Scocckius, in his treatise of butter, maintains, that there is no better means of keeping the teeth fair and sound, than by rubbing them over with butter: an opiate not much less distaste-

ful than that of the Spaniards, who wash their teeth every morning with urine.

To prevent and cure the scurvy in the gums, it is recommended to wash the mouth every morning with salt and water; and to hinder the teeth from spoiling or growing carious, some use only powder of hartshorn to rub the teeth with, and then wash the mouth with cold water: it is alledged, this is preferable to other dentifrices, on this account, because their hard particles are apt to abrade that fine smooth polish, with which the surface of the teeth is covered, and which is their preservative from the ill effects of air, aliment, liquors, &c. which occasion ailments of the teeth when wore off.

Dentifrices are usually compounded of powders of hartshorn, red coral, bone of the cuttle-fish, burnt alum, myrrh, dragon's blood, &c. Some commend powder of bricks, as sufficient to answer all the intentions of a good dentifrice. See DENTIFRICE.

TOP-gallant, } See the articles } FORE-top-gallant,  
TOP-mast, } FORE-top-mast,  
Heave out TOP-sails, } HEAVE.

TOPARCHY, \* a little state, or signory; consisting only of a few cities, or towns; or a petty country governed and possessed by a *toparch*, or lord.

\* The word is formed from the Greek, *τοπος*, place, and *αρχη*, command, government.

Judæa was anciently divided into ten *toparchies*. See Pliny, lib. 5. c. 14. and Joseph. lib. 3. c. 2. de Bel. Jud. & lib. 5. &c. —The last mentioned author calls the cities of Azotus, Jamna, and Phasaelis, which Herod left by testament to his sister Saloma, a *toparchy*.

Procopius only gives the quality of *toparchy* to the kingdom of Edeffa; to Abgarus, the *toparch* or lord whereof there is a tradition, that Jesus Christ sent his picture, with a letter.

TOPAZ, a sort of gem or precious stone; the third in order after the diamond. See GEM, and PRECIOUS Stone.

The *topaz* is transparent; its colour, a beautiful yellow, or gold colour: it is very hard, and takes a fine polish.—It is the true chrysolite of the ancients, and is found in several parts of the Indies, in Ethiopia, Arabia, Peru, and Bohemia. See CHRYSOLITE.

The oriental *topazes* are most esteemed; their colour borders on the orange: those of Peru are softer, but their colour much the same: the yellow of those of Bohemia is a little blackish; they are the softest of all, and their polish the coarsest. Those of Madagascar were in much esteem, but are now held good for little.

Tavernier mentions a *topaz*, in the possession of the great Mogul, weighing 157 carats, which cost 20,300*l.* sterling: and Boetius de Boot, in his treatise of precious stones; affirms to have seen in the cabinet of the emperor Rudolphus, whose physician he was, a *topaz* above three foot long, and six inches broad. Probably it might be some marble a little transparent, of a *topaz* colour.

The *topaz* is easily counterfeited; and there are factitious ones, which, to the eye, do not come behind the natural ones. If we might believe the ancients, the *topaz* has very notable virtues; but those are now in discredit: and yet the *topaz* is of some use in medicine, reduced into an impalpable powder, and applied in water. See GEM.

Some say, it takes its name *topaz* from an island in the red sea of the same name, where it was first found by Juba, king of Mauritania; but it was known to the Hebrews before, as appears from the 118th psalm.

TOPHUS, in medicine, a stony or chalky concretion in any part of an animal body; as in the bladder, kidneys, &c. (see STONE) or in the joints, &c. See GOUT, NODE, &c.

Dr. Ratty, in his treatise of the urinary passages, takes the stone to arise from the attraction between volatile saline particles: of which particles the stone, when viewed with a microscope, seems to be made up: he thinks the fault of these aggregates of saline particles, ought generally to be supposed to begin in, or proceed from, the papillæ of the kidneys, and not from the sediment of urine in the bladder.

The reason why wine-drinkers are more subject to the stone, and other concretions, than malt or water-drinkers, he supposes to be the volatile and saline, or earthy particles contained in the wine in greater quantities than in the ale, &c. A calculus, he observes, reduced to a caput mortuum, will upon the affusion of warm water, dissolve, and intirely mix; but in a short time will again settle, and the particles thereof so closely unite or attract, as that, by repeated affusions, they cannot be brought again to dissolve. See LITHONTRIP-TIC.

TOPIC, in rhetoric, a probable argument, drawn from the several circumstances and places of a fact, &c. See PLACE, &c.

TOPICE, \* TOPIKH, TOPICA, expresses the art or manner of inventing and managing all kinds of probable argumentations. See INVENTION.

\* The word is formed from the Greek, *τοπος*, of *τοπος*, place: its subject being the *places*, which Aristotle calls the *seats* of arguments.

Aristotle has wrote *topics*; and Cicero a kind of comment on them, to his friend Trebatius, who, it seems, did not understand them.—But the critics observe, that the *topica* of Cicero agree so little with those eight books of *topics* which pass under the name of Aristotle, that it follows necessarily, either that Cicero was much mistaken, which is not very probable, or that the books of *topics* attributed to Aristotle, are not wholly his.

Cicero defines *topica*, or *topice*, to be the art of finding arguments, *disciplina inveniendorum argumentorum*. See ARGUMENT.

Rhetoric is sometimes divided into two parts: judgment, called also *dialektice*; and invention, called *topice*. See RHETORIC.

TOPICS, \* or TOPICAL remedies, in medicine, are commonly used for what we otherwise call *external remedies*, i. e. such as are applied outwardly to some particular diseased, and painful part. See MEDICINE.

\* The word is formed from *τοπος*, locus, place.

Such are plaisters, cataplasms, blisters, unguents, salves, collyriums, &c. See EMPLASTER, CATAPLASM, UNGUENT, &c.

The gout is never cured by *topics*: they may assuage the pain for a time; but for a cure, the source of the evil must be attacked with internals. See GOUT.

TOPOGRAPHY, \* a description, or draught of some particular place, or small tract of land; as that of a city or town, manour or tenement, field, garden, house, castle, or the like; such as surveyors set out in their plots, or make draughts of, for the information and satisfaction of the proprietors. See MAP, SURVEYING, &c.

\* The word is formed from *τοπος*, place, and *γραφω*, I describe.

*Topography* differs from *chorography*, as a particular from more general; chorography being a description of a country, a diocese, province, or the like. See CHOROGRAPHY.

TORCH, *Tada*, a sort of luminary; being, properly, a stick of fir, or other resinous and combustible matter, as pine, linden, &c. more or less thick, and long; encompassed at one end with six wax candles, which being lighted, yield a kind of gloomy brightness.

*Torches* are used in some church ceremonies, particularly at the processions of the holy sacrament in the Romish church, and at the interments of the poorer people.

Formerly they were used at the funerals of those of the first rank; but tapers and flambeaux are now introduced in their stead; and frequently also called by their name. See FLAMBEAU, and TAPER.

TORCULAR, or TORCULARIS, among chirurgions, a contrivance for stopping bleedings in amputations. See AMPUTATION, HÆMORRHAGE, &c.

TORCULAR *Herophili*, \* in anatomy, a name given to a part in the duplicatures of the dura mater; formed of a concourse of a branch of the longitudinal sinus, with the lateral sinus's. See DURA Mater, DUPLICATION, BRAIN, SINUS, &c.

\* It has its name *torcular* from its resembling a press, or screw: *Herophili* is added from the discoverer's name.

TORE, \* TORUS, in architecture, a large round moulding, used in the bases of columns. See BASE.

\* Davilier derives the word from the Greek, *τοπος*, a cable, whereof it bears some resemblance; or from the Latin, *torus*, a bed, as being supposed to represent the edge of a bed or quilt, swelled out with the weight of the incumbent column.

The *tor* is also called *gros baton*, and *tordin*.—It is the bigness that distinguishes the *torus* from the astragal. See ASTRAGAL.

The bases of Tuscan and Doric columns have but one *tor*, which is between the plinth and the listel.—In the Attic base there are two; the upper, which is the smaller; and an under, or bigger.—See Tab. Architect. fig. 3. & fig. 24. lit. t. & fig. 26. lit. h. m.

TOREMATOGRAPHY, a Greek term, signifying the knowledge, or rather description, of ancient sculptures, and basso-relievo's. See SCULPTURE, BASSO-RELIEVO, ANTIQUE, &c.

The invention of *torematographia* is owing to Phidias, and its perfection to Polyclates: the Italian gravers have let a great deal of light into the *torematographia*.

TOREUTICE, \* TOPETTIKH, that part of sculpture, called turning. See SCULPTURE, and TURNING.

\* The word is formed of the Greek, *τοπος*, latb, of *τοπος*, *terebro*, perforo.

TORIES, or TORYS, a party or faction in England, opposite to the whigs. See FACTION, PARTY, WHIG, &c.

These two celebrated parties, which have so long divided our country, will make a considerable article in the English history, nothing inferior, in many respects, to that of the Guelfs and Gibellins.—The division has gone so deep, that it is presumed, no Englishman, who has any concern or principles at all, but inclines more to one side than the other: for which reason, we shall borrow our account of them from the mouths of foreigners, who may be supposed more impartial; and particularly from M. de Cize, a French officer, some time in the service of England, who has wrote the *History of whigism and torism*, printed

printed at Leipzig, anno 1717; and M. Rapin, whose *Dissertation sur les whigs & les tories*, printed at the Hague the same year, is well known.

During the unhappy war, which brought king Charles I. to the scaffold; the adherents of that king were first called *cavaliers*, and those of the parliament *round-heads*; which two names were afterwards changed into those of *tories* and *whigs*, on the following occasion.

A kind of robbers, or banditti in Ireland, who kept on the mountains, or in the islands formed by the vast bogs of that country, being called *tories*; a name they still bear indifferently with that of *rapparees*; the king's enemies accusing him of favouring the rebellion in Ireland, which broke out about that time, gave his partisans the name of *tories*: and on the other hand the *tories*, to be even with their enemies, who were closely leagued with the Scots, gave them the name of *whigs*, which is that given in Scotland to another kind of banditti, or rather fanatics, in that country. See WHIG.

The cavaliers, or *tories*, had then principally in view the political interests of the king, the crown, and the church of England: and the round-heads, or whigs, proposed chiefly the maintaining the rights and interests of the people, and of protestantism. Nor have the two factions yet lost their first views; though their first names, *cavalier* and *round-head*, be now entirely diffused.

This is the most popular account; and yet it is certain the names *whig* and *tory* were but little known till about the middle of the reign of king Charles II. M. de Cize relates, that it was in the year 1678, that the whole nation was first observed to be divided into *whigs* and *tories*; and that on occasion of the famous deposition of Titus Oates, who accused the catholics of having conspired against the king and the state.—The appellation *whig* was given to such as believed the plot real; and *tory* to those who held it fictitious.

We should here confine ourselves to the *tories*; and for what regards the *whigs*, refer to that article; but since by comparing and confronting the two parties together, both the one and the other will appear in the stronger light, it would be imprudent to separate them: so that we rather chuse to say the less under the word *whigs*, and refer thence hither.

The factions we are speaking of, may be considered either with regard to the *state*, or to *religion*.—The *state tories* are either violent or moderate: the first would have the sovereign to be absolute in England, as in other countries, and his will to be a law. This party, which is not very numerous, has yet been considerable; 1°. On account of its leaders, which have been lords of the first rank, and generally ministers and favourites. 2°. In that being thus in the ministry, it engaged the church *tories* to maintain stiffly the doctrine of passive obedience. 3°. Because the king has usually thought it his interest to support them.

The moderate *tories* would not suffer the king to lose any of his prerogatives; but neither would they sacrifice those of the people. These, says M. Rapin, are true Englishmen; have frequently saved the state, and will save it again whenever it shall be in danger, either from the violent *tories*, or from the republican *whigs*.

The *state whigs*, again, are either republican or moderate: the first, according to our author, are the remains of the party of the long parliament, who took in hand to change the monarchy into a commonwealth: These make so slender a figure, that they only serve to strengthen the party of the other *whigs*. The *tories* would persuade the world, that all the *whigs* are of this kind; as the *whigs* would make us believe that all the *tories* are violent.

The moderate *state whigs* are much in the same sentiments as the moderate *tories*; and desire the government may be maintained on its ancient foundation: all the difference is, that the moderate *tories* lean a little more to the side of the king, and the moderate *whigs* to that of the parliament and people. These last are in a perpetual motion to prevent the rights of the people from being broke in upon; and have sometimes taken precautions at the expence of the crown.

Before we consider our two parties with regard to religion, it must be observed, that the reformation, as carried on to a greater or lesser length, divided the English into episcopalians, and presbyterians or puritans: the first contended, that the episcopal jurisdiction should be continued on the same footing, and the church in the same form, as before the reformation: the latter maintained, that all ministers or priests had equal authority; and that the church ought to be governed by presbyteries, or consistories of priests and lay elders. See PRESBYTERIAN, &c.

After long disputes, the more moderate of each party relaxed a little of their stiffness, and thus formed two branches of moderate *whigs*, and moderate *tories*, with regard to religion; but there was a much greater number kept to their principles with inconceivable firmness: and these constituted two branches of rigid episcopalians and presbyterians, subsisting to this day; and now comprized under the general names of *whigs* and *tories*; in regard the first join the *tories*, and the latter the *whigs*.

From what has been observed, we may conclude, that as the names *tory* and *whig* have a regard to two different objects,

they are equivocal, and of consequence ought never to be applied without expressing in which sense it is done—for the same person may be, in the different respects, both *whig* and *tory*.

A presbyterian, for instance, who wishes the ruin of the church of England, is certainly on that score, of the party of *whigs*; yet if he oppose the attempts some of his party would make against the royal authority, it cannot be denied but he is effectually a *tory*.

After the like manner, the episcopalians ought to be esteemed as *tories* with regard to the church; and yet how many of them are *whigs* with regard to the government?

For the rest, the general motives that have formed and kept up the two parties, appear, in the main, to be no other than the private motives of particular persons: self-interest is the primum mobile of their actions; ever since the rise of these factions, each has struggled earnestly to get the advantage over the other; inasmuch as from such superiority accrue places, and honours, and promotions, &c. which the prevailing party distributes among its own members, exclusive of the contrary party.

As to the characters commonly attributed to the *whigs* and *tories*; the *tories*, says M. Rapin, appear fierce and haughty: they treat the *whigs* with the last contempt, and even somewhat hardly, when they have the advantage over them: they are very hot and vehement, and proceed with a rapidity which yet is not always the effect of heat and transport, but has its foundation sometimes in good policy: they are very subject to change their principles, as their party prevails, or gives way.

If the rigid presbyterians prevailed in the *whig* party, it would not be less hot and zealous than that of the *tories*; but it is said they have not the direction thereof; which gives room to affirm, that those at the head of the *whig* party are much more moderate than the chiefs of the *tories*: add, that they usually conduct themselves on fixed principles, proceed to their end gradually, and without violence; and their slowness is not less founded on good politics, than the hastiness of the *tories*.—Thus much, says our author, may be said to the advantage of the moderate *whigs*, that, in the general, they maintain a good cause, viz. the constitution of the government as by law established. See WHIGS.

TORMINA, in medicine, a term sometimes used to express pains in the general; but more particularly a species of pain called *termina ventris*, or *alvi*; in English, the *gripes*. See GRIPES.

Young children are very often troubled with gripes; it is upon this account, that nurses, in order to prevent or remedy them, usually mix with their spoon-meats, a little brandy or some carminative seed, as caraway seeds, &c. See CHILDREN.

Some children breed their teeth with violent gripes, which is apt to turn to convulsions of the bowels. See DENTITION.

In adults, the dry gripes is usually cured by the exhibition of warm cathartics, such are tincture of hiera picra, elixir salutaris, tincture of rhubarb, &c. with the assistance of opiates.

TORNADO, or TURNADO, a sudden and violent gust of wind from all points of the compass; frequent on the coast of Guinea. See WHIRLWIND.

TORNESOL. See the article TURNESOL.

TORPEDO, in natural history, a sea-fish, famed both among the ancient and modern naturalists, for a remarkable numbness wherewith it strikes the arm of such as touch it.

Various are the accounts given us of this singular fish; some authors raising the effects it produces, to a kind of miracle; and others treating them as little better than chimera's; some solving the appearance this way, and some that. But M. Reaumur, of the French academy of sciences, has at length cleared the point, and set the matter in a satisfactory light.

The *torpedo* is a flat fish, much of the figure of the thorn-back; sufficiently described in most treatises of fishes, and commonly enough found about the coasts of Provence, Gascony, &c. where the people eat it without any danger. See its figure represented in *Tab. Natural history*, fig. 9.

Phænomena of the TORPEDO.—Upon touching it with the finger, it frequently, though not always happens, that the person feels an unusual painful numbness, which suddenly seizes the arm up to the elbow, and sometimes to the very shoulder and head.

The pain is of a very particular species, and not to be described by any words; yet messieurs Lorenzini, Borelli, Redi, and Reaumur, who all felt it severely, observe it to bear some resemblance to that painful sensation felt in the arm, upon striking the elbow violently against a hard body: though M. Reaumur assures us, this gives but a very faint idea of it.

Its chief force is at the instant it begins; it lasts but a few moments and then vanishes entirely. If a man do not actually touch the *torpedo*, how near soever he holds his hand he feels nothing: if he touch it with a stick, he feels a faint effect: if he touch it through the interposition of any pretty thin body, the numbness is felt very considerably; if the hand be pressed very strong against it, the numbness is the less, but still strong enough to oblige a man speedily to let go.

Theory of the TORPEDO.—There are different ways of accounting for this effect: the first is, that of the ancients, who con-

tented themselves with ascribing a torporific virtue or faculty to this animal.

The second will have the effect produced by the *torpedo* to depend on an infinite number of corpuscles issuing continually out of the fish, but more copiously under some circumstances than others: this is the opinion most generally received; being adopted by Redi, Perrault, and Lorenzini.

They explain themselves thus, as the fire emits a quantity of corpuscles, proper to heat us, so the *torpedo* emits a quantity of corpuscles fit to numb the part they insinuate themselves into; whether it be by their entering in too great abundance, or by their falling into tracks or passages very disproportionate to their figures.

The third account, is that of Borelli, who looks on this emission of corpuscles, as imaginary: he says, that upon touching the fish, it puts itself into a violent tremor or agitation, and that this occasions a painful numbness in the hand that touches it. But M. Reaumur assures us, that notwithstanding all the attention he could view this fish withal, when ready to strike the numbness, he could perceive nothing of this trembling or agitation.

The last and justest hypothesis, is that of M. Reaumur: the *torpedo*, like other flat fishes, he observes, is not absolutely flat, but its back, or rather all the upper part of its body, a little convex: when it did not, or would not, produce any numbness in such as touched it, its back, he found, always preserved its natural convexity; but whenever it would dispose itself to resent a touch or thrust, it gradually diminished the convexity of the back parts of the body; sometimes only rendering them flat, and sometimes even concave.

The very next moment, the numbness always began to seize the arm; the fingers that touched, were obliged to give back, and all the flat and concave part of the body was again seen convex: and whereas it only became flat insensibly, it returned to its convexity so swiftly, that one could not perceive any passage from the one to the other state.

The motion of a ball out of a musket, is not, perhaps, much quicker than that of the fish reassuming its former situation; at least the one is not more perceivable than the other.

It is from this sudden stroke, that the numbness of the arm arises; and accordingly, the person when he begins to feel it, imagines that his fingers have been violently struck. It is the mere velocity of the stroke that produces the numbness.

The wonder is, how so soft a substance, as that of the fish, should give so rude a blow: indeed a single stroke of a soft body could never have done it; but in this case, there is an infinity of such strokes given in an instant. To explain the admirable mechanism hereof, we must give a view of the parts whereon it depends.

This mechanism, then, consists in two very singular muscles, *b, b*, described by several authors, who have given the anatomy of the *torpedo*. Redi, and after him Lorenzini, call them the *musculi falcati*; their form is that of crescents, and they together take up almost half the back of the fish; the one on the right side, and the other on the left. Their origin is a little above the mouth; and they are separated from each other by the bronchia, into the last of which they have their insertion.

What is singular in them, is their fibres; if, with the authors above-mentioned, we may give that name to a sort of smaller muscles as big as goose quills; of an assemblage whereof the two great muscles are formed. These lesser muscles are hollow cylinders, their length nearly equal to the thickness of the fish, and ranged a-side of each other; all perpendicular to the upper and lower surfaces of the fish, accounting these surfaces as two nearly parallel planes. The exterior surface of each of these cylinders, consists of whitish fibres, whose direction is the same with that of the cylinder: but these fibres only form a kind of tube, whose parietes are not above the thickness of a leaf of paper. The cavity of the tube is full of a soft matter, of the colour and consistence of pap, divided into twenty five or thirty different little masses, by so many partitions, parallel to the base of the cylinder; which partitions are formed of transverse fibres: so that the whole cylinder is in some measure composed of twenty-five or thirty smaller cylinders placed over each other, and each full of a medullary substance.

We need only now remember, that when the *torpedo* is ready to strike its numbness, it slowly flattens the outer surface of its upper part; and the whole mechanism, whereon its force depends, will be apparent. By that gradual contraction it bends, as it were, all its springs; renders all its cylinders shorter, and at the same time augments their bases, or, which amounts to the same, stretches all the little inclosures which divide the soft matter. In all probability, too, the large fibres, or little muscles, in that moment, lose their cylindrical form, to fill the vacuities between them.

The contraction being made to a certain degree, all the springs unbend; the longitudinal fibres are lengthened, the transverse ones, or those which form the inclosures, are shortened; each inclosure, drawn by the longitudinal fibres which are lengthened, drives the soft matter it contains, upwards; in which it

is apparently assisted by the undulatory motion, which is in the transverse fibres when contracting.

If then, a finger touch the *torpedo*, it instantly receives a stroke, or rather several successive strokes, from each of the cylinders whereon it is applied. As the soft matter is distributed into divers inclosures, it is more than probable, all the strokes are not given precisely at the same moment: nay, were there no inclosures to separate the matter, its impression would give strokes, in some measure, successive: for all parts of soft bodies do not strike at once; the impression of the last does not take till after the first have done acting. But these several inclosures serve to augment the number of the springs, and, of consequence, the velocity and force of the action.

These quick re-iterated strokes given by a softish matter, shake the nerves, suspend, or change the course of the animal spirits, or some fluid equivalent: or, if you had rather, these strokes produce an undulatory motion in the fibres of the nerves, which clashes or disagrees with that they should have, in order to move the arm. And hence the inability we are under of using the same, and the painful sensation which accompanies it.

Hence it is, that the *torpedo* does not convey its numbness to any degree, except when touched on these great muscles; so that the fish is very safely taken by the tail, which is the part by which the fishermen catch it.

The authors who have accounted for the effect of the *torpedo* from torporific effluvia, have been obliged to have recourse to the same two muscles; but then they only make them reservoirs of the corpuscles, whereby the numbness is effected.

Lorenzini, who has observed the contraction as well as Reaumur, pretends that all its use, is to express those corpuscles from out of the hollow fibres of these muscles wherein they are imprisoned; but this emanation of corpuscles admitted by most authors, is disproved by M. Reaumur, from the following considerations:

1°. In that no numbness is conveyed, if the hand be at the smallest distance from the *torpedo*: now, to use their own comparison, if the *torpedo* numbs as the fire warms, the hands would be affected at a distance from the one as well as the other.

2°. In that the numbness is not felt till the contraction of the muscles is over; whereas were the cause in torporific particles expressed by the contraction, the effect would be felt in the time of the contraction.

3°. In that were the numbness the effect of torporific particles, it would be conveyed by degrees, as the hand warms by degrees. Lastly, in that the *torpedo* conveys its numbness to the hand, through a hard, solid body, but does not do it through the air.

Were the only use the *torpedo* makes of its faculty, the saving itself from the fishermen, as some have supposed, it would signify but little; for it is very rare that it escapes their hands.

Pliny, Aristotle, and most naturalists, therefore agree, that it likewise serves it for the catching of other fishes: all we know for certain, is, that it lives on other fishes, and that it is generally found on banks of sand, &c. probably to serve it as a foundation or support for the exerting its faculty.

M. Reaumur had no fishes alive to examine what the *torpedo* would do to them; but an animal, next a-kin to a fish he tried it on, viz. a drake, which being shut up a while in water with the fish, was taken out dead; doubtless from its too frequent contacts on the *torpedo*.

In the history of Abyssinia, we are assured, that if the *torpedo* kill living fishes, it seems to bring dead ones to life again; dead fishes being seen to stir if put in the same vessel with it: but this is much less credible than what is told us in the same history, that the Abyssinians use *torpedo's* for the cure of fevers, by tying down the patient to a table, and applying the fish successively upon all his members, which puts him to cruel torment, but effectually rids him of his disease.

Bellonius assures us, that our own *torpedo's*, applied to the soles of the feet, have proved successful against fevers.

M. du Hamel, in his history of the academy of sciences, anno 1677, mentions a kind of *torpedo's*, which he compares to conger eels: M. Richer, from whom he has the account, affirms, on his knowledge, that they numb the arm strongly, when touched with a staff, and that their effects even go to the giving vertigo's.

**TORQUE**, in heraldry, a round roll of cloth twisted and stuffed; such is the bandage frequently seen in armories about the heads of moors, savages, &c.

It is always of the two principal colours of the coat. The *torque* is the least honourable of all the enrichments wore on the helmet by way of crest. See **CREST**.

**TORREFACTION**, \* in pharmacy, a kind of roasting or assation, wherein a drug is laid to dry on a metalline plate placed over coals, till it become friable to the fingers. See **ASSATION**.

\* The word is formed from the Latin, *torrefacere*, to roast. *Torrefaction*, is particularly used, when, after reducing some drug, as rhubarb, or myrabolans, into powder, it is laid on an iron or silver plate, and that placed over a moderate fire till the powder begin to grow darkish; which is a mark those remedies have lost their purgative virtue, and have acquired a more astringent one. See **RHUBARB**, **USTION**, &c.

Formerly

Formerly they used to *torrefy* opium, to get out some malignant parts fancied to be in it, before they durst use it in medicine; but the effect was, that its volatile spirits and sulphur, wherein its greatest virtue consists, were hereby evaporated. See OPIUM.

**TORRENT, TORRENS,** in geography, a temporary stream of water, falling suddenly from mountains wherein there have been great rains, or an extraordinary thaw of snow; sometimes making great ravages in the plains. See RIVER, &c.

**TORRICELLIAN,** a term very frequent among physical writers, used in the phrases, *torricellian tube*, and *torricellian experiment*, on account of the inventor, Torricelli, a disciple of the great Galileo.

**TORRICELLIAN Tube,** is a glass tube, as AB, about 3 foot long, and  $3\frac{1}{4}$  of an inch in diameter, represented *Tab. Pneumaticæ*, fig. 6. n. 2. whose upper orifice A is hermetically sealed.

**TORRICELLIAN Experiment,** is performed by filling the *torricellian* tube AB with mercury; then stopping the orifice B with the finger, inverting the tube, and plunging that orifice in a vessel of stagnant mercury C.—This done, the finger is removed, and the tube sustained perpendicular to the surface of the mercury in the vessel. See MERCURY.

The consequence is, that part of the mercury falls out of the tube into the vessel, and there only remains enough in the tube to fill from 28 to 31 inches of its capacity, above the surface of the stagnant mercury in the vessel.

Those 28, &c. inches of mercury are sustained in the tube by the pressure of the atmosphere on the surface of the stagnant mercury; and according as that atmosphere is more or less heavy, or as the winds blowing upwards or downwards, heave up or depress the air, and so increase or diminish its weight and spring, more or less mercury is sustained from 28 inches to 31. See AIR, and ATMOSPHERE.

The *torricellian experiment* makes what we now call the *barometer*. See BAROMETER.

**TORRID Zone,** that tract of earth lying under the line, and extending on each side to the two tropics, or to 23 degrees and a half of latitude. See TROPIC, ZONE, &c.

The ancients believed the *torrid zone* uninhabitable; but from the late navigations we learn, that the excessive heat of the day there is tempered by the coldness of the night.

**TORT,** in law, denotes injustice, or injury: as, *de son tort mème*, in his own wrong, &c. See WRONG, and INJURY. Hence also *tort-feaser*, &c.—The word is pure French, where it signifies the same.

*Executor de son TORT.* See the article EXECUTOR.

**TORTOISE-Shell,** the shell, or rather scales \* of a testaceous animal, called a *tortoise*; used in inlaying, and in various other works, as for snuff-boxes, combs, &c. See TESTACEOUS, and SHELL.

\* Mr. Catelby observes, that this hard strong covering which incloses all sorts of tortoises is very improperly called a shell; being of a perfect bony contexture; but covered on the outside with scales, or rather plates, of a horny substance: which are what the workmen call *Tortoise-shell*. Phil. Trans. N° 438. p. 117.

There are two kinds of *tortoises*, viz. the *land* and *sea tortoise*; *testudo terrestris*, & *marina*.

The *sea tortoise*, again, is of four kinds, viz. the *fresh tortoise*, the *caretta*, the *cabobanna*, and the *lager-bu*; but it is the caret alone furnishes that beautiful shell, so much admired in Europe.

The shell of the *caretta*, or hawkbill tortoise is thick, and consists of two parts, the upper, which covers the back, and the lower, the belly: the two are joined together at the sides by strong ligaments, which yet allow of a little motion.—In the fore part is an aperture for the head and fore legs, and behind for the hind legs and tail.

It is the under shell alone is used: to separate it from the upper, they make a little fire beneath it, and as soon as ever it is warm, the under shell becomes easily separable from the upper with the point of a knife, and is taken off in laminæ or leaves, without killing the animal, which, it is said, being turned to sea again, gets a new shell.

The whole spoils of the caret consist in 13 leaves or scales, 8 of them flat, and five a little bent: of the flat ones, there are 4 large ones, about a foot long, and seven inches broad.

The best *tortoise-shell* is thick, clear, transparent, of the colour of antimony, sprinkled with brown and white: when used in marquetry, &c. the workmen give it what colour they please by means of coloured leaves which they put underneath it.

In generation, Rondeletius observes, the embraces of the male and female *sea-tortoises* continue for a whole lunar month; and that they squirt water out of their nostrils in the same manner as the dolphin. On the Brazilian shore they are said to be so big as sometimes to dine fourscore men; and that in the Indian sea the shells serve the natives for boats. De Laet notes, that in the island of Cuba they are of such a bulk, that they will creep along with five men on their backs.

**TORTOISE,** in the military art. See TESTUDO.

**TORTURE,** a grievous pain inflicted on a criminal, or person accused, to make him confess the truth. See QUESTION.

The forms of *torture* are different in different countries. In some they use water, in others iron, in some the wheel or rack, in some the boot, thumbkins, &c. See RACK, BOOT, &c.

In England the use of all *torture* is abolished, both in civil and criminal matters, and even in cases of high treason; though something like it still obtains, where the criminal refuses to plead. See PAINE *fort & dure*.

In France the *torture* is not practised in civil matters; but by an ordonnance of 1670, if a person be accused of a capital crime, he may be put to the question, i. e. to the *torture*, if there be considerable proof against him, and yet not proof enough to convict him. See PROOF.

There are two kinds of *torture*: the one *preparatory*, appointed before sentence passed; the other *definitive*, decreed by a sentence of death.

The *preparatory torture* is ordered *manentibus indicis*, so that if the accused do not confess, he cannot be condemned to death, but only *ad omnia citra mortem*.

The *definitive torture* is that which a condemned criminal is put to, to make him confess his accomplices. The ordinary *torture* is given at Paris with six pots of water, and the little trestle; and the extraordinary, with six other pots, and the great trestle.

In Scotland the *torture* is given with the boot. See BOOT.—In some other countries, by heating the criminals feet; in others, with wedges, &c.

The *torture*, says M. Bruyere, is a sure expedient to destroy an innocent person of a weak complexion, and to save a criminal of a robust one.—It was a noble saying of an ancient, *They who can bear the torture will lie, and they who cannot bear it.*

**TORY.** See the article TORIES.

**TOTAL Cause,** } See the articles } CAUSE.

**TOTAL Eclipse,** } } ECLIPSE.

**TOTTED.**—A good debt to the king is, by the foreign apposer, or other officer in the Exchequer, noted for such by writing the word *tot*, q. d. *tot pecuniæ regi debentur*, whence it is said to be *totted*.—Also that which is paid is to be *totted*. See EXCHEQUER.

**TOUCAN,** in astronomy, a modern constellation of the southern hemisphere, consisting of eight small stars; otherwise called *anser Americanus*. See CONSTELLATION.

**TOUCH,** in music. An organ is said to have a good *touch*, or stop, when the keys close and lie down well, being neither too loose nor too stiff. See ORGAN.

**TOUCH the wind,** in the sea language, is when the steer's-man at the helm is bid to keep the ship as near the wind as may be. See STEERING.

**TOUCHING** is sometimes used for the sense of feeling. See FEELING.

**TOUCHING,** in geometry. A right line is said to *touch* a circle, when it meets in such a manner as, that being produced, it does not cut, but falls without the circle. See TANGENT.

**TOUCH-stone,** a black, smooth, glossy stone, used to try metals upon. See STONE, ESSAY, &c.

The ancients called it *lapis Lydius*, the *Lydian stone*, from Lydia, a country of Asia minor, whence it was brought.

The moderns call it *touch-stone*, in regard the proof they make of metals, chiefly silver, is by touching or rubbing the metal to be tried on this stone, and comparing the colour of the mark it leaves thereon, with the mark of another piece of metal of the same species, whose goodness is past doubt. See METAL, and ASSAY.

**TOUMAN.** See the article TOMAN.

**TOURNAMENT.** See the article TURNAMENT.

**TOUR,** *Turn*, a French term, often used among English writers for a journey.—Thus we say the *tour* of Paris, of Rome, &c.

**TOUR of hair,** a tress or border of hair, going round the head, which, mingled dextrously with the natural hair, lengthens and thickens it. See HAIR.

These *tours* are for men.—The women likewise use *tours*, and false hair, either to hide their age, or to supply the thinness of their natural hair on the forehead and temples.

The form is different according to the mode, sometimes raised and curled, sometimes straight and laid flat along the forehead. See PERRUKE.

**TOURN,** in law. See the article TURN.

**TOUT temps prêt & uncore est,** that is, always ready, and so at the present time: a kind of plea in way of excuse or defence for him that is sued for any debt or duty belonging to the plaintiff. See PLEA, TENDER, UNCORE, &c.

*Per my & per Tout.* See the article PER.

**TOW.**—Whatever is drawn or dragged after a ship or boat with a rope, is said to be *towed*. See TOWAGE.

**TOWAGE,** \* the hauling or drawing a ship or barge by men or beasts, or by another ship or boat fastened to her, in order to make her enter a port, ascend a river, or the like.

\* The word is probably derived from the Saxon, *tean*, to draw, drag.

The term is also used for money, or other recompence, given by bargemen to the owner of the ground next the river where they

they *tow* a barge or other vessel, for the liberty of passing along the side thereof.

**TOWER, TURRIS**, a tall building, consisting of several stories, are usually of a round form, though sometimes square, or polygonal.

Before the invention of guns, they used to fortify places with *towers*, and to attack them with moveable *towers* of wood, mounted on wheels, to set the besiegers on a level with the walls, and drive the besieged from under the same.

These *towers* were sometimes 20 stories, and 30 fathom high: they were covered with raw skins, and an hundred men employed to move them.

*Towers* are also built to enable one, by their elevation, to view to a great distance.—These are of all figures, as square, round, pentagonal, &c. See PHAROS.—In China is a famous *tower* of Porcelain, whereof the Dutch relate wonders.

*Towers* are also built for fortresses, prisons, &c. as the *Tower* of London, the *towers* of the Bastile, &c. See FORTIFIED Place.

The *Tower* of London is not only a citadel to defend and command the city, river, &c. but also a royal palace where our kings with their courts have sometimes lodged; a royal arsenal, wherein are arms and ammunition for 60000 soldiers: a treasury for the jewels and ornaments of the crown; a mint for coining of money; the great archive, wherein are preserved all the ancient records of the courts of Westminster, &c. and the chief prison for state criminals. See ARSENAL, MINT, &c.

In the midst of it is the great square, white *tower*, built by William the Conqueror.—Within the *Tower* is a parochial church, exempt from all jurisdiction of the archbishop, and a royal chapel, now disused.

The chief officer of the *Tower* is the constable, under whom is the lieutenant, who acts by his direction, and in his absence. He has, by grant of several of our kings, *unam lagenam*, two gallons and a pint of wine out of every vessel, and a certain quantity out of every boat laden with lobsters, oysters, and other shell-fish, and double the quantity out of every alien's boat passing by the *Tower*: to him also belongs a fee of 200 l. for every duke committed prisoner, 100 l. for every peer not a duke, and 50 l. for every commoner. See CONSTABLE, &c. Under the constable, and in his absence, under the lieutenant, are a *gentleman-porter*, and divers warders.—The first has charge of the gates to lock and unlock them, and deliver the keys every night to the constable or lieutenant, and receive them of him next morning: he commands the warders who are upon the day's wait, and at the entrance of a prisoner has for his fee *vestimenta superiora*, or else a composition for the same, which is usually 30 l. for a peer, and 5 l. a-piece for others.

Note, the ancient allowance from the king to a duke or marquis, prisoner in the *Tower*, was 12 l. a week, now but 4 l. To all other lords anciently 10 l. a week, now 2 l. 4 s. 5 d. To knights and gentlemen anciently 4 l. a week, now 13 s. and 4 d. And to inferior persons, now 10 s. a week.

For the yeomen warders of the *Tower*. See WARDER.

In the *Tower* is likewise kept a court of record every Monday, by prescription, for the liberty of the *Tower*, of debt, trespass, and other actions of any sum. See COURT.

Beside the ancient liberty of the *Tower*, which adjoins to it, the Old Artillery Garden by Spittle-Fields, and the Little Minories, are within the *Tower* liberty, within which the gentleman-porter has the same power and authority as sheriffs within their respective counties. See ORDNANCE, &c.

*Hollow Tower*, in fortification. See HOLLOW Tower.

**TOWN**, a place inhabited by a considerable number of people, of an intermediate magnitude and degree between a city, and a village. See VILLAGE, &c.

It is hard to give a tolerable definition of a *town*, in regard the idea is a little arbitrary, and unfixed. A *town* is generally without walls, which is the character that usually distinguishes it from a city; but this does not hold universally. See CITY.

We have several kinds of *towns*, borough *towns*, market *towns*, county *towns*, &c. See BOROUGH, &c.

*Town-house*,  
Freedom of a *Town*,  
*Hanse Towns*,

} See the articles  
HOUSE.  
FREEDOM.  
HANSE.

**TOXICUM, TOEIKON**, a sort of poison, said to be used by the Indians to their arrows, in order to render wounds made by them incurable. See POISON.

The Indians are supposed to poison their arrows, daggers, &c. with the virus of vipers, the mischievous effects whereof continue a long time after the matter is quite dried up. See VIPER.

**TRABEATION, TRABEATIO**, in the ancient architecture, the same with entablature. See ENTABLATURE.

It consists of three principal members or divisions, *viz.* the architrave, freeze and cornice, each of which consists of divers lesser members and ornaments. See ARCHITRAVE, FREEZE, &c.

The proportion, members, &c. are different in the several orders. See ORDER; see also each order apart, TUSCAN, DORIC, &c.

**TRACE**, a mark or impression which any thing leaves behind it in passing over another. See MARK, IMPRESSION, &c.

**TRACES of the brain**, among the Cartesian philosophers, are those impressions, more or less deep, which sensible objects make on the fine fibres of the brain, by means of the organs of sense. See BRAIN.

These impressions are also called *traces of the object*; the course of the animal spirits serves to keep them up, and to renew them. See SPIRIT.

The vivacity of the imagination arises from the prodigious quantity of *traces* of different objects in the brain, which are so linked together, that the spirits cannot be sent into one of them, but they run into all the rest; by which means the ideas occasioned by the application of the spirits to those several *traces*, are all excited, as it were, at once. See IMAGINATION.

Memory, according to the same, consists in the *traces* which the animal spirits have impressed. See MEMORY, HABIT, &c.

**TRACE of a hare**, among hunters, is her footing in the snow; distinct from other treadings, called *doubling*, and *pricking*, &c.

**TRACES** also denote the tracks of ravenous beasts, as wolves, wild beasts, &c.

**TRACHEA**, \* in anatomy, a large arterial vessel, called also *aspera*, and popularly the *wind-pipe*, being the canal or tube which carries the air into the lungs, for the use of respiration and speech.—See Tab. Anat. (Splanchn.) fig. 14. lit. cc. ee. dd. &c. See also the article ASPERA.

\* Galen gave it the name *trachea*, *τραχεια*, because of its being rough and uneven; on which account the Latins also called it *aspera*.

**TRACHOMA, ΤΡΑΧΩΜΑ**, in medicine, a roughness or asperity of the inner part of the palpebræ, attended with an itching, redness, and frequently with pustles, resembling millet-seeds.

Its degrees are the sycofis, and tylofis, or rather those are higher disorders into which the *trachoma* is liable to degenerate.

**TRACT, TRACTUS**, properly denotes an extent of ground, or a portion of the surface of the terraqueous globe. See TERRAQUEOUS, &c.

**TRACT, or TRACTATE, TRACTATUS**, does also signify a small treatise, or written discourse upon any subject. See TREATISE.

**TRACT**, in hunting, denotes the trace or footing of a wild beast. See TRACE.

**TRACTION**, *drawing*, the act of a moving power whereby the moveable is brought nearer to the mover; called also *attraction*. See ATTRACTION.

**TRACTRIX**, in geometry, a curve line, called also *catenaria*. See CATENARIA.

**TRADE, traffic, commerce**, the act or art of dealing, buying, selling, exchanging, &c. of commodities, bills, money, &c. See EXCHANGE, BILL, MONEY, MERCHANTIZE, &c.

For the origin, progress, &c. of *trade*. See COMMERCE, and NAVIGATION.

*Balance of TRADE*. See the article BALANCE.

**TRADE-WINDS** denote certain regular winds at sea, blowing either constantly the same way, or alternately this way and that; thus called from their great use in navigation, and the Indian commerce.

The *trade-winds* are of different kinds, some blowing three or six months of the year one way, and then the like space of time the opposite way; very common in the Indian seas, and called *monsoons*. See MONSOON.

Others blow constantly the same way; such is that general wind between the tropics, which off at sea is found to blow all day long from east to west.—For the phenomena of each, with their physical causes, see WIND.

Dr. Lister has a conjecture in the *Philosophical Transactions*, that the tropical or *trade-winds* arise, in great part, from the daily and constant breath of a sea-plant, called the *sargossa*, or *lentacula marina*, which grows in vast quantities from 36° to 18° north latitude, and elsewhere upon the deepest seas.—For the matter of wind coming from the breath of one only plant, must needs be constant and uniform; whereas the great variety of trees and plants at land, furnishes a confused matter of winds. Hence, he adds, it is, that these winds are briskest about noon; the sun quickening the plant most then, and causing it to breathe faster and more vigorously. Lastly, the direction of this wind from east to west, he attributes to the general current of the sea; for a gentle air is observed to be constantly led along with the stream of a river: nor must it be omitted, that every plant is, in some measure, a heliotrope, and bends itself, and moves after the sun, and consequently emits its vapour thitherward; so that the direction of the *trade-wind* is, in some measure, also owing to the course of the sun.

Dr. Gordon has another hypothesis: the atmosphere, which surrounds the earth, and moves along with it in its diurnal motion, he supposes to keep pace therewith, that part of it at least which is near the earth, if the remoter part should be judged to lose ground.

If then there were no changes in the atmosphere's gravity, he supposes it would always go along with the earth from west to east in an uniform motion, altogether insensible to us: but the portion of the atmosphere under the line being extremely rarefied,

rarefied, its spring expanded, and so its gravity and pressure much less than the neighbouring parts of the atmosphere, it is incapable of the uniform motion towards the east, and must therefore be pressed westwards, and makes the continual breeze from east to west between the tropics.

**TRADING Society.** See the article SOCIETY.

**TRADITA Nexu.** See ABALIENATION.

**TRADITION, TRADITIO,** the act of delivering a thing into the hands of another.—The sale of a moveable is completed by a simple *tradition*. See LIVERY.

**TRADITION,** in matters of religion, is applied to those laws, doctrines, relations, &c. which have been handed down to us from our fore-fathers, without being written.

Taking *tradition* in this sense, for every thing relating to faith, or the rites and ceremonies of religion thus derived down to us from the primitive church, there are two kinds, viz. *apostolical* and *ecclesiastical tradition*.

**Apostolical TRADITION,** which is what we properly call *tradition*, is defined by the Romanists to be the unwritten word of God, descended from the apostles to us through a continual succession of the faithful.

By this *tradition*, say they, it is, that the holy scriptures have been kept intire, both as to the letter, i. e. the text, and as to the spirit or sense thereof. This *tradition* the council of Trent declares to have the same authority with the holy scripture itself, and pronounces every one who rejects it a heretic.

**Ecclesiastical TRADITIONS,** are certain statutes and regulations regarding the rites, customs and circumstances of religion, introduced since the time of the apostles by councils, popes, &c. and continued to our time through a constant observance of the church.

The Romanists make another division of *tradition*, viz. into *written* and *unwritten*.

**Written TRADITION,** is that whereof we find some traces in the ancient fathers, and doctors.

**Unwritten TRADITION,** is that whereof there appear no signs or steps in any of the fathers extant.

The church of Rome pretends to be the depository of each kind: *tradition* she holds to be absolutely necessary in the church, grounding this necessity on the promise of infallibility which Jesus Christ is pretended to have made her.

Yet others of that communion deny *tradition*, how excellent soever it may be for the reclaiming of heretics, to be absolutely necessary; maintaining, that the church would not be less infallible, nor less the rule of doctrine, &c. if the fathers had never wrote at all.

**TRADITIONARY, TRADITIONARIUS,** a name given among the Jews, to such of them as acknowledge tradition, follow it, and explain the scriptures thereby: in opposition to the Caraites, who refuse any thing but the pure scriptures themselves. See CARAITE.

The *traditionaries* are what we more usually call rabbins and rabbinites, or talmudists. See RABBIN, RABBINISTS, TALMUD, &c.—Hillel shone among the *traditionaries*, and Schammai among the textuaries. See TEXTUARY.

**TRADITORES,** a name given in the first ages of the church to such christians as, in times of persecution, to avoid death and martyrdom, delivered up the sacred writings to the persecutors.

The enemies of religion, even under the old law, made their utmost efforts to deprive the world of the holy scriptures: in that cruel persecution which Antiochus raised against the Jews, the books of the law were very solicitously sought after, torn, and burnt, and such as kept them put to death; as we read in the first book of Maccab. cap. i. ver. 56, 57.

Dioclesian renewed the same impiety, by an edict published in the 19th year of his empire, commanding all the sacred books to be brought to the magistrates, and burnt.

Many weak christians, and even some bishops, overcome by the fear of punishment, carried in their books to the persecutors; which the church detesting, made very severe laws against them, and gave them the infamous name of *traditores*, from *trado*, I deliver, betray.

As the great pretence of the schism of the Donatists was, that the catholics tolerated the *traditores*, it was decreed in the council of Arles, held in 314, that such as should be found guilty of having delivered up any of the holy books or vessels, should be deposed from the order of the clergy, &c.

**TRADUCIANS,\* TRADUCIANI,** a name which the Pelagians anciently gave the catholics, because of their teaching that original sin was transmitted from father to children, or that it was communicated to the children by the father in the way of generation. See ORIGINAL Sin.

\* The word is formed of the Latin, *tradux*, which was made use of to express that communication; and which comes from *trahere*, I transmit, or propagate from one to another.

At present some give the appellation *traduciani* to such as hold that the souls are transmitted to the children by the father. See SOUL.

**TRADUCTION,\*** the act of translating, or turning out of one language into another. See TRANSLATION, and METAPHRAST.

\* The word is formed of *trans*, beyond, and *duco*, I lead, draw.

**TRAFFIC.\*** See the article TRADE, and COMMERCE.

\* The word is formed from the French, *trafic*, and that from the Italian, *traffico*, which is again borrowed from the Arabic.

The principal *traffic* in Muscovy and the North is in furs and skins: the great *traffic* of the Dutch in the East is in spices: the *traffic* of money is mostly carried on at the Exchange.

**TRAFINE.** See TREPANUM.

**TRAGACANTH,\*** or **ADRAGANTH,** *Gum Dragon*, a kind of gum oozing out at incisions, made in the trunk and larger branches of a plant or little shrub of the same name, growing in the Levant. See GUM, and DIATRAGACANTH.

\* The word is Greek, *τραγανθα*, formed of *τραγος*, goat, and *ανθα*, thorn, by reason the plant is beset with prickles.

The naked hillocks of mount Ida in Candia, M. Tournefort tells us, produce a deal of the plant *tragacantha*, or goat's-thorn, which gives the gum spontaneously towards the end of June, and in the following months, when the nutritious juice of the plant, thickened by the heat, bursts most of the vessels it is contained in.

This juice coagulates in threads, which make their way into the pores of the bark, where being pushed forwards by new juice, they get through the bark, and are at length hardened in the air, either into little lumps, or into twisted pieces in form of little worms, more or less long, according to the store of the matter they are formed of.

It should seem too that the contraction of the fibres contributes to the expression of the gum: those fine fibres, like the fibres of hemp, laid bare and trampled under foot by men and horses, contract themselves, and facilitate the expression of the extravasated juice.—The plant grows also in several places of the Levant, particularly about Aleppo.

The gum is of different colours and qualities, some being white, other some greyish, some red, and some almost black. The white is the best: it must be chosen clear, smooth and twisted worm-like.

It dissolves easily in any aqueous menstruum, which it will give the consistence of a syrup to, in the small proportion of a dram to a pint. It is smooth and softening, and therefore good to obtund the acrimony of any humours, which makes it of service in such coughs as proceed from catarrhs and defluxions of rheum. It is also very strengthening in some seminal weaknesses, and prevalent against the whites in women.

**TRAGEA,** in pharmacy, an aromatic powder grossly beaten and mixed with sugar; taken by way of carminative.

**TRAGEDY,** a dramatic poem, representing some signal action performed by illustrious persons, and which has frequently a fatal issue, or end. See DRAMA, and ACTION.

Aristotle more scientifically defines *tragedy*, the imitation of one grave and intire action, of a just length, and which, without the assistance of narration, by raising of terror and compassion, refines and purges our passions.

This definition has given the critics some perplexity; and Corneille declares he cannot reconcile Aristotle with himself: the instances Aristotle cites, he thinks, ruin his own definition. He even denies the purging our passions to be the end of *tragedy*. See PASSIONS.

Our English authors are more favourable to the definition: by the purging our passions, they understand not the extirpating them, but the reducing them to just bounds; for by shewing the miseries that attend a subjection to them, it teaches us to watch them more narrowly; and by seeing the great misfortunes of others, it lessens the sense of our own.

*Tragedy*, in its original, M. Hedelin observes, was only a hymn sung in honour of Bacchus by several persons, who, together, made a chorus of music with dances and instruments. See CHORUS.

As this was long, and might fatigue the fingers, as well as tire the audience, they bethought themselves to divide the singing of the chorus into several parts, and to have certain recitations in the intervals. See SATYR.

Accordingly, Thespis first introduced a person upon the stage with this view: Æschylus finding one person insufficient, introduced a second to entertain the audience more agreeably by a kind of dialogue: he also clothed his persons more decently, and first put them on the buskin. See COTHURNUS.

The persons who made these recitations on the scene, were called *actors*; so that *tragedy* at first was without actors. And what they thus rehearsed, being things added to the singing of the chorus, whereof they were no necessary part, were called *episodes*. See EPISODE.

Sophocles found that two persons were not enough for the variety of incidents, and accordingly introduced a third: and here the Greeks seem to have stopped, at least it is very rare that they introduce four speakers in the same scene. See PERSON.

*Tragedy* and comedy were at first confounded with each other, but they were afterwards separated; and the poets applied themselves to the cultivating of *tragedy*, neglecting comedy. See COMEDY.

When *tragedy* was got into a better form, they changed the measure of its verse, and endeavoured to bring the action within the compass of a day, or of a revolution of the sun. See **UNITY**.

For the several parts of *tragedy*, see **ACT**, **SCENE**, **ACTION**, **FABLE**, **CHARACTER**, **MANNERS**, &c.

The English received the first plan of their drama from the French, among whom it had its first rise toward the end of the reign of Charles V. under the title of *chant-royal*, which consisted of pieces in verse composed in honour of the virgin, or some of the saints, and sung on the stage: they were called by the title *chant-royal*, because the subject was given by the king of the year, or the person who had bore away the prize the year preceding.

The humour of these pieces run wonderfully among the people, insomuch that in a little time there were formed several societies, who began to vie with each other: one of these, to engage the town from the rest, began to intermix various incidents or episodes, which they distributed into *acts*, *scenes*, and as many different persons as were necessary for the representation. Their first essay was in the Bourg St. Maur, and their subject the passion of our Saviour. The prevot of Paris prohibiting their continuing of it, they made application to court; and to render it the more favourable to them, erected themselves into a friary, or fraternity, under the title of *brothers of the passion*; which title has given some occasion to suspect them to have been an order of religious.

The king, on seeing and approving some of their pieces, granted them letters of establishment in 1402; upon which they built a theatre, and for an age and a half acted none but grave pieces, which they called *moralities*; till, the people growing weary of them, they began to intermix farces or interludes taken from prophane subjects.

This mixture of farce and religion displeasing many, they were re-established by an arret of parliament in 1548, on condition of their acting none but profane, lawful and decent subjects, without intermeddling with any of the mysteries of religion; and thus were the brothers of the passion despoiled of their religious character: upon which they mounted the stage no more in person, but brought up a new set of comedians, who acted under their direction.

Thus was the drama established, and on this foundation arrived in England. In process of time, as it was improved, it became divided into two branches, agreeable to the practice of the ancients, and the nature of things, *viz.* into *tragedy* and comedy properly so called; and this last again was subdivided into pure comedy and farce. See each under its proper head, **COMEDY**, &c.

**Hilaro TRAGEDY**. See the article **HILARO Tragedia**.

**TRAGI-COMEDY**, a kind of dramatic piece, representing some action passed among eminent persons, the event whereof is not unhappy or bloody, and wherein is sometimes admitted a mixture of less serious characters.

The ancients, M. Dacier observes, knew nothing of such compositions, wherein the serious and comic are blended; nor does the epithet M. Corneille gives them of heroic comedies, excuse their irregularity.

Their foundation is certainly bad; for, endeavouring both to make us laugh and cry in their turns, they endeavour at contrary emotions, which the heart can never undergo; every thing that disposes for the one, indisposing for the other.

The *tragi-comedy* was formerly very common on the English stage: scarce such a thing in the 17th century as a pure tragedy without a spice of comedy or farce to make the people laugh. Now, that the stage and our tastes are brought nearer to the model of nature and the ancients, the *tragi-comedy* is disused. *Tragi-comedy* is the only case, wherein comedy is allowed to introduce kings and heroes. See **COMEDY**.

**TRAGUS**, ΤΡΑΓΟΣ, in anatomy, one of the protuberances of the auricle, or external ear; called also *hircus*, because usually hairy. See **EAR**.

The *tragus* is that protuberance next the temple:—that on the opposite side, to which the soft lobe of the ear is annexed, is called the *antitragus*.

**TRAJAN Column**, a famous historical column, erected in Rome, in honour of the emperor *Trajan*. See **COLUMN**. It is of the Tuscan order, though somewhat irregular: its height is eight diameters, and its pedestal Corinthian; it was built in a large square there, called the *forum romanum*.

Its base consists of 12 stones of an enormous size, and it is raised on a socle or foot of eight steps. Within-side is a staircase, illuminated with 44 windows. It is 140 foot high, which is 35 foot short of the Antonine column; but the workmanship of the former is much more valued.

It is adorned from top to bottom with basso relievo's, representing the great actions of that emperor against the Dacæ.

Several learned men have explained the bas-reliefs of the *Trajan* column, and among others Ciaconius and Fabretti.—

The late king of France, Lewis XIV. had models of all the bas-reliefs taken off in plaster of Paris.

**TRAJECTORY** of a comet, is its path or orbit, or the line it describes in its motion. See **ORBIT**.

This Hevelius, in his *Cometographia*, will have to be very

nearly a right line; but Dr. Halley rather concludes it to be a very excentric ellipsis. See **ELLIPSIS**.

Sir Isaac Newton, in prop. 41. of his third book, shews how to determine the *trajectory* of a comet from three observations; and in his last proposition, how to correct a *trajectory* graphically described. See **COMET**.

**TRAIL-BOARD**, in a ship, is a carved board on each side of her beak, which reaches from the main stem to the figure, or the brackets.—See *Tab. Ship. fig. 2. n. 4.* See also the article **SHIP**.

**TRAIN**, the attendance of a great person, or the trail of a gown, or robe of state.

In falconry, it denotes the tail of an hawk. See **TAIL**.

**TRAIN** is likewise used for the number of beats which a watch makes in an hour, or any other certain time. See **WATCH-Work**, &c.

**TRAIN** is also used for a line of gun-powder laid to give fire to a quantity thereof, in order to do execution, by blowing up earth, works, buildings, &c. See **GUNPOWDER**, **MINE**, &c.

**TRAIN**, or **TRAIL** of artillery, includes the great guns and other pieces of ordnance belonging to an army in the field. See **GUN**, **CANNON**, **ORDNANCE**, &c. See also **ARTILLERY**.

**TRAIN Oil**, the oil procured from the blubber of whales, by boiling. See **OIL**, and **WHALE**.

**TRAIN-bands**, or **TRAINED-bands**, a name given to the militia of England. See **MILITIA**.

**TRAINING a lead**, among miners, is the searching for and pursuing a vein of ore. See **VEIN**.

**TRAITOR**. See the article **TRAYTOR**.

**TRAITTE**. See the article **FOREIGN Traitte**.

**TRAMBLING of tin ore**, among miners, is the washing it very clean: which is done with a shovel, and in a frame of boards. See **TIN**.

**TRAMEL**, an instrument or device, sometimes of leather, more usually of rope, fitted to a horse's legs, to regulate his motion, and form him to an amble. See **AMBLE**.

It is also taken in many places for an iron moveable instrument in chimnies, to hang pots over the fire.

**TRAMEL-NET**, \* is a long net wherewith to take fowl by night in champain-countries, much like the net used for the low-bell both in shape, bigness and meshes.

\* The word comes from the French, *tremail*, formed of the Latin, *tremaculum*, or *tremaculum*; of *macula*, by reason it is composed of three rows of meshes.

To use it, they spread it on the ground, so as the nether or further end, fitted with small plummets, may lie loose thereon: then the other part being bore up by men placed at the fore-ends, it is thus trailed along the ground. At each side are carried great blazing lights, by which the birds are raised: as they rise under the net, they are taken. See **Low-Bell**.

**TRAMONTANE**, \* or **TRAMONTAIN**, something beyond, or on the further side, the mountains.

\* The word is formed from the Italian, *tra*, of the Latin, *trans*, which signify *beyond*; and *mons* or *mont*, mountain.

The term is particularly applied by the Italian painters, to all such as live on the other side the Alps, *i. e.* all out of Italy; as the Germans, Flemish, French, &c.

The French lawyers give the same title of *tramontane*, or *ul-tramontane* doctors to the Italian canonists, Gomez, Hostiensis, Panorm, &c. who go upon rules and maxims too favourable to the court of Rome, and contrary to those of France, &c. On the Mediterranean and in Italy, a north wind is called *tramontana*, a *tramontane wind*.

Some also call the pole star, *tramontana*.—Hence the proverb, to lose the *tramontane*; that is, to be out of one's aim, to be disconcerted.

**TRANCHE**, or **TRENCH**, is used by the French armors, to express that manner of partition called among us, *party per bend dexter*. See **PARTY**, and **BEND**.

A scutcheon is said to be *tranché*, *cut*, when it is divided in two diagonally, the division coming from the dexter angle of the chief to the sinister angle of the point:—when it is divided contrarywise, it is said to be *taillé*, or *party per bend sinister*.

**TRANGLE**, in heraldry, the diminutive of a fesse, commonly called a *bar*. See **BAR**, and **FESSE**.

**TRANSACTION**, **TRANSACTIO**, in the civil law, an accommodation of some business or dispute between two parties, by a mutual and voluntary agreement or contract between them. See **ACCOMMODATION**, **COMPROMISE**, **ACCORD**, &c.

**Philosophical TRANSACTIONS**, are a kind of journal of the principal things that come before the royal society of London. See **JOURNAL**, and **ROYAL Society**.

The *transactions* contain the several discoveries and histories of nature and art, made by the members of the society, or communicated by them from their correspondents, with the several experiments, observations, &c. made by them, or transmitted to them, &c.

They were first set on foot in 1665 by Mr. Oldenburg, secretary of the society, and continued by him till the year 1679. After his death Dr. Hook, the succeeding secretary, continued them under the title of *philosophical collections*: but Dr. Grew, appointed to the same office in 1689, resumed the former title of *philosophical transactions*, which was retained by his successor Dr. Plott, and subsists to this day.

They

They were published every month with great care by Mr. Oldenburg, and the first secretaries; but after Dr. Plott, they were frequently interrupted. In the year 1700 Dr. Sloan restored their regular publication monthly; in time they relapsed, and only came out once in two months; from that they fell to 3, 4, and 6 months. They were afterwards published more frequently and regularly by the care of Dr. Jurin; but are now returned into their former languishing state.

**TRANSCENDANT**, or **TRANSCENDENTAL**, something raised, or elevated beyond other things; or which passes and transcends the nature and circumstances of other inferior beings, so as not to be intimately and essentially included under them.

The term is particularly applied to the object of metaphysics, which considers being in general, or *transcendental* beings, as God and angels, and truths consisting in pure speculation. See **METAPHYSICS**.

Logicians and metaphysicians give the name *transcendental terms* to those which are so general, and of a signification so extensive and universal, that they pass through all the categories, and agree to all kinds of things:—such are the terms *ens, unum, verum, bonum, res*. See **ENS**, &c.

**TRANSCENDENTAL Art**, } See **ART**.  
**TRANSCENDENTAL Perfection**, } See **PERFECTION**.

**TRANSCENDENTAL Quantities**, among school-men. See the article **QUANTITY**.

**TRANSCENDENTAL Quantities**, among geometers, are indeterminate ones; or such as cannot be expressed or fixed to any constant equation.—Such is a *transcendental curve*, or the like. See **TRANSCENDENTAL Curve**, and **CURVE**.

M. Leibnitz has a dissertation in the *acta erudit. Lips.* wherein he endeavours to shew the origin of such quantities, viz. why some problems are neither plain, solid, nor fur-solid, nor of any certain degree, but do transcend all algebraical equations. See **PROBLEM**.

He also shews how it may be demonstrated without calculus, that an algebraic quadratrix for the circle or hyperbola is impossible: for if such a quadratrix could be found, it would follow, that by means thereof any angle, ratio or logarithm, might be divided in a given proportion of one right line to another, and this by one universal construction; and consequently the problem of the section of an angle, or the invention of any number of mean proportionals, would be of a certain finite degree. See **CIRCLE**, **QUADRATRIX**, **QUADRATURE**, &c.

Whereas the different degrees of algebraical equations, and therefore the problem, understood in general of any number of parts of an angle or mean proportionals, is of an indefinite degree, and transcends all algebraical equations. See **EQUATION**.

**TRANSCENDENTAL Curve**, in the higher geometry, is such a one as cannot be defined by any algebraic equation; or which, when expressed by an equation, one of the terms thereof is a variable quantity. See **CURVE**.

These curves are the same with what Des Cartes, and after his example, several others, call *mechanical curves*, and which they would have excluded out of geometry; but Sir Isaac Newton and M. Leibnitz are of another sentiment. For, in effect, in the construction of geometrical problems, one curve is not to be preferred to another, as it is defined by a more simple equation, but as it is more easily described than that other. See **GEOMETRICAL Line**.

And some of these *transcendental* or *mechanical curves* are found of greater use than all the algebraical ones together, except the circle. See **MECHANICAL**.

Add that M. Leibnitz, in the *acta erudit. Lips.* gives us a kind of *transcendental* equations, whereby these *transcendental curves* are actually defined, and which are of an indefinite degree; that is, are not always the same in all the points of the curve.

Whereas algebraists use to assume some general letters or numbers for the quantities sought, in these *transcendental problems* M. Leibnitz assumes general or indefinite equations for the lines sought; e. gr. putting  $x$  and  $y$  for the absciss and ordinate, the equation he uses for a line sought, is  $a + bx + cy + exy + fx^2 + gyy$ , &c. = 0. By the help of which indefinite equation, which in reality is finite, for it may always be determined how far soever it is necessary to raise it, he seeks the tangent; and that which results, comparing with the given property of tangents, he finds the value of the assumed letters  $a, b, c$ , &c. and thus defines the equation of the line sought.

If the comparison above-mentioned do not proceed, he pronounces the line sought not to be an algebraical, but a *transcendental* one.

This supposed, he goes on to find the species of transcendancy: for some *transcendentals* depend on the general division or section of a ratio, or upon the logarithms, others upon the arcs of a circle, and others on more indefinite and compound inquiries.

Here therefore besides the symbols  $x$  and  $y$ , he assumes a third, as  $v$ , which denotes the *transcendental quantity*, and of these

three forms a general equation for the line sought, from which he finds the tangent according to the differential method, which succeeds even in *transcendental* quantities. What he finds, he compares with the given properties of the tangent, and so discovers not only the values of  $a, b, c$ , &c. but also the particular nature of the *transcendental* quantity.

And though it may sometimes happen that the several *transcendentals* are so to be made use of, and these of different natures too one from another; also though there be *transcendentals* or *transcendentals*, and a progression of these in infinitum: yet we may be satisfied with the most easy and useful one, and for the most part may have recourse to some peculiar artifices for shortening the calculus, and reducing the problem to as simple terms as may be.

This method being applied to the business of quadratures, or to the invention of quadratrices in which the property of the tangent is always given, it is manifest not only how it may be discovered, whether the indefinite quadrature may be algebraically impossible, but also how, when this impossibility is discovered, a *transcendental* quadratrix may be found; which is a thing which had not before been shewn. So that it seems that geometry is by this method carried infinitely beyond the bounds to which Vieta and Des Cartes brought it; since by this means a certain and general analysis is established, which extends to all the problems which are of no certain degree, and consequently not comprehended within algebraical equations.

Again, in order to manage *transcendental* problems (where-ever the business of tangents or quadratures occurs) by a calculus, there is hardly any that can be imagined shorter, more advantageous or universal, than the differential calculus, or analysis of indivisibles and infinites.

By this method we may explain the nature of *transcendental* lines by an equation, e. gr. Let  $a$  be the arc of a circle,

$\int dx$   
and  $x$  the versed sine: then will  $a = \sqrt{2x - xx}$  and if the ordinate of the cycloid be  $y$ , then will  $y = \sqrt{2x - xx} + \int dx$

$\sqrt{2x - xx}$  which equation perfectly expresses the relation between the ordinate  $y$  and the abscissa  $x$ , and from it all the properties of the cycloid may be demonstrated.

Thus is the analytical calculus extended to those lines which have hitherto been excluded, for no other cause, but that they were thought incapable of it. See **GEOMETRICAL Line**.

**TRANSCOLATION**, in pharmacy, the same with filtration, or percolation. See **FILTRATION**, &c.

**TRANSCRIPT**, a copy of any original writing, particularly that of an act, or instrument, inserted in the body of another. See **COPY**, **EXEMPLIFICATION**, &c.

In this sense, we say, *transcript of a fine*, &c. See **FINE**, **DUPLICATE**, &c.

**TRANSCRIPTO recognitionis factæ coram iudicariis itinerantibus**, &c. is a writ for certifying a recognition into chancery, taken before the justice in eyre. See **RECOGNIZANCE**.

**TRANSCRIPTO pedis finis levati mittendo in cancellariam**, is a writ for certifying the foot of a fine levied before justices in eyre, &c. into chancery. See **FINE**.

**TRANSEAT**, in the schools, &c. a term purely Latin, signifying, *let it pass*, or suppose a proposition to be true, without granting it. See **HYPOTHESIS**, **LEMMA**, &c.

Hence the proverb, *transeat, græcum est, non legitur*: the phrase is said to have taken its rise from some ancient commentators, or glossographers of the civil law, who, not understanding Greek, passed over all the words that occurred in that language, without explaining them.

In the Roman chancery, a *nil transeat* is a kind of opposition made to the sealing of a bull, or to the delivery of some other instrument, till the parties against whose interest it is directed, have been heard against it.

**TRANSELEMENTATION**, in the schools, a change of the elements or principles of one body into those of another. See **ELEMENT**.

Such is that which Roman catholics contend for in the eucharist, where the elements of bread and wine are changed into those of flesh and blood. See **TRANSUBSTANTIATION**.

*Transflementation*, where-ever it happens, is always allowed miraculous, or an effect beyond the ordinary powers of nature. See **MIRACLE**.

**TRANSFER**, in commerce, &c. an act whereby a person surrenders his right, interest or property in any thing moveable, or immoveable, to another.

The sale or donation of an inheritance, &c. transfers the property, rights, &c. thereof.

The term is principally used in the commerce of stocks; for the assigning and making over subscriptions or shares therein, to such as purchase them of the proprietors. See **SUBSCRIPTION**.

In the South-Sea company, the Bank, East-India, &c. *transfers* are made, by erasing the former proprietors names, and entering the stock under the name of the purchaser, under his proper letter of the alphabet. See COMPANY, BANK, &c. In order to a *transfer*, it is required the party bring another with him to swear he is the same person to whom the stock is entered. A counterfeit in this case is by act of parliament made a capital crime.

**TRANSFIGURATION**, among divines, that miraculous change wrought by Jesus Christ, in presence of St. Peter, St. James, and St. John, on mount Thabor, where he appeared in his glory, in the middle of Moses and Elias. See the description thereof in St. Matthew, chap. xvii.

The term is also applied to a feast held in the Romish church on the 6th of August, in commemoration of that miracle.

**TRANSFORMATION**, a metamorphosis, or change of form. See METAMORPHOSIS, FIGURE, and FORM.

The chymists have been a long time seeking the *transformation* of metals, that is, their *transmutation*, or the manner of changing them into gold. See TRANSMUTATION.

Among the mystics, by *transformation*, is understood a change of the contemplative soul, whereby it is in some measure deified or converted into the substance of God, and wherein it is, as it were, lost and swallowed up in the divinity, so as not to perceive its own distinction from God.

The word *transformation* is very liable to be abused; and, in effect, the Quietists and Quakers have abused it. But many of the mystics use it innocently enough; meaning no other by it than what St. Paul did when he said, *Vivus ego, jam non ego, vivit vero in me Christus*.

**TRANSFORMATION** is also sometimes used for what we more properly call *transubstantiation*. See TRANSUBSTANTIATION.

**TRANSFUSION**, \* **TRANSFUSIO**, the act of pouring a liquor out of one vessel into another. See DECANTATION.

\* The word is compounded of the Latin preposition *trans*, beyond, farther, and *fundo*, I pour.

In the preparations of chymistry and pharmacy, there are frequent *transfusions* of liquors, syrups, &c.

**TRANSFUSION of the Blood**, is particularly used for the letting out the blood of one animal, so as to be immediately received into the body of another. See BLOOD.

Dr. Lower is usually accounted the inventor of this *transfusion*, and the experiment said to have been first publicly made by him at Oxford in 1665, and the description thereof published in his excellent book *de Corde*.

Yet we are informed from good hands, that it had been proposed at Paris in 1658; that another of our countrymen had had the idea before, and that it had been known in Germany several years.—It is certain there is a passage in Libavius, wherein the *transfusion* is exactly described as since practised: it is true, he disapproves of it; and only mentions it to ridicule it.

The use most naturally expected from the operation, is, that one animal may live of the blood of another; so that those which want blood, or have corrupt, morbid blood, may be supplied from others with a sufficient quantity, and of such as is good and laudable.

However, it is certain the operation has no place in the present practice of physic; but whether that be the fault of the operation itself, or owing to the indolence and averfeness of people to run into new methods, we will not undertake to say.

The method of *transfusing*, Dr. Lower gives us the following effect: take up the carotid artery of the dog, or other animal whose blood is to be *transfused* into another of the same, or a different kind; separate it from the nerve of the eighth pair, and lay it bare above an inch. Make a strong ligature on the upper part of the artery; and an inch nearer the heart another ligature with a running knot, to be loosened and fastened as occasion requires. Draw two threads between the two ligatures; open the artery, put in a quill, and tie up the artery again upon the quill by the two threads, and stop the quill by a stick.

Then make bare the jugular vein of the other animal, for about an inch and half in length, and at each end make a ligature with a running knot; and in the space between the two knots, draw under the veins two threads, as in the other. Open the vein, and put into it two quills, one into the descending part of the vein, to receive the blood from the other dog, and carry it to the heart: the other quill put into the other part of the jugular, towards the head, through which the second animal's own blood is to run into dishes. The quills thus tied fast, stop them up with sticks till there be occasion to open them.

Things thus disposed, fasten the dogs on their sides towards one another, in such manner, as that the quills may go into each other: then unstop the quill that goes down into the second dog's jugular vein, as also that coming out of the other dog's artery; and by the help of two or three other quills put into each other, as there shall be occasion, insert them into one another.

Then slip the running knots, and immediately the blood runs through the quills as through an artery, very impetuously.

As the blood runs into the dog, unstop the quill in the upper part of his jugular, for his own blood to run out at, though not constantly, but as you perceive him able to bear it, till the other dog begin to cry, and faint, and at last die.

Lastly, take out both quills out of the jugular, tie the running knot fast, and cut the vein asunder, and sew up the skin: the dog thus dismissed, will run away as if nothing ailed him.

In the *Philosophical Transactions* we have accounts of the success of various *transfusions* practised at London, Paris, in Italy, &c. Sir Edmund King *transfused* 49 ounces of blood out of a calf into a sheep; the sheep after the operation appearing as well and as strong as before.

Mr. Coxe *transfused* 14 or 16 ounces out of a mangy into a sound dog: the effect was, that no alteration was observed in the sound dog, but the mangy one was cured.

M. Gayant *transfused* the blood of a young dog into the veins of an old one almost blind with age, and scarce able to stir; which yet, two hours afterwards, leaped and frisked about.

M. Denis *transfused* the blood of three calves into three dogs, which all continued brisk, and eat well as before.—The same person *transfused* the blood of four weathers into a horse 26 years old, which thence received much strength, and a more than ordinary appetite.

At St. Griffoni's at Udine, the blood of a lamb was *transfused* into the veins of a spaniel 13 years old, which had been quite deaf for three years, and so feeble as scarce to be able to walk at all.—After the operation he leaped from the table, and went about the house to seek his master.—Two days afterwards he ran up and down the streets with other dogs; his stomach grew strong, and he recovered his hearing.

**TRANSGRESSION**, \* **TRANSGRESSIO**, an offence against some law; or a breach, or violation thereof. See VIOLATION, LAW, CRIME, SIN, &c.

\* The word is compounded of *trans*, beyond, and *gradi*, to go.

The term is chiefly used in respect of the laws of God. In the doctrine of original sin, all mankind are supposed to share with Adam in the guilt of his first *transgression*. See ORIGINAL SIN.

Moses threatens the *transgressors* of his law with abundance of temporal punishments. See PUNISHMENT.

**TRANSGRESSION**, in our law, a writ usually called a *writ* or *action of trespass*. See TRESPASS.

Of this, Fitzherbert has two sorts: one *vicountiel*, thus called because directed to the sheriff, and not returnable, but to be determined in the county.—Its form differs from that of the other, as wanting the words *quare vi & armis*, &c. See VICOUNTIEL.

The other is termed a *writ of trespass*, and to be sued in the Common-Pleas, and King's-Bench. See TRESPASS.

**TRANSIENT Action**, } See the articles } **ACTION**.

**TRANSIENT Air**, } See the articles } **AIR**.

**TRANSIRE**, in *stat. anno 14 Car. II. c. 11.* is used for a custom-house warrant, or let-pass—from the verb *transire*, I go forth.

**TRANSIT**, \* **TRANSITUS**, in astronomy, signifies the passage of any planet, just by, or over a fixed star; and of the moon, in particular, covering or moving over any other planet. See STAR, and PLANET.

\* The word comes from the Latin, *transire*, to pass over; formed of *trans*, and *eo*, I go beyond.

Mercury and Venus, &c. in their *transits* over the sun, appear like dark specks. See MERCURY, and VENUS.

**TRANSITION**, in music, is when a greater note is broken into lesser, to soften the roughness of a leap, by a gradual passage to the note next following. See PASSAGE.

This is commonly called the *breaking of a note*. See NOTE.

**TRANSITION**, in rhetoric, a kind of connexion in discourse, whereby the several different parts and members thereof are joined, so as to constitute one regular whole. See DISCOURSE, PERIOD, &c.

Some place *transition* in the number of figures; others, with Quintilian, exclude it that rank. See FIGURE.

F. de Colonia makes two kinds of *transitions*; the one *perfect*, the other *imperfect*.

**Perfect TRANSITION**, is that wherein we briefly intimate what is said, and what remains to be said—as, *Now that we have spoke of war, there remains something to be said of peace.*—*Satis multa de turpitudine: dicam deinceps, quod proposui, de periculo.*—*Uni epistolæ respondi: venio ad alteram.*—*Sed hæc vetera; illud recens: Cæsarem meo consilio interfecit.*

**Imperfect TRANSITION**, is that wherein only one of these is expressed—as, *Let us now consider the consequences of, &c.*—*Postularet hic locus ut dicerem de—sed finis sit; neque enim præ lachrymis jam loqui possum; & hic se lachrymis defendi negat.*

**TRANSITIVE**, in grammar, an epithet given to such verbs as signify an action which passes from the subject that does it, to, or upon, another subject which receives it. See VERB, and ACTION.

Under the head of verbs *transitive*, come what we usually call verbs active and passive: other verbs, whose action does not pass out of themselves, are called *neuters*, and by some grammarians *intransitives*. See NEUTERS.

In

In the Hebrew, the verb *בָּיַב*, *bajab*, in the Greek *αἶμα*, and in the Latin, *sum*, are verbs purely neuter or intransitive; or, as the Latin and Greek grammarians more usually express it, verbs substantive, signifying the mere existence of the thing, without the active or transitive conjugations.

**TRANSITORY**, in common law, stands opposite to local. See **LOCAL**.—Thus actions are said to be *transitory* which may be laid in any county or place. See **ACTION**.

**TRANSITORY Chose**, } See the articles } **CHOSE**.  
**TRANSITORY Trespass**, } **TRESPASS**.

**TRANSLATION**,\* the act of transferring or removing a thing from one place to another. See **PLACE**.

\* The word is formed of *trans*, beyond, and *latio*, of *ferre*, to carry. We say the *translation* of a bishop's see, a council, a seat of justice, a parliament; the *translation* of the relics of a saint; the *translation* of the empire, &c.

The *translations* of bishops from one see to another, are prohibited by the council of Nice, which declares them null, and appoints the *translated* bishop to return to his former church.—The council of Sardica excludes *translated* bishops from communion. It had been observed, that no bishop was ever removed from a greater church to a lesser; and that those who thus quitted their churches, only did it out of ambition or avarice.

This discipline was generally observed for 900 years; and the first instance of any *translation* of note, was that of pope Formosus, who was bishop of Porto. One of his successors took hold of this pretence to have him dug out of his grave; and a council, held soon after, forbade this *translation* to be made a precedent.

However, the same church allowed of some legitimate causes of *translations*; as, the apparent advantage of the church: under which pretence, *translations* soon became so frequent, that for 500 or 600 years last past, they have been esteemed a kind of common law. See **BISHOP**.

The *translation* of a religious from one order to another, cannot be effected without the consent of the pope: it is added, that it is not allowed to *translate* from a severer rule to a laxer one.

**TRANSLATION** is also used for the version of a book, or writing out of one language into another. See **BOOK**, **VERSION**, &c.

*Translators* frequently endeavour to excuse themselves at the expence of their language; and ask pardon for it, as if it were not rich and copious enough to express all the force and beauties of the original.

Thus is the English tongue accused of the poverty and dryness which is in the *translator's* own genius; and the faults are charged on the former, which should only lie at the latter's door. See **ENGLISH**.—The Italians have a proverb, *traduttore, traditore*.

**TRANSMARINE**, **TRANSMARINUS**, something that comes from, or belongs to, the parts beyond sea. See **FOREIGN**, **EXOTIC**, **SEA**, &c.

**TRANSMIGRATION**, the removal or translation of a whole people into another country, by the power of a conqueror. See **COLONY**.

Some translate the leading of the children of Israel captive into Babylon, the *transmigration* of the Israelites, &c. See **MIGRATION**.

**TRANSMIGRATION** is particularly used for the passage of a soul out of one body into another: the same with what we otherwise call **METEMPSYCHOSIS**.

The Siamese, F. Tachard informs us, from a belief of the *transmigration* of souls into other bodies, forbear killing any beasts; lest, by that means, they should dispossess the souls of their deceased relations.

*Ionic* **TRANSMIGRATION**. See the article **IONIC**.

**TRANSMISSION**, in optics, &c. the act of a transparent body passing the rays of light through its substance, or suffering them to pass; in which sense the word stands opposed to reflection. See **REFLECTION**.

*Transmission* is also frequently used in the same sense with refraction, by reason most bodies, in *transmitting* the rays, do also refract them. See **REFRACTION**.

For the cause of *transmission*, or the reason why some bodies *transmit*, and others reflect the rays, see **TRANSPARENCY**, and **OPACITY**.

The rays of light, Sir Isaac Newton observes, are subject to fits of easy *transmission* and each reflection. See **RAY**, and **LIGHT**.

**TRANSMUTATION**, the act of transforming or changing one nature into another. See **TRANSUBSTANTIATION**, and **TRANSFORMATION**.

The term is chiefly used in chymistry and medicine: it is greatly questioned, whether the *transmutation* of silver into gold, and of tin into silver, so much sought by the chymists, be possible or not? See **GOLD**, &c.

The purest and subtlest parts of the food are *transmuted* or assimilated into the proper substance of the body. For the manner how, see **NUTRITION**.

Nature, Sir Isaac Newton observes, seems delighted with *transmutations*: he goes on to enumerate several kinds of *natural*

*transmutations*; gross bodies and light, he suspects, may be mutually *transmuted* into each other; and adds, that all bodies receive their active force from the particles of light which enter their composition. See **LIGHT**, and **FIRE**.

For all fixed bodies, when well heated, emit light as long as they continue so; and again, light intermingles itself and inheres in bodies as often as its rays fall on the solid particles of those bodies. See **OPACITY**.

Again, water, which is a fluid, volatile, tasteless salt, is by heat *transmuted* into vapour, which is a kind of air; and by cold into ice, which is a cold, transparent, brittle stone, easily dissolvable; and this stone is convertible again into water by heat, as vapour is by cold. See **WATER**, **VAPOUR**, **ICE**, &c.

Earth, by heat, becomes fire; and by cold is turned into earth again: dense bodies, by fermentation, are rarified into various kinds of air; and that air, by fermentation also, and sometimes without it, reverts into gross bodies. See **AIR**, &c.

Quicksilver sometimes puts on the form of a fluid metal; sometimes it appears in shape of a pellucid, fragile salt, called *sublimate*; sometimes of a pellucid, volatile, white, tasteless earth, called *mercurius dulcis*; by distillation it becomes vapour, and by agitation in vacuo, shines like fire, &c. See **MERCURY**, and **PHOSPHORUS**.

All bodies, beasts, fishes, insects, plants, &c. with all their various parts, grow and increase out of water, and aqueous and saline tinctures; and by putrefaction, all of them revert into water or an aqueous liquor again. See **WATER**.

Farther, water exposed a while to the open air, puts on a tincture, which in process of time has a sediment and a spirit; and before putrefaction, yields nourishment both for animals and vegetables. See **NUTRITION**, and **VEGETATION**.

**TRANSMUTATION**, in alchymy, denotes the act of changing or exalting imperfect metals into gold or silver. See **METAL**, **GOLD**, &c.

This is also called the *grand operation*, and is to be effected with the philosophers stone. See **PHILOSOPHERS Stone**.

Some alchymists hold, that the *transmutation* should rather be called the *perfection* of imperfect metals; as holding all metals intended by nature to arrive equally at this perfection, inasmuch as they are composed of the same matter; and that it is only the impurity of their matrices, that is, of the place wherein they are formed by nature, that has prevented their arriving thereat. See **METAL**.

The elixir being projected on any of those metals, it is supposed to purge, and separate the impure parts from the pure, and to join itself wholly to the mercury (which is the pure part) as being of the same nature. See **PROJECTION**.

Whether or no metals are *transmutable* into one another, is a point strongly disputed among the philosophers; the alchymists strenuously asserting the affirmative. See **ALCHYMY**.—Some metals, it is commonly allowed, may be changed into others; e. gr. iron into brass or copper, and lead into tin; but Cardan and some others deny even this, and argue farther, that though iron and brass, as being nearly alike in weight and tenacity, &c. provided their colour and hardness could be changed, might be converted into another, either really, or, at least, apparently; yet would the *transmuting* or ripening of other metals into gold or silver be still impossible; both as those metals are all to be first calcined, after which they can never be brought again to their pristine purity; and as there is a generation required, which is not the work of art, but nature.

Cardan de Metall. Lemery, Dickenson, and others, give us accounts of the various impostures of Adepti in the business of *transmutation*; some, for instance, fixing mercury with verdigrise, and then heightening the colour with cadmia, turmeric, &c. But this, if tried with the coppel, all goes off in fumes; and, in effect, nothing produced this way ought to be adjudged true gold, unless it endure coppelling, cementation, purification, with antimony, and the depart. See **PURIFICATION**, **ESSAYING**, &c.

Add, that it must have the malleability, extreme ductility, and specific gravity of gold, which is to water as 18 and half to 1. See **WEIGHT**.

The trick of *transmuting* cinnabar into silver is thus: the cinnabar being bruised grossly, is stratified in a crucible with granulated silver, and the crucible placed in a great fire; and after due time for calcination, taken off: then the matter being poured out, is found to be cinnabar turned into real silver, though the silver grains appear in the same number and form as when they were put into the crucible; but the mischief is, coming to handle the grains of silver, you find them nothing but light friable bladders, which will crumble to pieces between the fingers. Mr. Boyle, in his *Scept. Chymist*, tells us, that two friends of his did, by urging mercury in a skilfully managed fire, turn it almost weight for weight into water; but does not say what was the specific gravity of the produced water, nor of the remaining *untransmuted* mass of mercury.—He likewise assures us, that rain-water being distilled and re-distilled by a friend of his, near 200 times, did, after distillation, leave, at the bottom of the glass body, a considerable quantity of a white earth; and that more plentifully in the latter distillations than the former.

This he believed to be a certain quantity of water actually *transmuted* into earth; adding, that it was above twice as heavy specifically as common water, and of so fixed a nature, that it lay a considerable time in a red-hot crucible, without losing any thing of its weight, or emitting any smoke.

**TRANSMUTATION**, in geometry, denotes the reduction or change of one figure, or body into another of the same area, or solidity, but of a different form; as a triangle into a square, a pyramid into a parallelepiped, &c. See **FIGURE**, &c.

**TRANSMUTATION**, in the higher geometry, is used for the converting a figure into another of the same kind and order, whose respective parts rise to the same dimensions in an equation, admit the same tangents, &c. See **TRANSFORMATION**. If a rectilinear figure be to be *transmuted* into another, it is sufficient that the intersections of the lines which compose it be transferred, and lines drawn through the same in the new figure. See **REDUCTION**.

If the figure to be *transmuted* be curvilinear, the points, tangents, and other right lines, by means whereof the curve line is to be defined, must be transferred. See **CURVE**.

**TRANSMUTATION of Plants**. See the articles **SEED**, and **DEGENERATION**.

**TRANSOM**, among builders, the piece that is framed across a double light window. See **WINDOW**.

**TRANSOM**, among mathematicians, denotes the vane of a cross-staff; or a wooden member fixed across it, with a square whereon it slides, &c. See **VANE**, and **CROSS-STAFF**.

**TRANSOM**, in a ship, is a piece of timber which lies athwart the stern, between the two fashion pieces, directly under the gun-room-port.—See *Tab. Ship. fig. 2. n. 109*.

**TRANSPARENCY**, *Diaphaneity*, in physics, a quality in certain bodies, whereby they give passage to the rays of light. See **LIGHT**, and **DIAPHANEITY**.

The *transparency* of natural bodies, as glass, water, air, &c. some have imputed to the great number, and size of the pores or interstices between the particles of those bodies: but this account is exceedingly defective; for the most solid and opaque body in nature, we know, contains a great deal more pores than it does matter; a great deal more, sure, than is necessary for the passage of so infinitely fine and subtle a body as light. See **PORE**.

Aristotle, Des Cartes, &c. place *transparency* in the rectitude or straightness of the pores; by means of which, say they, the rays are enabled to make their way through, without striking against the solid parts, and being reflected back again: but this account, Sir Isaac Newton shews, is lame; the quantity of pores in all bodies being sufficient to transmit all the rays that fall on them, howsoever those pores be situated with respect to each other.

The cause, then, why all bodies are not *transparent*, must not be ascribed to their wanting rectilinear pores; but either to the unequal density of the parts, or to the pores being filled with some foreign matters, or their being quite empty; by means of which, the rays in passing through, undergoing a great variety of reflections and refractions, are perpetually diverted this way and that, till at length falling on some of the solid parts of the body, they are extinguished and absorbed. See **RAY**, and **REFLECTION**, &c.

Thus cork, paper, wood, &c. are opaque; when as glass, diamonds, &c. are *transparent*: the reason is, that in the neighbourhood of parts equal in density, such as those of glass, water, diamond, &c. are with respect to each other; the attraction being equal on every side, no reflection or refraction ensues; but the rays which entered the first surface of the bodies, proceed without interruption quite through the body; those few only excepted which chance to meet with the solid parts. But in the neighbourhood of parts, that differ much in density, such as the parts of wood and paper are both in respect of themselves, and of the air or the empty space in their pores; as the attraction will be very unequal, the reflections and refractions must be very great; and therefore the rays will not be able to make their way through such bodies, but will be perpetually deflected, and at last quite stopped. See **OPACITY**.

**TRANSPARENT Column**. See the article **COLUMN**.

**TRANSPIRATION**, the insensible, or almost insensible passage of an excrementitious matter through the pores of the skin; called also *perspiration*. See **PERSPIRATION**.

There are an infinity of these *transpiratory* pores in the skin; the most considerable whereof are the orifices of the ducts arising from the miliary glands. See **PORE**, and **SKIN**.

The cause of *transpiration* is the circulation and heat of the blood.—Insensible *transpiration* is found very much to exceed all the sensible evacuations put together. Sanctorius even shews, in his *Medicina Statica*, that a person loses more in one day by *transpiration*, than by all the other outlets in fifteen. He adds, that if the food taken by one day weigh eight pounds, the *transpiration* will be five of them.

Cold prevents *transpiration*, by its constringing the pores of the skin, and thickening the liquors, circulating in the cutaneous glands: heat, on the contrary, augments *transpiration*, both by its opening the excretory ducts of the glands, and by its

increasing the fluidity and velocity of the humours. See **COLD**, &c.

M. Dodart, from a number of experiments made for 33 years together, assures us, that we *transpire* much more in youth than in age.—In some persons, the *transpiration* is so copious, that they void but very little of the coarser excrements, though they eat very heartily.

*Transpiration* is absolutely necessary in the animal œconomy, to purify the mass of blood, and discharge it of a number of useless heterogeneous particles which might corrupt it. Hence it is, that upon a stoppage of the usual *transpiration*, there arise so many indispositions, particularly fevers, agues, itch, &c.

*Transpiration* is also of use to the organ of feeling, in that it prevents the papillæ of the skin from being dried; either by the air, or by the continual touches of external bodies.

**TRANSPIRATION** is also used by some authors, for the ingress or entrance of the air, vapours, &c. through the pores of the skin into the body. See **AIR**.

Cardan, by this kind of *transpiration*, accounts for the prodigy of a woman, whose daily urines weighed 27 pounds; though all the foods she took, both dry and liquid, did not exceed four pounds.—Dr. Baynard suspects some such *transpiration* to be the case in hydropical persons. See **DROPSY**.

**TRANSPLANTATION**, in agriculture and gardening, the act of removing trees or plants from the places where they were sowed or bred up, and planting them in other. See **TREE**, **PLANTING**, **REPLANTING**, &c.

In the *TRANSPLANTING of forest-trees*, care is to be taken to preserve the roots, and even the fine hairs or filaments thereof, with the earth that sticks thereto; these filaments being the mouths that suck the nourishment, and transfuse it to the tree. See **ROOT**, and **VEGETABLE**.

The pits or fosses, into which trees are *transplanted*, should be left open for some time before-hand, that the rain, frost, and sun may dissolve the compacted salt, render the earth friable, and qualify it for nourishing the tree.—The same may be done, in some measure, by burning straw in the new pits, and drenching the mould with water in dry seasons, and by enriching the ground with manure. See **MANURING**.

Pliny was of opinion, no tree should be removed under two, or above three years old. Cato would have none *transplanted* less than five fingers in diameter: but we are, now, able to *transplant* trees of all ages and sizes, without danger.

To *transplant* old trees was reckoned so difficult, that *veterem arborem transplantare* is become a proverb for a difficult enterprise; and yet we are informed of a grove of 600 coco-trees of 80 years growth, and 60 foot high to the lowest bough, *transplanted* by count Maurice, to his paradise of Friburg: and a great person in Devonshire, Mr. Evelyn tells us, *transplanted* oaks, as big as twelve oxen could draw, to supply a defect in an avenue.

For the *transplantation* of grown trees, Mr. Evelyn gives the following method, as practised with good success by the lord Fitzharding: choose trees about the thickness of a man's thigh; remove the earth from about them; cut through all the side roots, till the tree may be, by force, brought down on one side; so that the tap-roots may be conveniently come at to be cut off with the ax: then redress the tree, and let it stand covered with the mould from which it was loosened, till next year, or longer; and by that time it will have drawn new tender roots fit for *transplanting*, and may be taken up at a fit season.

Otherwise, for very large trees, before the hard frosts come on, make a trench about the tree, at such distance from the stem, as you judge sufficient for the root; dig so deep, as almost to undermine it; place blocks, and quarters of wood to sustain the earth, and cast in as much water as may fill the trench, or sufficiently wet it, unless the ground were very moist before. Thus let it stand till some hard frost bind it firmly to the roots, and then convey it to its new station, which may be preserved from freezing, by placing store of warm litter in it: so close the mould the better to the straggling fibres, and place the earth taken out of the pit about the root of the new-planted tree.

The common rules for *transplanting* are, 1°. The lighter the soil is, the deeper are the trees to be planted. 2°. If the soil be gravel, or sand, mix clay with it, and *vice versa*. 3°. The best season is either October or February; in warm, moist, clear weather. 4°. The large roots to be abated, to prevent the necessity of digging too deep: but the small fibrous ones to be spared. 5°. In taking up the trees to observe how the roots grow, and in *transplanting* to dispose them in the same order, and place the tree to the same aspect. 6°. To defend young trees after *transplantation*, both from the wind and sun, till the roots be fixed, and they begin to shoot. 7°. If the soil you *transplant* into be good, do not top the trees, but lop all the boughs to one single one, the most upright and promising among them: but if the soil be poor, top them, and when they are shot out again, lop off all the branches to one. See **PRUNING**.

**TRANSPLANTING of fruit-trees.**—After a summer's growth of fruit seedlings in the seminary, such are pulled up as are above a foot high, and *transplanted* into a nursery; the rest to be left in the seed-plot till another year. See **NURSERY**.

When drawn up, the sprigs are to be cut off, from about the top, the strings from the roots, and the extremities, both of the top, that it may not run too fast upwards, and of the tap or heart-root, that it may not pass directly downwards; left it go beyond the good soil. The holes or pits to be so deep, as that the plants may stand somewhat deeper in the ground, than when in the seed-plot; close the mould about them, and if it be a dry time, water them the first day, and cover the soil with old fern.

Mr. Bradley gives us a new method of *transplanting* trees of all kinds and ages with safety, either while they are in blossom, or with fruit upon them, thus: the holes to receive the trees, are to be prepared before the trees are taken up; and the earth which comes out of the holes to be made very fine, and put into large tubs and mixed with water, till it be about the consistence of thin batter. Then the holes wherein the trees are to be planted, are to be filled with this thus-tempered earth, before the earthy parts have time to settle.

The advantage hereof is, that the trees thus planted have their roots immediately inclosed and guarded from the air; and the warm season of the year disposing every part of the tree for growth and shooting, it will lose very little of its vigour.—In winter it does not succeed.

The same author adds, that in consideration of the circulation of the sap, it is as necessary to preserve the vessels of trees entire, as those in animal bodies: and therefore, in *transplanting* trees in the summer seasons, it is not proper to cut off any of the branches, or wound any of the vessels, till they have renewed their roots, which it is of absolute necessity to wound in *transplanting* them. For the wounded roots, he has provided a plaister of a mixture of gums, to prevent the canker and rot, and promote their healing.

**TRANSPLANTATION**, in natural magic, is used for a method of curing diseases, by transferring them from one subject to another; much in vogue among certain chymical, or rather sympathetical physicians. See **SYMPATHETIC**.

This *transplantation* is effected, either by the use of a certain medium, called on that account a *magnet*; or without, by simple contact.

The first kind, which is that most properly called *transplantation*, is when the patient's excrement being mixed up with earth, the disease is *transplanted* into a vegetable, arising from a seed sown in the said compost; or, when the parings of the nails, *e. gr.* of a gouty person, are inclosed in an auger-hole made in a plant, particularly an oak.

Here the patient's excrement is the magnet, and the vital spirit of the plant arising from the seed is the mumia which the magnet receives; and the case is the same, in the parings of the nails, and the vital spirit of the oak. See **MUMIA**.

The second kind of *transplantation*, properly called *approximation*, is, when a finger seized with a panaris, or whit-low, is cured by rubbing in a cat's ear, which is supposed to receive the pain.

In this case, the sound subject receives the vital spirits, unites with them, and corrects their morbid state: and, as certain diseases are got by approximation, the infected spirits of a diseased body, insinuating themselves into a sound one, and thus infecting the same: so they are cured by approximation; when the spirits of a diseased person entering a sound body, the latter corrects and retrieves the morbid state of the former.

*Transplantation*, by means of the magnet, is of five kinds, *viz.* *infestation*, *implantation*, *imposition*, *irrotation*, and *inescagation*; each whereof see under its proper article, **INESCATION**, **IMPLANTATION**, &c.

**TRANSPORT-Ship**, is a vessel whereon to convey provisions, warlike stores, soldiers, &c. See **VESSEL**.

**TRANSPORTATION**, the act of conveying, or carrying a thing from one place or country to another. See **EXPORTATION**.

In matters of commerce, *transportation* is of equal import with re-exportation, *viz.* the taking up of commodities in one foreign state or kingdom, bringing them hither, and paying duties for them; and then conveying them into some other foreign state: by which it is distinguished from *importation*, and *exportation*, where the commodities are either carried originally out of, or brought finally into, our own kingdom.

Our *transportation* or re-exportation of wool, butter, hides, tallow, herrings, beef, and salmon, which we *transport* from Ireland to other provinces, being the concerns of our merchants, and paying duties to his majesty, have been reckoned at 300,000 *l.* per annum.

It would be tedious to enumerate the value of our *transportations* from Denmark, Sweden, Spain, Portugal, the Streights, Turkey, Guinea, &c. the most considerable is from the East-Indies. In the infancy of that trade, *viz.* in the year 1613, of pepper only, besides what we consumed at home, we *transported* in one year to other countries, after it had paid duty

here, to the value of 200,000 *l.* and of late years our exportation of what we bring from thence, after we have supplied ourselves, is computed at 500,000 *l.* sterling. See **NAVIGATION**, and **COMMERCE**.

**TRANSPORTATION** is also a kind of punishment, or, more properly, an alleviation or commutation of punishment, for criminals convicted of felony, who, for the first offence, unless it be an extraordinary one, are ordinarily *transported* to the plantations, there to bear hard labour for a term of years, within which if they return, they are executed without farther trial. See **FELONY**, **PUNISHMENT**, &c.

**TRANSPOSITION**, in algebra, the bringing any term of an equation over to the other side. See **TERM**.

Thus, if  $a + b = c$ , and you may make  $a = c - b$ ;  $b$  is said to be *transposed*. See **EQUATION**.

**TRANSPOSITION**, in grammar, a disturbing or dislocating of the words in a discourse; or a changing of their natural order of construction; to please the ear, by rendering the contexture more easy, smooth, and harmonious. See **HYPERBATON**.

A *transposition*, which renders the sense perplexed, is vicious.—

The construction of the ancient languages being much more artful than that of the modern ones, allowed of much greater and more frequent *transpositions*. The English, French, &c. scarce ever allow of them but in oratory and poetry; in which cases they serve to give a force and energy to the discourse or the verse, and to prevent their languishing. See **CONSTRUCTION**.

**TRANSPOSITION**, in music, is a changing of the notes of a piece of music, or the shifting a song from its former situation, to set it either higher or lower, or in another octave.

Of this there are two kinds; the first with respect to the *clef*, the second with respect to the *key*.

**TRANSPOSITION with respect to the clef**, consists in changing the places or seats of the notes or letters among the lines and spaces; but so as that every note is set at the same letter. See **CLEF**.

This is done either by removing the same clef to another line, or by using another clef, but with the same signature, by reason the piece is still in the same key. See **KEY**.

The practice is easy in either case: in the first, you take the first note at the same distance above or below the clef-note, in its new position as before; and all the rest of the notes in the same relations or distances from one another; so that the notes are all set on lines and spaces of the same name.

In the second, or setting the music to a different clef, it is to be observed, the places of the three clef-notes are invariable in the scale, and are to one another in these relations, *viz.* the mean a 5th above the bass, and the treble a 5th above the mean. Now to *transpose* to a new clef, *e. gr.* from the treble to the mean, where-ever that new clef is set, we suppose it the same individual note, in the same place of the scale, as if that piece were that part in a composition to which this new clef is generally appropriated; that so it may direct to the same notes we had before *transposition*: now, from the fixed relations of the three clefs in the scale, it will be easy to find the seat of the first *transposed* note; and then all the rest are to be set at the same mutual distances they were at before. See **SCALE**.

Suppose, *e. gr.* the first note of a song be *d*, a 6th above the bass-clef; where-ever that clef is placed, the first note must be the greater 2d above it, because a greater 2d above the mean is a greater 6th above the bass-clef, the relation of those two being a 5th.—So that the first note will still be the same individual *d*.

The use of this *transposition* is, that if a song being set with a certain clef, in a certain position, the notes go far above or below the system of five lines; they may, by the change of the place of the same clef in the particular system, or by taking a new clef, be brought more within the compass of the lines.

**TRANSPOSITION from one key to another**, is a changing of the key, or a setting all the notes of the song at different letters, and performing it, consequently, in different notes upon an instrument. See **KEY**.

The design hereof is, that a song which being begun in one note, is too high or low, or otherwise inconvenient for a certain instrument, may be begun in another note, and from that carried on in all its just degrees and intervals.

The clef and its position here remain the same; and the change is of the notes themselves, from one letter, and its line or space, to another.

In the former *transposition*, the notes were expressed by the same letters, but both removed to different lines, and spaces: in this, the letters are unmoved, and the notes of the song transferred to, or expressed by other letters, and consequently set upon different lines and spaces, which, therefore, requires a different signature of the clef.

**TRANSUBSTANTIATION**, **TRANSUBSTANTIATIO**, in theology, the conversion or change of the substance of the bread and wine in the eucharist into the body and blood of Jesus Christ. See **EUCCHARIST**.

*Transubstantiation*, taken in its general and literal sense, implies any change of one substance into another; thus the change of Moses's rod into a serpent; of the waters of the Nile into blood; of Lot's wife into a pillar of salt, were preter-natural *transubstantiations*: and the change of the food we eat, into the substance of our bodies, is a natural *transubstantiation*. See SUBSTANCE.

But the word, in its proper and technical sense, is restrained to the miraculous change which the Romish church holds is wrought in the sacrament, by the consecration of the priest. One of the great articles of that church, rejected by the reformed, is that of *transubstantiation*; the latter maintaining the *transubstantiation* to be only figurative, and the former real. See PRESENCE, &c.

The reformed interpret *est, is*, in the text *hoc est corpus meum, this is my body*, by *significat*; q. d. *this signifies my body*: but the council of Trent stand up strenuously for the literal sense of the verb: thus in *can. 1. sess. 13.* of that council, it is expressly decreed, that in *transubstantiation*, the body and blood of our Lord Jesus Christ are truly, really, and substantially under the species of bread and wine.

It is added, that by *truly*, we mean *properly*, and not only by signification, as if the eucharist were no more than a sign of the body and blood of Jesus Christ; that by *really*, we mean *in fact*, and not only in figure, as if the eucharist were only a figure and representation of the body and blood of the Saviour of the world; and that by *substantially*, we mean *in substance*, and not only in virtue and energy.—Thus is *truly* opposed to a simple sign, *really* to a figure, and *substantially* to energy, or virtue.

TRANSMPTION, TRANSMPTIO, in the schools, a syllogism by concession or agreement, used where a question proposed is transferred to another, with this condition, that the proof of this latter shall be admitted for a proof of the former.

Thus Aristotle, in his book *de cælo*, undertaking to shew that all the stars are round, transfers the question to the moon, and proves her rotundity from her increasing and waning, supposing it a thing admitted by his opponents, that the stars are all alike.

TRANSVERSALIS, in anatomy, a name given to several muscles, &c. in respect of their situation, progress, &c. as the

TRANSVERSALIS abdominis, a muscle which lies under the obliqui, and arises from the cartilago xiphoides, from the extremities of the false ribs, from the transverse apophysis of the vertebræ of the loins, is fixed to the inner side of the spine of the ilium, and inserted in the os pubis and linea alba.—See *Tab. Anat. (Myol.) fig. 2. n. 29. fig. 7. n. 39.*

This, with the obliqui, unites its tendons, as it approaches the linea alba, and is the only muscle that is cut in the operation of the bubonocoele: it has a fine and thin membrane that closes exactly its ring or hole through which the vessels pass. See OBLIQUUS.

TRANSVERSALIS colli, is a part of the *transversalis dorfi*, which some divide into three, viz. the sacer, semi-spinatus, and *transversalis colli*.

It arises from the os sacrum, and from all the transverse processes of the vertebræ of the loins, back and neck, except the two first, and is inserted by so many distinct tendons into all their superior spines: it moves the whole spine obliquely backwards.

TRANSVERSALIS pedis plantarum comes from the bone of the metatarsus, that sustains the toe next the little toe, and passing across the other bones, is inserted into the os sesamoides of the great toe: its use is to bring all the toes close to one another.

TRANSVERSALIS penis arises from the ischium just by the erectores, and runs oblique to the upper part of the bulb of the urethra.

It helps to press the veins upon the back of the penis, against the os pubis, which is the cause of erection. See ERECTION.

TRANSVERSALIS Lumborum, } See } SACER.

TRANSVERSALIS Femoris, } See } QUADRATUS.

TRANSVERSALIS is also a name given a suture of the cranium, because of its transvering or crossing the face from one side to the other. See SUTURE.

It arises at one of the lesser angles of the eye, and passing along the bottom of its orbit, and the root of the nose, terminates in the other lesser angle.

TRANSVERSE, something that goes across another from corner to corner. See TRAVERSE.

Thus bends and bars in heraldry are *transverse* pieces or bearings. See BEND.—The diagonals of a parallelogram or a square are *transverse* lines. See DIAGONAL.

Lines which make intersections with perpendiculars, are also called oblique or *transverse* lines. See PERPENDICULAR, OBLIQUE, &c.

TRANSVERSE axis, or diameter, called also the *first* or *principal* axis. See AXIS, DIAMETER, and LATUS transversum.

The *transverse* axis of an ellipsis, is the longer axis, or that

which *traverses* it lengthwise, in contra-distinction from the conjugate one. See ELLIPSIS, and CONJUGATE.

The *transverse* axis of an hyperbola, is the line DK, *Tab. Conics, fig. 17.* cutting the curve in the points D and K. See HYPERBOLA.

TRANSVERSUM Latius, } See } LATUS.

Septum TRANSVERSUM, } See } SEPTUM.

TRANSVERSE Muscles, in anatomy, are certain muscles arising from the *transverse* processes of the vertebræ of the loins. See TRANSVERSALIS, and VERTEBRÆ.

TRANTRY, in some customs, denotes the money arising by amerciements of ale-sellers and victuallers for breaking the assize of bread and ale; particularly at Luston, and other manours in Herefordshire. See ASSIZE.

TRAPEZIUS. See CUCULLARIS.

TRAVERSE, or TRANSVERSE, something that goes athwart another, i. e. crosses, and cuts it obliquely. See TRANSVERSE.

TRAVERSE is particularly used for a piece of wood or iron placed transversely, to strengthen and fortify another: such are those used in gates, windows, &c.

To plane a board against the grain, is also called among joiners, &c. to *traverse* it.

TRAVERSE, in gunnery, signifies to turn or point a piece of ordnance, which way one pleases upon her platform. See ORDNANCE, CANNON, &c.

The laying or removing a piece of ordnance or a great gun, in order to bring it to bear, or lie level with the mark, is also called *traversing the piece*. See GUNNERY, &c.

TRAVERSE, in fortification, denotes a trench with a little parapet, sometimes two, one on each side, to serve as a cover from the enemy that might come in flank.

*Traverses* are sometimes covered over-head with planks, and loaded with earth.—They are very commodious for stopping an enemy's way, and to prevent being enfiladed. They likewise make a good defence in a dry foss, in making the parapet on the side next the opposite flank.

TRAVERSE, in a wet foss, is a sort of gallery, made by throwing fascines, joists, fascines, stones, earth, and other things into the foss, over-against the place where the miner is to be put to the foot of the wall, in order to fill up the ditch, and make a passage over it. See GALLERY.

TRAVERSE also denotes a wall of earth or stone raised across a work which is commanded, to cover the men.

TRAVERSE also signifies any retrenchment, or line fortified with fascines, barrels or bags of earth, or gabions. See RETRENCHMENT.

TRAVERSE, in navigation, is the variation or alteration of a ship's course, occasioned by the shifting of the winds, currents, &c. See COURSE.

*Traverse sailing* is used when a ship having set sail from one port towards another whose course and distance from the port sailed from is given or known, is, by reason of contrary winds, or other accidents, forced to shift and sail on several courses, which are to be brought into one course, to learn, after so many turnings and windings, the true course and distance made from the place sailed from, and the true point or place where the ship is; that so the wind coming fair, it may be known how to shape a course for the place intended. See SAILING.

This may be performed geometrically two ways: the first, by drawing new meridians, through the extremity of every course, parallel to the first meridian, or north and south line at first made, and setting off every course with a sweep of 60, as if it were a question in plain sailing. You may also let fall perpendiculars to every new meridian, from the point that the ship sailed to upon that course, by which you have the course, distance, difference of latitude, and departure to every course. To illustrate this by an example: a ship being bound for a port distant 120 miles N. E.  $\frac{1}{2}$  E. sails S. S. E. 30 miles, then N. E. by 40, then E. by N. 25, then N. N. E. 44; it is required to find the course and distance made good, and also the course and distance to the port bound for?

Draw the line HK (*Tab. Navigation, fig. 17.*) at pleasure for a meridian, or north and south line, and therein assume a point, as A, for the port sailed from; then with 60 of the chords, and one foot in A, draw the arch Lm, upon which set off two points (because the course is S. S. E.) from L to m, and draw the line Am, upon which set off the distance 30, from A to B; then is the ship at B: thus letting fall the perpendicular BK, AK  $27^{\circ} 7'$  is the difference of latitude, and BK  $11^{\circ} 5'$ , the departure for the first course.

For the second course, with the distance KB, draw the parallel BN, and thereby with the chord 60, as before, set off the second course and distance, N. E. by N. 40, from B to C, and let fall the perpendicular CL, then is the ship at C, the difference of latitude upon that course is BL 33 : 3, and departure CL 22 : 2.

Proceed in the same manner for the third course, with the parallel CO, set off E. by N. 25, from C to D, and draw the line DP, from which set off the last course, N. N. E. 44, then is your ship at E.

Since then the ship came from A, and is now at E, the line AE measured on the same equal parts upon which all the other distances were taken, will be found 91 miles, and the arch RQ measured on the rhumbs, five points, viz. N. E. by E. so that the ship is now 91 miles N. E. by E. from the port sailed from.

To find her course and distance to the port bound for, set off 4 half points upon the arch RQ from R to S, and from A through S draw the line ASF; upon which set off 120, the distance from the port sailed from to the port bound for, from A to F; then is F the port bound for: now the port bound for being at F, and the ship being but at E, the line EF measured on the same equal parts that the rest was taken from, will be found to be 31, and the arch TV measured on the chords, is  $35^{\circ} 12'$ , or N. E. by N. somewhat easterly, &c.

This method is useful, where the courses tend generally one way, without intersecting one another; but if they often cross, it is best to have recourse to the second method, which is without new meridians.

In order to this, observe how many points are between the point next to be laid down, and the point opposite to the course last laid down; for that is the point for laying down: then, with the chord of 60, and one foot in the point the ship is last come to, describe an arch; upon which set off the points found by the abovesaid rule, and through that draw the line for the next course, &c. For an example:

Draw a north and south line, as in the former, as the line RM, fig. 17. n. 2. in which assume a point, as at A, for the port sailed from; then from A set off the first course and distance, viz. N. N. W. 68, from A to B; and for the second course, with the chord of 60, and one foot in B, draw the arch TW, upon which to set off the next course S. S. W. 70, observe the rule above delivered, viz. to take the number of points between the point opposite to the last course sailed, and the point you are next to sail on. The reason of which rule is this: if from A to B your course be N. N. W. then back from B to A, must needs be S. S. E. the opposite point; and then if you were to sail S. by E. it must be one point to the southward of that S. S. E. line; if south, it is two points, and consequently the next course being S. S. W. you are to set off 4 points, upon which set off 70 miles, from B to C, and then is your ship at C: for the third course, if from B to C be S. S. W. then from C to B is N. N. E. but the next course being E. half N. the points between N. N. E. and E. half N. are five points and an half, and therefore with the chord of 60, and one foot in C, draw the arch XY, upon which set off five points and an half from X to Y, and through Y draw the line CD, upon which set off 90 miles from C to D: then is your ship at D.

After the same manner lay down all the rest, as DE, which is W. N. W. half N. 70, then EF south 25, then FG, E. half S. 45; then lastly GH, south 30, which is the last course.

Thus your ship being at H, and the port sailed from at A, the line AH 28 miles, is the distance made good; and the angle at A is four points, viz. S. E. but the port intended for, being S. W. 55, set it from A to K, and the ship being at H, the line HK 62 miles, is the distance from the ship to the port bound for; and the course is found by measuring the angle at H  $71^{\circ} 48'$ , or W. S. W. more than a quarter westerly, &c.

To work a TRAVERSE by the tables of difference of latitude and departure.—This is the principal use those tables are intended for; and the way of working a traverse hereby, is equal to the best for exactness, and superior in point of expedition.

Make a little table with six columns, the first for the course, the second for the distance, the third for the northing, the fourth for the southing, the fifth for the easting, the sixth for the westing. Then find the difference of the latitude and the departure to every course, and set them in their proper columns; as where the course is northerly, set the difference of the latitude under northing, or in the north column; and where the course is southerly, set the difference of latitude in the south column.

Again, where the course is easterly, set the departure in the east column, and when westerly, set it in the west column; then adding up each column by itself, subtract the north and south columns, the lesser from the greater, the remainder is the northing or southing made good. Also subtract the east and west columns, the lesser from the greater, the remainder is the easting or westing made good; then have you the difference of latitude and departure given, to find the course and distance.

In the first example above specified, the first course is S. S. E. 30 miles, or two points 30 miles; for which I find the difference of latitude 27 : 7. Now the course being between south and east, I place my difference of latitude in the south column, and my departure 11 : 5, in the east column, leaving the north and west columns blank.

Then for the second course N. E. by N. or three points 40 miles, my difference of latitude 33 : 3, is to be placed in the north column, and the departure 22 : 2, in the east column, because the course is between the north and east.

Then the third course being E. by N. or seven points 25 miles, I place my difference of latitude 4 : 9, in the north column, and departure 24 : 5, in the east column.

And so for the fourth course N. N. E. or two points 44 miles; I place my difference of latitude 40 : 6, in the north column; and my departure 16 : 8, in the east column; then adding up each column, the sum of the northing column is 78 : 8; and the sum of the southing column is 27 : 7, which subtracted from the northing 78 : 8, the remainder 51 : 1, is the difference of latitude made good, which is northing, because the northing was the greater number.

Again, the sum of the easting column is 75 : 0, which, because there is no westing to subtract from it, is the easting made good. Thus you have the northing 51 : 1, and the easting 75 : 0 given, to find course and distance; and though you cannot find in the table the exact number of 51 : 1, and 75 : 0 together, yet find the nearest you can, which is 75 : 4, and 50 : 9, over which at the top you find 34 degrees for the course, which is N. E. by N.  $0^{\circ} 15'$  easterly, and the distance 91 miles.

TRAVERSE, in law, denotes the denial of some matter of fact, alledged to be done in a declaration, or pleadings; upon which the other side coming and maintaining that it was done, issue is joined for the cause to proceed to trial. See ISSUE, and TRIAL.

The formal words of a traverse are in the law French, *sans ceo*, in Latin, *absque hoc*, and in English, *without that*, &c.

An answer, says West, (speaking of bills in chancery) is that which the defendant pleadeth or faith in bar to avoid the plaintiff's bill or action, either by confession and avoiding, or by denying and traversing the material parts thereof. A replication is the plaintiff's reply to the defendant's answer, which must affirm and pursue his bill, and confess and avoid, deny or traverse the defendant's answer.

A plea is nought which neither traverses nor confesseth the plaintiff's title, &c. Every matter of fact alledged by the plaintiff, may be traversed by the defendant, but not matter of law, or what is part matter of law, and part matter of fact; nor may a record be traversed, as this is not to be tried by a jury.

If a matter be expressly pleaded in the affirmative, which is expressly answered in the negative, no traverse is necessary, there being a sufficient issue joined; also where the defendant hath given a particular answer in his plea, to all the material points contained in the declaration, he need not take a traverse; for that when the thing is answered, there needs no further trial.

TRAVERSE of an indictment or presentment, is the contradicting or denying some chief point of it, and taking issue thereon. See INDICTMENT, and PRESENTMENT.—Thus, in a presentment against a person for a highway overflowed with water, for default of scouring a ditch, &c. he may either traverse the matter, by alledging that there is no highway, or that the ditch is sufficiently scoured; or he may traverse the cause, viz. by alledging that he hath not the land, or that he and they whose estate, &c. have not used to cleanse the ditch.

TRAVERSE of an office, is the proving that an inquisition made of lands or goods is defective, and untrue made. See OFFICE, and INQUISITION.

No person shall traverse an office, unless he can make to himself a good right and title: and if one be admitted to traverse an office, this admission of the party to the traverse, supposes the title to be in him, or else he had no cause of traverse.

TRAVERSE is sometimes used in heraldry, for a partition of an escutcheon, of the figure represented in Tab. Herald. fig. 90: which they blazon parti per pal, traverse, argent and gules.

TRAVERSE Tiles. See the article TILE.

TRAVESTY, or TRAVESTI, a term which some late authors have introduced into poetry: it is originally French, being a participle of the word *travestir*, to disguise one's self, or to appear in masquerade.—Hence *travestly* comes to be applied to the disguising of an author, or the translating him into a style and manner different from his own; by which means it becomes difficult to know him. See PARODY.

G. Battista Lalli has travestied Virgil, or turned him into Italian burlesque verse. Scarron has done the same in French, and Cotton and Phillips in English verse. See BURLESQUE. Castalio is charged with having travestied the bible, by reason of the difference of air and style between his version and the original.

TRAUMATICS, TRATMATIKA, *Vulneraries*, or medicines good for the healing of wounds. See VULNERARY, and AGGLUTINANT, HEALING, CONSOLIDATION, &c.

TRAYL-BASTON, or TRAIL-BASTON.—Edward I. in his 32d year, sent out a new writ of inquisition, under this denomination, against the intruders on other mens lands, who, to oppress the right owner, would make over their lands to great men; against batterers hired to beat men, breakers of peace, ravishers, incendiaries, fighters, false assisors, and other malefactors: which inquisition was so strictly executed, and such fines taken, that it brought in a world of treasure to the king.

Hence also *justices of trayl-baston*, a denomination given to the judges appointed to execute this commission, either by reason of their severe and summary way of proceeding, or because a staff was delivered to them as the badge of their office, and the offenders were dragged before this jurisdiction.

**TRAYTOR, TRAITOR, TRADITOR**, a betrayer of his king and country, or one guilty of high treason. See **TREASON**, and **TRADITORES**.

**TRAYTEROUS**, or **TRAITEROUS** *Position*, is particularly understood of a tenet, which some formerly held, of the legality of taking arms by the king's authority against his person, and those commissioned by him: which is condemned by statute 14 Car. II. c. 3.

**TREACLE**, in pharmacy, &c. See **THERIACA**.

**TREACLE Water**, *Aqua Theriacalis*. See **WATER**.

**TREASON, TREACHERY**, the act or crime of infidelity to one's lawful sovereign. See **TRAYTOR**.

*Treason*, in our laws, is of two sorts, *high* and *petty*.

**High TREASON**, or **TREASON paramount**, is an offence committed against the security of the king or kingdom, whether by imagination, word or deed.—Such are, to compass or imagine the death of the king, queen, or prince; or to deflower the king's wife, or his eldest daughter unmarried, or his eldest son's wife, or to levy war against the king in his realms, to adhere to his enemies, counterfeit his great seal, or money, to kill the king's chancellor, treasurer, justices of either bench, justices in eyre, of assize, or of oyer and terminer, being in their place during their office, diminishing or impairing current money: saying that the king is a heretic or papist, or intends to introduce popery, anno 13 Car. II.

It is a maxim, that *in majori proditiōe, omnes sunt principales*, there are no accessaries in *high treason*, all are principals. See **ACCESSARY**, and **PRINCIPAL**.

Also, that *voluntas non reputabitur pro facto, nisi in causa proditiōis*, the will is never taken for the deed in any case, but that of *high treason*.

Though some *high treasons* are much more heinous than others, yet the punishment appointed by law is the same in all (clipping and coining only excepted) which is, that the traitor be laid upon a hurdle or sledge, drawn to the gallows, there hanged, but cut down while alive, the entrails pulled out and burnt before the criminal's face, then his head and quarters cut off, and impaled where the king shall judge meet.—Add to this, that he forfeits all his lands and goods whatever to the king, his wife loses her dowry, his children their nobility, and all right of inheriting.

Even an idiot, or lunatic, though judged incapable of most crimes, shall be punished as a traitor, if he go about to kill the king.

For *Petit* or *Petty TREASON*, see **PETTY TREASON**.

This kind gives forfeiture of lands by escheat to the lord of the fee. See **ESCHEAT**.

There is also mention made of *accumulative* and *constructive treason*, in the statute 14 Car. II.

*Misprision of TREASON*. See the article **MISPRISION**.

**TREASURE**, *Thesaurus*, *θησαυρος*, a store or stock of money in reserve. See **TREASURER**, and **TREASURY**.

**TREASURE-Trove**, q. d. *treasure found*, in law, is when money, gold, silver, plate, or bullion, is found in the ground, in any place, and none knows to whom it belongs.

This should naturally fall to the finder, but particular nations have made particular provisions for it.—The Jews gave it the proprietor of the place where it was found: the Roman jurisprudence was various with regard hereto; sometimes it was given to the master of the grounds, sometimes to the finder, and sometimes it was adjudged to the public treasury.

In France and England the general usage is to have such *treasure* sequestered to the king, unless where the benefit thereof is expressly granted or made over by the king to some other, as the lord of the manour.

In some places in France, it is divided into three parts, one for the king, one for the proprietor of the land, and one for the finder.

Briton says, it is every subject's part, as soon as he hath found any *treasure* in the earth, to make it known to the coroner of the county, &c.

The punishment for concealing *treasure* found in England, is imprisonment and fine; but if any mine of metal be found in any ground, it always appertains to the lord of the soil, except it be a mine of gold or silver, which anciently always belonged to the king, in whose ground soever it were found: but by an act of parliament, the king now hath only the præemption.

**TREASURER**, an officer to whom the treasure of a prince or corporation is committed to be kept, and duly disposed of in payment of officers, and other expences. See **TREASURY**.

Of these there is a great variety.—His majesty of Great Britain, in quality of elector of Brunswic, is *arch-treasurer* of the Roman empire. See **ARCH-TREASURER**.—In the states of Poland are two *grand treasurers*, that of the kingdom of Poland, and that of the dutchy of Lithuania.

In England the principal officers under this denomination are the *lord high treasurer*, the *treasurer of the household*, *treasurer of the navy*, of the *wardrobe*, of the *king's chamber*, &c. See **CHAMBERLAIN**, &c.

Anciently we had likewise a *treasurer of the exchequer*, *treasurer of war*, &c.—In the Romish countries the title *treasurer*

is also given somewhat abusively to an ecclesiastic, who has the keeping of the relics, and the charters and archives of a church or monastery. See **ARCHIVES**, &c.

This dignity succeeds, in some measure, to that of the ancient deacons, who had the like charge in the primitive church. See **DEACON**.

**Lord High TREASURER of England**, is the third great officer of the crown; under whose charge and government is all the king's revenue kept in the exchequer. See **REVENUE**, and **EXCHEQUER**.

He receives the office by delivery of a white staff to him from the king, and holds it during the king's pleasure: anciently he received it by delivery of the golden keys of the treasury. He has the check of all the officers any way employed in collecting imposts, customs, tributes, or other revenues of the crown. He has the gift of all the customers, comptrollers and searchers places in all the ports of London, and the nomination of the escheators in every county. See **CUSTOM-HOUSE**, &c.

He alone, or others in commission with him, letteth leases of all the crown lands, gives warrants to certain persons of quality to have their wine custom-free, &c.

The ancient salary was 383*l.* but of late is said to have been 8000*l.* The office of *lord treasurer* is now in commission. See **TREASURY**.

**Under TREASURER of England**. See **UNDER-TREASURER**.

**TREASURER of the household**, is an officer who, in the absence of the lord steward, has power, with the comptroller and other officers of the green cloth, and the steward of the Marshalsea, to hear and determine treasons, felonies and other crimes committed within the king's palace. See **HOUSEHOLD**, **GREEN-CLOTH**, &c.

**TREASURER of the Navy**, is an officer who receives money out of the exchequer, by warrant from the lord high treasurer, or the lords commissioners executing that place, and pays all charges of the navy, by warrant from the principal officers of the navy. See **NAVY**.

**TREASURY**, the place wherein the revenues of a prince are received, preserved, and disbursed.

In England, the *treasury* is a part of the exchequer, by some called the *lower exchequer*. See **EXCHEQUER**.

The officers of his majesty's *treasury*, or the lower exchequer, are the lord treasurer, a chancellor, a secretary, two chamberlains, an auditor, four tellers, a clerk of the pells, ushers of the receipt, a tally-cutter, &c. See each officer under his proper article, **CHANCELLOR**, **TELLER**, **TALLY**, &c.

At Rome, under the emperors, there were two kinds of *treasuries*, the one called *ærarium*, wherein the monies destined to support the charges of the government were kept; the other *fiscus*, wherein were preserved those intended for the particular subsistence of the emperor and his court. In effect the *ærarium* belonged to the people, and the *fiscus* to the prince. See **ÆRARIUM**, and **FISCUS**.

We have still a resemblance of this difference among us, but it is confounded in France, &c. where the king disposes absolutely of the public treasure, &c.

**Lords of the TREASURY**.—In lieu of one single director and administrator of his majesty's revenues, under the title of lord high treasurer; it is frequently thought proper to put that office in commission, i. e. to appoint several persons to discharge it with equal authority, under the title of lords commissioners of the *treasury*. See **TREASURER**.

**TREAT**, in our old law-books, signifies as much as *taken out*, or *withdrawn*.—Thus a juror was challenged, because he could not dispend 40*l.* and therefore was *treat* by the statute, or discharged. *Old. Nat. Br.* See **JUROR**, &c.

**TREATISE, TRACTATUS**, a set discourse in writing on any subject. See **TRACT**.

A *treatise* is supposed more express, formal, and methodical, than an essay; but less so than a system. See **ESSAY**, &c.

**TREATY**, a covenant between several nations; or the several articles or conditions stipulated and agreed upon between sovereign powers. See **ALLIANCE**.

There are *treaties* of peace, of marriage, of confederacy, of neutrality, of capitulation, and of commerce and navigation. See **PEACE**, **CONFEDERACY**, &c.

The celebrated *treaties* are those of Nimeguen, of Munster, of the Pyreneans, of Westphalia, of Riswick, of Utrecht, of Hanover, of Vienna, &c.

*Treaties* of commerce are usually followed by various tariffs, to adjust the duties of exportation and importation of merchandizes into the respective dominions of the contracting powers.

The last *treaty* of peace, commerce, navigation, &c. between England and France, was signed at Utrecht the 1st of April 1713, and consists of 39 articles, most whereof are regularly executed between the two nations, only some of the more particular ones cannot yet be executed, by reason of some difficulties in the tariffs. See **TARIF**.

**Guarantee of a TREATY**. See the article **GUARANTEE**.

**TREBELLIANICA**, or **TREBELLIAN Fourth**, in the Roman jurisprudence, a right belonging to an heir instituted by testament.—If the testator, after appointing a full and general heir,

heir, spent and disposed of all his effects in legacies; or if he went *ultra dodrantem*, beyond three fourths thereof, in that case the heir was allowed to retrench and detain one fourth part of the legacies to his own use.—This was called the *Trebellianica*.

In like manner, if the testator charged his heir with a feoffment of trust, and to restore the inheritance to another; in that case, the heir might likewise retain a fourth of the whole succession, that the quality of heir might not be rendered wholly vain and fruitless.

**TREBLE**, in music, the highest or acutest of the four parts in symphony, or that which is heard the clearest and shrillest in a concert. See **MUSIC**, **GRAVITY**, and **SYMPHONY**.

In the like sense we say, a *treble* violin, *treble* hautboy, &c. See **VIOLIN**, &c.

In vocal music, the *treble* is usually committed to boys and girls.—Their part is the *treble*. See **PART**.

The *treble* is divided into first or highest *treble*, and second or base *treble*.—The half *treble* is the same with the counter-tenor. See **HARMONY**.

**TREBUCHET**, **TREBUCHETUM**, a tumbrel, or cucking-stool. See **CUCKING-STOOL**.

**TREDECILE**. See the article **ASPECT**.

**TREDDLE**, or **TREADLE**, *Chalaza*, in natural history. See the articles **CHALAZA**, and **EGG**.

**TREE**, *Arbor*, the first and largest of the vegetable kind, consisting of a single trunk, out of which spring forth branches and leaves. See **VEGETABLE**, &c.

*Standards*, or **TREES** in full air, are such as naturally rise a great height, and are not topped.—For the choice of trees of this kind to be transplanted out of a nursery, Quintiney recommends us to such as are straight, six foot high at least, and five or six inches thick at bottom, and three or four at top; the bark pretty smooth and shining, as a token of their youth, and of the good soil they grew in. See **TRANSPLANTATION**, **NURSERY**, &c.

*Dwarf* **TREES**, are such as are kept low, and never suffered to have above half a foot of stem.—These are used to be kept vacant or hollow in the middle, that the branches spreading round about the sides may form a kind of round bowl or bush. See **DWARF**.

*Wall* **TREES**, are those whose branches are stretched out, and nailed against walls. See **WALL**, and **ESPALIER**.

For dwarf and wall trees, such are to be chose out of the nursery for transplantation, as are straight, and consist of a single stem, and a single graft, rather than two or three grafts in several branches: their thickness at bottom should be two or three inches.

*Fruit* **TREES**, are such as bear fruit. See the article **FRUIT**.

*Timber* **TREES**, are those whose trunks are tall and straight, whereof beams, masts, &c. are used to be made. See **TIMBER**.

*Coniferous* **TREES**, are those whose fruit is of a conical figure, as the pine, fir, larch, &c.—These are also called *resiniferous*, by reason coniferous trees are generally covered with a bark that abounds in resin. See **RESIN**.

Mr. Ray, and other authors, speak of several trees of prodigious bulk.—The jesuit d'Acosta, in his history of the Indies, lib. 4. c. 3. mentions a hollow tree at Tlacocharaya, three leagues from Gauxa in New Spain, nine fathom within-side near the ground, and sixteen without-side. He adds, that it is under this tree the barbarians assemble to perform their religious ceremonies, dance round their idols, &c.—Herrera mentions another, which sixteen men, joining hands, cannot fathom.—F. Kircher, in his *Latium*, p. 50, affirms, he has seen a tree near Gonzano, which would lodge a whole family of 25 persons in its cavity. The common people have a tradition, that it was planted by Augustus.

In the Indies there are very large forests consisting only of a single tree, whose branches falling to the ground, take root, and put forth new trees: the fig tree and paretuvier are of this kind.

M. Lonvillers mentions trees in Peru, one part of whose branches produce fruit one half the year, and the other part the other half.—In China is a tree which bears tallow, whereof that nation make their candles. See **TALLOW**.

There are two or three very remarkable phenomena in the growth of trees, which have escaped the observation of the naturalists of all ages, except those of our own: these are the perpendicularity of their trunks or stems, to the horizon, and the parallelism of their tufts to the spot of earth they grow on. An account of each, see under the articles **PERPENDICULARITY**, and **PARALLELISM**.

For the planting, transplanting, semination, pruning, felling, grafting, throwding, barking, &c. of trees; see the respective articles, **PLANTING**, **TRANSPLANTING**, **SEMINATION**, **PRUNING**, **ENGRAFTING**, &c.

Mr. Ray distinguishes the trees and shrubs of our native growth in England, into, I. Such as have their flower disjointed, and remote from the fruit:—which are,

1°. *Nuciferous* **TREES**, or such as bear nuts: as the walnut tree, the hazle-nut tree, the beech, the chestnut, and the common oak. See **NUT**.

2°. *Coniferous* **TREES**, or such as bear a squamous or scaly fruit, of a conical figure, and a woody or hard substance, in which are many seeds; which, when they are ripe, the cone opens or gapes in all its several cells or partitions, and lets them drop out: of this kind are the Scotch firs, male and female; the pine, which, in our gardens is called the Scotch fir; the common alder tree, and the birch tree.

3°. *Bacciferous* **TREES**, or such as bear berries; as the juniper and yew tree. See **BACCIFEROUS**.

4°. *Lanigerous* **TREES**, or such as bear a woolly, downy substance: as the black, white, and trembling poplars, willows, and others of all kinds. See **LANUGO**, **TOMENTUM**, &c.

5°. **TREES** which bear their seeds (having an imperfect flower) in leafy membranes and cases: as, the horn-beam, or hard-beam, called in some places the horn-beech.

II. Such as have their fruits and flowers contiguous; which are either with the flower placed on the top of the fruit, or adhering to the base or bottom of the fruit.

Of the former kind, some are *pomiferous*, as apples and pears; and some *bacciferous*, as the sorb or service tree, the white or haw-thorn, the wild rose, sweet-brier, currants, the great bilberry-bush, honey-suckle, ivy, &c.

The latter kind are either such as have their fruit moist and soft when ripe, as—1°. *Pruniferous* ones, whose fruit is pretty large and soft, with a stone in the middle; as the black thorn or sloe tree, the black and white bullace tree, the common wild cherry, the black cherry, &c. See the article **PRUNIFEROUS**.

2°. *Bacciferous* **TREES**, as the strawberry tree in the west of Ireland, mistletoe, water elder, the dwarf a large laurel, the viburnum or way-faring tree, the dogberry tree, the sea black thorn, the berry-bearing elder, the privet, barberry, common elder, the holly, the buckthorn, the berry-bearing heath, the bramble, and the spindle tree or prickwood.

Or such as have their fruit dry when ripe; as the bladder-nut tree, the box tree, the common elm and ash, the maple, the gaul or sweet willow, common heath-broom, dyers weed, furze or gorse, the lime tree.

*Heart of a TREE*, } See **HEART**,  
*Parallelism of rows of TREES*, } See **PARALLELISM**.

*Diana's TREE*, *arbor Dianæ*, among the chymists, is a kind of metalline vegetation, which after a long process shoots out into branches, with the appearance of leaves, and even flowers. See **ARBOR**.

*TREE of Mars*, *arbor Martis*, is another very singular vegetation, first discovered accidentally by the younger Lemery. See **ARBOR**.

*Dormant TREE*, } See **DORMANT**,  
*Roof TREES*, } See **ROOF**.

**TREFOIL**. See the article **TRIFOLIUM**.

**TREMOR**, **TREMBLING**, in medicine, a disease nearly akin to a convulsion, wherein there is something of a convulsive motion or shaking, accompanying a voluntary or natural motion. See **CONVULSION**, and **PARALYSIS**.

A tremor is frequently found to arise upon the more violent passions, particularly anger, gluttony, venery, &c. but this is accidental and transitory.

A tremor is sometimes apt to degenerate into other worse diseases, viz. palsy, apoplexy, lethargy, spasmus, &c. In old men it is incurable. See **TREPIDATION**.

The medicine commonly made use of in tremors, and other nervous distempers, by the name of *palsy drops*, is no other than compound spirit of lavender. The most successful way of using it, is by taking 30 or 40 drops twice or thrice a day, dropt on loaf sugar or a little bread. It is supposed, that by this way the most spirituous and efficacious parts make their way directly by the nerves of the palate, &c. without undergoing the course of the circulation, as it is said to do when taken in a liquid vehicle.

*TREMOR of the heart*. See the article **PALPITATION**.

**TRENCH**, a ditch cut, or dug in the ground, to drain off the waters in a meadow, a morass, or the like; or to divert the course of a river. See **DITCH**, &c.

Many of the bogs in Ireland have been drained, and made good ground, by only digging trenches around them.

**TRENCHES**, in fortification, are ditches which the besiegers cut to approach more securely to the place attacked; whence they are also called *lines of approach*.—See *Tab. Fortif. fig. 21. n. II.*, &c. See also **DITCH**, **APPROACH**, **COUNTER-TRENCH**, &c.

They say, *mount the trenches*, that is, go upon duty in them.—To *relieve the trenches*, is to relieve such as have been upon duty there. See **MOUNTING**.

The enemy is said to have *cleared the trenches*, when they have driven away, or killed the soldiers who guarded them.

*Tail of the TRENCH*, is the place where it was begun. See **TAIL**.—And the *head* that to which it was carried. See **HEAD**, and **ATTACK**.

Trenches are of several sorts, according to the nature of the soil: if the adjacent territory be rocky, the trench is only an elevation of bavons, gabions, wool-packs, or epaulements of earth, cast round about the place—but where the ground may be

be easily opened, the *trench* is dug therein, and bordered with a parapet on the side of the besieged. See *PARAPET*, &c. The breadth of the *trenches* is from eight to ten foot, and the depth from six to seven; they are cut in talus, or aslope. See *TALUS*.

The *trenches* are to be carried on with winding-lines, in some manner parallel to the works of the fortrefs, so as not to be in view of the enemy, nor to expose their length to the enemy's shot: for then they will be in danger of being enfiladed, or scoured by the enemy's cannon: this carrying of the *trenches* obliquely, they call carrying them by *coudées*, or returns. See *ENFILADE*.

*Opening the TRENCHES*, is when the besiegers begin to work upon the line of approaches; which is usually done in the night; sometimes within musket-shot, and sometimes within half, or whole cannon-shot of the place, if there be no rising ground about it, the garison strong, and their cannon well served. See *OPENING*.

The workmen that open the *trenches* are always supported by bodies of men against the sallies of the besieged; and sometimes those bodies lie between them and the place, as also on their right and left.

The pioneers sometimes work on their knees; and the men that are to support them lie flat on their faces, in order to avoid the enemy's shot; and the pioneers are likewise usually covered with mantelets, or saucissons.

To *TRENCH the ballast*, is a sea phrase, signifying to divide the ballast into several *trenches* in a ship's hold. See *BALLAST*.

*TRENCHÉ*, in heraldry. See the article *TRANCHE*.

*TRENCHING-Plough*, is an instrument for cutting out the sides of *trenches* and drains, or the sides of turf, &c. See *PLOUGH*.

*TRENTAL*, *TRIGINTAL*, or *TRICENNAL*, a Romish office for the dead, consisting of thirty masses, rehearsed for thirty days successively after the party's death.

The *trental* is thus called from the Italian, *trenta*, *triginta*, *thirty*.—It is mentioned *anno primo Ed. VI. Et volo, & ordino, quod executores mei ordinent seu ordinare faciant unum trental pro salute anime mee*.

*TREPANUM*, *TREPAN*, a chirurgian's instrument, serving to perforate a bone, especially that of the cranium, and used as such in the operation of *trepanning*. See *TREPANNING*. It is also called *abaptiston*, *anabaptiston*, *modiolus*, *tereбра*, *terebellum*.—*Abaptiston*, from a privative, and βαπτίζω, to dip; as having a broad circle over its point, to prevent it, in the operation of *trepanning*, from penetrating through the membranes that invest the brain.—*Modiolus*, from *modus*, a measure; being contrived to enter only to a certain depth.—*Terebra*, &c. from τρέπω, to bore.

It is in form of a terebellum, or small wimble, only the handle indented, somewhat in manner of a round saw.

It serves for the cure of wounds, contusions and fractures of the cranium, when they do not go beyond the second table; for by means hereof, an amputation or exfoliation is made of what part, or quantity of a bone one pleases. See *CRANIUM*, *FRACTURE*, &c.

It has usually a sharp nail in the middle of its circumference, serving to keep it firm and steady during the operation.—It should also have a kind of cope to rise and fall as occasion requires, that it may not go deeper in the bone than is necessary. There are also two-pointed *trepans*, others triangular, quadrangular, and hexagonal for the cure of a caries of the bones.—There are also perforative *trepans*, and exfoliative ones. See *EXFOLIATION*.

*TREPANNING*, in chirurgery, the operation of relieving cuts, contusions, caries's, and fractures in the skull, by means of an instrument called the *trepandum*. See *TREPANUM*.

*Trepanning* is a very dangerous and difficult operation; not to be used, unless when the chips and prominences of the bones prick; when the upper table is entire, but depressed, and the lower broken; and when the extravasated blood would endanger the person's being suffocated. See *CRANIUM*.

The manner of *trepanning* or opening the skull, is thus: the hairs being shaven off, the skin is to be cut through to the pericranium, avoiding as much as possible, the muscles of the temples, and the sutures of the skull: and for this time the wound is to be bound up, unless there be so little blood spilt, that the pericranium may at the same time be pulled up from the bone.

After a few hours, stop the patient's ears, and take one of the instruments called a *male trepanum*, or *modiolus*; fix its point in the skull, but so far off the fracture, that it touch it not, much less the suture, with its teeth; though some surgeons do not mind to avoid the sutures, but assure us, they have perforated them as successfully as any other part.

Then, holding the instrument fast with the left hand, turn it round with the right, till you have cut a pretty deep hole: after this take a *female trepanum*, which has no point in the middle, and turn it round as before: in the mean time, take away the dust or chips that proceed from the perforation, and moisten the instrument in oil and water, to make it cool and slippery.

The blood appearing, will shew you are now gone as deep as the second table, i. e. beyond the scull, to the dura mater; in which case you must press very gently, lest that membrane be unadvisedly hurt.

When the bone begins to wag, put something in between the sides of the wound; loosen it, and take it out with a pair of surgeon's pincers, or forceps.

After the operation is over, the part is to be washed gently with weak red wine, and proper dressings applied thereon, as honey of roses, arceus liniment, oil of St. John's wort, &c.—If the dura mater be corrupted, add, as occasion requires, spirit of wine, tincture of myrrh and aloes, Venice turpentine, honey *Ægyptiacum*, &c.

Mr. Cheselden takes notice, that the sinus's and spine of the os frontis, make it very dangerous, if not impracticable, to apply a *trepandum* to the middle and lower part of the forehead.

*TREPIDATION*, in medicine, a tremor, or trembling of the nerves and members of the body. See *TREMOR*.

The first symptom of madness in dogs, is a *trepidation* of the members, &c. See *HYDROPHOBIA*.

*TREPIDATION*, in the ancient astronomy, denotes a libration of the eighth sphere; or a motion which the Ptolemaic system attributes to the firmament, to account for certain almost insensible changes and motions observed in the axis of the world; by means whereof the latitudes of the fixed stars come to be gradually changed, and the ecliptic seems to approach reciprocally, first towards one pole, then the other. See *PTOLEMAIC*, &c.

This motion is also called the motion of the first libration. See *LIBRATION*, and *TITUBATION*.

*TRESPASS*, in law, signifies any transgression of the law, under treason, felony, or misprision of treason. See *TRANSGRESSION*.

For a lord of parliament to depart from thence without the king's licence, is neither treason, nor felony, but *trespass*. *Staundford Pl. Cor.*

*TRESPASS*, however, is most commonly used either for that wrong or damage which is done to the king in his forest, or by one private man to another.

In this sense it is of two sorts: *trespass general*, otherwise called *trespass vi & armis*, where force or violence is used—and *trespass special*, otherwise called *trespass upon the case*; which should be that done without force. See *ACTION on the case*.—But the two species are sometimes confounded.

In an action of *trespass*, the plaintiff always sues for damages, or the value of the hurt done him by the defendant. See *DAMAGES*.

*Trespass* is also divided into *local* and *transitory*.

*TRESPASS local*, is that which is so annexed to the place certain, that if the defendant join issue upon a place, and traverse the place mentioned in the declaration, and aver it; it is enough to defeat the action. See *LOCAL*.

*TRESPASS transitory*, is that which cannot be defeated by the defendant's traverse of the place, because the place is not material.

The action of *trespass*, *quare clausum fregit*, ought to be local. *TRESSURE*, in heraldry, a diminutive of an orle, usually supposed to be half the breadth thereof. See *ORLE*.

It is usually borne flory, and counter-flory; and sometimes double, as in *Tab. Herald. fig. 85.* and sometimes triple.

*TRESTLE*, *TRESSEL*, or *TRUSSEL*, is explained by Minshieu to be a three-footed stool; more particularly a wooden frame or stand to bear up tables, scaffolds, or the like.

*TRET*, in commerce, an allowance made for the waste, or the dust that may be mixed with any commodity; which is always 4 pounds in every 104 pounds weight. See *TARE*.

*TREUGA Dei*, *TREVE de Dieu*. See *TRUCE of God*.

*TRIA prima*, among the chymists, the three hypostatical principles, viz. salt, sulphur, and mercury; of which they hold all bodies to be primarily made, and into which they are all held resolvable by fire. See *PRINCIPLE*, and *ELEMENT*. See also *SALT*, *SULPHUR*, and *MERCURY*.

*TRIAD*, *TRIAS*, *ΤΡΙΑΣ*, a term sometimes used for a trinity. See *TRIAS*, and *TRINITY*.

*TRIAL*, in law, the examination of any cause, whether civil or criminal, according to the laws of the realm, before a proper judge. See *PROOF*, &c.

Of this there are divers kinds: matters of fact, *e. gr.* being to be tried by the jurors; matters of law by the justice; matters of record by the record itself. See *JURY*, *JUDGE*, *JUSTICE*, *RECORD*, &c.

A lord of parliament, indicted of treason or felony, shall be tried, without any oath, by his peers, upon their honours and allegiance; but in appeal, at the suit of any subject, they shall be tried per bonos & legales homines. See *PEER*, and *APPEAL*. If ancient demesne be pleaded of a manour, and denied, this shall be tried by the record of domesday. See *ANCIENT Demesne*, and *DOMESDAY*.

Bastardy, excommunication, lawfulness of marriage, and other ecclesiastical matters, shall be tried by the bishop's certificate. See *BASTARD*, &c.

Before trial in a criminal case, it is usual to ask the criminal how he will be tried; which was anciently a very pertinent question,

question, though not so now; in regard there were formerly several ways of *trial*, viz. by *battle*, *ordeals*, and *jury*. See ORDEAL, and JURY.

When the criminal answered, by God and his country, it shewed he made choice to be tried by a jury.—But there is now no other way of *trial*.—This is also called *trying per pais*, *per patriam*.

For the ancient manner of *trial* by combat, and great affize, see COMBAT, DUEL, ASSISE, CHAMPION, &c.

TRIANGLE, in geometry, a figure comprehended under three lines, or sides, and which of consequence has three angles. See FIGURE, and ANGLE.

If the three lines or sides of the triangle be all right, it is said to be a *plain* or *rectilinear triangle*. See PLAIN, and RECTILINEAR.

If all the three sides of the triangle be equal (as ABC, *Tab. Geometry*, fig. 68.) it is said to be *equilateral*. See EQUILATERAL.

If only two of the sides of the triangle be equal (as in DEF, fig. 69.) it is called an *isosceles*, or *equicrural triangle*. See ISOSCELES, &c.

If all the sides of the triangle be unequal to each other (as in ACB, fig. 70.) the triangle is said to be *scalene*. See SCALENUS.

If one of the angles, as K, (fig. 71.) of a triangle KML, be a right angle, the triangle is said to be *rectangular*. See RECTANGLE.

If one of the angles, as N, (fig. 72.) be obtuse, the triangle is said to be *obtusangular*, or *amblygonous*. See AMBLYGON.

If all the angles be acute, as in ACB, (fig. 68.) the triangle is said to be *acutangular*, or *oxymous*. See ACUTANGLE, &c.

If the three lines of the triangle be all curves, the triangle is said to be *curvilinear*. See CURVILINEAR.

If some of the sides be right, and others curve, the angle is said to be *mixtilinear*.

If the sides be all arches of great circles of the sphere, the triangle is said to be *spherical*. See SPHERICAL Triangle.

Similar TRIANGLES,

Base of a TRIANGLE,

Canon of a TRIANGLE,

Legs of a TRIANGLE,

See the articles

SIMILAR,

BASE,

CANON,

LEGS.

Construction of TRIANGLES.—I. Two sides, as AB and AC, fig. 73. being given in numbers, or otherwise, together with the quantity of the angle intercepted between them, A; to construct a triangle—assume AB as a base, and in A make the given angle; on the other leg set off the other given line AC; lastly, draw BC: then will ABC be the triangle required.

Hence, two sides with the intercepted angle being determined, the whole triangle is determined.—Wherefore, if in two triangles ACB and acb;  $a=A$ ; and  $ab:ac::AB:AC$ , the triangles are determined in the same manner, and are therefore similar; consequently  $c=C$ , and  $b=B$ ,  $ab:bc::AB:BC$ , &c.

2. Three sides, AB, BC, and CA, fig. 68. being given, any two whereof, as AC, AB, taken together, are greater than the third, to construct a triangle.—Assume AB for a base; and from A, with the interval AC, describe an arch y; and from B, with the interval BC, describe another arch x; draw the right lines AC and BC. Thus is the triangle constructed. Hence, as of any three given right lines, only one triangle can be constructed; by determining the three sides, the whole triangle is determined.

Wherefore, if in two triangles ACB and acb (fig. 73.)  $AC:AB::ac:ab$ ;  $AC:CB::ac:bc$ ; the triangles are determined in the same manner, and consequently are similar, and therefore mutually equiangular.

3. A right line, as AB, and two adjacent angles A and B, which, taken together, are less than two right ones, being given, to describe the triangle ABC.—On the given line AB, make the two given angles A and B; continue the sides AC and BC till they meet in C: then will ABC be the triangle required.

Hence, one side and two angles being given, the whole triangle is determined.—Wherefore, if in two triangles  $A=a$  and  $B=b$ , the triangles are determined after the same manner, and therefore are similar.

Mensuration of TRIANGLES.—To find the area of a triangle, multiply the base AB (fig. 74.) by the altitude Cd; half the product is the area of the triangle ABC.

Or thus: multiply half the base AB by the altitude Cd; or the whole base by half the altitude; the product is the area of the triangle.

E. gr. AB=342	AB=342	$\frac{1}{2}$ AB=171
Cd=234	$\frac{1}{2}$ Cd=117	Cd=234
1368	2394	684
1026	342	513
684	342	342
2) 80028 (	40014	40014 area
area 40014		

Or, the area of any triangle is had by adding all the three sides together, and taking half the sum; and from that half sum subtracting each side severally, and multiplying that half sum and the remainder continually into one another, and extracting the square root of the product.

Hence, 1. if between the base, and half the altitude; or between the altitude and half the base, be found a mean proportional, it will be the side of a square equal to the triangle.

2. If the area of a triangle be divided by half the base, the quotient is the altitude.

Properties of plain TRIANGLES.—I. If in two triangles ABC and abc (fig. 73.) the angle A be  $=a$ , and the sides  $AB=ab$ , and  $AC=ac$ ; then will the side  $BC=bc$ , and the angles  $C=c$ , and  $B=b$ ; and therefore the whole triangles will be equal and similar.

2. If one side of a triangle ABC (fig. 75.) be continued to D, the external angle DAB will be greater than either of the internal opposite ones B or C.

3. In every triangle, the greatest side is opposed to the greatest angle, and the least to the least.

4. In every triangle, any two sides taken together are greater than the third.

5. If in two triangles, the several sides of the one be respectively equal to the sides of the other, the angles will likewise be respectively equal; and consequently the whole triangles equal and similar.

6. If any side, as BC (fig. 76.) of a triangle ACB be continued to D, the external angle DOA will be equal to the two internal opposite ones y and z taken together.

7. In every triangle, as ABC, the three angles A, B, C, taken together, are equal to two right ones, or  $180^\circ$ .

Hence, 1. If the triangle be rectangular, as MKL (fig. 71.) the two oblique angles M and L, taken together, make a right angle, or  $90^\circ$ ; and therefore are half right, if the triangle be isosceles.—2. If one angle of a triangle be oblique, the other two taken together are oblique likewise.—3. In an equilateral triangle, each angle is  $60^\circ$ .—4. If one angle of a triangle be subtracted from  $180^\circ$ , the remainder is the sum of the other two; and if the sum of two be subtracted from  $180^\circ$ , the remainder is the third.—5. If two angles of one triangle be equal to two of another, either together or separately, the third of the one is likewise equal to the third of the other.—6. Since in an isosceles triangle DFE (fig. 69.) the angles at the base y and v are equal; if the angle at the vertex be subtracted from  $180^\circ$ , and the remainder be divided by 2, the quotient is the quantity of each of the equal angles: in like manner, if the double of one of the angles at the base y be subtracted from  $180^\circ$ , the remainder is the quantity of the angle at the vertex.

8. If in two triangles ABC and abc (fig. 73.)  $AB=ab$ ,  $A=a$ , and  $B=b$ ; then will  $AC=ac$ ,  $BC=bc$ ,  $C=c$ , and the triangle ACB equal and similar to the triangle abc.—Hence, if in two triangles ACB and acb,  $A=a$ ,  $B=b$ , and  $BC=bc$ ; then will  $C=c$ ; consequently  $AC=ac$ ,  $AB=ab$ ; and the triangle  $ACB=acb$ .

9. If in a triangle DFE the angles at the base y and v, (fig. 69.) be equal, the triangle is isosceles; consequently, if the three angles be equal, it is equilateral.

10. If in a triangle ABC (fig. 77.) a right line DE be drawn parallel to the base, then will  $BA:BC::BD:BE::AD:EC$ ; and  $BA:AC::BD:DE$ ; consequently the triangle BDE similar to BAC.

11. Every triangle is inscribable in a circle. See CIRCLE.

12. The side of an equilateral triangle, inscribed in a circle, is in power triple of the radius. See RADIUS.

13. Triangles on the same base, and having the same height, that is, being between the same parallel lines, are equal. See PARALLEL.

14. Every triangle, as CFD, (fig. 41.) is one half of a parallelogram ACDB on the same, or an equal base CD, and of the same altitude, or between the same parallels: or a triangle is equal to a parallelogram upon the same base, but half the altitude; or half the base, and the same altitude. See PARALLELOGRAM.

15. In every triangle, as well plain as spherical, the sines of the sides are proportional to the sines of the opposite angles.

16. In every plain triangle, as the sum of two sides is to their difference, so is the tangent of half the sum of the opposite angles, to the tangent of half their difference. See TANGENT.

17. If a perpendicular be let fall upon the base of an oblique angled triangle, the difference of the squares of the sides is equal to double the rectangle under the base, and the distance of the perpendicular from the middle of the base.

18. The sides of a triangle are cut proportionably, by a line drawn parallel to the base.

19. A whole triangle, is to a triangle cut off by a right line, as the rectangle under the cut sides, is to the rectangle of the other two sides.

20. In a right lined triangle, a line drawn from the right angle at the top perpendicular to the hypotenuse, divides the triangle into two other right lined triangles, which are similar to the first triangle, and to one another.

21. In every right-angled triangle, the square of the hypotenuse is equal to the sum of the squares of the other two sides. See HYPOTHENUSE.

22. If any angle of a triangle be bisected, the bisecting line will divide the opposite side, in the same proportion as the legs of the angle are to one another. See BISECTION.

23. If the vertical angle of any triangle be bisected, the difference of the rectangles, made by the sides and the segments of the base, is equal to the square of the line that bisects the angle.

24. If a right line BE (fig. 78.) bisect an angle ABC of a triangle, the square of the said line BE = AB + BC - AE + EC. Newt. Arith. Univers.

To divide a triangle into any given number of equal parts, divide the base CD (fig. 77. n.2.) into as many equal parts as the figure is to be divided into; and draw the lines A1, A2, &c.

Resistance of a TRIANGLE, } See } RESISTANCE.  
Characteristic TRIANGLE, } See } CHARACTERISTIC.

Properties of spherical TRIANGLES. See SPHERICAL TRIANGLE. TRIANGLE, in trigonometry.—The solution or analysis of triangles is the business of trigonometry. See TRIGONOMETRY.

The several cases thereof are reducible to the following problems.

**Solution of plane TRIANGLES.**—I. Two angles A and C (Tab. Trigon. fig. 27.) being given, together with the side AB opposite to one of them, C; to find the side BC opposite to the other, A.—The rule or canon is this: as the sine of the angle C, is to the given side AB, opposite to the same; so is the sine of the other angle A, to the side required. The side BC, therefore, is commodiously found by the logarithms, from the rule for finding a fourth proportional to 3 numbers given. See LOGARITHM.

For an example: suppose C = 48° 35', A = 57° 28', AB = 74'. The operation will stand thus:

Log. of sine of C	9.8750142
Log. of AB	1.8692317
Log. of sine of A	9.9258681

Sum of log. of AB } 11.7950998  
and of sine of A }

Log. of BC 1.9200856. The number corresponding to which, in the table of logarithms, is 83, the quantity of the side sought.

2. Two sides AB and BC, together with the angle C, opposite to one of them given; to find the other angles A and B.—The rule is this: as one side AB is to the sine of the given angle opposite thereto C; so is the other side BC, to the sine of the angle required opposite thereto.

E. gr. suppose AB = 94', BC = 69', C = 72° 15'.

Log. of AB	1.9731279
Log. of sine of C	9.9788175
Log. of BC	1.8388491

Sum of log. of sine } 11.8176666  
of C and of BC }

Log. of sine of A 9.9444387. The number corresponding to which in the table of logarithms, is 61° 37'. Now, the given angle C being 72° 15', the sum of the two 133° 52' subtracted from 180, the sum of the three, gives 46° 8' for the other angle sought B.

In like manner, suppose, in a right angled triangle (fig. 28.) that beside the right angle A, is given the hypotenuse BC, 49, and the cathetus AC, 36, to find the angle B; then will the operation stand thus:

Log. of BC	1.6901961
Log. of whole sine	10.0000000
Log. of AC	1.5563025

Log. of sine of B 9.8661064. The corresponding number to which, in the table of logarithms, is 47° 16'; consequently C = 42° 44'.

3. Two sides BA and AC, together with the included angle A being given; to find the two remaining angles.—I. If the triangle ABC be rectangular; take one of the sides including the right angle, as AB, for radius; then will CA be the tangent of the opposite angle B: the rule then is—As one leg AB is to the other AC; so is the whole sine to the tangent of the angle B.

E. gr. suppose BA 79, and AC 54:

Log. of BA	1.8976271
Log. of AC	1.7323938
Log. of whole sine	10.0000000

Log. of tang. of B 9.8347667; the corresponding number to which, in the table of logarithms, is 34° 21'; consequently the angle C is 55° 39'.

II. If the angle A be oblique (fig. 27.) the rule is; as the sum of the given sides AB and AC (fig. 29.) is to their difference; so is the tangent of half the sum of the sought angles C and B, to the tangent of half the difference. Adding, therefore, the half difference to the half sum; the aggregate will be the greater angle C; and subtracting the half difference from the half sum; the remainder is the less angle B.

E. gr. suppose AB = 75', AC 58', A 108° 24'; then will

AB 75	AB 75	A + B + C 179° 60'
AC 58	AC 58	A 108 24
Sum 133	diff. 17	B + C 71 36
		$\frac{1}{2}(B+C)$ 35 48

Log. of AB + AC	2.1238516
Log. of AB - AC	1.2304489
Log. of tang. $\frac{1}{2}(B+C)$	9.8580694

Sum of logg. 12.0885183

Log. of tang.  $\frac{1}{2}(C-B)$  8.9646667. The corresponding number to which is 5° 16'.

$\frac{1}{2}(B+C) = 35° 48'$   $\frac{1}{2}(B+C) = 35° 48'$

$\frac{1}{2}(C-B) = 5° 16'$   $\frac{1}{2}(C-B) = 5° 16'$

C = 41 4 B = 30 32

4. The three sides, AB, BC and CA (fig. 30.) being given, to find the angle A, B and C.—From the vertex of the angle A, with the extent of the least side AB, describe a circle: then will CD be = the sum of the legs AC and AB; and CF their difference.—The rule then is, As the base BC is to the sum of the legs CD; so is the difference of the legs CF, to the segment of the base CG.—This segment, thus found, being subtracted from the base CB, the remainder is the chord GB. Then, from A to the chord GB let fall the perpendicular AE; thus will BE = EG =  $\frac{1}{2}$  GB.

Thus in a rectangular triangle, AEB, the sides AB and BE being given; or, in an obliquangled triangle, ACE, the sides AC and CE being given: the angles B and A are found.

E. gr. suppose AB = 36, AC = 45, BC = 40.

AC = 45	AC = 45
AB = 36	AB = 36

AC + AB = 81	FC = 9
Log. of BC =	1.6020600
Log. of AC + AB	1.9084850
Log. of FC =	0.9542425

Sum of logg. = 2.8627275

Log. of CG = 1.2606675. The corresponding number to which in the tables is 18.

BC = 4000	EG = 1089
CG = 1822	CG = 1822

BG = 2178 CE = 2911

BE = 1089

Log. of AB =	3.5563025
Log. of whole sine =	10.0000000
Log. of EB =	3.0370279

Log. of sine of EAB = 9.4807254. The corresponding number to which in the tables is 17° 36'; consequently the angle ABE 7° 14'.

Log. of AC =	3.6532125
Log. of whole sine =	10.0000000
Log. of CE =	3.4640422

Log. of sine of EAC = 9.8108297: to which the correspondent number in the tables is 40° 18'; therefore ACE 49° 42'; and CAB 57° 54'.

**Solution of right-angled spherical TRIANGLES, by the common rules.**—In a right-angled spherical triangle, any two parts beside the right-angle being given, to find any of the rest.

1. Consider whether the parts which come to the question, be conjunct or disjunct; (see PART.) If the disjunct be opposite to each other; as, if the hypotenuse BC, and the angle C (fig. 31.) be given, to find the opposite leg AB; then the rule is:—As the whole sine is to the sine of the hypotenuse BC; so is the sine of the angle C, to the sine of the opposite leg AB. 2. If the disjunct parts be not opposite to each other; as, if AB, and the adjacent angle B be given for the opposite angle C; the sides of the triangle are to be continued one way, till they become quadrants, that you may thus have a new triangle, wherein the parts that come into the question are mutually opposite to each other; as, in our case, the triangle EBF, wherein we have given BF, the complement of the leg AB, and the angle B for EF, the complement of the angle C. The rule then is:—As the whole sine is to the sine of BF; so is the sine of the angle B to the sine EF, or co-sine of C.

3. If the hypotenuse be not among the conjunct parts, as if the legs AB and AC be given for an angle opposite to one of them; the rule is:—As the sine of AC is to the whole sine; so is the tangent of AB, to the tangent of C.

4. But if the hypotenuse be found among the conjunct parts, as if the hypotenuse BC and the angle C be given to find the adjacent side AC; the sides of the triangle are to be continued one way till they become quadrants, that we may have a new triangle,

*triangle*, wherein the hypotenuse is not among the parts that come into the question; *e. g.* in our case, the *triangle* EBF, wherein are given the complement EB of the hypotenuse BC, and the complement of the angle C, and the angle F the complement of the leg AC. Since then, in the *triangle* EBF, the hypotenuse does not come in the question, the rule is as before:

As the sine of EF, or co-sine of C, is to the whole sine; so is the tangent of EB, or co-tangent of BC, to the tangent of F, or co-tangent of AC.

5. When the sides of a *triangle* are to be continued, it is the same thing which way soever they be produced, provided no acute angle come into the question, otherwise the sides are to be continued through the other oblique one. If both be in the connection, the sides are to be continued through that adjacent to the side in question.

By this means a *triangle* is always obtained wherein the thing required is found, either by the rule of sines or tangents.

*Solution of right-angled spherical TRIANGLES, by one catholic rule.*—Consider, as before, whether the parts that come in question be conjunct or disjunct. See PART.

If either one, or both the sides, including the right-angle, come into the question; for it, among the data, write its complement to a quadrant.—Since then by the catholic rule, delivered under the article trigonometry, the whole sine, with the sine complement of the middle part, is equal to the sines of the disjunct parts, and the co-tangents of the conjunct parts; from the sum of those data subtract the third datum; the remainder will be some sine or tangent, the side or angle corresponding to which, in the artificial canon of *triangles* is the side or angle sought.

This universal rule being of great service in trigonometry, we shall apply it to the various cases thereof, and illustrate it with examples; which examples, in the case of disjunct or separate parts will at the same time illustrate the common method, but in the case of contiguous parts admits of other solutions.

1. Given the hypotenuse BC 60° and the angle C 23° 30', to find the opposite leg AB (*fig. 22.*)—Since AB is the middle part, C and BC are disjunct, (see PART;) the whole sine, with the co-sine of the complement AB, *i. e.* with the sine itself of AB, is equal to the sines of C and BC.

Therefore from sine of C 96006997  
Sine of BC 99375306

Sum 195382303

Subtract whole sine 100000000

Remain sine of AB 95382303. The corresponding number to which, in the canon, 20° 12' 6".

2. Given the hypotenuse BC 60°, and the leg AB 20° 12' 6", to find the opposite angle C.—It is evident from the preceding problem, that from the sum of the whole sine, and the sine of the leg AB, the sine of the hypotenuse BC is to be subtracted, the remainder is the sine of the angle C. The example therefore of the former case is easily converted into an example of this.

3. Given the leg AB 20° 12' 6", and the opposite angle C 23° 30', to find the hypotenuse BC.—It is evident from the first case, that from the sum of the whole sine, and the sine of AB is to be subtracted the sine of the angle C, and the remainder is the sine of the hypotenuse BC.

4. Given the hypotenuse BC 60°, and one leg AB 20° 12' 16", to find the other leg.—Since BC is a mean part, and AB and AC are disjunct parts, the whole sine, with the co-sine of the hypotenuse BC, are equal to the sines of the complements; *i. e.* to the co-sines of the legs AB and AC.

Therefore from the whole sine 100000000  
Co-sine of BC 96989700

Sum 196989700

Subtract co-sine of AB 99724279

Remains co-sine of AC 97265421. The corresponding number to which, in the canon, is 32° 11' 34"; therefore AC 57° 48' 26".

5. Given the legs AC 57° 48' 26", and AB 20° 12' 6", to find the hypotenuse BC.—It is evident from the preceding case, that the whole sine is to be subtracted from the sum of the co-sines of the legs AB and AC; the remainder is the co-sine of the hypotenuse BC. The example, therefore, of the preceding case is easily applied to this.

6. Given the leg AC 57° 48' 26", and the adjacent angle C 23° 30', to find the opposite angle B.—Since B is a middle part, and A and C disjunct parts; the whole sine, with the co-sine of B, is equal to the sine of C, and the sine of the complement; *i. e.* to the co-sine of AC.

Therefore from the sine of C 96006997  
Co-sine AC 97265421

Sum 193272418

Subtract whole sine 100000000

Remains co-sine of B 93272418. The number cor-

responding to which, in the canon, is 12° 15' 56"; therefore B 77° 44' 4".

7. Given the leg AC 57° 48' 26", and the opposite angle B 77° 44' 4", to find the adjacent angle C.—It is evident from the preceding case, that the co-sine of AC is to be subtracted from the sum of the whole sine, and the co-sine of B; the remainder is the sine of C. The former example, therefore, is easily accommodated to the present case.

8. Given the oblique angle B 77° 44' 4", and C 23° 30', to find the leg adjacent to the other AC.—From problem the sixth it is evident, that the sine of C is to be subtracted from the sum of the whole sine, and the co-sine of B; and that the remainder is the co-sine of AC. The example of the sixth problem is easily applied to this.

9. Given the leg AC 57° 48' 26", and the adjacent angle C 23° 30', to find the opposite leg AB.—Since AC is a mean part, and C and AB conjunct parts; the whole sine, with the sine of AC, is equal to the co-tangent of C, and the tangent of AB.

Therefore from the whole sine 100000000  
Sine of AC 99275039

Sum 199275039

Subtract co-tangent of C 103616081

Remains tangent of AB 95658058. To which the corresponding number in the canon is 20° 12' 6".

10. Given the leg AB 20° 12' 6", and the opposite angle C 23° 30', to find the adjacent leg AC.—From the sum of the co-tangent of C, and the tangent of AB, subtract the whole sine; the remainder is the sine of AC.

11. Given the legs AB 20° 12' 6", and AC 57° 48' 26", to find the angle C, opposite to one of them.—From the sum of the whole sine, and sine of AC, subtract the tangent of BA; the remainder is the co-tangent of C.

12. Given the hypotenuse BC 60°, and the oblique angle C 23° 30', to find the adjacent leg AC.—Since C is a middle part, and BC and AC conjoint parts; the whole sine, with the co-sine of C, will be equal to the co-tangent of AC.

Therefore from whole sine 100000000  
Co-sine of C 99623978

Sum 199623978

Subtract co-tangent of BC 97614394

Remains tangent of AC 102009584. The number corresponding to which, in the tables, is 57° 48' 26".

13. Given the leg AC 57° 48' 26", and the adjacent angle C 23° 30', to find the hypotenuse BC.

From the sum of the whole sine, and the co-sine of C, subtract the tangent of AC; the remainder is the co-tangent of BC.

14. Given the hypotenuse BC 60°, and the leg AC 57° 48' 26", to find the adjacent angle C.

From the sum of the co-tangent of BC, and tangent of AC, subtract the whole sine; the remainder is the co-sine of C.

15. Given the hypotenuse BC 60°, and one angle C 23° 30', to find the other B.

Since BC is the middle part, and B and C disjunct parts, the whole sine, with the co-sine of BC will be equal to the co-tangents of B and C.

Therefore from whole sine 100000000  
Co-sine of BC 96989700

Sum 196989700

Subtract co-tangent of C 103616081

Remains co-tangent of B 93372719. The corresponding number to which, in the canon, is 12° 15' 56"; therefore B is 77° 44' 4".

16. Given the oblique angles B 77° 44' 4", and C 23° 30', to find the hypotenuse BC.—From the sum of the co-tangents of C and B, subtract the whole sine; the remainder is the co-sine of BC.

*Solution of oblique-angled spherical TRIANGLES.*—I. In an oblique-angled spherical triangle ABC (*Tab. Trigonometry, fig. 32.*) two sides AB and BC being given, together with an angle A, opposite to one of them, to find the other C: the rule is;

As sine of the side BC, is to the sine of the opposite angle A; so is the sine of the side BA, to the sine of the opposite angle C.

Suppose, for example, BC 39° 29', A 43° 20', BA 66° 45'; then will

Sine of BC 98033572

Sine of A 98364771

Sine of BA 99632168

Sum 197996939

Sine of C 99963367

The corresponding number to which, in the tables, is 82° 34' 7".

2. Given two angles C 82° 34' 7", and A 43° 20', together with the side AB 60° 45', opposite to one of them C; to find the side BC opposite to the other of them A; say, as sine of angle C is to sine of the opposite side AB; so

so is sine of angle A to sine of opposite side BC.—The former example may suffice for the present case.

3. Given two sides AB  $66^{\circ} 45'$ , and BC  $39^{\circ} 29'$ , together with an angle opposite to one of them A  $45^{\circ} 20'$ ; to find the angle included by them B.—Suppose the angle C to be acute, since the other, A, is also acute, the perpendicular BE falls in with the triangle. In the rectangled triangle ABE, therefore, from the given angle A, and side AB, find the angle ABE. Since BE is assumed as a lateral part in the triangle AEB, the angle EBC is a middle part, and the side BC a conjoint part: the co-sine of the angle EBC will be found by subtracting the co-tangent of AB from the sum of the co-sine of the angle ABE, and the co-tangent of BC. If then the angles ABE and EBC be added together, or in case the perpendicular fall without the triangle, be subtracted from each other, you will have the angle required B.

E. gr. Whole sine 10000000  
Co-sine of AB 95963154

Sum 195963154  
Co-tang. of A 100252805

Co-tang. of ABE 95710349. The number corresponding to which in the tables, is  $20^{\circ} 25' 35''$ . AB therefore is  $69^{\circ} 34' 25''$ .

Co-sine of ABE 95428300  
Co-tang. of BC 100141529

Sum 196269829  
Co-tang. of AB 96330085

Co-sine of EBC 99938544. The number corresponding to which in the tables, is  $80^{\circ} 24' 26''$ . Therefore ABC is  $79^{\circ} 9' 59''$ .

4. Given two angles A  $43^{\circ} 20'$ , and B  $79^{\circ} 9' 59''$ , together with the adjacent side AB  $66^{\circ} 45'$ , to find the side BC opposite to one of them.

From one of the given angles B, let fall a perpendicular EB, to the unknown side AC; and in the rectangled triangle ABE from the given angle A, and hypotenuse AB, find the angle ABE; which subtracted from the angle ABC, leaves the angle EBC. But if the perpendicular should fall without the triangle, the angle ABC should have been subtracted from ABE. Since as the perpendicular BE is taken for one of the lateral parts, the middle part in the triangle ABE is the angle B, and the conjoint part AB; in the triangle EBC the middle part is the angle B, and the conjoint part BC; the co-tangent of the side BC is found by subtracting the co-sine of EBA, from the sum of the co-tangent of AB, and the co-sine of EBC.—The example of the preceding case is easily applied to this.

5. Given two sides AB  $66^{\circ} 45'$ , and BC  $39^{\circ} 29'$ , with the angle A opposite to one of them,  $43^{\circ} 20'$ , to find the third side AC.

Letting fall, as before, the perpendicular BE; in the rectangled triangle ABE, from the given angle and hypotenuse AB, find the side AE. Since assuming BE for a lateral part in the triangle AEB, AB is the middle part, and AE the separate part; and in the triangle BEC, BC is the mean part, and EC a disjunct part; the co-sine of EC is found by subtracting the co-sine of AB from the sum of the co-sines of AE and CB. If then the segments AE and EC be added together, or in case the perpendicular fall without the triangle, be subtracted from each other, the side AC will be had.

6. Given two sides AC  $65^{\circ} 30' 46''$ , and AB  $66^{\circ} 45'$ , together with the included angle A  $43^{\circ} 20'$ , to find the third side BC opposite thereto.

Letting fall the perpendicular BE, find, in the rectangled triangle, the segment AE, which subtracted from AC, leaves EC. If the perpendicular fall without the triangle, AC is to be subtracted from AE. Since by assuming the perpendicular BE for a lateral part in the triangle AEB, AB becomes a middle part, and AE a separate part: in the triangle EBC, CB is the middle part, EC a separate part: the co-sine of BC is found by subtracting the co-sine of AE from the sum of the co-sines of AB and EC.

7. Given two angles A  $43^{\circ} 20'$ , and B  $79^{\circ} 9' 59''$ , together with the side CB  $39^{\circ} 29'$ , opposite to one of them, to find the side AB adjacent to both.

Letting fall the perpendicular CD from the unknown angle C, to the opposite side AB; and that falling within the triangle; from the given angle B, and the hypotenuse BC, seek in the rectangled triangle BCD for the segment BD. Since assuming the perpendicular CD for a lateral part in the triangle CDB, DB is the mean part, and the angle B a conjoint part; and in the triangle CDA, AD is the middle part, and the angle A a conjoint part: the sine of the segment AD is found by subtracting the co-tangent of the angle B from the sum of the sine of DB, and the co-tangent of the angle A. If then the segments AD and DB be added, or in case the perpendicular fall without the triangle, be subtracted from each other, the result will be side AB required.

8. Given two sides AB  $66^{\circ} 45'$ , and BC  $39^{\circ} 29'$ , with the included angle  $79^{\circ} 9' 59''$ , to find the angle A opposite to one of them.

Letting fall the perpendicular CD, find the segment BD, as in the preceding problem. This subtracted from AB leaves AD. If the perpendicular fall without the triangle, AB is to be added to DB. And since by assuming the perpendicular CD for a lateral part in the triangle CDB, BD is the middle part, and the angle B a conjoint part; and in the triangle CDA, AD is the middle part, and the angle A a conjoint part: the co-tangent of the angle A is found by subtracting the sine of DB from the sum of the co-tangent of the angle B, and of the sine of AD.

9. Given two angles A  $43^{\circ} 20'$ , and B  $79^{\circ} 9' 59''$ , together with the adjacent side AB  $66^{\circ} 45'$ , to find the angle C opposite to the same.

From one of the given angles B, letting fall the perpendicular BE, to the opposite side AC; in the rectangled triangle ABE, from the given angle A, and hypotenuse AB, we find the angle ABE; which subtracted from ABC, leaves the angle EBC. In case the perpendicular fall without the triangle, ABC is to be subtracted from ABE. Since by assuming BE for a lateral part in the triangle CEB, the angle C is a middle part, and the angle CBE a disjunct part; and in the triangle ABE, the angle A is the middle part, and the angle ABE a disjunct part: the co-sine of the angle C is found by subtracting the sine of the angle ABE, from the sum of the co-sine of the angle A, and the sine of EBC.

10. Given two angles A  $43^{\circ} 20'$ , and C  $82^{\circ} 34'$ , together with a side BA  $66^{\circ} 45'$ , opposite to one of them, to find the other angle.

From the sought angle B let fall a perpendicular BE; and in the right-angled triangle AEB, from the given angle A, and hypotenuse BA, find the angle ABE. Since assuming the perpendicular EB for a lateral part in the triangle ECB, the angle C is the middle part, and the angle CBE a disjunct part; and in the triangle ABE, the angle A is the middle part, and the angle ABE a disjunct part: the sine of the angle EBC is found by subtracting the co-sine of A from the sum of the co-sine of C, and of the sine of ABE. If then ABE and EBC be added, or in case the perpendicular fall without the triangle, be subtracted from each other, the result will be the angle required ABC.

11. Given the three sides, to find an angle opposite to one of them.—I. If one side AC (fig. 16.) be a quadrant, and the leg AB less than a quadrant, find the angle A: continue AB to F, till AF become equal to a quadrant; and from the pole A draw the arch CF, to cut the arch BF at right angles in F. Since in the rectangled triangle CBF, we have given the hypotenuse BC, and the side FB, or its complement AB to a quadrant, we shall find the perpendicular CF, which being the measure of the angle CAB, that angle is found of course.

II. If one side AC be a quadrant, and the other AB greater than a quadrant, seek again the angle A: from AB subtract the quadrant AD, and from the pole A describe the arch CD, cutting the arch CD at right angles in D. Since in the rectangled triangle CDB, the hypotenuse BC, and side DB, or excess of the side AB beyond a quadrant, is given, the perpendicular CD will be found as before, which is the measure of the angle A required.

III. If the triangle be isosceles, and AC=CF, and the angle ACF be required, bisect AF in D, and through D and C draw the arch DC. Since DC is perpendicular to AF, the angles A and F, and ACD and DCF are equal; from the hypotenuse AC, and leg AD, given in the rectangled triangle ACD, we find the angle ACD; the double whereof is the angle required ACF: and from the same data may the angle A or F be found.

IV. If the triangle be scalenous, and the angle A (fig. 32.) be required; from C let fall the perpendicular CD, and seek the semi-difference of the segments AD and DB, by saying, as the tangent of half the base AB is to the tangent of half the sum of the legs AC and CB, so is the tangent of their semi-difference to the tangent of the semi-difference of the segments AD and DB: add then the semi-difference of the segments to the half base, to find the greater segment; and subtract the same from the same for the less. Thus having in the rectangled triangle CAD, the hypotenuse AC, and the side AD, the angle A is found thence. After the same manner is B found in the other CDB, from CB and DB given.

12. Given the three angles A, B and C, to find any of the sides.—Since in lieu of the given triangle, another may be assumed, whose sides are equal to the given angles, and the angles to the given sides; this problem is resolved after the same manner as the preceding one.

TRIANGLE, TRIANGULUM, in astronomy, a name common to two constellations; the one in the northern hemisphere, called simply *triangulum*, or *triangulum caeleste*; the other in the southern hemisphere, called *triangulum australe*. See CONSTELLATION.

The

The stars in the northern triangle in Ptolemy's catalogue are 4; in Tycho's as many; in the Britannic 24: the longitudes, latitudes, magnitudes, &c. whereof, are as follow:

**TRIANGULAR Compasses**, are such as have three legs or feet, whereby to take off any triangle at once, much used in the construction of maps, globes, &c. See COMPASSES.

**TRIANGULAR Numbers**, are a kind of polygonal numbers; being the sums of arithmetical progressions, the difference of whose terms is 1. See POLYGONAL Number.

Thus—Of arithmetical progress 1 2 3 4 5 6  
are formed triang. numb. 1 3 6 10 15 21.

**TRIANGULAR Quadrant**, is a sector furnished with a loose piece, whereby to make it an equilateral triangle. See SECTOR.

The calendar is graduated thereon, with the sun's place, declination, and other useful lines; and by the help of a string and a plummet, and the divisions graduated on the loose piece, it may be made to serve for a quadrant. See QUADRANT.

**TRIANGULAR Winding Stairs**. See STAIR.

**TRIANGULARIS**, in anatomy, a name given to two muscles, in respect of their figure. See MUSCLE.

The *triangularis pectoris*, which has sometimes the appearance of three or four distinct muscles, arises from the inside of the sternum, and is implanted into the cartilages which join the four lowest true ribs to the sternum.

The action of this muscle is very obscure, since both the origination and insertion are at parts not moveable, but together.—Dr. Drake conjectures it may conduce towards forming the necessary incurvation of the sternum, and by its over-tension in children, while the cartilages are soft, may occasion that morbid acuminatation of the sternum seen in rickety children.—Others suppose it may contract the cavity of the thorax in expiration.

**TRIANGULARIS labii**. See DEPRESSOR labii superioris.

**TRIARI**, in the Roman militia, a kind of infantry, armed with a pike, a shield, a helmet and a cuirass; thus called, because they made the third line of battle.

The *triarii* were also called *postsignani*, because ranged behind the principes who bore the standard in a legion.

Polybius distinguishes four kinds of forces in the Roman army: the first, called *pilati*, or *velites*, were a raw soldiery, lightly armed.—The *hastati* or spear-men were a degree older, and more experienced. The third, called *principes*, princes, were still older, and better soldiers than the second.—The fourth were the eldest, the most experienced, and the bravest: these were always disposed in the third line, as a corps de reserve, to sustain the other two, and to restore the battle, when the others were broken or defeated.

Hence their name of *triarii*: and hence the proverb *ad triarios ventum est*, to shew that one is at the last, and hardest struggle.

**TRIAS Harmonica**, or the *Harmonical TRIAD*, in music, a compound of three radical sounds, heard all together; two whereof are a fifth and a third above the other, which is the fundamental. See CONCORD, &c.

The *triad* is properly a consonance formed of a third and a fifth; which, with the bass, or fundamental sound, makes three different terms, whence the name *trias*.—That of *harmonic* is doubtless given it from that wonderful property of the fifth, which divides itself naturally into two thirds, both excellent, and perfectly harmonical; so that this one sound disposed between two others, makes two thirds at once, and of consequence a double harmony. See FIFTH.

Hence it is, that in *trios*, particularly, this concord is preferred to that which divides the octave into a fifth and a fourth: in regard here, if there be a concord on one side, there is a discord on the other; whereas in the former case the harmony is complete on both sides.

Of the three sounds which compose the *harmonic triad*, the gravest is called the *fundamental*, or *bass*; the acute, *i. e.* that which makes the fifth, and which terminates the concord upwards, is called the *excluded* or *highest* sound; and that which divides the fifth so agreeably into two thirds, is called the *harmonic mean*.

The division of the fifth into two thirds, may be performed two ways, *viz.* 1. Harmonically, when the greater third is lowest, and the less above; in which case the *triad* is perfect and natural.

1. Arithmetically, when the less third is lowest, and the greater above; in which case the *triad* is imperfect and flat. Both are good; but the latter not to be often used.

**TRIBE, TRIBUS**, in antiquity, a certain quantity or number of persons; when a division is made of a city or people into quarters, or districts.

The city of Athens was divided into ten *tribes*.—The Jewish nation into twelve *tribes*, the descendants of the twelve sons of Jacob, *viz.* the *tribes* of Judah, of Reuben, Gad, Asher, Dan, Naphtali, Ephraim, Manasseh, Simeon, Levi, Issachar, Zebulun, and Benjamin.

These, in effect, make thirteen *tribes*, from twelve patriarchs; by reason the posterity of Joseph was divided into two *tribes*, that of Manasseh, and that of Ephraim. See PATRIARCH.—There were ten of these *tribes* that revolted and followed Jeroboam.

The Roman people was at first only divided into three *tribes*; and from this number *three, tres*, it was that the word *tribe, tribus*, took its rise.—This division was accommodated by Romulus, to the several nations he had united: the first consisted of the Albans, the second of the Sabins, and the third of a mixture of fugitives, who came to seek an asylum at Rome.

Servius Tullus, fearing this partition might occasion seditions, divided the inhabitants of Rome by cantons, not by nations, accordingly, he distributed the city into four quarters, or *tribes*; and by reason a great number of citizens had retired into the country about, of those he composed 26 other *tribes*; so that from this time the Roman people consisted of 30 *tribes*. In after-times, the number of *tribes* was increased to 35; but they then ceased to be ranged according to the quarters of the city.—The distribution depended on the censors, who formed their list at discretion, frequently confounding the country *tribes* with those of the city.

A man was never absolutely a Roman citizen, unless he had the *jus tribus*, *i. e.* till he were intitled to the honours of the magistrature, as also to a right of voting in assemblies of the people; and this was what they called *jus quiritium*.—Hence, the inhabitants of the municipal cities were only imperfect citizens, as being of no *tribe*. See MUNICIPAL, and CITIZEN. The freed-men were obliged to purchase this *right of tribe*, which did not otherwise belong to them, though they were citizens of Rome. See LIBERTUS.

The names of the 35 tribes were, 1. the Palatina; 2. the Suburana; 3. the Collina; 4. the Esquilina; 5. the Romilia; 6. the Æmilia; 7. the Crustumina; 8. the Cornelia; 9. the Fabia; 10. the Galeria; 11. the Lemonia; 12. the Mentina, or Menenia; 13. the Ocriculana; 14. the Papiria; 15. the Pollia; 16. the Popilia; 17. the Pupinia; 18. the Sergia; 19. the Veientina; 20. the Voltina; 21. the Claudia; 22. the Stellatina; 23. the Tromentina; 24. the Arnenfis; 25. the Sabatina; 26. the Pomptina; 27. the Publilia; 28. the Mæcia; 29. the Scaptia; 30. the Oufentina; 31. the Falerina; 32. the Anienfis; 33. the Terentina; 34. the Velina; 35. the Quirina. In ancient authors, and inscriptions, we meet with the names of others, *viz.* Pinaria, Sappinia, Camilla, Cestia, Cluentia, &c.

**TRIBRACHYS**, \* in the ancient prosody, a foot of verse, consisting of three syllables, and those all short—as, *Melius*.

\* The word is formed from the Greek, *τρεῖς*, three, and *βραχυς*, short. See FOOT, &c.

Some of the ancients call this foot *trochæus*. See TROCHÆE. **TRIBUCH**, and **TREBUCHET**, a tumbrel, or cucking-stool. See CUCKING-STOOL.

**TRIBUNAL**, *Judgment-seat*, the seat of a judge. See JUDGE. The *tribunal* in a court of justice, is properly the seat or bench whereon the judge, and his associates are placed, for the administration of justice. See BENCH, JUSTICE, &c.

The word is Latin, and takes its origin from a seat raised from the ground, wherein the *tribune* of the Roman people was placed to administer justice. See TRIBUNE.

**TRIBUNAL**, among the ancients, was also a place from whence the people were harangued.

Among the Romans it was an eminence in a temple, or the forum, as that called *pro rostris*, where the people were harangued in *tribes*.

The French architects likewise use the word *tribune* for a gallery or eminence in a church, or other place, wherein the music is placed for a symphony or concert.

**TRIBUNE**, **TRIBUNUS plebis**, in antiquity, a Roman magistrate, chosen out of the commons, to protect them against the oppressions of the great, and to defend the liberty of the people against the attempts of the senate, and consuls.

The *Tribunes of the people*, were first established in the year of Rome 259. The first design of the creation was to shelter the people from the cruelties of usurers, and to engage them to quit the Aventine mount, whither they had retired in displeasure.

Their number, at first, was but two; but the next year, under the consulate of A. Posthumus Aruncius and Cassius Viscellinus, there were three more added; and this number of five was afterwards increased by L. Trebonius to ten.

The appellation *tribune* was given them, by reason they were at first chosen out of the *tribunes* of the army. See the article following.

The *tribunes* were, as it were, the heads and guardians of the people.—They called assemblies of the people when they pleaded; and in those assemblies frequently annulled the decrees of the senate. Nothing could be concluded without their consent, which they expressed by subscribing the letter T at the bottom of the decree. They had it in their power to prevent the execution of any decree, without giving any reason for it, and merely by subscribing *veto*.—They sometimes even called the consuls and dictators to account for their conduct before the people.

Augustus himself was *tribune* for 37 years; Tiberius assumed the same quality; as likewise did his successor, signifying the year of their *tribunate* on their medals and coins: but their design, herein, was only to possess themselves of all the authority, that there might be no body to oppose them. See **TRIBUNICIAN**.

**TRIBUNE**, **TRIBUNUS militum**, or *militaris*, an officer in the Roman army, who commanded in chief over a body of forces, particularly the division of a legion; much the same with our colonel, or the French *metre de camp*. See **LEGION**.

There is some distinction of the *tribunes*, into *laticlavii* and *angusticlavii*: those born of noble families were allowed, after they were made *tribunes* of a legion, to take the *latus clavus*. See **LATUS CLAVUS**.—The rest were only to wear the *angusticlavus*; whence Suetonius takes care to inform us, that his father was *tribunus laticlavius* of the 13th legion.

Over these *tribunes* of legions and cohorts, there were other *tribunes* who commanded in the absence of the consuls, and who were invested with a consular authority.—Budæus will have these to be much the same as the marshals of France, or, at least, lieutenants-general.

Romulus likewise established a *tribune* of the cavalry, *tribunus equitum*, who was the same with the *magister equitum* under the dictators, the first officer after the kings. See **MASTER**.

The *tribunes* of the soldiery were of an elder standing than those of the people; those latter being elected out of the former.—Varro will have it, they were called *tribunes*, because, at first, they were only three in number in each legion, when the legion consisted of three thousand men, taken out of the three tribes then on foot.—In proportion as the legion was increased, the number of *tribunes* was likewise increased to the number of six.

At first, the nomination lay in the general of the army; but in the year of Rome 391, it was appointed, that the people should nominate one part, and the general another: the latter were called *Rufuli*, from Rutilius Rufus, who passed the law. Those chose by the people in the comitia, were called *comitatus*: they were indifferently either patricians or plebeians, and had the same marks of honour as the consuls themselves.—

The *tribune of the pretorian cohorts* was the captain of the guards. See **PRETORIAN**.

**TRIBUNE** was also an appellation given to various other officers; as the, *tribuni ærarii*, *tribunes of the treasury*.—*Tribune of the celeres*, the officer who commanded them.—*Tribuni fabricarum*, those who had the direction of the making of arms.—*Tribuni marinarum*, *tribuni nolanorum*, *tribuni voluptatum*, mentioned in the Theodosian Code, as intendants of the public shows and other diversions.

The title of **TRIBUNE**, **TRIBUNUS**, was also given to the chief of each tribe. See **TRIBE**.

**TRIBUNICIAN**, **TRIBUNICIUS**, a term among antiquaries and medallists.—The *tribunician power* was the dignity, office, or authority of the *tribune* of the people. See **TRIBUNE**. This power was assumed by the emperors, and makes one of the chief titles they bear on their medals: the quality was first introduced by Augustus, to keep the sovereign authority over the other magistrates, without either taking that of dictator or king. Indeed it was offered to Julius Cæsar, but he despised it. Augustus is the first who used it, and his successors followed his example.—They reckon the years of their empire on their medals by those of their *tribunician power*.

This power was sometimes given them for a certain number of years, and sometimes for ever. Sometimes the emperors would communicate the power to such as they associated, or

as they intended to succeed them: and Tiberius held it fifteen years with Augustus. But this practice only obtained till the time of Valerian and Gallienus. After them we only find T. R. P. II. in Claudius; T. R. P. V. in Aurelian; and T. R. P. in Probus.—This, however, is to be understood of medals; for in inscriptions we find it after that time.

Cardinal Noris and F. Pagi have disputed about this *tribunician power*, wherein it consisted.—The first maintains, that it did not at all differ from that of the ordinary *tribunes*, which consisted in three things: 1. In a right of opposing all the acts and resolutions of the other magistrates. 2. In that it rendered their persons sacred and inviolable. 3. In a power of making edicts and laws.

F. Pagi asserts, that it made an addition to the power of the *tribunes*; that the privilege it conferred of making edicts, was more ample than that of the ordinary *tribunes*; besides, that it carried with it a power of convening the senate at pleasure. M. Spanheim is of F. Pagi's opinion: he believes, that the *tribunician power* had much the advantage of the *tribunate*: 1. In that it was peculiar to the patricians, and did not reduce the person who held it to the degree of a plebeian. 2. In that it was not confined to the city of Rome alone, like the other, but extended throughout the empire, as well as the proconsular power, which was usually annexed to it. 3. That the dignity of the *tribunes* was inferior to that of the pretors; whereas the *tribunician power* of the Cæsars conferred, according to Tacitus, a sovereign authority over all magistrates, and rendered such as it was communicated to, equal to the emperors, and even their colleagues in the empire: besides the power of opposing the enterprizes of all the other magistrates, and that it rendered their persons sacred, and gave them a right to assemble and dismiss the senate, which were privileges the *tribunician power* had in common with the *tribunes*.

F. Hardouin thinks we should distinguish two *tribunician powers*; the one civil, the other military; but the proof he brings thereof is very weak.—M. Spanheim says, his distinction is only founded on vain conjectures, none of which deserve notice.

The learned are greatly divided as to the month and day whereon the *tribunician power* commenced: Sigonius and Petavius will have it begin on the 1st of January: others, as Perizonius, on the 5th of the calends of July: M. Toinard on the 4th of the ides of December: Onuphrius, cardinal Noris, F. Pagi, &c. on the day of the emperor's accession to the empire; with this difference, that F. Pagi takes it to be on the 5th of the calends of the month wherein the emperor was proclaimed; and that this day was, for this reason, held sacred among the Romans.

F. Hardouin thinks, that on medals the *tribunician power* commences on the anniversary of the building of Rome, viz. the 11th of the calends of May; excepting on the Greek medals, wherein it begins in September, in regard this month, which began the Greek year, was near the time when the *tribunician power* was first conferred.

Of all these sentiments the most probable is that of Onuphrius, &c. setting aside the restriction of F. Pagi. See M. Spanheim, *Dissert.* 12. tom. 2. p. 429.

**TRIBUTA Comitia**. See the article **COMITIA**.

**TRIBUTARY**, **TRIBUTARIUS**, one who pays tribute to another, in order to live in peace with him, or share in his protection. See **TRIBUTE**.

The republic of Ragusa is *tributary* to the grand Turk; so is the cham of Little Tartary, &c.

**TRIBUTE**, **TRIBUTUM**, a tax, or impost, which one prince or state is obliged to pay to another, as a token of dependance; or in virtue of a treaty, and as a purchase of peace.

The Romans made all the nations they subdued, pay them *tribute*.—Mahomet laid it down as a fundamental of his law, that all the world should pay him *tribute*.

In the states of the grand Signior, Christian children are taken in way of *tribute*, to make agemoglan, janizaries, &c. See **JANIZARY**, **AGEMOGLAN**, &c.

**TRIBUTE** is sometimes also used for a personal contribution, which princes levy on their subjects by way of capitation, or poll-money. See **TAX**.

In this it differs from an *impost*, which is properly what is laid on merchandises. See **IMPOST**.

**TRICENNAL**. See the article **TRENTAL**.

**TRICEPS**, in anatomy, a muscle of the thigh, having three originations, and as many insertions; and which may therefore be conveniently divided into three muscles, all arising from the os pubis, and inserted into the linea aspera of the thigh-bone, whereof they possess the greatest part.—See *Tab. Anat. (Myol.) fig. 1. n. 53. fig. 2. n. 36. fig. 6. n. 36. fig. 7. n. 26.*—They also serve as adductores, and draw the thighs together.

**TRICUSPIDES**, in anatomy, an epithet given to three valves, situate at the entrance of the vena cava into the heart. See **VALVE**.

They open from without inwards, so as to let the blood of the cava pass into the heart, but prevent its reflux into the cava. See **HEART**.

TAB: TRIGONOMETRY.

# TRI

They are thus called from their figure, which is triangular; for which reason they are also called by the Greeks *τριγωνοειδεις*.  
**TRIDENT**, **TRIDENS**, an attribute of Neptune; being a kind of scepter which the painters and poets put in the hands of that god, in form of a spear or fork with three teeth; whence the word. See **SCEPTER**.

The poets tell us, that Neptune makes the earth open, whenever he strikes it with his *trident*.

**TRIDENT**, among mathematicians, is used for a kind of parabola, by which Cartes constructed equations of six dimensions. See **PARABOLA**.

**TRIEMIMERIS**, **ΤΡΙΗΜΙΜΕΡΗΣ**, *Semiteriaria*; a kind of cæfura in Latin verse, wherein, after the first foot of the verse, there remains an odd syllable, which helps to make up the next foot.—As in, *Ille latus niveum molli fultus hyacintho*. See **CÆSURE**.

**TRIENNIAL**, an epithet applied chiefly to offices or employments which last for three years.

Thus we say, a *triennial* government: most regular monasteries have *triennial* superiors; they elect new ones at the end of each three years.

In 1695, an act was made for *triennial* parliaments, i. e. for parliaments which should be dissolved, and the members be elected anew, every three years. Till that time, the king had it in his power to prorogue and continue his parliaments as long as he pleased.—This opened a door to corruption, which the *triennial* bill was intended to prevent.

The *triennial* act has, from some other views, been since repealed: the great struggles usual at elections, the great ferment it usually puts the nation into, the great expences upon that occasion, with other considerations, determined the legislature, in 1717, to change *triennial* parliaments for septennial ones. See **PARLIAMENT**.

**TRIENS**, in antiquity, a copper-money, of the value of one third of an as, which on one side bore a Janus's head, and on the other a water-rat. See **AS**.

This was the piece of money used to be put in the mouths of the deceased, to pay Charon his fare for their passage into another life. See **MONEY**, and **COIN**.

**TRIENS**, or **TRIENTAL**, was also used for a drinking cup; and that which was ordinarily used.—It contained four cyathi. See **MEASURE**.

**TRIERS**. See the article **TRIOURS**.

**TRIFOLIUM**, **TREFOIL**, denotes any three-leaved grass. That most used in medicine is the *trifolium palustre*, or buckbean, which is very detergent, and used with success in scorbutic, rheumatic and scrophulous habits.

The ordinary way of using it is by making a pretty strong infusion of the dried herb, in form of tea.

**TRIGA**, in antiquity, a kind of carr, or chariot, with three horses. See **CARR**, &c.

The *triga*, in reality, was only drawn by two horses; so that it was properly a biga; but it had, besides, a third horse tied to the others, like a led horse, for change. See **BIGA**.—Statius calls the third horse, *equus funalis*; Hesychius, *παρρηος*; and Dionysius Halicarnassicus, *σκιραιοσ*.

We do not find the *triga* on any ancient monument; but it was a long time in use among the Romans, at their ludi circenses.—The Greeks, who first introduced it, soon abandoned it.

**TRIGAMY**, a third marriage; or the state of a person who has been married three times. See **MARRIAGE**.

In the ancient church, *trigamy* was only allowed to such as had no children by their former marriages.

If having children by one or both the former, they married again, after 40 years of age, they were excluded from communion for five years.—If they were only 40 years old, the penance was but four years. See **BIGAMY**.

**TRIGINTAL**. See the article **TRENTAL**.

**TRIGLYPHS**,\* in architecture, a sort of ornaments repeated at equal intervals in the Doric freeze. See **FREEZE**, &c. See also **DITRIGLYPH**.

\* The word is formed from the Greek, *τριγλυφον*, q. d. *three engravings*, from *γλυφα*, *sculps*.

Each *triglyph* consists of two intire gutters, or channels, cut to a right-angle, called *glyphes*, and separated by three interstices, called by Vitruvius *femora*, from each other, as well as from two other half channels which are at the sides.—See *Tab. Archit. fig. 28. lit. γ*. See also **GLYPHE**.

The ordinary proportion of *triglyphs*, is to be a module broad, and one and a half high.—But this proportion, M. le Clerc observes, sometimes occasions ill-proportioned intercolumnations in portico's; for which reason he chuses to accommodate the proportion of his *triglyphs* to that of the intercolumns. See **INTERCOLUMNATION**.

The intervals between the *triglyphs* are called *metopes*. See **METOPÉ**.—Under the channels, or *glyphes*, are placed guttæ, or drops. See **GUTTÆ**.

The *triglyphs* make the most distinguishing character of the Doric order.—Some imagine them originally intended for the conveyance of the guttæ that are underneath them: others fancy they bear some resemblance to a lyre, and thence con-

# TRI

jecture the ornament to have been originally invented for some temple sacred to Apollo. See **DORIC**.

*Capital of a TRIGLYPH*. See the article **CAPITAL**.

**TRIGON**,\* **TRIGONUS**, in geometry, a triangle. See **TRIANGLE**.

\* The word is formed from the Greek, *τριγωνον*, *triangle*.

**TRIGON**, in astronomy, denotes an aspect of two planets, wherein they are 120 degrees distant from each other; called also *trine*. See **TRINE**.

The *trigons* of Mars and Saturn are by astrologers held malefic aspects. See **ASPECT**, and **TRIPPLICITY**.

**TRIGON**, **TRIGONON**, was also a musical instrument, used among the ancients. See **MUSIC**.

The *trigon* was a kind of triangular lyre, invented by Ibycus. See **LYRE**.

**TRIGONOMETRY**, the art of finding the dimensions of the parts of a triangle unknown, from other parts known; or the art whereby, from any three parts of a triangle given, all the rest are found. See **TRIANGLE**.

Thus, e. gr. from two sides AB and AC and an angle B, we find by *trigonometry*, the two other angles A and C with the third side BC, *Tab. Trigonometry, fig. 2*.

The word literally signifies the *measuring of triangles*, formed from the Greek, *τριγωνον*, *triangle*, and *μετρον*, *measure*—Yet does not the art extend to the measuring of the area or surface of triangles, which comes under geometry: *trigonometry* only considers the lines, and angles thereof. See **TRIANGLE**.

*Trigonometry* is of the utmost use in various mathematical arts:—it is by means hereof that most of the operations of geometry and astronomy are performed; without it the magnitude of the earth and the stars, their distances, motions, eclipses, &c. would be utterly unknown.—*Trigonometry* therefore must be owned an art, whereby the most hidden things, and those remotest from the knowledge of men, are brought to light.

A person ignorant hereof can make no great progress in mixed mathematics; but will often be gravelled, even in natural philosophy, particularly in accounting for the phenomena of the rainbow, and other meteors.

*Trigonometry*, or the solution of triangles, is founded on that mutual proportion which is between the sides and angles of a triangle; which proportion is known, by finding the proportion which the radius of a circle has to certain other lines, called *chords*, *sines*, *tangents*, and *secants*. See **RADIUS**, **CHORD**, **SINE**, **TANGENT**, and **SECANT**.

This proportion of the sines and tangents to their radius, is sometimes expressed in common or natural numbers, which constitute what we call the *tables of natural sines, tangents, &c.*—Sometimes it is expressed in logarithms, and in that case constitutes the tables of *artificial sines, &c.* See **TABLE**, &c.

Lastly, sometimes the proportion is not expressed in numbers; but the several sines, tangents, &c. are actually laid down upon lines or scales; whence the *line of sines, tangents, &c.* See **LINE**, and **SCALE**.

*Trigonometry* is divided into *plain* and *spherical*: the first considering rectilinear triangles; and the second spherical ones.—The first is of obvious and continual use in navigation, measuring, surveying, and other operations of geometry. See **MEASURING**, **SURVEYING**, **SAILING**, &c.

The second is only learned, with a view to astronomy and its kindred arts, geography and dialling.—It is generally esteemed exceedingly difficult, by reason of the vast number of cases wherewith it is perplexed; but the excellent Wolfius has removed most of the difficulties. That author has not only shewn how all the cases of rectangled triangles may be solved the common way, by the rules of sines and tangents; but has likewise laid down an universal rule, whereby all problems, both in plain and spherical rectangled triangles, are solved: and even obliquangular triangles he teaches to solve with equal ease.—His doctrine, see under the article **TRIANGLE**.

*Plain TRIGONOMETRY*, is an art whereby, from three given parts of a plain triangle, we find the rest. See **PART**.

The great principle of *plain trigonometry*, is, that in every plain triangle, the sides are, as the sines of the opposite angles.—See this principle applied to the solution of the several cases of plain triangles, under the article **TRIANGLE**.

*Spherical TRIGONOMETRY*, is the art whereby, from three given parts of a spherical triangle, we find the rest. E. gr. whereby from two sides and one angle, we find the two other angles, and the third side. See **SPHERICS**, and **SPHERICAL**.

The principles of *spherical trigonometry*, as reformed by Wolfius, are as follow: 1. In every rectangled spherical triangle, ABC, rectangular at A, the whole sine is to the sine of the hypotenuse, BC (*Tab. Trigonomet. fig. 33.*) as the sine of either of the acute angles, C, is to the sine of the leg, opposite thereto AB; or, the sine of the angle B, to the sine of its opposite leg AC; whence we deduce, that the rectangle of the whole sine into the sine of one leg, is equal to the rectangle of the sine of the angle opposite thereto, into the sine of the hypotenuse.

2. In every right-angled spherical triangle ABC, (fig. 31.) none of whose sides is a quadrant, if the complements of the legs AB and AC to a quadrant, be considered as the legs themselves; the rectangle of the whole sine into the co-sine of the middle part, is equal to the rectangle of the sines of the disjunct parts, or extremes.

Hence, 1. If the sines be artificial, that is, the logarithms of the natural ones; the whole sine, with the co-sine of the middle part, will be equal to the sines of the disjunct parts.—

2. Since, in the rectilinear triangle ABC (fig. 34.) the whole sine is to the hypotenuse BC, as the sine of the angle B or C to the sine of the opposite leg AC or AB: if, instead of the sines of the sides, we take the sides themselves; here, too, the whole sine, with the co-sine of the middle part AC or AB, will be equal to the sine of the disjunct parts B or C and BC; i. e. to the sine of B or C, and BC itself.

This, Wolfius calls *regula sinuum catholica*, or the first part of the catholic rule of *trigonometry*; by means whereof all the problems of either *trigonometry* are solved, when the thing is effected by sines alone.—My lord Napier had the first thought of such a rule; but he used the complements of the hypotenuse BC (fig. 22.) and the angles B and C for the hypotenuse, and angles themselves: so that the tenor of his catholic rules of sines is this:

The whole sine, with the sine of the middle part, is equal to the co-sines of the disjunct, or, as he calls them, opposite parts.—But, in this, that harmony between plain and spherical *trigonometry*, visible in Wolfius's rule, does not appear.

3. In a rectangled spherical triangle ABC (fig. 31.) none of whose sides is a quadrant; as the whole sine is to the sine of the adjacent leg AC; so is the tangent of the adjacent angle C to the tangent of the leg AB.

Whence, 1. as the co-tangent of the angle C, is to the whole sine, as the whole sine is to the tangent of the angle C, so is the sine of AC to the tangent of AB; therefore the co-tangent of the angle C, will be to the whole sine, as the sine of the leg adjacent thereto, AC, is to the tangent of the opposite one AB. 2. The rectangle, therefore, of the whole sine, into the sine of one leg AC, is equal to the rectangle of the tangent of the other leg AB, into the co-tangent of the angle C, opposite to the same. And, in like manner, the rectangle of the whole sine, into the sine of the leg AB, is equal to the rectangle of the tangent of the leg AC into the co-tangent of the angle B.

4. In every right-angled spherical triangle, ABC, none of whose sides is a quadrant; if the complements of the legs AB and AC to a quadrant, or their excesses beyond a quadrant, be considered as the legs themselves; the rectangle of the whole sine, into the co-sine of the middle part, will be equal to the rectangle of the co-tangents, of the conjunct parts.

Hence, 1. If the sines and tangents be artificial; the whole sine, with the co-sine of the middle part, is equal to the co-tangents of the contiguous parts. 2. Since in a rectilinear, right-angled triangle, we use the tangents, when from the legs AB and AC (fig. 34.) given, the angle C is to be found; and in that case the whole sine is to the co-tangent of C, i. e. to the tangent of B, as AB to AC; therefore, also, in a rectilinear triangle, if for the sines and tangents of the sides be taken the sides themselves; the whole sine, with the co-sine of the middle part, i. e. with AC, is equal to the co-tangents of the conjunct parts, i. e. to the co-tangent of C, or tangent of B and the side AB.

This, Wolfius calls *regula tangentium catholica*, and constitutes the other part of the catholic rule of *trigonometry*; whereby all problems in each *trigonometry*, where tangents are required, are solved.

My lord Napier's rule to the like effect, is thus:—That the whole sine, with the sine of the middle part, is equal to the tangents of the contiguous parts.

It is, therefore, a catholic rule, which holds in all *trigonometry*; that in a rectangled triangle (*notatis notandis*, i. e. the complements of the legs AB and AC, being considered as legs themselves, and in rectilinear triangles, the sides themselves being taken for the sines and tangents of the sides.) The whole sine with the co-sine of the mean or middle part is equal to the sines of the disjunct or separate parts, and the co-tangents of the conjunct or contiguous parts.

For an illustration and application of this rule, in the solution of the various cases of spherical triangles. See TRIANGLE.

*Characters in TRIGONOMETRY.* See CHARACTER.

TRIING, or THRIING,\* from the Saxon, *Drihinge*, an extent containing three, or four hundreds, or the third part of a shire, or province. See TITHING.

\* Mr. Thoresby thinks the word ought to be written *Thritbing*. See *Thoresb. Ducatus Leodens.* p. 85.

The word is also used for a court held within that circuit, which was the same with what we now call a *court-leet*, which is above a court-baron, and inferior to the county-court. See COURT, LEET, &c.

TRILLION, in arithmetic, the number of a billion of billions. See NUMERATION.

After billions, we reckon by *trillions*, which makes a class of numeration, and is divided, like the other classes, into three

places: thus we say, *trillions*; *tens of trillions*; *hundreds of trillions*, &c.

TRIM of a ship, is her best posture, proportion of ballast, and hanging of her masts for sailing.

Hence, to find the best way of making a ship sail swiftly, is to find her *trim*.

To TRIM a boat, is to set the passengers so as to keep the boat even on both sides.

TRIMACRUS, or TRIMACER, in the ancient prosody, a foot in verse, consisting of three long syllables. See FOOT.

TRIMILCHI, a name by which the English Saxons called the month of May; because they milked their cattle three times a day in that month.

TRIMMERS, in architecture, pieces of timber framed at right angles to the joints, against the ways for chimneys, and well-holes for stairs.

TRINE dimension, or *threefold dimension*, includes length, breadth and thickness. See DIMENSION.

The *trine* dimension is peculiar to bodies or solids. See BODY, SOLID, &c.

TRINE in *astronomy*, is the aspect or situation of one star with regard to another, when they are distant 120 degrees,—as the arch AB (*Tab. Astronomy*, fig. 3.) which is a third of a circle, and its subtense AB, a side of an equilateral triangle ABC inscribed in the sphere. See ASPECT.

It is also called *trigon*, and signified by the character  $\Delta$ . See TRIGON.

TRINGLE,\* in architecture, a name common to several little square members, or ornaments; as reglets, listels and platbands. See REGLET, LISTEL, &c.

\* The word is French, where it signifies the same.

TRINGLE is more particularly used for a little member fixed exactly over every triglyph, under the plat-band of the architrave; from whence hang down the guttæ or pendant drops. See TRIGLYPH, and GUTTÆ.

TRINITARIANS, a term used very variously, and arbitrarily—frequently it stands as a common name for all heretics who have sentiments on the mystery of the Trinity, different from those of the catholic church. See TRINITY.

Sometimes it is more immediately restrained to some one or other particular class of heretics.—Thus *trinitarians* are frequently confounded with *unitarians*. See UNITARIANS, SOCINIANS, &c.

Sometimes it is even applied to the orthodox themselves, in contradistinction to the *antitrinitarians*, who deny or impugn the doctrine of the Trinity.—Thus the Socinians and others used to call the Athanasians, *trinitarians*. See ANTITRINITARIANS.

TRINITARIANS also denote an order of religious, instituted in honour of the Trinity, for redeeming of Christian captives from the infidels; vulgarly called *mathurins*, and brothers of the *redemption*.

They are clothed in white, and bear on the stomach a cross, partly red and partly blue; by which three colours, white, red and blue, is supposed to be represented, the mystery of the Trinity.

The *trinitarians* make it their business to go and ransom Christians held in slavery in the republics of Algiers, Tunis and Tripoly, and the states of Morocco.—They have a rule peculiar to themselves; though several historians rank them among the observers of the rule of St. Augustin.

The order had its rise in 1198, under the pontificate of Innocent III. The founders were John de Matha and Felix de Valois: the first of Faucon in Provence; the second, not of the royal family of Valois, as some have imagined; but thus called, in all probability, as being a native of the country Valois. Gauthier of Chatillon was the first who gave them a place in his lands to build a convent; which afterwards became the chief of the whole order: Honorius III. confirmed the rule. Urban IV. appointed the bishop of Paris and others to reform them: they did it; and the reform was approved, in 1267, by Clement IV.

This order possesses about 250 convents, divided into thirteen provinces; whereof six are in France, three in Spain, one in Italy, and one in Portugal.—Formerly, there was one in England, another in Scotland, and a third in Ireland.

In the general chapters held in 1573 and 1576, a reform was ordered, and begun some time afterwards by Julian de Nantonville, and Claude Aleph, two hermits of St. Michael, but now permitted by pope Gregory to take the habit of the Trinity; upon which their hermitage was converted into a house of the order.

In 1609, pope Paul allowed them to build new houses, and to introduce the reform into the old ones. In 1635, Urban VIII. by a brief, appointed the cardinal de Rochefoucault to introduce the reform into all the houses of the order; which was done accordingly, by a sentence containing the reform in eight articles; the principal whereof were, that they should observe the primitive rule approved of by Clement IV. should abstain from flesh, use woollen shirts, have mattins at midnight, &c. In 1554, there was also a reform made among those of Portugal.

The habit of the *trinitarians* is different in different countries; and that of the reformed different from the rest.

**Bare-footed TRINITARIANS**, are a reform of this order, made in Spain in a general chapter, held in 1594, where it was resolved, that each province should establish two or three houses, where the primitive rule should be observed, and where the religious should live up to a greater austerity, use coarser cloaths, &c. and yet should have the liberty of returning to their ancient convent when they thought fit.

Dom. Alvares Basan, intending to found a monastery at Valdepeñas, and desiring to have it occupied by bare-footed religious, it was agreed to add nudity of feet to the reform, that the *trinitarians* might have the benefit of that establishment.—The reform afterwards grew into three provinces, and was at length introduced into Poland and Russia, and thence into Germany and Italy.

There are also *bare-footed trinitarians* in France, established by F. Jerom Hallies, who being sent to Rome to solicit the first reform mentioned above; not content therewith, carried it further, and obtained a permission of pope Gregory, to add a coarse habit, and nudity of feet thereto. He began with the convent of St. Dionysius at Rome, and those of Aix in Provence.

In 1670 there were houses enough of this reform to make a province, and accordingly they held their first general chapter the same year.

There are also nuns of the **TRINITARIAN** order, established in Spain by St. John de Matha himself, who built them a convent in 1201.—Those who first took the habit were only oblates, and made no vows; but in 1201 the monastery was filled with real religious, under the direction of the infanta Constanza, daughter of Peter II. king of Arragon, who was the first religious, and the first superior of the order.

There are also bare-footed nuns of this order, established at Madrid about the year 1612, by Frances de Romero, daughter of Julian de Romero, lieutenant-general in the Spanish army. Her design being to found a monastery of bare-footed Augustines, she assembled a number of maids for that end, lodging them, for the time, in a house belonging to the monastery of bare-footed *trinitarians* in the neighbourhood.

Here, attending at the church of those fathers, and being under the direction of F. John Baptist of the conception, their founder, the knowledge of that father, and the services he did them, made them change their resolution of becoming Augustines, and demand of their director the habit of his order, which he gave them.

But the order opposing their design, and refusing to take them under its jurisdiction, they addressed themselves to the archbishop of Toledo, who allowed them to live according to the rule of that order; so that they took the habit a-new in 1612, and began their noviciate.

Lastly, there is a third order of *trinitarians*. See **THIRD ORDER TRINITY**, **TRINITAS**, **TRIAS**, **TRIAD**, in theology, the ineffable mystery of three persons in one God; Father, Son, and Holy Spirit. See **GOD**, **PERSON**, &c.

It is an article in the christian faith, that there is one God, an unity in nature and essence, and a *Trinity* of Persons.—

The term *trinity* implies the unity of three, the unity of three divine persons really different, and the identity of an indivisible nature: the *trinity* is a ternary of divine persons of the same essence, nature, and substance.

Theology teaches, that there is in God one essence, two processions, three persons, four relations, five notions, and the circumcession, which the Greeks call *perichoresis*. Of each whereof we shall enlarge a little.

There is, then, one single essence, one divine nature, which is infinite, eternal, spiritual; which sees all things, which knows all things, which is every where, all-mighty, and which created all things of nothing. See **GOD**.

In this God there are two processions, or emanations, *viz.* that of the Son, and that of the Holy Spirit: the first is called *generation*, and the second *spiration*. See **GENERATION**, &c.

The Son proceeds from the Father by way of knowledge; for God in knowing himself eternally, necessarily, and infinitely, produces a term, an idea, notion or knowledge of himself, and all his adorable perfections, which is called his *Word*, his *Son*, who is equal to him in all things, eternal, infinite, and necessary as his Father.—The Father regards the Son as his *Word*, and the Son has a regard to the Father as his principle: and in thus respecting each other eternally, necessarily, and infinitely, they love each other, and produce an act of their mutual love: the term of that love is the Holy Spirit, who proceeds from the Father and the Son by way of spiration, love, and impulsion; who is also equal in every thing to the Father and the Son. See **FATHER**, **SON**, and **SPIRIT**.

Each divine procession establishes two relations: the one on the side of the principle, or that from whence; and the other on that of the term, or that to which.—Hence, as there are two processions in God, there must be four relations; the paternity, the filiation, the active spiration, and the passive.

The *paternity* is a relation founded in what the school divines

call the notional understanding; in which the Father stands related to the second person, the Son.—The filiation is the relation wherein the second person, *viz.* the Son, refers to the Father. See **PATERNITY**, &c.

The active spiration, is the relation founded in the notional act of the will, whereby the first and second persons regard or refer to the third:—the passive spiration or procession, taken in its strict sense, is the relation whereby the third person regards, and is referred to the first and second.—Hence it appears, that there are in God, four relations, as we have already said, and five notions, as we shall shew hereafter.

Person is defined an individual, reasonable, or intellectual substance; or an intellectual and incommunicable substance. See **PERSON**.

The hypostasis, or substance, is what constitutes the person.—

There are then in the holy *trinity* three persons, Father, Son, and Holy Spirit, which have all things in common, except their relations; whence that axiom in theology comes to have place, in the divine persons there is no distinction where there is no opposition of relation: and hence it follows, that if power be sometimes attributed to the Father, wisdom to the Son, and goodness to the Holy Spirit; or if sins of infirmity or weakness be said to be against the Father, sins of ignorance against the Son, and sins of malice against the Holy Spirit, it is only spoke by way of appropriation, and not of propriety; for all those things are in common: whence that axiom, the works of the holy *Trinity* are common and undivided, (*i. e.* they agree to all the divine persons) but not their productions *ad intra* (as they are called) by reason they are relative.

By appropriation we mean the giving of some common attribute to a certain divine person, on account of some suitability or agreement. Thus, in the scriptures, in the apostles, and the Nicene creed, omnipotence is attributed to the Father, because he is the first principle, and a principle without origin, or higher principle.—Wisdom is attributed to the Son, because he is the term of the divine understanding, to which wisdom belongs: goodness is attributed to the Holy Spirit, as being the term of the will, to which goodness belongs.

Some divines give other reasons of such kinds of attributions and appropriations, *viz.* that it is to stave off those imperfections from the divine persons which are found in the creatures: for created fathers are weak, drooping, and impotent; wherefore to ward off this imperfection from the first person, he is peculiarly said to be *almighty*.

Again, created sons are generally imprudent; wherefore, to remove this imperfection from the second person, he is said to be *wise*, or *eternal wisdom*.

Lastly, great minds or spirits, among created beings, are frequently wicked; wherefore, to remove this imperfection from the third person, *goodness* is attributed to him.

The Father is the first person in the holy *trinity*, by reason the Father alone produces the Word by the way of *understanding*; and with the Word produces the Holy Spirit, by way of *will*.

Here is to be observed, that the Holy Spirit is not thus called from his spirituality, that being common and essential to all three Persons, but from the passive spiration which is peculiar to him alone.

Add, that when one person in the holy *trinity* is called *first*, another *second*, and another *third*, it must not be understood of a priority of time, or of nature, which would imply some dependance; but of a priority of origin and emanation, which consists in this, that one person produces the other in such manner, as that the person which produces cannot be, or be conceived, without that produced.

From these things it follows, that in the holy *trinity* there are five notions (understanding by *notion* the peculiar manner whereby one divine person is distinguished from another.) The notions then whereby the Father is distinguished from the Son and Holy Ghost, are innascibility, and paternity.—That whereby the Son is distinguished from the two other divine persons, is filiation.

Active spiration distinguishes the Father and the Son from the Holy Spirit, and passive spiration is that whereby the Holy Spirit is distinguished from the Father and Son.

The circumcession or perichoresis, is the intimate in-existence of the divine persons, or their mutual in-dwelling in each other: for though they be really distinct, yet are they consubstantial; whence it is that Jesus Christ says in St. John, chap. xiv. *Believe ye not that I am in the Father, and the Father in me?* Identity of essence, which the Greeks call *ousia*, and consubstantiality, with a distinction of persons, are necessary to this circumcession. See **CIRCUMCESSION**.

Many of the heathens seem to have had a notion of a *Trinity*.—Steuch. *Eugub. de Peren. Philos.* lib. 1. cap. 3. observes, that there is nothing in all theology more deeply grounded, or more generally allowed by them, than the mystery of the *trinity*. The Chaldeans, Hebrews, Phœnicians, Greeks, and Romans, both in their writings and their oracles, acknowledged that the supreme being had begot another being from all eternity, which they sometimes called the *Son of God*, some-

times the *Word*, sometimes the *Mind*, and sometimes the *Wisdom of God*, and asserted it to be the Creator of all things. See SON.

Among the sayings of the Magi, the descendants of Zoroaster, this is one; Πάντα ἐγένετο πατρὶ καὶ τῷ παραδόντι δευτέρῳ: *the Father finished all things, and delivered them to the second Mind.*

—The Egyptians called their *trinity*, *hemphra*, and represented it by a globe, a serpent, and a wing disposed into one hieroglyphic symbol.—Kircher, Gale, &c. suppose the Egyptians learned their doctrine of the *trinity* from Joseph, and the Hebrews.

The philosophers, says St. Cyril, owned three hypostases or persons; they have extended their divinity to three persons, and even sometimes used the term *trias*, *trinity*: they wanted nothing but to admit the consubstantiality of the three hypostases, to signify the unity of the divine nature, in exclusion of all triplicity with regard to difference of nature; and not to hold it necessary to conceive any inferiority of hypostases.

In effect, Plato, and some of his followers, speak of a *trinity* in such terms, that the primitive fathers have been accused of borrowing the very doctrine from the Platonic school; but F. Mourgues, who has examined the point, asserts, that nothing can be more stupid, than to suppose the Platonic *trinity* brought into the church; and to have recourse to the Platonism of the fathers to discredit their authority with regard to this dogma. See PLATONISM.

*Friary or Fraternity of the Holy TRINITY*, is a society instituted at Rome by St. Philip Neri in 1548, to take care of pilgrims coming from all parts of the world to that capital, to visit the tombs of St. Peter and St. Paul. See FRATERNITY.

In order to this, they had a house wherein they entertained them for the space of three days, and not only them, but poor people who were on the recovery, and who being turned too hastily out of the hospitals, were exposed to relapses.

It was first set on foot in the church of St. Saviour in Campo, and consisted only of fifteen poor persons, who met in that church the first Sunday of each month, to practise the exercises of piety prescribed by the founder, and to hear the exhortations he there gave.

In 1558 pope Paul IV. gave the fraternity the church of St. Benedict, to which they gave the title of the *Holy Trinity*. Since that time, they have built close by it a very ample hospital for pilgrims, and persons on the recovery.

The fraternity is now very considerable, and most of the nobles of Rome, of either sex, have done it the honour to be members of it.

*Congregation of the Holy TRINITY*, is a congregation of twelve priests established in the hospital of the fraternity just mentioned, to take care of pilgrims and others entertained therein. The frequent change of priests in the hospital occasioning a deal of diversity in the spiritual conduct and instruction of the pilgrims, to render it more uniform, the guardians and administrators established a congregation of twelve priests, who lodge in a quarter of the hospital, as in a monastery, and live there in community.

*Order of the Holy TRINITY*. See TRINITARIAN.

*TRINITY Sunday*, is the next Sunday after Whit-sunday; thus called, because on that day was anciently held a festival (as it still continues to be in the Romish church) in honour of the Holy Trinity.—The observation of this festival was first enjoined by the council of Arles in 1260.

*TRINITY House*, is a kind of college at Deptford, belonging to a corporation of sea-faring persons, who have power, by the king's charter, to take cognizance of such as destroy sea-marks, to correct the faults of sailors, &c. and to take care of several other things belonging to navigation and the seas, the examination of young officers, &c. anno 8<sup>o</sup> Eliz.

*TRINITY Term*. See the article TERM.

*TRINIUMGELD*, or *THRINIUMGILD*, a compensation used among our Saxon ancestors for great crimes, which were not absolved but by paying a fine thrice nine times. See GELD.

*TRINODA necessitas*, in our ancient customs, a three-fold necessary tax, to which all lands were liable, viz. *expeditio*, & *reparatio pontis*, & *arcis*; going to the wars, repairing of bridges, and of castles.

These were the three exceptions anciently inserted in the king's grants of lands to the church, after the words that freed them from all secular service. See PONTAGE.

*TRINODA*, or *TRINODIA terra*, in some ancient writers, denotes a quantity of land containing three perches. See PERCH.

*TRINOMIAL*, or *TRINOMIAL Root*, in mathematics, is a root consisting of three parts, or monomes, connected together by the signs +, or — See ROOT, and SQUARE.

Such is  $x+y+z$ , or  $a+b-c$ . See BINOMIAL.

*TRIO*, in music; a part of a concert wherein three persons sing; or more properly a musical composition consisting of three parts. See COMPOSITION.

*Trios* are the finest kind of composition, and these recitativo's are what please most in concerts. See CONCERT, HARMONY, &c.

*TRIOCTILE*, in astrology, an aspect or situation of two planets with regard to the earth, when they are three octants, or eighth parts of a circle, i. e. 135 degrees distant from each other.

This aspect, which some call the *sesquiquadrans*, is one of the new aspects super-added to the old ones by Kepler. See ASPECT.

*TRIONES*, in astronomy, a sort of constellation, or assemblage of seven stars, in ura minor; popularly called *Charles's Wane*. See URSA minor.

From the *septem triones* the north pole takes the denomination *septentrio*. See NORTH, POLE, &c.

*TRIOURS*, or *TRIEURS*, in law, such as are chosen by the court to examine whether a challenge made to the pannel of jurors, or any of them, be just or no. See JURY.

*TRIP*, a sea term. A ship is said to bear her topails *a-trip*, when she carries them hoisted up to the highest.

*TRIPARTITE*, *TRIPARTITUS*, something divided into three parts, or made by three parties; as, an indenture *tripartite*, &c. See INDENTURE.

*TRIPARTITION*, is a division by three, or the taking the third part of any number, or quantity. See PARTITION, and DIVISION.

*TRIPHTHONGUE*, in grammar, an assemblage or concurrence of three vowels in the same syllable; as in *Quae*. See SYLLABLE.

Quintilian, *lib. I. cap. 6.* asserts, that there never was any syllable of three vowels, but that one of them was always turned into a consonant: Scioppius asserts the contrary:—

However this may be in the Latin and Greek, which were the only languages Quintilian understood, it is certain there are several languages in Europe, wherein *triphthongues* are in use. See DIPHTHONG.

*TRIPLE*, three-fold. See RATIO, and SUB-TRIPLE.

*TRIPLE*, in music, is one of the species of measure, or time. See TIME, and MEASURE.

*Triple time* consists of many different species, whereof there are in general four, each of which has its varieties.—The common name of *triple* is taken hence, that the whole or half measure is divisible into three equal parts, and is beaten accordingly.

The first species is called the *simple triple*, wherein the measure is equal to three semibreves, three minims, three crotchets, three quavers, or three semiquavers; which are marked thus,  $\frac{3}{1}$ , or  $\frac{3}{2}$ ,  $\frac{3}{4}$ ,  $\frac{3}{8}$ ,  $\frac{3}{16}$ ; but the last is not much used, except in church music.

In all these, the measure is divided into three equal parts or times, called thence *triple time*, or the measure of *three times*, whereof two are beat down, and the third up.

The second species is the *mixt triple*: its measure is equal to six crotchets, or six quavers, or six semiquavers, and accordingly marked  $\frac{6}{2}$ , or  $\frac{6}{4}$ , or  $\frac{6}{8}$ ; but the last is seldom used.

The measure here is usually divided into two equal parts or times, whereof one is beat down, and one up; but it may also be divided into six times, whereof the first two are beat down, and the third up; then the next two down, and the last up, i. e. each half of the measure is beat like the *simple triple* (on which account it may be called the *compound triple*;) and because it may be thus divided either into two or six times (i. e. two *triples*) it is called *mixed*, and by some the *measure of six times*.

The third species is the *compound triple*, consisting of nine crotchets, or quavers, or semiquavers, marked  $\frac{9}{2}$ ,  $\frac{9}{4}$ ,  $\frac{9}{8}$ , the first and last are little used; some also add  $\frac{9}{16}$ ,  $\frac{9}{32}$ , which are never used.

Some authors add other two, viz. six semibreves, and six minims, marked  $\frac{6}{1}$  or  $\frac{6}{2}$ ; but these are not in use.

This measure is divided either into three equal parts or times, whereof two are beat down, and one up; or each third part may be divided into three times, and beat like the *simple triple*; on which account it is called the *measure of nine times*.

The fourth species is a compound of the second species, containing twelve crotchets, or quavers, or semiquavers, marked  $\frac{12}{2}$ ,  $\frac{12}{4}$ ,  $\frac{12}{8}$ , to which some add  $\frac{12}{16}$  and  $\frac{12}{32}$ , which are never used; nor are the first and third much used, especially the latter.

The measure here may be divided into two times, and beat one down, and one up; or each half may be divided, and beat as the second species, either by two or three; in which case it will make in all twelve times, and hence is called the *measure of twelve times*.

The French and Italian authors make a great many more species and divisions of *triple time*, unknown, or at least, unregarded by our English musicians, and therefore not so necessary to be dwelt upon here.

*TRIPLE quartan fever*. See the article FEVER.

*TRIPLE Incision*. See the article ENGRAFTING.

*TRIPPLICATE Ratio*, is the ratio which cubes bear to each other. See CUBE.

This ratio is to be distinguished from *triple ratio*, and may be thus conceived.—In the geometrical proportionals 2, 4, 8, 16, 32; as the ratio of the first term (2) is to the third (8) duplicate of that of the first to the second, or of the second to the third: so the ratio of the first to the fourth is said to

to be *triplicate* of the ratio of the first to the second, or of that of the second to the third, or that of the third to the fourth, as being compounded of three equal ratios. See **RATIO**.

**TRIPLICATIO, TRIPLICATION**, in civil law, is the same with sur-rejoinder in common law. See **SUR-REJOINDER**.

**TRIPPLICITY, or TRIGON**, among astrologers, is a division of the signs, according to the number of the elements, each division consisting of three signs. See **SIGN**.

*Triplicity* is frequently confounded with *trine aspect*; though, strictly speaking, the two are very different things: as *triplicity* is only used with regard to the signs; and *trine*, on the contrary, with regard to the planets. See **TRINE**.

The signs of *triplicity* are those which are of the same nature, and not those which are in *trine-aspect*.—Thus Leo, Sagittary and Aries are signs of *triplicity*, because those signs are all supposed fiery.

**TRIPLOIDES**, a surgeon's instrument, with a three-fold basis, used in the restoring great depressions of the skull. *Blanc*. See **TREPANUM**, and **TREPANNING**.

**TRIPOD, TRIPOS**, in antiquity, a famed sacred seat or stool, supported by three feet, whereon the priests and sibyls were placed to render oracles. See **ORACLE**.

It was on the *tripos* that the gods inspired the Pythians with that divine fury and enthusiasm, wherewith they were seized at the delivering their predictions. See **ENTHUSIASM, PYTHIAN, &c.**

M. Spanheim observes, that on Roman medals, the *tripod* expresses some priesthood, or sacerdotal dignity.—A *tripod*, with a raven and a dolphin, is the symbol of the duumviri, deputed for keeping of the sibyllin oracles, and for consulting them on occasion.

**TRIPODIUM**.—In the laws of Hen. I. occurs this passage—*In quibus vero causis triplicem ladam haberet, ferat iudicium tripodii, i. e. 60 solid.* The meaning whereof, according to some, is, that as for a small offence, the composition was twenty shillings; so for a great offence, which was to be purged *triplici lada*, the composition was three times twenty shillings, called *tripodium*.

**TRIPOLI, or TRIPOLY, Terra TRIPOLITANA**, a kind of dry, soft stone, or chalk, of a citron colour, used in polishing the lapidaries, goldsmiths, copper-smiths, and glass-grinders works. See **GLASS, GRINDING, POLISHING, &c.**

Some imagine *tripoli* to be a common stone burnt and calcined by the sulphurous exhalations which happen to be under the mines where it is found: of these mines there are a number in divers parts of Europe, particularly in Italy, where the *tripoli* is very good.—Others, with more probability, take it for a native earth. See **EARTH**.

**TRIPPING**, in heraldry, denotes the quick motion of all sorts of deer, and some other creatures, represented with one foot up, as it were on a trot. See **COUNTER-TRIPPING**. In speaking of lions, they say *passant*, instead of *tripping*. See **PASSANT**.

**TRIPTHONGUE**. See the article **TRIPHTHONGUE**.

**TRIPOTOTES**,\* in grammar, defective nouns, which have only three cases: such is, *fors, fortis, forte*; or *dicas, dicam, dicas*.

\* The word is compounded of *τρις, three*, and *πῶς, case*.

**TRIEME, or TRIEMIS**, in antiquity, a galley with three ranks of oars on a side. See **GALLEY**.

**TRISACRAMENTARIANS, or TRISSACRAMENTARIANS**, an appellation given to a sect in religion, who admit of three sacraments, and no more. See **SACRAMENT**.

There have been several *trissacramentarians* among the protestants, who allowed of baptism, the eucharist, and absolution, for sacraments.—The English are often misrepresented by foreigners as *trissacramentarians*, from an opinion that they allow ordination a sacrament. See **ORDINATION**.

**TRISAGION**,\* or **TRISAGIUM**, in church-history, a hymn wherein the word *holy* is repeated three times. See **HYMN**.

\* The word is Greek, *τρισάγιον*, compounded of *τρις, three*, and *ἅγιος, sanctus, holy*.

The proper *trifagion* is those words *holy, holy, holy, Lord God of sabaoth*, which we read in Isaiah vi. 3. and in the Apocalypse. From these words the church formed another *trifagion*, which is rehearsed in Latin and Greek, in the respective churches, to this effect: *Holy God, holy mighty, holy immortal! have mercy upon us.*

Petrus Fullensis to this *trifagion* added, *ὁ σταυρωθεὶς δι' ἡμᾶς, Thou who wast crucified for us,—have mercy, &c.* thus attributing the passion not to the son alone, but to all the three persons of the trinity, and pronouncing anathema to all such as would not say the same. See **THEOPASCHITE**, and **PATRIPASSIAN**.

The use of the second *trifagion* (exclusive of the addition of Fullen's) began in the church of Constantinople, from whence it passed into the other churches of the east, and afterwards into those of the west.—Damascenus, Codin, Balsamon, and others, say it was in the time of the patriarch Proclus that it was first introduced, and on the following occasion: there being a violent earthquake in the 35th year of the younger Theodosius, the patriarch made a grand procession, wherein, for several hours together, was sung the Kyrie eleison, Lord have mercy upon us. While this was in hand, a child was

taken up into the air, where, it seems, he heard the angels singing the *trifagion* just mentioned. He returned soon after, and told what he had heard: upon which they began to sing that hymn, and the more willingly too, as they attributed the troubles they were then under, to the blasphemies which the heretics of Constantinople uttered against the Son.—Aclepiades, Cedrenus, pope Felix, Nicephorus, &c. relate the same story.

Petrus Fullensis, patriarch of Antioch, and a zealous partisan of Nestorius, endeavoured to corrupt the hymn, by the addition above-mentioned, *who suffered for us*; but in vain: it still subsists in its primitive purity, both in the Latin, Greek, Ethiopic, and Mozarabic offices.

**TRISECTION, or TRISSECTION**, the dividing a thing into three. See **DIVISION, SECTION, &c.**

The term is chiefly used in geometry, for the division of an angle into three equal parts. See **ANGLE**.

The *trisection of an angle* geometrically, is one of those great problems, whose solution has been so much sought by mathematicians for these two thousand years; being, in this respect, on a footing with the quadrature of the circle, and the duplication of the cube angle. See **PROBLEM**.

Several late authors have wrote of the *trisection of the angle*, and pretend to have found out the demonstration thereof; but they have all committed paralogisms. See **ANGLE**.

**TRISMEGISTUS**,\* an epithet or surname given to one of the two Hermes's, or Mercuries, kings of Thebes, in Egypt, who was cotemporary with Moses. See **HERMES**.

\* The word is formed from *τρις, thrice*, and *μεγιστος, greatest*.

Mercury, or Hermes *Trismegistus*, is the latter of the two Hermes's: the former having reigned about the time of the deluge.—They are both of them represented as authors of many arts and institutions of the Egyptians. See **HERMETIC**.

**TRISMOS, ΤΡΙΣΜΟΣ, or ΤΡΙΜΟΣ**, a convulsion of the muscles of the temples, causing the teeth to gnash. See **CONVULSION, &c.**

**TRISOLYMPIONICA**,\* *ΤΡΙΣΟΛΥΜΠΙΟΝΙΚΗΣ*, among the ancients, a person who had thrice bore away the prize at the Olympic games. See **OLYMPIC**.

\* The word is composed of *τρις, tres, three*, *Ολυμπια, Olympic games*, and *νικη, victory*.

The *trisolymphionica*, or *trisolymphionics*, had great privileges and honours allowed them.—Statues were erected to them, of the kind called *iconica*, which were modelled to the size and form of their persons. See **STATUE**.

They were exempted from all taxes and incumbrances, and could never be marked with infamy.

**TRISPAST, or TRISPASTON**, in mechanics, a machine with three pullies; or an assemblage of three pullies, for raising great weights. See **PULLY**.

\* The word is compounded of *τρις, three*, and *σπασω, traho, I draw*.

The *trispaston* is a species of polyspaston. See **POLYSPASTON**.

**TRISSACRAMENTARIANS**. See the article **TRISACRAMENTARIANS**.

**TRISSECTION**, } See the articles { **TRISECTION**.  
**TRISSECTING Compasses**, } **COMPASSES**.

**TRISTRA, or TRUSTRA, or TRISTA**, in our old law-books, an immunity, whereby a man is excused from attending on the lord of a forest, when he is disposed to chase within the forest; so that he cannot be compelled to hold a dog, follow the chase, nor stand at a place appointed, which otherwise he might be, under pain of amercement. *Manw. P. I. p. 86.*

\* *Sint quieti, &c. de Chevagio, Hondpenny, Buckhol, & Tristis, &c. de omnibus misericordiis, &c.*—Privileg. de Semplingham.

**TRISYLLABLE, or TRISSYLLABLE**, in grammar, a word consisting but of three syllables. See **WORD**, and **SYLLABLE**.

**TRITE, TRITH**, in music, the third musical chord, in the system of the ancients. See **CHORD**.

There are three strings under this denomination in the ancient diagramma; viz. *trite hyperboleon, trite diazeugmenon*, and *trite synemmenon*. See **DIAGRAM**.

**TRITHEISM**, the opinion of the *tritheists*; or the heresy of believing three Gods. See **GOD**, and **TRINITY**.

*Tritheism* consists in admitting not only of three persons in the Godhead; but of three substances, three essences or hypostases, and three Gods. See **PERSON, HYPOSTASIS, &c.**

Several people, out of fear of giving into *tritheism*, have become sabellians; and several others, to avoid sabellianism, have commenced *tritheists*; so delicate and subtle is the medium. See **SABELLIAN**.

In the famous controversy between Dr. South and Dr. Sherlock, the first is judged to have run into sabellianism, by a too rigorous asserting the unity of a Godhead; and the latter into *tritheism*, by a too absolute maintaining the trinity.

John the grammarian, surnamed Philoponus, lover of labour, is held the author of the sect of the *tritheists*, under the emperor Phocas; at least it appears, he was a zealous advocate thereof.—Leontius and Georgius Pisides wrote against him.

**TRITON**, in poetry, a sea demi-god, held by the ancients to be an officer or trumpeter of Neptune, attending on him, and carrying his orders and commands from sea to sea. See **GOD**.

The poets and painters represent him as half man, half fish, terminating in a dolphin's tail, and bearing in one hand a sea-shell, which served as a trumpet.

Some of the ancients make him the son of Neptune, and the nymph Salacia; Hesiod, of Neptune and Amphitrite; Neumenius in his book *de piscationibus*, makes him the son of Oceanus and Tethys; and Lycophron, the son of Nereus.

But though Hesiod, and the mythologists, only speak of one triton, the poets have imagined several; giving some of them for trumpeters to all the sea-gods, particularly to Neptune and Venus: accordingly they were frequently introduced on the ancient theaters, and in the naumachia.

In effect, the tritons not only officiated as trumpeters in Neptune's retinue; but were also supposed to draw his chariot, i. e. the sea-shell wherein he rode over the waters: as we find in Virgil, *Æneid* X. 209. Ovid. *Metam.* I. 333. and on a medal of Claudius.

The fable of the tritons, no doubt, took its rise from sea or mer-men; for that there are such things as sea-men, would seem a thing scarce to be doubted, after what we have said under the article MER-MAID.

The poets ordinarily attribute to triton the office of calming the waves, and of making tempests cease.—Thus in the 1st of the *metamorphoses* we read, that Neptune desiring to recal the waters of the deluge, commanded Triton to sound his trumpet, at the noise whereof the waters all retired.

**TRITONE**, **TRITONO**, in music, a false concord, consisting of three tones, or a greater third, and a greater tone. See **THIRD**, and **CONCORD**.

Its ratio, or proportion in numbers, is, of 45 to 32. In dividing the octave, we find, on one side, the false fifth, and the tritone on the other. See **OCTAVE**.

The tritone is a kind of redundant fourth, consisting of three tones, whence its name; or, more properly, of two tones, with a greater semitone, and a lesser, as of *ut* to *fa*, sharp; of *fa* to *fi*, flat, &c.—But it is not, as many imagine, a greater fourth; for the fourth is a perfect interval, which does not admit of any majority or minority: nor must the tritone be confounded with the false fifth; for the tritone only comprehends four degrees, viz. *ut*, *re*, *mi*, *fa*, sharp; whereas the false fifth comprehends five, viz. *fa*, sharp, *sol*, *la*, *si*, *ut*: besides, that among the six semitones, which compose the tritone chromatically, there are three greater and three lesser; whereas among the six semitones, which compose the false fifth, there are only two lesser, and four greater. See **FOURTH**, **FIFTH**, &c.

**TRITURATION**,\* **TRITURA**, or **TRITUS**, in pharmacy, grinding; the act of reducing a solid body into a subtile powder, called also *levigation*, *pulverisation*, &c. See **POWDER**, **GRINDING**, **LEVIGATION**, &c.

\* The word is formed from the Latin, *triturare*, to *trab*; of *tero*, I wear, rub, grind.

The trituration of woods, barks, minerals, and other hard and dry bodies, is performed in metalline mortars.

The same term is also applied to the comminuting, bruising, and dividing of humid matters into little parts.—The trituration of moist bodies is performed in marble, or stone mortars, with pestles of wood, glass, ivory, &c.

Trituration, Boerhaave observes, has a wonderful force to dissolve some bodies, and will render them as fluid, as if they were fused by the fire.—Thus, if you grind the powder of myrrh, and salt of tartar together, they will dissolve each other. By rubbing new and bright filings of iron in a mortar, with double their weight of clean sulphur, the iron will be dissolved, so as by diluting it with water to afford the vitriolum martis. See **IRON**, and **VITRIOL**.

Gold long ground in a mortar, with salt of tartar, will yield a kind of tincture; and rubbed with mercury, in a mortar of glass, it intirely dissolves into a purple liquor, and becomes a most powerful medicine.

Dr. Langelotte has wrote a curious treatise of the great effects of trituration in chymistry; and describes a peculiar way he employed to grind gold, whereby he could render it as fluid as the fire does, and make an aurum potable, by the bare motion of a mill. See **GOLD**, and **AURUM**.

That author, in the *Philosophical Transactions*, mentions his way of grinding gold, and describes two engines, or philosophical mills for the purpose, with one of which, in the space of fourteen natural days, he reduced a leaf of gold to a dusky powder, and putting it into a shallow retort placed in a sand-heat, he thence obtained, by gradually increasing the fire, and giving a strong one at last, a few very red drops, which, digested *per se*, or with tartarized spirit of wine, afforded a pure and genuine aurum potable.

The success of this operation, the doctor attributes, in a great measure, to the salt of the air, which, in grinding, plentifully mixes and unites itself with the gold.

**TRITURATION** is also used in medicine, for the action of the stomach, on the food, whereby it is fitted for nutriment. See **STOMACH**, &c.

Some physicians maintain that digestion is performed by trituration, and not by fermentation; or that all the stomach does, is to grind and comminute the food into smaller parts to fit it for nutrition, without any other alteration therein.—See

the article **DIGESTION**, where the doctrine is laid down at large.

This system was much talked of some years ago, being countenanced by Dr. Pitcairn, and others; but seems now much declined.—The doctrine of trituration is not new: Erasistratus maintained it in all its latitude many ages ago; and the moderns have only revived it.

It was first broached in the time of Hippocrates, that is, in a time when anatomy was but little known: and it was this that rendered it current.—An opinion was entertained by some physicians of those times, that the stomach was only the receptacle of the solid or dry foods; that those foods, after having been diluted, and broke in the mouth, were again broke more perfectly in the stomach, and by this means alone were converted into a chyle: but that the drink, by reason of its liquidity, not being subject to be broken, went to the lungs, and not the stomach, where, by reason of its abundance, it would rather have prejudiced the digestion than have aided it.

Hippocrates, we read, in the fourth book of *diseases*, stood up strenuously against an opinion so visibly contrary to reason and experience; and he informs us, that if he gave himself this trouble, it was because the error had already got a good number of partisans.—It could not stand long against the reasons of Hippocrates; and its defeat was followed by the intire ruin of the system of trituration, which had its foundation thereon. But Erasistratus retrieved it again; and the doctrine, after having been supported for some time, fell anew into oblivion; whence some late authors have in vain endeavoured to recover it.

**TRIUMPH**, **TRIUMPHUS**, a ceremony, or solemnity, practiced among the ancient Romans, to do honour to a victorious general, by affording him a magnificent entry into their city. The triumph was the most pompous spectacle known among the ancients: authors usually attribute its invention to Bacchus; and tell us, that he first triumphed upon the conquest of the Indians; and yet this ceremony was only in use among the Romans.

The triumph was of two kinds, the lesser, and the greater.—The lesser triumph was granted upon a victory over some unequal or unworthy enemy; as over pyrates, slaves, &c.—This was called *ovatio*; because the only sacrifices offered herein were sheep. See **OVATIO**.

The greater triumph, called also *curulis*, and simply, the triumph, was decreed by the senate to a general, upon the conquering of a province, or gaining a signal battle.

The order and œconomy of the triumph was thus.—The general having dispatched couriers with tidings of his success, the senate met in Bellona's temple to read the letters:—this done, they sent him the title *imperator*, with orders for him to return, and to bring his victorious troops along with him. When he was arrived near the city, the general and principal officers took oath of the truth of the victory; and the day of triumph was appointed.

The day being arrived, the senate went to meet the conqueror without the gate called *capena*, or *triumphalis*, and marched in order before him to the capitol.—He was richly clad in a purple robe embroidered with figures of gold, setting forth his glorious achievements: his buskins were beset with pearl, and he wore a crown, which at first was only laurel, but afterwards gold: one hand bore a laurel branch, and the other a truncheon. He was drawn in a car or chariot, adorned with ivory and plates of gold, drawn usually by two white horses, though sometimes by other animals; as that of Pompey, when he triumphed over Africa, by elephants: that of Mark Anthony, by lions; that of Heliogabalus, by tygers; that of Aurelian, by deer; that of Nero, by hermaphrodite mares, &c.

At his feet were his children, or, sometimes, on the chariot horses.—It is added, that the public executioner was behind him, to remind him, from time to time, that these honours were transitory, and would not screen him from the severity of the laws, if he should ever be found delinquent.

The cavalcade was led up by the musicians, who had crowns on their heads: after them came several chariots, wherein were plans of the cities and countries subdued, done in relievo: they were followed by the spoils taken from the enemy, their horses, arms, gold, silver, machines, tents, &c. After these came the kings, princes or generals subdued, loaden with chains, and followed by mimicks and buffoons, who insulted over their misfortunes.—Next came the officers of the conquering troops, with crowns on their heads.

Then appeared the triumphal chariot; before which, as it passed, they all along strewed flowers; the music played in praise of the conqueror amidst the loud acclamations of the people, crying, *io triumphe*. See **ACCLAMATION**.

The chariot was followed by the senate clad in white robes, and the senate by such citizens as had been set at liberty or ransomed.

The procession was closed by the priests, and their officers and utensils, with a white ox led along for the chief victim.

In this order they proceeded through the triumphal gate, along the via sacra to the capitol, where the victims were slain.

In the mean time, all the temples were open; and all the altars loaden with offerings and incense: games and combats were

were celebrated in the public places, and rejoicings appeared every where.

What was horrible amidst all this mirth, was, that the captives, when arrived at the forum, were led back to prison and strangled; it being a point of religion with them, not to touch the victims till they had taken full revenge of their enemies.—

The rites and sacrifices over, the *triumpher* treated the people in the capitol, under the portico's, and sometimes in Hercules's temple.

**TRIUMPHAL arch,** } See the articles } **ARCH.**  
**TRIUMPHAL column,** } **COLUMN.**

**TRIUMPHAL crown or garland.** See **CROWN.**—It is said to have been taken from Apollo's crowning his head with a laurel after killing the Delphian serpent.

**TRIUMPHAL gown, toga triumphalis.** See the article **TOGA.**

**TRIUMPHANT Church.** See the article **CHURCH.**

**TRIUMVIR,** one of three persons who govern absolutely and with equal authority in a state.

The word is little used but in the Roman history.—Cæsar, Crassus and Pompey were the first *triumvirs*, i. e. the first who divided the government of the republic among them. See **TRIUMVIRATE.**

There were also other officers, called *triumvirs*, *triumviri*; as the *triumviri capitales*, created in the year of Rome 463, to take care of prisoners, and look to the execution of criminals.

*Triumviri monetales*, who were magistrates created at the same time, to look to the coinage of the money; whence that mark still extant on many ancient coins, **IIIVIRI**.—These officers were very considerable, and chosen out of the knights.—They made part of the *centumviri*. The title they bear on medals is, **IIIVIR AAA FF. triumvir auro, argento, ære flando, feriando**, which signifies that they had the direction of the casting and striking of gold, silver, and brass.

There were also—*triumviri ædibus reficiendis*, officers appointed to look to the reparation of temples:—*triumviri colonis deducendis*, for the conducting and settling of colonies:—*triumviri*, for the raising of troops:—*nocturnal triumviri*, to prevent or extinguish fires:—*triumviri*, to review the forces, &c.

In the Acilian family, we read of one M. Acilius **IIIVIR VALETU**, that is, *triumvir of health*, or a magistrate of health.—M. Spanheim takes him to have been a magistrate established to perform sacrifice to the gods of health, to dedicate their temples, &c.

Onuphrius and Vaillant read *triumvir valetudinis*; Patin, *triumvir valetudinarius*; but M. Spanheim, with much more reason, reads *triumvir valetudo*; in like manner, as on a medal of the Aquilian family, we read **IIIVIR VIRTUS**, signifying, that one M. Aquilius had been made *triumvir*, to repair the temple of virtue, and Acilius that of health.

**TRIUMVIRATE, TRIUMVIRATUS**, an absolute government administered by three persons, with equal authority. See **TRIUMVIR.**

There were two famous *triumvirates* at Rome.—Pompey, Cæsar and Crassus established the first; and Augustus, Mark Anthony, and Lepidus, the second.

This latter *triumvirate* gave the last blow to the liberty of the republic. Augustus having vanquished Lepidus and Anthony, the *triumvirate* sunk into a monarchy. See **MONARCHY.**

**TRIUNE, tres in uno**, three in one; a term sometimes applied to God, to express the unity of the God-head in a trinity of persons. See **TRINITY.**

**TROCHAIC, TROCHAICUS**, in the Latin poetry, a kind of verse consisting of trochees; or wherein that foot predominates; as the iambus does in the iambic. See **IAMBIC**, and **TROCHEE.**

The 18th ode of the 2d book of Horace's odes, consists of strophes of two verses, the first whereof is *trochaic diameter catalectic*; i. e. *trochaic*, composed of three trochees, and a syllable at the end: which some call the *Euripedean trochaic*.

*Non ebur neque aurum—*

*Largiora flagito.*

**TROCHANTER, TROXANTH**, in anatomy, a name given to two apophyses situate in the upper part of the thigh-bone. See **APOPHYSIS.**

The largest, which is above, is called the *great trochanter*; and the smaller, beneath, the *less trochanter*.—See *Tab. Anat. (Osteol.) fig. 7. n. 23. fig. 3. lit. t. and lit. u. fig. 7. n. 24.* See also the article **FEMUR.**

The word literally signifies *rotator*, or *roller*; formed from the Greek, τροχῶν, *roto*, *I run*, *I turn round*.—That appellation was given them by reason they receive the tendons of most of the muscles of the thigh, among which are the obturators, which move it round. See **OBTURATOR.**

**TROCHE, TROCHISCUS**, in pharmacy, a form of medicine, made to be held in the mouth to dissolve gradually.

The *troche* is properly a dry composition, the chief ingredients whereof, after having been brought into a very fine powder, are incorporated with some proper liquor, as distilled waters, wine, vinegar, or mucilages; and reduced into a mass, which

is moulded into little cakes, or balls of any form, at pleasure, and dried in the air, far from the fire.

There are *troches* of various kinds, and for various intentions; as, *purgative, alterative, aperitive, corroborative*, &c. *troches*. Latin authors call them *pastilli, rotulae, placentulae, orbes*, and *orbiculi*; and the English, frequently, *lozenges*. See **LOZENGE, PASTIL, &c.**

The chief *troches* are those of agaric, liquorice, nutmeg, amber, rhubarb, capers, myrrh, roses, camphor, squillæ, vipers, &c.—Those of colocintida, are called *troches of albandal*. from the Arabs, who called colocintida *bandal*.

**TROCHEE, TROCHÆUS**, in the Greek and Latin poetry, a kind of foot, consisting of two syllables, the first long, the latter short:—such are the words *vādē* and *mūjā*. See **FOOT**. The *trochee* is the reverse of the iambus, and has just a contrary effect; the latter being light and sprightly, and the former weak and languid, as all those measures are which move from a long to a short syllable. See **IAMBIC**.

Some call the *trochee, choreus*, because proper for songs and dances. These give the denomination *trochæus* to the tubræchys. *Quint. l. 10. c. 4.*

**TROCHILUS**, in architecture, a hollow member, more usually called by modern architects, *scotia*; and by our English workmen, *casement*.—See *Tab. Archit. fig. 4.* See also the article **SCOTIA**.

**TROCHITÆ, or TROCHITES**, in natural history, a kind of figured fossil stones, resembling plants; vulgarly called *St. Cutbert's beads*. See **FOSSIL**, and **STONE**.

They are usually of an opaque, dark colour, break like flint, glossy and shining, and are easily dissolved in vinegar.—

Their figure is generally cylindrical, sometimes a little tapering, the circumference smooth, and both the flat sides covered with fine radii drawn from a certain hole in the middle to the circumference.—See *Tab. Natural History, fig. 12. n. 1, 2, 3.*

Two or three or more of these *trochitæ*, joined together, constitute what the naturalists call an *entechos*.

The *trochitæ*, or single joints, are so set together, that the rays of one enter into furrows in the other, as in the sutures of the skull.—They are found in great plenty in the bodies of the rocks at Braughton and Stock, two villages in Craven, at all depths under ground; also in Mendip hills, &c. sometimes only sprinkled here and there, and sometimes in large strata or beds of all magnitudes, from the size of the smallest pin; to two inches about.

They are generally found ramous or branchy, larger branches arising from the stem, or cylinder, and smaller from these. The branches being deeply inserted into the stem, the tearing them off leaves great holes therein.

Dr. Lister has discovered a sort of little fragments among them, which he takes to have been the apices of the plants; and another sort, which he supposes to have been the roots.—In effect, the *trochitæ* are generally allowed to be the bodies of rock plants, such as coral is.

Mr. Beaumont, in the *philosophical transactions*, assures us, that he has found that all the cliffs in some mines are made up of these stone-plants, some whereof have been converted into limestone rocks; while in their tender growth; while others becoming spar, compose bodies of that substance: and considering that all the cliffs for a very large circumference in some places consist wholly of these plants, we may say, there have been, and, in all probability, still are, whole fields or forests of these under-ground, as there are of coral in the red sea. See **CORAL**. In the courses between the cliffs, are found of these plants at all stages and degrees of maturity, growing up in the gritty clay, and rooted in the rake-mold stones, many of them of the form and dimensions of a tobacco-pipe, some yet crude or raw clay, others of the consistence of lime-stone, others still harder, with the evident beginnings of circles and sutures, and others full grown, and become perfect spar, which is their point of maturity. See **SPAR**.

The pith continues still white and soft; as the whole plant, no doubt, was at first; and is continually refreshed by the mineral steams and moisture which have free access to it through five hollow slits or feet in the figured roots, or through the mass of clay usually lying under the plain roots.

Nor can it be denied, but these stone-plants have true life and growth.—In the curiosity of their make, they may vie with most of the vegetable kingdom, and are shaped and formed like them, having stem, branches, roots, an inward pith, as likewise joints and runnings in their grit, and sometimes cells to supply the place of veins and fibres; why, then, may not they be allowed as proper vegetations, as other plants?

Indeed, it is highly probable, these rock-plants are lapides sui generis, and not parts of animals or plants petrified, as many authors have imagined.—If the figured roots, whereon they sometimes grow, give any suspicion they might have belonged to an animal, particularly a species of the *stella arborescens*; the trunks clearly evince the contrary, and can never be looked on as parts of an animal: nor are they reducible to any known species of vegetables. Mr. Beaumont tells us, that he has by him above 20 different species of *trochites*, all of them wonderfully

regular, and not to be paralleled by any vegetable he knows of in nature: and it is inconceivable how so many species diffused through many parts of the earth, should come to be lost. See PLANT, PETRIFICATION, CORNU *Ammonis*, &c.

**TROCHLEA**, ΤΡΟΧΑΙΑ, one of the mechanical powers, usually called a *pulley*. See PULLEY.

Hence, the cavity in the bone of the arm or shoulder, whereinto, when the arm is stretched forth, the process of the undermost and lesser of the long bones of the cubitus enters, is also called *trichlea*. See CUBITUS, &c.

**TROCHLEARES**, in anatomy, a name given to the oblique muscles of the eye; because serving to pull the eye obliquely upwards or downwards, as if it turned like a pulley. See OBLIQUUS, and EYE.

**TROCHOID**, \* ΤΡΟΧΟΙΣ, or ΤΡΟΧΟΙΔΕΣ, in geometry, a curve, whose genesis may be thus conceived.—If a wheel or circle be moved with a two-fold motion at the same time, the one in a right line, and the other circularly about its centre: and these two motions be equal, *i. e.* describe two equal lines in the same time: and if in the radius, which at the beginning of the motion, reaches from the centre of the wheel, or the first point of the line which describes the circumference; if, I say, in this radius a point be taken any where except in the centre, this point will describe a curve, one part whereof will be below the line described by the centre, and the other above it.—This line, thus described by the point taken in the radius, is called the *trochoid*.

\* The word is formed from the Greek, τροχός, *wheel*, and εἶδος, *form*.

The right line which joins the two extremities of the *trochoid*, and which is either the path the wheel makes, or a line parallel to that path, is called the *basis of the trochoid*.

The *axis of the trochoid* is the diameter of the wheel, perpendicular to the base in the middle of the motion; or that part of the radius between the *trochoid* and its base.—The point wherein the axis is cut into two parts by the line described by the centre of the wheel, is called the *centre of the trochoid*; the uppermost point of the axis, the *vertex of the trochoid*; and the plane, comprehended between the *trochoid* and its base, the *trochoidal space*.

The *trochoid* is the same with what we otherwise call the *cycloid*; the properties, &c. whereof, see under the article CYCLOID.

**TROGLODYTES**, \* ΤΡΟΓΛΟΔΥΤÆ, in the ancient geography, a people of Æthiopia, said to have lived in caves under-ground.

\* The word is formed of the Greek, τρογλή, *caverna*, and δύω, *subeo*, *I enter*.

Pomp. Mela gives a strange account of the *Trogodytes*.—He says, they did not so properly speak as shriek; that they lived on serpents, &c.—Tzetzes calls them *ichthyophagi*. Montanus takes them to be the same with those called in scripture *Ghananim*. Ptolemy in Strabo will have the name wrote without the *I*, *Trogoditæ*.

**TROGLODYTES** is also an appellation given to a sect of Jewish idolaters. See SECT.

The prophet Ezekiel relates, chap. viii. ver. 8, 9, 10, &c. that God, among other abominations of the Israelites which he set before him, shewed him seventy old men, who with their censers in their hands, adored secretly all kinds of animals and reptiles painted on the wall.

Philastrus, on this vision of the prophet, erects these idolaters into a sect of Israelites, who, hiding themselves under-ground and in caves, adored all kinds of idols: and the editor of Philastrus calls this sect *Trogodytes*, from τρογλή, *a cave*, and δύω, *I penetrate*, as believing, on the credit of Philastrus, that those of this sect hid themselves in caves.

And yet the prophet plainly shews, that it was in secret parts of their houses, and not in subterraneous caverns, that these 70 Israelites idolatized.—The name *Trogodytes*, then, is feigned; so is the sect.

**TROIA**, or **TROJAN games**, *ludi TROJANI*, were games instituted by Ascanius, son of Æneas; and which afterwards passed to the Romans, and were celebrated in the circus by the youth of Rome. See GAMES, and CIRCUS.

One of the number who presided over the solemnity, was called *princeps juventutis*; and was always of one of the first families in Rome. See PRINCE.

At first, it is supposed, they only engaged on foot, and on horseback; because Virgil, who describes these games in the *Æneid lib. 5.* only speaks of horses and cavaliers, without any mention of bigæ and quadrigæ, which were not in use at Rome, till long after Ascanius.—And yet Dion, speaking of Cæsar's games, says, the youth there combated in chariots: but it is thought by some, that these were not the *Trojan games*, but races and combats of a different kind, proper for young people, of a more advanced age.

**TROLLING**, among Anglers.—To *troll*, is to fish for pikes with a rod, whose line runs on a reel. See PIKE-FISHING.

**TRONAGE**, \* ΤΡΟΝΑΓΙΟΝ, an ancient custom or toll paid for the weighing of wool.

\* The word comes from *trona*, an old name for a beam to weigh withal. Hence,

**TRONATOR**, an officer of the city of London, whose business it was to weigh the wool brought into that city. See WEIGHER.

**TRONCONNÉE**, or **TRONCENNE**, in heraldry, denotes a cross or other things cut in pieces and dismembered; yet so as all the pieces keep up the form of a cross, though set at a small distance from one another. See CROSS.

**TRONE weight**, was the same with what we now call *trov-weight*. See WEIGHT.

**TROOP**, a small body of horse, or dragoons, usually about 50; commanded by a captain: answering to a company of foot. See COMPANY, CAPTAIN, SQUADRON, &c.

*Independent TROOP*, is a *troop* that is not imbodyed with, or joined with any regiment. See REGIMENT, GUARD, &c.

To *beat the TROOP*, is the same with beating the assembly. See ASSEMBLY.

*TROOPS of the household*. See the article HOUSEHOLD.

**TROPE**, ΤΡΟΠΟΣ, in rhetoric, a word or expression used in a different sense from what it properly signifies.—Or, a word changed from its proper and natural signification to another, with some advantage. See FIGURE.

As, when we say an *ass*, for a *stupid person*; *thunderbolt of war*, for a *great captain*; to *wash the black-moor white*, for a *fruitless undertaking*.

This change of sense is never to be used, but where it gives a force and dignity, or renders the discourse more significant, weighty and graceful.

It is called *trope*, τροπή, from the Greek, τρέπω, *verto*, *I turn*, *change*, in regard the words are here transferred from the things they properly import, to others which they only import indirectly; and that *tropes* only signify the things they are applied to, by reason of the connexion and relation those things have with those others, whose proper names they are.

This change or inversion is performed various ways; but chiefly four; whence arise four principal *tropes*, *viz.* the metaphora, metonymia, synecdoche and ironia; each whereof, see under its proper article, METAPHORA, METONYMIA, SYNECDOCHE, &c.

Some authors confound *trope*, with figure; but they are very different things.—Most authors, as F. de Colonia, &c. make figure, the genus, and *trope*, a species; defining figure to be any ornament in discourse, whereby it is raised above the common language; and *trope* to be that peculiar kind of ornament which consists in a change of the sense, &c.

But Vossius makes *trope* and figure to be two collateral and independent things; defining *trope* to be the change of the sense, &c. and figure, to be any ornament, except what becomes so by such change, &c. See FIGURE.

'Tis in the *tropes*, principally, that the richness and variety of language consists; and yet those should never be used but to express what could only be represented imperfectly, in common and proper terms.—*Tropes* should always be clear; they are vicious, if they be obscure, or too far fetched. The idea of the *trope* should be so connected with that of the proper name, that they should follow each other; so that in exciting the one, the other should be awakened of course.

Besides the four capital *tropes* above-mentioned, there are several inferior ones.—When the *trope* is too bold, it is called an *hyperbole*; when continued, it is called an *allegory*; when too obscure, an *ænigma*; when it shocks us, or is too remote, a *catachresis*. See HYPERBOLE, ALLEGORY, ÆNIGMA, &c. Add to these, other *tropes*, as the metalepsis, antonomasia and litotes, or extenuation. See METALEPSIS, &c.

Some also refer the six kinds of scoffing or derision to the *tropes*; *viz.* the sarcasm, diafism, charientism, asteism, mycterism and mimesis; but without sufficient reason. See SARCASM, IRONY, &c.

**TROPHY**, \* ΤΡΟΠÆΟΝ, among the ancients, a pile or heap of arms of a vanquished enemy, raised by the conqueror in the most eminent part of the field of battle.

\* The word is formed from the Latin, *trophaum*, or *trophaum*, which Vossius deduces from the Greek, τροπή, *the flight of an enemy*.

The word is also used for an artificial representation of such a pile in marble, stone, or other matter.—Such were the *trophies* of Marius, and Sylla in the capitol, &c.

The ancient *trophies* consist of Greek and Roman arms; and the modern ones of arms of the various nations now in use; as in those insulated ones near Blenheim, in the Fauxbourg S. Antoine, and in the castle of Versailles.—Some are done in basso-relievo, as those of the Trajan column, and the attic of the court of the Louvre.

*Trophies* are likewise frequently exhibited on medals of the emperors, struck on occasion of victories; wherein, besides arms and spoils, are frequently seen, one or two captives by the sides of the *trophy*.

*Trophies*, M. Vaillant observes, were, originally, nothing but trunks of trees, which the victor planted on the most eminent part of the conquered province, and hung them with the spoils of the enemy, to perpetuate the memory of his defeat.

**TROPHY money**, a duty paid annually by the housekeepers in the several counties of England towards providing harness, drums, colours, &c. for the militia. See MILITIA.

TROPICAL

**TROPICAL Year.** See **YEAR**, and **SOLAR**.

**TROPICS, TROPICI**, in astronomy, two immoveable circles of the sphere, drawn through the solstitial points, parallel to the equator. See **CIRCLE**, and **SPHERE**. Such as the circles **ME** and **NL**, *Tab. Astronomy, fig. 52.* See **SOLSTITIAL point**.

The *tropics* may be defined, two circles parallel to the equator, at such distance therefrom, as is equal to the sun's greatest recess from the equator towards the poles; or to the sun's greatest declination; or the obliquity of the ecliptic. See **DECLINATION**, **OBLIQUITY**, &c.

Of the two *tropics*, that drawn through the beginning of cancer **E**, is called the *tropic of cancer*. See **CANCER**. And that through the beginning of capricorn, the *tropic of capricorn*. See **CAPRICORN**.

They have their name from the Greek, τροπή, *turn, conversion*, as being the limits of the sun's way, or declination towards north and south; so that when the sun is arrived at either of them, he turns the other way.

Hence, 1. Since the declination of the ecliptic is the arch **EA** or **LD**; **EN** will be the distance of the *tropics*; which is double the greatest declination.

2. Wherefore if the sun's meridian altitude be observed, both in the winter and summer solstice, and the latter be subtracted from the former, the remainder will be the distance of the *tropics*; half whereof is the greatest declination of the ecliptic. See **ECLIPTIC**, **SOLSTICE**, &c.

**TROPICS**, in geography, are two lesser circles of the globe, drawn parallel to the equator, through the beginnings of cancer and capricorn. See **CANCER**, and **CAPRICORN**.

These *tropics* are in the planes of the celestial *tropics*, and at the distance of 23° 29' from the equator, which is the sun's greatest declination. See **CIRCLE**, and **GLOBE**.

**TROPISTS**, or **TROPICI**, the name of a sect.—St. Athanasius, in his letter to Serapion, gives this appellation to the Macedonians, who were also called *pneumatomachi* in the east, and *patripassians* in the west. See **PNEUMATOMACHI**, &c.

The reason of the name *tropist* was, that they explained the scripture altogether by tropes and figures of speech. See **TROPE**, **ALLEGORY**, **MYSTICAL**, &c.

The Romanists also give the appellation *tropists* to those of the reformed religion; in regard of their construing the words of the eucharist figuratively. See **TRANSUBSTANTIATION**.

**TROPITES, TROPITÆ**, a sect, who, according to Philastrius, maintained that the Word was turned or converted into flesh, or into man. See **INCARNATION**.

This opinion they founded on that passage of St. John, misunderstood; *the Word was made flesh*; as if it imported, that the Word was converted into flesh, and not that he was clothed with our flesh, and our nature.

**TROT**, in the manage, one of the natural paces of a horse, performed with two legs in the air, and two on the ground at the same time, cross-wise, like St. Andrew's cross; and continuing so alternately to raise the hind leg of one side, and the fore leg of the other side at once, leaving the other hind and fore leg upon the ground till the former come down.

In this motion, the nearer the horse takes his limbs from the ground, the opener, the evenner, and the shorter his *trot* will be.—If he takes up his feet slovenly, it is a sign of stumbling and lameness; if he tread narrow, or cross, it betokens interfering or failing; if he tread long, it shews over-reaching; if he steps uneven, it bespeaks toil and weariness.

**TROUBADOURS**, a name anciently, and to this day, given the ancient poets of Provence. See **POETRY**.

Some will have the word borrowed from *trouver*, *to find*, by reason of their inventions; though others take them to have been called *trombadours*, by reason they sung their poems on an instrument called a *trompe* or *trump*.

The poetry of the *troubadours* consisted in sonnets, pastorals, songs, syrventes or satyrs, which were much to their taste; and in tençons, which were love disputes.

Jean de notre Dame, commonly called Nostradamus, a procureur in the parliament of Provence, wrote an ample discourse of these poets.—He makes the number seventy-six.

Pasquier tells us, he had an extract of an ancient book belonging to cardinal Bembo, intitled, *Los noms daquels qui firent tençons & syrventes*, which made their number ninety-six, among which was an emperor, viz. Frederic I. and two kings, viz. Richard I. of England, and a king of Arragon, with a dauphin, several counts, &c. Not that all these had composed intire works in provincial; some of them had not brought forth any thing beyond epigrams.

Petrarch speaks with applause of several *troubadours* in the IVth chapter of the triumph of love.—The Italian poets are said to have borrowed their best pieces from the *troubadours*. Pasquier declares expressly, that Dante and Petrarch are, indeed, the fountains of Italian poetry; but fountains which have their sources in the provincial poetry.

Bouche, in his history of Provence, relates, that about the middle of the XIIth century, the *troubadours* began to be esteemed throughout Europe, and that their credit and poetry was at the highest about the middle of the XIVth. He adds, that it was in Provence that Petrarch learned the art of rhyming, which he afterwards practised, and taught in Italy.

**TROVE**, in law. See **TREASURE trove**.

**TROVER**, in law, an action which a man hath against one that, having found any of his goods, refuseth to deliver them upon demand.

Actions of detinue are frequently turned into actions upon the case *sur trover* and conversion. See **DETINUE**, and **DEPOSITE**.

**TROUGH of the sea**, is the hollow or cavity made between two waves or billows in a rowling sea.

Hence, when a ship lies down there, they say she lies in the *trough of the sea*.

**TROUSSEQUIN**, in the manage, a piece of wood cut arch-wise, raised above the hinder bow of a great saddle, and serving to keep the bolsters firm.

**TROUT coloured**.—A horse is said to be of this colour when he is white, and speckled with spots of black, bay, or sorrel, especially about the head and neck.

**TROUT-fishing**. See **Trout-FISHING**.

**TROY-weight**, anciently called *trone-weight*. See **TRONAGE**, and **WEIGHT**.

**TROY-pound**. See the article **POUND**.

**TRUCE**, \* **TREUGA**, a suspension of arms; or a cessation of hostilities between two parties at war. See **SUSPENSION**, and **ARMISTICE**.

\* The word, according to Menage, &c. comes from the Latin, *treuga*, which signifies the same; and which Caseneuve derives further from the German, *traue* or *treue*, which signifies *trust*.

*Truces* are frequently concluded between princes, in order to come to a peace.—*Truces* of many years serve in lieu of treaties of peace between princes, whose differences cannot be finally adjusted. See **TREATY**.

**TRUCE of God, Treuga Dei**, is a phrase famous in the histories of the XIth century, when the disorders and licences of private wars between particular lords and families, obliged the bishops of France to forbid such violences within certain times, under canonical pains.

Those intervals they called *treuga Dei, treve de Dieu, q. d. truce of God*, a phrase frequent in the councils since that time.

The first regulation of this kind was in a synod held in the diocese of Elno in Roussillon, anno 1027, where it was enacted, that throughout that county, no person should attack his enemy from the hour of nones on Saturday, to that of prime on Monday, that Sunday might have its proper honour: that no body should attack, at any time, a religious priest walking unarmed, nor any person going to church, or returning from the same, or walking with women: that no body should attack a church, or any house within thirty paces around it.—The whole under penalty of excommunication, which, at the end of three months, was converted into an anathema.

**TRUCHMAN, Dragoman, or Dregman**, in the countries of the Levant, an interpreter. See **DRAGOMAN**.

**TRUCK**, in a ship, a square piece of wood at the top of a mast, to put the flag-staff in.—See *Tab. Ship. fig. 1. n. 34, 79, 96, 121, 145. lit. q.*

**TRUCKING**, in commerce. See **PERMUTATION**, **EXCHANGE**, **COMMERCE**, &c.

**TRUCKS**, among gunners, round pieces of wood in form of wheels, fixed on the axel-trees of carriages; to move the ordnance at sea, and sometimes also at land. See **CARRIAGE**.

**TRUE**, something agreeable to the reality of things, or to truth. See **TRUTH**.

In this sense we say, the *true* God, the *true* religion, *true* gold, &c.—in opposition to false, or pretended ones. See **FALSEHOOD**.

**TRUE place** of a planet, or star, in astronomy, is a point of the heavens shewn or pointed out by a right line drawn from the centre of the earth through the centre of the planet or star. See **PLACE**. See also **PLANET**, &c.

In this sense the word stands opposed to *apparent* place, which is that found by a right line drawn from the observer's eye through the centre of the planet or star. See **APPARENT**.

This point in the heavens is referred to the ecliptic or zodiac, by the planets or stars circle of longitude. See **CIRCLE of Longitude**.

TRUE altitude,	} See the articles {	ALTITUDE,
TRUE anomaly,		ANOMALY.
TRUE horizon,		HORIZON.
TRUE asthma,		ASTHMA.
TRUE proposition,		PROPOSITION.
TRUE recovery,		RECOVERY.
TRUE ribs,		RIBS.
TRUE suture,		SUTURE.

**TRUFFLES**, \* *Tubera terræ*, in natural history, a kind of subterraneous vegetable production, not unlike mushrooms. See **MUSHROOM**.

\* The word is formed from the French, *truffe* or *truffle*; of the Latin, *tuber* or *tuberculum*.

The ancient physicians, and naturalists, rank *truffles* in the number of roots, bulbs, or cloves; and define them to be a species of vegetables, without stalks, leaves, fibres, &c. Bradley calls them *under-ground edible mushrooms*, or *Spanish truffles*, and *under-ground deer's balls* or *mushrooms*.

They are produced most in dry chapped grounds, and that, as Pliny says, chiefly after rains and thunder, in autumn.—Their duration

duration he limits to a year.—Their colour is uncertain; some being white, others black, &c.

In Italy, France, &c. they eat them as a great dainty, either fried in slices with oil, salt and pepper, or boiled over and again in their own broth.—The hogs are exceedingly fond of them, and are frequently the means of discovering the places where they are; whence the common people call them *swine-bread*. The modern botanists rank *truffles* in the number of plants; though they want most of the usual parts thereof.—All we know of their growth, is, that they are at first no bigger than a pea, reddish without, and within whitish; and that as they ripen, the white parts grow more dusky and black: only there are still left a number of white streaks, which all terminate at places where the outer coat is cracked, or open: and which, in all probability, are the vessels that convey the nourishment into the *truffles*.

In these vessels is found a whitish matter, which, when viewed with a microscope, appears to be a transparent parenchyma, consisting of vesiculæ; in the middle whereof are perceived little round black grains, separate from each other, supposed to be the seed of the *truffles*. See SEED.

When the *truffles* rot in the ground through excess of ripeness, these grains are the only thing that remain of them; and these are supposed to produce new *truffles*, which grow one after another.

What confirms the opinion of their coming from seed, is, that there have been *truffles* lately discovered in England, and this only in Northamptonshire, and even only in one place thereof, viz. near Rulhton, a place stocked with plants, formerly brought from Languedoc; and it is only since then, that any *truffles* have been there observed: whence it is concluded, that the seed of these *truffles* was brought from France among the roots of the other plants.

These English *truffles* were first discovered by Dr. Hatton.—Dr. Tancred Robinson assures us, they are the true French *truffles*, the Italian *tartuffi* or *tartuffole*, and the Spanish *turmas de tierra*, being not noted by Mr. Ray as ever known on English ground: indeed, he adds, that he has seen them thrice as large at Florence, Rome, &c.

Those observed in England are all included in a studded bark or coat, and the inner substance is of the consistence of the fleshy part of a young chestnut, of a paste colour, a rank or hircine smell, and unsavoury.

By a chymical analysis, *truffles* are found to abound in a volatile alkali salt mixed with oil, upon which their smell, &c. depends. They never rise out of the ground, but are found usually half a foot beneath the surface thereof.

Dr. Hatton has observed several little fibres issuing out of some *truffles*, and insinuating themselves within the soil, which, in all probability, do the office of roots.—The *truffles* grow tolerably globular, as receiving their nourishment all around them; they being to be considered like sea plants encompassed with their food, which they suck in through the pores of their bark or rind. See CORAL.

They are tenderest and best in the spring, though easiest found in autumn; the wet swelling them, and the thunder and lightening disposing them to send forth their scent, so alluring to the swine: hence some of the ancients called them *ceraunia*, q. d. *thunder-stones*.

The depth at which the *truffles* lie, Dr. Robinson observes, is no objection to their being of the vegetable tribe; that being a thing common to several other plants which shoot up stalks, particularly the lathyrus tuberosus, commonly called *chamaebalanus* and *terre glans*, in English *pease*, *earth-nuts*, the roots of our bulbocastanum, &c.

The ancients are exceedingly divided as to the use of *truffles*; some affirming them to be wholesome food, and others pernicious; Avicenna particularly, who will have them to cause apoplexies.—For my own part, says M. Lemery, I am of opinion they have both good and evil effects; they restore and strengthen the stomach, promote the semen, &c. but when used too freely, they attenuate and divide the juices immoderately, and by some volatile and exalted principles, occasion great fermentations, &c. though the pepper and salt they are ordinarily eaten withal, do doubtless contribute greatly to those effects:—Their rich taste is owing to their not putting forth any stalk; in effect, their principles being united, and, as it were, concentrated in a little bulb, must yield a richer and more delicious flavour than if the juices were dispersed by vegetation through the several parts of a common plant.—Some roast the *truffles* under the ashes; others pulverize and mix them in sauces.

TRUG,\* or TRUG-corn, TRUGA frumenti, in our ancient customs, denotes a measure of wheat.

\* Tres trug frumenti vel avenæ faciunt 2 bushels, inter præbendam de Hunderton in ecclesia Heref. M. S. de temp. E. 3.

At Lempster, the vicar has *trug-corn* allowed him for officiating at some chapels of ease, as Stoke and Dockly within that parish.

TRULLIZATION, in the ancient architecture, the art of laying on strata or layers of mortar, gypsum, or the like, with the trowel, in the inside of vaults, cieling, &c.

TRULLUM, a barbarous word, signifying *dome*; chiefly used in the phrase, *council in trullo*. See COUNCIL.

This was a council assembled in the year 680, against the Monothelites, in the dome of the palace of Constantinople, called *trullum*; the name whereof it has retained. It was also called the *Quinifextum*. See QUINISEXTA.

The *trullum* was properly a hall in the palace of the emperors of Constantinople, where they usually consulted of matters of state.\*—The council held therein was the 6th œcumenical or general council, called *in trullo*.

\* The term is formed from the Latin, *trulla*, cup; the hall being so called because vaulted.

TRUMPET,\* a musical instrument, the most noble of all portable ones of the wind kind, used chiefly in war, among the cavalry, to direct them in the service. See MUSIC.

\* The word is formed from the French, *trompette*. Menage derives it from the Greek, τρομπε, *turbo*, a shell anciently used for a trumpet. Du Cange derives it from the corrupt Latin, *trumpa*, or the Italian, *tromba*, or *trombetta*; others from the Celtic, *trompill*, which signifies the same.

It is usually made of brass, sometimes of silver, iron, tin and wood. Moses, we read, made two of silver, to be used by the priests, Numb. x. and Solomon made 200 like those of Moses, as we are informed by Josephus, lib. viii. which shews abundantly the antiquity of that instrument.

The ancients had various instruments of the trumpet kind; as the tubæ, cornua, and litui. See HORN, &c.

The modern trumpet consists of a mouth-piece, near an inch broad, though the bottom be only one third so much.—The pieces which convey the wind are called the *branches*; the two places where it is bent, *potences*; and the canal between the second bend and the extremity, the *pavilion*; the places where the branches take asunder, or are foldered, the *knots*; which are five in number, and cover the joints.

When the sound of the trumpet is well managed, it is of a great compass.—Indeed its extent is not strictly determinable; since it reaches as high as the strength of the breath can force it.—A good breath will carry it beyond four octaves, which is the limit of the usual keys of spinets and organs.

In war, there are eight principal manners of sounding the trumpet: the first, called the *cavalquet*, used when an army approaches a city, or passes through it in a march.—The second the *boute-felle*, used when the army is to decamp or march.—The third is when they found to horse, and then to the standard.—The fourth is the *charge*.—The fifth the *watch*.—The sixth is called the *double cavalquet*.—The seventh the *chamade*.—And the eighth the *retreat*. Besides various flourishes, voluntaries, &c. used in rejoicings.

There are also people who blow the trumpet so softly, and draw so delicate a sound from it, that it is not only used in church music, but even in chamber music: and it is on this account that in the Italian and German music we frequently find parts intitled, *tromba prima*, or I<sup>a</sup>, first trumpet, *tromba II<sup>a</sup>*, *figenda*, III<sup>a</sup>, *terza*, second, third trumpet, &c. as being intended to be played with trumpets.

There are two notable defects in the trumpet, observed by Mr. Roberts in the *philosophical transactions*;—The first is, that it will only perform certain notes within its compass, commonly called *trumpet notes*: the second, that four of the notes it does perform, are not in exact tune. See NOTE.—The same defects are found in the *trumpet marine*; and the reason is the same in both. See TRUMPET MARINE.

TRUMPET MARINE, is a musical instrument consisting of three tables, which forms its triangular body.—It has a very long neck with one single string, very thick, mounted on a bridge, which is firm on one side, but tremulous on the other.—It is struck by a bow with one hand, and with the other the string is pressed or stopped on the neck by the thumb.

It is the trembling of the bridge, when struck, that makes it imitate the sound of a trumpet; which it does to that perfection, that it is scarce possible to distinguish the one from the other.—And this is what has given it the denomination of *trumpet marine*, though, in propriety, it be a kind of monochord.

The *trumpet marine* has the same defects with the trumpet, viz. that it performs none but trumpet notes, and some of those either too flat or too sharp.—The reason, Mr. Fr. Roberts accounts for, only premising that common observation of two unison strings, that if one be struck, the other will move; the impulses made on the air by one string, setting another in motion, which lies in a disposition to have its vibrations synchronous to them: to which it may be added, that a string will move, not only at the striking of an unison, but also at that of an 8th or 12th, there being no contrariety in the motions to hinder each other. See UNISON, and CHORD.

Now in the *trumpet marine* you do not stop close, as in other instruments, but touch the string gently with your thumb, whereby there is a mutual concurrence of the upper and lower part of the string to produce the sound.—Hence it is concluded, that the *trumpet marine* yields no musical sound, but when the stop makes the upper part of the string an aliquot part of the remainder, and consequently of the whole; otherwise the vibrations of the parts will stop one another, and make a sound

suitable

suitable to their motion, altogether confused. Now these aliquot parts, he shews, are the very stops which produce the trumpet notes.

**Harmonical TRUMPET**, is an instrument which imitates the sound of a trumpet, and which resembles it in every thing, excepting that it is longer, and consists of more branches.—'Tis ordinarily called *Jackbut*. See **SACKBUT**.

**Speaking TRUMPET**, is a tube from six to fifteen foot long, made of tin, perfectly strait, and with a very large aperture; the mouth-piece being big enough to receive both lips.

The mouth being applied hereto, it carries the voice to a very great distance, so as it may be heard distinctly a mile; whence its use at sea.

The invention of this trumpet is held to be modern; and is commonly ascribed to Sir Samuel Morland, who called it the *tuba stentorophonica*.—But Ath. Kircher seems to have a better title to the invention; for it is certain he had such an instrument before ever Sir S. Morland thought of his.

Kircher, in his *phonurg.* says, that the tromba published last year in England, he invented 24 years before, and published in his *musurgia*: he adds, that Jac. Albanus Ghibbifius and Fr. Eschinardus, ascribe it to him; and that G. Schottus testifies of him, that he had such an instrument in his chamber in the Roman college, with which he could call to, and receive answers from the porter.

Indeed, considering how famed Alexander the great's tube was, wherewith he used to speak to his army, and which might be heard distinctly 100 stadia or furlongs, it is somewhat strange the moderns should pretend to the invention; the stentorophonic horn of Alexander, whereof there is a figure preserved in the Vatican, being almost the same with that now in use. See **STENTOROPHONIC**.

**Listening, or Hearing TRUMPET**, is an instrument invented by Joseph Landini, to assist the ear in hearing of persons who speak at a great distance, without the assistance of any speaking trumpet. See **HEARING**, and **EAR**.

**TRUMPETER**, in anatomy. See **BUCCINATOR**.

**TRUNCATED** \* *pyramid*, or *cone*, is one whose top or vertex is cut off by a plane parallel to its base. See **PYRAMID**, and **CONE**.

\* The word is formed of the Latin, *truncare*, to cut off a part from the whole; whence also *truncus*, *trunchion*, &c. In heraldry they say *trunked*. See **TRUNKED**.

A *truncated cone*, or the frustum of that body, is sometimes also called a *curly-cone*. See **FRUSTUM**. See also **GAUGING**.

**TRUNCATED roof**. See the article **ROOF**.

**TRUNCHEON**, of the French *troncon*, and the Latin *truncus*; a battoon; or a kind of short staff used by kings, generals, and great officers, as a mark of their command. See **BATTOON**.

**Columns in TRUNCHEONS**. See the article **COLUMN**.

**TRUNDLE**, is a kind of carriage with low wheels, whereon to draw heavy cumbersome burdens.

**TRUNDLE shot**, is an iron shot about 17 inches long, sharp-pointed at both ends, with a round bowl of lead cast upon it, about a hand breadth from each end. See **SHOT**.

**TRUNK**, **TRUNCUS**, the stem, or body of a tree; or that part between the ground and the place where it divides into branches. See **STEM**, **BRANCH**, and **TREE**.

In lopping of trees, nothing is left but the *trunk*. See **PRUNING**, **SHROWDING**, &c.

**TRUNK** is also used for the stump, or that part left over the root in felling.—Large trees when felled, shoot out from the *trunk*, and make a copse or underwood.

'Tis by means of the *trunks* left rotting in the ground, that the wastes in forests are discovered.

**TRUNK**, in anatomy is used for the busto of the human body, exclusive of the head and limbs. See **BUSTO**.

**TRUNK**, *truncus*, is also used for the main body of an artery, or vein; in contra-distinction to the branches and ramifications thereof. See **VEIN**, and **ARTERY**.

The word is particularly applied to certain parts of the aorta and cava.—See *Tab. Anat. (Angeiol.) fig. 5. lit. a.* See also **AORTA**, and **CAVA**.

**TRUNK**, in architecture, is used for the fust, or shaft of a column.—Also, for that part of the pedestal between the base and the cornice, otherwise called the *dye*.—See *Tab. Archit. fig. 24. lit. y.* See also **SHAFT**, **COLUMN**, **PEDESTAL**, **DYE**, &c.

**TRUNK**, is also popularly used for the snout of an elephant: by naturalists called the *proboscis* thereof. See **PROBOSCIS**.

**TRUNK roots**, of a plant, are little roots which grow out of the *trunks* of plants. See **ROOT**.

These are of two kinds, 1. Such as vegetate by a direct descent, the place of their eruption being sometimes all along the *trunk*, as in mints, &c. and sometimes only in the utmost point, as in brambles.

2. Such as neither ascend nor descend, but shoot forth at right-angles to the *trunk*; which therefore, though as to their office they are true roots, yet, as to their nature, are a medium between a *trunk* and a root.

**TRUNKED**, among heralds, is applied to trees cut off at each end, which are said to be *trunked*, or *truncated*. See **TRUNCATED**.

**TRUNNIONS** or **TRUNIONS**, of a piece of ordnance, those knobs or bunches of the gun's metal, which bear her up on the cheeks of the carriage. See **GUN**, **CANNON**, **ORDNANCE**, **CARRIAGE**, &c.

**TRUNNION ring**, is the ring about a cannon, next before the *trunnions*. See **ORDNANCE**.

**TRUSS**, **TRUSSA**, a bundle or certain quantity of hay, straw, &c.

A *truss* of hay is to contain fifty-six pounds, or half an hundred weight; thirty-six *trusses* make a load.—In June and August the *truss* is to weigh sixty pounds, on forfeiture of 18s. *per truss*.

A *truss* of forrage, is as much as a trooper can carry on his horse's crupper.

**TRUSS**, of flowers, is used by florists to signify many flowers growing together on the head of a stalk; as in the cowslip, auricula, &c.

**TRUSS** is also used for a sort of bandage or ligature, made of steel or the like matter, wherewith to keep up the parts in those who have hernias or ruptures. See **HERNIA**, &c.

**TRUSSES**, in a ship, are ropes made fast to the parrels of a yard; either to bind the yard to the mast, when the ship rolls, or to hale down the yards in a storm, &c.

**TRUSSING**, in falconry, is an hawk's raising any fowl or prey aloft, soaring up, and then descending with it to the ground. See **HAWK**, and **FALCONRY**.

**TRUST**. See the article **CESTUI qui trust**.

**TRUSTEE**, one who has an estate, or money put or trusted in his hands for the use of another. See **FIDEI commissum**.

**TRUSTRA**. See the article **TRISTRA**.

**TRUTH**, *veritas*, a term used in opposition to *falsehood*; and applied to propositions which answer or accord to the nature and reality of the thing whereof something is affirmed or denied. See **PROPOSITION**, &c.

Thus, when we say that 4 is the fourth part of twice 8; that proposition is true, because agreeable to the nature of those numbers. See **FALSHOOD**.

*Truth*, according to Mr. Lock, consists in the joining or separating of signs as the things signified by them do agree or disagree one with another.—Now the joining or separating of signs, is what we call making of propositions.—*Truth* then, properly, belongs only to propositions, whereof there are two sorts, mental and verbal; as there are two sorts of signs commonly made use of, viz. ideas and words. See **IDEA**, and **WORD**.

Mental propositions, are those wherein the ideas in our understanding are put together, or separated by the mind perceiving or judging of their agreement or disagreement.

Verbal propositions, are words put together, or separated, in affirmative or negative sentences:—So that proposition consists in joining or separating of signs; and *truth* consists in putting together or separating those signs, according as the things they stand for agree or disagree.

*Truth*, therefore, as well as knowledge, may come under the distinction of *verbal* and *real*; that being only *verbal truth*, where terms are joined according to the agreement or disagreement of the ideas they stand for, without regarding whether our ideas are such as really have, or are capable of having any existence in nature.—But it is then they contain *real truth*, when these signs are joined as our ideas agree; and when our ideas are such, as we know are capable of having an existence in nature; which in substances we cannot know, but by knowing that such have existed. See **SUBSTANCE**.

*Truth* is the marking down in words the agreement or disagreement of ideas, as it is.—*Falsehood* is the marking down in words the agreement or disagreement of ideas, otherwise than it is: and so far as these ideas, thus marked by sounds, agree to their archetypes, so far only is the *truth* real.

The knowledge of this *truth* consists in knowing what ideas the words stand for, and the perception of the agreement or disagreement of those ideas, according as it is marked by those words. See **PROBABILITY**, **EVIDENCE**, &c.

Besides *truth* taken in the strict sense before-mentioned, which is also called *logical truth*, there are other sorts of *truths*; as, **Moral TRUTH**, which consists in speaking things according to the persuasion of our own minds; called also *veracity*.

**Metaphysical, or transcendental TRUTH**, which is nothing but the real existence of things conformable to the ideas which we have annexed to their names. See **KNOWLEDGE**. See also **ERROR**, &c.

In which sense a clock may be said to be *true*, when it answers the idea or intention of the person who made it.

Others will have metaphysical *truth* to consist in the agreement of a thing with the idea thereof in the divine understanding.

**TRUTINA hermetis**, is used among astrologers, for an artificial method of examining and rectifying a nativity, by means of the time of conception. See **HOROSCOPE**.

# T U B

**TRUTINATION**, \* the act of weighing or ballancing a thing. See **WEIGHT**, and **BALANCE**.

\* The word is formed from the Latin *trutina*, a pair of scales.

**TRYAL**. See the article **TRIAL**.

**To TRY**, in the sea language.—A ship is said to *try*, or lie *a-try*, when she has no sails abroad but her main-sail, or mislen-sail.

**TRYPHERA**, \* *Τρυφερα*, in pharmacy, a denomination given to divers medicines especially of the opiate kind.—The great *tryphera* is composed of opium, cinnamon, cloves, and several other ingredients: it is used to fortify the stomach, to stop fluxes, and for some diseases of the womb.

\* The word is formed from the Greek, *τρυφερος*, delicate, on account of their gentle and pleasant operation, or according to others, because they make those who use them rest.

The Saracenic *tryphera*, and Persian *tryphera*, thus called, because first introduced, the one by the Saracens, and the other by the Persians, are both of them gentle purgatives.

**TSCHIRNHAUSIANA quadratrix**. See **QUADRATRIX** *Tschirnhausiana*.

**TUB** is used as a kind of measure, to denote the quantity of divers things.—A *tub* of tea, is a quantity of about 60 pounds. —A *tub* of camphire, is a quantity from 56 to 80 pounds.

**TUBE**, **TUBUS**, pipe, conduit, or canal; a cylinder, hollow within-side, either of lead, iron, wood, glass or other matter, for the air or some other fluid to have a free passage, or conveyance through.

The term is chiefly applied to those used in physics, astronomy, anatomy, &c. On other ordinary occasions, we more usually say *pipe*. See **PIPE**.

In the memoirs of the French academy of sciences, M. Varignon gives us a treatise on the proportions necessary for the diameters of *tubes*, to give precisely any determinate quantities of water.—The result of his piece turns upon these two analogies; that the diminutions of the velocity of water, occasioned by its friction against the sides of *tubes*, are as the diameters; the *tubes* being supposed equally long: and the quantities of water issuing out at the *tubes*, are as the square roots of their diameters, deducting out of them the quantity each is diminished. See **FLUID**, **FOUNTAIN**, **FRICTION**, &c.

For the *tubes* of barometers and thermometers; see **BAROMETER**, and **THERMOMETER**.—For the ascent of liquors in capillary *tubes*; see **ASCENT**, and **CAPILLARY**.

**Alimentary TUBE**. See **DUCT**.

**Fallopian TUBE**. See the article **FALLOPIAN**.

**Stentorophonic TUBE**. See **STENTOROPHONIC**.

**Toricellian TUBE**. See **TORRICELLIAN tube**.

**TUBE**, in astronomy, is sometimes used for *telescope*; but more properly for that part thereof into which the lens's are fitted, and by which they are directed and used. See **TELESCOPE**.

The goodness of the *tube*, being of great importance to that of the telescope: we shall here add its structure.

**The Construction of a Draw-TUBE for a telescope**.—The chief points to be regarded here, are, that the *tube* be not troublesome by its weight, nor liable to warp and disturb the position of the glasses: so that any kind of *tube* will not serve in every case: but

1. If the *tube* be small, 'tis best made of thin brass plates covered with tin, and formed into pipes or draws, to slide within one another.

2. For long *tubes*, iron would be too heavy; for which reason some chuse to make them of paper, thus:—A wooden cylinder is turned, of the length of the paper to be used; and of a diameter equal to that of the smallest draw. About this cylinder is rolled paper, till it be of a sufficient thickness: when one pipe is dry, provide others after the same manner; still making the last serve for a mould for the next, till you have enough for the length of the *tube* desired. Lastly, to the extremes of the draws are to be glewed wooden ferrils, that they may be drawn forth the better.

3. Since paper draws are apt to swell with moist weather, so as to spoil their sliding; and in dry weather to shrink, which renders them loose and tottering: in both which cases, the situation of the lens's is easily disturbed; the best method of making *tubes*, is as follows: glue parchment round a wooden cylinder, and let the parchment be coloured black, to prevent the reflected rays making any confusion. Provide very thin slits of beech, and bending them into a cylinder, glue them carefully to the parchment: cover this wooden case with white parchment, and about its outer extreme make a little ring or ferril: after the same manner make another draw over the former; and then another, till you have enough for the length of the *tube*.

To the inner extremes of each draw, fit a wooden ferril, that the spurious rays striking against the sides, may be intercepted and lost. In those places where the lens's are to be put, it will be proper to furnish the ferrils with female screws. Provide a wooden cover to defend the object-glass from the dust, and putting the eye-glass in its wooden ferril, fasten it by the screw to the *tube*. Lastly, provide a little wooden *tube* of a length equal to the distance the eye-glass is to be from the eye, and fit it to the other extreme of the *tube*.

**TUBER**, or **TUBERCEE**, in botany, a kind of round turgid root, in form of a knob or turnip. See **ROOT**.

# T U M

The plants which produce such roots, are hence denominated *tuberosæ* or *tuberosus plants*. See **TUBEROUS**.

**TUBER** or **TUBEROSITY**, in medicine, is used for a knob or tumor growing naturally on any part; in opposition to tumors which arise accidentally, or from a disease. See **TUMOR**.

The same term is also used for a knot in a tree. See **KNOT**.

**TUBERA Terræ**. See the article **TRUFFLES**.

**TUBERCULES**, **TUBERCLES**, little tumors which suppurate and discharge pus; often found in the lungs. Quinc. See **LUNGS**, and **PHTHISIS**. See also **PHYMA**.

**TUBEROUS**, or **TUBEROSE**, an epithet given to such roots as are round, and consist of an uniform fleshy substance: having neither skin, nor shell.—See **TUBER**, and **ROOT**. Such are the roots of saffron, paiony, &c. See **BULB**.

**TUBILUSTRIUM**, \* in antiquity, a feast or ceremony in use among the Romans.—This denomination was given to the day whereon they purified their sacred trumpets; as also to the ceremony of purifying them.—It was held on the fifth and last day of the feast of Minerva called *quinquatus*, or *quinquatria*, which was performed twice a year.

\* The word is compounded of *tubus*, trumpet, and *lustrum*, I purify.

**TUBULI lactiferi**, in anatomy, is a name used by some writers, for those small tubes through which the milk flows to nipples of the mammæ or breasts. See **MILK**, and **BREAST**.

**TUBULI vermiculares**, a name sometimes used by naturalists, for certain small winding cavities on the outsides of shells. See **SHELL**.

**TUESDAY**. See the article **HOLE Day**.

**TUFT**, a term used by some authors for the bushy part of trees; or that part set with branches, leaves, &c. See **BRANCH**.

**Parallelism of the TUFTS of trees**.—All trees are observed naturally to affect to have their *tufts* parallel to the spot of ground they shadow; an account of which phenomenon, see under the article **PARALLELISM**.

**TUILERIE**, \* or **TYLERY**, a *tile-work*; a large building with a drying-place, covered a-top, but furnished with apertures on all sides, through which the wind having admittance, dries the tiles, bricks, &c. in the shade, which the sun would crack, before they be put in the kiln. See **BRICK**, and **TYLE**.

\* The word is pure French, formed from *tuile*, *tile*.

The garden of the Louvre is called the *Tuileries*, as being a place where tiles were anciently made, &c.—But the term *Tuileries* does not only include the garden; but also a magnificent palace, whose front takes up the whole length of the garden: and hence it is, that they say, the king lodges in the *Tuileries*; the king has quitted the *Tuileries* for a few days, to reside in the Louvre.

The palace of the *Tuileries* is joined to the Louvre by a large gallery, which runs along the banks of the river Seine, and has its prospects thereon.

The *Tuileries* was begun in 1564, by Catherine de Medicis, wife of Henry II. in the time of her regency; finished by Henry IV. and magnificently adorned by Louis XIV.—The garden of the *Tuileries* was much improved by Louis XIII.

**TUMBLER**, a sort of dog, called in Latin, *vertagus*, from his quality of tumbling and winding his body about, before he attacks and fastens on the prey.

These dogs are often less than hounds; being lankier, leaner, and somewhat pricked-eared; and by the form of their bodies, might be called mungrel grey-hounds, if they were a little bigger.

**TUMBREL**, **TUMBRELLUM**, an engine of punishment, which ought to be in every liberty, that has a view of frankpledge, for the correction and cooling of scolds and unquiet women. See **CUCKING-stool**.

**TUMEFACATION**, the act of swelling, or rising into a tumor. See **TUMOR**.

Inflammations and *tumefactions* of the testes, frequently happen in the gonorrhæa; either from the weakness of the vessels, violent motion, unseasonable use of astringents, a neglect of purging, or the like. See **GONORRHÆA**.

**TUMOR** or **TUMOUR**, in medicine, &c. a preternatural rising or eminence on any part of the body.

*Tumor* is defined by the physicians, a solution of continuity, arising from some humor collected in a certain part of the body, which disjoins the continuous parts, insinuates itself between them, and destroys their proper form.

This has given occasion to the Arabs to define a *tumor* to be an indisposition, composed of three kinds of diseases, viz. an intemperature, an ill conformation, and a solution of continuity; all which they comprise under the name *aposthem*, from the Greek, *αποσθημα*. See **APOSTHUME**.

*Tumors* may proceed from various causes.—The mass of blood throwing off or discharging itself of any particular humor, as sometimes happens in the crisis of a fever, pleurisy, empyema, bubo, &c. will give rise hereto.—And according to the nature of the humor so discharged, whether sanguinous, watery, bilious, &c. the *tumor* is different.

Other *tumors* there are, occasioned by flatulency, as the tympany, after the same manner as hydropical *tumors* are occasioned by a collection of the lymphæ, or serum, in a particular part.

# T U M

part.—Ruptures of the intestines, or their starting from their places, will likewise cause a *tumor*. See RUPTURE.

External injuries are another general cause of *tumors*.—Thus a contusion, or a violent stricture of any part, a wound, fracture, dislocation, &c. will make it swell, or rise above its natural level. And the same thing may likewise happen from the bites of venomous creatures, &c. See WOUND, ULCER, CONTUSION, &c.

*Tumors*, properly so called, i. e. *humoral tumors*, or those which contain a fluid matter, arise either from a stagnation, i. e. an obstruction of the passage of some fluid, occasioning a slow congestion, or from the translation or fluxion of an humor from some other part; or from the generation of some new humor. See HUMOUR.

*Tumors* of the first kind are very numerous, and are usually divided, with regard to the particular humors they are filled with, into *phlegmons*, which come from the blood. See PHLEGMON, and BLOOD.—Erysipelas's, which are filled with bile. See ERYSIPELAS, and BILE.—Oedema's, filled with puita. See OEDEMA, and PITUITA.—And scirrhus's, with melancholy. See SCIRRHUS.—To which may be added, flatulencies, filled with wind. See FLATUS, &c.

Of the second kind, are *critical tumors*. See CRITICAL.—And of the third kind, are cancers, ganglions, and all *tumors* contained in a cystis or bag. See CANCER, GANGLION, &c.

*Tumors* also frequently acquire peculiar denominations from the part affected; as, ophthalmia, if in the eye; parotis, about the ears; paronychia, in the fingers, &c. See OPHTHALMIA, &c.

With respect to the cure, all *tumors* are divisible into *simple*, and *compound*, i. e. into such as are of a kindly nature, and go off, or are cured in a reasonable time, by the use of common means, without the appearance of any violent or dangerous symptoms; and such as are more malignant, or prove difficult of cure, and are attended with bad symptoms, and affect the adjacent parts, or the whole body.—When a *tumor* is formed by fluxion, a sudden pain, heat, tension and pulsation are felt in the part, and manifest signs of a fever appear.

In those formed by congestion, the swelling rises slowly, and the pain and other symptoms come on gradually, and prove less violent; unless it happen in the joints, and other of the more sensible parts.

All *tumors*, except those from ruptures, terminate or are removed, either by discussion, suppuration, putrefaction, induration, or translation. See DISCUTIENT, SUPPURATIVE, &c.

When a *tumor* is discussed, the part that was affected, appears relaxed, or reduced to its natural size and figure, and is free from pain and hardness. See DISCUSSION.

When a *tumor* hastens to suppuration, a considerable degree of heat, pain and pulsation is felt in the part; and if the *tumor* be large, or lie deep, a fever generally comes on: when the matter is formed, these symptoms commonly decrease, and sometimes totally vanish. And now, if the situation of the parts permits it, the *tumor* appears drawn to a point, or becomes conical in the middle, or most depending part, where the matter collected commonly proves white.—At this time likewise the *tumor* appears to be more contracted, and the skin of the part more shrivelled or flaccid than before: and now, upon pressure, if the *tumor* be superficial, or by vibrating it between the fingers, the matter may be felt to quash from side to side. See SUPPURATION.

*Tumors* in the fleshy parts of the body, tend to their state, or suppurate, faster than *tumors* in the joints, glands, &c.

When a *tumor* is resolved by induration, the swelling of the part and the pain decrease as the hardness comes on.—When it terminates in putrefaction or mortification, the part grows senseless, and turns black and foetid. See MORTIFICATION. But when a *tumor* goes off by repulsion, or a return of the matter into the blood, it disappears at once; upon which a fever, or some other acute disease presently ensues. See REPELLENT.

*Windy tumors*, M. Littré describes as formed of air, inclosed under some membrane, which it dilates more or less in proportion to the quantity, and from which it cannot escape; at least not for some time.

The difficulty is, to conceive how the air should come to be collected here.—M. Littré thinks that the most ordinary cause of *windy tumors*, is the gathering of juices in some neighbouring part, wherein there is an obstruction. The air, which is intimately mixed with all the juices of the body, continues to be so while they are in their natural fluidity and motion; but if they be collected in any part, and by consequence have their motion and fluidity diminished, the air gets its liberty, and disengages itself from them. Now the membranes of the part wherein the liquor is collected, becoming dilated by this collection, and their pores enlarged, the disengaged air escapes through them, but the juice is left behind, as being too much thickened by its stay there: it therefore runs under some other neighbouring membrane, which it raises, swells and extends. See TYMPANITES.

# T U N

TUN, \* or TON, originally signifies a large vessel or cask, of an oblong form, biggest in the middle, and diminishing towards its two ends, girt about with hoops, and used to put up several kinds of merchandizes in, for their better carriage; as brandy, oil, sugar, skins, hats, &c.

\* Some derive the word from *autumnus*, in regard it is then *tuns* are most needed: Du Cange deduces it from *tunna* or *tonna*, words used in the base Latin for the same thing; whence also *tunnare*, to *tun*.

The term is also used for certain vessels of extraordinary bigness, serving to keep wine in for several years.—In Germany there are many scarce ever emptied: the Heidelberg *tun* is famous.

The *tun*, we frequently call a *hogthead*. See HOGSHEAD.

TUN, or TON, is also a certain measure for liquids; as wine, oil, &c. See MEASURE.

The English *tun* contains two pipes, or four hogheads, or 252 gallons. See HOGSHEAD, GALLON, PIPE, &c.

The *tun* of Amsterdam contains 6 aems or awms; the *aem* 4 ankers, the *anker* 2 *stekans*, the *stekan* 16 mingles; 12 *stekans* are equal to an English barrel, or 63 gallons.

The *tun* of Bourdeaux and Bayonne contains four barrels, equal to three Paris muids.—At Orleans and Berry it is about two Paris muids. See MUID.

The *tun* of Malaga, Alicant, Sevil, &c. is two bottas, equal to about 36 or 37 *stekans*.—The *tun* of Lisbon is two Portuguese bottas, equal to 25 *stekans*.

TUN is also a certain weight, whereby the burthen of ships, &c. are estimated. See WEIGHT, &c.

The *sea tun* is computed to weigh two thousand pounds, or twenty quintals or hundreds weight (amounting to 2440 pounds avoirdupois) so that when we say a vessel carries two hundred *tuns*, we mean it is able to carry two hundred times the weight of two thousand pounds, i. e. four hundred thousand pounds: it being found by a curious observation, that the sea water, whose room the vessel fills when full loaden, weighs so much.

To find the burthen and capacity of a ship, they measure the hold, or place where she is loaden; allowing 42 cubic feet to the *sea tun*. See BURDEN, and HOLD.

The price of freight, or carriage of merchandizes, is ordinarily settled on the foot of the *sea tun*: and yet though the *tun* is twenty hundred weight, there is some difference made therein, either on account of the weight or cumberfomness, or bulk of the commodities, the space they take up, or the like. See FREIGHT.

Accordingly, at Bourdeaux four barrels of wine are held a *tun*, five barrels of brandy are estimated two *tuns*, three of syrup are one *tun*, four barrels of prunes one *tun*, two dozen of walnut-tree tables one *tun*, a dozen of planks one *tun*; twenty bushels of chefnuts are accounted one *tun*, and the like of wheat, or other grain; ten bales of cork, five bales of feathers, and eight of paper, make each one *tun*.

A *tun* or load of timber is 40 solid feet, if the timber be round: if it be hewed, or square, 50. See TIMBER.

TUN, TON, in the end of words, or names of places, signifies a town, village, or dwelling-place.—From the Saxon, *tun*, *sepes*, *vallum*, *villa*, *vicus*, *oppidum*; and this from *don* or *dun*, a hill, where they formerly built towns. See TOWN.

TUN-GREVE, a term anciently used for a reeve or bailiff, *qui in villis, & quæ dicimus maneris, domini personam sustinet, ejusque vice omnia disponit & moderatur*. Spelman. See BAILIFF, REVE, GREVE, &c.

TUNE, or TONE, in music, is that property of sounds whereby they come under the relation of *acute* and *grave* to one another. See GRAVITY, &c. See also TONE.

Though gravity and acuteness be mere terms of relation, yet the ground of the relation, the *tune* of the sound, is something absolute; every sound having its own proper *tune*, which must be under some determinate measure in the nature of the thing.

The only difference then between one *tune* and another is in degrees, which are naturally infinite, i. e. we conceive there is something positive in the cause of sound, which is capable of less and more, and contains in it the measure of the degrees of *tune*; and because we do not suppose a least or greatest quantity of this, we conceive the degrees depending on those measures to be infinite. See SOUND.

If two or more sounds be compared together in this relation, they are either equal or unequal in the degree of *tune*.—Such as are equal are called *unisons*. See UNISON.

The unequal constitute what we call *intervals*, which are the differences of *tune* between sounds. See INTERVAL.

Cause and measure of TUNE, or that whereon the tune of a sound depends.—Sonsorous bodies, we find, differ in *tune*, 1. According to the different kinds of matter: thus the sound of a piece of gold is much graver than that of a piece of silver of the same shape and dimensions; in which case, the *tones* are proportional to the specific gravities.

2. According to the different quantities of the same matter in bodies of the same figure; as a solid sphere of brass, one foot in

# T U N

in diameter, sounds acuter than a sphere of brass two foot in diameter; in which case the *tones* are proportional to the quantities of matter.

Here then are different *tunes* connected with different specific gravities, and different quantities of matter; yet cannot the different degrees of *tune* be referred to those quantities, &c. as the immediate cause. In effect, the measures of *tune* are only to be sought in the relations of the motions that are the cause of sound, which are no-where so discernible as in the vibrations of chords. See CHORD.

Sounds, we know, are produced in chords by their vibratory motions; not, indeed, by those sensible vibrations of the whole chord, but by the insensible ones, which are influenced by the sensible, and, in all probability, are proportional to them.—So that sounds may be as justly measured in the latter, as they could be in the former, did they fall under our senses: but even the sensible vibrations are too small and quick to be immediately measured.—The only resource we have, is to find what proportion they have with some other thing: which is effected by the different tensions, or thickness, or lengths of chords, which, in all other respects, excepting some one of those mentioned, are the same. See VIBRATION.

Now, in the general, we find that in two chords, all things being equal, excepting the tension, or the thickness, or the length, the *tones* are different; there must therefore be a difference in the vibrations owing to those different tensions, &c. which difference can only be in the velocity of the courses and recourses of the chords, through the spaces wherein they move to and again.—Now, upon examining the proportion between that velocity, and the things just mentioned, whereon it depends, it is found to be a demonstration, that all the vibrations of the same chord are performed in equal times.

Hence, as the *tone* of a sound depends on the nature of those vibrations whose differences we can conceive no otherwise than as having different velocities, and as the small vibrations of the same chord are all performed in equal time; and as it is found true in fact, that the sound of any body arising from one individual stroke, though it grows gradually weaker, yet continues in the same *tone* from first to last; it follows, that the *tone* is necessarily connected with a certain quantity of time in making every single vibration; or that a certain number of vibrations, accomplished in a given time, constitutes a certain and determinate *tune*: for the frequenter those vibrations are, the more acute is the *tune*; and the slower and fewer they are in the same space of time, by so much the more grave is the *tune*; so that any given note of a *tune*, is made by one certain measure of velocity of vibrations, *i. e.* such a certain number of courses and recourses of a chord or string in such a certain space of time, constitutes a determinate *tune*. See NOTE.

This theory is strongly supported by our best and latest writers on music, Dr. Holder, Mr. Malcolm, &c. both from reason and experience.—Dr. Wallis, who owns it very reasonable, adds, that it is evident the degrees of acuteness are reciprocally as the lengths of the chords; though, he says, he will not positively affirm that the degrees of acuteness answer the number of vibrations as their only true cause: but his diffidence arises hence, that he doubts whether the thing have been sufficiently confirmed by experiment.—Indeed, whether the different number of vibrations in a given time be the true cause on the part of the object, of our perceiving a difference of *tune*, is a thing which we conceive does not come within the reach of experiment; it is sufficient the hypothesis is reasonable. See CONCORD, HARMONY, &c.

**TUNICA**, a kind of waistcoat or under-garment wore by the ancients, both at Rome and in the east.

The common people ordinarily wore only a single *tunica*; but those of better fashion wore a *toga* or gown over it.—See **TOGA**.—The philosophers wore a gown without a *tunica*, as professing to go half naked.

The *tunica* was peculiar to the men, the under-garment of the women not being called *tunica*, but *stola*. See **STOLE**.

The senators wore their *tunica* enriched with several little pieces of purple, cut in form of large nails; whence it was called *laticlavata*: the knights had lesser nails on their *tunica*, which was hence called *angusticlavata*; the common people wore their *tunica* without any clavi at all.—And it was by these three different sorts of *tunica*'s, that the three different orders of the Roman people were distinguished. See **LATICLAVIA**, &c.

Among religious, the woollen shifts, or under-garments, are styled *tunica*'s or *tuniques*.

**TUNICA**, **TUNIC**, in anatomy, is applied to the membranes which invest the vessels, and divers others of the less solid parts of the body.—See *Tab. Anat. (Angeiol.) fig. 7. lit. a a. b b. c. d.* See also **MEMBRANE**.

The eye consists principally of a number of humors contained in *tunics* ranged over one another: as the *tunica albuginea*, the *tunica cornea*, the *tunica retiformis*, &c. See **EYE**, **ALBUGINEA**, &c.

**TUNICA Vaginalis**. See the article **VAGINALIS**.

**TUNNAGE**, or **TONNAGE**, a duty or custom due for merchandize brought or carried in *tuns*, and such like vessels, from

# T U R

or to other nations; thus called, because rated at so much *per tun*. See **CUSTOM**.

**Tunnage** is properly a duty imposed on liquids according to their measures; as poundage is that imposed on other commodities according to their weight. See **POUNDAGE**.

They were both first settled by authority of parliament under king Edward III. were re-established in 1660, under the reign of king Charles II. for his life, upon abrogating all the laws made under Oliver Cromwell, and re-ordaining the execution of the ancient laws and regulations: and have been continued and renewed by the parliaments ever since.—By an act made in the first year of the reign of Queen Anne, they were continued for 96 years, expiring in the year 1798.

This duty at first was 4*l.* 10*s.* sterling *per tun*, for French wines brought into the port of London by the English, and only three for that brought into the other ports.—For the same wine imported by strangers to London, this duty was 6*l.* and that brought into the other ports 4*l.* 10*s.* sterling.

Rhenish wine, in virtue of the same act, paid 7*l.* 10*s.* sterling; and Spanish, Portuguese, Malmsey, and Greek wines, the same as French wines.

But there have been divers additional duties imposed since.—As the *additional duty of the old subsidy, seignorage, duty of ancient impost of tunnage, duty of additional impost, orphans money, new subsidy*, &c. See **DUTY**.

**TUNNAGE** is also used for a certain duty paid the mariners by the merchants for unloading their ships arrived in any haven, after the rate of so much *per tun*. See **DUTY**.

**TUNNEL**, or **FUNNEL**, an instrument through which any liquor is poured into a vessel.

Part of the draught of a chimney, above the mantle-piece, is also called by the same name. See **CHIMNEY**.

**TUNNEL-Net**, is a kind of net much used for the catching of partridges; thus called from its form, which is a cone 15 or 18 feet long.

To use it, a covey of those birds being found, a compass is taken, and the net pitched at a good distance from them, according to the situation of the ground.—Then, with a natural or artificial stalking horse, they are surrounded, and gently driven towards the net, never coming on them in a direct line, but by windings, turnings, &c. See **STALKING**.

**TUNNING**, or **TONNING**, a part of the process of brewing, or rather an operation which is the sequel thereof. See **BREWING**.

The *tunning of beer*, &c. is performed various ways; some being of opinion it is best *tunned* as it cools, or begins to come; while others let it stand longer to become riper.

The most regular method is to cleanse and *tun* just as it comes to a due ferment, and gets a good head; for then it has the most strength to clear itself.—What works over is to be supplied with fresh beer of the same brewing.

**TURBAN**,\* **TURBANT**, the head-dress of most of the eastern and mahometan nations; consisting of two parts, *viz.* a cap, and a shawl of fine linnen, or taffaty, artfully wound in divers plaits about the cap.—See **HAT**, **CAP**, **TIARA**, &c.

\* The word is formed from the Arabic *دَار*, *dar*, or *دُر*, *dur*, or *دَل*, *dal*, or *دُل*, *dul*, which signifies to encompass; and *بَنْد*, *band* or *bend*, which signifies shawl, or scarf, or band; so that *durbant*, or *turbant*, or *tulbant*, only signifies a scarf, or shawl, tied round; it being the shawl that gives the denomination to the whole *turban*.

The cap is red or green, without any brim, pretty flat, though roundish a-top, and quilted with cotton, but does not cover the ears.—About this is wrapped a long piece of fine thin linnen or cotton, in several wreaths variously disposed.

There is a good deal of art in giving *turbans* the fine air; and the making them up constitutes a particular trade, as the making of hats does among us.

The Emirs, who pretend to be descended of the race of Mahomet, wear their *turbans* quite green: those of the other Turks are ordinarily red, with a white shawl.—Your genteel people are to have frequent changes of *turbans*.—M. de Tournesfort observes, that the *turban*, all things considered, is a very commodious dress; and that he even found it more easy to him than his French habit.

The grand Seignior's *turban* is as big as a bushel, and so exceedingly respected by the Turks, that they dare scarce touch it.—It is adorned with three plumes of feathers enriched with diamonds and precious stones: he has a minister on purpose to look to it, called *tulbentoglan*.

That of the grand vizier has two plumes: so have those of divers other officers, only smaller one than another; others have only one, and others none at all.—The *turban* of the officers of the divan is of a peculiar form, and called *mugenezek*.

The shawl of the Turks *turban*, we have observed, is white linnen, that of the Persians is red woollen. These are the distinguishing marks of their different religions, Sophi, king of Persia, who was of the sect of Ali, being the first who assumed that colour, to distinguish himself from the Turks, who are of the sect of Omar, and whom the Persians esteem heretics. See **KIRILBASCHI**, &c.

**TURBARY**,

**TURBARY, TURBARIA**, a right to dig turf in another man's ground; from *turba*, an old Latin word for a turf. See **TURF**.

**Common of TURBARY**, is a liberty which some tenants have by prescription to dig on the lord's waste. See **COMMON**.

**TURBARIA** is sometimes also taken for the ground where turfs are digged. See **TURF**.

**TURBARIA Bruaria**, more particularly denotes flaw turf, or heath turf: mentioned in a charter of Hamon de Maffly.

**TURBINATED**, is a term applied by naturalists to shells which are spiral, or wreathed, conically, from a larger basis to a kind of apex. See **SHELL**.

**TURBITH, or TURPETH, TURPETHUM**, a medicinal root, brought from the East Indies, particularly Cambaya, Surat, and Goa; though others will have it, that the true *turbith* comes chiefly from Ceylon.

The *turbith* of the moderns bears so little resemblance to that of the ancients, that it is difficult to suppose them the same.—That sold by our druggists is a longish root about the thickness of the finger, resinous, heavy, and of brownish hue without, and whitish within.—It is brought to us cloven in the middle, lengthwise, and the heart or woody matter taken out. When in the ground it shoots out tendrils, some whereof creep along the ground, and the rest wind about the neighbouring trees and shrubs.

*Turbith* is a violent purgative, and is used in the dropsy, palsy, and apoplexy. See **PURGATIVE**.—It is commonly supposed to take its name *turbith* from *turbare*, on account of the violence of its operation, as disturbing the whole oecconomy.

It yields a deal of resinous matter in a spirituous menstruum, which Dr. Quincy observes, does not affect the larger passages much; but is very active in the smaller vessels, and glandulous contortions, which it wonderfully clears of all viscid adhesions. See **PURGATIVE**.

Some apothecaries, either through ignorance or parsimony, substitute white thapsia, which they call grey *turbith*, or *turbith garganicum*, for the true *turbith*; though both as to taste, colour and qualities, they are very different.

**Mineral TURBITH, TURPETHUM Minerale**, is a name which the chymists give to a yellow precipitate of mercury, which purges violently. See **MERCURY and PRECIPITATE**.

The method of preparing it is thus:—On the dry powder gained by dissolving mercury in oil of vitriol, pour a proper quantity of warm rain water, and the powder will immediately turn of a yellow colour. Continue to wash this powder by repeated affusions of water, till the liquor comes away as insipid and colourless as it was poured on, leaving a beautiful yellow calx at the bottom of the vessel, which being gently dried at the fire, is called by the name of *turbith mineral*.

This powder is called *mineral turbith* from the resemblance it bears to the vegetable *turbith* of the Arabians, in strongly purging the most internal recesses of the body; for though it be insipid upon the tongue, yet it is possessed of very considerable virtues.—Being boiled with water, it loses more of its salts, and thereby grows milder, and more safe; so it does by being deflagrated twice or thrice, or distilled with spirit of wine.

A very few grains of this *turbith* will prove emetic and purgative.—It is also accounted an excellent medicine in the cure of the venereal disease: but as it operates with considerable violence, it ought not to be given, unless the viscera are known to be sound. See **PURGATIVE**.

This appears to have been the grand secret of Paracelsus, which, in his scarce German book of hospital medicines, he praises so extravagantly for the venereal and all chronical diseases.—Sydenham also commends it in venereal cases, given in the quantity of six or eight grains, in strong habits of body, so as to prove emetic; but when imprudently used, it is apt to give the dysentery. See **VENEREAL Disease**.

**TURBO**, in meteorology, a whirlwind. See **VORTEX, WHIRLWIND, &c.**

**TURCICA Sella**. See the article **SELLA**.

**TURCOIS, \* or TURQUOIS**, in natural history, a precious stone, of a blue colour; ordinarily opaque, but sometimes a little transparent. See **PRECIOUS Stone**.

\* The Greeks and Latins seem to have known it under the names *calais*, and *μαλακ*: and it appears to have had a place in the rationale of the high priest of the Jews.

There are *turcoises* both oriental and occidental, of the new rock and the old. The oriental partakes more of the blue tincture than the green; and the occidental more of the green than the blue.—Those of the old rock are a deep blue, and those of the new rock more whitish, and do not keep their colour.

The oriental ones come from Persia, the Indies, and some parts of Turkey; and some even suppose that it is hence they derive their modern name *turcois*.—The occidental are found in various parts of Europe, particularly Germany, Bohemia, Silesia, Spain, and France.

*Turcoises* all grow of a round or oval figure: they cut easily, and besides seals, which are frequently engraved on them, some are formed into crucifixes, or other figures near two inches

high; though de Boot mistakenly affirms, that none have been known to exceed the bigness of a walnut.

The ancients attribute a kind of sympathetic virtue to the *turcois*.—It is commonly supposed, that it changes colour, or breaks, at the death, sickness, or even misfortune of the person who bears it; that it disagrees with married people, and even breaks on their fingers; that it marks all the changes and accidents that happen in the body of the wearer, by correspondent changes in its colour; and that it is for this reason the ladies have forbore the use of it.—De Boot endeavours to account for all these effects from natural, and even probable causes.

The *turcois* is easily counterfeited; and that so perfectly, that it is impossible to discover the deceit, without taking it out of the collet.

In the memoirs of the academy of sciences, we have a very curious account of the formation of the *turcois*, and the manner of giving it the blue colour, by M. Reaumur.—The *turcois*, he observes, is one of the sortest of precious stones, its hardness scarce exceeding that of a crystal, or a transparent pebble; though some are much harder than others: and still the harder, *ceteris paribus*, the more valuable, by reason of the vivacity of the polish, which is always proportionable to the hardness.

Rosnell, a jeweller, and the author of a scarce treatise, called *Mercurie Indien*, estimating the several precious stones, sets a hard *turcois*, whose blue is neither bright nor deep, on the foot of the most perfect emeralds, that is, on a level with a diamond.—Those with any defect he only values at a French crown the carat.

Tavernier assures us, there are but two mines of *turcoises* known in all the earth, and those are both in Persia; the one called the *old rock*, near a town called Necabourg, three days journey to the north-east of Meched: the other called the *new rock*, is five days journey.—The latter, he adds, are but little valued; and the king of Persia hath for many years prohibited the digging in the former for any but himself.—M. Reaumur takes the old rock to be now exhausted; in effect, the common division of *turcoises* into the old rock, or oriental, and new rock, or occidental, is very arbitrary and precarious.—All the best, and most perfect, grow they where they will, in India or Europe, are reckoned among the former, and the rest among the latter.

Near Simore, in the lower Languedoc, are several considerable mines of *turcoises*; but that fine blue colour admired in the *turcois*, is not natural to these rocks; the prevailing colour being sometimes white, and sometimes much like that of Tripoli of Venice. Other precious stones are dug out of the mine with all their colour, to the force whereof nothing can be added, though it may frequently be diminished, as we see fire bring down the too deep colour of the sapphire, and quite take away that of a pale sapphire: these *turcoises*, on the contrary, are naturally whitish or yellowish, of a colour as common as that of a free-stone; and by opposing them for some time to the action of the fire, they assume a blue colour.

It seems a paradox, and yet M. Reaumur has made it exceeding probable, that *turcoises* are originally the bones of animals.—In the mines in France, pieces have several times been found of the figure of teeth, bones of the arms, legs, &c. And *turcoises* which are yet imperfect or half formed, are apparently composed of laminæ or leaves like those of bones, between which some petrifying juice insinuating itself, binds them close together: and still, the softer, and more imperfect the stones are, the more distinguishable are the different directions of the fibres and laminæ, with their interfections, and the greater resemblance they bear to fractured bones, and the less to any kind of stones known.

To give them the blue colour, they dry them awhile in the air, then heat them gradually in a furnace made after a particular manner. If they be heated too hastily, the humidity between the laminæ, wanting time to evaporate all, will separate into scales or flaws. Some of the stones require a greater degree of heat to bring them to their colour than others; and even in large pieces, several parts ordinarily require several degrees of heat.

On this account a world of care is to be taken in the heating them; for the fire, which gives them their blue by degrees, if they be exposed beyond a certain degree, takes it away again.

M. Reaumur accounts for their taking a blue colour by heat very well: when fresh cut out of the rock; it seems, their substance is found sprinkled and streaked all over with spots, veins, little circles, &c. of a dark-blue colour: these he takes to be remains of a deep bluish matter, which the fire rarefying, spreads and diffuses throughout the whole substance of the stone.—This matter, again, he concludes to have been either originally the juice contained in the bones, since mixed and coagulated with the petrifying juice, or some other mineral matter insinuated into the pores of the stone.

The great defect of all *turcoises* is, that in time they lose their blue colour, and become green; and then cease to be of any value.

**TURF**, *Peat*; a blackish sulphurous earth, used in several parts of England, Holland, and Flanders, as fewel. See FEWEL, and TURBARY.

In Flanders, their *turf* is dug or pared from off the surface of the earth, and cut in form of bricks.—The gramen, a species of grass growing very thick on the *turf* earth, contributes greatly, when dry, to the maintenance of the fire.

The Dutch draw their *turf* from the bottom of the dikes or canals which run across most of their lands; by which means they not only supply the defect of wood, which is very great in most of the united provinces, but also keep their dikes clear and navigable: this *turf* earth is very black. As they take it up from the bottoms of the dikes, they spread it about the edges, of such a thickness, as that it may be reduced to three inches when moderately dried.—In this condition they cut it into pieces or *turfs* seven or eight inches long, and three broad; and, to compleat the drying, lay them up in heaps, and at last in stacks.

In the north of England, Scotland, &c. *turf* or peat is dug out of a soft, moist, rotten earth, called *peat-moss*: for the formation whereof see MOSS.

They dig horizontally from the surface, to the depth of about four foot, with a spade, which at once fashions and takes them out in parallelepipeds nine or ten inches long, and three square; which are spread on the ground to drain as fast as dug; and then set up an end three or four against each other, for the wind to blow through them; and at last stacked or housed.—The pits or dikes in a few years fill up again, and afford a fresh crop.

**TURFING**-*spade*, among husbandmen, is an instrument used to under-cut the *turf*, after it is marked out with a trenching-plough.

**TURGESCENT**, **TURGESCENTY**, a swelling, or growing bloated. See ORGASM.

**TURIONES**, the first young tender shoots which plants annually put forth. See GEM, CYON, &c.

TURKY silk,		SILK.

**TURLUPINADE**, a term used chiefly among the French for a low jest, or witticism.—The occasion of the name is derived from a famous comedian at Paris, called *Turlupin*; whose talent, like that of our Penkethman, consisted chiefly in raising a laugh by miserable puns and quibbles.

**TURLUPINES**, **TURLUPINI**, a sect of heretics, or rather of people who made public profession of impudence, going naked, without so much as covering their privy parts, and having to do with women, like the Cynics, in open market. They called their sect the *fraternity of the poor*, and spread themselves over England and France.—They are said by some to have had their name *turlupins*, *quod ea tantum habitarent loca quæ lupis exposita erant*. See ADAMITE.

They attempted to settle themselves at Paris in 1372, but were a great part of them burnt, with their books; as is related by Gaguin and du Tillet in the life of Charles V.

**TURMERIC**, *Curcuma*, a medicinal root, used likewise by the dyers, to give a yellow colour. See YELLOW.

It is yellow both within and without side, very hard, as if petrified, and not unlike, either in figure or size, to ginger.—The leaves it produces are like those of white hellebore; its flowers rise in form of a spica or ear; and its fruit rough like our new chefnuts.

It is brought chiefly from the East-Indies; though the island Madagascar does likewise afford it.—You are to chuse that which is big, new, resinous, hard to break, and heavy.

Some people have mistakenly imagined there was a native red *turmeric*; their error was owing to this, that the yellow root, as it grows old, turns brown; and when pulverised reddish.

It is much used by the glovers, &c. to dye their gloves; as also by the founders, &c. to give a gold colour to bras.—The Indians use it to dye their rice, and other foods, of a yellow colour; whence some call it *Indian saffron*.

Our dyers do not find that it gives so steady a yellow as the luteola or weld; but it is admirable to brighten and heighten the red colours died with cochineal or vermilion; as scarlets, &c. See DYING.

*Turmeric* is used in medicine by way of decoction, infusion, powder, &c. with other ingredients, in hypochondriac, leucophlegmatic, and cachectical constitutions. It is held a sort of specifick in the jaundice, and dropsy.

**TURN**, is used for a circular motion; in which sense it coincides with *revolution*. See REVOLUTION.

**TURN**, in a clock or watch-work, particularly denotes the revolution of a wheel, or pinion. See WHEEL, PINION, &c. In calculation, the number of *turns* which the pinion hath in one *turn* of the wheel, is commonly set down as a quotient in common arithmetic, thus,  $5)60(12$ , where the pinion 5 playing in a wheel of 60, moves round 12 times in one *turn* of the wheel.—Now, by knowing the number of *turns*, which

any pinion hath in one *turn* of the wheel it works in, you may also find how many *turns* a wheel or pinion has at a greater distance; as the contrat-wheel, 5) 55 (11 crown-wheel, &c. by multiplying together the 5) 45 (9 quotients, and the number produced, is the number of *turns*; as in this example:

The first of these three numbers has 11 *turns*, the next 9, and the last 8. If you multiply 11 by 9, it produceth 99; that is, in one *turn* of the wheel 55; there are 99 *turns* of the second pinion 5, or the wheel 40, which runs concentrical, or on the same arbor with the second pinion 5.—If you multiply 99 by the last quotient 8, it produces 792, which is the number of *turns* the third pinion 5 hath.

**TURN**, or **TOURN**, is also used for the sheriff's court, kept twice a year in every hundred within his county, viz. a month after Easter, and within a month after Michaelmas. See SHERIFF, COURT, and COUNTY.

From this court none are exempted but archbishops, bishops, earls, barons, religious men and women, and all such as have hundreds of their own to be kept. See HUNDRED.

It is a court of record in all things that pertain to it; and is also the king's leet through all the county, whereof the sheriff is judge; this court being incident to his office.—The attendance on it is called *sesta regalis*, or *suit-royal*. See SUIT.

It is called the *sheriff's turn*, because he takes a *turn* or circuit for this purpose through the shire, holding the same in several places.

**TURNADO**, or **TORNADO**, a wind which on some coasts blows all night from the shore. See WIND, WHIRLWIND, TRADE-WIND, MONSOON, &c.

**TURNAMENT**, or **TOURNAMENT**, a martial sport or exercise, which the ancient cavaliers used to perform, to shew their bravery, and address.

The first *turnaments* were only courses on horseback, wherein the cavaliers tilted at each other with canes, in manner of lances; and were distinguished from *jufts*, which were courses or careers, accompanied with attacks and combats with blunted lances and swords.

Others say, it was a *turnament* when there was only one quadril or troop; and that where there were several to encounter each other, it was a *juft*.—But it is certain the two became confounded together in process of time; at least we find them so in authors. See JUST.

The prince who published the *turnament*, used to send a king at arms with a safe conduct, and a sword to all the princes, knights, &c. signifying, that he intended a *turnament* and a clashing of swords, in the presence of ladies and damsels: which was the usual formula of invitation.

They first engaged man against man, then troop against troop; and after the combat, the judges allotted the prize to the best cavalier, and the best striker of swords; who was, accordingly, conducted in pomp to the lady of the *turnament*; where, after thanking her very reverently, he saluted her, and likewise her two maids.

These *turnaments* made the principal diversion of the XIIIth and XIVth centuries.—Munster says, it was Henry the Fowler, duke of Saxony, and afterwards emperor, that first introduced them; but it appears from the chronicle of Tours, that the true inventor of this famous sport, was one Geoffry, lord of Preuilli, about the year 1066.

From France they passed into England and Germany.—The *Historia Byzantina* tells us, that the Greeks and Latins borrowed the use thereof from the Franks; and we find mention made of them in Cantacuzenus, Gregorias, Bessarion, and others of the late Greek authors.

Budæus derives the word from *trojana agmina*; others from *trojamentum*, *quasi ludus trojæ*. Menage deduces it from the Latin, *tornensis*, or the French, *tourner*, in regard the combatants turned and twisted this way and that. M. Paris calls them in Latin, *basiludia*; Neubrigenis, *meditationes militares*; others *gladiatura*, others *decurfiones ludicæ*, &c.

Pope Eugenius II. excommunicated those who went to *turnaments*, and forbade them burial in holy ground.—K. Henry II. of France died of a wound received at a *turnament*.—One Chiaoux, who had assisted at a *turnament* under Charles VIII. said very happily, *If it be in earnest, it is too little; if in jest, too much*.

It is to the exercise of *turnaments* that we owe the first use of armories; of which the name blazonry, the form of the escutcheons, the colours, principal figures, the mantlings, labels, supporters, &c. are undeniable evidences. See ARMS. In Germany, it was anciently a custom to hold a solemn *turnament* every three years, to serve as a proof of nobility.—For the gentleman who had assisted at two, was sufficiently blazoned and published; i. e. he was acknowledged noble, and bore two trumpets by way of crest on his *turnament* cask.—Those who had not been in any *turnaments*, had no arms, though they were gentlemen. See NOBILITY, DESCENT, &c.

**TURNESOL**, or **TORNESOL**, *Heliotrope*, or the *Sum-flower*; a plant whose flower is said to follow the motion of the sun, and to turn still towards it.

Some

Some say, it is hence it takes its name, and account for the effect, by supposing that its heavy stalk, warmed and softened with the heat which is strongest on that side toward the sun, inclines naturally towards the same; but others take the opinion to have had its rise from the name, which was given it by reason of its appearance in the time of the greatest heats, when the sun is in the tropic.

Some have imagined the sun-flower of use in medicine; but its reputation that way is now out of doors. Its principal use is in dying: in order to which, its juice is inspissated and prepared with calx and urine, into blue cakes; used also with starch, instead of smalt. See BLUE, SMALT, &c.

Its juice likewise furnishes the colour wherewith the people of Languedoc and some other parts of France, where it grows, prepare what they call the *turnesol en drapeux*, or *turnesol in rags*. The process whereof we owe to M. Nissolle of the royal academy of sciences, and is as follows:

The summits or tops of the plants being gathered in the beginning of August, are ground in mills, not unlike our oil-mills: then, being put up in bags, the juice is expressed with presses.

This juice having been exposed to the sun about an hour, they dip linnen rags therein, and hang them out in the air till they be well dried again. When, moistening them for some time, over the vapour of about ten pound weight of quick lime slaked in a sufficient quantity of urine, they lay them out again to the sun to dry; to be again dipped in the juice of the ricinoides.

When they are dried for the last time, they are in their perfection; and are thus sent into most parts of Europe, where they are used to tinge wines and other liquors, and give them an agreeable colour.

The Dutch prepare a kind of *turnesol* in pastes or cakes, or stones; pretended to be the juice of that plant inspissated: but there is reason to think it a cheat, and to be the juice of some other plant prepared after this manner; the *turnesol* being no plant of their growth.

**TURNETUM**, in our old law-books, a duty paid to the sheriff for holding his turn, or county-court. See TURN, and SHERIFF.

**TURNING**, a branch of sculpture; being the art of fashioning hard bodies, as brass, ivory, wood, &c. into a round or oval form, in a lathe. See LATHE.

*Turning* is performed by putting the substance to be turned upon two points, as an axis; and moving it about on that axis; while an edge-tool, set steady to the outside of the substance, in a circumvolution thereof, cuts off all the parts that lie further off the axis, and makes the outside of that substance concentric to the axis.

The invention of *turning* appears to be very ancient.—Some, indeed, to do honour to the age, will have it brought to perfection by the moderns; but if what Pliny, and some other ancient authors relate, be true, that the ancients turned those precious vases, enriched with figures and ornaments in relievo, which we still see in the cabinets of the curious; it must be owned, that all that has been added in these ages, makes but a poor amends for what we lost of the manner of *turning* of the ancients. See SCULPTURE.

The principal instruments used in *turning*, beside the lathe, are chisels and mandrels of various forms; the description whereof see under their proper articles.

**TURNING palisades**, } See the articles { PALISADE.  
**TURN-UP compasses**, } COMPASSES.

**TURNPIKE**, a gate set up across a road, watched by an officer for the purpose, in order to stop travellers, waggons, coaches, &c. to take toll of them, towards repairing, or keeping the roads in repair. See ROAD.

**TURNPIKE** is also used in the military art, for a beam stuck full of spikes, to be placed in a gap, a breach, or at the entrance of a camp, to keep off an enemy. See CHEVAL DE FRISE.

The *turnpike*, called also *cheval de frise*, is a spar of timber, twelve or fourteen feet long, and about six inches diameter; of a sexangular form, and bored with holes, one right under another, about an inch diameter; the axis of the holes being six inches one from another, and to go in from each side.—The spikes or pickets that are driven into the holes, are five or six feet long, pointed with iron; and with wedges or nails fastened tight into the holes.

Two of these fastened together with an iron chain and staple, six inches long, are of great use to stop the enemy in the breaches or elsewhere.

Those intended to be thrown into breaches, must be made of oak; and need not be so big, or the pickets so long.

**TURPENTINE**, **TEREBINTHINA**, a transparent sort of resin, flowing either naturally or by incision, from several unctuous and resinous trees—as the terebinthus, larch, pine, fir, &c. See RESIN.

We distinguish several kinds of *turpentine*s; as that of Chio, that of Venice, that of Bourdeaux, that of Cyprus, Strasbourg, &c.

The *turpentine* of Chio, or Sio, which is the only genuine kind, and that which gives the denomination to all the rest,

is a whitish resin, bordering a little on green, very clear and a little odoriferous; drawn by incision from a tree called *terebinthus*, very common in that island, as also in Cyprus, and some parts of France and Spain.

The resin must be chosen of a solid consistence, almost without either taste or smell, and not at all tenacious, which distinguishes it from the false *turpentine* of Venice, commonly substituted for it, which has a brisker smell, a bitter taste, and sticks much to the finger.—This *turpentine* of Chio is indisputably the best; but its scarcity occasions it to be little in use.

The *turpentine* of Venice is falsely so called; for though there was a *turpentine* anciently brought from Venice, yet that now so called comes from Dauphiné.—It is liquid, of the consistence of a thick syrup, and whitish; and flows either spontaneously, or by incision from the larch-tree, chiefly in the wood de Pilatze.

That flowing naturally, called by the peasants *bijm*, is a kind of balsom, not inferior in virtue to that of Peru, for which it is frequently substituted.—That drawn by incision, after the tree has ceased to yield spontaneously, is of considerable use in several arts, and it is even of this that varnish is chiefly made. See VARNISH.—It must be chosen white and transparent, and care be taken it have not been counterfeited with oil of *turpentine*.

The *turpentine* of Bourdeaux is white and thick as honey.—

It does not ooze from the tree in the manner it is sent to us; but is properly a composition, wherein, among other ingredients, is a white hard sort of resin called *galipot*. See PITCH.

The *turpentine* of Strasbourg, the produce of the abies or silver fir, is that most commonly used among us; and is preferred, by our people, to that of Venice, which it is distinguished from by its green hue, fragrant smell, and citron flavour.

The uses of *turpentine* in medicine are innumerable.—It is a great vulnerary, and very detergent, and as such is prescribed in abscesses, and ulcerations, &c. It promotes expectoration, and as such is prescribed in diseases of the lungs, and breast: but it is most famous for clearing the urinary passages, and as such prescribed in obstructions of the reins, in gonorrheas, &c.

**Oil of TURPENTINE**.—There are two kinds of oils drawn from *turpentine* by distillation; the first white, the second red; both esteemed as balsoms proper for the cure of wounds, chilblains, &c. But they are so little used among us, that it is not easy to procure either of them.

What is commonly sold under the name of *oil of turpentine*, or *etherial oil*, is only a distillation of the resinous juice of the tree fresh as it is gathered.—It is used with success in the cure of green wounds, as also by the painters, farriers, &c.—To be good, it must be clear and white as water, of a strong penetrating smell, and very inflammable.

**TURPETH**, } See the articles { TURPITH.  
**TURQUOIS**, } TURCOIS

**TURUNDA**, in medicine and chirurgery, *tent*, *pellet*, or *penicil*; a piece of lint thrust into a wound, ulcer, or other cavity. See TENT, and PENECILLUS.

**TUSCAN**, in architecture, the first, simplest, and most massive of the five orders.—See *Tab. Archit. fig. 24*. See also the article ORDER.

The *Tuscan order* takes its name from an ancient people of Lydia, who coming out of Asia to people Tuscany, first executed it in some temples, which they built in their new plantations.

Vitruvius calls the *Tuscan* the *rustic order*; with whom agrees M. de Cambray, who in his parallel says, it ought never to be used but in country-houses and palaces. M. le Clerc adds, that in the manner Vitruvius, Palladio, and some others, have ordered it, it does not deserve to be used at all. But in Vignola's manner of composition, he allows it a beauty, even in its simplicity; and such as makes it proper not only for private houses, but even for public buildings, as in the piazzas of squares and markets; in the magazines and granaries of cities, and even in the offices and lower apartments in palaces.

The *Tuscan* has its character and proportions as well as the other orders; but we have no ancient monuments to give us any regular *Tuscan* order for a standard.

M. Perrault observes, that the characters of the *Tuscan* are nearly the same with those of the Doric; and adds, that the *Tuscan* is, in effect, no other than the Doric, made somewhat stronger, by shortening the shaft of the column; and simpler, by the small number, and largeness of the mouldings. See DORIC.

Vitruvius makes the whole height of the order 14 modules, wherein he is followed by Vignola, M. le Clerc, &c.—Serlio only makes it 12.—Palladio gives us one *Tuscan* profile, much the same as that of Vitruvius; and another too rich: on which side Scamozzi is likewise faulty. Hence it is, that that of Vignola, who has made the order very regular, is most followed by the modern architects. See COLUMN.

Of all the orders, the *Tuscan* is the most easily executed; as having neither triglyphs nor dentils, nor modillions to cramp its intercolumns.—On this account the columns of this order may be ranged in any of the five manners of Vitruvius, viz.

the pycnostyle, systyle, eustyle, diastyle, or aræostyle. See INTERCOLUMNATION.—For the parts and members of the *Tuscan* order, their proportions, &c. see CAPITAL, BASE, PEDESTAL, FREEZE, &c.

**TUSCULAN**, in matters of literature, is a term which frequently occurs in the phrase, *tusculan questions*.—Cicero's *tusculan questions*, are disputations on several topics in moral philosophy, which that great author took occasion to denominate from *Tusculanum*, the name of a country-seat or villa, where they were composed, and where he lays the scene of the dispute.

They contain five books: the first on the contempt of death; the second of enduring pain; the third on allwaging grief; the fourth on the other perturbations of the mind; and the last, to shew, that virtue is sufficient to a happy life.

**TUSKES**, or **TUSKS** of a horse. See TOOTH.

**TUSSIS**. See the article COUGH.

**TUT**, in armory, &c. an imperial ensign of a golden globe, with a cross on it.

**TUTELARY**, **TUTELARIS**, one who has taken something into his patronage, and protection. See GUARDIAN, PROTECTION, &c.

It is an ancient opinion, that there are *tutelary* angels of kingdoms and cities, and even of particular persons, called *guardian angels*. See ANGEL, DÆMON, GENIUS, &c.

The ancient Romans, it is certain, had their *tutelary* gods, whom they called *penates*. See PENATES.—And the Romish church to this day, hold an opinion not much unlike it: they believe that every person, at least every one of the faithful, has, from the time of his birth, one of those *tutelary* angels attached to his person, to defend him from all temptations; and it is on this, principally, that their practice of invoking angels is founded.

F. Anthony Macedo, a Portuguese jesuit of Coimbra, has published a large work in folio, on the *tutelary* saints of all the kingdoms, provinces and great cities of the christian world: *divi tutelares orbis christiani*, at Lisbon 1687. See PATRON, SAINT, &c.

**TUTOR**, in the civil law, is one chosen to look to the person and estate of children, left by their fathers and mothers in their minority. See GUARDIAN, MINOR, and PUBERTY.

By the custom of Normandy, the father is the natural *tutor* of his children.—A person nominated *tutor*, either by testament, or by the relations of the minor, may decline that office, if he have five children alive; if he have any other considerable *tutorage*; if he be under 25 years of age; if he be a priest or a regent in an university; or if he have any law-suit with the minors, &c. See TUTORAGE.

The marriage of a pupil, without the consent of his *tutor*, is invalid.—*Tutors* may do any thing for their pupils, but nothing against them; and the same laws which put them under a necessity of preserving the interest of the minors, put them under an incapacity of hurting them. See PUPIL.

**Honourary TUTOR**. See the article HONOURARY.

**TUTOR** is also used in our universities, for a member of some college or hall, who takes on him the instructing young students in the arts and faculties. See UNIVERSITY.

**TUTORAGE**, **TUTELA**, in the civil law, a term equivalent to guardianship in the common law; signifying an office imposed on any one, to take care of the person and effects of one or more minors. See MINOR, TUTOR, &c.

By the Roman law, there are three kinds of *tutorage*.—*Testamentary*, which is appointed by the father's testament.—*Legal*, which is given by the law to the nearest relation.—And *dative*, which is appointed by the magistrate.

But in all customary provinces, as France, &c. all *tutorages* are *dative* and elective; and though the father have by testament, nominated the next relation to his pupil, yet is not that nomination of any force, unless the choice be confirmed by that of the magistrate, &c.

By the Roman law, *tutorage* expires at 14 years of age; but in France not till 25 years. A minor quits his *tutorage*, and becomes free by marriage; in which case a curator is given him. See CURATOR, and GUARDIAN.

**TUTTY**, **TUTIA**, or *Lapis TUTIÆ*, a kind of metallic foot, thrown off from brass, in the furnace, and formed into concave flakes of different sizes, and thickness; very hard, greyish, and full of little protuberant grains as big as pins heads. See CADMIA, POMPHOLYX, SPODIUM, &c.

It is found adhering to rolls of earth suspended for that purpose over the furnaces of the founders in brass, to receive the fumes of the melted metal. See COPPER, FOUNDERY, &c.

*Tutty* is now brought chiefly from Germany. Anciently, it came from Alexandria.—To prepare the *tutty* for use, they heat it red hot three times in a crucible, among burning coals; and quench it as often in rose-water: then they grind it on a porphyry stone, mixing it with as much rose-water, or plantain-water as is necessary, till it be brought to a very fine powder: then they make it up into little troches, and thus dry it.

*Tutty* is very desiccative. Its principal use is in diseases of the eyes, particularly inflammations; in order to which, it is to

be diluted with rose-water, or plantain-water, and applied in form of a collyrium. See COLLYRIUM.

Some also use it incorporated with hog's lard, or fresh butter, in the form of an unguent.—In the *London Dispensatory*, we have a composition called *ointment of tutty*, good for eye-diseases; and frequently also used by surgeons with other dryers to cicatrize ulcers.—It is also reputed good in the hæmorrhoids. It is made up with calamine, and unguentum rosaceum.

**TWA-NIGHTS Geste**, in our ancient customs. See THIRD-NIGHT-awn Hynde.

If the *twa-nights geste* did any harm to any, his host was not answerable for it, but himself. See HOGENHINE.

**TWELF-HIND**, in our ancient customs, imports much the same with *thane*. See THANE.

Among the English Saxons, every man was valued at a certain price; and when an injury was done, either to the person or goods, a pecuniary mulct was imposed, and paid in satisfaction of that injury, according to the worth and quality of the person to whom it was done.—And hence all men were ranked in three classes; which see in HINDENI, and TWI-HINDI.

Those who were worth 1200 s. were called *twelve-hindi*, and if an injury was done to them, satisfaction was to be made accordingly. See SYXHINDEMEN.

**TWELFTH-DAY**, or **TWELFTH-Tide**, the festival of the Epiphany, or the manifestation of Christ to the Gentiles; so called, as being the *twelfth-day*, exclusive, from the nativity, or Christmas-day. See EPIPHANY.

**TWELVE-MEN**, *duodecim homines legales*, otherwise called *jury*, or *inquest*, is a number of *twelve* persons, or upwards to twenty-four; by whose oath, as to matters of fact, all trials pass, both in civil and criminal cases, through all courts of the common law in this realm. See JURY, and TRIAL.

In civil cases, when proof is made of the matter in question, the point of fact, whereon they are to give their verdict, is delivered to them; which is called the *issue*.—Then they are put in mind of their oath, and are by the judge's summing the evidence, sent out of court by themselves, to consider on the evidence on both sides, till they be agreed. See ENQUEST.

In causes criminal, there are two sorts of inquests or juries: the *grand inquest*, and the *inquest of life and death*.—The first is so called, because it consists of sixteen persons at least, or because all causes criminal or penal pass through their hands; whereas the other inquest is especially appointed for one or more matters. Those of the grand inquest are called by Bracton, *duodecim milites*, because they were wont to be knights; if so many could be had. See KNIGHT.

Their function is to receive all presentments of any offence, and accordingly to give their general opinion thereof, by writing either the words *billa vera* upon the bill of presentment, which is an indictment of the party presented: or else *ignoramus*, which is a doubting of the fact presented. See IGNORAMUS, BILLA VERA, and INDICTMENT.

*Laws of the TWELVE Tables*. See the article TABLE.

**TWELVE-MONTH**, the space of a year, according to the calendar months. See YEAR, and MONTH.

**TWI-FALLOWING** of Ground, in husbandry, is the tilling or ploughing it a second time. See TILLING, and PLOUGHING.

**TWI-HINDI**, or **TWYHINDI**, among our Saxon ancestors, were men valued at 200 s. See TWELFHINDUS, and HINDENI.

These men were of the lowest degree; and if such were killed, the mulct was 30 s.—Thus in *Leg. H. I. c. 9. de twi-hindi hominis interfeciti, wera debit reddi secundum legem*.—Where note, that this was not an introduction of a new law, but a confirmation of the old, made in the reign of king Alfred.

**TWINS**, two young ones delivered at a birth by an animal which ordinarily brings forth but one. See BIRTH.

It has been greatly disputed, which of two *twins* is to be esteemed the elder?—The faculty of Montpellier have given it, that the latter born is to be reputed the elder, because first conceived: but by all the laws which now obtain, the first-born enjoys the privileges of seniority; and the custom is confirmed by the instance of Esau and Jacob.

But if two *twins* be born so intermixed, that one cannot distinguish which of the two appeared the first, it should seem that neither the one nor the other can pretend to the right of primogeniture, which ought to remain in suspense, by reason of their mutual concurrence.

In such case, some would have the decision left to the father, and others to the chance of a lot. Sometimes there are born three *twins*, as in the instances of the *Horatii* and *Curatii*; and sometimes there have been known four, or even five or more. See FOETUS, and EMBRYO.

**TWINS**, in astronomy. See the article GEMINI.

**TWIST** of a rope, cord, &c. See ROPE, CORDAGE, CABLE, &c.

**TWIST**,

**Twist**, again, is used for the inside, or flat part of a man's thigh, upon which a true horseman rests when on horseback. See **THIGH**.

To **Twist** a horse, is violently to wring or twist his testicles twice about, which causes them to dry up, and deprives them of nourishment, and reduces the horse to the same state of impotency with a gelding. See **GELDING**.

**Twisted Column**, } See the articles **COLUMN**.  
**Twisted Silks**, } **SILK**.

**Two thirds Subsidy**. See the article **DUTY**.

**TYCHONIC System**, or *Hypothesis*, is an order or arrangement of the heavenly bodies, of an intermediate nature between the Copernican and Ptolemaic, or participating alike of them both. See **SYSTEM**.

It takes its name from Tycho Brahe, a noble Dane, of whom some account is hereafter given, under the article **URANIBOURG**.

In this system, the earth is, with Ptolemy, placed in the middle, and supposed immovable; and the sun and moon to revolve in orbits, respecting the same as a centre: but the other five planets are supposed, with Copernicus, to revolve round the sun as their centre.—So that the orbits of the three superior planets include the earth, but not those of the inferior ones, by reason they are nearer to the sun than the earth is.

Accordingly, the heavens are here supposed to be fluid; and to consist of three different orbs or spheres; the first moveable, supposed to make a revolution in 24 hours; the second the sphere of the planets; and the third the firmament, or region of the fixed stars.—See the disposition of the heavenly bodies in this system, represented in *Tab. Astronomy, fig. 45*.

Some later astronomers finding the Ptolemaic system disagree with phenomena; and not daring to make the earth move; but at the same time disliking the *Tychonic* notion of two centres, one of them moveable, viz. the sun, and the other fixed, the earth; have framed a new system out of the Ptolemaic and *Tychonic*, called the *Semi-Tychonic*; wherein not only the Sun and Moon, but Jupiter also and Saturn, are supposed to move in excentrics or deferents, respecting the earth as a centre, though revolving at the same time in their respective epicycles.—But even here, the inferior planets are still supposed to move round the sun as their centre; their phases, observed with the telescope, being no otherwise accountable for. See **SUN**, **MOON**, **PLANET**, &c.

**TYLE**,\* or **TILE**, in building, a sort of thin, factitious, laminated stone, used in the roofs of houses; or, more properly, a kind of fat, clayey earth, knodden and moulded of a just thickness, dried and burnt in a kiln, like a brick, and used in the covering and paving of houses. See **BRICK**, and **COVERING**.

\* It is thus called from the French, *tuile*, of the Latin, *tegula*, which signifies the same.

*Tyles* are made, says M. Leybourn, of better earth than brick-earth, and something nearer akin to the potter's earth.—According to *stat. 17 Edw. IV.* the earth for *yles* should be cast up before the first of November, shired and turned before the first of February, and not made into *yles* before the first of March; and should likewise be tried and severed from stones, marle and chalk.—For the method of burning them, see **BRICK**.

As to the applying of *yles*; some lay them dry, as they come from the kiln, without mortar or any thing else: others lay them in a kind of mortar made of loam and horse-dung.—In some parts, as in Kent, they lay them in moss.

There are various kinds of *yles*, for the various occasions of building; as, *plain*, *thack*, *ridge*, *roof*, *crease*, *gutter*, *pan*, *crooked*, *Flemish*, *corner*, *hip*, *dorman*, *dormar*, *scallop*, *astragal*, *traverse*, *paving* and *dutch* *yles*.

**Plain** or **thack** **TYLES**, are those in ordinary use for the covering of houses. They are squeezed flat, while yet soft, in a mould.—They are of an oblong figure, and by *stat. 17 Edw. IV. c. 4.* are to be 10½ inches long, 6½ broad, and half an inch and half a quarter thick. But these dimensions are not over-strictly kept to.

**Ridge**, **roof** or **crease** **TYLES**, are those used to cover the ridges of houses; being made circular, breadth-wise, like a half cylinder.—These are what Pliny calls *laterculi*, and are by statute to be 13 inches long, and of the same thickness with the *plain* *yles*.

**Hip** or **corner** **TYLES**, are those which lie on the hips or corners of roofs.—As to form; they are first made flat, like *plain* *yles*, but of a quadrangular figure, whose two sides are right lines, and two ends, arches of circles; one end being a little concave, and the other convex: the convex end to be about seven times as broad as the concave end; so that they would be triangular, but that one corner is taken off: then, before they are burnt, they are bent on a mould, breadth-wise, like *ridge* *yles*.—They have a hole at their narrow end, to nail them on by; and are laid with their narrow end upwards. By statute, they are to be 10½ inches long, and of a convenient breadth and thickness.

**Gutter** **TYLES**, are those which lie in gutters or valleys in cross-buildings.—They are made like *corner* *yles*, only the corners

of the broad end are turned back again with two wings.—They have no holes in them, but are laid with the broad end upwards, without any nailing.—They are made in the same mould as *corner* *yles*, and have the same dimensions on the convex side. Their wings are each 4 inches broad and 8 long. **Pan**, **crooked**, or **Flemish** **TYLES**, are used in covering of sheds, lean-to's, and all kinds of flat-roofed buildings.—They are in form of an oblong parallelogram, as *plain* *yles*; but are bent breadthwise forwards and backwards, in form of an S, only one of the arches is at least three times as big as the other; which biggest arch is always laid uppermost, and the lesser arch of another *tile* lies over the edge of the great arch of the former.—They have no holes for pins, but hang on the laths by a knot of their own earth: they are usually 14½ inches long, and 10½ broad. By 12 G. I. c. 25. they are to be, when burnt, not less than 13½ inches long, 9½ wide, and half an inch thick.

**Dormar** or **dorman** **TYLES**, consist of a plain *tile* and a triangular piece of a plain one, standing up at right angles to one side of the plain *tile*, and swept with an arch of a circle from the other end, which end terminates in a point.—Of these *yles* there are two kinds; the triangular piece, in some, standing on the right, in others on the left side of the plain *tile*.—And of each of these, again, there are two kinds; some having a whole plain *tile*, others but half a plain *tile*. But in them all, the plain *tile* has two holes for the pins, at that end where the broad end of the triangular piece stands.

Their use is to be laid in the gutters, betwixt the roof and the cheeks or sides of the dormars, the plain part lying on the roof, and the triangular part standing perpendicularly by the cheek of the dormar.—They are excellent to keep out the wet in those places, and yet are not perhaps known any where but in *Suffex*.—The dimensions of the plain *tile* part are the same as those of a plain *tile*, and the triangular part is of the same length; and its breadth at one end 7 inches, and at the other nothing.

**Scallop** or **astragal** **TYLES**, are in all respects like plain *yles*; only their lower ends are in form of an astragal, viz. a semicircle, with a square on each side.—They are used in some places for weather *tyling*.

**Traverse** **TYLES**, are a kind of irregular plain *yles*, having the pin-holes broke out, or one of the lower corners broke off.—These are laid with the broken end upwards, upon rafters, where pinned *yles* cannot hang.

**Flemish** or **Dutch** **TYLES**, are of two kinds, *ancient* and *modern*.—The *ancient* were used for chimney-foot foot-paces: they were painted with antic figures, and frequently with postures of soldiers, some with compartments, and sometimes with moreque devices; but came much short, both as to the design and colours of the modern ones.

The *modern* *Flemish* *yles* are commonly used plaistered up in the jaumbs of chimneys, instead of chimney-corner-stones.—These are better glazed, and such as are painted (for some are only white) much better performed than the ancient ones. But both kinds seem to be made of the same whitish clay as our white glazed earthen ware.—The ancient ones are five inches and a quarter square, and about three quarters of an inch thick: the modern ones six inches and a half square, and three quarters of an inch thick.

**TYLER**, one that covers or paves with *yles*.

*Tylers* and bricklayers were incorporated 10 Eliz. under the name of Master and wardens of the society of freemen of the mystery and art of *tylers* and bricklayers. See **BRICK**.

**TYLERY**. See the article **TUILERIE**.

**TYLWITH**, in matters of heraldry and descent, is sometimes used for a tribe or family branching out of another; which the modern heralds more usually call the *second* or *third* house.

**TYMBER** of *Skins*. See the article **TIMBER**.

**TYMPAN**, or **TYMPANUM**, in architecture, the area of a pediment: being that part which is in a level with the naked of the freeze.—Or it is the space included between the three cornices of a triangular pediment, or the two cornices of a circular one.—See *Tab. Archit. fig. 36. lit. c.* See also the article **PEDIMENT**.

Sometimes the *tympan* is cut out, and the part filled with an iron lattice to give light; and sometimes it is enriched with sculpture, in basso relievo, as in the west front of St. Paul's, the temple of Castor and Pollux at Naples, &c.

**TYMPAN** is also used for that part of a pedestal, called the *trunk* or *dye*. See **PEDESTAL**, and **DYE**.

**TYMPAN**, among joiners, is also applied to the pannels of doors. See **PANNEL**.

**TYMPAN** of an *Arch*, is a triangular space or table in the corners or sides of the arch; usually hollowed and enriched, sometimes with branches of laurel, olive-tree, or oak; or with trophies, &c. sometimes with flying figures, as fame, &c. or sitting figures, as the cardinal virtues. See **ARCH**.

**TYMPAN**, in anatomy, mechanics, &c. See the article **TYMPANUM**.

**TYMPAN**, among printers, is a double frame belonging to the press, covered with parchment, on which the blank sheets are laid, in order to be printed off. See **PRINTING Press**.

**TYMPANITES**, or **TYMPANY**, in medicine, a flatulent tumor, or swelling of the abdomen or belly; very hard, equal, and permanent; whereby the skin is stretched so tight, that when struck, it gives a sound like that of a drum. See **TUMOR**.

The *tympanites* is a species of dropsy, by some called a *dry dropsy*: but what the cause and seat of the disease is, or what the morbid matter is that occasions the tumour, physicians are not at all agreed. See **DROPSY**.

Wind certainly makes a principal part of the morbid matter; but this is scarce ever found without water, excepting at the beginning; so that some will not allow of any difference between the *tympany* and the *ascites*.

Some suppose it to arise from a watry humour extravasated and rarified into vapour; and by a property common to it with common air, corrupting the parts.—But this, Boerhaave makes a particular kind of *tympanites*, or wind dropsy; and adds, that it is cured like the *ascites*, or water dropsy, by tapping, &c. See **PARACENTESIS**, and **ASCITES**.

Others will have the *tympanites* to arise from the air's insinuating itself through perforations in the putrified intestines.—A *tympanites* from this cause, Boerhaave, who makes it a peculiar class, observes, is almost always incurable.

Willis sets aside this latter cause, and accounts for the disease from an irregularity in the animal spirits belonging to the viscera, which rushing tumultuously into the nervous fibres, bloat them up: thus is the peritoneum inflated, the intestines distended, and the mesentery, and other viscera, rendered turgid; and while this is doing, that the vacuities left in the tumified viscera may be filled up, a quantity of the humour contained in them is rarified into vapour, which presently spreads in blasts through the vacant places.—Others account for the *tympanites* from a convulsion of the muscles of the abdomen, &c.

M. Littré has proposed a new system of the *tympanites*, built on a great number of observations.—According to him, it does not proceed from any convulsion of the abdominal muscles, nor from any air contained in the cavity thereof, or in the thorax, the mesentery, or epiploon; but from the air inclosed in the stomach and intestines, which swells them excessively.

This air, always carried into those parts with the food, maintains a kind of equilibrium therein; opposing on the one hand, the too great pressure on that long canal when empty of food; and finding, on the other side, in the spring of the coats of the stomach and intestines, an obstacle capable of preventing its too great dilatation.

If this equilibrium chance to be destroyed by the irritation of the fibres, whose spring in that case prevails over that of the air, this latter is expelled either upwards or downwards, or both: (whence belching, &c.) But if the equilibrium come to be broke by the force of the air, rendered superior to that of the fibres, by those latter being left destitute of spirits, from the blood's being impoverished after a long sickness; in that case, the air rarifying itself beyond measure, swells the cavities it is contained in.

If it be demanded, why when the stomach and intestines are so full of wind, none of the wind escapes, either through the anus, or by the mouth, which uses to be expelled by those passages?

M. Mery solves the paradox thus: according to this theory, the fibres, both of the stomach and intestines have lost their spring, at least in part, and are in an imperfect palsy; but the winds evacuated either by the anus or mouth, are winds which those viscera expel out of their cavities, by putting them in a state of contraction capable of surmounting the forces which oppose the egress of the matters contained in those cavities.—These forces are two sphincters, one whereof shuts the upper orifice of the stomach, and the other the anus: but paralytic viscera, i. e. viscera destitute of spirits, in which alone consists the strength of the muscles, cannot overcome the resistance of those two muscles: whence the wind, therefore, cannot escape through its usual outlets.

The *tympanites* rarely kills of itself; but frequently degenerates into an *ascites*.—Cathartics rather aggravate than alleviate it: antihysterics, antiscorbutics, chalybeats, and strengtheners are of use, before it be commenced an *ascites*. Equal quantities of leek and elder leaves mixed analytically, is a famed empirical medicine, which has often proved effectual when every thing else had failed.

It is usual to apply carminatives to the belly, as the emplaster of cummin-seeds, &c. and also to use carminatives mixed with cathartics, diuretics, &c. internally: but if the disease proceed from a paralytic cause, destroying the tone of the fibres of the first passages, what is of use in rectifying paralytic disorders, where the tension of the fibres is insufficient, will doubtless for the same reason be of use here. See **PALSY**.

**TYMPANUM**, **TYMPANON**, *drum*; a musical instrument, which, among the ancients, consisted of a thin piece of leather or skin, stretched upon a circle of wood or iron, and beat with the hand: See **DRUM**.

**TYMPANUM**, **TYMPAN**, in mechanics, is a kind of wheel

placed round an axis or cylindrical beam, on the top of which are two levers or fixed staves, for the more easy turning the axis about, in order to raise a weight required. See **WHEEL**. The *tympanum* is much the same with the peritrochium; but that the cylinder of the axis of the peritrochium is much shorter and lesser than the cylinder of the *tympanum*. See **PERITROCHUM**.

**TYMPANUM** of a machine, is also used for any hollow wheel, wherein one or more people, or other animals, walk to turn it; such as that of some cranes, calenders, &c. See **WHEEL**.

**TYMPANUM**, in anatomy.—*Membrana TYMPANI*, is a thin tender skin or membrane, stretched upon a bony circle, in the meatus auditorius of the ear, which it shuts; and supposed to be the immediate organ of hearing.—See *Tab. Anat. (Osteol.) fig. 13. lit. c.* See also **EAR**.

The *tympanum*, popularly called the *drum*, with respect to the erect posture of the body, is situate obliquely, facing downwards; whence it is that we hear sounds coming from below, better than those from above. See **DRUM**.

Its external surface is a little hollow in the middle.—It is composed of two membranes, or, as others will have it, of only two or more lamellæ of one.—It has a perforation, or, at least a disengaged part, which admits of the passage of wind, and, in some, of smoke from the meatus a palato. See **FORAMEN**.

Behind it, is a cavity of the os petrosus, called *tympani cavitas*, and sometimes simply *tympanum*; wherein are four little bones, viz. the *malleolus*, *incus*, *stapes*, and *os orbiculare*: which see under their respective articles, **MALLEOLUS**, &c. Within the *cavitas tympani*, Vieussens has discovered a very fine thin membrane, serving to shut the door of the labyrinth, and prevent the internal air from having any communication with the external.—The *membrana tympani* has a remarkable branch of a nerve passing on its internal surface between the incus and malleolus, called the *chorda tympani*. See **CHORDA**. The *tympanum*, Dr. Willis takes to be a kind of preparatory instrument to hearing; and its office to be, to receive the first impressions of sounds, or the sensible species, and to convey them duly modified and proportioned to the sensorium. See **SOUND**, **SENSATION**, &c.

Its office, in effect, with respect to the sense of hearing, seems to be the same as that of the pupil of the eye with regard to seeing: each of them prevent the ingress of too many rays, temper and soften them, and deliver them, as it were, commensurate to the sensory; upon which, if they should fall immediately, they might be apt to spoil its delicate constitution. See **PUPIL**.

The *tympanum*, it is true, does not hear: but it contributes to the better and safer hearing.—That it may do the office of a porter the better, it is necessary its expanse should, like the pupil, be contracted and relaxed on occasion; and to this purpose serve the four little bones above-mentioned, which have the same use in straining and relaxing, as the braces of the war drum have in that instrument.—By means of this extension and retraction, the *tympanum* is made to correspond to all sounds loud or languid; as the pupil does to all the degrees of light. See **HEARING**.

The ingenious Dr. Holder has improved on this theory. He conceives that the action of the muscle, whereby the *tympanum* is stretched and relaxed, does ordinarily and constantly draw it to a moderate tension; but when we have occasion to listen, and give a particular attention to any sound, the action of that muscle is then more intense, and the drum is drawn to a more than ordinary tension, to facilitate the passage of the sound. See **ATTENTION**.

Upon these considerations, that author having a young gentleman, who was born deaf, put into his hands, and perceiving the great defect to lie in the want of a due tension of the *tympanum*, he advised his mother to consult with physicians, whether by some astringent fumes, or otherwise, it might not be restored to a due tension.

In the mean time, he thought of a temporary way, by the pulse of any vehement sound; as of a drum beaten near him: which sound, during its continuance, must needs give the *tympanum* a tension, by driving and swelling it outwards, as a fresh gale of wind fills the sails of a ship. And the experiment succeeded according to expectation: for so long as he beat a drum fast and loud by him, he could hear those that stood by him call him gently by his name. But when the drum ceased, he could no longer hear the same persons calling him very loudly. See **DEAFNESS**.

But what makes the use of the *tympanum* appear the less considerable is, that there are instances where the hearing has been perfect, without any use of a *tympanum*.—Mr. Chefelden relates, that he broke the *tympanum* in both ears of a dog, yet it did not destroy his hearing; though for some time afterwards he received strong sounds with great horror: He adds, that Mr. St. Andre assured him, that a patient of his had the *tympanum* destroyed by an ulcer, and the auditory bones cast out, without destroying his hearing.

*Chorda TYMPANI*. See the article **CHORD**.

# T Y P

**TYMPANUM**, in architecture. See the article **TYMPANUM**.  
**TYMPANY**, **TYMPANIAS**, or **TYMPANITES**, in medicine. See the article **TYMPANITES**.

**TYPE**, \* **TYPUS**, a copy, image, or resemblance of some model. See **MODEL**, **IMAGE**, &c.

\* The word is formed from the Greek, *τυπος*, form, figure.

The term *type* is less in use than its compounds *prototype* and *archetype*, which are the originals that are made without models. See **ARCHETYPE**, **PROTOTYPE**, **ECTYPE**, &c.

**TYPE** is also a scholastic term, much used among divines, signifying a symbol, sign, or figure of something to come.

In this sense, the word is commonly used with relation to *antitype*, *αντιτυπος*, which is the thing itself, whereof that is a *type*, or figure. See **ANTITYPE**.

Thus, Abraham's sacrifice, the paschal lamb, &c. were *types*, or figures of our redemption: the brazen serpent was a *type* of the cross, &c.

*Types* are not mere conformities, or analogies, which the nature of things holds forth between them; nor arbitrary images arising merely from the casual resemblance of things: but there is further required a particular institution of God to make a *type*; a particular declaration of his that it is so.

Gale divides *types* into *historical* and *prophetic*.—The first are those used by the ancient prophets in their agitations and visions: the second, those wherein things done, or ceremonies instituted in the Old Testament, prefigure Christ, or things relating to him in the New Testament.

The ancient fathers, as well as the modern critics, have been greatly divided about the nature and use of *types*, and *typical* representations, in the Old Testament; and it is this makes one of the great difficulties in understanding the ancient prophecies, and in reconciling the New and Old Testament together. See **PROPHECY**.

There is no denying but that there were *types* which the divine wisdom instituted to be the shadows and figures of things to come; and yet people run into an excess that way: some looking for *types* in every thing; like Origen, who discovered mysteries in the very caldrons of the tabernacle.—One should be contented with the more sensible and obvious ones; nor propose any without proving them as much as possible, and shewing that they were really intended for *types*, in order to justify the solidity of the reasoning of the apostles, who argued from them.

A late author maintains, that not the fathers only, but St. Paul himself, was of the opinion, that "Christianity was all contained in the Old Testament, was implied in the Jewish history and law; both which are to be reputed *types* and shadows of Christianity."—In order to which, he quotes Hebrews viii. 5. x. 1. and Colos. ii. 16, 17.—He adds, "That the ritual laws of Moses, being in their own nature no other than *types* and shadows of future good things, are to be considered as having the effect of prophecies."—This is likewise the sense of Mr. Whiston, and others; but the same author even quotes our Saviour speaking in behalf of this *typical* reasoning, in that passage Matth. xi. 13. where he affirms, that "The law prophecies; and that he came to fulfil the law as well as the gospel," Matth. v. 17. *Disc. of the Grounds*, &c.

An ingenious divine takes this occasion to observe, that had the ancients, with the modern retainers to the *typical* way, expressly designed to have exposed Christianity, they could not have done it more effectually than by thus making every thing *types* and prophecies.—It is no wonder, he adds, that atheists and deists scoff at the credulity of Christians, and reject what is supported by such folly and absurdity.

Not that he denies the reality of such thing as *types*.—It is manifest, there were many under the Old Testament; such were Zachariah's staves, beauty and bands, ch. xi. 7, 10, 14; such was Hosea's adulterous wife, ch. i. 2; and such were his children, ver. 4, 6.—The prophets designed by these to prefigure future events; but in these instances the reader is at once, by the declaration of the prophet, made to understand as much, and not left to his own conjectures about them, after the events are over.

In effect, all this is urged from scripture for the *typical* or allegorical interpretation of the Jewish law, history, ceremonies, &c. it is asserted, may be set aside, without any violence to the sacred text, which may be explained on more natural and intelligible principles, and more consistently with grammar. See **ALLEGORICAL**.

The word *τυπος*, we have observed, literally denotes no more than a copy or impression of any thing; and accordingly, in our translation, we find it sometimes rendered by *print*, sometimes by *figure*, sometimes by *fashion*, and sometimes by *form*.

Hence also the word is figuratively applied to denote a moral pattern; in which sense it signifies no more than *example* and *similitude*.

Again, the word *αντιτυπος*, in scripture, signifies any thing formed according to a model or pattern; and thus in the epistle to the Hebrews, the tabernacle, and holy of holies being made according to the pattern shewn to Moses, are said to be *antitypes* or figures of the true holy places.—In the like

# T Y P

sense, St. Peter speaking of the flood and the ark, whereby eight persons were saved, calls baptism an *antitype* thereto; by which he expresses no more than a similitude of circumstances.

The other words used in scripture to imply a future event, prefigured by some foregoing act, are—*τυπος*, rendered by *imitation* and *example*; and *σκια*, *shadow*.

This last word is frequently used by St. Paul, and applied to the Jewish law, ceremonies, priests, &c. which are represented as only shadows of things to come, or of heavenly things. It is from such general expressions, that people were led to mistake the apostle's design in these comparisons, and to assert, that all the Mosaic rites were *types* of, or designed to signify future events; and that the gospel is to be found in the pentateuch.—Whereas St. Paul's intent appears no other than to shew the great advantage of the gospel over the law in several particulars, wherein it has as much pre-eminence as the substance has over the shadow. See **ACCOMMODATION**.

If the shadow of things to come signify a prefiguration of future events, what are those events to which the Jewish new moons, Col. ii. 16. or the Jewish meats and drinks, have a respect? Or, how did the law of Moses, made of commands about persons, times, places, and sacrifices, prefigure a dispensation where regard to sacrifices, holy persons, times and places, are so far from being enjoined, that they are declared useless? Can a particular holy place in the law be designed a prefiguration of a state where all places are equally holy? Such being the import of all the terms used in the New Testament writers, seeming to imply any prefiguration of future events under the gospel, we may observe,

1. That to argue from *types*, is only to argue from examples or similitudes; and, consequently, all inferences drawn from such reasonings, are no farther conclusive, than reasonings from similitudes are.—The intent of similitudes is only to help to convey some ideas more clearly or strongly; so that to deduce consequences from a simile, or infer any thing from other parts of the simile than what are plainly similar, is absurd.

2. It cannot be proved that the ceremonies of the Mosaic law were ever designed to prefigure any future events in the state of the Messiah's kingdom.—No such declared prefigurations are mentioned in the writings of the Old Testament, whatever notions prevailed among the writers who immediately followed. It is granted, that the apostles argued from the rites in the Mosaic institution; but it appears to have only been by way of illustration and analogy.

There is certainly a general likeness in all the dispensations of Providence: an analogy of things in the natural as well as the moral world, from which it is easy arguing by way of parity, and it is very just and usual so to do: but that one of these dispensations was therefore given to prefigure another that was future, can never be proved, unless it be expressly declared.—The Land of Promise, we know, was to be a place where the Jews were to enjoy rest from their labours; God likewise did, himself, rest the seventh day from his works: yet, who ever imagined God's rest from the creation to be prefigurative of the Jews rest in Canaan? and is it not equally reasonable to say, that God's rest on the seventh day, prefigured the entrance of the Jews into Canaan, as to say, that the Jews rest in Canaan prefigured the rest mentioned by David in the Psalms?

This will equally imply, that all the following events in the uniform course of God's government, similar to any preceding ones, were designed to be prefigured; in which sense, it will readily be owned, that the rest of the Jews was *typical* of the rest of the Christians.

It is in the same manner we are to understand St. Paul, where he says, "That Christ our passover is sacrificed for us." And thus we are to understand John the Baptist, when he calls our Saviour the "Lamb of God."—There was this similitude of circumstance, that Christ was slain on the same day with the paschal lamb; that he died about the same time of the day when the priests began their hillel; that not a bone of the one or the other was broken. Add, that as the paschal lamb was without blemish, so was Christ without sin.—From these, and other circumstances, the apostle applied the term *passover* to Christ.

Thus, also, are we to account for what St. Paul calls the baptism of the children of Israel in the cloud, and in the sea; and for the comparison betwixt the high priest entering the holy place every year, and Christ entering into heaven. See **QUOTATION**.

**TYPE**, \* **ΤΥΠΟΣ**, is also a name given to an edict of the emperor Constant II. published in 648, to impose a general silence both on the orthodox and the Monothelites. See **MONOTHELITE**.

\* It had the name *type*, as being a kind of formulary of faith; or rather a form whereon men were to regulate their conduct. The *type* owed its original to Paul, patriarch of Constantinople, who persuaded that emperor to take away the *ecthesis* compiled and hung up in all the public places by Heraclius; (as occasioning great complaints from the orthodox, by its favouring the Monothelites) and to publish an edict to impose silence on both parties.

But

## TYR

But such kinds of pacifications are held inexcusable in matters of religion; accordingly pope Theodore soon procured the patriarch Paul to be deposed: the *type* was examined in the council of Rome in 649, and condemned; and an anathema pronounced against all such as admitted either the impious ecsthesis or *typus*. See ECTHESIS.

TYPE, TYPUS, is also used to denote the order observed in the intension and remission of fevers, pulses, &c. See FEVER, PULSE; &c.

TYPHODES, ΤΥΦΩΔΗΣ, in medicine, a kind of ardent or burning fever usually attending on erysipelas of any of the viscera. See FEVER.

TYPHOMANIA, \* ΤΥΦΟΜΑΝΙΑ, in medicine, a disease of the brain; wherein the patient not being able to sleep, though greatly inclined thereto, lies with his eyes shut, talks absurdly, and flings himself this way and that.

\* The word is formed from the Greek, τυφω, *smoke*, and μανα, *madness*.

If he be pulled, or the like; he just opens his eyes, looks about, and sinks again into a kind of dozing, which is interrupted by a train of disagreeable imaginations.

The *typhomania* is a kind of combination of a phrenzy with a lethargy.—It is also called a *coma vigil*. See COMA, PHRENZY, and LETHARGY.

TYPOGRAPHY, \* the art of printing. See PRINTING.

\* The word is formed from the Greek, τυπω, and γραφω, *scriptura*, *writing*.

TYRANT, TYRANNUS, among the ancients, denoted simply a king, or monarch. See KING, and MONARCH.

## TYT

But the ill use several persons invested with that sacred character, made of it, has altered the import of the word; and *tyrant* now carries with it the idea of an unjust and cruel prince, who invades the people's liberty, and rules in a more despotic manner than the laws of nature, or the country do allow of.

The term *tyrant*, we are told, became odious among the Greeks, those zealous lovers of liberty, almost as soon as introduced: but Donatus assures us, it was never taken so among the Romans till the latter ages of that empire.

TYRIAN-Purple, } See the articles } PURPLE.

TYRO, } See the articles } TYROCINIUM.

TYROCINIUM, \* TYROCINY, a novitiate or apprenticeship in any art or science. See NOVICE, and NOVITIATE.

\* The word is formed of *tyro*, a *raw*, *fresh-water* soldier.

We have several writings under the title of *tyrociniums*: *tyrocinium chymicum*, *tyrocinium chirurgicum*, &c. containing the rudiments of those arts, accommodated to the apprehensions of the beginners.

TYROSIS, \* ΤΥΡΩΣΙΣ, in medicine, a coagulating or curdling of milk in the stomach; after the manner of cheese. See CURDLING, and COAGULATION.

\* The word is formed of the Greek, τυρος, *caseus*, *cheese*. See CHEESE.

TYTH, or rather TITHE. See the article TITHE.

TYTHING and TYTHING-Man. See TITHING, DECENNIAL, TENMENTALE, HUNDRED, WAPENTAKE, &c.

U,

## V A C

## V A C

U,

The twentieth letter in the alphabet, and the fifth vowel. See LETTER, and VOWEL. Besides the vowel *u*, there is a consonant of the same denomination, wrote *v*, or *v*. See CONSONANT.

The pronunciation of the *u*, as now used among the English, French, &c. is borrowed from the antient Gaulish: for all the other western people, with the Romans, pronounce it *ou*.

V is also a numeral letter, and signifies *five*; according to the verse,

V, *vero quinque dabit tibi, si recte numerabis.*

When a dash was added atop, *V̄*, it signified 5000.

V. R. among the Romans, stood for *uti rogas*, as you desire: which was the mark of a vote, or suffrage for the passing of a law. See ROGATIO; see also A.

VACANCY, or VACUUM, in philosophy, an empty interval, or space void of matter. See VACUUM.

VACANCY, in law, &c. a post or benefice wanting a regular officer, or incumbent. See AVOIDANCE, &c.

The canonists hold, that the kind of *vacancy* is to be expressed in the impetration of a benefice. See BENEFICE.

A future *vacancy*, or voidance of a spiritual living, some writers call *vacatura*.—Devolution is a species of canonical *vacancy*. See DEVOLUTION.

VACANT Effects, *Prædia VACATIA*, or *VACUA*, are such as are abandoned for want of an heir, after the death or flight of their former owner. See GOODS.

In our law-books, *vagantes terræ*, for *vacantes*, expresses forsaken, or uncultivated lands.

A benefice is said to be *vacant in curia Romana*, when the incumbent dies in Rome, or within twenty leagues thereof; though it be only by accident that he was there.—The pope nominates to all benefices *vacant in curia Romana*, excepting those of the neighbouring bishopricks.

VACANT Cylinder, in gunnery. See the article CYLINDER.

VACATION, *Non-term*, in law, all the time included between the end of one term, and the beginning of the next succeeding one. See TERM.

This intermission was called by our ancestors *pax Dei*, and *ecclesiæ*; and sometimes, the *time or days of the king's peace*. See PEACE.

Among the Romans, it was called *justitium*, or *feriæ*, or *dies nefasti*. See DAY, NEFASTUS, FASTUS, FERIE, &c.

The time from the death of a bishop, or other spiritual person, till the bishoprick, or other dignity be supplied by another, is also called *vacation*. See PLENARTY.

Cicero, in his *Orations*, mentions a law, whereby the priests were exempted from service in all wars, except only uproars, and civil tumults; which exemptions he calls *vacationes*.

VACUUM, VACUITY, in physics, a space empty or devoid of all matter, or body. See SPACE, and MATTER.

Whether there be any such thing in nature as an absolute *vacuum*; or whether the universe be completely full, and there be an absolute plenum; is a thing has been controverted by the philosophers of all ages. See PLENUM.

The ancients, in their controversies, distinguished two kinds; a *vacuum coacervatum*, and a *vacuum interspersum*, or *diffeminatum*.

VACUUM *Coacervatum*, is conceived as a place destitute of matter: Such, *e. gr.* as there would be, should God annihilate all the air, and other bodies within the walls of this chamber.

The existence of such a *vacuum* is maintained by the Pythagoreans, Epicureans, and the Atomists, or Corpuscularians; most of whom assert such a *vacuum* actually to exist without the limits of the sensible world.—But the modern Corpuscularians, who hold a *vacuum coacervatum*, deny that application; as conceiving, that such a *vacuum* must be infinite, eternal, and uncreated. See UNIVERSE.

According, then, to the later philosophers, there is no *vacuum coacervatum* without the bounds of the sensible world; nor would there be any *vacuum*, provided God should annihilate divers contiguous bodies, than what amounts to a mere privation, or nothing: the dimensions of such a space, which the ancients held to be real, being by these held to be mere negations; that is, in such a place, there is so much length, breadth, and depth wanting, as a body must have to fill it.—To suppose, that when all the matter in a chamber is annihilated, there should yet be real dimensions, is to suppose corporeal dimensions without body; which is absurd.

The Cartesians, however, deny any *vacuum coacervatum* at all; and assert, that if God should immediately annihilate all the matter, *v. gr.* in this chamber, and prevent the ingress of any other matter, the consequence would be, that the walls would become contiguous, and include no space at all.—

They add, that if there be no matter in a chamber, the walls can be conceived no otherwise than as contiguous; those things being said to be contiguous, between which there is not any thing intermediate: but, if there be no body between, there is no extension between; extension and body being the same thing: and if there be no extension between, then the walls are contiguous; and where is the *vacuum*?

But the reasoning is built on a mistake, *viz.* that body and extension are the same thing. See EXTENSION, and SPACE.

VACUUM *Diffeminatum*, or *Interspersum*, is that supposed to be naturally interspersed in, and among bodies, in the pores of the same body, and in the interstices between different bodies. See PORE.

It is this kind of *vacuum* which is chiefly disputed among the modern philosophers: the Corpuscularians strenuously asserting it; and the Peripatetics, and Cartesians, as stiffly impugning it. See CORPUSCULAR, CARTESIAN, &c.

The great argument the Peripatetics urge against a *vacuum interspersum*, is, that there are divers bodies frequently seen to move contrary to their own nature, and inclination; and for no other apparent reason, but to avoid a *vacuum*: whence they conclude, that nature abhors a *vacuum*; and give us a new class of motions ascribed to the *fuga vacui*, or nature's flying a *vacuum*. See FUGA.

Such is the rise of water in a syringe, upon the drawing up the piston; such also is the ascent of water in pumps, the swelling of the flesh in a cupping-glass, &c.

But since the weight, elasticity, &c. of the air have been ascertained by sure experiments, those motions and effects are universally ascribed to the gravity, and pressure of the atmosphere. See AIR; see also SYRINGE, PUMP, CUPPING-Glass, &c.

The Cartesians deny not only the actual existence, but even the possibility of a *vacuum*: and that on this principle, that extension being the essence of matter, or body, wherever extension is, there is matter: but mere space, or vacuity, is supposed to be extended; therefore it is material.—Whoever asserts an empty space; conceives dimensions in that space; *i. e.* conceives an extended substance in it; and therefore denies a *vacuum*, at the same time that he admits it.

On the other hand, the Corpuscular authors prove, not only the possibility, but the actual existence of a *vacuum*, from divers considerations; particularly from the consideration of motion in general; and that of the planets, comets, &c. in particular; from the fall of bodies; from the vibration of pendulums; from rarefaction, and condensation; from the different specific gravities of bodies; and from the divisibility of matter into parts.

1°. It is argued, that motion could not be effected without a *vacuum*. See MOTION.—This is what Lucretius urged long ago—*Principium quoniam cedendi nulla daret res—undique materies quoniam stipata fuisset.*

The force of this argument will be increased from the two following considerations, *viz.* first, that all motion is either in a straight line, or in a curve which returns into itself, as the circle, and ellipsis; or in a curve that does not return into itself, as the parabola, &c. And, secondly, that the moving force must always be greater than the resistance.

For, hence it follows, that no force, even though infinite, can produce motion where the resistance is infinite; consequently, there can be no motion either in a straight line, or a non-returning curve; because, in either of those cases, the protrusion, and consequently the resistance, would be infinite.

—There remains, therefore, only the motion in a revolving curve practicable; which must either be a revolution upon an axis, or an annular motion round a quiescent body; both which are, again, impossible in an elliptic curve: and consequently, all motion must be in circles geometrically true; and the revolving bodies must either be spheres, spheroids, cylinders, or portions of them, exactly geometrical; otherwise, their revolutions in a plenum would be impossible: but such motions, or such figured bodies, we do not know in nature. Therefore there is a *vacuum*.

2°. The motions of the planets, and comets, demonstrate a *vacuum*: thus Sir Isaac Newton—"That there is no such fluid medium as æther, (to fill up the porous parts of all sensible bodies, as the air, and interstellar parts, and so make a plenum) "seems probable; because the planets and comets "proceed with so regular and lasting a motion, through "the celestial spaces, both from and to all parts: for "hence it appears, that those celestial spaces are void of "all sensible resistance, and consequently of all sensible matter. For the resisting force of fluid mediums, arises partly from the attrition of the parts of the medium, and partly from the inactivity of matter.—Now, that part "of the resistance of any medium, which arises from the

"tenacity, or attrition of its parts, may be lessened by dividing the matter into smaller parts, and by rendering those parts more smooth and slippery: but that part of the resistance which arises from the inactivity of matter, is always in proportion to the density of the matter; nor can be diminished by dividing the matter, nor by any other means, except by diminishing the density thereof.

"Consequently, if the celestial regions were as dense as water, or quicksilver, they would resist almost as much as water or quicksilver; but if they were perfectly dense, without any interspersed vacuity, though the matter were ever so fluid and subtle, they would resist more than quicksilver does; a perfect solid globe, in such a medium, would lose above half its motion, in moving three lengths of its diameter; and a globe not perfectly solid, such as the bodies of the planets and comets are, would be stopped still sooner.—Therefore, that the motion of the planets and comets may be regular, and lasting, it is necessary the celestial spaces be void of all matter, except perhaps some few, and much rarified effluvia of the planets and comets, and the passing rays of light. See RESISTANCE, MEDIUM, PLANET, COMET, &c.

3°. The same great author deduces a *vacuum* from the consideration of the weights of bodies; thus: "All bodies about the earth gravitate towards the earth; and the weights of all bodies, equally distant from the earth's centre, are as the quantities of matter in those bodies.—If the æther, therefore, or any other subtle matter, were altogether destitute of gravity, or did gravitate less than in proportion to the quantity of its matter; because (as Aristotle, Des Cartes, and others argue) it differs from other bodies only in the form of the matter; the same body might, by the change of its form, gradually be converted into a body of the same constitution with those which gravitate most in proportion to the quantity of matter: and, on the other hand, the most heavy bodies might gradually lose their gravity, by gradually changing their form: and therefore the weights would depend upon the forms of bodies, and might be changed with them; which is contrary to all experiment. See WEIGHT.

4°. The descent of bodies proves that all space is not equally full; for the same author goes on, "If all spaces were equally full, the specific gravity of that fluid, with which the region of the air would in that case be filled, would not be less than the specific gravity of quicksilver or gold, or any other the most dense body; and therefore neither gold, nor any other body, could descend therein.—For bodies do not descend in a fluid, unless that fluid be specifically lighter than the body.—But by the air-pump, we can exhaust a vessel, till even a feather shall fall with a velocity equal to that of gold in the open air: the medium, therefore, through which the feather falls, must be much rarer than that through which the gold falls. See DESCENT.

"The quantity of matter, therefore, in a given space, may be diminished by rarefaction: and why may not it be diminished in infinitum? Add, that we conceive the solid particles of all bodies to be of the same density; and that they are only rarefiable by means of their pores: whence a *vacuum* evidently follows. See RAREFACTION, PORES, and PARTICLE.

5°. "That there is a *vacuum*, is evident from the vibrations of pendulums: for since those bodies in places out of which the air is exhausted, meet with no resistance to retard their motion, or shorten their vibrations; it is evident there is no sensible matter in those spaces, or in the occult pores of those bodies. See PENDULUM.

For, as to what Des Cartes urges of his *materia subtilis*, that its tenuity prevents its resistance from being sensible, and that a small body striking against a greater, cannot in the least move, or resist the motion of that other; but is reflected back again with all its momentum: it is contrary to all experience. For Sir Isaac proves, that the density of fluid mediums, is proportionable to their resistances, very nearly; and that they are exceedingly mistaken, who suppose the resistance of projectiles to be infinitely diminished, by dividing the parts of the fluid, even in infinitum. (*Princip. Lib. II. Prop. 38.*) When, on the contrary, it is clear the resistance is but little diminished by the subdivision of the parts; (*ibid. Prop. 40.*) and that the resisting forces of all fluids are nearly as their densities.—For why should not the same quantity of matter, whether divided into a great number of subtle parts, or into a few larger ones, have the same resisting force? If then there were no *vacuum*, it would follow, that a projectile moving in the air, or even in a space whence the air is exhausted, should move with as much difficulty as in quicksilver; which is contrary to experience. See PROJECTILE.

6°. That there are interspersed vacuities, appears from matter's being actually divided into parts, and from the figures of those parts: for, on supposition of an absolute plenitude, we do not conceive how any part of matter could be actually divided from that next adjoining, any more than it is possible

to divide actually the parts of absolute space from one another: for by the actual division of the parts of a continuum from one another, we conceive nothing else understood, but the placing those parts at a distance from one another, which, in the continuum, were at no distance from one another: but such divisions between the parts of matter, must imply vacuities between. See DIVISIBILITY.

7°. As for the figures of the parts of bodies, upon the supposition of a plenum, they must either be all rectilinear, or all concavo-convex; otherwise, they would not adequately fill space; which we do not find to be true in fact.

8°. The denying a *vacuum*, supposes what it is impossible for any one to prove to be true; viz. that the material world has no limits. See UNIVERSE.

Since then the essence of matter does not consist in extension, but in solidity, or impenetrability, the universe may be said to consist of solid bodies moving in a *vacuum*: nor need we at all fear, lest the phenomena of nature, most of which are plausibly accounted for from a plenitude, should become inexplicable when the plenum is set aside.—The principal ones, such as the tides; the suspension of the mercury in the barometer; the motion of the heavenly bodies, of light, &c. are more easily and satisfactorily accounted for from other principles. See TIDES, &c.

*VACUUM*, or *Vacuum Boyleanum*, is also used, somewhat abusively, to express that approach to a real *vacuum*, which we arrive at by means of the air-pump. See AIR-PUMP.

Thus, any thing put in a receiver so exhausted, is said to be put in *vacuo*: and thus, most of the experiments with the air-pump, are performed in *vacuo*, or in *vacuo Boyleano*.

Some of the principal phenomena observed of bodies in *vacuo*, are; that the heaviest and lightest bodies, as a guinea and a feather, fall here with equal velocity:—That fruits, as grapes, cherries, peaches, apples, &c. kept for any time in *vacuo*, retain their nature, freshness, colour, &c. and those withered in the open air, recover their plumpness in *vacuo*:—All light, and fire becomes immediately extinct in *vacuo*:—The coalition of flint and steel in *vacuo*, produces no sparks:—No sound is heard, even from a bell rung in *vacuo*:—A square viol, full of common air, well closed, breaks in *vacuo*; a round one does not:—A bladder half full of air, will heave up forty pound weight in *vacuo*:—Cats, and most other animals, readily expire in *vacuo*.

By experiments made in 1704, Mr. Derham found, that animals which have two ventricles, and no foramen ovale, as birds, dogs, cats, mice, &c. die in less than half a minute, counting from the first exsuction: a mole died in one minute, a bat lived seven or eight.—Insects, as wasps, bees, grasshoppers, &c. seemed dead in two minutes; but, being left in *vacuo* twenty four hours, came to life again in the open air: snails continued twenty four hours in *vacuo*, without appearing much concerned.

Seeds planted in *vacuo* do not grow:—Small bear dies, and loses all its taste in *vacuo*:—Lukewarm water boils very vehemently in *vacuo*:—Air, rushing through mercury into a *vacuum*, throws the mercury in a kind of shower upon the receiver, and produces a great light in a dark room. See ATTRITION, &c.

The air-pump can never produce a precise *vacuum*; as is evident from its structure, and the manner of its working: in effect, every exsuction only takes a part of the air: so that there will still be some left after any finite number of exsuctions.—Add that the air-pump has no longer any effect, than while the spring of the air remaining in the receiver, is able to lift up the valves: when the rarefaction is come to that degree, you can come no nearer to a *vacuum*. Sir Isaac Newton, observing that a thermometer suspended in *vacuo*, and in that state removed to a warm or a cold room, receives the heat or cold, rises, or falls, almost as soon as another in open air; takes thence occasion to suspect, that the heat of the warm room is conveyed through the *vacuum*, by the vibrations, of a much subtler medium than air, which remained in the *vacuum* after the air was drawn out. (*Opt. p. 323.*) See MEDIUM, HEAT, &c.

*VADARI*, in the civil law, denotes a person to pledge, undertake, or give security in behalf of another; that he shall, on a certain day, appear in court, to prosecute, or answer. See VOUCH, and APPEARANCE.

If he fails, his surety has an action *vadimonii deserti* against him; that is, an action for deserting his bail. See VADIMONIUM, BAIL, DEFAULT, &c.

Properly speaking, *vadari reum*, among the Romans, was the act of the plaintiff himself, who here demanded surety, or bail from the defendant, that he would appear before the prætor on a certain day.

*VADLECT*. See the article VALLECT.

*VAD-MECUM*, or a *VENI-MECUM*, a Latin phrase, used in English, to express a thing that is very handy, and familiar; and which one usually carries about with him: chiefly applied to some favourite book.

Some make Virgil, others Horace, their *vade-mecum*; others an Epictetus, others a Thomas à Kempis, &c.

This

This is what the Greeks call *συγγενής*, or *manual*.—The Arabs have a phrase of equal import; viz. *Habib al feir*, comes *itineris*, friend of the journey.—In Latin it is best expressed by *comes*; as *comes theologicus*, *comes rusticus*, &c.

**VADIMONIUM**, in the civil law, a promise, or bond, given for appearance before the judge upon a day appointed. See **VADARI**.

**VADIUM**. See the article **PONE per Vadium**.

**VAGABOND**, \* a person that wanders about, having no certain dwelling; or a sturdy beggar, &c. mentioned in divers statutes.

\* *De vagabundis & aliis hominibus mendicantibus qui se nominant.*—Travelling men, &c. Charta 22 Hen. VI.—Item utemur quod nullus vagabundus vagetur seu deambulet de nocte in villa seu suburbio post pulsationem campanæ nostræ communis, vocatæ Coverfeu, & si aliquis ibidem capiatur post pulsationem dictæ campanæ, ducatur ad Gaulam domini regis, & ibi morabitur usque in crastinum ut notitia personæ suæ habeatur, &c. MS. Cod. de Leg. & Stat. Burgi villæ Mountgomer. Temp. Hen. II.

All itinerant beggars, fortune-tellers, collectors for goods, fencers, bearwards, players of interludes, minstrels, jugglers, gypsies, &c. shall be reputed *vagabonds*, rogues and sturdy beggars, 39 Eliz. c. 4. See **ROGUE**, &c.

**VAGINA**, a Latin term, literally signifying a *sheath*, or *scabbard*; used on divers occasions.—As,

**VAGINA**, in architecture, is used for the lower part of a terminus; because resembling a sheath, out of which the statue seems to issue. See **TERMES**.

The *vagina* is that long part between the base, and the capital; and is formed in divers manners, and with divers ornaments.

**VAGINA**, in anatomy, denotes a canal, or cavity, leading from the pudendum, to the uterus of women. See **GENERATION**.

The *vagina*, called also *cervix uteri*, is a membranous passage, extended from the rima, or aperture of the labia, to the neck of the womb.—See *Tab. Anat. (Splanchn.) fig. 9. lit. b. fig. 11. lit. a.* See the article **CERVIX**.

It lies upon the rectum, to which it finally adheres; and under the urinary bladder: its length is ordinarily seven or eight inches.

Its inward substance is nervous, and exquisitely sensible; the outer membranous, and loose: at its orifice it is much narrower than elsewhere; especially in virgins.

Through its whole course it is full of rugæ, or wrinkles; especially in the upper internal surface; which rugæ the use of venery renders less apparent, and frequent parturition almost obliterates: which shews, that they were intended, to render the part more easily distensible for parturition.

Along the whole tract of the *vagina* are pores, or ostia, or little ducts seen, which, in the act of venery, emit a liquor that has been by many mistaken for seed. See **SEED**.

The *vagina* has a constrictory muscle, inserted under the clitoris; which, with a broad series of fibres, embraces and constricts the lower part of the *vagina*, and puts the dimension of the part, in some measure, in the power of the mind. See **MATRIX**.

**VAGINÆ Uteri Sphincter**. See **SPHINCTER Vaginæ**, &c.

**VAGINALIS Gula**, in anatomy, a name some anatomists give to the muscular coat of the gula; as supposing it a proper muscle, conspiring with the œsophagæus in thrusting the aliment down, when entered. See **ŒSOPHAGÆUS**, **DEGLUTITION**, &c.

**VAGINALIS Tunica**, the same with what we otherwise call *elythroides*. See **ELYTROIDES**.

**VAGUM**, in anatomy, a name given to the eighth pair of nerves of the medulla oblongata, called the *par vagum*, because dispended to divers parts of the body.—See *Tab. Anat. (Osteol.) fig. 5. lit. q. q.* See also the article **NERVE**.

**VAIR**, in heraldry, a kind of fur, or doubling, consisting of divers little pieces, argent and azure, resembling a Dutch U, or a bell-glass. See **VAIRY**.

*Vairs* have their point azure, opposite to their point argent, and the base argent to the azure.

When there are only two or three *vairs*, the antient heralds call it *great vair*; and when there are more, *small vair*.

*Vair* is intended to represent a kind of skin, used antiently by the kings of France, in lieu of a fur, and wherewith the gowns of the presidents a mortier, the counsellors of the court, the heralds coats, &c. were lined, till the fifteenth century.

It was properly the skin of a kind of squirrel, called also, in French, *vair*, and in Latin, *sciurus*; which was white underneath, and dove-colour a-top. It is described by Aldrovandus, under the name of *sciurus varia*, and is the same, according to Gesner, with the *mus ponticus* of Aristotle and Pliny; which the Latins call *varus*, or *varius*, from the variety of its colour.—Its two skins joined together, make the figure of the *vairs* in armories; being naturally white and azure.

*Vair*, Colombiere observes is the second sort of fur, antiently used as a lining of the garments of great men; consisting of little pieces, sewed by the furriers on white skins: and because

these pieces were usually blue, those who first settled the rules of heraldry, decreed, that this fur, in its natural blazon, should always be argent and azure.—So if it be absolutely said, such a family bears *vair*; it is supposed to be argent and azure.

Regularly, there must be but four rows or ranks of *vair* in the shield; if there be either more, or less, the number must be specified.—The smallest number, being three rows, is called *beffroy de vair*; and the most, being five or six, is called *menu*, or *small vair*.

The *beffroy* is also known by the first figure on the dexter-side of the escutcheon, being always of metal, and in form of a belt; whereas that of mere *vair* is in shape of a glass.

**VAIRY**, **VAIRE**, **VERRY**, or **VARRY**, is applied to a coat, or the bearings of a coat, when charged, or chequered, with *vair*. See **VAIR**.

When the colours are argent and azure, or white and blue, it is *very proper*: if it be otherwise, the colours are to be expressly named; *vairy* of such a colour or metal.—He bears *vairy* or, and vert: this is particularly called *vair composé*.

The bearings are likewise said to be *vairy*, when they are charged with *vairs*.—When chiefs, crosses, pales, fesses, &c. happen to be *vairy*, the number of ranks are to be specified.

*Vairy* gowns are observed, by Julius Pollux, to have been the habit of the antient Gauls, as ermins were of the Armenians. See **ERMIN**.

**VAIRY Cuddy**, or **VAIRY Taffy**, or *Potent counterpotent*, is a bearing in heraldry, composed of pieces representing the tops of crutches.—See *Tab. Herald. fig. 87*. See also the article **COUNTERPOTENT**.

In blazon, the colours must be expressed; as azure, argent, &c.

**VALDENSES**. See the article **VAUDOIS**.

**VALECT**, or **VADALECT**. See the article **VALET**.

**VALENTIAM**. See the article **CAPE ad Valentiam**.

**VALENTINIANS**, an antient and famous sect of Gnostics; thus called from their leader *Valentinian*. See **GNOSTIC**.

**VALERE**. See the article **PERINDE Valere**.

**VALERIAN**, **VALERIANA**, a plant, whose root is of considerable use in medicine; thus called, according to some, from one *Valerius*, who first brought it into use; according to others, from *valere*, to be of great virtue.

There are various kinds of *valerian*; but those chiefly in use, are the larger garden *valerian*, *valeriana hortensis*; called by Dioscorides, *phu*, *falis olusatris*,—and the *valeriana sylvestris*, or great wild *valerian*.

The former is an ingredient in Venice treacle: its chief use is in disorders of the nerves: in which respect, however, it is held inferior to the latter.

The wild *valerian* is warm, and aromatic, but somewhat of a fetid scent: its efficacy, as a sudorific, is supported by the testimony of both antient and modern practice.—It has been reckoned by some deterfive, so much as to make it diuretic, and good in all obstructions of the viscera.—It is extolled also for strengthening the optic nerves, and restoring decayed sight; but the present practice acknowledges it not in any such intentions.—It sometimes does wonders in hysterical affections; especially where things of the fetid kind are good, and the spirits are too impetuous in their motions, so as to occasion convulsions.—It is also assisted with camphire, and some other things of the like nature, which are very powerful in breaking through the minutest obstructions, to cure obstinate agues.—It is efficacious in all nervous cases; and particularly the epilepsy: which virtue in it seems to have been first discovered by Fabius Columna, who prescribed it for that purpose in powder.

M. Merchant, in the *Memoirs of the Academy of Sciences*, has confirmed this virtue, by many instances within his knowledge: and what is very remarkable, is, that in the two observations he enlarges most upon, the patients voided great quantities of worms.—His custom was, always to purge before he administered it.

**VALESIANS**, **VALESIANI**, ancient sectaries, so called from one *Valesius*, a person unknown to Epiphanius, who makes mention of this sect, *Her. 58*. though he owns we know but very little of them; only this, that they admitted none into their society but eunuchs; at least, if any were admitted before castration, they obliged them not to eat any meat till the operation was performed.—For then, being no longer subjects to the motions of the flesh, they allowed them to eat any kind of meats. See **EUNUCH**, &c.

**VALET**, or **VALECT**, a French term, antiently wrote *valet*.

In France, *valet* is a common name for all domestic servants, employed in the lower and more servile offices; including what we call *grooms*, *footmen*, *coachmen*, *bailiffs*, &c. But the word is not used among us in this sense, nor any otherwise than in the phrase *valet de chambre*; which is a servant, whose office is to dress, and undress his master, to look

look to his bed-chamber, wait on him at table, &c. the same with what we otherwise call a *gentleman*.

In the history of Lewis XII. by Seifel, we always find *varlet de chambre du roi*, *varlet de la garde-robe*, &c. But *varlet*, like *knave*, and divers other words, is now degenerated into a word of reproach.

*Valet*, *valeet*, *vadalet*, *vadlet*, and *vallet*, Camden observes, were antiently used at our court, for a gentleman of the privy-chamber.

Selden, in his *Titles*, relates, that *valets* antiently signified young gentlemen, and heirs of great estate and quality; especially such as were to be knighted.

In the accounts of the Inner-temple, *valet* is used for a bench-er's clerk, or servant.—The butlers of the house still call them *varlets*.

**VALETUDINARY**, **VALETUDINARIUS**, a term sometimes used by the writers of medicine, for a person of a weak, sickly constitution, frequently out of order, &c.

Dr. Cheyne, by all means, directs the weakly, the studious, the sedentary, and the *valetudinary*, to a low, spare regimen. See **FOOD**, **EXERCISE**, **DIET**, &c.

**VALID**, a term applied to acts, transactions, expeditions, &c. which are clothed in all the formalities requisite to their being put into execution, and to their being admitted in a court of justice. See **NULLITY**.

A contract by a minor is not *valid*, or is *invalid*: a marriage is not *valid*, unless performed with the solemnities enjoined.

**VALLAR**, \* **VALLARIS**, in antiquity, an epithet given to a kind of crown, which the Roman generals bestowed on him who, in attacking the enemies camp, first broke in upon the lines, or palisades. See **CROWN**.

\* The word is formed from *vallum*, a stake with branches, whereof he made the palisade of a camp, called *lorica*.

The *corona vallaris* was the same with what was otherwise called *corona castrensis*, from *castra*, a camp.—Aulus Gellius assures us, that it was of gold, as the mural and naval crowns were: yet, though they were made of that precious metal, they were not the most valued: for Pliny, lib. xxii. cap. 3. gives the preference to the *corona obsidionalis*, which yet was only of grass, or grass.

**VALLEY**, **VALE**, in geography. See **MOUNTAIN**.

**VALORE** *Maritagli*, **VALUE** of marriage, a writ which antiently lay for the lord, after having proffered suitable marriage to an infant who refused the same; to recover the value of the marriage. See **MARRIAGE**.

**VALVASOR**, or **VALVASOUR**. See **VAVASOR**.

**VALUE**, **VALOR**, in commerce, the price or worth of any thing.

*Intrinsic* **VALUE**, denotes the proper, real, and effective worth of any thing: and is used chiefly with regard to money; the popular *value* whereof may be raised, and lowered at the pleasure of the prince; but its real, or *intrinsic* value, depending wholly on its weight and fineness, is not at all affected by the stamp, or impression thereon. See **MONEY**, **COIN**, &c.

It is generally on the foot of this *intrinsic* value, that species are received in foreign countries; though in the places where they are coined, and where the sovereign power makes them current, they generally pass for much more. See **PAR**.

It is, in good measure, on the difference of those two values, one whereof is, as it were, arbitrary, and the other, in some sort, natural; that the difference of exchanges depends: and those still rising and falling, as the rate at which a species is current, comes nearer or farther off the just price of the metal whereof it consists. See **EXCHANGE**.

**VALUE**, in bills of exchange, is used to signify the nature of the thing, (as ready money, merchandizes, bills, debts, &c.) which is given, as it were, in exchange from the sum specified in the bill. See **BILL**.

From four different manners of expressing this value, some distinguished four kinds of bills of exchange.—The first bears *value received*, simply and purely, which comprehends all kinds of value; the second, *value received in money*, or *merchandize*; the third, *value of myself*; and the fourth, *value understood*.

The first is dangerous, and the fourth but little used: accordingly, to have the value well expressed, and to prevent the ill consequences of oversights therein, it is well provided by the French ordonnance of 1673, that bills of exchange shall contain the name of the person to whom the contained sum is to be paid; the time of payment; the name of him who has given the value; and whether it was received in money, merchandize, or other effects. See **BILL of exchange**.

**VALUE**, **VALOR**, or **VALENTIA**, in law.—West gives us a nice difference between *value*, and *price*; the *value* (says he) of things in which offences are committed, is usually comprised in indictments; which seems necessary in theft, to make a difference from petty larceny; and in trespass, to aggravate the fault, and increase the fine. See **THEFT**, **LARCENY**, &c.

But no price of things *feræ naturæ* may be expressed, as of

deers, hares, &c. if they be not in parks and warrens.—And where the number of things taken is to be expressed in the indictment, as of young doves in a dove-house, there must be said *pretii*, or *ad valentiam*: but of divers dead things, *ad valentiam*, and not *pretii*: of coin not current it shall be said *pretii*; but of coin current, neither *pretii*, nor *ad valentiam*; the price and value being certain.

**VALVE**, \* **VALVULA**, in hydraulics, pneumatics, &c. is a kind of lid, or cover of a tube, or vessel, so contrived, as to open one way; but which, the more forcibly it is pressed the other way, the closer it shuts the aperture: so that it either admits the entrance of a fluid into the tube, or vessel, and prevents its return; or admits it to escape, and prevents its re-entrance.

\* The word is formed from the Latin, *valva*, folding doors.

Valves are of great use in the air-pump, and other wind-engines; in which they are ordinarily made of pieces of bladder. See **AIR-Pump**, and **WIND-Gun**.

In hydraulic engines, as the emboli of pumps, they are frequently of leather; their figure round, and are fitted to the bottoms, or other parts of the barrel, &c. to shut the aperture. See **EMBOLUS**.

Sometimes they are made of two round pieces of leather, inclosed between two others of brass; having divers perforations, which are covered with another piece of brass, moveable upwards and downwards, on a kind of axis, which goes through the middle of them all.

Sometimes they are made of brass, covered over with leather, and furnished with a fine spring, which gives way upon a force applied against it: but upon the ceasing of that, returns the valve over the aperture. See **PUMP**, &c.

**VALVE**, **VALVULA**, in anatomy, a thin membrane, applied, like a door or shutter, on divers cavities and vessels of the body; to afford a passage to some humour, or other matter, going one way, and prevent its reflux towards the part whence it came. See **VESSEL**, &c.

The veins and lymphatics have valves, situate from space to space, which open towards the heart, but keep close on that side towards the extremities, *i. e.* they let the blood and lymph pass towards the heart, but prevent their returning to the extreme parts, whence they came. See **VEIN**, and **BLOOD**.

The heart has also its valves, placed at the entrance of the vessels arising out of it.—Those at the entrance of the vena cava, and pulmonary vein, let the blood pass on to the heart, and prevent its return: on the contrary, those at the entrance of the aorta, and pulmonary artery, let the blood pass out of the heart, and prevent its flowing back again.—See *Tab. Anat. (Angeiol.) fig. 1. lit. A.* See also **HEART**, **CIRCULATION**, **CAVA**, &c.

“In the jejunum, and ileum, the inner tunic being larger than the outer, is much corrugated; the loose folds of which have been thought, in some measure, to do the office of valves; and have therefore been called *valvule conniventes*.” Drake, *Anat.* p. 49.

“The lacteals, opening into the intestines, receive the prepared fluid part of the chyle; and appear at intervals, as it were, girt and straightened; and when pressed, do not admit of a reflux towards the intestines; though the liquor be easily propelled towards the glands: which argues, that there are valves in them, though too minute to be sensible to the eye.” *Id. ibid.* p. 56.

The colon has a thick valve, to prevent the excrements from passing into the ileon; and several other valves, to retard the descent of the excrements. See **COLON**, and **EXCREMENT**.

Constantine Varolius, a Boulognese, and physician of Gregory XIII. who died in 1570, was the first that observed the valve in the colon.—Bart. Eustachio, a native of San Severino in Italy, discovered, about the same time, the valve at the orifice of the coronary vein; and that remarkable one at the orifice of the lower trunk of the vena cava, near the right auricle of the heart: though he did not take it for a valve, but merely for a membrane.

Sig. Lancisi, physician to the late pope, who first published Eustachio's works, takes the use of this valve to be to prevent the blood of the upper vena cava from striking with too much violence against that of the lower: and M. Winslow, who, has considered it very diligently in the *Memoirs of the Royal Academy of Sciences*, is much of the same opinion.

But as it gradually dwindles in children, and at length becomes quite lost in adults, still diminishing as the foramen ovale does; it should seem to have some other office; and that, chiefly, regarding the circulation of the blood in the foetus.

In effect, by means hereof, M. Winslow reconciles the two opposite systems of the circulation of the blood in the foetus, delivered under the article *circulation*. See **CIRCULATION of the Blood**, and **FOETUS**.

**Great VALVE**, *Valvula major*, is the upper part, and, as it were,

were, the lid of the isthmus between the testes, and the first vermicular process of the cerebellum: its substance is medullary.—Its use is to prevent the lymph from falling on the nerves at the base of the cranium.

**VAN, VANT, or VAUNT**, (of the French *avant*, or *avaunt*, before) is a term used in composition with several words in our language.—As,

**VAN-COURIERS**, are light-armed soldiers, sent before to beat the road, upon the approach of an enemy. See **RECONNOITRE**.

**VAN-FOSSE**, a ditch dug without the counterscarp, and running all along the glacis; usually full of water. See **DITCH**.

**VAN, or VANT, or VAUNT-CORPS**. See **CORPS**.

**VAN, or VAN-GUARD**, is a military term, signifying the first line of an army, drawn up in battalia. See **LINE**, and **ARMY**.

It is the same with the *front* of an army, and gives the first charge upon an enemy. See **FRONT**.

Every army is composed of three parts, a *van-guard*, *rear-guard*, and *main body*. See **GUARD**.

**VAN-Lay**. See the article **VAUNT**.

**VANEERING**. See the article **VENEERING**.

**VANES**, on mathematical instruments, are flights made to move and slide upon cross-staves, fore-staves, Davis's quadrants, &c. See **CROSS-STAFF**, **FORE-STAFF**, &c.

**VANES, or FANES of Feathers**. } **FEATHER**.

*Weather VANES*. } **WEATHER**.

*VANES of Windmills*. } **WINDMILL**.

**VANILLA**, or **VANELLA**, a little black seed, growing in longish pods; used in the West-Indies, France, Spain, &c. as a principal ingredient in the composition of chocolate; to give it strength, and an agreeable flavour. See **CHOCOLATE**. It is also used to perfume tobacco and snuff withal. See **TOBACCO**.

It is supposed to strengthen the brain, and stomach; to attenuate viscid humours, provoke urine, and the menses.

**VANT, or VAUNT**. See the article **VAN**.

**VAPORARIUM**, or **VAPOROSUM Balneum**, *Vapour-bath*, in chymistry, a term applied to a chymist's bath, or heat, wherein a body is placed, so as to receive the fumes of boiling water. See **BATH**.

The *balneum vaporosum* consists of two vessels, disposed over one another in such manner, as that the vapour raised from the water contained in the lower, heats the matter inclosed in the upper. See **HEAT**.

The *vapour-bath* is very commodious for the distilling of odoriferous waters, and the drawing of spirit of wine.

We also use the term *vapour-bath*, when a sick person is made to receive the vapours arising from some liquid matter placed over a fire. See **BATH**, **FUMIGATION**, &c.

**VAPORATION**, **VAPORATIO**, in chymistry, a term applied to the action of fume, or vapour. See **VAPOUR**.

**VAPORATION**, is a kind of bathing, or rather fomentation, whereby the warmth, or humidity of a vapour is made to act on some other body, that is to be warmed, or moistened. See **BATH**, and **HEAT**.

**VAPOROSUM Balneum**. See the article **VAPORARIUM**.

**VAPOUR**, **VAPOR**, in meteorology, a thin vesicle of water or other humid matter, filled or inflated with air; which being rarefied to a certain degree by the action of heat, ascends to a certain height in the atmosphere, where it is suspended, till it return in form of rain, snow, or the like. See **RAIN**, and **SNOW**.

An assemblage of a number of particles, or vesicles of *vapour*, constitutes what we call a *cloud*. See **CLOUD**.

Some use the term *vapour*, indifferently, for all fumes emitted, either from moist bodies, as fluids of any kind; or from dry bodies, as sulphur, &c.—But Sir Isaac Newton, and other authors, better distinguish between humid and dry fumes, calling the latter *exhalations*. See **EXHALATION**.

For the manner wherein **VAPOURS** are raised, and again precipitated, see **DEW**, **RAIN**, **HEAT**, **COLD**, and **BAROMETER**.—For the effect of **VAPOUR** in the formation of springs, &c. see **SPRING**, and **VAPOR**.

The quantity of *vapour* raised from the sea by the warmth of the sun, is far greater than one would imagine.—Dr. Halley has attempted to estimate it.

In an experiment made with that view, and described in the *Philosophical Transactions*, he found that a quantity of water, no warmer than air in summer, lost in *vapour*, in the space of two hours, no less than one fifty-third part of an inch in depth: now, for one fifty-third part in two hours, taking, for the easier calculation, one sixtieth part, in the twelve hours that the sun is up each day, it will raise one tenth of an inch from the surface of the sea.

On this supposition, every 10 square inches of the surface of water, yield in *vapour*, per diem, a cubic inch of water; and each square foot, half a wine pint; every space of four foot square, a gallon; a mile square, 6914 tuns; a square degree, supposed of 69 English miles, will evaporate 33 millions of tuns: and if the Mediterranean be estimated at 40 degrees long, and four broad, allowances being made for the places

where it is broader, by those where it is narrower, there will be 160 square degrees at sea: and consequently the whole Mediterranean must lose in *vapour*, in a summer's day, at least, 5280 millions of tuns.

And this quantity of *vapour*, though very great, is only the remains of another cause, which cannot be reduced to rule; we mean the winds; whereby the surface of the water is licked up, sometimes faster than it exhales by the heat of the sun; as is well known to those that have considered those drying winds. See **EVAPORATION**.

**VAPOUR-Bath**. See **VAPORARIUM**, and **BATH**.

**VAPOURS**, in medicine, a disease popularly called *hypo*, or the *hypochondriacal* disease; and in men particularly, the *spleen*. See **SPLEEN**.

It is supposed to be owing to a subtile *vapour*, rising from the lower parts of the abdomen, particularly the hypochondria, to the brain; which it disturbs, and possesses with wild delirious, but generally disagreeable imaginations. See **HYPPOCHONDRIACAL Disease**.

*Vapours*, supposed to be emitted from the womb, in women, are what we otherwise call *hysterical affections*, or *suffocations*, or *fits of the mother*. See **HYSTERICAL**, &c.

**VARI**, in medicine, little, hard, ruddy tumours, whitish about the tips, and of the size of an hempseed; frequently found on the face and neck of young people; chiefly such as are much addicted to venery.

If the red be very lively, the cure is somewhat difficult; and though the pustules be taken away, the redness remains.—

To which, if an inflammation and hoarseness be added, it is a symptom of an approaching leprosy. See **LEPROSY**.

**VARIABLE**, in geometry and analytics, is a term applied by mathematicians, to such quantities as either increase, or diminish, according as some other quantity either increases, or diminishes.

Thus, the semiordinates, and abscisses of an ellipsis, &c. are *variable quantities*; because, if the one increase, the other increases likewise. See **SEMIORDINATE**, &c.

They are thus called, in contradistinction to *constant*, or *given*, or *stable quantities*; which are always the same, though others change: as the semidiameter of a circle, which remains the same, though the abscisses and semiordinates increase.

*Variable quantities*, are usually denoted by the last letters of the alphabet, *x*, *y*, *z*. See **QUANTITY**, **CHARACTER**, &c. Some authors, instead of *variable*, and *constant* quantities, use the terms *fluent*, and *stable* quantities.

The infinitely small quantity whereby a *variable* quantity is continually increasing, or diminishing, is called the *fluxion*, or *difference*; the calculation whereof, is the subject of the new *methodus differentialis*, or *doctrine of fluxions*. See **DIFFERENTIAL**, and **FLUXION**.

**VARIABLE Winds**. See the article **WIND**.

**VARIANCE**, **VARIANTIA**, in law, an alteration or change of condition in a person, or thing; after some former concern, or transaction therewith.

Thus, if the commonalty of a town make a composition with a lord, and afterwards bailiffs be granted by the king to the same town; there, if the lord commence any suit for breach of the composition, he must *vary* from the word *commonalty*, used in the composition; and use *bailiffs and commonalty*.

**VARIANCE** is also used for an alteration of something formerly laid in a plea; or where the declaration in a cause differs from the writ, or from the deed upon which it is grounded. See **PLEA**, **DECLARATION**, &c.

**VARIATION**, in geography, navigation, &c. a term applied to the deviation of the magnetical needle, or compass, from the true north point, towards either east, or west; called also the *declination*. See **DECLINATION**.

The *variation* or *declination* of the needle, is properly defined, the angle which a magnetic needle, suspended at liberty, makes with the meridian line on a horizontal plane; or an arch of the horizon, comprehended between the true, and the magnetical meridian. See **NEEDLE**.

In the sea language, the *variation* is usually called *north-easting*, or *north-westing*. See **COMPASS**, &c.

All magnetic bodies, we find, range themselves, in some sort, to the meridian; but it is rare they fall in precisely with it: in one place, they decline from the north to the east, and from the south to the west; and in another place, on the contrary, from the north to the west, and from the south to the east; and that, too, differently, at different times. See **MAGNET**, and **MAGNETISM**.

Various are the hypotheses framed, to account for this extraordinary phenomenon: we shall only mention some of the later, and more probable. The first is that of Gilbert, which is followed by Cabeus, &c.

Their notion was, that it is the earth, or land, that draws the needle out of its meridional direction; and hence they argued, that the needle varied more, or less, as it was more or less distant from any great continent: consequently, that if it were placed in the middle of an ocean, equally distant from equal tracts of land, on each side, eastward and westward,

ward, it would not decline either to the one or the other; but point justly north and south.

Thus, in the Azores islands, which are equally distant from Africa on the east, and America on the west, there is, in effect, found no *variation*; but, as from the Azores you sail towards Africa, the needle begins to decline from the north to the east, and that still more and more, till you reach the shore.

If you still proceed eastward, the declination gradually diminishes again; by reason of the land left behind on the west, which continues to draw the needle.

The same holds till you arrive at a place where there are equal tracts of land on each side, and there, again, there is no *variation*.

The observations of our mariners in their East-India voyages, seem to confirm this system: as they proceed towards the cape of Good Hope, the *variation* is still eastward; at length, arriving at the cape De las Aguillas, *q. d.* of the Needles, the meridian line, then, dividing Africa into two equal parts, there is no *variation* at all: but as they proceed further, and leave the African coasts on the west, the *variation* becomes westward.

But the misfortune is, the law does not hold universally: in effect, a great number of observations of the *variations*, in various parts, made and collected by Dr. Halley, overturn the whole theory.

Others, therefore, having recourse to the frame and compasses of the earth, considered as interwoven with rocks and shelves, which being generally found to run towards the poles, the needle comes to have a general tendency that way;

but which seldom going perfectly in the direction of the meridian, the needle, of consequence, has commonly a *variation*. See EARTH.

Others hold various parts of the earth to have various degrees of the magnetic virtue; as some are more intermixed with heterogeneous matters, which prevent the free action or effect thereof, than others. See MAGNETISM.

Others ascribe all to magnetic rocks, and iron mines, which affording more of the magnetic matter than other parts, draw the needle more. See IRON, &c.

Lastly, others imagine earthquakes, or high tides, to have disturbed and dislocated several considerable parts of the earth, and so changed the magnetic axis of the globe, which originally was the same with the axis of the globe itself.

But still, that great phenomenon, the *variation of the variation*, i. e. the continual change of the declination, in one and the same place, which the modern observations do abundantly evince, is not accountable for, on any of these foundations; nor even constant with them.

Dr. Halley, therefore, gives us a new system; the result of a great number of observations; and even of a great number of voyages made, at the public charge, on this very account. The light that excellent author has let into this obscure part of natural history, is very great; and the consequences thereof in navigation, &c. very considerable. Add, that he has reduced the divers *variations* of divers places, to a precise rule, or order, which before appeared all precarious and arbitrary.

His theory, therefore, will deserve a more ample detail.—The observations it is built on, as laid down in the *Philosophical Transactions*, are as follow.

Observations of the variations of the needle, in divers places, and at divers times.

Names of Places.	Longitude from London.	Latitude.	Year of observation.	Variation observed.

From these observations, the learned author gathers, 1°. That throughout all Europe, the *variation*, at this time, is west; and more in the eastern parts thereof than the western, increasing that way.

2°. That on the coasts of America, the *variation* is westerly; increasing all the way as you go northerly along the coast; so as to be above 20 degrees at Newfoundland, nearly 30 degrees in Hudson's Straights, and not less than 57 degrees in Baffin's bay: and that as you sail eastward from this coast, the *variation* diminishes. Hence, he argues, somewhere between Europe and the north part of America, there must be an easterly *variation*, or at least no *variation*.

3°. That on the coast of Brazil, there is east *variation*; increasing as you go to the southward, so as to be 12 degrees at cape Frio, and 20 degrees and half over-against R. Plata; and thence failing south-westerly, to the Straights of Magellan, it decreases 17 degrees, and at the west entrance about 14 degrees.

4°. That eastward of Brazil, this easterly *variation* decreases, so as to be very little at S. Helena and Ascension, and to be quite gone, and the compass point true, about 18 degrees longitude from the cape of Good Hope.

5°. That to the eastward of the aforesaid places, a westward *variation* begins and governs in all the Indian sea, rising to 18 degrees under the equator, about the meridian of the northern part of Madagascar; and 27 degrees and a half, in 39 degrees south latitude, near the same meridian: easterly from thence, the west *variation* decreases, so as to be not much above eight degrees at cape Comorin, and about three

degrees upon the coast of Java; and about the Molucca islands to be quite gone; as also a little to the westward of Van Diemen's land.

6°. That to the eastward of the Molucca's, and Van Diemen's land, in south latitude, there arises another easterly *variation*, which seems not so great as a former, nor of so large extent; for that at the island Rotterdam, it is sensibly less than upon the east coast of New Guinea; and at the rate it decreases, it may well be supposed, that about 20 degrees further eastward, or 225 degrees east longitude from London, in the latitude of 20 degrees south, a westerly *variation* begins.

7°. That the *variation* taken at Baldivia, and at the west entrance of the Straights of Magellan, shews, that the east *variation* noted in the third observation, is decreasing apace; and that it cannot well extend many degrees into the South sea, from the coast of Peru and Chili; leaving room for a small westerly *variation*, in that tract of the unknown world, that lies in the mid-way between Chili, and New Zealand, and between Hounds Island, and Peru.

8°. That in failing north-west from S. Helena, by Ascension, as far as the equator, the *variation* continues very small east, and, as it were, constantly the same: so that in this part of the world, the course, wherein there is no *variation*, is evidently no meridian, but rather north-west.

9°. That the entrance of Hudson's Straights, and the mouth of R. Plata, being nearly under the same meridian, at the one place the needle varies 29 degrees and a half west; at the other 20 degrees and a half east.

Theory

*Theory of the VARIATION of the needle.*—From the circumstances above rehearsed, the learned author takes occasion to assert, "That the whole globe of the earth is one great magnet, having four magnetical poles, or points of attraction; near each pole of the equator, two; and that in those parts of the world which lie nearly adjacent to any one of these magnetical poles, the needle is governed thereby; the nearest pole being always predominant over the more remote."

The pole which at present is nearest to us, he conjectures to lie in, or near the meridian of the Lands-end of England, and not above 7 degrees from the arctic pole: by this pole, the *variation* in all Europe and Tartary, and the North sea, are principally governed; though still with some regard to the other northern pole, whose situation is in the meridian, passing about the middle of California, and about 15 degrees from the north pole of the world; to which the needle has chiefly respect in all the North America, and in two oceans on either side thereof, from the Azores, westwards, to Japan, and farther.

The two southern poles, he imagines, are rather farther distant from the south pole of the world: the one about 16 degrees therefrom, in a meridian some 20 degrees to the westward of Magellan Straights, or 95 degrees west from London: this commands the needle in all South America, in the Pacific sea, and the greatest part of the Ethiopic ocean.—The other seems to have the greatest power, and the largest dominion of all, as it is the most remote from the pole of the world, being little less than 20 degrees distant therefrom, in the meridian which passes through New Holland, and the island Celebes, about 120 degrees east from London: this pole is predominant in the south part of Africa, in Arabia, and the Red sea, in Persia, India, and its islands; and all over the Indian sea, from the cape of Good Hope, eastwards, to the middle of the great South sea, that divides Asia from America.

Such seems to be the present disposition of the magnetical virtue, throughout the whole globe of the earth.—It remains to shew, how this hypothesis accounts for all the *variations* that have been observed of late; and how it answers to the several remarks drawn from the table.

1°. Then, it is plain, that as our European north pole is in the meridian of the Lands-end of England, all places more easterly than that, will have it on the west side of their meridian; and consequently the needle, respecting it with its northern point, will have a westerly *variation*; which will still be greater as you go to the eastwards, till you come to some meridian of Russia, where it will be the greatest, and from thence decrease again.—Accordingly, in fact, we find that at Brest the *variation* is but 1 degree 3 quarters; at London, 4 degrees and an half; and at Dantzick, 7 degrees west (in 1683).—Again, to the westward of the meridian of the Land's-end, the needle ought to have an easterly *variation*; were it not that (by approaching the American northern pole, which lies on the west side of the meridian, and seems to be of greater force than this other) the needle is drawn thereby westward, so as to counterbalance the direction given by the European pole, and to make a small west *variation* in the meridian of the Land's-end itself. Yet, about the isle Tercera, it is supposed our nearest pole may so far prevail, as to give the needle a little turn to the east; though but for a very little space; the counter-balance of those two poles permitting no considerable *variation*, in all the eastern part of the Atlantic ocean; nor upon the west coasts of England, and Ireland, France, Spain, and Barbary.—But to the westward of the Azores, the power of the American pole overcoming that of the European, the needle has chiefly respect thereto; and turns still more and more towards it, as you approach it. Whence it comes to pass, that on the coast of Virginia, New England, Newfoundland, and in Hudson's Straights, the *variation* is westward; that is, increases as you go from thence towards Europe: and that it is less in Virginia, and New England, than in Newfoundland, and Hudson's Straights.

2°. This westerly *variation*, again, decreases, as you pass over the north America, and about the meridian of the middle of California, the needle again points due north; and from thence westwards, to Yedzo and Japan, it is supposed the *variation* is easterly; and half sea over, not less than 15 degrees: and that this east *variation* extends over Japan, Yedzo, East Tartary, and part of China, till it meet with the westerly, which is governed by the European north pole, and which is the greatest somewhere in Russia.

3°. Towards the south pole the effect is much the same; only that here the south point of the needle is attracted.—Whence it will follow, that the *variation* on the coast of Brazil, at the river of Plata, and so on to the Straights of Magellan, should be easterly, if we suppose a magnetical pole, situate about 20 degrees more westerly than the Straights of Magellan.—And this easterly *variation* extends eastward over the greatest part of the Ethiopic sea, till it be counterpoised by the virtue of the other southern pole; as it is about mid-

way, between the cape of Good Hope, and the isles of Tristan d'Acunha.

4°. From thence eastwards, the Asiatic south pole becoming prevalent, and the south point of the needle being attracted thereby, there arises a west *variation*, very great in quantity and extent; because of the great distance of this magnetical pole of the world.—Hence it is, that all the Indian sea, as far as Hollandia Nova, and farther, there is constantly a west *variation*, and that under the equator itself, it rises to no less than 18 degrees, where it is most.—Add, that about the meridian of the island of Celebes, being likewise that of this pole, this westerly *variation* ceases, and an easterly begins, which reaches to the middle of the South sea, between the middle of Zelandia Nova, and Chili; leaving room for a small west *variation*, governed by the American south pole.

5°. From the whole it appears, that the direction of the middle, in the temperate and frigid zone, depends chiefly upon the counterpoise of the forces of two magnetical poles of the same nature; as also why, under the same meridian, the *variation* should be in one place 29 degrees and a half west, and in another 20 degrees and a half east?

6°. In the torrid zone, and particularly under the equinoctial, respect must be had to all four poles, and their positions well considered; otherwise it will not be easy to determine what *variations* shall be; the nearest pole being always strongest: yet not so, as not to be counterbalanced sometimes by the united forces of two more remote.—Thus, in sailing from S. Helena by the isle of Ascension, to the equator, on the north-west course, the *variation* is very little easterly, and in that whole tract unalterable; because the south American pole (which is considerably the nearest in the aforesaid places) requiring a great easterly *variation*, is counterpoised by the contrary attraction of the north American, and the Asiatic south pole; each whereof, singly, is, in these parts, weaker than the American south pole: and upon the north-west course, the distance from this latter is very little varied; and as you recede from the Asiatic south pole, the balance is still preserved by access towards the north American pole.—In this case, no notice is taken of the European north pole; its meridian being little removed from those of these places, and of itself requiring the same *variations* we here find.

After the same manner, may the *variations* in other places, under, and near the equator, be accounted for: so that the hypothesis must be allowed very adequate, and sufficient for the phenomena. See VARIATION of the VARIATION.

To observe the VARIATION, or declination of the needle.—Draw a meridian line, as directed under the article MERIDIAN: then, a style being erected in the middle thereof, place a needle thereon, and draw the right line it hangs over.—Thus will the quantity of the *variation* appear. See COMPASS.

Or thus:—As the former method of finding the declination, cannot be applied at sea, others have been thought of; the principal whereof follow.—Suspend a thread and plummet over the compass, till the shadow pass through the centre of the card: observe the rhumb, or point of the compass, which the shadow touches when it is the shortest.—For the shadow is then a meridian line: consequently the *variation* is shewn.

Or thus:—Observe the rhumb wherein the sun, or some star rises and sets: bisect the arch intercepted between the rising and setting; the line of bisection will be the meridian line: consequently the declination is had as before.—The same may be had from two equal altitudes of the same star, observed either by day or night.

Or thus:—Observe the rhumb wherein the sun, or a star rises and sets; and from the latitude of the place, find the eastern or western amplitude: for the difference between the amplitude and the distance of the rhumb observed, from the eastern rhumb of the card, is the *variation* sought.

Or thus:—Observe the altitude of the sun, or some star, SI, (Tab. Navigation, fig. 16.) whose declination is known; and note the rhumb in the compass, to which it then corresponds.

—Since then in the triangle ZPS we have three sides, viz. PZ, the complement of the elevation of the pole PR; SP, the complement of the declination DS; and ZS, the complement of the altitude SI; the triangle PZS is found by spherical trigonometry, (see TRIANGLE:) the contiguous one to which, viz. AZS, measures the azimuth HI.—The difference then, between the azimuth, and the distance of the rhumb observed from the south, is the *variation* sought.

Note, to have the eastern or western amplitude accurately, regard must be had to the refraction; the laws whereof are delivered under the article REFRACTION.

For the more commodious observing in what rhumb of the compass the sun, or a star is seen, it will be proper to have two little apertures, or glass windows, opposite to each other under the limb thereof; with a telescope-light fitted to one of them, and to the other a fine thread.

VARIATION of the VARIATION, is the change in the declination

variation of the needle, observed, at different times, in the same place.

This *variation*, first, it is said, discovered by Gassendus, is found to observe one and the same law pretty regularly.—It is supposed, owing to the difference of velocity of the motions of the internal and external parts of the globe.

*Theory of the VARIATION of the VARIATION.*—From the observations above recited, under the head *VARIATION*, it seems to follow, that all the magnetical poles have a motion westward: but if it be so, it is evident, that it is not a rotation about the axis of the earth: for then the *variations* would continue the same, in the same parallel of latitude (the longitude only changed) as much as the motion of the magnetical poles: but the contrary is found by experience; for there is no where, in the latitude of 51 and a half north, between England and America, a *variation* of 11 degrees east, at this time; as it was once here at London.—Wherefore, it seems that our European pole is grown nearer the arctic pole than it was heretofore; or else, that it has lost part of its virtue.

But whether these magnetic poles move all together with one motion, or with several; whether equally, or unequally; whether circular, or libratory: if circular, about what centre; if libratory, after what manner? are things yet unknown.

This theory seems yet somewhat obscure, and defective: to suppose four poles in one magnetical globe, in order to account for the *variation*, is a little unnatural; but to conceive those poles to move, and that by such laws as to solve the *variation* of the *variation*, is still more extraordinary.—In effect, the solution appears not much less implicit and arbitrary than the problem.

The learned author of the theory, therefore, found himself under a necessity to solve the phenomena of his solution; and with this view, presented the following hypothesis.

The external parts of the globe, he considers as the shell, and the internal as a nucleus, or inner globe; and between the two he conceives a fluid medium.—That inner earth having the same common centre, and axis of diurnal rotation, may turn about with our earth each 24 hours. Only the outer sphere having its turbinating motion some small matter either swifter or slower than the internal ball; and a very minute difference in length of time, by many repetitions, becoming sensible; the internal parts will, by degrees, recede from the external; and not keeping pace with one another, will appear gradually to move, either eastward, or westward, by the difference of their motions.

Now, suppose such an internal sphere, having such a motion, the two great difficulties in the former hypothesis are easily solved: for if this exterior shell of earth be a magnet, having its poles at a distance from the poles of diurnal rotation, and if the internal nucleus be likewise a magnet, having its poles in two other places, distant also from the axis; and these latter, by a gradual and slow motion, change their place, in respect of the external: we may then give a reasonable account of the four magnetical poles aforementioned, as likewise of the changes of the needle's *variation*.

The period of this motion being wonderful great, and there being hardly an hundred years since these *variations* have been duly observed; it will be very hard to bring this hypothesis to a calculus: especially since, though the *variations* do increase and decrease regularly in the same place, yet in differing places, at no great distance, there are found such casual changes thereof, as can no ways be accounted for by a regular hypothesis; but seem to depend upon the unequal and irregular distribution of the magnetical matter, within the substance of the external shell or coat of the earth, which deflect the needle from the position it would acquire from the effect of the general magnetism of the whole.—Of which, the *variations* at London and Paris, give a notable instance; for the needle has been constantly about  $1\frac{1}{2}$  more easterly at Paris than at London: though it be certain, that according to the general effect, the difference ought to be the contrary way; notwithstanding which, the *variations*, in both places, do change alike.

Hence, and from some other things of like nature, it seems plain, that the two poles of the external globe are fixed in the earth; and that if the needle were wholly governed by them, the *variations* thereof would be always the same, with some irregularities, upon the account just now mentioned.—But the internal sphere having such a gradual translation of its poles, does influence the needle, and direct it variously, according to the result of the attractive or directive power of each pole; and, consequently, there must be a period of the revolution of this internal ball; after which, the *variations* will return again, as before. But if it shall in future ages be observed otherwise, we must then conclude, that there are more of these internal spheres, and more magnetical poles than four; which, at present, we have not a sufficient number of observations to determine, and particularly in that vast Mar del Zur, which occupies so great a part of the whole surface of the earth.

If then two of the poles be fixed, and two moveable, it remains to ascertain, which they are that keep their place.

The author thinks it may be safely determined, that our European north pole is the moveable one of the two northern poles, and that which has chiefly influenced the *variations* in these parts of the world: for in Hudson's Bay, which is under the direction of the American pole, the change is not observed to be near so fast, as in these parts of Europe, though that pole be much farther removed from the axis.—As to the south poles, he takes the Asiatic pole to be fixed, and consequently the American pole to move.

This granted, it is plain the fixed poles are the poles of this external shell, or cortex of the earth; and the other the poles of the magnetical nucleus, included and moveable within the other.—It likewise follows, that this motion is westwards; and, by consequence, that the aforesaid nucleus has not precisely attained the same degree of velocity, with the exterior parts in their diurnal revolutions; but so very nearly equals it, that in 365 revolves, the difference is scarce sensible.—That there is any difference arises hence, that the impulse, whereby the diurnal motion was impressed on the earth, was given to the external parts; and from thence, in time, communicated to the internal: but not so, as yet perfectly to equal the velocity of the first motion impressed on, and still conserved by, the superficial parts of the globe.

As to the precise period, we want observations to determine it; though the author thinks we may, with some reason, conjecture, that the American pole has moved westward 46 degrees in 90 years; and that the whole period thereof is performed in about 700 years.

Mr. Whiston, in his *New laws of Magnetism*, raises several objections against this theory; which see under the article *MAGNETISM*.

*VARIATION of Quantities*, in algebra. See *CHANGE*, and *COMBINATION*.

*VARIATION*, in astronomy.—The *variation of the moon*, called by Bullialdus, the *reflexion of her light*, is the third inequality observed in the moon's motion; whereby, when out of the quadratures, her true place differs from her place twice equated. See *PLACE*, *EQUATION*, &c.

Sir Isaac Newton takes the moon's *variation* to arise partly from the form of her orbit, which is an ellipsis; and partly from the inequality of the parts of space, which the moon describes in equal times, by a radius drawn to the earth. See *MOON*.

To find the greatest *variation*, observe the moon's longitude in the octants; and for the time of observation, compute the moon's place quite equated: the difference between the computed, and the observed place, is the greatest *variation*.

Tycho makes the greatest *variation*  $40' 30''$ : Kepler makes  $51' 49''$ ; Sir Isaac Newton makes the greatest *variation* at a mean distance between the sun and the earth, to be  $35' 9''$ ; at the other distances, the greatest *variation* is in a ratio compounded of the duplicate ratio of the times of the moon's synodical revolution directly, and the triplicate ratio of the distance of the sun from the earth inversely. *Phil. Nat. Princ. Math. Prop. XXXIX. Lib. iii.*

*VARIATION*, in the Italian music, is understood of the different manners of playing, or singing a tune, or song; whether by subdividing the notes into several others of lesser value, or by adding graces, &c.—In such manner, however, as that one may still discern the ground of the tune through all the enrichments; which some call *embroideries*.

Thus, *e. gr.* the divers couples of chacons, Spanish folies, gavots, French passecaillies, &c. are so many *variations*: so also many diminutions of courants, gavots, and other pieces for the lute, harpsichord, &c. are real *variations*.

*VARICIFORMES Parastatae*, in anatomy, a name which some authors give to two vessels near the bladder; by reason of their many turnings; serving to work and prepare the seed the better. See *PARASTATÆ*, and *DEFERENTIA Vasa*.

*VARICOSUM Corpus*, in anatomy, the same as *corpus pyramidale*. See *PYRAMIDALE Corpus*.

*VARICOUS Ulcers*. See the article *ULCER*.

*VARIATION*, among botanists and florists, the act of streaking or diversifying the leaves, &c. of plants and flowers, with several colours.

*Variation* is either *natural*, or *artificial*.—Of *natural variation* there are four kinds; the first shewing itself in yellow spots, here and there in the leaves of plants; called by gardeners the *yellow blotch*.

The second, called the *white blotch*, marks the leaves with a greater number of white spots, or stripes; the whitest lying next the surface of the leaves, usually accompanied with other marks of a greenish white, that lie deeper in the body of the leaves.

The third, and most beautiful, is, where the leaves are edged with white, being owing to some disorder or infection in the juices, which stains the natural complexion or verdure of the plant.

The fourth kind is that called the *yellow edge*.

*Varis-*

*Variegation* is, in itself, a disease; and these are only so many species, or rather degrees thereof.—In the yellow, the disease is the slightest: the white is a sure sign of a deep infection, and weakness in the plant: which is further evinced by this; that no two leaves are ever marked exactly alike.—This sometimes degenerates into the third, or edge kind; which is a total and immoveable disease, that lays hold not only of the leaves, but of the wood, and even the fruit, seed, &c.

In the two first kinds, there is a possibility of recovering the plants to their native verdure, by inarching them into a healthful stock of the same species, and letting the stocks stand a year or two joined together; by which means, the juices of the strong stock overpowering the distemper, throw off the morbid humours by perspiration: but the third kind is incurable; no art can recover the edged plant to produce plain green leaves again.

*Artificial Variegation*, is performed by inarching or inoculating a striped, or *variegated* plant into a plain one of the same sort; as a *variegated* common jessamin, into a plain, common, Spanish, Brazil, or Indian jessamin. See INOCULATION, and ABLACTATION.

A single bud, or eye, Mr. Bradley observes, being placed in the escutcheon of a distempered tree, where it can only receive nourishment from the vitiated juices, will become *variegated*, proportionably to the nourishment it draws; and will partake more of the white or yellow juice, than if a branch should be inarched: the bud having nothing to nourish it, but the juices of the plant it is inoculated on; whereas, a cyon inarched, is fed both by the striped plant, and the healthful one. As to the natural stripes, or *variegations*, there are some particular circumstances to be observed: 1°. That some plants only appear *variegated*, or bloached in the spring and autumn; the stains disappearing as they gather strength in summer: of this kind are rue, thyme, and pot marjoram.

2°. Some plants are continually bloached in the spongy part of their leaves; the sap-vessels, all the time, remaining of a healthful green: such are the alternus, orange-mint, &c. which, being strengthened by rich manure, or being inarched into healthful plants, throw off the distemper.

3°. In other plants, the disease is so rooted and inveterate, that it is propagated with the seed: such are the archangel, water betony, bank cress, borrag, striped selary, and sycamore; the seeds of which produce striped plants.

**VARIOLÆ\***, or **VARIOLI**, a contagious disease, popularly called the *small-pox*. See *Small-Pox*.

\* It is called *variola*, as shewing itself in pustules, or little tumours like *varices*; or as variegating the skin. See **VARIIX**, &c.

**VARIORUM**,\* in matters of literature, a term or phrase of abbreviation, used for an edition of a classic author, printed in Holland, with the notes of divers authors thereupon: *Cum notis variorum*, or *cum selectis variorum observationibus*.

In this sense, we say, *Plautus variorum*; a set of Dutch *variorum*, &c.—The *variorum*, for the generality, are the most valued editions.

\* The word is the genitive plural of the Latin *varius*, different, divers.

**VARIX**,\* in medicine, a dilatation of a part of a vein, so as to make it buldge out, and form a little, soft, knotty, painless tumor. See **VEIN**, **ANEURYSM**.

\* The word is pure Latin, formed from the verb *variare*; by reason of the turns and meanders of the veins, which the tumor sometimes follows.

Sometimes it is confined to one single branch of a vein; and sometimes it extends to several: and sometimes runs crooked, and bent, in various knots and circumvolutions.

It happens ofteneft to the crural and hæmorrhoidal veins; sometimes, also, to those in the testes, and frequently in the abdomen and breasts of pregnant women, and such as give suck. It is supposed owing to the great abundance, or thickness of the blood; or the relaxation of the membranes of the veins; immoderate labour, sprains, cramps, too great pressure or stricture by bandages. Stagnations of the blood, from a plethora, cachochymia, &c. may also give occasion thereto.

Melancholic persons, and those who feed on coarse meats, are most subject to them: the generality of women with child, have *varices* on their thighs and legs, occasioned by the foetus compressing the iliac veins; and by that means, preventing the reflux of blood to the heart.

*Varices* happening spontaneously, and proving of a moderate size, are rarely dangerous; but even are allowed servicable in case of the hæmorrhoids.—When immoderate, they sometimes occasion a cachexy, dropsy, or consumption.

The cure is to be attempted by evacuations, as phlebotomy, and cathartics; external applications, as discutient fomentations, cataplasms, embrocations, bandages, &c. Or, lastly, where the case grows dangerous, by incision.

**Hernia VARICOSA**, the same with *circoscele*. See **CIRSOCELE**.

The *hernia varicosa* is known by the situation of the tumor, the course of the vein, relaxation of the part, or its appearing inflated with air, distended, and painful. See **HERNIA**.

It is remedied by a proper truss, or bandage, with the medicines abovementioned.

**VOL. II.** N° CLVIII.

**VARIÉT.** See the article **VALET**.

**VARNISH**, or **VERNISH**, **VERNIX**, a thick, viscid, glossy liquor; used by painters, gliders, and various other artificers, to give a gloss and lustre to their works, as also to defend them from the weather, dust, &c.

There are divers kinds of *varnishes*, all made of gums dissolved in spirit of wine.

*White VARNISH* is usually made of gum sandarach and gum mastic dissolved in spirits, left to settle two days, then strained through a linen cloth, and after standing some time, the clear poured off, and bottled for use.

The more curious artists dissolve the two gums separately; and having made a separate *varnish* of each, mix them occasionally, as their work requires a stiffer or a softer *varnish*.

But for the *best white varnish*, more gums are required, viz. Venice turpentine, gum copal, elemi, benzoin, annise, and white rosin.

*Lacc-VARNISH*, is made of gum lacca and spirit of wine, frequently shaken till the gum be dissolved, then strained, and the clear decanted off, as above.

The lacc ought to be of the kind called seed-lacc.—Though for varnishing ordinary woods, shell lacc is often used.—But this will not stand against the weather.

Besides these, there are *hard*, and *soft varnishes*, or grounds, used by the etchers, and engravers. See **ETCHING**.

**VARNISH**, is also used for a kind of glossy coat, wherewith potters ware, Delft ware, China ware, &c. are covered, to give them a smoothness, and lustre.—Melted lead, is the *varnish* ordinarily used for the first; and smalt for the second. See **POTTERS**.

The true *varnish* used by the Chinese, and Japanese, to give that inimitable lustre to their porcelain, is one of the grand secrets in that manufacture; and almost the only thing wanting, to make Delft and French ware vie with the Chinese. Several have described the preparation thereof; particularly Kircher: but none ever succeeded in the trial. See **PORCELAIN**.

**VARNISH** is also a term applied to the colours which antique medals acquire in the earth. See **MEDAL**.

The value of a medal is heightened by a beauty, which nature alone is able to give, and art has never yet attained to counterfeit: we mean, the colour or *varnish*, which certain soils tinge the medal withal; some with a blue, almost as beautiful as that of a turquoise; others with an inimitable vermilion colour; others with a glossy shining brown, infinitely beyond any of our figures in bronze.

The most usual *varnish* is a fine green, which hangs to the most delicate strokes, without effacing them; much more accurately than the finest enamel does on metals.

Brass alone is susceptible of it; for as to silver, the green rust that gathers on it, always spoils it; and it must be scowered off with vinegar, or lemon juice.

There is also a *false*, or *modern varnish*; which the falsifiers of medals give to their counterfeits, to give them the air of antiquity: it is discovered by its being softer than the natural *varnish*, which is as hard as the metal itself.

Some lay their spurious medals under ground, where they contract a degree of *varnish*, that may impose on the less knowing: others use sal armoniac, mixed with vinegar, others burnt paper.

**VAROLI Pens.** See the article **PENS**.

**VAS**, *Vessil*. See **VESSEL**, **VESICULA**, **ANGIOLOGY**.—Hence (in the stile of anatomists) the *Vasa adiposa*, *præparantia*, &c.

**Vas Breve**, *Short VESSEL*, in anatomy, a vessel at the bottom of the stomach; thus called from its shortness. See **STOMACH**.

It sends divers little branches from the bottom of the stomach to the spleen; or, according to the use the ancients imagined it to be of, from the spleen to the stomach: for their notion was, that, by means of this vessel, the spleen supplied the stomach with an acid juice: which acting on the inner nervous membranes of the stomach, caused the sensation of hunger; and at the same time mixing with the foods contained therein, assisted, by its acid quality, in the dissolution thereof. See **SPLEEN**, **HUNGER**, &c.

But upon examining the little branches of this vessel more accurately, we find, they do not pierce into the stomach, and that they are no more than branches of veins, serving to return the blood into the splenic vein; whence it passes into the vena porta. See **SPLENIC**, and **PORTA**.

**VASA Concordia**, among hydraulic authors, are two vessels, so constructed, as that one of them, though full of wine, will not run a drop; unless the other, being full of water, do run also.—Their structure and apparatus may be seen in Wolfius, *Element. Mathes.* T. II. *Hydraul.*

**VASCULAR**, **VASCULARIS**, in anatomy, is applied to any thing consisting of divers vessels, veins, arteries, &c.

We say, the *vascular* and valvular texture of the lungs.—All the flesh in an animal body, is found to be *vascular*, none of it parenchymous, as the ancients imagined. See **FLESH**, **PARENCHYMA**, &c.

**VASCULAR Glands.** See the article **GLAND**.

**VASCULAR Glands.** See the article **GLAND**.

**VASCULAR, VASCULARIUS**, in antiquity, was the denomination of a kind of artificers, among the antient Romans; who made silver and gold vessels without reliefs, or figures imbossed thereon.

Hence, according to Salmasius, it is, that Cicero, in his sixth oration against Verres, distinguished *vascularius* from *cælator*, engraver.

In the art called by the Greeks *ματαισκη*, which was the art of superadding ornaments of precious stones, or rich metals, to vases of other metals; the *vascularii* and *cælatores* were different; the first being the goldsmiths who made the vase, the second, the sculptors who added the ornaments.—But in the art called *τοπειρικη*, or the art of cutting bas reliefs, or stamping figures on metal; the *vascularii* were also *cælatores*, or engravers: that is, they who made the vase, made also the reliefs, or figures, wherewith it was enriched. See **SCULPTURE**, &c.

**VASCULIFEROUS Plants**, among the botanists, such as have a peculiar vessel or case to contain the seed; which is sometimes divided into cells. See **PLANT**.

These have always a monopetalous flower; either uniform, or difform. See **MONOPETALOUS**.

The former have all their seeds divided: 1°. Into two partitions, as the *hyoscyamus*, *nicotiana*, *priapeia*, and the *gentiana*. 2°. Into three partitions, as the *convolvulus*, *speculum veneris*, *trachelium*, *repunculus* or *campanula*, *repunculus corniculatus*, &c. 3°. Into four partitions, as the *stramonium*. Those of the latter kind, which have a difform monopetalous flower, as the *linaria*, *pinguicula*, *antirrhinum*, *aristolochia*, *scrophularia*, *digitalis*, *pedicularis*, *melampyrum*, *euphrasia*, &c.

**VASE**, a term of equal import with the Latin *vas*, whence it is formed; and the English *vessel*. See **VESSEL**.

It is applied to the antient vessels, dug from under ground, or otherwise found, and preserved in cabinets, &c. as vessels of sacrifice, urns, &c. and to other more modern vessels, which are rather of curiosity and shew, than use; as those of crystal, porcelain, &c.

**VASES**, in architecture, or ornaments of sculpture, placed on socles, or pedestals; representing the vessels of the antients; particularly those used in sacrifice, as the *præfericulum*, *simpulum*, incense-pots, flower-pots, &c. and occasionally enriched with basso relievos.

They are commonly placed there to crown, or finish facades, or frontispieces. See **CROWNING**.—They are frequently also called *acroteria*; and are usually insulate. See **ACROTHERIA**.

Vitruvius mentions a kind of *theatrical vases*, made of brass, or earthen ware, called *echæa*, *ἡχία*; which they disposed in private places, under the steps and seats of the theatres, to aid and increase the reflection and resonance of the actors voices, &c. See **THEATRE**.—It is said, there are also *vases* of this kind in the cathedral church of Milan.

**VASE** is particularly used in architecture, to signify the body of the Corinthian and composite capital; called also the *tambour*, or *drum*; and sometimes the *campana*, or *bell*.—See **Tab. Archit. fig. 21. lit. c. c.** See also **CORINTHIAN**, and **TAMBOUR**.

**VASE** is also sometimes used among florists, for that they otherwise call the *calyx*.

The *vase*, or rather calyx of a tulip, is the top, or head of a tulip; the leaves whereof form a kind of *vase*, or cup. See **CALYX**.

Goldsmiths, braisers, &c. also use *vase* for the middle of a church candlestick; which is usually of a roundish figure, bordering somewhat on that of a *vase*.

**VASSAL, \* VASSALLUS**, in our antient customs, a person who vowed fidelity, and homage to a lord, on account of some land, &c. which he held of him, in fee. See **FEALTY**, **HOMAGE**, **LORD**, &c.

\* Du Cange will have the word to come from *vassus*, which antiently signified a *servant*, or *domestic* of a prince, and sometimes also the *comites*, or *assessores* in public trials.—Menage, after Cujas, takes *vassal* to have been formed of *gesfel*, an antient German word, signifying *companion*.—Caseneuve derives it from the Gaulish *geffus*, a *brave man*, from *geffo*, or *geffum*, or *jæsum*, a kind of javelin used among them.—Vossius derives *vassal* from *vas*, *vadis*, *pledge*; whence also he will have it to be, that they are sometimes called *fideles*.

The *vassal* was also called *piratus*, *lord's-man*, and *fee-man*; but now the denomination is changed into that of *tenant in fee*. See **TENANT**, **VILLAIN**, &c.

They sometimes also used the term *vassour* for *vassal*; whence *vavasour*. See **VAVASOUR**, and **VAVASORY**.

If a *vassal* offended his lord grievously, either in person, or in honour, he committed the crime of felony; which carried with it a confiscation of his fee. See **VASSALAGE**, **FELONY**, &c.

A **Rear VASSAL**, is he who holds of a lord, who himself is *vassal* of another lord. See **MESNE**.

**VASSAL** was also antiently used for soldier; by reason fees, at first, were given to none but military men. See **FREE**.

**VASSALAGE**, the state of a vassal; or a servitude and dependency on a superior lord. See **VASSAL**, **SERVICE**, **TENURE**, &c.

Antiently, they distinguished between *liege vassalage*, and *simple vassalage*.

*Liege vassalage* only belonged to the king; as carrying with it an obligation on the side of the vassal, to serve his lord in war, against all persons whatever. See **LIEGE**.

In all *simple vassalage*, the fealty, or *liege vassalage*, was still reserved to the king. See **FEALTY**.

Some also distinguish *active vassalage*, and *passive*: the first is the right of fealty residing in the lord; the second, the service and duties incumbent on the tenant. See **LORD**, &c.

**VASTO**, in law, a writ that lies against the tenant for life, or years, for making waste. See **WASTE**.

**VASTUS**, in anatomy, a name common to two muscles of the leg, distinguished into *internal* and *external*; thus called from their largeness: both of them serving to extend the leg.

**VASTUS Externus**, springs from the root of the great trochanter, and from the linea aspera; outwardly tendinous, and inwardly fleshy; and descending obliquely forwards, becomes, *vice versa*, tendinous inwardly, and fleshy outwardly; till meeting the tendon of the rectus, it grows quite tendinous, and is inserted together with it.—See **Tab. Anat. (Myol.) fig. 1. n. 60. fig. 2. n. 41. fig. 6. n. 35.**

**VASTUS Internus**, arises likewise partly tendinous, and partly fleshy, from the linea aspera, immediately below the less trochanter, upon the outside of the tibia; and is continued almost to the lower apophysis thereof, on the inside: whence it descends obliquely; and growing tendinous, is inserted with the former.—See **Tab. Anat. (Myol.) fig. 1. n. 55. fig. 2. n. 39. fig. 7. n. 42.**

**VAT**, or **FAT**, a kind of vessel, used to hold wine, ale, beer, cyder, or any other liquor, in the time of its preparation.

**VATICAN, \* VATICANUS**, is properly the name of one of the seven hills whereon Rome stands: on the foot hereof is the famous church of S. Peter, hence called the *Vatican*; and a magnificent palace of the pope, which has the same denomination.—Hence arise divers figurative expressions; as *the thunderbolt of the Vatican*, q. d. the pope's anathema, &c.

\* The word, according to Aulus Gellius, is derived from *vaticinium*, *prophecy*; by reason of the oracles and predictions which were used to be delivered there by the inspiration of an antient deity, called *Vaticanus*; who was supposed to unbind the organs of speech in new-born children; and whom others will have to be no other than Jupiter, considered in that capacity.

The **Library of the VATICAN**, is one of the most celebrated in the world: it is particularly remarkable for its manuscripts.—Towards the beginning of the last century, it was greatly augmented by the addition of that of the elector Palatine.—It is open to all the world three or four times a week.—In it are shewn a *Virgil*, *Terence*, &c. above a thousand years old; the manuscript whereon the edition of the *Septuagint* was made; and abundance of rabbinical manuscripts. See **LIBRARY**.

**VATICINATION, VATICINATIO**, the act of prophecy-ing, or divining. See **DIVINATION**, and **PROPHECY**.

**VAVASOR, VALVASOR, VAVASOUR, or VALVASOUR**, in our antient customs, a diminute of *vassal*, or *vassor*; signifying a *vassal of a vassal*, or one who held a fee of another vassal. See **VASSAL**, and **VAVASORY**.

Yet Camden, and others, hold *vavasor* to be a dignity, next below that of a baron: he adds, that the word is formed of *vas sortitum ad valetudinem*, a vessel chosen for safety, and health.—Others derive it à *valvis*, *quasi obligatus sit adflare ad valvas domini, vel dignus sit eas intrare*; as being a person obliged to wait at his lord's door, or as worthy to enter thereat: but the etymology is ridiculous enough.

Du Cange distinguishes two sorts of vassals under this denomination.—The *great*, called *valvasores*, who held of the king: such were counts, and barons.—And the *lesser*, called *valvasani*, who held of the former.

**VAVASORY, \* VAVASORIA**, the quality of the land, or fee held by a vavasor. See **VAVASOR**.

\* *Quod dicitur de baronia non est observandum in vavatoria, vel aliis minoribus fœdis quam baronia, quia caput non habent sicut baronia.* Bract. Lib. II. cap. 39.

There are *base vavasories*, and *frank*, or *noble vavasories*; according as it has pleased the lord to make his *vavasor*.—*Base vavasories*, are those for which the lord of the fee owes sum-mage, light-horse, rents, or other services.—*Free vavasories*, are such as are exempt from these services.

**VAUDOIS, VALDENSES, or WALDENSES**, a name given to a sect of reformers, who made their first appearance about the year 1160; or, as others will have it, about the year 1118.

The occasion of their rise is thus delivered:—"In an assembly of several of the more considerable citizens of Lyons, one of them fell down suddenly dead in the middle.—Upon which, Pierre Valdo, who was one of the number, being struck with the accident, distributed a large sum of money among the poor on the spot.—This drawing a great number of people to follow him, he exhorted them to embrace a voluntary poverty, after the example of Jesus Christ, and his apostles: and as he was a man of some learning, he expounded to them the New Testament in the vulgar tongue.

The clergy soon began to cry out on him as a rash intruder: but he, despising their reprimands, still held on; and even went further.—For the accusations of the priests having exasperated him, he began to declaim against them; exposed their corrupt lives and morals; and even, by degrees, came to censure some of the corruptions in the discipline and doctrine of the church.—And this paved some of the way to the Reformation.

The *Vaudois* had their name from this Valdo, whose retainers they were.—They were also called *Lyonists*, and *Sabatez*, or *Insabatez*, or *Ensabatez*.

**VAULT**, *Fornix*, in architecture, an arched roof, so contrived, as that the several stones whereof it consists, do, by their disposition, sustain each other. See **ARCH**.

*Vaults* are to be preferred, on many occasions, to soffits, or flat ceilings, as they give a greater rise and elevation; and besides, are more firm and durable. See **CEILING**, **ROOF**.

The antients, Salmasius observes, had only three kinds of *vaults*: the first, *fornix*, made cradle-wise; the second, *testudo*, tortoise-wise, called by the French, *cul de four*, or oven-wise; the third, *concha*, or shell-wise.

But the moderns subdivide these three sorts into a great many more, to which they give different names, according to their figures and use: some are *circular*, others *elliptical*, &c.

The sweeps of some, again, are larger, others less portions of a sphere: all above hemispheres are called *high*, or *surmounted vaults*; all that are less than hemispheres, are *low*, or *surbated vaults*, &c.

In some, the height is greater than the diameter; in others, it is less: there are others, again, quite flat, only made with haunches; others oven-like, or in form of a cul de four, &c. others growing wider, as they lengthen, like a trumpet.

Of *vaults*, some are *single*, others *double*, *cross*, *diagonal*, *horizontal*, *ascending*, *descending*, *angular*, *oblique*, *pendent*, &c.—There are likewise *Gothic vaults*, with *pendentives*, &c. See **OGIVE**, **PENDENTIVE**, &c.

**Master VAULTS**, are those which cover the principal parts of buildings; in contradistinction to the *lesser*, or subordinate *vaults*, which only cover some little part; as a passage, a gate, &c.

**Double VAULT**, is such a one as, being built over another, to make the exterior decoration range with the interior, leaves a space between the convexity of the one, and the concavity of the other: as in the dome of S. Paul's at London, and S. Peter's at Rome.

**VAULTS with Compartiments**, are such whose sweep, or inner face, is enriched with pannels of sculpture, separated by platbands: these compartiments, which are of different figures, according to the *vaults*, and usually gilt on a white ground, are made with stucco, on brick-walls; as in the church of S. Peter's at Rome; and with plaister, on timber *vaults*.

**Theory of VAULTS**.—A semicircular arch, or *vault*, standing on two piers, or imposts, and all the stones that compose them, being cut and placed in such manner, as that their joints, or beds, being prolonged, do all meet in the centre of the *vault*; it is evident, all the stones must be in form of wedges, *i. e.* must be wider and bigger atop than at bottom: by virtue of which, they sustain each other, and mutually oppose the effort of their weight, which determines them to fall.

The stone in the middle of the *vault*, which is perpendicular to the horizon, and is called the *key of the vault*, is sustained on each side by the two contiguous stones, just as by two inclined planes: and of consequence, the effort it makes to fall, is not equal to its weight.

But still, that effort is greater, as the inclined planes are less inclined; so that, if they were infinitely little inclined, *i. e.* if they were perpendicular to the horizon, as well as the key, it would tend to fall with its whole weight; and would actually fall, but for the mortar.

The second stone, which is on the right or left of the key-stone, is sustained by a third; which, by virtue of the figure of the *vault*, is necessarily more inclined to the second, than the second is to the first; and of consequence, the second, in the effort it makes to fall, employs a less part of its weight than the first.

For the same reason, all the stones, reckoning from the key-stone, employ still a less and less part of their weight to the last; which, resisting on a horizontal plane, employs no part of its weight; or, which is the same thing, makes no effort to fall; as being intirely supported by the impost.

Now, in *vaults*, a great point to be aimed at is, that all the vouffours, or key-stones, make an equal effort in order to fall: To effect this, it is visible, that as each (reckoning from the key to the impost) employs a still less and less part of its whole weight; the first, for instance, only employing one half; the second, one third; the third, one fourth, &c. there is no other way to make those different parts equal, but by a proportionable augmentation of the whole, *i. e.* the second stone must be heavier than the first; the third, than the second, &c. to the last; which should be infinitely heavier.

M. de la Hire demonstrates what that proportion is, in which the weights of the stones of a semicircular arch must be increased, to be in equilibrio, or to tend with equal forces to fall; which is the firmest disposition a *vault* can have.

Before him, the architects had no certain rule to conduct themselves by; but did all at random. Reckoning the degrees of the quadrant of the circle from the key-stone to the impost; the extremity of each stone will take up so much the greater arch, as it is farther from the key.

M. de la Hire's rule is, to augment the weight of each stone above that of the key-stone, as much as the tangent of the arch of the stone exceeds the tangent of the arch of half the key.—Now, the tangent of the last stone, of necessity becomes infinite, and of consequence its weight should be so too: but as infinity has no place in practice, the rule amounts to this, that the last stones be loaded as much as possible, that they may the better resist the effort which the *vault* makes to separate them; which is called the *shoot*, or *drift of the vault*.

M. Parent has since determined the curve, or figure, which the extrados, or outside of a *vault*, whose intrados, or inside, is spherical, must have, that all the stones may be in equilibrio.

**Key of a VAULT**, is a stone, or brick, in the middle of the *vault*, in form of a truncated cone, serving to bind or fasten all the rest. See **KEY**.

**Reins**, or **Fillings up of a VAULT**, are the sides which sustain it.

**Pendentive of a VAULT**, is the part suspended between the arches or ogives. See **PENDENTIVE**.

**Impost of a VAULT**, is the stone whereon the first vouffoir, or arch-stone of the *vault*, is laid. See **IMPOST**, &c.

**VAULT**, or **VOLT**, in manage. See **VOLT**.

**VAUNT**, or **VANT**. See the article **VAN**.

**VAUNT-Lay**, among hunters, a setting of hounds, or beagles, in readiness where the chase is to pass; and casting them off before the rest of the kennel come in. See **RELAY**.

**VAYVODE**, or **VAIVODE**. See the article **WAYVODE**.

**UBIQUISTS**, \* **UBIQUITARIES**, or **UBIQUITARIANS**, a sect of Lutherans, which rose and spread itself in Germany; and whose distinguishing doctrine was, that the body of Jesus Christ is every where, or in every place. See **LUTHERANISM**.

\* The word is formed from the Latin adverb, *ubique*, every where.

Brentius, one of the earliest reformers, is said to have first broached this error, in 1560.—Melancthon immediately declared against it; maintaining, that it introduced, with the Eutychians, a kind of confusion into the two natures of Jesus Christ; and protested, that he would oppose it as long as he lived.

On the other hand, Andrew and Flacius Illyrius, Osiander, &c. espoused Brentius's party; and asserted the body of Jesus Christ to be every where.

The universities of Leipzig and Wirtemberg, and the generality of Protestants, set themselves against this new heresy, but in vain: the *Ubiquitarians* grew stronger and stronger.—Six of their leaders, Schmidelin, Selnecker, Musculus, Chemnitius, Chytræus, and Cornerus, having a meeting in 1577, in the monastery of Berg, they there composed a kind of credo, or formula of faith, wherein the *ubiquity* was established as an article.

All the *Ubiquitists*, however, are not agreed: some of them, and among the rest the Swedes, hold that Jesus Christ, even during his mortal life, was every where: others maintain, that it is only since his ascension that his body is every where.

G. Hornius only allows Brentius the honour of being the first propagator of *ubiquitism*; its first inventor, according to him, was John of Westphalia, a minister of Hamburg, in 1552.

**UBIQUIST**, in the university of Paris, is a term applied to such doctors in theology, as are not restrained to any particular house; either to that of Navarre, or Sorbonne.

The *Ubiquists* are called, simply, *doctors in theology*; whereas the others add, *of the house of Sorbonne*, or *Navarre*, &c. See **SORBONNE**, **DOCTOR**, &c.

**UBIQUITY**, *Omnipresence*; an attribute of the Godhead, whereby he is always intimately present to all things; gives the esse to all things; knows, preserves, and does all in all things. See **GOD**.

For since God cannot be said to exist in all places, as placed therein, (because, then, he would need something to his existence, *viz.* place; and would have extension, parts, &c.) he must be conceived to be every where, or in all things, as a first, universal, efficient cause, in all his effects. He is present, therefore, to all his creatures, as a pure act, or an exercise of an active virtue, which knows, preserves, governs, &c. every thing.—Nor are, even finite minds, present otherwise than by operation. See PRESENCE.

UDDER, UBER, in comparative anatomy, that part in brutes wherein the milk is prepared; answering to the mammae, or breasts in the human kind. See BREAST, and MILK.

VECTIS, in mechanics, one of the powers; more usually called lever. See LEVER.

Heterodromus VECTIS. See the article HETERODROMUS.

VECTOR, in astronomy, a line supposed to be drawn from any planet moving round a centre, or the focus of an ellipsis to that centre, or focus. See PLANET.

This, by some writers of the new astronomy, is called *vector*, or *radius vector*, because it is that line by which the planet seems to be carried round its centre; and with which it describes areas proportional to the times. See AREA, &c.

VEDETTE, in the military art, a sentinel on horseback, detached from the main body of the army, to discover and give notice of the enemy's designs.

VEER, a sea term variously used.—*Veering out a rope*, denotes the letting it go by hand, or letting it run out of itself: thus, they say, *Veer more cable*; that is, let more run out.

But they do not use the word for the letting out of any running rope, except the sheat.

VEER, is also used in reference to the wind: for when it changes often, and suddenly, they say, the *wind veers*.

When a ship under sail, has her sheat *veered* out, they say, *she goes veering*; that is, at large; neither by a wind, nor directly before it, but between both: which they also call *quartering*. See WIND, and QUARTERING.

VEGETABLE, VEGETABILE, in physiology, a term applied to all plants, considered as capable of growth; *i. e.* all natural bodies which have parts organically formed for generation, and accretion, but not sensation. See PLANT.

In *vegetables*, there is supposed to be a principle of life, commonly called the *vegetative soul*. See VEGETATIVE, and VEGETATION.

Boerhaave very scientifically defines a *vegetable* to be a body generated of the earth; to which it adheres, or is connected, by parts called *roots*, through which it receives the matter of its nourishment, and increase; and consists of juices, and vessels, sensibly distinct from each other: or, a *vegetable* is an organical body, composed of vessels and juices, every where distinguishable from each other; to which grow roots or parts, whereby it adheres to some other body, from which it derives the matter of its life, and growth.

This definition furnishes a just and adequate idea of a *vegetable*: for by its consisting of vessels and juices, it is distinguished from a *fossil*; and by its adhering to another body, and deriving its nourishment therefrom, it is distinguished from an *animal*. See FOSSIL, and ANIMAL.

A *vegetable* is defined an organical body, because consisting of different parts, which jointly concur to the exercise of the same function. See ORGANICAL.

Adhering by some of its parts to another body—for we know of no plant that is so absolutely vague and fluctuating, but has still a body it adheres to; though that body may be various, *e. gr.* earth, as in our common plants; stone, as in rock-plants; water, as in sea-plants; and air, as in some mucilages.

As to those few plants which appear to float with the water, their manner of growth is somewhat anomalous: M. Tournefort has shewn, that all plants do not arise strictly from seeds; but that some, instead of semen, deposite, or let fall a little drop of juice, which sinking in the water, by its gravity reaches the bottom, or some rock, &c. in its way; to which it sticks, strikes root, and shoots into branches. Such is the origin of coral. See CORAL.

Add, that the root of a plant may have any situation at pleasure, with respect to the body thereof; nor needs it either be lowest or highest, &c.—Accordingly, in alces, coral, mosses, fungus's, &c. the root is frequently uppermost, and its growth downwards.

The vascular structure of *vegetables*, is rendered very apparent, by an experiment of Mr. Willughby—Cutting off some pretty big branches of birch, and making a sort of bason, or reservoir, on the end thereof with soft wax; upon filling this with water, and holding the branch upright, the water, in a few minutes, sunk into the vessels of the wood, and running quite through the length, dropped out considerably fast; continuing to do so, as long as the water was poured on.—The same succeeds in a sycamore, walnut-tree, &c. though the flux here is not so copious. *Philosoph. Transact.* N<sup>o</sup> 70.

There are secrets whereby the growth of *vegetables* is surprisingly promoted.—Mr. Boyle mentions a virtuoso, who entertained his friends at the end of their meal with a salad of lettices, which he sowed in their presence, immediately before they sat down to table.

The chymists also furnish us with an extraordinary sort of *vegetables*: as, the arbor Dianæ, arbor Martis, &c.—In effect, gold, silver, iron, copper, being prepared in aqua fortis, there rises out of them a kind of tree, which vegetates, or grows, to the naked eye, and spreads into branches, leaves, &c. the whole height of the water; till all the matter is spent therein. See ARBOR Dianæ, &c.

This water, the chymists call *flint water*; the secret whereof has been communicated by Rhodocanasses, a Greek chymist.

VEGETABLE Oil. See the article OIL.

VEGETATION, VEGETATIO, the act whereby plants, and other living bodies, receive nourishment, and grow. See PLANT, VEGETABLE, ACCRETION, &c.

Plants, we learn from the microscope, consist of different parts, vessels, &c. analogous to those of animals: and each kind of vessel is supposed to be the vehicle of a different humour, or juice, secreted from the mass of sap; which is considered as the blood, or common fund of them all. See SAP, and BLOOD.

Dr. Grew assigns the offices of the several vessels: those placed on the inner verge of the bark, he calls *lymphæducts*, and supposes them destined for the conveyance of the most aqueous, or watery liquor; these Mr. Bradley calls the *new forming vessels*, which are annually produced, and help to increase the bulk of the tree.

Those in the middle of the bark, Dr. Grew calls *lactiferous*, or *resiniferous* vessels; their use, according to Bradley, is to return the superfluous sap: these vessels, Grew observes, are the principal viscera of plants; and adds, that as the viscera of animals are but vessels conglomerated; so the vessels of a plant are viscera drawn out at length. See VISCERA.

To the nutrition of plants, as well as animals, it seems necessary that there be a concurrence of two specifically distinct fluids; and a learned author maintains an intermixture of two such humours in every part of a tree, like that which we observe in linsley-woolsey: every part of sap being impregnated with other tinctures, and continually filtered from fibres of one kind to those of another. From this mixture, many of the phenomena of the ripening, odours, colours, &c. are accounted for.

Theory of VEGETATION.—The process of nature in the *vegetation* of plants, is very accurately delivered by the excellent Malpighi, to the effect following.

The egg (or seed) of the plant being excluded out of the ovary, (called *pod*, or *husk*) and requiring further fostering and brooding; is committed to the earth. See SEED, and EGG.

There, that kind mother having received it into her bosom, not only does the office of incubation, by her own warm vapours and exhalations, joined with the heat of the sun; but, by degrees, supplies what the seed requires for its further growth: as abounding every where with canals and sinus's, wherein the dew, and rain-water, impregnated with fertile salts, glide, like the chyle and blood in the arteries, &c. of animals.

This moisture meeting with a new deposited seed, is percolated, or strained through the pores or pipes of the outer rind, or husk, (corresponding to the secundines of foetus's) on the inside whereof lie one or more, commonly two, thick seminal leaves, (answering to the placenta in women, and the cotyledons in brutes.) See SECUNDINE, PLACENTA, &c.

These seed-leaves consist of a great number of little vesiculæ, or bladders; with a tube, corresponding to the navel-string in animals. See UMBILICUS.

In these vesiculæ is received the moisture of the earth, strained through the rind of the seed; which makes a slight fermentation with the proper juice before contained therein.

This fermented liquor is conveyed by the umbilical vessel to the trunk of the little plant; and to the gem, or bud, which is contiguous thereto: upon which, a *vegetation* and increase of the parts succeeds.

Such is the procedure in the *vegetation* of plants; which the illustrious author exemplifies in a grain of wheat; as follows.

—The first day the grain is sown, it grows a little turgid; and the secundine, or husk, gapes a little in several places: and the body of the plant, being continued by the umbilical vessel to a conglobated leaf, (which is called the *pulp* or *flesh* of the seed, and is what constitutes the flower) swells; by which means, not only the gem, or sprout, (which is to be the future stem) opens, and waxes green; but the roots begin to bunch out; whence the placenta, or seed-leaf, becoming loose, gapes.

The second day the secundine, or husk, being broke through, the stem, or top of the future straw, appears on the outside thereof, and grows upwards by degrees: in the mean time,

the seed-leaf guarding the roots, becomes turgid with its vesiculæ; and puts forth a white down. And the leaf being pulled away, you see the roots of the plant bare; the future buds, leaves, and rest of the stalk still lying hid.—Between the roots, and the ascending stem, the trunk of the plant is knit, by the navel-knot, to the flower-leaf; which is very moist, though it still retains its white colour, and its natural taste.

The third day, the pulp of the conglobated, or round leaf, becomes turgid with the juice which it received from the earth, fermenting with its own.

Thus the plant increasing in bigness, and its bud or stem becoming taller, from whitish, turns greenish: the lateral roots also break forth greenish, and pyramidal from the gaping sheath, which adheres closely to the plant; and the lower root grows longer, and hairy, with many fibres shooting out of the same.

Indeed there are hairy fibres hanging all along on all the roots, except on their tips; and these fibres are seen to wind about the saline particles of the soil, little lumps of earth, &c. like ivy; whence they grow curled. Above the lateral roots, there now break out two other little ones.

The fourth day, the stem mounting upwards, makes a right angle with the seminal leaf: The last roots put forth more; and the other three, growing larger, are clothed with more hairs, which straightly embrace the lumps of earth; and where they meet with any vacuity, unite into a kind of network.—The conglobate, or flower-leaf, is now softer; and, when bruised, yields a white sweetish juice, like barley cream.—By stripping it off, the root and stem of the plant are plainly seen, with the intermediate navel-knot, whose outer part is solid, like a bark, and the inner more soft, and medullary.

The fifth day, the stalk still rising, puts forth a permanent, or stable leaf, which is green, and folded; the roots grow longer, and there appears a new tumor of a future root: the outer, or sheath-leaf is loosened; and the seed-leaf begins to fade.

The sixth day, the stable-leaf being loosened, the plant mounts upwards; the sheath-leaf still cleaving about it like a bark.—The seed-leaf is now seen sinuous, or wrinkled, and faded: and this being cut or freed from the secundine, the flesh, or pericarpium, is found of a different texture; the outer part, whereby the outside of the seed or grain is heaved up, being more solid; but the inside vesicular, and filled with humor, especially that part next the navel-knot.—All the leaves being pulled off, the roots torn, and the flower-leaf removed, the trunk appears; wherein, not far from the roots, the navel-knot bunches out, which is solid, and hard to cut: above, there is the mark of the sheath-leaf, which was pulled off; and underneath, as in an arm-pit, the gem is often hid.—The hind part of the plant, shews the breakings forth of the roots, likewise the faded placenta, &c.

After the eleventh day, the seed-leaf, as yet sticking to the plant, is crumpled, and almost corrupted; within it is hollow; and about the secundine, the mucous, and white substance of the seed, being continued to the navel-knot, forms a cavity. All the roots becoming longer, put forth new branches out of their sides: the seed-leaf withers, and its vesicles are emptied: the internodes, or spaces between the knots, grow longer; new gems appear; and the middle root grows several inches long.

After a month, the roots and stalk being grown much longer, new buds break out at the first knot, and little tumors bunch out, which, at length, break into roots.—For other circumstances of Vegetation, see GENERATION, JUICE, SEED, RADICLE, PLUME, PERPENDICULARITY, PARALLELISM, &c.

As to the Vegetable Matter, or the food whereby plants grow, there is some doubt: the common opinion among naturalists, is, that water is the great vegetable food; which is confirmed by any easy experiment.

A sprig of balm, mint, or the like plant, is set in a phial of pure water, without any mixture of earth; yet the sprig grows, puts forth roots, leaves, and branches.

Agreeable to which, is another famed experiment of Van Helmont; who drying 200 pounds of earth, and planting a willow which weighed 5 pounds therein, he watered it only with rain, or distilled-water; and to secure it from any other earth, covered it with a perforated tin cover: at 5 years end, weighing the tree, with all the leaves it had born in that time, he found it to weigh 169 pounds 3 ounces; yet the earth was only diminished 2 ounces. See WATER.

To ascertain this point, Dr. Woodward has made some very good experiments; which, at the same time, give light to many other circumstances of vegetation.—His experiments are most of them made with sprigs of mint, and some other plants, nicely weighed, and inclosed in equal glass phials, well covered up with parchment; leaving only room for the stems to ascend through it; and filled with water: some with spring-water, others with rain-water, others with Thames-water.

VOL. II. NO. CLIX.

At the end of 77 days he took them all out again; weighed them, as also the water left; and computed the weight of water expended on them, and the proportion of the increase of the plant, to the expence of the water.

The next year, viz. 1692, he made fresh experiments with the same phials, and the same sort of plants, weighed as before, only some were filled with Hyde-Park conduit-water alone, others with the same water and a certain proportion of garden-earth dissolved in it; and others in the same water distilled.

At the end of 56 days, he weighed the plants, water, &c. and computed what each plant had gained, what quantity of water was expended on the plant, and the proportion of the increase of the plant, to the decrease of the water.

The result of all which experiments, he gives us in the following observations, and reflections.—1°. In plants of the same kind, the less they are in bulk, the smaller quantity of the fluid mass, in which they are set, is drawn off.—The consumption, where the mass is of equal thickness, being pretty nearly proportional to the bulk of the plant.

In effect, the water seems to ascend up the vessels of plants, in much the same manner as up a filtre: and it is no great wonder, that the larger filtre should draw off more water than the smaller; or that a plant, that hath no more and larger vessels should take up a greater share of the fluid, in which it is set, than one that has fewer can: nor is this noted as a thing very considerable in itself, but chiefly with regard to what follows.

2°. Much the greater part of the fluid mass thus drawn off, and conveyed into the plant, does not settle or abide there; but passes through their pores, and exhales up into the atmosphere.—That the water, in these experiments, ascended only through the vessels of the plants, is certain; since some glasses, which had no plants in them, though disposed in like manner as the rest, remained at the end of the experiment as at first, without any diminution of water: and that the greater part of it flies off from the plant, into the atmosphere, is as certain.

The least proportion of the water expended, was to the augment of the plant, as 46 or 50 to 1; and in some 100, 200, nay, in one, as 700 to 1.

This so continual an emission of water, in so great plenty, from the parts of the plant, affords a manifest reason, why countries that abound with trees, and the larger vegetables especially, should be very obnoxious to damps, great humidity in the air, and more frequent rains, than others that are more open and free.—The great moisture in the air, was a great inconvenience, and annoyance to those who first settled in America; which, at that time, was overgrown with woods and groves: but as these were burned and destroyed, to make way for habitations, and culture of the earth; the air mended, changed into a temper much more serene and dry than before.

Nor does this humidity go off pure, and alone, but usually carries with it many parts of the same nature, with those whereof the plant, through which it passes, consists: the crasser, indeed, are not so easily born up into the atmosphere, but are usually deposited on the surface of leaves, flowers, and other parts of the plants; whence our mannas, our honies, and other gummous exudations of vegetables: but the finer and lighter parts, are with greater ease sent up into the atmosphere; thence they are conveyed to our organs of smell, by the air we draw in respiration; and are pleasant or offensive, beneficent or injurious to us, according to the nature of the plants from which they arise.—And since these owe their rise to the water that ascends out of the earth, through the bodies of plants; we cannot be far to seek for the cause, why they are more numerous in the air, and a greater quantity of odours is found exhaling from vegetables, in warm humid seasons, than in any others.

3°. A great part of the terrestrial matter that is mixed with water, ascends up into the plant, as well as the water.

—There was much more terrestrial matter, at the end of the experiment, in the water of the glasses that had no plants in them, than in those which had plants.—The garden-mould dissolved in some of the glasses, was considerably diminished, and carried off; nay, the terrestrial and vegetable matter, was born up in the tubes filled with sand, cotton, &c. in that quantity, as to be evident, even to sense: and the bodies in the cavities of the other tubes, that had their lower ends immersed in water, wherein saffron, cochineal, &c. had been infused, were tinged with yellow, purple, &c.—To look abroad a little towards our shores, and parts within the verge of the sea, these will present us with a large scene of plants, that, along with the vegetable, take up into them mere mineral matter also, in great abundance; such as our sea-purflain, the several sorts of algas, of samphires, and other marine plants: those contain common sea-salts, which are the same as the fossil, in such plenty, as not only plainly to be distinguished on the palate, but may be drawn out of them in considerable quantity; nay, some affirm, there are plants found, that will yield nitre, and other mineral salts.

The vegetable matter being very fine and light, is surprizingly apt, and disposed to attend water in all its motions, and follow it into each of its recesses; as appears not only from the instances above alledged, but many others: percolate it with all the care imaginable, filtre it with never so many filtrations, yet some terrestrial matter will remain.—Dr. Woodward has filtered water through several sheets of thick paper, and after that, through very close fine cloth, twelve times doubled; and this over and over, and yet a considerable quantity of this matter discovered itself in the water, after all.—Now if it thus passes interstices that are so very small and fine, along with the water, it is the less strange, it should attend in its passage through the ducts and vessels of plants: it is true, filtering and distilling the water, intercepts, and makes it quit some of the earthy matter it was before impregnated withal; but then, that which continues with the water after this, is fine and light, and such, consequently, as is, in a peculiar manner, fit for the growth and nourishment of vegetables.—And this is the case of rain-water: the quantity of terrestrial matters it bears up into the atmosphere, is not great; but what it does bear up, is chiefly of that light kind, or vegetable matter, and that, too, perfectly dissolved, and reduced to single corpuscles, all fit to enter the tubules, and vessels of plants: on which account it is, that this water is so very fertile and prolific.

The reason why all the terrestrial matter mixed with the water, does not ascend into the plant, is, that the mineral matters makes a great deal of it, which is not only gross and ponderous, but scabrous and inflexible; and so not disposed to enter the pores of the roots: besides, a great many of the simple vegetable particles, by degrees, unite, and form small clods, or molecule, which stick to the extremities of the roots of those plants; and others of them, entangled in a looser manner, from the nubeculæ, or green bodies, so commonly observed in stagnant water: these, when thus conjoined, are too big to enter the pores, or ascend up the vessels of plants; which singly they might have done.

Hence it is, that in agriculture, be the earth never so rich, good, and fit for the production of corn, or other vegetables; little will come of it, unless the parts of it be separated and loose: and it is on this account, such pains are bestowed in the digging, tilling, ploughing, fallowing, harrowing, and breaking the clodded lumps of earth: and it is the same way that sea-salt, nitre, and other salts, promote *vegetation*.

Some authors imagine nitre essential to plants; and that nothing in the vegetable kingdom is transacted without it: but Dr. Woodward assures us, that by all the trials he has been able to make, the thing seems to him quite otherwise: and when contiguous to the plant, nitre rather destroys than nourishes it.—But nitre, and other salts, certainly loosen the earth, and separate the concreted parts thereof; by that means, fitting and disposing them to be assumed by the water, and carried up into the seed or plant, for its formation and increase.—It is every body's observation, how apt all sorts of salts are to be wrought upon by moisture, how easily they run with it; and when these are drawn off, and have deserted the lumps wherewith they were incorporated, those must moulder immediately, and fall asunder of course: the hardest stone we meet with, if it happen, as it frequently doth, to have any sort of salt intermixed with the sand of which it consists, upon its being exposed to a humid air, in a short time dissolves and crumbles all to pieces; and much more will clodded earth, or clay, which is not of so compact and solid a constitution.

The same way is lime likewise serviceable in *vegetation*: the husbandmen say, it does not fatten, but only mellows the ground: by which they mean, it doth not contain any thing in itself, that is of the same nature with the vegetable mould, or afford any matter fit for the formation of plants, but merely softens, and relaxes the earth; by that means, rendering it more capable of entering the seeds of vegetables set in it, in order to their nourishment, than otherwise it would have been.—The properties of lime are well known, and how apt it is to be put in a ferment, and commotion by water; nor can such commotion ever happen, when lime is mixed with earth, however hard and clodded that may be, without opening and loosening it.

4°. The plant is more or less nourished, in proportion as the water in which it stands contains a greater or smaller quantity of proper terrestrial matter in it.—The truth of this proposition is discernable through the whole process of this author's experiments.—The mint in one of his glasses, was of much the same bulk and weight with that of two or three others: but the water in which the first was, being river-water, which was apparently stored more copiously with terrestrial matter, than the spring or rain-water, wherein the others stood, occasioned it to arrive at almost double the bulk that either of them had, and with a less expence of water too: so likewise the mint in another glass, in whose water was dissolved a small quantity of good garden-mould;

though it had the disadvantage to be less, when first set, than either of the mints in two other glasses, whose water was the very same with the first, only had none of the earth mixed with it; yet, in a short time, the plant not only overtook, but much outstripped the others.

The reason why the proportion of the increase of the plant is limited to the quantity of proper terrestrial matter in the water, is, that all even vegetable matter, is not proper for the nourishment of every plant: nor do there want good indications, that every kind of vegetable requires a peculiar and specific matter for its formation and nourishment; yea, each part of the same vegetable: and that there are very many and different ingredients to go to the composition of the same individual plant.—If, therefore, the soil wherein any vegetable or seed is planted, contains all, or most of these ingredients, and those in due quantity, it will grow and thrive there; otherwise it will not: if there be not as many sorts of corpuscles, as are requisite for the constitution of the main, and more essential parts of the plant, it will not prosper at all; if there are these, and not in sufficient plenty, it will never arrive to its natural stature: or, if there be any the less necessary and essential corpuscles wanting, there will be some failure in the plant; it will be defective in taste, smell, colour, or some other way.

Indeed, it is inconceivable how one uniform, homogeneous matter, having its principles, or original parts of the same substance, constitution, magnitude, figure, and gravity, should constitute bodies so unlike in all those respects, as vegetables of different kinds are; nay, even as the different parts of the same vegetable: that one should carry a resinous, another a milky, a third a yellow, a fourth a red juice in its veins; one afford a fragrant, another an offensive smell; one sweet to the taste, another acid, bitter, acerb, austere, &c. that one should be nourishing, another poisonous; one purging, another astringent.—And this argument makes equally strong against those who suppose mere water the matter out of which all bodies are formed.—A cataputia in one of the glasses received but little increase, only  $3\frac{1}{2}$  grains all the while it stood, though 2501 grains of water were spent upon it: but this might possibly be owing, not to the water's wanting matter fit for the nourishment of that particular plant, but to the water's being an improper medium for it to grow in: too much of that liquor, in some plants, may probably hurry the terrestrial matter through the vessels too fast for them to lay hold of it.

But a farther proof of this doctrine is, that the soil once proper for the production of some sort of vegetable, does not ever continue to be so; but, in tract of time, loses its property; and sooner in some lands, and later in others: If wheat, for example, be sown upon land proper for that grain, the first crop will succeed very well, and perhaps the second, and the third, as long as the ground is in heart, as the farmers call it; but in a few years it will produce no more, if sowed with that corn: some other grain it may, as barley; and after this has been sown so oft, that the land can bring forth no more of it, it may afterwards yield some good oats; and perhaps pease after them.—At length it becomes barren; the vegetative matter that at first it abounded with, being reduced by the successive crops, and most of it born off: each sort of grain takes forth that peculiar matter, that is proper for its own nourishment.

It may be brought to bear another series of the same vegetables; but not till it is supplied with a new fund of matter, of the like sort with what it first contained; either by the ground's lying fallow for some time, till the rain has poured a fresh stock upon it; or by the manuring it.—That this supply is of the like sort, is evident from the several manures found best to promote the *vegetation*; which are, chiefly, either parts of vegetables, or of animals: of animals, we say, which either derive their own nourishment immediately from vegetable bodies, or from other animals that do so; in particular, the blood, urine, and excrements of animals; shavings of horns, and hoofs; hair, wool, feathers, calcined shells, lees of wine and beer, ashes of all sorts of vegetable bodies, leaves, straw, roots, and stubble, turned into earth by ploughing, or otherwise, to rot and dissolve there.—These are our best manures; and being vegetable substances, when refunded back again into the earth, serve for the formation of other like bodies. See MANURING, and COMPOST.

The like is observable in gardens, where the trees, shrubs, and herbs, after their continuing in one station, till they have derived thence the greater part of the matter fit for their increase, will decay, and degenerate; unless either fresh earth, or some fit manure be applied to them: it is true they may maintain themselves there for some time, by sending forth roots farther and farther, to an extent all around, to fetch in more provision; but, at last, they must have a fresh supply brought to them, or they themselves be removed or transplanted to some place better furnished with matter for their subsistence.—And accordingly, gardeners observe, that plants that

that have stood a long while in a place, have longer root than usual; part of which they cut off, when they transplant to a fresh soil, as not now of any farther use to them.

All these instances point forth a peculiar terrestrial matter, and not water, for the subject to which plants owe their increase: were it water only, there would be no need of manures, or transplanting; the rain falls in all places, in this field and that, indifferently; on one side of an orchard or garden, as well as another: nor could there be any reason, why a tract of land should yield wheat one year, and not the next, since the rain showers down alike on each.

5°. Vegetables then are not formed of water, but of a certain peculiar terrestrial matter.—A little distillation shews, that there is a considerable quantity of this matter contained both in rain, spring, and river-water: and the experiments above-mentioned, shew that the much greatest part of the fluid mass that ascends up into plants, does not settle or abide there, but passes through the pores of them, and exhales into the atmosphere; and that a great part of the terrestrial matter, mixed with the water, passes up into the plant along with it; and that the plant is more or less augmented, in proportion, as the water contains a greater or smaller quantity of that matter: from all which, we may reasonably infer, that earth, and not water, is the matter that constitutes vegetables.

One of the sprigs of mint drew up into it 2501 grains of the fluid mass, and yet had received but  $3\frac{1}{2}$  grains of increase from it: a second, though it had at first the disadvantage to be much less than the third, yet, being set in water wherewith earth was plentifully mixed, and the other in water without any such earth, it had vastly outgrown it; weighing, at least, 145 grains more than the former: a fourth plant, though at first a great deal less than the fifth, yet being set in the foul craf-water, that was first in the still, after that in which the last was set was drawn off, had gained in weight, at the end, above double what that in the finer and thinner water had.—The proportion of the augment of that plant which thrived most, was to the fluid mass spent upon it, but as 1 to 46; in others, as 1 to 60, 100, 200; and in the cataputia, but as 1 to 714.—One of the sprigs took up 39 grains of water a day, one day with another; which was much more than the whole plant originally, and yet it gained not  $\frac{1}{4}$  of a grain a day in weight: and another took up 253 grains a day, which was near twice as much as its original weight; and after all, the daily increase of the plant was no more than  $2\frac{1}{2}$  grains.

6°. Spring and rain-water contain near an equal charge of vegetable matter; river-water more than either of them.—These proportions hold in the main, but a strict and just comparison is hardly to be expected; inasmuch as in all probability, the water that falls in rain, contains at some times a greater share of terrestrial matter, than that which falls at other times; a more powerful and intense heat, of necessity, hurrying up a larger quantity of that matter, along with the humid vapours that form rain, than one more feeble and remiss possibly can.—The water of one spring may flow forth with an higher charge of this matter, than that of another: this depending partly upon the quickness of the ebullition of the water, and partly upon the quantity of that matter latent in the strata, through which the fluid passes, and the greater or less laxity of those strata: for the same reason the water of one river may abound with it, more than that of another; nay, the same river, when much agitated, and in commotion, must tear up of more of it, than when it moves with less rapidity, and violence.—That there is a greater quantity of this matter in rivers, and that it contributes vastly to the ordinary fertility of the earth, we have an illustrious instance in the Nile, the Ganges, and other rivers, that yearly overflow the neighbouring plains: their banks shew the fairest and largest crops of any in the world.

7°. Water serves only for a vehicle to the terrestrial matter which forms vegetables, and does not itself make any addition to them.—Where the proper terrestrial matter is wanting, the plant is not augmented, though never so much water ascend into it: water, then, is not the matter that composes vegetable bodies; it is only the agent that conveys the matter to them, and distributes it to their several parts for their nourishment: that matter is sluggish and inactive, and would lie eternally confined to its beds of earth, without advancing up into plants, did not water, or some like instrument, fetch it forth, and carry it into them.

This fluid is capacitated for the office here assigned it, several ways: by the figure of its parts, which, as appears from many experiments, is exactly and mathematically spherical; their surfaces being perfectly polite, and without any the least irregularities. It is evident, corpuscles of such a figure are easily susceptible of motion, and far above any others whatever; and consequently the most capable of moving and conveying other matter that is not so active: then, the intervals of bodies of that figure, are, with respect to their bulk, of all others, the largest, and so the most fitted to receive and entertain foreign matter in them; besides, as far as the trials

hitherto made inform us, the constituent corpuscles of water are each singly considered, absolutely solid, and do not yield to the greatest external force: this secures their figure against any alteration, and the intervals of the corpuscle must be always alike.—By the latter, it will be ever disposed to receive matter into it; and by the former, when once received, to bear it along with it.—Water is farther capacitated to be a vehicle to this matter, by the tenuity and fineness of the corpuscles of which it consists: we hardly know any fluid in all nature, except fire, whose constituent parts are so exceeding subtle, and small, as those of water are: they will pass pores and interstices, that neither air, nor any other fluid will.—This enables them to enter the finest tubes and vessels of plants, and to introduce the terrestrial matter, conveying it into all parts of them; whilst each, by means of organs it is endued with for the purpose, intercepts, and assumes into itself such particles, as are suitable to its own nature, letting the rest pass on through the common ducts.

8°. Water is not capable of performing this office to plants, unless assisted by a due quantity of heat.—This must concur, or *vegetation* will not succeed.—The plants set in the glasses in October, and the following colder months, had not near the quantity of water sent up into them, or so great an additional increase by much, as those that were set in June, July, and the hotter months.—It is plain, water has no power of moving itself, or rising to the vast height it does, in the more tall and lofty plants; so far from it, that it doth not appear from any discovery yet made, that even its own fluidity consists in the intestine motion of its parts, whatever the Cartesians think.—Indeed, we need nothing more to solve all the phenomena of fluidity, than such a figure, and disposition of parts, as water has: spherical corpuscles must stand so very ticklish upon each other, as to be susceptible of every impression; and though not perpetually in motion, must be always ready and liable to be put into it, by any the slightest force imaginable: it is true, the parts of fire, or heat, are not capable of moving themselves, any more than those of water; but they are more subtle, light, and active than those are, and so more easily put into motion. See FLUIDITY.

That the concurrence of heat in this work is really necessary, appears not only from the experiments before us, but from all nature; from the fields and forests, gardens and orchards: we see in autumn, as the sun's power is gradually less and less, so its effect on plants is remitted, and *vegetation* slackens by little and little.—Its failure is first discernable in trees; which being raised highest above the earth, require a more intense heat, to elevate the water, charged with nourishment, to their tops; so that for want of fresh support and nutriment, they shed their leaves, unless secured by a firm and hard constitution indeed, as our ever-greens are: next, the shrubs part with theirs; and then the herbs, and lower tribes: the heat, being, at length, not sufficient to supply even these, though so near the earth, and the fund of their nourishment.—As the heat returns the succeeding spring, they all recruit again, and are furnished with fresh supplies and verdure: but first, those which are lowest and nearest the earth, and that require a lesser degree of heat to raise the water with its earthy change unto them: then the shrubs, and high vegetables, in their turns; and lastly, the trees.—As the heat increases, it grows too powerful, and hurries the matter with too great rapidity, through the finer and more tender plants; these, therefore, go off, and decay; and others that are more hardy and vigorous, and require a greater degree of heat, succeed in their order.—By which mechanism, provident nature furnishes us with a very various and differing entertainment; and what is best suited to each season all the year round.

As the heat of the several seasons affords us a different face of things, so the several distant climates shew the different scenes of nature, and productions of the earth.—The hotter countries ordinarily yield the largest and tallest trees, and those, too, in a much greater variety than the colder; even those plants common to both, attain to a much greater bulk in the southern, than the northern climes: nay, there are some regions so cold, that they raise no vegetables at all to a considerable size; this we learn from Greenland, Iceland, and other places of like cold situation and condition: in these there are no trees, and the shrubs are poor, little, and low.—Again, in the warmer climates, and such as do furnish trees, and the large vegetables, if there happen a remission or diminution of the usual heat, their productions are impeded in proportion: our cold summers gives us proof enough of this; for though, at such times, the heat we have is sufficient to raise the vegetative matter into the lower plants, our corns, wheat, barley, pease, and the like; and we have plenty of strawberries, raspberries, gooseberries, currants, and the fruits of such vegetables as are low and near the earth; and a moderate store of cherries, mulberries, plums, &c. and some others that grow at somewhat greater height; yet our apples, pears, walnuts, and the productions of the taller trees, have been fewer, and those not so thoroughly ripened, and

and brought to that perfection; as they are in more benign and warm seasons: and indeed, in trees of the same kind; those that keep close to the earth, always produce the most and best fruit: for which reason it is, that the gardeners check and restrain the growth of their better fruit-trees, and prevent their running up to too great a height.—As to our grapes, apricots, peaches, nectarines, and figs, they being transplanted hither out of hotter countries, it is the less wonder we have a failure of them in cold summers.—Nor is it the sun, or the ordinary emission of the subterranean heat only, that promotes *vegetation*, but any other indifferently, according to its power and degree; as we find from our stoves, hot-beds, &c. See **HEAT, COLD, WATER, EARTH, SOIL, TREE, DWARE, HOT-BED, &c.**

**VEGETATIVE, VEGETATIVUS**, a term applied to that principle, or part in plants, by virtue whereof they receive nourishment, and grow, or vegetate. See **VEGETATION**.

The philosophers speak of three kinds of souls, the *vegetative, sensitive, and rational*. See **SOUL**.

The *vegetative* soul, is that principle whereby trees and plants live, grow, produce their kind, &c. See **PLANT**.

This *vegetative* principle is differently seated in different plants: an ingenious author observes, that, generally speaking, its place is exactly between the trunk, and root; at least, this appears to be the place in most of the seminiferous tribe; which, if cut down near the place, rarely shoot again.

In other plants, as the elm, and many edible plants, it seems to reside wholly in the roots; which, if cut into ever so many parts, yet, those being planted in the ground, soon grow. See **ROOT, and PLANTING**.

In others, as the willow kinds, it seems to be diffused all over, both root, trunk, and branches; inasmuch, that if cut into a thousand pieces, there is no destroying them without splitting them in the middle; and scarcely then. See **FECUNDITY**.

Lastly, in others, as the cereus's, ficus's, &c. it is seated in the body, branches, and leaves; any of which being put into the ground, strike root immediately, and grow.

The office of this *vegetative* principle, is to concoct the indigested earth and salts which ascend through the roots; and to assimilate them to the nature of the plant. See **VEGETATION**.

**VEHICLE, VEHICULUM**, in its literal sense, signifies somewhat that carries, or bears a thing along. See **CARRIAGE, WAGGON, WHEEL, &c.**

Thus, in anatomy, the serum is said to be the *vehicle* that conveys the globules of the blood. See **BLOOD**.

In pharmacy, any liquid serving to dilute another with, or to administer it in, more agreeably to a patient, is called a *vehicle*.

Water is the *vehicle* of the nutritious matter of the vegetables. See **VEGETATION, and WATER**.

**VEIL, VELUM**, a piece of stuff, serving to hide, or prevent the sight of any thing.

In this sense, we read of a large *veil*, or curtain, in the temple of Jerusalem, miraculously rent at the passion of our Saviour. In the Romish churches, in time of Lent, they have *veils*, or curtains, over the altar, crucifix, images of the saints, &c.

**VEIL**, is also used for a large piece of crape, wore on the head by nuns; as the badge of their profession.—Whence, to *take the veil*, signifies to commence religious. See **PROFESSION**.

The novices wear white *veils*; and those who have made the vows, black *veils*. See **NOVICE**.

The prelate before whom the vows are made, blesses the *veil*, and gives it the religious. See **RELIGIOUS, &c.**

**VEIN, VENA**, in anatomy, a name given to several vessels, or canals, which receive the blood from the divers parts of the body, to which the arteries had conveyed it from the heart; and carry it back to the heart again.—See **Tab. Anat. (Angeiol.) fig. 6, 7.** see also **BLOOD, &c.**

The *veins* are only a continuation of the extreme capillary arteries, reflected back again towards the heart. See **CAPILLARY, and ARTERY**.

In their progress, uniting their channels as they approach the heart, they, at last, all form three large *veins*, or trunks, *viz.* The *vena cava descendens*; which brings the blood back from all the parts above the heart.—The *vena cava ascendens*; which brings the blood from all the parts below the heart.—And the *porta*, which carries the blood to the liver. See **CAVA, HEART, PORTA, &c.**

The anastomosis, or inoculation of the *veins* and arteries, was first seen by the microscope, in the feet, tails, &c. of frogs, and other amphibious animals, by Leewenhoeck; but has since been observed in other animals, particularly the omentum of a cat, by Mr. Cowper, &c. See **ANASTOMOSIS, CIRCULATION, &c.**

The coats of the *veins* are four, the same with those of the arteries; only the muscular coat is thin in all the *veins*, as it is in the capillary arteries; the pressure of the blood against

the sides of the *veins*, being less than that against the sides of the arteries, because the force of the heart is much broke in the capillaries.—See **Tab. Anat. (Angeiol.) fig. 7. a. a. b. b. c. d.** see also the article **PHLEBOTOMY**.

In the *veins* there is no pulse, because the blood is thrown into them with a continual stream, and because it moves from a narrow channel to a wider.—But they have a peristaltic motion, which depends on their muscular coat. See **PULSE, &c.**

The *capillary veins* unite with one another, as has been said of the capillary arteries; only their course is directly opposite: for instead of a trunk distributed into branches and capillaries, a *vein* is a trunk, formed out of a concurrence of capillaries. See **CAPILLARY**.

In all the *veins*, which are perpendicular to the horizon, excepting those of the uterus, and the porta, there are small membranes, or valves; sometimes there is only one, sometimes there are two, and sometimes three, placed together, like so many half thimbles stuck to the sides of the *veins*, with their mouths towards the heart.

These, in the motion of the blood toward the heart, are pressed close to the sides of the *vein*; but shut the *veins*, against any reflux of the blood that way from the heart, and thereby sustain the weight thereof in the great trunks. See **VALVE**.

The *veins* are distinguished, with respect to their situation, into *superior, and inferior, ascending, and descending; right, as the mesenteric, and left, as the splenic branch; internal, as the basilica; and external, as the humeral*.

Many of them, likewise, acquire denominations from the parts wherein they are found; as, the *jugulars, phrenitic, renal, iliac, hypogastric, epigastric, axillary, crural, umbilical, fural, sciatica, saphena, mediana, cephalic, thoracic, subclavian, intercostal, coronal, diaphragmatic, hæmorrhoidal, cervical, thymal, mammillary, gastric, stomachic, epiploic, splenic, &c.*

They are also distinguished from their particular offices, into *spermatic, emulgent, &c.* all which see exhibited in **Tab. Anatomy, (Angeiol.)**—and their particular descriptions under their proper article **JUGULAR, PHRENITIC, &c.**

**VEIN** is also applied to the streaks, or waves of divers colours, appearing on several sorts of woods, stones, &c. as if they were really painted; and which the painters frequently imitate in painting wainscots, &c.

Marble is generally full of such *veins*. See **MARBLE**.—Lapis lazuli has *veins* like gold. See **LAPIS**.—Ovid, speaking of the metamorphoses of men into stones, says,—*Quæ modò vena fuit, sub eodem nomine manfit.*

*Veins*, in stones, are a defect, proceeding usually from an inequality in their consistence, as to hard, and soft; which makes the stone crack, and shiver in those parts.

**VEIN** is also applied, in the same sense with *stratum*, to the various dispositions and kinds of earth met withal in digging. See **STRATUM**.

Thus, we say, a *vein* of sand, another of rock, &c. a *vein* of ocher, vitriol, allom, calamine, coal, &c.—Mineral waters acquire their different qualities, by passing through *veins* of vitriol, sulphur, &c. See **MINERAL**.

In the same sense, we say, a *vein* of gold, silver, quicksilver, &c. meaning certain parts of the earth, wherein the ore or glebe of those metals is found; and which is distributed into divers branches, like the *veins* in the body. See **ORE, MINE, &c.**

Tavernier gives us a description of the *veins* in the diamond mines in Golconda, with the manner of digging them. See **DIAMOND**.

In digging of coal-pits, they meet with a variety of *veins*, the order, &c. of which, is different, in different places: in the *Philosophical Transactions*, N<sup>o</sup>. 360. the *veins* in those famous coal-mines at Mendip, in Somersetshire, are observed to be, (below the turf, or loam, or malm, a reddish fire-stone; the coalclives, which is blackish rock) the *sinking vein*, a hard coal for mechanic uses; five feet below which, is the *cathead vein*, 22 feet thick, intermixed with lumps of stone; at a like distance below which, is the *three-coal vein*, divided into three kinds of coal, and about three feet thick.

The *veins* hitherto mentioned, are frequently worked in the same pit.—The next is the *peaw vein*, which is intermixed with cockle-shells, and fern-branches, usually wrought in a separate pit: though its depth below the *three-coal vein* be only above five feet, yet the cliff between is very hard, and liable to water: this *vein* is about a yard thick; and the like distance below it, is the *smith's-coal vein*: beneath which, is the *shelly vein*; and under that, a *vein* of 10 inches, little worth, and seldom wrought. See **COAL**.

The same *veins* are found in a place 7 or 8 miles apart.—All the *veins* lie obliquely, or shelving, like the side of a house: the obliquity, or *pitch*, as they term it, is about 22 inches in a fathom; which, when it rises to the land, is called *crop*, and in some places *basseting*.

In digging to the south-west, they oft meet with ridges, which cause the *vein* to *trap up*; i. e. being cut off by the ridges, they

they find it over their heads, when they are through the ridge: on the contrary, working through a ridge to the north-east, they say, it *traps down*, i. e. they find it under their feet.

**VEJOURS, VISORES**, in law, are those sent by the court, to take view of any place in question, for the better decision of the right. See **VIEW**.

It is also used for those sent to view such as effoign themselves *de malo lecti*; whether, in truth, they be such as that they cannot appear, or whether they counterfeit. See **ES-SOIGN, VIEWER, &c.**

**VELAMEN**, is used by some surgeons, for the bag, skin, or bladder of an imposthume, or swelling. See **CYSTIS, TUMOR, ABSCESS, &c.**

**VELAMENTUM Bombycinum**, a name which some anatomists give to the velvet membrane, or inner skin of the intestines. See **INTESTINES**.

**VELARIUS**, in antiquity, an officer in the court of the Roman emperors; being a kind of usher, whose post was behind the curtain, *vela*, in the prince's apartment; as that of the chancellor's was at the entry of the balustrade, *cancelli*; and that of the *ofiararii* at the door.

The *velarii* had a superior, of the same denomination, who commanded them; as we find in two inscriptions, quoted by Salmasius, in his notes on Vopiscus; and by a third in Gruter.—The first is,

D. M.  
TI. CL. HALLUS  
PRÆPOSITUS VELARIORUM  
DOMUS AUGUSTANÆ  
FEC. SIBI ET FILIIS SUIS L. L.  
POST. EORUM.

Salmasius, and others, for **HALLUS**, which is in the stone whereon the inscription is at Rome, put **THALLUS**: though we find mention of the same Hallus, as a Samaritan by nation, and Tiberius's freedman, in Josephus; which shews that the *velarii*, and their chief, were very antient officers, and in use among the first emperors.

**VELITES**, in the Roman army, a kind of antient foldiery, who were armed lightly with a javelin, a cask, cuirasse, and shield. See **TRIARI**.

**VELLEITY, VELLEITAS**, in the school philosophy, is usually defined a languid, cold, and remiss will. See **WILL**. Others say, it implies an impotency of obtaining what we require.—Others will have it, a slight desire for something, which a person does not matter much, or is too indolent to seek: as, *catus amat piscem, sed non vult tangere lympham*.

**VELLICATION**, among physicians, the act of twitching.—The word is more particularly applied to a sort of sudden convulsions, that happen to the fibres of the muscles. See **FIBRE**, and **CONVULSION**.

**VELOCITY**, in mechanics, *swiftness*; that affection of motion, whereby a moveable is disposed to run over a certain space in a certain time. See **MOTION**.

It is also called *celerity*; and is still proportional to the space moved.—The greatest *velocity* wherewith a ball can descend, by virtue of its specific weight, in a resisting medium, is that which the same ball would acquire by falling in an unresisting medium, though a space which is to four thirds of its diameter, as the density of the ball to the density of the fluid. See **DESCENT**.

Huygens, Leibnitz, Bernoulli, Wolfius, and the foreign mathematicians, hold, that the momenta, or forces of falling bodies, at the end of their falls, are as the squares of their *velocities* into the quantity of matter; the English mathematicians, on the contrary, maintain them to be as the *velocities* themselves, into the quantity of matter. See **MOMENTUM**.

*Velocity* is conceived, either as *absolute*, or *relative*: the *velocity* we have hitherto considered, is *simple*, or *absolute*, with respect to a certain space, moved in a certain time.

*Relative*, or *respective velocity*, is that wherewith two distant bodies approach each other, and come to meet in a longer, or less time: whether only one of them moves, towards the other at rest, or whether they both move; which may happen two ways; either by two bodies mutually approaching each other in the same right line, or by two bodies moving the same way in the same line, only the foremost slower than the other; for by this means, this will overtake that. And, as they come to meet, in a greater or less time, the *relative velocity* is greater or less.

Thus, if two bodies come nearer each other by two feet, in one second of time; their respective *velocity* is double that of two others, which only approach one foot in the same time.

**VELOCITIES of bodies moving in Curves**.—According to Galileo's system of the fall of heavy bodies, now admitted by all philosophers, the *velocities* of a body falling vertically, are, each moment of its fall, as the roots of the heights from whence it has fallen; reckoning from the beginning thereof. Hence that author gathered, that if a body fall along an inclined plane, the *velocities* it has at the different times, will

VOL. II. N°. 159.

2

be in the same ratio: for since its *velocity* is all owing to its fall, and it only falls as much as there is perpendicular height in the inclined plane; the *velocity* would be measured by that height, as much as if it were vertical.

The same principle, likewise, led him to conclude, that if a body fall through two contiguous inclined planes, making an angle between them, much like a stick when broke, the *velocity* would be regulated after the same manner, by the vertical height of the two planes taken together: for it is only this height it falls; and from its fall it has all its *velocity*.

The conclusion was universally admitted, till the year 1693, when M. Varignon demonstrated it to be false: from his demonstration, it should seem to follow, that the *velocities* of a body falling along the cavity of a curve, for instance, of a cycloid, ought not to be as the roots of the heights; since a curve is only a series of an infinity of infinitely little contiguous planes, inclined towards one another. So that Galileo's proposition would seem to fail in this case too, and yet it holds good; only with some restriction.

All this mixture of truths and errors, so near akin to each other, shewed that they had got not hold of the first principles; M. Varignon, therefore, undertook to clear what related to the *velocities* of falling bodies; and to set the whole matter in a new light: he still supposes Galileo's first system, that the *velocities*, at the different times of a vertical fall, are as the roots of the correspondent heights.—The great principle he makes use of to attain his end, is that of compound motion. See **COMPOSITION of Motion**.

If a body fall along two contiguous inclined planes, making an obtuse angle, or a kind of concavity between them; M. Varignon shews, from the composition of those motions, that the body, as it meets the second plane, loses somewhat of its *velocity*; and, of consequence, that it is not the same at the end of the fall, as it would be, had it fell through the first plane prolonged: so that the proportion of the roots of the heights asserted by Galileo, does not here obtain.

The reason of the loss of *velocity*, is, that the motion, which was parallel to the first plane, becomes oblique to the second, since they make an angle: this motion, which is oblique to the second plane, being conceived as compounded, that part perpendicular to the plane, is lost, by the opposition thereof, and part of the *velocity* along with it: consequently, the less of the perpendicular there is in the oblique motion, or, which is the same thing, the less the two planes are from being one, i. e. the more obtuse the angle is, the less *velocity* does the body lose.

Now, all the infinitely little, contiguous, inclined planes, whereof a curve consists, making infinitely obtuse angles among themselves, a body falling along the concavity of a curve, the loss of *velocity* it undergoes each instant, is infinitely little: but a finite portion of any curve, how little soever, consisting of an infinity of infinitely little planes, a body moving through it, loses an infinite number of infinitely little parts of its *velocity*: and an infinity of infinitely little parts, makes an infinity of a higher order, i. e. an infinity of an infinitely little parts makes a finite magnitude, if they be of the first order, or kind; and an infinitely little quantity of the first order, if they be of the second; and so in infinitum.—Therefore, if the losses of *velocity* of a body falling along a curve, be of the first order, they will amount to a finite quantity in any finite part of the curve, &c. See **CURVE**.

The nature of every curve is abundantly determined, by the ratio of the ordinates, to the correspondent portions of the axis; and the essence of curves in general, may be conceived as consisting in this ratio, which is variable a thousand ways.—Now this same ratio will be likewise that of two simple *velocities*, by whose concurrence a body will describe any curve: and, of consequence, the essence of all curves in the general, is the same thing as the concurrence, or combination of all the forces, which, taken two by two, may move the same body.—Thus we have a most simple, and general equation, of all possible curves, and all possible *velocities*. See **CURVE**.

By means of this equation, as soon as the two simple *velocities* of a body are known, the curve, resulting from them, is immediately determined.—It is observable, that on the foot of this equation, an uniform *velocity*, and a *velocity* that always varies according to the roots of the heights, produce a parabola, independent of the angle made by the two projectile forces that give the *velocities*: consequently, a cannon ball, shot either horizontally, or obliquely to the horizon, must always describe a parabola.—The best mathematicians, hitherto, had much ado to prove, that oblique projections formed parabolas, as well as horizontal ones. See **PROJECTILE**, and **PARABOLA**.

To have some measure of *velocity*, the space is to be divided into as many equal parts, as the time is conceived to be divided into: for the quantity of space, corresponding to that division of time, is the measure of the *velocity*.

For an instance; suppose the moveable A, (Tab. Mechanics, fig. 40.) travel a space of 80 feet, in 40 seconds of time;

13 E

dividing

dividing 80 by 40, the quotient 2 shews the *velocity* of the moveable to be such, as that it passes over an interval of two feet in one minute: the *velocity*, therefore, is rightly expressed by  $\frac{2}{1}$ ; that is, by 2.

Suppose, again, another moveable, B, which, in 30 seconds of time, travels 90 feet; the index of the celerity will be 3. Wherefore, since in each case the measure of the space is a foot, which is supposed every where of the same length; and the measure of time a second, which is conceived every where of the same duration: the indices of the *velocities* 2 and 3, are homogeneal: and therefore, the *velocity* of A, is to the *velocity* of B, as 2 to 3.

Hence, if the space be  $=f$ , and the time  $=t$ , the *velocity* may be expressed by  $f:t$ ; the space being in a ratio of the time, and the *velocity*. See MOTION.

Circular VELOCITY. } See the article } CIRCULAR.

Measure of VELOCITY. } MEASURE.

VELOCITY of Wind, of Light, Sound, &c. See WIND, LIGHT, SOUND, &c.

VELOM\*, a kind of parchment, finer, evenner, and whiter than the common parchment. See PARCHMENT.

\* The word is formed from the French *velin*, of the Latin *vitellinus*, belonging to a calf.

Abortive VELOM. See the article ABORTIVE.

VELVET\*, a rich kind of stuff, all silk, covered on the outside with a close, short, fine, soft shag; the other side being a very strong, close tissue. See PLUSH.

\* The word is formed of the French *velours*, which signifies the same; and which comes from *velu*, a thing covered with hair.

The nap or shag, called also the *velveting*, of this stuff, is formed of part of the threads of the warp, which the workman puts on a long narrow channelled ruler, or needle; and which he afterwards cuts, by drawing a sharp steel tool along the channel of the needle, to the ends of the warp.

The principal and best manufactories of *velvet* are in France and Italy, particularly at Venice, Milan, Florence, Genoa, and Lucca: there are others in Holland, set up by the French refugees; whereof, that at Haerlem is the most considerable: but these all come short of the beauty of those in France; and, accordingly, are sold for 10 or 15 per cent. less.—There are even some brought from China, but they are the worst of all.

There are *velvets* of various kinds, as—*plain*, that is, uniform and smooth, without either figures or stripes.

Figured VELVET, that is, adorned and worked with divers figures; though the ground be the same with the figures; that is, the whole surface *velveted*. See FIGURED.

Ramage, or branched VELVET, representing long stalks, branches, &c. on a fatten ground, which is sometimes of the same colour with the *velvet*, but more usually of a different one.—Sometimes, instead of fatten, they make the ground of gold and silver; whence the denominations of *velvets with gold ground*, &c.

Shorn VELVET, is that wherein the threads, that make the *velveting*, have been ranged in the channelled ruler, but not cut there.

Striped VELVET, is that wherein there are stripes of divers colours, running along the warp; whether those stripes be partly *velvet*, and partly fatten, or all *velveted*.

Cut VELVET, is that wherein the ground is a kind of taffety, or gros de Tours, and the figures *velvet*.

*Velvets* are likewise distinguished, with regard to their different degrees of strength and goodness, into *velvets* of four threads, three threads, two threads, and a thread and half: the first are those where there are eight threads of shag, or *velveting*, to each tool of the reed; and the second have only six, and the rest four.

In general, all *velvets*, both worked and cut, shorn and flowered, are to have their warp and shag of organfin, spun and twisted, or thrown in the mill; and their woof of silk well boiled, &c. They are all of the same breadth.

VENA, VEIN, in anatomy. See the article VEIN.

VENA Cava. See the article CAVA.

VENA Porta, &c.—See Tab. Anat. (Splen.) fig. 5. lit. i; see also the article PORTA, &c.

VENA Pulmonis. See the article PULMONARY.

VENÆ-SECTIO, the opening of a vein; called also *phlebotomy*; and popularly, *bleeding*. PHLEBOTOMY, &c.

VENÆ Lactææ. } See the article } LACTEAL.  
VENÆ Lymphaticæ. } LYMPHATIC.  
VENÆ Præputii, &c. } PREPUCE.

VENAL, or VENOUS, among anatomists, something that bears a relation to a vein. See VEIN.

The extremities of the cava and pulmonary veins, where they enter the auricles of the heart, are called *venous sinuses*. See CAVA, and PULMONARY; see also HEART, and CIRCULATION.

VENAL\*, VENALIS, is also used for something bought with money, or procured by bribes.

\* The word is formed from the Latin, *venalis*, to be sold.

Thus, we say, *venal* bards; courtizans, and flatterers are *venal*; justice in Turkey is *venal*; it must be bought of the bakhaws.

In England, there are several offices in the revenue, policy, &c. *venal*: but this *venality* of offices is no where so considerable, as in France; where all offices of judicature are bought of the king, and only municipal officers are elected. See OFFICE.

Offices, in England, are *venal* only by a kind of connivance; in France, it is a thing solemn, and authorized.—The *venality* was first introduced by Louis XII. who, to clear those immense debts contracted by his predecessor Charles VIII. without burthening his people with new taxes, bethought himself to sell the offices; and, in reality, made a vast sum thereby.

Francis I. made an advantage of the same expedient to get money, and sold his posts openly: under the same king, it was only accounted a kind of loan; but that loan was no more than a name to disguise a real sale.—The parliament not being able to relish the *venality* of offices, always made the buyer take an oath, that he did not buy his post, either directly or indirectly; but there was a tacit exception made, of monies lent the king for being put into them.—At length, the parliament finding its oppositions were in vain, and that the traffic of offices were publicly authorized, abolished the oath in 1597.

VENDEE, in law, the person to whom any thing is sold; in contradistinction to *vendor*, or the seller.

VENDITIONI Exponas, is a judicial writ, directed to the sheriff; commanding him to sell goods, which he has formerly, by commandment, taken into his hands; for the satisfying a judgment given in the king's court.

VENEERING, VANEERING, or FINEERING, a kind of marquetry, or inlaying; whereby several thin slices, or leaves of fine wood, of different kinds, are applied and fastened on a ground of some common wood. See MOSAIC.

There are two kinds of inlaying; the one, which is the more ordinary, goes no further than the making of compartments of different woods; the other requires a deal more art, and represents flowers, birds, and the like figures.

The first kind is what we properly call *veneering*; the latter we have already described under the article MARQUETRY. The wood intended for *veneering*, is first sawed out into slices or leaves about a line thick: in order to saw them, the blocks or planks are placed upright, in a kind of sawing-press:—The description whereof may be seen under the article PRESS.

These slices are afterwards cut into narrow slips, and fashioned divers ways, according to the design proposed: then the joints being carefully adjusted, and the pieces brought down to their proper thickness, with several planes for the purpose; they are glued down on a ground, or block of dry wood, with good strong English glue.

The pieces thus jointed and glued, the work, if small, is put in a press; if large, it is laid on the bench, covered with a board, and pressed down with poles, or pieces of wood, one end thereof reaches to the ceiling of the room, and the other bears on the board.

When the glue is quite dry, they take it out of the press, and finish it; first with little planes, then with divers scrapers; some whereof resemble rasps, which take off the dents, &c. left by the planes.

When sufficiently scraped, the work is polished with the skin of a sea-dog, wax, and a brush and polisher of shave-grass: which is the last operation.

VENELLIS. See VICIS & Venellis mundandis.

VENEREAL, something belonging to Venus. See VENUS.

A *venereal* person, is one addicted to *venery*, or *venereal* pleasures.—*Venereal* medicines, are called *aphrodisiacs*, *provocatives*, &c.

VENEREAL Disease, Lues VENEREA, the French disease, foul disease, French pox, or great pox, is a contagious malady, contracted by some impure humour, generally received in coition; and discovering itself in ulcers and pains about the genital and other parts. See POX.

It is usually said to have made its first appearance in Europe in the year 1493; though others will have it much older, and contend for its being known to the antients, only under other names.

Mr. Becket, particularly, has attempted to shew, that it is the same with what among our forefathers was called the *leprosy*; and which, in many of our antient English writings, charters, &c. is called *brenning*, or *burning*.

In order to prove his point, he has searched the records relating to the stewards antiently kept on the Bankside, Southwark, under the jurisdiction of the bishop of Winchester. See STEWS.

Among other constitutions of these stewards, dated 1162, it was appointed, "That no steward should keep any woman "that hath the perillous infirmity of BURNING." And in another vellom manuscript, now in the custody of the bishop of Winchester, dated 1430, it is again ordered, "That no "stew-

"flew-holder keep any woman within his house that hath any sickness of BRENNING, but that she be putte out, upon the payne of making a fine unto the lord of a hundred shillings." See BURNING.

To confirm this account, Mr. Becket quotes a description of the disease from a manuscript of John Arden, Esq; surgeon to king Richard II. and king Henry IV. Arden defines the disease called *brenning, incendium*, to be a certain inward heat and excoriation of the urethra: which definition, Mr. Becket observes, gives us a perfect idea of what we now call a *clap*; agreeable to the latest and most exact anatomical discoveries, and free of all the errors of Platerus, Rondeletius, Bartholin, Wharton, and other later writers on this disease. See CLAP, and GONORRHEA.

As to the leprosy being the same with this *venereal disease*, it must be owned, there are a good many symptoms in the one disease, which quadrate well enough with those in the other; but then the symptoms in each are so precarious, that a great deal of stress cannot be laid hereon. See LEPROSY.

The common tradition is, that the *venereal disease* first broke out in the French army, when it lay encamped before Naples; and that it was owing to some unwholesome food: on which account, the French call it the *Neapolitan disease*; and the Italians, the *mal Francese*.

But others go much higher, and suppose it to be the ulcer Job complained of so grievously: and accordingly, in a *Mis-fal* printed at Venice in 1542, there is a *mal* in honour of S. Job, to be said by those recovered of this disease; as being supposed to owe their deliverance to his intercession.

But the opinion which prevails most among the more knowing of our physicians, is, that the disease is of Indian extraction; and that it was brought hither by the Spaniards from the American islands, where it was very common, before ever the Spaniards set footing there: whence the Spaniards call it *farva des India*, or *las buvas*: notwithstanding what Herrera says, that the Spaniards carried it to Mexico, instead of bringing it thence.

Lister, and others, take it to have had its first rise from some of the serpentine kind; either from a bite thereof, or from some of their flesh taken as food: this is pretty certain, that men bitten or stung by scorpions, are greatly eased by coition; but the woman, Pliny assures us, receives a deal of damage thereby: which is no slender argument of the disease's arising from some person so poisoned.

Lister adds, there is no room to doubt, but that the lues arose from some such cause; for upon any venomous bite, the penis becomes vehemently extended; and the patient being seized with a fatyrasis, breaths nothing but rage, and lust: nature, in effect, seeming to direct him to coition for a remedy.

But what proves a remedy to the wounded person, proves a disease to the woman: and from women thus infected, other men, who have to do with them, become infected in their turns; and thus has the disease been propagated.

The first symptoms generally arising after an affair with an infected person, are a heat, swelling, and inflammation about the penis, or vulva, with a hotness of urine.

The second or third day usually brings on a gonorrhæa, or dripping, which denominates it a *clap*; and which, in a few days more, is followed by a chordee. See GONORRHEA, and CHORDEE.

Though sometimes there is no gonorrhæa, or clap; but the poison rather makes its way, through the cutis, to the groin; and there raises buboes, with various malignant pustules in all parts of the body. See BUBO.

Sometime, also, there happen callous ulcers, called *shankers*, in the scrotum and perinæum; and sometimes a cancerous and callous ulcer between the prepuce and glans; and in some the testicles swell. See SHANKER.

Add to these, violent nocturnal pains, nodes, heats in the palms of the hands, and soles of the feet; and hence fissures, excoriations, condylomata, &c. about the anus; falling of the hair; ruddy, yellow, or livid spots; hoarseness, relaxation, and erosion of the uvula, ulcers of the palate, ozena, tingling of the ears, deafness, blindness, itch, consumption, &c.—But it is rare all these symptoms happen to the same person.

The *venereal disease*, Sydenham observes, is communicated by copulation, lactation, handling, saliva, sweat, the genital mucus, and the breath: and in whatever part it is received, it there discovers itself first.—When the infection is received along with the milk from the nurse, it commonly shews itself in forecuffs and ulcers of the mouth.

The method of cure is various, according to the various symptoms, and stages: for the first stage, viz. a gonorrhæa virulenta, or clap, see CLAP, and GONORRHEA.

Dr. Pitcairn's method is this:—After two or three vomits, he directs mercurius dulcis, for some days, twice a day; when the mouth grows sore, let alone the mercury for three or four days, and purge every other day. As the mouth grows

well again, repeat the use of mercury; and thus alternately, till the symptoms cease. See MERCURY.

For a confirmed lues, mercurial salivation is generally held the only effectual cure: though mercurial frictions, applied in such quantity, and at such intervals, as not to raise a salivation, are held by some to be not only easier and safer, but even more successful, in this disease, than salivation itself. See SALIVATION.

Dr. Sydenham tells us, he uses to salivate immediately, without any preliminary evacuation, or preparation of the body at all.—His method is this: he prescribes an unguent of ʒii of axung. porcin. i. e. swines-seam, and ʒi of mercury. With a third part of this, he orders the patient to anoint his arms and legs, for three nights successively, with his own hands; so as not to touch either the arm-pits, the groin or the abdomen.—After the third unction, the gums usually swell, and a ptyalism comes on.—If it does not come in the time, he directs turbith mineral gr. viii. in conserve of red roses; which occasioning a vomiting, raises the ptyalism.—And if, afterwards, the salivation abate, ere the symptoms are quite disappeared, he orders it to be promoted with a fresh dose of mercurius dulcis.—The diet, and other regimen, to be the same as in a catharsis.

VENERIS Oestrum, the stimulus or incentive of venery; is an appellation given, by some anatomists, to the clitoris. See CLITORIS.

VENERIS Oestrum, is also used by others for the transport of love, or the utmost ecstasy of desire, or enjoyment in coition. See ORGASM.

Some are of opinion, that infectious women are the most apt to communicate the poison, when they are thus excited with desire; whereas, with indifference, they may admit the same intercourse, without giving the infection.

VENERIS Ens. See the article ENS.

VENERY\*, is used for the act of copulation, or coition of the two sexes. See COITION, and GENERATION.

\* It takes its name from Venus, the supposed deity of the passion of love.

VENERY, also denotes the arts or exercise of hunting wild beasts; which are also called *beasts of venery*, and *beasts of forest*. See HUNTING.

Such are the hare, hart, hind, boar, and wolf. See BEAST.

VENEW. See the article VENUE.

VENIA\*, among our antient writers, denotes a kneeling, or low prostration to the ground; used by penitents. GENUFLEXION.

\* Walsingham, p. 196. *Rege interim prostrato in longa venia.*—*Per venias centum verrunt barbis pavimentum.*

VENIAL, a term in the Romish theology, applied to slight sins, and such as easily obtain pardon. See SIN.

In confessing to the priest, people are not obliged to accuse themselves of all their *venial* sins.—The thing that gives the greatest embarrass to the Romish casuists, is to distinguish between *venial* and mortal sins.

The Reformed reject this distinction of *venial* and mortal sins; and maintain, that all sins, how grievous soever, are *venial*; and all sins, how slight soever, are mortal: And the reason they urge is, that all sins, though of their own nature mortal, yet become *venial*, or pardonable, by virtue of our Saviour's passion, to all such that fulfil the conditions on which it is offered in the gospel.—To which the Romanists answer, That the chief of these conditions is confession. See CONFESSION, and ABSOLUTION.

VENIRE Facias, in law, is a judicial writ, lying where two parties plead, and come to issue; directed to the sheriff, to cause twelve men of the same neighbourhood to meet to try the same, and say the truth upon the issue taken. See TWELVE-MEN, and VENUE.

If this inquest comes not at the day of the writ returned; then shall go an habeas corpus, and after that a distress, until they come.

VENIRE Facias tot Matronas. See VENTRE Inspiciendo.

VENISON\*, VINAISON, the flesh of beasts of game, or of animals to be caught in the way of game, i. e. by hunting, &c. as deer, hare, &c. See GAME.

\* The word is French, *venaison*; formed of the Latin *venatio*, hunting. See HUNTING.

Beasts of VENISON. See the article BEAST.

VENOM, VENENUM. See the article POISON.

The terms *venom* and *poison* only differ from each other in this, that the latter is more frequently used where the noxious matter is taken inwardly, as in foods, drinks, &c. and the former, where it is applied outwardly, as in stings and bites of serpents, scorpions, vipers, spiders, &c.

The pike is said to have a *venomous* tooth.—All *venomous* beasts in the general, have that quality in a greater degree, when bred in mountainous and dry places, than when in wet and marshy places; the southern more than the northern; those hungry and enraged, than others; and in summer more than winter. See VIPER.

VENOUS, VENOSUS, See the article VENAL.

VENOUS

**VENOUS Artery, Arteria VENOSA.** See **ARTERY, LUNGS, CIRCULATION, &c.**

**VENT\*, VENT-HOLE, or Spiracle,** a little aperture left in the tubes, or pipes of fountains, to facilitate the air's escape; or, on occasion, to give them air; as in frosty weather, &c. for want of which they are apt to burst. See **FOUNTAIN.**

\* The word is formed from the Latin *ventus*, wind.

A *vent*, taken in this sense, is properly the end of a pipe, placed erect, and reaching above ground; usually folded to the turns, or elbows of pipes.—The *vents* of large pipes, are to be as high as the superficies of the reservoir; unless there be a valve in them.

**VENT** is also used for a little hole, pierced in vessels of wine, beer, &c. that are on tap; and which admits air enough to make the liquor run, but not so much as to corrupt and spoil it.

**VENT**, again, is applied to the covers in wind-furnaces, whereby the air enters, which serves them for bellows; and which are stopped with registers, or slices, according to the degree of heat required; as in the furnaces of glass-houses, essayers, &c. See **BELLOWS, FURNACE, &c.**

**VENT** is also used for a pipe of lead, or potter's ware; one end whereof opens into the cell of a necessary house, and the other reaches to the roof of the house; to give room for the corrupt fetid air to exhale.

There are also *vents*, or apertures made in the walls which sustain terraces, to furnish air, and give a passage for the waters.

This kind of *vent* the Italians, and we from them, call a *barbacane*. See **BARBACANE.**

**Port-VENT.** See the article **PORT-VENT.**

**VENTER, Belly,** in anatomy, a cavity in the body of an animal, containing viscera, or other organs necessary for the performance of divers functions. See **BODY, VISCERA, &c.**

Physicians divide the human body into three *venters*, regions, or cavities; the first, the *head*, containing the brain, &c. See **HEAD, and BRAIN.**

The second, the *breast*, or *thorax*, as far as the diaphragm, containing the organs of respiration. See **THORAX, LUNGS, &c.**

The third, which is what we more commonly call the *venter*, or *belly*, is that wherein the intestines, and the organs of generation and digestion are contained; called by anatomists the *abdomen*. See **ABDOMEN.**

**VENTER, or Belly,** is also popularly used for the exterior part of the lower *venter*.—In which sense, we say, the navel is in the middle of the *venter*, &c.

**VENTER** is also used for the ventricle, or stomach; because that part is inclosed in the cavity thereof. See **VENTRICLE.**—In this sense it is, that Jonas is said in scripture to have been three days in the whale's belly.

**VENTER** is also used for the womb, or uterus of women.—and hence the writ *de ventre inspiciendo*. See **VENTRE Inspiciendo.**

Hence, also, in the civil law, we say, *partus sequitur ventrem*, the child follows the belly; meaning that its condition is either free or servile, according to that of its mother. See **MARRIAGE.**

They also say, to *appoint a curator for the belly*, with regard to posthumous children, yet in the mother's womb. See **POSTHUMOUS.**—With regard to princes, the *venter*, or belly has been sometimes crowned, in form.

**VENTER** is also used, in speaking of a partition of the effects of a father and mother, among children born, or accruing from different marriages.

This partition is so ordered, as that a single child of one marriage, or *venter*, takes as much as several of another marriage, or *venter*: in order to which, the estate is divided into so many parts, as there have been *venters*, or marriages.

**VENTER** is also used for the children, whereof a woman is delivered at one pregnancy.—Thus, two twins are said to be of the same *venter*.

Many people take for a fable, what is related of the countess of Holland, viz. that she had 365 children at one *venter*, all living and baptized: and yet the story is very gravely related by abundance of authors; and the font, or basin, is still shewn in the church where they were baptized; with a kind of monument of the fact inscribed thereon. See **FOETUS.**

**VENTER, or belly** of a muscle, is the fleshy, or body part thereof; as contradistinguished from the two tendons, its extremities; one whereof is called the *head*, and the other the *tail* of the muscle. See **MUSCLE.**

**VENTER Draconis, Dragon's belly,** in astronomy, denotes the middle of a planet's orbit; or that part most remote from the nodes, i. e. from the dragon's head and tail; being the part which has the greatest latitude, or is at the greatest distance from the ecliptic. See **ORBIT, and NODE.**

There are two points under this denomination, in each orbit: that towards the south, is also called the *southern*

*limit*, and that towards the north, the *northern limit*. See **LIMITS.**

The moon has 5 degrees of latitude, when in the dragon's belly; and is 90 degrees distant from the nodes. See **LATITUDE.**

**VENTER Equi, Horse's belly,** among chymists, denotes horfeding, or a dunghil, wherein are inclosed certain vessels for particular operations, to be performed by means of the gentle heat thereof. See **FIRE, HEAT, BATH, &c.**

**VENTIDUCTS**, in building, are spiracles, or subterraneous places, where fresh, cool winds being kept, are made to communicate, by means of tubes, funnels, or vaults, with the chambers, or other apartments of a house; to cool them in sultry weather.

These are much in use in Italy, where they are called *ventidotti*.—Among the French they are denominated *prisons des vents*, and *palais d'Eole*. See **BUILDING, HOUSE, &c.**

**VENTOSA Spina.** See the article **SPINA Ventoſa.**

**VENTOSITY**, in medicine. See the article **FLATUS.**

**VENTRE Inspiciendo.** a writ for the search of a woman that says she is with child, and thereby holds land from him that is, otherwise, next heir at law.

**VENTRICLE, VENTRICULUS, q. d. little belly,** in anatomy a diminutive of *venter*; signifying a cavity, smaller than what we express by a *venter*; or rather, a division of a *venter*; or some smaller cavity, contained in a larger. See **VENTER.**

There are two cavities in the heart, adjoining to the auricles; and four in the brain; called *ventricles*; which see explained under the articles **HEART, and BRAIN.**

The *right ventricle* of the heart, in relaxing, admits the blood by the right auricle from the cava; and, contracting, drives it out into the pulmonary arteries; the *left*, receiving the blood by the left auricle, from the lungs, drives it out into the aorta.—*Tab. Anat. (Anatol.) fig. 9. lit. c.* see also the articles **CAVA, AORTA, and LUNGS; SYSTOLE, DIASTOLE, CIRCULATION, &c.**

**VENTRICLE, or VENTRICULUS**, by way of eminence thus called, is the same with the stomach. See **STOMACH.**

For the action of the **VENTRICLE** in vomiting, see **VOMITING.**

**VENTRICULI Ardor.** See the article **ARDOR.**

**VENTRILLOQUOUS\*, VENTRILLOQUUS, Gastriloquous or Engastrimythus,** a term applied to persons who speak inwardly, having a peculiar art of forming speech, by drawing the air into the lungs; so that the voice proceeding out of the thorax, to a by-stander seems to come from a distance. See **ENGASTRIMYTHUS, GASTRILLOQUOUS.**

\* The word is compounded of *venter*, belly, and *loquor*, I speak.

Such a person we had lately in London, a smith by profession, who had the faculty in such perfection, that he could make his voice appear, now, as if it came out of the cellar; and the next minute, as if in an upper room; and no body present perceive that he spoke at all: accordingly, he has frequently called a person first up, then down stairs; then out of doors, then this way, then that, without stirring from his seat, or appearing to speak at all.

Rolandus, in his *Aglossostomographia*, mentions, that if the mediastinum, which is naturally a single membrane, be divided into two parts, the speech will seem to come out of the breast; so that the by-standers will fancy the person possessed. See **ENGASTRIMANDER.**

**VENTURINE, or ADVENTURINE,** is sometimes used for the finest and slenderest gold wire, used by embroiderers, &c. See **GOLD WIRE.**

When reduced into powder, as fine as it can be clipped, or filed, this powder may be strewed on the first layer of pure varnish, made use of in japanning, after the varnish is dry, in order to lay any colour over it. See **JAPANNING.**

**VENUE, or VENEW**, in law, a neighbouring, or near place.—*Locus quem vicini habitant.*

Thus, we say, twelve of the assizes ought to be of the same *venue* where the demand is made. See **ASSIZE.**

—“And also return, in every such pannel, upon the venire facias, six sufficient hundreders, at the least, if there be so many within the hundred where the venire lies.” *Stat. 25 Hen. VIII.* See **VENIRE FACIAS.**

**VENUS**, in astronomy, one of the inferior planets; denoted by the character, ♀. See **PLANET.**

*Venus* is easily distinguished by her brightness, and whiteness, which exceeds that of all the other planets, and which is so considerable, that, in a dusky place, she projects a sensible shadow.—Her place is between the earth and Mercury.

She constantly attends the sun, and never departs from him above 47 degrees: when she goes before the sun, that is, rises from him, she is called *phosphorus*, or *lucifer*, or the *morning star*; and when she follows him, that is, sets after him, *hesperus*, or *vesper*, or the *evening star*. See **PHOSPHORUS, VESPER, &c.**

The semidiameter of *Venus*, is to that of the earth, as 10 to 19; her distance from the sun is  $\frac{1}{3}$  of the earth's distance from

from the sun: her excentricity 5; the inclination of her orbit  $3^{\circ} 23'$ . See INCLINATION, EXCENTRICITY, &c. Her periodical course round the sun performed in 224 days 17 hours; and her motion round her own axis, in 23 hours. See PERIOD, and REVOLUTION.

Her greatest distance from the earth, according to Cassini, is 38000 semidiameters of the earth; and her smallest 6000. See DISTANCE.—Her parallax is 3 minutes. See PARALLAX.

*Venus*, when viewed through a telescope, is rarely seen to shine with a full face, but has phases just like those of the moon; being now gibbous, now horned, &c. and her illuminated part constantly turned towards the sun, *i. e.* it looks towards the east, when *phosphorus*, and towards the west, when *heperus*. See PHASES.

De la Hire, in 1700, through a telescope of 16 feet, discovered mountains in *Venus*; which he found to be larger than those in the moon. See MOON.

And Cassini, and Campani, in the years 1665, and 1666, discovered spots in her face: from the appearances of which, he ascertained her motion round her axis. See SPOTS, MACULÆ, &c.

Sometimes she is seen in the disk of the sun, in form of a dark, round spot. See TRANSIT.

In 1672, and 1686, Cassini, with a telescope of 54 feet, thought he saw a satellite moving round this planet, and distant from it about  $\frac{1}{3}$  of *Venus's* diameter.—It had the same phases as *Venus*, but without any well defined form; and its diameter scarce exceeded  $\frac{1}{4}$  of that of *Venus*.

Dr. Gregory thinks it more than probable, that this was a satellite; and supposes the reason why it is not usually seen, to be the unfitness of its surface, to reflect the rays of the sun's light; as is the case of the spots in the moon: of which, if the whole disk of the moon were composed, he thinks, that planet could not be seen as far as to *Venus*. See SATELLITE.

The phenomena of *Venus*, evidently shew the falsity of the Ptolemaic system: for that system supposes, that *Venus's* orb, or heaven, encloses the earth; passing between the sun and Mercury.—And yet all our observations agree, that *Venus* is sometimes on this side the sun, and sometimes on that; nor did ever any body see the earth between *Venus* and the sun: which yet must frequently happen, if *Venus* revolved round the earth in a heaven below the sun. See SYSTEM, EARTH, &c.

*VENUS*, in chymistry, is used for the metal copper. See COPPER.

Its character is ♀; which, say the adepts, expresses it to be gold, only joined with some corrosive and arsenical menstruum; which removed, copper would be gold. See GOLD.

*Venus* is universally allowed, by the chymists, &c. to be one of the most powerful medicines in nature: of this, is said to have been composed the famous Butler's stone, which cured most diseases by only licking it.—Of this is composed that noble remedy of Van Helmont, *viz.* the sulphur of vitriol, or ens vitrioli, fixed by calcination, and cohobation.—Of the ens vitrioli of *Venus*, is likewise composed Mr. Boyle's arcanum, the colcothar vitrioli. See VITRIOL.

It is certain, copper is a most excellent emetic, and a noble antidote against poisons; for it is no sooner taken than it exerts its force: whereas other vomitories lie a good while in the stomach: but one single grain of rust of *Venus* immediately vomits.—Hence syrups, that have stood over night in copper vessels, create a vomiting. See EMETIC, VOMITING, &c.

It is also an excellent medicine in chronical cases: hence a famous physician is recorded to have cured Charles V. of a dropsy by the use of copper.

*Venus* is dissoluble by all the salts known, both acid, alkaline, and nitrous; nay, even by water and air, considered as they contain salt. See DISSOLUTION, SALT, &c.

It is from this common reception of all menstruums, that copper is called *Venus*, *q. d. meretrix publica*, a common prostitute: though others take the denomination to have been occasioned by its running of a sea-green colour, when dissolved by acids.

*Crystals of VENUS*. See the article CRYSTAL.

*Mount of VENUS*, *Mons VENERIS*, among anatomists, is a little hairy protuberance, in the middle of the pubes of women; occasioned by the more than ordinary collection of fat under the skin in that place. See PUBES.

Among chiromancers, the *mount of Venus* is a little eminence in the palm of the hand, at the root of one of the fingers.

*VERA Billa*. See the article BILLA.

*VERB*, in grammar, a word serving to express what we affirm of any subject, or attribute to it—as the words, *is*, *understands*, *hears*, *believes*, &c. See WORD.

The *verb* is thus called of the Latin *verbum*, word, by way of eminence; as being the principal word of a sentence. See SENTENCE.

The common definition given by grammarians, is, that a *verb* is a word which betokens *being*, *doing*, or *suffering*.

VOL. II. N<sup>o</sup>. 159.

To conceive the origin and offices of *verbs*, it may be observed, that the judgment we make of any thing, as when I say *the earth is round*, necessarily includes three terms. See TERM.—The first, called the *subject*, is the thing we affirm of, *e. gr.* earth. See SUBJECT.—The second, called the *attribute*, is the thing affirmed, *e. gr.* round. See ATTRIBUTE.—The third, *is*, connects those two terms together, and expresses the action of the mind, *affirming* the attribute of the subject.

This last is what we properly call the *verb*; and which some of our later grammarians, particularly the port royalists, chuse to call by a more significant word, *affirmation*.—The reason is, that its principal use is to signify *affirmation*; that is, to shew the discourse, wherein that word is used, is the discourse of a man who does not only conceive things, but judges and affirms somewhat of them.

By this circumstance, a *verb* is distinguished from nouns which also signify an affirmation, as *affirmans affirmatio*; those only signify an affirmation, as that, by a reflection of of the mind, is rendered an object of thought: so that they do not shew, that the person who uses them *affirms*, but only that he conceives an *affirmation*. See AFFIRMATION.

Though the principal use of *verbs* be to signify affirmation; they also serve to express the other motions of the soul: as to desire, pray, command, &c. but this they only do, by changing the mood, or inflection. See MOOD.

Here, we only consider the *verb* in its primary signification, which is that it has in the indicative mood.—On this footing, the *verb* should have no other use, but to mark the connection which we make in the mind, between the two terms of a proposition; but the *verb esse*, to be, is the only one that has retained this simplicity: nor, in strictness, has this retained it, but in the third person, as *est*, is.

In effect, men being naturally inclined to shorten their expressions, to the affirmation they have almost always added other significations, in the same word: thus, *e. gr.* they add that of some attribute, so as that two words make a proposition; as in *Petrus vivit*, Peter lives: where *vivit* includes both the attribute and affirmation; it being the same thing to say *Peter lives*, as that *Peter is living*.—And hence the great variety of *verbs* in every language.

For, had people been contented to give the *verb* its general signification, without any additional attribute, each language would only have needed one *verb*, *viz.* the *verb substantive est*, is.

Again, on some occasions, they also superadd the subject of the proposition, as *sum homo*, I am a man: or *vivo*, I live: and hence the diversity of persons in *verbs*. See PERSON.

Again, we also add to the *verb*, a relation to the time, with regard to which we affirm; so that one single word, as *caenasti*, signifies that I attribute to the person I speak the action of supping, not for the present time, but for the past: and hence the great diversity of tenses in most *verbs*. See TENSE.

The diversity of these significations, or additions in the same word, has perplexed and deceived many of our best authors, in the nature of a *verb*; and led them to consider it, not according to what is essential to it, which is to affirm; but according to some of its accidental relations.

Thus, Aristotle, taking up with the third of those additional significations, defines *verb* to be *vox significans cum tempore*; a word signifying something with time.

Others, as Buxtorf, adding the second relation, define it, *vox flexilis cum tempore & persona*; a word admitting of divers inflections, in respect of time and person.

Others, taking up with the first of the additional significations, which is that of the attribute, and considering that the attributes men ordinarily add to the affirmation, were actions and passions; have supposed the essence of a *verb* to consist in signifying *actions*, or *passions*.

Lastly, Scaliger imagined he had made a great discovery in his book of the *Principles of the Latin tongue*, in saying, that the distinction of things into *permanentes*, and *fluentes*, into what remain, and what pass away, is the proper source of the distinction between *nouns*, and *verbs*; the first being to signify what remains, and the second what passes.

But from what we have said, it is easy to perceive, that these definitions are all false; and that the only true definition is, *vox significans affirmationem*: This definition includes all that is essential to the *verb*; but if one would likewise include its principal accidents, one might define it, *vox significans affirmationem, cum designatione personæ, numeri, & temporis*; a word which signifies an affirmation, with a designation of person, number, and tense: which is what properly agrees to the *verb substantive est*.

For as to other *verbs*, considering as becoming different by the union of certain attributes, one may define them thus; *vox significans affirmationem alicujus attributi, cum designatione personæ, numeri, & temporis*; a word which expresses the affirmation of some attribute, with a designation of person, number and time.

*Verbs* are variously divided; with respect to the subject, they are divided into *active*, *passive*, *neuter*, &c. with respect to their inflections, into *regular*, and *irregular*; *personal*, and *impersonal*; *auxiliary*, *substantive*, &c.

**VERB Active**, is a *verb* which expresses an action that falls on another subject, or object. See **ACTIVE**.

Such are, *I love, I work, &c.* which signify the action of *loving, working, &c.*—Of these grammarians make three kinds; the one called *transitive*, where the action passes on a subject different from the agent;—*reflected*, where the action returns upon the agent;—*reciprocal*, where the action returns mutually upon the two agents that produc'd it.

**VERB Passive**, is that which expresses a passion; or which receives the action of some agent; and which is conjugated in the modern tongues, with the auxiliary *verb, I am, je suis, je sono, &c.* See **AUXILIARY**.

Some do not allow of any *verb passive* in the modern languages: the reason is, what we call *passive*, is nothing but the participle of the *verb*, joined with the auxiliary *verb, to be*; whereas the *verbs passive* of the Latin, &c. have their particular terminations.

**VERB Neuter**, is that which signifies an action that has no particular object whereon to fall; but which, of itself, takes up the whole idea of the action—as, *I sleep, thou yawnest, he snores, we walk, you run, they stand.* See **NEUTER**.

The Latins call them *neuters*, by reason they are neither active nor passive; though they have the force and signification of both: as, *I languish*, signifies as much as *I am languishing*; *I obey*, as much as *I exercise obedience, &c.* only that they have no regimen to particularize this signification.

Of these *verbs*, there are some which form their tenses by the auxiliary *verb, to have*; as, *I have slept, you have run.*—These, grammarians call *neuters active*.

Others there are, which form their compound parts by the auxiliary, *to be*; as, *to come, to arrive, &c.* for we say, *I am come, not I have come, &c.*—These are called *neuters passive*.

**VERB Substantive**, is that which expresses the being, or substance which the mind forms to itself, or supposes in the object; whether it be there, or not—as, *I am, thou art.* See **SUBSTANTIVE**.

**Auxiliary, or Helping VERBS**, are those which serve in conjugating active and passive *verbs*: such are, *I am, I have, &c.* See **AUXILIARY**.

The abbot de Dangeau distinguishes all *verbs* into two general kinds; *auxiliary verbs*, and *verbs* which make use of auxiliaries. This distinction some may tax as not very just; in regard, *auxiliary verbs*, sometimes make use of auxiliaries themselves; but this does not destroy the division; it only shews, that the *auxiliary verb* has two formalities, or two different qualities to be considered under; in virtue whereof, it constitutes, as it were, two sorts of *verbs*.

The *verbs* which make use of auxiliaries, he divides into *active*, *neuter*, and *pronominal*.—*Verbs neuter*, he farther distinguishes into *neuters active*, and *neuters passive*. *Pronominals* he distinguishes into *identic*, *reciprocal*, *neutrized*, and *passive*.—But several of these are peculiar to the French language.

*Verbs*, in the English, and most modern tongues, do not change their endings, as in Latin, to denote the several times, modes, &c. of their being, doing, or suffering; but in lieu thereof, make use of auxiliaries: as *have, am, be, do, will, shall, may, can, &c.*

**Regular VERBS**, are those which are conjugated after some one manner, rule, or analogy. See **CONJUGATION**.

**Irregular, or Anomalous VERBS**, are those which have something singular in the terminations, or formations of their tenses. See **ANOMALOUS**.

The irregularities in our English *verbs*, lie wholly in the formation of the preter tense, and passive participle.—The first, and most general irregularity, took its rise from the quickness of our pronunciation, by changing the consonant *d* into *t*; the vowel *e*, in the regular ending *ed*, being cut off, that the pronunciation might be more ready: thus, for *dwelled, kept, sent, fended*, we say, *dwelt, kept, sent*.

**VERBS impersonal**, are those which have only the third person—as, *it behoves, &c.* See **IMPERSONAL**.

There are also *reduplicative verbs*; as, *resound, recall, &c.* *frequentative verbs, &c.*

**VERBAL\***, something that belongs to *verbs*, or even to words spoke with the mouth. See **ORAL**.

\* The word is formed from the Latin, *verbato*, I smite.

**Verbal nouns**, are those formed from verbs. See **NOUN**.—A *verbal contract*, is that made merely by word of mouth; in opposition to that made in writing. See **CONTRACT, &c.**

**VERBAL Accident**. See the article **ACCIDENT**.

**VERBERATION**, *smiting*, in physics, a term used to express the cause of sound, which arises from a *verberation* of the air, when struck, in divers manners, by the several parts of the sonorous body first put into a vibratory motion. See  **SOUND**.

**VERDEGREASE\***, or **VERDEGRIS**, a kind of rust of copper, of great use among painters for a green colour. See **GREEN, and COLOUR**.

\* The word is formed from the Latin, *viride aris*: It is also called *arugo*. Others call it the *flower*, and others the *vitriolic salt of copper*; though, in reality, it be the proper substance of the metal. See **VITRIOL**.

**Verdegreafe** is prepared from copper-plates, and rape or husks of grapes well saturated with wine, put up in earthen pots; and ranged stratum super stratum; that is, first rape, then copper; and so alternately.

When the pots are filled, they are set in a cellar; whence, after some time, they are taken out, to gather the *verdegreafe*, which is a green rust covering the plants all over. See **RUST, and COPPER**.

Some talk of *verdegreafe* made with vinegar, and other corrosive salts; but it is a mistake; the best wine being nothing too good for the purpose.

Accordingly, the greatest part of the *verdegreafe* consumed in Europe, is made in Languedoc, of the wines of that country; and is exported in cakes of about 25 pounds weight each. There is but little quite pure: to be good, it must be very dry, of a deep green, and pretty clear of white spots.

The apothecaries use to dissolve *verdegreafe* in distilled vinegar, and then filtrate and evaporate it in the cellar; upon which it shoots into crystals.—These crystals are used among chirurgeons, &c. to cleanse old ulcers, eat off fungous flesh, &c.

**VERDERER\***, or **VERDEROR**, a judicial officer of the king's forest, whose business is to look to the vert, and see it well maintained. See **VERT**.

\* The word is formed from the Latin *viridarius*, which Ulpian uses in the like signification.

He is sworn to keep the affizes of the forest; as also to view, receive, and to enroll the attachments and presentments of all manner of trespasses, relating to vert and venison therein. See **FOREST**.

**VERDETER**. See the article **VERDITER**.

**VERDICT\***, is the answer of the jury given to the court, concerning the matter of fact, in any cause, civil or criminal, committed by the court to their trial and examination. See **JURY, and TRIAL**.

\* It is called *verdict*, for *vere dictum*, q. d. *dictum veritatis*, the dictate of truth.

A *verdict* is either *general*, or *special*.

**General VERDICT**, is that which is brought into the court in like general terms as the general issue: as in action of disseisin, the defendant pleads, no wrong, no disseisin.—Then the issue is general, whether the fact be wrong, or not: which being committed to the jury, they, upon consideration of the evidence, come in and say, either for the plaintiff, *That it is a wrong disseisin*; or for the defendant, *That it is no wrong, no disseisin.* See **ISSUE**.

**Special VERDICT**, is, when they say at large, that such and such a thing they found to be done by the defendant, or tenant; declaring the course of the fact, as in their opinion it is proved; and as to the law, upon the fact, proving the judgment of the court.

This *special verdict*, if it contain any ample declaration of the cause from the beginning to the end, is called a *verdict at large*.

**Attainder by VERDICT**. See the article **ATTAINDER**.

**VERDITER, VERDETER**, a kind of mineral substance sometimes used by the painters, &c. for a blue, but more usually mixed with yellow for a green colour. See **GREEN, &c.** *Verditer*, according to Savary, ought to be made of the lapis armenus; or, at least, of an earthy substance much like it, brought from the mountains of Hungary, &c. only prepared by powdering it, and cleansing it by lotion. See **ARMENIAN Stone**.

But this stone and earth are very rare; and the *verditer* used is not a native, but a factitious substance: the proper way of preparing it, we are told, is by casting wine or water upon new copper, just as it comes red hot out of the furnace, and catching the steams which rise from it upon copper-plates.—Others say, it is prepared by dissolving copper plates in wine, much after the manner of *verdegreafe*.

The method in practice, among us, is said to be as follows:—Into an hundred pounds weight of whiting, the refiners pour their copper water, and stir them together every day for some hours, till the water grows pale: then they pour that away, and set it by for farther use; and pour no more of the green water, and so till the *verditer* be made: which being taken out, is laid on large pieces of chalk in the sun, till it be dry for the market. *Harris*.

The water mentioned to be poured off from the *verditer*, (which remains at the bottom of the tub) is put into a copper, and boiled till it come to the thickness of water-gruel: now, consisting principally of salt-petre reduced, most of the spirit of vitriol being gone with the copper into the *verditer*; and a dish full of its being put into the other materials for aqua fortis, is re-distilled, and makes what they call a *double water*, which is near twice as good as that made without it.

**VERDOY**, in heraldry, is applied to a bordure of a coat of arms; charged with any kinds or parts of flowers, fruits, seeds, plants, &c.

**VERDURE**,

# VER

**VERDURE\***, the quality of greenness. See **GREEN**.

\* The word is French, formed of *verd*, green.

**VERGE**, **VIRGA**, a rod, switch, or yard; particularly a stick or wand, which persons are admitted tenants by holding in their hands, swearing fealty to the lord of the manor. See **VIRGA**, and **INVESTITURE**.

On this account, they are all called *tenants by the verge*. See **TENANT**.

**Dented VERGE**, among florists, is a jagged edge, or circumference of a leaf. See **LEAF**, and **DENTED**.

**VERGE** is also used for the compass or extent of the king's court; within which is bounded the jurisdiction of the lord steward of the king's household. See **COURT**, **STEWARD**, **HOUSEHOLD**, &c.

It is thus called, from the *verge* or staff which the marshal bears. — It was antiently also denominated *pax regis*, or the king's peace. See **PEACE**.

The lord steward, by virtue of his office, without any commission, judges of all transgressions, as treasons, murders, felonies, bloodshed, &c. committed in the court, or within the *verge* thereof; which extends, every way, the space of twelve miles from the chief tunnel of the court; only London, by charter, exempted.

**Court of VERGE**, is a court, or tribunal, in manner of a king's-bench; which takes cognizance of all crimes, and misdemeanors committed within the *verge*, or jurisdiction of the king's court.

It is held in the compting-house, by the lord steward, as judge thereof, assisted by other officers of the household; as, the treasurer, comptroller, cofferer, clerks of the green-cloth, &c. See **GREEN-CLOTH**, &c.

**VERGE of Land**, *Virga Terræ*. See the article **YARD-LAND**.

**VERGERS**, *VIRGATORES* *servientes*, are officers who carry white wands before the justices of either bench; called also, *porters of the verge*. See **PORTER**.

**VERGERS of cathedral or collegiate churches**, are inferior officers, who go before the bishop, dean, &c. with a verge, or rod tipped with silver.

**VERGILIÆ**, a constellation, whose appearance denotes the approach of the spring. See **SPRING**.

According to the poets, they were the daughters of Atlas; and by the Greeks were called *pleiades*: but the Romans named them *vergile*. See **PLEIADES**.

**VERIFICATION**, the act of proving, or making a thing appear true. See **CONFIRMATION**, &c.

In the French law, *verifying* is used for the recording of the king's edicts, and decrees by the parliament.

**VERIFICATIONE Relicta**. See the article **RELICTA**.

**VERISIMILI**. See the article **RULE de verisimili notitia**.

**VERISIMILITUDE**. See the article **PROBABILITY**.

**VERJUICE**, a juice or liquor drawn from four grapes, or apples, unfit for wine, or cider; or from sweet ones, while yet acid, and unripe. See **CIDER**.

Its chief use is in sauces, ragouts, &c. though it is also an ingredient in some medicinal compositions; and is used by the wax-chandlers to purify their wax.

It has its name from a large sort of grape, called *verjus*, or *bourdela*; which is said never to grow perfectly ripe; or rather, which in its utmost maturity is too austere and sour to be used in wine: whence it is commonly turned into *verjuice*; tho' in France all unripe grapes are denominated *verjus*. There is also a tolerable *verjuice* made of crabs, gathered, laid in a heap to sweat, the stalks, &c. separated; then stamped, or ground, and the crab-mash put in a hair bag; the juice squeezed in a press, bared up close, and set in a warm place to work for ten or twelve days.

**VERMES**, in medicine. See the article **WORMS**.

**VERMICELLI\***, or **VERMICHELLY**, a kind of mels, prepared of flower, cheese, yolks of eggs, sugar, and saffron; and reduced into little long pieces, or threads, like worms, by forcing it with a piston through a number of little holes in the end of a pipe made for the purpose.

\* The word, in the original Italian, signifies *little worms*: they also call it *tagliarini*, and *millefanti*.

It was first brought from Italy, where it is in great vogue. In effect, it is the great regale of the Italians. — Other nations are not easily brought into the taste of it. — It is chiefly used in soups and pottages, to warm, provoke venery, &c.

**VERMICULAR**, an epithet given to any thing that bears a relation, or resemblance to worms, *vermiculi*. See **WORM**. Anatomists particularly apply it to the motion of the intestines, and certain muscles of the body. See **INTESTINE**, &c.

The *vermicular*, or peristaltic motion of the intestines, is performed by the contraction of the fibres thereof, from above downward; as the antiperistaltic motion is by their contraction from below upwards. See **PERISTALTIC**.

The contraction happening in the peristaltic, which others call the *vermicular motion*, as resembling the motion of worms, does not affect all the parts of the intestines at once; but one part after another.

**VERMICULAR**, or **VERMICULATED Work**, *Opus vermicu-*

# VER

*latum*, in sculpture, a sort of ornament, consisting of frets, or knots, in Mosaic pavements, winding, and presenting, in some sort, the tracks made by worms\*. See **MOAIC**.

\* *Quam lepide lexeis compositæ, ut tessellæ omnes Arte pavimento, atque emblemate vermiculato.*

Cic. de Orat. lib. III.

**VERMICULARES** (in anatomy) *Musculi*, *Tabuli*.

**VERMIFORMIS**, in anatomy, a term applied to various parts in the human body; bearing some resemblance to worms. — Such are the

*Processus*, or *Apophyses* **VERMIFORMES**; two extremities of the cerebellum, situate near the fourth ventricle of the brain. See **CEREBELLUM**, and **EPIPHYSES**.

**VERMIFORMES Musculi**, are the four muscles in each hand and foot, which bring the fingers and toes towards the thumbs and great toes; called also *lumbricales*. See **LUMBRICALES**.

**VERMIFUGUS**, the same with *anthelmintic*. See **ANTHELMINTIC**, and **WORM-POWDER**.

**VERMILION**, a bright, beautiful red colour; in great esteem among the antients, under the denomination of *minium*. See **RED**, **COLOUR**, **MINIUM**, &c.

There are two kinds of *vermilion*; the one *natural*, the other *factitious*.

The *natural* is found in some silver mines, in form of a ruddy sand; which they prepare, and purify by several lotions, and coctions.

**VERMILION** is made of artificial cinnabar, ground up with white wine, and afterwards with the whites of eggs: in this state it is made into cakes, and left to dry. To fit it for use, they grind it up a second time with water and whites of eggs. — To purify and heighten its colour, some grind it up with urine, or spirits of wine, to which a little saffron is added. — See **CINNABAR**.

Some also pretend to make *vermilion* of lead, burnt and washed; or of ceruse, rubified by fire. — But these are not properly denominated *vermilion*, but *red lead*. See **LEAD**.

It is this last, however, that seems to be the artificial minium of the antients; and accordingly, apothecaries, and painters still give it the name, to enhance the price. See **MINIUM**.

The antient Greek and Latin authors, have given divers fabulous accounts of their minium; and several of the moderns have adopted their dreams: Theophrastus attributes the first invention of making it to Callias the Athenian; who hit upon it, in endeavouring to draw gold, by fire, out of a red sand, found in the silver mines, in the year of Rome 249. — But Vitruvius says, it was discovered in the Cilbian fields; where it was drawn from a red stone, called by the Greeks *anthrax*.

We have two kinds of *vermilion* from Holland; the one of a deep red, the other pale: but it is the same matter at bottom; the difference of colour only proceeding from the cinnabar's being more or less ground: when fine ground, the *vermilion* is pale; and this is preferred to the coarser, and redder.

It is of considerable use among the painters in oil, and miniature; and likewise among the ladies, as a fucus, or paint, to heighten the complexion of such as are too pale. See **PAINTING**, **MINIATURE**, &c.

**VERMILION** is sometimes also, though improperly, used for what we otherwise call *kermes*, or *scarlet grain*. See **KERMES**, &c.

**VERMINATION**, **VERMINATIO**, the act of breeding worms, and other vermine; particularly bots in cattle, &c.

**VERMINATION** is sometimes also used, among physicians, for a sort of tormina ventris, or wringing of the guts; wherein the patient is affected, as if worms were gnawing his intestines. See **GRIPES**, and **TORMINA**.

**VERMINE**, **VERMINA**, a collective name, including all kinds of little animals, or insects, which are hurtful or troublesome to men, beasts, fruits, &c. as worms, lice, fleas, bugs, caterpillars, ants, flies, &c. See **INSECT**, **WORM**, **BLIGHT**, &c.

**VERMIVOROUS Animals**, are such as feed upon worms. See **ANIMAL**.

**VERNACULAR**, is applied to any thing that is peculiar to some one country. See **LOCAL**, &c.

Whence, diseases which reign most in any particular nation, province, or district, are sometimes called *vernacular diseases*: more frequently *endemic diseases*. See **ENDEMIC** and **DISEASE**. Such are the *plica polonica*, *scorbutus*, *tarantism*, &c. See **PLICA**, **SCORBUTUS**, **TARANTISM**, &c.

**VERNAL**, something belonging to the spring season. See **SPRING**. — Hence, *vernal leaves*, are those leaves of plants which come up in the spring, &c. See **LEAF**.

**VERNAL Signs**, are those which the sun is in, during the spring season, viz. Aries, Taurus, and Gemini. See **SIGN**.

**VERNAL Equinox**, is that which happens when the sun is ascending from the equator towards the north pole. See **EQUINOX**.

**VERNISH**. See the article **VARNISH**.

**VERONICA**, a term abbreviated from *veronica* of *vera icon*, q. d. *true image*; and applied to portraits, or representations of the face of our Saviour on handkerchiefs.

*Veronica's* are imitations of that celebrated original one, preserved with great veneration at St. Peter's in Rome; and imagined

imagined, by some, to be the handkerchief laid over our Saviour's face in the sepulchre.

The first mention we find of this famous relic, is in a ceremonial, compiled in 1243, dedicated to pope Celestin, by Benedict a canon of S. Peter's: but there is no mention made of the time when it was brought to Rome.—A feast is kept in honour thereof in most churches, on the Tuesday in quinquagesima week.

It is to be observed, that the name *veronica*, is only given to such handkerchiefs as represent no more of our Saviour than his face: for such as represent his whole body, as that of Benfançon, which shews his fore part at length; and that of Turin, which represents both his fore and hind part, as having covered him all over, were never called by this name. The painters sometimes represent the *veronica* as held up by an angel, but most commonly by a woman; which woman, the common people imagine to be a saint, called Saint *Veronica*. On this principle, some people, towards the close of the ninth century, began to fancy there might have been a woman of that name in Jerusalem, who had presented her handkerchief to our Saviour, as he went to Calvary, to wipe his face withal, besmeared, as it was, with sweat and blood; and that the picture of his face had been miraculously impressed thereon.

This was no sooner imagined by some, than it was believed by others: and accordingly, we find by the travels of Bernard de Bredemback, dean of Mentz, to the Holy Land, in 1483, printed in 1502, that it was not long ere her very house was found out.—From that time the fiction gained ground, and became a current legend.

It was at length added, that this same woman, S. *Veronica*, was the woman troubled with the flux of blood in the gospel: and accordingly, she was soon joined with S. Fiacrius, and invoked together with him against the hæmorrhoids.—And hence the establishment of feasts, in honour of S. *Veronica*, in the churches dedicated to S. Fiacrius.

In some of these churches, particularly at S. Giles's in Valenciennes, this saint is commonly called S. *Venice*, by abbreviation from the genitive, *Veronica*: and the women have a custom at certain times of the year, to hang linen swathes, wherewith they had girt themselves for nine days, near her statue.—And it is thence, or rather, for our Saviour's picture expressed on the linen handkerchief, that the milliners have taken S. *Veronica*, or, as they call her, S. *Venisse*, or S. *Venecia*, or *Venisa*, for their tutelary saint.

**VERRUCA**, in medicine. See the article **WART**.

Hence, *verrucous* is applied to any excrescences which have a resemblance to warts.—There are also *verrucous* ulcers, &c.

**VERRY**, in heraldry. See the article **VAIRY**.

**VERSA**. See the article **VICE** *Verfa*.

**VERSE**, **VERSUS**, in poetry, a line or part of a discourse, consisting of a certain number of long and short syllables, which run with an agreeable cadence; the like being also reiterated in the course of the piece. See **POETRY**.

This repetition, according to F. Bossu, is necessary to distinguish the notion of *verse* from that of prose: for in prose, as well as *verse*, each period and member are parts of discourse, consisting of a certain number of long and short syllables; only prose is continually diversifying its measures, and cadences; and *verse* repeats them. See **PROSE**.

This repetition of the poets, appears even in the manner of writing; for one *verse* being finished, they return to the beginning of another line to write the *verse* following: and it is to this return, that *verse* owes its name; *versus* coming from *vertere*, to turn, or return.

Accordingly, we find the same word used, to signify any thing that is placed in a certain, regular order: Cicero uses *versus* for a line in prose; Virgil for a row of trees, and even of oars in a galley. But as the regularity of *verse* carries with it more charms, and requires a greater degree of exactness, the word has, in time, become appropriated to poetry.

To make *verse*, it is not enough that the measures and quantities of syllables be observed, and six just feet put, one after another, in the same line: there are further required certain agreeable cadences, particular tenes, moods, regimens, and even some words unknown in prose.

But what is chiefly required, is an elevated, bold, figurative manner of diction: this manner, is a thing so peculiar to this kind of writing, that without it, the most exact arrangement of longs and shorts, does not constitute *verse*, so much as a sort of measured prose. See **VERSIFICATION**.

The Greek and Latin *verses*, consist of a certain number of feet, disposed in a certain order. See **FOOT**.—Some have attempted to make French and English *verses* on the same foundation; but without success. See **QUANTITY**, and **HEXAMETER**.

Vossius is very severe on the modern *verse*, and makes it altogether unfit for music: Our *verses*, says he, run all as it were on one foot; without distinction of members, or parts, and without regard to the natural quantities of syllables.—We have no rhythmus at all: and we mind nothing, but to have a certain number of syllables in a *verse*, of whatever nature, and in whatever order. See **RHYTHMUS**.

Mr. Malcolm vindicates our *verse* from this imputation. It is true we do not follow the metrical composition of the antients; yet we have such a mixture of strong and soft, long and short syllables, as makes our *verses* flow, smooth or rumbling, slow or rapid, agreeable to the subject.—Instances of all which we have in the following lines:

“Soft is the strain when Zephyr gently blows:

“The hoarse rough *verse* should like the torrent roar.

“The line too labours, and the words move slow.

“Flies o'er the unbended ears, and skims along the main. By making a small change, or transposition of a word or syllable, in any of these *verses*, any body who has an ear will find, that we make a great matter, of the nature and order of the syllables. See **NUMBERS**.

Vossius adds, that the antient odes were sung, as to the rhythmus, in the same manner as we scan them: every pes being a distinct bar, or measure, separated by a distinct pause: though, in reading, that distinction was not accurately observed.

Lastly, he observes, that their odes had a regular return of the same kind of *verse*; and the same quantity of syllables, in the same place of every *verse*: whereas, in the modern odes, to follow the natural quantity of our syllables, every stanza would be a distinct song. See **ODE**.

It is next to impossible to write prose without, sometimes, intermixing *verse* with it; so that Vaugelas's rule, which enjoins us to avoid them, is next to impracticable.—This may be further said, that for short *verses*, they are so little perceived, that it is scarce worth while to strain one's self to avoid them; and as to long *verses*, they are chiefly to be avoided in the ends of periods; for, in the middle, they are scarce felt. In the general, rules of this kind must be considered, as principally regarding numerous *verses*, and such as are readily distinguished by their cadence: thus, in Latin, it is scarce possible to avoid iambic *verses*; but hexameters must, by all means, be avoided, their cadence being more sensible and more studied. See **RHYME**, &c.

**VERSES** are of various kinds; some denominated from the number of feet whereof they are composed; as, the *monometer*, *dimeter*, *trimeter*, *tetrameter*, *pentameter*, *hexameter*, *hendecasyllabum*, &c.—Some from the kinds of feet used in them; as the pyrrhichian, proceleusmatic, iambic, trochaic, dactylic, anapaestic, spondaic or molossean, chor-iambic, iambi-dactylic, or dactylotrochaic.—Sometimes from the names of the inventors, or the authors who have used them with most success: as, the anacreontic, archilochian, hippocratic, pherecratian, glyconian, alcmæan, aëlepiæan, alcaic, stesichorian, phaliscan, aristophanian, callimachian, galliambic, phalæcian, and sapphic.—Sometimes from the subject, or the circumstances of the composition; as, the heroic, elegiac, adonic, &c. See **HEXAMETER**, **PENTAMETER**, **IAMBIC**, &c.

\* In reckoning the feet of iambics, trochaics, and anapaestics, each meter is a dipody, or comprehends two feet.—In other *verses* a meter is but a single foot.—Hence it is, that the iambic trimeter is also called *senarium*, because composed of six feet. *Serv. Centim. p. 1817*.

The moderns have invented *heroic*, or *alexandrine verses*, which consist of twelve or thirteen syllables. See **ALEXANDRINE**. The antients, likewise, invented various kinds of poetical devices in *verse*; as *centos*, *echos*, and *monorhymes*. See **CENTO**, **ECHO**, &c.

**Equivocal VERSES**, those where the same words, contained in two lines, carry a different sense. See **EQUIVOCAL**, &c.

**Reciprocal VERSES**, those which read the same backwards as forwards. See **RETROGRADE**.

<b>Technical VERSES.</b>		<b>TECHNICAL.</b>

**VERSE**, is also used for a part of a chapter, section, or paragraph subdivided into several little articles. See **CHAPTER**. The whole Bible is divided into chapters; and the chapters subdivided into *verses*. See **BIBLE**.

The division of *verses* in the New Testament, was first made by Robert Stephens: and so negligently was it done, that his son, Henry Stephens, assures us, he worked at it as he travelled from Paris to Lyons.—Many learned men find great fault with that division; and yet it is every where followed. M. Simon observes, that the Greeks and Latins meant by *verse*, a line, containing a certain number of words.—He adds, that the authors of those days, to prevent any thing being added or taken away from their works, used to mark at the end, the number of *verses* they contained; but the books themselves were wrote all running, without any divisions, points, or the like.

**VERSED sine of an Arch**, a segment of the diameter of a circle, lying between the foot of a right sine, and the lower extremity of the arch. See **ARCH**, and **COVERSED**.

Thus, DE, (*Tab. Trigonometry, fig. 1.*) is the *versed sine* of the arch AE. See SINE.

**VERSIFICATION**, the art, or manner of making verse; also the tune and cadence of verse. See VERSE.

*Verseification*, is properly applied to what the poet does more by labour, art, and rule, than by invention, and the genius or furor poeticus.

The matter of *verseification*, is long and short syllables, and feet composed of them; and its form, the arrangement of them, in correct, numerous, and harmonious *verses*; but this is no more than a mere translator may pretend to, and which the Catilinarian war, put in verse, might merit. See MEASURE, QUANTITY, CADENCE, RHYTHM, &c. It is with reason, therefore, that these simple matters are distinguished from the grand poetry, and called by the name *verseification*. See POETRY.

In effect, there is much the same difference between grammar and rhetoric, as between the art of making verses, and that of inventing poems.

**VERSION**, a translation of some book, or writing, out of one language into another. See TRANSLATION.

**VERSO**. See the article FOLIO *Verso*.

**VERT**, in heraldry, the term for a green colour. See GREEN, and COLOUR.

It is called *vert* in the blazon of the coats of all under the degree of nobles; but in coats of nobles it is called *emerald*; and in those of kings, *Venus*.

In engraving, it is expressed by diagonals, or lines drawn athwart, from right to left, from the dexter chief corner, to the sinister base. See *Tab. Herald. fig. 48*.

In lieu of *vert*, the French heralds use *sinople*, or synople. See SINOPLÉ.

**VERT**, or *Green Hue*, in forest law, any thing that grows, and bears a green leaf within the forest, that may cover a deer. See FOREST, GAME, &c.

This is divided into *over-vert*, and *nether-vert*.

**Over-VERT** is the great woods; which, in law-books, are usually called *haut-bois*.

**Nether-VERT** is the under-woods; otherwise called *sub-bois*.

We sometimes also meet with *Special VERT*, which denotes all trees growing in the king's woods, within the forest; and those that grow in other men's woods, if they be such trees as bear fruit to feed the deer.

**VERTEBRÆ**\*, a chain of little bones, reaching from the top of the neck, down the back, to the os sacrum; and forming a third part of the human skeleton, called the *spina dorsalis*. See SPINE.

\* They have their name à-*vertendo*; because it is on them the head and trunk turn: the Greeks call them σπονδυλοι, *spondyli*, for the same reason.

The *vertebræ* are 24 in number; seven of them belong to the neck, twelve to the back, and five to the loins. See NECK, LOINS, &c.

They lie not in a strait line; those of the neck bend inward, and those of the back outwards, for enlarging the cavity of the thorax; and those, again, of the loins bend inwards, and those of the os sacrum outwards, to enlarge the cavity of the basin.

The body of each *vertebra* is spongy and cavernous; having in the middle a large perforation, through which the medulla spinalis passes, and seven apophyses, or processes.

The fore-part of this body is round and convex; the hind-part somewhat concave: its upper and lower sides are plain, each covered with a cartilage which is pretty thick forwards, but thin backwards, by means whereof it is, that we bend the body forwards; the cartilages yielding to the pressure of the bodies of the *vertebræ*, which, in that motion, come closer to one another: which could not be effected, if the hard bodies of the *vertebræ* were close to one another.

The processes of each *vertebra* are of three sorts: two transverse, or lateral; in each of which there is a tendon of the *vertebral muscles* inserted: four oblique ones; by which the *vertebræ* are articulated to one another: and one acute, on the hindmost part of the *vertebra*. See *Tab. Anat. (Osteol.) fig. 10. lit. a. a. b. b. fig. 7. lit. a. a. a. a. fig. 7. lit. n. n. o. o. o. r. r. f. f. &c. fig. 11, lit. b. b. c. c. fig. 8. lit. b. b. a. a.*

These processes, which are peculiarly called the *spines*, form, with the hinder or concave part of the body of the *vertebra*, a large hole in each *vertebra*; and all the holes answering one another, make a channel for the descent of the spinal marrow, which sends out its nerves to the several parts of the body by pairs, through two small holes, formed by the jointing of four notches, in the sides of each superior and inferior *vertebra*. See MEDULLA Spinalis.

The *vertebræ* are articulated to one another, by ginglymus: for the two descending oblique processes of each superior *vertebra* of the neck and back, have a little dimple in their extremities, wherein they receive the extremities of the two ascending oblique processes of the inferior *vertebra*; so that the two ascending processes of each *vertebra* of the neck, and back, are received, and the two descending do receive, ex-

VOL. II. N°. CLX.

cept the first of the neck, and last of the back; but the ascending processes of each *vertebra* of the loins receive, and the two descending are received; contrary to those of the neck, and back.

The *vertebræ* are all tied together by a hard membrane, made of strong and large fibres: It covers the body of all the *vertebræ* forwards; reaching from the first of the neck, to the os sacrum.—There is another membrane, which lines the canal, made by the large hole of each *vertebra*; which also ties them together: besides, the bodies of each *vertebra* are tied to one another, by the intervening cartilages; and the tendons of the muscles, which are inserted in their processes, tie them together behind.

This structure of the spine is admirable; for had it been all one bone, we could have had no motion in our backs; had it been of two or three bones articulated for motion, the medulla spinalis must have been necessarily bruised at every angle, or joint; besides, the whole would not have been so pliable, for the several postures we have occasion to put ourselves in: if it had been made of several bones, without intervening cartilages, we should have had no more use of it, than if it had been but one bone.—If each *vertebra* had had its own distinct cartilages, it might have been easily dislocated.

—Lastly, the oblique processes of each superior and inferior *vertebra*, keeps the middle one, that it can neither be thrust backwards nor forwards, so as to compass the medulla spinalis.

The *vertebræ* of the neck differ from the rest, in that they are smaller and harder, their transverse processes perforated for the passages of the *vertebral vessels*, and their acute processes forked and straight. See *Tab. Anat. (Osteol.) fig. 3. n. 1. 1. fig. 7. n. 14. 14. fig. 8. and fig. 9.*

Add, that the first and second have something peculiar to themselves.

The first, called *atlas*, is tied to the head; and moves with it upon the second, semicircularly. See ATLAS.

The second is called *epistropheus*, *axis*, or *cardo*; also *vertebra dentata*: in the middle, between its two oblique ascending processes, it has a long and round process like a tooth; which is received into a sinus of the atlas; and upon it, the head with the first *vertebra*, turns half round, as upon a hinge, or axis. The extremity of this process, is knit to the occiput, by a small, but strong ligament.—A luxation of this tooth is mortal, because it compresses the medulla spinalis.

The third is also by some, though improperly, denominated *axis*. The *vertebræ* of the back differ from the rest in this, that they are larger than those of the neck, and smaller than those of the loins: their acute processes slope downwards upon one another. They have in each side of their bodies a small dimple, wherein they receive the round extremities of the ribs: the uttermost of them is sometimes called the *crest*; the second the *axillaris*; and the rest *costales*. See *Tab. Anat. (Osteol.) fig. 3. n. 13. 13. fig. 7. n. 15. 15. fig. 10.* The *vertebræ* of the loins, are the broadest; and the last of them, the largest of all the *vertebræ*. See *Tab. Anat. (Osteol.) fig. 3. n. 14. 14. fig. 7. n. 16. 16. fig. 11.*

Though each *vertebra* has but a small motion, yet the motion of them all is considerable: the head, we have observed, moves only backwards and forwards on the first *vertebra*, and semicircularly on the second.—The motion of the other *vertebræ* of the neck is not so manifest, yet is greater than that of the *vertebræ* of the back; because their acute processes are short and straight, and the cartilages, which are between their bodies, thicker.—The *vertebræ* of the back have the least motion of any, because their cartilages are thin, their acute processes long, and very near to one another: and they are fixed to the ribs, which neither move forwards, nor backwards.—The greatest motion of the back, is performed by the *vertebræ* of the loins; because their cartilages are thicker, and their acute processes are at a greater distance from one another: for the thicker the cartilages are, the more we may bend the body forwards; and the greater distance there is between the acute processes, the more we may bend backwards.

Such is the structure and motion of the *vertebræ*, when in their natural position: but we frequently find them variously distorted.—If the *vertebræ* of the back stick out, it constitutes what we call a *bunched back*: and in such cases, the cartilages between the *vertebræ* are very thin and hard forwards, but considerably thick backwards, where the oblique processes of the superior and inferior *vertebra*, are at a considerable distance from one another, which distance is filled up with a viscous substance.

This inequality of the thickness of the cartilages happens, either by a relaxation, or a weakness of the ligaments and muscles, fastened to the back-side of the *vertebræ*: in which cases, their antagonists finding no opposition, remain in a continual contraction.

The os sacrum does also consist of *vertebræ* in children; which grow so close together in adults, that they make but one large and solid bone of the figure of an isosceles triangle, whose bases is tied to the last *vertebra* of the loins, and the

upper part of its sides to the ilia, and its point to the os coccygis. See SACRUM *Os*.

**VERTEBRALES**, in anatomy, a pair of muscles, whose office is to stretch out all the *vertebrae* of the back. See VERTEBRÆ.

**VERTEX**, in anatomy, the crown of the head; or that uppermost and middle part situate between the finciput and occiput. See HEAD.

Hence, also, *vertex* is figuratively used for the top of other things.—Thus, the *vertex* of a cone, pyramid, conic section, &c. is the point of the upper extremity of the axis; or the top of the figure. See CONE, PYRAMID, &c.

**VERTEX of an Angle**, is the angular point; or the point A, (Tab. Geometry, fig. 91.) wherein the legs meet. See ANGLE.

**VERTEX of a Figure**, is the *vertex* of the angle opposite to the base. See FIGURE.

Such is the point M, (Tab. Geometry, fig. 19.) opposite to the base KL. See BASE.

**VERTEX of a curve**, is the point A, (Tab. Geometry, fig. 51.) from which the diameter is drawn; or the intersection of the diameter, and the curve. See CURVE.

**VERTEX of a Glass**, in optics, the same with the pole thereof. See POLE, OPTIC Glass, &c.

**VERTEX** is also used, in astronomy, for that point of heaven perpendicularly over our heads; properly called the *zenith*. See ZENITH.

**Path of the VERTEX**. See the article PATH.

**VERTICAL Circle**, in astronomy, is a great circle of the sphere, passing through the zenith Z, and nadir N, (Tab. Astronomy, fig. 6.) and any other given point on the surface of the sphere, as B. See CIRCLE, and SPHERE.

The *vertical circles* are also called *azimuths*. See AZIMUTH.—The meridian of any place is a *vertical circle*. See MERIDIAN, &c.—All the *vertical circles* intersect each other in the zenith and nadir. See ZENITH, and NADIR.

The use of the *vertical circles*, is to measure the height of the stars, and their distances from the zenith, which is reckoned on these circles; and to find their eastern and western amplitude, by observing how many degrees the *vertical* wherein the star rises, or sets, is distant from the meridian. See ALTITUDE, AMPLITUDE, &c.

**Prime VERTICAL**, is that *vertical circle*, or azimuth, which passes through the poles of the meridian; or which is perpendicular to the meridian, and passes through the equinoctial points. See PRIME Vertical.

**VERTICAL of the Sun**, is the *vertical* which passes through the centre of the sun, at any moment of time.

Its use is in dialing, to find the declination of the plane whereon the dial is to be drawn; which is done by observing how many degrees that *vertical* is distant from the meridian, after marking the point, or line of the shadow upon the plane, at any times. See DECLINATION.

**VERTICAL Angles**.—Two angles, as,  $\phi$  and  $\alpha$ , (Tab. Geometry, fig. 18.) are said to be *vertical*, if the legs of one of them, AE and EC, be only continuations of the legs of the other, DE and BE. See ANGLE, and OPPOSITE.

**VERTICAL Plane**, in perspective, is a plane perpendicular to the geometrical plane; passing through the eye, and cutting the perspective plane at right angles. See PLANE.

**VERTICAL Plane**, in conics, is a plane passing through the vertex of the cone, and parallel to any conic section. See PLANE, and CONE.

**VERTICAL Line**, in conics, is a right line drawn on the *vertical plane*, and passing through the vertex of the cone. See LINE.

**VERTICAL Dial**, in a sun-dial, drawn on the plane of a *vertical circle*; or perpendicular to the horizon. See DIAL, &c.

These are particularly called *oriental*, east; *occidental*, west; *meridional*, south; and *septentrional*, or north *verticals*, when opposed to one or other of these cardinal points of the horizon. See EAST, WEST, &c.

When they do not look precisely to any of them, they are called *decliners*; and when their plane, or surface is not perfectly perpendicular, *recliners*. See DECLINER, RECLINER, &c.

**VERTICAL Point**, in astronomy, the same with *vertex*, or *zenith*.

Hence, a star is said to be *vertical*, when it happens to be in that point which is perpendicularly over any place.

**VERTICAL Line**, in dialing, is a line or any plane perpendicular to the horizon.

This is best found and drawn on an erect and reclining plane, by holding up a string and heavy plummet steadily, and then marking two points of the shadow of the thread on the plane, a good distance from one other; and drawing a line through these marks. See DIALING.

**VERTICILLATE Plants**, are such as have their flowers intermixed with small leaves, growing in a kind of whirls

about the joints of a stalk; as penny-royal, hore-hound, &c. See PLANT.

The peculiar characteristic of this genus of plants, according to Mr. Ray, is, that their leaves grow by pairs, one just against another, on the stalk; the flower monopetalous, but usually growing down with a kind of lip, or turning something like the form of a helmet: four seeds after each flower; to which the perianthium of the flower serves instead of a capsula feminalis.

The same author makes two species of these *verticillate plants*.—1°. The *fruticosa*, or such whose superficies is perennial: these, again, have either a plain flower, as the chamædrys vulgaris, thucrium, and the marum syriacum; or a flower with a lip, which they call a *labiated flower*; or one something in the form of an helmet, which they call *galeated*; as the sacria stæchas, hyssopus, rosmarinus, satureia, marum vulgare, thymum vulgare, and the polium montanum.

2°. The *herbacea*, or such whose stalks are not perennial; these are the mentha, verbena, dictamnus creticus, origanum, majorana, ocimum, horminum, galeopsis, nepeta, betonica, prunella, stachys, clinopodium vulgare, lamium, moluca, hederæ terrestres, galericulata, calamintha, melissa, marrubium commune, nigrum & aquaticum; chamæpitys, scarodonia, scordium, bugula, syderitis, cardiaca.

**VERTICILLATE Flowers**. See FLOWER.

**VERTICITY**, is that property of the loadstone, whereby it turns or directs itself to some peculiar point. See MAGNET.

The attraction of the magnet was known long before its *verticity*. See COMPASS, NEEDLE, &c.

**VERTIGO\***, in medicine, an indisposition of the brain, wherein the patient sees the objects about him as if they turned round, and fancies he turns round himself, though all the while at rest.

\* The word is Latin, formed à *vertendo*, from turning round.

Physicians distinguish two kinds, or rather, two degrees of *vertiges*.—The first, called a *simple vertigo*, is when the body and external objects appear to turn round, without any great dimness of sight.

The other, called *scotomia*, or *vertigo tenebrosa*, is when the eyes are also darkened; and, as it were, covered with a mist. See SCOTOMIA.

Some make a third stage, *viz. vertigo caduca*, wherein the patient actually falls down.—But this seems scarce to differ from an epilepsy. See EPILEPSY.

Sometimes the *vertigo* is seated in the fore-part of the head, and sometimes in the hind-part: where the latter is much the more dangerous.

Bellini accounts for the *vertigo* very well, from a preternatural motion in the retina: for it is evident, an object will seem to move circularly, if the images thereof, painted on the retina, fall successively on different parts of the retina. See RETINA, and VISION.

This they may do, either by the object's moving while the eye is at rest, or from the eye moving while the object rests; or, lastly, the object and eye being both at rest, and the rays falling on the same place, by the optic nerve's being alone in motion. For since a right and an oblique incident do not excite the same tremors in the nerves, and the same species of motion; if the optic nerve only be moved, and the object be at rest, it will appear to shift its situation, by the change of the place in which it was represented. See VISION.

External causes of *vertigines*, are a continued turning round of the body, drunkenness, too long fasting, immoderate exercise, surprize, voracity, much use of pulse, onions, leeks, radishes, cabbage, mustard, &c. and, in the general, whatever may press, distend, or contract the arteries.

The first step in the cure, is bleeding in the jugular, or cupping; then they proceed to an emetic; then a vesicatory on the neck, or a perpetual blister, or issues; with sternutatories, and the other medicines that obtain in the apoplexy. See APOPLEXY.

**VERTILLAGE**, in agriculture, the tilling, or preparing of ground to receive the seed, by turning, stirring, or tossing it. See the article VIRTUE.

**VIRTUE**. See the article VIRTUE.

**VERTUOSO**. See the article VERTUOSO.

**VERUMONTANUM**, in anatomy, a kind of little valve, in the place wherein the ejaculatory ducts enter the urethra. See VALVE, URETHRA, &c.

Its use is, to prevent the urine, in passing the urethra, from getting in at those ducts, and so mixing with the semen. See URINE, &c.

**VERY\*** Lord, and **VERY Tenant**, are those that are immediate lord and tenant to one another. See LORD, MESN, &c.

\* — And know ye, that in taking of leases six things are necessary, *viz. very, lord, and very tenant*; service behind; the day of the taking; scisin of the services, and within his fee; and that a man is not *very tenant*, until he have attuned to the lord by some service. *Old. Nat. Brew.* See TENANT, ATTOURNMENT, &c.

**VESICA**, in anatomy, a *bladder*; a membranous or skinny part, in which any humour is contained. See **BLADDER**, **CYSTIS**, &c.

**VESICA Biliaria**. See **VESICULA FELLIS**.

**VESICA**, among chymists, is a large copper vessel, tinned on the inside; used in distilling ardent spirits: so called, as resembling the figure of a blown bladder. See **DISTILLATION**.

**VESICÆ Fundus**. } See the article { **FUNDUS**.  
**VESICÆ Sphincter**. } **SPHINCTER**.

**VESICATORY**, **VESICATORIUM**, an external medicine, serving to raise a blister; whence also it is itself, though improperly, called a *blister*. See **EPISPASTIC**.

*Vesicatories* are unguents, cataplasms, or plaisters made of sharp, irritating medicaments, which have a faculty of drawing the humours from within, outwards; inflaming and ulcerating the skin, and raising vesicæ, or bladders; whence their denomination, *vesicatory*.

We have *vesicatories* made of cantharides, euphorbium, figs, sublimate of mercury, lapis infernalis, mustard, anacardium, squills, briony, vinegar, pepper, leaven, &c. which are incorporated and made up with honey, gums, resins, &c. to bring them to the consistence required. See **CANTHARIDES**, &c.

*Vesicatories* are a stronger sort of sinapisms, and potential cauterics. See **SINAPISM**, **CAUTERY**, **CAUSTIC**, &c.

**VESICULA**, **VESICLE**, a diminutive of *vesica*; signifying a *little bladder*. See **VESICA**, and **BLADDER**.

The lungs consist of *vesiculæ*, or lobules of *vesiculæ*, admitting air from the bronchiæ; and not only air, but also dust, &c. See **LOBULE**, and **LUNGS**.

There are several parts in the body which bear this appellation; as,

**VESICULA fellis**, *cistula fellis*, or the *gall-bladder*; which is an oblong membranous vessel, not unlike a pear both in form and size; situate in the hollow part of the liver. See **LIVER**.

It adheres to the liver, not only by its vessels, which it receives from it, but likewise by its membranes, whereof, the external is common to both.—The lower part, which hangs out of the liver, rests on the pylorus of the stomach.

Its trunks, or membranes, are usually reckoned five; an outer, or common one, from the peritonæum; an inner one, on that side which adheres to the liver from the capsula of the porta, and of the porus biliaris.—And three proper ones: the first whereof is vasculous; the second, muscular; and the third, glandulous.

But Dr. Drake, viewing a piece of dried gall-bladder with a microscope, found but little reason for this accurate distinction; the several orders of fibres of the several coats appearing to be no other than an infinite perplexity of vessels diversly ramified.

The gall-bladder is usually distinguished into the *fundus*, which is the widest part; and *collum*, or neck, which is the narrowest.

The neck of the *vesicula fellis* being prolonged, terminates in a duct, called *meatus cysticus*, or *biliaris*; which, at about two inches distance from the gall-bladder, is joined to the meatus hepaticus; these, together, form the ductus communis. See **DUCTUS**, **MEATUS**, &c.

The use of the gall-bladder, is to receive the bile, after its being secreted in the glands of the liver; and to discharge it by the common duct into the duodenum.

The bile found in this vessel is of a brighter yellow, a greater consistence, and more bitter and acrimonious than that in the porus biliaris. See **BILE**.

**VESICULÆ Seminales**.—See *Tab. Anat. (Splanchn.) fig. 8. lit. o. o. fig. 15. lit. bb*; see also the article **SEMINALES**.

**VESICULÆ Adiposæ**. See the article **ADIPOSÆ**.

**VESICULAR Glands**. See the article **GLAND**.

**VESPER**, in astronomy, called also *hesperus*, and the *evening-star*; is the planet Venus, when she is eastward of the sun, and consequently sets after him. See **VENUS**, and **HESPER**.

**VESPER**, in the Romish church, *evening song*; that part of the office which is rehearsed after noon—answering to our *evening prayers*; except that it differs more from the office of the morning, called *mattins*. See **MATTINS**.

**Silician VESPER**, is a famous æra in the French history; signifying a general massacre of all the French in Sicily, in the year 1282; to which the first toll that called to *vespers* was the signal.

Some will have it to have happened on Easter-eve: others on the day of the Annunciation.—It was raised by one Prochites, a cordelier, at the time when Charles of Anjou, count of Provence, was king of Naples and Sicily.—The women with child by French-men were not spared.

After the like manner, we say, the *mattins of Moscow*, speaking of the Muscovites assassinating their prince Demetrius, and all the Poles, his adherents, at Moscow, the 27th of May 1600, under the conduct of their duke Choutsky, at six o'clock in the morning.

**VESPERTILIONUM** *Alæ, bats wings*, among anato-

mists, two broad membranous ligaments, with which the bottom of the womb is tied to the bones of the ilium; so called from their resembling the wings of a bat.—See *Tab. Anat. (Splanchn.) fig. 11. lit. g. g. UTERUS*.

**VESPERTINE**, **VESPERTINUS**, in astronomy, is when a planet is seen descending to the west after sun-set.

**VESSEL**, **VAS**, **VASE**, a thing proper to hold, or contain liquor. See **VAS**, **VASE**, **VESICA**, **VESICULA**, &c.

Thus, a tun, hoghead, &c. are *vessels*, fit to contain ale, wine, &c. See **TUN**, **BARREL**, &c.

The chymists use a great diversity of *vessels* in their operations; as matrasses, pelicans, retorts, receivers, &c. See **MATRASS**, **PELICAN**, &c.

**Double VESSEL**. See the article **DOUBLE**.

Among anatomists, &c. all the tubes or canals, wherein the blood, and other juices, or humours are secreted, conveyed, deposited, &c. as the veins, arteries, lymphatics, spermatics, &c. are called *vessels*.—See *Tab. Anat. P. 2. Vessels of human body*; see also **TUBE**, **CANAL**, **DUCT**, **VEIN**, **VESICULA**, &c.

Some even extend the word *vessel* to the nerves; as supposing them the conduits of the animal spirits. See **NERVE**.

*Vessels* consist of membranes, variously formed, and disposed for the reception of the fluids; and these membranes, again, consist of lesser vesicles, or vesiculæ: and this, for what we know, without end. See **MEMBRANE**, **FLUID**, &c.

In the new system of many modern philosophers and physicians, *vessel* is a name common to all the solid parts of the body. See **SOLID**.

These authors explain the whole animal œconomy, functions, &c. from the divers liquors diffused throughout the body, and the various tubes, or *vessels* which contain those liquors.—In effect, all we know in the human body, is either *vessel*, or liquor. See **DIGESTION**.

The ancients, it is true, had a notion, that some parts of the body, as the heart, spleen, &c. are mere parenchyma's, *i. e.* a kind of pulp, or pith, void of all *vessels*; but the moderns, by the advantage of microscopes, injections, &c. find that these, and all other parts of the body, are mere congeries, or masses of *vessels* interwove. See **PARENCHYMA**, **FLESH**, &c.

Some philosophers even extend the modern system to all material beings; owning, only two elements, *viz.* a matter infinitely liquid, diffused through all nature; and hard, or solid parts; which are, as it were, the *vessels* of that matter. See **ELEMENT**, &c.

The *vessels* have a considerable share in the vital actions; all that is required to the maintenance of life, being a due quantity of a proper humour and its continued motion along the *vessels*: this motion depends in great measure, on the action of the *vessels* themselves; and the action of the *vessels*, depends on the contraction of the fibres, whereby, when stretched and distended by the flowing humour, they shorten themselves again, and dispute themselves into right lines, still approaching towards the axis of their cavity; and thus, they propel their contents: so that the force of the *vessels* is chiefly to be determined from their figure. See **FIBRE**, **ELASTICITY**, &c.

The number of *vessels*, some of our latest and best anatomists observe, is greatest in embryo's; and continually decreases as age comes on. See **FOETUS**.

For in the actions whereby nutrition, &c. are effected, the greater *vessels* being much distended by their humours, the smaller vesicles, whereof the membranes, or coats of the larger are wove, become compressed and streightened, and at length quite dry, and void of juices; so that growing together, the fibres become the firmer and stronger, by the loss of the vesicles.—And hence the strength, firmness, stiffness &c. of the solid parts. See **SOLID**; see also **DISEASE**, and **DEATH**.

Axis of a VESSEL.	} See the article {	AXIS.

Spermatic VESSELS.		SPERMATIC.
Umbilical VESSELS.		UMBILICAL.

**VESSEL**, in navigation, is a name common to all sorts of shipping, *i. e.* all floating machines, or vehicles that move in the water. See **SHIP**.

*Vessels* are frequently distinguished in two general classes, *viz.* *high-bottomed* or *decked vessels*; which are those that move wholly with wind and sail, and live in all seas; as *pinks*, *galions*, *ships*, &c. See **SAILING**.

And *flat-bottomed vessels*, which go both by oars and sails: such are *boats*, *galleys*, *praams*, *wherries*, &c. See **OARS**, **ROWING**, &c. see also **BOAT**, **GALLEY**, &c.

*Floating vessels*, are usually distinguished into *boats*, *lighters*, *barges*, *barks*, *fishing vessels*, *ships of trade*, and *vessels of war*; of each whereof there are divers kinds and denominations. See **BOAT**, **BARGE**, **LIGHTER**, **SHIP**, &c.

*Vessels of war*, are a *three-decked ship*, first and second rate; a *frigate*,

a *frigate*, or *two decked ship*, third, fourth, and fifth rate; a *one decked ship*, sixth rate; a *boom-vessel*, a *fire-ship*, a *ketch*, a *machine-vessel*, a *smoaker*. See *RATE*.

A *vessel* is said to be of *three or four hundred tons*; meaning that it will carry three or four hundred times two thousand weight: or, that when immersed in water, it possesses the space of three or four hundred tun of water, which is equal to the weight of the *vessel*, and all the loading it can carry. See *TUN*, and *BURDEN*.

A *vessel* is said to *draw ten or fifteen feet water*; meaning, that when loaden, it sinks so deep under water.

The figure of *vessels*, is a thing of great importance, with regard to their motion, sailing, &c. and in the determining what form is most commodious, the new doctrine of infinites becomes of apparent service to navigation and commerce.

A body moving in an immoveable fluid, is obliged to sever the parts thereof; and they resist such separation.—Now, setting aside a certain tenacity, whereby they are, as it were, glued together; and which is different in different fluids; the whole force of the resistance depends on that of the shock, or impulse: for a body that is struck, strikes at the same time; but a perpendicular stroke is that a liquid resists the most, as being the greatest: and for a body to move freely therein, it must be of such figure, as to present itself as obliquely as possible.—If it were triangular, and moved with the point foremost, it is certain all its parts would strike the fluid obliquely, but they would all strike it with the same obliquity; and it were more advantageous, that each should strike more obliquely than its neighbour.

Now, such a perpetual augmentation of obliquity, can nowhere be had in a curve line; each point whereof is considered as an infinitely small right line, always inclined to the other little right lines contiguous to it.

To find what curve it is, whose perpetual change of obliquity, or inclination in all its parts, renders it, of all others, the fittest to divide the fluid easily; is a problem much more difficult than it appears to be; and, in effect, only to be solved by the new geometry: the solution was first given by Sir Isaac Newton, in his investigation of the solid of the least resistance.

That author, however, did not publish his analysis; yet the marquis de l'Hôpital hit upon it: and afterwards M. Fatio resolved the same problem; though by a much longer, and more perplexed way. See *SOLID of the least resistance*.

*Book of VESSELS*. See the article *BOOK*.

*VEST*, and *VESTITURE*. See the article *INVESTITURE*.

*VESTALIA*, feasts held in honour of the goddess *Vesta*, on the fifth of the ides of June; i. e. on the ninth day of that month. See *FEAST*.

On that day, banquets were made before the houses; and meats sent to the *vestals*, to be offered by them to the goddesses. See *VESTAL*.

The asses that turned the mills for grinding corn, were, on this occasion, led about the city, crowned with flowers, and chaplets formed of pieces of bread; and the mill-stones were likewise decked with garlands and crowns.

The ladies went barefooted in procession to the temple of *Vesta*; and an altar was erected to *Jupiter the baker*, *Jovis pistori*, in the capitol.

The *vestalia* had their name from that of their goddess *Vesta*, from the Greeks called *ἱστία*, fire, or hearth; whence *Cicero* derives the Latin name.—Accordingly, the poets frequently use *Vesta* for fire, or flame; as *Jupiter*, for air, *Ceres*, for corn, &c. See *GOD*, &c.

*VESTALS*, *VESTALES*, in antiquity, maids in ancient Rome, consecrated to the service of the goddess *Vesta*; and particularly, to watch the sacred fire in her temple. See *VESTALIA*.

*Numa* first instituted four *vestals*; and *Plutarch* tells us, *Servius Tullus* added two more: which number, six, lasted as long as the worship of the goddess *Vesta*.—It is true, *S. Ambrose* reckons them seven; but without any foundation. The *vestals* made a vow of perpetual virginity: their employment was, the sacrificing to *Vesta*, and keeping up the holy fire in her temple.—If they violated the vows of chastity, they were punished with remarkable severity; being shut up, or buried in a deep pit, or cavern, with a lighted lamp, and a little water and milk, and their left to be devoured by hunger.—If they let out the fire, they were whipped by the pontifex maximus; and the fire was re-kindled by the sun-beams collected, some say, in burning-glasses, and not otherwise.

To be secure of their virginity at their admission, it was provided, that they should not be above six years old.—They were chosen by lot, out of 20 virgins, carried by the pontiff to the comitia, for that purpose.

They were only consecrated for 30 years; after which time, they were at liberty to go out and be married. If they continued in the house after that time, they were only to be assistant, in point of advice, to the other *vestals*.

The first ten years they were to employ in learning their functions; the ten following they were to exercise them; and the last ten, to teach them to others.

Their order was very rich; both on account of the endowments of the emperor, and of other persons.

The *vestals* had a particular place allotted them at the amphitheatres, and games of the circus.—Their vehicle was the *carpentum*, or *pilentum*.—The vail wherein they sacrificed, was called *suffibulum*.

At first, they were nominated by the kings; but after the extinction of monarchy, by the pontifex maximus, or high priest.—The oldest of them was called *maxima*, as the first pontiff was maximus. See *PONTIFF*.

They had divers privileges: disposed of their effects by testament, in their father's life-time; had the same gratification as a mother of three children; and whenever they met a criminal going to execution, had a power to pardon him.

The fire which the *vestals* were to watch, was not on an altar, or hearth; but in little earthen vessels with two handles, called *capeduncula*.

This fire was held a pledge of the empire of the world: If it went out, it was judged a very unlucky prognostic; and was to be expiated with infinite ceremonies.—Among the Romans, *Festus* tells us, it was only to be re-kindled by the rubbing a kind of wood, proper for the purpose. But among the Greeks, *Plutarch*, in the life of *Numa*, observes, it was to be rekindled, by exposing some inflammable matter, in the centre of a concave vessel held to the sun.—For it is to be noted, the Romans were not the only people who kept the perpetual fire of *Vesta*, in imitation of the celestial fires: but the Greeks were possessed with the same superstition; particularly the Delphians, Athenians, Tenedians, Argives, Rhodians, Cyziceniens, Milesians, Ephesians, &c.

*VESTIARIUS*, *VESTIARY*, in antiquity, master of the wardrobe; an officer under the Greek empire, who had the care and direction of the emperor's apparel, robes, &c. See *WARD-ROBE*.

The *protovestiarius*, or first *vestiary*, was the grand master of the wardrobe.—But, among the Romans, *vestiarius* was only a salesman, or taylor.

*VESTIBLE*\*, *VESTIBULUM*, in the ancient architecture, a large open space before the door, or entrance of a house.

\* *Martinius* derives the word from *vestra stabulum*; by reason the fore-part of the house was dedicated to *Vesta*.—*Daviler* derives it from *vestis*, and *ambulo*; by reason people there begin to let their trains fall.

The Romans had places called *vestibles*, at the entrance of their houses, to shelter people obliged to stand at the door from the weather: we have still *vestibles* of the like kind, in many old churches, houses, &c. called *porches*. See *PORCH*, and *PROPYLÆUM*.

*Vestibles* only intended for magnificence, are usually between the court and the garden: these are sometimes *simple*; that is, have their opposite sides equally enriched with arches; and sometimes their plan is not contained under four equal lines, or a circular one, but forms several van-corps, and rear-corps, furnished with pilasters.

*VESTIBLE*, *VESTIBULUM*, in anatomy, denotes the fore-part of the labyrinth of the ear. See *EAR*, and *LABYRINTH*. The *vestible* is a small cavity, of an irregular form, placed immediately above the basis of the stapes; between the semicircular canals, and the cochlea. See *COCHLEA*.

In it appears divers foramina; as that of the fenestra ovalis; the five foramina of the semicircular canals; that of the cochlea; and five other very small ones, through which so many nerves pass. See *FENESTRA*, &c.

*VESTIGIA*, a Latin term, frequently used by English writers, to signify the traces, or footsteps any thing has left behind it. See *TRACE*.

The word is particularly applied to the marks remaining of something antique, gone to ruin by time. See *RUIN*.

*VESTIS Angelica*. See the article *ANGELICA*.

*VESTMENT*. See the article *VESTURE*.

*VESTRY*, *VESTIARIA*, a room adjoining to a church, where the priests vestments, and sacred utensils are kept, and parochial assemblies held. See *SACRISTY*, and *VESTRY-Men*.

*VESTRY-Men*, a select number of the principal persons of every parish within the city of London, and elsewhere; who yearly choose parish-officers, and take care of its concerns. See *PARISH*.

They are thus called, because they usually meet in the *vestry* of the church. See *SACRISTY*.

*VESTRY-Clerk*, an officer who keeps the parish accounts. See *PARISH*, *CLERK*, &c.

*VESTURE*, *VESTMENT*, a garment, or cloathing.

In our law-books, it is also used metaphorically: as in, *vestura terræ*, i. e. *segetes quibus terræ vestitur*; the corn where-with the earth is clothed, or covered.

*VESTURE of an Acre of Land*, is the produce on it; or the wood, corn, &c. growing on it.—It shall be enquired how much

## V I A

much the *vesture* of an acre of ground, and how much the land, &c. 4 Ed. I. 14 Ed. III. &c.

**VESTURE**, *VESTURA*, also signifies a possession, or seisin. See **POSSESSION**, and **SEISIN**.

In which sense, it is borrowed from the feudists; with whom *investitura* signifies a delivery of possession by a spear or staff; and *vestura*, possession itself. **INVESTITURE**.

**VETERAN**, *VETERANUS*, in the Roman militia, a soldier who was grown old in the service; or who had made a certain number of campaigns; and on that account was entitled to certain benefits and privileges.

Twenty years service, were sufficient to entitle a man to the benefits of a *veteran*.—These privileges consisted in being absolved from the military oath; in being exempted from all the functions of a soldier; in enjoying a certain salary, or appointment, &c.

In France, the term **VETERAN** is still retained to such officers as have held their posts 20 years; and who enjoy certain of the honours and privileges affixed thereto, even after they have laid them down.

A *veteran* counsellor has a voice and seat at audiences, though not at processs by writing.—A *veteran* secretary of the king, acquires the privileges, &c. of nobility, to himself and his children.

**VETERINARIA**, *Mulo-medicina*, or medicine applied to the diseases of cattle. See **MEDICINE**, **HORSE**, &c.—Whence,

**VETERINARIUS**, a farrier, or horse-leech. See **FARRIER**.

**VETERNUS**, is used by some physicians for a lethargy, or other drowsy disease. See **LETHARGY**, &c.

**VETITUM** *Namium*, in law, imports a forbidden distress. See **NAM** and **DISTRESS**.

Such, *e. gr.* is that when the bailiff of a lord distrains beasts, or goods, and the lord forbids his bailiff to deliver them when the sheriff comes to replevy them; and to that end, drives them to places unknown:—Or when, without any words, they are so effoined, as they cannot be replevied.

Divers lords of hundreds, and courts-baron, have power to hold plea de vetito namio.—*Mathilda de Morton clamat in manerio de Mauerdon duos law-days, & infangenthest & placita de namio vetito, sine breve domini regis.* Int. Record. in Thesaur. Scac.

**VEXES**. See the article **NE INJUSTE Vexes**.

**VIA ARMIS**, *q. d. by force and arms*, a law term used in an indictment; to denote the forcible and violent commission of any crime. See **TRESPASS**, and **INDICTMENT**.

**VILAICA remouenda**, a writ, lying where debate being between two parsons, or provisors for a church; and of them makes a forcible entry into it, with a number of laymen, and holds the other out.

**VIA**, *Way*. See the articles **WAY**, and **ROAD**.

**VIA LACTEA**, in astronomy, the *milky way*, or galaxy. See **GALAXY**.

**VIA MILITARIS**, in our law-books, is used for a *highway*—*quæ publica dici poterit & ducit ad mare & ad portum, & quandoque ad mercata.* Bracton, Lib. IV. c. 16.

**VIA REGIA**, the *king's highway*, is defined in *Leg. Hen. I.* to be “that which is always open, and which no body may shut by any threats, as leading to a city, port, or town.”

Its breadth the same laws prescribe to be such, as that two carts may pass each other, and sixteen horsemen armed go abreast.

**VIA SOLIS**, the *sun's way*, in astronomy, is used, among some astronomers, for the ecliptic line; so called, because the sun never goes out of it. See **ECLIPTIC**.

**VIA PRIMÆ**, *first passages*, among physicians, are the œsophagus, stomach, and guts; including the whole length of the alimentary duct, or canal, from the mouth to the sphincter ani. See **DUCT**, **STOMACH**, **INTESTINES**, &c.—See also **PRIMÆ**.

In this sense, we say, An obstruction in the *primæ viæ*.—Purging and emetic medicines operate chiefly on the *primæ viæ*.—Sudorifics, alteratives, cardiacs, &c. suspend their action till after they have passed the *primæ viæ*. See **MEDICINE**, **PURGATIVE**, **EMETIC**, &c.

**VIAL**, or **PHIAL**, a small thin glass bottle. See **PHIAL**.

**VIALES**, in mythology, a name given, among the Romans, to the gods who had the care and guard of the roads, and highways. See **GOD**.

The *dii viales*, according to Labeo, were of the number of those gods called *dii animales*; who were supposed to be the souls of men changed into gods; and were of two kinds, viz. the *viales*, and *penates*. See **PENATES**.

The *viales* were the same with those otherwise called *lares*; at least, some of the *lares* were denominated *viales*, viz. such of them as had the more immediate intendency of the roads. See **LARES**.

Hence, the two names are sometimes joined, and those highway deities called *lares viales*: witness that inscription in Gruter.

**VIATICUM**, among the antient Romans, was the allowance or appointment which the republic gave to such of its officers as were sent into the provinces, to exercise any office, or perform any service, or commission; as also to the officers of the army, and even the soldiers, &c. See **PROVINCE**. Tacitus makes mention of it, Lib. I. *Annal.* c. 37. *Viaticum amicorum ipsiusque Caesaris*; meaning the appointments which the republic paid to Germanicus, and his officers.

This *viaticum*, however, did not consist altogether in money: the ring given the magistrates and officers sent into the provinces, was part of it; so were the clothes, baggage, tents, and the rest of their equipage.

In the Romish church, **VIATICUM** is still the allowance made a religious, to defray the expences of a journey, mission, &c. See **MISSION**.

**VIATICUM** is also used for the communion, or eucharist, which is given to the people in the pangs of death; or who are about to make the voyage of the other world. See **COMMUNION**. The *viaticum* is not given to persons executed in course of justice.

**VIATOR**, in antiquity, an officer of justice among the Romans.—The term, originally, had no other signification than that of a publick messenger, or servant sent to advertise the senators and magistrates when assemblies were to be held, where their presence was required.

Hence, because, in the first ages of that empire, the Roman magistrates lived mostly at their country-houses; these officers being obliged to be frequently upon the road, were called *viatores*, travellers; from *via*, highway.

In process of time, the name *viator* became common to all officers of the magistrates, lictors, accensi, scribes, statores, and cryers; either by reason these names and offices were confounded in one: or because *viator* was a general name, and the rest particular ones, specifying the particular functions they discharged, as A. Gellius seems to insinuate, when he says, that member of the company of *viatores*, who binds a criminal condemned to be whipped, was called *lictor*. See **ACCENSI**, **SCRIBE**, &c. Be this as it will, the names *lictor* and *viator* are often used indiscriminately for each other; and we as often meet with *Send to seek, or advertise him by a lictor, as by a viator*.

None but the consuls, pretors, tribunes, and ædiles, had a right to have *viators*.—They were not to be Roman citizens, and yet were required to be free.

**VIBEX**, is sometimes used, by physicians, for a black and blue spot on the skin, occasioned by an afflux, or extravasation of blood. See **PETECHIA**, &c.

**VIBRATION**, in mechanics, a regular, reciprocal motion of a body; *e. gr.* a pendulum; which, being suspended at freedom, swings or *vibrates*, first this way, then that.

For the bob being raised, falls again by its gravity; and with the velocity thus acquired, rises to the same height on the other side; whence, its gravity makes it fall again: and thus its *vibrations* are continued. See **PENDULUM**.

Mechanical authors, in lieu of *vibration*, frequently use the term *oscillation*. See **OSCILLATION**.

The *vibrations* of the same pendulum are all isochronal; that is, performed in equal time, at least in the same climate; for, towards the equator, they are found somewhat slower.

A pendulum 3 feet 3 inches, and 2 tenths of an inch, according to Huygens, or 39, 25 inches, according to Sir J. Moor and lord Brouncker, *vibrates* seconds, or makes 3600 *vibrations* in an hour. See **SECOND**.

The *vibrations* of a longer pendulum, take up more time than those of a shorter one, in the subduple ratio of the lengths.—Thus, a pendulum 3 feet long will make 10 *vibrations*; while another 9 inches long makes 20.—For 10 is the half of 20, and 3 feet, or 36 inches, are the square of 6 inches; which is double of 3, whose square is 9: so that 10 is to 20 in a subduple ratio of 36 to 9.

The same thing is meant, when we say, that the number of *vibrations* of pendulums in a given time, is in a reciprocal ratio of their lengths.

M. Mouton, a priest of Lyons, wrote an express treatise, to shew, that by means of the number of *vibrations* of a given pendulum, in a certain time, one might establish an universal measure throughout the whole world; and fix the several measures in use among us, in such manner, as that they might be recovered again, if at any time they should chance to be lost, as is the case of most of the antient measures, which we now only know by conjecture. See **MEASURE**.

The *VIBRATIONS* of a stretched cord, or string, arise from its elasticity; which power being of the same kind with that of gravity, the *vibrations* of a cord follow the same laws as those

of pendulums: consequently the *vibrations* of the same cord equally stretched, though they be unequal in length, are equidurnal, or performed in equal times; and the squares of the times of the *vibrations* are among themselves; inversely, as the powers whereby they are equally bent, and inflected. See CHORD, ELASTICITY, FIBRE, &c.

The *vibrations* of a spring, too, are proportionable to the powers whereby it is bent: these follow the same laws as those of the cord, or pendulum, and, consequently, are equidurnal; which is the foundation of spring-watches. See SPRING, and WATCH.

VIBRATION is also used in physics, &c. for divers other regular alternate motions.—Sensation is supposed to be performed, by means of the *vibratory* motion of the nerves, begun by external objects, and propagated to the brain. See SENSATION, VISION, NERVE, &c.

The several forts and rays of light, Sir Isaac Newton conceives to make *vibrations* of several bignesses; which, according to those magnitudes, excite sensations of several colours; much after the same manner as *vibrations* of air, according to their several magnitudes, excite sensations of several sounds. See COLOUR, SOUND, &c.

Heat, according to the same author, is only an accident of light, occasioned by the rays putting a fine, subtle ethereal medium, which pervades all bodies, into a *vibrative* motion, which gives us that sensation. See MEDIUM, and HEAT. From the *vibrations*, or pulses of the same medium, he accounts for the alternate fits of easy reflection, and easy transmission of the rays. See LIGHT, RAY, REFLECTION, &c. In the *Philosophical Transactions* it is observed, that the butterfly, into which the silk-worm is transformed, makes 130 *vibrations*, or motions of its wings, in one coition.

VICAR\*, VICARIUS, a person appointed as deputy of another; to perform his functions, in his absence, and under his authority. See LIEUTENANT, DEPUTY, VICE-GERENT, &c.

\* The word is formed from *vicarius*, *qui alterius vices geret*.

The pope pretends to be *vicar* of Jesus Christ on earth.—He has under him a *grand-vicar*, who is a cardinal, and whose jurisdiction extends over all priests, both secular, and regular; and even over laymen.

Among the antient Romans, *vicarius*, *vicar*, was a legatus, or lieutenant, sent into the provinces where there was no governor: so that the *vicarii* were properly the emperor's *vicars*, not those of governors. *Cod. de Offic. Vicar.*

Italy, in the time of the eastern empire, was governed by two *vicarii*: the one *vicar of Italy*, who resided at Milan; the other of the city, who resided at Rome.

Cujas observes, that the word *vicar* was sometimes, though rarely, attributed to the lieutenant-generals of proconsuls, or governors of Roman provinces.

VICAR, in the canon law, denotes a priest of a parish, the predial tithes whereof are impropriated, or appropriated; that is, belong either to a chapter, religious house, &c. or to a layman, who receives them, and only allows the *vicar* the small tithes, or a convenient salary, antiently called *portio congrua*. See TITHE, APPROPRIATION, &c.

He is thus called *quasi vice fungens rectoris*, as serving for, or in lieu of a rector, who would be intitled to the great tithes. See RECTOR, and PARSON.

These *vicars* were antiently called *perpetui vicarii*; because not appointed by the impropriator, and licensed by the bishop to read service; but presented by the patron, and canonical institution given them by the hands of the ordinary; and so having constant succession, or corporations, and never dying. See INDUCTION, CURE, &c.

The canonists mention four species of *vicars*: some *perpetual*; others appointed for a certain time, and, on some special occasion, called *mercenarii*; others called *speciales*, appointed not for the whole cure, but for some certain place, article, or act: others *generales*, neither perpetual, nor appointed for any certain act, but for all things in the general.

VICAR General, was a title given by king Henry VIII. to Thomas Cromwell, earl of Essex; with full power to oversee the clergy, and regulate all matters relating to church affairs.

VICE, VITIUM, in ethics, is ordinarily defined an elective habit, deviating, either in excess, or defect, from the just medium wherein virtue is placed. See VIRTUE.

It is called a *habit*, to distinguish it from *sin*, which is only an act: hence, a sin is looked on, as something transient: and a *vice*, as something permanent. See SIN, HABIT, &c.

Authors distinguish three states of *vice*: the first *incontinentia*, of incontinence; wherein a person sees, and approves the good, but is hurried to evil by the violence of his passions.—The second, *intemperantia*, of intemperance; wherein even the judgment is depraved, and perverted.—The third, *feritatis*, of obduracy; wherein the person is totally immersed in *vice*, without any sense or feeling thereof.

The state of incontinency, is considered as infirmity, wherein the person feels the sharpest stings of conscience: that of intemperance, as malice, wherein the remorse is not so lively.—In that of obduracy there is none. See CONSCIENCE.

VICE, in smithery, and other arts employed in metals, is a machine, or instruments, serving to hold fast any thing they are at work upon; whether it be to be filed, bent, riveted, &c. To file square, it is absolutely necessary the *vice* be placed perpendicular, with its chaps parallel to the work-bench. See FILING.

The parts of the *vice* are, the *face*, or *plane*, which is its uppermost part; the *chaps*, which are cut with a bastard cut, and well tempered; the *screw-pin*, cut with a square strong worm; the *nut*, or *screw-box*, which has a square worm, and is brazed into the round box; the *spring*, which throws the chaps open; and the *foot*, on which the whole is mounted.

Hand-VICE, is small kind of *vice*, serving to hold the lesser works in, that require often turning about.

Of this there are two kinds, the *broad chapt hand-vice*, which is that commonly used; and the *square nosed hand-vice*, seldom used but for filing small round work.

VICE is also a machine used by the glaziers, to turn, or draw lead into flat rods, with grooves on each side, to receive the edges of the glass. See LEAD.

This machine consists of two iron chaps, or cheeks, joined with two cross iron pieces.—In the space between the chaps, are two steel wheels, with their spindles, or axes passed through the middle; each of which has its nut, or pinion with teeth, that catch into each other: to the lowest is fitted a handle, whereby the machine is turned.

There are some of these *vices* double, and that will draw two leads at once: these have three wheels.—Some glaziers will turn lead of different sizes in the same *vice*; by changing their cheek for each size. See CHEEK.

With another pair of spindles, whose nuts almost meet, they turn lead for *tiers*; which, when it comes out of the *vice*, is almost cut asunder, in two thicknesses, easy to be parted. Before the invention of this *vice*, which is but a late thing, they used a plane: accordingly, in all antient windows, we find the lead planed, and grooved that way. See GLASS.

VICE is also used in the composition of divers words, to denote the relation of something which comes instead, or in the place of another.

In this sense, the word is Latin, *vice*, stead, place, turn, &c.

VICE ADMIRAL, is one of the three principal officers of the royal navy; who commands the second squadron, and has his flag set up in the fore-top of his ship. See ADMIRAL, NAVY, &c.

VICE-CHAMBERLAIN, called also, in antient statues, *under-chamberlain*; is an officer in the court, next under the lord chamberlain; and, in his absence, has command, and controul, of all officers belonging to that part of the household, called the *chamber* above stairs. See CHAMBERLAIN.

VICE-CHANCELLOR of a university, is an eminent member, chose annually, to manage affairs in the absence of the chancellor. See UNIVERSITY.

VICE-DOGE, is a counsellor of Venice, who represents the doge when sick, or absent; that the seignory may never be without a chief.

The *vice-doge* never takes the ducal chair, nor bears the horn, nor is addressed under the title of *serenissimo*: yet, the foreign ambassadors, speaking to the college, use the common apostrophe of *serenissimo principe*: and he performs all the offices of doge; and gives answers to ambassadors, without moving his cap. See DOGE.

VICE-DOMINUS, a vicount, sheriff, or vidame. See VICOUNT, VIDAME, &c.

VICE-DOMINUS *Abbatia*, or *Ecclesia*, in the civil and canon law, an advocate, or protector of an abbey, or church. See ADVOCATE, and ADVOWEE.

VICE-DOMINUS *Episcopi*, in the canon law, is the commissary, or vicar-general of a bishop. See COMMISSARY, &c.

VICE-GERENT, *Vicegerens*, a vicar, deputy, or lieutenant. See VICAR, LIEUTENANT, &c.

VICE-COMES, in law, &c. } See { VICOUNT.  
Accedas ad VICE-COMITEM. } See { ACCEDAS.

Respectu habendo computi VICE-COMITIS. See RESPECTU.

VICE-LEGATE, an officer whom the pope sends to Avignon, and some other cities, to perform the office of a spiritual and temporal governor, at a time when there is no legate, or cardinal to command there.

All the Gaule Narbonnoise, as Dauphine, Provence, &c. has recourse to the *vice-legate* of Avignon, for all ecclesiastical dispatches; in like manner as the other provinces address themselves to Rome. See LEGATE.

VICE-ROY, a governor of a kingdom, who commands therein, in the name, and stead of a king; with full and sovereign authority.

Sicily, Catalonia, Mexico, &c. are governed by *vice-roys*. See KING.

VICE *Verfa*, a Latin phrase, frequently retained in English writings; signifying as much as, *on the contrary*.

Thus, as the sun mounts higher and higher above the horizon, insensible perspiration increases; and, *vice versa*, as he descends lower, it diminishes.

VICEN-

**VICENNALIS**, in antiquity, something of 20 years, or that returns after 20 years.

Among the Romans, *vicennalia* was particularly used for the funeral feasts, held on the 20th day after a person's decease.

**VICENNALIA**, or **VICENNALES Ludi**, were also games, feasts, and rejoicings, held every 20th year of the reign of a prince.

On medals, we frequently meet with *vicennalia vota*; the vows put up on that occasion, for the safety of the emperor, and enlargement of the empire.

These are expressed by **VOT. X & XX**, in the medals of Tacitus, Gallienus, and Probus; **VOT. X. M. XX**, in those of Valerius Maximianus, and Galerius Maximianus; **VOT. X. MUL. XX**, in those of Constantine, Valentinian, and Valens; **VOT. X. MULT. XX**, in those of Dioclesian, Constantine, Julian, Valentinian, Theodosius, Arcadius, Honorius; **VOTIS X. MULT. XX**, in those of Julian, Valentinian, Gratian; **VOT. X. SIC. XX**, in those of Valerius Constantius; **VOT. XII. FEL. XX**, in the younger Licinius; **VOT. XV. FEL. XX**, in Constantine. See **Vows**.

**VICINAGE**, and **VICINITUM**, a neighbourhood. See **VENUE**.

*Common per Cause de VICINAGE*. See **COMMON**.

**VICIS & Venellis Mundandis**, a writ lying against a mayor, bailiff, &c. for not taking care that the streets be well cleansed.

**VICISSITUDE**, **VICISSITUDO**, the succeeding of one thing after another.—As, the *vicissitude* of seasons, fortune, &c.

**VICOUNTIEL**. } See the article { **VISCOUNTIEL**.  
**VICONTIELS**. } { **VISCOUNTIELS**.

**VICOUNT**, **VICE-COMES**, in our law-books, signifies the same with *sheriff*; between which two words, there seems to be no other difference, but that the one came from our conquerors, the Normans; the other from our ancestors, the Saxons. See **SHERIFF**.

**VICOUNT**, or **VISCOUNT**, is also used for a degree of nobility, next below a count or earl, and above a baron. See **NOBILITY**.

Camden observes, that this is an antient name of office, but a new one of dignity, never heard of among us till Henry VIth's days, who, in his 18th year, created, in parliament, John lord Beaumont, *viscount Beaumont*: but it is much more antient in other countries.

Du Cange, indeed, will have the dignity to have had its first rise in England; but it is much more probable, it was first brought over hither by the Normans.

The privileges of a *vicount*, are, that he may have a cover of assay held under his cup when he drinks, and may have a travers in his own house.—And a *vicountess* may have her gown bore up by a man, out of the presence of her superiors; and in their presence by a woman.

**VICOUNTIELS**, **VICONTIELS**, **VICCOMITALIA**, in our law-books, denotes things belonging to the sheriff; particularly certain farms, for which the sheriff pays a rent to the king, and makes what profit he can of them. See **SHERIFF**.

*Writs VICOUNTIEL*, are such as are triable in the county or sheriff's-court.—Of which kind are divers writs of nuisance, &c. See **WRIT**, &c.

**VICOUNTIEL**, or **VICONTIEL Jurisdiction**, is that jurisdiction belonging to the officers of a county; as sheriffs, coroners, escheators, &c.

**VICTIM**, **VICTIMA**, a bloody sacrifice offered to some deity, of a living thing; either a person, or a beast, which is slain to appease his wrath, or to obtain some favour. See **SACRIFICE** and **LUSTRATION**.

The Greeks offered Iphigenia, at Aulis, for a *victim* to obtain a favourable wind.—The gods of the heathens had each their proper *victims*: thus, the goat was Bacchus's *victim*; the horse Neptune's. See **GOD**, and **VICTIMARIUS**.

**VICTIMARIUS**, a minister, or servant of the priest, whose office was to bind the *victims*, and prepare the water, knife, cake, and other things, necessary for the sacrifice. See **SACRIFICE**.

To the *victimarii* it also belonged, to knock down, and kill the victims: in order to which, they stood close by the altar, naked to the waist, but crowned with laurel; and holding a hatchet or a knife up, asked the priest leave to strike; saying, *Agone? shall I strike? Whence they were called agones, and cultellarii, or cultrarii*.

When the *victim* was killed, they opened it, and after viewing the entrails, took them away, washed the carcase, sprinkled the flower on it, &c.

The same *victimarii* lighted the fire, wherein books were condemned to be burnt. See **Liv. 40. lib. 40. c. 29.** and **A. Gellius, lib. 1. c. 1. extr. 12.**

**VICTORIAN Period**, in chronology. See **PERIOD**.

**VICTORY**, **VICTORIA**, the overthrow, or defeat of an enemy, in war, combat, duel, or the like. See **WAR**, **COMBAT**, **DUEL**, **CHAMPION**, &c.

Among the Romans, crowns, triumphs, &c. were decreed to their generals, for the *victories* they gained. See **CROWN**, **TRIUMPH**, &c.

**VICTUALLING-Office**, an office kept on Tower-hill, for the furnishing his majesty's navy with *victuals*. See **OFFICE**. It is managed by seven commissioners, who have their inferior officers; as secretaries, clerks, &c. besides agents in divers parts of Great Britain, Ireland, &c. See **NAVY**.

**VICTUS Ratio**, among physicians, a particular manner of living for the preservation health, and prevention of diseases. See **DIET**, **REGIMEN**, &c.

**VIDAME\***, *Vice-Dominus*, was antiently used for the bishop's deputy in temporals; as *comes*, or *vice-comes*, was the king's. See **VICE-DOMINUS**, &c.

\* The word according to Nicod. comes from *vicarius*; according to Pasquier, from *vice-dominus*; *dum* signifying *dominus*, or lord. See **DOM**.

The original institution of *vidamos*, was for defence of the temporalities of bishopricks, while the bishops themselves were taken up in prayers, and other spiritual functions.—They also led the bishop's forces, when they were obliged to go to war, either to defend their temporalities, or for the arrier-ban.

They also managed, and pleaded their cause in courts of justice; distributed justice among their tenants, prevented any body's pillaging, or damaging the houses of deceased bishops, &c.—In effect, they represented the bishop, considered as a temporal lord. See **BISHOP**, **OFFENDER**, &c. In some antient charters, the *vidames* are called *advocates*, *advowees*. See **ADVOCATE**, and **ADVOWEE**.

**VIDAME** is still a title of seignory, or lordship: attributed to several gentlemen in France: as, the *vidame* of Chartres, of Amiens, &c.

The antient *vidames*, Pasquier says, were the bishops temporal judges; and had the same privileges as the vicounts.

By degrees, the *vidames* converted their office into a fee: and the bishops their *vidames*, or judges, into vassals, as kings did their counts, dukes, &c. See **COUNT**, **VASSAL**, &c.—Accordingly, the *vidame* of Chartres, &c. still hold lands of the bishops of those places.

**VIDIMUS**, in law, the same with *innoteimus*; being letters patent of a charter of feoffment, or some other instrument not of record.

**VIDUITATIS Professio**, the making a solemn profession of living a chaste widow; a custom heretofore observed in England, and attended with divers ceremonies. See **WIDOW**.

**VIE**. See the article **CESTUI qui vie**.

**VIEW\***, **VISUS**, in law, the act of *viewers*, or *viewers*. See **VEIOR**, and **VIEWER**.

\* This is called, by Bracton, *Res quasi sacra quia solam personam regis respicit, & introducta pro pace, & communi utilitate*.

When a real action is brought, and the tenant knows not well what the land is the demandant asks; he may pray the *view*: which is, that the jury may see the land which is claimed.

This course of proceeding we received from the Normans, as appears by the *Grand customary*.—It is used in various cases; as in assize of rent-service, rent-charge, rent-seck; in a writ of nuisance; in a writ quo jure; in the writ de rationabilibus divisis, &c.

**View of Franc-pledge**, **VISUS Franci Plegii**, is the office which the sheriff in his county-court, or the bailiff in his hundred, performs; in looking to the king's peace, and seeing that every man be in some pledge. See **FRANC-Pledge**.

**VIEW**, in matters of optics, perspective, &c. See **VISION**, **SIGHT**, **PERSPECTIVE**, &c.

**Point of VIEW**. See the article **POINT**.

**VIEW**, among hunters, the track, or print of the feet of a fallow deer on the ground. See **TRACK**, &c.

To **VIEW a place**, in the military art, is to ride about it, before the laying of a siege, in order to observe the strength or weakness of its situation, and fortification. See **RECONNOITRE**.

**VIEWERS**, or **VEIORS**, in law, are persons sent by a court, to *view* a place, or person in question; as the situation of a place where a fact was committed; or a person, in case of sickness, &c. See **VIEW**, and **VEIOR**.

**VIGIL**, or **EVE**, in church chronology, the day before any feast, &c. See **FEAST**, and **EVE**.

Though the civil day begin at midnight, yet the ecclesiastical, or scriptural day, begins at six o'clock in the evening, and holds till six in the evening the ensuing day. See **DAY**.

Hence, the collect for every Sunday and holy-day, by order of the church, is to be read, at the preceding evening-service; at six o'clock the day before; from which time the religious day was supposed to begin.

And this first part of the holy-day, from six o'clock the day before, was, by the primitive Christians, spent in hymns, and other devotions; and being often continued till late in the night, was called *vigil*. See **WAKE**.

These *vigils* came, by degrees, to be so enlarged, that, at last, all the day preceeding the holy-day was called by the name.

The

The origin of *vigils* is deduced by Forbes from a custom in the antient church, for the people, both men and women, to meet together in the evening before Easter-day, and watch and pray, as expecting the coming of our Lord, who was to rise early in the morning. This practice, Tertullian observes, *ad Uxorem*, afterwards got to other feasts and saints-days.— But abuses creeping in, they were forbid by a council, in 1322, and in lieu thereof fastings were instituted on the day before, tho' still called by the antient name of *vigils*.

**Coma VIGIL.** See the article COMA.

**VIGILIA**, that state of an animal which is opposite to sleep, and popularly called *waking*, or *watching*. See SLEEP, and WATCHING.

**VIGINTIVIRATE**, a dignity among the ancient Romans, established by Cæsar.

This dignity comprehended four others; for of the *vigintiviri*, or twenty men which composed the company, there were three who sat and judged of all criminal affairs; three others had the inspection of the coins, and coinage; four took care of the streets of Rome; and the rest were judges of civil affairs.

**VILL, VILLA.** See the article VILLAGE.

**VILLA Regis**, or *Regia*, a title antiently given to those *villages* where the kings of England had a royal seat, and held the manor in their own demesne: having there commonly a free chapel exempt from the bishop's jurisdiction.

**VILLÆ Præpositus.** See the article PRÆPOSITUS.

**VILLAGE\***, *VILLA*, or *VILL*, an assemblage of houses, inhabited chiefly by peasants and farmers, having usually a church, but no market.

\* The word is French, formed of *vil*, or *vilis*, low, mean, contemptible: or rather, from the Latin, *villa*, a country house, or farm.

The want of a market distinguishes a *village* from a *town*, as the church does from a *green*, *street*, &c. See TOWN, &c. Among our Saxon ancestors, *vill*, or *village*, was used in the sense of the Roman *villa*; viz. for a country farm, or seat, furnished with convenient out-houses, &c. for repositing the fruits thereof. Afterwards it came to be taken for a manor: then for part of a parish, or the parish itself. See PARISH.

Hence, in several antient law-books, *vill* and *parish* are the same thing: accordingly, Fortescue, *de Laudibus Leg. Ang.* writes, "That the boundaries of *villages* are not by houses, streets, or walls; but by a large circuit of ground, within which may be divers hamlets, waters, woods, &c."

Fleta makes this difference between a *mansion*, a *village*, and a *manor*; that a mansion may consist of one, or more houses; though there is only to be one dwelling-place, without any other very near it: for if other houses be contiguous, it is then a *village*.—A manor may consist of one or more *villages*. See MANSION, and MANOR.

For the better government of *villages*, the lord of the soil has usually a power to hold a court-baron every three weeks. See COURT-BARON.

**VILLAIN, VILLANUS**, in our antient customs, the same with *bond-man*: called also, in Domesday-book, *servus*, slave. See SERVANT, SLAVE, &c.

A *villain* was one who held lands in *villainage*, or on condition of rendering base services to his lord. See SERVICE, VASSAL, &c. There were antiently in England two sorts of *villains*, viz. *villains in gross*, who were bound immediately to the persons of the lords, and to their heirs.—and *villains regardant* to a manor, by the civilians called *glebæ adscripti*; who were bound to their lord, as members belonging to such a manor, of which he was owner. See REGARDANT.

This latter was a *pure villain*, of whom the lord took redemption to marry his daughter, and to make him free; and he might put him out of his lands and tenements at his will; might beat and chastise him, but not maim him.

They were called *villains* from *villa*; because they dwelt in *villages*: the same were also called *pagenfes*, and *rustici*; and of such servile condition were they, that they were usually sold with the farm to which they respectively belonged. See PAGAN. There are not properly any such *villains* now, though the law concerning them stands unrepealed.—The lands before held in *villainage*, are now held in free and common socage. See TENURE, SOCAGE, &c.

**VILLAIN Estate**, or condition, is contradistinguished to *free estate*. See BASE Estate, and VILLENAGE.

**VILLAINAGE.** See the article VILLENAGE.

**VILLAINOUS Judgment**, is that which casts the reproach and stain of *villany* and shame on him against whom it is given.—As that against a conspirator, &c. See JUDGMENT, and INFAMOUS.

Lambard calls it *villainous punishment*; and says, it may well be called *villainous*, in regard the judgment, in such case, shall be like the antient judgment in attainments, viz. that the criminals shall not be of any credit afterwards; nor shall it be lawful for them, in person, to approach the king's court: that their lands and goods shall be seized into the king's hands, their trees rooted up, their bodies imprisoned, &c.

**VILLARUM Nomina.** See the article NOMINA.

**VILLENAGE**, or **VILLAINAGE**, **VILLANIA**, the quality or condition of a *villain*. See VILLAIN.

*Villainage* is more particularly used for a servile kind of tenure of lands, or tenements; whereby the tenant was bound to do all such service as the lord commanded, or were fit for a *villain* to perform: which Bracton expresses, by *Sciri non poterit vespere, quale servitium fieri debet manè*. See VILLAIN, and SERVICE.

*Villainage* is divided into that by blood, and that by tenure.—Tenure, in *villainage*, could make no freeman a villain, unless it were continued time out of mind; nor could free land make a villain free. See TENURE.

*Villainage* is also divided by Bracton into *pure villainage*, where the services to be performed were indeterminate and arbitrary, as above expressed—and *socage villainage*, which was to carry the lord's dung into his fields, to plough his ground on certain days, sow and reap his corn, &c. and even to empty his jakes: as the inhabitants of Bickton were bound to do to the lord of Clun-castle in Shropshire; which was afterwards turned into a rent, now called *Bickton silver*; and the *villainous* service excused.

**VILLI**, *coarse hair*, in anatomy, is used in the same sense as *fibres*, or *fibrillæ*. See FIBRE.

**VILLI**, in botany, denotes a sort of tomentum, or down, like the grain or shag of plush; with which, as a kind of excrescence, some trees do abound. See TOMENTUM.

**VILLOUS**, **VILLOSA**, is particularly applied to one of the coats or membranes of the stomach, called *crusta villosa*.—See Tab. Anat. (Splanchn.) fig. 2. lit. b. see also STOMACH, &c. It takes its name from innumerable *villi*, or fine fibrillæ, wherewith its inner surface is covered. See CRUSTA Villosa.

**VINALIA**, in antiquity, a name common to two feasts among the antient Romans; the one in honour of Jupiter, and the other of Venus. See FEAST.

The first was held on the nineteenth of August, and the second on the first of May.—The *vinalia* of the nineteenth of August, were called *vinalia rustica*, and were instituted on occasion of the war of the Latins against Mezentius; in the course of which war, that people vowed a libation to Jupiter of all the wine of the succeeding vintage.

On the same day likewise fell the dedication of a temple of Venus; whence some authors have fallen into a mistake, that these *vinalia* were sacred to Venus.—But Varro, LLL. V. and Festus, in *Verbo Rustica*, distinguish between the two ceremonies; and expressly assert the *vinalia* to be a feast of Jupiter.

**VINCULUM**, in algebra, a character in form of a line, or stroke drawn over a factor, divisor, or dividend, when compounded of several letters, or quantities, to connect them, and shew that they are to be multiplied, or divided, &c. together, by the other term. See CHARACTER, MULTIPLICATION, DIVISION, &c.

Thus,  $d \times a + b = c$ , shews that *d* is to be multiplied into  $a + b = c$ .

**VINDEMIATING\***, the gathering of the grapes, or other ripe fruits; as apples, pears, cherries, &c.

\* The word is formed of the Latin, *vindemia*, vintage. See VINTAGE.

**VINDEMIATRIX**, or **VINDEMIATOR**, a fixed star of the third magnitude, in the northern wing of the constellation Virgo; whose longitude, latitude, &c. see among the rest of those of VIRGO.

**VINDICATION**, *Claiming*, in the civil law, an action arising from the property a person has in any thing: or a permission to take or seize a thing, as one's own, out of the hands of a person, whom the law has doomed not to be the true proprietor.

**VINE**, **VITIS**, a noble plant, or shrub, of the reptile kind; famous for its fruit, or grapes, and for the liquor they afford. See WINE.

The kinds of *vines* are almost infinite; denominated either from the soil, and place where they grow; as the *Bourguignon*, *Bourdelas*, *Italian*, *Mantua vine*, &c. or from the form, colour, taste, &c. of their grapes; as the *acorn*, *apricot*, *damask*, *birds-bill*, *muscadine*, &c. *vine*.

Our gardeners find, that *vines* are capable of being cultivated in England, so as to produce large quantities of grapes; and those ripened to such a degree, as may afford a good substantial vinous juice.—Witness the vineyards in Somersetshire; particularly that famous one at Bath.

In effect, it does not seem so much owing to the inclemency of our English air, that our grapes are generally inferior to those of France, as to the want of a just culture.

Those fitted for the English climate, Mr. Mortimer finds to be the small black grape, the white muscadine, parsley grape, muscadilla, white and red Frontigniac.—Mr. Bradley recommends the July grape, the early sweet water grape, lately brought from the Canaries; the arbois, or French sweet water grape: all which, if well managed, and the weather favourable, are ripe by the middle of August.—He also recommends the claret and Burgundy grapes.

The

The best soil for *vines*, according to Mortimer, is the hottest gravel, sand, or dry rocky ground; provided it be well watered and shaded.—At first planting, Mr. Bradley recommends chalky hills, as proper for *vines*.

To mend a soil that wants those qualities, it is good to throw in the rubbish of old buildings, well mixed with twice as much earth, and sifted about the roots of the *vines*. See **VINEYARD**. *Vines* are propagated either by layers, or cuttings; that is, either by laying down the young branches as soon as the fruit is gathered, or by making plantations of slips, or cuttings, at that time. See **PROPAGATION**.

Mr. Mortimer says, it may be done any time in the winter before January; though Bradley says, he has done it, with success, in March and April.

For the Pruning of **VINES**. } See the article { **PRUNING**.  
For the Planting of **VINES**. } { **VINEYARD**.

**VINEA**, or fortification. MANTELET.

**VINEGAR**\*, *Acetum*, an agreeable, acid, penetrating liquor, prepared from wine, cyder, beer, and other liquors; of considerable use, both as a medicine, and a sauce. See **ACETUM**.

\* The word is French, *vinaigre*; formed from *vin*, wine; and *aigre*, sour. See **WINE**.

Wine, and other vinous liquors are said to gain a grateful sharpness, *i. e.* to become *vinegar*, by having their salts exalted by insolation, or other means; and their sulphurs weakened and depressed.

Others ascribe the conversion of vinous liquors into *vinegar*, to the grinding or sharpening of the longitudinal particles thereof; by which means, they become more sharp and pungent.

The method of making *vinegar* has long been kept a secret among the people of that profession; who, it is said, oblige themselves to each other by oath not to reveal it: but, notwithstanding this, the *Philosophical Transactions*, and some other late writings, furnish us with approved accounts thereof.

*Method of making Cider VINEGAR*.—The cider (the meanest of which will serve the purpose) is first to be drawn off fine into another vessel, and a quantity of the must, or pouz of apples to be added: the whole is set in the sun, if there be a convenience for the purpose; and, at a week or nine days end, it may be drawn off. See **CIDER**.

*Method of making Beer VINEGAR*.—Take a middling sort of beer, indifferently well hopped; into which, when it has worked well, and is grown fine, put some rape, or husks of grapes, usually brought home for that purpose: mash them together in a tub; then, letting the rape settle, draw off the liquid part, put it into a cask, and set it in the sun as hot as may be; the bung being only covered with a tile, or slate-stone: and in about thirty or forty days, it will become a good *vinegar*, and may pass in use as well as that made of wine, if it be refined, and kept from musty.

Or thus:—To every gallon of spring water, add three pounds of Malaga raisins; which put into an earthen jar, and place them where they may have the hottest sun from May till Michaelmas: then pressing all well, tun the liquor up in a very strong iron-hooped vessel, to prevent its bursting: it will appear very thick and muddy, when newly pressed; but will refine in the vessel, and be as clear as wine.—Thus let it remain untouched for three months, before it be drawn off, and it will prove excellent *vinegar*.

*To make Wine VINEGAR*.—Any sort of vinous liquor, being mixed with its own faeces, flowers, or ferment, and its tartar first reduced to powder; or else with the acid and austere stalks of the vegetable from whence the wine was obtained, which hold a large proportion of tartar: and the whole being kept frequently stirring in a vessel which has formerly held *vinegar*, or set in a warm place full of the steams of the same, will begin to ferment a-new, conceive heat, grow sour by degrees, and soon after turn into *vinegar*.

The remote subjects of acetous fermentation, are the same with those of vinous; but the immediate subjects of it, are all kinds of vegetable juices, after they have once undergone that fermentation which reduces them to wine: for it is absolutely impossible to make *vinegar* of must, the crude juice of grapes, or other ripe fruits, without the previous assistance of vinous fermentation.

The proper ferments for this operation, whereby *vinegar* is prepared, are—1°. The faeces of all acid wines.—2°. The lees of *vinegar*.—3°. Pulverized tartar; especially that of rhenish wine, or the cream or crystals thereof.—4°. *Vinegar* itself.—5°. A wooden vessel, well drenched with *vinegar*, or one that has long been employed to contain it.—6°. Wine that has often been mixed with his own faeces.—7°. The twigs of vines, and the stalks of grapes, currants, cherries, or other vegetables of an acid austere taste.—8°. Bakers leaven, after it is turned acid.—9°. All manner of ferments, compounded of those already mentioned.

*Vinegar* is no production of nature, but a creature of art: for verjuice, the juices of citrons, lemons, and the like native acids, are improperly said to be *natural vinegars*; because, when distill'd, they afford nothing but vappid water: whereas it is not the property of *vinegar* to yield an acid spirit by distillation.

VOL. II. No. 160.

*Method of making VINEGAR in France*.—The French use a method of making *vinegar* different from that above described.

—They take two very large oaken vessels, the larger the better, open at the top; in each whereof they place a wooden grate, within a foot of the bottom: upon these grates, they first lay twigs, or cuttings of vines, and afterwards the stalks of the branches, without the grapes themselves, or their stones; till the whole pile reaches within a foot of the brim of the vessels: then they fill one of these vessels with wine to the very top, and half fill the other; and with liquor drawn out of the full vessel, fill up that which was only half full before; daily repeating the same operation, and pouring the liquor back from one vessel to the other; so that each of them is full, and half full by turns.

When this process has been continued for two or three days, a degree of heat will arise in the vessel, which is then but half full, and increase for several days successively, without any appearance of the like in the vessel which happens to be full during those days; the liquor whereof will still remain cool: and as soon as the heat ceases in the vessel that is half full, the *vinegar* is prepared: which, in the summer, happens on the fourteenth or fifteenth day from the beginning; but in the winter, the fermentation proceeds much slower: so that they are obliged to forward it by artificial warmth, or the use of stoves.

When the weather is exceeding hot, the liquor ought to be poured off from the full vessel into the other twice a day: otherwise, the liquor would be over-heated, and the fermentation prove too strong; whence the spirituous parts would fly away, and leave a vappid wine, instead of *vinegar*, behind.

The full vessel is always to be left open at the top, but the mouth of the other must be closed with a cover of wood; in order the better to keep down and fix the spirit in the body of the liquor; for otherwise, it might easily fly off in the heat of fermentation.—The vessel that is only half full seems to grow hot, rather than the other, because it contains a much greater quantity of the vine-twigs and stalks, than that, in proportion to the liquor; above which the pile rising to a considerable height, conceives heat the more, and so conveys it to the wine below.

**VINEGAR of Antimony**, is an acid spirit, drawn by distillation from the marcasite of antimony. See **ANTIMONY**.

Its use is commended in continued and malignant fevers.

The apothecaries have, likewise, a kind of theriacal *vinegar*, *acetum theriacale*, made of Venice treacle digested in wine *vinegar*. See **ACETUM**.

**VINEYARD**, **VINETUM**, a plantation of vines. See **VINE**.

The best situation of a *vineyard*, is on the declivity of an hill lying to the south. See **EXPOSURE**.

The vine is propagated by slips, layers, or suckers, planted in a nursery, and thence transplanted, about February, into the *vineyard*.

As to the soil, it is agreed, nothing can be too dry for them: and as to the sorts of vines, none but the forward ones ought to be planted in England.—These are found to ripen very well in open borders, without walls.

They are to be planted in lines running north and south, five or six foot apart; only two vines in each hole.—The September following, the shoots of that summer to be pruned shorter, according to their strength; and the summer following, the strongest will begin to shew a little fruit.—They are now to be supported with stakes, &c. so as they may run above a foot above ground: the higher they run, the less danger they are in of being spoiled with wet; but the lower, the sweeter grapes, and the stronger wine.

If, notwithstanding due pruning, they do not seem inclinable to bear large bunches, the ground to be helped with a mixture of rubbish of some old building, with sea-coal ashes, or drift sand.—Thus managed, a *vineyard*, in five or six years, will produce good store of grapes.

The celebrated *vineyard* at Bath, containing about six acres of ground, planted with white muscadine, and black cluster grapes, Mr. Bradley assures us, by such management, some years ago, yielded sixty hogsheds of wine at a vintage: though in the year 1721, it only yielded three hogsheds.

The same author mentions a little *vineyard* of a private person at Rotherhith; which, though only consisting of 100 vines, and some of them only of the second year's growth, yielded, at a vintage, 95 gallons of wine; which, he adds, had the true Burgundy flavour, as being made from that sort of grape: and exceeded any made from any *vineyard* on this side Paris. See **WINE**.

**VINOUS**, **VINOSUS**, something that relates to wine; or that has the taste, and smell thereof. See **WINE**.

All vegetables, by a due treatment, afford a *vinous* liquor; as corn, pulse, nuts, apples, grapes, &c. See **MALT**, **BREWING**, &c.

A second fermentation, duly managed, turns any *vinous* liquor into an acetous one. See **VINEGAR**.

The proper character, and effect of fermentation, is to produce

duce either a *vinous*, or an acetous quality in the body fermented. See FERMENTATION.

Some of our countrymen, bound on a voyage to the East Indies, having filled several casks with Thames-water, to carry along with them; observed an intestine motion in it, when they came to the equator; and found it afterwards turned into a kind of *vinous* liquor, capable of affording an inflammable spirit by distillation. See WATER, and SPIRIT. This, without dispute, proceeded from the flowers, leaves, roots, fruits, and other vegetable matters, continually falling, or washed down in that river.—Such waters were always found in a state of putrefaction, ere they put on a *vinous* nature. See PUTREFACTION.

VINTAGE, the crop of wine, or what is got from the vines each season. See WINE.

The word is also used for the time or season of gathering, or pressing the grapes.

In France, a decree or ordinance of the proper judge, and a solemn publication thereof, are required, ere the *vintage* can be begun.

VINUM, a liquor, or drink, popularly called *wine*. See WINE.

VINUM, in medicine, VINUM Medicatum, is particularly applied to several medicated wines, i. e. medicinal preparations, whereof wine is the basis; such as the

VINUM Absynthites, or worm-wood wine; made of the great or little *absynthium*, by taking the apices, or tops of the flowers, putting them in a sacculus, or bag, and suspending it in the middle of a vessel of wine; which fermenting, extracts the taste, smell, and virtues of the worm-wood. See ABSYNTHIUM.

VINUM Aromaticum, made by infusing aromatics, or spices, in new wine, or must.

VINUM Cydonites, quince-wine, made of the slices of that fruit, steeped in must, or new wine.

VINUM Emeticum, emetic wine; is wine wherein the glass, or regulus of antimony, or crocus metallorum, have been steeped. See EMETIC.

It only takes a certain degree of efficacy from the matters; nor is it found any stronger at three months end, than at the end of eight days.—It purges both upwards, and downwards.

VINUM Hippocraticum, or *hippocras*; so called of *manica Hippocratis*, or Hippocrates's sleeve, through which it is strained; is a sort of spiced wine, in which sugar and spices have been steeped for some time. See HIPPOCRAS, CLARET, &c.

VINUM Marinum, sea-wine; made by casting sea-water on the grapes in the vat.

VINUM Picatum, pitched wine; made of pitch infused in must.

VINUM Rosatum, rose-wine; made by steeping roses for three months in wine.

VINUM, called also *acetum*, *scilliticum*. See SCILLA.

VINUM Strobilites, or pine-apple wine:—*Vinum hyssopites*, hyssop-wine.

VIOL, VIOLA, a musical instrument, of the same form with the *violin*; and struck, like that, with a bow. See VIOLIN. There are *viols* of divers kinds.—The first, and principal, among us, is the *bass-viol*, called, by the Italians, *viola di gamba*, or the *leg-viol*; because held between the legs. It is the largest of all; and is mounted with six strings. Its neck is divided in half notes, by seven frets fixed thereon. Its sound is very deep, soft, and agreeable.—The tablature, or music for the *bass-viol*, is laid down on six lines, or rules.

What the Italians call *alto viola*, is the counter-tenor of this; and their *tenore viola*, the tenor. They sometimes call it, simply, the *viol*: some authors will have it the *lyra*, others the *cithara*, others the *chelys*, and others the *testudo* of the ancients. See LYRA, &c.

2°. The *love-viol*, *viola d'amore*, which is a kind of triple *viol*, or violin; having six brass or steel strings, like those of the harpsicord.—It yields a kind of silver sound, which has something in it very agreeable.

3°. A large *viol*, with 44 strings, called, by the Italians, *viola di bardone*; but little known among us.

4°. *Viola bastarda*, or *bastard viol*, of the Italians; not used among us: Brossard takes it to be a kind of *bass-viol*, mounted with 6 or 7 strings, and tuned as the common one.

5°. What the Italians call *viola di braccio arm-viol*; or, simply, *braccio*, *arm*; is an instrument answering to our counter-tenor, treble, and fifth violin.

6°. Their *viola prima*, or *first viol*, is really our countertenor violin; at least, they commonly use the cliff of *c sol ut* on the first line, to denote the piece intended for this instrument.

7°. *Viola secunda*, is much the same with our tenor violin; having the cliff of *c sol ut* on the second line.

8°. *Viola terza*, is nearly our fifth violin; the cliff *c sol ut* on the third line.

9°. *Viola quarta*, or fourth *viol*, is not known in England, or France: though we frequently find it mentioned in the Italian compositions, the cliff on the fourth line.

Lastly, their *violetta*, or little *viol*; is, in reality, our triple *viol*: though strangers frequently confound the term, with what we have said of the *viola prima*, *secunda*, *terza*, &c.

VIOL, is also a term used among mariners, when a hawser, or strand-rope is bound fast with nippers to the cable, and brought to the jeer-captain, for the better weighing of the anchor, where the main capstan proves insufficient. See ANCHOR, CABLE, CAPSTAN, &c.

VIOLATION, the act of *violating*, i. e. forcing a woman, or committing a rape upon her. See RAPE.

Amnon, David's son, *violated* his sister, who was avenged by Absalom: Tereus *violated* his sister-in-law Philomela.—To *violate* the queen, the king's eldest daughter, or the princess of Wales, is high treason. See TREASON.

VIOLATION, is also used, in a moral sense, for a breach, or infringement of a law, ordinance, or the like. See TRANSGRESSION.

Thus, we say, a *violation* of the law of nature, of a treaty of peace, of one's oath, &c.—The law of nations was *violated* in the insult offered to Mr. S—— the king's ambassador at Madrid.

VIOLATION, is also used for a profanation.—In which sense, we say to *violate* a church, &c. See PROFANATION.

VIOLENT, in the schools, a thing done by force.—In which sense it stands opposed to *spontaneous*. See SPONTANEOUS.

A thing is said to be *violent*, when effected by some external principle; the body that undergoes it contributing nothing thereto, but struggling against it.

The body, in such case, is said to *struggle*, by reason whatever is *violent*, discomposes and distracts a thing from its natural constitution, and tends to destroy it.

The schoolmen all allow, that man, as being endued with reason, is capable of suffering such *violence*; but brute and inanimate bodies are not: *in brutum*, &c. *violentum non cadit*.

VIOLENT Motion. See the article MOTION.

VIOLIN, VIOLINO, *Fiddle*, a musical instrument, mounted with four strings, or guts; and struck, or played with a bow.

The *violin* consists, like most other instruments, of three parts; the *neck*, the *table*, and the *soundboard*.

At the sides are two apertures, and sometimes a third towards the top, shaped like a heart.

Its bridge, which is below the apertures, bears up the strings, which are fastened to the two extremes of the instrument; at one of them, by a screw, which stretches, or loosens them at pleasure.

The style and sound of the *violin*, is the gayest and most sprightly of all other instruments; and hence it is, of all other, the fittest for dancing. Yet there are ways of touching it, which render it grave, soft, languishing, and fit for church, or chamber music.

It generally makes the treble, or highest parts in consorts.—Its harmony is from fifth to fifth. Its play is composed of bass, counter-tenor, tenor, and treble; to which may be added, a fifth part: each part has four fifths, which rise to a greater seventeenth.

In compositions of music, *violin* is expressed by V: two VV denote two *violins*.

The word *violin* alone, stands for *treble violin*: when the Italians prefix *alto*, *tenore*, or *basso*, it then expresses the counter-tenor, tenor, or bass-*violin*.

In compositions, where there are two, three, or more different *violins*, they make use of *primo*, *secundo*, *terzo*, or of the characters I° II° III°, or 1° 2° 3°, &c. to denote the difference.

The *violin* has only four strings, each of a different thickness, the smallest whereof makes the *e si mi* of the highest octave of the organ; the second, a fifth below the first, makes the *a mi la*; the third, a fifth below the second, is *d la re*; lastly, the fourth, a fifth below the third, is *g re sol*. Most nations, ordinarily, use the cliff *g re sol* on the second line, to denote the music for the *violin*; only in France, they use the same cliff as the first line at bottom: the first method is best, where the song goes very low, the second, where it goes very high.

The VIOLONCELLO of the Italians, is properly our fifth *violin*, which is a little bass *violin*, half the size of the common bass *violin*, and its strings just half as thick, and half as long; which renders the sound just an octave lower than the same.

Their VIOLONE is a double bass, almost twice as big as the common bass *violin*, and the strings bigger and longer, in proportion; and consequently, its sound an octave lower than that of our bass *violin*: which has a noble effect in great concertos. See VIOL.

VIPER, VIPERA, in natural history, a kind of serpent, famed not only for the exceeding venomousness of its bite, which is one of the most dangerous poisons in the animal kingdom, but also for the great usefulness of its flesh in medicine: whence vipers come to make a considerable article in divers arts. See POISON.

This remarkable reptile, has the biggest and flattest head of all the serpent-kind. Its usual length is about half an ell; and its thickness an inch: its snout is not unlike that of a hog. It has sixteen small immoveable teeth in each jaw; besides, two other large, sharp, hooked, hollow, transparent, canine

canine teeth, situate at each side of the upper jaw, which are those that do the mischief: these are flexible in their articulation; and are ordinarily laid flat along the jaw, the animal never raising them but when it would bite.

The roots or bases of these teeth, or fangs, are encompassed with a vesicle, or bladder, containing the quantity of a large drop of a yellow insipid salivous juice.

It has only one row of teeth; whereas all other serpents have two: its body is not at all fetid; whereas the inner parts of the bodies of other serpents are intolerable.—It creeps very slowly, and never leaps like other serpents; though it is nimble enough to bite, when provoked.

Its body is of two colours, ash-coloured, or yellow, and the ground speckled with longish brown spots.—The scales under its belly, are of the colour of well polished steel.

The male has two sets of genital instruments, and the female two matrixes, &c. She brings forth her young living; whereas other serpents lay eggs, and hatch them: on which account, the *viper* is ranked among the viviparous animals. See VIVIPAROUS.

Her young ones come forth wrapped up in thin skins, which break on the third day, and set the animal at liberty.—She brings forth to the number of 20 young; but only one each day. The ancients, particularly Pliny, Galen, &c. believed that the young killed their mother in the delivery; but this is not the only mistake they were guilty of on the subject of the *viper*.—They held, that it eat cantharides, scorpions, &c. which rendered its poison so very dangerous.

Dr. Mead observes, that the ancients esteemed the *viper* sacred; and that the kings of the East Indies caused cottages to be built for their entertainment, and their killers to be punished with death.—On medals, the *viper* is frequently represented as a symbol of divine power; and as such, given by way of tribute to the ancient physicians.

As to the manner wherein the *viper* conveys its poison, authors are a little disagreed.—Francisco Redi, and Moïse Charras, have each of them wrote very curious pieces on the subject, but their result is very different.

Redi maintains, that all the venom of the *viper*, is contained in the two vesiculæ, or bags, which cover the base of the two canine teeth; whence, upon biting, the yellowish liquor is squeezed out into the wound: where, mixing with the blood, and other juices, it produces those dreadful symptoms.

This hypothesis he maintains, by a good number of experiments; as of animals, viz. cocks, &c. being bit with *vipers*, after these vesiculæ and their juice had been taken out; without any signs of poison, or any ill consequence at all.

Charras, on the other hand, maintains, that this yellow liquor is not poisonous; that he has given it to pigeons, as food, without their being at all disordered thereby; that the *viper's* bite he has always found mortal to animals, even after the bag has been taken clear out, as well as before: and lastly, that the poison must lie in the irritated spirits of the *viper*, which it exhales in the ardor of its biting; and which are so cold, that they curdle the blood, and stop the circulation.

The controversy between these two ingenious authors, is very extraordinary: their systems are opposite; yet both maintained by a great number of well attested experiments.—The public, however, generally give into the sentiment of Sig. Redi; as answering best to the mechanism of the parts.

Dr. Mead supposes it the true one, in his essay on the poison of the *viper*; and adds to Redi's account, that the poison in the *viper's* bag is separated from the blood, by a conglomerate gland, lying in the lateral anterior part of the os incipitis, behind the orbit of the eye; from which gland is a duct, that conveys the poison to the bags at the teeth.—The teeth, he adds, are tubulated for the conveyance and emission of the poison into the wound; but their hollowness does not reach to the apex, or tip of the tooth, but ends in a long slit below the point, out of which the poison is emitted.

These slits, or perforations of the teeth, Galen says, the mountebanks, of his days, used to stop with some kind of paste; after which, they would publicly expose themselves to be bitten, without danger.

**Effects of the bite of the VIPER**—The symptoms following the bite of a *viper*, are an acute pain in the place wounded; swelling, first red, afterwards livid, spreading by degrees; great faintness; a quick, low, and sometimes interrupted pulse; sickness at the stomach; bilious convulsive vomiting; cold sweats; sometimes pains about the navel; and death itself, if the strength of the patient, or slightness of the bite, do not overcome it.

If he do overcome it, the swelling continues inflamed for some time; and the symptoms abating, from the wound runs a sanious liquor, little pustules are raised about it, and the colour of the skin is as if the patient were icterical.

By the microscope, the virus has been found to consist of minute salts in continual motion; after which a number of spicula, or darts appeared, resembling, but much finer, a spider's web.—This, when mixed with syr. violar. inclined to red, no ways to green; so that the juice is not alkalious: But

Mr. Boyle, and Dr. Pitcairn, prove the blood to be only an alkaly.

Such a small quantity of the virus, seems to have so great an effect by wounding the fibres, and altering the cohesion of the globules of blood, which, by the elastic matter thereof proves a nimble vehicle, to carry the viperine spicula almost every where suddenly.—These will stimulate and fret the sensible membranes; whereupon, a more than usual afflux of the animal juices may be carried to the parts.

The cure seems very unsettled: Mr. Boyle found a hot iron held near the place successful; but it proved otherwise with M. Charras.—Again, the snake-stone from the East Indies, immediately applied to the place, is much commended: but signior Redi, and M. Charras, found it of no use; yet Baglivi, and Dr. Havers, give instances of its good success.

Dr. Mead adds, that the same stone directly applied to a pigeon, when bitten, saved its life four hours; whereas, most of the other pigeons bitten died in half an hour.

This stone is not natural, but factitious; its virtue lies in its porosity, which is supposed to imbibe the virus.

The *viper*-catchers, Dr. Mead adds, have a specific, in which they can so far confide, as not to be afraid of being bitten.

—That specific is, the axungia of the *viper* presently rubbed into the wound; which consisting of clammy, viscid, penetrating, and active parts, sheaths the salts of the virus.

The same author, applying it to the nostrils of a dog bitten, found it well the next day: when this is not timely applied, and the virus has insinuated into the blood, the *ful viper*, is excellent, given and repeated till sweats be produced.—This succeeded well with M. Charras; and Dr. Mead relates, that it recovered one, after the virus had induced an universal icterus.

*Vipers* make a considerable article in medicine.—Most authors agree, that there is no part, humour, or excrement, not even the gall itself, of a *viper*, but may be swallowed without much harm.—Accordingly, the ancients, and, as several authors assure us, the Indians at this day, both of the east and west, eat them as we do eels.

*Caro viperina*, *viper's* flesh, either roasted, or boiled, the physicians unanimously prescribe as an excellent restorative; particularly in the elephantiasis, incurable consumptions, leprosy, &c. and Dr. Mead thinks, they might be less sparing in the quantity than they are; instead of a little *viper's* flesh, he recommends the broth, or jelly of *vipers*; or, as the ancients did, to boil and eat them as fish, or at least, to drink vinum viperinum, i. e. wine wherein they have been long infused.

*Viper's* flesh is an ingredient in several of our best antidotes; as the theriaca andromach. &c. See THERIACA.

The apothecaries also sell the pulvis viperinus, which is only dried *vipers* pulverized, heart, liver, and all, and passed through a sieve.—This, to heighten the price we suppose, they call *animal bezoard*. See BEZOARD.

The *salts of vipers*, whether volatile, or fixed, also their fat, or axungia, and their oil, chymically drawn, are drugs in good repute.

VIPER-WINE. See the article WINE.

VIRAGO\*, a woman of extraordinary stature; and who, with the female sex, has the mien and air of a man, and performs the actions and exercises of men. See AMAZON.

\* The word is pure Latin, formed from *vir* man; and seldom used, but in the way of diversion.

Such were Semiramis, and Penthesilea, among the ancients, and Jeanne la Pucelle, commonly called *the maid of Orleans*, among the moderns.

In the vulgate version of the Bible, Eve is called *virago*, because made of the rib of the man.—The Latin translator, by this, aimed to preserve the etymology which is in the Hebrew, and of *vir*, formed *virago*; as Adam, in the Hebrew text, called Eve *Ischa*, of *isch*, man.

VIRGA. See the article YARD.

VIRGA\*, is particularly used in law for a *verge*, or *rod*, such as sheriffs and bailiffs carry a badge of their office. See VERGE.

\* — *Ranf. ap Howel, præpositus de Lantiffin americiatus pro eo quod habuit in manu sua coram justiciariis hic virgam nigram & inbonestam, ubi habere debuisset virgam albam & bonistam certæ longitudinis, prout decet.* In fess. Itin. de Cardiff. 7 Hen. VI. See VERGERS.

VIRGÆ, in physiology, a meteor, called also *columellæ*, and *funes tentorii*; being an assemblage of several streams of light, representing a bundle of rods, or ropes. See METEOR.

It is supposed owing to the streaming of the sun beams through certain simulæ, or chinks: at least, through the more lax and open parts of a watery cloud; happening chiefly in the morning and evening.

There is also another kind, consisting not of streams of mere white light, but, as it were, painted of various colours; like those of the rainbow. See RAINBOW.

VIRGATA Terra, or VIRGA terra, a yard-land. See YARD-LAND.

VIRGATORES Servientes, in Fleta, are vergers, or tipstaves, who attend the judges. See VERGER, and SERJEANT at Arms.

VIRGIN,

**VIRGIN, VIRGO**, a female who has had no carnal commerce with man; or, more properly, who has still the *flos virginis*, or maiden-hood. See **VIRGINITY**.

In the Roman Breviary, there is a particular office for *virgins* departed, answering to those for saints, martyrs, and confessors. See **OFFICE**.

Critics and antiquaries are much divided about a feast held in that church in honour of S. Ursula, and her companions; who are said in the Ritual, Legend, &c. to have been eleven thousand *virgins*.

Some imagine there has been a mistake in reading the ancient rituals, wherein XI. M. V. which was only an abbreviation of *eleven virgin martyrs*, was read according to the numeral letters, *eleven thousand virgins*.—F. Sirmond conjectures, that in the ancient lists of martyrs, there was found S. S. Ursula, and Undecimilla V. M. and that in lieu of Undecimilla, which is the name of a *virgin martyr*, the copists had made *undecimilla*, which is eleven thousand.

By the Mosaic law, the priests are enjoined to take none to wife but those that are *virgins*; the widow, the divorced, and the harlot are to be refrained from.

**VIRGIN** is also applied, by way of eminence, to Mary the mother of our Saviour; as conceiving, and bringing him forth without any breach of her chastity. See **CONCEPTION**, **ANNUNCIATION**, &c.

The fathers, many of them, with the modern churches, hold that the *virgin* not only conceived, but brought forth, or was delivered, without breach of her virginity; otherwise, says S. Augustin, it would be false which is said in the creed, that he was born of a *virgin*.—'Tis even defined, that she still remained a *virgin* to the end of her life: whence the Greeks always call her *αειπαρθενος*, *ever virgin Mary*; and after them the Latins, *semper virgo*. Though, as this is not recorded in holy writ, many have denied it, and held, that she had afterwards to do with Joseph, and bore other children; and this as early as the time of Origen. Tertullian himself is produced as one that denied the perpetual *virginity*: and the like may be said of Apollinaris and Eunomius, with their followers.

These impugnors of the perpetual *virginity* increased afterwards to a great number, and are called by Epiphanius, *Antidicomarianitæ*; and were condemned under that name by the sixth general council. The same were also called by the Latins *Helvediani*, from Helvedius a disciple of Auxentius, whose name was made use of as having been refuted by S. Jerom. He was followed by Jovinian, a monk of Milan, as Jerom testifies; though S. Augustin speaks otherwise, viz. that he held, that the *virgin* lost her virginity in bringing forth: And Bonofus, a bishop in Macedonia, was condemned for the same position.

This error was founded on the same subtle interpretations of scripture: as, because S. Matthew says, that Joseph knew not Mary (ως) 'till she had brought forth her first-born: from hence they infer, that he knew her afterwards: so because he was called her first-born, they argue, that she must have had a second.—But the Jewish law determines what is meant by first-born, and affixes it to the aperture of the womb: *primogenitum omne quod aperit vulvam*, Luke ii. 22, 23.—But they add, that mention is made of the mother and brethren of Jesus; John ii. 12. and Matth. xii. 46. But this the ancient fathers, especially of the Greek church, explain, after Origen, of some children of Joseph by a former wife, of which some make six; the eldest of which was James, the brother of our Lord: But in reality there seems no necessity of supposing, from these texts, that Joseph had any other offspring; because the language of the Jews included in the name of brethren, not only the strict relation of fraternity, but also the larger of consanguinity. See **BROTHERS**.

But the Helvedians further argue, that the scriptures not only call them the brothers of Christ, but declare them to be the sons of Mary: for that the Jews, Matth. xiii. 35. say, "Is not his mother called Mary, and his brethren James, and Joses, and Simon, and Judas?"—To this bishop Pearson answers, that Mary the mother of James and Joses was a different person from Mary the *virgin*; which he shews, by comparing the accounts of John xix. 25. Matth. xxvii. 5, 6. and Mark xv. 40. where this Mary the mother of James, and the sister of Mary the *virgin*, is represented as the wife of Cleophas. Nestorius and his adherents maintained, that the *virgin* could not, with any propriety, be called the *mother of God*; as being really no more than the *hostess of God*: for that the eternal Word could not be conceived, and born of the womb of a *virgin*. See **NESTORIANS**.

This heresy was condemned at the council of Ephesus; yet it has been lately revived in Holland, chiefly by a refugee monk, one Renoult.

*Charity of the holy VIRGIN.* } See **CHARITY**.

*Presentation of the VIRGIN.* } See **PRESENTATION**.

**VIRGIN** is also applied, figuratively, to several things that retain their absolute purity, and have never been made use of.—Thus,

**VIRGIN-WAX**, is that which has never been wrought, but remains as it came out of the hive. See **WAX**.

**VIRGIN Oil**, is what oozes spontaneously from the olive, &c. without pressing. See **OIL**.

**VIRGIN Gold**, is that metal such as it is got out of the oar, without any mixture or alloy; in which state it is sometimes so soft, that it will take the impression of a seal. See **GOLD**.

**VIRGIN Copper**, is a native copper found in the mine, and which has never been melted down. See **COPPER**.

**VIRGIN Quicksilver**, is that found perfectly formed, and fluid, in the veins of mines; or, at least, is got from the mineral earth, by mere lotion, without fire. See **MERCURY**.

**VIRGIN Parchment**, is that made of the skin of an abortive lamb, or calf. See **PARCHMENT**, and **VELOM**.

**VIRGIN Sulphur.** } See the article **SULPHUR**.

**VIRGIN's Milk.** } See **LAC Virginalis**.

**VIRGIN's Thread**, a sort of meteor that flies in the air, like small untwisted silk; and which falling upon the ground, or upon plants, changes itself in a form like a spider's web. See **METEOR**.

In these northern climates, it is most frequent in summer; the days being then temperately warm, the earth not exceeding dry, nor yet over-charged with moisture.

This has formerly passed for a sort of dew, of an earthy, slimy nature: but naturalists are now agreed, that the *virgin's threads* are no other than so many spiders webs. See **WEB**.

**VIRGINALE Claustum**, in anatomy, the same as *hymen*. See **HYMEN**.

**VIRGINEUS Morbus**, the *virgin's disease*; the green-sickness, or chlorosis. See **CHLOROSIS**.

**VIRGINIS Spica.** See the article **SPICA**.

**VIRGINITY, VIRGINITAS**, the test or criterion of a *virgin*; or that which entitles her to the denomination. See **VIRGIN**.

In the first ages of the Christian church, *virginity* grew into great honour and esteem; inasmuch, that the women were admitted to make solemn vows thereof in public.—Yet was it held infamous among the Jews, for a woman to die a maid. The vestals, among the ancients, and the nuns or religious, among the moderns, found guilty of a breach of the vow of *virginity*, are allotted a severe punishment; the first to be buried alive, the latter to be immured. See **VESTAL**, &c. The physicians, both ancient and modern, are exceedingly divided upon the subject of *virginity*: some holding that there are no certain marks, or testimonies thereof, and others that there are. Solomon says expressly, there are four things too wonderful for him to know: "The way of an eagle in the air; of a serpent on the rock; of a ship in the midst of the sea; and "the way of a man in a maid;" which our translators have rendered, less justly, *the way of a man with a maid*.

Yet Moses established a test, which was to be conclusive among the Jews.—The nuptial sheets, it seems, were to be viewed by the relations on both sides; and the maid's parents were to preserve them as a token of her *virginity*; to be produced, in case her husband should ever reproach her on that score.

In case the token of *virginity* was not found thereon, she was to be stoned to death at her father's door.

This test of *virginity* has occasioned abundance of speculation about the parts concerned; but the nicest inquiries cannot settle any thing certain about them.—Dr. Drake says expressly, that, whatever might be expected among the Jews, there is not the same reason to expect those tokens of *virginity* in these countries: for besides, that the Hebrews married extremely young, as is the custom in all the eastern countries, there are several circumstances which may here frustrate such expectations, even in virgins not vitiated either by any male contact, or any wantonness of their own.

In effect, in these northern climates, the inclemency of the air exposes the sex to such checks of perspiration, as gives a great turn to the course of the humours, and drives so much humidity through the parts, as may extraordinarily supple and relax those membranes from which the resistance is expected; and from which, in hotter countries, it might more reasonably be depended on.

What most commonly passes among us for a test of *virginity*, is the hymen: and yet the most curious among the anatomists are greatly divided not only about the figure, substance, place, and perforations of this famous membrane, but even about the existence thereof; some positively affirming, and others as flatly denying it. See **HYMEN**.

As nice a point as that of *virginity* is among anatomists, the midwives and matrons treat it with less diffidence.—In the statutes of the sworn matrons, or midwives, of Paris, containing likewise divers formula's of reports, and depositions made in court, upon their being called to visit girls that made their complaint of being deflowered, they lay down fourteen marks whereon to form a judgment.

Laur. Joubert, a famous physician of Montpellier, has transcribed three of these reports: one made to the provost of Paris, another in Languedoc; and a third in Bearn.—These reports are very consistent with each other; and contain fourteen marks of *virginity*, expressed in their proper terms; such as were received among the women of that profession, and authorized in court.

M. Joubert

M. Joubert does not explain those terms; nor do we find any explanation of them any where, but in another report of the 23d of October 1672, inserted in the *Picture of Love of Vennette*, a physician of Rochel; a copy of which, we shall here give in English.

We, Mary Miran, Christophlette Reine, and Jeanne Porte Pouillet, sworn matrons of the city of Paris, certify to all those whom it may concern, that on the 22d of October, in this present year, at the appointment of Monsieur the provost of Paris, we went into the street de Pompierre, to a house next the sign of the silver key, to view and visit Olive Tiffierand, of the age of 30 years; on a complaint made by her in court against James Mudont, citizen of Roche sur Mer, for forcing and violating her the said Olive: and having viewed and examined the whole with the eye, and finger, we find, *Les touts devoyez*, that is, the breasts loose and flaccid, *mammæ marcidæ & flaccidæ*: *Les barres froissées*, i. e. the os pubis bruised, *os pubis collisum*: *Le lippion recoquillé*, i. e. the hair curled up, *pubes in orbem sinuata*: *L'entrepet ridé*, i. e. the perinæum or seam wrinkled, *perinæum corrugatum*: *Le pouvant debiffé*, i. e. the vulva, or pudendum, tumbled and disordered, *vulva dissoluta & marcescens*: *Les baluniaux pendants*, i. e. the labia hanging down, *labia pendentia*: *Le lippendis pilé*, i. e. the edge of the labia bared of hair, *labiorum ora pilis defectæ*: *Les baboles abbatues*, i. e. the nymphæ beat down, *nymphæ depressæ*: *Les balerons demis*, i. e. the caruncles undone, or opened *carunculae dissolutæ*: *L'entrecheat retourné*, i. e. the membranes which connect the caruncles inverted, *membrana connectens inversa*: *Le barbidau ecotché*, i. e. the clitoris excoriated, *clitoris excoriata*: *Le guilboquet fendu*, i. e. the neck of the womb torn, *collum uteri dilaceratum*: *Le guilbard elargi*, i. e. the vagina stretched, or widened, *vagina dilatata*: *La dame du milieu retirée*, i. e. the hymen broke and gone, *hymen deductum*: *L'arriere fosse ouverte*, i. e. the inner orifice of the womb opened, *os internum matricis apertum*. — *Le tout veu & visité feuillet par feuillet nous avons trouvé qu'il y avoit trace de* — The whole viewed and examined part by part, we find plainly the track or foot-step of — *Omnibus sigillatim perspectis & perscrutatis*, &c. — Accordingly we, the said matrons, do certify it to be true, to you, Monsieur le provost, on the oath we have taken. — Done at Paris the 23d of October, 1672.

In Peru, and several other provinces of South-America, we are assured by Pedro de Cieca, in the history of the Yncas, &c. that the men never marry, but on condition that the next relation, or friend of the maid's, shall undertake to enjoy her before him, and take away her virginity. — And our countryman Lawson relates the like of some of the Indian nations of Carolina. — So little is the *flos virginis*, prized so much among us, valued by them.

**VIRGO**, in astronomy, one of the signs, or constellations of the zodiac, into which the sun enters in the beginning of August. See **SIGN**, and **CONSTELLATION**.

The stars in the constellation *Virgo*, in Ptolemy's catalogue, are 32; in Tycho's, 39; in the Britannic, 89. — The longitudes, latitudes, magnitudes, &c. whereof, are as follows:

Names and Situations of the Stars.	Longitude.			Latitude.			Magnit.
	°	'	"	°	'	"	
That preced. <i>Virgo's</i> head	17	30	05	5	19	13	N 6

**VIRGULA Divina**, or *baculus divinatorius*, a forked branch in form of a Y, cut off a hazle-tree; by means whereof people have pretended to discover mines, springs, &c. under ground. See **MINE**, &c.

The method of using it is this: the person who bears it walking very slowly over the places where he suspects mines or springs may be, the effluvia exhaling from the metals, or vapour from the water, impregnating the wood, makes it dip, or incline; which is the sign of a discovery.

We find no mention made of this *virgula* in any author before the eleventh century: but from that time it has been in frequent use; divers fine names have been invented for it, some calling it *caduceus*, others *Aaron's rod*, &c.

Some dispute the matter of fact, and deny it to be possible; others, convinced with the great number of experiments alleged in its behalf, look out for the natural causes thereof.

— The corpuscles, say these authors, rising from the springs, or minerals, entering the rod, determine it to bow down, in order to render it parallel to the vertical lines which the effluvia describe in their rise.

In effect, the mineral, or watery particles are supposed to be emitted by means of the subterraneous heat, or of the fermentations in the entrails thereof: now the *virgula* being of a light, porous wood, gives an easy passage to those particles, which, withal, are very fine and subtle; the effluvia then driven for-

wards by those that follow them, and oppressed at the same time by the atmosphere incumbent on them, are forced to enter the little interstices between the fibres of the wood, and by that effort oblige it to incline or dip down perpendicularly, to become parallel with the little columns which those vapours form in their rise.

**VIRGULA**, in grammar, a term which Latin, French, and some other authors use for a point in writing, usually called by us *comma*. See **COMMA**.

*Virgula's*, F. Simon observes, as an invention of the modern grammarians, to give the greater clearness to discourse.—The use thereof was unknown to the ancient Greeks and Romans, who wrote all without taking off the pen, so that their books lie all together without any distinction of points, and *virgula's*. See **POINTING**.

**VIRGULTUM**, in our ancient law-books, is used for an holt, or plantation of twigs, or ozers. See **WICKER**. Sometimes, also, for a coppice of young wood.—*Et præterea concedo virgultum meum & totam communiam domini mei*. Mon. Angl.

In another place of the same work *virgultum*, or rather *virgulta*, may be taken for *virgata*, viz.—*Dedit prædictæ ecclesiæ unam virgultam terræ in manerio de Crumpton*. See **YARD-Land**.

**VIRIDARIO** *Eligendo*, a writ that lies for the choice of a verdor in the forest. See **VERDEROR**.

**VIRIDE** *æris*, the same as *æruugo*, or *verdegrease*. See **VERDEGREASE**.

**VIRILE**, something that belongs, or is peculiar to man, or the male sex.

Thus *virile* member, *membrum virile*, is frequently used for the penis. See **PENIS**.

**VIRILE** *Age*, *Ætas virilis*, is the strength and vigour of a man's age, viz. from thirty to forty-five years, which is an age wherein we are equally removed from the extremes of youth and old age. See **AGE**.

The civil lawyers only make one age of youth and *virility*; and yet their different temperatures seem to require a distinction; for which reason, some compare youth to summer, and *virility* to autumn. See **PUBERTY**.

At Rome, the youth quitted the *prætexta* at fourteen or fifteen years of age, and took the *virile* gown, *toga virilis*, to shew, it seems, that they then entered on a serious age. See **PRÆTEXTA**, and **TOGA**.

M. Dacier will have it, that children did not take the *prætexta* till thirteen years of age, nor quit it for the *toga virilis*, till seventeen.

**VIRILIA**, a man's genitals, or privy members; including the penis, and testes. See **PENIS**, **TESTICLE**, **GENERATION**. &c.

The cutting off the *virilia*, according to Bracton, was felony by common law; and that, whether the party were consenting or not\*. See **EUNUCH**, and **CASTRATION**.

\* — *Henricus Hall & A. uxor ejus capti & detenti in prisona de Exilcheester, eo quod recitati fuerunt quod ipsi absciderunt virilia Johannis Monachi, quem idem Henricus deprehendit cum prædicta A. uxore ejus.* Rot. Claus. 13 Hen. III.

**VIRTSUNGIANUS**\* *Ductus*, or *Ductus VIRTUNGII*, in anatomy, a canal, more usually called *ductus pancreaticus*. See **PANCREATIC**.

\* It took its name *virtungianus*, from the inventor, *Virtungius*, professor at Padua.

**VIRTUAL**, *Potential*, something that has a power, or virtue of acting, or doing. See **VIRTUALLY**.

The term is chiefly understood, of something that acts by a secret invisible cause; in opposition to *actual*, and *sensible*. See **POTENTIAL**.

**VIRTUAL** *Focus*, in optics, is a point from which rays, before converging, begin to diverge, or divaricate. See **FOCUS**.

Hence it is also called, *point of dispersion*, or *divergency*; in opposition to the *focus*, which is called the *point of concurrence*. See **POINT**, **DISPERSION**, **DIVERGENT**, &c.

Suppose, e. gr. the concavity of a glass to be *abc* (*Tab. Optics*, fig. 11.) and its axis *de*; let *fg* be a ray of light falling on the glass parallel to the axis *de*, and let *d* be the centre of the arch *abc*.

This ray *fg*, after it has passed the glass, at its emersion at *g*, will not proceed directly to *b*, but be refracted from the perpendicular *dg*, and become the ray *gk*.

Draw then directly *gk*, so that it may cross the axis in *e*. — The point *e* so found, Mr. Molyneux calls the *virtual focus*, or *point of divergence*. Diopt. Nov.

**VIRTUALITY**, **VIRTUALITAS**, in the schools, denotes some mode or analogy in an object, which, in reality, is the same with some other mode, but out of regard to contradictory predicates, is considered as if distinct therefrom.

Thus the divine nature, and the person of the Word, are two *virtualities*; for though, in reality, they be the same, yet are they considered as things different.—For the person of the Word is said to have been begotten, and his nature is said not to be begotten; now begotten, and not begotten, are contradictory predicates.

And hence arise what we call *virtual distinctions*, whereby one *virtuality* is distinguished from another, not one thing from another.

Thus it is, the divine nature is distinguished from the divine person, and the divine understanding from the divine will. See **TRINITY**.

**VIRTUALLY**, **VIRTUALITER**, in the schools, is applied to a mode of existence.—A thing is said to be *virtually* any where, when it is deemed to be there by some *virtue*, influence, or other effect produced by it.—Thus the sun is *virtually* on earth, i. e. by his light, heat, &c.

A thing is also said to be *virtually* present, when the virtues, or properties belonging to it, and issuing from it, remain.—In which sense, the forms of the elements are held to be *virtually* in mixed bodies. See **PRESENCE**.

A thing is also said to be a cause *virtually*, or a *virtual cause*, and that two ways: the first, when there is no real distinction between it, and the effect attributed to it; and yet it is conceived by us, as if it were really the cause thereof.—Thus, immutability in God, is the cause of eternity.

Secondly, when an effect is not of the same kind with the cause, and yet the cause has the power or *virtue* of producing the effect: thus the sun is not formally, but *virtually* hot; and fire is not contained formally, but *virtually* in heat. See **CAUSE**, **EFFECT**, &c.

**VIRTUE**, **VIRTUS**, a term used in various significations.

In the general, it denotes *power*, or *perfection* of any thing, whether natural, or supernatural, animate, or inanimate, essential, or accessory.—Hence the *virtues*, that is, powers of God, angels, men, plants, elements, &c. See **POWER**, and **FACULTY**.

**VIRTUE**, in its more proper and restrained sense, signifies a habit, which improves and perfects the haver, or possessor, and his actions. See **HABIT**, **PERFECTION**, &c.

In this sense, *virtue* is a principle of acting, or doing well and readily; and that, either infused from above, such as are the *theological virtues*; or acquired by our own application, as the *intellectual*, and *moral virtues*.

For as there are two things in man, from which all his actions proceed, viz. the understanding, and the will; so the *virtue*, by which he is perfected, or whereby he is disposed to do all things rightly, and to live happily, must be twofold: the one, of the understanding; the other, of the will. That which improves the understanding is called *intellectual*, or *dianoetic*; and that, the will, *moral*, or *ethic*—For, since there are two things required in order to live aright, viz. to know what should be done; and, when known, readily to perform it: and since man is apt to err various ways in each respect, unless regulated by discipline, &c. he alone can deport himself rightly in his whole course of life, whose understanding and will have attained their utmost perfection.

**Intellectual VIRTUE**, then, according to Aristotle, is a habit of the reasonable soul, whereby it conceives, or speaks the truth; either in affirming, or denying. See **TRUTH**.

The *virtues* which come under this class, are divided into *speculative*; which are those conversant about necessary things, that can only be known, or contemplated; and *practical*, which are conversant about contingent things, that may likewise be practised.

Aristotle has another division of *intellectual virtue*, fetched from the subject; as some of them are seated in the *speculative*, or *contemplative part*, viz. those conversant about necessary things, as *science*, *wisdom*, *intelligence*. See **SCIENCE**, **UNDERSTANDING**, &c.

And others, in the *practical*, or *practical part*; such as those conversant about contingent things, as *prudence*, *art*, &c. See **ART**, &c.

**Moral VIRTUE**, is defined by Aristotle, to be an elective habit, placed in a mediocrity, determined by reason, and as a prudent man would determine.

The Scotists maintain every moral habit to be indifferent, as to good or evil, and capable of becoming, successively, either *virtue* or *vice*: *virtue*, if it have a relation of conformity with right reason; and *vice*, if it have not. See **VICE**.

According to them, therefore, *virtue* is a habit subjectively, but not entitatively, good: as it is only a relation of conformity, &c. which is separable from the entity of the habit. The Thomists, on the contrary, assert *virtue* to be a habit essentially good; nor capable of ministering any thing to any act positively bad.—And they philosophize thus: every habit essentially good, inclines to acts, like those whereby it was acquired; thus, by doing justly, we become just; and, by abstaining from forbidden pleasures, we become temperate. But *moral virtue* is produced, or acquired by acts essentially good; good, we mean, both in respect of our duty, and of the motive and end: therefore *moral virtue* inclines only to good acts.

Others disallow the peripatetic notion of *virtue*, as placed in a habit: for a habit, or habituality, say they, includes two things; a custom, and facility; the first as a cause, and the second as an effect: so that a habit is nothing but a facility acquired by custom.—They therefore who make *virtue* a habit of doing well, must, of necessity, ascribe it to a frequent

quent exercise of good actions.— But this cannot be; for the *virtue* must be before the good actions; and the habit, after them.— Indeed, whence should the actions proceed, but from *virtue*? *Virtue* therefore is before the good actions, and certainly before a habit, resulting from a frequency of good actions. Hence, they define *virtue* to be a firm purpose, or resolution of doing whatever right reason demands to be done.— For though a custom of doing well be required, to make a person esteemed good among men; yet it does not follow, that that custom or habit is the formal cause of that denomination, or the goodness itself.

Moralists usually distinguish four *principal*, or, as they are vulgarly called, *cardinal virtues*, viz. *prudence*, *justice*, *fortitude*, and *temperance*: the reason of which division is founded in this, that for a man to live *virtuously* and honestly, it is necessary he know what is fit to be done; which is the business of *prudence*. That he have a constant and firm will to do what he judges best; which will perfect the man, either as it restrains too violent perturbations, the office of *temperance*.—

Or, as it spurs and urges on those that are too slow and languid, which is the business of *fortitude*.

Or, lastly, comparatively, and with regard to human society; which is the object of *justice*.

To these four all the other *virtues* are referred, either as parts, or as concomitants.

**VIRTUES**, in the celestial hierarchy, the third rank, or choir of angels; being that in order between *dominations*, and *powers*. See **HIERARCHY**.

To these is attributed the power of working miracles, and of strengthening and reinforcing the inferior angels in the exercise of their functions. See **ANGEL**.

**VIRTUOSO**, an Italian term, lately introduced into English; signifying a man of curiosity and learning; or one who loves and promotes the arts and sciences.

In Italy, *virtuosi* are properly such as apply themselves to the polite arts of painting, sculpture, turning, mathematics, music, &c.— A person who makes profession thereof, is called *virtuoso*, *questo è un virtuoso*.

Among us, the term seems appropriated to those who apply themselves to some curious and quaint, rather than immediately useful art or study: as antiquaries, collectors of rarities of any kind, microscopical observers, &c.

**VIRULENT**, a term applied to any thing that yields a *virus*; that is, a contagious, or malignant pus. See **PUS**.

The *gonorrhœa virulenta*, is what we popularly call a *clap*. See **GNORRHÆA**.

**VIS**, a Latin word, signifying *force*, or *power*; adopted by physical writers, to express divers kinds of natural powers, or faculties. See **POWER**, and **FACULTY**.

**Vis Inertia**, or *powers of inactivity*, is defined by Sir Isaac Newton, to be a power implanted in all matter, whereby it resists any change endeavoured to be made in its state, i. e. whereby it becomes difficult to alter its state, either of rest, or motion. See **INERTIA**.

This power, then, coincides with the *vis resistendi*, power of resisting, whereby every body endeavours, as much as it can, to persevere in its own state, whether of rest, or uniform rectilinear motion: which power is still proportional to the body, and only differs from the *vis inertia* of the mass, in the manner of conceiving it.

Bodies only exert this power, in changes brought on their state by some *vis impressa*, force impressed on them.— And the exercise of this power, is, in different respects, both resistance, and impetus: resistance, as the body opposes a force, impressed on it to change its state; and impetus, as the same body endeavours to change the state of the resisting obstacle. *Phil. Nat. Princ. Math. Lib. I.*— See **REACTION**.

The *vis inertia*, the same great author elsewhere observes, is a passive principle, by which bodies persist in their motion or rest; receive motion, in proportion to the force impressing it, and resist as much as they are resisted. See **MOTION**.

For the effect of the *Vis Inertia*, in resisting and retarding the motion of Bodies, &c. see **RESISTANCE**, and **RETARDATION**.

**Vis Impressa**, is defined by Sir Isaac Newton, to be the action exercised on any body, to change its state, either of resisting, or moving uniformly in a right line.

This force consists altogether in the action; and has no place in the body after the action is ceased.— For the body perseveres in every new state, by the *vis inertia* alone.

This *vis impressa* may arise from divers causes, as from the percussion, pressure, and centripetal force. See **PERCUSSION**, &c.

<b>Vis Centripeta.</b>	} See {	<b>CENTRIPETAL Force.</b>
<b>Vis Centrifuga.</b>		<b>CENTRIFUGAL Force.</b>
<b>Vis Motrix.</b>		<b>MOTION.</b>
<b>Vis Stimulans.</b>		<b>STIMULATING.</b>

**VISCERA**\*, in anatomy, a term of equal import with *entrails*; including the heart, liver, lungs, spleen, intestines, and other inward parts of the body. See *Tab. Anat. (Splanch.) P. 3.* see also the articles **BODY**, **HEART**, **LIVER**, &c.

\* The term is pure Latin, being formed of *vesci*, to feed; by reason, eatables, called in Latin *vesca*, undergo divers preparations in the *viscera*. See **DIGESTION**, &c.

The word is also frequently used singularly, *viscus*, to express some particular part of the entrails; by reason the word *entrails* has no singular.

**VISCIDITY**, or **VISCOSITY**, the quality of something that is *viscid*, or *viscous*, i. e. glutinous, or sticky; like birdlime, which the Latins call by the name *viscus*. See **BIRDLIME**. *Viscid bodies*, are those which consist of parts so implicated within each other, that they resist, a long time, a complete separation, and rather give way to the violence done them, by stretching or extending each way. See **PARTICLE**, and **COHESION**.

The too great *viscosity* of foods has very ill effects: thus, meals, or farinæ not fermented, gellies, &c. of animals, tough cheese, or curd too much pressed, produce a weight or oppression in the stomach; winds, yawnings, crudities, obstructions of the minuter vessels in the intestines, &c. Hence, an inactivity of the intestines themselves, a swelling of the abdomen; and, hence, a *viscosity* of the blood, from the reunion of the *viscid* particles; obstructions of the glands; paleness, coldness, tremors, &c.

**VISCOUNT**. See the article **VICOUNT**.

**VISCUS**, and **VISCOSITY**. See **VISCERA**, and **VISCIDITY**.

**VISCUS**; or **VISCUM**, in natural history, &c. See **MISSILE TOE**.

**VISIBLE**, **VISIBILE**, something that is an object of sight, or vision; or something whereby the eye is affected, so as to produce a sensation. See **VISION**.

The school philosophers made two kinds of *visibles*, or *visible* objects: the one *proper*, or *adequate*; which are such as are no other way perceivable, but by sight alone: the other *common*; which are subject to divers senses, as the sight, hearing, feeling, &c.

Again, the first, or *proper object of vision*, is of two kinds, viz. *light*, and *colour*, for these two are only sensible by sight.— The first, and primary, viz. *light*, they make the formal, and *colour*, the material object. See **OBJECT**.

The Cartesians think they philosophize better, when they say, that light, alone, is the proper object of vision; whether it flow from a luminous body through a transparent medium, and retain its first name, *light*; or whether it be reflected from opaque bodies, under a certain new modification, or habitude, and exhibit their images; or, lastly, whether in being reflected, it is likewise refracted, after this, or that manner, and affects the eye with the appearance of *colour*.

But, agreeably to Sir Isaac Newton's sentiments, colour alone is the proper object of sight: colour being that property of light, whereby the light itself is *visible*; and whereby the images of opaque objects are painted on the retina. See **LIGHT** and **COLOUR**.

Aristotle, *De Anima*, Lib. II. enumerates five kinds of common *visibles*, which are usually received for such in the schools, viz. *motion*, *rest*, *number*, *figure*, and *magnitude*.— Others maintain nine, as in the verses;

*Sunt objecta novem visus communia: quantum,  
Inde figura, locus, sequitur distantia, situs,  
Continuumque & discretum, motusque, quiesque.*

Authors reason very variously as to these common objects of vision: there are two principal opinions among the schoolmen.— The adherents to the first, hold, that the common *visibles* produce proper representations of themselves, by some peculiar species or image, whereby they are formerly perceived, independently of the proper *visibles*.

But the second opinion prevails most, which imports, that the common *visibles* have not any such formal peculiar species to become *visible* by; but that the proper objects are sufficient to shew themselves in this or that place, or situation, and in this or that distance, figure, magnitude, &c. by the circumstances of their conveyance to the sensory.

In effect, since these common *visibles* cannot be represented alone, (for who ever saw place, distance, figure, situation, &c. of itself) but are always conveyed along with the images of light and colour to the organ; what necessity is there to conceive any such proper images, whereby the common *visibles* should be formally perceived by the soul? It is much more probable, that from the peculiar manner, wherein the sensitive faculty perceives a proper object, it is apprized of its being in this or that situation, or place; in this or that figure, magnitude, &c.— How this is affected, may be conceived from what follows.

I. The situation and place of *visible* objects, are perceived without any intentional species thereof, merely by the impulse being made from a certain place, and relation, either above, or below, on the right, or left, before, or behind; whereby the rays of the proper *visibles* are thrown upon the retina, and their impression conveyed to the sensory.

For since an object is seen by those rays which carry its image to the retina, and in that place to which the visive power is directed by the rays it receives: as it perceives the impulse of the rays to come from any place, &c. it is abundantly admonished of the object's being in that place, and situation. See **PLACE**. From this principal, several remarkable phenomena of vision are accountable for; as,

1°. That

10. That if the distance between two *visible* objects be an angle that is insensible, the distant bodies will appear as if contiguous: whence, a continuous body being the result of several contiguous ones; if the distances between several *visibles* subtend insensible angles, they will appear one continuous body: which gives a pretty illustration of the notion of a continuum. See CONTINUITY.

20. If the eye be placed above a horizontal plane, objects, the more remote they are, the higher they will appear, till the last be seen in a level with the eye.— Whence it is, that the sea, to persons standing ashore, seems to rise higher and higher the further they look.

30. If any number of objects be placed below the eye, the most remote will appear the highest; if they be above the eye, the most remote will appear the lowest.

40. The upper parts of high objects appear to stoop, or incline forwards; as the fronts of churches, towers, &c.— And statues atop of buildings, to appear upright, must recline, or bend backwards. See further under the articles REFRACTION, HORIZON, &c.

II. The mind perceives the distance of *visible* objects, from the different configurations of the eye, and the manner wherein the rays strike the eye, and the image is impressed thereon.

For the eye disposes itself differently, according to the different distances it is to see, viz. for remote objects the pupil is dilated, and the crystalline brought nearer the retina, and the whole eye made more globous: on the contrary, for near objects, the pupil is contracted, the crystalline thrust forwards, and the eye lengthened. See PUPIL, CRYSTALLINE, &c.

The distance, again, is adjudged of by the angle the object makes, from distinct or confused representation of the object, and the briskness or feebleness, the rarity or spissitude of the rays.

To this it is owing, 10. That objects which appear obscure or confused, are judged to be more remote: a principle which the painters use, to make some of their figures appear farther distant than others on the same plane. See PERSPECTIVE, &c.

To this it is likewise owing, that rooms whose walls are whitened, appear the smaller: that fields covered with snow, or white flowers, show less than when covered with grass: that mountains covered with snow, in the night-time, appear the nearer: that opaque bodies appear the more remote in twilight. See DISTANCE.

III. The magnitude or quantity of *visible* objects, is known chiefly by the angle comprehended between two rays drawn from the two extremes of the object, to the centre of the eye. See OPTIC ANGLE.

An object appears so big as is the angle it subtends: or bodies seen under a greater angle appear greater; and those under a less, &c.— Hence, the same thing appears now bigger, and now less, as it is less or more distant from the eye.— This we call *apparent magnitude*. See MAGNITUDE.

Now, to judge of the real magnitude of an object, we consider the distance: for since a near and a remote object may appear under equal angles, the distance must necessarily be estimated; that if it be great, and the optic angle small, the remote object may be judged great, and vice versa.

The magnitude of *visible* objects, is brought under certain laws, demonstrated by the mathematicians; as,

10. That the apparent magnitudes of a remote object, are as the distances reciprocally.

20. That the co-tangent of half the apparent magnitudes of the same objects, are as the distances: hence, the apparent magnitude and distance being given, we have a method of determining the true magnitude: the canon is this, As the whole sine is to the tangent of half the apparent magnitude, so is the given distance to half the real magnitude.— The same canon, inverted, will, from the distance and magnitude given, determine the apparent one.

30. Objects, seen under the same angle, have their magnitudes proportional to their distances.

40. The subtense AB (Tab. Optics, fig. 51.) of any arch of a circle, appears of equal magnitude in all the points DCEG, though one point be vastly nearer than another; and the diameter DG, appears of the same magnitude in all the points of the periphery of the circle.— Hence we take a pretty hint for the most commodious form of theatres.

50. If the eye be fixed in A, (fig. 52.) and the right line BC be moved in such manner, as that the extremes thereof always fall on the periphery; it will always appear of the same magnitude.— Hence, the eye being placed in any angle of a regular polygon, the sides will appear equal.

60. If the magnitude of an object directly opposite to the eye, be equal to its distance from the eye, the whole object will be taken in by the eye, but nothing more.— Whence, the nearer you approach an object, the less part you see of it. See FLAME.

IV. The figure of *visible* objects is estimated chiefly from our opinion of the situation of the several parts thereof.

This opinion of the situation, &c. enables the mind to apprehend an external object under this or that figure, more justly than any similitude of the images in the retina with the object can; the images being frequently elliptical, oblong, &c. when the objects they exhibit to the mind are circles, squares, &c.

The laws of vision, with regard to the figures of *visible* objects, are,

10. That if the centre of the pupil be exactly against, or in the direction of a right line, the line will appear as one point.

20. If the eye be placed in the direction of a surface, so that only one line of the perimeter can radiate on it, it will appear as a line.

30. If a body be opposed directly towards the eye, so as only one plane of the surface can radiate on it, it will appear as a surface.

40. A remote arch, viewed by an eye in the same plane, will appear as a right line.

50. A sphere, viewed at a distance, appears a circle.

60. Angular figures, at a distance, appear round.

70. If the eye look obliquely on the centre of a regular figure, or a circle, the true figure will not be seen; but the circle will appear oval, &c. See FIGURE.

V. The Number of *visible* objects is perceived, not only by one or more images formed in the fund of the eye; but also by such a position of those parts of the brain, whence the optic nerves spring, as the mind has been used to, in attending to a certain place, and that either single, or manifold.

Accordingly when either of the eyes, with the contiguous part of the brain, are forced out of their just parallelism with the other, v. gr. by pressing it with the finger, &c. all things appear double: but when they are in the requisite parallelism, though their be two images in the fund of the two eyes, yet the object will appear single.— Again, one thing may appear double, or even manifold, not only with both eyes, but even with only one of them open: by reason, the common concurrence of the cones of rays, reflected from the object to the eye, either falls short of the retina, or goes much beyond it. See SEEING.

VI. Motion and rest are seen, when the images of objects represented in the eye, and propagated to the brain, are either moved, or at rest: and the mind perceives these images either moving or at rest, by comparing the moved image to another, with respect to which it changes place; or, by the situation of the eye to the object being continually changed.

So that motion is only perceived, by perceiving the images to be in different places and situations: nor are these changes perceived, unless affected in time. So that to perceive motion, a sensible time is required.— But rest is perceived by the visual faculty, from the perception of the image in the same place of the retina, and the same situation for some sensible time.

Hence the reason, why bodies moving exceedingly fast appear at rest: thus, a live coal, swung briskly round, appears a continued circle of fire; the motion not being commensurate with *visible* time, but much swifter than the same: so that in the time the soul requires to judge of any change of situation of the image on the retina, or that it is moved from this place to that, the thing itself performs its whole circuit, and is in its former place again.

Laws of vision with regard to the motion of *visibles*, are—

10. That if two objects, unequally distant from the eye, move from it with equal velocity; the more remote one will appear the slower: or, if their celerities be proportionable to their distances, they will appear to move equally swift.

20. If two objects, unequally distant from the eye, move with unequal velocities in the same direction, their apparent velocities are in a ratio compounded of the direct ratio's of their true velocities, and the reciprocal one of their distances from the eye.

30. A *visible* object, moving with any velocity, appears to be at rest, if the space described in the interval of one second be imperceptible at the distance of the eye.— Hence it is, that a near object, moving very slowly, as the index of a clock, or a remote one very swiftly, as a planet, seem at rest.

40. An object, moving with any degree of velocity, will appear to rest, if the space it runs over in a second of time be to its distance from the eye, as 1 to 1400: nay, in fact, if it be as 1 to 1300.

50. The eye proceeding straight, from one place to another, a lateral object, either on the right or left, will seem to move the contrary way.

60. If the eye and the object move both the same way, only the eye much swifter than the object, that last will appear to go backwards.

70. If two or more objects move with the same velocity, and a third remain at rest, the moveables will appear fixed, and the quiescent in motion the contrary way.— Thus, clouds moving very swiftly, their parts seems to preserve their situation, and the moon to move the contrary way.

If the eye be moved with a great velocity, lateral objects, at rest appear to move the contrary way.— Thus, to a person, sitting in a coach, and riding briskly through a wood, the trees seem to retire the contrary way; and to people in the ship, &c. the shores seem to recede.

VISIBLE Horizon.	} See the article {	HORIZON.
VISIBLE Place.		PLACE.
VISIBLE Species.		SPECIES.

VISIER, or VIZIER, an officer or dignitary in the Ottoman

man empire; whereof there are two kinds: the first called, by the Turks *visier azem*, that is, *grand visier*; first created in 1370, by Amurath I. in order to ease himself of the chief and weightier affairs of the government.

The *grand* or *prime visier*, is the prime minister of state of the whole empire.—He commands the army in chief, and presides at the divan, or great council.—Renegado Christians, have been sometimes raised to the *visierate*: such were Khairadain, surnamed *Barharoffa*, Ulug Ali, Cuproli, &c.

Next to the *grand visier*, are six other subordinate *visiers*, called *visiers of the bench*, who officiate as his counsellors, or assessors, in the divan.

**VISION, VISIO**, the act of seeing, or of perceiving external objects by the organ of sight. See **SEEING**, and **SIGHT**. *Vision* is well defined to be a sensation, whereby, from a certain motion of the optic nerve, made in the bottom of the eye by the rays of light emitted or reflected from objects, and hence conveyed to the common sensory in the brain, the mind perceives the luminous object, its quantity, quality, figure, &c. See **VISIBLE**.

The phenomena of *vision*, the causes thereof, and the manner wherein it is effected, make one of the greatest and most important articles in the whole system of natural knowledge.

—Indeed, a great part of the physical, mathematical, and anatomical discoveries and improvements of the moderns terminate here; and only tend to set the business of *vision* in a clearer light.

Hitherto refer what Sir Isaac Newton and others have discovered of the nature of light, and colours; the laws of inflexion, reflexion, and refraction of the rays; the structure of the eye, particularly the retina, and optic nerves, &c.

It is not necessary we should here give a minute detail of the process of *vision* from its first principles: the greatest part is already delivered under the respective articles.—The eye, the organ of *vision*, we have described under the article **EYE**; and its several parts, tunics, humours, &c. under their proper heads, **CORNEA**, **CRYSTALLINE**, &c.

The immediate and principal organ of *vision*, viz. the retina, according to some, and the choroides, according to others, are distinctly considered: as also, the structure of the optic nerve, which conveys the impression to the brain; and the texture and disposition of the brain itself, which receives them, and represents them to the soul. See **RETINA**, **CHOROIDES**, **OPTIC NERVE**, **BRAIN**, **SENSORY**, &c.

Again, the nature of light, which is the medium, or vehicle, whereby objects are carried to the eye, is laid down at large under the articles **LIGHT**, and **COLOURS**; and the chief properties thereof concerned in *vision*, under **REFLEXION**, **REFRACTION**, &c. and many of its circumstances under **RAY**, **MEDIUM**, &c.—What remains for this article, therefore, is only to give a general idea of the whole process; in which all the several parts are concerned.

**Different Opinions, or Systems of VISION.**—The Platonists and Stoics held *vision* to be effected by the emission of rays out of the eyes; conceiving, that there was a sort of light thus darted out, which, with the light of the external air, taking, as it were, hold of the objects, rendered them visible; and thus returning back again to the eye, altered and new modified by the contact of the object, made an impression on the pupil, which gave the sensation of the object.

The reasons whereby they maintain their opinion, are fetched, 1°. From the brightness and lustre of the eye: 2°. From our seeing a remote cloud, without seeing one which we are encompassed withal; (the rays being supposed too brisk and penetrating to be stopped by the near cloud, but growing languid at a greater distance, are returned to the eye:) 3°. From our not seeing an object laid on the pupil: 4°. From the eye's being weary with seeing, i. e. by emitting great quantities of rays: and lastly, From animals which see in the night; as cats, lions, moles, owls, and some men.

The Epicureans held *vision* to be performed by the emanation of corporeal species, or images from objects; or, a sort of atomical effluvia, continually flying off from the intimate parts of objects to the eye.

Their chief reasons are, 1°. That the object must necessarily be united to the visive faculty; and since it is not united by itself, it must be so by some species that represents it, and that is continually flowing from bodies: 2°. That it frequently happens, that old men see remote objects better than near ones; the distance making the species thinner, and more commensurate to the debility of their organ.

The Peripatetics hold, with Epicurus, that vision is performed by the reception of species; but differ from him in the circumstances: for they will have the species (which they call *intentionales*) to be incorporeal.

It is true, Aristotle's doctrine of *vision*, delivered in his chapter *de Aspectu*, amounts to no more than this; That objects must move some intermediate body, that by this they may move the organ of sight.—To which he adds, in another place, that when we perceive bodies, it is their species, not their matter, that we receive; as a seal makes an impression on wax, without the wax's retaining any thing of the seal.

VOL. II. No. 161.

But this vague and obscure account, the Peripatetics have thought fit to improve.—Accordingly, what their master called *species*, the disciples understanding of real proper species, assert, That every visible object expresses a perfect image of itself, in the air contiguous to it; and this image another, somewhat less, in the next air; and the third another, &c. till the last image arrives at the crystalline, which they hold for the chief organ of sight, or that which immediately moves the soul.—These images they called *intentional species*. See **SPECIES**.

The modern philosophers, as the Cartesians and Newtonians, give a better account of *vision*.—They all agree, that it is performed by rays of light reflected from the several points of objects, received in at the pupil, refracted and collected in their passage through the coats and humours, to the retina; and thus striking, or making an impression on so many points thereof: which impression is conveyed, by the correspondent capillaments of the optic nerve, to the brain, &c.

As for the Peripatetic series, or chain of images, it is a mere chimera; and Aristotle's meaning is better understood without, than with them.—In effect, setting these aside, the Aristotelian, Cartesian, and Newtonian doctrine of *vision* are very consistent: for Sir Isaac Newton imagines, that *vision* is performed chiefly by the vibrations of a fine medium, which penetrates all bodies, excited in the bottom of the eye by the rays of light; and propagated through the capillaments of the optic nerves, to the sensorium.—And Des Cartes maintains, That the sun pressing the materia subtilis, wherewith the world is filled every way, the vibrations or pulses of that matter reflected from objects, are communicated to the eye, and thence to the sensory: so that the action or vibration of a medium, is equally supposed in all. See **MEDIUM**.

**Modern Theory of VISION.**—In order to *vision*, we are certain, it is required that the rays of light be thrown from the visible objects to the eye.—What befalls them in the eye, will be conceived from what follows.

Suppose, e. gr. Z the eye, and A B C the object, (*Tab. Optics, fig. 53.*) Now, though every point of an object be a radiant point, that is, though there be rays reflected from every point of the object to every point of the circumambient space, each carrying with it its respective colour, (which we falsely imagine to be those of the object;) yet, as only those rays which pass through the pupil of the eye affect the sense, we shall here consider none else.

And, again, though there be a great number of rays passing from one radiant point, as B, through the pupil, yet we shall only consider the action of a few of them; as B D, B E, B F.

Now then, the ray B D, falling perpendicularly on the surface E D F, will pass out of the air into the aqueous humour, without any refraction, and proceed right to H; where, falling perpendicularly on the surface of the crystalline humour, it will go on, without any refraction, to M; where, again, falling perpendicularly on the surface of the vitreous humour, it will proceed straight to the point O, in the fund or bottom of the eye. Again, the ray B E, passing obliquely out of the air upon the surface of the watery humour E D F, will be refracted, and approach towards the perpendicular E P: thus, proceeding to the point G, in the surface of the crystalline, it will be there refracted still nearer to the perpendicular.—So also E G, falling obliquely out of air into a harder body, will be refracted towards the perpendicular G R; and falling on the point L of the surface of the vitreous humour, it will still be brought nearer to M.

Lastly, G L, falling obliquely out of a denser, upon the surface of a rarer body L M N, will be refracted, and recede from the perpendicular L T; in receding from which, it is evident it approaches towards the ray B D O, and may be so refracted, as to meet the other in O.—In like manner, the ray B F, being refracted in B, will turn to I, and thence to N, and thence to the others in O.—But the rays between B E and B F, being somewhat less refracted, will not meet precisely in the same point O.

Thus will the radiant point B affect the fund of the eye, in the same manner as if the pupil had had no breadth, or as if the radiant itself had only emitted one single ray, such as were equal in power to all those between B E, and B F.

In like manner, the rays proceeding from the point A, will be so refracted in passing through the humours of the eye, as to meet near the point X; and the rays from any intermediate point between A and B, will nearly meet in some other point in the fund of the eye, between X and O.

Upon the whole, it may be asserted universally, that every point of an object, affects only one point in the fund of the eye; and, on the contrary, that every point in the fund of the eye, only receives rays from one point of the object.—Though this is not to be understood in the utmost rigour. See **RADIANT**.

Now if the object recede from the eye, in such manner, as that the radiant point B, does not decline from the line B D; the rays which would proceed from B, not enough divaricated, would be so refracted in passing the three surfaces, as that they would meet ere they reached the point O: on the contrary,

if the object should be brought nearer the eye, the rays passing from the point B to the pupil, too much divaricated, would be refracted so, as not to meet till beyond the point O. Nay, the object may be so near, that the rays proceeding from any point may be so divaricated, as that they shall never meet at all.— In all which cases, there would be no point of the object, but would move a pretty large portion of the fund of the eye; and thus the action of each point would be confounded with that of the contiguous one.

And this would commonly be the case, but that nature has provided against it; either by contriving the eye, so as its bulb may be lengthened, or shortened, as objects may be more or less distant; or, as others will have it, so as that the crystalline may be made more convex, or more flat; or, according to others, so as that the distance between the crystalline and the retina may be lengthened or shortened.

The first expedient is the most probable; on the footing of which, when we direct our eyes to an object so remote, as that it cannot be distinctly viewed by the eye in its accustomed figure, the eye is drawn back into a flatter figure, by the contraction of four muscles; by which means, the retina becoming nearer the crystalline humour, receives the rays sooner: and when we view an object too near, the eye being compressed by the two oblique muscles, is rendered more globular; by which means, the retina being set further off from the crystalline, does not receive the rays of any point before they meet.

It may be here added, that this access, and recess of the crystalline, is so necessary to *vision*, that, whereas, in some birds the coats of the eye are such a bony consistence, that muscles would not have been able to contract and distend them; nature has taken other means, by binding the crystalline down to the retina, with a kind of blackish threads, not found in the eyes of other animals.— Nor must it be omitted, that of the three refractions above mentioned, the first is wanting in fishes; and that to remedy this, their crystalline is not lenticular, as in other animals, but globular.— Lastly, since the eyes of old people are generally worn flatter than those of young ones; so that the rays from any point, fall on the retina ere they become collected into one; they must exhibit the object somewhat confusedly: nor can such eyes see any but remote objects distinctly. See PRESBYTÆ.— In others, whose eyes are too globular, the case is the reverse. See MYOPES.

From what has been shewn, that every point of an object moves only one point of the bottom of the eye; and, on the contrary, that every point in the fund of the eye, only receives rays from one point of the object; it is easy to conceive, that the whole objects moves a certain part of the retina; that in this part there is a distinct, and vivid collection of all the rays received in at the pupil; and that as each ray carries its proper colour along with it, there are as many points painted in the fund of the eye, as there were points visible in the object.— Thus is there a species, or picture, on the retina, exactly like the object; all the difference between them, is, that a body is here represented by a surface; a surface frequently by a line, and a line by a point: that the image is inverted, the right hand answering to the left of the object, &c. and that it is exceedingly small, and still the more so, as the object is more remote. See VISIBLE.

What we have shewn under other articles of the nature of light, and colours, readily accounts for this painting of the object on the retina.— The matter of fact is proved by an easy experiment, first tried by Des Cartes; thus: The windows of a chamber being shut, and light only admitted at one little aperture; to that aperture apply the eye of some animal newly killed, having first dextrously pulled off the membranes that cover the bottom of the vitreous humour, viz. the hind part of the sclerotica, choroides, and even part of the retina; then will the images of all the objects, without doors, be seen distinctly painted on any white body, as on an egg-shell, that the eye is laid upon.— The same thing is better shewn by an artificial eye, or a camera obscura. See EYE, and CAMERA Obscura.

The images of objects, then, are represented on the retina; which is only an expansion of the fine capillaments of the optic nerve, and from which the optic nerve is continued into the brain.— Now, any motion or vibration, expressed on one extreme of the nerve, will be propagated to the other: Hence the impulse of the several rays, sent from the several points of the object, will be propagated as they are on the retina, (i. e. in their proper colours, &c. or in particular vibrations, or manners of pressure, corresponding thereto) to the place where those capillaments are interwoven into the substance of the brain.— And thus is *vision* brought to the common case of sensation.

For such, we know, is the law of the union between the soul and body; that certain perceptions of the first, do necessarily follow certain motions of the last: but the different parts of the object do separately move different parts of the fund of the eye; and those motions are propagated to the sensory: it follows, therefore, that there must arise so many distinct sensations at the same time. See SENSATION.

Hence, 1<sup>o</sup>. we easily conceive, that the perception, or image in the mind, must be the clearer, and more vivid, the more rays the eye receives from the object: consequently, the largeness of the pupil will have some share in the clearness of *vision*. See PUPIL.

2<sup>o</sup>. Considering only one radiant point of an object, we may say, that that point would move the sense more weakly, or be seen more obscurely, as it is more remote; by reason the rays coming from any point, like all qualities propagated in orbem, are always diverging; and therefore the more remote, the fewer of them will be received in at the pupil.— But, as it is not a single point of an object, but all of them together, that affect the organ of sense; and as the image of the object still possesses a less part of the retina, as it is more remote; therefore, though the rays that flow from any point of an object two miles off, into the pupil, be rarer, or fewer by half, than those flowing from the same point at a mile's distance; yet the same capillament of the optic nerve, which, in the latter case, would only be moved by that one point, in the former, will be affected with the joint action of the neighbouring points; and therefore the image be as clear as in the other case.— Add, that the pupil dilating itself more, as the object is more remote, takes in more rays than it would otherwise do.

3<sup>o</sup>. The distinctness of *vision*, is somewhat concerned in the size of the image, exhibited in the fund of the eye.— For there should be, at least, as many extremes of capillaments, or fibres of the optic nerve, in the space that image possesses, as there are particles in the object, that sends rays into the pupil: otherwise, every particle will not move its separate capillament: and if the rays from two points fall on the same capillament, it will be the same, as if only one point had fell there; since the same capillament cannot be differently moved at the same time.— And hence it is, that the images of very remote objects being very small, they appear confused, several points of the image affecting each capillament: and hence, also, if the object be of different colours, several particles affecting the same capillament at the same time, only the brightest and most lucid will be perceived: thus, a field, furnished with a good number of white flowers, among a much greater quantity of green grass, &c. at a distance appears all white.

Our seeing of objects *single*, though with two eyes, in each of which is a several image, or picture; and our seeing of them *erect*, whereas the picture inverted, are two great phenomena in *vision*: which see considered under the articles SIGHT, and SEEING.— For the manner of seeing, and judging of the distance and magnitude of objects, see VISIBLE, MAGNITUDE, &c. VISION, in optics.— The laws of *vision*, brought under mathematical demonstrations, make the subject of *optics*, taken in the greatest latitude of that word: for among the writers of mathematics, optics is generally taken in a more restrained signification, for the doctrine of *direct vision*; catoptrics, for the doctrine of *reflected vision*; and dioptrics, for that of *refracted vision*. See OPTICS, CATOPTRICS, and DIOPTRICS.

*Direct*, or *Simple VISION*, is that performed by means of direct rays; that is, of rays passing directly, or in right lines, from the radiant point to the eye. See DIRECT.— Such is that explained in the preceding article, VISION; see also RAY.

*Reflected VISION*, is that performed by rays reflected from specula, or mirrors. See REFLECTION.— The laws hereof, see under REFLECTION, and MIRROR.

*Refracted VISION*, is that performed by means of rays *refracted*, or turned out of their way, by passing through mediums of different density; chiefly through glasses and lens's.— The laws of this, see under the articles REFRACTION, LENS, &c.

*Arch of VISION*. See the article ARCH.

*VISION*, among divines, is used for an appearance, which God occasionally sent his prophets and saints; either by way of dream, or in reality. See PROPHECY, REVELATION, &c. Such were the *visions* of Ezekiel, Amos, &c. the *vision* of S. Paul, lifted up to the third heaven, &c. of Joseph, by which he was assured of the purity of the virgin, &c.

Many among the Romish saints still pretend to *visions*: the *Revelations of S. Bridget* are so many *visions*. See REVELATION.

Hence the word has come into disrepute, and become a common name for all chimeras, or spectres, which either our own folly or fear possesses us with: and hence, a person that frames to himself wild romantic notions, is called a *visionary*. See ENTHUSIASM, FANATIC, &c.

Quevedo's *visions*, are descriptions of what passed in the imagination of that author.

*Beatific VISION*, denotes the act whereby the angels and blessed spirits see God in paradise.

VISIR, VISIER, or VIZIER. See the article VISIER.

VISITATION, VISITATIO, an act of jurisdiction, whereby a superior, or proper officer, visits some corporation, college, church, or other public or private house, to see that the laws and regulations thereof be duly observed. See REFORM, and REFORMATION.

Among us, the bishop of each diocese is obliged to hold a *visitation* every third year, and the archdeacon the other two years;

to see that the discipline be well observed, the people well instructed; and take care, that neither the church, nor the pastors thereof, receive any detriment. See BISHOP, ARCHDEACON, &c.

Anciently the regar'der's office was expressed to be the *visitation of manners*. See REGARDER, CENSOR, &c.

The lawyers hold it a branch of the king's prerogative, to *visit* the universities, to enquire into the statutes, and the observations of them; to expel delinquents, &c. But some of the colleges disallow this privilege; and plead themselves, by royal charters, exempt from all civil and royal *visitations*. See UNIVERSITY.

Among the Romanists, the general of each religious order, is obliged to *visit* the several monasteries of order. See GENERAL, and ORDER.

In abbeys, that are chiefs of their orders, there are particular officers, called *visitors*; who are dispatched into all the houses and congregations depending on them, to see that the regular discipline is observed.

In Spain, there is a *visitor*, and *inquisitor general*.—The *visitation* of the cloister belongs to the ordinary.—At Paris, the parliament *visits* the several prisons and prisoners four times a year.

VISITATION, in a moral and religious sense, is also applied to the afflictions that befall mankind; as coming from the hand of God, to try or prove them. In which sense, the last plague among us is frequently called the *visitation*.

VISIVE, VISIVUS, in the school philosophy, a term applied to the power of *seeing*. See VISION.

Authors are exceedingly divided, about the place where the *visive faculty* resides: some will have it, in the retina; others, in the choroides; others, in the optic nerves; others, as Sir Isaac Newton, in the place where the optic nerves meet, before they come to the brain; and others, in the brain itself. See SIGHT, and SENSORY.

VISNE, VISNETUM, in law, a neighbouring place, or place near at hand. See VENUE.

VISUAL, something belonging to the sight, or seeing. See SIGHT, and SEEING.

VISUAL Rays, are lines of light, imagined to come from the object to the eye. See RAY.

All the observations of astronomers and geometers, are performed by means of the *visual rays*, received in at the sights, or pinnulae of alidades. See OBSERVATION, SIGHT, QUADRANT, LEVELLING, &c.

VISUAL Point, in perspective, is a point in the horizontal line, wherein all the ocular rays unite. See POINT.

Thus, a person standing in a straight long gallery, and looking forwards, the sides, floor, and ceiling seem to meet, and touch one another in a point, or common centre.

VISUAL Angle. } See the article { ANGLE.

VISUAL Line. } See the article { LINE.

VISUM. See the article HABERE facias Visum.

VITA, Life. } See the article { LIFE.

Cui in VITA. } See the article { CUI.

Aqua VITÆ. See the article AQUA.

VITAL, VITALIS, in anatomy, something that ministers principally to the constituting, or maintaining of life in the bodies of animals. See LIFE.

Thus, the heart, lungs, and brain, are called *vital parts*. See PART, HEART, &c.

VITAL Functions, or actions, are those operations of the *vital parts*, whereby life is effected; so as that it cannot subsist without them. See ACTION, MOTION, &c.

Such are the muscular action of the heart; the secretory action in the cerebellum; the respiratory action of the lungs; the circulation of the blood and spirits through the arteries, veins, and nerves. See HEART, BRAIN, RESPIRATION, CIRCULATION, &c.

VITAL Spirits, are the finest, and most volatile parts of the blood. See SPIRITS, BLOOD, HEAT, FLAME, &c.

VITELLIANI, in antiquity, a kind of a tablet, or pocket-book, wherein people anciently used to write down their ingenious, humorous, and even wanton fancies and impertinencies: the same with what in English we may call a *trifle-book*. See Martial, Lib. XIV. Epig. viii.

Some will have them to take their name from *vitellus*, a yolk of an egg; by reason, the leaves were rubbed therewith.—Others derive the name from one *Vitellius* their inventor.

VITI Choreia. See the article CHOREA Sancti Viti.

VITRIFICATION, or VITRIFICATION, the act of converting a body into glass, by means of fire. See GLASS. Of all bodies, fern-ashes, sand, bricks, and pebbles, *vitrify* the most easily. Accordingly, it is of these that glass is principally made.

Gold held, by Mr. Homberg, near the focus of the duke of Orleans's large burning concave mirror, at first smoked, then changed, all of it that did not go off in fumes, into glass, of a deep violet colour.—The glass of gold weighs less than gold. *Memoirs of the Royal Academy*, 1702. See GOLD.

All metals, and even almost all natural bodies, sufficiently heated, *vitrify*: and this *vitrification* is the last effect of the

fire; after which the most intense heat of the largest burning-glass, will make no further alteration. See BURNING-GLASS, MIRROR, and FIRE.

*Vitrification*, some authors will have to be chiefly effected, by the salts uniting and incorporating with the metalline particles. See CALCINATION.

But, according to M. Homberg, all *vitrification* arises from the earthy part; which, being exposed to a violent fire, and intimately penetrated by some other dissolvent, commences glass.—Thus, supposing the principles of gold to be mercury, a metallic sulphur, and an earth; the *vitrification* of gold is easily conceived: the mercury, being volatile, exhales in smoke, and leaves behind it the earth, and sulphur, which are fixed; the sulphur dissolves the earth, and *vitrifies* it.

VITRIOL\*, VITRIOLUM, a mineral substance, composed of an acid salt, intermixed with something metalline. See MINERAL, SALT, &c.

\* Some take the word *vitriolum* to be used *quasi vitri oleum*, because of its shining colour; but Menage rather derives it à *vitro colore*: the Latins call it *atramentum sutorium*; and the Greeks, *chalcantus*.

*Vitriol* is usually considered as a salt, but is more properly ranked among the class of semi-metals; as having a metallic matter mixt or combined with its salt.

*Vitriol* is defined by Boerhaave, a saline, metallic, transparent glebe; dissoluble in water, and fusible and calcinable by fire. It acquires different names, according to the different places where it is dug: and the *vitriols* of those also, differ from each other in denomination and colour, some being *white*, others *blue*, and others *green*.

Roman and Cyprus *vitriol*, for instance, is blue; and that of Sweden and Germany greenish: besides which, there is also a white kind.

*White vitriol* partakes but little of any metal, *blue* partakes of copper, and *green* of iron. See IRON, &c.

M. Geoffroy, the elder, observes, that they all consist of an acid salt, like that found in allum and sulphur; excepting that in allum, the acid is mixed with an absorbent earth, or calx: in sulphur, it is united with certain fatty, bituminous parts; and it *vitriols* with metallic parts.

According to Boerhaave, *vitriols* consist of a metallic part, with a sulphur adhering, a menstruous acid, and water.—In *blue vitriol*, the metal wherewith the acid, &c. is joined, is copper. See VENUS.—In *white vitriol*, called also *white copperas*, it is mixed with lapis calaminaris, or some ferruginous earth, intermixed with lead or tin. See COPPERAS.—In *green vitriol* the acid is joined with iron. \* See MARS.

\* In five ounces of *green vitriol*, M. Geoffroy, the younger, has found two of water, two of iron, and one of acid. *Vid. Hist. Acad. R. Scienc. an. 1728. p. 45.*

The ancients give the name *chalcitis*, or *chalcantus*, to *native vitriol*; or that which acquires its full perfection in the entrails of the earth, and which is a kind of mineral stone, of a reddish colour.—Of this they observed three different states, or transformations: *chalcitis*, in its first state, they called *misi*; this afterwards turned into *melanteria*, and that into *fori*. See CHALCITIS.

Some moderns take this *chalcitis* to be the same with the *colcothar* brought from Sweden and Germany; the best whereof is of a brownish red colour, and a *vitriolic* taste, and dissolves easily in water; and when broke, is of the colour of shining copper. See COLCOTHAR.

All the other *vitriols* above-named, are really facitious, being only a kind of crystals, drawn, by means of water, from a sort of marcasite ordinarily found in mines, and called by naturalists, *pyrites*, or *quis*. See PYRITES.

*Roman vitriol* is made by exposing these pyrites to the air, till such time as they calcine, and change into a greenish, acid, *vitriolic* calx, or dust; in which state they are thrown into the water, and are afterwards, by boiling and evaporation, reduced into that kind of crystals sent us from Italy.

All the other *vitriols* are made after the same manner; that is, much after the same manner as allum is made in England, or salt-petre in France. See ALLUM, and SALT-PETRE.

For *green vitriol*, they add a great number of pieces of iron to the liquor in the boiling; these raise a great ebullition.—As soon as the iron is dissolved, they evaporate the dissolution to a certain degree, and so let it crystallize.—The crystals being formed, there remains a thick, reddish, unctuous styptic, and astringent liquor; which M. Geoffroy calls *caumere de vitriol*; as containing all the principles of the mineral, though disunited.

The powder of this *vitriol* is exceedingly styptic, and excellent for the cure of wounds, and the stopping of blood.—Its effects this way, have been raised, by the knavery of some, and credulity of others, to a kind of miracle; it being this that makes the basis of the famous sympathetic powder. See SYMPATHETIC.

The medicinal virtues of *vitriol* are very great; but all owing to the iron, or other metallic parts mixed with it, and therefore follow the kind of metal.—Thus, those of *green vitriol* depend

depend on the stypticity or astringency of iron, or Mars. See MARS, &c.

The eau-mere drawn from *green vitriol*, M. Geoffroy observes, does not differ any way, essentially, from a great number of preparations which the chymists have given us of *vitriol*, iron, and the lapis hæmatites: as the fixed and anodyne sulphurs of *vitriol*, or Mars; arcana, and magisteries of *vitriol*; tinctures, &c. of *vitriol*, Mars, &c.—The common basis of all which is iron exceedingly subtilized and attenuated. See IRON.

A solution of *vitriol*, mixed with a tincture of galls, becomes instantly exceeding black: and it is this is the common writing-ink. See INK.

M. Lemery, the younger, has a pretty hypothesis to account for this blackness: he imagines, that as the *vitriol* whereof ink is made, is iron dissolved by an acid, and intimately mixed therewith; and as galls are an alkali, or absorbent, this alkali meeting the acids which hold the iron dissolved, unites with them, and makes them let the iron loose; which thereupon revivifies, and resumes its natural blackness: so that, in strictness, it is iron that we write withal.

This system is confirmed hence: that of the five sorts of *vitriol*, that of Cyprus or Hungary is the only one whose base is copper; that of the rest is iron: and accordingly they all serve to make ink withal, except the first.

Some naturalists hold *vitriol* to be the root, or matrix of copper; because, in the copper-mines, they never dig deeper than the glebe out of which the *vitriol* is drawn.

*Vitriol* affords several chymical preparations; as—*spirit of vitriol*, procured by first calcining, than distilling it. See SPIRIT.—*Oil of vitriol*, which comes out after the spirit, by heightening the fire wherewith that had been raised.—What remains after both, is *colcothar of vitriol*.—*Tartar of vitriol* is had by mixing *oil of vitriol* with oil of tartar per deliquium; a salt precipitating to the bottom, which being set to exhale and crystallize, is the *tartar of vitriol*. See TARTAR.

From the *colcothar of vitriol*, is prepared the ens veneris. See ENS VENERIS.

**Metallic VITRIOLS.**—All metals, it is to be observed, may be converted into *vitriols*, by dissolving them with acid spirits, and letting them stand to crystallize. See CRYSTAL, and CRYSTALLIZATION.

*Facitious vitriols*, being only metals dissolved and crystallized in saline menstrua, are frequently called by way of distinction, *metallic vitriols*, and *metallic salts*.

**VITRIOL of Iron, Vitriolum Martis**, is a preparation made by dissolving iron, or steel, in oil or spirit of *vitriol*; then evaporating or drawing off the moisture, and bringing the matter to crystallize, by setting it in a cool place.—This is also called *sal martis*, or *salt of steel*. See CHALYBEAT.

**VITRIOL of Luna, or the Moon**, is the body of silver chymically opened, and reduced into the form of salt by the sharp points of spirit of nitre. See LUNA, and SILVER.

**VITRIOL of Venus**, is a solution of copper in spirit of nitre, evaporated and crystallized, to gain the salt; called also *vitriol of copper*. See COPPER, &c.

**Ros VITRIOLI.** See the article ROS.

**VITRIOLATED**, among chymists, turned into *vitriol*, or having *vitriol* infused into it. See VITRIOL.

**Tartar VITRIOLATED.** See TARTARUM VITRIOLATUM.

**VITRIOLIC**, something that has the quality of *vitriol*, or partakes of the nature of *vitriol*. See VITRIOL.

In this sense, we say, *vitriolic spring*, *vitriolic stone*, *vitriolic spirits*, &c.—If iron be thrown into a *vitriolic water*, and the red rust arising on the surface of the iron be melted down, it will be found real copper; which is an instance of the transmutation of one metal into another. See TRANSMUTATION.

**VITRIOUS, or VITREOUS**, in anatomy, the third, or glassy humour of the eye, thus called from its resemblance to melted glass. See HUMOUR, and EYE.

It lies under the crystalline; by the impression of which, its fore-part is rendered concave. See CRYSTALLINE.

For the office of the *vitrious humour*, see VISION.

Some authors also call the coats or membranes that contain this humour, *vitrious tunics*.

**VITTA**, among anatomists, *fillet*, or *head-band*; is used for that part of the amnios, which sticks to the infant's head when it is just born. See AMNIO, COWL, &c.

**VITUS's Dance**, in medicine. See CHOREA SANCTI VITI.

**VIVA Pecunia**, was anciently used for live cattle. See PECUNIA, MONEY, &c.

**VIVA VOCE**, q. d. by word of mouth. See ORAL, WITNESS, EVIDENCE, DEPOSITION, &c.

**VIVARY, VIVARIUM**, in our law-books, is sometimes used for a park, warren, or fish-pond, wherein living creatures are kept, &c. See PARK, WARREN, &c.

**VIVIFICATION**, in medicine, the art of *vivifying*, that is, of contributing to the action that gives life, or maintains life. See LIFE.

The chymists also use the word, in speaking of the new force,

vigour, and lustre, which, by this art, they give to natural bodies, particularly to mercury; which, after having been fixed or amalgamated, they restore to its first state. See REVIVIFICATION.

**VIVIPAROUS, VIVIPARUS**, in natural history, an epithet applied to such animals as bring forth their young alive, and perfect: in contradistinction to such as lay eggs; which are called *oviparous animals*. See ANIMAL, OVIPAROUS, and EGG.

Vipers are distinguished from snakes; in that the latter lay eggs in dunghills, to be hatched by the warmth thereof; but the former are *viviparous*, that is, lay their eggs within their bellies, and bring forth live vipers. See VIPER.

In the *Philosophical Transactions*, we have an account of a *viviparous fly*, of the oestrum or gad-kind.—Dr. Lister tells us, he opened several females of this class, and found, in each, two bags of live white worms.—The like is hinted by Aldrovandus.—Lister even suspects, that all of this tribe are, in some measure, *viviparous*. See INSECTS.

**VIVO**, in architecture, the shaft, or fust of a column.—See Tab. Architect. fig. 24. lit. r; see also SHAFT, and COLUMN.

The term is also used, in a more particular sense, for the naked of a column, or other part. See NAKED.

**VIVUM Linum.** } See the article { LINUM.

**VIVUM Sulphur.** } See the article { SULPHUR.

**VIZARD, or VIZOR.** See the article MASQUE.

**VIZIER.** See the article VISIER.

**ULCER, ULCUS**, in medicine, a solution, or discontinuity of texture, or loss of substance in the fleshy parts of the body, proceeding from an internal cause. See SOLUTION.

Galen defines *ulcer* an inveterate erosion of the soft parts of the body; by which, instead of blood, they are brought to yield a kind of pus, or sanies; which prevents the consolidation.

Etmuller defines an *ulcer*, a solution of continuity from some corrosive sharpness or acidity, that takes away from the parts, and turns the proper nourishment of the body into a sanious matter.—A like solution of continuity happening in a bony part, is called a *caries*. See CARIES.

Galen commonly uses the words *ulcer* and *wound* indifferently; but the Arabs, and the moderns after them, distinguish between the two. See WOUND.

Spontaneous *ulcers*, are generally supposed to proceed from acrimony, or a corrosive disposition of the humours of the body; whether brought on by poisons, the venereal taint, or other causes.

*Ulcers* are divided into *simple*, and *compounded*.—They are again divided, with regard to their circumstances, into *putrid*, or *sordid*, wherein the flesh all around is corrupted, and fetid.—*verminous*, where the matter being thick, does not flow away, but generates worms, &c.—*virulent*, which instead of pus, or sanies, yield a malignant virus, &c.

They are again distinguished, with regard to their form, into *sinuous*, *fistulous*, *varicous*, *caries*, &c.

When an *ulcer* happens in a good constitution, and proves easy of cure, it is said to be *simple*.

When attended with other concurring symptoms, as a cachymic habit, which greatly retards or obstructs the cure, it is called a *compound ulcer*.

A *simple ulcer* is attended with no other sign, than that of erosion; but *compound ulcers*, happening in a scorbutic, dropical, or scrophulous constitution, may be attended with pain, a fever, convulsions, a large and emaciating discharge of matter, inflammation and swelling of the part, callosity of the lips, a caries of the bones, &c.

A *Putrid or sordid ULCER*, is that whose sides are lined with a tough, viscous humour, and is also attended with heat, pain, inflammation, and a large flux of humours to the part: with time the fordes increase and change colour, the *ulcer* corrupts, its matter grows fetid, and sometimes the part gangrenes.—Putrid fevers often gives rise to this kind of *ulcer*.

**Phagedænic ULCER**, is an *ulcer* of a corrosive nature, eating away the adjacent parts all around; the lips thereof remaining tumefied.—When this kind of *ulcer* eats deep, and spreads wide, without being attended with a tumour, but purtifies, and grows foul and fetid, it is called *noma*; and both, on account of the difficulty wherewith they heal, are also termed *dyssepulota*. See PHAGEDÆNA, &c.

**Varicous ULCERS**, are such as being seated in the veins, and becoming painful and inflammatory, swell up the part they possess.—These, when recent, being occasioned by the use of corrosives, or proceeding from a ruptured varix, are often attended with an hæmorrhage.—The veins adjacent to the *ulcers* are, in this case, præternaturally distended, and may, sometimes, be felt interwoven together, like net-work, about the part.

**Sinous ULCERS**, are such as run aslant, or sideways from their orifice; and may be known either by searching with the probe, wax-candle, &c. or the quantity of matter they discharge, in proportion to their apparent magnitude.—These sometimes lie deep, and have several turnings: they are distinguished from fistula's only by their want of callosity, except in the very orifice. See SINUS.

*Fistulous*

**Fistulous ULCERS**, are such as are finous, or winding, and attended with great callosity; and discharge a thin, serous, and fetid matter. See **FISTULA**.

**Old ULCERS** are rarely cured without the use of internals, which are to be such as absorb and destroy the acidity; sudorifics especially, decoctions of the woods, antimonials, viperines, and volatiles; but above all things, vomitories often repeated: in the most obstinate ulcers, mercurial salivation is often required; old ulcers are frequently incurable, without making an issue in the opposite part.

The cure of simple, shallow ulcers, is commonly effected by applying a pledget armed with liniment. arcæi, or basilic. flav. to the part, a plaister of diachyl. simp. or de mino, being laid over it, and repeating the dressing once aday, or seldom. If only the cuticula be lost, or eaten away, nothing more than a little unguent. desiccativ. rub. or diapomphol. &c. spread thin upon linen, need be applied.

If spongy flesh should grow up, in either case it may be kept down with a little Roman vitriol, &c. as in case of healing up the simple ulcers, made by the breaking of common tumors. Evacuations are indispensibly necessary in the cure of ulcers of the compound kind, where the constitution will admit thereof.— If the ulcer be fistulous, sinuous, cancerous, &c. and the matter fetid, thin, or sanious, it is found proper to join calomel with the purgatives, or to give it in small doses, between the repetitions thereof, so as not to salivate.

Besides the use of evacuating medicines, it will here also be proper to order a course of diet-drink, made with the sudorific woods, especially where the ulcer is suspected to be venereal.— In the mean time, proper dressings are to be used.

When the ulcer obstinately resists this treatment, a salivation is generally proposed, and seldom fails to promote the cure, though all other remedies should have been tried in vain.— If the patient be too weak to undergo the fatigue of a thorough salivation, it may be moderated, and kept up the longer, in proportion to his strength. See **SALIVATION**.

External medicines for ulcers, are digestives, cleansers, sarcotics, and epulotics.— M. Belloste gives us a medicine of singular efficacy in the cure of ulcers; and it is no more than a decoction of walnut-tree leaves in water, with a little sugar; in which a linen cloth being dipped, is to be laid on the ulcer, and this to be repeated every second or third day.— This simple and vulgar medicine he finds suppurates, deterges, incarnates, resists putrefaction, &c. more than any other medicine known.

An ulcer in the lungs, makes what we call a *phthisis*. See **PHTHISIS**.

The venereal disease is a grand source of ulcers; particularly in the prepuce and glans, in men; the vagina, &c. in women; and in the mouth and palate in both. See **VENEREAL Disease**.

Venereal ulcers are of various kinds; those that grow callous and cancerous, are called *shankers*. See **SHANKER**.

**ULCERATED Cancers**. See the article **CANCER**.

**ULCERATION**, **EXULCERATIO**, a little aperture, or hole in the skin, caused by an ulcer. See **EXULCERATION**.

Caustic medicines sometimes occasion ulcerations in the skin. See **CAUSTICS**.— Arsenic always ulcerates the parts it sticks to.— A flux at the mouth ulcerates the tongue and palate. See **ARSENIC**, and **SALIVATION**.

**ULIGINOUS**, **ULIGINOSUS**, implies as much as moist, moorish, fenny. See **FEN**, **MORASS**, &c.

**ULLAGE** of a cask, is so much as a vessel wants of being full. See **GAUGING**, and **SLIDING-Rule**.

**ULNA**, in anatomy, a long, hard bone in the arm, with a cavity in the middle; called also *foecile majus*, and *cubitus*.— See *Tab. Anat. (Osteol.) fig. 3. n. 8. fig. 7. n. 10.* See also the articles **ARM**, and **CUBITUS**.

The *ulna* lies on the inside of the fore-arm, reaching from the elbow to the wrist; is big at its upper end, and grows smaller to its lower end.

At its upper it has two processes, which are received into the fore and hind sinus's of the extremity of the humerus.— The foremost process is small and short; the hindmost, called *olecranon*, is bigger and longer; it stays the fore-arm, when it comes to a right line with the arm. See **OLECRANON**.

Between these processes it has a semicircular sinus, which receives the inner protuberance of the lower end of the humerus, upon which we bend and extend our fore-arm; and along the middle of that there runs a small ridge, by which this bone is articulated to the humerus by ginglymus.— Had the articulation here been an arthrodia, the joint must have been much weaker; but the hand could have received no more motion from it, than it has now from the shoulder.

The inside of this upper end has a small sinus, which receives the circumference of the round head of the radius.— Its lower extremity, which is round and small, is received into a sinus, in the lower end of the radius; and upon this extremity, it has a short and small process, from which the ligaments which tie it to the bones of the wrist arise: this process serves to keep the bones of the wrist in their place.

**ULNA**, an ell in measure. See **ELL**, and **MEASURE**.

VOL. II. No. 161.

**ULNA Ferrea**, denotes the standard iron ell, kept in the Exchange. See **STANDARD**.

**ULNAGE**. See the article **ALNAGE**.

**ULNARIS Extensor**, in anatomy, a muscle, called also *extensor carpi*.— See *Tab. Anat. (Mycl.) fig. 1. n. 38.* See also the article **EXTENSOR**.

**ULNARIS Flexor**. See the article **FLEXOR Carpi**.

**ULTERIOR**, in geography, is applied to some part of a country, or province, which, with regard to the rest of that country, is situate on the farther side of a river, mountain, or other boundary, which divides the country into two parts. Thus, Africa, with regard to Europe, is divided by mount Atlas, into *citerior*, and *ulterior*, i. e. into two portions, the one on this side mount Atlas, and the other on that.

**ULTIMA Basia**, *last kisses*, is a phrase used among some painters, for the last finishing touches with the pencil. See **PAINTING**.

**ULTRAMARINE**\*, **ULTRAMARINUM**, a beautiful blue colour, used by the painters, prepared from lapis lazuli. See **BLUE**, and **LAPIS**.

\* Some derive its name, *ultramarine*, q. d. beyond sea, from its being first brought into Europe, out of India, and Persia: Others say, it is because its colour is deeper than that of the sea.

This blue is one of the richest, and most valuable colours, used in painting.— The preparation consists, in first calcining the lapis in an iron pot or crucible, then grinding it very fine on porphyry stone; then mixing it up with a paste made of wax, pitch, mastick, turpentine, and oil; and at last washing the paste well in clear water, to separate the colouring part from the rest, which precipitates to the bottom, in form of a subtile, beautiful, blue powder.— The water is then poured off, and the powder at bottom dried in the sun; which is the true *ultramarine*.

Those who prepare this colour, have usually four kinds, which they procure by so many different lotions: the first is still the best; and the rest worse and worse, to the last.— There is *ultramarine* of the first kind, sold for 11 l. sterling per ounce; and of the last, for about 12 or 15 s.

The common opinion concerning its origin is, that the method of making it was first discovered in England; and that a member of the East India company, having a quarrel with his associates, to be revenged of them, made the secret public.

*Ultramarine* must be chosen of a high colour, and well ground, which is known by putting it between the teeth, where, if it feel gritty, it is a sign the triture is not sufficient.

To know whether it be pure and unmixed, put a little of it in a crucible, and heating it red hot, if the powder has not changed its colour after this trial, it is certainly pure: on the contrary, if you perceive any change, or any black specks in it, it is falsified.

Besides this, there is another kind, called *common*, or *Dutch ultramarine*; which is only lapis, or small well ground, and pulverized; the colour whereof, when used by the painters, is much like that of the true *ultramarine*, though much less valued.

**ULTRAMONTANE**, something beyond the mountains.

The term is principally used, in relation to Italy and France, which are separated by the mountains of the Alps.

In France, the opinions of the *ultramontane* canonists, i. e. of those of Italy, are not received.

The painters, particularly those of Italy, call all those that are not of that country, *ultramontanes*; or, simply, *tramontanes*.— Poussin is the only *tramontane* painter that the Italians seem to envy. See **TRAMONTANE**.

**ULTRAMUNDANE**, **ULTRAMUNDANUS**, *beyond the world*; is that part of the universe, supposed to be without, or beyond the limits of our world, or system. See **UNIVERSE**, **WORLD**, &c.

**UMBELICUS**. See the article **UMBILICUS**.

**UMBELICAL**. See the article **UMBILICAL**.

**UMBELLA**, or **UMBRELIA**. See the article **PARASOL**.

**UMBELLÆ**, **UMBELLIS**, among botanists, the round tufts, or heads of certain plants, set thick together, and all of the same height.— *Sparfed*, or thin *umbellæ*, are those which stand at a distance from one another, yet all of an equal height. See **UMBELLIFEROUS**.

**UMBELLIFEROUS Plants**, are such as have their tops branched, and spread out like an umbrella; on each a little subdivision of which, there is growing a small flower: such are fennel, dill, &c. See **PLANT**.

This flower is always pentapetalous; and is succeeded by two naked seeds adjoining to each other, which are the true characteristics that distinguish these plants from others.

The *umbelliferous* are a very large genus of plants, and are distinguished by Mr. Ray, into,

1<sup>o</sup>. Such as have a compounded leaf, of a triangular and pinnate form.— The seeds of these are either broad, flat, and plain, almost like leaves; as the sphondylium, pastinaca latifolia, panax heracleum tordylium, orcofelinum, thysselinum, apium cicutæ foliis, daucus alsaticus carvifolia, anethum, pucedanum, thapsia, ferula, &c. Or with a seed more tumid, and less compressed and flat, than the former; as the cachrys, laserpitium,

laferpitium, cicutaria vulgaris, scandix, cerefolium, myrrhis sativa angelica, levisticum, filer montanum, bulbocastanum, sitarum, oenanthe, fium, pimpinella, apium, cicuta, visnaga, faxifraga, crithmum, foeniculum, daucus vulgaris, anisum, caucalci, coriandrum, pastinaca marina, &c.

2<sup>o</sup>. Such as have a simple, or undivided leaf, or at least one only a little jagged; as the perfoliata, buplerum, astrantia nigra, fanicula, and the seseli æthiopicum.

UMBELLIFORM flowers. See the article FLOWER.

UMBER, or UMBRE, UMBRIA, among painters, &c. a dry dusky colour'd earth, which, diluted with water, serves to make a dark brown colour, usually call'd with us a hair-colour. It is called *umber* from *umbra*, shadow; as serving chiefly for the shadowing of objects: or rather from *Umbria*, a country of Italy, whence it is used to be brought. See SHADOW.

UMBILICAL, UMBILICALIS, in anatomy, something that relates to the *umbilicus*, or navel. See UMBILICUS, &c.

UMBILICAL Region, is that part of the abdomen lying round about the *umbilicus*, or navel. See ABDOMEN, and REGION.

UMBILICAL Vessels, are a set or assemblage of vessels belonging to a foetus; constituting what we call the *funiculus umbilicalis*, or navel-string. See FOETUS, SECONDINE, &c.

These vessels are two arteries, a vein, and the urachus.

The UMBILICAL arteries arise from the iliaes, near their division into external and internal; and pass thence on each side of the bladder, through the navel, to the placenta.— See *Tab. Anat. (Angeiol.) fig. 1. n. 56. 56. fig. 3. lit. e. e. fig. 16. l. g. g.*

The UMBILICAL vein, from innumerable capillaries united into one trunk, descends from the placenta, to the liver of the foetus; where it is partly distributed into the porta, and partly into the cava.— See *Tab. Anat. (Angeiol.) fig. 4. lit. c. (Splanch.) fig. 3. lit. i. fig. 16. lit. f.*

The urachus is only plainly found in brutes; though there is no doubt but it has place likewise in mankind. See URACHUS.

The use of these vessels, is to maintain a continuity and communication, between the mother and the foetus.— Some authors will have it, that the foetus receives its food and increase this way; and that it grows, like a vegetable, from the mother as the root, of which the *umbilical vessels* are the stem; and the child the head or fruit of this plant-animal. See CIRCULATION, NUTRITION, FOETUS, &c.

*Funiculus UMBILICALIS*, popularly called the *navel-string*, is a kind of string, formed of the *umbilical vessels*; which, being tied up in a common coat, or membrane, traverse the secundines, and are inserted, at one end, into the placenta of the mother, and at the other, into the abdomen of the foetus.— See *Tab. Anat. (Splanch.) fig. 16.* see also the article UMBILICAL Vessels.

The navel-string is membranous, wreathed, and unequal; arising out of the middle of the abdomen, and reaching to the placenta uterina: it is usually half an ell in length, and as thick as one's finger.— It was necessary it should be so long and lax, that when the foetus in the womb grows strong, it might not break it by its sprawling and tumbling about; and that after it is born, the secundine, or after-birth, might be drawn out the better by it.

The way that it passes from the navel to the placenta, is very unconstant; for sometimes it goes upon the right hand, to the neck, which having incompassed, it descends to the placenta; and sometimes it goes on the left hand, up to the neck, &c. Sometimes it comes not to the neck at all, but goes first a little up towards the breast, and then turns round the back, and from thence passes to the placenta.

This part, at the birth, is either broke, or cut away, to the navel; so that its vessels, viz. two arteries, a vein, and urachus, become perfectly useless, as vessels; and, drying up, become impervious, and serve only as ligaments to suspend the liver.

UMBILICAL Points, in mathematics, the same with *foci*. See FOCUS.

UMBILICUS, Navel, in anatomy, the centre of the middle part of the lower venter, or belly; being the place through which the *umbilical vessels* pass, out of the foetus, to the placenta of the mother.— See *Tab. Anat. (Splanch.) fig. 16. lit. e.*

\* The word is pure Latin, formed of *umbo*, the little bunch in the middle of a buckler; by reason of its resemblance to the navel. See UMBILICAL Vessels.

UMBILICUS, in mathematics, the same with *focus*. See FOCUS.

UMBONE, or Horn, among florists, signifies any pointed style, or pistil, in the middle of a flower. See PISTIL.

There is also an *umbone* called *doubly-pointed*, or *by-parted*, as in the peony; and sometimes the *umbone* has four sharp points, in which case it is termed, an *umbone* divided into so many heads, or cut into three or four parts.

UMBRA, Shadow. See the article LIGHT, SHADOW, PENUMBRA, &c.

UMBRE. See the article UMBER.

UMBRELLA. See the article UMBELLA.

UMPIRE\*, a third person, chosen to decide a controversy

left to an arbitration, in case the arbitrators cannot agree. See ARBITRATOR, and ARBITRATION.

\* Minshew supposes the word formed of the French *un pere*, a father.— Some call him a *sur-arbitrator*.

UNCASING, among hunters, the cutting up, or fleaing of a fox. See HUNTING.

UNCIA, a term generally used for the twelfth part of a thing.— In which sense it occurs in Latin writers, both for a weight, called by us an *ounce*; and a measure, called an *inch*. See OUNCE, and INCH; see also AS, WEIGHT, MEASURE, &c.

UNCIA Terræ, or Agri, is a phrase frequently met withal in the ancient charters of the British kings; but what the quantity of ground was, is a little obscure.— All that we know for certain, is, that it signified a large quantity, as much as 12 modii; which modius some conjecture to have been an hundred feet square.

UNCIAE, in algebra, are the numbers prefixed to the letters of the members of any power, produced from a binomial, residual, or multinomial root. See ROOT.

Thus, in the fourth power of  $a + b$ , that is,  $aaaa + 4aaab + 6aabb + 4abbb + bbbb$ , the *unciae* are 4, 6, 4.

See POWER, &c.

Sir Isaac Newton gives a rule, for finding the *unciae* of any power arising from a binomial root. Thus:— Let the index of the power be called  $m$ ; then will the *unciae* arise from such a continual multiplication as this, viz.  $1 \times \frac{m-0}{1} \times \frac{m-1}{2} \times \frac{m-2}{3}$

$\times \frac{m-3}{4} \times \frac{m-4}{5}$ , &c. Thus, if the *unciae* of the biquadrate, or fourth power, were required; the rule is,  $1 \times \frac{4-0}{1} (=4)$

$\times \frac{4-1}{2} (=6) \times \frac{4-2}{3} (=4) \times \frac{4-3}{4} (=1)$ ; which shews, that the *unciae* are 1, 4, 6, 4, 1. See POLYGONAL Number. Or thus: The terms of any powers are compounded of certain literal factums, with numbers called *unciae*, prefixed; and the factums are found, by making two geometrical progressions; the first of them beginning from the required power of the first part of the root, and ending in unity; and the second beginning with unity, and ending in the required power of the second part: thus, for a sixth power of  $a + b$ ;

$a^6 a^5 a^4 a^3 a^2 a^1$  first series,  
 $1 b b^2 b^3 b^4 b^5 b^6$  second series,

and multiplying the terms of the same order in either series, into one another: as  $a^6 + a^5 b + a^4 b^2 + a^3 b^3 + a^2 b^4 + a b^5 + b^6$ , out of which the sixth power of  $a + b$  is compounded.

The *unciae*, then, are found by writing the exponents of the powers of the second series, i. e. of  $b$ , under the exponents of the powers of the first series, i. e. of  $a$ ; and taking the first figure of the upper series for the numerator, and the first of the lower for the denominator of a fraction, which is equal to the *uncia* of the second term; and so for the rest. Thus, for the sixth power we have,

$\begin{matrix} 6 & 5 & 4 & 3 & 2 & 1 \\ 1 & 2 & 3 & 4 & 5 & 6 \end{matrix}$

Accordingly,  $\frac{6}{1} = 6$  is the *uncia* of the second term of the sixth power;  $\frac{6.5}{1.2} = \frac{30}{2} = 15$ , the *uncia* of the third term;

$\frac{6.5.4}{1.2.3} = \frac{120}{6} = 20$ , the *uncia* of the fourth term;  $\frac{6.5.4.3}{1.2.3.4} = \frac{270}{24} = 11\frac{1}{2}$ , the *uncia* of the fifth term;  $\frac{6.5.4.3.2}{1.2.3.4.5} = \frac{270}{120} = 2\frac{1}{2}$ , the *uncia* of the sixth term;  $\frac{6.5.4.3.2.1}{1.2.3.4.5.6} = 1$ ,

The *uncia* of the last power. See PYRAMIDAL Numbers.

UNCIAL, UNCIALIS, an epithet, which antiquaries give to certain large-sized letters, or characters, antiently used in inscriptions, and epitaphs. See LETTER, CAPITAL, &c. The word is formed from the Latin *uncia*, the twelfth part of any thing; and which, in geometrical measure, signified the twelfth part of a foot, viz. an inch; which was supposed to be the thickness of the stem of one of these letters—

UNCORE, or UNQUES *Prisf, still ready*; in law, a plea for the defendant, being sued for a debt due on a bond at a day past, to save the forfeiture of his bond, &c. by affirming, that he tendered the debt at the time and place, and that there was none to receive it; and that he is yet also ready to pay the same. See TENDER.

UNCTION, UNCTIO, the act of anointing, or smearing with oil, or other fatty matter. See OIL.

Mercurial *unction*, properly applied, brings on a salivation. See SALIVATION.—The surgeons cure divers wounds, ulcers, &c. by repeated *unctions*, with oils, unguents, cerats, &c. See UNGUENT, LINIMENT, &c.

UNCTION, in matters of religion, is used for the character conferred on sacred things, by anointing them with oil. See CHRIST and MESSIA.

Antiently, in the eastern countries, which abounded so much in oil, and odoriferous spices, it was the custom to separate persons and things designed for extraordinary offices, or uses, by anointing

ing them with ointments composed of such ingredients; symbolizing thereby, both an effusion of the necessary gifts to qualify them for their office, and a diffusion of the good and grateful effects expected from them.

There were three sorts of persons to whom this unction, or consecration, especially belonged, kings, priests and prophets; who, therefore, are all of them (says Barrow) stiled in scripture the *Lord's Anointed*.

The unction of kings is supposed to be a ceremony, introduced very late among Christian princes: Onuphrius says, none of the emperors were ever anointed before Justinian, or Justin. — The emperors of Germany took up the practice from those of the eastern empire. — King Pepin of France was the first king who received the unction.

In the Romish church, besides an unction at baptism, on the forehead, and at confirmation, on the head, they have an *extreme unction*, given to the people in the pangs of death, on the parts where the five senses reside, being the parts by which the person is supposed to have sinned. See *EXTREME UNCTION*.

UNCUTH\*, UNKNOWN, is used in the ancient Saxon laws, for him that comes to an inn, guest-wise, and lies there but one night. — In which case, his host was not bound to answer for any offence he committed, whereof he was guiltless himself. See *HOGENHINE*.

\* — *Prima nocte potest dici uncuth, secunda vero, guest, tertia nocte hogenhine. Bracton, Lib. III. See THIRD Night aron Hine.*

UNDECAGON, is a regular polygon of eleven sides. See *POLYGON*.

UNDECIMVIR, a magistrate among the ancient Athenians, who had ten other colleagues, or associates joined with him in the same commission.

The functions of the *undecimviri* at Athens, were much the same as those of the *prevots de marechaussée* in France. They took care of the apprehending of criminals; secured them in the hands of justice; and when they were condemned, took them again into custody, that the sentence might be executed on them.

They were chose by the tribes; each tribe naming its own: And as the number of tribes, after Callisthenes, was but ten, which made ten members, a scribe or notary was added, which made the number eleven. — Whence their name *οι undeca*, or *undecimviri*, as Cornelius Nepos calls them in the life of *Phocion*. — In Julius Pollux, they are denominated *παρχοι*, and *πομοφύλακες*.

UNDE', UNDEE, or UNDY, in heraldry. See *WAVY*.

UNDER the sea in the sea language. — A ship is said to be so, when she lies still, or waits for some other ships, with her helm lashed, or tied up a-lee.

UNDER-CURRENTS — Distinct from the upper, or apparent currents of the seas; some naturalists conclude, there are in divers places under-currents, which set or drive a contrary way. See *CURRENT*.

Dr. Smith, in the *Philosophical Transactions*, brings the hypothesis of under-currents, to solve that remarkable phenomenon, the sea's setting strongly through the Straights into the Mediterranean, with a constant current 20 leagues broad. — What should become of the vast quantity of water poured in this way; as also, of that running from the Euxine, through the Bosphorus, into the Hellespont, and thence into the Archipelago; is a speculation that has long employed the philosophers. This author's conjecture is, that there is an under-current, whereby as great a quantity of water is carried out as comes in.

— To confirm which, he observes, that between the north and south foreland, it is either high or low water upon the shore, three hours before it is so off at sea: a certain sign, that though the tide of flood runs aloft, yet the tide of ebb runs under-foot, or close by the ground.

He adds an account from an able sailor in the Baltic sound; that going with their pinnace into the middle stream, they were carried violently away by the current: but that sinking a bucket with a large cannon-bullet, to a certain depth of water, it gave a check to the boat's motion; and sinking it still lower, the boat was driven a-head to the windward, against the upper current, which was not above four or five fathom deep.

Dr. Halley solves the current's setting in at the Straights, without overflowing the banks, from the great evaporation; without supposing any under-current. See *VAPOUR*, and *EVAPORATION*.

UNDER-CHAMBERLAINS of the exchequer, two officers there, who cleave the tallies, and read the same; so that the clerk of the pell, and the comptrollers thereof, may see that the entries are true. See *EXCHEQUER*, *TALLY*, *PELLS*, &c. They also make searches for all records in the treasury, and have the custody of *Domesday book*. — See *CHAMBERLAIN*.

UNDERMINING. See the article *SAPPING*.

UNDER-SHERIFF, *Sub-vice-comes*. See *SHERIFF*.

UNDERSHRUB. See the article *SUFFRUTEX*.

UNDER-SITTER, an inmate. See *INMATE*.

UNDERSTANDING, *Intellectus*, is defined, by the Peripatetics, to be a faculty of the reasonable soul, conversant

about intelligible things, considered as intelligible. See *FACULTY*, and *SOUL*.

They also make it twofold, viz. *active*, and *passive*.

*Active UNDERSTANDING*, *Intellectus agens*, they hold, that faculty of the soul by which the species and images of intelligible things are framed, on occasion of the presence of phantasms, or appearances thereof. — For, maintaining the intellect to be immaterial, they hold it impossible it should be disposed to think by any disproportionate phantasms of mere body, and therefore that it is obliged to frame other proportionate species of itself; and hence its denomination *active*.

*Passive UNDERSTANDING*, *Intellectus patiens*, is that which, receiving the species framed by the *active understanding*, breaks forth into actual knowledge. See *KNOWLEDGE*.

The moderns set aside the Peripatetic notion of an *active understanding*. — The Cartesians define the *understanding* to be that faculty, whereby the mind conversing with, and, as it were, intent on itself, evidently knows what is true in any thing not exceeding its capacity. See *JUDGMENT*.

The corpuscular philosophers define the *understanding* to be a faculty, expressive of things which strike on the external senses, either by their images, or their effects, and so enter the mind.

— Their great doctrine is, *Nihil esse in intellectu quod non prius fuerit in sensu*; and to this doctrine our famous Mr. Locke, and most of the latest English philosophers subscribe. See *SENSE*, &c.

The Cartesians cry out aloud against it, between whom and the Corpuscularians there is this farther difference, that the latter make the judgment to belong to the *understanding*; but the former to the will. See *WILL*.

Hence, according to the most approved opinion of the Corpuscularians, the *understanding* has two offices, viz. *perception*, and *judgment*; according to the Cartesians only one, viz. *perception*. See *PERCEPTION*.

UNDERSTANDING is also used for the act, exercise, or exertion of this faculty; or the action whereby the mind knows things, or represents them in idea to itself.

UNDERTAKERS, were antiently such persons as were employed by the king's purveyors, and acted as their deputies. See *POURVEYORS*.

At present, the name is chiefly used for *upholders*, or persons who furnish out funerals. — And for such as undertake any great work, as the draining of fens, &c. Stat 53 Eliz.

UNDER-TREASURER of England, *Vice-Thesaurarius Angliæ*, an officer mentioned in the stat. 39 Eliz. c. 7. and whom several other statutes confound with treasurer of the Exchequer. See *EXCHEQUER*.

He chested up the king's treasure at the end of every term, and noted the content of money in each chest, and saw it carried to the king's treasury in the Tower, for the ease of the lord treasurer, &c.

In the vacancy of the lord treasurer's office, he also did every thing in the receipt, that the lord treasurer himself does. See *TREASURER*.

UNDER-WOOD, *sub-boscus*, is coppice, or any wood that is not accounted timber. See *COPPICE*, and *TIMBER*.

UNDULATION, in physics, a kind of tremulous motion, or vibration, observable in a liquid; whereby it alternately rises and falls, like the waves of the sea.\*. See *MOTION*.

\* And hence it is that the term takes its rise from the Latin, *unda*, wave. See *WAVE*.

This undulatory motion, if the liquid be smooth, and at rest, is propagated in concentric circles, as most people have observed upon throwing a stone, or other matter upon the surface of a stagnant water, or even upon touching the surface of the water lightly with the finger, or the like.

The reason of these circular undulations is, that, by touching the surface with the finger, there is produced a depression of the water in the place of contact. — By this depression the subjacent parts are moved successively out of their place, and the other adjacent parts thrust upwards, which lying successively on the descending liquid, follow it; and thus the parts of the liquid are alternately raised and depressed, and that circularly.

When a stone is thrown into the liquid, the reciprocal vibrations are more conspicuous: here the water in the place of immersion rising higher, by means of the impulse or rebound, till it comes to fall again, gives an impulse to the adjoining liquid, by which means that is likewise raised about the place of the stone, as about a centre, and forms the first undulous circle; which falling again, gives another impulse to the fluid next to it further from the centre, which rises likewise in a circle; and thus, successively, greater and greater circles are produced.

UNDULATORY Motion, is likewise applied to a motion in the air, whereby its parts are agitated after the like manner as waves in the sea; as is supposed to be the case when the string of a musical instrument is struck. See *CHORD*.

This undulatory motion of the air, is supposed the matter or cause of sound. See *SOUND*.

Instead

Instead of the *undulatory*, some authors chuse to call this a *vibratory motion*. See **VIBRATION**.

**UNDULATION** is also used, in chirurgery, for a motion ensuing in the matter contained in an abscess, upon squeezing it.— A tumor is said to be in a condition for opening, when one perceives the *undulation*. See **TUMOR**.

**UNEQUAL Courses.** } See the article { **MASONRY.**  
**UNEQUAL Hours.** } **HOOR.**

**UNEVEN Number.** See the article **NUMBER**.

**UNGELD\***, in our ancient customs, a person out of the protection of the law; so that if he were murdered, no *geld*, or fine, was to be paid in the way of compensation by him that killed him. See **WERE**.

\* The word is compounded of the negative *un*, and *gildan*, to pay. See **GELD**, and **ÆSTIMATIO Capitis**.

*Si Friihman*, i. e. *homo pacis, fugiet & repugnet, & se nolit indicare; si occidatur jaceat*, ungeld, i. e. no pecuniary compensation shall be made for his death. *Skinner*.— *Ungilda akere*, mentioned in Brompton, has much the same signification, viz. where any man was killed, attempting any felony, he was to lie in the field unburied, and no pecuniary compensation to be made for his death.

**UNGUENT, UNGUENTUM, Ointment**, in chirurgery, a topical remedy, or composition, chiefly used in the dressing of wounds and ulcers. See **WOUND, &c.**

*Unguent*s, liniments, and cerats, are external forms applied on divers parts of the body, both to cure, and to ease and relieve them.— They only differ from each other in consistence; with regard to which, *unguent*s hold the medium; being stiffer than liniments, but softer than cerats. See **LINIMENT**, and **CERAT**.

Oils are ordinarily the bases of all three; to which are added wax, axungia, and several parts of plants, animals, and minerals; both on account of the virtues they furnish, and to give a consistence to the oils, and to keep them longer on the part, that they may have more time to act.

The principal *unguent*s, or ointments, are *unguentum rosatum*; *unguentum album*, or white *unguent* of cerus; *populneum*, made of the buds of the poplar tree; *unguentum apostolorum*, so called from the twelve drugs it consists of, a cleanser; *unguentum basilicum*, a suppurative; *unguentum Ægyptiacum*, caustic; *unguentum aureum*, incarnative, and cicatrizing; *unguentum de apio*, mundificative; *unguentum Agrippæ*, said to be discovered by king Agrippa. See **POPULNEUM, ÆGYPTIACUM, APOSTOLORUM, &c.**— Pomatums are also ranked in the number of *unguent*s. See **POMATUM**.

**UNGUIS**, a Latin term, signifying a *nail* of the hand or foot. See **NAIL**.

**UNGUIS** (in Medicine) a disease of the eye; being a whitish speck on the adnata, formed of a nervous excrescence growing on that coat; beginning at the great canthus, somewhat of the shape and size of a nail of the hand, and spreading insensibly till it reach the pupil, and at last quite cover it.

The *unguis* is much of the same nature with the *pterygium* and *pannus*. See **PANNUS**.

The ordinary cause of the *unguis* is an excessive acrimony in the tears, which corrode the conjunctiva; as is often the case in an ophthalmia, or after the small-pox. See **OPHTHALMIA**.

**UNGUIS**, in anatomy, is applied to two bones of the nose, being as thin as scales, and resembling the nail; whence their name. See **NOSE**.

The *ungues* are the smallest bones in the upper jaw, and are situate close to the great canthus of the eye. See **MAXILLA**.

Some authors call them *ossa lachrymalia*, but improperly; there being no glandula lachrymalis in the canthus.— Others call them *orbitaria ossa*.

They are contiguous to four other bones, viz. the coronal, that of the nose, the maxillary, and that part of the ethmoides which forms the orbit.

**UNGUIS, or UNGUICULUS**, among botanists and florists, denotes a little speck, of a different colour from the rest of the petala, or leaves of flowers. See **PETALA**.

It has the figure of a nail of the hand: its place is at the origin, or root of those leaves; as we see in the rose, poppy-flowers, and divers others.

In preparing of medicines, the *ungues*, or *unguiculi*, are pulled off the flowers that enter the same.

**UNGUIS Odoratus. BLATTA Bizantia.**

**UNGULA**, in geometry, is the section of a cylinder, cut off by a plane passing obliquely through the plane of the base, and part of the cylindric surface. See **CYLINDER, &c.**

**UNGULA**, in natural history, the claw, or hoof of a quadruped. See **HOOF**.

**UNGULA Alcis**, the elk's claw. See the article **ELK**.

**UNGULA**, or *Hamus*, among surgeons, a sort of hooked instrument, wherewithal to extract a dead fœtus out of the womb.

**UNICORN**, in natural history, an animal famous among the Greek authors, under the name of *μονοκεφαλ*; and among the Latins, under that of *unicornu*.

Both these names it takes from its distinguishing characteristic, the having one horn only; which is represented as five palms long, growing in the middle of the forehead. See **HORN**.

This animal claims a place here, not only as it makes a curious article in natural history, but also as it furnishes something to medicine, commerce, and heraldry.

The popular account is, that it is about the size of a horse, its hair short, and of a dark-brown colour; very timorous, and therefore keeping mostly in the woods; and that its true place is the province of Agoas, in the kingdom of Damotes, in Ethiopia.

The first author who wrote of the *unicorn*, was one Cresius, whom Aristotle mentions as a very suspicious author: Ælian only speaks of it in very doubtful terms.— The other writers on the subject are Philostratus, and Solinus; Æneas Sylvius, who is pope Pius II. Marcus Paulus, Aleosius, Gesner, Garcias ab Horto, And. Marinus, &c. Of these, some say it resembles a horse, others an ass, others a goat, by its beard; others an elephant, others a rhinoceros, others a greyhound, &c.

Munster and Thevet will have it an amphibious animal, and its horn to be moveable at pleasure.— Others make all its strength to consist in its horn; and add, that when pursued by the hunters, it precipitates itself from the tops of the highest rocks, and pitches upon its horn; which sustains the whole effort of its fall, so that it receives no damage thereby.— In effect, the several authors do all give several accounts of the figure and colour, both of the animal, and of its horn, and all its parts.— And hence the more knowing among the moderns, do unanimously hold it a fabulous animal.

The legend adds, that it is wonderful fond of chaste persons; and therefore, in order to take it, a virgin is placed in its way; whom when the *unicorn* spies, he lies down by her, and lays his head on her lap, and so falls asleep; upon which the virgin making a signal, the hunters come in, and take the beast; which could never be caught any other way, because it would either cast itself headlong from a rock, or die.

What ordinarily passes among us for *unicorn's horn*, and is shewn for such in the collections of curiosities, and used for such by several physicians, we are assured by Pereyra, in his account of Greenland, is the tooth of a large fish of the whale kind, called by the islanders *narwal*; and, in other places, *walrus*, and *robart*; frequent enough in the icy sea. This tooth, or horn, turned, channelled, and terminating in a point, as it is, springs out of the middle of the fore-part of the upper jaw, where it has a root a foot long, as thick as the horn itself: it is the only tooth the animal has in the upper jaw, and serves it as a weapon of defence, wherewith it dares to attack the largest whale.\*— It can strike it with such violence, as even to pierce the side of a strong-built ship.

\* The horn of the Narwal caught in 1736 in a creek of the Elbe, in the dutchy of Bremen, arose, as Dr. Hampe assures us, from the fore-part of the head, just above the mouth, and was six foot long, white like ivory, and curiously twisted.— Yet Wormius, and the generality of authors, take it for a tooth. Many hold its chief use is to break the ice. Dr. Steigartahl rather imagines it to serve for seeking its food; and mentions a whale caught in Greenland, in the belly of which a Narwal had stuck his tooth up to the mouth, and had suck'd the blood and humours. Vid. Phil. Transf. Numb. 447. p. 147, & p. 149. seq.

There is a fine horn of this kind preserved in the repository of S. Denis at Paris, given by And. Thevet, and pretended to have been a present to him from the king of Monomotapa, who carried him to hunt the *unicorn*; which is frequent in that country: this horn some have suspected to be an elephant's tooth, carved in that manner.— At Strasbourg there is another, between seven and eight feet long.— In the repository at Venice, there is a good number; all different from each other. The antients held the *unicorn's horn* to be a counter-poison; and, that the animal used to dip it in the water, to purify and sweeten it ere it would drink: it is added, that for the same reason other beasts wait to see it drink before them.— Thence, as also from the rarity of the thing, people have taken occasion to attribute divers medicinal virtues thereto.

But Amb. Paré has proved it a mere piece of charletanery, and all the virtues attributed to it to be false; and yet the price it has bore is almost incredible: Andrea Racci, a physician of Florence, affirms the pound of 16 ounces to have been sold, in the apothecaries shops, for 1536 crowns, when the same weight of gold was only worth one hundred forty eight crowns.

The *unicorn* is one of the supporters of the arms of England. See **SUPPORTER**.— This beast is represented, by heralds, passant, and sometimes rampant.— When in this last action, as in the English arms, it is properly said to be *saillant*.— Argent, an *unicorn* saillant fable, armed and unguled, or, borne by the name of *Harding*.

**UNIFORM, UNIFORMIS**, denotes a thing to be similar, or consistent either with another thing, or itself, in respect of figure, structure, proportion, and the like.— In which sense it stands opposed to *difform*. See **SIMILITUDE**.

**UNIFORM, or Equable Motion.** See the article **MOTION**.

**UNIFORM Flowers of plants**, are such as are of the same figure all around, having their fore and back parts, as also their right and left parts, exactly alike. See **FLOWER**.

When they are otherwise, they are termed *difform flowers*. See **DIFFORM**.

**UNIFORM Temperament**. See the article **TEMPERAMENT**.

**UNIFORMITY**, *Regularity*, a similitude or resemblance between the parts of a whole.—Such is that we meet withal in figures of many sides, and angles respectively equal, and answerable to each other. See **REGULAR**.

A late ingenious author makes beauty to consist in *uniformity*, joined or combined with variety. See **BEAUTY**.

Where the *uniformity* is equal in two objects, the beauty, he contends, is as the variety; and where the variety is equal, the beauty is as the *uniformity*. See **DEFORMITY**.

**UNIFORMITY**, is particularly used for one and the same form of public prayers, and administration of sacraments, and other rites, &c. of the church of England, prescribed by the famous stat. 1 Eliz. and 14 Car. II. called the *Act of uniformity*. See **NONCONFORMIST**, **DISSENTER**, **SEPARATIST**, &c.

**UNION**, a junction, coalition, or assemblage of several different things in one.—Philosophers are exceedingly to seek about the manner of the *union* of soul and body, or by what medium it is that two such heterogeneous beings are kept so closely together?—It is one of the great laws of this *union*, that such and such an impression on the brain be followed by such and such a sensation, or perception in the soul. See **SOUL**, **SENSATION**, **MOTION**, &c.

**UNION**, in a philosophical sense, is used, by Dr. Grew, for one of the three ways of mixture; being the joining together of atoms, or insensible particles, so as to touch in a plane: as is supposed to be the case in the crystallizations of salts, and the like bodies. See **MIXTION**, **CRYSTALLIZATION**, &c.

**UNION**, among painters, expresses a symmetry and agreement between the several parts of a painting; when, *e. gr.* there is a deal of relation and connection between them, both as to the figures, and the colouring: so that they apparently conspire to form one thing. See **SYMMETRY**.

**UNION**, in architecture, may denote a harmony between the colours in the materials of a building.

**UNION**, in an ecclesiastical sense, denotes a combining or consolidating of two churches into one. See **CHURCH**, **BENEFICE**, **CONSOLIDATION**, &c.

This is not done without the consent both of the bishop, the patron, and the incumbent. See **PATRON**, &c.

The canonists distinguish three kinds of *union*: that of *accession*, that of *confession*, and that of *equality*.

**UNION of Accession**, is the most usual: by this the united benefice becomes a member, and accessory of the principal.

**UNION by Confusion**, is that where the two titles are suppressed, and a new one created, including both.

**UNION of Equality**, is that where the two titles subsist; but equal, and independent.

By stat. 37 Hen. VIII. it is enacted, "That an *union*, or consolidation of two churches may be admitted, provided the annual value of one of them, in the king's books, do not exceed 6*l.* and the distance between them, be not above one mile."—And by another stat. 17 Car. II. it is enacted, "That the *union* of two churches, or chapels, in any city or town, by the bishop, patron, and chief Magistrate of the town, shall be valid, unless the value of the churches so united exceed 100*l.*"

**Hypothetical UNION**. See the article **HYPOSTATICAL**.

**UNION**, or the **UNION**, by way of eminence, is more particularly used, among us, to express the act whereby the two separate kingdoms of England and Scotland were incorporated into one, under the title of the *kingdom of Great Britain*.

The *happy union*, in vain attempted by king James I. was at length effected in the year 1707, by the general consent of the queen, and the estates of each realm.

The act, or treaty of *union*, consists of twenty-five articles; which eleven English commissioners, and eleven Scotch ones, examined, approved, and signed on the third of August 1706.

—The parliament of Scotland approved it on the fourth of February, 1707; and the parliament of England, the tenth of March, in the same year.—On the 17th following, the queen went to parliament, where she approved the same treaty, with the act of ratification.

Since that time, there is only one privy council, and one parliament for the two kingdoms: the Scottish parliament is suppressed, or, rather super-added to the English; both of them only constituting one, under the title of the *parliament of Great Britain*.

The number of members which, by the articles of the *union*, the Scots are to send into the house of commons, to represent the commons of that country, are 45; and the number of peers, whereby their peerage is to be represented, is 16. See **PARLIAMENT**.

The great officers of the crown of Scotland, before the *union*, were the lord high chancellor, lord high treasurer, or treasurer, lord privy-seal, and lord register.—The lesser officers of state were, the lord register, lord advocate, lord treasurer depute, and lord justice-clerk.

The four first officers are dissolved by the *union*, and instead thereof new officers are erected, serving for both countries

under the title of *lord high chancellor of Great Britain*, &c. See **CHANCELLOR**, **TREASURER**, &c.—The four latter officers still subsist. See **ADVOCATE**, **REGISTER**, &c.

**UNIONS**, **UNIONES**, in physiology, the same with *margarites*, or *pearls*. See **PEARL**.

**UNISON**, in music, is the effect of two sounds, which are equal in degree of tune, or in point of gravity, and acuteness. See **TUNE**.

*Unison* may be defined a consonance of two sounds, produced by two strings, or other bodies of the same matter, length, thickness, and tension, equally struck, and at the same time; so that they yield the same tone, or note. See **NOTE**.

Or, it is the *union* of two sounds, so like each other, that the ear perceiving no difference, receives them as one and the same sound. See **SOUND**.

What constitutes *unisonance*, is the equality of the number of vibrations of the two sonorous bodies in equal times: where there is an inequality in that respect; and, of consequence, an inequality in degree of tune, the unequal sounds constitute an *interval*. See **INTERVAL**, and **VIBRATION**.

*Unison* is the first and greatest of concords; and the foundation, or, as some call it, the *mother* of all the rest: yet others deny it to be any concord at all, maintaining it to be only that in sounds which unity is in numbers. See **UNITY**.

These restrain the word *concord* to intervals, and make it include a difference of tune; but this is precarious: for as the word *concord* signifies an agreement of sounds, it is certainly applicable to *unisons* in the first degree.

But though *unisonance*, or an equality of tune, makes the most perfect agreement of sound; it is not true that the nearer any two sounds come to an equality of tune, they are the more agreeable.—The mind is delighted with variety; and the reason of the agreeableness, or disagreeableness of two sounds, must be ascribed to some other cause than the equality, or inequality of the number of their vibrations. See **CONCORD**.

It is a famed phenomenon in music, that an intense sound being raised, either with the voice, or a sonorous body, another sonorous body near it, whose tune is either *unison*, or octave to that sound, will sound its proper note *unison*, or octave, to the given note.—The experiment is easily tried by the strings of two instruments; or by a voice, and a harpichord; or a bell, or even a drinking-glass.

This our philosophers account for thus: one string being struck, and the air put in motion thereby, every other string within the reach of that motion, will receive some impression therefrom: but each string can only move with a determinate velocity of recourses, or vibrations; and all *unisons* proceed from equal, or equidistant vibrations; and other concords from other proportions.—The *unison* string, then, keeping equal pace with the sounded string, as having the same measure of vibrations, must have its motion continued, and still improved, till its motion become sensible, and it give a distinct sound. Other concurring strings have their motions propagated in different degrees, according to the frequency of the coincidence of their vibrations, with those of the sounded string: the octave, therefore, most sensibly; then the fifth: after which, the crossing of the motions prevents any effect.

This they illustrate by the pendulum; which being set a moving, the motion may be continued and augmented, by making frequent, light, coincident impulses; as blowing on it when the vibration is just finished: but if it be touched by any cross or opposite motion, and this, too, frequently; the motion will be interrupted, and cease altogether.—So, of two *unison* strings, if the one be forcibly struck, it communicates motion, by the air, to the other: and being equidistant in their vibrations, that is, finishing them precisely together, the motion of that other will be improved and heightened, by the frequent impulses received from the vibrations of the first; because given precisely, when that other has finished its vibration, and is ready to return: but if the vibrations of the chords be unequal in duration, there will be a crossing of motions, less or more, according to the proportion of the inequality; by which the motion of the untouched string will be so checked, as never to be sensible. And this we find is the case in all consonances, except *unison*, octave, and the fifth. See **CHORD**.

**UNIT**, **UNITE**, or **UNITY**, in arithmetic, the number *one*; or one single individual part of discrete quantity. See **NUMBER**.

If a number consist of four or five places, that which is outermost towards the right hand, is called the place of *units*. See **NUMERATION**.

Number, in general, is by Euclid defined to be *μῆκος ποσότης*, a multitude, or aggregate of *units*; in which sense, *unity* is not a number. See **UNITY**.

**UNITARIANS**, a name assumed by the new Antitrinitarians; as making profession to preserve the glory and attribute of divinity to the *one*, only great and supreme God, and Father of our Lord Jesus Christ. See **ARIANS**, **SOCINIANS**, &c.

**UNITED Affection.** See the article **AFFECTION**.

**UNITY, UNITAS**, the abstract, or quality, which constitutes, or denominates a thing *unum*, or one. See **UNIT**. The school philosophers generally define *unity*, by a thing's being undivided in itself, and divided from every thing else. — Others, more accurately, define it, a mode of being, whereby it agrees to any particular being, once: these make two kinds of *unity*, viz. *unity of simplicity*, which is both undivided and indivisible; such as that of God, angels, and human souls: the other, *union of composition*, which, though undivided, is divisible in the being, as consisting of divers parts: such is that of man, &c.

Hence, *unity* is also divided into that *per se*, which agrees to any being whose parts are collected into one substratum; and *unity per accidens*, whose parts are not united into one substratum; as that of a flock of sheep, &c.

Some also make a *singular*, or *numerical unity*, and an *universal unity*; a *real*, and an *imaginary unity*, &c.

It is disputed among mathematicians, whether or no *unity* be a number? — The generality of authors hold the negative, and make *unity* to be only inceptive of number, or the principle thereof; as a point is of magnitude, and *unison* of concord.

Stevinus is very angry with the maintainers of this opinion: and yet, if number be defined a multitude of units joined together, as many authors define it, it is evident *unity* is not a number. See **NUMBER**.

**UNITY**, among divines. — The Romanists, and the Reformed dispute, whether or no the church be one single body, all the members whereof are joined together, either really, or in inclination; so that whatever does not appertain to that body, is not part of the church: which is what they call *the unity of the church*; and which the Romanists maintain is restrained to one single society, or one communion, under one visible head; and out of which the Protestants are excluded!

These last, on the contrary, hold, that the *unity* of the church may still subsist, without the members being united under any one visible head; it being sufficient, that all Christians be united by the bonds of mutual love, and charity; and that they be agreed in the fundamental points of religion.

All the difficulty is, to fix what those fundamentals are; some inclining to make the door of the church wider than others. See **TOLERATION**.

**UNITY**, in poetry. — In the drama there are three *unities* to be observed; the *unity of action*, that of *time*, and that of *place*. See **DRAMA**.

In the epic poem, the great, and almost only *unity*, is that of the action. — Some regard, indeed, ought to be had to that of time: that of place there is no room for. — The *unity* of character is not reckoned among the *unities*. See **CHARACTER**.

The *unity* of the dramatic action, consists in the unity of the intrigue in comedy, and that of the danger in tragedy; and this not only in the plan of the fable, but also in the fable extended and filled with episodes. See **ACTION**.

The episodes are to be worked in, without corrupting the *unity*, or forming a double action; and the several members are to be so connected together, as to be consistent with that continuity of action so necessary to the body; and which Horace prescribes, when he says, — *Sit quodvis simplex duntaxat & unum*. See **EPISODE**.

The *unity* of the epic action, M. Dacier observes, does not consist in the unity of the hero, or in the unity of his character, and manners; though those be circumstances necessary thereto. — The *unity of action*, requires that there be but one principal action, of which all the rest are to be incidents, or dependencies. See **HERO**, **MANNERS**, &c.

F. Bossu assigns three things requisite thereto: the first, that no episode be used, but what is fetched from the plan, and ground of the action, and which is a natural member of that body: the second, that these episodes and members be well connected with each other: The third is, not to finish any episode, so as it may appear a whole action; but to let each be always seen in its quality of member of the body, and an unfinished part.

The same excellent critic examines the *Æneid*, *Iliad*, and *Odyssey*, with respect to these rules, and finds them strictly observed. — Indeed, it was from the conduct of those divine poems, that he took the hint of the rules themselves. Instances wherein these rules are all neglected, he gives us in Statius's *Thebaid*.

To the *unity of time* it is required, in the drama, that the action be included in the space of a day. — Aristotle says expressly, it must not exceed the time the sun employs in making one revolution, which is a natural day, under pain of irregularity: some critics will even have it included in the space of twelve hours, or an artificial day.

Indeed, the antient tragic poets sometimes dispensed with this rule; and the modern English ones many of them disallow it: few of them practise it.

In the epic poem, the *unity of time* is still less established: In effect, there is no fixing the time of its duration; in regard,

the warmer and more violent the action is, the less must be its continuance: Whence it is, that the *Iliad*, representing the anger of Achilles, only contains forty-seven days at most; whereas the action of the *Odyssey* holds eight years and an half, and that of the *Æneid* almost seven years.

But the length of the poem Aristotle gives us a rule for; which is, that it be such as it may be read over in one day: pretending, that if it exceeds that compass, the sight will be bewildered in it, and that one cannot see the end, without having lost the idea of the beginning.

As to the *unity of place* and *scene*, neither Horace nor Aristotle give us any rules relating thereto. — It were to be wished, indeed, that what is presented to the audience on the same stage, which is never shifted, might be supposed to have passed in the same house, and the same apartment. — But as such a constraint would cramp the poet too much; and as such a uniformity would suit very ill with abundance of subjects; it has been agreed, that what passes any where in the same town or city, shall be allowed for *unity of place*. — At least, if two different places be unavoidable; yet the place is never to be changed in the same act. See **SCENE**.

**UNITY of possession**, in law, signifies a joint possession of two rights, by several titles. See **POSSESSION**.

Thus, if I take a lease of land upon a certain rent, and afterwards buy the fee simple; this is an *unity of possession*, whereby the lease is extinguished: by reason I, who before had only the occupation for my rent, am now become lord of the same, and am to pay rent to none but myself. See **EXTINGUISHMENT**.

*Unity of possession*, amounts to the same with what civilians call *consolidation*. See **CONSOLIDATION**.

**UNIVERSAL\***, something that is common to many things: or it is one thing belonging to many, or all things. See **GENERAL**, **CATHOLIC**, &c.

\* The word, according to some, is compounded of *unum* *versus* *alia*.

There are *universal instruments*, for measuring all kinds of distances, as heights, lengths, &c. called also *pantometers*, and *holometers*.

An *universal dial*, is that whereby the hour may be found by the sun all over the earth; or under any elevation of the pole. See **DIAL**.

Several learned authors have had it in view, to establish an *universal character*; by which the different nations might understand each other's writings, without learning their language. See **CHARACTER**.

The Romanists are divided among themselves, about the title of *universal bishop*, which the popes have arrogated to themselves; though others of them have declined it. — Baronius holds the appellation to belong to the pope jure divino; and yet S. Gregory, opposing the same quality given by a council in 586, to John, patriarch of Constantinople, asserted expressly, that it did not belong to any bishop; and that the bishops of Rome could not, nor ought not to take it. — Accordingly, S. Leo refused to accept it, when offered him by the council of Chalcedon; for fear, lest giving something particular to one bishop, they should take from all; since there could not be an *universal bishop*, but the authority of the rest must be diminished. See **BISHOP**, **OECUMENICAL**, **POPE**, &c.

**UNIVERSAL, UNIVERSALE**, in logic, is either *complex*, or *incomplex*. — A *complex universal*, is either an universal proposition, as, "Every whole is greater than its part;" or whatever raises a manifold conception in the mind; as the definition of a reasonable animal.

An *incomplex universal*, is what produces one only conception in the mind, and is a simple thing, respecting many; as human nature, which relates to every individual wherein it is found.

According to the various order and respect this *universal* has to many, there are seven modes thereof assigned; viz.

*Universals in causing*, such are the common efficient causes of divers effects; as God, the sun, &c. See **CAUSE**, &c. —

*Universals in distributing*, such are common, or universal signs; as all, none, &c. — *Universals in knowing*, which know all things; as the understanding, &c. — *Universals in representing*, such are images, or ideas of universal things; as the idea of a house, of a man, &c. — *Universals in signifying*, such are common words, signifying many things; as animal, stone, &c. — *Universals in being*, or *existing*, are natures existing in several; as humanity in Peter, Paul, &c. — And, *Universals in predicating*, which exist in many things, and are separately predicated of them all; as, *ens*, and *unum*: these are also called *logical universals*.

All these kinds of *universals*, the two last only excepted, are not *universals* in themselves, but only with respect to their objects, *caused*, *represented*, &c. So that what we chiefly consider as *universals*, are the *universalia in essendo*, and *prædicando*.

Now in an *universal*, they distinguished two things, the *matter*, called the *material universal*, *universale materiale*, which is the one nature multipliable in many; as humanity in Peter,

ter, Paul, &c. and the *form*, called the *formal universal*, which is the unity of that nature.

Wherefore to constitute an *universal*, it is requisite the nature be one, yet multipliable: but what such a nature is, has proved matter of great controversy, both among the antient and modern philosophers.

The Platonists will have *universals* to be nothing but divine ideas—Now by *idea* they mean the pattern or form which the artificer has in view, when he makes any thing: but as this is two-fold, *internal*, which is a sort of image of the thing to be done, which the artificer frames in himself; and *external*, which is something out of himself, which the artificer imitates: the philosophers have been infinitely perplexed, to find which of the two Plato meant.—The Peripatetics insist he meant the *external*; but the Platonists, and most of the Christian divines, hold for the *internal*.

The Stoics and Nominalists hold this in common with the Platonists, that *universals* are not in the things themselves, but out of them: The Stoics, particularly, for *universals*, put a kind of formal conceptions, or acts of knowing; by reason they represent many things at the same time: *e. gr.* knowledge, representing all men, is, according to the Stoics, an *universal*.

The Nominalists make words *universals*; by reason the same word represents many things, as the word *man* represents all men: but both Stoics and Nominalists make *universals* to be something extrinsic to things themselves; by reason whatever exists, or is produced, is singular: so that there is no *universal* really in things.

The Peripatetics, however, contend, that there are *universal* and *common* natures in things themselves; or that things and natures like each other, form a material *universal*.—But as to the manner wherein they are *universal*, or whence they derive their *universality*, that is, their unity and aptitude of being in many, whether from nature, or from our understanding, is matter of dispute among them.—If they derive that unity, wherein their *universal* form is placed, from nature; then there is an *universal à parte rei*; which is the opinion of the Scotists. See SCOTISTS.

If they do not derive it from nature, but only from our minds or understandings, then the doctrine of the Thomists is allowed; who contend, that a formal *universal* has no other existence, but by an act of the intellect. See THOMISTS.

UNIVERSAL Theorem.		

UNIVERSALISTS, in polemical divinity, an appellation, given to such as hold *universal* grace; in like manner as the domination *particularists*, is given to those who hold *particular* and *efficacious* grace. See GRACE, EFFICACIOUS, PARTICULARIST, &c.

The Arminians are particularly denominated *universalists*. See ARMINIAN.

UNIVERSALITY, the quality that denominates a thing *universal*. See UNIVERSAL.

The Catholics assert the *universality* of their church, both as to time, and persons; and maintain this to be a note or mark of the true church; which distinguishes it from all other societies that pretend to the name. See UNIVERSAL, CHURCH, &c.

UNIVERSALITY, in the schools.—Logicians make two kinds of *universality*; the one *metaphysical*, the other *moral*.

*Metaphysical* UNIVERSALITY, is that which excepts nothing: as this proposition, "Every man is mortal."

*Moral* UNIVERSALITY, is that which admits of some exception: as, "All old men praise the times past."—In such like propositions, it is enough the thing be ordinarily so; it not being strictly required, that every old man should be of that disposition.

UNIVERSE, a collective name, signifying the whole world, or the assemblage of heaven and earth, with all things therein: called by the Greeks, *το πᾶν*, and by the Latins, *mundus*. See WORLD, HEAVEN, EARTH, SYSTEM, &c.

The antients, and after them the Cartesians, imagine the *universe* to be infinite.—The reason they give, is, that it implies a contradiction to suppose it finite, or bounded; since it is impossible not to conceive space beyond any limits that can be assigned it: which space, according to the Cartesians, is body; and consequently part of the *universe*. See SPACE, and EXTENSION.

But that the *universe* is finite, appears from the two following considerations.—1<sup>st</sup>, That whatever consists of parts, cannot be infinite; since the parts that compose it, must be

finite, either in number or magnitude; which if they be, what they compose must be so too; or, 2<sup>dly</sup>, they must be infinite in number or magnitude; but an infinite number is a contradiction, and to suppose the parts infinitely big, is to suppose several infinities, one bigger than another; which, though it may pass among mathematicians, who only argue about infinities, *in posse*, or in imagination, will not be allowed in philosophy. See INFINITE.

UNIVERSITY, UNIVERSITAS, a collective term, applied to an assemblage of several colleges established in a city, or town, wherein are professors in the several sciences, appointed to teach them to students; and where degrees, or certificates of study in the divers faculties are taken up. See ART, and SCIENCE.

In each *university* four faculties are usually taught; theology, medicine, law, and the arts and sciences. See THEOLOGY, &c.

They are called *universities*, or *universal schools*, by reason the four faculties are supposed to make the world, or whole compass of study. See FACULTY.

In the eye of the law, an *university* is held a mere lay body, or community; though, in reality, it be a mixed body, composed partly of laymen, and partly of ecclesiastics. See COMMUNITY, COMPANY, &c.

*Universities* had their first rise in the twelfth and thirteenth centuries.—Those of Paris and Bologna pretend to be the first that were set on foot; but then they were on a different footing from the *universities* among us. See SEMINARY, and SCHOOL.

The *university* of Paris is said to have commenced under Charlemagne, and to owe its rise to four Englishmen, disciples of venerable Bede; who, going to that city, made a proposal to set up, and sell learning; and accordingly, held their first lectures in places assigned them by that prince: such is the account given by Gaguin, Gilles, de Beauvais, &c.—Though the authors who wrote in those days, as Eginhard, Aimon, Rheginon, Sigebert, &c. make not the least mention thereof.

Add, that Pasquier, Du Tillet, &c. declare openly against the opinion; and assert, that its first foundations were not laid till Louis the young, and Philip Auguste, in the twelfth century.—The earliest mention we find made of it, is in Regordus, who lived in that age; and who was cotemporary with Peter Lombard, the master of the sentences, the great glory of that *university*; in memory of whom, an anniversary is to this day observed by that body, in the church of S. Marcel, where he lies buried.

But it is certain it was not established all at once: it appears to have been at first no other than a public school in the cathedral church; from which it grew, by little and little, under the favour and protection of the kings, into a regular body.

In effect, our own *universities*, Oxford and Cambridge, seem intitled to the greatest antiquity of any in the world; and University, Baliol, and Merton colleges in Oxford, and S. Peter's in Cambridge, all made colleges in the thirteenth century, may be said to be the first regular endowments of this kind in Europe.

For though University college in Cambridge had been a place for students ever since the year 872, yet this, like many of the other antient colleges beyond sea, and Leyden to this day, was no proper college; but the students, without any distinction of habit, lived in citizens houses; having only meeting-places to hear lectures, and dispute.

In after-times, there were houses built for the students to live in society; only each to be at his own charge, as in the inns of court.—These, at first, were called *inns*; but now *halls*. See INN, and HALL.

At last, plentiful revenues were settled on several of these halls, to maintain the students in diet, apparel, &c. and these were called *colleges*. See COLLEGE.

The *universities* of Oxford and Cambridge are governed next under the king, by a *chancellor*, who is to take care of the government of the whole *university*, to maintain the liberties thereof, &c. See CHANCELLOR.

Under him is the *high steward*, whose office is to assist the chancellor, and other officers, when required, in the execution of their offices, and to hear and determine capital causes, according to the laws of the land, and the privileges of the *university*.

The next officer is the *vice-chancellor*, who officiates for the chancellor in his absence.—There are also two *proctors*, who assist in the government of the *university*; particularly in the business of school-exercise, taking up degrees, punishing violaters of the statutes, &c. See PROCTOR.—Add to these a *public orator*, *keeper of records*, *register*, *beadles*, and *verger*.

For the degrees taken up in each faculty, with the exercises, &c. requisite thereto, see DEGREE; see also DOCTOR, BACHELOR, &c.

UNIVOCAL, in the schools, is applied to two or more names, or terms, that have but one signification.—In opposition

tion to *equivocal*, which is, where one term has two or more significations. See *EQUIVOCAL*.

Or, *univocal terms*, are such whose name, as well as nature, is the same; in opposition to *equivocals*, whose names are the same, but their natures very different. See *UNIVOCALS*. For a thing to be predicated *univocally* of any others, it is to be attributed to all of them alike, and in the same proper sense. See *PREDICATE*, and *PREDICABLE*.

*UNIVOCAL Generation*.—The doctrine of the antients, with respect to propagation, was, That all perfect animals were produced by *univocal generation*; that is, by the sole union, or copulation of a male and female of the same species, or denomination: and, that insects were produced by equivocal generation, without any seed, and merely of the corruption of the earth exhaled, and, as it were, impregnated by the sun's rays. See *EQUIVOCAL*, *INSECT*, &c.

Some philosophers make a kind of intermediate generation between equivocal and *univocal*, which they call *analogous generation*. See *GENERATION*.

*UNIVOCAL Action*. } See the article { *ACTION*.  
*UNIVOCAL Cause*. } { *CAUSE*.

*UNIVOCALS*, called by the Greeks *synonima*, are defined by Aristotle to be those things whose name is common, and also the reason corresponding to the name; that is, the definition of the idea affixed to it, the same. See *UNIVOCAL*. Thus, under the name and definition of *animal*, man and brute are equally included; and circle and square, in the reason or definition of a *figure*.

Here, the word, as *figure*, they use to call *univocum univocans*, or *univocating univocal*; and the things included under the *univocal name*, as *circle*, and *square*, *univoca univocata*, *univocated univocals*.

*UNIVOCATION*, in logics, and metaphysics.—The schoolmen have long disputed about the *univocation* of being, *i. e.* whether the general idea of *being* agree in the same manner, and in the same sense, to the substance and the accident; to God, and the creature?

*UNKNOWN*. See the article *UNCUTH*.

*UNLAWFUL*, *illegal*, something prohibited by, or contrary to the terms of law, either divine or human. See *LAW*.

*UNLAWFUL Assembly*, the meeting of three or more persons together, by force to commit some unlawful act; as, to assault any person, to enter his house, or land, &c. and thus abiding together, whether they attempt the execution, or not. See *ASSEMBLY*, *RIOT*, &c.

By the stat. 16 Car. II. if five persons, or more, shall be assembled together, above those of the family, at any conventicle or meeting, under colour of any exercise of religion, it is *unlawful*, and punishable by fines, and otherwise, as in that statute is provided.

*UNLIKE Quantities*, and *Signs*, in algebra. See *LIKE Signs*, and *Quantities*: see also *SIGN*, and *QUANTITY*.

*UNLIMITED*, or *indeterminate Problem*, is such a one as is capable of infinite solutions.—As, to divide a triangle given into two equal parts; to make a circle pass through two points assigned, &c. See *PROBLEM*.

*UNLUTING*, in chymistry, the taking away of the lute, loam, or clay, wherewith a vessel is closed, joined to another, or the like. See *LUTE*.

*UNMOOR*, a term used at sea, when a vessel that before rid, or was held by two anchors, is begun to be disengaged and prepared to weigh. See *ANCHOR*, and *MOORING*.

*UNQUES Prist*, *always ready*. See *UNCORE Prist*.

*UNREEVING a Rope*. See the article *REEVING*.

*UNRIGGING of a Ship*, is the taking away the rigging, or cordage. See *RIGGING*.

*UNSEELING*, in falconry, a taking away the thread that runs through the hawk's eye-lids, and hinders her sight. See *HAWK*, and *FALCONRY*.

Drawing the strings of the hood, to be in readiness to pull off, is called *unstriking the hood*.

*UNWRITTEN Tradition*. See the article *TRADITION*.

*VOCABULARY\**, *VOCABULARIUM*, in grammar, denotes a collection of the words of a language, with their significations: otherwise called a *dictionary*, *lexicon*, or *nomenclature*. See *WORD*, *NOMENCLATURE*, &c.

\* The word is French, formed of the obsolete term *vocabale*; of the Latin, *vocabulum*, word.

The *vocabulary* is, properly, a lesser kind of dictionary, which does not enter so minutely into the origins, and different acceptations of words. See *DICTIONARY*.—Though the Italian *vocabulary* of the academy de la Crusca seems to be an exception from this distinction; as being a copious and exact work, in three volumes folio, said to have been forty years in compiling.—And the like holds of the *vocabulario* Portuguez of F. Bluteau, in ten volumes folio.

*VOCAL*, something that relates to the voice, or speech. See *VOICE*, &c.

Thus, *vocal prayer* is that spoke out, or delivered in words, in contradistinction to *mental prayer*. See *PRAYER*.

In our antient customs, *VOCALIS* is frequently used for *so called*:—*Post hæc Morganus de tribu Valensium, &c. alter nomine Madocus vocalis princeps eorum.* Matt. Paris.

*VOCAL* is sometimes also used substantively, in speaking of matters of election, to signify a person who has a right to vote.—A man must have been religious a certain number of years, to be *vocal*. See *VOTE*.

*VOCAL Music*, is music set to words, especially verses; and to be performed with the voice.—In contradistinction to *instrumental music*, composed only for instruments, without singing. See *MUSIC*.

Poetry then makes a necessary part of *vocal music*; and this appears to have been the chief, if not the only practice of the antients, from the definitions which they give us of music. See *HARMONY*, &c.

Their *vocal music* seems to have had some advantage over ours, in that the Greek and Latin languages were better contrived to please the ear than the modern ones.—In effect, Vossius taxes all the later languages as unfit for music, and says, "We shall never have any good *vocal music*, till our poets learn to make verses on the model of the antients;" *i. e.* till the antient metrical feet and quantities are restored. See *VERSE*, and *QUANTITY*.

But it is to be observed, that the rhythmus of their *vocal music*, was only that of their poetry; and had no other forms and mutations, than what the metrical art afforded. See *MUTATION*.

Their changes were no other than from one kind of metrum or verse to another; as from iambic, to choriac. See *MEASURE*, and *RHYTHMUS*.

Their *vocal music*, then, consisted of verses set to musical tunes, and sung by one or more voices, in chorus, or alternately; sometimes with, and sometimes without the accompaniments of instruments. See *SYMPHONY*.

For instrumental music, in the manner we have defined it, it is not very clear they ever had any. See *SYNAULIA*, &c.

*VOCATION*, *Calling*; among divines, the grace or favour which God does any one in calling him out of the way of death, and putting him into the way of salvation.

In this sense, we say, the *vocation of the Jews*, the *vocation of the Gentiles*, &c.—There are two kinds of *vocation*; the one *external*, the other *internal*.—The first consists in a simple and naked proposing of objects to the will.—The second, is that which renders the first effectual, by disposing our faculties to receive those objects.

*VOCATION*, is also used for a destination to any state, or profession.—It is a rule, that none are to enter the ecclesiastic or monastic state, without a particular *vocation*, or call. See *ORDERS*, *ORDINATION*, &c.

The Romanists hold the *vocation* of the reformed divines null and invalid.—Among ourselves, some hold an uninterrupted succession necessary to the validity of the *vocation* of a priest.

*VOCATIVE*, in grammar, the fifth case, or state of nouns. See *CASE*.

When we name the person we are speaking to, or address ourselves to the thing we are speaking of, as if it were a person: the noun or name acquires a new relation, which the Latins and Greeks express by a new termination, called the *vocative*.

Thus, of *Dominus*, Lord, in the nominative, the Latins have made *Domine*, O Lord, in the *vocative*; of *Antonius*, *Antoni*, &c.—But as this was a thing not absolutely necessary, and as the nominative case might serve on such occasions, this new case, or termination, was not universal: in the plural, for instance, it was the same with the nominative; and even in the singular, it was only practised in the second declension among the Latins; and in Greek, where it is the most common, it is frequently neglected, and the nominative used instead of it: as in that passage in the Greek psalms, quoted by St. Paul, to prove the divinity of Jesus Christ, *Θεός σὺ, ὁ Θεός*, thy throne, O God!

In English, and most of the modern tongues, this case is ordinarily expressed in nouns that have an article in the nominative, by suppressing that article: as, *the Lord is my hope*—*Lord, thou art my hope!* though, on many occasions, we use an interjection.

*VOCIFERATIO\**, in our old law-books, the same with *hue and cry*. See *HUE and Cry*.

\* — *Qui furem plegiatum dimiserit, qui ei obviaverit & gratis sine vociferatione dimiserit, &c.* Leg. Hen. I.

*VOICE*, *Vox*, a sound produced in the throat and mouth of an animal, by an apparatus of instruments for that purpose. See *SOUND*.

*Voices* are either *articulate*, or *inarticulate*.

*Articulate VOICES*, are those whereof several conspire together to form some assemblage, or little system of sounds.—Such are the *voices* expressing the letters of an alphabet, numbers of which joined together, form words. See *LETTER*, and *WORD*.

*Inarti-*

*Inarticulate VOICES*, are such as are not organized, or assembled into words: such is the barking of dogs, the braying of asses, the hissing of serpents, the singing of birds, &c.

The formation of the *human voice*, with all the varieties thereof observed in speech, music, &c. make a very curious article of inquiry; and the apparatus and organism of the parts ministering thereto, is something exceedingly surprising.

Those parts are, the trachea, or wind-pipe, through which the air passes and repasses into the lungs; the larynx, which is a short cylindric canal, at the head of the trachea; and the glottis, which is a little oval cleft, or chink, left between two semicircular membranes, stretched horizontally within the larynx; which membranes, though capable of joining close together, do generally leave an interval, either greater or less, between them, called the *glottis*.— See particular descriptions of each of these parts, under the articles *TRACHEA*, *LARYNX*, and *GLOTTIS*.

The long canal of the trachea, terminated a-top with the glottis, appears so like a flute, that the ancients made no doubt but the trachea contributed the same to the *voice*, as the body of the flute does to the sound of that instrument.— Galen himself fell, in some measure, into the mistake: he perceived, indeed, that the principal organ of *voice* was the glottis; but he still allowed the trachea a considerable share in the production of sound.

Galen's opinion was followed by all the ancients after him; and even by all the moderns, before M. Dodart.— But that author, observing that we do not either speak or sing, when we inspire, or take in the air, but only when we expire, or expel it; and that, the air coming out of the lungs, passes always out of the minuter vesicles of that part into larger; and at last into the trachea itself, which is the largest of all: that thus its passage becoming still more free and easy, and this more than ever in the trachea, it can never undergo such a violence, and acquire such a velocity in that canal, as is required to the production of sound.— But that, as the aperture of the glottis is very small, in comparison with the width of the trachea, the air can never get out of the trachea by the glottis, without a vast compression and augmentation of its velocity; and that by this means, in passing, it communicates a brisk agitation to the minute parts of the two lips of the glottis, gives them a kind of spring, and occasions them to make vibrations; which, communicated to the passing air, occasions the sound. See *VIBRATION*.

This sound, thus formed, proceeds into the cavity of the mouth and nostrils; where it is reflected, and resounds: and on this resonance, M. Dodart shews, it is that the agreeableness of the *voice* intirely depends.— The different consistencies, forms, &c. of the divers parts of the mouth, contribute to the resonance, each in their way; and from this mixture of so many different resonances in their due proportion, results a harmony in the human *voice*, inimitable by any musician.— Hence it is, that when any of these parts is disordered, *e. gr.* the nose stopped, the *voice* becomes displeasing.

This resonance in the cavity of the mouth, does not seem to consist in a simple reflexion, such as that of a vault, &c. but in a resonance proportionate to the tones of the sound sent into the mouth from the glottis; and accordingly, we find this cavity to lengthen and shorten itself, according to the depth or acuteness of the tone.

Now, for the trachea to effect this resonance, as it was the common opinion it did, it would be required, that the air, after its being modified, and turned into sound by the glottis, instead of continuing its course from within outwards, should return from without inwards, and thus strike on the sides of the trachea: which can never happen, except in those who have a violent cough, and in ventriloquous persons.— Indeed, in most river fowl, which have a very strong *voice*, the trachea does resound; but the reason is, that the glottis is placed at the bottom of the trachea, and not at the top, as in men.

That canal, then, which at first passed for the principal organ of *voice*, is found not to be so much as the secondary one, *i. e.* not that which occasions the resonance.— It does not serve the glottis, as the body of a flute does its plug; but instead of that, the mouth serves the glottis, as the body of some other wind-instrument not yet known in music.— In effect, the office of the trachea is no other, than that of the port-vent in an organ, *viz.* to furnish wind.

For the cause of the different tones of *VOICE*.— As the organs that form the *voice* make a kind of wind-instrument, one might expect to find some provision therein, answerable to that which produces the differences of tones in some other wind-instruments.— But in the divers kinds of wind-instruments, the hautboy, organ, clarion, &c. there is none.— The tone, therefore, must be attributed either to the mouth and nostrils, which occasion the resonance, or to the glottis, which produces the sound: and as all the different tones are produced in man by the same instrument, it follows, that the part which produces them must be capable of changes answerable thereto.

Now, for a grave tone, we know there is more air required than for an acute one.— The trachea, therefore, to let this

VOL. II. N°. 162.

greater quantity pass, must dilate and shorten itself; by which shortening, the external canal, that is, the canal of the mouth and nose, reckoned from the glottis to the lips, or nostrils, is lengthened.— For, the shortening of the internal canal, *i. e.* of the trachea, brings the larynx and glottis lower down; and of consequence makes its distance from the mouth, &c. greater: and there is a change in the length of each canal, for every change of tone, and semitone.— Accordingly, it is easy to observe, that the knot of the larynx alternately rises and falls in all quaverings, or shakings of *voice*, how small soever the difference of tone may be.

Hence, as the depth of the tone of a hautboy, is answerable to the length of the instrument; or longest fibres of the wood, whose vibrations make the resonance, making always the slowest vibrations, and consequently the deepest tone: it may appear probable, that the concavity of the mouth, by its lengthening for grave tones, and shortening for acute ones, might serve very well for the production of the divers tones: but M. Dodart observes, that in that play of the organ called the *human voice*, the longest pipe is six inches, and yet with all that length, it does not make any difference of tone; but the tone of the pipe is precisely that of the plug; whereas the concavity of the mouth of a man of the gravest *voice*, not being above six inches deep; it is evident that cannot modify, vary, and give the tone. See *TUNE*.

It is the glottis, then, that forms the tone, as well as the sound; and the manner of forming the various tones, is by varying its aperture.— A piece of mechanism too admirable, not to be here particularly inquired into.

The human glottis, then, represented in *Tab. Nat. History*, fig. 11. is only capable of one proper motion, *viz.* that of an approach of its lips, ADD, and ADB.— Accordingly, the dotted lines AEB, AFB, AGB, exhibit three different degrees of approach.— These different apertures of the glottis, anatomists usually attribute to the action of the muscles of the larynx; but M. Dodart shews, from their position, direction, &c. that they have other uses; and that the opening and shutting of the glottis is effected by other means, *viz.* by two tendinous cords, or strings, inclosed in the two lips of that aperture.

In effect, each of the two semicircular membranes, whose interstice forms the glottis, is doubled back upon itself; and within each duplicature is a cord or string, which is fastned at one end, to the fore-part of the larynx, and to the hind-part at the other.— It is true they appear more like ligaments than muscles; as consisting of white and membranous fibres; not of red and fleshy ones: but the vast number of minute changes in this aperture, necessary to form the vast variety of tones, make an extraordinary kind of muscle, by whose contraction they should be effected, absolutely necessary.— Common fleshy fibres, wherein the blood is received in large quantity, had been infinitely too coarse for such delicate motions.

These strings, which in their state of relaxation make each a little arch of an ellipsis; as they contract more and more, become longer, but less and less curve; and at last, with the greatest contraction they are capable of, degenerate into two right lines, applied close to each other; so close, and so firm, that an atom of air cannot escape out of the lungs, how full soever they may be, and how great an effort soever all the muscles of the lower venter may make against the diaphragm, and by the diaphragm, against these two little muscles.

The different apertures of the lips of the glottis, then, produce all the different tones in the several parts of music, *viz.* *bass*, *tenor*, *counter-tenor*, *treble-bass*, and *treble*; and the manner is thus:

The *voice*, we have shewn, can only be formed by the glottis; but the tones of the *voice*, are modifications of the *voice*, and can only be produced by the modifications of the glottis.— Now the glottis is only capable of one modification; which is, the mutual approach or recess of its lips: it is this, therefore, produces the different tones.— Now that modification includes two circumstances: the first, and principal, is, that the lips are stretched more and more, from the lowest tone to the highest; the second is, that the more they are stretched, the nearer they approach.

From the first it follows, that their vibrations will be so much the quicker, as they come nearer their highest tone; and that the *voice* will be just, when the two lips are equally stretched, and false, when unequally; which agrees perfectly well with the nature of string instruments.

From the second it follows, that the higher the tones are, the nearer will they approach each other; which agrees perfectly well with wind instruments, governed by reeds, or plugs.

The degrees of tension of the lips, are the first and principal cause of tones; but their differences are insensible.— The degrees of approach, are only consequences of that tension; but their differences are more easily assigned.

To give a precise idea of the thing, therefore, we had best keep to that; and say, that this modification consists in a tension, from whence results a very numerous subdivision of a very small interval; which yet, small as it is, is capable, physically speaking, of being subdivided infinitely. See *DIVISIBILITY*.

The

The doctrine is confirmed, from the different apertures found in dissection of persons of different ages, of both sexes.—The aperture is less, and the exterior canal always shallower in the sex and ages fittest to sing treble.—Add, that the reed of a hautboy, separated from the body of the instrument, being a little pressed between the lips, will yield a tone, somewhat higher than its natural one; and if pressed still more, will yield another still higher: and thus an able musician may run successively through all the tones, and semi-tones of an octave. It is different apertures, then, that produce, or at least accompany different tones, both in natural wind instruments, and artificial ones; and the diminution of the aperture, raises the tones both of the glottis, and the reed.

The reason why lessening the aperture heightens the tone, is, that the wind passes through it with the greater velocity; and from the same cause it is, that if any reed, or plug of an instrument be too weakly blown, its tone will be lower than ordinary.

Indeed, the contractions and dilatations of the glottis, must be infinitely delicate: by an exact calculation of the ingenious author abovementioned, it appears, that to perform all the tones and semitones of a common voice, which is computed to reach twelve tones, to perform all the particles and subdivisions of those tones into commas, and other minuter, though still sensible parts; to perform all the shades, or the differences in a tone, when sounded more or less strong, without changing the tone: the little diameter of the glottis, which does not exceed  $\frac{1}{10}$  of an inch, but which varies within that extent at every change, must be actually divided into 9632 parts; which parts are yet very unequal, and therefore many of them much less than the  $\frac{1}{9632}$  part of an inch.—A delicacy scarce to be matched by any thing but a good ear, which has so just a sense of sounds as, naked, to perceive difference in all these tones; even those whose origin is much less than the  $\frac{1}{9632}$  part of an inch. See HEARING.

VOICE, in grammar, is a circumstance in verbs, whereby they come to be considered, as either *active*, or *passive*, i. e. either as expressing an action impressed on another subject, as *I beat*; or receiving it from another, as *I am beaten*. See VERB; see also ACTIVE, and PASSIVE.

VOICE, in matters of elections, denotes a *vote*, or *suffrage*. See VOTE, SUFFRAGE, &c.

In this sense, a man is said to have a *deliberative voice*, when he has a right to give his advice and opinion in a matter of debate, and his suffrage is taken.—An *active voice*, when he gives his vote for the election of any one; and a *passive voice*, when the suffrages may fall on himself to be elected.—An *excitative voice*, when he may act to procure another to be elected.—A *consultative voice*, when he can only offer reasons and remonstrances, whereon the chief, or head, determines at his own discretion: such the cardinals have, with regard to the pope; the masters of chancery, with regard to the lord chancellor, &c.

Part of the VOICE, in music. See the article PART.

VOID Space, in physics. See the article VACUUM, &c.

VOID, in common law. See ANNULING, ABRIGATION, RESCISSION, REVOCATION, &c.

VOID Bastions. See the article BASTION.

VOIDANCE, VACANCY, in the canon law, a want of an incumbent upon a benefice. See VACANCY, &c.

This is twofold, either in law, *de jure*; as when one holds several benefices that are incompatible: or *de facto*, in deed; as when the incumbent is dead, or actually deprived. See BENEFICE, PLENARTY, &c.

VOIDED, UIDE', in heraldry, is understood of an ordinary, whose inner or middle part is cut out; leaving nothing but its edges to shew its form; so that the field appears through it. Hence, it is needless to express the colour, or metal of the voided part; because it must, of course, be that of the field.

The Cross VOIDED, differ from the cross *imbriated*, in that this latter does not shew the field through it, as the other does.—And the same obtains in other ordinaries.

VOIDER, in heraldry, one of the ordinaries, whose figure is much like that of the flaque, or flanch; only that it doth not bend so much.—See Tab. Herald. fig. 89. see also the article FLANCH.

This armoury, they say, is properly the reward of a gentleman that has well served her prince.—It is always born by pairs.

VOIDED, Evacuating, in medicine. See EVACUATION. In the *Philosophical Transactions*, we have an account of one Matt. Milford, who voided a worm by urine, supposed to have come from the kidneys. See WORMS.

Dr. Lister mentions true caterpillars voided by a boy of nine years old.—Mr. Jessop saw hexapods vomited up by a girl.—Catherina Geilaria, who died in 1662, in the hospital of Altenburg, for 20 years voided, by vomit and stool, toads, and lizards. *Ephem. German.* T. I. Obf. 103.

In the same *Ephem.* is an instance of a kitten, bred in the stomach, and vomited up.—Of whelps, frogs, lacertæ aquaticæ, and other animals, bred and voided the like way.—Bar-

tholine gives us an instance of a worm, bred in the brain, and voided by the nose of O. W. See VERMES.

VOIR Dire, in law—When, upon a trial at law, it is prayed that a witness may be sworn upon a *voir dire*; the meaning is, that he shall upon his oath speak or declare the truth, whether he shall get or lose by the matter in controversy.—If he be unconcerned, his testimony is allowed; otherwise, not. See OATH, WITNESS, &c.

VOL, among heralds, signifies the two wings of a fowl joined together, born in armoury; as being the whole that makes the flight.—Accordingly, a *demi-vol*, is a single wing.

VOLA, the palm, or inside of the hand, comprehended between the fingers and the wrist. See HAND.

VOLANS. See the articles DRACO, and PISCIS.

VOLANT, in heraldry, is when a bird, in a coat of arms, is drawn flying, or having its wings spread out.

Pass-VOLANT. } See the article { PASS-Volant.  
Pont-VOLANT. } PONT.

VOLATILE, in physics, is commonly used to denote a mixt body, whose integral parts are easily dissipated by fire, or heat; but is more properly used for bodies, whose elements, or first component parts, are easily separated from each other, and dispersed in air. See BODY, COHESION, ELEMENT, &c. For, as any mixt body is said to be *fixt*, in a double sense; so may it be said to be *volatile* two ways: whence the same body, e. gr. mercury, is both *volatile*; and *fixt* at the same time.

Since, as its integral parts, or those which still retain the nature of mercury, are easily separable by fire, and readily fly away; it is said to be *volatile*: and yet, as it is very difficult to destroy its contexture, and resolve it by fire, or any other menstruum, into its first elements, it is said to be *fixt*.—The same may be said of sulphur, antimony, &c.

Minerals, for the generality, are less *volatile* than vegetables, and vegetables less than animals. See FIXT.

The chymists distinguish between *volatile* salts, and *fixt* salts. See SALT.—The capitals of aludels, stop and collect the *volatile* parts of substances in sublimation; and make what we call *flowers*. See FLOWERS, SUBLIMATION, &c.

“The particles of fluids, which do not cohere very strongly together, and are of such smallness, as renders them most susceptible of those agitations, which keep liquors in a fluor, are easily rarified into vapour; and, in the language of the chymists, are *volatile*.—Those which are grosser, and so less susceptible of alterations; or cohere by a stronger heat, or, perhaps, not without fermentation; these are what the chymists call *fixt bodies*.” *Newton. Optic.* p. 371.

VOLATILE, in chymistry—When the fire decomposes any mixt body, the parts most disposed to receive a great motion, are sooner loosened, and rise up in the order, which the differences of that disposition give them; the rest remaining immovable at the bottom of the vessel. See ANALYSIS, FIRE, &c.

Those that rise first are called *volatile parts*; such are *phlegm*, *oil*, *spirits*, and *salts* both urinous, and alkalious. See SPIRIT, PHLEGM, and SALT.

The parts remaining, viz. *earth*, and *lixivial salts*, are called *fixt*. See FIXT, EARTH, and VOLATILISATION.—For the making of *fixt* salts volatile; see VOLATILISATION.

VOLATILE Alkaly. } See the article { ALKALY.  
VOLATILE Salt of amber. } AMBER.

Sal VOLATILE Oleosum. See the article SAL.

VOLATILISATION, or VOLATILIZATION, the act of rendering *fixt* bodies *volatile*; or of resolving them by fire into a fine, subtle vapour, or spirit, which easily dissipates, and flies away. See VOLATILE.

All bodies, even the most *fixt*, as gold, may be *volatilized*; either of themselves, or with the admixture of some *volatile* substance, or spirit; by distillation, or sublimation. See DISTILLATION, and SUBLIMATION; see also GOLD, BURNING-GLASS, &c.

In the *Memoirs of the royal Academy*, we have a discourse on the *volatilisation of the fixt salts of plants*, by M. Homberg.—That admirable chymist, it seems, by an odd accident, found *fixt* salts spontaneously *volatilized* in soap: Now soap, we know, is a composition of oil, and the alkalious lixivial salts of the plant kali.—Upon this, M. Homberg conjectured, that the oil, from which the volatile salts seem to derive their volatility, being intimately mixed with the *fixt* salts of the kali in the soap, had rendered them *volatile*: so that they ceased to be alkalious, by reason their pores were now filled with the oil which they had absorbed.—Oil, in effect, has always somewhat of an acid in it; which acid, being joined to the alkali, the whole is rendered a kind of intermediate salt; which yet, as the acid and alkali were only joined by means of the oil, is still oily or sulphurous.

In consequence of this view he made divers chymical operations, whereby he found, that to dispose the *fixt* salts of plants to *volatilise*, the process is to be begun, by making them into a *sapo*, and letting that *sapo* shoot out little saline points, or crystals on its surface; which crystals are no other than *fixt* salts already *volatilized*.—Then, the remainder of the matter

is

is to be set over the fire, after being well imbibed and penetrated by some new liquor, proper to assist in a new sublimation of more fixt salts to be *volatilized*: and this to be repeated till no more salts will rise.

The choice of the liquor, wherewith the sapo is to be saturated, is not indifferent—Water is, of all others, the least fit for the effect: oil does well; yet distilled oil better than that drawn by expression: and spirit of wine best of all.

By such means, M. Homberg *volatilized* almost half a quantity of salt of tartar, which is a fixt vegetable salt. See TARTAR.

**VOLATILITY.** See VOLATILE, SUBLIMATION, &c.

**VOLCANO**, or **VULCANO**, in natural history, a name given to mountains that belch, or vomit fire, flame, ashes, cinders, stones, &c. See MOUNTAIN.

Such are mount Etna in Sicily, mount Vesuvius near Naples, &c. See ERUPTION.

Near Guatimala, in South America, are two mountains, the one called *volcano of fire*; the other of *water*.—Out of the first, huge pieces of rocks are frequently hurled, with as much vehemence as balls out of a cannon; and a written letter may be read by the light of its flames, at the distance of three miles.—Out of the other, vast quantities of water are continually spued up.

*Volcano's* and ignivomous mountains, though some of the most terrible phenomena in nature, have their uses; being a kind of spiracles, or tunnels, whereby to vent the fire and vapour, that would otherwise make a more dreadful havock, by convulsions and earthquakes.

Nay, if the hypothesis of a central fire and waters, be admitted; these outlets must be absolutely necessary to the peace and quiet of the terraqueous globe.—Accordingly, Dr. Woodward observes, there is scarce any country much annoyed with earthquakes, but has one of these fiery vents; which is constantly observed to be all in flames, whenever an earthquake happens; by which means, it disgorges that fire, which, while it was underneath, was the cause of the disaster.—He adds, that were it not for these diverticula, whereby the central fire has an exit, it would rage in the bowels of the earth much more furiously, and make much greater havock than it does; and that there are not wanting instances of countries, that have been wholly freed from earthquakes, by the eruption of a new *volcano* there. See EARTHQUAKE.

**VOLERY**, a great bird-cage, so large, that the birds have room to fly up and down in it. See AVIARY.

**VOLITION**, the act of willing. See WILL.

**VOLITIVE Thinking.** See the article THINKING.

**VOLLEY**, a military salute, made by discharging a great number of fire-arms at the same time. See SALUTE.

In the *Philosophical Transactions*, Mr. Robert Clarke gives us an account of a very remarkable effect of firing some *volleys* of small shot: “Upon proclaiming the peace, in 1697, two troops of horse were drawn in a line, the centre whereof was against a butcher’s door, who kept a very large, courageous mastiff dog, the biggest in the town. Upon firing of the first *volley*, the dog, who before lay asleep by the fire, started up, ran into an upper room, and hid himself under the bed.—The servant being about to beat him down, (as he had never used to go up stairs) a second *volley* came; which made the dog rise, run several times about the chamber, with violent tremblings, and strange agonies.—But immediately a third *volley* came; upon which the dog ran once or twice about, fell down, and died immediately; throwing out blood at mouth and nose.”

**VOLO**, in antiquity, a name which the Romans gave the slaves, who, in the second Punic war, offered themselves to serve in the army; upon a want of a sufficient number of citizens. See SLAVE.

The name *vol*, *volones*, they are said to have had from their offering themselves voluntarily.—Festus says, it was after the battle of Cannæ that this happened: Macrobius, *Sat. Lib. I. cap. II.* places it before that battle.

Capitolinus tells us, that Marcus Aurelius formed troops, or legions of slaves, which he called *voluntarii*; and that the like forces, in the second Punic war, had been called *volones*.—But before M. Aurelius, Augustus had given the name *voluntarii* to forces which he had raised out of *liberti*, or freedmen; as we are assured by Macrobius, *Sat. Lib. I. cap. ii.*

**VOLTE**, in the manage, signifies a round or circular motion, consisting of a gait of two treads, made by an horse going sideways round a centre; the two treads marking parallel tracks, one by the fore feet, larger; and the other by the hind feet, smaller: the shoulders bearing outwards, and the croup approaching towards the centre.

**Demi-VOLTE**, is a half-round of one tread, or two, made by the horse at one of the angles or corners of the *volte*, or at the end of the line of the passade; so as when he is near the end of this line, or near one of the corners of the *volte*, he changes hands, to return by a semicircle.

**Reversed, or inverted VOLTE**, is a track of two treads, which the horse makes with his head to the centre, and his croup out; going sideways upon a walk, trot, or gallop, and tracing out a larger circumference with his shoulders, and a smaller with his croup.

**VOLUME\***, **VOLUMEN**, a book, or writing, of a just bulk, to be bound by itself. See BOOK.

\* The word had its rise à *volvendo*, rolling, or winding; the antient way of making up books, being in rolls of bark, or parchment. See ROLL.

This manner lasted till Cicero’s time, and long after that paper was invented, and books wrote thereon.—The several sheets were glued, or pasted end to end, wrote only on one side; and at the bottom a stick fastened, called *umbilicus*; and at the other end a piece of parchment, whereon was the title of the book in letters of gold. See BOOK, PAPER, &c. And yet, we are assured, king Attalus, or rather Eumenes, had, long before, done up some of his books in the square form; as having found the secret of parchment, which would bear writing on both sides. See PARCHMENT.

The library of Ptolemy king of Egypt, contained, according to Aulus Gellius, three hundred thousand *volumes*; and, according to Sabellicus, seven hundred thousand. See LIBRARY.

Raymond Lully wrote above four thousand *volumes*; whereof we have divers catalogues extant.—It is held, that Trismegistus wrote six thousand five hundred twenty five *volumes*; others say, thirty six thousand five hundred twenty nine: But it is much more rational to suppose, with la Croix, that it was the custom of the Egyptians to put all the books they composed, under the name of *trismegistus*.

At present, **VOLUME** is chiefly used in the same sense with  *tome*, for a part or division of a work, bound separately.—In this sense, we say, “the councils are printed at the Louvre “ in 37 *volumes*. See TOME.

**VOLUME of a Body**, is also used, among foreign philosophers, for its *bulk*, or the space inclosed within its superficies. See BODY, MASS, &c.

**VOLUMUS**, in law, the first word of a clause in one species of the king’s writs of protection, and letters patent. See PROTECTION.

**VOLUNT**, **VOLUNTAS**, in law, is when a tenant holds lands, &c. at the will of the lessor, or lord of the manor. See TENANT, VASSAL, &c.

**VOLUNTARY**, in the schools.—The generality of philosophers use *voluntary* in the same sense with *spontaneous*; and apply it to any thing arising from an internal principle, attended with a due knowledge thereof.—In which sense, they say, “A dog moves *voluntarily* when he runs to the pot. See SPONTANEOUS.

Aristotle, and his followers, restrain the term *voluntary* to those actions that proceed from an inward principle, which knows all the circumstances of the action.

There are two things, therefore, required to the *voluntariness* of an action: the first, that it proceed from an inward principle; thus, walking for pleasure sake is a *voluntary* action; as arising from the will commanding, and the moving faculty obeying, which are both internal.—On the contrary, the motion of a man dragged to prison is not *voluntary*.

The second, that the action be performed with a perfect intelligence of the end, and circumstances thereof: in which sense, the actions of brutes, children, sleeping people, &c. are not properly *voluntary*. See WILL.

Anatomists distinguish between the *voluntary*, and natural, or *involuntary motions* in the body.—Of the first kind are those of the heart, lungs, pulse, &c. See MUSCULAR, MOTION, ACTION, &c.

**VOLUNTARY** Agent. }  
VOLUNTARY Escape. } See the article {  
VOLUNTARY Homicide. } AGENT.  
VOLUNTARY Novation. } ESCAPE.  
NOVATION. } HOMICIDE.

**VOLUTE\***, **VOLUTA**, in architecture, a kind of spiral scroll, used in the Ionic, and Composite capitals; whereof it makes the principal characteristic, and ornament.—See Tab. Archit. fig. 41. fig. 26. lit. D. fig. 32. lit. ii; see also the article CAPITAL.

\* Some call it the *ram’s-horn*, from its figure, which bears a near resemblance thereto.

Most architects suppose, that the antients intended the *volute* to represent the bark or rind of a tree, laid under the abacus, and twisted thus at each extreme, where it is at liberty: others will have it a sort of pillow, or bolster, laid between the abacus and echinus, to prevent the latter being broke by the weight of the former, and the entablature over it; and accordingly call it *pulvinus*.—Others, after Vitruvius, will have it to represent the curls, or tresses of a woman’s hair. See IONIC Order.

The number of *volute*s in the Ionic order is four; in the Composite, eight.

There are also eight angular *volute*s in the Corinthian capital, accompanied with eight other smaller ones, called *helices*. See HELIX, CAULICOLE, &c.

There

There are several diversities practised in the *volute*.— In some, the list or edge, throughout all the circumvolutions, is in the same line, or plane: such are the antique Ionic *volute*s, and those of Vignola.— In others, the spires or circumvolutions fall back; in others, project, or stand out.— Again, in some the circumvolutions are oval; in others, the canal of one circumvolution is detached from the list of another, by a vacuity or aperture.— In others, the rind is parallel to the abacus, and springs out from behind the flower thereof.— In others, it seems to spring out of the vase, from behind the ovum, and rises to the abacus, as in most of the fine Composite capitals.

The *volute* is a part of great importance to the beauty of the column.— Hence, architects have invented divers ways of delineating it.— The principal are that of Vitruvius, which was long lost, and at last restored by Goldman; and that of Palladio.— Daviler prefers the former as the easier.— The manner thereof is as follows.

Divide the altitude AB, (*Tab. Architecture, fig. 12.*) into eight equal parts, and assuming the fifth QP, for a diameter, from the centre G, with half the diameter GP, describe a circle for the eye of the *volute*.— Bisect the radii GP and GQ in 1 and 4, and subdivide the half parts G 1 and G 4, each into three equal parts: then, upon the right line 1 4, construct a square 1, 2, 3, 4; one of whose sides 2, 3, continue on to D; another, 3, 4, to E; and the third, 1, 2, to C. From G draw right lines G 2 and G 3; which divide into three equal parts.— Then, through 6 and 10, draw 6 1 and 10 N, parallel to 2 D. And through 11 and 7 draw 11 O and 7 K, parallel to 3 E; and through 5 and 9, draw 5 H, and 9 M, parallel to 1 C.— Lastly, from 12, 11, 10, 9, 8, &c. strike the quadrants PO, ON, NM, ML, LK, &c. which will form the *volute*.

Consoles, modillions, and other sorts of ornaments, have likewise their *volute*s, or scrolls. See CONSOLE, &c.

Canal of the VOLUTE } See the article { CANAL.  
Eye of the VOLUTE. } EYE.

VOLVULUS, in medicine, a name which some authors give to the iliac passion, by others called *chordapsus*, and by others, *mifere mei*. See ILIAC, CHORDAPSUS, and MISERE.

VOMER, in anatomy, a Latin name, signifying, literally, a *ploughshare*; used by authors to denote the eleventh, or, according to the numeration of others, the thirteenth bone of the upper jaw: by reason of the resemblance it bears to that utensil. See MAXILLA.

The *vomer*, or *vomer aratri*, is a thin bone, placed in the middle of the nose, over the palate, serving to part the two nostrils from each other. See NOSTRIL.

It is small, but hard, and is joined to the sphenoides and ethmoides, which have each of them little eminencies that are received into the cavities of the *vomer*; by which means it is fastened in its place. See NOSE.

VOMICA, in medicine, a collection of pus in any part of the body. See PUS, ABSCESS, IMPOSTHUME, &c.

When this mass, or collection, is in the lungs, it is called *vomica pulmonum*.— When in the kidneys, *vomica renum*, &c. See PHTHISIS, &c.

The *vomica* of the lungs differs from an empyema, which is a collection of pus in the cavity of the thorax. See EMPIEMA.

Nux VOMICA, *Vomic Nut*, is a little flat, round, woody fruit, or seed; hard as horn, of a mouse-colour without, but of various colours within: sometimes yellow, sometimes white, and sometimes brown. See NUX.

It is not known what the plant is that bears it.— It is a poison for dogs, and divers quadrupeds, which it kills presently, through excessive vomiting. See POISON.

VOMITING, VOMITUS, a violent casting up, or evacuating by the mouth, what is contained in the stomach. See EVACUATION.

This action has been generally allowed to be owing, principally, to the contraction of the fibres of the stomach, when irritated by the acrimonious quality, or oppressed with the quantity of its contents. See STOMACH.

But M. Chirac, and after him M. du Verney, and others, set aside the fibres of the stomach; and advance, that *vomiting* is produced wholly by the extraordinary motions of the diaphragm, and muscles of the lower venter.— So that the stomach is here supposed destitute of all action, and casts back its contents only by its being compressed and flatted, from some foreign and accidental causes.

However, Boerhaave, and most of our latest writers, allow both the stomach, the diaphragm, and the muscles of the abdomen, to have their share in the action of *vomiting*: accordingly, that diligent author makes *vomiting* to consist in a convulsive and retrograde motion of the muscular fibres of the gullet, stomach, and intestines; as well as those of the abdomen, and the septum transversum; which, when in a less degree, produce a nausea; and in a greater, a *vomiting*. See NAUSEA.

By the contraction of so many parts, the stomach comes to be squeezed, as in a press; whence it is obliged to give up what is contained in its cavity, and the neighbouring parts; just as water is in a bladder, or sponge, when squeezed between the hands.

The evacuation, too, must be upwards, rather than downwards; by reason the passage is more open and easy that way, and that the intestines are pressed by the diaphragm, and the muscles of the lower venter.

The primary cause of *vomiting*, uses to be the too great quantity, or too much acrimony of the contents, arising from poisons, contusions, compressions, inflammations, and wounds in the brain; inflammations of the diaphragm, stomach, intestines, spleen, liver, kidneys, pancreas, and mesentery; unusual agitations in coaches, at sea, &c. and *vomitive*, or emetic medicines. See EMETICS.

VOMITIVES, or VOMITIVE Medicines. See EMETICS.

VOPISCUS, a Latin term, used in respect of twins in the womb, for that which comes to the perfect birth; the other being before excluded abortive. See TWINS, and ABORTION.

VORTEX, *Whirlwind*, in meteorology, a sudden, rapid, violent motion of the air, in gyres, or circles. See WHIRLWIND.

VORTEX, VORAGO, is also used for an *eddy*, or *whirlpool*; or a body of water, in certain seas and rivers, which runs rapidly around, forming a sort of cavity in the middle.

The ordinary cause of these *vortices*, is a gulph, or outlet, whereby the water of the sea, &c. is absorbed, or precipitates itself into some other receptacles; sometimes to some other communicant sea; and sometimes, perhaps, into the vast abyss of central water. See ABYSS, &c.

An artificial VORTEX, expressive of the phenomena of the natural ones, may be made with a cylindric vessel, placed, immovable, on a horizontal plane, and filled to a certain height with water.— In this water a stick being plunged, and turned round as briskly as may be, the water is necessarily put into a pretty rapid circular motion, and rises to the very edge of the vessel; and when there arrived, ceases to be further agitated.

The water thus raised, forms a cavity in the middle, whose figure is that of a truncated cone; its base is the same with the upper cavity of the vessel; and its vertex in the axis of the cylinder.

What raises the water at the side of the vessel, which occasions the cavity in the middle, is its centrifugal force.— For the motion of the water being circular, it respects a centre taken in the axis of the vessel; or, which is the same, in the axis of the *vortex* formed by the water; the same velocity, then, being impressed on all the water, the circumference of a smaller circle of water, or a circle less remote from the axis, has a greater centrifugal force than another that is greater, or more remote from the axis.— The smaller circle, therefore, drives the greater towards the side of the vessel; and from this pressure, or impulsion, which all the circles receive from the smaller ones that precede them, and convey to the greater which follow them, arises that elevation of the water along the edge of the vessel to the very top, where we suppose the motion to cease.

With a *vortex* thus formed, M. Saulmon, of the royal academy of sciences, made divers experiments, by putting several solid bodies therein, to acquire the same circular motion; with intent to discover which of them, in making their revolutions round the axis of the *vortex*, approach toward, or recede from it, and with what velocity.— The result was, that the heavier the body, still the greater was its recess from the axis.

M. Saulmon's view in this attempt, was, to shew how the laws of mechanics produce the celestial motions; and that it is probably to those motions that the gravity or weight of bodies is owing.— But, unhappily, the experiments shew just the contrary of what they should do, to confirm the Cartesian doctrine of gravity. See GRAVITY.

VORTEX, in the Cartesian philosophy, is a system or collection of particles of matter moving the same way, and round the same axis.

Such *vortices* are the grand machines whereby these philosophers solve most of the motions, and other phenomena of the heavenly bodies.— Accordingly, the doctrine of these *vortices* makes a great part of the Cartesian philosophy. See CARTESIANISM.

The matter of the world, they hold to have been divided at the beginning into innumerable little equal particles, each endowed with an equal degree of motion, both about its own centre and separately, so as to constitute a fluid. See FLUID.

Several systems, or collections of this matter, they further hold to have been endowed with a common motion about certain points, as common centres, placed at equal distances; and that the matters moving round these, composed so many *vortices*.

Then,

Then, the primitive particles of the matter they suppose, by these intestine motions, to become, as it were, ground into spherical figures, and so to compose globules of divers magnitudes; which they call *the matter of the second element*: and the particles rubbed, or ground off them, to bring them to that form, they call *the matter of the first element*. See ELEMENT.

And since there would be more of this first element than would suffice to fill all the vacuities between the globules of the second, they suppose the remaining part to be driven towards the centre of the *vortex*, by the circular motion of the globules; and that being there amassed into a sphere, it would produce a body like the sun. See SUN.

This sun being thus formed, and moving about its own axis with the common matter of the *vortex*, would necessarily throw out some parts of its matter, through the vacuities of the globules of the second element constituting the *vortex*; and this especially at such places as are farthest from its poles; receiving, at the same time in, by these poles, as much as it loses in its equatorial parts. And, by this means, it would be able to carry round with it those globules that are nearest, with the greater velocity; and the remoter, with less.—And, by this means, those globules which are nearest the centre of the sun, must be smallest; because, were they greater, or equal, they would, by reason of their velocity, have a greater centrifugal force, and recede from the centre. See LIGHT.

If it should happen that any of these sun-like bodies, in the centres of the several *vortices*, should be so incrustated, and weakened, as to be carried about in the *vortex* of the true sun: if it were of less solidity, or had less motion than the globules towards the extremity of the *solar vortex*, it would descend towards the sun, till it met with globules of the same solidity, and susceptible of the same degree of motion with itself; and thus, being fixed there, it would be for ever after carried about by the motion of the *vortex*, without either approaching any nearer to, or receding from the sun; and so become a planet. See PLANET.

Supposing then all this, we are next to imagine, that our system was at first divided into several *vortices*, in the centre of each of which was a lucid spherical body; and that some of these being gradually incrustated, were swallowed up by others which were larger, and more powerful, till at last they were all destroyed and swallowed up by the biggest *solar vortex*; except some few which were thrown off in right lines from one *vortex* to another, and so became comets. See COMET.

But this doctrine of *vortices*, is, at best, merely hypothetical.—It does not pretend to shew by what laws and means the celestial motions are really effected, so much as by what means they possibly might, in case it should have so pleased the Creator.—But we have another principle which accounts for the same phenomena as well, nay, better than that of *vortices*; and which we plainly find has an actual existence in the nature of things: and this is *gravity*, or the weight of bodies. See GRAVITY.

The *vortices*, then, should be cast out of philosophy, were it only that two different adequate causes of the same phenomena are inconsistent. See NEWTONIAN Philosophy.

But we have other objections against it.—For, 1°. If the bodies of the planets and comets be carried round the sun in *vortices*, the bodies of the parts of the *vortex* immediately investing them, must move with the same velocity, and in the same direction; and besides, must have the same density, or the same vis inertiae.—But it is evident, that the planets and comets move in the very same parts of the heavens with different velocity, and in different directions.—It follows, therefore, that those parts of the *vortex* must revolve at the same time, in different directions, and with different velocities; since one velocity, and direction, will be required for the passage of the planets, and another for that of the comets. 2°. If it were granted, that several *vortices* are contained in the same space, do penetrate each other, and revolve with divers motions; since those motions must be conformable to those of the bodies, which are perfectly regular, and performed in conic sections; it may be asked, How they should have been preserved intire so many ages, and not disturbed, and confounded by the adverse actions and shocks of so much matter as they meet withal?

3°. The number of comets is very great, and their motions perfectly regular, observing the same laws with the planets, and moving in conic orbits, that are exceedingly excentric. Accordingly they move every way, and to all parts of the heavens, freely pervading the planetary regions, and going frequently contrary to the order of the signs, which would be impossible, unless these *vortices* were away.

4°. If the planets move round the sun in *vortices*, those parts of the *vortices* next the planets, we have already observed, would be equally dense with the planets themselves; consequently the *vortical* matter, contiguous to the perimeter of the earth's orbit, would be as dense as the earth itself: and that between the orbits of the Earth and Saturn, must

VOL. II. No. 162.

be as dense, or denser.—For a *vortex* cannot maintain itself, unless the more dense parts be in the centre, and the less dense towards the circumference: and since the periodical times of the planets are in a sesquialterate ratio of their distances from the sun, the parts of the *vortex* must be in the same ratio.—Whence it follows, that the centrifugal forces of the parts will be reciprocally as the squares of the distances.—Such, therefore, as are at a greater distance from the centre, will endeavour to recede therefrom with the less force. Accordingly, if they be less dense, they must give way to the greater force, whereby the parts nearer the centre endeavour to rise.—Thus, the more dense will rise, and the less dense descend; and thus there will be a change of places, till the whole fluid matter of the *vortex* be so adjusted, as it may rest in æquilibrium.

Thus will the greatest part of the *vortex* without the earth's orbit, have a degree of density and inactivity, not less than that of the earth itself.—Whence the comets must meet with a very great resistance, contrary to all appearances. Cotel. *præf. ad Newt. Princip.* See COMET, RESISTANCE, MEDIUM, &c.

The doctrine of *vortices*, Sir Isaac Newton observes, labours under many difficulties: for a planet to describe areas proportional to the times, the periodical times of the *vortex* should be in a duplicate ratio of their distances from the sun; and for the periodical time of the planets to be a sesquialterate proportion of their distances from the sun, the periodical times of the parts of the *vortex* should be in the same proportion of their distances: and, lastly, for the lesser *vortices* about Jupiter, Saturn, and the other planets, to be preserved, and swim securely in the sun's *vortex*, the periodical times of the parts of the sun's *vortex* should be equal.—None of which proportions are found to obtain in the revolutions of the sun, and planets around their axis. *Phil. nat. princ. math. apud schol. gen. in calce.*

Besides, the planets, according to this hypothesis, being carried about the sun in ellipses, and having the sun in the umbilicus of each figure, by lines drawn from themselves to the sun, do always describe areas proportionable to the times of their revolutions; which that author shews the parts of no *vortex* can do. *Scol. prop. ult. lib. 2 princip.*

Again, Dr. Keil proves, in his *Examination of Burnet's Theory*, that if the earth were carried in a *vortex*, it would move faster in the proportion of three to two, when it is in Virgo, than when it is in Pisces; which all experience proves to be false.

VOTE, or VOICE. See SUFFRAGE, and VOICE.

In the house of peers, they give their *votes*, or suffrages, beginning at the puisne, or lowest baron, and so to the rest seriatim, every one answering, apart, *content*, or *not content*: and if the affirmatives and negatives are equal, *semper præsumitur pro negante*; the speaker having no casting *vote*, unless he be a peer.

In the house of commons, they *vote* by *yea's* and *no's*, promiscuously. See PARLIAMENT.

VOTIVE Medals, are those whereon the vows of the people, for the emperors, or empresses, are expressed. See MEDAL, and VOW.

The public vows, made every five, ten, or twenty years, are more often found round the edges of medals, than on the faces thereof, at least under the western empire; for in the eastern the case is different: witness the medal of M. Aurelius the younger, where the reverse represents the vows made at the time of his marriage, VOTA PUBLICA. And on Greek medals, ΔΗΜΟΤ ΕΥΧΑΙ, which they sometimes express by the two initial letters, Δ. Ε. according to F. Hardouin's conjecture, which may be admitted in certain medals, where the ΔΗΜ ΕΞ. that this, ΔΗΜΑΡΧΙΚΗΣ ΕΒΟΥΣΙΑΣ, does not well agree. Witness also the medal of Antonine, VOTA SUSCEPTA DECENNALIA.

The origin of *vows*, and *votive medals*, is given by M. Du Cange, thus:—Augustus feigning himself willing to quit the empire, and having twice, at the prayers of the senate, condescended to hold it for ten years longer, it grew into a custom, to make fresh public prayers, sacrifices, and games, for his continuing it, at the ten years end; and these they call *decennalia*, or *vota decennalia*. See DECENNALIA.

Under the eastern emperors, these vows were repeated every five years: hence it is, that, after Dioclesian's time, we find on medals VOTIS V. XV, &c. which practice continued till the time of Theodosius, when Christianity being well established, a ceremony that had some remains of heathenism in it, was set aside. So that the VOTIS MULTIS, on a medal of Majorianus, must be a very different thing; and no other, doubtless, than a kind of acclamation, like that PLURA NATALIA FAELICITER.

VOTIVE Mass. See the article MASS.

VOTUM, Vow. See the article VOW.

VOTUM, in our ancient law-books, is used for *nuptiæ*, or marriage: so, *dies votorum*, is the wedding-day, *Plata*, lib. 4. cap. 2. par. 16. *Si donatarius ad alia vota convolaverit*, &c. See MARRIAGE.

**VOUCH.**—A person is said to *vouch* for another, when he undertakes to maintain, or warrant him in any thing, or passes his word in his behalf. See **VADARI**, **WAGER**, &c.

In law, to *vouch*, is to call such person, or *vouchee*, into court, to make good his warrant. See **WARRANTY**.

**VOUCHEE**, a person who is warranty, or *vouch* for another, who in respect hereof, is called *voucher*. See **VOUCHER**, and **WARRANTY**.

**VOUCHER\***, in law, the tenant in a writ of right, who calls another person into court, bound to warranty him, and either to defend his right against the demandant, or to yield him other lands, &c. to the value. See **WARRANTY** and **VOUCHEE**.

\* This seems in some measure to agree to the contract in the civil law, whereby the vendee binds the vendor, sometimes in the simple value of the things bought, sometimes in the double, to warrant the secure enjoying of the thing bought. — Yet there is this difference between the civil and common law, in this point, that the civil law binds every man to warrant the security of that which he selleth; which the common law doth not, unless it be specially covenanted. See **ADVOWING**.

The process whereby the vouchee is called, is a *summoneas ad warrantifandum*; and if the sheriff return upon that writ, that the party hath nothing whereby he may be summoned, then goes out another writ, called, *sequator sub suo periculo*.

A recovery with a *single voucher*, is when there is but one *voucher*; and with a *double voucher*, is when the vouchee voucheth over; and so a *treble voucher*. See **RECOVERY**.

There is also a *foreign voucher*, when the tenant impleaded in a particular jurisdiction, voucheth one to warranty in some other county, out of the jurisdiction of that court; and prays he may be summoned, &c.—This were more pertinently called a *voucher of a foreigner*.

**VOUCHER**, also signifies a leiger-book, or book of accompts, wherein are entered the warrants for the accomptant's discharge. See **BOOK-KEEPING**.

**VOUSSOIR**, *Vault-stone*, or *Key-stone*, in architecture, a stone proper to form the sweep of an arch, being cut somewhat in manner of a truncated cone, whose sides, were they prolonged, would terminate in a centre, to which all the stones of the vault are directed. See **VAULT**, **ARCH**, **KEY**, &c.

**VOW**, **VOTUM**, a solemn promise, or offering of a man's self, or other thing to God. See **OATH**, **OBLATION**, &c.

A person is constituted a religious, by taking three *vows*, that of poverty, that of chastity, and that of obedience. See **RELIGIOUS**, **MONK**, &c.

Authors are divided as to the antiquity of these *vows*.—It is agreed, the antient anachorets, and hermits of the Thebaide made none; they did not consecrate themselves to God by an indissoluble obligation, but were at liberty to quit their retirement, and return into the world, whenever the fervor that drove them out of it, came to abate. See **ANACHORET**, &c.

*Vows* were not introduced till long after; and that to fix the too frequent inconstancy of such as, after retiring from the world, represented themselves too soon, or too slightly; and by that means scandalized the church, and disturbed the quiet of families by their return.

Erasmus will have it, that solemn *vows* were not introduced till the thirteenth century, under the pontificate of Boniface VIII.—Others hold them as antient as the council of Calcedon: but the truth is, before Boniface VIII. there were none but simple *vows*, and such as might be dispensed withal.—Their *vows*, till that time, were not deemed eternal chains; they were not indissoluble. It is true, they were obligatory promises, as to conscience, and the inconstancy of such as violated them, was held an odious desertion: but, as to law, the persons were not held to be civilly dead, so as, upon their return, to render them incapable of all acts of civil society.

The most common *vow* was that of poverty, but this only regarded the convent; on account of which, every person divested himself of all property: but the making of *vows* did not at all exclude them from the rights of blood, or render them incapable of inheriting.

No religious, it is true, acquired the property of the effects that fell to him; they all belonged to the monastery, in favour of which he had divested himself of every thing; and the monastery only left him the usufruct and direction of them.—The popes have frequently confirmed this privilege to divers orders, and permitted the monks to inherit, as much as if they were seculars, and had made no *vows*.

At present, the civil death of a religious is dated from the day he makes the *vows*; and from that time he is utterly incapable of inheriting.—A religious may reclaim, or protest against his *vows* within five years; but after that, it is no longer admitted.—The failures in the profession, are esteemed to be purged, by his silence and perseverance for five years.

—Indeed, to be relieved from his *vows*, it is not enough the party reclaim within the five years; but he must likewise prove he was forced to take the habit.

**VOWS**, **VOTA**, among the Romans, signify sacrifices, offerings, presents, and prayers, made for the emperors and cæsars, particularly for their prosperity, and the lastingness of their empire.

These were, at first, made every five years, then every fifteen, and then every thirty, called *quinquennialia*, *decennialia*, and *vicennialia*. See **DECENNALIA**, **VICENNALIA**, and **QUINQUENNALIA**.

In divers antique medals and inscriptions, we read, *Vot. X. Vol. XX. Vol. mult.* signifying *volis decennialibus, vicennialibus, multis*, &c. See **VOTIVE**.

**VOWEL**, **VOCALIS**, in grammar, a letter which affords a complete sound of itself; or a letter so simple, as only to need a bare opening of the mouth to make it heard, and to form a distinct voice. See **LETTER**.

Such are *a, e, i, o, u*; which are called *vocales, vowels*, in contradistinction to certain other letters, which depending on a particular application of some part of the mouth, as the teeth, lips, or palate, can make no perfect sound without an opening of the mouth, that is, without the addition of a *vowel*; and are therefore called *consonants*. See **CONSONANT**.

Though we ordinarily only reckon five *vowels*, yet, besides that each of these may be either long or short, which occasions a considerable variety in the sound: to consider only their differences resulting from the different apertures of the mouth, one might add four or five more *vowels* to the number.—For the *e* open, and the *e* close, are different enough to make two *vowels*, as in *sea*, and *depth*; so also the *o* open, and *o* close, in *host*, and *organ*.—Add, that the *u* pronounced *ou*, as the Latins did, and as the Italians and Spaniards still do, has a very different sound from the *u*, as pronounced by the Greeks, and, as at this day, by the English and French.—Again, *eo*, in *people*, make but one simple sound, though we write it with two *vowels*.

Lastly, the *e* mute is, originally, no more than a surd joined to a consonant, when that is to be pronounced without a *vowel*, as when it is immediately followed by other consonants, as in the word *scamnum*.—This is what the Hebrews call *scheva*, especially when it begins the syllable: and this *scheva* is found in all languages, though overlooked in many of them, particularly the English, Latin, &c. by reason it has no proper character to denote it; though, in some of the vulgar tongues, particularly French and High-Dutch, it is expressed by the *vowel e* adding its sound to the rest.

Thus, without regarding the differences of the same sound or *vowel*, as to length or shortness, one may distinguish ten several *vowels*, expressed by the following characters, *a, e, i, o, u, ô, eu, au, u, e*, mute. See **ALPHABET**.

**VOX**, in law—*VOCES non habere*, is a phrase used by Bracton and Fleta, for an infamous person; one who is not admitted to be a witness. See **INFAMOUS**, **VILLAINOUS**, &c.

**UP-LAND**, denotes high ground, or, as some call it, *terra firma*: by which it stands opposed to such as is moorish, marshy, or low.—Or, it is pasture-land, which lies so high, as not to be overflowed with rivers, or land-floods. See **GROUND**.

**UPPER Hemisphere.**  
**UPPER Ocean.**  
**UPPER polar Dial.**  
**UPPER Region.**

See the article { **HEMISPHERE.**  
**OCEAN.**  
**DIAL.**  
**REGION.**

**UPRIGHT**, in architecture, a representation or draught of the front of a building; called also, an *elevation*, or *orthography*. See **ELEVATION**, **ORTHOGRAPHY**, **PLAN**, &c.

**UPRIGHT**, in heraldry, is used in respect of shell-fishes, as crevices, &c. when standing erect in a coat.—Inasmuch as they want fins, they cannot, according to Guillim, be properly said to be *hauriant*; that being a term appropriated to scaly fishes.

**URACHUS**, **ΟΥΡΑΧΟΣ**, in anatomy, a membranous canal in a foetus, proceeding from the bottom of the urinary bladder, through the navel, to the placenta, along with the umbilical vessels, whereof it is esteemed one.—See *Tab. Anat. (Splanchn.) fig. 1. lit. f. f. fig. 3. lit. e. d. fig. 8. lit. n. fig. 16. lit. n.* see also the articles **UMBILICAL Vessels**, and **FOETUS**.

The termination of the *urachus* in the placenta, forms a little oval vesica, or bladder, which serves to receive the urine secreted in the kidneys of the foetus, and that could not make its way through the urethra, by reason of the resistance of the sphincter of the bladder, which is not to be overcome, but by inspiration.

The humour found in the vesica of the *urachus*, is still in the greater quantity, the higher coloured, and the more like urine, as the foetus is nearer the time of the birth.

The *urachus* is not plainly found any where but in brutes; but there is no dispute but that it exists in a human foetus. See **FOETUS**.

M. Drelincourt, a celebrated professor of anatomy at Leiden, and some others after him, deny the *urachus* to be hollow: on

# U R E

on which supposition it would not be easy to assign its use, unless to keep the bladder suspended to the navel. But the former opinion seems the best warranted. See URINE.

URAN. See the article OURAN.

URANIBOURGH, a term often heard among astronomers, being the name of a celebrated observatory, in a castle in the little island Veena, or Huena, in the Sound; built by that noble Dane, Tycho Brahe, and furnished with instruments for observing the course and motions of the heavenly bodies. See OBSERVATORY.

This famed observatory, finished about the year 1580, did not subsist above seventeen years; when Tycho, who little thought to have erected an edifice of so short a duration, and who had even published the figure and position of the heavens, which he had chose for the moment to lay the first stone in, was obliged to abandon his country.

Soon after this, those to whom the property of the island Huena was given, made it their business to demolish *Uranibourgh*: part of the ruins were dispersed into divers places, the rest served to build Tycho a handsome seat upon his ancient estate, which, to this day, bears the name of *Uranibourgh*.—For as to the antient *Uranibourgh*, there is now no footsteps remaining.—It was here Tycho composed his catalogue of the stars. See CATALOGUE.

M. Picart, making a voyage to *Uranibourgh*, found Tycho's meridian line drawn thereon, to deviate from the meridian of the world; which confirms the conjecture of some, that the position of the meridian line may vary. See MERIDIAN.

URBICARY Provinces. See the article SUBURBICARY.

URDE', or URDE'E, in heraldry.—A cross *urde*, seems to be the same with what we otherwise call *cleché*. See CLECHE'.

URED O, the blasting or blighting of trees, or herbs. See BLIGHT, RUBIGO, DISEASES of plants, &c.

URED O, is sometimes used by physicians, for an itching, or burning in the skin. ITCH.

URENTIA, are sometimes used for medicines of a hot or burning quality. See CAUSTIC.

URETERS\*, OYPHTHEE, in anatomy, two long and slender canals, which come from the basin of the kidneys, one on each side, and terminate in the bladder; serving to convey the urine, secreted in the glands of the kidneys, into the bladder.—See *Tab. Anat. (Splanch.) fig. 1. lit. g. g. fig. 4. lit. f. fig. 8. lit. m. m. fig. 9. lit. II.* see also the articles KIDNEY, BLADDER, and URINE.

\* The word is formed from the Greek *ουρ*, *meiere*, to make water.

The *ureters* lie between the doubling of the peritonæum; and descending in the form of an S, pierce the bladder near its neck, where they run, first, some space betwixt its coats, and then open into its cavity.

They are composed of three coats.—The first is from the peritonæum; the second is made of small oblique muscular fibres; and the third, which is very sensible, has several small glands, which separate a slimy liquor, to defend it against the acrimony of the urine.

The neighbouring parts furnish them with blood-vessels; and they have nerves from the intercostal, and the vertebræ of the loins.—Their cavity is sometimes contracted in three or four places, especially towards the bladder.

Such as are subject to the gravel, and given to excessive drinking, have them sometimes so much dilated, that one may put the end of ones little finger into them. See STONE, and GRAVEL.—Their obstruction causes a suppression of the urine. See URINE.

URETHRA, OYPHOPA, in anatomy, a tube or canal arising from the neck of the bladder, and continued to the pudendum; serving to discharge, or carry off the urine out of the bladder. See *Tab. Anat. (Splanch.) fig. 8. lit. u. u. fig. 15. lit. d. f. m. m.* see also URINE.

Some will have it to be only a production of the neck of the bladder itself.—Its length is very different in the two sexes.—In man it terminates in the extremity of the glans, and is ordinarily a foot long.—In women, where it is usually called *meatus urinarius*, it is but two fingers breadth long, and terminates in the vulva; but it is much wider, and more easily dilated here, than in the other sex. See PENIS, and MEATUS.

Mr. Cowper gives us an instance of a woman, wherein the hymen was so firm and impervious, that her husband finding no passage through it, had opened himself another through the orifice of the *urethra*. See HYMEN.

The *urethra* is composed of two membranes, and a little spongy substance, like that of the corpora cavernosa; except at the end which joins the neck of the bladder; where the distance between the membranes is small, and filled up with a thin and red glandulous substance, whose excretory ducts, piercing the inner membrane, pour into the pipe a mucilaginous liquor, which lines and lubricates its cavity, and prevents the salts of the urine from galling it; as having a farther office in the male sex, viz. the emission of the seed. See SEED, CAVERNOSUM, and MUCUS.

# U R I

URIGO, a burning with a caustic, or cautery. See CAUSTIC, CAUTERY, and BURN.

URIM and Thummim, אורים וטומים q. d. *light and perfection*, the name of a kind of ornament belonging to the habit of the Jewish high-priest; in virtue whereof he gave oracular answers to the people. See PROPHECY, &c.

The high-priests of the Jews, we are told, consulted God in the most important affairs of their commonwealth, and received answers by the *urim and thummim*.—What these were is disputed among the critics: some take them to be the 12 precious stones in the breast-plate of the high-priest, which shone like a flame of fire. See RATIONALE.

Others will have them, the theraphim, or little human figures carried by the high-priest, hid in the fold of his robe or gown, and by which he answered the questions of the Jews. See THERAPHIM.

Diodorus Siculus relates, that there was a like ceremony in use among the Egyptians, whose principal minister of justice wore a collar of precious stones about his neck, which was called *αλφεια*, truth.

URINAL, in medicine, a vessel fit to receive and hold urine; and used accordingly, for the convenience of sick persons. See URINE, and UROCRITERIUM.

It is usually of glass, and crooked; and sometimes filled with milk, to assuage the pain of the gravel.

URINARIA *Fistula*, is the same as *urethra*; so called from its office, to convey the urine. See URETHRA.

Vesica URINARIA. See the article BLADDER.

Meatus URINARIUS. See the article MEATUS.

URINARY Bladder. } See the article { BLADDER.

URINARY Passage. } See the article { URETHRA.

URINE\*, URINA, a liquid excrement, or humour, separated from the blood in the kidneys, conveyed thence into the bladder, and discharged by the urethra. See EXCREMENT.

\* The word is formed from the Greek *ουρα*, which signifies the same.

The *urine* is secreted from the arterial blood, in the glands of the kidneys; from which arise numerous little pellucid pipes and veins; which, receiving the secreted *urine*, at length join into twelve papillæ; out of which the *urine* oozes into a cavity called the *pelvis*, from whence it runs into the ureters of either side, and through them into the bladder; and from that, at length, through the urethra, out of the body. See KIDNEYS, PAPILLÆ, PELVIS, URETER, BLADDER, and URETHRA.

The secretion of the *urine*, then, is not performed by any attraction, as some will have it; or by any emulsion, as others; or any fermentation, as others; or any precipitation, as others: but by the force of the heart, and arteries, whereby the blood is driven through innumerable turnings and windings of the vessels; attenuated by resistances, opposite motions, violent concussions, and various mixtures, till the more liquid and serous part thereof is forced through canals smaller than the blood-vessels, and so collected and discharged. See SECRETION.

It is more than probable, that the blood of the emulgent artery, conveyed through all the little branches that spread through the exterior membranes of the vesiculæ whereof the kidneys are composed, being by this means exceedingly divided, and, as it were, attenuated, enters the vesiculæ themselves, and gives them their red colour; that it is there filtrated, and the serous or *urinous* part secreted; that this filtration is promoted by the alternate contraction and dilatation of the fleshy fibres that inclose the little vesicles; and that after filtration, the parts that remain blood are resumed by the capillary branches of the veins; the rest entering the excretory ducts of the vesiculæ, which are the first receptacle of the *urine*. *Hist. Acad. des Sciences, Anno 1705.*

M. Morin, in the *Memoirs of the Academy of Sciences*, marks out a new rout, or course for the *urine*.—The ordinary one, which is the passage of any liquor we drink through the stomach into the intestines, thence into the lacteals, thence into the receptacle of the chyle, thence into the sub-clavian vein, thence into the cava, thence into the right ventricle of the heart, thence into the lungs, and thence into the left ventricle of the heart; thence into the aorta, thence into the emulgent artery, thence into the kidneys, thence into the ureters, and at last into the bladder, seems too long and circuitous; considering how readily mineral waters pass, and what a speedy effect asparagus is found to have on our *urine*.—Besides, that on this principle, the liquors we drink mixing with so many other liquors in their way, should be greatly altered thereby; whereas we frequently find a tincture of cassia, rendered by *urine* almost as black as when first taken: and the like is observed of divers other liquors.

M. Morin therefore, maintains, that a good part of the liquor we drink, oozes through the membranes of the stomach, and falls into the pelvis; where it enters the bladder through the pores thereof, without getting into the intestines, which are

are lined with too thick and viscid a humour to allow it ingress.

This system is confirmed hence, that both the stomach and bladder, even of a dead animal, are found easily permeable to water.

Accordingly, Dr. Morgan assures us, that if the contents of the abdomen be taken out of an animal body, after it is just opened, and the stomach be filled with warm water, while the parts are yet reaking, the liquor will pass into the bladder; which will visibly receive it, and be filled in proportion as the stomach empties.

The same author adds, that if a ligature be made upon the ureters, while the animal is yet living, and the blood continues to circulate; though this must cut off all communication from the kidneys to the bladder; yet any liquor, with which the stomach is filled, will pass into the bladder.

From the whole, though some of our best anatomists hold that a circulation of the whole mass of blood is effected in five minutes, and others in two, which might account for the quick passage of the *urine*, it is hard to conceive, but that part of it must go immediately from the stomach into the bladder.

The general design of nature in this new *urinary* drain, is supposed to be to prevent any sudden plethora, or immoderate distension of the vessels upon drinking. See *DRINK*, &c. As a necessary consequence of this system, the author establishes two kinds of *urine*; the one filtrated immediately out of the stomach into the bladder, the other passing the long course of circulation.

In the *Philosophical Transactions*, we have an instance given us, by Mr. Young, of a boy six years old, that pissed off almost all his *urine* by his navel.

In the same *Transactions*, Dr. Richardson gives an account of a boy at North Bierly in Yorkshire, who lived to seventeen years of age without ever making water; yet was in perfect health.—He had constantly a diarrhoea on him, but without much uneasiness. The obstruction, that author observes, must have been in his kidneys; for he had never any inclination to make water.

*Urine*s are of various kinds and properties.—After drinking plentifully of any aqueous fluid, the *urine* is crude, insipid, void of smell, and easily retained.—That yielded by chyle well concocted, is sharper, more saline, less copious, somewhat fetid, and more stimulating.—That from chyle already converted into serum, is redder, sharper, saltier, and more fetid and stimulating.—And that secreted after long abstinence, from humours well concocted, and worn off the solid parts, is the least copious, sharpest, saltest, reddest, most fetid, almost putrified, and of all others the hardest to retain. The *urine*, therefore, contains the watery part of the blood, its sharpest, subtilest, and most volatile salt, and that nearest to the alkaline kind; its sharpest, smallest, and most volatile oil, and that nearest to putrefaction; and its smallest most volatile earth. See *BLOOD*.

The sal armoniac of the antients was prepared from camels *urine*. See *ARMONIAIC*.—And the phosphorus, in use among us, from human *urine*. See *PHOSPHORUS*.—Saltpetre is likewise prepared from the *urine*, and other excrements of animals. See *SALT-PETRE*.

The Indians scarce use any other medicine but cows *urine*.—The Spaniards make great use of *urine* to clean their teeth withal: so did the Celtiberians of old.

*Urine* is also used in dying, to ferment and warm the woad.—Old *urine* tinges silver with a fine gold colour. See *DYING*.

The disorders in the *urine* are various. See *STRANGURY*, *RETENTION*, *DIABETES*, *STONE*, *NUBECULA*, &c.

**URINE**, in medicine.—The *urine* affords one of the principal criterions, or signs, whereby physicians judge of the state of the patient, and the course of the disease. See *SIGN*, *SYMPTOM*, *DISEASE*, &c.

In casting, or examining *urine*, the things to be considered are its *quantity*, *colour*, *smell*, *taste*, *fluidity*, and the matters swimming therein.

An *abundance* of *urine*, indicates a looseness of the renal pipes, a diminution of perspiration, sweat, saliva, an imperfect mixture of the blood, whereby the watry parts separate easily from the rest; a nervous indisposition, a copious drinking of some aqueous liquid, or some diuretic taken.—Such *urine* prefigures a thickens of what is left behind, and its acrimony; thirst, anxiety, obstructions, and their effects, a dry, thirsty, hot consumption.

A contrary state of the *urine*, indicates the contraries; and prefigures future repletions, heaviness, drowsiness, convulsive tremors, &c.

A *thin*, *limpid*, *insipid*, *colourless*, *tasteless* *urine*, denotes a great constriction of the renal vessels, and, at the same time, a brisk agitation of the humours; a strong cohesion of the oil, salt, and earth in the blood itself, and an imperfect mixture of the aqueous parts therewith; some grievous indisposition of the mind, a hysteric or hypochondriac fit; a debility of the viscera; crudity, pituita, obstructions of the vessels;

and, in acute diseases, a want of a coction and crisis.—Such *urine* portends much the same as a too copious *urine*; and, in acute inflammatory diseases, a bad condition of the viscera, deliria, phrensies, convulsions, death.

*Ruddy urine*, without any sediment, in acute diseases, indicates a violent motion and attrition among the parts that constitute the humours, and between the vessels and the humours; a close intimate mixture of the oil, salt, earth, and water in the humours: and hence a great crudity of the disease, and its long duration, and great danger.—Such *urine* prefigures gangrenous obstructions of the finest vessels, chiefly those of the brain and cerebel, and thence death: a difficult coction; a slow, doubtful crisis: and all these the worse, as the *urine* is redder, and freer of sediment.—If there be a heavy, copious sediment, it shews a strong antecedent attrition, loose vessels, sharp, saline, colliquated blood, unfit for nutrition, intermitting fevers, and scurvy.

The prefigures are, the durableness of the disease, wearing of the vessels, weakness, colliquative sweats, saliva, atrophy, and dropsy.—If the sediment in such *urine* be branny, scaly, filmy, &c. it prefigures the like, only worse.

A *yellow urine*, with a sediment as before, denotes a jaundice, and the symptoms thereof in the cutis, stools, hypochondriums, &c.

A *green urine*, with a thick sediment, denotes an atrabiliary temperature, and that the matter thereof is resolved, and now excreted: consequently anxieties about the præcordia, perturbations of stool, iliac and colic pains.

*Black urine*, denotes the same with green, only in a greater and worse degree.

Blood, pus, caruncles, filaments, hairs, anguillæ, grumæ, sand, parts of stone, and a mucus at the bottom of the *urine*, denote some disorder in the kidneys, ureters, bladder, testicles, feminal vesicles, prostata, and urethra.

*Fatty urine*, generally breeds small sands, adhering to some viscid matter, and thus produces a sort of oily membrane, or pellicle, which denotes an abundance of earth, and a heavy salt in the blood, and prefigures the scurvy, stone, &c.

A *fetid urine*, denotes the salts and oils to be attenuated, dissolved, and almost putrified; whence very great danger, both in chronic and acute diseases.

*Urine* which, when shook, retains its froth long, denotes a tenacity of the mixture, and thence a difficulty of crisis; and pulmonic diseases, or catarrhs in a head.

But the *urine* is chiefly consulted in acute fevers, where it is a very sure sign: For, 1°. *Urine* with a white, light, equable, turbidated, inodorous sediment, through the whole course of the disease to the crisis, is a very good preface.—2°. Copious, white, strangurious *urine*, with much white sediment, emitted at the time of the crisis, cures and takes away abscesses. 3°. A thin, ruddy *urine*, that does not subside a white, thin, watery *urine*; a thin, equable, yellow *urine*; a turbid *urine*, that does not subside, denotes, in very acute diseases, a great crudity, a difficult crisis, and a durable dangerous disease.

**URINE**, in agriculture, is of excellent use as a manure. See *MANURING*.

The knowing in agriculture and gardening, prefer *urine* for land, trees, &c. before dung; as penetrating better to the roots; and removing divers infirmities of plants.

The decay of the antient Kentish pippins, is a thing much complained of; and Mr. Mortimer observes, they will be quite lost, unless some persons set themselves to the antient way of culture; which, as all antient graziers and gardeners know, was by washing the mossy, worm-eaten, cankered, and unsound trees, two or three time in the month of March, with the *urine* of oxen, &c. gathered in earthen vessels, placed under the planks of the stalls wherein they were fattened.

In Holland, and in divers other parts, they preserve the *urine* of their beasts, &c. with as much care as their dung.—Mr. Hartlib, Sir Hugh Plat, Mr. Mortimer, &c. make a common complaint, that so great an improver of land, and so remarkable a strengthener of manure, should be so much disregarded among us.

**URINOUS Salts**, are the same with what we otherwise call *alkali salts*, or *alkalies*. See *ALKALI*.

There are two kinds of *urinous salts*, the one *fixt*, the other *volatile*.—The *fixt* prevail in plants, and the *volatile* in animals. See *SALT*, *FIXT*, and *VOLATILE*.

They are called *urinous*, in respect of their taste, and smell, which bear some resemblance to those of urine.

**URN**, *URNA*, a kind of vase, of a roundish form, but biggest in the middle, like the common pitchers; now seldom used, but in the way of ornament over chimney-pieces, in buffets, &c. or, by way of acroters, a-top of buildings, funeral monuments, &c. See *VASE*, and *ACROTER*.

The great use of *urns*, among the antients, was to preserve the ashes of the dead, after they were burnt: for which reason they were called *cineraria*, and *urnæ cineraria*; and were placed sometimes under the tomb-stone, whereon the epitaph

epitaph was cut; and sometimes preserved in vaults in their own houses. See SEPULCHRE, TOMB, and FUNERAL. Urns were also used at their sacrifices, to put liquid things in. See SACRIFICE.— They were also of use in the *sortes prænestinae*, or casting of lots. See SORTES.

At Rome, too, the custom was to absolve or condemn the accused, by the suffrages, or calculi, which the judges cast into the *judicatory urn*. See ABSOLUTION, &c.

Virgil represents Minos the judge of hell, shaking the *urn*, to decide the lots of mankind — *Quasitor Minos urnam movet*.

The *urn* is still the attribute of rivers, which are painted leaning on *urns*, representing their sources by the waters flowing therefrom.— We find them represented in the same manner on antique medals, and reliefs. See RIVER, and ATTRIBUTE.

URN, URNA, was also a Roman measure, for liquid things; containing about three gallons and a half of English wine-measure. See MEASURE.

The *urn* was half the amphora, and four times the congius. See AMPHORA.

UROCRITERIUM\*, or UROCRISIA, a casting of water; or giving judgment on diseases by the sight of the urine. See URINE.

\* The word is compounded of *ur*, urine, and *κρισις*, criterion, mark, sign.— Hence also, *uramancy*, *uroscopy*, &c.

URSA, in astronomy, the *Bear*, a name common to two constellations of the northern hemisphere, near the pole; distinguished by *major*, and *minor*. See CONSTELLATION.

URSA *major*, or the *great bear*, according to Ptolemy's catalogue, consists of 35 stars; according to Tycho's, of 56; but, in the Britannic catalogue, we have 215.— The longitudes, latitudes, magnitudes, &c. whereof, are as follow.

URSULINES, an order of nuns, who observe the rule of S. Augustin; and are chiefly noted for taking on them the education, and instruction of young maids. See ORDER, and RELIGIOUS.

They take their name from their institutress S. Ursula; and are clothed in white, or black.— The *Ursulines* have spread exceedingly in France, &c. within these few years.— Few maids but are put out to school to them.

USAGE, in law } See { PRESCRIPTION, and CUSTOM.  
USAGE, in language. } See { LANGUAGE.

USANCE, *Uso*, in commerce, is a determinate time for the payment of bills of exchange, reckoned either from the day of the bills being accepted, or from the day of their date; and thus called, because regulated by the usage and custom of the places whereon they are drawn. See BILL, and EXCHANGE.

Bills of exchange, are drawn at one or more *usances*, either from sight, or from date.— The Italians say *uso doppio*, for double *usance*, or two *usances*.

This term is longer or shorter, according to the different countries.— In France *usance* is fixed at thirty days.— At London, *usance* is a calendar month; and double *usance*, two months.— In Spain, *usance* is two months, or sixty days.— At Venice, Genoa, and Leghorn, three months.

At Hamburgh, *usance* of bills drawn from England, France, and Venice, is two months after date.— From Antwerp, and Nuremberg, fifteen days after sight.

At Venice, *usance* of bills drawn at Ferrara, Bologna, Florence, Lucca, and Leghorn, is five days after sight.— From Naples, Ausbourg, Genoa, and Vienna, fifteen days after sight.— From Mantua, Modena, and Milan, twenty days after date.— From Amsterdam, Antwerp, and Hamburgh, two months after date; and from London, three months after date.

At Milan, *usance* of bills drawn from Genoa, is eight days after sight.— From Rome, ten days after sight. And from Venice, twenty days after date.

At Florence, *usance* of bills drawn from Bologna, is three days after sight.— From Rome, ten days after sight.— From Venice and Naples, twenty days after date.

At Rome, *usance* of bills of exchange drawn in Italy, was, originally, ten days after sight; but, by an abuse, this term has been extended to fifteen.

At Leghorn, *usance* of bills drawn from Genoa, is eight days after sight: from Rome, ten days; from Naples, three weeks: from Venice, twenty days after date: from London, three weeks; and from Amsterdam, forty days.

At Amsterdam, *usance* of bills drawn from England and France, is a month after date: from Venice, and Madrid, Cadix, and Sevil, two months.

At Genoa, *usance* of bills from Milan, Florence, Leghorn, and Lucca, is eight days after sight: from Venice, Rome, and Bologna, fifteen days: from Naples, twenty two days: from Sicily, a month after sight, or two months after date: from Sardinia, a month after sight: from Antwerp, Amsterdam, and other places in the Low Countries, three months after date.

USE, *Usus*, in law, denotes the benefit or profit of lands, and tenements. See USUFRUIT.

*Ufe* imports a trust and confidence reposed in a man for the holding of lands; that he to whose use or benefit the trust is intended, shall reap the benefits thereof.

A deed consists of two principal parts: the *premises*, which include all that comes before the habendum, or limitation of the estate; and the *consequent*, which is the habendum itself; wherein

wherein are two limitations: the one of the *estate*, or property the party shall receive by the deed.—The other of the *use*, expressing to, or for what *use* and benefit he shall have the same. See DEED.

*Uses*, say some, were invented upon the stat. of Westminster, *quia emptores terrarum*: before which time, no such *uses* were known.—And because, in course of time, many deceits got footing, by settling the possession in one man, and the *use* in another; it was enacted, anno 27 Hen. VIII. That the *use* and possession of lands should stand united, or that the possession should be given to him who had the *use*.

USE and Custom, in antient law-books, denotes the ordinary method of acting or proceeding in any case, which, by length of time, has obtained the force of law. See CUSTOM, PRESCRIPTION, LAW, &c.

*Cestui qui USE.* } See the article { CESTUI.  
*Contingent USE.* } CONTINGENT.

USER de Action, in law, is the pursuing, or bringing an action, in the proper county, &c. See ACTION, PROCESS, &c.

USES and Customs of the sea, are certain maxims, rules, or usages, which make the base or ground-work of the maritime jurisprudence; by which the policy of navigation, and commerce of the sea, are regulated. See NAVIGATION, COMMERCE, &c.

These *uses* and customs consist in three kinds of regulations.—The first, called *laws*, or *judgments of Oleron*, were made by order of queen Eleanor, dutchess of Guienne, at her return from the holy war; and that chiefly from memoirs which she had gathered in the Levant, where commerce was at that time in a very flourishing condition.

She called them *rolls of Oleron*, by reason she then resided in an island of that name, in the bay of Aquitaine.—They were much augmented about the year 1266, by her son Richard, king of England, on his return from the Holy Land. The second regulations were made by the merchants of Wisbuy, a city in the island of Gothland, in the Baltic, antiently much famed for commerce, most of the nations of Europe having their quarters, magazines, and shops therein.

These were compiled in the Teutonic language, and are still the rule in the northern countries. Their date does not appear; but it is probable they were made since the year 1288, that the city of Wisbuy was destroyed the first time, afterwards restored by Magnus, king of Sweden.

The third set of regulations were made at Lubec, about the year 1597, by the deputies of the Hanse towns. See HANSE.

USHER, *Huissier*, signifies an officer, or servant, who has the care and direction of the door of a court, hall, chamber, or the like.

In the king's household there are two *gentlemen-usbers* of the privy-chamber, appointed to attend the door, give entrance, &c. to persons that have admittance thither.—Four *gentlemen-usbers*, waiters; and an assistant *gentleman-usber*.—Eight *gentlemen-usbers*, quarter-waiters in ordinary.

In the French court there are two *ushers* of the anti-chamber, or hall where the king dines in public.—They wait sword by side, all the year, and open the door to such as are to come in.—There are above sixteen *ushers* of the chamber, two of the cabinet, and one of the order of the Holy Ghost.

The *ushers* of the inquisition in Spain and Portugal, are persons of the prime quality, who think themselves highly honoured, by only looking to the doors of the sacred tribunal. See INQUISITION.

USHER, is also used for an officer in the Exchequer; of which sort, three or four attend the chief officers and barons, at the court at Westminster, and juries, sheriffs, and other accomptants, at the pleasure of court. See EXCHEQUER.

USHER of the black-rod. See the article BLACK-ROD.

In a chapter held at Whitehall, 13 Car. II. it was ordained that this office should be fixed to one of the *gentlemen-usbers* daily waiters at court; the eldest of which always holds the place; and is called *gentleman-usber*, and *black-rod*. See GARTER.

In relation to the order of the garter, he is appointed to carry the rod at the feast of S. George, and other solemnities, which he makes use of as an authority to attach delinquents, who have offended against the statutes of the order, which he frequently doth by touching them therewith.—He wears a gold badge, embellished with the ensigns of the order.—He has an house in Windsor-castle, and other privileges.

USNEA, in natural history, *muscus arboreus*; a sort of plant of the parasite or moss kind, growing like a great beard on the oak, cedar, and divers other trees. See MOSS, and PARASITE.

USNEA Humana, is a small greenish moss, growing on human skulls, that have lain a long time exposed to the air.

It is very astringent, and held proper to stop hæmorrhages.—It is also an ingredient in the weapon-salve of Paracelsus, and Crolius.

USQUEBAUGH, a strong, rich, compound liquor, chiefly taken by way of dram; its basis being brandy, or rectified spirits of wine.

The process is somewhat various, and the ingredients nutritious.—We shall give one much commended formerly, as a specimen.

To two gallons of brandy, or spirits, put a pound of spanish liquorice, half a pound of raisins of the sun, four ounces of currants; three of dates sliced; tops of thyme, bawm, savory, and mint, and tops or flowers of rosemary, of each two ounces; cinnamon and mace bruised, nutmegs, anis seeds and coriander seeds, bruised likewise, of each four ounces; citron, or lemon and orange peel, scraped, of each an ounce.

All these to be left to infuse 48 hours in a warm place, often shaking them together: then set them in a cool place, for a week; after which the clear liquor is to be decanted off, and to it an equal quantity of neat white port-wine, and a gallon of canary, are to be added.—The whole to be sweetened with a proper quantity of double refined sugar.

USTION\*, USTIO, in pharmacy, the preparing of certain substances, by burning them.

\* The word is formed from the Latin *urere*, to burn.

The antients made use of the *ustion* of horns, nails, feathers, and other parts of animals, for divers remedies: and the moderns still use *æs ustum*, which is burnt copper, or copper that has undergone the *ustion*, with sulphur. See *Æs USTUM*.

The *ustion* of minerals, is a more imperfect kind of calcination. See CALCINATION.—It is a degree beyond torrefaction. See TORREFACTION.

USTUM *Æs*. See the article *Æs USTUM*.

USUCAPTION, *Usucapio*, in the civil law, is an acquisition of the property of a thing, by a possession and enjoyment thereof for a certain term of years prescribed by law. See POSSESSION.

Some make a difference between *prescription* and *usucaption*, maintaining, that the latter is only used with regard to moveables, and the former with regard to immoveables.—But there is no essential difference between them; and accordingly, *prescription* and *usucaption*, are generally held synonyma's. See PRESCRIPTION.

USUFRUIT, *Usus-fructus*, in the civil law, the use or enjoyment, of any lands or tenements: or the right of receiving the fruits and profits of an inheritance, or other thing, without a power of alienating, or changing the property thereof. See USE, and POSSESSION.

When the *usufructuary* dies, the *usufruit* returns to the proprietor.—The dower to the jointure of a widow, is only an *usufructuary* due; that is, she only enjoys the *usufruit* thereof, and cannot dispose of the principal. See DOWER.

All mutual presents between man and wife, only import the *usufruit* of the goods of the first that dies, to the profit of the survivor.—The incumbents of benefices are only *usufructuary*. See BENEFICE.—An *usufructuary* has full right over the coppice; but cannot fell timber-trees.

USURER, a person charged with a habit or act of *usury*. See USURY.

The laws of our antient Saxon and Norman kings, are very severe upon *usurers*, or letters-out of money upon interest.—*Usurarios quoque defendit rex Edvardus (confessor) ne remaneret aliquis in toto regno suo; & si quis inde convictus esset, quod scenus exigerat, omni substantia propria careret & postea pro exlege habeatur: quoniam usura radix omnium malorum.* Leg. Edv. Confess. cap. 37.

They were indeed allowed to dispose of their goods before conviction, and whilst they were living; but after their death they were confiscate, if it could be proved they lent money to *use* within a year before their death. Matt. Paris.

If a clergyman were an *usurer*, his goods were not to be confiscated; but to be distributed to pious uses.—In those days *usury* was thus defined:

*Est usura suos quisquis tradit mihi nummos*

*Spe lucri, scenus duplex usura vocatur.*

USURIOUS Contract, is any bargain or contract, whereby a man is obliged to pay more interest for money than the statute allows. See INTEREST, CONTRACT, and USURY.

USURPATION, in law, is an injurious using, or enjoyment of a thing for continuance of time, that belongs of right to another. See USUCAPTION, and POSSESSION.

USURY, *Usura*, in the general, denotes a gain or profit, which a person makes of his money, by lending the same; or it is an increase of the principal, exacted for the loan thereof; or the price a borrower gives for the *use* of a sum credited to him by the lender: called also *interest*, and, in some antient statutes, *dry exchange*. See INTEREST, and EXCHANGE.

The word *usury* is usually taken in an evil sense, viz. for an unlawful profit which a person makes of his money; in which sense it is, that *usury* is forbidden by the civil and ecclesiastical law, and even by the law of nature: in this sense it also is, that it is held *usury* to lend money on pawns, to exact interest for money, without surrendering the principal, and to stipulate interest for money which is not employed in trade, nor brings any profit to the person who receives it: but

but as the Latin word *usura*, at least the plural thereof, *usuræ*, may be understood of a lawful interest, we do not see why *usury* may not be used in English, in the same harmless sense.

By the antient Roman law, people were allowed to lend out their money at one *per cent. per month*; which was 12 *per cent. per annum*.—If they received more, they incurred the note of infamy, and the overplus was charged on the principal.

This rate of *usury* was allowed of, as low as the time of Justinian, who moderated it a little by the 26th law in the code, *de usuris*. And not long after, the canon law forbid all sort of *usury* whatever.—In compliance with this prohibition, the customary laws do not allow any interest to be exacted, for money lent on a simple promise or obligation; but only by contract, and upon alienating the principal, which the debtor is to reimburse at pleasure: which is a kind of buying an annuity, or annual revenue.

So that in propriety, *unlawful usury* consists, in extorting an excessive rate for one's money, beyond what is prescribed by law. See *RATE*.

Du Moulin, indeed, makes *usury*, taken in the ill sense, to be a profit exacted for a loan made to a person in want; intimating, that it is unlawful to extort gain, from the assistance given to the unhappy, or to convert an office of humanity into a mercenary one.—The reason is, that money is a barren and fruitless thing, in the hands of a person whom necessity obliges to borrow; and that being lent him to be spent, he can make no advantage of it: whereas the principal pretext for requiring lawful interest is, that the person who lends, may share in the profits thereof, with the person to whom it is lent.

Notwithstanding, most of the antient canonists insist on a rigorous observation of that precept in Deuteronomy, *Non faneraberis fratri tuo*, Thou shalt not lend money to thy brother on *usury*: and plead, that nothing is to be required further than the principal.

However, in life, we call nothing *usury*, but what exceeds the bounds prescribed by the laws: so that when a person does not alienate his principal, or takes interest beyond what is limited by statute, these alone are *usury*.

By the stat. 12 Car. I. no man is allowed to take above six pounds, for the forbearance of one hundred pounds for one year, under certain penalties therein enjoined.—And by a later stat. 12 Annæ, no man may take above five pounds for the like occasion; and in proportion for any other sum.

U T, a Latin term, signifying, literally, *as*; much used in the stating of ratios and proportions. See *RATIO*, and *PROPORTION*.

Sir Isaac Newton assigns its use thus: if indeterminate quantities of divers kinds be compared together, and one of them be said to be *ut, as*, any other directly or inversely; the meaning is, that the first is increased or diminished, in the same ratio as the latter.—And if one of them be said to be, *ut, as*, two or more others directly, or inversely, the meaning is, that the first is increased or diminished, in a ratio, compounded of the ratios in which the others are increased or diminished.

Thus, if A be said to be *as* B directly, and *as* C directly, and *as* D inversely, the meaning is, it is increased or diminished, in the same ratio with  $B \times C \times D$ , that is, A and  $\frac{BC}{D}$

are to each other in a given ratio. *Phil. Nat. Princ. Math.*

U T, in music, the first of the musical notes. See *NOTE*.  
U t, *re, mi, fa*; the clef of G, *re, sol, ut*; of C, *sol, ut, &c.* See *SCALE*, &c.

This note, with the rest, were taken out of the hymn of S. John Baptist. *Ut queant laxis*, &c. See *MUSIC*.

UTFANGTHEF\*, an antient royalty, or privilege, granted to the lord of a manor by the king, giving him a power to punish a thief dwelling, and committing theft out of his liberty; if he be taken within the lord's fee.

\* *Utfangthes dicitur extraneus latro veniens aliunde de terra aliena, & qui captus fuit in terra ipsius qui tales habet libertates.* Bracon.

UTENSIL, UTENSILE, a little domestic moveable, belonging principally to the kitchen.—Such are pots, pans, plates, &c.

UTENSILS, are more particularly used in war, for the moveables which the host is obliged to furnish the soldiers quartered with him; which are, a bed with bed-cloths, a pot and a spoon.—They are likewise to have a place at their host's fire, and candle.—*Utenfils* are sometimes furnished in money, and sometimes in kind.

UTERINE, UTERINUS, something belonging to the uterus, or womb of women. See *UTERUS*, and *MATRIX*.  
*Uterine* brothers or sisters, as those born of the same mother, but different fathers. See *BROTHER*, &c.

Furor UTERINUS, in medicine, denotes a kind of madness, attended with lascivious speeches and gestures, and an invincible inclination to venery. See *FUROR*.

The *furor uterinus*, is a complication of hysterical symptoms

arising from a turgescency, or inflation of the *uterine* vessels. See *HYSTERIC*.

Men are subject to the like disease, as well as women; so that it might with more propriety be called, the *furor vene-reus*, or *venereal fury*.—It had its name *furor uterinus*, from an opinion, that it proceeded from vapours, rising from the womb to the brain.

It has been frequently found, that maids held to be possessed, were only seized with the *uterine fury*. See *POSSESSION*.

The *furor uterinus*, is usually supposed to consist in some irregular motion of the spirits, occasioned by a hot, lustful temperament, the conversation of debauched persons, or the reading of wanton books, hot foods, the abundance and acrimony of the serous matter which moistens the pudendum, suppression of the menses, large doses of cantharides, &c.

Before the paroxysm, the patient often appears silent and sorrowful, with a flushing in the face, and a respiration and pulse frequently intermitting, and suddenly varying.—During the paroxysm they burst sometimes into laughter, and then into a fit of tears, &c.

Bleeding, fætid suffiments, and other hysterical medicines, are proper during the fit.

UTERINUM *Jecur*. See the article *JECUR*.

UTERUS, in anatomy, *matrix*, or *womb*; that organ of generation in women, wherein the business of conception is performed, and wherein the embryo or foetus is lodged, fed, and grows, during the time of gestation, or till its delivery.

Its description see under the article *MATRIX*.—Its office, &c. under *GENERATION*, *CONCEPTION*, *GESTATION*, *FOETUS*, &c.

Fundus UTERI. } See the article } *FUNDUS*.

Procidencia UTERI. } See the article } *PROCIDENTIA*.

Vagina, or Cervix UTERI. See *VAGINA*, and *CERVIX*.

UTILE, a Latin term, signifying profitable or useful; sometimes used by English authors in the same sense.

The *utile* and the *dulce*, profit and delight, are both to be aimed at in poetry; but it is disputed which of them is to be aimed at in the first place.—Corneille says expressly, *Dans la tragedie l'utile n'entre que sous la forme du delectable*. See *POETRY*.

In the language of the philosophers, there is nothing *utile*, but what is just and honest: *nihil bonum nisi honestum: nihil malum nisi turpe*. Cic. de Fin. lib. 2.

UTILE Dominium. See the article *DOMINIUM*.

UTLAGARIÆ Perdonatio. See *PERDONATIO*.

UTLAGATIO, in law-term, an outlawry. See *OUT-LAWRY*.

UTLAGATO *Capiendo*, quando utlagatur in uno comitatu & postea fugit in alium, a writ for the apprehending a man who is outlawed in one country, and flies into another. See *OUTLAWRY*.

UTLAGATUM *Capias*. See the article *CAPIAS*.

UTLAGH, UTHLAGHUS. See the article *OUTLAW*.

UTLAND, *Outland*. See the article *INLAND*.

UTLARY, or UTLAWRY, UTLAGARIA. See *OUTLAWRY*.

UTRUM. See the article *ASSISE*, &c.

UTTER *Barrister*. See the article *BARRISTER*.

UVEA. See *TUNICA*.

UVEA (in anatomy) *aciniformis tunica*, the third tunic, or brane of the eye, thus called, as resembling the colour or figure of a grape. See *EYE*.

\* It is called—*uvea*, on account of its resembling the figure and colour of a grape, call'd, by the Latins, *uva*. For which reason also some have given it the name of—*Aciniformis*; from *acinus*, a grape-stone.

The hind part of this coat, or that the next, the orbit of the eye on each side, is called the *choroides*; and is derived from the *pia mater*.

The anterior, or fore part is, like the former, transparent, but thinner; and is, by authors, reckoned as a different tunic, and called *uvea*.

Of the duplicature of this part, is formed that striped, variegated circle, called the *iris*. See *IRIS*.

And in its middle is a perforation, through which appears a little black speck, which is the sight, or pupil of the eye; and about which the iris forms a ring. See *PUPIL*.

From the inside of this membrane, spring certain fibres, which spread themselves round the crystalline humour; serving to contract or dilate the sight at pleasure; and called the *ligamentum ciliare*. See *LIGAMENTUM*.

To the testicles belongs the *vaginalistunica*. See *ELYTROIDES*.

The

The antient *vulgate* of the Old Testament, was translated almost word for word, from the Greek of the Seventy. The author of the version is not known, nor so much as guessed at. See SEPTUAGINT.

It was a long time known by the name of the *Italic*, or old version; as being of very great antiquity in the Latin church. — It was the common, or vulgar version, before S. Jerom made a new one; whence its name *vulgate*.

Nobilius, in 1588, and F. Morin, in 1628, gave new editions of it; pretending to have restored, and re-collated it, from the antients who had cited it. — The *vulgate* was held by S. Augustine, to be preferable to all the other Latin versions then extant; as rendering the words and sense of the sacred text, more closely and justly than any of the rest. It has since been retouched from the corrections of S. Jerom; and it is this mixture of the antient Italic version, and some corrections of S. Jerom, that is now called the *vulgate*, and which the council of Trent has declared to be authentic.

It is this *vulgate* alone is used in the Romish church, excepting for some passages of the antient *vulgate* left in the missal, and the psalms; which are still sung, according to the old Italic version. See BIBLE.

**VULGATE of the New Testament.** — This the Romanists generally hold preferable to the common Greek text; in regard it is this alone, and not the Greek text, that the council of Trent has declared authentic: accordingly, that church has, as it were, adopted this edition. The priests read no other at the altar, the preachers quote no other in the pulpit, nor the divines in the schools.

Yet some of their best authors, F. Bouhours for instance, own, that among the differences that are found between the common Greek, and the *vulgate*, there are some wherein the Greek reading appears more clear and natural, than that of the Latin; so that the second might be corrected from the first, if the holy see should think fit. — But those differences, for the generality, only consist in a few syllables, or words; they rarely touch the sense. Besides, in some of the most considerable, the *vulgate* is authorized by several antient manuscripts.

Bouhours spent the last years of his life, in giving a French translation of the New Testament, according to the *vulgate*. In 1675, a new edition of the Greek Testament was published by the university of Oxford; and great care taken therein, to compare the common Greek text with all the most antient manuscripts in England, France, Spain, and Italy; and to note the differences observed therein.

In the preface of this work, the editors speaking of the divers versions of the Bible in the vulgar tongues, observe of the *vulgate*, that there is no version in any language to be compared with it. — And this they justify, by comparing passages that occur in the most celebrated Greek manuscripts, with the same passages in the *vulgate*, where there is any difference between that, and the common printed Greek copy. In effect, it is probable, that at the time the antient Italic, or *vulgate* version of the New Testament was made, and at the time it was afterwards compared with the Greek manuscripts, by S. Jerom; as they were then nearer the times of the Apostles, they had juster Greek copies, and those bet-

ter kept, than any of those used when printing was first set on foot, two centuries ago.

M. Simon calls the Greek version of the Seventy, before it was revised and reformed by Origen, *The antient vulgate Greek*. — Origen's correction got the upper hand of the antient Greek, and jostled it out of use; so that we have now scarce any copies thereof. See SEPTUAGINT.

**VULNERARY \***, in medicine, an epithet given to remedies, proper for the cure of wounds, and ulcers. See WOUND, and TRAUMATIC.

\* The word is formed from the Latin *vulnus*, wound.

There are divers *vulnerary* herbs; as aristolochia, or birth-wort; fanicle, or self-heal; plantain, mouse-ear, veronica, or fluellin, agrimony, vervein, or holy herb, &c.

There are also *vulnerary* potions, composed of various simples. — *Vulnerary* balms, unguents, plaisters, &c. See BAL-SAM, &c.

**VULNERARY Water.** See the article WATER.

**VULTUS de Luca**, the same with *veronica*. See VERONICA.

**VULVA \***, a name which some physicians give to the uterus, or womb. See MATRIX.

\* The word is Latin, *vulva*, quasi *valvae*, a door.

**VULVA** is sometimes also, though less properly, used for the cunnus, or pudendum muliebre. See GENITAL, and GENERATION.

**UVULA**, in anatomy, a round, soft spongy body, like the end of a child's finger; suspended from the palate, near the foramina of the nostrils, perpendicularly over the glottis. See GLOTTIS, LARYNX, VOICE, &c.

Its use is to break the force of the cold air, and prevent its entering too precipitately into the lungs. See RESPIRATION, LUNGS, &c.

It is formed of a duplicature of the membrane of the palate; and is called, by some authors, *columella*. and, by others, *gurguglio*. It is moved by two pair of muscles, and suspended by as many ligaments. — The muscles are, the *external*, called the *spheno-staphylinus*, which draws the *uvula* upwards, and backwards; and hinders the malicated aliment from passing into the foramina of the nostrils in deglutition. See SPHENOSTAPHYLINUS.

And the *internal*, called the *pterygo-staphylinus*; which draws the *uvula* upwards and forwards. See PTERYGOSTAPHYLINUS.

Both muscles move the *uvula* upwards, to give room for swallowing; and serve to raise it, when relaxed and fallen down. — In which case, it is usual to promote its rising, by applying a little beaten pepper on the end of a spoon to it. See DEGLUTITION.

Bartholin says, that such as have no *uvula* are subject to the phthisic, and usually die thereof; by reason the cold air, entering the lungs too hastily, corrupts them. See PHTHISIS.

**UVULÆ Procidencia.** See the article PROCIDENTIA.

**UXORIUM**, in antiquity, a fine, or forfeit paid by the Romans for not marrying. See MARRIAGE, POLITICAL Arithmetic, &c.

**UZIFIR, UZUFAR, or UZIFUR**, in chymistry, a name which some authors give to cinnabar. See CINNABAR.

## W A I

**W**, A letter particular to the northern languages, and people; as the English, Dutch, Polish, and others of Teutonic and Slavonic original. See LETTER, and ALPHABET.

The *w* is also sometimes admitted into the French, Italian, &c. in proper names, and other terms borrowed from the languages where it is used.

In English, the *w* is usually a consonant; and as such, may go before all the vowels, except *u*; as in *want*, *weapon*, *winter*, *world*, &c. See CONSONANT.

It is sometimes also a vowel; and as such, follows any of the vowels *a*, *e*, *o*, and unites with them into a kind of double vowel, or diphthong; as in *law*, *ewe*, *sow*, &c.

The English *w* is founded as in Latin, *u*, in *quantum*, *suadeo*, *lingua*.—Its sound is also commonly like the gross, or full *u* rapidly pronounced.—In French, the sound of the *w* does not differ from that of the single *v*. See U.

**WADD**, or **WADDING**, in gunnery, a stopple of paper, hay, straw, old cloths, or the like, forced into a gun upon the powder, to keep it close in the chamber; or put up close to the shot, to keep it from rolling out. See CHARGE, and TAMPION.

**WAFE**. See the article **WAIF**.

**WAF**.—*To waft a ship*, is to convoy her safe, as men of war do by merchants ships. See CONVOY.

*To make a WAF*, is to hang out some coat, sea-gown, or the like, in the main shrouds of the ship, as a sign for the men to come on board, &c.

Such *waft* is also frequently intended to shew that a ship is in distress, by a leak, &c. and therefore wants help from the shore, or from other ships.

**WAFTERS**, **WAFTORES**, conductors of vessels at sea. See CONVOY.

King Edward IV. constituted a triumvirate of officers with naval power, whom the patent styles *custodes*, *conductores*, and *waftores*; whose business chiefly was to guard our fishermen on the coasts of Norfolk, and Suffolk.

**WAGA**, or **VAGA**. See the article **WEIGH**.

**WAGAR**, **WAGING**, in law, *vadari*, signifies the giving security for the performance of any thing. See GAGE, PLEDGE, *VADARI*, &c.

Thus, *to wage law*, is to put in security that you will make law at the day assigned. See MAKE.

**WAGGON**, a kind of vehicle, or carriage in common use. See CARRIAGE, &c.

There are divers forms of *waggons*, accommodated to the divers uses they are intended for.—The common *waggon* consists of the *shafts*, or *radi*, which are the two pieces the hind horse bears up; the *welds*; the *flotes*, which are the cross pieces that hold the shafts together; the *bolster*, being that part on which the fore wheels and axletree turn, in wheeling the *waggon* across the road; the *chest*, or body of the *waggon*, having the staves or rails fixed thereon; the *bales*, or hoops, which compose the top; the *tilt*, the place covered with cloth at the end of the *waggon*: besides the *wheels*, *axletree*, &c.

The larger the wheels of the *waggon*, and their circumference, the easier the motion; and the less, the heavier, and more uneasy and jogging they go.—But still, the higher a *waggon*, &c. is set, the apter it is to overturn.—The only reason why the fore wheels of *waggons*, &c. are made less than the hind wheels, is for the conveniency of turning. See WHEEL.

The more upright or square the spokes of the wheels are from the box, or centre, the weaker they are when they come to bear on either side: on which account, as also to secure a wheel from breaking in a fall, they are made concave, or dishing.

**WAGGONER**, in astronomy, a kind of constellation, called also *Charles's wain*. See CHARLES'S WAIN.

**WAGGONER** is also used for a routier, or book of charts, describing the seas, their coasts, &c. See CHART, and ATLAS.

**WAIF**, or **WAFE**, a term primarily applied to stolen goods, which a thief, being pursued, or over-burthened, flies, and leaves behind him, or drops in the way.

The king's officer, or the bailiff of the lord within whose jurisdiction such *waifs* or *waif* goods were left (having by grant, or prescription, the franchise of *waif*) may seize the goods to his lord's use; except the owner come with fresh suit after the felon, and sue an appeal of robbery within a year and a day, or give in evidence against him, and he be attainted.—In which cases, the owner shall have his goods again.

*Waifs*, things lost, and estrays, are said to be *pecus vagrans*; and are *nullius in bonis ubi non apparet dominus*. And therefore belong to the lord of the franchise where they are found;

## W A L

who must cause them to be cried, and published in the markets, and churches near about: else the year and day does not run to the prejudice of him that lost them.

Though *waif* be properly spoken of things stolen, yet it may also be understood of goods not stolen.—As, if a man be pursued with hue and cry, as a felon, and he flies, and leaves his own goods; these shall be forfeit as goods stolen: and are properly called *fugitive goods*. See FUGITIVE.

**WAIN**. See the article CHARLES'S Wain.

**WAINSCOT**, in building, the timber-work serving to line the walls of a room; being usually in pannels, and painted, to serve in lieu of hangings. See WALL, &c.

Even in halls, it is common to have *wainscot* breast high; by reason of the natural humidity of walls. See WALL.

Some joiners put charcoal behind the pannels of the *wainscot*, to prevent the sweat of stone and brick-walls from ungluing the joints of the pannels.—Others use wool for the same purpose.—But neither the one nor the other is sufficient in some houses: the only sure way, is, by priming over the back-sides of the joints with white lead, Spanish brown, and linseed oil.

According to Neve, *wainscotting* with Norway oak, the workman finding stuff, is valued at six or seven shillings per yard square.—Plain square *wainscotting*, the workman finding deal, is valued at three shillings, or three shillings sixpence per yard.—Large bisection *wainscotting*, with Dantzick stuff, is valued at six or seven shillings per yard; and ordinary bisection work, at three shillings sixpence per yard. In taking dimensions, they use a string, which they press into all the mouldings; it being a rule that they are to be paid for all where the plane goes. See MEASURING.

**WAVE**, in law, a woman that is put out of the protection of the law. See OUTLAW.

She is called *waive*, as being forsaken of the law: and not *outlaw*, as a man is; by reason women cannot be of the decenna, are not sworn in leets to the king, nor to the law, as men are; who therefore are within the law: whereas women are not; and so cannot be outlawed, since they never were within it. See DECENNIAL, FRIBURGH, &c.

In this sense we meet with *waviaria mulieris*, as of the same import with *utlagatio viri*. See OUTLAWRY.

**WAKE** of a ship, is the smooth water a-stern, when she is under sail.

By this, a guess may be made of the speed she makes. See RECKONING.

They also judge from this, whether the ship goes as she looks; that is, whether she makes her way right a-head, as she lies; as she doth when her *wake* is right a-stern: but if this *wake* be a point or two to leeward, they judge that she falls to the leeward of her course.

When, in a ship's staying she is so quick, that she does not fall to leeward upon a tack, but that when tacked, her *wake* is to the leeward, they say, *She stays to the weather of her wake*; which is a sign she feels her helm well, and is nimble of steering.

Also, when one ship, giving chase to another, is got as far into the wind as she, and sails directly after her, they say, *She is got into her wake*.

**WAKEFULNESS**, or **WATCHING**, *insomnia*. See WATCHING.

**WAKES**\*, **VIGILS**, or **Country-WAKES**, are certain ancient anniversary feasts, in several parishes; wherein the people were to be awake at the several vigils, or hours to go to prayer. See VIGIL.

\* The word is formed from the Saxon, *Wæcce*, *vigilia*, *excubie*, watch.

They are usually observed, in the country, on the Sunday next after the saint's day to whom the parish-church is dedicated.

Cowel defines them by *vigils*, in the dedications of churches, where men sat drinking in the choir all night. See DEDICATION.

**WALDENSES**. See the article VAUDOIS.

**WALKERS**, a sort of forest-officers, appointed by the king to walk about a certain space of ground, committed to their care, and inspection. See FOREST.

*Walkers*, are the same with what we otherwise call *foresters*. See FORESTER.

**WALKS**, in gardening. See the article ALLEYS.

To keep the weeds from growing upon *walks*, Mr. Switzer directs, that the bottoms thereof be filled with lime-rubbish, or coarse gravel, flint stones, or other rocky stuff, eight or ten inches deep; over which may be laid a like depth of gravel, not too fine.

To keep them the drier, they are to be made rounding, or convex.—The usual proportion is, that a *walk* 20 feet wide,

be four inches higher in the middle, than at the sides; a *walk* 25 feet wide, 5 inches, &c.

After laying a *walk*, it is to be rolled, both lengthwise and cross-wise; and to lay it the firmer, it must have three or four water-rollings; that is, when it rains so very fast, that the *walk* swims with water: which, when dry weather comes, will bind as hard as terrace.

To make the gravel bind the better, some mix a little lime with it; which being apt to stick to the heels of the shoes in wet weather, others grind or pound sea-shells, and lay a thin coat thereof on the gravel; which being rolled, incorporates with the gravel, and hinders its hanging to the shoes.—Others beat smiths cinders to dust, and others bricks; strewing the dust on the *walks*, which dries up the moisture, and gives them a colour.

**Gravel-WALK.**

**Ring-WALK**, among hunters. } See { **GRAVEL.**  
**Terrace-WALK.** } **RING-Walk.**  
 } **TERRACE.**

**WALKING-Fire.** See the article *Ignis FATUUS*.

**WALL**, in architecture, &c. a work of stone, brick, wood, or the like; making the principal part of a building; as serving both to inclose it, and to support the roof, floors, &c. See **BUILDING, HOUSE, &c.**

*Walls*, though built very thick and strong, and their foundations laid deep, yet, if carried on straight in a line, are inclined to lean, or fall; and such as are built crooked, though thin and weak, are much more lasting.—A *wall* raised over a river, on arches of pillars, stands as firm as others, whose foundation is entire.

Hence it appears, that a *wall* built much thinner than usual, by only having at every 20 feet's distance an angle set out about two feet, or more, in proportion to the height of the *wall*; or by having at the like distance, a column, or pillar erected along with it, six or eight inches on each side, over and above the thickness of the rest of the *wall*: such *wall* will be much stronger, than if five times the quantity of materials were used in a straight *wall*.

*Walls* are distinguished into divers kinds, from the matter whereof they consist; as *plastered*, or *mud-walls*, *brick-walls*, *stone-walls*, *flint* or *boulder-walls*, and *boarder-walls*.—In all which these general rules are to be regarded.

1°. That they be built exactly perpendicular to the ground-work.

2°. That the massiest and heaviest materials be the lowest; as fitter to bear, than be born.

3°. That the *walls*, as they rise, diminish proportionally in thickness, for ease both of weight and expence.

4°. That certain courses, or ledges, of more strength than the rest, be interlaid, like bones, to strengthen the whole fabric.

**Mud and Plastered-WALLS**, are chiefly in ordinary timber-buildings.—These *walls*, being quartered and lathed between the timber, or sometimes lathed over all, are plastered with loam, (see **LOAM**;) which being almost dry, is plastered over again with white mortar. See **MORTAR**.

**Brick-WALLS**, are the most important and usual among us.—In these, particular care is to be taken about the laying of the bricks, *viz.* That in summer they be laid as wet, and in winter as dry as possible, to make them bind the better with the mortar: that in summer, as fast as they are laid, they be covered up, to prevent the mortar, &c. from drying too fast: that in winter they be covered well, to protect them from rain, snow, and frost, which are all enemies to the mortar: that they be laid joint on joint in the middle of *walls*, as seldom as may be; but, good bond made there, as well as on the outsides.—Care is likewise to be taken, that the angles be firmly bound: in order to which, in working up the *walls* of a building, it is not advisable to raise any *wall* above three feet high, ere the next adjoining *wall* be wrought up to it; that good bond may be made in the progress of the work.

Lastly, in building a house in the city of London, the *walls* are to be of such thicknesses, as are enjoined by the act of parliament for rebuilding that city. See **HOUSE**.

**Flint, or Boulder-WALLS**, are frequently used in divers parts for fence-walls, a-round courts, gardens, &c. and even for *walls* of out-houses.—Sir Henry Wotton observes, that the building of *walls* of flint, is a thing utterly unknown to the antients; who observing in that material a kind of metallic nature, at least a fusibility, reserved it for nobler uses. See **BOULDER**.

These *walls* are usually raised by a right and left-handed man, who have a hod of mortar poured down on the work, which they part betwixt them; each spreading it towards himself, and so they lay in the flints.—The mortar for this work is to be very stiff.

**Angle of a WALL.**

**Coping of a WALL.**

**Plinth of a WALL.**

**Scenography of WALLS.**

**Painting on WALLS.**

} **ANGLE.**

} **COPING.**

} **PLINTH.**

} **SCENOGRAPHY.**

} **PAINTING.**

**Party-WALLS.**

**Piers-WALL.**

**Fence-WALLS.**

**WALL** in fortification, &c. See the article **RAMPART**.

**WALLS**, in gardening, &c.—The position, matter, and form of *walls*, for fruit-trees, are found to have a great influence on the fruit: though authors differ as to the preference. See **GARDEN, ORCHARD, &c.**

The reverend Mr. Lawrence directs, that the *walls* of a garden be not built directly to face the four cardinal points, but rather between them, *viz.* south-east, south-west, north-east, and north-west: in which the two former will be good enough for the best fruit, and the two latter for plums, cherries, and baking pears. See **EXPOSURE**.

Mr. Langford, and some others, propose garden-walls to consist chiefly of semicircles; each about six or eight yards in front, and including two trees; and between every two semicircles, a space of two feet of plain *walk*.—By such a provision every part of a *wall* will enjoy an equal share of the sun, one time with another; beside, that the warmth will be increased, by the collecting and reflecting of the rays in the semicircles; and the trees within be screened from injurious winds.

As to the materials of *walls* for fruit-trees, brick, according to Mr. Switzer, is the best; as being the warmest and kindest for the ripening of fruit, and affording the best convenience for nailing.

Mr. Lawrence, however, affirms, on his own experience, that *mud-walls*, made of earth and straw tempered together, are better for the ripening of fruit, than either brick or stone *walls*: he adds, that the coping of straw laid on such *walls*, is of great advantage to the fruit, in sheltering them from perpendicular rains, &c.

M. Fatio, in a particular treatise on the subject, instead of the common perpendicular *walls*, proposes to have the *walls* built sloping, or reclining from the sun; that what is planted against them, may lie more exposed to his perpendicular rays; which must contribute greatly to the ripening of fruit in our cold climate.

The angle of reclination, is to be that of the latitude of the place; that, when the sun is in the meridian at the equinoxes, his rays may strike just perpendicularly. See **HEAT**. Yet some others prefer perpendicular *walls*, and even inclining ones, or such as hang forwards to the sun; as such receive the sun's rays perpendicularly when he is low; as in spring and autumn, or in the evening and morning: which they imagine of more service, than the greatest heats of the sun at midsummer, upon reclining *walls*.

Add, that in autumn the sun is most wanted to ripen winter pears; in order to which, they should be kept dry, which against sloping *walls* cannot be; the dews, &c. lying much longer thereon, than on those that are perpendicular.

One great advantage, however, of M. Fatio's sloping *walls*, is, that fruit-trees, as vines, &c. being planted against them, melon-glasses may be set on the fruit; which will much forward its ripening.

**Sea-WALLS.**

**WALL-Trees.**

**Planting WALL fruit-trees.**

**WALOON**, or **WALLOON**, a kind of old French; being the language spoke by the Walloons, or the inhabitants of a considerable part of the French and Austrian Low-Countries, *viz.* those of Artois, Hainault, Namur, Luxemburg, and part of Flanders and Brabant.

The *Waloon* is held to be the language of the antient Gauls, or Celts. See **LANGUAGE, &c.**

The Romans having subdued several provinces in Gaul, established prætors, or proconsuls, &c. to administer justice in the Latin tongue. On this occasion, the natives were brought to apply themselves to learn the language of the conquerors: and thus introduced abundance of the Roman words and phrases into their own tongue.

Of this mixture of Gaulish and Latin, was formed a new language, called *Romans*; in contradiction to the antient unadulterated Gaulish, which was called *Walon*, or *Walloon*.

This distinction is kept up to this day; for the inhabitants of several of the low-country provinces say, that in France they speak Romans; whereas they speak the *Walloon*, which comes much nearer the simplicity of the antient Gaulish. See **ROMANS**, and **FRENCH**.

**WANDASS.** See the article **WINDASS**.

**WANDERING Stars.** See the article **STAR**.

**WANLASS**, in hunting.—Driving the *wanlass*, is the driving of deer to a stand, that the lord may have a shoot: which is one of the customary services of fiefs. See **HUNTING**.

**WAPENTAKE**, or **WEAPENTAKE**, a division of certain northern counties, particularly those beyond the Trent, answering to what in other places is called a *hundred*, or a *cantred*. See **HUNDRED**.

Authors differ as to the origin of the word.—Brompton brings

brings it from the Saxon *waepen*, and *tarcan*, to deliver, by reason the tenants antiently delivered their arms to every new lord, as a token of their homage.

Sir Thomas Smith gives a different account.—Musters, he observes, were antiently taken of the armour and weapons of the several inhabitants of every hundred; and from such as could not find sufficient pledges for their good abearing, their weapons were taken away, and delivered to others.

Others give a different account of its rise, viz. That when first the kingdom was divided into *wapentakes*, he who was the chief of the division, and whom we now call *high-constable*, as soon as he entered upon his office, appeared in the field, on a certain day, on horse-back, with a pike in his hand; and all the chief men of the hundred met him with their lances; who alighting, touched his pike with their lances, as a signal they were firmly united to each other, by the touching their weapons.—Whence the denomination *wapentake* from the Saxon *waepen*, and *tac*, touching.

**WAR**, *Bellum*, a contest, or difference between princes, states, or large bodies of people; which not being determinable by the ordinary measures of justice and equity, is referred to the decision of the sword.

Hobbes's great principle is, that the natural state of man, is a state of *warfare*; most other politicians hold *war* to be a preternatural, and extraordinary state.

**Civil**, or *Intestine WAR*, is that between subjects of the same realm; or between parties in the same state. See **CIVIL**.

In this sense, we say, the *civil wars* of the Romans destroyed the republic: the *civil wars* of Granada ruined the power of the Moors in Spain: the *civil wars* in England begun in 1641, ended in the king's death, 1648.

**King's WAR**, *Bellum regis*.—At the time when particular lords were allowed to make *war* with one another, to revenge injuries, instead of prosecuting them in the ordinary courts of justice; the appellation *king's war* was given to such as the king declared against any other prince, or state: on which occasion, the lords were not allowed to make private *war* against each other; as being obliged to serve the king, with all their vassals. See **VASSAL**, &c.

**Religious WAR**, is a *war* maintained in a state, on account of religion; one of the parties refusing to tolerate the other.

**Holy WAR**, is that antiently maintained by leagues and cruises, for the recovery of the holy land. See **CROISADE**.

**Art of WAR**. See the article **MILITARY Art**.

**Council of WAR**, is an assembly of great officers, called by a general or commander, to deliberate with him on enterprises, and attempts to be made. See **COUNCIL**.

On some occasions, *council of war* is also understood of an assembly of officers, sitting in judgment on delinquent soldiers, deserters, coward-officers, &c.

**Habiliments of WAR**. } See the article { **HABILIMENT**.  
**Man of WAR**. } { **SHIP, RATE, &c.**  
**Officers of WAR**. } { **OFFICERS**.

**Place of WAR**, is a place fortified, on purpose to cover and defend a country, and stop the incursion of an enemy's army: or, it is a place wherein are disposed the provisions of *war*, for an army incamped in the neighbourhood; or whither an army retires into winter quarters. See **PLACE**.

**WARBLING of the wings**, in falconry, is when a hawk, after having mantled herself, crosses her wings over her back. See **HAWK**, and **FALCON**.

**WARD**, **WARDA**, *custody* or *keeping*. See **GUARD**.

**WARD**, is a word used in our law-books, in divers significations.—Thus, a *ward*, in London is a part of the city, committed to the special charge of one of the aldermen of the city. There are 26 wards in London, which are as hundreds, and the parishes thereof as towns. See **ALDERMAN**, **HUNDRED**, &c.

A forest is also divided into *wards*; so are most of our hospitals. See **FOREST**, **WOODWARD**, and **HOSPITAL**.

A prison is sometimes also called a *ward*. See **GOAL**.

The heir of the king's tenant, who held by knights-service, or in capite, was also called a *ward*, during his non-age.—But this sort of wardship is taken away by the statute, 12 Car. II. cap. 24. See **WARDS**.

**Cattle WARD**. See the article **CASTLE**.

**WARD**, **WARDA**, or **WARDAGIUM**, is also used in our antient writers, for the custody of a town or castle, which the tenants and inhabitants were bound to keep at their own charge. See **WARDAGE**.

**WARDA Ecclesiarum**, denotes the guardianship of churches: which is in the king during vacancies, by reason of the regalia, or temporalities. See **REGALIA**, and **TEMPORALITIES**.

**WARDAGE**, **WARDAGIUM**, is sometimes used in our antient law-writers, in the same sense with *wardpenny*. See **WARDPENNY**.

Sometimes it also seems to denote a being free from wardship. **WARDECORNE**, among our antient writers, a duty incumbent on the tenants, to guard the cattle, by sounding a horn upon the approach of an enemy; called also *cornage*. See **CORNAGE**.

**WARDEN**, *Guardian*, one who has the charge, or keeping of any person, or thing, by office. See **GUARD**, and **GUARDIAN**.

Such is the *warden of the fleet*, the keeper of the fleet prison; who has the charge of the prisoners there; especially such as are committed from the court of chancery for contempt. See **FLEET**.

Such also are, the *warden of the fellowships*, *warden of the marshes*, *wardens of peace*, *warden of the west marches*, *warden of the forest*, *warden of the alnage*, *warden of the king's wardrobe*, &c. See **GUARDIAN**; see also **JUSTICE**, **WARDROBE**, &c.

**WARDEN**, in an university, is the head of a college; answering to what in other colleges we call the *master* thereof. See **UNIVERSITY**, &c.

**WARDEN**, or *Lord WARDEN of the cinque-ports*, is the governor of those noted havens; who has the authority of an admiral, and sends out writs in his own name. See **CINQUE-PORTS**.

**WARDEN of the mint**, is an officer, whose business is to receive the gold and silver bullion brought in by the merchants; to pay them for it, and oversee the other officers.—He is also called *keeper of the exchange*, and *mint*. See **MINT**.

**Church-WARDENS**. } See the article { **CHURCH**.  
**Renter-WARDEN**. } { **RENTER**.

**WARDER**.—*Yeomen warders of the Tower*, are officers, forty in number, who are accounted the king's domestic servants, and are sworn by the lord chamberlain: their duty is, to attend the prisoners of state, and wait at the gates. See **TOWER**.

Ten of them are usually upon the day's wait, to take an account of all persons who come into the tower; to enter their names, and the names of the persons they go to, in a book to be perused by the constable or lieutenant.

**WARDFOEH**, or **WARDFEGH**, the value of a ward, or heir under age; or the money paid to the lord of the fee, for his redemption.

**WARD-HOOK**, in gunnery, a rod, or staff, with an iron end, turned serpent-wise, or like a screw, to draw the wads or ockam out of a gun, when it is to be unloaded.

**WARDMOTE**, in London, is a court so called, which is kept in every ward of the city; answering to the *curiata comitia*, in ancient Rome. See **MOTE**.

**WARD-PENNY**, **WARDPENI**, was formerly a customary due, paid to the sheriff, or other officer, for maintaining watch and ward. See **PENNY**.

It was payable at the feast of St. Martin; and is still paid within the manor of Sutton Colfield in Warwickshire; and with some very singular ceremonies.

**WARDROBE**, a closet, or little room adjoining to a bed-chamber; serving to dispose and keep a person's apparel in; or for a servant to lodge in, to be at hand to wait, &c.

**WARDROBE**, in a prince's court, is an apartment wherein his robes, wearing apparel, and other necessities are preserved; under the care and direction of proper officers.

His majesty has a *great wardrobe*, a *removing wardrobe*, and divers *standing wardrobes*, belonging to his bed-chamber, in each of his palaces, viz. at Whitehall, Kensington, Windsor, Hampton-Court, and the Tower; each under its respective keeper.

The *removing wardrobe* always attends on the king's person; as also on ambassadors, at christenings, masques, plays, &c.

—It is under the command of the lord chamberlain: the under-officers are, a yeoman, two grooms, and three pages. The *great wardrobe* is of great antiquity.—Antiently it was kept near puddle-wharf, in a house purchased for that purpose, by king Edward III. but since the fire of London, it has been kept in York-buildings.

The master or keeper thereof, is an officer of great dignity: high privileges were conferred on him by Hen. VI. King James I. enlarged the same, and erected the office into a corporation. See **MASTER**.

The officers are, the *master* or keeper, his *deputy*, and his *clerk*; besides several under-officers; and above sixty tradesmen, all sworn servants to the king. See **CLERK**.

This office is to provide for coronations, marriages, and funerals of the royal family; to furnish the court with beds, hangings, carpets, &c. to furnish houses for ambassadors, at their first arrival here; presents for foreign princes and ambassadors; furniture for the lord lieutenant of Ireland, and our ambassadors abroad; robes for the knights and officers of the garter, heralds, pursuivants, ministers of state, liveries for the officers of the bed-chamber, and other servants; liveries for the lord chief justice, and barons of the Exchequer; and other officers in those courts: as also yeomen, warders, trumpets, kettle-drums, messengers, coachmen, grooms, &c. with coaches, harnesses, saddles, &c. The watermen, game-keepers; linen and lace for the king's person; tilts, &c. for his barges, &c.

**WARDS**, a court first erected by king Henry VIII. and after augmented by him with the office of liveries: but now absolutely taken away and abolished, by a statute made 13 Car. II. cap. 24.

**WARD-STAFF**, the constable or watchman's staff.

The manor of Lambourn in Essex, is held by service of the *ward-staff*, viz. the carrying a load of straw in a cart with six horses, two ropes, two men in harness, to watch the said *ward-staff*, when it is brought to the town of Aibridge, &c. *Camd. tit. Essex.*

**WARD-WITE**, is defined by Fleta, as signifying a being exempted from the duty of watching.—Others rather take it for a duty paid towards the charge thereof.

\* The word is compounded of the Saxon *ward*, *vigilia*, watch; and *wite*, mulct.

**WARECTUM**, in antient writings, signifies land that has lain long neglected, and untilld.

In antient records, we meet with *tempus warecti*, for the time wherein land lies fallow, or else the season of fallowing. See **FALLOW**.

**WAREN**. See the article **WARREN**.

**WARMTH**. See the article **HEAT**.

**WARN**, in law, to summon a person to appear in a court of justice. See **SUMMONS**.

**WARNING-Wheel**, in a clock, is the third or fourth, according to its distance from the first wheel. See **CLOCK**.

**WARP**, in the manufactures, is the threads, whether of silk, wool, linen, hemp, cotton, or the like, that are extended lengthwise on the weaver's loom; and across which the workman, by means of his shuttle, passes the threads of the woof, to form a cloth, ribband, fustian, or other matter. See **WEAVING**.

For a woollen stuff, &c. to have the necessary qualities, it is required that the threads of the *warp* be of the same kind of wool, and of the same fineness throughout; that they be sized with Flanders or parchment size, well prepared; and that they be in sufficient number, with regard to the breadth of the stuff to be wrought. See **WOOF**, **CLOTH**, &c.

To **WARP** a ship, is to hale her to a place, when the wind is wanting, by means of a hawser, a cable, and an anchor fixed thereto.

**WARPENI**. See the article **WARDPENNY**.

**WARRANT**, an act, instrument, or obligation, whereby a person authorizes another to do something, which he had not otherwise a right to do. See **WARRANTY**, **GUARANTY**, and **VOUCHER**.

**WARRANT of Attorney**, is that whereby a man appoints another to do something in his name, and warrants his action. See **ATTORNEY**.

It seems to differ from a *letter of attorney*, which passes under hand and seal of him that makes it, before creditable witnesses; whereas *warrant of attorney*, in personal, mixed, and some real actions, is put in of course by the attorneys for the plaintiffs, or defendants.

Though a *warrant of attorney*, to suffer a common recovery by the tenant, or vouchee, is to be acknowledged before such persons as the commission for the doing thereof directs. See **RECOVERY**, &c.

In the court of common pleas, there is a *clerk of the warrants*, who enters all *warrants of attorney* for plaintiff, and defendant. See **CLERK**.

**WARRANTIZANDUM**. See the article **SUMMONS** *ad Warrantizandum*.

**WARRANTO**. See the article **QUO WARRANTO**.

**WARRANTY**, **WARRANTIA**, a promise, or covenant by deed, made by the bargainer for himself and his heirs, to warrant and secure the bargainee and his heirs, against all men, for enjoying the thing agreed on between them. See **VOUCHER**.

Such *warranty* passes from the seller to the buyer; from the feoffee to the feoffee; from him that releases, to him that is released from an action real.—The form of it is thus: *Et ego vero prefatus A. & heredes mei predictas quinque acras terre cum pertinentiis suis prefato B. hereditibus & assignatis suis contra omnes gentes warrantizabimus in perpetuum, per presentes.*

Note, under *heredes*, heirs, are comprized all such as the first warrantor's lands come to, whether by descent, purchase, or the like.

*Warranty* is either *real*, or *personal*.—*Real*, when it is annexed to lands and tenements granted for life, &c. which, again, is either *in deed*, or *in law*. See **DE FACTO**, &c.

*Personal*, either respects the property of the thing sold, or the quality of it.

*Real warranty*, again, in respect of the estate, is either *lineal*, *collateral*, or *commencing by disseisin*.

**WARRANTIA Chartæ**, a writ that lies for a person who is infeoffed in lands and tenements, with clause of *warranty*; and is impleaded in an assize, or writ of entry, wherein he cannot vouch, or call to *warranty*. See **VOUCHER**.

**WARRANTIA Diei**, a writ which lies in case where a man having a day assigned personally to appear in court to an action wherein he is sued, is, in the mean time, by commandment employed in the king's service; so that he cannot come at the day assigned.—It is directed to the justices, ordering them not to find or record him in default.

VOL. II. No. 163.

**WARREN**, **WARENNA**, a franchise, or place privileged, either by description, or grant from the king, to keep beasts and fowl of *warren* in; as rabbits, hares, partridges, pheasants, &c. See **BEAST**, **GAME**, **HUNTING**, &c.

By a statute 21 Edw. III. a *warren* may lie open, and there is no need of closing it in; as there is of a park. See **PARK**, &c.

If any person be found an offender in any such *free warren*, he is punishable for the same at common law. See **FREE**.

*Beasts of WARREN*. See the article **BEASTS**.

**WART**, *Verruca*, a little round, hard excrescence, arising on the flesh, like a pea. See **EXCRESCENCE**.

*Warts* are more frequent on the hands than any other part.—There are divers sorts; the most usual are called *porraceæ*; as having heads like leeks, and consisting of little threads, resembling the roots thereof.

Another sort is called *myrmecia*, which is a little round, callosous eminence on the hands of young children; rising suddenly, and disappearing again. See **MYRMECIA**.

A third sort is the *acrochordon*. See **ACROCHORDON**.

Some physicians also rank the corns growing on the toes under the class of *warts*: which the Latins call *clavi*; because occasioning shooting pains, as if one were pricked with the point of a nail. See **CLAVUS**.

*Warts*, if only rooted in the cutis, are easily taken away; but if they arise from the tendons underneath, there is scarce any extirpating them without great danger.—The juice of chelidon. maj. or esula, or dens leonis, or tithymal, frequently applied, takes off *warts*.

Borelli commends water wherein sal armoniac has been dissolved: which Dr. Mapletost, late professor of physick at Gresham-college, makes no scruple to say is the only sure remedy he knows of in all medicine.

**WASHING**. See the articles **ABLUTION**, **LOTION**, &c.

*Washing the feet*, was a common piece of civility among the Jews, practised upon strangers, visitors, &c. at their arrival.

*Washing the feet* of twelve poor people, is an anniversary ceremony, performed both by the kings of England and France, in commemoration of our Saviour's *washing* the feet of his apostles.

Arnobius, *adv. Gentes*, Lib. VII. mentions a feast in use among the antients, called *lavatio matris deum*, the *washing* of the mother of the gods, held on the 30th of March.

*Washing one's hands*. See the article **HAND**.

*Washing of a ship*, in the sea language, is when all the guns are brought to one side; and the men, getting upon the yards, *wash* her other side, and scrape her as far as they can reach.

**WASHING**, in painting, is when a design drawn with a pen, or crayon, has some one colour laid over it with a pencil; as indian ink, bistre, or the like; to make it appear the more natural, by adding the shadows of prominences, apertures, &c. and by imitating the particular matters, whereof the thing is supposed to consist.

Thus, they *wash* with a pale red, to imitate brick and tile; with a pale india blue, to imitate water and slate; with green, for trees and meadows; with saffron or French berries, for gold and brass; and with several colours, for marbles.

These *washes* are usually given in equal tints, or degrees, throughout; which are afterwards brought down, and softened over the lights with fair water, and strengthened with deeper colours for the shadows. See **LIGHT**, and **SHADOW**.

**WASHINGS**, or **WASHES**, among goldsmiths, coiners, &c. are the lotions whereby they recover the particles of gold and silver out of the sweep, i. e. ashes, earths, sweepings, &c.

This is either performed by simply *washing* them again and again, or by putting them in the *washing* mill.

To make one of these *washes*, they not only gather together the ashes of the furnaces, and sweepings of the work-houses; but they also break and pound the old earthen crucibles, and the very bricks whereof the furnaces are built; little particles of gold, &c. being found to stick to them, by the crackling natural to those metals, when in their last degree of heat.

These matters being as well ground, and mixed together, are put in large wooden basons, where they are *washed* several times, and in several waters, which run off, by inclination, into troughs underneath; carrying with them the earth, and the insensible particles of the metals, and only leaving behind them the larger and more considerable ones, which are visible to the eye, and taken out with the hand without more trouble.

To get out the finer parts, gone off with the earth, they use quicksilver, and a *washing* mill.—This mill consists of a large wooden trough, at bottom of which are two metalline parts, serving as mill-stones; the lower being convex, and the upper, which is in form of a cross, concave.

A-top is a winch, placed horizontally, which turns the upper piece round; and at bottom a bung, to let out the water and earth, when sufficiently ground.

To have a *wash*, then, the trough is filled with common water;

water; into which they cast thirty or forty pounds of quicksilver, and two or three gallons of the matter remaining from the first lotion.— Then turning the winch, they give motion to the upper mill-stone; which grinding the matter and the quicksilver violently together, the particles of gold and silver become the more easily amalgamated therewith: This work they continue for two hours; when opening the bung, the water and earth runs out, and a fresh quantity is put in. See AMALGAMATION, &c.

The earths are usually passed thus through the mill three times; and the same quantity of mercury usually serves all the three times.— When there is nothing left in the mill but the mercury, united with the gold or silver which it has amalgamated, they take it out, and *washing* it in divers waters, they put it in a ticken bag, and lay it in a press, to squeeze out the water, and the loose quicksilver: the remaining quicksilver they evaporate by fire, in a retort, or an alimbeck. The metal which remains, they refine with lead, or part it with aqua fortis. See GOLD, and SILVER; see also LAVATORY.

WASSAILE, or WASSEL, a festival song, sung heretofore from door to door, about the time of Epiphany. See WASSEL-Bowl.

WASSEL-Bowl, or WASTEL-Bowl, was a large cup or bowl of silver or wood, wherein the Saxons, at their public entertainments, drank a health to one another, in the phrase *was-heal*; that is, *health be to you*.

This *wassil-bowl*, seems plainly to be meant by the word *vassellum*, in the lives of the abbots of S. Albans, by Matt. Paris; where he saith, *abbas solus prandebat supremus in refectorio habens vassellum*: “He had set by him the *wassil-bowl*, to “drink an health to the fraternity; or the poculum charitatis.”

And hence the custom of going a *wassilling*, still used in Sussex, and some other places, seems to have taken its name.

WAST, or WASTE, *Vastum*, in law, has divers significations. — 1<sup>o</sup>. It is used for a spoil, made either in houses, woods, lands, &c. by the tenants for life, or for years, to the prejudice of the heir, or of him in reversion, or remainder.— Upon this, the writ of *waste* is brought for recovery of the thing *wasted*, and treble damages. See IMPEACHMENT.

WASTE of the forest, is, properly, where a man cuts down his own woods within the forest, without license of the king, or lord-chief-justice in eyre. See FOREST, and PURLIEU.

WASTE, is also taken for those lands which are not in any man's occupation; but lie common. See COMMON.

They seem to be so called, because the lord cannot make such profit of them as of his other lands; by reason of the use others have thereof, for passing to and fro.— Upon this none may build, cut down trees, dig, &c. without the lord's license.

Year Day and WASTE. See YEAR Day and Waste.

WASTE of a ship, is that part of her between the main-mast, and the fore-mast. See SHIP, and MAST.

WASTE-BOARDS, are boards sometimes set upon the side of a boat, or other vessel, to keep the sea from breaking into her.

WATCH, *Guet*, a person posted as a spy in any place, to have an eye thereto, and give notice of what passes. See CENTINEL, SENTRY, &c.

WATCH, is also used for a *corps de garde* posted at any passage; or a company of guards who go on the patrol. See GUARD.

— Some officers are exempted from *watch*, and guard.

In the same sense they say, *night-watch*, *guet de nuit*: *watch-word*, *mot de guet*: *royal-watch*, *city-watch*.

Chevalier de *guet*, is a name given by the French, to the officer who commands the *royal-watch*, &c.

WATCH, at sea, signifies a measure, or space of four hours; because half the ship's crew *watch*, and do duty in their turns so long at a time.

The ship's company is divided into two parts, the *larboard-watch*, and the *starboard-watch*.— The master of the ship commands the latter, and the chief mate the former.

Sometimes when a ship is in harbour, they *watch* but a *quarter-watch*, as they call it; that is, but a quarter of the company *watch* at a time.

The *watch-glass*, being four hours, is used at sea to shift or change their *watches*.— There are also *half-watch* hour-glasses; minute and half-minute glasses; by which last they count the knots when they heave the log, in order to find the ship's way. See LOG-Line, and KNOT.

Death-WATCH. See the article DEATH.

WATCH, is also used for a small portable movement, or machine, for the measuring of time; having its motion regulated by a spiral spring. See WATCH-WORK.

*Watches*, strictly taken, are all such movements as shew the parts of time; as clocks are such as publish it, by striking on a bell, &c. But, commonly, the name *watch* is appropriated to such as are carried in the pocket; and *clock* to the large movements, whether they strike the hour, or not. See CLOCK, and MOVEMENT.

Spring, or Pendulum WATCHES, stand pretty much on the same principle with pendulum clocks; whence their denomi-

nation.— If a pendulum, describing little arches of a circle, make vibrations of unequal lengths, in equal times; it is by reason it describes the greater with a greater velocity. For the same reason, a spring put in motion, and making greater or less vibrations, as it is more or less stiff, and as it has a greater or less degree of motion given it, performs them nearly in equal times.— Hence, as the vibrations of the pendulum had been applied to large clocks, to rectify the inequality of their motions; so, to correct the unequal motions of the balance of *watches*, a spring is added; by the isochronism of whose vibrations, the correction is to be effected. See PENDULUM.

The spring is usually wound into a spiral; that, in the little compass allotted it, it may be as long as possible; and may have strength enough, not to be mastered and dragged about by the inequalities of the balance it is to regulate.

The vibrations of the two parts, *viz.* the spring and balance, should be of the same length; only so adjusted, as that the spring, being the more regular in the length of its vibrations than the balance, may, on occasion, communicate its regularity thereto. See SPRING.

The invention of spring, or pocket-watches, is owing to the felicity of the present age.— It is true, we find mention made of a *watch* presented to Charles V. in the history of that prince: but this, in all probability, was no more than a kind of clock to be set on a table; some resemblance whereof, we have still remaining in the antient pieces made before the year 1670.

In effect, it is between Dr. Hooke, and M. Huygens, that the glory of this excellent invention lies: but to which of them it properly belongs, is greatly disputed; the English ascribing it to the former; and the French, Dutch, &c. to the latter.

Mr. Derham, in his *Artificial Clockmaker*, says roundly, that Dr. Hooke was the inventor; and adds, that he contrived various ways of regulation.— One way was with a loadstone.— Another with a tender straight spring, one end whereof played backwards and forwards with the balance; so that the balance was to the spring, as the bob to a pendulum; and the spring as the rod thereof.— A third method was with two balances, of which there were divers sorts; some having a spiral spring to the balance for a regulator, and others without.

But the way that prevailed, and which continues in mode, was with one balance, and one spring running round the upper part of the verge thereof. Though this has a disadvantage, which those with two springs, &c. were free from; in that a sudden jerk, or confused shake, will alter its vibrations, and put it in an unusual hurry.

The time of these inventions was about the year 1658; as appears, among other evidences, from an inscription on one of the double balance watches, presented to king Charles II. *viz.* Rob. Hooke Inven. 1658. T. Tompion fecit, 1675. The invention presently got into reputation, both at home and abroad; and two of them were sent for by the dauphin of France.

Soon after this, M. Huygens's *watch* with a spiral spring got abroad, and made a great noise in England, as if the longitude could be found by it.— It is certain, however, that his invention was later than the year 1673, when his book *de Horol. Oscillat.* was published; wherein he has not one word of this, though he has of several other contrivances in the same way.

One of these the lord Brouncker sent for out of France, where M. Huygens had got a patent for them.— This *watch* agreed with Dr. Hooke's, in the application of the spring to the balance; only M. Huygens's had a longer spiral spring, and the pulses and beats were much slower. The balance, instead of turning quite round, as Dr. Hooke's, turns several rounds every vibration.

Mr. Derham suggests, that he has reason to doubt M. Huygens's fancy first was set to work, by some intelligence he might have of Dr. Hooke's invention, from Mr. Oldenburg, or some other of his correspondents in England: tho' Mr. Oldenburg vindicates himself against that charge, in *Philosophical Transactions*, No. 118, and 129.

Huygens invented divers other kinds of *watches*, some of them without any string or chain at all; which he called, particularly, *pendulum watches*.

As it was in England that *watches* had their first rise; so it is there, too, they have arrived at their greatest perfection.— Witness that exceeding value put on an English *watch* in all foreign countries, and that vast demand made for them.

M. Savary, in his *Diction. de commerce*, pretends to match the French *watchmakers* against the English.— He asserts, “That if the English be in any condition to dispute it with them, they owe it entirely to the great number of French workmen, who took shelter here upon the revocation of the edict of Nants.” He adds, “That three fourths of the *watches* made in England, are the work of Frenchmen.”— From what authorities he says this, we know not:

not: but it need not be told Englishmen that it is false; there not being one French name, that we know of, among all our famed *watchmakers*: nor, in the body of *watchmakers*, is their one eighth part French.

It is certain the French people prefer our *watches* vastly to their own; inasmuch, that to have them with the more ease, a number of English workmen were invited over in 1719, and established with great countenance at Versailles, under the direction of the famous Mr. Law.— But the establishment, though every thing promised well for it, and the French *watch* and clockmakers seemed undone by it, fell to the ground in less than a year's time.— M. Savary imputes its fall, entirely, to that strong prejudice of the French people, in behalf of the English workmen, and to the opinion that the *watches* did not come from England. But the truth is, the workmen sent over being most of them men of loose characters, grew dissolute, quarrelled with the priests, insulted the magistrates, and were dismissed of necessity.

**Striking WATCHES**, are such, as besides the proper *watch*-part, for measuring of time, have a clock-part, for striking the hours, &c.

These are real clocks; only moved by a spring instead of a weight.— Properly speaking, they are called *pocket-clocks*. See **CLOCK**.

**Repeating WATCHES**, are such as by pulling a string, &c. do repeat the hour, quarter, or minute, at any time of the day or night.

This repetition was the invention of Mr. Barlow, and first put in practice by him in larger movements, or clocks, about the year 1676.— The contrivance straight set the other artists to work, who soon contrived divers ways of effecting the same.— But its application to pocket-watches, was not known before king James the second's reign; when the ingenious inventor abovementioned, having directed Mr. Thompson to make a *repeating watch*, was soliciting a patent for the same.

The talk of a patent engaged Mr. Quare to resume the thoughts of a like contrivance, which he had had in view some years before: he now effected it; and being pressed to endeavour to prevent Mr. Barlow's patent, a *watch* of each kind was produced before the king and council; upon trial of which, the preference was given to Mr. Quare's.

The difference between them was, that Barlow's was made to repeat, by pushing in two pieces on each side the *watch*-box; one of which repeated the hour, and the other the quarter: whereas Quare's was made to repeat by a pin that struck out near the pendant; which being thrust in, (as now it is done by thrusting in the pendant itself) repeated both the hour and quarter with the same thrust. See **WATCHWORK**.

**WATCHING, WAKEFULNESS, insomnia**, among physicians, denotes a disorder whereby a person is disabled from going to sleep. See **SLEEP**.

It is occasioned by a continual and excessive motion of the animal spirits in the organs of the body, whereby those organs are prepared to receive, readily, any impressions from external objects, which they propagate to the brain; and furnish the soul with divers occasions of thinking. See **SPIRIT**. This extraordinary flux of spirits may have two causes: for, 1°. The sensible objects may strike the organ with too much force. In which case, the animal spirits being violently agitated, and those agitations continued by the nerves to the brain, they give a like motion to the brain itself; the necessary consequence of which, is, that the animal must wake. Thus, a loud shriek, pains, head-ach, gripes, coughing, &c. cause *waking*.— Add, that the soul's being oppressed with cares, or deeply engaged in thinking, contributes to the same: since, as it acts by the ministry of the spirits, any cares or meditations that keep those in motion, must produce *watchfulness*.— Of this kind are those inveterate *wakings* of melancholic persons; some of whom have been known to pass three or four weeks without a wink of sleep. See **MELANCHOLY**.

2°. The other cause is in the spirits themselves; which have some extraordinary disposition to receive motion, or to persist in it: as, from their too great heat, or that of the brain in fevers, &c.— Hence it is, that the disorder is most frequent in summer, in the heat of youth, &c.

Long fasting has the same effect; the want of food subtilizing the spirits, and drying the brain.— The same is likewise an ordinary symptom in old age, by reason the pores of the brain, and the nerves, having been much widened by the continual passage of spirits, for a great number of years, the spirits now pass and repass through them with too much ease, and need not any extraordinary motion to keep the mind awake. See **HABIT**.

There are instances of *waking* for forty-five nights successively: and we even read of a melancholy person, who never slept once in fourteen months.— Such *watchings* usually degenerate into madness. See **NARCOTICS**, and **OPIATE**.

**WATCH-WORK**, is that part of the movement of a clock or watch, which is designed to measure, and exhibit the time on a dial-plate; in contradiction to that part which contri-

butes to the striking of the hour, &c. which is called *clock-work*. See **WATCH**, and **CLOCKWORK**.

The several members of the *watch*-part, are, 1°. The *balance*, consisting of the *rim*, which is its circular part; see **BALANCE**; and the *verge*, which is its spindle; to which belong the two *pallets* or *leaves*, that play in the teeth of the crown-wheel.

2°. The *potence*, or *pottance*, which is the strong stud in pocket-watches, whereon the lower pivot of the verge plays, and in the middle of which, one pivot of the balance-wheel plays; the bottom of the *pottance* is called the *foot*, the middle part the *nose*, and the upper part the *shoulder*.

3°. The *cock*, which is the piece covering the balance.

4°. The *regulator*, or *pendulum spring*, which is the small spring in the new pocket-watches, underneath the balance. See **REGULATOR**.

5°. The *pendulum*; whose parts are, the *verge*, *pallets*, *cocks*, and the *bob*.

6°. The *wheels*, which are the *crown-wheel*, in pocket-pieces, and *swing-wheel* in pendulums; serving to drive the balance or pendulum. See **CROWN-WHEEL**.

7°. The *contrate-wheel*, which is that next the crown-wheel, &c. and whose teeth and hoop lie contrary to those of other wheels; whence the name.

8°. The *great*, or *first wheel*; which is that the fussy, &c. immediately drives: after which are the *second wheel*, *third wheel*, &c.

Lastly, between the frame and dial-plate, are the *pinion of report*, which is that fixed on the arbor of the great wheel; and serves to drive the *dial-wheel*, as that serves to carry the hand.

**Theory, and Calculation of WATCH-WORK**.— Preliminaries necessary to the calculating of the *watch*-part of a movement, are laid down under the articles **BEATS**, **MOVEMENT**, and **CLOCKWORK**; see also **TURN**.

Preliminary rules, common to the calculation of all movements, the *clock* as well as the *watch*-parts; see under the article **MOVEMENT**.— Particular rules for the *striking part*; see under the article **CLOCKWORK**.— Those for the *watch*-part we have from the rev. Mr. Derham, as follow.

1°. The same motion, it is evident, may be performed either by one wheel, and one pinion, or many wheels, and many pinions; provided the number of turns of all the wheels bear the proportion to all the pinions, which that one wheel bears to its pinion: or, which is the same thing, if the number, produced by multiplying all the wheels together, be to the number produced by multiplying all the pinions together, as that one wheel, to that one pinion.— Thus suppose you had occasion for a wheel of 1440 teeth, with a pinion of 28 leaves; you may make it into three wheels of 36, 8, and 5, and three pinions of 4, 7, and 1. For the three wheels, 36, 8, and 5, multiplied together, give 1440 for the wheels; and the three pinions 4, 7, and 1, multiplied together, give 28 for the pinions.— Add, that it matters not in what order the wheels and pinions are set, or which pinion runs in which wheel; only for contrivance-sake, the biggest numbers are commonly put to drive the rest.

2°. Two wheels, and pinions of different numbers, may perform the same motion.— Thus, a wheel of 36, drives a pinion of 4, the same as a wheel of 45, a pinion of 5; or a wheel of 90, a pinion of 10.— The turns of each being 9.

3°. If in breaking the train into parcels, any of the quotients should not be liked; or if any other two numbers to be multiplied together, are desired to be varied; it may be done by this rule.— Divide the two numbers, by any other two numbers which will measure them; multiply the quotients by the alternate divisors; the product of these two last numbers found, will be equal to the product of the two numbers first given.— Thus, if you would vary 36 times 8, divide these by any two numbers which will evenly measure them: so, 36 by 4, gives 9; and 8 by 1, gives 8: now, by the rule, 9 times 1 is 9, and 8 times 4, 32; so that for 36 x 8, you have 32 x 9; each equal to 288. If you divide 36 by 6, and 8 by 2, and multiply as before, you have 24 x 12 = 36 x 8 = 288.

4°. If a wheel and pinion fall out with cross numbers, too big to be cut in wheels, and yet not to be altered by these rules; in seeking for the pinion of report, find two numbers of the same, or a near proportion, by this rule: as either of the two given numbers, is to the other, so is 360, to a fourth. Divide that fourth number, as also 360, by 4, 5, 6, 8, 9, 10, 12, 15, (each of which numbers exactly measures 360) or by any of those numbers that brings a quotient nearest an integer.— As suppose you had 147 for the wheel, and 170 for the pinion; which are too great to be cut into small wheels, and yet cannot be reduced into less, as having no other common measure but unity: say, as 170 : 147 :: 360 : 311. Or, as 147 : 170 :: 360 : 416. Divide the fourth number, and 360 by one of the foregoing numbers; as 311, and 360 by 6, it gives 52 and 60; divide them by 8, you have 39, and 45: and, if you divide 360 and 416, by 8, you have 45 and 52 exactly. Wherefore, instead of the two num-

numbers 147, and 170, you may take 52, and 60; or 39 and 45, or 45 and 52, &c.

50. To come to practice in calculating a piece of *watch-work*, first pitch on the train or beats of the balance in an hour; as, whether a swift one, of about 20000 beats, (the usual train of a common 30 hour *pocket-watch*) or a slower, of about 16000, (the train of the new pendulum *pocket-watches*) or any other train.—Next, resolve on the number of turns the fufy is intended to have, and the number of hours the piece is to go: suppose, *e. gr.* 12 turns, and to go 30 hours, or 192 hours, (*i. e.* 8 days) &c. Proceed now to find the beats of the balance or pendulum in one turn of the fufy, by the direction given under the word BEATS.—Thus in numbers; 12 : 16 :: 20000 : 26666. Wherefore, 26666 are the beats in one turn of the fufy, or great wheel, and are equal to the quotients of all the wheels into the balance multiplied together.—Now this number is to be broken into a convenient parcel of quotients; which is to be done thus: first, halve the number of beats, *viz.* 26666, and you have 13333; then pitch on the number of the crown-wheel, suppose 17: divide 13333 by 17, and you have 784 for the quotient (or turns) of the rest of the wheels and pinions; which being too big for one or two quotients, may be best broken into three.—Chuse therefore three numbers; which, when multiplied all together continually, will come nearest 784: as suppose 10, 9, and 9, multiplied continually, gives 810, which is somewhat too much; therefore try again other numbers, 11, 9, and 8: these drawn one into another continually, produce 792; which is as near as can be, and convenient quotients.—Having thus contrived the piece from the great wheel to the balance; but the numbers not falling out exactly, as you first proposed, correct the work thus: first, (by the direction given under the word BEATS) multiply 792, the product of all the quotients pitched upon, by 17, (the notches of the crown-wheel) the product is 13464, which is half the number of beats in one turn of the fufy; then (by a rule given under the word BEATS) find the true number of beats in an hour.—Thus, 16 : 12 :: 13464 : 10098; which is half the beats in an hour.—Then find what quotient is to be laid upon the pinion of report, (by the rule given under that word).—Thus, 16 : 12 :: 12 : 9, the quotient of the pinion of report.—Having thus found your quotients, it is easy to determine what numbers the pinions shall have; for, chusing what numbers the wheels shall have, and multiplying the pinions by their quotients, the produce is the number for the wheels.

—Thus, the number of the pinion of report is 4, and its quotient is 9; therefore the number for the dial-wheel must be 4 × 9, or 36: so the next pinion being 5, its quotient 11, therefore the great wheel must be 5 × 11 = 55; and so of the rest.

Such is the method of calculating the numbers of a 16 hour *watch*.—Which *watch* may be made to go longer, by lessening the train, and altering the pinion of report.—Suppose you would conveniently slacken the train to 16000; then, by the rule given under the word BEATS, say, As  $\frac{1}{2}$  16000, or 8000 : 13464 :: 12 : 20. So that this *watch* will go 20 hours.—Then for the pinion of report, say, (by the rule given under that word) As 20 : 12 :: 12 : 7. So that 7 is the quotient of the pinion of report. And as to the numbers, the operation is the same as before; only the dial-wheel is but 28, for its quotient is altered to 7.

—If you would give numbers to a *watch* of about 10000 beats in an hour, to have 12 turns of the fufy, to go 170 hours, and 17 notches in the crown-wheel: the work is the same, in a manner, as the last example; and consequently thus: As 12 : 170 :: 10000 : 141666, which fourth number is the beats in one turn of the fufy; its half, 70833, being divided by 17, gives 4167 for the quotients: and because this number is too big for three quotients, therefore chuse four, as 10, 8, 8, 6  $\frac{1}{2}$ ; whose product into 17 makes 71808, nearly equal to half the true beats in one turn of the fufy.—Then say, As 170 : 12 :: 71808 : 5069, which is half the true train of your *watch*.—And again, 170 : 12 :: 12 :  $\frac{1}{2}$   $\frac{1}{2}$ , which expresses the pinion of report, and the number of the dial-wheel.—But these numbers being too big to be cut in small wheels, they must be varied by the fourth rule, above, thus:

As 144 : 170 :: 360 : 425;

Or 170 : 144 :: 360 : 305.

Then dividing 360, and either of these two fourth proportionals, (as directed by the rule;) suppose by 15, you will have  $\frac{1}{3}$ , or  $\frac{1}{2}$ ; then the numbers of the whole movement will stand as in the margin.

Such is the calculation of ordinary *watches*, to shew the hour of the day: in such as shew minutes, and seconds, the process is thus:

10. Having resolved on the beats in an hour; by dividing

the designed train by 60, find the beats in a minute; and accordingly, find proper numbers for the crown-wheel, and quotients, so as that the minute-wheel shall go round once in an hour, and the second wheel once in a minute.

Suppose, *e. gr.* you should chuse a pendulum of six inches to go eight days, with 16 turns of the fufy; a pendulum of 6 inches vibrates 9368 in an hour; and consequently, dividing it by 60, gives 156, the beats in a minute. Half these sums are 4684, and 78. Now, the first work is to break this 78 into a good proportion, which will fall into one quotient, and the crown-wheel. Let the crown-wheel have 15 notches, then 78, divided by 15, gives 5; so a crown-wheel of 15, and a wheel and pinion, whose quotient is 5, will go round in a minute to carry a hand to shew seconds.—For a hand to go round in an hour to shew minutes; because there are 60 minutes in an hour, it is but breaking 60 into good quotients, (suppose 10 and 6, or 8 and 7  $\frac{1}{2}$ , &c.) and it is done.—

Thus, 4684 is broken, as near as can be, into proper numbers.—But since it does not fall out exactly into the above-mentioned numbers, you must correct, (as before directed) and find the true number of beats in an hour, by multiplying 15 by 5, which makes 75; and 75 by 60, makes 4500, which is half the true train.—Then find the beats in one turn of the fufy; thus, 16 : 192 :: 4500 : 54000; which last is half the beats in one turn of the fufy.—This 54000 being divided by 4500, (the true numbers already pitched on) the quotient will be 12; which not being too big for a single quotient, needs not be divided into more; and the work will stand as in the margin.—As to the hour-hand, the great wheel, which performs only one revolution in 12 turns of the minute-wheel, will shew the hour; or it may be done by the minute-wheel.

**WATER, Aqua**, in physics, a simple, fluid, and liquid body; reputed the third of the four vulgar elements. See ELEMENT.

Sir Isaac Newton defines *water* to be a fluid salt, volatile, and void of taste: but this definition Boerhaave sets aside; inasmuch as *water* is a menstruum, or dissolvent of salts and saline bodies, which does not agree with the notion of its being a salt itself; inasmuch as we do not know of any salt that dissolves another. See SALT.

*Whether water be originally fluid?*—Though *water* be defined a *fluid*, it is a point controverted among philosophers, whether fluidity be its natural state, or the effect of violence: we sometimes find it appear in a fluid, and sometimes in a solid form; and as the former in our warmer climate is the more usual, we conclude it the proper one, and ascribe the other to the extraneous action of cold.—Boerhaave, however, asserts the contrary, and maintains *water* to be of the crystalline kind; since, wherever a certain degree of fire is wanting to keep it in fusion, it readily grows into a hard globe, under the denomination of *ice*. See ICE.

Mr. Boyle is much of the same sentiment.—Ice, he observes, is commonly reputed to be *water* brought into a preternatural state by cold: but, with regard to the nature of things, and setting aside our arbitrary ideas, it might as justly be said, That *water* is ice preternaturally thawed by heat.—If it be urged that ice, left to itself, will, upon the removal of the freezing agents, return to *water*; it may be answered, that, not to mention the snow and ice which lie all summer long on the Alps, and other high mountains, even in the torrid zone, we have been assured, that, in some parts of Siberia, the surface of the ground continues more months of the year frozen by the natural temperature of the climate, than thawed by the heat of the sun; and a little below the surface of the ground, the *water* which chances to be lodged in the cavities there, continues in a state of ice all the year round: so that when, in the heat of summer, the fields are covered with corn, if you dig a foot or two deep, you shall find ice, and a frozen soil.

*No pure water in all nature.*—*Water*, if it could be had alone, and pure, Boerhaave argues, would have all the requisites of an element, and be as simple as fire; but there is no expedient hitherto discovered for making it such.—*Rain-water*, which seems the purest of all those we know of, is replete with infinite exhalations of all kinds, which it imbibes from the air: so that filtered and distilled a thousand times, there still remain feces.—Further, the *rain-water* gathered from the roofs of houses, is a lixivium of tiles, slate, or the like; impregnated with the dungs and feces of the animals, birds, &c. deposited thereon; and the exhalations of numerous other things.—Add, that all the *rain-water* gathered in cities, must at least be saturated with the smoke of a thousand chimneys, and the various effluvia of numbers of persons, &c.—Beside, that there is fire contained in all *water*; as appears from its fluidity, which is owing to fire alone. See FIRE.

As what is in the air necessarily mixes itself with *water*, it hence

hence appears impossible to have such a thing as pure *water*.— If you percolate it through sand, or squeeze it through pumice, or pass it through any other body of the like kind, you will always have salt remaining.— Nor can distillation render it pure; since it leaves air therein, which abounds in corpuscles of all sorts. See AIR.

The purest of all *waters* we can any way arrive at, is that distilled from snow, gathered in a clear, still, pinching night, in some very high place; taking none but just the outer or superficial part thereof.— By a number of repeated distillations, the greatest part of the earth, and other fæces, may be separated herefrom: and this is what we must be contented to call *pure water*.

Mr. Boyle, indeed, relates, that a friend of his, by distilling a quantity of *water* an hundred times, found, at length, that he had got six tenths of the first quantity in earth: Whence he concludes, that the whole *water*, by further prosecuting the operation, might be converted into earth. See EARTH.

But it should be considered, that *water* cannot be removed, or poured into a vessel, without mixing some dust therewith; so, neither can the luting of the vessel be distilled, without losing something every time.— Boerhaave, therefore, rather concludes, that the *water* thus often distilled, might acquire still new earth from the dust floating in the air, and the instruments employed in the operation.

That author assures us, that after distilling some very pure *water*, by a gentle fire, the space of four months, it appeared perfectly pure; and yet, leaving it to rest in vessels exactly closed, it would conceive a slender kind of weedy matter, somewhat like the flamina of plants, or the little tufts of a mucilage: yet Schottus saw *water*, in Kircher's museum, that had been kept in a vessel, hermetically sealed, upwards of fifty years; yet still remained clear and pure, and stood to the same height in the vessel as at first, without the least sign of sediment.

Boerhaave adds, that he is convinced nobody ever saw a drop of pure *water*; that the utmost of its purity known, only amounts to its being free from this or that sort of matter: and that it can never, for instance, be quite deprived of salt; since air will always accompany it, and air has always salt. See AIR, and ATMOSPHERE.

*Water in all places and bodies.*— *Water* seems to be diffused every where, and to be present in all space where there is matter.— Not a body in all nature but will yield *water*: it is even asserted, that fire itself is not without *water*.— A single grain of the most fiery salt, which in a moment's time will penetrate through a man's hand, readily imbibes half its weight of *water*, and melts, even in the driest air imaginable.— Thus, salt of tartar, placed near the hottest fire, will attract or imbibe *water*; and, by that means, increase considerably its weight, in a small time: so, in the driest summer's day, a pewter vessel with ice in it, brought up from some cold subterraneous place, into the hottest room, will immediately be covered over with little drops of *water*, gathered from the contiguous air, and condensed by the coldness of the ice.

It is surprizing to consider the plenteous stock of *water* which even dry bodies afford.— Oil of vitriol, being exposed a long time to a violent fire, to separate all the *water*, as much as possible, from the same, will, afterwards, by only standing a few minutes in the air, contract fresh *water* so fast, as soon to afford it as plenteously as at first.— Hartshorn, kept forty years, and turned as hard and dry as any metal, so that if struck against a flint, it will yield sparks of fire; yet, being put into a glass vessel, and distilled, will afford one eighth part of its quantity of *water*.— Bones dead and dried twenty-five years, and thus become almost as hard as iron; yet, by distillation, have afforded half their weight of *water*.— And the hardest stones, ground and distilled, do always discover a portion thereof.

Eels, by distillation, yielded Mr. Boyle some oil, spirit, and volatile salt, besides the caput mortuum; yet all these were so disproportionate to the *water*, that they seemed to have been nothing but that coagulated: the same strangely abounds in vipers, though esteemed very hot in operation; and will, in a convenient air, survive, for some days, the loss of their heads and hearts.— Human blood itself, as spirituous and elaborate a liquor as it is reputed, so abounds in *water*, that out of seven ounces and an half, the same author, by distillation, drew near six of phlegm, before ever any of the other principles began to rise. See PHLEGM.

*Whether water be the common matter of all bodies?*— From considerations of this kind, Thales, and some other philosophers, have been led to hold, that all things were made of *water*: which opinion, probably, had its rise from the writings of Moses, where he speaks of the spirit of God moving upon the face of the *waters*.— But Mr. Boyle does not conceive the *water* here mentioned by Moses as the universal matter, to be our elementary *water*: we need only suppose it an agitated congeries of a great variety of seminal principles, and of other corpuscles fit to be subdued and fashioned.

VOL. II. No. CLXIV.

ed by them; and it may yet be a body fluid like *water*, in case the corpuscles it was made up of were, by their creator, made small enough, and put into such an actual motion, as might make them roll, and glide easily over one another.— However, Basil Valentine, Paracelsus, Van Helmont, Sendivogius, and others, have maintained the same principle, viz. that *water* is the elemental matter, or stamen of all things, and suffices alone for the production of all the visible creation.— Thus Sir Isaac Newton, “All birds, beasts, and fishes, insects, trees, and vegetables, with their several parts, do grow out of *water*, and watery tinctures, and salts; and, by putrefaction, return again to watery substances.”

Helmont endeavours to prove this doctrine from an experiment; wherein, burning a quantity of earth, till all the oil was consumed, and then mixing it up with *water*, to draw out all the salt; and putting this earth, thus prepared, into an earthen pot, which nothing but rain-*water* could enter; yet a willow, planted therein, grew up to a considerable height and bulk, without any sensible diminution of the earth: whence he concluded, that the *water* was the only nutriment of the vegetable kind, as vegetables are of the animal.— The same thing is inferred by Mr. Boyle, from a parallel experiment: and the whole is countenanced by Sir Isaac Newton, who observes, that *water*, standing a few days in the open air, yields a tincture; which, like that of malt, by standing longer, yields a sediment, and a spirit; but before putrefaction, is fit nourishment for animals and vegetables.

But Dr. Woodward endeavours to shew the whole a mistake: *water* containing extraneous corpuscles, some of these, he shews, are the proper matter of nutrition; the *water* being still found to afford so much the less nourishment, the more it is purified by distillation.— Thus, a plant in distilled *water* will not grow so fast as in *water* not distilled; and if the *water* be distilled three or four times over, the plant will scarce grow at all, or receive any nourishment from it. So that *water*, as such, does not seem the proper nutriment of vegetables; but only the vehicle thereof, which contains the nutritive particles, and carries them along with it, through all the parts of the plant. See VEGETATION.

Hence, a *water-plant*, e. gr. a nasturtium, brought up in a vessel of *water*, will be found to contain the more salt and oil, the muddier the *water* is: in effect, *water* nourishes the less, the more it is purged of its saponaceous salts; in its pure state, it may suffice to extend or swell the parts, but affords no new vegetable matter. See VEGETABLE, NUTRITION, &c.

Helmont, however, carries his system still further, and imagines, that all bodies may be re-converted into *water*.— His alkahest, he affirms, adequately resolves plants, animals, and minerals, into one liquor, or more, according to their several internal differences of parts: and the alkahest, being abstracted from these liquors, in the same weight, and with the same virtues as when it dissolved them, the liquors may, by frequent cohobations from chalk, or some other proper matter, be totally deprived of their seminal endowments, and return at last to their first matter, insipid *water*.

Thus much is confessed, that mixed bodies do all resolve by fire, into phlegm or *water*, oil, spirit, salt, and earth; each of which is found to contain *water*.

Spirits, for instance, cannot be better represented, than by spirit of wine; which, of all others, seems freest from *water*: yet, Helmont affirms, it may be so united with *water*, as to become *water* itself.— He adds, that it is materially *water*; only under a sulphurous disguise.— According to him, in making Paracelsus's balsamum-famech, which is nothing but sal tartari dulcified, by distilling spirit of wine from it, till the salt be sufficiently saturated with its sulphur, and till it suffers the liquor to be drawn off, as strong as it was poured on; when the salt of tartar, from which it is distilled, hath retained, or deprived it of the sulphurous parts of the spirit of wine, the rest, which is incomparably the greatest part of the liquor, will turn to phlegm. In effect, corrosive spirits, according to Mr. Boyle's observation, abound in *water*; which may be observed, by entangling, and so fixing their saline parts, as to make them corrode some proper body; or else by mortifying them with some contrary salt: which will turn them into phlegm. See SPIRIT.

And as to salts; salt of tartar well calcined, being laid to liquify in the air, will deposite an earth; and if it be then committed to distillation, will yield a considerable quantity of insipid *water*; inasmuch, that if it be urged with a vehement fire, the salt will almost all vanish, and nothing saline remain, either in the *water*, or the earth.— Whence Helmont concludes, that all salts might be converted into *water*. Add, that sea-salt, recovered from its own acid spirit, and oil of tartar, resolves into *water*, as much as into oil of tartar. See SALT.

Lastly, oils run, in great measure, into *water*; and it is probable, might be converted wholly into the same. See OIL, SULPHUR, &c.

*No standard for the weight and purity of water.*— *Water* scarce

ever continues two moments exactly of the same weight, by reason of the air and fire contained therein. Thus, a piece of pure limped ice, laid in a nice balance, never continues in equilibrio.—In effect, the expansion of *water* in boiling, shews what effect the different degree of fire has, on the gravity of *water*.—This makes it difficult to fix the specific gravity of *water*, in order to settle its degree of purity; but this we may say in the general, that the purest *water* we can procure, is that which is 880 times as heavy as air.—However, neither have we any tolerable standard in air; for *water* being so much heavier than air, the more *water* is contained in the air, the heavier of course must it be: as, in effect, the principal part of the weight of the atmosphere seems to arise from the *water*. See AIR, and ATMOSPHERE.

*Properties and effects of water.*—1°. *Water* is found the most penetrative of all bodies, after fire, and the most difficult to confine; so that a vessel through which *water* cannot pass, may retain any thing. Nor is it any objection, that syrups and oils will sometimes pass through bodies which will hold *water*; this not being owing to the greater subtilty and penetration of their particles, but to the resin, wherewith the wood of such vessels abounds, to which oils and syrups are as menstrums; so that dissolving the resin, they make their way through the spaces left thereby: whereas *water*, not acting on resins, is retained. See RESIN.

And yet, *water* gradually makes its way, even through all woods, and is only retainable in glass and metals; nay, it was found by experiment at Florence, that when shut up in a spherical vessel of gold, and then pressed with a huge force, it made its way through the pores even of the gold: so that the most solid body in nature, is permeable to *water*. See GOLD.

*Water* is even found more fluid than air; a body being reputed more fluid than another, when its parts will find way through smaller pores: now air, it is known, will not pass through leather, as is evident in the case of an exhausted receiver covered therewith; whereas *water* passes with ease.—Again, air may be retained in a bladder, but *water* oozes through. In effect, it is found, that *water* will pass through pores ten times smaller than air will. See PORE.

It must not be omitted, however, that M. Homberg accounts for this passage of *water* through the narrow pores of animal substances which will not admit the air, on another principle, viz. its moistening and dissolving the glutinous matter of the fine fibres of the membranes, and rendering them more pliable and distensible; which are things that the air, for want of a wetting property, cannot do.—As a proof of this doctrine, he filled a bladder, and compressed it with a stone, and found no air to come out; but placing the bladder thus compressed in *water*, the air easily escaped. *Hist. de l'Acad. An. 1700. p. 45.*

2°. *Water*, then, may even hence, viz. from its penetrative power, be argued to enter the composition of all bodies, both vegetable, animal, and fossil; with this peculiar circumstance, that it is easily, and with a gentle heat, separable again from bodies it had united with: which cannot be said of any other body.—Fire, indeed, will penetrate more than *water*; but it is difficult to procure it again from the bodies it is once fixed in, as is evident in red lead, &c. See MINNIUM, VERMILION, &c.

This property of *water*, joined with its smoothness and lubricity, fits it to serve as a vehicle for the commodious and easy conveyance of the nutritious matter of all bodies: being so fluid, and passing and repassing so readily, it never stops up the pores, but leaves room for the following *water*, to bring on a new supply of nutritious matter. See NUTRITION.

3°. And yet the same *water*, as little cohesive as it is, and as easily separated from most bodies, will cohere firmly with some others, and bind them together into the most solid masses: though it appears wonderful, that *water*, which will be shewn an almost universal dissolvent, should withal be a great coagulator.

*Water*, we see, mixed up with earth or ashes, gives them the utmost firmness and fixity.—The ashes, *e. gr.* of an animal, incorporated with pure *water* into a paste, and baked with a vehement fire, grow into a coppel; which is a body remarkable for this, that it will bear the utmost effort of a refiner's furnace.—It is, in effect, upon the glutinous nature of *water* alone that our houses stand: for take but this out of wood, and it becomes ashes; or out of tyles, and they become dust.

Thus, a little clay dried in the sun, becomes a powder, which, mixed with *water*, sticks together again, and may be fashioned at pleasure; and this dried again by a gentle fire, or in the sun, and then baked in a potter's oven, by an intense fire, becomes little other than a stone.—So the Chinese earth, whereof our porcelain vessels are made, which hold all liquors, and even melted lead itself, is diluted and wrought up with *water*. See PORCELAIN.

To say no more, all the stability and firmness seen in the

universe, is owing to *water* alone.—Thus, stone would be an incoherent sand, did not *water* bind it together; and thus, again, of a fat gravelly earth, wrought up with *water*, and baked or burnt, we make bricks, tyles, and earthen vessels, of such exceeding hardness and closeness, that *water* itself cannot pass through them. And these bodies, though to appearance perfectly dry, and destitute of *water*, yet, being pulverized and put in a retort, and distilled, yield an incredible quantity of *water*.

The same holds of metals; for the parings or filings of lead, tin, antimony, &c. by distillation, yield *water* plentifully; and the hardest stones, sea-salt, nitre, vitriol, sulphur, &c. are found to consist chiefly of *water*, into which they resolve by force of fire.

The *lapis calcarius*, or lime-stone, being exposed to the fire, affords a prodigious quantity of pure *water*; and the more of this *water* is expressed, the more friable does it become, till at length it commences a dry calx or lime, wherein, in lieu of the *water* so expelled, the fire, in the course of calcination, enters; which is expelled again, in its turn, by pouring on cold *water*. Yet, the same *water* and calx, tempered together, produce a mass scarce inferior, in point of solidity, to the primitive lime-stone. See LIME, MORTAR, &c. 4°. That *water* is not elastic, is evident hence, that it is incompressible, or incapable, by any force, of being reduced into less compass: this easily follows from that famous experiment abovementioned, made by order of the great duke of Tuscany.—The *water*, being incapable of condensation, rather than yield, transmuted through the pores of the metal, so that the ball was found wet all over the outside; till at length, making a cleft in the gold, it spun out with great vehemence.—From this last circumstance, indeed, some have weakly concluded it was elastic. For the impetus wherewith the *water* darted forth, was more probably owing to the elasticity of the gold, which communicated that impression to the *water*.

And hence we see the reason why blocks of marble sometimes burst in cold weather; and why a vessel filled with *water*, and afterwards, by any means, reduced to a less compass, bursts the vessel, though ever so strong.—This is observable in a piece of brass cannon, which being filled with *water*, and the mouth exactly stopped, so as to prevent all egress of *water*; if a cold night happens, sufficient to contract and congregate bodies; the metallic matter undergoing the common fate, and the *water* refusing to give way, the cannon is burst asunder with incredible violence.

Some bring an argument for the elasticity of *water* hence, that hot *water* takes up more room than cold; but no legitimate conclusion can be formed from hence: for in the hot *water* there is a good quantity of fire contained, which interposing between the particles of the *water*, makes it extend to a greater space, without any expansion of parts from its own elasticity. This is evident hence, that if *water* be once heated, there is no reducing it to its former dimensions, but by letting it cool again: which plainly shews, that the expansion depends not on the elasticity of parts, but on the presence of fire.—*Water*, then, though incapable of compression or condensation, may yet be rarefied by heat, and contracted by cold. See RAREFACTION, &c.

It may be added, that a further degree of cold, that is, such a one as congeals *water*, or turns it into ice, does expand it.—There are other ways to manifest this expansion of *water*, by freezing.—Mr. Boyle having poured a proper quantity of *water* into a strong cylindrical earthen vessel, exposed it, uncovered, both to the open air in frosty nights, and the operation of snow and salt; and found, that the ice produced in both cases, reached higher than the *water* before it was froze. Add, that it has been found, that the rain soaking into marble, and violent frosts coming on, have burst the stones: and even implements made of bell-metal, carelessly exposed to the wet, have been broken and spoiled by the *water*; which entering at little cavities of the metal, was there afterwards froze, and expanded into ice.

From the whole we may be enabled to settle something, as to the nature of the component particles of *water*; and, 1°. That they are, as to our senses, infinitely small; whence their penetrative power: 2°. Exceedingly smooth and slippery, void of any sensible asperities; witness their fluidity, and their being so easily separable from other bodies which they adhere to: 3°. Extremely solid: 4°. Perfectly transparent, and as such invisible; which we gather hence, that pure *water*, inclosed in a vessel hermetically sealed, projects no shadow; so that the eye shall not be able to discover whether the vessel have *water* in it or not; and in that the crystals of salts, when the *water* is separated from them, lose their transparency.—5°. Hard, rigid, and inflexible; as appears from their not being compressible.—If it be asked, how a body so light, fluid, and volatile, and which so easily a fire suffices to rarefy, should be so stubborn and incompressible? We see no other cause to assign, but the homogeneity of its parts.—If *water* be considered as consisting of spherical, or cubical particles, hollow within, and of a firm

firm texture; here will be enough to account for the whole: Its firmness and similarity will make it resist sufficiently; and its vacuity renders it light enough, &c. — The little contact between spherules, will account for the weakness of its cohesion, &c. See **PARTICLE**, **COHESION**, &c.

Salt melted in *water*, does not fill the vessel in proportion to its own bulk: whence it follows, that there are little spaces between the particles of *water*, to admit those of the salt. — And hence, again, we gather, that the *watry* particles are extremely solid and inflexible; since, though they have intermediate spaces, no force or weight can compress, or crowd them nearer. See **SALT**.

5°. *Water* is the most insipid of all bodies; the taste we sometimes observe therein, arising not from the mere *water*; but from salt, vitriol, or other bodies mixed therewith: and accordingly, all the sapid *waters*, recommended for medicinal uses, are found to deposite a quantity of some of those fossils.

6°. *Water* is perfectly inodorous, or void of the least smell. — *Water*, then, neither affects sight, taste, nor smell, provided it be pure; and consequently might remain for ever imperceptible to us, but for the sense of feeling.

*Whether water be convertible into air?* — It has been disputed, whether or no *water* be convertible into air; there being numerous instances of, at least, an apparent transmutation. — In the vapours daily raised, we find *water* rarefied to such a degree, as to take place in the atmosphere, and help to compose a considerable part of what we call *air*; and even to contribute to many of the effects ascribed to the air. See **VAPOUR**, **AIR**, and **ATMOSPHERE**. — But such a vapour-air has not the characters of true permanent air, being easily reducible into *water* again. So, in digestions and distillations, though *water* may be rarefied into vapours, yet it is not really changed into air, but only divided by heat, and diffused into very minute parts; which, meeting together, presently return to such *water* as they constituted before.

Yet, *water* rarefied into vapour in an æolipile, will, for a while, have an elastic power, the great and last characteristic of true air, and stream out perfectly like a blast of air: The elastic power of this stream, is manifestly owing to nothing else but the heat, that expands and agitates the aqueous particles thereof; and when the heat is gone, the elasticity, and other aerial properties disappear likewise. See **ELASTICITY**.

Rapid winds thus made, seem to be no more than mere *water*, broke into little parts, and put into motion; since, by holding a solid, smooth, and cold body against it, the vapours condensing thereon, will presently cover the body with *water*. — Indeed, though no heat intervenes, motion alone, if vehement, may perhaps suffice to break *water* into minute parts, and make them ascend upwards in form of air. — Mr. Boyle observes, that between Lyons and Geneva, where the Rhone is suddenly straitened by two rocks very near each other, that rapid stream, dashing with great impetuosity against them, breaks part of its *water* into minute corpuscles, and gives it such a motion, that a mist may be observed at a considerable distance, arising from the place, and ascending high into the air.

**WATER**, in geography and hydrography, is a common, or general name applied to all liquid transparent bodies, gliding or flowing on the earth. See **FLUID**, **LIQUID**, &c.

In this sense, *water* and earth are said to constitute our terraqueous globe. See **EARTH**.

Some authors have rashly and injuriously taxed the distribution of *water* and earth in our globe as unartful, and not well proportioned: supposing that the *water* takes up too much room. See **TERRAQUEOUS**.

An inundation, or overflowing of the *waters*, makes a deluge. See **DELUGE**.

**Cataract of WATER**. See the article **CATARACT**.

*Water* is distinguished, with regard to the places where it is found, into marina, *sea-water*; pluvialis, *rain-water*; fluviatilis, *river-water*; fontana, *spring-water*; putealis, *well-water*; cisternina, that of *cisterns*; palustris, that of *lakes*, *morasses*, &c. — which are each more impure, and heterogeneous than other.

**Sea-WATER**, is an assemblage of bodies, wherein *water* can scarce be said to have the principal part: it is an universal colluvies of all the bodies in nature, sustained and kept swimming in *water*, as a vehicle. See **SEA**, **OCEAN**, &c.

Dr. Lister considers it as the fund or source, out of which all bodies arise. He gives, in some measure, into the opinion of Thales, and Van Helmont; and imagines the *sea-water* to have been the only element created at the beginning, before any animal, or vegetable; or even before the sun himself. — *Fresh-water*, he supposes to have rose accidentally after the creation of these, and to owe its origin to the vapours of plants, the breath of animals, and the exhalations raised from the sun. *De Font. Med. Ang.*

Dr. Halley is of another opinion. — He takes it for granted, that the saltness of the sea, arises from the saline matter dis-

solved and imbibed by the rivers in their progress, and discharged, with their *waters*, into the ocean; and consequently, that the degree of saltness is continually and gradually increasing. — On this hypothesis, he even proposes a method for determining the age of the world: for two experiments of the degree of saltness, made at a large interval of time, will, by the rule of proportion, give the time wherein it has been acquiring its present degree. *Philos. Transact.* No. 344.

The *water* of the sea is liable to several periodical changes. See **TIDES**.

**High-WATER**.

**Low-WATER**.

**Ebb-WATER**.

} See the articles **FLUX**, **EBB**, &c.

**Rain-WATER**, is the *water* of the sea, purified by a sort of distillation: or rather, it is the *watery* vehicle, separated from the saline, and other matters residing therein, by evaporation. See **RAIN**, and **EVAPORATION**.

The *water* which descends in rain and snow, is, of all others, the purest, in a cold season, and a still sky; and this we must be contented to take for elementary *water*.

The *rain-water*, in summer, or when the atmosphere is in commotion, it is certain, must contain infinite kinds of heterogeneous matter: Thus, gathering the *water* that falls after a thunder-clap, in a sultry summers day, and letting it settle, a real salt is found sticking at the bottom. But in winter, especially when it freezes, the exhalations are but few, so that the rain falls without much adulteration: and hence, what is thus gathered in the morning-time, is found of good use for taking away spots in the face; and that gathered from snow, against inflammation of the eyes. See **SNOW**.

Yet this *rain-water*, with all its purity, may be filtered and distilled a thousand times, and it will still leave some fæces behind it.

**Spring-WATER** is the next, in point of purity. — This, according to Dr. Halley, is collected from the air itself; which being saturated with *water*, and coming to be condensed by the evening's cold, is driven against the cold tops of the mountains; where, being further condensed and collected, it gleets down, or distils, much as in an alembic. See **SPRING**, &c.

This *water*, which before floated in the atmosphere, in form of a vapour, being thus brought together, at first forms little streams; several of which meeting together, form rivulets; and these, at length, rivers.

**River-WATER**, on some occasions, is to be esteemed purer than that of springs. — If the stream, in descending from its spring, chance to flow over strata, or beds, wherein there is salt, sulphur, vitriol, iron, or the like, it dissolves and imbibes part thereof. — Otherwise, spring-*water* becomes purer and better; for while the river drives on its *waters* in an uninterrupted stream, all its salts, with the vegetable and animal matters drained into it, either from exhalations, or from the ground it washes, gradually either sink to the bottom, or are driven to the shore: and hence, the ancient poets and painters represent the deities of springs and rivers, as combing and carding their *waters*. See **RIVER**.

With regard to the qualities of *water*, it is further distinguished into salina, *salt-water*; dulcis, *fresh water*, &c.

**Salt-WATER**, or **Sea-WATER**. See **SALT**, and **SEA-WATER**.

**Fresh-WATER**. — It is generally granted, that those *waters*, ceteris paribus, are the best, as well for wholesomeness, as various other oeconomic uses, &c. that are freeest from saltness; which is an adventitious, and, in most cases, a hurtful quality in *waters*. — Mr. Boyle, therefore, contrived a very extraordinary method of examining the freshness and saltness of *waters*, by a precipitant, which could discover one part of salt in 1000, nay, 2 or 3000 parts of *water*. See **FRESH-WATER**.

The thawed ice of *sea-water* is often used in Amsterdam for brewing; and Bartholine, in his book *De Nivis Usu*, confirms the relation: "It is certain, says he, that if the ice of the *sea-water* be thawed, it loses its saltness; as has been lately tried by a professor in our university."

**Uses of WATER**. — The uses of *water* are infinite; in food, in medicine, in agriculture, in navigation, in divers of the arts, &c.

As a *food*, it is one of the most universal drinks in the world; and, if we may credit many of our latest and best physicians, one of the best too. — For this use, that which is purest, lightest, most transparent, simple, colourless, void of taste and smell, and which warms and cools fastest, and wherein herbs and pulse infuse and boil the soonest, is best. See **DRINK**.

Hippocrates, in his treatise *De Aëre, Aquis & Locis*, speaks much in behalf of light *water*. — Herodotus relates, that, among the antients, some nations drank a *water* so very light, that all woods readily sunk therein. — And Mr. Boyle mentions some *water* brought out of Africa into England, which was specifically lighter than ours, by four ounces in a pint, i. e. by one third. See **WATERPOISE**.

It is esteemed a good quality in *water*, to bear soap, and make a lather therewith. — This our river-*waters* readily do, but

but the pump and spring-waters are found too hard for it; yet may these be remedied, by barely letting them stand for four or five days.

As a *medicine*, it is found, internally, a powerful febrifuge; excellent against colds, coughs, stone, scurvy, &c. See FEBRIFUGE, &c.—Externally, its effects are no less considerable. See BATH.

In *agriculture*, and gardening, *water* is allowed absolutely necessary to vegetation; whence Varro places it in the number of the divinities he invokes in his first book *de re Rustica*: *Etiam, says he, precor lympba, quoniam sine aqua omnis misera est agricultura.* See WATERING.

The changes *water* is liable to, and the different forms it appears under, are numerous.—Sometimes as ice, then as a vapour, then as a cloud, shower, snow, hail, fog, &c. See ICE, VAPOUR, CLOUD, SHOWER, SNOW, HAIL, FOG, FREEZING, &c.

Many naturalists have even maintained *water* to be the vegetable matter, or the only proper food of plants; but Dr. Woodward has overturned that opinion, and shewn, that the office of *water* in vegetation, is only to be a vehicle to a terrestrial matter, whereof vegetables are formed; and does not itself make any addition to them.—All *water*, he allows, contains more or less of this terrestrial matter; spring and rain-water near an equal quantity, and river-water more than either of them. See VEGETATION.

*Water* is of the last use in chymistry; being one of the great instruments by means whereof its operations are all performed. See CHYMISTRY, and OPERATION.

It acts in various manners and capacities; as a menstruum, a ferment, a putrefacient, a vehicle, a medium, &c.

1°. As a *menstruum*, it dissolves all kinds of salts. See SALT, DISSOLVENT, DISSOLUTION, &c.—Air also seems to dissolve salts; but it is only by virtue of the *water* it contains.—Nor has any other body the power of dissolving salts, further than as it shares in this fluid. See AIR, &c.

The particles of salts, we have observed, inlinate themselves into the interstices between the particles of *water*; but when those interstices are once filled, the same *water* will not any longer dissolve the same salt; but it will dissolve a salt of another kind, by reason of the different figure of the particles, which enter and occupy the vacancies left by the former: and thus it will dissolve a third, or fourth salt, &c.—So, when *water* has imbibed its fill of common salt, it will still dissolve nitre; and when saturated with nitre, it will dissolve sal armoniac, and so on.

*Water* also dissolves all saline bodies, it being the constituent character of this class of bodies, that they are uninflamable, and dissoluble in *water*.—Hence, *water* may dissolve all bodies, even the heaviest and most compact, as metals; inasmuch as those are capable of being reduced into a saline form: in which state they may be so intimately dissolved by *water*, as to be sustained therein.

*Water* dissolves all saponaceous bodies, *i. e.* all alkalious salts and oils blended together: though oil itself be not dissoluble in *water*, the admixture of salt herewith, rendering it saline, brings it under the power of *water*.

Now, all the humours in the human body are apparently saline, though none of them are salt itself; and the same may be said of the juices of all vegetables, excepting the oils; and accordingly, they all dissolve in *water*.

*Water* dissolves glass itself.—This being melted with salt of tartar, becomes soluble in *water*. See GLASS.

It dissolves all gums, and gummy bodies; it being a characteristic of a gum, that it dissolves in *water*; in contradiction from a resin. See GUM, &c.

Further, *water* mixed with alkali salts, dissolves oil and oily bodies.—Thus, though mere *water* poured on greasy wool, be repelled thereby; yet a strong lixivium, or alkali salt being mixed with the *water*, it readily dissolves and absorbs all that was greasy and oleaginous: and thus it is that woollen cloths are scoured.

But, *water* does not dissolve resins; as we conceive a resin to be no other than an inspissated, or concentrated oil. See RESIN.

Oils and sulphurs *water* leaves untouched; and what is more extraordinary, it repels them; and by repelling, drives the oily particles into eddies.—Add, that it seems to repel all oleaginous, sulphurous, fatty, and adipous bodies, wherein oil predominates; and hence also it is, that the fatty parts in our bodies escape being dissolved by *water*.—And it is, in all probability, by this means that fat is collected in the adipose cells of all animals. See FAT.

Nor does it dissolve terrene or earthy bodies, but rather unites and consolidates them; as we see in tyles, &c. See EARTH.

After dissolving a body, the *water* unites and hardens together with it; and, if the body be of the saline kind, forms crystals, and retains the salts in that form. See CRYSTAL.

Salts, while thus joined with *water*, assume various figures;

the crystals of sea-salt, *e. gr.* are pyramidal; those of nitre, prismatical; those of sal gemmæ, cubical, &c. But, that *water* is the cause of these salts being in crystals, is evident hence, that upon separating the *water*, the crystals are no more; their form is lost, and their transparency ceases. See CRYSTALLIZATION.

2°. Without *water*, there can no fermentation be raised.—Thus, if you grind a plant into a dust, or farina, it will never ferment; even though you add yeast, or spirit of wine thereto: but *water* being poured on it, the fermentation readily arises. See FERMENTATION.

3°. All putrefactions, both of animal and vegetable bodies, are likewise performed by means of *water* alone; and without it, there would be no such effect in all nature. See PUTREFACTION.

4°. *Water* is indispensibly required to effervescence; which is an intestine motion, arising between contrary salts: for no such motion can arise from a mixture of contrary salts, unless there be *water* to dissolve and keep them in solution.

5°. A farther use is in the making separations of oily from saline parts, which is a thing of the last service: thus, any oleaginous substance, incorporated with salt, being shook some time in a proper quantity of *water*, the salts dissolving, will be extracted from the oil, and imbibed by the *water*: and thus is the body dulcified.—So butter, by a continued lotion in fair *water*, becomes insipid; and aromatic oils, agitated a long time in warm *water*, lay aside their saline spirituous parts, and become inert, and inodorous.

Spirit of wine, mixed with oil, makes one body therewith; but if you pour *water* thereon, it will repel the oil, and draw all the spirit to itself: nay, frequently, what the spirit had dissolved in other bodies, *water* will separate from them, by diluting the spirit, and letting the other matters precipitate.

6°. *Water* is of great service in directing and determining the degree of fire, or heat.—This was first discovered by M. Amontons, from an observation, that *water* over the fire grows gradually more and more hot, till it comes to boil; but then ceases to increase, and only maintains its present degree of heat, even though the fire were ever so much enlarged, or were continued ever so long.—This, therefore, affords a standard, or fixed degree of heat all over the world; boiling *water*, provided it be equally pure, being of the same heat in Greenland, as under the equator.

By means hereof, they make baths of divers degrees of heat, accommodated to the various occasions. See BATH, FIRE, HEAT, &c.

*Water* is of the utmost use in divers of the mechanical arts, and occasions of life; as, in the motion of mills, and other machines.—And the laws, properties, &c. of this fluid with respect thereto; as its motion, gravitation, pression, elevation, action, &c. And the construction of divers engines subservient thereto, or founded thereon; as siphons, pumps, &c. make the subject of *hydraulics*, and *hydrostatics*. See HYDRAULICS, FLUID, ASCENT, &c.

The quantity of *water* on this side our globe, Dr. Cheyne suspects to be daily decreasing; “some part thereof being continually turned into animal, vegetable, metalline, or mineral substances; which are not easily dissolved again into their component parts.—Thus, if you separate a few particles of any fluid, and fasten them to a solid body, or keep them asunder one from another, they are no fluid; to produce fluidity, a considerable number of such particles is required.” See FLUIDITY.

“Most of the fluids or liquids we know of, are formed by the cohesion of particles of different figures, magnitudes, gravities, and attractive powers, swimming in pure *water*, or an aqueous fluid; which seems to be the common basis of all.—Wine is only *water* impregnated with particles of grapes; and beer with particles of barley: all spirits seem to be nothing but *water*, saturated with saline or sulphurous particles: and all liquids are more or less fluid, according to the greater or smaller cohesion of the particles, which swim in the aqueous fluid.—And there is hardly any fluid without this cohesion of particles: not even pure *water* itself; as is apparent from the bubbles which sometimes will stand on its surface, as well as on that of spirits, and other liquors.” *Philosoph. Princip. of Relig.*

WATER, in natural history, &c. is distinguished into *pure*, called also *elemental*; *mineral*; and *artificial*, or *factitious*.

As to the *pure*, we have already observed, that there is, perhaps,

haps, none absolutely so: all *water* being found to contain more or less particles such as those in terrestrial bodies; not earthly particles, we mean, but oils, salts, &c.

**Mineral WATERS**, are those which contain such, and so many particles of different nature from *water*, as thence to derive some notable property beyond what common *water* has: or, *mineral waters* are those which have contracted some virtue extraordinary, by passing through beds of minerals, as allum, vitriol, sulphur, &c. or by receiving the fumes thereof. See **MINERAL**.

The kinds of *mineral waters* are various, as are the kinds of compositions of the minerals they are impregnated withal. See **FOSSIL**.

Some are *simple*, as only containing mineral particles of one sort; others *mixed*, of two, three, four, or more sorts.

Hence, we have, 1°. *Metallic waters*, in different parts, *golden, silver, copper, tin, leaden, and iron waters*. See **METAL, FERRUGINOUS, CHALYBEAT, &c.**

2°. *Saline waters*, viz. *nitrous, aluminous, vitriolate*, and those of common salt. See **SALT**.

3°. *Bituminous, sulphurous, antimonial, carbonaceous*, and *amber waters*. See **BITUMEN, &c.**

4°. *Earthy and stony waters*, viz. *lime, chalk, oker, cinabar, marble, and alabaster waters*.

To which some add *mercurial waters*. See **MERCURY, &c.**

This division of *mineral waters*, is taken from their essences; that is, from the mineral particles they contain: but the most usual and celebrated division, is borrowed from the manner wherein they affect our senses; with regard to which there are ten kinds; viz. *acid, bitter, hot, cold, oily, and fat, poisonous, coloured, boiling, petrifying, incrustating, and saline*.

**Acid WATERS**, called also *acidulæ*, arise from the admixture of vitriol, nitre, allum, and salt.—These are cold, and very frequent, there being not reckoned less than 1000 in Germany alone: some of which are said to be sour as vinegar, and used instead thereof; others vinous, and serving for wine; others astringent, &c. See **ACIDULÆ**.

**Hot WATERS**, called *thermæ*, arise from the admixture of sulphurous particles and fumes.—Of these, the hottest is that in Japan, which, it is said, no fire can bring *water* to equal; and which keeps hot thrice as long as our boiled *water*. See **THERMÆ, &c.**

**Oily, and Fat WATERS**, arise from a bituminous and sulphurous matter; as amber, petroleum, pitch, naphtha, &c. See **NAPHTHA, PETROL, &c.**

**Bitter WATERS**, are produced from an impure sulphur, bitumen, nitre, and copper.—Such is the lacus asphaltites.

**Very cold WATERS**, have their rise from a mixture of nitre and allum; or of mercury, iron, &c. The depth of the source or spring too, have some effect.

**WATERS which change the nature of bodies**.—Of these there is great variety.

1°. Near Armagh in Ireland, is a lake, wherein a staff being fixed some months, the part that stuck in the mud will be turned into iron; and that part encompassed with the *water* into bone; the rest remaining as before.—Thus Gyraldus, and Maginus; but Brietius denies it.

2°. In the northern part of Ulster is a spring, which, in the space of seven years, petrifies wood, or converts it into stone.—The like are found in divers other parts, as in Hungary, Burgundy, &c. Vitruvius mentions a lake in Cappadocia, which converts wood into stone in one day. See **PETRI-FACTION**.

3°. There are also *waters* supposed to transmute, or turn iron into copper. See **TRANSMUTATION**.

4°. Others are said to change the colour of the hair.—Gyraldus mentions a spring in Ireland, wherein if a person were washed, he instantly became grey. See **HAIR**.

**Poisonous WATERS**, are occasioned by their creeping through arsenical, antimonial, and mercurial earths; or being impregnated by their fumes.—Such is the lacus asphaltites, and divers others about the Alps, &c. which immediately kill those who drink of them: but these are most of them filled up with stones; which is one reason so few are known.

**Saline WATERS**, are generated two ways; either they are derived from the sea, by some subterraneous passage; or are generated from mineral salts, which they meet withal in their passage, ere they arrive at their springs. See **SEA, and SALT**.

**Boiling, or Bubbling WATERS**, are produced either by a sulphurous, or a nitrous spirit, mixed with the *water* in the earth: if it be sulphurous, the *water* is hot; if nitrous, cold. For all the *waters* that boil as if hot are not so, but some few are cold: we read both of *thermæ* and *acidulæ* that boil.

There are divers other *waters* which have very singular properties not reducible to any of these classes: such—1°. is that spring in Portugal, which absorbs all bodies cast into it, though the lightest: and not far from it there was anciently another, in which no bodies, not the heaviest, could sink.

VOL. II. No. 164.

— 2°. In Andalusia, we are assured by Euseb. Nierembergenfis, there is a lake which foretels approaching storms, by making a terrible bellowing, that may be heard 18 or 20 miles distance— 3°. In Granada is a well, whose *water* dissolves stones.— 4°. We read of a spring in Arcadia, which rendered those who drank of it abstemious.— In the island of Chio is a spring, which converts those who drink of it into fools.— 6°. There are springs in divers parts of England, Wales, Spain, &c. which ebb and flow daily with the flux and reflux of the sea; and some are even said to ebb and flow against the tide.— Add, 7°. *Stalactical waters*. See **STALACTITES**.

**Bath-WATER**

**Spaw-WATER.**

**Petrifying-WATER.**

**BATH.**

**SPAW.**

**PETRIFYING.**

**Interdiction of Fire and WATER.** See **INTERDICTION**.

**WATER**, in chymistry, by the chymists called more usually *phlegm*; is the fourth of the five chymical principles, and one of the passive ones. See **PRINCIPLE, and PHLEGM**.

It is never drawn pure, and unmixed; which, Dr. Quincy observes, makes it usually a little more deterfive than common *water*.

This principle, probably, contributes much to the growth of bodies, in that it both renders and keeps the active principles fluid; so that they are capable of being conveyed by circulation into the pores of the mix'd: and also because it tempers their exorbitant motion, and keeps them together; so that they are not so easily and soon dissipated.

In all such bodies whose active substances are joined and united pretty closely together; as in common salt, tartar, all plants that are not odoriferous, and in many animal bodies, this principle is the first that comes in distillation: but when *water* is mixed with volatile salts, or with spirit of wine, or is in any odoriferous mixture; then the volatile particles will rise and come away first. See **PRINCIPLE, ELEMENT, &c.**

**WATERS**, in medicine, pharmacy, chymistry, &c. called also *artificial*, and *medicated waters*; are a kind of liquors, produced or prepared by art from divers bodies, principally of the vegetable tribe; having various properties, and serving various purposes.

These *waters* are either *simple*, or *compound*.

**Simple WATERS**, are those procured from some one vegetable body. See **VEGETABLE, PLANT, &c.**

A *simple water* is not supposed to be the mere *water*, or phlegm of the body it is drawn from, as is evident from the taste and smell thereof.—The intention of making such *water*, is to draw out the virtues of the herb, seed, flower, root, or the like, so as it may be more conveniently given in that form, than any other. But the phlegm, or *watery* part of any medicinal simple, is no better than common *water* undistilled: so that all those ingredients, which in distillation raise nothing but phlegm, as may be discovered from the scent and taste of what comes over, are not fit for the still.— On this principle, a great part of the *waters* retained in the dispensatories, will appear good for nothing, at least not worth distilling.

The means whereby this separation is effected, are either *evaporation, infusion, decoction, or distillation*.—The first is performed by exposing the vegetable in a cold still, to a gentle heat, like that of a summer's sun; and catching the effluvia which exhale from it. See **HEAT, EVAPORATION, &c.**

The effect of this operation, is a *water*, or fluid matter, which is the most volatile, fragrant, and aromatic part of the plant; and that wherein its specific virtue resides.— And thus is it, that the aromatic or odoriferous *waters* of vegetables are procured. See **AROMATIC**.

The second means, viz. *infusion*, is performed by putting the vegetable in hot rain-*water*, below the degree of boiling; keeping it to this degree by an equable heat, for the space of half an hour; and then straining or pouring it off. See **INFUSION**.—The only *waters* procured this way, in much use in the modern practice, are those of frog-spawn, and oak-buds.

The third means, viz. *decoction*, only differs from the second in this, that the *water* is kept to the degree of boiling. See **DECOCTION**.

The fourth means, viz. *distillation*, is performed by infusing the subject in an alembic, with a gentle warmth, for some time; and, then increasing the heat, so as to make it boil; and lastly, catching and condensing the steam, or vapour arising therefrom. See **DISTILLATION**.

This process furnishes what we call the *distilled waters*, of so much use in medicines, &c.—The vegetable subjects best fitted for it, are the sapid and odorous, or those of the aromatic tribe; as angelica, aniseed, baum, carraway, coriander, cumin, dittany, fennel, hyssop, marjoram, mint, roses, rosemary, saffron, sage, scurvygrass, thyme, cinnamon, citron, juniper, lime, myrtle, orange, peach, &c.

The medicinal virtues of *waters* prepared after this manner,

are the same as those of the respective plants, &c. they are drawn from.— Thus, the distilled *water* of mint is stomachic; that of worm-wood, vermifugous, &c.

The materia medica, it may be observed, affords no remedies in this way, but for the intentions either of cordials, diuretics, or diaphoretics.— Were it practicable to raise a balsamic cathartic, or opiate in this way, yet would those properties be much more conveniently brought forth by other processes; so that nothing is to be looked for in a distilled *water*, but such subtle and light parts of a medicinal simple, as may fall in with the forementioned intentions: indeed, very little comes over, under that division, weighty enough to affect even the urinary secretions.

The *simple waters*, of chief virtue, are the following ones, viz. *Dill-water*, aqua anethi; *baum-water*, aqua melissæ; *angelica-water*, aqua angelicæ; *mint-water*, aqua menthæ; *rosemary-water*, aqua anthos; *orange-flower-water*, aqua naphæ; *black-cherry-water*, aqua cerasor. nig. parfly-water, aqua petroselinii; *camomile*, chamom. pennyroyal, pulegii; *fennel-water*, aqua fœniculi; *damask-rose-water*, aqua rosarum dam. hyssop-water, aqua hyssopi; *rue-water*, aqua rutæ; *juniper-water*, aqua juniperi bacc. *elder-water*, aqua sambuci flor. *lovage-water*, aqua levistici; *carminative-water*, aqua carminativa, &c.

It may be here proper to note, that whatever properties any simple has from the grossness or solidity of its parts, which make it act as an emetic, cathartic, or astringent; the residue left after distillation, will remain in full possession thereof.— Thus, the purging syrup of roses, is as well made after the damask-rose-water is drawn off, as if the flowers were put into infusion; because nothing of a cathartic quality rises with the *water*.

Sometimes, the subject is fermented, by the addition of yeast, honey, or the like ferment, to the hot *water*, before the distillation begin: in which case, if the ferment added were in sufficient quantity to effect a thorough fermentation, the liquid afterwards exhaled and drawn off, would be thin and inflammable; which makes what we call a *spirit*; otherwise, thick, white, sapid, &c. and called a *water*. See FERMEN-TATION, SPIRIT, &c.

The *waters* procured in this manner, contain the oil of the plant in great perfection; which makes them of considerable use in medicine, further than those raised without fermentation; beside that they keep better and longer; the spirit in them preventing their corrupting or growing mothery.

**Compound WATERS**, or those wherein several ingredients are used, are very numerous, and make a large article in commerce; some prepared by the apothecaries, according to the dispensatory precepts, for medicinal uses; others by the distillers, to be drank by way of dram, &c. and others by the perfumers, &c.

They are distinguished by different epithets, taken from the Latin, Greek, Arabic, English, &c. in respect either of the specific virtues of the *waters*; or the parts of the body, for the cure whereof they are intended; or the diseases they are good against; or the ingredients they are compounded of; or their different uses, &c.

The most considerable among the class of *compound-waters*, we shall here enumerate.— The manner of making them, it is true, is not always the same; especially those intended for drinking; for which, every one gives his own method as the best.— Those we here deliver, are taken from such as have the greatest reputation in preparing these things; or from those who have wrote best of them.

We have only three general remarks to add, with regard to those intended for drinking: 1°. That such wherein any thing is infused, as bruised fruits, pounded herbs, or ground spices, are always passed through a strainer, to make them finer and purer.— 2°. That those made with brandy, or spirit of wine, are usually distilled after mixing their ingredients; which renders those liquors exceedingly strong and dangerous, and confirms the proverb; *Plures occidit gula quam gladius*. In effect, some of them are so penetrating, that they burn the tongue when taken.— 3°. That the *waters* which take their name from any particular thing, as *cinnamon*, &c. have always some other ingredients joined with them, according to the taste or smell required.

**Alexipharmic**, or **Alexiterial WATERS**, are *waters* that resist poisons and the plague.— Such are those of angelica, scorzonera, citron, orange, scordium, rue, &c. See ALEXIPHARMIC.— Such also are *treacle-water*, *plague-water*, *milk-water*, *poppy-water*, &c.

**Allum-WATER**, is a *vulnery water*, thus called, by reason the basis, or principal ingredient thereof, is allum. See ALLUM, and VULNERY.

**Angelica-WATER**, is usually prepared of brandy, angelica-roots and seeds, carduus, baum, fennel-seed, &c. the whole beat together in a mortar; infused for a night in French brandy, and then distilled.— It is reputed a good carminative, and cordial; as also a cephalic, &c. See ANGELICA.

**Anised-WATER**.— To eight parts of essence of aniseed distilled, put three parts of brandy, with one of *water* boiled;

mix the whole together: and if you require it sugared, add half a pint of clarified sugar; but many prefer it without: and strain the whole.

**Apricot-WATER**.— To a quart of *water*, put six or eight apricots, sliced; boil the whole, to extract the taste; and when cold, add four or five ounces of sugar.— When that is dissolved strain it.

**Aromatic-WATERS**, we have already spoke of among the *simple waters*.

**Arthritic-WATERS**, are *waters* good against the gout, palsy, tremors, pains in the joints, &c.— Such are those of piony, chamæpitys, betony, rosemary, &c.

**Bryony-WATER**, is one of the *compound waters* prescribed in the college dispensatory, prepared from bryony-roots, rue, mugwort, favin, feverfew, dittany, &c. It is a good hysterical, opens menstrual obstructions, &c.

**Carduus-WATER**, is made from carduus benedictus pounded in a mortar, and put in an alembic.— Then, a sufficient quantity of the juice of the same sort of plant, drawn by expressi-on, is poured into the alembic, that the herbs swimming in the juice, may be in no danger of sticking to the bottom of the cucurbit in distillation. Lastly, sitting on a capital, and luting the joints, distil half as much juice as you put in.— This *water* is sudorific, and good against the plague, malignant fevers, &c. See CARDUUS.

**WATER of separation**, or *depart*, is only *aqua fortis*; thus called, because serving to separate gold from silver. See DE-PART. It is also called

**Caustic-WATER**, and is prepared of a mixture of spirit of nitre and vitriol, drawn by force of fire; to which are sometimes added allum, &c.

It dissolves all metals, gold only excepted.— The invention of aqua fortis, is usually referred to the thirteenth century: though some hold it to have been known in the time of Moses. See AQUA Fortis, AURUM Potabile, &c.

**Cephalic-WATERS**, are *waters* proper to strengthen and comfort the brain.— Such are those of rosemary, marjoram, sage, piony, betony, baum, &c. See CEPHALIC.

**Chalybeat-WATER**, is a *water* wherein red-hot steel has been quenched.— It is astringent, and good, like ferruginous, or iron *waters*, for diarrhoeas, &c. CHALYBEAT, and MARTIAL.

**Cherry-WATER**.— In a quart of *water* crush half a pound of cherries, with four or five ounces of sugar. Strain the whole through a cloth, till it be very clear.

**Cinnamon-WATER**.— In a quart of *water* boil half an ounce of broken cinnamon; and taking it off the fire, add a quarter of a pound of sugar: let it cool, and strain it.— Or thus: take a pound of cinnamon, three pounds of *rose-water*, and as much white-wine: bruise the cinnamon, infuse it fourteen days, then distil it.— The first *water* that rises is the best; then the second; then the third. See CINNAMON.

**Clary-WATER**, is composed of brandy, sugar, and cinnamon, with a little ambergrease dissolved in it.— It helps digestion, and is cardiac.— This *water* is rendered either purgative or emetic, by adding resins of jallop and scammony, or crocus metallorum.— Some make *clary-water* of brandy, juice of cherries, strawberries and gooseberries, sugar, cloves, white pepper, and coriander-seeds, infused, sugared, and strained.

**Clove-WATER**, is prepared of brandy, and cloves bruised therein, and distilled. See CLOVE.

**Cordial**, or **Cardiac WATERS**, are *waters* proper to strengthen and comfort the heart.— Such are those of enive, chicory, bugloss, burrage, marigolds, &c. See CARDIAC, and CORDIAL.

**Cosmetic-WATERS**, are *waters* proper to cleanse, smoothen, and beautify the skin. See COSMETIC.

**Fennel-WATER**.— Infuse a handful of fennel in a pint of cold *water*, for an hour, or an hour and a half: add three or four ounces of Sugar. Strain it, and drink it.

**Gentian-WATER**.— Take four pounds of gentian roots, either green, or dried; mince them small, infuse them in white-wine, or only sprinkle them therewith; then distil them, with the addition of a little centaury the lesser. See GENTIAN.

It is frequently used as a stomachic, and is also commended for a detergent; serving in dropsies, jaundice, obstructions of the viscera, &c.

**Gum-WATER**, is that made by letting gum-arabic, inclosed in a linen rag, infuse in common *water*.— The ladies also make *water* to gum their hair, of quince-kernels steeped in *water*. See GUM, and ARABIC.

**Hepatic-WATERS**, are those used to cleanse, strengthen, and refresh the liver.— Such are those of chicory, capillaries, purslain, agrimony, fumitory, &c.

**Honey-WATER**, is a *water* prepared in places where much honey is made, by washing out the honey-combs, and the vessels they have been in, in common *water*.— This gives it a honey-taste, and it afterwards becomes very clear, and the people use it as their common drink. See HONEY.

**Horse-raddish WATER**, aqua raphani, is prepared of the juices of scurvygras, brook-lime, water-cressies, white-wine, lemon-juice,

juice, bryony-root, horse-raddish, winter's-bark and nutmeg, digested and distilled.— It is a good diuretic; cleansing, and removing obstructions of the viscera, promoting perspiration, &c.

**Hungary-WATER**, is a liquor distilled in balneo mariæ, from rosemary-flowers, and spirit of wine well rectified.— It has its name from the wonderful effects it is said to have had on a queen of Hungary, at the age of 72 years.— It is good against faintings, palsies, lethargies, apoplexies, and hysterical disorders.— There are divers ways of preparing it. See HUNGARY.

**Hysteric-WATERS**, are those proper to strengthen the matrix, or womb, and remedy the disorders that befall it.— Such are those of bryony, matricary or motherwort, hyssop, fennel, baum, mugwort, smallage, &c. See HYSTERIC.

**Iced, or Frozen WATERS**, are certain agreeable and wholesome waters, as orange-water, or the like, artificially froze in summer-time, particularly in hot Countries, to be used in collations, &c. as coolers.— The way of making them is thus: the vessels containing the liquors designed to be froze, are first set in a pail, in such manner, as not to touch each other; then covered up, and the void space in the pail filled with common ice, beaten, and mixed with salt.— Every half hour they clear out what water the thawing ice sends to the bottom of the pail, by means of a hole at bottom; and at the same time stir up the liquors with a spoon, that they may freeze into snow: for were they to shoot in form of ice, or icicles, they would have no taste.— Then, covering the vessels again, they fill up the pail with more beaten ice, and salt, in lieu of that dissolved and evacuated. The more expeditious the freezing is required to be, the more salt is to be mixed with the ice. See FREEZING.

**Imperial-WATER**, *Aqua imperialis*, is a water distilled from cinnamon, nutmeg, citron-bark, cloves, calamus aromaticus, fennel, and divers other simples, infused in white-wine and baum-water.— It is a pleasant cordial-dram, good against diseases of the brain, stomach, and womb.

**Juniper-WATER**, is a compound water, made of brandy, and juniper-berries beaten therein, and distilled. See JUNIPER, and GENEVA.

**Lime-WATER**, is common water, wherein quick-lime has been slaked; and afterwards filtered. See LIME.

**Milk-WATER**, *Aqua lactis*, is prepared of mint, wormwood, carduus benedictus, goat's-rue, and meadow-sweet, bruised, infused in milk, and drawn off by infusion.— It is held alexipharmic, and cephalic.

**Aqua Mirabilis, or the wonderful WATER**, is prepared of cloves, galangals, cubebs, mace, cardomums, nutmeg, ginger, and spirit of wine, digested twenty-four hours, then distilled.— It is a good and agreeable cordial, carminative, &c.

**Nephritic-WATERS**, are such as strengthen the reins, and help them to discharge, by urine, any impurities therein.— Such are those of the honeysuckle, pellitory, raddish, beans, mallows, &c. See NEPHRITIC.

The nephritic-water of Dr. Radcliff, popularly called *Dr. Radcliff's water*, is taken into the last edition of the college dispensatory.— It is prepared from the kernels of black cherries, peaches, and bitter almonds, beaten in a mortar into a paste, with rhenish wine; and seeds of smallage, treacle, mustard, gromwel, and parsley, beaten likewise, and added thereto: to the mixture are put juniper-berries, garlic, onions, leeks, pimpnel, horse-raddish, calamus aromaticus, cinnamon, wall-rue, mace, and nutmegs: the whole macerated in rhenish, spirit of black cherries, &c. and thus distilled.— It is one of the most powerful detergers and cleansers known; good in the dropsy, jaundice, asthma, pleurisy, &c.

**Ophthalmic, or Eye-WATERS**, are such as are good in disorders of the eyes.— such are those of eye-bright, fennel, vervain, plantain, celandine, cyanus, &c. See OPHTHALMIC.

**Orange-flower WATER**, is made of common water, sugar, and orange-flowers, infused for about two hours.— After the like manner, one may make waters of divers other flowers; as violets, jonquils, jessamines, tuberoses, &c.

**Peach-WATER**, is made after the same manner as apricot-water; only with peaches.

**Phagedænic-WATER**, is lime-water, to every pound whereof, is added twenty or thirty grains of corrosive sublimate, in powder.— It serves to cleanse old ulcers, to eat off fungous flesh, &c. See PHAGEDÆNIC.

**Plague-WATER**, *Aqua epidemica*, is prepared from the roots of masterwort, angelica, pyony, and butter-bur; viper-grass, Virginia snake-root, rue, rosemary, baum, carduus, water-germander, marigold, dragon, goat's rue, and mint; the whole infused in spirit of wine, and distilled. See PLAGUE.— It is of frequent use, as an alexipharmic: it revives the spirits, and promotes a diaphoresis. It is the basis of most juleps now prescribed, especially in feverish cases.

**Poppy-WATER**, is prepared from the flowers of wild poppies, infused in white-wine, or brandy, and drawn off in a cold

still.— It is a cordial, good against the colic, and by some called *red plague-water*.

**Pyony-WATER**, is made of pyony and lime-flowers, and lilly of the valley steeped in canary, and distilled: to the water thus procured, are added the root of male pyony, white dittany, birthwort, misletoe, rue, castor, cubebs, cinnamon, betony, &c.— It is a good cordial, and much used in nervous cases.

**Rose-WATER**.— Take of roses three parts, and of fennel and rue each, one part; chop them small, and mix them well together; then distil them. See ROSE.— This water is excellent for the eyes, &c.

**Scordium-WATER**, is prepared from the juices of goats-rue, sorrel, scordium, citrons, and venice treacle, digested and distilled.— It is an alexipharmic.

**Second-WATER**. See the article SECUNDA Aqua.

**Specific-WATERS**, are such as have some peculiar virtue, appropriate to certain diseases. Thus *purslain-water*, wherein mercury has been infused, is a specific against worms in young children. See SPECIFIC.

**Splenetic-WATERS**, are those proper against diseases of the spleen. Such are those of the tamarisk, cucuta, hartstongue, hops, &c. See SPLEEN.

**Stephens's WATER**, *Aqua Stephani*, is made from cinnamon, ginger, galangals, cloves, nutmegs, paradise-grains, aniseeds, sweet-fennel, carraway, thyme, mint, sage, pennyroyal, pellitory, rosemary, red roses, camomile, origany, and lavender, steeped in french brandy, or spirit of wine, and distilled.— It is a good cephalic and cardiac, and is also reputed hysterical.

**Stomachic-WATERS**, are such as have the virtue to cleanse, strengthen, and confirm the stomach.— As red rose-water, mint-water, aniseed-water, &c. See STOMACHIC.

**Stygian-WATER**. See the article AQUA Regalis.

**Styptic-WATER**, is a dissolution of rubified vitriol, or the colcothar remaining in the retort, after the spirit has been extracted; with burnt allum and sugar-candy.— With thirty grains of each of these three Drugs, some mix half an ounce of urine of a young man, as much rose-water, and two ounces of plantain-water.— Its use is to stop bleeding. See STYPTIC.

**Surfeit-WATER**. See the article SURFEIT.

**Treacle-WATER**, *Aqua Theriacalis*, is directed by the college dispensatory to be made of green walnuts, rue, carduus, marigold, baum, butter-bur-roots, burdock, angelica, masterwort, water-germander, Venice-treacle, mithridate, canary-vinegar, and lemon-juice, steeped and distilled.— It is the most used of any in the shops; though Dr. Quincy decries it as one of the worst concerted of all.— Its intention is to be an alexipharmic, and sudorific.

Other dispensaries give a more simple *treacle-water*, made from venice treacle, with an equal quantity of brandy and vinegar.— It is good for ulcers, and erosions of the mouth; especially if a little Armenian bole be dissolved therein. See THERIACA.

**Vulnery-WATER**, is a water proper for the healing of wounds, prepared from the juice of vulnerary plants. See VULNERY.

**WATER**, in anatomy, &c. is applied to divers liquors, or humours in the human body. See HUMOUR, FLUIDS, &c. Such is the aqua phlegmatica, *phlegmatic-water*; which is a soft ferous humour contained in the pericardium, and wherein the heart swims. See PERICARDIUM.

Anatomists are divided about it: some will not have it natural, but suppose it separated forcibly during the pangs of death: their reason is, the difficulty they meet withal in tracing its passage, or how it is carried off.— The latest anatomists, however, seem to agree to its being a natural and necessary humour: and one reason is, that it is found even in the pericardiums of foetus's.

It has likewise been disputed whence it should be separated.— The freshest opinion is, that it is secreted by some glands about the basis of the heart; and that it distils thence, drop by drop, into the cavity of the pericardium, in such quantity, as just to supply what is expended daily by the motion and warmth of the heart; and so needs no evacuation.— Its use is to moisten, lubricate, and cool the heart, and prevent any inflammation that might arise from the dry friction of the heart and pericardium.— So that it does the same office to the heart, that the water does wherein the foetus swims; which, without it, would not have liberty to move at all. See HEART.

**WATER** is also used in divers ceremonies, both civil and religious.— Such is the *baptismal water*, *holy water*, &c. See BAPTISM, &c.

**Holy WATER**, is a water prepared every Sunday in the Romish church, with divers prayers, exorcisms, &c. used by the people to cross themselves withal at their entrance, and going out of church; and pretended to have the virtue of washing away venial sins, driving away devils, preserving from thunder, dissolving charms, securing from, or curing diseases, &c.

The use of *holy water* appears to be of a pretty ancient standing

ing in the church: witness S. Jerom, in his life of S. Hilarion, and Gretser *de Benedict.* cap. x, &c.—M. Godeau attributes its original to pope Alexander, a martyr under the emperor Adrian.

Many of the reformed take the use of *holy water* to have been borrowed from the *lustral water* of the ancient Romans. See *LUSTRAL*.—Though it might as well be taken from the sprinklings in use among the Jews. See *Numbers* xix. 17.

Urban Godfrey Siber, a German, has a dissertation printed at Leipzig, to shew, by proofs brought from church-history, that one may give *holy water* to drink, to brutes.

*Bitter WATERS of Jealousy.*—In the Levitical law, we find mention made of a *water*, which served to prove whether or no a woman were an adulteress.—The formula was this: the priest, offering her the *holy water*, denounced,—“If thou hast gone aside to another, instead of thy husband, and if thou be defiled, &c. the Lord make thee a curse and an oath among thy people, by making thy thigh to rot, and thy belly to swell: and this *water* shall go into thy bowels, to make thy belly to swell, and thy thigh to rot.” And the woman shall say, *Amen*.—“These curses the priest shall write in a book, and blot them out with the *bitter water*.—“When he hath made her drink the *bitter-water*, it shall come to pass, that, if she be defiled, the *water* shall enter into her, and become bitter, and her belly shall swell, &c.”—“If she be not defiled, she shall be free, and conceive seed.” *Numbers*, ch. v.

*WATER Ordeal*, or *Trial*, was of two kinds; by hot, and by cold *water*. See *ORDEAL*, &c.

*Trial or Purgation by boiling, or hot WATER.*—Among our ancestors, there was a way of proving crimes, by immersing the body, or the arm in hot *water*, with divers religious ceremonies. See *PURGATION*, &c.

In the judgment by *boiling water*, the accused, or he who perfonated the accused, was obliged to put his naked arm into a cauldron full of *boiling water*, and to draw out a stone thence, placed at a greater or less depth, according to the quality of the crime—This done, the arm was wrapped up, and the judge set his seal on the cloth; and at the end of three days they returned to view it; when, if it were found without any scald, the accused was declared innocent.

The nobles and great persons purged themselves thus by *hot water*; and the populace by *cold water*.

F. Mabillon will have this ceremony to have been introduced by pope Eugenius II. in lieu of making oath with the hand laid on the relics of some saint; which, having been abused, was prohibited by Innocent III. at the council of Lateran.

“Theotberge, wife of Lothaire of France, having been accused of incest, committed before marriage with her brother duke Hubert; as she could not be convicted by any witnesses, certain of the bishops were consulted as to the manner wherein the judges should proceed, in an affair where the crime, though very dubious, did dishonour to the king.—The bishops were of opinion, they should have recourse to the proof by *boiling water*; which consisted in this: that the accused, to prove her innocence, should plunge her hand into a basin of *boiling water*, and take out a ring put therein.—Sometimes, indeed, they substituted another person to make the trial, in the room of the accused: accordingly, the rank and quality of Theotberge excusing her from making the proof herself, she chose a man to do it for her; who, either out of zeal for the life and honour of the princess, or for money, stood the test, and drew out his hand and the ring, without harm.” *F. Daniel's Hist. of France*.

*Trial or Purgation by cold WATER.*—After certain prayers, and other ceremonies, the accused was swaddled, or tied up all in a pelatoon, or lump; and thus cast into a river, lake, or vessel of *cold water*; where, if he sunk, he was held criminal; if he floated, innocent. See *JUDICIUM, PURGATION, PROOF, DUEL*, &c.

*WATER*, among jewelers, is properly the colour or lustre of diamonds, and pearls; thus called, by reason these were antiently supposed to be formed, or concreted of *water*. See *GEM*, &c.

Thus, they say, such a pearl is of a fine *water*. See *PEARL*. The *water* of such a diamond is muddy. See *DIAMOND*. The term is sometimes also used, though less properly, for the colour or hue of other precious stones. See *PRECIOUS Stone*, *GEM*, &c.

*WATER-Bailiff*, is an officer antiently established in all port-towns, for the searching of ships; as appears from 28 Hen. VI. cap. v.

There is such an officer still on foot in the city of London, who supervises and searches all fish brought thither; and gathers the toll arising from the river of Thames.—He attends also on the lord-mayor in his expeditions by *water*, and hath the principal care of marshalling the guests at the table.—He also arrests men for debt, or other personal or criminal matters on the river of Thames, by warrant of his superiors, &c.

*WATER-Born*, in the sea language.—A ship is said to be *water-born*, when she is where there is no more *water* than will barely bear her from ground; or when lying even with the ground, she first begins to float, or swim.

*WATER-Camlets.* See the article *CAMBLET*.

*WATER-Colours*, in painting, are such colours as are only diluted and mixed up with *gum-water*.—In contradistinction to *oil-colours*. See *COLOUR*.

The use of *water-colours*, makes what we call *limning*; as that of *oil-colours* does *painting*, properly so called. See *LIMNING*, and *PAINTING*.

*Cut-WATER.* See the article *CUT-WATER*.

*Dead-WATER*, in the sea language, is the *eddy-water* that follows the stern of the ship, not passing away so fast as that which slides by her sides. See *DEAD*.

*WATER-Farcin.* See the article *FARCIN*.

*WATER-Gage*, an instrument to measure the depth, or quantity of any *water*.

*WATER-Gang*, a channel cut to drain a place, by carrying off a stream of *water*. See *CANAL*, *TRENCH*, &c.

*WATER-Gilding.* See the article *GILDING*.

*WATER-Line*, of a ship, is a line which distinguishes that part of her under *water*, from that above, when she is duly laden.

*WATER-Measure.*—Salt, sea-coal, &c. while aboard vessels in the pool, or river, are measured with the corn-bushel heaped up; or else five striked pecks are allowed to the bushel.—This is called *water-measure*; and exceeds Winchester-measure by about three gallons in the bushel. See *MEASURE*, *CHALDRON*, &c.

*WATER-Poise.* See the article *HYDROMETER*.

Dr. Hooke has contrived a *water-poise*, which may be of good service in examining the purity, &c. of *water*.—It consists of a round glass ball, like a bolt-head, about three inches in diameter, with a narrow stem or neck,  $\frac{1}{4}$  of an inch diameter; which being poised with red lead, so as to make it but little heavier than pure sweet *water*, and thus fitted to one end of a fine balance, with a counterpoise at the other; upon the least addition, of even  $\frac{1}{1000}$ th part of salt to a quantity of *water*, half a inch of the neck will emerge above the *water*, more than did before. *Philosophical Transactions*. N<sup>o</sup>. 197.

*WATER-Rocket.* See the article *ROCKET*.

*WATER-Scape*, of the Saxon *waterschap*, denotes an aqueduct, drain, or passage for *water*. See *AQUEDUCT*.

*WATER-Shoot*, a young sprig, which springs out of the root or stock of a tree. See *SUCKERS*, *STOCK*, &c.

*WATER-Shot*, in the sea language, a sort of riding at anchor, when a ship is moored neither cross the tide, nor right up and down; but quartering betwixt both.

*WATER-Table*, in architecture, is a sort of ledge, left in stone or brick walls, about 18 or 20 inches from the ground: from which place, the thickness of the wall begins to abate. See *WALL*.

*WATER-Way*, in a ship, is a small ledge of timber, lying fore and aft on the deck, close by her sides; to keep the *water* from running down there.

*WATER-Wheel*, an engine for raising *water* in great quantity out of a deep well. See *PERSIAN Wheel*.

*WATERING*, in gardening, &c. the application of *water* to the soil of plants, &c. when not sufficiently moistened with rain, dew, &c. See *SOIL*, *VEGETATION*, &c. After sowing seed of any kind, though the ground be ever so dry, they should never be *watered* till they have been forty-eight hours in the ground, and the ground is a little settled about them; otherwise, a too great glut of nourishment at first will be apt to burst them. See *SEED*, and *SEMINATION*.

Care is to be taken, that the leaves of young and tender plants be not *watered* at all while the weather is cold; only the ground to be wet about them.—For hardy plants and seeds, if the nights be cold, *water* in the forenoon; otherwise, in the evening.

*Water* that comes out of deep pits, or wells, should stand a day in an open vessel, ere it be applied to tender plants in the spring.—Dung of sheep, pigeons, or hens, or ashes, lime, &c. infused in the *water*, will forward the growth of plants. See *MANURING*.

*WATERING*, in the manufactures.—To *WATER a Stuff*, is to give it a lustre, by wetting it lightly, and then passing it through the press, or the calender, whether hot or cold. See *CALENDER*, *TABBY*, *PRESSING*, &c.

*WATERY Humour.* See the articles *AQUEOUS*, and *HUMOUR*.

*WATTLES*, among husbandmen, grates or hurdles, for folds for sheep. See *HURDLES*, *PARK*, &c.

The word is also used for the gills of a cock—and for the naked red flesh that hangs under a turkey's neck.

*WAVE*, *Unda*, in physics, a cavity in the surface of *water*, or other fluid, with an elevation aside thereof. See *FLUID*, and *WATER*.

The origin of *waves* may be thus conceived.—The surface of a standing *water* being naturally plain, and parallel to the horizon;

horizon; if by any means it be rendered hollow, as at A, (*Tab. Hydrostatics. fig. 30.*) its cavity will be surrounded with an elevation B B; this raised water will descend by its gravity, and with the celerity acquired in descending, form a new cavity; by which motions, the water will ascend at the sides of this cavity, and fill the cavity A, while there is a new elevation towards C; and when this last is depressed, the water rises a-new towards the same part.— Thus arises a successive motion in the surface of the water; and a cavity, which carries an elevation before it, is moved along from A towards C.— This cavity, with the elevation next it, is called a *wave*; and the space taken up by the *wave* on the surface of the water, and measured according to the direction of the *wave's* motion, is called the *breadth of the wave*. See RIVER, and UNDULATION.

The Motion of WAVES makes an article in the new philosophy; and the laws thereof being now pretty well determined, we shall give the reader the substance of what is taught thereon.

1<sup>o</sup>. Then, the cavity, as A, is encompassed every way with an elevation; and the motion above-mentioned expands itself every way: therefore the *waves* are moved circularly.

2<sup>o</sup>. Suppose, now, A B, (*fig. 31.*) an obstacle, against which the *wave*, whose beginning is at C, strikes; and we are to examine what change the *wave* suffers in any point, as E, when it is come to the obstacle in that point.— In all places through which the *wave* passes in its whole breadth, the *wave* is raised; then a cavity is formed, which is again filled up; which change while the surface of the water undergoes, its particles go and return through a small space: the direction of this motion is along C E, and the celerity may be represented by that line.— Let this motion be contrived to be resolved into two other motions, along G E and D E, whose celerities are respectively represented by those lines.— By the motion along D E, the particles do not act against the obstacle; but after the stroke, continue their motion in that direction with the same celerity; and this motion is here represented by E F, supposing E F and E D to be equal to one another: but by the motion along G E, the particles strike directly against the obstacle, and this motion is destroyed; for though the particles are elastic, yet, as in the motion of the *waves* they run through but a small space, going backward and forward, they proceed so slowly, that the figure of the particles cannot be changed by the blow; and so are subject to the laws of percussion of bodies perfectly hard. See PERCUSSION.

But there is a reflection of the particles from another cause: the water which cannot go forward beyond the obstacle, and is pushed on by that which follows it, gives way where there is the least resistance; that is, ascends: and this elevation, which is greater in some than other places, is caused by the motion along G E; because it is by that motion alone that the particles impinge against the obstacle.— The water, by its descent, acquires the same velocity with which it was raised; and the particles of water are repelled from the obstacle, with the same force in the direction E G, as that with which they struck against the obstacle.— From this motion, and the motion above-mentioned along E F, arises a motion above E H, whose celerity is expressed by the line E H, which is equal to the line C E: and by the reflection, the celerity of the *wave* is not changed; but it returns along E H, in the same manner, as if, taking away the obstacle, it had moved along E h.

If from the point C, C D be drawn perpendicular to the obstacle, and then produced, so that D c shall be equal to C D, the line H E continued will go thorough c: and as this demonstration holds good in all points of the obstacle, it follows, that the reflected *wave* has the same figure on that side of the obstacle, as it would have had beyond the line A B, if it had not struck against the obstacle.— If the obstacle be inclined to the horizon, the water rises and descends upon it, and suffers a friction, whereby the reflection of the *wave* is disturbed, and often wholly destroyed: and this is the reason why very often the banks of rivers do not reflect the *waves*.

If there be a hole, as I, in the obstacle B L, the part of the *wave* which goes through the hole continues its motion directly, and expands itself towards Q Q; and there is a new *wave* formed, which moves in a semicircle, whose centre is the hole. For the raised part of the *wave*, which first goes through the hole, immediately flows down a little at the sides; and by descending, makes a cavity, which is surrounded with an elevation on every part beyond the hole, which moves every way in the same manner as was laid down in the generation of the first *wave*.

In the same manner, a *wave* to which an obstacle, as A O, is opposed, continues to move between O and N; but expands itself towards R, in a part of a circle, whose centre is not very far from O.— Hence, we may easily deduce what must be the motion of a *wave* behind an obstacle, as M N.

*Waves* are often produced by the motion of a tremulous body, which also expand themselves circularly, though the body

goes and returns in a right line; for the water which is raised by the agitation, descending, forms a cavity, which is every where surrounded with a rising.

Different *waves* do not disturb one another, when they move according to different directions.— The reason is, that whatever figure the surface of the water has acquired by the motion of the *waves*, there may in that be an elevation and depression; as also such a motion as is required in the motion of a *wave*.

To determine the celerity of the *waves*, another motion, analogous to theirs, must be examined.— Suppose a fluid in the bent cylindric tube E H, (*fig. 32.*) and let the fluid in the leg E F, be higher than in the other leg by the distance *l*; which difference is to be divided into two equal parts at *i*.— The fluid, by its gravity, descends in the leg E F, while it ascends equally in the leg E H: so that when the surface of the fluid is arrived at *i*, it is at the same height in both legs; which is the only position wherein the liquid can be at rest: but by the celerity acquired in descending, it continues its motion, and ascends higher in the tube G H; and in E F is depressed quite to *l*, except so much as it is hindered by the friction against the sides of the tube.— The fluid in the tube G H, which is higher, also descends by its gravity, and so the fluid in the tube rises and falls, till it has lost all its motion by the friction.

The quantity of matter to be moved, is the whole fluid in the tube; the moving force, is the weight of the column *l* E, whose height is always double the distance *E i*; which distance, therefore, increases and diminishes in the same ratio with the moving force.— But the distance *E i*, is the space to be run through by the fluid, in order to its moving from the position E H, to the position of rest; which space, therefore, is always as the force continually acting upon the fluid: but it is demonstrated, that it is on this account that all the vibrations of a pendulum, oscillating in a cycloid, are isochronal; and therefore, here also, whatever be the inequality of the agitations, the fluid always goes and returns in the same time.— The time in which a fluid thus agitated ascends, or descends, is the time in which a pendulum vibrates, whose length is equal to half the length of the fluid in the tube, or to half the sum of the lines E F, F G, G H. This length is to be measured in the axis of the tube. See PENDULUM.

From these principles, to determine the celerity of the *waves*, we must consider several equal *waves* following one another immediately; as A, B, C, D, E, F, (*fig. 33.*) which move from A towards F: the *wave* A has run its breadth, when the cavity A is come to C; which cannot be, unless the water at C ascends to the height of the top of the *wave*, and again descends to the depth C; in which motion, the water is not agitated sensibly below the line *b i*: therefore, this motion agrees with the motion in the tube above-mentioned; and the water ascends and descends, that is, the *wave* goes through its breath, while a pendulum of the length of half B C performs two oscillations, or while a pendulum of the length B C D, that is, four times as long as the first, performs one vibration. Therefore, the celerity of the *wave* depends upon the length of the line B C D; which is greater, as the breadth of the *wave* is greater, and as the water descends deeper in the motion of the *waves*.— In the broadest *waves*, which do not rise high, such a line as B C D, does not much differ from the breadth of the *wave*; and in that case, a *wave* moves its breadth, while a pendulum, equal to that *wave*, oscillates once. See OSCILLATION.

In every equable motion, the space gone through increases with the time and the celerity; wherefore, multiplying the time by the celerity, you have the space gone through: whence it follows, that the celerities of the *waves*, are as the square roots of their breadths: for as the times in which they go through their breadths are in that ratio, the same ratio is required in their celerities, that the products of the times, by their celerities, may be as the breadths of the *waves*, which are the spaces gone through.

WAVE Camblets. See the article CAMBLET.

WAVED, or WAVY, a term in heraldry, when a bordure, or any ordinary or charge in a coat of arms, has its outlines indented, in manner of the rising and falling of *waves*.— This is also called *undy*, *undé*, or *ondé*.

To WAVE, is used in the sea language, for the making signs for a vessel to come near, or keep off. See SIGNAL.

WAVESON, in the admiralty law, a term used for such goods, as, after shipwreck, appear swimming on the waves. See FLOTSON, &c.

WAVY. See the article WAVED.

WAX, *Cera*, a soft yellowish matter, whereof the bees form cells to receive their honey. See HONEY-COMB, CELLS, &c.

*Wax* is not the excrement of this laborious insect, as the ancients, and after them many of the moderns, have imagined.— It is properly a juice, exuding out of the leaves of plants, and adhering to the surface thereof; from which it is scraped off by the bees, with their rough thighs, to build their

combs withal.—It is chiefly afforded by lavender and rosemary; from which last, any body may gather *wax*; and, with the assistance of the microscope, the *wax* may be plainly seen sticking on the leaves of the plant.—So that *wax* is not an animal, but a vegetable substance.

Naturalists have generally imagined *wax* to be gathered from the flower, some from the petala, and others from the apices; but Boerhaave affirms it a juice peculiar to the leaves, and not afforded by the flowers, which only yield honey. See HONEY.

The honey is formed of a liquid matter, sucked into the body; and only seems to arrive at its perfection, in the entrails of the little animal: whereas the *wax*, being a hard substance, is gathered only with the fore legs and chaps; conveyed thence to the middle legs, and thence to the middle joint of the hind legs, where there is a small cavity, like the bowl of a spoon, to receive it; and where it is collected into heaps, of a shape and size of lentils.

The bee arrived at the hive with its load of *wax*, finds some difficulty in unburdening himself of so tenacious a matter.—Frequently, being unable to lay it down himself, he calls for assistance, by a particular motion of the legs and wings; upon which, a number of his companions straight run to his succour, and each with his jaws takes off a small quantity of the *wax*; others succeeding; till their laden fellow be quite disburdened. See HONEY.

*Wax* makes a very considerable article in commerce; the consumption thereof, throughout the several parts of Europe, being incredible.—There are two kinds, *white*, and *yellow*; the *yellow* is the native *wax*, just as it comes out of the hive, after expressing the honey, &c. the *white* is the same *wax*, only purified, washed, and exposed to the air. The preparation of each follows.

**Yellow Wax.**—To procure the *wax* from the combs for use; after separating the honey from them, in the manner described under the article HONEY; they put all the matter remaining in a large kettle, with a sufficient quantity of water; where, with a moderate fire, they melt it, and then strain it through a linen cloth, by a press: ere cold, they scum it with a tyle, or a piece of wet wood, and cast it, while yet warm, in wooden, earthen, or metalline moulds; having first anointed them with honey, oil, or water, to prevent the *wax* from sticking.—Some, to purify it, make use of Roman vitriol, or copperas; but the true secret is to melt, scum it, &c. properly, without any ingredients at all.

The best is that of a high colour, an agreeable smell, brittle, and that does not stick to the teeth when chewed. It is often sophisticated with rosin, or pitch coloured with rocaw, or turmeric.

By chymistry, *wax* yields a white thick oil, resembling butter; whence the chymists call it *butter of wax*.—From this oil is drawn a second, as clear as water; both the one and the other are excellent for chilblains.—The faeces remaining in the bag, after expressing the *wax*, is used both by surgeons and farriers, with success, against strains.

**White Wax.**—The whitening or blanching of *wax*, is performed by reducing the yellow sort, first, into little bits or grains, by melting it, and throwing it, while hot, into cold water, or else by spreading it into very thin leaves, or skins. See WHITE.

This *wax*, thus granulated, or flatted, is exposed to the air on linen cloths; where it rests night and day, having equally need of sun and dew.—Then they melt and granulate it over again several times; still laying it out to the air, in the intervals, between the meltings.

When the sun and dew have at length perfectly blanched it, they melt it, for the last time, in a large kettle; out of which they cast it, with a ladle, upon a table, covered over with little round dents or cavities, of a form of the cakes of *white wax* sold by the apothecaries, &c. having first wet those moulds with cold water, that the *wax* may be the easier got out.—Lastly, they lay out these cakes to the air for two days and two nights, to render it more transparent, and drier.

This *wax* is used in the making of torches, tapers, flambeaux, figures, and other *wax*-works. See TAPER, FLAMBEAU, &c.

It is also an ingredient in plaisters, cerats, and divers pomatums, and unguents, for the complexion. See CERATE, &c.

*Yellow wax* is made soft with turpentine, yet retains its natural colour.—Red *wax*, is only the white melted with turpentine, and reddened with vermilion or orcanette.—Verdegreafe makes it green; and burnt paper, or lampblack, black.—Some travellers tell us of a natural black *wax*; assuring us there are bees, both in the East and West-Indies, that make an excellent honey, included in black cells.—Of this *wax* it is, that the Indians make those little vases, wherein they gather their balsam of Tolu.

**Chafe Wax.** See the article CHAFE.

**Virgin Wax, Propolis,** is a sort of reddish *wax*, used by the bees to stop up the clefts, or holes of the hive.—It is applied

just as taken out of the hive, without any art, or preparation of boiling, &c.—It is the most tenacious of any, and is held good for the nerves. See PROPOLIS, and VIRGIN. **Sealing Wax, or Spanish Wax,** is a composition of gumlacca, melted and prepared with rosin and chalk, and coloured red with ground cinnabar. See LACCA.

**Wax-Candles.** See the article CANDLE.

**Wax-work.**—Here we must not forget that pretty invention of M. Benoist, a man famous at Paris for his figures of *wax*.—Being, by profession, a painter, he found the secret of forming moulds on the faces of living persons, even the fairest and most delicate, without any danger, either to their health, or complexion: in which moulds he cast masks of *wax*; to which, by his colours, and glass eyes imitated from nature, he gave a sort of life: inasmuch, as when clothed in proper habits, they bore such a resemblance, that it was difficult distinguishing between the copy and the original.

**Grafting Wax,** is a composition serving to bind or fix the bud, or graft in the cleft of the stock. See ENGRAFTING. Instead of *grafting wax*, the country gardeners, &c. only use clay, which they lay over a piece of linen cloth, and so keep it moist; and to prevent its cracking with the heat of the sun, tie moss over it.—But the *wax* ordinarily used, is a compost of one pound and a half of pitch, a quarter of a pound of *wax*, and an ounce of oil of almonds, melted and mixed together; with the addition, in spring or autumn, of a moderate quantity of turpentine. See MUMMY.

For cleft-grafting, whip-grafting, and grafting by approach, Mr. Mortimer recommends tempered clay, or soft *wax*; but for rind-grafting, clay and horse-dung.

**WAXING, Ceratio,** in chymistry, the preparation of any matter to render it fit and disposed to liquify, or melt, which of itself it was not.

This is frequently done, to enable things to penetrate into metals, or other solid bodies.

**WAX-SHOT, or Wax-Shot, Ceragium,** in our ancient customs, money paid twice a year towards the charge of maintaining lights, or candles in the church.

**WAY, Via.** See ROAD, and VIA; see also WEIGH.

Roman ways are divided into *consular, prætorian, military, and public*. See MILITARY, &c.

We have four notable ones in England; antiently called *chimini quatuor*, and entitled to the privileges of *pax regis*. The first *Watling-street*, or *Watbeling-street*, leading from Dover to London, Dunstable, Toucester, Atterston, and the Severn, near the Wrekin in Shropshire, extending as far as Anglesea in Wales.—The second, called *Hikenild*, or *Ikenild-street*, stretches from Southampton, over the river Isis at Newbridge, thence by Camden and Lichfield, then passes the Derwent near Derby, so to Bolsover-Castle, and ends at Tinmouth.—The third, called *Fosse-Way*, because in some places it was never perfected, but lies as a large ditch; leads from Cornwall through Devonshire, by Tetbury near Stow in the Wolds; and beside Coventry to Leicester, Newark, so to Lincoln.—The fourth, called *Erming*, or *Erminage-street*, stretches from S. David's in West-Wales, to Southampton.

**Milly Way.** See the article GALAXY.

**Way of a ship,** is sometimes used for the same with the *rate*, or run of her, forward and afterward on. See RUN.

But the term is more commonly understood, in respect of her failing.—When she goes apace, they say, *she has a good way*; and they call the account how fast she sails by the log, *keeping an account of her way*. See LOG.

And because most ships are apt to fall a little to the lee-ward of their true course; they always, in casting up the log-board, allow something for her *lee-ward way*: which is one point, or more, according to her way of failing. See LEE-WAY.

**Way of the rounds, chemin des rondes,** in fortification, is a space left for the passage of the rounds, between the rampart, and the wall of a fortified town. See ROUND.

This is not now much in use; because the parapet not being above a foot thick, it is soon overthrown by the enemy's cannon.

**Covert-Way.**

**Fosse-Way.**

**Gang-Way.**

**Hatch-Way.**

**Spur-Way.**

**Water-Way.**

See the article } COVERT.  
FOSSE-Way.  
GANG-Way.  
HATCH-Way.  
SPUR-Way.  
WATER-Way.

**WAY-WISER,** an instrument for measuring the road, or distance gone; called also *perambulator*, and *podometer*. See PERAMBULATOR, and PEDOMETER.

**WAYWODE,** is properly a title given the governors of the chief places in the dominions of the czar of Muscovy.

The palatines, or governors of provinces in Poland, also bear the quality of *waywodes*, or *warwodes*. See PALATINE.

The Poles likewise call the princes of Walachia and Moldavia, *waywodes*; as esteeming them no other, than on the foot of governors; pretending that Walachia and Moldavia

are provinces of Poland, which have withdrawn themselves from the obedience of the republic.—Every where else these are called *hospodars*. See *HOSPODAR*.

Du Cange says, that the name *waywode* is used in Dalmatia, Croatia, and Hungary, for a *general of an army*: and Leunclavius, in his *Pandects of Turkey*, tells us, it usually signifies *captain*, or *commander*.

**WEAK Pulse.** See the article *PULSE*.

**WEALD, or WELD**, the woody part of a country; as the *Weald* of Kent.—It is mis-printed in some books and maps, *The Wilds* of Kent, Suffex, and Surry.

**WEANEL**, a country word for a young beast newly weaned, or taken from sucking its dam.

**WEANING, Ablactation.** See *ABLACTATION*.

**WEAPONS.** See the articles *ARMS*, and *ARMOUR*.

**WEAPON-Salve**, a kind of unguent, supposed to cure wounds sympathetically, by being applied, not to the wound, but to the *weapon* that made it. See *SYMPATHETIC Powder*, *TRANSPLANTATION*, &c.

**WEAR, or WEER**, a great flank, or dam in a river; fitted for the taking of fish, or for conveying the stream to the mill. See *FISHING*.

**WEATHER**, the state or disposition of the atmosphere, with regard to moisture or drought, heat or cold, wind or calm, rain, hail, frost, snow, fog, &c. See *ATMOSPHERE*, *RAIN*, *HEAT*, *WIND*, *HAIL*, *FROST*, &c.

As it is in the atmosphere that all plants and animals live and breathe, and as that appears to be the great principle of most animal and vegetable productions, alterations, &c. (See *AIR*.)—There does not seem any thing in all philosophy, of more immediate concernment to us, than the state of the *weather*.—In effect, all living things are only assemblages, on bundles of vessels, whose juices are kept moving by the pressure of the atmosphere; and which, by that motion maintain life. So that any alterations in the rarity or density, the heat, purity, &c. of that, must necessarily be attended with proportionable ones in these.

What vast, yet regular alterations, a little turn of *weather* makes, in a tube filled with mercury, or spirit of wine, or in a piece of string, &c. every body knows, in the common instance of barometers, thermometers, hygrometers, &c. and it is owing partly to our inattention, and partly to our unequal, intemperate course of living, that we do not feel as great and as regular ones in the tubes, chords, and fibres, of our own bodies.

It is certain, a great part of the brute creation have a sensibility, and sagacity this way, beyond mankind; and yet, without any means or disposition thereto, more than we; except that their vessels, fibres, &c. being, in other respects, in one equable habitude; the same, or a proportionable cause from without, has always a like, or proportionable effect on them: that is, their vessels are regular barometers, &c. affected only from one external principle, viz. the disposition of the atmosphere; whereas ours are acted on by divers from within, as well as without; some of which check, impede, and prevent the action of others. See *BAROMETER*, *THERMOMETER*, *HYGROMETER*, &c.

We know of nothing more wanting than a just theory of the *weather*, on mechanical principles.—But, in order to that, a complete history of the *weather* will be required.

Were registers carefully kept in divers parts of the globe, for a good series of years, we should be enabled to determine the directions, breadth, and bounds of the winds, and of the *weather* they bring with them; the correspondence between the *weather* of divers places, and the dependance between one sort and another at the same place.—In time, no doubt, we might learn to foretell divers great emergencies; as, extraordinary heats, rains, frosts, droughts, dearths, plagues, and other epidemical diseases, &c.

The members of our Royal society, the French academy of sciences, and divers other authors of note, have made some essays this way; but the driness and quaintness of the subjects, has induced them all to drop it.

Eraf. Bartholin, for instance, has observations of the *weather* for every day throughout the year 1671: Mr. W. Merle made the like at Oxford, for seven years, viz. the years 1337, 1338, 1339, 1340, 1341, 1342, 1343. Dr. Plot did the same at the same place, for the year 1684: Mr. Hillier, at Cape Corfe, for the years 1686, 1687: Mr. Hunt, &c. at Gresham College, for the years 1695, 1696; Mr. Derham, at Upminster in Essex, for the years 1691, 1692, 1697, 1698, 1699, 1703, 1704, 1705; Mr. Townley, in Lancashire, in 1697, 1698; Mr. Cunningham, at Emin in China, for the years 1698, 1699, 1700, 1701; Mr. Locke, at Oats in Essex, 1692; Dr. Scheuchzer, at Zurich, in 1708; and Dr. Tilly, at Pisa, the same year. See the *Philosoph. Transact.*

The form of Mr. Derham's observation, we give as a specimen of a journal of this kind; observing that he notes the strength of the winds, by 0, 1, 2, 3, &c. and the quantity of rain, as it fell through a tunnel, in pounds and centesimals.

*Phænomena of the WEATHER*, October 1697.

Day.	Hour.	Weather.	Wind.	Barometer.	Rain.
27	7	Fair	S.W. 2	29 37	1 52
	12	Rain	S.W. by W. 5	29 34	
	9	Stormy	0	29 88	0 29

As a specimen of the use of such histories, we shall add some general remarks, drawn from them by Mr. Derham; and,—1°. That foggy *weather* makes the mercury rise in the barometer, as well as the north wind.—The cause, he suggests, probably enough, to be the accession of the load of vapour, to the former weight of the atmosphere. See *FOG*. *Misling weather*, he likewise observes to have the like effect. See *BAROMETER*.

2°. The colds and heats in England and Switzerland, begin and end nearly about the same time: nay, and any remarkable *weather*, especially if it continue any while, affects one place as well as the other. See *HEAT*.

3°. That the remarkably cold days in June, anno 1708, were found, in Switzerland, to precede ours, commonly by about five days, or more; and that the remarkable heats in the following months, began to abate in both places about the same time; only somewhat sooner here than there. See *COLD*.

4°. That though the winds in both places frequently agree, yet they oftener differ. See *WIND*.

5°. That the barometer is always lower at Zurich than at Upminster, by sometimes one, and sometimes above two English inches; but the common difference is about half an inch. Which may be solved, either by supposing Zurich situate one fourth of a mile higher above the level of the sea than Upminster; or else, by supposing that part of the terraqueous globe, as lying nearer the line, to be higher, and more distant from the centre than ours is, which lies nearer the pole. See *EARTH*, *MOUNTAIN*, &c.

6°. That the barometers generally rise and fall together at far distant places: though this agreement of the barometer is not so constant between Zurich and Upminster, as in places nearer home, viz. at London and Paris; where, again, the agreement is not so great as between Upminster and Lancashire.

7°. That the variations of the barometer are greatest, as the places are nearest the pole.—Thus, e. g. the mercury at London has a greater range by two or three lines than at Paris; and at Paris, a greater than at Zurich.—In some places near the equinoctial, there is scarce any variation at all. See *BAROMETER*.

8°. That the rain in Switzerland and Italy is much greater in quantity, throughout the year, than that in Essex; yet the rains are more frequent, i. e. there are more rainy days in Essex, than at either of those places.—The proportion of the annual rains that fall in several places we have any good observations of, stand thus: At Zurich, the depth of the annual rain, at a medium, is about 32  $\frac{1}{2}$  English inches; at Pisa, 43  $\frac{1}{2}$ ; at Paris, 23; at Lille in Flanders, 23  $\frac{1}{2}$  inches; at Townley in Lancashire, 42  $\frac{1}{2}$ ; at Upminster, 19  $\frac{1}{4}$ . See *RAIN*.

9°. That cold contributes greatly to rain; and that, apparently, by condensing the suspended vapours, and making them descend.—Thus, very cold months, or seasons, are generally followed immediately by very rainy ones; and cold summers are always wet ones. See *COLD*, and *VAPOUR*.

10°. That high ridges of mountains, as the Alps, and the snows they are covered withal, not only affect the neighbouring places by the colds, rains, vapours, &c. they produce, but even distant countries, as England, often partake of their effects.—Thus, the extraordinary colds, December 1708, and the relaxations thereof, were felt in Italy and Switzerland, several days ere they reached us: an indication, Mr. Derham thinks, that they were derived from them to us.

*Prognostics of the WEATHER.*—We do not here mean to obtrude the idle, arbitrary observations of fanciful people upon our reader.—That cloud of popular predictions from the brute world, which partly the sagacity, and partly the credulity of our countrymen have established, we set aside, as not flowing from any natural, necessary relations, that we know of, in the things themselves.—Such is the foretelling of rain and wind, from water-fowls flocking to land, or land-fowls to the water; from birds pruning their feathers, geese gagging, crows cawing loud, and flying in companies; swallows chattering, and flying low, peacocks crying much, asses braying, deer fighting, foxes and wolves howling, fishes playing, ants and bees keeping within doors, moles casting up earth, earthworms creeping out, &c.—We shall offer nothing on this head, but what has some visible foundation in the nature of things; and which lets some light into the cause and reason of *weather* itself, or discovers some notable effects thereof.

1°. Then,

1<sup>o</sup>. Then, a thick, dark sky, lasting for some time, without either sun or rain, always becomes first fair, then foul, i. e. changes to a fair clear sky, ere it turns to rain.—This, the rev. Mr. Clarke, who kept a register of the weather for 30 years, since put into Mr. Derham's hands by his grandson the learned Dr. Samuel Clarke; this, he says, he scarce ever knew to fail: at least, when the wind was in any of the easterly points: but Mr. Derham has observed the rule to hold good, be the wind where it will. And the cause is obvious.—The atmosphere is replete with vapours, which, though sufficient to reflect and intercept the sun's rays from us, yet want density to descend; and while the vapours continue in the same state, the weather will do so too.—Accordingly, such weather is generally attended with moderate warmth, and with little or no wind to disturb the vapours, and an heavy atmosphere to sustain them; the barometer being commonly high.—But when the cold approaches, and, by condensing, drives the vapours into clouds or drops, then, way is made for the sun-beams; till the same vapours, being by further condensation formed into rain, fall down in drops.

2<sup>o</sup>. A change in the warmth of the weather, is generally followed by a change in the wind.—Thus, the northerly and southerly winds, commonly esteemed the causes of cold and warm weather, are really the effects of the cold or warmth of the atmosphere: of which Mr. Derham assures us he has had so many confirmations, that he makes no doubt of it.—Thus, it is common to see a warm southerly wind suddenly changed to the north, by the fall of snow or hail; or to see the wind, in a cold frosty morning, north, when the sun has well warmed the earth and air, wheel towards the south; and again turn northerly or easterly in the cold evening.

3<sup>o</sup>. Most vegetables expand their flowers and down in sun-shiny weather, and towards the evening; and against rain, close them again; especially at the beginning of their flowering, when their seeds are tender and sensible.—This is visible enough in the down of dandelion, and other downs: and eminently in the flowers of pimpernel; the opening and shutting of which, Gerard observes, are the countryman's weatherwiser, whereby he foretells the weather of the following day.—The rule is, if the flowers be close shut up, it betokens rain and foul weather: if they be spread abroad, fair weather. Ger. Herb. Lib. II.

*Est & alia [arbor in Tylis] similis, foliosor tamen, roseique floris; quem noctu comprimens, aperire incipit solis exortu, meridie expandit. Incolæ dormire eum dicunt.* Plin. Nat. Hist. Lib. XII. cap. 11.

The stalk of trefoil, my lord Bacon observes, swells against rain, and grows more upright: and the like may be observed, though not so sensibly, in the stalks of most other plants.—He adds, that in the stubble fields there is found a small red flower, called, by the country-people, *wincopipe*; which opening in a morning, is a sure indication of a fine day.

That vegetables should be affected by the same causes that affect the weather, is very conceivable; if we consider them as so many hygrometers, and thermometers, consisting of an infinite number of tracheæ, or air-vessels; by which they have an immediate communication with the air, and partake of its moisture, heat, &c.—These tracheæ are very visible in the leaf of the scabiose, vine, &c. See PLANT, VEGETABLE, &c.

Hence it is, that all wood, even the hardest and most solid, swells in moist weather; the vapours easily insinuating into the pores thereof; especially of that which is lightest and driest.—And hence we derive a very extraordinary use of wood, viz. for breaking rocks and mill-stones. See WOOD.

The method at the quarries is this.—Having cut a rock into a cylinder, they divide that into several lesser cylinders, by making holes at proper distances round the great one: these holes they fill with so many pieces of fallow wood, dried in an oven; which, in moist weather, becoming impregnated with the humid corpuscles of the air, swell; and, like wedges, break or cleave the rock into several stones.

Predictions of the WEATHER from the barometer. See BAROMETER.

WEATHER-COCK, or WEATHER-VANE, a moveable vane, in form of a cock, or other shape, placed on high, to be turned round according to the direction of the wind, and point out what quarter the wind blows from. See WIND, and ANEMOMETER.

WEATHER-GLASSES, are instruments contrived to indicate the state, or disposition of the atmosphere, as to heat, cold, gravity, moisture, &c. to measure the changes befalling in those respects; and, by those means, to predict the alteration of weather, as rains, winds, snow, &c.

Under the class of weather-glasses, are comprehended barometers, hygrometers, manometers, and anemometers, of each whereof there are divers kinds: see their theories, constructions, uses, kinds, &c. under the respective articles, BAROMETER, THERMOMETER, HYGROMETER, &c.

WEATHER-BOARD, in the sea language, that side of a ship which is to the windward.

WEATHER GAGE at sea.—A ship is said to have the weather-gage of another, when she is to windward of her. See GAGE.

WEATHERING, a doubling, or sailing by a point, or place.

To weather a ship, is to get to the windward of her.

The WEATHERING of a hawk, among falconers, is the setting her abroad to take the air. See HAWK, and HAWKING.

WEAVING, the art or act of working a web of cloth, silk, linen, or other stuff, on a loom, with a shuttle. See LOOM, SHUTTLE, WEB, &c.

It is difficult to say, with any assurance, who it is we owe this admirable invention to, unless we chuse to ascribe it to the spider, that poisonous, but ingenious little insect, which draws certain infinitely fine threads from its own substance through papillæ near its anus. See SILK, and WEB.

WEAVING of Cloth.

WEAVING of Tapestry, &c. } See { CLOTH. TAPESTRY, &c. STOCKING WEAVING.

WEB, a sort of tissue, or texture, formed of threads interwoven with each other; some whereof are extended in length, and called the *warp*; and others drawn across them, called the *woof*. See TEXTURE, WOOF, WARP, &c.

Spider's WEB, or Cob-WEB, is a very delicate and wonderful tissue, which that insect spins out of its own bowels; serving it as a sort of toil, or net to catch flies, &c. withal.—For the manner wherein the spider spins his web, the admirable mechanism of the parts subservient thereto, and the uses thereof, see SILK.

Dr. Lister tells us, that attending nearly to a spider weaving a net, he observed it suddenly to desist in the mid-work; and turning its tail to the wind, darted out a thread, with the violence and stream we see water spout out of a jet: this thread, taken up by the wind, was immediately emitted some fathoms long; still issuing out of the belly of the animal.—By and by the spider leaped into the air, and the thread mounted her up swiftly.—After this discovery, he made the like observation in near thirty different sorts of spiders; and found the air filled with young and old, sailing on their threads, and doubtless seizing gnats and other insects in their passage: there being often manifest signs of slaughter, legs and wings of flies, &c. on these threads, as well as in their webs below.

Dr. Hulse discovered the same thing about the same time.—In a letter of Dr. Lister to Mr. Ray, he thinks there is a fair hint of the darting of spiders in Aristotle, *Hist. An.* Lib. IX. cap. 39. and in Pliny, Lib. X. cap. 74. But for their sailing, the antients are silent, and thinks it was first seen by him.—In another letter to Mr. Ray, dated January 1670, speaking of the height spiders are able to fly to, he says, “Last October, &c. I took notice that the air was very full of webs; I forthwith mounted to the top of the highest steeple on the Minster, [in York] and could there discern them yet exceeding high above me.”

Pin and WEB. See PANNUS.

WEDGE, *Cuneus*, in mechanics, the last of the five powers, or simple machines. See MECHANICAL Power.

The wedge is a triangular prism, whose bases are equilateral acute-angled triangles. See PRISM.

Authors are divided about the principle whence the wedge derives its power.—Aristotle considers it as two levers of the first kind, inclined toward each other, and acting opposite ways.—Guido Ubaldus, Merfennus, &c. will have them levers of the second kind.—But Fr. de Lanis shews, that the wedge cannot be reduced to any lever at all. See LEVER. Others refer the wedge to the inclined plane.—Others, again, with De Stair, deny the wedge to have scarce any force at all; and ascribe much the greatest part to the mallet that drives it.—But the latest Authors agree to refer the effect of the wedge, to the cochlea, or screw. See SCREW.

Its doctrine is contained in this proposition.—“If a power be applied to a wedge, in such manner, as that the line of direction CD, (*Tab. Mechanics*, fig. 53.) perpendicular to AB, is to the resistance to be overcome, as AB to CD; the power will be equal to the resistance.”

Or thus: “If the power directly applied to the head of the wedge, be to the resistance to be overcome by the wedge, as the thickness of the wedge is to its height; then the power will be equivalent to its resistance; and, if increased, will overcome it.”

For the firmness whereby the parts of the obstacle, suppose wood, adhere to one another, is the resistance to be overcome by the wedge. See FIRMNESS, and RESISTANCE. Now it is evident, that while the wedge is drove into the wood, the way or length it has gone is BA, (*fig. 54.*) and DC is the way or length gone in the same time, by the impediment; that is, the parts C and D of the wood, are so far divided asunder: and according as the wedge is drove down farther and farther along its height; so the parts C and D of the wood, are divided more and more, along the thickness of the wedge.

Hence, if the thickness of the *wedge* (that is, the way of the impediment, and consequently its velocity) be to the height of the *wedge* (that is, the way, and consequently the velocity of the power) as the power to the impediment, or resistance; then the momentum of the power, and the impediment, will be equal the one to the other; and consequently the power, being increased, will overcome the resistance.

Hence, 1<sup>o</sup>. the power equivalent to half the resistance, is to it as A C to D C, *fig. 53*. that is, as the whole sine to the co-tangent of half the angle of the *wedge* A D C.— And, 2<sup>o</sup>. as the tangent of a less angle is less than that of a greater, the power must have a greater proportion to half the resistance, if the angle be greater, than if less.— Consequently, the acuter the *wedge* is, the more does it increase the power.

To the *wedge* may be referred all edge-tools, and instruments which have a sharp point, in order to cut, cleave, slit, chop, pierce, bore, or the like; as knives, hatchets, swords, bodkins, &c.

**WEDLOCK.** See **MARRIAGE, WIFE, HUSBAND, &c.**

**WEDNESDAY.** See the article **MONTH, DAY, &c.**

*Apb*-**WEDNESDAY.** See the article *ASH-Wednesday*.

**WEED**, a common name for all rank and wild herbs, that grow of themselves, to the detriment of other useful herbs they grow among. See **PLANT, HERB, &c.**

*Dyer's* **WEED**, *woodwax*, or *genista tinctoria*, See **DYING**.

*Fuller's* **WEED**. See the articles **THISTLE**, and **TEAZLE**.

**WEED**, in the miners language, denotes the degeneracy of a load or vein of fine metal, into an useless marcasite. See **VEIN, MINE, METAL, MARCASITE, &c.**

**WEEDS**, also denote a peculiar habit, wore by the relicts of persons deceased, by way of mourning. See **MOURNING**.

**WEEK**, *Septimana, Hebdomada*, in chronology, a division of time, comprising seven days. See **TIME**, and **DAY**.

The origin of this division of *weeks*, or of computing time by sevenths, is greatly controverted.— Some will have it to take its rise from the four quarters or intervals of the moon, between her changes of phases, which being about seven days distant, gave occasion to the division. See **MOON, QUARTER, &c.**

Be this as it will, the division is certainly very antient.— The Syrians, Egyptians, and most of the oriental nations, appear to have used it from all antiquity: though it did not get footing in the west, till Christianity brought it in: the Romans reckoned their days not by sevenths, but by ninths; and the antient Greeks by decads, or tenths.

Indeed, the Jews divided their time by *weeks*, but it was upon a different principle from the other eastern nations.— God himself having appointed them to work six days, and to rest the seventh, in order to keep up the sense and remembrance of the creation; which being effected in six days, he rested the seventh. See **SABBATH**.

Some authors will even have the use of *weeks*, among the other eastern nations, to have proceeded from the Jews; but with little appearance of probability.— It is with better reason that others suppose the use of *weeks* among the heathens of the east, to be a remain of the tradition of the creation, which they had still retained with divers others.

This is the opinion of Grotius, *De Veritat. Relig. Christ.* Lib. I. who likewise proves, that not only throughout the east, but even among the Greeks, Italians, Celtæ, Sclavi, and even the Romans themselves, the days were divided into *weeks*; and that the seventh day was in extraordinary veneration.— This appears from Joseph. *adv. Appion.* II. Philo *De Creatione*, Clem. Alexand. *Strom.* Lib. V.— Though Helmoldus, Lib. I. cap. 84. Philostratus, Lib. III. cap. 13. Dion. Lib. XXXVIII. Tibullus, Lucian, Homer, Callimachus, Suetonius, Herodotus, &c. who mention the septenary division of days as very antient, suppose it to have been derived from the Egyptians.

The *Days of the Week* were denominated by the Jews, from the order of their succession from the sabbath.— Thus, the day next after the sabbath, they called the *first* of the sabbath, the next, the *second* of the sabbath, and so of the rest; except the sixth, which they called *parasceve*, or preparation of the sabbath. See **PARASCEVE**.

The like method is still kept up by the Christian Arabs, Persians, Ethiopians, &c.— The antient heathens denominated the days of the *week* from the seven planets; which names are still generally retained among the Christians of the west.— Thus, the first day was called *sun-day*, dies solis; the second *moon-day*, dies lunæ, &c. a practice the more natural on Dion's principle, who says, the Egyptians took the division of the *week* itself from the seven planets.

In effect, the true reason of these denominations seems to be founded in astrology.— For the astrologers, distributing the government and direction of all the hours in the *week* among the seven planets, ♄ ♃ ♀ ☿ ☿ ♃ ♄, so as that the government of the first hour of the first day fell to Saturn, that of the second day to Jupiter, &c. they gave each day the name of the planet which presided over the first hour thereof: and that, according to the order specified above; and which is included in the following technical verse:

VOL. II. N<sup>o</sup>. CLXV.

*Pop. SIM SUM sequitur, pallida Luna subest.*

Wherein, the capital letters SIM SUM and L, are the initial letters of the planets.— So that, the order of the planets in the *week*, bears little relation to that in which they follow in the heavens: the former being founded on an imaginary power each planet has, in its turn, on the first hour of each day. See **PLANET, HOUR, HOUSE, ASCENDENT, HORUSCOPE, &c.**

Dion. Cassius gives another reason of the denomination, fetched from the celestial harmony.— For it being observed that the harmony of the diatessaron, which consists in the ratio of 4 to 3, is of great force and effect in music; it was judged meet to proceed directly from Saturn to the Sun; because there are three planets between Saturn and the Sun, and four from the Sun to the Moon. See **DIATESSARON, HARMONY of the Spheres, &c.**

To find the accomplishment of Daniel's prophecy of the Messiah, the destruction, rebuilding, &c. of the temple, chap. ix. ver. 24, &c. the critics generally agree to understand *weeks of years*, instead of *weeks of days*. See **PROPHECY, YEAR, &c.**

**Ember WEEKS.** See the article **EMBER**.

**Passion WEEK**, or the *holy WEEK*, is the last *week* in Lent, wherein the church celebrates the mystery of our Saviour's death and passion. See **LENT, PASSION, &c.**

This is sometimes also called the *great week*.— Its institution is generally referred, both by Protestants and Papists, to the times of the apostles.— All the days of that *week* were held as fasts: no work was done on them; no justice distributed; but the prisoners were ordinarily set at liberty, &c. even pleasures otherwise allowed, but now prohibited.

The oculum charitatis was now forbore; and divers mortifications practised by all sorts of people, and even the emperors themselves.

**Rogation WEEK.** See the article **ROGATION**.

**WEEK**, or **WIECK** of a candle, &c. the cotton match in a candle or lamp. See **CANDLE, LAMP, &c.**

**WEeping.** See the article **TEARS**.

**WEER.** See the article **WEAR**.

**WEFT**, a kind of web, or thing woven: as, a *weft* or tress of hair. See **WEB, HAIR, TISSUE, &c.**

**WEIF.** See the article **WAIF**.

**WEIGH\***, **WAY**, or **WEY**, *Waga*, a weight of cheese, wool, &c. containing 256 pounds avoirdupois.— Of corn, the *weigh* contains 40 bushels; of barley or malt, 6 quarters.— In some places, as Essex, the *weigh* of cheese is 300 pounds. See **MEASURE**.

\*— Et decimam casei sui de Herting, præter unam peisam quæ pertinet ad ecclesiam de A. Mon. Angl. where *peisa* seems to be used for a *weigh*.— Coke also speaks of *weighs* of bay salt.

**WEIGHER**, an officer in divers cities, appointed to *weigh* the commodities bought or sold, in a public balance, &c.

These *weighers* are generally obliged by oath, to do justice to both parties; and to keep a register of the things they weigh.— In Amsterdam there are twelve *weighers*, established into a kind of office.

As it was formerly allowed them to touch the strings of the balance of *weighing*, it was easy for them to favour either the buyer or seller, according as the one gave them more money than the other.— To prevent which abuse, it was charged on them, by an ordinance of the burgomasters, in 1719, not to touch the balance in any manner whatever.

**WEIGHING**, the act of examining a body in the balance, to find its *weight*. See **BALANCE**, and **WEIGHT**.

The distillers in London *weigh* their vessels when full; and for half a hoghead, which is 31 gallons and an half, allow 200 one quarter and 11 pounds for the cask and liquor.— For a puncheon, they allow 600 one quarter and 2 pounds: for a canary pipe 800 a half and 17 pounds.

**WEIGHING-CHAIR**, a machine contrived by Sanctorius, to determine the quantity of food taken at a meal, and to warn the feeder when he had eat his quantum.

That ingenious author having observed, with many others, that a great part of our disorders arise from the excess in the quantity of our foods, more than in the quality thereof; as also how much a fixed portion, once well adjusted, would, if kept to regularly, contribute to health; he thought himself of an expedient to that purpose.— The result was the *weighing-chair*: which was a chair fixed at one arm of a sort of balance, wherein a person being seated at meat, as soon as he had eat his allowance, the increase of *weight* made his seat preponderate: So that, descending to the ground, he left his table, victuals, and all out of reach. See **PERSPIRATION**.

**WEIGHING of the air.** See the article **WEIGHT of air**.

**WEIGHING Anchor**, in the sea language, is the drawing up the anchor out of the ground it had been cast into; in order to set sail, or quit a port, road, or the like. See **ANCHOR**.

The anchor is ordinarily *weighed* or recovered by means of the capstan; sometimes by a windlass. See **WINDLASS**, and **CAPSTAN**.

**WEIGHT**, *Gravitas, Pondus*, in physics, a quality in natural bodies, whereby they tend downwards, toward the centre of the earth. See **BODY**, **DESCENT**, **EARTH**, &c. Or, *weight* may be defined, in a less limited manner, to be a power inherent in all bodies, whereby they tend to some common point, called the *centre of gravity*; and that with a greater or less velocity, as they are more or less dense, or as the medium they pass through is more or less rare. See **CENTRE**, **DENSITY**, &c.

In the common use of language, *weight* and *gravity* are considered as one and the same thing. — Some authors, however, make a difference between them; and hold *gravity* only to express a *nisus*, or endeavour to descend; but *weight* an actual descent.

But there is room for a better distinction. — In effect, one may conceive gravity to be the quality, as inherent in the body; and *weight*, the same quality, exerting itself, either against an obstacle, or otherwise. See **QUALITY**, &c.

Hence, *weight* may be distinguished, like gravity, into *absolute*, and *specific*. See **GRAVITY**.

Sir Isaac Newton demonstrates, that the *weights* of all bodies, at equal distances from the centre of the earth, are proportionable to the quantities of matter each contains. — Whence it follows, that the *weights* of bodies have not any dependance on their forms, or textures; and that all spaces are not equally full of matter. See **VACUUM**.

Hence also it follows, that the *weight* of the same body is different, on the surface of different Parts of the earth; by reason its figure is not a sphere, but a spheroid. See **PENDULUM**.

The law of this difference, the same author gives in the following theorem. — “The increase of *weight*, as you proceed from the equator to the poles, is, nearly, as the versed sine of double the latitude; or, which amounts to the same, as the square of the right sine of the latitude.”

Therefore, since the latitude of Paris is  $48^{\circ} 50'$ , that of a place under the equator  $00^{\circ} 00'$ ; and that of a place under the pole  $90^{\circ} 00'$ ; and the versed sines of the double latitudes are 11334,00000 and 20000, the radius being 10000; and the *weight* at the pole, is to the *weight* at the equator, as 230 to 229; and the excess of *weight* at the pole, to that at the equator, as 1 to 229: the excess of gravity in the latitude of Paris, to that under the equator, will be as  $1 \times \frac{11334}{229}$  to 229, or as 5667, to 2290000; and therefore, the whole *weights* in those places, will be to each other as 2295667, to 2290000.

Hence also, as the lengths of pendulums that perform their vibrations in equal times, are as their *weights*; and the length of a pendulum, which in the latitude of Paris vibrates seconds, is three Paris feet, and eight lines  $\frac{1}{2}$ : the length of a pendulum, that vibrates seconds under the equator, will be short of a synchronous pendulum at Paris, by one line, and an 87000th part of a line. *Phil. Nat. Princ. Math. Lib. III. p. 382, &c.* See **PENDULUM**.

A body immersed in a fluid specifically lighter than itself, loses so much of its *weight*, as is equal to the *weight* of a quantity of the fluid of the same bulk with itself. See **FLUID**.

Hence, a body loses more of its *weight* in a heavier than in a lighter fluid; and therefore weighs more in a lighter, than a heavier fluid. See **SPECIFIC Gravity**.

To find the *weight* of any quantity of a fluid, *e. gr.* of the wine contained in a hoghead. — Find the bulk or quantity of the liquor by the rules of gauging. See **GAUGING**.

Suspend a cubic inch of lead therein by a horse-hair; and by a balance note the *weight* lost. — This will be the *weight* of a cubic inch of the fluid.

Wherefore, since in a homogeneous fluid, the *weight* is proportionable to the bulk; the *weight* of the fluid will be found by the rule of three. — Thus, if the capacity of the Hoghead be 88 cubic feet, and the cubic foot of wine 68 pounds, the whole *weight* of the wine will be 5984.

The *weight* of a cubic foot of water, has been determined by several; but as in different springs, &c. the *weight* of the water is different, and there is even a difference in the same water at different times; it is no wonder the observations of the several authors should be found very different. — Dr. Wiberd, by repeated experiments, found a cubic foot of water to weigh 76 pounds troy. See **WATER**.

**WEIGHT**, *Pondus*, in mechanics, is any thing to be raised, sustained, or moved by a machine; or any thing that in any manner resists the motion to be produced. See **MOTION**, &c. In all machines, there is a natural ratio between the *weight*, and the moving power. — If the *weight* be increased, the power must be so too; that is, the wheels, &c. are to be multiplied, and so the time increased, or the velocity diminished. See **POWER** and **MACHINE**.

“The centre of gravity F, (*Tab. Mechanics, fig. 55.*) of a body I H, together with the *weight* of the body, being given; “to determine the point M, in which, lying on an horizontal plane, a given *weight* G, hung in L, cannot remove “the body I H out of its horizontal situation.”

Conceive a *weight* hung in the centre of gravity F, equal to the *weight* of the whole Body I H, and find the common centre of gravity M, of that and the given *weight* G. — If the point M be laid on the horizontal plane, the *weight* G will not be able to move the body I H out of its place.

Suppose, *e. gr.* F the centre of gravity of the staff, which is distant from its extremity, by the space I F 20 inches; the bucket of water to weigh 24 pounds, and the *weight* of the staff to be 2 L F = 18 ounces: we shall find L M = L F. F. (G + F) = 18. 2 : 22 :: 18 : 11 =  $\frac{11}{2}$ ; so that it is no wonder the bucket hung on the staff I H, laid on the table, does not fall.

“The centre of gravity C, (*fig. 56.*) of a body A B, together with its *weight* G, being given; to determine “the points L and M, wherein props N and O are to be “placed, that each may bear any given proportion of the “*weight*.”

In the horizontal line A B, passing through the centre of gravity C, assume the right lines M C and C L in the given ratio. — Props, then, N, O, placed in these points, will be pressed in the given ratio.

Hence, if in the points M, L, in lieu of props, you place the shoulders, or arms of porters, &c. they will be able to bear the burden alike; if their shares be proportioned to their strengths. — Thus we have a way of distributing a burden in any given ratio.

**WEIGHT of the atmosphere.** See **ATMOSPHERE**.

**WEIGHT** in commerce, denotes a body of a known weight, appointed to be put in the balance against other bodies, whose weight is required. See **WEIGHING**, **BALANCE**, &c.

These *weights* are usually of lead, iron, or brass; though in divers parts of the East-Indies they are common flints, and in some places, a sort of little beans.

The security of commerce depending, in good measure, on the justness of these *weights*; there is scarce any nation, but has taken proper measures to prevent the falsification thereof. — The surest means are the stamping, or making them by proper officers, from some original or standard, deposited where recourse may be had to them.

This expedient is very antient; and many authors are of opinion, that what among the Jews was called *shekel of the sanctuary*, was not any particular kind of *weight*, different from the common one; but a standard or original *weight*, preserved by the priests in the sanctuary. See **SHEKEL**, and **SANCTUARY**.

Thus, also, in England, the standard of *weights* is kept in the Exchequer, by a particular officer, called the *clerk*, or *comptroller of the market*. — In France the standard *weight* is kept under several keys, in the cabinet of the cour des Monnoyes. See **STANDARD**.

Most nations, wherein there is any thing of commerce flourishing, have their particular *weights*; and even sometimes different *weights* in the different provinces, and for the different kinds of commodities.

This diversity of *weights*, makes one of the most perplexing articles in commerce; but it is irremediable. — The reducing the *weights* of different nations to one, is not only impracticable; but even the reduction of those of the same nation: witness those vain attempts made for reducing the *weights* in France by so many of their kings, Charlemain, Philip the long, Louis XI. Francis I. Henry II. Charles IX. Henry III. Louis XIV.

*Weights* may be distinguished into *antient*, and *modern*, *foreign*, and *domestic*.

**Modern WEIGHTS**, used in the several parts of Europe, and the Levant.

**English WEIGHTS.** — By the twenty-seventh chapter of *Magna Charta*, the *weights* are to be the same all over England; but for different commodities there are two different sorts, *viz.* *troy weight*, and *avordupois weight*.

The origin from which they are both raised, is the grain of wheat, gathered in the middle of the ear. See **GRAIN**.

In **Troy WEIGHT**, 24 of these grains make a *penny weight* sterling; 20 *penny weight* make an *ounce*; and 12 *ounces* a *pound*. See **OUNCE**, **POUND**, &c.

By this *weight* we weigh gold, silver, jewels, grains, and liquors. — The apothecaries also use the *troy pound*, *ounce*, and *grain*; but they differ from the rest, in the intermediate divisions — They divide the ounce into 8 *drachms*; the drachm into 3 *scruples*; and the scruple into 20 *grains*. See **DRACHM**, **SCRUPLE**, &c.

In **Avordupois WEIGHT**, the *pound* contains 16 *ounces*; but the ounce is less by near  $\frac{1}{12}$  than the troy ounce; this latter containing 490 grains, and the former only 448. — The ounce contains 16 drachms — 80 ounces avordupois, are only equal to 73 ounces troy; and 17 pounds troy, equal to 14 pounds avordupois. See **POUND**.

By *avordupois weight*, are weighed mercury and grocery wares, base metals, wool, tallow, hemp, drugs, bread, &c. See **AVORDUPOIS**.

Table

# W E I.

Table of *Troy Weight*, as used by the Goldsmiths, &c. Apothecaries.

Grains.				Grains.			
24	Penny-weight.			20	Scruple.		
480	20	Ounce.		60	3	Drachm.	
5760	240	12	Pound.	480	24	8	Ounce.
				5760	288	96	12 Pound.

Table of *Averdupois weight*.

Scruples.				Scruples.			
3	Drachm.			20	Scruple.		
24	8	Ounce.		60	3	Drachm.	
384	128	16	Pound.	480	24	8	Ounce.
43008	14336	1792	112 Quintal, or Hundred.	5760	288	96	12 Pound.
860160	286720	35840	2240	20	Tun.		

The moneyers, jewellers, &c. have a particular class of *weights*, for gold and precious stones, viz. *carat*, and *grain*; and for silver, the *penny-weight*, and *grain*. See *CARAT*; see also *GOLD*, and *SILVER*.

The moneyers have also a peculiar subdivision of the *grain* troy: Thus;

The	{ Grain	into	{ 20 Mites.
	{ Alite		{ 24 Droits.
	{ Droit		{ 20 Perits.
	{ Perit		{ 24 Blanks.

The dealers in wool have likewise a particular set of *weights*, viz. the *sack*, *weigh*, *tod*, *stone*, and *clove*. See *WEIGH*, &c.—The proportion of which, see under the article *WOOL*.

**French WEIGHTS.**—The common or *Paris pound*, is 16 ounces; which they divide two ways: the first division is into two *marcs*, the marc into 8 ounces; the ounce into 8 *gros*; the gros into 3 *penny-weights*; the penny-weight into 24 grains; the grain equivalent to a grain of wheat.—The second division of the pound, is into 2 *half-pounds*; the half-pound into 2 *quarters*; the quarter into 2 *half-quarters*; the half-quarter into 2 ounces; and the ounce into two *half-ounces*.

The *weights* of the first division are used to weigh gold, silver, and the richer commodities: and the *weights* of the second division, for commodities of less value.

Grains.				Grains.			
24	Penny-weight.			20	Scruple.		
72	3	Gros.		60	3	Drachm.

But the pound is not the same throughout France.—At Lyons, *e. gr.* the city pound is only 14 ounces: so that 100 Lyons pounds, make only 88 Paris Pounds.—But beside the city pound, they have another at Lyons for silk, containing 16 ounces.—At Tholouse, and throughout the Upper Languedoc, the pound is 13 ounces and  $\frac{1}{2}$  of Paris

# W E I

*weight*.—At Marfeilles, and throughout Provence, the pound is 13 ounces of Paris *weight*.—At Rouen, beside the common Paris pound and marc, they have the *weight* of the *vicomte*; which is 16 ounces and  $\frac{1}{2}$  and  $\frac{1}{8}$ , of the Paris *weight*.

The *weights* enumerated under the two articles of English and French *weights*, are the same that are used throughout the greatest part of Europe; only under somewhat different names, divisions, and proportions. See *POUND*, *GROS*, *MARC*, *PENNY-WEIGHT*, &c.

Particular nations, have also certain *weights* peculiar to themselves: Thus, Spain has its *arrobas*, containing 25 Spanish pounds, or  $\frac{1}{4}$  of the common quintal: its *quintal macbo*, containing 150 pounds, or  $1\frac{1}{2}$  common quintal, or 6 *arrobas*: its *adarma*, containing  $\frac{1}{16}$  of its ounce.—and for gold, it has its *castellan*, or  $\frac{1}{100}$  of a pound.—Its *toinin*, containing 12 grains, or  $\frac{1}{8}$  of a castellan.—The same are in use in the Spanish West-Indies.

Portugal has its *arroba*, containing 32 Lisbon *arratels*, or pounds: Savary also mentions its *faratelle*, containing two Lisbon pounds: and its *rottoli*, containing about 12 pounds.—And for gold, its *chego*, containing four *carats*.—The same are used in the Portuguese East-Indies.

Italy, and particularly Venice, have their *migliaro*, containing four mirres; the *mirre* containing 30 Venice pounds: the *faggio*, containing a sixth part of an ounce.—Genoa has five kinds of *weights*, viz. *large weights*, whereby all merchandizes are weighed at the custom-house: *cash-weights*, for piasters, and other species: the *cantara*, or *quintal*, for the coarsest commodities: the large balance, for raw silks; and the small balance for the finer commodities.—Sicily has its *rottolo*, 32 and a half pounds of Messina. *Savar*.

Germany, Flanders, Holland, the Hanse towns, Sweden, Denmark, Poland, &c. have their *schippendts*, which at Antwerp and Hamburg is 300 pounds; at Lubeck, 320; and at Coningsberg, 400 pounds.—In Sweden, the *schippendts* for copper is 320 pounds; and the *schippendts* for provisions 400 pounds.—At Riga, and Revel, the *schippendts* is 400 pounds; and at Dantzic, 340 pounds; in Norway, 300 pounds; at Amsterdam, 300; containing 20 *lyspendts*, each weighing 15 pounds. *Id.*

In Muscovy, they weigh their large commodities by the *bercheroff*, or *berkewits*, containing 400 of their pounds.—They have also the *poet*, or *poede*, containing 40 pounds, or  $\frac{1}{5}$  of the *bercheroff*. *Id.*

In Turkey, at Smirna, &c. they use the *batman*, or *battamant*, containing six *occos*; the *occo* weighing 3 pounds  $\frac{1}{2}$  English.—They have another *batman* much less, consisting, as the former, of six *occos*: but the *occo* only containing 15 ounces English: 44 *occos* of the first kind, make the Turkish *quintal*.—At Cairo, Alexandretta, Aleppo, and Alexandria, they use the *rotto*, *rotton*, or *rotoli*. The *rotoli* at Cairo, and other parts of Egypt, is 144 drachms; being somewhat over an English pound.—At Aleppo there are three sorts of *rottos*; the first 720 drachms, making about seven pounds English, and serving to weigh cottons, galls, and other large commodities: the second is 624 drachms, used for all silks but white ones, which are weighed by the third *rotto* of 700 drachms.—At Seyda the *rotto* is 600 drachms.

The other ports of the Levant, not named here, use some of these *weights*; particularly the *occo*, or *acqua*, the *rottoli*, and *rotto*.

To shew the proportion of these several *weights* to one another, we shall add a reduction of the divers *pounds* used throughout Europe, by which the other *weights* are estimated, to one standard pound, viz. the pound of Amsterdam, Paris, and Bourdeaux; as calculated with great accuracy by M. Ricard, and published in the new edition of his excellent *Traite de Commerce*, in 1722.

Proportion of the *WEIGHTS* of the chief cities in Europe, or those of Amsterdam.

An hundred pounds of Amsterdam, are equal to	
108 Pounds of Alicant.	151 lb. of Bologna.
105 lb. of Antwerp.	100 lb. of Bourdeaux.
120 lb. of Archangel, or three poedes.	104 lb. of Bourg en Bresse.
105 lb. of Arschot.	103 lb. of Bremen.
120 lb. of Avignon.	125 lb. of Breslaw.
98 lb. of Basil in Switzerland.	105 lb. of Bruges.
100 lb. of Bayonne in France.	105 lb. of Bruffels.
166 lb. of Bergamo.	105 lb. of Cadiz.
97 lb. of Berg ap zom.	105 lb. of Cologne.
95 lb. $\frac{1}{2}$ of Bergen in Norway.	125 lb. of Coningsberg.
111 lb. of Bern.	107 lb. and $\frac{1}{2}$ of Copenhagen.
100 lb. of Befancon.	87 Rottos of Constantineple.
100 lb. of Bilbao.	113 lb. and $\frac{1}{2}$ of Dantzic.
105 lb. of Bois le duc.	100 lb. of Dort.
	97 lb. of Dublin.
	97 lb. of Edinburgh.
	143 lb. of Florence.

An

An hundred pounds of Amsterdam, are equal to	125 <i>Bercheroets</i> of Muscovy.
98 lb. of Francfort on the Maine.	100 lb. of Nantes.
105 lb. of Gaunt.	106 lb. of Nancy.
89 lb. of Geneva.	169 lb. of Naples.
163 lb. of Genoa, <i>cash-weight</i> .	98 lb. of Nuremberg.
102 lb. of Hamburg.	100 lb. of Paris.
106 lb. of Leiden.	112 lb. and $\frac{1}{2}$ of Revel.
105 lb. of Leipfic.	109 lb. of Riga.
105 lb. and $\frac{1}{2}$ of Liege.	100 lb. of Rochel.
114 lb. of Lille.	146 lb. of Rome.
143 lb. of Leghorn.	100 lb. of Rotterdam.
106 lb. and $\frac{1}{2}$ of Lisbon.	96 lb. of Rouen, <i>Vicounty-weight</i> .
109 lb. of London, <i>Averdupois weight</i> .	100 lb. of S. Malo.
105 lb. of Lovaine.	100 lb. of S. Sebastian.
105 lb. of Lubec.	158 lb. and $\frac{1}{2}$ of Saragofa.
141 lb. and $\frac{1}{2}$ of Lucca, <i>light-weight</i> .	106 lb. of Seville.
116 lb. of Lyons, <i>city-weight</i> .	114 lb. of Smirna.
114 lb. of Madrid.	110 lb. of Stetin.
105 lb. of Malines.	81 lb. of Stockholm.
123 lb. and $\frac{1}{2}$ of Marfeilles.	118 lb. of Tholoufe, and Upper Languedoc.
154 lb. of Messina, <i>light-weight</i> .	151 lb. of Turin.
168 lb. of Milan.	158 lb. and $\frac{1}{2}$ of Valencia.
120 lb. of Montpellier.	182 lb. of Venice, <i>small weight</i> .

**WEIGHTS used in the several parts of the East-Indies, China, Persia, &c.**—The *Chinese weights* are—The *pice*, for large commodities; it is divided into 100 *cattis*, or *cattis*, though some say into 125: the *cattis* into 16 *taels*, or *taels*; each *tael* equivalent to  $\frac{1}{16}$  of an ounce English, or the *weight* of one rial and  $\frac{1}{16}$ , and containing 10 *mas*, or *masses*; and each *mas* 10 *condrins*. So that the *Chinese pice* amounts to 137 pounds English *Averdupois*, and the *cattis* to 1 pound 8 ounces.—The *picol*, for silk, containing 66 *cattis* and  $\frac{1}{2}$ : the *babar*, *bakaira*, or *barr*, containing 300 *cattis*.  
Tonquin has all the same *weights*, measures, &c. as China.  
Japan has only one *weight*, viz. the *catti*; which, however, is different from that of China, as containing 20 *taels*.—At Surat, Agra, and throughout the states of the great mogul, they use the *man*, or *maund*, whereof they have two kinds; the *king's man*, or *king's weight*; and the *man* simply: the first used for the weighing of common provisions, containing 40 *seers*, or *seers*; and each *seer* a just Paris pound. Though Tavernier will have the *seer* near a seventh less than the Paris pound.—The common *man*, used in the weighing of merchandize, consists likewise of 40 *seers*, but each *seer* is only estimated at 12 Paris ounces, or  $\frac{1}{4}$  of the other *seer*.  
The *man* may be looked on as the common *weight* of the East-Indies, though under some difference of name, or rather of pronunciation; it being called *mao* at Cambaya, and in other places *mein*, and *maun*.—The *seer* is properly the Indian

pound, and of universal use: the like may be said of the *barbar*, *tael*, and *catti* abovementioned.  
The *weights* of Siam are the *pice*, containing two *schans*, or *cattis*; but the Siamese *catti* is only half the Japonese, the latter containing 20 *taels*, and the former only 10: though some make the Chinese *catti* only 16 *taels*, and the Siamese 8.  
—The *tael* contains 4 *baats*, or *ticals*; each about a Paris ounce: the *baat* 4 *selings*, or *mayons*: the *mayon* 2 *fouangs*: the *fouang* 4 *payes*: the *paye* 2 *clams*: the *sempaye*, half a *fouang*. Savar.  
It is to be observed, that these are the names of their coins, as well as *weights*; silver and gold being, there, commodities, sold, as other things, by their *weights*. See COIN, &c.  
In the isle of Java, and particularly at Bantam, they use the *gantun*, which amounts to near three Dutch pounds.—In Golconda, at Visapour and Goa, they have the *furatelle*, containing 1 pound 14 ounces English: the *mangalis*, or *mangelin*, for weighing diamonds and precious stones; weighing at Goa 5 grains, at Golconda, &c. 5  $\frac{1}{2}$  grains.—They have also the *rotolo*, containing 14  $\frac{1}{4}$  ounces English: the *metricol*, containing the sixth part of an ounce: the *vall*, for piastres and ducats; containing the 73d part of a rial.  
In persia, they use two kinds of *batmans*, or *mans*; the one, called *cabi*, or *cheray*, which is the king's *weight*; and the other *batman of Tauris*, from the name of one of the chief cities of Persia.—The first weighs, according to Tavernier, 13 pounds 10 ounces English; the second, 6 pounds  $\frac{1}{2}$ . According to Sir J. Chardin, the king's *batman* is 13 pounds 14 ounces, and the *batman of Tauris* 6 pounds  $\frac{1}{2}$ .—Its divisions are the *ratel*, or a 16th; the *derhem*, or drachm, which is the 50th; the *meschal*, which is half the derhem; the *dung*, which is the 6th part of the *meschal*; being equivalent to 6 *carat-grains*; and lastly, the *grain*, which is the 4th part of the *dung*.—They have also the *vakie*, which exceeds, a little, our ounce: the *sab-cheray*, equal to the 1170th part of the derhem: and the *toman*, used to weigh out large payments of money, without telling: its *weight* is that of 50 *abassis*. Savar. See TOMAN.

**African and American WEIGHTS.**—We have little to say as to the *weights* of America: the several European colonies there, making use of the *weights* of the states or kingdoms of Europe they belong to. For as to the *aroue* of Peru, which weighs 27 pounds, it is evidently no other than the Spanish *arroba*, with a little difference in the name.  
As to the *weights* of Africa, there are few places have any, except Egypt and the coasts of Africa, whose *weights* are enumerated among those of the ports of the Levant, &c.  
As to the coasts beyond Cape Verde, viz. Guinea, Congo, to Soffola, Mozambica, &c. they have no *weights*; only the English, French, Dutch, Portugueze, and Danes have introduced their own *weights* in their respective settlements.  
The isle of Madagascar, indeed, has its particular *weights*; but it has none that exceed the drachm, nor are they used for any thing but gold and silver.—Other commodities they never weigh.

The

The Roman ounce is the English averdupoise ounce, which they divided into seven *denarii*, as well as eight *drachms*; and since they reckoned their denarius equal to the Attic drachm, this will make the Attic *weights* one eighth heavier than the correspondent Roman *weights*. Arbuth.

Note, The Grecians divided their *obolus* into *chalci* and *λινια*. Some, as Diodorus, and Suidas, divided the *obolus* into six *chalci*, and every *chalcus* into seven *λινια*. Others divided the *obolus* into eight *chalci*, and every *chalcus* into eight *λινια*, or *minuta*.

**WEIGHT of the Air**, is equal to the elasticity thereof. See AIR, and ELASTICITY.

To find the weight of a cubic inch of Air.—Weigh a round glass vessel full of common air, very accurately: exhaust the air out of it: weigh the exhausted vessel, and subtract the latter weight from the former; the remainder is the weight of the air exhausted.

Find, then, the content of the vessel by the laws of measuring, (see SPHERE:)—And the ratio of the remaining air to the primitive air. See AIR-PUMP.

This done, the bulk of the remaining air is found by the rule of three; which being subtracted from the capacity of the vessel, the remainder will be the bulk of air extracted.—

Or, if the air-pump be very tight, and the exhaustion continued as long as any air is got out, the remaining air will be so small, that it may be safely neglected, and the content of the vessel taken for the bulk of the exhausted air.

Having, therefore, the weight and bulk of the whole exhausted air, the weight of one cubic inch is easily had by the rule of three.

This method was first used by Otto Gueric, and afterwards by Burcher de Volder; who gives us the following particulars in his experiment.—10. That the weight of the glass spherical vessel he made use of, full of common air, was 7 pounds, 1 ounce, 2 drams, 48 grains; when exhausted of air, 7 lb. 1 oz. 1 dr. 31 gr. and when full of water, 16 lb. 12 oz. 7 dr. 14 gr. The weight of the air, therefore, was 1 dr. 12 gr. or 77 gr. the weight of the water 9 lb. 11 oz. 5 dr. 43 gr. or 74743 gr. Consequently, the ratio of the specific gravity between water and air is 74743 : 77 :: 970  $\frac{1}{2}$  : 1.—Now, de Volder having found a cubic foot of water to weigh 64 pounds, by inferring, as 970 is to 1, so is 64 pounds to a fourth proportional; which, found by the rule of three, is the weight of a cubic foot of air, viz. one ounce, 27 gr. or 507 grains nearly. See AIR.

The weight of sea-water is different in different climates.—Mr. Boyle having furnished a learned physician, going on a voyage to America, with a hydrostatical balance, and recommended him to observe, from time to time, the difference of weight he might meet withal, this account was returned him: That the sea-water increased in weight the nearer he came to the line, till he arrived at a certain degree of latitude, as he remembers, about the 30th; beyond which, it retained the same specific weight, till he came to Barbados. *Philosoph. Transact.* No 18.

Auncel WEIGHTS.		AUNCel Weight.

**WELD**, or **WOLD**, a plant used by the dyers to give a yellow colour; and for this reason called in Latin *luteola*, of *luteus*, yellow. See DYING, and YELLOW.

This plant is sown in a light ground, in the month of March or September; and is ripe in June, or July.—In hot countries it is frequently dry enough when gathered; but in the colder, care must be taken to dry it.—Great circumspection is to be used, that it be not gathered before thorough ripe; as also, to prevent its getting wet when gathered.

*Weld* is much cultivated in Kent, for the use of the London dyers.—With the help of pot-ashes, it yields a deep lemon colour; but either by the smallness of the proportion put into the liquor, or by taking from it a slighter tincture, it serves to dye all colours between white and a deep yellow.—Its dye will hold well, except against urine and tartarous liquors.

**WELD**, or **WEALD**, in a chorographical sense. See WEALD.

**WELDING Heat**, a degree of heat which smiths give their iron in the forge, when there is occasion to double up the iron, and to *weld* a work in the doublings; so that the iron should grow into a lump thick enough for the purpose. See IRON, FORGING, &c.

It is also used when two bars of iron are to be joined together at the ends to make a length.

**WELL**, a hole dug under ground, below the level or surface of the water collected in the strata. See STRATA, and WATER.

It is usually of a cylindrical figure, walled with stone, and lined with mortar. See SPRING.

M. Blondel informs the royal academy of sciences of a device they use in the lower Austria, which is incompassed with the mountains of Stiria, to fill their wells with water, viz. That they dig in the earth to the depth of 20 or 25 feet,

VOL. II. No. 165.

till they come to a clammy earth, which they bore through, till the waters break forcibly out: which water, in all probability, comes from the neighbouring mountains, in subterraneous channels.—Cassini observes, that in many places of Modena, and Bologna, they make themselves wells by the same artifice.—Mr. Derham adds, that the like has been sometimes found in England, particularly in Essex.

In the *Philosophical Transactions*, we are informed by Mr. Norwood, that in Bermudas, wells of fresh water are dug within twenty yards of the sea, and even less, which arise and fall with the tides as the sea itself does.—He adds, that in digging wells in that island, they dig till they come almost to a level with the surface of the sea; and then they certainly find either fresh water or salt: if it prove fresh, yet by digging two or three feet deeper, they always come at salt-water. If it be sandy ground, they usually find fresh water; but if hard lime-stone rock, the water is salt or brackish. See FRESH Water, &c.

In the diocese of Paderborn in Westphalia, is a well which loses itself twice in 24 hours; returning always, after six hours absence, with great noise, and so forcibly, as to drive three mills not far off.—The inhabitants call it the *bolder-bourn*, q. d. the boisterous spring.—*Lay-well*, near Torbay, ebbs and flows very often every hour; though somewhat oftener in winter than in summer. Dr. Oliver observes, its flux and reflux sometimes return every minute, though sometimes not above 26, or 20 times in an hour. *Philosoph. Transact.* No 104. See TIDES.

**WELL-Water**. See the article WATER.

**WELL**, in the military art, denotes a depth which the miner sinks into the ground, from which he runs out branches or galleries, either to prepare a mine, or find out, and disappoint the enemy's mine. See MINE, SAP, &c.

**WELL-HOLE**, in building, is the hole left in a floor, for the stairs to come up through. See STAIRS.

**WEN**, a tumor, or excrescence, growing on divers parts of the body; consisting of a cystis, or bag, filled with some peculiar matter. See TUMOR, and EXCRESCENCE.

Of this, physicians usually reckon three kinds, according to the matter it is formed of, i. e. the humour contained therein.—If soft, resembling a pulp, the wen is called *atheroma*; if honey, *meliceris*; and if fuct, *steatoma*. See ATHEROMA, MELICERIS, and STEATOMA.

M. Littre, in *Mem. de l'Acad. des Sciences*, adds a fourth kind, which he calls *lipoma*; by reason, the wen is formed of soft fat.

*Wens* are all, usually, of the like colour with the rest of the body; begin from very little, and grow gradually. They are not dangerous, but frequently last a long while. Sometimes they degenerate into abscesses.—The cure is, to cut off the cystis by the root, which is always narrow.

In the *Philosophical Transactions*, we have an account of a very extraordinary wen, on the lower jaw of one Alexander Palmar, of Keith in Scotland.—It was 27 years a growing: at length its enormous bulk, and the pain it gave him, together with its emaciating him exceedingly, determined him to have it cut off.—Dr. Bowers assures us, its basis was five inches over, which should seem too large for the whole face, and that, with blood and all, it weighed one or two and twenty pounds.—Its form was spheroidal; and when measured, was 34 inches about, one way, and 28 another.—It seemed to be an atheroma, being a glandulous substance, with several big blood-vessels in it, and hair growing on it. It was as sensible as any other part.—The hæmorrhage, after cutting it off, was stopped by the vitriolic powder, and the ordinary dressing being used, a cure was completed in six weeks time.

**WENS of pearl**. See the article PEARL.

**WERE**, **WERA**, in our old law-books, signifies as much as *æstimatio capitis*, or *pretium hominis*; that is, so much as was antiently paid for killing a man. See *ÆSTIMATIO Capitis*, *HINDENI*, &c.

When such crimes were punished with pecuniary mulcts, not death; the price was set on every man's head, according to his condition and quality.—*Were suum*, id est, *pretium sue redemptionis*, his ransom. See RANSOM.

**WERELADA**, among our Saxon ancestors, the denying a homicide on oath, in order to be quit of the fine, or forfeiture called *were*. See WERE.

Where a man was slain, the price at which he was valued was to be paid to the king and his relations. For in the time of the Saxons, the killing a man was not punished by death, but by a pecuniary mulct, called *wera*. See WERGILD.

If the party denied the fact, he was to purge himself by the oaths of several persons, according to his degree and quality.—If the guilt amounted to four pounds, he was to have eighteen jurors on his father's side, and four on his mothers: if to fourteen pounds, he was to have sixty jurors. And this was called *werelada*.—*Homicidium werâ solvatur aut wereladâ negatur*.

**WERGILD**, **WEREGELD**, in our antient customs, the price of a man's head: *pretium seu valor hominis occisi, homicidii*

*cidii pretium*; which was paid partly to the king for the loss of his subject, partly to the lord whose vassal he was; and partly to the next of kin. See **WERE**.

The *wergeld* of an archbishop, and of an earl, was 15000 thrimfa's. Selden's *Titles of Honour*.— That of a bishop, or alderman, 8000; that of a general, or governour, 4000; that of a priest, or thane, 2000; that of a king, 30000; half to be paid to his kindred, and the other half to the nation.

**WEST**, *Occidens*, *Occasus*, in cosmography, one of the cardinal points of the horizon; diametrically opposite to the east. See **CARDINAL POINT**, **EAST**, &c.

*West* is strictly defined, the intersection of the prime vertical with the horizon, on that side the sun sets in. See **SETTING**.— To draw a true west-line. See **MERIDIAN**.

**WEST**, in astronomy, is chiefly used for the place in, or towards which the sun or stars sink under the horizon.— Thus, we say, the Sun, Mars, &c. are in the *west*.

The point the sun sets in, when in the equator, is particularly called the *equinoctial west*, or *point of true west*. See **EQUINOCTIAL**.

**WEST**, and **WESTERN**, in geography, are applied to certain countries, &c. situate towards the point of sun-setting with respect to certain others.

Thus, the empire of Rome, antiently, and of Germany, at present, is called the *empire of the west*, or *western empire*; in opposition to that of Constantinople, which is called the *empire of the east*. See **EMPIRE**.

The Latin or Roman church, is called the *western church*; in opposition to the Greek church. See **CHURCH**, **GREEK**, &c.

The French, Spaniards, Italians, &c. are called *western nations*, in respect to the Asiatics; and America, the *West-Indies*, in respect of the East-Indies.

**WEST-WIND**, is also called *zephyrus*, and *favonius*. See **WIND**.

**WEST-SAXONLAGE**, or the law of the West-Saxons. See **LAW**.

**WESTPHALIA-Ham.** See the article **HAM**.

**WET-GLOVER**, a dresser of the skins of sheep, lambs, goats, &c. which are slender, thin, and gentle. See **GLOVE**, **SKIN**, &c.

**WET Dock.** See the article **DOCK**.

**WEY.** See the article **WEIGH**.

**WHALE**, in astronomy, one of the constellations. See **CETUS**.

**WHALE-Bone**, a commodity procured from the *whale*, used as stiffening in stays, fans, busks, skreens, &c.

There are many kinds of *whales*; but two principal; one, retaining that name, the other called *cachalot*.— The difference consists in this, that the *cachalot* has teeth, and the *whale* properly so called, instead of teeth, has a kind of whiskers in his throat, about a span broad, and 15 feet long, ending in a sort of fringe, much like swine's bristles.

They are set in the palate, and do, in some measure, the office of teeth.— These whiskers, split and fashioned, are what we call *whalebone*.— The pizzle, or genital member of the animal, serves likewise for the same purpose.

**WHALE-Fins.** See the article **FIN**.

**WHALE-Fishery.** See the article **FISHERY**.

**WHARF**, a space on the banks of a haven, creek, or hithe; provided for the convenient loading and unloading of vessels upon. See **HAVEN**, **HITHE**, &c.

The fee paid for the landing of goods on a *wharf*, or for shipping them off, is called *wharfage*. And the person who has the oversight and direction of the *wharf*, receives *wharfage*, &c. is called the *wharfinger*. See **KEY**.

**WHARLES** of flowers, among herbalists, are rows of lesser flowers, set at certain distances about the main stalk or spike. See **FLOWER**.

**WHEAT**, *Triticum*. See the article **CORN**.

**WHEEL**, *Rota*, in mechanics, a simple machine consisting of a round piece of wood, metal, or other matter; which revolves on an axis. See **AXIS**.

The *wheel* is one of the principal mechanic powers.— It has places in most engines; in effect, it is of an assemblage of wheels, that most of our chief engines are composed.— Witness clocks, mills, &c. See **CLOCK**, **MILL**, &c.

Its form is various, according to the motions it is to have; and the use it is to answer.— By this it is distinguished into *simple*, and *dented*.

**Simple WHEELS**, are those whose circumference and axis is uniform, and which are used singly, and not combined.— Such are the *wheels* of carriages; which are to have a double motion: the one circular about their axis; the other rectilinear; by which they advance along the road, &c. which two

motions they appear to have; though, in effect, they have but one: it being impossible the same thing should move, or be agitated two different ways at the same time.

This one is a spiral motion; as is easily seen, by fixing a piece of chalk on the face of a *wheel*, so as it may draw a line on a wall, as the *wheel* moves.— The line it here traces is a just spiral, and still the more curve, as the chalk is fixed nearer the axis.— For a very nice phenomenon, in the motion of these *wheels*, see **ROTA Aristotelica**.

We shall add, that in *wheels* of this kind, the height should always be proportioned to the stature of the animal that draws or moves them.— The rule is, that the load, and the axis of the *wheels* be of the same height with the power that moves them: otherwise, the axis being higher than the beast, part of the load will lie on him; or, if it be lower, he pulls to disadvantage, and must exert a greater force. Though Stevinus, Dr. Wallis, &c. shew, that to draw a vehicle, &c. over waste, uneven places, it were best to fix the traces to the *wheels* lower than the horses breast.

The power of these *wheels* results from the difference of the radii of the axis, and circumference.— The canon is this: "As the radius of the axis is to that of the circumference, so is any power, to the weight it can sustain hereby."

This is also the rule in the axis in the peritrochio; and, in effect, the *wheel*, and the axis in peritrochio, are the same thing; only, in theory, it is usually called by the latter name, and in practice, by the former. See **AXIS in Peritrochio**.

**Dented WHEELS**, are those either whose circumference, or axis, is cut into teeth, by which they are capable of moving and acting on one another, and of being combined together.

The use of these is very conspicuous in clocks, jacks, &c. See **CLOCKWORK**, **WATCHWORK**, &c.

The power of the *dented wheel* depends on the same principle, as that of the simple one.— It is only that to the simple axis in peritrochio, which a compound lever is to a simple lever. See **LEVER**, and **AXIS**.

Its doctrine is comprised in the following canon, viz.— "The ratio of the power to the weight," in order for that to be equivalent to this, "must be compounded of the ratios of the diameter of the axis of the last *wheel* to the diameter of the first; and of the ratio of the number of revolutions of the last *wheel*, to those of the first, in the same time.— But this doctrine will deserve a more particular explication."

1°. Then, if the weight be multiplied into the product of the radii of the axis, and that product be divided by the product of the radii of the *wheels*, the power required to sustain the weight will be found.— Suppose, *e. gr.* the weight *A*, (*Tab. Mechanics*, fig. 63.) = 6000 pounds, *BC* = 6 inches, *CD* = 34 inches, *EF* = 5 inches, *EG* = 35 inches, *HI* = 4 inches, *HK* = 27 inches. Then will *BC*, *EF*, *HI* = 120; and *CD*, *EG*, *IK* = 32130. Hence the power, required to sustain the weight, will be 6000. 120 : 32130 = 22  $\frac{1}{2}$  very nearly; a small addition to which will raise it.

2°. If the power be multiplied into the product of the radii of the *wheels*, and the factum be divided by the product of the radii of the axis; the quotient will be the weight, which the power is able to sustain.— Thus, if the power be 22  $\frac{1}{2}$  of a pound, the weight will be 6000 pounds.

3°. "A power and a weight being given, to find the number of *wheels*, and in each *wheel*, so, as that the radius of the axis, to the radius of the *wheel*: so, as that the power being applied perpendicularly to the periphery of the last *wheel*, may sustain the given weight."

Divide the weight by the power: resolve the quotient into the factors which produce it.— Then will the number of factors, be the number of *wheels*; and the radii of the axes will be to the radii of the *wheels*, as unity to the several *wheels*.— Suppose, *e. gr.* a weight of 3000 pounds, and a power of 60, is 500, which resolves into these factors, 4. 5. 5. 5. Four *wheels* are to be made, in one of which, the radius of the axis is to be the radius of the *wheel*, as 1 to 4.— In the rest, as 1 to 5.

4°. If a power move a weight by means of two *wheels*, the revolutions of the slower *wheel*, are to those of the swifter, as the periphery of the swifter axis, is to the periphery of the *wheel* that catches on it.

Hence, 1°. the revolutions are as the radius of the axis *FE*, to the radius of the *wheel* *DC*.— 2°. Since the number of teeth in the axis *FD*, is to the number of teeth in the circumference of the *wheel* *M*, as the circumference of that, to the circumference of this: the revolutions of the slower *wheel* *M*, are to the revolutions of the swifter *N*, as the number of teeth in the axis, to the number of teeth in the *wheel* *M* it catches into.

5°. If the factum of the radii of the *wheels* *GD*, *DC* be multiplied into the number of revolutions of the slowest *wheel* *M*; and the product be divided by the factum of the radii of the axes which catch into them, *GH*, *DE*, &c. the quotient will be the number of revolutions of the swiftest wheel

*wheel* O. *E. gr.* If  $GE=8$ ,  $DC=12$ ,  $GH=4$ ,  $DE=3$ , and the revolution of the *wheel* M be one; the number of revolutions of the *wheel* O will be 8.

6°. If a power move a weight by means of divers *wheels*, the space passed over by the weight, is to the space of the power, as the power to the weight.—Hence, the greater the power, the faster is the weight moved; and vice versa.

7°. The spaces passed over by the weight and the power, are in a ratio compounded of the revolutions of the slowest *wheel*, to the revolutions of the swiftest; and of the periphery of the axis of that, to the periphery of this.—Hence, since the space of the weight and the power are reciprocally as the sustaining power to the weight; the power that sustains a weight, will be to the weight, in a ratio compounded of the revolutions of the slowest *wheel*, to those of the swiftest, and of the periphery of the axis of that, to the periphery of this.

8°. “The periphery of the axis of the slowest *wheel*, with the periphery of the swiftest *wheel*, given; as also, the ratio of the revolutions of the one, to those of the other: to find the space which the power is to pass over, while the weight goes any given length.”

Multiply the periphery of the axis of the slowest *wheel*, into the antecedent term of the ratio, and the periphery of the swiftest *wheel*, into the consequent term; and to these two products, and the given space of the weight, find a fourth proportional: this will be the space of the power.—Suppose, *e. gr.* the ratio of the revolutions of the slowest *wheel*, to those of the swiftest, to be as 2 to 7; and the space of the weight 30 feet: and let the periphery of the axis of the slowest *wheel*, be to that of the swiftest, as 3 to 8. The space of the power will be found 280.

9°. “The ratio of the peripheries of the swiftest *wheel*, and of the axis of the slowest; together with the ratio of their revolutions, and the weight, being given: to find the power able to sustain it.”

Multiply both the antecedents, and the consequents of the given ratios into each other: and to the product of the antecedents, the product of the consequents, and the given weight, find a fourth proportional: that will be the power required.—Suppose, *e. gr.* the ratio of the peripheries 8:3. That of the revolutions 7:2; and the weight 2000: the power will be found 2147.—After the same manner may the weight be found; the power and the ratio of the peripheries, &c. being given.

10°. “The revolutions the swiftest *wheel* is to perform, while the slowest makes one revolution, being given; together with the space the weight is to be raised, and the periphery of the slowest *wheel*; to find the time that will be spent in raising it.”

Say, as the periphery of the axis of the slowest *wheel* is to the space of the weight given; so is the given number of revolutions of the swiftest *wheel*, to a fourth proportional; which will be the number of revolutions, performed while the weight reaches the given height.—Then, by experiment, determine the number of revolutions the swiftest *wheel* performs in an hour; and, by this, divide the fourth proportional found before.—The quotient will be the time spent in raising the weight.

**WHEELS** of a clock, &c. are the crown *wheel*, contrat *wheel*, great *wheel*, second *wheel*, third *wheel*, striking *wheel*, detent *wheel*, &c. See **CLOCK**, and **WATCH**.

**WHEELS** of coaches, waggons, &c.—In the *Philosophical Transactions*, we have some experiments, shewing the advantages of high *wheels* in carriages of all kinds: the results of the experiments amount to this:

1°. That, four *wheels* of 5½ inches high, viz. one half of the ordinary height of the *wheels* of a waggon, draw a weight of 50½ lb. averdupoise up an inclined plane, with less power by six ounces, than two of them matched with two smaller ones of 4½ inches height.

2°. That any vehicle might be much more easily drawn in rough ways, if the fore *wheels* were as high as the hind *wheels*, and the thills fixed under the axis.

3°. That such a vehicle would likewise be drawn more easily where the *wheels* cut in clay, sand, &c.

4°. That high *wheels* would not cut so deep as low *wheels*.

5°. That low *wheels* are indeed best for turning in a narrow compass.

**Potter's WHEEL.** See the article **POTTERY**.

**Aristotle's WHEEL.**

**Measuring WHEEL.**

**Persian WHEEL.**

**Water WHEEL.**

**WHEEL** is also the name of a kind of punishment, which great criminals are put to in divers countries. See **PUNISHMENT**. In France, their assassins, parricides, and robbers on the highway, are condemned to the *wheel*, i. e. to have their bones first broke with an iron bar on a scaffold, then to be exposed, and left to expire on the circumference of a *wheel*.—In Germany, they break their bones on the *wheel* itself.

This cruel punishment was unknown to the antients; as is

observed by Cujas.—It is not certain who was the inventor.—Its first introduction was in Germany. It was but rarely practised any where else, till the time of Francis I. of France; who, by an edict of the year 1534, appointed it to be inflicted on robbers on the highway. Richelet dates the edict in the year 1538, and quotes Brodæus, *Miscell. L. II. c. 10*.

**WHEEL**, in the military art, is the word of command, when a battalion or squadron is to alter its front, either one way or the other. See **EVOLUTION**, **QUARTER-Wheeling**, &c. To *wheel to the right*, the man in the right angle is to turn very slowly, and every one to *wheel* from the left to the right, regarding him as their centre: and vice versa, when they are to *wheel to the left*.

When a division of men are on the march, if the word be *wheel to the right*, or *to the left*, then the right or left-hand man keeps his ground, turning only on his heel, and the rest of the rank move about quick, till they make an even line with the said right or left-hand man.

Squadrons of horse *wheel* much after the same manner.

**WHEEL-Barometer.** See the article **BAROMETER**.

**WHEEL-Fire**, among chymists, a fire used for fusing of metals; properly called *ignis rotæ*. See **FUSION**, **METAL**, &c. It is a fire which covers or encompasses the crucible, coppel, or melting-pot quite over; a-top, as well as around the sides, See **FIRE**.

**WHERLICOTES**, a sort of open chariots, of the antient Britons invention, used by persons of quality, before the invention of coaches. See **COACH**, **CARR**, &c.

**WHERRY.** See the articles **VESSEL**, **BOAT**, &c.

**WHETSTONE**, *Car*, a sort of stone of a lax composition, and coarse grain; serving for the whetting or sharpening knives, and other tools upon. See **STONE**, and **HONE**.

**WHEY**, the serum or watery part of milk. See **MILK**, and **SERUM**.

**WHIFFLER**, of a company in London, a young freeman, who goes before, and waits on the company on occasions of public solemnity. See **COMPANY**.

**WHIGS**, a party or faction in England, opposite to the *tories*. See **FACTION**, **TORY**, &c.

The origin of the names of these two mighty factions is very obscure.—If some little trivial circumstance, or adventure which escapes the knowledge of mankind, give the name to a party, which afterwards becomes famous, posterity labours in vain to find the original of such names: it searches the sources, forms conjectures, invents reasons, and sometimes meets the truth, but always without knowing it assuredly.

Thus, in France, the Calvinists are called *Huguenots*; yet no body was ever able certainly to assign the cause of that appellation. See **HUGUENOT**.

*Whig* is a Scottish, and some say, too, an Irish word, literally signifying *whew*.—*Tory* is another Irish word, signifying a robber, or highwayman.

Now, under the reign of king Charles the second, while his brother, then duke of York, was obliged to retire into Scotland, there were two parties formed in that country.—That of the duke, which was strongest, persecuted the other, and frequently reduced them to fly into the mountains and woods, where those unhappy fugitives had often no other subsistence for a long time, but cows milk.—Hence, their adversaries they called *tories*, *q. d.* robbers; and the *tories* upbraiding them with their unhappiness, from the milk whereof they lived, called them *whigs*.—From Scotland the two names came over with the duke into England.

Others give the origin and etymology of the two words thus:—During the unhappy war which brought king Charles I. to the scaffold, the partizans of that prince were at first called *cavaliers*; and those of the parliament, *round-heads*.—Now, *tory* was a name for a kind of banditti in Ireland, who sheltered themselves in the mountains, and the islands formed by the bogs; as, then, the king's enemies charged him with favouring the rebellion in Ireland, which broke out at that time, they changed the name *cavalier* into that of *tory*.—And these last, to be even with their enemies, who were strictly leagued with the Scots, changed *round-heads* for *whigs*, the name of a sort of enthusiasts in Scotland, who living in the open fields and woods, fed much on milk.—*Dissert. de M. Rapin Thoyras sur les whigs & les tories. Haye An. 1717.*

**WHINE**, a hunting term, used in respect of the cry of an otter. See **HUNTING**.

**WHIP**, or **WHIP-STAFF**, in a ship, a piece of timber in form of a strong staff, fastened into the helm, for the steersman, in small ships, to hold in his hand; thereby to move the rudder, and direct the ship.—See *Tab. Ship. fig. 2. n. 103*; see also the articles **HELM**, and **STEERING**.

**WHIP-Grafting.** } See the article } **ENGRAFTING**.

**WHIP-Saw.** } See the article } **WHIP-SAW**.

**WHIPPER.** See **FISHING**.

**WHIPPING**, a term used by anglers, when they fasten a line to the hook, or rod. See **ANGLING**.

The word is also taken for the casting in of the hook, and drawing it gently on the water.

**WHIPT**

**WHIPT Syllabus.** See the article SYLLABUS.

**WHIRLPOOL**, an eddy, vortex, or gulph, where the water is continually turning round. See GULPH, EDDY, VORTEX, &c.

**WHIRL-WIND**, a wind that rises suddenly, is exceedingly rapid, and impetuous, when risen, but soon spent. See WIND, and HURRICANE.

There are divers sorts of *whirl-winds*, distinguished by their peculiar names; as the *prester*, *typho*, *turbo*, *exhydria*, and *cenephias*.

The *prester* is a violent wind, breaking forth with flashes of lightning.— This is rarely observed; scarce ever without the *cenephias*.— Seneca says, it is a *typho*, or *turbo* kindled or ignited in the air. See PRESTER.

The *cenephias* is a sudden and impetuous wind, breaking out of some cloud; frequent in the Æthiopic sea, particularly about the Cape of Good Hope.— The seamen call them *travados*.

The *exhydria* is a wind bursting out of a cloud, with a great quantity of water.— This only seems to differ in degree from the *cenephias*, which is frequently attended with showers.

A *typho*, or *vortex*, most properly called a *whirl-wind*, or *hurricane*, is an impetuous wind, turning rapidly every way, and sweeping all round the place.— It frequently descends from on high.— The Indians call it *orancan*, the Turks, &c. *oliphant*.— It is frequent in the eastern ocean, chiefly about Siam, China, &c. and renders the navigation of those parts exceeding dangerous. See VORTEX, HURRICANE, SPOUT, &c.

**WHISPERING.** See HEARING, ATTENTION, &c.

**WHISPERING-Places** depend on this principle, that the voice being applied to one end of an arch, easily rolls to the other. See SOUND, ARCH, &c.

Accordingly, all the contrivance in a *whispering-place* is, that near the person who whispers there be a smooth wall, arched either cylindrically, or elliptically.— A circular arch will do, but not so well. See PHONICS.

Places famed for the conveyance of *whispers*, are the prison of Dionysius at Syracuse, which increased a soft *whisper* to a noise, the clap of one's hand to the sound of a cannon, &c.— The aqueducts of Claudius, which carried a voice sixteen miles; and divers others, enumerated by Kircher in his *Phonurgia*.

The most considerable in England, are, the dome of S. Paul's, London, where the ticking of a watch may be heard from side to side; and a very easy *whisper* be sent all round the dome.— This, Mr. Derham found to hold not only in the gallery below, but above upon the scaffold, where a *whisper* would be carried over one's head round the top of the arch, though there be a large opening in the middle of it into the upper part of the dome.

The famous *whispering-place* in Gloucester cathedral, is no other than a gallery above the east end of the choir, leading from one side thereof to the other.— It consists of five angles, and six sides, the middlemost of which is a naked window; yet two *whisperers* hear each other at the distance of twenty-five yards.

**WHITE**, one of the colours of natural bodies. See COLOUR.

*White* is not so properly said to be any one colour, as a composition of all the colours; it being demonstrated by Sir Isaac Newton, that those bodies only appear *white*, which reflect all the kinds of coloured rays alike. See WHITENESS.

Hevelius affirms it as a thing most certain, that in the northern countries, animals, as hares, foxes, bears, &c. become *white* in the winter-time; and in summer resume their natural colours. See HAIR.

Black bodies are found to take heat sooner than *white* ones; by reason the former absorb or imbibe rays of all kinds and colours, and the latter reflect all. See BLACKNESS.

Thus, black paper is sooner put into flame by a burning-glass, than *white*; and black clothes hung up by the dyers in the sun, dry sooner than *white* ones. See HEAT.

WHITE Arsenic.	} See the article	ARSENIC.
WHITE Ashes.		ASHES.
WHITE Cinnamon.		CINNAMON.
WHITE Copperas.		COPPERAS.
WHITE Cordage.		CORDAGE.
WHITE Diachylon.		DIACHYLON.
WHITE Eagle.		EAGLE.

**WHITE of the Eye**, denotes the first tunic or coat of the eye, called *albuginea*, and *conjunctiva*, because serving to bind together, or inclose the rest. See CONJUNCTIVA, &c.

WHITE Flag.	} See the article	FLAG.
WHITE Frost.		FROST.

**WHITE-Friars**, a name common to several orders of monks, from their being clothed in a *white* habit. See MONK, HABIT, &c.

Such are the regular canons of S. Augustin, the Premonstratenses, and Bernardins. See AUGUSTIN, PREMONSTRATENSES, &c.

**WHITE Glasses.** See the article GLASS.

**WHITE-hart Silver**, *candidi cervi Argentum*, a tribute or mulct

paid into the exchequer, out of certain lands in or near the forest of *White-hart* in *Dorsetshire*; which has continued from Henry the third's time, who first imposed it upon Thomas de la Linde, and others, for killing a beautiful *white hart*, which that king had purposely spared in hunting.

**WHITE Hellebore.** See the article HELLEBORE.

**WHITE Lead**, is a sort of rust of lead; or lead dissolved with vinegar; much used by the painters. See LEAD.

It is prepared two ways:— either by reducing the lead into thin laminæ, steeping them in strong vinegar, and every ten days scraping off the rust formed on the surface; and repeating this till the lead be quite consumed.

Or, by rolling the laminæ into cylinders like sheets of paper, only so as that there be a little space left between the several folds or turns.— These laminæ they suspend in the middle of earthen pots, at the bottom of which is vinegar.— The pots being well closed, are buried in a dunghil for thirty days; after which, being opened, the lead is found, as it were, calcined, and reduced into what they call *cerusse*, or *white lead*, to be broke into pieces, and dried in the sun.

It is used both in painting in oil and in water-colours, and makes a good colour in each.— But it is somewhat dangerous both in the grinding and using it, as being a rank poison. See COLOUR.

Of this *white lead* it is that the paint used by the ladies, called *cerufs*, is made. See CERUSS.

**WHITE Line**, among printers, a void space greater than usual, left between two lines. See PRINTING.

**WHITE Line**, in anatomy. See the article LINEA Alba.

**WHITE Linen**, is cloth of hemp, or flax, bleached by divers lyes, and waterings on the ground. See BLEACHING.

**WHITE Meats**, include milk, butter, cheese, white-pots, custards, and other foods coming of milk, or eggs. See MILK, FOOD, &c.

**WHITE Money**, *Libra alba*. See the article MONEY.

**WHITE Mortar.** } See the article { MORTAR.

**WHITE Order.** } { ORDER.

**WHITE Paper**, is that intended for writing, printing, &c. in contradistinction to *brown paper*, *marbled paper*, *blotting paper*, &c. See PAPER.

**WHITE Pepper**, is black pepper blanched, or whitened, by shelling off its upper skin. See PEPPER.

**WHITE-Pot**, denotes milk or cream baked with the yolks of eggs, fine bread, sugar, and spice, in an earthen pot. The cooks furnish us with a variety of dishes under this form and denomination, *Norfolk white-pot*, *Westminster white-pot*, *rice white-pot*, &c.

**WHITE Precipitate.** See the article MERCURY.

**WHITE Rent**, a rent or duty of 8 *d.* payable yearly, by every tinner in the county of Devon, to the duke of Cornwall. See QUIT Rent.

**WHITE Salt**, is common, or sea-salt, dried and calcined by the fire, so as not to leave any moisture therein.— The chymists call it *decrepitated salt*.

There are some salts naturally *white*; and others that need to be *whitened*, either by dissolving and purifying them in fair water, which is afterwards evaporated; or by means of fire; or by the sun. See SALT.

**WHITE Sauce**, a sort of sauce made of blanched almonds, and the breast of a capon, pounded together with cloves, cinnamon, &c.— We also hear of *white broth*, being a sort of broth enriched with sack, and spices, having blanched almonds scraped into it, and the whole thickened with the yolks of eggs, &c.

**WHITE Soap.** See the article SOAP.

**Spanish WHITE**, is a kind of fucus used by the ladies to *whiten* the complexion, and hide the defects thereof.— It is made of tin-glass dissolved in spirit of nitre, and precipitated into a very fine powder, by means of salt-water. See BIS-MUTH, &c.

WHITE Spurs.	} See the article	ESQUIRE.
WHITE Star.		STAR.
WHITE Sugar.		SUGAR.
WHITE Tartar.		TARTAR.
WHITE Varnish.		VARNISH.
WHITE Vitriol.		VITRIOL.

**WHITE Wax**, is yellow wax blanched, and purified by the sun and dew. See WAX.

**WHITE Wine**, is that of a clear, bright, transparent colour, bordering on *white*.— It is thus called, to distinguish it from the red wines, or clarets.

The generality of *white wines* are made from white grapes; though there are some from black ones. See WINE.

**WHITENESS**, *Albedo*, the quality which denominates a body *white*. See WHITE, and COLOUR.

Sir Isaac Newton shews, that *whiteness* consists in a mixture of all the colours; and that the light of the sun is only *white*, because consisting of all colours. See RAY.

From the multitude of rings of colours, which appear upon compressing two prisms, or object-glasses of telescopes together, it is manifest, that these do so interfere and mingle with one another at last, as, after eight or nine reflexions, to dilute

dilute one another wholly, and constitute an even and uniform *whiteness*: whence, as well as from other experiments, it appears, that *whiteness* is certainly a mixture of all colours; and that the light which conveys it to the eye, is a mixture of rays indued with all those colours. See **LIGHT**.

The same author shews, that *whiteness*, if it be most strong and luminous, is to be reckoned of the first order of colours; but if less, as a mixture of the colours of several orders: of the former sort he reckons white metals; and of the latter, the *whiteness* of froth, paper, linen, and most other white substances.—And as the white of the first order is the strongest that can be made by plates of transparent substances, so it ought to be stronger in the denser substances of metals, than in the rarer ones of air, water, and glass.

Gold or copper mixed either by fusion, or amalgamation, with a very little mercury, with silver, tin, or regulus of antimony, becomes white; which shews, both that the particles of white metals have much more surface, and therefore are smaller than those of gold or copper; and also, that they are so opaque, as not to suffer the particles of gold or copper to shine through them.—And as that author doubts not, but that the colours of gold and copper are of the second or third order, therefore the particles of white metals cannot be much bigger than is requisite to make them reflect the white of the first order. See **PARTICLE**.

**WHITENING.**

**WHITENING of Hair.** } See the article { **BLEACHING.**  
**WHITENING of Wax.** } **HAIR.**  
**WHITES, in medicine.** See the article **FLUOR ALBUS.**

**WHITLOW, or WHITLOE,** the popular name for what the physicians commonly call *panaris*.

**WHITSUN Paribings.** See the article **PENTECOSTALS.**

**WHITSUNTIDE,** the fiftieth day after Easter. See **EASTER, FEAST, &c.**

The season properly called *Pentecost*, is popularly called *Whitsuntide*; some say, because in the primitive church, those who were newly baptized came to church between Easter and Pentecost in white garments.

*Whitsunday* always falls between the 9th of May, and the 14th of June, exclusive. See **PENTECOST.**

**WHOLE, Totum,** in arithmetic, &c. See **PART, DIVISION, PARTITION, &c.**

**WHOLE Measure.** } See the article { **MEASURE.**  
**WHOLE Number.** } **NUMBER.**  
**WHOLE Sine.** } **SINE.**

**WHOODINGS, or HOODINGS,** a sea term, used for planks joined and fastened along the ship's sides into the stem.

**WHORE.** See **COURTESAN, HARLOT, CONCUBINE, &c.**

**WHORLBAT, or HURLBAT,** a kind of gauntlet, or leathern strap laden with plummets; used by the ancient Romans in their solemn games, and exercises; and by them called *castus*. See **CÆSTUS.**

**WHUR,** in falconry, denotes the fluttering of partridges, or pheasants, as they rise.

**WIC,** denotes a place on the sea-shore, or on the bank of a river—though, in the original Saxon, it more properly signifies a *street, village, or dwelling-place*; also a *castle*. See **WYKE.**

We often meet with *wic* in the Saxon writers, as a termination of the name of a town, which had a compleat name without it:—as, *Lunden-wic*; that is, London town; which signifies no more than *London*:—In the Saxon *Annals*, it is mentioned, that king Æthelbert made Mellitus bishop of *Lunden-wic*.—So, Ipswich is written in some old charters, *villa de Gippo*, and sometimes *villa de Gippo wico*; which is no variance, but the same thing; for *Gipps* is the compleat name, and *Gipp-wic* is Gipps town.

**WICKER,** a twig of the osier shrub.

**WICKET,** of the French, *guichet*, a little door within a gate; or a hole in a door, through which to view what passes without. See **DOOR.**

**WICKLIFFISTS, or WICKLIFFITES,** a religious sect, who had their rise in England, and their name from their leader *John Wickliff*, a professor of divinity in the university of Oxford. See **LOLLARD.**

To that immortal author it is we owe the first hint of the great reformation, effected 200 years after him. See **REFORMATION.**

*Wickliff* maintained, that the substance of the sacramental bread and wine still remained such after consecration.—He also opposed the doctrine of purgatory, indulgences, the invocation of saints, and the worship of images. See **TRANSSUBSTANTIATION, PURGATORY, &c.**

He made an English version of the Bible; and composed two large volumes, called *Aletheia*; that is, *truth*; which was the source whence John Hus first learned most of his doctrines. See **HUSSITES.**

The archbishop of Canterbury called a council against *Wickliff*, and he was condemned therein; but the good Reformer set the condemnation at nought.—After this, king Richard

VOL. II. NO. 165.

banished him out of England; but he was afterwards recalled, and died in his own country in the year 1384.

Forty years afterwards, his doctrines, and the adherers thereto, were condemned by the council of Constance; in consequence of which, his bones were dug up, and the council condemned him of forty errors.

**WIDOW, Vidua,** a woman that has lost her husband. See **WOMAN, WIFE, HUSBAND, &c.**

Some also use the term **WIDOWER**, for a man who has lost his wife.—Marriage with a *widow*, is a kind of bigamy in the eye of the canon law. See **BIGAMY.**

**WIDOW of the King,** was she, who, after her husband's death, being the king's tenant in capite, was driven to recover her dower by the writ *de Dote Assignanda*; and could not marry again without the king's consent.

**WIDOW Bench,** in the county of Sussex, is that share which a *widow* is allowed of her husband's estate, besides her jointure. See **BENCH.**

**WIECK.** See the article **WEEK.**

**WIFE, Uxor,** a married woman; or one joined with, and under the protection of a husband. See **WOMAN, MARRIAGE, and HUSBAND.**—See also **MATRON, &c.**

A *wife*, in our English law, is termed *feme covert*; and, in the judgment of the law, is reputed to have no will, as being supposed entirely under, and subject to that of her husband: *uxor fulget radiis mariti*. See **COVERT, and COVERTURE.**

If any goods or chattels be given her, they all immediately become her husband's.—She cannot let, sell, give away, or alienate any thing, without her husband's consent.—Her very necessary apparel is not her's in property.—All her personal chattels which she held at her marriage, are so much her husband's, that after his death they shall not return to her, but go to the executor, or administrator of her husband; except only her parapherna, or præter-dotalia, being her necessary apparel; which, with the consent of her husband, she may demise by will. See **PARAPHERNALIA.**

The *wife* can make no contract without her husband's consent; and in all law matters, *sine viro respondere non potest*.

The law supposes in the husband, the full power over his *wife*, as over his child or servant; and therefore he must answer for all her faults, and trespasses.

If a *wife* bring forth a child during her husband's absence, though of many years; yet if he lived all the time *inter quatuor maria*, within the island, he must father the child; and the child, if first born, shall inherit.

If a *wife* bring forth a child begot by a former husband, or any other person, before marriage, but born after marriage with another man; this latter must own the child; and that child shall be his heir at law.

The *wife*, after her husband's death, having no jointure settled before marriage, may challenge the third part of his yearly rents of land, during her life; and within the city of London, a third part of all her husband's moveables for ever.

The *wife* partakers of the honours, and condition of her husband; but none of the *wife's* dignities come, by marriage, to her husband.

Yet, the husband, for getting his *wife* with child, which must appear by its being born alive, shall have all his *wife's* lands for life. See **COURTESY.**

The English laws are generally esteemed by foreigners, as very hard, in respect of the women; and yet Chamberlayne is of a very different sentiment, asserting, that the condition of *wives* in England, is better than in any other country.

Tertullian has two books, on the ornaments and attire of *wives*.—In the second he labours to prove, that a Christian *wife* cannot, in conscience, endeavour to please by her beauty, which she knows to be naturally liable to raise loose desires; and that she ought not only to avoid all affected beauty, but even to conceal and cover her natural beauty.

**Mid-WIFE, Obstetrix.** See **DELIVERY, FOETUS, SECUNDINE, VIRGINITY, &c.**

**WILDERNESS,** see **DESART, GROVE, LABYRINTH, &c.**

**WILD-FIRE, Ignis Grægalis, or Græcus.** See **FIRE.**

**WILD-FIRE Arrows,** such as are trimmed with *wild-fire*, and shot burning, to stick in the sails or rigging of ships in a fight.

**WILD-Fire,** also denotes a disease in cattle; which is infectious, deadly, and even imputed incurable. See **MURRAIN.**

**WILD-Honey.** See the article **HONEY.**

**WILL, Voluntas,** is usually defined a faculty of the mind, whereby it embraces or rejects any thing represented to it, as good or evil by the judgment. See **SOUL, FACULTY, GOOD, EVIL, &c.**

Others will have it to be the mind itself, considered as embracing or refusing; adding, that as the understanding is nothing

thing else but the soul, considered as *perceiving*; so the *will* is nothing else but the soul considered as *willing*, &c. See SOUL, UNDERSTANDING, &c.

Mr. Locke more intelligibly defines the *will*, a faculty which the soul has of beginning, or forbearing, continuing or ending several actions of the mind, and motions of the body, barely by a thought or preference of the mind, ordering, or as it were, commanding the doing, or not doing, such and such a particular action.— This power the mind has, to order the consideration of any idea, or the forbearing to consider it; or to prefer the motion of any part of the body to its rest, and vice versa, is what we call the *will*. See POWER.

The actual exercise of that power, is what we call *volition*, or *willing*; and the doing or forbearing any action consequent on such order of the mind, is called *voluntary*. See VOLUNTARY, &c.

Father Malebranche lays it down, that the *will* is that to the soul, which motion is to the body; and argues that as the author of nature is the universal cause of all the motions in matter, so he is of all the inclinations in the mind: and that as all motions are direct, unless their course be diverted and changed by some foreign cause; so all inclinations are right, and could have no other end, but the enjoyment of truth and goodness, were there not some foreign cause, to determine the natural impression to evil ends. See NATURAL Inclination.

Accordingly, he defines *will* to be the impression or natural motion, which carries us towards good indeterminately, and in the general; and the power the mind has, to direct this general impression towards any particular object that pleases it, is what he calls *liberty*. See LIBERTY, and NECESSITY.

Aristotle distinguishes two kinds of acts of the *will*; viz. *Budon*, *willing*, *volition*; and *apocapsion*, *election*.— The first, that employed about the ultimate end; the latter, about the means.

The schoolmen also distinguish the actions of the *will*, into *elicit* and *commanded*.— Elicit acts, *actiones elicite*, are those immediately produced by the *will*, are really inherent therein; such are *willing*, and *nilling*.— Commanded acts, *actiones imperate*, are effects produced by other powers, *v. gr.* the sensitive, intellectual, or locomotive powers, at the command or instigation of the *will*— As, to *follow*, *stay*, *fight*, *fly*, &c. See ACT, ACTION, &c.

But others will have the former kind properly to belong to the understanding; and only the latter to the *will*.

The word *will* is taken in three senses; 1°. For the power, or faculty of *willing*; in which sense it is, we have considered it above.— 2°. For the act, or exercise of this power; as, when we say, no man *wills* his own destruction.—

3°. For a habit, or a constant disposition and inclination to do any thing.— In which sense, justice is defined a constant *will*, to give every one what belongs to him: *justitia est constans & perpetua voluntas jus suum unicuique tribuendi*. *Instit.* Justin.

*Antecedent WILL*. See the article ANTECEDENT.

*Free WILL*. See LIBERTY, and FREEDOM.

*WILL, Last WILL, or Testament*, in law, a solemn act, or instrument, whereby a person declares his mind and intention as to the disposal of his goods, effects, &c. after his death. See TESTAMENT.

*Wills* are of two kinds: A *will in writing*— And a *will by word of mouth* only, called a *nuncupative will*; which being proved by three or more witnesses, may be of as good force as that in writing; except for lands, which are only devisable by testament in writing, during the life of the testator. See NUNCUPATIVE.

*Probate of a WILL*. See the article PROBATE.

*WILL with a wisp*, a meteor known among the people under this name; but more usually among authors, under that of *ignis fatuus*. See IGNIS FATUUS.

*WIMPLE*, of the Dutch *wimpel*, a muffler, or plaited linen cloth, which nuns wear to cover their necks and breast.

The word is also sometimes used for a streamer, or flag. See FLAG, &c.

*WIN*, in the beginning or end of the names of places, signifies that some great battle was fought, or a victory gained there.— The word is formed from the Saxon *winman*, to win or overcome.

*WIND, Ventus*, a sensible agitation of the air, whereby a large quantity thereof flows out of one place, or region, into another. See AIR.

The *winds* are divided into *perennial*, *stated*, and *variable*— They are also divided into *general*, and *particular*.

*Perennial, or constant WINDS*, are such as always blow the same way.— Of these we have a very notable one between the two tropics blowing constantly from east to west; called the *general trade-wind*. See TRADE-Wind.

*Stated, or periodical WINDS*, are such as constantly return at certain times.— Such are the sea and land-breezes, blow-

ing from sea to land in the evening; and from land to sea in the morning. See BREEZE.

Such also are the *shifting*, or *particular trade-winds*, which, for certain months of the year, blow one way, and the rest of the year, the contrary way. See MONSOON.

*Variable, or erratic WINDS*, are such as blow now this, now that way; are now up, now hushed, without any rule or regularity, either as to time or place.

Such are all the *winds* observed in the inland parts of England, &c. Though several of these claim their certain times of the day.— Thus, the *west-wind* is most frequent about noon; the *south-wind* in the night; the *north* in the morning, &c. See WEATHER.

*General WIND*, is such a one, as at the same time blows the same way, over a very large tract of ground, almost all the year.— Such only is the *general trade-wind*.

But even this has its interruptions: for, 1°. At land it is scarce sensible at all, as being broke by the interposition of mountains, valleys, &c. 2°. At sea, near the shore, it is disturbed by vapours, exhalations, and particular *winds*, blowing from landward; so that it is chiefly considered as *general*, only at mid-sea: Where, 3°. It is liable to be disturbed by clouds driving from other quarters.

*Particular WINDS* include all others, excepting the general *trade-winds*.

Those peculiar to one little canton, or part, as called *topical*, or *provincial-winds*.— Such is the *north-wind*, on the western side of the Alps, which does not blow above one or two leagues lengthwise, and much less in breadth: such also is the *pontias* in France, &c.

*Physical cause of WINDS*.— Some philosophers, as Des Cartes, Rohault, &c. account for the general *wind*, from the diurnal rotation of the earth; and from this general *wind* derive all the particular ones.— The atmosphere, say they, investing the earth, and moving round it; that part will perform its circuit soonest, which has the smallest circle to describe: The air therefore, near the equator, will require a somewhat longer time to perform its course in, from west to east, than that nearer the poles.— Thus, as the earth turns eastward, the particles of the air near the equinoctial, being exceeding light, are left behind; so that, in respect of the earth's surface, they move westwards, and become a constant easterly *wind*.

This opinion seems confirmed by this, that these *winds* are found only between the tropics, in those parallels of latitude where the diurnal motion is swiftest.— But the constant calms in the Atlantic sea, near the equator, the westerly *winds* near the coast of Guinea, and the periodical westerly monsoons, under the equator in the Indian seas, declare the insufficiency of this hypothesis.

Besides, the air being kept close to the earth by the principle of gravity, would, in time, acquire the same degree of velocity, that the earth's surface moves with, as well in respect of the diurnal rotation, as of the annual about the sun, which is about thirty times swifter.

Dr. Halley, therefore, substitutes another cause, capable of producing a like constant effect, not liable to the same objections, but agreeable to the known properties of the elements of water and air, and the laws of the motion of fluid bodies.— Such a one is the action of the sun's beams upon the air and water, as he passes every day over the ocean, considered together with the quality of the soil, and the situation of the adjoining continents.

According to the laws of statics, the air, which is less rarefied or expanded by heat, and consequently more ponderous, must have a motion towards those parts thereof, which are more rarefied, and less ponderous, to bring it to an equilibrium; also the presence of the sun, continually shifting to the westward, that part towards which the air tends, by reason of the refraction made by his greatest meridian heat, is, with him, carried westward; and, consequently, the tendency of the whole body of the lower air is that way.

Thus a general easterly *wind* is formed, which being impressed upon the air of a vast ocean, the parts impel one the other, and so keep moving till the next return of the sun, whereby so much of the motion, as was lost, is again restored; and thus the easterly *wind* is made perpetual.

From the same principle it follows, that this easterly *wind* should, on the north side of the equator, be to the northwards of the east, and in south latitudes, to the southwards thereof; for near the line, the air is much more rarefied, than at a greater distance from it; because the sun is twice in a year vertical there; and at no time distant above 23½ degrees: at which distance, the heat being as the sine of the angle of incidence, is but little short of that of the perpendicular ray; whereas under the tropics, though the sun stay longer vertical, yet he is a long time 47 degrees off; which is a kind of winter wherein the air so cools, as that the summer heat cannot warm it to the same degree with that under the equator. Wherefore, the air towards the northward and southward, being less rarefied than that in the middle, it

it follows, that from both sides, it ought to tend towards the equator. See **HEAT**.

This motion compounded with the former easterly wind, accounts for all the phenomena of the general trade-winds; which, if the whole surface of the globe was sea, would undoubtedly blow quite round the world, as they are found to do in the Atlantic, and the Ethiopic oceans. But seeing so great continents do interpose, and break the continuity of the oceans, regard must be had to the nature of the soil, and the position of the high mountains, which are the two principal causes of the variation of the wind, from the former general rule: for if a country lying near the sun prove to be flat, sandy, and low land; such as the deserts of Lybia are usually reported to be; the heat occasioned by the reflections of the sun's beams, and the retention thereof in the sand, is incredible to those who have not felt it; whereby the air being exceedingly rarefied, it is necessary that the cooler, and more dense air, should run thitherwards to restore the equilibrium.

This is supposed to be the cause, why near the coast of Guinea, the wind always sets in upon the land, blowing westerly, instead of easterly; there being sufficient reason to believe, that the inland parts of Africa are prodigiously hot, since the northern borders thereof were so intemperate, as to give the ancients cause to conclude that all beyond the tropics was uninhabitable by excess of heat. See **TORRID, and ZONE**. From the same cause it happens, that there are so constant calms in that same part of the ocean called the rains; for this tract being placed in the middle, between the westerly winds blowing on the coast of Guinea, and the easterly trade-winds, blowing to the westwards thereof; the tendency of the air here, is indifferent to either, and so stands in equilibrio between both: and the weight of the incumbent atmosphere, being diminished by the continual contrary winds blowing from hence, is the reason that the air here holds not the copious vapour it receives, but lets it fall in so frequent rains. See **RAINS**.

But, as the cool and dense air, by reason of its greater gravity, presses upon the hot and rarefied, it is demonstrable, that this latter must ascend in a continued stream, as fast as it rarefies; and that being ascended, it must disperse itself, to preserve the equilibrium; that is, by a contrary current, the upper air must move from those parts where the greatest heat is: so, by a kind of circulation, the north-east trade-wind below, will be attended with a south-westerly wind above; and the south-east, with a north-west wind above. See **CURRENT, UNDER-CURRENT, &c.**

That this is more than a bare conjecture, the almost instantaneous change of the wind to the opposite point, which is frequently found in passing the limits of the trade-winds, seems to assure us; but that which above all confirms this hypothesis, is the phenomenon of the monsoons, by this means most easily solved, and without it hardly explicable. See **MONSOON**.

Supposing therefore such a circulation as above; it is to be considered, that to the northward of the Indian ocean, there is every where land, within the usual limits of the latitude of 30°, viz. Arabia, Persia, India, &c. which, for the same reason as the Mediterranean parts of Africa are subject to insufferable heats, when the sun is to the north, passing nearly vertical; but yet are temperate enough, when the sun is removed towards the other tropic, because of a ridge of mountains at some distance within the land, said to be frequently, in winter, covered with snow, over which the air, as it passes, much needs be much chilled.—Hence it happens, that the air coming, according to the general rule, out of the north-east, to the Indian sea, is sometimes hotter, sometimes colder, than that which, by this circulation, is returned out of the south west; and, by consequence, sometimes the under current, or wind, is from the north-east, sometimes from the south-west.

That this has no other cause, is clear from the times wherein these winds set, viz. in April: when the sun begins to warm these countries to the north, the south-west monsoons begin, and blow, during the heats, till October, when the sun being retired, and all things growing cooler northward, and the heat increasing to the south, the north-east winds enter and blow all the winter, till April again. And it is, undoubtedly, from the same principle, that to the southward of the equator, in part of the Indian ocean, the north-west winds succeed the south-east, when the sun draws near the tropic of Capricorn. See **TIDE**.

But, the industry of some late writers, having brought the theory of the production and motion of winds, to somewhat of a mathematical demonstration; we shall here give it the reader in that form.

**Laws of the production of WINDS.**—If the spring of the air be weakened in any place, more than in the adjoining places; a wind will blow through the place where the diminution is. See **AIR, and ELASTICITY**.

For, since the air endeavours, by its elastic force, to expand itself every way; if that force be less in one place than ano-

ther; the nifus of the more, against the less elastic, will be greater than the nifus of the latter, against the former.—

The less elastic air, therefore, will resist with less force than it is urged by the more elastic: consequently, the less elastic will be driven out of its place, and the more elastic will succeed.

If, now, the excess of the spring of the more elastic, above that of the less elastic air, be such as to occasion a little alteration in the baroscope; the motion both of the air expelled, and that which succeeds it, will become sensible; i. e. there will be a wind.

2°. Hence, since the spring of the air increases, as the compressing weight increases, and compressed air is denser than air less compressed; all winds blow into rarer air, out of a place filled with a denser.

3°. Wherefore, since a denser air is specifically heavier than a rarer; an extraordinary lightness of the air in any place, must be attended with extraordinary winds, or storms.

Now, an extraordinary fall of the mercury in the barometer, shewing an extraordinary lightness of the atmosphere; it is no wonder if that foretells storms. See **BAROMETER**.

4°. If the air be suddenly condensed in any place, its spring will be suddenly diminished: hence, if this diminution be great enough to affect the barometer, there will a wind blow through the condensed air.

5°. But since it cannot be suddenly condensed, unless it have before been much rarefied; there will a wind blow through the air, as it cools, after having been violently heated.

6°. In like manner, if air be suddenly rarefied, its spring is suddenly increased; wherefore it will flow through the contiguous air, not acted on by the rarefying force.—A wind, therefore, will blow out of a place, in which the air is suddenly rarefied: and on this principle, in all probability, it is, that,

7°. Since the sun's power in rarefying the air is notorious, it must necessarily have a great influence on the generation of winds. See **HEAT, RAREFACTION, &c.**

8°. Most caves are found to emit wind, either more or less. The rising and changing of the wind, is determined experimentally, by means of weather-cocks placed a-top of houses, &c.—But these only indicate what passes about their own height, or near the surface of the earth: Wolfius assures us, from observations of several years, that the higher winds, which drive the clouds, are different from the lower ones, which move the weather-cocks.—And Mr. Derham observes something not unlike this. *Phys. Theol. L. I. c. 2.*

The author last mentioned relates, upon comparing several series's of observations made of the winds in divers countries, viz. England, Ireland, Switzerland, Italy, France, New-England, &c. that the winds in those several places seldom agree; but when they do, it is commonly when they are strong, and of long continuance in the same quarter; and more, he thinks, in the northerly and easterly, than in other points.—Also, that a strong wind in one place, is oftentimes a weak one in another; or moderate, according as the places are nearer, or more remote. *Philosoph. Transactions, N° 267, and 321.*

**Laws of the Force and Velocity of WIND.**—Wind being only air in motion, and air being a fluid, subject to the laws of other fluids, its force may be brought to a precise computation: thus—“The ratio of the specific gravity of any other fluid to that of air, together with the space that fluid, impelled by the pressure of the air, moves in any given time, being given; we can determine the space which the air itself, acted on by the same force, will move in the same time.” By this rule:

1°. As the specific gravity of air, is to that of any other fluid; so, reciprocally, is the square of the space which that fluid, impelled by any force, moves in any given time, to the square of the space which the air, by the same impulse, will move in the same time.

Supposing, therefore, the ratio of the specific gravity of that other fluid to that of air, to be  $b:c$ ; the space described by the fluid to be called  $f$ ; and that which the air will describe by the same impulse,  $x$ . The rules gives us  $x = \sqrt{(bs^2:c)}$ .

Hence, if we suppose water impelled by the given force, to move two feet in a second of time; then will  $f = 2$ ; and since the specific gravity of water to the air, is as 970 to 1; we shall have  $b = 970$ , and  $c = 1$ ; consequently  $x = \sqrt{970 \cdot 4} = \sqrt{3880} = 623$  feet. The velocity of the wind therefore, to that of water moved by the same power, will be as 623 to 2; i. e. if water move two feet in a second, the wind will fly 623 feet.

2°. Add, that  $f = \sqrt{(cx^2:b)}$ ; and therefore the space any fluid, impelled by any impression, moves in any time, is determined, by finding a fourth proportional to the two numbers that express the ratio of the specific gravity, and the square of the space the wind moves in, in the given time.—The square root of that fourth proportional is the space required.

M. Mariotte, *e. gr.* found, by various experiments, that a pretty

pretty strong *wind* moves 24 feet in a second of time; wherefore, if the space which the water, acted on by the same force as the air, will describe in the same time, be required; then will  $c = 1$ ,  $x = 24$ ,  $b = 970$ ; and we shall find  $f = \sqrt{(576:970)} = \frac{24}{37}$ .

3°. "The velocity of *wind* being given, to determine the "pressure required to produce that velocity;" we have this rule:—The space the *wind* moves in one second of time, is to the height a fluid is to be raised in an empty tube, in order to have a pressure capable of producing that velocity; in a ratio compounded of the specific gravity of the fluid to that of the air, and of quadruple the altitude a body descends in the first second of time, to the aforesaid space of the air.

Suppose, *e. gr.* the space the air moves in a second,  $a = 24$  feet, or 288 inches; call the altitude of the third  $x$ , and the ratio of mercury to air  $b:c = 13580:1$ ,  $d = 181$  inches;  $x$  will be less than that number by one line, or  $\frac{1}{16}$  of an inch.—And hence we see why a small, but sudden change in the barometer, is followed with violent *winds*. See BAROMETER.

The force of the *wind* is determined experimentally by a peculiar machine, called an *anemometer*, wind-measurer; which being moved by means of sails, like those of a wind-mill, raises a weight, that, still the higher it is raised, receding further from the centre of motion, by sliding along an hollow arm fitted on to the axis of the sails, becomes heavier and heavier, and presses more on the arm, till being a counter-poise to the force of the *wind* on the sails, it stops the motion thereof.—An index, then, fitted upon the same axis at right angles with the arm, by its rising or falling, points out the strength of the *wind*, on a plane divided like a dial-plate into degrees. See ANEMOMETER.

Qualities and Effects of WIND.—1°. "A *wind* blowing from the sea, is always moist: in summer, it is cold; and in winter, warm; unless the sea be frozen up."—This is demonstrated thus: There is vapour continually rising out of all water (as appears even hence, that a quantity of water being left a little while in an open vessel, is found sensibly diminished) but especially if it be exposed to the sun's rays; in which case, the evaporation is beyond all expectation. See VAPOUR.—By this means, the air incumbent on the sea becomes impregnated with a deal of vapour. But the *winds* blowing from off the sea, sweep these vapours along with them; and consequently are always moist.

Again, water in summer, &c. conceives less heat than terrestrial bodies exposed to the same rays of the sun; but in winter, sea-water is warmer than the earth covered with frost and snow, &c. Wherefore, as the air contiguous to any body, is found to partake of its heat and cold, the air contiguous to sea-water will be warmer in winter, and colder in summer, than that contiguous to the earth.—Or thus: Vapours raised from water by the sun's warmth in winter, are warmer than the air they rise in (as appears from the vapours condensing, and becoming visible, almost as soon as they are got out into air.) Fresh quantities of vapour, therefore, continually warming the atmosphere over the sea, will raise its heat beyond that of air over the land.—Again, the sun's rays reflected from the earth into the air, in summer, are much more than those from the water into air: the air, therefore, over the earth, warmed by the reflection of more rays than that over water, is warmer.—Hence, *sea-winds* make thick, cloudy, hazy weather.

2°. "*Winds* blowing from the continent, are always dry; "in summer warm; and cold in winter."—For there is much less vapour arising from the earth, than from water; and therefore the air over the continent will be impregnated with much fewer vapours.—Add, that the vapours, or exhalations, raised by a great degree of heat out of the earth, are much finer, and less sensible, than those from water.—The wind, therefore, blowing over the continent, carries but little vapour with it; and is therefore dry.

Further, the earth in summer is warmer than water exposed to the same rays of the sun.—Hence, as the air partakes of the heat of contiguous bodies; that over the earth in summer will be warmer than that over the water: therefore the *wind*, &c.

After the like manner it is shewn, that the *land-winds* are cold in winter.—Hence, we see why *land-winds* make clear, cold weather. See WEATHER.

Our northerly and southerly *winds*, however, which are commonly esteemed the causes of cold and warm weather, Mr. Derham observes, are really rather the effect of the cold or warmth of the atmosphere.—Hence it is, that we frequently see a warm southerly wind, on a sudden, changed to the north, by the fall of snow, or hail; and that in a cold, frosty morning, we see the *wind* north, which afterwards wheels about towards the southerly quarter, when the sun has well warmed the air; and again, in the cold evening, turns northerly, or easterly.

For the manner wherein north-easterly *winds* contribute to blights, see BLIGHT.—For the effects of *winds* on the ba-

rometer, and thermometer; see BAROMETER, and THERMOMETER.

WIND, in navigation, is the same agitation of the air, considered as serving for the motion of vessels on the water. See SAILING.

The *winds* are divided, with respect to the points of the horizon from which they blow, into *cardinal*, and *collateral*.

Cardinal WINDS, are those blowing from the four cardinal points; east, west, north, and south. See POINT, and CARDINAL.

Collateral WINDS, are the intermediate *winds* between two cardinal *winds*.—The number of these is infinite, as the points from which they blow are; but only a few of them are considered in practice: *i. e.* only a few of them have their distinguishing names. See COLLATERAL.

The antient Greeks, at first, only used the four cardinal ones; at length they took in four more.—Vitruvius gives us a table of twenty, besides the cardinals, in use among the Romans.

The moderns, as their navigation is much more perfect than the antient, have given names to twenty-eight collateral ones; which they range into *primary*, and *secondary*—and the secondary they subdivide into those of the *first* and *second* order. See POINT.

The English Names of the primary collateral *winds* and points, are compounded of the names of the cardinal ones, north and south being still prefixed.

The names of the secondary collateral *winds* of the first order, are compounded of the names of the cardinals, and the adjacent primary one.—Those of the second order, are compounded of the names of the cardinal, or the next adjacent primary; and the next cardinal, with the addition of the word (*by*).—The Latins have distinct names for each; all which are expressed in the following table.

Names of the <i>winds</i> , and points of the compass.		Distances of the points, &c. from the north.	
English.	Latin, and Greek.		
1. North.	Septentrio, or Boreas.	0°	0'
2. North by east.	Hyperboreas. Hypaquito. Gallicus.	11	15
3. North-north-east.	Aquilo.	22	30
4. North-east by north.	Mesoboreas. Mesaquito. Supernas.	33	45
5. North-East.	Arctapeliotes. Borapeliotes. Græcus.	45	
6. North-east by east.	Hypocæfias.	56	15
7. East-north-east	Cæfias, hellepontius.	67	30
8. East by north.	Mefocæfias. Carbas.	78	30
9. East.	Solanus, subsolanus, apeliotes.	From the east. 0°	0'
10. East by south.	Hypeurus, or hypercurus.	11	15
11. East-south-east.	Eurus, or volturnus.	22	30
12. South-east by east.	Meseurus.	33	45
13. South-East.	Notapeliotes, euroauster.	45	
14. South-east by south.	Hypophœnix.	56	15
15. South-south-east.	Phœnix, phœnicias, leuco-notus, gangeticus.	67	30
16. South by east.	Mefophœnix.	78	45
17. South.	Auster, notus, meridies.	From the south. 0°	0'
18. South by west.	Hypolibonotus, alfanus.	11	15
19. South-south-west.	Libonotus, notolibycus, austro-africanus.	22	30
20. South-west by south.	Mefolibonotus.	33	45
21. South-west.	Noto-zephyrus. Noto-libycus. Africanus.	45	
22. South-west by west.	Hypolibus. Hypafricanus. Subvesperus.	56	15
23. West-south-west	Libus.	67	30
24. West by south	Mefolibus. Mefozephyrus.	78	45

Names

Names of the winds, and points of the compass.		Distances of the points, &c. from the west.	
English.	Latin, and Greek.		
25. West.	Zephyrus, favonius, occidens.	00	01
26. West by north.	Hypargestes. Hypocorus.	11	15
27. West - north-west.	Argestes. Caurus, corus, japyx.	22	30
28. North-west by west.	Mefargestes. Mefocorus.	33	45
29. North-west.	Zephyro-boreas, borolibycus, olimpias.	45	
30. North-west by north.	Hypocircius. Hypothrafcias. Scirem.	56	15
31. North-north-west.	Circius, thrafcias.	67	30
32. North by west.	Mefocircius.	78	45

Note, The antient names are here, after Ricciolus, adapted to the modern ones; not as the winds formerly denoted by those, were precisely the same with these, (for the antient number and division being different from the modern, the points they refer to will be somewhat different) but as these are what come the nearest.— Thus, Virtruvius only reckoning twenty-four winds, disposes the points they refer to in a different order; as in the following table.

Names of the winds.	Distance from north.	Names of the winds.	Distance from east.
1 Septentrio.	00	7 Salamus.	00
2 Gallicus.	15	8 Ornithias.	15
3 Supernas.	30	9 Cæcias.	30
4 Aquilo.	45	10 Eurus.	45
5 Boreas.	60	11 Voltumnus.	60
6 Carbas.	75	12 Euronotus.	75

Names of the winds.	Distance from south.	Names of the winds.	Distance from west.
13 Austér.	00	19 Favonius.	00
14 Alfanus.	15	20 Etesia.	15
15 Libonotus.	30	21 Circius.	30
16 Africus.	45	22 Caurus.	45
17 Subvesper.	60	23 Corus.	60
18 Argestes.	75	24 Thrafcias.	75

For the use of the winds in navigation, &c. see SAILING, RHUMB, COMPASS, &c.

Quarter WIND. See the article QUARTER.

Whirl-WIND. See the article WHIRL-Wind.

WIND-COLIC. } See the article { COLIC.

WIND-DROPSY. } TYMPANITES.

WIND-EGG, an addle egg, or egg that has taken wind. See EGG.

WIND-FALL, denotes fruit blown off the tree by the wind.

WIND-FURNACE. See the article FURNACE.

WIND-GALL, in horses, a soft, flatulent tumor, or bladder, arising on the fetlock joint, and causing great pain, especially in hot weather, and hard ways.

It is usually owing to a violent strain, extreme labour, and heat, a horse's standing on a sloping floor, a blow from another, or the like.

WIND-GUN, a machine, serving to explode bullets, and other shot, with great violence, by the force of the air. See GUN.

This sort of arm, charged with air, has an effect scarce inferior to that of a common fire-arm charged with gun-powder; but it discharges itself with a much less report: and it is this, which, in all probability, gave occasion to the fable of white gun-powder. See GUN-Powder.

There are wind-guns of divers contrivances; the most easy and portable one, and the most in use, is represented *Tab. Pneumatics, fig. 14.* It consists of a round metalline tube 3, 3. open at the end *c c*, and exactly stopped at the other end *a*, like the barrel of other guns; 1, 1, 1, 1, is another larger metal tube, wherein the former is disposed, so as to leave a space between them 4, 4, wherein air may be inclosed.—The two tubes are joined together at the common aperture *c c*, by a circular plate exactly folded to both, so as to prevent the air from escaping out of the space 4, 4, &c.—At 8 is a spring valve, which opening inwardly, lets the air pass through from 2 into the space 1, but prevents its return from 1 to 2.—Near the close end of the inner tube are two

holes, 6 and 5; by the first, the space 1 and the inner tube communicate, so that the air would pass out of that into this, but that the passage is stopped by a valve opening outwardly; by the latter, there is a communication between the open air, the space 4, and the inner barrel: only the air pent up in the space cannot escape at this hole, by reason of a little tube exactly folded to both barrels, which stops the communication: nor can air escape out of the inner barrel through this little tube, by reason of a little moveable pin, which exactly fills the cavity of the tube.

Lastly, the part 2, 2, 2, 2, represents the body of a syringe, or sucking pump; by which, as much air as possible, is to be intruded into the space 4, 4, &c.—After which a bullet being put into a cavity of the inner barrel as high as the little tube 5, the gun is charged. See SYRINGE.

Now, to discharge it, the little valve 6 is pushed up by means of the pin that plays in the little tube 5. Upon this, the compressed air in the cavity of the outer barrel 4, rushing through the hole 6 into the cavity of the inner barrel, expels the bullet with a vast force, sufficient to penetrate a thick board.

Note, To give the machine a greater resemblance of a fire-arm, the part 2, 2, 2, 2, is usually fashioned like the butt-end of a musquet; and on the part 2, 8, 2, 8, is fitted a lock; by turning the trigger of which, the pin 5 is made to push back the valve, and so discharge the piece.—By the lock too, it is contrived, that either the whole charge of air may be spent at one explosion, or only part of it, and the rest reserved for fresh bullets.—By this piece of mechanism, we can have half a dozen good, effective shoots, with one charge of air.

WIND-INSTRUMENTS, in music, are instruments played by the wind, chiefly the breath; in contradistinction to string-instruments, and instruments of the pulsatile kind. See MUSIC.

The wind-instruments known to the antients, were the *tibia*, *fistula*, *syringa* of Pan, consisting of seven reeds joined side-wise; also *organs*, *tubæ*, *cornua*, and *lituus*. See FISTULA, ORGAN, &c.

Those of the moderns, are the *flute*, *bagpipe*, *hautboy*, *trumpet*, &c. See FLUTE, TRUMPET, BAGPIPE, &c.

WIND-MILL, a kind of mill which receives its motion from the impulse of the wind. See MILL.

The wind-mill, though a machine common enough, has yet somewhat in it more ingenious than it is usually imagined.—Add, that it is commonly allowed to have a degree of perfection which few of the popular engines have attained to, and which the makers are but little aware of.—Though the new geometry, &c. has furnished ample matter for its improvement.

Structure of the WIND-Mill.—The internal structure of the wind-mill, is much the same with that of water-mills.—The difference between them lies chiefly in an external apparatus, for the application of the power.

This apparatus consists of an axis *E F* (*Tab. Pneumatics, fig. 15.*) through which pass two arms, or yards, *A B*, and *C E*, intersecting each other at right angles in *E*, whose length is usually about 32 feet: on these yards are formed a kind of sails, vanes, or flights, in the figure of trapeziums, with parallel bases, the greater whereof, *H I*, is about six feet, and the less, *F G*, determined by radii drawn from the centre *E*, to *I* and *H*.

These sails are to be capable of being always turned to the wind, that they may receive its impression: in order to which, there are two different contrivances, which constitute the two different kinds of wind-mills in use.

In the one, the whole machine is sustained upon a moveable arbor or axis, perpendicular to the horizon, on a stand, or foot; and turned occasionally this way, or that, by means of a lever.

In the other, only the cover, or roof of the machine, with the axis and sails, turn round.—In order to which,

The cover is built turret-wise, and the turret encompassed with a wooden ring, wherein is a groove, at the bottom whereof are placed, at certain distances, a number of brass truckles, and within the groove is another ring, upon which the whole turret stands.—To the moveable ring are connected beams *a b* and *f c*; and to the beam *a b*, in *b* is fastened a rope, which at the other extreme thereof, is fitted to a windlass, or axis in peritrochio: this rope being drawn through the iron hook *G*, and the windlass turned, the sails will be moved round, and put in the direction required.

Theory of the motion of a WIND-Mill with the position of the sails, or vanes thereof.—The angle the sails are to make with their common axis, so as the wind may have the greatest effect, is a matter of nice enquiry, and has employed the thoughts of the mathematicians.

To conceive why a wind-mill moves at all, the theory of compound motions must be supposed.—A body moving perpendicularly against any surface, strikes it with all its force. If it move parallel to the surface, it does not strike it at all: and if it move obliquely, its motion being compounded of

the perpendicular and parallel motion, only acts on the surface, considered as it is perpendicular, and only drives it in the direction of the perpendicular. So that every oblique direction of a motion, is the diagonal of a parallelogram, whose perpendicular and parallel directions, are the two sides. Add, that if a surface, which being struck obliquely, has only received the perpendicular direction, be fastened to some other body, so as that it cannot pursue its perpendicular direction, but must change it for some other; in that case, the perpendicular itself becomes the diagonal of a new parallelogram, one of whose sides is the direction the surface may follow, and the other, that it cannot. See COMPOUND, and MOTION. Thus, a rudder fastened obliquely to the keel of a vessel, being struck by the current of water parallel to the keel, and, of consequence, obliquely with regard to itself; it will appear, by drawing the line of perpendicular impulse, that it tends to tear the rudder from the keel, and to carry it away: and that this direction perpendicular to the rudder, is oblique to the keel. — The rudder, then, would be carried off in an oblique direction: but, as, in reality, it is so secured, that it cannot be torn or carried off; we are only to consider, in this compound motion, that of the two directions, where-with it can move without being torn from the keel: and leave the other, which would tear it off, as useless.

Now, the direction in which it can move without parting from the keel, is that which carries it circularly about its extremity, as a centre. So that the effect of the oblique impulse of the water on the rudder, is reduced, first to a perpendicular impression, which is again reduced to the mere turning the rudder round; or, if the rudder be immovable, to the turning of the vessel.

Now, in an oblique and compound motion, where only one of the directions is of service; the greater ratio the other has thereto, the less effect will the motion have; and vice versa. — In examining the compound motions of the rudder, we find that the more oblique it is to the keel, the ratio of the direction that serves to turn it to the other, is the greater. But, on the other hand, the more oblique it is to the keel, and, of consequence, to the course of the water which is supposed parallel thereto, the more weakly it strikes. The obliquity of the rudder, therefore, has, at the same time, both an advantage, and a disadvantage; but as those are not equal, and as each of them is still varying with every different position of the rudder, they become complicated variously, so that sometimes the one prevails, and sometimes the other.

It has been a point of enquiry to find the position of the rudder, wherein the advantage should be the greatest. — M. Renau, in his famous theory of the working of ships, has found, that the best situation of the rudder is, when it makes an angle of 55 degrees with the keel. See SAILING, STEERING, &c.

If, now, a *wind-mill*, exposed directly to the wind, should have its four sails perpendicular to the common axis wherein they are fitted, they would receive the *wind* perpendicularly; and it is visible that impulse would only tend to overturn them. — There is a necessity, therefore, to have them oblique to the common axis, that they may receive the *wind* obliquely.

For the greater ease; let us only consider one vertical sail. — The oblique impulse of the wind on this sail, is reducible to a perpendicular impulse: and that direction, as the sail cannot absolutely keep to it, is compounded of two; one where-of tends to make it turn on its axis, and the other to fall backwards. — But it is only the first of these directions can be obeyed. — Of consequence, the whole impulse of the *wind* on the sail has no other effect, but to make it turn from right to left, or from left to right, as its acute angle turns this way or that. And the structure of the machine is so happy, that the three other sails are determined, from the same reasons, to move the same way.

The obliquity of the sails, with regard to their axis, has precisely the same advantage, and disadvantage, with the obliquity of the rudder to the keel. — And M. Parent, seeking by the new analysis, the most advantageous situation of the sails on the axis, finds it precisely the same angle of 55 degrees. Yet, in practice, this rule is very little observed; as, indeed, being little known. — The sails are usually fixed at an angle of about 60 degrees, which is very much out of the way.

**Elliptical WIND-Mill.** — M. Parent considers further, what figure the sails of a *wind-mill* shall have, to receive the greatest impulse from the *wind*; and he determines it to be a sector of an ellipsis, whose centre is that of the axis or arbor of the mill; and the little semi-axis, the height of thirty-two feet: as for the greater, it follows necessarily from the rule that directs the sail to be inclined to the axis in an angle of 55 degrees.

On this foot he assumes four such sails, each whereof is one fourth of an ellipsis; which, he shews, will receive all the *wind*, and lose none, as the common ones do. — These four surfaces multiplied by the lever, with which the *wind* acts on one of them, expresses the whole power the *wind* had

to move the machine, or the whole power the machine has when in motion.

The same manner of reasoning, applied to a common *wind-mill*, whose sails are rectangular, and their length about five times their breadth; shews that the *elliptic wind-mill* has above seven times the power of the common one. A prodigious advantage! and worthy, sure, to have the common practice set aside for, could so common a practice be easily changed.

A *wind-mill*, with six elliptic sails, he shews, would still have more power than one with four. — It would only have the same surface with the four; since the four contain the whole space of the ellipsis, as well as the six. But the force of the six, would be greater than that of the four, in the ratio of 245 to 231. — If it were desired to have only two sails, each being a semi-ellipsis, the surface would be still the same, but the power would be diminished, by near one third of that with six sails; by reason the greatness of the sectors would much shorten the lever with which the *wind* acts.

**Best form and proportion of rectangular WIND-Mills.** — But, as elliptical sails would be something so new, that there is little room to expect they will come into common use; the same author has considered which form, among the rectangular ones, will be the most advantageous, *i. e.* which, the product of whose surface, by the lever of the *wind*, will be the greatest. — And by the method *de maximis & minimis*, he finds it very different from the common ones.

The result of his enquiry is, that the width of the rectangular sail should be nearly double its length; whereas the length is usually made almost five times the width. — Add, that as we call height or length, the dimension which is taken from the centre of the axis; the greatest dimension of the new rectangular sail, will be turned towards the axis, and the smallest from it: quite contrary to the position of the common sails.

The power of a *wind-mill*, with four of these new rectangular sails, M. Parent shews, will be to the power of 4 elliptic sails, nearly as 13 to 23; which leaves a considerable advantage on the side of the elliptic ones: yet will the force of the new rectangular sails, be considerably greater than that of the common ones.

M. Parent likewise considers what number of the new sails will be most advantageous, and finds that the fewer sails, the more surface there will be, but the less power. — The ratio of the power of a *wind-mill* with 6 sails, will be to another with 4, nearly as 14 to 13. And the power of another with 2, will be to that with 4, nearly as 13 to 9.

As to the common *wind-mill*, its power still diminishes as the breadth of the sails is smaller, in proportion to the length. The usual proportion, therefore, of 5 to 1, is exceedingly disadvantageous.

The uses of this new theory of *wind-mills* are very obvious. — The more power a *wind-mill* has, the swifter it turns, the more it dispatches, and the less *wind* it needs. — Add, that on this theory, one may have a *wind-mill*, whose sails shall be a deal shorter, and yet the power greater, than in the common one.

**WIND Tumors; &c.** See the article TUMOR.

**WINDASS\*,** or **WANDASS,** or **WANLASS,** an antient term in hunting. — Thus, to drive the *windass*, signifies the chasing a deer to a stand, where one is ready with a bow or gun to shoot. See HUNTING.

\* — *Omnes illi qui tenuerunt in bondagii tenura solebant vocari custumarii: et quotiescunque dominus ad venandum venerit, illi custumarii solebant fugare windassum, ad stabulum, in venatione ferarum bestiarum secundum quantitatem tenuræ sue, MS. de Consuetud. Manerii de Sutton Colfield, An. 3. Ed. II.*

**WINDERS of wool.** See the article WOOL-Winders.

**WINDING Stairs.** See the article STAIR.

**WINDLASS,** or **WINDLACE,** a machine used to raise huge weights withal, as guns, stones, anchors, &c. See MACHINE.

It is very simple, consisting only of an axis, or roller supported horizontally at the two ends by two pieces of wood; and a pulley. — The two pieces of wood meet a-top; being placed diagonally, so as to prop each other. — The axis or roller goes through the two pieces, and turns in them. — The pulley is fastened a-top, where the pieces join.

Lastly, there are two staves, or hand-spikes go through the roller, whereby it is turned; and the rope, which comes over the pulley, is wound off and on the same.

**WINDLASS in a ship,** is an instrument in a small vessel, placed upon the deck, abaft the fore-mast: it consists of a piece of timber, having six or eight squares. It is turned by hand-spikes, put into holes made for that purpose.

This *windlass* will purchase more than any capstan in the weighing of an anchor or the like, and without any danger to those that heave. — Since if any of the hand-spikes should break, the *windlass* would fall of itself.

**WINDOW,** *q. d.* *Wind-door,* an aperture, or open place in the

the side of an house, to let in the air and light.— See *Tab. Archit. fig. 49.* see also the articles BUILDING, APER-TION, LIGHT, &c.

We have various kinds and forms of *windows*; as glass *windows*, wire *windows*, horn *windows*, &c.— Arched *windows*, circular *windows*, elliptical *windows*, square and flat *windows*; round *windows*, oval *windows*, gothic *windows*, regular *windows*, rustic *windows*, to which add sky-lights. See GLASS, LEAD, PLUMBERY, VICE, &c.

The chief rules, with regard to *windows*, are— 1°. That they be as few in number, and as moderate in dimensions as may consist with other respects; inasmuch as all openings are weakenings.

2°. That they be placed at a convenient distance from the angles, or corners of the building; because that part ought not to be open and infiebled, whose office is to support and fasten all the rest of the building.

3°. That care be taken the *windows* be all equal one with another, in their rank and order; so that those on the right hand may answer to those on the left, and those above, be right over those below: for this situation of *windows*, will not only be handsome and uniform; but also the void being upon the void, and the full upon the full, it will be a strengthening to the whole fabric.

As to their dimensions, care is to be used, neither to give them more, or less light than is needful; therefore regard is to be had to the bigness of the rooms which are to receive the light.— It is evident that a great room needs more light, and consequently, a greater *window* than a little room; and *è contra*.

The apertures of *windows*, in middle-sized houses, may be four and a half, or five feet between the jambs; and in the greater buildings, six and a half, or seven feet; and their height may be double the length at the least.— But in high rooms or larger buildings, their height may be a third, a fourth, or half their breadth, more than double their length.

Such are the proportions for *windows* of the first story; and according to these must those in the upper stories be for breadth: but, as to height, they must diminish; the second story may be one third part lower than the first, and the third story one fourth part lower than the second. See BUILDING.

*Architrave WINDOWS.* See the article ARCHITRAVE.

*Dormer WINDOWS, or Lutherns.* See LUTHERN, &c.

*Transom WINDOWS.* See the article TRANSOM.

*Scenography of WINDOWS.* See the article SCENOGRAPHY.

*WINDOW, in anatomy, &c.* See FENESTRA.

*WIND-TACKLE-Blocks*, in a ship, are the main double blocks or pulleys; which, being made fast to the end of a small cable, serve for the hoisting of goods into the ship, &c. See BLOCK, TACKLE, &c.

*To wind, or wend a ship*, signifies to bring her head about.

*How winds, or wends the ship?* is a question asked by mariners concerning a ship under sail, signifying as much as, upon what point of the compass does she lie with her head?

*WIND-TAUGHT*, a sea-term, implying as much as, *stiff in the wind*. See TAUGHT.

Too much rigging, high masts, or any thing catching or holding wind aloft, is said to hold a ship *wind-taught*; by which they mean, that she stops too much in her sailing, in a stiff gale of wind.

Again, when a ship rides in a main stress of wind and weather, they strike down her top-masts, and bring her yards down, which else would hold too much wind, or be too much distended, and *wind-taught*.

*WINDWARD Tide*, in the sea language, a tide which runs against the wind. See TIDE.

*WINDY Tumors.* See the article TUMOR.

*WINE, Præum*, a brisk, agreeable, spirituous, and cordial liquor, drawn from vegetable bodies, and fermented. See VEGETABLE, and FERMENTATION.

The character of a *wine*, according to Boerhaave, is, that the first thing it affords by distillation, be a thin, oily, inflammable fluid; called a *spirit*. See SPIRIT.

This distinguishes *wines* from another class of fermented vegetable juices, *viz. vinegars*; which, instead of such spirit, yield, for the first thing, an acid, un-inflammable matter. See VINEGAR.

All sorts of vegetables, fruits, seeds, roots, &c. afford *wine*; as grapes, currants, mulberries, elder, cherries, apples, pulse, beans, pease, turnips, radishes, and even grass itself. See VINOUS.

Hence, under the class of *wines*, or vinous liquors, come not only *wines* absolutely so called, but also ale, cider, &c. See MALT Liquor, ALE, CIDER, &c.

*WINE* is, in a more particular manner, appropriated to that which is drawn from the fruit of the vine, by stamping its grapes in a vat, or crushing and expressing the juice out of them in a press, and then fermenting, &c. See VINE, and VINEYARD.

The goodness of *wine* consists in its being neat, dry, fine,

bright, and brisk, without any taste of the soil, of a clean steady colour; having a strength, without being heady; a body, without being sour; and keeping, without growing hard, or eager.

*Wine* being a liquor mostly of foreign produce; the divers names, forms, kinds, distinctions, &c. thereof, are borrowed from the countries where it is produced; the principal whereof, at this day, is France: to *wines* of which country, a good part of what we have to say of this noble liquor, will more immediately belong.

*Wine*, in France, is distinguished, from the several degrees and steps of its preparation, into

*Mere-goutte*, mother-drop; which is the virgin *wine*, or that which runs of itself out of a tap of the vat wherein the grapes are laid, before the vintager enters to tread, or stamp the grapes.

*Must, surmust, or stum*; which is the *wine* or liquor in the vat, after the grapes have been trod, or stamped.

*Pressed WINE, vin de pressurage*, which is that squeezed with a press out of the grapes half bruised by the treading.

The husks left of the grapes, are called *rape, murk, or mark*; by throwing water upon which, and pressing them a-fresh, they make a liquor for servants use, answerable to our cyder-kin, and called *boisson*; which is of some use in medicine, in the cure of disorders occasioned by viscid humours.

*Sweet WINE, vin doux*, is that which has not yet worked, or fermented.

*Bouru*, that which has been prevented working, by casting in cold water.

*Cuvé, or worked wine*; that which has been let work in the vat, to give it a colour.

*Cuit, or boiled wine*; that which has had a boiling ere it worked; and which, by that means, still retains its native sweetness.

*Passé, or strained wine*, that made by steeping dry grapes in water, and letting it ferment of itself.

*Wines* are also distinguished, with regard to their colour, into *white wine, red wine, claret wine, pale wine, rose, or black wine*.— And, with regard to their country, or the soil that produces them, into *French wines, Spanish wines, Rhenish wines, Hungary wines, Greek wines, Canara wines, &c.*— And more particularly into *Port wine, Madera wine, Burgundy wine, Champaign wine, Falernian wine, Tokay wine, Schiras wine, &c.*

*Wines*, again, are distinguished, with regard to their quality, into *sweet wines, rough or dry wines, and rich or luscious wines, vins de liqueur*; of which last, some are exceedingly sweet, others sweet and poignant: all chiefly used by way of dram after meals, &c.

Such are French *Frontignac, Madera, the Canary, the Hungary, Tokay, the Italian Montefiascone, the Persian Schiras, the malmsey wines* of Candia, Chio, Lesbos, Tenedos, and other islands of the Archipelago, which antiently belonged to the Greeks, but now to the Turks.— These are sometimes called *Greek wines*, and sometimes *Turky wines*.

*Wine* is also variously denominated, according to its state, circumstances, qualities, &c.

*Natural WINE*, is such as comes from the grape, without further mixture, or sophistication.

*Brewed, or adulterated WINE*, is that wherein some drug is added to give it a strength, fineness, flavour, briskness, sweetness, or some other quality which is wanted.

*Pricked, or eager WINE*, is that turned sourish.

*Flat WINE*, is that fallen weak and vappid, for want of being drank in time.

*Sulphured WINE*, is that put in casks wherein sulphur has been burnt; in order to fit it for keeping, or for carriage by sea. See SULPHUR.

*Colour WINE*, is some thick *wine*, of a very deep colour, serving to dye the *wines*, that are too pale, &c. as the *black wine*, in use among our vintners.

*Chip WINE*, is that poured on chips of beech wood, to fine, or soften it.

*Rape WINE*, is that put in a cask half full of fresh grapes picked for the purpose, to recover the strength, briskness, &c. it had lost by keeping, &c.

*Burnt WINE*, is that boiled up with fugar; and sometimes with a little spice. See HIPPOCRAS.

There is also a sort of *Malmsey wine*, made by boiling of muscadine. See MALMSEY.

*Method of making and fining WINE.*— In the southern parts of France, their way is, for *red wines*, to tread, or squeeze the grapes between the hands, and to let the whole stand, juice and husks, till the tincture be to their liking: after which they press it.— But for *white wines*, they press the grapes immediately.

When pressed, they tun the must, and stop up the vessel; only leaving the depth of half a foot or more empty, to give room for it to work — At ten days end, they fill this space with some other proper *wine*, that will not provoke it to work again.— This they repeat from time to time; new *wine* spending itself a little ere it come to perfection.

About

About Paris, and the northern parts of France, they let the must stand two days and nights for *white wines*, and at least a week for *claret wines*, ere they tun it. — While it continues working, it is kept as warm as possible.

Some, upon stopping it up for good and all, roll the cask about the cellar, to mix the liquor with the lees; and, after settling a few days, rack it off with great improvement.

To fine it down, they put shavings of green beech into the vessel; having first taken off all the rind, and boiled them an hour in water, to extract their rankness; and afterwards dried them in the sun, or an oven: a bushel of these serve for a tun of *wine*. These put the liquor in a gentle working, and purify it in twenty-four hours. They also give an agreeable flavour. — The same chips being washed, serve again and again, till almost quite consumed.

Some sweeten their *wines* with raisins of the sun, trod in the vat with the grapes, having been first plumped by boiling: others, by boiling half the must, scumming it, and tunning it up hot with the other.

For English *wine*, the method recommended by Mr. Mortimer, is, first, to gather the grapes when very dry, to pick them from the stalks, then to press them, and let the juice stand twenty-four hours in the vat covered. Afterwards, to draw it off from the gross lees, and then put it up in a cask, and to add a pint or quart of strong red or white port to every gallon of juice; and let the whole work: bunging it up close, and letting it stand till January; then bottle it in dry weather.

By this method, he assures us, he has made English *wine* as good as any the best and purest French *wine*, drank either in Paris, or Champaign.

Mr. Bradley chuses to have the liquor, when pressed, stand with the husks, stalks and all, in the vat to ferment for fifteen days.

He adds, that, according as the vines have been managed, the *wine* will be stronger or weaker. — Those, *e. gr.* which run at liberty up high trees, and are never pruned, make the smallest *wines*: those kept tied to stakes about four feet high, and which have their branches duly pruned, stronger *wines*: and those nearest the ground, the strongest.

The force of the fermenting *wine* is very great; being able, if close stopped up, to burst through the strongest cask. — The readiest and only way to stop or abate the fermentation, is by the fume of burning sulphur.

Add, that when *wine* already made is upon the fret, or, by any alteration in the air, begins to ferment again; the way used by the vintners and wine-coopers to save it, is by the flame of common sulphur, or a lighted match dipped in it; which, held under a cask just ready to burst its hoops, calms its fury, and makes it immediately subside. See SULPHUR.

See the article

The uses of WINE are very great; not only as a drink, but as a medicine. See DRINK, &c. — Several physicians recommend it as an excellent cordial, and particularly serviceable in fevers, the lues venerea, &c.

Pliny mentions Staphylus as the first who mixed *wine* with water; but Athenæus gives the credit thereof to Amphitryon king of Athens. — On this occasion a fable was invented; that Bacchus having been struck with a thunderbolt, and being all inflamed, was presently cast into the nymph's bath, to be extinguished.

The age of WINE is properly reckoned by leaves. — Thus, they say, *wine* of two, four, six leaves, to signify a *wine* of six, four, or two years old; taking each new leaf put forth by the vine, since the *wine* was made, for a year.

Among the Romans, the age of *wines* was, as it were, the criterion of their goodness. — Horace, in his *Odes*, which one may call *Bacchic songs*, boasts of his drinking Falernian *wine*, born, as it were, with him, or which reckoned its age from the same consuls.

Pliny mentions *wines* kept above a hundred years, and yet potable. — Others he speaks of kept two hundred years, which, by that time, were reduced to the consistence of honey.

But the moderns keep no *wines* to any such age. — Where they are kept the longest, as in Italy and Germany, there are scarce any to be found above fifteen leaves. — In France, the *wines* that keep best, are those of Dijon, Nantz, and Orleans, and are reckoned superannuated at five or six leaves old.

Lees of WINE, are the impurities thereof, or the thick sediment, remaining at the bottom of the casks, when the *wine* is drawn out. See LEES, and VINEGAR.

WINE is also a denomination, applied in medicine and pharmacy, to divers mixtures or compositions, wherein the juice of the grape is a principal ingredient. See VINUM.

These medicated *wines* make a considerable article in our dispensatories, in quality of diet-drinks; some being denomi-

nated from the ingredients used in them; some from the intentions wherewith they are prescribed; and some from their qualities, &c.

Bitter WINE, *vinum amarum*, is an infusion of certain bitter stomachic herbs, as gentian root, juniper-berries, tops of centaury, orange and lemon peel, in white port, or other white *wine*; taken by way of whet in a morning, to restore the palled stomach after a debauch, and bring the fibres to their due tension.

Chalybeate, or Steel WINE, is prepared of steel-filings, and saffron infused and filtered. — It is good for removing obstructions in the viscera, as in the chlorosis, &c.

Vinum benedictum, the blessed WINE, is made of crocus metalorum, and mace, infused in *wine*. — It was formerly a celebrated emetic, but now almost out of use for its roughness.

Elecampane WINE, *vinum enulatum*, is an infusion of the root of that plant, with sugar and currants, in white port. — It cleanses the viscera, prevents disorders and obstructions of the lungs, and is good in asthmatic cases, cachexies, &c.

Hog-lice WINE, *vinum millepedum*, is prepared of hog-lice put alive in white port; and after some infusion, pressed and strained out: to the liquor is added saffron, salt or steel, &c. — It is recommended against the jaundice, droply, cachectic habits, &c. See MILLEPEDES.

Pectoral WINE, *vinum pectorale*, is prepared of liquorice, saffron, coriander-seeds, carraway, anise, salt of tartar, pennyroyal, and hyssop waters, digested with canary *wine*, and strained. — It is a good expectorant, helping to deterge and cleanse the lungs, &c.

Emetic WINE, *vinum emeticum*. See the article EMETIC.

Hippocrates's WINE, *vinum Hippocraticum*, or Hippocras. See HIPPOCRAS.

Viper WINE, *vinum viperinum*, is a preparation of female vipers, infused six months in canary *wine*. — It is a great restorative, and provokes to venery; good against cutaneous eruptions, &c.

Vinum Scilliticum, WINE of Squills, is an infusion of those onions in white *wine* for forty days; after which the squills are strained out, and the liquor preserved for use. — It is a gentle emetic, good against inundations of rheum, &c. See SCILLÆ.

WINE-Measure. See the article MEASURE.

WING. See the articles FEATHER, and FLYING.

Warbling of the WINGS. See the article WARBLING.

WINGS, in heraldry, are born sometimes single, sometimes in pairs, in which case they are called *conjoined*; when the points are downward, they are said to be *inverted*; when up, *elevated*. See VOL.

WING, *Ala*, or *Axilla*, in botany, the angle which the leaves of a plant, or the pedicles of the leaves, form with the stem, or a branch of the plant. See LEAF.

This angle is commonly acute, and always turned upward. — It has its name from its resembling the angle which the wings of a bird form with the body; or, rather, from the angle which a man's arms make with his trunk, which is also called *ala*, wing. See AXILLA.

WINGS, in gardening, &c. denote such branches of trees, or other plants, as grow up aside of each other. See BRANCH. La Quintiny says, the term is particularly applied to artichokes, whose wings, or *alæ*, are the lesser heads or fruits that grow up with the principal one, on the same stalk.

WINGS, *alæ*, in the military art, are the two flanks or extremes of an army, ranged in form of battle; being the right and left sides thereof, and including the main body. See ARMY, BATTALION, &c.

The cavalry are always posted in the wings; *i. e.* on the flanks, or the right and left sides of each line; to cover the foot in the middle. See LINE, and FLANK.

Pan, one of Bacchus's captains, is said to have been the first inventor of this method of ranging an army; whence, say they, it is that the antients painted him with horns on his head; what we call wings, being by them called *cornua*, horns. See PANIC.

This, at least, is certain, that the method of arranging in wings is very antient. — The Romans, we know, used the term *alæ*, or wings, for two bodies of men in their army; one on the right, the other on the left, consisting each of 400 horse, and 4200 foot usually, and wholly made up of confederate troops. — These were designed to cover the Roman army, as the wings of a bird cover its body.

The troops in these wings they called *alares*, and *alares copie*; and we at this day distinguish our armies into the *main-body*, the *right* and *left wings*.

WINGS are also used for two files that terminate each battalion, or squadron, on the right and left. — The pikes are ranged in the middle, and the musqueteers in the wings.

WINGS, in fortification, denote the longer sides of horn-works, crown-works, tenailles, and the like outworks; including the ramparts, and parapets, with which they are bounded on the right and left, from the gorge to their front.

These wings, or sides, are capable of being flanked, either with the body of the place, if they stand not too far distant;

or

or with certain redoubts; or with a traverse made in their ditch.

**S. Michael's WING**, is the name of a military order in Portugal, instituted, according to the jesuit Mendo, in 1165; or according to di Michieli, in his *Tesoro Militar de Cavalleria*, in 1171. Its institutor was, Alphonfus Henry I. king of Portugal; and the occasion was a victory gained by him over the king of Sevil, and his Saracens; for which he thought himself beholden to S. Michael, whom he had chose for his patron in the war against the infidels.

The banner they bore was a *wing* resembling that of the arch-angel, of a purple colour, encompassed with rays of gold.— Their rule was that of S. Benedict; the vow they made was to defend the Christian religion, and the borders of the kingdom, and to protect orphans.— Their motto, *Quis ut Deus*.

**WINGED**, in botany, a term applied to such stems of plants as are furnished, all their length, with a sort of membranous leaves. See **STALK**, **STEM**, &c.

Several kinds of thistles have *winged* stalks, and branches. See **THISTLE**, &c.

**WINGED Leaves**, are such as consist of divers little leaves, ranged in the same direction, so as to appear no more than one and the same leaf.— Such are the leaves of agrimony, acacia, ash, &c. See **LEAF**.

**WINGED Seeds**, are such as have down or hairs on them; whereby the wind taking hold, blows them to a distance. See **SEED**, and **SEMINATION**.

**WINGED Stalk**. See the article **STALK**.

**WINGED**, in heraldry, is applied to a bird, when its wings are of a different colour, or metal, from the body.

*Winged* is also applied to any thing represented with wings, though contrary to its nature; as a *winged*, or *flying hart*, &c.

**WINNOW**, signifies to fan, or separate corn from the chaff by wind.

**WINTER**, one of the four seasons, or quarters of the year. See **SEASON**, &c.

*Winter* commences on the day when the sun's distance from the zenith of the place is the greatest, and ends on the day when its distance is at a mean between the greatest and least. See **SUN**.

Notwithstanding the coldness of this season, it is proved, in astronomy, that the sun is really nearer to the earth in *winter* than in summer.— The reason of the decay of heat, &c. see under the articles **HEAT**, **LIGHT**, &c.

Under the equator, the *winter*, as well as the other seasons, return twice every year; but all other places have only one *winter* in the year; which, in the northern hemisphere, begins when the sun is in the tropic of Capricorn; and in the southern hemisphere, when in the tropic of Cancer: so that all places in the same hemisphere have their *winter* at the same time. See **TROPIC**.

**WINTER**, among printers, that part of the printing-press, serving to sustain the carriage, &c. See **PRINTING-Press**.

**WINTER's Bark**, *Cortex WINTERI*, or *WINTERANUS*. See **CORTEX**, and **CINNAMON**.

**WINTER-Quarters**. See the article **QUARTERS**.

**WINTER-Rig**, amongst husbandmen, signifies to fallow, or till the land in *winter*. See **FALLOW**, &c.

**WINTER-Solstice**. See the article **SOLSTICE**.

**WINTONIA Rotulus**. See the article **ROTULUS**.

**WIRE**, **WIAR**, **WIER**, or **WYRE**, a piece of metal, drawn through the hole of an iron, into a thread, of a fineness answerable to the hole it is passed through. See **IRON**.

*Wires* are frequently drawn so fine, as to be wrought along with other threads of silk, wool, or hemp: and thus they become a considerable article in the manufactures.

The metals most commonly drawn into *wire* are gold, silver, copper, and iron.— And hence we have *gold wire*, *silver wire*, *iron wire*, &c. as in the following articles.

**Gold and silver WIRE**.— What we call *gold wire*, is made of cylindric ingots of silver, covered over with a skin of gold; and thus drawn successively through a vast number of holes, each smaller and smaller, till at last it is brought to a fineness exceeding that of a hair.

That prodigious ductility which makes one of the distinguishing characters of gold, is no where more conspicuous than in this gilt *wire*.— A cylinder of 48 ounces of silver, covered with a coat of gold, only weighing one ounce, Dr. Halley informs us, is commonly drawn into a *wire*, two yards of which only weigh one grain: whence 98 yards of the *wire* only weigh 49 grains; and one single grain of gold covers the said 98 yards.— So that the ten thousandth part of a grain is above half an inch long.

The same author, computing the thickness of the skin of gold, found it to be only  $\frac{1}{134788}$  part of an inch— yet so perfectly does it cover the silver, that even a microscope does not discover any appearance of the silver underneath.

M. Rohault observes, that a like cylinder of silver covered with gold, 2 feet 8 inches long, and 2 inches 9 lines in circumference, is drawn into a *wire* 307200 feet long; i. e. into 115200, its former length.

VOL. II. No. 166.

Mr. Boyle relates, that 8 grains of gold covering a cylinder of silver, is commonly drawn into *wire* thirteen thousand feet long. See **GOLD**.— The method of drawing it, see further illustrated under the article **DUCTILITY**.

**Silver WIRE** is the same with gold *wire*, except that the latter is gilt, or covered with gold, and the other is not. See **SILVER**.

There are also counterfeit gold and silver *wires*: the first made of a cylinder of copper, silvered over, then covered with gold; and the second of a like cylinder of copper silvered over, and drawn through the iron, after the same manner as gold and silver *wire*.

**Brass WIRE** is drawn after the same manner as the former.— Of this, there are divers sizes, suited to the divers kinds of works. The finest is used for the strings of musical instruments, as spinets, harpsichords, manichords, &c. See **CHORD**.

The pinmakers likewise use vast quantities of *wire* of several sizes, to make their pins of. See **PIN**.

**Iron WIRE**, is called, by the French, *fil d'archal*; the reason of which, their authors are not agreed about.— That celebrated etymologist, M. Menage, derives it from *filium & aurichalcum*; but others, more conversant in the commerce thereof, deduce it from one Richard Archal, the first inventor thereof.

There are various sizes of this *wire*, from  $\frac{1}{2}$  an inch, to  $\frac{1}{16}$  of an inch diameter. The smallest sizes are used to string musical instruments withal, particularly harpsichords, psalteries, &c.— Vast quantities of *iron-wire* are brought yearly from the Baltic; partly spent at home, and part exported to France, &c.

**WIRE-Drawing**.— For the several manners of drawing gold and silver, see **GOLD**, **SILVER**, **DUCTILITY**, &c.

The first iron that runs from the stone, when melting, being the softest, and toughest, is preserved to make *wire* of. See **IRON**.

**WISDOM**, *Sapientia*, usually denotes a higher and more refined knowledge of things, immediately presented to the mind, as it were by intuition, without the assistance of ratiocination. See **KNOWLEDGE**, **DISCOURSE**, **SCIENCE**, &c. In this sense, *wisdom* may be said to be a faculty of the mind, or at least a modification and habit thereof. See **FACULTY**, **MODIFICATION**, **HABIT**, &c.

Sometimes the word is more immediately used in a moral sense, for what we call *prudence* or *discretion*; which consists in the soundness of the judgment, and a conduct answerable thereto. See **JUDGMENT**.

The school-divines, sometimes restrain *wisdom* to the knowledge of the more sublime and remote objects, as that of God, &c. In which sense, theology is properly said to be *wisdom*. The Latin word for *wisdom*, is *sapientia*, which literally expresses the sense of tasting; to which *wisdom* is supposed to have some conformity.— The sight, and other senses, only represent to us the surface of things: taste goes deeper, penetrates into the substances; so that what, *e. gr.* to the feeling seemed cold, to the taste shall be found hot: so *wisdom*, arising from a deep attention to our ideas, goes further; and frequently judges otherwise than the common apprehensions of men would reach to. See **UNDERSTANDING**, **REASON**, &c.

**WIST**, **WISTA**, a quantity, or measure of land among our Saxon ancestors; of different dimensions, in different places.— In the *Monasticon*, it is said to be half a hide, or sixty acres: in an old chronicle of the monastery of Battle, it is said to be forty-eight acres. See **HIDE**, &c.

**WIT**, a faculty of the mind, consisting, according to Mr. Locke, in the assembling, and putting together of those ideas with quickness and variety, wherein can be found any resemblance or congruity; whereby to make up pleasant pictures, and agreeable visions to the phantasy. See **FACULTY**, and **IMAGINATION**.

This faculty, the same great author observes, is just the contrary of *judgment*, which consists in the separating carefully from one another, such ideas wherein can be found the least difference, thereby to avoid being misled by similitude, and, by affinity, to take one thing for another. See **JUDGMENT**.

It is the metaphor, and allusion, wherein, for the most part, lies the entertainment and pleasantry of *wit*; which strikes so lively on the fancy, and is therefore so acceptable to all people, because its beauty appears at first sight, and there is required no labour of thought, to examine what truth or reason there is in it.— The mind, without looking any further, rests satisfied with the agreeableness of the picture, and the gaiety of the imagination; and it is a kind of affront to go about to examine it by the severe rules of truth, or reason.— Whence it should seem, that *wit* consists in something that is not perfectly conformable to them. *Essay on Hum. Underst.* Lib. I. cap. 11.

**WIT** is also an appellation, given to persons possessed of the faculty called *wit*, *esprit*.

A French author, who, in 1695, published a treatise of *wit*, *du bel esprit*, lays down four characteristics thereof.—

1°. A man, who, with an open air, and easy motions, affects those he converses withal agreeably; and on any subject that presents itself, advances new thoughts, and adorns them with a spritely turn; is, all the world over, a *wit*.  
2°. Another, who, less solicitous about the choice and delicacy of his sentiments, knows how to make himself valued by I know not what elevation of discourse; who draws a deal of attention, and shews a deal of vivacity in his speaking, and readiness in his answers, is likewise acknowledged a *wit*.

3°. A third, who takes less care about thinking, than about speaking well; who affects fine words, though perhaps low and poor in matter; who pleases by any easy pronunciation, and a certain tone of voice, is placed in the same rank.

4°. Another, whose chief aim is not to make himself esteemed, so much as to raise mirth and laughter: who jokes pertinently, rallies pleasantly, and finds something to amuse himself withal in every pretty subject, is likewise allowed a *wit*.

Yet, it may be observed, that in all these cases, there is nothing of real *wit*, as above defined; but the whole is *imagination*, or *memory* at most: nay, the whole is no more than temperament may give.

A true *wit* must have a just faculty of discernment; must have, at the same time, both a deal of energy, and of delicacy in his sentiments; his imagination must be noble, and withal happy and agreeable; his expressions polite and well turned; without any thing of parade or vanity in his discourse, or his carriage.—It is not at all essential to a *wit*, to be ever hunting after the brilliant; still studying fine thoughts, and affecting to say nothing but what may strike and surprize.

This is a fault very frequent in dramatic persons: the duke of Buckingham rallies it very justly.—

“What is that thing which we *sheer wit* do call?

“’Tis when the *wit* of some great writer shall

“So overflow, that is, be none at all;

“That even his fools speak sense.—

*Humour*, say our critics, is the genuine *wit* of comedy. See HUMOUR, COMEDY, &c.

*Child-WIT*. See the article CHILD-WIT.

WITCHCRAFT, the crime of sorcery, especially in women. See SORCERY, and MAGIC.

There may, perhaps, be some foundation for what we call *fascination*, and *witchcraft*.—We have infinite instances, and histories to this purpose; which it were not fair to set aside, merely because they are not reconcilable to our philosophy: but, as it happens, there seems to be something in philosophy to countenance them. See FASCINATION.

All living things, we know, emit effluvia, both by the breath, and the pores of the skin.—All bodies, therefore, within the sphere of their perspiratory, or expiratory effluvia, will be affected by them; and that, in this or another manner, according to the quality of the effluvia; and in this or that degree, according to the disposition of the emittent, and recipient parts. See EFFLUVIA.

Thus far is incontestable; nor need we produce instances of animals exhaling sweet, or stinking smells; or of infectious diseases conveyed by effluvia, &c. in confirmation thereof.

Now, of all parts of an animal body, the eye, we know, is the quickest.—It moves with the greatest celerity, and in all the variety of directions.—Again, its coats and humours are as permeable as any other part of the body, (witness the rays of light it so copiously receives).—The eye, therefore, no doubt, emits its effluvia like the other parts.—The fine humours of the eye must be continually exhaling.—The heat of the pervading rays will rarefy and attenuate them: and that, with the subtle juice, or spirit of the neighbouring optic nerve, supplied, in great abundance, by the vicinity of the brain, must make a fund of volatile matter to be dispensed, and, as it were, determined by the eye.

Here, then, we have both the dart, and the hand to sling it.—The one furnished with all the force and vehemence, and the other with all the sharpness and activity, one would require. No wonder if their effects be great!

Do but conceive the eye as a sling, capable of the swiftest and intensest motions and vibrations: and, again, as communicating with a source of such matter, as the nervous juice elaborated in the brain; a matter so subtle and penetrating, that it is supposed to fly instantaneously through the solid capillaments of the nerves; and so active and forcible, that it distends and convulses the muscles, and distorts the limbs, and alters the whole habitude of the body, giving motion and action to a mass of inert, inactive matter.—A projectile of such a nature, flung by such an engine as the eye, must have an effect wherever it strikes: and the effect will be limited and modified by the circumstances of distance, the impetus of the eye, the quality, subtilty, acrimony, &c. of the juices, and the delicacy, coarseness, &c. of the object it falls on.

This theory, we are of opinion, may account for some of the phenomena of witchcraft, particularly of that branch called *fascination*.—It is certain the eye has always been esteemed the chief seat, or rather organ of *witchcraft*; though, by most, without knowing why, or wherefore: The effect was apparently owing to the eye; but how was not dreamed of.—Thus, the phrase, to have an *evil eye*, imports as much as to be a *witch*.—And hence Virgil—*Nescio quis teneros oculus mihi fascinat argos*.—Again, old, bilious persons, are those most frequently supposed to have the faculty; the nervous juice in them being depraved, and irritated by a vicious habitude of body; and so rendered more penetrating, and malignant.—And young persons, chiefly children and girls, are most affected by it; by reason their pores are patent, their juices incoherent, and their fibres delicate, and susceptible. Accordingly, the *witchcraft* mentioned by Virgil, only reaches to the tender lambs.—Lastly, the faculty is only exercised when the person is displeased, provoked, irritated, &c. It requiring some extraordinary stress, and emotion of mind, to dart a proper quantity of the effluvia, with a sufficient impetus, to produce the effect at a distance. That the eye has some very considerable powers, is past dispute.—The antient naturalists assure us, that the basilisk, and opoblepa, kill other animals merely by staring at them. If this fail of credit; a late author assures us to have seen a mouse running round a large toad, which stood looking earnestly at it, its mouth open: still the mouse made less and less circles about it; crying all the while, as if compelled thereto; and, at last, with a deal of seeming reluctance, ran into the gaping mouth, and was straight swallowed.

Who has not observed a setting-dog; and the effects of its eye on the partridge? The poor bird, when once its eyes meet those of the dog, stands as if confounded, regardless of itself, and easily lets the net be drawn over it.—We remember to have read of squirrels stupified, and overcome by a dog's staring hard at them, and thus made to drop out of their trees into his mouth.

That man is not secure from the like affections, is matter of easy observation. Few people but have, again and again, felt the effects of an angry, a fierce, a commanding, a disdainful, a lascivious, an intreating eye, &c.—These effects, no doubt, are owing to the different ejaculations from the eye; and are a degree of *witchcraft*. See PHYSIOGNOMY.

WITENA-Mot, or WITENA-Gemot, among our Saxon ancestors, a term literally signifying council, or assembly of sages, or wise men; applied to the great council of the land, of latter days called *parliament*. See PARLIAMENT.

WITHERNAM\*, in law, a reprisal, or taking of other goods or cattle, in lieu of those unjustly taken and esoined, or otherwise with-holden.

\* The word is compounded of the Saxon *wiþen*, *contra*, against, and *nam captio*, taking. See NAM.

Where goods are taken by colour of distress, and driven to an hold, or out of the county; so that the sheriff cannot, upon replevin, make deliverance thereof to the party distrained: in this case the writ of *withernam*, or *de vetito namio*, is issued, directed to the sheriff, for the taking as many of the party's beasts, as he did thus unlawfully restrain; or as much goods of his, till he had made deliverance of the first distress. See DISTRESS, REPLEVIN, &c.

*Homine capto in WITHERNAMUM*. See HOMINE.

WITHERS of an horse, the juncture of the shoulder-bones at the bottom of the neck and main, towards the upper part of the shoulder. See HORSE.

WITNESS, *Testis*, a person who certifies, or asserts the truth of any fact. See EVIDENCE.

Among the Romans, it was a custom to pull or pinch the ears of *witnesses* present at any transaction; that they might remember it when they were called to give in their testimony. Two eye-witnesses, or *de visu*, not suspected, are deemed a conclusive proof. See TESTIMONY, PROOF, CERTITUDE, &c.

Falsse *witnesses*, suborners of *witnesses*, &c. in England, are punished with the pillory; in several other countries, with death. See PERJURY, SUBORNATION, &c.

In a synod at Rome, under Constantine, in the year 320, it was decreed, that there should be 72 *witnesses* heard, to condemn a bishop; which was called *libra testium*, a pound of *witnesses*. Accordingly there were 72 *witnesses* heard against Pope Marcellinus; who, says the historian, *erant electi libra occidua*. See OATH, PURGATION, &c.

Antiently there were synodal *witnesses*, *testes synodales*, in each parish, chose by the bishop, to enquire into the heresies, and other crimes of the parishioners; and to make oath thereof on the relics of the saints. See SYNODALES.

Attic WITNESS. See the article ATTIC.

WOAD, *Guadam*, or *Glastum*, a drug used by the dyers, to give a blue colour. See BLUE, and DYING.

It arises from a seed, sown annually in the spring; which puts forth a plant called *glastum sativum*, whose leaves resemble those of ribwort-paintain.—They have usually three, four,

four, or five crops of leaves every year; but only the two or three first are of any value; whereof the first is best, and the rest in their order.

When the leaves are ripe, they crop or gather them; after which, they carry them to a woad-mill to grind them small: after which, they are laid eight or ten days in piles or heaps; and at last made into a kind of balls, which are laid in the shade, on hurdles, to dry.

This done, they break or grind them to powder; and when ground, spread it on a floor, and water it, which they call *couching*.

Here they let it smoke and heat, till, by torrifying it every day, it becomes quite dry, which they call *silvering*. A week after which, it is in a condition to be used in dying. The antient Britons used to dye their bodies herewith; and some hold, that it was from this plant, glass took its denomination; though others derive both *glass*, and *glastum*, from the British *glas*, which, to this day, denotes a blue colour. See GLASS.

A *woad blue*, is a very deep blue, almost black; and is the base of so many sorts of colours, that the dyers have a scale, whereby they compose the divers casts or degrees of *woad*, from the brightest to the deepest. See DYING.

WOLD\*, signifies a plain down, or open champain-ground, hilly, and void of wood.

\* Hence the names, Stow in the *Wold*, and *Cotswold* in Gloucestershire; whence also that part of Leicestershire, which lies northward beyond the Wrekin, is called the *Wold of Leicestershire*.

WOLD, or WELD, among dyers. See the article WELD.

WOLFESHEAD\*, or WULVESHEAD, *Caput lupinum*, denoted the condition of those out-lawed for criminal matters in the Saxons time, and not yielding themselves to justice. — For if they could have been taken alive, they must have been brought to the king; and if they, for fear of being apprehended, did defend themselves, they might be slain, and their heads brought to the king; for their head was no more to be accounted of than a *wolf's head*. LL. Edw. in Lamb. fol. 127. and *Bract. Lib. III. Tract. 2. cap. 11*. See UTLAWRY.

\* The word is originally Saxon, *pulfer-heafod*, compounded of *pulf*, *wolf*, and *heafod*, *head*.

WOLVES Teeth, of an horse, are over-grown grinders, the points of which being higher than the rest, prick their tongue and gums in feeding, so as to hinder the chewing of their meat.

They are seldom met with in young horses; but if the teeth be not daily worn by chewing, they will grow up even to pierce the roof of the mouth. See TOOTH.

ROUT of WOLVES. See the article ROUT.

WOMAN, FOEMINA, *Mulier*, the female of man. See FEMALE, MALE, &c.

S. Augustin calls *women* the *devout sex*: at least this is the common opinion; though others rather think, that in the prayer usually attributed to that father, and still rehearsed in the Romish church to the holy virgin, the words *intercede pro devoto femineo sexu*, are to be understood of *women* devoted, or consecrated to God in religious houses; which had been sufficiently expressed by the words, *ora pro populo, interveni pro clero*. See SEX; see also RELIGIOUS, &c.

It is a popular tradition among the Mahometans, which obtains to this day, that *women* shall not enter paradise. See HEAVEN.

An anonymous author, about the close of the sixteenth century, published a little Latin dissertation, to prove that *women* are not men; that is, are not reasonable creatures: *dissertatio perjuranda qua anonymus probare nititur mulieres homines non esse*. — He also endeavours to prove, what naturally follows from this principle, *viz.* that *women* shall not be saved; that there is no future life, or happiness for them. His proofs are all taken from scripture, or founded on scripture. — Though, after all, his aim is not so much to degrade *women* to the condition of brutes; as to ridicule the principle or method of many Protestants, who, in points of controversy, admit of no proofs or considerations, but what are taken from scripture alone. — This appears from the conclusion of the work. — *Probavi, opinor, invictissimis SS. Litterarum testimoniis, mulierem non esse hominem, nec eam salvam: quod si non effeci, ostendi tamen universo mundo quo modo hujus temporis heretici, & praesertim Anabaptistae, sacram soleant explicare scripturam, & quo utantur methodo ad stabilenda sua execranda dogmata*.

Yet, Simon Gedecus, a Lutheran divine, wrote a serious confutation of this piece in 1595; wherein the *women* are restored to the expectation of heaven, on their good behaviour.

The antient Marcionites allowed their *women* to baptize; as we are assured by S. Epiphanius, *Her. 42. c. 4*. — The Montanists admitted *women* to the priesthood, and even the episcopate. *Epiph. Her. 49. c. 2*. — The modern Quakers also permit their *women* to preach and prophecy, on an equal footing with the men. See MARCIONITE, QUAKER, &c.

It is a point much controverted, how far learning and study become the sex? — Erasmus handles the question at large in one of his letters to Budæus. — Lud. Vives, in his *Institutio Fœminæ Christianæ*, has a chapter express on the same subject. — Madam Schurman, a German lady, has gone beyond them both, in a treatise on this problem; *Num Fœminæ Christianæ conveniat studium literarum?*

Several of the *women* remarkable for learning, have been also distinguished for their want of conduct. — The reason, no doubt, lay in this; that their first studies lying in books of gallantry and intrigue, the imagination was early turned that way, and the memory filled with a sort of ideas, which a favourable disposition, and age, adopted too easily, and improved too fast. — It is not that study in itself has any natural tendency to produce such effects; rather the contrary: The close abstracted researches of metaphysics, logics, mathematics, physics, criticism, &c. no doubt, would be one of the surest means to secure and establish the virtue of continency in a *woman*.

A *woman*, in England, as soon as she is married, with all her moveables, is wholly in *potestate viri*, at the will and disposal of her husband. See HUSBAND.

There are divers considerable things relating to *women* in the laws of England; which see under the article WIFE.

WOMB. See the article MATRIX.

Suffocation of the WOMB. See the article SUFFOCATION.

WONDER. See the article MIRACLE.

The *seven wonders of the world*, as they are popularly called, were, the *Egyptian pyramids*; the *mausoleum*, erected by Artemisia; the *temple of Diana* at Ephesus; the *walls and hanging gardens* of the city of Babylon; the *colossus*, or brazen image of the sun at Rhodes; the *statue of Jupiter Olympius*; and the *pharos*, or watch-tower, of *Ptolemy Philadelphus*. See PYRAMID, MAUSOLEUM, COLOSSUS, PHAROS, &c.

WONDERFUL Water. See the article WATER.

WOOD, *lignum*, a solid substance, whereof the trunks and branches of trees consist; and deriving its growth from certain juices in the earth. See TRUNK, BRANCH, UNDERWOOD, &c.

The *wood* is all that part in a tree, included between the bark and the pith. See TREE, and BARK.

Dr. Grew, in his *Anatomy of Plants*, has discovered, by means of the microscope, that what we call *wood* in a vegetable, notwithstanding all its solidity, is only an assemblage of infinite minute canals, or hollow fibres; some of which rise from the root upwards, and are disposed in form of a circle; and the others, which he calls *injections*, tend horizontally from the surface to the centre; so that they cross each other, and are interwove like the threads of a weaver's web. See VEGETATION, SAP, &c.

*Woods* are distinguished into divers kinds, with regard to their natures, properties, virtues, and uses. — Of *wood*, considered according to its qualities, whether useful, curious, medicinal, &c. the principal is that called *timber*, used in building houses, laying floors, roofs, machines, &c. See TIMBER.

*Woods* valued on account of their curiosity, are *cedar*, *ebony*, *box*, *calambo*, &c. which, by reason of their extraordinary hardness, agreeable smell, or beautiful polish, are made into tables, combs, beads, &c. See EBONY, &c.

The medicinal *woods* are, *guaiac*, which the Spaniards call *ligno sancto*; *aloes*, or *agallochum*; *sassafras*, *nephriticum*, *fantal*, *saraparilla*, *asphaltum*, *eagle wood* or *pao d'aquila*, &c. See ALOES, SASSAFRAS, &c.

*Woods* used in dying, are the *Indian wood*, *Brazil*, *Campeche*, &c. See BRASIL, INDIAN, &c.

Cord WOOD, denotes *wood* for the fire, generally made of the branches or loppings of trees, piled up in order.

This is limited to be below, seventeen inches, and above, six inches thick; and, at least, three feet and a half long. See CORD.

Fossil subterraneous WOOD. — There are divers places where *wood* is found under ground: whether overturned, and buried there from the time of the deluge, as many suppose; or whether formed and produced there, as jet is known to be. See SUBTERRANEAN, FOSSIL, JET, &c.

Not long ago, there were found in England, above a hundred feet depth, several huge oaks, with all their branches on; and which, by their subterraneous situation, had contracted a black colour, nothing inferior to jet, joined with a hardness, which far surpassed that of any living oak. — It is hard to conceive how such trees should have come there, unless by a general subversion of the whole terrestrial globe at the flood. See DELUGE.

Mr. Boyle mentions a huge oak dug out of a salt-mine in Transilvania, so hard as not easily to be wrought on by iron tools; yet being exposed to the air, out of the mine, became so rotten, that in four days it crumbled between the fingers. *Dissert. de Admir. Hung.* — And Mr. Derham observes the same of the trees lately turned up by the breaches at Dagenham, &c. *Philos. Transf. N° 335*. See MOSS.

WOOD, *Sylva*, in geography, a multitude of trees, extended over a large continued track of land, and propagated without culture. See FOREST.

The generality of woods only consist of trees of one kind.—

At Cape Verd in Africa, are woods of orange and lemon trees; in Ceylon, are woods of cinnamon trees; in the Molucca islands, woods of caraway trees; in the islands of Nero, Lontour, Losgain, &c. woods of nutmeg trees; in Brazil, woods of brazil trees, &c. in Numidia, woods of date trees; in Madagascar, woods of tamarind trees, &c.

WOOD and wood, in the sea language, is when two pieces of timber are so let into each other, that the wood of the one joins close to the other.

WOOD-CORN, is a certain quantity of oats, or other grain antiently given by customary tenants to their lord, for the liberty to pick up dead or broken wood.

WOOD-GELD, WOODGELDUM, in our antient customs, the gathering or cutting of wood within the forest.— Or it may denote the money paid for the same to the foresters. Sometimes it also seems to signify an immunity from this payment, by the king's grant.— Crompton says expressly, it signifies to be free from the payment of money for taking of wood in a forest. See GELD.

WOOD-HAY, an antient custom at Exeter; whereby a log out of every seam of wood brought over Ex bridge, is taken towards the reparation of that bridge. *Antiq. of Exeter.*

WOOD-MOTE, the antient name of that forest-court, now called the court of attachment. See ATTACHMENT, and FOREST.

WOOD-PLEA-Court, is a court held twice a year in the forest of Clun in Shropshire, for determining all matters relating to wood, and the feeding of cattle there.— Perhaps it was originally the same with wood-mote-court.

WOODWARD\*, an officer of the forest, whose function is to look after the woods, and observe any offences either in vert or venison, committed within his charge; and to present the same; and in case any deer are found killed, or hurt, to inform the verdurer thereof, and present them at the next court of the forest. See FOREST.

\* Woodward may not walk with bows, and shafts, but with forest-bills.— *Arcum & calamos gestare in foresta non licet, sed (ut rescripti utar verbo) baculum tantummodo.* Term. Hill. An. 13 Ed. III.

WOOF, among manufacturers, the threads which the weavers shoot a-crofs, with an instrument called a shuttle, between the threads of the warp, to form the web. See WARP, WEB, WEAVING, &c.

The woof is of different matter, according to the piece to be wrought.— In taffety, both woof and warp are silk. See TAFFETY.

In mohairs, the woof is usually wool, and the warp silk.— In sattins, the warp is frequently flax, and the woof silk. See CLOTH, SERGE, SATTIN, VELVET, &c.

WOOL, *lana*, the hair, or covering of sheep; which, washed, shorn, dressed, combed, spun, wove, &c. makes divers kinds of stuffs, cloths, &c. for apparel, furniture, &c. See HAIR, and MANUFACTURE.

While the wool remains in the state it was first shorn off the sheep's back, and not sorted into its different kinds, it is called fleece. See FLEECE.

Each fleece consists of wool of divers qualities, and degrees of fineness, which the dealers therein take care to separate.

The French and English usually separate each fleece into three sorts; viz. 1<sup>o</sup>. *Mother-wool*, which is that of the back and neck. 2<sup>o</sup>. The wool of the tails and legs. 3<sup>o</sup>. That of the breast, and under the belly.

The Spaniards make the like division into three sorts, which they call *prime*, *second*, and *third*; and, for the greater ease, denote each bale or pack with a capital letter, denoting the sort.— If the triage or separation be well made, in fifteen bales there will be twelve marked R; that is, refine, or prime; two marked F, for fine, or second; and one S, for thirds.

The wools most esteemed are the English; chiefly those about Leominster, Cotswold, and the Isle of White; the Spanish, principally those about Segovia; and the French, about Berry: which last are said to have this peculiar property, that they will knot or bind with any other sort; whereas the rest will only knot with their own kind.

Among the antients, the wools of Attica, Megara, Laodicea, Apulia, and especially those of Tarentum, Parma, and Altino, were the most valued.— Columella sets the two last even about that at Tarentum, Lib. VIII. c. 2.— And Varro assures us, the people there used to clothe their sheep with skins, to secure the wool from being damaged. *De Re Rust.* Lib. II. c. 2.

Tavernier affirms, that the wools in Asia are incomparably finer than those of Europe; and that there is no doubt, but that wool was the golden fleece sought for at Colchis. See GOLDEN FLEECE.

The art of preparing and working wool, is attributed, by the antients, to Minerva; who, accordingly, is made the genius and protectress thereof. See WOOLLEN.

English WOOL.— The wools of England have always been in the highest repute; and that more abroad than at home.— Some we have, which, manufactured by our own clothiers, Chamberlayne observes, does, both for softness and fineness, vie with the choicest silks.— Spanish wools, we know, bear a great price among us; but it is certain, much the greatest part of that, which, when manufactured, our clothiers, &c. call Spanish cloth, grows in England.— Add, that the French can make no good cloth of their own wool, without, at least, one third of English wool mixed with it.— It is allowed, the goodness of the Spanish wool is owing to a few English sheep sent over into Spain, as a present, by Henry II. of England; or, as others will have it, though we think mistakenly, by Edward IV. in 1465.

The fineness and plenty of our wools is owing, in some measure, to the sweet, short grass in many of our pastures and downs; though the advantage of our sheep feeding on this grass all the year, without being obliged to be shut up in folds during the winter, or to secure them from wolves at other times, contributes not a little thereto.

The Scotch and Irish wools, are commonly sold abroad for English; and upon the same footing.— But foreigners, skilled in those matters, find they come far short of it in fineness; though, in some markets, the Irish is even said to be preferred to the English.

The yearly produce of wool in England is calculated by Dr. Davenant, and Mr. King, at two millions sterling. See WOOLLEN Manufactory.

Antiently, the principal commerce of the nation consisted in wool unmanufactured; which foreigners, especially the French, Dutch, and Flemish bought of us. Infomuch, that the customs of English wool exported in Edward the third's reign, amounted, at 50 s. a pack, to 250000 l. per annum. An immense sum in those days! See COMMERCE.

This excessive custom on the export of unmanufactured wool, set our people to the making it into cloth themselves.— In which they succeeded so well, that towards the close of the sixteenth century, under the reign of queen Elizabeth, the exportation of any wool at all was absolutely prohibited; and this, upon pain of having the right hand struck off. See CONTRABAND.

From that time, England has been exceedingly jealous of its wool.— To prompt their vigilance, the judges, king's council at law, and masters in chancery, in parliament, are seated on wool packs.— Accordingly, scarce a parliament but has renewed, and reinforced the prohibition; particularly, about the middle of the seventeenth century, the exporting of wool was made a capital crime.

But all these precautions are ineffectual; the English themselves, particularly about the coasts of Sussex, making use of the long winter nights to waft over their wools to France: being sure of carrying them to a good market, they despise the penalty, with an intrepidity, that the rest of Europe are amazed at it. See OWLERS.

M. Colbert, a name the French manufactures and commerce are infinitely indebted to, had entertained a design of procuring some of our English sheep, and propagating them in France; hoping, that by chusing them, in the provinces of that kingdom, such pastures, and such a sky as they had in their own island, they might there be perpetuated; and France be no longer obliged precariously to depend on the clandestine supplies of wool from the English owlers.— But the count de Cominges, then ambassador of France at the English court, laid the impossibility of having such an export of sheep, and the almost equal impossibility of keeping and making them multiply there, so strongly before him, that he abandoned the design.

Wool is reckon'd by the sack, containing two weighs; the weigh, six tod and a half; the tod, two stones; the stone, two cloves; and the clove, seven pounds.— Twelve sacks make a last, or 4368 pounds. See LAST, SACK, &c.

A sack of wool, or 364 pounds, is sufficient for four standard cloths, to render them true breadth, i. e. six quarters and a half; true weight, i. e. sixty pound; and the true length, i. e. twenty-four yards.

From the divers preparations of wool, see CARDING, COMBING, SPINNING, WEAVING, FULLING, CLOTH, &c.

Pocket of WOOL. } See the article { POCKET.  
Sarplar of WOOL. } SARPLAR.

WOOL-DRIVERS, are those who buy wool of the sheep-owners in the country, and carry it on horseback to the clothiers, or market-towns, to sell it again.

WOOLLEN Manufactory, includes the several sorts of commodities into which wool is wrought; as broad cloths, long and short kerseys, bays, serges, flannel, perpetuanas, says, stuffs, frieze, pennistons, stockings, caps, rugs, &c.— Each where—

whereof, see under its respective article **CLOTH, SERGE, FLANNEL, &c.**

The *woollen manufactory*, which now makes the principal article both in our foreign and domestic trade, being that which furnishes the cargoes of our vessels, that employs our people, &c. may be said to have had its rise in the fifteenth century.

Till that time, our *wool* was all sold in the fleece, to such of our neighbours as came to fetch it.— Among our customers, however, the principal were the Flemings, and Brabanters; and particularly the merchants of Gant and Louvain, who took off vast quantities to supply two manufactories that had flourished in those two cities from the tenth century; and had furnished the greatest part of Europe, and even England itself, with all sorts of *woollen* cloths, &c.— But the richness of the manufactories of Gant, and the incredible number of hands employed therein, having spirited up the inhabitants to revolt, divers times, against their sovereigns, on account of certain taxes which they refused to pay; the seditious were at length punished, and dispersed, and part of them took refuge in Holland, and the rest in Louvain.

These last, together with their art of manufacturing cloths, carried with them their spirit of sedition.— And it was not long ere several of them, to avoid the punishment they had deserved for killing some of the magistrates, removed into England; where they instructed our people how to work their own *wools*.

This establishment is referred to the year 1420; from which time no endeavours have been spared to keep our *wools* to ourselves. See **WOOL**.

The president Thuanus makes this epocha an hundred years later; and attributes the establishment of the *woollen manufatures* in England to queen Elizabeth, and the troubles about religion, which the severity of the duke of Alva and the Spanish Inquisition had occasioned, and kept up so long in the Low Countries.— But what that noble author says, is rather to be understood of their perfection, than their first establishment; and of the several great manufatures then set up at Norwich, Colchester, Sandwich, Hampton, &c.— For in the English and Flemish historians, we find mention made of the manufatures of London, long before any part of the seventeen provinces had attempted to throw off the Spanish yoke.

As this manufacture now stands, Dr. Davenant and Mr. King compute the produce thereof to be eight millions per annum; three fourths whereof are consumed at home, and the rest exported. See **REVENUE, POLITICAL Arithmetic, &c.**

So jealous are we now become of our *woollens*, that, besides the precautions taken to use all our own *wools* ourselves, we have added that of selling them ourselves, and of carrying them to the places where they are required; not admitting strangers to come and buy any in England. See **NAVIGATION**.

And hence the establishment of those famous *magazines* in Holland, the Levant, and the North, where our *woollens* are repositied, to be vended by factors, or commissioners.— The magazine in Holland has changed place divers times; and it has been successively at Middleburgh, Delf, Rotterdam, and Dort, where it now remains; and where all the Germans come to furnish themselves.— That for the Levant, is at Smyrna; and that for the North, at Archangel.

A pack, or 240 pounds weight of short *wool*, it is computed, employs sixty-three persons a week, to manufacture it into cloth; viz. three men to sort, dry, mix, and make it ready for the stock-carder; five to scribble, or stock-card it; thirty-five women and girls, to card and spin it; eight men to weave it; four men and boys to spool it, and reed quills; eight men and boys to scour, burl, mill, or full it; row, shear, pack, and press it.

A pack of large, long, combing *wool*, made into stuffs, serges, sagathies, &c. for the Spanish trade, will employ, for one week, 202 persons, whose wages amount to 43 l. 10 s.— Thus, 7 combers, 3 l. 10 s. dyers, 5 l. 150 spinners, 18 l. 20 throwers, and doublers, 5 l. 25 weavers, and attendants, 12 l.

A pack of *wool* made into stockings, will employ, for one week, 184 persons, who will earn 56 l.— Thus, 10 combers, 5 l. 5 s. the dyer, 1 l. 6 s. 102 spinners, 15 l. 12 s. doublers and throwers, 4 l. 10 s. 60 stocking-weavers, 30 l.

**Bleaching of WOOLLENS.** See the article **BLEACHING**.

**WOOL-STAPLE**, denotes a city or town where *wool* used to be sold. See **STAPLE**.

**WOOLSTED.** See the article **WORSTED**.

**WOOL-WINDERS**, are persons employed in winding up fleeces of *wool* into bundles, to be packed, and sold by weight.— These are sworn to do it truly between the owner and the merchant.

**WORD**, in language, is an articulate sound, designed to represent some idea. See **SOUND, VOICE, SIGN, IDEA, &c.**

**WORD**, in writing, is an assemblage of several letters, forming one or more syllables, and signifying some thing. See **LETTER, and SYLLABLE**.

VOL. II. No. 166,

The Port-Royalists define *words* to be distinct articulate sounds, agreed on by mankind, to convey their thoughts and sentiments by. See **LANGUAGE**.

Grammarians divide *words* into eight classes, called *parts of speech*; which are the *noun, pronoun, verb, participle, adverb, conjunction, preposition, and interjection*; to one or other of which, all the *words* and terms in all languages, which have, or may be invented to express our ideas, are reducible. See each under its proper article, **NOUN, PRO-NOUN, VERB, &c.**

*Words*, again, are divided into *primitives* and *derivatives*, *simple* and *compound*, *synonymous* and *equivocal*. See **PRIMITIVE, DERIVATIVE, ROOT, &c.**

With regard to their syllables, *words* are further divided into *monosyllables*, and *polysyllables*. See **MONOSYLLABLE, and POLYSYLLABLE**.

The grammatical figures of *words*, which occasion changes in the form, &c. thereof, are *syncope, apocope, apostrophe, diæresis, aphæresis, prosthesis, epenthesis, paragoge, metathesis, &c.* See each in its proper place, **SYNCOPE, APOCOPE, &c.** see also **FIGURE, &c.**

The use of *words*, we have observed, is to serve as sensible signs of our ideas; and the ideas they stand for in the mind of the person that speaks, are their proper significations. See **SIGN, SEMEOTICA, SCIENCE, &c.**

*Simple* and *primitive words* have no natural connection with the things they signify; whence there is no rationale to be given of them: it is by a mere arbitrary institution and agreement of men, that they come to signify any thing.— Certain *words* have no natural propriety or aptitude, to express certain thoughts, more than others; were that the case, there could have been but one language. See **PRIMITIVE**.

But, in derivative and compound words, the case is somewhat different.— In the forming of these, we see, a regard is had to agreement, relation, and analogy: thus, most *words* that have the same ending, have one common and general way of denoting or signifying things; and those compounded with the same prepositions, have a similar manner of expressing and signifying similar ideas in all the learned languages where they occur.

For the perfection of language, it is not enough, Mr. Locke observes, that sounds can be made signs of ideas; unless these can be made use of, so as to comprehend several particular things; for the multiplication of *words* would have perplexed their use, had every particular thing needed a distinct name to be signified by.

To remedy this inconvenience, language had a farther improvement in the use of general terms, whereby one *word* was made to mark a multitude of particular existences; which advantageous use of sounds was obtained only by the difference of the ideas they were made signs of; those names becoming general, which are made to stand for general ideas; and those remaining particular, where the ideas they are used for are particular. See **GENERAL, ABSTRACT, &c.**

It is observable, that the *words* which stand for actions, and notions quite removed from sense, are borrowed from sensible ideas; as, to imagine, apprehend, comprehend, understand, adhere, conceive, instil, disgust, disturbance, tranquillity, &c. which are all taken from the operations of things sensible, and applied to modes of thinking.— *Spirit*, in its primary signification, is no more than breath; *angel*, a messenger. By which we may guess what kind of notions they were, and whence derived, which filled the minds of the first beginners of languages; and how nature, even in the naming of things, unawares, suggested to men the originals of all their knowledge: whilst, to give names that might make known to others any operations they felt in themselves, or any other ideas that came not under their senses, they were forced to borrow *words* from the ordinary and known ideas of sensation. See **SENSATION, PERCEPTION, &c.**

The ends of language in our discourse with others, are chiefly three: first, to make our thoughts or ideas known one to another.— This we fail in, 1°. When we use names without clear and distinct ideas in our mind. 2°. When we apply received names and ideas, to which the common use of that language doth not apply them. 3°. When we apply them unsteadily, making them stand now for one, and anon for another idea.

Secondly, to make known our thoughts with as much ease and quickness as possible.— This men fail in, when they have complex ideas, without having distinct names for them; which may happen either through the defect of a language, which has none; or the fault of the man, who has not yet learned them.

Thirdly, to convey the knowledge of things.— This cannot be done, but when our ideas agree to the reality of things.— He that has names without ideas, wants meaning in his *words*, and speaks only empty sounds.— He that has complex ideas without names for them, wants dispatch in his expression.— He that uses his *words* loosely and unsteadily, will either not be minded, or not understood.— He

that applies names to his ideas, different from the common use, wants propriety in his language, and speaks gibberish; and he that has ideas of substances, disagreeing with the real existence of things, so far wants the materials of true knowledge. See KNOWLEDGE.

*Division of Words.* } See the article { *DIVISION.*  
*General Words.* } *GENERAL.*

**WORD, Watch-WORD**, in an army, or garrison, is some peculiar word, or sentence, by which the soldiers know, and distinguish one another in the night, &c. and by which spies, and designing persons are discovered.

It is used also to prevent surprizes.—The *word* is given out in an army every night by the general, to the lieutenant, or major-general of the day, who gives it to the majors of the brigades, and they to the adjutants; who give it first to the field-officers, and afterwards to a serjeant of each company, who carry it to the subalterns.

In garrisons it is given, after the gate is shut, to the town-major, who gives it to the adjutants, and they to the serjeants. See **ROUNDS**.

**WORD**, in heraldry, &c. See the article **MOTTO**.

**WORK-HOUSE**, a place where indigent, vagrant, and idle people are set to *work*, and maintained with cloathing, diet, &c.

Such is Bridewell, and several other places about the city, or suburbs; particularly that in Bishopgate-street, for employing the poor children of the city and liberties, who have no settlement; and that for the parish of S. Margaret's Westminster, called the *grey-coat hospital*. See **HOSPITAL**.

At Amsterdam they have a famous *work-house*, or house of correction, called the *Rasphuyse*, which, by a privilege granted in 1602, has alone the right of shaving, and cutting the dyers woods, as brazil, fantal, campeche, sassafras, &c.

Each person, tolerably strong, kept in the house, is obliged to furnish 250 pounds of rasped wood per day; and the weaker, a certain quantity of chips.

**WORKS, Opera**, in fortification, the several lines, trenches, ditches, &c. made round a place, an army, or the like, to fortify, and defend it.—See *Tab. Archit. fig. 21.* see also the articles **LINE**, **TRENCH**, &c.

The principal *works*, in a fortress, or fortified place, see under the articles **FORTIFIED Place**, **FORTIFICATION**, &c.

**WORLD, Mundus**, the assemblage of parts which compose the universe. See **UNIVERSE**.

The *duration of the world*, is a thing which has been greatly disputed.—Plato, after Ocellus Lucanus, held it to be eternal; and to have flowed from God, as rays flow from the sun. Aristotle was much of the same mind: he asserts, that the *world* was not generated, so as to begin to be a *world*, which before was none: and, in effect, his whole eighth book of *Phys.* and first book of *de Cælo*, is spent in proving the eternity of the *world*. See **ETERNITY**.

He lays down a pre-existing and eternal matter, as a principle; and thence argues the *world* eternal.—His argument amounts to this, that it is impossible an eternal agent, having an eternal passive subject, should continue long without action. See **ARISTOTELIAN, MATTER**, &c.

His opinion was generally followed; as seeming to be the fittest to end the dispute among so many sects about the first cause. See **CAUSE**.

Epicurus, however, though he makes matter eternal, yet shews the *world* to be but a new thing, formed out of a fortuitous concurrence of atoms. See *Lucretius*, Lib. V. See **MATTER, ATOM**, &c. see also **EPICUREAN**, &c.

Some of the modern philosophers refute the imaginary eternity of the *world*, by this argument: that, if it be ab æterno, there must have been a generation of individuals, in a continual succession from all eternity; since no cause can be assigned why they should not be generated, viz. one from another.—Therefore, to consider the origin of things, and the series of causes, we must go back in infinitum, i. e. there must have been an infinite number of men, and other individuals already generated; which subverts the very notion of number.—And if the cause which now generates hath been

produced by an infinite series of causes; how shall an infinite series be finite, to give room for new generations?

Dr. Halley suggests a new method of finding the age of the *world*, from the degree of saltiness of the ocean. See **SALT-NESS**, &c.

It is another popular topic of controversy, whether the *world* be finite, or infinite? See the arguments on both sides, under the article **UNIVERSE**.

It is likewise disputed, whether the plurality of *worlds* be possible? See **PLURALITY**.

Some hold the affirmative, from an opinion of the infinite power of the Deity; it being a setting bounds to omnipotency, to say, that he created so many bodies at first, and that he could not create more.

The Cartesians maintain the negative, upon these principles: that it is a contradiction to say, there are several *worlds* existing at the same time, since this implies several universes of created beings, the *world* being the *το πᾶν*. That if there were several *worlds*, they must either be at a distance from one another, or contiguous; but neither can be said: for were they contiguous, they would only constitute one; and were they distant, there must be something between. But what can be between? If it be extended, it is corporeal; and instead of separating the several *worlds*, will connect them into one.

The *Existence of an eternal World* has been much controverted of late. The arguments on either side, see under the articles **BODY, EXISTENCE** and **EXTERNAL**.

The *world* is sometimes divided into *upper*, and *lower*.

*Lower*, or *sublunary WORLD*, is the globe of our earth. See **EARTH**.

*Upper WORLD*, includes the heavens, and heavenly bodies. See **HEAVEN, COELESTIAL**, &c.

<i>Axis of the WORLD.</i>	} See the article {	<b>AXIS.</b>
<i>Map of the WORLD.</i>		<b>MAP.</b>
<i>Soul of the WORLD.</i>		<b>ANIMA Mundi.</b>
<i>System of the WORLD.</i>		<b>SYSTEM.</b>

**WORMS, Lumbrici**, or *Vermes*, in medicine, a disease arising from some of those reptiles being generated, and growing in the body: whence, frequently, dire symptoms do proceed. The ordinary place of the *worms*, is the intestines: though there is scarce any part of the body but is sometimes infected with them: for besides the *vermes intestinales*, there are *dentales*, *gingivales*, *pulmonarii*, *cardiaci*, *sanguinari*, *cutaneous*, *umbilical*, *hepatic*, *salival*, &c.

They are all usually supposed to be ingendered from the eggs of some insect, deposited in something that is taken into the body by way of food; or some other way: an hypothesis, however, which will hardly account for certain species of these insects, not to be found but in the bodies of animals.—A solution of this difficulty will, perhaps, be hard to find, without having recourse to the first stamina of animals, and the principles of generation. See **ANIMAL, GENERATION, INSECT**, &c.

There are three species of *worms*, most frequent in the human body: the *teretes*, or round and thick, mostly found in the duodenum; the *latus*, or flat, called also *tænia*; and the round and small, found in the rectum, called *ascarides*. See **ASCARIDES**, &c.—Sometimes, indeed, there are anomalous *worms* expelled; as horned, hairy, four-footed, two-headed, &c. *worms*.

The symptoms of this disease are, vomiting, head-ach, heart-burn, sighing, swooning, feeble pulse, heavy sleep, deliria, squinancy, pleurisy, canine hunger, and innumerable others; occasioned by the animals sucking, moving, vellicating, gnawing, consuming the chyle, irritating the nerves, wounding the solids, &c.

As to the *latus*, beside the other common symptoms, those affected with this, have one peculiar to them; which is, that with their stools they discharge several little bodies, like gourd-seeds.

Dr. Tyson, in the *Philosophical Transactions*, No 146. gives a curious account of the *flat worm*, or *lumbricus latus*; called by Hippocrates, *tænia*, and in English, ordinarily, the *tape-worm*, or *joint-worm*.—This is always single: it lies variously convoluted; being sometimes as long as all the guts; and sometimes vastly exceeds that length.

Olaus Borrichius assures us, a patient of his, in a year's time, voided 800 foot of this *worm*, though he had not yet met with the head: in voiding, the patient always observed it to break off.

Dr. Tyson parallels this case with that of a patient of his, who voided vast quantities of this *worm*, for several years together; but in various pieces: some two, three, four, six, or more yards long: but all put together, he says, would much exceed the length of that of Borrichius.

The joints in this *worm* are very numerous: in one of 24 feet long, Dr. Tyson numbered 507 joints.—Above the middle of the edges of each joint, he observed a protuberant orifice.—Those orifices he takes for so many *mou*ths; the best microscopes discovering no mouth in what usually passes for the head.

The *worm* is frequent enough in most kinds of animals; as dogs,

dogs, oxen, crabs, herrings, pikes, &c.—Some authors assert, that it is not one, but many *worms* linked together, and included in a spoliolum of the intestines; and that this spoliolum is not animated, but receives its sense and motion from a sort of vermiculi cucurbitini inclosed in it.—This, Gabucinus, *de Lumb. Com.* says, he has plainly discovered: but Dr. Tyfon abundantly evinces the contrary.

In Persia, &c. there are very long slender *worms*, six or seven yards long, bred in the legs, and other parts of men's bodies: when arrived at a certain pitch, they put out their heads, necks, &c. and withdraw them (if displeased or hurt) again, causing intolerable pains, fevers, &c. See CRINONES, and DRACUNCULI.

Aristotle observes, that all deer have *worms* under their tongues.—Sheeps noses often abound with them.

In the *Philosoph. Transact.* No 113. we have accounts of divers remarkable operations whereby *worms* were taken out of divers unsuspected parts of the body; the operators being chiefly women.—Mrs. Mary Hastings is there recorded, as famous for the discovering of *worms* hid in the face, gums, tongue, &c. which she managed with such address, that she took them out of any part affected, with a goose-quill.—Mr. Dent relates, that he himself was cured of certain odd tumors on his tongue, by one of those worm-doctresses, Mrs. French; who, piercing the parts affected with a lancet, drew out five or six *worms* at a time.—In less than eight days, he assures us, she took out of his tongue above a hundred *worms*, and thirty out of his gums. See HYDATIDES.

Sir Theodore Mayerne assures us, in the *Philosoph. Transact.* No 211. that the famous sugar, or remedy given by Pontæus, (a celebrated chymical empiric) for the *worms* in children, is fifteen grains of mercurius dulcis, with five grains of scammony, or two or three times as much sugar, made up in lozenges.—He adds, that this dose, which in France purges grown persons, is ineffectual in England, to persons of above fifteen years old, and ought to be augmented. See WORMSEED.

Cochineal WORM.	} See the article	COCHINEAL.
Silk WORM.		SILK.
Solitary WORM.		SOLITARY.
Spermatic WORM.		SPERMATIC.

WORM, in chymistry, denotes a long, winding pewter-pipe, which distillers and apothecaries place in a tub of water, to cool and condense the vapours in the distillation of spirits. See ALEMBIC, DISTILLATION, &c.

This the chymists also call a *serpentine*. See SERPENTINE.—Formerly, this *worm*, or something like it, was placed above the head of the still, with a refrigeratory at the upper end of it, which is useful enough in the distilling of spirit of wine. See REFRIGERATORY.

To WORM a cable, or *hawser*, in the sea-pharse, signifies to strengthen it, by winding a small line, or rope, all along between the strands. See CABLE, &c.

To WORM a dog, is to take out a kind of *worm* from under his tongue; which, if let alone, would make him mad.

WORM-SEED, *Semen contra, semen sanctum, or semen santonicum*, is a hot, bitter, drying kind of seed, proper to destroy *worms* generated in a human body, particularly in children. See WORMS.

This seed is small, of a brownish colour, an oblong figure, a bitter taste, and a strong smell.—It must be chosen new, greenish, of a sharp, bitter, aromatic taste, not a little disagreeable.

The place where it is produced, is Persia, about the frontiers of Muscovy. It is brought to us from Aleppo, &c.—Naturalists are not agreed about the plant that produces it. J. Bauhine has a large dissertation on the subject.—Some will have it the species of absynthium, or wormwood, called *santonicum*, or *marinum absynthium*; others will have it the *tanacetum*, others the *abrotanum*.

M. Tournefort gives us the following account of this notable drug, in the second volume of his travels. The *sementine*, or *worm-powder*, is not gathered like our seeds.—The plant grows in the meadows, and must be let ripen; and the mischief is, that as it grows near to maturity, the wind scatters a good part of it among the grass, where it is lost; and this it makes it so dear.

As they dare not touch it with the hand, for fear of making it spoil the sooner; when they would gather what is left in the ear, they have recourse to this expedient.—They take two hand-baskets, and, walking along the meadows, sweep the baskets, the one from right to left, the other from left to right, as if they were mowing; by this means the seed is shook out into the baskets.

WORMWOOD, a medicinal herb, among physicians, &c. called *absynthium*. See ABSYNTHIUM.

WORMWOOD-Wine, *Vinum absynthites*. See VINUM.

WORSHIP of God, *Cultus Dei*, amounts to the same with what we otherwise call *religion*. See RELIGION.

This *worship* consists in paying a due respect, veneration, and homage to the Deity, under a certain expectation of reward. See GOD.

And this internal respect, &c. to be shewn, and is testified by external acts; as prayers, sacrifices, thanksgivings, &c. See PRAYER, SACRIFICE, &c.

The Quietists, and some other mystic divines, set aside not only all use of external *worship*; but the consideration of rewards and punishments. See QUIETISM, DEIST, &c.

Yet, even the heathens had a notion, that God did not require us to serve him for nought:—*Dii quamvrem colendi sunt*, says Cicero, *non intelligo, nullo nec accepto ab illis nec sperato bono*.

The school-divines divide *worship* into divers kinds, viz. *latría*, that rendered to God; and *idolatria*, that rendered to idols, or images.—To which the Romanists add, *dulia*, that rendered to saints; and *hyperdulia*, that to the virgin. See IDOLATRY, IMAGE, LATRIA, HYPERDULIA, &c.

WORSTED, or WOOLSTED, in matters of commerce and manufacture, is a kind of woollen-thread. See WOOL. *Worsted* is, properly, a thread spun of wool that has been combed; and which, in the spinning, is twisted harder than ordinary. See COMBING.

It is chiefly used either to be knit, or wove into stockings, caps, gloves, or the like. See STOCKING, &c.

The name *worsted*, is supposed to be borrowed from a town thus called, in Norfolk, noted for fine spinning.—They who write it *woolsted*, do it on supposition of the word's being formed from *wool*, the matter of this thread.

WOVEN Stockings. See the article STOCKING.

WOULD, or WELD, among dyers. See WELD.

WOULDING, a sea-term, for the winding of ropes fast round about a yard, or mast of a ship, after it has been strengthened by some piece of timber nailed thereto.

WOUND, *Vulnus*, in medicine and chirurgery, a recent separation, made in the soft or fleshy parts of the body, from an external cause; and particularly the action of some hard and sharp instrument. See SOLUTION.

Or, it is a solution of the continuity of a fleshy part, made by some penetrating body; while it yet remains fresh, bloody, and without putrefaction: by which circumstances a *wound* is distinguished from an *ulcer*. See ULCER.

A like separation happening in a bony part, is called a *fracture*. See FRACTURE; see also FLESH, BONE, &c.

All *wounds* proceed either from puncture, incision, or contusion, according to the nature and make of the instrument they were caused by. See PUNCTURE, CUTTING, CONTUSION, &c.

*Wounds* are usually divided, with respect to their cause, circumstances, cure, &c. into *simple*, and *compound*.—*Simple wounds* are those made by puncture, incision, or contusion separately; those of the outer skin, without any considerable loss of substance, or hurting any remarkable vessel; and those not complicated with any dangerous symptoms.

*Compound wounds*, are those made both by puncture and incision at the same time, to which is sometimes also added contusion; those attended with great loss of flesh, or the hurt of some considerable vessel; add, those made by envenomed instruments, or attended with violent symptoms.

The history of a *wound* is thus delivered by Boerhaave.—Immediately upon the solution, the *wounded* parts recede further and further from each other.—The blood gushes out, at first, with some violence; but stops of itself: then a bloody scab is formed in the cavity of the *wound*, and a thin ruddy humour oozes out; the lips of the *wound* begin to redden, ache, swell, and turn back; and in (great *wounds*) a fever and thirstiness succeed.—On the third or fourth day, there is found a white, viscid pus; upon which, the heat, redness, tumor, &c. abate, and the cavity gradually fills up from the bottom upwards, and from the circumference to the centre with growing flesh.—Lastly, the *wound* dries, and cicatrises. But note, these symptoms vary according to the nature and cause of the *wound*.—Thus, if it be by incision, and a large blood-vessel be cut, the hæmorrhage is more violent; especially if it be an artery; in which case florid blood flies out impetuously, and by starts: if only a vein be cut, the flux is more moderate and equable, and the blood of a darker colour.—If the *wound* be attended with contusion, the hæmorrhage is small.

In *wounds*, where any large artery is quite cut in two, the flux usually proves mortal.—A lesser artery, cut transversely, flies back against the solid parts, and will have its mouth stopped: if any artery be not quite cut off, there arises a perpetual flux; or, if that be stopped, an aneurysma.—A nerve being cut off, flies back, produces a pain, and obstruction about the *wound*; and below it, a numbness, and wasting immobility: the case is much the same in wounded tendons, and membranes.—*Wounds* of the temporal muscle are rarely cured; but generally bring on horrible convulsions.

The following *wounds* are commonly reputed mortal; viz. those of the cerebellum, and of the cerebrum, if they be deep enough to hurt the medulla oblongata; deep *wounds* in the spinal marrow, especially the upper part thereof; those of the heart, lungs, liver, spleen, kidneys, pancreas, mesentery, stomach, intestines, &c. and those of the cava, aorta, carotides,

rotides, pulmonary, and other large veins and arteries; those of the bronchia, thorax, diaphragm; large wounds of the oesophagus, trachea, and the bladder; and all invenomed wounds.

In young children, and aged persons, wounds frequently prove mortal, which seemed but slight.— Those wounds generally prove troublesome which happen in an ill state of body, and especially a low, or spare diet.— All wounds are reputed more dangerous and difficult of cure in winter, than summer; in autumn, than in spring.

The cure of wounds consists in uniting the divided parts; which is the work of nature alone, and which the surgeon can only contribute to by removing external impediments, and applying medicines familiar to the part, called vulneraries, and balsamics. See VULNERARY, &c.

The first step, then, to be taken in a simple wound, is to cleanse it, and extract any heterogeneous body that may chance to be lodged therein.— Next, the cavity to be gently wiped with doffils dipt in warm red wine.— The lips, now, to be brought together by bandages or sutures; and the wound to be covered with a pledget dipt in balsam of Peru, or oil of sweet almonds.— The pain thus eased, and the symptoms removed, the wound is to be suppurated, deterged, incarnated, and cicatrized after the manner of tumors, and ulcers. See SUPPURATION, DETERGENT, INCARNATIVE, CICA-TRISIVE, &c.

If the wound be dangerous, the symptoms violent, and the body cacochymic, more powerful means are had recourse to; as, first, phlebotomy, then gentle cathartics, or clysters; then vulnerary drinks, apozems, and ptisans; which cardiacs and pargotics interposed.— In internal wounds, vulneraries and alkalies do well, particularly album græcum, river lobsters, mercurials, &c.

Fresh wounds are cured, ordinarily, in three or four days, without any other means, than applying a few drops of balsam of Peru.— Sometimes, however, digestives are required. Gun-shot wounds are usually the worst of all, by reason of the violent contusion and separation of the parts; which prevent their coming to digestion for the space of three or four days.

In the cure of large wounds, bandages and sutures are required, to fit and dispose them for healing. See SUTURE, &c.

WRACK. See the article WRECK.

WREATH, in heraldry, a roll of fine linen, or silk, (like that of a Turkish turban) consisting of the colours born in the escutcheon; placed, in an achievement, between the helmet and the crest, and immediately supporting the crest. See CREST, &c.

WRECK, WRACK, or Sea-WRECK, in natural history, a kind of herb growing in the sea, upon rocks, and which the waves tearing off, cast upon shore.

In some places it is used to manure the ground.— In Normandy, and other parts, they burn it; and of the ashes make a kind of soda, which they use in the making of common green glass, to promote the fusion or vitrification of the other materials. See GLASS.

WRECK, WRECCUM, called also Ship-WRECK, or Ship-WRACK, in law, &c. is when a ship perishes in the sea, and no man escapes alive out of it.

The civilians term it *naufragium*.— The goods in the ship, which are brought to land by the waves, belong to the king, or him to whom he assigns the right thereof\*.

\* Thus, in the Stat. Prærog. Reg. c. 11.— *Rex habebit wreckum maris per totum regnum, balenas & sturges captas in mari, vel alibi intra regnum, exceptis quibuslibet privilegiatis locis, &c.*

If a man, a dog, or even a cat escape alive, the party to whom the goods belong coming within a year and a day, and proving the goods to be his, shall have them again.

In divers charters, and old writings, it appears, that wreck, antiently, not only comprehended goods which came from a perishing ship, but whatever else the sea cast upon land; whether it were precious stones, fishes\*, sea-weed, or the like.

\* This wreck, in the Grand Customary of Normandy, c. 17. is called *warech*, and latined *veriscum*; and in some of our antient charters, *wreche*, *werec*, *werech*, and *seupwerp*; q. d. *sea-upwerp*, of sea, and up-werpen, to cast up.

WRESTLING, a kind of combat, or engagement between two persons, unarmed, body to body, to prove their strength and dexterity; and try which can throw his opponent to the ground. See EXERCISE, GAME, &c.

Wrestling, *palæstra*, is an exercise of very great antiquity and fame.— It was in use in the heroic age; witness Hercules, who wrestled with Antæus. See PALÆSTRA, and GYMNASICS.

It continued a long time in the highest repute; and had very considerable rewards and honours assigned it at the Olympic games.— It was the custom for the athlete to anoint their bodies with oil, to give the less hold to their antagonist. See ATHLETA, &c.

Ablancourt observes, that Lycurgus ordained the Spartan

maids to *wrestle* in public, quite naked, to break them of their too much delicacy and niceness; to make them appear more robust, and to familiarize the people, &c. to such nudities. See GYMNASIUM, GYMNASTIC, &c.

WRIST. See the article CARPUS.

WRIT\*, *Breve*, in law, a precept of the king in writing, under seal, whereby any thing is commanded to be done, touching a suit, action, or process for justice.— As, the summoning a defendant, taking a distress, redressing a disseisin, or the like. See BREVE, PRECEPT, &c.

\* The word is formed from the Saxon, *prutan*, to write.

Writs are variously divided, and in various respects.— Some, with regard to their order, or manner of granting, are termed *original*, and others *judicial*.

Original WRITS, are those sent out of the high court of chancery, to summon the defendant in a personal, or tenant in a real action; either before the suit begins, or to begin the suit thereby. See PROCESS, &c.

Judicial WRITS are those sent by order of the court where the cause depends, upon emergent occasions, after the suit begins.

Judicial Writs are distinguished from original, in that their teste bears the name of the chief justice of that court whence they come; whereas the original say, *teste me-ipsa*, in the name, or relating to the king.

Writs are also distinguished, according to the nature of the action, into *real* and *personal*.— *Real*, are either touching the possession, called *writs of entry*; or the property, called *writs of right*. See ENTRY, and RIGHT.

*Personal writs*, are those relating to goods, chattels, or personal injuries. See PERSONAL.

To which may be added, *mixt writs*, for the recovery both of the thing and damages.

Some writs, again, are at the suit of the party; some, of office; some, ordinary; some, of privilege.— A *writ of privilege*, is that which a privileged person brings to the court for his exemption, by reason of some privilege which he enjoys.

WRIT of *Neisty*. See the article NEIF.

WRIT of *Rebellion*. See the article COMMISSION of Rebellion.

WRITS *Vicountiel*, are such as are triable in the sheriff's, or county court. See VICOUNTIEL.

WRIT of *Assistance*, that issuing out of the exchequer, to authorize some person to take a constable, or other public officer, to seize goods or merchandize prohibited, and uncustomed, &c. Stat. 14. 2 Car. II. c. 1.

There is also a writ of this name issuing out of chancery, to give possession of lands.

Action of a WRIT.

Appeal by WRIT.

Attachment by WRIT.

Continuance of a WRIT.

} See ACTION.  
APPEAL.  
ATTACHMENT.  
CONTINUANCE.

WRITER of the *Tallies*, an officer of the exchequer, being clerk to the auditor of the receipt; who writes upon the tallies the whole letters of the tellers bills. See TALLY, EXCHEQUER, &c.

WRITING, *Scriptura*, the art or act of signifying and conveying our ideas to others, by letters, or characters visible to the eye. See CHARACTER, LETTER, WORD, &c.

Writing is now chiefly practised among us by means of pen, ink, and paper. See PAPER, INK, &c.— The antients had other methods. See BOOK, BARK, STYLE, &c.

The invention of the art of writing is referred to Cadmus. See LETTER, and GREEK.

In law, we say, deeds, conveyances, &c. are to be in *writing*.— A will may either be in *writing*, or by word of mouth. See DEED, CONVEYANCE, WILL, &c.

We also say, *written law*, *lex scripta*, in opposition to common law, which is called *lex non scripta*. See LAW, STATUTE, COMMON LAW, &c.— We have also *written* and *unwritten* traditions, &c. See TRADITION, ORAL, &c.

Authentic writings of any contract, sealed, and delivered, make the evidences thereof. See AUTHENTIC, EVIDENCE, MUNIMENT, SEAL, SIGNATURE, TESTIMONY, &c.

J. Ravenau has a treatise entitled *Des Inscriptions en Faux*, wherein he shews how to revive, and restore old writings almost effaced, by means of galls ground in white wine, and distilled; and thus rubbed over the writing.

La Vayer has a curious dissertation on the proof of facts by comparison of hand-writings, wherein he endeavours to shew this method of proof to be very suspicious and fallacious. See PROOF, &c.

It is a point controverted among the school-philosophers, what it is that *writing* properly signifies, or represents? whether ideas, or things, or words? i. e. whether it expresses things themselves, or our ideas of things, or the articulate sounds by which, on other occasions, we express those ideas? See WORD, SIGN, SCIENCE, &c.

The common opinion is, that *writing* only represents words, that its proper object is the voice, and that it only signifies ideas mediately, or secondarily; and by means of those things themselves.

Others,

Others, on the contrary, will have ideas, speech, and *writing*, all equally, and immediately representatives of things. See **IDEA**, **NOTION**, &c.

But the controversy is impertinent enough!—No doubt, our ideas of things, are the things themselves; there being no foundation for any distinction between them. See **EXTERNAL**, **EXISTENCE**, **BODY**, &c.

And as to *writing*, some may be said to be *real*, or *significant* of things and ideas.—As, the Egyptian hieroglyphics; the characters of chymists, astronomers, &c. which are a kind of images, or bear some natural resemblance or analogy with the things they are intended to express. See **SYMBOL**, **HIEROGLYPHIC**, *Real CHARACTER*, &c.

But the common *writing* only represents sounds, which is the first and most natural language; and accordingly, our orthography is apparently formed on, or adapted to the pronunciation. See **ORTHOGRAPHY**, and **PRONUNCIATION**.

Hence, the end of *writing* is to excite, as it were, certain sounds which have been made the arbitrary signs of certain ideas.—This they do by virtue of a combination, or association between such and such figures made with the pen, and such and such inflexions of the voice.

In effect, we have a great many *written* words which have no ideas belonging to them; as, *scindapsus*, *bladri*, &c. which tend no further than to produce sounds.—Add, that people, when they begin to learn to read *writing*, take it from sounds which they hear produced by the person who teaches them: an abundant argument, that writing does not immediately signify ideas and things; but first sounds, and then things.

**Gothic WRITING.** See the article **GOthic**.

**Secret WRITING.** See **CRYPTOGRAPHY**, **STEGANOGRAPHY**, **SCYTALA**, **CIPHER**, **DECIPHERING**, &c.

**Short WRITING.** See the article **BRACHYGRAPHY**.

**WRITTEN Tradition.** See the article **TRADITION**.

**WRONG**, in a logical sense. See **ERROR**, **FALSHOOD**, **TRUTH**, &c.

**WRONG**, in a legal sense, *injury tort*. See **INJURY**, **JUSTICE**, **TORT**, **RIGHT**, &c.

**WULVESHEVED**, or **WULWESHEAD**. See **WOLFESHEAD**.

**WYCH-House**, a house in which salt is boiled. See **SALT**.

**WYDRAUGHT**, a water-course, or water-passage, to carry off the filth and suilage of a house; properly a sink, common-flare. See **SEWER**, and **CLOACA**.

**WYKE**, antiently denoted a farm, hamlet, or little village. See **WIC**, **FARM**, **HAMLET**, and **VILLAGE**.

**WYTE\***, **WYTA**, or **WITE**, **WITA**, in our antient customs, a pecuniary penalty, or mulct.

\* — *Jurat secundum witam quod nec fuerat furti confcius nec coadjutor in eo.* Leg. Inæ.

The Saxons had two kinds of punishments, *were*, and *wyte*; the first, for the more grievous offences. See **WERE**.

The *wyte* was for the less heinous ones.—It was not fixed to any certain sum; but left at liberty, to be varied according to the case.

Hence, also, *wyte*, or *wittree*, one of the terms of privilege granted our portsmen; signifying a freedom or immunity from fines, or amerciaments: or, as it is vulgarly conceived, from being liable to be begged for fools, for lack of wit.

**WYTA**, or **WITA Plena**, signified a forfeiture of one hundred and twenty shillings.—*Si pundbreche fiat in curia regis plena wita fit; alibi quinque marce.*

To swear according to the *wyte*, *secundum witam jurare*, was to purge one's self by the oaths of so many witnesses, as the nature of the crime, and the punishment, or *wyte*, did require. See **PURGATION**.

Hence, also, *bloodwite*, *legerwite*, *ferdwite*, *chilawite*, *wardwite*, &c. See **FERDWITE**, **LEGERWITE**, **CHILDWITE**, &c.

**WYTHE**, in law, the same as *waif*. See **WAIF**.

## X I P

## X Y S

**X**, A double consonant, and the twenty-second letter in the English alphabet. See LETTER, CONSONANT, ALPHABET, &c.

The *x* of the Latins, and *ξ* of the Greeks, are compounded of *c s*, and *κ σ*; whence to this day, the letter *x*, in the English and French, has the same sound with *c s*, or *k s*.— Thus we pronounce *Alexander*, as if wrote *Alec-sander*, or *Alek-sander*. See C, K, S, &c.

The Italians have no *x* at all in their language; but, both speak and write *Alessandro*.— The Spaniards pronounce the *x*, like our *c* before *a*; viz. *Alexandro*, as if it were *Alecandro*.— The Portuguese pronounce it like *sh*.

In foreign words, used in English, we sometimes soften the *x* into a double *s*; as *Brussels*, for *Bruxelles*, &c.

The letter is not known in the Hebrew, or other oriental languages; but, in lieu of it, they write the two simple letters whereof it is compounded.— And the like do the modern Germans.

**X** is also a numeral letter, and signifies ten; as representing two V's placed one a-top of the other. See V.

*X Supra denos numero tibi dat-retinendos.*

When laid flat, thus **X**, it signifies a thousand; and when a dash is added over it, **X̄**, it signifies ten thousand.

**XENIA**, in some antient customs, were gifts, or presents, made to the governors of provinces, by the inhabitants thereof.

The word occurs pretty frequently in charters of privileges; where, *quietos esse à xeniis*, denotes an exemption from making such presents to kings and queens, upon their travelling through such precincts.

**XENODOCHUS**, an ecclesiastical officer of the Greek church; the same with *hospitaler*; or a person who takes care of the reception and entertainment of strangers. See HOSPITALER.

S. Isidore, a priest and solitary, surnamed *Xenodochus*, lived in the fourth century.— He was thus called, because entrusted with that office in the church of Alexandria.

**XEROPHAGIA**\*, **XEROPHAGY**, in church-history, the feeding on dried foods. See FOOD.

\* The word is formed from *ξηρ*, *secus*, dry, and *φαγω*, I eat.

In the first ages, some, not contented with simple fasting, added the *xerophagy* thereto; abstaining not only from flesh and wine, but also from all fresh, succulent, and vinous fruits.— And some even brought themselves to bare bread and water. See FAST, and ABSTINENCE.

Tertullian, in his book *de Abſtinentia*, c. 9. speaks of the *xerophagia*, as a thing commendable in time of persecution.

**XEROPHTHALMIA**\*, **ΞΗΡΟΦΘΑΛΜΙΑ**, a kind of ophthalmia, wherein the eyes itch, and are red, but without swelling, or watering. See OPHTHALMIA, and SCLE-ROPHTHALMIA.

\* The word is compounded of *ξηρ*, dry, and *οφθαλμος*, eye.

**XESTA**, **ΞΕΣΤΗΣ**, an Attic measure of capacity; answering to the Roman *sextary*. See MEASURE, and SEXTARY.

**XIPHIAΣ**, **ΞΙΦΙΑΣ**, a fiery meteor, in form of a sword. See METEOR.

It differs from the *acutias*, in that this latter is longer, and

more like a dart; and the former shorter, and broader in the middle. See ACUTIAS.

**XIPHOIDES**, **ΞΙΦΟΕΙΔΗΣ**, in anatomy, a cartilage at the bottom of the sternum, called also *ensiformis*. See CARTILAGE.

It is about an inch long, and shaped like the point of a sword.— Whence its appellation, from *ξίφος*, sword, and *ειδος*, figure. See STERNUM.

**XV. VIR**, *Quindecimvir*. See the article QUINDECIMVIR. Authors, and especially antiquaries, make use of such abbreviations, which they borrow from medals, and other monuments of antiquity, where those names are so expressed.

**XYLO-ALOE**\*, in medicine, the lignum aloes: called also *agallochum*. See ALOES.

\* The word is compounded of *ξύλον*, *lignum*, wood, and *αλον*, aloes.

**XYLO-BALSAMUM**\*, **ΞΥΛΟΒΑΛΣΑΜΟΝ**, a name which naturalists, &c. give to the wood of the tree, which yields that precious gum, known to the Latins by the name of *opo-balsamum*, and among us, by the name of *balm of Gilead*. See BALSAM.

\* The word is compounded of *ξύλον*, wood, and *βαλσαμον*, balsam, balm.

We have branches of this tree brought us from Cairo. They are very freight, brittle, unequal, and full of knots; their bark reddish without, and greenish within.— The wood is whitish, and full of pith; and, when broke, yields an agreeable smell, resembling that of the balm.

The *xylo-balsamum* is reputed good to strengthen the brain, and stomach, and to expel poison.

**XYNOECIA**\*, a feast among the antient Athenians, instituted on occasion of Theseus's uniting all the petty communities of Attica into one commonwealth; the assemblies whereof were to be held at Athens, in the Prytaneum. See FEAST.

\* The word is formed of the Greek, *ξυν*, or *συν*, with, and *οικω*, I inhabit.

**XYSTARCHA**, in antiquity, the master or director of the *xyſtus*. See XYSTUS, and GYMNASTICS.

In the Greek gymnasium, the *xyſtarcha* was the second officer: the first was the *gymnasiarcha*.— The *xyſtarcha* was his lieutenant, and presided over the two *xyſti*, and all exercises of the *athletæ* therein. See GYMNASIUM, and GYMNASIARCH.

**XYSTUS**\*, in the antient architecture— A *xyſtus*, among the Greeks, was a long spacious portico, either open, or covered over; wherein the *athletæ*, and others, practised wrestling, and running. See WRESTLING, &c.

\* The word is Greek, *ξύστος*, formed of *ξύειν*, to polish, shave, rub.

The *xyſtus* made a necessary part of a gymnasium. See GYMNASIUM.— The *athletæ*, who practised therein, were called *xyſtici*. See ATHLETA, &c.

**XYSTUS**, among the Romans, was an alley, or double row of trees, meeting arbor-wise a-top, and forming a shade to walk under.

## Y A R

**Y** The twenty third-letter in the English alphabet, borrowed, originally, from the Greek  $\psi$ . See **LETTER**, and **ALPHABET**.

It is occasionally both vowel, and consonant. — **Y** a vowel, some authors have judged it unnecessary in our language, in regard its sound is precisely the same with that of the *i*. — Accordingly, it is but little used, except in words borrowed from the Greek, to denote their origin, by representing the Greek  $\psi$ .

The vowel *y*, however, has a place even in some words purely English; and that both in the middle thereof, as in *dying*, *frying*, &c. and at the end, as in *lay*, &c.

Some ascribe the use of the *y*, in pure English and French words, and those that have no *y* in Latin or Greek, to this, that antiently each of those words were pronounced with a double *ii*; which having something awkward in it, the *y* was substituted in lieu thereof. See **I**.

Others say, that those words being antiently wrote, as well as pronounced with a double *ii*, which they still are in the Walloon, as *paing*, *paifan*, &c. to avoid their being mistaken for an *u* with two dots over it, they made the second *i* longer than the first, and so formed the *y* without designing it. — Some give a particular reason, why words ending in *i*, came to be wrote with *y*; viz. that the copists found the tail of the *y* very commodious, to adorn the margins, and bottoms of pages withal.

When the *y* follows a consonant, it is a vowel; and when it precedes a vowel, it is a consonant, and should be called *ye*, and not *wy*.

The Romans used the *y* for the vowel *u*, which they had no character for, distinct from the *v* consonant: their way being to pronounce the common *u*, as we do the diphthong *ou*; and the Greek  $\psi$ , as the English and French *u*.

In our own, and some other modern tongues, authors begin to dispense more and more with the precise orthography, which requires all words that have an upsilon, in the Greek, to be wrote with a *y*. And with reason; since our Greek *y* has lost the sound it had, in the language whence we borrow it. — But it is certainly ridiculous to use it, as many do, in words which indeed have a Greek origin, but have no *u* in the Greek; as in *eclipse*. See **ECLIPSE**, **ECLIP-TIC**, &c.

**Y** is also a numeral letter, signifying 150, or, according to Baronius, 159; as in the verse.

*Y dat centenos & quinquaginta novenos.*

When a dash was added a-top,  $\bar{Y}$ , it signified 150 thousand. — Pythagoras used the **Y** as a symbol of human life; the foot representing infancy, and the forked top the two paths of vice and virtue, one or the other of which people are to enter upon, after attaining to the age of discretion.

**YACHT**, or **YATCH**, a kind of vessel used by the English, furnished with masts, and sails; fit to go to sea; and commodiously contrived and adorned, within and without, to suit for state-passengers, &c.

\* The word seems derived from the Dutch *Yacht*, hunting, by reason of the lightness of these vessels.

*Yachts* are vessels with one deck, carrying from 4 to 12 guns, with from 20 to 40 men; being of burden from 30 to 160 tun. — They draw little water, and are used for running, and making short trips, &c. — Their make and form is various.

The Dutch have also *yachts*, but not so well prepared to live at sea. — They are seldom used, but to sail on rivers and canals.

**YARD**, *Virga*, a long measure, used in England, and Spain; chiefly to measure cloth, stuffs, &c. See **MEASURE**, **VERGE**, **VIRGA**, &c.

The English *yard* contains three feet. — It was first settled by Henry I. from the length of his own arm. See **FOOT**, &c.

The English *yard* is just seven ninths of the Paris ell; so that nine *yards* make seven ells. — To reduce ells, therefore, into *yards*, say, if seven ells give nine *yards*, how many *yards* will the given number of ells give?

*Yards* are converted into ells Flemish, by adding a third part; into ells English, by subtracting a fifth part; or multiplying by 8, and casting off the right-hand figure. — Ells English are converted into *yards*, by adding a fourth. — To turn ells Flemish into *yards*, subtract one quarter. See **ELL**.

The Spanish *vara*, or *yard*, chiefly used at Sevil, is, in some places, called *barra*. — It contains  $\frac{11}{12}$  of the Paris ell; so that 17 ells make 24 Spanish *yards*.

**YARD**, in anatomy, the penis, or virile member; serving for

the evacuating of the urine, and seed. See **PENIS**; see also **URINE**, and **SEED**.

**YARD-LAND**\*, *Virgata terra*, or *virga terra*, is a certain quantity of land, various according to the place. — At Wimbleton in Surrey, it is only 15 acres; but in most other countries it contains 20, in some 24, in some 30, and in others 40, to 45 acres. See **ACRE**.

\* *Virgata terra continet 24 acras; & 4 virgate constituunt unam hidam, & quinque hidae constituunt fœdum militare.* M. Abbat. Malmes. See **HIDE**, **KNIGHT'S FEE**, **PLOW-LAND**, &c.

**YARDS**, or *Sail-YARDS*, of a ship, are long pieces of timber, tapering at each end, fitted across the several masts, to carry the sails. See **MAST**, and **SAIL**.

The sails are fastened to the *yards* at the heads; so as to be hoisted up, and let down together with them, by ropes called *balliards*. See **HALLIARD**.

The main *yard*, is that of the main-mast. — The mizzen *yard*, the bolt-sprit *yard*, &c. are those of the mizzen, &c. — See *Tab. Ship*, fig. 1. n. 2. 20. 37. 44. 67. 86. 93. 109. 126. 138. See also **MIZZEN**, **BOWSPRIT**, &c.

They have several phrases, and words of command, relating to the management of the *yards*; as — *Brace the yard*, which signifies to traverse aft the *yard-arm*, whose brace is haled; so that to *traverse the yard*, is the same as to *say*, brace it aft. — *Square the yard*, is as much as to *say*, see that it hang right across the ship, and one *yard-arm* not traversed more than the other. — *Top the yards*, that is, make them hang even.

**YARD-Arm**, is that half of the *yard* which is on either side the mast, when it lies athwart the ship.

**YARDS** also denote places belonging to the navy, where the ships of war, &c. are laid up in harbour. See **NAVY**, **HARBOUR**, **SHIP**, &c.

The king's *yards*, are Chatham, Deptford, Woolwich, Portsmouth, Sherehef, Plymouth, and Harwich; each of which is provided with several docks, wharfs, launches, and graving places for the building, repairing, and cleaning his majesty's ships. See **DOCK**, **WHARF**, &c.

In these *yards* are also lodged great quantities of timber, masts, planks, anchors, &c. There are also store-houses belonging to each *yard*, wherein are reserved vast quantities of cables, rigging, sails, blocks, &c.

In the several *yards* are great rope-yards, wherein cables, and all sorts of cordage are made. See **CORDAGE**, **CABLE**, &c.

**YARE**, among sailors, implies as much as, nimble, ready, quick, expeditious. — Hence, to *be yare at the helm*, as some say, signifies to set a fresh man at the helm.

**YARN**, denotes spun wool. See **WOOL**, **SPINNING**, **CLOTH**, &c.

*Rope-YARN*. See the article **ROPE**.

**YARRINGLES**, or *YARRINGLE Blades*, a kind of reel, or instrument, with which hanks of yarn are wound on to clues, or balls. See **REEL**.

**YATCHES**. See the article **YACHT**.

**YAWS**, or **YAWES**, in the sea-language. — A ship is said to make *yawes*, when, through the fault of him at the helm, she is not kept steady in her course; but makes angles in and out. See **HELM**, **RUDDER**, **STEERING**, &c.

To prevent this, the conner cries to him at the helm, *steady, steady*. See **STEADY**.

**YAWNING**, *Ositatio*, an involuntary opening of the mouth, occasioned by a vapour, or ventosity, endeavouring to escape; and generally witnessing an irksome weariness, or an inclination to sleep.

The remedy Hippocrates prescribes against continual yawnings, is to make long breathings, or respirations. — The same he recommends against the hiccough. See **HICCUP**.

The nervous membrane of the oesophagus, has been held the seat of yawning, which, according to the usual system, is produced, whenever any irritation determines the spirits to flow thither in too great abundance. — The cause of the irritation is supposed to be some troublesome humour, wetting the inner membrane of the oesophagus; which humour may proceed either from the glands spread throughout the membrane, or from acid vapours arising from the stomach, and condensing on the sides of the oesophagus. — By such means, the nervous fibres of the membrane of the gullet being irritated, dilate the gullet; and the mouth is constrained to follow the same motion, as being lined with the same membrane. — But this system of ositation has, of late, given way to a better, and more mechanical one.

*Yawning* is performed by expanding almost all the muscles of voluntary motion at the same time; but most considerably those

those of the lungs: by springing a great quantity of air, very slowly, and after retaining it some time, and rarefying it, by expelling it again, slowly, and restoring the muscles to their natural state.

Hence, its effects are to move, accelerate, and distribute all the humours of the body, equably through all the vessels; thereby disposing the organs of sensation, and all the muscles of the body, for the performance of their respective functions. *Vid.* Boerh. *Inst. Med.* §. 638.

**YCONOMUS.** See the article **OECONOMUS**.

**YDRARGYROS, HYDRARGYROS, or Quicksilver.** See **MERCURY**.

**YEAR, Annus,** in the full extent of the word, is a system, or cycle of several months; usually twelve. See **CYCLE**, and **MONTH**.

Others define *year*, in the general, a period, or space of time, measured by the revolution of some celestial body in its orbits. See **TIME**, and **PERIOD**.

Thus, the time wherein the fixed stars make a revolution, is called the *great year*. And the times wherein Jupiter, Saturn, the Sun, Moon, &c. finish their revolutions, and return to the same point of the zodiac, are respectively called the *years of Jupiter*, and *Saturn*; the *Solar*, and the *Lunar years*. See **SUN**, **MOON**, **PLANET**, &c. **Solar YEAR**, **Lunar YEAR**, &c.

*Year*, properly, and by way of eminence so called, is the *solar year*; or the space of time wherein the sun moves through the twelve signs of the ecliptic. See **ECLIPTIC**.

This, by the observations of Cassini, Bianchini, and de la Hire, contains 365 days, 5 hours, and 49 minutes; which is the quantity of the *year* assumed by the authors of the Gregorian calendar. See **Solar YEAR**.

But, in the civil, or popular account, this *year* only contains 365 days; except every fourth, which contains 366. See **Civil YEAR**.

The vicissitude of seasons seems to have given occasion to the first institution of the *year*.—Man, naturally curious to know the cause of that diversity, soon found it was the proximity and distance of the sun; and upon this, gave the name *year* to the space of time wherein that luminary, performing his whole course, returned to the same point of his orbit. See **SEASON**.

And hence, as it was on account of the seasons, in a great measure, that the *year* was instituted, their chief regard and attention was, that the same parts of the *year* should always correspond to the same seasons; *i. e.* that the beginning of the *year* should always be when the sun was in the same point of his orbit; and that they should keep pace, come round, and end together.

This, different nations aimed to attain by different ways; making the *year* to commence from different points of the zodiac; and even the time of his progress different. So that some of their *years* were much more perfect than others, but none of them quite just; *i. e.* none of them but whose parts shifted, with regard to the parts of the sun's course.

It was the Egyptians, if we may credit Herodotus, that first formed the *year*, making it to contain 360 days; which they subdivided into 12 months.

Mercury Trismegistus added five days more to the account.—And, on this footing, Thales is said to have instituted the *year* among the Greeks. Though that form of the *year* did not hold throughout all Greece.—Add, that the Jewish, Syrian, Roman, Persian, Ethiopic, Arabic, &c. *years*, were all different.

In effect, considering the poor state of astronomy in those ages, it is no wonder different people should disagree in the calculus of the sun's course.—We are even assured by Diod. Siculus, Lib. I. Plutarch. in *Numa*, and Pliny, Lib. VII. c. 48. that the Egyptian *year* itself was at first very different from that now represented. See **Egyptian YEAR**, **Roman YEAR**, **Jewish YEAR**, &c.

**Solar YEAR**, is the interval of time wherein the sun finishes his course through the zodiac; or, wherein he returns to the same point thereof whence he had departed. See **SUN**.

This, according to our account, is 365 days, 5 hours, 49 minutes; though some astronomers make a few seconds, and some a whole minute less; as Kepler, for instance, who makes it 365 days, 5 hours, 48 minutes, 57 seconds, 39 thirds.—Ricciolus, 365 days, 5 hours, 48 minutes; and Tycho Brahe, 365 days, 5 hours, 48 minutes.

The *solar year* is either *astronomical*, or *civil*.

**Solar astronomical YEAR**, is that determined precisely by the observations of astronomy; and is of two kinds, *tropical*, and *siderial*, or *astral*.

**Tropical, or Natural YEAR**, is the time which the sun employs in passing through the zodiac; which, as before observed, is 365 days, 5 hours, 49 minutes.

**Siderial, or astral YEAR**, is the space of time wherein the sun, going from any fixed star, returns to the same.—This consists of 365 days, 6 hours, 10 minutes. See **SIDERIAL**.

**Civil YEAR**, is that form of *year* which each nation has contrived to compute time by: or the *civil* is the *tropical year*, considered as only consisting of a certain number of whole days; the odd hours and minutes being set aside, to render the computation of time, in the common occasions of life, more easy. See **CIVIL**.

Hence, as the *tropical year* is 365 days, 5 hours, 49 minutes, the *civil year* is 365 days.—And hence, also, as it is necessary to keep pace with the heavens, it is required that every fourth *year* consists of 366 days.

Hence, lastly, the *civil year* is either *common*, or *bissextile*.

The *common civil YEAR*, is that consisting of 365 days.—This, therefore, has seven months of 30 days each, and five of 31 days.

**Bissextile, or Leap YEAR**, is that consisting of 366 days; or has one day extraordinary; which day is called the *intercalary*, or *bissextile day*. See **INTERCALARY**, and **LEAP-YEAR**.

This intercalary, or additional day to every fourth *year*, was first appointed by Julius Cæsar; who, to make the *civil years* keep pace with the tropical ones, contrived that the six hours which the former came short of the latter, should, in four *years*, make a whole day, and be added after the twenty-fourth of February, which was their sixth of the calends of March.

Hence, as, in that *year*, they reckoned this day twice over, or had *bis sexto calendas*, the *year* itself came to be called *bis sextus*, and *bissextile*.

The intercalary day, however, among us, is not got in by telling the twenty-fourth of February twice over; but by adding a day after the twenty-eighth of February; which month, that *year*, comes to contain twenty-nine days. See **BISSEXTILE**.

A further reformation, in this *year*, was made by pope Gregory. See **Gregorian YEAR**.

**Lunar YEAR**, is a system of twelve lunar months. See **LUNAR**.

Hence, from the two kinds of synodical lunar months, there arise two kinds of *lunar years*; the one *astronomical*, the other *civil*.

**Lunar astronomical YEAR**, consists of twelve lunar synodical months; and therefore contains 354 days, 8 hours, 48 minutes, 38 seconds, 12 thirds. See **SYNODICAL**.

**Lunar civil YEAR**, is either *common*, or *embolismic*.

The *common Lunar YEAR*, consists of twelve lunar civil months; and therefore contains 354 days.

The *embolismic, or intercalary YEAR*, consists of thirteen lunar civil months; and therefore contains 384 days. See **EMBOLISMIC**.

Note, as the difference between the common lunar civil *year* and the tropical *year* is 11 days, 5 hours, and 49 minutes; to have the former keep pace with the latter, there are 34 months of 30 days, and 4 months of 31 days each, to be inserted in every 100 lunar *years*; which still leave behind them an appendix of 4 hours, 21 minutes, which in six centuries make nearly a day more.

Thus far we have considered *years* and months, with a view to the principles of astronomy, whereon the division is founded.—By this, the various forms of civil *years* that have antiently obtained, or still do obtain, in divers nations, are to be examined.

**Antient Roman YEAR**, was the *lunar year*, which, as first settled by Romulus, only consisted of ten months; *viz.* 1<sup>o</sup>. March, containing 31 days. 2<sup>o</sup>. April, 30. 3<sup>o</sup>. May, 31. 4<sup>o</sup>. June, 30. 5<sup>o</sup>. Quintilis, 31. 6<sup>o</sup>. Sextilis, 30. 7<sup>o</sup>. September, 30. 8<sup>o</sup>. October, 31. 9<sup>o</sup>. November, 30. 10<sup>o</sup>. December, 30; in all 304 days; which came short of the true lunar *year* by 50 days; and of the solar, by 61 days.

Hence, the beginning of Romulus's *year* was vague, and unfixed to any precise season; which inconvenience to remove, that prince ordered so many days to be added yearly as would make the state of the heavens correspond to the first month, without incorporating these additional days, or calling them by the name of any month.

Numa Pompilius corrected this irregular constitution of the *year*, and composed two new months, January and February, of the days that were used to be added to the former *year*.—Thus, Numa's *year* consisted of twelve months; *viz.* 1<sup>o</sup>. January, containing 29 days. 2<sup>o</sup>. February, 28. 3<sup>o</sup>. March, 31. 4<sup>o</sup>. April, 29. 5<sup>o</sup>. May, 31. 6<sup>o</sup>. June, 29. 7<sup>o</sup>. Quintilis, 31. 8<sup>o</sup>. Sextilis, 29. 9<sup>o</sup>. September, 29. 10<sup>o</sup>. October, 31. 11<sup>o</sup>. November, 29. 12<sup>o</sup>. December, 29; in all 355 days; which exceeds the quantity of a lunar civil *year* by one day; and that of a lunar astronomical *year*, by 15 hours, 11 minutes, 24 seconds; but came short of the common solar *year* by ten days; so that its beginning was vague, and unfixed.

Numa, however, desiring to have it fixed to the winter-solstice, ordered 22 days to be intercalated in February every second year, 23 every fourth, 22 every sixth, and 23 every eighth *year*.

But

But this rule failing to keep matters even, recourse was had to a new way of intercalating; and instead of twenty-three days every eighth year, only fifteen were added; and the care of the whole committed to the pontifex maximus; who, neglecting the trust, let things run to the utmost confusion.—And thus the Roman year stood till Julius Cæsar made a reformation. See *Julian YEAR*.

For the manner of reckoning the days of the Roman months, see *CALENDs*, *NONES*, and *IDES*.

*Julian YEAR*, is a solar year, containing, commonly, 365 days; though every fourth year, called *bissexile*, contains 366. See *BISSEXTILE*.

The months, &c. of the Julian year stand thus: 1<sup>o</sup>. January, 31 days. 2<sup>o</sup>. February, 28. 3<sup>o</sup>. March, 31. 4<sup>o</sup>. April, 30. 5<sup>o</sup>. May, 31. 6<sup>o</sup>. June, 30. 7<sup>o</sup>. July, 31. 8<sup>o</sup>. August, 31. 9<sup>o</sup>. September, 30. 10<sup>o</sup>. October, 31. 11<sup>o</sup>. November, 30. 12<sup>o</sup>. December, 31.—But, every *bissexile* year, a day is added after the 28th of February; which month, then, contains 29 days.

The astronomical quantity, therefore, of the Julian year, is 365 days, six hours, which exceeds the true solar year by eleven minutes; which excess, in 131 years, amounts to a whole day.—And thus the Roman year stood, till the reformation made therein by pope Gregory. See *Gregorian YEAR*.

For this form of the year, we are indebted to Julius Cæsar; who, in the contrivance thereof, was assisted by Sosigenes, a famous mathematician, called over from Egypt for this very purpose; who, to supply the defect of sixty-seven days, which had been lost through the fault of the pontifices, and to fix the beginning of the year to the winter solstice, made that year to consist of fifteen months, or 445 days; which, for that reason, is used to be called *annus confusionis*, the year of confusion.

This form of the year was used in all Christian nations, till the middle of the sixteenth century; and still continues to be so, not only by several nations (and, among the rest, by the English, Swedes, Danes, &c.) but also by the modern astronomers, and chronologers.—For, since the error is known, there is no danger from it.

*Gregorian YEAR*, is the Julian year corrected by this rule; that, whereas on the common footing, every secular or hundredth year, is *bissexile*; on the new footing, three of them are common years, and only the fourth *bissexile*.

The error of eleven minutes in the Julian year, little as it was, yet, by being repeated over and over, at length became considerable; and from the time when Cæsar made his correction, was grown into thirteen days, by which means the equinoxes were greatly disturbed.—To remedy this irregularity, which was still a-growing, pope Gregory XIII. called together the chief astronomers of his time, and concerted this correction; and, to restore the equinoxes to their place, threw out the ten days that had been got from the time of the council of Nice, and which had shifted the fifth of October to the fifteenth.

In the year 1700, the error of ten days was grown to eleven; upon which the Protestant states of Germany, to prevent further confusion, accepted the Gregorian correction. See *CALENDAR*, *STYLE*, &c.

Yet is the Gregorian year far from being perfect; for we have shewn, that, in four centuries, the Julian year gains three days, one hour, twenty minutes: but it is only the three days are kept out in the Gregorian year; so that here is still an excess of one hour, twenty minutes, in four centuries; which, in seventy-two centuries amounts to a whole day. See *EASTER*.

*Egyptian YEAR*, called also the year of Nabonassar, is the solar year of 365 days, divided into twelve months, of thirty days each, besides five intercalary days added at the end.

The names, &c. of the months are as follows: 1<sup>o</sup>. Thot. 2<sup>o</sup>. Paophi. 3<sup>o</sup>. Athyr. 4<sup>o</sup>. Chojac. 5<sup>o</sup>. Tybi. 6<sup>o</sup>. Mecheir. 7<sup>o</sup>. Phamenoth. 8<sup>o</sup>. Pharmuthi. 9<sup>o</sup>. Pachon. 10<sup>o</sup>. Pauni. 11<sup>o</sup>. Epiphi. 12<sup>o</sup>. Mefori; beside the *ἡμέραι παραγομένας*.

Hence, as the Egyptian year, in every four years, loses a whole day of the Julian year, its beginning, in the space of 460 years, runs through every part of the Julian year; which space elapsed, they meet again.

This year is used by Ptolemy in his *Almagest*; so that the knowledge thereof, is of use in astronomy, for comparing the antient observations with the modern.

The antient Egyptians, we are told by Diodorus Siculus, Lib. I. Plutarch, in the life of Numa, and Pliny, Lib. VII. c. 48. measured their years by the course of the moon.—At first, they were only one month; then three; then four, like that of the Arcadians; and then six, like that of the people of Acarnania.—Those authors add, that it is on this account, they reckon such a vast number of years from the beginning of the world; and that in the history of their kings, we meet with some who lived 1000, or 1200 years.

VOL. II. No. 167.

But Herodotus is silent on this point: he only says, that the Egyptian year consisted of 12 months, as we have above represented it.—Besides, we learn from scripture, that, from the times of the flood, the year was composed of 12 months: Cham, consequently, and his son Misraim, the founder of the Egyptian monarchy, must have had that custom; and it is no way probable his descendants should alter it.—Add, that Plutarch speaks of it with a deal of uncertainty; and as no more than a report: and Diod. Siculus, as only a conjecture of I know not what authors, whom he does not name; and who, in all probability, might have framed this hypothesis, to reconcile the Egyptian chronology with that of some other nations.

F. Kircher, however, maintains, that besides the solar year, there were some of the names, or cantons of Egypt, who used a lunar one; and that, in the remotest ages, there were some who took a revolution of the moon, that is, a month, for a year; and others, who finding the year too short, made it two months, others three, and others four, &c. *Oedip. Egypt.* Tom. II. p. 252.

A late author observes, that Varro has affirmed of all nations, what we have here quoted of the Egyptians; and adds, that Lactantius takes him to task on that subject.—We do not know in what places of Varro, or Lactantius, he has seen this: all we can say, is, that Lactantius, *Divin. Inst.* Lib. II. c. 13. where he gives Varro's opinion, only represents him as speaking of the Egyptians.—However, S. Augustin, *de Civit. Dei*, l. 15. c. 14. shews, that the years of the patriarchs mentioned in scripture, are like ours, and not one of ours equal to ten of theirs, as, it appears, had been the opinion of some people.

Upon the Egyptians being subdued by the Romans, they received the Julian year; though with some alteration; for they still retained their antient months, with the five *ἡμέραι παραγομένας*, and, every fourth year, intercalated another day between the 28th and 29th of August.—Add, that the beginning of their year answered to the 29th of August of the Julian year.

This year, thus reformed, was called the *annus Abiaticus*, as being instituted soon after the battle of Actium. See *ACTIAN*.

*Antient Greek YEAR*, was lunar; consisting of 12 months; which at first was 30 days a-piece, then alternately 30, and 29 days, computed from the first appearance of the new moon; with the addition of an embolismic month of 30 days, every 3d, 5th, 8th, 11th, 14th, 16th, and 19th years of a cycle of 19 years; in order to keep the new and full moons, to the same terms or seasons of the year. See *EMBOLISMIC*.

Their year commenced at the full moon next after the summer solstice.—The order, &c. of their months was thus: 1<sup>o</sup>. *Ἐκατομβαιων*, containing 29 days. 2<sup>o</sup>. *Μεταγιστιων*, 30. 3<sup>o</sup>. *Βοηδρομιων*, 29. 4<sup>o</sup>. *Μαιμακλῆριων*, 30. 5<sup>o</sup>. *Πυανησιων*, 29. 6<sup>o</sup>. *Ποσειδιων*, 30. 7<sup>o</sup>. *Γαμηλιων*, 29. 8<sup>o</sup>. *Αιθεςπριων*, 30. 9<sup>o</sup>. *Ελαφβολων*, 29. 10<sup>o</sup>. *Μουχυων*, 30. 11<sup>o</sup>. *Θαργηλιων*, 29. 12<sup>o</sup>. *Σκεφωφοριων*, 30.

The Macedonians had other names for their months: so had the Syro-Macedonians, Smyrnæans, Tyrians; so also the Cypriots, Paphians; and so the Bithynians, &c. See *Macedonic YEAR*.

*Antient Macedonian YEAR*, is a lunar year, only differing from the Attic, in the names and order of the months; the first Macedonian month, agreeing with the Attic *μαμακτηριον*.—

The months stand thus: 1<sup>o</sup>. *Δι*, 30 days. 2<sup>o</sup>. *Απ*, 30. 3<sup>o</sup>. *Αυδυνα*, 30. 4<sup>o</sup>. *Περιτ*, 29. 5<sup>o</sup>. *Δυσ*, 30. 6<sup>o</sup>. *Εαυθικ*, 29. 7<sup>o</sup>. *Αρτιμισ*, 30. 8<sup>o</sup>. *Δαισι*, 29. 9<sup>o</sup>. *Πανμ*, 30. 10<sup>o</sup>. *Λω*, 29. 11<sup>o</sup>. *Γορπια*, 30. 12<sup>o</sup>. *Υπερβηρεται*, 29.

*Modern Macedonian YEAR*, is a solar year, whose beginning is fixed to the first of January of the Julian year, with which it perfectly agrees.

This year was particularly called the *Attic year*; and the intercalary month, after *posideon*, was called *πρωσιδιων β*, or *latter posideon*.

*Antient Jewish YEAR*, is a lunar year, consisting, commonly, of eleven months, which alternately contain 30 and 29 days.

It was made to agree with the solar year, either by the adding of 11, and sometimes 12 days at the end of the year, or by an embolismic month.

The names and quantities of the months stand thus: 1<sup>o</sup>. Nisan, or Abib, 30 days. 2<sup>o</sup>. Ijar, or Zius, 29. 3<sup>o</sup>. Siban, or Siwan, 30. 4<sup>o</sup>. Thamuz, or Tamuz, 29. 5<sup>o</sup>. Ab, 30. 6<sup>o</sup>. Elul, 29. 7<sup>o</sup>. Tisri, or Ethanim, 30. 8<sup>o</sup>. Marchesvan, or Bul, 29. 9<sup>o</sup>. Cisleu, 30. 10<sup>o</sup>. Tebeth, 29. 11<sup>o</sup>. Sabat, or schebeth, 30. 12<sup>o</sup>. Adar, in the embolismic year, 30. Adar, in the common year, was but 29. Note, in the defective year, Cisleu was only 29 days; and in the redundant year, Marchesvan was 30.

*Modern Jewish YEAR*, is likewise lunar, consisting, in common years, of 12 months, but of 13 in embolismic years; which, in a cycle of 19 years, are the 3d, 6th, 8th, 11th,

# Y E A

14th, 17th, and 19th.—Its beginning is fixed to the new moon next after the autumnal equinox.

The names, &c. of the months are, 1°. Tifri, containing 30 days. 2°. Marchefvan, 29. 3°. Cisleu, 30. 4°. Tebeth, 29. 5°. Schebeth, 30. 6°. Adar, 29. 7°. Veadar, in the embolismic year, 30. 8°. Nifan, 30. 9°. Ijar, 29. 10°. Sivan, 30. 11°. Thamuz, 29. 12°. Ab, 30. 13°. Elul, 29.

**Syrian YEAR**, is a solar year, having its beginning fixed to the beginning of October in the Julian year; from which it only differs in the names of the months, the quantities being the same; as follows:

1°. Tifhrin, answering to our October, and containing 31 days. 2°. Latter Tifhrin, containing, like our November, 30. 3°. Canun, 31. 4°. Latter Canun, 31. 5°. Shabat, 28. 6°. Adar, 31. 7°. Nifan, 30. 8°. Aiyar, 31. 9°. Haziram, 30. 10°. Tamuz, 31. 11°. Ab, 31. 12°. Elul, 30.

**Persian YEAR**, is a solar year, of 365 days, consisting of 12 months of 30 days each, with 5 intercalary days added at the end.

The months are as follow: 1°. Afrudia meh. 2°. Ardihafcht meh. 3°. Cardi meh. 4°. Thir meh. 5°. Merded meh. 6°. Schabarir meh. 7°. Mehar meh. 8°. A-ben meh. 9°. Adar meh. 10°. Di meh. 11°. Behen meh. 12°. Affirer meh.

This year is called the *yezdegerdic year*, to distinguish it from the fixed solar year, called the *gelalean year*, which the Persians began to use in the year 1079; and which was formed by an intercalation made six or seven times in four years, and then once every fifth year.

The *yezdegerdic year*, it may be observed, is the same with Nabonassar's year.—As to the *gelalean year*, it is absolutely the best and justest of all the civil years yet invented, as being found, by calculation, to keep the solstices and equinoxes precisely to the same days, and answering very accurately to the solar motions; which no other civil year does, not even the Gregorian, for want of so commodious an intercalation.

**Arabic, and Turkish YEAR**, is a lunar year, consisting of 12 months, which contain, alternately, 30, and 29 days.

Though, sometimes it contains 13 months; the names, &c. whereof are as follow: 1°. Muharram, containing 30 days. 2°. Saphar, 29. 3°. Rabia, 30. 4°. Latter Rabia, 29. 5°. Jomada, 30. 6°. Latter Jomada, 29. 7°. Rajab, 30. 8°. Shaaban, 29. 9°. Samadan, 30. 10°. Shawal, 29. 11°. Dulkaadah, 30. 12°. Dulheggia, 29; and in the embolismic year, 30.—An intercalary day is added every 2d, 5th, 7th, 10th, 13th, 15th, 18th, 21st, 24th, 26th, 29th, in a cycle of 29 years.

**Ethiopic YEAR**, is a solar year perfectly agreeing with the Actian, except in this, that the names of the months are different.—It commences with the Egyptian year, on the 29th of August of the Julian year.

Its months are, 1°. Mascaram. 2°. Tykympt. 3°. Hydar. 4°. Tyshas. 5°. Tyr. 6°. Jacatit. 7°. Magabit. 8°. Mijazia. 9°. Ginbat. 10°. Syne. 11°. Hamle. 12°. Hahafe. Intercalary days 5.

YEAR of the Hegira. } HEGIRA.

**New YEAR's day**, or the day wherein the year commences, has always been very different, in different nations, and yet in all held in great veneration.

Among the Romans, the first and last day of the year were consecrated to Janus; on which account it was, that they represented him with two faces.

To them we owe the ceremony of wishing a *happy new year*; which appears to be very antient.—Before the first day was spent, they not only visited and complimented each other, but also presented strenæ, and offered vows to the gods for the preservation of each other.—Lucian represents it as a practice of a very antient standing, even in his time; and refers it to Numa. See STRENÆ, VOW, &c.

# Y E L

Ovid intimates the same ceremony, in the beginning of his *Fasti*.

*Postera lux oritur, linguisque animisque favete:  
Nunc dicenda bono, sunt bona verba die.*

And Pliny, more expressly, Lib. XXVIII. cap. 1. *Primum anni incipientis diem lætis precationibus invicem faustum omni-  
nantur.*

The civil, or legal YEAR, in England, commences on the day of the annunciation, i. e. on the 25th day of March; though the historical year begins on the day of the circumcision, i. e. the first of January, on which day the German and Italian year also begins.—Stow observes, that William the conqueror, having been crowned on the first of January, that thenceforth became the first of the year for historians, &c. Though, in all civil affairs, they retained the antient manner of accounting, which began with the 25th of March. See CIRCUMCISION, NATIVITY, &c.

The part of the year between those terms is usually expressed both ways, as  $172\frac{4}{5}$  or  $172\frac{1}{5}$ .—Since the conqueror, the king's patents, charters, proclamations, &c. are usually dated by the year of the king's reign.

The church, as to her solemn service, begins the year on the first Sunday in advent, which is always that next S. Andrew's day, or the 30th of November. See ADVENT.

The Jews, as most other nations of the east, had a civil year, which commenced with the new moon in September; and an ecclesiastical year, which commenced from the new moon in March.

The French year, during the reigns of the Merovingian race, began on the day whereon the troops were reviewed; which was the first day of March.—Under the Carolingians it began on Christmas-day; and, under the Capetians, on Easter-day; which, therefore, varied between the 22d of March, and the 25th of April.

And this is still the beginning of the French ecclesiastical year.—But for the civil, Charles IX. appointed in 1564, that for the future it should commence on the first of January.

The Mahometans begin their year the minute the sun enters aries.—The Persians in the month answering to our June. The Chinese, and most of the Indians, begin it with the first moon in March.—The Brachmans begin it with the new moon in April; on which day they hold a feast called *sam-wat saradi pauduga*, q. d. feast of New-year's day.—The Mexicans, according to d'Acofta, begin the year on our 23d of February, when the leaves begin to grow green.—Their year consists of 18 months, 20 days each: which making 360 days, the remaining five days are spent in mirth, and no business suffered to be done, nor even any service at the temples.—Alvarez relates much the same of the Abyssinians; who begin their year on the 26th of August, and have five idle days at the end, which they call *pagomen*.—At Rome there are two ways of computing the year; the one beginning at the nativity of our Lord: this the notaries use, dating à nativitate. The other in March, on occasion of the incarnation; and it is by this the bulls are dated, anno incarnationis.—The Greeks begin their year of the world from the first of September. See INCARNATION.

Years are also distinguished with regard to the epocha's whence they are numbered: thus, *years of our Lord*, are those reckoned from the birth of Jesus Christ, which are now 1727.—*Years of the world*, are those elapsed since the creation, which Scaliger makes to be 5676.—*Years of Rome*, of the Hegira, of Nabonassar, &c. See the difference between these years, under the article EPOCHA.

**YEAR and Day**, in law, &c. is a time that determines a right in many cases, and is in some an usucaption, and in others a prescription. See PRESCRIPTION, &c.

Thus, in the case of an estray, if the owner, proclamation being made, challenge it not within a year and day, it is forfeit. In like manner is the year and day given in cases of appeal, of descent, of entry or claim, of non-claim upon a fine, or writ of right, of the death of a man fore bruised, or wounded; of protections, effoins in respect of the king's service; of a wreck, &c. See APPEAL, WRECK, &c.

**YEAR Day and Waste**, *annus dies & vastum*, is a part of the king's prerogative, whereby he challenges the profits of the lands and tenements of persons attainted for petit-treason, or felony, for the space of a year and a day; whosoever is lord of the manour to which they belong.

Not only this, but at the end thereof he may waste the tenements, destroy the houses, root up the woods, gardens, pasture, and plow up the meadows, unless the lord of the fee agree with him for the redemption of such waste.—After the year day and waste, they are to be restored to the lord of the fee.

**Y E A R N**, in hunting, signifies to bark, as beagles properly do, at their prey. See HUNTING.

**Y E L K**. See the article YOLK.

**Y E L L O W**\*, a bright colour, reflecting the most light of any after white. See COLOUR, and LIGHT.

\* The

\* The word is formed from the Italian *giallo*, or the German *geel*, which signifies the same; or from the Latin *galbanus*, bright, gay.

There are divers *yellow* substances that become white, upon wetting and drying them again several times in the sun: As wax, linen-cloth, &c. See BLEACHING; see also HAIR, &c.

The same bodies, if they be already white, and continue a long time in the air without being wetted, turn *yellow*.

Paper and ivory applied near the fire, become successively *yellow*, red, and black.—Silk, when turned *yellow*, is whitened again with the fumes of sulphur. See WHITE, WHITENESS, &c.

**YELLOW**, in dying, is one of the five simple and mother colours. See COLOUR, and DYING.

For the finest *yellow*s, they first boil the cloth, or stuff, in allum and pot-ashes; then give the colour with the weld, or would. See WELD.

Turmeric likewise gives a good *yellow*, though not the best. There is also an Indian wood that gives a *yellow* colour bordering on gold.—A fourth sort of *yellow* is made with saffron, but this is inferior to them all.

Greens are usually made of *yellow*, and blue mixed. See GREEN.—With *yellow*, madder red, and goat's hair prepared with madder, are made the golden *yellow*, aurora, pansy, nacarate, isabella, and chamois-colour; which are all casts or shades of *yellow*.

Painters and enamellers make their *yellow* of massicot, which is cerufs raised by the fire; or with yellow oker. See ENAMEL, and ENAMELING.—Limners and illuminers make it with saffron, and French berries, orcanette, &c.

Brantom observes, it was antiently the custom to paint a man's door *yellow*, and strew his house with salt; to declare him traitor to his king.

**YELLOW**, or French berries. See the article AVIGNON.

**YELLOW Jaundice**. See the article JAUNDICE.

**YELLOW**S, a disease in a horse, much the same with that called *jaundice* in man. See JAUNDICE.

There are two kinds of it, the *yellow*, and the *black*.

The *yellow*s is a very frequent disorder, say the farriers, arising from obstructions in the gall-pipe, or the little ducts opening into the same, occasioned by viscid or gritty matters lodged therein, or a plenitude and compression of the neighbouring blood-vessels; by means whereof, the matter that should be turned into gall, is taken up by the vein, and carried into the mass of blood; which it tinctures *yellow*: so that the eyes, inside of the lips, and other parts of the mouth capable of shewing the colour, appear *yellow*.

The effect whereof is, that a horse will be dull, heavy, and low-spirited; easily jaded by the least labour or exercise, &c.

**YEOMAN**, the first or highest degree among the commons, or plebeians of England; next in order to the gentry. See COMMONS, and GENTLEMAN.

The *yeomen* are properly the freeholders, who have land of their own; so called from the Saxon *gemane*, or *geman*, common.—The word *yongman*, is used for *yeoman* in the statute 33 Hen. VIII. and in an old deed it is sometimes also written *jeman*, which, in the German, signifies any body.

According to Sir Thomas Smith, a *yeoman* is a free-born Englishman, who can lay out of his own free-land in yearly revenue, to the sum of forty shillings sterling.

The *yeomanry* of England, are capable of holding lands of their own to a good value; are adjudged capable of certain offices, as constables, church-wardens, jury-men, to vote in elections to parliament, and to serve in the army.

The *yeomen* were famous, in antient times, for military valour, being particularly expert at the management of the bow; whence the infantry was composed chiefly of them. See ARCHER.

In many cases, the law conceives a better opinion of the *yeomanry*, that occupy lands, than of tradesmen, artificers, &c. See FREEHOLDER.

By a statute, 2 Henry IV. it is enacted, That no *yeoman* shall take or wear a livery of any lord, upon pain of imprisonment, and a fine at the king's pleasure. See LIVERY.

**YEOMAN**, is also a title of office in the king's household, of a middle place, or rank, between an usher and a groom. See USHER, and GROOM.

Such are the—*Yeoman* of the pantry; *yeoman* of the scullery; *yeoman* of the stirrop, &c. See HOUSEHOLD.

**YEOMEN Warders**. See WARDERS of the Tower.

**YEOMEN** of the Guard, properly called *yeomen of the Guard of the king's body*, were antiently 250 men, and of the best rank under gentry, and of larger stature than ordinary; every one being required to be six feet high. See GUARD.

At present there are but one hundred *yeomen* in constant duty; and seventy more not in duty; and as any of the hundred die, his place is supplied out of the seventy.

They go clad after the manner of King Henry the eighth's times.—They had diet as well as wages, when in waiting, but this was taken off in the reign of queen Anne.

Their attendance is on the sovereign's person, both at home, and abroad; and they have a room allotted for them only, called the *guard-chamber*.

The officers and *yeomen* are at the disposal of the captain, but the captain at the appointment of the king.

**YERKING**, in the manage, is when a horse strikes with his hind legs, or flings and kicks back with the whole hind quarters; stretching out the two legs nearly together, and even to their full extent. See AIR, SALT, &c.

**YEST**, or *Barm*, a head, or scum rising upon beer, or ale, while working or fermenting in the vat. See BREWING, MALT-Liquor, &c.

It is used for a leaven or ferment in the baking of bread; as serving to swell or puff it up very considerably in a little time, and to make it much lighter, softer, and more delicate.—When there is too much of it, it renders the bread bitter. See BAKING.

The use of *yest* in bread, is but of late standing among us: it is not above eighty years since the avarice of the bakers first introduced it; and then it was only done by stealth.—Though Pliny witnesses it to have been used by the antient Gauls.

The faculty of medicine of Paris, by a decree of the 24th of March 1688, solemnly maintained it noxious to the health of the people; yet could not that prevent its progress. See BEER, BREWING, &c.

**YEZDEGERDIC Year**. See Persian YEAR.

**YGROMETER**. See the article HYGROMETER.

**YIELDING** and *paying*, a law phrase, formed by corruption from the Saxon *geldan*, or *gildan*, to pay.—Hence, in Domestday, *gildare* is frequently used for *solvere*, *reddere*; the Saxon G being easily converted into a Y. See GELD, and GILD.

**YNCA**, **YNCAN**, or **INCA**, an appellation antiently given to the kings of Peru, and the princes of their blood; the word signifying, literally, *lord*, *king*, *emperor*, and *royal blood*. See INCA.

The king himself was particularly called *capac ynca*, i. e. great lord.—His wife, *pallas*, and the princes simply, *ynca's*. These *ynca's*, before the arrival of the Spaniards, were exceedingly powerful.—Their people revered them to excess, as believing them to be sons of the sun, and never to have committed any fault.—If any person offended the royal majesty in the smallest matter, the city he belonged to was totally demolished.

When they travelled, whatever chamber they lay in on the road, was walled up as soon they departed, that no body might ever enter in after them.—The like was done to the room wherein the king died; in which, likewise all the gold, silver, and precious furniture were immured, and a new apartment built for his successor.

His beloved wives, domestics, &c. likewise sacrificed themselves, and were buried alive in the same tomb along with him. See the *History of the Yncas*, by Garcilasso de la Vefia.

**Y O A K**, or **Y O K E**, in agriculture, a frame of wood, fitted over the necks of oxen; whereby they are coupled together, and harnessed to the plough, &c. See PLOUGH.

It consists of several parts; as, the *yoke* properly so called, which is a thick piece of wood, lying over the neck; the *bow*, which compasses the neck about; the *stitchings* and *wreathings*, which hold the bow fast in the *yoke*; and the *yoke-ring*, and *ox-chain*.

The Romans made the enemies they subdued, pass under the *yoke*, which they called *sub jugum mittere*: that is, they made them pass under a sort of *furcæ patibulares*, or gallows, consisting of a pike, or other weapon laid across two others planted upright in the ground.—This done, they treated them with humanity enough, and sent them home again. See FURCA.

The same measure was sometimes dealt them by their enemies upon the same occasion.—Thus Cæsar, Lib. II. observes, that the consul L. Cassius, had been killed by the Swifs, his army defeated, and made pass under the *yok*.

**Y O A K of Land**, *jugata terræ*, in our antient customs, was the space which a *yoke* of oxen, that is, two oxen, may plough in one day. See HIDE, YARD-Land, &c.

**Sea-Y O A K**. See the article SEA.

**Y O I D E S**\*, or **HY O I D E S**, in anatomy, a bone situate at the root of the tongue, and composed of divers little bones, united by cartilages, which sometimes ossify. See HYOIDES.

\* It has its name *voides*, and sometimes *uoides*, *uphioides*, from its resembling a Greek *υ*, or uphilon.—Some call it *lambdoides*, as resembling a lambda inverted.

It is not contiguous to the extremity of any other bone, nor has any articulation with them: on which account, it is not shewn in the skeletons.

Its use is to fortify the base or root of the tongue, and facilitate the passage of the air into the trachea, and the food into the gullet.—It has five pair of muscles, which move it together with the tongue. See TONGUE.

**Y O L K**,

# Y O U

**YOLK**, or **YELK**, in natural history, the yellow part in the middle of an egg. See **EGG**.

The chicken is formed out of, and nourished by the white alone, till it be grown to some bulk: after which, the *yolk* serves it for nourishment; which it likewise does, in part, after it is hatched.— For a good part of the *yolk* remains after exclusion; being received into the chicken's belly: and being there reserved, as in a store-house, is by the ductus intestinalis, as by a funnel, conveyed into the guts, and serves instead of milk. *Willughb. Ornithol. Lib. I. c. 3.*— This was even known to Pliny: *Ipsum animal ex albo liquore ovi corporetur: cibus ejus in luteo est. Lib. X. c. 53.*

**YOUNG**. See **GENERATION**, **CONCEPTION**, **GESTATION**, **EMBRYO**, **FOETUS**, **DELIVERY**, **CHILD**, &c. see also **STORGE**, &c.

In the army, that regiment or officer, is said to be the *younger*, *junior*, which was last raised, or whose commission is of latest date, whatever be the age of the man, or however long he may have served in other capacities.

**YOUNKERS**, among sailors, are the *younger* sailors, otherwise called *foremast-men*; whose business is to take in the top-sails, furl the sails, sling the yards, &c.

# Y Q U

**YOUTH**, *Adolescence*. See **AGE**, and **ADOLESCENCE**.

**YPSILOIDES**, *ΥΨΙΛΟΕΙΔΗΣ*, in anatomy, the third genuine suture of the cranium; thus called from its resembling a Greek *ψ*, or *upsilon*. See **SUTURE**.

Some also call it *λambdoides*, *lambdoides*. See **LAMBDOIDES**.

There is also a bone at the root of the tongue, called *ypsiloïdes*, and *yoides*. See **YOIDES**.

**YQUETAYA**, in natural history, a plant in Brasil, long used as a medicine in that country; and lately discovered to the Europeans by a French surgeon.

It has been since found in France, where, being cultivated and examined by M. Marchant, it appears to be a kind of scrophulary, or blood-nettle.

It has this remarkable property, that it takes away from senna all its ill taste and smell; which property of correcting the infusion of senna, was unknown in the scrophulary. See **SENNA**.

To use this plant, it must be dried ten or twelve days in the shade, and afterwards exposed to the sun, till quite dry.

## ZEN

**Z**, The last letter in the alphabet, and one of the double consonants, both among the Latins and Greeks. See LETTER, and CONSONANT. Its pronunciation is much more soft and obtuse than the x, which makes Quintilian call it *jucundissima*, and *dulcissima*.— Nevertheless, the sound was not always the same as it is now; which is but, as it were, half that of an S. See S. It had something also in it of the d; but only what sounded very smoothly: Thus, *Mezentius* was pronounced, as if it had been *Medfentius*, &c. See D. The Z had also an affinity with the g: Thus *Capella*; *z à Græcis venit, licet etiam ipsi primo g Græcâ utebantur*. See G.

Z was also a numeral letter, signifying 2000; according to the verse:

*Ultima z tenens, finem bis mille tenebit.*

When a dash was added a-top Z̄, it signified two thousand times two thousand.

**ZAIM**, a portion of land, allotted for the subsistence of a horse-man in the Turkish militia; called also *timar*. See TIMAR, and TIMARIOT.

**ZAIRAGIA**, or **ZAIRAGIAH**, a kind of divination in use among the Arabs; performed by means of divers wheels or circles, placed concentric to one another, and noted with several letters which are brought to answer to each other, by moving the circles according to certain rules. See DIVINATION.

This is also called *zaraiah*, by reason the circles of this machine, which are called *mutazariat*, *laflak*, &c. correspond to the orbs of the planets, and the atmospheres of the several elements.

**ZAPATA\***, or *Sapata*, a kind of feast, or ceremony held in Italy, in the courts of certain princes, on S. Nicholas's day, wherein people hide presents in the shoes or slippers of those they would do honour to, in such manner, as they surprize them on the morrow when they come to dress.

\* The word is originally Spanish, *capato*, and signifies a shoe, or slipper.

It is done in imitation of the practice of S. Nicholas, who used, in the night-time, to throw purses of money in at the windows, to marry poor maids withal.

F. Monestrier has described these *zapatas*, their origin, and different usages, in his treatise *des ballets anciens, & modernes*.

**ZEAL**, **ZELUS**, ζῆλος, the exercise of a warm animated affection, or passion for any thing. See PASSION, &c.

Some will have *zeal* to be properly a mixt, or compound sensation, where one affection is raised or inflamed by another. — On these principles, it may be defined an affection arising from love and indignation, which cannot bear a thing to be given to another, that a person desires for himself, or one whom he loves and favours. — Others make it consist in an eager study, or desire to keep any thing inviolate; or a fervour of mind, arising from an indignation against those who abuse or do evil to a person beloved.

The Greek philosophers make three species of *zeal*. — The first, of *envy*: the second, of *emulation*, or imitation: the third of *piety*, or devotion; which last makes what the divines call *religious zeal*. See EMULATION, &c.

Josephus speaks much of a party or faction, called the *zealous*, or *zealots*, which arose among the Jews during the war with Vespasian and Titus. Lib. XIV. c. 6. *Antiq.* and Lib. IV. c. 12. *de Bello Judaico*.

**ZECHIN**, or **ZECCHINO**. See the article SEQUIN.

**ZEDOARY**, **ZEDOARIA**, a medicinal root, belonging to a plant growing in the East-Indies, whose leaves are like those of ginger, only longer and broader. See ROOT.

*Zedoary* is of an ash-colour, has an aromatic, bitterish taste; and is ranked in the class of cephalics: but it is also reckoned, by many, amongst the alexipharmics, whereupon it comes to have a place in the capitals; and is even said to prevent infection, by holding it only in the mouth. See ALEXIPHARMIC, &c.

On account of its agreeable bitter, it is also prescribed among stomachics; and for its spicy warmth, is commended in colics, and hysterical affections, for promoting the menses, &c. See AROMATIC.

**ZENITA**, in astronomy, the vertical point; or a point in the heavens directly over our head. See VERTEX, and VERTICAL.

Or, the *zenith* is a point, as Z (*Tab. Astronomy, fig. 52.*) in the surface of the sphere, from which a right line, drawn through the spectator's head, passes through the centre of the earth. See VERTEX, and VERTICAL.

VOL. II. N<sup>o</sup>. 167.

## ZIN

Hence, there are as many *zeniths* as there are different places on the earth, where the heavens may be seen; and upon the changing our place, we also change our *zenith*.

The *zenith* is also called the *pole of the horizon*, because 90 degrees distant from each point thereof. See HORIZON.

It is also the pole of all the almucantars, or parallels of the horizon, whereby the altitude of the stars is estimated. See ALMUCANTAR.

Through the *zenith* pass the vertical-circles, or azimuths. See VERTICAL-Circle, and AZIMUTH.

The point diametrically opposite to the *zenith*, is called the *nadir*; which is the point directly under our feet. See NADIR.

The *nadir* is the *zenith* to our antipodes; as our *zenith* is the *nadir* to them. See ANTIPODES.

**ZENITH-Distance**, is the complement of the sun's, or a star's meridian altitude; or what the meridian altitude wants of 90 degrees. See COMPLEMENT, and ALTITUDE.

**ZENSUS**, in arithmetic, a name which some authors give to a square number; or the second power. See SQUARE Number, and POWER.

The higher powers they call *zensensus*, *zensicubus*, *zensizensensus*, *zensurdefolidus*, &c. See POWER.

**ZEPHYRUS\***, or **ZEPHYR**, the west-wind; a wind blowing from that cardinal point of the horizon opposite to the east. See WEST, WIND, and CARDINAL-Point.

\* The word is Greek, ζephyρος. — The poets personify it.

It is also called *favonius*, and *occidens*; and by many confounded with *africus*.

**ZEST**, the woody, thick skin, quartering the kernel of a walnut. — Some physicians prescribe *zest*, dried and taken with white-wine, as a remedy against the gravel.

The word is also used for a chip of orange or lemon-peel; such as is usually squeezed into ale, wine, &c. to give it a flavour.

Hence, to *zest* an orange or lemon, among confectioners, is to cut the peel from top to bottom into small slips, as thin as possible.

**ZETA\***, or **ZETECULA**, a little closet, or withdrawing-chamber, with pipes running along the walls, to receive, from below, either the cool air, or steam of warm water. See CALEDUCT, HYPOCAUSTUM, &c.

\* The word is formed either from ζῆν, to be warm; or of ζῶν, *vivere*, to live, on account of the use made hereof for love and enjoyment.

**ZETETICE\***, **ZETETIC-Method**, in mathematics, the method made use of to investigate, or find the solution of a problem. See RESOLUTION, PROBLEM, &c.

\* The word is Greek, ζητητική, formed from ζητω, I seek.

The ancient Pyrrhanians were sometimes called *zetetici*, *q. d.* seekers. See PYRRHANIANs.

**ZEUGMA\***, a figure in grammar, whereby an adjective, or verb, which agrees with a nearer word, is also, by way of supplement, referred to another more remote. See FIGURE.

\* The word is Greek, ζευγμα, which literally denotes a joining together: from ζυγνυω, I join.

Thus Terence, *Utinam aut hic surdus, aut hæc muta facta sit*. — So Virgil, *Hic illius arma hic currus fuit*. — In which cases, the words *facta sit*, agreeing primarily with *hæc muta*, are also made to agree or extend to *hic surdus*: and the verb *fuit*, is not only referred to *hic currus*, which it properly respects, but further, to *hic illius arma*.

The Latins, it may be here observed, take a liberty in construction, which some of the nicer critics among the moderns, particularly the French, will not allow in the modern tongues. See CONSTRUCTION.

**ZIBETHUM**, or **ZIBETTA**, in natural history, civet; a perfume like musk, contained in a kernally bladder, in the groin of a civet cat. See CIVET.

**ZICZAC**. See the article ALLEY in Ziczac.

**ZINDIKITES**, a sect among the Mahometans, denominated from their leader Zindik, whom Grotius makes to be one of the magi, and a follower of Zoroaster. See MAGI.

The *Zindikites* believe no providence nor resurrection. — They allow no other God but the four elements; and in this sense assert, that a man, being a mixture of those simple bodies, returns to God when he dies.

**ZINK**, a kind of metalline substance, very hard, white, and brilliant; and which, though not ductile enough to denominate it a metal, yet stretches a little under the hammer. See METAL, DUCTILITY, &c.

*Zink* is the same with what is otherwise called *spelter*, and used to purge and purify tin; much as lead is to purify gold, silver, and copper. See SPELTER, and LEAD.

Founders, toymen, &c. also use it with turmeric to tinge copper, &c. It gives a fine gold colour, though not a very lasting one. See COPPER, BRASS, &c.

13 G g

M. Homberg

M. Homberg conjectures, with a good deal of probability, that *zink* is no other than a natural mixture of two real metals, *viz.* tin, and iron.—What led him to the opinion was, that *zink* yields precisely the same fumes by the burning-glass, as such a mixture does.—Accordingly, he assures us, he often substituted the one for the other; and this always with the very same effect.

**ZINZIBER**, or **ZINGIBER**. See the article **GINGER**.

**ZIZYPHA**, or **ZIZYPHUS**, a name sometimes given to a kind of fruit, more usually called *jujub*. See **JUJUB**.

**ZOCCO**, **ZOCCOLO**, **ZOCLE**, or **SOCLE**, in architecture, a kind of stand or pedestal; being a low, square piece, or member, serving to support a busto, statue, pedestal, or the like thing, that needs to be raised.—See *Tab. Archit. fig. 24. lit. z.* see also the article **SOCLE**.

**ZODIAC**\*, **ZODIACUS**, in astronomy, a fascia, or broad circle, whose middle is the ecliptic, and its extremes two circles parallel thereto, at such distance from it as to bound, or comprehend the excursions of the sun and planets. See **SUN**, and **PLANET**.

\* The word is formed from the Greek ζῶν, animal; by reason of the constellations therein: others derive it from ζῶν, life; from an opinion that the planets have a great influence on animal life.

The sun never deviates from the middle of the *zodiac*; i. e. from the ecliptic; the planets all do, more or less. See **ECLIPTIC**.

Their greatest deviations, called *latitudes*, are the measure of the breadth of the *zodiac*: which is broader, or narrower, as the greatest latitude of the planets is made more or less.—Accordingly, some make it 16, some 18, and some 20 degrees broad. See **LATITUDE**.

The *zodiac* cutting the equator obliquely, makes an angle therewith of 23 degrees and an half; or more precisely of 23°, 29', which is what we call the *obliquity of the zodiac*, and is the sun's greatest declination. See **OBLIQUITY**, and **DECLINATION**.

The *zodiac* is divided into twelve portions, called *signs*; and those divisions or signs are denominated from the constellations which antiently possessed each part. See **CONSTELLATION**.—But the *zodiac* being immoveable, and the stars having a motion from west to east, those constellations no longer correspond to their proper signs; whence arises what we call the *precession of the equinoxes*. See **PRECESSION**.

When a star, therefore, is said to be in such a *sign of the zodiac*, it is not to be understood of that sign, or constellation of the firmament; but only of that twelfth part of the *zodiac*, or dodecatemory thereof. See **SIGN**, **STAR**, and **DODECATEMORY**.

Cassini has also observed a track in the heavens, within whose bounds most of the comets, though not all of them, are observed to keep; which, for this reason, he calls the *zodiac of the comets*. See **COMET**.

This he makes as broad as the other *zodiac*, and marks it with signs or constellations like that; as Antinous, Pegasus, Andromeda, Taurus, Orion, the lesser Dog, Hydra, the Centaur, Scorpion, and Sagittary.

**ZONE**\*, **ZONA**, in geography and astronomy, a division of the terraqueous globe, with respect to the different degree of heat found in the different parts thereof. See **EARTH**, and **HEAT**.

The word is Greek, ζών, q. d. belt, girdle.

A *zone* is the fifth part of the surface of the earth, contained between two parallels. See **PARALLEL**.

The *zones* are denominated *torrid*, *frigid*, and *temperate*.

**Torrid ZONE**, is a fascia, or band surrounding the terraqueous globe, and terminated by the two tropics. See **TROPIC**.—Its breadth, therefore, is 46°, 58'. The equator running through the middle of it, divides it into two equal parts, each containing 23°, 29'.

The antients imagined the *torrid zone* uninhabitable. See **TORRID**.

**Temperate ZONES**, are two fasciæ, or bands environing the globe, and contained between the tropics, and the polar circles.—The breadth of each is 43°, 2'. See **TEMPERATE**.

**Frigid ZONES**, are segments of the surface of the earth terminated, the one by the antarctic, and the other by the arctic circle.—The breadth of each is 46°, 58'. See **ARCTIC**, **ANTARCTIC**, &c.

The difference of *zone* is attended with a great diversity of phenomena.—1°. In the *torrid zone*, the sun passes through the zenith twice a year; and his recess from the equator towards the pole which is above the horizon, is twice a year equal to the height of the pole.

2°. In the temperate and frigid *zones*, the least height of the pole exceeds the greatest distance of the sun from the equator; and therefore, to the inhabitants thereof, the sun never passes through the zenith; yet if on the same day the sun rises at the same time to a greater height, the height of the pole is the less, in regard the inclination of the circles of diurnal revolution to the horizon is less.

3°. In the temperate and torrid *zones*, the sun rises and sets every natural day, by reason the distance of the sun from the pole always exceeds the height of the pole; yet every where but under the equator, the artificial days are unequal, and the inequality is the greater as the place is less distant from the frigid *zone*. See **DAY**.

4°. Where the temperate *zones* terminate on the frigid, the height of the pole is equal to the sun's distance from the pole, when in the neighbouring tropic; and, consequently, once a year, the sun, in its diurnal motion, performs an entire revolution, without going down under the horizon.

5°. Every where in a frigid *zone*, the height of the pole is greater than the least distance of the sun from the pole; and therefore during some revolutions of the earth, the sun is at a distance from the pole less than the pole's height; and during all that time, does not set, nor so much as touch the horizon.—Where the distance from the pole, as the sun recedes from it, exceeds the height of the pole, or latitude of the place, the sun rises or sets every natural day. See **DAY**, **NIGHT**, **RISING**, **SETTING**, &c.

**ZONNAR**\*, a kind of belt, or girdle of black leather, which the Christians and Jews of the Levant, particularly those in Asia, and the territories of the grand seignior, are obliged to wear; to distinguish themselves from the Mahometans.

\* The word is corrupted from the vulgar Greek, a contraction of ζωνάριον, of ζῶν, girdle.

It was Motavakkel X. kaliph, of the family of the Abassides, that first enjoined the Christians, &c. to wear the *zonnar*. The ordinance to this effect was published in the year of the Hegira 235.

Hence, as most of the Christians of Syria, Mesopotamia, &c. are either Nestorians, or Jacobites; those sectaries are often called *Christians of the girdle*. See **GIRDLE**.

**ZOOLOGIA**\*, **ZOOLOGY**, a discourse, or treatise upon animals, or living creatures. See **ANIMAL**.

*Zoology* makes a considerable article in natural history; comprehending what relates to the form, structure, method of living, feeding, propagating, &c. of the divers species of brute creatures. See **NATURAL HISTORY**.

\* The word is Greek, ζωολογία, comprehended of ζῶν, life, and λογία, speech, discourse.

**ZOOPHORIC Column**, is a statuary column; or a column that bears or supports the figure of an animal. See **COLUMN**.

**ZOOPHORUS**, or **ZOPHORUS**, in the antient architecture, the same thing with the *frieze* in the modern. See **FRIEZE**.

It was thus called in Greek, because antiently adorned with the figures of animals; from ζῶν, animal, and φέρω, I bear. The Greeks sometimes also call the *zodiac*, *zoophorus*, because of the signs and constellations therein. See **ZODIAC**.

**ZOOPHYTON**\*, **ZOOPHYTE**, in natural history, a kind of intermediate body, partaking both of the nature of a sensitive, and a vegetable.

\* The word is Greek, ζωοφυτον, compounded of ζῶν, animal, and φυτον, plant, q. d. plant-animal.

Such is the *planta pudica* commonly supposed to be; though with little foundation. See **SENSITIVE PLANT**.—The antients also reputed sponges to be *zoophytes*. See **SPONGE**. The foetus, while in the womb, appears to be a real *zoophyte*; growing to the mother by the funiculus umbilicalis, as plants do to the earth by their stem. See **FOETUS**, **EMBRYO**, &c.

Olearius mentions a very extraordinary sort of *zoophyte*, called *agnus Scythicus*, or *borametz*, growing near Samara on the Volga.—It is a kind of melon shaped like a lamb, all the parts whereof it has, and grows to the earth by a stem, which serves it for a navel-string.—As it grows, it changes place as much as its stem will allow of; and it consumes and dries up all the grass where it grows.—When ripe, the stem withers, and the body, or fruit, becomes covered with a downy skin, which may be dressed, and used as fur.

Olearius was shewn some of this skin, taken off the covering of a bed; which the people swore came from the fruit; but he could hardly believe them: it was covered with a soft curled wool, like that of a young lamb.—Scaliger adds, that this fruit lives, and grows, till such time as it wants grass.—But what credit is to be given to most of the marvellous in these accounts, may be seen in *Philosop. Trans.* n. 247. p. 461. and n. 390. p. 353. The skin shewn to Olearius was, in all probability, such as those described by Breynius from Kämpfer, in the forecited *Transact.* n. 390.

**ZOOTOMY**\*, **ZOOTOMH**, the art or act of dissecting animals, or living creatures. See **DISSECTION**.

\* The word is compounded of ζῶν, animal, and τέμνω, *seco*, I cut.

*Zootomy* amounts to the same with *anatomy*, or rather *comparative anatomy*. See **ANATOMY**, and **COMPARATIVE**.

**ZOPHORIC**. See the article **ZOOPHORIC**.

**ZOPHORUS**. See the article **ZOOPHORUS**.

**ZOPISSA**

# Z U I

**ZOPISSA\***, ΖΩΠΙΣΣΑ, *Naval-pitch*; a kind of mixture of pitch and tar, scraped off ships that have been a long time at sea. See **PITCH**, and **TAR**.

\* The word seems formed from *ζω*, *bullio*, I boil, and *πισσα*, pitch; *q. d.* boiled, or concocted pitch

This matter, by being gradually penetrated by the salt of the sea, becomes partaker of its qualities; and being applied to the body externally, is found resolute and desiccative.

**ZUINGLIANS**, a branch of antient Reformers or Protestants; denominated from their author Uldric, Huldric Zuinglius. See **REFORMATION**.

This eminent divine was born at Wildehausen, in the county of Toggenbourg in Switzerland, in 1487.—After having finished his studies in theology, and received the doctor's cap at Basil, in 1505, he applied himself to preaching; and with good success.

Soon after Luther had taken up arms against Rome, Zuinglius, being then minister of the chief church in Zurich, fell in with him; preached openly against indulgencies, then against the intercession of the saints, then against the mass, the hierarchy, the vows, and celibacy of the clergy, abstinence from flesh, &c.

As to the eucharist, interpreting *hoc est corpus meum* by *hoc significat corpus meum*, he maintained, that the bread and wine were only bare significations, or representations of the body and blood of Jesus Christ; in which he differed from Luther, who held a consubstantiation. See **LUTHERANS**, **EUCCHARIST**, **CONSUBSTANTIATION**, &c.

In a conference held with the deputies of the bishop of Constance, in 1523, he procured most of the external ceremonies of religion to be abolished.—As to matters of grace, Zuinglius seemed inclined to Pelagianism; giving all to free-will, considered as acting by the mere strength of nature; in which

# Z Y T

he differed from Calvin. See **CALVINISM**, **GRACE**, **PELAGIAN**, &c.

**ZYGOMA\***, ΖΥΓΩΜΑ, in anatomy, a bone of the head, otherwise called *os jugale*. See **BONE**.

\* The word is formed from *ζυγνυμαι*, I join; so that *zygoma*, properly speaking, is the juncture of those two bones

The *zygoma* is no single bone, but an union or assemblage of two processes, or eminences of bones; the one from the *os temporis*, the other from the *os malæ*.—See *Tab. Anat. (Osteol.) fig. 2. lit. c*; see also the article *OS TEMPORIS*.

These two eminences, or apophyses, are joined together by a suture, thence called *zygomaticus*. See **ZYGOMATICUS**.

**ZYGOMATICUS**, a muscle of the head, which has its origin in the *processus jugalis*, or *zygoma*; and passing obliquely, is inserted near the angle of the lips.—It helps to draw the lips obliquely upwards.—See *Tab. Anat. (Myol.) fig. 1. n. 9. fig. 6. n. 4. fig. 7. n. 2*; see also **LIPS**.

**ZYGOMATICUS**, is also an epithet given to the suture that binds the two processes of the *zygoma* together. See **ZYGOMA**, and **SUTURE**.

**ZYMOSIMETER\***, an instrument proposed by Swammerdam, in his book *de Respiratione*, wherewith to measure the degree of fermentation occasioned by the mixture of different matters; and the degree of heat which those matters acquire in fermenting; as also the heat or temperament of the blood of animals. See **FERMENTATION**, **HEAT**, &c.

\* The word is formed from *ζυμωσις*, fermentation, and *μετρον*, measure.

**ZYTHUM**, or ΖΥΘΟΣ, a sort of malt-liquor, in use among the antient Germans. See **MALT-Liquor**. Matthiolus represents the antient *zythum*, and curmi, as the same with our beer and ale. See **BEER**, and **ALE**.
