Flanders glue boiled together; for coloured leathers, they use the white of an egg beaten in water: Morocco's have their *lustre* from juice of barberries, and lemon or orange.

For hats, the *lustre* is frequently given with common water, sometimes a little black dye is added. — The same *lustre* serves skimmers, except that in white furs they never use any black dye. — For very black furs, they sometimes prepare a *lustre* of galls, copperas, Roman alum, ox marrow, and other ingredients.

The *lustre* is given to cloths and mohairs, by pressing them under the calendar. See **CALENDAR** and **PRESSING**.

**LUSTRAL**, an epithet applied by the ancients, to the water used in their ceremonies, to sprinkle and purify the people. From them the Romanists have borrowed the holy water used in their churches. See **Holy WATER**.

**LUSTRAL Day**, *Dies LUSTRICUS*, that whereon the illustrations were performed for a child, and its name given; which was usually the ninth day from the birth of a boy, and the eighth from that of a girl. Though others performed the ceremony on the last day of that week wherein the child was born, and others on the fifth day from its birth.

Over this feast-day the goddess Nundina was supposed to preside, the midwives, nurses, and domestics handed the child backwards and forwards, around a fire burning on the altars of the gods, after which they sprinkled it with water. The old women mixed saliva and dust with the water. — The whole ended with a sumptuous entertainment.

**LUSTRATION**, *Expiation*; sacrifices, or ceremonies, by which the Romans purified their cities, fields, armies, or people, defiled by any crime, or impurity. See **LUSTRUM**, **EXPIATION**, **PURIFICATION**, &c.

Some of their *lustrations* were public, others private.

There were three species, or manners of performing *lustration*; viz. by fire and sulphur; by water; and by air; which last was done by fanning and agitating the air round the thing to be purified. See **ABLUTION**.

There was also a peculiar kind of *lustration* for young children. See **LUSTRAL Day**.

Lomeir has a volume express on the *lustrations* of the ancients: Joh. Lomeieri Zutphanensis *Epimenides, sive de veterum gentium Lustrationibus*; first printed at Utrecht in 1681, and since, with additions, in 1702. 4°.

All persons, slaves only excepted, he shews, were ministers of some sort of *lustration*. — When any one died, the house was to be swept after a particular manner, by way of purification; the priest threw water on new married people, with the like intention. — To purify themselves, people would even sometimes run naked through the streets; such was their extravagance. And, as if fancy was not fertile enough in inventing modes of *lustration*, they even used enchantments to raise the dead, in order to get instructions what they must do to purge themselves of their sins. Add, that they frequently raised the opinion of the sanctity of their expiations by fictitious miracles.

The birds, they say, practise *lustration*, both by washing themselves, and throwing water on their nest. The hen takes straw, and uses it to purify her chickens. — There was scarce any action, at the beginning and end of which the Gentiles did not perform some ceremony to cleanse themselves, and appease the gods. When they had no animals to sacrifice, they made the figure of the beast they would offer in dough, metal, or other matter; and thus sacrificed in effigy.

Some expiations were performed in the water; for which reason, certain fountains and rivers were in great reputation:

VOL. II. N°. XCIII.

others were performed in the air. — A certain Heathen caused himself to be seriously sifted in a sieve, as we now sift corn: another hung himself by a cord, and was tossed backwards and forwards: another shut his eyes, and set himself blindfold to find out a nosegay tied to a cord: others played at fee-faw, as a more efficacious way of appeasing the gods.

Fire was much used for expiation: Sometimes the penitents were cast into the fire; at others, only brought to the flame, or smoke.

It was common, on these occasions, to shed human blood: The priests of Cybele, Bellona, and Baal, made cruel incisions on themselves. — Erectheus, king of Attica, sacrificed his daughter to Proserpina. Several had their throats cut at Rome, to obtain the emperor's health from the Gods. Those who commanded armies, offered one of their soldiers to appease the anger of the gods; that he alone might suffer all the wrath the army deserved.

All sorts of perfumes, and odoriferous herbs, had place in *lustration*. — The egg was much used among them, as being the symbol of the four elements; its shell, they say, represents the earth; the yolk, a globe of fire; the white, resembles the water; and besides, it has a spirit which represents the air. For this reason it is, that the Bonza's, or Indian priests, believe to this day that the world came out of an egg. — There is scarce any pot-herb, pulse, tree, mineral, or metal, which they did not offer the gods by way of expiation: Nor did they forget milk, bread, wine, or honey: what is more, they made use of the very spittle, and urine.

The poets had feigned that the gods purified themselves, and they did not omit to purify their statues. — They made a *lustration* for children, the eighth day after their birth. — When a man, who had been falsely reputed dead, returned home, he was not to enter his house by the door. — It was a settled custom to offer no expiation for those who were hanged by order of justice; or that were killed by thunder. Neither did they offer any for those who were drowned in the sea; it being the common opinion, that their souls perished with their bodies. And hence it was, that persons in danger of shipwreck sometimes thrust their swords through their bodies, that they might not die in the sea; where they thought their soul, which they supposed to be a flame, would be totally extinguished.

The most celebrated expiatory sacrifice was the hecatomb, when they offered an hundred beasts; though they commonly did not offer so many, but contented themselves with killing twenty five; but those being quadrupeds, their feet came to an hundred. See **HECATOMB**.

*Lustrations*, and *lustratory* sacrifices were not only performed for men, but also for temples, altars, theatres, trees, fountains, rivers, sheep, fields and villages. When the Arval brothers offered a victim for the fields, their sacrifice was called *ambarvalia*. See **AMBARVALIA**.

Cities were all to be purified, from time to time: Some walked the victim round their walls, and then slew him. — The Athenians sacrificed two men, one for the men of their city, and the other for the women. The Corinthians sacrificed the children of Medea so; though the poets say, Medea killed them herself. The Romans performed the ceremony of purifying their city every fifth year; whence the name of *lustrum*, given to the space of five years. See **LUSTRUM**.

Divers of the expiations were austere: some fasted; others abstained from all sensual pleasures: Some, as the priests of Cybele, castrated themselves; others, that they might live chaste, eat rue, or lay under the branches of a shrub called *agnus castus*. See **AGNUS Castus**.

The postures of the penitents were different, according to the different sacrifices: They sometimes joined prayers to the solemnity; at other times, a public confession of sins was made. — The Indians, when they sacrifice to Hercules, call him a thousand reproachful names; and think they incur his anger, if any respectful term come out of their mouth.

The priests changed their habits, according to the ceremonies to be performed: white, purple, and black, were the most usual colours. They had their heads always covered, and long hair, except in the sacrifices of Saturn, Hercules, Honour, and a few others: only the priests of Isis were shaven, because that goddess underwent the same operation, after the death of her husband Osiris. — In some ceremonies the priests were shod, in others barefoot: the poets express the former by the word *vincula*. They had no girdles; nay, they durst not pronounce the word *ivy*, because ivy cleaves to every thing. — In the sacrifices of Venus, and the Moon, every one took the habit of the contrary sex. — Every thing was to be done by odd numbers; because they looked on an even number, which may be equally divided, as the symbol of mortality and destruction. The odd number was with them holy: hence Neptune's trident, Cerberus's three heads, and Jupiter's thunder-dart, with three points.

They cast into the river, or at least out of the city, the animals, or other things that had served for a *lustration*, or sacrifice of atonement; and thought themselves threatened with

Some great misfortune, when by chance they trod upon them.—At Marseilles, they took care to feed a poor man for some time; after which, they charged him with all the sins of the country, and drove him away: Those of Leucade fastened a number of birds to a man charged with their sins, and in that condition cast him headlong from a high tower; and if the birds hindered his being killed, they drove him out of the country.

Part of these ceremonies were abolished by the emperor Constantine, and his successors; the rest subsisted till the Gothic kings were masters of Rome, under whom they expired; except that several of them were adopted by the popes, and brought into the church, where they make a figure to this day: witness the numerous consecrations, benedictions, exorcisms, ablutions, sprinklings, processions, feasts, &c. still in use in the Romish church. See CONSECRATION, &c.

**LUSTRUM**\*, a term used by the Romans, to signify a space of five years.

\* Varro derives the word from *lao*, to pay; because at the beginning of every fifth year, they paid the census, or tribute imposed by the censors; whose authority, at their first institution, was continued to them for five years; though afterwards it was abridged to one.—Others rather derive the word from *lustrare*, to make a review; because once in five years, the censors reviewed the army. See CENSUS and CENSOR.

**LUSTRUM** was also a ceremony, or sacrifice used by the Romans, after numbering their people once in five years. See LUSTRATION.

**LUTE**, **LUTUM**, in chymistry, a composition of certain tenacious substances, wherewith to close the apertures, and junctures of vessels in distillation, &c.

Under *lute* is comprehended any sort of cement, or plaister, used either in the construction of furnaces, or in fitting to them vessels of glass, or earth, that are to resist a very violent fire.—*Lutes* are made of flower and water; others, of quick-lime and whites of eggs; others, of iron filings, brick-dust, and linseed oil; others, of potter's earth, river sand, horses dung, powder of broken pots, caput mortuum of vitriol, dross of iron, beaten glass, flocks of wool mixed with salt water, or bullock's blood.

The *lute* used by Lemery, was only two parts of sand, and one of clay, tempered together in water; which does very well for joining the noses of retorts, and their receivers in distilling of volatile spirits, &c.

In distilling by the alembic, or vesica, or copper body, with its head or serpentine, a wet bladder serves very well to *lute* the junctures of the vessels: but for the distillation of corrosive spirits, as also to stop the cracks of glasses, &c. the following composition is recommended; viz. starch boiled, or fish-glue dissolved in spirit of wine, with flower of sulphur, mastic, and lime slacked in milk.

**LUTE**\*, a musical instrument of the string-kind; which had anciently but five rows of strings; though in course of time four, five, or six more had been added.

\* Some derive the Word from the German *laute*, which signifies the same; or from *lauten sonare*.—Scaliger and Bochart derive it from the Arabic, *allaud*.

The *lute* consists of four principal parts: the table; the body or belly, which has nine or ten sides; the neck, which has nine or ten stops or divisions marked with strings; and the head or cross, wherein are screws, for raising or lowering the strings to the proper tone.—In the middle of the table is a rose, or passage for the sound. There is also a bridge that the strings are fastened to, and a piece of ivory between the head and the neck, to which the other extremity of the strings are fitted. In playing, the strings are struck with the right hand, and with the left the stops are pressed.

The *lutes* of Bologna are esteemed the best; on account of the wood, which is said to have an uncommon disposition for producing a sweet sound.—The theorbo is an improvement on the *lute*.

**Temperament of the LUTE**, denotes the alteration requisite to be made in the intervals, both with regard to concords, and discords, in order to render them more just on that instrument.

**Archi-LUTE**. See the article **ARCILEUTO**.

**Theorbo LUTE**. See the article **THEORBO**.

**LUTHERANISM**, the sentiments of Dr. Martin Luther, and his followers, with regard to religion.

*Lutheranism* had its rise in the 16th century: its author was born at Eisleben in Thuringia, in 1483.—After his studies, he entered himself among the Augustines; and in 1512, took the cap of a doctor in theology, in the university of Wirtemberg. In 1516, he attacked the school-divinity in several theses.—In 1517, Leo X. having ordered indulgences to be dispensed to those who should contribute towards the building of St. Peter's church at Rome, he gave a commission thereof to the Dominicans.—The Augustines thinking they had a title to it before any body else, John Staupitz, their commissary-general, appointed Luther to preach against those dispensers of indulgences. See INDULGENCE.

Luther acquitted himself, in a manner, that perhaps the commissary had not imagined: from the preachers of indul-

gences he proceeded to indulgences themselves, and inveighed very warmly, both against the one and the other.

At first he only advanced ambiguous propositions; but being engaged in dispute about them, he maintained them openly, and without reserve; inasmuch, that in 1520 he was solemnly condemned, and excommunicated by the pope.—But neither the pope's thunder, nor the condemnation of several universities, could make any impression of terror upon him; but he continued preaching, writing and disputing, not against indulgences only, but several other corruptions which then prevailed in the church.

The character of the man, the strength of his arguments, and the weakness of his adversaries cause, soon procured him a number of followers.—And thus it was that *Lutheranism* was formed; the adherents whereto were called *Lutherans*, from *Lutherus*, a name which has a Greek turn, and which he assumed in lieu of his family name, *Lotter*, or *Lauter*; it being the custom of those days, for men of learning to give themselves Greek names: witness Erasmus, Melancthon, Bucer, &c. See NAME.

In 1523, Luther quitted the habit of a religious, and in 1524, married; after having been a happy instrument of reforming a great part of Germany, under the protection of George duke of Saxony.—He died at his native place, in 1546. See REFORMATION.

The first who received *Lutheranism*, were the people of Mansfeld, and the Saxons: it was preached at Kreichsaw in 1521.—It was received at Goslar, Rostock, Riga in Livonia, Rentling, and at Hall in Suabia, at Augsburg, Hamburg, and Treptow in Pomerania, in 1522.—In Prussia, in 1523; at Einbeck in the duchy of Lunenburg, at Nuremberg, and Bresslaw, in 1525.—In Hesse, in 1526; at Aldenburg, Strasbourg, and Brunswick, in 1528; at Gottingen, Lemgou, and Lunenburg, in 1530; at Munster, and Paderborn in Westphalia, in 1532; at Ethlingen, and Ulm, in 1533; in the duchy of Grubenhagen, at Hanover, and in Pomerania, in 1534; in the duchy of Wirtemberg, in 1535; at Cothuis, in the lower Lusatia, in 1537; in the county of Lippe, in 1538; in the electorate of Brandenburg, at Bremen, Hall in Saxony, Leipzig in Misnia, and at Quedlenburg, in 1539; at Embden in East-Friseland, Hailbron, Halberstadt, and Magdeburg, in 1540; in the palatinate of the duchy of Newburg, at Regensburg, and Wismar, in 1542; at Buxtende, Hildesheim, and at Osnaburg, in 1543; in the lower Palatinate, in 1546; in Mecklenburg, in 1552; in the marquisate of Durlach, and that of Hochberg, in 1556; in the county of Bentheim, in 1564; at Haguenaw, and in the lower marquisate of Baden, in 1568; and in the duchy of Magdeburg, in 1570. *Jovet*, T. I. p. 460, seq.

*Lutheranism* has undergone some alterations since the time of its founder.—Luther rejected the epistle of St. James, as inconsistent with the doctrine of St. Paul, in relation to justification; he also set aside the Apocalypse: both which are now received as canonical, in the Lutheran church.

Luther reduced the number of sacraments to two, viz. baptism, and the eucharist; but he believed the impanation, or consubstantiation: that is, that the matter of the bread and wine, remain with the body and blood of Christ; and it is in this article, that the main difference between the Lutheran and English churches consists. See CONSUBSTANTIATION.

Luther maintained the mass to be no sacrifice; exploded the adoration of the host, auricular confession, meritorious works, indulgences, purgatory, the worship of images, &c. which had been introduced in the corrupt times of the Romish church. He also opposed the doctrine of free-will; maintained predestination, asserted that we are necessitated in all we do, that all our actions done in a state of sin, and even the virtues themselves, of heathens, are crimes; that we are only justified by the imputation of the merits and satisfaction of Christ. He also opposed the fastings in the Romish church, monastical vows, the celibate of the clergy, &c.

Some authors reckon thirty nine different sects, which at different times have sprung up among the Lutherans, viz. the *Confessionists*, *Antinomians*, *Samosatereses*, *Inferani*, *Anti-diaphorists*, *Antiswenkfeldians*, *Antiofandrians*, *Anticalvinists*, *Layers on of hands*, *Bissacramentales*, *Trissacramentales*, *Majorites*, *Adiaphorists*, *Quadrifacramentales*, *Luthero-calvinists*, *Annetes*, *Mediofandrians*, *Confessionists firm and wavering*, *Swenkfeldians*, *Onandrians*, *Stanoandrians*, *Antistancarians*, *Zuinglians simple*, *Zuinglians significative*, *Carlostadians*, *Evargic Tropists*, *Arrabonarii spiritual*, *Sucefeldians*, *Servetists*, *Davidics* or *Davidi-Georgians*, *Mennonites*, &c. *Jovet*, T. I. p. 475.

**LUTHERANS**, a sect of Protestants who profess *Lutheranism*, or adhere to the doctrine and tenets of Luther. See LUTHERANISM.

The *Lutherans*, of all Protestants, are those who differ least from the Romish church.—They are divided into several sects; the principal whereof are recited in the following articles, and in their proper places in the course of this book.

**Moderate LUTHERAN**, one who softens or mitigates Luther's doctrine;

# L U X

doctrine; or follows the doctrine of Luther thus mitigated.—Melanchthon was the first of this sect.

**Lax LUTHERAN**, is an appellation given to those who complied with the Interim, and who formed three different parties; that of Melanchthon, Pacius, or Pfeffinger, and that of the university of Leipzig, and the divines of Franconia. See **INTERIM**, and **ADIAPHORIST**.

**Rigid LUTHERAN**, one who still maintains the ancient Lutheranism of Luther, and the first *Lutherans*.

As to the articles of predestination, and grace, the *Lutherans* are no longer rigid.—The head of the *rigid Lutherans* was Flaccius Illyricus, the chief of the four authors of the *Ecclesiastical History divided into Centuries*; known under the name of *Magdeburg Centuries*, or *Centuriators*.—This man could not bear the least alteration to be made in Luther's doctrine.

**LUTHERO-CALVINIST**, one who holds the opinions of Calvin, together with those of Luther; so far as they are capable of subsisting together.

**LUTHERO-OSIANDRIAN**, one who blends together the doctrine of Luther, and that of Lucas Osiander.

**LUTHERO-PAPIST**, an appellation given to those *Lutherans* who excommunicated the Sacramentarians.

**LUTHERO-ZUINGLIAN**, one who jumbles together the opinions of Luther and Zuinglius.

Martin Bucer, of Scheffstadt in Alsace, who, from a Dominican, by a twofold apostasy, as the Romanists call it, became a *Lutheran*, was the head of the *Luthero-Zuinglians*; whose tenets were not so much a mixture of *Lutheranism* and *Zuinglianism*.—But what rather entitled them to the appellation was, that they formed a society, who agreed to tolerate and bear with each other's opinions.

**LUTHERN**\*, a kind of window over the cornice, in the roof of a building; standing perpendicularly over the naked of the wall; and serving to illuminate the upper story. See **WINDOW**.

\* The word comes from the French, *lucarne*, of the Latin *lucerna*, light, or lantern.

The French architects distinguish these into various kinds, according to their various forms; as *square*, *semicircular*, *bulls eyes*, *flat arches*, *Flemish lutherns*, &c.

**LUTUM Sapiientia**, is the hermetical seal; made by melting the end of a glass vessel by a lamp, and twisting it up with a pair of pliers. See **HERMETICAL Seal**.

**LUXATION**\*, **LUXATIO**, in medicine and surgery, the slipping of the head of a bone from its proper receptacle into another place; whereby the natural motion of the joint is destroyed. See **BONE** and **ARTICULATION**.

\* The word is Latin, formed from *luxare*, to loosen.

*Luxation* is the same with what is otherwise called *dislocation*; being the displacing of a bone, or rather the disjoining of two bones, articulated together for the motion of the part.

*Luxations* are either *violent*, proceeding from some external cause; as falls, strains, blows, leaps, extensions, &c.—Or *gentle*, arising from internal causes; as a natural laxity of the ligaments, a fluxion of humours, or gradual collection thereof between the joints, &c.

*Luxation*, properly, has place only amongst bones whose structure determines them to a manifest motion, as are all those united by diarthrosis; those articulated by synarthrosis, where there is no manifest motion, are indeed subject to fracture, caries, exostosis, &c. but not to *luxation*. See **DIARTHROSIS**, &c.

*Luxations*, again, are either *perfect*, or *imperfect*.

**Perfect**, or **complete LUXATION**, **ΕΞΑΡΘΗΜΑ**, is that where the head of a bone is actually started out of the cavity of another.—It is known by a tumour, or protuberance, formed by the head of the separated bone, which raises up the skin, and muscular flesh above its natural level in the part not destined to receive it; and a hollowness or sinking in the place from whence it is started, perceivable by the touch.—It is also attended with great pain, a total abolition of motion, and a shortening of the limb.

**Imperfect**, or **partial LUXATION**, **ΠΑΡΑΡΘΗΜΑ**, called also *subluxation*, is where the motion is only much impaired, the joint weakened, and a deformity perceivable in it, when compared with the opposite part, which is sound.—This is otherwise called a *strain*, when it proceeds from an external cause; or, simply, a *relaxation*, when from an internal one.

A *luxation* is said to be *simple*, when it has no other accident or injury accompanying it—*complicated*, when it is attended with a wound, inflammation, fracture, or the like.

The cure of a *luxation*, is by a speedy reduction of the dislocated member to its natural place.—To this are necessary, 1°. *Extension*, *ἀντίστροφis*, which a luxated as well as fractured member requires; as well on account of the contraction of the tendons, as that the head of the bone may more directly be intruded into its seat.—This extension is made either by the hands alone, which is called *modus palæstricus*, because, among wrestlers, dislocated members use to be reduced after this manner; or by ligatures, or towels; or by instruments, or great machines, when the *luxation* is difficult, and inveterate.

# L Y M

2°. After extension, follows the intruding of the joint into the natural cavity; which, likewise, may either be effected by the hands only, or by the heel, (as when the head of the os humeri is fallen into the arm-pit) or by means of ladders, doors, pestles, or Hippocrates's instrument, called *ambe*.—This way is termed *methodical*, by way of distinction from the third, which is called *organical*, because performed by large instruments, and machines, but now altogether out of use. Gourmelinus to these adds *ανόστροφis*, the very act of reducing the member into its own place, which is to be known by the sound usually heard, and from the use and motion of the reduced joint.

Lastly, because on account of the laxity of the tendons, &c. the reduced bone cannot remain in its natural position, it is necessary yet further to apply compresses and bandages; by whose means the articulation is preserved safe, till the ligaments may acquire their usual strength of elasticity and adhesion.

**LYCANTHROPY**\*, **ΛΥΚΑΝΘΡΩΠΙΑ**, a species of madness, wherein those affected run, in the night-time, howling about the fields like wolves; and some bite and snarl like dogs; whence the disease is also called by the ancients, *cynanthropy*.

\* The word is formed of the Greek *λυκος*, wolf, and *άνθρωπος*, man: *q. d.* man-wolf.

*Lycanthropy* is also used for an imaginary metamorphosis of a man into a wolf, by magic power; wherein the persons affected seem not only to themselves in the form of wolves, but to others. See **METAMORPHOSIS**.

**LYCEUM**, **ΛΥΚΕΙΟΝ**, the name of a celebrated school, or academy at Athens, where Aristotle explained his philosophy. See **ARISTOTELIAN**.

The place was composed of portico's, and trees planted in the quincunx form, where the philosophers disputed walking. See **PERIPATETIC**.

Hence, *philosophy of the lyceum* is used, to signify the philosophy of Aristotle, or the peripatetic philosophy.

Suidas observes, that the *lyceum* took its name from its having been originally a temple of Apollo *Lyceus*; or rather, a portico, or gallery built by Lycus, son of Apollo: but others mention it to have been built by Pisistratus, or Pericles.

**LYCOCTONON**. See the article **ACONITE**.

**LYDIAN Mode**. See the article **MODE**.

**LYGMOS**, **ΛΥΓΜΟΣ**. See the article **HICCUP**.

**LYMPH**, **LYMPHA**, in anatomy, a thin transparent humour, something like water; secreted from the serum of the blood in all parts of the body, and returned to the blood again, by proper ducts of its own, called *lymphatics*; and supposed by some, to be the immediate matter of nutrition. See **LYMPHATICS**, **HUMOUR**, **NUTRITION**, &c.

If the *lymph* be chymically examined, it will be found to contain a great deal of volatile, but no fixed salt, some phlegm, some sulphur, and a little earth.

The use of the *lymph* may be gathered from the consideration of the parts into which it discharges itself.—That which comes from the head, neck, and arms, is thrown into the jugular and subclavian veins.—All the lymphatics, which the parts in the cavity of the thorax send out, empty themselves into the thoracic duct; and the *lymph*, from all the rest of the body, flows to the common receptacle: so that there can be no doubt, but that its chief use is to dilute, and perfect the chyle, before it mixes with the blood. See **CHYLE**, **CHYLIFICATION**, and **SANGUIFICATION**.

**LYMPHATICS**, or **LYMPHADUCTS**, a sort of fine, small, transparent vessels, generally arising from the glands, and conveying back to the blood a transparent liquor, called *lymph* or *lymphe*. See **LYMPH**.

These, though not so visible as the other vessels, because of their minuteness, and transparency, are, however, existent in all parts of the body; but the difficulty of finding them, has prevented their being described in many parts.

The *lymphatics* are contracted at small and unequal distances by two opposite semi-lunar valves, which permit the lymph to pass through them towards the heart; but shut, like flood-gates, upon its returning.

They arise in all parts of the body, but after what manner, needs no great dispute; for, without doubt, all the liquors in the body, excepting the chyle, are separated from the blood in the fine capillary vessels, by a different pipe from the common channel in which the rest of the blood moves: but whether this pipe be long or short, whether it be visible or invisible, it is still a gland, whilst it suffers some part of the blood to pass through it; denying a passage to the rest. See **GLAND**.

Now, the glands which separate the lymph must be of the smallest kind, for they are invisible to the finest microscope; but their excretory ducts, the *lymphatic* vessels, unite with one another, and grow larger, as they approach the heart: yet, they do not open into one common channel, as the veins do; for sometimes we find two, or three, or more *lymphatics*, running by one another; which only communicate by short intermediate ducts, and which unite, and immediately divide again.—In their progress, they always touch at one or

# LYR

two conglobate or vesicular glands, into which they discharge themselves of their lymph.—Sometimes the whole *lymphatic* opens, at several places, into the gland; and sometimes it sends in only two or three branches, whilst the main trunk passes over, and joins the *lymphatics* which arise from the opposite sides of the gland, exporting again their lymph to their common receptacle.

The glands of the abdomen, which receive the *lymphatics* from all its parts, as likewise from the lower extremities, are the glandulæ inguinales, sacrae, iliacæ, lumbares, mesentericæ, and hepaticæ; all which send out new *lymphatics*, which pour their contents into the receptaculum chyli; as those of the chest, head, and arms do into the ductus thoracicus, jugular and subclavian veins.

These glands are round and smooth bodies, about the bigness of a hazle nut, bigger or lesser, according to the number of *lymphatics* they receive.—Their substance is membranous, and their whole bulk divided into little cells, which receive the lymph from the *lymphatics*; and are therefore improperly called *glands*, because they separate no liquor from the blood. It is true, that their exporting *lymphatics*, communicating with their arteries, do receive a lymph from them; but this is done without the help of conglobate glands; as the lacteal veins do with the capillary arteries of the guts; the chief use of their vesicular bodies seems to be, that the slow-moving lymph may receive a greater velocity from the elastic contraction of their membranous cells, as well as from the new lymph immediately derived from the arteries. See GLAND.

LYRA, a constellation in the northern hemisphere. See STAR and CONSTELLATION.

The number of its stars in Ptolemy's and Tycho's catalogues are 10, in the Britannic catalogue 19; the names, places, longitudes, latitudes, and magnitudes whereof, are as follow:

## Stars in the Constellation Lyra, or Vultur Cadens.

Names and Situations of the Stars.	Signs.	Longitude			Latitude North			Magnit.
		°	'	"	°	'	"	
South in the preced. wing of the Vult.	♍	3	35	39	59	24	42	5

LYRA *Lucida*. See the article LUCIDA.

LYRE, LYRA, a stringed instrument much used among the ancients; said to have been invented by Mercury, on occasion of his finding a dead shell-fish, called by the Greeks, *chelone*, and Latins, *testudo*, left on an inundation of the Nile; of the shell whereof he formed his *lyre*; mounting it with seven strings, according to Lucian, and adding a kind of jugum to it, to stretch or loosen the strings.

Boethius relates the opinion of some, who say, that Mercury's *lyre* had but four strings, in imitation of the mundane music of the four elements.—Diodorus Siculus says it had but three strings, in imitation of the three seasons of the year; which were all the Greeks counted, viz. spring, summer, and winter.—Nicomachus, Horace, Lucian, and others, make it have seven strings, in imitation of the seven planets.

This three, four, or seven stringed instrument, Mercury gave to Orpheus; who being torn to pieces by the Bacchantes, the *lyre* was hung up by the Lesbians in Apollo's temple.—Others say, Pythagoras found it in some temple in Egypt, and added an eighth string.—Nicomachus says, that when Orpheus was killed, this *lyre* was cast into the sea, and thrown up at An-

# LYS

tissa, a city of Lesbos; where the fishermen finding it, gave it to Terpander; who carried it into Egypt, and called himself the inventor.—The seven strings were diatonically disposed, by tones, and semi-tones; and Pythagoras's eighth string made up the octave.

Mr. Barnes, in the prolegomena to his edition of *Anacreon*, has an enquiry into the antiquity and structure of the *lyre*; of which he makes Jubal the first inventor. For the several changes this instrument underwent, by the addition of new strings, he observes, that according to Diodorus, it had originally only three; whence it was called *τρίχορδος*. Afterwards, it had seven strings; as appears from Homer, Pindar, Horace, Virgil, &c. Festus Avienus gives the *lyre* of Orpheus nine strings. David mentions an instrument of that sort strung with ten, in *psalterio decachordo*. Timotheus of Miletus added four to the old seven, which made eleven. Josephus, in his *Jewish Antiquities*, makes mention of one with twelve strings; to which were afterwards added six others, which made eighteen in all.—Anacreon himself says, p. 253. of Mr. Barnes's edition, *canto viginti totis chordis*.—For the modern *lyre*, or Welsh harp, consisting of forty strings, it is sufficiently known.

From the *lyre*, which all agree to be the first instrument of the stringed kind in Greece, arose an infinite number of others, differing in shape, and number of strings; as the *psalterium*, *trigon*, *sambucus*, *pectis*, *magadis*, *barbiton*, *testudo*, (the two last used promiscuously, by Horace, with the *lyre* and *cithara*) *epigonium*, *simmicium*, and *pandura*; which were all struck with the hand, or a plectrum. See PSALTERY, SAMBUCA, MAGADIS, BARBITON, CITHARA, &c.

LYRE, among painters, statuaries, &c. is an attribute of Apollo, and the muses. See ATTRIBUTE.

LYRIC, something sung, or played on the lyre or harp. See LYRE.

LYRIC is more particularly applied to the ancient odes, and stanza's; which answer to our *airs*, or *songs*, and may be played on instruments. See ODE.

The ancients were great admirers of *lyric verses*; which name, Mr. Barnes observes, they gave to such verses as were sung to the lyre. See VERSE.

This species of poetry was originally employed in celebrating the praises of gods and heroes; though it was afterwards introduced into feasts, and public diversions: it is a mistake to imagine Anacreon, as the Greeks do, the author of it; since it appears from scripture to have been in use above a thousand years before that poet.—Mr. Barnes shows how unjust it is to exclude heroic subjects and actions from this sort of verse, *lyric poetry* being capable of all the elevation and sublimity such subjects require; which he confirms by the example of Alcæus, Stesichorus, Anacreon, and Horace, and by his own essay, *A Triumphal Ode, inscribed to the Duke of Marlborough*, at the head of this edition: he concludes with the history of *lyric poesy*, and of those ancients who excelled in it.

The characteristic of *lyric poetry*, which distinguishes it from all others, is *sweetness*.—As *gravity* rules in heroic verse; *simplicity*, in pastoral; *tenderness*, and *softness*, in elegy; *sharpness*, and *poignancy*, in satyr; *mirth*, in comedy; the *pathetic*, in tragedy; and the *point*, in epigram: so in the *lyric*, the poet applies himself wholly to sooth the minds of men, by the sweetness and variety of the verse, and the delicacy of the words, and thoughts; the agreeableness of the numbers, and the description of things most pleasing in their own nature. See ODE, SONG, &c.

LYSIARCHA, an ancient kind of magistrate, being the pontiff of Lycia, or superintendant of the sacred games of that province.

Strabo observes, that the *Lysiarcha* was created in a council, consisting of the deputies of twenty three cities; that is, of all the cities in the province: some of which cities had three voices, others two, and others but one.

Cardinal Noris says, that the *Lysiarcha* presided in matters of religion; in effect, the *Lysiarcha* was nearly the same with the *Arsiarcha*, and *Syriarcha*; who though they were all the heads of the councils, or states of those provinces, yet were they established principally to take care of the games and feasts celebrated in honour of the gods, whose priests they were inaugurated at the same time that they were created *Lysiarcha*, *Syriarcha*, or *Arsiarcha*.

**M**, A liquid consonant, and the twelfth letter in the alphabet. See LETTER, and ALPHABET.

It is pronounced by striking the upper lip against the lower; in which the pronunciation of this letter agrees with that of *b*: the only difference between the two consisting of a little motion made in the nose in pronouncing *M*, and not in *b*: whence it happens that those who have taken cold, for *M*, ordinarily pronounce *b*; the nose in that case being disabled from making the necessary motion. See B. Quintilian observes, that the *M* sometimes ends Latin words, but never Greek; the Greeks always changing it in that case into *n*, for the sake of the better sound. See N.

*M* is also a numeral letter, and among the ancients was used for a thousand; according to the verse,

*M caput est numeri quem scimus mille tenere.*

When a dath is added a-top of it, as *M̄*; it signifies a thousand times a thousand.

*M*, in astronomical tables, and other things of that kind, is used for *Meridional* or southern; sometimes for *Meridies*, or midday.

*M*, in medicinal prescription, is frequently used to signify a manipule, or handful. See MANIPULE.

*M* is sometimes also put at the end of a recipe, for *miscē*, mingle; or *mixtura*, a mixture. Thus, *m. f. julapium* signifies, mix and make a julep.

*M*, in law, the brand or stigma of a person convicted of manslaughter, and admitted to the benefit of his clergy.—It is to be burnt on the brawn of his left thumb.

MACARONIC, or MACARONIAN\*, a kind of burlesque poetry; consisting of a jumble of words of different languages, with words of the vulgar tongue latinized, and Latin words modernized. See BURLESQUE, &c.

\* *Maccaronē*, among the Italians, as has been observed by Cælius Rhodiginus, signifies a coarse clownish man; and because this kind of poetry, being patch'd out of several languages, and full of extravagant words, is not so polite and smooth as those of Virgil, &c. the Italians, among whom it had its rise, gave it the name of *Maccaronian*, *Maccaronic* poetry. Others chuse to derive it à *Macaronibus*, from *Macaroons*, a kind of confection made of meal not bolted, sweet-almonds, sugar, and the white of eggs; accounted a great dainty among the country people in Italy; which from their being composed of various ingredients occasioned this kind of poetry, which consists of Latin, Italian, Spanish, French, English, &c. to be called by their name.

For an instance; a bold fellow in the *Macaronic* style, says;  
*Enfilavi omnes Scadrones & Regimandos, &c.*

Another example:

*Archeros pistoliferos furiamque manantum,  
Et grandem esmeutam quæ inopinum facta ruellæ est:  
Toximumque alto troublantem corda clochero, &c.*

Theoph. Folingius, a Benedictin monk of Mantua, was the first who invented, or at least cultivated, this kind of verse: For though we have a *Macaronea Ariminensis* in a very old letter, beginning, *Est Author Typhis Leonicus atque Paransus*; yet it seems to have been the work of Guarinus Capellus Sarasinus, who in the year 1526, printed six books of *Macaronic* poetry, in *Cabrinum Gagmogæ Regem*: but as both these came out after the first edition of Folingius, which was published under the name of Merlinus Coccajus in 1520; so were they likewise much inferior to him both in the style, invention and episodes wherewith he has enriched the history of Balus; which make the subject of his poem.—The famous Rabelais first transferred the *Macaronic* style out of the Italian verse into French prose, and on the model thereof formed some of the best things in his *Pantagruel*.

Merlin Coccajus met with so much success in his new way, that he composed another book partly in *Macaronic* style, called *Il Chars del tri per uno*; but with very different success. After this, appeared in Italy, *Macaronica de syndicato, & condemnatione doctoris Samsonis Lembi*, a low performance; and *Macaronis Forza*, an excellent one, by Stefano a jesuit. In 1620, Bajani published a *Carnavale Tabula Macaronea*. The last Italian who wrote in this way, was Cæsar Ursinius, to whom we owe *Capricia Macaronica magistri Stopini poeta Pouzanensis*, printed in 1636.

The first who succeeded in the *Macaronic* style among the French was Antonius de Arena Provensalis de Bragardissima Villa de Solriis, in two poems, which he has left us, *de Arte Donfandi, & de Guerra Neapolitana Romana & Genuensi*. He was followed by another lawyer, who wrote *Historia bravissima Caroli V. Imperat. a Provincialibus passanis triumphanter fugati*. Some time after, Remi Belleau, among his other French poesies, printed *Diætamen metrificum de bello Hugonotico, & rusticorum pigliamine ad sodales*; a piece much valued. This was succeeded by *Cacasanga Reistro Suizzo*

VOL. II. N<sup>o</sup>. 93.

*Lansqueneterum per M. J. B. Lichardum Recatolicatum Spalporcinum postam*; to which Stephen Tabouret returned an answer in the same strain. Lastly, John Edward de Monin entered the lists, and left us *inter teretissima sua carmen arenaicum de quorundam nugigerulorum piaffa insupportabili*. The *Recitus veritabilis super terribili esmeuta passanorum de Ruellio*, is one of the best pieces of this kind.

We have little in English in the *Macaronian* way; nothing scarce, but some little loose pieces collected in Camden's remains: which is no discredit to our authors; for one may say of such pieces in general,

*Turpe est difficile habere nugas,*

*Et stultus labor est ineptiarum.*

But the Germans and Netherlanders have had their *Macaronic* poets; witness the *Certamen catholicum cum Calvinistis*, of one Martinus Hamconius Frisius, which contains about twelve hundred verses, all the words whereof begin with the letter *C*. MACE, MACIS, a medicinal bark or rind; the second of the three which cover the nutmeg. See NUTMEG.

It is of an astringent and drying nature, and is used as a corrector in cardiac and cathartic compositions. See BARK.

MACEDONIANS. See the Article SEMIARIAN.

MACERATION, in pharmacy, the operation of dissolving a solid body by means of water. See DISSOLUTION.

In which sense, the word amounts to much the same with liquefaction or liquation. See LIQUEFACTION.

MACERATION is also used for the infusing a body in any menstruous fluid, in order to a solution of its principles, whether with or without fire.

In which sense *Maceration* amounts to much the same with Digestion. See DIGESTION.

Others restrain *Maceration* to that particular kind of digestion, which is performed in thick substances, as when having mixed roses with fat to make Unguent. Rosatum, the mixture is exposed for some days to the sun, that the virtue of the roses may be the better communicated to the fat.

MACHINE, MACHINA\*, in the general, signifies any thing that serves to augment, or to regulate moving powers: or it is any body destined to produce motion, so as to save either time or force. See MOTION and POWER.

\* The word comes from the Greek, μηχανή, *Machine*, *Invention*, *Art*.—And hence in strictness, a *Machine* is something that consists more in art and invention, than in the strength and solidity of the materials; and for this reason it is, that the inventors of *Machines* are called *Ingenieurs* or *Ingeners*. See ENGINE.

*Machines* are divided into *simple* and *compound*.

*Simple* MACHINES are those otherwise called mechanical powers. See MECHANICAL POWER.

There are six *simple* *Machines*, to which all other may be reduced; viz. the balance, lever, wheel, pulley, wedge, and screw.—For the doctrine of which, see BALANCE, LEVER, &c.

*Compound* MACHINE is that which is composed of several simple ones combined together.

The number of *compound* *Machines* is now almost infinite; and yet the ancients seem to have out-done the moderns in this respect; their *Machines* of war, architecture, &c. being described as vastly superiour to ours.

Architectonical MACHINE, is an assemblage of pieces of wood so disposed, as that by means of ropes and pulleys, a small number of men may raise vast loads, and lay them in their places. Such are cranes, &c.

It is hard to conceive what *Machines* the ancients must have used to raise those immense stones found in some of the antique buildings.

Hydraulic, or Water-MACHINE, is either used to signify a *simple* *Machine*, serving to conduct or raise water; as a sluice, pump, &c. or several of these acting together, to produce some extraordinary effect; as the

MACHINE of Marly, the primum mobile whereof, is an arm of the river Seine, which by its stream turns several large wheels, which work the handles, and these with pistons raise the water into the pumps, and with other pistons force it up in pipes against the ascent of a hill to a reservoir in a stone tower, 62 fathom higher than the river; sufficient to supply Versailles with a constant stream of 200 inches.

Military MACHINES, among the ancients were of three kinds; the first serving to launch arrows, as the scorpion; javelins, as the catapulta; stones, as the balista; or fiery darts, as the pyraboli: the second serving to beat down walls, as the battering ram and terebra: and the third to shelter those who approached the enemies wall; as the tortoise or testudo, the vinea, and the towers of wood. See SCORPION, ARIES, &c. The *Machines* of War now in use, consist in artillery, bombs, petards, &c. See ARTILLERY, GUN, CANNON, &c.

MACHINE, in dramatic poetry, is when the poet brings some

divinity or supernatural being upon the stage; to perform some exploit, or solve some difficulty out of the reach of human power.

The *Machines* of the drama are gods, angels, ghosts, &c. which are so called from the *Machines* or contrivances by which they are represented upon the stage, and afterwards removed again.

Hence, the use of the word *Machine* has also passed into the epic poem; though the reason of its name be there wanting: it denotes in both cases, the intervention, or ministry of some divinity: but as the occasion of *Machines*, in the one and the other, are somewhat different, the rules and laws of managing them are different likewise.

The ancient dramatic poets never brought any *Machine* on the stage, but where there was an absolute necessity for the presence of a god; and were generally laughed at for suffering themselves to be reduced to such a necessity. Accordingly *Aristotle* lays it down as an express law, that the unravelling of the piece should arise from the fable itself; and not from any foreign *Machine*, as in the *Medea*. Horace is something less severe; and contents himself with saying, that the gods should never appear, unless where the *Nodus*, or knot, is worthy of their presence; *Nec Deus interfit nisi dignus Vindice Nodus*, — *Inciderit*. See *INTRIGUE*, *CATASTROPHE*, &c.

But it is quite otherwise with the *Epopæa*; there must be *Machines* every where, and in every part. Homer and Virgil do nothing without them. Petronius, with his usual fire, maintains, that the poet should deal more with the gods than with men; that he should every where leave marks of his prophetic raptures, and of the divine fury that possesses him; that his thoughts be all full of fables, that is, of allegories and figures: In fine, he will have a poem distinguished from an history in all its parts; not so much by the verses, as by that poetical fury which expresses itself wholly by allegories, and does nothing but by *Machines*, or the ministry of the gods.

A poet, therefore, must leave it to the historians to say, that a fleet was dispersed by a storm, and driven to foreign shores; and must himself say with Virgil, that Juno went to seek *Æolus*, and that this god, at her request, turned the winds loose against the Trojans. — He must leave the historian to write, that a young prince behaved himself with a great deal of prudence and discretion on all occasions; and must say with Homer that Minerva led him by the hand in all his enterprizes. — Let an historian say, that Agamemnon, quarrelling with Achilles, had a mind to shew him, though mistakenly, that he can take Troy without his assistance. The poet must say that Thetis, piqued at the affront her son received, flies up to heaven to demand vengeance of Jupiter; and that this god, to satisfy her, sends the god *Somnus*, or Sleep, to Agamemnon, to deceive him, and make him believe that he shall take Troy that day.

It is thus that the epic poets used *Machines* in all parts of their works: in the *Iliad*, *Odyssey*, and *Æneid*, the proposition mentions them; the invocation is addressed to them; and the narration is full of them: they are the cause of actions; they make the knots; and at last they unravel them. — This last circumstance is what *Aristotle* forbids in the drama; but it is what Homer and Virgil have both practised in the *Epopæa*. Thus Minerva fights for Ulysses against Penelope's lovers, helps him to destroy them; and the next day, herself makes the peace between Ulysses and the Ithacans, which closes the *Odyssey*.

The use of *Machines*, in the epic poem, is, on some accounts, entirely opposite to what Horace prescribes for the theatre. In tragedy that critic will never have them used without an absolute necessity; whereas in the *Epopæa* they should never be used but where they may be as well let alone; and where the action appears as if it did not necessarily require them. How many gods and *Machines* does Virgil implore to raise the storm that drives *Æneas* into Carthage? which yet might easily have happened in the ordinary course of nature!

*Machines*, in the epic poem, therefore, are not contrivances of the poet to recover himself after he has made a false step; nor to solve any difficulty peculiar to some part of the poem; but it is the presence of a divinity, and some supernatural and extraordinary action which the poet inserts in most of the incidents of his work, to render it more majestic and admirable; and to train his readers to piety and virtue. This mixture should be so managed, as that the *Machines* may be retrenched, without retrenching any thing from the action.

As to the manner in which the *Machines* are to act; it may be observed, that in the old Mythology there are gods both good, bad, and indifferent; and that our passions may be converted into so many allegorical divinities: so that every thing both good and bad, in a poem, may be attributed to these *Machines*, and may be transacted by them. — They don't however always act in the same manner; sometimes they act without appearing, and by simple inspirations, which have nothing in them extraordinary or miraculous; as when we say the devil suggested such a thought, &c.

The second manner of acting is entirely miraculous; as when a divinity presents itself visible before men, so as to be known by them; or when they disguise themselves under some human form without discovering themselves. The third manner partakes of each of the two, and consists in oracles, dreams, and extraordinary inspirations; which *Boslu* calls *Demi-Machines*.

All these manners ought to be so managed, as to carry a verisimilitude; and though verisimilitude be of a vast extent in *Machines*, as being founded on the divine power; yet it has its bounds. See *PROBABILITY*.

Horace proposes three kinds of *Machines* for the stage; the first is a god visibly present among the actors, which, he says, should never be introduc'd but on a great occasion. The second contains more incredible and extraordinary *Machines*; as the metamorphosis of *Progne* into a swallow, or of *Cadmus* into a serpent: and even these *Machines* he does not absolutely condemn, or exclude them out of the poem, but only out of the scene and the sight of the spectators: they are not to be represented, but may be recited. The third kind of *Machines* is absolutely absurd; and he rejects it entirely: the instance he gives, is that of a child taken alive out of the belly of a monster that had devoured it. The other two manners are allowed indifferently in the *Epopæa*; and without that distinction of Horace, which only suits the stage; it being in the drama alone, that a difference may be made between what passes in the scene, or the sight of the spectators, and what behind the curtain.

**MACROCEPHALUS\***, ΜΑΚΡΟΚΕΦΑΛΟΣ, denotes a person with a head larger or longer than the natural size. See *HEAD*.

\* The word is compounded of the Greek μακρος, long, large, and κεφαλη head.

**MACROCOSM\***, ΜΑΚΡΟΚΟΣΜΟΣ, denotes the great world; that is the universe. See *WORLD* and *UNIVERSE*.

\* The word is compounded of the Greek μακρος, great and κοσμος, world.

In which sense it stands contra-distinguished from *microcosm*. See *MICROCOSM*.

**MACULÆ**, in astronomy, dark spots appearing on the luminous faces of the sun, moon, and even some of the planets. See *SPOT*, *MOON*, *PLANET*, *PHASES*, &c.

In which sense *Maculæ* stands contra-distinguished from *Faculæ*. See *FACULÆ*.

**Solar MACULÆ** are dark spots, of an irregular, changeable figure, observed in the face of the sun; first taken notice of by Scheiner in 1611, and afterwards accurately observed by Galileus, Hevelius, Mr. Flamsteed, Cassini, Kirch, &c. See *SUN*. Many of these *Maculæ* appear to consist of heterogeneous parts; whereof the darker and more dense are called by Hevelius, nuclei, and are incompassed, as it were, with atmospheres, somewhat rarer and less obscure: but the figure both of the nuclei and entire *Maculæ* are variable. — In 1644, Hevelius observed a small thin *Macula*, which in two days time grew to ten times its bulk; appearing withal much darker, and with a larger nucleus: and such sudden mutations are frequent. The nucleus, he observed, began to fail sensibly ere the spot disappeared, and that ere it quite vanished broke into four, which in two days reunited. Some *Maculæ* have lasted 2, 3, 10, 15, 20, 30, seldom 40 days, tho' Kirchius observed one in 1681, from April 26 to the 17th of July. — The spots move over the sun's disk, with a motion somewhat slower near the limb than near the centre; that observed by Kirch was twelve days visible on the sun's disk; for fifteen days more it lay behind it; it being the usual rule to return to the limb whence they departed in 27, sometimes in 28 days.

Lastly, it must be observed that the *Maculæ* contract themselves near the limb, and in the middle of the disk appear much larger; those often running into one in the disk, which in the limb were separate; that many of them arise in the middle of the disk, and many disappear in the same: and that none of them are observed to deviate from their path near the horizon; whereas Hevelius observing Mercury in the sun, near the horizon, found him too low, being thrust 27 seconds beneath his former path.

From these phenomena we collect, 1<sup>o</sup>. that since Mercury's depression below his path arises from his parallax, the *Maculæ* having no parallax from the sun are nearer him than the planet: — but since they are hid behind the sun three days longer than they are in the hemisphere visible to us, it follows also, that they do not adhere to the surface of the sun, but are at some distance from it.

2<sup>o</sup>. That since they arise and disappear in the middle of the sun's disk, and undergo various alterations with regard both to bulk, figure and density, they must be formed *de novo*, and again dissolved about the sun; and are therefore, in all probability, a kind of solar clouds formed out of its exhalations.

3<sup>o</sup>. Since then the solar exhalations rise over his body, and are suspended at a certain height from it; it appears, from the laws of hydrostatics, that the sun must be incompassed with some fluid to drive those exhalations upwards; which fluid must be denser, as it is lower; and rarer, as higher, like

like our atmosphere: And since the *Maculae* dissolve and disappear in the very middle of the sun's disk, the matter thereof, i. e. the solar exhalations, must fall back again to the sun; whence there must arise changes in the sun's atmosphere, and consequently in the sun itself.

4°. Since the revolution of the *Maculae* round the sun is very regular; and since their distance from the sun is very small, it is not properly the *Maculae* that move round the sun: but it is himself, together with his atmosphere wherein the *Maculae* swim, that in the space of 27 days, moves round its axis: and hence it is that the *Maculae*, being viewed obliquely near the limb, appear narrow and oblong.

5°. Since the sun appears with a circular disk in every situation; his figure, as to sense, must be spherical. See SUN.

**MADDER**, a red, bitter, astringent root of a plant, call'd by botanists, *Rubia Tinctorum*; much used by dyers to give a strong and rich red colour. See RED.

It has its uses too in medicine, being found of service in obstructions of the viscera, and cachectic constitutions; and is generally made up in form of decoctions, diet-drinks, and medicated ales.

**MADNESS, MANIA**, in medicine. See MANIA.

**MADRIER**, in the military art, a thick plank, sometimes armed with iron plates, having a cavity sufficient to receive the mouth of a petard when charged; with which it is applied against a gate, or other body designed to be broke down. See PETARD.

**MADRIER** also denotes a long and broad plank, used for supporting the earth in mining, carrying on saps, making caponiers, galleries, and the like.

There are also *Madrirs* lined with tin, and covered with earth; serving as defences against artificial fires, in lodgments, &c. where there is need of being covered over head.

**MADRIGAL**\*, in the modern Italian, Spanish, and French poetry, denotes a little amorous piece, containing a certain number of free unequal verses, not tied either to the scrupulous regularity of a sonnet, or the subtlety of an epigram; but consisting of some tender, delicate, yet simple thought, suitably expressed.

\* Menage derives the word from *Mandra*, which, in Latin and Greek, signifies a sheepfold; imagining it to have been originally a kind of pastoral or shepherd's song; whence the Italians formed their *Madrigale*, and we *Madrigal*. Others rather chuse to derive the word from *Madrugar*, which, in the Spanish signifies to rise in the morning, the *Madrigales* being formerly sung early in the morning, by those who had a mind to serenade their mistresses. See SERENADE.

The *Madrigal*, according to M. le Brun, is an epigram without any thing very brisk and sprightly in its fall or close: something very tender and gallant is usually the subject of it; and a certain beautiful, noble, yet chaste, simplicity, forms its character.

The *Madrigal* is usually looked on as the shortest of all the lesser kinds of poems, and may consist of fewer verses than either the sonnet or roundelay. There is no other rule regarded in mingling the rimes, and verses of different kinds, but the fancy and convenience of the author. This poem, however, really allows of less licence than any other; whether we regard the rime, the measures, or the purity of expression.

**MAGAS, MAGADIS**, the name of a musical instrument in use among the ancients. See MUSIC.

There were two kinds of *Magades*; the one a string instrument, the invention whereof is ascribed by some to Sappho, by others to the Lydians, and by others to Timotheus of Miletus.

The other was a kind of flute, which at the same time yielded very high and very low notes.—The former kind was much improved by Timotheus of Miletus, who is said to have been impeached of a crime; for that by increasing the number of chords, he spoiled and discredited the ancient music.

**MAGAZINE**, in the military art, a place in fortified towns, where all sorts of stores are kept, and where carpenters, wheelwrights, smiths, &c. are employed in making things needful to furnish out the train of artillery. See ARSENAL.

**MAGDALEN**.—*Religious of St. MAGDALEN*, is a denomination given to divers communities of nuns, consisting generally of penitent courtezans; sometimes also call'd *Magdalenites*.

Such are those of Metz, established in 1452; those at Paris in 1492; those at Naples, first established in 1324, and endowed by queen Sancha, to serve as a retreat for public courtezans, who should quit their trade, and betake themselves to repentance; and those of Rouen and Bourdeaux, which had their original among those of Paris.

In each of these monasteries there are three kinds of persons and congregations; the first consists of those who are admitted to make vows; and these bear the name of *St. Magdalen*: the congregation of *St. Martha* is the second, and is composed of those whom it is not judged proper to admit to vows: the congregation of *St. Lazarus* is composed of such as are detained there by force.

The Religious of *St. Magdalen* at Rome, were established by Pope Leo X. Clement VIII. settled a revenue on them, and further appointed, that the effects of all public prostitutes, dying intestate, should fall to them; and that the testaments of the rest should be invalid, unless they bequeathed a portion of their effects, which was to be at least a fifth part, to them.

**MAGI, or MAGIANS**\*, a title which the ancient Persians gave to their wisemen, or philosophers. See PHILOSOPHER.

\* The learned are in great perplexity about the original of the word *Magus, Magos*. Plato, Xenophon, Herodotus, Strabo, &c. fetch it from the Persian language, in which it signified a *Priest*, or person appointed to officiate in holy things, as *Druid* among the Gauls, *Gymnosophist* among the Indians, and *Levite* among the Hebrews. Others derive it from the Greek *μεγας*, great, which being borrowed of the Greeks by the Persians, was returned in the form of *μαγος*; but Vossius, with more probability, brings it from the Hebrew *מגן*, *bagam*, to meditate; whence *מגים*, *maghim*, in Latin *Meditabundi*, q. d. *People addicted to meditation*.

*Magi*, among the Persians, answered to σοφοί, or φιλοσοφοί, among the Greeks, *Sapientes* among the Latins, *Druids* and *Brachmans* among the Gauls, *Gymnosophists* among the Indians, and *Prophets* or *Priests* among the Egyptians. See DRUID, BRACHMAN, &c.

The ancient *Magi*, according to Aristotle and Laertius, were the authors and conservators of the Persian philosophy: and the philosophy principally cultivated among them was theology and politics; they being always esteemed as the interpreters of all laws both divine and human, on which account they were wonderfully revered by the people.—Hence Cicero observes, that none were admitted to the crown of Persia, but such as were well instructed in the discipline of the *Magi*, who taught the *τα βασιλικα*, and shew'd princes how to govern. Plato, Apuleius, Laertius, and others, agree, that the philosophy of the *Magi* related principally to the worship of the gods: they were the persons who were to offer prayers, supplications, and sacrifices, as if the gods would be heard by them alone.

According to Lucian, Suidas, &c. the theology, or worship of the gods, about which the *Magi* were employ'd, was little more than the diabolical art of divination. So that *μαγεια*, strictly taken, signifies divination. See MAGIC.

Porphyry defines the *Magi* well; Cicero, *divina sapientes & in iisdem ministrantes*; adding, that the word *Magus* implied as much in the Persian tongue.—These people, says he, are held in such veneration among the Persians, that Darius the son of Hytaspes, among other things, had it engraven on his monument, that he was the master of the *Magi*.

Philo-Judæus describes the *Magi* to be diligent inquirers into nature, out of the love they bear to truth; and who setting themselves apart for those things, contemplate the divine virtues the more clearly, and initiate others in the same mysteries. Their descendants, the modern *Magi*, or fire-worshippers, are divided into three classes; whereof the first, and most learned, neither eat, nor kill animals, but adhere to the old institution of abstaining from living creatures. The *Magi* of the second class refrain only from tame animals: nor do the last kill all indifferently; it being the firm and distinguishing dogma of them all, *την μετεμψυχωσιν ευζει*, that there is a transmigration of souls. See METEMPSYCHOSIS.

To intimate the similitude between animals and men, they use to call the latter by the name of the former; thus their fellow-priests they call'd lions, the priestesses lionesses, the servants crows, &c.

**MAGIC, MAGIA, MAFEIA**, in its ancient sense, the science, or discipline and doctrine of the *Magi*, or wise-men of Persia. See MAGI.

The origin of *Magic* and the *Magi* is ascribed to Zoroaster: Salmalius derives the very name from Zoroaster, who, he says, was surnam'd *Mog*, whence *Magus*. Others, instead of making him the author of the Persian philosophy, make him only the restorer and improver thereof; alledging, that many of the Persian rites, in use among the *Magi*, were borrowed from the Zabii among the Chaldeans, who agreed in many things with the *Magi* of the Persians; whence some make the name *Magus* common both to the Chaldeans and Persians. Thus Plutarch mentions, that Zoroaster instituted *Magi* among the Chaldeans, in imitation whereof the Persians had theirs too.

**MAGIC**, in a more modern sense, is a science which teaches to perform wonderful and surprizing effects.

The word *Magic* originally carried with it a very innocent, nay laudable, meaning, being used purely to signify the study of wisdom, and the more sublime parts of knowledge: but in regard the ancient *Magi* engaged themselves in astrology, divination, forcery, &c. the term *Magic* in time became odious, and was only used to signify an unlawful and diabolical kind of science, depending on the assistance of the devil, and departed souls. See NECROMANCY, WITCHCRAFT, FASCINATION, &c.

If any wonder how so vain and deceitful a science should gain so much credit and authority over mens minds, Pliny gives the reason of it. It is, says he, because it has possessed itself

of

# M A G

of three sciences of the most esteem among men; taking from each, all that is great and marvellous in it. Nobody doubts but it had its first origin in medicine, and that it insinuated itself into the minds of the people, under pretence of affording extraordinary remedies. To these fine promises it added every thing in religion that is pompous and splendid, and that appears calculated to blind and captivate mankind. Lastly, it mingled judiciary astrology with the rest; persuading people, curious of futurity, that it saw every thing to come in the heavens. See **MAGIC**, **ASTROLOGY**, &c. Agrippa divides *Magic* into three kinds; *natural*, *celestial*, and *ceremonial* or *superstitious*.

**Natural MAGIC** is no more than the application of natural active causes to passive causes or subjects; by means whereof many surprizing, but yet natural, effects are produced. See **PHYSICS**, and **PHILOSOPHY**.

Baptista Porta has a treatise of natural *Magic*, or of secrets for performing very extraordinary things by natural causes. The natural *Magic* of the Chaldeans was nothing but the knowledge of the powers of simples, and minerals. The *Magic*, which they called *Theurgia*, consisted wholly in the knowledge of the ceremonies, to be observed in the worship of the Gods, in order to be acceptable. By virtue of these ceremonies they believed they could converse with spiritual beings, and cure diseases. See **THEURGY**.

**Celestial MAGIC** borders nearly on judiciary astrology: It attributes to spirits a kind of rule or dominion over the planets, and to the planets a dominion over men; and on those principles builds a ridiculous kind of system. See **ASTROLOGY**.

**Superstitious** or **Goetic MAGIC** consists in the invocation of devils. Its effects are usually evil and wicked, though very strange and seemingly surpassing the powers of nature; supposed to be produced, by virtue of some compact, either tacit or express, with evil spirits: but the truth is, these have not all the power that is usually imagined, nor do they produce half those effects ordinarily ascribed to them.

Naude has published an apology for all the great men suspected of *Magic*.—Agrippa says, that the words used by those in compact with the devil, to invoke him, and to succeed in what they undertake, are *Dies*, *mies*, *jesquet*, *benedoefet*, *dou vima*, *enitemaus*. There are an hundred other superstitious formulas of words composed at pleasure, or gathered from several different languages, or patch'd from the Hebrew, or formed in imitation of it.

**MAGIC Lantern**, an optic machine, by means whereof little painted images are represented on an opposite wall of a dark room, magnified to any bigness at pleasure. See **LANTERN**.

**Construction of the MAGIC Lantern**.—Suppose **A B C D** (*Tab. Optics*, *Fig. 10.*) a common tin lantern, to which is added a tube to draw out, **F G**. In **H** is fixed a metallic concave speculum of a foot diameter at most, or four inches at least; or, in lieu thereof, near the extremity of the tube, is placed a convex lens, consisting of a segment of a small sphere, its diameter not exceeding a few inches. In the focus of the concave speculum, or lens, is placed a lamp **L**; within the tube, where it is soldered to the side of the lantern, is placed a small lens, convex on both sides, being a portion of a small sphere, having its focus about the distance of three inches. The extreme part of the tube **F M** is square, and has an aperture quite thro'; so as to receive an oblong frame **N O**, passed through it; in this frame are round holes an inch or two in diameter. According to the bigness of these holes, are drawn circles on a plain thin glass; and in these circles are painted any figures or images at pleasure, with transparent water-colours. These images fitted into the frame, and placed invertedly, at a little distance from the focus of the lens **I**; will be projected on an opposite white wall of a dark room, prodigiously magnified in all their colours, and an erect situation.

Or thus:—Every thing being managed as in the former; into the sliding tube **F G**, insert another convex-lens **K**, the segment of a sphere somewhat larger than **I**; now if the picture be brought nearer to **I**, than the distance of the focus, diverging rays will be propagated as if they proceeded from **P**: wherefore if the lens **K** be so placed, as that **P** is very near its focus, the image will be exhibited on the wall exceedingly magnified.

**Theory of the MAGIC Lantern**.—The lamp being placed in the focus of the concave speculum, or any convex glass, the rays will be propagated parallel to each other, and the image will be strongly illumined, and will therefore emit a great number of rays upon the lens **I**. But being supposed to be placed near the lens **I**, the inverted image of the picture inverted must be formed on the opposite wall, exceedingly magnified after its refraction through the lens; and it will be still the more magnified as the lens is a segment of a less sphere, and as the picture is placed nearer the focus of the lens; in a dark place therefore the picture will be represented prodigiously large and extremely vivid. See **LENS**.

To heighten the light, specula are preferred to lens's; the focus of a speculum being nearer than that of a lens.

# M A G

De Chales orders the diameter of the lens **I** to be two, four, or five digits, and in a subduple proportion to the other **K**; i. e. if **I** be five digits, **K** must be 10; and the diameter of the speculum, according to the same, is to be two digits. Zahnus chuses to have the diameter of **I**  $\frac{3}{4}$  of a foot, and that of **K** one foot and  $\frac{1}{2}$ , &c.

Little animals being included in the *magic lantern*, in the manner observed in speaking of the microscope; or any little transparent objects fastned to a slice of talc or glass, and substituted instead of images; the *magic lantern* will become a microscope. See **MICROSCOPE**.

**MAGIC Square**, a square figure formed of a series of numbers in arithmetical proportion, so disposed in parallel and equal ranks, as that the sums of each row, taken either perpendicularly, horizontally, or diagonally, are equal.

The several numbers which compose any square number; (for instance, 1, 2, 3, 4, 5, &c. to 25 inclusive, which compose the square number 25) being disposed after each other in a square figure of 25 cells, each in its cell: if then you change the order of these numbers, and dispose them in the cells, in such manner, as that the five numbers which fill an horizontal rank of cells, being added together, shall make the same sum with the five numbers in any other rank of cells, whether horizontal or vertical; and even the same number with the five in each of the two diagonal ranks; this disposition of numbers is called a *Magic Square*, in opposition to the former disposition, which is called a *Natural Square*. See the figures following.

*Natural Square.*

1	2	3	4	5
6	7	8	9	10
11	12	13	14	15
16	17	18	19	20
21	22	23	24	25

*Magic Square.*

16	14	8	2	25
3	22	20	11	9
15	6	4	23	17
24	18	12	10	1
7	5	21	19	13

One would imagine that *Magic Squares* had that name given them in regard this property of all their ranks, which, taken any way, make always the

same sum, appeared extremely surprizing, especially in certain ignorant ages, when mathematics passed for *Magic*. But there is a great deal of reason to suspect, that these squares merited their name still further by the superstitious operations they were employed in, as the construction of talismans, &c. For according to the childish philosophy of those days, which attributed virtues to numbers, what virtues might not be expected from numbers so wonderful? See **NUMBER**, **TALISMAN**, &c.

However, what was at first the vain practice of makers of talismans and conjurers, has since become the subject of a serious research among mathematicians; not that they imagine it will lead them to any thing of solid use, or advantage. *Magic Squares* favour too much of their original, to be of much use. But only as it is a kind of play, where the difficulty makes the merit; and as it may chance to produce some new views of numbers which mathematicians will not lose the occasion of.

Eman. Moschopolus, a Greek author of no great antiquity, is the first that appears to have spoke of *Magic Squares*; and by the age wherein he lived, there is reason to imagine he did not look on them merely as a mathematician. However, he has left us some rules for their construction.—In the treatise of Cor. Agrippa so much accused of *Magic*, we find the squares of seven numbers, viz. from three to nine inclusive, disposed *magically*; and it must not be supposed that those seven numbers were preferred to all the others without a very good reason. In effect, it is because their squares, according to the system of Agrippa and his followers, are planetary. The square of 3, for instance, belongs to Saturn, that of 4 to Jupiter, that of 5 to Mars, that of 6 to the Sun, that of 7 to Venus, that of 8 to Mercury, and that of 9 to the Moon. M. Bachet applied himself to the study of *Magic Squares*, on the hint he had taken from the planetary squares of Agrippa; as being unacquainted with the work of Moschopolus, which is only in manuscript in the French king's library; and, without the assistance of any other author, found out a new method for those squares whose root is uneven, for instance 25, 49, &c. but could not make any thing of those whose root is even.

After him came M. Frenicle, who took the same subject in hand. A great algebraist was of opinion, that whereas the sixteen numbers, which compose the square, might be disposed 20322789888000 different ways in a natural square (as from the rules of combination it is certain they may) they could not be disposed in a *Magic Square* above sixteen different ways. But M. Frenicle shewed, that they might be disposed 878 different ways; whence it appears how much his method exceeds the former, which only yielded the 55th part of *Magic Squares* of that of M. Frenicle.

To this enquiry he thought fit to add a difficulty, that had not yet been considered: The *Magic Square* of 7, for instance, being constructed, and its 49 cells filled, if the two horizontal ranks of cells, and at the same time the two vertical ones,

ones, the most remote from the middle, be retrenched, that is, if the whole border or circumference of the square be taken away; there will remain a square, whose root will be 5, and which will only consist of twenty five cells.—Now it is not at all surprizing that the square should be no longer *magical*, in regard the ranks of the large one were not intended to make the same sum, excepting when taken entire with all the seven numbers that fill their seven cells; so that being mutilated each of two cells, and having lost two of their numbers, it may be well expected, that their remainders will not any longer make the same sum. But M. Frenicle would not be satisfied, unless when the circumference or border of the *Magic square* was taken away, and even any circumference at pleasure, or in fine, several circumferences at once, the remaining square were still *magical*: which last condition, no doubt, made these *Squares* vastly more *magical* than ever.

Again, He inverted that condition, and required that any circumference taken at pleasure, or even several circumferences should be inseparable from the square; that is, it should cease to be *magical* when they were removed, and yet continue *magical* after the removal of any of the rest. M. Frenicle, however, gives no general demonstration of his methods, and frequently seems to have no other guide but his groping. It is true, his book was not published by himself, nor did it appear till after his death, viz. in 1693.

In 1703, M. Poignard, Canon of Brussels, published a treatise of sublime *Magic Squares*. Before him there had been no *Magic Squares* made but for series's of natural numbers that formed a square; but M. Poignard made two very considerable improvements; 1°. Instead of taking all the numbers that fill a square, for instance, the thirty six successive numbers which would fill all the cells of a natural square whose side is 6, he only takes as many successive numbers as there are units in the side of the square, which in this case are six; and these six numbers alone he disposes in such manner, in the thirty six cells, that none of them are repeated twice in the same rank, whether it be horizontal, vertical or diagonal: whence it follows, that all the ranks, taken all the ways possible, must always make the same sum, which M. Poignard calls repeated progression. 2°. Instead of being confined to take these numbers according to the series and succession of the natural numbers, that is, in an arithmetical progression, he takes them likewise in a geometrical progression, and even an harmonical progression.—But with these two last progressions the *Magic* must necessarily be different from what it was: In the squares, filled with numbers in geometrical progression, it consists in this, that the products of all the ranks are equal, and in the harmonical progression, the numbers of all the ranks continually follow that progression: he makes squares of each of these three progressions repeated.

This book of M. Poignard gave occasion to M. de la Hire to turn his thoughts the same way, which he did with such success, that he seems to have well nigh completed the theory of *Magic Squares*.—He first considers uneven *Squares*; all his predecessors on the subject having found the construction of even ones by much the most difficult; for which reason M. de la Hire reserves those for the last. This excess of difficulty may arise partly from hence, that the numbers are taken in arithmetical progression. Now in that progression, if the number of terms be uneven, that in the middle has some properties, which may be of service; for instance, being multiplied by the number of terms in the progression, the product is equal to the sum of all the terms.

M. de la Hire proposes a general method for uneven squares, which has some similitude with the theory of compound motions, so useful and fertile in mechanics. As that consists in decomposing motions, and resolving them into others more simple, so does M. de la Hire's method consist in resolving the square that is to be constructed, into two simple and primitive squares. It must be owned, however, it is not quite so easy to conceive those two simple and primitive squares in the compound or perfect square, as in an oblique motion to imagine a parallel and perpendicular one.

Suppose a square of cells, whose root is uneven; for instance 7, and that its forty nine cells are to be filled magically with numbers, for instance, the first 7. M. de la Hire, on the one side, takes the first seven numbers, beginning with unity, and ending with the root 7; and on the other, 7, and all its multiples to 49 exclusively; and as these only make six numbers, he adds 0, which makes this an arithmetical progression of seven terms as well as the other. 0. 7. 14. 21. 28. 35. 42. This done, with the first progression repeated, he fills the square of the root 7 magically. In order to this, he writes in the first seven cells of the first horizontal rank, the seven numbers proposed, in what order he pleases, for that is absolutely indifferent; and it is proper to observe here, that those seven numbers may be ranged in 5040 different manners in the same rank. The order in which they are placed in the first horizontal rank, be it what it will, is that which determines their order in all the rest. For the second horizontal rank, he places in its first cell, either the third, the fourth, the fifth, or the sixth number, from the first number of the first rank,

VOL. II. N°. 93.

and after that writes the six others in the order as they follow. For the third horizontal rank, he observes the same method with regard to the second, that he observed in the second with regard to the first, and so of the rest. For instance, suppose the first horizontal rank filled with the seven numbers in their natural order, 1. 2. 3. 4. 5. 6. 7. the second horizontal rank may either commence with 3, with 4, with 5, or with 6; but in this instance it commences with 3, the third rank there-

1	2	3	4	5	6	7
3	4	5	6	7	1	2
5	6	7	1	2	3	4

2	3	4	5	6	7	1
4	5	6	7	1	2	3
6	7	1	2	3	4	5

fore must commence with 5, the fourth with 7, the fifth with 2, the sixth with 4, and the seventh with 6. The commencement of the ranks which follow the first being thus determined, the other numbers, as we have already observed, must be written down in the order wherein they stand in the first, going on to 5, 6, and 7, and returning to 1, 2, &c. till every number

in the first rank be found in every rank underneath, according to the order arbitrarily pitched upon at first. By this means, it is evident, no number whatever can be repeated twice in the same rank, and by consequence that the seven numbers, 1. 2. 3. 4. 5. 6. 7. being in each rank, they must of necessity make the same sum.

It appears, from this example, that the arrangement of the numbers in the first rank being chosen at pleasure, the other ranks may be continued in four different manners; and since the first rank may have 5040 different arrangements, there are no less than 20160 different manners of constructing the *Magic Square* of seven numbers repeated.

1	2	3	4	5	6	7
2	3	4	5	6	7	1
3	4	5	6	7	1	2
4	5	6	7	1	2	3

5	6	7	1	2	3	4
4	5	6	7	1	2	3
3	4	5	6	7	1	2
2	3	4	5	6	7	1

The order of the numbers in the first rank being determined; if in beginning with the second rank, the second number 2, or the last number 7 should be pitched upon; in one of those cases one of the diagonal ranks would have the same number constantly repeated; and, in the other case, the other diagonal would have it repeated; of consequence therefore, either the one or the other diagonal would be false, unless the number repeated seven times should happen to be 4; for four times seven is equal to the sum of 1. 2. 3. 4. 5. 6. 7. and, in general, in every square consisting of an uneven number of terms, in arithmetical progression, one of the diagonals would be false according to those two constructions, unless the term, always repeated in that diagonal, were the middle term of the progression.

It is not however at all necessary to take the terms in an arithmetical progression; for, according to this method, one may construct a *Magic Square* of any numbers at pleasure, whether they be according to any certain progression or not. If they be in an arithmetical progression, it will be proper, out of the general method, to except those two constructions, which produce a continual repetition of the same term, in one of the two diagonals; and only take in the case, wherein that repetition would prevent the diagonal from being just. Which case being absolutely disregarded, when we computed that the square of 7 might have 20160 different constructions; it is evident, that by taking that case in, it must have vastly more. To begin the second rank with any other number besides the second and the last, must not however be looked on as an universal rule. It holds good for the square of 7, but if the square of 9; for instance, were to be constructed, and the fourth figure of the first horizontal rank were pitched on for the first of the second, the consequence would be, that the fifth and eighth horizontal ranks would likewise commence with the same number; which would therefore be repeated three times in the same vertical rank; and occasion other repetitions in all the rest. The general rule therefore must be conceived thus: Let the number in the first rank pitched on, for the commencement of the second, have such an exponent of its quota, that is, let the order of its place be such, as that if an unit be taken from it, the remainder will not be any just quota part of the root of the square; that is, cannot divide it equally. If, for example, in the square of 7, the third number of the first horizontal rank be pitched on for the first of the second, such construction will be just; because the exponent of the place of that number, viz. 3, subtracting 1, that is 2, cannot divide 7. Thus also might the fourth number of the same first rank be chosen, because 4—1, viz. 3, cannot divide 7, and for the same reason the fifth or sixth number might be taken: But in the square of 9, the fourth number of the first rank must not be taken, because 4—1, viz. 3, does divide 9. The reason of this rule will appear very evidently, by considering

dering in what manner the returns of the same numbers do or do not happen, taking them always in the same manner in any given series. And hence it follows, that the fewer divisions the root of any square to be constructed has, the more different manners of constructing it there are; and that the prime numbers, that is, those which have no divisions, as 5. 7. 11. 13. &c. are those whose squares will admit of the most variations in proportion to their quantities.

The squares constructed, according to this method, have some particular properties not required in the problem: For the numbers that compose any rank parallel to one of the two diagonals, are ranged in the same order with the numbers that compose the diagonal, to which they are parallel. And as any rank parallel to a diagonal must necessarily be shorter, and have fewer cells than the diagonal itself, by adding to it the corresponding parallel which has the number of cells the other falls short of the diagonal; the numbers of those two parallels, placed,

Its construction being made, and of consequence all its ranks making the same sum, it is evident, that if we bring the two into one, by adding together the numbers of the two corresponding cells of the two squares, that is, the two numbers of the first of each, the two numbers of the second, of the third, &c. and dispose them in the forty nine corresponding cells of a third square; it will likewise be *magical*, in regard its ranks, formed by the addition of equal sums to equal sums must of necessity be equal among themselves. All that remains in doubt is, whether or no, by the addition of the corresponding cells of the two first squares, all the cells of the third will be filled in such manner, as that each not only contain one of the numbers of the progression from 1 to 49, but also that this number be different from that of any of the rest, which is the end and design of the whole operation.

As to this, it must be observed, that if in the construction of the second *Primitive Square*, care have been taken in the commencement of the second horizontal rank, to observe an order with regard to the first, different from what was observed in the construction of the first square; for instance, if the second rank of the first square begun with the third term of the first rank, and the second rank of the second square commence with the fourth of the first rank, as in the example it actually does; each number of the first square may be combined once, and only once, by addition with all the numbers of the second. And as the numbers of the first are here 1. 2. 3. 4. 5. 6. 7. and

Perfect Square.

1	9	17	25	33	41	49

1	19	27	35	36	46	3
34	42	43	2	10	18	26

those of the second 0. 7. 14. 21. 28. 35. 42. by combining them in this manner, we have all the numbers in the progression from 1 to 49, without having any of them repeated; which is the *Perfect Magic Square* proposed.

The necessity of constructing the two *Primitive Squares* in a different manner, does not at all hinder but that each of the 20160 constructions of the one may be combined with all the 20160 constructions of the other: of consequence therefore 20160 multiplied by itself, which makes 406425600, is the number of different constructions that may be made of the *Perfect Square*, which here consists of the 49 numbers of the natural progression. But as we have already observed, that a *Primitive Square* of seven numbers repeated may have above 20160 several constructions, the number 406425600 must come vastly short of expressing all the possible constructions of a perfect *Magic Square* of the forty nine first numbers.

As to the *Even Squares*, he constructs them like the *Uneven ones*, by two *Primitive Squares*; but the construction of *Primitives* is different in the general, and may be so a great num-

ber of ways: and those general differences admit of a great number of particular variations, which give as many different constructions for the same even square. It scarce seems possible to determine exactly, either how many general differences there may be between the construction of the primitive squares of an even square and an uneven one; nor how many particular variations each general difference may admit of: and of consequence we are still far from being able to determine the number of different constructions of all those that may be made by the primitive squares.

**MAGISTER**, **MASTER**, a title frequently found in old writings; noting the person who bore it to have attained some degree of eminency in *scientia aliqua præsertim literaria*.

In old times, those we now call *Doctors*, were called *Magistri*. See **DOCTOR**, **DEGREE**, and **MASTER**.

**MAGISTER Y**, **MAGISTERIUM**, in chymistry, a very fine powder made by solution and precipitation; or a precipitate of some solution made by a salt, or other body, which breaks the force of the dissolvent. See **PRECIPITATE**.

**MAGISTER Y** of *Bismuth* is a fine powder, made by dissolving bismuth in spirit of nitre, and pouring on it salt water, which precipitates the *Magistry* to the bottom. See **BISMUTH**.

**MAGISTER Y** of *Lead* is a fine powder, made by dissolving saccharum Saturni in distilled vinegar, and then precipitating it with oil of tartar *per deliquium*. See **LEAD**.

**MAGISTER Y** is also used in speaking of resins, or resinous extracts of scammony, jalap, turbith, &c. which are made by dissolving the matter in spirit of wine, and precipitating it with water. See **RESIN**.

Mr. Boyle takes the proper notion of a *Magistry* to consist in a preparation of a body, whereby it is wholly, or at least in great measure, by means of some extraneous additament, converted into a body of a different kind: as when iron or copper is turned into crystals of Mars and Venus.

**MAGMA**, **MAGMA**, among chymists, &c. the dregs or recement of an unguent, remaining after all the more fluid parts are expressed.

**MAGNA Arteria**, the same with aorta. See **AORTA**.

**MAGNA Charta**\*, the *Great Charter* of liberties, granted in the ninth year of Henry the third, and confirmed by Edward the first. See **CHARTER**.

\* The reason of its being termed *magna* or great, is either because of the excellency of the laws and liberties therein contained; or because there was another charter, called *Charta de foresta*, established with it, which was the lesser of the two; or because it contained more than any other charters; or in regard of the wars and troubles in the obtaining of it; or of the great and remarkable solemnity in the denouncing excommunications against the infringers of it.

*Magna Charta* may be said to derive its origin from king Edward the confessor, who granted divers liberties and privileges both civil and ecclesiastical by charter: The same, with some others, were also granted and confirmed by king Henry I. by a celebrated great charter now lost. And his successors king Stephen, king Henry II, and king John, confirmed or re-enacted the same; but that last prince violating his charter, the barons took up arms, and his reign ended in blood. Henry III. who succeeded him, after having procured an inquisition to be made by twelve men in each county, what the liberties of England were in the time of Henry I, granted a new charter, being the present *Magna Charta*; which he several times confirmed, and as often broke again: till, in the thirty seventh year of his reign, he came to Westminster-hall; where in the presence of the nobility and bishops, with lighted candles in their hands, *Magna Charta* was read, the king all the while laying his hand on his breast, and at last solemnly swearing faithfully and inviolably to observe all the things therein contained, as he was a man, a christian, a soldier, and a king. Then the bishops extinguished their candles, throwing them on the ground, crying, Thus let him be extinguished and stink in hell who violates this charter.

*Magna Charta* is the basis of the English laws and liberties. See **LAW** and **STATUTE**. It was thought to be so beneficial to the subject, and a law of so great equity in comparison of those which were formerly in use, that king Henry, for the granting it, had the fifteenth penny of all the moveable goods both temporal and spiritual.—Sir Edward Coke observes, *Magna Charta* has been above thirty times confirmed.

**MAGNET**, **MAGNES**\*, the *Loadstone*; a sort of ferruginous stone, in weight and colour resembling iron ore, though somewhat harder and more heavy; endued with divers extraordinary properties, attractive, directive, inclinatory, &c. See **MAGNETISM**.

\* The *Magnet* is also called *Lapis Heracleus*, from Heraclea, a city of Magnesia, a port of the ancient Lydia, where it is said to have been first found, and from which it is usually supposed to have taken its name. Though others derive the word from a shepherd named *Magnes*, who first discovered it with the iron of his crook on mount Ida. It is also called *lapis nauticus* by reason of its use in navigation; and *siderites*, from its attracting iron, which the Greeks call *cidnp*®.

The

# M A G

The *Magnet* is usually found in iron mines, and sometimes in very large pieces, half *Magnet*, half iron. Its colour is different, according to the different countries it is brought from. Norman observes, that the best are those brought from China and Bengal, which are of an iron or sanguine colour; those of Arabia are reddish, those of Macedonia blackish, and those of Hungary, Germany, England, &c. the colour of unwrought iron. Neither its figure nor bulk are determined, but it is found of all forms and sizes.

The ancients reckoned five kinds of *Magnets* different in colour and virtue: the Ethiopic, Magnesian, Boeotic, Alexandrian, and Natolian. They also took it to be male and female: but the chief use they made of it was in medicine; especially for the cure of burns, and defluxions on the eyes. —The moderns, more happy, take it to conduct them in their voyages. See NAVIGATION.

The most distinguishing properties of the *Magnet*, are, that it attracts iron, and that it points to the poles of the world; and in other circumstances also dips or inclines to a point beneath the horizon, directly under the pole; and that it communicates these properties by touch, to iron. —On which foundation are built the mariners needles; both horizontal, and inclinatory, or dipping needles. See NEEDLE, DIPPING, &c.

The attractive power of the *MAGNET* was known to the ancients, and is mentioned even by Plato and Euripides, who call it the *Herculean Stone*; because it commands iron, which subdues every thing else: but the knowledge of its directive power, whereby it disposes its poles along the meridian of every place, and occasions needles, pieces of iron, &c. touched with it, to point nearly north and south, is of a much later date: though the exact time of its discovery, and the discoverer himself, are yet in the dark. The first tidings we hear of it, is in 1260, when Marco Polo the Venetian is said by some to have introduced the mariners compass; though not as an invention of his own, but as derived from the Chinese, who are said to have had the use of it long before: though some imagine that the Chinese rather borrowed it from the Europeans.

Flavio de Gioia a Neapolitan, who lived in the thirteenth century, is the person usually supposed to have the best title to the discovery: and yet Sir G. Wheeler mentions, that he had seen a book of astronomy much older, which supposed the use of the needle; though not as applied to the uses of navigation, but of astronomy. And in Guyot de Provins, an old French poet, who wrote about the year 1180, there is express mention made of the *Loadstone* and the compass; and their use in navigation obliquely hinted at. See COMPASS.

The variation of the *MAGNET*, or its declination from the pole, was first discovered by Seb. Cabot, a Venetian, in 1500; and the variation of that variation by Mr. Gellibrand, an Englishman, about the year 1625. See VARIATION.

Lastly, The dip or inclination of the needle, when at liberty to play vertically, to a point beneath the horizon, was first discovered by another of our countrymen, Mr. R. Norman, about the year 1576. See the article DIPPING Needle.

Phænomena of the *MAGNET*. 1°. In every *Magnet* there are two poles, one whereof points northwards, the other southwards; and if the *Magnet* be divided into ever so many pieces, the two poles will be found in each piece. 2°. These poles in different parts of the globe, are differently inclined towards a point under the horizon. 3°. These poles, though contrary to one another, do help mutually towards the *Magnet's* attraction and suspension of iron. 4°. If two *Magnets* be spherical, one will turn or conform itself to the other, so as either of them would do to the earth; and after they have so conformed or turned themselves, they endeavour to approach or join each other; but if placed in a contrary position, they avoid each other. 5°. If a *Magnet* be cut through the axis, the parts or segments of the stone, which before were joined, will now avoid and fly each other. 6°. If the *Magnet* be cut by a section perpendicular to its axis, the two points, which before were conjoined, will become contrary poles; one in one, the other in the other segment. 7°. Iron receives virtue from the *Magnet* by application to it, or barely from an approach near it, though it do not touch it; and the iron receives this virtue variously, according to the parts of the stone it is made to touch, or even approach to. 8°. If an oblong piece of iron be any how applied to the stone, it receives virtue from it, only as to its length. 9°. The *Magnet* loses none of its own virtue by communicating any to the iron; and this virtue it can communicate to the iron very speedily; though the longer the iron touches or joins the stone, the longer will its communicated virtue hold; and a better *Magnet* will communicate more of it, and sooner, than one not so good. 10°. Steel receives virtue from the *Magnet* better than iron. 11°. A needle touched by a *Magnet* will turn its ends the same way towards the poles of the world, as the *Magnet* itself does. 12°. Neither *Loadstone* nor needle touched by it do conform their poles exactly to those of the world, but have usually some variation from them: and this variation is different in divers places, and at divers times in the same place. 13°. A *Loadstone* will take up much more iron when armed

# M A G

or capped than it can alone. And though an iron ring or key be suspended by the *Loadstone*, yet the *magnetical* particles do not hinder that ring or key from turning round any way, either to the right or left. 14°. The force of a *Loadstone* may be variously increased or lessened by the various application of iron, or another *Loadstone* to it. 15°. A strong *Magnet* at the least distance from a lesser or a weaker, cannot draw to it a piece of iron adhering actually to such lesser or weaker stone; but if it come to touch it, it can draw it from the other: but a weaker *Magnet*, or even a little piece of iron, can draw away or separate a piece of iron contiguous to a greater or stronger *Loadstone*. 16°. In these northern parts of the world, the south pole of a *Loadstone* will raise up more iron than the north pole. 17°. A plate of iron only, but no other body interposed, can impede the operation of the *Loadstone*, either as to its attractive or directive quality. Mr. Boyle found it true in glasses sealed hermetically; and glass is a body, as impervious as most are, to any effluvia. 18°. The power or virtue of a *Loadstone* may be impaired by lying long in a wrong position, as also by rust, wet, &c. and may be quite destroyed by fire. 19°. A piece of iron wire well touched, will, upon being bent round in a ring, or coiled round on a stick, &c. generally, quite lose its directive virtue; but always have it much diminished: and yet if the whole length of the wire were not entirely bent, so that the ends of it, though but for the length of one tenth of an inch, were left strait, the virtue will not be destroyed in those parts; though it will in all the rest. This was first observed by Grimaldi and de la Hire; and is confirmed by the experiments of Mr. Derham; who adds further, that though coiling or bending the wire as above, would always destroy its virtue by day, yet it would not do it in the evening. 20°. The sphere of the activity of *Magnets* is greater and less at different times: in particular, that reserved in the repository of the Royal Society will keep a key or other body suspended to another, sometimes, at the height of eight or ten feet; and at others, not above four feet. To which we may add, that the variation of the *magnetical* needle from the meridian, varies at various times of the day; as appears from some new experiments of Mr. Graham. See VARIATION. 21°. By twisting a piece of wire touched with a *Magnet*, its virtue is exceedingly diminished, and sometimes so disordered and confused, that in some parts it will attract, and in others repel; and even in some places, one side of the wire seems to be attracted, and the other side repelled by one and the same pole of the stone. 22°. A piece of wire that has been touched, being split, or cleft in two; the poles are sometimes changed, as in a cleft *Magnet*; the north becoming the south, and the south the north; and yet sometimes one half of the wire will retain its former poles, and the other half have them changed. To which it may be added, that laying one or other side of the half uppermost, causes a great alteration in its tendency or aversion to the poles of the *Magnet*. 23°. A wire being touched from end to end with the same pole of the *Magnet*, the end whereat you begin will always turn contrary to the pole which touched it. If it be again touched the same way with the other pole of the *Magnet*, it will then be turned the contrary way. 24°. If a piece of wire be touched in the middle with only one pole of the *Magnet*, without moving it backwards or forwards; in that place will be the pole of the wire, and the two ends will be the other pole. 25°. If a *Magnet* be heated red-hot, and again cooled either with its south pole towards the north in a horizontal position, or with its south pole downwards in a perpendicular position; its poles will be changed. 26°. Mr. Boyle (to whom we are indebted for the following *magnetical* phenomena) found he could presently change the poles of a small fragment of a *Loadstone*, by applying them to the opposite vigorous ones of a large *Magnet*. 27°. Hard iron tools well tempered, when heated by a brisk attrition, as filing, turning, &c. will, while warm, attract thin filings or chips of iron, steel, &c. but not when cold; though there are not wanting some instances of their retaining the virtue when quite cold. 28°. The iron bars of windows, &c. which have a long time stood in an erect position, grow permanently *magnetical*; the lower ends of such bars being the north pole, and the upper the southern. 29°. A bar of iron that has not stood long in an erect posture, if it be only held perpendicularly, will become *magnetical*; and its lower end the north pole; as appears from its attracting the south pole of a needle: but then this virtue is transient, and by inverting the bar, the poles will shift their places. In order therefore to render the quality permanent in an iron bar, it must continue a long time in a proper position. But the fire will produce the effect in a short time: for as it will immediately deprive a *Loadstone* of its attractive virtue; so, it soon gives a verticity to a bar of iron, if being heated red-hot, it be cooled in an erect posture, or directly north and south. Nay, tongs and fire-forks, by being often heated and set to cool again in a posture nearly erect, have gained this *magnetical* property. 30°. Mr. Boyle found, that by heating a piece of English oker red-hot, and placing it to cool in a proper posture, it manifestly acquired a *magnetic* virtue. And an excellent *Magnet* of the same ingenious gentleman's

man's having lain near a year in an inconvenient posture, had its virtue surprizingly impaired; as if it had been by fire. 31°. A needle well touched, it is known, will point north and south: if it have one contrary touch of the same stone, it will be deprived of its faculty; and by another such touch will have its poles quite changed. 32°. If a bar of iron have gained a verticity by being heated red-hot and cooled again, north and south, and then hammered at the two ends; its virtue will be destroyed by two or three smart blows on the middle. 33°. By drawing the back of a knife, or long piece of steel wire, &c. leisurely over the pole of a *Loadstone*; carrying the motion from the middle of the stone to the pole; the knife or wire will accordingly attract one end of a needle; but if the knife or wire be passed from the said pole to the middle of the stone, it will repel that end of the needle which in the other case it attracts. 34°. Either a *Magnet* or a piece of iron being laid on a piece of cork, so as to swim freely in water; it will be found, that which soever of the two is held in the hand, the other will be drawn to it; so that iron attracts the *Magnet* as much as it is attracted by it; action and re-action being always equal. In this experiment, if the *Magnet* be set a-float it will direct its two poles to the poles of the world. 35°. A knife, &c. touched with a *Magnet*, acquires a greater or less degree of virtue, according to the part it is touched on. It receives the strongest touch, when it is drawn leisurely from the handle towards the point over one of the poles: And if the same knife thus touched, and thus in possession of a strong attractive power, be re-touched in a contrary direction, viz. by drawing it from the point toward the handle over the same pole, it immediately loses all its virtue. Lastly, a *Magnet* acts with equal force in *vacuo*, and in the open air.—See farther under the article *MAGNETISM*.

**MAGNET**, in chymistry, *MAGNES Arsenicalis*, denotes a mixture of equal parts of arsenic, sulphur, and antimony, melted together over the fire, and condensed in manner of a stone. It is a very gentle caustic, and was first invented by Angelus Sala.—It has its name *Magnet*, because being wore during malignant diseases, it is supposed to preserve the wearer from infection, by a *magnetical* power.

**MAGNETISM**, *MAGNETISMUS*, the quality, or constitution of a body, and its pores, whereby it is rendered *magnetical* or a *Magnet*. See *MAGNET*.

*Magnetism* is found to be a transient power, capable of being produced and destroyed again. See *POLE*.

The laws of *MAGNETISM* are laid down by Mr. Whiston in the following propositions.—1°. The *Loadstone* has both an attractive and a directive power united together; whereas iron touched by it has only the former; i. e. the *Magnet* not only attracts needles or filings of steel, but directs them to certain different angles, with respect to its own surface and axis: whereas iron touched with it, does little or nothing more than attract them; still suffering them to lie along or stand perpendicular to its surface and edges in all places; without any such special direction.

2°. Neither the strongest nor the large *Magnets* give a better directive touch to needles than those of a less size or virtue: to which it may be added, that whereas there are two qualities in all *Magnets*, an attractive and a directive one; neither of them depend on, or are any argument of the strength of the other.

3°. The attractive power of *Magnets* and of iron, will greatly increase or diminish the weight of needles on the balance: nay, will overcome that weight, and sustain other additional weights too: while the directive power has much smaller effect. Gassendus indeed, as well as Mercennus and Dr. Gilbert, maintain it has none at all; but by mistake: for Mr. Whiston found from repeated trials on large needles, that after the touch they weighed less than before. One of 4584½ grains lost 2½ grains by the touch; and another of 65726 grains weight, no less than 14 grains.

4°. It is probable that iron consists almost wholly of the attractive particles; and the *Magnet* of the attractive and the directive together; mixed probably with other heterogeneous matter; as having never been purged by the fire, which iron has: And hence may arise the reason why iron, after it has been touched, will lift up much greater weights than the *Loadstone* that touched it.

5°. The quantity and direction of *magnetic* powers, communicated to needles, is not properly, after such communication, owing to the *Magnet* which gave the touch; but to the goodness of the steel that receives it, and to the strength and position of the terrestrial *Loadstone*, whose influence alone those needles are afterwards subject to, and directed by: so that all such needles, if good, move with the same strength and point to the same angle; what *Loadstone* soever (provided it be good) they were excited by. Nor does the touch seem to do much more in *magnetical*, than attrition in electrical cases; i. e. it serves to rub off some obstructing particles, that adhere to the surface of the steel, and open the pores of the bodies touched, and so make way for the entrance and exit of such effluvia as occasion or assist the powers we are speaking of. Hence Mr. Whiston takes occasion to observe, that the directive power

of the *Loadstone* seems to be mechanical; and to be derived from *magnetic* effluvia, circulating continually round it.

6°. The absolute attractive power of different armed *Loadstones*, is *ceteris paribus*, according to the quantity, not of their diameters or solidities, but of the surfaces of the *Loadstones*; or in a duplicate proportion of their diameters.

7°. The power of good *Magnets* unarmed, not sensibly different in strength, similar in figure and position, but unequal in magnitude, is sometimes a little greater, sometimes a little less than in the proportion of their similar diameters.

8°. The *Loadstone* attracts needles that have been touched, and others that have not been touched with equal force, at distances unequal, viz. where the distances are to one another as 5 to 2.

9°. Both poles of a *Loadstone* equally attract needles, till they be, though roughly, touched; then it is, and then only, that one pole begins to attract one end, and repel the other: though the repelling pole will still attract upon contact, nay at very small distances, notwithstanding.

10°. The attractive power of *Loadstones*, in their similar position to, but different distances from *magnetic* needles, is in the sesquiduplicate proportion of the distances of their surfaces from their needles reciprocally; or as the mean proportionals between the squares and the cubes of those distances reciprocally; or as the square roots of the fifth powers of those distances reciprocally. Thus the *magnetic* power of attraction, at twice the distance from the surface of the *Loadstone*, is between a fifth and sixth part of that power at the first distance. At thrice the distance the power is between the fifteenth and sixteenth part, at four times the distance the power is thirty two times as small, and at six times the distance eighty eight times as small. Where it is to be noted, that the distances are not taken, as in the law of gravity, from the center; but from the surface: all experience assuring us, that the *magnetic* power resides chiefly, if not wholly, in the surfaces of the *Loadstones* and iron; without any particular relation to any center at all. The proportion here laid down was determined by Mr. Whiston, from a great number of experiments of Mr. Hawksbee, Dr. Brook Taylor, and himself. The force they measured by the chords of those arcs, by which the *Magnet*, at several distances, draws the needle out of its natural direction, to which chords (as he has demonstrated) it is ever proportional. The numbers in some of their most accurate trials he gives us in the following table, setting down half the chords, or the sines of half those arches of declination, as the true measures of the power of *Magnetism*.

Distances in inches.	Degrees of inclination.	Sines of ½ arcs.	Rat. sesquidupl.
20	2	175	466
14 ⅞	4	349	216
13 ⅝	6	523	170
12 ⅜	8	697	138
11 ⅜	10	871	105
10 ¼	12	1045	87
9 ¼	14	1219	70

11°. An inclinatory, or dipping-needle, of six inches radius, and of a prismatic or cylindric figure, when it oscillates along the *magnetic* meridian, performs here, every mean vibration in about 6" or 360"; and every small oscillation in about 5" ½, or 330"; and the same kind of needle, four foot long, makes every mean oscillation in about 24", and every small one in about 22".

12°. The entire power of *Magnetism* in this country, as it affects needles a foot long, is to that of gravity nearly as 1 to 300; and as it affects needles four foot long, as 1 to 600.

13°. The quantity of *magnetic* power accelerating the same dipping-needle, as it oscillates in different vertical planes, is ever as the cosines of the angles made by those planes, and the *magnetic* meridian, taken on the horizon.

Thus if we would estimate the quantity of forces in the horizontal and vertical situations of needles at London; we shall find that the latter in needles a foot long, is, to the entire force along the *magnetic* meridian, as 96 to 100; and in needles four foot long, as 9667 to 10000; whereas in the former, the entire force in needles a foot long, is as 28 to 100; and in those four foot long, as 2560 to 10000. Whence it follows, that the power by which horizontal needles are governed in these parts of the world, is but one quarter of the power by which the dipping needle is moved.

Hence also, since the horizontal needle is moved only by a part of the power which moves the dipping needle; and that it only points to a certain place in the horizon, because that place is the nearest its original tendency of any its situation will allow it to tend to: whenever the dipping-needle stands exactly perpendicular to the horizon, the horizontal needle will not respect one point of the compass more than another, but will wheel about every way uncertainly.

14°. The time of oscillation and vibration, both in dipping and horizontal needles equally good, is as their length directly; and the actual velocity of their points along their arcs always equal.

Hence

Hence *magnetic needles* are, *ceteris paribus*, still better the longer they are; and that in the same proportion with their length. See *NEEDLE*.

15°. The earth, on which we live, includes within it a vast spherical *Magnet*, concentric thereto, having its own poles, meridians, equator and parallels; and all much of the same general nature with those of small *terrella*, or spherical *Loadstones*, in the possession of the curious among us.

16°. The power of a good *terrella*, or a spherical *Loadstone*, as it affects a needle a foot long, is equal to the *magnetic power* of that internal *Loadstone* about two and an half, or three diameters of such *Loadstone*. From which consideration, the quantity of *magnetic attraction*, at all distances from the internal *Loadstone*, for needles a foot long may be determined; and from the same consideration it appears, that the diameter of this internal *Loadstone* is about eleven hundred and fifty miles. To which we may add, that, in regard Sir Isaac Newton has demonstrated, that the Power of gravity diminishes within the earth, and is lesser there than at its surface, nearly in the proportion of its greater nearness to the center; the *magnetic power* at two thousand nine hundred miles distance from us, and nearly one thousand and sixty from the earth's center, which is  $\frac{1}{4}$  of the power of gravity here, will be somewhat greater than the power of gravity there: Which limit is worth our attention, gravity being stronger than *Magnetism* on the one side of it, and weaker on the other; we mean as it affects needles of one foot diameter. At that limit therefore, at least near the *magnetic poles*, iron a foot long, will be twice as heavy, and fall twice as fast as any other natural body, *viz.* by the union of those two equal powers, gravity and *Magnetism*; and of consequence, above that limit, such an iron will be less than twice as heavy; below it, more than twice as heavy as any other natural body. See *GRAVITY, WEIGHT, &c.*

17°. The earth's internal *Loadstone* is not fixed to our upper parts, but is moveable with respect thereto, and actually revolves on the earth's axis from east to west in a certain long period of time; as appears, beyond contradiction, from the constant variation of the horizontal needle westward; as well as the regular increase of inclination of the dipping needle.

The only way to render this motion, *i. e.* the variation, possible and intelligible (to use Dr. Halley's words) is to suppose it to turn about the center of the globe, having its center of gravity fixed and immoveable in the same common center of the earth. This moveable internal surface must likewise be loose, and detached from the external parts of the globe, which may be reckoned the shell, and the other the nucleus, or inner globe, included within it, with a fluid medium between. Now from the variation's moving westwards, it is plain, that the foresaid nucleus has not precisely attained the same degree of velocity with the exterior parts in their diurnal revolution; but so nearly equals it, that in three hundred and sixty-five revolves, the difference is scarce sensible; and must probably have risen from hence, that the impulse, whereby the diurnal motion was impressed on the earth, was given to the external parts, and thence communicated to the internal.

18°. This internal *Magnet* has one central pole northwards, in the nature of the poles of our common *Loadstones*; but its southern pole appears not to be central, but rather circular; and that at a great distance from the southern pole of the earth.

19°. The northern *magnetic pole* is now situate about the latitude of 76 degrees  $\frac{1}{2}$ ; *i. e.* 13 degrees  $\frac{1}{2}$  from the north pole of the earth, and about 30 degrees eastward from the meridian of London.

20°. The southern *magnetic circular pole* has its center, or central pole, nearly in the parallel of 60 degrees; and in a meridian passing along the east coast of Borneo, about 117 degrees eastward of London: its radius is also an arc of a great circle of about 44 degrees.

21°. The respective motion of the internal *Magnet*, or the velocity, *v. g.* of its north-pole, appears to be 27 deg. 0 min. in 144 years, *i. e.* upwards of one degree in five years; so that it makes an intire revolution in 1920 years.

Hence, as the number of degrees in the upper earth's diurnal revolution, is to the number of days in the revolution of the internal *Magnet*, *i. e.* as 1 is to 700000, so is the respective motion of this *Magnet* from east to west to the real motion of the upper earth from west to east; or to speak strictly, so is the difference of their motions from west to east, to the entire motion of the upper earth the same way. This external fixed earth has therefore communicated almost all its motion already to the internal *Magnet*, and can communicate no more than this difference of their motion, and that only in an infinite term of years; or, in other words, this real internal motion can never be the seven hundred thousandth part swifter than it is at present. This internal motion therefore began with the commencement of the diurnal motion of the upper earth; and has gone on still faster and faster by the communication of that motion through the intermediate fluid. Since therefore action and re-action are equal, and tend to contrary parts, this internal *Loadstone*, thus accelerated by the upper part, must have all along retarded that upper earth, and made the diurnal rotation

still slower and slower. This acceleration on one side, and retardation on the other, must have been very great at the first beginning of the diurnal motion, when the difference of their motion was equal to the entire motion itself, and must have been diminishing ever since. To which cause is probably owing that acceleration of the moon's motion with respect to that of the earth, since the time of the old astronomers first taken notice of by Dr. Halley, and embraced by Sir Isaac Newton. And the same consideration seems to suggest a method for determining the age of the world; for were the proportions of the quantity of matter in the upper earth to the internal *Magnet*, with the tenacity of the intermediate fluid, &c. known, one might go back from the known difference of their velocity now, and find those differences and quantities of motion themselves, *à priori*, in all past ages; or were the velocity of the diurnal rotation of the upper earth known, we might geometrically determine, *à priori*, how long ago that rotation began, or how ancient our earth is. See *EARTH, WORLD, &c.*

22°. The variation of *magnetic needles* from the azimuth of the meridians of the internal *Magnet*, is derived from the difference of the strength of the several parts of the internal *Magnet's* surface; which as it is only to be known by experience, that variation cannot be determined beforehand, unless where there are good accounts how much it had formerly been; it being probable that it returns round, and will be the same in any year of the next revolution of the internal *Magnet*, that it has been in the like year of any former revolution, or will itself have a revolution in about 1920 years.

23°. The two fixed *magnetic poles*, in our upper earth, first introduced by Dr. Halley, as necessary to solve the irregularity of the variation of the horizontal needle from the meridians of the moveable internal *Magnet*, seem not to have any just foundation in nature; the like irregularities being found in the common *terrella* or spherical *Loadstones*; and being best accounted for from the composition of the *Magnets*, which are found to have parts of different degrees of purity, strength, and perfection; so that where the parts are weaker than ordinary, the stronger neighbouring parts prevail, and draw the needle that way: not but Dr. Gilbert's notions of prominent and depressed parts on *Magnets* may have some room, and be allowed to contribute somewhat to such variations. See *VARIATION*.

For the causes of *MAGNETISM*, or the manner in which these phenomena of the *Magnet* are produced, we have yet no hypothesis that will satisfactorily account for them.—Plutarch tells us, the *Magnet* attracts iron, by emitting some spiritual effluvia, whereby the contiguous air being opened and driven on either side, does again drive that contiguous to it; and thus the action being communicated round, the iron is thereby protruded: but this is contradicted by the equally vigorous action of the *Loadstone* in vacuo, and in the open air. Others of the ancients ascribe the action of the *Magnet* to a soul that animates it; and others to I know not what sympathy between the effluvia of the iron and those of the *Magnet*.

The opinion that principally prevails among the moderns, is that of Des Cartes, maintained by Malebranche, Rohault, Regis, &c. and even admitted, and confirmed by Mr. Boyle, &c. In this it is supposed there is continually flowing, from the poles of the world, a subtle, impalpable, and invisible matter, channelled or striated: which matter circulating round the earth, in the plains of the meridians, re-enters at the pole opposite to that from which it issued, and passes again through the poles parallel to its axis: That the *Magnet* has two poles answerable to those of the earth, and that out of these there issues a matter like that just mentioned: That this matter, entering in at one of the poles, gives the impulse whereby iron tends to the *Magnet*, and produces what we call attraction.—Now besides the *magnetical* matter re-entering the poles of the *Magnet*, there is always a certain quantity thereof circulating round the *Magnet*; composing a kind of vortex about it. The space wherein this matter moves, is the sphere of activity of the *Magnet*, within which its attractive faculty is confined.

As to its directive faculty, or the inclination of a needle touched with it to the poles of the world, and its dip to a point beneath the horizon, they follow from the same principle; since were the *Magnet* or needle to have any other situation, the *magnetic* matter would strike on its other surface in vain; and not being able to get admission, would, by degrees, change its situation, till such times as its pores correspond to the course of the *magnetical* matter; which situation having once acquired, it would cease to move; the *magnetical* matter then ceasing to disturb it.

The form or essence of a *Magnet* therefore is supposed to consist in its being perforated by an infinite number of parallel pores; some whereof are disposed to admit the striated matter from the north pole of the world, others that of the south; hence the north and south poles of the *Magnet*. See *POLE*.

M. Hartsoecker maintains that the *Magnet* is no more than a common stone, full of an infinite Number of hollow prisms,

which, by the diurnal motion of the earth, are ranged parallel to each other, and nearly parallel to the axis of the earth. These prisms have their cavities filled with an extremely subtle matter, which, by the diurnal motion of the earth, is passed from prism to prism; thus making a circulation, and returning into the prisms where it first began: from these principles he deduces all the phenomena of the *Magnet*; and M. Andry does the same, from the doctrine of alkali and acid.

For the directive power of the *Magnet*, Mr. Whiston, from the first, second, third, &c. laws of *Magnetism*, inclines to think it mechanical; and ascribes it to magnetic effluvia circulating continually round the *Loadstone*; of which circulations he thinks there are evident indications in magnetic experiments; as Mr. Boyle thinks there are of the *Magnetism* or magnetic effluvia of the earth; though those effluvia were never yet rendered sensible, as electric effluvia begin to be.—But the attractive power, Mr. Whiston thinks entirely immechanical, as the power of gravity is; not being able to devise any such motion of a subtle fluid belonging to the *Loadstone*, as will account for the attractive power in the sesquiduplicate proportion of the distances reciprocally; though if he could, yet would that be no more than to remove the immediate power of the Supreme Being one step further; the last resort of all mechanical principles whatever, being into the immechanical power and efficiency of the Deity. See CAUSE, &c.

**MAGNETISM**, is also used by some chymists, to signify a certain virtue, whereby one thing becomes affected at the same time with another, either, in the same or a different manner. This amounts to the same with what they otherwise call *sympathy*. See SYMPATHY.

**MAGNETICAL Amplitude**, an arch of the horizon, contained between the sun, at his rising and setting; and the east or west point of the compass. See AMPLITUDE, and COMPASS.

**MAGNETICAL Azimuth**. See the article AZIMUTH.

**MAGNIFYING**, among philosophers, is chiefly used in speaking of microscopes, which are said to *magnify* objects, that is, make them appear bigger than they really are: though in reality, they do not, nor cannot, *magnify* any object, but only shew it nearer, and more of its parts, than before were taken notice of. See MICROSCOPE, VISION, &c.

**Magnifying GLASS**, in optics, denotes a little spherical convex lens; which, in transmitting the rays of light, inflects them so, as that the parallel ones become converging, and those which were diverging become parallel; by means whereof, objects viewed through them appear larger than when viewed by the naked eye. See LENS, MICROSCOPE, REFRACTION, &c.

**MAGNITUDE**, any thing that has parts without (or *extra* to) parts, connected together by some common term. See PART. *Magnitude* is any thing locally extended, or continued; or that has several dimensions. See EXTENSION, DIMENSION, &c. The origin of all *Magnitude* is a point, which, though void of parts itself, yet its flux forms a line, the flux of that a surface, and of that a body. See POINT, LINE, &c.

*Magnitude* amounts to much the same with what is otherwise called *quantity*. See QUANTITY.

**Literal MAGNITUDE**, denotes a *Magnitude* expressed by letters. See SPECIOUS.

**Numerical MAGNITUDE** is that expressed by numbers.

**Broken MAGNITUDE**, denotes a fraction. See FRACTION.

**Complex MAGNITUDE** is that formed by multiplication.

**Incommensurable MAGNITUDE** is that which has no proportion to unity. See INCOMMENSURABLE.

**Apparent MAGNITUDE** of a body, in optics, is that measured by the optic or visual angle, intercepted between rays drawn from its extremes to the center of the pupil of the eye.

It is one of the fundamental maxims in this science, that whatever things are seen under the same or equal angles, appear equal; and on the contrary. See VISION.

The *apparent Magnitudes* of an object at different distances, are in a ratio less than that of their distances reciprocally. See DISTANCE.

The *Apparent Magnitudes* of the two great luminaries, the sun and moon, at rising and setting, is a phenomenon that has extremely embarrassed the modern philosophers. According to the ordinary laws of vision, they should appear the least when nearest the horizon, as being then furthest distant from the eye; and yet we find the contrary true in fact.—Ptolemy in his *Almagest*. l. 1. c. 3. ascribed this appearance to a refraction of the rays by vapours, which actually enlarge the angle under which the moon appears, just as the angle is enlarged by which an object is seen from under water: and his commentator Theon explains distinctly how the dilatation of the angle in the object immersed in water is caused.—But it was afterwards discovered, that there is no alteration in the angle: upon which another solution was started by the Arab Alhazen; and followed and improved by Vitellio, Kepler, Peckham, Rog. Bacon, and others. According to Alhazen, the sight apprehends the surface of the heavens as flat, and judges of the stars as it would of ordinary visible objects extended upon a wide plain: that the eye sees them under equal angles, but withal perceives a difference

in their distances, and (on account of the semidiameter of the earth which is interposed in one case and not in the other) that it is hence induced to judge those which appear more remote to be greater. See *Robin's Remarks on Smith's Optics*. Des Cartes, and from him Dr. Wallis, and most other authors, account for the appearance of a different distance under the same angle from the long series of objects interposed between the eye and the extremity of the sensible horizon, which make us imagine it more remote than when in the meridian, where the eye sees nothing in the way between the object and itself. This idea of a great distance, makes us imagine the luminary the bigger: For any object being seen under any certain angle, and believed, at the same time, very remote, we naturally judge it must be very large, to appear under such an angle at such a distance. And thus a pure judgment of the mind makes us see the sun or the moon bigger in the horizon, than in the meridian; notwithstanding their images painted on the retina are less in the former situation than the latter.

This hypothesis, F. Gouye destroys, by observing that the narrower and more confined the sensible horizon is, the greater does the sun or moon appear; the contrary of which should happen on the principle laid down.

Gassendus is of opinion, that the pupil of the eye, which is always more open as the place is more dark; being more so in the morning and evening than at other times, by reason the earth is covered with gross vapours; and besides, being obliged to pass through a longer column or series of vapours, to reach the horizon; the image of the luminary enters the eye at a greater angle, and is really painted there larger at the former times, than the latter. See PUPIL, and VISION.

In answer to which, it may be said, that notwithstanding this dilatation of the pupil, occasioned by the obscurity; if the moon be viewed through a little pin-hole made in a paper, she appears less when in the horizon, than in the meridian.

F. Gouye finding both the conjectures false, advances a third; which is, that when the luminaries are in the horizon, the neighbourhood of the earth, and the gross vapours wherewith they then appear enveloped, have the same effect with regard to us, as a wall, or other dense body placed behind a column; which in that case appears bigger than when insulated, and incompassed on all sides with an illumined air.—Further, it is observed that a column when fluted, appears bigger than before, when it was plain; the flutes being so many particular objects, which by their multitude occasion the mind to imagine the whole object whereof they are composed of a larger extent.—The same thing may be said of the several objects seen towards the horizon, to which the sun or moon correspond at their rising and setting.—And hence it is that they appear larger still, when they rise or set between trees; the narrow, yet distinct intervals whereof have the same effect with regard to the apparent diameter of the luminary, as a greater number of flutes with regard to the shaft of a column.

**MAGOPHONIA\***, the name of a feast among the ancient Persians held in memory of the expulsion of the magians.

\* The word is formed from *Magos*, magus, and *Phonos*, slaughter.

The magus Smerdis having usurped the throne of Persia, upon the death of Cambyses, 521 years before Jesus Christ, seven of the principal lords of the court conspired to drive him out of it. Their design was executed with good success; Smerdis and his brother, another magus, called Pitizithes, were killed. Upon which, the people also rose, and put all the magi to the sword; inasmuch that there would not one have escaped, had not night come upon them. Darius, son of Hyftaspes, was then elected king. In memory of this massacre of the magi, a feast was instituted, says Herodotus, called *Magophonia*. See MAGI.

**MAHIM, MAHEM, MAIHEM, or MAYHEM\***, in law, a *Maim*, or corporal hurt, whereby a man loseth the use of any member, that is, or may be, of defence to him in battle; as the eye, hand, foot, scalp of the head, fore-tooth, or, as some say, a finger or toe. See MEMBER, and MUTILATION.

\* The word comes from the French, *Mehain*, of *Mebaigner*, to mutilate: the canonists call it *membri mutilatio*; and all agree, it consists in the loss of a member or the use thereof.

If any one shall of malice, or forethought, cut or disable any limb or member of another person, with intention, in so doing, to *maim*, or disfigure him; it is felony without benefit of clergy: and when the case is difficult to judge, whether it be a *Mahim*, or not, the judges commonly view the party wounded, and sometimes take the opinion of surgeons.

**MAHOMETANISM or MAHOMETISM**, the system of religion broached by *Mahomet*, and still adhered to by his followers.

*Mahometanism* is embraced by the Turks, Persians, and several nations among the Africans, and many among the East-Indians.

The system of *Mahometanism*, is contained in the Koran, commonly called the Alcoran. See ALCORAN.

The first and chief article of the *Mahometan* creed, is, that *there is no other God but God*; which they have from the alcoran, where these words are repeated incessantly: *There is no other God but him. Your God is the only God. I am God, and there*

*there is no other God but me.*—This grand axiom of their theology seems to have been taken from the Jews, who were continually rehearsing those words of Deuteronomy, *Hear, O Israel, the Lord our God is One.* See GOD.

For this reason, the *Mahometans* account all such as own any thing of number in the divinity, to be infidels or idolaters: And accordingly, one of the first lessons they teach their children, is, That God is neither male nor female, and consequently can have no children. See SON, GENERATION, TRINITY, &c.

The second article of *Mahometanism*, consists in this, *That Mahomet was sent from God.* By which they exclude all other religions; under pretence that their prophet was the last and greatest of all the prophets that God would ever send; and that as the Jewish religion ceased with the coming of the Messiah, so likewise the Christian religion was to be abrogated with the coming of *Mahomet*. Not but that they own Moses and Jesus Christ to have been great prophets; but *Mahomet* they hold to be *The Prophet*, by way of excellence; and the paraclete or comforter promised in scripture. See JUDAISM, &c.

These are the two fundamentals of *Mahometanism*; so that when any is to make profession of that faith, they content themselves with his rehearsing these words, *There is no other God but God, and Mahomet is his envoy, or prophet.*

To these articles the *Mahometans* have added that of bathing or purification, in imitation of the Jews. And such an opinion have they of these purifications, that it is purely on that account they seem to have retained the practice of circumcision. For they pretend, with the Jews, that if the least part of the body remained unwashed, the bathing is of no effect. Hence they find themselves under a necessity of being circumcised; that the part covered by the prepuce may also have its share in the lotion. See ABLUTION, CIRCUMCISION, &c.

Prayer is also one of the things to which the *Mahometans* are obliged; and they perform it five times a day, to distinguish themselves from the Jews, who only do it thrice. Some of their periods or hours of prayer they hold to be necessary, and of divine obligation; others they esteem convenient and prudential. That at nine a-clock in the morning, they do not esteem necessary: but those at noon and in the afternoon are held to be *jure divino*. They are obliged to observe an infinity of things in order to be heard: If they speak or smile in praying, their prayers are vain; and it is the same thing if they weep, unless it be with the thought of paradise or hell. In many of their prayers they use beads.

The *Mahometans* believe with the Christians and Jews, a resurrection of the dead: they hold, that ere that time, an *Anti-Mahomet* will come; and that Jesus Christ will descend from heaven to kill him, and establish *Mahometanism*. To which they add a great many more chimæras, relating to Gog and Magog; and the beast that is to come out of Mecca. The mountains are to fly in the air like birds, and at last the heavens will melt and drop down upon the earth. They add however, that some time after, God will renew and re-establish the earth; that then the dead will be raised, &c. See further under AL-CORAN.

**MAIDEN**, an edged instrument used in some countries, particularly Scotland, for the beheading of criminals.

The *Maiden* is a broad piece of iron, a foot square, sharp on the lower part, and loaded above with lead, so as scarce to be lifted: At the time of execution, it is pulled up to the top of a narrow wooden frame ten feet high, with a groove on each side for the *Maiden* to slide in.—The prisoner's neck being fastened to a bar underneath, on a sign given, the *Maiden* is let loose, and the head in an instant separated from the body.

**MAJESTY**, **MAJESTAS** \*, a title or quality given to kings; and which frequently serves as an appellation to distinguish them by. See TITLE, QUALITY, KING, &c.

\* The word seems composed of the two Latin words, *major*, greater, and *status*, state.

The emperor is called, His Cæsarian or Imperial *Majesty*; the king of Spain his Catholic *Majesty*; the king of France, his most Christian *Majesty*; the king of Great-Britain, his Britanick *Majesty*, &c. Some have also extended this title to the popes. See POPE.

Pasquier observes, that our fore-fathers used this quality exceeding sparingly; and that the frequent use of the word which now obtains, had not its beginning before the reign of their Henry II. He instances several letters of St. Gregory, who writing to King Theodebert and Theodoric, only compliments them with Excellency. See EXCELLENCY.

Till the time of Charles V. the king of Spain had no title but that of Highness: And before our king Henry VIII. the kings of England were only addressed under the titles of Grace and Highness. See GRACE and HIGHNESS.

At the peace of Munster, there was a great contest between the ministers of the emperor and those of France: The first would not allow the title of Serenity to the king of France, and the latter would not give that of *Majesty* to the emperor. At last it was agreed, that whenever the French king should write with his own hand to the emperor, he should give him the title of Imperial *Majesty*; and reciprocally, when the em-

peror should write to the king, he should give him that of Royal *Majesty*.

Under the Roman republick, the title *Majesty*, *Majestas*, belonged to the whole body of the People, and to the principal magistrates; so that to diminish or wound the *Majesty* of the commonwealth, was to be wanting in respect to the state, or its ministers.—But the power passing into the hands of a single person, the appellation of *Majesty* was transferred to the emperor, and the imperial family. Pliny complements Trajan on his being contented with the title of Greatness; and speaks very invidiously on those who affected that of *Majesty*. And yet *Majesty* seems to be the modestest and justest title that can be attributed to sovereigns, since it signifies no more at bottom, than the royalty or sovereign power.

**MAIL**, **MAILLE**, is primarily applied to the meshes or holes in net-work.

*Coat of MAIL*, a piece of defensive armour, made of iron wire interwoven net-wise: called also *habergeon*. See HABERGEON. Anciently they also wore shirts of *Mail* under the doublet, to serve as a defence against swords and poniards. We also read of gloves of *Mail*.

**MAIL**, or **MALL**, also signifies a round ring of iron; whence the play of pall-mall, from *palla*, a ball, and *maille*, the round ring through which it is to pass.

**MAILED** implies a thing speckled, or full of specks; as the feathers of hawks, partridges, &c. or the furs of some wild beasts.

**MAIN-MORTE**, a term in some ancient customs, still obtaining in Burgundy, signifying a right which the lord has, on the death of the chief of a family that is *Mainmortable*, of taking the best moveable in the house; or in default of that, the right hand of the deceased was offered him, in token that he could serve him no longer. See MORT-MAIN.

**MAINOUR**, **MANOUR**, or **MEINOR**, in law, signifies the thing that a thief takes away, or steals.

Thus, to be taken with *Mainour*, is to be taken with the thing stolen about him.—If the defendant were taken with the *Mainour*, and so carried to court, in ancient times they would arraign him on the *Mainour* without any appeal or indictment.

**MAINPRISE** \*, in law, the taking or receiving a man into friendly custody, who otherwise might be committed to prison; upon security given for his forth-coming at a day assigned.

\* The word is compounded of the French *Main*, hand, and *pris* or *prins*, taken.

They who thus undertake for any are called *Mainpernors*, because they receive him into their hands; whence also comes the word *Mainpernable*, denoting the person who may be thus bailed.

Manwood makes a great difference between bail and *Mainprise*: he that is *mainprised* is already said to be at large after the day he is set to *Mainprise* till the day of his appearance; but it is quite otherwise where a man is let to bail to four or two men, by the lord justice in eyre of the forest, or any other judge, until a certain day; for there he is always accounted by the law to be in their ward and custody for the time; and they may, if they please, keep him in prison all that time. So that he who is bailed, is not supposed to be at large, or at his own liberty: whereas under *Mainprise*, a man is supposed to go at large, and is not liable to be confined by his sureties or *Mainpernors*. See BAIL.

The author of the *Mirroure of Justice* says, that pledges are those who bail, or redeem any thing but the body of a man; and *Mainpernors* those who free the body: on which footing, pledges belong properly to real and mixed actions, and *Mainpernors* to personal. See PLEDGE.

**MAINTENANCE**, **MANUTENENTIA** \*, in law, an unlawful maintaining, or upholding a cause, or suit between others; either by word, writing, countenance or deed.

\* The word is metaphorically taken from the succouring a young child, that learns to go by one's hand; and is used in the evil part in some of our statutes.

When a man's act in this kind is esteemed *Maintenance*, and when not, see Brooks and Kitchin. See also BARRATOR.

There lies a writ against a *Maintainer*, called a Writ of *Maintenance*.

**MAJOR**, in the art of war, a name given to several officers of different qualities, and functions.—Thus,

**MAJOR-General** is a general officer who receives the general's orders, and delivers them out to the *Majors* of brigades, with whom he concert's what troops are to mount the guard, what to go on parties, what to form detachments, or to be sent on convoys, &c.

It is his business also to view the ground to encamp on, and do other services; being subordinate to the general, and lieutenant-general, and the next commanding officer to them. See GENERAL.

**MAJOR of a brigade**, either horse or foot, is he who receives orders, and the word, from the major-general, and gives them to the particular majors of each regiment. See BRIGADE.

**MAJOR of a regiment**, is an officer, whose business is, to convey all orders to the regiment, to draw it up, and exercise it; to see

it march in good order, to look to its quarters, and to rally it, if it happen to be broke in an engagement, &c.

The *Major* is the only officer of a regiment of foot, who is allowed to be on horseback in time of service; but he rides that he may speedily get from place to place, as occasion serves. See REGIMENT.

*Major of a Regiment of Horse*, is the first captain of the regiment; and commands in the absence of the colonel.

*Town-MAJOR*, is the third officer in order in a garrison, being next to the deputy-governor.

He ought to understand fortification, and hath charge of the guards, rounds, patrols, and sentinels.

There are also *Aids-Major*, *Drums-Major*, and other Officers; so called by reason of some seniority or prerogative that they have over the rest. See AID, DRUM, &c.

*MAJOR*, in law, a person who is of age to manage his own affairs. See AGE.

By the civil law a man is not a *Major* till the age of twenty-five years; in England, he is a *Major* at twenty-one, and in Normandy at twenty. See MINOR.

*MAJOR*, in logic, is understood of the first proposition of a regular syllogism. See SYLLOGISM.

It is called *Major*, because it has a more extensive sense than the *minor* proposition, as containing the principal term. See PROPOSITION, TERM, PREMISES, &c.

*MAJOR and Minor*, in music, are applied to concords which differ from each other by a semi-tone. See CONCORD.

There are *Major* and *minor* thirds, &c. See THIRD, &c.

*Major* tone is the difference between the fifth and fourth; and *Major* semi-tone the difference between the *Major* fourth and the third. The *Major* tone surpasses the *minor* by a comma. See TONE, and SEMI-TONE.

*MAJOR-DOMO*, an Italian term, frequently used to signify a steward, or master of the household. See STEWARD.

The title *Major-Domo* was formerly given in the courts of princes to three different kinds of officers. 1<sup>o</sup>. To him who took care of what related to the prince's table, or eating, otherwise called *eleuter*, *praefectus mensae*, *architriclinus*, *dapifer*, and *princeps coenarum*. 2<sup>o</sup>. *Major-Domo* was also applied to the steward of the household. 3<sup>o</sup>. The title *Major-Domo* was also given to the chief-minister, or him to whom the prince deputed the administration of his affairs, foreign and domestic, relating to war as well as peace. — Instances of *Major-Domos* in the two first senses are frequent, both in the English, French, and Norman affairs. See SENESCHAL.

*MAKE*, in law, signifies to perform and execute.

Thus, to *make* his law, is to perform that law to which a man had formerly bound himself; *v. gr.* to clear himself of action commenced against him by his own oath, and the oath of his neighbours. See LAW.

So, to *make* services, or customs, is nothing else but to perform what belongs to them. See SERVICE, &c.

*MALACIA*, *MAAKIA*\*, a disease consisting in a depraved appetite, wherein the patient covets and longs for some particular kind of food with extraordinary earnestness, and eats it to excess. See APPETITE.

\* The word seems derived from the Greek *μαλακία*, soft; too lax a tone of the stomach being generally the occasion of indigestion, and unusual cravings.

Many authors confound this affection with another called *pica*, which consists in a depravation of appetite leading the patient to covet things unnatural and absurd, as lime, coals, &c. See PICA.

The *Malacia* seems to arise from an ill disposition of the menstruum in the stomach; or from some defect in the imagination, which determines it to some one thing rather than another.

*MALANDERS*, *MALANDRIA*, a disease in horses, so called from the Italian, *Malandare*, to go ill.

It consists in certain ulcerous chops, or chinks, appearing on the inside of the fore-legs, just against the bending of the knee, which void a red, sharp, and pungent humour.

*MALE*, the sex which has the parts of generation without-side, and which has ordinarily the preheminance over the other. See SEX, GENITALS, GENERATION, MASCULINE, &c.

In which sense *Male* stands opposed to *female*. See FEMALE.

For the proportion of *Males* to *females*, see MARRIAGE.

*MALEBRANCHISM*, the doctrine or sentiments of father *Malebranche*, a priest of the oratory of France.

*Malebranchism* is in a great measure the same with Cartesianism. It must be owned however, that though F. *Malebranche* thought the same with Des Cartes, yet he does not so properly seem to have followed him, as to have met with him. See CARTESIANISM.

*Malebranchism* is contained in the *Recherche de la verité*; and to give a general notion of it, we need only repeat what M. Fontenelle says of that work. The *Enquiry after truth*, says he, is full of God: God is the only agent, and that too, in the strictest sense. All power of acting, all actions belonging immediately to him. Second causes are no causes. They are only occasions that determine the action of God; occasional causes. See CAUSE, and OCCASIONAL.

F. *Malebranche*, however, does not here lay down his system

entire, with regard to religion, or rather the manner in which he would reconcile religion to his system of philosophy: That he reserved for his *Entretiens chretiennes*, printed in 1677, where he proves the existence of a God, the corruption of human nature by original sin, the necessity of a mediator, and of grace.

*Malebranchism*, notwithstanding, appears to many persons not only ill grounded, but even dangerous and destructive to religion: and has accordingly been vigorously opposed by many zealous French authors. The first was M. Foucher. After him came M. Arnaud; and in 1715, (the year F. *Malebranche* died) F. du Tertre, a Jesuit, published an ample confutation (as he imagines) of his whole system. — That part which relates to our seeing all things in God, has been answered by Mr. Locke.

*MALEDICTION*, *MALEDICTIO*, in law, a curse usually annexed to donations of lands, &c. to churches and religious houses; imprecating the most direful punishments on those who should infringe them. See IMPRECATION.

*MALIGNANT*, in medicine, that quality in a disease which renders it more than ordinarily dangerous and difficult to cure. See DISEASE.

*Malignant* is generally applied to such fevers as are epidemical or infectious, and are attended with spots and eruptions of various kinds. See FEVER, PLAGUE, &c.

*MALLEABLE*, something hard and ductile, and that may be beaten, forged, and extended under the hammer without breaking. See DUCTILITY.

All metals are *Malleable*, excepting quick-silver; but gold in the greatest degree of all. The chymists have long sought the fixation of Mercury, to render it *Malleable*. See MERCURY.

It is a popular error, that ever the art of making glass *Malleable*, was known; its nature is incapable of it. For if it were ductile, its pores would not be opposite to each other, and of consequence it would not be transparent; so that its principal criterion would be lost. See GLASS and TRANSPARENCY.

*MALLEOLUS*, a process in the lower part of the leg just above the foot. See PROCESS, FOOT, &c.

There is one *internal*, and another *external Malleolus*.

The *internal Malleolus* is an eminence of the tibia; see TIBIA, FIBULA, &c. the *external*, of the fibula: the two together form the ancle. — See Tab. anat. (osteol.) fig. 3. n. 23.

*MALLET*, a large kind of hammer, made of wood; much used by artificers who work with a chissel, as sculptors, masons and stone-cutters, whose *Mallet* is ordinarily round; and by carpenters, joiners, &c. who use it square. See HAMMER.

*MALLEUS*, in anatomy, denotes one of the bones of the ear; so called from its resemblance to a hammer, or mallet; first discovered, as some assert, by Alexander Achillinus: though others have mistakenly attributed it to Jac. Carpenfis. Vid. Douglas Bibl. Anat. p. 48. See also EAR.

*MALMSEY*, or *MALVASY*, a rich luscious kind of wine brought from Greece or Candia; so called from *Malvasia*, a city in Peloponnesus, the ancient Epidaurus, whence this celebrated liquor was first brought.

That brought from Candia is now esteemed the best. See WINE.

*MALMSEY*, or *MALVOISY*, is also the name of a kind of muscadine wine brought from Provence. See WINE.

*MALT*, denotes barley cured, or prepared to fit it for making a potable liquor, under the denomination of beer or ale. See BEER, and ALE.

The manner of making *Malt*, Sir Robert Murray describes as follows. — Take good barley newly threshed, &c. put about six English quarters in a stone trough full of water, where let it steep till the water be of a bright reddish colour; which will be in about three days, more or less, according to the moisture or dryness, smallness or bigness of the grain, the season of the year, or the temperature of the weather. — In summer, *Malt* never makes well; in winter it requires longer steeping than in spring or autumn. It may be known when it is steeped enough, by other marks besides the colour of the water; as by the excessive swelling of the grain if it be over-steeped, and by too much softness: being, when it is in a right temper, like the barley prepared to make broth of.

When it is sufficiently steeped, take it out of the trough, and lay it on heaps, to let the water drain from it; then after two or three hours turn it over with a scoop, and lay it in a new heap, about twenty or twenty-four inches deep.

This is called the *coming heap*, in the right management whereof lies the principal skill. In this heap it may lie forty hours, more or less, according to the forementioned qualities of the grain, &c. before it come to the right temper of *Malt*; which that it may do equally, is mainly desired.

While it lies in this heap, it must be carefully looked to, after the first fifteen or sixteen hours; for about that time the grains begin to put forth roots: which when they have equally and fully done, the *Malt* must within an hour after be turned over with a scoop; otherwise the grains will begin to put forth the blade or spire also, which must by all means be prevented. — If all the *Malt* do not come equally, but that which

## M A L

which lies in the middle, being warmest, come the soonest: turn it, so as the outmost may lie inmost, and thus manage it till it be all alike.

As soon as the *Malt* is sufficiently come, turn it over, and spread it to a depth not exceeding five or six inches; and by that time it is all spread out, begin and turn it over and over again three or four times. Afterwards, turn it over in like manner once in four or five hours, making the heap deeper by degrees: and continue so to do for the space of forty-eight hours at least.—This frequent turning it over, cools, dries, and deadens the grain, whereby it becomes mellow, melts easily in brewing, and separates entirely from the husk.

Then throw up the *Malt* into a heap, as high as you can; where let it lie till it grow as hot as your hand can endure it, which usually comes to pass in about thirty hours space.—This perfects the sweetness and mellowness of the *Malt*.

After it is sufficiently heated, throw it abroad to cool, and turn it over again about six or eight hours after, and then lay it on a kiln with hair-cloth or wire spread under it; where, after one fire, which must last for twenty-four hours, give it another more flow, and afterwards, if need be, a third: for if the *Malt* be not thoroughly dried, it cannot be well ground, neither will it dissolve well in the brewing; but the ale it makes will be red, bitter, and unfit to keep.

The best fuel is peat or turf; the next charcoal. If there be not enough of one kind, burn the best first, for that gives the strongest impression.—Indeed, the best and most natural method of drying it is in the sun in the months of April or May. This yields the palest, the most wholesome, and the finest liquor. However this be, take care the *Malt* be not smoked in the drying.—As to the complexion or colour of *Malt*, white is accounted the best, because the most natural.

For the manner of preparing liquors of *MALT*, see BREWING.

*MALT Liquors* have different names, as well as different virtues, properties and uses, both from the different manners of preparing the *Malt*, whence they are distinguished into *pale* and *brown*; and from the different manners of preparing or brewing the *Liquors* themselves; whence they are divided into *beer* and *ale*, *strong* and *small*, *new* and *old*. See DRINK, ALE, and BEER.

*Malt* drinks are either pale or brown, as the *Malt* is more or less dried on the kiln; that which is the slenderest dried tinging the liquor least in brewing, and therefore called *pale*; whereas that higher dried, and as it were roasted, makes it of a higher colour.—A mixture of both these makes an amber colour, whence several of these *Liquors* take their name.

Now it is certain the pale *Malt* has most of the natural grain in it, and is therefore the most nourishing; but for the same reason, it requires a stronger constitution to digest it. Those who drink much of it are usually fat and sleek in their bloom; but are often cut off with sudden fevers; or if they avoid this, fall early into a diffempered old age.

The brown *Malt* makes a drink much less viscid, and fitter to pass the several strainers of the body; but if very strong, may lead on to the same inconveniences with the pale; though a single debauch wears off much more easily in the brown.

Dr. Quincy observes, that the best pale *Malt Liquors* are those brewed with hard waters, as those of springs and wells: in regard the mineral particles, wherewith these waters are impregnated, help to prevent the cohesions of those drawn from the grain, and enable them to pass the proper secretions the better; as the viscid particles of the grain do likewise defend these from doing the mischief they might otherwise occasion.—But softer waters, as rain and river waters, seem best suited to draw out the substance of high-dried *Malts*, which retain many fiery particles in their contexture, and are therefore best lost in a smooth vehicle.

For the differences in the preparations of *Malt Liquors*, they consist chiefly in the use of hops, as in beer; or in their omission, as in ale. See HOPS.

The difference made by hops, is best discovered from the nature and qualities of the hops themselves: These are known to be a subtle grateful bitter; in their composition therefore with this *Liquor*, they add somewhat of an alkaline nature, *i. e.* particles that are sublime, active, and rigid.—By which means the ropy, viscid parts of the *Malt* are more divided and subtilized, and are therefore not only rendered more easy of digestion and secretion in the body; but also, while in the *Liquor*, prevent it from running into such cohesions as would make it ropy, vapid, and sour.

For want of this, in unhopped drinks, that clammy sweetness which they retain after working, soon turns them acid, and unfit for use; which happens sooner or later, in proportion to the strength they receive from the *Malt*, and the comminution it has undergone by fermentation.

It is a common opinion, that ale is more diuretic than beer, that is, unhopped liquor more than that with hops in it. Which may hold in some constitutions, in regard ale being more smooth, softening, and relaxing, where urine is to be promoted by enlarging the passage, as in thin dry constitutions, this is the most likely to effect it.—But where the promoting of urine is to be done by attenuating and breaking the

## M A L

juices, and rendering them more fluid, it is certainly best answered by those drinks which are well hopped.

As to the dispute, whether or no hops tend to breed the stone? it is too long to enter upon here. Dr. Quincy is of opinion, there is but little reason for the affirmative side of the question; and in the general makes no scruple to say, that for one constitution damaged by beer, there are numbers spoiled by ale.—For this last manifestly fouls the glands, stuffs the vessels with slime and viscosity, makes the body unwieldy and corpulent, and paves the way for cachexies, jaundice, asthma, and at last incurable dropsies.—The urinary passages also, which it is supposed to clear, will in time be filled with slough and matter of as ill consequence as gravel.

The different strengths of *Malt Liquors* also make their effects different.—The stronger they are, the more viscid parts they carry into the blood; and though the spirituous parts make these imperceptible at first, yet when these are evaporated, which will be in a few hours, the other will be sensibly felt by pains in the head, nausea at the stomach, and lassitude or listlessness to motion.—This, those are the most sensible of, who have experienced the extremes of drinking these *Liquors* and wines; for a debauch of wine they find much sooner wore off, and they are much more lively and brisk afterwards, than after fuddling *Malt Liquors*, whose viscid remains will be long ere they are shook off.

*Malt Liquors* therefore are more wholesome for being small; *i. e.* of such a strength as is able to carry a small degree of warmth into the stomach, but not so great as to prevent their being proper diluters of the necessary food. Indeed in robust people, or those who labour hard, the viscidities of the drink may be broke into convenient nourishment; but in persons of another habit and way of living, they serve rather to promote obstructions and ill humours.

The age of *Malt Liquors* is the last thing by which they are rendered more or less wholesome.—Age seems to do nearly the same thing as hops; for those *Liquors* which are longest kept, are certainly least viscid: age breaking the viscid parts, and by degrees rendering them smaller and fitter for secretion. But this is always determined according to their strength; in proportion to which they will sooner or later come to their full perfection as well as decay: For when ale or beer is kept till its particles are broke and comminuted as far as they are capable, then it is they are best; and beyond this they will be continually on the decay, till the finer spirits are entirely escaped, and the remainder becomes vapid and sour.

**MALTA.**—*Knights of MALTA*, an order of military religious, who have bore various names; as, Hospitalers of St. John of Jerusalem, Knights of St. John, Knights of Rhodes, order of Malta, religion of Malta, &c. See KNIGHTS, HOSPITALER, &c.

About the Year 1048, some Neapolitan merchants founded a church after the Latin rite at Jerusalem, giving it the name of *Santa Maria della Latina*. They also founded a monastery of religious, after the order of St. Bennet, for the reception of pilgrims; and afterwards an hospital near the monastery, to take care of the diseased, under the direction of a master or rector, to be nominated by the abbot of Santa Maria della Latina. Besides which, they also built a chapel in honour of St. John Baptist.

In 1099, Godfrey of Bulloign having taken Jerusalem, endowed this hospital with some demesnes he had in France; and others imitating his liberality, the revenues of the hospital became considerably augmented. Upon this, Gerhard Torn their rector, in concert with the Hospitalers, resolved to separate from the abbot and religious of *Santa Maria*, and to form a distinct congregation, under the name and protection of St. John Baptist: And hence it was, that they had the name of *Hospitalers*, or *brothers of St. John of Jerusalem*.

Pope Paschal II. by a bull in the year 1113, confirmed the donations made to this hospital, which he settled under the protection of the holy see; ordering that the rectors, after Gerhard's death, should be chosen by the Hospitalers. Raymond de Puy, Gerhard's successor, took the title of *Master*: he gave a rule to the Hospitalers, which was approved by Calixtus II. in 1120.—Such was the first rise of the order of *Malta*. Their first grand master finding the revenues of the hospital vastly to exceed what was necessary for the entertainment of poor pilgrims and diseased persons, resolved to employ the surplus against the infidels; and with this view offered himself to the King of Jerusalem.

He divided his hospitalers into three classes; the first consisted of nobles, whom he destined to the profession of arms, for the defence of the faith, and the protection of pilgrims; the second consisted of priests and chaplains, who were to say mass; and the third of servitors, who were not noble, but were also appointed for the war.—He also regulated the manner of admitting knights-brothers; and had the whole confirmed by pope Innocent; who gave them for Arms a white cross in a field argent, which continues still the standard of this order.

After the loss of Jerusalem, they retired first to Margath, then to Acre, which they defended very vigorously in 1290. After the entire loss of the Holy Land, they withdrew to Cyprus,

# M A L

prus, where king Henry of Lusignan, whom they had followed thither, gave them the city of Limislon.—Here they continued 18 years; when taking the island of Rhodes from the Saracens in 1308, they settled there. And now it was that they first took the name of Knights, viz. *Knights of Rhodes*.

Andronicus, emperor of Constantinople, granted to their grand master, Fulk de Villaret, the investiture of this order; and the donation was confirmed by Pope Clement. The year following, with the assistance of Amadeus IV. Duke of Savoy, they defended themselves and their island against an army of Saracens. In 1480, their grand master d'Aubusson made a vigorous defence against Mahomet II. and preserved the island, in spite of a formidable army which besieged it for the space of three months.—But in 1522, it was attacked by Soliman with an army of three hundred thousand men, and taken by him, after having been in the possession of the Knights 213 years.

After this loss, the grand master and knights retired first into the isle of Candia: Some time after, pope Clement VII. gave them Viterbo: Lastly, Charles V. in 1530, gave them the island of Malta, which they still hold; and hence they come by the appellation of *Knights of Malta*; though their proper name is that of *Knights of the order of St. John of Jerusalem*; and their grand master, among his other titles, still retains that of *master of the hospital of St. John, and guardian of the poor of our Saviour Jesus Christ*.

The order of *Malta* have no other dominion besides their island, and some other little places in the neighbourhood, the chief whereof are Goza and Comino.

The government is both monarchical and aristocratical, the grand master being the sovereign, and the chapter the senate.—It is monarchical with regard to the inhabitants of *Malta*, and the isles adjacent, and even with regard to the Knights in every thing relating to the statutes and rule of their order; and aristocratical, with regard to the decision of any important affairs, which are not to be dispatched but by the grand master and the chapter.

There are two councils; the one ordinary, composed of the grand master, as chief, and the grand crosses; the other complete, consisting of the grand master, the grand crosses, and the two senior Knights of each language.

By the languages of *Malta* are meant the several nations whereof the order is composed.—Of these there are eight, viz. Provence, Auvergne, France, Italy, Arragon, Germany, Castile and England. See LANGUAGE.

The pillar (as he is called) of the language of Provence is the grand commander of the order; he of Auvergne the grand marshal; he of France the grand hospitaler; he of Italy grand admiral; he of Arragon grand conservator, or draper, as he was anciently called; the pillar of the language of Germany is grand bailiff, and he of Castile grand chancellor: the language of England, which has been extinct since the time of the reformation under king Henry VIII. had for its pillar or chief, the grand turcopolier, or colonel of the cavalry. The language of Provence is the first, on account of Raimond de Puy, their first grand master, who was a Provencial.

In each language there are several grand priories and capital bailiages. To each language belongs a hall, where the Knights eat, and hold their ordinary assemblies. Each grand prior has a number of commanderies.

The commanderies are either magisterial by right, or by favour; the magisterial are those annexed to the grand mastership, whereof there is one in each grand priory: Commanderies by right are those which come by right of seniority; their seniority is computed from the time of their admission, but they must first have lived five years at *Malta*, and have made four caravannes, or cruising voyages on the Turks and Corsairs: Commanderies by favour, are those which the grand master, or the grand priors have a right of conferring; one of these they confer every five years on whom they please.

The noble Knights are called Knights by right; excepting whom, none can be bailiffs, grand priors, or grand masters.—Knights by favour are those who, not being noble of themselves, are raised on account of some great exploit, or notable service, into the rank of nobles.

The servitors, or serving-brothers, are of two kinds; 1°. The servitors of war, whose functions are the same with those of the Knights. 2°. Servitors of religion, whose whole business is to sing the praises of God in the conventual church, and to officiate each in his turn as chaplain on board the vessels and galleys of the order.

The brothers of obedience are priests, who, without being obliged to go to *Malta*, take the habit of the order, make the vows, and attach themselves to the service of some of the churches of the order, under the command of a grand prior, or commander, to whom they pay obedience.

The Knights of majority are those who, according to the statutes, are admitted at sixteen years of age.—The Knights of minority are those who are admitted from the time of their birth; which, however, cannot be done without a dispensation from the pope.

# M A N

The chaplains can only be admitted regularly from ten to fifteen years of age; after fifteen they must have a brief from the pope; till fifteen the grand master's letter is sufficient. These are called *diacos*, and must give proof of their being born of creditable families.

For the proofs of nobility to be made, ere the admission of Knights, in the language of Germany, they go back six generations; in the rest it is sufficient to go back to the great grandfather on the father's or mother's side.

All the Knights, after their profession, are obliged to wear a white cross, or star with eight points over the cloak or coat on the left side, which is the proper habit of the order; the golden cross being only an ornament.

There are also female Hospitalers of the order of St. John of Jerusalem, sometimes also called *Chevalieresses*, or *She-Knights*, of equal antiquity with the Knights themselves; whose business was to take care of the women-pilgrims, in an hospital apart from that of the men.

**MALTHA**, *μαλθη*, in antiquity, denotes any cement or glutinous body, which has the faculty of binding things together. See CEMENT, LUTE, GLUE, &c.

Ancient writers make mention of divers sorts of *Maltha*, native and factitious: One of the latter much in use was composed of pitch, wax, plaister, and grease.

Another kind, wherewith the Romans plaistered and whitened the insides of their aqueducts, was made of lime slacked in wine, incorporated with melted pitch and fresh figs.

Natural *Maltha* is a kind of bitumen, wherewith the Asiatics plaister their walls.—When this is once set on fire, water will not quench it, but serves rather to make it burn more fiercely.

**MAMALUKES**, *MAMMELUKES*, or *MAMMALUCKS*\*, the name of a dynasty which reigned a considerable time in Egypt.

The Word comes from *مملوك*, *regere, imperare*, the Arabic participle passive whereof is *مملوك*, *Mamluc*, which signifies *subject*, or one under the dominion of another. Scaliger holds, that the word is Arabic, but that it properly signifies something bought with money; but others will have it signify any thing acquired, either as prize or purchase.

The *Mamalukes* were originally Turkish and Circassian slaves, bought of the Tartars by Melicfaleh, to the number of a thousand; whom he bred up to arms, and raised some to the principal offices of the empire.—They killed Sultan Moadam in 1250; being affronted at his concluding a treaty with his prisoner St. Louis without their privy. This Moadam was the last Sultan of the Ajoubites; to whom succeeded the *Mamalukes*, the first of whom was Sultan Azeddin, or Mouz Ibec, the Turcoman.

Others say, that the *Mamalukes* were ordinarily chosen from among the Christian slaves, and that they were the same thing in great measure with the Janizaries among the Turks. They never married. The first are said to have been brought from Circassia; and some add, that they first began to be talked of about the year 869.

**MAMMÆ**. See the article BREASTS.

**MAMMÆANÆ**. See ALIMENTARY.

**MAMMIFORM**, *MAMMIFORMIS*, in anatomy, a name given to two apophyses of the bone in the back of the skull; so called from their resembling a breast. See MASTOIDES.

**MAMMILLARY**, *MAMMILLARIS*, in anatomy, an epithet given to two little protuberances, somewhat resembling the nipples of the breast, found under the fore-ventricles of the brain, and supposed to be the organs of smelling.—See Tab. Anat. (osteol.) fig. 7. n. 3. fig. 13. let. d. See also SMELL. These are called *apophyses Mammillares*. See APOPHYSES.

There is also a muscle called *Mammillaris*, or *Mastoides*, serving to stoop the Head. See MUSCLE.

**MANAGE**, or *MANEGE*\*, an academy, or place for learning to ride the great horse; as well as for breaking horses to the proper motions and actions. See HORSE and HORSEMANSHIP.

\* The word is borrowed from the French *Manage*, and that from the Italian *Maneggio*, or, as some will have it, *à manu agendo*, acting with the hand.

In a *Manage* is a centre, or a place destined for vaulting round a pillar; a course or career for running the ring; and on the side are pillars, between which are placed the horses intended for high airs. See CAREER, PILLAR, &c.

**MANAGE** is also used for the exercise itself, either of the horse, or the rider. See AIR, &c.

**MANCIPIE**, *MANCEPS*, in old authors, denotes a caterer. There was anciently an officer in the Temple called by this name, now called the steward; and both name and office is still retained in the colleges in both universities.

**MANDAMUS**, a writ issuing out of the court of king's bench; sent by the king to the head of some corporation, commanding them to admit or restore a person into his place or office.

**MANDAMUS** was also a charge to the sheriff, to take into the king's hands all the lands and tenements of the king's widow, who, against her oath formerly given, married without the king's consent.

MAN-

# M A N

**MANDARIN\***, a name given by the Portuguese to the nobility and magistracy of the eastern countries, especially those of China.

\* The word *Mandarin* is unknown in this sense among the Chinese, who in lieu thereof call their grandees and magistrates *Quan*, or *Quan-fu*, q. d. servant, or minister of a prince.

There are in China nine orders of *Mandarins*; or nine degrees of nobility; which have as many different animals for their characteristics.—The first is distinguished by a crane, the second by a lion, the third by an eagle, the fourth by a peacock, &c.

There are in all thirty-two or thirty-three thousand *Mandarins* in China. There are *Mandarins* of letters, and *Mandarins* of arms; both the one and the other of which pass several examinations: besides civil *Mandarins*, or of justice.

Since the time that the Tartars have rendered themselves masters of China, most of the tribunals, or courts of justice, &c. instead of one *Mandarin* for a president, have two; the one a Tartar, the other a Chinese.

The *Mandarinate* is not hereditary, nor are any raised to it but men of letters. See **LITERATI**.

**MANDARIN** is also a name which the Chinese give to the learned language of the country. See **LANGUAGE**.

Besides the proper and peculiar language of each nation and province, they have one common to all the learned men in the empire; and which is that in China which the Latin is in Europe.—This they call the *Mandarin* tongue, or the language of the court.—Their public officers, as notaries, lawyers, judges, and chief magistrates, write and speak the *Mandarin*. See **CHINESE**.

**MANDATE**, **MANDATUM**, in the canon law, denotes a rescript of the pope, by which he commands some ordinary, collator, or presenter, to put the person there nominated in possession of the first benefice vacant in his collation.

An Apostolical *Mandate* for the provision of benefices, is a monitorial and comminatory letter from the pope to a bishop, by which he is enjoined to provide a subsistence for those who have been ordained by him, or his predecessors, from the tonsure to sacred orders inclusively; and to allow them this subsistence till they be provided of a benefice; which practice was occasioned by the bishop's laying hands on great numbers, and afterwards abandoning them to misery and want.

At first the popes only gave monitory *Mandates*, which were no more than simple prayers and requests, that did not bind the ordinary; afterwards they gave preceptory *Mandates*, which did not annul the provisions of the ordinary; at last they set up executory *Mandates*, by which the provisions made by the ordinary, in prejudice of the *Mandate*, were declared null; and the executor of the *Mandate*, in default of the ordinary, conferred the benefice on the mandatory: but the pope's power in issuing these *Mandates* is now very much restrained.

**MANDIBULA**, the jaw. See **MAXILLA**. Hence **MANDIBULARES**, or *manducatorii musculi*. See **MASSETERS**.

**MANDIL**, the name of a kind of cap, or turban wore by the Persians. See **CAP**, or **TURBAN**.

The *Mandil* is formed, by first wrapping round the head a piece of fine white linnen five or six ells long; over this they wrap, in the same manner, a piece of silk of the same length, and oftentimes of great value.—To make the *Mandil* genteel, care must be taken, that in wrapping the silk, it be so managed, as that the several colours found in the several folds, make a kind of waves, somewhat like what we see in marbled paper.

This dress is extremely majestic, but at the same time very heavy: It serves either as a shelter to the head from cold, or as a skreen from the excessive heat of the sun; it is said the cutlafs will not penetrate it.—In rainy weather they cover it up with a kind of case or hood, made of red cloth.

The mode of the *Mandil* has been altered of late: during the time of Schach-Abbas II. it was round at top; in the time of Schach-Soliman, they brought one end of the silk out of the middle of the *Mandil* over the head; and, lastly, in the reign of Schach-Husseini, the end of the silk, in lieu of its being gathered as before, was plaited in manner of a rose; and this the Persians account extremely graceful, and use it to this day.

**MANDRAGORA**, or **MANDRAGORAS**, **MANDRAKE**, a medicinal plant, which makes a principal ingredient in the unguentum populneum. See **POPULNEUM**.

There are two kinds of *Mandragora*: *male* and *female*; each bearing a kind of apples: those of the male, as well as the leaves, roots, &c. being twice as large as those of the female; but the juice of each is a narcotic poison, equally violent.

Naturalists tell strange stories of this plant; but, setting aside its soporiferous virtue, the modern botanists will scarce warrant any of them, not even that human figure ordinarily ascribed to its roots, especially since the discovery of the artifice of Charletans in fashioning it, to surprize the credulity of the people.

*Chinese* **MANDRAGORAS** is the plant ginseng. See **GINSENG**.

**MANDREL**, a kind of wooden pulley, making a member of the turner's lathe.

# M A N

Of these there are several kinds; as

**Flat MANDRELS**, which have three or more little pegs or points near the verge, and are used for turning flat boards on.

**Pin MANDRELS**, which have a long wooden shank to fit into a round hole made in the work to be turned.

**Hollow MANDRELS**, which are hollow of themselves, and used for turning hollow work.

**Screw MANDRELS**, for turning Screws, &c. See **TURNING**, and **LATHE**.

**MANDUCATION**, the action of *chewing*, otherwise called *Mastication*. See **MASTICATION**.

*Manducation* is a term seldom used but in speaking of the eucharist.—The Catholics maintain a real *Manducation* of the body of Christ; the Reformed, on the contrary, take this *Manducation* to be only figurative and by faith.—St. Augustine calls it *spiritual Manducation*.

**MANEQUIN**, among painters. See **LAYMAN**.

**MANES**, a poetical term, signifying the shades, or souls of the deceased. See **SOUL**.

The heathens used a world of ceremonies and sacrifices to appease the *Manes* of those who died without burial. See **LEMURES** and **LEMURIA**.

**Dii MANES** were the same with *Inferi*, or the infernal gods who tormented men; and to these the heathens offered sacrifices to assuage their indignation. See **GOD**.

The heathen theology is a little obscure with regard to these Gods *Manes*: Some hold that they were the souls of the dead, others that they were the genii of men; which last opinion suits best with the etymology of the word. See **GENIUS**.

The heathens, it is pretty evident, used the word *Manes* in both these senses; so that it sometimes signified the ghosts of the departed, and sometimes the infernal or subterraneous deities, and in general all divinities that presided over tombs.

The evocation of the *Manes* of the dead seems to have been very frequent among the Thessalians, but was expressly prohibited by the Romans. See **NECROMANCY**.

**MANIA**, in medicine, **MADNESS**; a vehement kind of delirium without a fever. See **DELIRIUM**.

The cause of the *Mania* is thus accounted for by Dr. Quincy.—As often as the species of things wherewith we have been acquainted, are hurried together, we may be said to dream; and thence in sleep these species are added with other things, and variously compounded, from the manifold repercussions of the animal spirits which arise from the cause producing sleep, and pressing the nerves, so as to revert the fluctuation of their juice. A delirium is therefore the dreams of waking persons, wherein ideas are excited without order or coherence, and the animal spirits are drove into irregular fluctuations. See **DELIRIUM**.

If then the cause inducing a delirium be of that nature, that it can excite ideas or motions of a considerable impetus, without any regularity or order; such a delirium will be attended with boldness or rage, and violent motions of the body; that is, a *Mania* will be produced. See **PASSION**.

Now it is plain, that all the known causes of this distemper give a greater disposition to the blood for motion, and render it fluxile, but not consistent, and uniformly thick enough; and therefore that they dispose persons likewise to continued fevers, since they occasion the blood to be thrown out of the heart with an increased force, unless some other cause intervenes, whereby the efficacies of these are interrupted in disposing the blood into febrile motions; and the blood is so disposed, as often as it can be rarified into its minutest parts; that is, so uniformly rarified, that it can easily, with any force by the motion received from the heart, go into parts divisible at the occurrences of those orifices, into which it ought to be distributed: for then the cohesion of the parts, which can be but very small, will not be any obstruction to the increase and propagation of the blood's velocity. But if it happen that the efficient cause, or the heart, throws the blood with a greater force, or that the blood can be more easily propelled in any given time, it will occasion, at the same time, that some parts of the blood will be more nearly united, so as to form molecules, consisting of cohering particles; which molecules will cohere to one another, and not so easily obey the direction of the heart's propelling force. The blood hereupon cannot be uniformly rarified, nor enter so easily into the small orifices of the vessels, and so soon travel through them, and therefore there will no fever arise, but a delirium without a fever, wherein the heat of the blood will be greater, and the pressure in the brain uncertain: whence uncertain recursions of the spirits, inordinate undulations, confused vibrations of the nerves, and a remarkable energy of imagination; whence will proceed audacity and passion beyond measure.—It is a disease very hard to cure, and is generally found to baffle the physician.

**MANICHEES**, or **MANICHEANS**, **MANICHÆI**, a sect of antient heretics, who asserted two principles; so called from their author *Manes*, or *Manicheus*, a Persian by nation. See **PRINCIPLE**.

This heresy had its first rise about the year 277, and spread itself principally in Arabia, Egypt and Africa. St. Epiphanius, who treats of it at large, observes, that the true name of this heresiarch,

heresiarch was Cubricus; and that he changed it for *Manes*, which in the Persian or Babylonish language signifies vessel. A rich widow, whose servant he had been, dying without issue, left him store of wealth; after which he assumed the title of apostle or envoy of Jesus Christ.

He established two principles, *viz.* a good one and an evil one: The first, which he called *Light*, did nothing but good; and the second, which he called *Darkness*, nothing but evil.—This philosophy is very ancient; and Plutarch treats of it at large in his *Isis and Osiris*. See **GOOD** and **EVIL**.

Our souls, according to *Manes*, were made by the good principle, and our bodies by the evil one; those two principles being co-eternal and independent of each other. He borrowed many things from the ancient Gnostics; on which account many authors consider the *Manicheans* as a branch of the Gnostics. See **GNOSTIC**.

In truth, the *Manichean* doctrine was a system of philosophy, rather than of religion. They made use of amulets, in imitation of the Basilidians; and are said to have made profession of astronomy and astrology. See **BASILIDIAN**. They denied that Jesus Christ assumed a true human body, and maintained it was only imaginary. They pretended that the law of Moses did not come from God, or the good principle, but from the evil one; and that for this reason it was abrogated. They abstained entirely from eating the flesh of any animal; following herein the doctrine of the ancient Pythagoreans.—The rest of their errors may be seen in St. Epiphanius and St. Augustine; which last having been of their sect, may be presumed to have been thoroughly acquainted with them.

Though the *Manichees* professed to receive the books of the New Testament, yet, in effect, they only took so much of them as suited with their opinions. The first formed to themselves a certain idea or scheme of Christianity; and to this adjusted the writings of the Apostles; pretending that whatever was inconsistent with this, had been foisted into the New Testament by latter writers, who were half Jews.—On the other hand, they made fables and apocryphal books pass for apostolical writings; and even are suspected to have forged several others, the better to maintain their errors. St. Epiphanius gives a catalogue of several pieces published by *Manes*, and adds extracts of some of them.

*Manes* was not contented with the quality of Apostle of Jesus Christ, but also assumed that of the Paraclete, whom Christ had promised to send. He left several disciples, and among others, Addas, Thomas, and Hermas. These he sent, in his life-time, into several provinces to preach his doctrine.—*Manes* having undertaken to cure the king of Persia's son, and not succeeding, was clapt into prison upon the young prince's death; whence he made his escape, but was apprehended soon after, and burnt alive.

Towards the middle of the twelfth century the sect of *Manichees* took a new face, on occasion of one Constantine, an Armenian and adherer to it; who took upon him to suppress the reading of all other books besides the evangelists and the epistles of St. Paul, which he explained in such manner as to make them contain a new system of *Manichæism*. He entirely discarded all the writings of his predecessors, rejected the chimeras of the Valentinians and their thirty *Æons*; the fable of *Manes*, with regard to the origin of rain, which he made to be the sweat of a young man in hot pursuit after a maid; and other dreams: but still retained the impurities of Basilides. In this manner he reformed *Manichæism*, inasmuch that his followers made no scruple of anathematizing Scythian Buddas, and even *Manes* himself; Constantine being now their great apostle. After he had seduced an infinite number of people, he was at last stoned by order of the emperor.

**MANICORDION\***, a musical instrument, in form of a spinett. See **SPINETT**.

\* Du Cange derives the word from *Monocbord*, on a supposition this instrument has but one cord; but he is mistaken, it has fifty, or more. See **MONOCHORD**.

Its strings are covered with pieces of scarlet cloth, to deaden, as well as soften, the sound; whence it is also called the *dumb Spinett*, and is much used in nunneries for the religious to learn to play on; so as not to disturb the silence of the dormitory.—Scaliger makes the *Manichord* more ancient than the spinett or harpichord.

**MANIFESTO**, an apology, or public declaration in writing, made by a prince, shewing his intentions in any enterprise, the motives that induced him to it, and the reasons on which his right and pretensions are founded.

**MANILLE**, or **MENILLE**, in commerce, one of the principal commodities carried by the Europeans to the coast of Africa, to traffick with the Negroes in exchange for slaves; consisting of a large brass ring, in form of a bracelet, either flat or round, plain or engraven; which the natives used to deck themselves withal, putting them on the finall of the leg, and the thick of the arm above the elbow.

The better sort among the Negroes wear silver and gold *Manilles*; but these are of their own manufacture; most of the money they receive for their other merchandizes being melted into *Manilles*.

**MANIPULATION**, a term used in the mines, to signify

the manner of digging the silver, &c. out of the earth. See **SILVER**.

**MANIPULUS**, **MANIPULE\***, among the Romans was a little body of infantry, which, in the time of Romulus, consisted of an hundred men; and in the time of the consuls and first Cæsars, of two hundred.

\* The word properly signifies a handful; and, according to some authors, was first given to the handful of hay which they bore at the end of a pole to distinguish themselves by, ere the custom was introduced of bearing an eagle for their ensign; and hence also the phrase, an handful of men. But Vegetius, Modestus, and Varro, give other etymologies of the word: The last derives it from *manus*, a little body of men following the same standard. According to the former, this corps was called *Manipulus*, because they fought hand in hand, or all together: *Contubernium autem Manipulus vocabatur ab eo quod conjunctis manibus pariter dimicabant*.

Each *Manipule* had two centurions, or captains, called *manipularii*, to command it; one whereof was lieutenant to the other.—Each cohort was divided into three *Manipules*, and each *Manipule* into two centuries. See **COHORT**, and **CENTURY**.

Aulus Gellius quotes an old author, one Cincius, who lived in the time of Hannibal, (whose prisoner he was) and who, writing on the art of war, observes, that then each legion consisted of sixty centuries, of thirty *Manipules*, and of ten cohorts.—And again, Varro and Vegetius mention it as the least division in the army, only consisting of the tenth part of a century; and Spartan adds, that it contained no more than ten men: which shews, that the *Manipulus* was not always the same thing. See **LEGION**, &c.

**MANIPULUS** is also an ecclesiastical ornament, wore by the priests, deacons, and sub-deacons in the Romish Church. It consists of a little fillet in form of a stole, three or four inches broad, and made of the same stuff with the chasuble; signifying and representing an handkerchief, which the priests in the primitive church wore on the arm, to wipe off the tears they were continually shedding for the sins of the people.—There still remains a mark of this usage in a prayer rehearsed by those who wear it; *Merear, Domine, portare Manipulum fletus & doloris*.

The Greeks and Maronites wear two *Manipules*, one on each arm.

**MANIPULUS**, in physic, denotes a measure, or fixed quantity of herbs, or leaves, *viz.* an handful, or so much as the whole hand can grasp: generally mark'd in prescription with *M*. **MANNA**, in pharmacy, a medicinal drug, in great use in the modern practice, as a gentle purgative, and cleanser of the first passages. See **PURGATIVE**, &c.

*Manna* is a white sweet juice oozing from the branches and leaves of the ash-tree, chiefly in *Calabria*, during the heats of summer.

*Manna* has been commonly held a kind of *mel ærium*, or honey-dew, which falling in the night gathers on certain trees, and even on rocks, and the earth itself; where it hardens with the sun. But what refutes this opinion is, that such dews melt in the sun; whereas *Manna* whitens and hardens in it. Add, that such dews are only found on the tops and extremes of the leaves; whereas *Manna* is chiefly found to lodge near the trunks of the branches: and that the honey-dew falls only on trees open to the air; whereas *Manna* is found on trees which are under cover: as was experienced by Dr. Cornelius, who gathered *Manna* from branches covered on purpose with cloth; and Lobelius assures, that *Manna* had been gathered from branches of the ash which had been thrown the day before into a cellar. See **HONEY-DEW**.

It is much more rational to rank *Manna* amongst the number of gums, which exuding from the juice of the tree, and mixing with some saline particles of the air, is condensed into those flakes in which we see it. See **GUM**.

The Italians gather three kinds of *Manna*:—*Manna di corpo*, which oozes spontaneously from the branches of the tree in the month of July.—*Manna forzata*, or *forzatella*, which is not gathered till August, after an incision of the tree, when the flux of the first has ceased.—*Manna di fronda*, which issues of itself, in little drops, like a kind of sweat from the nervous part of the leaves of the ash, and gathers into grains about the bigness of those of wheat, which are hardened by the sun in August. The leaves are frequently found so laden with these grains, that they seem covered with snow.

*Manna* is a gentle, and safe purge; and is also used in broths: Altimarus, a physician of Naples, has written a Treatise expressly upon it; and Donzelli another.—*Manna*, though accounted a kind of honey, purges the bile; whereas common honey increases it. Formerly the Syrian was in the most repute, but now it gives way to the Calabrian. Fuchsius observes, that the peasants of mount Libanus eat *Manna* ordinarily as others do honey. At Mexico they are said to have a *Manna* which they eat as we do cheese.

The *Manna* most esteemed, is that in tears; which many take to be factitious, and the work of the Jews at Leghorn; but it is certainly natural: And what gives it this figure is, that they put straws and slips of wood in the incisions, along which the *Manna* gliding, is condensed as it comes out, and assumes this form.

MANNA,

**MANNA**, is also a scripture-term, signifying a miraculous kind of food which fell from heaven for the support of the Israelites in their passage through the wilderness: being in form of coriander-seeds; its colour like that of bdellium, and its taste like honey.

They call it *Manna*, either from the Hebrew word *manah*, a gift, to intimate its being a gift from heaven; or from *minnah*, which signifies to prepare, because the *Manna* came to them ready for eating, and needed no preparation but gathering; or from the Egyptian word, *Man*, what is it? which last etymology seems the more probable, in regard the scripture takes notice of the surprize they were under when they first saw this new food descend.

Salmasius, however, prefers another: According to him, the Arabs and Chaldeans used the word *Man*, to signify a kind of dew or honey that fell on the trees, and was gathered in great abundance on mount Libanus. On which footing the Israelites did not use the term *Manna* out of surprize, but because they found this food fall with the dew, in the same manner as the honey so well known to them under the name of *Man*.

Salmasius adds, that the *Manna* of the Israelites was in reality no other than that honey, or dew condensed; and that the one and the other were the same with the wild honey wherewith St. John was fed in the wilderness. So that the miracle did not consist in the formation of any new substance in favour of the Israelites; but in the punctual manner in which it was dispensed by providence for the sustenance of so vast a multitude.

**MANNER**, in painting, &c. expresses that particular character observable in the works of painters, poets, and other artists, by which their pencil, hand, or style, are distinguished.

The curious in pictures know the *Manners* of the painters; and distinguish readily between the *Manners* of Rubens, Titian, or Da Vinci; between the ancient, and the new *Manner* of the same painter; the Flemish, and the Italian *Manner*.

*Manner* is used with respect both to the invention, the design, and the colouring. The *Manner* of Michael Angelo, or Raphael, may also be known in their scholars. Thus we say, such a piece is of Raphael's school, &c.

**MANNERS**, in poetry, denote the inclinations, genius, and humour, which the poet gives to his persons, and whereby he distinguishes his characters. See **CHARACTER**.

Aristotle defines *Manners*, to be that which discovers the inclination of him who speaks, and shews what he will resolve upon, or what reject, before he has actually determined: whence he concludes, that *Manners* are not always, and in all kinds of discourses: *Non quælibet oratio est morata*.

One instance will make this definition clear. In the first book of Virgil, *Æneas* is represented extremely pious, and determined to execute the will of the gods at all adventures. In the fourth book, he has a difficult choice proposed; being engaged on the one hand, out of a principle of love, gratitude, and honour, not to quit Dido; and having, on the other hand, an express order from the gods not to depart for Italy.—Now, before it appears on which side he has determined, what he has before said, should shew his will and inclinations, and which party he will take.—And those preceding discourses, which discover his future resolution, make what we call the poetical *Manners*.

Those make it past doubt he will abandon Dido, to obey the gods: This he does in effect; the *Manners* therefore are good, and well conducted.—Had he disobeyed the orders of Jupiter, to stay with Dido, the manners had been ill; in regard they would have foretold a resolution contrary to what he was really to take.—But had there been nothing to make us foresee any resolution of *Æneas* at all, neither that which he actually took, nor the contrary, in that case there had been no *Manners* at all.

It is the *Manners*, as before observed, that distinguish the characters: and, unless the *Manners* be well expressed, we shall never be acquainted with the persons at all; nor, consequently, shall we be either terrified with foreseeing their dangers, nor melted into pity by seeing their sufferings. See **CHARACTER**. The *Manners* should have four qualities; they should be good, like, suitable, and equal.

The *Manners* are good when they are well marked or expressed; that is, when the discourse of the persons make us clearly and distinctly see their inclinations, and what good or evil resolutions they will take.—*Likeness* of *Manners* only relates to known and public persons, whose characters are in history, with which the poetic characters must agree; that is, the poet must not give a person any quality contrary to any of those which history has given him. And here it may be observed, that the evil qualities given to princes and great men, ought to be omitted by the poets, if they be contrary to the character of a prince, &c. but the virtues opposite to those known vices ought not to be imposed, by making him generous and liberal in the poem, who was avaritious in the history.

The *Manners* must likewise be suitable; that is, they must be agreeable to the age, sex, rank, climate, and condition of the person that has them. Horace observes, *Intererit multum Davijne loquatur an heros*.—Again, the manners must be equal;

Vol. II. No. 94.

that is, they must be constant, or consistent through the whole character; or the variety or inequality of the *Manners*, as in nature, so in the drama, must be equal. The fearful must never be brave, nor the brave timorous; the avaritious must never be liberal, nor *vice versa*. In this part, Shakespear's *Manners* are admirable.

Besides these four qualities above-mentioned, there is a fifth essential to their beauty; which is, that they be necessary; that is, that no vicious quality, or inclination, be given to any poetic person, unless it appear to be absolutely necessary, or requisite to the carrying on of the action.

**MANOMETER**, or **MANOSCOPE**\*, an instrument to shew, or measure, the alterations in the rarity, or density of the air. See **AIR**, **RARE**, and **DENSITY**.

\* The word is formed from the Greek *μανος*, rarus, and *μετρον*, mensura, &c.

The *Manometer* differs from the barometer, in that the latter only measures the weight of the atmosphere, or of the column of air over it; but the former the density of the air in which it is found: which density depends not only on the weight of the atmosphere, but on the action of heat and cold, &c.—Authors, however, generally confound the two together; and Mr. Boyle himself gives us a very good *Manometer* of his contrivance, under the title of a *statical barometer*; the structure whereof see under the word **BAROMETER**.

**MANOR**, or **MANNOR**\*, an antient lordship, or royalty; consisting of demesnes and services, and of a court-baron, as incident thereto. See **LORD**, and **DEMAIN**.

\* The word is formed from the French *Manoir*, a mansion-house; and that from the Latin, *Manere*, to remain or dwell, as being the lord's usual place of residence. See **MANSION**.

*Manor* is the same with what was formerly called *baronia*, *barony*. See **BARONY**.

A *Manor* is a kind of noble fee granted out partly to tenants for certain services to be performed, and partly reserved to the use of the lord's family, with jurisdiction over his tenant for the lands or estates held of him. See **FEE**.

For the original of *Manors*,—we are told there was anciently a certain compass of ground, granted by the king to some man of worth, for him and his heirs to dwell upon, and to exercise some jurisdiction, more or less, within that circuit, such as he thought good to grant; but performing, withal, such services, and paying such yearly rent, as by this grant was required. Now, the lord afterwards, parcelling the same to other meaner men, received rent and services from them, and by that means, as he became tenant to the king, the inferiors became tenants to him.

But at this time a *Manor* rather signifies a jurisdiction, and royalty incorporeal, than the land and suit: For a man may have a *Manor* in gross, i. e. the right and interest of a court-baron, with the perquisites, and another enjoy every foot of land belonging to it.

A *Manor* may be compounded of divers things, as of an house, arable land, pasture, meadow, wood, rent, advowson, court-baron, &c. And this ought to be, by long continuance of time, beyond man's memory.

It is held by some, that a *Manor* cannot now be made, since a court-baron cannot be made; and without a court-baron, and at least two suitors, there can be no *Manor*. See **COURT**.

**MANSE**, **MANSUS**, **MANSA**, or **MANSUM**\*, in ancient law-books, denotes an house, or habitation; either with or without land. See **HOUSE**, and **MANSION**.

\* The word is formed à *Manendo*, abiding; as being the place of dwelling and residence.

**Capital MANSE**, *Mansum capitale*, denotes the manor-house, or lord's court. See **MANOR**, and **COURT**.

**MANSUS Presbyteri**, is a parsonage, or vicarage-house, for the incumbent to reside in.

This was originally, and still remains, an essential part of the endowment of a parish-church, together with the glebe and tythes.—It is sometimes called *Presbyterium*. See **PRESBYTERY**.

**MANSION**, **MANSIO**, a dwelling-house or habitation, especially in the country. See **MANSE**.

**MANSION** is more particularly used for the lord's chief dwelling-house within his fee, otherwise called the *capital messuage*, or chief manor place. See **MANOR**.

**MANSIO**, or **MANSUS**, was sometimes also used in the same sense with *hide*; that is, for as much land as one plow could till in a year. See **HIDE**.

**MAN-SLAUGHTER**, **HOMICIDE**; the unlawful killing a man without any premeditated malice. See **HOMICIDE**.

As, when two persons who before meant no harm to one another, falling out on some sudden occasion, the one kills the other.

*Man-slaughter* differs from murder, as not being done with foregoing malice; and from chance-medley, because it hath a premeditated intent to kill.—It is esteemed felony, but admitted to the benefit of the clergy, for the first time. See **MURDER**, **CHANCE-MEDLEY**, and **SE-DEFENDENDO**.

By a law of king Canutus, if a man is killed openly and premeditatedly,

meditatedly, the murderer shall be committed to the relations of the deceased: but if, on his trial, the fact be proved, but not wilful, the bishop is to judge him.

**MANSORII** *Musculi*, the same with *masseters*. See **MASSE-TER**.

**MANTELETS**, in war, a kind of moveable parapets made of planks, about three inches thick, nailed one over another, to the height of almost six feet, generally cased with tin, and set upon little wheels; so that in a siege, they may be driven before the pioneers, and serve as blinds, to shelter them from the enemy's small shot. See **BLINDS**.

There are other sorts of *Mantelets*, covered on the top, whereof the miners make use, to approach the walls of a town, or castle. —See *Tab. Fortif. fig. 17*.

It appears from Vegetius, that these were in use among the ancients, under the name of *vineæ*; but they were built slighter, and yet larger than ours, being eight or nine feet high, as many broad, and sixteen long: They were defended by a double covering, the one of boards, the other of faggots, with the ribs of osiers, and cased without with skins steeped in water, to prevent fire.

**MANTLE**, or **MANTLE-tree**, in architecture, is the lower part of a chimney; or that piece of timber which is laid across the jaumbs, and sustains the compartment of the chimney-piece. See **CHIMNEY**.

**MANTLE**, or **MANTLING**, in heraldry, that appearance of folding of cloth, flourishing, or drapery, that is in any achievement, drawn about the coat of arms.

It is supposed originally to have been the representation of a *Mantle*, or military habit worn by antient cavaliers over their armour, to preserve it from rust; or, as others hold, a short covering only worn over the helmet; which in after-times was lengthened, and made to hang from the helmet below the whole shield. See *Tab. Herald. fig. 29*.

The *Mantle* is always laid in blazon to be doubled, that is, lined throughout with one of the furs, as ermin, pean, vary, &c. See **COAT**.

**MANTLE** is likewise a term used in falconry.—They say, the hawk *mantles*, that is, spreads her wings after her legs.

**MANUCAPTIO**, in law, a writ which lies for a man, who, being taken on suspicion of felony, and offering sufficient bail for his appearance, is refused to be admitted thereto by the sheriff, or other having power to let to mainprise.

**MANUDUCTOR**\*, a name given to an antient officer in the church, who, from the middle of the choir where he was placed, gave the signal for the choristers to sing, marked the measure, beat time, and regulated the music. See **CHOIR**, &c.

\* The Greeks called him *Mesachoros*, because seated in the middle of the choir: But in the Latin church, he was called *Manuductor*, from *manus* and *duco*, I lead; because he led and guided the choir by the motions and gesture of the hand.

**MANUFACTURE**\*, a place where several artists and workmen are employed in the same kind of work; or make a commodity of the same kind. See **COMMERCE**, &c.

\* The word comes from the Latin, *Manufactus*, q. d. made with hands.

**MANUFACTURE** is also popularly used to signify the work itself; and by extension, the like work carried on independently in different parts of a country.

In this sense, we say the woollen *Manufacture*, silk *Manufacture*, velvet *Manufacture*, tapestry *Manufacture*, muslin *Manufacture*, &c. *Manufacture* of hats, stockings, &c. See **WOOLL**, **SILK**, **VELVET**, **TAPESTRY**, **MUSLIN**, &c.

**MANUMISSION**, **MANUMISSIO**\*, an Act whereby a slave, or villain, is set at liberty, or out of bondage. See **SLAVE**, &c.

\* The word comes from the Latin *manus*, hand, and *mittere*, to send; *quia servus mittebatur extra manum, seu potestatem domini sui*.

Some authors define *Manumission* an act by which a lord enfranchises his tenants, who till that time had been his vassals, and in a state of slavery, inconsistent with the sanctity of the christian faith. See **VILLAIN**, **VASSAL**, &c.

Among the *Romans*, the *Manumission* of slaves was performed three several ways. 1°. When, with his master's consent, a slave had his name entered in the census, or public register of the citizens. 2°. When the slave was led before the prætor, and that magistrate laid his wand called *Vindicta*, on his head. 3°. When the master gave the slave his freedom by his testament.—Servius Tullus is said to have first set on foot the first manner; and P. Valerius Publicola the second: A particular account is given of the third in the *Institutes* of Justinian.

It was not necessary, that the prætor should be on his tribunal to perform the ceremony of *Manumission*: he did it any where indifferently, in his house, in the street, going to bathe, &c. He laid the rod on the slave's head, pronouncing these words, *Dico eum liberum esse more Quiritum*; I declare him a freeman after the manner of the Romans. This done, he gave the rod to the lictor, who struck the slave with it on the head, and afterwards with his fist on his face and back: And the notary, or scribe, entered the name of the new-freed man in the register, with the reasons of his *Manumission*. See **LIBERTIN**.

The slave had likewise his head shaved, and a cup given him

by his master, as a token of freedom. Tertullian adds, that he had then also a third name given him: If this were so, three names were not a token of nobility, but of freedom. See **NAME**.

The emperor Constantine ordered the *Manumissions* at Rome to be performed in the churches.

Of *Manumission* there have also been various forms in England: In the time of the conqueror, villains were *manumitted* by the master's delivering them by the right hand to the vicount in full court, shewing them the door, giving them a lance, and a sword, and proclaiming them free.

Others were *manumitted* by charter.—There was also an implicit *manumission*; as when the lord made an obligation for payment of money to the bondman at a certain day; or sued him, where he might enter without suit; and the like.

**MANURING** of ground, the application of a matter proper for meliorating the soil, and rendering it more fertile. See **COMPOST**, **VEGETATION**, &c.

The matters used for *Manure* are various in various countries: The most ordinary are dung, lime, and marl. See **LIME** and **MARL**.

In some parts of Ireland they use sea-shells, as those of cockles, periwinkles, &c. which are found to agree well with boggy, heathy, clayey, wet or stiff land; as they seem to give it a kind of ferment, as barm does to bread, opening and loosening the clods, and by that means making way for the roots to penetrate, and the moisture to enter into the fibres of the roots.

—This kind of *Manure* continues a long time ere its effects are exhausted; whereas lime, &c. spend themselves at once. The shells being hard, melt away very slowly, so that the operation needs not to be repeated for twenty or thirty years.

In the west of England, they *manure* their land with a brackish sea-sand; which Dr. Bury observes, quickens dead land: so that what would otherwise be the barrenest part of that country, is now the richest. The sea-salt, he observes, is too lusty and active of itself, and that it does best when mingled with lime. Glauber orders the mixture to be made up and burnt like bricks, and then applied.

In some counties they burn the surface of their heathy ground, instead of *manuring* it; which others think but ill husbandry, inasmuch as it impoverishes it; and by destroying the sap of the earth, and roots of the grass, and other vegetables, renders it useless for several years after the third, when it is plowed. See **DENSHIRING**, and **ASHES**.

Dr. Jackson observes, that all the ground about Nantwich, where salt or brine is spilt, is, when dug up, an excellent *Manure* for grazing ground; and even bricks, thoroughly tinged with it, dissolve and fertilize land very considerably. See **SALT**. Dr. Beal says, it is a common observation of gardeners and skilful husbandmen, that frost and snow improve and fertilize the land both more speedily and more effectually than the influence and warmth of the sun. See **SNOW**, &c.

Dr. Lister tells us, that in some parts of the north-riding of Yorkshire the soil is sandy, and the people *manure* it with clay. The soil, with any other *Manure*, bears nothing but rye; but with clay, bears oats, barley, &c. This clay *Manuring* will, by certain experience, last forty-five years in the ground ere it need be repeated.—The bogs in Ireland are said to be best improved by sandy, or other gravelly *Manures*.

**MANUSCRIPT**, a book, or paper, written with the hand. See **WRITING**.

By which it stands opposed to a printed book or paper. See **PRINTING**.

A *Manuscript* is usually denoted by the two letters MS, and in the plural by MSS, or MMSS.—What makes public libraries valuable, is the number of antient *Manuscripts* repositied in them. See **LIBRARY**.

**MANWORTH**, in old law-books, denotes the Price, or value of a man's head. See **GELD**, and **WERGELD**.

In antient times, every man, according to his degree, was rated at a certain price: according to which, satisfaction was made to his lord, if any one killed him. See **ÆSTIMATIO**.

**MANZEL**. See the article **CARAVANSERA**.

**M A P**, a plain figure, representing the surface of the earth, or a part thereof, according to the laws of perspective. See **EARTH**, and **PERSPECTIVE**.

A *Map* is a projection of the surface of the globe, or a part thereof, on a plane surface; representing the forms and dimensions of the several countries and rivers; with the situations of cities, mountains, and other places. See **PROJECTION**. *Maps* are either *universal*, or *particular*.

*Universal MAPS* are those which exhibit the whole surface of the earth; or the two hemispheres.

*Particular MAPS* are those which exhibit some particular region, or part thereof.

Each kind are frequently called *Geographical*, or *Land-Maps*, in contra-distinction to *Hydrographical*, or *Sea-Maps*, representing only the seas and sea-coasts; properly called *Charts*. See **CHART**.

There are three qualifications required in a *Map*. 1°. That all places have their just situation with regard to the chief circles of the earth, as the equator, parallels, meridians, &c. because

# M A P

on these depend many properties of regions, as well as celestial phenomena. 2°. That the magnitudes of the several countries have the same proportion as on the surface of the earth. 3°. That the several places have the same distance and situation with regard to each other, as on the earth itself.

For the foundation of MAPS, and the laws of projection, see PERSPECTIVE, and PROJECTION of the Sphere.—The application thereof, in the construction of MAPS, is as follows.

*Construction of a MAP, the eye being placed in the axis.*—Suppose, *v. g.* the northern hemisphere to be represented with the eye in a point of the axis, *v. g.* the south pole: For the plane, whereon the representation is to be made, we take the plane of the equator, and from all the points of the surface of the northern hemisphere, conceive lines passing through the plane to the eye; which points connected together, constitute the *Map* required.

Here the equator will be the limit of the projection; the pole, the centre. The meridians will be right lines passing from the pole to the equator: the parallels of latitude, &c. circles concentric with the equator; and all the other circles, and arches of circles, as the horizon, vertical circles, &c. ecliptic, &c. conceived in that hemisphere, will be ellipses, or arches of ellipses.

The better to apprehend the projection of the circles on the plane, conceive a radiant cone, whose vertex is the eye, its base the circle to be represented, and its sides the rays passing between the circle and the eye. Suppose this cone cut by the plane. It is obvious, that, according to the various position of the cone, there will be a different section, and consequently a different line of representation.

*For the application of this doctrine in practice:*—In a plane, *v. g.* a paper, take the middle point *P* (*Tab. geography, fig. 2.*) for the pole, and from this, as a centre, describe a circle, of the intended bigness of your *Map*, to represent the equator. These two may be pitched on at pleasure, and from these all the other points and circles are to be determined. Divide the equator into 360°, and drawing right lines from the centre to the beginning of each degree, these will be meridians; whereof that drawn to the beginning of the first degree, we suppose the first meridian. See MERIDIAN.

For the parallels.—There are four quadrants of the equator; the first 0,90; the second, 90,180; the third, 180,270; the fourth, 270,0; which, for the better distinction, we will note with the letters *AB, BC, CD, DE*. Taking one of these, *v. g.* *BC*, from the several degrees thereof, as also from 23°, 30°, and 66°, 30' thereof, draw occult right lines to the point *D*, marking where these lines cut the semidiameter *BPC*; and from *P*, as a centre, describe arches passing through the several points in *PC*.—These arches will be parallels of latitude. The parallel at 23° 30', will be the tropic of Cancer, and that at 66° 30', the arctic circle. See PARALLEL and TROPIC. The meridians and parallels thus described, from a table of longitudes and latitudes, lay down the places; reckoning the longitude of each place on the equator, commencing at the first meridian, and proceeding to the meridian of the place; and for the latitude of the place, choosing a parallel of the same latitude; the point where this meridian and parallel intersect, represents the place: And in the same manner all the other places may be determined, till the *Map* be compleat.

For the ecliptic, half of which comes in this hemisphere; we have observed, that it makes an ellipsis; so that the points through which it passes are to be found. The first point, or that wherein the ecliptic cuts the equator, is the same with that wherein the first meridian cuts the equator, which is therefore distinguished by the sign of Aries: the last point of this half ellipsis, or the other intersection of the equator and ecliptic, *viz.* the end of Virgo, will be in the opposite point of the equator, *viz.* at 180°. The middle point of the ellipsis is that wherein the meridian 90 cuts the tropic of Cancer. Thus we have three points of the ecliptic determined: for the rest, *viz.* for 1° and 15° of Taurus, 1° and 15° of Gemini, 1° of Leo, 1° of Virgo, the declinations of those points from the equator must be taken from a table, and set off in the *Map*. See DECLINATION, &c.

—Thus where the meridian of 13° cuts the parallel of 5°, that point will be 15° of Aries. Where the meridian 27° cuts the parallel, 11° will be the first degree of Taurus; and so of the rest. These points being all joined by a curve line, will be a portion of an ellipsis representing the ecliptic.

*Maps* of this projection have the first qualification above required; but are defective in the second: the surface being stretched further, as it approaches nearer the equator. For the third they are still further out.

By this method may almost the whole earth be represented in one *Map*, placing the eye, *v. g.* in the antarctic pole, and assuming for the plane of projection that of some circle near it, *v. g.* the antarctic circle.—Nothing is here required besides the former projection, but to continue the meridian, draw parallels on the other side of the equator, and compleat the ecliptic; but this distorts too much for practice.

This projection is of all others the easiest; but that, where the

# M A P

eye is placed in the plane of the equator, is preferred for use. It is, in effect, of the latter kind that *Maps* are ordinarily made. The former are added to them, in small, by way of supplement, to represent the intermediate spaces left between the two hemispheres.—Further, as the situation of the ecliptic, with regard to the earth, is continually changing; strictly speaking, it has no place on the earth's surface; but is used to be represented according to its situation some certain moment; *viz.* so as the beginning of Aries and Libra may be in the intersections of the first meridian and equator.

*Construction of MAPS, with the eye in the plane of the equator.*—

This method of projection, though more difficult, is yet much juster, more natural and commodious, than the former. To conceive it, we suppose the surface of the earth cut into two hemispheres by the entire periphery of the first meridian, each of which hemispheres we represent in a distinct *Map*. The eye is placed in the point of the equator 90° distant from the first meridian; and for the transparent plane, wherein the representation is to be, we take the plane of the first meridian. In this projection, the equator is a right line, and the meridian 90° distant from the first, is also a right line; but the other meridians, and all the parallels of the equator, are arches of circles, and the ecliptic an ellipsis.

The method is thus. From a point *E*, as a centre, (*fig. 3.*) describe a circle according to the intended bigness of the *Map*. This represents the first meridian, and is opposite; for, drawing the diameter *BD*, there arise two semi-circles, the one whereof *BAD* is the first meridian, the other *BCD* its opposite, or the meridian of 180°. This diameter *BD* represents the meridian of 90 degrees, whereof the point *B* is the arctic pole, and the point *D* the antarctic. The diameter *AC*, perpendicular to that *BD*, is the equator. Divide the quadrants *AB, BC, CD, DA*, each into 90 degrees; and to find the arches of the meridians and parallels, proceed thus. Divide the equator into its degrees, *viz.* 180, (as being indeed only half the equator;) through these several divisions, and the two poles describe arches of circles, representing meridians, as *B 1 D, B 2 D, &c.*—How to find centres for describing those arches, see under the word CIRCLE. Indeed, the operation will be both more easy and accurate, if performed by a canon of tangents.

To describe the parallels, the meridian *BD* must be in like manner divided into 180 degrees; then through each of these divisions, and the corresponding divisions of the quadrants *AB, CB*, describe arches of circles. Thus shall we have parallels of all degrees, with tropics, polars, and meridians.

The ecliptic may be designed two ways: For its situation over the earth may either be such, as that its intersection with the equator may be over the place *A*; in which case, the projection of its semi-circles, from the first degree of Cancer, to the first of Capricorn, will be a strait line, to be determined by numbering 23° 30' from *A* towards *B*, and from the extreme of that numeration drawing a diameter through *E*; which line will be half the ecliptic in this situation, and may be divided, as before, into degrees, to which the numbers, signs, &c. are to be affixed.—But if the ecliptic be so placed, as that its intersection with the equator is over the place *A*, in the first meridian, its projection in that case will be a segment of an ellipsis; whereof two of the points are *A, C*; a third that wherein the meridian 90 cuts the tropic of Cancer.—The other points must be determined in the manner laid down above, *viz.* by taking the declinations and right ascensions of 15° of Aries, 1° of Taurus, 15° of Gemini, &c. For where the parallels, according to their several degrees of declination, cut the meridians, taken according to the several right ascensions; those points of intersection are the points of the 15° of Aries, &c. A curve line therefore being drawn, these will give the projection of the ecliptic.

Nothing remains to compleat the *Map*, but to take the longitudes and latitudes of places from a table; and to set them off on the *Map*, as was directed under the former method.

In this projection the whole surface of the earth may be represented in one *Map*; if instead of the plane of the first meridian, some other plane parallel to it, but very near the eye, be taken; for by this means the entire parallels and meridians will be described.—But as this distorts the face of the earth too much, it is seldom used; and we rather take the two hemispheres in two distinct tables.

One great advantage in this projection is, that it represents the longitudes and latitudes of places, their distance from the pole and from the equator, almost the same as they are on the earth.

—Its inconveniences are, that it makes the degrees of the equator unequal; being the greater as they are nearer the first meridian *DAB*, or its opposite *BCD*; and for this reason equal tracts of the earth are represented unequal; which defect may be in some measure remedied by removing the eye far from the earth. Lastly, the distances of places, and situation with regard to each other, cannot be well determined in *Maps* of this projection.

*Construction of MAPS on the plane of the horizon*, or wherein any given place shall be the centre, or middle.—Suppose, for instance,

stance, it is desired to have London the centre of the *Map*. Its latitude we will suppose to be 51 degrees, 32 minutes. The eye is placed in the nadir. The transparent table is the plane of the horizon, or some other plane, if it is desired to represent more than an hemisphere.—Take then the point E (fig. 4.) for London; and from this, as a centre, describe the circle ABCD to represent the horizon, which you are then to divide into four quadrants, and each of these into 90 degrees. Let the diameter BD be the meridian, B the northern quarter, D the southern; the line of equinoctial east and west shews the first vertical, A the west, C the east, or a place of 90 degrees from the zenith in the first vertical. All the verticals are represented by right lines drawn from the centre E to the several degrees of the horizon. Divide BD into 180 degrees, as in the former methods; the point in EB representing 51 deg. 32 min. of the arch BC, will be the projection of the north pole, which note with the letter P. The point in ED representing 51 deg. 32 min. of the arch DC, (reckoning from C towards D) will be the projection of the intersection of the equator and meridian of London, which note with the letter Q; and from this, towards P, write the numbers of the degrees, 1, 2, 3, &c. As also from Q towards D, and from B towards P, viz. 51, 52, 53, &c.

Then taking the corresponding points of equal degrees, viz. 99 and 99, 88 and 88, &c. about those, as diameters, describe circles, which will represent parallels, or circles of latitude, with the equator, tropics, and polar circles. For the meridians, first describe a circle through the three points A, P, C. This will represent the meridian 90 degrees from London. Let its centre be M in BD, (continued to the point N, which represents the south pole) PN being the diameter, through M draw a parallel to AC, viz. FH, continued each way to K and L. Divide the circle PHNF into 360 degrees, and from the point P draw right lines to the several degrees, cutting KFH L; through the several points of intersection, and the two poles P, N, as through three given points, describe circles representing all the meridians. The centres for describing the arches, will be in the same KL, as being the same that are found by the former intersection; but are to be taken with this caution, that for the meridian next BDN towards A, the most remote centre towards L, be taken for the second, the second for this, &c.—The circles of longitude and latitude thus drawn, insert the places from a table as before directed.

**Construction of MAPS on the plane of the meridian.**—This projection is taught by Ptolemy, and recommended by him as proper for that part of the earth then known. In this, the equator and parallels are arches of circles, and the meridians arches of ellipses; the eye hanging over the plane of that meridian which passes over the middle of the inhabited world.—But in regard the description of these ellipses is somewhat perplexing, and because this method seems calculated only for a part of the earth, it is not now used.

There is a second method something a-kin to it, which represents the circles of latitude by right lines, and the meridians by arches of ellipses; as must be the case, if lines be conceived to fall from the several points of each hemisphere, perpendicularly on the plane of the first meridian, and the eye be supposed at an infinite distance from the earth; so that all the rays emitted from the places of the earth to it, may be accounted parallels, as well as perpendiculars to the plane of the first meridian.

**Rectilinear MAPS** are those wherein both the meridians and parallels are represented by right lines, which by the laws of perspective is impossible; in regard there can no such position be assigned the eye and the plane, as that the circles both of longitude and latitude shall be right lines.

In the first method above laid down, the meridians are right lines, but the parallels are circles: in the fifth, the parallels are right lines, and the meridians ellipses. In all other perspective methods, both kinds of circles are curve: one method indeed must be excepted, wherein the meridians are right lines, and the parallels hyperbola's; as when the eye is placed in the centre of the earth, and the plane, through which it is viewed, is parallel to the first meridian: but this method is rather pretty than useful.

**Rectilinear Maps** are chiefly used in navigation, to facilitate the estimation of the ship's way. See CHART.

**Construction of particular MAPS.**—*Particular Maps of large tracts*, as Europe, Asia, Africa, and America, are projected after the same manner as general ones; only let it be observed, that for different parts, different methods may be chosen. Africa and America, for instance, in regard the equator passes through them, cannot be conveniently projected by the first method, but much better by the second. Europe and Asia are most conveniently represented by the third; and the polar parts, or the frigid zones, by the first.

To begin then, draw a right line on your plane or paper, for the meridian of the place over which the eye is conceived to hang, and divide it into degrees, as before, which will be degrees of latitude. Then from the tables take the latitude of the two parallels, which terminate each extreme. The degrees of these latitudes are to be noted in the meridian; and through

them draw perpendiculars, bounding the *Map* towards north and south. This done, meridians and parallels are to be drawn to the several degrees, and the places to be inserted, till the *Map* is compleat.

**For particular MAPS of less extent.**—In *Maps* of smaller portions of the earth, the geographers take another method. First, a transverse line is drawn at the bottom of the plane, to represent the latitude, wherein the southernmost part of the country to be exhibited, terminates. In this line, so many equal parts are taken, as that country is extended in longitude. On the middle of this same line erect a perpendicular, having so many parts as there are degrees of latitude between the northern and southern limits of the country. How big these parts are to be, may be determined by the proportion of a degree of a great circle to a degree of the parallel represented by the transverse line at bottom. Through the other extreme of this perpendicular, draw another perpendicular, or a parallel to the line at bottom, in which are to be seen as many degrees of longitude, as in the lower line, and these too, equal to those other, unless the latitudes happen to be remote from each other, or from the equator. But if the lowest parallel be at a considerable distance from the equinoctial, or if the latitude of the northern limit go much beyond that of the southern; the parts or degrees of the upper line must not be equal to those of the lower, but less, according to the proportion which a degree of the more northern parallel has to a degree of the more southern.

After parts have been thus determined, both on the upper and lower line, for the degrees of longitude; right lines must be drawn through the beginning and end of the same number, which lines represent meridians: then, though the several degrees of the perpendicular erected on the middle of the first transverse line, draw lines parallel to that transverse line. These will represent parallels of latitude. Lastly, at the points wherein the meridians of longitude and the parallels of latitude concur, insert the places from a table, as before directed.

**For MAPS of provinces, or small tracts, as parishes, manors, &c.** we use another method, more sure and accurate than any of the former. In this, the angles of position, or the bearings of the several places, with regard to one another, are determined by proper instruments, and transferred to paper.—This constitutes an art apart, called *surveying*. See SURVEYING.

**The use of MAPS** is obvious from their construction. The degrees of the meridians and parallels shew the longitudes and latitudes of places, and the scale of miles annexed, their distances; the situation of places, with regard to each other, as well as to the cardinal points, appears by inspection, the top of the *Map* being always the north, the bottom the south, the right-hand the east, and the left the west; unless the compass, usually annexed, shew the contrary.

**MAPPARIUS**, an officer among the Romans, who in the public games, as those of the circus and the gladiators, gave the signal for their beginning, by throwing an handkerchief (*Map-pa*) which he had before received from the emperor, consul, prætor, or other supreme officer then present. See ACACIA.

**MARASMUS**, ΜΑΡΑΣΜΟΣ\*, in medicine; an extreme wasting, or consumption of the whole body. See CONSUMPTION.

\* The word is Greek, being derived from the verb *μαραίνειν*, to waste.

A *Marasmus* is an extreme degree of atrophy; as a hectic fever is an extreme degree of *Marasmus*. See ATROPHY, and HECTIC.

**MARAVEDI\***, a little Spanish copper coin, worth somewhat more than a French denier, or half a farthing English.

\* The word is Arabic, and took its rise from the *Almoravides*, a dynasty of Moors, who passing out of Africa into Spain, imposed their own name on this coin, which by corruption was afterwards changed into *Maravedi*.—Mention is made of it in the decretals, as well as other Latin writers, under the name of *Marabitini*.

The Spaniards always count by *Maravedis*, both in commerce, their finances, &c. though the coin itself is no longer current among them. Sixty-three *Maravedis* are equivalent to a rial of silver: so that the piaster, or piece of eight rials, contains five hundred and four; and the pistole of four pieces of eight, two thousand and sixteen *Maravedis*. See COIN, and MONEY.

This smallness of the coin produces vast numbers in the Spanish accounts and calculation; insomuch that a stranger or correspondent would think himself indebted several millions for a commodity that costs but a few pounds.

In the laws of Spain, we meet with several kinds of *Maravedis*; Alphonine *Maravedis*, white *Maravedis*, *Maravedis* of good money, *Maravedis* Combrenos, black *Maravedis*, old *Maravedis*.—When we find *Maravedis* alone, and without any addition, it is to be understood of those mentioned above. The rest were different in value, fineness of metal, time, &c. Mariana asserts, that this coin is older than the Moors; that it came from the Goths; that it was anciently equal to a third part of the rial, and consequently twelve times the value of the present *Maravedi*. Under Alphonse XI. the *Maravedi* was seventeen times, under Henry II. ten times, and under Henry III. five times, and under John II. two times and a half the value of the present *Maravedi*.

MARBLE,

**MARBLE, MARMOR** \*, a precious kind of stone found in great masses, dug out of pits, or quarries; being of a constitution so hard and compact, and again so fine as readily to take a beautiful polish: much used in ornaments of buildings, as columns, statues, altars, tombs, chimney-pieces, tables, and the like. See **STONE**.

\* The word comes from the French *Marbre*, and that from the Latin *Marmor*, of the Greek *μαρμαριον*, to shine or glitter.

There are an infinite number of different kinds of *Marble*, usually denominated either from their colour, their age, their country, their grain, their degree of hardness, their weight, or their defects: some are of one simple colour, as white or black, others streaked or variegated with stains, clouds, waves, veins, &c. but all opaque, excepting the white, which, when cut into thin slices, becomes transparent.

Some, under the genus of *Marble*, comprehend also porphyry, serpentine, granite, alabaster, &c. See **PORPHYRY**, **SERPENTINE**, **GRANITE**, **ALABASTER**, &c.

**Ancient MARBLES** are those, whose quarries are lost, or inaccessible to us, and whereof we have only some pieces remaining.

**Modern MARBLES** are those, whose quarries are still open, and out of which blocks continue to be dug.

**African MARBLE** is either of a reddish brown, streaked with veins of white; or of a carnation, with veins of green.

**English white MARBLE** is veined with red.

**Derbyshire MARBLE** is variously clouded and diversified with brown, red, yellow, &c.

**MARBLE of Auvergne** in France, is of a pale red mingled with violet, green, and yellow.

**MARBLE of Brabant** in Hainault, is black, veined with white.

**MARBLE of Bresse** in Italy, is yellow with spots of white.

**Brocatella MARBLE** is mingled with little shades of Isabella, yellow, pale, and grey. It comes from Tortosa in Spain, where it is dug out of an ancient quarry: There is also another kind of ancient *Brocatella* dug near Adrianople.

**MARBLE of Carrara**, on the coasts of Genoa, is very white, and the fittest of all others for works of sculpture.

**MARBLE of Champagne**, resembles the *Brocatella*, being mixed with blue in round stains like partridge eyes.

**Cipollino, or Cipollin, MARBLE**, is of a sea-green colour, mixed with large waves or clouds of white or pale green.—Scamozzi takes this to be the same with that which the ancients called *Augustum & Tiberium marmor*; because discovered in Egypt in the times of Augustus and Tiberius.

**MARBLE of Dinan**, near Liege, is of a pure black, very beautiful, and very common.

**MARBLE of Guachenet**, near Dinan, is of a reddish brown, with white spots and veins.

**MARBLE of Languedoc**, is of a vivid red, with large white veins or stains, and is very common; there is some, whose white borders pretty much on the blue, but this is of less value.

**Lumachello MARBLE**, is so called, because mingled with spots, brown, black, and white, wreathed somewhat like periwinkle-shells.—This is ancient, and its quarry is lost.

**MARBLE of Margutta**, in the Milaneze, has a white ground with brownish veins, resembling the colour of iron-rust. This is very common, and extremely hard.

**MARBLE of Lavée**, in Maine, has a black ground, with little narrow veins of white; there is another kind of it red, with veins of a dirty white.

**MARBLE of Namur** is black, like that of Dinan, but less beautiful, as inclining a little to the blue, and traversed with little streaks of grey.—This is very common, and is frequently used in paving.

**Parian marble** is antique, and much celebrated in authors; it is of a beautiful white: The greatest part of the Grecian statues were made of it. Varro calls it *Lychnites*, because the workmen dug it out of the quarry by lamp-light.

**MARBLE of Porta Santa**, at Rome called *Serna*, is mingled with large clouds and veins of red, yellow and grey.

**Portor MARBLE** has a black ground, with clouds and veins of yellow. It is dug out of the foot of the Alps towards Carrara.

**MARBLE of Rance**, in Hainault, is of a dirty red, mixed with blue and white clouds and veins: this is pretty common, but is different in degree of beauty.

**MARBLE of Savoy**, is a deep red mixed with other colours; each piece whereof seems cemented on to the rest.

**MARBLE of Sicily**, is a brownish red, stained with oblong squares of white and Isabella, like striped taffaty. The ancient has very vivid colours, and the modern comes pretty near it.

**MARBLE of Signam**, in the Pyreneans, is ordinarily of a greenish brown, with red stains; though this is somewhat various in its colours.

**MARBLE of Thau**, near Namur in Liege, is a pure black, soft and easy to work, and receives a more beautiful polish than those of Namur and Dinan.

**MARBLE Bigio Nero**, or black-grey, is antique.

**White veined MARBLE** has large veins, with grey and blue stains on a white ground. It comes from Carrara.

**White MARBLE**, that dug out of the Pyreneans on the side of

Bayonne, is inferior to that of Carrara, its grain being coarser, and shining, like a kind of salt. It is something like the ancient white Greek *Marble*, whereof their statues were made, but is not so hard or beautiful.

**Ancient black and white MARBLE** is now very rare, its quarries being intirely lost; it is divided between a pure white and a bright black in laminæ.

**Blue Turquin MARBLE** is mixed with a dirty kind of white, and comes from the coast of Genoa.

**MARBLE Fior di persica**, comes from Italy, consists of red and white stains, somewhat yellowish.

**Yellow MARBLE**, is a kind of yellow Isabella without veins; it is antique, and now very rare.

**Black Antique MARBLE** is of a pure black, without stains, and softer than the modern black. There was some of it brought from Greece called *Marmor Luculleum*; but this was not so much prized as that which the Egyptians brought from Æthiopia, approaching to an iron colour, and called *Basaltes*, or touch-stone, because it served them for the trial of metals. See **BASALTES**.

**White and black MARBLE**, has a pure black ground, with some very white veins.

**MARBLE Occhio di pavone**, or peacock's eye, is mingled with red, white, and bluish clouds, somewhat resembling the eyes at the end of a peacock's tail.

**Green MARBLE antique**, is a mixture of grass-green, and black, in clouds of unequal forms and bigness, and is very rare, the quarries being lost.

**Modern Green MARBLE**, improperly called Egyptian, is brought from Carrara, on the coast of Genoa; it is a deep green spotted with grey.

**Rigid MARBLE**, is that which, being too hard, works with difficulty, and is liable to splinter, as the black of Namur.

**Fibrous MARBLE**, is that full of threads or filaments.

**Brittle MARBLE**, is that which crumbles under the instrument, as the white Greek *Marble*, that of the Pyreneans, &c.

**Terracy MARBLE**, that with soft places in it, which must be filled up with cement as that of Languedoc.

There are two defects frequent in *Marbles*, which augment the difficulty in cutting and polishing them. The one, what they sometimes call *nails*, answering to the knots in wood; the other called *emeril*, is a mixture of copper or other metals, forming black stains in the *Marble*. The knots are common to all *Marbles*: the emeril peculiar to the white.

**Artificial MARBLES**.—The stucco whereof they make statues, busts, basso-relievos, and other ornaments of architecture, is only *Marble* pulverized, mixed in a certain proportion with plaister; the whole well sifted, worked up with water, and used like common plaister. See **STUCCO**.

There is also a kind of artificial *Marble* made of gypsum, or a transparent stone resembling plaister; which becomes very hard, receives a tolerable polish, and may deceive the eye. See **GYPNUM**.

There is another sort of artificial *Marble* formed by corrosive tinctures, which penetrating into white *Marble*, to the depth of a line, imitates the various colours of other *Marbles*.

**Polished MARBLE**, is that which, being well rubbed with free-stone, and afterwards with pumice stone, is at last polished with emery, if the *Marble* be of several colours; and with calcined tin, if it be white. In Italy they polish with a piece of lead and emery.

There are various ways of polishing *Marble*. Some lay three or four blocks in a row, and with another fixed to a broad beetle, and an handle fixed at oblique angles, with sand and water between, work the upper stone backwards and forwards on the lower ones, till the strokes of the ax are wore off; after which they polish them with emery and putty.

Father Kircher shews the manner of applying colours on *Marble*, so as to make them penetrate its whole substance; inso-much that if the *Marble* be slit into several parallel tables or slabs, the same figure will be found on each, that was painted on the first.

Spots of oil stain white *Marble* so as they cannot be taken out.

**Arundel MARBLES, MARMORA Arundeliana** or the *Oxford MARBLES*, are ancient stones, whereon is inscribed a chronicle of the city of Athens, engraven in capital letters in the island of Paros one of the Cyclades, 263 years before Jesus Christ.

They take the name from Thomas earl of Arundel, who procured them out of the east, or from Henry his grandson, who presented them to the university of Oxford.—An account of all their inscriptions were published in 1676, by Dr. Prideaux.

**MARbled**, something veined, or clouded, resembling marble. *Marbled paper*, is a paper stained with various clouds and shades, resembling in some measure, the divers veins of marble; the method of making which, see under **PAPER**.

**MARBLING**, the art or act of painting or disposing colours in such a manner, as that they may represent *Marble*.—Thus we *marble* books, paper, wood, &c. See **PAPER**.

**MARBLING of books**, among binders, denotes the sprinkling over the cover of a book with black, by means of a black pencil

struck gently against the finger, or on a stick held for that purpose.

*Marbling* is not used, except for books bound in calf; after it is finished, the cover is glazed over with beaten whites of eggs, then smoothed with a polishing iron.

They also *marble* books on the edges; but in this *Marbling* there is no black used; in lieu thereof red, blue, &c. See BOOK-BINDING.

MARCASITE, MARCASITA, a sort of metallic mineral, making, as it were, the seed or first matter of metals. See MINERAL, and METAL.

On this principle, there should be as many different *Marcasites* as metals, which is true in effect; the name being applied to every mineral body that has metallic particles in its composition; though not enough to make it worth working: in which case it would be called *ore*. See ORE.

There are only three kinds in the Shops, viz. *Marcasite* of gold, of silver, and of copper: though some repute the loadstone, *Marcasite* of iron; bismuth, *Marcasite* of tin; and zink, or spelter *Marcasite* of lead: but this we leave to the chymists. See MAGNET, BISMUTH, and ZINK.

*Marcasite* of gold is in little balls or nodules about the bigness of nuts, nearly round, heavy, of a brown colour without. *Marcasite* of silver is like that of gold, only paler coloured; within the colour differs much, the one having a gold colour, and the other a silver colour, both shining and brilliant. The *Marcasite* of copper is about the bigness of a small apple, round or oblong, brown without, yellow and crystalline within, brilliant and shining.

*Marcasites* are found in mines of metals; they all contain sulphur and a vitriolic salt, especially that of copper: some of them also contain antimony and bismuth.

MARCELLIANISM, the doctrine and opinions of the *Marcellians*, a sect of ancient heretics; so called from *Marcellus* of Ancyra, their leader, who was accused of reviving the errors of Sabellius. See SABELLIANS.

Some, however, are of opinion, that *Marcellus* was orthodox, and that it was his enemies the Arians, who fathered their errors upon him.—St. Epiphanius observes, that there was a great deal of dispute with regard to the real tenets of *Marcellus*; but that as to his followers, it is evident they did not own the three hypostases: so that *Marcellianism* is no imaginary heresy.

MARGRAVE, or MARGRAVE\*, a kind of dignity in Germany, answering to our marquis. See MARQUIS.

\* The word is derived from the German *Marche*, or *Marcke*, which signifies a frontier; and *Graf*, count, governor; *Margraves* being originally governors of cities lying on the frontiers of a country or state. See FRONTIER.

MARCH, MARTIUS, the third month of the year, according to the common way of computing. See MONTH, and YEAR.

Among the Romans, *March* was the first month; and in some ecclesiastical computations, that order is still preserved; as particularly in reckoning the number of years from the incarnation of our Saviour; that is, from the 25th of *March*.

In England, *March*, properly speaking, is the first month in order; the new year commencing from the 25th; though in compliance to the customs of our neighbours, we usually rank it as the third; but in this respect, we speak one way, and write another. See INCARNATION.

Till the Year 1564, the French reckoned the beginning of their year from Easter; so that there were two months of *March* in one year, one of which they called *March before Easter*, and the other *March after Easter*. When *Easter* fell within the month of *March*, the beginning of the month was in one year, and the end in another.

It was Romulus who divided the year into two months; to the first of which he gave the name of his supposed father *Mars*. Ovid, however, observes, that the people of Italy had the month of *March* before Romulus's time; but that they placed it very differently, some making it the third, some the fourth, some the fifth, and others the tenth month of the year.

In this month it was that the Romans sacrificed to Anna Perenna, that they began their comitia, that they adjudged their public farms and leases; that the mistresses served the slaves and servants at table, as the masters did in the Saturnalia; and that the vestals renewed the sacred fire.

The month of *March* was always under the protection of Minerva, and always consisted of thirty one days.—The ancients held it an unhappy month for marriage, as well as the month of May.

MARCHET, or MARCHETTA, a pecuniary fine anciently paid by the tenant to his lord, for the marriage of one of the tenant's daughters.

This custom obtained, with some difference, throughout all England and Wales, as also in Scotland, and still continues to obtain in some places.—According to the custom of the manor of Dinover in Carmarthenshire, every tenant, at the marriage of his daughter, pays ten shillings to the lord; which, in the British language, is called *Gwabr-Merched*, i. e. *Maid's-Fine*. See AMAEYR.

In Scotland, and the north parts of England, the custom was, for the lord to lie the first night with the bride of his tenant: but this usage was abrogated by king Malcolm III. at the instance of his queen; and instead thereof, a mark was paid by the bridegroom to the lord. Whence it is called *Murcheta mulieris*. See DEFLOWERING.

MARCIONITES, or MARCIONISTS, MARCIONISTÆ, a very ancient and popular sect of hereticks, who in the time of St. Epiphanius, were spread over Italy, Egypt, Palestine, Syria, Arabia, Persia, and other countries; denominated from their author *Marcion*.

*Marcion* was of Pontus, the son of a bishop, and at first made profession of a monastical life; but having had a criminal affair with a maid, was excommunicated by his own father, who would never admit him again into the communion of the church, not even on his repentance. On this he abandoned his own country, and retired to Rome, where he began to broach his doctrines.

He laid down two principles, the one good, the other evil; he denied the real birth, incarnation and passion of Jesus Christ, and held them all to be apparent only. He taught two Christs; one who had been sent by an unknown God for the salvation of all the world; another, whom the Creator would one day send to re-establish the Jews. He denied the resurrection of the body, and allowed none to be baptized, but those who preserved their continence; but these he granted might be baptized three times.

In many things he followed the sentiments of the heretic Cerdon, and rejected the law and the prophets. He pretended the gospel had been corrupted by false prophets, and allowed none of the Evangelists but St. Luke, whom he altered in many places, as well as the epistles of St. Paul, a great many things in which he threw out. In his own copy of St. Luke, he threw out the two first chapters intire.

MARCITES, MARCITÆ, a sect of heretics in the second century who also called themselves the *Perfetti*, and made profession of doing every thing with a great deal of liberty, and without any fear.

This doctrine they borrowed from Simon Magus, who, however was not their chief; for they were called *Marcites* from one *Marcus*, who conferred the priesthood, and the administration of the sacraments, on women.

MARCOSIANS, an ancient sect in the church; making a branch of the Gnostics. See Gnostic.

St. Irenæus speaks at large of the leader of this sect, *Marcus*, who, it seems, was reputed a great magician: He relates several things touching the prayers and invocation of the ancient Gnostics and *Marcosians*, wherein we find the traces of the ancient Jewish cabala on the letters of the alphabet, and their properties, as well as on the mysteries of numbers which the Jews and Gnostics had borrowed from the philosophy of Plato and Pythagoras.

*Marcus* was an Egyptian, and there it was he became acquainted with magic: to impose more easily on his followers, he made use of certain Hebrew, or rather Chaldee words, much used by the enchanters of those times.

The *Marcosians* had a great number of apocryphal books, which they held for canonical, and of the same authority with ours. Out of these they picked several idle fables, touching the infancy of Jesus Christ, which they put off for true histories. Many of these fables are still in use and credit among the Greek monks.

MARGARITÆ. See the article PEARLS.

MARK, in matters of commerce and manufacture, a certain character struck or impressed on various kinds of commodities, either to shew the place where they were made, and the persons who made them; or to witness they have been viewed, and examined by the officers or magistrates charged with the inspection of that manufacture; or lastly, to shew the duties imposed thereon have been regularly acquitted.

Thus are cloths, leathers, cutlery-ware, paper, plate, weights, measures, &c. to be *marked*.

MARK, in horfemanhip. See AGE.

MARK, is also a particular sign or character known only to the trader who pitches on it; whereby being fixed to any commodity, he recollects the price it cost him.

These *Marks*, otherwise called *numeros*, are taken according to the fancy of those who use them; but ordinarily, are chosen from among the letters of the alphabet, each having a relation to some particular number of figures.—They are of so much use in trade, that the reader will not take it amiss, if we insert a little table, to serve as a model for their construction.

A	B	C	D	E	F	G	H	I	K	L	M
0	1	2	3	4	5	6	7	8	9	10	20

One example will give the whole use of this table. Suppose, v. g. I would put on a piece of stuff, that it cost 37 s. 6 d. per ell. I put an M for 20 s. an L for 10 s. an H for 7 s. and a G for 6 d. So that the several letters wrote after each other (observing always to separate shillings from pounds and from pence

pence by points) will make this *Mark* M. L.H. G. equal to 37 s. 6 d.

Note, the *Mark* may be diversified infinitely, by adding other figures to the letters in lieu of these.

*Letters of MARK.* See the article MARQUE.

**MARK**, in a monastic sense.—*Canons of St. MARK*, a congregation of regular canons, founded at Mantua by Albert Spinola, a priest, towards the end of the twelfth century. See CANON.

Spinola made a rule for them, which was approved, corrected, and confirmed by several succeeding popes. About the year 1450, they were reformed, and followed only the rule of St. Augustin.

This congregation, which at first consisted of eighteen or twenty houses of men, and some of women, situate in Lombardy and the state of Venice; having flourished for the space of four hundred years, declined by little and little, and was at length reduced to two convents; and in 1584, that of St. Mark at Mantua, which was the chief, was given with the consent of pope Gregory XII. to the Camaldulians, and so the congregation became extinct. See CAMALDULIAN.

*Knights of St. MARK*, an order of knighthood in the republic of Venice, under the protection of St. Mark the evangelist.

The arms of the order are, a lion winged gules, with this device, *Pax tibi, Marce Evangelista*. This order is never conferred but on those who have done signal services to the commonwealth.

**MARK**, or **MARC**, also denotes a weight used in several states of Europe, and for several commodities, especially gold and silver in France. See WEIGHT.

The *Mark* is divided into eight ounces, or sixty four drachms, or an hundred and ninety two deniers or penny-weights, or an hundred and sixty esterlins, or three hundred mailles, or six hundred and forty felins, or four thousand six hundred and eight grains. See OUNCE, DRACHM, &c.

In Holland the *Marc* weight is also called troy-weight, and is equal to that of France.—When gold and silver are sold by the *Marc*, it is divided into twenty four carats, the carat into eight penny-weights, the penny-weight into twenty four grains, and the grain into twenty four primes. See CARACT.

**MARK** is also used among us for money of account; and in some other countries for a coin. See MONEY, &c.

The English *Mark* is two thirds of a pound sterling, or 13 s. 4 d. and Matthew Paris observes, it was of the same value in 1194. The ancient Saxons called the *Mark*, *Mancus*, or *Mancusa*, and *Meare*; among them it was equivalent to thirty pence, i. e. to seven shillings and six-pence of our money.

The *Mark-Lubs*, or *Lube Marc*, used at Hamburgh, is also a money of account, equal to one third of the rixdollar, or to the French livre.—Each *Mark* is divided into sixteen sols-lubs.

*Mark-Lubs*, or *danfch*, is also a Danish coin, equal to sixteen sols-lubs, or twenty French sols.

Lastly, *Mark* is a copper coin in Sweden, equal to two pence farthing sterling; it is divided into eight roustiqs, and each roustiq into two alleveures. See COIN.

The Swedish silver *Mark* is a money of account, equal to three copper Marks; though some make it a real coin.

**MARKET\***, a public place in a city or town where provisions are exposed to sale. See BUTCHER, and FORUM.

\* The word is formed from the French *Marché*, which signifies the same.

**MARKET** is also used for a liberty or privilege either by grant or prescription, whereby a town is enabled to keep a *Market*.

Bracton observes, that one *Market* ought to be distant from all others at least six miles and a half, and a third of a half.

In former times it was customary to have most fairs and *Markets* kept on sundays, and in the church-yard; so that matters of business and devotion were transacted under one. Which custom, though prohibited by several kings, was yet held up till the reign of king Henry the sixth, when it was effectually suppressed.—In many places they are still kept in the church-yard.

**MARLE\***, **MARGA**, a kind of dry, soft, fossile earth, harsh to the touch; used to be cast on land, to make it more fruitful. See MANURING.

\* The word comes from the ancient Celtic *Marga*, mentioned by Pliny: it was afterwards called *Margila*.

There are several sorts of *Marle*, of different colours, and qualities; the principal are *white* and *red*. Too much *Marle* thrown on the earth, is found to burn it. *Marle* is also of use in making lime, and is burnt like other stone. See LIME.

**MARMALADE**, a confection made of the juice or pulp of some fruit, as plumbs, apricocks, quinces, &c. boiled with sugar into a consistence. See CONFECTION.

The *Marmalade* of quinces is sub-astringent, and grateful to the stomach.

**MARONITES**, a sect of eastern Christians, who follow the Syrian rite, and are subject to the pope; their principal habitation being on mount Libanus.

The learned are divided about their origin and founder. Morin and cardinal Bona take *Maronite* for the name of a sect, as well

as Nestorian and Jacobite. But the *Maronites* themselves pretend, they are descended from one *Maron*, who lived in the beginning of the fifth century, and whose life is written by Theodoret. And the Jesuit Sacchini is of the same opinion: he thinks, that they never separated from the catholic church; and adds, that what has given occasion to their being judged in a schism, is their re-union with the Romish church, which some take for a return to the catholic faith.

The former opinion is founded on the testimonies of Eutychius, James de Vitri, and several others, who expressly assert the *Maronites* to have been formerly a part of the Monothelite Jacobites: According to their account, *Maron*, whom the *Maronites* qualify a saint, was in truth a heretic. Towards the year 1182, Aimeri, third Latin patriarch of Antioch, united the *Maronites* to that church. From that time they have used the mitre, ring, crozier, and other of the Latin episcopalia; but their service is still performed in the Chaldee language.

Faustus Nairon, a *Maronite* settled at Rome, has published an apology for *Maron* and the rest of his nation. His tenet is, that they really took their name from the *Maron* who lived about the year 400, and whereof mention is made in Chrysostom, Theodoret, and the Menologium of the Greeks. He adds, that the disciples of this *Maron* spread themselves throughout all Syria; that they built several monasteries, and among others, one that bore the name of their leader; that all the Syrians who were not tainted with heresy, took refuge among them: and that, for this reason, the heretics of those times called them *Maronites*.

The *Maronites* have a patriarch who resides in the monastery of Cannubin on mount Libanus, and assumes the title of patriarch of Antioch. He is elected by the clergy and the people, according to the ancient custom; but since their re-union with the church of Rome, he is obliged to have a bull of confirmation from the pope.—He keeps a perpetual celibate, as well as the rest of the bishops his suffragans: For the rest of the ecclesiastics, they are allowed to marry before ordination; and yet the monastic life is in great esteem among them.—Their monks are of the order of St. Anthony, and live in the most obscure places in mountains, far from the commerce of the world.

As to their faith, they agree in the main with the rest of the eastern church. Their priests do not say mass singly; but all say it together, standing round the altar. They communicate in unleavened bread; and the laity have hitherto partook in both kinds, though the practice of communicating in one has of late been getting footing, introduced by little and little.—In Lent they eat nothing, unless it be two or three hours before sun-rising: Their other fastings are very numerous. See LENT, and FAST.

**MAROTIC Style**, in the French Poetry, denotes a peculiarly gay, pleasant, yet simple and natural manner of writing, introduced by Clement Marot, and since imitated by other authors, but with most success by Voiture, and De la Fontaine.

The difference between the *Marotic* and the burlesque style is thus assigned: The *Marotic* makes a choice, the burlesque admits of all. The first is the most simple, but its simplicity has its nobleness; and where its own age will not furnish natural expressions, it borrows them from former times.—The latter is low and groveling, and borrows false and fulsome ornaments from the croud, which people of taste despise. The one resigns itself to nature, but examines first of all whether the objects she presents be fit for its paintings, and takes nothing but what carries with it somewhat of delicacy and mirth; the other runs headlong into buffoonry, and affects every thing that is extravagant and grotesque. See BURLESQUE.

**MARQUE**.—*Letters of MARQUE\**, are letters of reprisal, granted by a king or parliament, whereby the subjects of one country are licensed to make reprisals on those of another; by reason application has been made for redress to the government whereto the aggressor belongs, three times without effect. See LAW, and LETTER.

\* They are so called from the German *Marche*, limit, frontier; as being *jus concessum in alterius principis marchas seu limites transgredi, sibi que jus faciendi*; as being a right of pulling the limits or frontiers of another prince, and doing one's self justice. See REPRISALS.

**MARQUETRY**, *In-laid work*; a curious kind of work composed of pieces of hard fine wood of different colours, fastened, in thin slices, on a ground and sometimes enriched with other matters, as tortoise-shell, ivory, tin, and brass.

There is another kind of *Marquetry* made instead of wood, of glasses of various colours; and a third, where nothing but precious stones and the richest marbles, are used: but these are more properly called *Mosaic* work. See MOSAIC.

The art of inlaying is very ancient, and is supposed to have passed from east to west, as one of the spoils brought by the Romans from Asia. Indeed it was then but a simple thing; nor did it arrive at any tolerable perfection, till the fifteenth century, among the Italians: it seems however to have arrived at its height in the seventeenth century, among the French.

Till John of Verona, a cotemporary with Raphael, the finest works

works of this kind were only black and white, which are what we now call *Moresco's*; but that religious, who had a genius for painting, stained his woods with dyes or boiled oils, which penetrated them. But he went no further, than the representing buildings and perspectives, which require no great variety of colours. Those who succeeded him, not only improved on the invention of dying the woods, by a secret which they found of burning them without consuming, which served exceedingly well for the shadows; but had also the advantage of a number of fine new woods of naturally bright colours, by the discovery of America.—With these assistances the art is now capable of imitating any thing; whence some call it the *art of painting in wood*. See PAINTING.

The ground whereon the pieces are to be ranged and glued, is ordinarily of oak or fir well dried; and to prevent warping, is composed of several pieces glued together. The wood to be used being reduced into leaves, of the thickness of a line, is either stained with some colour, or made black for shadow; which some effect by putting it in sand extremely heated over the fire, others by steeping it in lime-water and sublimate, and others in oil of sulphur.—Thus coloured, the contours of the pieces are formed, according to the parts of the design they are to represent.

The last is the most difficult part of *Marquetry*, and that wherein most patience and attention are required. The two chief instruments used herein, are the saw and the vice; the one to hold the matters to be formed; the other to take off from the extremes, according to the occasion.—The vice is of wood, having one of its chaps fixed, the other moveable, and is opened and shut by the foot, by means of a cord fastened to a treadle. Its structure is very ingenious, yet simple enough, and will be easily conceived from the figure. *Tab. Miscellany, fig. 1.* The leaves to be formed (for there are frequently three or four of the same kind formed together) are put within the chaps of the vice, after being glued on the outermost part of the design whose profile they are to follow; then the workman pressing the treadle, and thus holding fast the piece, with his saw runs over all the out-lines of the design.—By thus joining and forming three or four pieces together, they not only gain time, but the matter is likewise the better enabled to sustain the effort of the saw; which, how delicate soever it may be, and how lightly soever the workman may conduct it, without such a precaution, would be apt to raise splinters, to the ruin of the beauty of the work.

When the work is to consist of one single kind of wood, or of tortoise-shell, on a copper or tin ground, or *vice versa*; they only form two leaves on one another, *i. e.* a leaf of metal, and a leaf of wood or shell: This they call sawing in counter-parts; for by filling the vacuities of one of the leaves by the pieces coming out of the other, the metal may serve as a ground to the wood, and the wood to the metal.

All the pieces thus formed with the saw, and marked, to know them again, and the shadow given in the manner already mentioned; they vaneer or fasten each in its place on the common ground; using for that purpose the best English glue.

The whole is put in a press to dry, planed over, and polished with the skin of the sea-dog, wax, and shave-grass, as in simple *Vaneering*; with this difference, however, that in *Marquetry* the fine branches, and several of the more delicate parts of the figures, are touched up and finished with a graver. See VANEERING.

It is the cabinet-makers, joiners, and toy-men among us, who work in *Marquetry*; it is the enamellers and stone-cutters, who deal in Mosaic work: The instruments used in the former are mostly the same with those used by the ebonists. See EBONY, see also MOSAIC.

MARQUIS, or MARQUESS\*, MARCHIO, a title given to a person in possession of a considerable demesne erected into a *Marquisate* by letters patent; holding a middle place between the dignity of a duke, and that of an earl or count. See NOBILITY, PEER, &c.

\* The word, according to some authors, comes from the *Marco-manni*, an ancient people who inhabited the marches of Brandenburg: Others derive it from the German *Marche*, limit; and

others from *Marcisia*, which in the Celtic language signified a wing of cavalry: Nicod derives it from the corrupt Greek *νομαρχία*, province: Alciat and Fauchet bring it from *Mark*, horse, taking a *Marquis* to be properly an officer of horse: Menage derives it from *Marca*, frontier; and Selden, Krantzius, and Hottoman do the same: Lastly, Pasquier fetches *Marquis* from the old French *Marche*, limit, or from *marchir*, to confine; the guard of the frontiers being committed to them.

*Marquesses* were anciently governors of frontier cities or provinces, called *Marches*.—In Germany they are called *Marcgraves*. See MARCGRAVE.

*Marquis* is originally a French title; the Romans were unacquainted with it: In the *Notitia Imperii* they are called *Comites limitanei*. The first time we hear of *Marquisses*, *Marchiones*, is under Charlemagne, who created governors in Gascony under this denomination.

Alciat has started a question, Whether a *Marquis* or count should have the precedence? To decide it, he goes back to the ancient function of counts, and observes, that counts who are governors of provinces, are above *Marquesses* who are only governors of frontiers; and that *Marquesses* who are governors of frontier-cities, are above counts who are governors of small towns. He adds, that in consequence of this distinction, the book of fiefs sometimes places *Marquesses* above counts, and sometimes counts above *Marquesses*.

Froissart observes, that the *Marquisate* of Juliers was erected into a county: But now-a-days, neither *Marquesses* nor counts are any longer governors; and as they are mere titles of honour, the counts make no scruple of resigning the precedency.

King Richard the second was the first who introduced the dignity of *Marquis* among us; by creating Robert de Vere earl of Oxford, *Marquess* of Dublin: But this was a title without office; the frontiers being governed by lords marchers. See COUNT, DUKE, &c.

MARRIAGE, a civil and religious contract, whereby a man is joined and united to a woman, for the ends of procreation.

The essence of *Marriage* consists in the mutual consent of the parties. *Marriage* is part of the law of nations, and is in use among all people. The Romanists account it a sacrament.

The woman, with all her moveable goods, immediately upon *Marriage*, passes wholly *in potestatem viri*, into the power and disposal of the husband. See WIFE, AFFINITY, DEGREE, &c.

In Germany they have a kind of *Marriage* called *morganatic*, wherein a man of quality contracting with a woman of inferior rank, he gives her the left hand in lieu of the right, and stipulates in the contract, that the wife shall continue in her former rank or condition, and that the children born of them shall be of the same; so that they become bastards as to matters of inheritance, though legitimate in effect: They cannot bear the name, or arms of the family.

None but princes, and great lords of Germany, are allowed this kind of *Marriage*.—The universities of Leipzig and Jena have declared against the validity of such contracts; maintaining, that they cannot prejudice the children, especially when the emperor's consent intervenes in the *Marriage*.

The Turks have three kinds of *Marriages*, and three sorts of wives; *legitimate*, *wives in kebin*, and *slaves*. They marry the first, hire the second, and buy the third. See CONCUBINE, and CONCUBINAGE.

The Roman laws speak of second *Marriages* in very hard and odious terms. *Matre jam secundis nuptiis funestata*, l. 3. C. de sec. nuptiis. By these laws it was enacted, that the effects of the husband or wife deceased should pass over to the children, if the survivor should marry a second time. By the law *Huc editali*, Cod. de sec. nupt. the survivor upon marrying a second time, could not give the person he married, a portion more than equal to that of each of the children. In the primitive church, the respect to chastity was carried so high, that a second *Marriage* was accounted no other than a lawful whoredom, or a species of bigamy. There are some ancient canons which forbid the ecclesiastics from being present at second *Marriages*. See BIGAMY.

For the proportions which *Marriages* bear to births, and births to burials, in several parts of Europe, Mr. Derham give us the following table.

Names of Places.	Marriages to Births, as	Births to Burials, as
England in general	1 to 4.63	1.12 to 1
London	1 to 4.	1 to 1.1
Hantsire, from 1569 to 1658	1 to 4.	1.2 to 1
Tiverton in Devon. from 1656 to 1664	1 to 3.7	1.26 to 1
Cranbrook in Kent, 1560 to 1649	1 to 3.9	1.6 to 1
Aynho in Northamp. for 118 years	1 to 6.	1.6 to 1
Upminster in Essex, for 100 years	1 to 4.6	1.8 to 1
Frankfort on the Maine in 1695	1 to 3.7	1.2 to 1
Old, Middle and Lower Marck, in 1698	1 to 3.7	1.9 to 1
Dominions of Elect. Branden. 1698	1 to 3.7	1.5 to 1
Breslaw in Silesia, from 1687 to 1691		1.6 to 1
Paris in 1670, 1671, 1672.	1 to 4.7	1.6 to 1

From which table it appears, that *Marriages*, one with another, do each produce about four births, both in England and other parts of Europe. And by Mr. King's computation, about one in a hundred and four persons *marry*; the number of people in England being estimated at five millions and a half, whereof about forty one thousand annually *marry*.

Major Graunt and Mr. King disagree in the proportions between males and females, the latter making ten males to thirteen females in London; in other cities and towns, and in the villages and hamlets, a hundred males to ninety-nine females. But major Graunt, both from the London and country bills, computes that there are in England fourteen males to thirteen females; whence he justly infers, that the Christian religion, prohibiting polygamy, is more agreeable to the law of nature than Mahometanism, and others that allow it. See *POLYGAMY*.

This proportion of males to females Mr. Derham thinks pretty just, being agreeable to what he had observed himself.—In the hundred years, for instance, of his own parish register of Upminster, though the burials of males and females were nearly equal, being six hundred and thirty-three males, and six hundred and twenty-three females in all that time; yet there were baptized seven hundred and nine males, and but six hundred and seventy-five females, which is 13 females to 13.7 males. From which inequality it appears, that one man ought to have but one wife, and yet that every woman, without polygamy, may have a husband; this surpluse of males above females being spent in the supplies of war, the seas, &c. from which the women are exempt.

That this is a work of providence, and not of chance, is well made out by the very laws of chance, by Dr. Arbuthnot: who supposes Thomas to lay against John, that for eighty-two years running, more males shall be born than females; and giving all allowances in the computation to Thomas's side, he makes the odds against Thomas, that it does not so happen, to be near five millions of millions of millions to one; but for ages of ages, according to the world's age, to be near an infinite number to one.

**MARRIAGE**, *MARITAGIUM*, in law, signifies not only the lawful joining of man and wife, but also the right of bestowing a ward, or a widow in *Marriage*; as well as the land given in *Marriage*. See *WARD*, and *WIDOW*.

*Duty of MARRIAGE*, is a term used in some ancient customs, signifying an obligation on women to *marry*.

To understand this, it must be observed, that old maids, and widows about sixty, who held fees in body, or were charged with any personal or military services, were anciently obliged to *marry*, to render those services to the lord by their husbands; or to indemnify the lord, for what they could not do in person.—And this was called *Duty* or *Service of Marriage*.

**MARROQUIN**, vulgarly *MOROCCO-Leather*. See *MOROCCO*.

**MARROW**, a soft oleaginous substance contained in the cavities of the bones. See *BONE*.

All the bones of the body, which have any considerable thickness, have either a large cavity, or are spongy, and full of little cells; in both the one and the other, is an oleaginous substance, called *Marrow*, contained in proper vesicles or membranes, which open into one another.

In the larger bones, this fine oil, by the gentle heat of the body, is exhaled through the pores of its small bladders, and enters some narrow passages, which lead to certain fine canals excavated in the substance of the bone, according to its length; and from these, other cross passages (not directly opposite to the former, lest they should weaken the bone too much in one place) carry the *Marrow* still farther into more longitudinal canals placed nearer the surface of the bone: All this contrivance is, that the *Marrow* may supply the fibres of the bones, and render them less apt to break.

The ancients imagined, that *Marrow* served for nourishment to the bones: but later observations have found blood-vessels in the bones; so that it appears the bones are nourished in the same manner as the other parts of the body. Besides, we find many bones which grow, and yet have no *Marrow* in them; witness the horns of the deer, lobsters claws, &c. See *MEDULLA*.

**MARS**, in astronomy, one of the five planets, and of the three superior ones; its place being between the Sun and Jupiter. See *PLANET*, and *SYSTEM*.

Its character is ♂. Its mean distance from the sun is 1524 of those parts, whereof the distance of the sun from the earth is 1000. Its excentricity 141. The inclination of its orbit, that is, the angle formed by the plane of its orbit with the plane of the ecliptic, 1 degree 52 minutes. The periodical time, in which it makes its revolution round the sun, 686 days, 23 hours. Its revolution about its own axis, is performed in 24 hours, 40 minutes.

For the diameter of *Mars*, see *DIAMETER*, and *SEMI-DIAMETER*.—For its density, see *DENSITY*.—For the force of gravity on its surface, see *GRAVITY*.

Its parallax, according to Dr. Hooke and Mr. Flamsteed, is scarce 30 seconds. See *PARALLAX*.

In the acronical rising of this planet, that is, when it is in opposition to the sun, it is found twice as near the earth as the

sun; which is a phenomenon that has extremely discredited the Ptolemaic hypothesis. See *ACRONICAL*.

Dr. Hooke, in 1665, observed several spots in *Mars*, which having a motion, he concluded the planet to turn round its centre. In 1666, M. Cassini observed several spots in the two faces or hemispheres of *Mars*, which, by continuing his different observations very diligently, he found to move by little and little from east to west, and to return in the space of 24 hours 40 minutes to their former situation.—Whence both the motion and period, or natural day of that planet, was determined. See *MACULÆ*, and *SPOTS*.

*Mars* always appears with a ruddy, troubled light; whence we conclude it is encompassed with a thick, cloudy atmosphere, which, by disturbing the rays of light in their passage and re-passage through it, occasion that appearance.

*Mars* having his light from the sun, and revolving round it, has an increase and decrease like the moon. It may also be observed, almost bisected, when in its quadratures with the sun, or in his perigæon, but never corniculated or falcated, as the inferior planets. See *PHASES*.

This planet's distance from the sun, is to the distance of the earth and sun, as  $1\frac{1}{2}$  to 1. So that a man placed in *Mars*, would see the sun's diameter less by one third than it appears to us, and consequently the degree of light and heat, which *Mars* receives from the sun, is less by one third than that received by the earth.—This proportion, however, will admit of a sensible variation, on account of the great excentricity of this planet.

Though the period or year of this planet, as has been already observed, is nearly twice as long as ours, and his natural day, or the time in which the sun appears above his horizon (setting aside the consideration of twilight) is almost every where equal to his night; yet it appears, that in one and the same place on his surface, there will be but very little variety of seasons, scarce any difference of summer and winter. And the reason is, that the axis of his diurnal rotation is nearly at right angles with the plane of his orbit. It will be found notwithstanding, that places situate in different latitudes, that is, at different distances from his equator, will have very different degrees of heat, on account of the different inclination of the sun's rays to the horizon; as it is with us, when the sun is in the equinoxes.

From this consideration, Dr. Gregory endeavours to account for the appearance of the *Fasciæ* in *Mars*; which are certain swathes or fillets seen in this planet, and posited parallel to his equator. For, as among us, the same climate has at different seasons very unequal degrees of heat; but in *Mars* it is otherwise, the same parallel having always a pretty equable degree of heat: it follows, that these spots may probably be formed in *Mars*, or his atmosphere, as snow and clouds are in ours; viz. by the constant different intensions of heat and cold in the different parallels; and so come to be extended in circles or belts parallel to his equator, or the circle of his diurnal revolution. And this same principle may, perhaps, solve the phenomenon of Jupiter's belts; that planet, like *Mars*, having a perpetual equinox. See *JUPITER*.

Besides the ruddy colour of *Mars*, we have another argument of his being encompassed with an atmosphere, and it is this; that when any of the fixed stars are seen near his body, they appear extremely obscured, and almost extinct. If this be the case, an eye placed in *Mars* would scarce ever see Mercury, unless perhaps in the sun at the time of conjunction, when Mercury passes over his disk, as he sometimes appears to us in form of a spot. A spectator in *Mars* will see Venus about the same distance from the sun as Mercury appears to us; and the earth about the same distance from the sun, that to us Venus appears. And when the earth is found in conjunction with, and very near the sun, he will see in *Mars* what Cassini saw on the earth, viz. the earth appear horned or falcated, and its attendant the moon of the same figure, and at its utmost distance from the earth, not above 15 minutes of a degree.

**MARS**, among chemists, signifies iron; because imagined under the influence of that planet. See *IRON*.

Physical writers hold iron preferable for all medicinal purposes to steel, which is only a more hardened, compact iron, made so by art; whereby it is rendered more unfit to yield those principles or parts in preparation, which the physician requires to be drawn out. See *STEEL*, and *CHALYBEAT*.

*Crocus MARTIS*, rust of iron. See *CROCUS Martis*.

*Crystals of MARS*. See the article *CRYSTAL*.

*Tree of MARS*, *arbor Martis*. See *ARBOR*.

*Games of MARS*, were combats instituted at Rome in honour of the god *Mars*.

They were held twice in the year; once in the Circus, on the 4th of the ides of May; and a second time on the 1st of August. These latter were established some time after the other; in memory of the dedication of the temple of *Mars* on that day. These games consisted in courses of horses, and combats with wild beasts. Germanicus is said to have killed two hundred lions in the Circus on these occasions. See *FIELD of Mars*.

**MARSHAL\***, or **MARESCHAL**, **MARESCALLUS**, primarily denotes an officer who has the care, or the command of horses.

- \* Nicod derives the word from *Polemarchus*, master of the camp: Matthew Paris from *Martis Seneschallus*. In the old Gaulish language, *March* signified horse, whence *Mareschal* might signify him who commanded the cavalry. Spelman, Skinner, and Menage derive it from the German *Maer*, *Marre*, a mare, or even a horse, and *Schalk*, servant: which makes some imagine, the title was first given to farriers, or those who shod and bled horses; and that in succession of time, it passed to those who commanded them. Pasquier makes four several derivations for the four several kinds of *Marshals* in use among the French, viz. *Marshals* of France, *Marshals* de camp, *Marshals* de logis or quarter-masters, and farriers, who are called by the name of *Marshals*. The third he derives from *Marche* or *Marchir*, to mark, limit; and the last from *Maitre*, master, and *Cbal*, horse.

**Earl-MARSHAL** of England, one of the great officers of the crown, who takes cognizance of all matters touching honour and arms, determines contracts relating to deeds of arms out of the realm upon land, and matters concerning war within the realm, which cannot be determined by common law, in which he usually proceeds according to the civil law. This office is hereditary, having been for many ages in the house of Norfolk. It is discharged by deputy on account of the religion of the duke of Norfolk, hereditary *Earl-Marshal*, which renders him incapable of administering it in person. See **EARL**.

The *Earl-Marshal* had anciently several courts under him, but hath now only the *Marshalsea*, where he may sit in judgment against criminals offending within the verge of the court.

**Knight-MARSHAL**, or **MARSHAL** of the king's house, is an officer whose business, according to Fleta, is to execute the commands and decrees of the lord-steward, and to have the custody of prisoners committed by the court of verge.—Under him are six *Marshal's* men, who are properly the king's bailiffs, and arrest in the verge of the court, when a warrant is backed by the board of green-cloth. The court where causes of this kind, between man and man, are tried, is called the *Marshalsea*, and is under the *Knight-Marshal*. See **KNIGHT**. There are some other inferior officers of this name; as

**MARSHAL** of the justices in eyre;

**MARSHAL** of the king's bench, who has custody of the prison called the *king's bench*, in Southwark.

In Fleta mention is also made of a *Marshal of the exchequer*; to whom the court commits the custody of the king's debtors, &c.

**MARSHAL**, or **MARESCHAL**, of France, is the highest dignity, or preferment in the French armies. The dignity of *Marshal* is now for life, though at its first institution it was otherwise. They were then only the king's first ecuyers under the constable, but in time they became the constable's lieutenants in the command of the army, the constable himself being then become captain-general. At first they were but two in number, and their allowance was but 500 livres *per annum* in time of war, and nothing in time of peace. In the reign of Francis the first, their number was increased to five; since him it has been various: the late king increased it at pleasure; and it is now eleven. Their office at first was to *marshal* the army under the constable, and to command in his absence.

They did then what the *Marshals de camp* do now; to which last they have given their title, and the least considerable part of their authority.

The first *Marshal* does the office of constable in an assembly of the *Marshals*.

**Arch-MARSHAL.**

**Clerk-MARSHAL.**

**Provost-MARSHAL.**

} See the Article { **ARCH.**  
CLERK.  
PROVOST.

**MARSHALLING**, a coat, in heraldry, signifies the due and proper joining of several coats of arms belonging to distinct families in one and the same shield or escutcheon; together with their ornaments, parts, and appurtenances. See **ARMS**.

**MART**.—Letters of **MART**. See **LETTERS**.

**MARTIAL**, is sometimes used to express preparation of iron, or such as are impregnated therewith; as the *Martial* regulus of antimony, &c. See **IRON**, **REGULUS**, and **ANTIMONY**.

**MARTIALE Bezoardicum.** See **BEZOARDICUM**.

**MARTIAL Law**, is the law of war, depending upon the arbitrary but just power and pleasure of the king or his lieutenants. The king, though in times of peace he make no laws, but by common consent in parliament; yet in war he uses absolute power over the soldiery:—though even this power hath been vested of late years in the king, or his generals of the army, by act of parliament, and under particular restrictions too. See **LAW**.

**MARTII Campus.** See the articles **CAMPUS**, and **FIELD**.

**MARTINGALE**, a thong of leather fastened at one end to the girths under the belly of a horse, and at the other end to the noseband, to hinder him from rearing, or tossing up his head.

**MARTINS**.—St. **MARTIN's** cope. See **COPE**.

**MARTLET**, in heraldry, a little bird represented without feet, and properly also without beak.

It is used as a difference or mark of distinction of a younger

brother; some say, more peculiarly of the fourth brother, or family. See **DIFFERENCE**.

**MARTYR\***, a person who suffers torments, and even death, in defence of the truth of the gospel.

- \* The word is Greek μαρτυρ, and properly signifies a witness. It is applied, by way of eminence, to those who suffer in witness of the truth of the gospel.

Anciently those who were banished for the faith, were called *Martyrs*, as well as those who perished in the holy wars. In the time of St. Augustine, the title of *Martyr* was given to confessors, or those who were tortured for the faith without losing their lives.—It is Tertullian's thought, in his apologetic; *Plures effimur, quoties metimur; semen est sanguis christianus*. St. Stephen is called the *Proto-Martyr*, or first *Martyr*.—Nineteen thousand seven hundred are computed to have suffered *Martyrdom* with St. Irenæus at Lyons, under the empire of Severus. Six thousand six hundred and sixty six soldiers of the Theban legion are said to have been *martyred* in Gaul. Father Papebroch reckons sixteen thousand Abyssinian *Martyrs*, and an hundred and fifty thousand others under Diocletian alone.

Mr. Dodwell endeavours to prove, in a dissertation express, that the number of *Martyrs* who suffered under the Roman emperors, was very moderate; alledging, that those we have accounts of in the fathers, come within a very small compass; and that, excepting Nero and Domitian, the rest of the emperors made scarce any.—F. Ruinart, on the contrary, endeavours to prove, that the catalogue of *Martyrs* is not at all swelled; that the carnage was immense under the first emperors, and especially in that of Diocletian.—F. Papebroch, in his *Acta sanctorum*, makes the number of *Martyrs* infinite.

Scarce any faith or religion but pretends to its *Martyrs*: Mahometans, heathens, idolaters, &c. See **SAINTS**.

In the ancient church, the acts, sufferings and deaths of the *Martyrs* were preserved with a world of care; and yet, mau- gre all this diligence, we have but very little left of them. Eusebius indeed composed a martyrology, but it never reached down to us; and those since compiled, are extremely suspected. See **MARTYROLOGY**.

**Era of MARTYRS**, is an æra followed in Egypt, and Abyssinia; and which even the Mahometans, since their becoming masters of Egypt, frequently observe. It is fixed to the beginning of the persecution of Diocletian, *A. D.* 302 or 303.

The æra of *Martyrs* is also called the æra of Diocletian. See **EPOCHÆ**.

**MARTYROLOGY\***, a register or catalogue of martyrs. See **MARTYR**.

- \* The word comes from the Greek μαρτυρ, witness, and λεγω, dico, I speak, or λεγω, colligo, I gather.

A *Martyrology*, properly speaking, should contain no more than the name, place, and day of martyrdom of each saint; but the term is frequently extended to the histories of martyrs. The custom of collecting *Martyrologies*, is borrowed from the heathens, who inserted the names of their heroes into their *Fæsti*, to preserve to posterity the memory and example of their noble actions. Baronius gives pope Clement the credit of being the first who introduced the custom of collecting the acts of the martyrs. See **ACTS**.

The *Martyrology* of Eusebius of Cæsarea was the most celebrated in the ancient church; it was translated into Latin by St. Jerom: but the learned agree, that it is not now extant.—That attributed to Beda in the eighth century, is of very doubtful authority; the names of several saints being there found, who did not live till after the time of Beda.—The ninth century was very fertile in *Martyrologies*. Then appeared that of Florus, sub-deacon of the church at Lyons, who, however, only filled up the chafms in Beda. This was published about the year 830; and was followed by that of Waldenbertus, monk of the diocese of Treves, written in verse about the year 848: That of Usuard, a French monk, and wrote by command of Charles the Bald, in 875; which last is the *Martyrology* now ordinarily used in the Romish church: That of Rabanus Maurus, which is an improvement on Beda and Florus, written about the year 845: That of Notker, monk of St. Gal, written about the year 894.

The *Martyrology* of Ado, monk of Ferrieres in the diocese of Treves, afterwards archbishop of Vienne, is a descendant of the *Roman*, if we may so call it; for Du Sollier gives its genealogy thus: The *Martyrology* of St. Jerom is the great *Roman Martyrology*; from this was made the little *Roman*, printed by Rosweyd. Of this little *Roman Martyrology*, was that of Beda, augmented by Florus; Ado compiled his in the year 858. The *Martyrology* of Nevelon, monk of Corbie, written about the year 1089, is little more than an abridgment of that of Ado. Father Kircher makes mention of a Coptic *Martyrology*, preserved by the Maronites at Rome.

We have also several protestant *Martyrologies*, containing the sufferings of the reformed under the popes; viz. an English *Martyrology*, by J. Fox; with others by Clark, Bray, &c.

**MARTYROLOGY**, is also used in the Romish church for a roll or register kept in the vestry of each church, containing the names of all the saints and martyrs both of the universal

universal church, and of the particular ones of that city, or monastery.

MARTYROLOGY, is also applied to the painted or written catalogues in churches, containing the foundations, obits, prayers, and masses, to be said each day.

MARY.—*Knights of St. MARY*, is a name by which several orders of knighthood are distinguished.—As, *St. Mary of the thistle*. See THISTLE. *St. Mary of the conception*. See CONCEPTION. *St. Mary of the elephant*. See ELEPHANT. *St. Mary and Jesus*. *St. Mary of Loretto*. *St. Mary of mount Carmel*. See CARMEL. *St. Mary of the Teutonic*. See TEUTONIC, &c.

MASBOTHÆI\*, or MESBOTHÆI, the name of a sect, or rather of two sects; for Eusebius, or rather Hegesippus, whom he cites, make mention of two different sects of *Masbothæans*. The first are one of the seven sects that arose out of Judaism, and proved very troublesome to the church: The others were one of the seven Jewish sects before the coming of Jesus Christ.

\* The word is derived from the Hebrew שבת *Sabat*, to rest, or repose, and signifies idle, easy, indolent people. Eusebius speaks of them, as if they had been so called from one *Masbothæus*, their chief; but it is much more probable, that their name is Hebrew, or at least Chaldaic, signifying the same thing with a Sabbatharian in our language, that is, one who makes profession of keeping sabbath.

Valesius will not allow the two sects to be confounded together: the last being a sect of Jews before, or at least cotemporary with Christ; and the former a sect of heretics descended from them. Rufinus distinguishes them in their names: The Jewish sects he calls *Masbuthæi*, and the heretics *Masbuthæani*.—The *Masbuthæans* were a branch of the Simonians.

MASCLE, or MACLE, in heraldry, a bearing in form of a lozenge, and voided of the field, that is, its inner part being cut out.—See *Tab. Herald. fig. 24*.

He bears gules a chevron ermin between three *Mascles* argent, by the name of *Bellgrave*.

According to Guillim, the *Mascle* represents the mesh of a net, and is an honourable bearing. It only differs from a lozenge, by being voided. See LOZENGE.

MASCULINE, something belonging to the male, or the stronger of the two sexes. See MALE.

MASCULINE, is more ordinarily used in grammar to signify the first and worthiest of the genders of nouns. See GENDER. The *Masculine* gender is that which belongs to the male kind, or something analogous to it.

Most substantives are ranged under the heads of *Masculine* or feminine.—This, in some cases, is done with a shew of reason, but in others is merely arbitrary; and for that reason, is found to vary according to the languages, and even according to the words introduced from one language to another.—Thus the names of trees are generally feminine in Latin, and *Masculine* in the French.

Farther, the genders of the same word are sometimes varied in the same language. Thus *alvus*, according to Priscian, was anciently *Masculine*, but is now become feminine. And *navire*, a ship, in French, was anciently feminine, but is now *Masculine*.

MASCULINE rime, in the French poetry, is that made with a word which has a strong, open, and accented pronunciation; as all words have, excepting those which have an *e* feminine in their last syllable. See RIME.

For instance, *amour* and *jour*, *mort* and *fort*, are *Masculine* rimes; —and *pere* and *mere*, *gloire* and *memoire* are feminine. Hence also verses ending with a *Masculine* rime, are called *Masculine* verses, and those ending with a feminine rime feminine verses. See VERSE.

It is now a rule established among the French poets, never to use above two *Masculine*, or two feminine verses successively, except in the looser kinds of poetry.

Marot was the first who introduced this mixture of *Masculine* and feminine verses, and Ronfard was the first who practised it with success. The *Masculine* verses should always have a syllable less than the feminine ones.

MASCULINE Signs—Astrologers divide the signs into *Masculine* and feminine; by reason of their qualities, which are either active, and hot, or cold, accounted *Masculine*; or passive, dry, and moist, which are feminine.

On this principle they call the Sun, Jupiter, Saturn, and Mars, *Masculine*: and the Moon and Venus, feminine. Mercury, they suppose, partakes of the two. Among the signs, Aries, Libra, Gemini, Leo, Sagittarius, Aquarius, are *Masculine*: Cancer, Capricornus, Taurus, Virgo, Scorpio, and Pisces, are feminine.

MASK, or MASQUE. See the article MASQUE.

MASON\*, a person employed usually under the direction of an architect, in the raising of a stone building. See MASONRY.

\* The word comes from the French *Mason*, which signifies the same. Some derive this further from the barbarous Latin *Machio*, a machinist, in regard these artificers are obliged to use machines for raising walls. Du Cange derives it from *Maceria*, a name given to the long fence-walls which inclose vineyards, &c. in which *Masons* are supposed to have been first employed: *Mason est Maceriarum constructor*. M Huet derives it from *Mas*, an old word, signifying house; hence *Mason* is a person who makes *Mas*'s, that

is, houses. In the corrupt Latin, a *Mason* was called *magister comacinus*, which Lindenbroeck derives from Comacina, an island in Romania, where, in the time of the Lombards, the best architects were found.

The chief business of a *Mason*, is to prepare the mortar, raise the walls from the foundation to the top, with the necessary retreats and perpendiculars, from the vaults, and employ the stones as delivered to him.

When the stones are large, the business of hewing or cutting them belong to the stone-cutters; though these are frequently confounded with the *Masons*.—The ornaments of sculpture are performed by carvers in stone, or sculptors.—The tools or implements principally used by *Masons* are, the square, level, plumb-line, bevel, compass, hammer, chissel, mallet, saw, trowel, &c. See SQUARE, LEVEL, &c.

Besides the common instruments used in the hand, they have likewise machines for the raising of great burthens, the conducting of large stones, &c. The principal of these are the lever, wheel, pully, &c. See WHEEL, &c.

Free, or Accepted MASONS, a very ancient society, or body of men, so called either from some extraordinary knowledge of masonry or building, which they are supposed to be masters of, or because the first founders of the society were persons of that profession.

They are now very considerable both for numbers and character; being found in every country in Europe, and consisting principally of persons of merit and consideration. As to antiquity, they lay claim to a standing of some thousand years; and, it is said, can trace up their original as early as the building of Solomon's temple.

What the end of their institution is, seems still, in some measure, a secret; though so much of it as is known, appears laudable enough, as it tends to promote friendship, society, mutual assistance, and good fellowship.

The brothers of this family are said to be possessed of a great number of secrets, which have been religiously observed from age to age.—Be their other virtues therefore what they will, it is plain they are masters of one in a very great degree, viz. secrecy.

MASONRY, a branch of architecture, consisting in the art of hewing, or squaring stones, and cutting them level, and perpendicular, for the uses of building. See ARCHITECTURE.

MASONRY, in a more limited sense of the word, is the art of assembling and joining stones together with mortar. See COLUMN.

Hence there arise as many different kinds of *Masonry*, as there are different forms and manners of laying, or joining the stones. Vitruvius makes mention of seven kinds of *Masonry* among the ancients; three of hewed stone, viz. that in form of a net, that in binding, and that called the *Greek Masonry*: and three of unhewed stones, viz. that of an equal course, that of an unequal course, and that filled up in the middle. The seventh was a composition of all the rest.—See *Tab. Architect. fig. 13. to 19*.

Net MASONRY, called by Vitruvius, *reticulatum*, from its resemblance of the meshes of a net, consists of stones squared in their courses, and so disposed, as that their joints go obliquely, and the diagonals are, the one perpendicular, and the other level. This is the most agreeable *Masonry* to the eye, but is apt to crack.—See *fig. 13*.

Bound MASONRY, *Inferta*, is that wherein the stones were placed one over another, like tiles; the joints of the beds being level, and the mounters perpendicular. So that the joint that mounts and separates two stones, falls directly over the middle of the stone below. This is less beautiful than the network, but more solid and durable.—See *fig. 15*.

Greek MASONRY, according to Vitruvius, is that where, after we have laid two stones, each of which makes a course, another is laid at the end, which makes two courses; and the same order observed throughout the building.—This may be called *double binding*, in regard the binding is not only of stones of the same course with one another, but likewise of one course with another course.—See *fig. 14*.

MASONRY by equal courses, by the ancients called *isodorum*, differs in nothing from the bound *Masonry*, but only in this, that its stones are not hewn.—See *fig. 16*.

MASONRY by unequal courses, called *pseudisodorum*, is also made of unhewed stones, and laid in bound work: but then they are not of the same thickness, nor is there any equality observed, excepting in the several courses; the courses themselves being unequal to each other.—See *fig. 17*.

MASONRY filled up in the middle, called by the ancients, *emplecton*, is likewise made of unhewed stone, and by courses; but the stones are only set in order as to the courses, the middle being filled up with stones thrown in at random among the mortar.—See *fig. 18*.

Compound MASONRY, is of Vitruvius's proposing; so called, as being formed of all the rest. In this, the courses are of hewn stone, and the middle being left void, is filled up with mortar and pebbles thrown in together. After this the stones of one course are bound to those of another course, with cramp-irons fastened with melted lead.—See *fig. 19*.

All

All the kinds of *Masonry* now in use may be reduced to these five, viz. *Bound Masonry*; that of *Brick-work*, where the bodies and projectures of the stones inclose square spaces or panels, &c. set with bricks: That *de moilon*, or small work, where the courses are equal, well squared, and their edges or beds rusticated: That where the *courses* are *unequal*; and that filled up in the middle with little stones and mortar.

**MASONRY**, is sometimes also used in a more general and unlimited sense; so as, besides proper *Masonry*, to include the hewing or sawing of larger stones to fit them for building, properly called *Stone-cutting*; and the carving of the ornaments on the members and mouldings, properly called *sculpture*. See **SCULPTURE**.

**MASQUE**, or **MASK**, a cover for the face, contrived with apertures for the eyes and mouth; worn chiefly by women of condition, either to preserve their complexion from the weather, or out of modesty, to prevent their being known. Poppæa, wife of Nero, is said to be the first inventor of the *Masque*; which she did to guard her complexion from the sun and weather, as being the most delicate woman, with regard to her person, that has been known.—Brantome observes, that the common use of *Masques* was not introduced till towards the end of the sixteenth century.

**MASQUE**, is also used to signify any thing used to cover the eyes, and to prevent a person's being known.

The penitents of Lyons and Avignon hide their faces with large white veils, which serve them for *Masques*. See **VEIL**.

**MASQUE**, in architecture, is applied to certain pieces of sculpture, representing some hideous forms, grotesque, or satyrs faces, &c. used to fill up and adorn vacant places, as in freezes, the pannels of doors, keys of arches, &c. but particularly in grottos.

**MASQUERADE**\*, or **MASCARADE**, an assembly of persons, masked, or disguised; meeting to dance, and divert themselves. This is a very common practice abroad, especially in carnival time. See **CARNIVAL**.

\* The word comes from the Italian *Mascarata*, and that from the Arabic *Masfara*, which signifies raillery, buffoonery.

**MASS**, **MASSA**, in mechanics, the matter of any body cohering with it, i. e. moving and gravitating along with it. See **BODY**. In which sense, *Mass* is distinguished from bulk, or volume, which is the expansion of a body in length, breadth, and thickness. See **MATTER**.

The *Mass* of any body is rightly estimated by its weight. And the *Masses* of two bodies of the same weight are in a reciprocal ratio of their bulks. See **MOTION**, **WEIGHT**, **MOMENT**, and **MEASURE**.

**MASS**\*, or **MESSE**, **MISSA**, in a religious sense, denotes the office, or public prayers made in the Romish church, at the celebration of the eucharist. See **EUCCHARIST**.

\* Nicod, after Baronius, observes that the word comes from the Hebrew, *Missach*, *oblatus*; or from the Latin *Missa*, *Missorum*; because in the former times, the catechumens and excommunicated were sent out of the church, when the deacon said, *Ite, missa est*, after sermon, and reading of the epistle and gospel; they not being allowed to assist at the consecration. See **CATECHUMEN**. Menage derives the word from *Misso*, dismissing: Others from *Missa*, mission, sending; because in the *Mass*, the prayers of men on earth are sent up to heaven.

Romish divines define the *Mass*, an oblation made to God, wherein, by the change of a sensible object by virtue of a divine institution, the sovereign dominion of God over all things is acknowledged.

This they esteem the greatest and most august ceremony in use in the church; as being the sacrifice of the new law, wherein the body and blood of Jesus Christ are offered up to God.

They are divided about the question, Whether or no it be proper or allowable for the same person to celebrate *Mass* several times in one day? having the authority of pope Leo in his letter to Dioscorus for the affirmative side of the question, and that of several of the councils for the negative.

There are a great variety of *Masses* in the Romish church; the thing acquiring new titles, and appellations, according to the different rites, intentions, and manners, in which it is performed as well as other circumstances.—Thus they have an *Ambrosian Mass*, celebrated according to the rite of St. Ambrose; particularly used in Milan.

*English Mass*, was the form which anciently obtained in England.

*Gallican Mass*, is the rite that formerly obtained in the churches of France.

*Greek Mass*, is that rehearsed according to the Greek rites, in the Greek language, and by Greek priests.

*Latin Mass*, is that used in the Latin church, in the Latin tongue, and according to the rites of the Latin church.

*High Mass*, called also *Grand Mass*, is that sung by the choir, and celebrated with the assistance of a deacon and subdeacon.

*Low Mass*, is that wherein the prayers are all barely rehearsed without any singing, and performed without much ceremony, or the assistance of any deacon or subdeacon.

*Mass of the Beata*, or *our lady*, is that offered to God by the means, and through the intercession of the virgin.

*Beau Mass*, is a *Mass* rehearsed every day, at which the ladies

and *Beau-morde* of the place attend.—This is also called the *perfumed Mass*.

*Common Mass*, or *Mass of the community*, in a monastery, is that celebrated at certain hours, whereat the whole body assists. *Mass of the Holy Ghost*, is that celebrated at the beginning of any solemnity or church assembly, commencing with an invocation of the *Holy Ghost*.

*Holy-day Mass*, is that wherein certain prayers, or lessons are read suitable to the day.

*Mass of Judgment*, was that wherein a person cleared himself of any calumny by some proof agreed upon. See **JUDGMENT**.

*Mass for the death of our enemies*, was a form that obtained a long time in Spain, but was at length abolished as inconsistent with Christian charity.

*Mass of the dead*, or *requiem*, is that performed at the request of the deceased: the introit whereof begins with *requiem*.—

In the thirteenth century, it was the custom, ere criminals were carried out to execution, to make them attend at a *Mass of the dead*, rehearsed for the repose of their souls.

*Parish Mass*, or *Great Mass*, is that which the parson is obliged to rehearse to his parishioners on Sundays and holy-days.

*Little Mass* is that said at private altars with less ceremony.

The first *Mass* is that said at break of day.

*Mass of a saint*, is that wherein God is invoked by the intercession of some saint.

Thus there are also *Masses* of apostles, martyrs, pontiffs, virgins, &c.

*Mass of scrutiny*, was formerly rehearsed at the examination of catechumens, when enquiry was made as to their disposition for baptism.

*Dry Mass*, is that where there is no consecration; as that, according to Durandus, where the priest cannot consecrate, by reason of his having said *Mass* before on the same day: or that used by the candidates of the priesthood, in order to their becoming acquainted with the ceremonies; as Eckius will have it.

*Votive Mass*, is an extraordinary *Mass* besides that of the day, rehearsed on some extraordinary occasion.

*Candle-Mass*. } See the article { *Candle-mass*.  
*Childer-Mass*. } *Childer-mass*.  
*Christ-Mass*. } *Christ-mass*.

**MASSSES**, in painting, denote those parts of a picture which contain great lights or great shadows. See **CLAIROSCURE**.

When it is almost dark, we only see the *Masses* of a picture; i. e. the places of the greatest lights and shadows.

**MASSALIANS**, **MASSALIANI**, certain sectaries, so called from a Hebrew word, signifying prayer; it being their distinguishing tenet, that a man is to be continually in prayer.

The Greeks call them *Euchitæ*, *ευχισταί*, which in their language signified the same thing. See **EUCHITÆ**.

St. Epiphanius distinguishes two kinds of *Massalians*, the *ancient* and the *new*.

The *ancient*, according to him, are neither Jews, Christians, nor Samaritans, but pure Gentiles; who owning several gods, adore only one, whom they call Almighty. They had oratories like our churches, where they used to meet, to pray and sing hymns in honour of God; their oratories being finely illuminated with lamps and flambeaux.—This description of St. Epiphanius comes so near the practice of the Esseni, that Scaliger thinks the two sects ought not by any means to be distinguished. See **ESSENI**.

For the *New Massalians*, who were by profession Christians, their rise was not till about the time of St. Epiphanius. Their doctrine was, that prayer alone was sufficient to salvation.—Many monks, who loved a life of laziness, and were averse to labour, joined the *Massalians*.

**MASSETER**, in anatomy, a triangular two-headed muscle, which surrounds the lower jaw, and helps to pull it upwards in eating. See **MAXILLA**.

The *Masseter* is thick and short, arising from the Zygoma, and from the first bone of the upper jaw, and is inserted into the lower edge of the lower jaw, from its external angle to its middle. Its fibres run in three directions; those from the Zygoma obliquely to the middle of the jaw, and those from the upper bone of the first jaw cross the former, and run to the angle of the lower jaw; and the fibres that are in its middle, run perpendicularly from their origin to their insertion.—See *Tab. anat. (myol.) fig. 1. n. 11. fig. 6. n. 6. fig. 7. n. 3.*

**MASSIVE**, something heavy and solid; in opposition to tenderness, and delicacy. See **SOLIDITY**.

Thus we say, a building is too *massive*; that is, its walls are too thick; a wall is *massive*; that is, the lights and openings are too small in proportion.

*Massive column*, is that which is too short for the order whose capital it bears. See **COLUMN**.

**MASSORA**, a term in the Jewish theology, signifying a work on the bible performed by several learned rabbins, to secure it from any alterations which might otherwise happen; and to serve, according to their expression, as a *hedge to the law*. See **BIBLE**.

Buxtorf defines the *Massora* a critique on the Hebrew text, contrived by the ancient Jewish doctors, in which they have numbered the verses, words and letters of the text, and marked all the variations of it.

The

The text of the sacred books, it is to be observed, was originally written without any breaks, or divisions into chapters, or verses, or even into words: so that a whole book in the ancient manner, was but one continued word; of which kind we have still several ancient manuscripts both Greek and Latin. In regard therefore the sacred writings had undergone an infinite number of alterations, whence various readings had arisen; and the original was become much mangled, and disguised; the Jews had recourse to a canon, which they judge infallible, to fix and ascertain the reading of the Hebrew text: and this rule they call *Massora*, tradition; as if this critique were nothing but a tradition, which they had received from their forefathers.

According to Elias Levita, it was the Jews of a famous school at Tiberias, who composed, or at least begun the *Massora*, whence they are called *Massoretes*, and *Massoretic doctors*. Aben Esra makes them the authors of the points and accents in the Hebrew text, as we now find it, and which serve for vowels. See POINT, and ACCENT.

The Arabs have done the same thing by their alcoran, that the *Massoretes* have done to the bible: Nor do the Jews deny their having borrowed this expedient from the Arabs, who first put it in practice in the seventh century. See ALCORAN.

There is a *great*, and a *little Massora*, printed at Venice, and at Basil, with the Hebrew text in a different character.—Buxtorf has written a *Massoretic* commentary, which he calls *Tiberias*.

**MASSORETES**, Jewish doctors, authors of the *Massora*. See MASSORA.

**MAST** of a forest, the fruit of a species of trees, called *Glandiferous*, or *Mast-bearing*; as beech, oak, chestnut, &c. See GLANDIFEROUS.

**MAST**\*, in navigation, a large pole, or long piece of round wood, raised in vessels, for the yards and sails to be fastened to, in order to their receiving the wind necessary for navigation. See SHIP, SAIL, YARD, NAVIGATION, &c.

\* The word *Mast* signifies the same thing in French, High-Dutch, Flemish, and English: The Italians say *albero*, and the Spaniards *mastil*.

In large vessels, the number of *Masts* is four. Their names are, the *Main-Mast*, the *Fore-Mast*, the *Mizen-Mast*, and the *Boltsprit*. To which some add a fifth, viz. a *Counter-Mizen*. *Main-Mast*, is the chief *Mast*, standing upright in the middle, or waist of the vessel; it bears the main-yard and main-sail. *Fore-Mast* is between the *Main-Mast* and the head. See FOREMAST.

*Mizen-Mast* is between the *Main-Mast* and the stern. See MISSEN.

The *Boltsprit* lies upon the beak, in the prow, or head of the ship. See BOLTSPRIT.

The *Counter-Mizen*, in large vessels and gallions, is in the stern.—See *Tab. Ship. fig. 1. n. 1. 19, 38, 81.*

We also use the word *Mast* to signify those divisions or additional pieces in the *Masts*, placed over one another. The *Main-Mast*, and *Fore-Mast*, have each of them two, viz. the *Main Mast*, *Main-Top-Mast*, *Main-Gallant-Mast*; the *Fore-Mast*, *Fore-Top-Mast*, *Fore-Top-Gallant-Mast*. The *Mizen-Mast* has one, viz. the *Mizen-Top-Mast*.

For the proportion of *Masts*, Sir H. Manwaring gives these rules: Whatever the breadth of a ship be in feet, multiply  $\frac{1}{2}$  of that breadth by 3, the product is the length of her *Main-Mast* in feet. Thus if a ship be 30 feet at the midship-beam  $\frac{1}{2}$  of 30 is 15; therefore that ship's *Main-Mast* must be 45 yards, or 72 feet in length. Then for its bigness, he allows an inch to every yard in length, and therefore this *Mast* must be 24 inches through, or thick. The *Fore-Mast* of a ship must be  $\frac{2}{3}$  of the length of the *Main-Mast*, that is, in this case, 19 yards  $\frac{1}{2}$ , and thick or through it must be near 20 inches. The *Boltsprit* is always the same length and bigness with the *Fore-Mast*; and the *Mizen-Mast* must be just half the length of the *Main-Mast*, and half as thick.

Heel of a MAST. } HEEL.  
Jury-MAST. } See the article } JURY.  
Spring a MAST. } SPRING.

**MASTER**, a title given to several officers, and persons of authority, and command: particularly, to the chiefs of the orders of knighthood, &c.

Thus we say, the grand *Master* of Malta, of St. Lazarus, of the golden fleece, of the free masons, &c. See MALTA, LAZARUS, &c.

**MASTER**, **MAGISTER**, was a title frequent among the Romans: They had their *Master* of the people, *Magister populi*, who was the dictator.—*Master* of the cavalry, *Magister equitum*, who held the second post in an army after the dictator.—Under the later emperors, there were also *Masters* of the infantry, *Magistri peditum*.—A *Master* of the census, *Magister census*, who had nothing of the charge of a censor or sub-censor, as the name seems to intimate; but was the same with the *Præpositus frumentariorum*.

**MASTER** of the militia, *Magister militiæ*, was an officer in the lower empire, created, as it is urged, by Diocletian, who had

the inspection and government of all the forces, with power to punish, &c. somewhat like a constable of France.

At first there were two of these officers instituted; the one for the infantry, and the other for the cavalry; but the two were united into one under Constantine. Afterwards, as their power was increased, so was their number too; and there was one appointed for the court, another for Thrace, another for the East, and another for Illyria. They were afterwards called *Comites*, counts, and *Clarissimi*. Their power was only a branch of that of the *Præfatus prætorii*, who by that means became a civil officer.

**MASTER** of arms, *Magister armorum*, was an officer or controller under the *Master* of the militia.

**MASTER** of the offices, *Magister officiorum*, had the superintendence of all the officers of the court. He was also called *Magister officii palatini*, simply *Magister*, and his post *Magisteria*.—This officer was the same in the western empire with the *Curopolates* in the eastern.

**MASTER**, in fine, in the Roman history and laws, is used for every officer, who is the chief of his kind; and has others of the same species, or that have the same functions, under him.

—In Latin, *Magister*, and oftentimes *Proximus*, or *Primicerius*. See PRIMICERUS.

**MASTER** of the Armory, is an officer who has the care and oversight of his majesty's arms, and armory. See ARMS, and ARMORY.

**MASTER** of Arts, the first degree taken up in foreign universities, but the second in ours; candidates not being admitted to it till they have studied in the university seven years. See DEGREE, BACHELOR, DOCTOR, &c.

**MASTER** of the Ceremonies, is an officer instituted by king James the first, for the more solemn and honourable reception of embassadors, and strangers of quality, whom he introduces into the presence.

The badge of his office is a gold chain and medal, having on one side an emblem of peace, with king James's motto; and on the reverse an emblem of war with *Dieu & mon droit*. He is always supposed to be a person of good address, and master of languages: He is constantly attending at court, and hath under him an assistant *Master*, or deputy, who holds his place during the king's pleasure.

There is also a third officer, called *Marshal of the Ceremonies*, whose business is to receive and distribute the *Master's* orders, or the deputy's, for the service; but without their order he can do nothing.—This is in the king's gift. See MARSHAL.

**MASTERS** of Chancery, are usually chosen out of the barristers of the common law, and sit in chancery, or at the rolls, as assistants to the lord chancellor, and master of the rolls.

To them is also committed interlocutory reports, stating of accounts, taxing costs, &c. And sometimes, by way of reference, they are empowered to make a final-determination of causes.

They have, time out of mind, had the honour to sit in the lords house, though they have neither writs, nor patent to empower them; but as assistants to the lord chancellor, and master of the rolls. They had anciently the care of inspecting all writs of summons, which is now performed by the clerk of the petty-bag. When any message is sent from the lords to the commons, it is carried by the *Masters of Chancery*. Before them affidavits are made, and deeds and recognizances acknowledged. See CHANCERY.

Besides these, who may be called *Masters of Chancery ordinary*, (being twelve in number, whereof the master of the rolls is reputed the chief) there are also *Masters of Chancery extraordinary*, appointed to act in the several counties of England beyond ten miles distance from London, by taking affidavits, recognizances, &c. for the ease of the suitors of the court.

**MASTER** of the court of Wards and Liveries, was the chief officer, and judge of that court, who kept the seal of it, and was named and assigned by the king.

But this court, and all its officers, members, power, and appurtenances, is taken away by a statute made 12 Car. II. c. 24. See WARD.

**MASTER** of the Faculties, an officer under the archbishop of Canterbury, who grants licences and dispensations: he is mentioned in the statute 22, 23 Car. II. See the article FACULTY.

**MASTER-Gunner** of England. See the article GUNNER.

**MASTER** of the Horse, a great officer of the crown, to whom is committed the charge of ordering and disposing all matters relating to the king's stables, races, and breed of horses, as he had anciently all the posts in England.

He hath a power of commanding the equeuries, and all the other officers and tradesmen employed in the king's stables; to all which he gives, by his warrant to the avener, the oath of allegiance, &c. for the faithful discharge of their duty. He has the peculiar privilege of making use of any horses, pages, or footmen, belonging to the king's stables; so that his coaches, horses, and attendants are the king's, and have the king's arms and liveries.

**MASTER** of the Household, is an officer under the lord-steward of

M A S

the household, and in the king's gift: His business is to survey the accounts of the household. See **HOUSEHOLD**.  
Anciently the lord-steward himself was called *Grand Master of the Household*. See **STEWARD**.

**MASTER of the Jewel-house**, is an officer of the king's household, who has charge of all the gold and silver plate used at the king's table, or that of any officer attending the court; and of all plate remaining in the tower of London; as also of chains and loose jewels, not fixed to any garment. See JEWEL.

MASTER of the Mint, was anciently the title of him who is now called *Warden of the Mint*; whose office is to receive the silver and bullion, which comes to the mint to be coined, and to take care thereof. See MINT.

MASTER of the Ordnance, a great officer, to whose care all the king's ordnance and artillery is committed. See ORDNANCE.

**MASTER of the Revels**, an officer, whose business is to order all things relating to the performance of plays, masks, balls, &c. at court. Formerly he had also a jurisdiction of granting licences to all who travel to act plays, puppet-shows, or the like diversions: neither could any new play be acted at either of the two houses, till it had passed his perusal and licence. But these powers are much abridged, not to say annihilated, by a late statute for regulating play-houses.

**MASTER of the Robes.** See the article ROBES.

**MASTER** *of the Rolls*, a patent officer for life; who has the custody of the rolls and patents which pass the great seal, and of the records of the chancery. See CHANCERY.

In the absence of the lord-chancellor, or keeper, he also sits as judge in the court of chancery; and is, by Sir Edward Coke, called his *assilant*. See CHANCELLOR.

At other times he hears causes in the rolls chapel, and makes orders and decrees. — He is also the first of the masters of chancery, and hath their assistance at the rolls: but all hearings before him are appealable to the lord-chancellor.

He hath also his writ of summons to parliament, and sits next to the lord chief justice of England, on the second woolpack.

He hath the keeping of the parliament-rolls, and the rolls house for his habitation ; as also the custody of all charters, patents, commissions, deeds, recognizances, which being made of rolls of parchment, gave rise to the name. Anciently he was called *Clerk of the Rolls*.

In his gift are the six clerks in chancery, the examiners, three clerks of the petty-bag, and the six clerks of the rolls chapel, where the rolls are kept. See ROLLS, CLERK, &c.

**MASTER** *of a Ship*, an officer, to whom is committed the direction of a merchant-vessel; who commands it in chief, and is charged with the merchandizes aboard.

In the Mediterranean, the *Master* is frequently called *Patron*, and in long voyages *Captain*. See CAPTAIN.

It is the proprietor of the vessel that appoints the *Master*; and it is the *Master* provides the equipage, hires the pilots, sailors, &c.—The master is obliged to keep a register of the seamen and officers, the terms of their contract, the receipts and payments, and in general, every thing relating to his commission. See SHIP.

**MASTER of the Temple.**—The founder of the order of the Templars, and all his successors, were called *Magni Templi Magistri*; and ever since the dissolution of the order, the spiritual guide and director of the house is called by that name. See **TEMPLE, TEMPLAR.**

**MASTER of the Wardrobe**, an officer in the lord-chamberlain's district, who has the direction of all the royal robes ; as those of the coronation, St. George's feast, the parliament-robes : as well as of the wearing apparel, collar of SS's, George and garter, &c.

He has also the charge and custody of all former kings and queens robes remaining in the Tower; all hangings, bedding, &c. for the king's house; the charge and delivery of velvet and scarlet allowed for liveries.

He has under him a clerk of the robes, and wardrobe-keeper, a yeoman, &c. See **WARDROBE**.

*Burgher-MASTER.* } See the article { *BURGHER.*  
*Fire-MASTER.* } { *FIRE.*  
*Quarter-MASTER.* } { *QUARTER.*

MASTER-*Arch.* See the article ARCH.

MASTER-*Vault*. See the article VAULT.

**MASTER-PIECE**, an exquisite, or extraordinary work or performance, in any art or science.

MASTER-PIECE, *Chef d'œuvre*, is particularly used among the French, for a work, which those who aspire to be admitted master in any art or trade, are to perform in presence of the masters or jurands of that company, by way of specimen of their capacity.

The *Master-Piece* of a carpenter, is a rampant curve of a staircase, the spiral well adjusted with the descent : That of a joiner, a flat-bottom chest, or a door-case, or a mantle-tree : That of a tiler, a lathern well conducted in the fourchette, with a ridge : That of a plumber, a little cistern *a cul de lampe* : That of a glazier, a pair of compartments of glasses of several colours, hollowed, incaltrated : That of paviors, a rose in a free-stone or flint-pavement : That of a cordwainer, a turn-up shoe, &c.

**MASTIC\***, or **MASTICK**, ΜΑΣΤΙΧΗ, a clear and sweet re-

## M A T

linous gum, issuing from the trunk and large branches of the *Mastic-trees*, or *lentiscus*, either without, or with, incision. See **LENTISCUS**.

\* It has its name *Mastic* from *masticare*, to chew, by reason of its being continually chewed by the Turks, especially the women.

*Mastic* is temperate in heat, and of a dry, binding quality; so that it strengthens the stomach, stays vomiting, stops issues of blood, and tickling coughs and catarrhs. It strengthens the reins, and is a good cleanser, and is for that reason prescribed in feminal weaknesses.

The jewellers mix *Mastic* with turpentine and black ivory, and lay it under their diamonds, to give them a lustre.

*Mastic* is chiefly the product of *Clio*; the trees that yield it are cultivated with as much care as the vines. It brings in a revenue of eighty thousand ducats *per annum* to the Grand Signior.—There is also a kind of black *Mastic* brought from Egypt, which serves to sophisticate camphor. The gum *Mastic* is in small granules, and white if good; though age makes it turn yellowish.

**MASTICATION**, **MASTICATIO**, in medicine, the action of chewing; or of agitating the solid parts of our food between the teeth, by means of the motion of the jaws, the tongue, and the lips; whereby it is broke into small pieces, impregnated with saliva, and so fitted for deglutition, and a more easy digestion in the stomach. See **DIGESTION**, **CHYLIFICATION**, **DEGLUTITION**, &c.

The mixture of saliva with the food, is of absolute necessity; for the saliva imbibed within the parts, dissolves the salts hid in them; and by so doing, prepares the food for fermentation in the stomach: The food therefore has the beginning of its digestion from the saliva, and its conclusion from the ferment in the stomach. See SALIVA, FERMENTATION, &c.

**MASTICATORIES, MASTICATORIA**, in medicine, are such remedies as are taken in at the mouth, and chewed; in order to promote the evacuation of the salival humour; as tobacco, ginger, pepper, sage, rosemary, thyme, mastic, &c.

MASTOIDES\*, ΜΑΣΤΟΕΙΔΗΣ, in anatomy, the same with *Mammillaris*. See MAMMILLARIS.

\* The word comes from the Greek *μασος*, nipp'e, dug, and *ειδος*, *imago*, figure.

**MASTOIDES** is applied to such processes in the body, as have the appearance of breasts or dugs; arising from a broad basis, and terminating in an obtuse top.

MASTOIDES is sometimes also applied to those muscles which stoop the head; proceeding from the neck-bone, and breast-bone, and terminating in the process mammiformis.

MATCH, a kind of rope slightly twitted, and prepared to retain fire, for the uses of artillery, mines, fire-works, &c.

It is made of hempen tow, spun on the wheel like cord, but very slack; and is composed of three twists, which are afterwards again covered with tow; so that the twists do not appear: lastly, it is boiled in lees of old wines; whence its colour.—This, when once lighted at the end, burns on gradually and regularly, without ever going out, till the whole be consumed.

Since fuses have been introduced in lieu of *Match-lock* mufkets, the confumption of *Match* has been much lefs confiderable than before.

MATER *Tenuis*, or *Pia* MATER. See MENINGES, and PIA.  
MATER *Dura*. See also MENINGES, and DURA.

**MATERIA, MATTER.** See the article **MATTER.**  
**MATERIA subtilis**, denotes a fine subtle matter, which the Cartesians suppose to pervade and penetrate, freely, the pores of all bodies, and to fill up all their pores, so as not to leave the least vacuity or interstice between them. See **CARTESIANISM.** This machine they have recourse to, to support the doctrine of an absolute plenum, and to make it consistent with the phenomena of motion, &c. and accordingly make it act and move at pleasure; but in vain: for were there any such matter, in order for it to be able to fill up the vacuities of other bodies, it must, itself, be entirely void of any, *i. e.* be perfectly solid, (see **SOLIDITY**) vastly more solid than gold, and therefore more ponderous, and resist vastly more: (see **RESISTANCE**.) which is inconsistent with phenomena. See **VACUUM** and **PLENUM.** Yet Sir Isaac Newton allows of the existence of a *subtile Matter*, or medium, vastly finer than air, penetrating the closest bodies, and contributing to the production of many of the phenomena of nature.—The existence of such a matter he argues from the experiment of two thermometers, which being inclosed in glass vessels, ‘one of them exhausted of its  
‘air, and both carried from a cold to a warm place, the thermometer *in vacuo* grows warm, and rises, almost as soon as  
‘that in the air; and if returned into the cold place, both cool  
‘and fall about the same.—Hence, says he, is not the heat of  
‘the warm room conveyed through the vacuum by the vibrations of a much subtler medium than air, which remained *in vacuo*, after the exhaustion of the air? And is not this medium the same with that whereby light is refracted, reflected,  
‘&c.? See **MEDIUM.**

**MATERIAL**, denotes something composed of matter. See **MATTER**.

$$\ln$$

# M A T

In which sense the word stands opposed to immaterial. See **IMMATERIAL**.

The Epicureans, Spinozists, &c. own no other but *material* substances: See **SUBSTANCE**. Among causes, some are *material*, others formal. See **CAUSE**.

*Material* causes, having no understanding or liberty, must always act in the same manner, when under the same circumstances. Philosophers and divines dispute, whether or no there be any *material* forms really distinct from matter? See **FORM**. The Valentinians formerly applied the term *material* to all people but those of their own sect; asserting, that their souls perished with their bodies.—Thus also the Stoics maintained, that none but the soul of their wise men survived the body. See **GNOSTICS**, **STOICS**, **SOUL**, **IMMORTAL**, &c.

**MATERIAL Circle**. See the article **CIRCLE**.

**MATERIAL Object**. See the article **OBJECT**.

**MATERIALISTS**, a sect in the ancient church, composed of persons, who, being prepossessed with that maxim in the ancient philosophy, *Ex nihilo nihil fit*, *Out of nothing nothing can arise*, had recourse to an eternal matter, on which they supposed God wrought in the creation; instead of admitting God alone as the sole cause of the existence of all things. See **WORLD**, and **MATTER**.

Textullian vigorously opposes the doctrine of the *Materialists*, in his treatise against Hermogenes, one of their number.

**MATHEMATICAL points**. See the article **POINT**.

**MATHEMATICS**\*, the science of quantity; or a science that considers magnitudes either as computable, or measurable. See **QUANTITY**, and **MAGNITUDE**.

- \* The word in its original *μαθηματις*, signifies *discipline*, or *science* in the general; and seems to have been applied to the doctrine of quantity, either by way of eminence, or by reason this having the start of all other sciences, the rest took their common name therefrom. See **SCIENCE**.

For the origin of the *Mathematics*, Josephus dates it before the flood, and makes the sons of Seth observers of the course and order of the heavenly bodies: he adds, that to perpetuate their discoveries, and secure them from the injuries either of a deluge or a conflagration, they had them engraven on two pillars, the one of stone, the other of brick; the former of which, he says, was standing in Syria in his days. See **ASTRONOMY**. The first who cultivated *Mathematics* after the flood, were the Assyrians and Chaldeans; from whom, the same Josephus adds, they were carried by Abraham to the Egyptians; who proved such notable proficient, that Aristotle makes no scruple to fix the first rise of *Mathematics* among them. From Egypt, five hundred eighty-four years before Christ, they passed into Greece through the hands of Thales, who having learnt geometry of the Egyptian priests, taught it in his own country. After Thales, comes Pythagoras; who, among other mathematical arts, paid a peculiar regard to arithmetic; fetching the greatest part of his philosophy from numbers: He was the first, as Laertius tells us, who abstracted geometry from matter; and to him we owe the doctrine of incommensurable magnitude, and the five regular bodies, besides the first principles of music and astronomy. Pythagoras was succeeded by Anaxagoras, Oenopides, Briso, Antipho, and Hippocrates of Scio; who all applied themselves particularly to the quadrature of the circle, the duplicature of the cube, &c. but the last with most success: This last is also mentioned by Proclus, as the first who compiled elements of *Mathematics*.

Democritus excelled in *Mathematics* as well as physics; though none of his works in either kind are extant: the destruction of which, some authors lay at Aristotle's door. The next in order is Plato, who not only improved geometry, but introduced it into physics, and so laid the foundation of a solid philosophy.—Out of this school proceeded a croud of *Mathematicians*. Proclus mentions thirteen of note; among whom was Leodamus, who improved the analysis first invented by Plato; Theætetus, who wrote elements; and Archytas, who has the credit of being the first who applied *Mathematics* to use in life. These were succeeded by Neocles and Theon, the last of whom contributed to the elements. Eudoxus excelled in arithmetic and geometry, and was the first founder of a system of astronomy. Menechmus invented the conic sections, and Theudius and Hermotimus improved the elements.

For Aristotle, his works are so stored with *Mathematics*, that Blancanus compiled a whole book of them: Out of his school came Eudemus and Theophrastus; the first of whom wrote of numbers, geometry, and invisible lines; the latter a mathematical history. To Aristotle, Isidorus, and Hypsicles, we owe the books of solids; which, with the other books of elements, were improved, collected and methodized by Euclid, who died 284 years before Christ.

An hundred years after Euclid, came Eratosthenes and Archimedes. Cotemporary with the latter was Canon, a geometri-  
cian and astronomer. Soon after came Apollonius Pergæus; whose conics are still extant. To him are likewise ascribed the fourteenth and fifteenth books of Euclid, which are said to have been contracted by Hypsicles. Hipparchus and Menelaus wrote on the sines in a circle, the latter also on spherical triangles: Theodosius's three books of spherics are still extant.

# M A T

And all these, Menelaus excepted, lived before Christ.

A. D. 70. Ptolemy of Alexandria was born; the prince of astronomers, and no mean geometrician: He was succeeded by the philosopher Plutarch, of whom we have still extant some mathematical problems. After him came Eutocius, who commented on Archimedes, and occasionally mentions the inventions of Philo, Diocles, Nicomedes, Sporus, and Heron, on the duplicature of the cube. To Ctesebes of Alexandria, we owe our pumps; and Geminus, who came soon after, is preferred by Proclus to Euclid himself.

Diophantus of Alexandria was a great master of numbers, and the first inventor of Algebra: Among others of the ancients, Nicomachus is celebrated for his arithmetical, geometrical, and musical works, Serenus for his books on the section of the cylinder; Proclus, for his comments on Euclid; and Theon has the credit, among some, of being author of the books of *Elements* ascribed to Euclid. The last to be named among the ancients, is Pappus of Alexandria, who flourished A. D. 400, and is celebrated for his books of *mathematical* collections still extant.

See the progress of each branch of *Mathematics*, with the authors who have wrote on it, under the respective heads; as **GEOMETRY**, **ALGEBRA**, **ASTRONOMY**, &c.

*Mathematics* are distinguished with regard to their end, into

**Speculative MATHEMATICS**, which rest in the bare contemplation of the properties of things; and

**Practical MATHEMATICS**, which apply the knowledge of those properties to some uses in life.

With regard to their object, *Mathematics* are divided into *pure* or *abstract*; and *mixed*.

**Pure MATHEMATICS** consider quantity, abstractedly; and without any relation to matter or bodies.

**Mixed MATHEMATICS** consider quantity as subsisting in material being:—e. gr. length in a road, breadth in a river, height in a star, or the like.

**Purer Mathematics** again, either consider quantity as discrete, and so computable, as arithmetic; or as concrete, or continued, and so measurable, as geometry, and trigonometry. See **ARITHMETIC**, **GEOMETRY**, &c.

**Mixed Mathematics** are very extensive, and are distinguished by various names, as the subjects they consider, and the views wherein they take them, vary: it being sufficient to determine an art to be a branch of *mixed Mathematics*, that pure *Mathematics* are applicable thereto, i. e. that it may be explained and demonstrated from the principles of arithmetic and geometry. Such are

Mechanics, which consider motion, or the laws of moving bodies. See **MOTION**.—Hydrostatics, which consider the laws of fluids, or of bodies gravitating in fluids. See **FLUID**.—Pneumatics, the air, with regard to the laws and mensuration thereof. See **AIR**.—Hydraulics, the motion of fluids. See **FLUIDS**.—Optics, direct light or vision. See **VISION**.—Catoptrics, reflected vision. See **REFLECTION**.—Dioptrics, refracted vision. See **REFRACTION**.—Perspective, the Images of objects, in order to delineate or represent them. See **PERSPECTIVE**.—Astronomy, the universe, and the phenomena of the heavens. See **SPHERE**, and **STAR**.—Geography, the earth, both as in itself, and in its affections. See **EARTH**.—Hydrography, the sea, principally as navigable. See **NAVIGATION**.—Chronology, time, with regard to the measuring and distinguishing thereof. See **TIME**, **YEAR**, **EPOCHA**, &c.—Gnomonics, or Dialling, shadows, in order for determining the hour of the day. See **DIAL**, and **SHADOW**.—Pyrotechny, artificial fires, with regard both to diversion, and to the uses of war. See **FIRE**, **ROCKETS**, &c.—Military architecture, the strength of places, with regard to their defence against an enemy. See **FORTIFICATION**.—Civil architecture (now become a branch of *Mathematics*) buildings. See **BUILDING**.—Music, sounds, and their effects on the ear. See **SOUND**, **TUNE**, &c.

For the elements of each, see the respective heads: For an accurate system of all the parts above-mentioned (Music alone excepted) orderly digested, and clearly demonstrated, see the excellent Wolfius's *Elementa Mathematicæ universæ*.

**MATHURINS**. See the article **TRINITARIANS**.

**MATRASS**, **MATRACIUM**, or **BOLT-HEAD**, a glass vessel, used by chymists in distillation and other operations.

The *Matrasi* is made in form of a bottle, somewhat bellied in the middle, with a long narrow neck: It is luted with earth, when it is to be placed on a very hot fire. When it is required it should be stopped very close, they seal it hermetically. See **BOLT-HEAD**.

**MATRICE**, or **MATRIX**. See the article **MATRIX**.

**MATRICE**, or **MATRIX**, in dying, is applied to the five simple colours, whence all the rest are derived or composed. These are, the black, white, blue, red, and fallow or root colour. See **COLOURS**, and **DYING**.

**MATRICES**, or **MATRIX's**, used by the letter-founders are those little pieces of copper or brass, at one end whereof are engraven, dent-wise, or *en creux*, the several characters used in the composing of books.

Each character, virgula, and even point, in discourse, has its several

several *Matrix*, and of consequence its several puncheon to strike it. It is the engravers on metal that cut or grave the *Matrices*. See ENGRAVING.

When types are to be cast, the *Matrice* is fastened to the end of a mould, so disposed, as that when the metal is poured on it, it may fall into the creux or cavity of the *Matrice*, and take the figure and impression thereof. See LETTER-FOUNDRY, and PRINTING.

MATRICES used in coining, are pieces of steel in form of dyes: whereon are engraven the several figures, arms, characters, legends, &c. wherewith the species are to be stamped.

The engraving is performed with several puncheons, which being formed in relievo, or prominent, when struck on the metal, make an indented impression, which the French call *en creux*. See the manner hereof under ENGRAVING on steel. See also COINING.

MATRICULA, a register kept of the admission of officers, and persons entered into any body, or society, whereof a list is made. See REGISTER.

Among ecclesiastical authors, we find mention made of two kinds of *Matricula's*: the one containing a list of the ecclesiastics, called *Matricula clericorum*; the other of the poor subsisted at the expence of the church, called *Matricula pauperum*.

MATRICULA was also applied to a kind of alms-house, where the poor were provided for. It had certain revenues appropriated to it, and was usually built near the church; whence the name was also frequently given to the church itself.

MATRIX\*, in anatomy, the *womb*; or that part of the female of any kind, wherein the foetus is conceived and nourished till the time of its delivery. See FOETUS, CONCEPTION, GENERATION, &c.

\* The ancient Greeks called the *Matrix* μήτηρ, from μήτηρ, mother: whence, disorders of the womb are frequently called *Fits of the mother*. They also called it ὄστρον, as being the last of the entrails, by its situation. Sometimes they also called it φούρα, or *natura*; and *vulva*, from *volve*, to fold or envelop, or *valva*, doors.

Plato and Pythagoras took the *Matrix* for a distinct animal within and her. P. Ægineta observes, that the *Matrix* may be taken away from a woman, without her death; and there have been instances of people, who have lived a long time after the loss of the *Matrix*. Rhafis and Paræus observe, that some persons have been cured of diseases, by having the *Matrix* extirpated. In 1669, a child was produced at the French academy, which had been conceived out of the *Matrix*, and which nevertheless had grown to the length of six inches. See EMBRYO, FOETUS, &c.

The *Matrix* in women is situate in the pelvis, or capacity of the hypogastrium, between the urinary bladder and the intestine rectum, and reaches as far as the flanks: It is surrounded and defended by mighty bones; before, by the os pubis; behind by the sacrum; on each side, by the ilium and ischium. It is in figure somewhat like a flat flask, or dried pear. In women with child, it expands and receives different forms, according to the different times and circumstances of gestation. It has several coats, arteries, veins, nerves and ligaments, is interwoven with several different kinds of fibres.

Anatomists divide the *Matrix* into the *fundus*, and *cervix*; a broad part, and a neck. It is in extent, from the extremity of the one to that of the other, about three inches in length; its breadth at the fundus is about two and a half, and its thickness two. It has but one cavity, unless we distinguish between the cavity of the uterus, and that of its neck. That of the cervix is very small, scarce sufficient to contain a garden-bean. At the bottom or neck, towards the fundus, it grows very narrow in virgins; the extremity of it is called the *osculum internum*: In pregnant women it opens, more especially towards the time of delivery. The other and lower orifice of the neck, towards the vagina, called *osculum externum*, is a little prominent, resembling, in some measure, the glands of the virile organ.—See *Tab. anat. (splanc.) fig. 9.*

The substance of the *Matrix* is membranous and carnosus: It consists of three tunics; or, according to some, who deny that name to the middle substance, of two only. The external tunic, called also *communis*, is derived from the peritonæum, and consists of two lamellæ; the exterior of which is pretty smooth, the interior rugged and uneven. This membrane invests the whole *Matrix*, and connects it to the intestine rectum, bladder, &c. The middle tunic is very thick, and composed of strong fibres, variously disposed: Some think it contributes to the exclusion of the foetus; though others imagine, it serves only to recover the tone, after any violent distension. The inner tunic is nervous.

The *Matrix* is connected by its neck to the vagina; behind, by its outward common membrane, and before by the same to the bladder: Its sides are tied to other parts; but the fundus is left loose, that it may expand and dilate more freely. Its ligaments are four, two of which are called *broad*, and two *round*, from their figure. The broad ligaments are membranous, loose, and soft; whence they have been compared by some to the wings of bats, called *alæ versperilionum*. The round ligaments are of a firmer texture, and consist of a double membrane, wrapped up in its arteries, veins, nerves, and

lymphæducts. The blood-vessels, both in these and the round ligaments, make a great part of what is called their *substance*: These, as well as the others, serve to keep the womb in a right position; and are very liable to be injured by unskilful midwives. See LIGAMENT.

On each side of the fundus of the womb, arises a duct, which opens into the womb with a small orifice, but in its progress enlarges, and towards the end is contracted again: At the end next the ovaria, which is at liberty, it expands again into a kind of foliage fringed round; which expansion Fallopius, the first discoverer, imagined like the end of a trumpet; whence he called the whole duct, *tuba*. It consists of a double membrane. Both veins and arteries are very numerous here, especially the latter, which, by various ramifications and contortions, make the main substance of them. Dr. Wharton gives them valves, but the other anatomists disallow it. See FALLOPIAN Tube.

Suffocation of the MATRIX. See SUFFOCATION.

Speculum MATRICIS. See the article SPECULUM.

MATRIX is also applied to places proper for the generation of vegetables, minerals, and metals.

Thus the earth is the *Matrix* wherein seeds sprout; marcasites are considered as the *Matrices* of metals. See FOSSIL, MINERAL, MARCASITE, &c.

MATRIX is also applied figuratively, to several things, wherein there appears a kind of generation; and where certain things seem to acquire a new being, or at least a new manner of being. Of which kind are the moulds wherein the printers types or letters are cast, and those used in striking money and medals, called also *coin*. See COIN and COINING.

MATRON, MATRONA, among the Romans signified a married woman, and sometimes also the mother of a family. There was, however, some difference between *Matrona*, and *mater-familias*. Servius says, that some imagined the difference to lie in this, that *Matrona* was a woman who had one child, and *mater-familias*, she that had several. But others, particularly Aulus Gellius, take the name *Matrona* to belong to a married woman, whether she had any children or no; the hope and expectation of having them, being enough to warrant the title of mother, *Matrona*: and for which reason it is, that that marriage is called *matrimony*. This opinion is supported by Nonius.

MATRONALIA, feasts of the Roman ladies, or rather *matrons*, celebrated on the calends of March, in honour of the god Mars.

No men living in celibate, were allowed to assist at the feast.

MATROSSES, soldiers in the train of artillery, next below the gunners; their duty is to assist the gunners in traversing, spunging, loading, and firing of guns, &c. See ARTILLERY, &c. They carry fire-locks, and march along with the store-waggons, both as a guard, and to help in case a waggon should break down.

MATTADORE. See the article OMBRE.

MATTER, MATERIA, *Body*; or an extended, solid, divisible, moveable, and passive substance, the first principle of all natural things, from the various arrangements and combinations whereof, all bodies are formed. See BODY.

Aristotle makes three principles, *Matter*, form, and privation: Which last the Cartesians throw out of the number; and others, the two last. See PRINCIPLE.

The properties of *Matter* we are pretty well acquainted with, and can reason about its divisibility, solidity, &c. (See DIVISIBILITY, &c.) But the essence thereof, or the subject wherein these properties reside, or their substratum, is still a mystery. Aristotle speaks very darkly on the subject, defining *Matter* to be *nec quid, nec quantum, nec quale*, nor any certain determinate thing at all; which many of his followers interpret so, as to believe, that *Matter* does not at all exist. See BODY. The Cartesians make the essence of *Matter* to consist in extension; arguing, that since the properties above-mentioned are all that are essential to *Matter*, some of them must constitute its essence: and since extension is conceived prior to all the rest, and is that without which none of the rest can be conceived, extension is that which constitutes the essence of *Matter*.—But the conclusion here is unjust; for on this principle, the existence of *Matter*, according to Dr. Clarke, would have the fairest title to constitute its essence, the *to existere* being conceived prior to all properties, and even to extension.

Since then the word extension appears to go further, and to be more general than *Matter*; that impenetrable solidity, which is essential to all *Matter*, and to *Matter* alone, and from which all its properties manifestly flow, may, with more propriety, be called the *essence of Matter*. See ESSENCE.

Again, if extension were the essence of *Matter*, and so *Matter* and space the same thing; it would follow, that *Matter* is infinite and eternal, that it is a necessary being, and could neither be created nor annihilated; which is absurd. Besides, it appears both from the nature of gravity, the motions of comets, the vibrations of pendulums, &c. that space is not *Matter*: and therefore it is not extensive, but solid, impenetrable extension, which has a power of resisting, that constitutes *Matter*. See VACUUM and EXTENSION.

Many

effects, both in these and the round of what is called their *substance*: serve to keep the womb in a right state to be injured by unskilful mid-

of the womb, arises a duct, which a small orifice, but in its progress is contracted again: At the end of liberty, it expands again into a duct; which expansion Fallopius, the end of a trumpet; whence it consists of a double membrane. It contains here, especially various ramifications and contortions of them. Dr. Wharton gives anatomists disallow it. See FAL-

is, *Matter*, form, and privation: out of the number; and others,

are pretty well acquainted with, ability, solidity, &c. (See Divisibility thereof, or the subject whereof substratum, is still a mystery. In the subject, defining *Matter* as *quale*, nor any certain determination of his followers interpret so, not at all exist. See BODY. Essence of *Matter* to consist in extension, some of them must contain is conceived prior to all which none of the rest can be constituted the essence of *Matter*. It is; for on this principle, the Dr. Clarke, would have the essence, the *to exist* being conceived even to extension.

seems to go further, and to be impenetrable solidity, which *Matter* alone, and from which may, with more propriety, be

ESSENCE. Essence of *Matter*, and so *Matter* would follow, that *Matter* is a necessary being, and could not be; which is absurd. Besides, of gravity, the motions of comets, &c. that space is not *Matter*, but solid, impenetrable, of resisting, that constitutes EXTENSION.

Many

## M A T

Many among the old philosophers maintained the eternity of *Matter*, out of which they supposed all things to be formed by the hands of nature; as being unable to conceive how any thing should be formed out of nothing. Plato maintained, that *Matter* had existed eternally, and concurred with God in the production of all things, as a passive principle, or a kind of collateral cause. See ETERNITY.

*Matter* and form, the two simple and original principles of all things, according to the ancients, composed some simple natures, which they called *elements*; out of the various combinations whereof, all natural things were composed. See ELEMENT.

Dr. Woodward seems of an opinion, not very, unlike it; viz. That *Matter* is originally and really very different, being as its first creation divided into several ranks, sets or kinds of corpuscles, differing in substance, gravity, hardness, flexibility, figure, size, &c. from the various compositions and combinations of which, arise all the varieties in bodies, as to colour, hardness, gravity, taste, &c.—But Sir Isaac Newton takes all those differences to result from the various arrangements of the same *Matter*; which he judges to be homogeneous and uniform in all bodies. See CORPUSCLE, and PARTICLE.

Besides the properties of *Matter* hitherto known, Sir Isaac Newton has discovered a new one, viz. 'That of attraction, or that every particle of *Matter* has an attractive power, or a tendency towards every other particle: which power is strongest in the point of contact, and suddenly decreases, in so much that it acts no more at the least sensible distance, and at a greater distance is converted into a repellent force, whereby the parts fly from each other. On this principle of attraction, he accounts for the cohesion of the particles of bodies, otherwise inexplicable.' See COHESION.

For he takes occasion to observe, 'That all bodies seem to be compounded of hard particles: even light itself, and all other the most volatile of fluids; in so much as hardness may be esteemed a property of all uncompounded *Matter*: at least the hardness of *Matter* stands on as good a footing as that of its impenetrability; all the bodies we know of, being either hard themselves, or capable of being hardened. Now if compound bodies be so hard, as we find some of them, and yet are very porous, and consist of parts which are only laid together; the simple particles, which are void of pores, and were never yet divided, must be much harder. Now such hard particles being heaped together, can scarce touch one another in more than a few points, and therefore must be separable with much less force than is requisite to break a solid particle, whose parts touch in all the space, without any pores or interstices to weaken their cohesion: How then should such very hard particles, only laid together and touching only in a few points, stick together, and that so firmly as they do, without the assistance of something that causes them to be attracted or pressed towards each other?' The same great author observes further, 'That the smallest particles may cohere by the strongest attractions, and compose bigger particles of weaker virtue; and many of these may cohere, and compose bigger particles, whose virtue is still weaker, and so on for divers successions, until the progression end in the biggest particles; on which the operations in chemistry, and the colours of natural bodies depend; and which, by cohering, compose bodies of sensible magnitude. If the body is compact, and bends or yields inward to pressure; without any sliding of its parts; it is *hard*, and *elastic*; returning to its figure with a force arising from the mutual attraction of its parts. If the parts slide from one another, the body is *malleable* or *soft*. If they slip easily, and are of a fit size to be agitated by heat, and the heat is big enough to keep them in agitation, the body is *fluid*; and if it be apt to stick to things, it is *humid*. And the drops of every fluid affect a round figure by the mutual attraction of their parts, as the globe of the earth and sea affects a round figure, by the mutual attraction of gravity of its parts.' See ATTRACTION.

Again, 'Since metals dissolved in acids, attract but a small quantity of the acid, their attractive force reaches but to a small distance. Now, as in algebra, where affirmative quantities cease, there negative ones begin; so in mechanics, where attraction ceases, there a repulsive virtue must succeed. That there really is such a virtue, seems to follow, from the reflections and inflections of the rays of light; the rays being repelled by bodies in both these cases, without the immediate contact of the reflecting or inflecting body. The same thing seems also to follow from the emission of light; a ray, as soon as shaken off from a shining body by the vibrating motion of the parts of the body, and got beyond the reach of attraction, being driven away with exceeding great velocity: for that force, which is sufficient to turn it back in reflection, may be sufficient to emit it. It seems also to follow from the production of air and vapour; the particles, when they are shaken off from the body by heat or fermentation, so soon as they are beyond the reach of the attraction of the body, receding from it, and also from one another, with great strength, and keeping at a distance, so as sometimes to

Vol. II. N<sup>o</sup>. XCVI.

## M A T

'take up above a million of times more space than they did before in the form of a dense body. Which vast contraction and expansion seems unintelligible, by feigning the particles of air to be springy, and ramous, or rolled up like hoops, or by any other means than a repulsive power. The particles of fluids, which do not cohere too strongly, and are of such a smallness, as renders them most susceptible of those agitations which keep liquors in a flux, are more easily separated and rarefied into vapour, i. e. in the language of the chymist, they are *volatile*; rarefying with an easy heat, and condensing with cold. But those which are grosser, and so less susceptible of agitation, or cohere by a stronger attraction, are not separated without a stronger heat, or perhaps not without fermentation. And these last are the bodies which chymists call *fixed*, and being rarefied by fermentation, become true permanent air; those particles receding with the greatest force, and being most difficultly brought together, which upon contact cohere most strongly. And because the particles of permanent air are grosser, and arise from denser substances, than those of vapours; thence it is that true air is more ponderous than vapour; and that a moist atmosphere is lighter than a dry one, quantity for quantity. From the same repelling power it seems to be, that flies walk upon the water without wetting their feet; and that the object-glasses of long telescopes lie upon one another without touching; and that dry powders are difficultly made to touch one another so as to stick together, unless by melting them, or wetting them with water, which by exhaling may bring them together; and that two polished marbles, which by immediate contact stick together, are difficultly brought so close together, as to stick.' See REPELLING, and REPULSION.

He further observes, 'That all things considered, it seems probable, God, in the beginning, formed *Matter* in solid, massy, hard, impenetrable, moveable particles, of such sizes, figures, and with such other properties, and in such proportion to space, as most conduced to the end for which he formed them; and that these primitive particles being solid, are incomparably harder than any porous bodies compounded of them; even so very hard, as never to wear, and break in pieces: no ordinary power being able to divide, what God himself made one in the first creation. While the particles continue intire, they may compose bodies of one and the same nature and texture in all ages; but should they wear away, or break in pieces, the nature of things depending on them, would be changed. Water and earth, composed of old worn particles and fragments of particles, would not be of the same nature and texture now, with water and earth composed of entire particles in the beginning. And therefore that nature may be lasting, the changes of corporeal things are to be placed only in the various separations, and new associations and motions of these permanent particles; compound bodies being apt to break, not in the midst of solid particles, but where those particles are laid together, and touch in a few points.'

It seems farther, 'That these particles have not only a *vis inertiae*, accompanied with such passive laws of motion, as naturally result from that force, but also that they are moved by certain active principles, such as is that of gravity, and that which causeth fermentation, and the cohesion of bodies. These principles are to be considered not as occult qualities, supposed to result from the specific forms of things, but as general laws of nature, by which the things themselves are formed; their truth appearing to us by phenomena, though their causes are not yet discovered.' See PARTICLE; see also FERMENTATION, FIRMNESS, GRAVITATION, ELASTICITY, HARDNESS, FLUIDITY, SALT, ACID, &c. Hobbes, Spinoza, &c. maintain all the beings in the universe to be *material*, and their differences to arise from their different modifications, motions, &c. Thus *Matter* extremely subtle, and in a brisk motion, they conceive, may think; and so exclude all spirit out of the world. See SPIRIT.

Dr. Berkeley, on the contrary, argues against the existence of *Matter*; and endeavours to prove, that it is a mere ens rationis; and has no existence out of the mind: 'Thus, says he, that neither our thoughts, passions, nor ideas, formed by the imagination, exist without the mind, is evident; nor is it less evident, that the various sensations or ideas imprinted on the sense, however blended or combined together (that is, whatever objects they compose) cannot exist otherwise, than as in a mind perceiving them. This no man can doubt of, that attends to what is meant by the term *exist*, when applied to sensible things. Thus I say, the table I write on exists, i. e. I see and feel it, and if I were out of my study, I should say it existed; meaning thereby, that if I were in my former situation, I should see and feel it as before. Again, I say, there was odour, i. e. I smelt it; a sound, i. e. it was heard; a colour or touch, i. e. it was perceived by sight or touch. This is the utmost that can be meant by such expressions; for as to the absolute existence of any unthinking being, distinct from its being perceived, it is a chimera. Their *esse* is *percipi*; nor is it possible they should have any existence out of the minds that perceive them. Again, what are hills and

\* trees, &c. but things perceived by sense; and what do we perceive, but our own ideas or sensations: and can any one of these, or any combination of them, exist unperceived? What are light and colours, heat and cold, extension and figure, but so many sensations, ideas, or impressions on the sense? And is it possible, even in thought, to separate these from perception? It is next to self-evident therefore, that all the choir of heaven, and furniture of earth; in a word, all the bodies that compose the system of the world, have not any subsistence out of a mind; their *esse* is nothing more than their being perceived: and therefore as long as they do not exist in me, i. e. are not perceived by me, nor any other created spirit; they have no shadow of existence at all, unless perhaps in the mind of some eternal spirit. It appears therefore with the light of an axiom, that there is not any other substance but spirit, &c. See *Inquiry into principles of human knowledge*. See also *EXTERNAL World*.

*Ethereal MATTER.* } See the article { *ETHERIAL.*  
*Subtile MATTER.* } *MATERIA Subtilis.*  
*Quantity of MATTER.* } *QUANTITY.*

*MATTER of Deed*, signifies a truth to be proved, though not by any record: by which it stands contra-distinguished from *MATTER of record*, which is that which may be proved by some record. See *PRISONER*.

If a man be sued to an exigent, during the time he was in the king's wars; this is *Matter in deed*, and not *Matter of record*: and therefore he that will alledge this for himself, must come before the seire faeias, or execution be awarded against him: for after that, nothing will serve but *Matter of record*; that is, some error upon the process appearing upon record.

*Foreign MATTER.* See the article *FOREIGN*.

*MATTINS\**, the first part of the daily service in the Romish church. See *HOURS*.

\* The word comes from the Italian *Mattina*, or the French *Matin*, morning.

*Mattins* is sometimes held early in the morning, sometimes at midnight, and sometimes the even before. And infirm people, even in monasteries, are dispensed from attending *Mattins*.

*MATULAM.*—*Hydiops ad MATULAM*. See the article *HYDROPS*.

*MATURANTIA*, in medicine, &c. *ripeners*; or such things as promote maturation. See *RIPENERS*, and *SUPPURATION*.

*MATURATION*, in pharmacy, a preparation of fruits, or other simples, gathered before their *Maturity*; to fit them to be eaten. See *FRUIT*, &c.

*M AUNCH*, the figure of an ancient sleeve of a coat, so called by the heralds; and is born in many gentlemen's escutcheons: as in the earl of Huntingdon's.—See *Tab. Herald. fig. 40*.

*MAUNDY*, or *MAUNDEY Thursday*, *Dies MANDATI*, the Thursday before Easter; so called from the French *Mande*, i. e. *sportula*; it being a custom on that day to give a largesse or bounty to certain poor men, whose feet the king formerly washed, as a mark of humility, and in obedience to the command of Christ.

*MAUSOLEUM\**, a magnificent tomb, or funeral monument decorated with architecture and sculpture, and inscribed with an epitaph; erected in honour of some emperor, prince, or other illustrious person. See *TOMB*.

\* The word comes from *Mausolus*, the name of a king of Caria, to whom Artemisia, his widow, erected a most stately monument, that has since been numbered among the wonders of the world; calling it from his name, *Mausoleum*. See *MONUMENT*.

*MAUSOLEUM*, is also used to signify the decoration of a fictitious tomb, or catafalcha, in a funeral pomp.

*MAW*: See *ABOMASUS*.

*MAXILLÆ*, in anatomy, the *jaws*; or those parts of an animal wherein the teeth are set, and which serve for masticating the food. See *MASTICATION*, and *TOOTH*.

The *Maxillæ* are two in number, denominated from their situation, *superior*, and *inferior*.

*MAXILLA superior*, or the upper jaw, is immoveable in man, and all other animals we know of; excepting parrots, crocodiles, and the acus vulgaris, or gar-fish.—Vid. *Ray Synops. Pif. p. 109*.

It consists of eleven bones, joined to each other per harmoniam; five disposed on each side and one in the middle. Their names are the zygoma, os maxillare, os unguis, os nasi, os palati, and vomer: See *ZYGOMA*, &c. In this jaw are alveoli or sockets for sixteen teeth.—*Tab. anat. (osteol.) fig. 1. lit. d.*

*MAXILLA inferior*, or the lower jaw, only consists of two bones, which unite in the middle of the chin, by the intervention of a cartilage, which hardens as the child grows; and at length, about the age of seven years, becoming bony joins the two bones into a continued one, resembling the Greek *υ*.—See *Tab. anat. (osteol.) fig. 1. lit. e.*

It consists of two tables, betwixt which is a spongy substance, in children medullary. The fore-part is shallow, just sufficient to afford sockets for sixteen teeth. It has two processes, the corone and condyloides, (which see) four holes or foramina for the passage of vessels, and five pair of proper muscles, viz. the crotaphytes or temporal, the masseter, biventer or digastricus,

pterygoideus internus, and pterygoideus externus. See each in its place, *CROTAPHYTES*, *MASSETER*, &c.

*MAXILLARY Gland*, *MAXILLARIS Glandula*, a considerable gland of the conglomerate kind, situate on the inside, under the lower jaw-bone, near the musculus digastricus.

It discharges itself by several branches of ducts, which form one trunk that passes under the mylohyoideus, and meets with the *Maxillary gland* of the other side within the fore teeth of the lower jaw, having distinct orifices, with a papilla on each side the frænum linguæ. See *GLAND*, and *MOUTH*.

*MAXIM*, denotes an established proposition or principle.

In which sense it amounts to much the same with axiom. See *AXIOM*.

*Maxims*, are a kind of propositions, which have passed for principles of science; and which being self-evident, have been supposed innate. See *INNATE*.

*MAXIMUM*, in mathematics, denotes the greatest quantity attainable in any given case.

By which it stands opposed to *minimum*. See *MINIMUM*.

*Methodus de MAXIMIS & MINIMIS*, a method so called, in use among mathematicians, whereby they arrive at the greatest or least possible quantity attainable in any case.

If the semi-ordinates of any curve continually increase or decrease to some certain term, which once passed, they begin again to increase or decrease, the method whereby their *Maxima & minima*, i. e. their greatest and least states is determined, is called the method *de Maximis & minimis*; which, it is true, may be used to determine other quantities that increase or decrease to any certain term; but then they must always be represented by the semi-ordinates of curves.

If a flowing quantity in an equation be proposed to be determined to an extreme value—The rule is: Having put the equation into fluxions, let the fluxion of that quantity (whose extreme value is sought) be supposed = 0; by this means all those members of the equation, in which it is found, will vanish, and the remaining ones will give the determination of the *Maximum* or *minimum* desired.

The reason of the rule is, that every *maximum* or *minimum* is in its own nature a stable quantity: To determine therefore any flowing quantity to a *Maximum* or *minimum*, is to make it (instead of a flowing) a permanent one; but the fluxion of a permanent quantity is equal to nothing.—This we shall illustrate by an example or two.

To determine the greatest or least applicate in an algebraic curve. Since in curves that have a *Maximum* and a *minimum* the tangent TM (*Tab. analysis, fig. 4*, and *fig. 26*.) degenerates at length into DE, and becomes parallel to the axis, and so the perpendicular MH coincides with the greatest or least applicate CG; in the case of *Maximum* and *minimum*, the sub-tangent TP becomes infinite, and the sub-normal PH equal to nothing, but  $PH = y dy : dx$ . If then  $y dy : dx = 0$ ; we shall find  $dy = 0$ , and because of  $PT = y dx : dy = \infty$  (the note of infinity)  $dx = \infty$ .

It is possible for the tangent HG (*fig. 5*.) to lie directly against the semi-ordinate GC; in which case the subtangent PT is equal to nothing, but the subnormal PH infinite. But  $PT = y dx : dy = 0$ ; therefore if  $y dx : dy = 0$ , we shall have  $dx = 0$ ; or because of  $PH = y dy : dx = \infty$ , we find  $dy = \infty$ , both  $dx$  and  $y$  being, in respect of  $dy$ , infinitesimals. From the equation of the curve, therefore we are to find the value of  $dy$ , which is to be made equal either to nothing, or to infinity, that we may have the value of the abscisse, to which the greatest applicate is co-ordinate.

To cut a right line AB (*fig. 6*.) in such a manner in D, that the rectangle AD and DB shall be the greatest that can possibly be thus constructed. Let  $AB = a$ ,  $AD = x$ , then will  $DB = a - x$ ; consequently  $AD \cdot DB = ax - xx$  some *Maximum*; and hence its differential will be equal to nothing, as being conceived at a circle, to which

$$ax - xx = yy.$$

$$\text{Wherefore } a dx - 2x dx = 2y dy = 0$$

$$a - 2x = 0$$

$$\frac{1}{2} a = x.$$

The line AB therefore is to be cut into two equal parts; and the square is the greatest of all rectangles, whose altitudes and bases, taken together, are equal to each other.

*MAY\**, *MAIUS*, the fifth month in the year, reckoning from the first of January; and the third, counting the year to begin with March, as the Romans anciently did. See *MONTH*, and *YEAR*.

\* It was called *Maius* by Romulus, in respect to the senators and nobles of his city, who were named *Majores*; as the following month was called *Junius*, in honour of the youth of Rome, *in honorem Juniorum*, who served him in the war: though others will have it to have been thus called from *Maia*, the mother of Mercury, to whom they offered sacrifice on that day; and Papias derives it from *Madius*, *eo quod tunc terra maderet*.

In this month the sun enters Gemini, and the plants of the earth begin to flower.

The

The month of *May* was under the protection of Apollo; and also they kept the festival of Bona Dea, that of goblins, called *Lemuria*; and the ceremony of Regifugium, or the expulsion of the kings. See *LEMURIA*, &c.

The vulgar have a great opinion of the virtues of *May-dew*, and *May-butter*. See *DEW*.

The month of *May* has ever been esteemed favourable to love; and yet the ancients, as well as many of the moderns, look on it as an unhappy month for marriage: The reason may perhaps be referred to the feast of Lemures, which was held in it. Ovid alludes to this in the fifth of his *Fasti*, when he says,

*Nec viduae tædis eadem, nec virginis apta  
Tempora; quæ nupsit, non diuturna fuit:  
Hæc quoque de causa, si te proverbia tangunt,  
Mense malas Maio nubere vulgus erit.*

**MAYHEM.** See the article *MAHIM*.

*Appeal of MAYHEM.* See the article *APPEAL*.

**MAYL**, in falconry, signifies to pinion the wings of a hawk. See *HAWK*, and *FALCON*.

**MAYOR\***, or *MAIOR*, the chief magistrate, or governor in the cities, and most corporation-towns of England; chosen annually by his peers out of the number of the aldermen. See *ALDERMAN*.

\* The word, according to Vossian, comes from the ancient English *maier*, able, potent, of the verb *may*, or *can*.

The *Mayor* of the place is the king's lieutenant, and with the aldermen and common-council, can make laws, called *Bilaws*, for the government of the place. See *BILAWS*. He has also the authority of a kind of judge, to determine matters, and to mitigate the rigour of the law.

King Richard I, *A. D.* 1189, first changed the bailiffs of London into *Mayors*; by whose example others were afterwards appointed. See *PORTREVE*, *BAILIFF*, &c.

**MAYOR'S COURT.** See the article *COURT*.

**MEAD**, a wholesome, agreeable liquor prepared of honey and water. See *DRINK*, *HONEY*, &c.

One of the best methods of preparing *Mead* is as follows.—Into twelve gallons of water, slip the whites of six eggs; mixing these well together, and to the mixture adding twenty pounds of honey. Let the liquor boil an hour, and when boiled, add cinamon, ginger, cloves, mace, and a little rosemary. As soon as it is cold, put a spoonful of yeast to it, and tun it up, keeping the vessel filled as it works; when it has done working, stop it up close, and when fine bottle it off for use.

**MEAN**, the *Middle* between two extremes. See *MEDIUM*, and *EXTREME*.

Thus we say *mean* motion of a planet; its *mean* distance, &c. meaning a motion or distance, which as far exceeds the least distance or motion, as it is exceeded by the greatest. See *MOTION*, *DISTANCE*, *ANOMALY*, and *APOGEE*.

**MEAN**, in logic. See the article *MEDIUM*.

**MEAN proportion.** See *EXTREME Proportion*.

**MEAN time.** See the article *TIME*.

**MEAN axis**, in optics. See the article *AXIS*.

**MEAN diameter** in gauging. See *DIAMETER*.

**MEAN**, in law, refers either to time or dignity.—Thus in the first sense, we say, his action was *mean* betwixt the disseisin made to him and his recovery, *i. e.* in the interim.

In the second sense, we say, there is Lord *Mean*, or *Mesne*, that is, a lord of a manor, who has tenants that hold of him, yet himself holds of the king. See *LORD*, and *MESNE*.

**MEASLES**, *Morbilli*, in medicine, a cutaneous disease, consisting in a general appearance of eruptions, not tending to supuration; accompanied with a fever.

This distemper seems to bear a great affinity to the small-pox; the symptoms being in many respects the same, the cause nearly the same, and the regimen and cure not much different. See *Small-Pox*.

The eruptions usually appear about the fourth day, like fleabites, over the whole body; but thicker and redder, and with greater inflammation, than those of the small-pox, and vanish in four or six days after appearance; being, when at the height, not larger than pins heads.

The *Measles* is more sickly than dangerous; though it often inclines to consumptions by a cough which it leaves behind.

**MEASNE.** See the article *MESNE*.

**MEASURE**, *MENSURA*, in geometry, denotes any certain quantity assumed as one, or unity, to which the ratio of other homogeneous, or similar quantities, is expressed. See *MEASURING*. This definition is somewhat more agreeable to practice than that of Euclid, who defines *Measure* a quantity, which being repeated any number of times, becomes equal to another.—Which only answers to the idea of an arithmetical *Measure*, or quota part. See *ALICQUOT-PART*.

**MEASURE of an angle**, is an arch, described from the vertex *a*, (*Tab. Geomet. fig. 10.*) in any place between its legs; as at *d f*. Hence, angles are distinguished by the ratio of the arches, described from the vertex, between the legs, to the peripheries. Angles then are distinguished by those arches; and the arches are distinguished by their ratio to the periphery.—Thus the angle *lae* is said to be of so many degrees, as in the arch *f d*. See *ANGLE*.

**MEASURE of a figure**, or plain surface, is a square, whose side is one inch, foot, yard, or other determinate length.

Among geometricians, it is usually a rod, called a *square rod*, divided into ten square feet, and the square feet into square digits.—Hence square *Measures*. See *SQUARE*.

**MEASURE of a line**, is any right line taken at pleasure, and considered as unity. See *LINE*.

The modern geometricians use a *decempeda*, or rod, divided into ten equal parts, called *feet*. The feet they subdivide into ten digits, the digit into ten lines, &c.

This decimal division of the *Measure* was first introduced by Stevinus, probably from the example of Regiomontanus: The index or character of the *decempeda* he made 0, that of feet 1, of digits 2, of lines 3, &c. which, in regard the *Measure* was subdivided in a decuple ratio, were the logarithms of the division. Bayer, in lieu of these, expressed the logarithms by the Roman characters; *v. gr.* 5 perches, 4 feet, 3 digits, and 2 lines, he expressed thus; 5°, 4', 3'', 2'''. It is frequently most commodious to separate the integers, or rods, from the fractions by a point; thus instead of 5°, 4', 3'', 2''' to write 5.432. F. Noel observes, that among the Chinese, the decimal division obtains in their common *Measures*, and even in their weights. See *DECIMAL*, *DEGREE*, &c.

**Line of MEASURES.** See the article *LINE*.

**MEASURE of the mass or quantity of matter**, in mechanics, is its weight; it being apparent, that all the matter which coheres and moves with a body, gravitates with it: and it being found by experiment, that the gravities of homogeneous bodies are in proportion to their bulks; hence while the mass continues the same, the weight will be the same, whatever figure it puts on: its absolute weight, we mean; for as to its specific weight it varies as the quantity of surface varies. See *WEIGHT*, *GRAVITY*, &c.

**MEASURE of a number**, in arithmetic, is such a number, as divides another, without leaving any fraction; thus 9 is a *Measure* of 27. See *NUMBER*.

**MEASURE of a solid**, is a cube, whose side is one inch, foot, yard, or other determined length.

Among geometricians, it is sometimes a rod or perch, called a *cubic perch*; divided into cubic feet, digits, &c.—Hence cubic *Measures*, or *Measures* of capacity. See *CUBE*, and *TIMBER*.

**MEASURE of velocity**, in mechanics, is the space passed over by a moving body in any given time. See *MOTION*.

To *measure* a velocity, therefore the space must be divided into as many equal parts, as the time is conceived to be divided into. The quantity of space answering to such an article of time, is the measure of the velocity. See *VELOCITY*.

**MEASURE**, in a legal, commercial, and popular sense, denotes a certain quantity or proportion of any thing bought, sold, valued, or the like.

*Measures*, then, are various, according to the various kinds, and dimensions of the things *measured*. Hence arise

*Lineal* or *longitudinal MEASURES* for lines or lengths.

*Square MEASURES* for areas, or superficies: and

*Solid* or *cubic MEASURES* for bodies, and their capacities.

All which again are very different in different countries, and in different ages, and even many of them for different commodities. Whence arise other divisions of *domestic* and *foreign Measures*, *ancient* and *modern* ones, *dry* and *liquid Measures*, &c.

The business of *Measures* has been so confusedly, and imperfectly delivered by English writers, that the reader will not be displeased with the pains we have here taken to disembroil, and supply it.—Under this head he will find enumerated the various, general, standing *Measures*, long, square, and cubic, now or heretofore in use, with their proportions and reductions: for particulars, he must be contented to be referred to the particular heads; as *FOOT*, *DIGIT*, *ELL*, *TUN*, *GALLON*, *BUSHEL*, *PERCH*, *LEAGUE*, *FURLONG*, &c.

**Long MEASURES**, or *MEASURES of application*.—The *English Standard Long MEASURE*, for commerce, or that whereby the quantities of things are ordinarily estimated in the way of trade, is the yard; containing three English feet: equal to three Paris feet, 1 inch  $\frac{1}{4}$  of an inch; or  $\frac{7}{8}$  of a Paris ell.—Its divisions are the foot, span, palm, inch, and barley-corn, which see under their respective heads: *FOOT*, *INCH*, &c.—Its multiples are the pace, fathom, pole, furlong, and mile. See *MILE*, *FURLONG*, *POLE*, &c.—The proportions these severally bear to each other, will be expressed in a table for the purpose.—*Assay of Measures.* See *ASSAY*.

The *French Standard MEASURE*, for commerce is the aune or ell, containing 3 Paris feet, 7 inches, 8 lines; or one yard,  $\frac{3}{4}$  English; the Paris foot royal exceeding the English by  $\frac{1}{100}$  parts, as in one of the following tables. This ell is divided two ways; *viz.* into halves, thirds, sixths, and twelfths; and into quarters, half-quarters, and sixteenths. This ell holds throughout the greatest part of France; excepting at Troyes in Champagne; at Arc in the Barrois; in some parts of Picardy and Burgundy, where the ell only contains two feet, five inches, one line; in Bretagne, where it contains four feet, two inches, eleven lines; and at St. Genoux in Berry, where it exceeds the Paris ell by eight lines. See *ELL*. But in Languedoc, particularly at Marseilles, Montpellier, Toulouse,

Toulouse, in Provence, Guienne, they measure by the canna, which at Toulouse and in Guienne contains five Paris feet, five inches, and six lines; or one Paris ell and a half. At Montpellier, and throughout the lower Languedoc, as also in Provence and Avignon, and even Dauphine, the canna is six feet and nine lines; or one Paris ell, two thirds. See CANNA.

The Standard MEASURE in Holland, Flanders, Sweden, a good part of Germany, many of the Hans-towns, at Dantzick and Hambourg; and at Geneva, Francfort, &c. is likewise the ell: But the ell in all these places differs from the Paris ell. In Holland, it contains one Paris foot, eleven lines, or four sevenths of the Paris ell. The Flanders ell contains two feet, one inch, five lines and a half line, or seven twelfths of the Paris ell. The ell of Germany, Brabant, &c. is equal to that of Flanders. See ELL.

The Italian MEASURE is the braccio, brace, or fathom; which obtains in the states of Modena, Venice, Florence, Lucca, Milan, Mantua, Bologna, &c. but of different lengths. At Venice it contains one Paris foot eleven inches, three lines, or eight fifteenths of the Paris ell. At Bologna, Modena, and Mantua, the brace is the same as at Venice. At Lucca, it contains one Paris foot nine inches, ten lines, or half a Paris ell. At Florence, it contains one foot, nine inches four lines, or forty nine hundredths of a Paris ell. At Milan, the brace for measuring of silks is one Paris foot, seven inches, four lines, or four ninths of a Paris ell: That for woollen cloths, is the same with the ell of Holland. Lastly, at Bergama, the brace is one foot, seven inches, six lines, or five ninths of a Paris ell. The usual Measure at Naples, however, is the canna, containing six feet, ten inches, and two lines, or one Paris ell, and fifteen seventeenths. See FATHOM, CANNA, &c.

The Spanish MEASURE, is the vara, or yard, in some places called the barra; containing seventeen twenty-fourths of the Paris ell.—But the Measure in Castile and Valencia is the pan,

span, or palm; which is used, together with the canna, at Genoa.—In Arragon, the vara is equal to a Paris ell and a half, or five feet, five inches, six lines.

The Portuguese MEASURE, is the cavedos, containing two feet, eleven lines, or four sevenths of the Paris ell; and the vara, an hundred and six whereof make an hundred Paris ells.

The Piedmontese MEASURE is the ras, containing one Paris foot, nine inches, ten lines, or half a Paris ell.

In Sicily, their Measure is the canna; the same with that of Naples.

The Muscovite MEASURES are the cubit, equal to one Paris foot, four inches, two lines; and the arcin, two whereof are equal to three cubits.

The Turkish and Levant MEASURE, are the picq, containing two feet, two inches, and two lines; or three fifths of the Paris ell.—The Chinese Measure, the cobe; ten whereof are equal to three Paris ells.—In Persia, and some parts of the Indies, the gueze, whereof there are two kinds; the royal gueze, called also the gueze monkelfer, containing two Paris feet, ten inches, eleven lines, or four fifths of the Paris ell; and the shorter gueze, called simply gueze, only two thirds of the former.—At Goa and Ormus, the Measure is the vara, the same with that of the Portuguese, having been introduced by them.—In Pegu, and some other parts of the Indies, the cando or candi, equal to the ell of Venice.—At Goa and other parts, they use a larger cando, equal to seventeen Dutch ells; exceeding that of Babel and Balfora by  $\frac{7}{8}$  per centum, and the vara by  $6\frac{1}{2}$ .—In Siam, they use the ken, short of three Paris feet by one inch. The ken contains two foks, the fok two keubs, the keub twelve niou, or inches; the niou to be equal to eight grains of rice, i. e. to about nine lines.—At Camboia, the hafter; in Japan, the tatam; and the span on some of the coasts of Guinea.

**Cubical MEASURES, or MEASURES of capacity for liquids.**—*English liquid Measures*, were originally raised from troy weight; it being enacted by several statutes, that eight pounds troy of wheat, gathered from the middle of the ear, and well dried, should weigh a gallon of wine-Measure; the divisions and multiples whereof were to form the other Measures: At the same time it was ordered, that there should be but one *liquid Measure* in the kingdom: yet custom has prevailed, and there having been introduced a new weight, viz. the avoirdupois, we have now a second standard gallon adjusted thereto, and therefore exceeding the former in the proportion of the avoirdupois weight to troy-weight. From this latter standard are raised two several Measures, the one for ale, the other for beer.

The sealed gallon at Guildhall, which is the standard for wines, spirits, oils, &c. is supposed to contain 231 cubic inches; on which supposition, the other Measures raised therefrom, will contain as in the following tables; yet, by actual experiment made in 1688, before the lord mayor and the commissioners of excise, it was only found to contain 224 cubic inches: It was however agreed to continue the common supposed contents of 231 cubic inches; so that all computations stand on their old footing.—Hence, as 12 is to 231, so is  $14\frac{1}{2}$  to  $281\frac{1}{2}$  the cubic inches in the ale gallon: but in effect the ale quart contains  $70\frac{1}{2}$  cubic inches; on which principle, the ale and beer gallon will be 282 cubic inches.

The several divisions and multiples of these Measures, and their proportions, are exhibited in the tables underneath.

**French liquid MEASURES.** At Paris, and in a great part of the kingdom, the Measures, to begin with the smallest, are, the pesson, which contains six cubic inches; two pessos make the demi-septier; two demi-septiers, the septier or chopine; two chopines, a pint; two pints, the quart or pot; four quarts, the gallon, or septier of estimation; and thirty-six septiers, the muid, which is subdivided into two demi-muids, four quarter-muids, and eight half-quarter muids. See MUID, SEPTIER, QUART, CHOPINE, &c. From the quart are likewise raised the Measures used in other parts, as the queue used in Orleans, Blois, &c. containing a Paris muid and a half, or four hundred and twenty pints; the tun used at Bayonne and Bourdeaux, consisting of four barriques, and equal to three Paris muids; at Orleans, to two: so that the first tun contains eight hundred and sixty-four pints, and the second five hundred and seventy-six. See TUN. The demi-queue, used in Champagne, ninety-six quarts; the pipe, used in Anjou and Poitou, containing two buffards, equal to two demi-queues of Orleans, &c. or a muid and a half of Paris, or four hundred and thirty-two pints. See PIPE. The millerolle used in Provence, containing sixty-six Paris pints; and the poincon used at Nantes, in Touraine and the Bleslois, equal to half the Orleans tun. The poincon used at Paris, is the same with the demi-queue.

**Dutch liquid MEASURES.** At Amsterdam, their Measures, to begin with the diminutions, are, mengles, or bottles, equal to French pots, and containing two pounds, four ounces, marc, of an ordinary liquor. The mengle is divided into two pints, four half pints, eight muffsies, sixteen half-muffsies, &c. Seven hundred and seventy mengles make their tun. The viertel, or quarter, consists of five mengles, and one sixth of a mengle. The wine viertel is just six mengles. The stekans, or stekaimen, contains sixteen mengles. The anker contains two stekans; and four ankers, the awn. For oils they use the tun, which contains six awms, or ahms; equal to sixteen hundred Paris pints. See TUN.

**Spanish liquid MEASURES,** are the bota, containing between thirty-six and thirty-seven Dutch stekans, holding about a thousand weight. The bota consists of thirty arrobas, each

weighing twenty-eight pounds. Each artoba is again divided into eight azumbres, and the azumbre into four quarts. The pipe consists of eighteen arrobas.

**Portuguese liquid MEASURES,** are botas, almudes, cavadas, quartas; and for oil, alqueirs or cantars. The Portuguese bota is somewhat smaller than the Spanish; the latter being equal to thirty-six or thirty-seven stekans, and the former only to twenty-five or twenty-six. The quartas is one fourth of the cavadas. The cavadas, or cavado, is the same with the Dutch mengle. Six cavadas make an alquier, and two alquiers one almude, or almoid; twenty-six almudes, a bota.

**Italian liquid MEASURE;** at Rome, are the boccale, or pot, containing a little more than a Paris pint. Seven boccales and a half make the rubbo, and thirteen rubbos and a half, the brenta; so that the brenta contains ninety-six boccales.—At Florence, the staro or stalo, containing three bariles, and the barile twenty fiascos or flasks, nearly equal to Paris pints.—At Verona, they use the bafza, sixteen whereof make a brenta; the brenta contains ninety-six boccales, or thirteen rubbos and a half.—At Venice, the amphora, containing two bottes; the botte, four bigoncios; the bigoncio, four quarts; the quart, four tischaufferas. The Venetian botte is again divided into mostachios, seventy-six whereof make the amphora.—At Ferrara, the mastilly, containing eight sechios.—In Istria, sechios; six whereof make the urna. In Calabria, and Apulia, pignatolis, equal to French pints; thirty-two pignatolis make the staro or stalo; and ten staros, the salma.

**German liquid MEASURES.** The fuder is used almost throughout all Germany, but with some difference in its length, as well as its sub-divisions. The fuder is supposed the load of a cart with two horses. Two fuders and a half make the roeder; six awms, the fuder; twenty fertels, the awm; and four maassens, or maasses, the fertel: so that the roeder contains one thousand two hundred maasses, the fuder four hundred and eighty, the awm eighty, and the fertel forty-one. At Nuremberg, the division of the fuder is into twelve heemers, and the heemer into sixty-four maasses.—At Vienna, they divide the fuder into thirty-two heemers, the heemer into thirty-two atchtelings, and the atchteling into four felitins. The awm, there, is eighty maasses; the fertel, called also *schrewe*, four maasses; and the driclinck twenty-four heemers.—At Aufbourg, the fuder is divided into eight jez; the jez into two muids, or twelve besons; the beson into eighty maasses, which makes seven hundred sixty-eight maasses in the fuder, as in that of Nuremberg.—At Heidelberg, the fuder is divided into ten awms; the awm into twelve vertels; and the vertel into four maasses.—In Wirtemberg, the fuder is divided into six awms; the awm into sixteen yunes; the yune into ten maasses.

**Liquid MEASURES on the coasts of Barbary.**—At Tripoli, &c. they use the rotolo, or roteli; thirty-two whereof make the matuli.—At Tunis, forty-two of the rotoli of Tripoli, make a matara, or mataro; and the other places on the same coast use nearly the same measures.—It may be here observed, that most, if not all the eastern nations, with whom the Europeans traffic, have not any such thing as Measures of capacity, whether for things liquid or dry; but that they sell every thing, even liquors, by the weight. We may, however, rank among the number of *liquid Measures*, the cocos and canan of Siam. The first are the cocos-shells cleared of their kernel. And since these are not all of the same capacity, they measure them with cauris, or little shells found in the Maldives; which also serve for money in some states of the Indies. Some cocos hold a thousand cauris, and some only five hundred. Above the cocos is the canan, a little Measure used in the same country, and called by the Portuguese, *choup*; holding about a Paris quart.

Cubical

M E A

*Cubical MEASURES of capacity for things dry.*—*English dry or corn* MEASURES, are raised from the Winchester gallon; which contains  $272\frac{1}{2}$  solid inches, to hold of pure running or rain-water, nine pound, thirteen ounces. This seems to stand on the foot of the old wine gallon, of 224 cubic inches; 12 being to  $14\frac{1}{2}$ , as 224 to  $272\frac{1}{2}$ . Yet by an act of parliament, made 1697, it is decreed, that a round bushel, eighteen inches and a half wide, and eight deep, is a legal Winchester bushel. But such a vessel will only hold 2150.42 cubic inches; consequently the gallon will contain  $268\frac{1}{2}$  cubic inches. The divisions and multiples are as in the table following.

*French dry MEASURES*, are the litron, bushel, minot, mine, septier, muid, and tun. The litron is divided into two demilitrons, and four quarter litrons, and contains thirty-six cubic inches of Paris. By ordonnance, the litron is to be three inches and a half high; and three inches, ten lines broad. The litron for salt is larger, and is divided into two halves, four quarters, eight demi-quarters, and sixteen mesurettes.—The bushel is different in different jurisdictions. At Paris, it is divided into demi-bushels; each demi-bushel into two quarts; the quart into two half-quarts; and the half-quart into two litrons: so that the bushel contains sixteen litrons. By ordonnance, the Paris bushel is to be eight inches, two lines and a half high; and ten inches broad, or in diameter, within-side. The minot consists of three bushels; the mine of two minots, or six bushels; the septier of two mines, or twelve bushels; and the muid of twelve septiers, or a hundred forty-four bushels. *The bushel for oats* is estimated double that of any other grain; so that there go twenty-four bushels to make the septier, and two hundred eighty-eight to make the muid. It is divided into four picotins; the picotin containing two quarts, or four litrons. *The bushel for salt* is divided into two half-bushels, four quarters, eight half-quarters, and sixteen litrons; four bushels make a minot, sixteen a septier, and a hundred ninety-two a muid. *The bushel for wood* is divided into halves, quarters, and half-quarters. Eight bushels make the minot, sixteen a mine; twenty mines, or three hundred and twenty bushels the muid. For *plaster*, twelve bushels make a sac, and thirty-six sacs a muid. For *lime*, three bushels make a minot, and forty-eight minots a muid. See **BUSHEL**.—The minot is, by ordonnance, to be eleven inches, nine lines high; and fourteen inches eight lines in diameter. The minot is composed of three bushels, or sixteen litrons; four minots make a septier, and forty-eight a muid.—The mine is no real vessel, but an estimation of several others. At Paris, the mine contains six bushels, and twenty-four make the muid. At Rouen, the mine is four bushels; and at Dieppe, eighteen mines make a Paris muid. See **MUID**.—The septier differs in different places: At Paris it contains two mines, or eight bushels; and twelve septiers the muid. At Rouen, the septier contains two mines, or twelve bushels. Twelve septiers make a muid at Rouen, as well as Paris; but twelve of the latter are equal to fourteen of the former. At Toulon, the septier contains a mine and a half; three of which mines make the septier of Paris. See **SEPTIER**.—The muid, or muy, of Paris, consists of twelve septiers; and is divided into mines, minots, bushels, &c. That for oats is double that for other grain; *i. e.* contains twice the number

M-E A

of bushels. At Orleans, the muid is divided into mines; but those mines only contain two Paris septiers and a half. See **MUID**. In some places they use the tun in lieu of the muid; particularly at Nantes, where it contains ten septiers of sixteen bushels each, and weighs about three thousand three hundred pounds. Three of these tuns make twenty-eight Paris septiers. At Rochel, &c. the tun contains forty-two bushels, and weighs two *per cent.* less than that of Nantes. At Brest, it contains twenty bushels, is equal to ten Paris septiers, and weighs about two thousand two hundred and forty pounds. See **TUN**.

*Dutch, Swedish, Polish, Prussian, and Muscovite dry MEASURES.*  
In these places they estimate their dry things on the foot of the *last, lest, leth, or lecht*; so called according to the various pronunciations of the people who use it.—In Holland, the last is equal to nineteen Paris septiers, or thirty-eight Bourdeaux bushels, and weighs about four thousand five hundred sixty pounds; the last they divide into twenty-seven mudes, and the mude into four schepels.—In Poland, the last is forty Bourdeaux bushels, and weighs about four thousand eight hundred Paris pounds.—In Prussia, the last is a hundred thirty-three Paris septiers.—In Sweden and Muscovy, they measure by the great and little last; the first containing twelve barrels, and the second half as many. See *LAST* In Muscovy, they likewise use the chefford, which is different in various places: That of Archangel is equal to three Rouen bushels.

*Italian dry MEASURES.* At Venice, Leghorn, and Lucca, they estimate their dry things on the foot of the staro or staio: the staro of Leghorn weighs fifty-four pounds: an hundred and twelve staros, and seven eighths, are equal to the Amsterdam last.—At Lucca, a hundred and nineteen staros make the last of Amsterdam.—The Venetian staro weighs a hundred twenty-eight Paris pounds; the staro is divided into four quarters. Thirty-five staros, and one fifth, or a hundred and forty quarters, and four fifths, make the last of Amsterdam.—At Naples, and other parts, they use the tomolo, or tomalo, equal to one third of the Paris septier. Thirty-six tomoli and a half, make the carro; and a carro and a half, or fifty-four tomoli, make the last of Amsterdam.—At Palermo, sixteen tomoli make the salma; and four mondili, the tomolo. Ten salmas, and three sevenths, or a hundred and seventy-one tomoli, and three sevenths, make the last of Amsterdam.

*Flemish dry MEASURES.* At Antwerp, &c. they measure by the viertel; thirty-two and a half whereof, make nineteen Paris septiers. — At Hambourg, the scheffel; ninety whereof make nineteen Paris septiers.

*Spanish and Portuguese dry MEASURES.* At Cadiz, Bilbao, and St. Sebastian, they use the fanega, twenty-three whereof make the Nantes, or Rochel tun, or nine Paris septiers and a half: though the Bilbao fanega is somewhat larger, inasmuch that twenty-one fanegas make a Nantes tun.—At Seville, &c. they use the anegros, containing a little more than the Paris mine; thirty-six anegros make nineteen Paris septiers.—At Bayonne, &c. the concha; thirty whereof are equal to nine Paris septiers and a half.—At Lisbon, the alquier, a very small Measure, two hundred and forty whereof make nineteen Paris septiers, sixty the Lisbon muid.

The usual MEASURE of wood for firing, is the cord; four feet high, as many broad, and eight long; divided into two half cords, called *ways*, and by the French, *membrures*, from the pieces stuck upright to bound them; or *voyes*, as being supposed half a waggon load. See CORD.

The MEASURE for horses, is the hand, or handful; which by the statute contains four inches. See HAND, and HORSE.

MEASURE, is also used to signify the cadence, and time observed in poetry, dancing, and music, to render them regular, and agreeable. See CADENCE, &c.

The different Measures or metres in poetry, are the different manners of ordering and combining the quantities, or the long and short syllables. Thus hexameter, pentameter, iambic, sapphic verses, &c. consist of different Measures. See METER, QUANTITY, VERSE, &c.

In English verses, the Measures are extremely various and arbitrary, every poet being at liberty to introduce any new form he pleases.—The most usual are, the heroic, generally consisting of five long, and five short syllables; verses of four feet; and of three feet, and a cæsure or single syllable.

The ancients, by variously combining and transposing their quantities, made a vast variety of different Measures. Of words, or rather feet of two syllables, they formed a spondee, consisting of two long syllables; a pyrrhic, of two short syllables; a trochee, of a long and a short syllable; an iambic of a short and a long syllable. See SPONDEE, PYRRHICHIUS, TROCHEE, &c.

Of their feet of three syllables, they formed a molossus, consisting of three long syllables; a tribrach, of three short syllables; a dactyl, of one long, and two short syllables; an anapaest, of two short and one long syllable. See DACTYL, ANAPÆST, &c. The Greek poets contrived a hundred and twenty-four different combinations or Measures, under as many different names, from feet of two syllables to those of six. See RHYTHM, and FOOT.

MEASURE, in music, the interval, or space of time, which the person who beats time takes between the raising and falling of his hand or foot, in order to conduct the movement, sometimes quicker, and sometimes slower, according to the kind of music, or the subject that is sung or played. See TIME.

The Measure is that which regulates the time we are to dwell on each note. See NOTE.

The ordinary or common Measure, is one second, or sixtieth part of a minute, which is nearly the space between the beats of the pulse or heart; the systole, or contraction of the heart, answering to the elevation of the hand; and its diastole, or dilatation, to the letting it fall. The Measure usually takes up the space that a pendulum, of two feet and a half long, employs in making a swing or vibration. See VIBRATION.

The Measure is regulated according to the different quality or value of the notes in the piece; by which the time that each note is to take up, is expressed. The semi-breve, for instance, holds one rise, and one fall; and this is called the Measure, or whole Measure; sometimes the Measure-note or time-note; the minim, one rise, or one fall; and the crotchet, half a rise, or half a fall, there being four crotchets in a full Measure. See NOTE.

Binary, or double MEASURE, is that wherein the rise and fall of the hand are equal. See BINARY.

Ternary, or triple MEASURE, is that wherein the fall is double to the rise; or where two minims are played during a fall, and but one in a rise: To this purpose, the number 3 is placed at the beginning of the lines, when the Measure is intended to be triple; and a C, when the Measure is to be common or double. This rising and falling of the hands, was called by the

Greeks *apoc* and *thesis*. St. Augustin calls it *plausus*, and the Spaniard, *compas*. See ARSIS and THESIS.

MEASURING, MENSURATION, defined geometrically, is the assuming any certain quantity, and expressing the proportion of the similar quantities to the same.

MEASURING, defined popularly, is the using a certain known measure, and determining thereby, the precise extent, quantity or capacity of any thing. See MEASURE.

Measuring in the general, makes the practical part of geometry; see GEOMETRY. From the various subjects whereon it is employed, it acquires various names, and constitutes various arts. Thus

MEASURING of lines, or quantities of one dimension, we call Longimetry. See LONGIMETRY.—And when those lines are not extended parallel to the horizon, altimetry. (See ALTIMETRY.)—When the different altitudes of the two extremes of the line are alone regarded, levelling. See LEVELLING.

MEASURING of superficies, or quantities of two dimensions, is variously denominated, according to its subjects; when conversant about lands, it is called *geodesia*, or *surveying*: in other cases, simply *Measuring*. See GEODÆSIA and SURVEYING. The instruments used are the ten-foot rod, chain, compass, circumferentor, &c. See AREA, CHAIN, COMPASS, &c.

MEASURING of solids, or quantities of three dimensions, we call Stereometry; see STEREOMETRY: where it is conversant about the capacities of vessels, or the liquors they contain particularly, gauging. See GAUGING. The instruments are the gauging rod, sliding-rule, &c. See SOLID, GAUGING-ROD, SLIDING-RULE, &c.

From the definition of *Measuring*, where the Measure is expressed to be similar or homogeneous to, *i. e.* of the same kind with the thing measured; it is evident that in the first case, or in quantities of one dimension, the Measure must be a line; in the second, a superficies; and in the third, a solid.—

For a line, *v. gr.* cannot measure a surface; to measure, being no more than to apply the known quantity to the unknown, till the two become equal. Now a surface has breadth, and a line has none: And if one line have no breadth, two or a hundred have none: A line, therefore, can never be applied so often to a surface, as to be equal to it, *i. e.* to measure it.—And from the like reasoning it is evident, a superficies, which has no depth, cannot become equal to, *i. e.* cannot measure a solid, which has.

While a line continues such, it may be measured by any part of itself: but when the line begins to flow, and to generate a new dimension, the Measure must keep pace, and flow too; *i. e.* as the one commences superficies, the other must do so too: Thus we come to have square Measures, and cubic Measures. See SQUARE and CUBE.

Hence we see why the Measure of a circle is an arch, or part of the circle; for a right line can only touch a circle in one point, but the periphery of a circle consists of infinite points: The right line therefore to measure the circle, must be applied infinite times, which is impossible.—Again, the right line only touches the circle in a mathematical point; which has no parts or dimensions, consequently no magnitude; but a thing that has no magnitude or dimensions, bears no proportion to another that has; and cannot therefore measure it.—Hence we see the reason of the division of circles into 360 parts or arches, called degrees. See ARCH, CIRCLE, and DEGREE.

MEASURING of triangles, or from three given sides or angles, to determine all the rest, is called trigonometry. See TRIGONOMETRY.

MEASURING of the air, its pressure, spring, &c. is called *aërometry* or *pneumatics*. See *AEROMETRY*, &c.

MEATUS *auditorius*, the entrance of the ear; a cartilaginous substance, irregularly divided with fleshy membranous interpositions in several parts of it, not unlike the bronchia in the lungs, only its fleshy fibres are here thicker. The inner part, or that next the brain, is bony. It is lined throughout with a thin membrane, derived from the skin, which is continued on the membrana tympani, where it becomes thinner.—See *Tab. Anat. (osteol.) fig. 13. lit. f.* See also *EAR*, *AQUEDUCT*. From the beginning of the *Meatus*, almost half way, arise a great number of small hairs, at whose roots issue the ear-wax, which is entangled in those hairs, the better to break the impetus of the external air, and prevent its too suddenly rushing in on the membrana tympani. See *CERUMEN*.

MEATUS *cysticus*, a biliary duct, about the bigness of a goose-quill, which at about two inches distance from the gall-bladder, is joined to the meatus hepaticus; and these together form the ductus communis. See *BILE*, *DUCT*, and *CYSTICUS*.

MEATUS *urinarius*, or *urinary passage* in women, is very short, lined internally with a very thin membrane; next to which is a coat of a white substance. Through this coat, from some lacunæ in it, pass several ducts, which convey a limpid glutinous matter, serving to anoint the extremity of the urethra.—See *Tab. Anat. (splanch.) fig. 9. lit. r. fig. 11. lit. k.* See also *URINARY*.

MECHANICS, *MECHANICA*, *ΜΗΧΑΝΙΚΗ*, a mixed mathematical science, which considers motion and moving powers, their nature and laws, with the effects thereof, in machines, &c. See *MOTION* and *POWER*.

That part of *Mechanics* which considers the motion of bodies arising from gravity, is by some called *Statics*. See *GRAVITY*, *STATICS*, *RESISTENCE*, &c.—In distinction from that part which considers the *mechanical* powers, and their application, properly called *Mechanics*. See *MECHANIC POWERS*, *MACHINE*, *ENGINE*, *FRICTION*, *EQUILIBRIUM*, &c.

MECHANICAL, something that relates to *Mechanics*, or is regulated by the nature and laws of motion. See *MECHANICS*, and *MOTION*.

In which sense we say, mechanical powers, mechanical properties or affections, mechanical principles, reasoning, knowledge, &c.

MECHANICAL *affections*, are such properties in matter, as result from their figure, bulk, and motion. See *AFFECTION*, and *BODY*.

MECHANICAL *causes* are those founded on such affections. See *CAUSE*.

MECHANICAL *solutions* are accounts of things on the same principles. See *SOLUTION*.

MECHANICAL *Philosophy*, is the same with what we otherwise call the *corpuscular philosophy*; viz. that which explains the phenomena of nature, and the operations of corporeal things, on the principles of *Mechanics*, viz. the motion, gravity, figure, arrangement, disposition, greatness or smallness of the parts which compose natural bodies. See *CORPUSCLE*, *CORPUSCULAR*, *ATOM*, *PARTICLE*, *ATTRACTION*, *GRAVITY*, &c.

MECHANICAL *powers*, denote the six simple machines; to which all others, how complex soever, are reducible, and of the assemblage whereof they are all compounded. See *POWER*, and *MACHINE*.

The *Mechanical powers*, are the balance, lever, wheel, pulley, wedge, and screw; which see under their proper heads: *BALANCE*, *LEVER*, &c.

They may, however, be all reduced to one, viz. the *Lever*. The principle whereon they depend, is the same in all, and may be conceived from what follows.

The momentum, impetus, or quantity of motion of any body, is the factum of its velocity, (or the space it moves in a given time) multiplied into its mass. Hence it follows, that two unequal bodies will have unequal moments, if the lines they describe be in a reciprocal ratio of their masses.—Thus, if two bodies, fastened to the extremities of a balance or lever, be in a reciprocal ratio of their distances from the fixed point; when they move, the lines they describe will be in a reciprocal ratio of their masses.

E. gr. If the body A (*Tab. Mechanics, fig. 6.*) be triple the body B, and each of them be so fixed to the extremities of a lever AB, whose fulcrum, or fixed point is C, as that the distance of BC be triple the distance CA; the lever cannot be inclined on either side, but the space BE, passed over by the less body, will be triple the space AD, passed over by the great one. So that their motions or moments will be equal, and the two bodies in æquilibrium. See *MOTION*.

Hence that noble challenge of Archimedes, *datis viribus, datum pondus movere*; for as the distance CB may be increased infinitely, the power or moment of A may be increased infinitely.

—So that the whole *Mechanics* is reduced to the following problem.

Any body, as A, with its velocity C, and also any other body, as B, being given; to find the velocity necessary to make the moment, or quantity of motion in B, equal to the moment of A, the given body.—Here, since the moment of any body is equal to the rectangle under the velocity, and the quantity of matter; as B : A :: C : to a fourth term, which will be c, the celerity proper to B, to make its moment equal to that of A. Wherefore in any machine or engine, if the velocity of the power be made to the velocity of the weight, reciprocally as the weight is to the power; such power will always sustain, or if the power be a little increased, move the weight.

Let, for instance, AB be a lever whose fulcrum is at C, and let it be moved into the position acb.—Here, the velocity of any point in the lever, is as the distance from the centre. For let the point A describe the arch Aa, and the point B the arch Bb; then these arches will be the spaces described by the two motions: but since the motions are both made in the same time, the spaces will be as the velocities. But it is plain, the arches Aa and Bb will be to one another as their radii AC and AB, because the sectors ACA, and BCB, are similar: wherefore the velocities of the points A and B, are as their distances from the centre C.

Now, if any powers be applied to the ends of the lever A and B, in order to raise its arms up and down; their force will be expounded by the perpendiculars Sa, and bN; which being as the right lines of the former arches, Bb and aA, will be to one another also as the radii AC and CB; wherefore the velocities of the powers, are also as their distances from the centre.

And since the moment of any body is as its weight, or gravitating force, and its velocity conjunctly; if different powers or weights be applied to the lever, their moments will always be as the weights and the distances from the centre conjunctly.—

Wherefore, if to the same lever, there be two powers or weights applied reciprocally proportional to their distances from the centre, their moments will be equal; and if they act contrarily, as in the case of a stilliard, the lever will remain in an horizontal position, or the balance will be in æquilibrium.—And thus it is easy to conceive how the weight of one pound may be made to equilibrate a thousand, &c.

Hence also it is plain, that the force of the power is not at all increased by engines; only the velocity of the weight in either lifting or drawing, is so diminished by the application of the instrument, as that the moment of the weight is not greater than the force of the power.—Thus, for instance; if any force can raise a pound weight with a given velocity, it is impossible by any engine to effect, that the same power shall raise two pound weight, with the same velocity: But by an engine it may be made to raise two pound weight with half the velocity; or 10000 times the weight, with  $\frac{1}{10000}$  the former velocity. See *PERPETUAL MOTION*.

MECHANICAL is also applied to a kind of *reasoning*, which of late has got great ground both in physics, and medicine; thus denominated, as being conformable to what is used in the contrivance, and accounting for the properties and operations of machines. See *PHYSICS*.

This manner of thinking and arguing, Dr. Quincy insists, is the result of rightly studying the powers of a human mind, and the ways by which it is only fitted to get acquaintance with material beings: For considering an animal body as a composition out of the same matter, from which all other bodies are formed, and to have all those properties which concern a physician's regard, only by virtue of its peculiar make and construction; it naturally leads a person to consider the several parts, according to their figures, contexture, and use; either as wheels, pulleys, wedges, levers, screws, chords, canals, cisterns, strainers, or the like; and throughout the whole of such enquiries, to keep the mind close in view of the figures, magnitudes, and mechanical powers of every part or movement; just in the same manner, as is used, in enquiring into the motions and properties of any other machine. For which purpose it is frequently found helpful to design, or picture out in diagrams, whatsoever is under consideration, as it is customary in common geometrical demonstrations.

The knowledge obtained by this procedure is called *Mechanical knowledge*. See *KNOWLEDGE*.

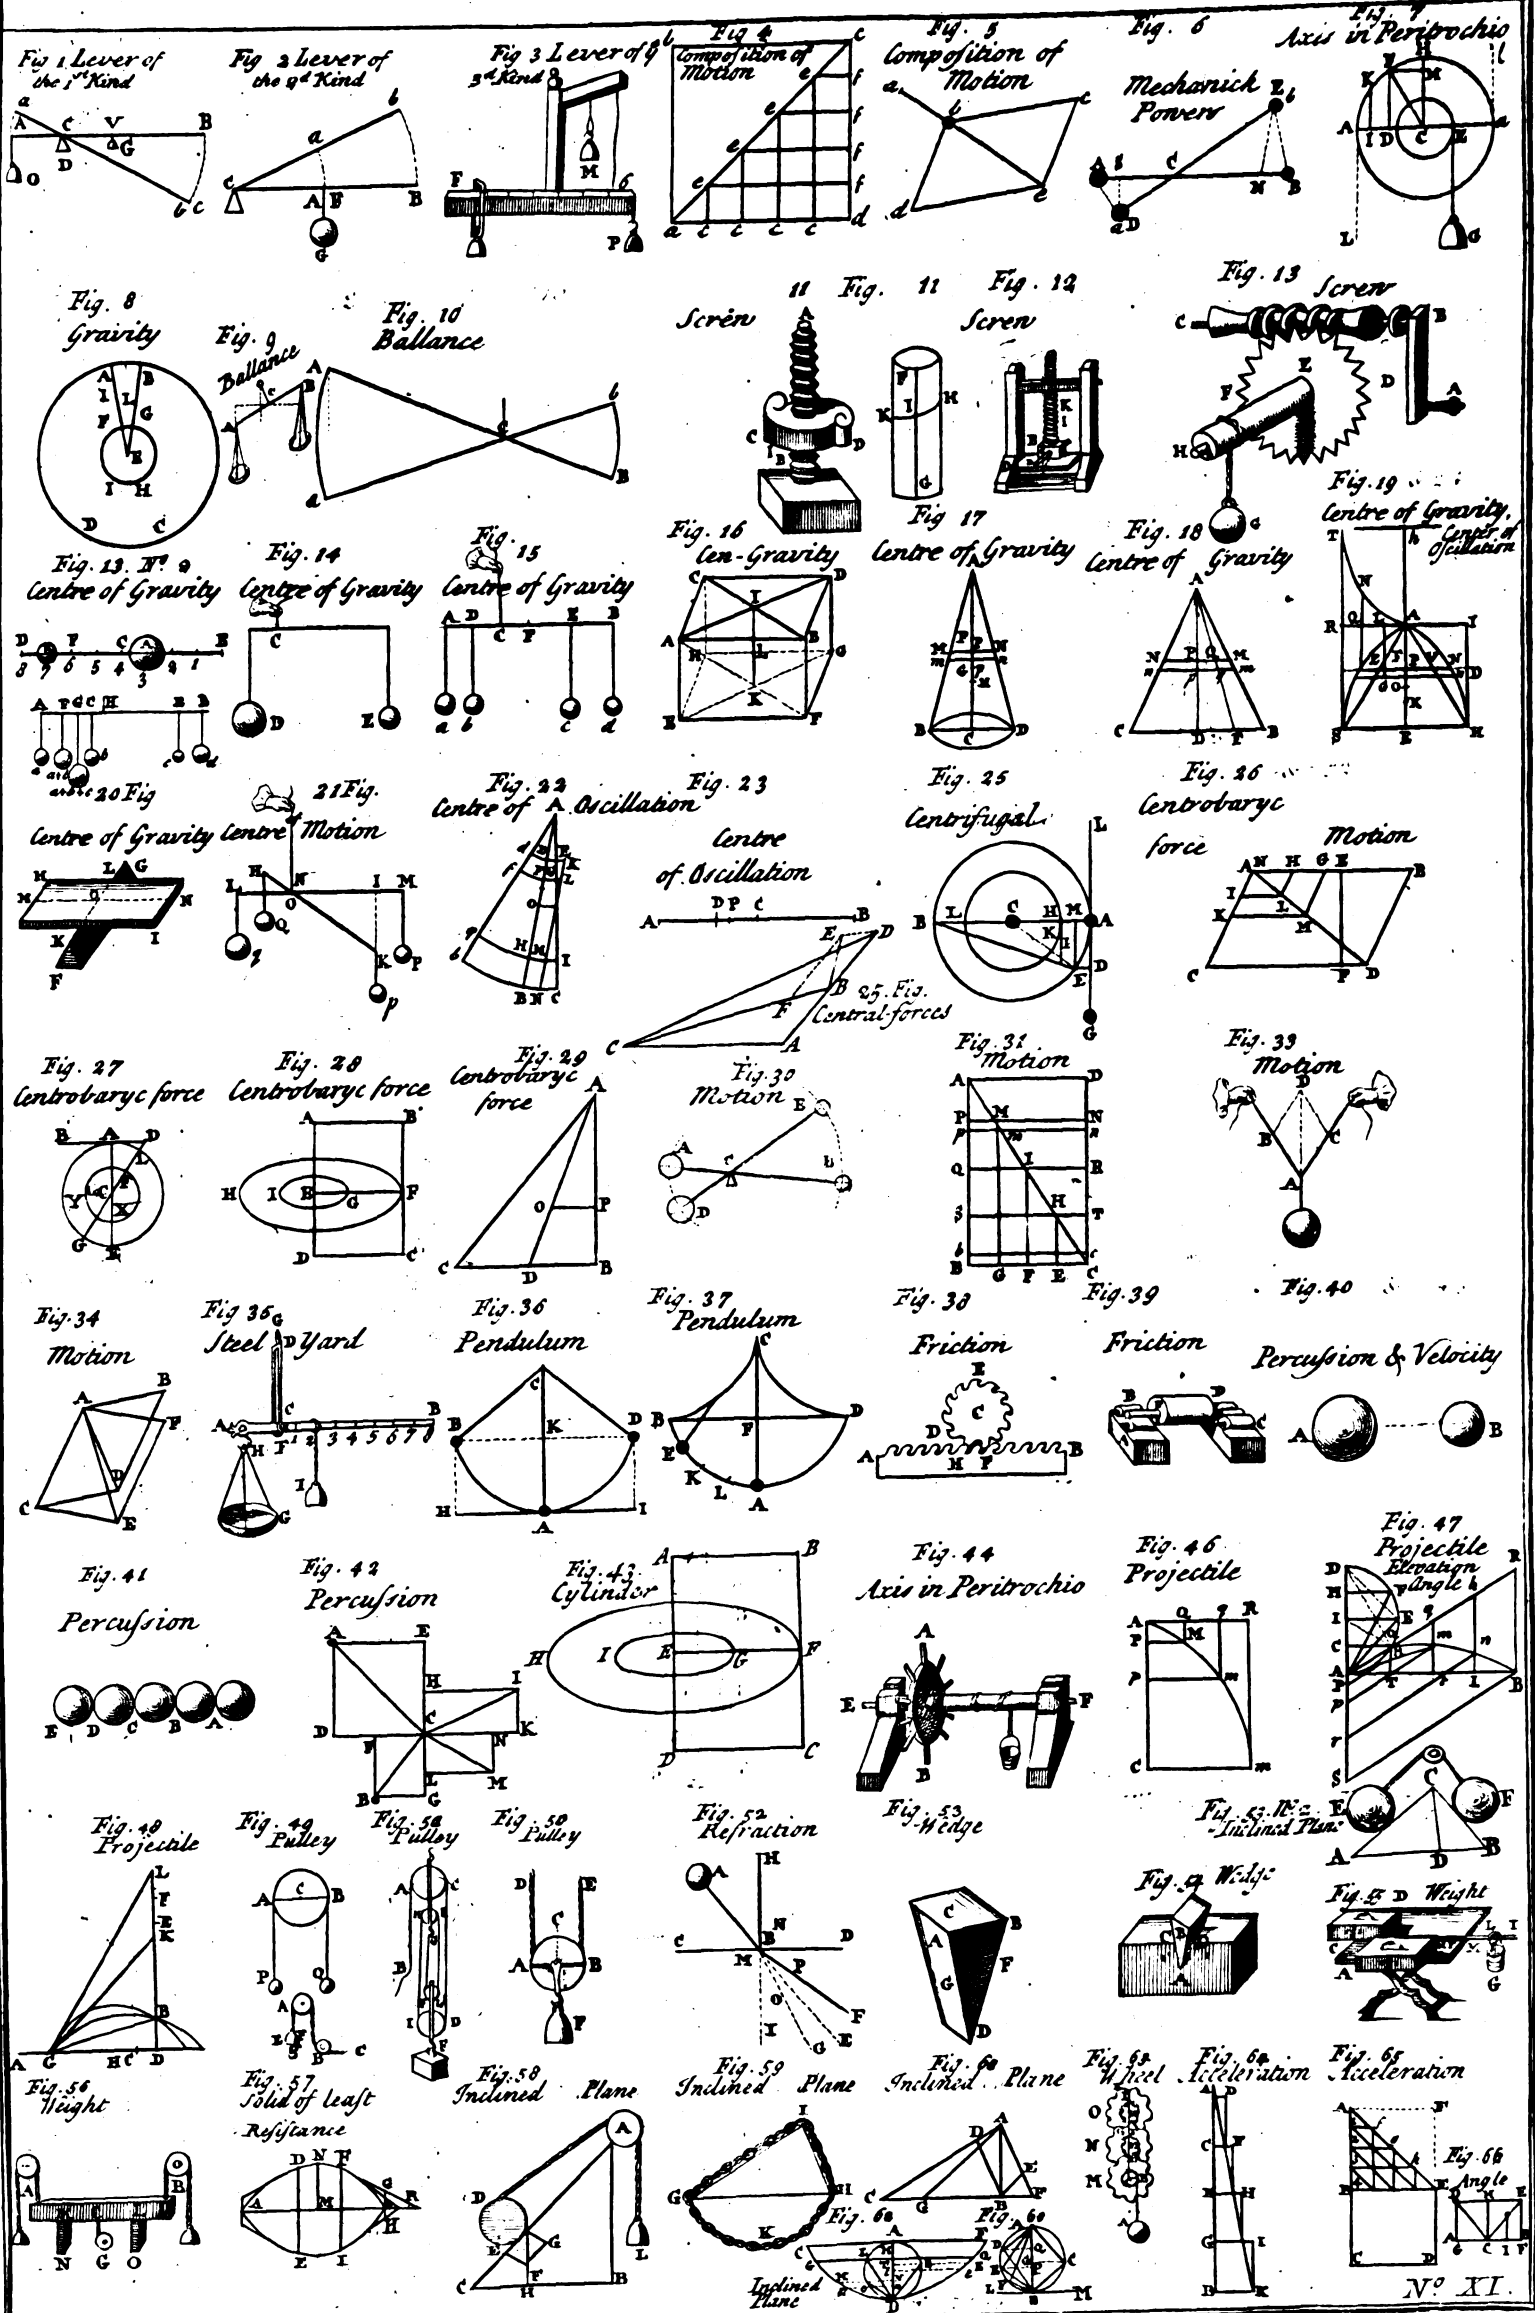

MECHANICAL is also used in mathematics, to signify a construction or proof of some problem, not done in an accurate and geometrical manner, but coarsely and unartfully, or by the assistance of instruments; as are most problems relating to the duplicature of the cube and the quadrature of the circle. See *CONSTRUCTION*, *QUADRATURE*, *DUPLICATION*, *DEMONSTRATION*, and *LINES*.

MECHANICAL *arts*. See article *ARTS*.

MECHANICAL *curve*, a term used by Des Cartes for a curve, which cannot be defined by any algebraic equation.—By which it stands contradistinguished from algebraic or geometrical curves. See *ALGEBRAICAL*, and *GEOMETRICAL*.

M. Leibnitz and some others, in lieu of mechanical curves, call them *transcendental curves*, and dissent from Cartes, in excluding

# TAB: MECHANICKS.

## M E D

cluding them out of geometry: Leibnitz has even found a new kind of transcendental equations, whereby these curves are defined: They are of an indefinite nature; that is, do not continue constantly the same in all points of the curve; in opposition to algebraic curves which do. See TRANSCENDENTAL, and CURVE.

**MECHANISM** of the barometer. See the article BAROMETER.

**MECHANISM** of the double microscope, &c. See MICROSCOPE.

**MECHOACAN**, **MECHOACANNA**, called also *white jalap*, *white rhubarb*, and *American scammony*; a medicinal root, taking its name from a province of New Spain, from whence it is brought.

*Mechoacan* was known and used as a purgative before *jalap*, though the latter is now in more general use, as being found more efficacious. Yet *Mechoacan* is the sweeter and more gentle of the two, and on that account preferable. See **JALAP**.

The seat of its action is chiefly in the extreme parts, for which reason it is accounted good in arthritic pains. It has the advantage of needing no preparation or corrective; and of purging in its own proper substance, such as it grows.

M. Boulduc found by analysing it, that it contains twelve times as much salt as resin; but neither the saline nor resinous extract purge so freely as the substance, even though taken in larger doses; nor do they yet purge so gently.

In the choice of *Mechoacan*, prefer those pieces which are the brownest within, and whose substance is the closest, and most compact.

**MECONIUM**\*, **MHKONION**, in pharmacy, is the juice of the poppy, drawn by expression, and dried. See **POPPY**.

\* The word comes from the Greek *μῆκων*, poppy.

*Meconium* differs from opium, in that this last oozes out spontaneously after an incision made in the heads of the poppies, whereas the former is drawn by violence both from the heads and leaves, and even from the whole plant bruised and pressed together. See **OPIMUM**.

**MECONIUM** is also a black thick excrement, gathered in the intestines of a child during the time of gestation.

In colour and consistence, it resembles pulp of cassia. It is also found to resemble *meconium*, or juice of poppy, whence it takes its name.

**MEDAL**\*, **MEDALIA**, a small figure, or piece of metal, in form of a coin, destined to preserve to posterity the portrait of some great man, or the memory of some illustrious action.

\* Scaliger derives the word from the Arabic, *Methalia*, a coin whereon is impress'd the figure of a human head. Menage and Vossius rather derive it from *Metallum*. Du Cange observes, that the obolus was anciently called *Medalia*, *quasi Medietas nummi*, as being half of another coin.

The parts of a **MEDAL**, are the two sides; one whereof is called the *face*, or *head*; the other the *reverse*. See **REVERSE**.

On each side is the area or field, which makes the middle of the *Medal*; the rim or border; and the *exergum*, which is beneath the ground whereon the figures represented are placed. See **EXERGUM**. On the two sides are distinguished the type, and the inscription or legend. The type or devise is the figures represented; the legend is the writing, especially that around the *Medal*; though in the Greek *Medals*, the inscription is frequently in the area. What we find in the *exergum* is frequently no more than some initial letters, whose meaning we are unacquainted withal; though, sometimes too, they contain epochas, or words that may be accounted an inscription. See **LEGEND**.

Some authors imagine, that the ancient *Medals* were used for money. M. Patin has a chapter express to prove, that they had all a fixed regular price in payments; not excepting even medallions. F. Joubert is of the same opinion. Others, on the contrary, maintain, that we have no real monies of the ancients; and that the *Medals* we now have, never had any course as coins. Between these two extremes, there is a medium, which appears by much more reasonable than either of them. See **MONEY**.

**MEDALS** are divided into *ancient* and *modern*.

*Ancient MEDALS* are either of the higher or lower antiquity.

—The former class consists of such as were struck before the end of the third century. The latter of such as were struck between the third and ninth centuries.

*Modern MEDALS* are those struck within these three hundred years. See **COIN**.

Among the ancient *Medals* some are Greek, others Roman.

—The Greek *Medals* are the most ancient. That people struck *Medals* in all the three metals with such exquisite art, as the Romans could never come up to. The Greek *Medals* have a design, accuracy, force, and a delicacy that expresses even the muscles and veins, and it must be owned, goes infinitely beyond any thing of the Romans.

There are also *Hebrew Medals*, *Punic*, *Gothic*, and *Arabic Medals*; which make new classes in the ancient and modern ones.

*Consular MEDALS* are so called, to distinguish them from the imperial; not that they were struck by order of the consuls, but because in those times the republic was governed by consuls. Of these, father Joubert reckons about fifty or sixty of gold;

## M E D

two hundred and fifty of copper; and near a thousand of silver.—Goltzius has described them in a chronological order, according to the *Fasti consulares*. Urfinus has disposed them genealogically, according to the order of the Roman families. M. Patin has collected an entire series of them, in the same order with Urfinus; and only computes one thousand thirty-seven consulars, which relate to one hundred seventy-eight Roman families. M. Vaillant, and M. Morel, each promised a new edition of the consular *Medals*; M. Vaillant kept his word, and his book was printed ere he died, in three volumes, folio.

The consular *Medals* are certainly the most ancient *Medals* of the Romans: And yet those of copper and silver do not go beyond the four hundred eighty-fourth year of Rome; nor those of gold beyond the year five hundred forty-six. If any are produced of an older date, they are spurious.

Among the *Imperial MEDALS*, we distinguish between the *upper* and the *lower empire*: The upper empire commenced under Julius Cæsar, and ended about the year of Jesus Christ two hundred and sixty: The lower empire comprehends near one thousand two hundred years, viz. till the taking of Constantinople.—It is the custom, however, to account all the imperial *Medals*, till the time of the Palæologi, among the antique; and yet we have no imperial *Medals* of any considerable beauty, later than the time of Heraclius, who died in 641.

After the time of Phocas and Heraclius, Italy became a prey to the Barbarians; so that the monuments we have remaining of those two emperors, finish the set or series of imperial *Medals*.—To these are added the *Medals* of the lower empire, and the Greek emperors; whereof a series may be made as low as our time, taking in the modern ones.—M. Patin has made an ample collection of the imperial *Medals* till the time of Heraclius.

The *Gothic MEDALS* make part of the imperial ones: They are so called as having been struck in the time of the Goths, and in the declension of the empire; and favouring of the ignorance, and barbarity of the age.

As to *Modern MEDALS* they are such as have been struck in Europe, since the usurpation of the Goths has been extinct; and sculpture and engraving have begun to re-flourish.—The first was that of the famous reformer John Huf in 1415; if any pretend to be more ancient, they are spurious.—In France there were none struck with the king's effigy before the reign of Charles VII.

The study of modern *Medals* is so much the more useful, as they afford more light than the ancient, and mark the times and consequences of events more precisely: whereas the inscriptions of the ancient *Medals* are very short, and simple, and generally without any date.—Add to this, that the ancient *Medals* are extremely liable to be counterfeited, by reason of the excessive price they bear. But in the modern, there is not near that danger of being imposed upon.

There are no true *Hebrew Medals*; those which we see of the heads of Moses, and Jesus Christ, are spurious and modern. We have a few shekels of copper and silver, with Hebrew or Samaritan legends; but none of gold; though there is mention made of one in the king of Denmark's cabinet.—F. Souciet has a dissertation on the *Hebrew Medals*, commonly called *Samaritan Medals*, where he distinguishes accurately between the genuine and spurious, and shews, that they are true Hebrew coins struck by the Jews, but on the model of the ancients; and that they were current before the Babylonish captivity. See **SAMARITAN**.

*Singular MEDALS*, in the popular sense, are such as are not found in the cabinets of the curious, and are only met with by chance; but in the stricter sense are such, whereof there is not above one of a kind extant.—The *Otho* in large copper is a singular *Medal*. When a *Medal* exceeds the value of ten or twelve pistoles, it is worth what the owner pleases. The *Pescennius Niger*, and *Pertinax*, are very rare in all metals. The *Didius Julianus* is hardly found any where, but in large copper. Carteron, a Dutchman, and some others, have made mills on purpose to strike *Medals* that never were, as those of Cicero, Virgil, Priam, &c.

*Greek MEDALS* are such as have either the heads of Greek emperors, or Greek inscriptions.

*False* or *Spurious MEDALS*, are those counterfeited, and put off for antique, when they are not.

*Mutilated MEDALS*, are those that are not entire, or are defaced.

*Redintegrated MEDALS*, are those wherein we find the letters *Rest.* which shew that they have been restored by the emperors.

*Dipt MEDALS*, are struck of pure copper, and afterwards silvered.—This is a contrivance that the curious have frequent recourse to, in order to compleat their silver sets.

*Covered* or *plated MEDALS*, are those which have only a thin silver leaf over the copper, but which are struck so artfully, that the cheat does not appear, without cutting them: these are the least suspected.

*Grained* or *indented MEDALS*, are those, whose edges are cut or notched like teeth, which is a sign of purity and antiquity. They are common among the consulars, but we have none later than Augustus.

# M E D

Augustus. There are several of them, however, among those of the kings of Syria.

**MEDALS countermarked**, are those which have marks cut either on the side of the head, or of the reverse:—These countermarks serve to denote the change of their value; and this kind is much enquired for by the curious. There are also

**Cast MEDALS**, which are not struck, but cast in a mould; and **MEDALS without Reverse**. See the article **REVERSE**.

*Medals* have been struck in three kinds of metals, which make three several sets, or series's in the cabinets of the curious. That of gold is the least numerous, as not consisting of above one thousand, or twelve hundred of the imperial; that of silver may contain about three thousand imperial; and that of brass or copper, of the three several sizes, viz. the great, the middle, and the small, consists of six or seven thousand, all imperial. See **SERIES**.

It is not either the metal, or the size, which makes a *Medal* valuable; but the scarcity of the head, or of the reverse, or the legend.—Some *Medals* are common in gold, which yet are very rare in copper; and others very rare in silver, which in copper and gold are very common. The reverse is sometimes common, where the head is singular; and some heads are common, whose reverse are very scarce.

There are also *Medals* very scarce in some sets, and yet very common in others: For instance, there is no Antonia in the sets of large copper, and the middle copper is forced to supply its place. The Otho is very rare in all the copper sets, and yet common in the silver ones. Otho's, of the large copper, are held at an immense price; and those of the middle copper at forty or fifty pistoles. And the Gordians Afric, are rated near as high. Singular *Medals* are invaluable.

M. Vaillant has collected all the *Medals* struck by the Roman colonies; F. Hardouin those of the Greek and Latin cities; F. Noris those of Syria.—M. Moris has undertaken an universal history of *Medals*, and promised cuts of twenty-five thousand. He ranges them under four classes: The first contains the *Medals* of kings, cities, and people, which have neither the name nor image of the Roman emperors. The second contains the consular *Medals*; the third the imperial *Medals*; and the fourth, the Hebrew, Punic, Parthian, French, Spanish, Gothic, and Arabic.—He begins with the imperial, and brings them down as low as Heraclius. He places the Latin, in order, before the Greek.

Ad. Occo, a German physician, and count Mezzabarba, have endeavoured to range the *Medals* in a chronological order; but that is impracticable. For in many of the imperial *Medals* there is no mark either of the consulate, or of the year of the reign; and since Gallienus, there are few of the Roman imperial *Medals* that bear the least footsteps of chronology.

The most noted *Medalists*, or authors on *Medals*, are, Antonius Augustinus, Wolf. Lazius, Ful. Ursinus a learned antiquary, Aeneas Vicus, Hubert Goltzius a famous graver, Oisellius, Seguin, Occo, Trifan, Sirmond, Vaillant, Patin, Noris, Spanheim, Hardouin, Morel, Joubert, Mezzabarba, Beger, &c. For the manner of striking *Medals*, see the article **COINING**.

**Academy of MEDALS**. See the article **ACADEMY**.

**Repairing a MEDAL**. See the article **REPAIR**.

**Restitution of MEDALS**. See the article **RESTITUTION**.

**Votive MEDALS**. See the article **VOTIVE**.

**MEDALLION\***, or **MEDALION**, a *Medal* of extraordinary bigness. See **MEDALS**.

\* The word is formed from the French *Medallion*, or Italian *Medaglione*, which signify the same, and which were originally formed from *Mutalliones*, a name by which these pieces are frequently called in ancient Latin writers.

*Medallions* are ordinarily a kind of *Medals* which princes use to present, as a token of honour or esteem; for which reason the Romans called them *Miffilia*.

*Medallions* were never any current coins, as medals probably were: They were struck purely to serve as public monuments, or to make presents of.

There cannot be any set made of them, even though the metals and sizes should be joined promiscuously: The best cabinets do not contain above four or five hundred; though M. Morel promises us figures of above a thousand.

Authors vary about the time when they first began to be struck: Some antiquaries will have it under the empire of Theodosius: but this must be a mistake; for there were some struck even in the upper empire: witness a Nero, a Trajan, and an Alexander Severus, still extant.—*Medallions* of gold are very rare, as also those of a large copper.

*Medallions* are distinguished from medals by the volume, that is, by the thickness, and compass; as well as by the largeness, and relieve of the head.

**MEDIAL alligation**. See **ALLIGATION**.

**MEDIANA**, the name of a vein, or little vessel, made by the union of the cephalic and basilic, in the bend of the elbow.

It is not a particular vein, or a third vein of the arm, as some authors imagine; but merely a branch of the basilica; which running into the inner part of the elbow, unites with the cephalica, and forms a common vein, called *Mediana*; and by

# M E D

the Arabs, the *black vein*.—See *Tab. Anat. (angiul.) fig. 6. lit. p.* **MEDIANA linea**, a line or seam running down the middle of the tongue, and dividing it into two equal parts; though not so effectually, but that the blood-vessels of the one side communicate with those of the other. See **TONGUE**.

**Columnæ MEDIANÆ**, in Vitruvius, are the columns in the middle of a portico; whose intercolumnation is to be larger than those of the angular columns. See **COLUMN**.

**MEDIASTINA**, the name of a vein of the mediastinum. See **VEIN**, and **MEDIASTINUM**.

**MEDIASTINUM**, in anatomy, a double membrane, formed by a duplicature of the pleura; serving to divide the thorax, and the lungs into two parts; and to sustain the viscera, and prevent their falling from one side of the thorax to the other. See **THORAX**, &c.

It proceeds from the sternum, and passing strait down through the middle of the thorax to the vertebræ, divides its cavity into two. It contains the heart between its two lamellæ, and it affords a passage to the vena cava, the oesophagus, and the stomachic nerves. The membranes of the *Mediastinum* are finer and thinner than the pleura, and have a little fat. It receives branches of veins and nerves from the mammillary, and diaphragmatic, particularly, one called *Mediastina*; its nerves come from the stomachic: it has also some lymphatics, which open into the thoracic duct.

The *Mediastinum* divides the thorax longitudinally into two parts; to the end that one lobe of the lungs may officiate, if the other be hindered by a wound on the other side. Sometimes there is a matter contained betwixt its membranes, immediately under the sternum, which may occasion the tapping of this place.

**MEDIASTINUM cerebri**, the same with *septum transversum*. See **SEPTUM**, &c.

**MEDIATE**, or **INTERMEDIATE**, a term of relation to two extremes, applied to a third, which is in the middle between them. See **MEAN**, and **MEDIUM**.

Substance is a genus with regard to man; but between the two there are other *mediate* genus's, as body and animal.

*Mediate* stands opposed to *immediate*. Thus when we say, that God and man concur to the production of man; God is the *Mediate* cause, man the *immediate*.—It is a popular question in theology, whether the Holy Ghost convert a sinner *mediately* or *immediately*? See **IMMEDIATE**, and **INTERMEDIATE**.

**MEDIATE modes**. } See the article } **MODES**.  
**MEDICAMENTOSUS lapis** } **LAPIS**.

**MEDICINAL hours**, are those parts of the day supposed proper to take medicines in. See **MEDICINE**.

Of which there are usually reckoned four, viz. in the morning fasting, about an hour before dinner, about four hours after dinner, and going to bed: but in acute cases, the times are to be governed by the symptoms and aggravation of the distemper; without regard to any *Medicinal hours*.

**MEDICINAL waters**. See the article **WATER**.

**MEDICINALIS sacculus**. See the article **SACculus**.

**MEDICINE**, **MEDICINA**, the art of healing. See **HEALING**.

*Medicine*, properly called *physic*, consists, according to Boerhaave, in the knowledge of those things, by whose application, life is either preserved sound and healthy, or when disordered, again restored to its pristine healthiness. See **HEALTH**, and **DISEASE**.

Galen defines *Medicine*, the art of preserving present health, and of retrieving it when past: Hippocrates, the addition of what is wanting, and the retrenchment of what is redundant: Herophilus, the knowledge of things good, indifferent, and ill, with regard to health.

*Medicine* must have been nearly coeval with the world. The injuries and vicissitudes of the air, the nature and qualities of foods, the violence of external bodies, the actions of life, and lastly, the fabric of the human compages, must have rendered diseases almost as old as mankind: And the presence of a disease, as it brings with it a painful sensation, or the loss perhaps of the use of a limb, does, by a necessary mechanical impulse, both in brutes and men, compel the diseased to seek for help, and to apply remedies, either by mere experiment, or by instinct, and spontaneous appetite.—Hence arose the art of *Medicine*; which, in this sense has been always, every where, among mankind.

Ancient histories and fables tell us, that in a little time, from the flood, it was so well cultivated by the Assyrians, Babylonians, Chaldeans, and Magi, that they were able to remove present diseases, and to prevent future ones.—Hence it passed into Egypt, Lybia, Cyrenaica, and Crotona; and thence into Greece, where it flourished, principally in the islands of Cnidus, Rhodes, Cos, and in Epidaurus.

The first foundations of the art were laid by chance, natural instinct, and events unforeseen: These were improved by the memory of the success of former experiments; by writing down diseases, their remedies, and events, on columns, paintings, and the walls of their temples; by exposing the sick in the markets and public ways, that those who passed by, might enquire into the disease, and communicate a remedy, if they knew any: and lastly, by analogy, or reasoning from a comparison

comparison of things already observed, with things present and to come.

The art at length received a much greater degree of perfection, by the appointing of physicians; some for the cure of particular diseases, and others for diseases in general; by an accurate observation of the disease, and its symptoms; and by an exact description of the remedy, and its use: immediately, upon which, it got among the priests, and at length was confined to particular families; descending, by way of inheritance, from father to son: which, again, proved a great bar to its progress. The extispicy or inspecting the entrails of beasts, used by the priests; the custom of embalming dead carcases, and even butchery itself, promoted the knowledge of the human fabric, and of the causes both of health, diseases, and death.

Lastly, the dissecting of live animals for philosophical purposes, distinct narratives of the cause, rise, increase, crisis, declension, end, and effect of diseases, and the knowledge of *Medicines*, their choice, preparation, application, powers, and events, seemed to have almost brought the art to its perfection.

Hippocrates, who was cotemporary with Democritus, and perfectly acquainted with every thing then discovered, and besides, furnished with a great number of observations of his own; collecting into one all that was valuable and useful; compiled a body of Greek *Medicine*; and was the first who deserved the title of a true physician: for being a master of the *εμπειρια*, experience, as well as of analogy and reason, and withal well versed in a pure philosophy; he first, made philosophy rational; and laid the foundation of the dogmatical *Medicine*, which has ever since obtained. See DOGMATICAL, THEORETICS, &c.

What Hippocrates had done, continued a long time sacred and unaltered, and was the standing practice of many ages; at length Aretæus the Cappadocian digested it into a more orderly body: whence, in various places, at various times, and by various hands, particularly the Alexandrian school, it was further altered and improved, till at length it came into the hands of Claud. Galen; who, collecting the scattered parts, digesting those which were confused, and explaining every thing by the rigid doctrines of the Peripatetics, did both a great deal of service, and a great deal of mischief, to the noble art; he being the first who introduced the doctrine of the elements, the cardinal qualities, and their degrees, the four humours, &c. into *Medicine*: and on these he made the whole art to depend. See GALENIC, TEMPERAMENT, HUMOUR, QUALITY, &c. After the sixth century, the arts were not only extinguished, but almost all memory of them lost, till the ninth; from which, to the thirteenth, *Medicine* was vigorously cultivated by the Arabs in Asia, Africa, and Spain: who applying themselves particularly to the study of the materia medica, and its preparations, and to the operations of chirurgery, rendered both more just and more copious at the same time. And yet Galen's errors became now more predominant than ever.

At length, however, they were purged out and exploded by two different means; principally indeed by the restoration of the pure discipline of Hippocrates in France; and then also by the experiments and discoveries of chymists and anatomists: till at length the immortal Harvey overturning, by his demonstration, the whole theory of the ancients, laid a new and certain basis of the science. Since his time, *Medicine* is become free from the tyranny of any sect, and is improved by sure discoveries in anatomy, chymistry, physics, botany, mechanics, &c. See MECHANICAL.

Hence it appears, that the art originally consisted solely in the faithful collecting of observations; and that a long time after, they began to inquire, and dispute, and form theories: the first part has ever continued the same; but the latter always mutable. See HYPOTHESIS, &c.

For the several sects that have arose in *Medicine*. See EMPIRIC, DOGMATIC, GALENIST, CHYMIST, PARACEL-SIST, HERMETICAL, &c.

*Medicine* is divided into five principal branches. The first considers the human body, its parts and fabric, life and health, and the effects following from them: this is called *physiology*, the doctrine of the animal economy, or of the use of the parts: and its objects, now enumerated, are called *res naturales*, or things according to nature. See PHYSIOLOGY, OECONOMY, NATURAL Things, &c.

The second branch considers the diseases of the human body, their differences, causes, and effects; and is called *Pathology*, as it considers the diseases; *Ætiology*, as it inquires into their causes; *Nosology*, when it examines their differences; and lastly, *Symptomatology*, when it explains their effects.—The objects of this part are called *res præternaturales*, or beyond nature. See PATHOLOGY, ÆTIOLOGY, &c.

The third branch considers the signs or symptoms, and how to apply them to use; so as to judge both in a sound, and a diseased body, what, which, is, will be, the degree, order, effect, of the health, or the disease: This is called *Semiotica*.—Its objects are things both natural, non-natural, and præternatural. See SEMEIOtica.

The fourth branch considers the remedies, and their use, whereby life may be preserved; whence it is called *Hygiene*.

VOL. II. N<sup>o</sup>. XCVII.

Its objects are what we strictly call *Non-natural*. See HYGIENE and NON-NATURALS.

Lastly, The fifth furnishes the materia medica, its preparation, and manner of exhibition, so as to restore health, and remove diseases; and is called *Therapeutica*, comprehending the *Dietetica*, *Pharmaceutica*, *Chirurgica*, and *Iatrica*. See DIÆTETIC, PHARMACEUTIC, CHIRURGERY, and THERAPEUTIC.

Clinical MEDICINE, *Medicina clinica*. See CLINICA.

Characters in MEDICINE } See the article } CHARACTERS.

Panæctis of MEDICINE } See the article } PANÆCT.

MEDICINES, or MEDICAMENTS, denote any natural substances applied to a human body, in order to answer some intention of cure. See REMEDY.

*Medicines* are distinguished, with regard to the manner of application, into *internal* and *external*.

*Internal MEDICINES*, are those taken in at the mouth.

*External, or topical MEDICINES*, are those applied outwardly to any particular part. See TOPIC, &c.

With regard to the different manner of their operation, *Medicines* are distinguished into *agglutinants*, *alterants*, *anastomatics*, *astringents*, *evacuants*, *incarnatives*, *specifics*. See EVACUANT.

A general idea of the manner wherein *Medicines* operate on a human body, as explained by the sect of mechanical physicians, may be conceived from what follows.

A few different sorts of particles, variously combined, will produce great variety of fluids; some may have one sort, some two, some three or more. If we suppose only five different sorts of particles in the blood, and call them, *a, b, c, d, e*; their several combinations, without varying the proportions in which they are mixed, will be these following: but whether more or less, need not be determined.

*a b : a c : a d : a e :*

*b c : b d : b e : c d :*

*c e : d e : a b c : a d c :*

*a b d : a b e : a c e : a d e :*

*b d c : b d e : b e c : d e c :*

*a b c d : a b c e : a c d e : a b d e : b c d e : a b c d e :*

No theory of secretion has hitherto been able to give any tolerable account of the operation of such *Medicines*, as promote an evacuation. For if the humours be equally mixed with the blood, that is, if the blood be in every part of the body the same, and its particles be not more apt to form certain humours, in some certain parts of the body, than in others; or if they be not forced, by the power of some *Medicine*, to form such humours; then the quantities of humour, separated in equal times, will always be as the velocity of the blood; but the velocity of the blood is seldom doubled by any *Medicine*, and never tripled by the most acute fever. The quantity of humour, however, drawn off by evacuating *Medicines*, is often twenty times greater than the natural quantity; and therefore, upon supposition that the humours are every where equally mixed with the blood, the operation of evacuating *Medicines* can never be accounted for. See PURGATIVE.

Though this argument have the strength of a demonstration, yet there are some who explain the operation of purgative, and other evacuating *Medicines*, by a stimulating faculty; whereby the sluggish juices are not only forced out, but the obstructed canals opened, and the motion of the blood quickened. But though such a power be allowed, it would remain to be explained, why certain *Medicines* do only stimulate certain glands? For it is evident that evacuating *Medicines* have some other power, besides the squeezing out stagnant juices; because when they are all squeezed out, they still evacuate as much, if they be repeated, as they did before: as is plain, by continuing a salivation for many days. 2<sup>o</sup>. We cannot suppose, that all bodies have every where, and at all times, juices stagnating; but these *Medicines* constantly produce their effects, more or less, at all times. 3<sup>o</sup>. If the vessels be supposed to be obstructed, an evacuating *Medicine* could but double the quantity that was evacuated, before it was taken. 4<sup>o</sup>. If these *Medicines* operate only these ways, then in a healthy body, where there were no obstructions, they would have no effect at all. 5<sup>o</sup>. If the removing obstructions were the cause of a greater quantity evacuated, then the evacuation should still continue in a greater degree than before the obstruction was removed; whereas, in fact, we constantly find it less, as the *Medicine* works off. 6<sup>o</sup>. Though a *Medicine*, by stimulating a vessel, may quicken the motion of the fluid in that vessel; yet it can never increase the quantity of fluid running through it, in equal spaces of time; because it quickens the motion of the fluid, only by contracting the vessel: and therefore the faster the fluid is made to run through the vessel, the less fluid does the orifice of the vessel admit; and consequently, after the vessel is contracted by the stimulating *Medicine*, the secretion will be less, instead of being greater.

That a stimulus causes the part on which it acts, to contract, is matter of fact; and that purgative *Medicines* do stimulate the bowels; but it may perhaps be likewise said, they stimulate the heart and arteries, and increase their force, because they not only quicken, but raise the pulse: so that a greater quantity of blood is sent to the glands of the guts. This may be

granted; but not that it is the principal action of purgative *Medicines*; because that, by the same force, a greater quantity of blood is sent to all the other glands of the body, whose fluids are not, however, sensibly increased; and the glands of the intestines receive a less quantity, in proportion, than any others, because they cannot be so much dilated by the greater force of the blood, as others, which are not so much stimulated by the *Medicine*.

There are others, who will have evacuating *Medicines* endued with an attenuating quality, by which they dissolve all the cohesions of the particles of the blood, and so set the several humours at liberty, to pass through their proper glands: but if these *Medicines* have a power universally to dissolve all the cohesions of the blood, then every evacuating *Medicine* would equally and indifferently increase the quantity of every secretion. Mercury would as constantly purge as salivate, and nitre promote perspiration, as well as urine; but this is repugnant to experience. If they have a power to dissolve certain cohesions, and not others; this is but setting certain particles at liberty to pass through their proper glands, which were not so before; and is a preparing the humours, in order to increase the quantity of secretion. Evacuating *Medicines* must therefore have a power to affect some particles, and not others; that is, to repel some, and attract, retain, and alter others; and this is what may be affirmed to be in all *Medicines*, and is what a thousand chymical experiments demonstrate.

The several humours then being formed, by the different cohesion of the particles of the blood, the quantity of humour secreted by any gland, must be in a proportion compounded of the proportion that the number of the particles cohering in such a manner as is proper to constitute the humour which passes through the gland, bears to the mass of blood; and of the proportion of the quantity of blood that arrives at the gland. And hence it follows, that where there is a determinate quantity of a certain humour to be separated, the number of particles that are proper to compose the secreted liquor, must be reciprocally proportional to the quantity of the blood that arrives at the gland: and therefore, if the quantity of the secretion is to be increased, the number of particles must be increased; if the secretion is to be lessened, the number of particles, proper for such a secretion, must be lessened in the same proportion.

*Medicines*, therefore, which can alter the cohesions, and combinations of the particles, may either increase or diminish the quantity of any secretion. Thus, suppose the humour, which passes through the glands of the intestines, to be composed of three or four several sorts of particles; that *Medicine*, which will easily cohere to those particles, and cohering, increase their mutual attractions, so as they may unite in greater numbers at, or before they arrive at the intestines, than they would have done, if the *Medicine* had not been given, must necessarily increase the quantity of humour which passes through the glands of the intestines; if the quantity of blood which arrives at the glands, be not diminished in the same proportion, as the number of particles is increased.—After the same manner do diuretics, sudorifics, and *Medicines* which promote all other secretions, operate. See DIURETIC, SUDORIFIC, &c.

Why increasing the quantity of some secretions, should diminish that of others, is not easy to explain on any other foot: for if the blood be equally mixed in every part of the body, with all the humours which are separated from it; that is, if the mixture of the blood be every where alike, so that every humour bears the same proportion to the rest of the arterial blood, in one part of the body, that it does in another; and if every humour has its own proper gland, through which it is separated: then what is separated by one gland, is not subtracted from another; and consequently does not diminish the quantity of humour which flows to this other, but does indeed rather increase the quantity of this other secretion: for the more any one humour is carried off, the greater proportion any other remaining in the blood, bears to the remaining blood: And therefore the more any one secretion is increased, the more all the rest should be increased likewise. But if all the humours be composed by a combination of a few different sorts of particles, then the more apt these particles are to run into any one sort of combination, the less all other combinations must be: and consequently the increasing any one secretion, must necessarily diminish the quantity of all others; but more especially of that, which has the most of the same sort of particles. See SECRETION, HUMOUR, &c.

*Capital Medicines*. See the article CAPITAL.

*Chalastic Medicines*. See the article CHALASTIC.

*Hypochondriacal Medicines*. See HYPOCHONDRIACAL.

*Hysteric Medicines*. See the article HYSTERIC.

*MEDIETAS linguae*, an ineffect impannelled, whereof the one half consists of natives or denizens, the other of aliens.

It is used in pleas, wherein the one party is a stranger, and the other a denizen.—Solomon de Stanford, a Jew, in the time of Edward I. had a cause tried before the sheriff of Norwich, by a Jury of *sex probos & legales homines, & sex legales Judaeos de civitate Norwici*. See JURY.

*MEDITATION*, an act by which we consider any thing

closely, or wherein the soul is employed in the search, or consideration of any truth. See ATTENTION.

In religion, it is used to signify a consideration of the mysteries, and grand truths of the christian faith.

Mystic divines make a great difference between *Meditation*, and *contemplation*: The former consists in discursive acts of the soul, considering methodically, and with attention, the mysteries of faith, and the precepts of morality; and is performed by reflections and reasonings, which leave behind them manifest impressions in the brain.—The pure contemplative have no need of *Meditation*, as seeing all things in God at a glance, and without any reflection.

When a man therefore has once quitted *Meditation*, and is arrived at contemplation, he returns no more; and, according to Alvarez, never resumes the oar of *Meditation*, except when the wind of contemplation is too weak to fill his sails.

See CONTEMPLATION.

*MEDITERRANEAN*, something inclosed within land; or that is remote from the ocean. See EARTH, OCEAN, &c.

*MEDITERRANEAN* is more particularly used to signify that large sea, which flows between the continents of Europe, and Africa; entering by the streights of Gibraltar, and reaching into Asia, as far as the Euxine sea, and the Palus Mæotis. See SEA. The Mediterranean was anciently called the *Grecian Sea*, and the *Great Sea*: It is now cantoned out into several divisions, which bear several names. To the west of Italy it is called the *Ligustic*, or *Tuscan Sea*; near Venice, the *Adriatic*; towards Greece, *Ionic* and *Ægean*; between the Hellespont and the Bosphorus, the *White Sea*, as being very safe; and beyond, the *Black Sea*, its navigation being dangerous.—The Arabs call the Mediterranean Sea, the *chamber-pot*, by reason, it seems, of its figure.

*MEDITULLIUM*, is used by anatomists for that spongy substance between the two plates of the cranium; and in the interstices of all laminated bones. See BONE, and CRANIUM.

*MEDIUM*, a latin term, signifying *middle*, or *mean*. See MEAN and MEDIATE.

*MEDIUM*, in logic, or *Medium of a syllogism*, called also the *mean*, or *middle term*, by the Italians, *mezzo termino*; is an argument, reason, or consideration, for which we affirm, or deny any thing: Or it is the cause, why the greater extreme is attributed to, or denied of the less, in the conclusion. See MAJOR, MINOR, CONCLUSION, &c.

Thus, in the syllogism, 'Every good thing is to be desired; but all virtue is good; therefore all virtue is to be desired:' the term *good* is the *medium*; *virtue* the less extreme, and to be desired the greater. See SYLLOGISM, EXTREME, PROPOSITION, TERM, PREMISES, &c.

It is called *medium*, as being a kind of mediator between the subject and predicate; or, by reason the extremes are so disposed as to affirm, or deny by means hereof.—Some call it *argumentum tertium*, a third argument; and others simply *argumentum*, as being the cause why we assent to the conclusion. See ARGUMENT.

*Mediums*, or *middle terms*, are the things principally sought for, in discoursing; so that the invention of *Mediums* make the most essential part of logic. But the rules commonly given by logicians for that purpose, are mere impertinencies.—In effect, no such rules can be given: Nor have we any way of coming at such *Mediums* or reasons, but by a close attention to clear ideas. See DISCOURSE, LOGIC, INVENTION, &c.

*MEDIUM*, in arithmetic, or an *arithmetical Medium*, or *mean*, called in the schools *Medium rei*, is that which is equally distant from each extreme; or, which exceeds the lesser extreme, as much as it is exceeded by the greater; in respect of quantity, not of proportion.

Thus, nine is a *medium* between six and twelve. See *arithmetical PROPORTION*.

*Geometrical MEDIUM*, or *mean*, called in the schools *Medium personæ*, is that where the same ratio is preserved between the first and second, as between the second and third terms; or that which exceeds in the same ratio, or quota of itself, as it is exceeded. Thus six is a *geometrical Medium* between four and nine. See *geometrical PROPORTION*.

This is the *Medium* which virtue is supposed to observe; whence some call it *Medium quoad nos*, as having a view to circumstances, times, places, persons, &c. Distributive justice observes a *geometrical Medium*; communicative justice, an *arithmetical* one. See JUSTICE.

*MEDIUM participationis*, in the schools, is that said to be compounded of the two extremes.—Thus, man, who is partly body, partly mind, is a *Medium* by participation of the two extremes; so, is warmth the *Medium* of heat and cold, &c.

*MEDIUM negationis* or *remotionis*, is that, from which both extremes are derived; or, it is a subject, capable of receiving both extremes, and yet not necessarily possessed of either.

In which latter sense, the will is a *mean* with respect to virtue and vice; and the understanding, with respect to knowledge and ignorance.

*MEDIUM quod*, or *Medium suppositi*, is somewhat between the agent and patient, and receives the action of the one, ere it arrive at the other. In

## M E D

In this sense, air is a *Medium* between the fire, and the hand heated thereby.

*MEDIUM quo*, is the form, or faculty, whereby an agent produces an effect: in which sense, heat is said to be the *Medium* or *mean*, whereby fire acts on the hand.

*MEDIUM sub quo*, is that which renders the power to act, complete, in the general; without determining it to any particular object: In which sense, light is the *Medium* under which the eye perceives any colour.

*MEDIUM in quo*, is that, by inspection whereof, a power is produced in any thing, of knowing or perceiving another: Such, is a speculum, as it shews an object; an image, as it represents the reality, &c.

*MEDIUM*, in mechanical philosophy, is that space or region, through which a body passes in its motion towards any point. See *MOTION*.

Thus æther is supposed to be the *Medium*, wherein the heavenly bodies move. (See *ÆTHER*.) Air the *Medium* wherein bodies move near our earth. (See *AIR* and *ATMOSPHERE*.) Water is the *Medium* in which fishes live and move. See *WATER*. And glass is also a *Medium* of light, as it affords it a free passage. See *GLASS*, *LIGHT*, *RAY*, &c.

That density or consistence in the parts of the *Medium*, whereby the motion of bodies in it is retarded, is called the *resistance of the Medium*; which, together with the force of gravity, is the cause of the cessation of motion of projectiles. See *RESISTANCE of the Medium*, &c.

*Subtile or ætherial MEDIUM*.—Sir Is. Newton makes it probable, That beside the particular aerial *Medium*, wherein we live and breathe, there is another more universal one, which he calls an *ætherial Medium*; vastly more rare, *subtile*, elastic, and active, than air; and by that means freely permeating the pores and interstices of all other *Mediums*, and infusing it self through the whole creation: And by the intervention hereof he thinks it is, that most of the great phenomena of nature are effected. See *NEWTONIAN*.

This *Medium* he seems to have recourse to, as the first and most remote physical spring; and the ultimate of all natural causes. By the vibrations of this *Medium*, he takes heat to be propagated from lucid bodies; and the intenseness of heat increased and preserved in hot bodies, and from them communicated to cold ones. See *HEAT*.

By this *Medium* he takes light to be reflected, inflected, refracted, and put alternately in fits of easy reflection and transmission; which effects he elsewhere ascribes to the power of attraction: so that this *Medium* appears the source and cause even of attraction. See *LIGHT*, *REFLECTION*, *REFRACTION*, *INFLECTION*, and *ATTRACTION*.

Again, this *Medium* being much rarer within the heavenly bodies, than in the heavenly spaces: and growing denser, as it recedes further from them; he supposes the cause of the gravitation of these bodies towards each other, and of the parts towards the bodies. See *GRAVITATION*.

Again, from the vibrations of this same *Medium*, excited in the bottom of the eye by the rays of light, and thence propagated though the capillaments of the optic nerves into the sensory, he takes vision to be performed; see *VISION*. And so hearing, from the vibrations of this or some other *Medium*, excited in the auditory nerves, by the tremors of the air, and propagated through the capillaments of those nerves into the sensory: and thus of the other senses. See *SENSATION*, *HEARING*, &c.

And again, he conceives muscular motion to be performed by the vibrations of the same *Medium*, excited in the brain at the command of the will, and thence propagated through the capillaments of the nerves into the muscles: and thus contracting and dilating them. See *MUSCLE* and *MUSCULAR*.

The elastic force of this *Medium*, he shews, must be prodigious: Light moves at the rate of 70,000,000 miles in about seven minutes, yet the vibrations and pulses of this *Medium*, to cause the fits of easy reflection and easy transmission, must be swifter than light, which is yet 700,000 times swifter than sound. The elastic force of this *Medium*, therefore, in proportion to its density, must be above 490,000,000,000 times greater than the elastic force of the air, in proportion to its density: The velocities and pulses of elastic *Mediums* being in a sub-duplicate ratio of the elasticities, and the rarities of the *Mediums*, taken together. And thus may the vibrations of this *Medium* be conceived as the cause of the elasticity of bodies. See *ELASTICITY*.

Further, the particles of this *Medium* being supposed infinitely small, even smaller than those of light; if they be likewise supposed, like our air, to have a repelling power, whereby they recede from each other, the smallness of the particles may exceedingly contribute to the increase of the repelling power, and consequently to that of the elasticity and rarity of the *Medium*, and so fit it for the free transmission of light, and the free motions of the heavenly bodies.—In this *Medium* may the planets and comets roll without any considerable resistance. If it be 700,000 times more elastic, and as many times rarer, than air; its resistance will be above 600,000,000 times less than

## M E D

that of water: A resistance that would make no sensible alteration in the motion of the planets in ten thousand years.

And is not such a *Medium* better disposed for the heavenly motions, than that of the Cartesians, which fills all space adequately, and without leaving pores; is vastly denser than gold; and therefore must resist more? See *subtile MATTER*, *PLENUM*, &c.

If any ask how a *Medium* can be so rare, let him tell how the air, in the upper regions of the atmosphere, can be above a hundred thousand times rarer than gold. How an electrical body can, by friction, emit an exhalation so rare and subtile, yet so potent, as, though its emission occasions no sensible alteration in the weight of the body, yet it shall be diffused through a sphere of two foot in diameter, and carry up leaf-copper, or leaf-gold, at the distance of a foot from the electrical body. Or how the effluvia of a magnet can be so subtile, as to pass a plate of glass without any resistance or diminution of force; yet so potent, as to turn a magnetic needle beyond the glass. See *EFFLUVIA*, *ELECTRICITY*, &c.

That the heavens are not filled with any other, but such a subtile ætherial *Medium*, is evident from phenomena: whence else are those lasting and regular motions of the planets and comets, in all manner of courses and directions? And how are such motions consistent with that resistance, which must result from that dense, fluid *Medium*, wherewith the Cartesians fill the heavens?

The resistance of fluid *Mediums* arise partly from the cohesion of the parts of the *Medium*, and partly from the vis inertie of matter. The first, in a spherical body, is nearly as the diameter, or, at most, as the factum of the diameter, and the velocity of the body. The latter is as the square of that factum. Thus are the two kinds of resistance distinguished in any *Medium*; and being distinguished, it will be found that almost all the resistance of bodies, moving in ordinary fluids, arises from the vis inertie. That part which arises from the tenacity of the *Medium*, may be diminished, by dividing the matter into smaller parts, and making those more smooth and slippery: But the other will still be proportional to the density of the matter, and cannot be diminished any other way, but by a diminution of the same. See *RESISTANCE*.

Thus the resistance of fluid *Mediums*, is nearly proportional to their densities; and thus the air we breathe, being about nine hundred times lighter than water, must resist about nine hundred times less than water: As, in effect, the same author has found it does by experiments on pendulums. Bodies moving in quick-silver, water, or air, do not appear to meet with any other resistance, but what arises from the density and tenacity of those fluids; which they must, were their pores filled with a dense and subtile fluid. See *VACUUM*.

Heat, it is found, diminishes the tenacity of bodies very much; yet does it not decrease the resistance of water, sensibly. The resistance of water, therefore, arises chiefly from its vis inertie; consequently, if the heavens were as dense as water, or as quick-silver, they would not resist much less: if absolutely dense, without any vacuum, be the particles never so subtile and fluid, they would resist much more than quick-silver. A solid globe, in such a *Medium*, would lose above half its motion, while it moves thrice the length of its own diameter; and a globe not perfectly solid, such as the planets, would lose more.

To make way therefore for the lasting motions of the planets and comets, the heavens must be empty of all matter, except, perhaps, some very fine effluvia, from the atmospheres of the earth, planets, and comets; and some such ætherial *Medium* as we have described.—A dense fluid can serve for no purpose, in the heavens, but to disturb the celestial motions, and make the frame of nature languish; and in the pores of bodies, can only serve to check the vibrating motion of their parts, wherein their heat and activity consists. Such a *Medium*, therefore, unless we had some evidence of its existence, must be given up; and that given up, the hypothesis of light's consisting in a pression, falls also to the ground. See *LIGHT*, *PLANETS*, *PRESSION*, *CARTESIANISM*, &c.

*MEDIUM septum*. See the article *SEPTUM*.

*MEDIUS venter*, in anatomy, denotes the breast or thorax. See *THORAX* and *VENTER*.

*Glutæus MEDIUS*. See the article *GLUTÆUS*.

*MEDLEY*. See the article *CHANCE medley*.

*MEDULLA ossium*, Marrow of the bones, is a soft fatty substance, placed in the cavities or pores of divers bones. See *MARROW*.

The *Medulla* is inclosed in a membrane; and is devoid of sense: it is red in the greater cavities, white in the less, and soft and succulent in spongy bones. See *BONE*.

From this is secreted the medullary oil. See *MEDULLARY oil*.

*MEDULLA cerebri* and *cerebelli*, denotes the white soft part of the brain and cerebellum, covered on the outside with the cortical substance, which is of a more dark or ashy colour.—See the origin, structure, and use thereof, under *BRAIN* and *CEREBELLUM*.

*MEDULLA oblongata*, is the medullary part of the brain and cerebellum

## M E D

rebellum joined in one; the fore-part of it coming from the brain, and the hind-part from the cerebellum.—See *Tab. anat.* (osteol.) *fig. 5. litt. d d.*

It lies on the basis of the skull, and is continued through the great perforation thereof into the hollow of the vertebræ of the neck, back, and loins: though only so much of it retains the name *oblongata*, as is included within the skull. After its exit thence, it is distinguished by the name of *Medulla spinalis*. See *MEDULLA spinalis*, and *CRURA*.

The substance of the *Medulla oblongata* being only an aggregate of those of the brain and cerebellum, must, like them, be purely fibrous or nervous, and only an assemblage of minute tubes for the conveyance of the animal spirits. It arises, as it were, from four roots; whereof the two largest spring from the brain, and are called *crura*: the two lesser from the cerebellum, which Dr. Willis calls *pedunculi*. See *BRAIN* and *CEREBELLUM*. Upon inverting it, the first thing that appears upon its trunk, is a protuberance, somewhat like a ring, and for that reason called *protuberantia annularis*. Then follow ten pair of nerves, which have their origin here, and are hence sent to the several parts of the body. See *NERVE*. Immediately under the first pair, or olfactory, appear two small arteries, or branches of the carotides. The second pair, or optics, being cut off, appears the infundibulum, which ends in the glandula pituitaria, and on each side, the carotid arteries enter the skull. In the lateral ventricles of the *Medulla*, are two prominences on each side, the one pair called *corpora striata*, from the appearance of stripes, or nervous fibres, within them; their outer substance being cortical or glandulous, like the rest of the surface of the brain, though not so deep. Betwixt the corpora striata is a broad thin production of the *Medulla*, called *fornix*; and underneath them lie two other prominences, called *thalami nervorum opticorum*. On either side of these is a plexus of blood-vessels, called *plexus choroides*. And under the fornix a narrow aperture, called the *rima*, which lets into the infundibulum; which is a passage from the third ventricle to the glandula pituitaria, through the *Medulla* of the brain; being lined with the pia mater. Under this, in the sinus called *fella equina*, or *turcica*, upon the os cribrosum, is the glandula pituitaria; which is surrounded with a plexus of vessels, called *rete mirabile*, only visible in drutes. See *RETE*, *PITUITARY*, &c. On the hind-part of the third ventricle is a small foramen, called *anus*, leading to the fourth ventricle of the cerebellum: At the orifice of this is seated a small gland, which, from its fancied resemblance to a pine-apple, is called *conarium*, or *glandula pinealis*; where Des Cartes and his followers imagine the seat of the soul to be. See *PINEAL*. On the back-side of the *Medulla oblongata*, near the cerebellum, are four protuberances, whereof the upper and larger are called *nates*, the under and lesser *testes*. See *NATES*, and *TESTES*. Between these and the processes of the cerebellum, is a fourth ventricle, from its figure called *calamus scriptorius*. See *CALAMUS*. On the *Medulla oblongata*, near its extremity, are four other prominences, two on each side; called *corpora pyramidalia*, and *olivaria*. See *OLIVARIA*, *CONARIUM*.

**MEDULLA spinalis**, or the *spinal Marrow*, is a continuation of the *Medulla oblongata*, or *medullary* part of the brain, without the skull. See *SPINE*.

It consists, as the brain does, of two parts, a white or *medullary*, and a cineritious or glandulous; the former without, and the other within. The substance of the exterior part is much the same with that of the corpus callosum, only somewhat tougher, and more fibrous: which difference becomes the more apparent, as it descends the lower; by reason of the freightness of the cavity, which growing gradually more narrow, presses the *medullary* fibres closer together, and renders them more compact, and gathers them into more distinct fasciculi, till having descended the whole tract of the spina, they end in the cauda equina. It is the origin of most of the nerves of the trunk of the body: It sends out thirty pair on each side to the limbs, the great cavities, and the other parts; which are nothing but fasciculi of *medullary* fibres, covered with their proper membranes. See *NERVE*.

The *spinal Marrow* is generally said to be covered with four coats: The first, or external one, is a strong nervous ligament, which ties the vertebræ together, to the inside of which it firmly adheres. The second is a production of the dura mater; it is exceedingly strong, and serves to defend the *spinal Marrow* from any hurt from the flexures of the vertebræ.

The third is a production of the arytænoïdes, and is a thin pellucid membrane, lying between the dura and pia mater, or the second and fourth membranes of the *Medulla*. This membrane gives a coat to the nerves that go out of the spina, which is the inner membrane of the nerves, as the dura mater gives the outer. The fourth coat is a continuation of the pia mater, and is an extremely thin, fine, transparent membrane; strictly embracing the whole substance of the *Medulla*, dividing it in the middle into two tracts, and making, as it were, two columns of it.—See *Tab. Anat.* (osteol.) *fig. 6.* See also *SPINE*, *VERTEBRÆ*, &c.

**MEDULLARY oil**, is no more than the finer and more subtile

## M E L

parts of the *Medulla*, or marrow of the bones. See *MARROW*, and *OIL*.

This, Dr. Havers observes, passes not into the bones through ducts, but by small pores formed into vesicles or glandules, which are conglomerated into distinct lobules, contained in several membranes investing the whole marrow; all which vesicles or bags are propagated from the outward coat of the arteries; and by these it passes from one to another, till it arrives at the sides, or extreme parts of the bone. That part of it which is supplied to the interstices of the joints, goes into them by passages, penetrating through the bone into those cavities, and formed for that end. The use of this *oil* is either common to all the bones, whose temper it preserves, and keeps from being too brittle; or more peculiarly to the joints, where it is very serviceable, 1°. To lubricate the bones at their extremities, that they may move more easily and free. 2°. To keep the ends of the articulated bones from growing hot with motion. 3°. To preserve the joints from wearing by attrition, and rubbing one against another: And 4°. To preserve the ligaments of the joints from dryness and rigidity, and lubricate those parts which slide upon the bones, and keep the cartilages which are joined to them, flexible.

**METER**. See the article *METRE*.

**MEGADOMESTICUS**. See *DOMESTIC*.

**MEGALENSIA\***, or *MEGALESIA*, in antiquity, solemn feasts celebrated among the Romans on the 12th of April, in honour of the great mother of the gods, that is, Cybele, or Rhea; wherein were sports or combats held before the temple of that goddess. See *FEAST*, &c.

\* They were called *Megalensia*, from the Greek *μεγαλη*, great; Cybele being accounted the great goddess.

**MEI miserere**. See the article *MISERERE*.

**MEINOUR**. See the article *MAINOUR*.

**MELA**, a surgeon's instrument, called also *speculum*, and by the vulgar, *tenta*, or *probe*. See *PROBE*.

Its use is to probe ulcers, or draw a stone out of the yard: Its form is various, according to the use it is intended for. See *SPECULUM*.

**MELANCHOLY\***, in medicine, a low kind of delirium, without a fever; usually attended with fear, heaviness, and sorrow, without any apparent occasion. See *DELIRIUM*.

\* The word is Greek, *Μελαγχολία*, formed from *μελας*, black; and *χολη*, bile.

The ancients attributed this disease to black and cloudy spirits, arising as vapours from a redundant atrabiliary humour. See *ATRABILIS*, and *CHOLER*.

Some of the moderns ascribe it to the irregular motion of the spirits, and their acid constitution; and others, who seem to know it better, to too heavy and viscid a blood, which permits not a sufficiency of spirits to be separated in the brain, to animate and invigorate the nerves and muscles: lastly, others to a dryness of the meninges of the brain.

This disease is varied an infinite number of ways, according to the temperament and ideas of the person affected with it. It is a species of madness, and only differs from a downright mania in degree. See *MANIA*.

**MELANOGOGUES\***, *ΜΕΛΑΝΟΓΩΓΑ*, are such *Medicines* as are supposed particularly to purge off atrabiles or black choler.

\* The word is formed from *μελας*, *niger*, black; and *αγω*, *duco*, to lead, or draw.

But there is no such species of choler now regarded, and consequently this distinction of evacuants is but little used. See *PURGATIVES*, and *ATRABILIS*.

**MELASSES**. See the article *MOLOSSES*.

**MELCHITES**, a religious sect in the Levant, who scarce differ from the Greeks in any thing relating either to faith, or worship; only that they do not speak the Greek language.

The word, in the original Syriac, signifies *royalists*, and was formerly applied by the catholics to the heretics who refused to submit to the decisions of the council of Chalcedon: intimating by this appellation, that they were of the religion of the emperor.

Those now called *Melchites*, are such people, as, inhabiting among the Syrians, Coptæ, or Egyptians, and other Levantine nations, follow the opinions of the Greeks, though no Greeks themselves: And it is for this reason that Gabriel Sionita calls them indifferently by the names of *Greeks*, and *Melchites*. See *GREEK*.

The same author observes, that they are spread through all the Levant; that they deny purgatory; and are declared enemies to the pope and his primacy.—For the rest, they fall in with the Greeks, both as to articles of faith, and discipline.

They have translated the Greek euchologium, and other books of that kind, into Arabic; and have the canons of councils in the same language. To those of the council of Nice, they have added new canons, commonly called the *Arabic canons*; which are likewise received by the Jacobites and Maronites: Though most of the learned look on them as spurious.

**MELCHIZEDECHIANS**, or *MELCHISEDEKIANS*, ancient sectaries, so called, because they raised *Melchisedech* above all creatures, and even above Jesus Christ.

The

The author of this sect, was one Theodotus, whence the *Melchizedechians* became more commonly known by the name of *Theodotians*; all the difference between those and the strict *Theodotians*, consisting in that particular article relating to *Melchizedech*; who, according to them, was the great and supreme virtue.

**MELICERIS**, ΜΕΛΙΚΗΡΙΣ, a tumour or abscess inclosed in a cystis; consisting of matter not unlike honey, whence its name. The *Meliceris* is otherwise called *atheroma*.—It gathers without pain, and gives way upon pressure, but returns again: It is to be cured by warm discutients. See **ATHEROMA**.

**MELISMATICO** *style*. See the article **STYLE**.

**MELITITES**, ΜΕΛΙΤΗΣ, a greyish stone, which, when pulverized, yields a milky liquor, of a taste somewhat like honey, whence it takes its name.

It is found in mines of metals, and seems to partake pretty much of the nature of lead; having a sweetness somewhat like the sal saturni, but much fainter.

It only differs from the galactite, and that it is milder to the taste. See **GALACTITES**. The ancients used it in inflammations of the eyes, and to dry ulcers.

**MELIUS inquirendum**, a writ which lieth for a second inquiry to be made of what lands and tenements a man died seized, where partiality is suspected upon the writ called *diem clausit extremum*.

**MELODY**\*, ΜΕΛΩΔΙΑ, in music, is the agreeable effect of different musical sounds, ranged or disposed in succession. See **SOUND**.

\* The word is compounded of the Greek μέλι, honey; and ᾠδή, singing.

*Melody* is the effect only of one single part, voice, or instrument; by which it is distinguished from *harmony*; though in common speech these two are frequently confounded.

Harmony is the agreeable result of the union of two or more concurring musical sounds heard in consonance, *i. e.* at one and the same time; so that harmony is the effect of two parts at least: As therefore a continued succession of musical sounds produces *Melody*, so does a continued combination of these produce harmony. See **HARMONY**, **CONCORD**, and *music in PARTS*.

Though the term *Melody* is chiefly applicable to the treble, as the treble is chiefly distinguished by its air; yet so far as the bass may be made airy, and to sing well, it may be also properly said to be *melodious*. See **TREBLE**, and **BASS**. Of the twelve harmonical intervals of musical sounds, distinguished by the names of *second lesser*; *second greater*; *third lesser*; *third greater*; *fourth*; *fifth*; *sixth lesser*; *sixth greater*; *seventh lesser*; *seventh greater*; and *octave*; all *Melody* as well as harmony, are composed: For the octaves of each of these are but replications of the same sound; and whatever is said of any, or all of these sounds, is to be understood also of their octaves. See **OCTAVE**.

For the rules of **MELODY**, see the article **COMPOSITION**.

**MELT**. See the article **MILT**.

**MELTING**-fire. } See the article { **FIRE**.

Surveyor of **MELTING**. } See the article { **MELTING**.

**MEMBERS**, in anatomy, the exterior parts, arising from the trunk, or body of an animal, like boughs from the trunk of a tree. See **BODY**.

In which sense, *Members*, *membra*, amount to much the same with *limbs*, *artus*: Though some make a difference between the two; restraining *Members* more immediately to the fleshy parts which cover the limbs, and *artus* to the bones and nerves. Physicians divide the body into three regions or venters, the head, the breast, and the lower ventricle; and the extremities, which are the *Members*. See **EXTREMITY**.

Each *Member*, and portion of the body, was anciently devoted to some divinity. The head to Jupiter, the breast to Neptune, the navel to Mars, the ear to Memory, the forehead to the Genius, the right-hand to Faith or Fidelity, the knees to Mercy; the eye-brows, again, to Jupiter, the eyes to Cupid, or, according to others, to Minerva, the hind-part of the right ear to Nemesis, the back to Pluto, the reins to Venus, the feet to Mercury, the heels and soles of the feet to Thetis, and the fingers to Minerva.

**MEMBER**, in architecture, denotes any part of a building; as a frieze, cornich, or the like.

**MEMBER** is sometimes also used for moulding. See **MOULDING**.

**MEMBER**, in grammar, is applied to the parts of a period, or sentence. See **PERIOD**, and **SENTENCE**.

**MEMBERED**, or **MEMBRED**, in heraldry, is where the legs or feet of an eagle, griffin, or other bird, are of a different colour from the rest of the body.

**MEMBRANA**, in anatomy. }  
**MEMBRANA communis muscularum.** } See { **MEMBRANE**.  
**MEMBRANA propria muscularum.** }  
**MEMBRANA communis vascularum.** }

**MEMBRANA adiposa.** }  
**MEMBRANA carnea.** } See { **ADIPOSA**.  
**MEMBRANA nictitans.** } **CARNOSA**.  
**MEMBRANA tympani.** } **NICTITATING**.  
**MEMBRANA urinaria.** } **TYMPANUM**, and **FORAMEN**.  
**ALLANTOIS**.

**MEMBRANE**, MEMBRANA, in anatomy, a similar part of an animal body; being a thin, white, flexible, expanded skin, formed of several sorts of fibres interwoven together, and serving to cover or wrap up certain parts of the body. See **BODY**, and **PART**.

The *membranes* of the body are various; and variously denominated:—Such are the *periosteum*, *pleura*, *pericardium*, *peritoneum*, &c. which see under their proper articles; **PERIOSTEUM**, &c.—Such also are the *Adiposa*, *Carnosa*, and *Nictitating*.

Those *membranes* which serve as integuments, or covers of vessels, are called *coats* or *tunics*; and those which cover the brain, are, by a peculiar name, called *meninges*. See **TUNIC**, and **MENINGES**.

The fibres of *membranes* give them an elasticity, whereby they can contract, and closely grasp the parts they contain; and their nervous fibres give them an exquisite sense, which is the cause of their contraction: they can therefore scarcely suffer the sharpness of medicines, and they are difficultly united when wounded. In their texture there is a number of small glands, which separate an humour, fit for moistening the parts they contain. By reason of the thickness and transparency of the *membranes*, the ramifications of the blood-vessels are more apparently seen in them, than in any other part of the body: here the innumerable divisions, windings and turnings, serpentine progressions, and frequent inosculations, not only of veins and arteries together, but also of veins with veins, and arteries with arteries, make a most agreeable embroidery, and delicate net-work, covering the whole *membrane*. See **VESSEL**, &c.

The use of the *membranes* is to cover and wrap up the parts, and strengthen them; and save them from external injuries; to preserve the natural heat; to join one part to another; to sustain small vessels, and the nerves which run through their duplicatures; to stop the returning of the humours in their vessels, as the valves stop the returning of the blood in the veins and heart; of the chyle in the thoracic duct; and of the lymph in the lymphatic vessels. See **VALVE**, &c.

Anatomists generally assert, that there is a *membrana communis muscularum*, or *membrane* common to all the muscles, being led into that mistake by the aponeurosis of several; whereas, upon stricter observation, there is no such thing to be found. See **MUSCLE**.

The *membrana propria muscularum*, is that which immediately covers all and every one of the fibres of a muscle, and is closely tacked to them. There is another common *membrane*, called *membrana communis vascularum*; which is a thin *membrane*, accompanying almost all the vessels of the body. See **VESSEL**, **VEIN**, **ARTERY**, &c.

All these *membranes* receive veins, arteries, and nerves, from the parts which are nearest to them.

**MEMBRANES of the eyes.** } See the article { **EYE**.  
**MEMBRANOSA armilla.** } See the article { **ARMILLA**.

**MEMBRANOSUS**, in anatomy, a muscle of the leg, so called from its large *membranous* expansion inclosing all the muscles of the tibia and the tarsus; whence it is also called *fascia lata*.—See *Tab. Anat. (Myol.) fig. 2. n. 34. fig. 1. n. 48. fig. 6. n. 34.*

It hath a sharp fleshy beginning from the fore-part of the spine of the os ilium, but soon becomes *membranous*, and covers almost all the muscles of the thigh and leg, down to the foot, where it joins with the ligamentum annulare; and in its action turns the leg outwards.

**MEMBRED**. See the article **MEMBERED**.

**MEME**.—*Que est MEME*. See the article **QUE**.

**MEMOIRS**, or **MEMORIALS**, a term now much in use for histories, composed by persons who had some share, or concern in the transactions they relate, or who were eye-witnesses of them; answering to what the Latins called *commentarii*. See **COMMENTARY**, and **HISTORY**.

The French are great dealers in this way of writing, and have an infinite number of books of *memoirs*, containing, for the generality, the lives, actions, intrigues, amours, &c. of the writers.

**MEMOIRS** is also used for a journal of the acts, and proceedings of a society; or a collection of the matters debated, transacted, &c. therein.—Such are the *memoirs* of the royal academy of sciences, &c. See **JOURNAL**, **ACADEMY**, &c.

**MEMORY**, MNHMH, a power, or faculty of the mind, whereby it retains or recollects the simple ideas or images of things we have seen, imagined, understood, &c. See **SOUL**, **POWER**, **FACULTY**, &c.

Of all the faculties, there is none harder to account for, or that has perplex'd philosophers more, than the *memory*. Some will have it a mere organ, as the eye, ear, &c.—Dr. Hooke, in an *Essay towards a mechanical account of memory*, makes it to consist in a stock of ideas or images, formed occasionally by the mind out of the fine parts of the brain, and disposed, or laid by in order.

Des Cartes and his followers maintain, That the animal spirits exciting a motion in the most delicate fibres of the brain, leave a kind of traces or footsteps, which occasion our *remembrance*. Hence it happens, that by passing several times over the same things, the spirits becoming accustomed to the same passages, leave

# M E M

leave them open, and so make their way without any effort or labour; and in this consists the ease wherewith we recollect such ideas. Thus wine is found to sharpen the *memory*, in regard the spirits of the wine put the animal spirits in motion, and agitate the fibres of the brain the more briskly. See *IDEA*, *BRAIN*, *TRACE*, *REMEMBRANCE*, &c.

Father Malebranche expresses his notion of *memory* thus: 'It being granted, that all our different perceptions are owing to changes happening in the fibres of the principal part of the brain, wherein the soul more immediately resides, the nature of the *memory* is obvious: for as the leaves of a tree, that have been folded for some time, in a certain manner, preserve a facility or disposition to be folded again in the same manner; so the fibres of the brain, having once received certain impressions by the course of the animal spirits, and by the action of objects, preserve, for some time, a facility to receive the same disposition. Now it is in this facility that *memory* consists; for we think on the same things, when the brain receives the same dispositions.

Further, as the animal spirits act sometimes more briskly, and sometimes more languidly on the substance of the brain; and as sensible objects make much deeper, and more lasting impressions, than the imagination alone; it is easy, on this scheme, to conceive why we do not remember all things alike: Why a thing, for instance, seen twice, is represented more vividly to the mind, than another seen but once: Why things that have been seen, are usually remembered more distinctly, than those that have been only imagined, &c. See *HABIT*.

Old men are defective in *memory*, and cannot learn any thing without much difficulty, because they want animal spirits to make new traces, and because the fibres of the brain are become too hard to receive, or too moist to retain such impressions. For the same reason, those who learn with the greatest ease, forget the soonest; in regard when the fibres are soft and flexible, objects make a slight impression, which the continual course of animal spirits easily wears off: On the contrary, the fibres of those who learn slowly, being less flexible, and less subject to be shaken, the traces are more deeply engraven, and last the longer.

From all which observations it follows, that the *memory* is absolutely dependent on the body; being impaired or strengthened, according to the changes that befall the body; a fall, the transports of a fever, &c. being frequently found to erase or blot out all the traces, to bear away all the ideas, and to cause an universal forgetfulness.

The chief difficulty that clogs the doctrine of *memory*, is to conceive how such an infinite number of things, as the head is stored withal, should be ranged in so much order in the *memory*, as that the one should not efface the other: and how in such a prodigious assemblage of traces impressed on the brain, the animal spirits should awake precisely those which the mind has occasion for! See *SPIRITS*.

Seneca says of himself, that by the mere effort of his natural *memory*, he was able to repeat two thousand words upon once hearing them, each in its order; though they had no dependence or connection on each other. After which he mentions a friend of his, Portius Latro, who retained in his *memory* all the declamations he had ever spoke, and never had his *memory* fail him, even in a single word. He also mentions Cyneas, ambassador to the Romans from king Pyrrhus, who in one day had so well learnt the names of his spectators, that the next he saluted the whole senate and all the populace assembled, each by his name. Pliny says, that Cyrus knew every soldier in his army by name; and L. Scipio, all the people of Rome. Charmidas, or rather Carneades, when required, would repeat any volume found in the libraries, as readily as if he were reading.

—Dr. Wallis tells us, that without the assistance of pen and ink, or any thing equivalent, he was able in the dark, by mere force of *memory*, to perform arithmetical operations, as multiplication, division, extracting of roots, &c. to forty places. Particularly, that in February 167 $\frac{1}{2}$ , at the request of a foreigner, (by night, in bed) he proposed to himself a number of fifty-three places, and found its square root to twenty-seven places; and without ever writing down the number, dictated it from his *memory*, at his next visit, twenty days afterwards.

*Local or artificial MEMORY*, is an art or invention, by means whereof the *memory* is supposed to be aided, strengthened, and enlarged.

This art seems to consist in nothing else but a certain method of coupling or associating ideas of things to be remembered, with the ideas of other things, already disposed orderly in the mind, or that are before the eyes.—It is of an old standing, having been practised by many of the ancient orators; some whereof are said to have made use of paintings, images, and emblems on this occasion: Though others contented themselves with the parts, members, ornaments, furniture, and other circumstances of the place where they were to speak. Muretus tells us, that a young man of Corsica pretending to do wonders this way, Muretus put him to the trial; and upon dictating to him two or three thousand words, some Greek, some Latin, some Barbarous; all without any relation to each

# M E N

other, and the greatest part without any meaning at all; the artist immediately, and without any hesitation, or the least stumbling or displacing, repeated them all, from first to last, in the same order wherein they had been dictated; and this done, beginning where he ended, he repeated them all backwards, from last to first. Adding, that this was but a slight essay of his *memory*; and that he would undertake to repeat thirty-six thousand words in the same manner.

The truth is, this art seems better calculated for retaining things without any coherence or dependence on one another, as mere words or sounds, &c. than for things where reason or judgment are any way required.

Raim. Lully took so much pains with it, that it now goes by his name, being called *Lully's art*. See *ART*.

*MEMPHITES*, or *lapis MEMPHITICUS*, a sort of stone mentioned by Dioscorides, Pliny, and other natural historians; supposed to be found in Egypt not far from the city Cairo, the ancient Memphis; whence its name.

The property it is famed for, is, that being pulverized, and smeared on any part of the body to be cut off, it deadens it so, as that the patient shall perceive no pain from the operation.

*MENANDRIANS*, the most ancient branch of Gnostics; thus called from Menander their chief, a disciple of Simon Magus, and himself a reputed magician. See *SIMONIAN*, and *GNOSTICS*.

He taught, that no person could be saved unless he were baptized in his name: He conferred a peculiar sort of baptism, which would render those who received it immortal in the next world. St. Irenæus represents him, as pretending to be, That first virtue hitherto unknown to the world, and to have been sent by the angels for the salvation of all mankind.

He took upon him, says St. Epiphanius, *bar. 2.* to be greater than his master; which contradicts Theodoret, who makes Menander a subordinate virtue to Simon Magus, the great virtue of all. See *SIMONIANS*.

*MENDICANTS*, *beggars*; a term applied to several orders of religious, who live on alms, and go a begging from door to door. See *MONK*, and *RELIGIOUS*.

There are four ancient orders which pass principally by the name of the *four mendicants*: The Carmelites, Jacobines, Franciscans, and Augustins. See *CARMELITES*, *JACOBINES*, &c.

Among the number of *mendicants*, are also ranked the Capuchins, Recollects, Minims, and others, who are branches, or derivations from the former. See *CAPUCHINS*, *RECOLLECTS*, &c.

The *mendicants* at their first establishment, were rendered incapable of having any revenues. The multitude of *mendicants* is now a heavy tax on the people.

*MENIAN column.* See the article *COLUMN*.

*MENINGES*, *MHNITEX*, in anatomy, the coats, or membranes, wherewith the brain is inclosed. See *BRAIN*.

The Arabs call them mothers; whence we also usually call them in Latin the *pia*, and *dura mater*. See *PIA*, and *DURA MATER*.

There are two *meninges*, external and internal; called *meninx crassa*, and *tenuis*.

*Crassa MENINX*, or *dura mater*, is the external one, and the grossest. It lies immediately under the cranium, and covers the whole substance of the brain, and the spinal marrow, and affords a coat to the trunks of the larger nerves. See *NERVE*, &c. It is connected on the upper part to the periosteum by means of fibres, and on the under side to the *pia mater* by the branches of the sinus's, and by the arteries and nerves. It consists of two lesser coats or membranes, which some have taken for two *dura mater's*; the exterior, hard; and the inner, more smooth, soft, and moist. It descends double between the two hemispheres of the brain, which it divides as deep as the corpus callosum, and by reason of its curvature, occasioned by the convexity of the brain in that part, is called *falx*, from its resemblance to a sickle. See *FALX*. It likewise insinuates itself between the brain and cerebellum, and so prevents the brain from lying too hard on the cerebellum. In the duplicatures thereof are several cavities called *sinus's*, which are a sort of venous canals serving for the conveyance of the blood. Of these there are four considerable ones, *viz.* the longitudinales, and laterales. See *SINUS*.

*MENINX tenuis*, or *pia mater*, lies under the *dura mater*, immediately under the brain. It is a fine thin membrane adhering so closely, and insinuating itself into all the folds and anfractuous parts of the brain, that it is scarce to be separated from it. This membrane covers the whole brain, cerebellum, and medulla oblongata, and serves, together with the other, for the defence of the brain, and the support of its vessels.

Between the two, lies another fine transparent membrane, called

## M E N

called *arachnoides*; but the best anatomists take this for no more than the external lamina of the pia mater. See ARACHNOIDES.

**MENIPPEAN**, *satyra MENIPPEA*, a kind of satyr consisting of prose and verse intermixed. See SATYR.

It is thus called from Menippus, a Cynic philosopher, who delighted in composing satirical letters, &c.—In imitation of him, Varro also wrote satyrs under the title of *satyra Menippeæ*: Whence this sort of composition is also denominated *Varronian satyr*.

Among the moderns, there is a famous piece under this title, first published in 1594, against the chiefs of the league, called also the *Catholicon* of Spain. It is esteemed a master-piece for the time. See CATHOLICON.

**MENISCUS**, in optics, a glass, or lens, concave on one side, and convex on the other; sometimes also called *lunula*. See LENS and OPTIC glass.

In a *meniscus*, if the diameter of the convexity be equal to that of the concavity, a ray falling parallel to the axis, will continue parallel thereto after refraction.

Such a *meniscus* therefore, will neither collect, nor disperse the rays; and is therefore of no use in dioptrics. See REFRACTION.

To find the focus of a *meniscus*, the rule is, As the difference of the semi-diameters of the convexity and concavity, is to the semi-diameter of the convexity: so is the diameter of the concavity, to the distance of the focus from the *meniscus*. Hence if the semi-diameter of the concavity, be triple the semi-diameter of the convexity, the distance of the focus from the *meniscus* will be equal to the semi-diameter: and therefore the *meniscus* will be equivalent to a lens equally convex on either side. See CONVEX-lens.

Again; if the semi-diameter of the concavity be double that of the convexity; the distance of the focus will be equal to the diameter: and therefore the *meniscus* will be equivalent to a plano-convex lens. See PLANO-convex.

If the semi-diameter of the concavity be quintuple that of the convexity, the *meniscus* will be equivalent to a square. See SPHERICAL LENS.

The semi-diameter therefore of the concavity being given; that of the concavity required to remove the focus to any given distance from the *meniscus*, is easily found. See FOCUS.

**MENNONITES**, a sect in the United Provinces, in most respects the same with those in other places called *Anabaptists*. See ANABAPTIST.

They had their rise in 1496, in a village in Friesland: their founder was one Mennon, who undertook to reform the religion of the ancient Anabaptists, and to throw out all enthusiasm touching the new kingdom of Christ, &c.

The *Mennonites* hold, that there is no original sin; that the first man was not created just; that in speaking of the father, son, and holy ghost, we must not use the word *person*, nor that of *trinity*; that Jesus Christ did not take his flesh from the substance of his mother, but from the essence of the father; or that the word of the father became man; that he brought it from heaven, or that we do not know whence he had it: And that the union of the divine and human nature was so effected, as that the divine was rendered visible, and liable to death.

The *Mennonites* teach farther, that Christians are not allowed to swear; to exercise any civil magistrature; to use the sword, not even for the punishment of criminals. They add, that ministers of the word are not permitted to receive any wages for their work; that they must not baptize little children; and that the souls of men after death rest in an unknown place till the day of judgment.

The *Mennonites* are sub-divided into divers sects; whereof the two principal are, the *Mennonites* of Friesland, and those of Flanders.

The latter exercise a very strict church-discipline, and excommunicate for the slightest offence; nor do they hold it lawful to have any society or communication with those excommunicated.—Those of Friesland, on the contrary, receive into their communion such as are excommunicated by the others; whence they have been called *stercorarii*, and *borboristæ*. Their discipline is very remiss.

They recommend an universal toleration of religions very earnestly, and receive all kinds of persons into their assemblies, provided they be of good morals, and believe the scripture to be the word of God; however divided they may be as to the particular articles of faith.

Though the *Mennonites* usually pass for a sect of Anabaptists, yet M. Herman Schin, a *Mennonite* minister, who has published their history and apology, maintains that they are not Anabaptists, either in principle, or by origin: He owns they baptize none but adults; but then, neither do they re-baptize any who have received it in their childhood. They speak with a great deal of prudence and reserve as to the extraordinary operations of the holy spirit; and are far from the fanaticism of the old Anabaptists. No people are more submissive to magistrates, or carry passive obedience farther than they. Far from rebellion; they condemn even the most just war, &c.

**MENOLOGY**\*, **MENOLOGIUM**, in the Greek church, is

## M E N

much the same with *martyrology*, or *calendar* in the Latin. See MARTYROLOGY, and CALENDAR.

\* The word comes from the Greek, *μην*, month, and *λογος*, discourse.

The Greek *Menologium* is divided into the several months in the year; and contains an abridgment of the lives of the saints; with a bare commemoration of the names of such whose lives were never written. The Greeks have various *Menologies*. The Romans tax them with inserting divers heretics in their *Menologies* as saints. Baillet treats of them at large.

**MENSÆ DOMESTICUS**. See the article DOMESTICUS.

**MENSALIA**, **MENSALS**, such parsonages, or livings as were formerly united to the tables of religious houses; and therefore by canonists called *mensal* benefices. See PARSONAGE, and BENEFICE.

**MENSES**\*, **CATAMENIA**, in medicine, the monthly evacuations from the uterus, of women not with child, or not giving suck. See MENSTRUAL.

\* They are so called from *mensis*, month, the period wherein they return. They are also called *flowers*, *courses*, &c. See FLOWERS.

The *menfes* make one of the most curious and difficult phenomena in the whole human body; for the explanation whereof, many hypotheses have been framed, though the matter is yet scarcely ascertained.

It is generally agreed by all, that the necessity women are under for some extraordinary supply to compensate the expence, and support them during the time of gestation, was the final reason why this redundancy at other times was given them. But this is all they agree in. Some not content with this occasion alone, will have the *menstruous* blood offend in quality more than in quantity; which they argue from the pain it gives many women in the evacuation.—They add, that its malignity is so great, that it excoriates the parts of men by mere contact; that the breath of a *menstruous* woman will give a permanent stain to ivory, or a looking-glass; that a little of the blood dropped on any vegetable, blasts, or renders it sterile; that if a pregnant woman be defiled with the *menfes* of another woman, she miscarries; that if a dog tastes them, he runs mad, and grows epileptic: All which, with many more fables of the same kind, though related by great authors, Dr. Drake rejects, as too ridiculous to need a refutation.

Others ascribe this effect to an imaginary dominion of the moon over the bodies of women.—This was formerly the prevailing opinion; though the smallest reflection would have shewn the weakness of it: For had this purgation been owing to the influence of the moon, all women of the same age and temperament, would have found it at the same periods and revolutions of the moon, *i. e.* at the same time; which all experience shews to be false.

There are two other opinions which carry with them great probability, and are argued with a great deal of strength and reason. In both which, the quality of the blood is allowed to be innocent; but they still differ about the reason of its issue.—The former is that of Dr. Bohn and Dr. Freind, who maintain this flux to be the result of a plethora, or plenitude; and to be evacuated only for relief against the quantity. See PLETHORA.

Dr. Freind, who has maintained the cause of a plethora with the greatest strength and clearness, supposes that this plethora arises from a coacervation in the blood-vessels of a superfluity of aliment, which he thinks remains over and above what is expended by the ordinary ways; and that women have this plethora, and not men, because their bodies are more humid, and their vessels, especially the extremities of them, more tender, and their manner of living generally more unactive than that of men; and that these things concurring, are the occasion that women do not perspire sufficiently to carry off the superfluous alimentary parts, till it be accumulated in such quantity as to distend the vessels, and force its way through the capillary arteries of the uterus. It is supposed to happen to women more than the females of other species, which have the same parts, because of the erect posture of the former; and the vagina, and other canals, being perpendicular to the horizon; so that the pressure of the blood is directed towards their orifices: whereas, in brutes, they are parallel to the horizon, and the pressure wholly on the sides of those vessels. The discharge, he thinks, happens in this part rather than in any other, as being more favoured by the structure of the vessels; the arteries being very numerous, and the veins sinuous and winding, and therefore more apt to retard the impetus of the blood; and consequently, in a plethoric case, to occasion the rupture of the extremities of the vessels, which may last, till by a sufficient discharge the vessels are eased of their over-load.

This is the substance of Dr. Freind's theory, from whence he very mechanically, and very philosophically, accounts for the symptoms.

To his argument, why women have *menfes* rather than men, we may add from Boerhaave, that in the former, the os sacrum is wider, and stands farther out, and the os coccygis farther in; the ossa innominata wider, and farther apart, and the lowest of them, as well as the lower eminences of the os pubis, farther outwards than in the latter. Hence, in women, the latitude

tude or expansion about these bones, and the capacity of the pelvis, is vastly great in proportion to those of men; and yet in a woman not pregnant, there is not much to fill this expanse. Again, the fore-side of the thorax is smoother in women than in men, and the blood-vessels, lymphatics, adipose and nervous vessels, membranes and fibres, are much laxer in women than in men: whence all their cavities, cells, vessels, &c. are more easily replenished, and the humours aggregated in them; besides, that they are found to perspire less than men, and to arrive much sooner at their maturity, or *ακμή* of increase. To which he adds the consideration of the soft pulpos texture of the uterus, and the vast number of veins and arteries it is filled withal.

Hence, a healthy maid, being arrived at her growth, begins to prepare more nutriment than is required for the support of the body; which, as there is not to be any farther accretion, must of necessity fill the vessels, and especially those of the uterus, and breasts, as being the least compressed. These will be dilated more than the others; whence the lateral vascules evacuating their humour into the cavity of the uterus, it will be filled, and extended: Hence, a pain, heat, heaviness, will be felt about the loins, pubes, &c. the vessels of the uterus at the same time will be so dilated, as to admit blood into the cavity of the uterus, its mouth will be lubricated and loosened, and blood issue out. As the quantity of blood is diminished, the vessels will be less pressed, and will contract themselves closer, so as again to retain the blood, and let pass the grosser part of the serum; till at length, only the usual serum passes. Again there are more humours prepared, which are more easily lodged in vessels once dilated; hence the *menfes* go, and return at various periods in various persons.

This hypothesis, however plausible, is opposed by Dr. Drake, who maintains that there is no such repletion, or at least that it is not necessary to menstruation. Arguing, that if the *menfes* were owing to a plethora so accumulated, the symptoms would arise gradually, and the heaviness, stiffness, and inactivity, necessary symptoms of a plethora, would be felt long before the period were completed, and women would begin to be heavy, and indisposed soon after evacuation, and the symptoms increase daily: Which is contrary to all experience; many women, who have them regularly and easily, having no warning, nor other rule to prevent an indecent surprize, than the measure of the time; in which, some that have slipped, have been put to confusion and shifts, no ways consistent with the notice a plethoric body would give. He adds, that even in those who are difficultly purged this way, the symptoms, though very vexatious and tedious, do not make such regular approaches, as a gradual accumulation necessarily requires. If we consider what violent symptoms come on in an hour, we shall be extremely puzzled to find the mighty accession of matter which should in an hour or a day's time make such great alterations. According to the hypothesis, the last hour contributes no more than the first, and of consequence, the alteration should not be greater in the one than the other; setting aside the bare eruption.

This is the substance of what is argued against Dr. Freind's theory; which, it must be owned, notwithstanding these objections, is still the most rational and consistent that has yet been advanced.

Those who oppose it, give into the doctrine of fermentation, and maintain the evacuation of blood, in those parts, to be the effect of an effervescence, or ebullition of the blood. This opinion has been maintained by many, particularly Dr. Charleton, Bale, De Graaf, and Drake. The two first of whom suppose a ferment peculiar to the women which produces this flux, and affects that part only, or at least principally. De Graaf, less particular in his notion, only supposes an effervescence of the blood raised by some ferment, without assigning how it acts, or what it is. The sudden turgescence of the blood, occasioned them all to think, that it arose from something till then extraneous to the blood, and led them to the parts principally affected, to seek for an imaginary ferment, which no anatomical enquiry could ever shew, or find any receptacle for, nor any reasoning necessarily infer. Again, that heat which frequently accompanies this turgescence, led them to think the case more than a plethora, and that there was some extraordinary intestine motion at that time.

Dr. Drake improves on the doctrine of a ferment; and contends not only that it is necessary there should be a ferment, but a receptacle also for this ferment: Concluding from the suddenness and violence of the symptoms, that a great quantity must be conveyed into the blood in a short time, and consequently, that it must have been ready gathered in some receptacle, where, while it was lodged, its action was restrained. But he goes farther still, and pretends to ascertain the place, &c. both of the one and the other, making the gall-bladder to be the receptacle, and the bile the ferment. This liquor he thinks well adapted to raise a fermentation in the blood, when discharged into it in a quantity: And as it is contained in a receptacle that does not admit of a continual issue, may be there reserved, till in a certain period of time, the bladder becoming curged and full through the compression of the incumbent vis-

cera, it emits the gall: which, by the way of the lacteals, insinuating itself into the blood, may raise that effervescence which occasions the aperture of the uterine arteries. See GALL. To confirm this, he alledges, that persons of a bilious constitution, have the *menfes* either more plentifully, or more frequently than others; and that distempers manifestly bilious, are attended with symptoms resembling those of women labouring under difficult menstruation. If it be objected, that on this foot, men should have *menfes* as well as women; he answers, that men do not abound in bile so much as women; the pores of the former being more open, and carrying off more of the serous part of the blood, which is the vehicle of all the other humours; and, consequently, a greater part of each is discharged through them than in women; wherein the superfluity must either continue to circulate with the blood, or be gathered in proper receptacles, which is the case in the bile. The same reason he gives why menstruation should not be in brutes; the pores of these being manifestly more open than those of women, as appears from the crop of hair which they bear; for the vegetation whereof, a large cavity, and a wider aperture of the glands is necessary, than where no such thing is produced. Yet there is some difference between the males and females even among these, the latter having their *menfes*, though not so often, nor in the same form and quantity, as women.

He adds, that the several phenomena of the *menfes*, whether in a natural, a regular, or diseased case, flow naturally and readily from this hypothesis; and that whatever may be accounted for from a plethora, or from any particular ferment, may, without any straining, be applied to this.

The root of black hellebore, and steel, are the principal remedies for obstructions of the *menfes*; the former is almost infallible, and in many cases where the latter is not only ineffectual, but improper; as in plethoric habits, for with such, steel will sometimes raise hysteric commotions, convulsions, and a kind of uterine furor; whereas hellebore thins the blood, and disposes it for a discharge without making it more impetuous. So that though each provoke the *menfes*, yet they do it by different ways; steel by increasing the blood's velocity, and giving it a greater moment against the uterine arteries; and hellebore by dividing it, and rendering it more fluid. See HELLEBORE, and CHALYBEAT.

MENSIS. } See { MONTH.  
MENSIS chymicus. } { MENSTRUUM.  
MENSIS vetitus. } { FENCE month.

MENSTRUAL, or MENSTRUOUS, a term in medicine, applied to the blood which flows from women in their ordinary monthly purgations. See MENSES.

The *menstrual* blood is the excess, or redundance of the blood in the body. It may be defined an excrement serving for the formation, as well as nutrition of the foetus in the womb, and which at other times is evacuated monthly. See BLOOD.

Of all animals, there are none besides women, and perhaps apes, which have their *menstrual* purgations.—Hippocrates says, that the *menstrual* blood gnaws and tears the earth like vinegar. Pliny and Columella add, that it burns herbs, kills plants, tarnishes looking-glasses, and that dogs which taste it, run mad. But this is all fabulous; it being certain that this blood is the same with that in the veins and arteries. See BLOOD.

By the Jewish law, a woman was unclean while the *menstrual* blood flowed: and the man who touched her, or the moveables she had touched, were declared unclean. Levit. chap. xv.

MENSTRUAL epacts. } See { EPACT.  
MENSTRUAL longitude of the moon. } { ARGUMENT.

MENSTRUUM\*, SOLVENT, or DISSOLVENT, in chemistry, any liquor that will dissolve, that is, separate the parts of hard bodies. See DISSOLVENT and DISSOLUTION.

\* The term takes its rise from this, that some chemists pretend the compleat dissolution of a mixed body cannot be effected in less than forty days; which period they call a *philosophical month*.

Thus aqua regalis is a *menstruum* for gold; aqua fortis, and spirit of nitre, for most other metals; common water for salts, &c. See GOLD, SILVER, SALT, &c.

*Menstruum* is properly defined a body, which being applied to, or intermixed with another, does so dissolve it, as that all the dissolving parts float among the parts dissolved; and so divides it into its minutest parts, as that the parts of the dissolvent are intermixed with those of the body dissolved.—Whence it appears, that every *menstruum* in dissolving a body, is likewise dissolved itself; so as with the body it dissolves, to make up one body. A knife therefore divides bread, but is not on that account a *menstruum*; as it does not constitute one body with the bread: but water boiled with the bread is a *menstruum*, with regard to the bread, as it only makes up one body therewith. See DISSOLUTION.

MENSTRUUMS may be divided into two classes; the first consists of such as are fluid; the second of such as are solid; that is, they are either actually divided, or they must be so ere they act.

Fluid MENSTRUUMS are water, dew, oils, saline and acid spirits, alkali salts, &c.

Solid MENSTRUUMS, are such as must be made fluid ere they will dissolve; such are most salts, nitre, vitriol, &c. See WATER, SALT, VITRIOL, &c.

All *menstruums*, at the time they act as such, that is, at the time they are dissolving, act as fluids: whether such *menstruum* be a fluid or a solid. Thus, *e. gr.* silver is a *menstruum* with regard to gold; for if you take an ounce of silver, melt it in the fire, and add a grain of gold; all the parts of the silver will intermix themselves with the parts of the gold; so as that the gold and silver, which before were separate, now make one mass.—But gold and silver are only *menstruums* as they are dissolved by the fire; *i. e.* as they are fluid.

For the action of MENSTRUUMS, Sir Isaac Newton accounts for it from the acids wherein they are impregnated. The particles of acids are found to be endued with a strong attractive force, wherein their activity consists, and by virtue whereof they dissolve bodies. See ATTRACTION. These acids he supposes of a middle nature between water and hard bodies, and to attract both. By this attraction they gather together about the particles of bodies, whether metallic, stony, or the like, and adhere to them very close, so as scarce to be separable from them by distillation, or sublimation. Thus strongly attracted, and gathered together on all sides, they raise, disjoin and shake asunder the particles of bodies, *i. e.* they dissolve them; and by the attractive power whereby they rush against the particles of the bodies, they move the fluid, and so excite heat, shaking some of the particles to that degree, as to convert them into air, and so generating bubbles. See ACID.

Dr. Keil gives us the theory or foundation of the action of *menstruums*, in the following propositions.

1°. Two corpuscles may be placed so near each other, without touching, as that the force wherewith they attract each other, shall easily exceed that of their gravity.

2°. If a corpuscle placed in a fluid be every way equally attracted by the ambient particles, the corpuscle will not be put in any motion; but if it be attracted more by some of the particles than by others, it will then tend towards that quarter where the attraction is the strongest: and the motion thus produced will be correspondent to the inequality of the attraction: that is, if the inequality be great, the motion will be so; and if little, little.

3°. Corpuscles swimming in a fluid, and attracting each other more than the interposed particles of the fluid; those particles of the fluid will be driven aside, and the corpuscles approach each other with a force equal to the excess of their mutual attraction, beyond the attraction of the particles of the fluid.

4°. If a body be placed in a fluid whose parts attract the particles of the fluid more strongly than those particles are attracted by one another; and if in the body there be several pores pervious to the particles of those fluids, the fluid will presently diffuse itself through the pores; and if the connection of the parts in that body be not so strong as that it may be exceeded by the impetus of the particles rushing together; the immersed body will undergo a dissolution.

Hence, for a *menstruum* to be fit to dissolve a given body, there are three things required. 1°. That the parts of the body attract the particles of the *menstruum* more strongly than those are attracted by each other. 2°. That the body have pores adequate and pervious to the particles of the *menstruum*. 3°. That the cohesion of the parts of the body be not so strong but that it may be torn asunder by the impetus of the particles rushing together. Hence also it follows, that the particles which constitute spirit of wine, are more strongly attracted by each other, than by those of a saline body immersed in it.

Hence we see the reasons of the different effects of different *menstruums*; why some bodies, for instance metals, dissolve in a saline *menstruum*: Others again, as resin, in a sulphureous one, &c. particularly why silver dissolves in aqua fortis, and gold only in aqua regalis; all the varieties whereof are accountable for, from the different degrees of cohesion, *i. e.* of attraction in the parts of the body to be dissolved, the different diameters and figures of its pores, the different degrees of attraction in the *menstruum*, and the different diameters and figures of its parts. See COHESION.

Suppose, *e. gr.* the attraction of gold to that of silver, to be as  $a$  to  $b$ ; and of silver to aqua fortis as  $b$  to  $d$ ; but that of aqua fortis to aqua regia, as  $d$  to  $e$ ; let  $f$  signify the magnitude of particles in aqua fortis, and  $r$  those in aqua regia;  $c$  the cohesion of gold, and  $g$  the cohesion of silver: If the diameters of the particles  $f$  be greater than the diameters of the pores of gold, they can never dissolve the gold, let their attractive force be ever so strong. But if  $b-fxa$  be greater than  $g$ , then the silver will yield to the *menstruum* whose particles are  $f$ , and less than the pores of the silver; and if  $b-exr$  be less than  $g$ , the silver will never dissolve in the *menstruum*, the particles whereof are  $r$ , and the attractive force is  $e$ . But if  $a-exr$  be greater than  $c$ , the *menstruum* made up of the particles  $r$ , and whose attractive force is  $e$ , will be able to penetrate and dissolve the gold.

How a *menstruum* may suspend bodies much heavier than itself, which very often happens, may be conceived by considering, that the parts of no fluid can be so easily separated, but they will a little resist, or retard the descent of any heavy bodies through them; and that this resistance is, *ceteris paribus*, still

proportionable to the surface of the descending bodies: But the surfaces of the bodies do by no means increase, or decrease, in the same proportion as their solidities do; for the solidity increases as the cube, but the surface only as the square of the diameter. Small bodies, therefore, will have much larger surfaces, in proportion to their solid contents, than larger bodies will; and consequently when exceedingly diminished, may easily be buoyed up in the liquor. See DESCENT, RESISTANCE, &c.

MENSTRUUM, in pharmacy, chiefly denotes a body that will extract the virtues of ingredients by infusion, decoction, or the like. See EXTRACT, INFUSION, DECOCTION, &c.

MENSTRUUM *peracutum*, is a name given by Mr. Boyle to a *menstruum* he extracted from bread only, that would prey on bodies more compact than many hard minerals, nay even on glass, and do many things that aqua fortis would not do.—With this he drew tinctures not only from crude corals, but also from the lapishæmatites, and granates, nay from diamonds, and rubies. See DIGESTION.

MENSURATION, the act, or art of *measuring*. See MEASURING, and TRIANGLE.

MENTAL, something that relates, or is restrained, to the operation of the understanding.

Thus, a *mental* prayer is such a one as is made merely in the mind, without pronouncing one word of it. See PRAYER.

*Mental* reservations are the refuge of hypocrites. See RESERVATION.

MENTUM, in anatomy, the lower part of the face, beneath the mouth; which we otherwise distinguish by the name of *chin*. See FACE.

MEPHITIS, or MEPHITICAL *exhalation*, denotes a poisonous and noxious steam issuing out of the earth, and chiefly from a sulphurous principle. See POISON, DAMP, EXHALATION, &c. The most remarkable place of this kind is the Grotta del Cane near Puzzoli, about two miles from Naples, in Italy: the steams of which kill dogs, or other animals, when brought within its reach: A very curious account of which, and the manner of its efficacy, is given by Dr. Mead, in his essay on poisons. See GROTTA.

MER.—*Oufter le MER*. See the article OUSTER.

MERCATOR's *chart*, or *projection*, is a sea-chart, or projection of the surface of the earth in plano, wherein the meridians, parallels and rhumb lines are all represented by straight lines; the meridians being likewise parallel, though their degrees are not equal, but are continually enlarged as they approach nearer the pole, in the same proportion as the parallel circles on the globe decrease as they approach the pole: that is, in the ratio of the radius to the sine complement of the latitude. See PROJECTION.

For the construction, use, advantages, &c. hereof, see *Mercator's* CHART.

MERCATOR's *sailing*, is that performed loxodromically, by means of *Mercator's* charts. See *Mercator's* SAILING.

MERCHANDIZE, or MERCANTILE *profession*, the function of a merchant; or the art, method, &c. of exercising a wholesale commerce. See COMMERCE.

The *mercantile* profession is esteemed noble, and independent. In France, by two arrets of Louis XIV. the one of 1669, the other of 1701, the nobility are allowed to trade, both by land and sea, without derogating from their nobility: And we have frequent instances of merchants ennobled in that country, in regard of the utility of their commerce, and the manufactures they have set up. In Bretagne, even a retail trade does not derogate from nobility.

When the nobles of that province are disposed for commerce, they let their nobility sleep; that is, they do not lose it, but only cease to enjoy the privileges of their noblesse while their commerce continues, and re-assume it, by giving over trade, without any letters or instrument of re-habilitation.

In republics it is still more valued; but no where more than in England, where the younger sons and brothers of peers are frequently bred up to *merchandize*. Add to this, that many of the Italian princes are the principal merchants of their states; and think it no discredit to make their palaces serve as warehouses: And that many of the kings of Asia, most of those of the coast of Africa and Guinea, traffic with the Europeans, sometimes by their ministers, and sometimes in person.

The qualifications requisite for the profession of a *merchant*, are, 1°. To keep books single or double, *viz.* journals, ledgers, and others. 2°. To draw invoices, contracts, charter-parties, policies of assurance, bills of exchange, letters missive, &c. 3°. To know the relation between the monies, weights, and measures, of several countries. 4°. The places where the several kinds of *merchandize* are manufactured, in what manner made, what the materials composed of, and whence; the preparation the materials require before they are wrought; and the merchandizes afterwards. 5°. The lengths and breadths of stuffs, as silks, wools, hairs, linens, &c. the regulations of the places where they are manufactured, and their different prices at different seasons. 6°. The dying, and the ingredients for the formation of the different colours. 7°. The *merchandizes* that abound, or are more rare, in one country than another; their

kinds and qualities; and the manner of trafficking in them to the best advantage, whether by land, by sea, or rivers. 8°. The commodities permitted or prohibited, both for the import and export of a state. 9°. The price of exchange according to the course of several places, and what it is that raises or lowers it. 10°. The duties to be paid both at the import and export of wares, according to the usage of the place, the tariffs, regulations, &c. 11°. The manner of packing, baling, and tuning merchandizes, to keep them either in magazines, or in voyages, &c. 12°. On what terms a merchant-vessel may be freighted and insured. 13°. The goodness and value of every thing requisite for the construction or refitting of vessels, the prices of woods, cordage, masts, anchors, sails, and other necessaries. 14°. The wages ordinarily given captains, officers, and sailors: and the manner of contracting with them. 15°. The foreign languages, which may be reduced to three principal ones, viz. the Spanish, used almost through all the east, particularly on the coast of Africa, from the Canaries to the cape of Good Hope; the Italian, used throughout the coasts of the Mediterranean, and many places of the Levant; and the Teutonic or German, used throughout most countries of the north. 16°. The consular jurisprudence, the laws, customs, companies, colonies, chambers of insurance, consulates in the several countries; and in the general, all the ordinances, regulations, and policies, relating to commerce.

**MERCHANT**, a person who carries on merchandize, or sustains the mercantile profession. See **MERCHANDIZE**.

**MERCHANT-ship**. See **SHIP**.

**Law Merchant**.

**Statute Merchant**.

**Tenant per statute Merchant**.

**MERCHENLAGE**, the law of the Mercians. See **LAW**.

**MERCURE galant**. See the article **GALANT**.

**MERCURIAL**, something that consists of, or bears a relation to, mercury. See **MERCURY**.

Thus we say, a *mercurial* person, to denote a person of a brisk, volatile complexion; such persons being supposed by astrologers to be under the more immediate influence of the planet Mercury. So also, we say *mercurial* fumes, *mercurial* spirits, &c. with reference to the mineral mercury.

**MERCURIAL medicines**.

**MERCURIAL phosphorus**.

**MERCURIAL salivation**.

**MERCURIAL thermometer**.

**MERCURIAL unguents, frictions, &c.**

**MERCURIAL waters**.

**MERCURIALS**, medicines composed, or prepared, of mercury, or quick-silver. See **MERCURY**.

The principal of the class of *mercurials*, are mercurius albus, or white precipitate of mercury; sweet and corrosive sublimate of mercury; calomel; artificial cinnabar; turbith mineral; prince's powder; æthiops mineral, &c. See each under its proper article, **SUBLIMATE**, **PRECIPITATE**, **MERCURY**, **CINNABAR**, **TURBITH**, **CALOMEL**, &c.

The medicinal efficacy of mercury depends on its extreme divisibility, and fineness of its particles, and on their gravity, or weight. By means of the first, it finds a passage into the inmost recesses of the animal structure, and when properly guarded, does not exert itself till it comes in the remotest scenes of action; where most other medicines either do not arrive, or at least not till their force is rebated.—This property it has in common with camphor. See **CAMPHOR**.

By the latter, it is enabled to make still more considerable alterations in the animal economy, by rendering the fluids thinner, and breaking open the secretory passages: But this effect it has in common with chalybeats. See **CHALYBEATS**.

It may be added, that the same property whereby it becomes so powerful a deobstruent, indicates, that it is to be avoided in hectic, and all cases where the constitution is drawn low by too profuse evacuations; in regard *mercurials* tend to keep up or increase the excess of impetus in the fluids, and that overcapacity in the secretory orifices, wherein the defect of such a constitution seems to consist. See **HECTIC**.

**MERCURY**, ☿, in astronomy, the smallest of the inferior planets, and the nearest the sun. See **PLANET** and **SYSTEM**.

The mean distance of Mercury from the sun is to that of our earth from the sun as 387 to 1000; its excentricity 8 degrees. The inclination of its orbit, that is, the angle formed by the plane of its orbit with the plane of the ecliptic, is 6 degrees 52 minutes: Its diameter to that of the earth as 3 to 4; and therefore the globe of Mercury will be to that of the earth as 2 to 5. See **EXCENTRICITY**, **INCLINATION**, **DIAMETER**, **DISTANCE**, &c.

According to Sir Isaac Newton, the heat and light of the sun on the surface of Mercury, is seven times as intense as on the surface of our earth in the middle of summer: which, as he found by experiments made for that purpose by a thermometer, is sufficient to make water boil. Such a degree of heat therefore must render Mercury uninhabitable to creatures of our constitution. And if bodies on its surface be not inflamed and set on fire, it must be because their degree of density is proportionably greater than that of such bodies are with us. See **HEAT**. The revolution of Mercury round the sun, or his year, is per-

formed in eighty-seven days, twenty-three hours; his diurnal revolution, or the length of his day, is not yet determined; nor is it certain whether he has such a motion round his own axis, or not. See **PERIOD**, **REVOLUTION**, &c.

What variety of weather or seasons it may be liable to, we are still at a loss; as not knowing the inclination of his axis to the plane of his orbit. The force of gravity on the surface of Mercury, is seven times as strong as on the surface of the earth. Its density, and consequently, the gravitation of bodies towards the centre, cannot be accurately determined; but no doubt it must exceed that of our earth, by reason of the excess of heat there. See **GRAVITY**, **DENSITY**, &c.

Mercury changes its phases like the moon, according to its several positions with regard to the sun and earth. See **MOON**. It appears full, in its superior conjunctions with the sun, because we can see the whole illumined hemisphere: But in its lower conjunction, we only see the obscure or unillumined hemisphere: In his approach towards the sun, his light is falcated or horned. See **PHASES**.

The situation of this planet proves evidently, that the hypothesis of Ptolemy is false: For Mercury is sometimes observed betwixt the earth and sun; and sometimes beyond the sun. But the earth is never found between Mercury and the sun; which however must happen, if the spheres of all the planets encompassed the earth, as a centre, according to the Ptolemaic scheme. See **PTOLEMAIC system**.

The diameter of the sun viewed from Mercury, would appear three times as big as it appears on our earth; that planet being thrice as near him as we are; and therefore the sun's disk would appear seven times as large as it appears to us.

Its greatest distance from the sun, with regard to us, never exceeds twenty-eight degrees, whence it is seldom visible; being commonly either lost in the sun's light, or, when the most remote from the sun, in the crepusculum. The best observations of this planet, are those made when it is seen on the sun's disk; for in its lower conjunction, it passes before the sun like a little spot, eclipsing a small part of his body, only observable with a telescope. The first observation of this kind, was that of Gassendi in 1632. See **TRANSIT**.

To an inhabitant of Mercury, the solar spots will appear to traverse his disk sometimes in a right line from east to west, and sometimes elliptically. As the other five planets are above Mercury, their phenomena will be nearly the same there, as with us. Venus and the earth, when in opposition to the sun, will shine with full orbs, and afford a noble light to that planet.

**MERCURY**, in chemistry and natural history, denotes a fluid, mineral matter, perfectly resembling silver in fusion. See **MINERAL**.

Mercury is known under a great number of denominations: The common name among the ancients was *hydrargyrum*, q. d. water of silver. The moderns commonly call it *mercury*, from some supposed relation it bears to the planet of that name. In English it is popularly called *quick-silver*, from its appearance. Many of the chemists call it *Proteus* from the variety of forms, colours, &c. it passes through in their preparations.

Naturalists are divided what class of fossils to range mercury under: Some make it a metal; others a semi-metal; and others an imperfect metal. See **FOSSIL**, and **SEMI-METAL**.

Boerhaave observes, that it is very improperly called a *metal*, inasmuch as it has not all the characters of such a body; nor scarce any thing in common with the other metals, except weight and similarity of parts: Thus, for example, it is neither dissolvable by fire, malleable, nor fixed: In effect, it seems to constitute a peculiar class of fossils; and is rather the mother, or basis of all metals, than a metal itself. See **METAL**.

Perfect metals, according to M. Homberg, &c. are nothing but pure mercury whose little particles are penetrated on all sides, and filled with the matter of light, which unites and binds them together into a mass, so that the parts of fluid mercury, which are supposed to be little solid globes, in their metallification are rendered rough and uneven, being pierced on all sides, and having their pores or perforations filled with the matter of light. By such means they lose their first conformation, and the politure or smoothness of their surfaces, which is one of the principal causes of the fluidity of mercury.

The chymists make mercury one of their hypostatical principles: Not, as M. Homberg observes, that it answers the character of a principle, which is that whose substance cannot be analysed, or reduced into matters more simple; but because the analysis has not yet been discovered: though it is possible it may hereafter, there being little doubt but that mercury is a compound. This is the more probable, in regard mercury may be destroyed, which never happens to simple bodies. The manner of destroying mercury, is, first, by changing it into a perfect metal, by introducing a sufficient quantity of light within its substance; and then exposing this metal to a burning-glass, where, in a little time, it evaporates almost wholly into smoke, leaving nothing behind but a light earthy dust.

**Characters, or properties of MERCURY**, are, First, That of all bodies it is the heaviest, after gold; and still the purer it is, the heavier: Nay, some of the philosophers even hold, that mercury well purged of all its sulphur, would be heavier than gold.

gold itself. The ordinary proportion is that of fourteen to nineteen. If any *mercury* be found to weigh more than according to this ratio, it may be safely concluded to have gold in it. See GOLD, and WEIGHT.

The second character of *mercury*, is to be of all bodies the most fluid: that is, its parts separate, and recede from each other by the smallest force.—Consequently, of all bodies it is that whose parts cohere the least, or are the least tenacious; and therefore of all others the least ductile and malleable. The parts of water do not divide so readily as those of quick-silver; and the parts of oil much less: There is a certain tenacity even in the parts of spirit of wine which resists separation; but there is scarce any cohesion at all in the parts of *mercury*. See FLUIDITY, and FIRMNESS.

The third property of *mercury*, which, indeed, depends on the second, is, That of all bodies it is divisible into the minutest parts.—Thus, being exposed to the fire, it resolves into a fume scarce perceivable to the eye; but in whatever manner it be divided, it still retains its nature, and is the same specific fluid. For the vapours of distilled or volatilized *mercury* received in water, or on moist leather, or the like, become pure *mercury*; and if *mercury* be mixed with other bodies, in order to fix it, for it is scarce fixable of itself, it is easily separable from them again by fire, and reducible into pure *mercury* as before. See DIVISIBILITY.

The fourth character is to be extremely volatile, being convertible into fume, even by a sand-heat. In effect it does not sustain the fire long enough either to boil, or ignite. Though it must be added, if the fire be at first very gentle, and increase by easy degrees, it may be retained therein a pretty long time, and be fixed so at length to become ignited in the crucible, as we learn from some very tedious experiments made at Paris. See VOLATILITY.

The gilders are but too well acquainted with the vapours of *mercury*, which frequently render them epileptic, and paralytic, and sometimes salivate them; being of so penetrating a nature, as to take away any scirrhus tumours, though very apt to reach and destroy the nobler parts.

The fifth property is, that it easily enters, and intimately adheres to gold, less easily to the other metals, with difficulty to copper, and not at all to iron. See AMALGAMATION.

Indeed we have heard much among the adepts about making an amalgama with *mercury* and iron; but the experiment would never succeed with that industrious chymist, Dr. Boerhaave. It is possible there may be some way of binding those two bodies together; and no doubt an amalgama might be made, if a large quantity of gold were added to the iron: But then, if the compound were beaten into dust, in water, the iron would wash away, and the gold remain. On this account it is, that such as have occasion to handle quick-silver, always make choice of iron-instruments for that purpose. We have known women, in a salivation, to have their ear-rings grow white and soft with the effluvia of the *mercury*; and hence the gilders, to lay gold on any other body, dissolve it in hot *mercury*; which done, they apply the solution on the body to be gilt, suppose silver; then setting it over the coals, the *mercury* flies away, and leaves the gold adhering like a crust to the silver. Lastly, rubbing the crust with lapis hæmatites, the silver is gilt. See GILDING.

The sixth character is, That of all fluids, it is the coldest, and the hottest: supposing the circumstances the same.

Boerhaave shews, that fire is equally diffused through all bodies; and that there is in reality the same degree thereof in *mercury*, as in spirit of wine; and yet if you try with your finger, *mercury* in the cold, is much colder, and, over the same fire, considerably hotter, than this spirit. This property depends on the great weight of *mercury*: for the heat and cold of all bodies is *cæteris paribus* as their weights. Now, *mercury* being fourteen times heavier than water; if both of them be exposed in a winter's night to the same cold, the *mercury* must be so much colder than water, as it is heavier. So, also, if they be both applied to the same degree of heat, while the water becomes warm, the *mercury* will be hot enough to burn the hands. See HEAT, and COLD.

The seventh property is, that it is dissoluble by almost all acids, and unites itself with them; at least with all fossil acids. Thus it is dissolved in oil of vitriol, spirit of sulphur per campanam, spirit of nitre, and aqua regia.

It is prepared with oil of vitriol, into turbith mineral; with spirit of sulphur, into cinnabar; with aqua regia, or spirit of sea-salt or sal-gemma, into corrosive sublimate. See TURBITH, CINNABAR, SUBLIMATE, &c.

Only vinegar does not dissolve it; and hence we are furnished with a method of detecting the frauds of druggists, &c. who make a practice of sophisticating quick-silver with lead. Do but take a mortar, and pound the *mercury*, with vinegar therein; if the vinegar grow sweetish, it is a proof there is a mixture of lead: if copper have been mixed with it, the *mercury* will turn greenish, or bluish; if there be no adulteration, the *mercury* and vinegar will both remain as before.

The eighth property is, that it is the most simple of all bodies, next after gold: Accordingly, we find it the same in all its parts, so far as our observation goes. If a single grain of *mer-*

*cury* be dissolved in spirit of nitre, a proportionable part of the grain will be distributed into every minute particle of the menstruum; and by diluting the whole with an ounce of aqua stygia, the whole grain of *mercury* will be revived. Had we the *mercury* of the philosophers, called also *vital mercury*, *mercury of metals*, &c. so much talked of; it is asserted it would be still vastly simpler than gold: For, from gold, we can sometimes separate *mercury*, and sometimes sulphur; but from pure *mercury*, nothing beside itself can be separated.

The ninth property of *mercury* is, not to be in any measure acrid, for it shews no acrimony to the taste, nor does it corrode any body; and if a carcase were to be buried in quick-silver, it might doubtless remain there without being any way hurt.

The extraordinary effects, however, it produces in the body, have given people a notion of its being acrid. But the case is, that when received into the blood, it acts by its weight and velocity; whence it tears and destroys the vessels, and thus occasions those great alterations, which lead the chemists into their mistakes.

In effect, all its medicinal operations are to be accounted for from the properties already enumerated.

*Mines of MERCURY.*—The chief are those of Hungary, Spain, Friuli, and Peru. The greatest part of our quick-silver is brought us from Friuli, where there are abundance of mines belonging to the emperor, though now mortgaged to the Dutch. It is found under three several forms. 1°. In ruddy glebes or clods, called *cinnabar*. 2°. In hard stony glebes, or a mineral substance of a saffron, and sometimes a blackish colour. 3°. It is also found pure: For upon opening holes in the beds of stones, &c. there sometimes gushes a vein or stream of pure *mercury*, call'd *virgin-mercury*.

This last sort is most valued: Paracelsus and Basil Valentine prefer it far to any other sort, for chemical operations. Dr. Brown assures us in his travels, that enquiring of one of the directors of the quick-silver mines, wherein the difference between this and common *mercury* consisted; he was answered, that *virgin-mercury*, mixed and amalgamated with gold, renders the sulphur of the gold volatile: but this has been several times tried without success.

*Method of procuring or separating MERCURY from the ore or earth.*

—They first grind the mineral glebe into powder; this done, they pour a great quantity of water upon it, stirring and working the whole briskly about till the water become exceeding thick, and turbid. This water having stood till it be settled, they pour it off, and supply its place with fresh, which they stir and work as before. This they repeat, and continue to do, till the water at length comes away perfectly clear; then, all remaining at the bottom of the vessel, is *mercury*, and other metalline matter.

To this *mercury*, &c. they add the scoria of iron, putting the whole in large iron retorts, and so distilling it; by which means all the heterogeneous, metallic and stony part, is separated therefrom; and the *mercury* left pure.

As to the *mercury* in cinnabar, they do not find it worth while to distil, and get it out; cinnabar selling at too high a price alone. See CINNABAR.

The miserable people condemned or hired to work in those mines, all die in a little time. They are first affected with tremors, and proceed to salivate; then their teeth drop out, and they are seized with pains all over, especially in their bones, which the *mercury* penetrates, and thus die.

In Spain, the melting and exhaling the mineral is performed with more care, and with an engine contrived for that purpose. As to the earthy matter wherewith the *mercury* is mix'd, that of Spain is red, and speckled with black and white; and so hard, that it is not to be broken up with gunpowder. In Hungary it is frequently a hard stone, but ordinarily a reddish earth. In Friuli there is a soft earth where the virgin quick-silver is found, and a hard stone which yields the common *mercury*.

The mine of Idica, one of those belonging to Friuli, is so rich that it yields always half quick-silver, sometimes two thirds.

The mine of Juan Cabelaca, in Peru, is still more considerable; the earth is of a whitish red, like bricks half burnt; it is first broke, then exposed to the fire, by spreading it on a layer of common earth, wherewith the grate of an earthen surface is covered; under which is lighted a little fire of an herb, called by the Spaniards, *icho*: which is of that necessity in these works, that the cutting it is prohibited for the space of twenty leagues round. In proportion as the mineral heats, the *mercury* rises volatilized into smoke; which smoke finding no vent through the capital of the furnace, which is exactly luted, escapes through a hole made for the purpose, communicating with several earthen cucurbits fitted within one another. The water at the bottom of each cucurbit condensing it to smoke, the quick-silver precipitates, and is taken up, when the operation is over. In this process, there are three things remarkable. The first, That the further the cucurbits are from the furnace, the more they are filled with quick-silver. The second, That at last they all grow so hot, that they would break, were they not sprinkled from time to time with water. Thirdly, That the work-

## M E R

workmen employed never hold it long, but become paralytic, and die hectic. A precaution they use, is to hold a piece of gold in the mouth, to imbibe the effluvia, and intercept their passage into the body. Dr. Pope tells us of one he saw in the mines of Friuli, who in half a year's time was so impregnated with the metal, that putting a piece of brass in his mouth, or even rubbing it in his fingers, it would turn white as silver.

*The method of purifying MERCURY*, is, by washing it several times in vinegar, wherein common salt hath been dissolved; or by passing, and repassing it frequently over a shammy skin. Am. Paræus tells us, that the best way is to make a dog swallow a pound at a time, and afterwards to separate it from the excrements, and wash it in vinegar.

*The uses of MERCURY* are very considerable in gilding, making looking-glasses, in refining gold, &c. See each under its head, GILDING, REFINING, MIRROR, LOOKING-GLASS, FOLIATING, &c.

But especially in medicine, and particularly for the cure of the venereal disease, raising salivations, and on other occasions. See VENEREAL disease, SALIVATION, and MERCURIALS.

*The preparations of MERCURY* are very various; this metal making one of the most considerable articles in the chemical pharmacy. The most common preparations are,

*White precipitate of MERCURY*, MERCURIUS præcipitatus albus, is compounded of crude mercury drove over from sea-salt in a retort, or revived from common cinnabar, and dissolved in aqua fortis; then a brine prepared of spring-water and sea-salt is filtered through a cap-paper, and the solution of mercury dropped gradually into this brine, whence there is a white powder precipitated, which is to be washed from all its acrimony with some simple distilled water, or warm spring-water, and the whole dried.

This is the common precipitate of the shops, usually called *white precipitate*.—Its operation is mostly by stool, sometimes by vomit, and will salivate, if ordered accordingly. It is frequently mixed with pomatums for the itch, and other foulnesses of the skin; for which purpose, it is necessary to keep the body laxative, and to take something inwardly to take hold of the mercurial principles, and prevent their raising a salivation which they may otherwise do. See PRECIPITATE.

*Corrosive sublimate of MERCURY*, MERCURIUS sublimatus corrosivus, is a composition of vitriol calcined to a redness, common salt, and purified nitre, with crude mercury cleaned by straining through a leather, all rubbed together in a mortar, till the salts are reduced into powder, and not the least globule of mercury appears. The mixture is then put into a matras, and that set in a furnace with a sand-heat, under which a fire being kept to its greatest height for twelve or fifteen hours, the mercury will be sublimed, and stick to the top of the vessel. This sublimate is a violent escharotic, and eats away proud flesh; half a dram of it dissolved in a pound of lime-water, turns it yellow, which is then called *phagedænic water*; it is used to wash ulcers, and tetters eruptions. See SUBLIMATE.

*Sweet sublimate of MERCURY*, MERCURIUS sublimatus dulcis, or *aquila alba*, is a composition of the preceding corrosive sublimate with crude mercury, ground together till no mercury appear, and then put into a bolt-head, well stopped, and set in a sand-heat, with a gentle fire, for the space of two hours; which heat is to be then increased for three hours longer, and, lastly, made very strong, for as much more. When this is cold, the glass is broke, and the sublimate separated from the light flowers at top, and the dust at bottom.—This is then powdered afresh, and the operation repeated in the same manner three times.

If it be further repeated, a sixth time, it is called *calomel*. See CALOMEL.

*Fixing of MERCURY*. See FIXATION, and PHILOSOPHER'S stone.

MERCURY, or MERCURY of bodies, is also used by chemists to denote the third of the principles, or elements of natural bodies; called also *spirit*. See PRINCIPLE.

In this sense, *mercury* is defined the most subtle, light, volatile, penetrating, and active part of all bodies. See SPIRIT.

MERCURY of metals, or of the philosophers, is a pure fluid substance in form of common running mercury, said to be found in all metals, and capable of being extracted from the same. See METAL.

The notion of *mercury* of metals, is founded on the common system of the chemists. That *mercury* or quick-silver is the basis, or matter of all metals; and that metals are only *mercury* fixed by a certain sulphur. See SULPHUR, &c.

Mr. Boyle assures us, he had a way of drawing a true, running mercury, or quick-silver from antimony. See ANTIMONY.

*Animated MERCURY* is quick-silver impregnated with some subtle and spirituous particles; so as to render it capable of growing hot, when mingled with gold. See AMALGAMA.

MERCURY also serves as a title for books, and papers of news; so called from the heathen deity Mercury, supposed the messenger of the gods. See JOURNAL.

Thus we have monthly *mercuries*; the French have a gallant *mercury*, &c.

## M E R

In a like sense, *mercury* is also figuratively applied to persons who make it their business to collect news, or to run about and distribute it.

MERCURY, in heraldry, denotes the purple colour in the coats of sovereign princes. See PURPLE.

MERCURY is sometimes also used for the Torricellian experiment, or barometer. See BAROMETER.

Though *mercury* be not ordinarily sustained in a tube above the height of twenty-eight or twenty-nine inches, yet M. Huygens has found, that *mercury* well purged, and in a close still place, will be sustained to the height of seventy-two inches; which is a phenomenon the philosophers are all at a loss to account for. See TORRICELLIAN experiment.

MERIDIAN, in astronomy, a great circle of the sphere, passing through the zenith, nadir, and poles of the world; and dividing the sphere into two hemispheres, the one eastern, and the other western. See CIRCLE and SPHERE.

Or, the *meridian* is a vertical circle, as A Z B N (*tab. astron. fig. 6.*) passing through the poles of the world, P and Q. See VERTICAL circle.

It is called *meridian*, from the latin *meridies*, noon, or mid-day, by reason when the sun is in this circle, it is noon in those places situate under it.

MERIDIAN, in geography, is a great circle, as P A Q D, (*tab. geography, fig. 7.*) passing through the poles of the earth P and Q; and any given place at Z. So that the plane of the terrestrial *meridian*, is in the plane of the celestial one.

Hence, 1. As the *meridian* invests the whole earth, there are several places situated under the same *meridian*. And, 2. As it is noon-tide whenever the centre of the sun is in the *meridian* of the heavens; and as the *meridian* of the earth is in the plane of the former: it follows, that it is noon, at the same time, in all places situate under the same *meridian*. 3. There are as many *meridians* on the earth, as there are points conceived in the equator. In effect, the *meridians* always change, as you change the longitude of the place; and may be said to be infinite: Each several place from east to west having its several *meridian*.

*First MERIDIAN*, is that from which the rest are accounted, reckoning from west to east.—The first *meridian* is the beginning of longitude. See LONGITUDE.

The fixing of a first *meridian* is a matter merely arbitrary; and hence different persons, nations, and ages, have fixed it differently; whence some confusion has arose in geography. The rule among the ancients was to make it pass through the place furthest to the west that was known. But the moderns knowing, that there is no such place in the earth as can be esteemed the most westerly; the way of computing the longitudes of places from one fixed point is much laid aside.

Ptolemy assumed the *meridian* that passes through the furthest of the Canary Islands as his first *meridian*; that being the most western place of the world then known. After him, as more countries were discovered in that quarter, the first *meridian* was removed further off. Some fixed it to the island of St. Nicholas, near Cape Verd; Hondius to the isle of St. James; others to the island del Corvo, one of the Azores. The latest geographers, particularly the Dutch, have pitched on the Pike of Teneriff; others on the isle of Palm, another of the Canaries; and, lastly, the French; by command of their king, on the island of Ferro, another of the Canaries.

But, without much regard to any of these rules, our geographers, and map-makers, frequently assume the *meridian* of the place where they live, or the capital of their country, for a first *meridian*, and thence reckon the longitudes of their places.

The astronomers in their calculations usually chuse the *meridian* of the place where their observations are made, for their first *meridian*; as Ptolemy at Alexandria; Tycho Brahe at Uranibourg; Riccioli at Bologna; Mr. Flamsteed at the royal observatory at Greenwich; the French at the observatory at Paris. See OBSERVATORY.

In the *Philosophical Transactions*, there is a suggestion, that the *meridians* vary, in time.—This seems very probable, from the old *meridian-line* in the church of St. Petronio at Bologna, which is found to vary no less than eight degrees from the true *meridian* of the place at this time; and from that of Tycho at Uranibourg, which M. Picart observes, varies eighteen minutes from the modern *meridian*. If there be any thing of truth in this hint, Dr. Wallis says, the change must arise from a change of the terrestrial poles, (here on earth, of the earth's diurnal motion) not of their pointing to this or that of the fixed stars: For if the poles of the diurnal motion remain fixed to the same place on the earth, the *meridians* which pass through these poles must remain the same.

But the notion of the changes of the *meridian* seems overthrown by an observation of M. Chazelles, of the French Academy of Sciences, who, when in Egypt, found that the four sides of a pyramid built three thousand years ago, still looked very exactly to the four cardinal points. A position which can never be looked upon as fortuitous!

MERIDIAN of a globe, or sphere, is the brazen circle, in which the globe hangs and turns. See GLOBE.

It is divided into four nineties, or three hundred and sixty degrees,

grees, beginning at the equinoctial: On it, each way, from the equinoctial, on the celestial globes, is counted the south and north declination of the sun or stars: And on the terrestrial globe, the latitude of places north or south. There are two points on this circle called the *poles*: and a diameter continued from thence through the centre of either globe, is called the *axis*, of the earth or heavens, on which they are supposed to turn round. See *POLE*, and *AXIS*.

On the terrestrial globes there are usually thirty-six *meridians* drawn; one through every tenth degree of the equator, or through every tenth degree of longitude.

The uses of this circle are, to set the globes to any particular latitude; to shew the sun's or a star's declination, right ascension, greatest latitude, &c. See *GLOBE*.

**MERIDIAN line**, an arch, or part, of the meridian of a place; terminated, each way, by the horizon.

Or, a *meridian line* is the intersection of the plane of the meridian of the place, with the plane of the horizon; vulgarly called a *north and south line*, because its direction is from one pole towards the other. See *MERIDIAN*.

The use of a *meridian line* in astronomy, geography, dialling, &c. is very great; and on its exactness all depends: Whence infinite pains have been taken by divers astronomers to have it to the last precision.—M. Cassini has distinguished himself by a *meridian line* drawn on the pavement in the church of St. Petronio at Bologna, the largest and most accurate in the world. In the roof of the church, a thousand inches above the pavement, is a little hole, through which the sun's image, when in the *meridian*, falling upon the *line*, marks his progress all the year. When finished, M. Cassini, by a public writing, informed the mathematicians of Europe, of a new oracle of Apollo, or the sun established in a temple, which might be consulted with entire confidence as to all difficulties in astronomy. See *SOLSTICE*, and *GNOMON*.

**To draw a MERIDIAN line**.—Knowing the south quarter pretty nearly, observe the latitude FE (*Tab. Astronomy*, fig. 8.) of some star on the eastern side thereof not far from the *meridian* HZRN. Then keeping the quadrant firm on its axis, so as the plummet may still cut the same degree, only directing it to the western side of the *meridian*, wait till you find the star has the same altitude as before, *fe*. Lastly, Bisect the angle ECE formed by the intersection of the two planes wherein the quadrant is placed at the time of the two observations, by the right line HR. This HR is a *meridian line*.

Or thus; On a horizontal plane, from the same centre C, (*Fig. 9.*) describe several arches of circles BA, *ba*, &c. And on the same centre C, erect a style or gnomon perpendicular to the plain ACB, a foot, or half a foot long. About the twenty-first of June, between the hours of nine and eleven in the morning, and between one and three after noon, observe the points, B, *b*, &c. A, *a*, wherein the shadow of the style terminates. Bisect the arches AB, *ab*, &c. in D, *d*, &c. If then the same right line DE bisect all the arches AB, *ab*, &c. it will be the *meridian line* sought.

In regard the extremity of the shadow is somewhat hard to determine, it is best to have the style flat a-top, and to drill a little hole, noting the lucid spot projected by it on the arches AB and *ab*, instead of the extremity of the shadow. Otherwise the circles may be made with yellow, instead of black, &c.

Several authors have invented particular instruments and methods for the describing of *meridian lines*, or rather for determining equal altitudes of the sun in the eastern and western parts of the heavens; as Mr. Grey, Mr. Derham, &c. in the *Philosophical Transactions*. But as the former of the methods above delivered, suffices for astronomical observations, and the latter for more ordinary occasions, we shall forbear to give any descriptions thereof.

From what has been shewn, it is evident that whenever the shadow of the style covers the *meridian line*, the centre of the sun is in the meridian; and therefore it is then noon.—And thence the use of a *meridian line* in adjusting the motion of clocks, &c. to the sun.

Hence also, if the *meridian line* be bisected by a right line OV, drawn perpendicularly through the point C; OV will be the intersection of the meridian, and first vertical; and, consequently, O will shew the east point, and V the west.

Lastly, if a style be erected perpendicularly in any other horizontal plane, and a signal be given when the shadow of the style covers the *meridian line* drawn in another plane, noting the apex or extremity of the shadow projected by the style, a line drawn from that point through that wherein the style is raised will be a *meridian line*. See *MERIDIAN altitude*.

**MERIDIAN line**, on a dial, is a right line arising from the intersection of the *meridian* of the place with the plane of the dial. See *DIAL*.

This is the line of twelve o'clock; and from hence the division of the hour-line begins.

**Magnetical MERIDIAN**, is a great circle passing through or by the magnetical poles; to which the magnetic needle, or needle of the mariners compass, if not otherwise hindered, conforms itself. See *MAGNET*, and *COMPASS*.

VOL. II. N°. XCVIII.

**MERIDIAN altitude** of the sun or stars, is their altitude when in the *meridian* of the place where they are observed. See *ALTITUDE*.

The *meridian altitude* may be defined an arch of a great circle perpendicular to the horizon, and comprehended between the horizon and the star then in the *meridian* of the place. See *SUN*, *STAR*, *PLANET*, &c.

**To take the MERIDIAN altitude of the stars**.—Astronomers make two principal kinds of observations of the stars; the one when they are in the *meridian*, and the other when in vertical circles. See *CELESTIAL observation*.

For *meridian observations*; there are two instruments principally used, the quadrant and gnomon. See *QUADRANT*, and *GNOMON*.

**To take the meridian altitude with a quadrant**; if the position of the *meridian* be known, and the plane of the astronomical quadrant be placed in the *meridian* line by means of the plumb-line suspended at the centre; the *meridian* altitudes of the stars, which are the principal observations whereon the whole art of astronomy is founded, may easily be determined.

The *meridian altitude* of a star may likewise be had by means of a pendulum clock, if the exact time of the star's passage by the *meridian* be known. Now, it must be observed, that stars have the same altitude for a minute before and after their passage by the *meridian*, if they be not in or near the zenith: But if they be, their altitudes must be taken every minute when they are near the *meridian*; and then their greatest altitudes will be the *meridian* altitudes sought.

As to the manner of observing, it is found very difficult to place the vane of the quadrant in the *meridian* exactly enough to take the *meridian altitude* of a star; for unless there be a convenient place, and a wall where the quadrant may be firmly fastened in the plane of the *meridian*, which is not easily had, we shall not have the true position of the *meridian* proper to observe the stars. It will be much easier therefore, on several accounts, to use the portable quadrant, by which the altitude of the star may be observed a little before its passage over the *meridian* every minute till its greatest altitude be found. Here though we have not the true position of the *meridian* by this means, yet we have the apparent *meridian* altitude of the star.

Though this method, in the general be very good, and free of any sensible error, yet in case a star passes by the *meridian* near the zenith, it proves somewhat defective: For in these kind of observations, the inconvenient situation of the observer; the variation of the star's azimuth several degrees in a little time; the alteration of the instrument, and the difficulty of replacing it vertically, will prevent the observations from being oftner than in every four minutes. But in each minute, the altitude varies about fifteen minutes of a degree, so that there will be the difference of a degree in the star's altitude between each observation. In such cases, therefore, it will be better to have the true position of the *meridian*, or the exact time wherein the star passes the *meridian*, in order either to place the instrument in the *meridian*, or to observe the altitude of the star the moment it passes the *meridian*.

**To find the MERIDIAN altitude of the sun**, &c.—by a *gnomon*, See *GNOMON*.—by other means, see *ALTITUDE*.

**MERIDIANI\***, in antiquity, is a name which the Romans gave to a kind of gladiators, who entered the arena about noon; after the *bestiarii*, who fought in the morning against beasts, had finished. See *GLADIATOR*.

\* They were thus called from *Meridies*, i. e. noon, the time when they exhibited their shews.

The *Meridiani* were a sort of artless combatants, who fought man with man, sword in hand: Hence Seneca takes occasion to observe, that the combats of the morning were full of humanity, compared with those which followed.

**MERIDIONAL distance**, in navigation, the same with *departure*, or easting and westing; being the difference of longitude between the *meridian*, under which the ship now is, and any other *meridian* she was under before. See *DEPARTURE*, and *LONGITUDE*.

**MERIDIONAL parts**, miles, or minutes, in navigation, are the parts by which the *meridians* in Mercator's chart do increase, as the parallels of latitude decrease. See *CHART*.

The co-sine of the latitude of any place being equal to the radius, or semi-diameter of that parallel, therefore in the true sea-chart, or nautical planisphere, this radius being the radius of the equinoctial, or whole sine of ninety degrees, the *meridional parts* at each degree of latitude must increase as the secants of the arch contained between that latitude and the equinoctial do decrease.

The tables therefore of *meridional parts* in books of navigation, are made by a continual addition of secants, calculated in some books (as in Sir Jonas Moor's tables) for every degree and minute of latitude; and these will serve, either to make or graduate a Mercator's chart, or to work the Mercator's sailing.

To use them, you must enter the table, with the degree of latitude at the head, and with the minute on the first column towards the left hand; and in the angle of meeting, you will have the *meridional parts*.

Having the latitudes of two places, to find the *meridional miles*,

or *minutes* between them: consider whether the places be, one under the equinoctial, and the other wide thereof; or the one on the one side the equinoctial, and the other on the other; or whether they both lie on the same side.

If one place lie under the equator, the *meridional minutes* next under the degree of latitude of the other place, is the *meridional* difference of latitude, or latitude enlarged.

If one be in north, and the other in south latitude; the *meridional minutes* corresponding to the two latitudes added together, give the *meridional minutes* between them.

Both places lying towards the same pole; subtract the *meridional parts* answering to the less latitude from those of the greater; the remainder gives the *meridional minutes*.

MERIT, in theology, is used to signify the moral goodness of the actions of men, and the reward due to them.

The Romish schoolmen distinguish two kinds of *merit* towards God: the one of *congruity*, the other of *condignity*.

MERIT of *congruity*, is, when there is no just proportion between the action, and the reward; but he who bestows the reward, supplies by his goodness or liberality what was wanting in the action.—Such is the *merit* of a son towards his father: but this is only *merit* in an improper sense.

MERIT of *condignity*, is, when there is an absolute equality, and a just estimation between the action, and the reward: as in the wages of a workman.

Those of the reformed religion disclaim all *merit of condignity* towards God: Even their best works do not merit any thing at his hands.—The doctrine of *condign merits* makes one of the great articles of controversy between the Romish and Reformed churches.

MERLON\*, in fortification, that part of the parapet which lies betwixt two embrasures. See PARAPET, and EMBRASURE.

\* The word comes from *merula*, or *merla*, which in the corrupt Latin was used for a battlement.

It is usually from eight to nine feet long on the side of the cannon, and six on the side of the field; about six feet high, and eighteen thick.

MERMAID, or MERMAN, a sea-creature frequently talked of, supposed half human, and half a fish. See MONSTER.

However naturalists may doubt of the reality of *mermen*, or *mermaids*, we have testimony enough to establish it. In the year 1187, as Larry informs us, such a monster was fished up in the county of Suffolk, and kept by the governor for six months. It bore so near a conformity with man, that nothing seemed wanting to it but speech. One day it took the opportunity of making its escape, and plunging into the sea, was never more heard of. *Hist. de Angleterre*, P. I. p. 403.

In the year 1430, after a huge tempest, which broke down the dykes in Holland, and made way for the sea into the meadows, &c. some girls of the town of Edam in West-Friesland, going in a boat to milk their cows, perceived a *mermaid* embarrassed in the mud, with a very little water. They took it into their boat, and brought it with them to Edam, dressed it in women's apparel, and taught it to spin. It fed like one of them, but could never be brought to offer at speech. Some time afterwards it was brought to Haerlem, where it lived for some years, though still shewing an inclination to the water. Parival relates, that they had given it some notion of a deity, and that it made its reverences very devoutly when ever it passed by a crucifix. *Delices de Hollande*.

In the year 1560, near the island of Manar, on the western coast of the island of Ceylon, some fishermen brought up at one draught of a net, seven *mermen* and *maids*; of which, several Jesuits, and among the rest, F. Hen. Henriques, and Dimas Bosquez, physician to the vice-roy of Goa, were witnesses. The physician, who examined them with a great deal of care, and made dissections thereof, asserts, that all the parts both internal and external, were found perfectly conformable to those of men. See the *Hist. de la compagnie de Jesus*, P. II. T. IV. N°. 276. where the relation is given at length.

We have another account well attested of a *merman*, near the great rock called Diamond, on the coast of Martinico. The persons who saw it, gave in a precise description of it before a notary. They affirmed that they saw it wipe its hand over its face, and even heard it blow its nose.

Another creature of the same species was caught in the Baltic in the year 1531, and sent as a present to Sigismund king of Poland, with whom it lived three days, and was seen by all the court. Another very young one was taken near Rocca de Sintra, as related by Damian Goes.

The king of Portugal and the grand master of the order of St. James, are said to have had a suit at law to determine which party these monsters belong to.

MERO *motu*. See the article EX *mero*.

MERSION. See IMMERSION, and EMERSION.

MERUIT.—*Quantum* MERUIT. See QUANTUM.

MESARÆUM, ΜΕΣΑΡΙΟΝ, in anatomy, the same with *mesenterium*. See MESENTERY.

MESARÆUM, is also used in a more restrained sense for a part, or division of the mesentery; being that fastened to the small guts. See MESENTERY.

That part of the mesentery which is fastened to the thick guts is called mesocolon. See MESOCOLON.

MESARAIC vessels, in the general sense, are the same with *mesenteric*. See MESENTERIC.

In common use, *mesaraic* is more frequently applied to the veins; and *mesenteric* to the arteries, of the mesentery.

MESENTERIC, or MESARAIC, an epithet given to two arteries arising from the descending aorta, and proceeding to the mesentery.

There is an upper, or superior *mesenteric*, which goes to the upper part of the mesentery; and a lower, or inferior *mesenteric*, which distributes itself through the lower part.—See *Tab. Anat. (Angeiol.) fig. 1. n. 43, 45*. See also ARTERY.

We have also a *mesenteric vein*, composed of an infinity of veins proceeding from the mesentery; which, with the vena splenica arising from the spleen, form the vena porta.

Anatomists also reckon a *mesenteric nerve*, which arises from the intercostal, and sends several branches to the mesentery. See NERVE.

MESENTERIC plexus, a plexus, or piece of net-work formed by the branches or ramifications of the par vagum.

The *plexus mesentericus magnus*, or great *mesenteric plexus*, is formed out of the concurrent branches of several other plexus's, and sends its nervous fibres through the whole mesentery along with the *mesaraic vessels*, which, with various circumlignations, they accompany to the intestines. See PLEXUS.

Omphalo-MESENTERIC. See the article OMPHALO-mesenteric.

MESENTERY\*, MESENTERIUM, or MESARÆUM, in anatomy, a fatty membranous body; thus called, as being placed in the middle of the intestines, which it connects to one another. See INTESTINES.

\* The word comes from the Greek μέσος, middle, and εντέρον, intestine, gut.

The *mesentery* is almost of a circular figure, with a narrow production, to which the end of the colon, and the beginning of the rectum, are tied.

It is about four fingers and a half in diameter: Its circumference, being full of plaits and foldings, is about three ells in length. The intestines are tied like a border on this circumference of the *mesentery*: There are three inches of the intestines thus fastened. See INTESTINES.

The *mesentery* itself is strongly tied to the three first vertebrae of the loins. It is composed of three laminæ; the inner, upon which the glands and fat lie, and the veins and arteries run, is its own proper membrane; and the other two, which cover each side of the proper membrane, come from the peritonæum. Between the two external laminæ of the *mesentery*, run the branches of the arteria mesenterica, superior and inferior, which bring the blood to the intestines; and the venæ mesaraicæ, which being branches of the porta, carry the blood back to the liver. Here the large branches of both arteries and veins communicating with one another, march directly to the guts; where, with the nerves from the plexus mesentericus, they divide into an infinite number of small branches, which spread themselves extremely finely upon the coats of the intestines. The venæ lactææ, and lymphatic vessels, run likewise upon the *mesentery*, in which there are also several vesicular glands; the biggest of which in the middle of the *mesentery*, is called *pancreas asellii*; these glands receive the lymph and chyle from the lacteal veins. See PANCREAS and LACTEAL.

The *mesentery* has been ordinarily divided into two parts, the mesaræum, and mesocolon. The first appended to the intestina tenuia; and the latter to the crassa.—But this is a division of no great moment.

The use of the *mesentery*, is, first, to gather the intestines into a narrow compass, that the course of the chyloferous vessels towards their common receptacle may be but short; to cover and protect them and the blood-vessels; and to connect and dispose the intestines, so as to secure them from any entanglement that might hinder their peristaltic motion.

MESN\*, or MEASNE, a term in law signifying him who is lord of a manor, and so hath tenants holding of him; yet he himself holds of a superior lord. See LORD.

\* The word is properly derived from *maïne*, quasi minor natus, because his tenure is derived from another, for whom he holds.

MESN, also denotes a writ, which lieth where there is a lord *mesn* and tenant; and the tenant is distrained for services due from the *mesn* to the superior lord.

MESOCOLON, ΜΕΣΟΚΟΛΟΝ, in anatomy, that part of the mesentery connected to the great guts, especially the colon. See MESENTERY.

The *mesocolon* lies in the midst of the colon, to which it is joined. Its lower part sticks to a part of the rectum.

MESOLABE, MESOLABIUM, a mathematical instrument invented by the ancients for finding two mean proportionals mechanically, which they could not come at geometrically. See PROPORTIONAL.

It consists of three parallelograms moving in a groove to certain intersections. Its figure is described by Eutochius in his commentary on Archimedes.

MESO-LOGARITHM, a term used by Kepler to signify the logarithms of the co-fines, and co-tangents: The former of which my lord Neper calls *anti-logarithms*, and the latter *differentials*.

## M E S

These are also called *artificial signs and tangents*. See LOGARITHM, CO-SINE, CO-TANGENT, ANTI-LOGARITHM, &c.

MESOPLEURII\*, in anatomy, the intercostal muscles. See INTERCOSTAL.

\* The word is derived from *μεσος*, *medius*, middle; and *πλευρον*, *costa*, rib.

MESO-PLEURII, is sometimes also used for the intermediate spaces between the costæ, or ribs. See RIBS.

MESSE, or MASS, MISSA. See MASS.

MESSENGERS, in the English polity, are carriers of letters and messages; more particularly, certain officers chiefly employed under the direction of the secretaries of state; always in readiness to be sent with all manner of dispatches, foreign, and domestic. See SECRETARY of state.

They are also employed, with the secretaries warrants, to take up persons for high treason, or other offences against the state, which do not so properly fall under the cognizance of the common law, and perhaps, are not proper to be divulged in the ordinary course of justice.

The prisoners they apprehend are usually kept at their own houses, for which they are allowed by the government 6 s. 8 d. per day. When they are dispatched abroad, they have an allowance for their journey, as stated, viz. to Paris 30 l. to Holland 25 l. to Edinburgh 30 l. to Ireland 30 l. and so to other places in proportion. Part of which money is advanced to them for their journey.

They wait twenty at a time, monthly, distributed as follows, viz. four at court, five at one secretary's office, five at the other, and two at the third office for North Britain, three at the council-office, and one at the lord chamberlain's of the household. Their posts, if purchased, are esteemed worth 300 l. Their standing salary is 45 l. per annum.

MESSENGERS of the exchequer, are officers attending the exchequer, in the nature of pursuivants. They are four in number. Their business is to attend the lord treasurer, carry his letters, precepts, &c.

MESSANGER of the press, a person who by order of the court searches printing-houses, booksellers shops, &c. in order to discover seditious books, &c.

MESSIAH\*, a term signifying anointed or facted; and in that sense applied to kings and priests: but, by way of eminence, to Jesus Christ, the Saviour promised by the prophets of the old law. See CHRIST.

\* The word comes from the Hebrew, *maschuach*, anointed, of the verb *masbach*, to anoint: whence Jesus Christ claims the title on a manifold account: 1°. As having been anointed king of kings from all ages. 2°. As chief of the prophets. 3°. As high-priest of the law of grace, or priest for ever after the order of Melchizedek.

The son of God is variously denominated according to his various qualities and attributes. He is called the *word*, as being the eternal son of the father, and consubstantial with him: *Christ*, *Χριστος*, a Greek term, signifying anointed, of the same import with the Hebrew *Messiah*; *Jesus*, i. e. saviour, of the Hebrew, *Jehoshua*, by reason he saves his people from their sins.—In effect, he is called *word*, as being the son of God; *Jesus*, as man; *Christ*, as being anointed; and *Messiah*, as being both God and man.

The Jews still wait for the coming of the *Messiah*; being infatuated with the notion of a temporal *Messiah* that is to be a mighty conqueror, and to subdue all the world. See PROPHECY, &c.

Jesus Christ asserts himself the *Messiah*. In St. John, iv. 25. the Samaritan woman says to Jesus, *I know that when Messiah comes, (who is called the Christ) he will tell us all things.* Jesus answered her, *I that speak to thee, am he.*

There are several impostors who have endeavoured to pass for *Messiahs*. J. Lent, a Dutchman, has written a history of false *Messiahs*: *De pseudomessias*. The first he mentions was one Barcochab, who appeared under the empire of Adrian. The last is rabbi Mordecai, who began to be talked of in 1682. A little before him, viz. in 1666, appeared Sabbethai Sebi, who was taken by the Turks, and turned Mahometan.

MESSIEURS, a French title of honour, or civility, lately introduced into our language; being the plural of *monsieur*, and equivalent to the English, *sirs*. See MONSIEUR, SIRE, &c. The French lawyers always begin their pleadings, and harangues with *messieurs*; which word is also frequently repeated in the course of their speeches; on which occasion it answers to our English word, *gentlemen*.

The French say, *Messieurs du parlement*; *du conseil*; *des comptes*, &c.

MESSUAGE, MESSUAGIUM, in law, a dwelling-house with some land adjoining, assigned for its use.

By the name of *messuage* may a garden, shop, mill, cottage, chamber, cellar, or the like, pass.

In Scotland, MESSUAGE, denotes what we call the *manor-house*; viz. the principal dwelling-house within any barony. See MANOR, MANSION, &c.

MESYMNIMUM, a name which the ancients give to a part of

## M E T

their tragedy; or to certain verses in their tragedies. See TRAGEDY.

The *mesymnium* was a kind of burden, as *Io Pæan*; *O Dithyrambe*; *Hymen*, *O Hymenæe*, or the like; which when placed at the end of a strophe, was called *epymnium*; and when inserted in the middle of a strophe, *mesymnium*. See STROPHE, and CHORUS.

METACARPUS\*, or METACARPIUM, in anatomy, that part of the hand between the wrist and the fingers.—See Tab. Anat. (Osteol.) fig. 3. n. 10. fig. 7. n. 13. See also HAND.

\* The word comes from the Greek *μετα*, *post*, behind; and *καρπος*, *manus*, hand. See CARPUS.

The *metacarpus* consists of four bones, which answer to the four fingers; whereof that which sustains the fore-finger is the biggest and longest. They are all round and long, a little convex towards the back of the hand, and concave and plain towards the palm: They are hollow in the middle, and full of marrow; they touch one another only at their extremities, leaving spaces in their middle, in which lie the muscoli interossei. See INTEROSSEI.

In their upper end there is a sinus, which receives the bones of the wrist; their lower extremity is round, and is received into the sinus of the first bones of the fingers. See FINGER. The inner part of the *metacarpus* is called the *palm*, and the outer the *back of the hand*. See PALM, &c.

METACHRONISM, in chronology, an error in computation of time, either on the side of defect, or excess. See CHRONOLOGY, ANACHRONISM, &c.

METACISM, METACISMUS, in grammar, a defect in the pronunciation of the letter *M*.

Isidore represents the *metacism* as a final *m*, followed by a vowel; as *bonum aurum*, *Beiblehem erat*, &c.

METACONDYLI, is used by some authors for the outmost bones, or joints of the fingers, next the nails. See FINGER, and CONDYLUS.

METAL, METALLON, in natural history, a simple, ponderous, shining, fixt, fossil body, that fuses, and becomes fluid, by fire, and by cold coagulates and hardens into a solid mass, capable of being distended under the hammer. See FOSSIL.

*Metal* is said to be *simple*, as it may be affirmed of every the minutest particle of a *metal*, e. gr. a grain of gold, that it is gold, or has all the properties of gold. See GOLD.—*Fusible* by fire, that is, when exposed to a great fire, it dissolves into parts which are easily moveable among themselves, or are in actual motion. See FUSION.—*Fixt*, i. e. bearing the fire without flying off in vapours: Though it is only to a certain degree that *metals* are fixt; for by the large burning-glasses of Mess. Tschirnhausen and Vilette, all *metals* are found to evaporate. See FIXITY, VOLATILITY, BURNING-glass, &c.

Such is the proper idea of *metals*, which is not applicable to any other body in nature: for a diamond, or other stone, though a simple body, is not fusible in the fire, nor capable of being stretched under the hammer. See DIAMOND. And salt, though dissolvable by fire, is not malleable, but breaks under the hammer. See SALT, &c.

There are indeed certain woods which yield in some measure to the hammer; but then they fall to dust in the fire: and so of the rest. See MALLEABLE, &c.

We find but six *metals* in all nature, viz. gold, lead, silver, copper, iron, and tin. See the nature, characters, production, uses, &c. of each, under its proper article; GOLD, LEAD, SILVER, COPPER, IRON, and TIN.

To these a seventh *metal* is usually added, viz. mercury, or quick-silver; but improper, as it has not all the characters of a *metal*, nor scarce any thing in common with the other *metals*, except weight and similarity of parts. See MERCURY, &c.

Thus it is neither dissolvable by fire, malleable, nor fixt: In effect, it seems to constitute a peculiar class of fossils, and is rather the mother, or basis of all *metals*, than a *metal* itself.—However, it is usually reckoned among them, and as it wants nothing to render it a *metal*, but an additional sulphur to fix and connect its parts together, it may without any great harm be considered under that class.

The common radical character of *metals* is, that of all known bodies, they are the heaviest. By Dr. Halley's experiments, the weight of gold to that of glass is determined to be as 9 to 1; and the weight of tin, the lightest of all *metals*, to that of gold, as 7 to 19; which considerably surpasses the weight of all stones, marbles, gems and other the most solid bodies, as appears from the tables of specific gravities. Nor is there any body in nature but a *metal*, that is one third of the weight of gold. See SPECIFIC gravity.

The Royal Society furnish us with various experiments of this kind. The weights of the several *metals*, and other solids, they have examined hydrostatically, by weighing them in air and in water: and the weights of the fluids by weighing an equal portion of each. By such experiments they find, that taking the same weights of water and gold, the bulk or magnitude of the former is to the latter as 19636 to 1000; consequently that the weight of gold is to water nearly as 19 to 1.

The

# M E T

The specific weight of the several *metals* by this means determined, stands thus :

Gold	19636	Iron	7852
Quicksilver	14019	Tin	7321
Lead	11345	Granate	3978
Silver	10535	Water	1000
Copper	8843	Air	17

The cubic inch of	Ounces.	Drams.	Grains.
Gold	12	2	52
Quicksilver	8	6	8
Lead	7	3	30
Silver	6	5	28
Copper	5	6	36
Iron	5	1	24
Tin	4	6	17

As to the origin and formation of METALS, various are the sentiments of philosophers, ancient and modern.—M. Tournefort is of opinion, that *metals*, as well as all other minerals, have their origin from seeds, like plants; that they have vessels with juices circulating in them, &c. See STONE, and MINERAL.

Plato will have the cause of *metals* to be a humid vapour, inclosed in the bowels of the earth, which being variously intermixed with parts of the earth, produces various *metals*. Plo- tin maintains sulphur to be the father of *metals*; and an oleaginous viscous humour, the mother. Lidyat endeavours to prove all *metals* generated by a subterranean fire; urging, among other reasons, that many *metals*, when taken out of the earth, are exceedingly hot. Du Hamel shews, that *metals* do not take their rise either from any vapourous exhalation, or from water, or from earth; but are generated of mercury, sulphur, and salt. He adds, that *metals* take their matter and weight from the mercury, (See MERCURY) and their tincture and form from sulphur. See SULPHUR.

The same author owns the first rudiment of a *metal* to be a saline substance swimming in water, which is by little and little carried off. By how much the terrestrial parts are more exquisitely mixed with the aqueous or humid, by so much is the *metal* more heavy and firm, as having fewer and smaller pores. Hence its ductility: for its parts being extremely small, dense, and complicated, may be drawn out into a very spacious surface. On which account it is, that gold exceeds all other *metals* both in weight and ductility; hence also its fixity, its parts being too close and dense to be exhaled. The water defends the earth from being burnt, and the earth the water from flying off; neither forsakes the other, but each is bound in an undissolvable knot. The moisture gives ductility, the earth solidity. Where the mixture is less perfect, whether the earth or the water prevail, the *metal* will neither have so much weight, as having larger pores; nor will it bear the fire so well. For if the earth prevail, as in iron, or the water, as in lead; heat will set the one at liberty from the other; the moisture evaporates, and the earth is reduced into scoria, &c.

Dr. Woodward maintains, that all *metals* now found in the strata of the earth owe their present condition to the deluge; when, he also imagines, the strata of stone, earth, marble, &c. were formed. See DELUGE.

The *metallic* and mineral matter now found in the perpendicular intervals or fissures of the several strata, whereof the earth is composed, was, according to him, at the time of the deluge, lodged in the bodies of those strata; and brought thence, and transmitted into these intervals since that time; the intervals themselves not existing, till the strata were formed and broke again, to let the water from the earth. See STRATA.

Now the water, which, he imagines, is constantly ascending from the abyss (See ABYSS) towards the surface of the earth, continually pervading the strata, detaches out of their pores and interstices such *metallic* and mineral corpuscles as it finds loose in its way, carrying them along with it to the perpendicular intervals, where having a freer passage than before, it deserts them, and leaves them in those intervals. And this he takes to be the way in which all *metals* now found in those places, were brought thither, and still grow.

Those in the strata, however, he observes, do not nor can grow; but, on the contrary, are continually lessened and diminished, by so much as has been conveyed into the perpendicular intervals, and brought forth of the surface of the earth by springs and exhalations from the abyss, &c. See FOSSIL.

The same ingenious author complains of the great uncertainty and inconstancy in the mineral and *metallic* kingdom; neither colour, figure, nor situation in the earth, being to be depended on, so as to make any positive judgment from them.—A pyrites or marcasite, for instance, shall have the colour and brightness of gold or silver, and yet afford nothing but a little vitriol and sulphur; while a pebble in appearance shall have a mixture of a valuable *metal* in it. It is common too, to find the same *metal* shot into a great number of different forms, as well as to find different kinds of *metal* of the same form. And as to their place in the earth, there is the same uncertainty; being sometimes found in the perpendicular fissures or intervals of the strata sometimes interspersed in the bodies of the strata, and sometimes

# M E T

in both. The same *metals* are also placed indifferently in all kind of terrestrial matter, or in strata of very different natures. They are frequently intermixed with each other, so that it is a rare thing to find any of them pure and simple; but copper and iron shall be in the same mass, gold and copper, silver and lead, tin and lead; nay, sometimes all six together in the same lump. See MINERAL.

The French chymists have been very curious in their inquiries into the nature and production of *metals*.—M. Geoffroy, from a mixture of sulphur with a vitriolic salt, and an argillous earth, brought an iron, which he maintained to be a new production, or a composition resulting from the assemblage of certain principles which existed separately in the ingredients that formed the *metal*; in a word, that it was an artificial iron. And observing that there were parcels of this *metal* in the coloured ashes of plants, and of most other inflammable substances, he concluded that it might be formed there also by the union of the same three principles.

This was opposed by M. Lemery the younger, who maintained that the iron contained in the ashes of plants, was not formed there by calcination, but was really existent in the plants themselves; being raised in their vessels along with the juices of the earth; and further, that all the ingredients whereof M. Geoffroy's artificial iron was formed, do really contain iron in themselves, either in smaller or larger quantities: Not the argilla only, where the iron is easily discovered by an animated knife; nor the oil of vitriol, which is drawn from a mineral the ground whereof is iron; but also linseed-oil, whereof Mr. Geoffroy's sulphur was made; and even that of turpentine, sweet almonds, &c. relating withal the operations whereby each of those oils may be reduced to an earth wherein is iron.

To this it was answered, that in what manner soever iron be procured from the several ingredients separately, there will be still found infinitely less in them, than when mixed; and that of consequence the mixture produces iron. That as for oils, it is evident they are not simple substances, but are composed of an earth, an acid, and a sulphurous or inflammable part; which are the three precise principles required for the formation of iron: so that, according to all appearances, it is of an assemblage of those sulphurs, salts, and earth in the oil, that the iron is formed by calcination; and therefore that the means used to the iron in the ingredients, are the very same with those by which it is composed.

Hence it appears, that vegetable matters contain the principles of minerals. But M. Geoffroy goes further: and to support his doctrine of the production of *metals*, undertakes to prove, that the principles of vegetables, and those of minerals, are essentially the same; and that one may readily, and with ease, decompose minerals, by separating their principles, and compound them again, by substituting principles taken from vegetables in lieu of those taken away.

To clear this point, he examines and compares the principles of mineral and vegetable salts. The principal in the mineral class, are nitre, sea-salt, and vitriol: All which salts we find in plants. On the other hand, the essential salt of the parietaria is wholly nitrous, and melts on the coals like salt-petre. The fixt salts of the carduus benedictus, ablinthium, kali, &c. contain a great deal of sea-salt, which crystallizes in cubes, and precipitates on the coals. Add, that the greatest part of the fixt salts of plants calcined to a certain degree, yield a strong smell of sulphur, which can proceed from nothing but a vitriolic salt, rarefied and volatilized by the oil of the plant. By these salts we may be able to judge of all the other salts of plants; for the volatile salts are nothing else but fixed salts disengaged from the grossest part of their earth, and joined with parts of oil. See SALT.

Further, there is scarce any reason to doubt, that the acid juices drawn from vegetables are of the same nature with the mineral acids; with this only difference, that the acids of plants have been extremely rarefied by fermentation, united so closely with sulphurs, that it is not without a great deal of difficulty that they are separated.

Thus, distilled vinegar, which we make no scruple of ranking among the vitriolic acids; does only differ from spirit of sulphur, spirit of vitriol, or even the caustic oil of vitriol, in that the acids in the vinegar are diffused among a great deal of phlegm, and strongly united to a great deal of oil, which yet may be separated. By dissolving copper in the acid of vinegar, separated as much as possible from its oil, there are formed crystals, like in figure to those of blue vitriol. From all which it appears, that the salts of plants do not differ essentially from those of minerals.

For sulphurs, the inflammable or sulphurous principle is the same in vegetables as in minerals. And M. Geoffroy even shews, that the principle of inflammability in common sulphur, is the same with that which renders the fat of animals, the oils and resins of plants, and the bitumens of the earth, inflammable. To which he adds, that this same sulphurous principle is not only likewise found in metallic substances, but that it is this which gives them their fusibility, ductility, and metalline forms. Thus antimony, which is a substance approaching the nearest

of

of any to a *metal*, is little else but a burning sulphur. By exhaling this, it loses its *metallic* form, and turns to a kind of grey ashes, which being melted, instead of *metal* become glass. By melting this over again, and adding to it some inflammable matter, as tartar, it returns into a regulus.

As to the species of METALS, there are four which the chemists call *imperfect*, because their principles are not bound so fast together, but that the force of a common fire destroys them; these are iron, copper, lead, and tin; the others, which are proof against common fire, are gold and silver, called *perfect metals*.

In the four first it is easy to see the principle of inflammability: They become all fusible by the addition of salt-petre, either in a greater or less degree. Iron is that wherein this is the most visible; next, tin; then copper and lead.—But the principle is more conspicuous still, in the dust or small filings of the *metals*, let fall in the flame of a candle, than in the lump.

For gold and silver, the sulphurous principle is not so obvious. No heat but that of the sun collected into a focus, is able to decompose them. But no doubt they have the same principles with the other *metals*, though not so easily seen.—In gold, as well as in the imperfect *metals*, the basis is an earth capable of vitrification, as appears by the glass remaining after the calcination of gold in a burning-glass; and there is reason to believe, that the greatest part of what is exhaled in smoke during the operation, is the sulphurous principle mixed with salts.

As to silver, there is something in it extremely various. When purified with antimony, it vitrifies by the burning-glass; but if purified with lead, it leaves nothing behind it but grey ashes.—

The basis of this *metal* is doubtless an earth capable of vitrification; and what exhales in smoke, is apparently a mixture of sulphur, salts, and a little earth volatilized by the fire. See SULPHUR.

From all which, and many more observations of the same kind, M. Geoffroy ventures to draw the following conclusions. That the substances whereof *metals* are composed, do not differ essentially from those which compose vegetables.—That the imperfect *metals* are composed of a sulphur, vitriolic salt, and vitrifiable earth.—That this sulphurous principle is more or less strongly joined with the other principles; very strongly in gold and in silver, less in antimony, and very little in mineral sulphur.—That the principle of inflammability may be separated from *metallic* substances, either by culinary fire, or by the sun.—That the *metal* thus despoiled of its principle, is converted into ashes; and that these ashes, pursued farther with a violent fire, vitrify; and that such ashes or glasses, by the application of some inflammable matter, resume the *metallic* form they had lost.—That it is by this means linseed-oil turns argilla into iron.—

That if we knew all the other *metallic* earths, they might likewise be immediately converted into *metals*, by the projection of some inflammable matter.—That it is the saline and earthy parts found in oil of vitriol, that furnish the earthy vitrifiable part which makes the basis or ground of iron, and that it receives the *metallic* form from the sulphurous principle of the oil.—That the iron found in the ashes of plants, was produced there in the same manner: And, That it is a composition of the vitrifiable earth of the plants, the acid of those plants, and their oily or inflammable principle.

The same author, the better to ascertain the constituent parts of *metals*, made a great number of experiments on them with the duke of Orleans's large burning-glass; the result whereof falls in with, and confirms the doctrine laid down above.—From those experiments, he gathers, That the four *metals* which we call *imperfect*, viz. iron, copper, tin, and lead, are composed of a sulphur or oily substance, capable of burning, and a *metallic* earth, capable of vitrification.—That from this sulphur proceed the opacity, brightness, and malleability of a *metal*.—That this *metallic* sulphur does not appear at all different from the oil or sulphur of vegetables, or even animals; and that it is the same in mercury as in the four imperfect *metals*.—That these four *metals* have for their basis an earth susceptible of vitrification; that this earth is different in each of the four *metals*, in that it vitrifies differently in each; and that on this difference in vitrifying, depends the difference of *metals*. See VITRIFICATION.

The learned Boerhaave, after an accurate survey of the several *metals*, their characters, properties, preparations, uses, &c. draws the following corollaries concerning the general nature of *metals*. 1°. That which distinguishes *metals* from all other bodies, as well as from each other, is their heaviness: Though every *metal* has its peculiar weight; which no art is able to imitate, and which depends, as Helmont and the chemists express it, on the anatic homogeneity of their parts. Now, the later philosophers have proved, that all corporeal magnitude has just so much reality in it, as weight; and therefore if you have found the heaviness of any *metal*, you have at the same time found its corporeity. Sir Isaac Newton treating of gravity, and Huygens of the pendulum, shew that weight and reality are correspondent. See WEIGHT, and GRAVITY.

2°. The *metals* appear to be simple, yet are really compounds. Their component principles, according to the ancients, are sulphur and mercury; to which some of the moderns have added salt: but it is certain salt is no constituent part, or ingredient

Vol. II. No. 98.

of *metals*, but rather something external adhering to them. All *metals* consist of two parts, or principles; mercury as the basis or matter; and sulphur as the binder or cement: the first, the substratum, or *metallic* matter; and the second, that which renders it fixed and malleable. The mercury, it is to be noted, is the same with our quick-silver, only defæcate, and clear of any heterogeneous matter; whereas the common quick-silver is always mixed. As to the sulphur, it is not the vulgar fossil sulphur, but a peculiar sort of matter specifically denominated *sulphur of metals*, concluded by some of our latest, and best chemists, particularly M. Homberg, to be fire; which being mixed with the mercury, fixes it, and according to the different degrees of its union and cohesion therewith, produces different *metals*. See MERCURY, SULPHUR, FIRE, &c.

This doctrine of the composition of *metals* is confirmed by an experiment of Mr. Boyle, who after having retained mercury a long time in a moderate fire, took a piece of gold out of it, which it was apparent was not in the mercury before it was exposed to the fire. M. Homberg has an experiment to the same effect; from which he concludes, that gold consists of a sulphurous igneous part, and a heavy mercurial part fixed thereby; and that upon taking away the sulphurous or fiery part, the gold is converted into fluid mercury. See MERCURY.

3°. All *metals* must first be mercury, ere they be gold; and the thing superadded to common mercury, whereby it is prevented from becoming gold, is a sharp volatile body, which, when heated, becomes corrosive, and emits fumes; which are the properties of the fossil sulphur.

4°. If any *metal*, or other body, could be found, that only differed from gold in its wanting weight, it were impossible ever to make gold of it; and, on the contrary, if a body could be had that is as heavy as gold, all the other properties, as colour, fixity, ductility, &c. might easily be added. And hence the more knowing among the alchemists hold the primary matter of gold to be quick-silver; which, say they, is gold at heart, as coming nearest to gold in point of specific gravity. Only there is a corrosive body, i. e. sulphur, adhering to it, which, if it were separated, you would have gold; or if it were only inverted, silver.

And accordingly on such principles whoever would make gold out of any other foreign matter, must remember, that the more his matter differs from mercury in weight, &c. the less gold it will make. See PHILOSOPHER'S Stone.

5°. Therefore *metals* are transmutable into one another: for if mercury be the common matter of all *metals*, and if all the difference lie in the fixing spirit of sulphur, which, as it is less or more subtle or pure, constitutes this or that *metal*; it is no way improbable they should be transmuted by a purer fixing sulphur taking place of a corrosive one, and fixing the matter into a more perfect *metal*. See TRANSMUTATION.

6°. The purest *metals* result of the purest and most defæcate mercury, and the smallest quantity of the subtlest sulphur. Hence, mercury of gold is heavier than common mercury, and has always some impure part that is lighter than gold; and could that be taken away, and the fixing spirit be added, it would become heavier than gold.

7°. The imperfect *metals* consist of impure mercury and imperfect sulphur, with some other variable heterogeneous matter in it: This, fused by the fire, emits a fume which whitens copper, after which the sulphur exhales yet further. The reality of such a third matter is evinced hence, that all these baser *metals* are resolvable not only into mercury and sulphur, but also into scoria or fordes, which are lighter and more earthy than either of the other, and accordingly swim therein.

8°. Upon the whole it appears, that in the three nobler *metals*, gold, mercury, and silver, it is principally the greater or less proportion of the sulphur to the mercury, that determines them to be gold, mercury, or silver: That it is by this proportion those several *metals* are defined and denominated; and that from this difference of proportion, flow all the specific differences of colour, weight, fixity, ductility, volatility, fusibility, solubility, salubrity, &c.

9°. That in the other baser *metals*, besides this different proportion of the two principles, there intervenes another cause of diversity, viz. a third principle, or matter of an earthy kind, and very different from either of the rest; which adhering to the pure elemental sulphur, corrupts and adulterates, and variously modifies it: And from the different circumstances of this third principle, considered along with those of the sulphur itself, result the specific differences of the more imperfect *metals* as to weight, colour, &c.

Bath METAL, called also Princes METAL, is a kind of factitious *metal*, composed of the finest and purest brass mixed with tin, or rather with some mineral, as zinc; whereby it becomes more disposed to receive a polish, lustre, &c. as also fitter to be gilt. It is said to have been invented by prince Rupert, whence its name. See ZINC.

Bell METAL, is a composition of copper and tin melted together. See BELL.

The ordinary proportion is twenty-two or twenty-three pounds of tin to an hundred weight of copper.—Some add lead and brass to the composition. See BRASS.

**Blueing of METALS.** See the article BLUEING.

**Painting on METALS.** See the article PAINTING.

**Rust of METALS.** See the article RUST.

**Line of METALS.**—On Gunter's Sector, are sometimes two lines thus called, and noted with the characters of the seven metals, ☉, ♀, ♀, ♀, ♂, ♀, and ♀; their use is to give the proportions between the several *metals* as to their magnitudes and weights. See SECTOR.

**To be laid under METAL,** in gunnery, is when the mouth of a gun-lies lower than her breech.

**METAL,** in heraldry.—There are two *metals* used in heraldry, by way of colours, *viz.* gold and silver; in blazon, called *or*, and *argent*. See OR and ARGENT.

In the common painting of arms, these *metals* are represented by white and yellow, which are the natural colour of those *metals*. See COLOUR.

In engraving, gold is expressed by dotting the coat, &c. all over; silver, by leaving it quite blank.

It is a general rule in heraldry, never to place *metal* upon *metal*, nor colour on colour: So that if the field be one of the *metals*, the bearing must be of some colour, and *vice versa*; otherwise the arms are false: though this rule admits of some exceptions. See COLOUR.

**METALLIC,** or **METALLINE,** an adjective applied to something that bears a relation to *metals*. See METAL.

Painting in enamel is performed with *metallic* colours, that is, with such as come from *metals*, or are made with *metals*; no other being able to endure the fire. See ENAMEL.

F. Romani has published a *metallic* history of the popes. La France Metallique, is a Book of medals mostly imaginary, pretended to be taken from the cabinets of the curious, where they never were, by Jaques de Bie, engraver. M. Bizot has also published the *metallic* history of Holland.

**METALLIC mines.** See the article MINE.

**METALLIC vitriols.** See the article VITRIOL.

**METALLORUM crocus.** See the article CROCUS.

**Sulphur METALLORUM.** See the article SULPHUR.

**METALLURGIA,** the art of *metals*, that is, of preparing and working *metals*, from the glebe or mineral, to the utensil. See METAL.

The *metallurgia* includes what relates to the finding of the metallic glebe, or ore in the mine; the judging of its kind, richness, and the proportions of metal therein; the digging and separating it from the earth, and other matters; and the purifying and disposing it into a compleat, pure, malleable metal. See MINE, and MINERAL.

Boerhaave divides *metallurgia* into four parts. The first teaches how *metals* grow in the mine, how they are discovered, and how procured out of the same. The second how to separate the metallic from the other matter of the ore. The third, how to reduce the separated matter to its simplicity and ductility. The fourth, to work, gild, polish, and imitate the finer *metals* in the coarser.

**METAMORPHISTS,** a sect of heretics in the XVIth century, whose distinguishing tenet was, That the body of Jesus Christ was, upon his ascension into heaven, changed, and metamorphosed into God.

**METAMORPHOSIS\*,** *transformation*; the change of a person or thing into another form. See TRANSFORMATION.

\* The word is Greek, *Μεταμορφωσις*; formed of *μετα*, change, or removal from one place or state to another; and *μορφη*, form, figure.

The ancients held two kinds of *metamorphoses*: the one real, the other apparent. The *metamorphosis* of Jupiter into a bull, and of Minerva into an old woman, were only apparent. That of Lycaon into a wolf, and of Arachne into a spider, were of the real kind.

Most of the ancient *metamorphoses* include some allegorical meaning, relating either to physics or morality.—Ovid's *metamorphoses* is a collection of histories of such transformations, poetically related.—Some authors are of opinion, that a great part of the ancient philosophy is couched under them; and Dr. Hooke has made an attempt to unriddle, and lay open several of them.

**METAPHOR\*,** **METAPHORA,** in rhetoric, a figure of speech whereby a word is transferred from its proper signification, to another: or, whereby the proper denomination of one thing is applied to another; which other thing is more elegantly explained by this tralatitious or foreign name, than by that which naturally belongs to it. See TROPE.

\* The word comes from the Greek *μεταφορα*, translation, or displacing; of *μετα*, trans, and *φερω*, I bear, or carry.

As, when we say, the light of the understanding; to burn with zeal; to float between hope and despair, &c.

The *metaphor* is the most common of all the figures of speech; and is that usually meant when we say a thing is spoken figuratively. See FIGURE.

The *metaphor* is a short simile: an image being thereby called from its proper subject to give the resemblance of another. See SIMILE.—An allegory is no more than a continued *metaphor*. See ALLEGORY.

The sources or places whence *metaphors* are drawn, are innu-

merable: They may be fetched from divine matters; thus Cicero calls Plato our *God*, *deus ille noster Plato*. From the elements; as a *torrent* of eloquence. From plants; as where virtue has taken *root*. From artificial things; as where Appian is called the *cymbal* of the world; Longinus, a *living library*; Pertinax, fortune's *foot-ball*, &c.

Quintilian distinguishes *metaphors* into four kinds: The first, when a word is transferred from one animal to another; as when Livy says, that Cato used to *bark* at Scipio: or, when our Saviour calls Herod, *fox*. The second, when the word is transferred from one inanimate to another; as *bridle*, for *laws*. The third, when inanimates are applied to animates; as the *flower* of youth. And the last, when animates are applied to inanimates; as the river *disdained* its bounds.

As the *metaphor* is intended to set things before the eyes; it becomes so much the more perfect, as it shews them the more vividly, by representing them in motion and action. A *metaphor* should have nothing in it either coarse or shocking, or that may raise it above the simplicity of nature: Nor should it appear a *metaphor* to any but those who view it very closely. A *metaphor* should never be carried too far; for in that case, it degenerates into puerility.—*Metaphors* should always be followed in the same kind; they become unnatural, when different images are introduced.—In all *metaphorical* dictions, there should be a kind of unity, so that the different words used, may have a kind of suitableness to each other: Different ideas are always absurd: As in this instance; The church was besieged with a deluge of troubles: where the two images, *siege* and *deluge*, have no relation.

There is nothing young writers are more faulty in, than the indiscreet use of *metaphors*: Those who affect the marvellous, are eternally on the metaphorical strain; nor know any bounds, or restraint. They who understand them best, use them with the greatest reserve. Mr. Addison proposes it as a rule for writers, to imagine their *metaphors* actually painted before them, and to view and examine the justness of their application and assemblage under those circumstances; throwing every thing out of the writing, but what might be retained in the picture. Card. Perron prescribes this general rule for *metaphors*; that they must always descend from the genus to the species; and never go backwards from the species to the genus: Thus we say figuratively, the *bonds of society*; and not the *human cords* which tie us together: *Bond* being a genus, and *cord* a species.

**METAPHRAS**<sup>t</sup>, **METAPHRAS**<sup>tes</sup>, a translator, or person who renders an author into another form or another language, word for word. See TRANSLATION.

A *metaphrase*, *μεταφρασις*, usually signifies something more than either a paraphrase, or a translation: According to Baillet, a *metaphrase* implies a translator, glossator, and interpolator, all at once. See PARAPHRASE, &c.

**METAPHYSICS\*,** **METAPHYSICA,** *transnaturalis*; a branch of science, about whose nature and idea, there is some difference among authors. See SCIENCE.

\* The word is formed of the preposition *μετα*, *trans*, beyond, or above; and *Φυσις*, nature, or *Φυσικη*, natural.

Some define *metaphysics*, that part of science which considers spirits, and immaterial beings; which others chuse to distinguish by the name of *pneumatics*. See SPIRIT, and PNEUMATICS. Others, keeping closer to the etymology of the word, explain *metaphysics* by *trans-natural*, or *præter-natural*, or even *post-natural-philosophy*.

Others, with more propriety, conceive *metaphysics* to be what some others call *ontology*, or *ontosophy*, *i. e.* the doctrine *de ente*, or of being, *quatenus* being. See ONTOLOGY, and ABSTRACTION.

In the same view, some philosophers call this science by the name *philosophia*, or *scientia generalis*, as being the foundation, or, as it were, the *stamen* or root from whence all the other parts of philosophy arise, and wherein they all meet; its object being *being* in the abstract, or general, not restrained to this or that species of beings; not to spirit any more than body: So that the doctrines of *metaphysics*, are applicable to all beings whatever. See ENS.

Philosophers again, are divided as to the notion of a science *de ente* in general. Some hold it real, precise, and solid enough to be demonstrated; others judge it too obscure, faint, and confused to be admitted into philosophy.

Being, abstracted from every sort or species of being, is certainly a very vague term; and does not seem to give footing enough for a science: We do not see how it can affect the mind as an object. Add, that the common *metaphysics* cannot demonstrate any part of its subject, but assumes the whole: There are no principles, or axioms whereon to demonstrate *metaphysics*, which contain the principles of all other sciences. See MATHEMATICS.

The first who wrote professedly on the subject of *metaphysics* is Aristotle. Indeed he is the first who uses the word: *Μετα τα Φυσικα*, is the title of his books, which some of his commentators will have to signify no more than *after the books of physics*. M. du Hamel, taking the preposition *μετα* in the sense of *post*, is even of opinion that the word was coined by Aristotle's

Aristotle's followers; and that the word was unknown to Aristotle.

Aristotle's *metaphysics* seem to have been intended for a kind of natural theology. F. Malebranche and Mr. Locke have wrote much more clearly and consistently of *metaphysics*, than any of the ancients. See UNITY, MODE, TRUTH, DURATION, &c.

**METAPHYSICAL**, something belonging to *metaphysics*. See **METAPHYSICS**.

The word is also used to denote something subtle, abstract, and refined.—In which sense we say, such a reasoning; such a proof, is too *metaphysical*, &c.

A *metaphysical* case, is an imaginary or chimerical case, which can scarce ever happen, or not without much difficulty; and which ought not to be laid down as a rule for common occasions.

**METAPHYSICAL certitude**. See **CERTITUDE**.

**METAPHYSICAL distinction**. See **DISTINCTION**.

**METAPHYSICAL evidence**. See **EVIDENCE**.

**METAPHYSICAL form**. See **FORM**.

**METAPHYSICAL perfection**. See **PERFECTION**.

**METAPHYSICAL possible**. See **POSSIBLE**.

**METAPHYSICAL universality**. See **UNIVERSALITY**.

**METAPLASM**\*, **METAPLASMUS**, in grammar, a transmutation, or change made in a word, by adding, retrenching, or altering a letter or syllable thereof.

\* The word comes from the Greek μεταπλάσμος, which signifies the same; compounded of μετα and πλάσσω, *finger*.

**METASTASIS**, **METAΣΤΑΣΙΣ**, in medicine, the removal of a morbid humour from one part to another; frequently observed in nervous cases.

A *metastasis*, or translation, is sometimes also found in the grosser humours; the fluent blood taking up digested matter from one part, and disposing it upon another. See **FLUXION**.

**METATARSUS**\*, in anatomy, that part of the human skeleton, containing the middle of the foot.—See *Tab. Anat. (Osteol.) fig. 3. n. 30. fig. 7. lit. e. e.* See also **FOOT**.

\* The word comes from μετα, *trans*, beyond; and τάρσος. See **TARSUS**.

The *metatarsus* consists of five bones, reaching from the heel to the toes; whereof that which sustains the great toe, is the thickest: and that which sustains the next toe, the longest. The rest grow, each shorter than other. They are longer than the bones of the metacarpus; in other things they are like them, and are articulated to the toes, as these are to the fingers. See **METACARPUS**.

**METATHESIS**\*, *transposition*; a grammatical figure, whereby letters or syllables of a word are transposed, or shifted out of the natural situation.—as, *Evandre* for *Evander*; *I præ* for *præi*. See **TRANSPPOSITION**.

\* The word is Greek, μεταθεσις, formed of μετα, *trans*; and θεσις, *position*.

**METEMPSYCHI**, ancient heretics, who, in imitation of Pythagoras, held the *metempsychosis*, or transmigration of souls. See **METEMPSYCHOSIS**.

**METEMPSYCHOSIS**\*, **METEMΨΥΧΩΣΙΣ**, in the ancient philosophy, the passage or transmigration of the soul of a man, after death, into the body of some other animal. See **SOUL**.

\* The word is Greek, formed of μετα, *beyond*; and ἐμψυχω, *I animate, or enliven*.

Pythagoras and his followers held, That after death mens souls passed into other bodies, of this or that kind, according to the manner of life they had led. If they had been vicious, they were imprisoned in the bodies of miserable beasts, there to do penance for several ages; at the expiration whereof, they returned afresh to animate men.—If they had lived virtuously, some happier brute, or even a human creature, was to be their lot. See **PYTHAGOREANS**.

What led Pythagoras into this opinion, was, the persuasion he had, that the soul was not of a perishable nature: whence he concluded, that it must remove into some other body, upon its abandoning this. Lucan treats this doctrine as a kind of officious lye, contrived to mitigate the apprehension of death, by persuading men that they only changed their lodging; and ceased to live, to begin a new life.

Reuchlin denies this doctrine; and maintains, that the *metempsychosis* of Pythagoras implied nothing more than a similitude of manners, desires, and studies formerly existing in some person deceased, and now revived in another alive.—Thus, when it was said that Euphorbus was revived in Pythagoras, no more was meant than that the martial virtue, which had shone in Euphorbus at the time of the Trojan war, was now in some measure revived in Pythagoras, by reason of the great respect he bore the Athletæ. For those people wondering how a philosopher should be so much taken with men of the sword, he palliated the matter, by saying that the soul of Euphorbus, i. e. his genius, disposition and inclinations, were revived in him. And this gave occasion to the report that Euphorbus's soul, who perished in the Trojan war, had transmigrated into Pythagoras.

Ficinus asserts, That what Plato speaks of the migration of a human soul into a brute, is intended allegorically, and to be

understood only of the manners, affections, and habits degenerating into a beastly nature by vice.—Serranus, though he allows some force to this interpretation, yet inclines rather to understand the *metempsychosis* of a resurrection. See **RESURRECTION**.

Pythagoras is said to have borrowed the notion of a *metempsychosis* from the Egyptians, others say from the ancient Brachmans. It is still retained among the Banians and other idolaters of India and China; and makes the principal foundation of their religion. So extremely are they bigotted to it, that they not only forbear eating any thing that has life, but many of them even refuse to defend themselves from wild beasts. They burn no wood, lest some little animalcule should be in it; and are so very charitable, that they will redeem from the hands of strangers, any animals that they find ready to be killed. See **BRACHMANS**, **BANIAN**S, &c.

**METEMPTOSIS**\*, a term in chronology, expressing the solar equation, necessary to prevent the new moon from happening a day too late.

\* The word comes from the Greek, μετα, *post*, and πιπτω, *cado*, I fall.

By which it stands contra-distinguished from *proemptosis*, which signifies the lunar equation, necessary to prevent the new moon from happening a day too soon. See **PROEMPTOSIS**.

The new moons running a little backwards, that is, coming a day too soon at the end of three hundred and twelve years and a half; by the *proemptosis*, a day is added every three hundred years, and another every two thousand four hundred years: On the other hand, by the *metemptosis*, a bissextile is suppressed each one hundred thirty four years, that is, three times in four hundred years.—These alterations are never made, but at the end of each century; that period being very remarkable, and rendering the practice of the calendar easy.

There are three rules for making this addition, or suppression of the bissextile-day, and by consequence for changing the index of the epacts. 1°. When there is a *metemptosis* without a *proemptosis*, the next following, or lower index, must be taken. 2°. When there is a *proemptosis* without a *metemptosis*, the next preceding, or superior index, is to be taken. 3°. When there is both a *metemptosis* and a *proemptosis*, or when there is neither the one nor the other, the same index is preserved. Thus in 1600 we had D; in 1700, by reason of the *metemptosis*, C was taken; in 1800 there will be both a *proemptosis* and a *metemptosis*; so the same index will be retained. In 1900 there will be a *metemptosis* again, when B will be taken, which will be preserved in 2000; because there will then be neither the one nor the other.—This is as far as we shall need it. Clavius has calculated a cycle of 301800 years; at the end of which period, the same indices return in the same order. See **EPACT**.

**METEOR**\*, in physiology, a changeable, moveable, imperfect mixt body, or resemblance of a body, appearing in the atmosphere, and formed out of the matter of the common elements, altered a little by the action of the heavenly bodies, but not transformed.

\* The Greeks call them μετεωρα, q. d. *sublimia*, or high-raised; the Latins *impressiones*, as making signs or impressions in the air.

*Meteors* are of three kinds:

**Igneous** or **fiery METEORS**, consist of a flat sulphurous smoke set on fire; such are lightning, thunder, ignis fatuus, draco volans, falling stars, and other fiery phenomena appearing in the air. See **THUNDER**, **FATUUS**, &c.

**Aerial** or **airy METEORS**, consist of flatulent and spirituous exhalations; such are winds, whirlwinds, and hurricanes. See **WIND**, **HURRICANE**, &c.

**Aqueous** or **watery METEORS**, are composed of vapours, or watery particles variously separated and condensed by heat and cold; such are clouds, rainbows, hail, snow, rain, dew, and the like. See **CLOUDS**, **RAINBOW**, **HAIL**, **SNOW**, **RAIN**, **DEW**, &c.

The formation of *meteors* is explained pretty largely by Des Cartes, in a treatise express. Aristotle and Gassendus have also handled the same subject. Dr. Woodward's opinion is, That the matter of *meteors* is in great measure of a mineral nature: That the mineral particles contained in the strata of the earth, are raised by the subterraneous heat, together with the vapours ascending from the abyss, and pervading those strata; especially at such times as the sun's heat is sufficient to penetrate the exterior parts of the earth, and to make room for their escape into the atmosphere. This sulphurous, nitrous, and other active, and volatile mineral particles, form various *meteors*, according to the various fate they meet with in the air. See **VAPOUR**, **EXHALATION**, **MINERAL**, **AIR**, &c.

**METEOROLOGY**, the doctrine of meteors; explaining their origin, formation, kinds, phenomena, &c. See **METEOR**.

**METEOROSCOPE**\*, a name which the ancient mathematicians gave to such instruments as they used for observing, and determining the distances, magnitudes and places of the heavenly bodies.

\* From the Greek μετεωροσκόπος, *high*; and σκοπος of σκοπεομαι, *I view, observe*.

**METHEGLIN\***, a drink prepared of honey; one of the most pleasant and general drinks the northern parts of Europe afford; and much used among the ancient inhabitants. See **DRINK**, **HONEY**, **MEAD**, &c.

\* The word is Welch, *meddyglin*, where it signifies the same.

There are divers ways of making it: One of the best whereof follows. Put as much live honey naturally running from the comb, into spring-water, as that when the honey is thoroughly dissolved, an egg will not sink to the bottom, but be just suspended in it: This liquor boil for an hour, or more, till such time as the egg swim above the liquor about the breadth of a groat; when very cool, next morning, it may be barrelled up; adding to each fifteen gallons and an ounce of ginger, as much of mace and of cloves, and half as much cinnamon, all grossly pounded: a spoonful of yeast may be also added at the bung-hole, to promote the fermenting. When it has done working, it may be closely stopped up, and after it has stood a month, may be drawn off into bottles.

**METHOD\***, **METHODUS**, the art, or rule of disposing things in such a manner, as they may be easily comprehended; either in order to discover the truth, which we ourselves are ignorant of; or to shew and demonstrate it to others when known. See **TRUTH** and **ERROR**.

\* The word comes from the Greek *μεθοδος*, which signifies the same.

The schools have a long time disputed, whether logic be an art, a science, or *method*? See **LOGIC**, **ART**, **SCIENCE**, &c.

Gallendus distributes *method* with regard to its object, into three kinds or branches; viz. inventionis, *the method of invention*, or discovering a truth unknown. See **INVENTION**.

*Methodus judicii*, the method of judging, or determining of a truth, or proposition proposed. See **JUDGMENT**.

And *methodus demonstrationis*, or method of demonstration; that is, of exhibiting it to another. See **DEMONSTRATION**.

*Method*, with regard to the order of procedure, is usually divided into two kinds; the one of *resolution*, which is that we generally use in our enquiry after truth.—The other of *composition*, by which the truth once found, is taught or imparted to others. See **COMPOSITION**, and **RESOLUTION**.

In the *method of resolution*, called also by geometers the *analytic method*, we proceed from some general, known truth, to others which belong to some particular or singular thing. See **ANALYSIS**.

In the *method of composition*, called also the *synthetic method*, we propose some certain, general truths, from which we produce particular truths. See **SYNTHESIS**.

If in the *method of resolution* we lay down any axioms; it is not immediately in the beginning, and all together; but as they are found necessary in the disquisition: on the contrary, in the *method of composition*, they are proposed all together in the beginning, before there is any absolute need of them. See **AXIOM**, and **MAXIM**.

The two *methods* differ from each other, as the *methods* of searching out a genealogy, either by descending from the ancestors to their posterity, or by ascending from the posterity to the ancestors: both of them have this in common, That their progression is from a thing known, to another unknown. Those things that are known, in each, are set in the front, or first place; that by them we may be able to arrive at those which are not known.

The following things are required in both *methods*, that error may be avoided.—1°. That no proposition be admitted as true, to which a man can, with a good conscience, deny his assent; or which is not evident. 2°. That the connection of the following proposition with the foregoing, in every step of the progression, be likewise evident or necessary. To these may be added two other prudential maxims, that hold good in each *method*: as, that we ought to reason on those things only, of which we have clear and perspicuous ideas; or of obscure things only, so far as we know them: and that we should always begin from the simple and easy, and dwell on them a while, before we proceed to things compounded, and more difficult.

*Laws peculiar to the analytic method*, are, 1°. That we must clearly and perfectly understand the state of the question proposed. 2°. That with some energy or effort of the mind, one or more intermediate ideas be discovered; which are to be a common measure or standard, by whose help the relations between the ideas to be compared are to be found out. 3°. That we cut off all that has no necessary relation to the truth sought after, from the thing which is to be the subject of our consideration. 4°. That a compounded question be divided into parts, and those separately considered in such order, as that we begin with those which consist of the more simple ideas, and never proceed to the more compounded, till we distinctly know the more simple, and by reflection have rendered them obvious to the understanding. 5°. That certain signs of our ideas, comprehended in obvious and established figures, or in the fewest words possible, be imprinted in the memory, or marked on paper, lest the mind have any further trouble about them. 6°. These things done, that the ideas (according to the second law) be then compared with each other,

either by reflection alone, or by express words. 7°. If after we have compared all the ideas, we cannot find out what we seek, we are then, by the third law, to cut off all the propositions, which, after a full examination, we find of no use to the solution of the question, and begin afresh. If, after this method has been repeated as often as is necessary, nothing of what we have observed seems to conduce to the solution of the question, we ought to give it over as out of our reach.

The *synthetic method* is only practicable in things, whose principles we perfectly know; as in geometry, which is wholly employed in the consideration of abstract modes; of which our mind has clear and adequate ideas.—When the enquiry is into substances, as in physics, we cannot make use of the *method of composition*, by reason their kinds, and intimate essences are unknown to us. See **SUBSTANCE**, **BODY**, &c.

This *method* has not been by any so justly and accurately observed, as by the mathematicians, whose principles are perfectly known: its laws therefore will be best drawn from their practice. As 1°. To offer nothing but what is couched in words or terms perfectly understood; for which reason they always define the words they make use of. 2°. To build only on evident and clear principles, such as cannot be contradicted by any who understand them; for which reason they first propound their maxims or axioms, which they demand to be granted them, as being self-evident, and needing no proof. 3°. To prove demonstratively all their consequences; for which reason they use nothing in their arguments or proofs, but definitions that have been laid down, axioms that have been granted, and propositions that have been already proved; which become principles to things that follow them.

**METHOD**, *methodus*, is more peculiarly used in mathematics for divers particular processes for solving problems.—In this sense we say

**METHOD of exhaustions**. See **EXHAUSTIONS**.

**METHOD of fluxions**. See the article **FLUXIONS**.

**METHOD de maximis & minimis**, &c. See **MAXIMUM**.

**METHOD of tangents**. See the article **TANGENTS**.

**Differential METHOD**, &c. See **DIFFERENTIAL**.

**Exponential METHOD**, &c. See **EXPONENTIAL**.

**Poristic METHOD**. See the article **PORISTIC**.

**METHODISTS**, **METHODICI**, a sect of ancient physicians, who reduced the whole healing art to a few common principles or appearances. See **PHYSICIAN**.

The *methodists* were the followers of Theffalus, whence they were also called *Theffalici*.—They were strenuously opposed by Galen in several of his writings; who scrupled not to assert, that the *methodical heresy* ruined every thing that was good in the art.

Quincy mistakenly uses *methodists*, *methodici*, for those physicians who adhere to the doctrine of Galen, and the schools; and who cure with bleedings, purges, &c. duly applied according to the symptoms, circumstances, &c. in opposition to empirics and chymists, who use violent medicines, and pretended secrets or nostrums. See **EMPIRIC**, **CHYMI**, &c.

**METOCHÉ**, **METOXH**, in the ancient architecture, a term used by Vitruvius, to signify the space or interval between the dentils.—See *Tab. Archit. fig. 30. litt. c. c.* See also **DENTICLE**. Baldus observes, that in an ancient MS. copy of that author, the word *metatome* is found for *metoche*. Hence Daviler takes occasion to suspect that the common text of Vitruvius is corrupted; and concludes, that it should not be *metoche*, but *metatome*, q. d. section.

**METONIC cycle**, in chronology, the lunar cycle, or period of nineteen years; thus called from its inventor Meton, an ancient Athenian. See **CYCLE** and **PERIOD**.

When the *metonic cycle* is completed, the lunations, or the new and full moons, return on the same day of the month; so that on whatever days the new and full moons happen this year, nineteen years hence they will fall precisely on the very same day of the month, as Meton and the primitive fathers thought. See **LUNATION**.

For this reason, at the time of the council of Nice, when the manner of settling the time for observing Easter was established, the numbers of the *metonic cycle* were inserted in the calendar in letters of gold, on account of their great use; and the year of the cycle for that year was called the *golden number* of that year. See **GOLDEN NUMBER**.

**METONYMY\***, **METONYMIA**, a rhetorical trope, consisting in a transmutation, or change of names; or a putting of the effect for the cause, or the subject for the adjunct: and *vice versa*. See **FIGURE**.

\* The word comes from the Greek *μετα*, *trans*, and *ονομα*, *nomen*, *name*.

The *metonymy* is the most extensive of all the tropes. It is sometimes also called *transnominatio*, and differs not much from hypallage. See **HYPALLAGE**.

There are four kinds of *metonymies* in principal use: The first, when we put the inventor for the thing invented: as Bacchus for wine, Ceres for bread. The second, when we put the containing for the thing contained; as a glass for the wine within it. The third, when an effect is put for the cause; as the captain for his soldiers, Greece for the Greeks, the author for

for his works. The fourth, when the sign is put for the thing signified; as the gown for the priesthood, &c.

**METOPE**\*, or **ΜΕΤΟΠΑ**, in architecture, the square space or interval between the triglyphs, in the Doric frieze.—See *Tab. Archit. fig. 28. lit. R.* See also **TRIGLYPH**, and **FRIEZE**.

\* The word, in the original Greek, signifies the distance between one aperture or hole and another, or between one triglyph and another; the triglyphs being supposed to be solives or joists that fill the apertures: from *μετα*, *inter*, between, and *ων*, *foramen*.

The ancients used to adorn these parts with carved works, or paintings, representing the heads of oxen, vessels, basons, and other utensils of the heathen sacrifices.

As there is found some difficulty in disposing the triglyphs and metopes in that just symmetry which the Doric order requires; some architects make it a rule, never to use this order but in temples.

**Semi-METOPE** is a space somewhat less than half a metope, in the corner of a Doric frieze.

**METOPOSCOPY**\*, **ΜΕΤΩΠΟΣΚΟΠΙΑ**, the art of discovering the temperament, inclinations, and manners of persons by inspecting their features, and the lines in their faces, and especially of their foreheads. See **DIVINATION**.

\* The word comes from the Greek, *μετωπον*, *frons*, forehead; and *σκοπια*, inspection, of *σκοπεσθαι*, I view.

**Metoposcopy** is no more than a branch of physiognomy; the latter taking its conjectures from all parts of the body: But both the body, and the branch are extremely precarious, not to say vain. See **PHYSIOGNOMY**.

Ciro Spontoni, who has wrote on the subject of **metoposcopy**, observes, that there are seven principal lines considered in the forehead; each of which has its peculiar planet. The first is the line of Saturn; the second of Jupiter, &c.

**METRE**, or **METER**, **ΜΕΤΡΟΝ**, in poetry, denotes a system of feet of a just length. See **FOOT**, **VERSE**, and **MEASURE**. Aristides defines **metre**, a system of feet composed of dissimilar syllables, of a just extent.

In which sense **metre** amounts to much the same with genus carminis, or sort of verse, and differs from rhythm. See **VERSE**, and **RHYTHM**.

**METRICAL verses** are those consisting of a determinate number of long, and short syllables; as those of the Greek and Latin poets. See **QUANTITY**.

Capellus observes, that the genius of the Hebrew language is incompatible with **metrical** poetry. See **HEBREW**, **POETRY**, **VERSIFICATION**, &c.

**METRICE**, or **METRICA**, among the ancients, was that part of poetry employed about the quantities of syllables, feet, sorts of metre or verse, &c. See **QUANTITY**, **MUSIC**, **POETRY**, **VERSE**, **FOOT**, &c.

**METROCOMIA**\*, a term in the ancient church-history, signifying a borough or village, that had other villages under its jurisdiction.

\* The word comes from the Greek *μητηρ*, mother, and *κωμη*, town, village.

What a metropolis was among cities, that a **metrocomia** was among country towns. The ancient **metrocomia** had each its chorepiscopus or rural-dean, and here was his see or residence. See **METROPOLIS**, and **CHOREPISCOPUS**.

**METROPOLIS**\*, **ΜΗΤΡΟΠΟΛΙΣ**, the capital of a country, or province; or the principal city, and as it were, mother of all the rest. See **CITY**.

\* The word comes from the Greek *μητηρ*, mater, mother; and *πολις*, urbs, city; as who should say, the mother-city, &c.

**METROPOLIS** is also applied to archiepiscopal churches; and sometimes to the principal or mother church of a city. See **CHURCH**, and **METROPOLITAN**.

**METROPOLITAN**, is indifferently applied to an archbishop, and to his cathedral church. See **ARCHBISHOP**, and **CATHEDRAL**.

The Roman empire having been divided into thirteen dioceses, and one hundred and twenty provinces; each diocese and each province had its metropolis, or capital city, where the proconsul, or the vicar of the empire had his residence. See **DIOCESE**, and **PROCONSUL**.

To this civil division, the ecclesiastical was afterwards adapted; and the bishop of the capital city had the direction of affairs, and the pre-eminence over all the bishops of the province. His residence in the metropolis, gave him the title of **metropolitan**.

This erection of **metropolitan** is referred to the end of the third century, and was confirmed by the council of Nice.—Indeed Archbishop Usher, and de Marca, maintain it to be an establishment of the apostles; but in vain: For it is next to certain, that the ecclesiastical government was regulated on the foot of the civil, and that it was hence the name and authority of **metropolitans** was given to the bishops of the capital cities of the empire, or the provinces that composed it.—This is so true, that in the contest between the bishop of Arles, and the bishop of Vienne, each of whom laid claim to the **metropolitanship** of the province of Vienne; the council of Turin appointed, that which-ever of them could prove his city to be the civil metropolis, should enjoy the title, and rights of ecclesiastical **metropolitan**.

Though the ecclesiastical government was modelled on the political; yet in Gaul, and some other countries, the distinctions of **metropolitan** and primate were not observed till very late. As the Præfectus Galliarum resided by turns at Trevoux, Vienne, Arles, and Lyons, he communicated the rank and dignity of **metropolitan** and primate to each of them in their turn; and yet none of the Gallican bishops assumed to themselves the rights, nor even the precedence of **metropolitans**. The episcopate levelled them all; and they had no regard, but to the privileges of seniority.—This equality lasted till the fifth century, when the contest between the bishops of Vienne and Arles was set on foot.

M. du Pin observes, that in the provinces of Africa, excepting those whereof Carthage was the **metropolis**, the place where the most aged bishop resided became the **metropolis**. The reason of which without doubt was this, that neither the proconsul, nor præfectus, ever fixed their residence.

The same author observes, that in Asia there were **metropolis's** merely nominal, that is, which had no suffragan, nor any rights of **metropolitans**. The bishops of Nice, Chalcedon, and Berytus, had the precedence of the other bishops, and the title of **metropolitans**, without any other prerogative besides the honour of the appellation; they themselves being subject to their **metropolitans**.

A **metropolitan** has the privilege of ordaining his suffragans; and appeals from sentences passed by the suffragans, are preferred to the **metropolitan**. See **BISHOP**, and **PRIMATE**.

**MEZANINE**, or **MEZZANINE**, a term used by some architects to signify an attic, or little story contrived occasionally over the first story, for the conveniency of a wardrobe or the like. See **ATTIC**.

The word is borrowed from the Italians, who call *mezzanini* those little windows, less in height than breadth, which serve to illuminate an attic, or entresole.

**MEZZO-TINTO**, in sculpture, a particular manner of engraving figures on copper. See **ENGRAVING**.

*Mezzo-tinto* is said to have been first invented by prince Rupert; and Mr. Evelyn, in his history of Chalcography, gives us a head performed by that prince in this way.

It is pretty different from the common way of engraving. To perform it, they rake, hatch, or punch the surface of the plate all over with a knife, or instrument for the purpose; first one way, then a-cross, &c. till the face of the plate be thus entirely furrowed with lines or furrows close, and as it were contiguous to each other; so that if an impression were then taken from it, it would be one uniform blot or smut.

This done, the design is drawn, or marked on the same face: after which, they proceed with burnishers, scrapers, &c. to expunge and take out the dents or furrows in all the parts where the lights of the piece are to be; and that more or less, as the lights are to be stronger or fainter: leaving those parts black, which are to represent the shadows or deepnings of the draught.

**MIASMA**, **ΜΙΑΣΜΑ**, is used to signify such particles, or atoms, as are supposed to arise from disordered, putrefying, or poisonous bodies, and to affect people at a distance. See **CONTAGION**.

**MICHAELMAS**, the feast of St. Michael the arch-angel; held on the 29th of September. See **QUARTER-DAY**, and **TERM**.

**MICHAEL's wing**. See the article **WING**.

**MICROCOSM**\*, **ΜΙΚΡΟΚΟΣΜΟΣ**, a Greek term, literally signifying *little world*; chiefly understood of *man*, who is so called by way of eminency, as being an epitome of all that is wonderful in the great world, or macrocosm. See **MACROCOSM**.

\* The word is formed from the Greek *μικρος*, *parvus*, little; and *κοσμος*, *mundus*, world.

**MICROGRAPHIA**\*, **MICROGRAPHY**, a description of the parts, and proportions of objects that are too small to be viewed without the assistance of a microscope. See **MICROSCOPE**.

\* The word is compounded of *μικρος*, *parvus*, and *γραφη*, *scriptio*, description.

**MICROMETER**\*, an astronomical machine, which, by means of a very fine screw, serves to measure extremely small distances in the heavens; as the apparent diameters of the planets, &c. to a great degree of accuracy. See **DISTANCE**.

\* The word comes from the Greek *μικρος*, *parvus*, and *μετρον*, *mensura*; in regard a small length, *e. gr.* an inch, is hereby divided into a vast number of parts, *e. gr.* in some, 2800; and in others, more.

There is some controversy about the invention of the **micrometer**. Mess. Auzout and Picard have the credit of it in common fame; as being the first who published it, in the year 1666. But Mr. Townley, in the *Philosophical Transactions*, reclaims it for one of our own countrymen, Mr. Gascoyne. He relates, that from some scattered papers and letters of this gentleman, he had learnt, that before our civil wars he had invented a **micrometer**, of as much effect as that since made by M. Auzout, and had made use of it for some years, not only in taking the diameters of the planets, and distances upon land, but in determining other matters of nice importance in the heavens; as the moon's distance, &c.

Monf. de la Hire, in a discourse on the æra of the inventions of the micrometer, pendulum clock, and telescope, read before the royal academy of sciences, in 1717, makes M. Huygens the inventor of the micrometer. That author, he observes, in his *observations on Saturn's ring*, &c. published in 1659, gives a method of finding the diameters of the planets by means of a telescope, viz. by putting an object, which he calls *virgula*, of a proper bigness to take in the distance to be measured, in the focus of the convex object-glass: In this case, says he, the smallest object will be seen very distinctly, in that place of the glass. By such means, he adds, he measured the diameters of the planets, as he there delivers them.

This micrometer, M. de la Hire observes, is so very little different from that published by the marquis de Malvasia, in his ephemerides, three years after, that they ought to be esteemed the same; and the micrometer of the marquis differed yet less from that published four years after his by Auzout and Picard. Hence M. de la Hire concludes, that it is to M. Huygens the world is indebted for the invention of the micrometer: without taking any notice of the claim of our countryman, Mr. Gafcoyne, which is prior by many years to any of them.

**Construction and use of the MICROMETER.**—Wolfius describes a micrometer, of a very easy, and simple structure; first contrived by Kirchius, thus:

In the focus of a telescope fit a brass or iron ring AB (*tab. Astron. fig. 11.*) with female screws diametrically opposite to each other. Into these insert male screws CE and FB, of such length as that they may be turned into the tube so as to touch each other. And with this instrument very small spaces in the heavens may be accurately measured:

For when any objects, viewed through a tube, appear contiguous to the screws; if these be turned till they just touch two opposite points, whose distance is to be measured, it will be evident how many threads of the screw they are apart. To determine how many seconds answer to each thread; applying the tube towards the heavens, turn the screws; till they touch two points, whose distance is already accurately known; and observe the number of threads corresponding to that interval. Thus, by the rule of Three, a table may be made of the seconds corresponding to the several threads; by means whereof, without more ado, the distances of any points may be determined.

The structure of the micrometer now chiefly in use, with the manner of fitting it to a telescope, and applying it, is as follows:

ABCg (*Tab. Astron. fig. 12.*) is a rectangular brass frame; the side AB being about three inches long, and the side BC, as likewise the opposite side Ag, about six inches; and each of the three sides about eight tenths of an inch deep. The two opposite sides of this frame are screwed to the circular plate, to be mentioned hereafter.

The screw P, which has exactly forty threads in an inch, being turned round, moves the plate GDEF along two grooves, made near the tops of the two opposite sides of the frame; and the screw Q having the same number of threads in an inch as P, moves the plate RNMY along two grooves, made near the bottom of the said frame, in the same direction as the former plate moves, but with only half the velocity of that other. These screws are turned both at once, and so the plates are moved along the same way, by means of a handle turning the endless screw S, whose threads fall in between the teeth of the pinions on the screws P and Q. And note, that two half revolutions of the endless screw S, carry the screw P exactly once round.

The screw P turns the hand *a* fastened thereto, over a hundred equal divisions, made round the limb of a circular plate, to which the above-named two opposite sides of the frame are screwed at right angles. The teeth of the pinion on the screw P, whose number is 5, take into the teeth of a wheel on the back-side of the circular plate, whose number is 25. Again, on the axis of this wheel is a pinion of two, which takes into the teeth of another wheel, moving about the centre of the circular plate on the outside thereof; having fifty teeth. This last wheel moves the lesser hand *b* once round the above-mentioned circular plate, in the  $\frac{1}{100}$  part of the time the hand *a* is moving round: For because the number of teeth in the pinion on the screw P, are 5, and the number of teeth of the wheel this pinion moves, are 20; therefore the screw P moves four times round, in the time that wheel is moving once round. Further, since there is a pinion of two which takes into the teeth of a wheel, whose number is 50; therefore this wheel with 50 teeth, will move once round in the time that the wheel of 20 teeth moves 25 times round; and consequently the screw P, or hand *a*, must move a hundred times round, in the same time as the wheel of fifty teeth or the hand *b*, has moved once round.

Hence it follows, that if the circular plate W, which is fastened at right angles to the other circular plate, be divided into two hundred equal parts, the index *x*, to which the handle is fastened, will move five of those parts in the same time, in which the hand *a* moves one of the hundred divisions round the limb of the other circular plate. Thus by means of an in-

dex *x*, and plate W, every fifth part of each of the divisions round the other plate, may be known.

Farther, since each of the screws P and Q, have exactly forty threads in an inch; therefore the upper plate GDEF, will move one inch, while the hand *a* moves forty times round; the four thousandth part of an inch, while the hand moves over one of the divisions round the limb; and the twenty thousandth part of an inch, while the index *x* moves one part of the two hundred round the limb of the circular plate W: and the under plate RNMY will move half an inch, the two thousandth part of an inch, and the ten thousandth part of an inch, the same way, in the said respective times.

Hence, if the under plate, having a large round hole therein, be fixed to a telescope, so that the frame is moveable, together with the whole instrument, except the said lower plate; and the straight smooth edge HI, of the fixed plate ABIH; as likewise the straight smooth edge DE, of the moveable plate GDEF, be perceivable through the round hole in the under plate, in the focus of the object-glass; then, when the handle of the micrometer is turned, the edge HI of the narrow plate ABIH fixed to the frame, and DE of the moveable plate, will appear through the telescope equally to approach to, or recede from each other.

By these edges we shall be able to measure the apparent diameters of the sun, moon, &c. the manner of doing which take as follows:

Suppose in looking at the moon through the telescope, you have turned the handle till the two edges DE and HI are opened, so as just to touch or clasp the moon's edges; and that there were twenty-one revolutions of the hand *a*, to complete that opening. First say, As the focal length of the object glass, which suppose ten feet, is to radius, so is one inch to the tangent of an angle subtended by one inch in the focus of the object-glass; which will be found twenty-eight minutes thirty seconds. Again, because there are exactly forty threads of the screws in one inch; say, If forty revolutions of the hand *a*, give an angle of 28' 30", what angle will twenty-one revolutions give? The answer will be, fifteen minutes eight seconds. And such was the moon's apparent diameter; and so may the apparent diameters of any other objects be taken.

It must be here observed, that the divisions on the top of the plate GDEF, are diagonal divisions of the revolutions of the screws, with diagonal divisions of inches against them. Thus as the said plate slides along, these diagonals are cut by divisions made on the edge of the narrow plate KL, fixed to the opposite sides of the frame by means of two screws. These diagonal divisions serve for a register to count the revolutions of the screws, and to shew how many there are in an inch, or the parts of an inch.

Mr. Derham tells us, that his micrometer is not, as usually, to be put into a tube, but to measure the species of the sun on paper, (of any radius) or to measure any part of them. By this means he can easily, and very exactly, with the help of a fine thread, take the declination of a solar spot at any time of the day; and by his half-seconds watch, measure the distance of the spot from the sun's eastern or western limb.

**MICROSCOPE**, ΜΙΚΡΟΣΚΟΠΕΙΟΝ, a dioptrical instrument, by means whereof very minute objects are represented exceedingly large, and viewed very distinctly; according to the laws of refraction. See REFRACTION.

*Microscopes* are properly distinguished into simple, or single; and compound, or double.

*Single MICROSCOPES* are those which consist of a single lens, or a single spherule.

*Compound MICROSCOPES* consist of several lenses duly combined. See LENS.

As optics have been improved, other varieties have been contrived, in the sorts of the *microscopes*: Hence *reflecting microscopes*, *water microscopes*, &c. See REFLECTING, &c.

When, and by whom *microscopes* were first invented, is not certainly known. Huygens tells us, that one Drebbel, a Dutchman, had the first *microscope*, in the year 1621; and that he was reputed the inventor of it: though F. Fontana a Neapolitan, claims the invention to himself, but dates it from the same year. As a telescope inverted is a *microscope*; the discovery might easily enough have arose from thence. See TELESCOPE.

**Foundation and theory of single MICROSCOPES.**—If an object AB (*tab. Optics, fig. 21.*) be placed in the focus of a small convex lens, or simple *microscope* DE, and the eye be applied close to the other side of the microscope, the object will be seen distinctly, in an erect situation, and magnified in the ratio of the distance of the focus to the distance wherein objects are to be placed to be seen distinctly with the naked eye.

For the object AB being placed in the focus of the convex lens DE, the rays issuing from the several points thereof, after refraction, will be parallel to each other. See LENS and REFRACTION. Consequently the eye will see it distinctly, by virtue of what is proved under the word TELESCOPE.

Further, since one of the rays AF proceeding from the point A, after refraction, becomes parallel to the incident ray; and therefore, setting aside the thickness of the lens, is found directly

rectly against it; and the same holds of all the other rays carried to the eyes: the rays, A F, and B F, to which the rest coming from A and B are parallel, will enter the eye in the same manner as if they entered without passing through the lens; and will therefore appear erect; as if the lens were away. See VISION.

Lastly, it is manifest that the object A B will be seen under the same angle as if viewed by the naked eye: But since it appears very distinct, whereas to the naked eye, at the same distance, it would appear extremely confused, it is the same thing as if the object should seem removed to the distance F H, wherein it is viewed with equal distinctness, and under the same angle. The diameter of the object A B, therefore, will be to the apparent diameter I K, as F C to F H, i. e. as the distance of the focus of the lens to the distance wherein an object is to be placed in order to view it distinctly. See MAGNITUDE, and ANGLE.

Huygens takes it for granted, that an object seen with the naked eye, is then in its utmost distinctness when seen at the distance of eight digits, or tenths of a foot; which agrees pretty near with the observations of others.

**Laws of single MICROSCOPES.**—1°. Simple *microscopes* magnify the diameter of the object A B in the ratio of the distance of the focus F C to an interval of eight digits. *v. gr.* If the semi-diameter of a lens convex on both sides be half a digit, A B: I K =  $\frac{1}{2}$  : 8 = 1 : 16, that is, the diameter of the object will be increased in a sedecuple proportion, or as sixteen to one.

2°. Since the distance F H is constant, *viz.* eight digits, by how much the distance of the focus F C is smaller, so much the smaller ratio will it have to F H; consequently the diameter of the object will be so much the more magnified.

3°. Since in plano-convex lens's, the distance of the focus is equal to the diameter; and in lens's convex on both sides, to the semi-diameter; simple *microscopes* will enlarge the diameter so much the more, as they are segments of smaller spheres.

4°. If the diameter of the convexities of a plano-convex lens, and a lens convex on both sides be the same, *viz.* = 1; the distance of the focus of the first will be 1; of the second  $\frac{1}{2}$ . Consequently, the semi-diameter of the object A B will be to the apparent one in the first case as 1 to 8, in the latter as  $\frac{1}{2}$  to 8, i. e. as 1 to 16. A lens, therefore, convex on both sides, magnifies twice as much as a plano-convex.

As the whole depends on the just and steady situation of objects with regard to the lens, various methods have been contrived to that end: Whence we have several different kinds of single *microscopes*. The most simple is as follows.

1°. A B, *fig.* 22. is a little tube, to one of whose bases B C, is fitted a plain glass, to which an object, *viz.* a gnat, wing of an insect, down, or the like, is applied: To the other base, A D, at a proper distance from the object is applied a lens convex on both sides, whose semi-diameter is about half an inch. The plain glass is turned to the sun, or the light of a candle, and the object is seen magnified. And if the tube be made to draw out, lens's of different spheres may be used.

Again, a lens, convex on both sides, is inclosed in a cell A C, *fig.* 22. n° 2. and by a screw H there fastened across; through the pedicel C D passes a long screw, by means whereof, and the female screw I, a style or needle fixed perpendicular to its extreme, is kept firm at any distance from the lens. In E is a little tube, on which, and on the point G, the various objects are to be disposed: thus there may be lens's of various spheres applied.

2°. But the *microscope* which is found to answer the end best, is as follows: A B, *fig.* 23. is a round brass tube, whose exterior surface is formed into a screw of a length somewhat less than the distance of the focus of a glass convex on both sides, used here for illuminating the object, and fitted to its base A C, by a ring with a screw in it D E.

F G is another brass tube, somewhat wider than the first, and open each way for an object to be applied to the *microscope*. To its upper base G H is fastened a spring of steel-wire, twisted into a spiral I; whereby an object placed between two round plates or slices, K and L, in the manner hereafter mentioned, is by means of the screw B C, brought to the *microscopical* lens, (or magnifying glass, whereof there are several) and kept firm in its place. To the basis H G, which has a female screw M, are fitted cells N, with a male screw O, wherein lens's of various spheres, guarded by ferrils, are included. In P is a female screw, by which an ivory handle P Q is fastened to the *microscope*.

In the ivory slice T are round holes, in which are fitted little circles of Muscovy tale, for objects, especially small and pellucid ones, as little insects, or the wings, scales, &c. of larger, to be fastened to.

When live insects are to be viewed, they are covered with the brass slice Y, which is put in a little square brass bed, perforated with holes X: And the same slice, whether alone, or inclosed in the bed, being laid between the round plates K and L, is brought to the lens by means of the screw A B, till the object may be distinctly viewed.

If other pellucid oblong objects are to be viewed, as down, cuticle, &c. instead of the slice above, is used the instrument

mentioned above, for viewing wings of flies; whose structure is manifest from inspection.

There are other instruments in the apparatus of the *microscope*, as little tongs, &c. for taking up small objects, a glass tube for viewing the circulation of the blood in fishes, &c. which need no description.

What has been said hitherto, is to be understood of *lenticular microscopes*; for *spherical* ones, their doctrine will be understood from what follows.

If an object A B, *fig.* 21. n° 2. be placed in the focus of a glass spherule F, and the eye be behind it, *v. gr.* in the focus G; the object will be seen distinct, in an erect situation, and magnified as to its diameter, in a ratio of  $\frac{1}{2}$  of the diameter E I, to the distance at which objects are to be placed to be seen distinctly with the naked eye.

The first part of the proposition is proved in the same manner of spheres, as of lens's: As, then, a good eye sees an object distinctly at the distance of eight digits, a glass spherule will enlarge the diameter of an object in a ratio of  $\frac{1}{2}$  of the diameter to 88 digits. Suppose then the diameter of the spherule E I  $\frac{1}{10}$  of a digit, C E will be =  $\frac{1}{20}$ , and F E =  $\frac{1}{20}$ ; and therefore F C =  $\frac{1}{20} + \frac{1}{20} = \frac{1}{10}$ . Consequently, the true diameter of an object to its apparent one is in the ratio of  $\frac{1}{20}$  to 8; i. e. as 3 to 320, or 1 to 103 nearly.

Now a lens convex on both sides, increases the diameter in a ratio of the semi-diameter to the spaces of eight digits; wherefore  $\frac{1}{2}$  having a less ratio to 8 than  $\frac{1}{20}$ ; if a lens and a sphere have the same diameter, the former will magnify more than the latter: And pretty much after the same manner it may be shewn that a sphere of a less diameter, magnifies more than another of a large one.

For the methods of casting little glass spherules for MICROSCOPES; there are various.—Wolfius describes one as follows: A small piece of very fine glass, sticking to the wet point of a steel-needle, is to be applied to the extreme bluish part of the flame of a torch; or, which is better, to the flame of spirit of wine, to prevent its being blackened. Being there melted, and run into a little round drop, it is to be removed from the flame; upon which it instantly ceases to be fluid: folding, then, a thin plate of brass, and making very small smooth perforations so as not to leave any roughness on the surfaces; and further, smoothing them over to prevent any glaring: fit the spherule between the plates against the apertures, and the whole in a frame, with objects convenient for observation.

Dr. Adams gives another method, thus: Take a piece of fine window-glass, and raise it with a diamond into as many lengths as you think needful, not exceeding an eighth of an inch in breadth; then holding one of those lengths between the forefinger and thumb of each hand over a very fine flame till the glass begins to soften, draw it out till it be as fine as an hair, and break; then, applying each of the ends into the purest part of the flame, you have two spheres presently, which you may make larger or less at pleasure. If they stay long in the flame, they'll have spots; so they must be drawn out immediately after they are turned round. As to the stem, break it off as near the ball as possible; and lodging the remainder of the stem between the plates; by drilling the hole exactly round, all the protuberances are buried between the plates; and the *microscope* performs to admiration.

After these manners may spheres be made much smaller than any lens; so that the best *microscopes*, or those which magnify the most, are made thereof. For suppose the diameter of a spherule to be  $\frac{1}{10}$  of a digit, the distance of its focus will be  $\frac{1}{20}$ ; and therefore its real diameter to its apparent one, as  $\frac{1}{20}$  to  $\frac{1}{20}$ ; that is, as  $\frac{1}{20}$  to 8, or as 3 to 512; or lastly, as 1 to 170. Its surface therefore will be increased in the proportion of 1 to 28900, and its bulk in a ratio of 1 to 4913000.

M. Leewenhoeck and M. Musschenbroeck have succeeded very well in spherical *microscopes*; and the apparatus of the latter is much commended: but we forbear any descriptions thereof; it being easy for any who considers the structure of those consisting of lens's, to conceive how those of spheres may be contrived.

**Water MICROSCOPE.**—Mr. S. Gray; and after him, Wolfius and others, have contrived *water-microscopes*, consisting of spherules, or lens's of water instead of glass, fitted up somewhat after the manner of those above-mentioned; (as spheres of water may likewise be used instead of glass in any of the common *microscopes*.) But since the distance of the focus of a lens or sphere of water, is greater than in one of glass, (the spheres whereof they are segments being the same) *water-microscopes* magnify less, and are therefore less esteemed than those of glass.

The same Mr. Gray first observed that a small drop or hemisphere of water held to the eye by candle-light or moon-light, without any other apparatus, magnified the animalcule contained in it, vastly more than any other *microscope*. The reason is, that the rays coming from the interior surface of the first hemisphere, are reflected so as to fall under the same angle on the surface of the hind hemisphere, to which the eye is applied, as if they came from the focus of the spherule; whence they are propagated to the eye in the same manner

manner as if the objects were placed without the spherule in its focus.

Hollow glass spheres, of the diameter of about half a digit, filled with spirit of wine, are frequently used for *microscopes*; but they do not magnify near so much.

**Theory of compound, or double MICROSCOPES.**—Suppose an object-glass E D, *Fig. 24.* the segment of a very small sphere, and the object A B placed without the focus F.

Suppose an eye-glass G H, convex on both sides, and the segment of a sphere greater (though not too great) than that of D E, and let it be so disposed behind the object, as that if C E : C L :: C L : C K, the focus of the eye-glass may be in K.

Lastly suppose, L K : L M :: L M : L I.

If then O be the place wherein an object is seen distinct with the naked eye; the eye in this case being placed in I, will see the object A B distinctly in an inverted situation, and magnified in a compound ratio of M K to L K, and L C to C O; as is proved from the laws of dioptrics.

**Laws of double MICROSCOPES.**—1°. The more an object is magnified by the *microscope*, the less is its field, i. e. the less it takes in at one view.

2°. To the same eye-glass, may be successively applied object-glasses of various spheres; so as that both the entire objects, but less magnified, and their several parts, much more magnified, may be viewed through the same *microscope*. In which case, by reason of the different distance of the image, the tube L K, in which the lens's are fitted, should be made to draw out. For the proportion of the object-glass to the eye-glass, some commend the subduple ratio, and some the subsextile. De-Chales will have the semi-diameter of the convexity of the object-glass to be  $\frac{1}{2}$  of a digit; or at most  $\frac{1}{3}$ ; in the eye-glass an entire digit, or even  $1\frac{1}{2}$ . Cherubin makes the semi-diameter of the object-glass  $\frac{1}{4}$ ,  $\frac{1}{5}$ , or  $\frac{1}{7}$  of a digit; the semi-diameter of the eye-glass  $1\frac{1}{4}$ , or  $1\frac{1}{2}$  of a digit.

Since it is proved, that the distance of the image L K from the object-glass D E will be greater, if another lens, concave on both sides, be placed before its focus; it follows, that the object will be magnified the more, if such a lens be here placed between the object-glass D E, and the eye-glass G H.—Such a *microscope* is much commended by Conradi, who used an object-lens, convex on both sides, whose semi-diameter was two digits, its aperture equal to a mustard-seed; a lens concave on both sides 12, or at most 16 digits; and an eye-glass convex on both sides, of 6 digits.

4°. Since the image is projected to the greater distance, the nearer another lens of a segment of a larger sphere, is brought to the object-glass; a *microscope* may be composed of three lens's which will magnify prodigiously.

5°. From these considerations it follows, that the object will be magnified the more, as the eye-glass is the segment of a smaller sphere; but the field of vision will be the greater, as the same is a segment of a larger sphere: If then two eye-glasses, the one a segment of a larger, the other of a smaller sphere, be so combined, as that the object appearing very near through them, i. e. not farther distant than the focus of the first, be yet distinct; the object at the same time will be exceedingly magnified, and the field of vision much greater than if only one lens were used: And the object will be still more magnified, and the field enlarged, if both the object and eye-glass be double. But in regard an object appears dim, when viewed through so many glasses, part of the rays being reflected in passing through each; the multiplying of lens's is not advisable: And the best among compound *microscopes*, are those which consist of one object-glass, and two eye-glasses.

For a *microscope* of three lens's, De-Chales commends an object-glass of  $\frac{1}{4}$  or  $\frac{1}{5}$  of a digit; and the first eye-glass he makes 2, or  $2\frac{1}{2}$  digits; the distance between the object-glass and eye-glass about twenty lines.—Conradi had an excellent *microscope*, the object-glass whereof was half a digit, and the two eye-glasses (which were placed very near) four digits: But it answered best when in lieu of the object-glass, he used two glasses, convex on both sides, their sphere about a digit and half, or at most two, and their convexities touching each other within the space of half a line.—Eustachius de Divinis, instead of an object-glass, convex on both sides, used two plano-convex lens's, whose convexities touched. Grindelius did the same; only that the convexities did not quite touch. Zahnus made a binocular *microscope*, wherein both eyes were used.

**Structure or mechanism of a double MICROSCOPE.**—The industry and address of our countryman, Mr. Marshall, here deserves to be remembred: The most commodious *double microscope* is of his contrivance. In this, the eye-glasses are placed in the tube at A and B, *Fig. 25.* and the object-glass at C. The little pillar D E is turned by means of a ball E, moveable in the socket F; and thus the *microscope* is accommodated to any situation. The same pillar is divided into as many parts, 1, 2, 3, 4, 5, &c. as there are lens's of different spheres to be used in viewing different objects; so that the distance of the object from the object-glass may be found without any trouble. But as it is scarce exactly enough determined this way, the tube may be brought nearer the object at discretion by means of the screw G H.

The objects are either laid on the circle I, or fitted to proper

instruments, having their points or stiles passing through the little tube L M.

Lastly, to illuminate the object, a lens convex on both sides, N O, is disposed in a convenient situation. The rest appears from the figure.

**Reflecting MICROSCOPE**, is that which magnifies by reflection, as the abovementioned ones do by refraction. See REFLECTION.

The structure of such a *microscope* may be conceived thus: Near the focus of a concave speculum, A B, *fig. 25.* n° 2. place a minute object C, that its image may be formed larger than itself in D. To the speculum join a lens convex on both sides E F, so as the image D may be in its focus.

The eye will here see the image inverted, but distinct, and enlarged; consequently the object will be larger than if viewed through the lens alone. See MIRROR.

The inventor of this *microscope* is the great Sir I. Newton; but it is somewhat to be feared lest the objects appear dim.

Any telescope is converted into a *microscope*, by removing the object-glass to a greater distance from the eye-glass. And since the distance of the image is various, according to the distance of the object from the focus; and it is magnified the more, as its distance from the object-glass is greater; the same telescope may be successively converted into *microscopes* which magnify the object in different degrees. See TELESCOPE.

**MID, or MIDDLE**, in philosophy, and mathematics. See MEAN and MEDIUM.

**MIDDLE latitude**, in navigation, is half the sum of two given latitudes. See LATITUDE.

**MIDDLE latitude sailing**, is used for a method of working the several cases in sailing, nearly agreeing with Mercator's way, but without the help of meridional parts. See SAILING, MERIDIONAL parts, MERCATOR, &c.

**MIDDLE priced stones**. See the article STONE.

**MIDDLE region**. See the article REGION.

**MIDDLE of the action**. See the article ACTION.

**MIDDLE of an eclipse**. See the article ECLIPSE.

**Masonry filled up in the MIDDLE**. See the article MASONRY.

**MID-HEAVEN**, *medium cæli*, in astronomy, is that point of the ecliptic which culminates, or is in the meridian. See CULMINATION, &c.

**MIDRIF**, in anatomy. See the article DIAPHRAGM.

**MIDSHIP-men**, are officers aboard a ship, whose station, when they are on duty, is, some on the quarter-deck, others on the poop, &c.

Their business is to mind the braces, to look out, and to give about the word of command from the captain, and other superior officers. They all assist on occasion both in sailing the ship, and in stowing and rummaging the hold.

They are usually gentlemen, who having served their time as volunteers, are now upon their preferment.

**MIDSUMMER-day**, is the festival of St. John the baptist, held on the 24th of June. See QUARTER-DAY.

**MIGRATION, or TRANSMIGRATION**, the passage, or removal of any thing out of one state, or place into another; particularly of colonies of people, birds, &c. into other countries. See TRANSMIGRATION.

The *migration of the souls of men* into other animals after death, is the great doctrine of the Pythagoreans, called the *metempsychosis*. See METEMPSYCHOSIS.

The *migration of birds*, as the swallow, quail, stork, crane, fieldfare, woodcock, nightingale, and other birds of *passage*, is a very curious article in natural history, and furnishes a notable instance of the powerful instinct impressed by the Creator. Mr. Derham observes two things remarkable therein; the first, That these untaught, unthinking creatures should know the proper times for their passage, when to come and when to go; as also, that some should come when others go.—No doubt, the temperature of the air as to heat and cold, and their natural propensity to breed their young, are the great incentives to those creatures to change their habitation: But why should they at all shift their habitation, and why is not some certain place to be found in all the terraqueous globe, affording them convenient food and habitation all the year round?

The second, That they should know what way to steer their course, and whither to go. What instinct is it, that moves a poor foolish bird to venture over vast tracts of land and sea? If it be said, that by their high ascents up into the air, they can see cross the seas, yet what should teach or persuade them that that land is more proper for the purpose than this? That Britain, for instance, should afford them better accommodation than Egypt? than the Canaries? than Spain? or any other of the intermediate countries? *Physico-Theol.* p. 349.

Lud. de Beaufort remarks, that birds in their *migration* observe a wonderful order and polity: They fly in troops, and steer their course through huge unknown regions, without the compass. *Cosmol. Divin.* It is to be added, that the birds of *passage* are all peculiarly accommodated by the structure of their parts for long flights. See PASSAGE.

Naturalists are divided as to the places whither birds of *passage* retire when they leave us. Mr. Willughby thinks the swallows fly into Egypt, and Æthiopia. *Ornith. lib. 2. c. 3.*

Olaus

Olaus Magnus says, they lurk in holes, or under water; which is confirmed by Etzmüller, who assures us, that he saw a bushel of them taken out of a frozen fish-pond, all hanging together head to head, feet to feet, &c. in one cluster. *Dijfert.* 2. c. 10. --- Olaus adds, that this is a common thing in the northern countries; and that such a cluster being carried accidentally by some boys into a stove, the Swallows, after thawing, began to fly about, but weakly, and for a very little time.

A further confirmation of this account was given by Dr. Colas, a person very curious in such things, to the *Royal Society*. Speaking of the way of fishing in the northern parts, by breaking holes, and drawing their nets under the ice, he related, that he saw sixteen swallows so drawn out of the lake of Samrodt, and about thirty out of the king's great pond in Rosinellen; and that at Schlebitten, near a house of the earl of Dohna, he saw two swallows just come out of the waters that could scarce stand, being very wet and weak, with their wings hanging on the ground.—He added, that he had often observed the swallows to be weak for some days after their appearance.

**MILDEW**, *rubigo*, a disease happening to plants, caused by a dewy moisture, which falling on them, and continuing, for want of the sun's heat to draw it up; by its acrimony corrodes, gnaws, and spoils the inmost substance of the plant, and hinders the circulation of the nutritive sap: upon which the leaves begin to fade, and the blossoms and fruit are much prejudiced.

According to Cook and Mortimer, *mildew* is a thick, clammy vapour exhaled in the spring and summer from plants, blossoms, and even the earth itself, in close still weather, when there is neither sun enough to draw it on high, nor wind enough to disperse it.—Hanging thus in the lower regions, when the evening's cold comes on, it condenses and falls on the plants; with its thick clammy substance stops up their pores, and thus prevents perspiration, and hinders the sap from ascending to nourish its flowers, shoots, &c. See **DEW**.

It is added, this dew falling on the top of the shoot of a cherry-tree about Midsummer, has been found to stop the shoot; so as the tree has shot forth in other places.

Blights and *mildews* are commonly taken for the same thing; yet are they very different. See **BLIGHT**.

On plants which have smooth leaves, as the oak, &c. the dew hangs, and may be seen, tasted, &c. Others, whose leaves are rougher, imbibe it. When it falls on wheat, &c. it bespots the stems with a colour different from the natural one.

These dews, Mr. Mortimer takes to be the principal food of bees; being sweet, and easily convertible into Honey. See **HONEY**.

**MILE**, in geography, a long measure, whereby the English, Italians, and some other nations, use to express the distance between places. See **MEASURE**, **DISTANCE**, &c. See also **MERIDIONAL**.

In which sense *mile* amounts to much the same with *league* used by the French and other nations for the like purpose. See **LEAGUE**.

The *mile* is of different extent in different countries. The geographical, or Italian, *mile* contains a thousand geometrical paces, mille passus, whence the term *mile* is derived. See **PACE**, **GEOGRAPHICAL**, &c.

The English *mile* consists of eight furlongs, each furlong of forty poles, and each pole of sixteen foot one half. See **POLE**. Casimir has made a curious reduction of the *miles*, or leagues, of the several countries in Europe into Roman feet, which are equal to the Rhinland feet generally used throughout the north. See **FOOT**.

	Feet
The mile of Italy	5000
of England	5454
of Scotland	6000
of Sweden	30000
of Muscovy	3750
of Lithuania	18500
of Poland	19850
of Germany, the small	20000
The middle	22500
The largest	25000
of France	15750
of Spain	21270
of Burgundy	18000
of Flanders	20000
of Holland	24000
of Persia, called also Parafanga	18750
of Egypt	25000

**MILES**, a Latin term, which, in its general import, signifies *soldier*. See **SOLDIER**, and **MILITIA**.

In our English laws, and customs, *miles* is peculiarly appropriated to a knight, called also *eques*. See **KNIGHT**, and **EQUES**.

**MILIARY glands**, *glandulae MILIARES*, in anatomy, a great number of small glands interspersed throughout the substance of the cutis, or skin. See **GLAND** and **CUTIS**.

VOL. II. N<sup>o</sup>. XCIX.

The *miliary glands* are the organs whereby the matter of sweat, and insensible perspiration, is secreted from the blood. See **PERSPIRATION** and **SWEAT**.

They are interwove with the pyramidal papillæ of the skin; and are each served with a branch of an artery, vein, and nerve; as also with a proper excretory duct, through which the fluid matter secreted from the blood in the substance of the gland, is excreted, and sent forth at the pores, or perforations of the cuticle. See **PORE** and **CUTICLE**.

**MILIARY fever**, is a malignant fever wherein the skin is sprinkled over with little purple spots, like grains of *millet*:

It is also called a *purple fever*, from the colour of the spots. See **PURPLE**, and **FEVER**.

**MILIARY herpes**. See the article **HERPES**.

**MILITANT**, a term understood of the body of Christians; while here on earth.

The Romanists divide the church into *militant*, *patient*, and *triumphant*: The *militant* is on earth; the *patient*, or *passive*, they place in purgatory; and the *triumphant* in heaven. See **CHURCH**.

**MILITARE ærarium**. See the article **ÆRARIUM**.

**MILITARIS toga**. See the article **TOGA**.

**MILITARIS via**. See the article **VIA**.

**MILITARY**, something belonging to the *militia*, or soldiery. Thus,

**MILITARY architecture** denotes the art of fortification. See **ARCHITECTURE**, and **FORTIFICATION**.

**MILITARY art**, the art or science of making or sustaining war to advantage. See **WAR**.

**MILITARY column** among the Romans, was a column on which was engraved a list of the troops of an Army, or the soldiers employed in an expedition. See **COLUMN**.

**MILITARY execution**, the delivery of a city, or country, up to be ravaged, and destroyed by the soldiers, upon its refusing to pay contribution-money. See **EXECUTION**.

**MILITARY exercises**, are the evolutions, or various manners of ranging, and exercising soldiers. See **EVOLUTION**.

**MILITARY fever**, a kind of malignant fever frequent in armies by reason of the ill food, &c. of the soldiers. See **FEVER**.

**MILITARY government** is the supreme command and disposal of all the *military* power of a nation, by land and sea. See **GOVERNMENT**.

**MILITARY Law**. See **LAW of arms**, and **MARTIAL**.

**MILITARY machine**. See the article **MACHINE**.

**MILITARY order**. See **ORDER**, and **KNIGHTHOOD**.

**MILITARY pyrotechny**. See the article **PYROTECHNY**.

**MILITARY testament** among the Romans was what we call a nuncupative-will; or a testament made only by word of mouth, in the presence of two witnesses. See **TESTAMENT**.

This was a privilege peculiar to the soldiery, and to them only when in the field; for at other times they were subject to the common laws.

**MILITARY ways**, *viæ militares*, are the large Roman roads, which Agrippa procured to be made through the empire, in the time of Augustus, for the more convenient marching of troops, and conveyance of carriages. See **ROAD**.

N. Bergier has wrote the history of the origin, progress, and amazing extent of these *military roads*; which were paved from the gates of Rome to the extreme parts of the empire. See **VIA**.

**MILITES candidati**. See the article **CANDIDATI**.

**MILITIA**\*, a collective term, understood of the body of soldiers, or persons who make profession of arms. See **SOLDIER**.

\* The word comes from the Latin, *miles*, a soldier; and *miles*, from *mille*, which was anciently wrote *mile*: For in levying soldiers at Rome, as each tribe furnished a thousand, *mille* or *mile*, men, whoever was of that number, was called *miles*. See **TRIBE**.

**MILITIA**, in its proper and more restrained sense, is used to signify the inhabitants, or, as we call them, the *trained-bands* of a town, or country; who arm themselves, on a short warning, for their own defence.

In which sense, *militia* is opposed to regular, stated forces.

The standing *militia* of England is now computed to be about 200000 horse and foot; but may be increased at the pleasure of the King.

For the direction and command of these, the King constitutes *lords-lieutenants* of each county, with power to arm, array, and form into companies, troops, and regiments, to conduct, (upon occasion of rebellion, and invasion) and employ the men so armed within their respective counties, and other places where the king commands; to give commissions to colonels, and other officers; to charge any person with horse, horseman, arms, &c. proportionable to his estate, &c. See **LORD-lieutenant**, &c.

No person to be charged with a horse unless he have 500 pounds yearly revenue, or 6000 pounds personal estate; nor with a foot-soldier, unless he have fifty pounds yearly, or 600 pounds personal estate.

**MILITUM curia**. See the article **CURIA**.

**MILITUM expensis levandis**. See the article **EXPENSIS**.

**MILK**, *lac*, a white juice, or humour, which nature prepares in

in the breasts of women, and the udders of other animals ; for the nourishment of their young. See BREAST.

*Milk* is thicker, sweeter, and whiter, than the chyle itself, from which it is derived, and that probably, without much more artifice or alteration than the leaving behind some of its aqueous parts. See CHYLE.

The ancients held it formed from the blood ; but the moderns are of opinion, it comes from the pure chyle, conveyed by the arteries to the breasts, and without any other coction filtrated through the glands whereof they are composed, like urine through the reins ; without undergoing any considerable change. See SECRETION.

According to M. Leewenhoeck's observations, *milk* consists of little globules swimming in a clear transparent liquor, called *serum*, or *whcy*. See SERUM.

*Milk* is a composition of three different kinds of parts, butyrous, caseous, and ferous. The *butyrous* parts are the cream and oil that swim a-top. See BUTTER. The *caseous* are the grosser parts, and those that coagulate, and are made into cheese. See CHEESE. The *ferous* are properly a lymph, and make what we call *whcy*. See SERUM, LYMPH, &c.

Dr. Drake says, that *milk* is nothing but oil and water united by the artifice of nature, perhaps by the intervention of some peculiar salts, which, *milk* itself, however sweet at first, does, after a little standing, discover to be pretty plentifully therein. *Milk* is first found in the breasts of women after they have been pregnant about four months. The fermentation of the *milk* in the breasts, the first days after a woman is delivered, occasions a fever, which takes its name therefrom.

Aristotle says, there are some men who have *milk* in their breasts. Cardan tells us he saw one that had enough to suckle a child.

In the *Philosophical Transactions*, we have an account of a weaver brought to *milk* by the sucking of a lamb ; which lamb was maintained by it all the summer, till it was weaned.

*Milk* corrupted in the stomachs of children, occasions the several diseases incident to that age. Dohel, a Danish physician, who has wrote expressly on this subject, tells us, an excellent remedy in such case, is a glass of water with a little salt dissolved in it : This acts as an emetic, and throws up the corruption that occasioned the disorder. Celsus mentions this remedy, l. i. c. 3. See CHILDREN.

Galen observes, that in animals fed with *milk*, the greatest part of the food of the mother is converted into that humour.

There are several kinds of *milk*, used not only as food, but as physic : as cows *milk*, asses *milk*, mares *milk*, sheeps *milk*, and goats *milk*.—These are prescribed as proper to alter a sharp thin blood into a crasis more soft, balsamic, and nutritive ; and in constitutions where they fit the first passages, must be very good for that end, as being already prepared into nutriment, so far as is required for their admission into the blood. But where the juices of the stomach are sharp, these liquors are apt to be turned into curd. Whenever *milk*, therefore, of what kind soever, is ordered in consumptions, and as a restorative, it is with good reason joined with the testaceous powders, and such things as are proper to destroy those acidities.

Asses *milk* is said to be a great beautifier and preserver of the skin. Poppæa, wife of the emperor Nero, used it for that purpose ; having four or five hundred asses constantly in her retinue, to furnish her every morning with a fresh bath.

We have several artificial *milks*, so called from their resemblance of natural ones. As,

*MILK of the moon*, *lac lunæ*, a name given by naturalists to fossil agaric. See AGARIC.

*Milk of the moon*, or *flower of silver*, is a white, porous, friable, insipid earth, frequently found in form of a white farinaceous powder, but sometimes concentered into a mass, soft, fungous, and not unlike agaric.

Some say it is chiefly found in silver mines, and that it is a flower sublimated from the ore of that metal ; whence its denomination. See SILVER.

*MILK of Sulphur*, *lac sulphuris*, a preparation of flowers of sulphur, and salt of tartar ; prescribed by physicians, as a sudorific. See SULPHUR.

*MILK water*. See the article WATER.

*Virgin's MILK*, *lac virginale*, composed of rock allum, spring water, litharge, and vinegar ; used as a cosmetic, to drive in pimples, and check any cutaneous eruptions, by its cooling, restringent quality.

*MILKY grotto*. See the article GROTTA.

*MILKY way*, *via lactea*, or *galaxy*. See GALAXY.

*MILL*, in propriety, denotes a machine for grinding. See GRINDING.

*MILL*, in a more general signification, is applied to all machines whose action depends on a circular motion. See MACHINE, &c.

Of these there are various kinds, which acquire different names according to the various manner in which the moving power is applied.—They may all be reduced to three : viz. *wind-mills*, *water-mills*, and *hand-mills* ; under which last, are also comprehended those worked by horses, &c.

*Water-MILLS*, are those turned by the force, or fall of a river, &c. Of which, there are two kinds ; those where the force of the

water is applied above the wheel, called *over-shot* ; and those where it is applied below the wheel, called *under-shot mills*.

*Wind-MILLS*, are those turned by the force of wind gathered in their sails.

Of these, some are called *vertical*, others *horizontal*, according to the position of the sails ; or rather according to the direction of their motion with regard to the horizon.

For the best form of horizontal sails, as also for determining the position of the axis of wind-mills, see WIND-mill.

*Portative*, or *Hand-MILLS*, are those kept in motion by the hand ; or whose mill-stones are turned, or pistons driven, by the force of horses, or other beasts.

The use of *mills* and mill-stones, according to Pausanias, was first invented by Myla, son of Melceges, first king of Sparta. Though Pliny attributes the invention of every thing belonging to bread and baking, to Ceres. Polydore Virgil was not able to discover the author of so useful a machine. It is doubted whether or no water-mills were known to the Romans, there being no mention made in the Digest but of *mills* turned by slaves and asses.—Salmasius, however, and Gothofred, will not allow *water-mills* to have been unknown to the ancient Romans, though they were not in ordinary use.—*Wind-mills* are of much more modern invention : The first model of these was brought from Asia into Europe, in the time of the holy wars.

*MILL* is also used for any machine, which being moved by some external force, serves to give a violent impression on things applied thereto.

*Mills* in this sense, are machines of vast use in the manufactures, arts, and trades ; for the making and preparing divers kinds of merchandizes.—The principal are those which follow.

*Fulling-MILL*, is a water-mill which arises and beats down large wooden pistons in proper vessels, called *peels* or *troughs* ; in order to full, scower, and cleanse woollen stuffs. See FULLING.

*Linnen-MILLS* do not differ much from fulling-mills. Their use is to scower linnens, after having been first cleansed when taken out of the luvium, or lye. See BLEACHING. Some of these go by water, the generality by horses.

*Paper-MILL*, a water-mill furnished with several large hammers, which beat, or pound the rags or cloth in a kind of wooden troughs ; and thus by reducing them to little pieces, turn them into a kind of pulp, by means of water conveyed into the troughs by a pipe for the purpose. See PAPER.

*MILL* in coinage, is a machine used to prepare the laminæ or plates of metal, and to give them the proper thickness, hardness, and consistence before they be struck or stamped. See COINING.

This machine has not been long known among us, but is of some standing in Germany. It consists of several wheels dented like those of clocks, &c. which move two cylinders of steel, between which the metal is passed to be brought to its proper thickness. It was first turned with water ; since, with horses.

*MILL*, among gold-wire-drawers, is a little machine consisting of two cylinders of steel, serving to flatten the gold or silver wire, and reduce it into laminæ, or plates. See GOLD-WIRE.

They have also *mills* to wind the gold-wire or thread on the silk ; composed of several rows of bobbins all turned at the same time. See DUCTILITY.

*Forge-MILLS*, turned by water, serve to raise and let fall one or more huge hammers, to beat and form the iron into bars, anchors, or other massive works. See FORGE.

*Gun-powder MILL*, is that used to pound, and beat together the ingredients whereof gun-powder is composed. See GUN-POWDER.

This is done in a kind of iron or brass mortar by means of iron pestles wrought by a wheel without-side the *mill*, turned by the water falling on it.

*Leather-MILLS*, are used to scower, and prepare with oil, the skins of stags, buffalo's, elks, bullocks, &c. to make what they call *buff-leather*, for the use of military men.

This is effected by means of several large pistons rising and falling on the skins in large wooden troughs, by means of a wheel without-side, turned by the force of water. See BUFF.

*Oil-MILLS*, whether turned by men, water, hand, or horse, serve to bruise or break the nuts, olives, and other fruits and grains, whose juice is to be drawn by expression to make oil. See OIL, OLIVE, &c.

*Sawing-MILL* is a water-mill, serving to saw several planks or boards at the same time. See SAWING.

These are frequent in France, especially in Dauphiné. They were lately prohibited in England, where they were begun to be introduced, from a view to the ruin of the sawyers, which must have ensued.

There are also *Silk-MILLS*, for spinning, throwing and twisting silks ; which are large round machines in form of turrets, five or six foot high, and six yards in diameter ; which being turned either by the force of water, or that of men, work at the same time an infinity of bobbins fastened thereto, whereon the silk had been wound to be here spun and twisted. See SILK, &c.

There

There are abundance of *mills* of this kind in France, especially about Lyons and Tours, some of which are so disposed, as that three of them will go at the same time, and by the same wheel wrought by water, or by strength of hand. That in the Hopital de la Charité at Lyons, is wonderful, a single man working no less than forty-eight of these *mills*. See **MILLING**.

**Stamping MILL**. See the article **STAMPING**.

**Sugar-MILL**, is a machine that serves to bruise the sugar-canes, and express the liquor or juice contained therein. See **SUGAR**. The *sugar-mills* are very curious contrivances.—Of these there are four kinds, being turned either by water, wind, men, or horses.

Those turned by the hand were first in use, but are now laid aside, as being an intolerable hardship on the poor Negroes, who were doomed thereto; besides the slowness of their progress.

Wind-mills are the most modern, but they are yet somewhat rare; excepting in St. Christopher's and Barbadoes, and among the Portuguese. These make good dispatch, but have this inconvenience, that they are not easily stopped; which proves frequently fatal to the Negroes who feed them.

**Tan, or Bark-MILLS**, wrought by water or horses, serve to cut certain barks into a coarse sort of powder, proper for the tanning of hides, &c. See **BARK**, and **TANNING**.

**MILLS for sword-blades**, are likewise moved by water. They are frequent at Vienne in Dauphiné. By working heavy hammers, they forge those excellent sword-blades, called *blades of Vienne*.

**MILL-pool**. See the article **POOL**.

**MILLEPEDES**, *wood-lice*, a sort of little insects, with a multitude of feet, usually of a dark colour, and which when touched roll up into a ball; of considerable use in medicine.

*Millepedes* are so much in the acquaintance of the people, that they seem to be matters of their medicinal uses, and take them in many cases without any other direction. They are by all experience, found to be very diuretic and absterive; which makes them not only frequent in prescriptions for disorders in the reins, but also in obstructions of the viscera, and particularly in the jaundice.

They abound with a nitrous salt, which they seem to derive from the earthy diet they live on. It is somewhat volatilized by its digestion and circulation in the insect; as such salt always is more or less, in proportion to the digestive powers of the animal, into whose blood it enters; yet not so much, but that it is brackish and pungent upon the palate. This makes their deterfivè qualities extend further than the larger glands, and enables them to scower even the minutest passages, and keep the nerves clear from viscidities, and such things as would clog their springs; whereby they are good in palfies, epilepsies, and all nervous distempers.

As they open and cleanse away viscidities, and by their minuteness and asperities cut their way through any obstructions, they are good in struma's, and all inveterate tumours or ulcers. Remarkable cures have been performed in each way by a long use of them. They are best administered in substance, or bruised in whitewine, the liquor being taken without settling. There are several chymical preparations of *millepedes*, as spirit, volatile salt, oil, and wine of *millepedes*.

**MILLENARI\*, MILLENARIANS**, a sect among Christians, chiefly in the primitive church; who hold that Jesus Christ is to come again and reign on earth for the space of a thousand years; during which time, the faithful are to enjoy all manner of temporal blessings, and at the expiration of this term, the day of judgment is to take place. See **MILLENNIUM**.

\* The *millenarii* are also called *chiliasis*, *chiliasæ*; from the Greek *χίλιος*, *mille*, a thousand.

This opinion of the *millenarii* is very ancient, and may be traced back almost as far as the time of the apostles. It had its origin from a passage in the apocalypse too literally understood, wherein mention is made of Christ's reign on earth, &c.

The opinion of S. Papis, says Mr. Launoy, touching the new kingdom of Jesus Christ on earth, after the resurrection, was held for near three centuries, ere it was charged as erroneous; as appears from ecclesiastical history. It was allowed of, and followed by the greatest men among the primitive fathers; as Irenæus, Justin Martyr, Tertullian, &c. Dionysius of Alexandria, and St. Jerom, opposed this imaginary *millenary* reign very strongly.

**MILLENNIUM\***, a term literally signifying a *thousand years*; chiefly used for the time of our Saviour's second appearance, and reign on earth. See **MILLENARI**.

\* The word is Latin, compounded of *mille*, a thousand, and *annus*, year.

Mr. Whiston, in several of his writings, has endeavoured to support the notion of a *millennium*. According to his computation, it was to have commenced about the year 1720.

**MILLIARE, or MILLIARIUM**, among the Romans, denoted a *mile*, consisting of a thousand paces, *mille passus*; whence the name. See **MILE** and **LEAGUE**.

In the Roman empire, the *milliaria*, in all the great roads, were marked with stones, or columns, erected for that purpose;

commencing from a column in the heart of the city, called *milliare aureum*. See **ROAD**.

Those columns were also hence denominated *military columns*. See **COLUMN**.

**MILLIARY fever**. See the article **MILIARY**.

**MILLIARY glands**. See the article **MILIARY**.

**MILLIARY herpes**. See the article **HERPES**.

**MILLIARY terms**. See the article **TERM**.

**MILLING**, in the manufactories, an operation called also *fulling*. See **FULLING**.

**MILLING, or throwing of silk**, is the last preparation of silk before dyeing; serving to twist it, more or less according to the work it is intended for. See **SILK**.

To prepare the silk for *milling*, they first put it in boiling water, inclosed between two linnen cloths.—The *mill* is a square machine, composed of several pieces of wood mortised in each other so as to form a kind of large cage, in the centre whereof are two wheels placed parallel over each other, whose axis bears on two posts.—When the machine is simple, a single man turns these wheels by means of a little cog in which they catch, and a large handle.

The wheels put in motion by the handle, communicate their motion to eight windles, or reels, or even more, according to the largeness of the machine; on the flights, or arms whereof, the silk is wound from off two rows of bobbins placed on each side the machine, each row at the height of one of the two wheels in the centre.—These bobbins have their motion by means of leathern thongs, which bear on little cylinders of wood that support them, and turn at length on the two wheels at the centre; so that the silk on each bobbin twists, as it winds, and forms its separate skain.

The smallest wheel moves two hundred of these bobbins, over which a single person is sufficient to inspect, to put new bobbins or spools in lieu of those discharged of their silk, and to knot the ends when they break.

**MILLION**, in arithmetic, the number of ten hundred thousand; or a thousand times a thousand. See **NUMERATION**.

The revenues of princes are now only computed in *millions*. See **REVENUE** and **POLITICAL arithmetic**.

A *million of gold*, or *million of money*, is sometimes understood of a *million* of pounds; and sometimes a *million* of crowns. See **CROWN**, &c.

**MILL-REE, or MILLE-RAY**, a Portuguese gold coin, current for somewhat more than the Spanish pistole. See **COIN**.

The *mill-ree* is thus called, as consisting of a thousand *rees*. See **REE**.—It is also called, a *St. Stephen*, from the figure of that martyr impressed thereon.

They have also a *mill ree* of a little cross, which in reality is only half the former; and whose value is that chiefly used in computations.

**MILOHYOIDÆUS**. See **MYLOHYOIDÆUS**.

**MILT**, in anatomy, a popular name for the Spleen. See **SPLEEN**.

**MILT, or MELT**, in natural history, the soft roe in fishes; thus called by reason it yields, by expression, a whitish juice resembling milk. See **ROE**.

The *milt* is properly the seed, or spermatie part of the male fish. The *milt* of a carp is reckoned a choice bit.

It consists of two long whitish irregular bodies, each included in a very thin fine membrane. M. Petit considers them as the testicles of the fish wherein the seed is preserved: the lower part, next the anus, he takes for the vesiculæ seminales. Vid. *Mem. Acad. R. Scien.* ann. 1733. p. 291.

**MIME\*, MIMUS**, a term in the ancient comedy, signifying a *buffoon* or *mimic*, who acted postures suitable to the person, or subject represented. See **ARCHIMIMUS**.

\* The word comes from the Greek. *μιμῶ*, imitator; formed of *μιμῶμαι*, I imitate. The same comedians were also sometimes called *pantomimes*, because of their counterfeiting all manner of postures and gestures. See **PANTOMIME**.

**MIMESIS, ΜΙΜΗΣΙΣ**, in rhetoric, a figure, whereby the words, gestures, speech, actions, &c. of another person are imitated. See **MIME**, and **PANTOMIME**.

**MIND, mens**, denotes a thinking or understanding being. See **THINKING**, &c.

Philosophers generally allow of three kinds of *minds*, viz. *God*, *angels*, and the human *soul*. For a thinking being must either be finite or infinite; If infinite, it is *God*; and if finite, it is either joined with a human body, or not; if the latter, it is an *angel*; if the former, a *soul*. See **GOD**, **ANGEL**, and **SOUL**. The *human mind* is properly defined a thinking, rational substance: By *thinking*, it is distinguished from body; and by *reasoning*, from *God*, and *angels*, which are supposed to see and know things intuitively, without the help of deduction, and discourse. See **DISCOURSE**, **REASONING**, and **KNOWLEDGE**.

*Affections of the MIND*. See the article **AFFECTION**.

**MINE**, in natural history a place under ground where metals, minerals, or even precious stones, are dug up. See **METAL**, **MINERAL**, **PRECIOUS STONE**, &c.

As therefore the matter dug out of *mines* is various; the *mines* themselves acquire various denominations: as *gold mines*, *silver-*

*silver-mines, copper-mines, iron-mines, diamond-mines, salt-mines, mines of antimony, of alum, &c.*

For gold and silver mines, the richest and most celebrated are those of Peru and Chili in America. See GOLD and SILVER.

—Iron-mines are more abundant in France than elsewhere. See IRON.—Copper-mines are chiefly in Sweden and Denmark.

See COPPER.—Lead and Tin-mines abound most in England. See LEAD and TIN.—Quick-silver-mines in Hungary and Spain.—Diamond-mines in Golconda.—Salt-mines in Poland, &c. See QUICKSILVER, DIAMOND, SALT, &c.

*Metallic mines* are chiefly found in mountains; though the reason thereof does not appear. It is probable plains may abound as much therewith, would people dig deep enough. But plains are commonly cultivated; and beside, the water will scarce allow them to be dug. Add, that the *metallic veins* always run either horizontal or oblique; and for that reason, are easiest found on the sides of eminences.

The *metallic veins* are commonly encompassed with a sort of stone peculiar to the *mine*, and are accompanied with several strata of different matters, as clay, gravel, rock, &c. They who work in *mines*, know by the size, and colour of the stones, when they approach the vein. See STRATA, and VEIN.

They discover that there is a *mine* in a mountain by the marcasites, or mineral stones falling from it; by the mineral taste of the waters; by the quality of the exhalations raised from it; and by the difference between the earth over the *mines*, and that of the neighbouring parts in the cold parts of spring and autumn, the frost lying on the adjacent places, when it thaws about the *mines*. Add, that the ground's producing but little grass, and that little, pale and colourless, is an indication of a *mine*.

Some pretend to discover *mines* by the sole virtue of the hazle-tree, out of which they form a forked stick, called *virgula divinatoria*, which, they say, turns of itself, in their hands, but differently, according to the different nature of the metals or minerals underneath. This artifice made a great noise in France towards the end of the seventeenth century; and the corpuscular philosophy was called to account for it. But it is now in little credit. See VIRGULA DIVINA.

There are some *mines* wherein the metals are found at their first opening very crude and imperfect; which yet, in time, grow ripe and rich. Alonso Barba relates, that in Potosi, stones have frequently been thrown aside, as not containing any thing considerable of metal; and yet have been found many years afterwards exceeding full thereof. Cæsalpinus assures us, that earths which yield no metal at all, sometimes become very fertile veins. In an island of the Tyrrhene-Sea, after the iron *mines* have been exhausted, they stop them up about ten years, at the end whereof, they find them as rich as before.—For the formation of mineral and metallic matters in *mines*, see MINERAL.

MINE, in the art of war, denotes a subterraneous canal, or passage dug under the wall, or rampart of a fortification, intended to be blown up by gun-powder.

The *alley*, or passage of a *mine*, is usually about four foot square; at the end of this is the *chamber* of the *mine*, which is a cavity about five foot in width and in length, and about six in height; and here the gun-powder is bestowed. See CHAMBER.

The *saucisse* of the *mine* is the train; for which there is always a little aperture left. See SAUCISSE.

There are various kinds of *mines*, which acquire various names as royal *mines*, serpentine *mines*, forked *mines*, according as their passages are strait, oblique, winding, &c.

There are also *mines* made in the field, which are called *fougades*. See FOUGADE.

*Mines* are either dug within the body of the earth, as those made by the besieged to blow up the works of the besiegers, before they make a lodgment on the covered way: Or in eminences and rising grounds, as to make a breach in the ramparts, &c. Or to blow up walls: Or, lastly, to tear up rocks.

*Theory of MINES*.—M. Chevalier, in the memoirs of the royal academy of sciences, has handled the subject of *mines* with a great deal of accuracy. He has calculated the force of gun-powder, the effort it makes, and the resistance it meets with in heaving up the ground. He shews, that a cubic foot of air inclosed in two cubic feet of gun-powder, is capable of sustaining a weight of near 29000 pounds. But observes withal, that this force is vastly greater than what it is found by experience to have; and that in fact, 140 pounds of powder do not raise above 30000 pounds of earth. The reason of which difference he ascribes to several causes; as, that the powder does not take fire all at once, so that its force is divided; that part of the shock is lost in the canal or passage of the *mine*, and in the pores of the bodies encompassing the *mine*; that the tenacity of the parts of the earth resist a separation; that it is not enough that the earth be supported, but it must be carried upwards with a certain velocity; and that the weight of the atmosphere, is a very considerable obstacle, to which no regard is had in the calculation. See GUN-POWDER.

From a great number of experiments it appears, 1°. That the effect of a *mine* is always towards the weakest side; so that the

disposition of the chamber of a *mine* does not at all contribute to determine this effect either one way or another, as the miners mistakenly imagine.

2°. That the quantity of the powder must be greater or less, in proportion to the greater or less weight of the bodies to be raised, and to their greater or less cohesion; and the result of all the experiments that have been made for determining the different quantity of powder to be used for different bodies is to allow for each cubic fathom,

Of loose earth, 9 or 10 pounds of powder.

Of firm solid earth, and strong sand } 11 or 12

Of argil, or fat clayey earth, 15 or 16

Of new masonry, not very strongly bound, } 15 or 20

Of old masonry well bound, 25 or 30

3°. That the aperture, or funnel of a *mine* that has been played, if it had been rightly charged, is a cone, the diameter of whose base is double the height, taken from the center of the *mine*.

4°. That when the *mine* has been over-charged, its aperture is nearly cylindrical, the upper extremity not being much wider than the chamber at bottom, where the powder was lodged.

5°. That, beside the shock of the powder against the bodies it takes up, it likewise crushes all the earth that borders upon it, both underneath and side-ways, which crush extends itself the further as the matters make the less resistance.

To account for all the effects resulting from these experiments, and to determine the quantity of powder required for the charge of a *mine*, and the most advantageous disposition for answering the intent: let us conceive, 1°. A *mine*, whereof all the parts wherewith it is encompassed are incapable of being compressed, and make an equable resistance, such as that of a bomb equally thick throughout, suspended in the air; where it must be observed, that besides the resistance of the body, the effort of the powder must likewise surmount the weight of the ambient air; in which case the body will be beaten into dust, or at least into very small pieces.

2°. Conceive a *mine* encompassed wholly by such bodies as are equally compressible, and that resist every way with equal force. In this case, the first effect of the powder will be to compress all those bodies equally, and they will not be separated, till by the violence of their compression, they are all incapable, any longer, to resist its effort; so that unless the powder be in great quantity, all its effect may end in the mere compression of the adjacent bodies. For this reason, they sometimes block up the chamber of the *mine* with large beams, and sometimes wall it up with stones, that the adjacent bodies may resist the more.

Lastly, Suppose a *mine* where all the bodies that encompass it, are equally compressible, but where there is less resistance on one side than another; in this case, there will be a sphere of compression, whose diameter will be so much the greater, as the weak side resists the more. With regard to which, there are three things to be considered.

First, If the effort of the powder be very great with relation to the resistance of the weak side, the compression will but reach a little way, that side being tore off too suddenly for the neighbouring parts to receive their shock. In which case, the aperture or funnel will be almost cylindrical, the diameter of the upper extreme not much exceeding that of the chamber; and the earth will be thrown to a great distance, which the enemy may make an advantage of, by forming lodgments in the cavity, as was done at the siege of Verue.

Secondly, if the *mine* be under charged, it only makes a simple compression on the weakest side, as it happened at Ciudad Rodrigo.

Thirdly, if the *mine* be charged with a quantity of powder between the two extremes, it will raise a cone of earth, the diameter of whose base will have a greater or less ratio to its height from the center of the *mine*, as the effort of the powder is greater or less.

The most advantageous effect is when the diameter of the base of the cone is double its height: in which case, the earth blown up, falls almost all back again into the aperture of the *mine*; so that the enemy cannot make any lodgment.

To charge a *mine* therefore, so as it may have the most advantageous effect possible, the weight of the matter to be carried up must be known, i. e. the solidity of a right cone, whose base is double the height of the earth over the center of the *mine*, which is easily found from the rules of geometry.--- Having found the solidity of the cone in cubic fathoms, multiply the number of fathoms by the number of pounds of powder necessary for raising the matter it contains, according to the proportion already laid down: and if the cone contain matters of different weights, take a mean weight between them all; having always a regard to their degree of cohesion.

As to the disposition of *mines*, we have but one general rule, which is, that the side towards which one would determine the effect, be the weakest. But this varies according to occasions and circumstances.

Counter-MINE. See the article COUNTER-mine.

Gallery of a MINE. See the article GALLERY.

Knight

# MIN

*Knight of the MINE*, is a military honour, anciently conferred on persons who had distinguished themselves in engagements in mines.

*MINE-ships*, are ships filled with gun-powder, inclosed in strong vaults of brick or stone, to be fired in the midst of an enemy's fleet.

*MINE* is also a French measure. See *MEASURE*.

*MINERA*, in medicine, the seat, or rather matter, of a disease. See *DISEASE*.

The term is applied by some authors to those parts of the body wherein there are collections and coacervations of humours made; which hardening, form obstructions, and produce diseases.

In this sense we say, the *minera morbi*, &c.—

*MINERAL*, in natural history, is sometimes used in the general for *fossil*; and applied to any body, simple or compound, dug out of a subterraneous place or *mine*; from which it takes the denomination. See *MINE*.

In this sense, metals, sulphurs, fossil salts, semi metals, &c. are *mineral*. See *FOSSIL*.

On this principle, they divide *mineral* into two classes; the one *fusible*, and *malleable*; i. e. which melt with fire, and stretch on the anvil; which are what we properly call *metals*. See *METAL*.—The others want those two properties; and are what in the strict sense we call *minerals*. See *ORE*, and *MARCASITE*.

Some divide *minerals* into *simple* and *compound*: To the first belong *stones*; *salts*, as allum, nitre, &c. *Inflammable minerals*, as sulphur and bitumen; and *metals*, as gold, &c.

Other more accurate writers, restrain the word *mineral* to what we otherwise call *semi-metal*. See *SEMI-METAL*.

*MINERAL*, in this sense, may be defined a compound fossil, wherein there is something discovered, in all respects like metal, only that it is not malleable; joined, or compounded with some other fossil, as salt, sulphur, stone, or earth.

Such are *antimony*, *cinnabar*, *bismuth*, *calaminaris*, *vitriol*, *pyrites*, *marcasites*, *cobalt*, *oker*, the *magnet*, *lapis hzmatites*, *armenus*, and *stellatus*. See each under its proper article, *ANTIMONY*, *CINNABAR*, *BISMUTH*, *VITRIOL*, *CALAMINARIS*, &c.

Some attribute the formation of *minerals* to the action of the sun without; some to the central fire within; and some think the cold does all by uniting, condensing, and congealing certain juices of the earth.

Des Cartes takes metals to have been formed from the beginning of the world; and to have ranged themselves, by the laws of gravity, about the centre. In process of time, he supposes these to have been corroded by the acid salts, &c. and abundance of the parts thereof carried up along with those salts by the subterranean heat, and deposited in divers parts of the earth.

Monf. Tournefort supposes seeds of *minerals*, as of animals, and vegetables. Every thing, according to him, comes from eggs, even stones; and the largest rocks were originally no more than grains of sand. See his system more at length under the article *STONE*.

Others, as M. Geoffroy, contend that metals, &c. may be the result of a mixture of certain matters, which had nothing metallic in them. Thus, in the ashes of all vegetables we find a ferruginous matter which the load-stone attracts; and yet it will hardly be said that iron existed in the plants. We see no signs of iron in argilla, work it in what manner you will; and yet add linseed-oil and by fire you will procure iron. And the like may be said of divers other matters. Hence it is probable, metals may be formed by a mere combination of different ingredients; much like sulphur; which we all know is made by adding an inflammable principle to a vitriolic salt. The earth may every where abound with those matters, which are continually circulating through its pores and canals, and which meeting with an earth homogeneous to them, fix thereto; and commence *minerals*.

The *minerals*, metals, and stones lie in beds, and have done so ever since the flood, if not from the creation; yet it is highly probable they have a faculty of growing in their respective beds; that, as their beds are robbed and emptied by miners, so after a while they recruit again. Thus vitriol, Mr. Boyle thinks, may grow by the help of the air, and alum does the same. We are assured (says that author) by the experienced Agricola, that the earth, or oil of alum, being robbed of its salts will in tract of time, recover it by being exposed to the air.

As for metals, there is good reason to believe they grow likewise; from what has been alledged by Mr. Boyle in his observations about the growth of metals, and particularly as to the growth of iron. To the instances he brings from Pliny, Fallopius, Cæsalpinus, and others, we may add, that in the forest of Dean in Gloucestershire, the best iron, and in the greatest quantities, are found in the old cinders which they melt over again.—This some impute to the negligence of the former melters in not exhausting the ore. But Mr. Derham thinks it rather owing to the new impregnations of the old one, or cinders from the air, than to any seminal principle in the ore itself.

VOL. II. N<sup>o</sup>. 99.

# MIN

The chymists generally take *minerals* to be nothing else but imperfect metals, which not having arrived at maturity, may be perfected by the chymical operations, and raised to true metals.—This agreeable, but fatal delusion, has given rise to the sect of philosophers, who study the philosopher's Stone. See *METAL*, *GOLD*, *PHILOSOPHER'S Stone*, &c.

*Ethiops MINERAL*. See the article *ETHIOPS*.

*Turbith MINERAL*. See the article *TURBITH*.

*MINERAL-oil*. See the article *OIL*.

*MINERALE bezoardicum*. See the article *BEZOARDICUM*.

*Crystal MINERAL*. See *CRYSTAL mineral*.

*MINERAL-waters*, are those, which at their springing forth from under ground, are found impregnated with some *mineral* matter; as salt, sulphur, vitriol, &c. See *WATER*.

Such are hot baths, spaws, purging, &c. springs. See *BATH*, *SPAW*, *SPRING*, &c.

*MINIATURE*\*, or *MIGNATURE*, a delicate kind of painting, consisting of little points or dots, instead of lines; usually done on velom, with very thin, simple water-colours. See *PAINTING*.

\* The word comes from the Latin *minium*, red lead; that being a colour much used in this kind of painting. The French frequently call it *mignature*, from *mignon*, fine, pretty, on account of its smallness and delicacy.

*Miniature* is distinguished from other kinds of painting by the smallness and delicacy of its figures, the weakness of their colours, and faintness of the colouring; and in that it requires to be viewed very near.

Those colours that have the least body, are the best and most commodious for painting in *miniature*; as carmine, ultramarine, fine lakes, and green made of the juices of several kinds of herbs and flowers.

Painting in *miniature* is the nicest and most tedious of all others; being performed wholly with the point of the pencil.

There are some painters who never use any white colours in *miniature*, but make the ground of the velom serve to raise their figures; in which case, the lights appear bright in proportion to the depth and strength of the colours of the figures. Others, before they go to work, give the velom a light wash with white lead, well prepared and purified.

When the colours are laid on flat without dotting, though the figures be small, and the ground either velom or paper, it is not called *miniature*, but *washing*.

The colours for *miniature* may be mixed up with water of gum arabic, or gum tragacanth.

*MINIM*, in music, a note, or character of time; equal to two crotchets, or half a semibreve. See *TIME*, and *CHARACTERS of music*.

*Sextuple of the MINIM*. See the article *SEXTUPLE*.

*MINIMA naturæ*, or *MINIMA naturalia*, among philosophers, the primary particles, whereof bodies consist; the same with what are otherwise called *corpuscles* and *atoms*. See *CORPUSCLE*, *ATOM*, *MATTER*, *PARTICLE*, &c.

*MINIMA*, in the higher geometry, the smallest quantities attainable in any given case. See *MAXIMUM*.

*Per MINIMA*. See the article *PER minima*.

*MINIMENTS*, or *MUNIMENTS*. See *MUNIMENTS*.

*MINIMI digiti extensor*. See the article *EXTENSOR*.

*MINIMI digiti pedis abductor*. See the article *ABDUCTOR*.

*MINIMS*, *MINIMI*, an order of religious, instituted about the year 1440, by S. Francis de Paulo.

These have improved on the humility of the *minors*, by terming themselves *minimi*, or *minims*, q. d. least, or smallest. See *MINORS*.

*MINIMUS glutæus*. See the article *GLUTÆUS*.

*MINION*, a sort of cannon, or piece of ordnance, whereof there are two kinds; large, and ordinary. See *CANNON*, and *ORDNANCE*.

The large *MINION*, or one of the largest size, has its bore  $3\frac{1}{2}$  inch diameter, and is 1000 pounds weight; its load is  $3\frac{1}{4}$  pounds of powder; its shot three inches in diameter, and  $3\frac{3}{4}$  pound weight; its length is eight foot, and its level range 125 paces.

The ordinary *MINION* is three inches diameter in the bore, and weighs about 800 pounds weight. It is seven foot long; its load  $2\frac{1}{4}$  pounds of powder; its shot near three inches diameter, and weighs three pounds four ounces; and shoots point-blank 120 paces.

*MINISTER*, one that serves, or attends on God, the public, or a private person. See *SERVANT*.

In the reformed church, priests, or those ordained to preach, and do the other functions of the priesthood, are called absolutely and simply *ministers*.

In which sense, bishops, &c. are said to be *ministers* of God; *ministers* of the word; of the gospel, &c. In some churches they are also called *pastors*. See *BISHOP*, *PRIEST*, &c.

*MINISTERS of the altar*, are properly those who attend, and assist the priest at the administration of the eucharist.

Deacon and subdeacon, are titles that properly signify *ministers*; *diakonia*, *ministers*. See *DEACON*, and *SUBDEACON*.

Officers of state, &c. are called the king's *ministers*; as administering

# MIN

nistring the affairs of justice, policy, &c. for him. See OFFICER.

**MINISTER of state**, is he with whom a prince entrusts the administration of his government; or to whom he commits the care, and direction of the principal affairs thereof. See STATE, GOVERNMENT, and ARCH-MINISTER.

Boethius is proposed as a model for *ministers* of state. The grand visier is the prime *minister* of the Ottoman empire. See VISIER.

**Foreign MINISTERS**, or the *ministers of foreign princes*, are their ambassadors, envoys, agents or residents in the courts of other princes.

There are two kinds of foreign *ministers*.—*Ministers* of the first rank, who are also called *ambassadors* and *envoys in extraordinary*. See EMBASSADOR, and ENVOY.

And *ministers* of the second rank, who are the ordinary residents. See RESIDENT.

Those of the first rank have a representative character, which the others have not; though these last are sometimes invested with fuller powers than the former.

**MINISTER** is also the title which certain religious orders give to their superior. See SUPERIOR.

In this sense we say the *minister* of the Mathurins, or Trinitarians. See TRINITARIAN, &c.

**MINISTER**, among the Jesuits, is the second superior of each house; thus called, as being an assistant to the superior, or rector. See JESUITS.

The general of the Cordeliers order is called the *minister general*. See GENERAL.

**MINISTRY**, or **MINISTERY**, a profession, office, or employment which a person discharges for the service of God, the publick, or some particular person. See MINISTER.

In which sense we say, a bishop must give account to God of his *ministry*, &c.

**MINISTRY** is also used for the government of a state, by some great minister, under the sovereign authority.

In which sense we say, the *ministry* of the cardinal de Richelieu, &c.

**MINISTRY** is also frequently used as a collective word, signifying the ministers or officers of state.

Thus we say, the *ministry* opposed a thing; meaning, the ministers opposed it.

**MINIUM**, a mineral colour, called also *red lead*, used by painters, illuminers, &c. See LEAD.

*Minium* is a preparation of lead, performed by fire. It is made by melting the metal in an earthen unglazed pan, and stirring it over the fire till it be reduced to a powder called *calcined lead*, which being further urged by a reverberatory fire for three or four hours, turns red, and is the *minium*.

Beside the use of *minium* as a colour, it is also an ingredient in an officinal composition, called *emplastrum de minio*, used as a desiccative and cicatrizer.

It was with *minium*, prepared in this manner, the ancient Roman and Grecian ladies tinged their nails and faces of a red colour. For as to vermillion, without doubt, it was not known in those days. See VERMILLION.

**MINOR**, a Latin term, literally denoting *less*; used in opposition to *major*, greater. See MAJOR.

Thus we say, St. James *minor*; Asia *minor*; the *minor* excommunication, &c.

The four *MINOR orders*, are the four inferior orders conferred in the Romish church, between the tonsure and subdeaconate.—These are that of *porter*, or *door-keeper*; that of *reader*; that of *exorcist*; and that of *acolyth*. See EXORCIST, ACOLYTH, &c.

**MINOR ædiles**. See the article ÆDILE.

**MINOR anticus ferratus**. See the article SERRATUS.

**MINOR barons**. See the article BARON.

**Canis MINOR**. See the article CANIS.

**Rectus MINOR**. See the article RECTUS.

**MINOR gastricus**. See the article GASTRICUS.

**MINOR oculi obliquus**. See the article OBLIQUUS.

**Teres MINOR**. See the article TERES.

**Urfa MINOR**. See the article URSA.

**MINOR**, in law, denotes a person yet under age, or who, by the laws of the country, is not yet arrived at the power of administering his own affairs, or the possession of his estate. See AGE.

Among us a person is a *minor* till the age of twenty-one: before which time his acts are invalid. See MAJOR.

Yet if a patron, &c. have a right of advowson, by the common law he may present at the age of fourteen years; and may of himself, and without his father, or guardian, consent to any process relating to beneficiary matters. See PATRON.

Hence, in the canon law, there is no title, *de minoribus*; and the reason is, that the several ages whereat the common law declares a person capable of a benefice, or of sacred orders, are so many species of canonical majorities.

**MINOR**, in logic, is the second proposition of a formal, or regular syllogism, called also the *assumption*. See SYLLOGISM, PROPOSITION, ASSUMPTION, and MAJOR.

I grant the major, but deny the *minor*. See TERM, and PREMISES.

# MIN

**MINOR**, in music, is applied to certain concords, which differ from, or are lower than others of the same denomination by a lesser semi-tone, or four commas.

Thus we say, a third *minor*, or lesser third; a sixth major, and *minor*. See THIRD, SIXTH, &c.

Concords that admit of major and *minor*, i. e. greater and less, are said to be *imperfect concords*. See CONCORD.

**MINORS**, or *Friars MINORS*, an appellation which the Franciscans assume, out of shew of humility; calling themselves *fratres minores*, i. e. *lesser brothers*; and sometimes *minorites*. See CORDELIERS, and ORDER.

There is also an order of regular *minors* at Naples, established in the year 1588, and confirmed by Sixtus V.

**MINOT**, a French measure. See MEASURE.

**MINOTAUR**, MINOTAURUS, in antiquity, a fabulous monster, much talk'd of by the poets; feigned to be half man, and half bull.

The *minotaur* was brought forth by Pasiphaë, wife of MINOS king of Crete. It was shut up in the labyrinth of that island; and at last killed by Theseus. See LABYRINTH.

Servius gives us the explication of this fable. He says, that a secretary of King Minos, named Taurus, bull, had an intrigue with the queen Pasiphaë, in the chamber of Dædalus; and that she was at length delivered of twins, one of which resembled Minos, and the other Taurus.—This occasioned the production to be reputed monstrous.

**MINOVERY**\*, a trespass committed in the forest, by something that is a man's handy-work; as an engine to catch deer, &c. See FOREST.

\* The word is formed of the French *Main auxre*, q. d. handy-work.

**MINSTER**\*, anciently signified the church of a monastery, or convent. See CHURCH.

\* The word is Saxon, *mynster*, or *mynstre*.

**MINSTREL**\*, an ancient term for a fidler, or player on any other kind of musical instrument.

\* Borel derives the word from *manus* and *histrio*, one who diverts with the hand; or from *minor histrio*, little buffoon: Du Cange from *ministrellus*, a diminutive of minister, by reason the *minstrels* were anciently ranked among the lower officers, ministers, or servants.

The word *minstrel*, in its original, was used for people who sung, and serenaded their mistresses. Afterwards it became a name for all kinds of musicians; and at length passed to buffoons, and country-scraper.

**MINT**, the place where the king's money is coined. See COIN.

Anciently there were *mints* in most cities of England. See MONEY, and COINAGE.—The chief *mint* at present, is the Tower of London. See TOWER.

**Officers of the MINT**, are, 1°. The *warden*, who is the chief, and is to receive the bullion, and over-see all the other officers. See WARDEN, and MASTER. 2°. The *master-worker*, who receives the bullion from the warden, causes it to be melted, and delivered to the moneyers, and takes it from them again when coined. 3°. *Comptroller*, who is to see that the money be made to the just assize, and to over-see the officers. 4°. The *assay-master*, who weighs the silver and gold, and sees whether it be standard. 5°. The *auditor*, who takes all the accounts. 6°. The *surveyor of the melting*, who is to see the silver cast out, and that it be not altered after it is delivered to the melter, i. e. after the assay-master has made trial of it. 7°. The *clerks of the irons*, who is to see that the iron be clean, and fit to work with. 8°. The *graver*, who engraves the dyes and stamps for the coinage of the money. 9°. The *melters*, who melt the bullion before it comes to coining. 10°. The *blanchers*, who anneal, or boil and cleanse the money. 11°. The *porters*, who keep the gate of the *mint*. 12°. The *provost of the mint*, who provides for all the moneyers, and oversees them. And lastly, the *moneyers*, some of which shear the money; some forge it; some stamp or coin it; and some round and mill it. See COINAGE.

**MINT-water**. See the article WATER.

**MINTERS**, or **MONEYERS**. See MONEYERS.

**MINTING**, is sometimes used for the coining of money. See COINING.

**MINUS**, in algebra. See CHARACTERS in arithmetic.

*Quo MINUS*, in law. See the article *Quo minus*.

**MINUSCULÆ**, in printing, denotes the small, or running letters; as contradistinguished from *majuscule*, or capitals. See LETTER, CAPITAL, &c.

**MINUTE**\*, in geography and astronomy, is the 60th part of a degree. See DEGREE.

\* The word comes from the Latin, *minus*, small.

In which sense, *minute* is also called *prime*, or *prime-minute*. See PRIME.—The diameter of the sun is seen under an angle of 39 *minutes* in winter; and 31 in summer. See DIAMETER, and SUN.

The divisions of degrees are *fractions*, whose denominators increase in a sexagecuple ratio; that is, a *minute* or *prime* is  $\frac{1}{60}$ ; a second, or second *minute* is  $\frac{1}{3600}$ , &c. See SEXAGESIMAL.

In astronomical tables, &c. *minutes* are expressed by acute accents,

# M I R

cents, thus, ' ; seconds by two, " ; thirds by three, " . See SECOND, and THIRD, &c.

MINUTE, in computation of time, is used for the sixtieth part of an hour. See HOUR.

MINUTE, in architecture, usually denotes the sixtieth, sometimes only the thirtieth part, or division of a module. See MODULE.

MINUTE, is also used to signify a short memoir, or sketch of any thing taken hastily in writing.

In this sense we say, the *minutes* of the proceedings of the house of lords, &c.

Meridional MINUTES. See the article MERIDIONAL.

MINUTES of *emersion*. See the article EMERSION.

MIPARTY, *Chamber of*. See CHAMBER.

MIQUELETS, a kind of foot-soldiers, inhabiting the Pyrenean mountains; armed with pistols under their belts, a carbine, and a dagger. — The *miquelets* are dangerous people for travellers to meet.

MIRABILIS *aqua*. See the article WATER.

RETE MIRABILE. See the article RETE.

MIROBOLANS, or MYROBALANS, in pharmacy. See MYROBALANS.

MIRACLE, in a popular sense, is a *prodigy*; or an extraordinary event that surprizes us by its novelty. See PRODIGY.

MIRACLE, in a more accurate and philosophical sense, is an effect that does not follow from any of the known laws of nature; or which is inconsistent with some known laws thereof. See NATURE.

A *miracle*, therefore, being a suspension of some law, cannot come from any hand less than his who fixed that law. See GOD, LAW, &c.

Spinoza denies that any power can supersede that of nature; or that any thing can disturb, or interrupt the order of things: and accordingly defines a *miracle* to be a rare event, happening in consequence of some laws that are unknown to us. See SPINOSISM.

Divines define *miracle*, an extraordinary and wonderful effect, above the power of nature, wrought by God, to manifest his power or providence; or to give credit to some messenger sent from himself. — Thus Jesus Christ evinced the truth of his mission, and his doctrine, by *miracles*; and thus also did Moses. It is still a dispute in the world, how far it may be in the power of the devil to work *miracles*; or wherein the specific difference lies between the *miracles* of Moses, and those of Pharaoh's magicians; those of Jesus Christ and the apostles, and those of Simon Magus and Apollonius Tyaneus! Whether the latter were any more than mere delusions of the senses; or whether any supernatural and diabolical power concurred with them? See MAGIC.

The Romans attribute *miracles* to their emperors Adrian and Vespasian — The church of Rome abounds in *miracles*; it we believe their writers, some of their monks have wrought more *miracles* than all the apostles; and this without any visible necessity for them.

As full as that church pretends to be of saints, it is a rule with them, that none are ever canonized till there be good proof of his having wrought *miracles*. So that were all those allowed good *miracles*, and to have happened out of the common order of nature, they are so numerous, one would be tempted to think there were no order or law of nature at all. See SAINT and CANONIZATION.

St. Augustine is a strong advocate for *miracles*. He mentions several, whereof he was an eye-witness; and others, whereof he was informed by those that were. In the single city of Hippo he tells us there were seventy *miracles* wrought in the space of two years, on the building a chapel in honour of St. Stephen. There are those however, who set aside the authority of all *miracles*; thinking it unbecoming the wisdom of God to establish such laws, as that he should find it frequently necessary to supersede. And as the former, from the avowed authority of some *miracles*, fetch an argument for the truth of all; pleading those which are allowed as well as those which are questioned: so these alledge the false ones as conclusions against them all.

In effect, though *miracles* may prove the superintendency of a voluntary agent, and that the universe is not guided by necessity or fate; yet that mind must be weak and inadvertent, who needs them to confirm the belief of a wise and good deity: Since the deviation from general laws, unless upon very extraordinary occasions, must be a presumption of inconstancy and weakness, rather than of a steady wisdom and power; and must weaken the best argument we have for the sagacity and power of the universal mind. *Inquiry into the original of the ideas of beauty, &c.*

MIRROUR, or MIRROR, a *speculum*, or body which exhibits the images of objects presented thereto, by reflection. See REFLECTION.

The use of *mirrors* is very ancient. Mention is made of brazen *mirrors*, or looking-glasses, in Exodus xxxviii. 8. where Moses is said to have made a *brazen laver*, or basin, of the looking-glasses of the women continually assembled at the door of the tabernacle. It is true, some modern commentators will not allow the *mirrors* themselves to have been brass; but of glass,

# M I R

only set, or framed in brass. But the most learned among the rabbins do all allow that in those times, the *mirrors* made use of by the Hebrew women in dressing their heads, were of metal; and that the devout women mentioned in this passage, made presents to Moses of all their *mirrors* to make the brazen laver. See the Jesuit Bonfrerius's comment on this text. It might likewise be proved, that the ancient Greeks made use of brazen *mirrors*; from divers passages among the ancient poets. See BURNING glass.

MIRROUR, in the more confined sense of the word, is peculiarly used to signify a smooth surface of glass, tinned or quicksilvered on the back side; which exhibits the images of objects opposed thereto. See LOOKING-GLASS.

MIRROUR, in catoptrics, denotes any polished body impervious to the rays of light, and which of consequence reflects them equally. See RAY, and LIGHT.

Thus water in a deep well or river, and smooth polite metals, are ranked among the number of *mirrors*.

In this sense, the doctrine of *mirrors* makes the subject of catoptrics. See CATOPTRICS.

The doctrine of MIRROURS is founded on the following general principles. — 1°. Light reflected from any *mirrour*, or *speculum*, makes the angle of incidence equal to that of reflection; which see demonstrated under the word REFLECTION.

Hence, a ray of light, as H B (*Tab. Optics, fig. 26.*) falling perpendicularly on the surface of a *speculum*, D E, will be reflected back upon itself: — which we find by experience it actually does.

From the same point of a *mirrour*, therefore, A, there cannot be several rays reflected to the same point; since in that case, all the angles of reflection must be equal to the same angle of incidence A B D, and therefore to each other; which is absurd. Nor can the ray A B be reflected to two or more points, since, in that case, all the angles of reflection would be equal to the same angle of incidence A B F: which is likewise absurd.

2°. From every point of a *mirrour*, are reflected rays thrown on it from every point of a radiant object. — Since then rays coming from different parts of the same object, and striking on the same point of the *mirrour*, cannot be reflected back to the same point; the rays which flow from different points of the same radiating object, are again separated after reflection: so that each point shews whence it came. See RADIANT.

Hence it is, that the rays reflected from *mirrors* exhibit the objects to view. — Hence also, it appears, that rough uneven bodies must affect the light in such manner, as that rays coming from different points will be blended or thrown confusedly together.

*Mirrors* may be divided into *plane*, *concave*, *convex*, *cylindrical*, *conical*, *parabolical*, and *elliptical*.

Plane MIRROURS, are those which have a plain or flat surface. See PLANE, and PLAIN.

These, by a popular word, we call *looking-glasses*.

For the manner of making plain *mirrors*, or *specula*, see LOOKING-GLASS.

Laws and phenomena of plain *mirrors*. — 1°. In a plain *mirrour*, every point of an object, as A, (*Tab. Optics, fig. 27.*) is seen in the intersection, B, of the cathetus of incidence, A B, with the reflected ray C B.

Hence, 1°. As all the reflected rays meet with the cathetus of incidence in B; by whatever reflected ray the radiant point A be seen, it will still appear in the same place. Consequently, any number of persons viewing the same object in the same *mirrour*; will all see it in the same place behind the *mirrour*. — And hence it is, that the same object has only one image, and that we do not see it double with both eyes. See VISION.

Hence also the distance of the image B, from the eye C, is compounded of the ray of incidence A D, and the reflected ray C D: And the object A radiates reflectedly, in the same manner as it would do directly, were it removed into the place of the image.

2°. The image of a radiant point, B, appears just so far behind a plain *mirrour*, as the radiant point is before it.

Hence, If the *mirrour* A G be placed horizontal; the point A will seem so much below the horizon, as it is really elevated above it: Consequently, erect objects will appear as if inverted; and therefore men standing on their feet, as if on their heads. Or, if the *mirrour* be fastened to the ceiling of a room, parallel to the horizon, objects on the floor will appear above the ceiling as much as they really are below it; and that upside down.

3°. In a plain *mirrour*, the images are perfectly similar, and equal to the object. And hence their use as looking-glasses.

4°. In a plain *mirrour*, things on the right hand, appear as on the left; and *vice versa*.

Hence also, we have a method of measuring any inaccessible altitude by means of a plain *mirrour*. — Thus, the *mirrour* being placed horizontally in C, (*Fig. 28.*) retire from it till such time as the top of the tree be seen therein. Measure the height of the eye D E; the distance of the station from the point of reflection E C, and the distance of the foot of the tree from the same. Then to E C, C B, and E D, find a fourth proportional

portional A B. This is the altitude sought. See ALTITUDE. 5°. If a plain *mirrour* be inclined to the horizon in an angle of 45 degrees; an object perpendicular to it will appear parallel, and an horizontal object perpendicular.

And hence, the eye being placed beneath the *mirrour*, the earth will appear perpendicularly over it; or if placed over it, the earth will appear perpendicularly under it. Hence also, a globe descending down a plane a little inclined, may, by means of a *mirrour*, be exhibited as mounting up a vertical plain, to the great surprize of such as are unacquainted with catoptrics. — And hence we have a method of representing ourselves as if flying. — For a *mirrour* inclined to the horizon under an angle of 45°, we have observed, will represent vertical objects as if horizontal. Consequently, a large *mirrour* being so disposed; as you advance toward it, you will seem to move horizontally; and nothing will be wanting to the appearance of flying, but strike out the arms and legs. It must be added, however, that as the floor is elevated along with you, your feet will still be seen to walk as along a vertical plane. To deceive the eye intirely, therefore, it must be kept from the feet.

6°. If the object A B (fig. 29.) be parallel to the speculum C D, and equally distant from it, with the eye; the reflecting line C D will be half the length of the object A B.

And hence, to be able to see the whole body in a plain *mirrour*; its height and breadth must be half your height and breadth. Consequently, the height and breadth of any object to be seen in a *mirrour*, being given; we have also the height and breadth of the *mirrour* wherein the whole object will appear, at the same distance with the eye.

Hence also, as the length and breadth of the reflecting part of the speculum, are subduple of those of the object to be reflected; the reflecting part of the *mirrour*, is to the surface reflected in a subquadruple ratio. Consequently, the reflecting portion being a constant quantity; if in any place you see the whole body in a *mirrour*, you will see it in every other place, whether you approach nearer, or recede farther from it.

7°. If several *mirrours*, or several fragments, or pieces of a *mirrour*, be all disposed in the same plane; they will only exhibit an object once.

8°. If two plain *mirrours*, or specula meet in any angle; the eye, placed within that angle, will see the image of an object placed within the same, as often repeated as there may be catheti drawn determining the places of the images, and terminated without the angle.

Hence, as the more catheti terminated without the angle, may be drawn as the angle is more acute; the acuter the angle, the more numerous the images. Thus Z. Traber found at an angle of one third of a circle, the image was represented twice, at  $\frac{1}{2}$  thrice, at  $\frac{2}{3}$  five times, at  $\frac{3}{4}$  eleven times.

Further, if the *mirrours* be placed upright, and so contracted; or if you retire from them, or approach to them, till the images reflected by them coalesce, or run into one, they will appear monstrously distorted: Thus, if they be at an angle somewhat greater than a right one, the image of your face will appear with only one eye; if the angle be less than a right one, you will see three eyes, two noses, two mouths, &c. At an angle still less, the body will have two heads. At an angle somewhat greater than a right one, at the distance of four feet, the body will be headless, &c. Again, if the *mirrours* be placed the one parallel to the horizon, the other inclined to it, or declined from it, it is easy to perceive that the images will be still more romantic. Thus, one being declined from the horizon to an angle of 144 degrees, and the other inclined to it; a man sees himself standing with his head to another's feet.

Hence it appears how *mirrours* may be managed in gardens, &c. so as to convert the images of those near them into monsters of various kinds: And since glass *mirrours* will reflect the image of a lucid object twice or thrice; if a candle, &c. be placed in the angle between two *mirrours*, it will be multiplied an infinite number of times.

On these principles are founded various catoptric machines, some of which represent objects infinitely multiplied and distorted; others infinitely magnified, and set at vast distances. See CATOPTIC *cistula*, &c.

Convex MIRRORS are those whose surface is convex. See CONVEX.

Note, by *convex* surfaces, authors generally mean such as are spherically convex. See CONVEXITY.

Manner of preparing or making convex specula, or MIRRORS. — There are divers methods used by divers artists; particularly as to the matter, or composition. One of the best that is known, is given by Wolfius thus:

Melt one part of tin, another of marcasite together, and to the melted mass add two parts of mercury; as soon as the mercury begins to evaporate into smoke (which it presently does) the whole compost is to be thrown into cold water, and when well cooled, the water decanted off. The mixture is then to be strained through a linen cloth two or three fold; and what is thus fecerned, poured into the cavity of a glass sphere: this sphere is to be turned gently round its axis till the whole surface is covered; the rest being reserved for future use.

If the sphere were of coloured glass, the *mirrour* will be so too.

And in the same manner may conic, elliptic, cylindric, and other *mirrours* be made.

How they may be made of metal, see under *concave* MIRROR.

Laws, or phenomena of convex MIRRORS. — 1°. In a spherical convex *mirrour*, the image of a radiant point appears between the centre, and the tangent; but nearer to the tangent than the centre.

Hence, the distance of the object from the tangent is greater than that of the image. And, consequently, the object is further distant from the speculum than the image.

2°. If the arch B D, (fig. 31.) intercepted between the point of incidence D, and the cathetus A B; or the angle C formed in the centre of the *mirrour* by the cathetus of incidence A C, and that of obliquation F C, be double the angle of incidence; the image B will appear on the surface of the speculum.

3°. If the arch intercepted between the point of incidence, and the cathetus; or the angle C formed in the centre of the *mirrour* by the cathetus of incidence, and the cathetus of obliquation, be more than double the angle of incidence; the image will be without the *mirrour*.

4°. If the arch intercepted between the point of incidence, and the cathetus; or the angle formed in the centre of the *mirrour*, by the cathetus of incidence, and that of obliquation be less than double the angle of incidence; the image will appear within the speculum.

5°. In a convex *mirrour*, a remoter point, A, (fig. 32.) is reflected from a point F, nearer the eye O, than any nearer point B in the same cathetus of incidence.

Hence, if the point of the object A, be reflected from the point of the *mirrour* F; and the point of the object B from the point of the *mirrour* E: all the intermediate points between A and B will be reflected from the intermediate points of the speculum between F and E. Consequently F E will be the line that reflects A B.

Hence also, a point of the cathetus B, seems at a greater distance C b from the centre C; than a more remote one, A.

6°. A nearer point B (fig. 33.) not in the same cathetus with a remoter, H; is reflected to the eye O, from a nearer point of the speculum, than the remoter H.

Hence, if the point of an object A, be reflected from the point of a *mirrour* C; and the point of the object B, from the point of the speculum D, all upon the same point O: All the intermediate points between A and B will be reflected from all the intermediate points between C and D. Consequently, the image F G, of the object B A, is contained between the cathetus B E, and A E.

7°. In a spherical convex *mirrour*, the image is less than the object.

And hence the use of such *mirrours* in the art of painting, where objects are to be represented less than the life.

8°. In a convex *mirrour*, the more remote the object; the less its image: And again, the smaller the *mirrour*, the less the image.

9°. In a convex *mirrour*, the right hand is turned to the left; and the left to the right: And magnitudes perpendicular to the *mirrour*, appear topsy turvey.

10°. The image of a right line perpendicular to the *mirrour*, is a right line; but that of a right line either oblique to the *mirrour*, or parallel thereto, is convex.

11°. Rays reflected from a convex *mirrour*, diverge more than if reflected from a plane *mirrour*.

Hence light, by being reflected from a spherical *mirrour*, is weakened; and, consequently, the effects of reflected light are weaker than those of direct. Hence also, myopes see remote objects more distinctly in a convex *mirrour*, than they do directly.

Rays reflected from a convex *mirrour* of a smaller sphere diverge more than if reflected from a larger. Consequently, the light is more weakened, and its effects are less considerable in the former case than the latter.

Concave MIRRORS are those whose surface is concave. See CONCAVE.

Note, by *concave*, authors commonly mean spherically concave.

Manner of preparing or making concave MIRRORS. — First, a mould is to be provided for casting them. In order to this, take clay well dried, pulverize, and sift it; mix it up with water, and then strain or filter it; with this, work up horse-dung and hair shred small, till the mass be sufficiently tough; to which, on occasion, may be added charcoal-dust, or brick-dust, well sifted.

Two coarse moulds are then prepared of a gritty stone, the one concave, the other convex, which are to be ground on one another with wet sand between, till such time as the one perfectly fits the other. By this means a perfect spherical figure is acquired.

The mass prepared before, is now to be extended on the table by means of a wooden roller, till it be of a thickness proper for the *mirrour*; and then being strewn with brick-dust to prevent its sticking, it is laid over the convex mould, and so gets the figure of the *mirrour*. When this is dry, it is covered with another lay of the same mass; which once dried, both covers, or

or segments of the hollow sphere made of clay, are taken off. The innermost of the two being laid aside, the stone mould is anointed with a pigment prepared of chalk and milk, and the outer cover again put over it.

Lastly, the joining being covered over with the same clay whereof the cover is formed; the whole mould is bound together with iron-wire; and two holes cut through the cover, the one for the melted matter of the *mirrour* to be poured thro', the other for the air to escape at, to prevent the *mirrour's* being spoiled with bubbles.

The mould thus prepared; eight parts of copper, one of English tin, and five of marcasite, are melted together; a little of the mixture is taken out with a ladle, and if it be too red, when cold, more tin is put in; if too white, more copper: The mass is then poured into the mould before prepared; and so assumes the figure of a *mirrour*.

Some with ten parts of copper mix four of English tin, a little antimony and sal armoniac, stirring the mass about as long as any fumes arise from it. Others have other compositions; many of which are described by Schottus and Zahnus.

The *mirrour* being thus cast, is cemented to a wooden frame, and thus worked to and fro over the convex stone mould, first with water and sand; and lastly, without sand, till it be fit for polishing. The stone-mould is then covered with paper, and that smeared over with Tripoly-dust and calx of tin: over which the *mirrour* is worked to and fro till it has got a perfect polish --- And in the same manner are glass *mirrours* polished, excepting that the convex surface is there worked in the concave mould.

When the *mirrours* are very large, they are fixed on a table, and first ground with a gritty stone, then with pumice, then with fine sand, by means of a glass cemented to a wooden frame; and lastly rubbed with calx of tin and Tripoly dust by a wet leather.

For concave *mirrours* of glass; the mould is usually made of alabaster: The rest, as in metal *mirrours*.

*Laws and phenomena of concave MIRRORS.* --- 1°. If a ray, as K I, (fig. 34.) fall on a concave *mirrour* L I, under an inclination of 60 degrees, and parallel to the axis A B; the reflected ray I B will concur with the axis A B in the pole of the glass B. --- If the inclination of the incident ray be less than 60 degrees, as that of E, the reflected ray E F will concur with the axis at the distance B F, which is less than a fourth part of the diameter. --- And universally, the distance of the point F, wherein the ray H E concurs with the axis, from the centre C, is to half the radius C D in the ratio of the whole sine, to the cosine of inclination.

Hence it is gathered by calculation, that in a concave spherical *mirrour*, whose breadth subtends an angle of six degrees, parallel rays meet after reflection in a part of the axis less than the one thousand four hundred fifty seventh part of the radius: if the breadth of the concave *mirrour* be 6, 9, 12, 15, or 18 degrees; the part of the axis wherein the parallel rays meet after reflexion is less than  $\frac{1}{31}$ ,  $\frac{1}{128}$ ,  $\frac{1}{49}$ ,  $\frac{1}{25}$ ,  $\frac{1}{16}$  of the radius.

And on this principle it is, that *burning-glasses* are built. For since the rays diffused through the whole surface of the concave *mirrour*, after reflection are contracted into a very small compass; the light and heat of the parallel rays must be prodigiously increased thereby, viz. in a duplicate ratio of the breadth of the *mirrour*, and the diameter of the circle wherein all the rays are collected: And since the sun's rays are, as to any purposes on earth, parallel, (see LIGHT) no wonder concave *mirrours* should burn with so much violence. See BURNING-glass.

From this same principle is likewise deduced a method of representing the images of objects in a dark room; which see under CAMERA obscura.

2°. A lucid body being placed in the focus F, of a concave *mirrour*, E I, (fig. 34.) the rays after reflection become parallel. Hence an intense light may be projected to a vast distance, by a lighted candle, &c. placed in the focus of a concave *mirrour*. Hence also, if the parallel rays be received by another concave *mirrour*, they will again concur in its focus, and burn.

Zahnus mentions an experiment of this kind made at Vienna, where two concave *mirrours*, the one six, the other three feet diameter, being placed about twenty-four feet apart, with a live-coal in the focus of the one, and a match and tinder in the other, the rays of the coal lighted the candle.

3°. If a lucid body be placed between the focus F, (fig. 34. n. 2.) and the *mirrour* H B C, the rays after reflection will diverge from the axis B A. Whence it follows that light is weakened by reflection.

4°. If a lucid body be placed between the focus F, and the centre G, the rays after reflection will meet in the axis beyond the centre.

Hence if a candle be placed in I, its image will appear in A; if it be placed in A, its image will be in I; in the intermediate points between I and A the section of light will be a circle, and that so much the greater, as it is nearer the point of concourse.

5°. If a luminous body be placed in the centre of the *mirrour*, all the rays will be reflected back upon themselves.

Vol. II. N°. 99.

Hence if the eye be placed in the centre of a concave *mirrour*, it will see nothing but itself, and that confusedly through the whole *mirrour*.

68. If a ray falling from the point of the cathetus b, (fig. 35.) on the convex *mirrour*, b E, be together with its reflex I F, continued within the concavity of the *mirrour*; F H will be the incident ray from the point of the cathetus H, and F O its reflex.

Hence, since the point of the cathetus H is the image of the point b in the convex *mirrour*; but the point b the image of H in the concave: if the image of an object reflected by a convex speculum, be seen by a reflection made in its concavity, it will appear like the object itself.

And since the image of an infinite cathetus is less in a convex glass by one fourth of its diameter; a portion of the cathetus less than a fourth part of the diameter, may appear of any magnitude required in a concave one.

A point therefore distant from a concave speculum, less than one fourth of the diameter, must appear behind the *mirrour* at any distance, how great soever.

Since the image of any object, how broad soever, is contained in a convex speculum, between the two lines of incidence of its extreme points; if an object be placed between the two lines at a distance less than one fourth of its diameter, the breadth of the image, how great soever, may all appear.

Since the image of an object included between two lines, at a distance less than one fourth of the diameter, may exceed the just height and breadth of the object; nay, may be made of any magnitude, how big soever: Objects placed between the focus and *mirrour*, must appear of enormous magnitudes in concave *mirrours*; the image being so much the greater in the concave *mirrour*, as it is less in the convex.

In a convex *mirrour*, the image of a remote object appears nearer the centre than that of a nearer object: therefore in a concave *mirrour*, the image of an object remote from the *mirrour*, appears at a greater distance than that of a nearer object, provided the distance of the object from the centre be less than a fourth part of the diameter.

In a convex speculum, the image of a remote object is less than that of a near one; therefore in a concave one, the image of an object placed between the focus and the *mirrour*, is nearer the focus than the speculum.

The image therefore of an object receding continually from a concave speculum, becomes continually greater, provided it do not recede beyond the focus, where it becomes confused; and as it approaches, it grows continually less.

In a convex speculum, if the sphere, whereof it is a segment, be smaller, the image is smaller than in another of a larger sphere; therefore in a concave, if the sphere whereof it is a segment, be smaller, the image will be larger than in another, whose sphere is larger: whence concave *mirrours*, if they be segments of very small spheres, will do the office of microscopes.

7°. If an object be placed between a concave *mirrour* and its focus, its image will appear behind the *mirrour*, in an erect but inverted situation.

8°. If an object A B, (fig. 36.) be placed between the focus and the centre, its image E F will appear inverted, and in the open air, beyond the centre, the eye being placed beyond the centre.

9°. If an object E F be placed beyond the centre C, and the eye likewise beyond the centre, the image will appear inverted in the open air between the centre and the focus.

Hence, the inverted images of objects placed beyond the centre, are reflected by a concave *mirrour*, erect, and may be received on a paper applied between the centre and the focus, especially if the room be dark: if the object E F be further distant from the centre than is the focus, the image will be less than the object.

On this principle, concave *mirrours*, especially those which are segments of large spheres, and are capable of reflecting entire objects, exhibit many pleasing phenomena. Thus, if a man flourish a sword against the *mirrour*, another comes out thereof, and meets him with the same motions; and the image of his head coming out of the *mirrour*, if he strike it with his real sword, the imaginary sword will strike his real head. If he stretch out his hand, another hand will be stretched out of the *mirrour*, and meet it at a great distance in the open air, &c.

And on the same principle are built catoptric cistulae, which when looked into, exhibit images vastly bigger than the chett. See CATOPTRIC cistula.

10°. The image of a right line perpendicular to a concave *mirrour*, is a right line; but all oblique or parallel lines are concave.

Cylindrical, conical, parabolical, and elliptical MIRRORS, or specula, are those terminated by a surface respectively cylindrical, conical, parabolical, and spherical. See CYLINDER, CONE, PARABOLA, &c.

To prepare, or make, cylindrical, conical, parabolical, elliptical, and hyperbolical MIRRORS. --- For the cylindrical and conical for, if they are to be of glass, the method of preparing them

them is the same as that already laid down for convex *mirrours*.

If of metal, they are to be made after the manner of concave *mirrours*, only that the clay-moulds there described, require other wooden ones of the figure of the *mirrour*.

For *elliptical*, *parabolical*, and *hyperbolical mirrours*, the mould is to be thus prepared: On a wooden or brazen plane or table, describe the figure of an ellipsis, A B, (*fig. 37.*) a parabola, or an hyperbola, C D, (*fig. 38.*) after the manner taught under those heads; which done, cut out the figure from the plane with all the accuracy imaginable.

To the elliptic figure, fit an axis, as E F, with two fulera to sustain it, &c. and a handle to move it. Lay a quantity of the clay above described under it; and turn about the axis by the handle, till the plane A B have turned, or impressed the elliptical figure exactly thereon.

The axis of the parabolical, or hyperbolical figure C D, is to be fixed at the vertex in such manner as that it may always remain erect. This to be turn'd about as above, till it have given its own figure to the clay applied about it.

The part of the mould thus formed, is to be dried, and either smeared over with fat, or sprinkled with brick-dust. Then a convex mould to be made, by putting a quantity of the same clay into the cavity thus formed.—This latter is called the *male*, as the former the *female* mould.

The male mould being well dried, is to be applied within the female; in such manner as only to leave the intended thickness of the *mirrour* between them.—The rest as for concave *mirrours*.

These *mirrours* are not made without the utmost difficulty; by reason, be the moulds ever so just, the figure of the *mirrour* is apt to be damaged in the grinding.

*Phænomena, or properties of cylindrical MIRROURS.*—1°. The dimensions of objects corresponding length-wise to the *mirrour*, are not much changed; but those corresponding breadth-wise have their figures altered, and their dimensions lessened so much the more, as they are further from the *mirrour*: Whence arises a very great distortion.

2°. If the plane of reflexion cut the cylindric *mirrour* through the axis, the reflexion is performed in the same manner, as in a plane *mirrour*; if it cut it parallel to the base, the reflexion happens in the same manner as in a spherical *mirrour*; if, lastly, it cut it obliquely, or be oblique to its base, the reflexion is the same as in an elliptic *mirrour*.

Hence, as the plane of reflexion never passes through the axis of the *mirrour*, except when the eye and objective-line are in the same plane; nor parallel to the base, except when the radiant point and the eye are at the same height: the reflexion in a cylindrical *mirrour* is usually the same as in an elliptic one.

3°. If a hollow cylindric *mirrour* be opposed directly to the sun, instead of a focus of a point, the rays will be reflected into a lucid line parallel to its axis, at a distance somewhat less than a fourth part of its diameter.

Hence arises a method of drawing anamorphoses, *i. e.* wild deformed figures on a plane, which appear beautiful and well proportioned when viewed in a cylindrical *mirrour*. See ANAMORPHOSIS.

For *elliptic*, *parabolic*, *conic*, and *pyramidal MIRROURS*, we are not much acquainted with their properties: Only that, In the first, if a ray strike on it from one of its focus's, it is reflected into the other: So that a lighted candle being placed in one, its light will be collected in the other.

That the second, inasmuch as all the rays they reflect meet in one point, make the best burning-glasses of all others.

And, lastly, That wild irregular figures may be so drawn on a plane, as that the eye being placed over the axis of the two last, they shall appear beautiful and well proportioned. See ANAMORPHOSIS.

MIS, a particle prefixed to divers words, particularly law-terms; denoting some fault, or defect.—As, in *misprision*; *misdicere*, to scandalize one; *misdocere*, to teach amiss, &c. See MISPRISION, &c.

MISANTHROPY\*, a general dislike or aversion to man, and mankind.

\* The word is Greek, *μισανθρωπία*, formed of *μισος*, odium, hatred; and *ανθρωπος*, homo, man.

In which sense it stands opposed to *philanthropy*. See PHILANTHROPY.

MISADVENTURE, or MISADVENTURE, in law, the killing a man partly by negligence, and partly by chance.—As, if a person, thinking no harm, carelessly throw a stone, or shoot an arrow, wherewith he kills another: This is a *misadventure*; and in this case he commits no felony, but only loses his goods, and has a pardon of course for his life. See HOMICIDE.

Staundford distinguishes between *aventure* and *misadventure*. The first he makes to be mere chance; as if a man being upon, or near the water, be taken with some sudden sickness, and so fall in, and be drowned; or into the fire, and be burnt. See CHANCE-medley.

*Misadventure*, according to him, is when a man comes to his death by some outward violence; as the fall of a tree, the running of a cart-wheel, the stroke of a horse, or the like.

West distinguishes homicide into casual and mixed. The first, when a man is slain by mere accident, against the mind of the killer; as, if the ax fly off the helve, and kill a man: which is the same with Briton's *misadventure*.

MISCHNA, or MISNA, a part of the Jewish talmud. See TALMUD.

The *mischna* contains the text; and the *gemara*, which is the second part of the talmud, contains the commentaries: so that the *gemara* is, as it were, a glossary on the *mischna*.

The *mischna* consists of various traditions of the Jews, and of explanations of several passages of scripture.—The Jews maintain, that it was completed, and reduced into a body, by rabbi Juda, in the second century, to prevent the memory of their traditions from perishing. But the generality of the learned scarce allow it so much antiquity, and bring it several centuries lower.

It is written in a much purer style, and is not near so full of dreams and visions as the *gemara*. See GEMARA.

MISCONTINUANCE, in law, the same with *discontinuance*. See DISCONTINUANCE.

MISDEMEANOUR, an offence, or fault, particularly in the execution of an office.

*High crimes and misdemeanours*, denote offences of a heinous nature next to high-treason. See CRIME, &c.

MISE, a French term, literally denoting expence, or disbursement; used in our law-books in divers acceptations.—Sometimes for the profits of lands; sometimes for taxes, or *tailages*; and sometimes for expences, or costs: As, *pro misis & custagiis*, for costs and charges in the entries of judgments, &c.

MISE, more peculiarly denotes an honorary gift, or customary present, wherewith the people of Wales used to salute every new king and prince of Wales at their entrance upon the principality.

Anciently, the *mise* was given in cattle, wine, corn, &c. for the support of the prince's family; but when that dominion was annexed to the English crown, the gift was changed into money.—The county of Flint pays two thousand marks, &c. for their *mise*.

The county of Chester also pays a *mise* or tribute of five thousand marks at the change of every owner of the said earldom, for enjoying the privileges of that palatinate.—At Chester they have a *mise-book*, wherein every town and village in the county is rated what to pay towards the *mise*.

MISE is also used in speaking of a writ of right. What in other actions is called in *issue*, in a writ of right is called a *mise* or *me*: so that to join the *mise* upon the *meer*, is as much as to say, to join issue on the *meer* right, *i. e.* to join upon this point, whether has the more right, the tenant or demandant. See ISSUE, &c.

Yet even in a writ of right, if a collateral point be tried, it is there called an *issue*, not a *mise*. See RIGHT.

MISE is also sometimes used corruptly for *mease*, a messuage or tenement.

In some manors, a *mise* or *mease*-place is taken for such a messuage or tenement, as yields the lord a herriot at the death of the tenant.

MISERERE, *have mercy*, the name, and first word, of one of the penitential psalms; being that commonly given by the ordinary to such condemned malefactors, as are allowed the benefit of the clergy.—Whence it is also called the *psalm of mercy*. See CLERGY.

MISERERE *mei*, denotes a kind of colic, or disorder of the intestines wherein the excrements, instead of passing off the common way, are thrown up by the mouth. See COLIC.

The *miserere mei* is the same with what we otherwise call *volvulus* and *iliac passion*. See ILIAC passion.

It takes its name from the intolerable pain and anguish it occasions the patient; which is such as claims pity from the beholders: *Miserere mei* being a Latin phrase, which literally signifies, Have pity on me.

MISERICORDIA, MERCY, in law, an arbitrary amercement, or punishment imposed on any person for an offence. See AMERCEMENT.

Where the plaintiff or defendant in any action is amerced, the entry is always *ideo in misericordia*.

It is thus called, according to Fitzherbert, by reason it ought to be but small, \* and less than the offence, according to the tenor of magna charta.

\* *Multa lenior sic dicta, quod lenissima imponitur misericordia; graviores enim multas fines vocant; atrocissimas, redemptiones.* See FINE, and REDEMPTION.

Hence, if a man be unreasonably amerced in a court not of record, as a court-baron, &c. there is a writ called *moderata misericordia*, directed to the lord, or his bailiff, commanding them to take moderate amercements.

MISERICORDIA *communis*, is when a fine is set on the whole county, or hundred.

MISFEASANCE, in law, a misdeed or trespass. Whence also *misfeasor*, a trespasser. See TRESPASS.

MISKERING, *Miskerring*. See ABISHERSING.

MISLETOE. See the article MISTLETOE.

# MIS

**MISNA.** See the article MISCHNA.

**MISNOMER**\*, in law, a wrong name; or the using of one name for another. See NAME.

\* The word is compounded of the French *mis*, which in composition signifies amiss; and *nommer*, to name.

**MISPRISION**, in law, signifies a neglect, or oversight.--- Thus,

**MISPRISION of clerks**, is a neglect of clerks, in writing or keeping records. See CLERK.

By the *misprision of clerks*, no process shall be annulled or discontinued. And justices of assize shall amend the defaults of clerks mis-spelling of a syllable, or letter in writing.

**MISPRISION of treason**, is a negligence in not revealing treason, where a person knows it to be committed. See TREASON.

*Misprision* is the concealment, or not disclosing, of known treason, for which the offenders are to suffer imprisonment during the king's pleasure; and to lose their goods, and the profit of their lands during their lives.

**MISPRISION of felony**, is only fineable by the justices before whom the party is attained. See FELONY.

Justices of the common pleas have a power to assess any amer- ciements upon persons offending by *misprision*, contempts, or neglects, for not doing, or misdoing any thing in, or concern- ing fines. See FINE.

**MISSAL**, **MISSALE**, a mass-book, containing the several masses to be used on the several days, feasts, &c. See MASS.

The Roman *missal* was first compiled by pope Zachary, and afterwards reduced into better order by pope Gregory the great, who called it the *book of sacraments*.

Each diocese, and each order of religious, have their particu- lar *missal*, accommodated to the festivals of the province, or of the order.

**MISSELT OE.** See the article MISTLETOE.

**MISSEN-mast**, or **MIZZEN-mast**, of a ship, is a *mast*, or round long piece of timber, standing upright in the sternmost part.

---See *Tab. Ship. fig. 1. n. 1, 13, 19.* See also MAST.

**MISSEN-sail**, is that belonging to the missen-yard. See SAIL.

When at sea they use the word *missen* alone, they always mean the *sail*, and not the *mast*. See SAIL.

Some great ships require two *missens*; in which case, that next the main-mast, is called the *main-missen*; that next the poop the *bonaventure-missen*.

**Change the MISSEN**, that is, bring the *missen-yard* over to the other side the mast.

**Peek the missen**, that is, put the *missen* right up and down the mast. See PEEK.

**Spell the MISSEN**, &c. that is, let go the sheet, and peek it up.

**MISSION.** See EMISSION, MANUMISSION, REMISSION, and TRANSMISSION.

**MISSION**, in theology, denotes a power, or commission to preach the gospel. See EVANGELIST, &c.

Jesus Christ gave his disciples their *mission* in these words, *Go, and teach all nations*, &c. See APOSTLE.

The Romanists reproach the Protestants, that their ministers have no *mission*; as not being authorized in the exercise of their ministry, either by an uninterrupted succession from the apostles, or by miracles, or by any extraordinary proof of a vocation. See ORDINATION.

The Anabaptists deny any other *mission* necessary for the mi- nistry than the talents necessary to discharge it. See ANA- BAPTIST.

**MISSION** is also used for an establishment of people zealous for the glory of God, and the salvation of souls; who go and preach the gospel in remote countries, and among infidels. See MISSIONARY.

There are *missions* in the East, as well as the West-Indies.---

Among the Romanists, the religious orders of St. Dominic, St. Francis, St. Augustin, and the Jesuits, have *missions* in the Levant, America, &c.

The Jesuits have also *missions* in China, and all other parts of the globe, where they have been able to penetrate.--- The mendicants abound in *missions*.

**MISSION**, is also the name of a congregation of priests, and lay- men, instituted by Vincent de Paul, and confirmed in 1620, by Pope Urban VIII. under the title of *Priests of the congre- gation of the mission*.

These profess to make it their whole business to assist the poor people in the country; and to this purpose oblige themselves never to preach, or administer any of the sacraments in any town where there is an archbishop, bishop, or provincial re- siding.

They are settled in most provinces of France, Italy, Germa- ny, and in Poland.--- At Paris, they have a seminary, which they call the *foreign mission*; where youth are bred up, and qualified for *missions* abroad.

**MISSIONARY**, an ecclesiastic who devotes himself and his labours, to some *mission*; either for the instruction of the or- thodox, the conviction of heretics, or the conversion of infi- dels.

**MISSIVE**, something sent to another.---From the Latin, *mitto*, I send.

We say *missive* letters, or letters *missive*, meaning letters sent from one to another. See EPISTLE.

# MIT

In propriety, *letters missive* are letters of business, but not bu- siness of great concern; in contradistinction from letters of gallantry, letters on points of learning, dispatches, &c.

**MIST**, a meteor called also *fog*. See FOG.

**MISTLETOE**, **MISLETOE**, or **MISSELT OE**, in natural history, a plant of the parasite kind; growing, not on the ground, but on other trees, as the oak, apple-tree, pear-tree, white-thorn, ash, lime, willow, elm, &c. See PARASITE.

*Mistletoe*, by physicians, &c. called *viscus*, grows to the height of about two feet. It consists of several stems, which are usually covered with a greenish, sometimes a yellowish bark, about the thickness of the finger, hard, woody, and divided by knots; from which spring the leaves, which grow by two and two opposite to each other, oblong, thick, of a greenish, or yellow colour, veined their whole length, and rounded at the end. Its flowers grow by three and three, trefoil-wise, at the extremes of the branches in each flower is a yellow calyx, one third of an inch in diameter, divided into four parts.

The fruit likewise grows by three and three, at the extremes of the branches: They are a kind of white oval berries, not unlike little pearl, filled with a flattish seed in form of a heart; covered with a fine silvered membrane, and enclosed with a viscid, glutinous humour, of a whitish colour, wherein the seed naturally buds, or germinates, and puts forth two eyes.---

From this juice it is, that the Latins denominate the plant *viscus*.---The fruit grows on different branches from the flowers. That uncommon soil, whereon the *mistletoe* grows, has occa- sioned abundance of fabulous notions both as to its producti- ons and virtues.

Pliny, and most naturalists relate, that thrushes being exceed- ingly fond of the berries of the *mistletoe*; they swallow them, and cast them out again on the branches of trees where they use to perch; and by this means give occasion to a new pro- duction of *mistletoe*. By cracking the berries with their bills, or claws, they are supposed to let out the viscid juice, which facilitates their sticking. And hence that proverb, *Turdus sibi cacat malum*; the *viscus* being sometimes used as bird-lime.

Mr. Bradley endeavours to refute the popular opinion of the ancients, that the seeds of the *mistletoe* could not vegetate. Their endeavouring to propagate it in the earth without suc- cess, he takes to have led them into the error: And asserts, that it may be propagated by seed on any tree whatever. The method too is very easy. About Christmas, when the berries are full ripe, you need only apply them on the smooth bark of any tree; the viscid juices they are encompassed withal, will make them stick; and, provided the birds do not devour the seed, you may, without any further trouble, expect a young plant, the following year.

Others rather chuse to account for the propagation of *mistletoe* from the system hereafter advanced for that of *mushrooms*. See MUSHROOM.

For the virtues of *mistletoe*, it seems of the most efficacy in the epilepsy; against which some will have it specifick. Dr. Colbatch has wrote expressly to prove it such. It is also pre- scribed in apoplexies, lethargies, and vertigos; and wore a- bout the necks of children to prevent convulsions, and ease the cutting of their teeth.

The best is the *mistletoe of the oak*; though it is not this which is commonly used, but that of the apple or pear-tree. Mr. Bradley observes, that there is no variety in this plant, but that the leaves, flowers, fruit, &c. are all alike on whatever kind of tree it grows: But others pretend to distinguish that of the oak by several particulars.

The virtues ascribed to the *mistletoe*, may perhaps be the re- mains of the religious honours paid it by the ancient Gauls; among whom the Druids, assembled constantly on the first day of the year, went in quest thereof with hymns, and other cere- monies and rejoicings, distributing it again among the people, as a thing sacred, after having first consecrated it, crying, *Au gay l'an neuf*, to proclaim the new year. See DRUIDS. The cry is still kept up in Picardy, where they add *plantez*, to wish a plentiful new year.

M. Perrault observes, that the *mistletoe* is full of a poisonous juice, which weakens the tree whereon it grows; and that the fruit has always a disagreeable taste while it sticks on it.

**MISY**, **MIXT**, in natural history; see CHALCITIS.

**MITE**, a small coin, formerly current; equal to about one third part of a farthing. See MONEY and COIN.

**MITE** also denotes a small weight used by the moneyers. It is equal to the twentieth part of a grain, and is divided into twenty-four doits. See WEIGHT.

**MITHRIDATE**, **MITHRIDATIUM**, in pharmacy, an antidote or composition in form of an electuary, serving ei- ther as a remedy, or a preservative against poisons. See AN- TIDOTE, POISON, &c.

*Mithridate* is one of the capital medicines in the apothecaries shops; being composed of a vast number of drugs, as *opium*, *myrrh*, *agaric*, *saffron*, *ginger*, *cinnamon*, *spikenard*, *frankin- cense*, *castor*, *pepper*, *gentian*, &c.

It is accounted a cordial, opiate, sudorific and alexipharmic. ---Matthioli says it is more effectual against poison than Ve- nice-treacle; though easier to be made.

It takes its name from its inventor, Mithridates king of Pon- tus,

tus, who is said to have so fortified his body against poisons with antidotes and preservatives, that when he had a mind to dispatch himself, he could not find any poison that would take effect.

The receipt of it was found in his cabinet, written with his own hand, and was carried to Rome by Pompey. It was translated into verse by Damocrates, a famous physician, and was afterwards translated by Galen, from whom we have it: Though there is room to imagine it has undergone considerable alterations since the time of its royal prescriber.

**MITHRALES** *valvulae*, **MITHRAL** *valves*, in anatomy, two valves in the heart: thus called from their resembling the figure of a mitre. See **VALVE**, and **HEART**.

They are placed at the orifice of the pulmonary vein, in the left ventricle of the heart. Their office is to close the orifice thereof, and prevent the return of the blood through the pulmonary vein into the lungs again. See **PULMONARY vein**, **CIRCULATION**, &c.

**MITRE**\*, **MITRA**, a pontifical ornament, wore on the head by bishops, and certain abbots, on solemn occasions. See **BISHOP**, **ABBOT**, &c.

\* The word comes from the Greek *μῦρα*, which signifies the same.

The *mitre* is a round cap, pointed, and cleft a-top with two pendants hanging down the shoulders.---Abbots wear the *mitre* turned in profile; and bear the crosier inwards, to shew that they have no spiritual jurisdiction without their own cloisters. The pope has also granted to some canons of cathedrals the privilege of wearing the *mitre*.---The counts of Lyons are said to have assisted at church in *mitres*.

In Germany, several great families bear the *mitre* for their crest; to shew that they are advocates, or feudatories of ancient abbies, or officers of bishops, &c. See **ADVOUEE**.

The pope has four *mitres*, which are more or less rich according to the solemnity of the feast-days they are to be worn on. The *mitre* was originally the women's head-dress, as the hat was that of the men. This appears from Servius, who reproaches the Trojans, or Phrygians, that they were dressed like women, and wore *mitres*.---*Et tunicae manicas, & habent redimicula mitrae*.

The cardinals anciently wore *mitres*, before the hat which was first granted them by the council of Lyons in 1245. See **CARDINAL**.---Authors make no mention of the *mitre* as an episcopal ornament before the year 1000.

**MITRE**, in architecture, is the workmen's term for an angle that is just 45 degrees; or half a right one.

If the angle be a quarter of a right angle, they call it a *half-mitre*. See **ANGLE**, &c.

To describe such angles, they have an instrument called the *mitre-square*; with this they strike *mitre-lines* on their quarters, or battens: And for dispatch, have a *mitre-box*, as they call it, which is made of two pieces of wood, each about an inch thick, one nailed upright on the edge of the other; the upper piece hath the *mitre-lines* struck upon it on both sides, and a kerf to direct the saw in cutting the *mitre-joints* readily, by only applying the piece into this box. See **BEVIL**.

**MITRED** *abbots*. See the article **ABBOT**.

**MITTENDIS** *recordo & processu*. See **RECORDO**.

**MITTIMUS**, in law, a writ, by which records are ordered to be transferred from one court to another; sometimes immediately, as out of the King's-Bench into the Exchequer; and sometimes by a certiorari into the Chancery, and from thence by a *mitimus* into another court.

**MITTIMUS** is also used for a precept in writing directed by a justice of peace to a goaler, for the receiving and safe keeping a felon, or other offender, by him committed to the goal.

**MIXING** *of mortar*. See the article **MORTAR**.

**MIXT**, or **MIXT body**, in philosophy, is that which is compounded of divers elements, or principles. See **MIXTION**, &c. By which, *mixt* stands contradistinguished from *simple*, or *elementary*, which is applied to bodies consisting of one principle only; as the chymists take sulphur, salt, &c. to do. See **ELEMENT** and **BODY**.

The schoolmen define a *mixt body* to be a whole, resulting from several ingredients, altered, or new modified by the mixture.---On which principle, the several ingredients do not actually exist in the *mixt*, but are all changed, so as to conspire to a new body of a different form, from the forms of the ingredients.---But the modern philosophers rarely conceive the term in so much strictness.

The business of chymistry, we say, is to resolve *mixt bodies* into their principles, or component parts. See **PRINCIPLE**, **CHYMISTRY**, &c.

The school-philosophers distinguish *mixt bodies* into *perfect* and *imperfect*.

*Perfect* **MIXTS** are the class of vital or animated bodies; where the elements or ingredients they are composed of, are changed or transformed by a perfect mixture.---Such are plants, beasts, and men.

*Imperfect* **MIXTS** are inanimate bodies; the forms whereof remain still the same as of the ingredients that constitute them.---Such are meteors, minerals, metals, &c.

**MIXT action**, in law, is an action partly real, and partly personal. See **ACTION**.

A *mixt action* is that which lies both for the thing detained, and against the *person* of the detainer.---Or it is that which seeks both the recovery of a thing we are unjustly deprived of, and damages, or a penalty for the unjust detainment thereof. Such are actions of waste, and *quare impedit*; actions for tithes on the statute 2 and 3 Edw. 6. &c.

**MIXT angle**. See the article **ANGLE**.

**MIXT cloths**. See the article **CLOTH**.

**MIXT fables**. See the article **FABLE**.

**MIXT figure**, in geometry, is that which consists partly of right lines, and partly of curve lines. See **FIGURE**.

**MIXT force**. See the article **FORCE**.

**MIXT history**. See the article **HISTORY**.

**MIXT mathematics**. See the article **MATHEMATIC**.

**MIXT mode**, according to Mr. Locke, is a combination of several simple ideas of different kinds. See **IDEA**, and **MODE**.

Thus, *beauty*, as it consists in a certain composition of colour, figure, proportion, &c. of different parts, causing delight to the beholder, is a *mixt mode*. Such also are theft, murder, &c.

The mind, that author observes, being once furnished with simple ideas, can put them together in several compositions, without examining whether they exist so in nature together.

And hence it is that these ideas are called *notions*; as if they had their original and constant existence more in the thoughts of men, than in the reality of things; and that to form such ideas, it sufficed that the mind put the parts of them together; and that they were consistent in the understanding: without considering whether they had any real being. See **NOTION**.

There are three ways whereby we get these complex ideas of *mixt modes*. First, By experience and observation of things themselves: Thus by seeing two men wrestle, we get the idea of wrestling. Secondly, By invention, or voluntary putting together of several simple ideas in our own mind: So he that first invented printing, had an idea of it first in his mind before ever it existed. Thirdly, By explaining the names of actions we never saw, or notions we cannot see; and by enumerating all those ideas which go to the making them up.

Thus the *mixt mode* which the word *lye* stands for, is made up of these simple ideas; First, Articulate sounds. Secondly, Certain ideas in the mind of the speaker. Thirdly, Certain words, the signs of these ideas. Fourthly, Those signs put together by affirmation, or negation, otherwise than the ideas they stand for are in the mind of the speaker, since the language was made.

Complex ideas are usually got by the explication of those terms that stand for them. For since they consist of simple ideas combined, they may, by words standing for those simple ideas, be represented to the mind of one who understands those words; though that combination of simple ideas was never offered to his mind by the real existence of things.

**MIXT number**, in arithmetic, that which is partly an integer, and partly a fraction; as  $4\frac{1}{2}$ . See **FRACTION**.

**MIXT obligation**. See the article **OBLIGATION**.

**MIXT ratio**, or *proportion*, is when the sum of the antecedent and consequent is compared with the difference between the antecedent and consequent --- as if

$$\begin{array}{ccccccc} & & 3 & 4 & 12 & 16 & \\ & & a & : & b & : : & c & : & d \\ \text{then} & .7 & 1 \dots & 28 & 4 & & & & \\ a \times b & : & a - b & : : & c \times c & : & c - d & & \end{array}$$

See **RATIO** and **PROPORTION**.

**MIXT salts**. See the article **SALTS**.

**MIXT stairs**. See the article **STAIRS**.

**MIXT service**. See the article **SERVICE**.

**MIXT tithes**, are those of cheese, milk, &c. and of the young of beast. See **TITHE**.

**MIXTILINEAR angle**. See the article **ANGLE**.

**MIXTION**, **MIXTIO**, or **MISTIO**, the act of *mixing*; or the union and coalition of divers corpuscles into one body. See **MIXT**, and **MIXTURE**.

The Peripatetics, who hold an alteration essential to *mixtion*, define it the union of several altered ingredients, or miscibles. See **INGREDIENT**.

*Mixtion* makes a considerable operation in the chymical and galenical pharmacy; where divers powders, species, and other simples, are said to be *mixed*, *misceri*, though without any communication or transition of the virtues of one into those of another. See **COMPOSITION**.

**MIXTURE**, **MIXTURA**, or **MISTURA**, in a philosophical sense, is an assemblage, or union of several bodies of different properties, in the same mass. See **MIXT**, and **MIXTION**.

To determine the ratio of the ingredients of a *mixture*, is that celebrated problem proposed by Hiero king of Syracuse to Archimedes, on occasion of a crown of gold wherein the workmen had fraudulently mixed silver; the solution whereof was matter of so much transport to that divine mechanic.

It may be determined thus.---Weigh the *mixture*, immerge it in some fluid; and find the weight it loses therein. (See **SPECIFIC gravity**.) Then find what weight any determinate quantity of any ingredient loses in the same fluid: And by the rule of three find what weight each ought to lose therein, were its weight equal to that of the *mixture*. Subtract the less loss from the greater, which will give the excess wherewith the loss of the lighter exceeds that of the heavier. Then subtract

abstract the weight lost by the heavier, from that lost by the whole *mixture*, to find the excess of the weight lost by the *mixture* beyond that lost by the heavier.

**MIXTURE**, in matters of drapery, denotes the union, or blending of several wools of different colours, not yet spun. See **CLOTH**. Hence a *mixture*, or mixed stuff, is that whose wool and warp are of wools of different colours dyed and mixed before they were spun.

**MOAT**, in fortification, a depth or trench dug round a town, or fortress to be defended, on the outside of the wall, or rampart.—See *Tab. Fortif. fig. 21. lit. b b b, &c.* See also **RAMPART**, **Foss**, and **DITCH**.

The depth and breadth of the *moat* often depend on the nature of the soil; according as it is marshy, rocky, or the like. The brink of the *moat* next the rampart in any fortification is called the *scarp*, and the opposite one the *counterscarp*. See **SCARP** and **COUNTERSCARP**.

**Dry MOAT** is that which is destitute of water; and ought to be deeper than one which is full of water.

**Lined MOAT** is that whose scarp and counterscarp are cased with a wall of mason's work lying aslope.

**Flat-bottomed MOAT** is that which hath no sloping, its corners being somewhat rounded.

*Angle of the MOAT.* See the article **ANGLE**.

**MOATAZALITES**, a religious sect among the Turks, who deny all forms and qualities in the divine Being. See **GOD**, **ATTRIBUTE**, &c.

There are two opinions among the Turkish divines concerning God. The first admit metaphysical forms, or attributes; as, that God has wisdom by which he is wise; power by which he is powerful; eternity by which he is eternal, &c.

The second allow God to be wise, powerful, eternal; but will not allow any form or quality in God, for fear of admitting a multiplicity.

Those who follow this latter opinion are called *Moatazalites*.—They who follow the former, *Sephatites*.

**MOBILE**, *Moveable*; any thing susceptible of motion, or that is disposed to be moved either by itself, or by some other prior *mobile*, or mover. See **MOTION**.

**Primum MOBILE** in the ancient astronomy, was a ninth heaven, or sphere, imagined above those of the planets and fixed stars. See **SPHERE**, **HEAVEN**, and **PRIMUM**.

This was supposed to be the first mover, and to carry all the lower spheres round along with it; by its rapidity communicating to them a motion whereby they revolved in twenty-four hours.—But the diurnal revolution of the planets is now accounted for, without the assistance of any such *primum mobile*.

**Perpetuum MOBILE.** See **PERPETUAL motion**.

**MOBILIA bona**, in the civil law, are what in common law, &c. we call *moveables*, or *moveable goods*. See **MOVEABLES**.

**MOBILITY**, in the schools, &c. an aptitude, or facility to be moved. See **MOTION**.

The *mobility* of mercury is owing to the smallness, and sphericity of its particles; and is that which renders its fixation so difficult. See **MERCURY**, and **FIXATION**.

The hypothesis of the *mobility* of the earth is the most plausible; and is that commonly admitted by the later astronomers. See **EARTH**.

Pope Paul V. appointed commissioners to examine the opinion of Copernicus touching the *mobility* of the earth. The result of their enquiry, was, a prohibition to assert, not that the *mobility* was possible, but that it was actually true. That is, they allowed the *mobility* of the earth to be held as an hypothesis, which gives an easy and sensible solution of the phenomena of the heavenly motions; but forbade the *mobility* of the earth to be maintained as a thesis, or a real effective thing; by reason they conceived it contrary to scripture. See **COPERNICAN**.

**MODAL**, in logic, &c. a term applied to propositions which include certain conditions or restrictions. See **CONDITIONAL**, **PROPOSITION**, and **DISTINCTION**.

**MODE**, or **MOOD**, **MODUS**, in philosophy, a *manner* of being; or a quality, or attribute of a substance, or subject, which we conceive as necessarily depending on the subject, and incapable of subsisting without it. See **ATTRIBUTE**, and **SUBSTANCE**. Mr. Locke defines *modes* to be those ideas (he should have said *things*) which do not imply any supposition of subsisting by themselves, but are considered as mere dependencies, and affections of substances. See **ACCIDENT**.

Our ideas of things may be reduced to two kinds: The one of things which we conceive separately, and by themselves, called *substances*; and the other of things which we conceive as existing in others, in such manner as that we cannot allow them existence without them; and these we call *modes*, or *accidents*.

Thus, when we reflect on *wax*, and roundness; we consider the *wax* as a thing which may subsist without the roundness; *Wax* therefore we denominate a *substance*; on the contrary, we consider the *roundness* so dependant on the *wax*, that it cannot subsist without it, there being no conceiving of roundness distinct and separate from a round body.—This therefore we call a *mode*, or *accident*. See **IDEA**.

VOL. II. NO. C.

It is the characteristic, then, of a true *mode*, to have such a relation to some subject, as not to be clearly and distinctly conceivable without conceiving the subject, whereof it is a *mode*, at the same time: when, on the other hand, the conception of the subject does not at all infer or require that of the *mode*. See **SUBJECT**.

Thus, what gives us to know that thought is not a *mode* of extended substance, or matter, is, that extension, and the other properties of matter may be divided from thought, without ceasing to conceive thought all the while. See **THINKING**, **EXTENSION**, &c.

We always consider things as clothed with certain *modes*, except we reflect on them in the abstract, or general: And it is the variety of *modes*, and relations, that occasions the great variety of denominations of the same thing. It is the various *modes* of matter, *e. gr.* that make all the diversity of bodies, or corporeal beings in nature. See **RELATION**, **MATTER**, &c.

There are various divisions and kinds of *modes*: One of the most common, is into *internal* and *external*.

**Internal MODES** are those inherent in the substance;—as roundness in the bowl; flatness in the nose; crookedness in the finger, &c.

These, we have observed, cannot exist, nor even be conceived without the subject, as being only circumstances thereof, or even, according to some, only the subject itself considered, not simply, but as such. Thus the roundness of the bowl, is only the bowl itself considered as round, &c.

**External MODES** are those extraneous to the subject; as when we say a thing is desired, loved, beheld, &c. These coincide with what we call *relations*. See **RELATION**.

Add, that there are *modes* which are likewise substances, as apparel, hair, &c. which may subsist without the subject.

Mr. Locke divides *modes* into *simple*, and *mixed* or *compound*.

**Simple MODES** are combinations of simple ideas of the same kind, or even of the same simple ideas divers times repeated;—as a dozen, a score, &c. which are only the ideas of so many distinct units put together.

The modifications of any simple idea, Mr. Locke observes, are as perfectly different and distinct ideas in the mind as those the most remote and inconsistent: Thus, *two* is as distinct from *three*, as blindness from heat. With this view that author examines the *simple modes* of space.—Which are found to be distance, capacity, extension, figure, place, and duration. See **SPACE**, **DISTANCE**, **EXTENSION**, **FIGURE**, **PLACE**, and **DURATION**.

The mind has several distinct ideas of *sliding*, *rolling*, *walking*, *creeping*, &c. which are all but the different modifications of motion. *Swift* and *slow* are two different ideas of motion, the measures whereof, are made out of the distances of time and space put together. See **MOTION**.

The like variety we have in sounds; every articulate word is a different modification of sound, as are all notes of different length put together, which make that complex idea called *time*. See **SOUND** and **TIME**.

The *modes* of colours might be also very various; some of which we take notice of, as the different degrees, or as they are termed, *shades of the same colour*. But since we seldom make assemblages of colours without taking in figure also, as in painting, &c. those which are taken notice of, do most commonly belong to *mixed modes*; as *beauty*, *rainbow*, &c. All compounded tastes and smells are also *modes* made up of the simple ideas of those senses.

As to the *modes of thinking*; when the mind turns its view inward upon itself, *thinking* is the first idea that occurs, wherein it observes a great variety of modifications; and therefore frames to itself distinct ideas. See **THINKING**, and **THOUGHT**.

Thus the perception annexed to any impression on the body made by an external object, is called *sensation*. Where an idea recurs without the presence of the object, it is called *remembrance*. When sought after by the mind, and brought again in view, it is called *recollection*. When held there long under attentive considerations, it is called *contemplation*. When ideas float in the mind without regard or reflection, it is called in French, *reverie*. When the ideas are taken notice of, and, as it were, registered in the memory, it is *attention*. When the mind fixes its view on any one idea, and considers it on all sides, it is *intention* and *study*. See **SENSATION**, &c.

Of these various *modes* of thinking, the mind forms as distinct ideas, as it does of white and red, a square, or a circle.

**Mixed MODES** are combinations of simple ideas of several kinds; as in *beauty*, which consists in a certain composition of colour, figure, &c. *Theft*, which is the concealed change of the possession of any thing without consent of the proprietor, &c. See **MIXT**.

There are three ways whereby we get ideas of *mixed modes*.

- 1°. By experience and observation of things themselves; thus by seeing two men wrestle, we get the idea of wrestling.
- 2°. By invention, or voluntary putting together of several simple ideas in our own minds; so he that first invented printing had an idea of it first in his mind, before ever it existed.
- 3°. By explaining the names of actions we never saw, or notions

we cannot see; and by enumerating all those ideas, which go to the making them up.—Thus the *mixt mode* which the word *lye* stands for, is made up of these simple ideas: (1.) Articulate sounds. (2.) Certain ideas in the mind of the speaker. (3.) Words, the signs of these ideas. (4.) Those signs put together by affirmation, or negation, otherwise than the ideas they stand for are in the mind of the speaker.

*Mixt modes* have their unity from an act of the mind, combining those several simple ideas together, and considering them as one complex one: The mark of this union is one name given to that combination. Men seldom reckon any number of ideas to make one complex one: but such collections as there be names for. Thus, *the killing of an old man* is as fit to be united in one complex idea, as *the killing of a father*; yet there being no name for it, it is not taken for a particular complex idea; nor a distinct species of action, from that of killing any other man: Those collections of ideas have names generally affixed, which are of frequent use in conversation; in which cases men endeavour to communicate their thoughts to one another, with all possible dispatch. Those others, which they have seldom occasion to mention, they lay not together, nor give them names:

This gives the reason, why there are words in every language, which cannot be rendered by any one single word of another. For the fashions and customs of one nation make several combinations of ideas familiar in one, which another had never any occasion to make. Such were, *ὄψαλον*, among the Greeks; and *proscriptio* among the Romans. See *OSTRACISM*, and *PROSCRIPTION*. This also occasions the constant change of languages; because the change of customs and opinion brings with it new combinations of ideas, which, to avoid long descriptions, have new names annexed to them, and so they become new species of *mixt modes*.

Of all our simple ideas, those which have had most *mixt modes* made out of them, are thinking, and motion, (which comprehend in them all action) and power, from whence these actions are conceived to flow. For actions being the great business of mankind, it is no wonder that the several *modes* of thinking and motion, should be taken notice of; and the ideas of them observed, and laid up in memory, and have names assigned them. For without such complex ideas with names to them, men could not easily hold any communication about them.

Of this kind are the *modes* of actions distinguished by their causes, means, objects, ends, instruments, time, place, and other circumstances; as also of the powers fitted for those actions. Thus *boldness* is the power to do or speak what we intend, without fear or disorder; which power of doing any thing, when it had been acquired by frequent doing the same thing, is that idea we call *habit*; and when forward and ready upon every occasion, to break into action, we call it *disposition*: Thus *testiness* is a disposition or aptness to be angry. Power being the source of all action, the substances, wherein those powers are, when they exert this power, are called *causes*: And the substances thereupon produced, or the simple ideas introduced into any subject, *effects*. The efficacy whereby the new substance or idea is produced, is called in the subject exerting that power, *action*; in the subject wherein any simple idea is changed, or produced, *passion*. Which efficacy in intellectual agents, we can conceive to be nothing else, but *modes* of thinking and willing: In corporeal agents, nothing else but modifications or motions.

Whatever sort of action, besides these, produces any effect, we have no notion or idea of. And, therefore, many words which seem to express some action, signify nothing of the action; but barely the effect, with some circumstances of the subject wrought on, or cause operating: Thus *creation*, and *annihilation*, contain in them no idea of the action, or manner whereby they are produced, but barely of the cause, and the thing done. And when a country-man says, *the cold freezes water*, though the word *freezing* seems to import some action, yet it truly signifies nothing but the effect, *viz.* that the water that was before fluid, is become hard and consistent; without intimating any idea of the action whereby it is done.

In *mixt modes*, it is the name that seems to preserve their essences, and to give them their lasting duration. The collection of ideas is made by the mind; but the name is, as it were, the knot which ties them fast together: Hence we seldom take any other for distinct species of *mixt modes*, but such as are set out by names. We must observe, that the names of *mixt bodies* always signify the real essences of their species; which being nothing but the abstract complex ideas, and not referred to the real existence of things, there is no supposition of any thing more signified by any name of a *mixt mode*, but barely that complex idea, the mind itself has formed; which when the mind has formed, is all it would express by it, and is that on which all the properties of the species depend, and from which alone they flow; and so, in these, the real and nominal essence is the same.

This also shews the reason, why the names of *mixt modes* are commonly got, before the ideas they stand for are perfectly

known; because there being no species of these ordinarily taken notice of, but such as have names; and those species being complex ideas made arbitrarily by the mind; it is convenient, if not necessary, to know the names, before we learn the complex ideas: unless a man will fill his head with a company of abstract complex ideas, which others having no names for, he has nothing to do with, but to lay by, and forget again. In the beginning of languages, it was necessary to have the idea, before one gave it the name; and so it is still, where a new complex idea is to be made, and a name given it. In simple ideas, and substances, it is otherwise; which being such ideas, as have real existence and union in nature, the ideas or names are got, one before the other, as it happens.

The schoolmen make numerous other divisions of *modes*; as into *immediate* and *mediate*: *Essential* and *non-essential*: *Positive* and *privative*: Of *spirit* and of *body*: Of *thinking*, and of *having*.

*Immediate MODES* are those immediately attributed to their subjects, or substances.

*Mediate MODES* are those attributed to subjects by the intervention of some other *mode*.

Thus, *e. gr.* motion is an immediate *mode* of the body; knowledge of the mind, &c. But swiftness and slowness are not immediately attributable to the body; but only to the body in respect of motion.

*Essential, or inseparable MODES*, are attributes without which the substance cannot exist.—As, wisdom, goodness, power, &c. in God: figure, place, quantity, extension, &c. in body. See *ATTRIBUTE*.

*Non-essential, or separable MODES*, are attributes affecting created substances, and remaining affixed thereto so long as is necessary.—Such are coldness, of water: hardness, of stone: whiteness of milk, &c.

*Positive MODES*, are those which give something real, positive, and absolute to their substance.—Thus roundness is a positive *mode* of a globe, &c.

*Privative MODES* are attributed to subjects, when the mind perceiving some attributes wanting therein, frames a word, which at first sight seems to note something positive, but which in reality only notes the want of some property, or *mode*.—Thus a privation of light is attributed to a blind man, &c.

*MODES of spirit* are two, *viz.* cognition, or knowledge; and willing. See *KNOWLEDGE*, and *WILL*.

*MODES of body* are three, *viz.* figure, rest, and motion. See *FIGURE*, *REST*, and *MOTION*.

*MODES of having*, are those whereby any thing may be had by another.—Aristotle enumerates seven of these: A thing, for instance, may be had either by the *modes* of quality, as knowledge; by that of magnitude, as circumference; by the *mode* of part, as the hand, &c.

*Division of a MODE*. See the article *DIVISION*.

*MODE*, in grammar. } See the article *MOOD*.  
*MODE*, in logic. }

*MODE* is also used in logic, for the modification of a proposition; or that which renders it *modal* and *conditional*. See *CONDITIONAL*, and *PROPOSITION*.

*Indirect MODES*. See the article *INDIRECT*.

*MODE*, or *MOOD*, in music, a particular manner of beginning, continuing and ending a song, whereby we are engaged to make use of certain notes, or chords, preferable to, or oftener than others.

*MODE* is defined by some authors, the particular manner of constituting the octave; or the melodious constitution of the octave, as it consists of seven essential, or natural notes besides the key, or fundamental. See *OCTAVE*.

A *mode*, then, is not any single note, or sound; but the particular order of the concinnous degrees of an octave: The fundamental note whereof may, in another sense, be called the *key*, as it signifies that principal note which regulates the rest. The proper difference between a *mode* and a *key*, consists in this, that an octave with all its natural and concinnous degrees, is called a *mode*, with respect to the constitution, or the manner and way of dividing it; and with respect to the place of it in the scale of music, that is, the degree or pitch of tune, it is called a *key*: that is, an octave of sounds may be raised in the same order, and kind of degrees, which makes the same *mode*, and yet be begun higher or lower; that is, be taken at different degrees with respect to the whole, which makes different keys: and from the same definition it follows, that the same key may be found with different *modes*; that is, the extremes of two octaves may be in the same degree of tune, and the division of them different. See *KEY*.

Now it may be further observed, that of the natural notes of every *mode*, or octave, three go under the name of the essential notes in a peculiar manner, *viz.* the fundamental, the third, and fifth; their octaves being reckoned the same, and marked with the same letters in the scale: the rest are particularly called *dependents*. Again, the fundamental is also called the *final*; the fifth the *dominante*; and the third, as being between the other two, the *mediante*. See *KEY*.

The doctrine of the ancients with regard to *modes*, which they sometimes also call *tones*, is somewhat obscure; there being an unaccountable

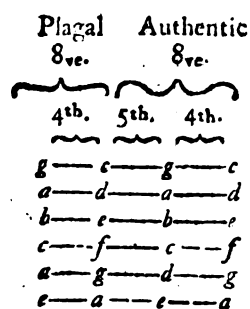

unaccountable difference among their authors as to the definitions, divisions, and names of their *modes*. They agree indeed, that a *mode* is a certain system or constitution of sounds; and that an octave, with all its intermediate sounds, is such a constitution: but the specific differences of tones, or *modes*, some place in the manner of division, or order of their concinnous parts; and others merely in the different tension of the whole; i. e. as the whole series of notes are acuter or graver, or stand higher and lower in the scale of music.

Boethius is very dark on this head, and defines a *mode* to be, as it were, an entire body of modulation, consisting of a conjunction of consonances: as, the diapason.

Ptolemy makes the modes the same with the species of the diapason; but at the same time speaks of their being at some distance from each other. Some contended for thirteen, some for fifteen *modes*, which they placed at a semi-tone's distance from each other; but it is plain, those understood the differences to be only in their place or distances from each other; and that there is one certain harmonious species of octave applied to all; viz. that order which proceeds from the proslambanomenos of the systema immutatum, or the A of the modern system. Ptolemy argues, that if this be all, they may be infinite, though they must be limited for use and practice. But, indeed, much the greater part define them by the species of the diapason; and therefore only make seven *modes*; but as to their use, we are left entirely in the dark.

If the *modes* be nothing but the seven species of octaves, the use of them can only be, that the proslambanomenos of any *mode*, being made the principal note of a song, there may be different species of melody answering to those different constitutions. But then we are not to conceive, that the proslambanomenos, or fundamental of any *mode* is fixed to any particular chord of the system, v. gr. the Phrygian to g, so that we must always begin there, when we would have a piece of melody of that species. When we say in general, that such a *mode* begins in g, it is no more than to signify the species of octave as they appear in a certain fixed system; but we may begin in any chord of the system, and make it the proslambanomenos of any *mode*, by adding new chords, or altering the tuning of the old. If this were the true nature, and use of the tones, most of these *modes* must have been imperfect, and incapable of good melody, as wanting some of those which we reckon the essential and natural notes of a true *mode*. Again, if the essential difference of the *modes* consist only in the gravity or acuteness of the whole octave, then we may suppose one species or concinnous division of the octave, which being applied to all the chords of the system, makes them true fundamentals for a certain series of successive notes, by changing, as above, the tone of certain chords in some cases, or by adding new chords to the system. But that must have been a simple kind of melody, produced by admitting only one concinnous series, and that too wanting some useful and necessary chords.

Music was considerably improved in the eleventh century, by Guido Aretinus; who, among other innovations, reformed the doctrine of *modes*. It is true, they were still defined by the species of the octave, in Ptolemy's manner; and their number was fixed to seven; but afterwards taking occasion to consider the harmonical and arithmetical divisions of the octave, whereby it resolves into a fourth above a fifth, or a fifth above a fourth, they hence constituted twelve *modes*, making of each octave two different *modes*, according to this different division: but because there are two of them that cannot be divided both ways, there are but twelve *modes*. Of these, such as were, divided harmonically, that is, with the fifths lowest (which were fix) were called *authentic*; and the other six, which had the fifths highest, were called *plagal modes*. See the scheme annexed.

remarkably; and because their concord is different, which makes the melody different, they established by this two *modes* in every natural octave that had a true fourth and fifth: Then, if the song was carried as far as this octave above, it was called a *perfect mode*; if less, as to the fourth or fifth, it was called *imperfect*; if it moved both above and below, it was called a *mixt mode*.—Thus it is some authors speak about these *modes*. Others considering how indispensable a chord the fifth is in every *mode*, took for the final, or key-note, in the arithmetically divided octaves, not the lowest chord of that octave, but that very fourth.—The only difference then in this method between the authentic and plagal *modes* is, that the authentic goes

To these *modes*, they gave the names of the ancient Greek tones, as Dorian, Phrygian, Lydian: But the several authors differ in the application and order of these names. So that we are still in great measure at a loss what they meant by those distinctions, and what their real use was.—The best account we can give is this; They considered that an octave which wants a fourth or fifth, is imperfect; these being the concords next to octave, the song ought to touch those chords most frequently and

above its final to the octave; the other ascends a fifth, and descends a fourth; which will indeed be attended with different effects, but the *mode* is essentially the same, having the same final to which all the notes refer.

We are now to consider wherein the *modes* of one species, as authentic, or plagal, differ among themselves: This must either be by standing higher or lower in the scale, i. e. by the different tension of the whole octave, or rather by the different subdivision of the octave into its concinnous degrees; there can be no other.—We are to consider then, whether these differences are sufficient to produce such very different effects as are ascribed to the several *modes*; for instance, that the one produces mirth, another sadness, a third is proper for religion, a fourth for love, &c. That these effects are owing merely to the constitution of the octave, scarce any body will affirm. The differences in the constitution will, indeed, have some influence; but it will be so little, as that, by the various combinations of other causes, one of these *modes* may be used to different purposes. The greatest difference is that of those octaves which have the third *f*, or third *g*, making what on other occasions we call the *sharp* and *flat key*.

However, if the *modes* depend upon the species of octaves, how can they be more than seven? And as to the distinction between authentic and plagal, we have already observed, that it is imaginary with respect to any essential difference constituted thereby in the kind of the melody; for though the carrying the song above or below the final, may have different effects, yet this is to be ascribed to other causes besides the constitution of the octaves. It is particularly observable, that those authors who give us examples in actual composition of their twelve *modes*, frequently take in the artificial notes *#* and *b*, to perfect the melody of their key; and by this means depart from the constitution of the octave, as it stands fixed in the natural system. There is nothing certain or consistent therefore in their way of speaking; but the *modes* are all really reducible to two, viz. the sharp and flat; the other differences respecting only the place of the scale where the fundamental is taken.

The ancient *modes*, besides their general division into authentic and plagal, had also their respective names from the several Greek provinces where they are supposed to have been invented.—Originally, indeed, there were but three, viz. Dorian, Lydian, and Phrygian; which were particularly called *tones*, because at a tone's distance from one another. The rest were added afterwards; and were some of them named from the relations they bore to the former, particularly the *hypo-doric*, as being below the doric.

The *Doric Mode* was a mixture of gravity and mirth, invented by Thamyris of Thrace. See *Doric*.

The *Phrygian Mode* was adapted to the kindling of rage; invented by Marsyas the Phrygian.

The *Lydian Mode* was proper for funeral songs; invented, according to Pliny, by Amphion.

The *Myxolodian* was invented by Sappho—the *Æolic*, *Ionic*, and *Hypo-doric* by Philoxenus.—And the *Hypo-Lydian* by Polymnestes.

Besides these *modes of tune*, old authors have also introduced *modes of time*, or measures of notes. These at first were distinguished into greater and less, and each of these again into perfect and imperfect. But afterwards they reduced all into four *modes*, which included the whole business of time.—As those *modes* are now disused, they are hardly worth the reciting. The common *mode* now in use, is much more simple and natural than any of those; the proportion, which in theirs varied, being in ours fixed, viz. 2:1. A large equal to two longs; a long to two breves; a breve to two semi-breves, &c. proceeding in the same proportion to the last or lowest notes. And if on some occasions the proportion of 3:1 betwixt two successive notes is required, it is easily expressed by annexing a point (·). See *TIME*, *NOTE*, &c.

The ancients had likewise their *modi melopœiæ*, of which Aristides names these; *dithyrambic*, *comic*, and *tragic*: which were called *modes* from their expressing the several motions and affections of the mind. See *DITHYRAMBIC*, &c.

**MODEL**, an original, or pattern proposed for any one to copy or imitate. See *ORIGINAL*.

St. Paul's church is said to be built on the *model* of St. Peter's at Rome. See *ARCHETYPE*, *ECTYPE*, &c.

**MODEL** is particularly used in building, for an artificial pattern, made of wood, stone, plaister, or other matter, with all its parts and proportions; in order for the better conducting and executing some great work, and to give an idea of the effect it will have in large.

In all great buildings, it is much the surest way to make a *model* in relief; and not to trust to a bare design or draught. See *DESIGN*.

There are also *models* for the building of ships, &c. for extraordinary stair-cases, &c.

**MODEL**, in painting and sculpture, is any thing proposed to be imitated.—And

Hence in the academies, they give the term *model* to a naked man, disposed in several postures, to give an opportunity to the scholars to design him in various views and attitudes.

The

The sculptors have little *models* of clay or wax to assist them in their designs of others that are larger, in marble, &c. and to judge of the attitude and correctness of a figure. See **FIGURE**. Statuaries likewise give the name *model* to certain figures of clay or wax, which are but just fashioned, to serve by way of guide for the making of larger, whether of marble, or other matter. See **STATUE**.

**MODERATOR**, in the schools, the person who presides at a dispute, or in a public assembly. See **PRESIDENT**. Such a doctor was the *moderator*, the president, at such a disputation, in such an assembly, &c.

**MODERN**, something new, or of our time.—In opposition to what is antique, or *ancient*. See **ANCIENT**.

*Modern authors*, according to Naude, are all those who have wrote since Boethius: The *modern* philosophy commences with Galileo: The *modern* astronomy with Copernicus. See **PHILOSOPHY**, and **ASTRONOMY**.

**MODERN medals**, are all those that have been struck within these three hundred years. See **MEDAL**.

**MODERN coins**. See the article **COINS**.

**MODERN Hebrew**. See the article **HEBREW**.

**MODERN weights**. See the article **WEIGHTS**.

**MODERN**, in architecture, is improperly applied to the present or Italian manner of building; as being according to the rules of the antique. (See **ANTIQUE**.) Nor is the term less abused, when attributed to architecture purely Gothic. See **GOTHIC**. *Modern architecture*, in propriety, is only applicable to that which partakes partly of the antique, retaining somewhat of its delicacy and solidity; and partly of the Gothic, whence it borrows members and ornaments, without proportion or judgment. See **ARCHITECTURE**.

**MODIFICATION**, in philosophy, that which *modifies* a thing; that is, gives it this or that manner of being. See **MODE**.

Quantity and quality are accidents which *modify* all bodies. See **QUANTITY** and **QUALITY**.

According to Spinoza's system, all the beings that compose the universe, are only so many different *modifications* of one and the same substance. It is the different arrangement and situation of their parts, that make all the difference between them. See **SPINOSISM**.

**MODIFICATIVE**, something that *modifies*, or gives a thing a certain manner of being. See **MODE**.

Father Buffier establishes a new part of speech, which he calls *modificative*. Nouns, and verbs, he observes, are susceptible of divers circumstances or *modifications*: In the phrase, *zeal acts*, we have a noun and verb, without any *modification*; but in that, *zeal without discretion acts rashly*, the noun and the verb are each attended with a *modification* or circumstance.

This last kind of words, which serve to *modify* nouns and verbs, since they have no general name in the common grammars, he chuses to call *modificatives*:—which include what grammarians commonly call *adverb*, *conjunction*, and *preposition*. See **CONJUNCTION**, **PREPOSITION**, &c.

**MODILLIONS\***, in architecture, ornaments in the cornice of the Ionic, Corinthian, and Composite columns.—See **Tab. Architect. fig. 20, and 26. lit. c.** See also **CORNICHE**.

\* The word comes from the Italian, *Modiglione*, a little measure.

The *modillions* are little inverted consoles, or brackets, in form of an S, under the soffit of the cornice, seeming to support the projecture of the larmier; though in reality they are no more than ornaments. See **CONSOLE**.

The *modillion* is sometimes also called *mutule*; though custom has introduced a little difference between the idea of a *modillion* and a *mutule*; the *mutule* being peculiar to the Doric order, and the *modillion* to the higher orders. See **MUTULE**.

The *modillions* ought always to be placed over the middle of the column. They are particularly affected in the Corinthian order, where they are usually enriched with sculpture.—Their proportions must be so adjusted, as to produce a regularity in the parts of the soffit.

The *inter-modillions*, i. e. the distances between them, depend on the inter-columnations, which oblige the *modillions* to be made of a certain length and breadth, in order to render the intervals perfect squares, which are always found to have better effect than parallelograms. To this it must be added, that in adjusting the *modillions*, care should be taken that they have such a proportion, as that when the orders are placed over one another, there be the same number in the upper order as in the lower, and that they fall perpendicularly over each other.

*Modillions* are also used under the corniches of pediments; though Vitruvius observes that they were not allowed of in his time, in regard *modillions* were intended to represent the ends of rafters, which could not be supposed to be found in a pediment. See **PEDIMENT**.

Some will have the *modillions* of a pediment to represent purlins; and those at the eaves to represent rafters. Daviler rather takes them for a kind of inverted consoles or corbels.

**MODIOLUS**, a surgeon's instrument, the same with *anabaptiston* and *trepandum*. See **TREPANUM**.

**MODIUS**, in antiquity, a kind of dry measure in use among the Romans for several sorts of grain. See **MEASURE**.

The *modius* contained thirty-two heminæ, or sixteen sextaries;

or  $\frac{1}{2}$  of the amphora: amounting to an English peck. See **HEMINA**, **AMPHORA**, &c.

**MODO & forma**, in law, a phrase used in processes and pleadings, whereby the defendant absolutely denies the thing charged on him by the plaintiff, *modo & forma declarata*, in the manner and form set forth.

The civilians in the like sense say, *negat allegata, prout allegantur, esse vera*.

**MODULATION**, in music, is the art of keeping in, and on occasion changing the mode, or key; and returning to it again; without offence to the ear. See **MODE**.

Under this term is comprehended the regular progression of the several parts through the sounds that are in the harmony of any particular key, as well as the proceeding naturally and regularly from one key to another.

The rules of *modulation* in the first sense belong to harmony and melody. See **HARMONY**, and **MELODY**.—We shall here only add a word with regard to the rules of *modulation* in the latter sense.

As every piece must have a principal key; and since the variety so necessary in music to please and entertain, forbids the being confined to one key; and that therefore it is not only allowable, but necessary, to *modulate* into, and make cadences on several other keys, having a relation and connection with the principal key: It must be considered what it is that constitutes a connection between the harmony of one key and that of another, that it may be hence determined into what keys the harmony may be conducted with propriety. See **KEY**.

As to the manner in which the *modulation* from one key to another is to be performed, so that the transition may be easy and natural; it is not easy to fix any precise rules; for though it is chiefly performed by the help of the seventh *g* of the key, into which the harmony is to be changed, whether it be flat or sharp; yet the manner of doing it is so various and extensive, as no rules can easily circumscribe. A general notion of it may be conceived under the following terms.

The seventh *g* in either sharp or flat key, is the third *g* to the fifth *f* of the key, by which the cadence in the key is chiefly performed; and by being only a semi-tone under the key, is thereby the most proper note to lead into it, which it does in the most natural manner imaginable. Inasmuch that the seventh *g* is never heard in any of the parts, but the ear expects the key should succeed it; for whether it be used as a third, or as a sixth, it always affects us with so imperfect a sensation, that we naturally expect something more perfect to follow, which cannot be more easily and smoothly accomplished, than by the small interval of a semi-tone, to pass into the perfect harmony of the key. Hence it is, that the transition into one key is best affected, by introducing its seventh *g*, which so naturally leads to it.

**MODULE**, in architecture, a certain measure, taken at pleasure, for regulating the proportions of columns, and the symmetry, or distribution of the whole building. See **COLUMN**. Architects usually chuse the diameter, or semi-diameter of the bottom of the column for their *module*; and this they subdivide into parts, or minutes. See **MINUTE**.

Vignola divides his *module*, which is a semi-diameter, into twelve parts, in the Tuscan and Doric, and into eighteen for the other orders.

The *module* of Palladio, Scamozzi, M. Cambray, Desgodetz, Le Clerc, &c. which is also the semi-diameter, is divided into thirty parts or minutes in all the orders. See **MINUTE**.

Some divide the whole height of the column into 20 parts for the Doric, 22 $\frac{1}{2}$  for the Ionic, 25 for the Roman, &c. and one of these parts they make a *module*, to regulate the rest of the building by.

There are two ways of determining the measures, or proportions of buildings; the first by a fixed standard measure, which is usually the diameter of the lower part of the column, called a *module*, subdivided into 60th parts, called *minutes*.—In the second, there are no minutes, nor any certain and stated division of the *module*; but it is divided occasionally into as many parts as are judged necessary. Thus, the height of the Attic base, which is half the *module*, is divided either into three, to have the height of the plinth; or into four, for that of the greater torus; or into six, for that of the lesser.

Both these manners have been practised by the ancient, as well as the modern architects: But the second, which was that chiefly used among the ancients, is in my opinion preferable. Perrault.

As Vitruvius, in the Doric order, has lessened his *module*, which in the other orders is the diameter of the lower part of the column; and has reduced that great *module* to a mean one, which is a semi-diameter: M. Perrault reduces the *module* to a third part for the same reason, viz. to determine the several measures without a fraction.—For in the Doric order, beside that the height of the base, as in the other orders, is determined by one of these mean *modules*; the same *module* gives likewise the heights of the capital, architrave, triglyphs, and metopes. But our little *module*, taken from the third of the diameter of the lower part of the column, has uses much more extensive; for, by this the heights of pedestals, of columns, and entablatures, in all the orders, are determined without a fraction.

As

As then the great *module*, or diameter of the column, has sixty minutes; and the mean *module*, or half the diameter, thirty minutes; our little *module* has twenty. *Id.*

MODUS *decimandi*, is when a parcel of land, a sum of money, or a yearly pension, belongs to the parson, either by composition or custom, time out of mind, in satisfaction for tithes in kind. See TITHE.

MOHAIR, a kind of stuff, ordinarily of silk, both woof and warp; having its grain wove very close.

There are two kinds of *mohairs*, the one smooth and plain; the other watered like tabbys: the difference between the two only consists in this, that the latter is calendered, the other not.---There are also *mohairs* both plain, and watered, whose woof is woollen, cotton, or thread.

MOIDORE, MOEDORE, or MOEDA, a gold coin, struck, and current in Portugal. See COIN.

The *moidore* is properly the Portuguese *pistole*; and is equivalent to two mille-rees. See PISTOLE, MILLE-REE, &c.

There are also *doppio-moedas*, or double pistoles, and demi-pistoles.

MOIETY, MEDIETAS, the half of any thing. See HALF.

MOINEAU, in fortification, is a flat bastion raised before a curtain when it is too long, and the bastions of the angles too remote to be able to defend one another. See BASTION.

Sometimes the *moineau* is joined to the curtain, and sometimes is divided from it by a moat.---Here musqueteers are placed, to fire each way.

MOISTURE *radical*. See the article RADICAL.

MOLA\*, in medicine, see the article MOLE.

\* The word is Latin, and literally signifies a mill-stone.

MOLA, in anatomy, a bone of the knee, called also *patella*, *rotula*, &c.---See *Tab. Anat. (osteol.) fig. 23. n. 21. 22.* See also PATELLA.

MOLARES, in anatomy, the *grinders*; an epithet given to the large teeth; as serving, like mill-stones, to grind the food.---See *Tab. Anat. (osteol.) fig. 2. lit. f.* See also TOOTH.

The number of *molars* is not always the same. Some persons have twenty; and others only sixteen, *viz.* four or five on each side of either jaw.---They are very large, hard, and strong; being fastened into their alveoli or sockets by several roots.

MOLASSES. See the article MOLOSSES.

MOLD. See the article MOULD.

MOULDED *column*. See the article COLUMN.

MOLE\* MOLA, or MOLA *carnea*, in medicine, a misshapen mass of hard flesh, sometimes generated in the wombs of women, instead of a foetus; called also a *false conception*. See CONCEPTION.

\* The Latins give it the name *mola*, which literally signifies *mill-stone*, from its resemblance thereto in form and hardness.

The *mole* is the chaos of an embryo; and would have grown to an infant, had not the process of conception been disturbed. Though it be without regular bones, viscera, &c. yet the lineaments frequently are not so far effaced, but that there are some remains of a child; sometimes a hand, and sometimes a foot, have been spied; but commonly the secundines. It is rare that more than one *mole* is excluded; though Sennerius observes there are instances of two, three, or even more. He adds, that though they usually come alone, yet they have been known to come with a foetus, sometimes before it, and sometimes after it. See CONCEPTION.

The *mole* is distinguished from an *Embryo*, in that it has no placenta whereby to receive its nourishment from the mother. Instead of that, it grows immediately to the womb; and is nourished thence. See FOETUS.

It has a kind of vegetative life, and continues growing in bulk till the time of exclusion. Sometimes it has been borne in the womb for two or three years.

This production is supposed to arise from some defect or indispotion of the ovum, or egg; or, perhaps, from the male's seed wanting force to penetrate it sufficiently in order to open, or expand the parts. Or, the effect may be accounted for, by supposing an ovum to drop into the womb, without being impregnated by the seed of the male: In all which cases, the egg continuing to grow, and yet wanting something necessary to organize and form it into an embryo, becomes a shapeless lump. See EMBRYO.

Authors are divided whether or no women ever bring forth *moles* which derive their origin from the menstuous blood detained, coagulated, and hardened; through which the blood and spirits have made themselves passages, &c. See MENSES.

The *mole* is distinguished from a true conception, by its tremulous palpitating motion; by its rolling from side to side; and by the belly's swelling equally every way. The breasts swell as in case of a just embryo; but the humour generated therein is not true milk, but a crude matter, formed of the suppressed menses.

To bring the *mola* out of the womb, bleeding and violent purging are used, and at last strong emmenagogues. If these fail, recourse is to be had to manual operation.

MOLE, MOLES, a massive work formed of large stones laid in

Vol. II. N<sup>o</sup>. 100.

the sea by means of coffer-dams, extended either in a right line or an arch of a circle, before a port; which serves to close; to defend the vessels in it from the impetuosity of the waves; and prevent the passage of ships without leave.

Thus we say the *mole* of the harbour of Medina, &c.

MOLE, is sometimes also used to signify the harbour itself. See HARBOUR.

MOLE, MOLES, among the Romans, was also used for a kind of mausoleum, built in manner of a round tower on a square base, insulate, encompassed with columns, and covered with a dome. See MAUSOLEUM.

The *mole* of the emperor Adrian, now the castle of St. Angelo, was the greatest, and most stately of all the *moles*. It was crowned with a brazen pine-apple, wherein was a golden urn containing the ashes of the emperor.

MOLECULE, MOLECULA, in physics, a little mass, or portion of any body. See PART, and PARTICLE.

The air, by respiration, insinuating itself into the veins and arteries, endeavours by its elastic power to divide and break the *molecules* of the blood, which on their side resist such division.

MOLESTANDO. See the article NON-molestando.

MOLINE', in heraldry. A *Cross-MOLINE'* is that which turns round both ways at all its extremities, though not so wide or sharpe as that said to be *anchored*. See CROSS.

In Upton, the points are all cut off, which makes it very different from the cross anchored. See FER de moulin.

MOLINISTS, a sect in the Romish church, who follow the doctrine and sentiments of the Jesuit *Molina*, relating to sufficient and efficacious grace. See GRACE, &c.

Their great antagonists are the Jansenists. See JANSENISM.

MOLINOSISTS, a sect among the Romanists, who adhere to the doctrine of Molinos.---These are the same with what are otherwise called *Quietists*. See QUIETISTS.

MOLLET. See the article MULLET.

MOLLIS *portio*. See the article PORTIO.

MOLMUTIN, or MOLMUTIAN *laws*, the laws of Dunwallo Molmutius, XVIth king of the Britons, who is said to have begun his reign 440 years before the incarnation. See LAW.

He was the first who published any laws in this land; and they continued famous therein till the time of William the Conqueror.

MOLOSSES, MOLASSES, or MELASSES, that gross, yet fluid matter remaining of sugar, after refining, and which no boiling will bring to a consistence more solid than that of syrup; hence also called *syrup of sugar*. See SUGAR, and REFINING.

Properly, *molasses* are only the sediment of one kind of sugar called *chypre*, or brown sugar, which is the refuse of other sugars not to be whitened, or reduced into loaves.

*Molasses* are much used in Holland among poor people, for the preparation of tobacco, and instead of sugar.

There are also a kind of brandy, or spirit made of *molasses*; but by some held exceedingly unwholesome, and therefore discouraged. See BRANDY, and SPIRIT.

MOLOSSUS, in the Greek and Latin poetry, a foot consisting of three long syllables.---As *audiri, cantabant, virtutem*. See FOOT.

It takes its name either from a dance in use among the people called *Molossi*, or *Epirotæ*; or from the temple of Jupiter *Molossius*, where odes were sung, in which this foot had a great share: or because the march of the *Molossi* when they went to the combat, was composed of these feet, or had the cadence thereof.---The same foot was also called among the ancients *Voitumnus, extensipes, hippius, & chanius*. Dion. 3. p. 475.

MOLTA, or MOLTURA, a duty or toll paid by vassals to the lord for grinding their corn at his mill.

MOLTING, or MOULTING, the falling off or change of hair, feathers, skin, horns, voice, and other dispositions of the body of animals, happening in some, annually, in others at certain stages of their life.

The generality of beasts *molt* in the spring.

The *molting* of a hawk is called *meewing*. See HAWK, and FALCONRY.

The *molting* of a deer is the quitting of his horns in February or March; the *molting* of a serpent is the putting off his skin. See EXUVIÆ.

MOLUTA *arma*. See the article ARMA.

MOMENT, in time, the most minute, and indivisible part of duration; or what we otherwise call an *instant*. See TIME, and INSTANT.

MOMENTS, in the new doctrine of infinites, denote the infinitely small parts of quantity. See INFINITE.

*Moments* are the same with what we otherwise call *infinitesimals*, and *differences*; being the *momentary* increments, or decrements of quantity considered as in a continual flux. See DIFFERENCE, and FLUXION.

*Moments* are the generative principles of magnitude. They have no determinate magnitude of their own; but are only inceptive thereof. See INCEPTIVE.

Hence, as it is the same thing if in lieu of these *moments*, the velocities of their increases and decreases be made use of, or

the finite quantities proportionable to such velocities; the method of proceeding which considers the motions, changes, or fluxions of quantities, is denominated by Sir Is. Newton the method of fluxions. See FLUXIONS.

Leibnitz, and most foreigners, considering these infinitely small parts, or infinitesimals, as the differences of two quantities; and thereby endeavouring to find the difference of quantities, *i. e.* some moments, or quantities infinitely small, which being taken an infinite number of times, shall equal given quantities, call these moments, *differences*; and the method of procedure, the *differential calculus*. See CALCULUS *differentialis*.

MOMENT, MOMENTUM, in mechanics, is the same with *impetus*; or the quantity of motion in a moving body. See MOTION.

MOMENTUM, is sometimes also used simply for the motion itself. *Moment* is frequently defined by the *vis insita*, or the power by which moving bodies continually change place. See VIS. In comparing the motions of bodies, the ratio of their *momenta* is always compounded of the quantity of matter, and the celerity of the moving body; so that the *moment* of any such body may be considered as a rectangle under the quantity of matter, and the celerity.

And since it is certain that all equal rectangles have the sides reciprocally proportionable; therefore if the *moments* of any moving bodies be equal, the quantity of matter in one to that of the other will be reciprocally as the celerity of the latter to the celerity of the former; and, on the contrary, if the quantities of matter be reciprocally proportionable to the celerities, the *moments*, or quantities in each, will be equal.

The *moment* also of any moving body may be considered as the aggregate or sum of all the *moments* of the parts of that body; and therefore where the magnitudes and number of particles are the same, and where they are moved with the same celerity, there will be the same *moments* of the wholes. See MOTION.

MOMENTARY motion. See the article QUANTITY.

MONARCHY\* MONAPXIA, a large state governed by one; or a state where the supreme power is lodged in the hands of a single person. See GOVERNMENT.

\* The word comes from the Greek *monarches*, one who governs alone; formed of *monos*, *solus*, and *arche*, *imperium*, government.

The most ancient *monarchy* was that of the Assyrians, which was founded soon after the deluge.—We usually reckon four grand, or universal *monarchies*, the Assyrian, Persian, Grecian, and Roman. Though St. Augustin makes them but two, *viz.* those of Babylon and Rome.—There seems in reality no necessity to make the Medes, Persians and Greeks succeed to the whole power of the Assyrians, to multiply the number of the *monarchies*: it was the same empire still, and the several changes that happened in it, did not constitute different *monarchies*. Thus the Roman empire was successively governed by princes of different nations, yet without any new *monarchy* being formed thereby. Rome therefore may be said to have immediately succeeded Babylon in the empire of the world. See EMPIRE.

Of *monarchies* some are *absolute* and *despotic*, where the will of the monarch is uncontrollable; as Denmark, &c. others *limited*, where the prince's authority is restrained by laws, and part of the supreme power lodged in other hands; as in England.

Some *monarchies* again are *hereditary*, where the succession devolves immediately from father to son; and others *elective*, where, on the death of the *monarch*, his successor is appointed by election; as in Poland.

According to Hobbes, *monarchy*, as well as aristocracy, derives all its authority from the people, who transfer all their right, *v. gr.* the supreme power, by a plurality of suffrages, &c. to some one person called a *monarch*; so that whatever the people could have done before this translation, may be now rightfully done by him, to whom the translation is made.—This done, the people are no longer to be looked on as a person, but a dissolved multitude; in regard they were only one by virtue of the supreme power, which they have now transferred to another.

Nor can the *monarch*, according to this author, oblige himself by any covenants, to any person, for the authority he has received; in regard he receives the power from the people, which as soon as that is done, ceases to be a person; and the person ceasing, the obligation to the person ceases of course.—The people therefore are obliged to pay obedience to the *monarch*, by virtue of those covenants, whereby they mutually oblige themselves to what the people, as a person, enjoins to be done.

He argues further, that as a *monarch* cannot be obliged by any covenants; so neither can he do any injury to his subjects: an injury being nothing else but a breach of covenant; and where there is no covenant, there can be no breach. *De cive*, cap. 8.

MONASTERII *provisor*. See the article PROVIDOR.

MONASTERY, a convent, or house built for the reception of religious; whether it be abbey, priory, nunnery, or the like. See ABBEY, PRIORY, &c.

MONASTERY is only properly applied to the houses of monks,

mendicant friars, and nuns. The rest are more properly called *religious houses*. See RELIGIOUS.

MONASTIC, something belonging to monks, or the monkish life. See MONK.

The *monastic* profession is a kind of civil death, which has the same effect with the natural death. The council of Trent, &c. fix sixteen years for the age at which a person may be admitted into the *monastical* state.

St. Anthony is the person who in the fourth century first instituted the *monastic* life; as St. Pachomius, in the same century, is said to have first set on foot the *cœnobitic* life, *i. e.* regular communities of religious. See COENOBITE.

In a short time, the deserts of Egypt became inhabited with a set of solitaries, who took upon them the *monastic* profession. See ANACHORET, HERMITE, &c.—St. Basil carried the monkish humour into the east, where he composed a rule, which afterwards obtained through a great part of the west.

In the eleventh century, the *monastic* discipline was grown very remiss: St. Odo first began to retrieve it in the monastery of Cluny: that monastery, by the conditions of its erection, was put under the immediate protection of the holy see; with a prohibition to all powers, both secular and ecclesiastical, to disturb the monks in the possession of their effects, or the election of their abbot. In virtue hereof, they pleaded an exemption from the jurisdiction of the bishop; and extended this privilege to all the houses dependent on Cluny. This made the first congregation of several houses under one chief immediately subject to the pope, so as to constitute one body, or, as they now call it, one *religious order*. Till then, each monastery was independent of other, and subject to the bishop. See ORDER, CONGREGATION, ABBOT, RELIGIOUS, &c.

MOND. See the article MOUND.

MONDAY.---Plough MONDAY. See the article PLOUGH.

MONETÆ *pes*. See the article PES.

MONETAGIUM, MONETAGE, or MINTAGE, the right or privilege of coining money. See MINT, COINING, &c.

MONETALES *triumviri*. See the article TRIUMVIRI.

MONETARIUS, or MONEER, a name which antiquaries and medalists give to those who struck the ancient coins, or monies. See MONEER.

Some of the old Roman, &c. coins, have the name of the *monetarius*, either written at length, or at least the initial letters of it. See COIN, &c.

MONEY, or MONY, MONETA, a piece of metal marked for coin, with the arms of a prince, or state, who make it circulate or pass, at a fixed rate, for things of different value; to facilitate the business of commerce. See COMMERCE. Paulus the lawyer, defines *money* a thing stamped with a public coin, and deriving its use and value from its impression rather than its substance.

Monf. Boizard defines *money* a piece of matter to which public authority has affixed a certain value, and weight; to serve as a medium in commerce.

The æra of the invention of *money* is not easy to be settled. There is no room to doubt but that in the earliest ages, the ordinary way of traffick among men was by trucking or exchanging commodity for commodity. Thus in Homer, Glaucus's golden armour was valued at one hundred cows; and Diomedes's armour at ten. See EXCHANGE.

But in course of time, it was found necessary in the way of commutative justice, to have some common measure or standard, according to which all other things should be estimated. This as some gather from Josephus, was first invented by Cain: Though the first tidings we hear of it, is in the time of Abraham, who paid four hundred shekels for a burying-place.

The Greeks refer the invention of *money* to Hermodice, wife of king Midas; and the Latins to Janus.—*Money* being a common measure for reducing wares to a balance, it was called by the Greeks *nomisma*; not from king Numa, but from *nomos*, as being established by law. By the Latins it was called *pecunia*; either because the wealth of those days consisted in their cattle; or, as Pliny will have it, because their first coin was stamped with the figure of a cow. They also call it *moneta*, *à monendo*, as Suidas observes, because when the Romans were at a want of *money*, Juno admonished them to use justice, and there should be no want of *money*. The effect whereof when they had found, she was sur-named *Juno Moneta*, and *money* was coined in her temple. In process of time, *money* herself was made a goddess, and enshrined by the name of *dea pecunia*, under the figure of a woman holding a balance in one hand, and a cornucopia in the other.

On the foot *money* now stands, it may be divided into *real*, or *effective*; and *imaginary*.

Real MONEY includes all coins, or species of gold, silver, copper, and the like; which have course in commerce, and do really exist.—Such are *guineas*, *crowns*, *pistoles*, *pieces of eight*, *ducats*, &c. which see under their proper heads; as also under COIN.

Real money, civilians observe, has three essential qualities, *viz.* *matter*, *form*, and *weight* or *value*.—For *matter*, copper is that thought to have been first coined; afterwards silver; and, lastly, gold, as being the most beautiful, scarce, cleanly, divisible, and pure of all metals.

The

The degrees of goodness are expressed in gold by carats ; and in silver by penny-weights, &c. For there are several reasons for not coining them pure and without alloy, viz. the great loss and expence in refining them, the necessity of hardening them to make them more durable, and the scarcity of gold and silver in most countries. See ALLOY.

Among the ancient Britons, iron rings, or, as some say, iron plates, were used for money. Among the Lacedæmonians, iron bars quenched with vinegar, that they might not serve for any other use. Seneca observes, that there was anciently stamped money of leather, *corium forma publica impressum*. And the same thing was put in practice by Frederic II. at the siege of Milan ; to say nothing of an old tradition among our selves, that in the confused times of the barons wars, the like was done in England : but the Hollanders, we know, coined great quantities of pasteboard in the year 1574. Numa Pompilius made money of wood and leather. Nor does it appear that the Romans were much acquainted with the art of striking money in metal during the time of their kings. The first silver money they coined was in the year of Rome 484 ; and their first gold money in 546. See COINING.

As to the form of money, it has been more various than the matter.—Under this are comprehended the weight, figure, impression, and value.

For the impression, the Jews, though they detested images, yet stamped on the one side their shekel, the golden pot which had the manna ; and on the other, Aaron's Rod. The Dardans, two cocks fighting. Alexander, as is held by some, his horse Bucephalus : though this may be doubted of, in regard the horse is found as frequently on the coins of several of the kings of Macedon, his predecessors, as on his : The Athenians stamped their coins with an owl, or an ox ; whence the proverb on bribed lawyers, *bos in lingua*. They of Ægina, with a tortoise ; whence that other saying, *virtutem & sapientiam vincunt testudines*. For the Romans, the monetarii sometimes impressed the images of men that had been eminent in their families on the coins : But no living man's head was ever stamped on a Roman coin till after the fall of the commonwealth. From that time they bore the emperor's head on one side. From this time the practice of stamping the prince's image on coins, has obtained among all civilized nations ; the Turks and other Mahometans alone excepted, who, in detestation of images, inscribe only the prince's name, with the year of the transmigration of their prophet.

As to the figure, it is either round, as in England ; multangular or irregular, as in Spain ; square, as in some parts of the Indies ; or nearly globular, as in most of the rest.

After the arrival of the Romans in this island, the Britons imitated them, coining both gold and silver with the images of their kings stamped on them. When the Romans had subdued the kings of the Britons, they also suppressed their coins, and brought in their own ; which were current here from the time of Claudius to that of Valentinian the younger, about the space of five hundred years.

Mr. Camden observes, that the most ancient English coin he had known was that of Ethelbert king of Kent, the first Christian king in the island ; in whose time all money accounts began to pass by the names of pounds, shillings, pence, and mancuses. See POUND, &c.

Pence seems borrowed from the Latin *pecunia*, or rather from *pendo*, on account of its just weight, which was about three pence of our money. These were coarsely stamped with the king's image on the one side, and either the mint-master's, or the city's where it was coined, on the other. Five of these pence made their scilling, probably so called from *scillingus*, which the Romans used for the fourth part of an ounce. Forty of these scillings made their pound, and four hundred of these pounds were a legacy, or a portion for a king's daughter ; as appears by the last will of king Alfred. See PENNY, &c.

By these names they translated all sums of money in their old English testament ; talents by *pundes* ; Judas's thirty pieces of silver by *thirtig scillinga* ; tribute money, by *penining* ; the mite by *feorthling*.

But it must be observed, they had no other real money, but pence only ; the rest being imaginary moneys, i. e. names of numbers, or weights. Thirty of these pence made a mancus, which some take to be the same with a mark ; manca, as appears by an old MS. was *quinta pars uncia*. See MARK.

These manca's or mancus's, were reckoned both in gold and silver. For in the year 680, we read that Ina king of the West Saxons obliged the Kentishmen to buy their peace at the price of thirty thousand manca's of gold. In the notes on king Canute's laws, we find this distinction, that *manca* was as much as a mark of silver ; and *manca* a square piece of gold, valued at thirty pence.

The Danes introduced a way of reckoning money by ores, *per oras*, mentioned in domes-day book ; but whether they where a several coin, or a certain sum, does not plainly appear. This, however, may be gathered from the abbey-book of Burton, that twenty ores were equivalent to two marks.

They had also a gold coin called *bizantine*, or *bezant*, as being coined at Constantinople, then called *Bisantium*. The

value of which coin is not only now lost, but was so entirely forgot even in the time of king Edward the third, that where-as the bishop of Norwich was fined a bizantine of gold to be paid the abbot of St. Edmund's-Bury, for infringing his liberties (as it had been enacted by parliament in the time of the conqueror) no man then living could tell how much it was : so it was referred to the king to rate how much he should pay.

Which is the more unaccountable, because but a hundred years before, two hundred thousand besants were exacted by the sultan for the ransom of St. Lewis of France ; which were then valued at one hundred thousand livres. See BESANT.

Though the coining of money be a special prerogative of the king, yet the ancient Saxon princes communicated it to their subjects ; inasmuch that in every good town there was at least one mint ; but at London eight, at Canterbury four for the king, two for the archbishop, one for the abbot at Winchester, six at Rochester, at Hastings two, &c. See MINT.

The Norman kings continued the same custom of coining only pence, with the prince's image on one side, and on the other the name of the city where it was coined, with a cross so deeply impressed, that it might be easily parted, and broke into two halves, which so broken, they called half-pence ; or into four parts, which they called *fourthings*, or *farthings*. See FARTHING.

In the time of king Richard the first, money coined in the east parts of Germany, came in special request in England, on account of its purity, and was called *easterling money*, as all the inhabitants of those parts were called *Easterlings*. And shortly after, some of those people skilled in coining were sent for hither, to bring the coin to perfection ; which since has been called *sterling for Easterling*. See STERLING.

King Edward the first, who first adjusted the measure of an ell by the length of his arm, herein imitating Charles the Great, was the first also who established a certain standard for the coin, which is expressed to this effect by Greg. Rockley, mayor of London, and mint-master.—‘ A pound of money containeth twelve ounces : in a pound there ought to be eleven ounces, two easterlings, and one farthing ; the rest alloy. The said pound ought to weigh twenty shillings and three pence in account and weight. The ounce ought to weigh twenty pence, and a penny twenty-four grains and a half.—Note, that eleven ounces two pence sterling ought to be of pure silver, called *leaf-silver*, and the minter must add of other weight seventeen pence half-penny farthing, if the silver be so pure.’

About the Year 1320, the states of Europe first began to coin gold, and among the rest, our king Edward III. The first pieces he coined were called *florences*, as being coined by Florentines ; afterwards he coined nobles ; then rose-nobles, current at six shillings and eight pence ; half-nobles, called *half-pennies*, at three shillings and four pence of gold ; and quarters at twenty pence, called *farthings of gold*. The succeeding kings coined rose-nobles, and double rose-nobles, great sovereigns, and half Henry nobles, angels and shillings.

King James the first coined unites, double crowns, Britain crowns : then crowns, half crowns, &c. See CROWN.

*False, or base MONEY*, is either that struck by an unqualified person, and of unstatutable metals ; or that which has lost of its weight, either by being clipped on the corners, or filed on the edges, or lastly, by having some of its surface peeled off ; if gold, by *aqua regalis* ; if silver, by *aqua fortis*.

Another kind of base money is that made of pieces of iron, copper, or other metal, covered on each side with a thin plate or leaf of gold or silver, neatly foddered and joined around the edges, and struck, like other coin, with figures, legends, &c. only to be distinguished from them by the bulk, and weight, and sound.

*Imaginary MONEY*, or *MONEY of account*, is that which has never existed, or at least which does not exist in real species, but is a denomination invented or retained to facilitate the stating of accounts, by keeping them still on a fixed footing, not to be changed, like current coins, which the authority of the sovereign raises or lowers according to the exigencies of state.—Of which kind are pounds, livres, marks, maravedies, &c.

*Money of account*, according to M. Boizard, is a sum of money, or a certain number of species which may change in substance and quantity, but never in quality.—Thus fifty pounds consists of fifty pieces called pounds, which are not real, but may be paid in several real species, as in guineas, crowns, shillings, &c. which are changeable, as guineas, *v. gr.* which are sometimes higher, sometimes lower. See POUND, and GUINEA.

*MONIES of account, or manner of reckoning MONEY in Europe and Asia*.—We here confine ourselves to the monies of those two parts of the world : America having none ; the respective monies of account of the Europeans, who have there made settlements, being established with them. As to Africa, the cities of Barbary and Egypt, whither the Europeans traffick, reckon much after the same manner as in the Levant, and in the dominions of the grand signior : for the rest, throughout that vast extent of coast, where we trade for negroes, gold dust, elephants teeth, wax, leathers, &c. either the miserable inhabitants do not know what money of account is, or if they have any, it is only what strangers, settled among them,

them, have introduced.—The *macoute*, however, and the *piece*, which are manners of accounting among these Barbarians, will be mentioned in their place. See *PIECE*.

**English MONEY of account**, is the pound, shilling, and penny sterling: The pound containing twenty shillings, and the shilling twelve pence. See *POUND*, *COIN*, and *STERLING*.

**French MONEY of account**, was anciently the *parisis*, *tournois*, and the *écu*, or the crown: but since the ordonnance of 1667, they only reckon by *livres*, *i. e.* pounds; *sols*, *i. e.* shillings; and *deniers tournois*, *i. e.* pence. The *livre*, 20 *sols*, or  $\frac{1}{4}$  of the *écu*, or crown; the *sol*, 12 *deniers*. See *LIVRE*, *DENIER*, &c.

The *maille*, *obole*, or half-penny *tournois*, is also now a *money* of account, though anciently a real coin. The *maille* is divided into two *mites*, and each *mite* into two *femi-mites*; all *moneys* of account. To which must be added the *frank*, of the same value with the *livre*, *viz.* 20 *sols tournois*; and the *blanc*, 5 *deniers tournois*; and the *carolus*, ten: all three anciently real coins. See *FRANC*, &c.

**Dutch and Flemish MONEYS of account**. In Holland, Zealand, Brabant, and Cologne, they use the *pundt*, or *livre de gros*; *schelling*, or *sol de gros*; and *penning*, or *deniers gros*. The *pundt*, containing 20 *schelling*; and the *schelling*, 12 *pennings*. The *pundt* equal to 7 *livres*, 4 *sols* French, or 10 shillings  $\frac{1}{3}$  sterling. They also account by *florins* or *guilders*, *patards* and *pennings*. The *florin* is equal to  $\frac{1}{2}$  of the *pound*, or 20 *patards*; and the *patard*, 12 *pennings*. The merchants use each method of accounting indifferently.

**Spanish MONEY of account**, is the *peso*, *ducat* of silver and *vellon*, *rial* of *vellon*, and *cornados* and *maravedis* of silver and *vellon*. The *peso* is to the *ducat* as 12 to 10. The *ducat* of silver contains 11 *rials* of silver; and that of *vellon*, 11 *rials* of *vellon*; which makes a difference of near one half. The silver *rial* being current for 7 shillings sterling, and that of *vellon* only at 3 *s.* 8 *d.* sterling, 34 *maravedis* make the *rial* of *vellon*, and 63 that of silver. The *maravedi* is divided into 4 *cornados*.

**German and Swiss MONEY of account**. In Switzerland, and many of the chief cities of Germany, particularly *Frankfort*, they account by *florins* (but on a footing different from that of Holland) by *creux's* or *creutzers*, and *penning*. The *florin* equal to three shillings sterling, and divided into 60 *creux*, or *kreutz*, and the *creux* into 8 *penning*. In others, as *Nuremberg*, &c. they account by *rix-dollars*, *florins*, and *creux*. The *rix-dollar* equal to 4 *s.* 8 *d.* sterling, divided into 100 *creux*, and the *creux* into 8 *penning*. In others, as *Hambourg*, *Berlin*, &c. by *rix-dollars*, *marks lubs*, *schellings lubs*, and *deniers lubs*. The *rix-dollar* and *dollar* on the foot of the French crown, or 4 *s.* 6 *d.* sterling, divided into 3 *marks*, and the *mark* into 16 *schellings*, and the *schelling* into 12 *penning*. At *Hambourg* they also use the *livre*, *schelling*, and *denier de gros*. At *Augsbourg* and *Bolzamont*, they account by *dollars* and *creux's*; the *dollar* equal to 4 *s.* 6 *d.* sterling, divided into 90 *creux's*. At *Nambourg*, by *rix-dollars* *gros* and *fenins*; the *rix-dollar* equal to 4 *s.* 6 *d.* sterling, divided into 36 *gros*, and the *gros* into 12 *fenins*. At *Strasbourg* by *florins*, *creux*, and *penning*. The *florin* equal to 1 *s.* 6 *d.* sterling, divided into 60 *creux*, and the *creux* into 8 *penning*.

**Italian MONEYS of account**. In Italy, the *moneys* of account are various, almost as the cities of commerce. At *Rome*, they account by *pounds*, *shillings*, and *pence* of gold *di stampa*. At *Venice*, by *ducats*, and *gros di banco*. The *ducat* divided into 24 *gros*, each *gros* equal to 2 *pence*  $\frac{1}{2}$  sterling. And by *ducats* current, called also *sequins*, equal to 9 *s.* 2 *d.* sterling; and by *pounds*, *shillings*, and *pence*. At *Lucca* and *Bergamo*, they use the four last; and only the three last at *Bologna*, *Mantua*, and *Savoy*: In *Geneva*, besides *pounds*, *shillings*, and *pence*, they account also by *florins*, containing 6 *solidi*, or 6 *pence*  $\frac{1}{2}$  sterling. At *Leghorn* and *Genoa*, besides *pounds*, *shillings*, and *pence*, they account by *piasters*, equal to 4 *s.* 6 *d.* sterling. At *Nova*, their *moneys* of account are *crowns*, *shillings*, and *pence* of gold *de marc*. At *Raconis*, *pounds*, *florins*, and *gros*. At *Ancona*, *crowns*, *shillings*, and *pence*. At *Naples*, *ducats*, *grains*, and *tarins*, equal to one shilling sterling, divided into 20 *grains*.

**Sicilian and Maltese MONEYS of account**. At *Messina*, *Palermo*, and throughout *Sicily*, they account by *pounds*, *ounces*, *tarins*, *grains*, and *piccoli's*; which are summed by 30, 20, and 6: the ounce being 30 *tarins*, the *tarin* 20 *grains*, and the grain 6 *piccoli's*. At *Malta*, they account by *pounds*, *ounces*, *carlins* and *grains*. The ounce 30 *tarins*, or 60 *carlins*, or 600 *grains*; the *carlin* equal to 6 *d.*  $\frac{1}{4}$  sterling.

**Polish MONEYS of account**. Throughout *Poland*, most of the dominions of the king of *Prussia*, and *Dantzic*, they account by *rix-dollars*, *roups*, and *grochs*. The *rix-dollar* equal to 4 *s.* 6 *d.* sterling, and divided into 32 *roups*; and again, in the *Prussian* territories, into 24 *grochs*: in *Poland*, into 90 *grochs*. Sometimes they use the *florin*, *groch*, and *penny*.

**Swedish, Danish, and Muscovite MONEYS of account**. In *Sweden*, they account by *dalles*, equal to 32 *sols lubs*, or 3 shillings sterling. In *Denmark*, by *rix-dollars*, and *stivers*; the *rix-dollar* divided into 48 *stivers*.

In *Muscovy*, they account by *roobles*, *altins*, and *grifs* or *grives*. The *rooble* equal to 100 *copecs*, or 2 *rix-dollars*, or 9 shillings sterling; divided into 10 *grifs*; 3 *altins*  $\frac{1}{2}$  make the *grif*, or 10 *copecs*; the *copec* at 13 *pence*  $\frac{1}{4}$  sterling.

**Turkish MONEYS of account**. The *Turks*, both in *Europe*, *Asia*, and *Africa*, account by *purfes*, either of silver or gold, (the last only used in the *seraglio*) with half-purfes of gold, called also *rizes*. The *purfe* of silver equal to 1500 French *livres*, or 112 *l.* 10 *s.* sterling. The half-purfe in proportion. The *purfe* of gold 15000 *sequins*, equal to 30000 French *crowns*, or 6750 *pounds* sterling; seldom used but for presents to favourites; so that a *purfe*, simply, signifies a *purfe* of silver, or 1500 *livres*. They are called *purfes*, because all the *money* in the treasury of the *seraglio* is kept in leathern bags or *purfes*, of those contents. The merchants also use Dutch *dallars*, called *astani* or *abouquels*, with *meideins* and *aspres*. The *dallar* equal to 35 *meideins*, and the *meidein* to 3 *aspres*; the *aspre* to  $\frac{1}{2}$  penny sterling.

**Persian MONEYS of account**. In *Persia*, they account by the *toman* (called also *man*, and *tumein*) and the *dinar-bifti*. The *toman* is composed of 50 *abaffis*, or a hundred *mamodies*, or 200 *chapes*, or 10000 *dinars*; which accounting the *abaffi* on the foot of eighteen French *sols*, or the *dinar* on that of a *denier*, amounts to 3 *l.* 12 *s.* 6 *d.* sterling the *toman*. They also account by *larins*, especially at *Ormus*, and on the coasts of the *Persian gulph*. The *larin* equivalent to 11 *pence* sterling; and on that footing used also in *Arabia*, and a great part of the *East-Indies*.

**Chinese MONEYS of account**, are the *pic*, *picol*, and *tael*; which though in effect weights, do likewise serve as *moneys* of account; obtaining in *Tunquin* as well as in *China*. The *pic* is divided into 100 *catis*, some say 125. The *cati* into 16 *taels*; each *tael* equal to 1 ounce 2 *drachms*. See *Chinese COINS*. The *picol* contains 66 *catis*  $\frac{1}{2}$ ; the *tael* equivalent to 6 *s.* 8 *d.* sterling.

**Japanese MONEYS of account**, are the *schuites*, *cockiens*, *oebans*, or *oubans*, and *taels*. Two hundred *schuites* are equal to 500 Dutch *pounds*; the *cockien* equal to 10 Low-country *pounds*; 1000 *oebans* make 45000 *taels*.

**Mogul MONEYS of account**. At *Surat*, *Agra*, and the rest of the estates of the Great *Mogul*, they use *lacs*, *acres*, or *leeths*; implying a hundred thousand: thus a *lacre* of *rupees* is a hundred thousand *rupees*; the *lacre* being nearly on the footing of the *tun* of gold in *Holland*, and the *million* of *France*.

**MONEYS of account of other islands and coasts of India**. Throughout *Malabar*, and at *Goa*, they use *tangas*, *vintins*, and *pardos xeraphin*. The *tanga* is of two kinds, *viz.* of good, and bad alloy. Hence their custom is to count by good or bad *money*. The *tanga* of good alloy is  $\frac{1}{2}$  better than the bad; so that 4 *tangas* good being allowed the *pardos xeraphin*, there will be required 5 of the bad; 4 *vintins* good make a *tanga* likewise good; 15 *barucos* a *vintin*. The good *baruco* is equal to a Portuguese *Ree*, a French *denier*, or  $\frac{1}{12}$  of a penny sterling. In the island of *Java*, they use the *fonta*, *sapacou*, *fardos*, and *catis*; which last *money*, together with the *leeth*, or *lacre*, is much used throughout all the *East-Indies*. The *fonta* is two hundred *caxas*, or little pieces of that country hung on a string; and is equal to  $\frac{1}{2}$  of a penny sterling. Five *fontas* make the *sapacou*. The *fardos* equal to 2 *s.* 8 *d.* sterling. The *cati* contains 20 *taels*; the *tael* 6 *s.* 8 *d.* sterling.

There are islands, cities, and states of the *East-Indies*, whose *moneys* of account are not here expressed; partly because reducible to some of those above-mentioned; and partly because we find no certain consistent account of them in any of the authors, or memoirs herein consulted.

**African MONEYS of account**. From *Cape Verd*, to the *Cape of Good Hope*, all exchanges and valuations of merchandizes are made on the foot of the *macoute* and *piece*: which though no *moneys* of account, (for those Barbarians having no real *moneys*, need no imaginary ones to estimate them by,) yet serve in lieu thereof. At *Loango de Boirie*, and other places on the coast of *Angola*, the estimations are made by *macoutes*; and at *Malimbo*, and *Cabindo*, on the same coast, the negroes reckon by *pieces*. Among the first, the *macoute* is equivalent to 10: Ten *macoutes* make 100; which likewise leaves us a kind of imaginary *money*. To estimate any purchase, exchange, &c. they fix on the one side the number of the *macoutes* required, *e. gr.* for a negro; on the other, for how many *macoutes* they agree to receive each kind of merchandize required for the negro: so that there are several bargains made for one. Suppose, *v. gr.* the slave be fixed at 3500; this amounts to 350 *macoutes*. To make up this number of *macoutes* in merchandizes, they fix the price of each in *macoutes*. Two *Flemish* knives, *e. gr.* are accounted one *macoute*; a copper-baton two *pounds* weight, three; a barrel of gunpowder, three, &c. For the *piece*, it serves in like manner to estimate the value of goods, duties, &c. on either side. Thus the natives require 10 *pieces* for a slave; and the Europeans put, *v. gr.* a *fusce* at 1 *piece*; a *piece* of *salampoures* blue, at 4 *pieces*, &c.

**MONEYS of account among the ancients**.—**Grecian MONEYS of account**. The *Grecians* reckoned their sums of *money* by *drachmæ*, *minæ*, and *talenta*. The *drachma* equal to 7  $\frac{1}{4}$  *l.* sterling; 100 *drachmæ* made the *mina*, equal to 3 *l.* 4 *s.* 7 *d.* sterling;

sterling; 60 minæ made the talent, equal to 193  $\frac{1}{2}$  l. 15 s. sterling: Hence 100 talents amounted to 19375 l. sterling. The mina and talentum indeed, were different in different provinces: Their proportions in Attic drachms are as follow. The Syrian mina contained 25 Attic drachms; the Ptolemaic 33  $\frac{1}{2}$ ; the Antiochic and Eubæan 100; the Babylonian 116; the greater Attic and Tyrian 133  $\frac{1}{2}$ ; the Ægean and Rhodian 166  $\frac{2}{3}$ . The Syrian talent contained 15 Attic minæ; the Ptolemaic 20; the Antiochic 60; the Eubæan 60; the Babylonian 70; the greater Attic and Tyrian 80; the Ægean and Rhodian 100.

Roman MONEYS of account, were the sestertius and sestertertium. The sestertius equal to 1 d. 3  $\frac{1}{2}$  s. sterling. One thousand of those made the sestertertium, equal to 8 l. 1 s. 5 d. 2 q. sterling. One thousand of these sestertertia made the decies sestertertium (the adverb centies being always understood) equal to 8072 l. 18 s. 4 d. sterling. The decies sestertertium they also called *decies centena millia nummum*. Centies sestertertium, or centies HS were equal to 80729 l. 3 s. 4 d. Millies HS to 807291 l. 13 s. 4 d. Millies centies HS to 888020 l. 16 s. 8 d.

MONEYERS, MONEYORS, or MONIERS, officers of the mint, who work, and coin gold and silver money; and answer all the waste and charges. See MINT, COINING, and MONETARIUS.

MONEYERS is sometimes also used for bankers; or those who make a trade of turning and returning money. See BANKER.

MONITORY letters, are letters of warning and admonition, sent from an ecclesiastical judge upon information of scandals and abuses within cognizance of his court.

MONK\*, anciently denoted a person who retired from the world, to give himself up wholly to God, and to live in solitude, and abstinence. See RELIGIOUS.

\* The word is derived from the Latin *monachus*, and that from the Greek *μοναχικός*, solitary, of *μονος*, *solus*, alone; by reason the ancient monks lived in solitude, as the true monks still do.

Such were the Hermits and Anachorets, who withdrew into deserts, and lived remote from all commerce of mankind. See HERMIT and ANACHORET.

Some writers, as father Helyot, *differt. prelim.* trace the original of monks up as early as the time of the Therapeutæ, and maintain that there had been an uninterrupted succession of monks from the Therapeutæ to St. Anthony. Others, on the contrary, are contented with going back as far as St. Paul, the first hermit. See THERAPEUTÆ.

The monks, at least the ancient ones, were distinguished into *solitaries*, *cœnobites*, and *sarabaites*.

The *solitaries* are those who live alone, in places remote from all towns, or habitations of men, as do still some of the hermits. The *cœnobites* are those who live in community with several others in the same house, and under the same superiors. See COENOBITE.

The *sarabaites* were strolling monks, having no fixed rule or residence. See SARABAITES.

The houses of monks again were of two kinds, viz. *monasteries* and *lauræ*. See MONASTERY, and LAURA.

Those we call monks now-a-days, are cœnobites, who live together in a convent or monastery, who make vows of living according to a certain rule established by the founder, and wear a habit which distinguishes their order. See VOW, and RULE.

Those that are endowed, or have a fixed revenue, are most properly called monks, *monachi*; as the Chartreux, Benedictines, Bernardines, &c.—The Mendicants, or those that beg, as the Capuchins, and Franciscans, are more properly called religious, and friars; though the names are frequently confounded. See RELIGIOUS.

The first monks were those of St. Anthony; of St. Basil, called in the east, *calogeri*, from *καλός* *καλός*, good old man; and those of St. Jerom; the hermits of St. Augustine, and afterwards those of St. Benedict and St. Bernard; at length came those of St. Francis, and St. Dominic, with a legion of others; which see under their proper heads, BENEDICTINES, &c.

Monks are distinguished by the colour of their habits into black, white, grey, &c.—Among the monks, some are called monks of the choir, others professed monks, and others lay monks; which last are destined for the service of the convent, and have neither clericate nor literature. See LAY.

Cloistered MONKS, are those who actually reside in the house: in opposition to *extra-monks*, who have benefices depending on the monastery.

Monks are also distinguished into reformed, whom the civil and ecclesiastical authority have made masters of ancient convents, and put in their power to retrieve the ancient discipline which had been relaxed; and ancient, who remain in the convent, to live in it according to its establishment at the time when

they made their vows, without obliging themselves to any new reform.

Anciently, the monks were all laymen, and were only distinguished from the rest by a particular habit, and an extraordinary devotion.—Not only the monks were prohibited the priesthood; but even priests were expressly prohibited from becoming monks, as appears from the letters of St. Gregory. Pope Cyricius was the first who called them to the clericate, on occasion of some great scarcity of priests, that the church was then supposed to labour under. And since that time, the priesthood has been usually united to the monastical profession. See FATHER, &c.

Professed MONKS. See the article PROFESSED.

Proprietary MONKS. See the article PROPRIETARY.

MONKS-HOOD. See the article ACONITE.

MONKS rhubarb. See the article RHUBARB.

MONKS seam, among sailors, is when the selvages of sails are laid a little over one another, and sewed on both sides.

MONOCHORD, a musical instrument wherewith to try the variety and proportion of musical sounds. See TUNE.

*Monochord*, according to Boethius, is an instrument invented by Pythagoras, for measuring geometrically, or by lines, the quantities and proportions of sounds.

The ancient *monochord* was composed of a rule divided, and subdivided into divers parts, whereon there was a string pretty well stretched upon two bridges, at each extreme thereof. In the middle between both was a moveable bridge, called *magas*, by whose means, in applying it to the different divisions of the line, the sounds were found to be in the same proportion to one another, as the divisions of the line cut by the bridge were.

The *monochord* is also called the *harmonical canon*, or *canonical rule*; because serving to measure the degrees of gravity, and acuteness of sounds. Ptolemy examines his harmonical intervals by the *monochord*. See CANON, GRAVITY, &c.

There are also *monochords* with divers strings, and a multitude of fixed bridges; the use of all which may be supplied by one single moveable bridge; by only shifting it under a new chord or string, which is placed in the middle, and represents the entire sound, or the open note, answering all the divisions on the other bridges.

When the chord was divided into equal parts, so that the terms were as 1 and 1, they called them *unisons*; if they were as 2 to 1, *octaves*, or *diapasons*; when they were as 8 to 2, *fifths*, or *diapentes*; if they were as 4 to 3, they called them *fourths*, or *diatesseron*; if the terms were as 5 to 4, *diton*, or a greater third; if as 6 to 5, a *demi-diton*, or a lesser third; lastly, if as 24 to 25, *demi-diton*, or *disis*. See UNISON, OCTAVE, DIAPASON, DIAPENTE, DIATESSERON, &c.

The *monochord* being thus divided, was properly what they called a *system*, of which there were many kinds according to the different divisions of the *monochord*. See SYSTEM.

Dr. Wallis has taught the division of the *monochord* in the *Philosophical Transactions*; but that instrument is now disused, the modern music not requiring such division.

MONOCHORD\*, is also used for any musical instrument, consisting of only one chord, or string.—Such is the trumpet-marine. See CHORD and TRUMPET.

\* The word is Greek, *μονοχορδός*, formed of *μονος*, *solus*, single, and *χορδή* chord.

MONOCHROMA\*, MONOCHROMA, a picture all of one colour. See CAMIEUX, CLAIROSCURE, &c.

\* The word is compounded of the Greek, *μονος*, single; and *χρῶμα*, colour.

MONODY\*, MONODIA, in the ancient poetry, a kind of mournful song, or ditty, sung by a person all alone; to utter his grief.

\* The word is compounded of *μονος*, *solus*, and *ὄδῃ*, song.

MONOGAMY\*, the state or condition of those who have only married once, or are restrained to a single wife. See MARRIAGE, BIGAMY, &c.

\* The word is compounded of *μονος*, *solus*, and *γάμος*, marriage, See POLYGAMY.

MONOGRAM, MONOGRAMUS, a cipher or character, composed of one or more letters interwoven; being a kind of abbreviation of a name; anciently much used as a badge, seal, arms, &c. See SEAL, CIPHER, &c.

Under the eastern empire, it is usual to find MIK, which are the monogram of Maria, Jesus, Constantine.

The use of monograms is of an ancient standing, as appears from Plutarch, and from some Greek medals of the time of Philip of Macedon, Alexander his son, &c.

The Roman labarum bore the monogram of Jesus Christ, consisting of two letters, a P placed perpendicularly through the middle of an X, *e. gr.*  $\text{P}$ , as we find it in several medals of the time of Constantine; those being the two first letters of the word  $\text{ΧΡΙΣΤΟΣ}$ , Christ. See LABARUM.

Kings formerly marked their coins with their monograms: Of this we have instances in Charlemain's coins. That prince also used the monogram for his signature. Eginhard gives us this reason for it, viz. that Charlemain could not write; and that having attempted in vain to learn in his grown age, he was reduced to the necessity of signing with a monogram.

The ancients also used *monograms* as notes, or abbreviations of inscriptions; for the understanding whereof we have express treatises of Valerius Probus, Sert. Urfatus, &c. See CHARACTER.

**MONOLOGUE\***, a dramatic scene, wherein a person appears alone on the stage, and speaks to himself. See SOLILOQUY.

\* The word is formed of the Greek *μονος*, *solus*; and *λογος*, discourse, speech.

**MONOMACHIA\***, **MONOMAXIA**, a duel, or single combat of man against man. See DUEL.

\* The word comes from the Greek, *μονος*, *solus*; and *μαχη*, combat.

*Monomachia* was anciently allowed by law, for the trial or proof of crimes. It was permitted in pecuniary causes, as appears by ancient records. It is now forbid both by the civil and canon laws. See COMBAT.—Alciat has wrote a treatise *De monomachia*.

**MONOMIAL**, in algebra, a root or quantity that has but one name; or consists but of one part or member.—Such are *ab*, *aab*, *aaabb*. See QUANTITY, BINOMIAL, TRINOMIAL, ROOT, &c.

*Monomials* may be either rational, or irrational. See RATIONAL, &c.

**MONOPETALOUS**, in botany, a term applied to flowers which have only one undivided petalum or leaf. See FLOWER, PETALA, &c.

**MONOPHYSITES\***, a general name given to all those sectaries in the Levant, who only own one nature in Jesus Christ. See THEANDRIC.

\* The word comes from the Greek, *μονος*, *solus*; and *φύσις*, *natura*.

The *monophysites* however, properly so called, are the followers of Severus, and Petrus Fullensis. See JACOBITE.

**MONOPOLY\***, **ΜΟΝΟΠΟΛΙΟΝ**, an unlawful kind of traffic, when one or more persons make themselves sole masters of any commodity, trade, manufacture, or the like, with design to enhance its price; those who have occasion for it being obliged to purchase it at their hands, and on their own terms.

\* The word is pure Greek, formed of *μονος*, *solus*, and *πωλεω*,  *vendo*, q. d. I sell alone.—Among the Romans, the term was so odious, that Tiberius, as Suetonius relates, having occasion to make use of it, begged leave of the senate for it, as being borrowed from the Greek.

There are two kinds of *monopolies*: The one, when a merchant buys up, for instance, all the corn of a province, to retail it at an advanced rate to the people.

The other, when a letter, or patent, is procured from the prince, prohibiting any other person to sell any commodity besides the patentee.

**MONOPTERE**, **ΜΟΝΟΠΤΕΡΟΣ**, a kind of temple among the ancients, round, and without walls; having its dome supported by columns. See TEMPLE.

**MONOPTOTE**, **ΜΟΝΟΠΤΟΤΟΝ**, in grammar, a noun which has only one case: as, *inficias*. See CASE.

**MONOPYRENEOUS** fruits, are such as only contain one kernel, or seed. See FRUIT.

**MONORHYME\***, a poetical composition, all the verses whereof end with the same rhyme. See RHYME.

\* The word comes from the Greek, *μονος*, *solus*; and *ῥυθμος*, rhyme. See RHYME.

*Monorhymes* are said to have been invented by the old French poet Leonin, who addressed some Latin verses of this kind to pope Alexander III. Whence they are also called *Leonine verses*. See LEONINE.

**MONOSTICH**, **ΜΟΝΟΣΤΙΧΟΝ**, an epigram or poetical piece consisting of one single verse. See VERSE, and EPIGRAM.

**MONOSYLLABLE**, **ΜΟΝΟΣΥΛΛΑΒΟΝ**, a word of a single syllable; or, that consists of one or more letters which are pronounced together. See WORD, and SYLLABLE.

The French language abounds in *monosyllables* more than any other. This renders it the more perplexing to foreigners, and yet the beauty of the language seems to consist in it. One of the best and smoothest lines in Malherbe consists of twelve *monosyllables*; speaking of Calista, he says,—*Et moy je ne voy rien quand je ne la voy pas*.—In this the genius of the English tongue differs very much from the French, an uninterrupted series of *monosyllables* in the former having always an ill effect. This Mr. Pope both intimates and exemplifies in the same verse.—*And ten low words oft creep in one dull line*.—Pasquier cites an elegy of forty-two verses, consisting wholly of *monosyllables*.

**MONOTHELITES\***, an ancient sect, who sprung out of the Eutychians; thus called, as only allowing of one will in Jesus Christ. See EUTYCHIAN.

\* The word is compounded of the Greek, *μονος*, *single*; and *θελημα*, will, of *θεω*, *volo*, I will.

The opinion of the *monothelites* had its rise in 630, and had the emperor Heraclius for an adherent: It was the same with that of the Acephalous Severians. See SEVERIANS.

They allowed of two wills in Christ, considered with regard to the two natures; but reduced them to one, by reason of the union of the two natures: Thinking it absurd there should be two free wills in one and the same person. See PERSON.

They were condemned by the sixth general council, as being supposed to destroy the perfection of the humanity of Jesus Christ, depriving it of will, and operation. That council declared their belief of two wills, and two operations, without division, or without changing the one for the other, without either distinguishing or confounding them; the human will being subject to the divine. See THEANDRIC.

**MONOTONIA**, **MONOTONY**, a want of variation, or inflection, of the voice; or a fault in pronunciation, where a long series of words are delivered with one unvaried tone. See PRONUNCIATION.

This is one of the principal faults of our English orators. *Monotonia* is opposed to chanting, or singing.

**MONS LUNE**. See AEDUCTOR.

**MONSEIGNEUR\***, in the plural *MESSEIGNEURS*, a title of honour and respect used by the French in writing to persons of superior rank, or quality.

\* The word is a compound of *mon*, my, and *seigneur*, lord.

Dukes, peers, archbishops, bishops, and presidents *a la mortier*, are complimented with the title of *monseigneur*. In the petitions presented to the sovereign courts, they use the term *nosseigneurs*.

**MONSEIGNEUR**, absolutely used, is a quality now restrained to the dauphin of France. See DAUPHIN.

This custom was unknown till the time of Louis XIV. Till then, the dauphin was styled *monseigneur le dauphin*.

**MONSIEUR\***, in the plural *MESSEIGNEURS*, a term, or title of civility, used by the French, in speaking to their equals, or those a little below them; answering to Mr. or Sir, among the English. See SIRE.

\* The word is a compound of *mon*, my, and *seigneur*, Sir. See SIEUR.—Borel derives it from the Greek *κύριος*, *lord* or *fire*, q. d. *monseigneur*. Pasquier derives *seigneur*, and *monseigneur*, from the Latin *senior*, elder. The Italians say *signor*, and the Spaniards *senor*, in the same sense, and from the same origin.

The superscriptions of all letters begin, *A monsieur monsieur*, such a one.

The use of the word *monsieur* was formerly more extensive than at present: They applied it to people who lived many ages before them: Thus, *monsieur* St. Augustine, *monsieur* St. Ambrose; and the vulgar still say, *monsieur* St. Paul, *monsieur* St. James, &c. The Romans, during the flourishing times of their liberty, were unacquainted with that term of parade and flattery, which they afterwards made use of in the word *dominus*. In speaking, or writing to each other, they only gave each other their proper names; which practice lasted even after Cæsar had brought the republic under his command. But after the Roman emperors were once well seated in the throne, the courtiers, and minions who by flattery sought to procure favours from them, studied new honours. Suetonius observes, that a comedian on the theatre having called Augustus, *dominus*, lord; the spectators all stared at him. So that the emperor forbade, for the future, that quality to be attributed to him. Caligula was the first, who expressly commanded himself to be called *dominus*. Martial, entirely devoted to tyranny, calls Domitian *dominum deumque nostrum*.—In time, the title was also applied to the people; and of *dominus*, at length was formed *dom*. See DOM.

**MONSIEUR**, absolutely used, is a title or quality appropriated to the second son of France, or the king's brother.

In a letter of Philip de Valois, that prince speaking of his predecessor, calls him *monsieur le roy*, *monsieur* the king. At present, no body calls the king *monsieur*, but the children of France. See SIRE.

**MONSOON**, a regular, or periodical wind, in the East-Indies, blowing constantly the same way, during six months of the year, and the contrary way the remaining six. See WIND. In the Indian ocean, the winds are partly *general*, and blow all the year round the same way, as in the Æthiopic ocean; and partly *periodical*, i. e. half the year blow one way, and the other half near on the opposite points. And those points and times of shifting differ in different parts of this ocean.—These latter are what we call *monsoons*.

*Monsoons* then are a species of what we otherwise call *trade-winds*. See TRADE-WIND.

They take the denomination *monsoon* from an ancient pilot, who first crossed the Indian sea by means hereof. Though others derive the name from a Portuguese word signifying *motion*, or change of wind, and sea.

Lucretius and Apollonius make mention of annual winds which arise every year, *etefia flabra*, which seem to be the same with what in the East-Indies we now call *monsoons*.

**MONSTER\***, **MONSTRUM**, a birth, or production of a living thing, degenerating from the proper and usual disposition of parts, in the species it belongs to.—As, when there are too many members, or too few; or some of them are extravagantly out of proportion, either on the side of defect or excess.

\* The word comes from the Latin, *monstrum*, of *monstrando*, shewing.—Whence also the box wherein relics were anciently kept to be shewn, was called *monstrum*. Dugdale mentions an inventory of the church of York with this article, *Item unum monstrum cum ossibus sancti Petri in Beryl, & crucifixo in summitate*. See RELICK.

Aristotle defines a *monster* to be a defect of nature, when acting towards

towards some end, it cannot attain to it, by reason some of its principles are corrupted. See NATURE.

*Monsters* do not propagate their kind; for which reason some rank mules among the number of *monsters*; as also hermaphrodites. See MULE, and HERMAPHRODITE.

Females, which bring forth twins, are found most liable to produce *monsters*.—The reason, probably, is owing to this; that though the twins are covered with one common chorion, yet they have each their separate amnios, which, by their contiguity may chance to grow together, and so occasion a confusion, or blending of the parts.—Hence so many double creatures. See DOUBLE.

F. Malebranche accounts for the production of *monsters* in the animal world thus.—The creator has established such a communication between the several parts of his creation, that we are not only naturally led to imitate one another, *i. e.* have a disposition to do the same things, and assume the same manners with those with whom we converse; but also have certain natural dispositions which incline us to compassion, as well as imitation. These things most men feel, and are sensible of; and, therefore, need not be proved. The animal spirits then are not only naturally carried into the respective parts of the body to perform the same actions, and the same motions which we see others do, but also to receive in some manner their wounds, and take part in their sufferings.

Experience tells us, that when we look attentively on any person severely beaten, or that hath a large wound, ulcer, or the like; the spirits immediately flow into those parts of our body which answer to those we see suffer in the other; unless their course be stopped from some other principle. This flux of spirits is very sensible in persons of a delicate constitution, who frequently shudder, and find a kind of trembling in the body on these occasions; and this sympathy in bodies, produces compassion in the mind.

Now, it must be observed, that the view of a wound, &c. wounds the person who views it the more strongly and sensibly, as the person is more weak and delicate; the spirits making a stronger impression on the fibres of a delicate body, than in those of a robust one. Thus strong, vigorous men, &c. see an execution without much concern, while women, &c. are struck with pity and horror. As to children still in their mother's womb, the fibres of their flesh being incomparably finer than those in women, the course of the animal spirits must necessarily produce much greater alterations.

These things being laid down, *monsters* are easily accounted for. Suppose, *v. gr.* a child born a fool, and with all its legs and arms broke in the same manner as those of criminals in some countries are; which case we chuse to instance in, because we are told from Paris that such a *monster* was actually born there; and lived in one of their hospitals twenty years: The cause of this accident, according to the principles laid down, was, that the mother seeing a criminal executed, every stroke given to the poor man, struck forcibly the imagination of the woman; and by a kind of counter-stroke, the tender and delicate brain of the child. Now, though the fibres of the woman's brain were strangely shaken by the violent flux of animal spirits on this occasion, yet they had strength and consistence enough to prevent an entire disorder; whereas the fibres of the child's brain being unable to bear the shock of those spirits, were quite ruined; and the ravage was great enough to deprive him of reason all his life-time.

Again, the view of the execution frightening the woman, the violent course of the animal spirits was directed forcibly from the brain to all those parts of the body corresponding to the suffering parts of the criminal; and the same thing must happen in the child. But in regard the bones of the mother were strong enough to resist the impulse of those spirits, they were not damaged. And yet the rapid course of these spirits could easily overpower, and break the tender and delicate fibres of the bones of the child; the bones being the last parts of the body that are formed, and having a very slender consistence while the child is yet in the womb.

To which it may be here added, that had the mother determined the course of these spirits towards some other part of her body, by tickling or scratching herself vehemently, the child would not, in all probability, have had its bones broken; but the part answering that, in which the motion of the spirits was determined, would have been the sufferer.

Hence appears the reason, why women in the time of gestation, seeing persons, &c. marked in such a manner in the face, impress the same mark on the same parts of the child: And why, upon rubbing some hidden part of the body, when startled at the sight of any thing, or agitated with any extraordinary passion, the mark or impression is fixed on that hidden part rather than on the face of the child. From the principles here laid down, may most, if not all, the phenomena of *monsters* be easily accounted for.

**Vegetable MONSTERS.**—There are also monstrous productions in the plant world: Such, *v. gr.* are what some botanists call *mules*. See MULE, GENERATION, &c.

Florists give the denomination *monsters*, or *monstrous flowers*, to those flowers which are not only double, but double podded;

or when instead of one flower there are two or three rising one above another from a single stalk. See FLOWER.

**MONSTRANS de droit**, a writ issuing out of chancery, for restoring a person to lands or tenements that are his in right, tho' on some occasion found in possession of another lately dead.

**MONSTRAVERUNT**, a writ which lies for a tenant who holds by free charter in ancient demesne, upon his being diltrained for the payment of any service or imposition contrary to the liberty he does, or ought to enjoy.

**MONTANISTS**, ancient heretics, so called from their leader Montanus, who acted the prophet, and had his prophetesses.

The *Montanists* are the same with what were otherwise denominated *Phrygians*, *Cataprygians*, and *Quintilians*. See PHRYGIAN, CATAPHRYGIAN, QUINTILIAN, and PEPUZIAN.

**MONTANUM veru.** See the article VERU.

**MONTENSES.** See AGONISTICI.

**MONTH, MENSES**, the twelfth part of a year. See YEAR.

Time, we have observed, is duration marked out for certain uses, and measured by the motions of the heavenly bodies. See TIME, and DURATION.

Hence result divers kinds of years, and months, according to the particular luminary by whose revolution they are determined, and the particular purposes they are destined for: as, *solar months*, *lunar months*, *civil months*, *astronomical months*, &c.

**Solar MONTH** is the space of time wherein the sun moves through one entire sign of the ecliptic. See SUN.

Hence, if regard be had to the sun's true motion, the *solar months* will be unequal; since the sun is longer in passing through the winter signs, than those of the summer.

But as he constantly travels through all the twelve in 365 days, 5 hours, and 49 minutes, the quantity of a mean month will be had by dividing that number by 12. On this principle, the quantity of a *solar month* will be found 30 days, 10 hours, 29 minutes, 5 seconds.

**Lunar MONTHS** are either *synodical*, *periodical*, or *illuminative*.

**Lunar synodical MONTH**, called also absolutely, *lunar MONTH*, and *lunation*, is the space of time between two conjunctions of the moon with the sun; or between two new moons. See SYNODICAL month and LUNATION.

The quantity of the *synodical month* is 29 days, 12 hours, 44', 3", 11". See MOON.

**Lunar periodical MONTH** is the space of time wherein the moon makes her round through the zodiac; or wherein she returns to the same point. See PERIODICAL.

The quantity of this month is 27 days, 7h. 43'. 8".

The ancient Romans made use of *lunar months*, and made them alternately of 29 and 30 days. They marked the days of each month by three terms, *viz.* *Calends*, *nones*, and *ides*. See CALEND, NONES, &c.

**Lunar illuminative MONTH**, is the space from the first time of her appearance after new moon, to her first appearance after the new moon following.

Hence, as the moon appears sometimes sooner after the new moon, and sometimes later; the quantity of the *illuminative month* is not always the same.—By this month the Turks and Arabs go

**Astronomical, or natural MONTH**, is that measured by some exact interval corresponding to the motion of the sun, or moon.

Such are the lunar and solar months above mentioned. Where note, That these months can be of no use in civil life; where it is required that the months begin and end on some certain day. For this reason recourse is had to another form of months.

**Civil, or common MONTH**, is an interval of a certain number of whole days, approaching, nearly to the quantity of some astronomical, either lunar, or solar month. See DAY.

**Civil Months** are various, according to the astronomical month they are accommodated to.

**Civil lunar MONTHS** are to consist alternately of 29 and 30 days. Thus will two *civil months* be equal to two astronomical ones, abating for the odd minutes. And, consequently, the new moon will be hereby kept to the first day of each such *civil month* for a long time together.

However, to make them keep constant pace with the *civil months*, at the end of each 948 months, a month of 29 days must be added; or else every 33d month must consist of 30 days.

This was the month in civil, or common use among the Jews, Greeks, and Romans, till the time of Julius Cæsar.

**Civil solar MONTHS** are to consist alternately of 30 and 31 days; excepting one month of the twelve, which for every fourth year should consist of 30 days, and the other years of 29.—This form of *civil months* was introduced by Julius Cæsar.

Under Augustus, the sixth month, till then from its place called *sextilis*, was denominated *augustus*, in honour of that prince, and to make the compliment yet greater, a day was added to it. So that it now consisted of 31 days, though till then it had only contained 30. To make up for which, a day was taken from February; so that henceforward it only consisted of 28 days, and every third year of 29; though before it had ordinarily consisted of 29 days, &c.—And such are the *civil* or *calendar months* which now obtain through Europe. See CALENDAR.

*Philosophical*

**Philosophical MONTH**, among chymists, is the space of 40 days and nights. See **MENSTRUUM**.

**Dracontic MONTH**. See the article **DRACONTIC**.

**Embolismic MONTH**. See the article **EMBOLISMIC**.

**Fence-MONTH**. See the article **FENCE-month**.

**Twelve MONTH**. See the article **TWELVE-month**.

**MONTH climates**. See the article **CLIMATE**.

**MONTHLY courses**. See the article **MENSES**.

**MONT-PAGNOTE**, the post of the invulnerable, an eminence chose without the reach of the cannon of a place besieged, where curious persons post themselves to see an attack, and the manner of the siege, without being exposed to danger.

**MONUMENT\***, in architecture, a building destined to preserve the memory of the person who raised it, or of him for whom it was raised.—Such are, a triumphal arch, a mausoleum, a pyramid, &c. See **MAUSOLEUM**, &c.

\* The word comes from the Latin *monumentum*, of *monere*, to advise, advertise.

The first monuments which the ancients erected, were the stones which they laid over their tombs, whereon they wrote the names and actions of the deceased. See **TOMB**.

These stones were distinguished by various names according as their figures were different. The Greeks gave the name *stelæ*, *Στελæ*, to such as were square in their base, and preserved the same depth throughout their whole length; whence were derived our square pilasters, or attic columns. See **PILASTER**.

They called those *styles*, *Στυλæ*, which being round in their base, ended in a point at top, which gave occasion to the invention of diminished columns. See **COLUMN**.

The name *pyramids* they gave to those which were square at the foot, and terminated in a point at top, in manner of a funeral-pile. See **PYRAMID**.

And the name *obelisk*, to those whose bases were more in length than in breadth, and which rose, still lessening, to a very great height, resembling the figure of the spits or instruments used by the ancients in roasting the flesh of their sacrifices, which they called *obeli*, *ὀβελί*. See **OBELISK**.

The **MONUMENT**, absolutely so called among us, denotes a magnificent pillar erected by order of parliament, in memory of the burning of the city, anno 1666, in the very place where the fire began.

It is of the Doric order, 202 foot high from the ground, and 15 foot in diameter, all of solid Portland-stone, with a staircase in the middle of black marble. The pedestal is 21 foot square, and 40 high; the front being enriched with curious basso-relievo's.

**MONEY**. See the article **MONEY**.

**MOOD**, or **MODE**, in logic, called also *sylogistic mood*, is a proper disposition of the several propositions of a syllogism, in respect of quantity, and quality. See **SYLLOGISM**, and **PROPOSITION**.

By proper disposition, we mean such wherein the antecedent being true, the consequent, in virtue of the form, cannot be false.—So that all those moods or manners of syllogisms are at once excluded, where no conclusion formally follows: or where the antecedent being true, a false conclusion may be drawn from it. See **CONCLUSION**, &c.

There are two kinds of moods; the one *direct*, the other *indirect*.

**Direct mood**, is that wherein the conclusion is drawn from the premises directly and immediately.—As, every animal is a living thing; every man is an animal; therefore every man is a living thing.

**Indirect mood**, is that wherein the conclusion is not inferred immediately from the premises, but follows from them by means of a conversion.—As, every animal is a living thing, every man is an animal; therefore some living thing is a man. There are fourteen direct moods; whereof four belong to the first figure; 4 to the 2d; and 6 to the 3d. See **FIGURE**.

They are denoted by so many artificial words framed for that purpose, viz. 1. *Barbara*, *celarent*, *darii*, *ferioque*. 4. *Baralip*, *celantes*, *dabitis*, *fapesmo*, *friseson*. 2. *Cesare*, *camestres*, *festino*, *baroco*. 3. *Darapti*, *felapton*, *disamis*, *datisi*, *bocardo*, *ferison*. The use and effect of which words lie wholly in the syllables, and the letters whereof the syllables consist. Each word, e. gr. consists of three syllables, denoting the three propositions of a syllogism, viz. major, minor, and conclusion. Add, that the letters of each syllable are either vowels or consonants: The vowels are *A*, which denotes an universal affirmative proposition; *E*, an universal negative; *I*, a particular affirmative; and *O*, a particular negative.

Thus, *barbara* is a syllogism or mood of the first figure, consisting of three universal affirmative propositions: *Baralip* of the fourth figure, consisting of two universal affirmative premises, and a particular affirmative conclusion. See **BARBARA**, **CELARENT**, **DARII**, &c.—The consonants are chiefly of use in the reduction of syllogisms. See **REDUCTION**.

**MOOD**, or **MODE**, in grammar, is used to signify the different manners of conjugating verbs agreeably to the different actions, or affections to be expressed; as shewing, commanding, wishing, &c. See **VERB**.

Hence arise five moods, viz. the *indicative*, *imperative*, *opta-*

*tive*, *subjunctive*, and *infinitive*. See **INDICATIVE**, **IMPERATIVE**, **OPTATIVE**, &c.

Some grammarians reckon but four moods, confounding the optative with the subjunctive; and some make six, dividing the optative into potential, and optative.

The Greeks have five moods of verbs differing in termination; but the Latins have but four.—In English the terminations are the same in all the moods.

For the origin of moods, it may be observed, that verbs are of that kind of words which signify the manner and form of our thought; whereof the principal is affirmation. Verbs are also formed to receive different inflections, as the affirmation regards different persons, and different times, whence arise the tenses and persons of verbs. See **VERB**, &c.

But besides these, men have thought fit to invent other inflections, to explain what passes in their mind still more distinctly: For, in the first place, they considered, that beside the simple affirmations, as, *he loves*, *he loved*; there were others modified and conditional, as, *if he loved*, *though he should love*: And the better to distinguish these affirmations from the others, they doubled the inflections of those tenses, or times; making some serve for simple affirmations, as *I love*, *he loved*; and reserving the rest for affirmations that were modified; as, *if he should love*, *might he have loved*.—Yet they kept not steadily to their rules; but sometimes made use of simple inflections to express affirmations that were modified; as *et si vereor*, for *et si verear*. And it is from this last kind of inflection, that grammarians have formed the mood they call *subjunctive*. See **SUBJUNCTIVE**. But further, besides the affirmation, the action of our will may be taken for a mood, or manner of our thought: and men have found themselves under a necessity of expressing what they *will*, as well as what they *think*.—Now we may will a thing in several manners; whereof there are three which may be considered as the principal. First then, we sometimes will things which do not depend on ourselves, and in that case we only will them by a bare wish, which the Latins express by the particle *utinam*; and we by, *please God*. Some languages, for instance the Greek, have invented particular inflections for this end; whence the grammarians have taken occasion to call it the *optative mood*: and there seems something like both in the French, Italian, and Spanish tongues, in regard these have a kind of triple tenses; but in Latin, English, &c. the same inflections serve for the subjunctive, and for the optative. For this reason, one may very well retrench this mood from the Latin conjugation; it being the different inflections that make moods, not the different manners of signifying, which may be varied to infinity. See **OPTATIVE**.

We sometimes will in another manner; as when we are content a thing should come to pass, though we do not absolutely desire it; as when Terence says, *profundat*, *perdat*, *periat*, let him spend, sink, perish.—Men might have invented a particular inflection to express this movement, as in Greek they have done to express a simple desire: But they have not done it; and in lieu thereof, make use of the subjunctive. In English we add the particle, let him spend, &c.—Authors call this the *potential*, or *concessive mood*. See **POTENTIAL**.

The third manner of willing, is when what we desire, depending on another person, of whom we can obtain it, we signify our will that he do it.—This is the motion we use, when we command or pray; and to express this motion, was invented the mood we call *imperative*; which has no first person in the singular, because a man, properly speaking, cannot command himself: In some languages it has no third person, because, in strictness, a man cannot command any person, but him to whom he speaks and addresses himself.—And in regard the command or prayer always relates to what is to come, it happens that the imperative mood, and the future tense, are frequently used for each other, (especially in the Hebrew;) as *non occides*, *thou shalt not kill*, for *do not kill*. Hence some grammarians place the imperative among the number of futures. See **IMPERATIVE**.

Of all the moods we have mentioned, the oriental languages have none but the last, which is the imperative; and on the contrary, the modern languages have none of them any particular inflection for the imperative.—The method we take for it in English, is either to omit the pronoun, or transpose it: thus, *I love*, is a simple affirmation; *love*, an imperative: *We love*, an affirmation; *love we*, an imperative.

**MOOD**, in philosophy. } See the article **MODE**.

**MOOD**, in music.

**MOON**, *luna*, ☾, in astronomy, one of the heavenly bodies, usually ranked among the planets; but with more propriety accounted a satellite, or secondary planet. See **PLANET**, and **SATELLITE**.

The moon is an attendant of our earth, whom she respects as a centre, and in whose neighbourhood she is constantly found; inasmuch as if viewed from the sun, she would never appear to depart from us by an angle greater than ten minutes. See **EARTH**.

As all the other planets move primarily round the sun, so does the moon round the earth: her orbit is an ellipsis, in which she is retained by the force of gravity; performing her revolution round

round us in 27 days, 7 hours, 43 minutes, which is also the precise time of her rotation round her axis. See ORBIT, and REVOLUTION.

The mean distance of the *moon* from the earth, is  $60\frac{1}{2}$  semidiameters of the earth; which is equivalent to 240,000 miles. See DISTANCE.

The mean eccentricity of her orbit, is  $\frac{1}{1000}$  of her mean distance, which makes a considerable variation in that mean distance. See ECCENTRICITY.

The *moon's* diameter is to that of the earth, as 11 to 40.2; or 2175 miles: Its mean apparent diameter is 31 minutes  $16\frac{1}{2}$ , and that of the sun 32 minutes 12 seconds. See DIAMETER, and SEMI-DIAMETER.

The *moon's* surface contains 14,000,000 square miles; and its solidity 5,000,000,000 cubical ones: The density of the *moon's* body is to that of the earth, as 48911 to 39214; to that of the sun, as 48911 to 10000: Its quantity of matter to that of the earth, nearly as 1 to 39.15: and the force of gravity on its surface, is to that on the surface of the earth, as 139.2 to 407.8. See SOLIDITY, DENSITY, GRAVITY, &c.

**Phænomena of the MOON.**---The different appearances of the *moon* are very numerous: Sometimes she is increasing, then waning; sometimes horned, then semi-circular; sometimes gibbous, then full and globular. See PHASES.

Sometimes again, she illumines us the whole night; sometimes only a part of it; sometimes she is found in the southern hemisphere; sometimes in the northern: All which variations having been first observed by Endymion, an ancient Grecian, who watched her motions, he was fabled to have fallen in love with her.

The source of most of these appearances, is, that the *moon* is a dark, opaque, and spherical body; and only shines with the light she receives from the sun: whence only that half turned towards him is illumined; the opposite one remaining in its native darkness. The face of the *moon* visible on our earth, is that part of her body turned towards the earth; whence, according to the various positions of the *moon* with regard to the sun, and earth, we observe different degrees of illumination, sometimes a large, and sometimes a less portion of the enlightened surface being visible.

**Phases of the MOON.**---To conceive the lunar phases: Let S (*Tab. Astronomy, fig. 13.*) represent the sun, T the earth, RST a portion of the earth's orbit, and ABCDEFG the orbit of the *moon*, wherein she revolves round the earth, in the space of a month, advancing from west to east: Connect the centres of the sun and *moon* by the right line SL, and through the centre of the *moon* imagine a plane MLN, to pass perpendicular to the line SL: the section of that plane with the surface of the *moon*, will give the line that bounds light and darkness, and separates the illumined face from the dark one.

Connect the centres of the earth and *moon* by TL, perpendicular to a plane PLO, passing through the centre of the *moon*, that plane will give on the surface of the *moon*, the circle that distinguishes the visible hemisphere, or that towards us from the invisible one, and therefore called the *circle of vision*.

Whence it appears, that whenever the *moon* is in A, the circle bounding light and darkness, and the circle of vision, coincide. So that all the illumined face of the *moon* will be turned towards the earth: in which case, the *moon* is with respect to us full, and shines the whole night: with respect to the sun, she is in opposition; in regard the sun and *moon* are then seen in opposite parts of the heavens; the one rising when the other sets. See CONJUNCTION, and OPPOSITION.

When the *moon* arrives at B, the whole illumined disk MPN is not turned towards the earth; so that the visible illumination will be short of a circle, and the *moon* will appear gibbous, as in B. See GIBBOUS.

When she reaches C, where the angle CTS is nearly right, there only one half of the illumined disk is turned towards the earth, and then we observe a half *moon*, as in C; and she is said to be *dichotomized* or *bisected*. See DICHOTOMY.

In this situation the sun and *moon* are a fourth part of a circle removed from each other; and the *moon* is said to be in a *quadrant aspect*, or to be in her *quadrature*. See QUADRATURE.

The *moon* arriving at D, only a small part of the illumined face MPN, is turned towards the earth: for which reason, the small part that shines upon us, will be seen falcated, or bent into narrower angles or horns, as in D. See FALCATED. At last, the *moon* arriving at E, shews no part of her illumined face to the earth, as in D; this position we call the *new moon*, and she is then said to be in conjunction with the sun; the sun and *moon* being in the same point of the ecliptic. See CONJUNCTION.

As the *moon* advances towards F, she resumes her horns: and as before the new *moon*, the horns were turned westward; so now they change their position, and look eastward: when she comes at G, she is again in quadrature aspect with the sun; in H gibbous, and in A again full.

Here, the arch EL, or the angle STL, contained under lines drawn from the centres of the sun and *moon* to that of the earth, is called the *elongation of the moon* from the sun: and the arch MO, which is the portion of the illumined circle MON,

VOL. II. N<sup>o</sup>. CI.

that is turned towards us, and which is the measure of the angle that the circle bounding light and darkness, and the circle of vision, make with each other, is every where nearly similar to the arch of elongation EL; or which is the same thing, the angle STL is nearly equal to the angle MLO: as is demonstrated by geometers. See ELONGATION.

**To delineate the MOON's phases for any time.**---Let the circle COBP (*fig. 14.*) represent the *moon's* disk turned towards the earth, and let OP be the line in which the semi-circle OCP is projected, which suppose cut at right angles by the diameter BC; then making LP the radius, take LF equal to the cosine of the elongation of the *moon*; and upon BC, as the greater axis, and LF, the less, describe the semi-ellipse BFC; this ellipse will cut off from the *moon's* disk the portion BFCP of the illumined face visible on the earth.

As the *moon* illumines the earth by a light reflected from the sun, so is she reciprocally illumined by the earth, which reflects the sun's rays to the surface of the *moon*, and that more abundantly than she receives them from the *moon*.---For, the surface of the earth is above 15 times greater than that of the *moon*; and therefore supposing the texture of each body alike, as to the power of reflecting; the earth must return 15 times more light to the *moon* than she receives from it.---In new moons, the illumined side of the earth is turned fully towards the *moon*, and will therefore at that time illumine the dark side of the *moon*; and then the lunar inhabitants (if such there be) will have a full earth, as we, in a similar position, have a full *moon*: And hence arises that dim light observed in the old and new moons; whereby, besides the bright horns, we perceive somewhat more of her body behind them, though very obscurely.---When the *moon* comes to be in opposition to the sun, the earth seen from the *moon* will appear in conjunction with him, and its dark side will be turned towards the *moon*; in which position the earth will disappear to the *moon*, as that does to us at the time of the new *moon*, or in her conjunction with the sun. After this, the lunar inhabitants will see the earth in a horned figure.---In fine, the earth will present all the same phases to the *moon*, as the *moon* does to the earth.

Dr. Hook, accounting for the reason why the *moon's* light affords no visible heat, observes, that the quantity of light which falls on the hemisphere of the full *moon*, is rarified into a sphere 288 times greater in diameter than the *moon*, ere it arrive at us; and consequently that the *moon's* light is 104368 weaker than that of the sun.---It would therefore require 104368 full moons to give a light and heat equal to that of the sun at noon. See SUN, HEAT, &c.

**Course and motion of the MOON.**---Though the *moon* finish its course in 27 days, 7 hours, which interval we call a *periodical month*, she is longer in passing from one conjunction to another; which space we call a *synodical month*, or a *lunation*. See MONTH, and LUNATION.

The reason is, that while the *moon* is performing its course round the earth in its own orbit, the earth with its attendant is making its progress round the sun, and both are advanced almost a whole sign towards the east; so that the point of the orbit, which in the former position was in a right line passing the centres of the earth and sun, is now more westerly than the sun: and therefore when the *moon* is arrived again at that point, it will not yet be seen in conjunction with the sun; nor will the lunation be compleated in less than 29 days and a half. See PERIODICAL, SYNODICAL, &c.

Were the plane of the *moon's* orbit coincident with the plane of the ecliptic, i. e. were the earth and *moon* both moved in the same plane, the *moon's* way in the heavens, viewed from the earth, would appear just the same with that of the sun; with this only difference, that the sun would be found to describe his circle in the space of a year, and the *moon* hers in a month.---But this is not the case; for the two planes cut each other in a right line, passing through the centre of the earth, and are inclined to each other in an angle of about five degrees. See INCLINATION.

Suppose, e. gr. AB (*fig. 15.*) a portion of the earth's orbit; T the earth; and CEDE the *moon's* orbit, wherein is the centre of the earth: from the same centre T, in the plane of the ecliptic, describe another circle CGDH, whose semi-diameter is equal to that of the *moon's* orbit: Now, these two circles being in several planes, and having the same centre T, will intersect each other in a line DC, passing through the centre of the earth. Consequently, CED, one half of the orbit of the *moon*, will be raised above the plane of the circle CGH, towards the north; and DFC, the other half, will be sunk below it towards the south.---The right line DC, wherein the two circles intersect each other, is called the *line of the nodes*, and the points of the angles C and D, the *nodes*: whereof, that where the *moon* ascends above the plane of the ecliptic, northwards, is called the *ascending node*, and the *head of the dragon*; and the other D, the *descending node*, and the *dragon's tail*. (See NODE.) and the interval of time between the *moon's* going from the ascending node, and returning to it, a *dracontic month*. See DRAGON, and DRACONTIC.

If the line of the nodes were immoveable, that is, if it had no other motion, but that whereby it is carried round the sun, it

would still look towards the same point of the ecliptic; *i. e.* would always keep parallel to itself: but it is found by observation, that the line of the nodes constantly changes place, and shifts in situation from east to west, contrary to the order of the signs, and by a retrograde motion, finishes its circuit in about 19 years; in which time each of the nodes returns to that point of the ecliptic, whence it before receded. See CYCLE.

Hence it follows, that the *moon* is never precisely in the ecliptic, but twice, each period, *viz.* when she is in the nodes.---Throughout the rest of her course she deviates from it, being nearer or further from the ecliptic, as she is nearer or further from the nodes. In the points F and E, she is at her greatest distance from the nodes; which points are called her *limits*. See LIMITS.

The *moon's* distance from the nodes, or rather from the ecliptic, is called her *latitude*, which is measured by an arch of a circle drawn through the *moon* perpendicular to the ecliptic, and intercepted between the *moon* and the ecliptic.---The *moon's* latitude, when at the greatest, as in E or F, never exceeds five degrees, and about 18 minutes; which latitude is the measure of the angles at the nodes. See LATITUDE.

It appears by observation, that the *moon's* distance from the earth is continually changing; and that she is always either drawing nearer, or going further from us.---The reason is, that the *moon* does not move in a circular orbit, which has the earth for its centre; but in an elliptic orbit; (as represented in fig. 16.) one of whose foci is the centre of the earth: AP represents the greater axis of the ellipsis, and the line of the apsides; and TC, the eccentricity: the point A, which is the highest apsis, is called the *apogee* of the *moon*; and P, the lower apsis, is the *moon's perigee*, or the point wherein she comes nearest the earth. See APOGEE, and PERIGEE.

The space of time wherein the *moon*, going from the apogee, returns to it again, is called the *anomalistic month*.

If the *moon's* orbit had no other motion, but that wherewith it is carried round the sun, it would still retain a position parallel to itself, and always point the same way, and be observed in the same point of the ecliptic; but the line of the apsides is likewise observed to be moveable, and to have an angular motion round the earth from west to east, according to the order of the signs, returning to the same situation in the space of about nine years. See ANGULAR motion, and APSIS.

The irregularities of the *MOON's* motion, and that of her orbit, are very considerable.---For, 1°. When the earth is in her aphelion, the *moon* is in her aphelion likewise; in which case she quickens her pace, and performs her circuit in a shorter time: On the contrary, when the earth is in its perihelion, the *moon* is so too, and then she slackens her motion; and thus revolves round the earth in a shorter space, when the earth is in her aphelion, than when in her perihelion: So that the periodical months are not all equal. See PERIODICAL month.

2°. When the *moon* is in her syzygies, *i. e.* in the line that joins the centres of the earth and sun, which is either in her conjunction or opposition; she moves swifter, *ceteris paribus*, than when in the quadratures. See SYZYGIES.

3°. According to the different distance of the *moon* from the syzygies, *i. e.* from opposition or conjunction, she changes her motion: In the first quarter, that is, from the conjunction to her first quadrature, she abates somewhat of her velocity; which, in the second quarter, she recovers: In the third quarter, she again loses; and in the last, again recovers.---This inequality was first discovered by Tycho Brahe, who called it the *moon's* variation. See VARIATION, and REFLECTION.

4°. The *moon* moves in an ellipsis, one of whose foci is in the centre of the earth, round which she describes areas proportionable to the times, as the primary planets do round the sun; whence her motion in the perigee must be quickest, and slowest in the apogee.

5°. The very orbit of the *moon* is changeable, and does not always persevere in the same figure; its eccentricity being sometimes increased, and sometimes diminished; greatest, when the line of the apsides coincides with that of the syzygies; and least, when the line of the apsides cuts the other at right angles. See ORBIT.

6°. Nor is the apogee of the *moon* without an irregularity; being found to move forwards, when it coincides with the line of the syzygies, and backwards, when it cuts that line at right angles.---Nor is this progress and regress in any measure equal: in the conjunction, or opposition, it goes briskly forwards; and in the quadratures, moves either slowly forwards, stands still, or goes backward. See APOGEE.

7°. The motion of the nodes is not uniform; but when the line of the nodes coincides with that of the syzygies, they stand still; when the nodes are in the quadratures, *i. e.* when their line cuts that of the syzygies at right angles, they go backwards, from east to west; and this Sir I. Newton shews, with the velocity of 16", 19", 24''', in an hour. See NODE.

The only equable motion the *moon* has, is that wherewith she turns round her axis exactly in the same space of time, in which she revolves round us in her orbit; whence it happens, that she always turns the same face towards us.

For, as the *moon's* motion round its axis is equal, and yet its motion or velocity in its orbit is unequal; it follows, that when the *moon* is in its perigee, where it moves swiftest in its orbit, that part of its surface, which, on account of its motion in the orbit, would be turned from the earth, is not so, entirely; by reason of its motion round its axis.---Thus, some parts in the limb, or margin of the *moon*, sometimes recede from the centre of the disk, and sometimes approach towards it, and some parts, that were before invisible, become conspicuous: which is called the *moon's* libration. See LIBRATION.

Yet this equability of rotation occasions an apparent irregularity: for the axis of the *moon*, not being perpendicular to the plane of its orbit, but a little inclined to it; and this axis maintaining its parallelism, in its motion round the earth; it must necessarily change its situation, in respect of an observer on the earth; to whom, sometimes the one, and sometimes the other pole of the *moon*, becomes visible. Whence it appears to have a kind of wavering or vacillation.

Physical cause of the *MOON's* motions.---The *moon*, we have observed, moves round the earth, by the same laws, and in the same manner, as the earth and other planets round the sun.---The solution therefore of the lunar motion, in general, comes under those of the earth, and other planets. See PLANET, and EARTH.

As for the particular irregularities in the *moon's* motion, to which the earth, and other planets, are not subject, they arise from the sun, which acts on, and disturbs her in her ordinary progress through her orbit; and are all mechanically deducible from the same great law, whereby her general motion is directed, *viz.* the law of gravitation or attraction. See GRAVITATION.

Other secondary planets, *v. gr.* the satellites of Jupiter and Saturn, are doubtless subject to the like irregularities with the *moon*; as being exposed to the same perturbing or disturbing force of the sun; but their distance secures them from our observation. See SATELLITE.

The Laws of the several irregularities in the *syzygies*, *quadratures*, &c. see under SYZYGIES, QUADRATURES, &c.

Astronomy of the *MOON*.---1°. To determine the period of the *moon's* revolution round the earth, or the *periodical month*; and the time between one opposition and another, or the *synodical month*.

Since, in the middle of a lunar eclipse, the *moon* is opposite to the sun: (See ECLIPSE.) Compute the time between two eclipses, or oppositions; and divide this, by the number of lunations, that have passed in the mean time: the quotient will be the quantity of the synodical month.---Compute the sun's mean motion during the time of the synodical month, and add this to the entire circle described by the *moon*.---Then, as the sun is to 360°, so is the quantity of the synodical month to the periodical.

Thus, Copernicus, in the year 1500, November 6, at twelve at night, observed an eclipse of the *moon* at Rome; and August 1, 1523, at 4 h. 25', another at Cracow: hence the quantity of the synodical month is thus determined:

Obs. 2 An. 1523 d. 237 h. 4.25'.  
Obs. 1 An. 1500 d. 310 h. 2.20'.

Interval of time An. 22 d. 292 h. 2.5'.  
Add the intercalary days 5

Exact interval An. 22 d. 297 h. 2.5'.  
or 11991005'.

Which divided by 282 months elapsed, in the mean time, gives the quantity of the synodical month 42521', 9", 9"; that is 29 days, 12 hours, 41 minutes.

From two other observations of eclipses, the one at Cracow, the other at Babylon, the same author determines more accurately the quantity of synodical months to be

42524'. 3". 10'''.

That is, 29 d. 11 h. 43'. 3". 10'''.

The sun's mean motion in the time 29°. 6'. 24". 18'''.

The *moon's* motion 389. 6. 24. 18.

Quantity of the periodical month 27 d. 7 h. 43'. 5".

Hence, 1°. The quantity of the periodical month being given; by the rule of three we may find the *moon's* diurnal and horary motion, &c. and thus may tables of the mean motion of the *moon* be constructed. See TABLES; see also DIURNAL, and HORARY.

2°. If the sun's mean diurnal motion be subtracted from the *moon's* mean diurnal motion; the remainder will give the *moon's* diurnal motion from the sun; and thus may a table of latitudes be constructed, such as those of Bullialdus. See LATITUDE.

3°. Since in the middle of a total eclipse, the *moon* is in the node; if the sun's place be found for that time, and to this be added six signs, the sum will give the *place of the node*. See NODE.

4°. From comparing the ancient observations with the modern, it appears that the nodes have a motion, and that they proceed in *antecedentia*, *i. e.* from Taurus to Aries, from Aries to Pisces, &c. If then to the *moon's* mean diurnal motion, be added the

the diurnal motion of the nodes, the same will be the motion of the latitude; and thence, by the rule of three, may be found in what time the moon goes  $360^\circ$  from the dragon's head, or in what time she goes from, and returns to it: That is the quantity of the *draconic month*. See *DRACONTIC*.

5°. If the motion of the diurnal apogee be subtracted from the mean motion of the moon, the remainder will be the moon's mean motion from the apogee: and thence, by the rule of three, is determined the quantity of the *anomalistic month*.

According to the observations of Kepler, the mean synodical month is 29d. 12h. 44'. 3". 2". Her periodical month 27d. 7h. 43'. 8". The place of the apogee for the year 1700, January 1. old stile, was 118.  $8^\circ$ . 57'. 1". The place of the ascending nodes 4S.  $27^\circ$ . 39'. 17". Mean diurnal motion of the moon  $13^\circ$ . 10'. 35". Diurnal motion of the apogee 6'. 41". Diurnal motion of the nodes 3'. 11". Lastly, the eccentricity 4362 parts, such, whereof the semi-diameter of the eccentric is 100000: and therefore the diurnal motion of the latitude is  $13^\circ$ . 13'. 46"; and the diurnal motion from the apogee  $13^\circ$ . 3'. 54".

To find the Moon's age.—To the day of the month add the epoch of the year, and the months from March inclusive.—The sum, if under 30; if over, the excess is the moon's age.—If the month have but 30 days, the excess above 29 is the moon's age. See AGE.

To find the time of the MOON's being in the meridian, or southing.—Multiply her age, if under 15 days, by 4; and divide the product by 5; the quotient gives the hour, and the remainder multiplied by 12, the minute. If her age exceed 15, subtract 15, and proceed with the remainder as before.

To find the time of the MOON's beginning to shine.—Multiply her age, if under 15, by 48; and divide the product by 60: the quotient gives the hour; and the remainder the minute. If her age be above 15 days, subtract the time thus found, from 24; the remainder gives the time of shining in the morning.

For the eclipses of the MOON, see ECLIPSES.—For the MOON's parallax, see PARALLAX.

Theory of the MOON's motions and irregularities.—The tables of equation, which serve to solve the irregularities of the sun, do likewise serve for those of the moon. See EQUATION.

But then these equations must be corrected for the moon: otherwise they will not exhibit the true motions in the syzygies.—

The method is thus: Suppose the moon's place in the zodiac, required in longitude, for any given time; here, we first find, in the tables, the place where it would be, supposing its motion uniform, which we call *mean*, and which is sometimes faster, and sometimes slower than the true motion: then, to find where the *true* motion will place her, which is also the *apparent*, we are to find in another table at what distance it is from its apogee; for, according to this distance, the difference between her true and mean motion, and the two places which correspond thereto, is the greater.—The true place thus found, is not yet the *true* place; but varies from it, as the moon is more, or less remote both from the sun, and the sun's apogee: which variation respecting, at the same time, those two different distances, they are to be both considered and combined together, as in a table apart. Which table gives the correction to be made of the true places first found.—That place thus corrected is not yet the *true* place, unless the moon be either in conjunction, or opposition: If she be out of these, there must be another correction, which depends on two things taken together, and compared, *viz.* the distance of the moon's corrected place from the sun; and of that at which she is with regard to her own apogee; this last distance having been changed by the first correction.

By all these operations and corrections, we at length arrive at the moon's true place for that instant. In this it must be owned, occur prodigious difficulties: The lunar inequalities are so many, that it was in vain the astronomers laboured to bring them under any rule, before the great Sir Is. Newton; to whom we are indebted both for the mechanical causes of these inequalities, and for the method of computing and ascertaining them: So that he has a world, in great measure, of his own discovering, or rather subduing.

From the theory of gravity he shews, that the larger planets revolving round the sun, may carry along with them smaller planets revolving round themselves; and shews, *a priori*, that these smaller must move in ellipses having their umbilici in the centres of the larger; and have their motions in their orbit variously disturbed by the motion of the sun; and, in a word, must be affected with those inequalities which we actually observe in the moon. And from this theory, he argues analogous irregularities in the satellites of Saturn.

From this same theory he examines the force which the sun has to disturb the moon's motion, determines the hoary increase of the area which the moon would describe in a circular orbit by radii drawn to the earth—her distance from the earth—the hoary motion in a circular and elliptic orbit—the mean motion of the nodes—the true motion of the nodes—the hoary variation of the inclination of the moon's orbit to the plane of the ecliptic.

Lastly, From the same theory he has found the annual equation of the moon's mean motion to arise from the various dilata-

tion of her orbit; and that variation to arise from the sun's force, which being greater in the perigee, distends the orbit; and being less in the apogee, suffers it to be again contracted.—In the dilating orbit, she moves more slowly; in the contracted, more swiftly; and the annual equation, whereby this inequality is compensated, in the apogee, and perigee, is nothing at all; at a moderate distance from the sun, amounts to  $11'$ . 50"; and in other places is proportional to the equation of the sun's centre, and is added to the mean motion of the moon, when the earth proceeds from its aphelion to its perihelion; and subtracted when in the opposite part.

Thus, supposing the radius of the *orbis magnus* 1000, and the earth's eccentricity  $16\frac{2}{3}$ ; this equation, when greatest, according to the theory of gravity, comes out  $11'$ . 49".

He adds, that in the earth's perihelion the nodes move swifter than in the aphelion, and that in a triplicate ratio of the earth's distance from the sun, inversely. Whence arise annual equations of their motions, proportionable to that of the centre of the sun.—Now the sun's motions in a duplicate ratio of the earth's distance from the sun inversely, and the greatest equation of the centre which this inequality occasions, is  $1^\circ$ . 56'. 26", agreeable to the sun's eccentricity  $16\frac{2}{3}$ . If the sun's motion were in a triplicate ratio of its distance inversely, this inequality could generate the greatest equation  $2^\circ$ . 56'. 9"; and therefore the greatest equations which the inequalities of the motions of the moon's apogee and nodes occasion, are to  $2^\circ$ . 56'. 9", as the mean diurnal motion of the moon's apogee, and the mean diurnal motion of her nodes are to the mean diurnal motion of the sun.—Whence the greatest equation of the mean motion of the apogee comes out  $19'$ . 42"; and the greatest equation of the mean motion of the nodes  $9'$ . 27". The former equation is added, and the latter subtracted, when the earth proceeds from its perihelion to its aphelion; and the contrary in the opposite part of its orbit.

From the same theory of gravity it also appears, that the sun's action on the moon must be somewhat greater when the transverse diameter of the lunar orbit passes through the sun, than when it is at right angles with the line that joins the earth and sun: And, therefore, that the lunar orbit is somewhat greater in the first case, than in the second.—Hence arises another equation of the mean lunar motion, depending on the situation of the moon's apogee with regard to the sun, which is greatest when the moon's apogee is in an octant with the sun; and none, when she arrives at the quadrature, or syzygies, and is added to the mean motion, in the passage of the moon's apogee from the quadrature to the syzygies, and subtracted in the passage of the apogee from the syzygies to the quadrature.

This equation, which Sir Isaac calls *femestris*, when greatest, *viz.* in the octants of the apogee, arises to  $3'$ . 45", at a mean distance of the earth from the sun; but increases and diminishes in a triplicate ratio of the sun's distance inversely; and therefore in the sun's greatest distance, is  $3'$ . 34"; in the smallest,  $3'$ . 56", nearly. But when the apogee of the moon is without the octants, it becomes less, and is to the greatest equation, as the sine of double the distance of the moon's apogee, from the next syzygy or quadrature, to the radius.

From the same theory of gravity it follows, that the sun's action on the moon is somewhat greater when a right line drawn through the moon's nodes passes through the sun, than when that line is at right angles with another joining the sun and earth: And hence arises another equation of the moon's mean motion, which he calls *secunda femestris*, and which is greatest when the nodes are in the sun's octants, and vanishes when they are in the syzygies, or quadratures; and in other situations of the nodes is proportionable to the sine of double the distance of either node from the next syzygy, or quadrature.

It is added to the moon's mean motion while the nodes are in their passage from the sun's quadratures to the next syzygy, and subtracted in their passage from the syzygies to the quadratures in the octants.

When it is greatest, it amounts to  $47''$ , at a mean distance of the earth from the sun; as appears from the theory of gravity: At other distances of the sun, this equation in the octants of the nodes is reciprocally as the cube of the sun's distance from the earth; and therefore in the sun's perigee is  $45''$ ; in his apogee nearly  $49''$ .

By the same theory of gravity, the moon's apogee proceeds the fastest when either in conjunction with the sun, or in opposition to it; and is retrograde when in quadrature with the sun.—In the former case, the eccentricity is greatest, and in the latter smallest.—These inequalities are very considerable, and generate the principal equation of the apogee, which he calls *femestris*, or *semi-menstrual*. The greatest *semi-menstrual* equation is about 120. 18'.

Horrox first observed the moon to revolve in an ellipse round the earth placed in the lower umbilicus: And Halley placed the centre of the ellipse in an epicycle whose centre revolves uniformly about the earth: And from the motion in the epicycle arise the inequalities now observed in the progress and regress of the apogee, and the quantity of the eccentricity.

Suppose the mean distance of the moon from the earth divided into 100000, and let T (*Tab. Astronom. fig. 17.*) represent the earth, and

and TC the mean eccentricity of the *moon* 5505 parts ; produce TC to B, that CB may be the sine of the greatest semi-menstrual equation  $12^{\circ}$ ,  $18'$  to the radius TC ; the circle BDA, described on the centre C, with the interval CB, will be the epicycle wherein the centre of the lunar orb is placed, and wherein it revolves according to the order of the letters BDA.--- Take the angle BCD equal to double the annual argument, or double the distance of the true place of the sun from the *moon's* apogee once equated, and CTD will be the semi-menstrual equation of the *moon's* apogee ; and TD the eccentricity of its orbit tending to the apogee equated a second time.---From hence the *moon's* mean motion, apogee, and eccentricity, as also the greater axis of its orbit 200000 ; the *moon's* true place, as also her distance from the earth are found, and that by the commonest methods.

In the earth's perihelion, by reason of the greater force of the sun, the centre of the *moon's* orbit will move more swiftly about the centre C, than in the aphelion, and that in a triplicate ratio of the earth's distance from the sun inversely. By reason of the equation of the centre of the sun, comprehended in the annual argument, the centre of the *moon's* orbit will move more swiftly in the epicycle BDA, in a duplicate ratio of the distance of the earth from the sun inversely.

That the same may still move more swiftly in a simple ratio of the distance inversely from the centre of the orbit D, draw DE towards the *moon's* apogee, or parallel to TC ; and take the angle EDG equal to the excess of the annual argument, above the distance of the *moon's* apogee from the sun's perigee in consequentia ; or, which is the same thing, take the angle CDF, equal to the complement of the true anomaly of the sun to  $360^{\circ}$  ; and let DF be to DC as double the eccentricity of the *orbis magnus* to the mean distance of the sun from the earth, and the mean diurnal motion of the sun from the *moon's* apogee, to the mean diurnal motion of the sun from its own apogee, conjunctly, *i. e.* as  $33\frac{1}{2}$  is to 1000, and  $52'$ ,  $27''$ ,  $16'''$ , to  $59'8''$   $10'''$  conjunctly ; or as 3 to 100. Conceive the centre of the *moon's* orbit placed in the point F, and to revolve in an epicycle whose centre is D, and radius DF, while the point D proceeds in the circumference of the circle DABD : Thus the velocity wherewith the centre of the *moon's* orbit moves in a certain curve, described about the centre C, will be reciprocally as the cube of the sun's distance from the earth.

The computation of this motion is difficult, but it will be made easy by the following approximation. If the *moon's* mean distance from the earth be 100000 parts, and its eccentricity TC 5505 of those parts, the right line CB or CD will be found  $1172\frac{1}{2}$ , and the right line DF  $35\frac{1}{2}$ . This right line at the distance TC, subtends an angle to the earth, which the transferring of the centre of the orbit from the place D to F generates in the motion of this centre ; and the same right line doubled, in a parallel situation, at the distance of the upper umbilicus of the *moon's* orbit from the earth, subtends the same angle, generated by that translation in the motion of the umbilicus ; and at the distance of the *moon* from the earth subtends an angle which the same translation generates in the motion of the *moon* ; and which may therefore be called the *second equation of the centre*.

This equation of a mean distance of the *moon* from the earth, is as the sine of the angle contained between the right line DF, and a right line drawn from the point F to the *moon*, nearly ; and when greatest, amounts to  $2'$ ,  $25''$ .---Now the angle comprehended between the right line DF and a line from the point D, is found either by subtracting the angle EDF from the mean anomaly of the *moon*, or by adding the *moon's* distance from the sun to the distance of the *moon's* apogee from the apogee of the sun. And as radius is to the sine of the angle thus found, so is  $2'$ ,  $25''$  to the second equation of the centre, which is to be added, if that sine be less than a semi-circle, and subtracted if greater : Thus we have its longitude in the very syzygies of the luminaries.

If a more accurate computation be required, the *moon's* place thus found must be corrected by a second variation. The first and principal variation we have already considered, and have observed it to be greatest in the octants. The second is greatest in the quadrants, and arises from the different action of the sun on the *moon's* orbit, according to the different position of the *moon's* apogee to the sun, and is thus computed : As radius is to the versed sine of the distance of the *moon's* apogee from the sun's perigee, in consequentia, so is a certain angle P to a fourth proportional. And as radius is to the sine of the *moon's* distance from the sun, so is the sum of this fourth proportional and another angle Q to the second variation, which is to be subtracted, if the *moon's* light be increasing ; and added, if diminishing.

Thus we have the *moon's* true place in her orbit ; and by reduction of this place to the ecliptic, the *moon's* longitude. The angles P and Q are to be determined by observation : in the mean time, if for P be assumed  $2'$ , and for Q  $1'$ , we shall be near the truth.

*Nature and furniture of the MOON.*---1<sup>o</sup>. From the various phases of the *moon* : From her only shewing a little part illuminated, when following the sun ready to set : From that part's

increasing as she recedes from the sun, till at the distance of  $180^{\circ}$  she shines with a full face ; and again wanes as she re-approaches that luminary, and loses all her light when she meets him : From the lucid part's being constantly turned towards the west, while the *moon* increases ; and towards the east when she decreases ; it is evident, that only that part shines on which the sun's rays fall.---And from the phenomena of eclipses, happening when the *moon* should shine with a full face, *viz.* when she is  $180^{\circ}$  distant from the sun ; and the darkened parts appearing the same in all places, it is evident she has no light of her own, but borrows whatever light she has from the sun. See PHASES, ECLIPSE, and SUN.

2<sup>o</sup>. The *moon* sometimes disappears in a clear heaven, so as not to be discoverable by the best glasses ; little stars of the fifth and sixth magnitude all the time remaining visible.---This phenomenon Kepler observed twice anno 1580, and 1583 ; and Hevelius in 1620. Riccioli, and other Jesuits at Bologna, and many people throughout Holland observed the like April 14, 1642 ; yet at Venice and Vienna she was all the time conspicuous. December 23, 1703. there was another total obscuration : At Arles she first appeared of a yellowish brown ; at Avignon ruddy and transparent, as if the sun had shone through ; at Marseilles, one part was reddish, the other very dusky ; and, at length, though in a clear sky, wholly disappeared.---Here it is evident, that the colours appearing different at the same time, do not belong to the *moon* ; but that they are occasioned by an atmosphere around her variously disposed in this and that place, for refracting of these or those coloured rays.

3<sup>o</sup>. The eye, either naked, or armed with a telescope, sees some parts in the *moon's* face darker than others, which are called *maculae*, or *spots*. Through the telescope, while the *moon* is either increasing or decreasing, the illumined parts in the *maculae* appear evenly terminated ; but in the bright parts, the boundary of the light appears jagged and uneven, composed of dissimilar arches, convex and concave. (See *Tab. Astronomy*, fig. 18.)---There are also observed lucid parts dispersed among the darker ; and illumined parts are seen beyond the limits of illumination ; other intermediate ones remaining still in darkness ; and near the *maculae*, and even in them, are frequently seen such lucid specks.---Beside the *maculae* observed by the ancients, there are other variable ones invisible by the naked eye, called *new maculae*, always opposite to the sun ; and which are hence found among those parts which are the soonest illumined in the increasing *moon*, and in the decreasing *moon* lose their light later than the intermediate ones ; running round, and appearing sometimes longer, sometimes smaller. See *MACULAE*, and *SPOTS*. Hence, (1.) As all parts are equally illumined by the sun, in as much as they are equally distant from him : If some appear brighter, and others darker ; some reflect the sun's rays more copiously than others ; and therefore they are of different natures. And, (2.) Since the boundary of the illumined part is very smooth and equable in the *maculae*, their surface must be so too. (3.) The parts illumined by the sun sooner, and deserted later than others that are nearer, are higher than the rest, *i. e.* stand up above the other surface of the *moon*. (4.) The new *maculae* answer perfectly to the shadows of terrestrial bodies.

4<sup>o</sup>. Hevelius writes, that he has several times found, in skies perfectly clear, when even stars of the sixth and seventh magnitude were conspicuous, that at the same altitude of the *moon*, and the same elongation from the earth, and with one and the same excellent telescope, the *moon* and its *maculae* do not appear equally lucid, clear, and conspicuous, at all times ; but are much brighter, purer, and more distinct at one time than another. From the circumstances of the observation, it is evident, the reason of this phenomenon is not either in our air, in the tube, in the *moon*, nor in the spectator's eye ; but must be looked for in something existing about the *moon*.

5<sup>o</sup>. Cassini frequently observed Saturn, Jupiter, and the fixed stars, when hid by the *moon*, near her limb, whether the illumined or dark one, to have their circular figure changed into an oval one ; and in other occultations found no alteration of figure at all. In like manner, the sun and *moon* rising and setting in a vaporous horizon, do not appear circular, but elliptical.

Hence, as we know, by sure experience, that the circular figure of the sun and *moon* is only changed into an elliptical one by means of the refraction in the vapory atmosphere ; it is pretty apparent, that at the time when the circular figure of the stars is thus changed by the *moon*, there is a dense matter incompassing the *moon*, wherein the rays emitted from the stars are refracted ; and that at other times, when there is no change of figure, this matter is wanting. See *ATMOSPHERE*.

This phenomenon is well illustrated by the following experiment : To the inner bottom of any vessel, either plane, convex, or concave, with wax fasten a circle of paper ; then pouring in water, that the rays reflected from the circle into the air may be refracted before they reach the eye ; viewing the circle obliquely, the circular figure will appear changed into an ellipsis.

6<sup>o</sup>. The *moon*, then, is a dense opaque body, beset with mountains, valleys, and seas.---That the *moon* is dense, and impervious to the light, has been shewn : but some parts sink below, and

and others rise above the surface; and that considerably, in as much as they are visible at so great a distance of the earth from the sun: In the *moon* therefore are huge mountains, and very deep vallies. Ricciolus measured the height of one of the mountains, called *St. Catharine*, and found it nine miles high. Again, in the *moon* are spacious tracts having smooth even surfaces, and those reflecting less light than the rest: Hence, as the surface of fluid bodies is naturally even, and as such bodies being transparent, transmit a great part of the rays of light, and reflect very little; the lunar spots are fluid, transparent bodies: and as they continue constantly the same, are *seas*.—In the *moon*, therefore, are mountains, valleys and seas.—Hence again, the lucid parts of the spots are *insulas and peninsula's*. And since in the maculae, and near their limbs, are seen some parts higher than others, in the lunar seas are *rocks* and promontories.

And since the new spots are contiguous to the mountains, and in all respects like the shadows of bodies on our earth; no doubt they are the shadows of the lunar mountains: Whence also appears that the matter of the *moon* is opaque.

*Note*, This reasoning will be put past doubt by viewing the sensible horizon from some eminence: Where it passes over a plain, the line will appear smooth and even; where a-crofs mountains and valleys, irregular and winding; smooth, but dark, &c.

7°. The *moon* is encompassed with an heavy and elastic atmosphere, wherein vapours and other exhalations ascend, and whence they return in form of dew and rain.

In a total eclipse of the sun, we find the *moon* incircled with a lucid ring parallel to her periphery.

Of this, we have too many observations to doubt: In the great eclipse in 1713, the ring was very conspicuous at London, and elsewhere. Kepler observes the same of an eclipse in 1605, at Naples and Antwerp; and Wolfius of another in 1606 at Leipfick, described at large in the *Acta Eruditorum*, with this notable circumstance, that the part next the *moon* was visibly brighter than that furthest from it; which is confirmed by the observations of the French astronomers in the *Memoires de l'Academie*, &c. an. 1706.

Hence about the *moon* is some fluid, which corresponds to her figure, and which both reflects and retracts the sun's rays. And hence also, this fluid is denser below, near the *moon's* body; and rarer above. Now as the air which encompasses our earth to such a fluid, it is manifest there is *air* above the *moon*; and since the different density of the air depends on its different gravity and elasticity, no doubt the different density of the lunar air has the same causes. Again, we have observed; the lunar air is not always equally clear and transparent: sometimes it changes the spherical figures of the stars into ovals; and in several total eclipses just mentioned, there was observed a trembling in the *moon's* limb, immediately before immersion, with an appearance of thin, light smoke flying over it during immersion, very apparent in England. And hence, as these same phenomena are observed in our air when full of vapours, it is pretty plain, at the time when these phenomena are observed in that of the *moon*, it is full of *vapours* and *exhalations*. And lastly, since at other times the lunar air is clear and transparent, producing none of these phenomena, the vapours must have been precipitated on the *moon*; and therefore either dew, or rain, or snow have fallen.

8°. The *moon*, then, is a body in all respects like our earth, and fitted for the same purposes. For we have shewn that it is dense—opaque—has mountains and valleys—seas, with islands, peninsulæ, rocks, and promontories—a changeable atmosphere; wherein vapours and exhalations rise and fall—day and night; a sun to illuminate the one, and a moon the other,—summer and winter, &c.

From these, by analogy, may infinite other properties and appendages of the *moon* be deduced.—From the changes in the atmosphere will follow winds, and other meteors; and according to the different seasons of the year, rains, mists, frost, snow, &c.—From the inequalities upon the *moon's* surface will arise lakes, rivers, springs, &c.

Now nature, we know, produces nothing in vain: rains and dews fall on our earth to make plants vegetate; and plants take root, grow, produce seeds and fruits for animals to feed on.—But nature is still uniform and consistent with herself, and like things serve for like ends.—Why then may not there be plants and animals in the *moon*? To what other purpose so nice a provision for them?

These arguments will receive new force when we come to shew that our earth itself is a planet; and that when viewed from the other planets, it appears, in some, like the *moon*; in others, like Venus; in others, like Jupiter, &c. a similitude between the planets, both optical and physical, being a strong presumption their furniture is alike. See EARTH, and PLANET.

To measure the height of the mountains of the MOON.—Suppose ED (fig. 19.) the *moon's* diameter, ECD the boundary of light and darkness; and A the top of a hill in the dark part beginning to be illumined: With a telescope observe the proportion of A E, or the distance of A from the line where the light commences, to the diameter E D: Here we have two sides

of a rectangled triangle A E, C E; the squares of which added together give the square of the third; whence the semi-diameter C D being subtracted, leaves A B, the height of the mountain.

Ricciolus, *v. gr.* found the top of mount St. Catharine illumined at the distance of  $\frac{1}{4}$  of the *moon's* diameter from the confines of light. Supposing, therefore, C E, 8; and A E, 1; the squares of the two will be 65, whose root is 8.062 the length of A C; subtracting therefore B C = 8, the remainder is A B = 0.62. The *moon's* semi-diameter, therefore, is to the mountain's height as 8 is to 0.62; i. e. as 800 to 62. Supposing, therefore, the diameter of the *moon* 1182 English miles, by the rule of three we find the height of the mountain nine miles. The heights, &c. of the lunar mountains being measurable, astronomers have taken occasion to give each its name. Ricciolus, whom most others now follow, distinguished them by the names of celebrated astronomers; and by these names they are still expressed in observations of the lunar eclipses, &c. See the figure, *Tab. Astron. fig. 20.*

MOON-dial. See the article DIAL.

Prime of the MOON. See the article PRIME.

MOOR, MORA, a heath, or barren tract of ground. See WASTE and COMMON.

The word is sometimes also used for a *marass*, *moss*, or *fen*. See MORASS.

Mora musca, in ancient writings, particularly denotes a moss; or peat-moss. See TURF.

MOORING, at sea, is the laying out of anchors, in a proper place, for the secure riding of a ship. See ANCHOR, and UN-MOOR.

To MOOR across, is to lay out one of the anchors on one side. To MOOR alongst, is to have an anchor in a river, and a hawser on shore.

To MOOR quarter-shot, is to moor quartering, between the two first ways.

MOORING for east, west, &c. is when they observe which way, and on what point of the compass the wind or sea is most likely to endanger the ship, and there lay out an anchor.

MOORS-head, in chymistry, a copper cap made in form of a head, to be set over the chimney of a reverberating furnace. See REVERBERATORY, and HEAD.

MOORS-head also denotes the head of a copper or glass-still or alembic, which is luted on to the body or cucurbit, and hath a beak or pipe to let the spirit run down into the receiver.

MOOT\*, a difficult case, or question argued by the students of inns of court, by way of exercise. See MOOTING.

\* The word is formed either from the Saxon, *metan*, *gemetan*, meeting: or from the French, *mot*, word.

MOOTING, the chief exercise of the students in the inns of court; being the arguing of cases, which young utter barristers, &c. perform at appointed times, the better to enable them for practice, and the defence of their clients causes. See MOOT, and INNS of court.

Such, as from their learning and standing are called by the benchers to argue *moot-cases*, are sometimes called *utter barristers*; the rest, who for want of experience, &c. are not admitted, are by some called *inner barristers*. See BARRISTER.

The place where the *moot-cases* were argued, was anciently called a *moot-hall*. See HALL.

In the inns of court there is a *bailiff* or *surveyor of the moots*, yearly chosen by the bench to appoint the *moot-men* for the inns of chancery, and to keep account of performance of exercises; both there and in the house.

MOOT-men, are those who argue *moot-cases*. See MOOT.

Out of these *moot-men* are chosen readers for the inns of chancery; where, in term-time and in vacations, they argue cases in the presence of attorneys and clerks. See MOOTING.

MORALS, any thing relating to the manners, or conduct of life. See MANNERS.

Besides the theological virtues, as *faith*, *hope*, *charity*, &c. there are also moral virtues, as *justice*, *temperance*, &c. See VIRTUE.

MORAL actions, or acts, are such as render the agent good or evil; and consequently rewardable and punishable, because he does them. See GOOD, &c. See also ACTION.

MORAL cause. See the article CAUSE.

MORAL certainty, or assurance, is used to signify a very strong probability; in contradistinction to a mathematical demonstration. See CERTITUDE.

MORAL evidence.

MORAL evil.

MORAL fables.

MORAL good.

MORAL impossibility, is what we otherwise call a *very great*; and almost insuperable difficulty; in opposition to a physical, or natural impossibility. See IMPOSSIBILITY.

MORAL necessity. See the article NECESSITY.

MORAL perfection. See the article PERFECTION.

MORAL philosophy, a science whose object is to direct, and form men's manners; to explain the reason, and nature of actions; and to teach and instruct us how to acquire that felicity which is agreeable to human nature. See PHILOSOPHY.

*Moral Philosophy* is the same with what we otherwise call *ethics*, sometimes *morality*. See **ETHICS**, and **MORALITY**.

**MORAL quantity**. See the article **QUANTITY**.

**MORAL sense**, the faculty whereby we discern, or perceive what is good, virtuous, beautiful, &c. in actions, manners, characters, &c.

A late Author has endeavoured to prove, that it is a peculiar sense whereby we get the ideas of these things; and denominates it a *moral sense*. See **MORAL SENSE**.

**MORAL theology**, is that which treats of cases of conscience; called also *casuistry*, or *casuistical divinity*. See **THEOLOGY**.

**MORAL universality**. See the article **UNIVERSALITY**.

**MORAL of a fable**, is the instruction drawn from it. See **FABLE**.

Thus when Phædrus at the end of a fable adds, *Hoc illis dictum qui*, &c. This makes what we call the *moral*: The Greeks called it *ἠθικόν*, when at the end of the fable; and *πρῶτον*, at the beginning. Among the Latins it was called *affabulatio*.

**MORALITY**, denotes a conformity in things and actions, to those unalterable obligations which result from the nature of our existence, and the necessary relations of life; whether to God, as our creator, or to mankind as our fellow-creature. See **ACTION**, &c.

**MORALITY**, is also used for the science, or doctrine of morals; or the art of living well and happily: deduced from reason, and the nature, relation, and fitness of things.

In which sense it amounts to the same with what we otherwise call *ethics*, *moral philosophy*, or the *doctrine of offices*. See **ETHICS**, **MORAL**, **OFFICE**, **DUTY**, &c.

Notwithstanding the great obscurity and uncertainties in the moral science, Mr. Locke is of opinion, that the doctrine of manners is equally capable of being brought to demonstration with the doctrine of quantity and number, that is, with the purest parts of mathematics. See **KNOWLEDGE**, **DEMONSTRATION**, **QUANTITY**, **NUMBER**, **MATHEMATICS**, &c.

According to this author, the idea of a supreme Being, infinite in power, goodness, and wisdom, whose workmanship we are, and on whom we depend; and the idea of ourselves, as understanding rational creatures; would, if duly considered, afford such foundations of our duty, and rules of action, as might place *morality* among the sciences capable of demonstration; wherein we need not doubt, but that from principles as incontestable as those of the mathematics, by necessary consequences, the measure of right and wrong, might be made out to any one, who will apply himself, with the same indifference and attention to the one, as he doth to the other of these sciences. For the relations of other modes may certainly be perceived, as well as those of number and extension.—*E. gr.* That *where there is no property, there is no injustice*, is a proposition as certain as any in Euclid; for the idea of property being a right to any thing, and the idea of injustice being the invasion or violation of that right, it is evident, that these ideas being thus established, and these names annexed to them, I can as certainly know this proposition to be true, as that a triangle has three angles equal to two right ones.—Again, *no government allows absolute liberty*: the idea of government being the establishment of society, upon certain rules or laws, which require conformity to them; and the idea of absolute liberty being for any one to do whatever he pleases, I am as capable of being certain of the truth of this proposition, as of any in mathematics.

What has given the advantage to the ideas of quantity, and made them thought more capable of certainty and demonstration, than the ideas of good and evil, right and wrong, &c. is, 1<sup>o</sup>. That the former can be represented by sensible marks, which have a nearer correspondence with them than any words or sounds. Diagrams drawn on paper are copies of the ideas, and not liable to the uncertainty that words carry in their signification; but we have no sensible marks that resemble our moral ideas, and nothing but words to express them by, which though, when written, they remain the same; yet the ideas they stand for may change in the same man, and it is very seldom they are not different in different persons.

2<sup>o</sup>. Moral ideas are commonly more complex than figures; whence these two inconveniences follow. 1<sup>o</sup>. That their names are of more uncertain signification: the precise collection of simple ideas they stand for, not being so easily agreed on, and so the sign that is used for them in communication always, and in thinking often, does not readily carry with it the same idea. 2<sup>o</sup>. The Mind cannot easily retain those precise combinations so exactly and perfectly, as is necessary in the examination of the habitudes and correspondencies, agreements or disagreements of several of them one with another, especially where it is to be judged of by long deductions, and the intervention of several other complex ideas, to shew the agreement or disagreement of two remote ones.

One part of these disadvantages in moral ideas, which has made them be thought not capable of demonstration, may in a good measure be remedied by definitions, setting down that collection of simple ideas which every term shall stand for, and then using the term steadily and constantly for that precise collection. See **DEFINITION**.

The mathematician considers the truth and properties belonging to a rectangle or circle, only as they are ideas of his own

mind, which possibly he never found actually existed mathematically; that is, precisely true: yet his knowledge is not only certain, but real; because real things are no further, nor intended to be, meant by any such propositions, than as things really agree to those archetypes in the mind. It is true of the idea of a triangle, that its three angles are equal to two right ones; it is true also of a triangle, where-ever it exists: What is true of those figures that have barely an ideal existence in the mind, will hold true of them also, when they come to have a real existence in matter. Hence it follows, that moral knowledge is as capable of real certainty as mathematics: For certainty being nothing but the perception of such agreement, by the intervention of other ideas, our moral ideas, as well as mathematical, being archetypes themselves, and so adequate or compleat ideas, all the agreement or disagreement we shall find in them, will produce real knowledge, as well as in mathematical figures. That which is requisite to make our knowledge certain, is the clearness of our ideas; and that which is required to make it real, is that they answer their archetypes.

But it will here be said, That if moral knowledge be placed in the contemplation of our own moral ideas, and those are of our own making, what strange notions will there be of justice and temperance? What confusion of virtues and vices, if every man may make what ideas of them he pleases? It is answered: No confusion or disorder at all in the things themselves, nor the reasonings about them, no more than there would be a change in the properties of figures, and their relations one to another, if a man should make a triangle with four corners, or a trapezium with four right angles; that is, in plain English, change the names of the figures, and call that by one name which is called ordinarily by another. The change of name will indeed at first disturb him, who knows not what idea it stands for; but as soon as the figure is drawn, the consequences and demonstrations are plain and clear.

Just the same is it in moral knowledge: Let a man have the idea of taking from others, without their consent, what they are justly possessed of, and call this *justice* if he pleaseth; he that takes the name there, without the idea put to it, will be mistaken, by joining another idea of his own to that name: but strip the idea of that name, or take it, such as it is, in the speaker's mind, and the same things will agree to it, as if you called it *injustice*. One thing we are to take notice of, That where God, or any other law-maker, has defined any moral names, there they have made the essence of that species to which that name belongs; and there it is not safe to apply or use them otherwise; but in other cases, it is bare impropriety of speech to apply them contrary to the common usage of the country they are used in.

**MORASSE**\*, a marsh, fen, or low moist grounds, which receive the waters from above, without having any descent to carry them off again. See **FEN**.

\* Somner derives the word from the Saxon *merse*, lake: Salmasius from *mare*, a collection of waters; others from the German *maras*, a muddy place; and others from *marese*, of *maricetum*, a marish, i. e. rushes.

In Scotland, Ireland, and the north of England, they have a peculiar kind of *morasses*, called *mosses*, or *peat-mosses*, whence the country people dig their peat or turf. See **TURF**.

The earl of Cromartie gives a particular account of these mosses in the *Philosophical Transactions*. They are covered with a heathy scurf, under which is a black, moist, spongy earth, in some places shallower, in others deeper, ordinarily from three or four, to seven or eight feet depth, though in some few places twice, or thrice as much.

This black, spongy earth, they cut into oblong squares with iron spades fitted to that end, eight or nine inches long, and four or five broad; as the men cut them up, they are carried and spread on a dry ground, to be dried in the wind and sun. Some of these become harder, some softer, according to the nature of the mould or earth: The more black and solid, the better fire; and they are the least esteemed which are grayest, lightest, and most spongy.

When they have cut off one surface of four or five inches deep, they proceed downwards to another, and so to a third and a fourth, till they come to the hard channel; unless they be stopped with water, which they also ordinarily remove by making a channel, if they can; but where they cannot, there the water stagnates. In such wasted pits, or *peat-dikes*, as they call them, where water hinders the cutting the spongy earth to the bottom, the pits will be filled up again in some years with a new spongy earth; which in process of time comes to the consistence of peat-mosses as at first, and a scurfy heath-turf grows over the top of it. When the dikes are dug down to the hard channel, the mosses do not renew, as in the other case; though it has been observed, that if they be cut down to the channel, provided the heathy turf cut off from the top be but laid on the channel, in course of time the moss grows again. These mosses are always level; though they are frequently found on hills, and near the tops of them too. Yet, as that curious nobleman observes, the mosses have always a descent to them, and generally from them; insomuch that he never knew any where the water might stagnate. It is the water draining from

from above, that seems to be the parent of peat. In many of these mosses are found quantities of fir and oak wood, usually whole trees; for the smaller branches are seldom found unconsumed. This wood is as good for use as any old wood is; only that having imbibed a deal of moisture, it takes some time to dry, in order to fit it for use.

There are many places where wood will not grow, where yet the mosses are well stocked with this under-ground timber; but yet it appears there must have been woods formerly; else how come they in the mosses? To prove this, that noble lord gives us the history and origin of a moss, in great measure from his own experience.—In the parish of Lochburn, in the year 1651, he saw, near the top of a very high hill, a plain about a mile over, then covered with a firm standing wood, but which was so very old, that not only the trees had no leaves or bark on, but the outside for the space of an inch inward was dead, white timber, though within they were firm. Coming by the same place fifteen years after, he could not discover the least appearance of a tree, but instead thereof a plain green ground covered with a moss; the trees being all fallen, and having lain so thick over one another, the green had over-run the whole timber, by means of the moisture draining from the hill above it, and stagnating on the plain. He adds, that none could pass over it; the scurf not being firm enough to support them. In thirty years more he found the whole piece of ground turned into a common peat-moss, and the country-people digging turf and peats.—This accounts for the generation of mosses, and whence it is that many of them are furnished with timber.

**MORATOR**, or **DEMORATUR**, in law, signifies as much as, *he demurs*; that is, the party here goes not forward, but rests, or abides upon the judgment of the court, who take time to deliberate, argue, and advise thereon. See **DEMURRER**. When the council of the party are of opinion, that the court or plea of the adverse party is insufficient in law; then he *demurs*, and abides in law, and refers the same to the judgment of the court.

**MORBID**, **MORBIDUS**, in medicine, is applied to those parts, humours, &c. wherein a disease lies. See **DISEASE**.

**MORBID**, in painting, is particularly applied to fat flesh very strongly expressed.

**MORBILLI**, in medicine, a disease popularly called *measles*. See **MEASLES**.

**MORBUS**, a term purely Latin, signifying *disease*. See **DISEASE**.

**MORBUS comitialis**, denotes the *epilepsy*; thus called by the Romans, because when in any of their public assemblies persons fell down with this distemper, they immediately broke up, and dissolved the comitia, which was the common appellation for such courts. See **EPILEPSY**, and **COMITIALIS**.

<b>MORBUS Gallicus.</b>	} See the article	<b>VENEREAL disease.</b>
<b>MORBUS prodromus.</b>		<b>PRODROMUS.</b>
<b>MORBUS pedicularis.</b>		<b>PEDICULARIS.</b>
<b>MORBUS regius.</b>		<b>JAUNDICE.</b>
<b>MORBUS virgineus.</b>		<b>CHLOROSIS.</b>
<b>Cholera MORBUS.</b>		<b>CHOLERA.</b>

**MORESK**, or **MORISCO**, a kind of painting, carving, &c. done after the manner of the Moors; consisting of several grotesque pieces and compartments promiscuously intermingled, not containing any perfect figure of a man, or other animal, but a wild resemblance of birds, beasts, trees, &c. See **GROTESQUE**. These are also called *arabesques*, and are particularly used in embroideries, damask-work, &c. See **ARABESQUE**.

*Moresque dances*, vulgarly called *morrice-dances*, are those altogether in imitation of the Moors; as farabands, chacons, &c. which are usually performed with castanets, tabours, &c. See **CATANETS**.

**MORGANATIC marriage**. See the article **MARRIAGE**.

**MORNING**, the beginning of the day; or the time of the sun rising. See **DAY**, and **RISE**.

The astronomers reckon *morning*, *manè*, from the time of midnight, to that of mid-day.—Thus an eclipse is said to begin at eleven a-clock in the *morning*, &c.

**MORNING-star**, is the planet Venus, when a little to the westward of the sun; that is, when she rises a little before him.

In this situation, she is called by the Greeks, *phosphorus*; by the Latins, *lucifer*, &c. See **PHOSPHORUS**.

**MORNING twilight**. See the article **CREPUSCULUM**.

**MOROCCO\***, or **MARROQUIN**, the skin of a goat, or some other animal resembling it, called *menon*, frequent in the Levant, dressed in sumac, or galls, and coloured of any colour at pleasure, much used in tapistry, book-binding, &c.

\* The name is ordinarily derived from the kingdom of Morocco, whence it is supposed the manner of preparing them was first borrowed.

We have *Morocco* skins brought from the Levant, Barbary, Spain, Flanders, and France; red, black, yellow, blue, &c.

---The various manners of preparing *Morocco*s, both black and in colours, are so curious, and withal so little known among us, that the publick will not be displeased to find them here.

*Manner of preparing black MOROCCO*.---The skins having been dried in the hair, are steeped in clear water three days and

nights, stretched on a wooden horse or leg, like that used by tanners, beaten with a large knife for the purpose, and steeped a-fresh in water, changed daily till they be well come again.---In this state, they are thrown into a large vat in the ground, full of water, wherein quick-lime has been slaked, where they lie fifteen days; whence, however, they are taken, and again returned every night and morning: They are then thrown into a fresh vat of lime and water, and shifted night and morning as before, for fifteen days longer; then rinsed in clear water, and the hair taken off, on the leg, with the knife; returned into a third vat, and shifted as before, for about eighteen days; steeped twelve hours in a river, taken out, rinsed, put in pails, where they are pounded with wooden pestles, changing the water twice; then laid on the horse, and the flesh taken off, returned into pails of new water, taken out, and the hair-side scraped; returned into fresh pails, taken out, and thrown into a pail of a particular form, having holes at bottom: Here they are beaten the space of an hour, the fresh water poured on from time to time; stretched on the leg, and scraped on either side; returned into pails of fresh water; taken out, stretched, and sewed up all around in manner of bags, leaving out the hind legs, which serve to make an aperture for the conveyance of a mixture mentioned hereafter.

The skins thus sewed, are put in luke-warm water, where dogs excrement has been dissolved. Here they are stirred with long poles half an hour, left at rest a dozen, taken out, rinsed in fresh water, and filled by a tunnel with a preparation of water and sumac mixed and heated over the fire till ready to boil; and as they are filled, the hind-legs are sewed up to stop the passage. In this state they are let down into the vessel of water and sumac, and kept stirring four hours successively, taken out, and heaped on one another; after a little time, their sides are changed; and thus they continue an hour and half, till drained. This done, they are loosened, and filled a second time with the same preparation, sewed up again, and kept stirring two hours, piled up, and drained as before. This is again repeated a third time, with this difference, that they are now only stirred a quarter of an hour; after which, they are left till the morrow morning, when they are taken out, drained on a rack, unfewed, the sumac taken out, folded in two from head to tail, the hair-side outwards, laid over each other on the leg, to perfect their draining, stretched out, and dried; then trampled under foot by two and two, stretched on a wooden table, what flesh and sumac remains scraped off, and the hair-side rubbed over with oil, and that again with water.

Having thus received their oil and water, they are wrung in the hands, then stretched and pressed right on the table with an iron instrument like that of the curriers, the flesh-side uppermost; then turned, and the hair-side rubbed strongly over with a handful of rushes, to squeeze out as much of the oil remaining within as possible. The first course of black is now laid on the hair-side, by means of a lock of hair twisted and steeped in a kind of black dye, prepared of four beer, wherein pieces of old rusty iron have been thrown. When half dry by hanging in the air, they are stretched on a table, and rubbed over every where with a paumelle or wooden-toothed instrument, to raise the grain, over which is passed a light couche of water, then sleeked, by rubbing them with rushes prepared for the purpose. Thus sleeked, they have a second couche of black, then dried, laid on the table, rubbed over with a paumelle of cork, to raise the grain again; and after a light couche of water, sleeked over anew, and to raise the grain a third time, a paumelle of wood used.

After the hair-side has thus received all its preparations, the flesh-side is pared with a sharp knife for the purpose; the hair-side rubbed strongly over with a woollen cap, having first given it a lustre with barberries, citron, or orange. The whole is finished, by raising the grain lightly for the last time with the paumelle of cork, which leaves them in a condition for sale and use.

*Manner of preparing red MOROCCO*.---The skins are steeped twenty-four hours in a river, taken out, stretched on the leg, beat with the knife, returned into the water for twenty-four hours, re-beaten on the leg, re-steeped; thrown into a vat, and for three weeks, taken out and returned every morning, to dispose them to peel.---Being taken out for the last time, they are scraped with the knife, and when the hair is quite off, thrown in pails of fresh water, where they are rinsed; then the flesh-side scraped, thrown into the pails, and thus alternately from the leg to the pails, till they leave the water quite clean; then they are put in lukewarm water, with the sumac as before, and after twelve hours, rinsed in clear water, and scraped on the leg on both sides, pounded in pails, and the water changed three times; then wrung and stretched on the leg, and passed after each other into water, with allum dissolved in it. Thus allumed, they are left to drain till the morning, then wrung out, pulled on the leg, and folded from head to tail, the flesh inwards.

In this state they receive their first dye, by passing them after one another into a red liquor, prepared with lacca, and some other ingredients, kept secret among the *maroquineers*.---This they repeat again and again, till the skins have got their first colour.

# MOR

colour. They are then rinsed in clear water, stretched on the leg, and left to drain twelve hours; thrown into water into which white galls pulverized have been passed through a sieve, and stirred incessantly for a day with long poles, taken out, hung on a bar a cross the water all night, white against red, and red against white, and in the morning the water stirred up, and the skins returned into it for twenty-four hours.

**MORPHEW**, **MORPHÆA**, a leprous sort of freckle or scurf which breaks out sometimes upon the skin; particularly about the forehead; called also *alphus*. See **ALPHUS**.

**MORSELLI**, or **MORSULI**, are denominations given to those forms of medicines to be chewed in the mouth, as a *lozenge*; the word signifying a little mouthful. See **LOZENGE**.

**MORSUS diaboli**, *devil's bit*; a plant which seems to have a fringe around the bottom of its root: otherwise called *succisa*. See **SUCCISA**.

It has its denomination from its roots, which appear as if bitten off at the bottom: which superstitious people attributed to the devil as done out of envy, lest we should have too much of so salutary a root. It was formerly looked on as a good alexipharmic; but is now much out of use.

From a likeness hereto, has the edge or selvedge of the tubæ Fallopianæ, obtained the same appellation. See **FALLOPIAN**.

**MORSUS canis rabidi**. See the article **HYDROPHOBIA**.

**MORSUS viperæ**. See the article **VIPER**.

**MORT d'ancestre**, in law, see **ASSISE of mort d'ancestre**.

**MORTALITY**, a term frequently used to signify a contagious disease, which destroys great numbers either of men, or beasts. See **DISEASE**, **PLAGUE**, **MURRAIN**, &c.

**Bills of MORTALITY**, are weekly lists compiled by the parish-clerks in, and about, London, containing the numbers of such as die of each disease, as well as of those that are born, every week. See **BILL**.

The bills of mortality comprehend not only the alleys, suburbs and liberties of London, and Westminster, and borough of Southwark, but fifteen out-parishes next adjacent.—But then they are limited to the christenings and burials in the parish-churches: For as to those of the Dissenters, Quakers, &c. they do not come under the cognizance of the parish-clerks.

The bills are of some standing in England, in imitation whereof the like are now established at Paris. They are very useful on several accounts, particularly in judging of the mortality of any disease, and whether an epidemic or infectious distemper increases or abates.

There are also *yearly bills*, collected out of the weekly ones.—By these it appears, that the annual number of burials at London is twenty-five or twenty-six thousand: at Paris it is seventeen, or eighteen thousand.

Mr. Graunt, who examined the London bills very accurately, has wrote an express treatise of them.—Among other things, he calculates from them, that of 100 persons who are born in the same week, there are but 64 left at the end of six years; but 40 at the end of sixteen years; at the end of twenty-six years, but 25; and at the end of thirty-six years, but 16; at the end of forty-six years, but 10; at the end of fifty-six, no more than 6; at the end of sixty-six years, but 3; at the end of seventy-six, but 1: and at the end of eighty years, they are reduced to none.

He likewise makes it appear, that in England in general, more are born than die; but in London, more die than are born: The proportion of births to burials, in the former, being as 1  $\frac{1}{11}$  to one; in the latter as 1  $\frac{1}{13}$  to one. Thus also cities and market towns are found to bury 1  $\frac{1}{13}$  to 1 birth. But in Paris they outdo London; their deaths being 1  $\frac{1}{4}$  to 1 birth. In the villages of England, fewer die than are born; there being but one death to 1  $\frac{1}{10}$  births. See **MARRIAGE**.

**MORTAR**, or **MORTER**, in architecture, a composition of lime, sand, &c. mixed up with water; serving, as a cæment, to bind the stones, &c. of a building. See **BUILDING**, **CÆMENT**, &c.

The ancients had a kind of mortar so very hard and binding, that, after so long a duration, it is next to impossible to separate the parts of some of their buildings; though there are some who ascribe that excessive strength to time, and the influence of certain properties in the air, which is found to harden some bodies very surprizingly. See **AIR**.

The lime used in the ancient mortar is said to have been burnt from the hardest stones, and even fragments of marble. See **LIME**.

De Lorme observes, that the best mortar is that made of pozzolana for sand; adding, that it penetrates black flints, and turns them white. See **POZZOLANA**.

Mr. Worledge observes, that fine sand makes weak mortar; and the rounder the sand, the stronger the mortar. He therefore advises the sand to be washed ere mixed; and adds, that dirty water weakens the mortar considerably. See **SAND**.

Wolfius observes, that the sand should be dry and sharp, so as to prick the hands when rubbed; yet not earthy, so as to foul the water it is washed in.

Vitruvius observes, that fossil-sands dry sooner than those taken out of rivers. Whence he adds, the latter is fitted for the insides, the former for the outsides of a building. He subjoins,

# MOR

that fossil-sand lying long in the air, becomes earthy. Palladio takes notice, that of all sands white ones are the worst; the reason is owing to their want of asperity.

The proportion of lime and sand in our common mortar is extremely variable. Vitruvius prescribes three parts of pit-sand and two of river-sand to one of lime; but the sand here seems to be over-dosed. About London, the proportion of sand to quick lime is as 36 to 25. In some parts they use equal quantities of each.

**Mixing and blending of MORTAR**.—M. Felibien observes that the ancient masons were so very scrupulous herein, that the Greeks kept ten men constantly employed for a long space of time, to each bason, which rendered the mortar of such prodigious hardness, that Vitruvius tells us the pieces of plaister falling off from old walls served to make tables.—Felibien adds, it is a maxim among old masons to their labourers, that they should dilute with the sweat of their brow, *i. e.* labour it a long time, instead of drowning it with water, to have done the sooner.

Besides the common mortar used in laying of stones, bricks, &c. there are several other kinds. As,

**White MORTAR**, used in plaistering the walls and ceilings; made of ox-hair mixed with lime and water, without any sand. See **PLASTER**.

**MORTAR used in making of water-courses, cisterns, &c.** is very hard and durable, made of lime and hog's grease, sometimes mixed with the juice of figs, and sometimes with liquid pitch; after application it is washed over with linseed-oil. See **CISTERN**.

**MORTAR for furnaces, &c.** is made with red clay wrought in water, wherein horse-dung and chimney-foot has been steeped. See **FURNACE**.

**MORTAR for sun-dials** on walls may be made of lime and sand tempered with linseed oil; or, for want of that, with scummed milk. This will grow to the hardness of a stone.

For buildings, one part of washed soap-ashes mixed with another of lime and sand, make a very durable mortar. See **CÆMENT**, &c.

**MORTAR-PIECE**, a short piece of ordnance, thick and wide, proper for throwing bombs, carcasses, shells, stones, &c. See **ORDNANCE**, **BOMB**, **CARCASS**, &c.

There are two kinds of mortars; the one hung, or mounted on a carriage with low wheels, after the manner of guns; called *pendent*, or *hanging mortars*. See **MOUNTING**.—The other fixed on an immoveable base, called *standing mortars*.

At the head of the bore, or chase of the mortar, is the *chamber* for the charge of powder.—This is usually made cylindrical, all but the base, which they make hemispherical: Though some of the latter engineers prefer spherical chambers; as the surface of those being less, under equal capacities, make less resistance to the gun-powder. See **CHAMBER**.

The thickness of the Mortar about the chamber is to be much greater than about the chase; by reason the gun-powder makes a much greater effort about the chamber than elsewhere: The diameter of the chamber to be much less than that of the bore; by reason bombs, shells, &c. are much lighter than the bullets of equal diameters; and, consequently, less powder suffices. See **BULLET**.

**To charge, or load a MORTAR**, the proper quantity of gun-powder is put into the chamber; and if there be any vacant space, they fill it up with hay; some chuse a wooden plug. Over this they lay a turf; some a wooden tampion fitted to the bore of the piece; and lastly the bomb, taking care that the fusee be in the axis thereof, and the orifice be turned from the muzzle of the piece. What remains, is to be filled up with hay, straw, turf, &c. so as the load may not be exploded without the utmost violence. See **CHARGE**.

The quantity of gun-powder to be used, is found by dividing the weight of the bomb by 30. Though this rule is not always to be strictly observed. See **GUN-POWDER**.

**To elevate the MORTAR**, so as its axis may make any given angle with the horizon; they apply the artillery-level, or gunner's quadrant; the use whereof see under the articles **LEVEL** and **QUADRANT**. See also **ELEVATION**.

An elevation of 70 or 80 degrees is what is commonly chose for rendering mortars most serviceable in casting shells into towns, forts, &c. though the greatest range be at 45°. See **RANGE**.

If all mortar-pieces were, as they ought to be, exactly similar, and their requisites of powder as the cubes of the diameters of their several bores; and if their shells, bombs, carcasses, &c. were also similar, then, comparing like with like, their ranges on the plane of the horizon, under the same degree of elevation, would be equal; and, consequently, one piece being well proved, *i. e.* the range of the granado, bomb, carcass, &c. being found to any degree of elevation, the whole work of the mortar-piece would become very easy, and exact.

But since mortars are not thus similar, it is required that the range of the piece at some known degree of elevation be accurately found by measuring; and from whence all the other ranges may be determined.

Thus, to find the range of the piece at any other elevation required; say, as the sine of double the angle under which the experiment

experiment was made, is to the sine of double the angle proposed, so is the range known, to the range required.

Suppose, for instance, it be found that the range of a piece elevated to 30 degrees is 2000 yards; to find the range of the same piece with the same charge when elevated to 45 degrees: Take the sine of 60°, the double of 30°, and make it the first term of the rule of three; the second term must be the sine of 90°, the double of 45°; and the third the given range 2000: The fourth term will be 2310, the range of the piece at 45°. If the elevation be greater than 45°, instead of doubling it, take the sine of double its complement to 90°. As suppose the elevation of a piece be 50°, take the sine of 80°, the double of 40°.

Again, if a determinate distance to which a shot is to be cast, be given, and the angle of elevation to produce that effect be required; the range known must be the first term in the rule of three, which suppose 2000 yards, the range proposed, which we suppose 1600 yards, the second term; and the sine of 60 degrees of the elevation for the range of 2000 yards, the third term. The fourth term will be found the sine of 43°, 52', whose half 21°, 56', is the angle of elevation the piece must have, to produce the desired effect. And if 21°, 56', be taken from 90°, you will have 68°, 4' for the other elevation of the piece, with which the same effects will likewise be produced.

Note, to avoid the trouble of finding sines of double the angles of proposed elevation, Galileo and Torricelli give us the following table, wherein the sines of the angles sought are had by inspection.

Degrees.	Degrees.	Ranges.	Degrees.	Degrees.	Ranges.
90	0	0	0	0	0
89	1	349	66	24	7431
88	2	698	65	25	7660
87	3	1045	64	26	7880
86	4	1392	63	27	8090
85	5	1736	62	28	8290
84	6	2079	61	29	8480
83	7	2419	60	30	8660
82	8	2556	59	31	8829
81	9	3090	58	32	8988
80	10	3420	57	33	9135
79	11	3746	56	34	9272
78	12	4067	55	35	9397
77	13	4384	54	36	9511
76	14	4695	53	37	9613
75	15	5000	52	38	9703
74	16	5299	51	39	9781
73	17	5592	50	40	9841
72	18	5870	49	41	9903
71	19	6157	48	42	9945
70	20	6428	47	43	9976
69	21	6691	46	44	9994
68	22	6947	45	45	10000
67	23	7193			

The use of the table is obvious.—Suppose, for instance, it be known by experiment that a mortar elevated 15°, charged with three pounds of powder, throw a bomb to the distance of 350 fathom; and it be required, with the same charge, to throw a bomb 100 fathom farther: Seek in the table the number answering to 15 degrees, and you will find it 5000. Then as 350 is to 450, so is 5000 to a fourth number, which is 6428. Find this number, or that nearest it, in the table, and against it you will find 20°, or 70°; the angles of elevation.

For the weight, dimensions, &c. of the bombs, &c. to be cast out of mortars, and the lines of the projection; see BOMB, PROJECTILE, &c.

**MORTGAGE**\*, in law, an obligation, whereby lands or tenements of the debtor, are pawned or bound over to the creditor for money, or other effects borrowed; peremptorily to be the creditor's, for ever, if the money be not repaid at the day agreed on. See GAGE, &c.

\* Glanvill defines mortgage, *mortuum vadium*, to be that *cujus fructus vel redditus interim percepti in nullo se acquiescant*. Thus it is called mortgage, i. e. dead gage, of mort, death; and gage, pledge; Because whatever profit it yields, yet it redeems not itself by yielding such profit, except the whole sum borrowed be likewise paid at the day; the mortgager being by covenant to receive the profits till default of payment. Others hold it called mortgage, because if the money be not paid at the day, the land *mortitur*, dies to the debtor, and is forfeited to the creditor.

In this sense, mortgage, in common law, amounts to much the same with *hypotheca* in the civil law. See HYPOTHECA.

The creditor holding such land, on such agreement, is in the mean time called *tenant in mortgage*. See TENANT.—He who lays the pawn or gage, is called the *mortgager*, and he that takes it the *mortgagee*.—If a mortgage include excessive usury, it is prohibited by a statute 37 Hen. VIII.

The French sometimes use the word *mortgage* in the same sense in their language, where it stands in contradistinction to a simple contract, which does not carry with it the mean profits, and which they call *vif-gage*, live-pledge.

Vol. II. No. 101.

A mortgage is an engagement for the security of the creditor; for which purpose various means have been contrived: That of the pawn or pledge, seems to have been the most ancient, being in reality the same thing with the mortgage; all the difference consisting in this, that in a mortgage the pawn was put into the hands of the creditor; whereas in a simple engagement, the thing remained in the hands of the debtor.—But it was afterwards found much more commodious to engage lands by a simple convention, than by an actual delivery.

Accordingly, this was practised by the Greeks; and from them borrowed by the Romans; who, the better to prevent deceipts, fixed up visible marks to inform the public, that the estate was engaged by the proprietor: Though these marks were found so injurious to the debtors, that the use of them was at length prohibited.

The Romans had four kinds of mortgages, or *hypotheca*. The *conventional*, which proceeds from the will and consent of the contractors: The *legal*, which is introduced by the law, and which is therefore called *tacit*: The *mortgage of the praetor*, when by the flight or refusal of the debtor, the creditor was put in possession of his effects: And the *judiciary mortgage*, when the creditor was put in possession, in consequence of a decree or sentence.

The civil lawyers distinguish twenty-six different kinds of *tacit mortgages*.

**MORTIER**, a badge, or ensign of dignity born by the chancellors, and great presidents of the parliaments of Paris. That born by the chancellor is a piece of cloth of gold, lined and turned up with ermin: That of the first president is a piece of velvet edged with a gold lace; that of the other president is only a piece of gold lace.

They formerly bore it on their heads, but now in their hands, except in grand ceremonies, as at the entry of a king.—Hence the denomination, *presidents a mortier*.

**MORTIFICATION**, *necrosis*, in medicine, a total extinction of the natural heat of the body, or a part thereof. See HEAT.

Some define *mortification* a disease, wherein the natural juices of any part quite lose their proper motion; and by that means fall into a fermentative one, and corrupt, and destroy the texture of the part.

There are two species, or rather degrees of mortification: The one called a *gangrene*, which is a mortification in its first, or beginning state: The other a *sphacelus*, which is a perfect, or finished mortification. See GANGRENE, and SPHACELUS.

**MORTISE**\*, or **MORTOISE**, in carpentry, &c. a kind of joint, wherein a hole or incision, of a certain depth, is made in the thickness of a piece of wood, which is to receive another piece, called a *tenon*. See TENON.

\* The word is originally French, *mortoise*, which signifies the same; and which Borel derives further from *mordre*, to bite.

**MORTMAIN**\*, in law, the alienation of lands and tenements to any guild, corporation, or fraternity, and their successors; as bishops, parsons, vicars, &c. which may not be done without the king's licence, and that of the lord of the manor; or of the king alone, if it be immediately holden of him.

\* The word literally denotes *dead-hand*; being a compound of *mort*, dead, and *main*, hand.—Accordingly Hototian defines *mortmain* to be the possession of those who are, as it were, immortal, because they never cease to have heirs; so that the estate never reverts to its first lord; *main* hand, being used for possession; and *mort*, dead, by antiphrasis, for immortal.—Others assign the reason of the name thus; that the services and other profits due for such lands, should not without such licence come into a dead hand, (*mainmort*), i. e. into a hand as it were dead, that is, so dedicated to God, or pious uses, as to be different from other lands, tenements, or hereditaments, and never to revert to the donor, or any temporal or common use.

The presidents and governors of hospitals may, without licence in *mortmain*, purchase land, &c. not exceeding the yearly value of 3000 l. Stat. 14 Car. 2.

**MORTUARY**, is a gift left by a man at his death to his parish-church, for a recompence of personal tithes and offerings, not duly paid in his life-time.

A mortuary is not properly and originally due to an incumbent from any but those of his own parish: But, by custom, in some places of the kingdom, it is paid to the parsons of other parishes, as the corpse passes through them.

**MORTUUM caput**. See the article CAPUT.

**MOSAIC**\*, **MOSAIC work**, or, as some chuse to call it, **MUSAIIC**, an assemblage of little pieces of glass, marble, shells, precious stones, woods, or the like, of various colours, cut square and cemented on a ground of stucco, &c. imitating the natural colours and degradations of painting. See PAINTING.—In which sense *mosaic work* includes *marquetry*, or *inlaid work*, *vaneering*, &c.

\* The critics are divided as to the origin and reason of the name: Some derive it from *mosaicum*, a corruption of *musaicum*, as that is of *musivum*, as it was called among the Romans. Scalliger derives it from the Greek *μουσα*, and imagines the name was given to this sort of works, as being very fine and ingenious. Nebricensis is of opinion it was so called, because *ex illis picturis ornabantur musea*.

But in its more proper and restrained sense *Mosaic* only takes in

# M O S

works of stone, metals, and glass; those of wood being distinguished by the name of *marquetry* or *inlaying*. See *MARQUETRY*.

Others distinguish otherwise between *mosaic* and *marquetry*. In that properly called *mosaic*, the several stones are all of the same colour; and the changes, and diminutions of colours, and shades, are made by applying different stones one on another, but all of the same colour. *Marquetry*, on the contrary, consists of stones of different colours; and by these the several colours, shades, degradations, &c. are expressed.

*Mosaic* seems to have taken its origin from *paving*: The fine effect and use of pavements, composed of pieces of marble of different colours so well joined together, as that when dried they might be polished, and the whole make a very beautiful and solid body, which continually trodden upon, and washed with water, was not at all damaged; gave the painter the hint; who soon carried the art to a much greater perfection: so as to represent foliage, masks, and other grotesque pieces of various colours, on a ground of black or white marble. In fine, observing the good effect which this kind of work had in pavements, and finding that it resisted water, they proceeded to line walls therewith, and to make various figures for the ornament of their temples and public buildings.

But nature not producing variety of colours enough for them in marbles, to paint all kinds of objects, they bethought of counterfeiting them with glass and metal colours; which succeeded so well with them, that having given all manner of tints to an infinite number of little pieces of these two matters, to counterfeit stones of various colours, in order to get more colours; the workmen arranged them with so much art, that their *mosaic* seemed almost to dispute with paintings. This way of representing objects having this advantage, that it resists the injuries of the air as well as marble itself; and even grows more beautiful with time, which effaces all other kind of painting.

But the moderns have gone further, and setting aside glass and metals, as too mean materials, have introduced, along with the finest marbles, the richest of precious stones, as lapis, agat, cornelians, emeralds, turquoises, &c.

Of these three kinds of *mosaic-work*, that of coloured glass and metals is now little in use, though of a surprising lustre and durability: of the other two, that of marbles alone is in common use; the *mosaic* of precious stone being so very dear, that the few workmen who apply themselves to it, make little else but petty-works, as ornaments for altar-pieces, tables for rich cabinets, &c. Though out of these must be excepted that sumptuous chapel of the dukes of Tuscany, which has been so long in hand, and which, if ever it be finished, will be a noble monument of the magnificence and piety of those princes, as well as of the patience and address of the workmen employed therein.

We shall however enter into some detail of the manner of working in those three kinds of *mosaic*; to which we shall add a fourth much newer, yet equally ingenious with any of the rest, made with a kind of gypsum or talc, found in stone-quarries about Paris.

**MOSAIC work of glass.**—This kind they begin with little pieces of glass, which they provide of as many different colours as possible. To this end, the glassmen's furnaces being disposed, and their pots or crucibles full of the matter of which glass is made, or rather of glass already made, they put what colour or dye they think fit in each crucible, always beginning with the weakest, and augmenting the strength of the colours from crucible to crucible, till they come to the deepest dye, as in mixing of colours on a palette to paint in oil. When the glass has had sufficient coction, and all the colours are in their perfection, they take out the glass hot, as it is, and lay it on a smooth marble, flattening it down with another like marble, and then cutting it into slices of equal bigness, and about the thickness of an inch and half. They then with an instrument, which the Italians call *bocca di cane*, make other pieces square, and others of different figures and sizes, as occasion requires; these they dispose orderly in cases; as in painting in fresco, 'tis usual to range all the different tints in shells, according to their colour.

If it be desired to have gold, either in the ground of the painting, or in the ornaments, or the draperies, they take some of the pieces of glass, formed and cut in the manner just mentioned. These they moisten on one side with gum-water, and afterwards lay them over with gold-leaf. Then they put this piece, or several pieces at a time, on a fire-shovel, which they place in the mouth of the furnace, after having first covered them with another hollow piece of glass. Here they continue till such time as they become red-hot; after which the shovel is drawn out, all at once, and the gold becomes so firmly bound to the glass, that it will never afterwards leave it. Now, to apply these several pieces, and out of them to form a picture, they first make a cartoon, or design; this they transfer on the ground or plaster, by calquing, as in painting in fresco. See *Fresco*.

As this plaster is to be laid thick on the wall, it will continue fresh and soft a considerable time, so that there may be enough prepared at once to serve three or four days. It is composed of

# M O S

lime made of hard stone, with brick-dust very fine, gum-tragacanth, and whites of eggs; when it is thus prepared, and laid on the wall, and the design finished of what is to be represented; with piers they take out the little pieces of glass, ranging them one after another, and still keeping strictly to the light, shadow, different tints and colours represented in the design; pressing or flattening them down with a ruler, which serves both to sink them within the ground, and to render the surface even.

Thus, in a long time, and with an infinite deal of trouble, they finish the work, which is still the more beautiful, as the pieces of glass are more uniform, and ranged at more equal heights. Some of these are executed with so much justness, that they appear as smooth as a table of marble, and as finished and masterly as a painting in fresco; with this advantage, that they have a fine lustre, and will hold almost for ever.

The finest works of this kind, that have descended to us, and those whereon the moderns have retrieved the art, almost lost, are those of the church of St. Agnes, formerly the temple of Bacchus at Rome; besides some at Pisa, Florence, and other cities of Italy. The most esteemed among the works of the moderns, are those of Joseph Pine, and the chevalier Lanfranc, in the church of St. Peter at Rome. There are very good ones likewise at Venice.

**MOSAIC work of marble, and precious stones.**—These two kinds bear so near a relation to each other, as to the manner of working, that to avoid repetition, we shall give them both under one; observing, by the way, wherein the one differs from the other, either in the sawing or the ranging of stones.

*Mosaic of marble* is used in large works, as in pavements of churches, basilics, and palaces; and in the incrustation and vaneering of the walls of the same edifices.—As to that of stones, especially *precious stones*, it is only used in small works, as before observed.

The ground of *mosaic* works wholly marble, is ordinarily a massive of marble, either white or black. On this ground the design is cut with a chissel, having been first calqued. When it is dug of a sufficient depth, i. e. an inch or more, it is filled up with marble of a proper colour, first contoured, or fashioned to the design, and reduced to the thickness of the cavities, with various instruments. To make the pieces, thus inserted into the cavities, hold, whose several colours are to imitate those of the design, they use a stucco, composed of lime and marble-dust; or a mastic, which each workman prepares differently; after which, the work is half polished with a soft kind of stone.

The figures thus marked out, the painter, or sculptor himself draws, with a pencil, the colours of the figures not determined by the ground, and in the same manner makes strokes or hatchings, in the places where shadows are to be; and when he has engraved with the chissel all the strokes thus drawn, he fills them up with a black mastic, composed partly of Burgundy pitch, poured on hot; taking off, afterwards, what is superfluous, with a piece of soft stone or brick, which with water and beaten cement, takes away the mastic, polishes the marble, and renders the whole so even, one would imagine it only consisted of a single piece: It is this kind of *mosaic* we see in the pompous church of the invalids at Paris, and the fine chapel at Versailles; and wherewith some intire apartments of that palace are incrustated.

For *mosaic work of precious stones*; there are required other and more delicate instruments than those used in marble; as wheels, drills, tin-plates, &c. used by lapidaries, and carvers, in stone. As none but the richest marbles and stones enter this work, to make them go further, they are sawn into the thinnest leaves imaginable, scarce exceeding half a line in thickness; the block to be sawed, is fastened firmly with cords, on the bench, only raised a little on a piece of wood, one or two inches high. Two iron pins, which are on one side of the block, and which serve to fasten it, serve also to direct the saw. The pieces to be sawed, are put into a vice contrived for the purpose; in which state, with a kind of saw or bow made of fine brass wire, bent on a piece of springy wood, together with emery steeped in water, the leaf is gradually fashioned, by following the strokes of the design made on paper, and glued on the piece. See *MARQUETRY*.

When there are pieces enough fashioned to form an entire flower, or some other part of the design, they are applied. The ground that sustains this *mosaic*, is usually of free stone. The matter wherewith the stones are joined together, is a mastic, or stucco, laid very thin on the leaves as they are fashioned; and the leaves in this state, applied with piers. If any contour, or side of a leaf, be not either rounded enough, or squared enough, to fit the place where it is to be used, when it is too large, it is brought down with a brass file or rasp, and when too small, is managed with a drill, and other lapidary instruments.

**Manner of making MOSAIC work of gypsum,** a kind of coarse talc, or shining transparent stone, found in the quarries of Montmartre near Paris, among the stones thence dug to make the plaster of Paris.—It is different from the plaster, but retains the name which the Romans gave the plaster, viz. *gypsum*. See *GYPsum*, and *PLASTER*.

Of

# M O S

Of this stone, calcined in a kiln, beaten in a mortar, and passed through a sieve, they make a kind of artificial marbles, imitating precious stones, and of these compose a kind of *mosaic* work, which comes little short either of the durability or vivacity of the natural stones; and which has this advantage, that it admits of continued pieces, or paintings of entire compartments, without any joining visible.

Some make the ground of plaister of Paris, others of free-stone: if the former, it is spread in a wooden frame, of the length and breadth of the intended work, and about an inch and half thick. This frame is so contrived, as, the tenons being only joined to the mortises by single pins, they may be taken asunder, and the frame be dismounted when the plaister is dry. This frame they cover on one side with a strong linnen cloth, nailed all round; and being placed horizontally, with the linnen at bottom, it is filled with plaister, passed through a wide sieve. The plaister being half dry, the frame is set perpendicular, and left till it be quite dry; then taken out, by dismounting the frame. In this *mosaic*, the ground is the most important part. Now to prepare the sifted gypsum to be applied on this ground, they dissolve and boil it in the best English glue, and after mixing with it the colour it is to bear, the whole is worked up together into the ordinary consistence of plaister; and then taken and spread on the ground, five or six inches thick. It must be observed, that if the work be such, as that mouldings are required, they are formed with gouges and other instruments.

It is on this plaister, thus coloured like marble or precious stone, and which is to serve as a ground to a work either of lapis, agat, alabastr, or the like, that the design to be represented is drawn; having been first pounced or calqued. To hollow or impress the design, they use the same instruments with the sculptors; the ground whereon they are to work, not being much less hard than marble itself. The cavities thus made in the ground are filled up with the same gypsum boiled in glue, only differently coloured; and thus are the several colours of the original represented. To have the necessary colours and tints at hand, they temper quantities of the gypsum with the several colours in little pots. When the design is thus filled, and rendered visible, by half polishing it with brick or soft stone; they go over it again, cutting such places as are either to be weaker, or more shadowed, and filling them with gypsum; which is repeated till all the colours, added one after another, represent the original to the life. The work being finished, is scoured with soft stone, sand and water; then with pumice stone, and lastly, polished with a wooden rubber and emery. Lastly, a lustre is given it, by smearing it over with oil, and rubbing it a long time with the palm of the hand; which gives it a gloss nothing inferior to that of natural marble.

If it be only required to make a variegated table, or other work of several colours, without *mosaic* figures; the process is somewhat different.—To this end, they only prepare separately, in large bowls, as many different colours as nature shews in the marble to be imitated, and after incorporating them with the gypsum and glue-water, they take a truell-full of each, and dispose them in a trough, without any order; then without mingling them, and only by cutting or crossing the gypsum of each truell once or twice with each of the rest, they give them that beautiful confusion, for which natural marbles are so much valued: Of these they then make their tables, or lay a mold, according to the work to be done.

As to *Mosaic work of wood*, more properly called *marquetry* or *inlaid work*, the ancients were well acquainted with it, and used it for the adorning of their beds, tables, and other moveables; employing for this purpose ivory, and the richest woods.—But friar John of Verona seems to have contributed the most to its perfection, by discovering the secret of dying woods of all colours and degrees, by which means he was enabled to imitate paintings, and even to represent architecture in perspective. They begin with sawing their woods into leaves, of the thickness of one or two tenths of an inch; then take pieces of the design they are to follow, and fasten them to these leaves, and with a little steel saw fashion these to the contour of the design. All that is necessary being taken off with the saw, they give the shadow to those places that require it; by placing the piece in a hot sand, or otherwise, with the direction necessary to shadow it more or less. This done, they lay each piece in its place, on a ground of another wood, as dry oak, and there fasten them with strong glue.

There are two other branches of *mosaic* work; the one called *damaskeening*, or *damask-work*, consisting in an assemblage of gold or silver threads, of which are sometimes formed flat works, and sometimes basso-relievos. See *DAMASKEENING*.

The other is called *shell-work*, consisting of shells, artificial congelations, petrifications, &c. used in grottos. See *GROTTO*.

**MOSQUE**, or *Mosk*, among the Mahometans, is a temple set apart for the exercises of their religion. See *TEMPLE*, *MAHOMETANISM*, &c.

\* The word comes from the Turkish *mosjid*, or *mosjid*, which properly signifies a temple built of wood, such as the Turks first used. Hence the Spaniards derive their *mosjora*, and the Italian *mosjura*, and the French and English *mosque*, and *mosh*.

# M O T

Borel derives the word from the Greek *μωτο* calf, because of the frequent mention of a cow in the Alcoran. Others, and with the greatest appearance of reason, derive it from the Arabic *mosjid*, a place of worship.

There are royal *mosques* founded by the emperors, as the Solimania and Velidea at Constantinople; and private *mosques* founded by musties, vizirs, bassa's, &c.

*Mosques* are built like large halls, with isles, galleries, and domes; and are adorned on the inside with compartments, and pieces of *arabesque* work.—On one side is always found a pool with several cocks: and on the top is placed a crescent.

The Turks have converted most of the Christian churches into *mosques*. See *CHURCH*.

**MOSS**, *Muscus*, in natural history, a little plant of the parasite kind, growing on the barks, &c. of several trees, as oak, poplar, ash, cedar, &c. as well as on the ground. See *PARASITE*. The most esteemed, and odoriferous bark, is that of the cedar; it is of some medicinal use, being astringent, and proper to stop hæmorrhages and dysenteries.

The ancients took the *moss* of trees to be the effect of a disorder or discomposure of the texture of the bark; or at most a kind of little filaments arising from the bark. But the moderns find by several observations, that *mosses* are all real, distinct plants, whose seed being extremely small, is inclosed in little capsules, which bursting of themselves, the seed is carried off by the winds, till falling on the inequalities of the bark of trees, it is there stopped, takes root, and feeds at the expence of the tree, as mouldiness does on bread, &c. See *MOULDINESS*.

The different kinds of *mosses* are very numerous; Monsi Vailant reckons 137 several species in the single neighbourhood of Paris.

There is also a kind of greenish *moss* growing on human skulls that have been long exposed to the air, called *usnea humana*, or *muscus calvarius*. The ancients made a deal of use of it as an astringent, &c. See *USNEA*.

*Mosses* make an article of commerce; there being several kinds used in medicine, in perfuming, &c. Among others, the *sea-moss*, called *coralline*, (see *CORALLINE*) and the *moss* of cedar and fir, which enter the composition of cyprus powder.

The *moss* of common trees, as oak, ash, poplar, &c. is used for caulking of vessels. It is also used by bird-merchants, to prepare cages for certain kinds of birds to hatch in.

The gardeners, &c. reckon *moss* among the diseases, or infirmities of plants. See *DISEASE*. Mr. Mortimer, &c. directs it to be rubbed, and scraped off with some proper instrument that will not hurt the bark of the tree, or with a piece of hair-cloth after a soaking rain; though the surest cure is by removing the cause; which is affected by draining the land well of all superfluous moisture. Or, it may be prevented, in the first planting of trees, by not setting them too deep.

**MOTE**, *Mota*, frequently occurs in our ancient customs for a meeting, court, or plea.

Of *motes*, by the Saxons also called *gemotes*, considered in the sense of assemblies, or courts, there were divers kinds, as *wittenagemote*, *folkegemote*, *schiregemote*, *hundredgemote*, *burgemote*, *wardgemote*, *haligemote*, *swainagemote*, &c. See each under its proper article, *WITTENAGEMOTE*, *FOLKEGEMOTE*, &c.

*Mote*, *mota*, was also used for a fortress, or castle; as *mota de Windsor*, &c.

*Mote*, also denoted a standing water to keep fish in; sometimes a large ditch encompassing a castle, or dwelling-house. See *MOAT*.

**MOTECTICO** *style*. See the article *STYLE*.

**MOTHER**, *mater*, a female who stands in the relation of parent to another. See *PARENT*, &c.

Thus Eve is called our common *mother*; Cybele, among the ancients, was the *mother* of the gods. See *GOD*.

*Queen mother*, signifies the same with what we otherwise call *queen dowager*. See *DOWAGER*.

We meet with empresses on medals and inscriptions with the title of *mother* of the camp, *mother* of the senate, *mother* of the country: *Mater senatus*, *mater castrorum*, *mater patriæ*, &c. See *FATHER*.

*MOTHER of God*, is an attribute commonly given to the blessed Virgin. See *VIRGIN*. It had its origin from the Greeks; who first called her *Θεοτοκος*; in imitation of whom some Latins began to call her *Deipara*, and *Dei genitrix*. The council of Ephesus first gave a sanction to the appellation; but the 5th of Constantinople decreed that the Virgin should always be thus called. This gave rise to terrible disputes: Anastasius a presbyter of Nestorius, patriarch of Constantinople, first asserted in a sermon that the Virgin was by no means to be called *Θεοτοκος*; upon which words a great tumult arising, Nestorius took his presbyter's part, and taught the same doctrine. See *NESTORIAN*.

But though *Θεοτοκος* may be extended so as to signify as much as the *Mother of God*, because *τοκος* sometimes denotes as much as *γενναι*; whence accordingly it had been translated in Latin *Dei genitrix* as well as *Deipara*; yet those ancient Greeks who called the Virgin *Θεοτοκος*, did not call her *μωτηρ το θεου*, the *mother of God*: Till the Latins translating *Θεοτοκος* by *Dei genitrix*

# MOT

*genetrix*, the Greeks came at length to re-translate *Dei genetrix* by *θεογονος*. And thus both were brought to call her *Mother of God*.

The first who is noted by the Greeks to have thus styled her *Mother of God* is Leo Magnus: His reason, as represented by S. Cyril, was this, that taking the *Lord* and *God* to be synonymous, he apprehended that *Elizabeth* first styled Mary the *Mother of God*, because she styled her the *Mother of her Lord*.

**MOTHER tongue**, is properly an original language, from which others are formed. See **LANGUAGE**.

Of *mother tongues*, Scaliger reckons ten in Europe, viz. the Greek, Latin, Teutonic or German, Slavonic, Epirotic, Scythian or European Tartar, Hungarian, Cantabrian, Irish and British. See **GREEK, LATIN, TEUTONIC, &c**

**MOTHER churches**, are those which have founded, or erected others. See **CHURCH**.

In beneficiary matters they say, it is not lawful for a man to enjoy at the same time both the *mother* and the daughter: Meaning that the canon law does not allow an abby, and the benefices depending thereon, to be held by the same person.

*Fits of the MOTHER*. See the article **HYSTERIC affection**.

**MOTION**, primarily so called, or *local MOTION*, is a continued, and successive change of place; or that state of a body whereby it corresponds successively to several different places, or is present successively in different parts of space. See **PLACE**. In which sense, the doctrine and laws of *motion* make the subject of mechanics, or statics. See **MECHANICS, &c**.

The ancient philosophers considered *motion* in a more general and extensive manner. They defined it, a passage out of one state into another: and thus made six kinds of *motion*, viz. *creation, generation, corruption, augmentation, diminution, and lation* or *local motion*. See **GENERATION, &c**.

Some of the later schoolmen reduce these six kinds of *motion* to four: The first is general, including any passage from one state to another; under which kind come *creation, production, and mutation*.—The second is a passage of something already existing from one state to another: And thus *generation* is a *motion*.—The third, a successive passage of something already existing from one term to another; and thus *alteration, and accretion* are species of *motion*.—The last, is *lation*, or *local motion*; and thus walking is *motion*.

But the latest philosophers deny any other species beside *local motion*; and reduce all the sorts above-mentioned to this one.—So that we have here only to do with *lation* or *local motion*; whereof the rest are only so many different determinations, or effects. See **ACCRETION, ALTERATION, &c**.

Physical writers, both ancient and modern, have ever been perplexed about the nature, and definition of *local motion*.—The peripatetics define it by, *Actus entis in potentia, prout in potentia*, Arist. 3. Phys. c. 2. But the notion seems too abstract and metaphysical for our days; and is of no use in explaining the properties of *motion*.

The Epicureans explain *motion* by the migration of a body, or a part of a body, from one place to another. On which definition, the later Epicureans refine, and call it the migration or passage of a body from space, to space: Thus substituting the word *space* for that of *place*.

The Cartesians define *motion* a passage, or removal of one part of matter out of the neighbourhood of those parts immediately contiguous thereto, into the neighbourhood of others.

Which definition agrees, in effect, with that of the Epicureans: All the difference between them consisting in this; that what the one calls *body* and *place*, the other calls *matter*, and *contiguous parts*.

Borelli, and other late writers after him, define *motion* more accurately and fully, the successive passage of a body from one place to another, in a determinate time, by becoming successively contiguous to all the parts of the intermediate space.

*Motion*, then, is agreed to be the translation of a body from place to place: But authors differ infinitely when they come to explain wherein this translation consists.—And hence the divisions of *motion* become extremely precarious.

Aristotle, and the Peripatetics, divide all *motion* into *natural* and *violent*.

**Natural MOTION**, is that which has its principle, or moving force, within the moving body.—Such is that of a stone falling towards the centre of the earth.

**Violent MOTION**, is that whose principle is without, and against which the moving body makes a resistance.—Such is that of a stone thrown upwards.

The moderns generally divide *motion* into *absolute* and *relative*.

**Absolute MOTION**, is the change of absolute place, in any moving body; whose celerity, therefore, will be measured by the quantity of absolute space which the moveable body runs through. See **PLACE**.

**Relative MOTION**, is a mutation of the relative, or vulgar place of the moving body; and has its celerity estimated by the quantity of relative space run through.

Others divide *motion* into *proper*, and *improper*, or *foreign*.

**Proper MOTION**, is a removal out of one proper place into another, which hereby becomes proper, as being possessed by the body alone, in exclusion of all others.—Such is the *motion* of a wheel in a clock.

# MOT

**Improper, extraneous, foreign, or common MOTION**, is the passage of a body out of one common place into another common place.—Such is that of a clock when moving in a ship, &c.

The reason of all this diversity seems to arise from the not attending to the different meanings of the words; but comprising all in one definition and division; which they should rather have distinguished into several parts.

Some, *e. gr.* in their definitions of *motion*, consider the moving body, not as it regards the adjacent bodies, but as it regards immoveable and infinite space. Others, again consider the moving body, not as it regards infinite space, but as it regards other bodies vastly remote.—And others, lastly, consider the moving body, not as it regards remote bodies, but that surface only to which it is contiguous.

But these various meanings once settled, the dispute clears up; for as every thing that moves may be considered in these three several manners, there hence arise three several kinds of *motions*: Whereof, that which regards the parts of infinite immoveable space, without consideration of the circumambient bodies, may be called *absolutely and truly proper motion*.

That which regards circumambient bodies vastly remote, which may themselves possibly be moved, we call *relatively common motion*.

The last, which regards the surfaces of the next contiguous bodies, in as much as it may want all, both absolute and common *motion*, we call *relatively proper motion*.

**Absolutely and truly proper MOTION**, then, is the application of a body to different parts of infinite and immoveable space.

This alone is *proper and absolute motion*, being always generated and changed by forces impressed on the moving body itself, and by those only; and being that to which the real forces of all bodies, to put others in *motion* by impulse, are owing; and to which those *motions* are proportioned.—But this *motion* we cannot investigate or determine accurately; nor can we distinguish, when two bodies are impelled on each other, in which of the two, (*v. gr.* that which appears to move the more swiftly, or the other which appears to move more slowly, and perhaps even to be at rest,) the real *motion*, and consequently, the real force whence the impulse arose, is placed; not being able to determine whether the centre of gravity of the whole system (which is but a point in infinite space) is itself at rest or in *motion*.

**Relatively common MOTION**, is a change of the situation of a body with respect to other remote circumambient bodies: And this is the *motion* we speak of, when we say that men, cities, and the earth itself move round the sun.

This is also the *motion* we mean, when we estimate the quantity of *motion*, and the force any body has to impel another.—For instance, if a wooden sphere, filled with lead to make it the heavier, be dropped from the hand, we use to estimate the quantity of *motion*, and the force which the sphere has to impel another, by the celerity of the sphere and the weight of the included lead; and that truly with regard to the force itself, and the effect thereof, as it falls under our senses.—But whether the real power or *motion* be in the sphere which appears to strike, or in the earth which appears to be struck, that, as has been observed above, we cannot determine.

**Relatively proper MOTION**, is the successive application of a body to the different parts of the contiguous bodies.

And this is the *motion* usually understood in physical disputes about the natures of particular things; as when we say, that heat, sound, fluidity, &c. consist in *motion*.

This must be added however, that by successive application of a body, its whole surface, taken together, must be conceived successively applied to different parts of the contiguous bodies. From these several definitions of *motion* arise as many definitions of place: For when we speak of *motion* (or rest) *truly and absolutely proper*, then place is that part of infinite and immoveable space which the body fills.—When of *motion relatively common*, then place is a part of any space or moveable dimension.—When of *motion relatively proper*, (which is really very improper) place is then the surface of the next adjacent bodies, or sensible spaces. See **PLACE**.

The definition of rest is pretty well agreed on; but whether rest be a mere privation of *motion*, or any thing positive, is hotly disputed.—Malebranche, and others, maintain the former side of the question: Cartes, and others, the latter.—These last contend, that a body at rest, has no power to persevere in that rest, nor to resist any bodies that would destroy it; and that *motion* may as well be called a cessation of rest, as rest of *motion*. See **REST**.

The main argument urged by the former is this: Suppose a globe at rest, and suppose God cease to will its rest; what will be the consequence? It will rest still. Let it be in *motion*, and let God cease to will its *motion*; what will be the consequence? It will cease to move; that is, be at rest; because the power whereby a body in *motion* perseveres in that state, is the positive will of God: That whereby the quiescent body perseveres, only his privative will.

But this is a *petitio principii*; for the force or conatus whereby bodies, whether moving or quiescent, persevere in those states, is the mere inactivity of matter; and therefore were it possible for

for God not to will any thing, a body already in *motion*, would move for ever; as a body at rest, would rest for ever.---To this inactivity of matter, it is owing that all bodies resist according to their quantities of matter, and that any body striking another with any given velocity, will move it in the same proportion which its density, or quantity of matter has, to the density or quantity of matter of the other. See *VIS INERTIAE*.

*Motion* has ever been esteemed a species of quantity; and its *quantum*, or greatness, which we otherwise call its *momentum*, is estimated partly from the length of the line which the moving body describes; (as if a body pass over a line of a hundred feet, the quantity of its *motion* is greater than if it passed over ten feet) and partly from the quantity of the matter moved together, or at the same time, *i. e.* not from the bulk or extension of the body, but from its mass or weight; the air, and other subtle matters wherewith the pores are filled, not entering into the account: As if a body of two cubic feet run over a line of a hundred feet, the quantity of its *motion* is greater than that of a body of one cubic foot describing the same line: For whatever *motion* one whole has, that is had in one half of the other; and the *motion* of the whole is the sum of the *motion* of all its parts. See *QUANTITY*.

Hence it follows, that for two unequal bodies to have equal *motions*, or *momentums*, the lines which they pass over must be in a reciprocal proportion of their masses or weights; *i. e.* if one body have three times the quantity of matter that another has, the line it runs over must be  $\frac{1}{3}$  of the line run over by the other.---If two bodies, then, fastened to the two extremities of a balance or lever, have their masses in a reciprocal ratio of their distances from the fixed point, when these are moved, they must describe lines in a reciprocal ratio of these masses.

For instance, if the body A. (*Tab. Mechanic. fig. 30.*) have three times the mass or weight of B, and each be fastened to the extremes of the lever AB, whose fulcrum or fixed point is C, in such manner as that the distance BC is thrice the distance CA; the lever cannot incline either way, but the space which the less body moves, BE, will be thrice the space AD, which the greater moves: so that their *motions* will be equal.

---Nor is there any reason why the body A tending downwards, *v. gr.* with four degrees of *motion*, should raise the body B, rather than B tending downwards likewise with the same four degrees of *motion*, should raise the body A: They will therefore be in equilibrium.---On which foundation depends the whole doctrine of mechanics. See *BALLANCE*, *STEELYARD*, &c.

Hence that great problem of Archimedes, With any given power, how small soever, to raise any weight given, how great soever.---For by increasing the distance CB infinitely, the power of the body A will be increased infinitely. See *MECHANICS*, and *EQUILIBRIUM*.

And it is allowed on all hands, that *motion* is no essential attribute of matter; hence arises a dispute about its *production*, and to what cause its *continuation* is owing? See *COMMUNICATION*, &c.

*Quantity of MOTION, if always the same?*---The Cartesians maintain, that the Creator at the beginning impressed a certain quantity of *motion* on bodies; and that under such laws, as that no part of it should be lost, but the same portion of *motion* be constantly preserved in matter: And hence they conclude, that if any moving body strike on any other body, the former loses no more of its *motion* than it communicates to the latter. See *CARTESIAN*.

This principle Sir Isaac Newton overturns in the following words:---'From the various compositions of two *motions*, it is manifest there is not always the same quantity of *motion* in the world; for if two balls joined together by a slender wire, revolve with an uniform *motion* about their common centre of gravity, and at the same time that centre be carried uniformly in a right line drawn in the plane of their circular *motion*; the sum of the *motions* of the two balls, as often as they are in a right line drawn from their common centre of gravity, will be greater than the sum of their *motions* when they are in a line perpendicular to that other. Whence it appears, that *motion* may both be generated and lost. But by reason of the tenacity of fluid bodies, and the friction of their parts, with the weakness of the elastic power in solid bodies, nature seems to incline much rather to the destruction, than the production of *motion*; and in reality *motion* becomes continually less and less. For bodies which are either so perfectly hard, or so soft, as to have no elastic power, will not rebound from each other: Their impenetrability will only stop their *motion*. And if two such bodies, equal to each other, be carried with equal but opposite *motions*, so as to meet in a void space, by the laws of *motion* they must stop in the very place of concurrence, lose all their *motion*, and be at rest for ever; unless they have an elastic power to give them a new *motion*. If they have elasticity enough to enable them to rebound with  $\frac{1}{2}$ , or  $\frac{1}{3}$ , or  $\frac{1}{4}$ , of the force wherewith they meet, they will lose  $\frac{1}{2}$ , or  $\frac{1}{3}$ , or  $\frac{1}{4}$ , of their *motion*. And this is confirmed by experiments: For if two equal pendulums be let fall from equal heights, so as to strike full on each other; if those pendulums be of lead, or soft clay, they will lose all, or almost all their *motion*; and if they be of any elastic matter, they

VOL. II. N<sup>o</sup>. CII.

'will only retain so much *motion* as they receive from their elastic power.' If it be asked, how it happens that *motion* being thus continually lost, should be continually renewed again; the same author adds, that it is renewed from some active principles, 'Such as the cause of gravity, whereby the planets and comets preserve their *motions* in their orbits, and all bodies acquire a great degree of *motion* in falling; and the cause of fermentation, whereby the heart and blood of animals preserve a perpetual warmth and *motion*; the inner parts of the earth are kept continually warmed; many bodies burn and shine; and the sun himself burns and shines, and with his light warms and cheers all things.' (as also from the cause of elasticity, by which bodies restore themselves into their former figures;) 'For we find but little *motion* in the world, except what plainly flows, either from these active principles, or from the command of the willer.' See *GRAVITY*, *FERMENTATION*, *ELASTICITY*, &c.

As to the continuation of *MOTION*, or the cause why a body once in *motion* comes to persevere in it; this has been extremely controverted among physical writers, and yet follows very evidently from one of the grand laws of nature, *viz.* That all bodies persevere in their present state, whether of rest or *motion*, unless disturbed by some foreign powers. *Motion* therefore once begun, would be continued in *infinitum*, were it to meet with no interruption from external causes; as the power of gravity; the resistance of the medium, &c. So that Aristotle's principle, every thing in *motion* affects rest, is groundless. See *NATURE*. Nor has the communication of *motion*, or the manner how a moving body comes to affect another at rest; or how much of its *motion* is communicated by the first to the last, been less disputed. See the laws thereof under the word *PERCUSSION*. See also *COMMUNICATION*.

*MOTION*, we have observed, is the subject of mechanics; and mechanics is the basis of all natural philosophy; which hence becomes denominated *mechanical*. See *MECHANICAL*, and *PHILOSOPHY*.

In effect, all the phenomena of nature; all the changes that happen in the system of bodies, are owing to *motion*; and are directed according to the laws thereof.

Hence, the modern philosophers have applied themselves with peculiar ardour to consider the doctrine of *motion*; to investigate the properties, laws, &c. thereof; by observation, experiment, and the use of geometry.---And to this we owe the great advantages of the modern philosophy above that of the ancients; who were extremely disregarding of *motion*; notwithstanding that they seemed so sensible of its importance, that they defined nature, by the first principle of *motion* and rest of the substance wherein it is. See *NATURE*.

Among all the ancients, there is nothing extant on *motion*, excepting some things in Archimedes's books, *De aequi ponderantibus*.---To Galileo, a great part of the doctrine of *motion* is owing: He first discovered the general laws of *motion*, and particularly of the descent of heavy bodies, both at liberty, and on inclined planes; the laws of the *motion* of projectiles; the vibrations of pendulums, and stretched chords; with the theory of resistances, &c. which were things the ancients had little notion of. See *DESCENT*, *PENDULUM*, *PROJECTILE*, *RESISTENCE*, &c.

His disciple, Torricelli, polished, and improved the discoveries of his master; and added to them divers experiments concerning the force of percussion, and the equilibrium of fluids. See *PERCUSSION*, and *FLUID*.---M. Huygens improved very considerably on the doctrine of the pendulum; and both he and Borelli on the force of percussion.---Lastly, Newton, Leibnitz, Varignon, Mariotte, &c. have brought the doctrine of *motion* still nearer to perfection.

The general laws of *motion* were first brought into a system, and analytically demonstrated together, by Dr. Wallis, Sir Christopher Wren, and M. Huygens, all much about the same time; the first in bodies not elastic, and the two last in elastic bodies.---Lastly, the whole doctrine of *motion*, including all the discoveries both of the ancients and moderns on that head, was given by Dr. Wallis in his *Mechanica, sive de motu*, published in 1670.

*MOTION* may be considered either as *equable*, and *uniform*; or as *accelerated*, and *retarded*.---*Equable motion* again may be considered either as *simple*, or as *compound*: And *compound motion* either as *rectilinear*, or *curvilinear*.

And all these again may be considered either with regard to themselves, or with regard to the manner of their production, and communication, by percussion, &c.

*Equable MOTION*, is that wherein the moving body proceeds with the same unvaried velocity. See *EQUABLE*.

The laws of *equable motion* are as follow.---The reader being only to observe, by the way, that *mass*, or quantity of matter is expressed by *M*; *momentum*, or the quantity of *motion* or impetus, by *I*; *time*, or the duration of *motion*, by *T*; *velocity*, or its swiftness, by *V*; and *space*, or the line it describes, by *S*. See *MOMENT*, *MASS*, *VELOCITY*, &c.

Thus, if the space be  $= s$ , and the time  $= t$ ; the velocity will be expressed by  $s:t$ . And if the velocity  $= v$ , and the mass  $= m$ ; the momentum will likewise be  $= v m$ .

# MOT

**Laws of uniform or equable MOTION.**—1°. The velocities  $V$  and  $v$  of two bodies moving equably, are in a ratio compounded of the direct ratio of the spaces  $S$  and  $s$ , and the reciprocal ratio of the times  $T$  and  $t$ .

$$\text{For, } V = S : T \text{ and } v = s : t \\ \text{therefore, } V : v :: S : s \\ \frac{V}{v} :: \frac{S}{s} \cdot \frac{t}{T}$$

$$V : v :: S t : s T \\ \text{Q. E. D.}$$

This, and the following theorems, may be illustrated in numbers, thus:—Suppose a body  $A$ , whose mass is as 7, that is, 7 pounds, in the time of 3 seconds passes over a space of 12 feet; and another body  $B$ , whose mass is as 5, in the time of 8 seconds passes over a space of 16 feet. We shall then have  $M = 7$ ,  $T = 3$ ,  $S = 12$ ;  $m = 5$ ,  $t = 8$ ,  $s = 16$ . And therefore  $V = 4$ ,  $v = 2$ . The case then will stand thus:

$$V : v :: S t : s T \\ 4 : 2 :: 12 \cdot 3 : 16 \cdot 8 :: 4 : 2.$$

Hence, if  $V = v$ , then will  $S t = s T$ ; therefore  $S : s :: T : t$ . That is, if two bodies move equably, and with the same velocities, their spaces are as the times.

The corollaries may be illustrated by numbers, in like manner as the theorems.---Thus suppose  $S = 12$ ,  $T = 6$ ,  $s = 8$ ,  $t = 4$ . Then will the  $V = 12 : 6 = 2$ , and  $v = 8 : 4 = 2$ .

$$\text{Consequently by reason } V = v \\ S : s :: T : t \\ 12 : 8 :: 6 : 4.$$

If  $V = v$ , and also  $T = t$ ; then will  $S = s$ , and so the bodies moving equably, will describe equal spaces in equal times. 2°. The spaces  $S$  and  $s$ , over which two bodies pass, are in a ratio compounded of the ratio of the times  $T$  and  $t$ , and of the velocities  $V$  and  $v$ .

$$\text{For } V : v :: S t : s T$$

$$\text{Therefore } V s T = v S t \\ \text{And } S : s :: V T : v t$$

$$\text{In numbers } 12 : 16 :: 4 \cdot 3 : 2 \cdot 8 :: 12 : 16.$$

Hence, If  $S = s$ ,  $V T = v t$ , so that  $V : v :: t : T$ , that is, if two bodies moving equably, describe equal spaces; their velocities will be in a reciprocal ratio of their times.

In numbers, if we suppose  $S = 12$ , and  $s = 12$ . Because  $S = V T$  and  $s = v t$ ; if  $V = 2$  and  $v = 3$ ,  $T = 6$  and  $t = 4$ . So that we have  $V : v :: t : T$

$$2 : 3 :: 4 : 6.$$

Further, if  $t = T$ , then will  $V = v$ ; and therefore bodies which move equably, describe equal spaces in equal times, and have their velocities equal.

3°. The momenta, or quantities of motion, of two bodies moving equably,  $I$  and  $i$ , are in a ratio compounded of the velocities  $V$  and  $v$ , and the masses or quantities of matter  $M$  and  $m$ .

For  $I = V M$ , and  $i = v m$ ; therefore  $I : i :: V M : v m$ ; that is, the ratio  $I$  to  $i$  is compounded of the ratio of  $V$  to  $v$ , and of  $M$  to  $m$ . Q. E. D.

If  $T = t$ , then will  $V M = v m$ ; and therefore  $V : v :: m : M$ . That is, if the momenta of two bodies moving equably, be equal; the velocities will be in a reciprocal ratio of their masses.

And therefore if  $M = m$ ,  $V = v$ ; that is, if the momenta and masses of two moving bodies be equal, their velocities are also equal.

4°. The velocities  $V$  and  $v$  of two bodies moving equably, are in a ratio compounded of the direct ratio of their momenta  $I$  and  $i$ , and the reciprocal one of their masses  $M$  and  $m$ .

$$\text{Since } I : i :: V M : v m$$

$$I v m = i V M$$

$$V : v :: I m : i M$$

$$\text{Q. E. D.}$$

$$\text{In numbers } 4 : 2 :: 28 \cdot 5 : 10 \cdot 7 :: 4 : 2.$$

Hence, If  $V = v$ , then  $I m = i M$ ; and therefore  $I : i :: M : m$ ; that is, if two bodies move equably, and with the same velocity, their momenta will be in the same ratio with their masses. If  $M = m$ ,  $I = i$ ; and therefore if two bodies, that have the same masses, move equably, and with equal velocity, their momenta are equal.

5°. In an equable motion, the masses of the body  $M$  and  $m$  are in a ratio compounded of the direct ratio of their momenta, and the reciprocal ratio of their velocities  $V$  and  $v$ .

$$\text{For, since } I : i :: V M : v m$$

$$\text{Therefore } I v m = i V M$$

$$M : m :: I v : i V$$

$$\text{In numbers } 7 : 5 :: 28 \cdot 2 : 10 \cdot 4 :: 7 : 5.$$

If  $M = m$ , then will  $I v = i V$ ; and therefore  $I : i :: V : v$ . That is, if two bodies moving equably, have their masses equal, their momenta will be as their velocities.

In numbers, suppose  $I = 12$ ,  $i = 8$ ,  $M = 4$ ,  $m = 4$ ; then will

# MOT

$$V = 12 : 4 = 3, \text{ and } v = 8 : 4 = 2.$$

$$\text{Therefore } I : i :: V : v.$$

$$12 : 8 :: 3 : 2$$

6°. In an equable motion, the momenta  $I$  and  $i$  are in a ratio compounded of the direct ratios of the Masses  $M$  and  $m$ , and the spaces  $S$  and  $s$ , and the reciprocal ratio of the times  $T$  and  $t$ .

$$\text{For because } V : v :: S t : s T$$

$$\text{And } I : i :: V M : v m$$

$$\text{Therefore } V I : v i :: V M S t : v m s T$$

$$I : i :: M S t : m s T$$

$$\text{Q. E. D.}$$

Hence, if  $I = i$ , then will  $M S t = m s T$ ; and therefore  $M : m :: s T : S t$ ,  $S : s :: m T : M t$ , and  $T : t :: M S : m s$ ; that is, if two bodies moving equably, have their momenta equal, 1°. Their masses are in a ratio compounded of the direct ratio of their time, and the reciprocal one of their spaces. 2°. Their spaces are in a ratio compounded of the direct ratio of the times, and the reciprocal one of their masses. 3°. Their times are in a ratio, compounded of their masses and their spaces. Further, if  $M = m$ ; then will  $s T = S t$ ; and therefore  $S : s :: T : t$ ; that is, if two bodies moving equably, have their momenta, and their masses equal, their spaces are as their times.

Again, if  $T = t$ , then will  $S = s$ . Two moving bodies therefore, whose masses and momenta are equal, describe equal spaces in equal times.

If besides  $I = i$ ,  $S = s$ ; then will  $m T = M t$ ; and therefore  $M : m :: T : t$ ; that is, if two moving bodies, whose momenta are equal, pass over equal spaces, their masses are proportionable to their times.

Further, if  $T = t$ , then will  $M = m$ ; and therefore bodies, whose momenta are equal, and which moving equably, describe equal spaces in equal times, have their masses equal.

If besides  $I = i$ ,  $T = t$ ; then will  $M S = m s$ ; and therefore  $S : s :: m : M$ ; that is, the spaces passed over in the same time by two moving bodies, whose momenta are equal, are in a reciprocal ratio of their masses.

7°. In an equable motion, the spaces  $S$  and  $s$  are in a ratio compounded of the direct ratios of the momenta  $I$  and  $i$ , and the times  $T$  and  $t$ ; and the reciprocal one of the masses  $M$  and  $m$ .

$$\text{For because } I : i :: M S t : m s T,$$

$$I m s T = i M S t$$

$$\text{Wherefore } S : s :: I T m : i t M.$$

$$\text{Q. E. D.}$$

$$\text{In numb. } 12 : 16 :: 3 \cdot 28 \cdot 5 : 8 \cdot 10 \cdot 7 :: 3 \cdot 4 : 8 \cdot 2 \cdot 1 :: 12 : 16.$$

Hence, if  $S = s$ ,  $I t m = i t M$ ; and therefore  $I : i :: t M : T m$ ,  $M : m :: I T : i t$ ,  $T : t :: i M : I m$ . If two bodies therefore move equably over equal spaces, 1°. Their momenta will be in a ratio compounded of the direct ratio of the masses, and the reciprocal one of the times. 2°. Their masses will be in a ratio compounded of the momenta and the times. 3°. The times will be in a ratio compounded of the direct ratio of the masses, and the reciprocal one of the momenta.

If beside  $S = s$ ,  $M = m$ ; then will  $I T = i t$ ; and therefore  $I : i :: t : T$ . That is, bodies whose masses are equal, have their momenta reciprocally proportionable to the times in which they move over equal spaces.

If beside  $S = s$ ,  $T = t$ ; then will  $i M = I m$ ; and therefore two bodies moving equably, and through equal spaces in equal times, have their momenta proportionable to their masses.

8°. Two bodies moving equably, have their masses  $M$  and  $m$ , in a ratio compounded of the direct ratios of the momenta  $I$  and  $i$ , and the times  $T$  and  $t$ , and the reciprocal one of the spaces  $s$  and  $S$ .

$$\text{For because } I : i :: M S t : m s T, I m s T = i M S t.$$

$$\text{Wherefore } M : m :: I T s : i t S.$$

$$\text{Q. E. D.}$$

$$\text{In numbers } 7 : 5 :: 3 \cdot 28 \cdot 16 : 8 \cdot 10 \cdot 12 :: 3 \cdot 7 \cdot 2 : 1 \cdot 10 \cdot 3 :: 7 : 5.$$

$$\text{Again } I : i :: M S t : m s T.$$

$$\text{In numbers } 28 : 10 :: 7 \cdot 12 \cdot 8 : 5 \cdot 16 \cdot 3 :: 7 \cdot 4 : 5 \cdot 2 \cdot 1 :: 28 : 10.$$

Hence if  $M = m$ , then will  $I T s = i t S$ ; and therefore  $I : i :: t S : T s$ ,  $S : s :: I T : i t$ , and  $I : t :: i S : I s$ . That is, in two moving bodies, whose masses are equal; 1°. The momenta are in a ratio compounded of the direct ratio of the spaces, and the reciprocal one of the times. 2°. The spaces are in a ratio compounded of the momenta and the times. 3°. The times are in a ratio compounded of the direct ratio of the spaces, and the reciprocal one of the momenta.

If beside  $M = m$ ,  $T = t$ , then will  $i S = I s$ ; and therefore  $I : i :: S : s$ . That is, the momenta of two bodies, whose masses are equal, are proportional to the spaces passed over in equal times.

9°. In equable motions, the times  $T$  and  $t$  are in a ratio compounded of the direct ratios of the masses  $M$  and  $m$ , and the spaces  $S$  and  $s$ , and the reciprocal one of the momenta  $I$  and  $i$ .

For

# MOT

For because  $I : i :: M S t : m f T$ ,  $I m f T = i M S t$ .  
Wherefore  $T : t :: i M S : I m f$ .

Q. E. D.

Hence, if  $T = t$ ,  $i M S = I m f$ ; and therefore  $I : i :: M S : m f$ ,  $M : m :: I f : i S$ ; and  $S : f :: I m : i M$ . That is, if two bodies, moving equably, describe equal spaces in equal times; 1°. Their momenta will be in a ratio compounded of the masses and the spaces. 2°. Their masses will be in a ratio compounded of the direct ratio of the momenta, and the reciprocal one of the spaces. 3°. The spaces will be in a ratio compounded of the direct ratio of the momenta, and the reciprocal one of the masses.

**Accelerated MOTION**, is that which continually receives fresh accessions of velocity: --- It is said to be *uniformly accelerated*, when in equal times its accessions of velocity are equal. See **ACCELERATION**, and **ACCELERATED**.

**Retarded MOTION**, is that whose velocity continually decreases: --- It is said to be *uniformly retarded*, when its decrease is continually proportioned to the time. See **RETARDATION**.

**Laws of MOTIONS uniformly accelerated and retarded**.---It is an axiom that a body once at rest, will never move, unless some other body put it in *motion*; and when once in *motion*, it will continue for ever to move, with the same velocity, and in the same direction, unless it be forced from its state by some other cause.---This is evident from that fundamental axiom in philosophy, That nothing happens without a sufficient cause. It follows, that a body moved by one only impulse, must proceed in a right line.---If then it be carried in a curve, it must be acted on by a double power; one, whereby it would proceed in a right line; another, whereby it is continually drawn out of it.

If the action and re-action of two (*unelastic*) bodies be equal, there will no *motion* ensue; but the bodies after collision, will remain at rest, by each other.

If a moving body be impelled in the direction of its *motion*, it will be accelerated; if by a resisting force, it will be retarded. Heavy bodies descend with an accelerated *motion*.

10°. If a body move with an uniform accelerated velocity; the spaces will be in a duplicate ratio of the times.

For, let the velocity acquired in the time  $t$  be  $= v$ , then the velocity acquired in the time  $2t = 2v$ , in the time  $3t = 3v$ , &c. and the spaces corresponding to those times,  $t$ ,  $2t$ ,  $3t$ , &c. will be as  $t v$ ,  $4 v t$ ,  $9 v t$ , &c. (by Law 2.) The spaces therefore are as 1. 4. 9, &c. And the times as 1. 2. 3, &c. that is, the spaces are in a duplicate ratio of the times. Q. E. D. Hence, in a *motion* uniformly accelerated, the times are in a subduplicate ratio of the spaces.

11°. The spaces passed over by a body uniformly accelerated, increase, in equal times, according to the unequal numbers 1. 3. 5. 7, &c.

For, if the times, wherein a moving body equably accelerated, proceeds, be as 1. 2. 3. 4. 5, &c. the space passed over in one moment, will be as 1, in 2 moments as 4, in 3 as 9, in 4 as 16, in 5 as 25, &c. (Law 10.) If therefore you subtract the space passed over in one moment, viz. 1, from that passed over in two moments, 4, there will remain the space corresponding to the second minute, viz. 3. In the same manner may be found the space passed over in the third minute,  $9 - 4 = 5$ . The space corresponding to the fourth minute,  $16 - 9 = 7$ ; and so of the rest. The space of the first minute therefore is as 1, that of the second as 3, that of the third as 5, of the fourth as 7, of the fifth as 9, &c. Therefore the spaces passed over by a body, moving with an uniformly accelerated *motion*, in equal times, increase according to the unequal numbers, 1, 3, 5, 7, 9, &c. Q. E. D.

12°. The spaces passed over by a body equably accelerated, are in a duplicate ratio of the velocities.

For, supposing the velocities to be  $V$  and  $v$ , the times  $T$  and  $t$ , the spaces  $S$  and  $s$ ; then will  $V : v :: T : t$ . Wherefore, since  $S : s :: T^2 : t^2$ , (Law 10.)  $S : s :: V^2 : v^2$ .

Wherefore, in a *motion* uniformly accelerated, the velocities are in a subduplicate ratio of the spaces.

13°. Heavy bodies descend with an uniformly accelerated *motion*, in a medium void of resistance, if the spaces be not very great. For, since heavy bodies descend with an accelerated velocity, the power of gravity must certainly impel them. But the power of gravity is found the same at all distances from the earth where the experiment can be made. Therefore heavy bodies must be driven downwards in the same manner in equal times. If then, in the first moment of time, they be impelled with the velocity  $v$ , they will be impelled with the same velocity  $v$  in the second moment, and with the same in the third, fourth, &c. moments. Now the medium being supposed void of all resistance, (by *Hypothesis*) they will still retain the velocity they acquire; and by reason of their equal fresh acquisitions every minute, they will descend with a *motion* uniformly accelerated. Q. E. D. See **GRAVITY**.

Hence, the spaces of descent are in a duplicate ratio of their times, and also of their velocities, and increase according to the uneven numbers 1, 3, 5, 7, 9, &c.

The times, and likewise the velocities, are in a subduplicate ratio of the spaces.

# MOT

In supposing heavy bodies to move through a medium void of resistance, we exclude, at once, all manner of impediments, under what name soever they be called, or from whatsoever cause they proceed; and among the rest, that motion where-with the earth revolving on its axis, carries with it heavy bodies during the time of their fall; though this is not sensible at any moderate distance.

It was Galileo who first discovered the law of the descent of heavy bodies; and that too by reasoning; though he afterwards confirmed it by experiments. These he repeated again and again, and still found the spaces passed over as the square of the time: But it must be observed, that the spaces are not to be taken in the length, but the height of the plane, as will be shewn elsewhere. See **DESCENT**.

The same experiments were tried, though in a different manner, by Ricciolus and Grimaldus, who let fall several stone balls of the same bulk and weight, eight ounces each, from various altitudes; measuring the times of descent by the vibrations of a pendulum. The result of their experiments is seen in the following table.

Vibrations.	Time.	Space at the end of the time.	
		Rom. feet.	Rom. feet.
5	0	50	10
10	1	40	30
15	2	30	50
20	3	20	70
25	4	10	90
6	1	0	15
12	2	0	45
18	3	0	75
24	4	0	105

14°. If a heavy body fall through a medium void of resistance, and from a height not very great; the space it passes over is subduple of that which it would pass over by an uniform *motion* in the same time, with the velocity it has acquired at the end of its fall.

For, let the right line  $AB$  (*Tab. Mechanics, fig. 31.*) represent the whole time of a heavy body's descent; and let this be divided into any number of equal parts; to the abscisses  $A$ ,  $P$ ,  $AQ$ ,  $AS$ ,  $AB$ , draw the right lines  $PM$ ,  $QI$ ,  $SH$ ,  $BC$ , which may be as the velocities required, in those times, in the descent. Since then  $AP : AQ :: PM : QI$ ,  $AP : AS :: PM : SH$ , &c. (*Eucl. VI. 2.*) If then the altitude of the triangle  $ABC$  be conceived to be divided into equal parts infinitely small; the *motion* being uniform in a moment of time infinitely small; the little area  $PpMm = Pp$ .  $PM$  as the space passed over in the little moment of time  $Pp$ . Therefore the space passed over in the time  $AB$ , will be as the sum of all the little areas, i. e. as the triangle  $ABC$ . But the space that would be described in the same time  $AB$  with the uniform velocity  $BC$ , being as the rectangle  $ABCD$ , it will be to the other space as 1 to 2. (*Eucl. I. 41.*)

Hence, the space passed over in half the time  $AB$ , with the velocity  $BC$ , is equal to the space which the heavy body passes over from a state of rest in the whole time  $AB$ .

Hence also, the time wherein a heavy body falls from any given altitude being given; to determine the spaces it passes over in each part of that time.

Let the given altitude  $= a$ , the time  $= t$ , the space passed over in one part of that time  $x$ . Then

$$1 : x :: t^2 : a$$

$$t^2 x = a$$

$$x = a : t^2$$

The space therefore passed over in the first part of time is  $a : t^2$ , and therefore that passed over in the second part of time  $= 3 a : t^2$ ; that passed over in the third part  $= 5 a : t^2$ , &c. *E. gr.* In the above-mentioned experiments of Ricciolus, the ball descended 240 feet in four seconds. The space therefore passed in the first second  $= 240 : 16 = 15$ ; that in the next second  $= 15. 3 = 45$ ; that in the third  $= 15. 5 = 75$ , &c. The time of a heavy body's descent in a medium void of resistance through any given space, being given, to determine the time wherein it will pass over another given space, in the same medium.

Since the spaces are as the squares of the time, to the space the heavy body moves in the given time, the space required in the question, and the square of the given time, seek a fourth proportional; this will be the square of the time required: Its square root therefore being extracted, will yield the time required.---*E. gr.* In Ricciolus's experiments the ball fell 240 feet in four seconds; it is demanded then how much time it will take up in falling 135 feet? This time will be found  $= \sqrt{135. 16 : 240} = \sqrt{135 : 15} \sqrt{9} = 3$ .

The space a body falls in any given time in a medium void of resistance.

resistance being given, to determine the space it will fall, in any other given interval of time.

Since the spaces are as the squares of the times, find a fourth proportional to the square of the time wherein the body falls through the given space, the square of the time wherein it is to fall through the space required, and the space given; this fourth proportional will be the space required.

Thus, by Ricciolus's experiments a ball falling 60 feet in two seconds, to find the space it falls through in four seconds? The answer will be found  $16.60 : 4 = 4.60 = 240$ .

15°. If a body proceed with a *motion* uniformly retarded, it will pass over half the space which it would describe in the same time by an equable *motion*.

For, suppose the given time divided into any number of equal parts; and draw the right lines BC, SH, QI, PM thereto, which are to be as the velocities corresponding to the parts of time  $\alpha$ , BS, BQ, BP, BA; so as letting fall the perpendiculars HE, IF, MG, the right lines CE, CF, CG, CB may be as the velocities lost in the times HE, FI, GM, AB; that is, BS, BQ, BF, BA. Since  $CE : CF :: EH : FI$ ,  $CG : CB :: GM : BA$ , ABC will be a triangle, (Eucl. III. 17.) If Bb, therefore, be a moment of time infinitely small, its *motion* will be uniform; and, therefore, the space described by the moving body will be as the little area BbcC. The space therefore described in the time AB is as the triangle ABC, viz. as the sum of all the little areas BbcC. Now the space described by the body moving uniformly with the velocity BC in the time AB, is as the rectangle ABCD, therefore the former is half of this. (Eucl. I. 41.)

16°. The spaces described by a *motion* uniformly retarded, in equal times, decrease according to the unequal numbers 7, 5, 3, 1.

For, suppose the moving body in the first instant of time to pass over seven feet; I say, that in the second, if it be equally retarded, it will pass over 5; in the third 3; and in the fourth 1. For let the equal parts of the axis of the triangle BS, SQ, QP, PA be as the times; the semi-ordinates BC, SH, QI, PM as the velocities at the beginning of any time; the trapezia BSHC, SQIH, QPMI, and the triangle PAM as the spaces described in those times. Let then  $BC = 4$  and  $BS = SQ = QP = PA = 1$ . Then will  $SH = 3$ ,  $QI = 2$ ,  $PM = 1$ , (Law 13.)  $BSHC = (4 + 3) : 1 : 2 = \frac{7}{2}$ .  $SQIH = (3 + 2) : 1 : 2 = \frac{5}{2}$ .  $QPMI = (2 + 1) : 1 : 2 = \frac{3}{2}$ .  $PAM = \frac{1}{2}$ . Consequently the spaces described in equal times are as  $\frac{7}{2}$ ,  $\frac{5}{2}$ ,  $\frac{3}{2}$ ,  $\frac{1}{2}$ , that is as 7, 5, 3, 1.

For the cause, &c. of the acceleration of MOTION, see GRAVITY, and ACCELERATION.

For the cause, &c. of retardation, see RESISTENCE, and RETARDATION.

The laws wherein MOTION is communicated by the collision and percussion of bodies, are very different, as the bodies are either elastic or unelastic, and as the direction of the stroke is oblique or direct.

What relates to the collision of bodies not elastic, when the stroke or shock is direct, will come under the following heads.

17°. A moving body striking against a body at rest, will communicate *motion* thereto, and both will proceed in the direction of the first; and the momentum, or quantity of *motion*, in the two, will be the same after the stroke, as in the single one before it.

For, it is the action of the first that gives the latter all the *motion* it has; and it is the re-action of the latter that takes off any part of the *motion* of the first. Now, as action and re-action are always equal, the momentum acquired by the one must be just equal to that lost by the other; so that there is neither loss nor gain from the stroke.

Hence, the velocity after the stroke, is found by multiplying the mass of the first body by its velocity before the stroke, and dividing the product by the mass of the second body.

Hence if a body in *motion* strike on another moving in the same direction, but more slowly, both will continue their *motion* in their first direction; and the momenta, or sum of *motion* will be the same after as before the stroke.

If two equal bodies move against each other with equal velocities, after the stroke they will both remain at rest.

Simple MOTION is that produced by some one power.

Compound MOTION is that produced by several conspiring powers. See COMPOUND and COMPOSITION.

Powers are said to *conspire*, when the direction of the one is not opposite to that of the other; as when the radius of a circle is imagined to whirl round on its centre, and a point in the same radius is at the same time supposed impelled strait along it. All curvilinear *motion* is compound; as all simple *motion* is rectilinear.

18°. If a moving body A (fig. 26.) be acted on by a double power; the one according to the direction AB, the other according to AC; with the *motion* compounded thereof, it will describe the diagonal of a parallelogram AD; whose sides AB and AC it would have described in the same time with each of the respective powers apart.

For, if the body A were only acted on by the force impressed

along AB; in the first instant of time it would be in some point of the right line AB, as in H, and so in the line HL parallel to AC; if it were only acted on by the power impressed in the direction AC, it would in the same instant of time be in some point of the line AC, as in I, and so in the line IL parallel to AB. — But since the directions of the powers are not opposite to each other, neither of them can impede the other; and therefore the body in the same instant of time will arrive both at the point HL and at IL; and will consequently be in the point L, where the two meet.

—In the same manner it appears that if KM and MG be drawn parallel to AB and AC, the body in the second instant of time will be in M, and at length in D. Q. E. D.

Hence, since about every right line as AD, a parallelogram as ABCD, may be constructed, by making two equal triangles ACD and ABD, on one common base AD; every rectilinear *motion*, when it may be of service for the demonstration, may be considered as a compound one.

But as the proportion of the sides AC and CD may be various, so also may the right line AD be described by a *motion* compounded various ways; and therefore the same rectilinear *motion* may be reduced to various compound *motions*.

Hence, if a moveable body be drawn by three several powers according to the directions BA, AD, and AC, (fig. 33.) two of which taken together are equivalent to the third; they will be to each other as the right lines BD, DA, DC, parallel to their directions, that is, reciprocally as the sines of the angles included between the lines of their directions, and the line of direction of the third: DB being to AD as the sine of the angle BAD to the angle ABD.

19°. In an equable compound *motion*, the velocity produced by the conspiring powers, is to the velocity of each of the two apart, as the diagonal AD (fig. 26.) of the parallelogram ABCD, in the direction of whose sides they act, to either of those sides AB or AC.

For in the same time that one of the powers would carry it over the side of the parallelogram AB, and the other over AC separately, joined together they carry it over the diagonal AD. The diagonal AD therefore is the space described by the conspiring powers in the same time: but in an equable *motion* the velocities in the same time are as the spaces; the velocities therefore arising from the conspiring forces are to the velocity arising from either force, as AD to AB or AC.

Hence the conspiring forces therefore being given; i. e. the ratio of the velocities being given, by the lines AB and AC given in magnitude, and the direction through those lines being given in position, or by the angle of direction; the celerity and direction of the oblique *motion* is given: because the diagonal is given both in magnitude and position.

The oblique *motion* however being given, the simple ones are not, *vice versa*, given; because the same oblique *motion* may be compounded of various simple ones.

20°. In a compound *motion* produced by the same forces, the velocity is greater if the angle of direction be less; and less, if this be greater.

For, let the greater angle of direction be BAC, (fig. 34.) the less FAC; since the powers are supposed the same, AC will be common to each parallelogram AFCE and BACD, and besides AB = AF. Now it is evident that in the case of the greater angle, the diagonal AD is described; and in the case of the less angle, AE; and both in the same time, by reason AB = AF. The velocities therefore are as AD to AE: Wherefore since AD is less than AE, the velocity in the case of the greater angle is less than in that of the less angle.

Hence, since the legs AC and CE, with the included angle being given, the angle CEA, and thence, also, AE is found; the velocity of the conspiring powers, and the angle of direction, in any particular case, being given, the velocity of the compound *motion*, and consequently the ratio of the velocities produced by the same powers under different angles of directions, may be determined.

For the particular laws of MOTION arising from the collision of bodies both elastic and unelastic, and that where the directions are both perpendicular and oblique, see PERCUSSION.

For circular MOTION, and the laws of projectile, see CENTRAL forces, and PROJECTILE.

For the MOTION of pendulums, and the laws of oscillation, see PENDULUM, and OSCILLATION.

Altitude of MOTION. See the article ALTITUDE.

Longitude of MOTION. See the article LONGITUDE.

Undulatory MOTION. See the article UNDULATORY.

Perpetual MOTION. See PERPETUAL motion.

The celebrated problem of a perpetual *motion*, consists in the inventing a machine, which has the principle of its *motion* within itself. — M. de la Hire has demonstrated the impossibility of any such machine, and finds that it amounts to this, viz. to find a body which is both heavier and lighter at the same time; or a body which is heavier than itself. See MACHINE.

Animal MOTION, is that whereby the situation, figure, magnitude, &c. of the parts, members &c. of animals are changed. See ANIMAL.

Under

# MOT

Under these *motions* come all the animal functions, as *respiration*, *circulation* of the blood, *excretion*, *walking*, &c. See **FUNCTION**.

*Animal motions* are usually divided into two species, viz. *spontaneous*, and *natural*.

**Spontaneous**, or *muscular MOTION*, is that performed by means of the muscles, at the command of the will; hence also called *voluntary motion*. See **MUSCULAR motion**.

**Natural**, or *involuntary MOTION*, is that effected without such command of the will; by the mere mechanism of the parts.

Such is the *motion* of the heart, and pulse; the peristaltic *motion* of the intestines, &c. See **HEART**, **PERISTALTIC**, &c.

**Intestine MOTION**, denotes an agitation of the particles, whereof a body consists. See **INTESTINE**, **FERMENTATION**, **EFFERVESCENCE**, &c.

Some philosophers will have every body, and every particle of a body, in continual *motion*. For fluids, it is the definition they give of them, that their parts are in continual *motion*. See **FLUIDITY**.

And as to solids, they infer the like *motion* from the effluvia continually emitted through their pores. See **EFFLUVIA**.

Hence *intestine motion* is represented to be a *motion* of the internal and smaller parts of matter, continually excited by some external, latent agent, which of itself is insensible, and only discovers itself by its effects; appointed by nature to be the great instrument of the changes in bodies.

**MOTION**, in astronomy, is peculiarly applied to the orderly courses of the heavenly bodies. See **SUN**, **PLANET**, **COMET**, &c.

The *motion* of the Earth, from west to east, is now generally granted among astronomers: See it proved under the article **EARTH**.

The *motions* of the celestial luminaries are of two kinds, *diurnal* or *common*; and *secondary* or *proper*.

**Diurnal** or *primary MOTION*, is that wherewith all the heavenly bodies, and the whole mundane sphere, appears to revolve every day round the earth, from east to west. See **DIURNAL**, and **STAR**.

This is also called the *motion of the primum mobile*, and the *common motion*; to distinguish it from that rotation which is peculiar to each planet, &c.—It is about the various phenomena resulting from this *motion*, that astronomy is chiefly employed. See **ASTRONOMY**.

**Secondary** or *proper MOTION*, is that wherewith a star, planet, or the like, advances a certain space every day from west towards east. See **MOBILE**.

See the several *motions* of each luminary, with the irregularities, &c. thereof, under the proper articles; **EARTH**, **MOON**, **STAR**, &c.

**Angular MOTION**. See the article **ANGULAR**.

**Horary MOTION** of the earth. See the article **HORARY**.

**Paracentric MOTION** of impetus. See **PARACENTRIC**.

**MOTION** of *trepidation*, &c. See **TREPIDATION**, and **LIBRATION**.

**MOTION**, in music, denotes the manner of beating the measure, to hasten or slacken the time of the words, or notes. See **MEASURE**, and **TIME**.

The *motion*, in songs composed in double time, differs from those in triple time. It is the *motion* that distinguishes courants and farabands, from gavots, borees, chacones, &c.

**MOTION** is also used among mechanics for the inside of a watch, &c. more commonly called *movement*. See **MOVEMENT**.

**MOTIONS**, in war, denote the marches, counter-marches, &c. an army makes in changing its post. See **MARCH**.

The great skill of a general consists in discovering the enemies *motions*, and concealing his own. Nothing is more dangerous, than to make great *motions* before a powerful enemy, ready to come to blows.

**MOTION**, or *emotion*, in rhetoric, &c. See **PASSION**.

**MOTORII**, **MOTORY nerves**, the third part of nerves; serving for the motion of the eye. See **NERVE**.

This pair is united into one near their insertion into the brain; by which means, when one eye is moved towards any object, the other is directed towards the same. See **EYE**.

**MOTOS**, *Moros*, a piece of lint, or linen cloth, teased like wool, to be put into ulcers, to stop the flux of blood, &c.

**MOTRIX**, something that has the power or faculty of *moving*. See **FACULTY**, **MOTION**, &c.

**MOTTO**, an Italian term, literally signifying *word*, or *saying*; used in arms, devices, &c. See **ARMS**, and **DEVISE**.

**MOTTO** of an *armoury*, is a short sentence or phrase carried in a scroll generally over, sometimes under the arms; sometimes alluding to the name of the bearer, sometimes to the bearing, and sometimes to neither. See **ARMS**.

The *motto*, or word, says Guillim, is an external ornament annexed to coat-armour; being the invention or conceit of the bearer, succinctly and significantly expressed, usually in three, or four words, which are set in some scroll or compartment, placed at the foot of the escutcheon.

As the *motto* holds the lowest place in arms; so it is the last in blazoning. In strictness, it should express something intended

# MOV

in the achievement; but custom has now received whatsoever fancy of the deviser. See **BLAZON**.

The use of *motto's* is very ancient; history, both sacred and profane, furnishing instances thereof. Our ancestors made choice of *motto's* to express their predominant passions, as of piety, love, war, &c. or some extraordinary adventure befallen them: Most of which, from some such original, have become hereditary in divers families.

The *motto* of the royal family of England, is, *Dieu & mon droit*, God and my right; of the royal family of Bourbon, *Esperance*, hope; of the order of the garter, *Honi soit qui mal y pense*, shame be to him that evil thinks; of the duke of Norfolk, *Sola virtus invicta*; of the duke of Bedford, *Che sera sera*; of the duke of Devonshire, *Cavendo tutus*, alluding to the family's name, Cavendish; of the duke of Kingston, *Pie reponete*, alluding to the name Pierpoint; of the earl of Radnor, *Quæ supra*, alluding to the three stars in his arms; of the earl of Abingdon, *Virtus ariete fortior*, alluding to the three battering rams bore in the arms; of Fortescue Lord Clinton, *Fortis scutum salus ducum*.

The *motto* of a *devise*, is also called the *soul of the devise*. See **DEVISE**.

**MOTU**.—*Ex mero MOTU*. See the article **EX**.

**MOVE** in *arrest of judgment*. See the article **ARREST**.

**MOVEABLE**, something susceptible of motion; or that is disposed to be moved. See **MOTION**.

A sphere is the most *moveable* of all bodies, i. e. the easiest to move: A door is *moveable* on its hinges, the magnetical needle on a pin, or pivot, &c.

*Moveable* is frequently used in contradistinction to *fixt*. See **FIXT**.

**MOVEABLE feasts**, are such as are not always held on the same day of the year or month; though they be on the same day of the week. See **FEAST**.

Thus, Easter is a *moveable* feast; being always held on the Sunday which falls upon or next after the first full moon following the 21st of March. Vid. *Philos. Transf.* N° 240. p. 185.

All the other *moveable* feasts follow Easter, i. e. keep their distance from it; so that they are fixed with respect thereto.

Such are *Septuagesima*, *Sexagesima*, *Ash-Wednesday*, *Ascension-Day*, *Pentecost*, *Trinity-Sunday*, &c. Which see under their proper articles, **SEPTUAGESIMA**, &c.

**MOVEABLES**, or **MOVEABLE goods**, by civilians called *bona mobilia*, are those which are capable of being removed from one place to another; or which may be concealed or perverted, as not being fixed to the ground, &c. See **GOODS**.

In England, we have two kinds of effects, *moveable* and *immoveable*: the *moveable* are ready money, merchandizes, bonds, book-debts, cattle, and household furniture, not fastened either with iron or nail, nor sealed in the plaister, but which may be transported without either fraction, or deterioration. See **CHATTEL**.

In the customary laws, they say, *moveables* follow the person, and his proper habitation; *moveables* follow the body, &c. which words have different meanings in different countries.

Sometimes they signify, that *moveables* go according to the custom of the place where is the habitation of the deceased, though he die in another place; and sometimes they signify, that *moveables* follow the custom of the place where the defunct died.

**MOVEMENT**, *motion*, a term frequently used in the same sense with *automaton*. See **AUTOMATON**.

The most usual *movements* for keeping time, are *watches* and *clocks*: The first are such as shew the parts of time; the second such as publish it. See **WATCH**, and **CLOCK**.

**MOVEMENT**, in its popular use among us, signifies all the inner work of a watch, clock, or other engine, which *move*, and, by that *motion*, carry on the design of the instrument,

The *movement* of a clock, or watch, is the inside; or that part which measures the time, strikes, &c. exclusive of the frame, case, dial-plate, &c.

The parts common to both of these *movements* are, the *main-spring*, with its appurtenances; lying in the spring-box, and in the middle thereof lapping about the spring-arbor, to which one end of it is fastened.—A-top of the spring-arbor is the *endless screw*, and its wheel; but in spring-clocks, this is a ratchet-wheel with its click, that stops it.—That which the main spring draws, and round which the chain or string is wrapped, is called the *fusy*: This is ordinarily taper; in large works going with weights, it is cylindrical, and called the *barrel*.—The small teeth at the bottom of the *fusy* or barrel, which stop it in winding up, is called the *ratchet*; and that which stops it when wound up, and is for that end driven up by the spring, the *garde-gut*.—The *wheels* are various: the parts of a wheel, are the *hoop* or *rim*; the *teeth*, the *cross*, and the *collet*, or piece of brass soldered on the arbor or spindle, whereon the wheel is riveted.—The little wheels playing in the teeth of the larger, are called *pinions*; and their teeth, which are 4, 5, 6, 8, &c. are called *levers*; the ends of the spindle are called

*pivots*; and the guttered wheel, with iron spikes at bottom, wherein the line of ordinary clocks runs, the *pully*.—We need not say any thing of the *band*, *screws*, *wedges*, *stops*, &c. See *WHEEL*, *FUSY*, &c.

*Theory of calculating the numbers for MOVEMENTS*.—1°. It is to be observed, that a wheel divided by its pinion, shews how many turns the pinion has to one turn of the wheel.

2°. That from the fuly to the balance, the wheels drive the pinions; consequently the pinions run faster, or make more revolutions than the wheels; but it is the contrary from the great wheel to the dial-wheel.

3°. That the wheels and pinions we write down either as vulgar fractions, or in the way of division in common arithmetic; *v. gr.* a wheel of 60 moving a pinion of 5, is wrote either  $\frac{60}{5}$ , or better 5)60. And the number of turns the pinion has in one turn of the wheel, as a quotient, thus, 5)60(12. A whole *movement* may be wrote, as in the adjoining scheme; where the uppermost number expresses the pinion of report 4, the dial-wheel 36, and the turns of the pin 9; the second, the pinion, and great wheel; the third, the second wheel, &c. the fourth, the contrat wheel; and the last, 17, the crown-wheel.

Hence, 4°. From the number of turns any pinion makes in one turn of the wheel it works in, may be determined the number of turns a wheel or pinion has at any greater distance, *viz.* by multiplying together the quotients; the produce whereof is the number of turns. Thus,

Suppose the wheels and pinions as in the case adjoining; 11 multiplied by 9, gives 99, the number of turns of the second pinion 5, in one turn of the wheel 55, which runs concentrical, or on the same spindle with the pinion 5. Again, 99 multiplied by 8, gives 792, the number of turns the last pinion has in one turn of the first wheel 5.

Hence we proceed to find, not only the turns, but the number of beats of the balance in the time of those turns. For having found the number of turns the crown-wheel has in one turn of the wheel sought, those turns multiplied by its notches, give half the number of beats, in that one turn of the wheel. Suppose, *v. gr.* the crown-wheel to have 720 turns, to one of the first wheel; this number multiplied by 15, the notches in the crown-wheel, produces 10800; half the number of strokes of the balance in one turn of the first wheel of 80 teeth. See *CALCULATION*.

The general division of a *movement*, is into the clock, and watch-parts. See *CLOCK-work*, and *WATCH-work*.

*MOVER*, or *first MOVER*. See *MOBILE*.

*Perpetual MOVER*. See *PERPETUAL motion*.

*MOULD*, or *MOLD*, in the mechanic arts, &c. a cavity artfully cut, with design to give its form, or impresson to some softer matter applied therein.

*Moulds* are implements of great use in sculpture, foundery, &c. See *SCULPTURE*, *FOUNDERY*, &c.

The workmen employed in melting the mineral or metallic glebe dug out of mines, have each their several *mould*, to receive the melted metal as it comes out of the furnace; but different according to the diversity of metals and works.—In gold mines, they have *moulds* for ingots: In silver-mines for bars: In copper or lead-mines for pigs or salmons: In tin-mines for pigs and ingots: And in iron-mines for sows, chimney-backs, anvils, caldrons, pots, and other large utensils and merchandizes of iron, which are here cast, as it were, at first hand. See *GOLD*, *SILVER*, *LEAD*, *TIN*, *IRON*, &c.

The *MOULDs* of *founders* of large works, as statues, bells, guns, and other brazen works, are of wax, supported within-side by what they call a *core*, and covered without-side with a cap or case.—It is in the space which the wax took up, which is now melted to leave it free, that the liquid metal runs, and the work is formed; being carried thither through a great number of little canals which cover the whole *mould*. See *FOUNDERY*.

The *MOULDs* of *moncyers*, are frames full of sand, wherein the plates of metal are cast that are to serve for the striking of species of gold or silver. See *COINAGE*.

*MOULDs* of *founders* of small works, are like the frames of coiners. It is in these frames, which are likewise filled with sand, that their several works are fashioned; into which, when the two frames whereof the *mould* is composed, are rejoined, the melted brass is run. See *FOUNDERY*.

*MOULDs* of *letter-founders*, are partly of steel, and partly wood: The wood, properly speaking, serves only to cover the real *mould* which is within, and to prevent the workman who holds it in his hand, from being incommoded by the heat of the melted metal. Only one letter or type can be formed at once in each *mould*. See *Letter-FOUNDERY*.

*MOULDs* in the manufacture of paper, are little frames composed of several brass or iron-wires fastened together by another wire still finer. Each *mould* is of the bigness of the sheet of paper to be made, and has a rim or ledge of wood to which the wires are fastened. These *moulds* are more usually called *frames* or *forms*. See *PAPER*.

*Furnace*, and *crucible maker's MOULDs*, are made of wood, of the same form with the crucibles; that is, in form of a truncated cone. They have handles of wood to hold, and turn them with, when being covered with the earth, the workman has a mind to round or flatten his vessel. See *FURNACE*, &c.

*MOULDs* for *leaden bullets*, are little iron pinchers, each of whose branches terminates in a hemispherical concave, which when shut, form an entire sphere. In the lips or sides where the branches meet, is a little jet or hole, through which the melted lead is conveyed.

*Glaziers MOULDs*.—The glaziers have two kinds of *moulds*, both serving to cast their lead. In the one they cast the lead into long rods or canes fit to be drawn through the vice, and the grooves formed therein. This they sometimes call *ingot mould*. In the other they *mould* those little pieces of lead a line thick, and two lines broad, fastened to the iron-bars. These may be also cast in the vice. See *VICE*, and *GLASIERY*.

*Goldsmiths MOULDs*.—The goldsmiths use the bones of the cuttle-fish to make *moulds* for their small works; which they do by pressing the pattern between two bones, and leaving a jet or hole to convey the silver through after the pattern has been taken out.

*MOULD*, among masons, is a piece of hard wood or iron, hollowed within-side, answerable to the contours of the mouldings or cornishes, &c. to be formed. This is otherwise called *caliber*.

*MOULDs*, among plumbers, are the tables whereon they cast their sheets of lead.—These they sometimes call simply *tables*.—Besides which, they have other real *moulds* wherewith they cast pipes without soldering. See each described under the article *PLUMBERY*.

*MOULDs*, among glass-grinders, are wooden frames whereon they make the tubes wherewith they fit their perspectives, telescopes, and other optic machines. See *GLASS*, and *GRINDING*. These *moulds* are cylinders, of a length and diameter according to the use they are to be applied to, but always thicker at one end than the other, to facilitate the sliding.

The tubes made on these *moulds* are of two kinds; the one simply paste-board and paper; the other of thin leaves of wood joined to the paste-board.—To make these tubes to draw out, only the last or innermost is formed on the *mould*; each tube made afterwards serving as a *mould* to that which is to go over it; but without taking out the *mould* from the first. See *TUBE*.

*MOULDs* used in basket-making are very simple, consisting ordinarily of a willow, or osier turned or bent into an oval, circle, square, or other figure, according to the baskets, panniers, hampers, hots, and other utensils intended.—On these *moulds* they make, or more properly measure all their work; and accordingly have them of all sizes, shapes, &c.

*MOULDs*, among tallow-chandlers, are of two kinds: The first for the common dipped candles, being the vessel wherein the melted tallow is disposed, and the wick dipped.

This is of wood, of a triangular form, and supported on one of its angles, so that it has an opening of near a foot a-top. The other, used in the fabrick of *mould-candles*, is of brass, pewter, or tin.—Here each candle has its several *mould*. See each under the article *CANDLE*.

*MOULD*, among gold-beaters, a certain number of leaves of velom, or pieces of guts, cut square, of a certain size, and laid over one another, between which they put the leaves of gold and silver which they beat on the marble with the hammer. They have four kinds of *moulds*; two whereof are of velom, and two of gut. The smallest of those of velom consists of forty or fifty leaves, the largest contains an hundred. For the others, each contains five hundred leaves.

The *moulds* have all their several cases, consisting of two pieces of parchment serving to keep the leaves of the *mould* in their place, and prevent their being disordered in beating. See *GOLD-beating*.

*MOULD*, or *MOLD*, in agriculture, denotes a black kind of earth, every where obvious on the surface of the ground: called also *natural* or *mother earth*: and by some also *loam*. See *EARTH*, *SOIL*, &c.

The best *mould* for the gardener's purposes, according to Mr. Evelyn, is that of a blackish grey colour; according to Mr. Switzer, that of a lively chefnut, or hazle colour, which cuts like butter, and does not stick obstinately, but is short, tolerably light, breaking into small clods, may be tempered without crusting or chapping in dry weather, or turning to mortar in wet. Next to chefnut, are the dark greys, and russet. The light and dark ash-colours are naught, being those commonly found in heathy ground. The yellowish red is worst of all.

*Hip-MOULD*. See the article *HIP-mould*.

*Iron-MOULD*. See the article *IRON-mould*.

*MOULDINESS*, a term applied to bodies which corrupt in the air, from some hidden principle of humidity therein; and whose corruption shews itself by a certain white down, or lanugo on their surface.

This *mouldiness*, when viewed with a microscope, affords a curious spectacle; being a kind of meadow out of which arise herbs and flowers, some only in the bud, others full blown, and

# M O U

and others decayed; each having its little root, stalk, and other parts: the figure whereof may be seen in Hook's *Micrographia*.—The same may be observed of the *mouldiness* which gathers on the surface of liquid bodies.

Mr. Bradley observed this *mouldiness* in a melon very accurately; and found the vegetation of these little plants exceedingly quick.—Each plant had its seeds in great abundance, which did not seem to be three hours ere they began to shoot up, and in six hours more the plant was compleat and mature, and the seed ready to fall.—When the fruit had been covered with a mould for six days, its vegetative quality began to abate, and was intirely gone in two days more; then came on a putrefaction, and the fleshy parts of the melon yielded nothing but a stinking water, which began to have a gentle motion in its surface, and in two days time maggots appeared, which in six more laid themselves up in their bags, where they continued four days, and then came out flies. See MUSHROOM.

**MOULDING**, any thing cast in a mould, or that seems to have been so, though in reality it were cut with a chisel, or the ax.

**MOULDINGS**, in architecture, are jettings, or projectures beyond the naked of a wall, column, wainscot, &c. the assemblage whereof forms corniches, door-cases, and other decorations of architecture.—See *Tab. Architect.* fig. 1. to 12. See also ORNAMENT.

Some *mouldings* are square, others round, some strait, others curved, &c.—Some are plain, others carved, or adorned with sculpture, either hollowed, or in relievo.

Some *mouldings* again are crowned with a fillet; others are without, as the doucine, talon, ovolo, torus, plinth, scotia, astragal, gula, corona, and cavetto. See each under its proper article DOUCINE, TALON, OVULO, &c.

*Mouldings* are in architecture what letters are in writing.—By the various dispositions and combinations of *mouldings* may be made an infinite number of different profiles for all sorts of orders, and compositions, regular and irregular; and yet all the kinds of *mouldings* may be reduced to three; viz. square, round and mixt, i. e. composed of the other two.

For this reason, those who invented the Gothic architecture, resolving to recede from these perfect figures, and affecting to use others less perfect, to distinguish their architecture from the antique, introduced a new set of whimsical *mouldings* and ornaments. See GOTHIC, GROTESQUE, &c.

Regular *mouldings* are either large; as, doucines, ovolos, gulas, talons, torus's, scotias, &c. or small, as fillets, astragals, conges, &c. which see in their places, DOUCINE, OVULO, ASTRAGAL, FILLET, &c.

**Bed-MOULDING**. See the article BED-moulding.

**Plane-MOULDING**. See the article PLANE.

**MOULIN**.—*Per de MOULIN*. See FER.

**MOULINET**, a French term properly signifying a little mill; being a diminutive of *moulin*, mill.

It is used in mechanics to signify a roller, which being crossed with two levers, is usually applied to cranes, capstans, and other sorts of engines of the like nature, to draw ropes, and heave up stones, timber, &c. See CAPSTAN, &c.

**MOULINET** is also a kind of turn-stile, or wooden cross, which turns horizontally upon a stake fixed in the ground; usually placed in the passages to keep out horses, and to oblige passengers to go and come one by one.

These *moulinets* are often set near the out-works of fortified places, at the sides of the barriers, through which people pass on foot.

**MOULTING**, in natural history. See MOLTING.

**MOUND**, a term used for a bank, rampart, or other fence, particularly of earth. See WALL, &c.

**MOUND**, or **MOND**, in heraldry, is a ball or globe with a cross upon it; such as our kings are usually drawn with, holding it in their left hand, as they do the scepter in the right. See GLOBE.

**MOUNT**, an elevation of earth, called also *mountain*. See MOUNTAIN.

The words *mount* and *mountain* are synonymous; but the former is scarce ever used in prose, unless when accompanied with some proper name, as *mount Ætna*, *mount Gibel*, *mount Libanon*, *mount Sinai*, *mount Atlas*, *mount Parnassus*, &c.

*St. Catherine of MOUNT Sinai*. See the article CATHERINE.

*Knight of MOUNT Carmel*. See the article CARMEL.

**MOUNTS of piety**, are certain funds, or establishments in Italy, where money is lent out on some small security.—We had also *mounds of piety* in England, raised by contribution for the benefit of people ruined by the extortions of the Jews.

**MOUNTAIN**, **MONS**, a part of the earth arising to a considerable height above the level of the surface thereof. See EARTH. The origin of *mountains* is variously assigned by philosophers: Some will have them co-eval with the world, and created along with it.

Others, among whom Dr. Burnet, will have them to take their rise from the deluge; urging, that the extreme irregularity and disorder visible in them, plainly shews they do not come immediately out of the hand of God, but are the wrecks of the old world broken into the abyss. See ABYSS.

# M O U

Others again, alledge from history, that the roots of many hills being eaten away, the hills themselves have subsided, and sunk into plains: Whence they conclude, that where the corruption is natural, the generation is so too.

This, indeed, appears pretty evident, that some *mountains* must have been generated gradually, and have grown up in process of time, from the sea-shells, &c. found in many of them; which may be accounted for from a violent wind blowing the sand, &c. into huge heaps, which are afterwards made into a mass by the rain, &c.—Some among the divines tell us, that the earth was created perfectly even; and that when God separated the water from the land, he dug channels in the earth; and the earth scooped out, he threw up in *mountains*: but whether the *mountains* be sufficient to fill all the channels of the ocean, let them look to it.

The uses of *mountains* are numerous: We shall only mention two, or three. 1°. They serve as screens to keep off the cold and nipping blasts of the northern and eastern winds. 2°. They serve for the production of a great number of vegetables and minerals, which are not found in any other soil. 3°. The long ridges and chains of lofty and topping *mountains* being generally found to run from east to west, serve to stop the evagation of the vapours towards the poles, without which they would all run from the hot countries, and leave them destitute of rain.

Mr. Ray adds, that they condense those vapours, like alembic-heads, into clouds, and so by a kind of external distillation, give original to springs and rivers; and by amassing, cooling, and condensing them, turn them into rain; and by that means render the fervid regions of the torrid zone habitable. See SPRING, &c.

In history, we have instances of *mountains* travelling a considerable distance; particularly Huket-Marvel-Hill, if I misremember not, in Herefordshire, which is said to have made a considerable journey. See Speed's *Theat*.

To measure the height of a *mountain*, see ALTITUDE, &c.—Though there is another way used by Dr. Halley in the measure of Snowdon-Hill in Wales, by means of a barometer, the different heights of whose mercury at the top and bottom of the *mountain*, give its perpendicular altitude; accounting 82 feet perpendicular ascent, for every inch varied in the height of the mercury. See BAROMETER, and LEVELLING.

**MOUNTAIN-green** } See the article { **GREEN**.  
**Burning-MOUNTAINS**. } **VOLCANO**.  
**MOUNTAINS in the moon**. } **MOON**.

**MOUNTING** the guard, trenches, breach, &c. denotes the going upon duty, being upon guard, in the trenches, running to the breach, &c. See GUARD, TRENCH, &c.

**MOUNTING a cannon, mortar, &c.** is the setting it on its carriage; or the raising its mouth. See CANNON, MORTAR, CARRIAGE, &c.

**MOUNTING**, in the manufactories, something that serves to raise or set off a work.—Thus the frame or border, and its dependencies, make the *mounting* of a looking-glass: The fust, or but, the *mounting* of a musquet, carabine, &c. The hilt, &c. the *mounting* of a sword.

**MOUNTING of a fan**, the sticks which serve to open and shut it, whether they be of wood, ivory, tortoise-shell, whalebone, Indian-cane, or the like. See FAN.

**MOURNING**, a particular dress or habit, wore to signify grief, on some melancholy occasion. See FUNERAL, &c.

The modes of *mourning* are various in various countries; as are also the colours that obtain for that end.—In Europe, the ordinary colour for *mourning* is black; in China, white; in Turkey, blue, or violet; in Egypt, yellow; in Æthiopia, brown. The ancient Spartan and Roman ladies *mourned* in white; and the same colour obtained formerly in Castile on the death of their princes. Herrera observes, that the last time it was used, was in 1498, at the death of prince John.—Kings and cardinals mourn in purple.

Each people have their reasons for the particular colour of their *mourning*: White is supposed to denote purity; yellow, that death is the end of human hopes, in regard leaves when they fall; and flowers when they fade, become yellow. Brown denotes the earth, whither the dead return. Black, the privation of life, as being the privation of light. Blue expresses the happiness which it is hoped the deceased does enjoy; and the purple, or violet, sorrow on the one side, and hope on the other; as being a mixture of black and blue.

**MOUTH**, in anatomy, a part of the human face, consisting of the lips, the gums, the inside of the cheeks, and the palate. See FACE, LIPS, &c.

All these parts are lined with a glandulous coat, which is continued over the whole inner surface of the *mouth*, and all its parts, the teeth excepted.

From the glands of this coat, through innumerable little excretory ducts, is separated a kind of salival juice, which serves to keep the *mouth* and all its parts, moist, smooth and slippery. See SALIVA.

On the hind part of the palate, perpendicularly over the rima of the larynx, hangs a round, soft, smooth body, like the end of a child's finger, formed by the duplicature of the membrane

## M U C

brane of the palate, and called the *uvula*, which is moved by two muscles, called *sphenostaphylinus* and *pterygostaphylinus*; and suspended by as many ligaments. See *UVULA*.

Under the membrane of the palate, are a great number of glands, pretty conspicuous in the fore-part, like grains of millet whose excretory ducts piercing the membrane, open into the *mouth*: but towards the hind-part they lie much thicker, and about the root of the uvula are gathered so close to one another, that they seem to form one large conglomerate gland; which is therefore by Verheyen called *glandula conglomerata palatina*. See *PALATE*.—The gums are, as it were, the sockets and ligaments of the teeth. See *TOOTH*.

Besides the proper parts of the *mouth*, there are in and about it others highly serviceable and necessary thereto: Among which are the glands; the most considerable whereof are the parotides, the glandulæ maxillares, the sublinguales, and the tonsils or amygdalæ; which see in their respective places, *PAROTIDES*, &c.

These are the salival organs, whence springs all that liquor we call the *spittle*, which flows into the *mouth* by the respective ducts, after its separation from the blood in the bodies of the glands: As the demand of spittle is greater in actions of the lower jaw, *i.e.* in mastication, deglutition, much talking, &c. so does the disposition of these salival ducts favour that discharge on those occasions.

Mr. Derham observes that the *mouth*, in the several species, is nicely adapted to the uses of such a part; well sized and shaped for the catching of prey, for the gathering and receiving food, the formation of speech, &c.

In some creatures it is wide and large, in others little and narrow; in some with a deep incisure up into the head, for the better catching and holding of prey, and more easy comminution of hard, large and troublesome food; in others with a shorter incisure, for the gathering and holding of herbaceous food.

In insects it is very notable: in some forcipated, to catch, hold, and tear the prey; in others aculeated, to pierce and wound animals, and suck their blood; in others strongly ridged with jaws and teeth, to gnaw and scrape out their food, carry burdens, perforate the earth, nay the hardest wood, and even stones themselves, for houses and nests for their young.

Nor is the *mouth* less remarkable in birds, being neatly shaped for piercing the air, hard and horny to supply the want of teeth; hooked in the rapacious kind, to catch and hold their prey; long and slender in those who have their food to grope for in moorish places; and broad and long in those that search it in muddy places.

**MOUTH** is also used in the courts of princes, for what relates to their eating and drinking.—Hence, *officers of the mouth, yeomen of the mouth*, &c.

Daviler defines *mouth*, an apartment composed of several rooms, as offices, kitchens, &c. where the meat intended for the first tables, is dressed by itself.—At court, this is called the *king's-mouth*.

**MOUTH**, in the manage, denotes a horse's feeling or sensibility in that part where the bits are applied. See *BIT*, &c.

*Ridges of a horse's MOUTH*. See the article *RIDGE*.

*Opening, or shutting the MOUTH*, of a cardinal, is a ceremony used in the consistory at Rome; wherein the pope shuts a new-elected cardinal's *mouth*, so as he may not speak at all, even though the pope should speak to him; and remains in the mean time deprived of all voice, both active and passive, 'till the calling of another consistory, when the pope *opens his mouth* again, making a little harangue, to teach him how to speak, and comport himself in the consistory. See *CARDINAL*.

**MOXA**, a sort of cotton, or downy substance, brought from China, and by some said to grow on the lower part of the mugwort-leaf.

It is not known among us for any medicinal efficacy, however celebrated in the Indies for curing the gout, by being burnt upon the part: People here have not faith enough to try it this way; and some think if they had, in all likelihood, any other caustic would do as well. Quincy.

**MUCILAGE**, **MUCILAGO**, in pharmacy, &c. a thick, visciduous juice; so called, as resembling the *mucus* of the nose. See the article *MUCUS*.

*Mucilages* are prepared chiefly from roots, and seeds pounded in a mortar, and infused in hot water, and strained through a cloth. The seeds principally used for this purpose, are those of althæa, mallows, symphytum, &c.

*Mucilages* enter the composition of several plaisters.—They are sometimes also made of gums and fruits, as figs, quinces, ising-glass, tragacanth, &c. See *GUM*, &c.

**MUCILAGE** also denotes a thick, pituitous matter, evacuated with the urine, in the gravel, and dysuria.

**MUCILAGINOUS glands**, a very numerous set of glands in the joints, first described by Dr. Havers.—There are two sorts of *mucilaginous glands*, some small, next a-kin to miliary glands, being glandules placed all along the surface of membranes, which lie over the articulations. See *MUCUS*, and *ARTICULATION*.

## M U G

The other sort are conglomerated, or many glandules collected, and planted one upon another, so as to make a bulk, and appear conspicuously. In some of the joints, there are several of them; in others, there is a single one.

As to the structure of these large glands; they consist of small vesicles, which are not gathered together into several lobes, or bags of glandules, but are disposed upon several membranes lying over one another; of which membranes there are several in every one of these glands, which appear evidently in those who are hydropical. They have their blood-vessels, as other glands; but their veins have a particular texture, in their course, for retarding the return of the blood from the glands, that the *mucilaginous liquor*, which is not separated with the greatest expedition, may have time for separation; which is a contrivance, observed wherever a thick fluid is to be secreted. See *ANIMAL secretion*.

The large *mucilaginous glands* are variously situated; some in a sinus formed in the joint; others stand near, or over-against the interstice between the articulated bones: but in general, they are so placed, as to be squeezed gently, and lightly pressed in the inflection or extension of the joint, in order to yield a quantity of mucilage proportionate to the motion of the part, and the present occasion, without any injury.

The design of all these glands is to separate a *mucilaginous* kind of liquor, which serves principally to lubricate the joints, or to make them slippery. It serves likewise to preserve the ends of the articulated bones from attrition and heating: But all this it does in conjunction with the medullary oil; with which, together, is made a composition admirably well fitted for those ends: for the mucilage adds to the lubricity of the oil, and the oil preserves the mucilage from growing too thick and viscid.

Dr. Havers observes the same glands to lie between the muscles and tendons; and supposes that there is the same mixture there of an oily and *mucilaginous* substance; the one being that fat, which is found between the muscles, and is supplied by the glandulæ adiposæ; and the other separated by the *mucilaginous* glandules, of which the common membrane of the muscles is every where full. This mixture in the interstices of the muscles, lubricates them and their tendons, and preserves them from shrinking, and growing rigid and dry. See *MUSCLE*.

**MUCOUS glands**, are three glands, which empty themselves into the urethra; so called by the first discoverer, Mr. Cowper, from the tenacity of the liquor which they separate.—See *Tab. Anat. (Splanchn.) fig. 8. lit. w.* See also *MUCUS*.

The two first discovered of these, are about the bigness of a French bean, of a depressed oval figure, and a yellowish colour, like the prostates; being on each side the bulb of the cavernous body of the urethra, a little above it.

Their excretory ducts spring from the internal surface next the inner membrane of the urethra; into which they open a little lower, by two distinct orifices, just below its bending under the ossa pubis, in perinæo, where they discharge a transparent visciduous liquor.

The third *mucous gland*, is a small, conglobate, yellowish gland, like the former, but somewhat less, situate above the angle of flexure of the urethra, under the ossa pubis, in the perinæum, near the anus.—It has two excretory ducts, which enter the urethra obliquely, a quarter of an inch below the two former; and discharge a liquor like the former, both in colour and consistence. See *URETHRA*.

**MUCRO cordis**, in anatomy, the lower pointed end of the heart. See *HEART*.

The word is Latin, *mucro*, where it properly signifies the point of a spear, &c.

Hence, **MUCRONATED** is applied to whatever tends to, or terminates in a point, like that of a spear; as *mucronata cartilago*, &c. See *XIPHOIDES*.

**MUCUS**, of the joints, is a *mucilaginous liquor*, separated by its proper glands, conveniently placed in the interstices of the bones, where those glands are gently pressed by the motion of the parts: it serves to make the extremities of the bones, or joints, slip more easily. See *BONE*, and *MUCILAGINOUS*.

**MUCUS**, of the urethra, a viscid transparent liquor, serving to line, and lubricate the part; that the seed and the urine may slip more freely, without either adhering to or lacerating the part. See *URETHRA*.

It comes from glands lately discovered by Mr. Cowper, about the penis; and is that, which in women is often mistaken for semen. See *MUCOUS gland*, *PENIS*, *SEED*, &c.

**MUCUS**, of the nostrils, is a viscid excrementitious humour separated by its proper glands, placed in the internal membrane of those parts.—It serves to moisten, lubricate, and defend the olfactory nerves; which being extremely soft and naked, would, without such provision, be soon spoiled. See *NOSE*, &c.

**MUD-walls**. See the article *WALL*.

**MUFTI**. See the article *MUPHTI*.

**MUGGLETONIANS**, a religious sect, which arose in England, about the year 1657; denominated from their leader Lodowick Muggleton, a journeyman taylor.

Muggleton, with his associate Reeves, set up for great prophets; and it is said, pretended to an absolute power of saving and damning whom they pleased: giving out, that they were the

the two last witnesses of God, that should appear before the end of the world.

**MUID**, a large measure, in use among the French, for dry commodities; as corn, pulse, salt, lime, coals, &c. See **MEASURE**.

The *muid* is no real vessel used as a measure; but an estimation of several other measures, as the septier, mine, minot, bushel, &c.

At Paris, the *muid* of wheat, pulse, and the like, is composed of twelve septiers, each septier making two mines, the mine two minots, the minot three bushels, the bushel four quarts, or sixteen litrons, each litron 36 cubic inches, exceeding our pint by  $1\frac{1}{4}$  cubic inch.---The *muid* of oats is double that of wheat, though composed, like that, of 12 septiers; but each septier contains 24 bushels.---The *muid* of charcoal contains 20 mines, saeks, or loads, each mine two minots, each minot eight bushels, each bushel four quarts, &c.

**MUID** is also one of the nine casks, or regular vessels used in France, to put wine and other liquors in.---The *muid* of wine divided into two *demi-muids*, four *quarter-muids*, and eight *half-quarter-muids*, contains 36 septiers, each septier 8 pints, Paris measure; so that the *muid* contains 288 pints. See **MEASURE**.

**MULATTO**\*, a name given, in the Indies, to those who are begotten by a negro man on an Indian woman; or by an Indian man on a negro woman.

\* The word is originally Spanish, *mulata*, formed of *mula*, a mule, as being begotten of two different species.

Those begotten of a Spanish woman and an Indian man, are called *metis*; and those begotten of a savage by a *metis*, are called *jambos*.---These are all very different in colour, and in their hair.

**MULCT**, **MULCTA**, a penalty, or fine of money, imposed for a fault or misdemeanour. See **FINE**, **AMERCEMENT**, &c.

**MULE**, in natural history, a mongrel kind of quadruped usually generated between an ass and a mare; sometimes also between a horse and a she-ass.

Mules are a sort of monsters; and, therefore, do not propagate their kind. See **MONSTER**.

And yet the ancients mention a sort of mules that were prolific, in Phrygia, Syria, Cappadocia, and Africa. Witness Aristotle, *Hist. Animal.* l. 6. c. 36. Varro de *Re Rustica*, l. 2. c. 1. Columella, l. 7. c. 36. Theophrastus, and, after him, Pliny, l. 8. c. 44. Steno, examining the testicles of a mule, found *ova* therein, with a sort of placenta about them; which persuaded him that mules might engender without any miracle. But the observation is fanciful, and the conclusion unworthy so able a naturalist!

The Roman ladies had equipages drawn by mules; as appears from the medals of Julia and Agrippina. And at this day, in Spain, the coaches of the nobility, and even princes, are usually drawn by no other than mules. We are assured that M. de Thou, first president of the parliament, had the fourth coach in France, in 1585; till which time every body rid to court, parliament, &c. on mules. See **COACH**.

**MULES**, among gardeners, denote a sort of vegetable monsters produced by putting the farina fecundans of one species of plant into the pistil, or utericle of another. See **GENERATION of plants**.

The carnation and sweet-william being somewhat alike in their parts, particularly their flowers; the farina of the one will impregnate the other: and the seed so enlivened will produce a plant different from either.---An instance of this we have in Mr. Fairchild's garden at Hoxton; where a plant is seen neither sweet-william, nor carnation, but resembling both equally, which was raised from the seed of a carnation that had been impregnated by the farina of the sweet-william.---These couplings being not unlike those of the mare with the ass, which produce the mule; the same name is given them; and they are, like the others, incapable of multiplying their species.

This gives us a hint for altering the property and taste of any fruit, by impregnating one tree with the farina of another of the same class; *e. gr.* a codlin with a pearmain, which will occasion the codling to be impregnated to last a longer time than usual, and be of a sharper taste. Or if the winter-fruits be fecundated with the dust of the summer-seeds, they will decay before their usual time. And from this accidental coupling of the farina of one with another, it may possibly be that in an orchard where there is variety of apples, even the fruit gathered from the same tree differ in their flavour, and in the season of maturity. It is from the same accidental coupling that proceeds the numberless varieties of fruits and flowers raised every day from seed. See **FARINA** and **SEED**.

**MULIEBRIA**, a term sometimes used to signify the privities of women; or so much as is otherwise called *cunus*.---See *Tab. Anat. (Splanch.)* fig. 9. See also **GENITAL**, and **GENERATION**.

**MULIER**, in law, signifies lawful issue born in wedlock, but begot before. See **BASTARD**.

If a man have a son by a woman before marriage, which is a bastard and illegitimate; and he after marries the mother of the bastard, and they have another son: this second son is called *mulier*\*, and is lawful, and shall be heir to his father.

VOL. II. N<sup>o</sup>. 102.

These we sometimes also find with the additions, *bastard eigne*, and *mulier puisne*.

\* Some derive the word from the Latin *melior*, or French *meilleur*, better; in regard the condition of a son born thus is better than that of an elder brother born before wedlock. Though, according to Glanvil, the lawful issue is rather called *mulier* than *melior*, because begotten on *mulieris*, and not on *concubinae*: For he calls such issue *filius mulieratus*; opposing them to bastards.---Agreeable to which, Briton has *frere mulier*, i. e. the brother begotten of the wife; in opposition to *frere bastard*.

The like seems to obtain in Scotland, where, according to Skene, *mulieratus filius* is a lawful son begot of a lawful wife.

**MULIER** was also anciently used as an addition for a wife; sometimes also for a widow.---According to Coke, virgin is also included under the name *mulier*. See **ADDITION**, &c.

**MULLER**, or **MULLAR**, denotes a stone flat and even at the bottom, but round a-top; used for grinding of matters on a marble. The apothecaries use *mullers* to prepare many of their ingredients; and painters for their colours, either dry or in oil.

**MULLER** is also an instrument used by the glass-grinders; being a piece of wood, to one end whereof is cemented the glass to be ground, whether convex, in a basin, or concave, in a sphere or bowl. See **GLASS**, and **GRINDING**.

The *muller* is ordinarily about six inches long, turned round; the cement they use is composed of ashes and pitch.

**MULLET**, or **MOLLET**, in heraldry, a bearing in form of a flat, or rather of the rowel of a spur, which it originally represented.

The *mullet* has but five points; when there are six it is called a *star*.---Though others make this difference, that the *mullet* is, or ought to be, always pierced, which a star is not.---*Vide Tab. Heraldry*, fig. 71.

The *mullet* is usually the difference, or distinguishing mark for the fourth son, or third brother, or house. See **DIFFERENCE**.

Though it is often also borne alone, as coat-armour: Thus, Ruby on a chief pearl, two *mullets* diamond, was the coat of the famous lord Verulam, first Sir Francis Bacon.

**MULSUM**, **MULSE**, a liquor made of wine and honey; or even of honey and water. See **HYDROMEL**, **HONEY**, &c.

**MULTA**, or **MULTURA** *episcopi*, a fine, or final satisfaction anciently given the king by the bishops, that they might have power to make their last wills: and that they might have the probate of other men's, and the granting of administrations.

**MULTANGULAR**, a figure or body which has many angles. See **ANGLE**, and **POLYGON**.

**MULTILATERAL**, in geometry, is applied to those figures which have more than four sides or angles, more usually called *polygons*. See **POLYGON**.

**MULTINOMIAL**, or **MULTINOMINAL** roots, in mathematics, are such as are composed of many names, parts, or members; as,  $a + b + c + d$ , &c. See **ROOT**, **MONOMIAL**, **BINOMIAL**, &c.

For the method of raising an infinite *multinomial* to any given power, or of extracting any given root out of such a power; see a method of M. de Moivre in *Philos. Transact.* N<sup>o</sup> 230.

**MULTIPLE**, **MULTIPLEX**, in arithmetic, a number which comprehends some other number several times. See **NUMBER**, **EQUIMULTIPLE**, and **SUBMULTIPLE**.

Thus 6 is a *multiple* of 2; or, which is the same, 2 is a quota part of 6; 2 being contained in 6 three times. And thus 12 is a *multiple* of 6, 4, 3; and comprehends the 1st twice, the 2d thrice, the 3d four times, &c.

**MULTIPLE ratio**, or *proportion*, is that which is between *multiple* numbers. See **RATIO**.

If the lesser term of a ratio be an aliquot part of the greater, the ratio of the greater to the less is called *multiple*: And that of the less to the greater *sub-multiple*.

A *sub-multiple* number is that contained in the *multiple*. Thus the numbers 1, 2, and 3 are *sub-multiples* of 6 and 9.

Duple, triple, &c. ratio's; as also sub-duples, sub-triples, &c. are so many species of *multiple* and *sub-multiple* ratio's. See **DUPLE**, **TRIPLE**, &c.

**MULTIPLE echo**. See the article **ECHO**.

**MULTPLICAND**, in arithmetic, is one of the factors in the rule of multiplication; being that number which is given to be multiplied by another called the *multiplicator*, or *multiplier*. See **MULTIPLICATOR**.

**MULTIPLICATOR**, in arithmetic, a number multiplied by another called the *multiplicand*. See **MULTPLICAND**.

The largest number is ordinarily made the multiplicand, and placed above the smaller, or *multiplicator*; but the result is the same which soever of the numbers be made multiplicand, or *multiplicator*; 4 times 5, and 5 times 4 making the same sum. See **MULTIPLICATION**.

**MULTIPLICATION**, the act of multiplication, or increasing the number of any thing. See **MULTIPLYING**.

The multiplication of the loaves in the wilderness was one of our Saviour's greatest miracles. The Romanists hold a real multiplication of the body of Christ in the eucharist; in that every communicant has a whole body, &c.

It is ordained and established, that none from henceforth shall

# MUL

use to *multiply* gold, or silver, nor use the craft of *multiplication*; and if any the same do, he shall incur the pain of felony. *Stat. 5 Hen. IV. c. 4.* See *PHILOSOPHER'S-stone*. This statute was made on presumption that some person skilful in chymistry, could *multiply* or augment those metals by elixirs, or other ingredients; and change other metals into very gold and silver.--- Under Henry VI. letters patent were granted to certain persons (who undertook to perform the same, and to find the philosopher's stone) to free them from the penalty in the said statute.---But the statute has been since repealed, *1 Will. & Mar. c. 30.*

**MULTIPLICATION**, in arithmetic, the act, or art of *multiplying* one number by another, to find the product. See **PRODUCT**.

*Multiplication*, which is the third rule in arithmetic, consists in finding some third number, out of two others given; wherein, one of the given numbers is contained as often as unity is contained in the other.

Or, *Multiplication* is the finding what will be the sum of any number added to itself, or repeated, as often as there are units in another.---So that *multiplication* of numbers is a compendious kind of addition. See **ADDITION**.

Thus the *multiplication* of 4 by 5 makes 20, *i. e.* four times five amount to twenty; which algebraists express thus,  $4 \times 5 = 20$ . See **CHARACTER**.

In *multiplication*, the first factor, *i. e.* the number to be multiplied, or the multiplicand, is placed over that whereby it is to be multiplied; (See **MULTIPLICAND**) and the factum or product under both.

An example or two will make the process of *multiplication* easy.---Suppose I would know the sum 269 multiplied by 8, or 8 times 269.

Multiplicand	_____	269
Multiplier	_____	8
Factum, or Product	_____	2152

The factors being thus disposed, and a line drawn underneath, (as in the example) I begin with the multiplier thus: 8 times 9 make 72, set down 2, and carry 7 tens, as in addition; then 8 times 6 make 48, and 7 I carried, 55; set down 5, and carry 5; lastly, 8 times 2 make 16, and with 5 I carried 21, which I put down: so as coming to number the several figures placed in order, 2, 1, 5, 2, I find the product to be 2152. See **NUMERATION**.

Now supposing the factors to express things of different species, *viz.* the multiplicand men, or yards, and the multiplier pounds; the product will be of the same species with the multiplier. Thus the product of 269 men or yards multiplied by 8 pounds or pence, is 2152 pounds or pence; so many of these going to the 269 at the rate of 8 a-piece. Hence the vast use of *multiplication* in commerce, &c.

If the multiplier consist of more than one figure, the whole multiplicand is to be added to itself, first, as often as the right-hand figure of the multiplier shews, then as often as the next figure of the multiplier shews, and so on.---Thus  $421 \times 23$  is equal to  $421 \times 3$  and also  $421 \times 20$ . The product arising from each figure of the multiplier, multiplied into the whole multiplicand, is to be placed by itself in such a manner, that the first or right-hand figure thereof may stand under that figure of the multiplier from which the said product arises. For instance;

Multiplicand	_____	421
Multiplier	_____	23
Particular product of $421 \times 3$	_____	1263
Particular product of $421 \times 20$	_____	842
The total product	_____	9683

This disposition of the right-hand figure of each product, follows from the first general rule; the right-hand figure of each product being always of the same denomination with that figure of the multiplier from which it arises.

Thus in the example, the figure 2 in the product 842, is of the denominations of tens, as well as the figure 2 in the multiplier. For  $1 \times 20$  (that is the 2 of 23) = 20, or 2 put in the place of tens, or second place.

Hence if either of the factors have one or more ciphers on the right-hand, the *multiplication* may be performed without regarding the ciphers, till the product of the other figures be found: To which they are to be then affixed on the right. And if the multiplier have ciphers intermixed, they need not to be regarded at all.---Instances of each follow.

12	358	10	2400	8013
10	6000	10	30	5006
120	2148000	100	72000	48078
				40065
				40113078

Thus much for an idea of *multiplication*, where the multiplier consists wholly of integers; in the praxis whereof, it is supposed, the learner is apprized of the product of any of the

# MUL

nine digits multiplied by one another, easily learnt from the common table, (see **TABLE**) or otherwise.

There are also some abbreviations of this art.---Thus to multiply a number by 5, you need only add a cipher to it, and then halve it.---To multiply by 15, do the same, then add both together. The sum is the product.

Expedients for the more easy and expeditious multiplying large sums are sliding rules and Neper's bones.---The want of which may be supplied by tabulating the multiplicand.

Where the multiplier is not composed wholly of integers; as it frequently happens in business, where pounds are accompanied with shillings and pence; yards with feet and inches: the method of procedure, if you multiply by a single digit, is the same as in simple numbers, only carrying from one denomination to another, as the nature of each species requires. *E. gr.* to multiply  $123\text{ l. } 14\text{ s. } 9\text{ d. } 3\text{ q.}$  by five: Say,  $5 \times 3\text{ q.} = 15\text{ q.}$  that is  $3\text{ d. } 3\text{ q.}$  write down the  $3\text{ q.}$  and proceed, saying,  $5 \times 9 = 45\text{ d.}$  that is  $3\text{ s. } 9\text{ d.}$  set down the  $9\text{ d.}$  and proceed in the same manner through the rest.

If you multiply by two or more digits, the methods of procedure are as follow.---Suppose I have bought 37 ells of cloth at  $13\text{ l. } 16\text{ s. } 6\text{ d.}$  per ell, and would know the amount of the whole.---I first multiply 37 ells by the  $13\text{ l.}$  in the common method of *multiplication* by integers, leaving the two products without adding them up; then multiply the same 37 ells by  $16\text{ s.}$  leaving, in like manner, the two products without adding them. Lastly, I multiply the same 37 by the  $6\text{ d.}$  the product whereof is  $222\text{ d.}$  which divided by 12, (see **DIVISION**) gives  $18\text{ s. } 6\text{ d.}$  and this added to the products of the  $16\text{ s.}$  the sum will be  $610\text{ s. } 6\text{ d.}$  the amount of 37 ells at  $16\text{ s. } 6\text{ d.}$  the ell. Lastly, the  $610\text{ s. } 6\text{ d.}$  are reduced into pounds by dividing them by 20: (see **REDUCTION**) upon adding the whole, the amount of 37 ells at  $13\text{ l. } 16\text{ s. } 6\text{ d.}$  will be found as in the following.

37 ells	37 ells	37 ells.
At 13 pounds.	At 16 shillings.	At 6 pence.
111	222	222
37	37	
30 10 6	18 6	
Product 511 10 6	610 6	

Or thus: Suppose the same question; reduce the  $13\text{ l. } 16\text{ s.}$  into shillings, the amount will be  $276\text{ s.}$  reduce  $276\text{ s.}$  into pence, adding 6, the amount will be  $3318\text{ d.}$  Multiply the 37 ells by 3318, the amount will be  $122766\text{ d.}$  which divided by 12; and the quotient  $10230\text{ s. } 6\text{ d.}$  reduced into pounds by cutting off the last figure on the right, and taking half of those on the left, yields  $511\text{ l. } 10\text{ s. } 6\text{ d.}$  the price of the 37 ells, as before.

Though by these two methods any *multiplication* of this kind may be effected, yet the operations being long, we shall add a third much shorter.---Suppose the same question: Multiply the price by the factors of the multiplier, if resolvable into factors: if not, by those that come nearest it; adding the price for the odd one, or multiplying it by what the factors want of the multiplier. So, the work will stand thus: 37 ells at  $16\text{ s. } 6\text{ d.}$ :  $6 \times 6 = 36 \times 1 = 37$ :

Therefore	_____	6
	82	19 0
	497	14 0
	13	16 6
	511	10 6

The price of the 37 ells.

But the most commodious is the fourth method, which is performed by aliquot and aliquant parts---where you are to observe by the way, that *aliquot parts* of any thing are those contained several times therein, and which divide without any remainder; and that *aliquant parts* are other parts of the same thing composed of several aliquot parts. See **ALIQUT**, and **ALIQANT**.

To **MULTIPLY** by *aliquot parts*, is in effect only to divide a number by 3, 4, 5, &c. which is done by taking a 3d, 4th, 5th, &c. from the number to be multiplied. Example.

To multiply, *v. g.* by  $6\text{ s. } 8\text{ d.}$  Suppose I have 347 ells of ribbon at  $6\text{ s. } 8\text{ d.}$  per ell.

Multiplicand	_____	347 ells.
Multiplier	_____	$6\text{ s. } 8\text{ d.}$

Product	_____	$115\text{ l. } 13\text{ s. } 4\text{ d.}$
---------	-------	--------------------------------------------

The question being stated, take the multiplier, which according to the table of aliquot parts is the third; and say, the third of three is 1, set down 1; the third of 4 is 1, set down 1, remains 1, that is, 1 ten, which added to 7, makes 17; then the third of 17 is 5; remains 2 units, *i. e.* two thirds, or  $13\text{ s. } 4\text{ d.}$  which place after the pounds. Upon numbering the figures 1, 1, and 5, integers, and  $13\text{ s. } 4\text{ d.}$  the aliquot part remaining, I find the sum  $115\text{ l. } 13\text{ s. } 4\text{ d.}$

For **MULTIPLICATION** by *aliquant parts*: Suppose I would multiply by the aliquant part 19 s. I first take for 10 s. half the multiplicand; then for 5, which is the fourth, and, lastly, for 4, which is the 5th. The products of the three aliquot parts

# M U L

parts that compose the aliquant part, being added together, the sum will be the total product of the multiplication, as in the following example; which may serve as a model for multiplication by any aliquant part that may occur.

Multiplicand	—	356 ells.
Multiplier	—	19 s.
		178 l. for 10 s.
		89 l. for 5 s.
		71 l. 4 s. for 4 s.

Product — 338 l. 4 s.

For the proof of MULTIPLICATION.---The operation is right when the product divided by the multiplier quotes the multiplicand; or divided by the multiplicand quotes the multiplier. ---A readier way, though not absolutely to be depended on (see ADDITION) is thus: Add up the figures of the factors, casting out the nines; and setting down the remainders of each. These multiplied together, out of the factum, cast away the nines, and set down the remainder. If this remainder agree with the remainder of the factum of the sum, after the nines are cast out; the work is right.

Cross MULTIPLICATION, or otherwise called *duodecimal arithmetic*, is an expeditious method of multiplying things of several species, or denominations, by others likewise of different species, &c. E. gr. Shillings and pence by shillings and pence; feet and inches by feet and inches; much used in measuring, &c.—The method is thus.

Suppose 5 feet 3 inches to be multiplied by 2 feet 4 inches; say, 2 times 5 feet is 10 feet, and 4 times 3 is 6 inches: Again, 4 times 5 is 20 inches, or 1 foot 8 inches; and 4 times 3 is 12 parts, or one inch; the whole sum makes 12 feet 3 inches. In the same manner you may manage shillings and pence, &c.	F.	I.
	5	3
	2	4
	10	6
	1	8
		1

MULTIPLICATION, in geometry, or in lines, is effected by supposing a line *a b*, (*Tab. Geomet. fig. 9.*) called the *describent*, moving perpendicularly along another *b c*, called the *dirigent*. See DESCRIBENT, &c.

For by this means the describent forms the rectangle *a d c b*; and if it be divided together with the dirigent into any number of equal parts, will by its motion describe as many little rectangles as the units in the describent and dirigent will produce when multiplied into one another; viz. 21. See DIRIGENT.

For when the line *a b* hath moved over one part of *a d*, it will by its three parts have described the three little rectangles in the first column; when it comes to 2, it will have described three more. And this is the reason why multiplication in the Latin tongue is usually expressed by the word *ducta*, drawn; (and from hence also comes *product*.) As if *a b* were multiplied by *b c*, they say, *a b ducta in b c*, because the describent is led, as it were, or carried along in an exact posture upon the dirigent, and by that means describes the rectangle; so that the rectangle and product are all one in geometry.

Now, as in all multiplication unity is to one factor as the other is to the product, multiplication in lines may be performed thus.

Let *a b* (*fig. 10.*) be to be multiplied by *a d*.—Make any angle at pleasure; on one of the legs set off *a u* = to unity; and on the same leg set off *u d*, the multiplier (3); then set the multiplicand *a b* (2) from *a* on the other leg of the angle; draw *u b*, and parallel to it through *d*, draw *d c*, (6). I say, *d c* or 6, is the product: for *a u : a d :: a b : b c*.

MULTIPLICATION of plants. See FECUNDITY of plants.

MULTIPLICATIVES. See NUMERALS.

MULTIPLYING, in the animal œconomy, the producing of one's like. See GENERATION.

Mankind multiplied at a prodigious rate before the flood; rabbits, fish, and most insects, multiply incredibly: The single milt of a cod, examined with M. Leewenhoeck's microscope, was found to contain more ova than there are animals on the face of the earth. See INSECT, ANIMALCULE, &c.

M. Dodart has several discourses on the multiplication of plants in the *Memoirs of the royal academy of sciences*. He has examined the beach-tree particularly with this view, and found its increase to surpass all imagination. See FECUNDITY.

MULTIPLYING, in arithmetic, is the finding a number which contains the multiplicand as often as there are units in the multiplier. See MULTIPLICAND, &c.

The rule of three consists in multiplying the third term by the second, and dividing the product by the first. See RULE of three.

MULTIPLYING-glass, a lens, or glass in which objects appear increased in number. See LENS.

A multiplying-glass, called also *polyhedron*, is a glass formed or ground into several planes, or faces, making angles with one another; through which the rays of light issuing from the same point undergo different refractions, so as to enter the eye from every surface in a different direction; as if they came from several points.

And thus the same point is seen in several imaginary foci; and

# M U M

therefore appears multiplied. See REFRACTION.—For the phenomena and laws of multiplying-glasses, see POLYHEDRON. MULTISILIQUEOUS plants, are the same with corniculate plants, viz. those which, after each flower, have divers distinct, slender, and frequently crooked, filiquæ, or pods, wherein their seed is contained; and which when they ripen, open of themselves, and let the seeds drop. See CORNICULATE, and SEMINATION. See also PLANT.

MULTITUDE, MULTITUDO, an assemblage; or collection, of a great number of things, or persons.

Mutitude is properly the abstract whereby things are said to be many. See MULTUM.

In which sense multitude may be considered as number; (see NUMBER) and stands opposed to unity. See UNITY.

In law, some will have multitude to imply at least ten persons; but Sir Edward Coke says, he could never find it restrained by the common law to any certain number, but always left to the discretion of the judges.

A MULTO fortiori, or *à minore ad majus*, is a way of argumentation often used by Littleton; whose force is thus: If it be so in a feoffment passing a new right; much mote is it for the restitution of an ancient right.

MULTUM, in arithmetic.—If A be one, B one, C one, D one, &c. And B, C, and D be not the same with A; A, B, C, and D are multa, or *plura*, many. Wolfius.

MULTURA *episcopi*. See the article MULTRA.

MUM, a wholesome kind of malt-liquor, chiefly prepared in Germany. See MALT-LIQUOR.

The process of making mum, as recorded in the town-house or Brunswick, the place of most note for this liquor, is as follows:

Take 63 gallons of water that has been boiled to the consumption of a third part; brew it with seven bushels of wheaten-malt, one bushel of oat-malt, and one bushel of ground beans; when it is tunned, let not the hogthead be too full at first, and as soon as it begins to work, put into it of the inner rind of fir three pounds, tops of fir and birch one pound, carduus benedictus three handfuls, flower of rosa solis, one handful or two, burnet, betony, marjoram, avens, periny-royal, wild thyme, of each a handful and a half; of elder-flowers, two handfuls or more; seeds of cardamum bruised 30 ounces, barberries bruised one ounce: Put the herbs and seeds into the vessel when the liquor has wrought a while, and after they are added, let the liquor work over the vessel as little as may be, then fill it up: At last, when it is stopp'd, put into the hogthead ten new-laid eggs unbroken or cracked, stop it up close, and drink it at two years end.

Our English brewers use cardamum, ginger, and saffras instead of the inner rind of fir; and add walnut-rinds, madder, red sanders, and elecampane.

MUMMY\*, MUMIA, a carcass, or body embalmed or dried in the manner of the ancient Egyptians. See EMBALMING.

\* Menage, after Bochart, derives the word mummy from the Arabic *munia*; *mum*, wax. Salmasius, from *amomum*, a kind of perfume. (See AMOMUM.) Though others hold; that in the Arabic tongue, the word *mumia* signifies a body embalmed, or aromatized.

Properly speaking; mummy is not the flesh of the deceased, but the composition wherewith it is embalmed; but in common use mummy is also used for the body.

The preparation of mummy is of so old a standing, that it was in use in Egypt before the time of Moses. The coffin in which the mummy is contained is of sycamore-wood, which is found to keep sound for the space of 3000 years; but it is very different from our sycamore.

Mummy is said to have been first brought into use in medicine by the malice of a Jewish physician, who wrote that flesh thus embalmed was good for the cure of divers diseases, and particularly bruises, to prevent the blood's gathering and coagulating. The Turks prevent the export of mummy in Europe as much as possible.

There are two kinds of bodies denominated mummies.—The first are only carcasses, dried by the heat of the sun, and by that means kept from putrefaction; frequently found in the dry sands of Lybia.—Some say, they are the bodies of deceased people buried there on purpose to keep them entire without embalming; others, that they are the carcasses of travellers, &c. overwhelmed with clouds of sand raised by the hurricanes frequent in those deserts. Be that as it will, these mummies are of no use in medicine, and are only preserved as curiosities.

The second kind of mummies are bodies taken out of the pits, or catacombs near Cairo, wherein the Egyptians deposited their dead after embalming.—It is these make the mummy so much valued, and to which such extraordinary virtues are ascribed. It is said, that all the mummy sold in shops, whether brought from Venice or Lyons, or even directly from the Levant by Alexandria, is fictitious, and the work of certain Jews, who knowing the value the Europeans set on the Egyptian mummy, counterfeit it by drying carcasses in ovens, after having prepared them with powder of myrrh, caballin aloes, Jewish pitch, black pitch, and other coarse or unwholesome drugs. The French Charletans, it seems, have likewise got the art of preparing mummies. Their method is simple enough: Out

# M U N

of the carcase of a person hanged, they take the brain and entrails, dry the rest in an oven, steeping it in pitch, and other drugs. And this they sell for right Egyptian *mummy*.

Paræus has a very curious treatise of *mummies*, wherein he shews the abuses thereof; and makes it appear that they can never be of any real medicinal use.

Matthiolus is of the same opinion, after Serapion. Both these authors take even the Egyptian *mummies* to be no more than bodies embalmed with pissasphaltum.

**MUMMY**, *mumia*, is more particularly used for the liquor, or juice oozing from human bodies aromatized and embalmed; gathered in the sepulchres.---This is the *mummy* chiefly spoke of among the ancient writers.

**MUMMY** also denotes a medicinal drug, or a viscous composition partaking of bitumen and pitch, found in the mountains and forests of Arabia, and other hot countries of the east; much used in embalming of dead bodies.

Dioscorides speaks of a *mummy* found on the sea-coast near Epidaurus, brought thither by the torrents from the Ceraunian mountains, and there dried by the sun into huge heaps.

It smells like bitumen mixt with pitch. The people thereabouts call it *mineral wax*.---In Latin, or rather Greek, it is called *pissasphaltus*. See **PISSASPALTUS**.

**MUMMY**, *mumia*, is also used by some physicians for I know not what implanted spirit, found chiefly in carcases, when the infused spirit is fled.

The infused spirit is sometimes also called *mummy* in living subjects; and both the one and the other are supposed to serve in transplantation. See **TRANSPLANTATION**.

A plant, for instance, bringing this *mumia* from one subject to another, the *mumia* joins and unites itself immediately, with the *mumia* or spirit of the new subject; and from this union arises a natural and common inclination between the two subjects.---And on this principle they account for sympathetic or magnetic cures. See **SYMPATHETIC**, &c.

**MUMMY** is also used among gardeners for a sort of wax used in the planting and grafting of trees. See **WAX**.

Agricola directs the preparation thereof as follows: Take one pound of common black pitch, and a quarter of a pound of common turpentine; put them together in an earthen pot, and set them on the fire in the open air, having something in your hand to cover and quench it in time; the matter to be thus alternately lighted and quenched till all the nitrous and volatile parts be evaporated. To this a little common wax to be added; and the composition to be set by for use.

To apply it in the dressing of the roots of trees, melt it, and dip in the two ends of the pieces of root one after another; then put them in water, and plant them in the earth, the small end downward, so that the larger may appear a little way out of the earth, and so have the benefit of the air; then press the earth hard down upon them that they may not receive too much wet. See **PLANTING**.

**MUNDANDIS** *vicis & venellis*. See the article **VICIS**.

**MUNDIBURDUS**. See **ADVOCATE**.

**MUNDICK**, a sort of marcasite, or mineral glebe, found in the tin-mines, sometimes white, yellow, or green, but generally of a dark brown colour.

It is frequently called *masy*; and appears to be nothing else but a kind of sulphur; fire alone being found to separate it from the tin, in which case it evaporates into smoke. See **TIN**.

The *mundick ore* is easily distinguished by its brown, sad-coloured glittering, and by its discolouring the fingers.---Some say it feeds the tin, and yet allow that where there is much *mundick*, there is little or no tin. Vid. *Gibf. Addit. to Camd. Brit. in Cornwall*.

The tanners separate it with great care from the tin, because it made it thick and curdy.---But of late it has been tried, and wrought singly, and is found to turn to very good advantage by affording copper.

The steams of the *mundick* are very troublesome to the miners; yet it is found a good vulnerary; and the miners use no other remedy for wounds but washing them in water that runs from the *mundick ore*.

**MUNDIFICATIVES**, or **MUNDIFIERS**, in medicine, denotes *cleansers, purifiers, or detergents*. See **DETERGENT**.

*Mundificative* plaisters, or unguents, are such as deterge, and dry, and thus cleanse ulcers of two kinds of matter, *viz. pus and sanies*. See **ULCER**.

The chief ingredients in *mundificative* unguents, are gentian, aristolochia, enula campana, and vulnerary herbs. See **DETERGENT**.

**MUNDUS**, *world*. See the article **WORLD**.

*Anima MUNDI*. See the article **ANIMA**.

**MUNICIPAL**\*, **MUNICIPALIS**, or **MUNICEPS**, an appellation given to the inhabitants of the municipia, or municipal cities.

\* The word is compounded of *munus*, office, employ; and *capio*, I take or hold.

In the Roman law, *municipal* denotes a person vested with the rights and privileges of a Roman citizen.

# M U R

This title the Romans frequently bestowed on foreign cities and people; and in effect, it was little more than a title.

**MUNICIPAL** cities, *municipia*, were those whose inhabitants were capable of civil offices in the city of Rome.

These, according to Mariana, came somewhat short of the privileges of the colonies. See **COLONY**.

They had no suffrages or votes at Rome; but were left to be governed by their own laws, and magistrates.---It is true, some few *municipal* cities, by particular merit, &c. obtained the liberty of votes, which occasioned that received distinction of *municipium sine suffragio*, & *municipium cum suffragio*.

They were so called, because *muneris hujus honorarii participes*; but by *munus honorarium*, was meant no more than the bare appellation of a Roman, whereby they were privileged to fight in a legion, as denizens; and not in auxiliary bands, as associates. See **CITIZEN**.---The first who had the honour, were the *Cærites*.

**MUNICIPAL**, among us, is now applied to the customary laws that obtain in any particular city, or province; and which have no authority in the neighbouring places. See **CUSTOM**, and **LAW**.

**MUNICIPAL** officers, are those elected to defend the interests of cities, their rights and privileges, and to maintain order and good policy; as mayors, and sheriffs, consuls, bailiffs, &c. See **OFFICE**.

In Spain, the *municipal* offices are bought. In England, they are obtained by election. See **OFFICE**, **VENAL**, &c.

**MUNIMENTS**, or **MINIMENTS**, the evidences or writings, whereby a man is enabled to defend the title of his estate. See **MUNIMENT-house**, **WRITING**, **DOCUMENT**, &c.

Wrangford says, the word *muniment* includes all manner of evidence, deeds, charters, &c. See **EVIDENCE**, &c.

**MUNIMENT-house**, a little, strong apartment in cathedral and collegiate churches, castles, colleges, or the like, destined for keeping the seal, evidences, charters, &c. of such church, college, &c. called *muniments*, or *miniments*. See **ARCHIVE**.

**MUNIMINA**, the grants, or charters of kings, and princes to churches\*, so called, because *cum eis muniantur* against all those who would deprive them of those privileges.

\* The word is formed of the Latin *munio*, I defend, strengthen.

**MUNION**S, in architecture, the short upright posts or bars which divide the several lights in a window frame. See **WINDOW**.

**MUNITION**, or **AMMUNITION**, the provisions wherewith any place is furnished in order for defence; or wherewith a vessel is stocked for a voyage; or that follow a camp for its subsistence. See **AMMUNITION**.

**MUNITION-bread** is the proportion of bread distributed every day to the soldiers of a garrison or army.---Each officer is allowed so many rations of *munition-bread*. See **RATION**.

**MUPHTI**, or **MUFTI**, the chief, or patriarch of the Mahometan religion, residing at Constantinople. See **MAHOMETANISM**.

The *muphti* is the sovereign interpreter of the Alcoran, and decides all questions of the law. See **ALCORAN**, &c.

He takes place of the bathaws; and his authority is often terrible to the grand signior himself.---It is he girds on the sword to the grand signior's side; which ceremony answers to the coronation of our kings.

**MURAGE**, **MURAGIUM**, in our customs, a reasonable toll to be taken of every cart or horse coming laden into a city or town, for the building or repairing the walls thereof.

**MURAL**, something belonging to a wall; which the Latins call *murus*. See **WALL**.

**MURAL crown**, among the ancient Romans, was a kind of crown indented a-top, like the battlements of a wall. See **CROWN**.

The *mural crown* was the reward of those who first mounted the walls of the enemy; whence it was also called *corona obsidionalis*.

**MURAL arch**, is a wall, or walled arch placed exactly in the plane of the meridian, *i. e.* upon the meridian-line; for the fixing of a large quadrant, sextant, or other instrument, to observe the meridian altitudes, &c. of the heavenly bodies. See **MERIDIAN-line**, and **MERIDIAN-altitude**.

Tycho Brahe was the first who used a *mural-arch* in his observations; after him Mr. Flamsteed, de la Hire, &c. used the same means. See **COELESTIAL**, &c.

**MURDER**. See the article **MURTHUR**.

**MURDERING battery**. See the article **BATTERY**.

**MURE**.---*Counter-MURE*. See the article **COUNTER-mure**.

**MURENGERS**, two officers of great antiquity in the city of Chester, being two of the principal aldermen chose yearly to see the walls kept in good repair, and to receive certain toll and custom for the maintenance thereof.

**MURING**, the walling, or raising the walls of a building. See **WALL**.

**MURORUM domesticus**. See the article **DOMESTICUS**.

**MURRAIN**, *gargle*, a mortality, or contagious disease among cattle. See **MORTALITY**.

*Murrains* are occasioned various ways, but principally by a hot, dry season; or rather by a general putrefaction of the air, which

which begets an inflammation in the blood, and a swelling in the throat, which soon proves mortal, and is communicated from one to another.

The symptoms are generally a hanging down and swelling of the head, rattling in the throat, short breath, palpitation of the heart, staggering, abundance of gum in the eyes, &c. breath hot, and tongue shining.

The most remarkable *murrain* we hear of, is that mentioned in the *Philosophical Transactions*, which spread itself through Switzerland, Germany, into Poland, &c.

The contagion seemed to propagate itself in form of a blue mist, which fell on the grass where the cattle grazed, inasmuch that whole herds returned home sick, and being very dull, and forbearing their food, most of them died away in twenty-four hours time. On dissection were found large corrupted spleens, sphacelous and corroded tongues, &c. Those people who managed them, without a due regard to their own health, were infected by them, and died like the beasts.

Some imagine it had its rise from noxious vapours thrown out of the earth in three distinct earthquakes perceived in the neighbourhood of the place where it began: Though Dr. Slare rather thinks it owing to swarms of volatile insects. The antidote for the sound, and the medicine for the sick, were the same, viz. equal parts of foot, gun-powder, brimstone, and salt, with as much water as would wash it down, a spoonful in a dose.

MURREY, in heraldry, a kind of purple colour, called also *sanguine*. See SANGUINE, and PURPURE.

MURRHINE, MURRHINUS, MOPPINOS, in antiquity, an appellation given to a delicate sort of earthen or stone ware, brought from the east, whereof cups and vases were made, which added not a little to the splendour of a Roman banquet. Critics are divided concerning the matter of the *pocula* or *vasa murrhina*, *murrina*, or *murrea*. Some will have them to have been the same with our porcelain, or china-ware. See PORCELANE.

The generality hold them to have been made of some precious kind of stone, which was found chiefly, as Pliny tells us, in Parthia, but more especially in Carmania.—Some conjecture them to have been of agate, others of onyx, others of coral-line: Baronius doubtless was farthest out of the way, when he took them to be made of myrrh congealed and hardened.

Pompey is recorded as the first who brought these *murrhine* vessels out of the east, which he exhibited in his triumph, and dedicated to Jupiter Capitolinus.—But private persons were not long without them. So fond, in effect, did the Roman gentry grow of them, that a cup which held three sextaries was sold for seventy talents. T. Petronius, before his death, to spite Nero, (or as Pliny expresses it, *ut mensam ejus exhaerederet*, to disinheret his beaufet) broke a basin, *trulla murrhina*, valued at three hundred talents, on which that emperor had set his heart.

MURTHUR \*, or MURDER, the act of killing another with violence, injustice, and effusion of blood. See HOMICIDE.

\* The word comes from the Saxon *morib*, death; which some will have to signify a violent death; whence the barbarous Latin, *murdrum*, and *mordrum*.

Among the number of popular errors, is the notion which has obtained, that the dead body would bleed in the presence, or upon the touch of the *murtherer*.

The crime of *murther* is punished with death in almost all nations. See PUNISHMENT.

MURTHUR, in our law, denotes a wilful, and felonious killing another upon premeditated malice, whether secretly or openly, and whether Englishman or foreigner, living under the king's protection.

This premeditated malice, which makes the essence of *murther*, is twofold: 1<sup>o</sup>, *Express*, where it may be evidently proved that there was ill will. 2<sup>o</sup>, When one kills another suddenly, he having nothing to defend himself withal; as in going over a stile, or the like: For in such a case, or when a man kills a mere stranger, the law presumes he had malice, or that he would not have done it without any manner of provocation.

Formerly, *murther* was restrained to a clandestine, and treacherous killing.—Thus, *Murdritus homo antiquitus dicebatur, cujus interfector nesciebatur ubicumque vel quomodocumque esset inventus. Nunc adjunctum est, licet sciatur quis murdrum fecerit, homicidium per prodicionem. Leges Hen. I.—Arthurem nepotem propriis manibus per prodicionem interfecit, pessimo mortis genere quod Angli murdrum appellant.* Matt. Paris, an 1216.

Self-MURTHUR, is otherwise called *suicide*. See Felo de se.

MURTHURERS, or MURDERING pieces, are small pieces of ordinance, either of brass or iron, having chambers, (that is, charges made of brass or iron) put in at their breeches. See CHAMBER, and ORDINANCE.

They are mostly used at sea, at the bulk-heads of the fore-castle, half-deck, &c. in order to clear the decks when an enemy boards the ship.

MUSCADINE \*, a rich wine, of the growth of Provence, Languedoc, Cividat, &c. See WINE.

\* The word, as well as the liquor, is French: Some fetch its original from *musk*; the wine being supposed to have a little of the

smell of that perfume: others from *musca*, a fly, because the flies are extremely fond of its grapes; as the Latins had their *vinum apianum*, so called *ab apibus*, from the bees which fed on it.

The way of making *muscadine* at Frontignac is as follows: They let the *muscadine* grapes grow half dry on the vine; as soon as they are gathered, they tread and press them immediately, and tun up the liquor, without letting it stand, and work in the fat; the lee occasioning its goodness.

MUSCLE \*, MUSCULUS, in anatomy, a fleshy, fibrous part of the body of an animal, destined to be the organ or instrument of motion. See MOTION.

\* The word is derived from the Greek *μῦς*, or the Latin *mus*, a mouse; on account of the resemblance it is supposed to bear to a skinned mouse.—Dr. Douglas will have it from *μῦς*, to shut or contract; that being the proper office of a *muscle*.

The *muscle* is a bundle of thin, parallel plates; and is divided into a great number of fasciculi, or little *muscles*, each included in its proper membrane, from the internal surface whereof, pass an infinite number of transverse filaments; which intersect the *muscle* into several distinct areas, filled with their respective fasciculi of fibres.—See Tab. Anat. (Mysl.) fig. 1, 2, 3, 5, 7, &c. See also the article FIBRE.

A *muscle* is usually divided into three parts, the *head*, the *tail*, and the *belly*.—The *head* and *tail*, which are also called *tendons*, are the two extremes of the *muscle*; whereof the first is fixed to the stable part, and the latter to the part intended to be moved. See TENDON.

The *venter* or *belly* is the body of the *muscle*, being a thick, fleshy part, into which are inserted arteries and nerves, and out of which issue veins and lymphæducts.

All these parts of a *muscle*, the *belly*, and the *tendons*, are composed of the same fibres: Their only difference consists in this, that the fibres of the *tendons* are more closely and firmly bound together than those of the *belly*, which are more loose. Hence in the *belly* there is room for a sufficient quantity of blood to give them an appearance of redness; and the whiteness of the *tendons* only proceeds from the blood's being in some measure excluded by the tightness of their contexture.—The difference then between the *belly* and the *tendons* seem to be the same as between a skein of thread, and a cord made of the same thread.

All the *muscles* act by having their bellies inflated or swelled: for by that means they are shortened, so as to draw, or press the solid bodies to which they are fastened, according to the direction of their fibres.—All the difficulty then in *muscular* motion, is, to assign their fabric, and the cause of their swelling.

Every simple *muscle*, then, consists of one fleshy belly, and two *tendons*; but may be again divided into others similar, though less; and those again into others still less, yet still similar to the great one: Which division may be carried on to a degree of subtilty that exceeds all imagination; though it is reasonable to think it must have an end.—That last, therefore, being similar to the first, must, in like manner, have its *belly* and *tendons*; and this is what we ordinarily call a *muscular fibre*, in an assemblage or union of several whereof, a *muscle*, properly so called, consists. See FIBRE.

Some take the *muscular fibres* to be productions of the arteries and veins, or the capillaries of those vessels inoculated with, and continued to each other; by the intumescence of whose contents, the extremities are drawn nearer each other, and by consequence, the bone to which the moveable part is fixed, approximated to the other.—But that they are, in truth, neither venous, nor arterious, nor lymphatic vessels, is evident from the last observation. Whether they are vesicular; or whether they only consist of single threads, may be still a question!

Dr. Boerhaave, from a consideration that the nerves enter every *muscle* along with its veins and arteries, and that there laying aside their outer integument, they are so distributed through the whole body of the *muscle*, as that no one point can be assigned wherein a part of them is not found; that those nerves terminated here; and that in other parts of the body the extremities of the nerves are expanded, as it were, into membranes; concludes, that the *muscular fibres* are nothing else but extremely slender expansions of the nerves stript of their integument, hollow within, and of the figure of a *muscle*, and full of a spirit communicated by the nerve from its origin in the brain or cerebellum, by the continual action of the heart. See NERVE.

Of these fibres united, are formed fasciculi or bundles; which, again, have each their several membrane, wherein they are involved, and kept distinct from others. This membrane is extremely slender and porous within, full of oil, which is accumulated in time of rest, and spent in motion, furnished by the arteries; and this oil, in conjunction with a smooth mucous juice secreted by small mucilaginous glands, interspersed among these fasciculi, serves to lubricate the parts, and preserve the fasciculi from fretting on each other.

Now, besides the nerves, there are arteries also carried into the *muscles*, and those in such abundance, and of such contexture, that a man might be inclined to think the whole body of

the *muscle* composed of them. — These are principally distributed among the fasciculi, and the membranes that separate them, and perhaps also in the external surface of each fibrilla, where they terminate in reticular plexus's, in little oily secretories, small lymphatics, and perhaps in hollow fibrillæ like nerves; which fibrillæ may again either terminate in the cavity of the nervous muscular fibres, or make others like them. — This, at least, is clear, that every branch of an artery in the *muscles* has its corresponding little vein, which united to the other, increases its bulk; whence the blood-vessels of the *muscles* are also lymphatics.

Of two such *muscles* as have been described, fastened in opposite situations to each other, most of the *muscles*, or pairs of *muscles* we know of, consist.

It has been already observed, that the tendon of a *muscle* consists of the same number of fibres with the *muscle* itself; with this difference, that the cavities of the muscular fibres diminishing, and losing of their former diameter, form one compact, hard, rough, dry, narrow body, which is but little vascular. — From what has been said then it appears, that the redness of a *muscle* is owing to the blood; and its bulk to the fullness of the arteries, veins, oily cells, and lymphatics. — Hence we see, why in old age, leanness, consumptions, atrophies, constant heat, and hard labour, their redness as well as bulk are so diminished; and yet in old age, leanness, &c. the motion remains. This may be effected, when the *muscles* have no redness left; as appears in insects, whose flesh is not perceivable.

The fibres, fasciculi, arteries, and nerves, may be separated from each other in a live or a dead body, without breaking: They are always in a degree of tension, and endued with a contractive force; so that when cut asunder, the ends fly back from each other; and then they become shorter, their bulk is lessened, and they contract themselves into an undular kind of surface, and throw off their proper juices. Hence it appears that they are always in a state of violence, are ever opposing their elongation, ever endeavouring to shorten themselves, but more in a live body than in a dead one; and therefore require antagonists.

If the brain be strongly compressed, or have any violent contusion; if it be suppurated, obstructed, or torn, the voluntary action of all the *muscles* immediately ceases; as well as all sense and memory: however the spontaneous action of the *muscles* in the heart, lungs, the viscera, and vital parts, remains. — These same alterations being made in the cerebellum, the action of the heart, lungs, and life itself, ceases; when yet the vermicular motion continues a long time after in the stomach and intestines.

The nerve of any *muscle* being compressed, tied up, corrupted, or cut, all the motion of that *muscle*, both vital and voluntary, immediately ceases; and if a nervous trunk sending branches to several *muscles*, be thus bound up, cut, &c. they are all affected in the same manner. — The same things being done in any part of the spinal marrow, the action of all the *muscles* whose nerves arise from the part affected, is destroyed: And, the same thing being done to the artery which carries blood to one or more *muscles*, the effect is the same.

The tendon of a *muscle* in action, does not undergo any sensible alteration, but the belly shortens, becomes hard, pale, swollen, protuberant; the tendons are approached nearer, and the more moveable part fastened to the tendon, is drawn towards the other less moveable: which action of a *muscle* is called its *contraction*, which is much greater and stronger than that inherent contraction observed under the first phenomenon; and therefore is not natural, but superadded. — The tendon of a *muscle* not in action, is still the same; but the belly softer, redder, laxer, longer, and flatter: and this state of a *muscle* is called its *relaxation*, though it is usually owing to the contrary action of its antagonist; for that being frustrated, the contraction of the other continues, as not being balanced by the action of an antagonist.

If one antagonist remain at rest while the other is in action, the member in that case will be bent; if both act at the same time, it will be fixed and immoveable; if neither act, it will be indifferent, and ready to be moved whither the least excess shall carry it.

All which changes are performed in the smallest moment of time, and in the whole *muscle* at once; so that they can pass and repass reciprocally without leaving any trace in the body behind them.

By injecting warm water into the artery of a quiescent *muscle*, even that of a dead carcass, its contraction is restored; and that long after death. — The bulk of a *muscle* is increased rather than diminished by every experiment of its contraction.

A limb being bent, by some external force, against the will, the flexor *muscle* of that member assumes a state of contraction, as if acted by its proper motion; though not altogether so strenuously. — The will remaining indifferent, all the voluntary *muscles*, and all their vessels, are equally full, and moved by the blood and spirits equally conveyed to them, and that throughout the whole body at once.

For the application of this structure of the *muscles*, in account-

ing for the great phenomenon of muscular motion; see *MUSCULAR Motion*.

As to the muscular fibres, or, which comes to the same, the fasciculi of muscular fibres, they have not always the same situation with regard to each other, nor run in the same direction, but sometimes run parallel to themselves and their tendons; and are sometimes disposed obliquely both to their tendons and to each other. Hence there arise two different kinds of *muscles*: the one direct, and parallel; which some call *simple MUSCLES*. The other inclined, or oblique; called *compound MUSCLES*.

Under the first of these kinds are included several other species: for, first, either the fleshy fibres run strait from one extreme to the other, as in the  *Sartorius*, &c. or are turned into a circle, as in the *sphincters* of the bladder, and anus; or twisted into a spiral, as in the *oesophagus*: And hence they come to be called *recti*, *orbiculares*, and *spirales*. See *RECTI*, *SPHINCTER*, *ORBICULARES*, &c.

The second kind also includes various species, according to the various angles which the oblique fibres make with the tendons; some inclining equally to each tendon, so as to form a rhombus, or acute angled parallelogram with them, whence the *muscles* are called *rhomboidales*; others arising from two parallel tendons, are inserted obliquely into one common tendon, as in the biceps of the hand; lastly, others arising from the periphery of the circle, concur in a centre, and form *muscles* called *radii*. See *RHOMBOIDES*, *RADIÆUS*, &c.

There are divers other species, and divisions of *muscles*. — Some authors distinguish them into *muscles* of *voluntary*, and of *involuntary*, or *necessary motion*.

*MUSCLES* of *involuntary*, or *necessary motion*, have their contracting and extending powers within themselves, and have no antagonist: such are the heart and lungs supposed to be. See *HEART*, and *LUNGS*.

*MUSCLES* of *voluntary motion*, which we more peculiarly denominate *muscles*, and which are those we have here chiefly regard to, have each of them their antagonist *muscles*, which act alternately in a contrary direction; the one being stretched and extended, while the other is contracted at the instance of the will. See *MOTION*.

The *muscles* have also different names from their different actions, situations, forms, &c. Those which serve to move the same members contrary ways, are called *antagonists*; and those that concur to the same action, *fellows*, or *pairs*.

*Digastric MUSCLES*, are those which have two bellies. — *Trigastrics*, those with three. See *DIGASTRIC*, and *BIVENTER*.

*Sphincter MUSCLES*, are those destined to shut several apertures and passages in the body; as the *muscle* at the neck of the bladder, and that of the anus, which have the same effect with the string of a purse to close those parts. See *SPHINCTER*.

Some *muscles* have two or three heads, called *biceps* and *triceps*. See *BICEPS*, *TRICEPS*, &c.

We call *elevators*, those which lift up or raise the parts; *depressors*, those which move them downwards. See *ELEVATOR*, &c.

*Flexors*, those which bend them; *extensors*, those which stretch them out; *adductors*, those which move the parts inwards; *abductors*, those which move them outwards; *rotators*, those which move them round. See *FLEXOR*, *EXTENSOR*, *ABDUCTOR*, *ADDUCTOR*, *ROTATOR*, &c.

*Muscles* have also different names from their different figure; some resembling a bat; some a lizard; and some a turbot: Some are triangular, others square, others scalenous, others pentagonal, others pyramidal, round, &c. Whence the names of *deltoides*, *rhomboides*, *scalenus*, *trapezius*, &c. See *DELTOIDES*, *SCALENUS*, *TRAPEZIUS*, &c.

Anatomists are not agreed on the number of *muscles* in the human body; some reckon five hundred and twenty-nine; some four hundred and forty-six; and others only four hundred and thirty-five. — The calculus, according to these last, is as follows. Two of the forehead; two of the occiput; six of the eyelids; twelve of the eyes; seven of the nose; eight of the external ear; four of the internal ear; thirteen of the lips; eight of the tongue; four of the palate; fourteen of the larynx; seven of the pharynx; ten of the os hyoides; twelve of the under jaw; fourteen of the head; eight of the neck; eight of the omoplates; eighteen of the arms; twelve of the elbows; eight of the radii; twelve of the carpi; forty-eight of the fingers; fifty-seven of use in respiration; six of the loins; ten of the abdomen; two of the testicles; one of the bladder; four of the penis; four of the anus; thirty of the thighs; twenty-two of the legs; eighteen of the feet; forty-four of the toes.

The following table of the names and offices of the several *muscles* in the body is taken from Dr. Keil.

*Frontales*, serve to pull the skin of the forehead upwards. *Occipitales*, pull the skin of the hind-head upwards.

*Attollens* } *auricularum*.  
*Deprimens* }

*Internus malleoli*, distends the tympanum.

*Externus malleoli*, relaxes the tympanum.

*Obliquus malleoli*.

*Musculus stapedis*, moves the stirrup.

*Contragator*

# M U S

*Corrugator supercilii.*  
*Rectus palpebræ superioris*, lifts up the upper eye-lid.  
*Orbicularis palpebrarum*, shuts both eye-lids.  
*Attollens*  
*Deprimens* } *oculorum.*  
*Abductor*  
*Adductor*  
*Obliquus major*, pulls the eye forwards, and obliquely downwards.  
*Obliquus minor*, pulls the eye forwards, and obliquely upwards.  
*Attollens*  
*Dilatans* } *nares.*  
*Deprimens*  
*Incisivus*, pulls the upper lip upwards.  
*Triangularis*, pulls it downwards.  
*Caninus*  
*Elevator labii inferioris* } pull the lower lip upwards.  
*Quadratus*, pulls it downwards.  
*Zygomaticus*, draws both lips obliquely to either side.  
*Orbicularis*, draws both lips together.  
*Buccinator*, thrusts the meat between our teeth.  
*Temporalis* } pull the jaw upwards.  
*Masseter*  
*Pterygoideus internus*, draws the jaw to either side.  
*Pterygoideus externus*, draws the jaw forwards.  
*Quadratus*, pulls the jaw and the cheeks downwards.  
*Digastricus*, pulls the jaw downwards.  
*Peristaphylinus internus*, pulls the uvula forwards.  
*Peristaphylinus externus*, pulls the uvula backwards.  
*Styloglossus*, draws the tongue upwards.  
*Genioglossus*, pulls it out of the mouth.  
*Ceratoglossus*, pulls it into the mouth.  
*Geniohyoidæus*, pulls the os hyoides and tongue upwards and forwards.  
*Sternohyoidæus*, pulls the os hyoides downwards.  
*Milohyoidæus*, pulls it obliquely upwards.  
*Coracohyoidæus*, pulls it obliquely downwards.  
*Stylohyoidæus*, pulls it to either side, and somewhat upwards.  
*Stylopharyngæus*, pulleth up and dilateth the pharynx.  
*Oesophagæus*, streightens the pharynx.  
*Sternothyroidæus*, pulls the thyroides downwards.  
*Hyothyroidæus*, pulls the thyroides upwards.  
*Cricothyroidæus.*  
*Cricocarytænoidæus posticus.*  
*Cricorytænoidæus lateralis.*  
*Thyrcarytænoidæus*, dilates the glottis.  
*Arytænoidæus*, contracts the glottis.  
*Splenius* } move the head backwards.  
*Complexus*  
*Rectus major* } nod the head backwards.  
*Rectus minor*  
*Obliquus inferior* } perform the semicircular motion of the head.  
*Obliquus superior*  
*Mastoidæus*  
*Rectus internus major* } nod the head forwards.  
*Rectus internus minor*  
*Rectus lateralis*, nods the head to one side.  
*Intercostales interni & externi*  
*Subclavius* } pull the ribs upwards in inspiration.  
*Serratus anticus major*  
*Serratus posticus superior*  
*Triangularis*  
*Serratus posticus inferior* } make the motion of the ribs downward in expiration the swifter.  
*Sacro-lumbaris*  
*Diaphragma*, used in inspiration and expiration.  
*Obliquus externus* } compress the parts contained in the lower belly; assist the motion of the ribs downwards in expiration; and help to bend the vertebræ of the loins forwards.  
*Obliquus internus*  
*Transversalis*  
*Rectus*  
*Pyramidalis*  
*Longissimus dorsi*, keep the body erect.  
*Transversalis dorsi*, move the body obliquely backwards.  
*Inter-spinalis*, draws the acute processes near one another.  
*Quadratus lumborum*, draws the vertebræ of the loins to one side.  
*Longus* } bend the vertebræ of the neck.  
*Scalenus*  
*Psoas parvus*, helps to bend the vertebræ of the loins.  
*Cremaster*, draws up the testicles in the act of generation.  
*Erectores penis.*  
*Transversales penis.*  
*Acceleratores urinæ.*  
*Erectores clitoridis.*  
*Sphincter vesicæ*, contracts the neck of the bladder, that the urine may not run continually.  
*Levatores ani*, draw up the anus.  
*Sphincter ani*, shuts the anus.  
*Serratus anticus minor*, draws the shoulder-blade forwards.  
*Trapezius*, moves it upwards, backwards, and downwards.  
*Rhomboides*, pulls it backwards.  
*Levator scapulæ*, pulls the shoulder-blade upwards.

# M U S

*Deltoides*  
*Supra spinatus* } lift the arm upwards.  
*Coracobrachialis*  
*Teres major* } pull the arm downwards.  
*Latissimus dorsi*  
*Pectoralis*, moves the arm forwards.  
*Infra spinatus* } draw the arm backwards.  
*Transversalis*  
*Subscapularis*  
*Biceps* } bend the fore-arm.  
*Brachæus internus*  
*Longus*  
*Brevis* } extend the fore-arm.  
*Brachæus externus*  
*Anconæus*  
*Rotundus* } perform the motion of pronation, or turn the palm of the hand downwards.  
*Quadratus*  
*Longus* } perform the motion of supination, or turn the palm of the hand upwards.  
*Brevis*  
*Cubitæus internus* } bend the wrist.  
*Radæus internus*  
*Cubitæus externus* } extend the wrist.  
*Radæus externus*  
*Palmaris*, helps the hand to grasp any thing closely.  
*Palmaris brevis*, makes the palm of the hand concave.  
*Sublimis* } bend the fingers.  
*Profundus*  
*Extensor digitorum communis.*  
*Lumbricales*, assist in bending the first joint of the fingers.  
*Interossei interni*, draw the fingers to the thumb.  
*Interossei externi*, draw the fingers from the thumb.  
*Flexor pollicis longus.*  
*Flexor pollicis brevis.*  
*Extensor primi.*  
*—secundi.*  
*—tertii internodii pollicis.*  
*Thenar*, draws the thumb from the fingers.  
*Antithenar*, draws the thumb to the fingers.  
*Abductor indicis.*  
*Extensor indicis.*  
*Hypothenar*, draws the little finger from the rest.  
*Extensor auricularis.*  
*Psoas*  
*Iliacus* } bend the thigh.  
*Pectinæus*  
*Glutæus major* } extend the thigh.  
*Glutæus medius*  
*Glutæus minor*  
*Triceps*, pulls the thigh inwards.  
*Pyramiformis*  
*Gemini* } move the thigh outwards.  
*Quadratus*  
*Obturator internus* } help to move the thigh obliquely and circularly.  
*Obturator externus*  
*Seminervosus*  
*Semimembranosus* } bend the leg.  
*Biceps*  
*Gracilis*  
*Rectus*  
*Vastus externus* } extend the leg.  
*Vastus internus*  
*Cruræus*  
*Sartorius*, makes the legs cross one another.  
*Popliteus*, turns the leg somewhat inwards.  
*Membranosus*, turns it a little outwards.  
*Tibialis anticus* } bend the foot.  
*Peronæus anticus*  
*Gastrocnemii* } extend the foot.  
*Soleus*  
*Plantaris*  
*Tibialis posticus*, moves the foot inwards.  
*Peronæus posticus*, moves the foot outwards.  
*Profundus*

MUSCULAR, or MUSCULOUS, something that relates to the muscles; or that partakes of the nature thereof. See MUSCLE. In which sense we say, *muscular fibre*, *muscular coat*, *muscular flesh*, *muscular veins*, *muscular arteries*, &c.

MUSCULAR *arteries*, two arteries proceeding from the subclavians, and distributed among the hind-muscles of the neck. The same denomination is also given by some to certain arteries of the loins: These are divided into *upper* and *under*. — *Musculares superiores*, the *upper-musculars*, proceed from the large artery, and lose themselves in the flesh.

The *under-musculars*, *musculares inferiores*, are branches of the inner iliac arteries. See ARTERY.

MUSCULAR, *muscularis*, is also a name given to two arteries of the thigh, the one called the *internal muscular*, as being distributed among the inner muscles of the thigh; the other the *external muscular*, because it proceeds to the outer part.

MUSCULAR *fibres*, are fine threads, or fibres, already described, whereof the body of muscles is composed. See MUSCLE. Anatomists are exceedingly divided as to the nature of these fibres. Some will have them blood-vessels, *viz.* veins and arteries; others, nerves, &c. See ARTERY, NERVE, &c. Some restrain *muscular fibres* to the longitudinal and red, called also *fleshy fibres*: The transverse, and spiral ramifications wherewith the former are bound about, they call *nervous fibres*. See FIBRE.

Dr. Morgan endeavours to prove, that all the fibres which enter the structure and composition of a muscle, are endued with an intrinsic elasticity, spring, or power of contracting or restoring themselves, as a given weight or force, by which they may be stretched; and that this elasticity, or contractive restitutive power, being a natural inherent property of the fibres themselves, does not depend on the mixture, rarefaction, or effervescence of any fluids, or humours whatsoever. See MUSCULAR *motion*.

MUSCULAR *flesh*. See the article *Muscular FLESH*.

MUSCULAR *membrane*, *membrana musciosa*, is a membrane supposed to invest the whole body, immediately under the adipose membrane; called also *panniculus carnosus*, and *membrana muscilorum communis*. See PANNICULUS *carnosus*, and MEMBRANA *communis*.

MUSCULAR *motion*, is the same with voluntary or spontaneous motion; thus called, because effected by means of the contraction and dilatation of the muscles. See MOTION, MUSCLE, &c.

The mechanism of a *muscle* we have delivered at large; but how this mechanism is employed to produce motion in animals, is matter of endless doubt. — The generality of writers suppose the belly of the *muscle* to be swelled, and thus its extremes brought nearer; and consequently the part it is fixed to, moved.

The structure of a *muscle* we have shewn to be such as renders it capable of being swelled and contracted, and by that means of having its extremities brought nearer each other, which is its proper action: But how the contraction is effected, is the point in dispute!

The generality account for it from the influx of some fluid into the muscular fibres. — Others solve it from the natural elasticity of those fibres. — And the retainers to a fluid, are subdivided as to the particular fluid employed for this purpose.

From the structure and phenomena of the *muscles* above laid down, we may gather the properties of the hidden cause that moves the *muscles*; *viz.* 1<sup>st</sup>, That it may either be present or absent in a *muscle*; and therefore, 2<sup>dly</sup>, May enter into it, and go out again: *i. e.* 3<sup>dly</sup>, It is derived to it from some other place, and passes from it elsewhere: And, 4<sup>thly</sup>, All this, by an instantaneous direction of the will: 5<sup>thly</sup>, And in the same moment of time, wherein the *muscle* is contracted, must pass from within outwards to every point of the surface of the *muscle*; that is, 6<sup>thly</sup>, It must be at once equally distributed throughout the whole belly of the *muscle*: And therefore, 7<sup>thly</sup>, fill and dilate the membranes of the fibres, change them from an oblong into a more spherical figure, lengthen their less diameter, and diminish their longer, and so draw the tendons nearer each other: 8<sup>thly</sup>, That it must have its rise from the cerebrum and cerebellum, the origin of the nerves, and be powerful enough to overcome those obstacles which here strongly resist it. — On the whole then, it must be a most fluid, subtle, active body, and be applied with some energy within the *muscle*. Now all the fluids in the body that have any pretensions to these properties, that are any way qualified to produce the phenomena above, or that have been alledged as the cause of *muscular motion*, are the *animal spirits*, (or, as our later writers call it, the *nervous juice*) and the *blood*: but as each of these singly scarce appears adequate to the effect, our authors have supposed them to mix in the *muscles*, and each to contribute to the action of the other. — But the animal spirits seem to have the greatest number of advocates, though their existence was never yet fully proved; besides that the manner of their action, as assigned by authors, seems to be arbitrary and precarious.

Some, with the learned Dr. Willis, make the tendons a receptacle for the spirits, which are raised at the instigation of the

will, and sent thence into the belly of the *muscle*; where meeting with the active particles of the blood, they ferment, and cause an intumescence, and so contract the *muscle*.

Others, among whom Des Cartes and his followers, allow no receptacle for them but the brain, and send them thence through the nerves like lightening at every summons of the will; because they cannot allow the tendons to be a proper lodgment, on account of the closeness of their texture, nor can believe that the animal spirits should remain there inactive.

Others, among whom M. du Verney, imagine this intumescence may be without fermentation, by the animal spirits, and a juice from the arteries running into the tendons and fleshy fibres, and extending them; as ropes, &c. swell in moist weather. Dr. Chirac, and others, maintain, that every muscular fibre, besides its vein, artery, and nerve, has also from space to space, several little cavities, or pores of an oblong figure, when the *muscle* is slack or flaccid; and that the blood circulating thro' the *muscle*, is continually depositing into those pores a sulphurous recrement, abounding with alkaline salts; which meeting with the spirits that flow by the nerves into those same oval pores, their nitro-aerial particles ferment with the saline ones of the sulphurous recrement, and, by a kind of explosion, so distend the pores, as to change the long oval figure into a round one: and thus the *muscle* is contracted.

Borelli takes the fibres of a *muscle* to consist of a chain of rhombus's or lozenges, whose areas are enlarged or contracted as the nervous juice, with the lymph and blood, are let into, or forced out of them, at the instance of the soul.

Dr. Croon supposes every fleshy fibre to consist of a chain of little bladders, or globules, communicating with each other; into which the nutritious juice, and one or two more liquors entering, do, by means of the natural heat, make an effervescence; by which the body of the *muscle* is extended, &c.

Dr. Cheyne takes the small fibrillæ of the *muscles* to be so many slender elastic canals, bound about by small transverse parallel threads, which divide the hollow fibrillæ into so many elastic cystes or vesiculæ, which are orbicular, being formed of two concave segments of a sphere; into every one of which vesiculæ, an artery, vein, and nerve, enter; the two first to carry and bring back the blood, the last to carry thither the liquidum nervosum, or nervous juice, which mingling in the vesiculæ with the blood, does, by its acid pointed particles, prick and break the globules of the blood, so as to let out the imprisoned elastic air (contained in the globules) into those little vesiculæ; whereby the elastic cells of the fibres will be blown up, and thereby their longitudinal diameters from cell to cell strained: and this must contract the length of the whole fibre, and so move that organ to which one of the tendons is fixed.

Dr. Keil, not contented with this theory, sets up another, wherein the same structure of the *muscle* is supposed, and the same fluid; *viz.* the blood and nervous juice, the agents or instruments of contraction: but instead of the pungent particles of the nervous juice piercing the globules of blood, and setting at liberty the imprisoned elastic aura, he resolves the whole into the power of attraction. See ATTRACTION.

According to this author, the distension of the vesicles of the fibres is not owing to their being filled with a greater quantity of blood and animal spirits than before their contraction; but to a rarefaction arising from the mixture of those two fluids, by means whereof they come to possess a greater space.

To account for this rarefaction of the blood and spirits in the vesicles of the muscular fibres, he supposes a small globule of air between the particles of a fluid, which particles have a strong attractive force, whereby they endeavour to come together: By pressing every way equally on the globule of air, they will hinder its escape from between them. But the force whereby they endeavour to come together being vastly greater than that of gravity, the globule of air must be considerably condensed; but the force of elasticity being proportional to that of its condensation, the force wherewith the airy globule endeavours to expand itself, will likewise be vastly great: so that if the nifus of the particles of the fluid to come together should be taken off, the air between them would expand itself with a considerable force. Now, if upon the mixing of another fluid, the particles of the first fluid be more strongly attracted to the particles of this other fluid, than they were before to one another, their nifus to one another will then cease, and give the inclosed globule of air liberty to expand itself; so that the whole fluid will take up a greater space than it did before: But when the particles of the two globules come to be united together, they will again inclose the globule of air that lies between them, and, by their mutual attraction, soon bring it to its former state of condensation.

Now, that the blood contains a great number of globules of air, is evident from the great quantity it yields in the air-pump; and that the particles of the blood have a strong attractive force, cannot well be denied. — Upon the meeting, then, of these two fluids in the vesicles of the fibres, the nervous juice, consisting of smaller particles than the blood, must, from what Sir I. Newton has proved of the rays of light, attract the particles whereof they are composed more strongly than

than those do one another; and consequently the nifus of those particles to one another ceasing, the condensed globule of air will expand itself with a considerable force; whereby each vessel of the fibre will be distended, and consequently, therefore, shortened; *i. e.* the whole muscle will be contracted: but when the particles of the blood are well mixed with the nervous fluid, they will both together inclose the globule of air again, and compress it into as small a space as it was before: And the contraction of the muscle must immediately cease, till fresh blood and spirits, still succeeding one another, continue the inflation of the vesicles. But when a muscle has been strongly attracted for some time, the quantity of spirits spent being more than can be prepared in the space of time by the glands which supply its nerves, the inflation of the vesicles must fall, and the muscle grow feeble and weak.—And thus that ingenious author conceives the vesicles to be distended without any ebullition or effervescence; and their distension to cease without any precipitation, or flying-off, of the aerial globules through the pores of the muscles.

He proceeds to shew how artfully the mechanism of the fibres is contrived for contraction.—It is a known experiment, that a bladder blown up and distended as to its capacity, but contracted as to length, will raise a weight to some determined height. Two bladders, therefore, thus blown up, and communicating with each other, he argues, will raise the weight double the height, and three bladders thrice the height, &c. So that if there were a string of bladders joined together, of equal bulk, and like figures, the space through which the weight would rise, would be proportionable to the number of bladders, *i. e.* to the length of the string.—Now each fibre of a muscle consisting of an infinite number of small vesicles, resembles a chain or string of bladders; so that the contraction of the muscle is always proportionable to the length of its fibres. Farther, the vesicles whereof the fibres consist being very small, though one large bladder might raise a weight as high as several small ones, yet the quantity of elastic fluid used in the inflation would in that case be much greater than where the weight is raised by a string of small ones.

For, supposing two bladders of similar figures, but the diameter of the one triple that of the other; then will the one require twenty-seven times the quantity of elastic fluid to expand it that the other does, and will also expand to twenty-seven times the space; and yet three of the less bladders joined together, (he goes on) will raise the weight to the same height that the bigger one does; but with nine times less expence of elastic fluid, and take up but a ninth part of the space.—By diminishing, therefore, the bigness of the vesicles, and increasing their number, the force required to distend them, and the distension itself, may be diminished in any given proportion, and come at last to be insensible. Suppose a bladder, *v. gr.* of a determinate bigness, can raise a weight a foot; a hundred bladders, whose diameters are each a hundredth part of the former, being blown up, will raise the weight to the same height; but the force required to inflate them, and the swelling of all put together, will be ten thousand times less than of the large one.

Again, if a weight of a determinate bigness can be raised to a certain height by a bladder, or one string of bladders, to which the weight is tied; twice that weight may be raised by two such bladders, or strings; thrice by three, &c. and, consequently, the weight a muscle can raise, will be always as the number of its fibres, *i. e.* as its thickness, supposing the distension of the vesicles equal, and the absolute strength of one muscle to that of another, as their bulks.—Thus much for the once flourishing system of the chain of bladders; which being liable to very great difficulties as to the geometricity of it, has of late given way to others.

Dr. Boerhaave finding all the requisites before laid down, for the action of the muscles in the nervous juice, or animal spirits, and in no other fluid in the body, thinks it needless to have recourse to a mixture of several liquors where one will do; and therefore makes no scruple to attribute the whole business to it alone.—The manner of action he conceives thus:

Suppose the spirit, from any cause, to be moved more swiftly from the origin of some one nerve, than through the rest; the influx will here be greater into the muscular fibre open to this nerve than into another: This will therefore be more dilated; and the other phenomena mentioned above will succeed. The same cause continuing, the effect will be increased, so that in a moment of time, the whole will be swelled up; and while the same determination lasts, will remain contracted. And this obtaining in an infinite number of fibrillæ at once, the whole muscle will be inflated.

Hence it necessarily follows, that as the celerity is increased in one nerve, the motion will be less in another; this therefore being relaxed, the effort in contraction will be the stronger. For which reason, all the turgid fibres of a muscle will compress the intermediate spaces and blood with a great force; whence the veins will be emptied, and the arteries being compressed, will repel the grosser, that is, the red parts of the blood, but will drive the more subtle parts by the force of the heart and their own, into the most minute canals; and thus the

crucior being expelled, the whole body of the muscle will be found to act by a subtle humour concurring from the nerves and arteries.

Thus are all the phenomena accounted for; without any other assumption, than an accelerating force in the origin of the nerves; which is common to all hypotheses, and which cannot be traced any further.

All other systems, therefore, Boerhaave absolutely rejects; nor makes the least account of Galen's incorporeal power inflating the muscles; the nitrous spirit of the nerves mixing with the oil of the blood, and so rarefying it; the acid parts of the nervous juice mixing with the alcalious ones of the blood, the ebullition of the air, and the arterious juice; and the increase or diminution of attractive force of the minute corpuscles of the humours, as repugnant to sense, experience, the laws of matter, and of mixture, and to the phenomena of the muscles.

Dr. Astruc has gone a good way towards proving the nervous juice alone concerned in muscular motion; and that the blood has no share in it; by the following experiment, which he tried several times with the same success.

Cutting open the abdomen of a live dog, and removing the intestines out of the way, he bound up the aorta where it divaricates into the iliac arteries, with a thread, so as to constrict each iliac and the hypogastric artery very closely; then sewing up the epigastric muscles, he found the sensation and motion still as brisk and vivid in the dog's posteriors, as before. So that when once set at liberty, he stood on all four, and walked with his usual ease and firmness; though it is certain there could not be one drop of blood conveyed to those hind parts.

Astruc, however, differs from Boerhaave in the manner wherein this nervous juice acts; nor will allow that celerity, wherein the muscles act at the command of the will, to be owing to the velocity of the juice sent through the nerve, but to an impression given to one extremity of the thread, and communicated through all the intermediate parts to the other extremity; supposing the nerves in their natural state to be turgid, and full of spirits: so that if the extremity in the sensory be ever so little pressed by the accession of any new spirit, as much will be instantly expelled at the other extreme; and, vice versa, a small impression given to the outer extremity of the nerve, will immediately move the other extreme open to the sensory, so that part of it will drop out: Which accounts for sensation as well as muscular motion. See SENSATION.

Lastly, Dr. Lower, and Mr. Cowper, and after them Dr. Morgan, and other of the latest writers on that subject, setting aside all adventitious fluids, account for muscular motion from the intrinsic elasticity of the nervous fibrillæ contracting and restoring themselves against the stretching force of the circulating blood.

This system, Morgan endeavours to evince from the following considerations.—1<sup>o</sup>, All the vessels in an animal, consisting of flexible, distractile fibres, are in a state of tension; *i. e.* are both stretched transversely and longitudinally by their contained fluids: Thus, *v. gr.* let a vein, or artery be cut, and the opposite sides of the vessel will contract, and come nearly to a contact about the axis; while the two ends receding both ways leave a chasm: which shews that the vessel, while in its natural state, was distended both ways; and, consequently, that contraction, in all their dimensions, is the natural intrinsic action of the vessels, or fibres.

And the same might be deduced, a priori, from the growth of animals; for by the increased quantity of the accumulated blood, the vessels must necessarily be enlarged every way. Now, against this distending power of the fluids, the solid muscular fibrillæ continually exert a contractive, or restitutive force, by which they are kept in their proper state of tension.

2<sup>o</sup>, That this contractive power of the muscular fibres is a natural intrinsic property of the fibres themselves, and does not depend on any mixture, or mutual action of fluids, is evident from hence, that these fibres retain the same property, after they are taken out of the body and dried; as we see in thongs, catgut, and other such like cords or strings, cut out of the muscular coats and skins of animals, which may be stretched out to a considerable length beyond their natural state; and when the stretching force or weight is taken off, they will immediately contract again by their native spring.

3<sup>o</sup>, While a muscle contracts, the blood is squeezed out, and during its state of contraction, it is more hard and solid than before; that is, contains less blood when contracted, than when stretched; which shews, that the contraction cannot be by the addition of another fluid from the nerves mixing with the blood in the muscles.

4<sup>o</sup>, No such fluid in the nerves could ever be found, as being mixed with the blood, would occasion such fermentation, or expansion. But supposing the muscular cells thus inflated, no such effect could follow, as shortening the muscle in length, and swelling it in thickness: But the consequence must be, that the muscle would be lengthened as well as thickened; that is, it must increase its dimensions proportionably every way, which is the proper action of fluids on the solids.

If then it be said, that these bladders, when the muscle is stretched,

stretched, are drawn into oblong spheroids; and when inflated, by the mixture of the nervous fluid, reduced to a spherical figure, by which means their axes are shortened, and their conjugate diameters enlarged: It is answered, that those small vesicles are soft, flexible, distractile, and equally yielding every way; and since an included expansive fluid must press its containing vessels equally yielding every way, and equally expansive; a vessel, notwithstanding such distension, must retain its natural figure, and be equally stretched in all directions.

Again, since the blood circulates freely through these muscular cells, it is plain, that as soon as they begin to inflate, it must be immediately pushed forward with an increased velocity in the course of its circulation, which must prevent any such inflation in the muscles. Before these vessels, therefore, can be distended in the manner supposed, the exit of the fluid must be hindered; that is, the circulation must be stopped. If any one doubt of this, let him try whether he can blow up a bladder, or other vessel, that is open at both ends, and where the expansive fluid has as free an egress as ingress.

Thus much premised, the natural action of a muscle will be easily explained. From its structure, it follows, that on the contraction of its transverse and spiral fibres, which are the ramifications of the nerves, the longitudinal, red, and fleshy fibres, or blood-vessels, which constitute the body of the muscle, must be squeezed and drawn together, as being compelled to follow the motion of these elastic cords; by which means the blood being compressed, must be forced, with some impetuosity, through the muscle, and propelled forward in the course of its circulation.

Now if the blood should hereupon stop, and return no more to the muscle, it is plain the muscle must for ever remain in this contracted state, as its proper and natural state of quiescence to which it tends, and where it would rest: But the blood having received a fresh impetus by the contraction, and returning upon the muscle in the course of its circulation, again rushes into the blood-vessels, which being enlarged in all their dimensions by the force of the returning blood, the transverse and spiral nervous fibres must be hereby stretched, and the muscle extended: till by this means the blood-vessels being brought to their natural extent, and consequently the distending force of the blood ceasing, the contractive power of the nerves begins to act again, and restore them with the same force by which they were extended; till the returning blood re-enters the muscle, and stretches it again.

MUSCULAR consumption. See the article CONSUMPTION.

MUSCULAR, is also an appellation given to several veins; two whereof come from the skin and the hind-muscles of the thigh, and terminate in the subclavians. See VEIN.

There are three others in the loins also called *musculares*, and distinguished into *upper*, *middle*, and *under*; the first terminates in the trunk of the vena cava, and the two others open into the external iliac vein.

MUSCULI *aliformes*.

MUSCULOUS. See the article MUSCULAR.

MUSEUM, ΜΟΥΣΕΙΟΝ, was originally used to signify a place in the palace of Alexandria, which took up at least a fourth part of the city; so called, as being destined and set apart to the *muses*, and the sciences. See MUSE.

Here were lodged and entertained a great number of learned men, who were divided into companies or colleges, according to the sciences or sects whereof they were professors.—And to each house or college was allotted a handsome revenue—This establishment is attributed to Ptolemy Philadelphus, who here fixed his library. See LIBRARY.

MUSEUM has hence passed into a general denomination; and is now applied to any place set apart as a repository for things that have some immediate relation to the arts, or the *muses*. See REPOSITORY, CABINET, &c.

The MUSEUM at Oxford, called the *Ashmolean museum*, is a noble pile, erected at the expence of the university, for the promoting and carrying on several parts of curious and useful learning.—It was begun in 1679, and finished in 1683; at which time a valuable collection of curiosities was presented to the university by Elias Ashmole, Esq; and the same day there repositied, and afterwards digested and put in a just order by Dr. Plott, who was constituted first keeper of the *museum*.

Divers considerable accessions have been since made to the *museum*; as of hieroglyphics, and other Egyptian antiquities, by Dr. Huntingdon; and of an entire mummy by Mr. Goodyear; of a cabinet of natural rarities by Dr. Lister; also of divers Roman antiquities, altars, medals, lamps, &c.

Over the entrance of the *museum* is this inscription; MUSEUM ASHMOLEANUM, SCHOLA NATURALIS HISTORIÆ, OFFICINA CHYMICA.

MUSES\*, ΜΟΥΣÆ, ΜΟΥΣΑΙ, fabulous divinities of the antient heathens, who were supposed to preside over the arts, and sciences. See GOD, &c.

\* The word, according to Phornutus, is derived from the Greek, *μυωθαι*, which signifies the same with *ζητεω*, to search: Others

derive it from *μυωθαι*, similar, or alike; all the sciences being bound and united together: Eusebius derives it from *μυω*, to initiate, to instruct: Plato and Scaliger from *μαιωθαι*, *obstetricare*, because to them are attributed the invention of arts; and it is they who produced them. Lastly, Heinsius and Vossius derive it from the Hebrew, מוֹשֶׁה *mosar*, science, *disciplina*.—The *muses* are called by various names; *Camene*, *Heleconides*, *Parnassides*, *Anides*, *Pierides*, *Pegassides*, *Aganippides*, *Thespiades*, *Libetbrides*, and *Castalides*.

The antients admitted nine *muses*, and made them the daughters of Jupiter and Mnemosyne, or Memory. At first, indeed, their number was but three; viz. Melete, Mneme, and Aæde; Greek words signifying memory, singing, and meditation. But a certain sculptor of Sicyon having orders to make three statues of the three *muses* for the temple of Apollo, and mistaking his instructions, made three several statues of each *muse*; these however were found so beautiful, that they were all set up in the temple, and from that time they began to reckon nine *muses*: To whom Hesiod afterwards gave names; viz. *Calliope*, *Clio*, *Erato*, *Thalia*, *Melpomene*, *Terpsichore*, *Euterpe*, *Polyhymnia*, and *Urania*.

Each of these were supposed to preside over their respective art; Calliope over heroic poetry; Clio over history; Melpomene over tragedy; Thalia over comedy; Euterpe over wind-music; Urania over astronomy; Terpsichore over the harp; Erato, the lute; Polyhymnia, rhetoric.

They are painted young, handsome, and modest, agreeably dressed, and crowned with flowers. Their usual abodes were about mount Helicon in Boeotia, and mount Parnassus in Phocis. Their business was to celebrate the victories of the gods, and to inspire and assist the poets; and hence the custom of invoking their aid at the beginning of a poem. See INVOCATION.

It must not, however, be imagined, that the deities thus invoked, are considered even by the antient poets themselves as divine persons, from whom they expect any real help. Under the name of *muse*, they pray for the genius of poetry; and all the talents and circumstances necessary for a happy execution of their undertaking.

Their addresses to the *muses* are mere allegories, and manners of expressing themselves poetically; as when they make gods of sleep, of fame, of revenge, and other natural and moral things. See GOD.

Accordingly, the *muses* are of all ages, countries, and even of all religions. There are christian as well as heathen *muses*; Latin, Greek, English, and French *muses*. There are also *new muses*, which appear every day in favour of those who, disdaining things too trite and common, chuse to strike out of the road. When Virgil wrote his Eclogues, he invoked the Sicilian *muses*, because he imitated Theocritus; and the Sicilian poet having succeeded, the Roman begged for a genius as happy as that of this islander.

The *muses* of the poet Lucretius had never inspired any person before him. It is plain, from the doctrine of his book, what kind of divinity it was he invoked. He addresses himself to Venus, but at the same time tells us, that none of the deities trouble themselves with human affairs. His *muses*, therefore, must of necessity be mere allegories.

MUSHROOM, or MUSHROM, in natural history, a plant, of a form and structure very different from that of all other plants; having neither seeds nor flowers, that have ever yet been discovered. See PLANT, SEED, &c.

There are various kinds of *mushrooms*; and the vulgar call by this name all that come under the general head of fungus's; by the Greeks called *μυκτες*.

They are all used with some suspicion, though some are more harmless, as well as more delicious, than others. Those used among us, are *mushrooms of the wood*, called *morilles*; and of the meadows, called *champignons*; which are gathered in autumn, and esteemed for their whiteness above, their carnation underneath, and the sweetness of their smell.

Mr. Bradley mentions a hundred kinds of *mushrooms*, which he has seen in England; besides those very numerous small ones, which constitute the mouldiness of liquors, fruits, &c. which last are such quick growers, that they arrive at perfection in less than twelve hours. See MOULDINESS.

The fungoides only differs from a *mushroom* in its external form; the coralloides are of the same species, though of a different name, as being branched like coral; and truffles come under the same kind. See TRUFFLES, &c.

Matthioli mentions *mushrooms* which weighed thirty pounds each, and were as yellow as gold. Fer. Imperatus tells us, he saw some which weighed above a hundred pounds; and, to add no more, the *Journal des Savans* furnishes us with an account of some growing on the frontiers of Hungary, which made a full cart load.

The origin and production of *mushrooms*, has extremely puzzled the botanists. How a plant should be produced without a seed, is a mystery; and yet the best microscopes are not able to discover any appearance of a seed; and the manner of cultivating this plant, seems to make it still more probable that it has not any. See SEED.

M. Tournefort gives a very curious account of their culture, in

in the *Memoirs of the Royal Academy*, with the substance of which we shall here present the reader.—All the secret of bringing up *mushrooms* speedily and in abundance, consists in ranging balls of horse-dung about the bigness of the fist, in lines, at the distance of about three feet from each other, and at the depth of one foot under ground, and covering these over with mould, and that again with horse-dung.

If this be done in April, in the beginning of August the pieces of dung will begin to whiten, and grow mouldy, being covered all over with little hairs, or fine white threads, branched, and woven about the straws whereof the dung is composed. The dung now loses its former excrementitious smell, and spreads an admirable odour of *mushrooms*.

According to all appearance, these white threads are no other than the opened seeds or buds of *mushrooms*, which seeds were before inclosed in the dung, but in so small a compass, that they could not be perceived till after they had shot themselves into little hairs. By degrees the extremity of these hairs grows round into a kind of button, which swelling by little and little, at length opens itself into a *mushroom*, whereof the lower part is a kind of pedicle, bearded in the place where it enters the ground, and at the other end loaden with a roundish capital or head, in the manner of a calotte, which expands itself without producing either seeds or flowers, that are sensible; the bottom is spread with laminæ, which proceeding from the centre to the circumference, may be called the *leaves of the mushrooms*.

At the foot of each *mushroom* are found an infinite number of little ones, not bigger than the head of a pin, when the others are at their growth. The buds of the *mushrooms*, or the white hairs of the dung, preserve themselves a long time without rotting, if kept dry; and if laid again on the ground, will produce new *mushrooms*.

*Mushrooms*, then, are nothing else but the produce of what we call the *mouldiness of horse-dung*: But what analogy is there between these two things? Or how should so artful and delicate a structure as this of a plant, result from the mere fortuitous concurrence of a few juices, differently agitated?

It seems past doubt then, that *mushrooms*, like all other plants, have their origin in seeds: Now we know that the seeds of plants cannot vegetate every where; there are first required certain juices proper to penetrate their coats, to excite a fermentation, and to join themselves to the little parts thereof, and increase them. Hence arises that infinite diversity of places, wherein different species of this plant are produced. There are some which will only grow on some other particular plants, whose trunk, bark, or roots, alone, have the juices proper for them.

What M. Tournefort mentions from Mess. Lemery and Mery, is still more surprizing: There is a species of *mushrooms*, which grow on the fillets and bandages applied to the fractures, &c. of the patients in the Hotel-Dieu. After which, it will not be at all surprizing that horse-dung, prepared in the manner M. Tournefort mentions, should be a soil, or matrix, capable of making common *mushrooms* grow.

Hence it seems to follow, that the seeds of *mushrooms* should be spread in an infinite number of places where they do not vegetate; and in a word, throughout the whole earth; and the same may be said of a great number of other plants. See SEED, and SEMINATION.

It must be owned, the imagination is shocked, at such a prodigious multitude of different seeds thrown every where at random, and in many places to no purpose; but a little reasoning will put the matter of fact past doubt.

Dioscorides tells us, he was assured that pieces of the bark of the poplar tree being laid in the ground over horse-dung, there would grow out of them very good *mushrooms*. Ruel says, that by boring the trunk of a white poplar tree near the root, and washing it with leven steeped in water, *mushrooms* spring out of it, as it were, instantly. He adds, that the hillocks produce several kinds of *mushrooms*, if the stubble be burnt on them in the rainy season.

M. Tournefort tells us, on his own knowledge, that where the stubble is burnt, as in Provence, Languedoc, and the islands of the Archipelago, there arise great quantities of black poppies in the first autumnal rains, which disappear the year following; so that they are never found but on burnt lands. And we know that after the burning of London, the ground as far as the fire reached, shot up with vast quantities of *erysimum latifolium majus glabrum*. One of the chief reasons, if not the only one, why mountains produce plants different from the plains or valleys, and places become fenny, from the same places when they were dry; is the difference in the nutritious juices found in those places. Without this, how shall we account for the origin of mistletoe or hypocyfius, which are never known to grow in the earth, at least without adhering to some other plant; but the one grows on trees, and the other to the root of the cystus? Why do the ivy, and vine of Canada, pellitory, polypody, the species of capillaries, grow only on the trunks of trees, on walls, and in the clefts of rocks, unless it be, that the juices of those places are the best adapted to them.

These, and other incontestable facts, prove plainly both the vast multitude of seeds dispersed every where; and the necessity of certain circumstances to make them vegetate.

If to this speculation on the invisible seeds of plants, we join that of the invisible eggs of insects, which must be allowed equal thereto, the earth will be found full of an inconceivable infinity of animals and vegetables, perfectly formed, and designed, as it were, in miniature; and only waiting for certain favourable circumstances to enable them to make their appearance in large. How rich then must the hand be that has sown with so much profusion! See INSECT, ANIMALCULE, &c. We have been the more particular on this head, on account of the oddness of the phenomena; and because what is here said of *mushrooms* will give light into the generation of all other vegetables, &c. whose seeds are yet undiscovered. See PLANT, and VEGETATION.

Dr. Lister, indeed, thinks he has found out the seeds of *mushrooms*. He instances, particularly, in the fungus porosus crassus magnus J. B. the texture of whose gills is like a paper pricked full of pin-holes. These gills, he makes no doubt, are the very flower and seed of this plant; when it is ripe, the gills are easily separable from the rest of the head, each seed being distinct from other, and having its impression in the head of the *mushrooms*; just as the seed of an artichoke hath in the bottom of it: the bigger end of the seeds is full and round, and they are disposed in a spiral order, like those of the artichoke: And the same he thinks will hold of all other *mushrooms*, however differently figured. If it happen that these, when sown, prove sterile, and do not produce their kind, it is no wonder; there being whole genus's of plants that come up, and flower, and seed, yet their seed was never known to produce plants of their kind, being no more than a barren volatile dust; as that of all the orchides, or bee-flowers, is said to be.

MUSIC, ΜΟΥΣΙΚΗ, the science of sound, considered as capable of producing melody, or harmony: or, the art of disposing and conducting sounds, considered as grave and acute; and of proportioning them among themselves, and separating them by just intervals, pleasing to the sense. See SOUND.

\* The word is supposed originally formed from *musa*, muse; the muses being supposed to be the inventors thereof. Kircher, however, will have it take its name from an Egyptian word, as supposing its restoration after the flood to have begun there, by reason of the reeds, &c. on the banks of the Nile.—Hesychius tells us, the Athenians gave the name *music*, μουσική, to every art.

Mr. Malcolm defines *music*, a science that teaches how sounds under certain measures of tune, and time, may be produced, and so ordered or disposed, as either in consonance, or succession, or both, they may raise agreeable sensations.

*Music* naturally divides itself into *speculative* and *practical*.

*Speculative Music*, is the knowledge of the materia musica, or how to produce sounds in such relations of tune, and time, as shall be agreeable in consonance, or succession, or both.

By which, we do not mean the actual production of these sounds by an instrument or voice, which is merely the mechanical or effective part; but the knowledge of the various relations of tune and time, which are the principles, out of which the pleasure sought derives. See TUNE.

*Practical Music*, is that which shews how these principles are to be applied; or how sounds, in the relations they bear to *music* (as those are determined in the speculative part) may be ordered, variously put together in succession and consonance, so as to answer the end.

And this we call the art of *composition*, which is properly the practical part of *music*. See COMPOSITION.

Some add a third branch, viz. *instrumental music*, or the knowledge of instruments; but as this depends altogether on the first, and is only an application or expression of it, it cannot come regularly under the definition, and consequently is no part of the division of the science.

The first branch, which is the contemplative part, divides itself into these two, viz. the knowledge of the *relations and measures of tune*, and the *doctrine of time*.

The former is properly what the antients call *harmonica*, or the doctrine of harmony in sounds, as containing an explication of the grounds, with the various measures and degrees of the agreement of sounds, in respect of their tune. See HARMONICA.

The latter is what they call *rhythmica*, because it treats of the numbers of sounds or notes with respect to time; containing an explication of the measures of long and short, or swift and slow, in the succession of sounds. See RHYTHMICA.

The second branch, or the practical part of *music*, as naturally divides into two parts, answering to the parts of the first.

That corresponding to the harmonica, the antients called *melopœia*; because it contains the rules of making songs, with respect to tune, and harmony of sounds; though we have no reason to think the antients had any thing like composition in parts.

That which answers to the rhythmica, they call *rhythmopœia*; containing rules for the application of the numbers and time. See RHYTHMOPOEIA.

We

We find a strange diversity in the antient writers, as to the nature, office, extent, division, &c. of *music*.

Hermes Trismegistus defines *music* to be the knowledge of the order of all things; which is also the doctrine of the Pythagorean school, and of the Platonists, who teach, that every thing in the universe is *music*.—Agreeable to which wide sense, some divide *music* into *divine* and *mundane*.

*Divine Music*, is that respecting the order and harmony which obtains among the celestial minds.

*Mundane Music*, is that which respects the relations and order of every thing else in the universe.

Though Plato, by *divine music* understands that which exists in the divine mind, viz. those archetypal ideas of order and symmetry, according to which God formed all things.—And as this order exists in the mundane creatures, he calls it *mundane music*.

This last species the antients again subdivided into four, viz.

*Elementary Music*, or the harmony of the elements of things.

*Celestial Music*, or the *music of the spheres*; comprehending the order and proportions in the magnitudes, distances and motions of the heavenly bodies, and the harmony of the sounds resulting from those motions.

*Human Music*, which consists chiefly in the harmony of the faculties of the human soul, and its various passions; and is also considered in the proportion, temperament, and mutual dependance of the parts of the body.—Lastly,

*MUSIC*, properly so called, which has for its object motion, considered as under certain regular measures and proportions, by which it affects the senses in an agreeable manner. See *MOTION*.

Now as motion belongs to bodies, and as sound is the effect of motion, and cannot be without it, but all motion does not produce sound; hence this last branch of *music* became farther subdivided.

Where the motion is without sound, or as it is only the object of sight, it was either called *musica orchestrica*, or *saltatoria*, which contains the rules for the regular motions of dancing.—

Or *musica hypocritica*, which respects the motion and gestures of the pantomimes. See *DANCE*, and *PANTOMIME*.

When the motion is perceived only by the ear, i. e. when sound is the object of *music*, there were three species; viz.

*Harmonica*, which considers the differences and proportions with respect to grave and acute.—*Rhythmica*, which respects the proportion of the sounds as to time, or the swiftness and slowness of their successions.—And *Metrica*, which belongs properly to the poets, and respects the art of making verses. See *HARMONICA*, &c.

Aristides, Quintilianus, Bacchius, and some other antient writers, define *music* the knowledge of singing, and of the things belonging thereto; which they explain by the motions of the voice and body: as if the singing consisted only in the different tones of the voice. See *SINGING*.

The same Aristides, considering *music* in the largest sense of the word, divides it into *contemplative* and *active*. The first, he says, is either *natural*, or *artificial*.—The natural is either *arithmetical*, which considers the proportion of numbers; or *physical*, which examines the order of the things of nature.

The artificial he divides as above, into *harmonica*, *rhythmica*, and *metrica*.

The *active*, which is the application of the artificial, is either *enuntiative*, as in oratory; *organical*, or instrumental performance; *odical*, for voice and singing; *hypocritical*, in the motions of the pantomimes.—To which some add *hydraulic*, though in reality no more than a species of the organical; in which, water is used, for the producing or modifying of sound. See *HYDRAULICS*.

Porphyrus makes another division of *music*, taking it in the limited sense, as having motion both dumb and sonorous for its object; and without distinguishing the speculative and practical, he makes its parts these six, viz. *rhythmica*, for the motions of dancing; *metrica*, for the cadence and recitation; *organica*, for the practice of instruments; *poetica*, for the numbers and feet of verses; *hypocritica*, for the gestures of the pantomimes; and *harmonica*, for singing.

The *musical faculties*, as they call them, are *melopœia*, which gives rules for the tones of the voice or instrument; *rhythmopœia*, for motions; and *poësis*, for making verses. See *POETRY*.

*Music* appears to have been one of the most antient of arts: and of all others, *vocal music* must undoubtedly have been the first kind.—For man had not only the various tones of his own voice to make his observations on, before any other art or instrument was found out, but had the various natural strains of birds, to give him occasion to improve his own voice, and the modulations of sounds it was capable of. See *VOCAL*.

Of many antient authors who agree in this conjecture, we shall only mention Lucretius, who says,

*At liquidas avium voces imitauer ore,  
Ante fuit multo quam levia carmina cantu,  
Concelebrare homines possent, aureisque juvare.*

The first invention of stringed instruments, the same poet ascribes to the observation of the winds whistling in the hollow reeds.

As for other kinds of instruments, there were so many occa-

sions for cords or strings, that men could not be long in observing their various sounds, which might give rise to stringed instruments. See *CHORD*.

And for the pulsatile instruments, as drums and cymbals, they might arise from the observation of the hollow noise of concave bodies. See *DRUM*, *CYMBAL*, &c.

Plutarch, in one place, ascribes the first invention of *music* to the god Apollo, and in another to Amphion, the son of Jupiter and Antiope. This last, however, is pretty generally allowed to have been the first who brought *music* into Greece, and to have been the inventor of the lyre.—The time he lived in, is not agreed upon. See *LYRE*.

To him succeeded Chiron, the demi-god; Demodocus; Hermes Trismegistus; Olympus; Orpheus, whom some make the first introducer of *music* into Greece, and the inventor of the lyra; to whom add Phemius, and Terpander, who was contemporary with Lycurgus, and set his laws to *music*. To him some attribute the first institution of musical modes, and the invention of the lyre: Lastly, Thales; and Thamyras, who is said to have been the first inventor of instrumental *music* without singing.

These were the eminent musicians before Homer's time. Others of a later date, were Lasus Hermionensis, Melnippides, Philoxenus, Timotheus, Phrynnis, Epigonius, Lysander, Simmicus, and Diodorus; who were all considerable improvers of *music*.—Lasus is said to have been the first author who wrote on *music*, in the time of Darius Hystaspes; Epigonius invented an instrument of forty strings, called the *epigonium*; Simmicus also invented an instrument, called *simmicium*, of thirty-five strings: Diodorus improved the *tibia*, by adding new holes; and Timotheus the *lyre*, by adding a new string; for which he was fined by the Lacedemonians.

As the accounts we have of the inventors of musical instruments among the antients are very obscure; so are also the accounts what those instruments were; we scarce knowing any thing of them besides the bare name.

The general division of instruments, is into *stringed instruments*, *wind instruments*, and the *pulsatile* kind.—Of *stringed instruments*, we hear of the *lyra* or *cithara*, the *psalterium*, *trigonum*, *sambuca*, *pelis*, *magas*, *barbiton*, *testudo*, *epigonium*, *simmicium*, and *pandoron*; which were all struck with the hand, or a plectrum; and which see in their places, *LYRE*, *CITHARA*, &c.

Of *wind instruments*, we hear of the *tibia*, *fflula*, *hydraulic organs*, *tubæ*, *cornua*, and *lituus*. See *FISTULA*, *FLUTE*, &c. The *pulsatile instruments*, were the *tympanum*, *cymbalum*, *crepitaculum*, *tintinnabulum*, *crotalum*, and *fistrum*. See *TYPANUM*, *CYMBALUM*, &c.

*Music* has ever been in the highest esteem, in all ages, and among all people. Nor could authors express their opinion of it strongly enough, but by inculcating, that it was used in heaven, and was one of the principal entertainments of the gods, and the souls of the blessed.

The effects ascribed to it by the antients, are almost miraculous; by means hereof, diseases are said to have been cured, unchastity corrected, seditions quelled, passions raised and calmed, and even madness occasioned.—Athenæus assures us, that antiently all laws, divine and civil, exhortations to virtue, the knowledge of divine and human things, lives and actions of illustrious men, were written in verse, and publickly sung by a chorus to the sound of instruments; which was found the most effectual means to impress morality, and a right sense of duty on the mind.

*Music* made a great part of the discipline of the antient Pythagoreans, and was used by them to draw over the mind to laudable actions, and settle in it a passionate love of virtue: It was their doctrine, that the soul itself consists of harmony; and therefore by *music*, they pretended to revive the primitive harmony of its faculties.—By this primitive harmony, they meant that which, according to their dogma, was in the soul, in its preexistent state in heaven. See *PYTHAGOREAN*, and *PREEXISTENCE*.

Dr. Wallis has endeavoured to account for the surprising effects ascribed to the antient *music*; and charges them principally on the novelty of the art, and the hyperbola's of the antient writers: nor does he doubt but the modern *music*, cæteris paribus, would produce effects at least as considerable as the antient.—The truth is, we can match most of the antient stories of this kind in the modern histories. If Timotheus could excite Alexander's fury with the Phrygian mode, and sooth him into indolence with the Lydian; a more modern musician is said to have driven Eric king of Denmark into such a rage, as to kill his best servants. Dr. Niewentiit tells us of an Italian, who by varying his *music* from brisk to solemn, and so vice versa, could move the soul, so as to cause distraction and madness. And Dr. South has founded his poem, called *Musica Incantans*, on an instance he knew of the same thing.

*Music*, however, is not only found to exert its force on the affections, but on the parts of the body also; witness the Gafcon knight, mentioned by Mr. Boyle, who could not contain his water at the playing of a bagpipe; the woman, mentioned by the same author, who would burst out in tears at the hearing

ing of a certain tune, with which other people were but little affected.—To say nothing of the trite story of the tarantula: We have an instance in the history of the academy of sciences, of a musician's being cured of a violent fever, by a little concert occasionally played in his room. See TARANTULA.

Nor are our minds and bodies alone affected with sounds, but even inanimate bodies.—Kircher tells us of a large stone, that would tremble at the sound of one particular organ-pipe; and Morhoff mentions one Petter, a Dutchman, who could break rummer-glasses with the tone of his voice. Merfenne also tells us of a particular part of a pavement, that would shake and tremble, as if the earth would open, when the organs played. Mr. Boyle adds, that seats will tremble at the sound of organs; that he has felt his hat do so under his hand, at certain notes both of organs and discourse; and that he was well informed, every well-built vault would answer some determinate note. There is a great dispute among the learned, whether the antients, or moderns, best understood and practised music? Some maintain that the antient art of music, by which such wonderful effects were performed, is quite lost; and others, that the true science of harmony is now arrived to much greater perfection, than was known or practised among the antients.

This point seems no other way to be determinable, but by comparing the principles and practice of the one with those of the other.—As to the theory or principles of harmonics, it is certain we understand it better than the antients; because we know all that they knew, and have improved considerably on their foundations.—The great dispute then lies on the practice. With regard to which it may be observed, that among the antients, music, in the most limited sense of the word, included harmony, rhythmus, and verse; and consisted of verses sung by one or more voices alternately, or in choirs, sometimes with the sound of instruments, and sometimes by voices only. Their musical faculties, we have already observed, were *melopœia*, *rhythmopœia*, and *poësis*. The first whereof may be considered under two heads, viz. melody and symphony. As to the latter, it seems to contain nothing but what relates to the conduct of a single voice, or making what we call melody: The antients do not appear to have ever thought of the concert, or harmony of parts; which is a modern invention, for which we are beholden to Guido Aretine, a Benedictine friar.

We would not, however, be understood to mean, that the antients never joined more voices or instruments than one together in the same symphony; but, that they never joined several voices so as that each had a distinct and proper melody, which made among them a succession of various concords, and were not in every note unisons, or at the same distance from each other as octaves.—This last indeed agrees to the general definition of the word *symphonia*; yet it is plain that in such cases, there is but one song, and all the voices perform the same individual melody.—But when the parts differ, not by the tension of the whole, but by the different relations of the successive notes, this is the modern art, which requires so peculiar a genius, and on which account the modern music seems to have much the advantage of the antient. For further satisfaction on the subject, see Kircher, Perrault, Dr. Wallis, Mr. Malcolm, the jesuit Cerceau, and others; who unanimously agree, that after all the pains they have taken to know the true state of the antient music, they could not find the least reason to think there was any such thing in their days as music in parts. See SYMPHONY, SYNAULIA, HARMONY, &c.

The antient musical notes are very mysterious and perplexed: Boethius and Gregory the Great first put them into a more easy and obvious method.—In the year 1204, Guido Aretine, a Benedictine of Arezzo in Tuscany, first introduced the use of a staff with five lines, on which, with the spaces, he marked his notes by setting a point up and down upon them, to denote the rise and fall of the voice; though Kircher mentions this artifice to have been in use before Guido's time. See NOTE, STAFF, &c.

Another contrivance of Guido's was to apply the six musical syllables *ut, re, mi, fa, sol, la*, which he took out of the Latin hymn,

UT queant laxis	RE sonare fibris
Mi ra gestorum	FA muli tuorum
SOL ve polluti	LAB ii reatum.
O Pater Alme.	

Besides his notes of music, by which, according to Kircher, he distinguished the tones, or modes, and the seats of the semitones, he also invented the scale, and several musical instruments, called *polypletra*, as spinets and harpifords. See NOTE, GAMUT, &c.

The next considerable improvement was in 1330, when Johannes Muria, or de Muris, doctor at Paris, (or as Bale and Gefner make him, an Englishman) invented the different figures of notes, which express the times, or length of every note, at least their true relative proportions to one another, now called *longs, breves, semi-breves, crotchets, quavers*, &c. See CHARACTER.

The most antient writer of music, we have already observed,

was Lafus Hermionensis; but his work, as well as those of many others, both Greek and Roman, are lost. Aristoxenus, disciple of Aristotle, is the eldest author extant on the subject; after him came Euclid, author of the Elements: Aristides Quintilianus wrote after Cicero's time. Alypius stands next; after him Gaudentius the philosopher, and Nicomachus the Pythagorean, and Bacchius.—Of which seven Greek authors, we have a fair copy, with a translation and notes, by Meibomius.

Ptolemy, the celebrated mathematician, wrote in Greek of the principles of harmonics, about the time of the emperor Antoninus Pius. This author keeps a medium between the Pythagoreans and Aristoxenians. He was succeeded at a good distance by Manuel Bryennius.

Of the Latins, we have Bæthius, who wrote in the time of Theodoric the Goth; and one Cassiodorus, about the same time: Martianus, and S. Augustin not far remote.

Of the moderns, are Zarlin, Salinas, Vincenzo Galileo, Doni, Kircher, Merfenne, Paron, De Caux, Perrault, Wallis, Des Cartes, Holder, Malcolm, &c.

MUSK \*, MOSCHUS, a kind of perfume, of a very strong scent; only agreeable when moderated by the mixture of some other perfume. See PERFUME.

\* The word comes from the Arabic, *moscha*, musk: whence was formed the common Greek, *μοσχον*, musk.

Musk is found in a kind of bag, or tumour growing about the bigness of a hen's egg, under the belly, towards the genital parts of a wild beast of the same name; and appears to be nothing else but a kind of bilious blood there congealed, and almost corrupted.

The animal is pretty common in the kingdoms of Boutan, Tonquin, and some others, as Cochin-China, &c. But the most esteemed are those in the kingdom of Tiber.

They inhabit the woods and forests, where the natives hunt them down: when the beast is killed, they cut out the bladder under the belly, separate the coagulated blood, and dry it in the sun, where it is reduced into a little friable substance almost of the nature of a powder, of a dusky reddish colour; and acquires a very strong and disagreeable smell. It is then tied up again in bladders, and exported to other countries; and this is the musk which we use.

What the antients have wrote of it, is fabulous, viz. that it comes from the testicles of a castor, which, to stop the pursuit of the hunter, castrates itself. The occasion of their error may be owing to this, that among the Indians the musk animal goes by the name of *castor*. See CASTOREUM.

Musk is in considerable use among the perfumers and confectioners; though much less now than formerly. It is supposed to fortify the heart and brain; and is good against deafness; but is little used in medicine, as being apt to occasion the vapours.

MUSKET, or MUSQUET, a fire-arm borne on the shoulder, and used in war; to be fired by the application of a lighted match. See FIRE-ARM.

The length of the musket is fixed to three feet eight inches from the muzzle to the touch-pan, and its bore is to be such as may receive a ball of sixteen in a pound.

Muskets were antiently borne in the field by the infantry: at present they are little used save in the defence of places; fuses, or fire-locks, having taken their place.

MUSKET-TOON, a musket shorter, though thicker, than the ordinary musket.—It is fired by the collision of a steel and flint in the lock; whereas the musket is fired by a match. Its bore is a thirty-eighth part of its length; and carries five ounces of iron, or seven and a half of lead, with an equal quantity of powder.

MUSLIN, or MUSSLIN, a fine sort of cloth, wholly cotton; so called, as not being bare, but having a downy nap on its surface, resembling moss, which the French call *moisse*.

There are various kinds of muslins brought from the East-Indies; chiefly Bengall; betelles, tarnatans, mulmuls, tanejecs, terrindams, doreas, &c.

MUSSA *mora*. See the article MOOR.

MUSSLIN. See the article MUSLIN.

MUSSULMAN \*, or MUSULMAN, a title by which the Mahometans distinguish themselves; signifying, in the Turkish language, true believer, or orthodox. See MAHOMETANISM.

\* In Arabic, the word is written *Moslem*, *Moslemar*, or *Moselman*.

The appellation was first given to the Saracens; as is observed by Leunclavius.—There are to kinds of *Mussulmans*, very adverse to each other; the one called *Sonnites*, and the other *Shiites*.—The Sonnites follow the interpretation of the Alcor-

ran given by Omer; the Shiites are the followers of Ali. The subjects of the king of Persia are Shiites; and those of the grand signior, Sunnites. See SONNA, and ALCORAN. Some authors will have it, that the word *Mussulman* signifies *saved*, that is, predestinated; and that the Mahometans give themselves the appellation, as believing they are all predestinated to salvation.—Martinus is more particular as to the origin of the name; which he derives from the Arabic *مُسلِم* *musalam*, *saved*, snatched out of danger: the Mahometans, he observes, establishing their religion by fire and sword, massacred all those who would not embrace it, and granted life to all that did, calling them *Mussulmans*; q. d. *excepti à periculo*, whence the word, in course of time, became the distinguishing title of all those of that sect, who have affixed to it the signification of *true believer*.

**MUST**, **MUSTUM**, sweet wine newly pressed from the grape; or the new liquor pressed from the fruit before it has worked or fermented. See WINE.

**MUSTARD**, a preparation of a seed of that name, ground or beaten up with vinegar, or the *must* of wine; whence its name.

**MUSTARD-seed**, in Latin *sinapi*, a warm biting seed, which gives the denomination to a species of topical medicines called *sinapisms*. See SINAPISM.

*Mustard-seed* is also used in preparing shagreen. See SHAGREEN.

**MUSTER** \*, a review of a body of military forces under arms, in order to take account of their numbers, condition, accoutrements, arms, &c.

\* The word is formed of the French, *moustre*, specimen. See REVIEW.

**False-MUSTER**. See the article FALSE.

**MUSTER-master general**, or *commissary general of MUSTERS*, is an officer in the army, who takes account of every regiment, their number, horses, arms, &c. See COMMISSARY.

**MUSTER-rolls**, are lists of the soldiers in every troop, company, regiment, &c. delivered by the captains to the commissary: by which they are paid, and the strength of the regiment known. See ROLL.

**MUSTERED of record**, (Stat. 18. Hen. VI.) denotes a being enrolled in the number of the king's soldiers. See ROLL.

**MUTABILITY**. See the article IMMUTABILITY.

**MUTARE arma**. See the article ARMA.

**MUTATION**, the act of changing: or, sometimes, the change itself. See CHANGE, PERMUTATION, and TRANSMUTATION.

It is one of the laws of nature, that the *mutation* of motion is ever proportional to the moving force impressed. See NATURE, and MOTION.

**MUTATION**, in the ancient music, is applied to the changes, or alterations that happen in the order of the sounds which compose the melody. See MUSIC.

Aristoxenus represents *mutation* as a kind of passion in the order of the melody. See MELODY.

The changes are, 1°, in the genera; when the song begins in one, as the chromatic, and passes into another, as the diatonic. 2°, In the system; as when the song passes out of one tetra-chord, as *meson*, into another, as *diageugmenon*; or more generally, when it passes from a high place of the scale to a lower, or contrarily; i. e. part of it is sung high, and part low. 3°, In the mode or tone, as when the song begins in one, as the Doric; and passes into another, as the Lydian. 4°, In the melopœia, that is, when the song changes the very air, so as from gay and sprightly, to become soft and languishing; or from a manner that expresses one passion or subject, to the expression of some other.

**MUTE**, *dumb*, denotes a person that cannot speak, or has not the use of speech. See DUMBNESS.

*Mutes* and dwarfs make their fortune in the grand signior's seraglio. The *mutes* serve as executioners to take off persons of the first rank.

**MUTE**, in law, is he that stands dumb, or speechless; when he ought to answer, or plead.

A prisoner may stand *mute* two ways: 1°, When he speaks not at all: In which case it is enquired, whether he stand *mute* of malice, or by the act of God: If by the latter, then the judge, ex officio, ought to enquire whether he be the same person; and of all other pleas, which he might have pleaded if he had not stood *mute*. 2°, When he pleads not directly, or will not put himself upon the inquest to be tried.—The punishment of standing *mute*, is pressing, even to death. See PAINE *fort & dure*.

**MUTE**, in grammar, a letter which is not founded, or heard in the pronunciation: or, a letter which yields no sound of itself and without a vowel. See LETTER.

The consonants are ordinarily distinguished into *mutes*, and *liquids* or semi-vowels. See CONSONANT, LIQUID, &c.

The *mutes* in the English alphabet are eleven, viz. B, C, D, F, G, J, K, P, Q, T, V. They are called *mutes*, because a liquid cannot be founded in the same syllable before them, as *rpo*; but a *mute* may be pronounced in the same syllable before a liquid, as *pro*.

**MUTILATED cornice**. See the article CORNICHE.

**MUTILATED medals**. See the article MEDAL.

**MUTILATED roof**. See the article ROOF.

**MUTILATION**, the retrenching, or cutting away any member of the body. See MEMBER, &c.

The use of the word is also extended to statues, and buildings, where any part is wanting, or the projection of any member, as a cornice, or an impost is broke off. See STATUE, &c.

**MULITATION** is sometimes also used in a more immediate manner for *castration*. See CASTRATION.

**MUTUAL**, a relative term, denoting something that is reciprocal between two or more persons. See RECIPROCAL.

Thus we say, *mutual assistance*, *mutual aversion*, &c.—There are *mutual*, or reciprocal duties, offices, &c. between superiors, and inferiors; the king and his subjects; the master and his servants, &c.

Vaugelas makes a distinction between *mutual* and *reciprocal*: *Mutual*, according to him, is understood of what is between two only; and reciprocal of what is between more than two: But this decision is little regarded in common use.

**MUTUAL testament**, is that made by two persons who leave their effects reciprocally to the survivor.

**MUTULE**, **MUTULUS**, in architecture, a kind of square modillion in the Doric frieze. See MODILLION.

The chief difference between *mutule* and modillion consists in this, that the former is used in speaking of the Doric order, and the latter in the Corinthian, &c. See DORIC, &c.

The *mutules* in the Doric answer to the triglyphs, which are under them; whence some make *gutta*, or drops to hang. See GUTTA.

**MUTUUM**, in the civil law, is a loan simply so called; or a contract introduced by the law of nations, whereby a thing consisting in weight, as suppose bullion; in number, as money; or in measure, as corn, timber, wine, &c. is given to another, upon condition that he shall return another thing of the same quantity, nature, and value, on demand.

This, therefore, is a contract without reward: So that where use or interest arises, there must be some particular article in the contract whereon it is founded. See INTEREST.

**MUZZLE-ring**, of a gun, the moulding, or circle, which incompasses, and strengthens the mouth of it. See CANNON, &c.

**MY—Per MY & per tout**. See the article PER my.

**MYLOGLOSSUM**, in anatomy, a pair of muscles, thus called because arising about the backside of the molares, or grinding-teeth, and inserted into the ligament of the tongue; helping to pull it upwards. See TONGUE.

These are the same with what Mr. Cowper calls *styloglossum*. See STYLOGLOSSUS.

**MYLOHYOIDEUM**, in anatomy, a broad, but short muscle, lying immediately under the biverter muscle of the jaw, and which springing from the lower margin on each side the under jaw, is inserted into the basis of the os hyoides. See HYOIDES. Besides the common use ascribed to this muscle, which is to move the hyoides, the tongue, and the larynx both upwards, inwards, and side-ways; its series of transverse fibres have a further use when it is at rest; and that is to compress the glands under the tongue, and by this means promote the discharge of saliva into the mouth from the lower salival ducts. Whence it is we use this muscle when we want saliva in the mouth.

**MYOCEPHALON** \*, in medicine, a little part of the tunica uvea, protended over the sight of the eye; occasioned by an ulceration of the part: so called, as resembling the head of a fly. See UVEA.

\* The word is Greek *μυοκεφαλον*, formed of *μυια*, fly, and *κεφαλη*, head.

**MYOLOGY** \*, in anatomy, a description of the muscles; or the knowledge of what relates to the muscles of the human body.—See *Tab. Anat. (Myol.)* See also MUSCLE.

\* The word is formed of *μυς*, *μυς*, a muscle, and *λογος*, discourse.

**MYOMANCY**, a kind of divination, or method of foretelling future events by means of mice. See DIVINATION.

Some authors hold *myomancy* one of the most ancient kinds of divination; and think it is on this account that Isaiah, lxvii. 17. reckons mice among the abominable things of the idolaters. But beside that it is not certain that the Hebrew word *מכרר* used by the prophet, signifies a *mouse*; it is evident it is not divination by that animal, be it what it will, is here spoke of; but eating it.

**MYOPS** \*, **MYOPIS**, a person who is short-sighted; or, as we popularly call it, *purblind*. See SIGHT.

\* The word is Greek, *μωψ*, compounded of *μυς*, mouse; and *ωψ*, eye; by reason, we suppose, the same conformation of the eye is observed in mice.

*Myopes* are properly such as see remote objects confusedly, and near ones distinctly. See MYOPIA.—Those who labour under the opposite defect, are called *presbyters*. See PRESBYTER. The defect of *myopes* is not in the optic nerve, the pupil, or the like; but in the form of the crystalline, or the distance of the retina from the same. The crystalline being rounder, or more convex than ordinary, the rays will be rendered more convergent than ordinary in passing through the same. See REFRACTION.—By this means they will be brought to meet, or concur, at the less distance from the crystalline; so that if the

# MYR

the retina be at its usual distance, they will concur ere they reach it. It is the too great nearness, then, of the retina to the crystalline, that constitutes the *myopia*. See **CRYSTALLINE, RETINA, &c.**

**MYOPIA**, or **MYOPIAS**, *shortsightedness*, a confusion, or obscurity of sight, when directed to remote objects. See **MYOPS, VISION, SIGHT, &c.**

The *myopia* is owing to the too great convexity of the ball of the eye, and particularly of the crystalline; whence it happens, that the visual rays concur before they reach the retina. For this reason, to see an object distinctly, they must either apply it close to the eye, or use a concave glass. See **CONCAVE**.

The *myopia* wears off by time, the eye growing flatter and flatter as persons draw towards old age. See **EYE**.

**MYOTOMY**, **MYOTOMIA**, an anatomical dissection, or demonstration of the muscles. See **MUSCLE**.

**MYRIAD**, the number of ten thousand.—Whence *myriarcha*, a captain, or commander of ten thousand men.

**MYRMECIA**, in medicine, a kind of wart, by Latin writers called *formica*. See **FORMICA**.

**MYRMIDONS**, **MYRMIDONES**, in antiquity, a people of Thessaly, fabled to have arose from ants, or pismires, upon a prayer put up for that purpose by king Æacus to Jupiter, after his kingdom had been dispeopled by a severe pestilence.—In Homer, and Virgil, the *Myrmidons* are Achilles's soldiers.

**MYRMILLONES**\*, a kind of gladiators in ancient Rome; called also *murmulationes*. See **GLADIATOR**.

\* Turnebius derives the name from the *Myrmidons*.

**MYROBALANS**\*, **MYROBALANI**, a kind of medicinal fruit, brought from the Indies; much more used in the Arabic than the Greek pharmacy; and more among the ancients than the moderns; and still more abroad than in England.

\* The word comes from the Greek *μυρον*, unguent; and *βαλαν*, acorn; as being in form of acorns, and used in medicine.

There are five kinds of *myrobalans*, or purging Indian plums: the first called *citrini*, of a yellowish red, hard, oblong, and the size of an olive.—The second called *black* or *Indian myrobalans*, the bigness of an acorn, wrinkled, without stone.—The third, *chebuli myrobalans*, the size of a date, of a yellowish brown, pointed at the end.—The fourth *emblici*, round, rough, the size of a gall, of a dark brown.—The last called *bellerici*, hard, yellow, round, the size of an ordinary prune, less angular than the rest.—*Myrobalans* of each kind are slightly purgative, and astringent.

**MYRRH**\*, **MYRRHA**, a kind of gum, or resin, issuing, by incision, and sometimes spontaneously, from the trunk, and larger branches of a tree growing in Arabia, Egypt, and especially Abyssinia. See **GUM**.

\* The word comes from *μυρρα*, of *μυρα*, I run, or trickle.

Authors are not agreed about the tree which produces this gum: It is true, they all make it small and thorny; but disagree about the form of its leaves.

The incisions are made twice a year, and the *myrrh* oozing out is received on rush mats, disposed underneath.

The druggists sell two kinds of *myrrh*, viz. *myrrh in tears*, which they call *stacte*; the other *ungulata*, or in nails. See **STACTE, &c.**

Of the first kind, the best is in bright, yellow, transparent drops, friable, light, of a strong disagreeable smell: But this is very rare; and most of that in use is the *naild myrrh*, so called from little white spots observed thereon, much like those on the nails of the fingers.

The best is in little masses, or tears, red, and transparent; which, when broke, contain a kind of unctuous liquor, the most precious part of the *myrrh*, and the real *stacte* of the ancients.

This gum enters a great number of medicinal compositions. Its bitterness renders it good for the stomach, and against worms; it is chewed to prevent infection from contagious diseases. Dr. Quincy says it is excellent to cleanse and strengthen the womb, and against tickling rheums; a good detergent; and as such much used externally in unguents for the healing of wounds; and makes the principal ingredient in embalming. The chymists draw from it oils, spirits, tinctures, &c. to which they attribute extraordinary virtues.

**MYRRHINE vessels**, *vasa MYRRHINA*. See **MURRHINE**.

**MYRTIFORM glands**. See the article **GLAND**.

**MYRTIFORMIS caruncula**, in anatomy, little caruncles, or fleshy knots adjoining to, or rather in the place of the hymen in women.—See *Tab. Anat. (Splanchn.) fig. 9. lit. f. f.* See also **CARUNCLE**.

They are about the bigness of myrtle-berries, whence they take their name; and are supposed by some to be largest in maids, and by degrees to grow less through the use of venery. Others, and with more probability, derive them from the broken membrane of the hymen, whose fragments shrunk up, they take them to be. See **HYMEN**.

**MYRTLE-berries**, the fruit of a shrub well known under the name of *myrtle*, *myrtus*, growing common in Spain, especially in the mountains of Sierra Morena, &c.

There are two kinds of *myrtle*, *male* and *female*; the latter whereof produces the best berries, and in the greatest quantity. The fruit is at first green, but becomes black gradually within;

# MY S

it is a white seed in form of a crescent, solid, hard, and of an astringent taste; while the fruit continues on the trees, it is succulent and smooth, and only becomes hard and wrinkled, because dried in the sun for the convenience of carriage.

*Myrtle-berries* are rough and astringent, and are chiefly used in the way of syrup, as a strengthner against fluxes and abortion. They are also an ingredient in several of the strengthening plaisters.

The perfumers likewise use them in their perfumes, and draw an essence from them. The German dyers make a blue colour from them. In England the leaves and branches are also used in the tanning of leather.

**MYSTERY**\*, **MYSTERIUM**, something secret, or hidden; impossible, or difficult to be comprehended. See **ACATALEPSY**.

\* The word comes from the Greek *μυστήριον*; and that, according to some etymologists, from *μωω*, *claudio*, *taceo*, I shut, I am silent; and *σπυα*, mouth; but then whence comes the *ρ*? Must the *m* of *stoma* be converted into an *ρ*? The word seems derived with more propriety from the Hebrew *סתר* *sater*, to hide; whence is formed *מסתרים* *mistar*, a hidden thing.

*Mystery* is primarily used in speaking of certain truths revealed in scripture; into the full understanding whereof human reason cannot penetrate.—Such are the doctrines of the trinity, the incarnation, &c. See **TRINITY, &c.**

We have an epitome of the *mysteries of faith*, or the *mysteries of Christianity*, in the symbols, or creeds, compiled by the apostles, the council of Nice, and S. Athanasius. See **CREED**.

In all these, mention is made of the *mystery* of the trinity; the *mysteries* of the incarnation of the Son of God, his death and passion, and his descent into hell for the redemption of mankind: of his resurrection the third day, his ascension to heaven, his sitting at the right hand of God, and his coming again to judge the world: of the divinity, and co-equality of the holy Ghost with the Father and the Son: of the unity of the church: of the community of saints; the participation of the sacraments; and the general resurrection.—Such are the principal *mysteries* of faith; which the church declares necessary to be known and believed, in order to salvation.

From the earliest ages there have been particular festivals instituted in honour of these *mysteries*; to return thanks to God for having revealed them, and to oblige the ministers and pastors to instruct the people therein. See **FEAST**.

Such are the feast of the *mystery* of the incarnation, called also *Christmas*; those of the circumcision, passion, resurrection, &c. See **INCARNATION, CIRCUMCISION, EASTER, EPIPHANY, &c.**

The heathens too had their *mysteries*, particularly those of Ceres, the *bona dea*, &c. See **ELEUSINIA**.—The Egyptian priests concealed the *mysteries* of their religion and philosophy under hieroglyphics. See **HIEROGLYPHIC**.—Those who revealed the *mysteries* of the *bona dea* were severely punished; and none were trusted with them but those solemnly initiated, and sworn to secrecy.

But these were not called *mysteries*, as being incomprehensible, or raised above the ken of reason; but because they were covered, and disguised under types, and figures, to raise the greater veneration in the people.—The *mysteries* of paganism were celebrated in caves and grotto's, fitter to conceal crimes than to celebrate religious *mysteries* in. See **INITIATED, ORACLE, &c.**

**MYSTERY**, in scripture-language, is used with some latitude.—Sometimes it denotes any thing not to be known without divine revelation. See **REVELATION**.

In this sense we are to understand those texts: "He that reveals secrets, (or *mysteries*) makes known to thee what shall come to pass; Dan. ii. 29. "There is a God in heaven that reveals *mysteries*," *ib.* v. 28.

**MYSTERY** is also used to denote the secret things, which God has discovered by his ministers the prophets, Jesus Christ, and the apostles.

In which sense it is S. Paul says,—“We speak the wisdom of God in a *mystery*, which God had resolved before all ages to reveal for our glory, 1 Cor. ii. 7. We are to be accounted as ministers of Christ, and dispensers of the *mysteries* of God, 1 Cor. iv. 1. Though I understand all *mysteries*, and have the knowledge of all things, if I have not charity, I am nothing, 1 Cor. xiii. 2. Behold I shew you a *mystery*, 1 Cor. xv. 51. By reading my epistle, you may understand my knowledge in the *mystery* of Christ, Ephes. iii. 4.” And in the following verses he adds, that this *mystery* is, that the Gentiles are fellow-heirs, and make but one body with the Jews, being sharers with them in the promises of God in the gospel. “Holding the *mystery* of the faith in a pure conscience, 1 Tim. iii. 9. “When the seventh angel begins to sound his trumpet, the *mystery* of God shall be finished, as he has declared to his servants the prophets, Revel. x. 7.”

*Additions of MYSTERY*. See the article **ADDITION**.

**MYSTES**. See the article **HYDROMYSTES**.

**MYSTICAL**, **MYSTIXOS**, **MYSTIC**, something *mysterious*, or allegorical. See **MYSTERY, ALLEGORY, &c.** The commentators on the scripture, besides a literal, find also a *mystical*, and a moral meaning.—The Bible, they contend,

is a book written both within-side, and without-side.—Within-side, in respect to the *mystical*, internal, sublime, and hidden sense; and without-side, in respect to the literal and grammatical sense, immediately expressed by the words.

In effect, several of the ancient fathers, and doctors of the church, understand the books mentioned in Ezek. ii. 10. and in the Apocalypse, v. 1. “which were wrote both within-side and without,” of the scriptures: and take the literal and *mystical* sense to be here fairly intimated. See ALLEGORICAL, TYPE, &c.

The sense of scripture, say they, is either that immediately signified by the words and expressions in the common use of language: or it is mediate, sublime, typical, and *mystical*; where in the things themselves signified, are made to signify still other and further things, according to the particular design, and intention of God, and of the prophets and apostles inspired by him. See TYPICAL.

The literal sense they again divide into *proper* literal, which is contained in the words taken simply and properly:

And *metaphorical* literal, where the words are to be understood in a figurative and metaphorical sense; as where the right eye is commanded to be plucked out, &c.

Wherever the proper literal sense contains any thing absurd, or indecent, there recourse must be had to the metaphorical literal sense.

All scripture has a true literal sense, but not always a *mystical* one. We must ever understand it in the literal sense, when it speaks immediately of any of the laws of nature; of charity, of doing good; when it gives us instructions for the conduct of life, for regulating our manners; and when it relates any matter of fact, or point of history.

The same passage of scripture has sometimes several senses, expressed and signified immediately by the words taken in their proper, and their figurative sense, and which appear to have been all intended by the inspired person who spoke them, as having been so understood by others likewise inspired.—As those words in Psalm ii. “Thou art my son, this day have I begotten thee;” which S. Paul understands according to the strict letter in Heb. i. of the generation of Jesus Christ in time: and in Acts xiii. 33. he takes them in a metaphorical sense, and applies them to our Saviour’s resurrection.—Thus in Hosea xi. 1. the words of the prophecy, “I have called my son out of Egypt,” are understood literally of the children of Israel, whom God brought out of Egypt under the conduct of Moses; and yet in Matth. ii. 15. they are understood metaphorically of Jesus Christ. See PROPHECY.

The *mystical* sense of scripture, is that which the things expressed by the words do further signify; or it is a second signification, held forth or signified by the first: this second being expressed immediately by the first, and mediately by the words themselves.

Writers allow of three kinds of *mystical* senses in the word of

God: The first corresponding to faith, and called *allegorical*; the second to hope, called *anagogical*; and the third to charity, called the *tropological* sense. See ANAGOGICAL, &c. The four senses, and their applications, are included in the Latin distich,

*Litera gesta docet, quid credas allegoria,  
Moralis quid agas, quo tendas anagogia.*

Sometimes the same word in scripture is to be taken in all the four senses.—Thus the word *Jerusalem* literally signifies the capital of Judæa; allegorically, the church militant; tropologically and morally, a believer; and anagogically, heaven.

So, that passage in Genesis, “Let there be light, and there was light;” signifies, according to the letter, corporeal light; by allegory, the Messiah; in the tropological sense, grace; and anagogically, beatitude, or the light of glory.

MYSTIC *theology*, denotes a refined and sublime kind of divinity, professed by the *mystics*. See MYSTICS, and THEOLOGY.

It consists in a knowledge of God, and divine things, not acquired in the common way, but infused immediately by God, and which has the power to move the soul in an easy, calm, devout, affective manner; to unite it intimately to God; to illumine the understanding, and warm and enliven the will in an extraordinary manner.

Among the writings attributed to Dionysius the areopagite, is a discourse of *mystic* theology. Several others have wrote on the same subject, both antients and moderns.

MYSTICS, MYSTICI, a kind of religious sect, distinguished by their professing pure, sublime, and perfect devotion, with an intire disinterested love of God, free from all selfish considerations. See QUIETISM, &c.

The *Mystics*, to excuse their fanatic extasies, and amorous extravagancies, alledge that passage of S. Paul; “The spirit” “prays in us by sighs and groans that are unutterable.” Now, if the spirit, say they, pray in us; we must resign ourselves to its motions, and be swayed, and guided by its impulse, by remaining in a state of mere inaction.

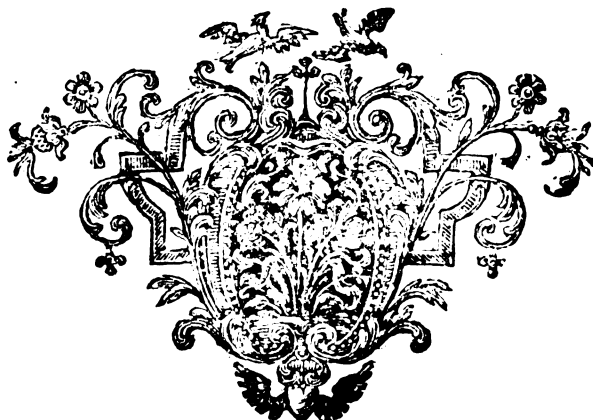

Passive contemplation is that state of perfection to which the *Mystics* all aspire. See CONTEMPLATION.

MYTHOLOGY\*, ΜΥΘΟΛΟΓΙΑ, the history of the fabulous gods, and heroes of antiquity; with the explanation of the mysteries or allegories couched therein. See GOD, HERO, FABLE, THEOGONY, &c.

\* The word is Greek, and signifies a discourse or description of fables; from μυθος, *fabula*; and λογος, *sermo*, discourse.

MYURUS\*, ΜΥΟΥΡΟΣ, in medicine, a pulse which is continually weakening by insensible degrees; so that the second beat is fainter than the first; the third than the second, &c. See PULSE.

\* The word is compounded of μυς, mouse, and ουρα, tail; the diminution of the pulse being supposed like that of the thickness of the tail of that animal, which grows less from the root to the tip.

## N A E

**N**, A liquid consonant, and the thirteenth letter of the Greek, Latin, English, &c. alphabets. See LETTER, and ALPHABET.

The *n* is a nasal consonant: Its sound is that of a *d*, passed through the nose; so that when the nose is stopped by a cold, or the like, it is usual to pronounce *d* for *n*. M. l'Abbe de Dangeau observes, that in the French, the *n* is frequently a meer nasal vowel, without any thing of the sound of a consonant in it.—He calls it the Slavonic vowel. The Hebrews call their *n*, *nun*, which signifies child, as being supposed the offspring of *m*; partly on account of the resemblance of sound, and partly on that of the figure.—Thus from the *m*, by omitting the last column, is formed *n*: and thus from the capital *N*, by omitting the first column, is formed the Greek minuscule *ν*.—Hence for *bimnius*, &c. the Latins frequently use *bimū*, &c. And the same people convert the Greek *ν* at the end of a word into an *m*; as, *φάρμακον*, pharmacum, &c. See M.

*N* before *p*, *b*, and *m*, the Latins change into *m*, and frequently into *l* and *r*, as *in-ludo*, *illudo*; *in-rigo*, *irrigo*, &c. in which they agree with the Hebrews, who in lieu of *nun*, frequently double the following consonant; and the Greeks do the same, as when for Manlius, they write *Μανλλις*; &c. The Greeks, also, before *z*, *γ*, *χ*, *ν*, changed the *ν* into *γ*: in which they were followed by the antient Romans, who for Angulus wrote *Aggulus*; for anceps, *ageps*, &c.

The Latins retrench the *n* from Greek nouns ending in *ων*; as *Λιον*, Leo; *Δρακων*, Draco.—On the contrary, the Greeks add it to the Latin ones ending in *o*; as *Κατων*, *Νιρων*, for Cato, Nero.

*N*, among the antients, was a numeral letter, signifying 900; according to the verse in Baronius,

*N, quoque nongentos numero designat habendos.*

And when a line was struck over it, *N̄*, nine thousand.

Among the antient lawyers, *N. L.* stood for non liquet, *i. e.* the cause is not clear enough to pass sentence upon.

*N*, or *Nº*, in commerce, &c. is used as an abbreviation of numero, number.—Thus also in medicine, caryophyllorum, *Nº vi.* signifies six cloves.

**NAAM, NAMIUM**, in law, the taking or distraining another man's moveable goods. See DISTRESS.

This is either *lawful*, or *unlawful*, and *prohibited*.

**Lawful NAAM**, is a reasonable distress, proportionable to the value of the thing distrained for; and was antiently called either *vif* or *mort*, as it was made of quick, or dead chattel.

**Lawful naam**, is so either by the common law; as when a man takes another's beasts doing damage in his ground; or by a man's particular fact, as on account of some contract, &c.

**Unlawful NAAM**, *Vetitum Namium*. See **NAMIUM**, and **VETITUM**.

**NABONASSAR**.—The æra of **NABONASSAR** is famous: We know but little of the history of the man; only that he was king of Babylon, and was also called Belesus; though some will have him the Baladan, mentioned in Isaiah xxxix. 1. and 2 Kings xx. 12. Some even conjecture that he was a Mede; and that he was set on the throne by the Babylonians, upon their rising and shaking off the subjection of the Medes.

The beginning of this prince's reign is of great importance in chronology; by reason Ptolemy assures us, there were astronomical observations made by the Chaldeans from *Nabonassar* to his time: and Ptolemy, and the other astronomers, account their years from that epocha. See ASTRONOMY.

From the observations quoted by Ptolemy, it follows, that the first year of this æra is the 747th year before Jesus Christ; and the 3967th of the Julian period. See EPOCHÆ. The years of this epocha are Egyptian years, of 365 days each; commencing on the 29th of February, and reckoned, according to the computation of astronomers, from noon. See YEAR.

**NADIR**\*, in astronomy, a point in the heavens diametrically opposite to the zenith. See ZENITH.

\* The word is pure Arabic, where it signifies the same.

The *nadir* is that point directly under our feet; or a point in a right line drawn from our feet through the center of the earth, and terminating in the under hemisphere.

The zenith and *nadir* are the two poles of the horizon, each 90° distant from it, consequently each in the meridian. See HORIZON.

**Sun's NADIR**, is the axis of the cone projected by the shadow of the earth; thus called, in regard that axis being prolonged, gives a point in the ecliptic diametrically opposite to the sun.

**NÆVI**, or **NEVI**, in the animal œconomy, marks made on the fœtus, by the imagination of the pregnant mother, in longing for any thing.

VOL. II. N° CIV.

## N A I

See these accounted for under the article MONSTER. See also FŒTUS, and IMAGINATION.

**NAIADS**\*, or **NAIDS**, **NAIADES**, a sort of nymphs, or heathen divinities, supposed to preside over fountains, and rivers. See NYMPH, and GOD.

\* The word comes from the Greek, *ναω*, fluo, I flow; or from *ναω*, I inhabit, abide.

Strabo says, the *naiades* were priestesses of Bacchus.

**NAIANT**, or **NATANT**, *q. d.* swimming; a term in heraldry, used in the blazoning of fishes, when drawn in an horizontal posture, fess-wise, or transversely, across the escutcheon; that being their swimming posture. See FISH.

**NAILING** of cannon, the driving of a *nail*, or iron spike, by force, into the touch-hole of a piece of artillery; so as to render it for some time useless to the enemy. See CANNON.

**NAILS**, in the animal body, a kind of horny excrescences, growing over the ends of the fingers, and toes of men, and several other animals; much of the same nature with the hoofs of others. See FINGER, and TOE.

Hoofs being nothing else but a number of small husks, answering to so many papillæ of the skin; it may be concluded, that *nails* are no more but the covers, or sheaths of the papillæ pyramidales of the skin, on the extremities of the fingers and toes, which dry, harden, and lie upon one another. See PAPILLÆ.

Their use is to strengthen and defend the ends of the fingers in handling any hard, and rugged bodies; that part being exceedingly sensible, by reason of the great number of nerves which terminate here for the sensation of feeling. See FEELING.

The *nails* are formed, and grow after the same manner as the rest of the body; their nourishment they receive from their roots, as is easily observable from the white specks sometimes seen on them, and which constantly recede from the root.

The Romans were very curious in the cutting their *nails*, and had it done by artists, who made an employment of it.

The Chinese doctors and literati pique themselves on the excessive length of their *nails*. F. le Compte says, some of them wear *nails* near as long as their fingers. See CIRCUMCISION.

**NAILS**, in building, &c. are little metalline members, serving to bind, or fasten the parts together, &c. See IRON, &c.

The several kinds of *nails* are very numerous.—As *back* and *bottom nails*; made with flat shanks to hold fast, and not open the wood.—*Clamp nails*, those proper to fasten the clamps in buildings, &c.—*Clasp nails*, whose heads clasping and sticking into the wood, render the work smooth, so as to admit a plane over it: They are of two kinds, *viz.* *long*, proper for fine buildings of fir, &c. and *strong*, fit for oak, and other hard wood.—*Clench nails*, those used by boat, barge, &c. builders; proper for boarded buildings, that are to be taken down, because they will drive without splitting, and draw without breaking.—*Clout nails*, those ordinarily used for nailing on of clouts to axle-trees.—*Deck nails*, those proper for fastening of decks in ships, doubling of shipping, and floors laid with planks.—*Dog nails*, proper for fastening of hinges to doors, &c.—*Flat points*, are of two kinds, *viz.* *longs*, much used in shipping, and proper where there is occasion to draw, and hold fast, yet no necessity of clenching.—*Jobent nails*, those commonly used to nail thin plates of iron to wood.—*Lead nails*, used to nail lead, leather, and canvas to hard wood.—*Port nails*, commonly used to nail hinges to the ports of ships.—*Pound nails*, are four-square in the shank; much used in Norfolk, Suffolk and Essex, though scarce elsewhere, except for paling.—*Ribbing nails*, used to fasten the ribbing, to keep the ribs of ships in their place in building.—*Ridge nails*, are drawn four-square in the shank, and commonly in a round tool.—*Rother nails*, chiefly used to fasten rother-irons to ships.—*Round-head nails*, proper to fasten on hinges, or other uses, where a neat head is required.—*Scupper nails*, much used to fasten leather and canvas to wood.—*Sharp nails*, much used, especially in the West-Indies, made with sharp points, and flat shanks.—*Sheathing nails*, used to fasten sheathing-boards to ships: the rule for their length, is to have them full three times as long as the board is thick.—*Square nails*, of the same shape as *sharp nails*; chiefly used for hard woods.—To which may be added *tacks*; the smallest, serving to fasten paper to wood; middling, for wool-cards and oars; larger, for upholsterers, and pumps.

In lathing, 500 *nails* are ordinarily allowed to a bundle of

five-foot laths.—In flooring, 200, i. e. 240, are allowed for a square of flooring.

*Nails* are said to be toughened, when too brittle, by heating them in a fire-shovel, and putting some tallow or grease among them. See **TEMPERING**.

**NAIL** is also a sort of long measure chiefly used in the commerce of cloths; containing the sixteenth part of a yard. See **YARD**, and **MEASURE**.

**NAIRANGIA**\*, a kind of divination in use among the Arabs, drawn from several phenomena of the sun and moon. See **DIVINATION**.

\* The word is formed from the Arabic *nairan*, the plural of *nair*, light.

**NAISSANT**, in heraldry, is applied to a lion, or other animal, shewing only the head, shoulders, fore-feet, and legs, with the tip of the tail; the rest of the body lying hid under the shield, or some charge, or ordinary thereon; from which it appears to be issuing or arising.—See *Tab. Herald. fig. 28*.

*Naissant* differs from *issuant*, in that the animal in the former case issues out at the middle, and in the latter, at the bottom, of the shield, or charge. See **ISSUANT**.

F. Menestrier says, *naissant* is only used for animals, which shew the bare head as arising out of the extremity of the chief, or from above the fesse.

**NAKED**, in architecture.—**NAKED** of a wall, &c. is the surface, or plain, from whence the projectures arise; or which serves as a ground to the projectures. See *Tab. Archit. fig. 24. lit. r.* See also **PROJECTURE**.

Thus, we say, a pilaster ought to exceed the *naked* of the wall by so many inches; and that the foliages of a capital ought to answer to the *naked* of the column. See **COLUMN**, &c.

**NAKED Fire**, is a term used by chymists for an open fire; or one where the containing vessel is immediately exposed to the fire. See **FIRE**, and **HEAT**.

**NAKED Seeds**, in botany, are such seeds of plants as are not inclosed in any pod, or case. See **PLANT**, and **SEED**.

**NAMATION**, **NAMATIO**, in law, the act of distraining, or taking a distress. See **DISTRESS**, and **NAAM**.

In Scotland, the word is particularly used for impounding. See **POUND**.

**NAME**, denotes a word, whereby men have agreed to express some idea; or which serves to denote, or signify a thing, or subject spoken of. See **WORD**.

This the grammarians usually call a *noun*, *nomen*, though their *noun* is not of quite so much extent as our *name*. See **NOUN**.

Seneca, Lib. II. *de Beneficiis*, observes, that there are a great number of things which have no *name*; and which, therefore, we are forced to call by other borrowed names. *Ingens est, says he, rerum copia sine nomine, quas cum propriis appellationibus signare non possumus, alienis accommodatis utimur*: Which may shew why, in the course of this dictionary, we frequently give divers senses to the same word.

It was Adam that first gave things their names, Gen. ii. 19. *Formatis, igitur, Dominus Deus, de humo cunctis animantibus terræ, & universis volatilibus cœli, & omnibus bestiis terræ, adduxit ea ad Adam, ut videret quid vocaret ea; omne enim quod vocavit Adam animæ viventis ipsum est nomen ejus.* Ver. 20. *Appellavitque Adam nominibus suis cuncta animantia, & universa volatilia cœli, & omnes bestias terræ.*

Names are distinguished into *proper* and *appellative*.

**Proper NAMES**, are those which represent some individual thing, or person; so as to distinguish it from all other things of the same species; as, *Socrates*, which represents a certain philosopher. See **PROPER**.

**Appellative**, or **General NAMES**, are those which signify common ideas; or which are common to several individuals of the same species; as, *horse*, *animal*, *man*, *oak*, &c.

**Proper names** are either called *christian*, as being given at baptism; or *surnames*: the first, imposed for distinction of persons; answering to the Roman *prenomén*. See **PRENOMEN**.

The second, for the distinction of families, answering to the *nomen* of the Romans, and the *patronymicum* of the Greeks. See **SURNAME**.

Originally every person had but one *name*; as among the Jews, *Adam*, &c. among the Egyptians, *Busiris*; among the Chaldees, *Ninus*; the Medes, *Astyages*; the Greeks, *Diomedes*; the Romans, *Romulus*; the Gauls, *Divitiacus*; the Germans, *Ariovistus*; the Britains, *Cassibelan*; the English, *Hengist*, &c. And thus of other nations, except the savages of mount Atlas, whom Pliny and Marcellinus represent as *anonymi*, *nameless*.

The Jews gave the *name* at the circumcision, viz. eight days after the birth: The Romans, to females the same day, to males the ninth; at which time they held a feast, called *nominalia*. See **LUSTRAL**, and **LUSTRATION**.

Since christianity has obtained, most nations have followed the Jews, baptizing, and giving the *name* on the eighth day after the birth; except our English ancestors, who, till of

late, baptized, and gave the *name*, on the birth-day. See **BAPTISM**.

The first imposition of *names* was founded on different views, among different people; the most common was to mark the good wishes of the parents, or to intitle the children to the good fortune a happy *name* seemed to promise.—Hence, *Victor*, *Castor*, *Faustus*, *Statorius*, *Probus*, &c.

Accordingly, we find such *names*, by Cicero called *bona nomina*, and by Tacitus, *fausta nomina*, were still first enrolled, and ranged in the Roman musters; first called to serve at the sacrifices, in the foundation of colonies, &c. —And, on the contrary, Livy calls *Atrius Umber*, *abominandi ominis nomen*: And Plautus, on occasion of a person named *Lyco*, i. e. greedy wolf, says;

*Vosmet nunc facite conjecturam cæterum  
Quid id sit hominis, cui Lyco nomen sit.*

Hence, Plato recommends it to men to be careful in giving happy *names*; and the Pythagoreans taught expressly, that the minds, actions, and successes of men, were according to their *names*, genius, and fate.—Thus Panormitan, *ex bono nomine oritur bona præsumptio*; and the common proverb, *Bonum nomen bonum omen*: And hence the foundation of the onomomantia. See **ONOMOMANTIA**.

Hence Camden takes it for granted, that the *names*, in all nations and languages, are significative, and not simple sounds, for meer distinction sake.—This holds not only among the Jews, Greeks, Latins, &c. but even the Turks; among whom, *Abdalla* signifies God's servant; *Soliman*, peaceable; *Mahomet*, glorified, &c. And the savages of Hispaniola, and throughout America, who, in their languages, *name* their children, *Glistening Light*, *Sun Bright*, *Fine Gold*, &c. And they of Congo, by the *names* of precious stones, flowers, &c.

To suppose *names* given without any meaning, however by the alteration of languages their signification may be lost, that learned author thinks, is to reproach our Ancestors; and that contrary to the sense of all antient writers.—*Porphyry* notes, that the barbarous *names*, as he calls them, were very emphatical, and very concise: And accordingly, it was esteemed a duty to be *φεισόμενοι*, or *sui nominis homines*: as *Severus*, *Probus*, and *Aurelius*, are called *sui nominis imperatores*.

And it was the usual way of giving *names*, to wish the children might discharge their *names*.—Thus when *Guthram*, king of France, named *Clotharius* at the font, he said, *Crescat puer, & hujus sit nominis executor*.

The antient Britains, Camden adds, generally took their *names* from colours, because they painted themselves; which names are now lost, or remain hid among the Welch.—When they were subdued by the Romans, they took Roman *names*; some of which still remain, corrupted; though the greatest part are become extinct, upon the admission of the English Saxons, who introduced the German *names*, as *Cridda*, *Penda*, *Oswald*, *Edward*, &c.—The Danes, too, brought with them their *names*; as *Suayne*, *Harrold*, *Knute*, &c.

The Normans, at the conquest, brought in other German *names*, as originally using the German tongue; such as *Robert*, *William*, *Richard*, *Henry*, *Hugh*, &c. after the same manner as the Greek *names*; *Aspafius*, *Boethius*, *Symmachus*, &c. were introduced into Italy, upon the division of the empire.—After the conquest, our nation, which had ever been averse to foreign *names*, as deeming them unlucky, began to take Hebrew *names*; as *Matthew*, *David*, *Sampson*, &c.

The various *names* antiently, or at present obtaining among us, from what language or people soever borrowed, are explained by Camden in his *Remains*.—As to the period when *names* began to be multiplied, and *surnames* introduced, &c. See **SURNAME**.

Of late years it has obtained among us to give *surnames* for *christian names*; which some dislike, on account of the confusion it may introduce.—Camden relates it as an opinion, that the practice first began in the time of Edward VI. by such as would be godfathers, when they were more than half fathers. Upon which, some were persuaded to change their *names* at confirmation; which, it seems, is usual in other countries.—Thus, two sons of Henry II. of France, christened *Alexander* and *Hercules*, changed them at confirmation into *Henry*, and *Francis*.

In monasteries, the religious assume new *names* at their admittance; to shew they are about to lead a new life, and have renounced the world, their family, and even their *name*: v. g. sister *Mary* of the incarnation, brother *Henry* of the holy sacrament, &c.

The popes also change their *name* at their exaltation to the pontificate; a custom first introduced by pope *Sergius*, whose *name*, till then, as *Platina* informs us, was *Swine-snout*. But *Baronius* refers it to pope *Sergius I.* and *Onuphrius* to John XII. or XIII. and at the same time, adds a different reason for it from that of *Platina*, viz. that

it was done in imitation of S. Peter and S. Paul, who were first called Simon and Saul.—Indeed pope Marcellus, of late, refused to change his *name*.

In Italy, it is frequent to join the *name* of some saint, in a kind of devotion, to the christian *name*; as Joannes Baptista Spinosa, &c.

Among the antients, those deified by the heathen consecrations, had new *names* given them; as Romulus was called Quirinus; Melicertes, Portunus, or Portumnus, &c. See CONSECRATION.

New *names* were also given in adoptions, and sometimes by testament; thus L. Æmilius, adopted by Scipio, took the *name* of Scipio Africanus; and thus Augustus, who at first was called C. Octavius Thurinus, being adopted by the testament of Julius Cæsar into his *name* and family, took the *name* of Caius Julius Cæsar Octavianus. See ADOPTION.

*Names* were also changed at enfranchisements into new cities.—Thus Lucumo, at his first being made free of Rome, took the *name*, Lucius Tarquinius Priscus, &c. and slaves, when made free, usually assumed their masters *names*. See FREEDOM, SLAVE, &c.

Those called to the equestrian order, if they had base *names*, were always new named, *Nomine ingenuorum veterumque Romanorum*.—And among the primitive Christians, it was the practice to change the *names* of the catechumens: Thus the renegado Lucianus, till his baptism, was called Lucius.

Of the *NAME*, is a phrase, frequent among historians, and genealogists, to denote persons of the same quality and *name*.—It is near nine hundred years since the emperors of the west first began to distinguish themselves in this manner by their number; and in the *Italia Sacra* of Ughellus, we meet with a charter of the emperor Louis le Debonnaire, anno 818. wherein he styles himself the first of the *name*. Le Blanc mentions a charter of the year 1084. wherein the emperor Henry III. styles himself king of Italy, the fourth of the *name*; and emperor, the third of the *name*.

Some French writers observe, that in a manuscript preserved in the king's library, their Louis XI. is only styled the ninth of the *name*; Louis the Debonnaire, and Louis the Stammerer, not being then reckoned in the number, by reason they were emperors, as well as kings of France: On which footing, the present king, instead of the fifteenth, should only be the thirteenth of the *name*.

NAMIUM, NAAM, in law. See the article NAAM.

NAMIUM *Vetitum*, or *Prohibited NAAM*, is an unjust taking the cattle of another, or driving them to an unlawful place, pretending damages done by them. See NAAM.

In such case, the owner of the cattle may demand satisfaction for the injury, which is called *placitum de namio vetito*. See VETITUM.

NAPE, is used for the hind-part of the neck; by reason, perhaps, of the soft short hair growing therein, like the nap of a cloth. See NECK, and NUCHA.

NAPELLUS. See the article ACONITE.

NAPHTHA\*, NAPHΘA, a kind of liquid bitumen, very oily, and inflammable; exuding out of the earth in several places in Chaldæa; particularly the place where stood the ancient Babylon: and found also in some provinces of Italy and France, particularly Auvergne, and near Ragusa. See SULPHUR, and BITUMEN.

\* The word, in the original Chaldee, signifies *pillare*, to ooze, or drop; *naphtha*, according to Pliny, running like a kind of bitumen.

*Naphtha* is found swimming on the surface of the water of some springs. It is usually of a black colour, though that found in certain springs about Babylon is said to be whitish.

That of France is soft and black, like liquid pitch, and of a fetid smell; that of Italy is a kind of petrol, or a clear oil, of various colours, oozing out of a rock, situate on a mountain in the dutchy of Modena. See PETROL.

*Naphtha* is esteemed penetrating, resolute, and vulnerable; but its virtues are little known in medicine: its chief use is in lamps, &c. on account of its inflammability.

The Turks call the *naphtha*, *cara sakiz*, black mastic, to distinguish it from pitch. Vossius has an express treatise on *naphtha*, antient and modern: He says, it is a flower of bitumen, of more virtue than any other bitumen.

NAPIERS, or NEPERS *Bones*. See NEPERS *Bones*.

NARCOTICS\*, in medicine, opiates, or medicines that excite drowsiness, and sleep. See OPIATES.

\* The word comes from the Greek *ναρκαω*, of *ναρκωσις*, drowsiness.

*Narcotics*, called also *hypnotics*, and *soporifics*, act by calming, and diminishing the motion of the blood, and spirits. See HYPNOTICS, and SOPORIFIC.

Authors are of various opinions, as to the manner wherein *narcotics* operate: the antients tell us, it is by their being cold in nature, whereby the stupify and deaden the sense. Etmüller, after Willis, takes the animal spirits to be composed of a fluid, volatile salt; and thinks they are dissolved by the mixture of sulphurs and oils, wherewith *narcotics* abound.—M. Andry's opinion is, that the salt of *narcotics* dissolves in

any liquor whatever; and that their ramous branches becoming thus disengaged from the salts, are embarrassed among one another, and thus stop the course of the blood and spirits.—Others think, that *narcotics* close the orifices of the nerves, and thus block up the passage of the spirits.—Lastly, Linden, in his treatise *de Venenis*, thinks, that the operation of *narcotics* is not the same in all; drowsiness being producible from a great variety of different causes. See SLEEP.

NARRATION, in oratory and history, a recital, or rehearsal of a fact as it happened, or as it is supposed to have happened.

This is of two kinds: either *simple*, and *historical*; as where the auditor or reader is supposed to hear or read of a transaction at second hand: or *artificial*, and *fabulous*, as where their imaginations are raised, and the action, as it were, reacted before them.

The *narration*, according to the writers of rhetoric, makes the second part of a just speech, or harangue; viz. that immediately following the exordium. See ORATION.

It makes the whole of a history; abating for the occasional reflections, episodes, and digressions. See HISTORY.

Cicero requires four virtues in a *narration*, viz. perspicuity, probability, brevity, and sweetness.

The *narration* is rendered perspicuous, by observing the order of time, by using none but proper and known terms, and by reciting the action uninterruptedly. See OBSCURITY.

It is rendered probable, by the credibility of the narrator, by the simplicity and openness of the *narration*, by avoiding every thing far remote from the common sense and opinion of mankind, and by a precise detail of circumstances. See PROBABILITY.

It is rendered brief, by taking it up no higher than is just necessary; nor fetching it back, as that impertinent author in Horace, *Qui gemino bellum Trojanum orditur ab ovo*: And by avoiding trivial circumstances.

Lastly, it is rendered sweet, by using smooth, numerous, and well-sounding words; by arranging them, so as to avoid any hiatus, or clashing. By the greatness, novelty, and unexpectedness of the things related; and by enriching it with tropes and figures: as frequent admirations, exclamations, interrogations, expectations, suspences, surprizing events; by grief, joy, fear, &c. See NUMBERS, CADENCE, and TROPE.

NARRATION, in poetry, is used more particularly for the action, or event, that makes the subject of an epic poem. See ACTION.

F. Boffu observes, that the actions in poetry are equally susceptible of the two kinds of oratorical *narration*; and that each constitutes a particular species of poetry.

Those under the artificial, or active form, are now called *dramatic*. See DRAMA.

And those only related by the poet, who here personates an historian, are called *epic*. See EPOPEA.

In the drama, the *narration* is the whole of the piece; in the epopea, it is only a part, though in effect it is the principal part, and the body of the poem.—It is preceded by the proposition, and invocation, which Boffu calls the pre-ludes; and is frequently interrupted by the poet's speaking in person, demanding pardon, favour, &c. See INVOCATION, &c.

The *narration* includes the whole action, episodified, with all its circumstances and its ornaments. See EPISODE.

It is in this part that the action is to be begun, carried on, and ended. It is this, is to shew the causes of all that is related; in this the difficulties are to be proposed and resolved; and the persons, both human and divine, are here to shew their interests, their manners, and their qualities, by their actions and their discourse: and all this is to be described with the beauty, the majesty, and force of verse, style, sentiments, comparison, and other ornaments proper to the subject in general, and to each thing in particular. See STYLE.

The qualities of the epic *narration* are, that it be agreeable, probable, moving, surprizing, and active.

Horace speaks of the utile and dulce as on the same footing. Boffu looks on the utile as an essential property; and the dulce as no more than an additional quality.

NASAL, something belonging to the nose, *nasus*; as the nose-piece of a helmet, antiently called *nasale*.

NASAL, in grammar, &c. is applied to those sounds, or letters, in whose formation the nose is the principal organ; and particularly where the sound formed is passed through the nose. See LETTER.

In most English words, the sounds expressed by the characters an, en, in, on, un, are simple sounds, and proper *nasal* vowels. See M, N, &c.

NASALIA, in medicine, a sort of remedies to be taken by the nose; called also *errhines*. See ERRHINES.

NASIOs, in anatomy, a thin bone, making the upper part of the nose. See NOSE.

NATALIS, NATALIS *Dies*, or NATALITIUM, properly signify a man's birth-day. See NATIVITY.

The

The word was first used among the Heathens, to signify the feast held on the anniversary of the birth of an emperor; whence it came, in time, to signify any sort of feast. And, accordingly, in the Falli, we meet with *natalis solis, natalis invicti*, &c. See FEAST.

The primitive Christians, finding the word thus established, used it in the same manner; and hence we meet in the ancient martyrologists with *natalis calycis*, for the feast of the supper, or Maunday-Thursdai: *natalis cathedræ*, for the pontificate of S. Peter: *natalis, or natalitium*, of such a church, for the feast of the dedication. See DEDICATION.

The word *genethlion* is used by the Greeks in the same sense as *natalis, or natalitium*, among the Latins.

*Ludi NATALITII*, NATAL games, were games introduced on the anniversaries of the birth-days of great men. See GAME.

NATAL Ring, *Annulus NATALITIUS*, was a ring only wore on the birth-day. See RING.

NATES, in anatomy, a term expressing those two fleshy posterior parts of the body, popularly called the *buttocks*: by the Latins *clunes, or nates*.

NATES *Cerebri*, are two circular protuberances of the brain, situate on the back-side of the medulla oblongata near the cerebellum. See BRAIN, and MEDULLA.

NATION, a collective term, used for a considerable people, inhabiting a certain extent of ground, enclosed within fixed limits, and under the same government.

Each nation has its particular character: It is proverbially said, light as a Frenchman, waggish as an Italian, grave as a Spaniard, wicked as an Englishman, fierce as a Scotchman, drunken as a German, idle as an Irishman, deceitful as a Greek, &c. See CHARACTER.

NATION is also used in some universities, for a distinction of the scholars, and professors of colleges. See UNIVERSITY.

The faculty of Paris consists of four nations; viz. that of France, that of Normandy, that of Picardy, and that of Germany; which are again, excepting that of Normandy, distinguished into tribes; each tribe has its deacon.

The German nation comprehends all foreign nations, English, Italian, &c.

When the procureur of the French nation speaks in publick, his style is, *Honoranda Gallorum natio*: He of Picardy says, *Fidelissima Picardorum natio*: He of Normandy, *Veneranda Normannorum natio*: He of the nation of Germany, *Constantissima Germanorum natio*.

NATIONAL Synod. See the articles SYNOD, and COUNCIL.

NATIVE, is applied to a person considered as born in a certain place; or deriving his origin therefrom.

The more accurate writers distinguish between a native of a place, and being born there. Born signifies no more than the having been there produced, or brought into the world, whether that were the proper country, or habitation of the parents, or whether they were there only by accident, as strangers, &c.—Whereas native refers to the proper mansion, or residence of the parents and the family; and where the person has his education.

And hence a person may be a native of one place, and born at another: Thus Jesus Christ is called a Nazarete, and Galilean, as a native; though he were born at Bethlehem in Juda.

NATIVE, NATIVUS, in our ancient law-books, signified a person who was born a slave or villain. See SLAVE, &c.

By which he differed from one who had sold himself, or become a slave by his own deed, who was called *bondman*. See VILLAIN.

NATIVE Tenentes, in our old law-books, are freemen, who hold native land; i. e. land subject to the services of natives. Spelm.

NATIVI de Stipite, were villains or bondmen by birth or family.—There were also *nativi conventionarii*, who were villains by contract or covenant. *Servi enim alii natura, alii facti, alii emptione, alii redemptione, alii sua vel alterius datione*. LL. Hen. I. cap. 76.

In Cornwall it was a custom, that if a freeman married *nativam* (that is, a neif) and brought her *ad liberum tenementum & liberum thorum*, and had two daughters, one of them was free, and the other a villain. Bract. l. 4. c. 21. See NEIF.

NATIVITY, NATIVITAS, or *Natal-Day*; the day of one's birth. See NATALIS.

The term is chiefly used in speaking of saints, &c. The *nativity* of S. John Baptist, &c.—When we say absolutely the *nativity*, it is understood of that of Jesus Christ, or the feast of Christmas. See FEAST, CHRISTMAS, &c.

It is commonly held, that pope Telephorus was the first who decreed the feast of the *nativity* to be held on the 25th of December. John, archbishop of Nice, in an epistle upon the *nativity* of Jesus Christ, relates, that at the instance of S. Cyril of Jerusalem, pope Julius procured a strict inquiry to be made into the day of our Saviour's *nativity*; which being found to be on the 25th of December, they began thenceforth to celebrate the feast on that day. See INCARNATION.

NATIVITY, *Nativitas*, in ancient law-books, signifies bondage, or servitude. See VILLENAGE.

NATIVITY, in astrology, the theme, or figure of the heavens and particularly of the twelve houses, at the moment when a person was born: called also *horoscope*. See HOROSCOPE.

Casting the *nativity*, or by calculation seeking to know how long the queen should live, &c. was made felony, anno 23. Eliz. c. 2.

NATRON, or ANATRON, in natural history, a brownish kind of salt, taken out of a lake of stagnant water, in the desert of Nitria, in Egypt. See SALT.

It is much of the nature of nitre, whence it is called Egyptian nitre, and is even supposed to be the proper nitre of the antients. See NITRE.

It is a popular error, that all bones or stones thrown into this lake, are by degrees converted into *natron*.—It makes a great ebullition, when mixed with acids; whence it is ranked as of the alkali kind, See ACID, and ALKALI.

It is used in the whitening of linens, but burns them, if not corrected by a mixture of ashes. See BLEACHING.

The *natron* of Egypt, as described by Pliny, Matthiolus, and Agricola, is an alkali salt perforated in manner of a sponge, and of a lixivial taste.

Its principles, Dr. Leigh takes to be chiefly two; viz. a sea-salt, and an urinous salt. The first, he takes it for granted, it receives from the earth; the second, from the air.

Dr. Huntington, who was on the spot, says, the *natron* is thought to rise from the bottom of the lake; where, by the heat of the sun, it is condensed, and hardened into the form we see it in: But his opinion is, that it is rather separated by the sun from the water.

M. de la Chambre adds, that three or four days before the Nile begins to overflow, there falls a certain dew, of a fermentative virtue, inasmuch as to leaven a paste exposed to it; and that at the same time the *natron* rises.

Hippocrates, Galen, Matthiolus, Dioscorides, &c. mention it as of use in phyc; and M. de Clois is even of opinion, that all the mineral waters of France are impregnated with this kind of nitre; and that it is hence they derive their medicinal virtues.

It is of singular efficacy in fertilizing of ground; which Dr. Leigh accounts for, by supposing its volatile particles heated by some subterraneous fire, or by the warmth of the sun; and thus readily made to ascend up the minute tubes of plants, and carry with them the juices of the earth.

Pliny derives the invention of glass from some of this *natron* accidentally melted down into the sand, where it ran into streams of glass. See GLASS.

This nitre is distinguished from the modern nitre, or saltpetre, by its fermenting with acids, which saltpetre will not do; by its volatile spirit, its lixivial smell, the clammy insipid substance it yields, &c.—It agrees with saltpetre, in that, by dropping spirit of sulphur upon it, it shoots into pyramidal crystals. Dr. Leigh thinks it comes nearer sal armoniac than saltpetre. See SALTPETRE.

Dr. Lister conjectures, that most of the salt water of the lakes of Egypt, having passed through the bodies of those vast animals wherewith they are stocked, as crocodiles, hippopotami, &c. must of consequence be rendered urinous, or salino-urinous; which is a part of the composition of sal armoniac. See ARMONIAC.

NATTA\*, or NATA, in medicine, a large fleshy excrescence, or tumor, arising in several parts of the body.

\* The word is also written *nafa, nafda, and napta*. Blancard defines it, a large, soft, painless, colourless tumor, arising usually on the back, sometimes on the shoulders, and other parts.—Its root is very small; yet it grows so prodigiously, that it sometimes equals a melon, or gourd. *Nattæ* oftenest appear on the neck, much after the manner of talpæ. See TALPA.

They are of the oedematous kind, and are to be extirpated by incision, and their return prevented by red precipitate, vitriol, or burnt allom strewed on the place.

Bartholine mentions a lady, who cured herself of a *natta*, by biting it off.

NATURAL, something that relates to nature; that arises from a principle of nature; or is conformable to the ordinary course and order of nature. See NATURE.

When a stone falls downwards, we vulgarly say it does it by a *natural* motion; but if it be thrown upwards, its motion is said to be violent. See MOTION.

Water suspended in a sucking pump, is said to be out of its *natural* place: cures wrought by medicines, are *natural* operations; but the miraculous ones wrought by Christ, supernatural. See MIRACLE, &c.

NATURAL Children, are those born out of lawful wedlock. See BASTARD.

NATURAL Horizon, is the sensible or physical horizon. See HORIZON.

NATURAL Law. See the article Law of NATURE.

NATURAL Day. } See the article } DAY.  
 NATURAL Year. } YEAR.  
 NATURAL Faculty. } FACULTY.

Quincy defines *natural faculty*, to be that power arising from the blood's circulation, which is conspicuous in all the secretions performed within the body; that secretion alone excepted, which is made at the origin of the nerves. See SECRETION, SPIRIT, NERVE, &c.

NATURAL Functions, in the animal oeconomy, are those actions whereby things taken into the body are changed, and assimilated, so as to become parts of our body. See FUNCTION.

These are the actions of the viscera, the vessels that receive, retain, move, change, mix, secrete, apply, excrete, and spend the humours of the body. See DIGESTION, NUTRITION, &c.

NATURAL Inclinations, are those tendencies, or motions of the mind, towards things seemingly good, which are common, in a greater or less degree, to all mankind.

*Natural inclination*, according to F. Malebranche, is the same thing with regard to minds, that motion is with regard to bodies: and as all the varieties in the material world arise from the several motions of bodies, so do all those of the intellectual world from inclinations: and as all motions are the results of impressions immediately communicated by the finger of the Creator, so all inclinations are certainly nothing else but continual impressions of the will of the Creator on that of the creature; and must therefore of necessity be agreeable to his; and therefore can naturally have no principal end but his glory; nor any secondary one, but their own preservation, and that of others: both still with regard to his will who gave them being.

Now as, properly speaking, there is but one love in God, viz. that of himself; so he only impresses one love or desire in us, which is that of good in the general. It is this general love, or desire, is the principle of all our particular ones; as, in effect, it is the will itself: the will being defined to be a continual impression of the author of nature, which carries the mind of man to good in general. See WILL.

But the impression towards good in the general, doth not only proceed from God, but also all our inclinations to particular goods; as, v. g. self-preservation, &c. See PASSION.

NATURAL History, a description of the natural products of the earth, water, or air; v. g. beasts, birds, fishes, metals, minerals, and fossils; together with such extraordinary phenomena, as at any time appear in the material world; as meteors, monsters, &c. See HISTORY.

Besides general natural histories, as those of Pliny, &c. there are particular ones; and that of two kinds. — The first, those which only consider one kind of things; such as the history of shells, by Dr. Lister; of fishes, by Willughby; that of birds, by the same; that of plants, by Ray; that of insects, by Swammerdam, and Mouffet; that of animals, by Gesner; that of fossils, by Agricola, Mercatus, &c.

The second, those which consider the several kinds of natural things found in particular countries, or provinces; as the *natural history* of Dauphiné, by Chorier; the *natural history* of the Antilles, by F. du Tertre, and M. Lonvillers de Poincy; those of Oxfordshire and Staffordshire, by Dr. Plott; that of Lancashire, by Leigh; of Northamptonshire, by Morton; and that of the same county, expected from Mr. Bridges; that of the western islands, by Martin, &c.

NATURAL Philosophy, that science which considers the powers of nature, the properties of natural bodies, and their mutual action on one another, otherwise called *physics*. See PHYSICS, and NATURE.

NATURAL Magic, is that which only makes use of natural causes. See MAGIC.

NATURAL Cause. See the article CAUSE.

NATURAL, in heraldry, is used where animals, fruits, flowers, &c. are blazoned with the colours they naturally have, though different from the common colours of heraldry; and this is to prevent the armories being accused of falsity, when blazoned with the names of colours unknown in heraldry. See COLOUR, and BLAZON.

NATURAL, in music, is sometimes used for *diatonic*. See DIATONIC.

NATURAL is also sometimes put for *physical*. — In which latter sense, *natural music* is that performed by natural organs, i. e. vocal music; in contradistinction to *artificial*, or instrumental. See MUSIC.

NATURAL Harmony, is that produced by the natural, and essential chords of the mode. See HARMONY.

NATURAL Note, is used in opposition to *flat* and *sharp* notes, which are called *artificial* notes. See NOTE, SCALE, &c.

NATURAL is also used for something coming immediately out of the hands of nature. — In which sense it stands opposed to *facitimus*, or *artificial*, which signifies something wrought by art. See ARTIFICIAL.

Bishop Wilkins observes, that there appears a world of

difference between *natural* and artificial things, when viewed with microscopes; the first ever appear adorned with all imaginable elegance and beauty; the latter, though the most curious in their kind, infinitely rude and unhewn: the finest needle appears a rough bar of iron; and the most accurate engraving, or embossment, as if done with a mattock or trowel.

NATURALIST, a person who has studied nature, and is well versed in natural bodies, especially what relates to metals, minerals, stones, vegetables, and animals. See ANIMAL, PLANT, MINERAL, &c.

Aristotle, Ælian, Pliny, Solinus, and Theophrastus, were the greatest *naturalists* among the ancients; but they fell into abundance of errors, which have been corrected by the happy industry of the moderns. — Aldrovandus is the most copious and complete of the modern *naturalists*; his work is in thirteen volumes in folio.

NATURALIZATION, in law, the act of naturalizing an alien, or putting him into the condition of a natural-born subject, and entitling him to the rights and privileges thereof. See ALIEN, and DENIZEN.

In France, *naturalization* is the king's prerogative; in England it is only done by act of parliament.

In France, Swiss, Savoyards, and Scots, need not any *naturalization*, being reputed regnicoles, or natives.

NATURALS, *Res Naturales*, in medicine. — In every animal, howsoever sick and diseased, there is still remaining some degree of life, and strength; and the causes and effects of each. — These are called *naturals*, natural things, or things according to nature; and sometimes barely nature; in contradistinction to *non-naturals*. See NON-NATURAL.

NATURE, NATURA, is a term variously used. Aristotle has a whole chapter wrote expressly to enumerate the various acceptations of the Greek word, *φύσις*, rendered into English, *nature*: and among Latin writers, the different acceptations are so many, that a certain author reckons up fourteen or fifteen. Mr. Boyle, in a precise treatise of the vulgarly received notion of *nature*, gives us eight principal ones.

NATURE, then, is sometimes used for the system of the world; the machine of the universe; or the assemblage of all created beings. See UNIVERSE, and SYSTEM.

In which sense we say, the author of *nature*. The sun is called the eye of *nature*, because he illumines the universe, and the father of *nature*, because he warms the earth, and makes it fruitful. And thus we say of the phoenix, or a chimæra, that there is no such thing in *nature*.

Instead of the word *nature*, in this sense, Mr. Boyle, to avoid ambiguity, and abuse of the word, wishes to have *world*, or *universe*, substituted. See WORLD.

NATURE, in a more confined sense, is applied to each of the several kinds of beings, created and increated; spiritual and corporeal. See ENS.

In which sense we say, human *nature*, meaning all men together, who possess the same spiritual, reasonable soul. Angelical *nature*; the divine *nature*, &c.

In this sense, the school divines say, *natura naturans*, and *natura naturata*; speaking of God, who is the *natura naturans*, as giving being and *nature* to all others: in opposition to the creatures, who are the *natura naturata*, as receiving their *nature* from the hands of another.

NATURE, in a still more restrained sense, is used for the essence of a thing; or that which the schoolmen call the *quiddity* thereof, that is, the attribute which makes it what it is. See QUIDDITY.

In which sense, the Cartesians say, it is the *nature* of the soul to think; and that the *nature* of matter consists in extension. See SOUL, MATTER, EXTENSION, &c.

And here the word *essence*, Mr. Boyle would have obtained, in lieu of *nature*. See ESSENCE.

NATURE is more particularly used for the established order, and course of material things; the series of second causes; or the laws which God has imposed on the motions impressed by him. See CAUSE, LAW, and MOTION.

In which sense it is we say, physics is the study of *nature*; *nature* makes the night succeed the day; *nature* has rendered respiration necessary to life, &c.

Thus S. Thomas defines *nature* a kind of divine art, communicated to beings, which carries them to the end they are determined for. — In which sense, *nature* is nothing else but that concatenation of causes and effects, or that order and oeconomy which God has established in the parts of his creation. See CONCATENATION, &c.

In this sense too we say, miracles are effects above the powers of *nature*: art is said to force, or surpass *nature*, by means of machines; in regard these produce effects which exceed what we find in the common course of things. See ART, MIRACLE, &c.

NATURE, again, is taken for an aggregate of powers belonging to any body, especially a living one.

In which sense physicians say, *nature* is strong, weak, or spent; or, that in such a disease, *nature* left to herself, will perform the cure.

**NATURE**, is still more strictly used for the action of providence, the principle of all things; or, that spiritual power, or being, which is diffused throughout the creation, and moves and acts in all bodies, and gives them certain properties, and produces certain effects. See PROVIDENCE.

In this, which Mr. Boyle considers as the most usual sense, *nature* is nothing else but God, acting himself, and according to certain laws he himself has fixed. See GOD.

This seems pretty agreeable to the opinion of many of the antients, who made *nature* the God of the universe, the *το πᾶν*, who presides over, and governs all: Thou others owned this an imaginary being, and by *nature* meant no more than the qualities, or virtues, which God has given his creatures, and which their poets and orators took occasion of personifying.

F. Malebranche says, the *nature* so much talked of in the schools, is fit for nothing but to lead us back to idolatry; the antient heathens hereby understanding something, which, without being God, acts continually throughout the universe. Thus the idol *nature* must be an actual principle, which, in concurrence with God, is the next and immediate cause of all the changes which befall matter. Which seems to fall in with the opinion of the *anima mundi*; as if *nature*, were a substitute of God, or a collateral cause with God, or a middle being between God and created things. See ANIMA MUNDI.

Aristotle defines *nature*, *principium & causa motus & ejus in quo est primo per se & non per accidens*: A definition so obscure, that none of his commentators, with all their glosses, have been able to render it intelligible.

This principle, which the Peripatetics called *nature*, they supposed to act necessarily; and was therefore destitute of knowledge, or liberty. See NECESSITY.

Thus also the Stoics conceived *nature* as a certain spirit, or virtue, diffused throughout the universe, which gave every thing its motion; so that all must be dragged away by the invariable order of a blind *nature*, and an inevitable necessity. See FATE.

In speaking of the action of *nature*, no more is to be understood, but that bodies act on one another, in a manner agreeable to the general laws of motion, which the Creator has established.

In this lies the mystery of that great word, which is only a compendious way of expressing the action of all bodies: but the mechanism of bodies would, perhaps, better express what is here meant by *nature*. See MECHANISM.

Some, Mr. Boyle observes, will have the *nature* of a thing to be only the law that it receives from the Creator, and according to which it acts on all occasions.—But this is an improper, and figurative expression.

The same author proposes a notion of *nature* as more fit than any yet given, to pass for the principal one of *nature*; with regard to which, many axioms and expressions relating to that word may be conveniently understood. In order to this, he distinguishes between *general* and *particular nature*.

**General NATURE**, he defines the aggregate of the bodies which make up the world in its present state, considered as a principle, by virtue whereof they act and suffer, according to the laws of motion prescribed by the author of things.

**Particular NATURE** of any subordinate, or individual, consists in the general *nature* applied to a distinct portion of the universe.—Or it is a convention of the mechanical properties (as magnitude, figure, order, situation, and local motion) of parts convenient and sufficient to constitute or entitle to, its particular species or denomination, the particular body they make up; the concurrence of all these being considered as the principle of motion, rest, &c.

**Laws of NATURE**, are axioms, or general rules of motion, and rest, observed by natural bodies in their actions on one another; and in all the changes which befall them in their natural state. See LAW.

The *laws of nature*, and of *motion*, are, in effect, the same; custom, indeed, has made some difference, and we find authors call the particular cases of motion, laws of motion; which see under MOTION.—The more general, or catholic ones, and those from which, as from axioms, the others are deduced, they call *laws of nature*.

Of these, Sir Isaac Newton has established three:

1°, That every body perseveres in the same state, either of rest, or uniform rectilinear motion; except so far as it is forced to change that state by some foreign force.

Thus projectiles persevere in their motions, except so far as they are retarded by the resistance of the air, and the cause of gravity; and thus a top, whose parts, by their cohesion, are continually drawing one another out of their rectilinear motion, only ceases to run round because resisted by the air, and the friction of the plane whereon it moves. And thus the larger bodies of the planets and comets, preserve their progressive and circular motions a long time undiminished, in regions void of all sensible resistance. See VIS INERTIÆ, RESISTANCE, and MEDIUM.

2°, The change of motion is ever proportional to the moving

force whereby it is effected, and in the direction of the right line wherein that force is impressed.

If a certain force produce a certain motion; a double force will produce double the motion; a triple force triple the motion; whether it be impressed all at once, or successively, and by degrees. And this motion, (since it is ever directed to the same point with the generating force) if the body were in motion before, is either to be added to it, as if the motions conspire; or subtracted from it, as where contrary; or added obliquely, as where oblique; and is compounded with it, according to the determinations of each. See COMPOSITION.

3°, Reaction is always contrary, and equal to action; or the actions of two bodies upon one another, are always mutually equal, and directed contrary ways.

Whatever presses, or pulls another, is equally pressed or pulled thereby. Thus, if I press a stone with my finger, the finger is equally pressed by the stone. If a horse draw a weight by a rope, the horse is equally drawn back towards the weight; for the rope being equally stretched each way, will, with an equal endeavour to relax itself, drive the horse toward the stone, and the stone toward the horse; and will hinder the progress of the one, as much as it promotes that of the other.

Again, if any body, by striking on another, do in any manner change its motion, it will, itself, by means of the other, undergo an equal change in its own motion, by reason of the equality of the pressure.

In these actions the changes are equal; not those, we mean, of the velocities, but those of the motions, the bodies being supposed free from any other impediments. For the changes of velocities, which are likewise made contrary ways, inasmuch as the motions are equally changed, are reciprocally proportional to the bodies. See REACTION.

This law also obtains in attractions. See ATTRACTION.

**NATURE**, in prosody.—A syllable is said to be long or short by *nature*, to signify that it is so originally, and independently of any rule of grammar, which might render it so by position, or otherwise. See QUANTITY, and PROSODY.

**NAVAL**, something relating to ships, or navigation. See SHIP, and NAVIGATION.

In this sense we sometimes say, *naval strength*, a *naval combat*, &c.

**NAVAL Crown**, *Corona NAVALIS*, among the antient Romans, a crown adorned with figures of prows of ships, conferred on persons who in sea engagements first boarded the enemy's vessel. See CROWN.

Though A. Gellius seems to speak in the general, where he says, the *naval crown* was adorned with prows of ships; Lipsius distinguishes two kinds of *naval crowns*; the one he calls *simple*, the other *rostrated*.

The first he supposes plain, and given to the common soldiers, &c.—The latter much more glorious, adorned with prows of ships, and only given to generals, or admirals, who had gained some important victory at sea.

**NAVE \***, in architecture—*NAVIS Ecclesiæ*, denotes the body of a church; or the place where the people are placed; reaching from the rail, or balluster of the choir, to the chief door. See CHURCH.

\* Baldus derives the word from the Greek *ναός*, temple; which Salmasius brings farther, from *navis*, ship; by reason the vault or roof of a church bears resemblance to a ship.

The antient Greeks called the *nave*, *pronaos*; the Latins frequently *cella*. See PRONAOS.

The *nave* of the church belongs to the parishioners; it is they are to repair it, &c. See REPARATION.

**NAVEL**, a part in the middle of the belly, by anatomists called *umbilicus*.—See Tab. Anat. (Splanchn.) fig. 3. lit. c. fig. 16. lit. e; see also UMBILICUS.

**NAVEL-String**, by anatomists is called *funiculus umbilicalis*. See UMBILICAL.

**NAVICULARE Os \***, in anatomy, the third bone in the foot, between the astragalus, and the ossa cuneiformia.

\* It is thus called from *navis*, a ship; to which it bears some resemblance: for which reason likewise it is sometimes called *cymbiforme*, from *cymba*, a boat; and *scaphoides*, from a Greek word of the like import. See FOOT.

The *os naviculare* has behind it a large sinus, which receives the anterior convex head of the first bone; and before it is convex. It is divided into three heads, which are received into the sinus's of the ossa cuneiformia.

**NAVIGATION**, the art, or act of sailing, or of conducting a vessel from one place to another, the safest, shortest, and most commodious way. See SHIP, and SAILING.

This art, in the full latitude of the word, comprehends three parts: 1°, The art of constructing and building ships. 2°, The loading of ships. And, 3°, the conducting and guiding of ships through the sea; which is in a peculiar sense called *navigation*, or sailing. See SAILING.

In

In this restrained sense of the word, *navigation* is either *common*, or *proper*.

**Common NAVIGATION**, usually called *coasting*, is where the ports are on the same, or very neighbouring coasts; and where the vessel is seldom out of sight of land, or out of reach of sounding. See **COASTING**.

In this, little else is required, but an acquaintance with the lands, the compass, and sounding-line; each of which see in its place, **COMPASS**, and **SOUNDING**.

**Proper NAVIGATION**, is where the voyage is long, and out in the main ocean.

In this, besides the requisites in the former, are likewise required the use of Mercator's chart, azimuth and amplitude compasses, log-line, and other instruments for celestial observations, as quadrants, forestaffs, &c. See each instrument, &c. in its place. See **CHART**, **QUADRANT**, &c.

*Navigation* turns principally on four things; two whereof being known, the rest are easily found from them by the tables, scales, and charts.

These four things are, the *difference of latitude*, *difference of longitude*, the *reckoning*, or distance run, and the *course*, or rhumb sailed on.

The latitudes are easily found, and with sufficient accuracy. See **LATITUDE**.

The course and distance, are had by the log-line, or dead reckoning, and the compass. See **LOG**, **COMPASS**, **COURSE**, and **DISTANCE**.

Nor is there any thing wanting to the perfection of *navigation*, but to determine the longitude.—The mathematicians of many ages have applied themselves with the utmost assiduity to supply this grand desideratum, but hitherto in vain; notwithstanding the magnificent rewards of several princes and states to the discoverer.—For the various methods that now occasionally obtain at sea for this purpose. See **LONGITUDE**.

The poets refer the invention of the art of *navigation* to Neptune, some to Bacchus, others to Hercules, others to Jason, others to Janus, who is said to have made the first ship. See **SHIP**.

Historians ascribe it to the Æginetes, the Phœnicians, Tyrians, and the antient inhabitants of Britain. Some will have it, the first hint was taken from the flight of the kite; others, as Oppian, *de Piscibus*, Lib. I. from the fish called Nautilus: Others ascribe it to accident.—Scripture refers the origin of so useful an invention to God himself, who gave the first specimen thereof in the ark built by Noah, under his direction. For the raillery the good man underwent on account of his enterprize, shews evidently enough, the world was then ignorant of any thing like *navigation*, and that they even thought it impossible. See **ARK**.

However, history represents the Phœnicians, especially those of their capital Tyre, as the first navigators; being urged to seek a foreign commerce by the narrowness and poverty of a slip of ground they possessed along the coasts; as well as by the conveniency of two or three good ports; and by their natural genius to traffic.

Accordingly, Lebanon, and the other neighbouring mountains, furnishing them with excellent wood for ship-building, in a short time they were masters of a numerous fleet, which constantly hazarding new *navigations*, and settling new trades, they soon arrived at an incredible pitch of opulency and populousness: inasmuch as to be in a condition to send out colonies; the principal of which was that of Carthage: which keeping up their Phœnician spirit of commerce, in time not only equalled Tyre itself, but vastly surpassed it; sending its merchant-fleets through Hercules's pillars, now the straits of Gibraltar, along the western coasts of Africa and Europe; and even, if we believe some authors, to America itself; the discovery whereof, so many ages afterwards, has been so glorious to the Spaniards. See **COMMERCE**.

Tyre, whose immense riches and power are represented in such lofty terms both in sacred and profane authors, being destroyed by Alexander the great; its *navigation* and commerce were transferred by the conqueror to Alexandria, a new city, admirably situated for those purposes; proposed for the capital of the empire of Asia, which Alexander then meditated.—And thus arose the *navigation* of the Egyptians, which was afterwards so cultivated by the Ptolemys, that Tyre and Carthage (which last, after having a long time disputed empire with the Romans, was at length subdued) were quite forgot.

Egypt being reduced into a Roman province after the battle of Actium, its trade and *navigation* fell into the hands of Augustus; in whose time Alexandria was only inferior to Rome: and the magazines of the capital of the world, were wholly supplied with merchandizes from the capital of Egypt.

At length, Alexandria itself underwent the fate of Tyre and Carthage; being surprized by the Saracens, who, in spite of the emperor Heraclius, overspread the northern coasts of Africa, &c. whence the merchants being driven, Alexandria has ever since been in a languishing state, though

still it has a considerable part of the commerce of the Christian merchants, trading to the Levant.

The fall of Rome, and its empire, drew along with it, not only that of learning, and the polite arts, but that of *navigation*; the barbarians, into whose hands it fell, contenting themselves with the spoils of the industry of their predecessors.

But no sooner were the more brave among those nations well settled in their new provinces, some in Gaul, as the Franks; others in Spain, as the Goths; and others in Italy, as the Lombards; but they began to learn the advantages of *navigation* and commerce, and the methods of managing them, from the people they subdued; and this with so much success, that in a little time some of them became able to give new lessons, and set on foot new institutions for its advantage.

Thus it is to the Lombards we usually ascribe the invention and use of banks, book-keeping, exchanges, rechanges, &c. See **BANK**, **EXCHANGE**, &c.

It does not appear which of the European people, after the settlement of their new masters, first betook themselves to *navigation* and commerce.—Some think it began with the French; though the Italians seem to have the justest title to it, and are accordingly ordinarily looked on as the restorers hereof, as well as of the polite arts, which had been banished together, from the time the empire was torn asunder.

It is the people of Italy then, and particularly those of Venice and Genoa, who have the glory of this restoration; and it is to their advantageous situation for *navigation*, they in great measure owe their glory.

In the bottom of the Adriatic were a great number of marshy islands, only separated by narrow channels, but those well screened, and almost inaccessible, the residence of some fishermen, who here supported themselves by a little trade of fish and salt, which they found in some of these islands.—Thither, then, the Veneti, a people inhabiting that part of Italy along the coasts of the Gulph, retired, when Alaric, king of the Goths, and afterwards Attila, king of the Huns, ravaged Italy.

These new islanders, little imagining that this was to be their fixed residence, did not think of composing any body politic; but each of the seventy-two islands of this little Archipelago, continued a long time under its several masters, and each made a distinct commonwealth.—When their commerce was become considerable enough to give jealousy to their neighbours, they began to think of uniting into a body: And it was this union, first begun in the sixth century, but not completed till the eighth, that laid the sure foundation of the future grandeur of the state of Venice.

From the time of this union, their fleets of merchantmen were sent to all the parts of the Mediterranean; and at last to those of Egypt, particularly Cairo, a new city, built by the Saracen princes on the eastern banks of the Nile, where they traded for their spices, and other products of the Indies.

Thus they flourished, increased their commerce, their *navigation*, and their conquests on the terra firma, till the famous league of Cambray, in 1508, when a number of jealous princes conspired to their ruin; which was the more easily effected by the diminution of their East-India commerce, of which the Portuguese had got one part, and the French another.

Genoa, which had applied itself to *navigation* at the same time with Venice, and that with equal success, was a long time its dangerous rival, disputed with it the empire of the sea, and shared with it the trade of Egypt, and other parts both of the east and west.

Jealousy soon began to break out, and the two republics coming to blows, it was three centuries almost continual war, ere the superiority was ascertained; when towards the end of the fourteenth century, the fatal battle of Chioza ended the noble strife: The Genoese, who till then had usually the advantage, having now lost all; and the Venetians, almost become desperate, at one happy blow, beyond all expectation, secured to themselves the empire of the sea, and superiority in commerce.

About the same time that *navigation* was retrieved in the southern parts of Europe, a new society of merchants was formed in the north, which not only carried commerce to the greatest perfection it was capable of till the discovery of the East and West Indies, but also formed a new scheme of laws for the regulation thereof, which still obtain under the names of *Usis and Customs of the Sea*. See **USES**.

This society is that famous league of the Hanse-towns, commonly supposed to have begun about the year 1164. See **HANSE TOWNS**.

For the modern state of *navigation* in England, Holland, France, Spain, Portugal, &c. See **COMMERCE**, **COMPANY**, &c.

We shall only add, that in examining the reasons of commerce's passing successively from the Venetians, Genoese, and

and Hanse-towns, to the Portuguese and Spaniards; and from those again to the English and Dutch; it may be established as a maxim, that the relation between commerce and navigation, or, if we may be allowed to say it, their union, is so intimate, that the fall of the one, inevitably draws after it the other; and that they will always either flourish or dwindle together.

Hence so many laws, ordinances, statutes, &c. for its regulation; and hence particularly that celebrated act of navigation, which an eminent foreign author calls the palladium, or tutelar deity of the commerce of England; which is too important not to be here mentioned; as it is the standing rule, not only of the English among themselves, but also of other nations with whom they traffic.

*Act of English NAVIGATION*, is a statute whereby the parliament of England have settled divers matters relating to the navigation and commerce of the kingdom.

Till this act, all nations were at liberty to import into England all kinds of merchandizes, whether of their own growth, or laden elsewhere, and that on their own vessels. Cromwell first perceiving the prejudice this liberty did to the English commerce, which was now almost wholly in the hands of foreigners, chiefly the Dutch, whom he hated, animated the English, by several acts of parliament, to resume their trade into their own hands; and particularly passed an act prohibiting the Dutch from importing any merchandizes, except those of their own growth or manufacture, which were very few.

Upon the restoration, the first parliament Charles II. called, distinguishing, in Cromwell, the politician from the parricide, condemned the memory of the one, and followed the plan of the other with regard to navigation and commerce; by passing that celebrated bill or act for the encouraging and increasing of shipping, and of navigation, which still subsists in its full latitude, and its antient vigour. Its date is from the first of December, 1660. 12 Car. II. c. 18.—Its chief articles follow.

1°, That no goods or commodities shall be imported or exported to or from any of the English colonies in Asia, Africa, or America, but on vessels built within the dominions of England, or really belonging to Englishmen; and whose masters, and at least three-fourths of the crew are English\*, on pain of forfeiture of the goods and vessel.

\* Under the name *English*, here, are comprehended all the king's subjects of England, Ireland, and the Plantations; as was explained in a subsequent act, 13 and 14 Car. II. c. 11.

2°, That no person born out of the subjection of England, or not naturalized, shall exercise any commerce in those colonies for himself, or others.

3°, That no merchandizes of the growth of Asia or America, shall be imported into any of the dominions of England on any other than English vessels.

4°, That no goods of foreign growth or manufacture that shall be brought into England, Wales, Ireland, islands of Jersey or Guernsey, or town of Berwick on Tweed, in English built shipping, or other shipping belonging to the foresaid places, and navigated by English mariners as aforesaid, shall be shipped or brought from any other place or country, but only from those of the growth or manufacture thereof.

5°, That all kinds of dried and salted sea-fish, train-oils, blubber, and whale-fins, not caught by English vessels, imported into England, shall pay double duties.

6°, That the commerce from port to port in England and Ireland shall be carried on wholly by English vessels, and English merchants: the crew to be always three-fourths English.

7°, That none but English vessels shall reap the benefit of the diminutions made, or abatements to be henceforth made, in the customs.

8°, All vessels are prohibited importing into England and Ireland any of the commodities of Muscovy, or even any masts, or other timber, foreign salt, pitch, rosin, hemp, raisins, prunes, oil of olive, any kind of corn, or grain, sugars, alhes, and soap, wine, vinegar, or brandy, except vessels, whereof English are owners or part-owners, and where the master and three-fourths of the mariners are English.—And that no currants, or other commodities, the growth or manufacture of the Turkish empire, shall be imported, but in vessels of English build, and navigated as aforesaid; except only such vessels as are of the build of the country or place whereof such commodities are the growth or manufacture, or of such part where such goods are usually shipped for transportation, and unless the master and three-fourths of the crew be natives of the country where they are laden.

9°, All timber, masts, boards, salt, pitch, tar, rosin, hemp, flax, raisins, figs, prunes, olive oils, corn, or grain of any kind, sugar, pot-ashes, brandies, and wines, and all goods of the growth and manufacture of Muscovy, all currants and Turkish goods imported into England, &c. in other than such shipping, and so navigated, shall be deemed aliens goods, and pay accordingly.

10°, That to prevent frauds in buying and disguising foreign

vessels, the proprietors shall take an oath, that they really belong to them, and that no alien has any part in them.

11°, That English vessels, and navigated by English, may import into the dominions of England, any merchandizes of the Levant, though not taken up in the places where they grow, or are manufactured: Provided it be in some part of the Mediterranean beyond the straits of Gibraltar. And the same is understood of commodities brought from the East-Indies; provided they be taken up in some port beyond the cape of Good-Hope: And those from the Canaries, and other colonies of Spain; and the Azores, and other colonies of Portugal, which are allowed to be shipped, the one in Spanish ports, the other in Portuguese.

12°, These penalties, prohibitions, and confiscations, not to extend to goods taken by way of reprisal from the enemies of England, nor to fish caught by the Scots, or their corn, and salt, which may be imported into England by the Scotch built ships.

13°, Five shillings per ton duty is imposed on every French vessel arriving in any port of England, so long (and even three months longer) as 50 sols per ton lies on the English vessels in France.

Lastly, That sugars, tobacco, and other commodities of the growth of the English colonies, shall not be imported into any other part of Europe, but the dominions of England. And that vessels going out of the ports of the same crown for the English colonies, shall give 1000 l. security, if under one hundred tons, and 2000 l. if above, ere they depart, that they will import their cargo into some port in the said dominions; and the like, ere they quit those colonies, that they will land their whole cargo in England.

*NAVIS*, *Argo NAVIS*, or the ship *Argo*, in astronomy, a constellation of the southern hemisphere. See *ARGO*.

*NAUMACHIA*\*, *NAUMACHY*, a spectacle, or shew, among the antient Romans, representing a sea-fight.

\* The word comes from the Greek *navis*, ship, vessel, and *μαχη*, pugna, fight.

*NAUMACHIA* is also used for a circus incompassed with seats and porticos; the pit whereof, serving as an arena, was filled with water, by means of pipes; for the exhibiting of sea-fights. See *CIRCUS*.

There were several of these *naumachias* at Rome; three built by Augustus, one by Claudius, and another by Domitian. Nero's *naumachia* served for the reverse of his medals.

*NAUSEA*\*, *ΝΑΥΣΙΑ*, in medicine, a retching, or propensity and endeavour to vomit; arising from a loathing of food, excited by some viscid humour that irritates the stomach, and urges it to discharge itself; and accompanied with anxiety about the præcordia, and salivation of the mouth. See *ANOREXY*.

\* The word is Latin, formed from the Greek *ναυσια*, of *navis*, ship: in regard, people, at the beginning of their voyages, are usually liable to this disorder.

A *nausea* is when the thoughts or sight of proper food create a sickness in the stomach, or a tendency to vomit.

*Nausea* and vomiting only differ from one another, as more or less violent.—The *nausea* is properly the effort the stomach makes to vomit, which has not always the effect. See *VOMITING*.

Boerhaave defines a *nausea* anatomically, to be a retrograde spasmodic motion of the muscular fibres of the œsophagus, stomach, and intestines; attended with convulsions of the abdominal muscles, and the septum transversum.

The usual causes of a *nausea*, and anorexia, are hard drinking, great heat; a fever, consumptions, laxness of the stomach occasioned by tea, &c. also narcotics, as tobacco, passions of the mind, suppression of evacuations inducing a plethora, foul stomach, tenacious humours lodged therein, and certain swimming or undulatory motions.

*NAUTICAL Planisphere*, a description of the terrestrial globe upon a plane, for the use of mariners. See *PLANISPHERE*, and *Sea-CHART*.

*NAUTICAL Chart*. See the article *Sea-CHART*.

*NAUTICAL Compass*. See the article *COMPASS*.

*NAUTICUS*, in anatomy, a muscle, called also *tibialis posterior*. See *TIBIALIS*.

*NAUTILUS*\*, *ΝΑΥΤΙΑΟΣ*, a species of turbinated sea shell, of a compressed figure, and having the whirl or volute latent, or hid within the body; frequently dug up at land, and often found petrified. See *SHELL*, *Fossil*, &c.

\* It takes its name from a testaceous animal, whose habitation it was, called *nautilus*, or the sailor; of which naturalists distinguish divers species.

*NAVY*, the fleet, or shipping of a prince, or state. See *FLEET*.

The direction of the *navy royal* of England is in the lord high admiral, and under him in the principal officers and commissioners, who hold their places by patent. See *ADMIRAL*.

*Principal Officers of the NAVY* are four, viz. The *treasurer*, whose business is to receive monies out of the exchequer, and to pay all the charges of the *navy*, by warrant from the principal officers.—*Comptroller*, who attends and controls all payment of wages, is to know the rates of stores, to examine and

and audite all accounts, &c.—*Surveyor*, who is to know the state of all stores, and see wants supplied, to estimate repairs, charge boatswains, &c. with what stores they receive; and at the end of each voyage, to state and audite accounts.—*Clerk of the acts*, whose business is to record all orders, contracts, bills, warrants, &c.

*Commissioners of the NAVY*, are five.—The first executes that part of the comptroller's duty, which relates to the victuallers accounts. The second, another part of the said comptroller's duty, relating to the accounts of the storekeepers of the yard. The third has the direction of the navy at the port of Portsmouth. The fourth has the same at Chatham.

The navy was antiently victualled by contract; but the victualling is now under commissioners, who keep their office on Tower-Hill. See VICTUALLING-Office.

The ordinary expences of the navy, in a year of peace, continuing in harbour, is so well regulated, that it amounts to scarce 130000 l. per annum.

The number of ships and vessels in the navy, as it stood in the year 1710, was 7 first-rates, 13 second rates, 48 third rates, 65 fourth rates, 68 fifth rates, 40 sixth rates, 5 fire-ships, 7 bomb-vessels, 18 yachts, 1 advice-boat, 2 brigantines, 7 sloops, 4 store-ships, 13 hulks, 26 hoys, 2 smacks. See RATE.

**NAZAREATE**, or **NAZARITESHIP**, the state and condition of a Nazarete, or Nazarean, among the Jews. See NAZARITE. The Nazareate was a state of separation from the rest of mankind; particularly in three things; 1<sup>o</sup>, In that the persons devoted hereto drank no wine. 2<sup>o</sup>, In that they did not shave their heads, but let the hair grow. 3<sup>o</sup>, In avoiding the touch of dead people, which they held a defilement.

The Nazareate was of two kinds; the one temporary, or for a certain number of days; the other for life.—The rabbins enquire what the term of the temporary Nazareate was, and determine it by the Cabbala: for since, in scripture, Numbers vi. 5, where it is said, *Domino sanctus erit*, the Hebrew verb, *erit*, consists of four letters; the first and third whereof, taken as numeral letters, do each make 10, and the rest each 5, all together 30; the term of the Nazareate, say they, was 30 days. See CABBALA.

**NAZARITE**\*, or **NAZARENE**, in the Old Testament, is used for a person distinguished and separated from the rest, by something extraordinary; either his sanctity, dignity, or vows. See NAZAREATE.

\* The word comes from the Hebrew נָזַר *nazar*, to distinguish, separate; in which it differs from Nazarean, an inhabitant of the country called Nazareth, which comes from נָזַר *nazar*, or *netzer*, to save, preserve.

In the book of Numbers, ch. vi. we find the vow of a Nazarite described; i. e. the vow whereby a man or woman separated themselves to the Lord; and the conditions, or effects thereof, as to abstinence, &c.

**NAZARITES**, **NAZARENES**, or **NAZAREANS**, were likewise a kind of sectaries in the church, in the first ages thereof.

S. Epiphanius tells us, the Nazareans were the same with the Jews in every thing relating to the doctrine and ceremonies of the Old Testament; and only differed from them in this, that they added Christianity thereto; professing to believe that Jesus Christ was the Messiah.

There were two kinds of Nazareans; the one pure, who kept the law of Moses and Christianity together; the other, real Ebionites. See EBIONITES.

Ecclesiastical writers tell us, that S. Matthew preached the gospel to the Jews at Jerusalem, and the rest of Palestine, in their own language; and that accordingly they had his gospel written in the Hebrew of that time. And S. Epiphanius adds, that this gospel was preserved entire among the Nazareans; only he doubts whether they might not have retrenched the genealogy of Jesus Christ, which was not in the copy of the Ebionites. S. Jerome, who translated it out of Hebrew into Greek and Latin, says, a great many people took the Hebrew gospel used by the Nazareans and Ebionites, to be the original of S. Matthew.

Hence Baronius in his *Annals* says, if the vulgate Latin version were to be reformed; it should rather be done by the Hebrew original, than by the Greek, which is but a copy.

Casaubon treats this opinion of Baronius as impious; as not being able to conceive how the authority of the Greek version should depend on a text quite lost.—He adds, that it was never used by any but the Nazareans, Ebionites, and some other heretics; and that it was full of fables, as having been altered and corrupted by those heretics.

**NE ADMITTAS**, a writ directed to the bishop, in behalf of the plaintiff, or defendant, in a cause where a quare impedit, or assize of darrein presentment, is depending; when either party fears that the bishop will admit the other's clerk during the suit between them.

**NEALING**, or rather **ANNEALING**, a term used for the preparing of several matters, by heating or baking them in an oven, or the like. See ANNEALING.

VOL. II. N<sup>o</sup> CIV.

**NEALING of Glass**, is the baking of glass, to dry, harden; and give it the due consistence; after it has been blown, and fashioned into the proper works. See GLASS.

This is usually performed in a kind of tower, called the *leer*, built over the melting-furnace. See FURNACE.

**NEALING of Glass**, is also used for the art of staining glass with metal colours. See PAINTING on Glass.

**NEALING of Steel**, is the heating it in the fire to a blood-red heat; and then taking it out, and letting it cool gently of itself. See STEEL.

This is done to make it softer, in order to engrave or punch upon it. See TEMPERING, ENGRAVING, &c.

**NEAP**, or **NEEP Tides**, are those tides which happen when the moon is in the middle of the second and fourth quarters. See TIDE.

The neap tides are low tides, in respect of their opposites, the spring tides. See SPRING Tide.

As the highest of the spring tides is three days after the full, or change; so the lowest of the neap is four days before the full, or change.—On which occasion the seamen say, that it is deep neap.

**NEAPED**—When a ship wants water, so that she cannot get out of the harbour, off the ground, or out of the dock; the seamen say, *She is neaped*, or *beneaped*.

**NEAT**, or **NET Weight**, the weight of a commodity alone, clear of the cask, bag, case, and even filth. See NET, and WEIGHT.

**NEBULOUS**, *Cloudy*, in astronomy, a term applied to certain of the fixed stars, which shew a dim, hazy light; being less than those of the sixth magnitude; and therefore scarce visible to the naked eye, to which, at best, they only appear like little dusky specks, or clouds.

Through a moderate telescope, these nebulous stars plainly appear to be congeries's, or clusters, of several little stars. See STAR.

In the nebulous star called *Præsepe*, in the breast of cancer, there are reckoned 36 little stars; three of which, Mr. Flamstead gives us in his catalogue. See CANCER.

In the nebulous star of Orion, are reckoned 21. F. le Compte adds, that in the Pleiades are 40; 12 in the star in the middle of Orion's sword; in the extent of two degrees of the same constellation, 500; and 2500 in the whole constellation. See ORION, &c.

**NEBULY**, **NEBULEE**, in heraldry, when a coat is charged with several little figures, in form of clouds, running within one another; or, when the out-line of a bordure, ordinary, &c. is indented or waved; as represented in *Tab. Herald. fig. 32*.

**NECESSARY**, in a philosophical sense, that which cannot but be, or cannot be otherwise. See NECESSITY.

The schoolmen make a great many kinds, or divisions hereof; as, *necessary in causing*; when there is a cause from which an effect must necessarily follow: *necessary in predicating*; *necessary in being*, &c.

There is also a *logical necessary*; *physical necessary*; *metaphysical*, and *moral necessities*.

**NECESSITY**, what is done by a necessary cause, or a power that is irresistible. See POWER, and CAUSE.

In which sense it stands opposed to liberty. See LIBERTY.

*Necessity* is usually confounded with *constraint*; yet, in God, the necessity of being good is not any constraint, but a perfection.—In effect, *necessity*, according to Rochefocault, differs from *constraint* in this, that the former is joined with the pleasure and inclination of the will, to which *constraint* is contrary. See WILL.

Simplicius, after Plato and Epictetus, distinguishes two kinds of *necessity*: the one *violent*, or *coactive*, which is opposite to liberty; the other *spontaneous*, or *voluntary*; very consistent with it: this latter, adds he, is that which necessitates all things to act according to their nature, as being connatural to them; since *autokineto*, a thing that is self-moved, must of necessity be moved according to its own nature, i. e. spontaneously.—This distinction is admitted by many of the divines, particularly S. Augustine, who urges it against the Pelagians, as is shewn by Janfenius.

The schools distinguish a *physical necessity*, and a *moral necessity*; a simple, *absolute necessity*, and a *relative one*.

**Physical NECESSITY**, is the want of a principle, or of a natural means necessary to act; which is otherwise called a *physical*, or *natural impotence*. See IMPOTENCE.

**Moral NECESSITY**, is only a great difficulty; such as that arising from a long habit, a strong inclination, or violent passion.

**Simple**, or **absolute NECESSITY**, is that which has no dependence on any state, or conjuncture, or any particular situation of things; but is found every where, and in all the circumstances in which the agent can be supposed.

Such is in a blind man the necessity he is under of not distinguishing colours.

**Relative NECESSITY**, is that which places a man in a real incapacity of acting, or not acting, in those circumstances,

and that situation he is found in; though in other circumstances, and another state of things, he might act, or not act.

Such, in the opinion of the Jansenists, is the *necessity* of doing evil in a man, who, with a violent passion, has only a feeble grace to resist it; or the *necessity* of doing well in a man, who having grace of seven or eight degrees of strength, has only concupiscence of two or three degrees to withstand.

All these kinds of *necessity* are opposite to liberty; since even in the last, it is as impossible for the man to act, or not act, as if he were in a state of *absolute, simple, and physical, necessity*.

The schoolmen admit other species of *necessity*; *antecedent, concomitant, consequent, &c.*

*Antecedent NECESSITY*, is that arising from an antecedent cause, necessarily operating.—Such is the *necessity* of the sun's rising to-morrow morning.

*Concomitant NECESSITY*, arises from an antecedent and necessary cause, but depends on the circumstances of the effect; the effect all the while being free.—Thus it is necessary Peter sit, supposing he is sitting.

**NECK**, a part in the human body, and in that of several other animals, between the head and the thorax, or trunk of the body.—See *Tab. Anat. (Osteol.) fig. 3. n. 1. 1. fig. 7. n. 14. 14.* See also **BODY, HEAD, &c.**

All animals have *necks*, which have lungs and voice; excepting frogs, and one class of fishes, whose characteristic it is, *vocem aliquam emittere*.

The upper part before is called the *throat*; and the lower part the *pomum Adami*.—The hole between the two clavicles is called the *jugulum*, by the Greeks *σφαγν*, murder; it being very easy to kill in this part.—The hind part of the *neck* is called *cervix*; and the hole between the first and second vertebra, the *nape*; that underneath, *epomis*. See **POMUM, JUGULUM, &c.**

Its lateral parts commence from the bottom of the ears, and are called *parotides*. See **PAROTIDES**.

The inner parts of the *neck*, are seven vertebrae; the trachea, larynx, jugular veins, carotid arteries, the intercostal nerve, that of the eighth pair, with the recurrent, and several muscles. See each part under its proper article.

The *NECKS of Quadrupeds*, Mr. Derham observes, are always equal to the length of their legs; to enable them to reach the ground for their food, without stooping the body. See **QUADRUPED**.

Indeed, the elephant is an exception from the rule; its *neck* is very short; but then it has a peculiar provision by a proboscis, or trunk. See **PROBOSCIS**.

Another thing remarkable in the *necks* of graminivorous quadrupeds, is a strong, tendinous and insensible aponeurosis, or ligament, braced from the head to the middle of the back; by means whereof they are enabled constantly to hold down the head, though very heavy, to gather their food without pain or labour.

**NECROLOGY**\*, **NECROLOGIUM**, a book antiently kept in churches, and monasteries; wherein were registered the benefactors to the same, the time of their deaths, and the days of their commemoration; as also the deaths of the priors, abbots, religious, canons, &c.

\* The word comes from the Greek *νεκρ*, dead, and *λογ*, discourse, enumeration.

This was otherwise called *calendar*, and *obituary*. See **CALENDAR, OBITUARY, &c.**

**NECROMANCY**\*, the art, or act of communicating with devils, and doing surprizing feats by their assistance; particularly calling up the dead, and extorting answers from them. See **MAGIC**.

\* The word is formed from *νεκρ*, dead, and *μαντια*, enchantment, divination.

**NECROSIS**\*, in medicine, a compleat mortification of any part; called also *fideratio*, and *sphacelus*. See **MORTIFICATION, and SPHACELUS**.

\* The word is Greek, *νεκρωσις*, where it has the same signification.

**NECTAR, NEKTAR**, among the antient poets, the drink of the fabulous deities of the heathens. See **AMBROSIA**.

**NEEDLE**, a very familiar little instrument, or utensil, made of steel, pointed at one end, and pierced at the other; used in sewing, embroidery, tapestry-work, &c.

*Needles* make a very considerable article in commerce; and the consumption thereof is almost incredible.—The sizes are from N° 1, the largest; to N° 25, the smallest.

There is scarce any commodity cheaper than *needles*; which will appear something extraordinary to the reader, after he has been shewn the great number of operations they undergo ere brought to perfection.

*Manufacture of NEEDLES*.—German and Hungary steel is of most repute for *needles*. The first thing, is to pass it through a coal fire, and under a hammer, to bring it out of its square figure into a cylindrical one. This done, it is drawn through a large hole of a wire-drawing iron; returned into the fire, and drawn through a second hole of the iron,

smaller than the first: and thus successively from hole to hole, till it have acquired the degree of fineness required for that species of *needles*; observing every time it is to be drawn, that it be greas'd over with lard to render it the more manageable. See **WIRE-DRAWING**.

The steel thus reduced into a fine wire, is cut in pieces of the length of the *needles* intended. These pieces are flatted at one end on the anvil, in order to form the head and eye. They are then put in the fire, to soften them farther, and thence taken out, and pierced at each extreme of the flat part, on the anvil, by force of a punchion of well tempered steel, and laid on a leaden block, to bring out, with another punchion, the little piece of steel remaining in the eye.

The corners are then filed off the square of the heads, and a little cavity filed on each side the flat of the head. This done, the point is formed with a file; and the whole filed over.

They are then laid to heat red-hot, on a long, flat, narrow iron, crooked at one end, in a charcoal-fire; and when taken out thence, are thrown into a basin of cold water to harden.—On this operation, a good deal depends; too much heat burns them; and too little leaves them soft; the medium is only to be learnt by experience.

When hardened, they are laid in an iron-shovel, on a fire more or less brisk, in proportion to the thickness of the *needles*; taking care to move them from time to time. This serves to temper them, and take off their brittleness; care here, too, must be taken of the degree of heat.

They are then straightened one after another with the hammer; the coldness of the water used in hardening them having twisted the greatest part of them.

The next process is the polishing.—To do this, they take twelve or fifteen thousand *needles*, and range them in little heaps against each other on a piece of new buckram, sprinkled with emery dust. The *needles* thus disposed, emery dust is thrown over them, which is again sprinkled with oil of olives. At last, the whole is made up into a roll, well bound at both ends.

This roll is then laid on a polishing table, and over it a thick plank laden with stones, which two men work backwards and forwards a day and a half, or two days successively. By which means, the roll thus continually agitated by the weight and motion of the plank over it, the *needles* within side being rubbed against each other with oil and emery, are insensibly polished.

In Germany, instead of hands, they polish with water-mills.

After polishing, they are taken out, and the filth washed off them with hot water and soap: then wiped in hot bran a little moistened, placed, with the *needles*, in a round box suspended in the air by a cord, which is kept stirring till the bran and the *needles* be dry.

The *needles* thus wiped in two or three different brans, are taken out and put in wooden vessels to have the good separated from those whose points or eyes have been broken either in polishing or wiping; the points are then all turned the same way, and smoothed with an emery-stone turned with a wheel.

This operation finishes them; and there remains nothing but to make them into packets of two hundred and fifty each.

*Chirurgeons NEEDLES*, are crooked, and their points triangular. They are of different sizes, and bear different names, according to the purposes they are used for.

The largest are *needles for amputation*; the next, *needles for wounds*; the finest *needles for sutures*.—They have others very short and flat, for tendons; others, still shorter, and the eye placed in the middle, for the tying together of vessels, &c. See **SUTURE, &c.**

*Magnetical NEEDLE*, in navigation, denotes a *needle* touched with a load-stone, and sustained on a pivot, or centre; on which, playing at liberty, it directs itself to certain points in, or under the horizon. See **MAGNET**.

*Magnetical needles* are of two kinds, *viz.* *horizontal* and *inclinary*.

*Horizontal NEEDLES*, are those equally balanced on each side the pivot which sustains them; and which, playing horizontally, with their two extremes point out the north and south points of the horizon.—For their application and use, see **COMPASS**.

*Construction of an Horizontal NEEDLE*.—A piece of pure steel is provided, of a length not exceeding six inches, lest its weight impede its volubility; very thin, to take its verticity the better; not pierced with any holes, or the like, for ornament sake, which prevent the equable diffusion of the magnetic virtue.

A perforation is then made in the middle of its length, and a brass cap or head soldered on, whose inner cavity is conical, so as to play freely on a style, or pivot, headed with a fine steel point.

The north point of the *needle*, in our hemisphere, is made a little lighter than the southern, the touch always destroying

ing the balance if well adjusted before; and rendering the north end heavier than the south, and thus occasioning the needle to dip. See *DIPPING-Needle*.

Now to give the *needle* its verticity, or directive faculty, it is to be rubbed leisurely on each pole of a magnet, from the south pole towards the north; first beginning with the northern end, and going back at each repeated rub, towards the south.—A rub in a contrary direction, takes away the power communicated by the former. See *POLE*, and *TOUCHING*.

If after touching, the *needle* be out of its equilibrium, something must be filed off from the heavier side, till it balance evenly.

*Needles* in sea-compasses are usually made of a rhomboidal, or oblong form.—See their structure under the article *COMPASS*.

A *needle*, on occasion, may be prepared without touching it on a load-stone: For a fine steel *needle*, gently laid on the water, or delicately suspended in the air, will direct itself to the north and south.

Thus, also, a *needle* heated in the fire, and cooled again in the direction of the meridian, or even only in an erect situation, acquires the same faculty. See *MAGNETISM*, *POLE*, &c.

The *needle* is not found to point precisely to the north, except in very few places; but deviates from it, more or less, in different places, and that too at different times; which deviation is called the *declination*.

*Declination of the NEEDLE*, is the variation of the horizontal *needle* from the meridian; or the angle it makes with the meridian, when freely suspended in a horizontal plane. See *DECLINATION*.

*Cleopatra's NEEDLES*. See the article *PORPHYRY*.

*Inclinator, or Dipping-Needle*. See *DIPPING-Needle*.

*NEEP Tides*. See the article *NEAP Tides*.

*NEFASTUS*, a Latin term.—The Romans used the appellation *dies nefasti*, for those days wherein it was not allowed to administer justice, or hold courts; nor for the pretor to pronounce the three solemn words or formula's of the law, *do, dico, addico*, I give, I appoint, I adjudge. See *FASTUS*. These days were distinguished in the calendar by the letter N. or by N. P. *nefastus primo*, as when the day was only *nefastus* for the first part thereof. See *DAY*.

*NEGATION*, in logic, an act whereby the mind separates one idea from another; or affirms the one to be different from the other; as, the soul is not the body. See *AFFIRMATION*.

*NEGATIVE*, a term that denies, or implies a denial of any thing. See *AFFIRMATIVE*.

Logicians, &c. say, a *negative* cannot be proved but by converting it into an affirmative.

*NEGATIVE Heretics*, in the language of the inquisition, are those, who being accused of heresy, by witnesses whose evidence they do not deny, still keep on the negative, make open profession of the catholic doctrine, and declare their abhorrence of heresy. See *INQUISITION*.

There are also *negative schisms*, as well as positive ones.—In the *negative*, it is sufficient to reject the errors of a church, without separating from it, or setting up a distinct society. See *SCHISM*.

*NEGATIVE Penalties*, the laws whereby certain persons are excluded from honours, dignities, &c. without inflicting any direct, and positive pains on them.

*NEGATIVE Quantities*, in algebra, those affected with the sign —; and which are supposed to be less than nothing. See *QUANTITY*.

*Negative quantities* are the effects of positive ones; where positive end, there *negative* ones commence. See *POSITIVE*.

*NEGATIVE Pregnant*, in law, a *negative* which implies or brings forth an affirmative.

As if a man being impleaded to have done a thing on such a day, and in such a place, denies he did it, *modo & forma declarata*; which implies nevertheless that he did it in some sort. See *FORM*.

*NEGATIVELY, NEGATIVE*, in the school philosophy, is variously used in contradistinction to *positively*. See *POSITIVE*.

*NEGRO'S*, a kind of black slaves, which make a considerable article in the modern commerce. See *BLACK*, and *SLAVE*.

The *Negro's*, also called *Blacks* and *Moors*, are a people of Africa, whose country extends on each side the river *Niger*, and is called *Nigritia*: Though, whether the people communicated their name to the river, &c. or received it therefrom, is not easily determined!

The origin of *Negro's*, and the cause of that remarkable difference in complexion from the rest of mankind, has much perplexed the naturalists; nor has any thing satisfactory been yet offered on that head. See *RETICULAR*.

They are brought from Guinea, and other coasts of Africa, and sent into the colonies in America, to cultivate sugar, tobacco, indigo, &c. and in Peru and Mexico, to dig in the mines.

This commerce, which is scarce defensible on the foot either of religion, or humanity, is now carried on by all the nations that have settlements in the West-Indies; particularly the English, Dutch, Spaniards, and Portuguese.

The Spaniards, indeed, have few *Negro's* at first hand, but have always treated with other nations to furnish them therewith: Thus they were formerly furnished by the company of the Grilles, established at Genoa: since by the *Assiento* in France; and since the peace of Utrecht, by the English South-sea company. See *ASSIENTO*, and *COMPANY*.

The best *Negro's* are brought from Cape Verd, Angola, Senegal, the kingdom of Joloffes, that of Galland, Damel, the river Gambia, &c.

A *Negro* between 17 or 18 and 30 years of age, was antiently only valued at about 45 s. in the commodities proper for that country, which are brandies, iron, linen, paper, brass-pots, basons, &c.—But their value is now much enhanced, and it is seldom they meet with a good *Negro* for five pounds: They frequently give seven or eight.

There are various ways of procuring them: Some, to avoid famine, sell themselves, their wives, and children, to their princes, or great men, who have wherewithal to subsist them. Others are made prisoners in war; and great numbers seized in excursions made for that very purpose by the petty princes upon one another's territories; in which it is usual to sweep away all, both old and young, male and female.

The *Negro's* make a frequent practice of surprizing one another, while the European vessels are at anchor, and dragging those they have caught to them, and selling them in spite of themselves; and it is no extraordinary thing to see the son sell, after this manner, his father or mother, and the father his own children, for a few bottles of brandy, and a bar of iron.

As soon as the ship has its complement, it immediately makes off; the poor wretches, while yet in sight of their country, falling into such deep grief and despair in the passage, that a great part of them languish, fall into sickness, and die: others of them dispatch themselves by refusing their food; others by stopping their breath, in a manner peculiar to themselves, by turning and folding their tongue, which immediately strangles them; others dash out their brains against the ship; and others jump over-board.

The only sure means to preserve them, is to have some musical instrument play to them, be it ever so mean. But this excessive love for their country abates as they get farther off.

At their arrival in the colonies, each *Negro* is sold for 38 or 40 pounds. They make the chief riches of the inhabitants of the islands, &c. A man, v. g. who has twelve *Negro's*, is esteemed a rich man.

*NEIF, Nativa*, in our antient customs, a bond-woman, or she-villain, born in one's house. See *NATIVE*, and *VILLAIN*.

Antiently, lords of manors sold, gave, or assigned their *neifs*, and natives. See *SLAVE*, *VILLAIN*, &c.

*Writ of NEIFTY*, is an antient writ, whereby the lord claimed such a woman for his *neif*.

*NE INJUSTE vexes*, a writ which lies for a tenant against the lord, forbidding him to distrain on the tenant, who has formerly prejudiced himself by doing or paying more than he needed.

*NEMÆAN, or NEMEAN Games*, one of the four great kinds of games, or combats, celebrated among the antient Greeks. See *GAMES*.

Some say, they were instituted by Hercules, on occasion of his killing the *Nemæan* lion; and that it was hence they took their name, as also the place of celebration, the forest of *Nemæa*.

Others relate, that the seven chiefs sent to Thebes, under the conduct of Polynices, being extremely pinched in their journey with thirst, met with Hypsipyle of Lemnos, who had in her arms Opheltes, son of Lycurgus priest of Jupiter, and Eurydice. They begging her to shew them some water, she laid the child down on the grass, and conducted them to a well. In her absence, a venomous serpent killed the child; upon which the nurse, out of an excess of grief, grew desperate. The chiefs, at their return with her, killed the serpent, buried the young Opheltes, and to divert Hypsipyle, instituted the *Nemæan games*.

Ælian says, it was indeed the seven chiefs going to the siege of Thebes, that instituted them; but adds, that it was in favour of Pronax.

Pausanias refers the institution of them to Adrastus, and their restoration to his descendants.

Lastly, Hercules, on his victory over the *Nemæan* lion, augmented the games, and consecrated them to Jupiter *Nemæus*.

The games were opened with sacrificing to *Nemæan* Jove, appointing him a priest, and proposing rewards for such as should be victors in the games.

They were held every three years, in the month called *Panemus*.

*Panemos* by the Corinthians, and *Boedromion* by the Athenians.

The Argians were the judges, and sat clothed in black, to express the origin of the games. As they were instituted by warriors, none at first were admitted to them but military men, and the games themselves were only equestrian and gymnastic; at length they were open to the people, and other kinds of sports introduced.

The conquerors were crowned with olive, till the time of the war with the Medes; when, a blow they received in that war, occasioned them to change the olive for smallage, a funeral plant. Though others maintain, that the crown was originally smallage, on account of the death of Opheltus, otherwise called Archemorus; this plant being supposed to have received the blood which run from the wound made by the serpent.

**NEMINE** *Contradicente*, i. e. none contradicting it; a term chiefly used in parliament, when any matter is carried with universal consent of all the members.

**NENIA** \*, or **NÆNIA**, in the ancient poetry, a kind of funeral song, sung to the music of flutes, at the obsequies of the dead. See **FUNERAL**.

\* The word comes from the Greek, *nenia*; on which Scaliger observes, that it should be wrote in Latin *nenia*, not *nania*.

Authors represent them as sorry compositions, sung by hired women-mourners, called *præficæ*. The first rise of these *nenia* is ascribed to the Phrygians.

Guichart notes, that *nenia* was antiently the name of a song, sung by nurses to lull children asleep; and conjectures it to come from the Hebrew *נִנ*, child.

In the heathen antiquity, the goddess of tears and funerals was called *Nenia*; whom some suppose to have given that name to the funeral song; and others to have taken her name from it.—Some will have the one, and some the other, formed by onomatopœia, from the sound or voice of those that weep.

**NEOMENIA**, in chronology, &c. a term used for the new moon. See **MOON**.

Some say, the Jews reckoned two kinds of *neomenia*, or new moons; the first, on the day of her conjunction with the sun; the second, on that of her apparition, or phasis; and add, that they celebrated two passovers, by reason of the uncertainty which of these days it should be held on.

F. Hardouin, on the contrary, maintains, they had no other *neomenia* but that of the moon's conjunction with the sun; which it was easy to ascertain by astronomical calculation: whereas the other was liable to mistakes; the moon sometimes not shewing herself till four or five days after her conjunction. See **PASSOVER**.

**NEOPHYTES** \*, **ΝΕΟΦΥΤΟΙ**, in the primitive church, were new Christians; or the heathens newly converted to the faith. See **CATECHUMEN**.

\* The word signifies a new plant; being formed of the Greek *νέος*, new, and *φυω*, I produce; *q. d.* newly born: baptism, whereby they commenced *neophytes*, being a kind of new birth. See **BAPTISM**.

The fathers never discovered the mysteries of their religion to the *neophytes*. See **MYSTERY**.

The term *neophyte* is still applied to the converts which the missionaries frequently make among the infidels.—The Japanese *neophytes*, in the latter end of the sixteenth, and beginning of the seventeenth century, are said to have shewn prodigies of courage and faith, equal to any known in the primitive church.

**NEOPHYTES** has formerly likewise been used to denote new priests; or those first admitted into orders: and sometimes, the novices in monasteries. See **NOVICE**.

**NEPENTHE** \*, or **NEPENTHES**, in antiquity, a kind of magic potion, which made persons forget all their pains, and misfortunes.

\* The word is Greek, *νεπενθε*, formed of the privative *ν*, non, or *absque*, and *πενθος*, *luctus*, sorrow.

The *nepenthe* mentioned in ancient authors, was the juice or infusion of a plant, now unknown: Homer says it was a plant of Egypt; and adds, that Helena made use of it to charm her hosts, and make them forget their pains.

Some authors say, it was the plant we call *Helenium*; others, *bugloss*; whose juice infused in wine has this effect.—M. Petit has a dissertation on the ancient *nepenthe*.

**NEPENTHE**, in pharmacy, is a name given to a kind of opiate, contrived by Theo. Zwingerus; from the great opinion he had of its giving ease in all manner of pain.

**NEPER'S**, **NAIPER'S**, or **NAPIER'S BONES**, an instrument whereby multiplication and division of large numbers are much facilitated and expedited; so called from its inventor, J. Neper, baron of Merchiston in Scotland.

*Construction of NEPER'S BONES*.—Five rods, plates, or lamellæ, are provided, of wood, metal, horn, pasteboard, or other matter, (*Tab. Algebra*, fig. 11.) of an oblong form, and divided each into nine little squares; each of which is resolved into two triangles, by diagonals.

In these little squares are wrote the numbers of multiplication table; in such manner as that the units, or right hand figures,

are found in the right-hand triangle; and the tens, or the left-hand figures, in the left-hand triangle: as in the figure.

*Use of NEPER'S Bones in multiplication*.—To multiply any given number by another; dispose the lamellæ in such manner, as that the top figures may exhibit the multiplicand; and to these, on the left-hand, join the lamella of units; in which seek the right-hand figure of the multiplier; and the numbers corresponding thereto, in the squares of the other lamellæ, write out, by adding the several numbers occurring in the same rhomb together, and their sums.—After the same manner write out the numbers corresponding to the other figures of the multiplier; let them be disposed under one another as in the common multiplication: and lastly, add the several numbers into one sum.

For example; suppose the multiplicand 5978, and the multiplier 937. From the outermost triangle on the right-hand (*Tab. Algebra*, fig. 12.) which corresponds to the right-hand figure of the multiplier 7, write out the figure 6, placing it under the line. In the next rhomb, towards the left, add 9 and 5; their sum being 14, write the right-hand figure, viz. 4, against 6; carrying the left-hand figure, 1, to 4 and 3, which are found in the next rhomb. The sum 8, join to 46, already put down; after the same manner, in the last rhomb, add 6 and 5, the latter figure of the sum 11, put down as before, and carry 1 to the 3 found in the left-hand triangle; the sum 4 join as before on the left of 1846: Thus will you have the factum of 7 into 5978; and after the same manner will you have the factum of the multiplicand, into the other figures of the multiplier: The whole added together gives the whole product.

*Use of NEPER'S Bones in division*.—Dispose the lamellæ so, as that the uppermost figures may exhibit the divisor; to these, on the left-hand, join the lamella of units. Descend under the divisor, till you meet those figures of the dividend, wherein it is first required how oft the divisor is found, or at least the next less number, which is to be subtracted from the dividend; the number corresponding to this, in the place of units, write down for a quotient. By determining the other parts of the quotient after the same manner, the division will be completed.

For example; suppose the dividend 5978)5601386(937, and the divisor 5978; since it is first asked how often 5978 is found in 56013, descend under the divisor, (*Tab. Algeb. fig. 12.*) till in the lowest series you find the number 53802, approaching nearest to 56013; the former whereof is to be subtracted out of the latter, and the figure 9 corresponding thereto in the lamella of units write

down for the quotient. To the remainder 2211, join the following figure of the divisor 8; and the number 17934 being found, as before, to be the next less number thereto, the corresponding number in the lamella of units, 3, is to be wrote down for the quotient; and the subtraction to be continued as before. After the same manner, the third and last figure of the quotient will be found to be 7; and the whole 937.

**NEPHEW** \*, a term relative to uncle and aunt; signifying a brother's or sister's son, who, according to the civil law, is in the third degree of consanguinity; and according to the canon law, in the second. See **AGNATION**, and **COGNATION**. See also **BROTHER**.

\* The word is formed from the Latin *nepos*; which in the corrupt ages of that language signified the same: though antiently and properly it denoted a grandson.

**NEPHRITIC** \*, **NEPHRITICUS**, something that relates to the kidneys. See **KIDNEY**.

\* The word is Greek, *νεφριτικός*, formed of *νεφρός*, rein, kidney.

**NEPHRITIC Colic**, is a sort of colic, or pain arising from a stone or gravel in the reins, &c. See **NEPHRITIS**. This is the most cruel of all colics. See **COLIC**.

**NEPHRITIC Wood**, *Lignum NEPHRITICUM*, a kind of medicinal wood growing in New Spain, chiefly in the kingdom of Mexico; called by the Indians *coult* and *tlapalcypally*, as being reputed sovereign against *nephritic* pains. See **WOOD**.

It must be chosen well cleared of its bark and rind; it is of a bitter taste, and a reddish yellow colour: but when infused in cold water, gives it a sky-blue tincture, when viewed by a false light, and a gold colour by a true one: A little of any acid being mixed with the tincture, both colours disappear, but a little oil of tartar restores its sky-blue. See **COLOUR**. Some substitute ebony, and others red brasil wood for *lignum nephriticum*, but the deceit becomes apparent by infusing it in water.

**NEPHRITIC Stone**, *Lapis NEPHRITICUS*, a sort of precious stone; so called from its extraordinary virtues against the stone and gravel in the kidneys. See **STONE**.

It is a species of jasper, commonly of an uniform dusky green colour; but sometimes variegated with white, black or yellow. It seems only to differ from jasper in its being harder, and always without any thing of red. See JASPER.

It is brought chiefly from New Spain, where it is sometimes found in pieces large enough to make moderate cups. There is some likewise found in Old Spain and Bohemia.

This stone is very dear, by reason of the wonderful virtues ascribed to it. A cup made of it was sold for 1600 crowns in the time of the emperor Rudolphus II.—The best for medicinal use is of a bluish grey, fat and unctuous, as talc of Venice.

The Indians of New Spain, who first discovered its use, and taught it the Europeans, wear it hung about their neck, after having cut it in various figures, chiefly beaks of birds: Whence some Charletans take occasion to counterfeit it, by cutting jada, and other stones, into like figures; and sell them at great prices to those who have an opinion of their nephritic faculty.

NEPHRITICS, NEΦPITIKA, medicines proper for diseases of the kidneys, particularly the stone. See STONE, &c.

Such particularly are the roots of althæa, dog's grass, asparagus, fago, pellitory of the wall, mallows, pimpinella, red chich-peas, peach-kernels, turpentine, lapis nephriticus, and lignum nephriticum, which see.

NEPHRITIS\*, or NEPHRITICUS Dolor, in medicine, a name given to a painful disease occasioned by the stone, or gravel in the kidneys. See STONE.

\* The word is Greek, νεφριτις, q. d. disease of the reins; formed from νεφρος, rein. See KIDNEY.

The Greeks also give the name νεφριτις, to the first vertebra of the loins, from its neighbourhood to the kidneys. See VERTEBRA.

NEPOTISM, a term used in Italy, in speaking of the authority which the popes nephews and relations have in the administration of affairs, and of the care the popes take to raise and enrich them.

Many of the popes have endeavoured to reform the abuses of nepotism: at present nepotism is said to be abolished. Leti has wrote expressly on this subject, *Il nepotismo*.

NEPTUNALIA, feasts held among the antients in honour of Neptune. See FEAST.

The neptunalia differed from the consualia, in that the latter were feasts of Neptune, considered particularly as presiding over horses, and the manage. See CONSUALIA.

Whereas the neptunalia were feasts of Neptune in general, and not considered under any particular quality.—They were celebrated on the 10th of the calends of August.

NEREIDS, NEREIDES, sea-nymphs; or fabulous deities of the antients, supposed to inhabit the sea. See NYMPH, and GOD.

The nereids were fifty in number; all the daughters of Nereus, by the nymph Doris.—Their names and genealogies are described by Hesiod.

NERVE, NERVUS, in anatomy, a round, white, long body, like a cord, composed of several threads, or fibres; deriving its origin from the brain, or the spinal marrow; and distributed throughout all parts of the body: serving for the conveyance of a peculiar juice, by some called animal spirits, for the performance of sensation, and motion. See SENSATION, MUSCULAR Motion, &c.

Origin of the NERVES.—From every point of the cortex of the brain, there arise minute medullary fibres; which, in their progress uniting together, at length become sensible; and thus constitute the medulla of the brain, and the spine. See BRAIN, MEDULLA, &c.

Hence they are continued, and in their farther progress, become distinguished, or separated by coats, which are detached to them from the dura and pia mater, into several distinct fasciculi, or nerves; resembling, in the position of their component fibrillæ, so many horses tails, wrapped up in a double tunic. See FIBRE.

It is probable that the medullary fibres of the cerebellum, rising up towards the fore-parts of the medulla oblongata, do, part of them, join the nerves arising thence, but so as still to retain their separate origin, progress, and functions. The rest of the fibres of the cerebellum are so mixed with those of the brain, as that there is, perhaps, no part of the whole medulla oblongata, or spinalis, where there are not found the fibres of each kind; and thus, to constitute the body of each nerve, both kinds of fibres contribute, though the end and effect of each be quite different. See CEREBELLUM, &c.

The nerves thus formed, and sent from the medulla oblongata and spinalis, while within the cranium, are ten pair; though very improperly so accounted; inasmuch as most of them do in reality consist of several distinct, very large nerves. From the spinal marrow, continued without the cranium, there arise, after the like manner, thirty pair; to which may be added another pair sent from the vertebræ of the neck, augmented in its progress by branches from the second and third pair, and at last joined to the eighth pair.

All these, while within the medulla, are pulposus; as soon as they quit it, they acquire a sheath, or case, wherewith being

defended, they proceed to the dura mater, which is perforated into an open vagina, reaching as far as the foramina of the cranium, destined for the transmission of the nerves; where the nine first pair, and the accessory pair, assuming this vagina, or case, pass safely out of the cranium.

The other thirty and one pair descend through spaces between the commissures of the apophyses of the vertebræ; whence, firm, hard, and well clothed as they are, they are dispersed through all, even the smallest points of the solid parts of the body yet known. See SOLID.

The coats, or covers, of these nerves, are every where invested with blood-vessels, lymphatics, and other vesicles of a very tight texture, which serve to collect, strengthen, and contract the fibrillæ; and from which many of the phenomena of the nerves, and of diseases, are accountable.

As soon as the last extremities of the nerves are about to enter the parts to which they belong, they again lay aside their coats, and become expanded either into a kind of thin membranula, or into a soft pulp. See MEMBRANE, and FLESH.

Now, upon considering, first, that the whole vascular medulla of the brain goes to the constituting of the fibrillæ of the nerves; nay, is wholly continued into, and ends in them; secondly, that upon compression, tearing, dispersion, putrefaction, &c. of the medulla of the brain, all the actions used to be performed by the nerves arising thence, are immediately abolished, even though the nerves continue entire and untouched; thirdly, that the nerves themselves are every where found lax, pendulous, crooked, retrograde, and oblique, yet effect motion and sensation almost instantaneously; fourthly, that when close bound or compressed, though in all other respects entire, they lose all their faculty in those parts between the ligature and the extremes to which they tend, without losing any in those parts between the ligature and the medulla of the brain, or cerebellum: it evidently appears, that the nervous fibrillæ do continually take up a humour or juice from the medulla of the brain, and transmit it by so many distinct canals to every point of the whole body; and by means hereof alone perform all their functions in sensation, muscular motion, &c. See SENSATION, and MUSCLE.—Which humour is what we popularly call animal spirits, or the nervous juice. See ANIMAL, and SPIRIT.

Nor does there appear any probability in that opinion maintained by some; viz. that the nerves perform all their action by the vibration of a tense fibrilla; which is inconsistent with the nature of a soft, pulposus, flaccid, crooked, wavy nerve, and with that nice distinctness wherewith the objects of our senses are represented, and muscular motions performed.

Now, after the same manner as the arterial blood is perpetually carried into all the parts of the body furnished with those vessels; so we conceive a juice prepared in the cortex of the brain and cerebellum, conveyed thence every moment through the nerves to every point of solid body. The smallness of the vessels in the cortex, as exhibited in Ruysch's injections, which yet are only arterious, and therefore incredibly thicker than the last emissary derived thence, shew how slender these hollow nervous flamina must be. But the great bulk of the brain, compared with the exceeding smallness of each fibrilla, shews, that their number must be great beyond the limits of all imagination. See STAMINA.

And again, the great quantity of juice constantly brought hither, and violently agitated, will occasion a constant plenitude, openness, and action of these little canals.

But, as fresh juice is every moment prepared, and the last is continually protruding the former; as soon as it has done its last office, it seems to be driven out of the last filaments into the smallest lymphatic venulæ, both about the glands, and elsewhere; thence into the lymphatics somewhat larger; and again from these to the common lymphatic vessels with the valves of veins, and at length into the veins and the heart; and thus like the other juices of the body, does it make its circuit round the body. See CIRCULATION of the Spirits.

Upon the whole, if we consider the great bulk of the brain, cerebellum, medulla oblongata, and medulla spinalis, with regard to the bulk of the rest of the solids of the body; the great number of nerves distributed hence throughout the whole body; that the brain and carina, that is, the spinal marrow, are the basis of an embryo, whence, according to the great Malpighi, the other parts are afterwards formed; and lastly, that there is scarce any part of a body, but what feels or moves; it will appear very probable, that all the solid parts of the body are wove out of nervous fibres, and consist wholly of them. See STAMINA, and SOLIDS.

The antients only allowed of seven pairs or conjugations of nerves, proceeding from the brain; which, with their functions, they comprised in these two Latin verses:

*Optica prima, oculos movet altera, tertia gustat.*

*Quartaq; quinta audit, vaga sexta est, septima lingua.*

But the moderns, as before observed, reckon ten, which are as follow.

**NERVES of the brain, or cerebrum,** are the **Auditory NERVES.** See seventh pair.

**Olfactory NERVES, par olfactorium,** which arise in the fore-part of the brain, just below the os frontis, these being pretty thick near the os cribrosum, are there called *processus papillares*, which Dr. Drake takes to be a properer name in that place, than that of *nerves*; they appearing rather productions of the medulla oblongata, whence the olfactory *nerves* arise, than distinct *nerves*. As soon as they have made their way through the os cribrosum, they are distributed throughout the membranes of the nose. Their use is in the sensation of smelling. See *Tab. Anat. (Osteol.) fig. 5. lit. b b*; see also **SMELLING, and OLFATORY.**

**Optic NERVES.**—These pass the skull through two perforations in its basis, a little above the fella equina, and are thence conveyed to the tunics of the eye; whereof the retina, supposed to receive the objects of vision, is an extension of the inner or medullary part alone. See *Tab. Anat. (Osteol.) fig. 5. lit. ii*; see also **VISION, RETINA, OPTIC, and THALAMI.**

**NERVES which move the eyes, oculorum motorii,** arise from the crura of the medulla oblongata, near the annular protuberance; whence they march out between two branches of the cervical artery; and passing out of the skull at an irregular oblong hole, immediately under the former, are spent on those muscles of the eyes called *attolent, depriment, adducens, and obliquus inferior*; except some small fibres spent in the muscles of the upper palpebra. See *Tab. Anat. (Osteol.) fig. 5. lit. k k*; see also **EYE.**

**Pathetic NERVES,** arise behind the testes, and passing out of the skull at the same foramen with the former pair, spend themselves wholly on the trochlear muscle. See *Tab. Anat. (Osteol.) fig. 5. lit. m m*.

**Fifth pair of NERVES,** the largest of all those coming from the brain, has its use as well as distribution more extensive; serving both for sense and motion, for touch and taste.—It sends branches not only to the eyes, nose, palate, tongue, teeth, and most parts of the mouth and face, but also to the breast, lower venter, præcordia, &c. by means of the intercostals, which are partly composed of branches of this *nerve*; whence arises a consent or sympathy between those several parts of the body. See *Tab. Anat. (Osteol.) fig. 5. lit. n n*; see also **CONSENT of parts.**

It arises from the annular protuberance, near the *processus cerebelli*, and is at its origin very large, but before its egress from the dura mater is divided into two branches, each consisting of innumerable nervous fibres, whereof those of one branch are pretty tough and firm; the other soft and lax. A little beyond the fella, it forms a plexus called *ganglioformis*, near which, each *nerve* is divided into an *anterior* and *posterior* branch.

The *anterior* or fore-branch, after a few twigs sent to the dura mater, enters the receptacle on each side the fella; whence it sends off one or two twigs to the intercostal; and as soon as it emerges thence, is again subdivided into three nearly equal branches. The *uppermost* passing the foramen lacerum into the orbit of the eye, is immediately subdivided into three less branches: the *first* of which, after sending twigs to the tunica adnata, glandula lacrymalis, the muscles that draw up the nose, and the orbicular muscles, running over the muscle which draws up the upper eye-lid, is spent on the muscles of the forehead, and the common integuments of the fore-part of the head.

The *second* branch running over the pathetics and motorii, is divided into two; whereof the outer and smaller send off several fibrillæ into the fat that envelopes the optic *nerve*; and joining with others from the third pair, forms a sort of plexus on the trunk of the optic *nerve*; whence fibrillæ are detached into the musculus deprimens, adducens, and the tunica sclerotica. The inner and bigger slip is subdivided into four twigs; the first running over the optic *nerve*, enters the sclerotica, and is spent in that membrane. The second, returning into the skull by a peculiar perforation, pierces the dura mater, and, sometimes turning back again, passes out of the skull through one of the holes of the cribriforme, and is distributed into the interior membrane of the nose. The third twig is spent partly on the eye-lids and their orbicular muscles, the external integument of the nose, and the muscles which draw it upwards. The fourth is distributed by several twigs into the eye-lids and orbicular muscles. The third slip of the upper branch is spent on the glandula innominata, and tunica adnata.

The *inferior* branch, ere it leave the skull, enters the orbit of the eye, and running along the outside of the musculus abducens, goes out again at a little perforation peculiar to it; after which it divides into several fibres, some of which go to the integuments of the cheeks; the rest to the muscles that raise the upper lip. As soon as it quits the skull at the third foramen, it is subdivided into three little branches, the first of which, after some twigs bestowed on the masseter, the teguments of the face, the gums and upper teeth, enters a peculiar sinus of the bone, making a lower part of the orbit,

and goes out at a hole peculiar to it; after which it divides into several fibrillæ which go to the teguments of the face, the upper lip, the muscle that draws the lower part of the nose laterally, and the inner muscle of the nose.

The *second small* branch running downwards behind the ducts which go from the nose to the fauces, is divided into two; the upper whereof is distributed by many twigs into the membrana pituitaria. The lower, passing a peculiar hole on the hind and lateral part of the bone of the palate, is distributed into that spongy flesh that lines the palate, and the tough membrane that covers it.

The *third little* branch is spent on that part of the membrana pituitaria that lines the fauces, upon the uvula and muscles thereabouts, and upon the tonsils.

The *posterior, or greater* branch, after sending a few twigs to the dura mater, passes the skull through the fifth foramen; and having sent off some twigs to the buccinator, masseter, and the muscles of the lower jaw, is divided into three considerable branches.

The *first* passes to the root of the tongue, and thence proceeding forwards, sends several branches to the maxillary glands. It sends others along the inner substance of the tongue, which end in capillaries at its extremity; and joining every where with the branches of the ninth pair, serve both the muscles and the papillary glands, and contribute to the taste, as well as the motion of the tongue.

The *second, or middle* branch, after distributing a twig into the maxillary glands, and the muscles styloglossus, and myloglossus, enters the sinus of the lower jaw, along which it runs accompanied with branches of the carotid arteries and little veins, which return to the internal jugulars; and besides sending off a twig to each tooth, with the membranes of the foresaid vessels, contributes to form a membrane which lines the whole sinus. At the fourth grinder it divides it into two; the less whereof runs to the joining of the jaw; the bigger, passing out at a peculiar perforation, is divided into several fibres, which are disposed into the muscles of the lower lip and chin.

The *third or exterior* branch, is spent on the parotid glands.

**Sixth pair of NERVES, or the gustatorii,** rise from the medullary tracts of the centrum ovale, below the annular process, and proceeding forwards, enter the same receptacle, or sinus of the skull, on the side of the stella, as the fifth pair does; whence sending off a twig to join those of the fifth pair, in their passage to the intercostals, it goes out of the skull at the same hole with the motorii oculorum, and ends in the abducens muscles of the eye; sending withal some twigs to the tongue. See *Tab. Anat. (Osteol.) fig. 5. lit. o o*; see also **TONGUE.**

**The seventh pair, or auditory NERVES,** arising from the medullary tract of the fourth ventricle, and passing out of the skull through a hole of the os petrosus, divides into two branches, or portions, a *hard* and a *soft* one.

The *hard* portion entering a little sinus in the upper part of the bone that constitutes the barrel of the ear, sends off a twig which distributes itself into the dura mater, except some small twigs which go to the membrane that lines the ear, to the internal muscles that line the ear, and the fine membrane that clothes the inside of the cavity of the apophysis mamillaris. After this, the hard branch sends off two other twigs, one to the eighth pair, the other to the tympanum, whose chord it forms; whence creeping over the malleolus, it goes out of the ear, and sends a ramification to the tongue. See *Tab. Anat. (Osteol.) fig. 5. lit. p p*.

The same hard branch, coming out of the *processus mamillaris*, sends some twigs to the masseter, and others to the glands about the ear; where it divides into two other ramifications; the interior bestowed on the glands, the cheek, and the upper lips, the rest on the lower palpebra, and the external part of the face. The exterior ramification, bestowing some fibrillæ on the glands, out of which it issues, divides into two; the upper, distributed into the quadratus and outer parts of the under jaw; the lower, spent on the integuments of the fore and lateral part of the neck, some muscles of the lower jaw, and the mastoid muscle.

The *soft* and larger portion of this pair divides into three ramifications; the *upper* whereof passes through a small foramen into the concha, where expanding, it forms a fine membrane which lines its inner surface. The *second* and *third* ramifications are also spent on the inner parts of the concha and semicircular ducts, which they furnish with membranes, the immediate organs of hearing. See **HEARING, and AUDITORY.**

**Eighth pair of NERVES, or the par vagum,** springs from the medulla oblongata, a little above the olivaria corpora, and passes out of the skull through the same perforations with the lateral sinus's of the dura mater. See *Tab. Anat. (Osteol.) fig. 5. lit. q q*.

This, in its progress, is joined by the par accessorium, and a little further by a twig of the hard part of the seventh pair, and at the second vertebra of the neck, by the *nervi* that issue from the cervical marrow; and detaches several twigs to the

the muscles of the larynx, gula, neck, &c. particularly from a ganglioform plexus, formed by its union with a branch of the intercostal. Hence descending to the thorax, it makes another plexus under the clavicle, whence arises the recurrent nerve on the right side, as on the left it has its rise from the trunk of the nerve itself. The right recurrent is reflected at the axillary artery; the left at the descending branch of the aorta; each running aside the trachea, impart some twigs to it, and terminate in the muscles of the larynx. Their use is in the formation and modulation of the voice. See VOICE.

Against the origin of the aorta it sends off a branch towards the heart; which dividing into two, the lesser twists about the pulmonary vein; the bigger proceeds to the pericardium, and heart, after having sent off a twig, which, with others from the intercostals, make the plexus cardiacus superior: proceeding still farther, it sends out several ramifications, which, meeting together, make the plexus pneumonicus, whence arise fibres that constrict the vessels and vesicles of the lungs. In its passage downwards, it distributes several branches to the œsophagus, along which it runs.

About the lower vertebræ of the neck, the trunk divides into two branches, the external and internal, communicating all along by several ramifications, and at length reuniting. The rest of this pair joins with the intercostals in the formation of several plexus's in the lower venter, and in them seems to terminate. See PLEXUS.

Along with these, and wrapped up in the same coat from the dura mater, passes the

**Accessory NERVES.**—*Par Accessorium*, has its origin from the medulla contained in the vertebræ of the neck. Soon after its return out of the skull, it leaves the par vagum again, and is distributed into the muscles of the neck and shoulders. See *Tab. Anat. (Osteol.) fig. 5. lit. r r*; see also ACCESSORY.

**Intercostal NERVES**, consist of nervous filaments, derived partly from the brain, viz. the branches of the fifth and sixth pair; and partly from the spinal marrow, by those branches they receive from the vertebral nerves.

In each trunk of these nerves, ere it arrives at the thorax, are two cervical plexus's; the upper whereof receives a branch from each trunk of the par vagum; the under sends out several ramifications to the œsophagus, and aspera arteria, and particularly a large one to the recurrent nerve. From the same plexus descend two other ramifications to the cardiac plexus; which are joined a little lower by a third, from which the intercostal nerve descending by the clavicles, divides into two, and embraces and constricts the subclavian artery; thence entering the thorax, it receives three or four twigs from the upper vertebral nerve, together with which it constitutes the intercostal plexus; and thence descending along the sides of the vertebræ, and receiving a nervous twig from each of them, to the os sacrum; and entering the abdomen, it forms several considerable plexus's, viz. the lienaris, hepaticus, the two renales, mesentericus magnus, and two little ones in the pelvis. See PLEXUS.

**Ninth pair of NERVES**, *motorii linguæ*, arise from the middle of the centrum ovale, by three or four small twigs, and go out of the skull near the process of the occiput; and send their branches to the tongue. See *Tab. Anat. (Osteol.) fig. 5. lit. f. f.*

They may be likewise called *gustatorii*, as they contribute, together with the branches of the fifth and sixth pair, to the sensation of tasting. See TASTING.

**Tenth pair of NERVES**, arises by two or three branches from the medulla oblongata, just below the corpora pyramidalia and olivaria, or rather, at the beginning of the medulla spinalis; whence reflecting a little backwards, it goes out of the skull between the first vertebra of the neck, and the process of the occiput. See *Tab. Anat. (Osteol.) fig. 5. lit. t t.*

It is spent on the external muscles of the head and ears. See EAR, &c.

**NERVES from the spinal marrow.**—The spinal NERVES, i. e. those springing from the medulla after its egress out of the skull, where it lays aside the name *oblongata*, and assumes that of *spinalis* are thirty pair: of which, some are reckoned as belonging to the neck, as having their origin thence, and called *cervical nerves*; others to the dorsum, or back, and called *dorsal nerves*; others to the loins, called *lumbal nerves*; and the rest to the os sacrum. See *Tab. Anat. (Osteol.) fig. 6. lit. b b*; see also SPINAL.

**Cervical NERVES.**—Of these there are seven pair: The first pair arise between the first and second vertebra of the neck, and, contrary to the rest, come out before and behind; whereas the other six pair come out laterally from the junctures of the vertebræ, through particular perforations near the transverse processes. They go to the muscles of the head and ear. See *Tab. Anat. (Osteol.) fig. 6. lit. d d.*

The second pair contributes the main branch towards the formation of the diaphragmatic nerves, which, according to Vieussens, spring only from the fourth and sixth pair. See PHRENETIC.

The three last pair of the neck joining with the two first of the dorsum, or thorax, make the *brachial nerves*.

All the *cervical nerves* send innumerable branches to the muscles, and other parts of the head, neck, and shoulders. See CERVICAL.

**Dorsal NERVES**, are in number twelve. These, excepting what the two upper pair contribute to the brachial nerves, are generally distributed into the intercostal and abdominal muscles, the pleura, and external parts of the thorax. See *Tab. Anat. (Osteol.) fig. 6. lit. f f.*

**Lumbal NERVES**, are five pair: The first of which sends two branches to the lower side of the diaphragm. The second, some twigs to the genital parts; and others, as well as the three following, to give the first roots to the crural nerves. The rest of the branches of the lumbal nerves are distributed into the muscles of the loins, and adjacent parts. See *Tab. Anat. (Osteol.) fig. 6. lit. g g.*

**NERVES of the os sacrum**, are six pair; the first three or four pair whereof are bestowed wholly on the crural nerves, the rest on the muscles of the anus, vesica, and genital parts.

**Brachial NERVES**, are the offspring, partly of the cervicals, and partly of the dorsals. These, after the several branches whereof they are composed have been variously complicated and united, run but a little way in a trunk ere they divide again into several branches, variously distributed into the muscles of the skin and arms. See *Tab. Anat. (Osteol.) fig. 6. lit. e e.*

**Diaphragmatic NERVES**, are likewise the offsprings of the cervicals. These, after joining in a trunk, run through the mediastinum undivided, till they arrive near the diaphragm, into which they send off several branches; some into the muscular, others into the tendinous part of it.

**Crural NERVES**, consist of an union of six or seven pair, viz. the three last of the lumbal, and three or four first of the os sacrum. These, after having spent their upper branches on the muscles of the thigh and skin, as far as the knee, proceed in a trunk downwards, which sends its branches to the extremities of the toes, supplying, as it goes, the muscles and skin of the leg and foot. This is the largest and firmest nervous trunk in the body.

**Capillaments of the NERVES.** See the article CAPILLAMENT. NERVES, in botany, are long, tough strings, running either across, or lengthwise of the leaves of plants. See LEAF.

**NERVES**, in architecture, denote the mouldings of projecting arches of vaults; or those arising from the branches of ogives, and crossing each other diagonally in Gothic vaults; serving to separate the pendentives. See VAULT, OGIVE, &c.

**NERVINES.** See the article NEURITICS.

**NERVOSA Corpora**, in anatomy. See the article CAVERNOSA Corpora.

**NERVOUS Colic.** See the article COLIC.
