**NERVOUS Spirit**, or *Juice*, denotes a pure, subtle, volatile humour, better known by the name of *animal spirits*; secreted from the arterious blood in the cortical part of the brain, collected in the medulla oblongata, and thence driven, by the force of the heart, into the cavities of the nerves; to be conveyed by them throughout the body, for the purposes of sensation and animal motion. See SPIRIT, MUSCULAR, SENSATION, NERVE, &c.

**NEST.** See the article NIDUS.

**NESTORIANS**, a sect of ancient heretics, still said to be subsisting in some parts of the Levant; whose distinguishing tenet is, that Mary is not the mother of God. See MOTHER of God.

They take their name from Nestorius, who, of a monk, became a priest, and celebrated preacher, and was at length, after the death of Sisinus, in 428, raised by Theodosius to the see of Constantinople.

At first he shewed a world of zeal against heresy, in his sermons before the emperor; but at length taking the liberty to say, that he found in scripture, that Mary was the mother of Jesus, but that he no where found, that Mary was the mother of God; his auditory was shocked, and a great part of them retired from his communion.

His writings were soon spread through Syria and Egypt; where he made many converts, notwithstanding the vigorous opposition of S. Cyril.

His capital tenet was, that there are two persons in Jesus Christ; and that the virgin was not his mother as God, but only as man. See PERSON.

This doctrine was condemned in the council of Ephesus, at which assisted above 200 bishops; and Nestorius was anathematized, and deposed from his see.

Nestorius was not the author of this error; but borrowed it at Antioch, where he had studied. Theodorus Mopsuestianus had taught the same before him.

It is something difficult to determine whether or no the Chaldee Christians, who still profess *Nestorianism*, have precisely the same sentiments with Nestorius, whom they still esteem as their patriarch! They have made several reunions with the Romish church, but none of them have subsisted long. The most considerable was that under the pontificate of Paul V.

Till the time of pope Julius III, they acknowledged but one patriarch,

patriarch, who assumed the quality of patriarch of Babylon.—But a division arising among them, the patriarchate became divided, at least for a time; and a new patriarch was appointed by that pope, who made his residence at Caremit in Mesopotamia; whose successor, however, unable to withstand the power of the patriarch of Babylon, was obliged to retire within the confines of Persia.—Thus matters stood till the pontificate of Paul V. under whom there was a solemn reunion with the Romish Church, whom their patriarch solemnly owned for the mother, &c. of all churches; sending his ministers to Rome to negotiate the union, and composing an explication of the articles of religion, wherein their disputes with the Romish church were represented as only verbal, &c.

**NET, NEAT**, in commerce, something pure, and unadulterated with any foreign mixture.

Thus, wine is said to be *net* when not falsified or balderdash; and coffee, rice, pepper, &c. are *net* when the filth and ordures are separated from them. See **NEAT**.

A diamond is said to be *net* when it has no stains or flaws; a crystal, when transparent throughout.

**NET** is also used for what remains after the tare has been taken out of the weight of any merchandize; *i. e.* when it is weighed clear of all package. See **TARE**.

Thus we say, a barrel of cochineal weighs 456 pounds; the tare is 50 pounds, and there remains *net* 400 pounds.

**NET-PRODUCE**, a term used to express what any commodity has yielded, all tare and charges deducted.

The merchants sometimes use the Italian words *netto proceduto*, for *net produce*.

**NET-MASONRY**. See the article **MASONRY**.

**Tramel-NET**. See the article **TRAMEL**.

**NETE Hyperboleon** \*, in the antient music, the name of the highest and most acute of the chords of the lyre, or the antient scale, or diagramma. See **DIAGRAMMA**.

\* The word is Greek, composed of *νητη*, and *ὑπερβολων*, *q. d.* the last of the highest, where is understood the word *chords*.

It answered to the A, mi, la, of the third octave of the organ, or the modern system.

**NETE Diazeugmenon** \*, in the antient music, was one of the chords of the lyre, or system of the antients. See **DIAGRAMMA**.

\* The word comes from the Greek *νητη*, and *διαζευγμενον*, last of the separate; where is understood the word *chords*.

It answers to the E, fi, mi, of the third octave of the organ, or modern system.

**NETE Synemmenon** \*, in the antient music, the name of the highest chord of a tetrachord of the Greek system, added to make the *b mollis* fall between the mese and paramese, *i. e.* between *la* and *fi*. See **DIAGRAMMA**.

\* The word comes from the Greek *νητη*, and *συνεμμενον*, the last of these added; where is understood the word *chords*.

The chord had the same sound with the paranete diazeugmenon, or our *la* by *b mollis*.

**NETHER Vert.** See the article **VERT**.

**NEVELLI Testa**. See the article **TESTA**.

**NEURITICS** \*, or **NERVINES**, in medicine, remedies proper for diseases of the nerves, and nervous parts, as the membranes, ligaments, &c.

\* The word is formed from the Greek *νευρον*, *nervus*.

Such are betony, lavender, rosemary, sage, laurel, marjoram, and others among the cephalics. See **CEPHALIC**.

**NEUROGRAPHIA**, in anatomy, a description of the nerves. See **NERVE**.

Raim. Vieussens, a physician of Montpellier, has an excellent treatise in Latin, under the title, *Neurographia Universalis*; where he shews, that there are more ramifications of the nerves in the skin, than in the muscles, and all the other parts. See **SKIN**.

Duncan, another physician of the same place, has also a treatise called *Neurographia Rationalis*. See **NEUROLOGY**.

**NEUROLOGY**, **ΝΕΥΡΟΛΟΓΙΑ**, a discourse of the nerves. See **NERVE**.

*Neurology* seems to be of less extent than *neurography*; inasmuch as the latter may be understood, not only of discourses on the nerves, but also of figures and engravings, representing them; whereas the former is restrained to discoursing alone.—Willis has given a fine *neurology*, in his *Anatome Cerebri*.

**NEUTER**, a person indifferent, who has espoused neither party, and is neither friend, nor foe.

A judge ought to be *neuter* in the causes he judges; in questions, where reason appears *neuter*, a man should ever incline to the side of the unhappy.

**NEUTER**, in grammar, denotes a sort of gender of nouns, which are neither masculine, nor feminine. See **GENDER**.

The Latins have three kinds of genders, masculine, feminine, and *neuter*. In English, and other modern tongues, there is no such thing as *neuter* nouns. See **NOUN**.

**Verbs NEUTER**, by some grammarians called *intransitive verbs*, are those which govern nothing, and that are neither active nor passive. See **VERB**.

When the action expressed by the verb has no object to fall upon, but the verb alone supplies the whole idea of the action; the verb is said to be *neuter*: as, I sleep, thou yawnest, he sneezes, we walk, ye run, they stand still.

Some divide *verbs neuter* into, first, such as do not signify any action, but a quality; as *albet*, it is white; or a situation, as *sedet*, he sits; or have some relation to place, as *adeft*, he is present; or to some other state or attribute, as *regnat*, he rules, &c.

And, secondly, those that do signify actions, though those such as do not pass into any subject different from the actor; as to dine, to sup, to play, &c.

But this latter kind sometimes cease to be *neuter*, and commence active; especially in Greek and Latin, when a subject is given them; as *vivere vitam*, *ambulare viam*, *pugnare pugnam*. Thus the old French poets say, *Soupirer son tourment*; the English, to *figh his woes*, &c.

But this is observed only to obtain where something particular is to be expressed, not contained in the verb; as *vivere vitam beatam*, to live a happy life; *pugnare bonam pugnam*, to fight a good fight, &c.

According to the abbot de Dangeau, *verbs neuter* may be divided into *active* and *passive*; the first, those that form their tenses in English, by the auxiliary verb *to have*; in French, by *avoir*. The second, those that form them in English with the verb *to be*; in French, *etre*.

Thus, to sleep, to yawn, *dormir* and *eteigner*, are *neuters active*.—To come, and to arrive, are *neuters passive*.

**NEUTRAL Salts**, among chymists, are a sort of intermediate salts between acids and alcalies; partaking of the nature of both. See **SALT**, **ACID**, and **ALCALY**.

Mr. Boyle also gives the appellation *neutral* to a sort of spirits, differing in divers qualities both from vinous, acid, and urinous spirits.—These he also calls *anonymous* and *adiaphorous* spirits. See **ADIAPHOROUS**.

**NEUTRALITY**, the state of a person, or thing, that is *neuter*. See **NEUTER**.

**NEW**. See the articles **ANCIENT**, **MODERN**, &c.

**NEW Algebra**. See the article **ALGEBRA**.

**NEW Astronomy**. See the article **ASTRONOMY**.

**NEW Moon**, **Neomenia**, that state of the moon a little before, and a little after her conjunction with the sun. See **MOON**, and **CONJUNCTION**.

**NEW Style**. See the article **STYLE**.

**NEW Tables**. See the article **TABLES**.

**NEWEL**, in architecture, the upright post, which a pair of winding stairs turn about; being that part of the stair-case which sustains the steps. See **STAIR**.

The *newel* is properly a cylinder of stone, which bears on the ground, and is formed by the ends of the steps of the winding-stairs.

There are also *newels* of wood, which are pieces of timber placed perpendicularly, receiving the tenants of the steps of wooden-stairs into their mortices, and wherein are fitted the shafts and rests of the stair-case, and the flights of each story.

**NEWTONIAN Philosophy**, the doctrine of the universe, and particularly of the heavenly bodies; their laws, affections, &c. as delivered by Sir Isaac Newton. See **PHILOSOPHY**.

The term *Newtonian philosophy*, is applied very differently; whence divers confused notions relating thereto.

Some authors, under this philosophy, include all the corpuscular philosophy, considered as it now stands corrected and reformed by the discoveries, and improvements made in several parts thereof, by Sir Isaac Newton.

In which sense it is that Gravefande calls his elements of physics, *Introductio ad Philosophiam Newtonianam*.

And in this sense the *Newtonian* is the same with the *new* philosophy, and stands contradistinguished to the Cartesian, the Peripatetic, and the antient Corpuscular. See **CORPUSCULAR**, **PERIPATETIC**, **CARTESIAN**, &c.

Others, by *Newtonian philosophy*, mean the method or order which Sir Isaac Newton observes in philosophizing; *viz.* the reasoning, and drawing of conclusions directly from phenomena, exclusive of all previous hypotheses; the beginning from simple principles; deducing the first powers and laws of nature from a few select phenomena, and then applying those laws, &c. to account for other things. See **LAW of NATURE**.

And in this sense, the *Newtonian philosophy* is the same with the *experimental* philosophy; and stands opposed to the antient *corpuscular*. See **EXPERIMENTAL**, &c.

Others, by *Newtonian philosophy*, mean that wherein physical bodies are considered mathematically; and where geometry, and mechanics are applied to the solution of phenomena.

In which sense, the *Newtonian* is the same with the *mechanical*, and *mathematical* philosophy. See **MECHANICAL**.

Others, again, by *Newtonian philosophy*, understand that part of physical knowledge, which Sir Isaac Newton has handled, improved, and demonstrated, in his *Principia*.

Others, lastly, by *Newtonian philosophy*, mean, the new principles

principles which Sir Isaac Newton has brought into philosophy; the new system founded thereon; and the new solutions of phenomena thence deduced; or that which characterizes, and distinguishes his philosophy from all others.—Which is the sense wherein we shall chiefly consider it.

As to the history of this philosophy we have but little to say: It was first made public in the year 1686, by the author, then a fellow of Trinity-college, Cambridge; and in the year 1713, republished with considerable improvements.—Several other authors have since attempted to make it plainer; by setting aside many of the more sublime mathematical researches, and substituting either more obvious reasonings, or experiments, in lieu thereof; particularly Whiston in his *Prælect. Phys. Mathematic.* Gravesande in *Element. & Instit.*, and Dr. Pemberton in his *View*.

Notwithstanding the great merit of this philosophy, and the universal reception it has met with at home, it gains ground very slowly abroad; *Newtonianism* has scarce two or three adherents in a nation; but *Cartesianism*, *Huygenianism*, and *Leibnitzianism* remain still in the chief possession.

The philosophy itself is laid down principally in the third book of the *Principia*. The two preceding books are taken up in preparing the way, and laying down such principles of mathematics as have the most relation to philosophy: Such are, the laws, and conditions of powers. And these, to render them less dry and geometrical, the author illustrates by scholia in philosophy, relating chiefly to the density and resistance of bodies, the motion of light, and sounds, a vacuum, &c.

In the third book he proceeds to the philosophy itself; and from the same principles deduces the structure of the universe, and the powers of gravity, whereby bodies tend towards the sun and planets; and from these powers, the motions of the planets and comets, the theory of the moon and the tides.

This book, which he calls *de Mundi Systemate*, he tells us, was first wrote in the popular way: But considering, that such as are unacquainted with the said principles, would not conceive the force of the consequences, nor be induced to lay aside their antient prejudices; for this reason, and to prevent the thing from being in continual dispute, he digested the sum of that book into propositions, in the mathematical manner; so as it might only come to be read by such as had first considered the principles. Not that it is necessary a man should master them all. Many of them, even the first-rate mathematicians, would find a difficulty in getting over. It is enough to have read the definitions, laws of motion, and the three first sections of the first book; after which, the author himself directs us to pass on the book *de Systemate Mundi*.

The several articles of this philosophy, are delivered under their respective heads in this dictionary; as SUN, MOON, PLANET, COMET, EARTH, AIR, CENTRIFUGAL Force, RESISTANCE, MEDIUM, MATTER, SPACE, ELASTICITY, &c. A general idea, or abstract of the whole, we shall here gratify the reader withal; to shew in what relation the several parts stand to each other.

The great principle on which the whole philosophy is founded, is the power of gravity. This principle is not new: Kepler, long ago, hinted it in his *Introduc. ad Mot. Martis*. He even discovered some of the properties thereof, and their effects in the motions of the primary planets: But the glory of bringing it to a physical demonstration was reserved to the English philosopher. See GRAVITY.

His proof of the principle from phenomena, together with the application of the same principle to the various other appearances of nature, or the deducing those appearances from that principle, constitute the *Newtonian system*; which, drawn in miniature, will stand thus.

1<sup>o</sup>, The phenomena are, first, That the satellites of Jupiter do, by radii drawn to the centre of the planet, describe areas proportional to their times; and that their periodical times are in a sesquuplicate ratio of their distances from its centre: in which all observations of all astronomers agree. Second, The same phenomenon holds of the satellites of Saturn, with regard to Saturn; and of the moon with regard to the earth. Third, The periodical times of the primary planets about the sun, are in a sesquuplicate ratio of their mean distances from the sun. But, fourth, the primary planets do not describe areas any way proportional to their periodical times, about the earth; as being sometimes seen stationary, and sometimes retrograde with regard thereto. See SATELLITES, PERIOD, &c.

2<sup>o</sup>, The powers whereby the satellites of Jupiter are constantly drawn out of their rectilinear course, and retained in their orbits, do respect the centre of Jupiter, and are reciprocally as the squares of their distances from the same centre. 2. The same holds of the satellites of Saturn with regard to Saturn; of the moon with regard to the earth: And of the primary planets with regard to the sun. See CENTRAL Force.

3<sup>o</sup>, The moon gravitates towards the earth, and by the power of that gravity is retained in her orbit: And the

same holds of the other satellites with respect to their primary planets; and of the primaries with respect to the sun. See MOON.

As to the moon, the proposition is thus proved: The moon's mean distance is 60 semidiameters of the earth; her period, with regard to the fixed stars, is 27 days, 7 hours, 43 minutes; and the earth's circumference 123249600 Paris feet. Now, supposing the moon to have lost all its motion, and to be let drop to the earth, with the power which retains her in her orbit; in the space of one minute she will fall  $15 \frac{1}{2}$  Paris feet; the arch she describes in her mean motion at the distance of 60 semidiameters of the earth being the versed sine of  $15 \frac{1}{2}$  Paris feet. Hence, as the power, as it approaches the earth, increases in a duplicate ratio of the distance inversely; so, as at the surface of the earth, it is  $60 \times 60$  greater than at the moon: A body falling with that force in our region must, in a minute's time, describe the space of  $60 \times 60 \times 15 \frac{1}{2}$  Paris feet; and  $15 \frac{1}{2}$  Paris feet in the space of one second.

But this is the rate at which bodies fall, by gravity, at the surface of our earth; as Huygens has demonstrated, by experiments with pendulums. Consequently, the power whereby the moon is retained in her orbit, is the same with that we call gravity: For if they were different, a body falling with both powers together, would descend with double the velocity, and in a second of time describe  $30 \frac{1}{2}$  feet. See DESCENT of Bodies.

As to the other secondary planets, their phenomena with respect to their primary ones, being of the same kind with those of the moon about the earth; it is argued by analogy, they depend on the same causes: It being a rule or axiom which all philosophers agree to, that effects of the same kind, have the same causes. Again, attraction is always mutual, *i. e.* the reaction is equal to the action. Consequently, the primary planets gravitate towards their secondary ones; the earth towards the moon, and the sun towards them all. And this gravity, with regard to each several planet, is reciprocally as the square of its distance from its centre of gravity. See ATTRACTION, REACTION, &c.

4<sup>o</sup>, All bodies gravitate towards all the planets; and their weights towards any one planet, at equal distances from the centre of the planet, are proportional to the quantity of matter in each.

For the law of the descent of heavy bodies towards the earth, setting aside their unequal retardation from the resistance of the air, is this; that all bodies fall equally in equal times: But the nature of gravity or weight, no doubt, is the same on the other planets, as on the earth. See WEIGHT.

Suppose, *e. gr.* such bodies raised to the surface of the moon, and together with the moon deprived at once of all progressive motion, and dropped towards the earth: It is shewn, that in equal times they would describe equal spaces with the moon; and, therefore, that their quantity of matter is to that of the moon, as their weights to its weight. Add, that since Jupiter's satellites revolve in times that are in a sesquuplicate ratio of their distances from the centre of Jupiter, and consequently at equal distances from Jupiter their accelerating gravities are equal; therefore, falling equal altitudes in equal times, they will describe equal spaces; just as heavy bodies do on our earth. And the same argument will hold of the primary planets with regard to the sun. And the powers whereby unequal bodies are equally accelerated, are as the bodies; *i. e.* the weights are as the quantities of matter in the planets. And the weights of the primary and secondary planets towards the sun, are as the quantities of matter in the planets and satellites. And hence are several corollaries drawn relating to the weights of bodies on the surface of the earth, magnetism, and the existence of a vacuum. Which see under the articles VACUUM, WEIGHT, and MAGNETISM.

5<sup>o</sup>, Gravity extends itself towards all bodies, and is in proportion to the quantity of matter in each.

That all the planets gravitate towards each other, has been already shewn; likewise, that the gravity towards any one considered apart, is reciprocally as the square of its distance from the centre of the planet: consequently, gravity is proportional to the matter therein. Farther, as all the parts of any planet, A, gravitate towards another planet, B; and the gravity of any part is to the gravity of the whole, as the matter of the part, to the matter of the whole; and reaction equal to action: the planet B will gravitate towards all the parts of the planet A; and its gravity towards any part, will be to its gravity towards the whole, as the matter of the part to the matter of the whole.

Hence, we derive methods of finding and comparing the gravities of bodies towards different planets; of finding the quantities of matter in the several planets, and their densities; since the weights of equal bodies revolving about planets, are as the diameters of their orbits directly, and as the squares of the periodical times, inversely; and the weights at any distance from the centre of the planet

are greater or less in a duplicate ratio of their distances, inversely: And since the quantities of matter in the planets are as their powers at equal distances from their centres: And, lastly, since the weights of equal and homogeneous bodies towards homogeneous spheres, are, at the surfaces of the spheres, as the diameters of those spheres; and, consequently, the densities of heterogeneous bodies are as the weights at the distances of the diameters of the spheres. See DENSITY.

6°, The common centre of gravity of the sun, and all the planets, is at rest: And the sun, though always in motion, yet never recedes far from the common centre of all the planets.

For, the matter in the sun being to that in Jupiter as 1033 to 1; and Jupiter's distance from the sun to the semidiameter of the sun in a ratio somewhat bigger; the common centre of gravity of Jupiter and the sun will be found a point a little without the sun's surface. And, by the same means, the common centre of Saturn and the sun will be found a point a little within the sun's surface: And the common centre of the earth, and all the planets will be scarce one diameter of the sun distant from the centre thereof. But the centre is always at rest: Therefore, though the sun will have a motion this and that way, according to the various situations of the planets, yet it can never recede far from the centre. So that the common centre of gravity of the earth, sun, and planets, may be esteemed the centre of the whole world. See SUN, and CENTER.

7°, The planets move in ellipses that have their foci in the centre of the sun; and describe areas proportional to their times.

This we have already laid down a posteriori, as a phenomenon: And now, that the principle of the heavenly motions is shewn, we deduce it therefrom a priori. Thus: Since the weights of the planets towards the sun are reciprocally as the squares of the distances from the centre of the sun; if the sun were at rest, and the other planets did not act on each other; their orbits would be elliptical, having the sun in their common umbilicus; and would describe areas proportional to the times: But the mutual actions of the planets are very small, and may be well thrown aside. Therefore, &c. See PLANET, and ORBIT.

Indeed, the action of Jupiter on Saturn is of some consequence; and hence, according to the different situations and distances of those two planets, their orbits will be a little disturbed.

The sun's orbit too is sensibly disturbed by the action of the moon: And the common centre of the two describes an ellipsis round the sun placed in the umbilicus; and with a radius drawn to the centre of the sun, describes areas proportional to the times. See EARTH, and SATURN.

8°, The aphelia and nodes of the planets are at rest. Excepting for some inconsiderable irregularities arising from the actions of the revolving planets and comets.—Consequently, as the fixed stars retain their position to the aphelia and nodes, they, too, are at rest. See NODE, STAR, &c.

9°, The axis, or polar diameter of the planets, is less than the equatorial diameter.

The planets, had they no diurnal rotation, would be spheres, as having an equal gravity on every side: But by this rotation, the parts receding from the axis endeavour to rise towards the equator, which, if the matter they consist of be fluid, will be effected very sensibly. Accordingly, Jupiter, whose density is found not much to exceed that of water on our globe, is observed by the astronomers to be considerably less between the poles, than from east to west. And on the same principle, unless our earth were higher at the equator than towards the poles, the sea would rise under the equator, and overflow all near it. See SPHEROID.

But this figure of the earth Sir Isaac Newton proves likewise a posteriori; from the oscillations of pendulums being slower, and smaller, in the equatorial, than the polar parts of the globe. See PENDULUM.

10°, All the moon's motions, and all the inequalities in those motions, follow from these principles: *e. gr.* her unequal velocity, and that of her nodes, and apogee in the syzygies and quadratures; the differences in her eccentricity, and her variation, &c. See MOON, QUADRATURE, SYZYG, &c.

11°, From the inequalities in the lunar motions, we can deduce the several inequalities in the motions of the satellites. See SATELLITES.

12°, From these principles, particularly the action of the sun and moon upon the earth, it follows, that we must have tides; or that the sea must swell and subside twice every day. See TIDES.

13°, Hence likewise follows the whole theory of comets; as, that they are above the region of the moon, and in the planetary spaces; that they shine by the sun's light reflected from them; that they move in conic sections, whose umbilici are in the centre of the sun; and by radii drawn to the sun, describe areas proportional to the times; that their

orbits, or trajectories, are very nearly parabolas; that their bodies are solid, compact, &c. like those of the planets, and must therefore acquire an immense heat in their perihelia; that their tails are exhalations arising from them, and encompassing them like atmospheres. See COMET.

The objections raised against this philosophy are chiefly aimed at the principle, gravity; which some condemn as an *occult quality*, and others as a *miraculous*, and præternatural cause; neither of which have longer any room in sound philosophy. Others, again, set it aside, as destroying the notion of vortices; and others, as supposing a vacuum. But these are all abundantly obviated under the articles GRAVITY, ATTRACTION, VORTEX, VACUUM, QUALITY, &c.

NEXUS of Matter. See the article COHESION.

NICHE\*, in architecture, a cavity, or hollow place, in the thickness of a wall; to place a figure, or statue in. See STATUE.

\* The word comes from the Italian *nicchia*, sea-shell; in regard the statue is here inclosed in a shell; or, perhaps, by reason of the shell wherewith the tops of some of them are adorned.

The larger niches serve for groups of figures; the small ones for single statues, sometimes only for busts.

Great care must be taken to proportion the niches to the figures; and that the pedestals of the figures be proportioned to the niches.

Niches are sometimes made with rustic work, sometimes with shell work, and sometimes of craild, or arbor-work.

Round NICHE, is that whose plan and circumference are circular.

Square NICHE, that where they are square.

Angular NICHE, that formed in a corner of the building.

Ground NICHE, that which, instead of bearing on a massive, has its rise from the ground; as the niches of the portico of the pantheon at Rome.—Their ordinary proportion is to be two diameters in height, and one in width.

Capital of a NICHE. See the article CAPITAL.

Cul de four of a NICHE. See the article CUL.

NICHED Column. See the article COLUMN.

Argonauts of St. NICOLAS. See ARGONAUTS.

NICOLAITANS, or NICOLAITES, one of the most antient sects in the Christian church; thus denominated from Nicolas, a person ordained a deacon of the church of Jerusalem together with S. Stephen.

The distinguishing tenet of the *Nicolaitans*, as represented by ecclesiastical historians, is, that all married women should be common; to take away all occasion of jealousy.

Other authors tax Nicolas with other impurities; but Clemens Alexandrinus imputes them all to his disciples, who, he says, abused their master's words.

Nicolas, it seems, having a very beautiful wife, was suspected by the apostles as jealous of her, and as being a lascivious man.—To remove this suspicion, he called his wife; and to shew he was not at all attached to her, offered any of them the liberty of espousing her. This is confirmed by Eusebius, who adds, that Nicolas never had more than one wife.

Other things charged on the *Nicolaitans*, are, that they made no scruple of eating meats offered to idols: that they maintained that the father of Jesus Christ was not the Creator: that some of them adored one Barbelo, who inhabited the eighth heaven, and who proceeded from the father, and was the mother of Jaldabaoth; or, according to others, of Sabaoth, who had forcibly taken possession of the seventh heaven. Others of them gave the name Pronicos to the mother of the heavenly powers; but all ascribed infamous actions to her, and with hers authorized their own impurities. Others shewed books, and pretended revelations under the name of Jaldabaoth.

Irenæus and Epiphanius relate these and other extravagancies; and represent the *Nicolaitans* as authors of the sect of Gnostics. See Gnostics.

Cocceius, Hoffman, Vitringa, and Maius, take the name *Nicolaitan* to be coined, to signify a man addicted to pleasure and decauchery; adding, that it has nothing to do with Nicolas one of the seven deacons. And, as the doctrine of the *Nicolaitans* is mentioned in the Apocalypse, immediately after mention made of Balaam, and his doctrine, they compare the two names *Balaam* and *Nicolas*, which, in their originals, the one in Greek, the other Hebrew, have nearly the same signification, viz. *prince*, or *master of the people*.

Maius adds, it was probable enough the *Nicolaitans* might value themselves on being the disciples of one of the seven deacons; but that it was without any ground: notwithstanding what the antients, ever too credulous, have represented to the contrary.

NICOTIANA,

ies, are very nearly parabolas; that *dela* compact, &c. like those of the planets, acquire an immense heat in their perihelia; exhalations arising from them, and encom-  
atmospheres. See COMET.

S, or NICOLAITES, one of the most ancient hian church; thus denominated from Nicolas, d a deacon of the church of Jerusalem to- phen.

ng tenet of the *Nicolaitans*, as represented hstorians, is, that all married women should take away all occasion of jealousy.

x Nicolas with other impurities; but Clemens putes them all to his disciples, who, he says, er's words.

ns, having a very beautiful wife, was fai- bles as jealous of her, and as being a luci- remove this suspicion, he called his wife; as not at all attached to her, offered any of of espousing her. This is confirmed by ds, that Nicolas never had more than one

arged on the *Nicolaitans*, are, that they of eating meats offered to idols: that they e father of Jesus Christ was not the Crea- them adored one Barbelo, who inhabited , and who proceeded from the father, and f Jaldabaoth; or, according to others, of ad forcibly taken possession of the seventh of them gave the name Pronicos to the heavenly powers; but all ascribed infamous and with hers authorized their own impuri- ewed books, and pretended revelations under abaoth.

han us relate these and other extravagancies; *Nicolaitans* as authors of the sect of Gnostics.

an, Vitranga, and Maius, take the name coined, to signify a man addicted to plea- ery; adding, that it has nothing to do of the seven deacons. And, as the dec- itants is mentioned in the Apocalypse, im- ention made of Balaam, and his doctrine, two names *Balaam* and *Nicolas*, which, the one in Greek, *prints*, or *master* of the signification, viz. *prints*, or *master* of the

as probable enough the *Nicolaitans* might on being the disciples of one of the seven it was without any ground: notwithstanding, ever too credulous, have represented to

NICOTIANA, or *Herba NICOTIANA*, a term given to tobacco; from Nicot the French ambassador at the court of Portugal, who first sent it into France in 1560, and gave it his own name, as he himself tells us in his dictionary. See TOBACCO.

NICTITATING Membrane, in anatomy, a thin mem- brane which covers the eyes of several creatures, and shelters them from dust, or too much light; yet is so thin, that they can see indifferently well through it. See EYE.

The *nictitating membrane* is chiefly found in the bird and fish kind. See BIRD, and FISH.

This membrane, in the eagle's eye, is remarkably close and firm, infomuch as to be accounted as a second eyelid: And hence that remarkable firmness of the eagle's sight in viewing the sun. See EAGLE.

NIDUS \*, *Nest*, a repository, wherein certain animals, particularly fowls, insects, and reptiles, lodge their eggs, for incubation; and wherein, when hatched, they nurse their young till they become able to shift for themselves. See EGG, and ANIMAL.

\* The word is Latin, and supposed to be derived from *nidor*, a rank, or ill smell; in regard the nests of animals usually stink.

Mr. Derham says, he has often wondered how wasps, hornets, and other insects that gather dry materials (as the dust of wood scraped off for that purpose) should find a proper matter to cement and glue their combs, and line their cells: but he adds, that in all probability it is in their own bodies; as in the *tinea vestivora*, the cadworm, &c.

Goedart observes of his *cruca* that fed on leaves, that it made its cell of leaves glued together with its own spittle.

NIECE, a term relative to uncle, and aunt; signifying a brother's or sister's daughter; which, in the civil law, is the third degree of consanguinity, and in the canon law, the second. See DEGREE.

NIENT *Comprise*, in law, an exception taken to a petition as unjust; because the thing desired is not in that act or deed whereon the petition is grounded.

Thus, a person desiring of the court to be put in possession of a house formerly adjudged to him among other lands. — The adverse party pleads, that this petition is not to be granted; by reason though the petitioner had a judgment for certain lands and houses, yet this house is *nient comprise*, not comprised therein.

NIGHT, that part of the natural day, during which the sun is underneath the horizon. See DAY.

Or, *night* is that space of time wherein the sun is out of our hemisphere. See SUN.

Under the equator, the *nights* are always equal to the days. — Under the poles, the *night* holds half the year.

The antient Gauls and Germans divided their time, not by days, but *nights*; as appears from Tacitus and Cæsar. — And the people of Iceland, and the Arabs, do the same at this day.

The same is observed of our Saxon ancestors. — Thus, in the council of Cloveshoe, anno 824, we read, *Ibi finita & proscripta contentione coram episcopo post 30 noctes, illum juramentum ad Westminster deductum est*. — Whence our custom of saying *seven-night*, *fortnight*, &c.

Signals by NIGHT. See the article SIGNALS.

Third-NIGHT-awn-hind. See the article THIRD.

NIGHTMARE \*, a popular name for a disease, by the Greek physicians called *ephaltes*, and the Latins, *incubus*; to which people lying asleep on their backs, and having their stomach charged with heavy food, difficult of digestion, are very liable. See INCUBUS.

\* The sleeping patient appears to himself as if oppressed with a huge weight on the breast; and frequently imagines some spectre, or phantom, stopping his breath: whence the appellations, *nightmare*, and *bag-ridden*.

The disease does not arise, as was antiently imagined, from gross vapours filling the ventricles of the brain; but rather from a too great repletion of the stomach, which prevents the motion of the diaphragm, and, of consequence, the dilatation of the breast necessary to respiration. — Though others take it to be produced by a convulsion of the muscles of respiration. See EPHALTES.

The Arabs, Etmuller observes, call this disease a *nocturnal epilepsy*; since upon its prevailing much, it degenerates into an epilepsy; and is in effect the prodromus hereof in young people, as in old ones of an apoplexy.

NIHIL, NIHILUM, *Nothing*, among the school philosophers, is, what has no real esse, and which is only conceived negatively, and denominated by a negative. See NOTHING.

NIHIL Capiat per Billam, or per Breve, is a form used when judgment is given against the plaintiff, so as to bar his action, or overthrow his writ, or bill.

NIHIL Dicit, is a failing of a defendant to put in an answer to the plaintiff's plea by the day assigned: on which omission judgment is given against him of course, *quod nihil dicit*, because he alledges nothing to the contrary.

NIHIL, or NIHILI Album. See the article POMPHOLYX.

NIHILS, or NICHILS, issues, which the sheriff that is appointed in the exchequer says are nothing worth, and illervable; for the insufficiency of the parties that should pay them.

Clerk of the NICHILS, *Nihilorum Clericus*, is an officer of the exchequer, who makes a roll of the sums which are *nichilid* by the sheriffs. See EXCHEQUER.

NILOMETER \*, or NILOSCOPE, an instrument used among the antients, to measure the height of the water of the Nile, in its overflowings.

\* The word comes from the Greek Νίλος, Nile, (and that from *nia* *ilus*, new mud: or, as others will have it, from *nia*, I flow, and *ilus*, muddy) and μέτρον, measure.—The Greeks more ordinarily call it *νιλοσκοπιον*.

In the French king's library is an Arabic treatise on *nilometers*, entitled *Neil fi alnal al Nil*; wherein are described all the overflowings of the Nile, from the first year of the Hegira to the 875th.

Herodotus mentions a column erected in a point of the island Delta, to serve as a *nilometer*: and there is still one of the same kind in a mosque of the same place.

As all the riches of Egypt arise from the inundations of the Nile, the Egyptians used to supplicate them at the hands of their Serapis, and committed the most execrable crimes as actions, forsooth, of religion, to obtain the favour. This occasioned Constantine expressly to prohibit these sacrifices, &c. and to order the *nilometer* to be removed into the church; whereas till that time it had been in the temple of Serapis. Julian the apostate had it replaced in the temple, where it continued till the time of the great Theodosius. — See on the subject of *nilometers*, the *Acta Eruditorum Lips.* anno 1686. p. 147.

NIMBUS, in antiquity, a circle observed on certain medals, around the heads of some emperors; answering to the aureolæ, or circles of light, drawn around the images of saints. See AUREOLA.

The *nimbus* is seen on the medals of Maurice, Phocas, and others, even of the upper empire.

NIMETULAHITES, a kind of religious among the Turks; so called from *Nimetulahi*, their institutor.

When a Turk would be admitted into the order, he is to shut himself up close in a chamber forty days, tied down to four ounces of food per day. The term expired, the *Nimetulabites* take him by the hand, and lead him a Moorish dance, accompanied with an infinity of ridiculous gesticulations; till the violence of the exercise, with his former regimen, throw him down on the ground. This fall is construed an extasy, during which he is supposed to have a vision.

The *Nimetulabites* meet every Monday in the night-time, and sing hymns to God, &c.

NINTH Pair of Nerves. See the article NERVE.

NIPPLE. See the articles PAPILLA, and BREAST.

NISI PRIUS, in law, a writ judicial, which lieth in cases where the jury being impanelled and returned, before the justices of the bank, one of the parties requests to have such writ, for the ease of the country, whereby to will the sheriff to cause the inquest to come before the justices in the same country, at their coming thither.

It is called a writ of *nisi prius*, and its effect is, that the sheriff is hereby commanded to bring to Westminster the men impanelled at a certain day, before the justices, *Nisi prius justic. domini regis ad assisas capiendas venerint*; that is, unless the justices go before that day into such a county to take assizes. See JUSTICE.

NITRE, NITPON, in natural history, a sulphureous, inflammable, bitter sort of salt, thus called by the antients: by the moderns, more usually, *saltpetre*. See SALTPETRE.

Naturalists differ as to the point whether our *saltpetre* be the *nitre* of the antients. G. C. Schelhammer has a particular treatise on the subject, *De nitro, tum veterum tum nstro, commentarius*. See NATRON.

Most authors hold the antient *nitre* to have been mineral or fossil; whereas our *saltpetre* is in great measure artificial. — Serapion says, the antient mines of *nitre* were like those of common salt, and that it was formed out of running water congealed in its progress into a sort of stone: He adds, that their *nitre* was of four kinds, distinguished by the countries whence it came; viz. the *Armenian*, *Roman*, *African*, called *aphronitre*, and by Avicenna, *baurach*; and the *Egyptian*, which was the most famous, giving name to all the rest; itself denominated from *Nitria*, a province in Egypt, where it was found in great abundance. He assures us, too, that their *nitre* was of divers colours, viz. white, red, and livid: that some was cavernous, like a sponge; others close and compact; others transparent, like glass; and others scaly.

Schelhammer gives a different account: The antients, he observes, distinguished between *νίτρον*, *nitre*, *αφρονίτρον*, *aphronitre*, and *αφροσίτρον*, *spuma nitri*, or scum of *nitre*. He adds, that Agricola, &c. is mistaken in asserting that there were antiently mines in Lybia, Magnesia, Caria, &c.

out

out of which *nitre* was dug like stones out of a quarry: And that the *nitre* used by the antients was brought out of several countries mentioned by Pliny, Lib. xxxi. c. 10.—A lake in Macedonia, whose waters were nitrous, and in the middle whereof, however, was a spring of fresh water, furnished the greatest quantity and the best: It was called Chalastricum, from a neighbouring cape in the gulf of Thessalonica, and was formed like a crust on the surface of the water during the dog-days. The waters of the lake Ascanius in Bithynia, and those of certain springs near Chalcis, were sweet and potable towards the surface, yet nitrous at bottom. There was also *nitre* gathered on the ground near Philippi, in Thrace; but it was little, and of no great value.

The valleys of Media also furnished some. And there were *nitre*-pits in Egypt, as there are salt-pits among us. See NATRON.

The chief virtue the antients ascribe to their *nitre*, is, that of drying, deterging, and attenuating; and, as such, it was used in ulcers, disorders of the eyes, the itch, the bites of serpents, gout, &c. They also took it inwardly to resolve and attenuate viscid humours: But its cooling quality, whereof the modern physicians make so much use, they were unacquainted withal.—It is found excellent in diseases of the heart, accompanied with a propensity to vomit.

**Aerial NITRE.**—Many of our physicians are full of the notion of a *volatile nitre* abounding in the air; and a world of phænomena they account for from the operation of the particles thereof. See AIR.

That the atmosphere abounds with saline particles, is most certain; for being filled continually with effluvia from the earth and sea, it must needs have from both a great quantity of saline corpuscles; and these will be of different kinds, according to the variety of those salts from whence they are derived. See SALT.

But why these should be mostly supposed of a nitrous nature, is not so easy to prove; for saltpetre is by no means found in greater quantity than the other salts, especially common salt; nor is it of a much more volatile nature than they, nor capable of being raised more easily, or by a lesser heat. But since foot, and that which produces it, smoke, is found to abound very much with a truly volatile salt; and since such a kind of salt is produced frequently by the putrefaction of animal and vegetable bodies; it is probable the air may abound with salts of this kind, among many other decomposed ones of different natures and names. See ATMOSPHERE, &c.

**Diaphoretic NITRE of Antimony.** See ANTIMONY.

**Fixed NITRE.** See the article FIXED.

**Spirit of NITRE.** See the article SPIRIT.

**NOBILIARY**, a collection, or historical account of the noble families of a province, or nation. See NOBILITY, PEER, &c.

Chorier has published a *nobiliary* of Dauphine; and Caumartin, another of Provence. The Germans are particularly careful of their *nobiliaries*, to keep up the purity of their families. See GENEALOGY.

**NOBILISSIMUS**, in antiquity, a title, or quality given to the princes of the imperial family. See TITLE.

F. Doucine advances, that the title *nobilissimus* was first given under the emperor Justin; others find the title *nobilis Cæsar*, or *N. C.* that is, *nobilissimus Cæsar*, on medals long before that time, even as early as Trajan. Spanheim and Joubert set this title on medals no higher than the time of Philip the younger: though it appears earlier in some inscriptions: so that even M. Tillemont is mistaken where he says, the quality of *nobilissimus* is not to be found in history before the time of Constantine the great, who first gave it to his two brothers; after which it was attributed to such of the emperors children as were not Cæsars. See CÆSAR.

Tristan adds, that the Cæsars bore the title of *nobilissimi* in all ages; but that the *nobilissime* first became a distinct independent dignity in the time of Constantine the great.

**NOBILITY**, a quality that dignifies, or renders a thing noble; particularly, that raises a person possessed thereof above the rank of a peasant or commoner. See NOBLE.

In England, indeed, the term *nobility* is restrained to degrees of dignity above knighthood. See KNIGHT.—Every where else, *nobility* and gentility, or gentry, are the same. See GENTLEMAN.

Some refer the origin of *nobility* in Europe to the Goths; who, after they had seized a part of Europe, rewarded their captains with titles of honour, and called them *nobles*, *nobiles*, to distinguish them from the common people.

*Nobility*, in England, is only conferred by the king, and that by patent, in virtue whereof it becomes hereditary. In other countries there are other ways of acquiring it.

Thus, in France, *v. gr.* there are several offices which convey perfect *nobility*, and such as descends to posterity. Such are all offices of the crown, those of counsellor of estate, &c. Others they have which only communicate an accessory, or personal *nobility*, which dies with the person. Thus, a

counsellor in parliament enjoys all the rights and exemptions of *nobility*; yet his son is never reputed noble; unless there have been a succession of them, and both father and grandfather have been noble; which they call *patre & avo consuli-bus*. See OFFICE.

They have a third kind of *nobility*, called *nobility* of the bell, *de la cloche*; which is what the mayors and sheriffs of certain cities, as Lions, Bourges, Rochel, Poitiers, &c. acquire in virtue of their magistracy.

The *nobility* of England is called the *peerage* of England. See PEERAGE.

Its degrees are only five, *viz.* that of a duke, marquiss, earl or count, viscount, and baron. See each under its proper article, DUKE, MARQUISS, &c.

The privileges of the English *nobility* are very considerable: They are all esteemed as the king's hereditary counsellors, and are privileged from all arrests, unless for treason, felony, breach of peace, condemnation in parliament, and contempt of the king. No supplicavit can be granted against them; no capias, or exigent, sued against them for action of debt, or trespass; no essoin lies against them: In criminal cases, they are only to be tried by a jury of peers, who are not put to their oath; but their verdict upon their honour suffices. In their absence, they are allowed a proxy to vote for them; and in all places of trust are allowed to constitute deputies, by reason of the necessity the law supposes them under of attending the king's person.

Guillim observes, that if an appeal of murder, or felony, be sued by a commoner, against a peer, he shall be tried by commoners, not peers. See APPEAL.

No peer may go out of the kingdom without the king's leave: If any have leave, he is to return upon the king's writ, or to forfeit goods and chattels.

Anton. Matthæus observes, that *nobility* among the Romans was a quite different thing from what it is among us. The nobles among the Romans were either those raised to the magistrature, or descended from magistrates: There was no such thing as *nobility* by patent.

Bartoli says, that doctors, after they have held a professor's chair in an university for twenty years, become *noble*; and are entitled to all the rights of counts. See COUNT.

But this claim is not admitted at court, &c. though Bartoli's sentiments be backed with those of several other authors, particularly Chassanæus in his *Consuetudin. Burgundiæ*; Boyer *sur la Coutume de Berry*; Faber *C. de Dig. def. 9, &c.* which last, however, restrains Bartoli's rule to doctors in law, and princes physicians. See DOCTOR.

By an edict of the French king, in 1669, it is declared, that trade shall not derogate from *nobility*, provided the person do not sell by retail. See COMMERCE.

In Bretagne, by antient custom, a *nobleman* loses nothing by trading even in retail: But he reassumes all his rights as soon as he ceases traffic; his *nobility* having slept all the time.

In Germany, a woman, not *noble* by birth, doth not become *v. gr.* a countess, or baroness, by marrying a count, or baron. A lady of the higher degree, indeed, becomes a princess by marrying a prince; but this doth not hold of a lady of the lower *nobility*. See MARRIAGE.

On the coast of Malabar, children are only capable of being *noble* by the mother's side; it being allowed them to take as many husbands as they please, and to quit them when they think good.

**NOBLE**\*, **NOBILIS**, a person who has a privilege which raises him above a commoner, or peasant, either by birth, by office, or by patent from his prince. See NOBILITY.

\* The word comes from the Latin *nobilis*, formed from the antient *noscibilis*, distinguishable, remarkable.

In England, the word *noble* is of a narrower import, than in other countries, being confined to persons above the degree of knights; whereas, abroad, it comprehends not only knights, but what we simply call *gentlemen*. See KNIGHT, GENTLEMAN, &c.

The *nobles* of England are also called *pares regni*, as being nobilitate pares, though gradu impares. See PEER.

The Venetian *noble* is famous: It is in this that the sovereignty of the state resides. It is divided into three classes: the first only comprehends 24 families.

The second includes the descendants of all those who were entered in the golden book, in 1289, and destined to govern the state, which then began to be aristocratic.

The third consists of such as have bought the dignity of *noble* Venetians.

This last class is only admitted to the inferior employs; the two former, to all indifferently.

The title of *noble* Venetians is sometimes also given to foreign kings, princes, &c.

**NOBLE**, also denotes a money of account, containing six shillings and eight pence. See MONEY.

The *noble* was antiently a real coin, under the denomination of *teston-noble*. See COIN, and ROSE.

Authors

Authors observe, that there has not been any piece of gold or  
silver of this name, coined with us, since 9 Hen. V. They  
were first coined by Edw. III. in 1334.

The Noble contained 80 d. the same with the present money  
of account.—Its half was called *Obolus*, containing 40 d. its  
fourth part the quadrans, or farthing in those days, 20 d. See  
OBOLUS, PENNY, and FARDING-deal.

NOCTAMBULI, \* or NOCTAMBULONES, a term of  
equal import with *somnambuli*, applied to persons who have a  
habit of rising, and walking about in their sleep. See SLEEP.

\* The word is a compound of the Latin, *nox*, night, and *ambulo*,  
I walk.

Schenckius, Horstius, Clauderus, and Hildanus, who have  
wrote of sleep, give us divers unhappy histories of such  
*Noctambuli*.

The disorder seems to consist in this, that the proper organs  
of muscular motion are at liberty, while the organs destined  
for sensation are bound up, or in a state of inaction. See  
MUSCULAR Motion and SENSATION.

To conceive the cause, it is to be observed, that the laws  
of the union of the soul and body, are such, as that cer-  
tain ideas follow upon certain motions of the fibres of the  
brain; and certain motions of those fibres upon certain  
ideas. Now, by much thinking on any one thing, the  
fibres acquire some permanent situation, which gives a freer  
passage to the spirits towards a certain part of the body  
than ordinary.—If then the animal spirits become too  
copious, or too much agitated, or consist of parts too solid;  
they throw themselves into the passages they find the most  
open, glide into the nerves and muscles corresponding to those  
passages, and there produce the motions proper to those  
muscles.

Accordingly, the body rises and walks; though the soul be  
excluded from thinking on the objects that use to employ it on  
such occasions.

The bilious, according to Horstius; the melancholic, accord-  
ing to Salius; and the sanguine, according to Libavius, are  
most subject to those nocturnal vagaries.

The remedies are all such things as temper the agitation of the  
spirits, and relax the fibres; as bleeding, and all coolers, either  
internally or externally: Aperitives too have a good effect;  
but the best remedy, according to some, is cold-bathing.

NOCTILUCA, among naturalists, a species of phospho-  
rus, so called because it shines in the night, without any light  
being thrown on it: such is the phosphorus made of urine.  
See PHOSPHORUS.

By which it stands distinguished from some other species of  
phosphorus, which, ere they shine, must be exposed to the  
sun-beams; such as is the bolonian-stone, &c. See BOLO-  
NIAN Stone.

Mr. Boyle, in a particular treatise on the subject, gives an  
account of three *Noctiluca*.—The first, invented by Krafft,  
he calls the *consistent*, or *gumous Noctiluca*, as being of a tex-  
ture not unlike that of a cherry-gum. This, on account of  
its uninterrupted action, is, by the Germans, called the *con-*  
*sistent Noctiluca*; among us it is now known under the deno-  
mination of *solid phosphorus*.

The second is liquid, invented by the said Krafft, being only a  
dissolution of the former in a convenient liquor.—The third  
kind was prepared by Mr. Boyle himself; and of a different  
nature from both the other; for, it would not shine of itself,  
like either of them, but required the contact of the air  
(though not any external rays or heat) to make it produce  
light, which would be very durable, in a well stopped vessel.  
Add, that it was not the body that shone, but an ex-  
halation, or effluvium mixed with the air; on which ac-  
counts, the inventor gives it the denomination of the *aerial*  
*Noctiluca*.

The same Mr. Boyle, afterwards, prepared another sort;  
which, from the little pellucid fragments, or crystals therein,  
he denominated the *icy Noctiluca*.

NOCTURNAL, something that relates to night, *nox*;  
in contradistinction to diurnal. See NIGHT and DIURNAL.  
In this sense we say, *Nocturnal assemblies*; *Nocturnal*  
*walks*; *Nocturnal pollutions*, &c. See POLLUTION, NOC-  
TAMBULI, &c.

NOCTURNAL Pains, are a frequent concomitant of venereal dif-  
orders, which can only be palliated with narcotics: nothing  
but a mercurial course, or a long continued use of diet-drinks  
can entirely remove them. See VENEREAL.

NOCTURNAL Arch, in astronomy, the arch of a circle described  
by the sun, or a star, in the night. See ARCH.

Semi-NOCTURNAL Arch of the Sun, is that portion of a circle  
he passes over between the lower part of our meridian, and  
the point of the horizon wherein he rises; or between the  
point of the horizon wherein he sets, and the lower part of  
our meridian.

NOCTURNAL, NOCTURLABIUM, is more particularly used for  
an instrument, chiefly used at sea, to take the altitude or de-  
pression of some of the stars about the pole, in order to find  
the latitude, and the hour of the night.

There are *Nocturnals* of various contrivances, some of them  
V O L. II.

projections of the sphere; such as the hemispheres, or plani-  
spheres, on the plane of the equinoctial: Those ordinarily used  
by the seamen are two; the one adapted to the polar star, and  
the first of the guards of the little bear; the other to the pole-  
star, and the pointers of the great bear.

Construction of the NOCTURNAL.—The instrument consists of  
two circular plates, (*Tab. Navigation, fig. 13.*) applied on  
each other. The greater, which has a handle to hold the  
instrument, is about 2  $\frac{1}{2}$  Inches diameter, and is divided into  
12 parts, agreeing to the 12 months; and each month subdivi-  
ded into every fifth day: And so, as that the middle of the  
handle corresponds to that day of the year, wherein the star  
here regarded has the same right ascension with the sun.

If the instrument be fitted for two stars, the handle is made  
moveable. The upper left circle is divided into 24 equal  
parts, for the 24 hours of the day, and each hour subdivided  
into quarters, as in the figure. These 24 hours are noted  
by 24 teeth; to be told in the night. Those at the hours  
12, are distinguished by their length. In the centre of the  
two circular plates, is adjusted a long index A, moveable  
upon the upper plate. And the three pieces, viz. the two  
circles and index, are joined by a rivet which is pierced through  
the centre, with a hole two inches in diameter for the star to  
be observed through.

Use of the NOCTURNAL. Turn the upper plate till the longest  
tooth marked 12, be against the day of the month on the  
under plate; then bringing the instrument near the eye, sus-  
pend it by the handle, with the plane nearly parallel to the  
equinoctial; and viewing the pole-star through the hole of  
the centre, turn the index about, till, by the edge coming  
from the centre, you see the bright star or guard of the little  
bear (if the instrument be fitted to that star) then that tooth  
of the upper circle, under the edge of the index, is at the  
hour of the night on the edge of the hour circle: which may  
be known without a light, by accounting the teeth from the  
longest, which is for the hour 12.

NOCTURNAL Pollution. See the article POLLUTION.

NOCUMENTI Affija. See the article ASSISA.

NODATED Hyperbola, a kind of hyperbola, which, in  
turning round, decussates or crosses itself. See CURVE and  
HYPERBOLA.

NODE, NODUS, in chirurgery, denotes a tumour arising on  
the bones; usually proceeding from some venereal cause. See  
TUMOR and BONE.

Node amounts to the same with what is otherwise called *exo-*  
*stosis*. See EXOSTOSIS.

It seems generated of a thick, cold, viscid humour, which is  
often found very difficult to resolve.—They frequently apply  
to it a leaden plate covered with mercury.

The cure is commonly attempted by *emplast. de ranis cum*  
*mercurio*; which failing, some mercurial unguent is now and  
then rubbed on them; and afterwards mercurial plaisters made  
of cinnabar, &c. applied.

Some give the denomination *Nodes* to all tumours formed by  
a coagulation of vicious matter in the external parts of the body.

NODE is more particularly applied to the tumours, or protube-  
rances arising on the joints of old gouty people; called also  
*tophi*. See TOPHUS.

They are supposed to be formed of a thick, crude, heavy,  
viscid indigested matter, mixed with a hot, sharp, bilious  
juice, the grosser and more terrestrial part whereof being  
detained, grows into a stony sort of concretion. See  
GOUT.

NODES, in astronomy, the two points wherein the or-  
bit of a planet intersects the ecliptic. See ORBIT and  
ECLIPTIC.

Such are the two points C and D, (*Tab. Astron. fig. 33*)—  
whereof the Node C, where the planet ascends Northwards  
above the plane of the ecliptic, is called the *ascending Node*,  
the *Northward Node*, and the *head of the dragon*, and thus  
marked  $\delta$ . See ASCENDING.

The other Node D, where the planet descends to the South,  
is called the *descending Node*, the *Southward Node*, or the  
*dragon's tail*; thus marked  $\gamma$ . See DRAGON'S Head and Tail.  
The right line DC, wherein the two circles intersect, is called  
the *line of the Nodes*. See LINE.

It appears from observation, that the line of the *Nodes* of all  
the planets constantly changes its place, and shifts its situation  
in *antecedentia*; i. e. from East to West, contrary to the order  
of the signs.—See RETROGRADATION.

Thus, by a retrograde motion, the line of the moon's *Nodes*  
finishes its circuit in 19 years; in which time, after having  
receded from any point of the ecliptic, it returns to the same.  
See MOON.

When the moon is in the *Nodes*, she is also in the ecliptic,  
viz. twice in each period; when she is at her greatest distance  
from the *Nodes*, viz. in the points E, F, she is said to be in  
her limits. See LIMIT.

The moon must be in one of the *Nodes* when there is an  
eclipse, either of the sun or moon. See ECLIPSE, PLA-  
NET, &c.

**NODULE, NODULUS**, in pharmacy, a bag of medicinal ingredients put into beer, or wine, to give its tincture thereto. See **SACCULUS**.  
*Nodules* are sometimes also parcels of odoriferous simples, tied up in a piece of silk, for the patient to be frequently smelling to.

**NODUS, KNOT**. See the article **KNOT**.  
**NODUS** in Poetry, &c. See **INTRIGUE**, and **PLOT**.

**NODUS, or NODE**, in dialing, denotes a point, or hole in the gnomon of a dial, by the shadow, or light whereof, either the hour of the day in dials without furniture, or the parallels of the sun's declination, and his place in the ecliptic, &c. in dials with furniture, are shewn. See **DIAL**, &c.

**NODUS** is also used for a hole in the ceiling of a room, or in the window, for the making of a dial on the floor, wall, or the like.

**NOETIANS**, a sect of ancient heretics, disciples of Noetius, an Ephesian, the master of Sabellius.  
 They only allowed of one person in the godhead; viz. the father; and accordingly taught, that it was God the father that suffered on the cross.—An error, says Epiphanius, who wrote an hundred years after Noetius, never heard of before; though it is certain there had been other Patripassians in the church before him. See **PATRIPASSIAN**.  
 Being reprehended by his superiors, Noetius made them this answer: What harm have I done? I adore only one God; I own none but him. He was born, suffered, and is dead.

**NOLI me tangere**, q. d. *touch me not*, a malignant eruption in the face; occasioned by an extremely sharp, corrosive humour: thus called, either because it infects those who touch it, or because the more it is touched, the worse it grows, and the farther it spreads.  
 The *Noli me tangere* is a species of herpes exedens; by some referred to the cancer, by others to the lepra. See **HERPES**, **CANCER**, and **LEPROSY**.

**NOLI me tangere**, is chiefly used among us for an external ulcer in the alæ of the nose; proceeding often from a venereal cause, though sometimes the effect of a scrophulous constitution. See **ULCER**.  
 It does not always confine itself to the alæ, but will spread and corrode the very substance of the nose. The cure is difficult, especially when it rises from a bad constitution.

**NOLI me tangere**, among botanists, a plant denominated from a singular property it has, of darting out its seed when ripe, upon the first approach of the hand to touch its pods. See **SEMINATION**.

**NOMADES**, \* *Nomades*, a name given, in antiquity, to several nations, or people, whose whole occupation was to feed and tend their flocks; and who had no fixed place of abode, but were constantly shifting, according to the conveniences of pasturage. See **HAMAXOBII**.  
 \* The word comes from the Greek *νομᾶν*, *pasco*, I feed.  
 The most celebrated among the *Nomades* were those of Africa, who inhabited between Africa, properly so called, to the East, and Mauritania to the West.—They are also called *Numidæ*, or *Numidians*.—Sallust says, they were a colony of Persians brought into Africa with Hercules.  
 The *Nomades* of Asia inhabited the coasts of the Caspian sea.—The *Nomades* of Scythia were the inhabitants of little Tartary; who still retain the ancient manner of living.

**NOMANCY**, \* a name given to the art of divining the fates of persons by means of the letters that form their names. See **NAME**.  
 \* The word is a compound of the Latin, *nomen*, name, and *magia*, divination. See **ONOMANCY**.  
*Nomancy*, or, as it should rather be called, *Nominomancy*, or *Onomatomancy*, seems to be nothing else but the cabbalistic gematria. See **CABBALA**.

**NOMARCHA**, in antiquity, the governor or commander of a nome, or nomos.  
 Egypt was anciently divided into several regions, or quarters, called *Nomes*, from the Greek *νομός*, taken in the sense of a division; and the officer who had the administration of each *Nome*, or *Nomos* from the king, was called *Nomarcha*, from *νομός*, and *ἀρχή* command.

**NOMBRIL Point**, in heraldry, is the next below the fess-point; or the very centre of the escutcheon. See **Point**.  
 Supposing the escutcheon divided into two equal parts below the fess; the first of these divisions is the *Nombril*; and the lower the base. See **ESCUTCHEON**.

**NOME, or NAME**, in algebra, denotes any quantity with a sign prefixed, or added to it, whereby it is connected with some other quantity; upon which the whole becomes a binomial, trinomial, or the like. See **QUANTITY**.  
 Thus  $a + b$  is a binomial, whose *Names*, or *Nomes*, are  $a$  and  $b$ ; and  $a + b + c$  a trinomial, whose *Names* are  $a$ ,  $b$ , and  $c$ , &c. See **BINOMIAL**, **TRINOMIAL**.

**NOMEN**. See the articles **PRÆNOMEN**, **NAME**, and **AGNOMEN**.

**NOMENCLATOR, or NOMENCULATOR**, among the Romans, was usually a slave, who attended persons that stood

candidates for offices, and prompted or suggested to them the names of all the citizens they met, that they might court them, and call them by their names; which among that people was the highest piece of civility. See **CANDIDATE**.

**NOMENCLATOR of the Roman Church**, was an officer, whose business was to call the persons whom the pope invited to dinner.  
 He also listened to those who were admitted to audience, in the same manner as those now retained by the cardinals, called *Auditors*.

**NOMENCLATURE, NOMENCLATURA**, a catalogue of several of the more usual words in any language, with their significations; compiled in order to facilitate the use, and retaining of such words to those who are to learn the tongue.  
 We have Latin, Greek, French, &c. *Nomenclatures*. See **DICTIONARY** and **VOCABULARY**.

**NOMINA Villarum**, an account of the names of all the villages, and the possessors thereof, in each county, drawn up by the several sheriffs, at the instance of king Edward II. and returned by them into the exchequer; where it is still preserved.

**NOMINAL Characters**. See the article **CHARACTER**.

**NOMINALS, or NOMINALISTS**, a sect of school-philosophers, the disciples and followers of Occam, or Ockham, an English Cordelier in the 14th century.  
 The *Nominalists* were great dealers in words; whence they were vulgarly denominated *word-sellers*.  
 They had the denomination *Nominalists*, because in opposition to the *Realists*, they maintained, that words, not things, were the object of dialectics. See **REALISTS**, &c.  
 This sect had its first rise towards the end of the eleventh century, and pretended to follow Porphyry and Aristotle; but it was not till Ockham's time that they bore the name.  
 The *Nominals* were the founders of the university of Leipzig: There are many yet abroad, who pique themselves on being *Nominals*.  
 The *Nominals*, with the Stoics, admit the formal conceptions, or ideas of things, as the subject and foundation of universality; but to this they add names, which represent and signify, after the same univocal manner, and without any distinction, a great variety of single things alike in genus and species.  
 Whence it is they are called *Nominals*; as pretending, that to become learned, it is not enough to have just ideas of things, but it is likewise required to know the proper names of the genera, and species of things, and to be able to express them clearly and precisely, without confusion, or ambiguity.

**NOMINATION**, the act of naming, and appointing a person for some function, employ, or benefice.  
 The word is chiefly used for the right of presenting to a benefice, &c. See **BENEFICE**, &c.  
 In common law, however, there is a difference between *Nomination*, and presentation; the former being properly a power which a man has, by virtue of a manor, or otherwise, to appoint, or name a clerk to a patron of a benefice, to be by him presented to the ordinary. See **PRESENTATION** and **COLLATION**.

**NOMINATIVE**, in grammar, the first case of nouns which are declinable. See **CASE**.  
 The simple position, or laying down of a noun, or name, is called the *Nominative case*, yet is it not so properly a case, as the matter or ground whence the other cases are to be formed, by the several changes and inflexions given to this first termination. See **NOUN**.  
 Its chief use is to be placed in discourse before all verbs, as the subject of the proposition, or affirmation, as, *Dominus regit me*, the Lord governs me; *Deus exaudit me*, God hears me: See **VERB**.

**NOMINATOR**, he who names, or presents a person to an office, or benefice. See **NOMINATION**.  
 Hence *nominee*, the person named or presented.  
 Errard observes, there are some customs where the *Nominator* is responsible for the solvibility of the nominee.

**NOMINIS Identitate**. See the article **IDENTITATE**.

**NOMOCANON**, \* a collection of canons, and of imperial laws, relative, or conformable thereto. See **CANON**.  
 \* The word is compounded of the Greek *νόμος*, *lex*, law; and *κανών*, *canon*, rule.  
 The first *Nomocanon* was made by Johannes Scholasticus in 554.—Photius, patriarch of Constantinople in 883, compiled another *Nomocanon*, or collation of the civil laws with the canons: This is the most celebrated.—Balsamon wrote a commentary on it in 1180.

**NOMOCANON**, also denotes a collection of the ancient canons of the apostles, councils, and fathers; without any regard to imperial constitutions.  
 Such is the *Nomocanon* published by M. Cotelier.

**NOMOCANON** is sometimes also used for a penitential book of the Greeks. See **PENITENTIAL**.

NON-

## NON

**NON-ABILITY**, in law, an exception taken against the plaintiff in a cause, on some just ground why he cannot commence a suit in law: as, præmunire, outlawry, being professed in religion, excommunicate, or a stranger born. See DISABILITY. This last holds only in actions real, and mixed; and not in personal, except he be both a stranger and an enemy. The civilians say, that such man hath not *personam standi in judicio*.

**NON-ADMITTAS**. See the article NE-ADMITTAS.

**NON-APPEARANCE**, a default in not appearing in a court of judicature. See APPEARANCE.

**NON-CLAIM**, in law, the omission, or neglect of him who challenges not his right within the time limited by law: as, within a year and a day, where continual claim ought to be made. See CLAIM.

By such neglect he is either barred of his right; as upon *Non-claim* within five years after a right accrued to him; or of his entry by descent, for want of a *claim* within five years after the disseisin.

**NON-COMPOS mentis**, a phrase denoting a person not to be of sound memory, or understanding. See NON-SANÆ memoriae.

Of this, in common law, there are said to be four kinds.—First, an idiot born; secondly, he that by accident loseth his memory, and understanding; thirdly, a lunatic, that has *lucida intervalla*, sometimes understanding, and sometimes not; fourthly, he that by his own act, for a time, depriveth himself of his right senses, as a drunkard.—But this last kind shall give no privilege to him, or his heirs. See IDIOT, LUNATIC, &c.

A descent takes away the entry of an idiot, though the want of understanding were perpetual.

**NON-EST Culpabilis**, *NON-Cul. q. d. he is not guilty*, in law, the general plea to an action of trespass, whereby the defendant absolutely denies the fact charged on him by the plaintiff: whereas, in other special pleas, the defendant grants the fact to be done, but alleges some reasons in his defence, why he lawfully might do it. See TRESPASS.

As *Non-Cul.* is the general answer in an action of trespass, i. e. a criminal action civilly prosecuted; so is it in all actions criminally followed, either at the suit of the king, or others, wherein the defendant denies the crime objected to him.

**NON-EST factum**, in law, an answer to a declaration, whereby a man denieth that to be his bond or deed whereupon he is impleaded.

**NON-JURIDICI Dies**. See the article DIES.

**NON-LIQUET**, *it does not appear*, a verdict given by a jury, when a matter is to be deferred to another day of trial. See VERDICT, and JURY.

The same phrase was used among the Romans: after hearing a cause, such of the judges as thought it not sufficiently clear to pronounce upon, cast a ballot into the urn with the two letters *N. L.* for *Non Liquet*.

**NON-MOLESTANDO**, a writ which lies for him who is molested contrary to the king's protection granted him.

**NON-OBSTANTE**, *notwithstanding*, in law, a clause frequent in statutes, and letters patent; importing a licence from the king to do a thing, which at common law might be lawfully done; but, being restrained by act of parliament, cannot be done without such licence.

All grants of such pensions, and every *Non obstante* therein contained, shall be void.—Henry III. took up the clause, *Non obstante*, (first introduced by the pope) in his grants.

**NON-OBSTANTES**, in the Romish canon law, make the third part of the provisions of the court of Rome beginning with *Non obstantibus* and comprising absolutions from censures, re-habilitations, and necessary dispensations for the enjoyment of benefices. None inferior to the pope can use the clause *Non obstante*.

**NON-OMITTAS**, a writ which lies where the sheriff having delivered a writ or process to a bailiff of a franchise in which the party it is to be served on dwells, and the bailiff having refused or neglected to serve it, upon the sheriff's returning that he delivered it to the bailiff, this second writ shall be directed to the sheriff, charging him to enter the franchise, and execute the king's command, either by himself or officer.

**NON-PLEVIN**, *Non plevina*, a default in not replevying of land in due time. See REPLEVIN.

In *Hengam magna*, it is said, that the defendant should be sure to replevy his lands seized by the king, within fifteen days. And that if he neglects, then, at the instance of the plaintiff at the next court-day, he shall lose his seisin, *sicut per defaultam post defaultam*.—But, by Stat. 9 Edward III. it was enacted, that no person should lose his land thenceforward because of *Non-Plevin*.

**NON-PONENDO in Assis, & Juratis**, a writ granted on divers occasions to men for freeing them from serving on assizes, and juries; as by reason of old age, charter of exemption, or the like. See JURY, &c.

**NON-PROCEDENDO ad Assisam Rege inconsulto**, a writ to stop the trial of a cause appertaining to one who is in the king's service, &c. till the king's pleasure be farther known.

## NON

**NON-RESIDENCE**, in law, is applied to such spiritual persons as are not resident on, but do absent themselves, for one month together, or two at several times of the year, from their benefices, or dignities. See BENEFICE.

Regularly, personal residence is required of ecclesiastical persons upon their cures; though there are some exceptions in favour of particular persons, as king's chaplains, bishops, &c. See RESIDENCE.

**NON-RESIDENTIA pro Clericis Regis**, is a writ directed to the ordinary, charging him not to molest a clerk employed in the king's service, on account of his *Non-Residence*.

**NON-SANÆ Memoriae**, or *NON sane Memoriae*, is an exception taken to an act declared to be done by another, importing that it was done at a time when the party that did it was mad, or not in his wits. See NON-COMPOS.

**NON-SUIT**, in law, the dropping or letting fall a suit or action. *Nonsuit* is a renunciation of a suit, by the plaintiff or demandant; most commonly upon the discovery of some error, or defect, when the matter is so far proceeded in, as that the jury is ready at the bar, to deliver their verdict.—The civilians term it *Litis renunciatio*.

**NON SUM Informatus**. See INFORMATUS non sum.

**NON-TENURE**, a plea in bar to a real action, whereby the party urges that he holdeth not the land mentioned in the count, or at least some part of it.

West distinguishes *Non-Tenure* into *general* and *special*. The *first*, where one denies himself ever to have been tenant to the land in question.—The *second*, where he only alleges that he was not tenant the day whereon the writ was purchased.

**NON-TERM**, the time of vacation between term and term. See VACATION.

It was anciently called *the time or days of the king's peace*. See PEACE of God and the church.

Among the Romans it was called *Feriae*, or *Dies Nefasti*. See FERIAE and NEFASTI.

**NON-ENTITY**, whatever has no real being, or is only conceived negatively, or claims only a negative denomination. See ESSE, ESSENCE, &c.

**NON-ESSENTIAL Modes**. See the article MODES.

**NON-NATURALS**, in medicine, *res non naturales*, are the causes and effects of diseases, whether near or remote. See DISEASE.

Physicians have digested all the causes of diseases into six classes, which they call the six *Non-naturals*.—These are, 1. Air. 2. Meat and drink. 3. Motion and rest. 4. The passions of the mind. 5. Excretions and retentions. 6. Sleep and waking. See each under its proper article, AIR, FOOD, DRINK, &c.

They are thus called, because, by their use, or abuse, they become either good, *naturals*, or evil, *contra-naturals*. See NATURALS.

But the division, in effect, is of no great use; the causes of diseases being much more commodiously laid down otherwise. See DISEASE.

**NONÆ and Decimæ** were payments anciently made to the church by those who were tenants of church-farms.

The *Nonæ* were a rent or duty claimed for things belonging to husbandry: the *Decimæ* were claimed in right of the church. See TITH.

**NONAGE**, in law, an incapacity of doing certain things from a want of age. See AGE.

The term of *Nonage* is different, with regard to different things.—In matters of inheritance, a man is in his *Nonage* till twenty-one years; for marriage till fourteen, &c. See MINORITY.

**NONAGE**, *NONAGIUM*, also denotes the ninth part of a man's moveable goods, anciently paid in the nature of a mortuary; being claimed by the clergy upon the death of those of their parish. See MORTUARY.

At first it was a third part of the goods, and was called *Tertiagium*; till by a bull of Clement VI. it was reduced to a ninth.

**NONAGESIMAL**, in astronomy, the ninetieth degree of the ecliptic, reckoned from its Eastern term, or point. See ECLIPTIC.

The altitude of the *Nonagesimal* is equal to the angle of the East, and if continued passes through the poles of the ecliptic: whence the altitude of the *Nonagesimal*, at a given time, under a given elevation of the pole, is easily found. See ALTITUDE.

If the altitude of the *Nonagesimal* be subtracted from 90°, the remainder is the distance of the *Nonagesimal* from the vertex.

**NONAGON**, a figure having nine angles and sides. See POLYGON.

**NONCONFORMISTS**, the name of a religious sect, or rather number of sects, in England. See SEPARATIST.

The term was anciently confined to the Puritans, or rigid Calvinists; at present it extends to all who dissent from the established church, the Romanists alone excepted. See DISSENTER, PURITAN, PRESBYTERIAN, INDEPENDENT, &c.

The word is said to have had its rise from a declaration of king Charles I. who appointed that all the churches of England and Scotland should have the same ceremonies and discipline; the acquiescence wherein, or dissenting from which, determined *conformity*, and *nonconformity*.

**NONE**, or **NONES**, **NONÆ**, one of the seven canonical Hours, in the Romish church. See **HOUR**.

*None*, or the ninth hour, is the last of the lesser hours, that is said before Vespers; and answers to three o'clock in the afternoon. See **VESPERS**.

The single office, and that for the dead, ends at *Nones*, which father Rosweyde observes, was anciently the hour for the breaking up of the synaxis, or usual meetings at church of the primitive christians.

The hour of *None* was also the usual time for taking the repast on fast-days; though some would keep the fast till night. See **FAST**.

**NONES**,\* **NONÆ**, in the Roman Calendar, the fifth day of the months January, February, April, June, August, September, November, and December; and the seventh of March, May, July, and October: These four last months having six days before the *Nones*, and the others only four. See **CALENDAR**.

\* The word apparently has its rise hence, that the day of the *Nones* was nine days before the *ides*, and might be called *Nono-Idus*. See **IDES**.

March, May, July, and October had six days in their *Nones*; by reason these alone, in the ancient constitution of the year by Numa, had 31 days apiece; the rest having only 29, and February 30.—But when Cæsar reformed the year, and made other months contain 31 days, he did not likewise allot them six days of *Nones*. See **CALENDAR**, **YEAR**, **MONTH**, &c.

**NOMUS Humeri Placentini**, in anatomy, a muscle, called also *Rotundus minor*. See **ROTUNDUS**.

**NORMANNORUM Terra**. See the article **TERRA**.

**NORMAL Line**, in geometry, is used for a perpendicular Line. See **PERPENDICULAR** and **SUBNORMAL**.

**NORROY**, *North Roy*, *q. d.* Northern king; the title of the third of the three kings at arms, or provincial heralds. See **KING at Arms**, and **HERALD**.

His jurisdiction lies on the North side of Trent, whence his name; as Clarencieux, on the South. See **CLARENCIEUX**.

**NORTH**, in cosmography, one of the four cardinal points of the horizon, being that intersection of the horizon and meridian which is nearest our pole. See **CARDINAL Point** and **HORIZON**.

**NORTH Latitude of the Moon**. See **LATITUDE**.

**NORTH Company**. See the article **COMPANY**.

**NORTH Dial**. See the article **DIAL**.

**NORTH East**, a rhumb, or point, in the middle between the East and North. See **RHUMB** and **POINT**.

**NORTH North East**, *North East and by East*, are subdivisions of the compass between the North and East. See **WIND**.

**NORTH Pole**. See the article **POLE**.

**NORTH Sea**. See the article **SEA**.

**NORTH-Star**, the last in the tail of the little bear; called also the *Pole-Star*. See **POLE-Star**.

**NORTH Wall**. See the article **WALL**.

**NORTH West**, is a point, or rhumb, in the middle between the North and West. See **WEST**, &c.

**NORTH Wind**. See the article **WIND**.

**NORTHERN Aspect**, or *Exposure*. See **EXPOSURE**.

**NORTHERN Light**, or *Aurora Borealis*. See **AURORA Borealis**.

**NORTHERN Ocean**. See the article **OCEAN**.

**NORTHERN Signs**, are those six on the North side of the equator. See **SIGN**.

**NORTHERN Hemisphere**. See the article **HEMISPHERE**.

**NORTHING**, in navigation, the difference of latitude, which a ship makes in sailing towards the North pole. See **SAILING**, **LATITUDE**, &c.

**NOSE**, the external organ of smelling; or that part in men which stands prominent, in the middle of the face. See **FACE**.

The *Nose* is usually divided by anatomists into *external* and *internal*; a division of very little service.

It is farther subdivided into several parts which make up its external figure.—First is the *dorsum*, or ridge, running along the whole length of it; one part whereof, about the middle, more prominent than the rest, is called the *Spine*; and the extreme, which in many is turned round, *Orbicular*—The sides are called the *Alæ*, or *Pinnae*.

The teguments of the *Nose* are common to the rest of the face. Under these appear the muscles of the *Nose*, which are three pair, *viz.* the *Elevatores Alæ Nasi*, serving to pull the *alæ* upwards, and turn them outwards; the *Dilatatores Alæ Nasi*, which draw them from each other, and widen the external apertures of the nostrils; and the *Constrictores Alæ Nasi*, which draw them downwards nearer each other; and at the same time the upper lip also downwards. See each muscle described under its proper head **ELEVATOR**, **DILATATOIRES**, &c.

The frame of the *Nose* is chiefly supported by two bones,

which end in cartilages of a triangular figure, and are divided in the middle by a third, called *Septum*, into two partitions, called the *Nares*, or *Nostrils*. See **NOSTRIL**.

This septum likewise ends in a cartilage; by means of which cartilages, the lower part of the *Nose* is rendered moveable, which the upper being perfectly ossaceous, is not. The cartilages of the *alæ* are tied to the others by ligaments, which loose connexion renders them moveable.

The bones of the *Nose* are either *proper*, or *common*.—The first of the *proper*, are the two external ones that constitute the *dorsum*, and are joined to the *os frontis*, the fourth bone of the upper jaw, and to each other, usually *per harmoniam*. See **DORSUM Nasi**.

In the concave of the arch of these two bones, at their union internally, is placed the bony part of the septum. Its upper part joins the *os ethmoides*; but in adults is continued so as the *ethmoides*, and its process, called *Crista Galli*, appear of a piece with the septum. The septum is thinnest in the middle, and divides the right nostril from the left; though its position is seldom perpendicular. It is capped with another thin bone, from its figure called *Vomer Aratri*, and is joined to the fourth bone of the upper jaw, and to the *os palati*. See **VOMER**.

The other proper bones are the *turbinata*, or *spongiosa*, two of which are usually found in each nostril sometimes three, one over the other.—The middlemost, when there are three, is so placed as to shelter the perforation of the *antrum maxillæ superioris* into the nostril, and prevent the sudden rushing in of air from the nostril into the antrum. They are all very porous, and turned, not unlike the shell *concha veneris*. In quadrupeds, these bones are very numerous. See **CRIBROSUM**.

The *common* bones of the *Nose* are such as make fences for the foramina narium, and help to compose the parts adjacent. The largest of these is the fourth bone of the upper jaw, which has the greatest share in framing the foramina. See **MAXILLA**.

These fourth bones, with the septum and *os turbinata*, chiefly frame the internal paries of the foramina. In the upper part, a portion of the *os frontis*, the inside of the *os unguis*, the *os cribrosum*, with part of the *sphenoides*; and backwards towards the fauces, the *os palati*, help to compose the foramina.

Besides the cavities circumscribed by the bones now mentioned, the foramina have several collateral cavities that open into them: The largest is that called *Antrum Genæ*; by Dr. Highmore, *Antrum maxillæ superioris*, framed in the fourth bone of the upper jaw, near two inches long, and an inch broad; the bony parts of which, with the *sphenoides*, make the *foramen lacerum externum*. Its lower surface makes a thin covering for all the roots of the molares, and canini, which frequently upon drawing a tooth, to which it sticks, is taken along with it, whereby this cavity is opened into the alveolus, and consequently into the mouth.

All these cavities of the *Nose* and cheek, as also the *os turbinata*, septum, &c. are invested with a membrane furnished with large arteries from the carotides; and veins, which empty themselves into the jugulars; and nerves, from the fifth pair, as well as the olfactory nerves.

In this membrane are a great number of small glands, placed very near each other, from whence flows all that puita, commonly discharged at the nostrils.

By means of this mucus or puita is the membrane kept soft, and defended from the injuries of extraneous bodies, especially those of the air, which must pass this way in inspiration when the mouth is shut. See **MUCUS**.

By this means, the olfactory nerves, here diffused, are rendered capable of the perception of odoriferous effluvia; which the dryness of the part would be apt to destroy. See **SMELLING**.

Besides this use of the *Nose*, which is the principal, nature has made it, as it were, a diverticulum to the eyes; there being a considerable passage into each nostril that empties itself under the middle *os turbinatum*, arising from two apertures, called *Puncta Lachrymalia*, at the great canthus.

By this way, the superfluous moisture of the eyes is carried off, which would otherwise incommode the cheeks; as in effect it does, when those parts are affected with any disorder; as in the *ægilops*, and *fistula lachrymalis*. See **FISTULA**, **LACHRYMALIA Puncta**, &c.

The diseases to which the *Nose* is subject, are a coryza, *ozæna*, polypus, farcoma, and *noli me tangere*, beside sneezing, and a loss of smelling. See each in its place.

Amb. Paré, in his 23d book, mentions an Italian surgeon, who had the art of restoring lost *Noses*, or making them come again after they were cut off. His method was to make an aperture in the patient's arm, and there to engraft the mutilated *Nose*; the arm being bound up for 24 days, the *Nose* took root in the wound, and glued itself with the flesh of the arm, and grew to its bulk; which done, he cut off the flesh of the arm, and fashioned the *Nose* to his liking, applied it in its place, and healed the wounds at leisure.

This

artilages of a triangular figure, and are divided by a third, called *Septum*, into two equal parts, called *Nares*, or *Nostrils*. See *NOSTRIL*. The lower ends in a cartilage; by means of which the *Nose* is rendered moveable, or being perfectly ossified, is not. The cartilages are tied to the others by ligaments, which renders them moveable.

The *Nose* are either *proper*, or *common*.—The *proper*, are the two external ones that constitute the *os frontis*, the fourth bone of the face, and to each other, usually *per harmoniam*.

The *Nose* are either *proper*, or *common*.—The *proper*, are the two external ones that constitute the *os frontis*, the fourth bone of the face, and to each other, usually *per harmoniam*. ## N O T

This operation we see burlesqued in *Hudibras*: "So learned Taliacotius, from—" &c. and also in the *Acta Eruditorum Lipsii*, anno 1682.

Hagarup, a Dane, maintains, that the *nose* is in some measure fitted for an organ of sight, and that a man may see through it; grounding his opinion on the authority of Smetius, who, in his fifth book of *Medicinal Miscellanies*, relates of his own knowledge, that a youth, quite blind in other respects, could see the light, and was able to discern the whiteness of flowers by the *nose*.

But, for our part, we should rather account for these sensations from the faculties of feeling and smelling, than those of seeing: Not but there is a very great resemblance between the various organs of sense, enough to give ground to the opinion, that they only differ as more or less delicate; for which reason we do not absolutely reject the instance given by Grimaldi, of a man who could distinguish colours by his feeling. See *SENSE*.

The nerves, whose texture and constitution, for any thing we know, is the same throughout the whole body, are confessedly the vehicles of all sensations from without; and those are all deposited in the same sensory, whether they be brought from the eye, the ear, or the *nose*, &c. and that singular apparatus, observable in each organ, seems rather intended for the bene esse, than the esse of that sense; rather to stop and detain the transient effluvia, to collect them where too scanty, disperse them where too copious, soften them where too rude, and break their force where too violent, and by this means to proportion them to the several degrees of fineness, tension, &c. of the nerves of the respective organs, in order to render the sensations adequate to the ends; than to produce them. See *SENSATION*.

In Tartary, the greatest beauties are those who have the least *noses*. Ruybroock mentions the wife of the great Jinghischan, the mother of Tamerlane, as a celebrated beauty, because she had only two holes for a *nose*. In most other countries, China excepted, great *noses* are in honour.

The Crim-Tartars break the *noses* of their children while young, as thinking it a great piece of folly to have their *noses* stand before their eyes.

**NOSOCOMIUM**, ΝΟΣΟΚΟΜΕΙΟΝ, an hospital, or infirmary, for the reception of the diseased. See *HOSPITAL*, *LAZAR*, &c.

**NOSOLOGY**\*, ΝΟΣΟΛΟΓΙΑ, a discourse, or treatise of diseases; otherwise called *pathology*. See *PATHOLOGY*.

\* The word is compounded of *nosos*, malady, disease, and *logos*, discourse, reason.

**NOSTRILS**, *Nares*, the two apertures, or cavities of the nose, through which the air passes, and which serve to convey odours, and to carry off the pituita separated in the sinus of the base of the cranium. See *NOSE*, and *MUCUS*.

The *nostrils* are separated by a cartilage, called *septum narium*, and lined with a very sensible membrane. See *SMELLING*.

Cicero observes, that the situation of the *nostrils* so near the mouth is very convenient; as the judging of the smells of meats and drinks, is a great part of their office: He adds, that their erect position argues the Creator's wisdom, in regard all odours rise from below upwards.

**NOT Guilty**, the general issue, or plea of the defendant, in any criminal action. See *NON EST CULPABILIS*.

**NOT putrid Fever**. See the article *FEVER*.

**NOT vital Action**. See the article *ACTION*.

**NOTABILIA Bona**. See the article *BONA*.

**NOTARICON**, the third part, or species, of the Jewish cabbala. See *CABBALA*.

Rabbi Nathan, in his great *Aruch*, says, that *notaricon* is when a single letter is taken for the sign of a thing, i. e. for a whole name.—He adds, that the word comes from the Latin *notarius*, a person who writes in notes, or short-hand.—And Rabbi Elias Levita gives the same account in his *Thef-bites*, except that in lieu of one letter for a word, he mentions two, or three. See *ABBREVIATURE*.

But after all, neither the one nor the other seems alone sufficient: For as a single letter frequently makes a word; so in the *notaricon*, a whole word sometimes stands for a single letter.

There are therefore two principal kinds of *notaricon*: the first is, when by aphæresis, or apocope, the first or last letter of several words are joined to make a single word, or phrase; which therefore is of two kinds, the one initial, the other final: and each is done several ways, viz. either by taking the letters the common way, or backwards: Though there is also a third kind, made, as the rabbins call it, by leaps, i. e. by skipping over some letters. The first of these kinds, which the rabbins call *rafche theboth*, appears very antient; and is supposed by some, well versed in the Hebrew, to have taken its origin from the Psalms, and other places of scripture, proceeding alphabetically; i. e. the first verse beginning with *A*, the first letter of the alphabet; the second with *B*, the second letter, &c. See *ABCDARY*.

VOL. II. N° CVI.

## N O T

The second kind is also very common, and called *sephé theboth*, i. e. the end of words. For instance, by telling the last letters of the words, *מִי שְׁמוֹ מִי מִי* *Mibi quidnam nomen est. Quodnam?* they find the name of God, Jehovah. This becomes still more puerile, when they take the letters backwards.

The third kind is more modern, more gross, and perplexed: Here a letter gives a whole word, instead of a word's only giving a letter; so that a word shall furnish a whole phrase.

Thus, for an example, in the first word of Genesis, *בְּרֵאשִׁית* *bereschit*, is found, "He created the heaven and the earth, the sea, the abyss," &c.

**NOTARY**, *NOTARIUS*, primarily denotes one who takes notes, or short draughts, of contracts, or other instruments. See *NOTE*, and *PROTHONOTARY*.

From the 44th Novel of Justinian, it appears, that contracts were first wrote in notes, or abbreviations, by the *notaries*, or clerks of the tabelliones; and were not yet obligatory.—Afterwards they were engrossed, or wrote at length by the tabellio himself, and then signed and sealed. See *TABELLIO*.

**NOTARY**, is more particularly used for an officer, who draws, and keeps notes, and minutes of contracts, obligations, and other instruments, executed before him, and delivers out authentic copies, &c. thereof.

Ragueau distinguishes between *notarii*, and *tabelliones*: *Notaries*, he says, in several cities, are only to receive and pass the minutes of contracts, and to deliver them to the parties in brief; being obliged to carry them to the tabelliones to be kept, and to have engrossed copies delivered out to the parties.

He adds, that the *notaries* were antiently clerks of the tabelliones; and that separating, by degrees, from their masters, they at length erected offices of their own; and at last took place of the tabelliones, who were suppressed.

They had their name *notarii*, from *nota*; because antiently they wrote in notes, or short-hand.

*Notaries* are now little used among us, except in mercantile affairs; though in France they still subsist in their legal capacity.—The *notaries* of the chatelet are called the king's counsellors, and note-keepers.

**NOTARY Public**, among us, is a person who draws, and publicly attests deeds, or writings, between merchants, to make them authentic in another country.

*Notaries* have the drawing, passing, keeping, issuing, &c. of all deeds, contracts, charter-parties, &c. in the mercantile world. In their books are registered protests, remonstrances, &c.

**Ecclesiastical NOTARIES**, were officers in the first ages of the church, whose business was to collect, and preserve the acts of the martyrs. See *ACT*, *MARTYR*, and *MARTYROLOGY*. They are supposed to have been first instituted by S. Clement. Their number was seven, and they were disposed in the seven quarters or regions of Rome.

Pope Fabian, judging the short-hand of the *notaries* too obscure for common use, added seven sub-deacons to them, to transcribe at length what the *notaries* drew in short.

At length these *notaries* were laid aside, and two other kinds established in their stead, viz. *apostolical notaries*, and *episcopal notaries*; whose business lies in spiritual, and beneficiary instruments. See *DEACON*, *CARDINAL*, &c.

**NOTATION**, in arithmetic, the art of characterizing numbers, or of representing them by proper figures. See *CHARACTER*.

The choice of arithmetical characters is arbitrary: Hence, in various nations, they are various. But perhaps there are none so commodious as those commonly used in Europe, usually said to have been invented by the Arabs, and thence called *Arabic characters*; though Dr. Wallis observes, that Altepedi, an Arab, refers the invention to the Indians. See *NUMERAL CHARACTER*.

The Greeks, Hebrews, and other eastern nations, as also the Romans, expressed numbers by the letters of their common alphabet. See *LITERAL CHARACTER*.

**NOTATION**, in algebra, is the representing of quantities by letters of the alphabet; or calling them by those names. See *QUANTITY*, *CHARACTER*, &c.

**NOTE**, *NOTA*, is used for a character, or abbreviation, serving to denote, or express something in a little compass. See *CHARACTER*, *SYMBOL*, *ABBREVIATURE*, and *NOTATION*.

The antient notaries wrote all in notes, or short-hand; whence they were sometimes denominated *cursores*, quia *notis cursim verba expediebant*. See *NOTARY*.

**NOTES** in music, are characters which mark the tones, i. e. the elevations, and fallings of the voice, or sound; and the swiftness, or slowness of its motions. See *SOUND*.

In the general, under *notes* are comprehended all the signs, or characters, used in music, for the making harmony of sounds. See *CHARACTER*.

But, in propriety, the word only implies the marks which denote

denote the degree of gravity, or acuteness, to be given each sound. See GRAVITY.

The Greeks used the common letters of their alphabet for musical notes; and in regard more notes were needed than they had letters, the defect was supplied by the different situation of the letters, viz. by placing them upright, inverted, &c. and by cutting off, or doubling some strokes.

Thus the same letter, *pi*, expressed different notes in all the following forms, Π, Π, Π, Π, Π, Π, Π. For every several mode they had no less than 18 signs.

Now, Alipius gives us signs for 15 different modes, which, with the differences of the genera, and the distinction between voice and instrument, Mr. Malcolm observes, makes in all 1620 notes. Not that they had so many distinct characters; but the same character has different significations on different occasions. Thus  $\phi$  in the diatonic genus, is lycanos hypaton of the Lydian mode; and hypate meson of the Phrygian.

The Latins, in the time of Boethius, had eased themselves of so needless a burthen; and only used the first 15 letters of their alphabet for notes. These, pope Gregory considering that the octave was the same in effect with the first, and that the order was the same in the upper and lower octave of the gamut, reduced to seven; which were to be repeated in a different character.

At length, in the eleventh century, a Benedictine, one Guido Aretine, in lieu of the letters, substituted the six syllables, ut, re, mi, fa, sol, la; placing them on different lines, and marking them with points. Lastly, it was thought proper to add notes likewise in the spaces. See GAMUT.

Of the seven musical notes, ut, re, mi, fa, sol, la, si; the first six are ascribed to Aretine, who is said to have invented them at Pomposa in the duchy of Ferrara. The seventh, viz. *si*, was added, according to some, by Vander Putten; according to others, by de Muris. It serves very good purposes, in avoiding the difficulty of the divisions remaining in Guido's scale.

Indeed Vossius will not allow Guido the honour of inventing any of them; but shews that the Egyptians had used them long before him; in which he is confirmed by the testimony of Halicarnassus: However, common fame ascribes to him not only the notes, but also the lines, letters, or clefs, flats, and sharps.

The notes ut, re, mi, &c. he is said to have taken from a hymn, in the vespers of S. John Baptist, *Ut queant laxis resonare fibris*, &c. See MUSIC.

Hitherto, the notes only served to express the degrees of tune: They were all of equal value as to time, till about the year 1330, when John de Meurs, or de Muris, a doctor of Paris, gave different figures to the several points, to express the quantity of time each was to be dwelt upon. See TIME.

There are three things to be considered in these notes. 1st, The quantity, i. e. the size and figure of the head. 2dly, The quality, i. e. the colour of the head; whether it be white or black, full or open. 3dly, The properties, as the Italians express themselves; viz. whether the note is accompanied with a virgula, or comma, or not. It must likewise be considered whether the notes be separate and distinct, or bound together.

The several musical notes are, the large, which contains 8 measures; though Merfennus makes it 12; (see its figure under CHARACTER) the long, containing 4 measures; the breve, containing 2; the semibreve, containing 1; the minim,  $\frac{1}{2}$ ; the crotchet,  $\frac{1}{4}$ ; the quaver,  $\frac{1}{8}$ ; the semiquaver,  $\frac{1}{16}$ ; and the demisemiquaver,  $\frac{1}{32}$ .

Usually we only distinguish six principal notes, represented by as many different characters; viz. the semibreve, equal to two minims; the minim, equal to two crotchets; the crotchet, equal to two quavers; the quaver, equal to two demiquavers; and the semiquaver, equal to two demisemiquavers. See each under its proper article, SEMIBREVE, MINIM, CROTCHET, &c.

The mathematicians compute, that one may make 720 changes, or varieties, with six notes, without ever repeating the same twice; and that of the notes of each octave, one may make 40320 different tunes, or songs. See CHANGE, COMBINATION, &c.

NOTE is also used for a mark made in a book, or writing, where there occurs something remarkable, and worthy of particular notice.

NOTE, is also used for an observation, or explication of some passage in an author, added in the margin, at the bottom of the page, or elsewhere, by an editor. See GLOSS.

In this sense, note stands contradistinguished to text. See TEXT.

The notes make the principal difference in the editions of classic, &c. authors. — We have Virgil, Horace, Terence, &c. with Ruæus's notes, the Dauphin's notes, Dacier's notes, Bentley's notes, Hare's notes; with *notis variorum*, &c. See VARIORUM.

NOTE is also a minute, or short writing, containing some article of business. See MINUTE.

In which sense we say, a promissory note, a note under hand, a bank note, &c. See BILL, BANK, &c.

To NOTE a Bill, is when a public notary goes as a witness, or takes notice, that a merchant will not accept or pay it. See BILL, and PROTEST.

NOTE of a Fine, is a brief of a fine made by the chirographer, before it be engrossed. See FINE, and CHIROGRAPHER.

Natural NOTE. See the article NATURAL.

NOTÆ Maternæ, Mothers Spots. See the article NÆVUS.

NOTHÆ Costæ, in anatomy, denote the five lowest ribs on each side. They are called *bastard*, or *spurious* ribs, in regard they do not join with the breast-bone, as the other ribs do, nor are they, as the others are, bony, but cartilaginous. See RIBS.

NOTHING, *Nihil*, *Nibilum*, or *Non Ens*. See NIHIL.

The schoolmen distinguish between *nothing*, taken *strictly*, which is what is impossible, or implies a contradiction; and *nothing* taken more *generally*, which is both applied to what is possible, and impossible. See POSSIBLE.

Again, they distinguish *nothing* into *negative*, which is the absence of reality in any subject; and *privative*, which is the absence of reality in a subject capable thereof, or wherein it ought to be found.

NOTHUS, ΝΟΘΟΣ, a Latin term, properly signifying *bastard*, or a person of spurious birth. See BASTARD.

Hence it is applied figuratively by physicians, &c. to such diseases as though, in respect of a similitude of symptoms, &c. they have the same denomination as some others; yet are of different origin, seat, or the like, from the same. See PERIPNEUMONY, EMPYEMA, &c.

NOTHUS, is sometimes also used for the back part of the chest, or thorax. See THORAX.

NOTION, NOTIO, in logic, an idea, or representation of any thing, in the mind. See IDEA, and PRENOTION.

M. Leibnitz is very accurate in the distinction of notions, in the *Acta Erudit. Leipf. anno 1684*.

A clear notion, he defines to be such an one as suffices us to recollect the object; v. gr. that a given figure is reckoned in the number of triangles.

An obscure NOTION, is that which doth not suffice to recollect the object; such, v. gr. is that of a plant, which upon seeing, you are in doubt whether or no it be the same you had seen elsewhere, and which is called by this or that name.

Distinct NOTION, is that wherein you are able to assign the very marks, or characters, by which you recollect the thing; v. gr. That a circle is a figure terminated with a curve line returning into itself, the several points whereof are equally distant from one and the same intermediate point. See DISTINCT.

A confused NOTION, is that wherein you are not able to assign the very marks or characters whereby you recollect the object; though it be resolvable into them. Such, v. gr. is the notion of red colour.

An adequate NOTION, that wherein you have distinct notions of the marks or characters whereof it is composed; such, v. gr. is the notion of a circle above instanced, where you have distinct notions of the curve returning into itself, of the intermediate point, and of the equal distance and termination. See ADEQUATE.

An inadequate NOTION, that wherein you have only a confused notion of characters that enter a distinct one.

Some confused notions are admitted into mathematics; viz. such whose resolution is of no great consequence to any demonstrations.

Thus, Euclid does not resolve the notion of equality, though it enter the notion of an equilateral triangle, a rhombus, &c. inasmuch as the propositions for whose demonstration it should be used, are easily granted without such a detail; as, v. gr. that things equal to the same third, are equal to one another, &c. But no notions are admitted into the number of mathematical definitions, except distinct ones, and those too as adequate as possible, or as occasion requires. See DEFINITION.

The schoolmen distinguish notions into *formal*, and *objective*; and each of these they subdivide into *first*, and *second*.

A first formal NOTION, is the knowledge we have of any thing according to what it is, or has in itself; as the knowledge of fire, *quatenus* fire; of a light body, *quatenus* light, &c.

A first objective NOTION, is the thing itself known, according to what it is, or has in itself; as the fire known as fire, &c.

Second formal NOTION, is the knowledge of a thing according to what it receives from the understanding; as, of fire, that it is the subject, and not the predicate.

Second objective NOTION, is what agrees to the thing by means of the operation of the intellect, or what it receives from the intellect.

**Common NOTIONS**, called also **PRENOTIONS**, *προληψεις*, and *κοιναι νοησαι*, are certain principles supposed to be innate, and which therefore are self-evident, *i. e.* appear, or are known by their own light, without the intervention of any medium, or proof; being impressed, as it were, by the finger of God; to serve as the foundations of all our conclusions in the sciences, which are to be demonstrated hereby. See **INNATE IDEA**, **KNOWLEDGE**, &c.

These *common notions*, considered as the foundations of sciences, are called *axioms*. See **AXIOM**.

They are called *common*, not as if so actually and necessarily perceived by every person, that no body could be ignorant of, or deny them; but because they are judged to be true and certain, by all persons of sound reason. For the same reason as we say, such a food is wholesome; not that it is so to all men, but to all that are of a sound body, and constitution. Aristot. *Topic.* c. 4.

There are two kinds of *common notions*, viz. *theoretical*, which lay the ground-work for speculation; such are, every thing either is, or is not; nothing can be made by itself; the whole is greater than a part; equal things being added to equal, the sums are equal: And *practical*, which lay the foundation for honesty, and good morals; such are, God is to be beloved and worshipped; our parents to be honoured; to give every body their due; to do as we would be done by; —

Some philosophers, however, and those of best note, deny the reality of any innate, or *common notions*; urging, that the mind does not need any actual *notions* to prepare it to think, but that an innate faculty of thinking may suffice; as appears in an infant, from its perception of pain, taste, colour, &c. They add, that the common organs of sense, if they have but objects presented to them, and the faculty we have of reflecting on, and variously combining or ordering the ideas received thereby, are sufficient to furnish us with all the stock of knowledge we have. See **KNOWLEDGE**.

**NOTIONAL Quantity**. See the article **QUANTITY**.

**NOTITIA**, **NOTICE**, something that has come under a person's knowledge, or observation. See **KNOWLEDGE**.

Hence *notification*, the action of giving notice, &c.

**NOTITIA** is also the title of certain books, composed for giving a particular knowledge of the places, roads, &c. of a province, kingdom, diocese, or the like.

Such is the *Notitia Imperii*, &c. M. Valois has given a *Notitia Galliarum*, being a collection of the several names which the cities and provinces of that kingdom have bore at different times.

The *Notitie Dignitatum Imperii*, both eastern and western, are of the utmost use both in the Roman, and in ecclesiastical history; yet are they of little service, at least to young people, without good notes; such are those of Pancirollus, &c. and unless the text, which is strangely corrupted and mutilated, be supplied.

**NOTORIOUS**, something known, manifest, and public. —Hence,

*Ars NOTORIA*, a chimerical kind of art, or science, whereby it is pretended a person may arrive at the knowledge of all things, all sciences, &c. And this by infusion, without any labour, or trouble, beside that of performing a few ceremonies.

**NOTRE Dame**, *Our Lady*, a term frequently used for the holy virgin. —Hence, *feasts of notre dame*; the office of *notre dame*; congregations, nunneries, orders of *notre dame*. See **VIRGIN**.

**NOVALE** \*, in our ancient customs, denotes land newly ploughed, and converted into tillage; and which had not been tilled within the memory of man, before.

\* *Quod novale semel fuit, semper erit novale quoad decimarum retentionem vel solutionem*. What was once *novale* will ever remain so, as to the paying, or non-paying of tithes. *Excepta decima novarium cujusdam terræ quam de novo excoluerunt*. Pat. 6 Edward III.

**NOVALE** is sometimes also used for fallow land, *i. e.* land which has been ploughed for two years, and rests, or lies fallow one more; or that lies fallow every other year. See **FALLOW**.

**NOVATIANS** \*, **NOVATIANI**, a sect of ancient heretics, so called from *Novatus*, an African bishop; or from *Novatianus*, a priest of Rome.

\* They were called also *Catbari*, from *καθαροι*, pure, *q. d.* Puritans.

*Novatian* first separated from the communion of pope Cornelius, on pretence of his being too easy in admitting to repentance those who had fallen off in times of persecution. Novatus, coming to Rome, joined himself to the faction of Novatian; and both maintained, that there was no other admission into the church, but by the repentance in baptism; grounding their opinion on that of S. Paul; "It is impossible for those once enlightened, and who have tasted the heavenly gift; if they fall away, to renew themselves by repentance."

Not that they denied but a person fallen into any sin, how grievous soever, might obtain pardon by repentance; for they themselves recommended repentance in the strongest terms. But their doctrine was, that the church had it not in its power to receive sinners into its communion; as having no way of remitting sins but by baptism, which, once received, could not be repeated. See **BAPTISM**.

In process of time, the *Novatians* softened and moderated the rigour of their master's doctrine; and only refused absolution to very great sinners. See **ABSOLUTION**.

The two leaders were proscribed, and declared heretics, not for excluding penitents from communion, but for denying that the church had a power of remitting sins.

**NOVATION**, *Innovation*, in the civil law, a change, or alteration of an obligation, whereby it becomes extinguished, or annihilated.

Thus when an obligation is discharged without receiving any money, but a simple promise is accepted in its stead, this occasions a *novation*.

There are two kinds of *novations*; the one *voluntary*, the other *necessary* and constrained.

*Necessary NOVATION* is that made in consequence of a sentence, or decree of justice.

*Voluntary NOVATION* is made three ways, viz. by changing the cause of the obligation, without the intervention of any other person; by changing the nature of the obligation; and by delegation, as when the debtor makes over a debt to the creditor for his satisfaction.

In all these cases there is a will to innovate: Accordingly Justinian says, *Voluntate non lege novandum*.

**NOVEL**, **NOVELLA**, in jurisprudence, a term used for the constitutions of several emperors, viz. Justin, Tiberius II. Leo, and particularly Justinian. See **CONSTITUTION**, and **LAW**.

Most of Justinian's *novels* were originally Greek; and afterwards translated into Latin. Their number is 165, comprized in nine collections, or chapters. See **CIVIL LAW**.

They had their name, *novel*, either from their making a great alteration in the face of the ancient law; or, as Cujas rather thinks, because made on new cases, not yet considered, and after the revival of the code, compiled by order of the emperor. See **CODE**.

Wherever Accursius speaks of *novels*, he means those published in Greek by Justinian; the Latin version of them, made in the time of Bulgarus, he calls *authentics*, by reason of its exactness and fidelity. See **AUTHENTIC**.

**NOVEL Assignment**, in an action of trespass, is an assignment of time, place, or the like, in a declaration, otherwise or more particularly than it was in the writ.

**NOVEL Diffisin**. See the article **ASSISE of Novel Diffisin**.

**NOVEMBER**, the eleventh month in the Julian year; but the ninth in the year of Romulus; whence its name. See **MONTH**, and **YEAR**.

**NOVEMSILES**, in mythology, a species of gods worshipped among the ancient Romans. See **GOD**.

The *dii novemfiles* were the gods of the Sabines, adopted by Romulus, and a temple built to them in consequence of a vow by king Tatius.

Some antiquaries take the name to have been given to those which were last placed among the number of the gods; as, Hercules, Vesta, Sanctity, Fortune, &c.

**NOVEMVIRI**, an order of magistrates at Athens, nine in number.

The *novemviri* were the chief magistrates of the city: their office only held for one year. Their chief was called *archon*, whose name was recorded in the Athenian feasts; as, at Rome, that of the consuls. See **ARCHON**.

The second bore the title of *basileus*; the third, *polemarcha*, *i. e.* chief of the troops; and the remaining six, *thesmothetes*.

**NOVENDIALE** \*, or **NOVEMDIALE**, in antiquity, a solemn sacrifice among the Romans, held on occasion of any prodigies appearing to menace them with ill fortune. See **SACRIFICE**.

\* It had its name from the term of its celebration, viz. *novem dies*, nine days.

**NOVICE**, a person not yet skilled, or experienced in an art, or profession. See **APPRENTICE**, **TYROCINIUM**, &c.

In the ancient Roman militia, *novicii*, or *novitii*, were the young raw soldiers, distinguished by this appellation from the veterans. See **VETERAN**.

In the ancient orders of knighthood, there were *novices*, or clerks in arms, who went through a kind of apprenticeship ere they were admitted knights. See **KNIGHT**.

**NOVICE** is more particularly used in monasteries for a religious yet in his, or her, year of probation, and who has not made the vows. See **NOVICIATE**.

In some convents, the sub-prior has the direction of the *novices*.—In nunneries, the *novices* wear a white veil; the rest a black one. See **VEIL**.

A *novice* is not esteemed dead in law, but is capable of inheriting till the time of actual profession; nor can his benefices be given away, during the year of probation, without his consent. See PROFESSION.

The council of Trent prohibits a *novice* from assigning over his benefices, till two months before the expiration of his year of probation; and he may even resume them if the profession be null.

A *novice* is not allowed to make any donation to his superior, by reason of the dependance he is under.—*Novices* may either quit the convent during their noviciate, or may be turned off by the convent.

NOVICIATE, a year of probation, appointed for the trial of religious, whether or no they have a vocation, and the necessary qualities for living up to the rule; the observation whereof they are to bind themselves to by vow. See PROBATION.

The *noviciate* lasts a year at least; in some houses more. It is esteemed the bed of the civil death of a novice, who expires to the world by profession. See VOW, and PROFESSION.

NOVICIATE is also used for the houses, or places where novices are instructed.

In this sense, the *noviciate* is frequently a cloister separate from the grand dormitory.

NOUN, NOMEN, in grammar, a name or word which expresses the subject spoke of; or expresses a subject whereof something is, or may be, affirmed: as man, food, whiteness, Henry, &c. See WORD, and NAME.

A *noun* therefore, in language, answers to an *idea* in logic. See IDEA.

The generality of subjects spoke of, have particular names; yet there are others, which, without being attached to the same particular subject, are yet real nouns.

Thus, beside the particular name, which each person bears, and whereby others denote him, he gives himself another when he speaks of himself; as, *I*, or *my self*.

It is only the more particular names that in grammar have retained the quality of nouns; the more general ones are called pronouns. See PRONOUN.

Nouns, again, are to be viewed in another light, viz. as divided into nouns substantive, and nouns adjective.

They are called *substantives*, when the objects they design are considered simply in themselves, and without any regard to their qualities. See SUBSTANTIVE.

They are called *adjectives*, when their objects are considered as clothed with any qualities. See ADJECTIVE.

Thus, when I say simply, *the heart*, the word *heart* is called a *noun substantive*, inasmuch as it does not express any of its qualities: But if I say, *the generous heart*, or *the perfidious heart*, I then consider the heart as accompanied with the quality of generous, or the quality perfidious. For this reason, the words *generous* and *perfidious* are called *nouns adjective*, because they add a quality to the object.

But, in effect, the object is alone designed by the *nouns substantive*; which, in this view, are alone the proper nouns.

Adjectives, at bottom, are only modificatives of nouns; though in one view they may be considered as nouns; viz. as they do not so much represent a quality or circumstance of the object, as the object itself, clothed with that quality or circumstance. Nor must it be omitted, that a *noun adjective* frequently becomes a substantive: For as its nature is to express the quality of an object, if that quality happen to be the object itself spoke of, then, according to our first definition, it becomes a substantive.

Thus, if I say a *good intention*, the word *good* is here an adjective, representing the intention as clothed with the quality of goodness; but if I say, *the good is to be chosen*, it is evident that *good* is here the subject spoke of, and of consequence is a *noun substantive*. Nor are there cases wanting wherein nouns substantives become adjectives.

It is true, in the common use of grammar, nouns that are really adjectives are not reckoned as such; none being esteemed adjectives but those which without any, or at least any considerable, change in their inflexion and termination, are joined indifferently to nouns substantives of different genders.

Nouns are again divided into *proper*, and *appellative*.

Nouns *proper*, are those which express a particular thing or person, so as to distinguish it from all other things of the same kind; as, Socrates. See PROPER.

Nouns *appellative*, are those common to several individuals of the same kind; as, man, angel, &c. See APPELLATIVE.

Heterogeneous Nouns, are such as are of one gender in the singular number, and of another in the plural. See HETEROCLITE.

NOURISHING Clysters. See the article CLYSTER.

NOURISHMENT. See the article NUTRITION.

NOWED, NOWE, i. e. *Knotted*, in heraldry, is applied to the tails of such creatures as are very long, and sometimes represented in coat-armour as if tied up in a knot.

NUBECULA, *little Cloud*, in medicine, a term sometimes used for a disease in the eye, wherein objects appear as through a cloud, or mist.

The *nubecula* seems to arise from certain gross particles detained in the pores of the cornea, or swimming in the aqueous humour, and thus intercepting the rays of light.

NUBECULA, or NUBES, is also used for what we otherwise call *albugo* and *pannus*. See ALBUGO, and PANNUS.

NUBECULA is also used for a matter in form of a cloud, suspended in the middle of the urine.—This they sometimes also call *enæorema*. See URINE.

NUBILES *Anni*. See the article ANNI.

NUCHA, the hinder part, or nape of the neck; called also *cervix*. See CERVIX, and NECK.

NUCIFEROUS, an appellation given by botanists to trees which bear nuts. See TREE, and NUT.

NUCKIANÆ Glandulæ\*, in anatomy, a number of small glands, situate in that part of the skull wherein the orbits of the eyes are, between the abducent muscle of the eye, and the upper part of the os jugale. See GLAND, and CRANIUM.

\* They were thus denominated from their inventor, Ant. Nuck, professor of physic at Leyden.

The same author gave his name to a salival duct, *ductus Nuckianus*. See SALIVAL, and AQUOSE.

NUCLEUS, a Latin word, literally denoting the kernel of a nut, or stone fruit; or, more strictly, the edible part contained within the skin of the kernel. See FRUIT.

NUCLEUS is also used by botanists, in a larger sense, for any fruit or seed contained within a husk, or shell.

NUCLEUS is also used by Hevelius, and some other astronomers, for the body of a comet, which others call its *head*, in contradistinction to its tail, or beard. See COMET.

NUCLEUS is also applied by some to the central parts of the earth, and other planets; as supposing them to be loose from the exterior part, which they consider as a cortex, or shell. See MAGNETISM, EARTH, &c.

NUCLEUS, in architecture, denotes the middle part of the flooring of the antients; consisting of a strong cement, over which they laid the pavement, bound with mortar.

NUDE Compact, NUDUM Pactum, a bare contract, engagement, or promise of a thing without any consideration: *Ex quo*, say the lawyers, *non oritur actio*. See CONTRACT, COVENANT, and PACT.

NUDE Matter, denotes a bare allegation of a thing done. See MATTER.

NUDITIES, in painting, and sculpture, denote those parts of a human figure not covered with any drapery; or those parts where the carnations appear. See CARNATION.

NUEL, or rather *newel* of a stair-case. See NEWEL, and STAIR-Case.

NULLITY, the quality of a thing null, that is void, and of no effect, by reason of something contrary to law, custom, or form. See ANNULING.

There are two kinds of *nullities* to invalidate a contract, or other instrument, viz. *de facto*, and *de jure*.—The former where the thing commences null, ipso facto, as soon as the thing is proved: In the latter, the act does not immediately become null, but a handle is given thereby to have it intirely annulled or set aside. See DE FACTO, &c.

NUMBER, in arithmetic, a collection, or assemblage of several units, or several things of the same kind. See UNIT.

Stevinus chuses to define *number* as that whereby the quantity of any thing is expressed: Agreeably to which, Sir Isaac Newton conceives *number* to consist, not in a multitude of units, as Euclid defines it, but in the abstract ratio of a quantity of any kind to another quantity of the same kind which is accounted as unity. And on this view he divides *number* into three kinds, viz. *integers*, *fractions*, and *surds*. See each under its proper article, INTEGER, FRACTION, and SURD.

Wolfius defines *number* to be something which refers to unity, as one right line refers to another.—Thus, assuming a right line for unity, a *number* may likewise be expressed by a right line.

A less general definition of *number*, that author thinks will not comprehend the several kinds of whole numbers, fractions, rationals, and surds.

The schoolmen, keeping to Euclid's definition, hold *number* to consist of *matter* and *form*: The *matter* is the things numbered; e. gr. coins: The *form*, the idea whereby comparing the several pieces, we bring them into one sum, as ten: So that *number* depends altogether on the mind of the person that numbers; whence changing the idea at pleasure, an hundred men shall only be called one, or it shall be two, or four, &c.

Hence, say they, the form of a *number* is not any thing added to the things numbered; for the idea is a mere mode of the mind, not any thing superadded to the things. And hence, though there may be some efficacy in *number*, considered

sidered with respect to the matter, as when we say, A triple rope is not easily broke; yet there is none in respect to form: For what alteration should my idea make? And hence the folly of the philosophy of numbers.

The same philosophers call *number* a *discrete quantity*: *Quantity*, as it admits of more and less; and *discrete*, since the several units it consists of are not united, but remain distinct. See QUANTITY, and DISCRETE.

For the manner of designing, or characterising NUMBERS. See NOTATION.

For that of expressing or reading those already characterised. See NUMERATION.

For the measure of a NUMBER. See the article MEASURE.

Mathematicians, considering *number* under a great many circumstances, different relations, and accidents, make many kinds of numbers.

A *determinate NUMBER*, is that referred to some given unit; as a ternary, or three: which is what we properly call a *number*.

*Indeterminate NUMBER*, is that referred to unity in the general; which is what we call *quantity*. See QUANTITY.

*Homogeneous NUMBERS*, are those referred to the same unit. See HOMOGENEAL.

*Heterogeneous NUMBERS*, those referred to different units.

For every *number* supposes some determinate unit, which is determined by the notion to which we have regard in numbering, *e. gr.* it is a distinguishing property of a sphere, that the several points of its surface are equidistant from its centre: If then, this be laid down as a note of unity, all bodies to which it agrees will have the nature of unity; and are the same units, *quatenus* contained under this notion. But if spheres be distinguished, *e. gr.* with regard to the matter they are composed of, then those which before were the same units, commence different. Thus, six golden spheres and three golden spheres, are *homogeneous numbers* among themselves; and three brass spheres and four silver ones, are *heterogeneous numbers*. See HETEROGENEOUS.

*Whole NUMBERS*, called also *natural numbers*, and *integers*, or simply *numbers*; are all the various assemblages of unity, or the ideas we have of several multitudes; or, according to Wolfius, all those which, in the manner of expressing, refer to unity, as a whole does to a part.

*Broken NUMBERS*, or *Fractions*, are those consisting of several parts of unity; or those which refer to unity as a part to the whole. See FRACTION.

*Rational NUMBER*, is that commensurable with unity. See COMMENSURABLE.—*Rational whole number*, is that whereof unity is an aliquot part.—*Rational broken number*, that equal to some aliquot part or parts of unity.—*Rational mixed number*, that consisting of a whole number and a broken one, or of unity and a fraction. See RATIONAL.

*Irrational NUMBER*, or *Surd*, a number incommensurable with unity. See SURD.

*Even NUMBER*, that which may be divided into two equal parts, without remainder or fraction; as 4, 6, 8, 10, &c. The sum, as also the difference, and the factum or produce of any number of even numbers, is always an even number. See EVEN.

An even number, multiplied, by an even number, produces an evenly even number.

An even number is said to be evenly even, when it may be measured or divided without any remainder by another even number. See EVENLY.

Thus, twice four being eight, eight is an evenly even number.

A number is said to be unevenly even, when it may be equally divided by an uneven number; as 20, which may be divided by 5.

*Uneven NUMBER*, that which exceeds an even number at least by unity; or which cannot be divided into two equal parts. Such are 3, 5, 9, 11, &c.

The sum, or the difference, of two uneven numbers, makes an even number; but the factum of two makes an uneven one.

If an even number be added to an uneven one; or if the one be subtracted from the other; in the former case, the sum, in the latter the difference, is an uneven number. But the factum of an even and uneven number, is even.

The sum of any even number of uneven numbers, is an even number; and the sum of any uneven number of uneven numbers, is an uneven number.

*Primitive, or prime NUMBER*, is that which is only divisible by unity; as 5, 7, 11, &c. See PRIME, and INCOMPOSITE.

*Prime NUMBERS among themselves*, are those which have no common measure beside unity; as 12 and 19.

*Compound NUMBER*, is that divisible by some other number besides unity; as 8, divisible by 4, and by 2. See COMPOUND.

*Compound NUMBERS among themselves*, those which have some common measure besides unity; as 12 and 15.

*Perfect NUMBER*, that whose aliquot parts added together, make the whole number; as 6, 28, &c. The aliquot parts

VOL. II. N° CVI.

of 6, being 3, 2, and 1=6. And those of 28, being 14, 7, 4, 2, 1. which together make 28. See PERFECT.

*Imperfect NUMBERS*, those whose aliquot parts added together make either more or less than the whole, whereof they are parts. See IMPERFECT.

*Imperfect numbers* are distinguished into *abundant* and *defective*.

*Abundant NUMBERS*, are those whose aliquot parts added together, make more than the number whereof they are parts; as 12, whose aliquot parts, 6, 4, 3, 2, 1, make 16. See ABUNDANT.

*Defective NUMBERS*, are those whose aliquot parts added together, make less than the number whose parts they are; as 16, whose aliquot parts, 8, 4, 2, and 1, only make 15.

*Plain NUMBER*, that arising from the multiplication of two numbers; *e. gr.* 6, which is the product of 3 multiplied by 2. The numbers, which thus multiplied produce a plain number, as here, 2 and 6, are called the *sides* of the plane. See PLAIN.

*Square NUMBER*, the product of any number multiplied by itself; thus 4, the factum of 2, by 2, is a square number. See SQUARE.

Every square number added to its root, makes an even number. See ROOT, and POWER.

*Cubic NUMBER*, the product of a square number, multiplied by its root; *e. gr.* 8, the product of the square number 4, multiplied by its root 2. See CUBE, and SOLID.

All cubic numbers, whose root is less than 6, *v. gr.* 8, 27, 64, 125, being divided by 6, the remainder is their root itself. Thus 8 being divided by 6, 2, the remainder of the division, is the cube root of 8. For the cubic numbers beyond 125; 216, the cube of 6, divided by 6, leaves no remainder; 343, the cube of 7, leaves a remainder 1, which added to 6, gives the cube root of 343. And 512, the cube of 8, divided by 6, leaves 2, which added to 6, makes the cube root of 512. So that the remainders of the divisions of the cubes above 216, divided by 6, being added to 6, always give the root of the cubic number divided; till that remainder be 5, and of consequence 11 the cube root of the number divided: But the cubic number above this, being divided by 6, there remains nothing, the cube root being 12. Thus, if you continue to divide the higher cubes by 6, you must not add the remainder of the division to 6, but to 12, the first multiple of 6; and thus coming to the cube of 18, the remainder of the division must not be added to 6, nor to 12, but to 18: and so in infinitum.

Monf. de la Hire, from considering this property of the number 6, with regard to cubic numbers, found that all other numbers raised to any power whatsoever, had each their divisor, which had the same effect with regard to them, that 6 has with regard to cubes. And the general rule he has discovered, is this: If the exponent of the power of a number be even, *i. e.* if that power be raised to the 2d, 4th, 6th, &c. power, it must be divided by 2; and the remainder, if there be any, added to 2, or to a multiple of 2, gives the root of the number corresponding to its power, *i. e.* the 2d or 6th root, &c. But if the exponent of the power of the number be uneven, *i. e.* if it be raised to the 3d, 5th, 7th, &c. power, the duple of that exponent will be the divisor, which shall have the property here required.

*Polygonous NUMBERS*, the sums of arithmetical progressions beginning with unity. These, where the common difference of terms is 1, are called *triangular numbers*. See TRIANGULAR.—Where 2, square numbers; where 3, pentagonal numbers; where 4, hexagonal numbers; where 5, heptagonal. See HEPTAGONAL, POLYGONAL, &c.

*Pyramidal NUMBERS*.—The sums of polygonous numbers, collected after the same manner as the polygons themselves are gathered out of arithmetical progressions, are called *first pyramidal numbers*.

The sums of the first pyramidal, are called *second pyramidal*. The sums of the second pyramidal, are called *third pyramidal*, &c.

In particular, they are called *triangular pyramidal numbers*, if they arise out of triangular numbers. *First pentagonal pyramidal*, if they arise out of pentagons, &c. See PYRAMID, and PYRAMIDAL.

*Cardinal NUMBERS*, those which express the quantity of units; as 1, 2, &c. See CARDINAL.

*Ordinal NUMBERS*, those which express their order or rank; as 1st, 2d, 3d, &c. See ORDINAL.

*Absolute NUMBER*. See the article ABSOLUTE.

*Abstract NUMBERS*. See the article ABSTRACT.

*Amiable NUMBERS*. See the article AMIALE.

*Artificial NUMBERS*. See the article ARTIFICIAL.

*Binary NUMBER*. See the article BINARY.

*Circular NUMBERS*. See the article CIRCULAR.

*Concrete NUMBERS*. See the article CONCRETE.

*Linear NUMBERS*. See the article LINEAR.

*Mixt NUMBER*. See the article MIXT.

*Similar NUMBERS*. See the article SIMILAR.

**Golden NUMBER**, in chronology. See **GOLDEN Number**.

M. Cassini defines the *golden number* by the number of years elapsed since that which had the new moon on its first day; as that of the year 1500, whose *golden number* was 0; which he takes for his epocha.

**Golden NUMBER** is also used, with somewhat less propriety, for a period of 19 years, invented by Meton the Athenian; at the end whereof, the same lunations return in the same days, though not precisely in the same hour and minute of the day. See **PERIOD**, and **LUNATION**.

In which sense, *golden number* amounts to the same with what we otherwise call *lunar cycle*, or *Metonic year*. See **CYCLE**, and **METONIC**.

Hence this period, called by the Greeks *enneadecaeteris*, is not perfectly just; there being a proemptions, or leap, at the end of each 312 years, i. e. in that time, the lunations fall out a day sooner than the *golden number* expresses them. See **PROEMPTIONS**.

This, among other things, was what engaged pope Gregory XIII. to reform the calendar, to throw out the *golden number*, and substitute the cycle of epacts instead of it. For the use of the *golden number*, which, in the Julian calendar, serves to find the new moons, only serves in the Gregorian to find the cycle of epacts. See **EPACT**, **CYCLE**, and **CALNDAR**.

This *number* is said to have had its name, *golden*, from the greatness of its use; or because the Athenians received it with so much applause, that they had it wrote in the publick market in letters of gold. See **GOLDEN**.

**NUMBER**, in grammar, is a modification of nouns, verbs, &c. to accommodate them to the varieties in their objects, considered with regard to *number*. See **NOUN**, &c.

Nouns or names agreeing to several things, may be considered either as applied to one of those things singularly, or to a *number* of them; and those either considered as several, or as united.—To distinguish these cases, two *numbers* have been invented, the *singular* and *plural*.

When a noun indicates an object considered as single, or alone, or a number of them considered as united together, it is said to be of the *singular number*: as, a tree, a troop, a temple. See **SINGULAR**.

When it indicates several objects, and those as distinct, it is of the *plural number*: as, trees, or temples.—Thus when I speak of myself, as making part of several others, instead of I, I say, we, &c. See **PLURAL**.

The Greeks have a third *number*, which they call the *dual number*, as signifying two.—The Hebrews have something like it; but then it only takes place when the words signify a thing double either by nature, as the hands, the eyes, &c. or by art, as scissars, tongs, &c.

As to common and appellative names, they seem all naturally to require a *plural number*; yet are there several which have none, as the names of gold, steel, &c.

The difference of *numbers* in nouns is expressed by a difference of termination, or ending.

In English, the *singular* is usually converted into *plural*, by adding s; as tree, trees, hand, hands, &c. Where the pronunciation requires it, as when the *singular* ends in s, or x, sh, or ch, it is usually done by the addition of es instead of s.

The  *plurals of adjectives*, though varied from the *singulars* in most other languages; yet in English are generally the same. See **VERB**.

**NUMBERS**, in poetry, oratory, music, &c. are certain measures, proportions, or cadences, which render a verse, period, or song, agreeable to the ear. See **VERSE**, **MEASURE**, **CADENCE**, &c.

*Poetical and prosaic numbers*, are somewhat different.

**Poetical NUMBERS** consist in a certain harmony, in the order, quantities, &c. of the feet and syllables; which make the piece musical to the ear, and fit for singing; for which all the verses of the antients were intended. See **RHYTHM**.

It is of these *numbers* Virgil speaks in his fourth Eclogue.

—Numeros memini si verba tenerem.

And again, in the sixth Eclogue:

Tum vero in numerum faunosque ferasque videres  
Ludere—

The *numbers* are what constitute the air and character of a verse; and denominate it *smooth*, or *soft*, or *low*, or *rough*, or *sonorous*. The following lines of Milton furnish an instance of soft easy *numbers*.

Then feed on thoughts, which voluntary move  
Harmonious *numbers*; as the tuneful bird  
Sings darkling, and in shadiest covert hid,  
Tunes her nocturnal note.—

How different from the *numbers* of these:

Arms meet with arms, fauchons with fauchons clash,  
And sparks of fire, struck out from armour, flash.

**Rhetorical**, or **prosaic NUMBERS**, are a sort of simple unaffected harmony, less glaring than that of verse; yet such as is perceived, and affects the mind with pleasure.

The *numbers* are that by which the style is said to be easy, free, round, flowing, &c. See **STYLE**.

A fine instance of *numbers* we have in that passage of Tully for Marcellus: *Nulla est tanta vis, tantaque copia quæ non ferro ac viribus debilitari frangique possit*. All the beauty of which would be intirely lost to any tolerable ear, if the *numbers* were a little inverted, thus: *Nulla est vis tanta, & copia tanta quæ non possit debilitari frangique viribus & ferro*.

*Numbers* are a thing absolutely necessary in all writing, and even all speech. Hence Aristotle, Tully, Quintilian, &c. lay down abundance of rules as to the best manner of intermixing dactyls, spondees, anapests, iambus's, choraic and dichoraic molossus's, &c. in order to have the *numbers* perfect.

The substance of what they have said, is reducible to what follows.—1°, The style becomes numerous, by the alternate disposition and temperature of long and short syllables; so, as that the multitude of short ones neither render it too hasty, nor that of long ones too slow and languid.—Thus, Tully to Cæsar: *Domuisti gentes immanitate barbaras, multitudine innumerabiles, locis infinitas, omni copiarum genere abundantes*, &c.

Sometimes, indeed, long or short syllables are designedly thrown together, without any such mixture; to paint the celerity or slowness of a thing by that of the *numbers*; as,

Quadrupedante putrem sonitu quatit ungula campum.

Æneid. l. 8.

Lustantes ventos, tempestatesque sonoras.

Id. l. 1.

2°, The style becomes numerous by the intermixing words of one, two, and more syllables; e. gr. *Vivis & vivis non ad deponendam sed ad confirmandam audaciam*. Whereas the too frequent repetition of monosyllables renders the style pitiful, and grating: e. gr. *Hac in re nos hic non feret*.

3°, It contributes greatly to the numerousness of a period, to have it closed by magnificent and well sounding words; as, *Qui locus quietis ac tranquillitatis plenissimus fore videbatur, in eo maximæ molestiarum, & turbulentissimæ tempestates existerunt*.

4°, The *numbers* depend not only on the nobleness of the words in the close, but of those in the whole tenor of the period: as in that fine oration of Cicero for Fonteius, brother of one of the vestal maids. *Nolite pati, judices, aras deorum immortalium, vestæque matris, quotidianis virginum lamentationibus de vestro judicio commoveri*.

5°, To have the period flow easily and equably, the harsh concurrence of letters and words is to be studiously avoided, particularly the frequent meeting of rough consonants; as *Ars studiorum, rex Xerxes*: The beginning the first syllable of a word with the last of the preceding; as, *Res mihi invisæ sunt*: The frequent repetition of the same letter or syllable; as in that verse of Ennius, *Africa terribili tremuit horrida terra tumultu*: And the frequent use of like-ending words; as *amatrices, adjutrices, præstigiatrices fuerunt*.

Lastly, The utmost care is to be taken, lest in aiming at *oratorical numbers*, you fall into *poetical* ones; and instead of prose, write verse; which even Cicero himself is sometimes guilty of: witness, *Cum loquitur tanti fletus gemitusque fiebant*. See **VERSE**.

**NUMERAL Letters**, those letters of the alphabet, which are generally used for figures; as I, V, X, L, C, D, M. See **LETTER**.

**NUMERAL Characters**. See the article **CHARACTER**.

**NUMERALS**, in grammar, are those words which express *numbers*; as six, eight, ten, &c. See **ORDINALS**.

**NUMERATION**, in arithmetic, the art of estimating or pronouncing any number, or series of numbers. See **NUMBER**.

The characters whereby *numbers* are ordinarily expressed, are the nine following ones, 1, 2, 3, 4, 5, 6, 7, 8, 9. It being the law of the common *numeration*, that when you are arrived at ten, you begin again, and repeat as before; only expressing the number of tens.

Weigelius, indeed, shews how to number without going beyond a quaternary, i. e. by beginning to repeat at each fourth. And Leibnitz, in what he calls his *binary arithmetic*, begins to repeat at every second; only using two characters, 1 and 0. But these are rather matters of curiosity than use. See **BINARY Arithmetic**.

That the nine numerical notes may express not only units, but also tens or decads, hundreds or centuries, thousands, &c. they have a local value given them; so, as that when either alone, or when placed in the right-hand place, they denote units; in the second place, tens; in the third, hundreds; in the fourth, thousands. See **NOTATION**.

Now, to express any written number, or assign the proper value to each character; divide the proposed number by comma's into classes, allowing three characters in each class; beginning at the right-hand. Over the right-hand figure of the

the third class, add a small mark, or transverse line; over the right-hand figure of the fifth class, add two marks, or transverse lines; over that of the seventh, three, &c. The number to the left of the first comma, expresses by thousands; that which has over it the first transverse line, expresses by millions; that with two, by billions; that with three, by trillions, &c. Lastly, the left-hand character of each class, expresses by hundreds; the middle one by tens; and the right-hand one, by units. Thus will the *numeration* be effected.

*E. gr.* The following numbers, 2<sup>'''</sup>, 125, 473<sup>''</sup>, 613, 578<sup>'</sup>, 432, 597, is thus expressed or read: Two trillions, one hundred twenty five millions of billions, four hundred seventy three billions, six hundred thirteen thousands of millions, and five hundred seventy eight millions, four hundred and thirty two thousand, five hundred and ninety seven.

**NUMERATOR**, in speaking of fractions, signifies the number which shews how many of those parts which the integer is supposed to be divided into, are expressed by the fraction. See **FRACTION**.

The *numerator* is that part of a fraction which is placed over the little bar: by which it is separated from the under number, called the *denominator*, which shews into how many parts the integer is divided. See **DENOMINATOR**.

Thus, *v. gr.*  $\frac{7}{10}$  expresses seven tenths; where 7 is the *numerator*, and 10 the denominator. See **FRACTION**.

**NUMERICAL**, **NUMEROUS**, or **NUMERAL**, something that relates to number. See **NUMBER**.

**NUMERICAL Algebra**, is that which makes use of numbers instead of letters of the alphabet. See **ALGEBRA**.

**NUMERICAL Difference**, is the difference whereby one individual is distinguished from another. See **INDIVIDUAL**.

Hence a thing is said to be *numerically* the same, *idem numero*, or *numerie*, when it is the same in the strictest sense of the word. See **UNITY**, and **IDENTITY**.

**NUMERO**, in commerce, &c. a term prefixed to any number of things; marked, or abbreviated thus, N<sup>o</sup>. See **BOOK**.

*De NUMERO*, *i. e.* by tale, is used in antient authors for the payment, *e. gr.* of a pound in a certain number of pieces; *viz.* twenty shillings.

In contradistinction to *libra pensa*, or a pound weighed out. See **POUND**.

**NUMEROUS Arithmetic**. See the article **ARITHMETIC**.

**NUMEROUS Exegesis**. See the article **EXEGESIS**.

**NUMISMATOGRAPHIA**, a Greek term, used for the description and knowledge of antient medals, and coins; whether of gold, silver, or brass. See **MEDAL**, and **COIN**. Fulvius Ursinus, Ant. Augustinus, bishop of Saragosa, Erizzo a noble Venetian, and Sambucus a Polish gentleman, have all succeeded in the *numismatographia*.—Nor must the more modern authors on the same subject be omitted; *viz.* the two Mezzabarba's, Patin, Spanheim, Hardouin, Morel, Vaillant, Joubert, Baudelot, Beger, and among ourselves Evelyn.

**NUMMUS**, or **NUMUS**, among the Romans, a piece of money otherwise called *sestertius*. See **SESTERCE**.

This was sometimes also called *nummus sestertius*.—*Decem millia nummum*, & *decem millia sestertium*, were Roman sums, which amounted to the same. See **MONEY**.

**NUN**\*, **NONNA**, a word antiently used for a female religious; and still retained in that sense in our language; and in other languages, particularly the French, but by way of ridicule and burlesque. See **RELIGIOUS**, and **PROFESSED**.

\* The word comes from *nonna*, *nonnana*, or *nonnanis*; all Latin terms, first used for penitents, then for religious.—Borel derives it from *nonno*, or *nonna*, which in Italian signifies grandfather, or grandmother; and adds, that it was applied by way of honour to the woman, as that of father to the man, religious. See **FATHER**.

Hence also *nunnery*, a monastery of female religious. See **MONASTERY**.

**NUNCIO**, or **NUNTIO**, an ambassador from the pope, to some catholic prince or state; or a person who attends, on the pope's behalf, at a congress, or an assembly of several ambassadors. See **EMBASSADOR**, &c.

The word *nuncio* has the same import with *ambassador*, but is restrained in its use to the ambassadors of popes alone; as that of *internuncio* to their envoys extraordinary.

Branton informs us, that when he first came to court, the *nuncio* had only the title of ambassador.

The *nuncio* has a jurisdiction, and may delegate judges in all the states where he resides, except in France, where he has no authority but that of a simple ambassador.

**NUNCUPATIVE**, in the schools, a term used to express something that is only nominal, or has no existence but in name.

Felix of Urgel maintained that Jesus Christ, as man, was only God *nuncupatively*, *i. e.* nominally. Alcuin, in his answer to Felix, maintains, that it is to fall into Nestorianism to distinguish two sons of God in Jesus Christ, the one na-

tural, the other adoptive; and two Gods, the one real, the other *nuncupative*. See **ADOPTIANI**.

**NUNCUPATIVE Will**, denotes a last will, or testament, only made verbally, or *viva voce*, and not put in writing. See **WILL**, and **TESTAMENT**.

**NUNDINAL**, **NUNDINALIS**, a name which the Romans gave to the eight first letters of the alphabet, used in their calendar. See **LETTER**.

This series of eight letters, A, B, C, D, E, F, G, H, is placed and repeated successively from the first to the last day of the year; one of these always expressed the market-days, or the assemblies called *nundinae*, quasi *novendinae*, because they returned every nine days.

The country people, after working eight days successively, came to town the ninth, to sell their several commodities, and to inform themselves of what related to religion and government.

Thus the *nundinal* day being under the letter A, on the 1st, 9th, 17th, and 25th days of January, &c. the letter D will be the *nundinal* letter of the year following.

These *nundinals* bear a good deal of resemblance to the dominical letters; which return every eight days, as the *nundinals* did every nine. See **DOMINICAL Letter**.

**NUNTIO**. See the article **NUNCIO**.

**NUPER Obiit**, in law, a writ which lies for a coheirefs being deforced by her coparcener of lands or tenements, whereof their common father, or ancestor, died seized in fee simple. See **COPARCENER**.

If the ancestor died seized in fee tail, the coheirefs deforced shall have a formedon. See **FORMEDON**.

**NUPTIAL**, something that relates to marriage. See **MARRIAGE**.

**NURSERY**, in gardening, denotes a seminary, or seed-plot, for raising young trees, or plants. See **SEMINARY**.

Some authors make a difference between *nursery* and *seminary*, holding the former not to be a place wherein plants are sown; but a place for the reception and rearing of young plants, which are removed, or transplanted hither from the seminary, &c. See **PLANTING**, **TRANSPLANTATION**, &c.

Mr. Lawrence recommends the having several *nurseries*, for the several kinds of trees: One for tall standards; *viz.* apples, ashes, elms, oaks, pears, sycamores, &c. Another for dwarfs; *viz.* such as are intended for apricots, cherries, peaches, plumbs, &c. and a third for evergreens. See **FRUIT**.

The *nursery* for standards should be in a rich, light soil, sown with proper seeds, in October, or November. For apples and pears, crab and wild pear kernels are to be preferred for stocks: Elms and lime are to be raised from planted suckers: Walnuts to be sown with the green shell upon them, to preserve them from mice. This *nursery*, if it be well managed, and weeded for two years, the crabs and pears will be fit for grafting and inoculating the third year. See **ORCHARD**.

Firs and pines are to be raised from those little seeds, taken out of their large apples.

The *nursery* for dwarfs does best by itself, that it may not be over-topped by taller trees. Stones of apricots and peaches are not proper to raise those trees; but in lieu thereof, sow the stones of the pear-plumb, mufel, or bonum magnum plumb; which prove better and more lasting than the former. For stocks for all sorts of cherries, black cherry stones do best. See **DWARF**.

Mr. Mortimer directs all stone-fruit to be sown quickly after gathering; for that if they be kept, they will be two years ere they come up. Add, that if they have not all the moisture of the winter to rot the shells, the kernel will scarce come up at all.

To furnish the *nursery* of evergreens, the several sorts of seeds or berries, as yew, holly, juniper, &c. are to be put in so many distinct pots or boxes, with fine mould over them, and thus buried for a year; after which, they are to be taken out and sown. See **EVERGREEN**.

If they were to be sown when gathered, like other seeds, they would not come up the first year, nor grow so kindly. See **SEED**, and **SEMINATION**.

**NUSANCE**\*, **NOCUMENTUM**, in law, is used not only for a thing done to the hurt, or annoyance of another, in his fee-lands, or tenements; but also for the assize, or writ lying for the same.

\* The word is derived from the French *nuire*, to hurt.

Manwood makes three kinds of *nusances* in the forest; the first, *common nusance*; the second, *special nusance*; the third, *general nusance*.

The writ of *nusance*, *de nocumento*, is either simply *de nocumento*, or *de parvo nocumento*.

Writs of *nusances* are now properly termed *trespasses*, and actions upon the case. See **TRESPASS**, &c.

**NUT**, **NUX**, a sort of fruit, inclosed in a hard cortex, or shell; which contains a foster edible nucleus, or kernel. See **NUCLEUS**, &c.

Of these we have divers kinds; small nuts, filberds, chesnuts, walnuts, &c. See FILBERD, and NUX.

**NUTATION**, in astronomy, a kind of trepidation, or tremulous motion of the axis of the earth; whereby, in each annual revolution, it is twice inclined to the ecliptic; and as often returns to its former position. See EARTH.

That the moon has the like motion, is shewn by Sir Isaac Newton, in the first book of his *Principia*; but he observes withal, that this motion must be very small, and scarce sensible. See MOTION, and AXIS.

**NUTMEG**, *Nux Moschata*, a delicate kind of aromatic fruit, or spice, brought from the East-Indies; whereof there are two kinds, *male* and *female*. See SPICE.

The *female* is that chiefly used among us; its form is round, its smell agreeable, and its taste hot and pungent.

The *male* is a wild nut, of a longish form, and without either taste or smell; yet sometimes put off, while yet in the pod, for the female.

*Nutmegs* are enclosed in four different covers: The first, a thick husk, something like that of our walnuts. Under this lies a thin reddish coat, of an agreeable smell, and aromatic taste, called *mace*; by others, though improperly, *flower of nutmeg*. This wraps up the shell, and opens in proportion as the pod grows. The shell which makes the third cover, is hard, thin, and blackish. Under this is a greenish film of no use: and in this is found the *nutmeg*, which is properly the kernel of the fruit.—Every *nutmeg* has a little hole in it, which some ignorantly take for a defect.

The best *nutmegs* are those gathered in April. They must be chosen heavy, of a whitish brown colour, well marbled without side, reddish within, having a fat unctuous moisture, and an agreeable smell.

As to the mace, it must be chosen in large blades, of a high colour, like the *nutmeg* in taste and smell. See MACE.

*Nutmegs* comfited green, are excellent to fortify the stomach, and restore the natural heat. They are particularly esteemed carminative.—The powder called *Duke*, esteemed a sovereign against rheums, is only *nutmeg* pulverized with sugar, and a little cinnamon.—*Nutmegs*, by distillation, or expression, yield an oil, said to have wonderful virtues.

The whole commerce of *nutmegs* is in the hands of the Dutch East-India company.—The *nutmeg* tree is propagated after a particular manner: Tavernier tells us, that the birds devouring the *nutmeg* when ripe, give it back whole by stool; and that thus falling down to the ground, besmeared with a viscous matter, it takes root, and produces a tree. See MISLETO.

**NUTRITION**, in the animal œconomy, the accession or apposition of new parts to the body, similar to those it already consisted of; either for its augmentation, or for the reparation of such as are worn off.

By the continual motion of the fluids in the minute vessels of the body, and the actions of the muscles, &c. small parcels are of necessity wore off from the solids, become mixed with the fluids, move with them, and are at length eliminated and exhaled through the pores. See PORE, and SOLID.

And at the same time, the fluids, diminished as they are by a constant attrition, apply to the orifices of the perspiring vessels, and vanish out of the body. See PERSPIRATION.

Hence the animal body, by the very condition of its frame, becomes soon liable to destruction. See DEATH.

To preserve life, therefore, it is necessary that a restitution be made to the juices and solids of the body; equal and similar to what is lost in those motions: which is what we call the *action of nutrition*.

Now the lost juices are easily supplied by meat, drink, air, &c. taken into the stomach, digested, converted into chyle, then into blood, and thence secreted by the proper ducts, and carried by the action of the body, to the proper receptacles; after the manner laid down under the articles DIGESTION, CHYLIFICATION, SANGUIFICATION, and SECRETION.

But the *nutrition* of the solid parts is much more obscure. This indeed has proved the subject of infinite doubts and differences among authors; nor had we any rational or satisfactory account of the same, till that of the accurate Boerhaave, whose doctrine is as follows.

Every solid part of the body consists of other lesser ones, in all respects like the larger; vessels, *v. gr.* of vesicles, and those of others still smaller; bones, of ossicles, &c. Which structure goes beyond all limits of sense, however assisted by art; as appears by the experiments and observations of Malpighi, Ruysch, Leewenhoeck, and Hook. Yet it is scarce possible this division and subdivision should be infinite, as that of foods and juices is.

Again, it appears from microscopes, injections, small wounds, excoriations, &c. that the solid parts of the body are very

small, compared with the fluids; and it is almost demonstrable from considering the rise, and generation, of the vessels, and the resolution of the greater vessels into their smaller constituent ones, that all the solid mass of the body is constructed of mere nerves, as its elements. See NERVE, STAMEN, &c.

And in effect, all this mass, an incredibly small particle only excepted, at first arose out of what was a very small coagument, much like the nervous juice itself; as is abundantly shewn by the great Malpighi in his two treatises on incubated eggs. For neither does the white of the egg nourish, till, by means of the incubation, it have passed innumerable degrees of fluidity, from its first thickness to that exceeding subtilty wherein it terminates. But even then, the liquor thus given to the embryo, is exceedingly thick, in comparison with what it is to be when converted into its vessels and viscera. See EGG.

Now the first tender solids arising for this subtle humour, do again pass infinite intermediate degrees, ere they arrive at their utmost state and consistence; as is shewn by Malpighi in eggs, and by Ruysch in embryo's and foetus's. Hence, therefore, it follows, that the solids, in their first formation out of the liquids whence they arise, only differ from them in rest, cohesion, and figure. Therefore such a particle, now in its fluid state, will become a part of the solid to be formed out of it, as soon as there happens to be a power to effect its cohesion with the other solid parts; howsoever that cohesion be effected.

This cohesion is easily produced in a fibre already formed, if there happen to be a proper cavity in the solid, left open by some lost particle, and at the same time a particle in the fluid, answerable thereto in bulk, figure, and nature; and lastly, a power wherewithal to intrude it into that place, or accommodate it thereto. Thus will arise a real *nutrition* of the solids in the minute vessels, by whose union the large ones are formed: that is, in the nerves, or in vessels similar thereto. Which being impracticable by any other liquid than that brought into these vessels, it appears very evident that the nervous juice, at least a juice perfectly like it, is the immediate matter of *nutrition*: Whence *nutrition* appears one of the last and most perfect actions in the body; since to have this laudable, all the precedent actions must of necessity have been so. See SPIRIT.

The chyle therefore, which some make the immediate matter of *nutrition*, is, indeed, fitted to fill the larger vessels, but cannot nourish or restore them. This, when attenuated, changed, more intimately mixed in the lungs by means of respiration, and thus fitted for the passage of certain vessels, is, indeed, rendered fitter, yet far from being quite fit, to be the matter of *nutrition*. See CHYLE.

But, by the repeated action of the lungs, the viscera, vessels, &c. there is formed out of this humour, a soft, tenacious, plastic, insipid serum, which thickening by the fire, becomes perfectly like the white of an egg. This fluid therefore has in it all the conditions found in that from whence, by sure experience, we know all the solid parts of an animal, arise, by meer incubation. It is therefore a step nearer, but is not yet quite disposed for nutriment. Much less is the cruor, or red, globular part of the blood so. Neither are yet fitted to enter the vessels; yet both the one and the other are, by different authors, made the nutritive juice. See BLOOD, SERUM, and CRUOR.

But as the heat of incubation, so the action of the viscera and vessels, on the serum, introduces various changes therein; till at length a part of it be rendered subtle enough for the purpose required. This, when exhausted, is instantly repaired: and thus we have the true immediate matter of *nutrition*.

But this same humour losing too many of its oily parts, by many repeated circulations, is rendered too sharp; and being likewise stripped of its most liquid parts, from the same cause, becomes too dense; and is thus rendered unfit for this secretion. Hence the necessity of new chyle, and new food, to keep up *nutrition*.

The matter of *nutrition* thus ascertained; the manner wherein, and the cause whereby, it is effected, are as follow. A juice being driven directly through a full, conic or cylindric, elastic or rigid canal; if its course be from a wider to a narrower part, or if it have any thing to oppose its motion, will endeavour to stretch the sides of its canal according to the axis of its length. This must be the case, every where in the body, except, perhaps, in the veins and receptacles. By this nifus, or endeavour, how weak soever, continually repeated, the vessels will be insensibly lengthened out; and in lengthening, will be made more and more slender. Hence the last extremities of the vessels, which in man are extremely small, are continually stretched and rendered less and less coherent, *i. e.* still nearer and nearer to a dissolution; and thus at length will they cohere so weakly, as scarce to differ from fluids.

While such motion goes on, therefore, and the propulsion is continued, there will of necessity, happen these two things:

things; first, the outmost particles of the minutest tubes being torn off, will again be converted into a kind of humour, what part of the body soever they stick in. Secondly, the smallest particles, which by their union composed the slenderest fibrillæ, will be so separated from each other, as to leave open interstices in those places, where, before, they cohered. Both these effects will be produced at all times, and in all parts of the body, so long as life continues; especially where nature is strong, and the actions of the body violent. But the same humour whereby these effects are produced, containing abundance of particles similar to those thus separated and lost, conveys and applies them to those interstices, by that very impetus whereby it endeavours to distend the canals; and thus intercepted, at length, it forms, adapts, and fastens them, so as to adhere in the same manner as the former.

The matter, preparation, application, energy of motion, still remaining the same; what from time to time is lost, is thus presently restored; and the solids continue in the same state as before, *i. e.* they are perpetually nourished, and supplied, and preserved.

In this the Creator's wisdom is very conspicuous; in that the same power, which inevitably destroys, does repair again at the same time, and by the same action; and that the greater the loss is, the more copious is the supply; and lastly, that those parts, first spent in the action of the body, are the first restored.

Further, it is evident, that the newer, the more tender, and the nearer to the moving cause these vessels are, the more easily will they be lengthened, distended, destroyed, and repaired: Our bodies therefore, the nearer to their origin, the more do they grow. For, the action still continuing, the greater vessels become more extended by their fluid; and at the same time the smaller, whereof the membranes or coats of the larger are composed, are compressed, dried, and at last concerted, and grow up; whence arises a firmness, indeed, of the fibres, but a loss of the vesicles.

Thus, what were formerly vessels, commence mere hard ligaments; and thus the fluids once fixed, the several vessels coalesce: from the concurrence of these causes arise the strength, hardness, rigidity, and thickness of the solid parts.

Hence the number of vessels is greatest in embryo's, and as age comes on, sensibly diminishes; and hence it is that their weakness constantly declines, and their strength and firmness increases. In young people, therefore, the quantity of humours is redundant, and greatly exceeds the solids: In old men, the solids exceed the fluids. And hence we see the reason, manner, and appearance of growth, state, declension, and at length of death from pure old age. See DEATH.

A person who considers this account, and compares it with what is actually observable in the body, will find every circumstance to obtain: Thus the whole cuticula is every where, and at all times, constantly desquamating, peeling off, and again renewing; and thus the hair, nails, teeth, continually rubbed, torn, and wore off, come again; parts taken off from the vessels, and the bones, soon grow again. And the fordes, or filth, rubbed off from the extremities of the vessels, when examined by a microscope, or diluted and viewed in water, appear plainly to consist both of solid and fluid parts; and those carried off by washing, shaving, &c. are the same.

Hence, too, we see that a general increase of the bulk of the body, with regard to habit, as in fat, fleshy, brawny persons, does not arise from any increase of the solids, but by their extension into larger cavities, crowded with stagnant humours. And hence fatness becomes hurtful, as it loads, weakens, and suffocates. See CORPULENCY.

Whence arises a very considerable distinction between *nutrition* and *repletion*; to which a physician must have special regard: the one strengthening and condensing the vessels, the other weakening, loosening, and extending the same. See PLENITUDE.

Hence, lastly, we see why the fabric of the solids is not destroyed by the contained fluids; how our machine comes to subsist so long; why, when a nerve is corrupted, the *nutrition* of that part it belongs to, ceases; and why the same obtains in an artery: Why in an embryo there are no solids, in a foetus very few, in old men a great deal; and why even the nerves, tendons, arteries, and receptacles, become first cartilaginous, then bony. See SOLIDS, &c.

**NUTRITION of Plants.** See VEGETATION, SAP, CIRCULATION, &c.

**NUTRITION**, in pharmacy, a kind of preparation, consisting in the gradual mixture of liquors of different natures, by stirring them together till they have acquired a thick consistence; as, in making butter of Saturn, or unguentum nutritum. See NUTRITUM.

**NUTRITIOUS Juice.** See the article NUTRITION.

**NUTRITIVE Faculty.** See the article FACULTY.

**NUTRITUM**, in pharmacy, is a denomination given to a desiccative, cooling, unguent, prepared by the agitation

and nutrition of litharge of gold with oil and vinegar, or the juice of solanum, in a mortar. See UNGUENT, and NUTRITION.

**N U X Vomica**, the fruit, or, as some will have it, the stone of the fruit of a tree, growing in several parts of Egypt, and in the islands Timor, and Ceylon; of a strong narcotic quality, so as to be ranked in the number of poisons.

It is round and flat, of a grey mouse-colour without, and various colours within; sometimes yellow, sometimes white, sometimes brown. The largest, whitest, newest, and cleanest, are the best.

This drug is said to be an assured poison for all animals except men. See POISON.—On the contrary, Hermannus, botanic professor at Leyden, who has wrote expressly on it, says, that the vomic nuts of Timor and Ceylon are excellent sudorifics, and to be ranked among diuretic medicines.

**Nux Galla.** See the article GALLS.

**Nux Indica**, the fruit of a tree called *cacao*. See CACAO, and CHOCOLATE.

**NYCTAGES**\*, or NYCTAZONTES, a religious sect, distinguished by their inveighing against the practice of waking in the night to sing the praises of God; in regard, said they, the night was made for rest.

\* The word comes from the Greek *νύξ*, night.

**NYCTALOPIA**\*, or NYCTALOPS, a disease which prevents the seeing by day, not by night; or an indisposition wherein a person sees better by night than by day.

\* The word comes from the Greek *νύξ*, night, and *αλωπιξ*, fox; this animal being said to see less by day, than night.

In which sense the word is used by Hippocrates.

The *nyctalopia* is supposed to be owing to the spirits being too much dissipated in the day, but collected by night. See SIGHT.

Boerhaave says, the *nyctalopia* consists in this, that the uvea is immoveable, and at the same time very open.

**NYCTALOFIA**, is also used by some for a disease of the eyes, which prevents their seeing, when the sun is set, and the light begins to diminish. See BLINDNESS.

In which sense it amounts to the same with *nocturna cæcitas*.

In the general, any disease which prevents the seeing at any particular time, when others see, is called *nyctalopia*.

In the *Philosophical Transactions*, we have an instance of a *nyctalopia*, or *nocturna cæcitas*, in a youth of twenty years of age; who had been affected with it as long as he could remember.—Dr. Parham assures us, he had a good sight all day, and distinguished objects at all distances as well as any body; but when twilight once came, he was quite blind, and saw nothing at all; nor could make scarce any use either of fire, candle, or glasses. Yet his eyes, upon examination, shewed nothing at all amiss; nor had he any vertigo, or other disease of the head. The cloudiness, as he himself told the doctor, used to come gradually on him like a mist, as day-light declined. He always saw alike in all aspects of the moon, felt no pain by fire or candle-light, and was the same in summer as winter.

Dr. Briggs accounts for the case thus: "As vapours are raised in great quantities during the day-time, which being condensed by the coldness of the evening, fall again, and render the air, near the earth, the thicker: So, perhaps, the humours in the eyes of this youth may be affected; and, in the evening, rendered grosser, and more turbid. As we see in urines, which frequently grow clear, or turbid, as heat or cold is applied to them. By such thickness or spirititude of the humours, the rays being either reflected, or too much refracted, do not reach the retina, or at least strike it too feebly."

**NYCTELIA Orgia**\*, or feasts in honour of Bacchus; so called, because held in the night time. See ORGIA.

\* The word is formed from the Greek *νύξ*, night, and *τελειω*, perficere, to accomplish, perform.

A great part of the ceremony consisted in running through the streets, with bottle and glass in hand, drinking: but there was no impurity unpractised in them.

The Athenians celebrated the *nyctelia* every three years at the beginning of the spring.

**NYCTHEMERON**, ΝΥΧΘΗΜΕΡΟΝ, the natural day.

**NYMPH**\*, NYMPHA, in mythology, a sort of heathen divinity, supposed to preside over waters, rivers, and fountains. See GODDESS.

\* The word comes from the Greek *νυμφη*, a bride, or woman newly married; and was applied to these deities, because represented under the figure of young maids. Though others derive *nymph* from *lymphæ*, water; in regard of their inhabiting near the waters.

Some extend the name *nymph* further, and comprize under it the goddesses of the fountains, forests, and trees; called particularly *oreades*, *dryades*, and *hamadryades*; as well as those of the sea, called *neræides*. See DRYAD, HAMADRYAD, NEREID, &c.

Meursius is of opinion, the Greeks borrowed their notion of the divinities from the Phœnicians: for *nympha* in their language signifying soul, the Greeks imagined, that the souls of the antient inhabitants of Greece were become *nymphs*. Particularly, that the souls of those who had inhabited the woods, were called *dryades*; those who had inhabited the mountains, *oreades*; those who had dwelt on the sea-coasts, *nerides*; and lastly, those who had their place of abode near rivers, or fountains, *naiades*. See *NAIADES*, &c.

**NYPHA**, among naturalists, is sometimes used for the little skin wherewith insects are enclosed; both while they are in the egg, and after they have undergone the first apparent transformation. See *INSECT*.

**NYPHA**, is used by others for the change itself of the eruca, or worm, into a flying animal; after having laid aside its former skin: which, as Swammerdam shews, is not effected by any proper transformation, but by simple accretion, or growth of the parts, whence the skin is by degrees stretched, and at last bursts: as is the case, likewise, in chickens and frogs.

**NYPHA** is more frequently used by naturalists for the insects themselves, while they have yet only the form of worms, or maggots.

The word properly signifies *bride*, or a new-married woman. — Of caterpillar, *aurelia* or *chrysalis*; so called, because the creature here is veiled or covered up from sight, like a bride. It being now, when it has laid aside its former skin, that it begins to shew all its parts distinctly. — In this change it loses its motion for a while, as when in the egg: so that these insects are twice in their *nympha* state; first, in the egg, which is their first *nympha*; and again in this change, which is their second.

The only difference between the two *nympha* states consists in this, that in the latter the members appear more distinctly. — Swammerdam calls this latter *nympha aurea*, or *aurelia*, and *chrysalis*; and the former simply *nympha*. — The *nympha* are otherwise distinguished into *vermiformes*, and *oviformes*.

The eggs of bees first change into *nympha* or maggots; these maggots inclosed in their alveoli or cells, are transformed into *nympha aurelia*; and twelve days afterwards come out bees. See *AURELIA*, and *CHRYSLIS*.

**NYPHÆ**, in anatomy, are two soft, spongy, red bodies, descending from the tip of the clitoris to the sides of the urinary passage; thus reaching to about the middle of the orifice of the vagina: where they grow less and less, till they disappear. See *Tab. Anat. (Splanchn.) fig. 9. lit. n n. fig. 13. lit. e e*; see also *CLITORIS*.

Their breadth is uncertain, usually in maids half a finger: sometimes they are larger, and are capable of being distended to a great degree; so as to hang a good way out of the body: whence, in some, these, as well as the clitoris, have been forced to be cut. See *NYPHOTOMIA*.

The use of the *nympha* is, by swelling in the act of coition, to embrace the penis, and by their sensibility to affect the woman, and mutually invite to procreation. See *GENERATION*.

Their substance is very spongy, composed of membranes, and vessels loosely cohering, and therefore easily distensible.

**NYPHEUM**\*, *NYMÆION*, among the antients, a public hall, or building, magnificently adorned and disposed for banqueting and entertainment; where those who wanted conveniences at home, held their marriage-feasts, &c.

\* The word comes from the Greek *νύμφη*, *bride*.

Some authors rather take the antient *nymphaeum* for a grotto, adorned with statues, jets, and other ornaments; and that it had its name by corruption, from *lymphæum*, of *lymphe*, water. — In which sense it must have been a public bath.

**NYPHOMANIA**, in medicine, the same with *furor uterinus*. See *UTERINUS*.

**NYPHOTOMIA**, in chirurgery, the operation of cutting off part of the *nympha*, or of the clitoris, by some also called *nympha*, when they are so large and tumid, as to prevent the consummation of marriage, or render it very difficult. See *NYPHÆ*.

The Egyptians, Galen observes, frequently practised the *nymphotomia*; but in our parts of the world, it is rarely found necessary.

When it happens to be so, the casuists give their judgment, that the woman is obliged to undergo it.

The *nymphotomia* is properly the circumcision of women. See *CIRCUMCISION*.

my, are two soft, spongy, red bodies, the tip of the clitoris to the sides of the urethra, reaching to about the middle of the orifice where they grow less and less, till they disappear. (Splanchn.) fig. 9. lit. n. n. fig. 13.

CLITORIS. uncertain, usually in maids half a finger: larger, and are capable of being distended; so as to hang a good way out of the body: these, as well as the clitoris, have been forced Nymphotomia.

Nymphæ is, by swelling in the act of coition, to, and by their sensibility to affect the woman, ite to procreation. See GENERATION. is very spongy, composed of membranes, and shering, and therefore easily distensible.

\* Nymæion, among the antients, a building, magnificently adorned and disposed for entertainment; where those who wanted home, held their marriage-feasts, &c. comes from the Greek νύμφη, bride.

Other take the antient nymphæum for a grotto, statues, jets, and other ornaments; and that it is corruption, from *lymphæum*, of *lymphæ*, in sense it must have been a public bath.

NIA, in medicine, the same with *furunculus*.

NIA, in chirurgery, the operation of cutting the nymphæ, or of the clitoris, by some also when they are so large and tumid, as to preclude marriage, or render it very difficult.

PHÆ. Galen observes, frequently practised the it in our parts of the world, it is rarely found

to be so, the casuists give their judgment, is obliged to undergo it.

is properly the circumcision of women.

SION.

O.

## O A T

**O**, The fourteenth letter of the alphabet; and the fourth vowel. See LETTER, and VOWEL.

The Grammarians call it a *close* vowel; because pronounced with the mouth shut.

Among the Latins, the *o* bore so great an affinity with the *u*, that they frequently confounded them; writing *consul*, and pronouncing *consul*. Vid. Gruter's *Inscript*.

Thus, also, they wrote *aequum* for *æquum*, *Aurelius* for *Aurelius*, *compascuos*; *duomvir*, &c.

The Greeks had two *o*'s, viz. omicron *o*, and omega *ω*; the first pronounced on the tip of the lips, with a sharper sound; the second in the middle of the mouth, with a fuller sound, equal to *oo* in our language.—The long and short pronunciation of our *o*, are an equivalent to the two Greek ones; the first, as in *suppose*; the second, as in *obey*.

**O**, among the antients, was a numeral letter, signifying eleven; as in the verse,

*O numerum gestat qui nunc undecimus extat.*

When a dash was added at the top, as *Ō*, it signified eleven thousand.

Among the Irish, the letter *o* at the beginning of the name of a family, is a character of dignity, annexed to great houses. Thus in the history of Ireland, we frequently meet with the *O Neals*, *O Carrolls*, &c. considerable houses in that island.

Camden observes, that it is the custom of the lords of Ireland to prefix an *O* to their names, to distinguish them from the commonalty.

A majuscule *O*, in music, is a note of time, called by us *semibreve*, by the Italians *circolo*; making what they call *tempe perfetto*. See SEMIBREVE, TIME, &c.

The antients used *O* as a mark of triple time; from a notion that the ternary, or number 3, was the most perfect of numbers, and therefore properly expressed by a circle, the most perfect of figures.

**O NI**, in the exchequer.—As soon as the sheriff enters into, and makes up his accounts for issues, amerciaments, and mean profits; the practice is to mark on his head, *O ni*; which signifies, *Oneratur nisi habeat sufficientem exonerationem*: and immediately he becomes the king's debtor, and a debt is set on his head.—Upon which the parties become debtors to the sheriff, and are discharged to the king. See SHERIFF.

**OAK.**

Royal OAK.

Scarlet OAK.

Mistletoe of the OAK.

} See the article {  
TIMBER.  
ROYAL.  
KERMES.  
MISLETOE.

**OAK-Balls**, **OAK-Apples**, or **OAK-Cones**, in natural history, a kind of galls, or excrescencies, arising out of the *oak*.—For whose generation and use, see GALLS.

**OAKHAM**, **OCKHAM**, or **OAKUM**, in the sea language, denotes the matter of old ropes untwisted, and pulled out again into loose hemp, like hurds of flax, to be used in the caulking of ships. See CAUKING.

**OAR**, in navigation, an instrument whereby a boat, barge, galley, &c. is rowed, or advanced along the water. See BOAT, GALLEY, &c.

In a vessel with *oars*, the water is to be considered as the point of support, or fulcrum; the *oar* as a lever; the boat as the burden to be moved, and the rower's hand as the moving power. See LEVER, and MECHANIC Power.

The burden is to be considered as applied to that point of the lever, where the *oar* rests on the boat.—The greater therefore the distance of the hand from that point, and the less the distance of the water from that point, the greater effect will the *oar* have.

**OAR**, in natural history. See the article ORE.

**ORISTUS**, or **ORISTYS**, a term in the Greek poetry, signifying a dialogue between a husband and his wife; such as that in the sixth book of the *Iliad*, between Hector and Andromache. See DIALOGUE.

Scaliger observes, that the *oristus* is not properly any particular little poem, or entire piece of poetry; but a part of a great one. He adds, that the passage now cited in Homer, is the only proper *oristus* extant in the antient poets.

**OASY**. See the article OAZY.

**OATH**, *Juramentum*, is usually defined a religious assertion, or asseveration; wherein a person invokes the Almighty, renounces all claim to his mercy, or even calls for the divine vengeance upon himself, if he speak falsely. See AFFIRMATION.

Some civilians look on this definition as too lax, since it may agree to perjury; and would have this essential to an *oath*, that the thing affirmed be true.—But this is arbitrary. See PERJURY.

## O B E

An *oath* is esteemed a kind of civil medium, between the person that gives it, and him to whom it is given; whereby some controversy, or other matter, which could not otherwise be determined, is brought to an issue.—Its form, and the ceremonies it is attended withal, are arbitrary, and various, in various countries.

The *oaths* we make to God are called *vows*, and in some cases *sacraments*. See VOW, and SACRAMENT.

**OATH**, in a legal sense, is a solemn action, whereby God is called to witness the truth of an affirmation, given before one or more persons impowered to receive the same.

*Legal oaths* end with "So help me God;" antiently with "So help me God at his holy dome;" i. e. judgment. See DOME.

This, according to our law books, is called a *corporal oath*; because the party, when he swears, touches the gospels with his right hand.

But, in some old customs of Anjou and Maine, it appears, that *corporal oath* was antiently a simple affirmation, or vow of faith, and fidelity, made by a vassal who was no liege, by lifting up his hand; in contradistinction to that made by a liege vassal, which was made by laying his hand on the gospel. See HOMAGE, FEALTY, VASSAL, &c.

An *oath* is called *canonical purgatio*, because allowed of by the canons; to distinguish it from *vulgares purgationes*, viz. by battle, fire ordeal, &c. which the church always discouraged. See PURGATION, ORDEAL, COMBAT, DUEL, CHAMPION, &c.

In small matters, which the plaintiff could not prove, or if he could, if his proof were set aside, the defendant might purge himself by his own *oath*; which was called *jurare propria manu*.

But in matters of more weight, he was to bring other credible persons, usually of the same quality with the plaintiff, to swear that they believed the defendant had sworn the truth.

These were called *compurgators*, or *sacramentales*; and their number was greater or less, according to the quality of the defendant, and the nature of the thing in question.—Hence, *jurare duodecima manu*.

**OATH** is also used for a solemn promise faithfully to execute, or observe something.

Trials at common law depend on twelve, or twenty four men, who take their *oaths* to declare the truth, as it shall appear to them. See JURY, and TRIAL.

In this sense we say, *state oaths*; the *oath of supremacy*, *oath of allegiance*, *oath of abjuration*. See ALLEGIANCE, SUPREMACY, &c.

At the meeting of a new parliament, the commons, all, take the *oaths* of allegiance, supremacy, and abjuration. See PARLIAMENT.

Kings and princes swear to the performance of the treaties they make: though antiently they did not swear of themselves; but others swore in their name. See TREATY.

Thus, in a treaty in 1177, between the emperor Frederic Barbarossa, Roger king of Sicily, pope Alexander III. and the cities of Lombardy; the count de Dieffe, by the emperor's order, swore, upon the soul of that monarch, that he would faithfully observe the peace; and, at the same time, Romuald archbishop of Salerno, and count Roger, swore, on the gospel, that when the emperor's messenger should arrive in Sicily, king Roger should procure some of his lords to swear for him.

*Test OATH*. See the article TEST.

**OAZY**, or **OASY Ground**, a name given by the seamen to soft, slimy, or muddy ground. See ANCHORAGE.

**OBEDIENCE**, **OBEDIENTIA**, is sometimes used in the canon law, for an office, or the administration of it. See OFFICE.

In our antient customs, *obedientia* was used in the general, for every thing that was enjoined the monks, by the abbot. See ABBOT, &c.

**OBEDIENTIA**, in a more restrained sense, was applied to the farm belonging to the abbey, to which the monks were sent *vi ejusdem obedientiæ*, either to look after the farm, or collect the rents.—Hence, also, those rents themselves were called *obedientiæ*.

**OBELISK**\*, **OBELISCUS**, a quadrangular pyramid, very slender, and high; raised as an ornament, in some public place, or to shew some stone of enormous size; and frequently charged with inscriptions, and hieroglyphics. See MONUMENT.

\* Borel derives the word from the Greek *obelos*, a spit, broach, spindle, or even a kind of long javelin.—Pliny says, the Egyptians cut their *obelisks* in form of sun-beams; and that in the Pænician language, the word *obelisk* signifies ray.

Th:

The Egyptian priests called their *obelisks*, the *sun's fingers*, because serving as styles, or gnomons to mark the hours on ground.—The Arabs still call them *Pharaoh's needles*: whence the Italians call them *aguglia*, and the English *Cleopatra's needles*.

The difference between *obelisks* and pyramids, according to some, consists in this, that the latter have large bases, and the former very small ones.

Though Cardan makes the difference to consist in this, that *obelisks* are to be all of a piece, or to consist of a single stone, and pyramids of several. See PYRAMID.

The proportions of the height and thickness are nearly the same in all *obelisks*; that is, their height is nine, or nine and a half, sometimes ten times their thickness; and their thickness or diameter at-top is never less than half, nor greater than three fourths of that at bottom.

This kind of monument appears very antient; and we are told was first made use of to transmit to posterity the principal precepts of philosophy, which were engraven in hieroglyphical characters hereon.—In after times they were used to immortalize the actions of heroes, and the memory of persons beloved.

The first *obelisk* we know of, was that raised by Rameses, king of Egypt, in the time of the Trojan war. It was 40 cubits high, and, according to Herodotus, employed 20000 men in the building. Phius, another king of Egypt, raised one of 45 cubits; and Ptolemy Philadelphus another of 88 cubits, in memory of Arsinoe. *Vid.* Porphyry.

Augustus erected an *obelisk* at Rome in the Campus Martius, which served to mark the hours on a horizontal dial drawn on the pavement. See DIAL.

F. Kircher reckons up 14 *obelisks* celebrated above the rest, *viz.* that of Alexandria, that of the Barberins, those of Constantinople, of the Mons Esquilinus, of the Campus Flaminius of Florence, of Heliopolis, of Ludovisio, of S. Mahut, of the Medici, of the Vatican, of M. Caelius, and that of Pamphilia.

**OBELISK**, in grammar, is a character, in form of a dagger, (†) serving to refer the reader to some note, or other matter in the margin. See CHARACTER.

**OBELUS**, in antiquity, denotes a little line, or stroke, like a needle: whence its name, *ὀβελος*, which signifies *needle*.

The word is chiefly used in speaking of Origen's *Hexapla*; wherein he distinguishes with an asterisk, or star, the supplements he makes to the text of the Septuagint, where it falls short of the Hebrew meaning; and with an *obelus*, or lineola (—) those places where the Septuagint had any thing not in the Hebrew. See HEXAPLA.

S. Jerom says, the *obelus* was only used in those places where something was to be retrenched from the Septuagint, as superfluous; and the asterisk in those that were defective. These marks frequently occur in antient manuscripts. Usually, the *obelus* is accompanied with two dots; the one above, the other underneath, as (÷); and the asterisk, is a S. Andrew's cross, cantoned with four points.

**OBSITY**, **OBSITAS**, in medicine, the state of a person too much loaded with fat, and flesh; otherwise called *corpulency*. See CORPULENCY.

**OBJECT**\*, in philosophy, something apprehended, or presented to the mind, by sensation, or by imagination. See SENSATION, and IMAGINATION.

\* The word is derived from the Latin *obicere*, to present to, to set before; which is composed of *ob*, and *jacio*, I lie against.

An *object* is something that affects us by its presence, that moves the eye, ear, or some of the other organs of sense; or, at least, is represented to us by the imagination.

The school-philosophers define *object* to be that about which a power, act, or habit, is employed. Thus, good is the *object* of the will; truth of the understanding; so colour is the *object* of sight; sound of hearing, &c. See OBJECTIVE.

*Objects* are usually divided into *next*, *proxima*, which are those the power, or habit is immediately employed on; in which sense, colour is the *next object* of sight.—And *remote*, which are those only perceived by means of the former: In which sense, the wall is the *remote object* of sight, since we only see it by means of its colour, &c.

Ideas are the immediate *objects* of the mind in thinking: Bodies, their relations, attributes, &c. are the mediate *objects*. See IDEA, BODY, &c.

Hence it appears that there is a sort of subordination of *objects*. But, note, that a *next object*, with regard to a *remote* one, is properly a subject, not an *object*. See SUBJECT.

They also distinguish *objects per se*, which are what properly move, or affect our senses: Such as are the sensible qualities.—And *objects per accidens*, which are substances, and only affect us by being invested with sensible qualities. See QUALITY, and SUBSTANCE.

Again, they distinguish between *common objects*, which are such as affect divers senses; as are motion, figure, &c. And *proper objects*, which only affect one sense. See SENSE.

There are several conditions requisite to an *object of sense*;

as that it be material; that it be within a certain distance, of a competent extent, its sensible qualities sufficiently intense, &c.

It is the *object* that reflects, or emits the rays of light which occasion vision.—*Objects* of themselves are invisible; we only seem to perceive them, because the different texture of their surface, disposing them to reflect differently coloured rays, occasion in us several sensations of colour, which we attribute to them. See COLOUR, VISION, &c.

The *objects* of the eye, or vision, are painted on the retina; though not erect, but inverted, according to the laws of optics.—This is easily shewn from Cartes's experiment of laying bare the vitreous humour on the back part of the eye; and clapping over it a bit of white paper, or the skin of an egg, and then placing the fore-part of the eye to the hole of a darkened room. By this means is had a pretty landskip of the *objects* abroad, printed invertedly on the back of the eye. See RETINA.

How in this case, the *objects* which are painted inverted should be seen erect, is matter of controversy. See SEEING.

**OBJECT-GLASS** of a telescope, or microscope, is the glass placed at that end of the tube which is next the *object*. See TELESCOPE, MICROSCOPE, and GLASS.

To prove the regularity and goodness of an *object-glass*.—Strike two concentric lines on a paper, the one having its diameter the same with the breadth of the *object-glass*; the other half that diameter: Divide the inner circumference into six equal parts, and making six fine small holes therein with a needle; cover one side of the glass with this paper. Then exposing it to the sun, receive the rays that pass through these six holes, on a plane, at a just distance from the glass; and by withdrawing or approaching this plane, from or to the glass, we shall find whether the rays that pass through these six holes, unite exactly together at any distance from the glass; if they do, we may be assured of the regularity of the glass; that is, of its just form; and at the same time we obtain exactly the glass's focal length.

Indeed there is scarce any better way of proving the excellency of an *object-glass*, than by placing it in a tube, and trying it with small eye-glasses at several distant objects; for that *object-glass* which represents objects the brightest, and most distinct, which bears the greatest aperture, and most convex, and concave eye-glass, without colouring or haziness, is the best.

To prove whether *object-glasses* be well centered.—Hold the glass at a due distance from the eye; and observe the two reflected images of a candle; where those images unite or coalesce, there is the true centre. If this be in the middle, or central point of the glass, it is truly centred.

**OBJECT** is also used for the matter of an art, or science; or that about which it is employed. See ART, SCIENCE, &c. In which sense, the word coincides with *subject*. See SUBJECT, &c.

The school philosophers distinguish divers kinds of *objects* in the same science, *viz.*

**MATERIAL OBJECT**, which is the thing itself that is considered, or treated of.—And thus it is the human body is the *object* of medicine.

**FORMAL OBJECT**, is the manner of considering it.—And thus the same human body considered with a view to the healing it, is the *formal object* of medicine.

**OBJECTUM quod complexum**, of an art, is the aggregative whole; or a collection of all the objective conclusions, or consequences found in the science.

**OBJECTUM quod incomplexum**, is a collection of all the subjects of the objective conclusions.—Thus, therefore air, as elastic, is the *complex object* of one branch of physics; and air itself, or the subject of the conclusion, the *incomplex object* of the same branch.

**OBJECTUM quo complexum**, is a collection of all the objective antecedents of the science.

**OBJECTUM quo incomplexum**, is a collection of all the mediums, or arguments contained in those antecedents, and whereby those conclusions are proved.

In these cases, the *object* is said to be *complex*, inasmuch as it includes both an affirmation and negation; and *incomplex*, as it includes neither: *Quod*, as being that which (*quod*) is shewn in the science; and *quo*, as being that whereby (*quo*) the conclusions therein are proved.

Schoolmen also distinguish an *object per se*, and *per accidens*; *objectum adaequatum*, and *inadaequatum*; *attributonis*, and *attributum*, &c.

**OBJECTION**, in reasoning, something urged to overthrow a position; or, a difficulty raised against an allegation, or proposition of a person we are disputing withal.

The answering of *objections* comes under that branch of oratory, or that part of an oration, called *confirmation*, or *confutation*. See CONFIRMATION, and CONFUTATION.

**Over-ruling an OBJECTION**. See OVER-RULING.

**OBJECTIVE**, **OBJECTIVUS**, is used in the schools in speaking of a thing which exists no otherwise than as an *object* known. See OBJECT.

The

The esse, or existence of such thing is said to be *objective*. Others call it *ratio objectiva*. See OBJECT.

OBJECTIVE is also used for the power, or faculty by which any thing becomes intelligible.—and, for the act itself, whereby any thing is presented to the mind, and known.

Hence a thing is said to *exist objectively, objectivè*, when it exists no otherwise than in being known; or by being an object of the mind. See EXISTENCE.

This, some will have to be a real esse; others deny it. See ESSE.

OBJECTIVE Evidence. See the article EVIDENCE.

OBJECTIVE Line. See the article LINE.

OBJECTIVE Notion. See the article NOTION.

OBJECTIVE Plane. See the article PLANE.

OBITU Nuper. See the article NUPER.

OBITU, OBITUS, in our ancient customs, was a funeral solemnity, or office for the dead; commonly performed when the corps lay uninterred in the church. See FUNERAL.

OBITU is also an anniversary-office, or mass, held yearly in the Romish church, on a certain day, in memory of some person deceased. See MASS and ANNIVERSARY.

One of the most ancient *obits* in Europe, is that of king *Childebert*, founded in the abbey of St. Germain Desprez; and said on the eve of St. Thomas's day.

The tenure of *obit*, or chantry lands held of the subject by such service, is decreed to be extinct with us; by Stat. 1. Edward 6. See TENURE, SERVICE, &c.

OBITUARY, OBITUARIUM, a funeral register, wherein are wrote the names of the dead, and the days of their burial; for whom obits or anniversaries are to be performed. See REGISTER and OBIT.

These, in some places, are also called *mortuaries*; but more frequently *neurologies*, or *calendars*. See NECROLOGY, CALENDAR, &c.

OBITUARY is more particularly used for a book containing the foundation, or institution of the several obits in a church or monastery. See OBIT.

This is more frequently called *martyrology*. See MARTYROLOGY.

OBLATA, things given, or voluntarily offered, particularly to the king, by any of his subjects. See OBLATION.

They are thus called, by reason the *oblata*, or offerings to our kings, were so strictly looked to in the reigns of king John and Henry III. that they were entered into the fine-roll, under the term *oblata*, and if not paid, put in charge to the sheriff. See BENEVOLENCE.

OBLATA, in the exchequer, signifies old debts; brought, as it were, together from preceding years, and put to the present sheriff's charge.

OBLATI, antiently, were secular persons, who bestowed themselves, and their estates on some monastery, and were admitted as lay-brothers. See LAY-BROTHER.

There were some of these *oblati*, properly called *donati*, who gave their persons, their families, and effects, and even entered into a kind of servitude themselves and their descendants.

They were admitted by putting the bell-ropes of the church around their necks, and, as a mark of servitude, a few pence on their heads.

The *donati* took religious habits, but those different from the monks. See HABIT.

In the archives of the abbey of St. Paul de Verdun, is a permission, given in 1360, to a man of that abbey to marry a wife, on condition, that of the children arising from the marriage, one half should belong to the abbey in quality of *oblati*; the other half to the bishop.—This kind of *oblati* are said to have taken their first rise in the eleventh century.

In the earlier times, those only were called *oblati* whom their parents engaged from their infancy to the monastic life.—Those who embraced it themselves, when at an age capable of choice, were called *converts*, *conversi*.

The *oblati* made no profession, yet kept the celibate, lived in obedience to the superiors, and did the drudgery of the monastery.—Yet they differed from the servants of the house, who were allowed to marry.

The *oblati* and *donati* were properly servants by devotion, as the others were by condition.

Helyot says, the *oblati* differed from *converts*, inasmuch as the latter made the profession, and wore the habit, which the former did not. See CONVERT.

OBLATI were also, in France, a kind of lay-monks, antiently placed by the king in all the abbeys, and priories in his nomination; to whom the religious were obliged to give a monk's allowance, on account of their ringing the bells, and sweeping the church, and the court.

These offices were usually filled with lame soldiers, and invalids, some of whom had pensions on benefices without any duty.—But these *oblati*, with their pensions, have since been all removed to the hotel of the invalids at Paris.

OBLATIONS, OFFERINGS, properly denote things offered to God. See SACRIFICE.

VOL. II.

In the canon law, *oblations* are defined to be any things offered, by godly Christians, to God, and the church, *i. e.* to the priests, whether they be moveables, or immoveables.

*Oblations* were antiently of various kinds, *viz.* *Oblationes altaris*, which the priest had for saying mass.—*Oblationes defunctorum*, given by the last wills of the faithful to the church.—*Oblationes mortuorum*, those given by the relations of the dead, at their burials.—*Oblationes pœnitentium*, those given by penitents.—and *Oblationes pentecostales*, or Whit-sun-offerings. See PENTECOSTALES.

Till the fourth century, the church had no fixed revenues, nor any other means of subsistence, but alms, or voluntary *oblations*. See TITHE, REVENUES, ALMS, &c.

OBLIGATION, an act whereby a person engages, or binds himself, or is bound by another, to do something; as to pay a sum of money, to be surety, or the like.

The acceptance of a bill of exchange is a kind of *obligation* to pay it. See EXCHANGE.

The exacting of interest on a sum due by a simple *obligation*, is accounted *usury*. See USURY.

All *obligations* arise from contracts, or quasi-contracts; from crimes, or quasi-crimes; and in the Roman law, were either civil, or prætorian; *i. e.* either approved by the civil law, or introduced by the prætor.

There are three kinds of *obligations*; *natural*, *civil*, and *mixt*.

*Natural OBLIGATIONS* are founded on the mere bond of natural equity, without any civil necessity, and without producing any action of constraint.—Such are the *obligations* a minor is under.

*Civil OBLIGATION*, is that supported on civil authority alone, and which induces a constraint, without any principle or foundation in natural equity.—Such is the *obligation* on a man condemned unjustly.

*Mixt OBLIGATION*, or an *obligation* both natural and civil, is that which being founded in natural equity, is further confirmed and enforced by civil authority.

There are also *personal obligations*, *hypothecary obligations*, *obligations* of goods, body, &c.

OBLIGATION, in a more strict sense, denotes a bond, containing a penalty, with a condition annexed, for payment of money at a certain time; or for performance of covenant, or the like.

A bond, or obligation is said to differ from a bill, in that the latter is commonly without a penalty, and without condition.—Yet a bill may be *obligatory*. Coke on Littl. See BILL.

Till the conquest, writings were rendered *obligatory* by certain marks of gold crosses, &c. The Normans first introduced the custom of making bills and *obligations* with a print or seal in wax set to every one's signature, attested by three witnesses. See SIGNATURE, SEAL, &c.

OBLIQUATION, in catoptricks.—*Cathetus* of OBLIQUATION, is a right line drawn perpendicular to a mirror, in the point of incidence, or reflexion of a ray. See CATHETUS, MIRROR, &c.

OBLIQUE, in geometry, something a-slant, indirect, or that deviates from the perpendicular. See PERPENDICULAR.

OBLIQUE angle, in geometry, is an angle that is either acute or obtuse; *i. e.* any angle, except a right angle. See ANGLE.

OBLIQUE-angled triangle, is that whose angles are *oblique*, *i. e.* either obtuse or acute. See TRIANGLE.

OBLIQUE Line, a line which falling on another, makes an *oblique* angle. See LINE.

A line falling *obliquely* on another, makes the angle on one side obtuse, and that on the other, acute.

OBLIQUE Planes, in dialing, are such as recline from the zenith, or incline toward the horizon. See DIAL and PLANE.

The obliquity, or quantity, of this inclination, or reclamation, is easily found by a quadrant; it being an arch of some azimuth, or vertical circle, intercepted between the vertex of the place and of that plane.—This azimuth, or vertical circle, is always perpendicular to the plane. See DIALING.

OBLIQUE percussion, is that wherein the direction of the striking body, is not perpendicular to the body struck; or is not in a line with its centre of gravity. See PERCUSSION.

The ratio an *oblique* stroke bears to a perpendicular one, is demonstrated to be as the sine of the angle of incidence to the radius.

OBLIQUE Powers, or Forces. See POWERS, MOTION, DIRECTION, &c.

OBLIQUE Projection, in mechanicks, is that where a body is impelled in a line of direction which makes an *oblique* angle with the horizontal line. See PROJECTION.

OBLIQUE Sphere, in geography, is that whose horizon cuts the equator *obliquely*; and one of whose poles is raised above

above the horizon, equal to the latitude of the place. See SPHERE.

It is this obliquity that occasions the inequality of days and nights. See NIGHT and DAY.

Those who live under an *oblique* sphere (as we, and all those in the temperate zone, do) never have their days and nights equal; except in the equinoxes. See EQUINOX.

**OBLIQUE Ascension**, in astronomy, an arch of the equator intercepted between the first point of Aries, and that point of the equator which rises together with a star, &c. in an *oblique* sphere. See ASCENSION.

The *oblique ascension* is numbred from West to East; and is more or less according to the different obliquity of the sphere. See SPHERE.

**OBLIQUE Descension**, an arch of the equator, intercepted between the first point of Aries, and that point of the equator, which sets with a star, &c. in an *oblique* sphere; and reckoned from West to East. See DESCENSION.

The difference between the right and *oblique* ascension, is called the *ascensional difference*. See ASCENSIONAL.

To find the *oblique ascension* and *descension* by the globe. See GLOBE.

**OBLIQUE Sailing**, in navigation, is when the ship being in some intermediate rhumb, between the four cardinal points, makes an *oblique* angle with the meridian, and continually changes both its latitude and longitude. See RHUMB, and LOXODROMIC.

*Oblique sailing* is of three kinds; viz. *Plain sailing*, *mercator's sailing*, and *great circle sailing*. See SAILING.

The seamen also call the application of the method of calculating the parts of *oblique* plane triangles, in order to find the distance of a ship from any cape, head-land, &c. *oblique sailing*.

**OBLIQUE Distillation**, in chymistry. See DISTILLATION.

**OBLIQUE Flank**, in fortification. See FLANK.

**OBLIQUE Cases**, in grammar, are all the cases of the declensions of nouns, besides the nominative. See CASE.

**OBLIQUE**, **OBLIQUUS**, in anatomy, is applied substantively, to several muscles of the head and eye; particularly, the

**OBLIQUUS Capitis Major**, or *Par OBLIQUUM Inferius*, the sixth muscle of the head; so called, because serving to turn the head aside: though it has neither its origin nor insertion in the head. See HEAD.

It rises fleshy from the external parts of the spine of the second vertebra of the neck, and swelling into a fleshy belly, runs *obliquely* to the transverse process of the first vertebra.—This same rank among the muscles of the neck. See NECK.

**OBLIQUUS Capitis Superior**, or *Minor*, the seventh muscle of the head, which springing fleshy from the transverse processes of the second vertebra of the neck, and ascending *obliquely*, is inserted laterally into the occiput.

Others will have its origin to be in the occiput, where the common opinion places its insertion; its insertion they make in the transverse processes of the first vertebra, near that of the same side.

The two *oblique* muscles, by pulling the transverse process, give the head a semi-circular motion. See VERTEBRA.

**OBLIQUUS Oculi Superior**, or *Major*, the fifth muscle of the eye. See EYE.

It has its origin in the upper part of the orbit; whence tending upwards towards the inward canthus of the eye, it passes through a cartilage on the bone of the forehead, called *trochlea*; whence also the muscle itself is called *trochlearis*; thence it is reflected to its termination in the *sclerotica*, on the back part of the ball of the eye.

When this muscle acts, that part of the ball of the eye is drawn downwards towards the trochlea, whereby the pupil is directed downwards, towards the lesser canthus, and at the same time the whole ball of the eye somewhat outwards.

**OBLIQUUS Oculi Inferior**, or *Minor*, rises from the external margin of the lower part of the orbit, near the inner canthus; whence rising towards the outward canthus, it terminates near the other.—It draws the ball of the eye outwards, and turns its pupil upward, contrary to the former.

**OBLIQUUS Descendens**, or *Declivis*, a very broad pair of muscles of the abdomen, each covering one half thereof, and part of the thorax; so called from the *oblique* course of its fibres.—It arises from the two last true ribs and five spurious ones; and is indented with the serratus major anticus by five or six digitations, each whereof receives a nerve from the interstices of the rib: It springs likewise from the margin of the ilium; and ends in a broad tendon in the linea alba.—See *Tab. Anat.* (Myol.) fig. 7. n. 19. fig. 1. n. 45. and fig. 6. n. 31.

Besides the ordinary use ascribed to it by all anatomists, which is to compress the intestines and bladder; Cowper and Glisson attribute to it another, which is to turn the trunk of the body without moving the feet.

**OBLIQUUS Ascendens**, or *Acclivis*, lies under the lower part of the former; running, with a course just contrary, from the lower part upwards. Its fleshy fibres have their origin from the edge of the ilium, and end at the spurious ribs. It terminates with a large double tendon in the linea alba; the upper part whereof creeping over the musculus rectus, and the other creeping under it, and joining together at the linea alba; do, as it were, sheath the rectus.—See *Tab. Anat.* (Myol.) fig. 2. n. 30. fig. 1. n. 44.

Its use is to shut and compress the belly, as also the cavity of the thorax in respiration; and it assists, with its antagonist, the *descendens*, in turning the body without moving the legs.

**OBLIQUUS Auris**, lies in the external part of the canal of the aquæduct; whence passing upwards and backwards, it enters the tympanum, by a very *oblique* sinuosity immediately above the bony circle, to which the tympanum is fixed; and is inserted into the slender process of the malleus.

**OBLIQUITY**, that which denotes a thing *oblique*. See OBLIQUITY.

The *obliquity of the sphere*, is the cause of the inequality of seasons, of nights and days. See SEASON, &c.

**OBLIQUITY of the ecliptic**, is the angle which the ecliptic makes with the equator. See ECLIPTIC.

Mess. Cassini and de la Hire, make the *obliquity of the ecliptic*, by their observations,  $23^{\circ}, 29'$ . M. le Chevalier de Louville, from later observations, makes it  $23^{\circ}, 28', 41''$ .

The same author, giving the history of the several determinations of this *obliquity*, by all astronomers in all ages, observes, that they constantly diminish; and thence takes occasion to suspect, that the real *obliquity* of the ecliptic itself may have been diminished since the time of the antient astronomers.

He goes so far, as even to fix the proportion of the diminution, which he makes to be at the rate of half a minute in fifty years. According to an antient tradition among the Egyptians, mentioned by Herodotus, the ecliptic was formerly perpendicular to the equator.

The libration of the sphere makes some alterations in the *obliquity* of the ecliptic; so that Wollius reckons a *great obliquity* of  $23^{\circ}, 53'$ ; a *mean obliquity* of  $23^{\circ}, 41'$ ; and a *small* one of  $23^{\circ}, 30'$ .

**OBLONG**, in geometry, a figure longer than it is broad. See FIGURE.

Thus, a rectangled parallelogram, whose sides are unequal, is an *oblong*; see PARALLELOGRAM: So an ellipsis is also an *oblong*. See ELLIPSIS.

**OBLONGATA Medulla**. See MEDULLA and CRURA.

**OBOLATA Terra**, in our antient law-books, is a certain quantity of land, which some authors fix at half an acre; though others make it but half a perch.

According to Thomafius, *obolus terræ* contains ten feet in length, and five in breadth. See FARDINGDEAL.

**OBOLUS**,\* an antient silver money of Athens, the sixth part of a drachma; worth somewhat more than a penny farthing sterling. See DRACHMA and COIN.

\* The word comes from the Greek *ὀβολος*, of *ὀβελος*, spit, or broach; either because it bore such an impression; or because, according to Eustathius, it was in form thereof. But those now in the cabinets of the antiquaries are round.

**OBOLUS** was also used among our ancestors for half a noble, or florin; where the noble was esteemed as the penny; and its quarter part a farthing. See NOBLE.

In effect, in the old histories and accounts of coins, we are to understand, by the word *denarius*, the whole coin, be it angel, rial, &c. by the *obolus* its half; and by *quadrans* its fourth part. See MONEY, PENNY, DENARIUS, &c.

**OBOLUS**, in medicine, is used for a weight of ten grains; or half a scruple. See WEIGHT.

Du Cange says the *obolus* weighs three carats, or four grains of wheat: Others divide it into six areolæ; and the areola into seven minutes. Others into three filiquæ, each filiqua into four grains, and each grain into a lentil and half. See GRAIN, &c.

Among the Sicilians, **OBOLUS** also denoted the weight of a pound. See POUND.

**OBREPTICIOUS OBREPTITIUS**, a quality of letters patent, or any other instrument which confers a favour, title, or concession; denoting it obtained of a superior by surprise, or by concealing from him the truth, which was necessary to have been expressed to render it valid.

In which sense the word stands opposed to *surreptitious*, where some falsehood has been expressed, in order to procure it the more easily.—*Obreption* annuls the grant wherever found.

By the canon law, a person demanding a benefice, without expressing those he is already possessed of, forfeits, &c. by *obreption*.

**OBRIKE, KNIGHTS of OBRINE**, a military instituted in the thirteenth century, by Conrad duke of Mazovia and Cujavia; whom some authors call also duke of Poland.

He first gave them the name of *knights of Jesus Christ*. Their first grand master was Bruno. Their chief end was to defend the country from the Prussians, who were yet idolaters, and committed great cruelties.

Duke Conrade putting them in possession of fort Obrine; they hence took a new name: and it was agreed between them, that whatever lands they conquered from the Prussians, should be equally divided with him.

But the Prussians blocking up the fort, so that none of the knights could get out; the order became useless, and was soon suppressed.—Upon this, Conrade called in the Teutonic knights. See *TEUTONIC Order*.

**OBSCURA Camera.** See *CAMERA obscura*.

**OBSCURA Clara.** See *CLAIR-OBSCURE*.

**OBSCURE**, something that is dark, or that only receives and returns a little light. See *LIGHT* and *SHADOW*.

**OBSCURE** is also used in a figurative sense, for a thing that is not clear, express, and intelligible; that one does not fully apprehend; or that may be construed in divers senses. See *OBSCURITY*.

**OBSCURE Notion, or Idea.** See *NOTION* and *IDEA*.

**Clair OBSCURE.** See the article *CLAIR-OBSCURE*.

**OBSCURITY**, that which denominates a thing obscure.

*Obscurity* is a fault that may either be in the perception, or the diction.

*Obscurity in the perception*, arises chiefly hence, that we do not conceive things as they are, or as we find them; but as we judge them to be, ere we know them: so that our judgment precedes our knowledge, and is made the rule, or standard, of our conceptions.—Whereas nature and reason direct, that things should be judged of according as they are known; and that they are to be known, not as they are in themselves, but only in such manner as God was pleased to have them known. See *KNOWLEDGE*.

*Obscurity in the diction*, may arise, first, from the ambiguity of the sense of words; secondly, from the figures or ornaments of rhetoric; thirdly, from the novelty, or obsolescence of the words.

**OBSECRATION, OBSECRATIO**, in rhetoric a figure whereby the orator implores the assistance of God, or man. See *FIGURE*.

This figure Cicero makes admirable use of, for K. Deiotarus; to Cæsar—*Per dexteram te istam oro, quam regi Deiotaro hospes, hospiti porrexisti: Istam inquam dexteram non tam in bellis & in præliis, quam in promissis & fide firmiorem.*

—Thus Virgil:

*Quod te per cæli jucundum lumen, & auras,  
Per genitorem oro, per spem surgentis iuli,  
Eripe me his invidiæ malis—*

**OBSEQUIES**,\* funeral solemnities, or ceremonies performed at the burials of eminent personages. See *FUNERAL*.

\* The word is derived from the Latin *obsequium*, obedience; these *obsequies* being the last devoirs we can render to the deceased.

**OBSERVANCE**, literally denotes the act of observing, or complying with a rule, law, or ceremony.

Hence *observance* is sometimes also used for a rule, statute, or ordinance to be observed. See *RULE*.

**OBSERVANCE, OBSERVANTIA**, is particularly understood, in a monastic sense, of a community of religious, who are tied to the perpetual observation of the same rule. In which sense the word coincides with *congregation*, or *order*. See *ORDER*, &c.

The Cordeliers denominate themselves, *religious of the observance*; the *great*, and the *lesser observance*. See *CORDELIERS*.

Among the Bernardines, there are monks of the *strict observance*, who eat nothing but fish. See *BERNARDIN*.

**OBSERVANTINES**, religious cordeliers of the observance. —In Spain, there are bare-footed *observantines*.

**OBSERVATION**, in the sea-language, the taking the sun's, or any star's meridian altitude, in order thereby to find the latitude. See *MERIDIAN-Altitude*.

For the method of making an *observation*. See *LATITUDE*.

—The finding of a latitude from the meridian-altitude observed, they call *working an observation*.

**OBSERVATIONS**, in astronomy. See *COELESTIAL observations*.

**OBSERVATORY, OBSERVATORIUM**, a place destined for observing the heavenly bodies; or, a building usually in form of a tower, raised on some eminence, and covered with a terrace, for making of astronomical observations.

The more celebrated *observatories*, are,—1°. The *Greenwich observatory*, built in 1676, by order of king Charles II. at the solicitation of Sir Jonas Moor and Sir Christopher Wren; and furnished with the most accurate instruments by the same; particularly a noble sextant of 7 feet radius, with telescope-sights.

The person to whom the province of observing was first committed, was Mr. J. Flamsteed; a man, who, as Dr. Halley expresses it, seemed born for the employment. For the space of fourteen years, with unwearied pains, he

watched the motions of the planets; chiefly those of the moon, as was given him in charge; that a new theory of that planet, exhibiting all her irregularities, being found, the longitude might thence be determined.

In the year 1690, having provided himself of a mural-arch of 7 feet diameter, well fixed in the plane of the meridian, he began to verify his catalogue of the fixed stars, which hitherto depended altogether on the distances measured with the sextant, after a new and very different manner, viz. by taking the meridian-altitudes, and the moments of culmination, or the right ascension and declination. See *CATALOGUE*.

This instrument he was so pleased with, that he laid the use of the sextant almost wholly aside. Thus was the astronomer royal employed for thirty years; in the course of which time, nothing had appeared in public, worthy so much expence and preparation: So that the observer seemed rather to have been employed for his own sake, and that of a few friends, than for the public; though it was notorious, the observations that had been made were very numerous, and the papers swelled to a great bulk.

This occasioned prince George of Denmark, in the year 1704, to appoint certain members of the Royal Society, viz. the honourable Fr. Robarts, Sir C. Wren, Sir I. Newton, Dr. Gregory, and Dr. Arbuthnot, to inspect Mr. Flamsteed's papers, and chuse out of them such as they should think fit for the press; purposing to print them at his own expence: But the patron of the work dying, ere the impression was half finished, it lay still for some time; till at length it was resumed by order of queen Anne; and the care of the press committed to Dr. Arbuthnot; and that of correcting, and supplying the copy, to Dr. Halley.

Such was the rise and progress of the *Historia Cælestis*; the principal part whereof is the catalogue of fixed stars, called also the *Greenwich catalogue*. See *CATALOGUE*.

The *Greenwich observatory* is found by very accurate observations to lie in 51°, 28', 30", north latitude.

2°. The *Paris observatory* built by the late Louis XIV. in the Faubourg St. Jacques.—It is a very singular, but without a very magnificent building; the design of M. Perrault. It is 80 feet high, and a-top is a terrace.—It is here M. de la Hire has been employed.—The difference in longitude between this and the *Greenwich observatory* is 2°, 20', West.

In the *Paris observatory* is a cave, or cellar, of 170 feet descent, for experiments that are to be made far from the sun, &c. particularly such as relate to congelations, refrigerations, indurations, conservations, &c.

3°. Tycho Brahe's observatory was in the little island Ween, or the Scarlet Island, between the coasts of Schonen and Zeland, in the Baltic.—It was erected and furnished with instruments at his own expence; and called by him Uraniburg.—Here he spent twenty years in observing the stars. The result is his catalogue. See *CATALOGUE*.

Mr. Gordon, in *Phil. Trans.* observes, that this was none of the fittest places for some kind of observations, particularly the risings and settings; as lying too low, and being landlocked on all the points of the compass but three; and the land-horizon exceedingly rugged and uneven.

4°. *Pekin observatory*. Father Le Compte describes a very magnificent *observatory* erected and furnished by the late emperor of China, in his capital, at the intercession of some jesuit missionaries, chiefly father Verbiest, whom he made his chief observer.

The instruments are exceedingly large; but the divisions less accurate, and the contrivance, in some respects, less commodious than those of the Europeans. The chief are an armillary zodiacal sphere of 6 Paris feet diameter, an equinoctial sphere 6 feet diameter, an azimuthal horizon 6 feet diameter, a large quadrant 6 feet radius, a sextant 8 feet radius, and a celestial globe 6 feet diameter.

**OBSESSION**, the action, or rather passion, of being beset by an evil spirit; which, without entering the body, torments, and, as it were, besieges the person without. See *DÆMONIAC*.

In which sense, *obsession* differs from possession. See *POSSESSION*.

The marks of *obsession*, according to some, are a being hoisted into the air, and thrown violently down without being hurt; speaking languages never learnt; having an aversion to all acts and offices of religion, &c.

Some physicians look on all cases of *obsession* as natural, and curable by natural medicines, particularly an unguent called *unguentum carrietheri*, with purgatives, or vomitives.

Of this opinion is doctor Gabriel Clauderus, member of the Leopoldine academy, which he confirms with the testimony of Fromannus, in his treatise *de Fascinationibus*, and Ganius de Corallis: adding, that it has been confessed by many witches and forcerers, that the plant hypericon, and other simples, &c. incommode them terribly, and prevent their operations.

He confirms this sentiment hence, that the devil in those he thus besets, makes use of the melancholic humour or the atra bilis, and the grosser impurities of the blood, without always acting immediately of himself. For which he refers to the books of Melchior Sebizius, and Jerom Jordan *de Divino in homine*; and gives the process of a cure of a manifest *obsession* of a child of a year old at Delitschebourg, three leagues from Leipsic.

**OBSDIONALIS**,\* an epithet which the Romans gave to a sort of crown wherewith they honoured such of their generals as had delivered a Roman army, or fortrefs, besieged by the enemy; and had raised the siege, or obliged them to decamp. See CROWN.

\*The word comes from the Latin *obsidio*, siege.

It was also called *graminea*, because made of grafs, or herbs found on the spot, or soil.

It was the soldiery who bestowed this crown; which, doubtless, was the reason of its not being of a more precious matter.

**OBSTRUCTION**, in medicine, a lett, or stoppage of the natural passages, or cavities of the body; occasioned either by the excessive quantity, or the vitious quality of the humours; as lentor, thicknes, or the like. See DISEASE.

*Obstructions* are supposed usually to arise from the gross parts of the blood, detained in the extremities of the capillary vessels, and thus blocking them up. See CAPILLARY.

Some physicians doubt whether there be any such thing as *obstructions* in the viscera; and rather attribute the inconveniencies usually ascribed to *obstructions*, to the acrimonies and crudities of the stomach.—But their reasons are not convincing: It is true, *obstructions* may not perhaps be so frequent as is usually supposed; and many of the symptoms ascribed to them, are doubtless owing to disorders of the stomach; but then there's no denying that there are any *obstructions* at all in the viscera, &c. Scirrhus's, and other kinds of tumours are incontestable proofs hereof. See TUMOUR, SCIRRHUS, &c.

*Obstructions* frequently prove the causes of dropsies. See DROPSY.

**OBSTRUENTS**. See the article DEOBSTRUENT.

**OBSTRUXIT**. *Quare* OBSTRUSIT. See QUARE.

**OBTURATOR**, in anatomy, a name given to two muscles of the thigh; by reason of their shutting, or covering up, the foramen or aperture between the os pubis, and the hip-bone.

The *obturators internus* and *marfupialis* are the two parts, or divisions that make the gemini. See GEMINI.

The *obturators externus* arises fleshy from the exterior margin of the os pubis and ischium, and is inserted tendinous at the root of the great trochanter.—See *Tab. Anat. (Myol.) fig. 7. n. 25.*

**OBTUSE** literally imports blunt, dull, &c. in opposition to acute, sharp, brisk, &c. See ACUTE, &c.

**OBTUSE Angle**, in geometry, an angle of more than 90 degrees, *i. e.* more than a quadrant of a circle; or an angle greater than a right angle. See ANGLE.

**OBTUSE-ANGLED Triangle**, is a triangle one of whose angles is obtuse. See TRIANGLE.

**OBTUSE Appui**. See the article APPUI.

**OBVENTIONS**, OBVENTIONES, in antient law-books, signify the produce of a benefice, or spiritual living; including oblations, tiths, rents, and other revenues. See OBULATION, TITH, BENEFICE, &c.

**OCCASIO**, in antient law-writers, denotes a tribute which the lord imposed on his vassals, or tenants, on occasion of war and other exigencies. See AID.

**OCCASIONAL Cause**, &c. See the article CAUSE, &c.

**OCCIDENTAL**, a term used chiefly in commerce, to distinguish commodities brought from the West-Indies, *i. e.* America, from those brought from the East-Indies, which are said to be *oriental*. See ORIENTAL.

In this sense we say, *occidental bezoard*; see BEZOARD. *Occidental pearl*; see PEARL.

**OCCIDENTAL horizon**. See HORIZON.

**OCCIPITAL**, in anatomy, a term applied to the parts of the occiput, or of the hinder part of the head. See OCCIPUT.

**OCCIPITAL Bone**. See the article OCCIPITIS Os.

**OCCIPITALES**, or **OCCIPITAL Muscles**, are a pair of muscles of the head; whose origin is in the same place with that of the frontales, *i. e.* in the upper part of the head near the vertex, but which go a quite opposite course, *viz.* from before, hindwards, and are inserted into the lower part of the hairy scalp, or skin of the occiput, which they serve to draw upwards.—See *Tab. Anat. (Myol.) fig. 6. n. 1.*

Dr. Drake observes, that the *occipitalis* and *frontalis* are one continued digastric muscle on each side; that part called the *occipitalis*, after a small ascent, becomes a thin tendon, and marches over the whole bregma, where it divides; the one part going on to the os jugale, the other, growing fleshy, acquires the name *frontalis*. See FRONTALES.

**OCCIPITIS Os**, or *Os prora*, in anatomy, the fourth bone of the cranium; so called from its situation in the occiput.—See *Tab. Anat. (Osteol.) fig. 2. lit. g. fig. 7. n. 2.* See also the article OCCIPUT.

It is the hardest and thickest of all the bones of the cranium. Its figure is triangular. In new-born children it is divided into four; but grows up, and becomes one in time. See CRANIUM.

It is joined to the bones of the sinciput, at the lambdoidal future; as likewise to the petrosa, and os sphenoides at the sphenoidal future.

The parts of this bone are either solid, or hollow, *i. e.* empty. The solid are two processes, called *coronae*. The hollow parts are either foramina, or sinus's.

The foramina are either common, or proper: The common are two, one on each side common with the ossa petrosa, affording a passage to the nerves, par vagum, and to the internal jugular veins.

The proper foramina are five: The first is very large, and through this it is that the spinal marrow passes. Two others give passage to the nerves of the tongue, and the two last an entrance to the cervical arteries. See NERVE, &c.

It has two large sinus's within-side, for the reception of the two hemispheres of the cerebellum. See CEREBELLUM.

On each side the foramina which give passage to the spinal marrow, is usually a process lined with a cartilage, articulated with the first vertebra of the neck.

In lieu of this, is sometimes only a prominence of the bone; which, or the process where it is found, receives the insertions of the muscles of the head, whereof there are ten, *viz.* the par splenium, par complexum, par rectum majus externum, par rectum minus externum, par obliquum superius, obliquum interius, par mastoideum, rectum internum majus, rectum internum minus, and rectum laterale; each of which see in its proper place.

**OCCIPUT**, the hinder part of the head, or skull; or the part wherein is the os occipitis. See HEAD, CRANIUM, OCCIPITIS Os, &c.

Scultetus observes, that cauterizing the *occiput* is very frequent in many places.

**OCCULT**, something secret, hidden, or invisible.—The occult sciences are magic, necromancy, cabbala, &c. See MAGIC, CABBALA, NECROMANCY, &c.

Agrippa has several books of *occult philosophy*, full of the vainest, wildest dreams; and Fludd nine volumes of the *cabbala*, or *occult science*, wrapt up under figures, or Hebrew characters.

Weak philosophers, when unable to discover the cause of an effect, and unwilling to own their ignorance, say it arises from an *occult virtue*, an *occult cause*, an *occult quality*. See QUALITY, &c.

**OCCULT**, in geometry, is used for a line that is scarce perceivable, drawn with the point of the compasses, or a black-lead pencil. See LINE.

*Occult*, or dry lines, are used in several operations; as the raising of plans, designs of building, pieces of perspective, &c. They are to be effaced when the work is finished.

**OCCULT Cancers**. See the article CANCER.

**OCCULTATION**, in astronomy, the time a star, or planet, is hid from our sight, by the interposition of the body of the moon, or of some other planet. See ECLIPSE.

*Circle of perpetual OCCULTATION*, is a parallel in an oblique sphere, as far distant from the depressed pole, as the elevated pole is from the horizon. See CIRCLE.

Between this line and the pole, all the stars contained do never rise; but lie constantly hid under the horizon of the place. See OCCULTATION, &c.

**OCCUPANT**, in law, he that first seizes and takes possession of a thing. See OCCUPATION.

If a tenant hold land, &c. for the term of another's life; and such tenant die first, without making any estate of it; he that first enters to hold that term out, is said to acquire a property, and is called an *occupant*, by reason his title comes by the first occupation.

So, if a tenant for his own life, grant over his estate to another; if the grantee dies before him, there shall be an *occupant*.

**OCCUPATION**, or **OCCUPANCY**, in the civil law, denotes the possession of such things as at present properly belong to no private person, but are capable of being made so: as, by seizing or taking spoils in war; by catching things wild by nature, as birds, and beasts of game, &c. or by finding things before undiscovered, or lost by their proper owners. See POSSESSION.

**OCCUPATION**, is also used in common law, for the putting a man out of his freehold in time of war.

*Occupation* amounts to the same with disseisin in time of peace; only that the former is deemed not so great an offence. See DISSEISIN.

Occu-

**OCTABIS.** in law. See the article OCTAVE.

OCTAETERIDES \*, in chronology, &c. the space, or duration of eight years.

\* The word is formed from the Greek *οκτατηρίς*, composed of *οκτω*, eight, and *ηρ*, year.

**OCTAGON.** See the article OCTOGON.

**OCTAHEDRON**, or **OCTAEDRON**, in geometry, one of the five regular bodies, consisting of eight equal and equilateral triangles. See *REGULAR Body*.

The *octahedron* may be conceived as consisting of two quadrilateral pyramids put together at their bases. See PYRAMID. Its solidity therefore is had by multiplying the quadrangular base of either, by one third of the perpendicular height of one of them; and then doubling the product. See SOLIDITY.

The square of the side of an *octahedron* is in a subduple ratio of the square of the diameter of the circumscribing sphere.

**OCTANT**, or **OCTILE**, in astronomy, an aspect, or position of two planets, &c. wherein their places are distant an eighth part of a circle, or 45 degrees from one another. See **ASPECT**, and **OCTILE**.

**OCTAPLA \***, a term in the sacred learning, used for a kind of antient polyglot bible, consisting of eight columns. See **BIBLE**, and **POLYGLOT**.

- The word is formed from the Greek *οκτω*, eight; *q. d.* something with eight rows, or columns.

In the first column was the Hebrew text in Hebrew characters; in the second, the same text in Greek characters; in the third, the Greek version of Aquila; in the fourth, that of Symmachus; in the fifth, the Septuagint; in the sixth, that of Theodotus; in the seventh, that called the *fifth*; the last was that called the *sixth*.

Origen was the author of the *octapla*, as well as of the *tetrapla*, and *hexapla*. See HEXAPLA, &c.

**OCTATEUCH**, in the sacred literature, is used for the eight first books of the Old Testament, *viz.* Genesis, Exodus, Leviticus, Numbers, Deuteronomy, Joshua, and Judges. See **BIBLE**, and **PENTATEUCH**.—Procopius of Gaza has ten commentaries on the *oſtateuch*.

**OCTAVE**, in music, an harmonical interval consisting of eight tones, or degrees of sound. See **INTERVAL**, **DEGREE**, and **SESQUIOCTAVE**.

The most simple perception the soul can have of true sounds, is that of unison; in regard the vibrations there begin and end together.—The next to this is the *octave*; wherein the more acute sound makes precisely two vibrations, while the graver or deeper makes one; and wherein, by consequence, the vibrations of the two meet at every vibration of the more grave. See TUNE, GRAVITY, &c.

Hence unison and *octave* pass almost for the same concord. See UNISON.  
Hence also the proportion of the sounds that form the *octave* are in numbers, or in lines, as 2 to 1; so that two chords or strings of the same matter, thickness, and tension, one whereof is double the length of the other, produce the *octave*. See CHORD.

The *octave* is called by the antients *diapason*, because containing all the simple tones and concords; all of which derive their sweetness from it, as they arise more or less directly out of it. See CONCORD.

To be juſt, it muſt contain diatonically 7 degrees, or intervals; and conſequently 8 terms, or ſounds, whence its name, *octave*.

The *octave* containing in it all the other simple concords, and the degrees being the differences of these concords, it is evident the division of the *octave* comprehends the division of all the rest. See SYSTEM.

By joining, therefore, all the simple concords to a common fundamental, we have the following series:

$$1 : \frac{5}{8} : \frac{4}{5} : \frac{3}{4} : \frac{2}{3} : \frac{5}{6} : \frac{3}{2} : \frac{1}{2}.$$

Fund. 3d. l, 3d. g, 4th, 5th, 6th. l, 6th, g, 8ve.  
Again, the system of *octave* containing all the original con-  
cords; and the compound concords being the sum of *octave*,  
and some lesser concord; in order to have a series to reach  
beyond an *octave*, we must continue them in the same order  
through a second *octave*, as in the first; and so on through a  
third and fourth *octave*. Such a series is called the *scale of*  
*music*. See SCALE.

Though the composition of *octaves* may be carried on infinitely, yet three or four *octaves* is the greatest length we go in ordinary practice. The old scales went no further than two, or at most three *octaves*, which is the full compass of an ordinary voice. And, notwithstanding the perfection of the *octave*, yet after the third, the agreement diminishes very fast; nor do they ever go so far at one movement, as from one extreme to the other of a double or triple *octave*; seldom beyond a single *octave*: Nor is either voice or instrument well able to go beyond.—To form a fourth *octave*, if the acuter string be half a foot, which is but a small length to give a clear sound; the longer must be eight feet. If then we go beyond the fourth *octave*, either the acute term will be too short, or the grave one too long.

7 L

# The

The *octave* is not only the greatest interval of the seven original concords, but the first in degree of perfection. As it is the greatest interval, all the less are contained in it: Indeed, the manner wherein the less concords are found in the *octave*, is somewhat extraordinary; viz. by taking both an harmonical and arithmetical mean between the extremes of the *octave*, and then both an arithmetical and harmonical mean between each extreme, and the most distant of the two means last found; i. e. between the last extreme and the first arithmetical, and between the greater extreme and the first harmonical mean, we have all the lesser concords. See CONCORD.

Mr. Malcolm observes, that any wind-instrument being overblown, the sound will rise to an *octave*, and no other concord; which he ascribes to the perfection of the *octave*, and its being next to unison.

From this simple and perfect form of the *octave*, arises this peculiar property, that it may be doubled, tripled, &c. and still be concord, i. e. the sum of two or more *octaves* are concord; though the more compound, gradually, the less agreeable. He adds, there is that agreement between its extremes, that whatever sound is concord to one extreme of the *octave*, is so to the other.

Des Cartes, from an observation of the like kind, viz. that the sound of a whistle, or organ-pipe, will rise to an *octave*, if forcibly blown, concludes, that no sound is heard, but its acute *octave* seems some way to echo or resound in the ear.

OCTAVE, or OCTAVIS, in law, denotes the 8th day after any feast, inclusively: which space is also called *utis*.

OCTAVE, among the Romanists, is used for the space, or period of eight days allowed for the celebration of a feast, or service in commemoration of some saint, or on other solemn occasions.

Easter, Whitsonide, S. John Baptist, S. Lawrence, Epiphany, the Dedication, &c. are celebrated with *octaves*.—The office in the *octave* is semi-double.

OCTILE, or OCTANT, in astrology, an aspect of two planets when distant from each other by an eighth of the zodiac, i. e. a sign and half, or 45°. See OCTANT, and TRIOCTILE.

OCTO, *Ad* OCTO. See the article AD OCTO.

OCTOBER, the eighth month of the year, in Romulus's calendar; though the 10th in that of Numa, Julius Cæsar, &c. consisting of 31 days. See MONTH, CALENDAR, &c.

*October* has still retained its first name, in spite of all the different names the senate, and Roman emperors would have given it.—The senate ordered it to be called *Faustinus*, in honour of Faustina the wife of Antoninus the emperor: Commodus would have had it bear the name of *Invisus*; and Domitian made it be called *Domitianus* after his own name.

OCTOGON, or OCTAGON, in geometry, a figure of eight sides and eight angles. See FIGURE, and POLYGON. When all the sides and angles are equal, it is called a regular *octogon*, or an *octogon* that may be inscribed in a circle.

OCTOGON, in fortification, denotes a place that has eight bastions. See BASTION.

OCTOSTYLE, in the antient architecture, the face of a building, or ordonnance, containing eight columns.

The eight columns of the *octostyle* may either be disposed in a right line, as in the pseudodiptere temple of Vitruvius, and in the Pantheon; or in a circle, as in the round monoptere temple of Apollo Pythius at Delphi, &c.

OCTO Tales. See the article TALES.

OCULARES Dentes, or Cynodentes, the eye-teeth. See TOOTH.

OCULUS, in anatomy. See the article EYE.

OCULI CANCROUM. See the article CRABS-EYES.

OCULI, Eyes, in botany, the gemmæ, or buds of a plant just putting forth, or the knots out of which the buds arise. See GERMIN, PRUNING, ENGRAFTING, &c.

Adductor OCULI. } See the article { ADDUCTOR.

Depressor OCULI. } { DEPRESSOR.

Elevator OCULI. } { ELEVATOR.

Obliquus OCULI. } { OBLIQUUS.

ODA, in the Turkish seraglio, signifies a *class*, *chamber*, or *order*.—See SERAGLIO.

The grand signior's pages are divided into five classes, or chambers, called *oda*. See PAGE.

The first, which is the lowest in dignity, is called the *great oda*, from the number of persons that compose it.

These are the juniors, who are taught to read, write, and speak the languages; which are the Turkish for this world; the Arabic for paradise; and the Persian for hell, by reason of the heresy of the people that speak it.

The second is called the *little oda*; where, from the age of 14 or 15 years, the youth are trained up to arms, and the study of such polite learning as the Turks are acquainted withal; viz. logic, arithmetic, geometry, and a little astrology.

In each of these chambers, is a page of the privy chamber who superintends them, as the prefects in the colleges of the jesuits.

The third chamber, called *kilar-oda*, comprehends two hundred pages; which, beside their other exercises, are commanded by the *kilerdgi-bach*, for the service of the buttery and fruitery.

The fourth only consists of twenty-four, which, under the *khazineda-bachi*, take care of the treasure in the grand signior's apartment, where they never enter with any clothes on that have pockets.

The fifth is called *klas-oda*, i. e. privy-chamber, and consists of forty pages, which attend the emperor's bed-chamber. The first of this chamber is called *oda-bachi*, the second *filiktar*, &c.

Eight of these pages keep constant guard every night in the emperor's bed-chamber. They are posted in several places, some nearer him, others farther off, according to their degrees in the chamber. They are to take care the light kept constantly in the chamber, do not glare in his eyes, and awake him; and if they find him disturbed with any troublesome dream, to take care he be awaked by one of the aga's.

ODABACHI, or ODDOBASSI, an officer in the Turkish soldiery, equivalent to a sergeant, or corporal among us.

The common soldiers, and janizaries, called *oldachis*, after having served a certain term of years, are preferred, and made *biquelars*; and of *biquelars* in time become *odabachi's*, i. e. corporals of companies, or chiefs of certain divisions, whose number is not fixed, being sometimes ten, and sometimes twenty.

Their pay is six doubles *per* month, and they are distinguished by a large felt, a foot broad, and above a foot long, hanging on the back with two long ostrich feathers.

ODD. See the articles EVENLY, and FOOT.

ODE\*, ODA, in the antient poetry, a song; or a composition proper to be sung, and composed for that purpose; the singing usually accompanied with some musical instrument, chiefly the lyre. See SONG, and LYRIC.

\* The word comes from the Greek *ωδη*, *cantus*, song, or singing.

*Ode*, in the modern poetry, is a lyric poem, consisting of long and short verses, distinguished into stanza's, or strophes, wherein the same measure is preserved throughout.

The *odes* of the antients, Vossius observes, had a regular return of the same kind of verse, and the same quantity of syllables in the same place of every similar verse: "But there is nothing, (says he) but confusion of quantities in the modern *odes*; so that to follow the natural quantity of our syllables, every stanza will be a different song."

He should have observed, however, that all the antient *odes* were not of such kind. But he proceeds: "The moderns have no regard to the natural quantity of the syllables, and have introduced an unnatural and barbarous variety of long and short notes, which they apply without any regard to the natural quantity of the syllables; so that it is no wonder our vocal music has no effect. *De poem. cantu*. See VERSE, VOCAL MUSIC, and QUANTITY.

Among the antients, *ode* signified no more than a song; with us, they are different things.—The antient *odes* were generally in honour of their gods, as many of those of Pindar and Horace: sometimes on other subjects, are those of Anacreon, Sappho, &c.—The English *odes* are generally composed in praise of heroes, and great exploits; as those of Dryden, Prior, &c.

The distinguishing character of the *ode* is *sweetness*: The poet is to soothe the minds of his readers by the variety of the verse, and the delicacy of words, the beauty of numbers, and the description of things most delightful in themselves. Variety of numbers is essential to the *ode*.

At first, indeed, the verse of the *ode* was but of one kind; but for the sake of pleasure, and the music to which they were sung, they by degrees so varied the numbers and feet, that their kinds are now almost innumerable. One of the most considerable is the pindaric, distinguished by the boldness and rapidity of its flights. See PINDARIC.

The antient *ode* had originally but one stanza, or strophe; but was at last divided into three parts, *strophe*, *antistrophe*, and *epode*.—The priests going round the altar, singing the praises of the gods, called their first entrance *strophe*, i. e. turning to the left: the second, turning to the right, they called *antistrophe*, q. d. returning. Lastly, standing still before the altar, they sung the remainder; which they called *epode*. See STROPHE, ANTISTROPHE, and EPODE.

Alcaic ODE. See the article ALCAIC.

ODEUM, *ᾠδαιον*, among the antients, was a place destined for the rehearsal of the music to be sung on the theatre.

ODEUM was sometimes also extended to buildings that had no relation to the theatre.—Pericles built an *odeum* at Athens, where musical prizes were contended for: Pausanias says, that Herod the Athenian built a magnificent *odeum* for the sepulchre of his wife.

Eccle-

Ecclesiastical writers also use ODEUM for the choir of a church. See CHOR.

ODIO & ATIA, antiently called *breve de bono & malo*, is a writ directed to the sheriff, to enquire whether a man, being committed to prison on suspicion of murder, be committed on just suspicion, or only malice, and ill will.

ODONTALGIA \*, in medicine, the tooth-ach; one of the most common, yet most cruel pains the body is subject to. See TOOTH.

\* The word is Greek *οδονταλγια*, formed from *οδον*, tooth, and *αλγος*, pain.

Its cause is some sharp serosity, thrown on the membrane that lines the sockets, or alveoli of the teeth. The liquor is sometimes so very sharp and corrosive, that it eats away the teeth by little and little, and makes them fall piece-meal.—Its more remote causes are sugars, very hot things, and very cold acids, &c.

The disease is frequently attended with an inflammation, or cedematous tumour of the jaw.—It is sometimes also owing to a worm found in the root of the tooth.

The academists *Curiosi Naturæ*, decad II. mention an *odontalgia* cured by a box on the ear given the patient; and add an instance of blindness and *odontalgia* caused by shaving a man's beard. The very sight of a remedy frequently drives away the pain.

ODONTOIDES \*, *ΟΔΟΝΤΟΕΙΔΗΣ*, in anatomy, an apophysis in the middle of the second vertebra; so called from its resemblance to a tooth. See PYRENOIDES, and VERTEBRA.

\* The word is formed from the Greek *οδον*, tooth, and *ειδος*, form.

Its surface is somewhat unequal, that the ligament which comes out of it, and binds it to the occiput, may take the better hold.

It is also encompassed with a solid ligament, contrived on purpose to prevent the spinal marrow from being compressed by this apophysis.

ODOR, or ODOUR. See the article SMELL.

ODORAMENTUM, in pharmacy, a medicine applied for the benefit of its smell, whether it be fetid, or agreeable. See SUFFITUS.

Such are frequently used in hysteric and hypochondriac disorders; *e. gr.* assa foetida, camphor, &c. See NODULUS.

ODORIFEROUS Glands. See the article GLAND.

ODOROUS, or ODORIFEROUS things, are such as exhale a brisk, agreeable smell, sensible at a distance. See SMELL.

Such are the jessamin, rose, tuberose, &c. See PERFUME.

ODYSSEE \*, ODYSSEA, an epic poem of Homer, wherein he relates the adventures that befel Ulysses in his return to Italy from the siege of Troy. See EPIC.

\* The word is formed from the Greek *οδυσσεια*, which signifies the fame, of *οδυσσευς*, Ulysses.

The design of the *Iliad*, F. Bossu observes, is to instruct the states of Greece considered as united in one body, or as parts of the whole; and that of the *Odyssey*, to instruct those same states, considered in their private capacities. See ILIAD.

A state consists of two parts: The head which commands is the first; and the members that obey, the second. Now, instructions are required both for the one and the other; but it is possible to have them both conveyed under the same person.

The fable, then, of the *Odyssey* is as follows.—A prince had been obliged to quit his country, and lead an army of his subjects upon a foreign expedition. After having gloriously executed this, he was upon his return home; but in spite of all his endeavours, was detained for several years by tempests, which threw him on several countries very different from one another as to manners, customs, polity, &c.

In the dangers he had to struggle withal, his companions, neglecting his advice, all perished, through their own default. In the mean time, the great men of his country, abusing his absence, commit strange disorders in his palace, squander his treasure, lay snares for his son, and will needs force his wife to choose an husband among them; all this from an opinion he was entirely lost. But at length he returns; and having discovered himself to his son, and some others of his friends who had persisted in their allegiance, he becomes an eye-witness of the insolence of his courtiers; punishes them as they deserved, and restores that peace and tranquillity to his island, which had been banished during his absence. See FABLE.

The truth or model whereon this fable is founded, is, that a person's absence from home, so as that he cannot have an eye to his affairs, occasions great disorders. Accordingly, the hero's absence is the principal, and most essential part of the action; and takes up the greatest part of the poem.

This poem, Bossu adds, is more calculated for the people,

than the *Iliad* is, where the subjects suffer rather from the ill conduct of their princes, than by their own fault. The great names of hero's, Ulysses, &c. do not here represent the poorest peasants less than princes, Cæsars, Alexanders, &c. The meanest people are as liable to ruin their estates and families by negligence, &c. as the greatest; and accordingly have as much need of Homer's lectures, and are as capable of profiting by them, as kings themselves. See ÆNEID.

Gerard Croes, a Dutchman, in a book intitled *ὈΜΗΡΟΣ ἘΒΡΑΙΟΣ*, printed at Dort in 1704, endeavours to prove, that the subjects of Homer's two poems are taken from the scriptures: that the action of the *Odyssey*, in particular, is nothing else but the adventures of the Israelites till the death of Moses; and that the *Odyssey* was composed before the *Iliad*, the subject whereof is the taking of Jericho. What fancies!

OECONOMICS, OECONOMICA, that part of moral philosophy which teaches how to manage the affairs of a family, or household. See MORALITY, and OECONOMY.

OECOMOMUS, OIKONOMOS, a person appointed to direct, and manage a vacant church revenue, or that of an hospital, or other community.

OECOMOMUS was also antiently used for a protector, or advocate, who defended the rights and effects of churches, monasteries, &c. See ADVOCATE, and ADVOWEE.

OECOMOMUS, was also an appellation given to a church officer, who took care of the buildings, and repairs of the church, and received and distributed alms, according to the directions of the bishop.

In which sense, the sixth council appoints that every church have its *oeconomus*.

OECONOMY, OIKONOMIA, the prudent conduct, or discreet, and frugal management of a man's estate, or that of another.

To recommend *oeconomy*, a modern author observes, that land as good as most in England is let at twenty shillings an acre per annum, and sold at twenty years purchase, or for twenty pounds. Now, in an acre of land are 43560 square feet, and in twenty pounds are 4800 pence: by which dividing 43560, the quotient will be 9, and 360 remaining; which shews that one penny will purchase 9 square feet and almost 13 inches of land; viz. a piece three feet long and three broad, and something more.

Whence it follows, that two shillings purchases a piece of ground of 216 feet; viz. 18 feet long, and 12 feet broad; enough to build a pretty house upon, and room for a little garden.

Animal OECONOMY, the first branch of the theory of medicine; or that which explains the parts of the human body, their structure, and use; the nature and causes of life and health, and the effects or phænomena arising from them. See MEDICINE.

This is otherwise called *physiology*, and its objects just enumerated are called *naturals*, or *res secundum naturam*. See NATURALS.

Legal, or Jewish OECONOMY, or Dispensation, is the manner wherein God thought good to guide and govern his people under the ministry of Moses. See JUDAISM.

This included not only the political and ceremonial laws, but also the moral law, inasmuch as it pronounced a curse on all those who did not fulfil it perfectly.

Evangelical, or Christian OECONOMY, or Dispensation, is used in opposition to the legal; and comprehends all that relates to the covenant of grace, which God has made with men by Jesus Christ.

OECONOMY of the parts of Plants. See the article PLANT.

OECUMENICAL \*, signifies as much as general, or universal. See GENERAL, and UNIVERSAL.

\* The word is formed of the Greek *οικουμηνικος*, of *οικουμηνη*, the habitable earth, or the whole earth.

In this sense we say, an *oecumenical* council, or synod; meaning one at which the whole Christian church assisted, or were invited to. See COUNCIL.

Du Cange observes, that many of the patriarchs of Constantinople, assumed to themselves the quality and denomination of *oecumenical* patriarchs; particularly John the Faster, in 590, and Cyril his successor. — Gregory the great of Rome, was exceedingly enraged at it; pretending it was a title of pride, and a character of antichrist; as supposing the title *oecumenical* to imply *universal* bishop, or bishop of all the world: whereas, in effect, it implied no more, than the quality of chief of the eastern church; in like manner as the first doctor of the church of Constantinople was called *doctor oecumenicus*.

The title *oecumenical* bishop was first offered to Leo I. but he refused it; nor did his successors accept of it for a long time. The fifth council of Constantinople gave it to John, patriarch of the city; though some of the Romanists pretend that the emperor Phocas gave it, by way of preference, to the bishop of Rome.

But

But those of Constantinople have preserved it; and so late as the council of Basil, that patriarch used the title. But *oecumenical* here is only to be understood as of the extent of each patriarchate. See PATRIARCH.

**OEDEMA** \*, *ΟΙΔΗΜΑ*, a tumor which appears whitish, soft, and lax, without any notable change of colour, heat, pain, or pulsation; and which yields to the pressure of the finger, so as for some time to retain the dent or impression thereof. See TUMOR.

\* The word comes from the Greek *οιδαν*, I swell; whence *οιδημα*, a tumor. Accordingly, Hippocrates uses the word *oedema* for any tumor in general.

The general cause of *oedemas* is vulgarly supposed to be a *pituita*, as it is called, or a phlegmy humour in the body. Contusions, fractures, luxations, &c. when of long standing, often give rise to *oedemas*, especially in dropical and aged persons: so do irregular living, want of exercise, ruptures, disorders of the lymphatics, defluxions of humours, weakness of the joints, &c.

Its chief seat is the legs: In a leucophlegmatia, the whole body is *oedematous*. It frequently comes upon other diseases, especially clinics; and is familiar to women with child. It is dangerous when it tends to an abscess; when it hardens it becomes scirrhus. See OEDEMATOUS.

There are also *spurious oedemas*; in which case the pituitous humour is mixed with other humours; whence the tumor becomes erysipelatous, scirrhus, and sometimes gypsous; and hence wens, &c.

**OEDEMATOUS**, in medicine, something that is of the nature of an *oedema*; or seized, or afflicted with an *oedema*. See OEDEMA.

Thus we say, an *oedematous arm*, *oedematous legs*, &c. — Physicians divide tumors into *inflammatory*, *oedematous*, *scirrhus*, *scrophulous*, *cancerous*, &c. See TUMOR.

*Oedematous* tumors seldom, of themselves, prove dangerous, or mortal: but when they are of a long continuance, the effect of old age, or a dropical habit; when they grow hard, scirrhus, painful, or come to suppurate, the cure is generally tedious and uncertain. Those which attend wounds, fractures, or the like, are less difficult to cure.

They are easily dissolved in their first formation by the external application of solutions of bay-salt, nitre, crude sal armoniac, &c. in Spanish wine, urine, lime-water, or other laxivious fluids; while the patient submits to a course of purgatives, to discharge the matter repelled by such applications.

Under the class of *oedematous tumors*, are ranked condylomata, cristæ, rhagades, thymi, talpæ, or natæ, the ganglion and pydracium. See each under its proper article, CONDYLOMA, CRISTA, &c.

**OENELÆUM** \*, in pharmacy, a mixture of wine and oil; usually thick black wine, and oil of roses. See WINE, &c.

\* The word is Greek, *οινελαιον*; formed of *οινος*, wine, and *ελαιον*, oil.

In fractures with wounds, where the bone is not bare, Scultetus orders that the compresses, to make them stick, be drenched with *oenelæum*, to soothe the pain, and prevent an inflammation; and the bandages to be every day moistened with the same, till the inflammation be out of all danger.

**OENISTERIA** \*, in antiquity, sacrifices, held by the youth of Athens, before the first time of cutting the hair, and shaving the beard. See BEARD, HAIR, &c.

\* The etymology of the word, which comes from *οινος*, wine, shews that the matter here offered was wine.

These sacrifices were offered to Hercules; and the quantity of what was offered was regulated by law.

**OENOPTÆ**, a kind of officers, or censors, at Athens, who attended at their feasts, regulated the number of cups each was to drink, and took care that none drank too much or too little.

Those who would not be kept within the bounds of temperance, were presented by the *oenoptæ* to the areopagus. — The *oenoptæ* were also called *eyes*, *oculi*.

**ESOPHAGÆUS**, in anatomy, one of the muscles of the pharynx, which it encompasses round like a ring. See PHARYNX.

It is single, and serves to squeeze the aliment down, by closing the pharynx after the manner of a sphincter: whence some call it the *sphincter gulæ*; others *deglutitor*, or *swallower*. See SPHINCTER, DEGLUTITION, &c.

Dr. Drake will have it no more than a production of the pterygopharyngæus, whose fibres surround the pharynx from a tendinous line on the back part of it: Though Verheyen makes it a distinct pair.

**ESOPHAGUS**, *ΟΙΣΟΦΑΓΟΣ*, in anatomy, the gula, or gullet; a membranous pipe or passage, whereby our food and drink is conveyed from the mouth to the stomach. — See *Tab. Anat. (Splanchn.) fig. 2. lit. a.* See also FOOD, &c. The *oesophagus* descends from the fauces to the stomach, between the *aspera arteria* and the *vertebræ* of the neck and back, in a strait line, excepting for a little deflection about the fifth vertebra of the thorax, where it turns a little to

the right to make way for the great artery, which runs along with it to the ninth; where turning again towards the left, it crosses the artery, and piercing the diaphragm, ends at the left orifice of the stomach. See STOMACH.

It consists of several coats or membranes, usually reckoned three; though some make four, others five or six, allowing the *crusta villosa* to be one: Which last division, Dr. Drake follows as most accurate.

The first coat is membranous, and only designed for a covering for the rest; and seems only a continuation of the outward membrane of the stomach, derived from the peritonæum; though some derive it from the pleura, and others from the diaphragm.

The second is muscular, consisting of strong, fleshy fibres, like other muscles; so that it seems to make the gullet a hollow fistulous muscle. According to Steno and Willis, it consists of two orders of fibres, going from top to bottom in spiral lines, contrary to and decussating each other. Which description is very exact of the gullet of ruminants, but not so of that of men. In men it consists of two fleshy lamellæ, like two distinct muscles: The outward composed of strait longitudinal fibres; the inner of annular fibres, without any observable angles. The use of this coat is to promote deglutition: The longitudinal fibres, when in contraction, shortening the *oesophagus*, and making its capacity larger to admit of the matter to be swallowed; and the annular, on the contrary, contracting the capacity, and closing behind the descending aliment, press it downward. So that the two orders of fibres seem to act as antagonist-muscles to each other. See DEGLUTITION.

The next coat, called the *vascular*, consists of a double membrane; the outer formed of irregular fibres and innumerable vessels interwoven; the inner, of strait longitudinal fibres mixed with little glands; whence some call it the *glandulous*. This membrane adheres closely to another within, called the *nervous* coat, which is exceedingly fine, and made up of excessively slender fibres, variously disposed. It is continued to that which covers the fauces, mouth, and lips; whence it happens, that tickling the bottom of the fauces by vellicating this membrane, provokes a retching to vomit. See VOMITING.

This membrane has a quick sensation; and in this part, as some think, is the seat of thirst, or the organ whereby the appetite of drinking is excited. See THIRST. — It is lined inwardly with a villous crust, which Dr. Drake takes to be the excretory ducts of the glands, and not unlike the cuticula of the cutis, to defend the subjacent membrane. In excoriation, this is sometimes cast out at the mouth.

The upper opening of the *oesophagus*, situate at the bottom of the fauces, is called the *pharynx*. See PHARYNX.

**OESTRUM Veneris**. See the article VENERIS.

**ESYPE** \*, or *OESYPOS*, a kind of fatty mucilage, of the consistence of an unguent; of a greyish colour, and a sickish disagreeable smell, drawn from the greasy wool growing on the throats and between the buttocks of sheep.

\* The word is formed from the Greek, *οις*, sheep; and *σηψω*, I putrify, or corrupt; the *oesype* being a filthy, and, as it were, corrupted matter, drawn from sheep.

This wool they wash, boil it in water to four, let the lotions or decoctions stand for some time, and from the top skim off a fatty substance, which being strained through a linen cloth, and set to cool, makes the *oesype*, much used externally to resolve, soften, and appease pain.

**FFA Alba**, a name which Van Helmont gives to the white coagulum arising from a mixture of rectified spirit of wine with spirit of urine.

Note, the spirit of urine must be distilled from well fermented wine; and that must be well dephlegmated: else, no *offa* will arise.

**OFFERING**. See OBLATION, and HEAVE-Offering.

**OFFERTORY**, **OFFERTORIUM**, an anthem sung, or played on the organ, at the time the people are making an offering. See ANTHEM, and OBLATION.

Antiently the *offertory* consisted of a psalm sung with its anthem; though it is somewhat dubious whether the psalm was sung entire; S. Gregory mentioning, that when it was time, the pope looking at the choir who sung it, gave the sign when they should end.

**OFFERTORY** was also a name antiently given to the linen whereon the offerings were laid. — Dr. Harris says, it was properly a piece of silk or fine linen wherein the occasional oblations, or offerings of each church, were wrapped up.

**OFFICE**, **OFFICIUM**, in a moral sense, denotes a duty; or that which virtue, and right reason directs a man to do. See MORAL, MORALITY, ETHICS, &c.

Virtue, according to Chauvin, is the purpose of doing well; the thing which immediately follows, or arises from this purpose, is obedience; which same is also denominated *officium*: so that an *office* is the object of an obedience to virtue. See VIRTUE.

Cicero,

Cicero, in his discourse of *offices*, censures Panætius, who had wrote before him on the same, for omitting to define the thing or subject on which he wrote; yet does he himself fall under the same censure. He insists much on the division of *offices*; but forgets the definition.—In other of his pieces we find him defining *office*, to be an action which reason requires to be done: *Quod autem ratione actum sit, id officium appellamus.* De Finib.

The Greeks, he observes, made two species of *office*: *Perfect*, called by them *καρποδωμια*; and *common*, or *indifferent*, called *καθαρως*; which they define so, as, that what is absolutely right, makes a *perfect office*; and what we can only give a probable reason for, a *common* or *intermediate office*. See REASON.

OFFICE, in a civil sense, denotes the mutual aid, and assistance, which men owe to one another.

Benevolence inspires a man with an endeavour to do good *offices* to all mankind. See COMMON-PLACE.

OFFICE is also a particular charge, or trust, whereby a man is authorized to do something. See OFFICER.

Loyseau defines *office* a dignity attended with a public function. See FUNCTION, and DIGNITARY.

The word is primarily used in speaking of the *offices* of judicature, and policy: as, the *office* of a secretary of state, of a justice of peace, of a sheriff, &c. See JUSTICE, SECRETARY, &c.

*Offices* are either venal, or not venal.—*Venal offices* are those bought with money.

*Venal offices* are subdivided into two kinds; viz. *Dominial* and *casual*.—*Dominial*, or *offices in fee*, are those absolutely torn off, and separated from the king's prerogative, so as not to become vacant by death, but passing in the nature of a fee, or inheritance. See FEE.

Of these we have but few instances among us, which go beyond a first reversion.—Among the French they are more frequent.

*Casual offices* are those given for life, by patent, commission, &c. and which become vacant, by the officer's death, to the king's benefit; unless the officer have before resigned, or disposed of it.

The venality of *offices* of judicature is one of the grievances in the French policy. See VENAL.

*Alienation OFFICE.*

*Alternate OFFICE.*

*Crown OFFICE.*

*Jewel OFFICE.*

*Victualling OFFICE.*

See the article } ALIENATION.  
} ALTERNATE.  
} CROWN.  
} JEWEL.  
} VICTUALLING.

OFFICE is also used for a place, apartment, or board, appointed for the officers to attend in, for the discharge of their respective duties, or employments.

Such are the *secretary's office*, the *six clerks office*, the *paper-office*, *signet-office*, the *prothonotary's office*, *pipe-office*, *king's silver-office*, *excise-office*, *office of ordnance*, &c. See each in its place, SECRETARY, SIX CLERK, PAPER, SIGNET, EXCISE, ORDNANCE, &c.

Of such *offices*, some are distinguished by the name of *boards*, and others of *chambers*; as the board of green cloth, &c. See GREEN CLOTH, CHAMBER, &c.

Where the inquisition obtains, the tribunal thereof is called the *holy office*. See INQUISITION.

OFFICE, in the canon law, is used for a benefice which has no jurisdiction annexed to it. See BENEFICE.

OFFICE is also used, in common law, for an inquisition made to the king's use of any thing found by virtue of his office who enquires or makes an inquisition *ex officio*.

Hence, to traverse an *office*, is to traverse an inquisition taken of *office* before an *excheator*.—To return an *office*, is to return that which is found by virtue of the *office*.

There are two sorts of *offices* issuing out of the exchequer by commission; viz. an *office* to intitle the king in the thing inquired into; and an *office* of instruction.

OFFICE is also used for divine service celebrated in public. See LITURGY.

S. Jerom is the person, who, at the request of pope Damasus, is said to have first distributed the psalms, epistles, and gospels in the order they are now found in the *Romish office*. The popes Gregory and Gelasius added the prayers, responses, and verses; and S. Ambrose the graduals, hallelujahs, &c.

OFFICE, is more particularly used in the *Romish church*, for the manner of performing the service; which varies every day.

Thus they say the *office* of Sunday; the *office* of such a saint, &c.—The *office* is either *single*, *half double*, or *double*. See SEMI-DOUBLE.

OFFICE, again, is applied to a particular prayer preferred in honour of a saint.

When any person is canonized, a particular *office* is at the same time assigned him out of the common *office* of the confessors, the virgin, or the like. See SAINT, and CANONIZATION.

We say, the *office* of the virgin; of the holy spirit; of the

VOL. II. N° CVII.

passion: the holy sacrament, &c. The *office* of the dead is rehearsed every day, excepting on feast-days, among the Carthusians. The *office* of the holy virgin is also added to the *office* of the day, in the order of Bernardins.

OFFICES, with regard to architecture, denote all the apartments that serve for the necessary occasions of a great house, or palace: as kitchens, pantries, brew-houses, confectioneries, fruiteries, granaries, &c. as also wash-houses, wood-houses, stables, &c. See HOUSE, BUILDING, &c.

The *offices* are commonly in the *basse-cour*; sometimes they are sunk under ground, and well vaulted, &c.

OFFICER, a person possessed of a post or office. See OFFICE.

Great OFFICERS of the crown, or state, are the lord high steward, the lord chancellor, the lord high treasurer, the lord president of the council, the lord privy-seal, the lord great chamberlain, the lord high constable, the earl marshal, and lord high admiral. See each under its proper article, CHANCELLOR, TREASURER, MARSHAL, &c.

OFFICERS of justice, are those who are intrusted with the administration of equity, and justice in the courts thereof. See COURT, JUSTICE, &c.

Royal OFFICERS are those who administer justice in the king's name; as the judges, &c. See JUDGE.

Subaltern OFFICERS, are those who administer justice in the name of subjects.—Such are they who act under the earl-marshal, admiral, &c.

OFFICERS of policy, are those in whom the government and direction of the affairs of a community are invested.—Such are mayors, sheriffs, &c. See POLICY.

OFFICERS of war, are those who have command in the forces. See ARMY.

These are either *general*, *field*, or *subaltern officers*.

General OFFICERS are such whose command is not limited to a single troop, company, or regiment; but extends to a body of forces composed of several regiments.

Such are the general, lieutenant-generals, major-generals, and brigadiers. See GENERAL, &c.

Field OFFICERS are such as have command over a whole regiment; such are the colonel, lieutenant-colonel, and major.

Subaltern OFFICERS, are the lieutenants, cornets, ensigns, sergeants, and corporals.—See each officer under his proper article, CAPTAIN, COLONEL, &c.

Commission OFFICERS are such as are appointed by the king's commission.

Such are all from the general to the cornet inclusive.

They are thus called in contradistinction to *warrant*, or *staff officers*, who are appointed by the colonel's, or captain's warrant: as quarter-masters, sergeants, corporals, and even surgeons and chaplains.

Sea-OFFICERS, or *officers of the marine*, are those who have command in ships of war. See NAVY.

Flag-OFFICERS, are the admirals, vice-admirals, and rear-admirals. See FLAG, ADMIRAL, &c.

OFFICERS of the household, are the lord steward, treasurer of the household, comptroller, cofferer, master, clerks of the green-cloth, &c. The lord chamberlain, vice-chamberlain, gentlemen of the privy and bed chamber, gentlemen-ushers, grooms, pages, master of the wardrobe, of the ceremonies, &c. The master of the horse, avenor, equerries, surveyors, &c. See HOUSEHOLD; see also each officer under his proper article.

Staff OFFICERS are such as in the king's presence bear a white staff; and at other times, going abroad, have a white staff borne before them by a footman bare-headed.

Such are the lord steward, lord chamberlain, lord treasurer, &c.

The white staff is taken for a commission; and at the death of the king, the officers break their staff over the hearse made for the king's body, and thereby discharge their inferior officers.

Municipal OFFICERS.

} MINT.  
} SIGNAL.

OFFICIAL, OFFICIALIS, in the canon law, the bishop's deputy, or lieutenant; or an ecclesiastical judge appointed by a bishop, chapter, abbot, &c. with charge of the spiritual jurisdiction thereof. See COURT.

Of these there are two kinds.—The one, as it were, vicar-general of the church; exercising jurisdiction throughout the whole diocese, called by the canonists *officialis principalis*, in our statute law the bishop's *chancellor*. See CHANCELLOR.

There is no appeal from his court to the bishop; his being esteemed the bishop's court. See BISHOP'S COURT.

The other, called *officialis foraneus*, as having his jurisdiction *foris*, & *extra civitatem*, is appointed by the bishop when the diocese is very large; having a certain extent of territory assigned him, wherein he resides.

This *official* has but a limited jurisdiction, though he have *universitatem causarum*, and exercise it in the bishop's name.—Our statute laws call him, *commissary*. See **COMMISSARY**.

The bishops, especially those of large sees, finding themselves oppressed with a multiplicity of business, at first, discharged a part of it upon their archdeacons and priests; to whom they gave commissions revocable at pleasure.—These are called *vicarii*, or *officiales*. See **ARCHDEACON**, and **VICAR**.

As we do not meet with this term any where before the constitutions of the *sextus decretalium*, it is pretty apparent the custom had not its rise till the end of the 13th century.

In process of time, the function was divided into two; and the title *official* given to him with whom the bishop entrusted the exercise of litigious justice; and that of vicars general, or grand vicars, to those who had the voluntary jurisdiction.

The number of *officials* was soon excessively multiplied; and not only bishops, but chapters and archdeacons would have their *officials*.

The *officials*, by degrees, had drawn to their cognizance and jurisdiction, most of the civil causes; till they were taken out of their hands by appeals, &c.

**OFFICIAL** is also used in our laws for a deputy appointed by an archdeacon, for the executing of his jurisdiction. See **ARCHDEACON**.

**OFFICIALTY**, the court, or jurisdiction, whereof an *official* is head. See **OFFICIAL**.

The practice of *officialties* is now reduced into a little compass; and actions of promises, and dissolutions of marriages, are the principal things transacted therein.

**OFFICINAL**\*, in pharmacy, a term applied to such medicines, whether simple or compound, as are required to be constantly kept in the apothecaries shops, ready to be made up in extemporaneous prescription. See **PRESCRIPTION**.

\* The word is formed of the Latin *officina*, shop.

The *officinal simples* are appointed, among us, by the college of physicians; and the manner of making the compositions directed in their dispensatory. See **DISPENSATORY**, **COMPOSITION**, &c.

**OFFICIO**.—*Suspension ab OFFICIO*. See **SUSPENSION**.

*Ex OFFICIO*. See the article *Ex officio*.

*Quod clerici non eligantur in OFFICIO*. See **QUOD**.

**OFFING**, or **OFFIN**, in the sea language, that part of the sea a good distance from shore; where there is deep water, and no need of a pilot to conduct the ship into port.

If a ship from shore be seen sailing out to seaward, they say she stands for the *offing*.—And if a ship having the shore near her, have another a good way without her, or towards the sea, they say, that ship is in the *offing*.

**OFF-SETS**, in gardening, &c. are young shoots which spring, and grow from roots that are round, tuberous, or bulbous. See **ROOT**, **BULB**, &c.

The word is also applied to the loose, outer, brown skins of tulips, onions, &c.

**OFF-SETS**, in surveying, are perpendiculars let fall, and measured from the stationary-lines, to the hedge, fence, or extremity of the inclosure. See **SURVEYING**.

**OGEE**, or **OG**, in architecture, a moulding, consisting of two members, the one concave the other convex: the same with what is otherwise called *cymatium*. See *Tab. Archit. fig. 7.* and *24. lit. f. x.* See also **CYMATIUM**.

Vitruvius makes each member of the *ogee* a quadrant of a circle; Scamozzi, and some others, make them somewhat flatter, and strike them from two equilateral triangles.

The figure of the *ogee* bears some resemblance to that of an S.

**OGIVES**, arches or branches of a Gothic vault, which, in lieu of being circular, pass diagonally from one angle to another, and form a cross with the other arches which make the side of the square, whereof the *ogives* are diagonals. See **ARCH**, **VAULT**, and **BRANCH**.

The middle, where the *ogives* cut or cross each other, is called the *key*, which is sometimes carved in form of a rose, or a cul de lampe.—The members or mouldings of the *ogives* are called nerves, branches, or reins; and the arches which separate the *ogives*, double arches. See **VAULT**.

**OGLIO**. See the article **OLIO**.

**OGRESSES**, or **AGRESSES**, in heraldry. See **PELLETS**.

**OIL**\*, **OLEUM**, a fatty, unctuous, inflammable matter, drawn from several natural bodies. See **FAT**.

\* The word is formed from the Latin *oleum*; of *olea*, olive-tree, the fruit whereof abounds in such juice. See **OLIVE**.

The word *oil* is sometimes applied to the juices which distil naturally from plants and trees; as balm, &c. but more strictly to those juices drawn by expression, &c. from plants, fruits, grains, or seeds; as *oil of olive*, *nut-oil*, &c. See **EXPRESSED**, and **EXPRESSION**.

The kinds of *oils*, their properties, manners of expres-

sion, &c. are numerous: For the generality of them, the reader is referred to the proper articles; such as could not be more conveniently inserted, are as follow.

**OIL of olives**, is the most popular, and most universal of all others; being that chiefly used in medicine, in foods, sailets, and in the manufactures. See **SALLET**, &c.

It is drawn from olives by presses, or mills, made for the purpose. The fruit is gathered when at its utmost maturity in December and January, as it begins to redden; being put under the mill, as soon as gathered, it yields that *oil* so very sweet, and of so charming an odour, called *virgin-oil*. But, as the olives newly gathered yield but little *oil*, those who rather regard quantity than goodness, leave them on the ground for some time, ere they press them. See **OLIVE**.

Neither the smell nor taste of this second *oil* is very agreeable; though there is a third kind still worse, which is the common *oil*, procured by throwing boiling water on the pressings, and re-pressing them more strongly.

The consumption of this *oil* is incredible; the south parts of France, Provence, Languedoc, &c. as also Candia, some parts of Italy, &c. yield vast quantities. Its use every body knows: it being reputed one of the most universally useful things in the whole world.

**OIL of sweet almonds**, cold drawn, or without fire, is prepared various ways. Some peel the almonds ere they pound them; others pound them without peeling. Some warm them in luke-warm water; others in *balneo marie*; some only bruise them; others beat them into a paste.—In effect, there are as many different ways of preparing this *oil*, as there are persons who make it their business to prepare it. See **ALMONDS**.

In this diversity, Pomet gives us a method easier and less expensive than any of the rest; which, it should seem, we cannot do better than follow.

*Method of procuring OIL of sweet almonds by expression, without fire*.—Take a pound and a half of sweet almonds, new and dry; after pounding them in a mortar, pass them through a coarse sieve, lay them in a hair-cloth, and put them under the press between two plates of copper, steel, or the like; press them gently; and when all the unctuous and fluid part is expressed, you will have a sweet *oil* without any sediments, which is scarce avoidable in any of the other manners.

**Palm OIL**, or **OIL of Senegal**, a thick unctuous liquor, of a yellow colour, and a violet smell; so called because drawn, by ebullition or by expression, from the fruit of a kind of palm-tree, growing in several places of Africa, especially in Senegal.

The Africans use this *oil* as we do butter; and burn it when old. In Europe it is esteemed a sovereign remedy against cold humours; and is even said to give ease in the gout. It is sometimes counterfeited with wax, *oil* of olives, iris, and turmeric; but the trick is found out either by air or fire. The air alters the colour of the genuine, and leaves the counterfeit unchanged; and on the contrary, fire changes the counterfeit, not the genuine.

**OIL of camomile**, an oil made with the flowers of this plant steeped in oil of olives, and exposed to the sun in the heat of summer: Its colour is blueish; some add fine turpentine. It is the most esteemed when old. It is used for the cure of several kinds of wounds; and is reputed a kind of balm.

**OIL of aspic**, or *spike*, an inflammable *oil*, drawn from the flowers or leaves of a plant frequent in the southern parts of France, resembling our lavender, and called by botanists *lavendula mas*.

It is of a white colour, and an aromatic smell; and is reputed the only *oil* that will dissolve in sandarach; whence the genuine *oil* is easily distinguished from the counterfeit, which is *oil* of turpentine mixed with a little petrol.

It is used by painters and farriers; and is of some use in medicine, where it makes a part in several galenical compositions.

**OIL of petrol**. See **NAPHTHA**, and **PETROLEUM**.—**OIL of amber**. See **AMBER**.—**OIL**, or *butter of antimony*. See **ANTIMONY**.—**OIL**, or *butter of arsenic*. See **ARSENIC**.—**OIL of balm**. See **BALSAM**.—**OIL of ben**. See **BEEN**.—**OIL of beech**. See **BEECH**.—**OIL of bricks**. See **BRICK**.—**OIL of camphor**. See **CAMPHOR**.—**OIL of cinnamon**. See **CINNAMON**.—**OIL of castor**. See **CASTOREUM**.—**OIL of wax**. See **WAX**.—**OIL of cummin**. See **CUMMIN**.—**OIL of nutmeg**. See **NUTMEG**.—**OIL of cloves**. See **CLOVES**.—**OIL of neroli**. See **ORANGE**.—**OIL of black pitch**. See **PITCH**.—**OIL of rosemary**. See **ROSEMARY**.—**OIL of sage**. See **SAGE**.—**OIL of tartar**. See **TARTAR**.—**OIL of turpentine**. See **TURPENTINE**.—**Train OIL**. See **Whale Fishery**, and **TRAIN**.

**Virgin OIL**, is understood of *oils* expressed from olives, nuts, &c. fresh gathered, without being heated, too much pressed, &c. See **OIL of olives**, and **VIRGIN**.

Granulated

**Granulated OIL**, is that fixed in little grains; this is the best, and most esteemed, especially of *oils* of olives.

*Oil* frequently takes new names from the drugs mixed with it; as *oil of roses*, which is that mixed with roses; *oil of jessamy*, that perfumed with jessamin.

Plato observes, that *oil* is destructive to all plants; and he adds too, to the life of all animals, except that of man, to which it is agreeable, as also to the rest of his body. He adds further, that it is very useful to the external parts of the body, but hurtful to the internal. Fernelius observes, that *oil* softens, moistens, and lubricates the body, and takes off the sense of weariness; for which reason the Greeks call it *acopum*: it also renders the body prompt and agil. Dioscorides says it cures leprosy, &c.

**OIL**, among the chymists, is the second of the elements, or hypostatical principles; otherwise called *sulphur*. See **ELEMENT**, **PRINCIPLE**, and **SULPHUR**.

All natural bodies yield *oil*, either by distillation, putrefaction, or liquation, called *per deliquium*: And hence the chymists will have it a necessary ingredient in the composition of all bodies. They make it the principle of odours; and to the diversities thereof ascribe all the differences of bodies in respect of smells. See **SMELL**.

All plants, unless distilled with water, yield a fetid *oil* at the end of distillation; but aromatic ones besides this yield another *oil*, which rises after the phlegm, and at the beginning of the distillation: This they call an *essential oil*, because it retains the natural smell of the plant; whereas the second *oil*, even that of aromatic plants, stinks intolerably. See **ESSENTIAL**.

M. Homberg, from an observation that plants which yield the most acid, yield likewise the most *oil*; took occasion to think that the acid might assist the *oil* to disengage itself from the body, and to rise in distillation; which he found to answer in the experiment. Mineral acids proved to have more force on the *oils* of plants, and put them in a condition of rising in distillation, and in greater quantity, by the action of fire, than vegetable ones. Accordingly, whereas the perfumers find a deal of difficulty in raising essential *oil* of roses; and scarce get an ounce out of an hundred pounds of the flower: M. Homberg, on his principle, got at least one third more; viz. by laying the roses fifteen days in water impregnated with spirit of vitriol, before distillation.

The chymists doctrine of principles, Mr. Boyle shews to be very deficient in the article of *oils*: For the characteristic of a sulphur, or that which denominates a thing such, is inflammability: Now, there are at least three substances manifestly different in consistence, texture, or both; which, according to the notion, ought to be referred to sulphurs: For sometimes the inflammable substance obtained from a mixed body by means of fire, appears in form of an *oil* that will not mix with water; sometimes in form of an inflammable spirit, which will readily unite with that liquor; and sometimes also in form of a consistent body almost like common sulphur. *Producib. of Chym. Princ.*

Dr. Slare, in the *Philosophical Transactions*, gives us a scheme, or analysis of *oils*. He distinguishes *oils* into *vegetable*, *animal*, and *mineral*.

The vegetable he divides into *essential*, and *not essential*. — The essential again, are either *perfect* stillations, made by the analysis of the chymist's fire, where the oleaginous particles are truly separated from all other; as those from the seeds of cummin, fennel, and dill: or *light* and *etherial*, usually drawn from the tops of plants, and specifically lighter than water, some of them than spirit of wine; as those from thyme, wormwood, hyssop, lavender, rosemary, penny-royal, rue, sage, favin, &c. Or *ponderous*, which commonly sink in water.

Those not essential, are *imperfect*, made by expression; being decomposed of several parts of the plants; as of almonds, olives, walnuts, lime, rape, &c.

The *animal oils* are either those of the *solid* parts, as hartshorn, human skull, hoofs, &c. Or those of the *fluids*, as of human blood.

Lastly, the *mineral oils* are those of *amber*, *petroleum*, *Barbadoes tar*, to which some add *bees-wax*.

Of these *oils*, there are twelve, that by a mixture of compound spirit of nitre, make an ebullition, explosion, and flame. Eighteen that make an ebullition and explosion without flame: and four that produce neither. See **EBULLITION**, **FLAME**, &c.

**Etherial OIL.**

**Causic OIL.**

**Medullary OIL.**

**Anointing with OIL.**

**Stillatious OILS.**

**Gilding in OIL.**

**Painting in OIL.**

**OIL-BAG**, a vessel in birds, replete with an unctuous substance, secreted by one, sometimes two, glands, for the purpose, disposed among the feathers; which being pressed by the

**ÆTHERIAL.**

**ARSENIC.**

**MEDULLARY.**

**UNCTION.**

**STILLATIOUS.**

**GILDING.**

**PAINTING.**

the bill or head, emits its *oily* matter, for the dressing and preening the feathers. See **FEATHER**.

**OIL-Mill.**

**OILY Waters.**

**OINTMENT**, in pharmacy, surgery, &c.

See the article **UNGUENT**.

**OKER**\*,

**OCHRA**, or

**OCHER**, in natural history, a yellow, dry, fossil earth; harsh to the touch; found in copper and lead mines, sometimes in those of silver, and sometimes in mines of its own. See **EARTH**.

\* The word comes from the Greek *οξος*, yellow earth; formed of *οξ*\*, yellow.

Others seem more rightly to refer *oker* to the class of semi-metals, than of earths. It consists, according to them, of earth and a metal, particularly iron, combined. See **METAL**.

Mr. Boyle assures us he has seen a piece of *oker* richer in metal than most iron ores; and which was even rendered magnetical by heating, and then cooling it in a perpendicular position. See **MAGNET**, and **MAGNETISM**.

*Oker*, in effect, is always impregnated with iron, and is what generally gives to the chalybeate springs their medicinal virtues; many of which we see, upon the water's standing, will deposit the *oker* at the bottom of the vessel.

Some authors esteem *oker* proper to promote the melting of metals, when they are too harsh and brittle; but its chief use is in painting.

It is only the yellow *oker* is natural; the red is prepared from the yellow, by calcining it in the fire till it have acquired its redness.

The beds are usually from one hundred fifty to two hundred foot deep; and their thickness from four to eight inches, between a white sand which covers them at top, and a yellow argillous earth underneath.

The best *oker* is that of Berry in France. There are several kinds dug up in England, all bordering on the red; some of them used in polishing looking-glasses.

**OLD Age.** See the articles **AGE**, and **LONGEVITY**.

**OLD Astronomy.**

**OLD Style.**

**OLD Subsidy.**

**OLD Imposition of Tonnage.** See the article **DUTY**.

**OLEAGINOUS**, something that partakes of the nature of oil; or out of which oil may be expressed. See **OIL**.

Thus olives, nuts, almonds, &c. are *oleaginous* fruits, or fruits out of which oil is expressed. See **FRUIT**. — Pines, firs, &c. are *oleaginous* woods, yielding rosin, turpentine, &c. See **ROSIN**, &c. — Of all woods, *oleaginous* ones burn the best. See **FUEL**. — An *oleaginous* urine in malignant fevers is a sign of death. See **URINE**.

**OLECRANUM**, *ολεκρανον*, in anatomy, an eminence behind the bend of the elbow; being the part whereon the arm bears when we rest on the elbow. See *Tab. Anat. fig. 7. n. 11*; see also the articles **ARM**, **ELBOW**, and **ANCON**.

This eminence is nothing else but the posterior apophysis of the head of the ulna, which stays that bone, and prevents its slipping back; so as to form an acute angle when the arm is bent. See **ULNA**.

The *olecranon* is received into the hind sinus of the lower end of the humerus; and with the fore protuberance of the ulna, which is received into the fore sinus of the humerus, forms a perfect ginglymus, whereby the two bones move as on a hinge.

**OLEOSUM** *Sal volatile*. See the article **SAL**.

**OLERON Laws**, or the *Sea Laws of OLERON*, are a set of antient laws relating to maritime affairs, made by king Richard I. See **LAW**.

They are thus called, because composed in the *Oleron*, an island in the bay of Aquitaine, at the mouth of the river Charent.

**OLFACTORY Nerves**, in anatomy, the first pair of nerves springing out of the medulla oblongata; so called as being the immediate instruments of smelling. See *Tab. Anat. (Osteol.) fig. 5. lit. hh*; see also **SMELLING**.

The antients called them *processus papillares*; which doctor Drake thinks a more suitable name, till their arrival at the os cribrosum; in regard they rather appear productions of the medulla oblongata, than distinct nerves; against which, their manifest cavities, and their communication with the ventricles, argue. See **MEDULLA Oblongata**.

The *olfactory* nerves have their rise just below the os frontis, and are distributed among the membranes of the nose. See **NERVE**.

**OLIBANUM**\*, in pharmacy, a kind of gum, or resin, usually called *male frankincense*. See **FRANKINCENSE**.

\* It has its name *olibanum*, quasi *oleum libani*; because distilled in form of an oil, from a tree on mount Libanon.

*Olibanum* is brought to us in large white tears, bordering a little on the yellow; very heavy, of a sharp bitter taste, and a brisk smell.

It is distinguished from the *female*, or common frankincense, by the largeness of the drops. — It is very glutinous, and consequently

frequently strengthening; and partakes enough of the turpentine to render it somewhat detergent: It is more used in compound strengthening plaisters, than in inward compositions.

**OLIGARCHY** \*, a form of government, wherein the administration is in the hands of a few persons. See GOVERNMENT.

\* The word is formed from the Greek *ολιγος*, few; and *αρχη*, command, government.

The states of Venice, and Genoa, may be ranked among *oligarchies*.

*Oligarchy* amounts to much the same thing with *aristocracy*; unless perhaps the former import a kind of defect or corruption; as if the sovereign power were monopolized by a few persons, in prejudice of the rights of a great number. See ARISTOCRACY.

**OLIO**, or **OGLIO**, a savoury dish, or food, composed of a great variety of ingredients: chiefly found at Spanish tables. The forms of *olio's* are various; to give a notion of the strange assemblage, we shall here add one from an approved author.—Take rump of beef, neat's tongues boil'd and dry'd, and Bologna sausages; boil them together, and after boiling two hours, add mutton, pork, venison, and bacon, cut in bits; as also turnips, carrots, onions, and cabbage, borage, endive, marigolds, sorrel, and spinach; then spices, as saffron, cloves, mace, nutmeg, &c. This done, in another pot put a turkey or goose, with capons, pheasants, widgeons, and ducks, partridges, teal, and stock-doves, snipes, quails, and larks, and boil them in water and salt. In a third vessel, prepare a sauce of white wine, strong broth, butter, bottoms of artichokes, and chestnuts, with colliflowers, bread, marrow, yolks of eggs, mace and saffron. Lastly, dish the *olio*, by first laying out the beef and veal, then the venison, mutton, tongues, and sausages, and roots over all; then the largest fowls, then the smallest, and lastly pour on the sauce.

**OLITORY**, a kitchen-garden; or a garden of herbs, roots, &c. for food. See GARDEN; SALLET, &c.

**OLIVARIA Corpora**, in anatomy, are two protuberances in the under part of the brain, placed on each side the corpora pyramidalia, towards the lower end; having their name from their figure, which resembles that of an olive. See BRAIN.

**OLIVE**, **OLIVA**, a stone fruit, which yields plenty of oil; the produce of the *olea* or olive-tree. See OIL.

There are three kinds of *olives* frequently sold; different in size and goodness: viz. those of Verona, which are the best; those of Spain; and those of Provence.

The *olives*, while on the tree, are intolerably bitter, without any thing of that delicious taste, which procures them admittance at the richest tables. To fit them for that they must be prepared as follows.

*Curing or pickling OLIVES*.—In the months of June and July, long ere the *olives* are fit to yield their oil, they are gathered, and laid to steep some days in fresh water; when taken out, they are put in a lye made of water prepared with barilla, or kali, with ashes of *olive* stones calcined; or at least with lime. They are next laid in a liquor of water and salt, with which they are put in those little barrels, wherein they are brought to us. To give them the flavour, they throw over them an essence usually composed of cloves, cinnamon, coriander, and fennel. This essence is a kind of secret among those who deal herein; and, in effect, it is in this that all the difficulty of the preparation lies.

*Drawing of oil of OLIVES*.—The *olives* being gathered, are laid for some time on the ground to drain, and to ripen further; they are then ground into a paste with a mill-stone: The paste is put in large frails, and boiling water poured over them. Lastly, the whole is pressed; by means whereof the oil is easily separated, and swims a-top of the water.

**OLIVE-COLOUR**, is a yellow, mingled with black. See COLOUR.

The term is chiefly used in speaking of the tincture of the complexion: The Spaniards and Indians are rarely white, generally *olive-complexioned*.

**OESTRUM Veneris**, *extasy* or *incentive of love*; an appellation sometimes given the *clitoris*, from the lascivious titillations it is capable of. See CLITORIS.

**OLYMPIAD**, **ΟΛΥΜΠΙΑΣ**, in chronology, a space, or period of four years; whereby the Greeks reckoned their time. See EPOCH.

This method of computation had its rise from the *olympic games*, which were celebrated every fifth year, near the city *Olympia* in Peloponnesus. See OLYMPIC.

The first *olympiad* commenced, according to some, in the year 3938 of the Julian period; the year from the creation 3174; the year before Christ 774; and 24 years before the foundation of Rome: Or rather, as others will have it, in the year of the world, 3251; the year of the Julian period, 3941; and 23 years before the building of Rome.

The Peloponnesian war begun on the first year of the 87th *olympiad*. Alexander the Great died the first year of the 114th; and Jesus Christ was born the first year of the 195th *olympiad*.

The *olympiads* were also called *anni Iphiti*, from Iphitus, who

instituted, or at least renewed the solemnity of the *olympic games*.

We do not find any computation by *olympiads* after the 364th, which ended with the year of Christ 440.—Except that in a charter of our king Ethelbert, the years of his reign are said to be reckoned by *olympiads*.

**OLYMPICS**, or **OLYMPIC Games**, were solemn games, famous among the antient Greeks; instituted, according to some, by Hercules, in honour of Jupiter; and held at the beginning of every fifth year, that is every 49th month, on the banks of the Alpheus, near Olympia, a city of Elis; to exercise their youth in five kinds of combats. See GAMES.

These games became so considerable, that the Greeks made them their epocha; distinguishing their years by the returns of the *olympics*. See OLYMPIAD.

Those who were conquerors in them, were so honoured by their countrymen, that at their return, a piece of the wall of the city was pulled down to give passage to their chariot.

The prize contended for, was a crown made of a peculiar sort of wild olive appropriated to this use. See OLYMPIONICES.

**OLYMPIC Fire**, is sometimes used for the fire arising from the sun's rays collected in the focus of a burning-glass. See FIRE, and BURNING-glass.

**Gli OLYMPICI**, the title of the academists of Vicenza in Italy. See ACADEMY.

**OLYMPIONICES**, **ΟΛΥΜΠΙΟΝΙΚΗΣ**, in antiquity, an appellation given to those who came off victorious in the *olympic games*. See OLYMPIC.

The *olympionices* were infinitely honoured in their country, as being esteemed to have done it immortal honour. The Athenians particularly, were so lavish in their presents to the *olympionices* their countrymen, that Solon found it necessary to restrain their liberality by a special law, which imported that the city should give 500 drachma's to the *olympionices*; which amounted to about 58 ounces of silver, our weight. No very considerable sum!

**OMBRE**, a celebrated court-game at cards; played by two, by three, or by five persons; but generally by three. See CARDS, and GAME.

The game of *ombre* is borrowed from the Spaniards; and requires all the phlegm and gravity of that people in the playing. The name signifies as much as the *game of man*; *ombre*, or *bombre*, in Spanish, signifying *man*, in allusion to the thought and attention required herein.

In *ombre by three*, nine cards are dealt to each party; the whole *ombre* pack being only 40; by reason the eights, nines, and tens are thrown aside: he that wins, must take five tricks, or four when the other five are divided so as one have two, and the other three.

After the cards are dealt, if none of the parties think their hand strong enough to attempt for the stake or game, they all *pass*; and, after something put down to the former stake, deal over again. If any will attempt for it, he henceforth is called the *ombre*; and the other two become leagued together, like two partners at whist, to defend it against him.—Note, each has the refusal of being *ombre*, according to his order of seniority.

There are two ways of undertaking for the game: In the first, which is the most usual, after chusing what he will have trumps, he *discards*, or lays aside what number of cards he pleases, and in their lieu takes an equal number from the remainder of the pack; the like do the other two.—The other way is, when he dare trust to his own hand, and therefore declines to discard, or change any cards, but leaves that to the others; which is called playing *jans prendre*: If he gains the point in this latter case, he reaps somewhat extraordinary, more than in the first.

If he fail in either case, he is said to be *beasted*; and the failure is called a *remise*, or *repucse*; and if one of the defenders of the stake win more tricks than he, such person is said to win *codille*, and takes up the stake the *ombre* played for: And in both cases, the *ombre* is to forfeit the value of the stake played for to the board.

If the *ombre* win all the nine tricks, it is called winning the *vole*, and he reaps doubly; and if he attempt it, and miscarry, he suffers proportionably.

The oversights and irregularities committed in the course of the game, are called *beastes*, and subject the persons chargeable therewith to forfeitures.

As to the order and value of the cards at *ombre*, it is to be observed, that the ace of spades, called *spadille*, is always the first or highest trump, in whatever suit the trump be; the duce of trumps, when trumps is of either of the black colours; or the seven, if of the red, is the second trump, and called *manille*; the ace of clubs, called *basto*, the third; and if either of the red suits be trump, the ace of that suit, called *punto*, the fourth. The rest in the black suits are valued according to the following order, viz. king, queen, knave, seven, six, five, four, and three. In the red suits they follow thus; king, queen, knave, duce, three, four five, and six.

The three first, or principal trumps, are called *matadores*; which have this privilege, that they are not obliged to attend an inferior trump when it leads; but for want of another small trump,

trump

## OME

trump, the person, may renounce trumps, and play any other card.—Add, that if the three matadores be in the hands of the ombre, in case he be beasted, he is to forfeit for them; or, if he gain his point, he is to have a consideration for them; but for nothing less than three. And it must be further noted, that the trumps immediately succeeding these, viz. punto, king, queen, &c. if they be found in the same hand with the former, are also reputed as matadores, and to be allowed, or forfeited for like the rest: And this as low as the sequence reaches without interruption.  
There are some varieties in the manner of playing the game of ombre.—Sometimes he who has spadille is obliged to play, let his game be ever so bad; which is called *force spadille*. Sometimes, when all have passed, a person undertakes the game on condition of discarding, and making up his hand ere he names trump; which is called *gascarille*.  
In ombre by five, which some even prefer to that by three, as not requiring so much attention; only eight cards apiece are dealt; and five tricks must be won, otherwise the ombre is beasted.  
Here the person who undertakes the game, after naming the trump, calls a king to his assistance; upon which, the person in whose hand the king is, without discovering himself, is to assist him as a partner, and to share his fate. If between both they can make five tricks, the ombre wins; and then the auxiliary king shares the spoil; and vice versa.  
If the ombre venture the game without calling in any king; this too is called playing *sans prendre*; in which case the other four are all against him, and he must win five tricks alone, or be beasted.—The rest is much the same as by three; mutatis mutandis.  
OMBRE *de Soleil*, in heraldry, shadow of the sun; is when the sun is borne in armoury, so, as that the eyes, nose, and mouth, which at other times are represented, do not appear; and the colouring is thin, so that the field may be seen through it.  
OMELET\*, a kind of pancake or fricassée of eggs, with other ingredients; very usual in Spain, and France.  
\* Menage derives the word from the Italian *animella*, little soul; which, he says, that people use for the nice bits among the giblets of fowls, &c. used for fricassees, as livers, hearts, kidneys, gizzards, &c. From whence, by resemblance, is formed the French *omelette*, a fricassée of eggs. Tripod derives the word from *apa*, together, and *auis*, to dissolve, moisten, mix: And M. de la Mothe le Vayer from the French *oeuf*, egg, and *melez*, mingled.  
The forms of omelets are various. We meet with farced omelets, omelets with sugar, omelets of green peas, omelets a la Turq. &c.  
A noted author in this way prescribes the following one. The eggs, being beaten, are to be seasoned with salt and pepper, and then fried in butter made boiling hot: This done, gravy to be poured on, and the whole stewed with chives and parsley shred small. When one side is fried enough, it is to be turned on the other.  
OMEN\*, a sign, or indication of something future, taken from the mouth of a person speaking. See AUGURY, DIVINATION, &c.  
\* Festus derives the word *omen* from *oremen*, quod sit ore, as being a preface by the mouth. See PRESAGE.  
OMEN *Prærogativum*, among the Romans, was the vote of the first tribe, or century, in their comitia.  
When a law, &c. was proposed, or an election to be made, an urn was brought in to the priests there present, into which were cast the names of the tribes, or centuries or curiæ; as the comitia were either tributa, centuriata, or curiata. And the lots being drawn, that tribe, century, &c. whose name came up first, was called *tribus*, or *centuria prærogativa*, because their voices were asked first. And so much did the Romans depend on this prerogative century, that the rest generally followed them. Hence a person who had the voices of the prerogative, was said to have *omen prærogativum*.  
OMENTUM\*, in anatomy, a fat, thin membrane spread over the intestines, and following them in all their sinuosities.—See Tab. Anat. (Splanchn.) fig. 2. lit. gg. fig. 3. lit. mm. See also INTESTINES.  
\* The omentum is the same with what is otherwise called *epiploon*, *caul*, *rete*, *reticulum*, &c.  
It reaches from the bottom of the stomach (to which it is connected) to the navel, at which it ordinarily terminates; though in some subjects it goes farther, so as upon a rupture of the peritonæum, to fall into the scrotum. Besides the stomach, it is fastened to the concave part of the liver, the backside of the duodenum, part of the colon, the back, and the spleen; its other extremity to the small guts.  
Its form resembles that of a pouch or fachel, which may be inflated with a blow-pipe to the capacity of a gallon.  
Its substance is membranous, consisting of two leaves, or coats, between which, and on the surfaces of which, are innumerable veins, arteries, nerves, and vasa adiposa, or fat vessels, variously interwove, and by their interfections dividing the part into a multitude of little areolæ, resembling the meshes of a fine net; whence its name, *rete*.  
The fat, in its proper ducts, running along with the other

## OMP

vessels, renders these areolæ very obscure; while the intermediate spaces are filled with a transparent membrane, full of small holes; so that the whole appears a beautiful kind of net. Its arteries come from the celiac and mesenterics, and its veins run to the porta, and are called *epiploicæ*; its nerves from the intercostals.  
The fat, here, as in the membrana adiposa, is either brought by the ducts into the adipose cells, or delivered from the cells into the ducts; for the fineness of the vessels, &c. renders their course exceeding difficult to trace: It is even doubted whether or no they be hollow. Malpighi, and many others, incline to the former opinion; and take the *omentum* to be nothing else but a large pouch, full of innumerable little ones, filled with fat; they add, that the ductus adiposi are real vessels arising out of the *omentum*, and spreading themselves, by means of the membrana adiposa, throughout the whole body; distributing fat to every part, in the same manner as the arteries distribute blood. See FAT, and DUCTUS *Adiposi*.  
The particular use of the *omentum* is to promote the peristaltic motion of the guts, by lubricating them with its oily substance, which transudes through its pores; and by following them in their doublings and windings, to serve as a bolster to slide upon; and by filling up their hollows, preventing their being too much distended with flatulencies, yet giving way to them when replete with aliment. See *Hist. Acad. R. Scienc.* an 1725. p. 12. *seqq.*  
The *omentum* is single in all animals, excepting monkeys, in which it is triple, or quadruple.  
OMITTAS. See the article NON *Omittas*.  
OMNIUM *florum Aqua*. See the article AQUA.  
OMOPHAGI\*, among the ancient geographers, a name given to certain nations who fed on raw flesh, as the Scythians, &c.  
\* The word is formed of *ομο*, crude, and *φαγω*, I eat.  
OMOPHORUM\*, a little cloak, antiently wore by the bishops over their shoulders; thereby to represent the good shepherd who brings home the strayed sheep on his shoulders.  
\* The word is pure Greek, formed from *ομο*, shoulder, and *φορεω*, I bear.  
For this reason the *omophorium* was put off at the opening of the gospels, because then the true shepherd Jesus Christ was supposed present in person.  
Some confound the *omophorium* with the *pallium* wore by the patriarchs: But there was this difference, that the *pallium* was a long cloak, of purple, and was peculiarly reserved for patriarchs; though since given to some bishops by way of distinction. See PALLIUM.  
OMOPATE\*, ΟΜΟΠΑΤΗ, in anatomy, is used in the general for the shoulder; but more particularly for two bones situate on the hind part of the upper ribs, one on each side; called also *scapulae* and *shoulder-blades*. See SCAPULA, and SHOULDER.  
\* The word comes from the Greek *ομο*, shoulder, and *πατος*, broad.  
These bones are broad, and especially in the middle; thick in their apophyses; of a triangular form; concave within, and convex without; and are joined to the clavicles and arms.  
OMPANORATE, an appellation given to the priests of the island of Madagascar.  
These are the school-masters of the country, and teach Arabic and writing. They have several books, but none of them contain more than some chapter of the Alcoran, and a few physical recipes.  
They are divided into several orders, bearing some resemblance to our ecclesiastical dignities: As *ombiasse*, secretary or physician; *tibon*, subdeacon; *mouladzi*, deacon; *faqih*, priest; *catibon*, bishop; *lamlamaba*, archbishop; *ompisquili*, prophets or diviners; *jababa*, calif, or chief of the religion.  
The *Ompanorates* deal much in talismans, and other charms, which they call *bitidzi*, and which they sell to the grandees of the place. They also make little statues or images, called *auli*, which they consult as oracles; and to which they ascribe various powers; as the making rich, destroying enemies, &c. They have public schools, where they teach their superstitions and fortileges.  
The *ompisquili* practise geomancy, and are mostly consulted on diseases, and the success of affairs; resolving all questions by figures drawn on a little table, covered with sand.  
OMPHACION\*, ΟΜΦΑΚΙΟΝ, in pharmacy, the juice of four or unripe grapes.  
\* The word is derived from the Greek *ομφαξ*, unripe grape.  
Some have also given the name to a kind of oil, pretended to be drawn from olives while yet green and sour.—But Pomet charges it as an imposture; adding, that olives yield no oil at all till perfectly ripe. See OIL, and OLIVE.  
OMPHALOCLE\*, in medicine, a kind of hernia, or tumor in the navel; arising, like other ruptures, from a relaxation, or rupture of the peritonæum; by which either the omentum or the guts fall down. See HERNIA.  
\* The word is Greek, *ομφαλοκλη*; formed of *ομφαλο*, navel, and *κλη*, tumor.—It is otherwise called *exomphalus*. See EXOMPHALUS.  
Its remoter causes are violent strains, loud cries, abundance of serous humor, difficult delivery, &c.

**OMPHALO-MESENTERIC**, in anatomy. — All foetus's are wrapped in at least two coats, or membranes; most of them have a third, called *allantoides*, or urinary. Some, as the dog, cat, hare, &c. have a fourth; which has two blood-vessels, viz. a vein and an artery, called *omphalo-mesenterics*; because passing along the string to the navel, and terminating in the mesentery. See **FOETUS**, **SECUNDINE**, &c.

**OMPHALOPTER**, or **OMPHALOPTIC**, in optics, a glass that is convex on both sides, popularly called a *convex lens*. See **CONVEX**.

**OMPHALUS**. See **ENTEROMPHALUS**, **EXOMPHALUS**, and **HYDROMPHALUS**.

**ONANIA**, and **ONANISM**, terms which some late empirics have framed, to denote the crime of self-pollution; mentioned in scripture to have been practised by Onan, and punished in him with death. Some take it for the same with what in other places of scripture, particularly Levit. ch. xx. is called "giving of seed to Moloch;" for which the punishment allotted is stoning to death. See **POLLUTION**.

\* This is but ill warranted: The ablest critics make them quite different things. Selden is positive the Jews, in imitation of their neighbours, actually sacrificed their children to Moloch. — Others fancy they only made them pass between two fires, in order to obtain the idol's favour and protection.

**ONDEE**, or **ONDE**, in heraldry. See the article **WAVY**.

**ONE Wheel Plough**. See the article **PLOUGH**.

**ONEIROCRITICA**\*, **ΟΝΕΙΡΟΚΡΙΤΙΚΗ**, the art of interpreting dreams; or a method of foretelling future events by means of dreams. See **DREAM**, **DIVINATION**, &c.

\* The word is formed from the Greek *ονειρον*, dream, and *κρινω*, of *κρισις*, judgment. — Some call it *oneirocratia*; and derive it from *ονειρον*, and *κρατω*, I possess, I command.

It appears from several passages of scripture, that there was, under the Jewish dispensation, such a thing as foretelling future events by dreams; but then there was a particular gift, or revelation required for that purpose.

It should seem hence, that dreams are really significative, and do forebode something to come; and all that is wanting among us is the *oneirocritica*, or the art of knowing what: Yet it is the opinion of many, that dreams are mere chimeras; bearing, indeed, some relation to what has passed, but none to what is to come. — As to the case of Joseph, it was possible for God, who knew all things, to discover to him what was in the womb of fate; and to introduce that, he might take the occasion of a dream: Not but that he might as well have foretold it from any other accident or circumstance whatever. Unless God, to give the matter more weight, should purposely communicate such a dream to Pharaoh, in order to fall in with the popular notion of dreams and divination, which then prevailed among the Egyptians. See **ONEIROCRITICS**.

**ONEIROCRITICS**\*, a title given to interpreters of dreams, or those who judge of events from the circumstances of dreams. See **ONEIROCRITICA**.

\* The word is formed from the Greek *ονειρον*, dream, and *κρισις*, judgment.

There is no great regard to be had to those Greek books called *Oneirocritics*; nor do we know why the patriarch of Constantinople, and others, should amuse themselves with writing on so pitiful a subject.

Rigault has given us a collection of the Greek and Latin works of this kind; one attributed to Astrampichus, another to Nicephoras, patriarch of Constantinople; to which are added the treatises of Artemidorus and Achmet. — But the books themselves are little but reveries; a kind of waking dreams, to explain and account for sleeping ones.

The secret of *oneirocriticism*, according to them all, consists in the relation supposed to be between the dream, and the thing signified: But they are far from keeping to the relations of agreement, and similitude; and frequently have recourse to others of dissimilitude, and contrariety.

**ONERANDO** *pro rata portionis*, a writ which lies for a joint tenant, or tenant in common, when distrained for more rent than the proportion of his land comes to.

**ONGLEE**, or **ONGLE**, is used by the French heralds to denote the talons or claws of beasts or birds, when of colours different from the body.

**ONKOTOMY**\*, in chirurgery, the operation of opening a tumor, or abscess.

\* The word is formed from the Greek *ονκος*, tumor, and *τομω*, I cut. See **TUMOUR**, &c.

**ONOMANCY**\*, or rather **ONOMAMANCY**, the art of divining the good or evil fortune which may befall a man, from the letters of his name. See **NAME**.

\* The word is supposed to be formed from the Greek *ονομα*, name, and *μαντια*, divination. — Indeed there is something singular in the etymology: For, in strictness, *onomancy* should rather signify divination by asses; being formed from *ονος*, assinus, and *μαντια*: To signify divination by names, it should be *onomatomancy*. See **NOMANCY**.

*Onomantia* was a very popular and reputable practice among the ancients: The Pythagoreans taught, that the minds, actions and successes of men, were according to their fate, genius,

and name; and Plato himself seems somewhat inclinable to the same opinion. Aufonius expresses it to Probus, thus:

*Qualem creavit moribus  
Fussit vocari nomine,  
Mundi supremus arbiter.*

Thus he plays with tippling Meroe, as though her name told she would drink mere wine without water, or, as he calls it, *merum merum*. Thus Hippolitus was observed to be torn in pieces by his coach-horses, as his name imported; and thus Agamemnon signified he should linger long before Troy. Priam, that he should be redeemed out of bondage in his childhood. Hitherto may be also referred that of Claudius Rutilius:

*Nominibus certis credam decurrere mores?  
Moribus aut potius nomina certa dari?*

It is a frequent observation in history, that the greatest empires and states have been founded and destroyed by men of the same name. Thus Cyrus, the son of Cambyfes, begun the Persian monarchy; and Cyrus, the son of Darius, ruined it. Darius, son of Hystaspes, restored it; and again, Darius, son of Arsamis, utterly overthrew it. Philip, son of Amintas, exceedingly enlarged the kingdom of Macedonia; and Philip, son of Antigonus, wholly lost it. Augustus was the first emperor of Rome; Augustulus the last. Constantine first settled the empire of Constantinople; and Constantine lost it wholly to the Turks.

It is an observation of the like kind, that some names are constantly unfortunate to princes: As Caius among the Romans; John in France, England, and Scotland; and Henry in France.

One of the great rules of *onomancy* among the Pythagoreans, was, that an even number of vowels in a name signified an imperfection in the left side of the man; and an odd number, in the right. — Another rule was, that those persons were the most happy, in whose names the numeral letters, added together, made the greatest sum: For which reason, say they, it was, that Achilles vanquished Hector; the numeral letters in the former name amounting, forsooth, to a greater number than in the latter.

And it was doubtless from a principle much of the same kind, that the young Romans toasted their mistresses at their meetings as often as there were letters in their names. Thus Martial,

*Nævix sex cyathis, septem Justina bibatur.*

Rhodiginus describes a singular kind of *onomantia*. — Theodotus, king of the Goths, being curious to know the success of his wars against the Romans; an *onomantical* Jew ordered him to shut up a number of swine in little styes, and to give some of them Roman, to others Gothic names, with different marks to distinguish them; and there to keep them till a certain day: which being come, upon inspecting the styes, they found those dead to whom the Gothic, and those alive, to whom the Roman names were given. — Upon which the Jew foretold the defeat of the Goths.

**ONOMATOPOEIA**\*, in grammar and rhetoric, a figure of speech, whereby names and words are formed to the resemblance of the sound made by the things signified.

\* The word is formed from the Greek *ονομα*, name, and *ποιω*, I make, I feign.

Thus is the word *trique-track*, formed from the noise made by moving the men at this game: And from the same source arises the *buzz* of bees, the *grunting* of hogs, the *cackling* of hens, the *snoring* of people asleep, the *clashing* of arms, &c. — The surest etymologies are those deduced from the *onomatopœia*. See **ETYMOLOGY**.

**NONYCHITES**\*, something that has the hoofs, that is, the feet of an ass.

\* The word is formed from the Greek *ονος*, ass; and *ονυξ*, hoof, nail.

**NONYCHITES** was an appellation which the heathens, in the first century, gave the God of the Christians, because they owned and adored the same God with the Jews. — For it was a notion, (howsoever it had its rise) as appears from Tacitus, *Hist. Lib. V. c. 3.* that the Israelites, much afflicted with thirst, were led to a spring by an ass going to drink; and that, in gratitude for the benefit, they worshipped an ass: and that the Christians did so likewise. *Vid. Tertull. Apol.*

**ONTOLOGY**, or **ONTOSOPHY**, the doctrine or science *de ente*, that is, of being, in the general, or abstract. See **ENS**. *Ontology* coincides with what in the schools is more usually called *metaphysics*. See **METAPHYSICS**.

**ONYCOMANCY**\*, or, as some write it, **ONYMANCY**, a kind of divination by means of the nails of the fingers. See **NAIL**.

\* The word is formed from the Greek *ονυξ*, nail, and *μαντια*, divination.

The ancient practice was to rub the nails of a youth with oil and foot, or wax; and to hold up the nails thus smeared against the sun. — Upon them were supposed to appear figures or characters, which shewed the thing required.

Hence also modern chiromancers call that branch of their art, which relates to the inspection of nails, *onycomancy*.

**ONYX**,

**ONYX**\*, **ONYX**, in natural history, a kind of precious stone, accounted a species of opake agat. See **PRECIOUS Stone**, **AGAT**, &c.

\* The word, in the Greek language, signifies *nail*; the poets making this stone to have been formed by the Parcae, from a piece of Venus's nails, cut off by Cupid with one of his arrows.

It is of a dark horny colour, in which is a plate of a bluish white, and sometimes of red; the several colours appearing as distinct as if laid on by art.

There are some brought from Arabia, mixed with a brownish hue; which, after taking off one lay or zone, shew another underneath, of a different colour. — Whence they take the name *memphitis*, or *camehuia*, *q. d.* another stone. See **CAMAIEUX**.

White zones or girdles are essential to an *onyx*.

Dioscorides and Galen rank alabaster among the number of *onyx's*; though this is very remote from the sentiment of the moderns. See **ALABASTER**.

**OPACITY**, in philosophy, a quality of bodies which renders them opake, that is, impervious to the rays of light. See **LIGHT**.

The term *opacity* is used in opposition to *transparency*. See **TRANSPARENCY**.

*Opacity*, according to the Cartesians, consists in this, that the pores of the body are not all strait, or directly before each other; or rather, not pervious every way.

But this doctrine is deficient; for though it must be allowed that to have a body transparent, its pores must be strait, or rather open every way: Yet how it should happen, that not only glass and diamonds, but even water, whose parts are so very moveable, should have all their pores open and pervious every way; and at the same time, the finest paper, or the thinnest gold plate, should exclude the light for want of such pores, is inconceivable. So that another cause of *opacity* must be found.

Now, all bodies have vastly more pores or vacuities than are necessary for an infinite number of rays to find a free passage through them in right lines, without striking on any of the parts themselves. For since water is nineteen times lighter, *i. e.* rarer than gold; and yet gold itself is so very rare, that magnetic effluvia pass freely through it without any opposition; and quicksilver is readily received within its pores, and even water itself by compression; it must have much more pores than solid parts; consequently, water must have at least forty times as much vacuity as solidity. See **PORE**.

The cause therefore why some bodies are opake, does not consist in the want of rectilinear pores, pervious every way; but, either in the unequal density of the parts; or in the magnitude of the pores, and being either empty, or filled with a different matter, by means whereof the rays of light, in their passage, are arrested by innumerable refractions and reflections; till, falling at length on some solid part, they become quite extinct, and are utterly absorbed. See **RAY**, and **REFRACTION**.

Hence cork, paper, wood, &c. are opake; while glass, diamonds, &c. are pellucid. For in the confines, or joining of parts alike in density, such as those of glass, water, diamonds, &c. among themselves; there arises no refraction or reflection, by reason of the equal attraction every way. So that such of the rays of light as enter the first surface, pass strait through the body; excepting such as are lost and absorbed, by striking on solid parts. But in the bordering of parts unequal in density; such as those of wood and paper, both with regard to themselves, and with regard to the air or empty space in their larger pores; the attractions being unequal, the reflections and refractions will be very great: Thus the rays will be unable to pass through such bodies, being continually banded about, till they become extinct. See **REFRACTION**, &c.

That this interruption, or discontinuity of parts, is the chief cause of *opacity*, Sir Isaac Newton argues, does appear hence, that all opake bodies immediately begin to be transparent, when their pores become filled with a substance of equal, or almost equal density with their parts. — Thus paper dipped in water or oil, the stone called *oculus mundi* steeped in water, linen cloth dipped in oil or vinegar, and other substances soaked in such fluids as will intimately pervade their little pores, become more transparent than before.

On the contrary, the most transparent substances, by emptying their pores, or separating their parts, may be rendered very opake. — Thus salts, or wet paper, or *oculus mundi*, by drying; horn, by scraping; glass, by pulverizing or flawing; and water itself, by being beat into bubbles or froth, are rendered opake.

Indeed, to render bodies opake and coloured, their interstices must not be less than of some determinate size: For the most opake bodies that are, if their parts be very minutely divided, as when metals are divided in acid menstrua, become perfectly transparent. See **COLOUR**, **TRANSPARENCY**, &c.

**OPAL**, **OPALUS**, a precious stone, of various colours; changeable according to the different position of the stone to the light. See **PRECIOUS Stone**.

In it are seen the red of the ruby, the purple of the amethyst, the green of the emerald, besides yellow, blue, and sometimes black and white.

When the stone is broke, most of these colours disappear; which shews that they arise by reflection from one or two principal ones.

Its form is always either round, or oval; its prevailing colour white. Its diversity of colours makes it almost of equal value with a sapphire or ruby.

Tavernier says, perhaps somewhat too positively, that there are mines of *opal* in Turkey. Other authors, antient and modern, say, Cyprus, Arabia, Egypt, Bohemia, and Hungary, produce it: whence it is distinguished into two kinds, *oriental* and *occidental*. Its figure is always either round, or oval, somewhat like a pearl. They polish it with tripoly.

Pliny among the antients, and Porta and Albertus Magnus among the moderns, are very copious on the virtues of the *opal*; forsooth, because it has the colours of all the other precious stones, it must have all their virtues too. The antients called it *paideros*, from its promoting love and good-will. Pliny and Solinus mention a species of *opal*, called *exacanthus*, which had sixty colours.

**Artificial OPAL**. — In the *Philosophical Transactions*, Mr. Colepreffe gives us an account of the manner of counterfeiting *opal*, as practised at Harlem. He says, the counterfeit is very lively, and thinks it only performed by the degrees of heat, which produce the colours. When the composition is melted, they take out some on the point of an iron rod, which being cooled either in the air or water, is colourless or pellucid; but being put into the mouth of the furnace on the same rod, and there turned by the hand for a little space, hath its little bodies so variously posited in various parts of the same piece, that the light falling on them, being variously modified thereby, represents the several colours seen in the natural *opal*. He adds, the colours may be destroyed and restored, according to the various motions of its particles, by heat.

**OPALIA**, in antiquity, feasts celebrated at Rome, in honour of the goddess Ops.

Varro says, they were held three days after the expiration of the Saturnalia. According to Macrobius, they were held on the nineteenth of December, which was one of the days of the Saturnalia. — He adds, that those two feasts were celebrated in the same month, because Saturn and Ops were husband and wife, and that it is to them we owe the invention of corn and fruits: For which reason, the feast was not held till the harvest and fruit-time were entirely over.

The same author observes, that the vows offered to the goddess, were made sitting on the ground; to shew that she was *earth*, the mother of all things.

**OPEN Flank**, in fortification, is that part of the flank which is covered by the orillon. See **FLANK**.

**OPEN Fire**. See **FIRE**, and **REVERBERATORY**.

**OPEN Fountain**. See the article **FOUNTAIN**.

**OPEN Pound**. See the article **POUND**.

**OPENING a Vein**. See the article **PHLEBOTOMY**.

**OPENING of Trenches**, is the first breaking of ground by the besiegers, in order to carry on their approaches towards a place. See **TRENCH**.

**OPENING of Gates**, in astrology, is when one planet separates from another, and presently applies to a third bearing rule in a sign opposite to that ruled by the planet, with which it was before joined.

**OPENING the Mouth**. See the article **MOUTH**.

**OPERA**, a dramatic composition set to music, and sung on the stage; accompanied with musical instruments; and enriched with magnificent dresses, machines, and other decorations. See **DRAMA**.

Bruyere says, that it is essential to the *opera* to keep the mind, the eyes, and ears in an enchantment. S. Evremond calls the *opera* a chimerical assemblage of poetry and music; where the poet and musician mutually cramp each other.

The *opera* we derive from the Venetians, among whom it is held one of the principal glories of their carnival. See **COMEDY**.

While the English and French comic and tragic theatres were forming, the Venetians invented the *opera*: The abbot Perrin, introducer of ambassadors to Gaston duke of Orleans, was the first that formed the design of introducing it into Paris; and he obtained the king's privilege for the same in 1669. And it was not long ere it passed thence into England. — The author of the *Spectator* observes, that the French music agrees with their accent and pronunciation much better than the English; and are at the same time better calculated for the gay humour of that people. See **RECITATIVE**.

At Rome they have a kind of *spiritual opera's*, frequent in Lent; consisting of dialogues, duo's, trio's, ritornella's, chorus's, &c. The subject whereof is taken out of scripture, the life of some saint, or the like. — The Italians call them *oratorio's*: The words are frequently Latin; and sometimes Italian.

**OPERATION**, in the general, the act of exerting, or exercising some power, or faculty, upon which an effect follows. See **POWER**.

The noblest operation of man, is that by the schoolmen called *vital*, or *inmanent*, viz. the operation of the mind; which, with

with regard to the understanding, is threefold; apprehension or perception, discretion or judgment, and reasoning or discourse. See APPREHENSION, JUDGMENT, and DISCOURSE. The directing of these makes the object of logic. See LOGIC. With regard to the will, the immanent *operations* are willing and nilling; to which are referred loving and hating. See WILL.

**OPERATION**, in medicine, denotes a methodical action of the hand, on the human body; in order to re-establish health. See CHIRURGERY.

Bleeding is a very common, but at the same time a dangerous *operation*. See PHLEBOTOMY, and BLEEDING.

Trepanning is one of the finest *operations* in chirurgery. See TREPANNING.—The *Cæsarean operation*, is the cutting open a woman with child, and drawing out the child through the aperture. See CÆSAREAN.

The other chirurgical *operations*, are sutures, tapping, castrating, cutting for the fistula, amputation, extirpation, cupping, &c. See each in its place, as SUTURE, &c.

**High OPERATION**. See the article HIGH.

**Lateral OPERATION**. See the article LITHOTOMY.

**OPERATION** is more particularly used in medicine, for the manner wherein any remedy produces its salutary effect; or that series of actions, mediate and immediate, whereby its remote end is attained. See MEDICINE.

See the *operations* of each kind of medicines under the proper heads, SPECIFICS, PURGATIVES, EMETICS, OPIATES, &c.

**OPERATIONS**, in chymistry, denote the processes, or experiments, by means whereof the proper changes are produced in bodies, and the effects of the art procured. See CHYMISTRY. The changes chymistry produces in bodies are reducible to two kinds, *viz.* an union of parts, and a separation thereof: Thus chymistry either separates spirits, salts, oils, &c. or compounds them together.

A chymical *operation*, then, consists in changing the situation of the parts; particularly, either in moving some parts, but not the whole, which is called *separating*; or in adding new parts, which is called *uniting*.

All chymical *operations*, therefore, are reducible to two kinds, *viz.* such whereby the parts of bodies before joined or united, are separated, which the antient chymists called *solution*; and such whereby the parts before dis-joined are combined, or united, called *coagulation*. See SOLUTION, and COAGULATION. Some, however, object digestion as a third species of *operation*, not reducible to either of them: But Boerhaave shews that it is a composition of both. See DIGESTION.

Most chymists, however, look on this division as scarce accurate and minute enough, and subdivide the art into a number of particular, or subordinate *operations*; as calcination, vitrification, distillation, sublimation, cobobation, amalgamation, fermentation, putrefaction, &c. See each in its place, CALCINATION, VITRIFICATION, SUBLIMATION, DISTILLATION, FERMENTATION, &c.

**OPERATION**, in theology, is used for the actions both of the word, and the man, in Jesus Christ. See PERSON.

The orthodox teach, that there are two *operations* in Jesus Christ, the one divine, the other human; and not one *theandric operation*, as was the doctrine of the Monothelites and Monophysites. See THEANDRIC, &c.

**OPERATOR**, in medicine, &c. a person who *operates*, or works with the hand, on the human body, to preserve, or restore its health.

We say an *operator for the stone*; meaning a lithotomist, or a person who cuts. See LITHOTOMY.

**OPERATOR for the eyes**, denotes a person who couches cataracts, &c. See CATARACT.

**OPERATOR for the teeth**, signifies a tooth drawer, &c. See TOOTH.

**OPHITES**\*, ΟΦΙΤΗΣ, in natural history, a sort of variegated marble of a dusky green ground, sprinkled with spots of a lighter green; otherwise called *serpentine*. See MARBLE, and SERPENTINE.

\* It is thus called from the Greek οφίς, serpent; by reason its spots resemble those of that animal.

**OPHITES** is also the name of a sect of antient heretics, who sprung out of the Gnostics; so called from their worshipping the serpent that seduced Eve.

This serpent, they taught, was instructed thoroughly in all knowledge; and make it the father and author of all the sciences.—On which principle they built a thousand chimera's; part of which may be seen in S. Epiphanius. See Gnostic.

They said this serpent was the Christ; that he was very different from Jesus born of the virgin, into whom, said they, the Christ descended; and that it was this Jesus, not the Christ, that suffered.—Accordingly, they made all those of their sect renounce Jesus, to follow Christ.

The Sethians, or Sethites, mentioned by Theodoret, were either the same with the *Ophites*, or very little different from them. See SETHIAN.

**OPHIUCHUS**, in astronomy, a constellation of the northern hemisphere; called also *serpentarius*. See SERPENTARIUS.

**OPHTHALMIA**\*, ΟΦΘΑΛΜΙΑ, in medicine, a disease of the eyes; properly, an inflammation of the tunica adnata, or conjunctiva; accompanied with a redness, heat, and pain. See EYE, SCLEROPHTHALMIA, and XEROPHTHALMIA.

\* The word is formed from the Greek οφθαλμος, eye.—Celsus calls the *ophthalmia*, lippitudo, by reason of a gum sticking to the eye-lids in this disease, which the Latins call *lippa*.

The *ophthalmia* is either *moist* or *dry*: In the first, there is a shedding of tears; in the second none at all.

It sometimes happens in the *ophthalmia*, that the two eye-lids are so distorted, that the eye continues constantly open, without being able to shut; which is called *χημωσις*; sometimes the eye-lids are so fastened together, that the eye cannot be opened, which is called *φίμωσις*, *q. d.* closure of things that should be open.

The immediate cause of the *ophthalmia*, is the blood flowing in too great abundance in the little vessels of the adnata, so as to stagnate therein, and distend them. The remote causes are the same with those of other inflammations.—In summer it is frequent to have epidemic *ophthalmia's*.

Snow applied to the afflicted eye, is reputed a good remedy for the *ophthalmia*: The ephemerides of the Leopoldine academy mention an *ophthalmia* cured by applying cows-dung, while hot, between two linen cloths, to the eye. A fox's tongue, and the fat and the gall of a viper, are empirical preservatives against the *ophthalmia*.

The cure of *ophthalmia's*, according to the modern practice, depends chiefly on the due repetition of purgatives. If these fail, recourse is had to vesicatories, issues, setons, &c. Tho' Pitcairn prefers bleeding; it being his observation, that no disease requires copious bleeding so much as the *ophthalmia*.

Pitcairn, and some others, distinguish an *external* and *internal ophthalmia*; the first in the adnata, which is that hitherto spoke of; the second in the retina.—The symptoms or indications of the latter, are muscæ volitantes, dust seeming to fly in the air, &c. See MUSCÆ, &c.

This, when inveterate, degenerates into a gutta serena, or amaurosis. See GUTTA Serena, &c.

**OPHTHALMICS**, medicines proper for diseases of the eyes. See EYE.

Such are *ophthalmic waters*. See WATER.—*Ophthalmic powders*, ointments, &c.—There is an excellent *ophthalmic* prepared of saccharum saturni.

**OPHTHALMIC Nerves**.—The fifth pair of nerves of the brain, dividing into three branches; the first is called *ophthalmic*, because it goes to the eye.—This again subdivides into two branches, after sending out several twigs which encompass the optic nerves, and are distributed into the choroides. See NERVE.

**OPHTHALMOGRAPHIA**\*, that branch of anatomy which considers the structure, and composition of the eye; the use of its parts, and the principal effects of vision. See EYE.

\* The word is formed from the Greek οφθαλμος, eye; and γραφω, description.

Our countryman, Dr. William Briggs, has published an excellent *ophthalmographia*, and Plempius another.

**OPHTHALMOSCOPIA**, that branch of physiognomy which considers a person's eyes, and looks; to deduce thence the knowledge of his temperament, humour, and manners. See PHYSIOGNOMY.

**OPIATE**, OPIATUM, in medicine, is sometimes applied to any confection, or electuary. See CONFECTIO.

In which sense it is defined an internal remedy, variously composed of powders, pulps, liquors, sugar, or honey, reduced into a soft consistence. See ELECTUARY, &c.

The *opiate* of Solomon is a composition of great fame, so called from one Solomon, a physician, its inventor; and first published by Laurence Joubert.

There are a particular kind of *opiates*, called *incarnatives*, for the teeth and gums, made of alum, sumach, lignum aloes, myrrh, mastic, &c. reduced into powder.

**OPIATE**, is also used for any medicine, given with an intention to procure sleep. See SLEEP.

In which sense the word is of the same import with *narcotic*, *hypnotic*, *soporific*, or *pacific*. See NARCOTIC, HYPNOTIC, &c.

**OPIATE** is more particularly used for a composition wherein opium is an ingredient. See OPIUM.

The operation of *opiates*, or the manner wherein they produce their effect in the body, Dr. Quincy thus lays down.

—All pain is a stimulus on the part affected, and is attended with contractions of the pained membranes, which occasion a greater afflux than ordinary of the nervous juice that way: On the other hand, pleasure, or a delightful sensation in any part, is accompanied with a smooth undulation, and easy reflux of the nervous juice towards the brain. This is, as it were, the entertainment of the mind; with which being taken up, it does not determine the spirits to the organs of motion; that is, there is such a relaxation of the muscular fibres, and such a disposition of the nervous fluid, as is necessary to sleep. See PAIN, &c.

Now, it is shewn that an agreeable sensation produced in the stomach, together with a distention of its membranes, is the immediate

immediate cause of that sleepiness, to which we are inclinable after eating; the one engaging the mind, the other acting on the body. For pleasure amuses the soul, and the fullness of the vessels in the brain checks and hinders, in some measure, the derivation of the nervous juice into the organs.

Now, to apply this; a moderate dose of an *opiate* usually transports people with a pleasing sensation, to that degree; that, as they often express themselves, they are in heaven; and though they do not always sleep, (which proceeds from the presentation of pleasing images to the mind so strongly, that, like dreams, they over-engage the fancy, and so interrupt the state of rest) yet they enjoy so perfect an indolence and quiet, that no happiness in the world can surpass the charms of so agreeable an extasy.

Thus we have from these medicines, but in a far more eminent degree, all those effects which are observed to follow upon that grateful sense in the stomach, which a moderate fullness produces. For no bodies are so fit and able pleasingly to affect our sensible membranes, as those which consist of volatile parts, whose activity is tempered and allayed by the smoothness of some which are lubricating and oily; for they lightly rarify the juices of the stomach, and cause a pleasant titillation of its nervous coat, whereby there is induced an agreeable plenitude, and the mind is entertained with ideas of satisfaction and delight.

And thus, we easily see upon what mechanism the other virtues of *opiates* depend; for their easing pains, checking evacuations, &c. proceed not only from the mind's being taken up with a pleasing sense, whereby it is diverted from a disagreeable one; but all pain being attended with a contraction of the part, the relaxation of the fibres, which they cause, eludes and destroys the force of the stimulus.

*Opiates* are found to abate immoderate secretions and evacuations, which they do by removing that irritation of the organs, whereby they are occasioned. And herein lies the in-crassating quality of those medicines, in that the twitching sense upon the membranes of the lungs, bowels, &c. being lessened, the sharp humour is suffered to lodge there in a greater quantity, before it is so troublesome as to be thrown off and expelled; it being all one as if there were no irritation of the part, if the uneasy sense thereof be not regarded by the mind. And these effects will all be heightened by the mixture of the *opiate* particles with the blood; which is hereupon rarified, and distends its vessels, especially those of the brain; and this does still, to a greater degree, lessen the influx of the nervous fluid to the parts, by pressing upon the tubuli, or little canals, through which it is derived. Whence the reason of that difficulty of breathing, which *opiates* occasion; this symptom being inseparable from the rarefaction of the blood in the lungs.

**OPINION, OPINIO**, denotes a probable belief; or a doubtful, and uncertain judgment of the mind. See FAITH, JUDGMENT, &c.

*Opinion* is better defined the assent of the mind to propositions not evidently true at first sight; nor deduced, by necessary consequence, from others that are so; but such as carry the face of truth. See TRUTH, and ERROR.

The schools define *opinion*, *assensus intellectus cum formidine de opposito*; an assent of the understanding, with some fear or distrust of the contrary being true.

According to logicians, demonstration begets science, or knowledge; and probable arguments beget *opinion*. See KNOWLEDGE, PROBABILITY, and PROBABLE.

Wherever the mind's acquiescence in a truth proposed to it, is accompanied with any doubt, this is what we call an *opinion*. See DOUBTING.

Plato makes *opinion* a medium between knowledge and ignorance; clearer and more express than ignorance; yet more obscure and unsatisfying than knowledge. See IGNORANCE.

**OPISTHOTONOS\***, ΟΠΙΣΘΟΤΟΝΟΣ, in medicine, a kind of convulsion, wherein the body is bent backwards, so as to form a bow.

\* The word is compounded of the Greek *οπισθεν*, backward, behind; and *τεννεν*, *tendere*, to stretch, bend.

In which sense the word stands opposed to *emprosthotonos*, wherein the body is bent forwards. See CONVULSION.

The *opisthotonos* arises from a tonic motion of the muscles of the posterior parts of the body; especially those on the back of the head.

**OPIUM\***, in pharmacy, &c. a narcotic juice, commonly drawn from the head of the white poppy, and afterwards inspissated. See POPPY.

\* The word is formed from the Greek *οπιον*, *succus*, juice. When the juice flows of itself, through incisions made in the poppy heads, it is properly called *opium*.—When drawn by expression, it ought rather to be called *meconium*. See MECONIUM.

The difference between the qualities and virtues of the two juices is very considerable. The former is preferable on all accounts; but it is exceeding rare; the Turks, among whom it is produced, and who make great use of it, never allowing it to be exported.—So that it is the latter that is ordinarily used among us, and sold for *opium*.

It is mostly brought from the Levant, and Cairo; generally very impure; the Levantines, to shorten their labour, and to have the more juice, drawing it equally from the heads and the leaves of poppies, by expression, and then reducing it to the thickness of an extract by fire.—Though a late traveller into their countries assures us, it is drawn by decoction, and afterwards inspissated. See *Mém. Acad. R. Scienc.* an, 1732. p. 427.

It must be chosen dry, the smoothest, and blackest possible, of a drowsy smell, and neither rugged, nor sticky, nor all in a mass.

It is a popular error, that there is any such thing as *white opium*; for though the juice as it runs from the heads of the poppies be of a milk-colour, it always becomes of a very deep brown as it thickens.—Wherever it is found yellowish or soft, it is a sign the juice has not had fire enough.

Most of the *opium* sold at Constantinople is brought from Anatolia, from a place called by the Turks *Aphium Carahissar*, i. e. black caule of *opium*.—It is also produced in the territory of Thebes in Egypt; but this is held much inferior to the Anatolian *opium*.

**Prepared OPIUM** is called *laudanum*: of which there are two kinds: the one, *simple*; extracted by means of rain water, and spirit of wine.—The other *compound*, called *laudanum opiatum*; wherein there enter several other ingredients. See LAUDANUM.

The uses of *opium* are to sooth pain, to excite sleep, to stop vomiting and looseness.—Its dose is from half a grain to two grains. Some persons, who have much habituated themselves to it, can take 50 or 60 grains. Charras says, he has taken 12 grains himself; and adds, he knew one who made no scruple of 36. And in the *Philosophical Transactions* we have an instance of one Mrs. Lovelock, who, in a fever, in three days time, took 102 grains.

*Opium* raises the spirits, occasions agreeable sensations, and has much the same effect with wine, or strong spirits.—The Turks ordinarily take to the quantity of a drachm when they go to battle, or undertake an affair that requires vigour and strength. *Opium* stops, for a time, all overflowings of humours, fluxes, hæmorrhages, &c. probably from the smoothness and roundness of its parts, which, by a kind of titillation, oblige the intestines, and other vessels, to contract themselves. See OPIATES. Willis, Sylvius, and Muller, look on *opium* as a coagulating poison, which fixes the spirits in the nerves.—Wepfer and Pitcairn, on the contrary, maintain it to be a hot dissolving poison, which subtilizes the blood, exalts and reduces it into vapours, which bloat up the arteries; and the bloated arteries compressing the veins and nerves, shut up the passage of the spirits. See POISON.

By analysis, *opium* is found to contain a great deal of volatile salt.

**OPOBALSAMUM**, in pharmacy, a whitish juice, gum, or resin, distilling from the branches of a tree called *balsamum*, or the *balsam tree*. See BALSAM.

It is whitish, pretty thick, transparent, of a smell approaching turpentine, but much more agreeable.

It is the same with the celebrated *balsamum verum*, or balm of the Levant; at least the difference is not visible, nor can authors fix it. See BALM.

It obtains a place among the alexipharmics, and is a good ingredient in the theriaca andromachi, and mithridate; very ill supplied with the expressed oil of mace for a succedaneum, which does not at all come up to the subtilty and activity of its parts, but is of a much heavier texture.

This, as all other balsams, is suppurative, deterfive, and incarnating, applied outwardly to tumors, ulcers, or green wounds.

**OPOPANAX\***, ΟΠΟΠΑΝΑΞ, in pharmacy, a vegetable juice, or gum, yellow without-side, white within, fatty, and brittle, of an agreeable taste, and a very strong smell. See GUM.

\* The word is formed from the Greek *οπιον*, juice, and *παναξ*, the name of the tree which yields it.

The Latins call it *panax Herculeum*, from Hercules, who is supposed to have invented it, or rather who first discovered its specific virtues.—It is one of the three celebrated panacea, or universal medicines, to which the antients attributed such wonderful virtues. The two others are the asclepium and chironium; the first found by Æsculapius, the second by Chiron. See PANACEA.

The gum *opopanax* flows by incision from a plant growing abundantly in Achaia, Boeotia, Phocis, and Macedonia: while it is liquid, it is white; but as it dries and hardens, it assumes a beautiful golden yellow.

There are three kinds imported; that in tears; that in the mass; and that counterfeited, or flatted.—The first is the best, and the second is the better, as it has the more tears; the third is a rank sophistication, and good for little.

It is little used internally; though Etmuller ranks it among cathartics.—Its chief use is in the cure of wounds; whence it enters the composition of the unguentum divinum, with the galbanum, ammoniac, and bdellium.

**OPPILATION**, in medicine, the act of obstructing, or stopping up the ducts, or passages of the body, by redundant or peccant humours. See OBSTRUCTION.

The word is chiefly used for obstructions of the lower belly. Viscid, heavy foods, difficult of digestion, are *oppilative*; do not pass off well, but stop in the mouths of the vessels.

**OPPILATIVE.** See the article **DEOPPILATIVE**.

**OPPONENT**, a person who withstands, or opposes another. See **OPPOSITION**.

The term is chiefly used in speaking of scholastic or academic disputes or exercises, where a person who opposes a thesis, or impugns it by his objections, is called *opponens*, opponent.

**OPPOSER** *Foreign.* See **FOREIGN Opposer**.

**OPPOSITE**S, **OPPOSITA**, among logicians, are such things as differ among themselves; but so, as not to differ in like manner from some third.

By which circumstance, *opposites* differ from *disparates*.

The schoolmen reckon four kinds of *opposites*; viz. relatively, contrarily, privatively, and contradictorily *opposites*.

Either, say they, the opposition is between ens and non ens: if the former, it is either with a dependent ens, which makes a relative opposition, the lowest of all; or an independent one, which is a contrary opposite: if with a non ens, it is either with a non ens *secundum quid*, which is privative; or with a non ens simply, which is the highest opposition. See **RELATIVE**, **CONTRARY**, **PRIVATIVE**, and **CONTRADICTORY**.

**OPPOSITES**, *Opposita*, complexly taken, are propositions that clash with each other.—As, man is an animal; and man is not an animal. See **OPPOSITION**.

**OPPOSITE Angles.** See the article **ANGLE**.

If a line ST, (*Tab. Geometry, fig. 46.*) meet two other lines, AP and BR, in different points A and B, but in the same direction; the angles u and y, as also z and y, hereby formed, are called *opposite angles*; particularly u, the *external opposite angle*, and z, the *internal opposite angle* of y.

**OPPOSITE Cones**, denote two similar cones, vertically *opposite*, that is, having the same common vertex as well as the same axis. See **CONE**.

**OPPOSITE Sections**, are two hyperbola's made by cutting two *opposite* cones by the same plane. See **HYPERBOLA**.

If a cone be cut by a plane through its vertex, and afterwards by a second plane parallel to the former; this latter plane produced through the *opposite* cone will there make the *opposite* sections. See **CONICS**.

**OPPOSITION**, in geometry, the relation of two things, between which a line may be drawn perpendicular to both.

**OPPOSITION**, in logic, the quality of disagreement between propositions which have the same subject, and the same attribute. See **PROPOSITION**.

*Opposition*, is said by logicians to be either *complex*, or *incomplex*.

*Incomplex* or *simple opposition*, is the disagreement of two things, which will not suffer each other to be in the same subject.

Thus *heat* is opposed to *cold*; *sight* to *blindness*, &c.—Which *opposition* has already been observed to be of four kinds. See **OPPOSITE**.

*Complex opposition*, is defined by Aristotle to be the affirming, and denying the same predicate of the same subject, not taken equivocally, but for the same, in the same manner, and at the same time.—As Socrates is learned; and Socrates is not learned. The later schoolmen, deviating from their master, define *opposition* an affection of enunciations, whereby two absolute propositions, the same extremes being supposed in the same order, and number, and understood without any ambiguity, of the same thing, oppose each other, either in respect of quantity, or of quality; or of both.

According to the former definition, there are three species of *opposition*, *contrary*, *subcontrary*, and *contradictory*: according to the second, a fourth species is admitted, viz. *subaltern*.

To know how and wherein, propositions are opposite, they must be compared in quantity and quality, all the ways they can be compared in.—If they be opposite both in quality and quantity; i. e. if the one be affirmative, and the other negative; the one universal, the other particular; they are said to be contradictory:—v. gr. no pleasure is allowed; some pleasure is allowed. See **CONTRADICTORY**.

If they be only opposite in quality, and not in quantity, they are called *contraries*, if universal; and *subcontraries*, if particular.—v. gr. All use of wine is evil; no use of wine is evil. Some means of preserving reputation are allowed; some means of preserving reputation are not allowed. See **CONTRARY**, &c.

If the propositions be only opposite in quantity, they are called *subalterns*.—v. gr. Every man is liable to sin; some man is liable to sin. But this last is no proper *opposition*; inasmuch as the universal proposition always includes the particular one.

Singular propositions, which can only be opposed in quality, are reducible to contradictory ones.

The essential properties of propositions considered with regard to their *opposition*; are, 1°, That of two contradictory propositions, there is one always true, and another false. 2°, Two contrary propositions can never be both true; but may be both false. 3°, Sub-contrary propositions may be all true at

the same time; as happens when the attribute is accidental to the subject; but when it is essential to it, the one is true, the other false. 4°, Subalterns may be either true or false at the same time; or the one may be true, the other false. If the attribute be essential to the subject, the subaltern affirmatives are true, and the negatives false; but if the negatives deny the subject an attribute incompatible with the subject, they will be both true. When the attribute is accidental to the subject, the universal subaltern is ordinarily false, and the particular one true.

**OPPOSITION**, in rhetoric, denotes a figure, whereby two things are joined together, which appeared incompatible: as when Horace says, a *wise folly*.

In Bouhours's notion, this figure, which seems to deny what it establishes, and contradicts itself in appearance, is very elegant.

**OPPOSITION**, in astronomy, is that aspect, or situation of two stars or planets, wherein they are diametrically opposite to each other, or 180°, that is, a semicircle, apart. See **CONJUNCTION**, and **SYZGY**.

When the moon is diametrically opposite to the sun, so that she shews her whole illumined face; she is said, with regard to the sun, to be in *opposition*; and she is then said to be *in her full*, and shines all night long. See **MOON**, and **PHASIS**. Eclipses of the moon never happen but when she is in *opposition* with the sun, and when they both meet in the nodes of the ecliptic. See **ECLIPSE**.

Mars in his *opposition* to the sun is nearer the earth than he is to the sun. See **MARS**.

**OPSONOMUS**, in antiquity, a magistrate of Athens, whereof there were two, or three; chosen out of the senate, or council. Their office was to inspect the fish-market, and to take care that every thing were done in order, and according to the laws.

**OPTATIVE**, in grammar, the third mood in the conjugations of verbs, serving to express an ardent desire or wish for any thing. See **MOOD**.

Instead of a particular mood, or a particular set of inflexions to express this desire, the English, Latins, &c. express it by an adverb of wishing prefixed to it. The Latins by *utinam*; the French by *plut a Dieu*; and the English by *would to God*, &c.

In these languages, setting aside the adverb, the *optative* is the same with the *subjunctive*; the inflections of the verb, which make what we call the moods, being the same in both.

Indeed, in the Greek, the wish is expressed by a particular inflexion, thence called *optative*; and in the French, Spanish, and Italian, there is something like it; their triple tenses serving the same purpose. But the *optative* mood may be safely retrenched from the Latin and English. See **SUBJUNCTIVE**.

**OPTERIA** \*, among the antients, presents made to a child, the first time a person saw it.

\* The word is formed from the Greek *οφθαλμοι*, I see.

**OPTERIA** was also used for the presents which the bridegroom made his bride when she was conducted to him; this being the first time he saw her. See Barthol. *de Puerp. vet.*

**OPTIC**, or **OPTICAL**, something that relates to vision, or the sense of seeing. See the article **VISION**, &c.

**OPTIC Angle.** See the article **ANGLE**.

**OPTIC Axis**, is a ray passing through the centre of the eye, and the middle of the *optic* pyramid, &c. See **AXIS**, &c.

**OPTIC Chamber.** See the article **Camera OBSCURA**.

**OPTIC Glasses**, are glasses ground either concave or convex; so as either to collect, or disperse the rays of light; by means whereof vision is improved, and the eye strengthened, preserved, &c. See **GLASS**, &c.

For the manner of grinding and polishing *optic glasses*, see **GRINDING**, **POLISHING**, **GLASS**, &c.—For their phenomena, see **LENS**, **MIRROR**, &c.

The principal among *optic glasses*, are *telescopes*, *microscopes*, *spectacles*, *reading glasses*, *magic lanterns*, &c. See the construction and use of each under its proper article, **TELESCOPE**, **MICROSCOPE**, **SPECTACLE**, **MAGIC Lantern**, &c.

**OPTIC Inequality**, in astronomy, is an apparent irregularity in the motions of far distant bodies; so called, because not really in the moving bodies, but arising from the situation of the spectator's eye: so that were the eye in the centre, it would always see the motions uniform.

The *optical inequality* may be thus illustrated.—Suppose a body revolving in the periphery of a circle ABDEFGQP, (*Tab. Optics, fig. 40.*) and moving through equal arches AB, BD, DE, EF, in equal times; and suppose the eye in the plane of the same circle, but at a distance from it, viewing the motion of the body from O: when the body goes from A to B; its apparent motion is measured by the angle AOB, or the arch HL, which it will seem to describe. But in an equal time, while it moves through the arch BD, its apparent motion will be determined by the angle BOD, or the arch LM, which is less than the former arch HL. And when arrived at D, it will be seen at the

The word is chiefly used for obstructions of the lower belly. Viscid, heavy foods, difficult of digestion, are *oppilative*; do not pass off well, but stop in the mouths of the vessels.

**OPPILATIVE.** See the article **DEOPPILATIVE**.

**OPPONENT**, a person who withstands, or opposes another. See **OPPOSITION**.

The term is chiefly used in speaking of scholastic or academic disputes or exercises, where a person who opposes a thesis, or impugns it by his objections, is called *opponens*, opponent.

**OPPOSER** *Foreign.* See **FOREIGN Opposer**.

**OPPOSITE**, **OPPOSITA**, among logicians, are such things as differ among themselves; but so, as not to differ in like manner from some third.

By which circumstance, *opposites* differ from *disparates*.

The schoolmen reckon four kinds of *opposites*; viz. relatively, contrarily, privatively, and contradictorily *opposites*.

Either, say they, the opposition is between ens and non ens: if the former, it is either with a dependent ens, which makes a relative opposition, the lowest of all; or an independent one, which is a contrary opposite: if with a non ens, it is either with a non ens secundum quid, which is privative; or with a non ens simply, which is the highest opposition. See **RELATIVE**, **CONTRARY**, **PRIVATIVE**, and **CONTRADICTORY**.

**OPPOSITES**, *Opposita*, complexly taken, are propositions that clash with each other.—As, man is an animal; and man is not an animal. See **OPPOSITION**.

**OPPOSITE Angles.** See the article **ANGLE**.

If a line ST, (*Tab. Geometry, fig. 46.*) meet two other lines, AP and BR, in different points A and B, but in the same direction; the angles u and y, as also z and y, hereby formed, are called *opposite angles*; particularly u, the *external opposite angle*, and z, the *internal opposite angle* of y.

**OPPOSITE Cones**, denote two similar cones, vertically *opposite*, that is, having the same common vertex as well as the same axis. See **CONE**.

**OPPOSITE Sections**, are two hyperbola's made by cutting two *opposite* cones by the same plane. See **HYPERBOLA**.

If a cone be cut by a plane through its vertex, and afterwards by a second plane parallel to the former; this latter plane produced through the *opposite* cone will there make the *opposite* sections. See **CONICS**.

**OPPOSITION**, in geometry, the relation of two things, between which a line may be drawn perpendicular to both.

**OPPOSITION**, in logic, the quality of disagreement between propositions which have the same subject, and the same attribute. See **PROPOSITION**.

*Opposition*, is said by logicians to be either *complex*, or *incomplex*.

*Incomplex* or *simple opposition*, is the disagreement of two things, which will not suffer each other to be in the same subject.

Thus *heat* is opposed to *cold*; *fight* to *blindness*, &c.—Which *opposition* has already been observed to be of four kinds. See **OPPOSITE**.

*Complex opposition*, is defined by Aristotle to be the affirming, and denying the same predicate of the same subject, not taken equivocally, but for the same, in the same manner, and at the same time.—As Socrates is learned; and Socrates is not learned. The later schoolmen, deviating from their master, define *opposition* an affection of enunciations, whereby two absolute propositions, the same extremes being supposed in the same order, and number, and understood without any ambiguity, of the same thing, oppose each other, either in respect of quantity, or of quality; or of both.

According to the former definition, there are three species of *opposition*, *contrary*, *subcontrary*, and *contradictory*: according to the second, a fourth species is admitted, viz. *subaltern*.

To know how and wherein, propositions are opposite, they must be compared in quantity and quality, all the ways they can be compared in.—If they be opposite both in quality and quantity; i. e. if the one be affirmative, and the other negative; the one universal, the other particular; they are said to be contradictory:—v. gr. no pleasure is allowed; some pleasure is allowed. See **CONTRADICTORY**.

If they be only opposite in quality, and not in quantity, they are called *contraries*, if universal; and *subcontraries*, if particular.—v. gr. All use of wine is evil; no use of wine is evil. Some means of preserving reputation are allowed; some means of preserving reputation are not allowed. See **CONTRARY**, &c.

If the propositions be only opposite in quantity, they are called *subalterns*.—v. gr. Every man is liable to sin; some man is liable to sin. But this last is no proper *opposition*; inasmuch as the universal proposition always includes the particular one.

Singular propositions, which can only be opposed in quality, are reducible to contradictory ones.

The essential properties of propositions considered with regard to their *opposition*; are, 1°, That of two contradictory propositions, there is one always true, and another false. 2°, Two contrary propositions can never be both true; but may be both false. 3°, Sub-contrary propositions may be all true at

the same time; as happens when the attribute is accidental to the subject; but when it is essential to it, the one is true, the other false. 4°, Subalterns may be either true or false at the same time; or the one may be true, the other false. If the attribute be essential to the subject, the subaltern affirmatives are true, and the negatives false; but if the negatives deny the subject an attribute incompatible with the subject, they will be both true. When the attribute is accidental to the subject, the universal subaltern is ordinarily false, and the particular one true.

**OPPOSITION**, in rhetoric, denotes a figure, whereby two things are joined together, which appeared incompatible: as when Horace says, a *wife folly*.

In Bouhours's notion, this figure, which seems to deny what it establishes, and contradicts itself in appearance, is very elegant.

**OPPOSITION**, in astronomy, is that aspect, or situation of two stars or planets, wherein they are diametrically opposite to each other, or 180°, that is, a semicircle, apart. See **CONJUNCTION**, and **SYZYG**.

When the moon is diametrically opposite to the sun, so that she shews her whole illumined face; she is said, with regard to the sun, to be in *opposition*; and she is then said to be *in her full*, and shines all night long. See **MOON**, and **PHASIS**. Eclipses of the moon never happen but when she is in *opposition* with the sun, and when they both meet in the nodes of the ecliptic. See **ECLIPSE**.

Mars in his *opposition* to the sun is nearer the earth than he is to the sun. See **MARS**.

**OPSONOMUS**, in antiquity, a magistrate of Athens, whereof there were two, or three; chosen out of the senate, or council. Their office was to inspect the fish-market, and to take care that every thing were done in order, and according to the laws.

**OPTATIVE**, in grammar, the third mood in the conjugations of verbs, serving to express an ardent desire or wish for any thing. See **MOOD**.

Instead of a particular mood, or a particular set of inflexions to express this desire, the English, Latins, &c. express it by an adverb of wishing prefixed to it. The Latins by *utinam*; the French by *plut a Dieu*; and the English by *would* to God, &c.

In these languages, setting aside the adverb, the *optative* is the same with the *subjunctive*; the inflections of the verb, which make what we call the moods, being the same in both.

Indeed, in the Greek, the wish is expressed by a particular inflexion, thence called *optative*; and in the French, Spanish, and Italian, there is something like it; their triple tenses serving the same purpose. But the *optative* mood may be safely retrenched from the Latin and English. See **SUBJUNCTIVE**.

**OPTERIA** \*, among the antients, presents made to a child, the first time a person saw it.

\* The word is formed from the Greek *οφτρουαι*, I see.

**OPTERIA** was also used for the presents which the bridegroom made his bride when she was conducted to him; this being the first time he saw her. See Barthol. *de Puerp. vet.*

**OPTIC**, or **OPTICAL**, something that relates to vision, or the sense of seeing. See the article **VISION**, &c.

**OPTIC Angle.** See the article **ANGLE**.

**OPTIC Axis**, is a ray passing through the centre of the eye, and the middle of the *optic* pyramid, &c. See **AXIS**, &c.

**OPTIC Chamber.** See the article **Camera OBSCURA**.

**OPTIC Glasses**, are glasses ground either concave or convex; so as either to collect, or disperse the rays of light; by means whereof vision is improved, and the eye strengthened, preserved, &c. See **GLASS**, &c.

For the manner of grinding and polishing *optic glasses*, see **GRINDING**, **POLISHING**, **GLASS**, &c.—For their phenomena, see **LENS**, **MIRROR**, &c.

The principal among *optic glasses*, are *telescopes*, *microscopes*, *spectacles*, *reading glasses*, *magic lanterns*, &c. See the construction and use of each under its proper article, **TELESCOPE**, **MICROSCOPE**, **SPECTACLE**, **MAGIC Lantern**, &c.

**OPTIC Inequality**, in astronomy, is an apparent irregularity in the motions of far distant bodies; so called, because not really in the moving bodies, but arising from the situation of the spectator's eye: so that were the eye in the centre, it would always see the motions uniform.

The *optical inequality* may be thus illustrated.—Suppose a body revolving in the periphery of a circle ABDEFGQP, (*Tab. Optics, fig. 40.*) and moving through equal arches AB, BD, DE, EF, in equal times; and suppose the eye in the plane of the same circle, but at a distance from it, viewing the motion of the body from O: when the body goes from A to B; its apparent motion is measured by the angle AOB, or the arch HL, which it will seem to describe. But in an equal time, while it moves through the arch BD, its apparent motion will be determined by the angle BOD, or the arch LM, which is less than the former arch HL. And when arrived at D, it will be seen at the

the point M of the line NLM. But it spends the same time in describing DE, as it does in AB or BD; and when arrived at E, is still seen at M; appearing stationary in all the space from D to E. When it arrives at F, the eye will see it in L; and at G, will appear at H; so that it will seem to have gone retrograde: and, lastly, from Q to P, it will again appear stationary. See STATION, and RETROGRADATION.

**OPTIC Nerves**, the second pair of nerves, springing from the crura of the medulla oblongata, and passing thence to the eye. See *Tab. Anat. (Osteol.) fig. 5. lit. ii*; see also the article NERVE.

These nerves approach, by degrees, in their recess from their origin; and at length meet, in the basis of the brain, near the infundibulum. Thence they again separate, but without decussating; and proceed, one to each eye. See EYE.

They are covered with two coats, which they take from the dura and pia mater; and which, by their expansions, form the two membranes of the eye, called the *uvea* and *cornea*. See UVEA, &c.

The *retina*, which is a third membrane, and the immediate organ of sight, is only an expansion of the fibrous, or inner, and medullary part of these nerves. See RETINA.

The construction of the *optic* nerve seems to be different from that of the other nerves, which all appear to consist of hard fibres: for this, ere it enters the orbit of the eye, is only a coat or cover formed by the pia mater, and including a production of the medulla of the brain, which is easily separated from it. At its entrance into the eye, it takes another coat from the dura mater; which two coats are bound together by exceedingly fine filaments: that from the pia mater is continued in the choroides, and that from the dura mater in the uvea.

From their entrance within the orbit, to the ball of the eye, the medulla, enclosed under the two coats, is separated into a number of little cells answering to each other. See VISION.

**OPTIC Pencil**, or *Pencil of Rays*, is that assemblage of rays by means whereof any point, or part of an object, is seen. See PENCIL, and RADIANT.

Some *optic* writers laugh at the notion of *optic pencils*, and maintain them mere chimera's.

**OPTIC Place** of a star, &c. is that point of its orbit in which it appears to be, to our eye. See PLACE.

This is either *true*; as when the eye is supposed at the centre of the earth, or planet it inhabits; or *apparent*, as when at the circumference. See APPARENT, PLANET, &c.—The difference between the two, makes what we call the *parallax*. See PARALLAX.

**OPTIC Pyramid**, in perspective, is the pyramid ABCO (*Tab. Perspective, fig. 1.*) whose base is the visible object ABC; and its vertex, in the eye O; formed by rays drawn from the several points of the perimeter to the eye.

Hence also may appear what is meant by *optic triangle*.

**OPTIC Rays**, are particularly used for those wherewith an *optic* pyramid, or *optic triangle*, is terminated.—As OA, OC, OB, &c.

**OPTICORUM Nervorum Thalami**. See THALAMI.

**OPTICS, OPTICA**, is properly the science of direct vision. See VISION.

**OPTICS** is also used, in a larger sense, for the science of vision, or visibles in general. See VISIBLE, &c.

In which sense, *optics* includes catoptrics, and dioptrics; and even perspective. See CATOPTRICS, DIOPTRICS, and PERSPECTIVE.

**OPTICS**, in its more extensive acceptation, is a mixed mathematical science, which explains the manner wherein vision is performed in the eye: treats of sight in the general; gives the reasons of the several modifications, or alterations which the rays of light undergo in the eye; and shews why objects appear sometimes greater, sometimes smaller, sometimes more distinct, sometimes more confused, sometimes nearer, and sometimes more remote. See SIGHT, EYE, &c.

In this extensive signification, it is considered by Sir Isaac Newton in his admirable work called *Optics*.

*Optics* make a considerable branch of natural philosophy; both as it explains the laws of nature, according to which vision is performed; and as it accounts for abundance of physical phenomena, otherwise inexplicable. For what can be determined about light, colours, transparency, opacity, meteors, the rainbow, parhelia, &c. but on principles of *optics*? What about the nature of the stars? the structure of the mundane system? the motions of the planets? the eclipses of the luminaries? &c.—*Optics*, therefore, make a considerable part of astronomy. See ASTRONOMY.

Euclid has wrote on the ancient optics and catoptrics: dioptrics were unknown to them. F. Honorat. Fabri has an abridgment of *optics*, catoptrics, and dioptrics. F. Echinard has given a century of problems in *optics*. Vitellio and Alhazen have performed well on the elements of *optics*. Father Kircher has a large volume on the secrets of *optics*, of light, and shadow, and their surprizing effects, which pass on the

people for magic. We have also *l'Optique & Catoptrique* of F. Merfenne, Paris 1651. *Dioptrique oculaire* of F. Chérubin, Paris 1671, fol. Christ. Scheineri *Optica*, Lond. 1652. Jacobi Gregorii *opticae*. Barrovii *Lectiones opticae*, Lond. 1663. Joh. Bapt. Porta, *De refractione opticae*, Lond. 1669. *Principe generale de l'Optique*, by M. Leibnitz, in the Leipzig acts, 1682. *L'Occhiale all'Occhio*, or *Dioptrica Practica*, Carol. Ant. Mancini, Bologna, 1660, 4°. *Physico Mathesis de lumine, coloribus & iride*, per F. Mar. Grimaldi, Bononiæ 1665, 4°. *Cogitationes Physico Mechanicae de Natura Visionis*, per Joh. Ott. Schaphusam, Heidel. 1670, 4°. And, which ought to be named first, the great Sir Isaac Newton's *Optics*, Latin and English, 4° and 8°.

From *optics* likewise arises *perspective*; all the rules whereof have their foundation in *optics*. Indeed Tacquet makes perspective a part of *optics*; though John, archbishop of Canterbury, in his *Perspectiva communis*, calls *optics*, catoptrics, and dioptrics by the name *perspective*. See PERSPECTIVE.

**OPTIMATES**, in antiquity, one of the divisions of the Roman people, opposed to *populares*. See POPULAR.

According to Tully's description, the *optimates* were the best citizens, or those who desired their actions might be approved by the better sort; and the *populares* those, who out of a thirst of vainglory, did not so much consider what was right, as what would please the populace, and get an interest in them.

Others rather make the *optimates* to be the vigorous asserters of the dignity of the chief magistrate, and the sticklers for the grandeur of the state; who cared not if the inferior members suffered, if it were for the advancement of the commanding powers: and the *populares* those who courted the favour of the populace, and encouraged them to demand larger privileges, to bring matters nearer to a level.

**OPTION**, the power, or faculty of wishing, or chusing; or the choice a person makes of any thing.

When a new suffragan bishop is consecrated, the archbishop of the province, by a customary prerogative, claims the collation of the first vacant benefice, or dignity, in that see, according as he shall chuse; which choice is called the archbishop's *option*.

**OR**, in heraldry, *yellow*, or the colour of gold. See COLOUR, and METAL.

Without this, or argent, there can be no good armory. See ARGENT, ARMS, &c.

In the coats of nobles, it is called *topaz*; and in those of sovereign princes, *sol*. It is represented in engraving by small points, or dots, all over the field, or bearing; as in *Tab. Herald. fig. 72*.

It is accounted the symbol of wisdom, temperance, faith, force, constancy, &c.

*Toison d'OR*. See the article TOISON.

**ORACLE**, an answer, usually couched in very dark and ambiguous terms, supposed to be given by dæmons of old, either by the mouths of their idols, or by those of their priests, to the people who consulted them on things to come.

The pythian was always in a rage when she gave *oracles*: Ablancourt observes, that the study or research of the meaning of *oracles*, was but a heartless thing; and that they were never understood till after the accomplishment. Historians relate, that Croesus was tricked by the ambiguity and equivocation of the *oracle*:

Κροισος· Ἄλυσ διαβας μετ' αὐτὴν ἀρχὴν καὶ ἀλυσσιν.

Thus rendered in Latin:

*Croesus Halym superans magnam pervertet opum vim.*

**ORACLE**, is also used for the dæmon who gave the answer, and the place where it was given. See DÆMON.

The principal *oracles* of antiquity are that of Abæ, mentioned by Herodotus; that of Amphiaraus; that of the Branchidae at Didymus; that of the camps at Lacedæmon; that of Dodona; that of Jupiter Ammon; that of Nabarca, in the country of the Anariaca, near the Caspian sea; that of Trophonius, mentioned by Herodotus; that of Chrysopolis; that of Claros in Ionia; that of Mallos; that of Patarea; that of Pella in Macedonia; that of Phaselides in Cilicia; that of Sinope in Paphlagonia; that of Orpheus's head, mentioned by Philostratus in his life of Apollonius, &c.

But of all others, the *oracle* of Apollo Pythius, at Delphos, was the most celebrated; this was consulted in the dernier resort, by most of the princes of those ages. See PYTHIA.

M. Bayle observes, that at first it gave its answers in verse; and that it fell at length to prose, upon the peoples beginning to laugh at the poorness of its verification.

It is a pretty general opinion among the more learned, that *oracles* were all mere cheats, and impostures; either calculated to serve the avaricious ends of the heathen priests, or the political views of the princes.

M. Bayle says positively, they were mere human artifices, in which the devil had no hand. He is strongly backed by Van Dale, and M. Fontenelle, who have wrote expressly on the subject.

There are two points in dispute on the subject of *oracles*; viz. whether they were human, or diabolical machines? and whether

whether or no they ceased upon the publication or preaching of the gospel?

Plutarch has a treatise on the ceasing of some *oracles*: and Van Dale, a Dutch physician, has a volume to prove they did not cease at the coming of Christ; but that many of them ceased long before; and that others held till the fall of paganism, under the empire of Theodosius the great; when paganism being dissipated, these institutions could no longer subsist.

Van Dale was answered by a German, one Mœbius, professor of theology at Leipzig, in 1685. M. Fontenelle espoused Van Dale's system, and improved upon it in his *History of Oracles*; and shewed the weakness of the argument used by many writers in behalf of Christianity, drawn from the ceasing of *oracles*.

F. Balthus, a learned Jesuit, has answered both Van Dale and Fontenelle. He labours to prove that there were real *oracles*, and such as can never be attributed to any artifices of the priests or priestesses; and that several of these became silent in the first ages of the church, either by the coming of Jesus Christ, or by the prayers of the saints.

This doctrine is confirmed by a letter from father Bouchet, missionary, to father Balthus; wherein it is declared, that what father Balthus says of the ancient *oracles*, is experimented every day in the Indies.

It seems, according to this missionary, that the devil still gives *oracles* in the Indies; and that, not by idols, which would be liable to imposture; but by the mouths of the priests, and sometimes of the by-standers: it is added, that these *oracles*, too, cease, and the devil becomes mute, in proportion as the gospel is preached among them.

It was Eusebius who first endeavoured to persuade the Christians, that the coming of Jesus Christ had struck the *oracles* dumb; though it appears from the laws of Theodosius, Gratian, and Valentinian, that the *oracles* were still consulted as low as the year 385. Cicero says, the *oracles* became dumb, in proportion as people, growing less credulous, began to suspect them for cheats.

Plutarch alleges two reasons for the ceasing of *oracles*: the one was Apollo's chagrin; who, it seems, took it in dudgeon to be interrogated about so many trifles. The other was, that in proportion as the genii, or demons, who had the management of the *oracles*, died, and became extinct, the *oracles* must necessarily cease. He adds a third, and more natural cause for the ceasing of *oracles*, viz. the forlorn state of Greece, ruined and desolated by wars. For, hence, the smallness of the gains let the priests sink into a poverty and contempt, too bare to cover the fraud.

Most of the fathers of the church took it to be the devil that gave *oracles*; and looked on it as a pleasure he took to give dubious and equivocal answers; in order to have a handle to laugh at them.—Vossius allows, that it was the devil who spoke in *oracles*; but thinks that the obscurity of his answers, was owing to his ignorance as to the precise circumstances of events. That artful and studied obscurity, wherein the answers were couched, shewed the embarrass the devil was under; as those double meanings they usually bore provided for their accomplishment. Where the thing foretold did not happen accordingly, the *oracle*, forsooth, was misunderstood.

Eusebius has preserved some fragments of a philosopher, called Oenomaus; who, out of resentment for his having been so often fooled by the *oracles*, wrote an ample confutation of all their impertinences: "When we come to consult thee, says he to Apollo, if thou seest what is in futurity, why dost thou use expressions that will not be understood? dost thou not know that they will not be understood? if thou dost, thou takest pleasure in abusing us; if thou dost not, be informed of us, and learn to speak more clearly. I tell thee, that if thou intendest an equivocal, the Greek word whereby thou affirmed that Cræsus should overthrow a great empire, was ill chosen; and that it could signify nothing but Cræsus's conquering Cyrus. If things must necessarily come to pass, why dost thou amuse us with thy ambiguities; what dost thou, wretch as thou art, at Delphos; employed in muttering idle prophecies!"

But Oenomaus is still more out of humour with the *oracle*, for the answer which Apollo gave the Athenians, when Xerxes was about to attack Greece with all the strength of Asia. The pythian declared, that Minerva, the protectress of Athens, had endeavoured in vain to appease the wrath of Jupiter; yet that Jupiter, in complaisance to his daughter, was willing the Athenians should save themselves within wooden walls; and that Salamis should behold the loss of a great many children, dear to their mothers, either when Ceres was spread abroad, or gathered together.

Here Oenomaus loses all patience with the god of Delphos: "This contest, says he, between father and daughter, is very becoming the deities! It is excellent, that there should be contrary inclinations and interests in heaven.—Pure wizzard, thou art ignorant whose the children are, that Salamis shall see perish; whether Greeks, or Persians? It

"is certain, they must be either one or the other; but thou needest not have told so openly, that thou knewest not which. Thou concealest the time of the battle under those fine poetical expressions, "either when Ceres is spread abroad, or gathered together:" and wouldst thou cajole us with such pompous language? Who knows not, that if there be a sea fight, it must be either in seed time, or harvest? It is certain it cannot be in winter. Let things go how they will, thou wilt secure thy self by this Jupiter, whom Minerva is endeavouring to appease. If the Greeks lose the battle, Jupiter proved inexorable to the last; if they gain it, why then Minerva at length prevailed."

ORACLES of the Sibyls. See the article *SIBYL*.

ORAL, something delivered by the mouth, or voice. See *VERBAL*.

In this sense, we say, *oral law*, *oral tradition*, &c. See *TRADITION*, &c.

ORANGE\*, a delicious fruit, of the apple kind, too well known to need a particular description; yet yielding too many kinds of merchandize, to be passed over.

\* The Latins call it *aurantium*, *aurantia malus*, or *malus aurea*, golden apple, from its colour.

Oranges are ordinarily brought from Nice, Ciouta, the isles of Hieres, Genoa, Provence, Portugal, the American islands, and even China and the coasts of India.

Those called *China oranges* were first brought into Europe from China, by the Portuguese; and it is said the very tree, whence all the European *orange* trees of this sort were produced, is still preserved at Lisbon, in the house of the count S. Laurent.

Those most esteemed, and that are made presents of as rarities, in the Indies, are no bigger than a billiard ball; when sweetened with a little sugar, they are esteemed excellent for disorders of the breast.—The juice is cooling and antiscorbutic.

Oranges are ordinarily comfited in halves and quarters. They are first peeled, then scooped and dried in a stove.—Orangeat is the *orange* peel cut in pieces and candied. Italy furnishes a great deal of flower of *oranges*, either dry or liquid.

The water of flower of *oranges*, called *aqua naphæ*, comes mostly from Provence. To be good, it must be very bitter, and not above a year old.

There are various oils drawn from *oranges*: The oil of neroli is the produce of the flowers by distillation. That drawn from the skin by water and an alembic, is altogether as good. There is also an oil drawn from little *oranges*, or *orangelettes*, by steeping them five or six days in common water, and distilling them with the same water in an alembic. These oils are all esteemed good for destroying worms in children; but are very apt to be sophisticated with oil of ben, or that of sweet almonds.

ORANGE Colour, is a hue or dye, that partakes equally of red and yellow; or is a medium between the two. See *COLOUR*, and *DYING*.

In heraldry, the term *orange*, or *orange*, is given in blazon to all roundles that are tenne, or tawney.

ORANGE flower water. See the article *WATER*.

ORANGEADE, a drink made of *orange*-juice, water, and sugar. See *ORANGE*, and *LEMONADE*.

Lemery says, it may be given to people in the height of a fever.

ORANGERY, a gallery in a garden, or parterre, exposed to the south, but well closed with a glass window, to preserve oranges in, during the winter season.

The orangery of Versailles is the most magnificent that ever was built: It has wings, and is decorated with a Tuscan order.

ORANGERY is also used for the parterre, where the oranges are exposed in kindly weather.

ORATION, a speech, or harangue, framed according to the rules of oratory, and spoke in public. See *ORATORY*, and *PERORATION*.

All the kinds of *orations* may be reduced to three heads: viz. *demonstrative*, *deliberative*, and *judicial*.

To the demonstrative kind belong, *panegyrics*, *genethliaca*, *epithalamia*, *epicedia*, *eucharistia*, *epinicia*, and *congratulations*. See *PANEGYRIC*, *GENETHLIAC*, &c.

To the deliberative kind belong, *persuasion*, *dissuasion*, *exhortation*, and *commendation*.

To the judicial kind belong, *accusation*, *confirmation*, *confutation*, &c. See each under its proper article *CONFIRMATION*, &c.

Funeral ORATION. See the article *FUNERAL*.

ORATORY, ORATORIA, the art of speaking well.

In which sense the word amounts to the same with *rhetoric*; the difference between the two only consisting in this, that the first is Latin, the other Greek. See *RHETORIC*.

ORATORY is also used among the Romanists, for a closet, or little private apartment, in a large house, near a bed-chamber, furnished with a little altar and a book-stand, for private devotion.

The ancient *oratories* were little chapels, adjoining to monasteries, wherein the monks said their prayers ere they had any churches

churches. Several councils and synods have condemned the use of private *oratories*. See CHAPEL.

In the sixth and seventh centuries, *oratories* were little churches, frequently built in burial grounds; without either baptistery, cardinal priest, or any public office; the bishop sending a priest to officiate occasionally. See COEMETERIUM.

ORATORY is also used for a society, or congregation of devout persons, who form a kind of monastery, and live in community: but without being obliged to make vows. Hence, *Priests of the Oratory*, a community of secular priests, who live together in a monastic manner, but without vows; first established at Rome, about the year 1590, by S. Philip Neri, a Florentine, under the title of *Oratory of Santa Maria in the Valicella*.

On the model of this, the cardinal Berulle established a congregation of the *Oratory of Jesus* in 1612, in France; which has since increased: so that there are now 60 houses of *priests of the Oratory* in that kingdom.

There is some difference, however, between the Italian and French institutions.—S. Philip Neri, to prevent the confusion which the great number of houses usually occasion in congregations; would have his to be a single house. And though others were at liberty to form the like congregations, yet they were to have no dependance on one another.

For this reason, the houses of the *Oratory* in Italy and Flanders are all independent: whereas those in France have a relation to each other, and all depend on the same chief, who has the quality of superior general; and, with three assistants, governs the whole congregation. See CONGREGATION.

ORB, ORBIS, in astronomy, a spherical body, or space, contained under two superficies; the one concave, the other convex. See SPHERE.

The antient astronomers conceived the heavens, as consisting of several vast, azure, transparent *orbs*, or spheres inclosed in one another: or vast circles, which in their area included the bodies of the planets; the radii whereof were comprised between the centre of the earth, and the highest point to which the planets rise; supposing the earth to be in the centre. See HEAVENS, and SPHERE.

There are *orbs concentric*, i. e. having the same centre; and *orbs excentric*. See CONCENTRIC, &c.

The *magnus ORBIS*, or *great ORB*, is that wherein the sun is supposed to revolve; or rather, that wherein the earth makes its annual circuit. See ORBIT.

ORB, in astrology.—An *orb* of light is a certain sphere or extent of light, which the astrologers allow a planet beyond its centre.

They say, that provided the aspects do but fall within this *orb*, they have almost the same effect, as if they pointed directly against the centre of the planet. See ASPECT.

The *orb* of Saturn's light they make to be 10 degrees; that of Jupiter 12°, that of Mars 7°, 30', that of the Sun 17°, that of Venus 8°, that of Mercury 7°, that of the Moon 12°, 30'.

ORBICULARE Os, ORBICULAR Bone, in anatomy, the fourth of the little bones of the inward ear; tied by a slender ligament to the stapes; and named from its figure, which is round. See EAR.

It was first discovered by Fran. Sylvius: Its use is in the extension and relaxation of the tympanum. See TYMPANUM.

ORBICULARIS, or *constrictor labiorum*, in anatomy, is one of the muscles of the lips. See CONSTRICTOR.

The *orbicularis* is single; its fibres make a ring about the mouth, and serve to constrict and draw up the lips, and by that means to shut the mouth, &c. It also serves to advance, or stretch them outwards; and has the chief part in the action of kissing. Whence it is also called *osculatorius*, or the kissing muscle.

Verheyen will not have it one muscle, but a pair, whose fibres meet, and join at both corners of the mouth; though other authors are unanimous in making it single, and call it a *sphincter*. See SPHINCTER.

ORBICULARIS, or *deprimens palpebrarum*, is a muscle springing from each corner of the eye, and answered by another of like figure and structure in the lower eyelid; which are therefore often considered as one *orbicular* muscle. See Tab. Anat. (Myol.) fig. 1. n. 2. See also EYELID.

Its fibres environ the eyelids, and are inserted into them, not unlike the sphincters of other parts. It is fastened to that part of the margin of the orbit, towards the nose, made by the fourth bone of the upper jaw.

ORBIT, ORBITA, in astronomy, the path of a planet, or comet; or the line described by its centre in its proper motion in the heavens. See PLANET, &c.

The sun's, or rather earth's *orbit*, is the curve which it passes along in its annual revolution; called the *ecliptic*. See ECLIPTIC.

The *orbit* of the earth, and that of all the primary planets, is an ellipsis; in one of whose foci, the sun is placed: in which ellipsis they move according to this law, that a radius drawn from the centre of the sun to the centre of the planet, al-

ways describes areas proportional to the times. See EARTH, SUN, AREA, &c.

The antient astronomers made the planets describe circular *orbits*, with an uniform velocity. Copernicus himself could not believe they should do otherwise; *Fieri nequit*, says he *ut celeste corpus simplex uno orbe inequaliter moveatur*. So that to account for their inequalities, they were obliged to have recourse to eccentrics and epicycles; from the embarrass whereof Copernicus himself could not entirely disentangle himself. See EPICYCLE, &c.

But after him came astronomers; who, with a little more physics, have made no difficulty of changing these circular *orbits* into elliptic ones; and of making them move with different velocities in different parts thereof.

Of these elliptic *orbits*, there have been two kinds assigned: The first, that of Kepler, which is the common ellipsis; to which Seth Ward, though he himself keeps to it, thinks one might venture to substitute circular *orbits*, by using two points taken at equal distances from the centre on one of the diameters, as they do in the foci of the ellipsis. The second is that of M. Cassini; whose character is this, that the products of the right lines drawn from each point of its circumference are every where equal; whereas in the common ellipsis, it is the sum of those right lines that is always the same. See ELLIPSIS.

M. Varignon shews how inconsistent Copernicus's sentiment is with the mechanism of the heavens: Since the forces which planets have to retain them in their *orbits*, must almost always conspire to make them move with really different velocities; and that among an infinity of cases, there is but one wherein they can move uniformly.

The semi-diameter of the earth's *orbit*, Dr. Gregory makes 94,696,969 miles English; and the semi-diameter of Saturn's *orbit* about 10 times as great.

The *orbits* of the planets are not all in the same plane as the ecliptic, or the earth's *orbit* round the sun; but variously inclined to it, and to one another. But still the plane of the ecliptic intersects the plane of the *orbit* of every planet in a right line, which passes through the sun. See INCLINATION.

The quantities of the inclinations of the planes of the *orbits* of the primary planets to that of the ecliptic, are as follow: That of Saturn, is an angle of 2 degrees  $\frac{1}{2}$ : That of Jupiter, an angle of 1 deg. 20 min. That of Mars is almost 2 deg. Venus is a little more than 3 deg. 20 min. And that of Mercury a little more than 7 degrees. See SATURN, MARS, VENUS, &c.

The *orbits* of comets, Cassini takes to be rectilinear; but Dr. Halley, from Sir Isaac Newton's theory, shews them to be parabolical, having the sun in one of their foci. See COMET.

ORBITS, in anatomy, the two large cavities, or sockets, wherein the eyes are placed. See Tab. Anat. (Osteol.) fig. 1. lit. b; see also EYE.

Their figure is pyramidal: They are formed of the processes of the os frontis, and the upper jaw-bone joined together; and are perforated at bottom, to give passage to the optic nerves.

ORBITER, in anatomy, a name sometimes given to two holes or cavities, either from their resemblance of, or nearness to, the orbits of the eyes.

The *orbiter externus*, is a hole in the cheek bone, below the orbit.

The *orbiter internus*, is a hole in the coronal-bone of the skull, within the orbit. See CORONAL.

ORCHARD, a seminary or plantation of fruit trees, chiefly apples and pears. See FRUIT-tree.

It is a rule among gardeners, that those *orchards*, cæteris paribus, thrive best, which lie open to the south, south-west, and south-east; and are screened from the north: the soil dry, and deep. See EXPOSURE.

*Orchards* are stocked by transplantation; seldom by semination. See PLANTING, SEMINATION, NURSERY, &c.

The season for transplanting apple trees into *orchards*, is in the months of October and November. If the leaves be not all off at the time they are removed, they must be pulled off. They are likewise to be pruned. Trees may be transplanted into *orchards* after three years grafting; and ought not to be set at a less distance than eight yards, nor greater than fourteen: And the richer the land, the greater the distance.

The trees are transplanted to best purpose, when young: for trees ten or twelve years old, a narrow trench must be dug the November before, deep enough to meet the spreading roots, at such a distance all around the tree, as the roots are to be cut off at. In making the trench, the roots to be cut off clean, and without splitting or bruising the bark, and the trench filled up again. This will enable the tree, upon removal, to draw more nourishment than otherwise it would, and so thrive better in its new mansion. See TRANSPLANTATION, INOCULATION, ENGRAFTING, &c.

The side branches of all tall *orchard* fruit trees, are to be cut off till the tree be arrived at the height desired. If the tree be to spread low, some are to be left on each side; so

as to form a kind of balance. For the first three years, at least, they must not grow thick and bushy headed; this must be prevented, by cutting off some of the inside shoots, and such as grow cros each other, or pendant. See PRUNING. The soil, if not rich enough, is to be amended in two or three years; by opening it around the tree, and on the outside of the ground first dug, when the tree was set; and in a month's time filling it up again with a proper compost or manure. See MANURING: see also PRUNING, and COMPOST.

**ORCHESTRA**, in the drama, the lower part of the antient theatre; made in form of a semicircle, and surrounded by the seats. See THEATRE.

It was so called, because in the Grecian theatres it was a place where they held their balls; from *ορχήστρα*, I dance.

The *orchestra* among the Greeks made a part of the scena; but on the Roman theatres, none of the actors went down to the *orchestra*, which was taken up with seats for the senators, magistrates, vestals, and other persons of distinction; answering, nearly, to the *pit* in our theatre. See SCENE, &c.

**ORDEAL**\*, **ORDALIUM**, a form of trial, that is, of discovering innocence, or guilt; practised in England in the time of Edward the Confessor, and since, as low as king John, and king Henry III. See TRIAL.

\* The word, in the original Saxon, signifies a great judgment; formed of *or*, great, and *deal*, or *dele*, judgment.

It was called *purgatio vulgaris*, or *judicium*, in opposition to *bellum*, or *combat*, the other form of purgation. See PURGATION, and COMBAT.

The practice of *ordeal* did not only obtain in England, but also in France and Germany: It was condemned by pope Stephen II. and abolished by a declaration of Henry III.

The *ordeal* was of various kinds, *viz.* that of fire, that of red-hot iron, that of cold water, that of judicial pottage, that of hallowed cheese, that of boiling water, that of the green cross, and that of dice laid on relics, covered with a woollen cloth.—There were particular masses for each species of *ordeal*. See MASS.

The more popular kinds of *ordeal* were those of red-hot iron and water: the first for freemen, and people of fashion; the second for peasants. See JUDICIUM, FIRE, WATER, &c. It is a popular story in our histories, that Emma, mother of Edward the Confessor, being accused of too much familiarity with the bishop of Leicester, demanded the *ordeal* of red-hot iron; and passed barefooted, and hoodwinked, over nine red-hot ploughshares, without touching any of them.

**ORDEFF**, or **OREDEF**, a word frequently used in charters of privileges, for a liberty whereby a man claims the ore found in his own ground. See ORE.

It properly signifies ore lying under ground; as, a *delf of coal*, is coal lying in veins under ground. See COAL.

**ORDER**, in architecture, a system of the several members, ornaments, and proportions of a column and pilaster.—Or, a regular arrangement of the projecting parts of a building; whereof the column is the chief; so as to form one beautiful whole. See *Tab. Archit.* fig. 25, 27, 29, 31, 33. See also COLUMN.

Perrault defines *order*, to be that which prescribes the proportions of entire columns, and determines the figures of certain parts suitable to the different characters their different uses and ends require. See ORDONNANCE.

M. le Clerc defines an *order* to be a column charged with an entablature, and supported on a pedestal.

The definitions Vitruvius, Barbaro, Scamozzi, &c. give of *order*, are so obscure, that it were vain to repeat them: without dwelling, therefore, on the definition of a word, which custom has established, it is sufficient to observe, that there are five *orders* of columns; three whereof are Greek, *viz.* the *Doric*, *Ionic*, and *Corinthian*; and two Italic, *viz.* the *Tuscan* and *Composite*.

The three Greek *orders* represent the three different manners of building, *viz.* the *solid*, *delicate*, and *middling*; the two Italic ones are imperfect productions thereof. The little regard the Romans had for these last, appears hence, that we do not meet with one instance in the antique, where they are intermixed. That abuse the moderns have introduced by the mixture of Greek and Latin *orders*, Daviler observes, arises from their want of reflection on the use made thereof by the antients.

The origin of *orders* is almost as antient as human society. The rigor of the seasons first led men to make little cabins, to retire into; at first, half under ground, and the half above covered with stubble: at length, growing more expert, they planted trunks of trees an-end, laying others across, to sustain the covering. See ARCHITECTURE.

Hence they took the hint of a more regular architecture; for the trunks of trees, upright, represent columns: the girts, or bands, which served to keep the trunks from bursting, expressed basis and capitals; and the summers

laid across, gave the hint of entablatures; as the coverings, ending in points, did of pedements. This is Vitruvius's hypothesis; which we find very well illustrated by M. Blondel. See CAPITAL, PEDESTAL, &c.

Others take it, that columns took their rise from pyramids, which the antients erected over their tombs; and that the urns, wherein they inclosed the ashes of the dead, represented the capitals, whose abacus was a brick, laid thereon to cover the urns: but Vitruvius's account appears the more natural. See ABACUS, ACANTHUS, &c.

At length, the Greeks regulated the height of their columns on the foot of the proportions of the human body: the *Doric* represented a man of a strong, robust make; the *Ionic* that of a woman; and the *Corinthian* that of a girl: Their bases and capitals were their head-dress, their shoes, &c. See BASE, &c.

These *orders* took their names from the people, among whom they were invented: Scamozzi uses significative terms to express their character; when he calls the *Tuscan*, the *gigantic*; the *Doric*, the *Herculean*; the *Ionic*, the *matronal*; the *Composite*, the *heroic*; and the *Corinthian*, the *virginal*. See each order under its proper articles, *TUSCAN*, *DORIC*, &c.

To give a general idea of the *orders*; it must be observed, that the whole of each *order* is composed of two parts at the least, *viz.* the column and entablature; and of four parts at the most, when there is a pedestal under the column, and an acroter, or little pedestal, atop of the entablature: that the column has three parts, *viz.* the *base*, the *shaft*, and the *capital*; the entablature has three likewise, *viz.* the *architrave*, the *freeze*, and *cornich*: which parts are all different in the several *orders*. See each part under its proper article, *ENTABLATURE*, *CAPITAL*, &c.

*Tuscan ORDER* is the first, most simple, and solid: its column is seven diameters high; and its capital, base, and entablature, have but few mouldings, or ornaments. See *TUSCAN*.

*Doric ORDER*, is the second, and the most agreeable to nature. It has no ornament on its base, or in its capital. Its height is eight diameters. Its freeze is divided by triglyphs and metopes. See *DORIC*.

*Ionic ORDER*, is the third; and a kind of mean proportional between the solid, and delicate manner. Its capital is adorned with volutes, and its cornich with denticles. See *IONIC*.

Mich. Angelo, contrary to all other authors, gives the *Ionic* a single row of leaves at the bottom of the capital.

*Corinthian ORDER*, invented by Callimachus, is the fourth, the richest, and most delicate. Its capital is adorned with two rows of leaves, and eight volutes, which sustain the abacus. Its column is ten diameters high, and its cornich has modillions. See *CORINTHIAN*.

*Composite ORDER*, the fifth and last, (though Scamozzi and Le Clerc make it the fourth) is so called, because its capital is composed out of those of the other *orders*; having the two rows of leaves of the *Corinthian*, and the volutes of the *Ionic*. It is also called the *Roman*, because invented among that people. Its column is ten diameters high; and its cornich has denticles, or simple modillions. See *COMPOSITE*, and *ROMAN*.

*Rustic ORDER*, is that adorned with rustic quoins, bossages, &c. See *RUSTIC*.

*Attic ORDER*, is a little *order* of low pilasters, with an architrave cornich for its entablature; as that of the castle of Versailles over the *Ionic* on the side of the garden. See *ATTIC*.

M. Blondel calls the little pilasters of attics and mezzanines, *false orders*.

*Persian ORDER*, is that which has figures of Persian slaves, instead of columns, to support the entablature. See *PERSIAN*.

*Caryatic ORDER*, is that whose entablature is supported with figures of women, instead of columns. See *CARYATIDES*.

*Gothic ORDER*, that which deviates from the ornaments and proportions of the antique; and whose columns are either too massive, in manner of pillars; or too slender, like poles: its capitals out of all measure; and carved with leaves of wild acanthus, thistles, cabbage, or the like. See *GOTHIC*.

*French ORDER*, is a new contrived *order*, wherein the capital consists of attributes agreeing to that people; as cocks-heads, flowers-de-luces, &c.

Its proportions are *Corinthian*: such is that of M. le Brun, in the grand gallery of Versailles; and that of M. le Clerc.

M. le Clerc gives a second *Tuscan order*, and a Spanish *order*, besides his French *order*.—The *Tuscan* he ranks between the first *Tuscan* and *Doric*. Its height he makes 23 semi-diameters, 22 minutes. The column to have 15, the pedestal 5, and the entablature 3, and 22 mi-

22 minutes: and he proposes its freeze to be adorned with turtles, which are the arms of Tuscany.

The Spanish *order* he places between the Corinthian and Composite. The whole *order* he makes 30 semidiameters, 28 minutes; whereof the column has 9, and 25 min. the pedestal 16, and 18 min. and the entablature 4, and 15 min. The horns of the abacus he sustains with little volutes; the middle, in lieu of a rose, has a lion's snout: that animal being the symbol of Spain, and expressing the strength, gravity, and prudence of that nation.

**Greek ORDERS.** See the article GREEK.

**ORDER**, is also used for a class, or division of the members of the body of a state; with regard to assemblies, precedence, &c. See RANK, PRECEDENCY, &c.

In this sense, *order* is a kind of dignity, which under the same name, is common to several persons; and which, of itself, does not give them any particular public authority, but only rank, and a capacity of arriving at honours, and employments.

To abridge this definition; *order* may be said to be a dignity attended with an aptitude for public employ. — By which it is distinguished from an *office*, which is the exercise of a public trust. See OFFICE.

In this sense, nobility is an *order*, &c. The-clericate is also an *order*, &c. See NOBILITY, &c.

**ORDER**, is also the title of certain antient books, containing the divine office, with the *order* and manner of its performance. See LITURGY, MASS, ORDINAL, &c.

*Roman order*, is that wherein are laid down the ceremonies which obtain in the Roman church. See RITUAL.

**ORDER**, in astronomy, &c.—A planet is said to go according to the *order* of the signs, when it is direct; proceeding from Aries to Taurus, thence to Gemini, &c.—It goes contrary to the *order* or succession of the signs, when it is retrograde, i. e. when it goes back from Pisces to Aquarius, &c. See DIRECTION, RETROGRADATION, SIGN, &c.

**ORDER**, in war, denotes an arrangement of the parts of an army, either by land or sea; whether for marching, sailing, or engaging. See ARMY.

**ORDER of Battle**, is the placing the battalions and squadrons in one, two, or three lines, according as the ground will allow, either in order to engage the enemy, or to be reviewed by the general. See LINE, &c.

An **ORDER of March**, is disposed in two or three columns, according to the ground.—The *orders* and evolutions make the subject of the science of tactics. See TACTIC.

**ORDER** is more particularly used for the equal distance of one rank, or file from another.

The usual *order* in files, is three foot; in ranks, six foot. — The open, or marching *order*, is twice as much. See RANK, and FILE.

**ORDERS**, by way of eminency, or *Holy ORDERS*, denote a character peculiar to ecclesiastics, whereby they are set apart for the ministry. See ORDINATION.

This the Romanists make their sixth sacrament. See SACRAMENT.

In the reformed churches there are but three *orders*; viz. bishops, priests, and deacons. In the Romish church there are seven, exclusive of the episcopate: all which the council of Trent enjoins to be received, and believed, on pain of anathema. See HIERARCHY.

They are distinguished into *petty*, or *secular orders*; and *major*, or *sacred orders*.

The *petty*, or *minor ORDERS*, are four; viz. those of door-keeper, exorcist, reader, and acolyth. See EXORCIST, ACOLYTH, &c.

Those in *petty orders* may marry without any dispensation: In effect, the *petty orders* are looked on as little other than formalities, and as degrees necessary to arrive at the higher *orders*.—Yet the council of Trent is very serious about them; enjoins that none be admitted into them, without understanding Latin; and recommends it to the bishops, to observe the intervals of conferring them, that the persons may have a sufficient time to exercise the functions of each *order*: but it leaves the bishops a power of dispensing with those rules; so that the four *orders* are usually conferred the same day, and only make the first part of the ceremony of ordination. See MINOR.

The Greeks disavow these *petty orders*, and pass immediately to the subdiaconate; the reformed, to the diaconate.

Their first rise, Fleury dates in the time of the emperor Justinian. There is no call nor benefice required for the four *petty orders*; and a bastard may even enjoy them, without any dispensation; nor does bigamy disqualify.

**Sacred**, or **major ORDERS**, we have already observed, are three; viz. those of deacon, priest, and bishop. See DEACON, PRIEST, and BISHOP.

The council of Trent, retrieving the antient discipline, forbids any person being admitted to the *major orders*, unless he be in peaceable possession of a benefice sufficient for a decent subsistence; allowing no ordinations on patrimonies or pen-

sions; except where the bishop judges it for the service of the church.

A person is said to be promoted to *orders per saltum*, when he has not before passed the inferior *orders*. The council of Constantinople forbids any bishop being ordained without passing all the degrees; yet church history furnishes us with instances of bishops consecrated, without having passed the *order* of priesthood; and Panormus still thinks such an ordination valid.

**Military ORDERS**, are companies of knights, instituted by kings and princes; either for defence of the faith, or to confer marks of honour, or make distinctions among their subjects. See KNIGHT.

There have been five *orders* purely military in England; viz. those of the knights of the *garter*, knights *bannerets*, knights of the *bath*, knights *batchelors*, and knights *baronets*. See the institution of each under its proper article, GARTER, BATH, BARONET, &c.

**ORDER of the Thistle.** See the article THISTLE.

The French have had five military *orders*; viz. that of the *genette*, instituted by Charles Martel; but which soon fell.—

The *order* of the *virgin Mary*, since called the *order* of the *star*, instituted by king John, in 1352.—The *order* of *S. Michael*, instituted in 1469, by Lewis IX.—The *order* of the *holy Ghost*, or the *blue ribband*; the members of which are first to be knights of *S. Michael*. See HOLY GHOST.—And the *order* of *S. Louis*, instituted by Louis XIV. in 1693.

The princes of the blood, marshals of France, admiral, and general, become knights of *S. Louis* by their office.

**ORDER of Alcantara.**

**ORDER of the Band.**

**ORDER of Christ.**

**ORDER of the Cross.**

**ORDER of the Elephant.**

**ORDER of the golden Fleece.**

**ORDER of the Knot.**

**ORDER of the Rosary.**

**ORDER of the Star.**

STOLE, &c.

**Religious military ORDERS**, are those instituted in defence of the faith, and privileged to say mass; and withal are prohibited marriage, &c.

Of this kind are the knights of *Malta*, or of *S. John of Jerusalem*.—Such also were the knights *templars*, the knights of *Calatrava*, knights of *S. Lazarus*, *Teutonic knights*, &c. See each under its proper article, MALTA, TEMPLAR, &c.

Father Putignani accounts those *military orders* where marriage is not allowed, real *religious orders*.—F. Papebroch says, it is in vain to search for *military orders* before the twelfth century.

**Religious ORDERS**, are congregations or societies of monastics, living under the same superior, in the same manner, and wearing the same habit. See RELIGIOUS, and CONGREGATION.

*Religious orders* may be reduced to five kinds, viz. *monks*, *canons*, *knights*, *mendicants*, and *regular clerks*. See each under its proper article, MONK, CANON, &c.

Father Mabillon shews, that till the ninth century, almost all the monasteries in Europe followed the rule of *S. Benedict*; and that the distinction of *orders* did not commence till upon the re-union of several monasteries into one congregation: that *S. Odo*, abbot of *Cluny*, first began this re-union, bringing several houses under the dependence of *Cluny*: that, a little afterwards, in the eleventh century, the *Camaldulians* arose; then, by degrees, the congregation of *Vallombrosa*; the *Cistercians*, *Carthusians*, *Augustines*; and at last, in the thirteenth century, the *Mendicants*. He adds, that *Lupus Servatus*, abbot of *Ferrieres*, in the ninth century, is the first that seems to distinguish the *order* of *S. Benedict* from the rest, and to speak of it as a particular *order*. See BENEDICTINS.

**White ORDER** denotes the order of regular canons of *S. Augustin*. See AUGUSTIN.

**Black ORDER**, denotes the order of *Benedictins*. See BENEDICTINS.

These names were first given these two *orders* from the colour of their habit; but are disused since the institution of several other *orders*, who wear the same colours.

**Grey ORDER**, was the antient name of the *Cistercians*; but since the change of the habit, the name suits them no more. See CISTERCIANS.

**ORDER of Charity.**

**ORDER of S. Saviour.**

**Third ORDER.**

See the article

CHARITY.

SAVIOUR.

THIRD.

**ORDER**, in the geometry of curves. See GENDER, LINE, and CURVE.

**Book of ORDERS.** See the article BOOK.

**ORDER Interlocutory**, in law. See INTERLOCUTORY.

**ORDINAL, ORDINALE**, a book containing the order, or manner of performing divine service. See RITUAL.

ORDINAL,

**ORDINAL**, in grammar, an epithet given to such numbers as mark the order of things, or in what rank they are placed. See **NUMBER**.

Thus, first, second, tenth, hundredth, &c. are *ordinal numbers*. See **CARDINAL**.

**ORDINANCE**, or **ORDONNANCE**, a law, statute, or command of a sovereign, or superior. See **LAW**, &c.

*Ordinance of parliament*, is ordinarily used in the same sense as *statute*, or *act of parliament*. See **STATUTE**.

In the parliament rolls, acts are often called *ordinances of parliament*.—Though in some cases we find a difference made between the two; *ordinances* being only temporary things, by way of prohibition; and capable of being altered by the commons alone: whereas an *act* is a perpetual law, and cannot be altered but by king, lords, and commons. See **ACT**.

Sir Edward Coke asserts, that an *ordinance* of parliament differs from an *act*, as the latter can only be made by the king, and the threefold consent of the estates; whereas the former may be made by one or two of them.

*Ordinance of the forest*, is a statute made in the thirty fourth year of Henry I. relating to forest matters. See **FOREST**, and **ASSISE**.

In the French jurisprudence, *ordonnances* are such laws as are established by the king's authority alone. All *ordonnances* begin with, *a tous presens & a venir salut*.

**ORDINANCE**, or **ORDNANCE**, is also a general term for all sorts of great guns, or cannon, mortars, &c. used in war. See **GUN**, **CANNON**, and **MORTAR**.

The parts of a piece of *ordinance* are the outside, round about the piece, which is called the *superficies of her metal*: the substance, or whole mass of metal, called her *body*: the part next us, when she stands ready to fire, the *breech* or *coyle*; and the pummel, or round knob at the end of it, the *cascabell*; by some the *cascabell-dock*. The *trunnions* are the two knobs, or ears, which hold the piece in the carriage. *Manillions* or *dolphins* in the German guns, are two handles placed on the back of the piece near the trunnions, and near the centre of gravity, to mount and dismount them more easily.

The rings about a piece of *ordinance* are five: the *base-ring*, that which is next below the touch-hole: the next above the touch-hole, is called the *reinforced-ring*: the next to that, forward, the *trunnion-ring*: the next to that, the *cornice-ring*: that at the mouth, the *muzzle-ring*, or the *freeze*.—All the rings near the mouth are sometimes called the *freezes*.

As to the internal parts; the whole cavity or bore of the piece, is called her *chase*: that part of the cavity between the trunnions and the muzzle or mouth, the *vacant cylinder*: that part from the trunnions to the end of the cavity, or so much of it as containeth (or is loaded with) the powder and shot, is called the *chamber*. The diameter of the mouth, the *caliber*: the space between the shot, and the hollow superficies of the piece within, the *vent*; being the difference between the diameter of the shot, and the mouth of the piece.

*Ordinance* in England is distinguished into two kinds, *viz.* *Field-pieces*, which are from the smallest to twelve pounders. — And *cannon of battery*, which are from a culverin to a whole cannon.

Each of these divisions is again subdivided; the first into *baze*, *rabinet*, *falconet*, *falcon*, *minion ordinary*, *minion largest*, *faker least*, *faker ordinary*, *demi-culverin least*, and *demi-culverin ordinary*. — The second into *culverin least*, *culverin ordinary*, *culverin largest*, *demi-cannon least*, *demi-cannon ordinary*, *demi-cannon large*, and *royal whole cannon*.

The lengths and weights of each whereof, as also the weights of the bullets they carry; see expressed in a particular table under the article **CANNON**. See also each piece under its proper head, **CANNON**, **CULVERIN**, **SAKER**, &c.

The strength and serviceableness of a piece of *ordinance* depends much on the thickness of the metal, especially about its chamber, and breech, which is called its *fortification*.

Of this there are three degrees, both for cannons and culverins. — Such as are ordinarily fortified, are called *legitimate pieces*. Those whose fortification is lessened, are called *bastard pieces*. Those doubly fortified, are called *extraordinary pieces*.

The fortification of a gun is reckoned from the thickness of the metal at the touch-hole, at the trunnions, and at the muzzle, in proportion to the diameter of the bore. The doubly-fortified pieces are a full diameter of the bore in thickness at the touch-hole,  $\frac{1}{2}$  of it at the trunnions, and  $\frac{1}{3}$  at the muzzle: the lessened cannons have but  $\frac{1}{3}$ , or  $\frac{1}{4}$  of the diameter of their bore, in the thickness at the touch-hole,  $\frac{1}{4}$  at the trunnions, and  $\frac{1}{5}$  at the muzzle.

All the double-fortified culverins, and all the lesser pieces of that kind, have a diameter and  $\frac{1}{3}$  at the touch-hole,  $\frac{1}{2}$  at the trunnions, and  $\frac{2}{3}$  at the muzzle. And the ordinary for-

tified culverins are every way as the doubly fortified cannon; and the lessened culverins as the ordinary cannon, in all respects.—The ordinary-fortified cannons have  $\frac{1}{4}$  at the touch-hole,  $\frac{1}{3}$  at the trunnions, and  $\frac{1}{2}$  at the muzzle.

**ORDINANCE**, in painting. See the article **ORDONNANCE**.

**ORDINANCE**, or **ORDNANCE Office**, is the standing, grand magazine of arms, habiliments, instruments, and utensils of war, as well by sea as land; not only for those lodged in the tower, but in all the garrisons, castles, forts, &c. in Great Britain: from whence, as occasion requires, his majesty's armies, &c. are supplied. See **ARSENAL**.

The officers of the *ordinance* are, the *master-general*, from whom are derived all orders and dispatches relating to the same, as the service shall best require. — This post has of late been annexed to the office of general and commander in chief.

Under him is a *lieutenant-general of the ordinance*, who receives orders from the master-general, and the rest of the prime officers at the board; sees them duly executed; orders the firing of the guns on days of rejoicing, and sees the train of artillery fitted out, when ordered to the field. See **LIEUTENANT**, **TRAIN**, &c.

Next to him is the *surveyor-general*, who has the inspection of the *ordinance*, stores, and provisions of war, in the custody of the store-keepers; he allows all bills of debts, keeps a check on labourers, &c. See **SURVEYOR**.

Under these is a *clerk of the ordinance*, who records all orders and instructions given for the government of the office; with all patents, grants, names of officers, &c. draws all estimates for provisions, and supplies all letters, instructions, commissions, deputations, contracts, &c. serves as a check between the two accountants of the office, the one for money, the other for stores. See **CLERK**.

This office has also a store-keeper, who takes into his custody all *ordinance*, ammunition, stores, &c. thereto belonging; and indents, and gives in legal security for the safe keeping thereof; and renders an exact account from time to time.

Here is also a *clerk of the deliveries*; whose duty is to draw up all provisions, either at the tower, or any other of his majesty's magazines, to see them duly executed, &c.

And lastly, a *treasurer*, through whose hands passes the money of the whole office, as well for payment of salaries as debentures.

*Spiking up the ORDINANCE*. See the article **SPIKING**.

**ORDINARI**, in antiquity, were a sort of gladiators; being those appointed to exhibit combats on certain stated days, &c. See **GLADIATOR**.

**ORDINARY**, something that happens, or passes frequently, usually. See **EXTRAORDINARY**.

We say, the *ordinary* course of things, whatever is done without miracles, is done by *ordinary* agents.

**ORDINARY Culverin**. See the article **CULVERIN**.

**ORDINARY Minion**, &c. See the article **MINION**, &c.

*Embassador*, or *Envoy in ORDINARY*, he who is sent to reside stately, and for a number of years, in the court of some prince or state, to keep up a good understanding, and watch the interests of his nation. See **EMBASSADOR**, **ENVOY**, **RESIDENT**, &c.

**ORDINARY** is also applied to several officers and servants belonging to the king's household, who attend on common occasions.—Thus we say, physician in *ordinary*, &c.

**ORDINARY**, **ORDINARIUS**, in the civil law, is any judge vested with authority to take cognizance of causes, in his own right, as he is a magistrate; and not by deputation. See **JUDGE**.

**ORDINARY**, in common and canon law, denotes him who has *ordinary* or immediate jurisdiction in ecclesiastical causes in such a place.

In which sense archdeacons are *ordinaries*.—Though the appellation be most frequently given to the bishop of the diocese, who has the *ordinary* ecclesiastical jurisdiction, and the collation to benefices therein. See **BISHOP**, **COURT**, **ECCLESIASTICAL**, &c.

There are several chapels, chapters, abbeys, &c. exempted from the jurisdiction of the *ordinary*. See **CHAPEL**, **ABBEY**, &c.

The archbishop is *ordinary* of the whole province, to visit and receive appeals from the inferior judicatures.

The Romish canonists call the pope *ordinary of ordinaries*, since by the Lateran council he has usurped the right of collating, by prevention, to all benefices; in exclusion of the *ordinary* collators. See **COLLATION**.

**ORDINARY of Assizes and Sessions**, was a deputy of the bishop of the diocese, antiently appointed to give malefactors their neck-verses, and judge whether they read or not; also to perform divine service for them, and assist in preparing them for death.

**ORDINARY**, or **Honourable ORDINARY**, in heraldry, a denomination given to certain charges properly belonging to that art. See **CHARGE**, and **HONOURABLE**.

The

are every way as the doubly fortified cannon; and culverins as the ordinary cannon, in all the trunnions, and  $\frac{1}{2}$  at the muzzle. See the article *ORDONNANCE*. The *ORDONNANCE Office*, is the standing, grand arms, habiliments, instruments, and utensils of war by sea as land; not only for those lodged in but in all the garrisons, castles, forts, &c. in which from whence, as occasion requires, his majesty's arms are supplied. See *ARSENAL*. The *ORDONNANCE* are, the *major-general*, from which all orders and dispatches relating to the service shall best require. — This post has of late been moved to the office of general and commander in

is a *lieutenant-general of the ordinance*, who reports from the *major-general*, and the rest of the council at the board; sees them duly executed; orders the guns on days of rejoicing, and sees the artillery fitted out, when ordered to the field. See *ARTILLERY*, *TRAIN*, &c.

is the *surveyor-general*, who has the inspection of the stores, and provisions of war, in the custody of the *surveyors*; he allows all bills of debts, keeps a book of the *surveyors*, who records all orders given for the government of the office; grants, names of officers, &c. draws all provisions, and supplies all letters, instructions, deputations, contracts, &c. serves as a check on the accountants of the office, the one for money and the other for stores. See *CLERK*.

is also a *store-keeper*, who takes into his custody, ammunition, stores, &c. thereto belonging, and gives in legal security for the safe keeping of them; and renders an exact account from time to time of the delivery; whose duty is to draw out, either at the tower, or any other of his magazines, to see them duly executed, &c.

*Treasurer*, through whose hands passes the money of the office, as well for payment of salaries as debts.

*ORDONNANCE*. See the article *SPRING*. In antiquity, were a sort of gladiators; being used to exhibit combats on certain stated days, &c.

*ORDONNANCE*. See the article *SPRING*. In antiquity, were a sort of gladiators; being used to exhibit combats on certain stated days, &c.

*ORDONNANCE*. See the article *SPRING*. In antiquity, were a sort of gladiators; being used to exhibit combats on certain stated days, &c.

*ORDONNANCE*. See the article *SPRING*. In antiquity, were a sort of gladiators; being used to exhibit combats on certain stated days, &c.

*ORDONNANCE*. See the article *SPRING*. In antiquity, were a sort of gladiators; being used to exhibit combats on certain stated days, &c.

*ORDONNANCE*. See the article *SPRING*. In antiquity, were a sort of gladiators; being used to exhibit combats on certain stated days, &c.

The *honourable ordinaries* are ten in number, viz. the *chief*, *pale*, *bend*, *fesse*, *bar*, *cross*, *saltier*, *chevron*, *bordure*, and *orle*. See each in its place, *CHIEF*, *PALE*, &c.

The heralds give several reasons for their being called *honourable*; viz. 1<sup>o</sup>, Their great antiquity, as having been used ever since armoury was set on foot. And, 2<sup>o</sup>, for that they denote the ornaments most necessary for noble and generous men: thus the chief represents the helmet, wreath, or crown, covering the head: the pale represents his lance, or spear: the bend and bar, his belt: the fesse, his scarf: the cross and saltier, his sword: the chevron, his boots and spurs: and the bordure and orle, his coat of mail.

As to the allotting or distributing of these *ordinaries*, some authors write, that when a gentleman having behaved himself gallantly in fight, was presented to the prince, or general, and a suitable coat-armour ordered him; if he were wounded in the head, they gave him a chief; if in the legs, he had a chevron; and if his sword and armour were discoloured with the blood of enemies, a cross or bordure.

Some heralds have attempted to increase the number of *honourable ordinaries* to twenty; adding to those above-mentioned, the plain quarter, the giron, the *escutcheon*, *cappe dexter* and *sinister*, *emmanch dexter* and *sinister*, *chasse dexter* and *sinister*, and the *point*. But these are not yet authorized.

*ORDINATE*. See the article *CO-ORDINATE*.

*ORDINATES*, in geometry and conics, are lines drawn from any point of the circumference of an ellipsis, or other conic section, perpendicularly across the axis, to the other side. See *CONIC SECTION*.

The Latins call them *ordinatim applicatae*.—Such are the lines MM, MM, &c. (*Tab. Conics*, fig. 26.)

Half of each of these, as the lines EM, EM, &c. are properly only *semi-ordinates*, though popularly called *ordinates*. See *SEMI-ORDINATE*.

In curves of the second order; if any two parallel right lines be drawn so as to meet the curve in three points: a right line which cuts these parallels so, as that the sum of two parts terminating at the curve on one side the secant, is equal to the third part terminated at the curve on the other side; will cut all other right lines parallel to these, and that meet the curve in three points, after the same manner; i. e. so as that the sum of the two parts on one side will always be equal to the third part on the other side:—and these three parts equal on either side, Sir Isaac Newton calls *ordinatim applicatae*, or *ordinates* of curves of the second order. See *CURVE*.

*ORDINATE in a parabola*.

*ORDINATE in an hyperbola*.

*ORDINATE in an ellipsis*.

*ORDINATE Ratio*, is that wherein the antecedent of the first ratio is to its consequent, as the antecedent of the second is to its consequent. See *RATIO*.

*ORDINATION*, the act of conferring holy orders; or of initiating a candidate into the diaconate, or priesthood. See *ORDERS*, and *RE-ORDINATION*.

The *ordination* of bishops is more properly called *consecration*. See *BISHOP*, and *CONSECRATION*.

*Ordination* has always been esteemed the principal prerogative of bishops; and they still retain the function as a kind of mark of spiritual sovereignty in their diocese.

In the antient discipline, there was no such thing as a vague, and absolute *ordination*; but every one was to have a church, whereof he was to be *ordained* clerk, or priest. — In the twelfth century, they grew more remiss, and *ordained* without any title, or benefice. See *BENEFICE*.

The council of Trent restored the antient discipline, and appointed that none should be *ordained* but those who were provided of a benefice sufficient to subsist them. — The shadow of which practice still obtains among us. See *COMMENDAM*. The reformed hold the call of the people the only thing essential to the validity of the ministry; and teach, that *ordination* is only a ceremony which renders the call more august and authentic.

The council of Rome in 744, orders, that no *ordinations* shall be held except on the first, fourth, seventh, and tenth months. — With us, *ordination-days* are the four sundays immediately following the ember weeks: being the second sunday in lent, trinity-sunday, and the sundays following the first wednesday after September the 14th, and December the 13th. Pope Alexander II. condemns *ordination per saltum*, as they call it; i. e. the leaping to a superior order without passing through the inferior.

*ORDONNANCE*. See the article *ORDINANCE*.

*ORDONNANCE*, or *ORDINANCE*, in painting, denotes the disposition of the parts of a picture, either with regard to the whole piece, or to the several parts; as the groups, masses, contrasts, aspects, &c. See *PAINTING*.

In the *ordonnance* there are three things regarded, viz. the place, or scene, where; the distribution, how; and the contrast.

VOL. II. N<sup>o</sup> CIX.

In the first, regard is to be had to the *disposition* of things to serve as a ground-work; and to the *plan*, or position of bodies: under the former whereof, come, 1<sup>o</sup>, The *landskip*; whether an uninhabited place, where there is a full liberty of representing all the extravagancies of nature; or inhabited, where the marks of cultivation, &c. must be exhibited. See *LANDSKIP*.

2<sup>o</sup>, The *building*, whether rustic; wherein the painter's fancy is at liberty: or regular; wherein a nice attention is required to the orders. See *ORDER*, and *ARCHITECTURE*.

3<sup>o</sup>, The mixture of both; wherein it is a maxim to compose in great pieces, and make the ground-plot big enough; to neglect some little places, in order to bestow more on the whole mass, and to shew the more considerable places with the more advantage; and to make some agitation in all the things that move.

As to plans of bodies; they are either solid: which again, are either so by nature, and which must be proportioned to their places; or artificial, where regard is to be had to the rules of geometry, perspective, architecture, &c. — Or they move: which they do, either by a voluntary motion, wherein care must be had to proportion them to their situation, and to strengthen them by regarding the equilibrium; or by some extraordinary power, as machines, &c. where the causes of their motions must appear. — Or they are things at a distance. In all which, an even plane must still be proposed to find their precise situation, and settle their place by sudden breaks, and distances, agreeable to perspective. See *PERSPECTIVE*, &c.

In placing the figures, regard must be had, 1<sup>o</sup>, To the *group*, which connects the subject, and stays the sight. In this are to be considered the knot, or nodus, which binds the group; and the nearness of figures, which we may call the chain, as it holds them together; that the group be sustained by something loose and distinct from it; and by the same joined and continued to the other groups: and that the lights and shadows be so disposed, as that we may at once see the effect of all the parts of the composition. See *GROUP*.

2<sup>o</sup>, To the *actions*, wherein forced attitudes are to be avoided, and simple nature shewn in her most advantageous postures. In weak and lean figures, the nudities not to be shewn; but occasions of covering them sought. In all human figures, special care to be taken, the head be well placed between the shoulders; the trunk on the haunches, and the whole on the feet. See *ATTITUDE*.

3<sup>o</sup>, To the *drapery*; which is to be adjusted, so as it may appear real garments, and not stuffs loosely thrown on. The folds to be so disposed, as to leave the great parts, wherein the nudity may appear, free; ranging the little folds about the joints, and avoiding them on the relieve of the members. And, lastly, to dispose the draperies, by raising the stuff, and letting it fall lightly, that the air sustaining the folds, may let them fall soft. See *DRAPERY*.

Lastly, in the *contrast*, are to be considered the actions, which vary infinitely: the aspects, which, in actions of the same kind, may, by their difference, make a contrast: the situation, according as they meet above or under the sight, far or near. And, lastly, custom; which extends, indeed, to all parts of painting, but is particularly to be regarded in the *ordonnance*; to be managed discreetly, however, and stiffness and formality avoided. See *CONTRAST*.

*ORDONNANCE*, in architecture, is nearly the same as in painting; viz. the composition of a building, and the disposition of its parts, both with regard to the whole, and to one another. See *BUILDING*.

Vitruvius defines *ordonnance* to be that which regulates the size or magnitude of all the parts of a building with respect to their use.

This definition is censured by M. Perrault, who takes the *ordonnance* to consist in the division of the plan or spot of ground whereon the building is to be raised; i. e. in the apportioning or laying it out, agreeably to the intended dimensions of the whole fabric; which Mr. Evelyn expresses in fewer words, by “determining the measure of what is assigned to compose the several apartments.”

On this foundation, *ordonnance* is the judicious contrivance of the plan or model; as when the court, hall, lodgings, &c. are neither too large, nor too little: but the court, v. gr. affords convenient light to the apartments about it, and is large enough for usual access. The hall of fit capacity to receive company; the bed-chambers accordingly, &c. When these divisions are either too great, or too small with respect to the place, as a large court to a little house, or a little chamber in a magnificent palace; the fault is in the *ordonnance*.

This the antients called *taxis*; and distinguished it from *diasthesis*, disposition; which is, where all the parts and members of a building are assigned their just place and situation with regard to their quality, office, rank, &c. without any regard to the dimensions, or quantity: as, that the vestibule or porch be before the hall, the hall before the parlor, and that before the

withdrawing room, &c. The bed-chambers again, to look to the sun-rising; libraries, galleries of paintings, and cabinets of curiosities, &c. to the north.

**ORE**, in natural history, the mineral glebe, earth or stone, dug out of mines, to be purified, and the metalline parts procured, and separated from the same. See **MINE**, and **METAL**.

The ore is frequently called the *mineral*; and sometimes *marcasite*; though, on other occasions, a difference is made; the denomination *ore* being only given where the mineral is rich enough of metal to be wrought.—When it is not, it is denominated *marcasite*. See **MINERAL**, and **MARCASITE**.

**ORE**, in navigation. See the article **OAR**.

**ORGAL**, the lees of wine dried, and used by dyers to prepare the cloth for more readily taking their several colours. See **DYING**, **COLOUR**, **TARTAR**, &c.

**ORGAN**, **OPRANON**, is used in the general for any thing framed and destined for some certain action, use, or operation. See **INSTRUMENT**.

**ORGAN**, or **ORGANICAL Part**, in physiology, is such a part of the body as is capable of the performance of some perfect act, or operation. See **PART**, and **BODY**.

In which sense, all the parts, even the most simple, may be denominated *organical*.

The organs are divided into *primary*, and *secondary*.—The primary are those composed of similar parts, and appointed for some one single function.—Such as consist of several of these, though appropriated to one single action, are esteemed *secondary organs*.

Thus the veins, arteries, nerves, and muscles, are primary organs; and the hands, fingers, &c. secondary organs.

**ORGAN of sense**, is that part of an animal body by means whereof it perceives external objects. See **SENSE**.

These, some divide into *internal*, which is the brain; and *external*, viz. the eye, ear, nose, &c. See **BRAIN**, **EYE**, **EAR**, **NOSE**, &c.

**ORGAN**, in music, denotes the largest and most harmonious of all wind instruments; chiefly used for playing a thorough bass, with all its accompaniments. See **MUSIC**.

The invention of the organ is very antient, though it is agreed it was little used till the eighth century. It seems to have been borrowed from the Greeks. Vitruvius describes one in his tenth book. The emperor Julian has an epigram in its praise. S. Jerom mentions one with twelve pair of bellows, which might be heard a thousand paces, or a mile; and another at Jerusalem, which might be heard to the mount of Olives. The structure of the modern organ may be conceived as follows.

The organ is an assemblage of several rows of pipes. Its size is usually expressed by the length of its largest pipe: thus we say an organ of 32 feet, of 16 feet, of 8 feet, and of 2 feet.

Church organs consist of two parts, viz. the main body of the organ, called the *great organ*; and the *positive*, or *little organ*, which is a small bouffet, usually placed before the great organ.

The organ has at least one set of keys, when it has only one body; and two or three, when it has a positive. The large organs have four, sometimes five sets. Besides, the pedals, or largest pipes, have their key, the stops or touches whereof are played by the feet. The keys of an organ are usually divided into four octaves; viz. the second sub-octave, first sub-octave, middle octave, and first octave. Each octave is divided into twelve stops, or frets; whereof the seven black mark the natural sounds, and the five white the artificial sounds; i. e. the flats and sharps. So that the keys usually contain 48 stops, or touches. Some organists add to this number one or more stops in the third sub-octave, as well as in the second. Note, in harpsicords and spinets, the natural stops or keys are usually marked white, the artificial ones black. The pedals extend to two or three octaves at the pleasure of the organist: so that the number of stops is indeterminate.

Each key or stop pressed down opens a valve or plug, which corresponds lengthwise, to as many holes as there are rows of pipes on the sound-board. The holes of each row are opened and shut by a register or ruler pierced with 48 holes. By drawing the register, the holes of one row are opened, because the holes of the register correspond to those of the sound-board. So that by opening a valve, the wind brought into the sound-board by a large pair of bellows, finds a passage into the pipe, which corresponds to the open hole of the sound-board. But by pushing the register, the 48 holes of the register, not answering to any of those of the sound-board, that row of pipes answering to the pushed register are shut. Whence it follows, that by drawing several registers, several rows of pipes are opened; and the same thing happens, if the same register correspond to several rows. Hence the rows of pipes become either *simple*, or *compound*: simple, when only one row answers to one register; compound, where several. The organists

say, a row is *compound*, when several pipes play upon pressing one stop.

The pipes of the organ are of two kinds; the one with mouths like our flutes; the other with reeds. The first called *pipes of mutation*, consist, 1<sup>o</sup>, of a foot A A B B, (Tab. *Miscellany*, fig. 15.) which is a hollow cone, and which receives the wind that is to sound the pipe. 2<sup>o</sup>, To this foot is fastened the body of the pipe B B D D. Between the foot and the body of the pipe is a diaphragm, or partition E E F, which has a little, long, narrow aperture to let out the wind. Over this aperture is the mouth B B C C; whose upper lip C C, being level, cuts the wind as it comes out at the aperture.

The pipes are of pewter, of lead mixed with a twelfth part of tin, and of wood. Those of tin are always open at their extremities; their diameter is very small, their sound very clear and shrill. Those of lead mixed, are larger; the shortest open, the longest are quite stopped; the mean ones partly stopped, and having besides a little ear on each side the mouth, to be drawn closer, or set further asunder, in order to raise or lower the sound. The wooden pipes are made square, and their extremity stopped with a valve or tampion of leather. The sound of the wooden and leaden pipes is very soft; the large ones stopped, are usually of wood; the small ones of lead. The longest pipes give the gravest sound; and the shortest the most acute: their lengths and widths are made in the reciprocal ratio's of their sounds; and the divisions regulated by their rule, which they call *diapason*. But the pipes that are shut are of the same length as the open ones, which yield the same sound. Usually, the longest pipe is 16 feet; though in extraordinary organs it is 32. The pedal tubes are always open, though made of wood and of lead.

A *reed-pipe* consists of a foot A A B B, (Tab. *Miscellany*, fig. 16.) which carries the wind into the shalot, or reed C D, which is a hollow demi-cylinder, fitted at its extremity D, into a kind of mould II, by a wooden tampion F G. The shalot is covered with a plate of copper E E F F, fitted at its extremity F F into the mould by the same wooden tampion: its other extremity E E is at liberty; so that the air entering the shalot, makes it tremble or shake against the reed; and the longer that part of the tongue which is at liberty F L, is made, the deeper is the sound. The mould II, which serves to fix the shalot or reed, the tongue, tampion, &c. serves also to stop the foot of the pipe, and to oblige the wind to go out wholly at the reed. Lastly, in the mould is foldered the part H H K K, called the *tube*, whose inward opening is a continuation of that of the reed. The form of this tube is different in the different ranks of pipes.

The degree of acuteness and gravity in the sound of a reed-pipe, depends on the length of the tongue, and that of the pipe C K, taken from the extremity C of the shalot, to the extremity K of the tube.

The quality of the sound depends on the width of the reed, the tongue, and the tube; as also on the thickness of the tongue, the figure of the tube, and the quantity of wind.

To diversify the sounds of the pipes, they add a valve to the port-vent, which lets the wind go in fits or shakes.

**Hydraulic ORGAN**, denotes a musical machine that plays by means of water. See **WATER**.

Of these there are several in Italy in the grotto's of vineyards. Ctesebes of Alexandria, who lived in the reign of Ptolemy Evergetes, is said to have first invented organs that played by compressing the air with water, as is still practised. Archimedes and Vitruvius have left us descriptions of the *hydraulic organ*. Felibien, *de la Vie des Archit.*

In the cabinet of queen Christina is a beautiful and large medallion of Valentinian, on the reverse whereof is seen one of these *hydraulic organs*; with two men, one on the right, the other on the left, seeming to pump the water which plays it, and to listen to its sound. It has only eight pipes, placed on a round pedestal.—The inscription is PLACEA SPETRI, if it be not wrong copied, which we suspect.

**ORGANICAL**, in the antient music, was that part performed with instruments. See **MUSIC**.

The *organical* comprehended three kinds of instruments; viz. *wind instruments*, as the trumpet, flute, &c. *stringed instruments*, as the lute, lyre, &c. and *pulsatile instruments*, or those played on by beating, as drums, &c. See each in its place, **TRUMPET**, &c.

**ORGANICAL Part**, is that part of an animal, or plant, destined for the performance of some particular function. See **ORGAN**, and **PART**.

**ORGANICAL Disease**, a disease in an *organical* part of the body, whereby its function is impeded, suspended, or destroyed. See **DISEASE**, &c.

**ORGANICAL Description** of curves, is the method of describing them on a plane, by means of instruments. See **CURVE**.

**ORGASM**,

**ORGASM**\*, **ORGASMUS**, an extasy, or impetuous desire of coition, occasioned by a turgescency of the seminal vessels, which are no longer able to restrain their contents.

\* The word is Greek, *οργασμος*, denoting violence, or turgescency; formed from *οργανω*, *turgo*, I swell.

The antients also extend *orgasm* to the other humours, and even excrements, which being accumulated, and coming to ferment, demand excretion.

Dr. Quincy uses *orgasm* for an impetuous, or too quick motion of the blood, or spirits; whereby the muscles are distended with uncommon force. See **SPIRIT**, **CONVULSION**, &c.

**ORGIA**\*, **OPTIA**, in antiquity, feasts and sacrifices in honour of Bacchus, instituted by Orpheus, and chiefly celebrated on the mountains, by wild, distracted women, called *Bacchæ*. See **BACCHANALIA**.

\* Eusebius derives the word *απο της οργης*, fury, madness. Others from *ορος*, mountain; because Orpheus removed from Thrace to mount Citheron: others from *οργας*, a place consecrated to some divinity: others from *αργανω*, to remove, repulse; in regard the profane were to be driven away.

The *orgia* were also called *orphica*, from their institutor. —They were held every third year. The chief solemnities were in the night time; and were attended with all manner of impurities.

Servius says, that at first *orgia* was a common name for all kinds of sacrifices among the Greeks; of the same import with the word *ceremonia* among the Romans.

**ORGUES**, in the military art, thick long pieces of wood pointed and shod with iron, and hung each by a separate rope over the gateway of a city, ready on any surprize or attempt of the enemy to be let down to stop up the gate. See **PORTCULLICE**, and **HERSE**.

**ORGUES**, is also used for a machine composed of several harquebuis or musquet-barrels, bound together; by means whereof several explosions are made at the same time; used to defend breaches, and other places attacked.

**ORGYIA**, **OPYIA**, an antient Grecian measure, containing six feet. See **MEASURE**.

Some represent the *orgyia* as the Grecian pace. See **PACE**. Hesychius describes it as the space comprehended between the two hands, when the arms are extended: answering to the Roman *ulna*, and our fathom. See **FATHOM**.

**ORIENT**, **ORIENS**, in geography and astronomy, the east, or east-point of the horizon. See **EAST**.

It is thus called from the Latin *orire*, to arise; because it is in this point the sun rises. See **RISING**.

**Equinoctial ORIENT**, is used for that point of the horizon wherein the sun rises when he is in the equator, or when he enters the signs Aries and Libra. See **SPRING**, and **AUTUMN**.

**Æstival ORIENT**, is the point wherein the sun rises in the middle of summer, when the days are longest.

**Hybernal ORIENT**, is the point where the sun rises in the middle of winter, when the days are shortest.

**ORIENTAL**, something situated toward the east with regard to us: in opposition to *occidental*. See **EAST**, and **OCCIDENTAL**.

In this sense we say, *oriental pearls*, *q. d.* such as are found in the East-Indies. (See **PEARL**).—*Oriental languages*, meaning the Hebrew, Syriac, Chaldee, and Cophtic. See **LANGUAGE**.

**ORIENTAL Bezoard.** } **BEZOARD.**  
**ORIENTAL Bibles.** } See the article } **BIBLE.**  
**ORIENTAL Emerald.** } **EMERALD.**

In astronomy, a planet is said to be *oriental*, when it appears in the east before the sun. See **RISING**.

**ORIENTING**, the turning a thing towards the east, or disposing it so as it may look towards the east.

In most religions, particular care has been taken to have their temples *oriented*.—S. Gregory Thaumaturgus is said to have made a mountain give way, because it prevented the *orienting* of a church he was building.

**ORIFICE**, **ORIFICIUM**, the mouth, or aperture of a tube, pipe, or other cavity. See **TUBE**.

**ORIFICE**, in anatomy, is particularly applied to the mouths of the several ducts, vessels, and other cavities; as of the bladder, uterus, stomach, &c.

The upper *orifice* of the stomach is the part where hunger is felt; the lower *orifice* is called the *pylorus*. See **HUNGER**, and **PYLORUS**.

There are some operations in chymistry, where the *orifices* of the vessel must be sealed hermetically. See **HERMETICAL**.

**ORIFICE** is also used, by extension, for the aperture of a wound, or ulcer. See **WOUND**, and **ULCER**.

**ORIGENIANS**, **ORIGENIANI**, a sect of antient heretics, who even surpassed the abominations of the Gnostics. S. Epiphanius speaks of them, as still subsisting in his time; but in very small number. He seems to fix their rise about the time of the great Origen; but does not say they took their name from him. On the contrary, he distinguishes them from the *Origenists*, whom he derives from Origen Ada-

mantius; adding, indeed, that they first took their name from one Origen; by which he intimates that it was not the Great. And S. Augustine says expressly it was another. As to their doctrine, all that modesty will allow to be said, is, that they rejected marriage; that they used several apocryphal books, as the acts of S. Andrew, &c. and that to excuse their open crimes, they accused the catholics of doing the same in private.

**ORIGENISTS**, in church history, followers of the errors of Origen, who maintained that Christ is only the son of God by adoption; that the human soul had a præ-existent state, and had sinned in heaven before the body was created; that the torments of the damned shall not be eternal, but that the devils themselves shall be relieved at last.

S. Epiphanius insists very largely on the errors of this father; but as he declares himself too warmly against him, there may be somewhat of exaggeration in what he says. Nor do S. Jerom, or Theophilus of Alexandria, seem to have kept their zeal within the proper bounds in speaking of Origen. For which reason, no doubt it was that S. Chrysostom himself was accused of being an *Origenist*, because not so vehemently bent against him. *Origenism* spread itself chiefly among the monks of Egypt.

**ORIGINAL**, a first draught, design, or autograph of any thing; serving as a model, or exemplar, to be imitated, or copied. See **DESIGN**, **MODEL**, &c.

Scarce any of the antient titles, tenures, &c. are now found in the *originals*. They are only vidimus's, or copies collated with the *originals*.

**ORIGINAL Sin**, is that crime we become guilty of at our birth; by the imputation of Adam's disobedience. See **SIN**, and **IMPUTATION**.

Father Malebranche accounts for *original sin* from natural causes, thus: Men at this day retain, in the brain, all the traces and impressions of their first parents. For as animals produce their like, and with like traces in the brain; whence it is that animals of the same kind have the same sympathies and antipathies, and do the same things on the same occasions; so our first parents, after their transgression, received such deep traces in their brain, by the impression of sensible objects, that it was very possible they might communicate them to their children.

Now, as it is necessary, according to the order established by nature, that the thoughts of the soul be conformable to the traces in the brain; it may be said, that as soon as we are formed in the womb, we are infected with the corruption of our parents: For having traces in the brain like those of the persons who gave us being; it is necessary we have the same thoughts, and the same inclinations with regard to sensible objects. Thus, of course, we must be born with concupiscence, and *original sin*. With concupiscence, if that be nothing but the natural effort the traces of the brain make on the mind to attach it to sensible things; and with *original sin*, if that be nothing but the prevalency of concupiscence; nothing, in effect, but these effects considered as victorious, and as masters of the mind and heart of the child. See **CONCUPISCENCE**.

**ORIGINAL Writ**. See the article **WRIT**.

**ORIGINALIA**, in the exchequer, are records, or transcripts sent to the remembrancer's office, out of chancery.

They differ from *records*, which contain the judgments and pleadings in suits tried before the barons.

**ORILLON**, in fortification, a small rounding of earth, lined with a wall; raised on the shoulder of those bastions that have casemates; to cover the canon in the retired flank, and prevent their being dismounted by the enemy.

There are other sorts of *orillons*, properly called *epaulements*, almost of a square figure. See **EPAULEMENT**.

**ORION**\*, in astronomy, one of the constellations of the southern hemisphere. See **CONSTELLATION**.

\* The word is formed from the Greek *ορις*, to make water; the antients supposing that it raised tempests at its rising and setting.

The stars in the constellation *Orion*, in Ptolemy's catalogue are 37, in Tycho's 62, in the Britannic catalogue 80.—The names, situations, magnitudes, longitudes, and latitudes whereof, are as follow:

<i>Names and situations of the stars.</i>	<i>Signs.</i>	<i>Longitude</i>			<i>Latitude South.</i>			<i>Magn.</i>

ORION'S River, in astronomy, a constellation called also Eridanus. See ERIDANUS.

ORIS Columna. } See the article } COLUMNNA.  
ORIS Distortor. } DISTORTOR.  
ORIS Speculum. } SPECULUM.

ORLE\*, ORLET, or ORLO, in architecture, a fillet under the ovolo, or quarter-round of a capital. See Tab. Archit. fig. 28; see also FILLET.

\* The word is French; formed from the Latin *orletum*, or *or-lum*; of *ora*, a border or list.

When it is at the top or bottom of the shaft, it is called *cincture*. See CINCTURE.

Palladio also uses *orlo* for the plinth of the bases of columns, and pedestals. See PLINTH.

ORLE, in heraldry, is an ordinary in form of a fillet, drawn round the shield, near the edge or extremity thereof, leaving the field vacant in the middle.

Its breadth is but half that of the tressure or bordure, which contains a sixth part of the shield; the *orle* only a twelfth: Add, that the *orle* is its own breadth distant from the edge of the shield; whereas the bordure comes to the edge itself. See BORDURE.

There is sometimes one *orle*, sometimes two, and sometimes three.—When there are three, or more, they take up the whole shield.—It is sometimes borne flory, or counterflory like the tressure. See TRESSURE.

The form of the *orle* is the same with that of the shield; whence it resembles an inescutcheon: as represented in Tab. Herald. fig. 73.

If a round of martlets, cinquefoils, &c. be placed about any ordinary, in manner of an *orle*, they are said to be *en orle*, or *orle-wise*.

ORLOPE, or ORLOPP, in the sea language, the uppermost space or deck in a great ship, from the main-mast to the mizen.

In three decked ships, the second and lowest decks are sometimes also called *orlope*. See Tab. Ship, fig. 2. lit. I. E. F.

ORNAMENTS, in architecture, express all the sculpture, or carved work, wherewith a piece of architecture is enriched. See SCULPTURE, &c.

ORNAMENTS in *Relievo*, are those carved on the contours of mouldings; as leaves, shells, scrolls, flowers, &c.

ORNAMENTS in *Creux*, are those cut within the mouldings; as eggs, flutes, &c. See MOULDING.

Vitruvius and Vignola also use the word *ornament* to signify the entablature. See ENTABLATURE.

Distribution of ORNAMENTS. See DISTRIBUTION.

ORNITHOLOGY\*, that branch of natural history, which considers and describes birds, their natures, kinds, &c. See BIRD.

\* The word is formed from the Greek *ornis*, bird, and *λογος*, discourse.

We have an excellent *Ornithology* of Fr. Willughby, Esq; and another of Mr. Ray, a posthumous work, which is chiefly an abridgment of the former, with the addition of his *Ichthyology*; and several kinds wanting in the other.

Willughby, herein, speaks with assurance of a swan that lived 300 years; and a goose that they were obliged to kill at 80, by reason of its mischievousness.

ORNITHOMANCY, a kind of divination, or method of arriving at the knowledge of futurity, by means of birds. See DIVINATION.

ORNITHOMANCY, among the Greeks, was the same with *augury* among the Romans. See AUGURY.

ORPHAN, a child, or minor, destitute of father; or that has neither father, nor mother.

Hence the Taborites, or followers of Zisca, finding themselves, at his death, without chief or conductor, took the appellation of *orphans*. See TABORITE.

ORPHANS Money, or Tax. See the article DUTY.

ORPIMENT, *Auripigmentum*, a mineral, or semi-metal, usually found in copper mines; and supposed to contain particles of gold; which may be extracted by chymistry, but which were never found to countervail the expence. See MINERAL, and SEMI-METAL.

*Orpiment* is found in stones, or glebes, of several sizes, and figures: its colour is always yellow, intermixed with shades of other colours; as green, red, orange, &c.

Sometimes it is found almost quite red; which is the proper sandaracha of the antients. See SANDARACHA.

But that usually called *red orpiment*, or *red arsenic*, is only the yellow *orpiment* heated to a great degree, and put in a crucible with oil of hemp-seed, olives, or nuts.

Painters, farriers, &c. make a great consumption of this mineral; but as it is found a violent corrosive, and even reputed a poison, it must be used with a great deal of precaution.

*Orpiment* must be chosen of a golden yellow hue, easy to scale, and the scales very thin, small, and shining like gold.

Some distinguish three kinds of *orpiment*; *white*, which is the same with arsenic: See ARSENIC.—*Yellow*, which is the proper

proper *orpiment*; and *red*, which is *sandarach*, or *realgar*. See *REALGAR*.

The Indians use *orpiment*, corrected with juice of lemons, with good success against fevers.

**ORTEIL**, in fortification. See the article *BERME*.

**ORTHODORON**, ΟΡΘΟΔΩΡΟΝ, an ancient Greek long measure; being the space from the carpus, or wrist, to the tips of the fingers: Rated at 11 inches. See *MEASURE*.

**ORTHODOXY** \*, a soundness of doctrine, or belief, with regard to all the points, and articles of faith.

\* The word is formed from the Greek ορθος, right, and δόξα, opinion, judgment.

*Orthodoxy* is used in opposition to *heterodoxy*, or *heresy*. See *HERESY*.

**ORTHODOXY**, or, *Fest of ORTHODOXY*, denotes a solemn feast in the Greek church, instituted by the empress Theodora; still held on the first Sunday in Lent, in memory of the restoration of images in churches, which had been taken down by the Iconoclastes. See *ICONOCLASTES*.

**ORTHOGONIAL**, *ORTHOGONIUS*, in geometry, denotes as much as rectangular, or right-angled. See *RECTANGULAR*, &c.

When the term is referred to a plain figure, it supposes one leg or side to stand perpendicular to the other: When spoken of solids, it supposes their axis to be perpendicular to the plane of the horizon.

**ORTHOGRAPHIC Projection of the Sphere**, is a representation of the several points the surface of the sphere on a plane which cuts it in the middle: the eye being placed at an infinite distance, vertical to one of the hemispheres.

It is thus called, because the perpendiculars from any point of the sphere, will all fall in the common intersection of the sphere with the plane of the projection. See *PROJECTION*.

**ORTHOGRAPHY** \*, in grammar, the art of spelling, that is, writing words justly, and with all the proper and necessary letters. See *WRITING*, and *SPELLING*.

\* The word is formed from the Greek ορθος, right, and γραφή, scriptio, writing.

*Orthography* makes one of the greatest divisions or branches of grammar. See *GRAMMAR*.

That diversity found in most of the modern languages, especially the English and French, between the pronunciation and *orthography*, makes one of the principal difficulties in acquiring them; yet does it arise from the same source as the languages themselves. See *LANGUAGE*.

The Gauls, *e. gr.* forming a new language from the ancient Latin, took the liberty to model the words to their fancy: at first, indeed, it is probable they wrote as they pronounced; but, by degrees, finding that words pronounced with all their letters sounded harsh, they began to pronounce more smoothly. Thus, in speaking, they thought fit to soften that harshness resulting from the concurrence and clashing of consonants: but as the *orthography*, or writing, did not offend the ear, it still continued on its former footing.

Attempts have been since made to reduce the writing to the pronunciation, or to make us write as we speak; which has occasioned great disputes. Pelletier of Mans was the first who pleaded for the change of the *orthography*; and after him Maignet, Peter Ramus, de Bois, Menage, and others; but in vain.

They have, however, occasioned a schism among writers, which has done more harm than the evil they intended to reform: the French writers being now divided into two parties; one of which retains to the *old*, the other to the *new orthography*.—The latter, F. Buffier observes, is the more considerable body, yet are these divided among themselves; some being for carrying the reformation much farther than others.

The chief matters urged in behalf of the ancient *orthography*, are, that by changing it, we should lose sight of the origin and etymology of words borrowed from the Greek, and Latin, &c. That it does not matter what characters are used to express sounds in writing, provided one know the relation between those characters and the sounds they represent: that by a necessary consequence of such change, the language would in time be all altered, and we should lose the use of our old authors; as ours, in their turn, would likewise become unintelligible.

What is alledged for the *new orthography*, is, its being more commodious, natural, easy, short, &c.

Some authors take a middle course between the two extremes; retrenching the letters where they are absolutely useless, as the *u* in a multitude of words; and yet studiously retaining all the letters whereon the etymology has any dependance.

In the English, the *orthography* is more vague, and unascertained, than in any other language we know of. Every author, and almost every printer, has his particular system. Nay, it is scarce so well with us as that: we not only differ from one another; but there is scarce any that confits with himself. The same word shall frequently appear with two or three different faces in the same page, not to say line. See *ENGLISH*.

The ancients who have wrote treatises of *orthography*, are Velius Longus, Marius Victorinus, Flavius Caper, Cassiodorus, and Beda. Among the moderns, Torelli, Lipsius, Dausquius, Scoppa, Valla, and Manutius the younger, have treated on the same subject.

**ORTHOGRAPHY** \*, in geometry, the art of drawing or delineating the fore-right plan or side of any object; and of expressing the heights, or elevations of each part.

\* It is called *orthography*, from the Greek ορθος, right, and γραφή, description, from its determining things by perpendicular right lines falling on the geometrical plane: or rather, by reason all the horizontal lines here are straight and parallel, and not oblique, as in representations of perspective.

**ORTHOGRAPHY**, in architecture, is the elevation of a building; shewing all the parts thereof in their true proportion. See *ELEVATION*.

The *orthography* is either *external* or *internal*.

**External ORTHOGRAPHY**, is a delineation of the outer face or front of a building; exhibiting the principal wall, with its apertures, roof, ornaments, and every thing visible to an eye placed before the building.

**Internal ORTHOGRAPHY**, called also *section*, is a delineation, or draught of a building, such as it would appear, were the external wall removed. See *SECTION*.

To draw the *ORTHOGRAPHY* of a building.—Draw a right line for a basis or ground line, (*Tab. Perspective, fig. 13.*)

A B, and at one end erect a perpendicular A D. Upon A B set off the widths and distances of the gates, windows, &c. On the right line A D, set off the heights of the several parts visible in the face of the building, *v. gr.* of the doors, windows, the roof, chimneys, &c. and apply a ruler to each point of division. The common intersections of the right lines drawn from three points, parallel to the lines A B and A D, determine the external *orthography* of the building: and after the same manner is the internal *orthography* laid down. See *PERSPECTIVE*.

**ORTHOGRAPHY**, in fortification, is the profile, or representation of a work; or a draught so conducted, as that the length, breadth, height, and thickness, of the several parts, are expressed; such as they would appear, if it were perpendicularly cut from top to bottom. See *PROFILE*, *FORTIFICATION*, and *GEOMETRY*.

**ORTHOPNOEA** \*, ΟΡΘΟΠΝΟΙΑ, in medicine, a great difficulty of respiration, wherein the patient is obliged to sit, or stand upright, to be able to breathe. See *RESPIRATION*.

\* The word is compounded of ορθος, right, erect, and πνέω, I respire, or breathe.

An *orthopnoea* is a species or degree of an asthma. See *ASTHMA*.

It may be caused from pus, thick or mucilaginous juices, or polypus's in the bronchia; mercurial, and other fumes, hindering the playing of the lungs; stoppage of evacuations; cachexies, ill digestions, or whatever affords viscid chyle, or occasions the blood to run slower through the lungs, either by straitening the canals, or thickening the blood, or hindering the motion of the animal spirits, so that they cannot elevate the breast; or that causes the blood to be more rarified, or more in quantity, so that there is not sufficient room to receive it into the vessels of the lungs.

**ORTIVE**, *ORTIVUS*, in astronomy.—*Ortive*, or *eastern amplitude*, is an arch of the horizon intercepted between the point where a star rises, and the east point of the horizon, or point where the horizon and equator intersect. See *AMPLITUDE*, and *HORIZON*.

**ORVIETA**, *Penitents of ORVIETA*. See *PENITENTS*.

**ORVIETAN**, a celebrated antidote, or counter-poison; so called, because invented and propagated by an operator from Orvieta in Italy; who made experiments thereof in his own person, on the public stage, by taking several doses of poisons. See *ANTIDOTE*, and *POISON*.

In Charas's *Pharmacopœia* is a method of making *orvietan*; where it appears that venice-treacle is one of the principal ingredients. See *THERIACA*.

**OS**, in anatomy. See *BONE*, and *MOUTH*.

*Os Pubis.*

*Os Sacrum.*

*Os Ischium.*

*Os Hyoides.*

*Os Femoris, &c.*

*PUBIS.*

*SACRUM.*

*ISCHIUM.*

*HYOIDES.*

*FEMUR, &c.*

**OSCEOLE** \*, ΟΣΧΕΟΚΗΛΗ, in medicine, a kind of hernia, wherein the intestines, or omentum, descend into the scrotum. See *HERNIA*.

\* The word is formed from the Greek οσχίον, scrotum, and κηλη, tumor.

**OSCHOPHORIA** \*, in antiquity, feasts instituted by Theus, in acknowledgment for his having destroyed the Minotaur, and by that means freed his country, Athens, from the tribute of seven young men, which were to be sent every year into Crete, to be devoured by that monster. See *MINOTAUR*.

\* The word is formed from the Greek οσχνη, branch of a vine, laden with grapes, and φέρο, I bear. Plutarch says, they

were so named, because instituted by Theseus at his return to Athens, which happened to be at the time of vintage.

Some say, the *oschophoria* were instituted in honour of Minerva and Bacchus, who had assisted Theseus in his enterprise. Others, that they were in honour of Bacchus and Ariadne.

To celebrate the *oschophoria*, the young people who had fathers and mothers alive, ran to the temple of Bacchus, and that of Minerva, with grapes in their hands. He who arrived there first, was the conqueror; and was to perform the sacrifice, by pouring out of a phial a mixture of wine, honey, cheese, flower, and oil.

**OSCILLATION**, in mechanics, *vibration*; or the reciprocal ascent, and descent of a pendulum. See PENDULUM.

**Axis of OSCILLATION**, is a right line, parallel to the apparent horizontal one, and passing through the centre; about which the pendulum *oscillates*. See AXIS.

If a simple pendulum be suspended between two semicycloids, whose generating circles have their diameter equal to half the length of the thread; all the *oscillations*, howsoever unequal, will be isochronal, or equi-diurnal. See ISOCHRONAL.

The time of the entire *oscillation* through any arch of a cycloid, is to the time of the perpendicular descent through the diameter of the generating circle, as the periphery of the circle to the diameter. See CYCLOID.

If two pendulums move in similar arches, the times of *oscillation* are in a subduplicate ratio of their lengths.

The numbers of isochronal *oscillations*, performed by two pendulums in the same time, are reciprocally as the times wherein the several *oscillations* are performed. See CLOCK.

M. Huygens's whole doctrine of *oscillation* is founded on this hypothesis; that the common centre of gravity of several bodies, connected together, must return precisely to the same height whence it fell; whether those weights return conjointly, or whether, after their fall, they return separately; each with the velocity it had then acquired. See CENTRE of Gravity.

This supposition was opposed by several, and very much suspected by others. And others who inclined to believe it true, yet thought it too daring to be admitted into a science, which demonstrates every thing.

At length M. James Bernoulli demonstrated it by strict geometry; by referring the weights to a lever. After his death, a more easy and natural demonstration of the centre of *oscillation* was advanced by his brother. The substance whereof may be conceived as follows:

A simple pendulum of a determinate length and weight, raised to a determinate height, whence it is to fall till it recover its vertical line, employs, in that fall, or demi-vibration, a determinate space of time, which can never possibly be either greater or less. Which time is necessarily such, because the agitative force, *i. e.* the force which produces the motion of the pendulum, is determined in every thing that concurs to the formation thereof: So that it can only cause one certain effect.

The agitative force of the pendulum arises from three things: 1°. The power or moment of gravity. 2°. The mass or body tied to the end of the inflexible rod. 3°. The distance of that body from the point of suspension, or, which is the same, the length of the rod, or the pendulum.

Now, 1°. The power of gravity, be the cause what it will, is that power which makes a body fall, and that, *v. gr.* at the rate of fourteen feet, in the first second of time. It is visible, then, that this force is the effect of a quantity which determines those fourteen feet; and that a heavy body would pass more or less space in that same first second, if the force of gravity were greater or less.

2°. As that force is inherent in each point, or infinitely small part of a body, the greater this body is, or the larger its mass, the greater quantity of motion or force it has.

3°. The distance of the moving body from the point of suspension, or the length of the rod, is always the radius of a circle, whereof the moving body describes an arch: And of consequence the greater the radius is, *cæteris paribus*, the larger arch the body describes. And at the same time, the greater height it falls from, the greater velocity it acquires.

Now, the agitative force of the pendulum is only that of the body fastened to the end of the rod. So that it is the product of the force of the weight, of the mass of that body, and of its distance from the point of suspension. The force of gravity therefore being always the same; and a body or weight fastened to the end of the rod, always the same; it is impossible that two simple pendulums of a different length should be isochronal, or should make their vibrations in the same time; for by virtue of those different

lengths, the velocities will be unequal, and of consequence, the times of their vibrations.

But if it be supposed that there are in nature different powers of gravity; it will then be possible that two simple pendulums of different lengths should be isochronal; the one animated by the natural weight, the other by the imaginary one. If the imaginary gravity or weight be greater than the natural one, the pendulum imagined isochronal to the natural one, will necessarily describe a larger space or arch in the same time; and of consequence the weight will be fastened at a greater distance from the point of suspension. Though to have an isochronism, the two agitative forces of the two pendulums must be equal; yet of the three things which compose these forces, there are already two greater in the imaginary, than the real pendulum: the third, therefore, *i. e.* the mass or ball, must be diminished in the necessary proportion. As the space or arch described by the imaginary pendulum is greater than that by the natural pendulum, in the same ratio as the imaginary gravity is greater than the natural one, and a radius of that arch, greater in the same ratio; are two things inseparable: the two gravities will be always to one another, as those two radii, or the two lengths of the two pendulums; which always gives the expression of the imaginary gravity, and by a necessary consequence, that of the diminished mass or ball of the imaginary pendulum. If the power of gravity be imagined less than that of the natural one, it is easy to observe how it is to be taken; but that were needless in our design.

If now there be a compound pendulum, charged with two weights or balls fastened to the same rod; M. Bernoulli conceives each of those weights removed to a greater distance from the point of suspension, than it was before; but both to the same; and, diminished in mass, in a due proportion: so as that both together only make one simple pendulum, animated with one weight, the expression whereof is had, and isochronal to the natural compound pendulum.

Thus we shall have one simple natural pendulum isochronal to the compound natural one, by having a simple natural pendulum isochronal to the simple imaginary pendulum before found; which is very easy: since as the imaginary gravity is to the natural, so is the length of the simple imaginary pendulum, to the length of the simple natural pendulum; and it is there is the centre of *oscillation* required.

**Centre of OSCILLATION**, in a suspended body, is a certain point therein, each vibration whereof is performed in the same manner, as if that point or part alone were suspended at that distance from the point of suspension.

Or, it is a point, wherein, if the whole length of a compound pendulum be collected; the several *oscillations* will be performed in the same time as before. See PENDULUM.

Its distance, therefore, from the point of suspension, is equal to the length of a single pendulum, whose *oscillations* are isochronal with those of the compound one. See CENTRE of *Oscillation*.

**OSCITATION**, the act popularly called yawning. See YAWNING.

**OSCUA**, in anatomy, a term used for the orifices, or openings of the lesser vessels. See ORIFICE, VESSEL, &c.

**OSCULUM**, in the new analysis.—A circle described on the point C, as a centre, (*Tab. Analysis, fig. 12.*) with the radius of the evolute MC, is said to *osculate*, kiss, the curve described by evolution, in M; which point M is called by the inventor, Huygens, the *osculum of the curve*. See EVOLUTE.

The line MC is also called the *radius of the osculum*. See RADIUS.

The evolute BCF is the place of the centres of all the circles that *osculate* the curve AM, described by evolution. See EVOLUTION.

The doctrine of the *oscula* of curves is owing to M. Leibnitz, who first shewed the use of Huygens's evolute in measuring the curvature of curves. See CURVE.

**OSCULUM pacis**.—Antiently it was a custom in the church, that in the celebration of mass, after the priest had consecrated the wafer, and spoke the words, *pax domini vobiscum*, the people kissed each other, which was called *osculum pacis*.

When this custom was abrogated, another arose; and while the priests spoke the words, a deacon or sub-deacon offered the people an image to kiss; which they called *pacem*.

**OSIANDRIANS**, a sect among the Lutherans, so called from Andrew Osiander, a celebrated German divine. See LUTHERAN.

Their distinguishing doctrine was, that man is justified formally, not by the faith and apprehension of the justice of Jesus Christ, or the imputation of our Saviour's justice, according to the opinion of Luther and Calvin; but by the essential justice of God. See JUSTIFICATION, &c.

*Septi-*

**Semi OSIANDRIANS**, were such among the *Osiandrians*, as held the opinion of Luther and Calvin with regard to this life; and that of Osiander, with regard to the other: Asserting, that man is justified here by imputation, and hereafter by the essential justice of God. See **IMPUTATION**.

**OSSA**, in anatomy. See the article **BONE**.

**OSSICLE**, **OSSICULUM**, *little bone*; a diminutive of *os*, bone. See **BONE**.

In which sense the term is used among anatomists.

Botanists also use *ossiculum* for the stone of a cherry, plum, apricot, or other stone-fruit. See **FRUIT**.

**OSSIFICATION**, in the animal œconomy, the formation of the bones; but more especially, the conversion of parts naturally soft, to the hardness and consistency of bones. See **BONE**.

Bones, Dr. Drake argues, are formed out of the most comminuted or broken part of the blood; since we see that the blood of old men, which by a long course of circulation, becomes in a manner unfit for the common office of nutrition, will however *ossify*, and convert into bones, many of the tendons and ligaments, and even the coats of the vessels themselves, whose substance being next to the bones the most compact, admits only of the smallest particles of the blood; which therefore soonest become osseous, as they are frequently found. See **NUTRITION**, **BLOOD**, &c.

**OSTENSIO**, a tax antiently paid by merchants, &c. for leave to shew, or expose their goods to show and sale in markets. See **SCAVAGE**.

**OSTENSIVE Demonstrations**, such as plainly and directly demonstrate the truth of any proposition.

In which they stand distinguished from *apagogical* ones, or reductions *ad absurdum*, or *ad impossibile*, which prove the truth proposed, by demonstrating the absurdity, or impossibility of the contrary. See **DEMONSTRATION**.

*Ostensive demonstrations* are of two sorts:—Some barely, but directly, prove the thing to be; which they call *ostia*: others demonstrate the thing from its cause, nature, or essential properties; and these are called in the schools, *ostia*.

**OSTEOCOLLA**, **ΟΣΤΕΟΚΟΛΛΑ**, in natural history, *glue-bone*; a white, or ash-coloured sparry stone, shaped like a bone, and by some supposed to have the quality of uniting broken bones; on which account it is ordered in some plaisters.

**OSTEOCOPOS**\*, or **ΟΣΤΟΚΟΠΟΣ**, is used by some for an acute pain, wherein the patient is affected as if his bones were breaking.

\* The word is formed from the Greek *οστος*, bone, and *κοπιω*, to break, cut, or cleave.

It arises from a sharp humour vellicating the periosteum, or membrane wherewith the bones are invested.—It is particularly incident to scorbutic and pocky persons.

**OSTEOLOGY**\*, **ΟΣΤΕΟΛΟΓΙΑ**, that part of anatomy which teaches the nature and fabric of the bones of the human body; their form, disposition, articulation, use, &c. —See *Tab. Anat. P. 1. Osteol.* See also the article **ANATOMY**.

\* The word is formed from the Greek *οστος*, bone, and *λογος*, discourse.

Dr. Clopton Havers has given us an *osteology* in good repute. See **BONE**.

**OSTIA**, in anatomy, a term used indifferently with *oscula*, *orifices*, &c. for the mouths or apertures of the vessels of the body: As the *ostia vaginæ*, &c. See **VAGINA**, **ORIFICE**, &c.

**OSTRACISM**\*, **ΟΣΤΡΑΚΙΣΜΟΣ**, a kind of popular judgment, or condemnation among the Athenians; being a sentence of banishment against persons whose too great power rendered them suspected to the people; or whose merit and credit gave umbrage lest they should attempt something against the public liberty, and their power degenerate into tyranny. See **BANISHMENT**.

\* It had the denomination *ostracism*, in regard the people gave their votes, by writing the name of the person to be banished in a shell, by the Greeks called *οστρακος*; and casting the shells into an urn.

This kind of banishment had nothing infamous in it, as not being for any crime; but, on the contrary, was held very honourable, as it was a mark of popularity. It lasted for ten years, but the banished person had the full enjoyment of his estate all the time.

*Ostracism* was null, unless there were 6000 citizens in the assembly of the people whereby it was enjoined.

**OSTRACITIS**, **ΟΣΤΡΑΚΙΤΙΣ**, in natural history, a kind of crusty stone, reddish, and in form of an oyster-shell, and, like that, separable into laminae; found in several places in Germany; and held of good service in the gravel.

Dr. Home, in the *Philos. Transact.* says, it rather dissolves the little stones than forces them out, as not being remarkably diuretic.—He adds, that he prescribes it in powder with a third part of flores chamæmeli.—The dose is from half a drachm to a whole one, in white wine.

**OSTRACITIS**, is also the name of a kind of cadmia, found at

the bottom of the furnaces where copper is purified. See **CADMIA**.

It is very heavy, and in structure resembles an oyster shell, whence its name.—It is esteemed astringent and deterfive; and is an ingredient in several unguents.

**OTACOUS TIC**\*, a term applied to instruments which aid, or improve the sense of hearing. See **HEARING**.

\* The word is formed from the Greek *οτις*, ear, and *ακουω*, I hear. See **ACOUSTIC**.

**OTALGIA**\*, **ΟΤΑΛΓΙΑ**, in medicine, denotes a pain in the ear, especially that in the farther parts of the auditory passage. See **EAR**.

\* The word is formed from the Greek *οτις*, ear, and *αλγος*, pain.

The *otalgia* usually arises from an inflammation; sometimes from a sharp serous humour, which vellicates the membrane wherewith the canal of the ear is lined. It is sometimes also occasioned by a wound or ulcer in that part, or from some pungent matter gathered within the ear.

The smoke of tobacco conveyed into the ear through a pipe, Etmuller recommends as good to assuage this pain; as also millepedes in a proper vehicle of oil.

The *otalgia* sometimes also arises from a worm in the ear; which is to be drawn out alive, or killed within.—Warm milk tempts the worm to come forth; wormwood juice destroys it within. See **WORMS**.

**OTIOSI**, in the Hebrew customs.—The learned are exceedingly divided about the *decem otiosi*, ten idle persons spoke of in the Jewish synagogues.

Some say, they were the three presidents and the seven readers; others, that they were ten persons hired to attend constantly at the synagogue, because, without the number ten, it could be no regular synagogue, or legal assembly; so that the *decem otiosi* were ten idle folks kept in pay, to form, by their presence, a legal synagogue, or quorum. See **SYNAGOGUE**.

Vitringa, in his *Archi-Synagoga*, refutes this opinion; and will have the *otiosi* to have been ten directors, or officers in the synagogue.—He shews that each synagogue had its directors; that the number was greater or less according to the dignity of the synagogue; that the smallest had at least two; that, from the earliest times, each synagogue had its chief, called *archi-synagogus*, who had two colleagues, to be present at the ceremonies, and other acts of religion, and to take care every thing were done with decency; but that the *archi-synagogus* reserved to himself the power of teaching: That besides these three, the *archi-synagogus* named several readers who read in the synagogue every Saturday; and that these made the *decem otiosi* of the synagogue; so called, because being disengaged from all other employments, their whole attendance was on divine service.

**OTTER Hunting**. See the article **HUNTING**.

**OVA**, Eggs, in natural history. See the article **EGG**.

**OVA**, in anatomy, &c. are little spherical bodies, in form of bladders, or bubbles; consisting each of two concentric membranulæ, replete with a limpid humour like the white of an egg, found under the external membrane of the ovaries of women, and connected to the minute orifices of the vesicles that compose the substance of the ovaries themselves, by a calix. See **OVARY**.

After the use of venery, the *ova* swell sensibly, become more and more pellucid, their membranes grow thicker, and at length raise that of the ovary, in form of papillæ; till, at last, breaking the membrane of the ovary, they are detached from their calix, taken into the cavities of the fallopian tubes, and thence conveyed into the womb; where, being cherished and impregnated with the male seed, they commence embryo's; or, for want of that, are again ejected. See **CONCEPTION**, **FALLOPIAN Tube**, **MATRIX**, **EMBRYO**, &c.

**OVA**, in architecture, are ornaments in form of eggs, carved on the contour of the ovolo, or quarter-round; and separated from each other by anchors, or arrows heads. See **OVOLO**, and **QUARTER-Round**.

The English usually call these ornaments *eggs and anchors*.—Instead of eggs, the antients sometimes carved hearts; on which foundation it was, that they introduced arrows; to symbolize with love.

**OVAL**, *Ellipsis*; an oblong curvilinear figure, with two unequal diameters: or a figure inclosed with a single curve line, imperfectly round, its length being greater than its breadth; like an egg, whence its name. See **OBLONG**.

The proper *oval*, or egg-shape, is an irregular figure, being narrower at one end than the other; in which it differs from an *ellipsis*, which is the mathematical *oval*, and equally broad at each end.

The common people confound the two together; the geometers also call the *oval*, a *false ellipsis*. See **ELLIPSIS**.

The method of describing an *oval* chiefly used among workmen, is, by a cord, or string, as *E f M*, (*Tab. Geometry*, fig.

fig. 48.) whose length is equal to the greater diameter of the oval, and which is fastened by its extremes to two points or nails E, f, planted in its longer diameter; by which means the oval is made so much the longer, as the two points or nails are farther apart.

○VAL Column. } See the article { COLUMN.  
○VAL Crown. } { CROWN.

○VALE Foramen, in anatomy. See FORAMEN *Ovale*.

○VARY, OVARIUM, in anatomy, that part of a female animal wherein the *ova*, or eggs are formed, and lodged.—See *Tab. Anat. (Splanchn.) fig. 11. lit. b b*; see also OVA, and EGG.

The ovaries in women are also called *testes muliebres*, female testicles; from their use, which the antients supposed analogous to that of the testicles in men. See TESTICLES.

They are two in number; lying near the ends of the fallopian tubes, two fingers distance from the uterus, to which they are connected by a strong ligament, called *vas deferens*, and in some measure by the fallopian tubes, and the broad ligament about the region of the ilium. They are fastened to the peritonæum by the spermatic vessels, by which means they are kept suspended about the same height with the fundus uteri. See MATRIX.

Their figure is semi-oval; their surface somewhat uneven; their size different in the different stages of life. At the time of puberty, when largest, they usually weigh a drachm and half.

They are covered with a common membrane from the peritonæum; their substance is whitish, composed of a number of little thin membranous and slender fibres, interwoven with arteries, veins, and nerves.

Among these fibres and vessels are interspersed a number of little round bodies, like bladders; full of a limpid substance, and called *ova*, or eggs, of great use in generation. See OVA, and GENERATION.

○VATION, OVATIO, in the Roman history, a lesser triumph allowed to commanders, for victories won without the effusion of much blood; or for the defeating of rebels, slaves, pyrates, or other unworthy enemies of the republic. See TRIUMPH.

Their entry was on foot, sometimes on horseback; but never in a chariot: and they wore crowns of myrtle, called *ovales*; having all the senate attending in their retinue.

The denomination *ovatio*, according to Servius, is derived from *ovis*, sheep; because the conqueror sacrificed a sheep on this occasion to Jupiter; whereas in the greater triumph, they sacrificed a bull. Others derive it from the sound or din of the acclamations and shouts of joy made by the people in honour of the solemnity; the people and soldiery, on this occasion, redoubling the letter O, as in the greater triumph they did the words *Io Triumpe*.

The *ovation* was first introduced in the year of Rome 250, or 251, in honour of the consul Posthumius Tubertus, after his defeating the Sabines.

○VELTY. See the article ○WELTY.

○VER-FLOWING, or Inundation. See RIVER, and DELUGE.

The *overflowing of lands* used by our husbandmen, is chiefly effected by diverting the streams of rivers, brooks, land-floods, or springs, or some part of them, out of their natural channel.

When the streams lie too low for this, they are made use of to turn such engines as may raise a sufficient quantity of water to do it. The most usual engine, on this occasion, is the Persian wheel. See PERSIAN Wheel.

○VER-RAKE, in the sea language.—When a ship riding at anchor, so over-beats herself into a head-sea, that she is washed by the waves breaking in upon her; they say, the waves *over-rake* her. See RAKE.

○VER-REACH, in the manage, is when a horse strikes his hind feet against his fore.

The word is also used for a strain, or painful swelling of the master-few of an horse; occasioned by such *over-reach*.

○VER-RULING an Objection, in law, is the rejecting, or setting it aside by the court.

○VER-RUNNING, among printers. See PRINTING, and CORRECTING.

○VERSAMESSA, an antient fine or penalty, imposed before the statute of hue and cry, on such persons, as hearing of a murder or robbery, did not pursue the malefactor. See HUE.

○VERT *Act* \*, a term in law, signifying an *open act*; or an act capable of being manifested, and proved.

\* The word is formed from the French, *ouvert*, open.

In which sense it is distinguished from an *intentional act*.

○VERT Pound. See the article POUND.

○VERT Word, denotes a plain open word, not to be mis-taken.

○VERTURE, or OUVERTURE, *opening*, or *preluding*; a term used for the solemnities at the beginning of a public act, or ceremony; as of an opera, tragedy, concert of music, &c.

The *overture* of the theatre, or scene, is a piece of music, usually ending with a fugue.

The *overture* of the jubilee, is a general procession, &c.

○VI Albumen. See the article ALBUMEN.

○VICULUM, in the antient architecture, a little *ovum*, or egg. See OVA.

Some also use the word *oviculum* for *ovolo*. See ○VOLO.

Baldus will have this to be the Lesbian *astragal* of Vitruvius. Daviler. See ASTRAGAL.

○VILIA, or *Septa*, in antient Rome, a place in the Campus Martius, at first railed in, like a sheep's pen; whence its name.—Afterwards it was mounted with marble, beautified with walks and galleries; as also with a tribunal, or seat of justice.

Within this precinct, or inclosure, the people were called to give their suffrages for the election of magistrates. See FIELD of Mars.

The ascent into the *ovilia* was not by stairs, but by pontes, a sort of bridges made for the time; every curia, tribe, and century, as the assembly was centuriate or tribuate, &c. having its proper bridge.—Whence the proverb, *de ponte dejiciendus*, where a person is to be barred from giving his vote. See COMITIA.

○VIPAROUS, in natural history, a term applied to such animals as produce their young, *ab ovo*, from eggs; as birds, insects, &c. See EGG, INSECT, ANIMAL, &c.

The *oviparous* kind stand in opposition to those which bring forth their young alive, called *viviparous* animals; as, man, quadrupeds, &c. See GENERATION, VIVIPAROUS, &c.

*Oviparous* animals, may be defined to be such as conceive eggs, which they afterwards bring forth: and from which, by the incubation of the parent, or some other principle of warmth and fermentation, at length arise animals; which, after they have spent the moisture or humour they were surrounded withal, and are grown to a sufficient bulk, firmness, and strength, break their shell, and come forth.

The *oviparous* kind, beside birds, include divers species of terrestrial animals; as, serpents, lizzards, tortoises; crabs, lobsters, frogs, &c. See OVARY.

○UNCE \*, UNCIA, a little weight, the sixteenth part of a pound averdupois; and the twelfth of a pound troy. See WEIGHT, and POUND.

\* The word is derived from the Latin *uncia*, the twelfth part of any whole, called *as*; particularly in geometrical measures, an inch, or the twelfth part of a foot. See INCH, and AS.

The *ounce averdupois* is divided into eight drachms, and the drachm into three scruples. The *ounce troy* into twenty penny weights, and the penny weight into twenty-four grains. See DRACHM, PENNY Weight, &c.

The *ounce, once*, makes the eighth part of the French mark, and is divided into three gros, or drachms; the drachm into three penny weights, or scruples; and the scruple into twenty-four grains: each grain computed to weigh a grain of wheat. See GRAIN, &c.

All precious merchandizes, as gold, silver, silk, &c. are sold by the *ounce*. See GOLD, SILVER, STANDARD, &c.

○UNCE Pearls, are those too small to be sold by tale; usually called *seeds of pearl*. See PEARL.

○UNCE Cottons, are certain cottons brought from Damascus, of a kind and quality superior to the rest. See COTTON.

○VOLO, OVUM, in architecture, a round moulding, whose profile, or sweep, in the Ionic and Composite capitals, is usually a quadrant of a circle; whence it is also popularly called the *quarter-round*. See QUARTER-Round.

It is usually enriched with sculptures among the antients, in form of chefnut-shells; whence Vitruvius, and others of the antients, call it *echinus*, chefnut-shell. See *Tab. Archit. fig. 5. fig. 24. lit. a. m. fig. 28. lit. p. fig. 32. lit. g. fig. 40. lit. e*; see also ECHINUS.

Among us, it is usually cut with the representation of eggs, and anchors, or arrows-heads, placed alternately; whence its Italian name *ovolo*, Latin *ovum*, and French *oeuf*, q. d. egg. See OVA.

○UR Lady. See the article NOTRE DAME.

○UR Lady of the Thistle. See the article THISTLE.

○URAN, or URAN SOANGUS, the name of a sect of magicians, in the island Grombocanore, in the East-Indies.

The word implies *men-devils*; these people, it seems, having the art of rendering themselves invisible, and passing where they please, and by that means, doing infinite mischief: for which reason the people hate and fear them mortally, and always kill them on the spot, when they can take them.

In the *Portuguese history*, printed 1581, folio, mention is made of a present made by the king of the island, to a Portuguese officer named Brittio, consisting of twelve of these *ourans*; with whom he made incursions on the people of Tidore, killed great numbers, &c.

To try whether, in effect, they had the faculty ascribed to them, one of them was tied by the neck with a rope, without any possibility of disengaging himself by natural means: yet in the morning it was found he had slipped his collar.

But, that the king of Tidore might not complain, Britton made war on him with devils, it is said he dismissed them at length into their own island.

**OUTSTED** \*, in our antient law-books, a being removed, or put out of possession.

\* The word is formed from the French, *oster*, to remove, take away.

**OUTSTER le Main**, *amovere manum*, in law, denotes a livery of lands out of the king's hands; or a judgment given for him that traversed or sued a *monstrans le droit*. See **MONSTRANS le droit**.

When it appeared upon the matter discussed, that the king had no right or title to the land he had seized; judgment was given in chancery, that the king's hands be moved.—Hereupon, *ouster le main*, or *amoveas manum* was awarded to the escheator, to restore the land, &c.

But now all wardships, liveries, *ouster le mains*, &c. are taken away and discharged by statute, 12 Car. II.

**OUTSTER le Mer** \*, in law, a cause of excuse or essoign; where a man not appearing in court upon summons, it is alledged that he is beyond the seas.

\* The term is compounded of the old French, *oultre*, and *le mer*, q. d. beyond the sea.

**OUTER Rainbow**. See the article **RAINBOW**.

**OUTFANGTHEFE** \*, a privilege whereby a lord was enabled to call any man dwelling in his fee, but taken for felony in another place, to judgment in his own court.

\* The word is formed from the Saxon, *ut extra*, without; *fang*, *capio vel captus*; and *thief*, thief: q. d. *Fur extracaptus*. Spelm.

**OUT-LAW**, **UTLAGATUS**, one deprived of the benefit of the law; or out of the king's protection. See **OUT-LAWRY**.

Bracton says, an *out-law* forfeits every thing he has; and that from the time of his outlawry, he wears a wolf's head; and any body may kill him impune; especially if he defend himself, or fly.—But in the beginning of king Edward the third's reign, it was resolved by the judges, that it should not be lawful for any man, but the sheriff alone (having lawful warrant therefore) to put to death a man *out-lawed*. See **WOLFESHEAD**.

**OUTLAWRY**, or **UTLAWRY**, **UTLAGARIA**, the punishment of him, who being called into law, and lawfully fought, does (after an original writ, and three writs of *capias*, alias & pluries, returned by the sheriff, with a non est inventus, and an exigent with a proclamation awarded thereupon) contemptuously refuse to appear. See **OUT-LAW**.

He must also be called at five county court-days, a month between each one; and if he appear not in that time, *pro ex-lege tenebitur, cum principi non obediat, nec legi, & extunc exlegabitur*; i. e. he shall be pronounced to be out of the king's protection, and deprived of the benefit of the law.

The effect of which is, if he be *out-lawed* at the suit of another, in a civil cause, he shall forfeit all his goods and chattels to the king; and if on felony, all his lands and tenements, which he has in fee, or for life, and all his goods and chattels.—And then, according to Bracton, he may perish without law, &c.

A minor, or a woman, cannot be *out-lawed*.—A woman is said to be waived, where a man is *out-lawed*. See **WAIVE**.

**Clerk of the OUTLAWRIES**. See the article **CLERK**.

**OUT-PARTERS**, in our antient writers, were a sort of thieves, or highwaymen, on the frontiers of Scotland, who rode about to fetch in such things as they could lay hold on. See **INTAKERS**.

**OUT-RIDERS**, are bailiffs errant, employed by sheriffs, or their deputies, to summons people in the remotest parts of their hundreds, to the county or hundred courts. See **BAILIFF**.

**OUTWARD flanking Angle**. See the article **ANGLE**.

**OUT-WORKS**, in fortification, all those works made without side the ditch of a fortified place, to cover and defend it. See **WORKS**, and **FORTIFICATION**.

*Outworks*, called also *advanced* and *detached works*, are those which not only serve to cover the body of the place, but also to keep the enemy at a distance, and prevent his taking advantage of the cavities and elevations usually found in the places about the counterscarp; which might serve them either as lodgments, or as rideaux, to facilitate the carrying on their trenches, and planting their batteries against the place.—Such are, ravelins, tenailles, hornworks, queue d'arondes, envelopes, crown-works. See **TENAILLE**, **HORNWORK**, &c.

The most usual of these are ravelins, or half-moons, formed between the two bastions, on the flanking angle of the

counterscarp, and before the curtain, to cover the gates and bridges. See **RAVELIN**, and **DEMI-LUNE**.

**OVERTURE**. See the article **OVERTURE**.

**OVUM Philosophicum**, or *Chymicum*, is a glass body, of an oval form, resembling an egg; used for the sublimation of mercury.

**OWELTY**, or **OVELTY of services**, in our law-books, an equality of services; as when the tenant paravail owes as much to the mesn, as the mesn does to the lord paramount. See **SERVICE**.

**OWLER**, a master of a ship, or other person, who conveys wool, or other prohibited goods in the night, to the sea-side, in order to ship them off, contrary to law. See **RUNNING**.

The name is derived hence, that, like *owls*, they only stir abroad in the night time.

**OWSE**, among tanners, is taken bark beaten, or ground small; to serve in the preparation of leather. See **BARK**, and **TANNING**.

**OXGANG** \* or **OXGATE of Land**, is ordinarily taken, in our old law-books, for fifteen acres; being as much land as it is supposed one ox can plough in a year.

\* *Bovata terra*, q. d. *quantum sufficit ad iter vel arum unius bovis*.

In Lincolnshire they still corruptly call it *oskin* of land.

**OX SPAVIN**. See the article **SPAVIN**.

**OXYCRATE** \*, **OXYCRATUM**, in pharmacy, &c. a mixture of water and vinegar.

\* The word is Greek, *οξύκρατος*; formed of *οξύς*, sharp, sour, and *κραννμαί*, I mix.

The usual proportion is one spoonful of vinegar to five or six of water.

*Oxycrate* is proper to assuage, cool, and refresh.—They make fomentations of *oxycrate*, clysters of *oxycrate*, &c.

**OXYCROCEUM** \*, in pharmacy, a preparation much used in plaisters, for fractures, and to form callus's; composed chiefly of saffron, with gums dissolved in vinegar.

\* The word is formed from the Greek *οξύς*, sharp, sour, and *κροκός*, saffron.

**OXYGALA**, **ΟΞΥΓΑΛΑ**, *Sour milk*. See **MILK**.

\* The word is formed from the Greek, *οξύς*, sharp, sour, and *γάλα*, milk.

The Turks use this as a popular drink, and call it *igur*.—Vigenere says, they drink sour milk diluted with water, which is found to cool and nourish much better than the milk alone.

**OXYGONIUS**, **OXYGONOUS**, in geometry, *acute-angled*; a figure consisting wholly of acute angles, or angles less than 90 degrees. See **ACUTE**.

The word is chiefly applied to triangles, where the three angles are all acute, or less than 90 degrees each. See **TRIANGLE**.

**OXYMEL** \*, **ΟΞΥΜΕΛΙ**, in pharmacy, a mixture of honey and vinegar, boiled to the consistence of a syrup.

\* The word is formed from the Greek, *οξύς*, sour, and *μέλι*, mel, honey.

There are two kinds of *oxymel*; the one *simple*, the other *compound*.

*Simple OXYMEL* is composed of two parts of good honey, and one of white-wine vinegar boiled into the consistence of a syrup: proper to incise and scour any phlegm adhering to the throat and breast.

*Compound OXYMEL* only differs from the *simple*, in that to the honey and vinegar, they add the decoction of the five greater opening roots, with the seeds of smallage, parsley, and fennel. It is used to open obstructions of the liver and spleen.

**OXYREGMIA** \*, **ΟΞΥΡΕΜΙΑ**, in medicine, a sourness of the stomach liquor, occasioning acid belches.

\* The word is formed from *οξύς*, and *ρεγγω*, *rusto*. See **RUC-TATION**.

**OXYRRHODON** \*, or **OXYRRHODINUM**, a mixture of two parts of oil of roses, and one part of vinegar, stirred together for some time.

\* The word is composed of the Greek *οξύς*, sour, and *ῥόδος*, rose.

To these are sometimes added distilled waters.—It is used for inflammations, and to dry up tetters.

Scultetus prescribes it as follows: two whites of eggs beaten, one ounce and half of vinegar of roses, four ounces of rose-water, and two ounces of oil of roses.

**OXYSACCHARUM** \*, **ΟΞΥΣΑΚΧΑΡΟΝ**, a liquid medicine composed of sugar and vinegar.

\* The word is compounded of *οξύς*, sour, and *σακχαρός*, sugar.

The name is more peculiarly given to a syrup prepared with vinegar, the juice of four pomegranates, and sugar; used to cool, refresh, and resist the malignity of peccant humours.

**OYER**, seems to have been antiently used for what we call *affises*. See **ASSISE**.

## O Y E

**OYER and Terminer** \*, a commission directed to the judges and other gentlemen of the county to which it is issued, by virtue whereof they are empowered to hear and determine treasons, and all manner of felonies and trespasses. See **JUSTICE, COMMISSION, &c.**

\* The term in French, and literally denotes to hear and determine.—In our statutes it is sometimes wrote *oyer and determine*.

It is the first and largest of the five commissions, by which our judges of assize do sit in their several circuits. See **ASSIZE**.

Antiently it was only in use upon some sudden outrage or insurrection in any place.

**OYER de Record**, is a petition made in court, praying that the judges, for better proof sake, will be pleased to hear, or look upon any record.

In the like sense one may demand *oyer* of a bond, deed, covenant, or the like.

## O Z Æ

**O YES**, a corruption of the French, *Oyez*, hear ye ; being a term, or formula, whereby the cryers, in our courts, enjoin silence, or attention, ere they make proclamation of any thing.

**OZÆNA** \*, in medicine, a putrid and stinking ulcer, in one or both nostrils ; wherein the humour is very acrid, or corrosive, sanious, and sometimes mixed with a bloody mucus. See **ULCER**.

\* The word is Greek, *οζανα*, which signifies the same thing.

It sometimes proceeds from neglected, or ill-managed wounds, contusions, &c. in the nostrils ; especially in scorbutic, scrophulous, or venereal habits ; and sometimes follows the small-pox.

It often spreads and eats through the alæ ; and at other times preys into the septum nasi, cartilage, and os palati ; especially in venereal cases. Whence the great danger of the nose in that distemper. See **VENEREAL**.

# P.

## P A C

**P**, A consonant, and the fifteenth letter in the English Alphabet. See LETTER, CONSONANT, &c.

When the *P* is followed with an *H* in the same word, it has the sound of an *F*; thus, *Philosophy* is pronounced *Filosofy*.

*P* and *B* are so like each other, that Quintillian declares, that in the word *obtinuit*, his reason required him to put a *b*, but that his ears could hear nothing but a *p*, *optinuit*: hence in ancient inscriptions, and old glossaries, it appears, these two letters have been often confounded. See *B*.

Several nations still pronounce one for the other, the Germans particularly, who say, *ponum vinum* for *bonum vinum*.

Plutarch observes, it was usual for those of Delphos to say *πατην* for *παιτην*, *βιζην* for *πιζην*; and among the Latins, as often as an *s* followed, the *b* was changed into a *p*, as *scribo*, *scripsi*.

*P*, in the Italian music, frequently represents *piano*; which is what in our music we call *soft*, i. e. the force of voice or instrument, is to be diminished, so as to make a kind of echo.

*PP* signifies *piu piano*, i. e. more soft, or a second echo weaker or more remote than the former: and *PPP* signifies *pianissimo* softest of all, or a third echo, the voice being, as it were, lost in the air.

*PM*, among astronomers, is frequently used for *post meridiem*, or afternoon; and sometimes for *post mane*, after the morning, i. e. after midnight. See MORNING.

*P* was also used among the ancients as a numeral letter, signifying the same with the *G*, viz. an hundred; according to the verse of Ugutio.

*P simile cum G numerum monstratur habere.*

Though Baronius thinks it rather stood for seven—See what has been observed, with respect to these numeral letters in general, under the letter *A*.

When a dash was added a-top *P̄*, it stood for four hundred thousand.

St. Jerome observes, on Daniel, that the Hebrews had no *P*; but that the *ph* served them instead thereof: adding, that there is but one word in the whole bible read with a *P*, viz. *apadna*.

*P*, in medicinal prescription, is used for *Pugil*, or the eighth part of a handful. See PUGIL.

*P Æ*, signify *partes æquales*, equal parts of any ingredients; otherwise denoted by *ā* or *ana*. See ANA.

*PP* signify *pulvis patrum*, i. e. jesuit's powder, or the cortex peruvianus in powder; which is so called, because first brought into Europe by those fathers. See CORTEX.

*PABULUM* is sometime used among naturalists for fewel; or that part in combustible bodies, which the fire immediately feeds on, or is supported by. See FIRE.

The oily or sulphurous part of fewels is the only proper *pabulum*. It is that alone, wherein fire can inhere. See FEWEL, SULPHUR, &c.

*PACALIA*, a feast held among the ancient Romans, in honour of the goddess *pax*, peace. See FEAST.

Aldhelmus, *de Laud. Virgin.* speaking of the impure festivals and ceremonies of the heathens, calls one of them *pœnalia*; which passage Gronovius charges as faulty, alledging, that there was no feast of that name, but that it should have been *Pacalia*, or perhaps *Palilia*. See PALILIA.

The ancients, who personified, and even deified every thing, were not forgetful of peace: she had an altar at Rome, and a stately temple; and religious rites were paid her with great solemnity.

*PACE*, *PASSUS*, *Step*; a measure taken from the space between the two feet of a man, in walking. See MEASURE.

The ordinary *Pace* of a man is two foot and a half; though many reckon it a yard: the *geometrical* or *German*, called also the *greater Pace*, is five feet. See FOOT.

The ancient Roman, and modern Italic mile consists of a thousand *paces*, *mille passus*. The French league is 3000 *paces*, the German 4000. See MILE, LEAGUE, &c.

*PACE*, in the manage, is a certain manner of motion, or progression of a horse. See HORSE.

The natural *paces* of a horse are three, viz. the walk, trot and gallop: to which may be added an amble; because some horses have it naturally. See each under its proper article, TROT, GALLOP, &c.

For the artificial *paces*, see the article AIRS.

Horses that mix their *paces*, i. e. shuffle betwixt a walk and amble, &c. are seldom of any value. The defect proceeds from their fretful, fiery temper; and sometimes from a weakness either in their reins or legs.

*PACE* is more particularly understood of that easy low motion

VOL. II.

## P A D

wherein the horse raises the two feet of the same side at a time; called also *amble*. See AMBLE.

*PACIFIC*, sometimes peaceful, or free from troubles, tumults, &c. See PEACE.

Geographers call the South Sea, *mare pacificum*, the *pacifit ocean*; as being less infested with storms than the atlantic. M. Frezier affirms, it does not deserve that appellation; and that he has seen as violent tempests therein as in any other sea: but Magellan happening to have a very favourable wind, and not meeting with any thing to ruffle him, when he first traversed this vast ocean in 1520, gave it the name, which it has retained ever since. Maty, however, adds, that the wind is so regular, that the vessels would frequently go from Acapulco to the Philippine Islands, without shifting a sail.

*PACIFIC Letters*, *Literæ PACIFICÆ*, in the ancient church, was a denomination given to all sorts of letters testimonial, given by the bishop or chorepiscopus to their priests, when they had occasion to travel abroad; certifying that the bearer was a catholic, and in communion with the church.

The life of pope Sixtus I. taken from the pontifical of pope Damasus, mentions that pope as the first who introduced those letters called *Formata*, *Canonica*, *Commendatitia*, *Communicatoria*, *Ecclesiastica*, & *Pacifica*.

*PACIFICATION* the act of restoring, or re-establishing the public peace, and tranquillity. See PEACE.

The word is particularly appropriated to the periods put to the religious broils raised in France, in the year 1562, by the edict of Nantz; and the civil commotions, between the English and Scots, ended in 1638. See EDICT.

*PACIFICATOR* is commonly understood in the same sense with Mediator, viz. for one who endeavours to reconcile princes, or powers at variance.

Wicquefort makes a difference between Mediator, and *Pacificator*.—The peace being concluded between France and England, in 1621. the instruments on each side were put in the hands of certain ambassadors, who had been employed as *Pacificators*, not as Mediators; to be kept till such time as the ratifications had been exchanged.—So, the archbishop of Pisa, the duke of Tuscany's ambassador at Madrid, was never esteemed a Mediator, though the French ambassadors allowed him to be present at the conferences held with the commissioners of Spain, to act as a *Pacificator* of the differences between them. The grand duke had not offered his mediation; nor would France have accepted it. Wicquefort, P. 2. §. 11.

*PACK* in commerce.—A *PACK* of wool is a horse's load; containing 17 stone, and 2 pounds; or 240 pound weight. See SARPLAR and WOOL.

*PACT\**, *PACTUM*, or *PACTION* in law, a covenant or convention between two or more parties. See COVENANT.

\* Ulpian derives the word from the Latin verb *pacisci*, to bargain, agree, contract: Others with more probability, from *paco*, I appease or pacify; or from *pango*, I fix, establish.

The civil lawyers after Ulpian, define the word *Pact* the consent of two or more parties to the same thing—*Duorum aut plurium in idem consensus*. L. III. Sect. 2. ff. de pactis.

There are two species of conventions, viz. the *Pact* and *Contract*. A *Pact* against good manners, against publick or natural equity, is null.—Tis a maxim in law, *ex nudo pacto non oritur lex*. See NUDE.

*PACTA Conventa*, in Poland, are the articles agreed on between the king and the republic; and which they mutually oblige each other to observe. See CAPITULATION.

*PADDOCK* or *PADDOCK-Course*, a piece of ground, conveniently taken out of a park, ordinarily a mile long, and a quarter of a mile broad, encompassed with pales, or a wall, for the exhibiting of races with greyhounds for wagers, plates, or the like. See PARK.

At one end of the *Paddock* is a little house, where the dogs are to be entered; and whence they are slipped; near which are pens to inclose two or three deer for the sport.

The deer, when turned loose, run all along by the pale; and the spectators are placed on the other side.

Along the course are several posts, viz. the law-post, 160 yards from the dog-house and pens: the quarter of a mile post, half mile post, and pinching post; beside the ditch, a place made to receive the deer and preserve them from further pursuit.

Near the ditch, are placed judges or triers. The keeper, to slip the dogs fairly, puts a falling collar upon each, to slip through a ring; and the deer being turned loose and put forward by a teaser, as soon as it is arrived at the law-post, the dog-house door is thrown open and the dogs slipped.

If, now, the deer swerve so much, as that his head is judged nearer the dog-house than the ditch, before he arrive at the pinching-

pinching-post; it is no match; but must be run over again three days after. If there be no such swerve, but the deer runs straight as far as the pinching-post; then the dog nearest him, if he chance to swerve afterwards, or by any accident, be blanced; or if there be no such swerve, &c. the dog that leaps the ditch first, wins the match.

**PADUAN**, among medallists, a modern medal in imitation of the antique; or a new medal struck with all the marks and characters of antiquity. See **MEDAL**.

The name is taken from *Paduan*, *Paduanus* a famous Italian painter, who succeeded so well in the imposture, if it may be so called, that the best judges are at a loss to distinguish them. This *Paduan* was thus called, from the place of his birth Padua: his proper name was Giovanni Cavino; he flourished in the XVIIth century.—His son Octavian, though born at Rome, was also called the *Paduan*.

**PADUAN** is, properly, applicable to those medals only, which are struck on the matrices of the elder *Paduan*; which are still preserved—Though it is frequently used in the general for all medals of this kind.

Joubert observes, that there have been a *Paduan* and *Parmesan* in Italy, and *Carteron* in Holland, who had the knack of imitating the antique in perfection. See **COIN** and **COINAGE**.

**PÆAN**\*, Παιων, in antiquity, a hymn in honour of Apollo, or some other of the gods; chiefly used on occasion of victory and triumph. See **HYMN**.

\* Festus derives the word *παιων*, *ferire*, to smite, shoot: but Hesychius rather takes Apollo to have been denominated *Pæan* from *παιω*, *ἰεργεω*, I heal; in allusion to his being the deity of Medicine.

The *Pæan* took its name from Apollo himself; who was denominated *Pæon*, because, in his combat with the serpent Python, his mother Latona encouraged him to make use of his arrows, by crying frequently *παι, παι*, do boy, bravely boy.

**PÆAN** or **PÆON** is also the name of a foot in the ancient poetry; so called, as commonly supposed, because appropriated to the hymn *Pæan*; though Quintilian derives the name from its inventor *Pæon*, a physician. See **FOOT**.

The *Pæon* consists of four syllables, one of which is long, and the rest short.

**PÆDO-BAPTISM**\*, infant-baptism, or that conferred on children. See **BAPTISM**.

\* The word is a compound of the Greek *παις*, *παιδος*, infant, and *βαπτισμος*, baptism.

**PAGAN**, **PAGANUS**, a heathen, gentile, or idolater; one who adores false gods. See **IDOLATRY**, &c.

Baronius derives the word *Paganus*, a *Pagis*, villages, because, when the christians became masters of the cities, the heathens were obliged by the edicts of Constantine and his sons, to go and live in the country villages, &c.—Salmasius will have the word come from *Pagus*, considered as originally signifying *Gens* or nation: whence we say indifferently, *Pagans* or *Gentiles*. See **GENTILE**.

The abbot de Fleury gives another origin of *Pagan*: he observes that the emperor Constantine going from Antioch against Maxentius in 350, assembled all his troops, and advised such as had not received baptism to receive it immediately; declaring withal that such as should be found unbaptized should quit the service, and go home.

Hence, perhaps, says the abbot, the name *Pagan* might be given to those who chose the latter: the Latin word, *Paganus*, properly signifying a person who does not bear arms; in opposition to *miles*, a soldier.

And hence it might, in time, extend to all heathens.—Or, continues he, the word might come from *Pagus*, village, in regard the peasants were those who stuck longest to the idolatry of the heathens.

**PAGANALIA**, an ancient rural feast; thus called, because celebrated in the villages, in *Pagis*. See **PAGAN**.

In the *Paganalia*, the peasants went in solemn procession all around the village, making lustrations to purify it. They had also their sacrifices, wherein they offered cakes on the altars of the gods. See **FEAST**.

Halicarnassus and St. Jerom, refer the institution of the *Paganalia* to Servius Tullus. They were held in the month of February.

**PAGANISM**, the religious worship, and discipline of *Pagans*; or the adoration of idols, and false gods. See **PAGAN**.

The gods of *Paganism*, were either men, as Jupiter, Hercules, Bacchus, &c. or fictitious persons, as victory, fame, fever, &c. or beasts, as in Egypt, crocodiles, cats, &c. or inanimate things, as onions, fire, and water, &c. See **GOD**.

**PAGARCHUS**\*, Παγάρχης, among the ancients, a petty magistrate of a *Pagus*, or little district, in the country; several times mentioned in the novels.

\* The word is formed from *Pagus*, village, and *αρχη* command.

**PAGE**\*, a youth of state, retained in the family of a prince, or great personage, as an honourable servant to attend in visits of ceremony, do messages, bear up trains, robes, &c. and at the same time to have a genteel education, and learn his exercises.

\* The word seems formed from the Greek, *παις*, child, boy.

The *Pages* in the king's household, are various, and have various provinces assigned them: as *Pages* of honour, *Pages* of the presence-chamber, *Pages* of the back-stairs, &c.

*Pages* were anciently distinguished from the other servants in livery, by their wearing drawers in lieu of breeches; and sleeves turned up with velvet.

Cujas and Gothofred observe; that *Pages* in the emperor's families, were called *Pædagogiani Pueri*. Fauchet says, the word *Page*, was first given to the little boys who attend tilers to bring them their tiles, &c. That till the time of Charles VI. or VII. the name was common to the basest servants; and that it is since then, that *Page* is become a term of honour; and the meaner servants distinguished from them by the names of lacqueys, valets, &c. See **VALET**.

**PAGE** is particularly used in the Turkish seraglio, for the children of tribute; or, slaves who wait on the grand signior.

They are commanded by the first *Aga*; and constitute four classes, called *Oda's*. See **ODA**.

**PAGE** of a Book. See the article **PRINTING**.

**PAGEANT**, a triumphal car, chariot, arch, or other the like pompous decoration, variously adorned with colours, flags, &c. carried about in publick shews, processions, &c. See **DECORATION**, **PROCESSION**, &c.

**PAGOD**, a name which the Portuguese have given to all the temples of the Indians, and idolaters of the East. See **TEMPLE**.

The *Pagods* of the Chinese, and Siamese are exceedingly magnificent. Among others, there is one at Golconda, whose nich, that they pray in, consists of a single stone, of such prodigious bulk, that they were five years in bringing it to the place; 600 men being constantly employed at it all that time; and the machine that brought it, drawn by 1400 oxen.

The revenues of the *Pagod* of Janigrate are so great, as to subsist, every day, from fifteen to twenty thousand pilgrims.

**PAGOD** is also used for the idol adored in the temple. See **IDOL**.

Hence the curious give the name *Pagod* to those little porcelain images brought from China.

**PAGOD** is also the name of a gold coin current in several parts of the Indies; on the footing of the piece of eight. See **COIN**, &c.

The English coin *Pagods* at fort St. George; and the Dutch at Palicate.

There are also silver *Pagods* struck at Narfingua, Bijnagar, &c. which usually bear the figure of some monstrous idol; whence their names. They are of various values.

**PAIN**, an uneasy sensation, arising from a sudden and violent solution of continuity in the nerves, membranes, vessels, muscles, &c. of the body. See **PLEASURE**.

*Pain*, according to some, consists in a motion of the organs of sense; according to others, it is an emotion of the soul, occasioned by those organs. See **SENSE**.

If it be inquired, what it is occasions the *Pain* of a puncture? one may answer, that the puncture cannot separate the fibres of the flesh, without shaking the nerves which proceed thence to the brain. If it be further asked, why we feel pain upon a shaking of that part of the brain? we are at a stand; there being no necessary connection between concussions of the brain, and the sensation of pain wherewith the soul is affected. See **BRAIN**.

To account, therefore, for *Pain*; F. Malebranche observes, we must have recourse to a superior being, who forms an arbitrary connection between the shakes of the brain, and the sensation of pain. See **SENSATION**.

From the physical definition of *Pain*, it follows, that whatever may distract or separate the parts of the nerves or membranes from one another may cause *Pain*; but there is nothing in the compass of nature, which may not do that, with whatever figures, or properties, it be endued: for since somewhat may always be applied, or added to any other body; such body may at length increase into a bulk too big to flow through a canal of a given diameter, and will therefore require more room: wherefore, while the sides of a canal are thrust outward beyond what they are used to be, that is, the parts composing those sides, before contiguous, become loosened and moved away from one another; if that body strike upon those sides with a brisk impetus, and that impetus be continually renewed, the solution will be considerable, or the nifus towards a solution violent; that is, there will be *Pain*.—Wherefore the constituent parts of fluids being sufficiently augmented in dimension, and propelled with a continually repeated impetus against any canal of our body, may occasion that solution, in which consists the essence of *Pain*.

For it comes to the same thing, whether some parts be added to a body; or the parts of that body be, by any cause whatsoever, separated to so great an interval near the sides of a canal, as to constitute a dimension equal to that which arose from the addition of a new part; for the bulk may so far increase both ways, as that the natural capacity of the canal shall not be big enough to contain it, without some violent dilatation, and a distraction of the fibres it is composed of: and consequently *Pain* must ensue.

Farther,

Farther, as there may be always somewhat added to another body; so from any body may somewhat be always taken away; a body so diminished in dimension, and impelled with a considerable impetus will break through the interstices of the fibres, where it is less than the capacity of such interstices, and moved obliquely: and because the superficies of the fibres are not wont to be contained under geometrical right lines, but to have particles standing out and prominent; these it divides from one another. And thus any body, of whatsoever figure, may occasion in us *Pain*, so it be big enough to distend the vessels beyond their wonted measure, or small enough to enter the pores in the sides of a canal, with an impetus in the manner intimated.

And what is thus advanced, with relation to things within the vessels, may be easily applied to others out of the vessels.

**PAIN**, in medicine, considered as a symptom of a disease, makes a considerable article in a palliative cure. See **PALLIATIVE**.

*Pain* is mitigated, or assuaged divers ways; as 1. by diluting and softening acrimonies, with warm water mixed with flower applied by way of drink, fomentation, clyster or bath. 2. By resolving and washing away obstructions, by the same means and resolvents. 3. By relaxing the nervous vessels, with drinks, fomentations, baths, relaxants, anodynes and aperients. 4. By correcting the acrimony itself with proper remedies. 5. By freeing the obstructed, obstructed, and acrimonious parts from the too great pressure of the vital humour; and by softening, and suppurating, and depurating them. 6. By rebating or deadening the sense by narcoticks, either internally or externally. See **NARCOTICK**, **ANODYNE**, &c.

**PAINE** *fort*, & *dure*, in law, an especial punishment for one, who being arraigned of felony, refuses to put himself upon the ordinary trial of God and his country, and thereby stands mute by the interpretation of law. See **MUTE**.

This is vulgarly called *pressing to death*.—The process whereof is thus prescribed:

“He shall be sent back to the prison, whence he came,  
“and be laid in some low dark house; where he shall lie naked  
“on the earth, without any litter, rushes, or other cloathing,  
“and without any raiment about him, but only something to  
“cover his privy-members; and he shall lie upon his back  
“with his head covered, and his feet; and one arm shall  
“be drawn to one quarter of the house, with a cord, and  
“the other arm to another quarter, and his legs in the same  
“manner: let there be laid upon his body iron, or stone, as  
“much as he may bear, or more; and the next day following,  
“he shall have three morsels of barley-bread without drink;  
“and the second day he shall have drink three times, as much  
“at each time as he can drink, of the water next unto the  
“prison, except it be running water; without any bread: and  
“this shall be his diet, till he dies.

**PAINIM**, the same with **PAGANS**. See **PAGAN**.

**PAINTING**, **PICTURA**, the art of representing natural bodies, and even giving them an appearance of life, by the duct or draught of lines, and the degrees of colours. See **COLOUR**, &c.

*Painting* is said to have had its rise among the Egyptians: and the Greeks, who learned it of them, carried it to its perfection; if we may believe the stories related of their Apelles, and Zeuxis.

The Romans were not without considerable masters in this art, in the latter times of the republic, and under the first emperors; but the inundation of Barbarians, who ruined Italy, proved fatal to *Painting*, and almost reduced it to its first elements. It was in Italy, however, that the art returned to its ancient honour, and in the beginning of the XV<sup>th</sup> century; when Cimabue, betaking himself to the pencil, translated the poor remains of the art, from a Greek painter or two, into his own country.

He was seconded by some Florentines: the first who got any reputation was Ghirlandai, Michael Angelo's master; Pietro Perugino, Raphael Urbin's master; and Andrea Verocchio, Leonardo Da Vinci's master.

But the scholars far surpassed the masters; they not only effaced all that had been done before them, but carried *Painting* to a pitch from which it has ever since been declining.

It was not by their own noble works alone that they advanced *Painting*; but by the number of pupils they bred up, and the schools they formed.

Angelo, in particular, founded the school of Florence; Raphael, the school of Rome; and Leonardo, the school of Milan; to which must be added, the Lombard school, established about the same time, and which became very considerable under Giorgione and Titian. See **SCHOOL**.

Besides the Italian masters, there were others on this side the Alps, who had no communication with those of Italy; such were Albert Durer, in Germany; Holbens, in Switzerland; Lucas, in Holland; and others in France and Flanders: but Italy, and particularly Rome, was the place where the art was practised with the greatest success; and where, from time to time, the greatest masters were produced.

To Raphaels school, succeeded that of the Caraccios, which has lasted, in its scholars, almost to the present time; wherein

the French painters, by the munificence of the late Louis XIV. seem almost in a condition to vie with those of Greece or Italy. In Paris they have two considerable bodies of painters, the one, the *Royal Academy of Painting and Sculpture*, the other the *Community of Masters in Painting, Sculpture, &c.* See **ACADEMY**.

The art of *Painting* is divided, by Fresnoy, into three principal parts; invention, designing, and colouring; to which some add a fourth, *viz.* disposition.—Felibien divides *Painting* into composition, designing, and colouring.

M. Testling, painter to the late king, divides it, somewhat more accurately, into the design or draught, the proportion, the expression, the clair-obscur, the ordonnance, and the colouring; to which his English translator adds the perspective. Under each of these heads, he gives us the rules and sentiments of the best masters; which see under their proper articles in this dictionary, **DESIGN**, **PROPORTION**, **EXPRESSION**, **CLAIR-OBSCURE**, **ORDONNANCE**, **COLOURING**, &c.

*Painting* is of various kinds, with regard to the materials used; the matter whereon they are applied; and the manner of applying them.—Hence come *Painting* in oil; *Painting* in water-colours, or Limning; *Painting* in fresco; *Painting* on glass; *Painting* in enamel; and *Painting* in miniature.

**PAINTING in Oil**. The art of *Painting* in oil was unknown to the ancients; and it was a Flemish painter, one John van Eyck, or John de Bruges, who first discovered, and put it in practice in the beginning of the XIV<sup>th</sup> century: till him, all the painters wrought in fresco, or in water-colours.

This was an invention of the utmost advantage to the art; since, by means hereof, the colours of a painting are preserved much longer and better, and receive a lustre and sweetness which the ancients could never attain to, what varnish soever they made use of to cover their pieces.

The whole secret only consists in grinding the colours with nut-oil or linseed-oil: but it must be owned, the manner of working is very different from that in fresco, or in water; by reason the oil does not dry near so fast; which gives the painter an opportunity of touching and retouching all the parts of his figures, as often as he pleases: which, in the other kinds, is a thing impracticable.

The figures too are here capable of more force and boldness; inasmuch as the black becomes blacker, when ground with oil than with water; besides that, all the colours, mixing better together, make the colouring sweeter, more delicate and agreeable, and give an union and tenderness to the whole work, inimitable in any of the other manners.

*Painting in Oil* is performed on walls, on wood, canvas, stones, and all sorts of metals.

**To PAINT on a Wall**.—When well dry, they give it two or three washes with boiling oil; till the plaster remain quite greasy, and will imbibe no more. Over this they apply defticate or drying colours, *viz.* white chalk, red oker, or other chalks beaten pretty stiff. This layer being well dry, they sketch out, and design their subject; and at last paint it over; mixing a little varnish with their colours, to save the varnishing afterwards.

Others, to fortify their wall better against moisture, cover it with a plaster of lime, marble-dust, or a cement made of beaten tiles soaked with linseed oil; and at last prepare a composition of Greek pitch, mastic, and thick varnish boiled together, which they apply hot over the former plaster: when dry, they lay on their colours as before.

Others, in fine, make their plaster with lime-mortar, tile-cement, and sand; and this dry, apply another of lime, cement, and iron scum; which being well beaten and incorporated with whites of eggs and linseed oil, makes an excellent plaster. When dry, the colours are applied as before.

**To PAINT on Wood**.—They usually give their ground a layer of white tempered with size; or they apply the oil above-mentioned: the rest as in *Painting* on walls.

**To PAINT on Cloth or Canvas**.—The canvas being stretched on a frame, they give it a layer of size, or past-water. When dry, they go over it with a pumice-stone, to smooth off the knots. By means of the size the little threads and hairs are all laid close on the cloth, and the little holes stopped up, so as no colour can pass through.

When the cloth is dry, they lay on oker, which is a natural earth, and bears a body; sometimes, mixing with it a little white lead to make it dry the sooner. When dry, they go over it with the pumice-stone to make it smooth.

After this, they sometimes add a second layer composed of white lead, and a little charcoal black, to render the ground of an ash-colour; observing in each manner to lay on as little colour as possible; that the cloth may not break, and that the colours, when they come to be painted over, may preserve the better.

In some *Paintings* of Titian and Paolo Veronese we find they made their ground with water, and painted over it with oil; which contributed much to the vivacity and freshness of their works: for the water ground, by imbibing the oil of the colours,

colours, leaves them the more beautiful; the oil itself taking away a deal of their vivacity.

As little oil therefore is to be used as possible, if it be desired to have the colours keep fresh: for this reason some mix them with oil of aspic, which evaporates immediately, yet serves to make them manageable with the pencil.

To PAINT on Stones or Metals, it is not necessary to apply size, as on cloth; it suffices to add a slight layer of colours, before you draw your design; nor even is this done, on stones where it is desired the ground should appear, as on certain marbles of extraordinary colours.

All the colours used in fresco are good in oil, except white of lime and marble-dust. See COLOUR.

Those chiefly used are white lead or cerufs, yellow and white masticot, orpiment, black lead, cinnabar or vermillion, lacca, blue and green ashes, indigo, lamp-black, burnt ivory, and verdigrease, &c. See the preparation, &c. of each under its proper article, CERUSS, ORPIMENT, VERMILLION, LACCA, INDIGO, &c.

As to oils, the best are those of walnuts, linseed, aspic, and turpentine. The desiccative or drying oils, are a nut oil boiled with litharge and sandarach, others with spirit of wine, mastic and gum-lacca.

To have a varnish that shall dry readily, they mix spirit of wine with turpentine. See VARNISH.

PAINTING in Water-Colours. See LIMNING.

PAINTING in Fresco. See FRESCO.

PAINTING in Miniature. See MINIATURE.

PAINTING on Glass. See GLASS.

PAINTING in Enamel. See ENAMEL.

PAINTING in Mosaic. See MOSAIC-WORK.

PAIR, PAR, a collective term, used for two equal and similar things ordinarily joined together; though more frequently for artificial things, than for natural ones. As, a Pair of gloves, of stockings, of shoes, &c.

PAIR is also used in compound things, for two parts alike each other, though they only make one whole.—As, a Pair of Scissars, &c.

PAIR is also used for a set, or system of several things joined to make another compleat,—as a Pair of bag-pipes, &c.

PAIR, again, is used by extension, for a thing that is single: as, a Pair of tables, &c.

PAIR, PAR, in anatomy, denotes an assemblage or conjugation of two nerves, having their origin together in the brain or spinal marrow; and thence distributed into the several parts of the body, one on the one side, and the other on the other. See NERVE.

Thus we say, the first Pair, second Pair, &c. the Par vagum, Par quintum, &c. sometimes the olfactory Pair, ophthalmic Pair, &c. See VAGUM, &c.

PALACE, PALATIUM, a name generally given to the dwelling houses of kings, and princes. See HOUSE.

Procopius derives the word from a Grecian called Pallas, who gave his own name to a magnificent house he had built: adding, that Augustus after him, gave the name Palatium to the house of the Roman emperors on the hill which for that reason was called the Palatine mount.—Others take it the contrary way; and say, that Romulus's house, wherein Augustus lived, was properly called Palatium, because situate on the Palatine mount.

Be this as it will, it is certain, Palatium, from a proper name, in time, became common to all houses of kings.

And as the kings usually heard and determined causes in their houses, in what part of the realm soever situate; hence also Palatium became a name for a court of justice; which usage is still retained, especially in France. See COURT.

In course of time, the name Palace has also been applied to the houses of other persons; taking different epithets, according to the quality of the inhabitants; as imperial Palace, royal Palace, pontifical, cardinal, episcopal, ducal Palace, &c.

PALÆSTRA, Παλαιστρά, among the ancient Greeks, a public building, where the youth exercised themselves in wrestling, running, quoits, &c. See GYMNASIUM.

Some say the Palæstra consisted both of a college, and an academy; the one for exercises of the mind, the other of the body. But most authors rather take Palæstra to be a Xystus or mere academy for bodily exercises, according to the etymology of the word, which comes from παλν, wrestling, one of the chief exercises amongst the ancients. See XYSTUS.

The length of the Palæstra was marked out by Stadia, each equal to 125 geometrical paces; and the name Stadium was given to the Arena whereon they ran. See STADIUM.

PALÆSTROPHYLAX\*, among the ancients, was the director of a Palæstra; and of the exercises performed therein. See PALÆSTRA.

\* The word is formed from the Greek παλαιστρ, and φυλαξ guardian, keeper.

This officer was also called Xystarcha and Gymnasiarcha. See XYSTARCHA, &c.

PALANQUIN, a kind of chaise, or chair bore by men on their shoulders; much used by the people of China and the East, as a vehicle for their easy conveyance from place to place.

PALATE, PALATUM\*, in anatomy, the flesh that composes

the roof, i. e. the upper and inner part of the mouth. See MOUTH.

\* Du Laurence says, it has its name from the Latin *pali*; because enclosed with two rows of teeth, resembling little stakes which the Latins call *pali*.

The Palate is a little vaulted, or concave: it is lined with a glandulous coat, under which are great numbers of pretty conspicuous glands, scattered in the fore-part of it like grains of millet, with many interstices, whose excretory ducts piercing the membrane, open into the mouth; but towards the hind-part, they lie much thicker; and about the root of the uvula are gathered so close together, that they appear to form one pretty large conglomerate gland, called by Verheyen, *glandula conglomerata palatina*.

Towards the bottom of the Palate, behind the uvula, is a pretty large perforation, which, a little from its orifice, divides into two, each whereof goes to one of the nostrils.

Many take the Palate to be the organ of tasting. See TASTE.

PALATI OS, a small square bone, forming the hind-part of the Palate, and joined to that part of the os maxillare which forms the fore-part of the Palate. See PALATE & MAXILLA superior.

PALATINATE, PALATINATUS, a province or signory, possessed by a Palatine; and from which he takes his title and dignity. See PALATINE.

The Palatinates, now subsisting, are either those of Germany, or Poland.—Those of Germany are the principalities of the upper, and lower Rhine, i. e. of Bavaria, and the Rhine.

The Palatinates in Poland, are the provinces and districts of the Polish grandes or senators, who are the governors thereof.

PALATINE—Count PALATINE\*, Comes PALATINUS, in ancient customs, was a title given to all persons who had any office, or employment in the prince's palace. See COUNT.

\* The appellation is derived hence, that anciently the emperors sent the judges of their palace, whom they called *comites palatini*, or *pals-graves*, to correct the abuses of the other judges in the provinces of Saxony, Bavaria, Franconia, and the Rhine. See PALSgrave.

Matthæus says, that Palatines were originally those who had the super-intendance of the palace; the same with what the Greeks called *Curopolata*, and the French, *Maires du Palais*; though, in time, the name became more general.

The only Palatine of this kind, now subsisting, is the prince Palatine of the Rhine.

PALATINE was afterward a title conferred on those delegated by princes to hold courts of justice in the provinces; and on such among the lords as had a palace, i. e. a court of justice, in their own houses.

The French writers make the Palatines of Champagne to be the first who bore the title; which, they will have it, the Germans and other people borrowed from them; not they from the Germans.

At present, the word Palatine is restrained to a prince of Germany, or a lord of Poland possessed of a Palatinate. See PALATINATE.

In the code we find a title, *De Palatinis sacrarum largitionum*, who were a kind of treasurers of the empire.

PALATINE Games, Ludi PALATINI, among the Romans, were games instituted in honour of Julius Cæsar, as some will have it, or as others, of Augustus. See GAMES.

It is pretended that Dion calls them *Augustalia*; which should seem to confirm the second sentiment. Indeed, it is certain that he says Livia instituted particular games on the Palatine mount, in honour of that prince; but he apparently distinguishes them from those called *Augustalia*. See AUGUSTALIA.

The Romans had also their *Apollo Palatinus*, a surname of that deity, given him in respect of the temple erected to him by Augustus on the Palatine mount, in consequence of a report of the Aruspices, which required it to be done: Augustus enriched it with a noble library; as is intimated by Horace, Lib. I. Epist. III. v. 17.

PALATINE Tribe was one of the four tribes, into which Rome was anciently divided by Servius Tullus. See TRIBE.

PALATO-SALPINGÆUS, called also *Musculus tubæ novus Valsalvæ*, and *Pterygostaphylinus externus*, a muscle arising broad and tendinous from the edge of the lunated part of the os palati, several of its fibres being spread on the membrane that covers the foramen narium; whence growing into a small thin tendon, it is reflected about the hook-like process of the inner wing of the processus pterygoidæus internus, and is inserted carnosus, into all the membranous, fleshy, and cartilaginous parts of the tube which leads from the palate to the ear. It is used to dilate and keep open this tube.

PALATO-STAPHYLINUS, in anatomy, a muscle called also *Pterygostaphylinus internus*. See PTERYGOSTAPHYLINUS.

PALE PALUS, a little pointed stake, or piece of wood, used in making inclosures, separations, &c. See PALISADE.

The Pale was an instrument of punishment and execution among the ancient Romans; and still continues so among the Turks.—Hence *Empaling*; the passing a sharp Pale through the fundament up the body. See EMPALING.

**PALE**, in heraldry, is one of the honourable ordinaries of an escutcheon; being the representation of a *Pale*, or stake, placed upright; and comprehending the whole height of the coat, from the top of the chief to the point. See **ORDINARY**. When the *Pale* is single, it is to contain one third of the breadth of the shield.

When there are several, more properly called *Pallets*, they are proportioned so, as that two take up two fifths of the shield; and three take up three sevenths: and in those cases the number of pieces is specified as well as that of those they are charged withal, &c. See **PALLET**.

*Pales* are bore various ways, as *wavy*, *crenellé*, *faillie*, *indented*, *ingrailed*, &c. There are also *cometed*, and *flaming Pales*, which are pointed, sometimes waved, &c.

**PALED**, **PALE** in heraldry. — A coat is said to be *Paled*, when it is equally charged with *pales* of metal, and colour. It is *Counter-Paled*, when it is cut, and the two *Demi-Pales* of the chief, though of colours the same with those of the point, yet differ in the place where they meet, so as if the first of the chief be metal, that corresponding to it, underneath, is of colour. The coat is said to be *Palissé*, when the *Pales* are pointed like those used in the defence of places.

In **PALE**, is applied to things born one above another in manner of a *Pale*. See **PALES**.

*Party per PALE* is where the shield is divided by a single line through the middle, from top to bottom. See **PARTY** and **PALY**.

**PALED Flowers**, in botany, are those which have leaves set about, or surrounding a head, or thrum: as in Marigolds, &c.

**PALES**, or **PILES**, in carpentry, denote rows of stakes drove deep into the ground, to make wooden bridges over rivers. See **PALLIFICATION**.

\* Du Cange derives the word from the Latin name *Palla*, a hanging, or piece of tapestry: the ancients gave the name *Pales* to the hangings or linings of walls: thus a chamber was said to be *paled* with cloth of gold, with silk, &c. as consisting of bands or stuffs of two colours. — Hence also the origin of the word *Pale* a stake, &c. The arms of Arragon are *paled or and gules*.

Tertullian observes, that the Romans planted *Pales* to serve as boundaries of inheritances; and they consecrated them to the god *Terminus*, under the Name of *Pali Terminales*. Ovid tells us, they were crowned and adorned with flowers, festoons, &c. The god was worshipped before these *Pales*. See **TERMINALIA**.

*Pales* serve to support the beams which are laid across them, from one row to another; and are strongly bound together with cross-pieces.

**PALILIA**, a feast among the ancient Romans in honour of the goddess *Pales*. See **FEAST**.

The *Palilia* by some called *Parilia*, were celebrated by the shepherds on the first of May; to beseech that goddess to take care of their flocks, and preserve them from wolves, and diseases.

Part of the ceremony consisted in lighting heaps of straw, and jumping over them.

**PALILICIUM**, in astronomy, a fixed star of the first magnitude, in the Bull's-eye; called also *Aldebaran*. See **ALDEBARAN**.

Its Longitude in Mr. Flamsteed's catalogue is 5°. 27'. 00". Its Latitude 5°. 29'. 49". South.

Pliny gives the name *Palilicium* to the Hyades, of which *Palilicium* is one. See **HYADES**.

**PALINDROMUS**, a verse, or sentence, which runs the same, read either backwards, or forwards. See **RETROGRADE**.

\* The word is Greek, *παλινδρομος*, *retro currens*, running backward, formed of *παλιν* again, and *δρομος* course.

Such is the verse

*Roma tibi subito motibus ibit amor.*

Some people of leisure have refined upon the *Palindromus*, and composed verses, each word whereof is the same backwards as forwards: As that instance in Camden.

*Odo tenet mulum, madidam mappam tenet Anna.*

*Anna tenet mappam madidam, mulum tenet Odo.*

**PALING**, or **PALEING**, in agriculture, &c. a kind of fence-work for fruit-trees, &c. planted in fields, &c.

It consists of three small posts driven into the ground, at a foot and a half distance; with cross bars nailed to each other near the top.

In fixing the *Pales* in a form of a triangle, room is to be left for the tree to play and bow by the high winds without galling. The trees are to be bound to a stake for a year or two, after which fern or straw may be stuffed in betwixt the tree and uppermost rails to keep it upright.

If the place be open to deer, rabbits, or the like, a post to be nailed to the bar between every two *Pales*.

**PALINGENESIA\***, *Παλιγενεσία*, a new birth, or regeneration. See **REGENERATION**, **REVIVICATION**, **REPRODUCTION**, &c.

\* The word is Greek, formed of *παλιν* over-again, a-new, and *γενεσις* *Genesis*, generation.

**PALINGENESIA**, is also used by some for the migration or passage of the soul of a defunct into another body.

VOL. II.

The *Palingenesia* is almost the same thing with the *Metempsychosis* taught by Pythagoras, and still believed by the Brachmans, Banians, and other philosophers of the east. See **METEMPSYCHOSIS**.

**PALINODY**, *Παλινωδία*, a discourse contrary to a preceding one.

Hence the phrase *Palinodiam Canere*, to sing *Psalmody*; *q. d.* to make a recantation. See **RETRACTATION**.

The word in the original Greek, signifies *singing again*, or a-new. Hence it has passed as a general name for any poem, or the like, which contains a retractation in favour of a person the poet had before offended.

The poet Stesichorus is said to be the first author of the *Palinody*. The sixth ode of the first book of *Horace* beginning, *O Matre pulchra*, is a true *Palinody*.

**PALINTOGIA\***, *Παλιντομία*, in antiquity, the birth or delivery of a child a second time. See **BIRTH**, &c.

\* The word is formed from the Greek *παλιν* a-fresh, a-new, and *τοκος* of *τακω*, I bring forth.

Thus the second birth of Bacchus, proceeding out of Jupiter's thigh, was a *Palintocia*.

**PALINTOCIA** is also used for the restitution of usury, or the refunding of interests. See **RESTITUTION**.

The Megarians, having expelled their tyrant, ordained the *Palintocia*; that is, they made a Law, that all the creditors should return to their debtors the interests they had received for moneys lent. See **INTEREST** and **USURY**.

**PALISADE** or **PALISADO**, in fortification, an inclosure of stakes, or piles driven into the ground, six or seven inches square, and eight foot long; three whereof are hid under ground. See *Tab. Fortif. Fig. 18*.

*Palisades* are used to fortify the avenues of open forts, gorges, half-moons, the bottoms of ditches, the parapets of covert-ways; and in general, all posts liable to surprize, and to which the access is easy, &c.

*Palisades* are usually painted perpendicularly; though some make an angle inclining towards the ground next the enemy, that the ropes cast over them, to tear them up, may slip.

*Turning PALISADES*, are an invention of M. Coehorn, in order to preserve the *Palisades* of the parapet of the covert-way from the besiegers shot.

He orders them so, that as many of them, as stand in the length of a rod, or in about ten foot, turn up and down like traps; so as not to be in sight of the enemy till they just bring on their attack: and yet are always ready to do the proper service of *Palisades*.

**PALISADE**, in gardening, denotes a sort of ornament; being a row of trees which bear branches and leaves from the bottom, cut and spread in manner of a wall, along the side of an alley, or the like; so as to appear like a wall covered with leaves.

*Palisades* are made of jessamin, phillyrea, &c.

**PALISSE**, in heraldry, a range of *Palisades*, before fortification represented on a fesse, rising up a considerable height; and pointed a top, with the field appearing through them. — *V. Tab. Herald. Fig. 31*.

**PALL**, in heraldry, denotes a kind of cross, representing the *Pallium* or archiepiscopal ornament sent from Rome to metropolitans. — See its figure in *Tab. Herald. Fig. 32*. — Which is blazoned thus: He beareth Gules, a *Cross Pall* Argent.

**PALLA**, among the old Romans, a mantle which women wore over the gown called *Stola*. See **STOLA**.

It was born in the left shoulder, whence passing to the other side, under the right arm, the two ends were bound under the left arm, leaving the breast and arm quite bare.

It made abundance of plaits or wrinkles; whence, according to Varro, it had its name, *viz.* from *παλλω*, *vibro*, I shake, tremble. Among the Gauls there was also a kind of *Palla* worn by the men, called *Gallica Palla*.

**PALLADIUM**, in antiquity, a statue of the goddess *Pallas*, preserved in Troy; whereon the fate of that city depended.

The tradition is, that in building a citadel, in honour of *Pallas*, and a temple in the most elevated part thereof; the *Palladium* dropped from heaven, and marked out the Place which the goddess was pleased to possess. — After this, Apollo gave an oracle, importing, that Troy should never be taken while the *Palladium* was found within its walls: which occasioned *Dionede* and *Ulysses* to undertake the stealing thereof. 'Tis said, there was anciently a statue of *Pallas* preserved at Rome, in the Temple of *Vesta*: which some pretended to be the true *Palladium* of Troy, brought into Italy by *Aeneas*: it was kept among the sacred things of the temple, only known to the priests and vestals.

This statue was esteemed the destiny of Rome; and there were several others made perfectly like it, to secure it from being stolen. See **ANCYLE**.

There was also a *Palladium* in the citadel of Athens, placed there by *Nicias*.

These *Palladiums*, in all probability, were no other than a kind of *Talismans*. See **TALISMAN**.

**PALLET**, among painters, a little oval table, or piece of wood, or ivory, very thin and smooth; on and around which the painters place the several colours they have occasion for, ready for the pencil. See COLOUR.

The middle serves to mix the colours on, and to make the tints required in the work. It has no handle, but in lieu thereof, a hole at one end, to put the thumb through to hold it.

**PALLET**, among potters, crucible-makers, &c. is a wooden instrument, almost the only one they use, for forming, beating, and rounding their works. See POTTER.

They have several kinds; the largest are oval, with a handle; others are round, or hollowed triangularly; others, in fine, in manner of large knives, serving to cut off what is superfluous on the moulds of their work.

**PALLET**, in gilding, is an instrument made of a squirrel's tail; used to take up the gold leaves from the pillow, to apply and extend them on the matter to be gilt. See GILDING.

**PALLET**, in heraldry, is the moiety or half of a pale; or a small pale, half the breadth of the usual one. See PALE.

The *Pallet* must never be charged with any thing either quick or dead; neither can it be divided into two equal parts: but it may be into four; for one fourth part of the *Pallet*, or  $\frac{3}{4}$  parts of the pale, is called an endorse. See ENDORSE.

If the pale be upon any beast, they say, the beast is *debruised* with the pale: but if the beast be upon the pale, they say he is *supported* by it. See DEBRUISED.

**PALLET** is also a part belonging to the balance of a watch or movement. See WATCH and MOVEMENT.

**PALLIATION**, the act of mitigating, soothing, or disguising a thing.

Hence, in medicine, *Palliatio* is used for the quieting and assuaging of pain, and providing against the severer symptoms of a disease, when nothing can be levelled directly against the cause. See PALLIATIVE.

**PALLIATIVE Indication**, is where the symptoms of a disease give too much trouble, and danger, to have their cure deferred till the disease, whereon they depend, is removed. See INDICATION.

Here, the symptoms, themselves, are to be cured, or mitigated a-part: and hence,

**PALLIATIVE Cure**, is the answering of a *Palliative* indication; or the removal, or mitigation of the symptoms of a disease; the cause of the disease still remaining. See CURE.

Boerhaave observes, that every mitigation of a symptom takes away somewhat from the disease itself; so that to cure all the symptoms together, is almost to cure the whole disease. See SYMPTOM.

The principal symptoms which call for such a cure, are thirst, pain, too much waking, and faintings. See each under its proper article, PAIN, THIRST, WATCHING, &c.

**PALLIER**, or **PAILLIER**, in building, a landing-place in a stair case; or a step, which, being broader than the rest, serves to rest upon. See STAIR-CASE.

The term is pure French, and not much used in English. In perrons, or large stair-cases, where there are sometimes several *Palliers* in the same range, or line, they ought to have at least the width of two steps. See PERRON.

Those in the turns of stair-cases ought to be as broad as long. Vitruvius calls the *Palliers* or landing-places of the theatres, *Diazomata*.

**PALLIFICATION**, in architecture, denotes the piling of the ground-work; or the strengthening it with piles, or timber driven into the ground: which is practised when they build upon a moist, or marshy soil. See FOUNDATION.

**PALLIO cooperire**. — It was an ancient custom, where children were born out of lawful wedlock, and their parents afterwards intermarried; that those children, together with the father and mother, should stand *Pallio cooperiti*, under a cloth spread over them, while the marriage was a solemnizing; which was a kind of adoption, and had the effect of a legitimation.

Thus Robert Grossthead, the famous bishop of Lincoln, in one of his letters says, — *In signum legitimatōis, nati ante matrimonium consueverunt poni sub pallio super parentes eorum extento, in matrimonii solemnizatione.*

Selden, in his notes on Fleta, adds, that the children of John of Gaunt duke of Lancaster, by Catherine Swinford, though legitimated by Act of Parliament, yet were *covered with the Pall* at the time of the marriage of their parents.

**PALLIUM** or **PALL**, a pontifical ornament worn by popes, patriarchs, primates, and metropolitans of the Romish church over their other garments, as a sign of their jurisdiction. See PONTIFICALIA, &c.

It is in form of a band, or fillet, three fingers broad, and encompasses the shoulder; whence by some authors it is called *Superhumerales*. It has pendants, or strings, about a palm long, both before and behind; with little laminæ of lead rounded at the extremes, and covered with black silk, with four red crosses.

The *Pallium* is made of white wool, shorn from off two lambs, which

which the nuns of St. Agnes offer every year, on the day of her feast, at the singeing of the mals, *Agnus Dei*.

The lambs are received by the two canons of the church of St. John de Lateran; who deliver them into the hands of the apostolical sub-deacons, to whom belongs the feeding and shearing of them in season, and who alone have the right of making these *Palliums*; which, when made, they lay over the bodies of St. Peter and St. Paul in the grand altar of their church, making prayers over them all night, according to the form prescribed for that purpose in the Roman Cereemonial.

Some, with Eusebius, will have the *Pallium* to have been introduced by pope Linus; adding, that as the Ephod was the mark of the pontifical Authority in the Jewish synagogue, so is the *Pallium* in the christian church. See EPHOD.

Others have observed, that there is no mention made hereof before the year 336.

Lastly, others will have it to have been first granted by Constantine the great, to pope Silvester; from whence it passed to the other patriarchs and archbishops.

The pope pretends to the sole right of conferring the *Pallium*; though some patriarchs have granted it to their suffragans, having first received it themselves from the Roman see.

Anciently, the pope used to send the *Pallium*, to certain of his diocesan bishops, on whom he laid a good part of his authority, and who were a kind of collaterals to him, as the *Patricii* were to the emperors.

The first, who received it in France, was Vigilius, archbishop of Arles, in order, as Pasquier observes, to give him the precedence over the other bishops.

Anciently, they went to Rome to seek the *Pallium* in person; afterwards, it was sent by the pope's legates. At last the custom was introduced of sending persons express to demand it, with this form, *Instante, Instantius, Instantissime*.

By the Romish canon laws, a metropolitan, till he have received the *Pallium*, cannot consecrate bishops, or churches, may not be called archbishop, &c. — Upon a translation he must have the *Pallium* afresh; and till then cannot hold a synod, nor perform any of his archiepiscopal functions.

The *Pallium* was anciently interred with the person.

The use of the *Pallium* is restrained to certain seasons and occasions; none but the pope having the right of wearing it always, and in all places.

The pope sometimes sends it to bishops on his own accord; and has sometimes given the right thereof to particular churches. Among the Greeks all the bishops wear the *Pallium*.

In ancient records, we find mention made of another *Pallium*, which was a long garment spread over with crosses. Tertullian says, it was a distinguishing garment of the christians; that of the heathens being called *Toga*.

**PALM**, **PALMUS**, an ancient long measure, taken from the extent of the hand. See MEASURE.

The Roman *Palmus* was of two kinds: the *great Palm*, taken from the length of the hand, answered to our span, and contained 12 fingers, digits, or fingers breadths, or 9 Roman inches, equal to about 8 English inches  $\frac{1}{2}$ . See DIGIT and SPAN.

The *small Palm*, taken from the breadth of the hand, contained 4 digits or fingers, equal to about two English inches, 9 tenths.

The Greek *Palm* or *Doron*, was of two kinds. The small contained four fingers, equal to 2 inches  $\frac{3}{4}$ . The great contained 9 fingers. — The double Greek *Palm*, called *Dichas*, contained in proportion.

The modern *Palm* is different in different places where it obtains. — At Rome it contains 7 inches  $\frac{1}{2}$ : At Naples, according to Riccioli, 8 inches: at Genoa, according to M. Petit, 8 inches  $\frac{1}{4}$ : at Morocco and Fez, 7 inches  $\frac{1}{2}$ : in Languedoc and some other parts of France, the *Palm* is 8 inches  $\frac{1}{4}$ . — The English *Palm* is 3 inches.

At Leghorn there are two kinds of *Palms*, the one for Soolens, the other for silks: the first one third shorter than the latter.

**PALM**, **PALMA**, in anatomy, denotes the inside of the hand; called also *Vola* and *Metacarpion*. See HAND, and METACARPUS.

**PALMARIS**, in anatomy, a muscle serving to contract the palm of the hand in grasping. — See Tab. Anat. (Myol) Fig. 2. n. 25. It arises from the internal protuberance of the humerus, and by a long and slender tendon, passes above the annular ligament to the palm of the hand; where it expands itself into a large aponeurosis, which cleaves close to the skin above, and to the sides of the metacarpus below, and to the first phalanx of the fingers; by which means it makes four cases for the tendons of the fingers to pass through.

The muscle is sometimes wanting, but the aponeurosis is always there.

**PALMARIS brevis** or **quadratus**, a muscle that lies under the aponeurosis of the first. It arises from the bone of the metacarpus that sustains the little finger, and from that bone of the carpus which lies above the rest. It goes transversely, and is inserted into the eighth bone of the carpus.

It

# P A L

It serves to draw the palm of the hand into a concave figure.

**PALMER**, in our ancient writers, is used for a pilgrim, and sometimes for a croisé, on account of a staff made of the palm-tree which they ever afterwards bore as a badge of their devotion. See **PILGRIM**, **CROISE**, **CROISADE**, &c.

**PALMISTRY**, a kind of divination, performed by inspecting the lines and marks of the hands and fingers: called also *chiromancy*. See **CHIROMANCY**.

**PALMS**, among botanists, white buds, shooting out of willows, or fallows, before the leaf; of the expansions whereof, the leaves themselves are formed. See **BUD** and **GERMINATION**.

**PALM-SUNDAY**, *Dominica PALMARUM*, the Sunday next before Easter-Sunday; or the last Sunday in Lent. See **LENT**.

It has been thus called from the primitive days, on account of a pious ceremony then in use, of bearing *Palms* in memory of the triumphant entry of Jesus Christ into Jerusalem, eight days before the feast of the passover, described by St. Matthew, Chap. XXI. St. Mark, Chap. XI. St. Luke, Chap. XIX.

The ancients had other names for this day. For 1°. they called it *Dominica Competentium*, i. e. Sunday of the Competentes; because on that day the catechumens came to ask the bishop leave to be admitted to baptism, which was conferred the Sunday following. See **BAPTISM** and **CATECHUMEN**. They had also, then, given them the symbol or credo to get off by heart, to be repeated to the bishop in the ceremony of Baptism. See **SYMBOL**.

2°. They called it *Capituluvium*, the Sunday of washing the head; by reason those, who were to be baptized the following Sunday, were prepared by washing their heads on this day.

Some time afterwards they called it *Indulgence Sunday*; by reason the emperors and patriarchs used to distribute gifts on that day. See **INDULGENCE**.

**PALMULARII**, more properly called **PARMULARII**, in antiquity, a sort of gladiators, who fought, armed with a sort of little buckler, called *parma*. See **GLADIATOR** and **PARMA**.

**PALPABLE**, something that may be perceived by the senses, especially the sense of feeling. See **SENSE**.

Hence, *impalpable-powder*. See **IMPALPABLE** and **POWDER**.

**PALPEBRÆ**, in anatomy, the eye-lids; or those external moveable covers which serve to screen and defend the eyes. See **EYE**.

They consist of a thin muscular membrane, covered without-side with a strong, yet flexible skin; and lined within-side with a production, as some think, of the pericranium. Their edges are fortified with a soft cartilage, by means whereof, they are enabled to close the better.

Out of these cartilages grow a palisade of stiff hairs called *Cilia*; of great use to warn the eye of the approach of danger, either in sleeping or waking; to keep off moths, flies, &c. in the air, and break the too fierce impression of the rays of light. See **CILIA**.

These hairs, it is observed, only grow to a certain convenient length, and never need cutting, as most others do; add to this, that their points stand out of the way; those of the upper eyelid being bent upwards, as those of the lower downwards; so nice was nature in such small matters.

At the commissure, or joining of the upper and under eye-lids are formed two angles called *Canthi*. See **CANTHUS**.

In the inner of these is a gland called *Glandula Lachrymalis*, from which proceed two or three ducts, which, opening on the inner surface of the eye-lid, serve to moisten the ball of the eye, and keep its membranes from growing harsh and dry. See *Glandula LACHRYMALIS*.

Near the other angle, is a gland called *Innominata*; which helping by several branches to irrigate the eye, the over-plus is carried to the greater angle, and transmitted to the nose through the puncta lachrymalia. See **LACHRYMALIA PUNCTA**. By these glands it is, that the humour, called tears, is secreted. See **TEARS**.

The eye-lids are both moveable; especially the upper, which has two muscles to raise and depress it, called *Attollens*, and *Deprimens* or *Orbicularis*. See **ATTOLLENS**, **ORBICULARIS**, &c. In quadrupeds the lower *Palpebra* is moveable, and the smaller; in birds, on the contrary, the lower is immoveable, and the greater. See **BIRD**, &c.

Animals that have hard eyes, as lobsters, and the generality of fishes have no *Palpebræ*; as being sufficiently secured without.

In the generality of brutes is a kind of third eye-lid, which is drawn like a curtain, to wipe off the humidity which might incommode the eyes; it is called the *Nictitating Membrane*. See **NICTITATING**.

The monkey is almost the only one that wants it; as being furnished like man, with hands to wipe the eye on occasion.

**PALPITATION**, **PALPITATIO**, in medicine, a preternatural beating, or pulsation of any of the solid parts of the body, especially the heart. See **PULSE**, &c.

The *Palpitation* of the heart, is an irregularity in the motions

# P A L

of that viscus, whereby it is driven with violence towards the ribs, in its contraction, attended with a great feebleness of pulse. See **HEART**.

There are several degrees of *Palpitation*: sometimes it is great, sometimes moderate, sometimes small; it is sometimes so impetuous, as to be heard and seen by the by-standers.

The trepidation or trembling of the heart, differs from the *Palpitation*, or panting. In the former the pulsations are faint, slow and faltering; in the latter, the shakes are immoderate, violent, and convulsive. See **TREPIDATION**.

The cause of the *Palpitation*, according to Boerhaave, is usually an inordinate and violent influx of the vital spirits into the villi of the heart; as in violent passions, sudden fear, hysteric affections, violent and sudden motions. Sometimes it is owing to an irritation of the fibres of the heart, occasioned by some sharp stimulus; as an inflammation of the heart or pericardium, or some other disorder thereof from a stone, worms, hairs, an aneurysma, &c.

Sometimes it arises from a thick, copious, polypous blood: and sometimes from the arteries, being become cartilaginous or bony: or their extremities obstructed therewith.

In the dictionary de Trevoux, an author, himself afflicted with this disease, makes a particular disquisition into its nature, and cause.

Anatomy, he observes, shews us a great number of occasional causes of this disease: but physicians are still at a loss to determine the efficient cause.

The moderns, with better reason than the ancients, seek for it in the blood of the pulmonary artery, which is supposed to rebound impetuously towards the right ventricle of the heart; by being prevented from pursuing its course towards the other vessels of the lungs, stopped by some obstruction, or compressed from various causes.

In opening the carcasses of people dead of this disease, or subject to it while living, worms or polypus's having been found in the pericardium.

In some the heart is extraordinarily big, and the pulmonary artery dilated to double, or quadruple its ordinary capacity, with obstructions of the pulmonary vein, consisting of cartilaginous matters which cram its cavity so close, that, as Biancard tells us, in his anatomy, it is sometimes difficult even to get a pin in. From these observations, some have concluded, that the capillary, &c. vessels of the lungs, opposing an impassable dike to the course of the thickest part of the blood, driven thither by the contraction of the heart, so as only a small quantity can find a passage through them; the rest must make an effort against their sides, and oblige them to give way, and stretch them out, in proportion to the quantity of blood impelled against them by the contraction of the heart.

But because the pulmonary artery cannot stretch wide enough to receive all the blood of the right ventricle driven thither at a contraction; and since the blood, by reason of obstructions, cannot continue its progressive motion, in proportion to the velocity wherewith it is impelled, by the contraction of the heart; the heart at each contraction fails to express into the pulmonary artery, all the blood it contained in its right ventricle.

Thus that part of the blood which remains, receiving the whole shock impressed by the contraction, returns it again to the heart by reflection, striking impetuously against its sides, and making it bound and shoot toward the ribs.

The same consequences will arise from obstructions of the aorta, preventing the entire evacuation of the left ventricle; and generally, from all obstructions or compressions of the vessels, as polypus's, abscesses, and dropsies in the parts near the heart. As to worms, their biting, and gnawing the fibrous parts of the heart, must occasion violent refluxes of spirits towards the brain, followed with a copious effusion of other spirits into the nerves of the lungs, by the consent of parts. And by such means violent and convulsive contractions will be occasioned throughout the whole texture of the lungs, which opposing the free passage of the blood may occasion a *Palpitation* of the heart.

The same disease may arise from a compression of the lungs, occasioned by the extraordinary rarefaction of vicious and fermentative juices, sojourning in the stomach and intestines; which dilate those parts to that degree, that the diaphragm and lungs, being extremely straightened, the blood cannot circulate without abundance of difficulty; a *Palpitation* therefore must ensue; which will last as long as that rarefaction in the first passages.

Such, according to modern physicians, are the immediate causes of the *Palpitation* of the heart: the remote or occasional causes are whatever may occasion such obstruction of the pulmonary artery, &c.

In the same work, another physician lays down winds or flatus's, as a cause of the *Palpitation*; he adds, that the ancients, to a man, looked on that as the most ordinary occasion thereof: In effect, says he, from this source may be deduced a multitude of causes of sympathetic *Palpitation*, by means of the ventricle, the diaphragm, mediastinum, &c.

Others will have the sole cause of *Palpitation* to be a viscid blood;

blood; which, by its extraordinary rarefaction, dilating the pulmonary artery, and, by that means, opening the cavity of its capillary vessels towards their extremities; or by this dilatation compressing the other little vessels of the lungs, prevents the blood from continuing its circulating motion with freedom, and thus occasions a *Palpitation* of the heart.

All these authors hold the *Palpitation* a dangerous disease, and Galen observes that those troubled with it, when young, never live to grow old.

According to M. Pison, a doctor of the faculty of Paris, the *Palpitation* of the heart may arise, either from a too abundant serosity, swelling the proper membrane of the heart; as Galen found to be the case in opening a monkey; or from too great a quantity of water contained in the pericardium; by which means, the heart being straightened, and disabled from moving with its usual freedom, is obliged to make several jerks or half beats, instead of the regular motions it had before; or, again, from a serosity thrown into the ventricles of the heart, either from the grand vessels which furnish the blood, or from the lungs, or from the brain.

Of these three causes, the most ordinary seems to be the too great extension of the pericardium, by water, as it is found to be in the bodies of most of those opened after this disease. See PERICARDIUM.

The different causes have their different symptoms. The boiling serosity, thrown out of the blood-vessels into the heart, shews itself by sudden beatings of the temples, whizzings in the ear, dim sight, wandering pains in various parts of the body.

In that produced by the abundance of water in the pericardium, or from the humour swelling the proper membrane of the heart, the heart seems as if suffocated in water, the pulse weak, the *Palpitation* continual, or nearly so, together with a feverishness, and a difficulty of breathing. To which may be added, that the disease comes by little and little.

The *Palpitation* arising from the serosity is cured by bleeding, the other by purging.

**PALSGRAVE**, a term used among the Germans, of the same import with *palatine*. See PALATINE.

It is compounded of the Latin, *palatium*, and the Dutch, *grave*, governor, *q. d.* governor, or superintendant of a prince's palace. See GRAVE.

**PALSY**, PARALYSIS, in medicine, a disease, wherein the body, or some of its parts, lose their motion, and sometimes their sensation, or feeling.

The causes of the *Palsy* are an impeded influx of the nervous spirits into the villi of the muscles; or of the arterious blood into their vessels; which may happen from some fault, either in the brain, the nerves, muscles or their vessels.

The *Palsy* is said to be *perfect* or compleat, when there is a privation of motion, and sensation at the same time.

*Imperfect*, when one of the two is destroyed, the other remaining.

The *Palsy* again, is either *universal*, *lateral*, or *partial*.

**Universal Palsy**, called also *Paraplegia* or *Paraplexia*, is a general immobility of all the muscles that receive nerves from the cerebrum or cerebellum, except those of the head.—Its cause is usually supposed to reside in the ventricles of the brain, or in the root of the spinal marrow.

Etmuller makes this a different disease from the *paralysis*, which he supposes to consist in a relaxation of the ligaments and membranes serving for motion; but the *paraplegia* in a meer obstruction of the nerves.

The *paraplegia* is seldom a primary disease, usually a secondary one, attending or following an apoplexy, scorbutus, carus, or arthritis. See PARAPLEGIA.

**Lateral Palsy**, called also *Hemiplegia*, is the same disease with the *paraplegia*; only that it affects but one side of the body.—Its cause is the same, only restrained to one side of the brain, or spinal marrow.

**Partial Palsy**, is where some particular part, or member alone is affected; *e. gr.* where the motion of the arm or leg is destroyed.

Dr. Quincy observes, that a *Palsy* where motion is destroyed, sensation remaining, may be produced: first, by too much humidity, stretching the muscular fibres in length. Secondly, from cold things, which thicken the juices. Thirdly, from external compression. Fourthly, from hot things, which straighten the supple membranes and vessels.—All these causes affect either the blood, or muscles; the former by thickening that humour so that it cannot suddenly rarify; and the latter, by relaxing the muscles into too great a length by too much moisture, or contracting them into too narrow dimensions by too much heat. But the sensation may yet be preserved, because, notwithstanding all these hindrances, the animal spirits and nerves may not be at all affected.

The causes of the *Palsy* where sensation is destroyed, motion remaining, he observes, may be all those things which so far thicken the animal spirits in the nerves, arising below the cerebellum, that though indeed they may flow into the muscles through the nerves, and there, by the occurrence of some

liquor secreted from the blood, rarify; yet they cannot alone flow in such quantities into the nerves, as from a very slight cause to be made to undulate; whence sensation will cease without losing the motion of the part.

The causes of this kind are also whatsoever render those nerves more lax and moist, and so less apt for lively vibrations; the animal spirits flowing in the mean time into the muscles, from whence motion is performed without sensation.

The cure of the *Palsy*, according to Waldschmidt, does not differ much from that of the venereal disease. Internally, mercurials, sudorifics, and decoctions of the woods are good: externally, unctions, particularly of spirituous and penetrating things, not on the part affected, but on the spina dorsa.

**PALUDAMENTUM**, in antiquity, *Chlamys*; a garment wore by the Romans in time of war; being the coat of arms of their principal men, especially the general; who, for that reason, were distinguished by the appellation *paludati*. See CHLAMYS.

The soldiers, having only short coats, were therefore named *sagati*. See SAGUM.

This garment was open on the sides, with short sleeves, by some resembled to angels wings; and came down no lower than the navel.

It was either white or red: Valerius Maximus remarks it was an ill omen to Crassus, that they gave him a black *Paludamentum*: *Pullum ei traditum est Paludamentum, cum in praelium euntibus album aut purpureum dari soleret.*

Cornutus says, the Romans wore the Toga in peace, and the *Paludamentum* in war.—And hence, *Togam Paludamento mutavit.*

**PALY**, or **PALE**, in heraldry.—When an escutcheon is divided into six, eight, or ten divisions pale-wise, *i. e.* by perpendicular lines drawn from the top to the bottom: it is blazoned *Paly* of six, eight, or ten, &c. pieces. See PALE.

If the number be odd, then the field is first named, and the number of the pales specified. See PALE and BEND.

The like is to be understood also of barry and bendy. See BARRY, &c.

**PALY-BENDY** is, when a coat is divided, both pale and bend-wise: In *Paly-Bendy*, the field is divided by perpendicular lines, which is called *Paly*, and then again by diagonals crossing the former from the dexter side to the sinister, which is the *Bendy*. See Tab. Herald. Fig. 30. The field is *Paly-Bendy*, topaz and diamond.

**PAMPINIFORME Corpus**, in anatomy, a sort of plexus, or knot of blood-vessels, formed by the spermatic veins; which, in their progress through the testes, constitute a body, called *Corpus Varicosum Pampiniforme*, or *Pyramidale*. See PYRAMIDALE Corpus. See also TESTICLE, SPERMATIC Vein, &c.

**PANACEA**\*, *Πανακεια*, an universal medicine; or a remedy for all diseases. See ELIXIR, &c.

\* The word is formed from the Greek *παν* all, *ακρον*, I cure.

The accurate Boerhaave overturns the notion of *Panacea's*; and shews, from the different causes, natures, effects, seats, &c. of diseases, that several may be cured by one medicine; but all, by none. See MEDICINE, &c.

He observes, that the most universal remedies known, are water, fire, mercury and opium; and adds, that by these alone, cautiously disguised, some have required the reputation of universal physicians. See MERCURY, OPIUM, &c.

**PANACEA**, **PANACES**, or **PANAX**, *All-beal*, is also applied to several plants, by reason of the extraordinary virtues ascribed to them.

There are three of these *Panacea's* peculiarly famed among the ancients: the *heraclea*, *asclepian*, and *chironian*; so called from their inventors, Hercules, Asclepias, and Chiron.

The first is the *Panax Heraclea vera ficulneo folio*, in English *true All-beal of Hercules*.—From the root and stem of this is drawn, by incision, the gum opopanax. See OPOPANAX.

The *asclepian*, according to some botanists, is a kind of ferula, which Gaf. Bauhin. calls *Libanotis Ferula folio & semine*.

The *chironian*, according to some is a kind of helianthemum: according to Bradley, it is Doria's woundwort.

**PANADA**\*, **PANATA**, or **PANATELLA**, a diet consisting of bread boiled in water, to the consistence of a pulp; given to sick persons whose digestion is weak, or to whom stronger foods would be improper. See DIET.

\* The word is formed from the name of the principal ingredient, *panis*, bread.

It is sometimes made thin; to serve as a drink; and sometimes likewise sweetened, &c. to render it more palatable.

**PANAGE** or **PANNAGE** in our ancient customs. See PANAGE.

**PANARIS**\*, **PANARITIUM**, or **PARONYCHIA**, in medicine, a painful tumor, or inflammation, arising on the extremities of the fingers or toes; popularly called among us *Whitloe*.

\* The word is Latin *Panaritium*, which we find in Apuleius, formed apparently from the Greek *παρονυχια*, *q. d.* an abscess at the root of the nails, of *παρ* juxta and *ονυχ* unguis.

It is occasioned by a sharp or saline humour, lodged between the bone and periosteum, and the nerves and tendons.

An infallible remedy for it, is to open it either with the point of a lancet, or with some unguent, and then to dip the finger in a lixivium of vine ashes.

Beside the mild kind, called *Whitloc*, there is also a malignant kind, called a *Fellon*.

The *Panaris* is exceedingly restless. It sometimes tends to an imposthume, but more usually gangrenes.

For the *Panaris*, after bleeding, and the universal remedies, Dr. Burnet orders the patient to hold his finger a good while in rotten egg, or a putrified mouse. Helmont tells us, he has seen a finger as big as an arm by means of a *Panaris*, cured by rubbing it with blood, then wrapping it up in a mole-skin.

Riverius adds, that to hold the finger affected in a cat's ear, cures a *Panaris* in two hours. Observat. 63. Cent. 4.

PANATA, or PANATELIA. See the article PANADA.

PANATHENÆA, Παναθηναία, in antiquity, a feast celebrated at Athens, in honour of Minerva, whom the Greeks called *Athena*.

Harpocration and Suidas, refers its institution to Erichthonius IV. king of Athens, who lived before Theseus. Theodoret, alone, says the feast was established by Orpheus.

Be this as it will, till Theseus, this was a particular feast of the city of Athens, and was called simply *Athenæa*: but that prince uniting all the people of Attica into one republic, they all assented to the feast; whence the name *Panathenæa*, i.e. feast of all Attica.

In effect all Attica was present; and each people sent a bullock for the sacrifices, and for the entertainment of the vast multitude of people assembled.

If they eat a great deal, it appears they did not drink less; witness the vessels they drunk out of, which were called *Panathenæica*, each of which held two congius's and a half. See CONGIUS.

There were two kinds of *Panathenæa*; the great celebrated every five years; and the little, every year, or every three years; if we may credit the author of the argument of Demosthenes's oration against Midias.

In the *Panathenæa* was held one of the processions which the ancients called *Pompæ*, composed of the briskest old men, each whereof bore, in his hand, an olive-branch; whence they were called *Thalophori*.

This was to do honour to Minerva, in quality of inventress of the olive-tree; on which account they had likewise combats, wherein the victors were rewarded with vessels of oil, and crowned with olive-crowns. It was a crime in any of the spectators to be clad in black.

The ceremonies were the same in the great, and the little *Panathenæa*; excepting a banner wherein the actions of the goddess were represented in embroidery performed by maids, with the names of those who had distinguished themselves in the service of the republic; which was only bore at the greater.

PANCARPUS\*, in antiquity, a sort of spectacle, or shew which the Roman emperors frequently exhibited to the people. See SPECTACLE.

\* The word is formed from the Greek, παν all, and καρπος, fruit.—Whence the name was also given by the Athenians to a sacrifice, wherein all kinds of fruits were offered.

The *Pancarpus* was a kind of chace, or hunt: for the performance hereof, a number of beasts, as hares, deer, bullocks, &c. were shut up in the circus or amphitheatre; into which trees were frequently transplanted, so as to form a kind of forest, wherein the beasts were let loose; whence the *Pancarpus* was also called *Sylva*. See CIRCUS and AMPHITHEATRE. The beasts were thus abandoned to the people, i.e. to all who were disposed to share in the pleasure of the chace; who pursued, shot, killed and cut in pieces all they could lay hold of. Heliogabalus, the Gordians and Probus, gave this diversion very frequently.

Casaubon, Cujas, Pithou, &c. make the *Pancarpus* and *Sylva* the same thing; Salmasius will have them different. The *Sylva*, according to him, was a diversion, as that above described; but the *Pancarpus* a combat, wherein robust people, hired for that purpose, fought with wild beasts; which opinion he confirms from Cassian, Justinian, Claudian, Firmicus, Manilius and Cassiodorus.

PANCHREAS. See the article PANCREAS.

PANCHREATIC. See PANCREATIC Juice.

PANCHREST\*, PANCHRESTOS, in medicine, a panacea, or remedy for all distempers. See PANACEA.

\* The word is Greek Πανχρεστος, formed of παν, all, and χρεστος, utilis, useful.

PANCHYMAGOGUE\*, PANCHYMAGOGUM, in pharmacy, an extract of aloes, rhubarb, senna, scammony, jalap, agaric, colocintida, and black hellebore. See EXTRACT.

\* The word is formed from the Greek παν, all, χυμος succus, juice, and αγω ducere, to draw off.

Its name arises hence, that being a composition of all the kinds of purgatives, it has the virtue of purging all the sorts of humours of the body at once. See PURGATIVE.

VOL. II.

PANCRATIUM\*, Πανκράτιον, among the ancients, a kind of intermixed exercise, consisting of the lucta or wrestling, and boxing or pugilate.

\* The word is compounded of παν, all, and κρην, I overcome.

The *Pancratium* was the third gymnastic exercise, and was not introduced till long after the former. See GYMNASITICE.

The people, who engaged in these exercises, were called *Pancratiastæ*; which name was also given to such as did not confine themselves to one exercise, but succeeded in several different ones.

PANCREAS\*, Πανκρεας, in anatomy, popularly called *Sweetbread*, a huge conglomerate gland; or a body composed of an infinite number of little glands, tied up in the same common membrane; situate at the bottom and hind-part of the stomach, and reaching from the duodenum to the spleen.—See Tab. Anat. (Splanchn.) Fig. 1. lit. f. see also GLAND, STOMACH, &c.

\* The word is formed of the Greek παν, all, and κρεας, caro, flesh.

The glands it consists of are bound together both by the vessel and by a membrane proper to each of them; and all together are loosely clothed with a thin membrane, from the peritonæum.

Its colour is carnation; its form like that of a dog's tongue, 8 or 9 fingers long, 2½ broad, and one thick; its weight 4 or 5 ounces.—Its arteries come from the cœliac; its veins go to the porta; its nerves come from the hepatic plexus.

Each little gland has an excretory duct, which uniting form one common excretory duct, called *Ductus Pancreaticus Virsungii*, from Virsungus, professor of anatomy at Padua, the discoverer thereof. See DUCT.

This duct, running along the middle of the *Pancreas*, opens into the cavity of the duodenum, generally by two mouths, the one four or five fingers below the pylorus, sometimes at the same orifice with the ductus choledochus; the other lower. It is of the bigness of a raven's quill, near the intestines, but less, further off. De Graaf observes, that it is frequently double.

The *Pancreas* serves to separate a peculiar humour from the blood, called the *Pancreatic Juice*. See PANCREATIC JUICE.

PANCREAS *Asellii*, in comparative anatomy, is a large gland in the middle of the mesentery of some brutes, especially dogs; to which, most of the lacteals resort; and whence the chyle is conveyed, by large vessels, that have their rise immediately from the intestines, and called *Lactea secundi Generis*. See MESENTRY.

It has its name from the author who first took notice of it, Asellius. See LACTEAL.—M. Perrault observes, that the fish, called *Place*, has 440 *Pancreas's*; though it has but five ducts opening into the intestines, each of which correspond to 80 *Pancreas's*, and 2 of them to 100 a-piece.

PANCREATIC Juice, an insipid, limpid juice, or humour separated from the blood, and prepared in the *Pancreas*. See PANCREAS.

This juice is not acid, as most authors have supposed; nor alkaline, as some others; but a little saline, and much resembling the saliva in its origin, vessels, and properties.

It is carried by the *Pancreatic* duct into the duodenum, where it serves to dilute the chyle, to render it more fluid and fit to enter the mouths of the lacteals; and perhaps to temper and dilute the bile, to change its viscosity, bitterness, colour, &c. and make it mix with the chyle, in order to reduce the several tastes, odours, and properties of the several foods into one homogeneous one. See BILE, CHYLE, and CHYLIFICATION.

Jansson ab Almelooven will have the *Pancreatic Juice* to have been known to Hippocrates and Galen.—De Graaf, a Dutch physician, has found means of collecting a quantity of it for experiments; and has published a treatise express, *de Succo Pancreatico*.

Brunner relates, that the *Pancreatic* duct, in several dogs having been tried, and cut, they still continued to eat, and drink, and perform all the other functions of life as usual. One of them seemed only to have the better stomach for it. See DUCT.

PANDECTS, PANDECTÆ, in jurisprudence, the digest, or collection made by Justinian's order, of 534 decisions, or judgments of the ancient lawyers, on so many questions occurring in the civil law; to which that emperor gave the force, and authority of law by the epistle prefixed to them. See DIGEST.

\* The word is Greek Πανδεκται, compounded of παν, all, and δεικναι capio, I take; q. d. a compilation, or a book containing all things.—Though others, as Bartoli, will have it formed from παν and δεικναι; as if these books contained the whole doctrine of the law.

The *Pandects*, consist of fifty books, and make the first part of the body of the civil law. See CIVIL LAW.

They were denoted by two π; but the copists taking those π for ff, the custom arose of quoting them by ff.

The *Florentine Pandects*, are those printed from a famous ancient manuscript at Florence.

Papias extends the denomination of *Pandects*, to the old and new testament.

There are also *PANDECTA Medicinæ*, *Pandects of Medicine*, a kind of dictionary of things relating to medicine, compiled by Mat. Sylvaticus of Mantua, who lived about the year 1297. Leunclavius has published *Pandects of Turkey*; and bishop Beveridge *Pandects of the canons*, *Pandecta Canonum*.

**PANDICULATION**, **PANDICULATIO**, in a general sense, is a violent and tense motion of the solids which usually accompanies the act of yawning; and is otherwise called *Stretching*. See **YAWNING**.

**PANDICULATION**, is also used in a peculiar sense for that restlessness, stretching, and uneasiness, which usually accompany the cold fit of an intermitting fever. See **INTERMITTING Fever**.

It is supposed to arise from a convulsive dilatation of the muscles, whereby nature endeavours to throw off something that disturbs her.

**PANDURA**, or **PANDORON\***, a musical instrument, used among the ancients; resembling the lute. See **LUTE**.

\* The word according to some, is formed from the Greek *παν*, and *δωρεν*, i. e. all-gift, all sorts of gifts. Iliodore derives the name from its inventor *Pandorus*; others from *Pan*, to whom they attribute its invention, as well as that of the flute.

It has the same number of strings; but they are of brass, and of consequence give a more agreeable sound than those of the lute. Its frets are of copper, like those of the cistre; its back flat like that of the guitarre; and the rims of its table, as well as its ribs, cut in semi-circles.

Du Cange observes, that Varro, Iliodore, and others of the ancients, mention it as having only three strings; whence it is sometimes also spoken of, under the denomination, *τρίχορδος*, *Trichordum*.

**PANEGYRIC\***, **PANEGYRIS**, or **PANEGYRICUS**, an oration in praise of some extraordinary person, or virtue. See **ORATION**.

\* The name is Greek *πανηγυρις*, formed of *παν*, all, and *αγορεω*, I assemble, because anciently held in public and solemn assemblies of the Greeks, either at their games, their feasts, fairs, or religious meetings.

The *Panegyric* is ranked among the demonstrative kind of orations. See **DEMONSTRATIVE**.

To make their *Panegyrics* the more solemn, they used to begin with the praises of the deity, in whose honour the games, &c. were celebrated; then they descended to the praise of the people or country where they were celebrated; then to the princes or magistrates who presided at them; and at length to the champions, especially the conquerors who had gained the prize.

F. de Colonia lays down two methods, or series's observed in *Panegyrics*.—The *Artificial*, where, without any regard to the order of time, every thing is reduced to certain heads. Thus, Tully refers the whole praise of Pompey to his skill in war, his virtue, authority, and felicity.

The other *Natural*, wherein the order and time of history are observed. This series he divides into three periods; the space before the person's birth, that wherein he lived, and if he be dead, that which followeth his death. This *natural* series requires much less art, genius, &c. than the other.

The places, or sources of *Panegyric* are chiefly the family, country, auguries at his birth, his virtues, the talents of his body and mind, honours, riches, manner of his death, and the consequences thereof.

**PANEGYRIC**, *πανηγυρις*, is also the name of a church-book, in use among the Greeks; so called, as consisting of *Panegyrics*, or discourses in praise of Jesus Christ, and the saints. It is found in MS. in most churches; but is not the same in all; each church having its particular saints; and the compilers of this kind of books, usually suiting their collections to the taste of their own devotion.

They are disposed according to the order of months, and frequently consist of twelve volumes, answering to the twelve months of the year.

**PANEL**, **PANELLA**, **PANELLUM**, in law, is derived by Spelman from *Pagella*, a schedule, or page: in which sense we say, a *Panel* of parchment, a *Counter-pane* of an indenture, &c.

**PANEL** or **PANNEL**, is more commonly used for a schedule or roll, containing the names of such Jurors, as the sheriff returns to pass upon any trial. See **JURY**.

Hence, the empanelling of a jury, is the entering of their names, by the sheriff, into a *Panel*, or little schedule of parchment; called also the *Panel of assise*, *Panellum assise*. See **ASSISE**.

Coke on Littleton, will have *Panel* to be an English word, signifying a little part; as being a diminutive of the word *Pane*, part. But Spelman takes this for an over-sight.

**PANEL**, in joinery, &c. See **PANNEL**.

**PANES**, in the ancient theology. See **FAUNS** and **SATYR**.

**PANIC**, or **PANIC-FEAR**, a term used for a needless, or ill-grounded fright.

Polyænus fetches the origin of the phrase from *Pan*, one of the captains of Bacchus, who, with a few men, put a nume-

rous enemy to rout, by a noise which his soldiers raised in a rock valley, favoured with a great number of echo's. This stratagem making their number appear much greater than it really was, the enemy quitted a very commodious encampment, and fled.—Hence all ill-grounded fears have been called *Panics* or *Panic-fears*; and it was this gave occasion to the fable of the nymph echo's being beloved by that god.

Others derive the origin of the expression hence, that in the wars of the Titans against the gods, *Pan* was the first who struck terror into the hearts of the giants.—Theon on Aratus says, he did it by the means of a sea-shell which served him for a trumpet, whereof he was the inventor.

**PANICULA**, **PANICLE**, in botany, a soft, woolly beard, or string, whereon the seeds of some plants hang, pendulous: as, in reeds, miller, &c.

Such are hence called *Paniculated Plants*. See **PLANT**.

**PANIS** & *Cerevisiæ Assisa*. See **ASSISA**.

**PANIS** & *Cerevisiæ Emendatio*. See **EMENDATIO**.

**PANNAGE**, **PANAGE** or **PAWNAGE**, are used in our law-books &c. for the mast of woods; as of beech, acorns, &c. See **MAST**.

As also, for the running, and feeding of swine, or other cattel in forests.

And for the moniestaken by agistors for the same. See **AGISTOR**.

**PANNAGIUM liberum**, or *free PANNAGE*, was a liberty of free running of swine in certain forests or woods, granted by privilege to certain private persons, and several religious houses.

Lindwood defines *Pannagium*, by *pastus pecorum in nemoribus, & in silvis, utpote de glandibus & aliis fructibus arborum sylvestrium, quarum fructus aliter non solent colligi*.

It is also mentioned 20 Car. II. *Quisque villanus habens decem porcos, dat unum porcum de Pannagio*; by which it appears, that one hog in ten was given for *Pannage*.

**PANNEL**, in law. See the article **PANEL**.

**PANNEL**, or **PANEL**, in joinery, &c. a tympan, or square piece of wainscot, sometimes carved; framed or grooved in a larger piece, between two mounters or upright pieces, and two traverses or cross pieces. See **WAINSCOT**.

Hence also *Panels*, or panes of glass, are compartments or pieces of glass of various forms, square, hexagonal, &c.

**PANNEL** in masonry, denotes one of the faces of a hewn stone. See **STONE**.

**PANNELS** \* of a *Saddle*, are two cushions full of hair, or flocks, placed under the saddle, one on each side, next the horses back, to prevent the bow from hurting the horse. See **SADDLE**.

\* The word is formed from the French, *Panneau*, of *Pan*, flatide.

**PANNICULUS\***, in anatomy, a term frequently used for a membrane. See **MEMBRANE**.

\* The word is Latin, formed by diminution, from *Pannus*, cloth, q. d. a little cloth or fine web.

Hence, *Panniculus adiposus*, &c. is the same with *Membrana adiposa*, &c. See **ADIPOSA**, &c.

**PANNICULUS Carnosus**, is a fleshy membrane, which the ancient anatomists supposed to be common to the whole body; and to be the fourth integument or covering thereof, after the epidermis, cutis, and the adiposus. See **SKIN**.

This *fleshy Pannicle*, according to them, is a thick membrane, which covers the whole body; and even comes muscular in some parts: but the latest anatomists deny any such membrane in the human body; maintaining, that what the ancients called the *fleshy Pannicle*, is only the fatty or adipose one.—Dr. Drake makes it a double membrane, one half of which forms the *membrana adiposa*, the other half the *membrana communis* of the muscles.

The use the ancients ascribed to the *fleshy Pannicle* was to wrinkle and contract the skin; but the truth is, where-ever the skin wrinkles, there are particular muscles for the purpose, called *cutaneous muscles*.

These muscles the ancients owned; but said their office was confined to particular motions; adding, that there are places where no fat is found between the cutis and the *fleshy Pannicle*; which is false.

Further, even in animals which do move the skin, this *Pannicle* is no more than a cutaneous muscle, as well as the *dartos*. See **DARTOS**.

Some of the modern anatomists, however, admit the *fleshy Pannicle*, and deny the adipose one; supposing the latter, in reality only a part of the former. See **FAT** and **FLESH**.

**PANNIER**, in architecture. See **CORBEL**.

**PANNUS\***, a Latin word, signifying cloth, rag, &c.

\* The word is derived from *παννός*, a web.

**PANNUS**, (in medicine) a disease of the eye, popularly called the *Web*.

The *Pannus* is an excrescence arising on the adnata or conjunctiva; less hard and membranous than the unguis; and representing a web, or tissue of little veins swelled with blood. Its cause is an obstruction of the blood in the minute vessels of that tunic.

Its cure is much the same with that of the *Ophthalmia*.

A chief difference is, that in the *Unguis*, the membranous excrescence

excrecence only covers part of the eye, after the manner of a nail; whereas in the *Pannus* it covers the whole. See *UNGUIS*.

**PANTALOO** or **PANTALON**, the name of an ancient garment frequent among our forefathers, consisting of breeches and stockings all of a piece.

The denominations comes from the Venetians, who first introduced this habit, and who are called *Pantalon*, from St. *Pantaleon*, who was formerly their patron.

**PANTALOO**, on the theatre, is a buffoon or mask, who performs high and grotesque dances, and shews violent and extravagant postures, and airs.

The word is also used for the habit or dress these buffoons usually wear; which is made precisely to the form of their body, and all of a piece from head to foot.

Hence those who wear a habit of this kind, for conveniency, under their other cloaths, are called *Pantaloons* of Venice.

**PANTHEA**, *πανθεα*, among the ancients were single statues, composed of the figures, or symbols of several different divinities combined. See *STATUE*.

Father Joubert, who calls them *Panthea*, and who has observed them on several medals, says their heads are most commonly adorned with symbols or attributes belonging to several gods. See *ATTRIBUTE*.

An instance hereof we have in a medal of Antoninus Pius; which at the same time represents Serapis, by the bushel it bears; the Sun, by the crown of rays; Jupiter Ammon, by the ram's horns; Pluto, by the large beard; and Æsculapius, by the serpent twisted in his hand. See *GOD*.

M. Baudelot, in a dissertation on the Lares, will have the *Panthea* to have had their rise from the superstition of those, who taking several gods for the protectors of their houses, united them all in the same statue, by adorning it with the several symbols, proper to each of these deities. See *LARES*.

**PANTHEON** \*, *πανθειον*, in architecture, a temple, or church, of a circular form; dedicated to all the gods, or all the saints. See *TEMPLE* and *CHURCH*.

\* It is thus named from the Greek *παν*, all, and *θεος*, God.

The *Pantheon* of ancient Rome, is of all others the most celebrated, and that whence they all take their name. It was built by Agrippa, son-in-law of Augustus, in his third consulate, 25 years before Christ. It was dedicated by him to Jupiter ultor; Jupiter the revenger; and had the name *Pantheon*, by reason of the great number of statues of the Gods ranged in niches all round; and because built of a circular form, to represent heaven, the residence of the gods. It has but one door, and one window, receiving all its light from the top of its dome.

The pope obtaining this *Pantheon* of the emperor Phocas, converted it into a church, without any alteration in the building; and dedicated it to the virgin, and all the martyrs.—And it still subsists at Rome under the title of *Notre Dame della Rotonda*. See *ROTONDA*.

The *Pantheon* of Nîmes, was a temple in that city, wherein were 12 niches, or statues, supposed to have been destined for the 12 great gods. See *GOD*.

In the escorial, is a magnificent chapel, called *Pantheon*, 35 feet in diameter, and 38 high, from the pavement which is of marble and jasper inlaid. The whole inside of the chapel is of black marble, excepting the luthern and some ornaments of jasper and red marble.

In this chapel are deposited the bodies of the kings and queens: there are only places made for 26: eight of which are already filled. See *ESCURIAL*.

**PAPA**, in antiquity. See the article *POPE*.

**PAPAL Crown**, is a deep cap, or mitre of cloth of gold, encompassed with three coronets or circles of gold, adorned with flowers; and the whole enriched with precious stones; having a globe at top, finished with a cross. See *CROWN*.

**PAPER**, a thin flexible leaf, usually white, artificially prepared of some vegetable substance, chiefly to write upon, with ink. See *WRITING*, *INK*, &c.

\* The word is formed from the Greek *παπυρος*, *Papyrus*, the name of an Egyptian plant, called also *βιβλος*, *Biblus*, whereon the antients used to write.

Various are the materials, on which mankind in different ages and countries have contrived to write their sentiments; as on stones, bricks, the leaves of flowers, and trees, and their rinds or barks; also tables of wood, wax, and ivory; to which may be added plates of lead, linen rolls, &c. At length the Egyptian *Papyrus* was invented; then parchment, cotton *Paper*, and lastly the common or linen *Paper*.

<sup>a</sup> Vid. Maffei *Istor. Diplom.* l. 2. § 3 — 10 *Bibl. Ital.* T. 2. p. 242. Leo Allat. *Antiq. Hetrusc.* p. 127. seq. Hug. de Scrib. *Origin.* Alex. ab Alexand. l. 2. c. 30. Barthol. *Diff. 4. de Libr. Legend.* p. 90, seq.

In some places and ages they have even written on the skins of fishes; in others, on the intestines of serpents; and in others, on the backs of tortoises—Not to mention what Epiphanius relates, that Moses received the law written on tables of sapphire; nor what the Cabbalists dream, that the same was written on a globe of fire; nor lastly, those military testaments

spoken of by civilians, which were written in the dust or sand.

<sup>b</sup> Vid. Mabill. *de Re diplomat.* l. 1. c. 8. Fabric *Bibl. Ant.* c. 21. § 9. p. 610. seq. Raimm. *Idea System. Antiq. Liter.* p. 309. See also the articles, *BOOK*, *PARCHMENT*, &c.

There are few sorts of plants but have been used for *Paper*, and books: and hence the several terms, *biblos*, *codex*, *liber*, *folium*, *tabula*, *tillura*, *philura*, *scheda*, &c. which express the several parts on which they were written: and though in Europe all these disappeared upon the Introduction of *Papyrus* and parchment, yet in some other countries the use of divers of them obtain to this day.—In Ceylon, for instance, they write on the leaves of the Talipot. The Bramin MSS. in the Tulinga language, sent to Oxford from Fort St. George, are written on leaves of the Ampana or Palma Malabarica<sup>b</sup>: Hermannus gives an account of a monstrous palm tree called, *Codda pana*, or *Palma Montana Malabarica*, which about the 35<sup>th</sup> year of its age, rises to be 60 or 70 foot high, with plicated leaves nearly round, 20 foot broad; wherewith they commonly cover their houses; and on which they also write; part of one leaf sufficing to make a moderate book. They write between the folds, making the characters through the outer cuticle.

In the Maldivce Islands, the natives are said to write on the leaves of a tree called *Macaragueus*, which are a fathom and a half long and a foot broad. And in divers parts of the East Indies, the leaves of the Musa Arbor or Plantain Tree dried in the sun, served the same use, till of late that the French have taught them the use of European *Paper*.—Ray, in his fine, enumerates divers kinds of Indian and American trees which bear *Paper*; particularly one called *Xagua*, which has something in it extraordinary; its leaves are so large, and of so close a texture, that they cover a man from top to toe, and shelter him from the rain, and other inconveniencies of the air like a cloak; from the innermost substance of which leaves, a *Paper* is taken; being a white and fine membrane like the skin of an egg, as large as a skin of our vellum or parchment, and nothing inferior for beauty and goodness to the best of our *Papers*.

<sup>d</sup> Vid. Savar. *D. de Comm.* T. 2. p. 967.

<sup>e</sup> Vid. Ray *Hist.*

*Plantar.* T. 2. l. 32. *Nouv. Rep. Let.* T. 12. p. 361.

*Paper* is chiefly made among us of linen or hempen rags, beaten to a pulp in water, and moulded into square sheets, of the thickness required.—But it may also be made of nettles, hay, turnips, parsnips, colewort-leaves, earth-flax, or any thing that is fibrous; nay it may be made of white woollen rags; though this would not serve for writing, because of the hairiness.—The Chinese *Paper* is so fine, that many of the Europeans have thought it was made of silk; not considering, says du Halde, that silk cannot be beat into such a paste, as is necessary to make *Paper*: Though the same author afterwards speaks of a *Paper* or parchment made of the balls of silk worms; and the like we are assured by others is done at Cathay.

<sup>g</sup> *Descript. of*

*Chin.* p. 360, seq. <sup>h</sup> Vid. Busbeq. *Legat. Turc. Epist.* 4. p. 329.

**PAPER**, with regard to the manner of making it, and the materials employed therein, is reducible to divers kinds: *Egyptian*, *European* and *Chinese Paper*: we also find mention of *cotton Paper*, *bark Paper*, and *asbestine* or *incombustible Paper*.

**Egyptian PAPER**, is that which was principally used among the ancients: made of a rush called *Papyrus*, or *Biblus*, growing chiefly in Egypt about the banks of the Nile: though it was also found in India; and Gualandinus assures us, he saw in Chaldaea at the confluence of the Tygris and Euphrates, large fens, wherein with his own hands he plucked a *Papyrus* differing in nothing from that of the Nile. Strabo likewise speaks of a sort of *Papyrus* growing in Italy; but we do not find it was ever used for making *Paper*.

The description given by Pliny<sup>i</sup> of the *Papyrus*, or *Paper-rush*, is somewhat obscure. Its root, according to him, is of the thickness of a man's arm, and ten cubits long: from this arise a great number of triangular stalks 6 or 7 cubits high, each thick enough to be easily spanned. Its leaves are long like those of the bul-rush; its flowers stameneous, ranged in clusters at the extremities of the stalks; its roots woody and knotty like those of rushes, and its taste and smell near akin to those of the *Cyperus*.

<sup>i</sup> Vid. Plin. *Hist. Nat.* l. 13. c. 11. <sup>k</sup> Vid. Theophr. *Hist. Plant.*

l. 18. p. 1883.—See also Bauhin. l. 18. c. 186. who with Gelsner makes it a species of *Cyperus*. Grew. *Mus. Reg. Societ.*

p. 2. sect. 2. p. 225, seq. Maffei, *Istor. Diplom. Bibl. Ital.*

T. 2. p. 246.

Besides *Paper*, they made sails, ropes, and other naval rigging; as also mats, blankets, clothes, and even ships, of the stalk of the *Papyrus*. Moses, we are told, when a child, was exposed on the banks of the Nile, in *βιβλος παπυρου*, i. e. in a basket of *Papyrus*. Add that the Egyptian priests wore shoes of *Papyrus*.

Gui-

Guilandinus, a Prussian physician, has a celebrated work expressly on the ancient *Papyrus*, by way of commentary on three chapters of Pliny\*, wherein is amply, and with great learning, explained all that relates to this subject; yet Scaliger has written a severe critique on it, in which some inaccuracies of Guilandinus are pointed out\*\*, which has not hindered Kirchmayer from adopting almost Guilandinus's whole book in a dissertation on the *Papyrus*\*\*\*. Add, that the most ingenious and learned count Scipio Maffei has lately vindicated Guilandinus against the exceptions of Scaliger, as well as of Vossius and Hardouin.—*Vid. Ist. Diplomat. l. 2. Bibl. Ital. T. 2. p. 248.*

\* *Melch. Guilandini Papyrus, h. e. Commentarius in tria C. Plinii Majoris de Papyro capita*, sc. lib. XIII. c. XI, XII, XIII, first published at Venice in 1572, and afterwards at Amberg in 1613, by Salmuth.—It seems Guilandinus intended a commentary on the whole of Pliny's *Natural History*; but this small part, not exceeding a moderate page, taking him up full six months, 'tis no wonder he was discouraged from proceeding with the rest. In these three chapters he has restored above twenty passages in the text of Pliny, not merely from his own conjecture, or the help of MSS. but from the nature of the things described, and the testimonies of authors of the first rank: besides that, he had been upon the spot, where formerly the *Papyrus* was manufactured, and had carefully examined all the ancient Greek and Latin authors who speak of it.

\* *Jos. Just. Scaligeri Animadversiones in Melchioris Guilandini Commentarium in tria C. Plinii capita*, lib. XIII. *Historiæ Mundi sive Naturalis, quibus agit de Papyro*, first published in the *Lectiones bibliothecariæ memorabiles*, of Rudolphus Capellus, at Hamburg in 1682.—Where he follows Guilandinus step by step, finds as many faults in him as his father had done in Cardan, and uses him altogether as coarsely; every where pointing out his literary mistakes, and labouring to show, that instead of restoring Pliny, he has often mistaken and corrupted him.

\*\*\* *M. Seb. Kirchmaieri Uffenhaimensis Franci Dissertatio Philologica de Papyro veterum, Wittebergæ 1666. 4<sup>to</sup>*.—He had done better service, if besides Guilandinus he had consulted others, and particularly Scaliger. \* But as he chose to follow one rather than many, and that too as the blind follow their guides, his fate has been much the same.

The origin of the art of making *Paper* of the *Papyrus* is very obscure: no doubt it was first discovered in Egypt. Isidore fixes it more particularly to the city Memphis.—*Orig. l. 6. c. 10.* In which he seems to be countenanced by Lucan, where he says

*Nondum flumineas Memphis contexere Biblos  
Noverat*———Pharfal. l. 3. v. 222.

The *Æra* of this invention is warmly disputed: Varro the most learned of the Romans, fixed it to the time of Alexander the Great, after the building of the city Alexandria by that conqueror; but several objections of no small weight are brought against this decision. Pliny recites a passage out of a very ancient annalist, one Cassius Hemina, wherein mention is made of *Paper* books found in Numa's tomb 535 years after his Death, which had been buried with him\*: Now Numa was prior to Alexander by above 300 years. Guilandinus in effect, maintains with great erudition, that the name and use of the *Papyrus* were known to the Greeks long before Alexander conquered Egypt; and that the words βιβλος and βιβλιον occur in their received signification in authors prior to, or at least older than Alexander, particularly Anacreon, Alcæus, Plato the comedian, Aristomenes, Cratinus, Antiphanes, Plato the philosopher, Æschylus and Aristotle. And whereas some speak of I know not what, *pseudo-biblus*, known before the discovery of the true sort, he argues on the contrary, that the *biblus* mentioned by those authors prior to the conquest of Alexander, appears from Herodotus, Theophrastus, and others, to be the very same plant with the *Biblus* or *Papyrus*, of which *Paper* was made. Even Homer and Hesiod, the most ancient Greek poets, and who, by Herodotus's testimony, lived about 400 years before himself, appear to have been no strangers to the *Papyrus*, since they make express mention of it<sup>b</sup>.

<sup>a</sup> *Vid. Plin. l. 13. c. 13.*

<sup>b</sup> *Guiland. Papyr. Membr. 2.*

<sup>c</sup> *Reimm. Idea Syst. Antiq. Liter. p. 285, seq. Kirchman. Diff. de Papyr. Art. 11. § 2.*

To this it may be answered, that supposing the plant *Papyrus* known in Greece long before Alexander's conquest of Egypt, it no more follows, that they had then the use of *Paper*, than it follows that men had wine immediately on the discovery of the Vine: this last it is certain was known among them long before they made wine; and to this day, a part of the new world called *Florida* is said to abound with wines, though no use have been yet made of them either by the inhabitants or the Spaniards. As it was with the vine, which must have been known before wine could be made from it, so it is with *Papyrus*, which among the Greeks was long used for tying up things, before it came to be written on. In reality, Guilandinus produces testimonies from Anacreon and Alcæus, in which the *Papyrus* is employed for binding and not for *Paper*: add, that he ill translates τὸν πυρὸν λυχνόν, Ellychnium, since λυχνόν here is the torch itself. Nor does the Poet say it was made of *Papyrus*, but tyed up with it.—*Vid. Scalig. lib. cit. Reimm. ubi supra, p. 305, seq.*

Some have even doubted whether the art of manufacturing the

*Papyrus* was so ancient as Alexander's time; chiefly on this ground, that for 200 years after Alexander, men wrote on skins, and barks of trees: But this is no-wise conclusive. The scarcity of the new manufacture may account for it: some ages afterwards, even as low as Tiberius, we read of such a scarcity of *Paper*, that its use even in contracts was dispensed with by a decree of the senate, and the opinion of the judges. The same consideration may be carried further: *Paper* might have been known in Egypt, Judæa, Syria, and Asia on this side Taurus, long before the Birth of Alexander, though not in common use: but it was later ere the Europeans received it; and probably it was by means of Alexander's conquest that it first became publickly known there.

When the manufacture of the Egyptian *Paper* ceased, is another question; for at present the *Papyrotechnia Ægyptiaca* may be reckoned among those arts that are lost. Eustathius, the learned commentator on Homer, testifies, that even in his time, viz. in 1170. it was disused<sup>c</sup>; Mabillon indeed maintains that it continued till the eleventh century after Christ, and cites one Fridogod, a monkish poet of the X<sup>th</sup> century, as speaking of it as subsisting in the age before his, that is in the IX<sup>th</sup>; but that it continued longer, the same Mabillon endeavours to evince from several papal bulls wrote on it as low as the XI<sup>th</sup> century<sup>d</sup>.

<sup>c</sup> *Vid. Eustath. ad Homer. Odyss. φ. Voss. de Art. Gramm. l. 1. c. 37.*

<sup>d</sup> *Vid. Mabill. de Re diplomat. l. 1. c. 8. § 6, seq. Reimm. Idea Syst. Antiq. Liter. p. 311.*

Maffei, on the other hand, maintains with more probability, that the *Papyrus* was generally disused before the V<sup>th</sup> century; for we find no authentic records written on it dated since that time; those bulls of popes, cited by Mabillon, appearing rather to be written on cotton *Paper*<sup>e</sup>. But this we may observe, relates only to the general and legal use of the *Papyrus*—For that it should have continued to be made by particular persons several hundred years after it first began to give way, is not to be wondered at.

<sup>e</sup> *Vid. Maffei Ist. Diplomat. loc. cit. Bibl. Ital. T. 2. p. 251.*

In reality, a more commodious sort of *Paper*, made of cotton, having been invented some ages before in the East, and coming to be introduced into Europe, seems to have turned the *Papyrus* out of doors.—To which the continual wars with the Saracens, by which the traffick to Alexandria was rendered precarious, might possibly contribute.

Yet several books written on leaves of the *Papyrus* have even continued to our days: Mabillon says, he had one of them, and adds, that there is another in the Petavian library, being a volume in small folio, containing several Sermons of St. Augustin; he also mentions a third, containing that father's epistles, formerly belonging to the church of Narbonne, and now in the custody of Madame de Phirmacon. Besides the Homilies of Avitus bishop of Vienne, and divers diploma's or charters all written on the *Papyrus*, which appear not to be less than 1100 years old<sup>f</sup>. But the decisions of this learned father concerning MSS. notwithstanding all his diplomatic skill so highly boasted of, are not always infallible: witness his taking the MS. of St. Mark's Gospel at Venice to be written on Egyptian *Papyrus*, and that of Josephus at Milan not to be so.—Maffei shews on the contrary, that the former is cotton *Paper*, and that the latter appears at first sight to be Egyptian: not but the Venetian MS. is very old; but it has been so much used, that its leaves are as it were transformed into the original paste from whence they were made<sup>g</sup>.

<sup>f</sup> *Vid. Mabill. Suppl. ad Libr. de Re diplomat. Journ. des Sav. T. 32. P. 2. p. 992.*

<sup>g</sup> *Vid. Maffei lib. cit. Bibl. T. 2. p. 252.*

*Manner of making the Egyptian PAPER.*—They began with lopping off the two extremes of the *Papyrus*, viz. the head and root as of no use in this manufacture: the remaining stem they slit lengthwise into two equal parts, and from each of these they stripped the thin scaly coats or pellicles\*, whereof it was composed, with the point of a penknife\*\*. The innermost of those pellicles were looked on as the best; and those nearest the rind or bark the worst: they were kept apart accordingly, and constituted different sorts of *Paper*.

\* These pellicles are called in Pliny by twelve different names, viz. *philura, ramentum, scheda, cutis, plagula, corium, tania, subtegmen, statumen, pagina, tabula, and papyrus*.

\*\* The generality of critics, in lieu of a penknife employ a needle to separate the pellicles: in which they are warranted by the common text of Pliny: *Præparantur ex eo chartæ, diviso acu in prætenues, sed quam latissimas philuras*. But Guilandinus makes a correction here: he had found by experiment, that the pellicles of *Papyrus* cannot be separated by a needle; but that a very sharp knife is required: for which reason instead of *diviso acu*, he reads *diviso scapo*<sup>a</sup>. In which he is followed by Maffei; though Hardouin, Vossius, Pitiscus, and others, retain the ancient reading<sup>b</sup>.

<sup>a</sup> *Vid. Guiland. Papyr. Membr. 10. § 3. & 5. Maffei Ist. Diplomat. ap. Bibl. Ital. T. 2. p. 247, seq.*

<sup>b</sup> *Voss. de Art. Grammat. l. 1. c. 37. Pitisc. L. Ant. l. 1. p. 413. var. Charta. Hardou. ad Plin. l. 13. c. 12.*

As the pellicles were taken off, they extended them on a table: then two or more of them were laid over each other transversely, so as that their fibres made right angles; in this state they

they were glued together by the muddy waters of the Nilus\*. These being next pressed to get out the water, then dried, and lastly flatted and smoothed by beating them with a mallet; constituted *Paper*: which they sometimes polished further by rubbing it with a hemisphere of glass, or the like.—*Vid. Plin. Guiland. and Maffei locc. cit.*

\* In other countries, where the waters of the Nile were not to be had, the pellicles were fastened together with a paste made of the finest wheat-flower, mixed with hot-water, and a sprinkling of vinegar.

There were *Paper* manufactures in divers cities of Egypt: but the greatest and most celebrated, was that at Alexandria, where, according to Varro's account, *Paper* was first made. It is certain at least it was from hence that Greece and Italy were furnished, on account of the convenient situation of that port: and it is more than probable it was this gave the Romans occasion to conclude the art had been invented there. It was not till late, when Egypt was reduced into a Roman province, that they had much intercourse or even knowledge of the inland cities of Egypt, where *Paper* was also made.—The trade and consumption of this commodity were in reality incredible. Vopiscus relates, that the tyrant Firmus who rebelled in Egypt, publicly declared he would maintain an army only with *Paper* and glue, *Papyro & glutine*. This, Casaubon understands as spoken of the produce, and revenue of *Paper*; though Salmasius takes it to be meant of the *Papyrus* itself, which could supply most of the necessities of life.—*Vid. Montfaucon. Palæogr. Græc. l. 1. c. 2. p. 14.*

We find divers species of Egyptian *Paper* mentioned in ancient writers: some denominated from the places where they were manufactured; as 1° the *Amphitheatrica*, supposed to have been made in some building belonging to an amphitheatre at Alexandria. Though Guilandinus, with more probability, reads it *Athribitica*, from *Athribis*, a city in the middle of the Delta, which was the place of its manufacture. What countenances the correction, is, that we find mention of this *Paper* before there was so much as an amphitheatre at Rome, much less at Alexandria.—2° *Saitica*, made in the city Sai.—3° *Teniotica*, or according to others *Taitica*, whose place authors are not agreed on. There were other sorts denominated from the makers; as 1° the *Fanniana*, from the grammarian Rhem. Fannius Palæmon, who kept a *Paper* work. It was small, but finer than the amphitheatrical *Paper*; being first wrought at Alexandria, and afterwards finished at Rome.—2° *Clandia*, first made by order of the emperor Claudius. This was reputed the best of all, in that besides the two pellicles, in common with the rest, it had a third.

Others were denominated upon the uses they were intended for, as 1° *Hieratica*, the first or oldest sort, which was appropriated to religious uses; this was afterwards denominated *Augusta* and *Liviana*, in complement to the emperor of that name, and his wife; who, according to some, improved and made it whiter than before.—2° *Emporetica*, or *Emporica*, a small and coarse sort, serving shop-keepers uses to tie up goods, &c. The qualities for which the ancient *Papers* were prized, were their thinness, closeness, whiteness and smoothness: though their breadth also considerably enhanced their value.—That sort called *Charta Claudia* was thirteen inches wide; the *Hieratica*, eleven; the *Fanniana*, ten; *Amphitheatrica*, nine: for the *Saitica*, it exceeded not the diameter of the mallet it was beaten with<sup>a</sup>.

<sup>a</sup> See further concerning the ancient *Paper* in Nigrifoli *Diff. de Charta ejusque usu apud antiquos. Ext. in Galler. de Minerv. T. 3. p. 249. seq.* Other authors are enumerated in Fabric. *Bibl. Antiq. c. 21. § 9. p. 609. Pitisc. L. Ant. locc. cit.*

*Bark PAPER*, if it may be so called, was only the *Liber*, or inner whitish rind inclosed between the *bark* and the wood of divers trees, as the maple, plane, beech, and elm, but especially the *tilia* *filix*, or linden-tree, which was that mostly used for this purpose.—On this, stripped off, flatted, and dried, the ancients wrote books; several of which are said to be still extant<sup>b</sup>.

<sup>b</sup> *Vid. Plin. Hist. Nat. l. 13. c. 11. Hardou. Not. ad eund. Suid. Lex in Vox. filix. l. 6. c. 13. Alexand. ab Alexand. l. 2. c. 30. Salmuth. ad Pancirol. l. 2. tit. 13. p. 252. seq.*

Mabillon and Montfaucon speak frequently of manuscripts and diploma's on *Bark*, and are very express in distinguishing between the *Papyrus* used by the Egyptians, and the *Liber* or *Bark* in use in other countries. The two are alledged to differ in this, that the *Bark Paper* was thicker and brittler than the *Papyrus*, as well as more apt to cleave or shiver, by which the writing was sometimes lost; as is the case in a *Bark* manuscript in the abbey of St. Germain, where the bottom of the *Paper* remains, but the outer surface, on which the letters had been drawn, is in many places peeled off<sup>c</sup>.

<sup>c</sup> *Vid. Montfaucon. Palæogr. Græc. l. 1. c. 2. p. 15. Mabill. de Re Diplom. l. 1. c. 8. Reimm. Idea Syst. Antiq. Litt. p. 311.*

But Maffei, it must not be forgot, combats the whole system of *Bark* manuscripts and charters as a popular error; and maintains that the ancients never wrote diploma's on *Bark*; that the distinction between the *Papers* made of the *Papyrus* and of *Cortex* is without foundation; that the only use of the *Tilia* or *Linden*, was for making thin boards or tablets for diptycha or pocket-books, wherein they wrote on both sides, as is done

Vol. II.

among us: an advantage which they could not have in the Egyptian *Paper* by reason of its thinness.

A late French writer on the rules of criticism wanders further out of the way; when he speaks of a sort of *Paper* in Egypt made of the pith of the cyperus: he describes the manner of preparation, which was by reducing this pith to a pulp, and then spreading it out in leaves.—*Vid. Hon. St. Marie Reflex. sur les Regl. de la crit. T. 2. Diff. 4. p. 77. not.*—But this we suspect for a chimera hatched only in the critic's brain.

Not but there occur divers anomalous sorts of *Paper*, which antiquaries are not a little puzzled with, what species to refer them to: such is that of two bulls in the archives of the church of Gironne issued by the antipopes Romanus and Formosus, between the years 891 and 895. They are two ells long, and one broad, consist of two leaves or pellicles glued together tranversly, and are still legible in most places. The conjectures of the French Scavans are numerous: the abbot Hiraut de Belmont has a discourse express on the occasion. Some will have them made of the leaves of the *Alga*, or seawreck—others of the leaves of a rush called *la Boga*, growing in the marshes of Rouffillon—others of *Papyrus*—others of *Cotton*—and others of *Bark*. So little certainty there is in these things, on which the critics nevertheless often lay a great stress.—*Vid. Mem. de Trev. Sept. 1711. p. 1559, seq.*

*Cotton PAPER*, *Charta Bombycina*, *Βομβυκίνη* (thus called from *Βομβύξ*, a word which anciently signified silk, though in after times, *Βομβύξ* and *Βαμβαξ* came to denote *Cotton*) is a sort which has been in use upwards of 600 years, as is shewn by Montfaucon from several authorities: What is more, *Cotton Paper* appears to have been very common at that time, and consequently must have been invented long before. In the French king's library, are MSS. on this *Paper*, which by the character, and other circumstances, appear to be of the X<sup>th</sup> century. Be this as it will, from the XII<sup>th</sup> century, *Cotton* MSS. are more frequent than parchment ones<sup>d</sup>.

<sup>d</sup> *Vid. Montfaucon. Palæogr. Græc. l. 1. c. 2. p. 17, seq. item l. 4. c. 6. p. 209. Maffei, lib. cit. Bibl. Ital. T. 2. p. 252.*

*Incombustible PAPER* is made of the *lapis asbestos* or *linum vitum*, which will bear burning without being injured. See *ASBESTOS*. Dr. Bruckmann, professor at Brunswick, has published a natural history of the *Asbestos* or *Incombustible Paper*; and what is most remarkable, has printed four copies of his book on this *Paper*: they are deposited in the library of Wolfenbuttel.—*Vid. Bibl. Germ. T. 14. p. 190.*

The manner of making this extraordinary *Paper* is described by Mr. Lloyd from an essay made by himself.—He pounded a quantity of the *asbestos* in a stone mortar, till it became a downy substance; then sifted it through a fine scarce, and by this means purged it indifferent well from its terrene parts; for that what earth or stones he could not pick out of it before, or at the pounding, being reduced to a powder, came through the scarce, the *linum* remaining. This done, he brought it to the paper-mill; and putting it in water in a vessel just big enough to make a sheet with such a quantity, he stirred it pretty much, and desired the workmen to proceed with it in the usual method, with their writing-paper mould; only to stir it about always before they put their mould in; considering it as a far more ponderous substance than what they used, and that frequently, if not immediately taken up after it was agitated, it would subside.

The *Paper* made of it proved but coarse, and too apt to tear: but this being the first trial, there is reason to believe it might be much improved; nor did the workmen doubt, but in case it were pounded in one of their mortars for twenty hours space, it would make good writing-paper.—*V. Phil. Trans. N° 166. p. 824.*

*Linnen or European PAPER*, is chiefly made of linnen rags beaten to a pulp with huge hammers, and the foil carried off by a continual supply of fresh water conveyed among the pulp in little troughs, till it be rendered perfectly white.

Besides the chief use of this *Paper*, which is for writing and printing on, there is a great consumption of it in packing up goods, and on other occasions.

The Turks, Busbequius tells us, have a veneration for *Paper* which approaches to superstition: they will not profane or prostitute the least bit to vile uses; but fold it very neatly, and lay it up safe, because the name of God, or some text, forsooth, of the alcoran may be written on it.—*Vid. Busbeq. Epist. 1. Legat. Turc. p. 50.*

Books in *large Paper*, are those which have wider margins than those on small *Paper*, though otherwise of the same impression. See *BOOK, IMPRESSION, &c.*

The manufacture of *Paper*, has got footing in most countries; though France, Holland, and Genoa, are the places where it succeeds best. In the general, it depends much on the quality of the linnen worn in the country where it is made: where that is fine, or coarse, and brown, &c. the rags, and consequently the *Paper* made thereof, must be so too. Hence the whiteness of the Dutch and Flemish *Papers*, beyond the Italian and French, and much more the German *Papers*. The English manufacture hitherto has been in no great reputation; but it is every day improving; insomuch that we now import little of the ordinary sorts, which were formerly all brought from abroad.

Yet paper-mills are of some standing among us. We find one erected at Dartford as early as the year 1588, which we believe was the first, and which is celebrated by a noted poet of that age, Tho. Churchyard, in a work in verse, intitled, *A description and discourse of Paper, and the benefits it brings; with the setting forth of a paper-mill built near Dartford, by a High-German, called Mr. Spilman, jeweller to the queen, Lond. 1588, 4<sup>to</sup>.*

In reality, the deficiency of the English *Paper-manufacture*, does not seem owing so much to the quality of our rags, as the want of skill and attention in the makers. The encouragement given it by the legislature, in the high duty laid on foreign *Paper* imported, we hope it will in time deserve. How considerable this is, will appear from the following state. — Genoa royal fine *Paper*, pays per ream, 7s. 7d.  $\frac{1}{2}$ . — Genoa royal second, 6s. 10d.  $\frac{1}{2}$ . — Fine Holland royal 7s. 7d.  $\frac{1}{2}$ . — Fine Holland second, 5s. — Ordinary royal, 2s. 6d. — Genoa demy fine, 3s. 10d.  $\frac{1}{2}$ . — Genoa demy second, 3s. 1d.  $\frac{1}{2}$ . — Dutch printing demy, 3s. 4d.  $\frac{1}{2}$ . — Genoa crown fine 3s. 1d.  $\frac{1}{2}$ . — Genoa crown second, 2s. 4d.  $\frac{1}{2}$ . — Dutch crown fine, 2s. 4d.  $\frac{1}{2}$ . — Dutch crown second, 2s. — Genoa fools cap fine, 3s. 1d.  $\frac{1}{2}$ . — Genoa fools cap second, 2s. 4d.  $\frac{1}{2}$ . — Dutch printing fools cap, 2s. — Atlas fine, 28s. 10d.

When and by whom *Linnen Paper* was invented, is a secret, which Polydore Vergil owns he could never trace<sup>a</sup>. Scaliger will have it to have been found out by the Germans<sup>b</sup>: Maffei affirms it certain, that the invention is owing to the Italians<sup>c</sup>. Others ascribe it to some refugee Greeks at Basil, who took the hint from the manner of making *Cotton-Paper* in their own country<sup>d</sup>. Conringius takes the Arabs to have first brought it among us<sup>e</sup>. Perhaps the Chinese have the best title to the invention; who for many ages have made *Paper* much after the same manner<sup>f</sup>, and even in some provinces of the same materials, viz. hemp, &c.<sup>g</sup>.

<sup>a</sup> Vid. Polyd. Verg. *de Inventor. Rer.* l. 2. c. 8. — <sup>b</sup> Vid. Second. Scaliger. p. 7. Fabric. *Bibl. Antiq.* c. 9. § 21. — <sup>c</sup> *Istor. Diplom.* l. 2. *Bibl. Ital.* T. 2. p. 253. — <sup>d</sup> Vid. *Phil. Transf.* N<sup>o</sup> 288. p. 1515. — <sup>e</sup> Vid. Conring. *Epist. ap. Act. Erud. Lips.* An. 1720. p. 94. — <sup>f</sup> Savar. *D. Comm.* T. 2. p. 963. — <sup>g</sup> Du Hald. *Descr. Chin.* T. 1. p. 367.

*Linnen Paper* appears to have been first introduced among us towards the beginning of the XIV<sup>th</sup> century. — The learned Conringius denies that there are any manuscripts of this *Paper* above 400 years old<sup>h</sup>; with whom agrees the count Maffei, who finds no marks of its use before the year 1300<sup>i</sup>.

<sup>h</sup> Vid. Conring. *Epist. ap. Act. erud. Lips.* An. 1720. p. 94.

<sup>i</sup> Maffei *Istor. Diplom.* l. 2. *Bibl. Ital.* T. 2. p. 253.

Some indeed go much further back; and take the *Liberi lintei* mentioned by Livy, and other Roman writers, to have been written on *Linnen Paper*<sup>k</sup>: But Guilandinus, and after him Al-latus and others, have sufficiently refuted this notion; and shewn, that the *Libri lintei* were written on actual pieces of linnen cloth, or canvas, prepared for this purpose, such as painters still use; and not on *Paper* made of linnen rags<sup>l</sup>.

<sup>k</sup> Vid. Liv. *Dec.* l. 1. 4. Plin. *Hist. Nat.* l. 13. c. 11. Pitisc. *L. Ant.* T. 2. p. 85. — <sup>l</sup> Guiland. *Papyr. Memb.* 25. Salmuth *ad Pancirol.* l. 2. tit. 13. p. 253.

Others run into the contrary extreme, and make *Paper* the invention but of yesterday. The jesuit Inchofer, dates its origin about 250 years ago<sup>m</sup>: with whom agrees Milius in his *Hortus Philosophicus*, who maintains, that the art of making *Paper* was not invented till about the year 1470<sup>n</sup>. Of the same opinion seems Ray, who tells us the art of making this paper was not known in Guernsey, till the year 1470, and when two persons, named Anthony and Michael, first brought it to Basse, out of Galicia in Spain<sup>o</sup>. In effect, if the invention be owing to the refugee Greeks at Basil, who fled thither after the sacking of Constantinople, it must at least be posterior to the year 1452, when that city was taken<sup>p</sup>. Some add a further argument for the novelty of *Paper*, drawn from the novelty of hempen cloth, which Rabelais, who died in 1553, mentions as first found out about an hundred years before him; and which was so scarce in the time of Charles VII. of France, who died in 1461, that the queen his wife, was the only woman in France that had a couple of shifts of it<sup>q</sup>.

<sup>m</sup> Vid. Mabil. *de Re Diplom.* l. 1. c. 8. Reimm. *Idea Syst. Antiq. Liter.* p. 313. seq. — <sup>n</sup> Balbin. *Miscell. Hist. Bohem.* c. 22. *Act. Erud. Lips.* 1682. p. 243. — <sup>o</sup> Ray *Hist. Plant.* l. 22. — <sup>p</sup> *Phil. Transf.* N<sup>o</sup> 288. p. 1515. — <sup>q</sup> Naudæan. p. 82. *Nouv. Rep. Let.* T. 26. p. 571.

But these suggestions are refuted by Mabilion, from the testimonies of writers prior to the time here spoken of, and from many manuscripts about 400 years old, which are written on *Linnen Paper*<sup>r</sup>. The jesuit Balbinus produces divers instances of *Paper* MSS. written before the year 1340<sup>s</sup>. An ingenious writer of our own country assures us, he had a piece of *Paper* which agreed well with a charter dated in 1358, in the 32<sup>d</sup> year of Edward III. He adds, that in the archives of the library belonging to the dean and chapter of Canterbury, is an inventory of the goods of Henry, prior of Christ Church, who died in 1340, written on *Paper*; and that in the Cotton Library there are several writings on our *Paper* in the times of most of our kings and queens as high as the 15<sup>th</sup> of Edw. III.

which coincides with the year 1335<sup>t</sup>. Dr. Prideaux assures us he has seen a registration of some acts of John Cranden, prior of Ely made on *Paper*, which bears date in the 14<sup>th</sup> year of King Edward II, that is, anno Dom. 1320.

p. 1515.

<sup>u</sup> Prid. *Connec.* p. 1. l. 7. p. 710.

Add, that the invention of *Paper* may appear more modern than it is, by reason records were not used to be wrote on it, but it was a considerable time confined to letters, and other fugacious compositions; which is so true, that to this day, few instruments of any consequence are written on it, though it have been so long in use. — It is even alledged, that Peter, the venerable abbot of Cluny, who died in 1157, has a passage in his book against the Jews, which plainly indicates *Paper* books to have been then known; on the authority whereof Valefius, in his notes on the panegyric of Berengarius Augustus, scruples not to make *Paper* upwards of 500 years old. — *Vid.* Mabil. *ubi sup.* Reim. *loc. cit.*

Father Hardouin even assures us, he had seen records or diploma's on it prior to the XIII<sup>th</sup> century. — But this will hardly be credited. Count Maffei assures us, that in all his researches he could never meet with one more ancient than the year 1367. It is highly probable the learned jesuit mistook a Cotton manuscript for a Linnen one: a mistake easily made, as the chief difference between the two consists in the greater thinness of the Linnen *Paper*. But it is known we have Linnen *Papers* of very different degrees of thickness; and the like may be said of those of Cotton. — *Vid.* Maffei *Istor. Diplom.* l. 2. *Bibl. Ital.* T. 2. p. 253, seq.

The invention, according to Prideaux, seems to have been brought from the East; for that most of the old MSS. in Arabic and other Oriental languages are written on this sort of *Paper*: some of which are certainly much older than any of the dates above-mentioned. This author thinks it most probable that the Saracens of Spain first brought it out of the East into that country; from whence it was propagated through the rest of Europe. — *Vide* Prid. *ubi supra*.

**Method of making Linnen PAPER.** — The process begins with preparing the rags. — These when brought to the paper-mills are first to be sorted into what they call the *grobins fine*, *grobins second*, and *grobins tres*: for among the rest will be some linsley-woolsey, which the dirt makes indiscoverable till they are once washed. — The way of washing, is by putting them in a puncheon with many holes in the bottom, and grates on the side made of strong wires. Here are the rags to be often stirred, that the dirt may run from them.

When sufficiently washed, they are laid in square heaps, and covered close with pieces of clean sacking, till they truly sweat and rot, which is called *fermenting*, and is usually performed in four or five days; if they be not taken in the due time, they are apt to mildew, discolour, and take fire. When duly fermented, they twist them in handfals, then cut them with a sharp hook set fast in a frame, with the point upwards, and edge from the workman; still drawing them upwards, and cutting them piece by piece about half inch long, or as the fingers will allow.

With the rags thus prepared, they prime or feed the mortars, which are made oval, about half a yard deep, of heart of oak right seasoned. At the bottom of each is an iron plate an inch thick, eight inches broad, and thirty long; shaped inward like a mould for a salmon with head and tail rounded. In the middle is a washing block groved with five holes in it, and a piece of hair sieve fastened on the inside. This keeps the hammers from touching it, and prevents any thing going out except filthy water.

The mortars are supplied with water night and day by little troughs, from a cistern fed by buckets fixed to the several floats of a wheel, so long as the wheel goes.

In these mortars the rags being beaten fit for a remove to the presses just by, they take them out with little iron hooped pails, out of any of the mortars, whose hammer they can stop whilst the others work. This makes what they call the *first stuff*. From the mortars, this first stuff is lodged in boxes of five foot high, made like the corn-chandlers bin, with the bottom board a-slant, and a little separation on the front for the water to drain away. — The pulp of rags being in, they take away as many of the front boards as are needful, and press the mass down hard with their hands: the next day they put on another board and more pulp, till the box is full. And here it remains mellowing a week, more or less, according to the weather.

In the whole process, there must be no iron work where it may be liable to grow rusty, which would ironmould the stuff, and spoil the *Paper*.

After this, the stuff is again put into clean mortars, beaten afresh, and removed into boxes as before; in which state it is called the *second stuff*.

The like understand of the third time, which fits it for the pit mortar, when it is again beaten, till some of it being mixed with fair water, and brewed to and fro, appears like flower and water without any lumps in it.

Thus prepared, it is fit for the pit mortar which has flat hammers without nails. Into this, by a trough, runs water continually

rinually whilst they work at the fat; and here the beating and water dissolves it perfectly: after which it is carried into the fat, and more is brought from the boxes.—And thus they do successively.

The fat is primed according to art, when the liquor has such a proportion of the pulp, as that mould dipped in it, will take up as much as will make the sheet of *Paper* of the thickness desired. A mould is a square sieve about an inch deep, bottomed with brails-wire-cloth, supported with sticks to prevent the wire from bagging down, and keep it perfectly horizontal: for that if it any ways bags, one Part of the sheet of *Paper* will be thicker than the other.

This mould the maker dips, with a deckle on, into the fat, and takes it out again shaking, that the water may run clear from the pulp in the sieve, and thus delivers it to the coucher, who couches it upon a felt laid on a plank, and lays another felt on it; and so successively, a sheet and a felt, a sheet and a felt, till a post, *i. e.* one pressing, containing six quire, be made.—Of post *Paper* they may make twenty posts or more *per* day.—The coucher having done his office, returns the mould to the maker, and the maker to the coucher successively.

A post being made, either the maker, or coucher whistles; upon which four or five men advance, one whereof draws the post under the prels with two little hooks; and the rest press it with great force till no water is left, which is quickly done with two or three pulls.

This being done, the post is pulled from the prels, and set on the right side by the laying stool; then the layer takes off the first felt, returns it to the coucher, and lays the first sheet on the laying stool, over which he lays the second, then the third very regularly; and thus successively till the whole post be laid out.—Which done it is set by till toward the end of the day, and then the whole day's work is pressed again, and set exactly one on another, so that it looks like one solid paste board.

This, after two or three pulls, as before, is taken out again by the dry workman, and carried up into the loft, and hung six or seven sheets together upon lines fastened to a thing called a *Tribble*, each tribble containing thirty lines ten or twelve foot long.

When dried it is taken down, laid on a three footed stool, and there rubbed smooth with the hands; and afterwards placed in heaps, seven or eight foot high, in a very dry place; where it stands still sizing, which is the next operation.

Choosing a fine, dry, temperate day, they put into a copper two barrels of water; and into this, when just warm, sixty pounds weight of clean parchment or vellum shavings; which they boil till it be reduced to a perfect size; then strain it through a fine cloth, on which is strewed a due proportion of white vitriol and roch-allom finely powdered, into a tub a foot deep.

Near to this tub are brought four or five reams of the *Paper*; and a full gage, or so much as can be taken up with the hands at a time, is dipped into the size, being as hot as the hands can well bear it; and by a certain gentle quick management, it is so ordered, that every sheet shall be sized: after which it is put regularly into the prels, pressed, moved thence into the drying loir, and hung usually sheet by sheet till dry. But care is taken, that the direct rays of the sun come not nigh it till it be dry, which would otherwise endanger the evaporation of the size. When thoroughly dry it is taken down, smoothed with the hands as before, heaped, pressed hard, and so it stands all night. Next morning it is taken out, and carried into the storehouse, where it is sorted; what is fit for inside quires, are laid by themselves, and the outside by themselves; and then it is pressed again, and so commonly stands all night.

In the morning it is carried into the storehouse again, where it is told into quires of 24 or 25 sheets each, folded, laid by in heaps; and when there is a press full, it is pressed again, double for a while, and then made into reams of twenty quire each<sup>a</sup>, and bales of 10 reams to a bale<sup>b</sup>.

<sup>a</sup> Vid. Hought. Collect. T. 2. p. 412, seq.

<sup>b</sup> Moor's Mathem.

Comp. p. 16.

The broken sheets are commonly put together, and two of the worst quires placed on the out-sides of the ream, called the *Out-side* quires; thus being tied up in wrappers made of the settling of the fat, it is fit for sale.

With some of the aforesaid pulp, is also made *Pasteboard*, after the same manner as *Paper*, only that it is thicker. See *PASTEBOARD*.

With a fine sort of this pasteboard, they also make playing cards. See *CARDS*.

*Paper* is sold by the ream, every where we think, except in the paper-works of Auvergne, where it is sold by weight, at the rate of 14 ounces to the pound; each ream according to its kind, being to weigh a certain number of pounds, prescribed by authority.—Savar. *loc. cit.*

**PAPERS** are of various kinds.—With regard to colours, they may be divided into *white, brown, blue, &c.*—With regard to quality into *fine, second, bastard, superfine, &c.*—With regard to use, into *writing, printing, pressing, cap, cartridge, copy, chancery, post, &c.*—With regard to dimensions, into *demy, medium, crown, fool's-cap, pot, royal, super-royal, imperial, elephant,*

*atlas, &c.*—With regard to country, into *Germany, Lomard, Rochel, Genoa, Holland, &c.*

French *Papers* are divided into *large, middle* and *small*.—To the small belong these called, *petit Romaine, petit Raisin, or Bâton royal, petit nom de Jesus, and petit a la main*, all thus nominated from the marks impressed on them in making. Also the *Cartier* for the backs of playing cards; *Pot* for the figure side; *Couronne*, which has commonly the arms of the comptroller general of the finances; *Telliere*; with the arms of the late chancellor *Tellier*, and a double T; and *Champy*, or a *Chassis la Serpente*, so called from its mark, the serpent; which being extremely fine and thin, is used by fan-makers.

To the *middling* sort belong the *grand Raisin simple, Carré simple, Cavalier, and Lombart*, the three last of which are for printing; *P'Ecu, or de compte simple, carré double, P'Ecu double, grand Raisin double, and Couronne double*, which three last are denominated *double* on account of their strength and thickness. Add to these the *Pantalon*, or *Paper* with the Dutch arms, and *grand Cornet*, so denominated from the impression on it.

To the *large*, belong the *grand Jesus, petite & grande fleur-de-lis, Chapelet, Colombier, grand Aigle, Dauphin, Soleil, and P'Etoile*, which are thus called from the figures they bear, being all proper for printing either at the letter-press, or rolling-press; also for merchants books, and for drawing on. The *grand Monde* is the largest of all.—Vid. Savar. *D. de Comm.* T. 2. p. 965, seq.

We have also *Printed-PAPER*, to hang rooms withal.—*Stamp'd Paper*, to write obligations, deeds and contracts upon.—*Ruled Paper* for books of accounts, &c.—To which may be added *Cue-Paper*, and *Gilt-Paper* for letters, &c.

*Blue PAPER*, is a sort used by tradesmen to wrap up goods; as sugar-loaves, pieces of linnen, &c.

*Blotting PAPER*, is *Paper* not sized, and in which therefore ink readily sinks or spreads. It is used in books of account, &c. in lieu of sand, to prevent blotting and disfiguring the opposite pages. The same is likewise used by apothecaries in filtrating juices and other matters, for which the *Manica Hippocratis* is not so proper.

*Teint, or Demi-teint PAPER*, for designing on, is either *brown, blue, or bislerd*.

*Bislerd PAPER*, is white *Paper* washed over with a sponge dipped in foot-water. Its use, is to save the labour of the crayon in places which are to be shadowed the same depth with the tint of this *Paper*.—For light places, they are made thereon with white chalk.—Vid. Corneil. *Elem. de la Peint. Prat.* c. 15. p. 34, seq.

*Marbled PAPER*, is a sort variously stained, or painted as it were with divers colours; made by applying a sheet on the surface of a liquor wherein colours diluted with oil or ox's gall are suspended. See *DYING*.

The manner of making it is thus.—A trough is provided of the shape and dimensions of a sheet of the *Paper* to be marbled, and about four fingers deep, made of lead or wood well joined, and pitched or primed to contain the liquor.—For the liquor, a quarter of a pound of gum tragacanth is macerated four or five days in fair water; this they stir from time to time, and add to it daily fresh water, till it be of a consistency somewhat thinner than oil; then they strain it into the trough.

The colours to be applied thereon, for blue, are indigo ground up with white lead.—For green, indigo and orpiment, the one ground, and the other tempered; mixed and boiled together with common water.—For yellow, orpiment bruised and tempered.—For red, the finest lake, ground with raspings of brasil wood which has been prepared by boiling half a day. Into all these colours they put a little ox or fish-gall, which is two or three days old; and if the colours dilate not of themselves sufficiently they add more gall.—On the contrary, if they spread too much, the gall is over-dosed, and must be corrected adding more of the colour without gall.

For the operation of marbling: when the gum is well settled in the trough, they extend a sheet of *Paper*, and plunge it very shallow into the liquor, suddenly lifting it out again, in order to stir up, and raise the subsiding gum towards the surface, and for the more universal impregnating of the liquor.

This done, and all the colours ranged in gallipots on the table, where also the trough is placed, they begin by dipping a brush of hog's hair into any colour, commonly the blue first, and sprinkle it on the surface of the liquor: If the colour were rightly prepared, it will dilate itself duly therein.—This done, the red is applied in the like manner, but with another pencil.—After this the yellow; lastly the green: for white, it is made by only sprinkling fair water, mixed with ox's gall, over the liquor.

When all the colours are thus floating on the liquor, to give them that agreeable cambletting which we admire in *Marble Paper*, they use a pointed stick, which being applied by drawing it from one side of the trough to the other with address, stirs up the liquor and fluctuating colours; then with a comb taken by the head with both hands, they comb the surface of the liquor

liquor in the trough from one extreme to another, permitting only the teeth to enter: this being performed with a gentle and uniform motion, makes those clouds and undulations whereon much of the beauty of the *Paper* depends.

If it be further desired to have the colours lye in any other fantastical posture, representing serpents or the like, it is effected with the pointed stick abovementioned, by drawing it over what has been already combed; but this must be done with a dexterous hand, and with a shallow dip into the liquor, circling as if you would draw some flourish, or figured letter.

Lastly, the colours being in this posture, the operator displays, and applies on them a sheet of white moistened *Paper*; to do which, artist-like, requires a sleight only to be obtained by practice; for that the surfaces of the liquor and the *Paper* are to meet equally in all parts: which done, before the colours have time to soak through, which, unless the *Paper* be very thick, will be in the space of two or three pulses, he lifts up the *Paper* nimbly, and with an even hand; and then spreading it a while on a board, hangs it on a line to dry; which when sufficiently done, they polish it with a marble stone, or ivory knob. It must be observed, that the sprinkling of the colours is to be renewed, and all the other ceremonies performed with the stick and comb at every application of a fresh *Paper*, by reason every *Paper* takes off all the colour from the liquor<sup>a</sup>.

<sup>a</sup> Vid. Kirch. de Luce & Umbra. l. 10. Par. 2. c. 4. Merr. Observ. on Neri de art. Vitr. c. 42. p. 312. Hought. Collect. T. 2. p. 419, seqq.

Some essays have been made to enrich the marbling by mixing gold and silver with the colours, which succeeded well, especially for the French King's library, though the expence has hindered the practice from obtaining.—Savar. ubi supra.

*Chinese Paper* is of various sorts; some made of the rinds, or barks of trees, especially those abounding in sap, as the mulberry-tree, and elm, but chiefly of the bambû and cotton tree. In reality, almost each province has its several *Paper*: that of Se-chwen is made of hemp; that of Fo-kyen, of soft bambû; that used in the northern provinces of the bark of the mulberry-tree: that of the province of Che-kyang, of wheat or rice straw; that of the province of Kyang-nan, of the skin found in the silk-worms balls. In fine, in the province of Hu-quang, the tree chu, or ko-chu furnishes the principal material for *Paper*.

For *PAPERS made of the barks of trees*; the manner of their preparation may be exemplified in the instance of that of the bambû, a tree of the cane, or reed-kind, being hollow, and divided into joints; but much larger, smoother, harder and stronger than any other sort of reed,

For *Paper*, they ordinarily only use the second coat or skin of the bark, which is soft and white; this they beat in fair water to a pulp, which they take up in very large moulds or frames, so that they have sheets ten or twelve feet long, and sometimes more. They are completed by dipping them sheet by sheet in allom-water, which serves instead of the size used among us, and not only hinders the *Paper* from imbibing the ink, but gives it that lustre, which at first sight makes it look silvered, or at least varnished over.

The *Paper* thus made, is white, soft and close, without the least roughness to arrest the motion of the pencil, or occasion the rising of any of its fibres. Though, being made of the bark of a tree, it cracks more easily than the European *Paper*: add that it is more apt to take moisture, that the dust sticks to it, and that the worms soon get into it; to prevent which last inconveniency, they are obliged often to beat their books, and expose them to the sun. Add, that its thinness making it liable to be soon worn out, the Chinese are under a frequent necessity of renewing their books, by fresh impressions taken from their blocks<sup>b</sup>.

<sup>b</sup> Vid. le Compt. Nouv. Mem. sur Chin. Lett. 7. Kust. Bibl. nov. Libr. An. 1697. p. 67, seq. Lett. Edif. & Cur. T. 19. p. 479.

But the *Paper* of the bambû, it is to be observed, is neither the best, nor that most used in China. In the former of these respects, it yields the priority to the paper made of the cotton shrub, which is the whitest and finest, and at the same time least subject to the inconveniences above mentioned; for that it keeps as well, and is as durable as the European *Paper*.—

Dr. Grew thinks we have many plants in England, which contain a down that in all probability would make as fine a *Paper* as that made by the Chinese from their cotton shrub.—By which it appears he mistakenly imagined that the Chinese *Paper* was made not from the rind of the cotton shrub, but from the down or cotton itself.—Vid. Grew Mus. Reg. Soc. P. 2. § 1. c. 5. p. 215.

But the *Paper* in most common use in China, is that made of the tree called *Chu-Ku*, or *Ku-Chu*, which du Halde compares, first to a mulberry-tree, then to a fig-tree, then to a sycamore tree, and lastly, to encrease the embarrass, to a strawberry-tree.—By all which, we know less of it than if he had said nothing about it. But this is a way of describing very familiar to that author, who is often strangely jejune in the midst of the utmost prolixity, and is never more confused and incoherent, than when he aims most at order and exactness. But to return to the *Ku-Chu*.

The method of preparing it for *Paper*, is by first scraping off lightly the thin outside of the tree, which is greenish: then they take off the inner rind in long thin slips, which they blanch in water and the sun; and afterwards prepare them in the same manner as the bambû.

It must not be forgot, that in the other trees it is only the inward bark that serves for making *Paper*; but the bambû, as well as the cotton shrub have this peculiarity, that not only their bark, but their whole substance may be employed, by means of the following preparations.

Out of a wood of the largest bambû's, they select shoots of a year's growth, which are about the thickness of the calf of a man's leg: these they strip of their first green rind, and split them into strait pieces of six or seven foot long: the pieces thus cleft, they steep in a pond of muddy water, till they rot and grow soft by the maceration. In a fortnight they take them out, wash them in clean water, spread them in a large dry ditch, and cover them with lime for a few days; then take them out again, and having washed them a second time, slip them into filaments, which they expose in the sun to dry and whiten; then throw them into large coppers, where they are thoroughly boiled: and lastly reduce them by the strokes of large hammers to a thin paste, or pulp.

Then they take some shoots of a plant called *Ko-teng*, soak them four or five days in water, till there come out an unctuous fizy sort of juice; this they mix with the pulp of which the *Paper* is to be made, somewhat in the same manner as painters temper their colours; care being taken not to put in too much, nor too little of it, on which the goodness of the *Paper* much depends.

When they have mixed the juice of *Ko-teng* with the cleft bambû, and beaten the whole till it resembles a thick clammy water; they pour it into a large deep reservoir, consisting of four walls raised breast high, and the sides and bottom so cemented, that the liquor cannot run out nor soak in.

This being done, and the workmen placed at the sides of the reservoir, they dip in their moulds, and take up the surface of the liquor, which almost instantly becomes *Paper*; the mucilaginous and glewy juice of the *Ko-teng* binding the parts, and rendering the *Paper* compact, soft, and glossy, qualities which the European *Paper* is a stranger to when first made.

To harden the sheets, and make them bear ink, they dip them in allom-water: this operation is called *Faning* from the Chinese word *Fan*, which signifies allom. The manner is this.—Six ounces of fish-glue cut very small, are put in divers porringers of water, which they afterwards boil up, stirring it all the time to prevent lumps: when the whole is reduced to a liquid substance, they throw into it three quarters of a pound of calcined allom, which they melt and incorporate with it. This mixture is next poured into a wide basin, across which is laid a small round stick: then they shut the edge of each sheet in another stick cleft from end to end, and in this manner dip the sheet, gently drawing it out as soon as it is wetted, by sliding it over the round stick. When the whole sheet has passed nimbly through this liquor, which makes it whiter and more compact, the long stick that holds the sheet by the edge, is stuck in a hole in the wall, and the sheet hung up to dry.—For the mould wherewith they take up the sheet, its frame is so contrived that it may be raised or lowered at pleasure; and its bottom is not made with wire, as ours, but with little slender slips of bambû drawn several times through holes made in a steel plate, whereby they are rendered as fine as wire: they are then boiled in oil till thoroughly soaked, that the mould may enter lightly into the water, and not sink deeper than is requisite to take up matter enough for a sheet.

To make sheets of any extraordinary size, care is taken to have a reservoir and mould large in proportion. This mould is sustained by strings which pass over the pulley; the moment these pull up the frame, the workmen placed aside the reservoir, assist to take the sheet off; working together in a regular manner. For drying the sheets when taken off, they have a hollow wall, whose sides are well whitened: at one end hereof is an aperture, through which, by means of a pipe, they convey the heat of a neighbouring furnace: and at the opposite end is a small vent to let out the smoke. By help of this sort of stove, they dry the *Paper* almost as fast as it is made.

Silvering of *Paper* is another secret among the Chinese, practised at a very small charge, and without using any silver.—In order to this, they take two scruples of glue made of neats leather, one of allom, and half a pint of clean water: these they simmer over a slow fire, till the water is consumed, that is, till no more steam arises; then on a smooth table they spread some sheets of *Paper*, and on this, with a pencil, apply two or three layers of the glue: then they take a powder made of talc boiled, and mixed with  $\frac{1}{2}$  the quantity of allom: the two are ground together, sifted, and the powder boiled again in water, then dried in the sun, and lastly pounded.—This powder they sift through a fine sieve, spreading it uniformly on the sheets prepared as above: after which they hang them in the shade to dry; and this effected, lay them again on the table, and rub them gently with clean cotton to take off the superfluous

fous talc, which serves a second time for the same purpose. With this powder diluted in water mixed with glue and allom, they draw any figures at fancy on the *Paper*—*Vid. Du Hald, Descrip. Chin. T. 1. p. 368, seq.*

**PAPER-CLOTHES** became a mode a few years ago in France. M. Flachs has a dissertation express on the subject, wherein he tells us this fashion scarce outlived half a day; and undertakes to shew that it is no new thing, but to have been practised among the ancients. But then it should be considered that the old Egyptian *Paper* was a very different thing from ours; as being likewise used for sails, ropes, &c.—*Bibl. Germ. T. 1. p. 260.*

**PAPER-MILLS**, See the article **MILL**. (In the court of king's bench) is where the writings belonging to that court are deposited.

**PAPER-OFFICE**, (in the palace of Whitehall) is where all the publick writings, matters of state and council, proclamations, letters, intelligences, negotiations of the king's ministers abroad, and generally, all the papers and dispatches that pass through the offices of the secretaries of state, are lodged, and disposed in the way of library.—It was chiefly from this noble repository that bishop Burnet had materials for his history of the reformation. *Vid. Nichol. Eng. Hist. Libr. P. 3. c. 1. p. 180.*

**PAPER-PORTRAITS, and Pictures**.—One Elizabeth Pyberg, who lived at the Hague in 1699, cut in *Paper* not only towns, as Loo and Hounslerrydyke, but faces to an extreme likeness. Mr. Ellys assures, she did king William and queen Mary better than any limner he had ever seen, and refused 1000 guilders for the pieces: which were so curious, that he could not believe the queen's drapery not to be point till he had most exquisitely inquired into it.—*Vid. Phil. Transf. N° 286. p. 1418.*

For the *Moving Paper-Work*, or High German *Paper* engine, contrived by Mrs. Vandenhurk, and now exposed to publick show in London, we can give no particular account of it.

**PAPERS** is also used for writings, especially those relating to a man's estate, property, dealings, or the like. See **WRITING**. In which sense, *Papers* include books of accounts, invoices, orders; also deeds, bonds, charters, and the like. See **ACT, INSTRUMENT, ACCOUNT, BOOKS, RECORD, ARCHIVE, REGISTER, &c.**

**PAPERS** is also sometimes used for manuscript-books. See **BOOK** and **MANUSCRIPT**.

Such an author left his *Papers* to \*\*\* college. Several of Sir Isaac Newton's *Papers* have been published since his death.—Tournefort assures us, that the heirs of M. de Peirensk warmed themselves a whole winter with the *Papers* he left in his cabinet. It had been cheaper, adds M. Tournefort, if they had burnt cedar, or aloes wood.—*Vid. Journ. Liter. T. 12. p. 64.*

**PAPERS** is more particularly used of late days for gazettes, journals, and other public news-writings. See **GAZETTE, JOURNAL, &c.**

In this sense we say to read the *Papers*: the *Papers* abound with falsehoods: the multitude of *Papers* is become a burthen on coffee-houses, but an advantage to the revenue.—We have daily *Papers*, weekly *Papers*, morning *Papers*, evening *Papers*, occasional *Papers*, political *Papers*, literary *Papers*, *Papers* of entertainment, &c.

**PAPER**, among bankers and other negociants, is also used for bills of exchange, bank, and promissory notes, &c. See **BILL, &c.** I have no money to give you, but only *Paper*; *Paper* indeed as good as ready money. In the year 1720 multitudes were ruined by changing their money and lands for *Paper*. It is the use and effect of credit to represent money by *Paper*. See **MONEY**.

Substituting *Paper* for money, and giving the *Paper* an arbitrary value, was the way of paying debts introduced in France by Mr. Law.—A royal bank was established, to which people were to carry their money, and receive the value of it in bills, which were to pass current in trade as so much money.—*Vid. Cheygn, Scient. des Pers. de la Cour. T. 2. p. 292. seq.*—It was made confiscation of goods, and the galleys, for any man to keep above 40 livres by him of any but *Paper* money. When the regent was told what a rage was spirited up against him about the arrears for making *Paper* current, and how openly the people threatened him, he answered coolly, the French were like watch dogs, they would bark but not bite, *les François ressemblent aux chiens à garde, ils aboient, mais ne mordent pas.* *Misc. Lett. T. 4. p. 16.*

**PAPER**, among fan-painters. See the article **FAN**.

**PAPILLA**, in anatomy, *nipple*; a prominence arising from the middle of the breast, or mamma. See **BREAST**.

The colour of the *Papilla* is various; in different states, and stages of life, it is reddish, bluish, blackish. It is encompassed with a pale brownish circle, called *Areola*.

The lacteal tubes coming from the several parts of the breasts, terminate in the *Papillæ*, with several nervous, or spongy emissaries which communicate with each other by anastomoses, through which, in sucking, the milk is drawn. See **MILK**.

**PAPILLÆ Pyramidales**, are little eminences arising from the subcutaneous nerves. See **PYRAMIDAL**.

Under the cutis lies a thick congeries of nerves, wove into a

kind of membrane; together with arteries, veins, and lymphatics: these nerves standing out about the level, form little *Papillæ*, which laying aside the outer coat given them by the dura mater, form the corpus reticulare, first observed by Malpighi in the feet, hands, and tongue; and since shewn by Ruysch, throughout the whole body.—See *Tab. Anat. (Myol.) Fig. 8. Lit. a a, &c. b b.* See also **RETICULARE**.

These *Papillæ* are still most numerous and conspicuous in the places of acute sense, as the tongue, glans of the penis, vagina, labia, œsophagus, ventricle, small intestines, and tips of the fingers and toes, where the cutis they are covered withal is extremely thin. See **CUTIS**.

In the other parts of the body the cutis is thicker, and the *Papillæ* much fewer, smaller, &c.

These *Papillæ* are supposed to be the immediate organ of feeling. See **FEELING**.

**PAPILLÆ of the tongue**, are little eminences of the tongue; so called from their resemblance to the *Papillæ* of the breast. See **TONGUE**.

From the papillary tunic of the tongue arise numerous nervous *Papillæ*, which, penetrating the viscous substance over them, terminate under the surface of the tongue. See **PAPILLARY**. It is by means of these *Papillæ*, that the tongue is supposed to have its Faculty of tasting. See **TASTING**.

**PAPILLÆ, or caruncula PAPILLARÆ**, of the kidneys, are bundles of little urinary pipes, joined together in the inner substance of the kidneys. See **KIDNEY** and **CARUNCULÆ**.

They end in short tubulous bodies, or larger pipes, answering in number to the *Papillæ*, which are usually 12; and are called *Fistulæ Membranaceæ*; being only productions of the membranous cell called the *Pelvis*. See **PELVIS**.

The *Papillæ* serve to distill the urine separated from the arteries, and brought them by the urinary pipes, into the pelvis. See **URINE**.

**PAPILLARY, PAPILLARIS**, in anatomy, an epithet given to a tunic or membrane of the tongue, called *Papillary Tunic, Papillary Membrane, or Papillary Body*. See **TONGUE**.

The *papillary tunic*, or body, is the third tegument, placed beneath the exterior membrane which lines the tongue, and the viscous substance next under the same.

It is full of nerves derived from the fifth, and ninth pair. From this tunic arise little eminences, called *Papillæ* or *Papillary Eminences*. See **PAPILLA**.

The salts and juices of bodies, striking against these prominences, occasion undulations therein, which are immediately communicated to the spirits contained in the nerves, which carry them to the brain, &c. See **TASTING**.

**PAPILLARY Processes**, is a name which the ancients gave to the olfactory nerves, from the place of their origin, to the os cribriform. See **NERVE**.

Dr. Drake thinks this name becomes them better in this place than that of nerves, in regard they rather appear as productions of the medulla oblongata, whence the olfactory nerves arise, than distinct nerves; against which their manifest cavities, and their communication with the ventricles, argue.

**PAPILIONACEOUS**, in botany, an appellation given to the flowers of some plants, as representing something of the figure of a *papilio* or butterfly, with its wings displayed. See **PLANT**. *Papilionaceous Flowers* have four petals, or leaves, joined together at the extremities: one in the middle of the flower is larger than the rest, and by some called *veixillum*, or the standard.

The plants, that have this flower, are of the leguminous kind, as pease, beans, vetches, &c. See **FLOWER**.

**PAPPUS**, in botany, that soft light down, which grows out of the seeds of some plants, as thistles, dandelion, hawkweed, &c. and which buoys them up so in the air, that they may be blown any where about with the wind. See **SEMINATION**.

This distinguishes a class, or kind of plants, which are hence denominated *Papposæ*, or *Pappiferae*.

**PAR**, in commerce, an equality between different monies; or so much as a person must give of one kind of specie, to render it just equivalent to a certain quantity of another. See **MONEY**.

The *Par*, differs from the course of exchange, in this, that the *Par* of exchange shews what other nations should allow in exchange; which is certain and fixed, by the intrinsic values of the several species to be exchanged: but the course shews what they will allow in exchange; which is uncertain and contingent, sometimes more, sometimes less. See **EXCHANGE**.

Some have charged our merchants with a great error in suffering our neighbours to settle the *Par* of our exchanges far below what it ought to have been settled at: by which means we have been imperceptibly robb'd of the greatest part of our silver, and no small part of our gold.

For instance, it hath been reckoned for upwards of 40 years last, that 37 Dutch schillings, and 4 ninths of their grois Flemish are exactly equal to, or on a *Par* with our pound sterling or twenty shillings: whereas it appears demonstrable that we lose between 4 and 7 per cent. by every such exchange.—See Sir I. Newton's *Essays and Calculations on foreign coins*.

The French crown of 60 sols, before the late diminution, was equivalent to 54 pence (now to 31 d. 1) sterl. of England; to

100 deniers grofs of Holland; and to 101 of those of Cologne. To 48 Lubec fols of Germany and Hambourg. To 88 creux of Aufbourg, and 90 of Franckfort, 83 of Bolzam, and 84 of Switzerland. To 8 Julio's and an half of Rome, and as many of Ancona; to 3 Testoons of Florence, 58 Soldi of Leghorn, 83 of Geneva, 94 of Milan, 60 of Nova; to 5 lires or livres of Genoa, 4 lires and 10 soldi of Lucca, 8 lires of Bergama, 3 lires and 15 soldi of Savoy; to 9 carlins of Naples, and as many of Sicily; 21 groats and three fifths of Venice, 24 of Naumbourg, to 372 maravedis of Spain, to 600 rees of Portugal, to 4 tarins and 15 grains of Malta, to 120 aspers of Constantinople, to a demi-honge of gold of Hungary, to two florins of Liege, 3 of Strasbourg, and 20 of Raconis, to 90 groats or groches of Poland, and 24 of Berlin, to 80 marks of copper of Sweden, to 50 grives or grifts of copper of Muscovy, and lastly, to 4 hors of Denmark.—Savar.

PAR, (in anatomy.) See PAIR.

PAR Vagum, or the eighth Pair, is a very notable conjugation of nerves of the medulla oblongata; thus called from their wide, vague distribution throughout the several parts of the body.—See their origin, course, distribution, &c. under NERVE.

PAR, (a term of nobility.) See PEER.

PARABLE\*, ΠΑΡΑΒΟΛΗ, a fable, or allegorical instruction founded on something real, or apparent in nature, or history; from which a moral is drawn, by comparing it with some other thing, wherein the people are more immediately concerned.

\* The word is formed from the Greek, παραβάλλω, to oppose, compare.

Such are those *Parables* of the ten virgins, of Dives and Lazarus, of the prodigal son, &c. in the *New Testament*. St. Matthew says, our Saviour never spoke to the people but by *Parables*. Aristotle defines *Parable*, a similitude drawn from form to form. Cicero calls it a collation, others a simile. F. de Colonia calls it a rational fable.

The Hebrew calls it מִשְׁלָּה, from a word which signifies to predominate, to assimilate; whence the proverbs of Solomon are also called מִשְׁלָּה *Parables*, or *Proverbs*. See *ÆNIGMA*.

Glossius defines *Parable* a simile, wherein a fictitious thing is related as real, and compared with some spiritual thing, or accommodated to signify it. See *ACCOMMODATION*.

Some make *Parable* differ from fable; Grotius and others use the two promiscuously. Kircher derives the use of *Parables* from the Egyptians. See *FABLE*.

In the *New Testament*, the word *Parable* is used variously. In Luke IV. 23. for a proverb, or adage: In Math. XV. 15. for a thing darkly and figuratively expressed: In Heb. IX. 9, &c. for a type: In Luke XIV. 7, &c. for a special instruction: Math. XXIV. 32. for a similitude or comparison.

PARABOLA, in geometry, a figure arising from the section of a cone, when cut by a plane parallel to one of its sides. See *SECTION*.

From the same point of a cone, therefore, only one *Parabola* can be drawn; all the other sections within those parallels being ellipses; and all without, hyperbola's. See *CONE*.

Wolffius defines the *Parabola* to be a curve wherein  $a x = y^2$ , that is, the square of the semi-ordinate is equal to the rectangle of the abscisse, and a given right line called the *parameter* of the axis, or *latus rectum*. See *PARAMETER*.

Hence, a *Parabola* is a curve of the first order; and as the abscisses increase, the semi-ordinates increase likewise; consequently the curve never returns into itself.

Hence also the abscisse is a third proportional to the parameter and semi-ordinate, and the parameter a third proportional to the abscisse and semi-ordinate; and the semi-ordinate a mean proportional between the parameter and abscisse.

To describe a PARABOLA.—The parameter AB (Tab. Conics. Fig. 8.) being given; continue it to C, and from B let fall a perpendicular to N. From centres taken at pleasure, with the compasses open to A, describe arches cutting the right line BV in I, II, III, IV, V, &c. And the right line BC in 1, 2, 3, 4, 5, &c. Then will B I, B 2, B 3, B 4, B 5, &c. be abscisses; and B I, B II, B III, B IV, B V, &c. semi-ordinates. Wherefore, if the lines B I, B 2, B 3, &c. be transferred from the line BC to that BN, and in the points 1, 2, 3, 4, &c. perpendiculars be raised, 1 I = B I, 2 II = B II, 3 III = B III, &c. the curve passing through the points, I, II, III, &c. is a *Parabola*; and PN its axis.

Every point of the *Parabola* may also be determined geometrically; e. gr. If it be inquired, whether the point M be in the *Parabola* or not; from M to BN let fall a perpendicular MP, and let PN be equal to the parameter AB; upon BN describe a semicircle. For if that pass through M, the point M is in the *Parabola*.

In a *Parabola*, the distance of the focus from the vertex, is to the parameter, in a subquadruple ratio: and the square of the semi-ordinate is quadruple the rectangle of the distance of the focus from the vertex, into the abscisse. See *FOCUS*.

To describe a PARABOLA by a continual Motion.—Assuming a right line for an axis, let f A, Fig. 9. = AF = a. In A fix a ruler

DB cutting the axis f D at right angles. To the extremity of another ruler EC, fasten a thread fixed at its other extreme in the focus E, which is to be = AD + AF. If then a style or point be fixed to the ruler EC, and the ruler be carried first to the right then to left, according to the direction of the other DB; the style will mark out a *Parabola*.—For FM will be constantly = EM = Pf =  $x + \frac{1}{4}a$ , and consequently the point M is in a *Parabola*.

Properties of the PARABOLA.—The squares of the semi-ordinates are to each other as the abscisses: and the semi-ordinates themselves, in a subduplicate ratio of the abscisses.

The rectangle of the sum of two semi-ordinates into their difference, is equal to the rectangle of the parameter into the difference of the abscisses: the parameter therefore is to the sum of the two semi-ordinates, as their difference to the difference of the abscisses.

In a *Parabola*, the rectangle of the semi-ordinate into the abscisse, is to the square of the abscisse, as the parameter to the semi-ordinate.

In a *Parabola*, the square of the parameter is to the square of one semi-ordinate, as the square of another semi-ordinate to the rectangle of the abscisses.

In a *Parabola*, the subtangent is double the abscisse, and the subnormal, subduple of the parameter.

Quadrature of the PARABOLA. See *QUADRATURE*.

Rectification of the PARABOLA. See *RECTIFICATION*.

Centre of gravity of a PARABOLA. See *CENTRE OF GRAVITY*.

Centre of oscillation of the PARABOLA. See *OSCILLATION*.

PARABOLA's of the higher kinds are algebraic curves, defined by  $a^m - x^m = y^m$ . e. gr. by  $a^2 x = y^3$ ,  $a^3 x = y^4$ ,  $a^4 x = y^5$ ,  $a^5 x = y^6$ , &c. See *CURVE*.

Some call these *Paraboloids*: more particularly, if  $a^2 x = y^3$ ; they call it a *Cubical Paraboloid*. If  $a^3 x = y^4$ , &c. they call it a *Biquadratical Paraboloid*, or a *Surdefolidal Paraboloid*. See *CUBICAL*.

And in respect of these, the *Parabola of the first kind*, above explained, they call the *Apollonian*, or *Quadratic Parabola*.

Those curves are likewise to be referred to *Parabola's* wherein  $a x^m = y^m$ . as e. gr.  $a x^2 = y^3$ ,  $a x^3 = y^4$ , which some call *Semi-parabola's*. They are all comprehended under the common equation,  $a^m x^m = y^m$ , which also extends to other curves, v. gr. to those wherein  $a^2 x^2 = y^3$ ,  $a^3 x^3 = y^4$ ,  $a^4 x^4 = y^5$ .

Since in *Parabola's* of the higher kinds,  $y^m = a^m - x^m$ ; if any other semi-ordinate be called  $v$ , and the abscisse corresponding thereto  $z$ , we shall have  $v^m = a^m - z^m$ , consequently  $y^m : v^m :: a^m - x^m : a^m - z^m$ . that is  $x : z$ . It is a common property, therefore, of these *Parabola's*, that the powers of the ordinates are in the ratio of the abscisses.

But in *Semi-parabola's*,  $y^m : v^m :: a x^m - x^m : a z^m - z^m$ . Or; the powers of the semi-ordinates are as the powers of the abscisses, one degree lower. e. gr. in *Cubical Semi-parabola's*; of the ordinates  $y^3$  and  $v^3$  are as the squares of the abscisses  $x^2$  and  $z^2$ . See *SEMI-PARABOLA*.

Apollonian PARABOLA, is the common, or *Quadratic Parabola of the first kind*; so called by way of distinction from *Parabola's* of the higher kinds: which see.

Quadratic PARABOLA, is the same with the *Apollonian*: which see.

Peleoid PARABOLA. See the article PELECOID.

Resistance of a PARABOLA. See the article RESISTANCE.

PARABOLAN\*, PARABOLANUS, among the ancients, was a sort of gladiator, called also *Confessor*. See *CONFECTOR*.

\* The name was given them from the Greek, παραβάλλω of βάλλω, to throw, precipitate; in regard they threw themselves on danger and death.

PARABOLANI, or PARABOLARII, is also used in church-history, for a set of people, especially in Alexandria, who devoted themselves to the service of churches, and hospitals.

The *Parabolani* were not allowed to withdraw themselves from their function, which was the attendance on the sick.—They made a kind of fraternity, amounting sometime to 600 persons, dependant on the bishop.

The design of their institution was, that the diseased, especially those infected with the plague, might not be without attendance.

PARABOLIC Conoid, a solid figure generated by the rotation of a *Parabola* about its axis. See *CONOID*.

The solidity of the *Parabolic Conoid*, is  $= \frac{1}{2}$  of that of its circumscribing cylinder.

The circles conceived to be the elements of this figure, are in arithmetical proportion, decreasing towards the vertex.

A *Parabolic Conoid* is to a cylinder of the same base and height, as 1 to 2; and to a cone of the same base and height, as  $1 \frac{1}{2}$  to 1.

PARABOLIC Cuneus, a solid figure formed by multiplying all the DB's, Tab. Conics, Fig. 10. into the DS's: or which amounts to the same, on the base APB erect a prism, whose altitude is AS: this will be a *Parabolical Cuneus*, which of necessity will be equal to the *parabolical pyramidoid*; inasmuch as the component rectangles, in one, are severally equal to all the component squares, in the other.

PARABOLIC Pyramidoid, a solid figure, generated by supposing all

all the squares of the ordinate applicates in the *Parabola*; so placed, as that the axis shall pass through all their centres at right angles; in which case the aggregate of the planes will form the *parabolic pyramidoid*.

The solidity hereof is had by multiplying the base by half the altitude; the reason whereof is obvious: for the component planes being a series of arithmetical proportionals beginning from 0, their sum will be equal to the extremes multiply'd by half the number of terms, that is, in the present case, equal to the base multiplied by half the height.

**PARABOLIC Space**, the space or area contained between any entire ordinate, as VV, *Tab. Conics, Fig. 8*, and the curve of the incumbent *Parabola*. See **PARABOLA**.

The *Parabolic Space* is to the rectangle of the semi-ordinate into the abscisse, as 2 to 3: to a triangle inscribed on the ordinate as a base, the *Parabolic Space* is as 4 to 3.

Every *Parabolical* and *Paraboloidal Space* is to the rectangle of the semi-ordinate into the abscisse as  $rxy : (m + r) \times y$ , that is, as  $r$  to  $m + r$ .

**Segment of a PARABOLIC Space**, is that space included between two ordinates. See **SEGMENT**.

**Quadrature of a Parabolical Segment**. See **QUADRATURE**.

**PARABOLIC Speculum or Mirrour**. See **MIRROR**.

**PARABOLIC Spindle**. See **PYRAMOID**.

**PARABOLOIDES**, in geometry, *Parabola's* of the higher kinds. See **PARABOLA of the higher Kinds**.

**Quadrature of a PARABOLOID**. See **QUADRATURE**.

**Rectification of a PARABOLOID**. See **RECTIFICATION**.

**Centre of Gravity of a PARABOLOID**. See **CENTRE**.

**Quadratic PARABOLOID, Cubical Paraboloid, Surdesolidal Paraboloid**. See **PARABOLA's of the higher Kinds**.

**PARACENTESIS\***, ΠΑΡΑΚΕΝΤΗΣΙΣ, an operation in chirurgery, popularly called *Tapping*.

\* The word is formed from the Greek Παρά, with, and κέντιν, pungere, to prick.

It consists in opening a little hole in the lower venter, or belly, to let out waters collected in the cavity thereof, or between the teguments, in an ascites or water dropfy. See **DROPSY**. The ancients cut the aperture with a lancet; but the moderns punch it with a kind of stilet or bodkin; clapping a cannula or tap into the hole when made, to carry off the water. See **CANNULA**.

The operation is usually performed two or three fingers breadth on one side the navel, sometimes a little lower, but always so as to avoid the *linea alba*.

The water is usually drawn off at several times, as the patient's strength will allow; and a new puncture is made, every time the belly is thus to be emptied.

The *Paracentesis* does not often succeed, though often repeated; because the root of the disease, notwithstanding the carrying off the water by this means, is still left behind.

**PARACENTESIS**, is also a Name applied by some authors to all operations either with the lancet, the needle, or punch; not excepting the operation of couching for cataracts; founded on the etymology of the word. — Others restrain it to apertures made in the head, breast, belly and scrotum; and others to the single operation of tapping in dropfies. See **PUNCTURE**, **COUCHING**, &c.

**PARACENTRIC Motion**, in astronomy, a term used for so much as a revolving planet approaches nearer to, or recedes farther from the sun, or centre of attraction. See **ATTRACTION**.

Thus if a planet in A, *Tab. Astronomy, Fig. 24*, move to B, then is SB—SA=bB, the *Paracentric* motion of that planet.

**PARACENTRIC Solicitation of Gravity**, amounts to the same with the *vis centripeta*, and, in astronomy, is expressed by the line AL, *Fig. 24*, drawn from the point A parallel to the ray SB (infinitely near SA) till it intersect the tangent BL.

**PARACLET**, a name which the Church has given to the Holy Spirit: from the Greek παρακλητος, q. d. comforter, advocate. See **SPIRIT** and **TRINITY**.

**PARACME**, Παράκμη, a Greek word signifying declension, or a thing's being past its aim. See **PERIOD**.

**PARACYNANCHE**, in medicine. See **PARASYNANCHE**, and **ANGINA**.

**PARADE**, the shew or expofal of any thing to view, in all its advantages and ornaments. See **SPECTACLE**.

Bed of *Parade*, is that wherein a person lies in state.

**PARADE**, in war, the place where troops assemble, or draw together in order to go on any service. See **PLACE of arms**.

**PARADE** is most properly the appearance of the officers and soldiery at a post assigned them, to put themselves under arms, in the best order they can; either to mount, or break up the guard, or to form a battalion, or on some other occasion.

**PARADE**, in fencing, the action of parrying, or turning off any push, or stroke. See **PARRYING**.

There are as many kinds of *Parades*, as of strokes, and attacks. *Parade* inward, outward, above, below, feigned, &c.

**PARADIGM\*** PARADIGMA, an example, or instance of something said, or done. See **EXAMPLE**.

\* The word is formed of the Greek παραδειγμα, exemplar, of παρὰ and δεικνυμι, ostendo, q. d. *juxta ostendo*.

**PARADISE\***, a term primarily used for the place wherein Adam was seated, during his innocence; and from which he was expelled for disobeying God: called, in a stricter manner, the *Terrestrial Paradise*.

\* The word is formed of the Greek, παραδισος, orchard, a place stored with apples, and all kinds of fruit. — Moses calls it the *Garden of Eden*, q. d. garden of delight, from ἡδονή, voluptas, pleasure.

The critics are in dispute about the precise place of *Paradise*. Some will have it in Judea, in the place where now is the lake Genesareth; others, in Syria, towards the springs of the Orontes, and Chryssorrhoe: but, in neither of those places do we discover any track of the rivers wherewith *Paradise*, in Moses's description, was watered. Others place it in the greater Armenia near the mountain Ararat, where Noah's Ark was left; and imagine they there discover the sources of the four rivers which watered the garden of Eden, viz. Euphrates; Hiddekel, now the Tygris; Gihon, now Araxes; and Pison, now Phazzo. But Sir J. Chardin assures us, in his travels, that the Phazzo springs out of the mountains of Caucasus, northward of the kingdom of Imereti, and far enough from mount Ararat: besides, that in Armenia, we have no signs of the countries of Havilah and Ethiopia, which those rivers washed after their departing from Eden.

There are various other opinions as to this point: Postellus will have *Paradise* placed under the north-pole; grounding his notion upon an ancient tradition of the Egyptians and Babylonians, that the ecliptic, or sun's way, was at first at right angles to the equator; and so passed directly over the north-pole. Others are against limiting it to any one place, and contend, that it included the whole face of the earth, which was, as it were, one continued scene of pleasures, till altered upon Adam's transgression.

But the most common and probable opinion is that of Hopkinson, Huet, Bochart, &c. who place *Paradise* between the confluence of the Euphrates, and Tygris, and their separation. These rivers are two of those wherewith the garden of Eden was watered: Pison was a branch arising out of one of them after their separation; and Gihon another branch arising from the other, on the side of Armenia, or the West: accordingly Ethiopia, one of the countries which these rivers washed, was, incontestably, Arabia Deserta; for Moses calls his Wife, who was of this country, an Ethiopian; and Havilah, the other country, must be the Chusistan in Persia; where there were anciently found gold, bdellium, the onyx, &c. mentioned in Moses's description.

**PARADISUS**, among ancient church-writers, denoted a square court, before cathedrals, surrounded with piazza's, or portico's for walking under, supported by pillars. See **PORTICO**. Matthew Paris calls it *Parvisus*. See **PERVISE**.

**PARADOX\***, ΠΑΡΑΔΟΞΟΝ, in Philosophy, a proposition seemingly absurd, because contrary to the received opinions; but yet true in effect. See **PROPOSITION**.

\* The word is formed from the Greek παρὰ, contra, against, and δόξα, opinion.

The Copernican system is a *Paradox* to the common people; the learned are all agreed of its truth. See **COPERNICAN**.

There are even *Paradoxes* in geometry; a number whereof are collected by the Jesuit Marius Bettinus: among others is this, That the contained is greater than the containing.

**PARADOXI**, or **PARADOXOLOGI**, among the ancients, were a kind of mimes or buffoons, who diverted the people with their drolling. See **PANTOMIME**.

They were also called *Ordinarii*, for this reason apparently, that, as they spoke without study or preparation, they were always ready.

They had another denomination, viz. *Nianicologi*, q. d. tellers of children's tales: and, besides, were called *Aretologi*, of ἀρετήν virtue, as talking much of their own rare talents and qualifications.

**PARÆNESIS\***, ΠΑΡΑΙΝΕΣΙΣ, a Greek term, signifying admonition, or exhortation.

\* The word is formed of παρὰ, and αἰνέω, laudo, I praise.

**PARAGE**, PARAGIUM in law, an equality of blood, or dignity; but more especially of land, in the partition of an inheritance between co-heirs. See **PEER**.

**PARAGE**, PARAGIUM, is more particularly used in ancient customs, for an equality of condition among nobles, or persons holding nobly. See **PEER** and **PEERAGE**.

Thus when a fief is divided among brothers; in this case the younger hold their part of the elder by *Parage*, i. e. without any homage or service.

This still obtains, in some measure, in Scotland, where the husbands of the younger sisters are not obliged to any faith or homage to the husband of the elder; nor their children, to the second degree.

This *Parage* being an equality of duty, or service among brothers and sisters, some have called it *Fratriage* and *Parentage*.

The customary of Normandy defines tenure by *Parage* to be, when a noble fief being divided among daughters, the eldest does homage to the chief lord for all the rest, and the youngest hold

hold their parts of the eldest by *Parage*, i. e. without any homage or fealty. See **FRATRIAGE**.

*Parage* ceases at the sixth degree inclusively. It likewise ceases when any of the sharers sell their part. See **HOMAGE**.

**PARAGOGÉ**, ΠΑΡΑΓΩΓΗ, in grammar, a figure, whereby a word is lengthened out, by adding a syllable at the end thereof, as in *dicier* for *dici*. See **FIGURE**.

**PARAGOGIC**\*, in grammar, denotes something added to a word without adding any thing to the sense thereof.

\* The word is formed of the Greek παραγω, I prolong; compounded of παρα and αγω.

In the Hebrew, the ה is frequently *Paragogic*; as in אברהם for, אברך I will praise.

The use of *Paragogic* letters is only to give a more full and agreeable sound to words, either for the sake of the verse, or the period.

**PARAGORICKS**. See the Article **PARAGORICKS**.

**PARAGOUÉ**. See the Article **PARAGUAY**.

**PARAGRAPH**, ΠΑΡΑΓΡΑΦΟΣ, a term in jurisprudence, signifying a section, or the division of the text of a law: otherwise called an *Article*. See **SECTION**.

Such a law is said to be divided into so many *Paragraphs*. The character of a *Paragraph* in quotation, is §. See **CHARACTER**. Among the Greek poets, *Paragraphs*, Παράγραφοι, were a species of critical Notes, serving to mark the couplets, strophes, and other divisions of odes, and other poetical compositions.—This *Paragraph*, as described by the scholiast of Aristophanes, was a short line with a dot at the extremity of it.

**PARAGUAY**, or **PARAGOUÉ**, in natural history, a celebrated plant of the shrub kind, growing in some provinces of South-America, especially *Paraguay*, whence its name; though better known among us, under the denomination of *South-Sea Tea*. See **TEA**.

This plant, which does not rise above a foot and half high, has very slender branches, and leaves like those of fenna; it may be looked on as a kind of occidental tea, which, like the oriental, is taken infused in hot water, to which it communicates a colour and smell nearly like those of the best tea seen in Europe.

There are two kinds of *Paraguay*, the one called simply *Paraguay*; the other *Camini*, by the Spaniards, *Yerva-Camini*; which last is most esteemed, and sold for a third more than the other. The first the Spaniards call *Yerva con palos*, i. e. herb with little sticks, because full of broken branches, and is chiefly used by domesticks and slaves: the latter is the drink of the richest. But both are of so much use, and esteemed of such absolute necessity, that no body in that part of America will live without them. The works of the mines of Potosi would stand still, but that the masters take care to supply the poor slaves that labour therein, with *Paraguay*, which is their constant remedy against those mineral steams wherewith they would otherwise be suffocated. Nor will a servant engage himself with any master, but upon this, among other conditions, that he have nothing but *Paraguay* for drink.

The *Paraguay* makes one of the most considerable articles of the South-American commerce. At Peru, Chily, and Buenos Ayres, there are above two millions worth sold *per Annum*; which passes almost altogether through the hands of the Jesuits. The use of *Paraguay* began lately to obtain in *England*; where many People seemed to like it as well as tea. But foreigners say, that their approbation flowed as much from their interest as their taste; in regard they came so easily by it, by reason of their commerce with the Spaniards of South America, and Buenos Ayres, since the treaty of Utrecht in 1713.

The preparation of the plant, and the making it into drink, is much the same with that of tea, except that they infuse both leaves and wood, that they drink it immediately out of the vessel it is made in; without letting it have time to infuse, by reason of the black tincture it gives; and that, to prevent leaves and all from coming, they suck it through a silver, or glass pipe, which goes round the company one after another. Frezier.

Besides all the virtues which the eastern people ascribe to their tea; as to be good in diseases of the head, breast, stomach, against phlegm, and to restore sleep; the Americans attribute to theirs this further, of purifying all kinds of water, how foul and corrupt soever, by only infusing it therein, either hot or cold. Thus, having always some of it with them, if they meet with none but the worst waters in the vast deserts to be crossed in going from Buenos Ayres to Peru and Chily, they are not afraid to drink them, after steeping some of the plant a little while therein. It is also held sovereign against the scurvy and putrid fevers.

**PARALEPSIS**, ΠΑΡΑΛΕΨΙΣ, in rhetoric, a pretence of omitting, or passing over a thing, and yet expressing it by the way. See **FIGURE**.

When the imagination is warmed, and reasons and arguments present themselves in abundance; the orator would willingly lay them all down, in form; but, for fear of wearying his audience, only produces some of them *en passant*, and without dwelling on them; and this is called a *Paralepsis*, by the Latins *Præteritio*, by the Greeks *Ἀποσχοπὴ*. See **PRETERITION**, &c.

For instance, I pass over in silence the many injuries I have received, &c. I won't insist on his last outrage.

**PARALIPOMENA**\*, ΠΑΡΑΛΙΠΟΜΕΝΑ, a supplement of things omitted, or forgot in some preceding work, or treatise. See **SUPPLEMENT**.

\* The word is formed from the Greek, παραλείπω, *prætermitto*, I pass by. — Some authors use the word *Subrelictum* instead of *Paralipomenon*.

In the canon of scripture, there are two books of *Paralipomena*, called in the English version, *Chronicles*; being a supplement to the four books of kings, the two first whereof are also called *Books of Samuel*.

Quintus Calaber has a work entituled, the *Paralipomena of Homer*.

**PARALLACTIC Angle**, called also simply, **PARALLAX**, is the angle made in the centre of a star by two right lines, drawn, the one from the centre of the earth, T B, (*Tab. Astron. Fig. 27.*) the other from its surface, E B.

Or, which amounts to the same, the *Parallaëtic* angle is the difference of the angles CEA, and BTA, under which the real and apparent distances from the zenith are seen. See **PARALLAX**.

The Sines of the *Parallaëtic* angles ALT and AST, *Tab. Astron. Fig. 30.* at the same or equal distances from the zenith SZ, are in a reciprocal ratio of the distances of the stars from the centre of the earth TL and TS.

**PARALLAX**, ΠΑΡΑΛΛΑΞΙΣ, in astronomy, an arch of the heavens intercepted between the true place of a star, and its apparent place. See **PLACE**.

The true place of a star is that point of the heavens, B, *Tab. Astronomy, Fig. 27.* wherein it would be seen by an eye placed in the centre of the earth, as at T.—The apparent place is that point of the heavens, C, wherein the star appears to an eye on the surface of the earth, as at E.

Now, as in effect, we view the celestial bodies not from the centre, but from the surface of our earth, which is a semi-diameter distant from the centre; we see it by a visual ray, which, passing through the centre of the star, and proceeding thence to the surface of the mundane sphere, marks out another point C, which is its apparent place.

This difference of places, is what we call absolutely, the *Parallax*, παραλλαξίς, or the *Parallax of Altitude*; by Copernicus called the *Commutation*; which, therefore, is an angle formed by two visual rays, drawn, the one from the centre, the other from the circumference of the earth, and traversing the body of the star; and is measured by an arch of a great circle intercepted between the two points of true and apparent place C and B.

**PARALLAX of Declination**, is an arch of a circle of declination SI, *Fig. 28.* whereby the *Parallax* of altitude increases or diminishes the declination of a star. See **DECLINATION**.

**PARALLAX of right Ascension and Declension**, is an arch of the equator Dd, *Fig. 28.* whereby the *Parallax* of altitude increases the ascension, and diminishes the descension. See **ASCENSION** and **DESCENSION**.

**PARALLAX of Longitude**, is an arch of the ecliptic Tt, *Fig. 29.* whereby the *Parallax* of altitude increases or diminishes the longitude. See **LONGITUDE**.

**PARALLAX of Latitude**, is an arch of a circle of latitude SI, whereby the *Parallax* of altitude increases or diminishes the latitude. See **LATITUDE**.

**PARALLAX** is also used for the angle made in the centre of the star, by two right lines, drawn, the one from the centre, the other from the surface of the earth.

This is also called *Parallaëtic Angle*. See **PARALLACTIC Angle**. Hence, the *Parallax* diminishes the altitude of a star, or increases its distance from the zenith, and has, therefore, a contrary effect to the refraction. See **REFRACTION**.

The *Parallax* of altitude CB, *Fig. 27.* is, strictly, the difference between the true distance from the zenith CA, and the apparent distance BA. See **PARALLACTIC Angle**.

The *Parallax* is greatest in the horizon; in the zenith, or meridian, a star has no *Parallax* at all; the true and apparent places then co-inciding.

The horizontal *Parallax* is the same, whether the star be in the true, or apparent horizon.

The fixed stars have no sensible *Parallax*, by reason of their immense distance, to which the semi-diameter of the earth is but a meer point. See **STAR** and **PLANET**.

Hence also, the nearer a star is to the earth, the greater is its *Parallax*, at an equal elevation above the horizon; Saturn is so high, that we have much ado to observe any *Parallax* at all. See **SATURN**.

The *Parallax* increases the right and oblique ascension, diminishes the descension; diminishes the northern declination, and latitude in the eastern part, increases them in the western; increases the southern in the eastern and western part; diminishes the longitude in the western part, increases it in the eastern. The *Parallax*, therefore, has just opposite effects to the refraction. See **REFRACTION**.

Hence the *Parallax* of the remoter star S, is less than the *Parallax*

*parallax* of the nearer  $L$ , at the same distance from the zenith; as before observed.

The sines of the *Parallaëtic* angles  $M$  and  $S$ , of stars equally distant from the centre of the earth  $T$ , are as the sines of the distances seen from the vertex  $ZM$ , and  $ZS$ .

Hence, as the distances from the vertex decrease, *i. e.* as the altitudes decrease, the *Parallax* decreases; and hence, also, the *Parallax* affects the altitude of the star, from the horizon to the zenith.

The doctrine of *Parallaxes* is of the utmost importance in astronomy; both for determining the distances of the planets, comets, and other phenomena of the heavens; for the calculation of eclipses; and for finding the longitude. See *PLANET, DISTANCE, LONGITUDE, and ECLIPSE*.

Methods of finding the *Parallaxes* of the celestial phenomena are various: Some of the principal and easier follow.

*To observe the PARALLAX of a celestial phenomenon.*—Observe when the phenomenon is in the same vertical with a fixed star which is near it; and measure its apparent distance from this star. Observe again, when the phenomenon and fixed star are in equal altitudes from the horizon; and again measure their distance.—The difference of those distances will be, very nearly, the *Parallax* of the star.

The *Parallax* of a phenomenon may be likewise found by observing its azimuth, and altitude; and by marking the time between the observation and its arrival at the meridian.

All required to find the *Parallax* of the moon, is the *Parallax* of right ascension: *i. e.* to find the effect of the magnitude of the semi-diameter of the earth, with regard to the phenomena of its motion, it is sufficient to know how far the meridian, to which the eye refers it, deviates from the true meridian. This is what  $M. Cassini$  found and practised, with regard to mars; and which  $M. Maraldi$  has since practised, with regard to the moon.—The whole mystery here consists in having the moon's true motion, which refers to the centre of the earth; and its apparent motion, which refers to the place of observation. The difference of these, which is greatest in the horizon, or horary circle of 6 o'clock, gives the horizontal *Parallax*, for that latitude, whence the general *Parallax*, or that under the equator is easily found: the *Parallax* of any parallel being to that of the equator, as the semi-diameter of this parallel is to that of the equator. See the *practice of this method exemplified in finding the PARALLAX of mars*.

*To observe the moon's PARALLAX.*—Observe the moon's meridian altitude, with the greatest accuracy, (See *ALTITUDE*) and mark the moment of time: this time being equated; (See *EQUATION*) compute her true longitude and latitude; and from these find her declination; (See *DECLINATION*) and from her declination and the elevation of the equator find her true meridian altitude. If the observed altitude be not meridian, reduce it to the true altitude for the time of observation. Take the refraction from the observed altitude, and subtract the remainder from the true altitude: the remainder is the moon's *Parallax*.

By this means Tycho, in 1583. Oct. d. 12. hor. 5. 19'. from the moon's meridian altitude observed,  $13^{\circ} 38'$  found her *Parallax* 54 minutes. See *MOON*.

*To observe the Moon's Parallax in an eclipse.*—In an eclipse of the moon, observe when both horns are in the same vertical circle; in that moment take the altitudes of both horns; the difference of the two being halved and added to the least, or subtracted from the greatest, gives nearly the visible altitude of the moon's centre. But the true altitude is nearly equal to the altitude of the centre of the shadow at that time. Now we know the altitude of the centre of the shadow; because we know the sun's place in the ecliptic, and its depression under the horizon, which is equal to the altitude of the opposite point of the ecliptic, in which the centre of the shadow is. Thus have we both the true and apparent altitude; the difference whereof is the *Parallax*.

From the moon's *PARALLAX AST*, Fig. 30. and altitude  $SR$ , to find her distance from the earth.—By her apparent altitude given, we have her apparent distance from the zenith, *i. e.* the angle  $ZAS$ ; or by her true altitude the angle  $ATS$ . Wherefore, since, at the same time, we have the *Parallaëtic* angle  $S$ ; and the semi-diameter of the earth  $AT$  is reputed as 1; by plain trigonometry we shall have the moon's distance in semi-diameters of the earth, thus: as the sine of the angle  $S$  is to the opposite side given, so is the sine of the other angle  $T$ , to the side required  $TS$ .

Hence, according to Tycho's observation, the moon's distance at that time from the earth was 62 semi-diameters of the earth. Hence also, since, from the moon's theory, we have the ratio of her distances from the earth in the several degrees of her anomaly; those distances being found by the rule of three in semi-diameters of the earth, the *Parallax* is thence determined to the several degrees of the true anomaly.

De la Hire makes the greatest horizontal *Parallax*  $1^{\circ} 1' 25''$ . the smallest  $54' 5''$ . the moon's distance, therefore, when in her perigee is  $55\frac{2}{3}$ , that is almost 56 semi-diameters; in her apogee  $63\frac{1}{3}$ , that is,  $63\frac{1}{3}$  semi-diameters of the earth.

VOL. II. N<sup>o</sup> 111.

*To observe the PARALLAX of mars.*—1. Suppose mars in the meridian and equator, in  $H$ , *Tab. Astronomy*, Fig. 31, and that the observer under the equator in  $A$ , observes him culminating with some fixed star. 2. If now the observer were in the centre of the earth, he would see mars constantly in the same point of the heavens with the star; and therefore, together with it in the plane of the horizon, or of the sixth horary. But since mars, here, has some sensible *Parallax*, and the fixed star none; mars will be seen in the horizon, when in  $P$ , the plane of the sensible horizon; and the star, when in  $R$  the plane of the true horizon: observe, therefore the time between the transits of mars and of the star through the plane of the sixth hour. 3. Convert this time into minutes of the equator; by this means we shall have the arch  $PM$ , to which the angle  $PAM$ , and consequently the angle  $AMD$  is nearly equal, which is the horizontal *Parallax* of mars.

If the observer were not under the equator, but in a parallel,  $IQ$ , that difference will be a less arch  $QM$ . Wherefore, since the little arches,  $QM$  and  $PM$ , are as their sines  $AD$  and  $ID$ ; and since  $ADG$  is equal to the distance of the place from the equator, *i. e.* to the elevation of the pole; and therefore,  $AD$  to  $ID$ , as the whole sine to the co-sine of the elevation of the pole; say, as the co-sine of the elevation of the pole  $ID$  is to the whole sine  $AD$ ; so is the *Parallax* observed in  $I$ , to the *Parallax* to be observed under the equator.

Since mars and the fixed star cannot be commodiously observed in the horizon; let them be observed in the circle of the third hour: and since the *Parallax* there observed,  $TO$ , is to the horizontal one,  $PM$ , as  $IS$  to  $ID$ ; say, as the sine of the angle  $IDS$ , or  $45^{\circ}$  (since the plane  $DO$  is in the middle between the meridian  $DH$  and the true horizon  $DM$ ) is to the whole sine, so is the *Parallax*  $TO$  to the horizontal *Parallax*  $PM$ .

If mars be likewise out of the plane of the equator; the *Parallax* found will be an arch of a parallel; which must, therefore, be reduced, as above, to an arch of the equator.

Lastly, if mars be not stationary, but rather direct, or retrograde; by observations for several days, find out what his motion is every hour, that his true place from the centre may be assigned for any given time.

By this method, Cassini, to whom we owe this noble invention, observed the greatest horizontal *Parallax* of mars to be 25 seconds, or a little less. By the same method Mr. Flamstead found it near 30 seconds.

By the same method the same author Cassini observed the *Parallax* of Venus.

It must be here noted, that the observation is to be made with a telescope, in whose focus are strained four threads cutting each other at right angles  $A, B, C, D$ , fig. 45, n<sup>o</sup> 2, and the telescope to be turned about, till some star near mars be seen to pass over some of the threads, that the threads  $AB$  and  $CD$  may be parallel to the equator, and therefore,  $AC$  and  $BD$  may represent circles of declination. Thus, by means of the perpendicular threads, the situations of the star, and of mars in the meridian, and circle of three o'clock will be determined.

*To find the Sun's PARALLAX.*—The great distance of the Sun renders its *Parallax* too small to fall under even the nicest immediate observation: Indeed, many attempts have been made both by the ancients and moderns, and many methods invented for that purpose. The first, that of Hipparchus, followed by Ptolemy, &c. was founded on the observation of lunar eclipses; the second was that of Aristarchus, whereby the angle subtended by the semi-diameter of the moon's orbit seen from the sun, was sought from the lunar phases: but, these both proving deficient, astronomers are forced to have recourse to the *Parallaxes* of the planets nearer us, as mars and venus; for from their *Parallaxes* known, that of the sun, which is inaccessible by any direct observation, is easily deduced.

For from the theory of the motions of the earth and planets, we know at any time the proportion of the distances of the sun and planets from us; and the horizontal *Parallaxes* are in a reciprocal proportion to those distances: knowing, therefore, the *Parallax* of a planet, that of the sun may be found from it. Thus, mars, when opposite to the sun, is twice as near as the sun is: his *Parallax*, therefore, will be twice as great as that of the sun: and venus, when in her inferior conjunction with the sun, is sometimes nearer us than he is; her *Parallax*, therefore, is greater in the same proportion.

Thus, from the *Parallaxes* of mars and venus, the same Cassini found the sun's *Parallax* to be ten seconds, which implies his distance to be 22000 semi-diameters of the earth.

In an observation of the transit of venus over the sun, which will be seen in May, 1761. Dr. Halley has shewn a method of finding the sun's *Parallax* and distance to a great nicety, *viz.* to a five hundredth part of the whole. See *SUN*.

*The PARALLAX of the Stars, with regard to the earth's natural orbit.*—The stars have no *Parallax*, with regard to the earth's semi-diameter; yet, with regard to the earth's annual orbit, it is justly expected that some *Parallax* be found. See *ORBIT*.

The axis of the earth in its annual motion describes a kind of cylinder, which being prolonged to the heaven of the fixed stars, there draws a circular circumference; each point whereof is the pole of the world for its respective day: so that the situation of the apparent pole, with regard to any of the fixed stars, changes very considerably in the course of a year.

Could this be found by observation, it would irrefragably evince the annual motion of the earth round the sun, and remove that only objection which lies against it, urged by Ricciolus, from no such *Parallax* being observed. See EARTH. Accordingly, Dr. Hook attempted to find it by observing the various distances of a fixed star from the zenith, in different parts of the earth's orbit; and Mr. Flamsteed, from the access and recess of a fixed star from the equator at different times of the year; and with success; the result of his observations being, that a fixed star, near the pole, was found 40 or 45 seconds nearer it at the winter solstice than at the summer one, for seven years successively.

M. Cassini the younger allows the observations of Flamsteed to agree with those made at the royal observatory; but he denies the consequences: he says, the variations in the distance of the pole star are not such as they should be, supposing the motion of the earth. Fontenelle accounts for them from a supposition, that the stars, like the sun, turn or revolve on their centres, and that some of them have their hemispheres unequally luminous: whence, when the more shining hemisphere is turned towards us, the star appears bigger, consequently nearer the neighbouring stars than when the darker is towards us. See STAR.

PARALLAX is also used in levelling, for the angle contained between the line of true level, and that of apparent level. See LEVELLING.

PARALLEL, in geometry, is applied to lines, figures and bodies, which are every where equidistant from each other; or which, though infinitely produced, would never either approach nearer, or recede further from each other.

PARALLEL *Right Lines*, are those which, though infinitely produced, would never meet.

Thus, the line OP, *Tab. Geometry*, Fig. 36, is parallel to QR. See LINE.

*Parallel Lines* stand opposed to lines converging, and diverging. See CONVERGING. &c.

Some define an inclining or converging Line, that which will meet another at a finite distance; and a *Parallel Line*, that which will only meet it at an infinite distance.

A perpendicular is by some said to be the shortest of all lines that can be drawn to another; and a *Parallel* the longest.

But for the orthodoxy of these notions of parallelism we do not undertake.

Geometricians demonstrate, that two lines, parallel to the same third line, are also parallel to one another; and that if two *Parallels*, OP and QR, be cut by a transverse line ST in A and B; 1. The alternate angles  $x$  and  $y$  are equal; 2. The external angle  $u$  is equal to the internal opposite one  $y$ ; and thirdly, that the two internal opposite ones  $z$  and  $y$  are also equal to two right ones.

It is shewn on the principles of opticks, that if the eye be placed between two parallel lines, they will appear to converge towards a point opposite to the eye. And if they run to such a length, as that the distance between them be but as a point thereto, they will there appear to coincide.

*Parallel Lines* are described by letting fall equal perpendiculars, and drawing lines through their extremes, by sliding the compasses open to the desired width along a line, &c.

PARALLEL *Planes* are those planes which have all the perpendiculars drawn betwixt them equal to each other. See PLANE.

PARALLEL *Rays*, in opticks, are those which keep at an equal distance in respect to each other, from the visible object to the eye, which is supposed to be infinitely remote from the object. See RAY.

PARALLEL *Ruler*, called also *Parallelism*, an instrument consisting of two wooden, brass, or steel rulers, AB, and CD; Fig. 37, equally broad every where, and so joined together by the cross blades EF, and GH, as to open to different intervals, accede and recede, yet still retain their *Parallelism*.

The use of this instrument is obvious; for one of the rulers being applied to RS, and the other withdrawn to a given point V; a right angle AB, drawn by its edge, through V, is a parallel to RS.

PARALLELS, or PARALLEL *Circles*, in geography, called also *Parallels of Latitude*, and *Circles of Latitude*, are lesser circles of the sphere, conceived to be drawn from west to east through all the points of the meridian; commencing from the equator, to which they are parallel, and terminating with the poles. See CIRCLE.

They are called *Parallels of Latitude*, &c. because all places lying under the same *Parallel*, have the same latitude. See LATITUDE.

PARALLELS of *Latitude*, in astronomy, are lesser circles of the sphere parallel to the ecliptic, imagined to pass through every degree and minute of the colures. See LATITUDE.

They are represented on the globe by the divisions of the

quadrant of altitude, in its motion round the globe, when screwed over the poles of the ecliptic. See GLOBE.

PARALLELS of *Altitude*, or *Almucantars*, are circles parallel to the horizon, imagined to pass through every degree and minute of the meridian between the horizon, and zenith; having their poles in the zenith. See ALTITUDE.

On the globe, they are represented by the divisions on the quadrant and altitude, in its motion about the body of the globe, when screwed to the zenith. See GLOBE.

PARALLELS of *Declination*, in astronomy, are the same with *Parallels of latitude* in astronomy. See DECLINATION.

PARALLEL *Sphere*, that situation of the sphere, wherein the equator coincides with the horizon, and the poles with the zenith and nadir. See SPHERE.

In this sphere all the *Parallels* of the equator become *Parallels* of the horizon, consequently no stars ever rise or set, but all turn round in circles parallel to the horizon; and the sun, when in the equinoctial, wheels round the horizon the whole day. After his rising to the elevated pole, he never sets for six months; and after his entering again on the other side of the line, never rises for six months longer.

This position of the sphere is theirs who live under the poles; if any such there be. Their sun is never above  $23^{\circ}$ ,  $30'$  high. See POLE.

PARALLEL *Sailing*, in navigation, is the sailing under a parallel of Latitude. See SAILING.

Of this there are but three cases. 1<sup>o</sup> Given the departure and distance; required the latitude.—The canon for which is, as the difference of longitude is to the radius, so is the distance to the co-sine of the latitude.

2<sup>o</sup> Given the difference of longitude between two places under the same *Parallel*, required their distance.—The canon is, as radius to difference of longitude, so is co-sine of latitude to distance.

3<sup>o</sup> Given the distance between two places in the same latitude; required their difference of longitude.—The canon is, as the co-sine of latitude to distance, so is radius to difference of longitude.

PARALLELEPIPED, in geometry, one of the regular bodies, or solids, comprehended under six parallelograms, the opposite ones whereof are similar, parallel and equal.—As in *Tab. Geom.* Fig. 38. See REGULAR.

A *Parallelepiped*, is by some defined a prism, whose base is a parallelogram. See PRISM.

*Properties of the PARALLELEPIPED*.—All *Parallelepipeds*, prisms, and cylinders, &c. whose bases and heights are equal, are themselves equal.

A diagonal plane divides the *Parallelepiped* into two equal prisms: a triangular prism, therefore, is half a *Parallelepiped* upon the same base, and of the same altitude. See PRISM.

All *Parallelepipeds*, prisms, cylinders, &c. are in a ratio compounded of their bases and altitudes: wherefore, if their bases be equal, they are in proportion to their altitudes; and conversely.

All *Parallelepipeds*, cylinders, cones, &c. are in a triplicate ratio of their homologous sides; and also of their altitudes.

Equal *Parallelepipeds*, prisms, cones, cylinders, &c. reciprocate their bases and altitudes.

To measure the surface and solidity of a *Parallelepiped*.—Find the areas of the parallelograms ILMK, LMON and OMKP (See PARALLELOGRAM) Add these into one sum, and multiply that sum by 2: the factum will be the surface of the *Parallelepiped*.

If then the base ILMK be multiplied by the altitude MO, the product will be the solidity.

Suppose, *v. g.* LM = 36 MK = 15 MO = 12. Then,

LM = 36	LM = 36	MK = 15
MK = 15	MO = 12	MO = 12
180	72	30
36	36	15
LIK M 540	LMON 432	MOK P 180
	LIK M 540	
	MOK P 180	
	1152	
MO 12	2	
580	2304	Superficies.
6480		Solidity.

PARALLELISM, the quality of a *Parallel*, or that which denominates it such: or it is that whereby two things, *v. gr.* lines, rays, or the like, become equi-distant from one another. See PARALLEL and PARALLELOGRAM.

Thus, we say remote objects are scarce perceptible, by reason of the *Parallelism* of their rays. See RAY and VISION.

PARALLELISM of the earth's axis, in astronomy, or, motion of PARALLELISM, is that situation or motion of the earth's axis, in its progress through its orbit, whereby it still looks to the same point of the heavens, *viz.* toward the pole star; so that if a line be drawn parallel to its axis, while in any one position; the axis, in all other positions or parts of the orbit,

orbit, will be always parallel to the same line. See AXIS.  
 This *Parallelism* is the necessary result of the earth's double motion; the one round the sun, the other round its own axis. Nor is there any necessity to imagine a third motion, as some have done, to account for this *Parallelism*. See EARTH.  
 It is to this *Parallelism* that we owe the vicissitude of seasons, and the inequality of day and night. See SEASON. See also DAY, &c.

**PARALLELISM of rows of trees.** — The eye placed at the end of an alley bounded by two rows of trees, planted in parallel lines, never sees them parallel, but always inclining to each other, towards the further extreme.

Hence mathematicians have taken occasion to enquire, in what lines the trees must be disposed, to correct this effect of the perspective, and make the rows still appear parallel. Parallel they must not be, but diverging; but according to what law must they diverge? the two rows, in fine, must be such, as that the unequal intervals of any two opposite or corresponding trees may be seen under equal visual angles.

On this principle F. Fabry has asserted, without any demonstration, and F. Tacquet, after him, demonstrated, by a long and intricate synthesis, that the two rows of trees must be two opposite semi-hyperbolas.

M. Varignon has since, in the memoirs of the royal academy, an. 1717, found the same solution by an easy and simple analysis. But he renders the problem much more general, and requires not only that the visual angles be equal, but to have them increase, or decrease in any given ratio: provided the greatest do not exceed a right angle. The eye he requires to be placed in any point, either just at the beginning of the ranges, or beyond, or on this side.

All this laid down, he supposes the first row to be a right line, and seeks what line the other must be, which he calls the *curve of the range*. This he finds must be an hyperbola, to have the visual angles equal. The straight and hyperbolic rows will be seen parallel to infinity: and if the opposite semi-hyperbola be added, we shall have three rows of trees (the straight one in the middle) and all three parallel.

Nor is it required, this second hyperbola be the opposite of the first, i. e. of the same kind, or have the same transverse axis: It is enough if it have the same centre, its vertex in the same right line, and the same conjugate axis. Thus the two hyperbolas may be of all the different kinds possible; yet all have the same effect. See HYPERBOLA.

Again, the straight row being laid down as before; if it be required to have the trees appear under decreasing angles, M. Varignon shews, that if the decrease be in a certain ratio, which he determines; the other line must be a parallel straight line. But he goes yet farther; and supposing the first row any curve whatever, he seeks for another that shall make the rows have any effect desired, i. e. be seen under any angles, equal, increasing or decreasing.

**PARALLELOGRAM**, in geometry, a quadrilateral right-lined figure, whose opposite sides are parallel and equal to each other. See QUADRILATERAL.

A *Parallelogram* is generated by the equable motion of a right line always parallel to itself. See FIGURE.

When the *Parallelogram* has all its four angles right, and only its opposite sides equal, it is called a *rectangle* or *oblong*. See RECTANGLE.

When the angles are all right, and the sides equal, it is called a *square*, which some make a species of *Parallelogram*, others not. See SQUARE.

If all the sides be equal, and the angles unequal, it is called a *rhombus* or *lozenge*. See RHOMBUS.

If both the sides and angles be unequal, it is called a *rhomboides*. See RHOMBOIDES.

**Properties of the PARALLELOGRAM.** — In every *Parallelogram*, what kind soever it be of, e. gr. that ABCD, *Tab. Geometry*, Fig. 41, a diagonal DA divides it into two equal parts, the angles diagonally opposite B, C, and A, D, are equal; the opposite angles of the same side C, D, and A, B, &c. are, together, equal to two right angles; and each two sides, together, greater than the diagonal.

Two *Parallelograms* ABCD, and ECDF on the same or equal base CD, and of the same height AC, or between the same parallels AF, CD are equal. — And hence two triangles CDA, and CDF on the same base and on the same height, are also equal.

Hence, also, every triangle CFD is half a *Parallelogram* ACDB upon the same or an equal base CD, and of the same altitude, or between the same parallels. Hence also a triangle is equal to a *Parallelogram*, having the same base and half the altitude, or half the base and the same altitude. See TRIANGLE.

*Parallelograms*, therefore, are in a given ratio, compounded of their bases and altitudes. If then the altitudes be equal, they are the bases, and conversely.

In similar *Parallelograms* and triangles, the altitudes are proportional to the homologous sides; and the bases are cut proportionably thereby. Hence similar *Parallelograms* and triangles

are in a duplicate ratio of their homologous sides, also of their altitudes and the segments of their bases: they are, therefore, as the squares of the sides, altitudes, and homologous segments of the bases.

In every *Parallelogram*, the sum of the squares of the two diagonals is equal to the sum of the squares of the four sides.

This proposition, M. de Lagny takes to be one of the most important in all geometry; he even ranks it with the celebrated 47<sup>th</sup> of Euclid, and with that of the similitude of triangles; and adds, that the whole first book of Euclid is only a particular case hereof. For, if the *Parallelogram* be rectangular, it follows that the two diagonals are equal; and, of consequence, the square of a diagonal, or, which comes to the same thing, the square of the hypotenuse of a right angle, is equal to the squares of the sides.

If the *Parallelogram* be not rectangular, and, of consequence, the two diagonals be not equal; which is the most general case; the proposition becomes of vast extent: it may serve, for instance, in the whole theory of compound motions, &c. There are three manners of demonstrating this problem; the first by trigonometry, which requires 21 operations; the second geometrical and analytical, which requires 15. M. de Lagny gives a more concise one, in the *Memoirs de l'Acad.* which only requires 7. See DIAGONAL.

**To find the area of a rectangled Parallelogram, ABCD.** — Find the length of the sides AB, and AC; multiply AB into AC, the produce will be the area of the *Parallelogram*. Suppose, e. gr. AB to be 345; AC 123; the area will be 11385.

Hence, 1. Rectangles are in a ratio compounded of their sides AB and AC. 2. If, therefore, there be three lines continually proportional; the square of the middle one is equal to the rectangle of the two extremes: and if there be four proportional lines, the rectangle under the two extremes is equal to that under the two middle terms. See RECTANGLE.

Other *Parallelograms*, not rectangular, have their area's found by resolving them, by diagonals, into two triangles; and adding the areas of the separate triangles into one sum. See TRIANGLE.

**Complement of a PARALLELOGRAM.** See COMPLEMENT.

**Centre of gravity of a PARALLELOGRAM.** See CENTRE of GRAVITY, and CENTROBARYC Method.

**PARALLELOGRAM, or PARALLELISM**, also denotes a machine used for the ready and exact reduction or copying of designs, schemes, prints, &c. in any proportion; which is done hereby without any knowledge or habit of designing. See DESIGNING. The *Parallelogram* is also called *Pentagraph*. See its description and use under the article PENTAGRAPH.

**PARALOGISM**, ΠΑΡΑΛΟΓΙΣΜΟΣ, in logic, a false reasoning; or a fault committed in demonstration, when a consequence is drawn from principles that are false, or not proved; or when a proposition is passed over, which should have been proved by the way. See ERROR, REASONING, DEMONSTRATION, &c. A *Paralogism* differs from a *sophism* in this, that the *sophism* is committed out of design and subtlety; and the *Paralogism* out of mistake, and for want of sufficient light and application. See SOPHISM.

Yet Messieurs du Port-Royal do not seem to make any difference between them. None of the pretenders to the quadrature of the circle but have made *Paralogisms*. See QUADRATURE.

**PARALYSIS\***, ΠΑΡΑΛΥΣΙΣ, in medicine, a disease popularly called *Palsy*. See PALSY.

\* The word is formed from the Greek *παρυνω*, I unbind; this disease being supposed to unbind the nerves and muscles.

The *Paralysis* only differs from the *paresis* as the greater from the less. See PARESIS.

Authors distinguish the *Paralysis* into a paraplegia or paraplexia, hemiplegia, and partial *Paralysis*.

The first is a Palsy of the whole Body. See PARAPLEGIA.

The second, of one side of the body. See HEMIPLEGIA.

The third, of some particular member, which is the proper *Palsy*. See PALSY.

**PARALYTIC**, a person affected with the *paralysis*, or *palsy*. See PALSY, &c.

**PARAMESE\***, ΠΑΡΑΜΕΣΗ, in the ancient music, the ninth chord, or found in the diagramma, or scale of music. See DIAGRAMMA.

\* The word is Greek, and signifies *juxta mediam*, next to the middle; its situation in the first state of the scale, being next the mese, or middle chord. See CHORD.

**PARAMETER**, in geometry, a constant right line in each of the three conic sections; called also *latus rectum*. See LATUS RECTUM.

In a Parabola VBV, *Tab. Conics* Fig. 8, the rectangle of the *Parameter* AB, and an abscissa, e. gr. B 3, is equal to the square of the correspondent semi-ordinate 3 III. See PARABOLA.

In an ellipsis and hyperbola, the *Parameter* is a third proportional to the conjugate and transverse axis. See ELLIPSIS, and HYPERBOLA.

PARA-

**PARAMOUNT**, in our law, signifies the supreme lord of the Fee. See **LORD**, **FEE**, **TREASON**, &c.

There may be a tenant to a lord, who holdeth himself of another lord; in respect whereof, the former lord is called *lord Mesne*; and the latter *lord Paramount*. See **MESNE**.

All honours, which have manors under them, have lords *Paramount*. See **HONOUR** and **MANOR**.

But even the term *lord Paramount* is only comparative; for as one man may be great, compared to a less, and little, being compared with a greater; so none simply seems to be *lord Paramount* but the king, who is patron *Paramount* to all the benefices in England. See **KING**, **PATRON**, &c.

**PARANYMPH**, **PARANYMPHUS**, among the ancients, the person who waited on the bride, directed the nuptial solemnities; called also *pronubus*, and *auspex*, because the ceremony begun with taking auspices. See **MARRIAGE**.

In strictness, however, the *Paranymphe*, *παρanymphe*, only officiated on the part of the bridegroom; on the part of the bride, a woman officiated, called *Pronuba*.

The Jews had likewise a kind of *Paranymphe*, which the talmud and the rabbins call *ששכבין* *Schuschabin*, *q. d.* companions of the spouse.

The IV<sup>th</sup> council of Carthage appoints, that, when the married couple came to ask the priest's blessing, they be presented, either by their fathers and mothers, or by their *Paranymphe*s.

**PARAPET**\*, *Breastwork*, in fortification, a defence or skreen, on the extreme of a rampart, or other work, serving to cover the soldiers, and the cannon from the enemy's fire. See **DEFENCE**.

\* Borel gives us, from Jos. Maria Subresius, a curious collection of names, which the ancients and moderns have given to this kind of *Parapets*: the Latins called them *Subarræ*, and *Bastie*, whence the names Bastion and Bastile. They also called them *Poginematæ*, *Loricæ*, and *Antemuralia*. The Spaniards called them *Barbacanes*; the Italians, *Parapetti*; because of their defending the breast, *petto*, whence our *Parapet*.

*Parapets* are raised on all works, where it is necessary to cover the men from the enemy's fire; both within and without the place, and even the approaches. See **WORK**.

The *Parapet Royal*, or that of the rampart, is to be of earth, cannon-proof, from 18 to 20 foot thick; six foot high towards the place, and four or five towards the rampart. — This difference of height makes a glacis or slope for the musketeers to fire down into the ditch, or at least the counterscarp. See **RAMPART** and **ROYAL**.

Before the *Parapet* is a banquette, or little eminence, a foot and half high, for the soldiers to stand on. See **BANQUETTE**. The *Parapet* of the wall is sometimes of stone. — The *Parapet* of the trenches is either made of the earth dug up; or of gabions, fascines, barrels, sacks of earth, or the like.

**PARAPET** is also a little wall, breast-high, raised on the brinks of bridges, keys, or high buildings; to serve as a stay, and prevent people's tumbling over.

**PARAPH**, a particular character, knot, or flourish, which people habituate themselves to make always in the same manner at the end of their name, to prevent their signature from being counterfeited. See **CIPHER**.

The *Paraph* of the Kings of France is a grate, which the secretaries always place before their own, in all letters. &c. *Ménage* derives the word from *Paragraphe*. See **PARAGRAPH**.

**PARAPHERNALIA**\*, or **PARAPHERNA**, in the civil law, those goods which a wife brought her husband, besides her dower, and which were still to remain at her disposal, exclusive of her husband, unless there were some provision made to the contrary in the marriage-contract. See **DOWER** and **GOODS**.

\* The word is formed from the Greek *παρα* beyond, or over, and *δοτον*, *dos*, dower. — In his rebus, *quas extra dotem mulier habet*, &c. *quas Græci παραδοτὴν vocant*, nullam, uxore prohibente, vir habeat communionem. *Cod. de pactis*.

The grand customary of Normandy gives a different sense to the word; it calls *Paraphernalia* the moveables, linen, and other female necessities, which are adjudged to a wife in prejudice of the creditors, when she renounces the succession of her husband.

Some of our English lawyers give a still different sense to the word *Paraphernalia*, defining it to be such goods as a wife challengeth over and above her dower, or jointure after her husband's death; as furniture for her chamber, wearing apparel, and jewels, which are not to be put into the inventory of her husband's goods.

**PARAPHIMOSIS**, *ΠΑΡΑΦΙΜΩΣΙΣ*, in medicine, a disorder of the penis, wherein the prepuce is shrunk, and withdrawn behind the glans, so as not to be capable of being brought to cover the same. See **PREPUCE** and **GLANS**.

This happens oftentimes in venereal disorders, where the humours of a gleet frequently prove so sharp, as to cause this retraction. There sometimes arises a necessity in this case to snip, or cut the prepuce open, otherwise the humours will be pent up under it, and do a great deal of mischief. See **PHIMOSIS**.

**PARAPHRASE**, *ΠΑΡΑΦΡΑΣΙΣ*, an explanation of some text in clearer and more ample terms, whereby we supply what the author might have said, or thought on the subject. See **TEXT**.

Colomelius looks on Erasmus's *Paraphrase* on the New Testament, as so extraordinary a work, that he makes no scruple to declare, he thinks the author to have been divinely inspired when he penned it.

**Chaldee PARAPHRASE**, is a phrase frequent among the critics and divines. — There are three *Chaldee Paraphrases* on the pentateuch: that of Onkelos, whom some take to be the same with Aquila, and whom others take to have been that Onkelos whom the talmudists, in the treatise *Gittin*, make a nephew of the emperor Titus. See **PENTATEUCH**.

The second is the *Paraphrase* of Jonathan. — The third is called the *Targum* of Jerusalem. See **TARGUM**.

The *Chaldee Paraphrase* on the prophets, is of Jonathan son of Uzziel, whom some confound with Theodotio.

The author of the *Chaldee Paraphrase* on the hagiographers is unknown. Some attribute it to one Joseph, surnamed the Squinter; others to rabbi Akiba. Others say, there is so much difference in the style, that no one person can have been the author of the whole.

**PARAPHRENEISIS**, or **PARAPHRENITIS**, *ΠΑΡΑΦΡΕΝΙΤΙΣ*, in medicine, a secondary kind of phrenzy, supposed by the ancients, to be owing not to any immediate disorder of the brain, or meninges, but to an inflammation of the ventricle, the liver, and especially the diaphragm, whereby the brain and meninges come to be affected by consent of parts. See **PHRENITIS**.

The ancients called it a *Pseudo-Phrenesis*, false phrenzy, to distinguish it from the true one, which they made to consist in an inflammation of the brain and its meninges.

The moderns do not make any such distinction in phrenzies: they all come from the same cause; but that cause is neither an inflammation of the brain, nor of the diaphragm. See **MANIA**, **MELANCHOLY**, &c.

**PARAPHRENITIS**, among modern Physicians, is an inflammation of the mediastinum, or pleura about the diaphragm, attended with a continual fever, and exquisite pain in the parts affected, on contracting the abdominal vessels; as also a delirium and a rising of the hypochondria.

**PARAPLEGIA**\*, or **PARAPLEXIA**, *ΠΑΡΑΠΛΗΓΙΑ* or *ΠΑΡΑΠΛΗΞΙΑ*, in medicine, a species of paralysis, or palsy, usually succeeding an apoplexy. See **PALSY** and **APOPLEXY**.

\* The word comes from the Greek *παρα*, much, and *πλησσειν* or *πληττω*, I strike.

The *Paraplegia* is a general palsy, affecting the whole body, the head alone excepted. — Boerhaave defines it an immobility of all the muscles below the head, that have nerves from the cerebrum and cerebellum.

Sometimes all sense, as well as motion, are destroyed hereby, sometimes only one of them.

Its original is usually supposed to be some disorder or obstruction in the fourth ventricle of the brain, or in the beginning of the spinal marrow.

Etmuller distinguishes the *Paraplegia* from the *Paralysis*. The paralysis, according to him, is a relaxation or resolution of the ligaments and members ministering to motion, not from any obstruction of the nerves, but from a resolution of the nervous parts. — Whereas the *Paraplegia* arises from some obstruction of the nerves.

The latter usually succeeds an apoplexy, epilepsy, convulsions, vertigo's; the former, the scorbutus, hypochondriacal disease, colic, &c.

**PARAPLEXIA**, in medicine. See **PARAPLEGIA**.

**PARASANG**\*, *ΠΑΡΑΣΑΓΓΗΣ*, an ancient Persian measure different at different times, and in different places; being usually 30, sometimes 40, and sometimes 50 stadia, or furlongs. See **MEASURE**, **STADIUM**, &c.

\* The word, according to Littleton, has its rise from *Parasch Angarius*, *q. d.* the space a post-man rides from one station, *Angaria*, to another.

**PARASCENIUM**, among the Romans, was a place behind the theatre, whither the actors withdrew to dress, undress, &c. more frequently called *Postscenium*. See **THEATRE**.

**PARASCEVE**, *ΠΑΡΑΣΚΕΥΗ*, the sixth day of the last week of lent, popularly called *Good-Friday*. See **LENT**.

St. John says, our Saviour was crucified on the *Parasceve* of the Passover: *i. e.* on the eve or day of preparation of the passover: For Isidore and Papias observe, that the word, in the original Greek, signifies *preparation*, and was applied among the Jews to Friday, because on that day they used to prepare what was necessary for the celebration of the Sabbath. See **PASSOVER**. Hence what our translation of the New Testament renders preparation of the Sabbath, M. Simon, and some others, call *Parasceve*. See **PREPARATION**.

**PARASELENE**\*, in physiology, *mock-moon*; a meteor, or phenomenon encompassing or adjacent to the moon, in form of a luminous ring; wherein is sometimes observed one, sometimes two apparent images of the moon. See **METEOR**.

\* The word is formed from the Greek *παρα*, near, and *σεληνη*, the moon.

The *Paraselenes* are formed after the same manner as the *parhelias*, or *mock-suns*. See **PARHELION**.

**PARASITE**, *ΠΑΡΑΣΙΤΟΣ*, among the Greeks, was originally a very

very considerable title; the *parasites* being a kind of priests, or at least ministers of the gods; in the same manner as at Rome were the *epulones*. See **EPULO**.

They took care of the sacred corn; or the corn destined for the service of the temples and the gods, viz. for sacrifices, feasts, &c. they had even the intendance over sacrifices, and took care they were duly performed.

At Athens there was a kind of college of twelve *parasites*; each people of Attica furnishing one, who was always chosen out of the best families.

Polybius adds, that *parasite* was also an honourable name among the ancient Gauls; and was given to their poets.

**PARASITES**, or **PARASITICAL** plants, in botany, a kind of diminutive plants, growing on trees, and so called from their manner of living and feeding, which is altogether on others. See **PLANT**.

Such is moss, which was anciently supposed the effect of a decomposition of the texture of the bark; or a kind of rust, or at most, little filaments arising from the bark: but from many observations of the moderns, it appears, that mosses are real plants, whose seed is exceedingly fine, and inclosed in very little capsule; which bursting of themselves, the seed is driven by the wind, and, at length, detained in the inequalities of the barks of trees; where it takes root and is fed at the expence thereof. See **MOSS**.

Of these mosses M. Vaillant reckons no less than 137 species, all in the neighbourhood of Paris; which, with the lichens and mistletoes, make the family of *parasite* plants. See **MISTLETOE**, &c. The most pernicious of these *parasites*, to the trees that support them, are the lichens; which appear on the barks of trees, in form of a crust, mixed with yellow and a dirty white. See **DISEASES of Plants**.

M. de Reffons gives us a remedy for this disease, in the French Memoirs of the Acad. Roy. It consists in making an incision through the bark to the very wood, from the first branches to the earth; the bark closes again in a little time, and always preserves itself clean and free from mosses for the future.

This aperture renders the course of the sap more free, and prevents the forming of those inequalities so favourable to the production of mosses. The incision, he adds, is to be made from March to the end of April, and on that side turned most from the sun.

**PARASOL**, a little moveable, in manner of a canopy, bore in the hand to screen the head from the sun, rain, &c. more usually called *umbrella*.

It is made of leather, taffety, oil-cloth, &c. mounted on a stick, and opened or shut at pleasure by means of pieces of whalebone that sustain it. — The East-Indians never stir without a *parasol*.

The word is French. — That used against rains is sometimes called *parapluie*.

**PARASTATA**, in the ancient architecture, a kind of pier, or piedroit, serving as a defence or support to a column or arch. See **PIER** and **PIEDROIT**.

Mr. Evelyn makes the *parastata* the same with pilaster: Barbaro, and others, the same with anta: Daviler, the same with piedroit. See **PILASTER**, **ANTA**, &c.

**PARASTATÆ**, in anatomy, *Epididymidæ*; or two tuberos, varicose bodies, lying upon, and adhering to the upper part of the testicles, whereof they properly appear to be a part; though different from the rest, in form and consistence. See **TESTICLE** and **VARICIFORMES**.

The *parastatæ* consist, like the testicles, of a convolution of feminal tubuli, mixed with blood-vessels; the difference between them lying only in this, that, in the *parastatæ*, the tubuli are united into one; the various convolutions of which, being more firmly bound together by a strong membrane arising from the tunica albuginea, it feels more compact than the testicles. See **SEED**, **SPERMATIC**, &c.

The *parastatæ* and testicles, are said to be inclosed in three proper membranes; the first muscous, derived from the cremaster muscle; the second, called the *vaginalis*; the third, the *albuginea*. See each under its proper article.

**PARASYNANCHE**\*, in medicine, a kind of angina or squinancy, wherein the exterior muscles of the throat are inflamed. See **ANGINA** and **QUINZY**.

\* The word comes from *παρά, συν, ασκω*, to suffocate.

**PARATHESIS**, in the Greek church, the prayer which the bishop rehearses over the catechumens, stretching his hands over them to give them benediction; which they receive, bowing their heads under his hands.

**PARATHESIS**, (popularly called *Brackets* or *Crotchets*) is also the name of a kind of point or mark, as [ ] used in writing, chiefly to include synonymous, explicative, and the like matters, not essential to the discourse. See **PARENTHESIS**.

**PARATHESIS**, in grammar, *apposition*; or a figure whereby two or more substantives are put in the same case. See **APPOSITION**.

**PARATILMUS**, in the ancient Greek jurisprudence, a name given to a sort of punishment imposed on adulterers, who were poor and unable to stand the common penalty. See **ADULTERY**. It consisted either in making them run a horse-radish up the anus,

which they called *απορραδισμός*; or in tearing up by the roots the hair about the pudendum, which they called *παρτιλμός* of *παρτιλίσαι*, to tear, pluck up.

**PARATITLES**, **PARATITLA**, in jurisprudence, short notes, or summaries of the titles of the digest, and code; which have been made by several lawyers, in order to compare and examine the connection of the several parts with one another. See **CODE** and **DIGEST**.

We have *paratitles* of Cujas, of Maran, &c. Chassaneus has a second comment on the *paratitles* of Cujas.

**PARAVAIL**, **PARAVAILLE**, in law, the lowest tenant of a fee; or he that is immediate tenant to the land. See **TENANT**. He is called *tenant paravail*, because it is presumed he hath profit and avail by the land.

**PARAZONIUM**, **ΠΑΡΑΖΟΝΙΟΝ**, or *Scipio*, among medallists a sceptre, rounded at the two ends in manner of a truncheon, or commander's staff; or a kind of poniard, or short sword represented as wore at the girdle, on several ancient medals. Antiquaries are much divided on the explication of the *parazonium*; as, indeed, the form and manner of bearing it are very different. — It is sometimes thrown across the shoulders in manner of a quiver.

**PARBOILING**, in pharmacy, &c. a term applied to fruits, herbs, &c. which are boiled a little while, to draw out the first juices, in order to be afterwards inspissated, or thickened. See **BOILING**.

**PARCÆ**, goddesses who, according to the ancient Pagan theology, preside over the periods or durations of human lives.

These the ancients frequently confounded with the fates, or destinies; and, in effect, the *Parcæ*, according to Plato, were the daughters of necessity, and destiny. See **FATE** and **DESTINY**.

The *Parcæ* were three, Clotho, Lachesis, and Atropos; because, forsooth, all things have their beginning, progress and end. Hence the poets tell us, the *Parcæ* spun the thread of mens lives; that Clotho held the distaff, and drew the thread; Lachesis twirled the spindle, and spun it; and Atropos cut it. *Clotho colum retinet, Lachesis net, Atropos occat*.

The ancients represent the *Parcæ* divers ways: Lucian, in the shape of three poor old women, having large locks of wool, mixed with daffodils on their heads; one of which holds a distaff, the other a wheel, and the third a pair of scissors, wherewith to cut the thread of life. — Others represent them otherwise; Clotho appearing in a long robe of divers colours, wearing a crown upon her head adorned with seven stars, and holding a distaff in her hand: Lachesis in a robe beset with stars, with several spindles in her hand; and Atropos, clad in black, cutting the thread with a pair of large scissors.

The ancients imagined that the *Parcæ* used white wool for a long and happy life, and black for a short and unfortunate one.

**PARCEL-Makers**, two officers in the exchequer, who make *parcels* of the escheater's accounts, wherein they charge them with every thing they have levied for the king's use, within the time of their office, and deliver the same to one of the auditors of the court, to make their accompts therewith. See **ESCHEATOR**.

**Bill of PARCELS**. See the article **BILL**.

**PARCENERS**, *quasi* **PARCELLERS**. See **CO-PARCENERS**.

**PARCHMENT**\*, in commerce, &c. sheep or goat's skin prepared after a peculiar manner, which renders it proper for several uses; particularly for writing on and covering of books, &c. See **WRITING** and **BOOK-BINDING**.

\* The word comes from the Latin *Pergamena*, the ancient name of this manufacture: which it is said to have took from the city Pergamos, to Eumenes, king whereof, its invention is usually ascribed. Though, in reality, that prince appears rather to have been the improver, than the inventor of *Parchment*. For the Persians of old, according to Diodorus, wrote all their records on skins; and the ancient Ionians, as we are told by Herodotus, made use of sheep-skins and goat-skins in writing, many ages before Eumenes's time. Nor need we doubt that such skins were prepared and dressed for that purpose, after a manner not unlike that of our *Parchment*; though probably not so artificially. — *Vide* Diod. Sicul. l. 2. p. 84. Herodot. l. 5. Prid. Connect. part 1. l. 7. p. 708.

*Parchment* is begun by the skinner, and ended by the *parchment-maker*. It constitutes a very considerable article in the French commerce: it is made in most of their cities; and besides the consumption at home, they send vast quantities abroad, particularly to England, Flanders, Holland, Spain, and Portugal. That called *virgin parchment*, and which superstitious people believe to be made of a kind of caul, wherein some children are inclosed in the womb, is nothing but a somewhat thinner and finer sort than the rest, proper for certain purposes, as fans, &c. and made of the skin of an abortive lamb, or kid. See the article **VIRGIN**.

**Manufacture of PARCHMENT**. — The skin having been stripped of its wool, and passed the lime-pit (after the manner described under the article **SHAMMY**) the skinner stretches it on a kind of frame, consisting of four pieces of wood, mortised into each other at the four angles, and perforated lengthways from distance to distance, with holes, furnished with wooden pins that may be turned at pleasure, like those of a violin.

To stretch the skin on this frame, they make little holes all around it, and through every two holes draw a little skewer; to this skewer they tie a piece of small packthread, and tie that over the pins; so that, coming to turn the pins equally, the skin is strained tight every way, like that of a drum.

The skin being thus sufficiently stretched on the frame, the flesh is pared off with a sharp instrument for that purpose; this done, it is moistened with a rag, and a kind of white stone or chalk reduced to a fine dust, strewed over it; then with a large pumice-stone, flat at bottom, much after the manner of a mullet for grinding colours, they rub over the skin, as if about to grind the chalk; and thus scower off the remains of the flesh. Then they go over it again with the iron instrument; again moisten it as before, and again rub it with the pumice-stone without any chalk underneath; this smoothen and softens the flesh-side very considerably. They drain it again, by passing over it the iron instrument as before.

The flesh-side thus drained, they pass the iron on the wool or hair-side; then stretch it tight on the frame by means of the pins, and go over the flesh-side again with the iron: this finishes its draining; and the more the skin is drained, the whiter it ever becomes.

They now throw on more chalk, sweeping it over with a piece of lamb-skin that has the wool on; this smoothen it still further, and gives it a white down or nap. It is now left to dry, and when dried, taken off the frame, by cutting it all round.

The skin, thus far prepared by the skinner, is taken out of his hands by the parchment-maker; who first scrapes or pares it dry on the summer, with an iron instrument like that above-mentioned, only finer and sharper; with this, worked with the arm from top to bottom of the skin, he takes away about one half of its thickness. The skin thus equally pared on both sides, they pass the pumice-stone over both sides, to smoothen it. This last preparation is performed on a kind of form or bench covered with a sack stuffed with flocks, and leaves the parchment in a condition for writing on.

The paring the skin dry on the summer, is the most difficult preparation in the whole process of parchment-making; for which reason the skimmers seldom dare meddle with it, but usually leave it to those more experienced in it: the summer whereon it is performed, is a calf-skin well stretched on a frame, serving as a support to the skin, which is fastened a top of it with a wooden instrument, that has a notch cut in it. Lastly, that the iron knife may pass the easier between the summer and the skin to be pared, they put another skin which they call the counter-summer. The parings thus taken off the leather, are used in making glue, size, &c. See GLUE, &c. What we call vellum is only parchment made of the skins of abortive calves, or at least of sucking calves; 'tis finer, whiter, and smoother than the common parchment, but it is prepared in the same manner as that, abating that it is not passed through the lime-pit.

*Roll of PARCHMENT.* See the article ROLL.

**PARCO *fratto***, in law, a writ which lies against him who violently breaks open a pound, and takes out beasts thence, which, for some trespass done, were lawfully impounded. See PUND-EREC and POUND.

**PARDON**, in law, a remission, or forgiveness of a felonious, or other offence, against the king, or the laws.

This our lawyers make twofold; the one, *ex gratia regis*, the other *per cour de ley*.—The first is that which the king, out of some special regard to the person, or some other circumstance, grants by his absolute prerogative, or power, either before conviction of the offender, or after.

**PARDON *by cour de ley***, is that which the king grants, as the law and equity persuade, for a slight offence; as homicide, casual, &c.

*Charter of PARDON.* See the article CHARTER.

**PARDON**, in the canon law, is an indulgence which the pope grants to supposed penitents, for remission of the pains of purgatory, which they have merited for the satisfaction of their sins. See INDULGENCE.

The grand time for the dispensation of pardons is the Jubilee. See JUBILEE.

In this sense, *pardon* is properly the angelic salutation said to the virgin at the sound of three little strokes on a bell, rung in the morning, noon, and night, in order for the person to be entitled to indulgences.

**PARDONERS**, in our ancient customs, were persons who carried about the pope's indulgences, and sold them to the best bidders. See INDULGENCE.

**PAREGORICKS**\*, in medicine, remedies which assuage pain.—The same with what we otherwise call *anodynes*, and *opiates*. See ANODYNE and OPIATE.

\* The word is Greek, *παρηγορικα*, formed of *παρηγορεω*, *lenio*, I appease, mitigate.

**PAREIRA BRAVA**, the root of a plant growing in the West-Indies, chiefly Mexico and Brazil; esteemed a specific for the cure of the stone and gravel.

The name, which, in the original Portuguese, signifies wild-vine, or bastard-vine, bears a good deal of analogy to the plant, which bears branches laden with leaves perfectly like those of

the vine; and which, like it, creeps along walls and trees. The Portuguese value this root on an equal footing with the *ipe-cacuanha*. Some druggists call it, by corruption, *parada prava*. M. Geoffroy attributes the efficacy of this root, in nephritic cases, to its dissolving the viscid matters, whereby the particles of the sand, &c. were cemented together: and hence, he gives it with the same intention in jaundices, asthmas, &c. It is administered in decoction.

The Portuguese hold it also a remedy for dysenteries, quinzies, bites of venomous beasts, &c.

**PARELCON**, in grammar, a figure, whereby a word or syllable is added to the end of another.

**PARELIA**, or rather *Parhelia*, in physiology. See PARMELIUM.

**PARENCHYMA**\*, in anatomy, a peculiar kind of substance different from flesh, whereof several parts of the body, as the heart, lungs, liver, spleen, kidneys, &c. were anciently supposed to be formed. See FLESH.

\* It is thus called from the Greek *παρεχυμα*, effusion, *q. d.* generated by a collection and condensation of juice.

Erasistratus first used the name; as imagining the substance of these parts not to be vascular like the rest, but to consist of a mass or coagulum of blood, stagnated in the vessels of the parts. But the moderns reject this opinion: the observations made by microscopes, injections, &c. clearly shewing, that the heart is a true muscle. (See HEART,) the lungs and spleen, clusters of membranous vesicles, and vessels (See LUNGS and SPLEEN,) and the liver and kidneys, compositions of glands, through which the bile and urine are filtrated. See LIVER and KIDNEY.

**PARENCHYMA *of plants***. Dr. Grew gives the name *parenchyma*, to the pith or pulp, or that inner part of the plant, through which the juice is supposed to be distributed. See PLANT, PITH, &c.

This, when viewed with a microscope, appears to resemble marrow; or rather a sponge; being a porous, flexible, dilatable substance. See MEDULLA.

Its pores are innumerable, and exceedingly small; receiving as much humour as is requisite to fill and extend them; which disposition of pores it is, that is supposed to fit the plant for vegetation and growth. See VEGETATION.

The *Parenchyma* is white at first, but changes its colour, in proportion as the root grows thicker. Thus it becomes yellow in the root of the bastard rhubarb, and red in that of the snake-weed. See PLANT.

**PARENT**, **PARENS**, a term of relation, applicable to those from whom we immediately receive our being. See FATHER and MOTHER.

**PARENTALIA**, in antiquity, funeral obsequies; or the last duties paid by children to their deceased parents. See OBSEQUIES, and FUNERAL.

**PARENTALIA**, is also used for a sacrifice or solemn service offered annually to the manes of the dead. See MANES.

**PARENTELA**—*De parentela se tollere*, in ancient customs, signified a renunciation of one's kindred and family. See ABDICATION.

This was done in open court, before the judge, and in the presence of twelve men, who made oath, they believed it was done for a just cause.

We read of it in the laws of Henry I. After such abjuration, the person was incapable of inheriting any thing from any of his relations, &c.

**PARENTHESIS**\*, in grammar, certain intercalary words inserted in a discourse, which interrupt the sense or thread, but which seem necessary for the fuller understanding of the subject.

\* The word is Greek, *παρεθεσις*, formed of *para*, *inter*, *between*, and *thesis*, *position*, *q. d.* putting between.

The politest of our modern writers avoid all *parentheses*; as keeping the mind in suspense, embarrassing it, and rendering the discourse less clear, uniform, and agreeable: long and frequent *parentheses* are intolerable, especially in verse, which they ever render dull and languid, and like to prose.

The proper characteristic of a *parenthesis* is, that it may be either taken in or left out, the sense and grammar remaining entire.

In speaking, *parentheses* are to be pronounced in a different tone; and in writing, are inclosed between ( ), to distinguish them from the rest of the discourse.

The character itself whereby they are distinguished, is also called a *parenthesis*. See CHARACTER.

**PARERE**, in commerce, an Italian term which begins to be naturalized. It signifies the advice, or counsel of a merchant, or negotiant; for that such a person, being consulted on any point, introduces his answer, in Italian, with *mi pare*, i. e. I think, it seems to me.

The method of negotiating, especially that of bills of exchange, being borrowed from the Italians, most trading cities, especially Lyons, retain the use of *pareres*; which are the advices or opinions of merchants and negotiants, and which serve as acts before notaries, when given by authority of a judge-conservator, or at a particular consultation, for maintaining the right of the consulter.

M. Savary

M. Savary has an excellent treatise, entitled *Parere, ou avis & conseils sur les plus importantes matieres du commerce*; containing the resolution of the most difficult questions relating to bankrupts and failures, bills of exchange, orders without date or expression of value, blank-signings, renewing of bills of exchange, those drawn or accepted by women in behalf of their husbands, or during the minority of the drawer, &c.

**PARE RGA**, ΠΑΡΕΡΓΑ, a term sometimes used in architecture, for additions, or appendages, made, by way of ornament, to a principal work.

It is sometimes also used, in painting, for little pieces, or compartments on the sides, or in the corners of the principal piece.

**PARE SISIS**, ΠΑΡΕΣΙΣ, in medicine, a disease called also *paralysis* and *palsy*. See **PARALYSIS**, &c.

**PARGETING**, in building, is used for the plastering of walls; sometimes for the plaster itself. See **PLASTER**.

**PARGETING** is of various kinds; as, 1. White lime and hair mortar laid on bare walls. 2. On bare laths, as in partitioning and plain cieling. 3. Rendering the insides of walls, or doubling partition-walls. 4. Rough-casting on heart-laths. 5. Plastering on brick-work, with finishing mortar, in imitation of stone-work; and the like upon heart-laths.

**PARHELIUM**\*, or **PARHELION**, in physiology, a mock-sun, or meteor, in form a very bright light, appearing aside of the sun; formed by the reflexion of his beams in a cloud properly posited. See **METEOR**.

\* The word is formed from the Greek, παρὰ, *juxta*, near, and ἥλιος, *sol*, sun.

The *parhelia* usually accompany the coronæ, or luminous circles, are placed in the same circumference, and at the same height. Their colours resemble those of the rainbow, the red and yellow on the side towards the sun, and the blue and violet on the other. See **RAINBOW**.

Though there are coronæ sometimes seen entire, without any *parhelia*; and *parhelia* without coronæ.

**PARHELIA** are sometimes double, triple, &c.

In the year 1629 was seen at Rome a *parhelion* of five suns; and in 1666 another at Arles of six.

M. Mariotte accounts for the appearance of *parhelia*, from an infinity of little parcels of ice floating in the air, which multiply the image of the sun, either by refracting or breaking his rays, and thus making him appear where he is not; or by reflecting them, and serving as mirrors. See **MIRROR**, &c.

The known laws of reflection and refraction have given a handle for geometrizing on these phænomena; and M. Mariotte has determined the precise figure of the little icicles, and their situation in the air, the size of the coronæ, or circles which accompany the *parhelia*, and the colours wherewith they are painted, by a geometrical calculus.

M. Huygens accounts for the formation of a *parhelion*, in the same manner as for that of the halo, viz. by supposing a number of small icy cylinders with opaque kernels, carried in the air, neither in a perpendicular nor parallel direction, but inclined to the horizon in a certain angle, nearly half a right one.

To make the effect of these cylinders manifest, M. Huygens produced to the academy of Paris, a glass cylinder a foot long, with an opaque cylinder of wood in the middle, and the ambient space filled with water, and transparent ice; which cylinder being exposed to the sun, and the eye put in the requisite situation, there were successively seen all the refractions and reflections necessary for the phænomena of the *parhelia*. See **HALO**.

**PARIAN Marble**. See the article **MARBLE**.

**PARIETALIA** *Ossa*, in anatomy, the third and fourth bones of the cranium; so called, because they form the *parietes*, or sides of the head. See **CRANIUM**.

They are also denominated *ossa bregmatis*, and *ossa sincipitis*. See **BREGMA** and **SINCIPIUT**.

Their Substance is finer and thinner than that of the coronal and occipital bones. Their figure is square; their size surpasses that of the other bones of the head; and their situation, in the lateral parts, which they possess entirely.

The sagittal suture connects them at the upper part; the coronal joins their fore-part to the *os frontis*; the lamdoidal joins them by the hind-part to the occipital bone; and, lastly, the squamous suture joins them by the lower part of the *ossa petrosa*.

The outer surface of these bones is very smooth and polite; the inner rough and uneven, full of impressions which the arteries of the *dura mater* have made by their continual pulsation, before the bones were ossified.

**PARIETES**, in anatomy, a term used for the inclosures, or membranes that stop up, or close the hollow parts of the body; especially those of the heart, the thorax, &c. See **HEART**, **THORAX**, &c.

The *parietes* of the two ventricles of the heart are of unequal strength and thickness, the left exceeding the right, because of its office, which is to force the blood through all parts of the body; whereas the right only derives it through the lungs. See **VENTRICLE**, &c.

**PARISH**\*, the precinct, or territory of a parochial church; or the circuit of ground within which the people belonging to

any church do inhabit. See **CHURCH**. See also **PAROCHIAL**, and **REGISTER**.

\* The word comes from the Latin *parochia*, of the Greek παροικία, habitation; compounded of παρὰ, near, and οἶκος, house.

— Accordingly Du Cange observes, that the name *παροικία* was anciently given to the whole territory of a bishop, and derives it from *neighbourhood*; because the primitive christians, not daring to assemble openly in cities, were forced to meet secretly in neighbour-houses.

In the ancient church there was one large edifice in each city for the people to meet in; and this they called *parochia*, *parish*. But the signification of the word was afterwards enlarged, and by *parish* was meant a diocese, or the extent of the jurisdiction of a bishop, consisting of several churches; unless we will suppose, as some do, that those bishops were only pastors of single churches. See **DIOCESE** and **BISHOP**.

Du Pin observes, that country *parishes* had not their origin before the IV<sup>th</sup> century; but those of cities are more ancient. The city of Alexandria is said to have been the first that was divided into *parishes*. Baronius says, that, in the time of pope Cornelius, there were 46 *parishes* in Rome.

The division of England into *parishes*, is attributed to Honorius archbishop of Canterbury, in 636. Camden reckons 9284 *parishes* in England. Chamberlayn makes, at present, 9913.

**PARISH-PRIEST**, the parson, or minister, who holds a *parish* as a benefice. See **PARSON**.

If the predial tythes be appropriated, the parson is called *rector*. See **RECTOR**. If they be impropriated, he is called *vicar*. See **VICAR** and **TYTHE**.

**PARISIS**, a French money of account, formerly a real coin struck at Paris, at the same time with the tournois struck at Tours. See **MONEY** and **COIN**.

The *parisis* exceeded the *tournois* by one fourth; so that the livre or pound *parisis* was 25 sols; and the livre *tournois* 20. The sols and deniers *parisis*, &c. in proportion. See **LIVRE**, **SOL**, &c.

**PARK**\*, **PARCUS**, a large inclosure, privileged for wild beasts of chase, either by the king's grant, or by prescription.

\* The word is originally *Celtic*, it signifies an inclosure, or place shut up with walls.

Manwood defines a *park* a place of privilege for beasts of venery, and other wild beasts of the forest, and of chase, *tam sylvestres quam campestris*.—A *park* differs from a forest in that, as Crompton observes, a subject may hold a *park* by prescription, or the king's grant, which he cannot do by a forest. See **FOREST**.

A *park* differs from a chase also; for that a *park* must be enclosed; if it lie open, it is a good cause of seizing it into the king's hand; as a free chase may be, if it be enclosed. Nor can the owner have any action against such as hunt in his *park*, if it lie open. See **CHASE**.

Du Cange refers the invention of *parks* to king Henry I. of England; but Spelman shews, it is much more ancient; and was in use among the Anglo-Saxons. Zosimus assures us, the ancient kings of Persia had *parks*.

**PARK** is also used for a moveable pallisade set up in the fields to inclose sheep in to feed, and rest in during the night. See **HURDLES**.

The shepherds shift their *park*, from time to time, to dung the ground, one part after another.

**PARK** is also used for a very large net, disposed on the brink of the sea, with only one hole, which looks towards the shore; and which becomes dry after the flood is gone off; so that the fish has no way left to escape.

**PARK**, in war. **PARK of artillery**, a post in the camp out of cannon-shot of the enemy, and fortified to secure the magazines and ammunition.

Here are the artillery, artificial fireworks, powder, and other warlike provisions kept, and guarded by pikemen only, to avoid all casualties that might happen by fire.

Every attack, at a siege, has its *park* of artillery. See **ARTILLERY**.

**PARK of provisions**, is a place in a camp, on the rear of every regiment, which is taken up by the sutlers, who follow the army with all sort of provisions, and sell them to the soldiers.

**PARLEY**\*, a conference with an enemy, &c.

\* The word is formed of the French, *parler*, to speak, talk.

Hence to beat or sound a *parley*, is to give a signal for the holding such a conference by beat of drum, or sound of trumpet. See **CHAMADE**.

**PARLIAMENT**, **PARLIAMENTUM**, a grand assembly, or convention of the three estates of the kingdom, viz. lords spiritual, lords temporal, and commons, summoned to meet the king, to consult of matters relating to the common-weal; and particularly to enact and repeal laws. See **ESTATE**, **PEER**, &c.

The two houses of *Parliament* are the king's grand council. See **COUNCIL** and **COURT**.

Till the conquest, the great council, consisting only of the great men of the kingdom, was called *magnatum conventus*, and *prælatorum procerumque concilium*. The Saxons, in their own tongue, called it *Wittenagemote*, i. e. assembly of the wise.

After

After the conquest, about the beginning of the reign of king Edward I, some say, in the time of Henry I, it was first called *parlementum*, *q. d. speechment*, from the French, *parler*, to speak; though it still only consisted of the barons, or great men of the nation; 'till in the reign of Henry III, according to some, the commons were also called to sit in *parliament*, the first writs sent out to summon them bearing date 49 Henry III, anno 1217, though sir Walter Raleigh, in his prerogative of *parliaments*, thinks the commons were first called in the 17<sup>th</sup> of Henry I; and Dr. Heylin fixes the time of their first admission to the reign of Henry II.

Indeed, sir Edward Coke, Dodderidge, Prynne, and others, have shewn, that the commons of England had ever a share in the legislature, and a place in the great assemblies; though not on the present footing, as making a distinct house, and as composed of knights, citizens, and burgesses. See COMMONS. *Parliaments* are to be summoned, prorogued, and dissolv'd by the king alone: nor can a *parliament* begin without the king's presence, or his commissioner's. See KING, PROROGATION, &c. At first, new *parliaments* were called every year: by degrees their term grew longer. In the time of king Charles II, they were held a long time, with great interruptions between. Both which methods were found of so ill consequences, that in the beginning of the reign of king William, an act was passed whereby the term of all *parliaments* was restrained to three sessions, or three years; hence called the *triennial act*. Since that, from other views, the period of *parliaments* is again, 3 Georgii I, lengthened to seven years.

A *parliament* is called by the king's writ or letter, directed to each lord, commanding them to appear; and by other writs directed to the sheriffs of each county, to summon the people to elect two knights for each county, and one or two burgesses for each borough, &c.

Anciently all the people had votes in the elections; 'till it was enacted by Henry VI, that none but freeholders, residing in the county, and who had a yearly revenue of 40s. should be admitted to vote; nor were any to be elected that were under 21 years of age.

That the members might attend in *parliament* with more freedom, they, and all their menial servants, were privileged from all arrests, attachments, imprisonments, &c. for debts, trespasses, &c. *eundo, morando, ad propria redeundo*; but not from arrests for treason, felony, and breach of peace.

The place where the *parliament* meets, is wherever the king pleases; of late it has been in the palace of Westminster; the lords and commons each in a distinct apartment. In the lords house, the princes of the blood are placed in distinct seats; the great officers of state, dukes, marquesses, and bishops on benches; and the viscounts and barons on others across the house; all according to their order of creation, place, &c. See PRECEDENCY.

The commons sit promiscuously; only the speaker has a chair at the upper end; and the clerk and his assistant at a table near him. Before any matters be done, all the members of the house of commons take the oaths, and subscribe their opinions against transubstantiation, &c. which test, the lords too, though they do not take the oaths, are obliged to take.

The house of lords is the sovereign court of justice of the realm, and the dernier resort: the house of commons is the grand inquest, but no court of justice. See PEER and COMMONS.

*As to the manner of debating and passing bills in PARLIAMENT.* Any member may move to have a bill brought in for any thing, which, upon a question put, being agreed to by the majority, that person, with others, are ordered to prepare and bring in the same. When ready, a time is appointed for reading: after reading it by the clerk, the speaker reads the abstract thereof, and puts the question, whether or no it shall have a second reading? after a second reading, the question is, whether or no it shall be committed? which is either to a committee of the whole house, if it be of importance; or to a private committee, any member naming the persons. See COMMITTEE.

The committee appointed, and a chairman chosen, the chairman reads the bill, paragraph by paragraph, puts every clause to the question, fills up blanks, and makes amendments, according to the opinion of the majority. The bill thus gone through, the chairman makes his report at the side-bar of the house, reads all the additions and amendments, &c. and moves for leave to bring up the report to the table; which granted, he delivers it to the clerk, who reads the amendments, &c.

The speaker then puts the question, whether they shall be read a second time; and, if agreed to, reads them himself. To so many as the house acquiesces in, the question is now put, whether the bill, thus amended, shall be engrossed, and writ fair in parchment, and read a third time? the bill engrossed, the speaker holds it in his hand and asks if it shall pass? if the majority be for it, the clerk writes on it, *soit baille aux seigneurs*. Or, in the house of lords, *soit baille aux communes*. — If a bill be rejected, it cannot be any more proposed during that session. See BILL.

Forty members constitute a house of commons, and eight a committee. A member of the commons, to speak, stands up, uncover'd, and directs his speech to the speaker only. If what he says be answered by another, he is not allowed to reply the same day, unless personally reflected on. Nor may any person speak more than once to the same bill in the same day. In the lord's house they vote, beginning at the peer or lowest baron, and so up orderly to the highest, every one answering apart, *content*, or *not content*. In the house of commons they vote by *yea's* and *nay's*; and, if it be dubious which is the greater number, the house divides. If the question be about bringing any thing into the house, the *ay's* go out; if it be about any the house already has, the *no's* go out. In all divisions the speaker appoints four tellers, two of each opinion. In a committee of the whole house they divide by changing sides, the *ay's* taking the right, the *no's* the left of the chair, and then there are but two tellers.

If a bill pass one house, and the other demur to it, a conference is demanded in the painted chamber, where certain members are deputed from each house; and here the lords sitting covered, the commons standing bare, the case is debated. If they disagree, the affair is null; if they agree, this, with the other bills that have passed both houses, is brought down to the king, in the house of lords, who comes thither clothed in the royal robes, and with the crown on, before whom the clerk of the *parliament* reads the title of each bill, and as he reads, the clerk of the crown pronounces the royal assent or dissent.

If it be a public bill, the royal assent is given by these words, *le roy le veut*. If a private one, by *soit fait comme il est desire*. If the king refuse the bill, the answer is, *le roy s'aviserá*. If it be a money bill, the answer is, *le roy remercie ses loyaux sujets, accepte leur benevolence & aussi le veut*.

The bill for the king's general pardon has but one reading. The number of members in the house of lords is uncertain, as increasing at the king's pleasure. The members of the house of commons, when full, are 553, viz. 92 knights of shires; 52 deputies for the 25 cities, London having 4; 16 for the 8 cinque ports; 2 for each university; and finally, 332 for 180 boroughs, besides 12 boroughs for Wales, and 45 members for Scotland.

*Porter of PARLIAMENT house.* See the article PORTER.

*Rolls of PARLIAMENT.* See the article ROLLS.

*Session of PARLIAMENT.* See the article SESSION.

PARLIAMENT is sometimes also used for other assemblies besides those of the states of the realm.—Thus we read, that the abbot of Croyland was used to call *parliaments* of his monks, to consult of the affairs of the monastery.—And, at this day, an assembly of the two temples, called to consult of their common affairs, is called a *parliament*. See TEMPLE.

PARLIAMENTS of France, are courts or assemblies established by the kings to judge of the differences between particular persons, and to pronounce on appeals from sentences given by inferior judges. See COURT.

There are ten of these *parliaments* in France. That of Thoulouze, established in 1303: that of Dijon, in 1476: that of Grenoble, in 1453: that of Rouen, in 1499: that of Rennes in Bretagne, in 1553: that of Bourdeaux, in 1502: that of Aix, in 1501: that of Metz, in 1633: that of Pau in Bearn, in 1519: and that of Paris.

The *parliament* of Paris is the principal, and that whose jurisdiction is of the greatest extent. This is the chief court of justice throughout the realm. It consists of six chambers: the grand chamber, where causes of audience are pleaded; and five chambers of inquests, where processes are adjudged in writing. See CHAMBER.

Under their second race of kings, this *parliament*, like that of England, was the king's council, gave audience to ambassadors, and consulted of the affairs of war and government.

The kings, like ours, presided in them, without being, at all, masters of their resolution. But, in after-times, their authority has been abridged, the kings having reserved the decision of the grand affairs of the public to their own councils; leaving none but private ones to the *parliaments*.

PARLIAMENTUM *Indoctorum*, a denomination given to a *parliament*, held at Coventry, 6 Henry VI, whereunto, by special precept to the sheriffs of the several Counties, no lawyer, or person skilled in the law, was to be called.

PARLIAMENTUM *Insanum*, was a *parliament* held at Oxford, anno 41 Henry III, thus called, say our chronicles, because the lords came with great retinues of armed men to it; and many things were violently transacted therein, against the king's prerogative.

PARLIAMENTUM *Diabolicum*, was a *parliament* held at Coventry, 38 Henry VI, wherein Edward Earl of March, afterwards king, and several others, were attainted. — The acts passed therein were annulled by the succeeding *parliament*.

PARLIAMENTUM *de la bonde*, was a *parliament* in Edward II's time, whereto the barons came armed against the two Spencers, with coloured bands on their sleeves for distinction.

PARLOUR,

**PARLOUR**, **PARLOIR**\*, in nunneries, a little room or closet, where people talk to the nuns through a kind of grated window.

\* The word is formed from the French *parler*, to talk.

Anciently there were also *parlours* in the convents of monks, where the novices used to converse together at the hours of recreation; but there were listening places over, from whence the superiors could hear what they said. Such a one there still subsists in the abbey of St. German de Prez.

In the order of Feuillans, the *parlour* is a little room open on all sides, placed at each end of the dormitory, where the monks talk together, it not being allowed them to speak in the dormitory. See **FEUILLANS**.

**PARMA**, among antiquaries, a kind of ancient buckler. See **BUCKLER**.

Polybius describes the *parma* as very strong, round, three feet in diameter, and big enough to cover the whole body; yet Servius, on the *Æneid*, and even Virgil himself mention it as a light piece of armour in comparison of the clypeus, though bigger than the pelta. See **SHIELD**, and **PELTA**.

**PARMASITTY**, the popular name for *Sperma Ceti*.

**PARMESAN**. See the article **PADUAN**.

**PAROCHIAL**, something belonging to a parish. See **PARISH**, and **EXTRAPAROCHIAL**.

Every church is either cathedral, collegiate, or *parochial*.

Cathedral is where there is a bishop's see or seat, called *cathedra*. Collegiate, consists either of regular clerks, professing some religious order; or of a dean and chapter. See **CATHEDRAL**, **COLLEGIATE**. &c.

*Parochial* church is that instituted for the performing of divine service to the people who dwell within a certain compass of ground. See **PARISH**.

**PARODICAL** *degrees*, in an equation, the several regular terms in a quadratic, cubic, biquadratic or other equation, the indices of whose powers ascend or descend orderly in an arithmetical progression. See **TERM**, and **EQUATION**.

Thus,  $Z^3 + Z^2 M + Z^2 = S$  is a cubical equation where no term is wanting, but having all its *parodic* degrees; the indices of the terms regularly descending thus 3, 2, 1, 0. Harris.

**PARODY**\*, **PARODIA**, a popular maxim, adage, or proverb. See **PROVERB**, and **ADAGE**.

\* The word is formed from the Greek *παρά* and *ὁδός*, *via*, way; as being trite, or passing among the people.

**PARODY**, *Παρωδία*, is also a poetical pleasantry, consisting in applying the verses of one person, by way of ridicule, to another; or in turning a serious work into burlesque, by affecting to observe, as nearly as possible, the same rhymes, words, and cadences. See **BURLESQUE**.

The *parody* was first set on foot by the Greeks; from whom we borrow the name. It comes near to what some of our late writers call *travesty*. See **TRAVESTY**, **SATYR**, &c.

**PAROEMIA**\*, *ΠΑΡΟΙΜΙΑ*, a proverb. See **PROVERB**.

\* The word is formed from the Greek *παρά* and *οἶμος*, way; *quasi* *παρά οἶμον*, *juxta viam*, i. e. *tritum*.

**PAROL**, **PAROLE**, in law, is sometimes used in ancient writers for a plea in court. See **PLEA**.

*Lease-PAROL*, or *per PAROL*, is a lease by word of mouth; thus called to distinguish it from one in writing. See **LEASE**.

**PAROLE**, in war, &c. when a prisoner of war is allowed to go into his own country, or to his own party, upon his word and promise to return at a time appointed, if not exchanged; he is said to be out upon *parole*, i. e. upon his word.

*Pass-PAROLE*. See the article **PASS-PAROLE**.

**PAROLI**, in gaming, the double of what was laid at stake before.—Hence, to offer the *paroli*, &c.

**PARONOMASIA**\*, *ΠΑΡΟΝΟΜΑΣΙΑ*, in rhetoric, a figure whereby words nearly alike in sound, but of very different senses, are affectedly or designedly used.

\* The word is formed from the Greek *παρά*, near, and *ὄνομα*, name, *q. d.* proximity or resemblance of two names.

As, not friends but fiends were here: so Tully to Anthony, *cum in gremio mimarum mentem & mentum deponeres*; and to Atticus, *consul ipse parvo animo & pravo, facie magis quam facietis ridiculus*. And that of P. Chrysologus, *monachorum cellulae jam non eremiticae sed aromaticae*. And in another place, *hoc agant in cellis quod angeli in caelis*.

Among the Greeks the *paronomasia* was very familiar. Thus Herodotus *παθηματα μαθηματα, quae nocent docent*.

And thus that inscription of Apollodorus a celebrated painter, on one of his pieces.

*Μωμησεται τις μλλον η μιμησεται.*

*It will be easier to deride than to imitate.*

**PARONYCHIA**\*, *whitloc*, in medicine, a painful kind of tumor, or abscess, arising at the ends of the fingers, and the roots of the nails; otherwise called *Panaritium* and *Panaris*. See **PANARITIUM**.

\* The word is derived from the Greek *παρά*, near, and *ὄνυξ*, *unguis*, nail.

The humour, or matter of the *paronychia*, is sometimes so sharp as to corrode the tendons, nerves, periosteum, and even the bone itself.

It is either lodged between the integuments, or between the periosteum and bone. The deeper the more dangerous.

VOL. II. N° CXII.

**PAROTIDES**\*, *ΠΑΡΩΤΙΔΕΣ*, in anatomy, two big glands situate behind the two ears; and filling all the space between the posterior angle of the under jaw, and the mastoidal apophysis. See **GLAND** and **EAR**.

\* The word is formed from the Greek *παρά*, near, and *ὤς*, ear.

They are of the conglomerate kind, and by divers excretory ducts, which, at last, coalesce into one trunk, discharge a humour separated in them from the arterious blood, called *saliva*, into the mouth, by two vessels formed of several branches uniting at the issue of these glands, and which run along the cheek to the third grinder. See **SALIVA** and **SALIVAL**.

**PAROTIDES**, in medicine, tumors, or inflammations arising behind the ears, on the *parotid* glands.

*Parotides* are very frequent after malignant and pestilential fevers: children are particularly liable to them. They are to be treated like bubo's. See **BUBO**.

**PAROXYSM**\*, *ΠΑΡΟΞΥΣΜΟΣ*, in medicine the severe fit of a disease which grows higher, or exasperates; as of the gout, &c. See **GOUT**.

\* The word is formed from the Greek *παρά*, much, and *ὤξω*, acute.

**PAROXYSM** is sometimes also used for the access, or return of a disease that intermits; as an ague. See **ACCESS**.

**PARRICIDE**, **PARRICIDA**, or **PATRICIDA**, in strictness, denotes the murder, or murderer of a father: as matricide does of a mother. See **MURDER**.

Though the word *parricide* is also ordinarily extended to both. The Romans for a long time, had no law against *parricides*; from an opinion no body could be so wicked as to kill his parents. L. Ostius was the first, who killed his father, 500 years after Numa's death; and then the Pompeian law was made, which ordained, that the person convicted of this crime, after he had been first whipped till the blood came, should be tied up in a leathern sack, together with a dog, an ape, a cock, and a viper, and so thrown into the sea, or the next river.

**PARRICIDE** is also extended to the murder of any near relation, as a husband, wife, brother, sister, child, grandchild, uncle, &c. and even to that of great or sacred persons, though no way allied in blood, as a king, &c. See **FRATRICIDE**, and **TREASON**.

**PARRYING**, in fencing, the action of defending a man's self, or of staying off the strokes, &c. offered him by another. See **FENCING**.

Good fencers push and *parry* at the same time. See **GUARD**.—The Spaniards *parry* with the poniard. The ancients *parried* with their bucklers. See **PARADE**.

**PARSON**, **PERSONA**, the rector or incumbent of a parish church. See **CHURCH** and **PARISH**.

He is said, by some, to be thus called by way of eminence; the revenues of a church being destined to maintain *magnam personam*; or, as some will have it, because he is bound by virtue of his office, *in propria persona servire deo*, whence *impersonare*, in old charters, is to put in possession of a parsonage, &c.—Or as others, because the original *parsons*, *personae*, were, in reality, only dignitaries, and possessed benefices which gave them some personal pre-eminences in the church or chapter, but no power.—Or, lastly, as others, because the *parson*, for his time, represents his church, and sustaineth the person thereof, as well in suing, as in being sued in any action touching the same. See **PARSONAGE**.

Some distinguish between a *rector* and *parson*: the rector, say they, is where the vicarage is endowed; and the *parson*, *persona*, where the parsonage is without a vicarage: but the distinction seems new and subtle: Bracton apparently uses *rector*, and *parson*, as synonymus. See **RECTOR**.

Formerly he who had a church by institution and induction only for his own life, was called *parson mortal*: but any collegiate, or conventual body, to whom the church was for ever appropriated, was called *parson immortal*. See **APPROPRIATION**. Some again make a distinction between *parson* simply, and *parson impersonae*, impersonated.

*Parson impersonae* is the rector or incumbent in possession of a parish church, whether presentative or inappropriate, and with whom the church is full.

*Parson* simply, they contend, is properly the patron, or he that has the right of presentation; called *parson*, by reason, before the Lateran council, he had a right to the tithes, in respect of his liberality in erecting or endowing the church, *quasi sustineret personam ecclesiae*.

It is certain, in the register of writs, *persona impersonata* is used for the rector of a benefice presentative: and in Dyer, a dean and chapter are said to be *parsons impersonae* of a benefice appropriated to them.—So that *personata* seems only changed into *impersonata*, in respect of the possession of the benefice. See *Coke on Littl. fol. 300*.

**PARSONAGE**, a *rectory*; or a parish church endowed ordinarily with house, glebe and tithe, for the maintenance of a minister with cure of souls within such parish. See **PARSON**, **PARISH** and **RECTORY**.

There may also be a rectory or *parsonage* without any glebe land, except the church and church yard; and without any tithes, or other fixed income, except an annual payment, or pound rate.

**PARSONAGE** in its original, and at this day in other countries, is a *benefice* which gives some prerogative, or pre-eminence in a church or chapter, but without any jurisdiction. See **BENEFICE**.

The ancient *Parsonages* gave a little honour and dignity as to the person, but no power: whence, apparently, the name; intimating the effect of the dignity to be restrained to the person, *persona*, *parson*.

Such are still the chantries in several churches, and the sub-chantries in others. See **CHANTOR**.

Some, as Oldrade, &c. extend the word *parsonage* to dignity, and comprehend under it the archdeacons, deans, &c. in cathedrals; but this seems to be straining the sense of the word.

In effect, the canonists use the term very differently: some applying it to all who have any prerogative in the choir, or the chapter, over the other canons, either in options, suffrages, elections, or barely in place and procession; thus confounding it with dignity; while others apply it to simple rectors, &c. See **DIGNITARY**.

**PART, PARS**, a portion of some whole, considered as divided, or divisible. See **DIVISION**.

Quantity is divisible into an infinite number of *parts*: not equal *parts*, but proportional ones. See **DIVISIBILITY**. Philosophy is divided into four *parts*, viz. logicks, ethicks, physics and metaphysics. See **PHILOSOPHY**, &c.

The schoolmen usually distinguish *parts* into *logical* and *physical*. **Logical PART**, is that referring to some universal as its whole—in which sense the species are *parts* of a genus; and individuals, or singulars, *parts* of the species. See **GENUS**.

**Physical PART** is that, which, though it enter the composition of a whole, may yet be considered a-part, and under its own distinct idea—in which sense, a continuum is said to consist of *parts*. See **CONTINUUM**.

It is controverted in the schools, whether the *parts* of a continuum or physical whole, e. g. water, do exist actually before the division be made, or only potentially.

*Physical parts*, again, are of two kinds; *homogeneous*, and *heterogeneous*—the first are those of the same denomination with some other; the second of a different one. See **HOMOGENEOUS**, &c.

*Parts*, again, are distinguished into *subjective*, *essential*, and *integral*.

**Subjective or potential PART**, is the same with *logical part*, viz. that contained in some universal whole, not in act, but only in power—As, man and horse are in animal: Peter and Paul in man.

**Essential PART** is that, whereby, with the concurrence of some other, an essential whole is constituted.—Thus body and soul are essential *parts* of man.

**Integral or Integral PART** is that which is necessary to the integrity of the whole—As a head is of a man, &c.

Anatomists divide the *parts* of the human body into containing and contained; similar and dissimilar; and the similar, again, into spermatic and sanguineous, &c. See **SIMILAR**, &c.

**Noble or essential PARTS**, are those absolutely necessary to life: as, the heart, the lungs, liver, brain, &c.

**Natural or genital PARTS**, popularly called *privy parts*, are those ministering to generation. See **GENERATION**.

The finest writings of physicians are those which treat of the use of the *parts*: Galen's work *de usu partium*, affords infinite arguments of the being and wisdom of a God.

Nature, we say, always discharges itself on the weak *part*, the diseased *part*, the *part* affected, &c.

**Consent of PARTS**. See the article **CONSENT**.

In chymistry, bodies are said to be resolved into their minute *parts*, their component *parts*, &c. See **CHYMISTRY**, **ANALYSIS**, **ELEMENT**, &c.

That art is said to separate the homogeneous *parts* from the heterogeneous; volatile, subtle, sulphureous, mercurial, &c. *parts*, from the fixed, crass, earthy, viscid, &c. *parts*. See **VOLATILE**, **FIXT**.

**PART**, in geometry and astronomy, is applied to the divisions of lines and circles.

The semi-diameter of the circle, called also the radius, and whole sine, is divided into an hundred thousand *parts*; the circumference of the circle into 360 *parts*, or degrees; in which two divisions all the celestial computations are made. See **DEGREE**, &c.

**Aliquot PART**, is a quantity which, being repeated any number of times, becomes equal to an integer. Thus 6 is an *aliquot part* of 24; and 5 an *aliquot part* of 30, &c. See **ALIQUOT**, and **MULTIPLICATION**.

**Aliquant PART**, is a quantity which, being repeated any number of times, becomes always either greater or less, than the whole. Thus 5 is an *aliquant part* of 17; and 9 an *aliquant part* of 10, &c. See **ALIQUANT**.

The *aliquant part* is resolvable into aliquot *parts*. Thus 15, an *aliquant part* of 20, is resolvable into 10 a half, and 5 a fourth *part* of the same. See **MULTIPLICATION**.

**Proportional PART** is a *part* or number agreeable and analogous to some other *part* or number; or a medium to find some

number or *part* unknown by proportion and equality of reason. See **PROPORTION**.

**Similar PARTS** are those which are to one another, as their wholes are to one another. See **SIMILITUDE**, and **SIMILAR**.

**Organical PART**. See the article **ORGANICAL**.

**PART**, in music, denotes a piece of the score or partition, wrote by itself, for the convenience of the musician: or it is one or more of the successions of sounds which make the harmony, wrote a-part. See **PARTITION**.

Or, the *parts* are the sounds made by several persons singing, or playing in concert. See **CONCERT**.

Music in *parts* was unknown to the ancients; they had but one *part*; all their harmony consisted in the succession of notes, none in the consonance. See **MUSIC** and **SYMPHONY**.

There are four principal *parts*; the treble, bass, tenor, and counter-tenor. See **TREBLE**, **BASS**, **TENOR**, &c.

Some compare the four *parts* in music to the four elements: the bass represents the earth; the tenor, water; counter-tenor, air; and treble, fire.

**PART**, in trigonometry. In a rectangular spherical triangle ABC, Tab. Trigon. fig. 22, that *part* lying between two others, considered as extremes, is called by some authors, the *middle part*.—Thus, if AB and BC be the extreme *parts*, the angle B will be the middle *part*.

If the *parts*, considered as extremes, be contiguous to the middle *part* and one of the extremes; those are called *conjunct parts*.—Thus, if B be the middle *part*, AB and BC will be the *conjunct parts*.

If between the extremes and the middle *part*, there lie another, besides a right angle; then the *parts* are said to be *disjunct*, or *separate*;—e. g. If B be the middle term, AC and C will be *disjunct parts*; because, between the middle *part* B and the extreme C, there lies the hypotenuse BC; and between the middle *part* B and the other extreme AC, besides the right angle, there lies the leg AB. See **TRIANGLE**.

Those *parts*, either joined to the middle *part*, or separated from it, are called *lateral parts*.

**PARTS of speech**, in grammar, are all the sorts of words which enter the composition of discourse. See **WORD** and **SPEECH**.

The grammarians usually admit of eight *parts* of speech, viz. noun, pronoun, verb, participle, adverb, conjunction, preposition, and interjection. See each in its proper place, **NOUN**, **PRONOUN**, &c.

**PART of fortune**, in judiciary astrology, is the lunar horoscope; or the point wherein the moon is, at the time when the sun is in the ascending point of the east.

The sun in the ascendant is supposed to give life; and the moon dispenses the radical moisture, and is one of the causes of fortune.—In horoscopes, the *part of fortune* is represented by a circle divided by a cross.

**Art and PART**, in law. See the article **ART**.

**Ex PARTE**. See the article **EX**.

**PARTERRE**, in gardening, that open part of a garden into which we enter, coming out of the house; usually, set with flowers, or divided into beds, encompassed with platbands, &c. See **GARDEN**.

The *Parterre* is a level division of ground, which, for the most part, faces the south and best front of a house, and is generally furnished with greens, flowers, &c.

There are divers kinds of *parterres*, as bowling-green or plain *parterres*; *parterres* of embroidery; *parterres* cut in shell-work, in scrollwork, &c. with sand allies between.

An oblong, or long square is accounted the most proper figure for a *parterre*; the sides whereof to be as two, or two and a half to one.

**PARTI, PARTY or PARTED**, in heraldry, is applied to a shield, or escutcheon, denoting it divided or marked out into partitions. See **SHIELD** and **ESCUTCHEON**.

The French heralds, from whom we borrow the word, have but one kind of *parti*, the same with our *parti per pale*, which they call simply *parti*: but, with us, the word is applied to all the sorts of partitioning; and is never used without some addition to specify the particular one intended.

Thus we have *parti* or *parted per cross*, *per chief*, *per pale*, *per fess*, *per bend dexter*, *per bend sinister*, *per chevron*, &c. See **QUARTERING**.

The humour of our ancestors, Colombiere observes, turning much upon exploits of arms and chivalry; they used to preserve their battered and hacked armour as honourable symbols of their hardy deeds; and those who had been in the hottest service, were distinguished by the most cuts and bruises that appeared on their shields. To perpetuate the memory hereof, says the same author, they caused them to be painted on their shields, and thus handed down to posterity.—And when heraldry grew into an art, and officers were appointed to direct the manner of bearing, and blazoning; they gave names to those cuts, answerable to the nature thereof; appointing four, from which all the others proceed: these are *parti* (in English, *parti per pale*) *coupe* (in English, *parti per fesse*) *tranche* (in English, *party per bend dexter*) and *taille* (in English, *party per bend sinister*.) See **COUPED**, **TRANCHE**, &c.

PARTI

**PARTI per pale**, is when the shield is divided perpendicularly into two halves, by a cut in the middle from top to bottom. See PALE, &c.

**PARTI per fesse**, is when the cut is a-cross the middle, from side to side. See FESSE.

**PARTI per bend dexter**, is when the cut comes from the upper corner of the shield on the right hand, and descends athwart to the opposite lower corner. See BEND.

**PARTI per bend sinister**, is when the cut, coming from the upper left corner, descends a-cross to the opposite lower one.

From these four partitions have proceeded an infinite number of others of various and extravagant forms.

Spelman, in his *Aspilogia*, observes, that the present divisions of escutcheons were unknown in the reign of the emperor Theodosius; were brought up in the time of Charlemagne, or later; little used among the English in the days of king Henry II, but more frequently under Edward III.

The erect or upright section, he observes, is called in Latin, *polaris*, from its resemblance to a *palus*, or stake; and two coats are often entire on the sides, the husband's on the right, and the wife's on the left. — The direct section a-cross, being in the place of a belt, is called *baltica*, &c.

When the shield is *parti*, and *coupée*, it is said to be *écartelée*. See QUARTERLY and QUARTERING.

It is said to be *parti one from the other*, when the whole shield is charged with some honourable bearing divided by the same line that parts the shield. — Here it is a rule, that one side be of metal, and the other of colour. Thus he bears sable *parti d'argent*, a spread eagle *parti* from one to the other.

**PARTIAL Cause**. See the article CAUSE.

**PARTIAL Eclipse**. See the article ECLIPSE.

**PARTICIPATION, PARTICIPATIO**, that which gives us a part or share in any thing, either by right or grace.

In Italy they distinguish *participating officers*, as prothonotaries, &c. which have a real function, from *honorary ones*, which have only a title, without any duty or employ. See OFFICE and OFFICER.

**PARTICIPATIONIS medium**. See the article MEDIUM.

**PARTICIPLE, PARTICIPIUM**, in grammar, an adjective formed of a verb; so called, because it still participates of some of the properties of the verb; retaining the regimen and signification thereof: whence most authors confound it with the verb. See VERB.

There are two kinds of *participles*, the one called *active*, because expressing the subject which makes the action of the verb; as *legens, audiens; reading, bearing*. — The other called *passive*, because expressing the subject that receives the action of the verb, as *lectum, auditum; read, heard*.

As our adjectives are not declined, the *participles*, being real adjectives are not declined neither: in the Latin, &c. where the adjectives are declined, the *participles* active are declined likewise. — Thus they say, *audiens, audientis, audienti*, &c. and, in the French, the *participles* passive are declinable like their adjectives, as *j'ay lue, elle a lue, nous avons lue*, &c.

We take this occasion to observe, that declension, or the changing or not changing the termination, is a thing perfectly accidental to the several kinds of words: the Latins, *e. gr.* have indeclinable nouns, as *cornu* and *nequam*; yet both Latins and Italians decline their adverbs, as *fortiter, fortissime; bene, benissimo*, &c. and some nations scarce conjugate their verbs at all. Indeed the English do it very little, in comparison with the Latins, Greeks, French, &c.

In our language the *participle* and gerunds are not at all distinguishable. See GERUND.

**PARTICLE, PARTICULA**, in physicks the minute part of a body, of an assemblage or coalition of several whereof natural bodies are composed. See BODY and PART.

**PARTICLE**, in the new philosophy, is frequently used in the same sense with *atom* in the ancient Epicurean philosophy; and *corpuscle* in the latter. See ATOM and CORPUSCLE.

Some of the more accurate writers, however, distinguish them; making *particle* an assemblage or composition of two or more primitive, and physically indivisible corpuscles or atoms; and *corpuscle*, or little body, an assemblage, or mass of several *particles*, or secondary corpuscles. See ELEMENT.

Indeed the distinction is of no great moment; and, as to most purposes of physicks, *particle* may be understood as synonymous with *corpuscle*.

*Particles*, then, are, as it were, the elements of bodies: it is the various arrangement, and texture of these, with the difference of the cohesion &c. that constitute the various kinds of bodies, hard, soft, liquid, dry, heavy, light, &c. See BODY.

The smallest *particles* or corpuscles cohere with the strongest attractions, and compose bigger *particles* of weaker cohesion; and many of these cohering compose bigger *particles*, whose vigour is still weaker; and thus on for divers successions, 'till the progression end in the biggest *particles*, whereon the operation in chemistry, and the colours of natural bodies depend, and which, by cohering, compose bodies of sensible bulks. See MATTER.

The cohesion of the particles of matter, the Epicureans imagined was effected by means of hooked atoms; the Aristotelians, by rest, that is, by nothing at all. But Sir Isaac Newton shews it is done by means of a certain power, whereby the *particles* mutually attract or tend towards each other. See COHESION.

By this attraction of the *particles* he shews, that most of the phenomena of the lesser bodies are effected; as those of the heavenly bodies are by the attraction of gravity.

For the laws of this attraction of the particles. See ATTRACTION.

All bodies, the same great author shews, consist of the same solid, perfectly-hard *particles* or corpuscles. See MATTER.

**PARTICLE**, in grammar, denotes a little indeclinable word, consisting of one or two syllables at the most. See WORD, &c. Those are properly *particles*, which are neither declined nor conjugated.

Brighland calls *particles*, *manners of words*, because rather serving to express the circumstances and manners of other ideas and objects of the mind, than to represent any distinct objects of their own.

*Particles* may be reduced under three heads: the first shew the manners or qualities of words, by being added to them; called *adverbs*. See ADVERB.

The second denote some circumstances of actions, and join words to words, sentence to sentence, &c. See CONJUNCTION. The third express the emotions of the soul. See INTERJECTION.

It is in the right use of *particles*, Mr. Locke observes, that more particularly consists the clearness and beauty of a good style. To express the dependance of his thoughts and reasonings one upon another, a man must have words to shew what connexion, restriction, distinction, opposition, emphasis, &c. he gives to each respective part of his discourse. This cannot be rightly understood without a clear view of the postures, stands, turns, limitations, exceptions, and several other thoughts of the mind. Of these there are a great variety, much exceeding the number of *particles*, that most languages have to express them by; for which reason it happens, that most of these *particles* have divers, and sometimes almost opposite significations.

Thus the *particle* BUT, in English, has several very different significations: as in, *but* to say no more, where it intimates a stop of mind in the course it was going, before it came to the end of it. I saw *but* two planets; here it shews, that the mind limits the sense to what is expressed, with a negation of all other. You pray, *but* it is not that God would bring you to the true religion, *but* that he would confirm you in your own. The former of these intimates a supposition in the mind, of something otherwise, than it should be; the latter shews, that the mind makes a direct opposition between that and what goes before. All animals have sense, *but* a dog is an animal: here it signifies the connection of the latter proposition with the former.

**PARTICLES** is also a term in theology, used in the Latin church for the crumbs or little pieces of consecrated bread, called *μυστήρια* in the Greek church.

In the Greek church they have a particular ceremony, called *τὸν μυστήριον*, of the *particles*, wherein certain crumbs of bread not consecrated, are offered up in honour of the virgin, St. John Baptist, and several other saints. They also give the name *προσφορά*, oblation, to these *particles*.

Gabriel, archbishop of Philadelphia, has a little treatise expressing *τὸν μυστήριον*, wherein he endeavours to shew the antiquity of this ceremony, in that it is mentioned in the liturgies of St. Chrysostom and Basil.

There has been a considerable dispute on this head between the reformed and the catholic divines. Aubertin and Blondel explain a passage in the theory of Germanus, patriarch of Constantinople, where he mentions the ceremony of the *particles* as in use in his time, in favour of the former: Messieurs de Port Royal contest the explanation: but M. Simon, in his notes on Gabriel of Philadelphia, endeavours to shew, that the passage is an interpolation, not being found in the ancient Copies of Germanus; and consequently that the dispute is ill grounded.

**PARTICLE out of share**, in astronomy. See PARTICULA exfors.

**PARTICULA exfors**, in astronomy, the difference between the æquatorial triangle LAC, (*Tab. Astronom. Fig. 32.*) and its fellow BLZ. See EQUATION.

To find the *particula exfors*, the menstrual eccentricity AC, and the annual argument of longitude HAD being given; from the data in the triangle BCA, find the hypotenuse AB to the angle C, and to the angle CAB find the subtense CB. Multiply CB into half the menstrual eccentricity AC; the product is the area of the triangle ACB. Find likewise the area of the circle described by the radius of the eccentric BL. Then as the area of the circle is to 360° or 129600"; so is the area of the triangle ACB to its value in those seconds; which value is the *particula exfors*.

**PARTICULAR, PARTICULARIS**, a relative term, referring to species, or individual, and opposed to general, or universal. See GENERAL, &c.

In the schools, *particular* is defined to be something included under an universal; as man under animal. Though sometimes it is also taken for an individual, as PETER. See INDIVIDUAL. There is this difference between *particular* and *singular*, that *particular* denotes a thing taken as a part; as Peter in respect of mankind. — Whereas *singular* denotes the part taken after the manner of a whole; as Peter considered in himself.

PARTICULAR <i>Averment.</i>	} See the article	AVERMENT.
PARTICULAR <i>Cause.</i>		CAUSE.
PARTICULAR <i>Character.</i>		CHARACTER.
PARTICULAR <i>Executor.</i>		EXECUTOR.
PARTICULAR <i>Geography.</i>		GEOGRAPHY.
PARTICULAR <i>Gravity.</i>		GRAVITY.
PARTICULAR <i>Maps.</i>		MAP.
PARTICULAR <i>Nature.</i>		NATURE.
PARTICULAR <i>Qualities.</i>		QUALITY.
PARTICULAR <i>Rheumatism.</i>		RHEUMATISM.
PARTICULAR <i>Tenant.</i>	}	TENANT.
PARTICULAR <i>Theorem.</i>		THEOREM.
PARTICULAR <i>Winds.</i>		WINDS.

**PARTICULARIST**, among polemical divines, a person who holds for particular grace, *i. e.* teaches, or believes that Christ died for the elect only; and not for mankind in general. See GRACE, PREDESTINATION. &c.

**PARTIES**, in law, are those who are named in a deed, or fine, as *parties* to it: *e. gr.* those who levy the fine, and to whom the fine is levied. See FINE.

So they who make any deed, and they to whom it is made, are called parties to the deed. See DEED.

**PARTILE aspect**, in astrology, an exact and full aspect of any kind. See ASPECT.

Thus a *partile* conjunction is when two planets are precisely in the same degree of longitude and latitude: if one of them deviate a little to the north, and the other to the south, the aspect or conjunction is no longer *partile*. See CONJUNCTION.

**PARTING**, or **DEPARTING**, a method of separating gold and silver by means of *aqua fortis*. See DEPART and REFINING.

**PARTITION**, the act of parting, dividing, or distributing a thing. See DIVISION, DISTRIBUTION, QUADRIPARTITION, and TRIPARTITION.

The denomination *Partitiones oratoriae*, is also given to a dialogue of Cicero's between him and his son; in regard the discourse is, as it were, parted or divided between them.

**PARTITION**, in law, a dividing of lands descended by common law or custom among coheirs, where there are two at least. See COPARCENER.

The *partition* is made four ways; whereof three are by agreement, the fourth by compulsion.

The first *partition* by agreement is, when the parceners divide the land equally themselves into so many parts as there are coheirs. The second is, when each chuses some of his friends to make the division for him.

The third is by drawing lots, thus: having first divided the land into as many parts as there are persons, they write every part severally in a distinct scroll, and wrapping it up, throw each into a hat, or such like thing; out of which each one draws according to his superiority; and so the land is severally allotted. The fourth *partition*, which is by compulsion, is, when one or more of the heirs, by reason of the refusal of some other, sues out a writ of *partitione facienda*; by force whereof they shall be compelled to divide.

In Kent, where land is of gavel-kind nature, they call their *partition*, shifting. See GAVEL-KIND.

*Partition*, also may be made by joint-tenants, and tenants in common, by assent, by deed, or by writ.

**PARTITION**, in music, the disposition of the several parts of a song set on the same leaf; so as upon the uppermost ranges of lines are found the treble; in another the bass; in another the tenor, &c. that they may be all sung or played either jointly or separately. See PART, MUSIC, &c.

**PARTITION**, in architecture, that which divides or separates one room or apartment from another. See BUILDING. APARTMENT, &c.

**PARTITION**, in heraldry. See the article QUARTERING.

**PARTIUM prece**. See the article PRECE.

**PARTNER**, and **PARTNERSHIP**. See COMPANY, COPARCENER and FELLOWSHIP.

**PAR TOUT**. See the article PASS *par tout*.

**PARTURITION**, the act of bringing forth, or being delivered of young. See DELIVERY.

**PARTUS**, in medicine and law, the delivery of a woman, or the birth of a child. See DELIVERY and BIRTH.

**Caesareus PARTUS**, is that where the mother is cut open, and the child taken out at one side. See CAESAREAN.

**PARTY** or **PARTIE**, a faction, interest, or power, considered as opposite to another. See FACTION.

The French and Spaniards were always of opposite *parties*. England has, for upwards of a century, been divided into two *parties*. See WHIG and TORY.

**PARTY**, in law. See the articles PARTIES and CHARTER-PARTY.

**PARTY**, in the military sense, is used for a small body of men, whether cavalry, infantry, or both, commanded out on any expedition.

A *party* of cavalry carried off a great number of cattle. By the French military law, those who go out on *parties* should have an order in writing from the commanding officer, and be at least twenty in number, if foot; or fifteen, if horse; otherwise they are reputed as robbers.

**PARTY Jury** in law. See MEDIETAS *Linguae*.

**PARTY**, in heraldry. See the articles PART, PALE, and FESSE.

**PARVISE**. See the article PERVISE.

**PARULIS**\*, *παραυλισ*, in medicine, an inflammation of the gums attended with a violent pain and an aposthume: sometimes ending in an ulcer, and sometimes in a cancer, fistula, gangrene, &c.

\* The word is Greek, formed of *παρ*, near, and *ουλις*, gingiva, gum. Sennertus orders it to be cured by revulsion, derivation, and proper gargarisms. Care is to be taken in the beginning to prevent the aposthume.

**PARVUM cape**. See the article CAPE.

**PASCHAL**, **PASCHALIS**, something belonging to the Jewish Passover, or the Christian Easter. See PASSOVER. See also EASTER.

The *paschal* lamb, is a lamb which the Jews eat with a deal of ceremony, in memory of their having been brought out of slavery in Egypt. It should be eaten standing, their loins girt, the staff in hand, &c.

**PASCHAL canon**. See the article CANON.

**PASCHAL taper**. See the article TAPER.

**PASCHAL rents**, are rents, or annual duties paid by the inferior clergy to the bishop, or arch-deacon, at their Easter visitations.

They are also called *Synodals*. See SYNODALS.

**PASCHAL letter**, in church-history, a circular letter, which the patriarch of Alexandria, first, then the pope, anciently wrote to all the metropolitans; to inform them of the day whereon the feast of Easter was to be celebrated. \*See EASTER.

**PASQUIN**, a mutilated statue, seen at Rome, in a corner of the palace of the Urfini. It takes its name from a cobbler of that city called *Pasquin*, famous for his sneers and gibes; and whose shop was the resort of a number of idle people, who diverted themselves with bantering folks as they passed by.

After *Pasquin's* death, as they were digging up the pavement before his shop, they found a statue of an ancient gladiator, well cut, but maimed and half spoiled. This they set up in the place where it was found, at the corner of the deceased master *Pasquin's* shop; and, by common consent, called it by the name of the defunct.

From that time all satires and lampoons are ascribed to this figure, are put in its mouth, or pasted against it; as if they came from *Pasquin redivivus*. — *Pasquin* usually addresses himself to *Marforio*, another statue in Rome; or *Marforio* to *Pasquin*, whom they make reply.

The answers are usually very short, poignant, and unlucky. When *Marforio* is attacked, *Pasquin* comes to his assistance; and *Pasquin* is assisted by *Marforio* in his turn, *i. e.* the people make the statues speak just what they please. See PASQUINADE.

**PASQUINADE**, or **PASQUIL**, is properly a satirical libel fastened to the statue of *Pasquin*. See PASQUIN.

Hence, by extension, the term becomes used for any satire, lampoon, or sneer upon the public, or the ruling powers. See LIBEL.

There is this difference between a *Pasquinade* and a *Satire*; that the end of the latter is to correct and reform; whereas that of the former is only to scoff, and expose. See SATYRE. The Italians have published several books which they call *Pasquino in estasi*, *Pasquin* in an ecstasy.

**PASS**, **PASSADE**, in fencing, a leap, or advance upon the enemy. See PARRYING and GUARD, &c.

Of these are several kinds; as *voluntary passes*, commencing from the left foot out of measure of the firm foot; as when the enemy is not expected.

Others, *necessary*, made after a push from the right foot; where being so pressed by the enemy, as not to have time to retire, you endeavour to seize the guard of his sword.

The measure of the *Pass* is, when the two points of the swords are so near as that they may touch one another.

There are *passes*, within, above, beneath, to the right, the left; *passes* under the sword, over the line, &c.

**PASS of arms**, in chivalry, a place which the ancient knights undertook to defend, *e. gr.* a bridge, a road, &c. which was not to be passed without fighting the person who kept it. See KNIGHT, KNIGHTHOOD, and ARMS.

The knights, who held the *pass*, hung up their arms on trees, pales, columns, &c. erected for the purpose: such as were disposed to dispute the *pass*, touched one of these armories with his sword, which was a challenge the other was obliged to accept. The vanquished gave the victor such prize as was before agreed on.

**PASSA**,

**PASSA**, *vea* **PASSA**, in pharmacy, a term applied to those dried grapes, which we call *raisins*, and *currants*. See **RAISINS**, and **CURRENTS**.

*Uvee* **PASSAE**, is sometimes also used, with less propriety, for figs. See **FIG**.

**PASSADE**, or **PASSADO**, in fencing, a thrust or pass. See **PASS**.

**PASSADE**, is also a benevolence or alms given to poor passengers. See **ALMS**.

**PASSADE**, in the manege, signifies a turn, or course of a horse backwards or forwards on the same plot of ground; passing or repassing from one end to the other.

**PASSAGE**, in commerce, or *right of* **PASSAGE**, is an imposition which some princes exact by their officers or farmers, in certain narrow, close places of their territories, either by land or sea; on all vessels, vehicles, and carriages of all kinds; and even sometimes on persons, and passengers coming in or going out of ports, &c.

The *passage* of the Sound, (that famous streight which carries us out of the German into the Baltic sea) is the most celebrated *passage* in Europe: The dues thereof belong to the king of Denmark, and are paid at Ellenoer or Cronenburg. See **SOUND**.

*Birds of* **PASSAGE**, are such as only come at certain seasons, and then disappear again; being supposed to *pass* the sea to some other climate. See **MIGRATION**.

The *birds of passage* are the stork, swallow, nightingale, martin, woodcock, quail, &c. There are also fishes of *passage*, as herrings, mackerel, &c. See **BIRD**, and **FISH**.

Mr. Derham produces it as a remarkable instance of instinct, that,—*the stork in the heavens knoweth her appointed times, and the turtle, and the crane, and the swallow, observe the time of their coming.* Jer. viii. 7. No doubt the temperature of the air, and their natural propensity to breed their young, are the great incentives to this migration: but how these untaught, unthinking creatures, should so exactly know the best and only proper seasons to go and come from a place that would obstruct their generation, or not afford convenient food for them and their young; or how they should know which way to steer their course, and whither to go; is a difficult consideration. *Physico theol.* L. VII. c. 3.

**PASSAGE**, in the manege, an action wherein the horse raises two legs together, a hind and a fore leg, in form of St. Andrew's cross; then, setting these two on the ground again, he raises the other two; and thus alternately; never gaining above a foot of ground at a time.

The beauty of the *passage* consists in keeping the legs a good while in the air: setting that aside, the motion of the legs in the *passage* is the same as in pacing and trotting.

**PASSAGE**, or **PASSO**, in music, a portion of an air, or tune, consisting of several short notes, as quavers, demi-quavers, &c. lasting one, two, or at most, three measures.

What the Italians call *Contrapunto d'un sol passo*, is a portion consisting of one, two, or three measures, composed in the first notes of a piece, and which is to be afterwards imitated on the other notes of the piece, not with the same chords or tones, but only by observing the same motion, number, and figure as in the notes of the first *passage*.—This makes one of the kinds of *Contrapunto per fidato*.

**PASSAGERS**. *Vide* **ALBIGENSES**.

**PASSALORHYNCHITES**, **PASSALORHYNCHITAE**, a sect of montanists in the second century, who made profession of perpetual silence, and the better to maintain it, kept the thumb continually upon the lips: founding their practice on that of the Psalmist, *Set a guard, O Lord, on my mouth*.

St. Jerom mentions his having met with some of them in his time.

**PASSANT**, in heraldry, a term applied to an animal in a shield, appearing to walk leisurely; or, to the ordinary posture of terrestrial animals. See **COUNTER-PASSANT**.

Thus we say, he bears gules two lions *passant* over one another. In most beasts, except lions, they frequently use *tripping*, instead of *passant*.

**PASSION**, **PASSIO**, ΠΑΘΟΣ or ΠΑΘΗΜΑ, is applied to the different motions and agitations of the soul, according to the different objects that present themselves to the senses. See **SOUL**. In propriety, all those motions whereby the soul is carried towards any thing, as love, ambition, revenge, &c. are rather actions, than *passions*. See **ACTION**.

Those motions whereby the soul finds itself interrupted in its actions, as grief, &c. are the only real *passions*.

We find various modifications and impressions of pleasure and pain, inseparably annexed, by an established law of nature, to the several judgments we form concerning good and evil: these judgments, with their respective modifications of pleasure or pain annexed, according to the various appearances and relations of the object considered, either as good or evil, present or absent, certain or uncertain, probable or improbable, possible or impossible, and affecting the machine in a certain manner peculiar to such modifications; make what we call the *passions*.

How, or by what means, this mutual action and communication between soul and body are effected, we are, in a great measure, ignorant: we have but very obscure and faint notions of any thing prior, or more simple, to resolve it into; except the immediate will and agency of the first cause itself. See **COMMUNICATION**, **CAUSE**, &c.

Malebranche defines the *passions* to be all those emotions naturally arising in the soul, on occasion of extraordinary motions of the animal spirits, and the blood.—In opposition to those motions of the soul which are common to us with pure intelligences, and which he calls *natural inclinations*. See **NATURAL inclination**.

Though the *passions* be inseparable from inclinations, and though a man be only capable of sensible love or hatred, because he is capable of spiritual ones; yet does it appear just in that author to distinguish between them. *Passions* are much stronger and warmer than inclinations; their objects are different, and so are their causes: *passions* and inclinations differ just as much as sense and imagination.

In effect, the *passions* of the soul are impressions of the author of nature, which incline us to our bodies, and all things that may be of use to their preservation: natural inclinations are impressions of the author of nature, which determine us primarily to love him, as our supreme good.

Philosophers are not agreed about the number and division of the *passions*: the ordinary distribution is into *passions of the concupiscible appetite*, which are pleasure and pain, desire and aversion, love and hatred: and those of the *irascible appetite*, which are anger, courage, fear, hope, and despair.—See the authors on the subject of the *passions*; Des Cartes, who considers them physically; Coeffeteau who gives us the tableau, or picture of the *passions*; La Chambre, the characters of the *passions*, and Senault, the uses of the *passions*. See also **CONCUPISCENCE**, **IRASCIBLE**, &c.

Dr. Cheyne considers the *passions* as either spiritual or animal:—*Spiritual passions* he defines to be those sentiments produced in the soul by external objects, either spiritual ones immediately, or material ones by the mediation of the organs of the body.

*Animal passions* he defines to be those effects produced by spirits or bodies, immediately on the body.

Hence, as outward objects may be considered either as goods or evils; the most natural division of the *passions*, whether spiritual, or animal, as they regard those objects, is into *pleasurable* and *painful*.

And in this sense, all the *passions* may be reduced to love and hatred; of which joy and sorrow, hope and fear, are only so many modifications, or complexions, according to the various appearances, positions, &c. of the object.

In effect, all the *passions* may not only be reduced to two, *viz.* love and hatred; but, perhaps, to one, love; and even that may be all resolved into self-love; and this into a principle of self-preservation, or necessary invincible desire of pleasure, or happiness.—The rest are only rivulets from this source; or special applications of this principle to particular occasions.

Thus, the desire of any thing under the appearance of its goodness, suitability, or necessity to our happiness, constitutes the *passion* of love: the desire of eschewing or avoiding any thing apprehended to be mischievous, hurtful, or destructive, constitutes hatred or aversion: the desire of a good, which appears at the same time probable, and in our power, constitutes hope; but if the good appear improbable, difficult, or impossible, it constitutes fear or despair: the unexpected gratification of desire is joy: the desire of happiness to another under pain or suffering, is compassion; and the desire of another's punishment, revenge or malice, &c.

The single desire of happiness, then, is the spring or motive of all our *passions*; as those are of all our actions. Some wise and reasonable motive, or end of action, says Dr. Morgan, is certainly necessary to all wise and reasonable action; to act without a motive, would be the same thing as not to act at all, that is, such an action could answer no farther or better end than not acting; and consequently the action, as well as the agent, would be so far insignificant and useless. He who should have no object at all of his love or aversion, hope or fear, joy or grief, must be simply and purely indifferent to all action; and consequently must either be in a state of perfect rest and inaction, or in a state equivalent thereto; wherein the action of such a being could be of no more significance, than the uncertain fluctuation of an atom, or the quivering of a feather in the air.

The natural, or occasional cause of all the *passions*, Malebranche makes to be the motion of the animal spirits, which are diffused through the body to produce and preserve a disposition therein suitable to the object perceived; to the end, that the body and mind may mutually assist each other on this occasion; it being the order of the creator, that our wills be followed by motions of the body proper to execute them; and that the motions of the body mechanically excited in us by the view of external

objects, be accompanied with a *passion* of the soul which inclines to will or nill what appears serviceable or noxious to the body.

It is a continual impression of the will of the creator, that unites us thus intimately to a piece of matter, and occasions this reciprocation of motions and sensations; were this impression of the creator's will suspended a moment, we should be delivered from all dependance, all *passions*, &c. For, what people usually imagine of a necessary connection between the motions of the spirits and blood, and the emotions of the soul, is inconceivable.

Certain little parts of the bile, say they, move with some violence among the fibres of the brain: therefore the soul must necessarily be agitated with some *passion*, and this *passion* must be anger, rather than love. What relation can we conceive between the faults of an enemy, a *passion* of contempt or hatred, and a bodily motion of the parts of the blood striking against certain parts of the brain? how can the union or alliance of two things so different as spirit and matter be effected, but by the omnipotent will of the author of nature?

It is a point, about which the divines and philosophers can never agree, whether this relation and connection of thoughts of the mind, and motions of the body, be the gift of nature, or the punishment of the first sin? and whether the *passions* be the institution of nature, or the corruption thereof? Indeed, considering the good and wise purposes the *passions* serve, and that absolute necessity they are of, it is surprizing it should ever be doubted, that they are essential to human nature.

This union or relation is found in all men, but in different degrees, and of different extent, according to the different temperaments, conditions, ages, sexes, occasions, objects, &c. Thus, *e. gr.* our union or relation to sensible objects we have seen, is stronger than that to things we have only heard talk of. And thus, as the great have a relation to many more things than others, their slavery is more extensive. A general, *e. gr.* retains or has a relation to all his soldiers, as they all respect him; and it is this slavery that usually occasions his generosity: the desire of being esteemed by all in whose sight he is, frequently obliges him to sacrifice more reasonable pleasures.

It is thus throughout the world: vanity animates virtue, otherwise we should never have such lengths gone. Again, children do not mind the same things with grown people. Women look no further than their families and neighbourhood: but men retain to their whole country; it is for them to defend it; they mind honours, offices, &c. Nor is there a less variety resulting from the different circumstances and employments of people.

The disposition of mind in a married man differs much from that in a bachelor. The people in monasteries have both the mind and heart turned very differently from people who live in the world. They are united to much fewer things; but then the attachment is much closer and stronger. Their *passions* move in a narrow sphere, and, like the sun's rays in a convex lens, are collected, as it were, in a focus.

In every *passion* there may seven things be distinguished: the first, the judgment the mind makes of an object, or the view of the relation the object bears to us. The second, a new determination of the will towards that object, supposing it to appear as good. The third, the peculiar sensation or modification which accompanies them; as the sensation of love, hatred, desire, or joy; which sensations are always different in the different *passions*, and, as it were, the characteristics thereof. The fourth, a new determination of the course of the blood and spirits towards the several parts of the body: before the sight of the object of the *passion*, the animal spirits were pretty equally diffused throughout the body; but the presence of the new object disturbs the whole œconomy; and the greatest part of the spirits are sent into the muscles of the arms, legs, face, &c. The fifth is the sensible emotion of the soul, which finds itself shaken by this sudden overflowing of spirits. The sixth is the different sensation of love, hatred, &c. caused, not by the intellectual view of good or evil, but by the different shakes or movements the animal spirits occasion in the brain. The last is a certain sensation of joy, or inward satisfaction, which detains the soul in its *passion*, and attests its being in the state it ought to be with regard to that object.

PASSIONS, in a view to medicine, make one of the six non-naturals, of the utmost consequence, with respect to health or disease. See NON-NATURAL.

In consequence of the several judgments we form concerning objects, as either good or evil, the organs of sensation and motion, *i. e.* the nervous fibres, are variously impressed or stimulated; whence arise certain sensations, and certain modifications of motion, which, it is apparent, are reciprocal, and follow mutually from each other, whether the impression be supposed first made on the body, or on the mind: that is, any strong, violent motion made on the organs, will excite a painful sensation in the mind; or any such painful sensation, first excited in the mind from the bare consideration of an object, will impress a violent motion on the organs. And, on the contrary, an easy and placid undulation, impressed originally by the actual impulse of objects,

will excite a pleasurable sensation in the mind; or a pleasurable sensation excited in the mind, from the mere contemplation of an object, will be followed with a like easy, placid undulation of the organs.

The painful *passions*, then, as well as bodily pain, impress the nervous fibres with a violent motion, which brings them alternately into forcible contractions, and dilatations, or strengthens and increases their muscular force, and action. While, then, this pain or uneasiness of desire annexed to the passions, and impressed on the nerves, is moderate and restrained within the bounds of nature, such stimulating desires have a good effect; as they strengthen muscular motion, keep up the circulation of the blood, promote the natural secretions, and excite a man to such actions and exercises, wherein animal life, health, and vigour consist. But where the uneasiness annexed to the *passion* is too violent, such a continual stimulus will gradually derive a too great proportion of blood to the stimulated organs, by which the vessels will be over-stretched and distended, their muscular force gradually impaired, and the equilibrium of the blood and juices be interrupted. And hence, from a mere painful sensation, will arise a complicated train of bodily illnesses and pains, in consequence of the established laws of the union and communication of soul and body.

Again, while we are wearing off the uneasiness of desire annexed to any *passion*, we feel a sensible pleasure, or agreeable emotion; and the organs, hereupon falling into easy, uniform, placid undulations, the too great current of the blood toward them is diverted, and the equilibrium restored. As soon as the uneasiness is all gone, the pleasure ceases, and terminates in mere indolence, which disposes the person to rest and inaction, till the return of some fresh desire, stimulating to farther action, renews the same succession and interchangeable series of pains and pleasures.

And this is the circle of animal life: as the stimulus of desire throws off the indolence of rest, and excites to action; so the gratification moderates the pain of desire, creates a pleasure at first, and then terminates in the former indolence and inaction; till fresh desires returning, stimulate to farther action, and continue the same round.

Dr. Cheyne divides the *passions* into acute and chronical, after the same manner, and for the same reason as diseases are so divided. See DISEASE.

The *acute passions*, whether pleasureable or painful, he observes, have much the same effect, and operate after the same manner as acute diseases do. They effect a brisk circulation of the fluids, and constrict the solids for some short time. Thus, sudden gusts of joy or grief stimulate the nervous fibres, and the coats of the animal tubes, and thereby give a greater celerity to their included fluids; and the functions of the heart and lungs being involuntary, they have their more necessary and immediate effects on them. Thus, both sudden joy and grief make us breathe short and quick, and render the pulse small and frequent: and retaining our breath some time to reflect more intently on a painful object, forces at length a strong expiration, which becomes a sigh. Thus a sudden painful idea, making a quick circulation, and thereby throwing a great quantity of blood upward, makes it appear in the superficial vessels of the face, neck, and breast, and so produces a blush. The same principles will account for the effects of fear and anger, which make us change colour, and look red or pale as the blood is accelerated or retarded in its course. Sudden and great fear does so convulse the nervous system, that it sometimes alters the position of the parts: thus the hair shall stand on end in a fright, and the nerves be rendered so stiff and rigid, as to stop at once the animal functions, whence fainting, and sometimes death.

Chronical *passions* waste the nervous system gradually. Those nerves employed in considering, brooding over, and fixing such a set of ideas in the imagination, must be worn out and impaired; and the rest, by disuse, rendered resty and unactive, lifeless and destitute of a sufficient flux of warm blood and due nourishment. Thus do long grief, dark melancholy, hopeless love, over-weening pride, &c. impair the habit; and sometimes, when long indulged, terminate in madness; the reason is that a constant habit of fixing one thing in the imagination, begets a ready disposition in the nerves, to produce again the same image, till the thought of it become spontaneous and natural, like breathing, or the motion of the heart. Thus the Faquirs in India fix one or both hands, by long holding them up, so as that they cannot bring them down again. *Essay of Health, &c.*

Dr. Morgan seems to have gone beyond any body in explaining the origin and effects of the *passions*.—From a course of actual observations of the several phenomena in the body, which attend the several *passions*, *viz.* the state of the pulse, respiration, warmth, digestion, &c. that author draws these general conclusions:

1°. That all the grateful or pleasurable *passions* raise the vital tide, strengthen and quicken the pulse, diffuse the natural heat, and take off any antecedent stimulus, or pressure upon the abdomen and interior organs: and on the contrary, the painful *passions* sink and depress the blood, weaken the pulse, recall and concenter

concenter the natural heat, and fix a stimulus or compression on the inferior organs.

2°. All the *passions* impress their characteristic sensations, or modifications of pleasure and pain, especially upon the oesophagus, and upper orifice of the stomach.

3°. That they impress the different modifications on the muscles of the larynx, and thus discover themselves by the different modulation and tone of the voice.

And hence he infers, that the nerves of the eighth conjugation, or par vagum, are the principal instruments of the *passions*; by means whereof they are variously impressed, modified, and organized: these, therefore, which are dispersed to all parts of the breast and abdomen, particularly the heart, lungs, stomach, liver, oesophagus, diaphragm, intestines, the organs of generation, &c. he considers as *patheticks of the first order*; the intercostal, which accompany all the divisions of the par vagum, he calls *patheticks of the second order*: the nerves which serve the muscles employed in respiration, and have the nearest communication with those of the par vagum, by means of the intercostal, he calls *patheticks of the third order*: and the nerves which immediately dispense sense and motion to the several parts of the head, and have a remoter communication with the par vagum, *patheticks of the fourth order*. See NERVE.

According to this gradation, then, the organs which are immediately supplied with nerves from the par vagum, or *patheticks of the first order*, will be first affected in the *passions*, and with the smallest degree of impressed motion; with which the parts communicating immediately with the intercostal, or *second order of patheticks*, keep pace, and are affected almost at the same time, and with the same motion: then the organs supplied with the *third order of patheticks*, or the nerves employed in the muscles of respiration, are affected: and, lastly, the organs of sense and motion in the brain itself, by which sensation and imagination are performed, are put in a forcible emotion; by which the ordinary operations of sense, judgment, &c. are much disturbed.

This gradual rise and progress of the *passions* is confirmed by fact, observation, and experience; but how they are generated, and by what steps they make these advances, requires some farther consideration.

It may be observed, then, that the quantity of motion impressed on the pathetick nerves in any *passion*, is always proportional to the strength of the desire; but such impressed motion is not always uniform, or equally diffused through the whole pathetick system; for as the largest and most numerous branches of the pathetick nerves are spent on those parts which derive their blood from the descending trunk of the aorta, viz. the stomach, spleen, kidneys, &c. upon any motion too forcibly impressed, or too long continued, these inferior organs are the first and greatest sufferers; whence the blood flowing impetuously and irregularly to the parts thus stimulated, they become over-stretched; and hence a sense of pain, weight, and oppression. By this means the head and superior parts being deprived of their due share of blood, the pulse must sink, the natural heat diminish and retire, and a sense of cold and constriction be felt about the oesophagus, where the branches of the par vagum are very numerous: and hence the patient will be excited to sigh, groan, moan, cry out, and complain, and discover in the tone of the voice, and modulation of the muscles of the larynx, the characteristic of the prevailing *passion*.

Such is the state of nature under the painful *passions*, where the strong desire of good is attended with an appearance of difficulty, or improbability: where the same desire is attended with a seeming probability of obtaining or effecting it, this appearance, by moderating the intenseness of the pain of the desire, and taking off the too violent action of the pathetick nerves on the inferior organs, puts the pathetick system in an easy, natural, uniform undulation; by which the equilibrium of the blood being restored, the pleasurable *passions* of love, joy, hope, &c. will be raised: and in this case the pulse will rise, and the natural heat be diffused, and by the action of the pathetick nerves on their proper organs, the several symptoms be produced, which discover their placid emotion. Where the desire is very keen and intense, we see what a prodigious force it will impress on the nerves, by the actions of madmen, and men in a fright. In this case the stimulus of desire being exceeding strong, and the impressed motion universal, the pathetick nerves of the fourth or last order come to be affected; that is, the organs of sensation and imagination in the brain are brought into such violent vibrations, as to disturb the operations of reason.

And from this violent perturbation of the pathetic nerves in the brain, madmen have their imagination as strong and vivid as sensation itself. See IMAGINATION and SENSATION.

Hence, also, we may observe the heights, or extremes of the two contrary painful and pleasurable *passions*, the one rising at length into a mania or raving madness, and the other sinking into a hypochondriacal melancholy. The principal seat of the one is the brain; and of the other the viscera of the abdomen, especially the spleen and mesentery. The one inflames and overheats, the other chills and freezes the imagination: the one hangs over the understanding, like a glaring, dazzling light,

which animates and leads us on with zeal and vehemence; the other like a thick, black, and dismal cloud, that sinks all the powers of nature into the depths of misery and despair. See MANIA and MELANCHOLY.

*Cæliac* PASSION. See the article COELIAC.

*Hypochondriac* PASSION. See the article HYPOCHONDRIAC.

*Hysteriæ* PASSION. See the article HYSTERIC.

*Iliac* PASSION. See the article ILIAC.

PASSIONS, in poetry, denote the *passionate* sentiments, gestures, actions, &c. which the poet gives his persons. See CHARACTER. The *passions* are, as it were, the life and spirit of the longer poems. Their necessity in tragedy and comedy is obvious; nor can the epopœa subsist without them. See TRAGEDY, COMEDY, &c.

It is not enough the epic narration be surprizing; it must likewise be moving and *passionate*, hurrying away the reader's mind, and filling it with anxiety, joy, terror, or some other violent *passion*, and this for subjects it knows are feigned. See EPIC and NARRATION.

Though *passions* be always necessary, yet all are not equally necessary, or suitable to all. Comedy has joy, and agreeable surprizes for its part: tragedy, on the contrary, has terror, and compassion. The proper *passion* of the epopœa is admiration; though the epopœa, as a medium between the two others, takes in both their kinds of *passions*; as we see in the griefs of the fourth book of the *Æneid*, and the games and diversions of the fifth. Admiration, in effect, is consistent with each; we admire with joy the things that surprize us agreeably, and with terror and grief those that amaze and afflict us.

Besides the general *passion*, which distinguishes the epic from dramatic poems, each epopœa has its peculiar *passion*, which distinguishes it from other epic poems. This peculiar *passion* still follows the character of the hero. Thus wrath and terror reign in the *Iliad*, because Achilles is wrathful, and *παρὰ πᾶσι κακῶτατος ἀνδρῶν*, the most terrible of men. The *Æneid* is all in the tender, softer *passions*; such being the character of *Æneas*. The prudence of Ulysses not allowing these excesses, we find none of them in the *Odyssæe*.

As to the conducting of the *passions*, to make them have their effect, there are two things required; viz. that the audience be prepared or disposed to receive them; and that several incompatible *passions* be not mixed together.

The necessity of disposing the audience is founded on the natural necessity of taking up things where they are, in order to remove them elsewhere. The application of this maxim is easy; a man is calm and at ease, and you would put him in a *passion* by a discourse made on purpose. You must begin, then, in a calm manner; by this means you join yourself to him; and afterwards walking together, he won't fail to follow you in all the *passions* to which you lead him insensibly.

If you shew your anger at first, you will be as ridiculous, and will have as little effect as Ajax in the *Metamorphoses*; in whom the ingenious Ovid gives a fine example of this failing. He begins his harangue in the height of *passion*, and with the most violent figures, before his judges in the deepest tranquillity.

————— *Sigeia torvo*

*Littora prospexit classemque in littore vultu;*

*Protendensque manus, Agimus, prohi Jupiter! inquit,*

*Ante rates causam, & necum confertur Ulysses!*

The necessary dispositions arise from some preceding discourse, or at least from some action, which has already begun to raise the *passions*, ere they are mentioned. The orators themselves sometimes use this last means: for though, ordinarily, they do not raise the *passions* till the end of their discourse; yet, when they find their audience already moved, it would be ridiculous in them, by an unseasonable tranquillity, to lay them again.

Thus the last time Catiline came to the senate, the fathers were so shocked at his presence, that those near the place where he sat down, rose up, retired, and left him alone. On this occasion, Cicero had too much sense to begin his oration with the usual tranquillity and coolness of exordiums. By this means he would have palled and abated the indignation of the senators against Catiline, which it was his business to spirit up, and inflame; and would have eased the parricide of that consternation the behaviour of the senators had given him; and which it was Cicero's design to aggravate. Omitting, therefore, the first part of his oration, he takes his auditors in the condition he finds them, continues and augments their *passions*: *Quousque tandem abutere, Catilina, patientia nostra? Quamdiu nos etiam furor iste tuus eludet? Quem ad finem sese effrenata jactabit audacia? Nihilne te nocturnum præsidium palatii, nihil urbis vigiliæ, nihil timor populi, nihil, &c.*

The poets are full of instances of this kind, where the *passion* is prepared or kept up by actions. Dido, in Virgil, begins a discourse like Ajax: *Prohi, Jupiter! ibi hic, ait, &c.* But then the motions are here well disposed; Dido is before represented under terrible apprehensions of *Æneas*'s quitting her, &c.

Seneca's conduct, indeed, is quite opposite to this rule. If he has a *passion* to raise, he is sure first to take from his audience any disposition they might have to be affected. If they be in grief,

grief, fear, or the expectation of something horrible, &c. he will begin with some fine description of the place, &c. In the Troades, Hecuba and Andromache being prepared to hear the violent and barbarous death of their son Astyanax, whom the Greeks precipitated from the top of a tower; what booted it to tell them, that of the spectators that crowded from all quarters to see the execution, some placed themselves on stones, which the ruins of the walls made to project; that others shook their legs, as being placed too high, &c. *Alta rupes, cuius è cacumine erecta summus turba libavit pedes*, &c.

The second thing required in the management of the *passions*, is, that they be found pure, and disengaged from any thing that might prevent their effect.

Polymythy, therefore, *i. e.* a multiplicity of fables, actions, or histories, must be avoided: all adventures much broken, and hard to be retained; and all intrigues intricate and difficult to conceive, are at once excluded. These embarrass the mind, and require so much attention, that there is none to spare for the *passions*. The soul must be free and disengaged, to feel; and we divert ourselves even from our real sorrows, by an application to other things.

But, of all others, the greatest enemies to the *passions* are the *passions* themselves: They oppose and destroy one another; and if two opposite ones, *e. gr.* joy and sorrow, meet in the same object, they will neither of them stand it. It is the nature of these habits that imposes this law: The blood and spirits cannot move gently and equally, as in a state of tranquillity, and at the same time be stopped and suspended with some violence occasioned by admiration. Nor can they be in either of those situations, while fear calls them from the outer parts of the body, to assemble them about the heart; or rage sends them into the muscles, and makes them act there with violences very opposite to the operations of fear.

The causes and effects, therefore, of the *passions* in the soul, are to be studied, to be able to manage them with all their force. Virgil furnishes two examples of what we have said about the simplicity and engagement of each *passion*, in the deaths of Camilla and Pallas.

**PASSION**, in heraldry, — *Cross of PASSION*, is a cross thus called, because in shape of that whereon our Saviour suffered, *i. e.* not crossed in the middle, but nearer the top; with arms short in proportion to the length of the shaft. See **CROSS**.

**PASSION-WEEK**, the Week next preceding Easter. See **EASTER** and **WEEK**.

It is thus called from our Saviour's *passion*, *i. e.* his crucifixion, &c. which happened on the Friday of this week, now called *Good Friday*.

**PASSIVE**, a term of relation, implying a thing to suffer or undergo the action of some other: which, in respect thereof, is denominated *active*. See **ACTIVE**.

In all generation, philosophers conceive an *active* power and a *passive*. See **POWER**.

In civil life, we say, such a person in such an election, has both an *active* voice, and a *passive*, *i. e.* he is both capable of electing, and being elected. See **VOICE**.

Some also use the term *passive debt*, for a debt which we owe another, in contradistinction to an *active* debt, which is owing us. See **DEBT**.

The chemists divide their principles, or elements into *active* and *passive*. — *Passive* are such as have no *active* force inherent in themselves, and which only act by being joined with some of the others. See **PRINCIPLE**.

Such are phlegm and earth, some say also salt, and, in effect, all but sulphur, or fire, which they will have the only principle of action and motion in the universe. See **EARTH**, **SULPHUR**, **FIRE**, &c.

**PASSIVE qualities**. See the article **QUALITY**.

**PASSIVE understanding**. See **UNDERSTANDING**.

**PASSIVE prayer**, in the language of mystick divines, is a total suspension, or ligature of the intellectual faculties, in virtue whereof the soul remains, of itself, and as to its own power, impotent with regard to the producing of any effects. See **PRAYER**. The *passive* state, says Fenelon, is only *passive* in the same sense as contemplation is so, *i. e.* it does not exclude peaceable, disinterested acts, but only unquiet ones, or such as tend to our own interest.

In the *passive* state, the soul has not properly any activity, any situation of its own: it is a mere infinite flexibility of the soul, which the feeblest impulse of grace gives motion to. *Id.*

**PASSIVE**, in grammar, denotes a second voice, or inflexion of verbs, which of *active* becomes *passive*, by assuming, in the modern languages, new auxiliary verbs: in the ancient, by new terminations. See **VERB**, **VOICE**, &c.

The English verbs become *passive*, by taking the auxiliary verb *I am*, in lieu of *I have*, wherewith the *active* are conjugated: the French by *Je suis*, in lieu of *Jay*; the Italian by *Jo so*, for *Jo ho*, &c.

Latin verbs become *passive*, by changing their termination; as *amor* for *amo*, &c. *amari*, for *amare*, &c.

English verbs *passive* are nothing else, in effect, but the verb *I am*, in all its inflections joined to the participle *passive*; as,

*I am praised*, in Latin *laudor*; in French *Je suis loué*, I have been praised; *Jay été loué*, *laudatus fui*, &c.

**Neuter PASSIVE**, is a verb that has a *passive* conjugation, but a neuter signification. See **NEUTER**.

Of these there are a very small number in Latin, more in French, fewer in English; as, *I am entered*, *ingressus sum*, *je suis entré*, &c.

Grammarians are frequently mistaken here; taking verbs for neuters *passive*, which, in effect, are *actives*, and only differ in that they act on themselves, by adding the pronoun personal; and which, on that footing, should rather be neuters *active* than neuters *passive*.

Some admit of no genuine *passive* verbs in the modern tongues; such, we mean, as answer to the notion of *passives* in the ancient, where all is done by different terminations. On which footing, there should be none but *actives passive* and neuters *passive*.

**PASSIVE vassalage**. See **VASSALAGE**.

**PASSO**. See the article **PASSAGE**.

**PASSOVER**, ΠΑΣΧΑ, a solemn feast, celebrated among the Jews, on the fourteenth day of the moon next after the vernal equinox. See **FEAST**.

This feast was called, by the ancient Latins and Greeks, *pascha*; not from *πασχω*, I suffer, as Lactantius weakly imagines; but from the Hebrew פֶּסַח *Pesabb*, passage, leap; the design of the feast being to commemorate the destroying angel's *passing over* the houses of the Israelites, when he entered in, and destroyed the first-born in those of the Egyptians.

Yet many weakly imagine, that it was in memory of their *passing* the Red sea, that the *passover* was instituted; though it is certain the feast was held, and had its name before the Israelites took a step of their way out of Egypt; and consequently several days before their *passing* the Red sea.

Besides the *passover* celebrated on the fourteenth of the first month; there was a second *passover* held on the fourteenth of the second month after the equinox, instituted by God in favour of travellers and sick persons, who could not attend at the first; nor be at Jerusalem on the day.

The Greeks, and even some of the catholic doctors, from the XVIII<sup>th</sup> chapter of St. John, take occasion to conclude, that Jesus anticipated the day marked for the *passover* in the law; but the authority of three evangelists seems to evince the contrary.

F. Lamy is of opinion, he did not attend at the *passover* the last year of his life; which sentiment has drawn upon him abundance of opposers.

F. Hardouin maintains, that the Galileans celebrated the *passover* on one day, and the Jews on another. See **SAMARITAN**.

**PASS-PAROLE**, a command given in the head of an army; and thence communicated to the rear; by passing it from mouth to mouth. See **WORD**.

**PASS-PAR-TOUT**, a master-key; or key that opens indifferently several locks belonging to the same lodge or apartment. See **KEY** and **LOCK**.

**PASS-PORT**, a licence, or letter from a prince, or governor, granting liberty and safe conduct to travel, enter, and go out of his territories freely, and without molestation.

The *pass-port* is, properly, given to friends; and the *safe-conduct* to enemies. See **SAFE CONDUCT**.

Palquier takes *pass-port* to have been introduced for *passé par-tout*. Balzac mentions a very honourable *passport* given by an emperor to a philosopher in these terms: If there be any one, on land or sea, hardy enough to molest Poramon, let him consider, whether he be strong enough to wage war with Cæsar.

**PASS-PORT** is also used for a licence granted by a prince for the importing or exporting merchandises, moveables, &c. without paying the duties.

Merchants sometimes procure such *pass-ports* for certain kinds of commodities; and they are always given to ambassadors and ministers for their baggage, equipage, &c.

**PASS-PORT** is also a licence obtained for the importing or exporting of merchandises deemed contraband, and declared such by tariffs, &c. as gold, silver, precious stones, ammunition of war, horses, corn, wool, &c. upon paying duties.

**PASS-VOLANT**, or **PASSE-VOLANT**, a faggot, or a pretended foldier, not enrolled, whom the captain or colonel makes pass in review, or muster, to shew that his company is compleat, or to receive the pay thereof to his own profit. See **FAGGOT**, &c. In France the *passé-volants* are condemned to be marked on the cheek with a flower-de-luce.

**PAST-BOARD**, a kind of thick paper, formed of several sheets pasted together. See **PAPER**.

There is also a coarse kind of *past-board* made of old paper and old *past-board*, beaten in a mortar with water, and reduced into a kind of pulp; to which is added a little paste, to give the mass a consistence; after which it is formed in a mould; and to finish it, laid in a press, to squeeze out all the water, and reduce it to its proper thickness.

Each kind is distinguished by numero's, which express its fineness and value: the finest is covered on both sides with a very white smooth paper, others only on one side; and others on both sides with common paper.

The

# P A S

The chief use of *past-board* is in the binding of books, letter-cases, hat-cases, gloves, &c. See BOOK-BINDING.

**PASTE**, in cookery, a soft composition of flour, wrought up with proper fluids, as water, milk, or the like, to serve for cases or coffins, therein to bake meats, fruits, &c.

*Paste*, is the basis, or foundation of pyes, tarts, patties, pasties, and other works of pastry. See PASTRY, &c.

**PASTE**, is also used in confectionery, &c. for a preparation of some fruit, made by beating the pulp thereof with some fluid, or other admixture, into a soft pappy consistence, spreading it into a dish, and drying it with sugar, till it become as pliable as an ordinary paste. See CONFECT.

It is used occasionally for making the crusts, and bottoms of pyes, &c.

Thus they make almond *pastes*, apple *pastes*, apricot *pastes*, cherry, currant, lemon, plumb, peach, and pear *pastes*.

**PASTE** is also used for a preparation of wheaten flour, boiled up, and incorporated with water; used by several artificers, as upholsterers, fadlers, bookbinders, &c. instead of glue or size, to fasten or cement their cloths, leathers, papers, &c. See CEMENT.

**PASTEL**. See the article PASTIL.

**PASTER**N, of a horse, the distance between the fetlock or joint next the foot, and the coronet of the hoof.

This part should be short, especially in middle sized horses, because long *pasterns* are weak, and cannot so well endure travel.

**PASTER**N joint is the joint above the *pastern*.

The *pastern joint*, after travelling, is apt to be crowned, i. e. to have a swelling round it beneath the skin, in form of a circle, a third of an inch broad.

**PASTIL**, or **PASTEL**, among painters, &c. a sort of paste made of several colours, ground up with gum-water, either together or separately; in order to make crayons to paint with on paper, or parchment. See CRAYON.

**PASTIL**, **PASTILLUS**, is also used for a dry composition, yielding a fragrant smell when burnt in a perfuming pan, to clear and scent the air of a chamber. See PERFUME.

It is composed of odorous resins, mixed with aromatic woods, or drugs pulverized, and incorporated with mucilages of gum tragacanth. Some call these compositions *Offsets of Cyprus*.

There are also *pastils* for the mouth, eaten to procure a sweet breath. These have several names, and consist of several preparations, as muscadines, conserves, &c.

**PASTIL**, or **PASTEL**, is sometimes also used for the plant otherwise called woad or glass-wort. See WOAD.

**PASTIL** in confectionery is a preparation of sugar with lemon-water, &c. boiled up with gum-water, strained, beat up, and by the addition of more dry sugar, worked into a pliable paste, and thus formed into round or oblong figures, and dried in the stove. See LOZENGE.

**PASTINATION**, a term sometimes used in agriculture for the act of opening, loosening, and preparing the earth for planting. See EARTH and PLANTING.

**PASTOR**, originally, signifies one that (*pasceit*) feeds.—Hence it was anciently used for a shepherd, or advocate; and is now appropriated to a minister, or one that hath the cure of souls.

**PASTORAL**, something that relates to shepherds, *pastores*.

The poets represent the *pastoral* life and *pastoral* manners in the most agreeable light. We must not imagine them so beautiful in nature as in their descriptions.

**PASTORAL**, in poetry, denotes a composition, the subject whereof is something in the *pastoral*, at least rural life, and the persons shepherds, at least rusticks. See POETRY.

Most authors, except the English, esteem *pastoral* of the dramatic kind, and define it a dramatic piece, wherein the persons are clad like nymphs and shepherds, and act their own amours. See DRAMATIC.

The scene is always in the fields or woods; whence Tasso calls *pastoral*, *Favola boscareccia*.

Such are the *Pastor Fido* of Guarini, the *Aminta* of Tasso, the *Sylvia* of Mairet the French poet, the *Comus* of Milton, &c.

Tasso assumes to himself the honour of having invented *pastoral*; but the first idea of this kind of drama seems to be Beccari's due, who made the first attempt of this kind in 1552. But Tasso's *Aminta*, which did not appear till the year 1573, effacing what had been done by Beccari, the first author was forgot, and Tasso left the inventor.

It is certain this kind of *pastoral* fable, composed according to the rules of the stage, was unknown among the ancients. The Greeks and Latins have indeed introduced shepherds in their eclogues; but these eclogues had nothing theatrical in them; nor were the shepherds ever brought upon the stage. See ECLOGUE.

This kind of dramatic *pastoral* is still but little known among us; nor have we any thing considerable under the title of *pastorals*, but country pieces after the manner of the eclogues, or idyllions of the ancients. See IDYLLION.

Every *pastoral*, even in this last view, should have a little plot, or fable, which may deserve the title of a *pastoral scene*. It must be simple, and but one; yet not so as to refuse all digressions, provided they be but short. This rule of the Plot is every where observed by Virgil.

**PASTORAL column**. See the article COLUMN.

**PASTORAL staff**. See the article CROSIER.

# P A T

**PASTRY**, that branch of cookery which teaches the preparation of *paste* with several flavouring ingredients of flesh, fruits, spices, sugar, butter, &c. See PASTE.

*Pastry* is chiefly conversant in the making of pyes, pasties, patties, cakes, biscuits, &c. See PASTY.

**PASTURE**, **PASTURA**, in our law-books, is any place where cattle are occasionally fed.

By which it differs from *pascua*, which is a place set wholly apart for feeding, and never ploughed, \* &c.

\* *Pastura omne genus pascendi significat, five in pratis, five in stipula, five in agris, five in campis: Sed pascua est locus principaliter deputatus pecoribus pascendis, ut, puta, in montibus, moris, mariscis, et planis non cultis nec aratis.* Lindwood.

**PASTURE** ground is properly that which is not cultivated; that is, is neither meadow nor arable; but reserved for the feeding of cattle.

The best domains are those consisting in *pasture*; they need no tilling. Holland is a country abounding much in *pasture*.

*Admeasurement of PASTURE*. See ADMEASUREMENT.

**PASTUS**, the procuration, or provision, which the king's, or lord's tenants are bound to make for them at certain days, or seasons, or as often as they make a progress to their lands.

This, in many places, has been converted into a pecuniary fee; as in the procurations of the clergy. See PROCURATION.

**PASTY**, in cookery, a work of pastry; being a preparation of some proper meat, as beef, venison, lamb, or the like, well boned, beaten up to a pulp, and highly seasoned, put up in a paste, and then baked in an oven.—They also make veal *pasties*, umble *pasties*, kidney *pasties*, marrow *pasties*, &c.

**PATARINS**. Vide ALBIGENSES.

**PATAVINITY**, **PATAVINITAS**, among critics, a fault objected to Titus Livius, which he derived from his country Padua, by the antients called Patavium.

Atinius Pollio, as we are informed by Quintilian, taxed Livy with *patavinity*.—What this *patavinity* consisted in, has given the critics a world of pains to find out.

Paolo Beni, professor of eloquence in the university of Padua, is of opinion, it must be understood of the inclination of that historian to Pompey's party.—But would Pollio have reproached him with an inclination from which he himself was not exempt? Pignorius will have the *patavinity* to consist in Livy's retaining the vicious orthography of his countrymen of Padua, who wrote *sibe* and *quase*, for *sibi* and *quasi*; which he proves from several ancient inscriptions.

F. Rapin takes the *patavinity* to be only a faulty pronunciation, which shocked the delicate ears of the people in the court of Augustus; and favoured a little of the country.

Morhof believes it to be a certain turn of expression, and some phrases peculiar to the Paduense.—All we know for certain, is, that it was a fault in the language of Livy, not in the sentiments, or manners. In all probability, it is one of those delicacies that are lost in a dead language. M. Balzac could not ridicule his dotard better than by supposing he valued himself on having discovered the *patavinity* objected by Pollio to Livy.

Dan. Georg. Morhof has an express treatise *De patavinitate Liviana*, printed at Kiel in 1685; where he explains, very learnedly the urbanity and peregrinity of the Latin tongue.

**PATE**, in fortification, a kind of platform, like what they call an horse-shoe; not always regular, but generally oval, encompassed only with a parapet, and having nothing to flank it. It is usually erected in marshy grounds, to cover a gate of a town, or the like. See HORSE-SHOE.

**PATEE**, or **PATTEE**, a term in heraldry for a cross, small in the centre, and widening towards the extremes. *V. Tab. Herald fig. 76.*

The field is fable, a cross *patee* argent, by the name of Crois.

This form of a cross is also called *formé*. See FORME.

**Petty PATES**. See the article PETTY.

**PATELLA**, in anatomy, a bone which covers the forepart of the joint of the knee; called also *mola*, *rotula*, and popularly, the *knee-pan*.—See *Tab. Anat. (Osteol.) fig. 3. n. 21. fig. 7. n. 25.* See also the article MOLA.

The *patella* is roundish on the outside, somewhat of the figure of a shield, covered with a smooth cartilage, and about two inches in diameter; over it slide the tendons of the muscles which extend the leg, as on a trochlea, or pulley.

But its more immediate use is to hinder the leg from being bent forwards in extension; which would of necessity be the case in this articulation, did not this bone, like a bolster, check its rolling forwards; as the olecranon does the swing of the cubitus backwards. See OLECRANUM.

In an erect posture, when one foot is set forwards, the whole weight of the body bears on the *patella*; which in this situation hinders the knee from bending backwards, and straining the muscles that inflect it behind.—Hence it was that Galen's wrestler, who had dislocated his *patella*, found so much pain in going down hill.

**PATENA**, in the Romish church, the cover or lid of the chalice, made of the same metal therewith, serving to hold the particles of the host, and given the people to kiss when they make an offering. See CHALICE.

It has its name *patena*, a *patendo*; and is a general name, in Columella, for any broad flat vessel.

**PATENTS**, or *letters PATENT*, in law, the king's letters, sealed with the great-seal; serving to convey the title or property of

# P A T

some grant, favour, privilege of a new establishment, or the like. See *LETTERS patents* and *EXEMPLIFICATION*. They have their name because deliver'd open, *ut pateant omnibus*; by way of contradistinction from *letters de cachet*, which are sealed.

It is to be noted, that *patents* differ from writs; a coroner is made by writ, not by *patent*. See *WRIT*.

To this office, enacted 18 Jac. 1. belong a Clerk, &c.

**PATENTEE**, is he to whom the king grants his letters patent. See *PATENTS*.

**PATERA**\*, among antiquaries, a goblet, or vessel, used by the Romans in their sacrifices; wherein they offered their consecrated meats to the gods; and wherewith they made libations. See *SACRIFICE* and *LIBATION*.

\* The word is Latin, formed from *pateo*, I am open; *quod pateat*, because it has a great aperture; in contradistinction to bottles, &c. which have only narrow necks, or whose aperture is less than the body of the vessel.

On medals the *patera* is seen in the hands of several deities; and frequently in the hands of princes, to mark the sacerdotal authority joined with the imperial, &c.

Hence F. Joubert observes, that beside the *patera*, there is frequently an altar, upon which the *patera* seems to be pouring its contents.

The *patera* was of gold, silver, marble, brass, glass, or earth; and they used to enclose it in urns with the ashes of the deceased, after it had served for the libations of wine and liquors at the funeral.

The *patera* is an ornament in architecture, frequently seen in the Dorick freeze, and the tympan of arches.

**PATERERO**. See the article *PEDRERO*.

**PATERNITY**, the quality of a father. See *FATHER*.

There is an immediate relation between the *paternity* of the father, and the filiation of the son, in the mystery of the trinity. See *TRINITY*.

Divines have a long time disputed, whether *paternity* be a real and specific character, which absolutely distinguishes the father from the son; or whether it be a meer relation of economy, and subordination? On the one hand, if *paternity* be supposed incommunicable to the son, and if it constitute a real and positive distinction; this seems to amount to tritheism. See *TRITHEISM*.

On the other hand, if *paternity* be only regarded as a mode, or a term of order and economy; there is no essential and intrinsic difference between the father and son; which is nothing less than Sabellianism. See *SABELLIAN*.

**PATER-NOSTER**, the Lord's-Prayer; a form so called from the initial words thereof in Latin.

**PATER-NOSTER** is also used for a chaplet or string of beads; because serving to number the rehearsals of that prayer. See *chaplet*.

**PATER-NOSTERS**, in architecture, a sort of ornaments cut in form of beads, either round or oval, used on baguettes, astragals, &c. See *BAGUETTE*, *BEAD*, &c.

**PATER-NOSTRE**, in heraldry. A cross *Pater-nostre* is a cross made of beads; as represented in *Tab. Herald. Fig. 77*. See *CROSS*.

This cross is to be so shadowed in drawing, as that the sphericity of the beads may appear, to distinguish them from besants, &c.

**PATH** of the *Vertex*, a term frequently used by Mr. Flamsteed, in his doctrine of the sphere, signifying a circle, described by any point of the earth's surface, as the earth turns round its axis. This point is considered as vertical to the earth's centre; and is the same with what is called the *vertex* or *zenith* in the Ptolemaic projection.

The semi-diameter of this *path* of the vertex is always equal to the complement of the latitude of the point or place that describes it; that is, to the place's distance from the pole of the world.

**PATHETIC**\*, *ΠΑΘΗΤΙΚΟΣ*, something that relates to the passions; and particularly that is proper to awake or excite them. See *PASSION*.

\* The word comes from the Greek *παθος*, passion, emotion.

The *pathetic* and sublime have a near affinity. See *SUBLIME*. See also *STYLE*.

**PATHETIC**, in music, something very moving, expressive, or passionate; capable of exciting pity, compassion, anger, or the like. In this sense we say the *pathetic* style, a *pathetic* fugue, *pathetic* song, &c.

The chromatic genus, with its greater and lesser semi-tones, either ascending or descending is very proper for the *pathetic*; as is also an artful management of discords; with a variety of motions, now brisk, now languishing, now swift, now slow.

Nieuwentyt tells us of a musician at Venice, who excelled in the *pathetic* to that degree, that he was able to play any of his auditors into distraction: he adds, that the great means he made use of, was the variety of motions, &c.

**PATHETICI**, in anatomy, the fourth of the ten pair of nerves, which arise out of the *medulla oblongata*. — See *Tab. Anat. (Osteol.) fig. 5. lit. mm.* See also the article *NERVE*. The *pathetici* are the smallest nerves of the brain; they have their origin in the lower part of the *medulla oblongata*, behind the *natio* and *teyles*.

# P A T

They have their name *pathetici*, from their serving to move the eyes in the various passions; and are by some also called *amatorii*, from the great use made thereof by lovers, in ogling, &c. See *EYE*, &c.

**PATHOGNOMONIC**, *ΠΑΘΟΓΝΩΜΟΝΙΚΟΣ*, in medicine, an essential sign, or characteristic; or a symptom peculiar to, and inseparable from some disease, and every stage thereof. See *SYMPTOM*.

Thus Blancard, and after him Harris, &c. — But the truth is, there is nothing in all medicine that answers to the idea of a *pathognomonic*; diseases and symptoms are too complicated. And we are to judge of the former not by any one sign, but by the concurrence of several. See *SIGN* and *DIAGNOSTIC*.

**PATHOLOGY**\*, *ΠΑΘΟΛΟΓΙΑ*, that part of medicine which considers diseases, both those of the body, and the mind; their natures, causes, symptoms, &c. See *DISEASE*.

\* The word is formed from the Greek *παθος*, passion, suffering, and *λογος*, discourse.

**PATHOS**, *ΠΑΘΟΣ*, passion; a term used in speaking of the movements, which the orator excites in his audience.

There is a world of *pathos* in his discourse. — We sometimes also use the word for energy or stress. See *ENERGY*.

**PATIENT**, among physicians, a person under the direction of a physician, or surgeon, to be cured of some disease.

*Agent and PATIENT*. See the article *AGENT*.

**PATIENTIÆ musculus**, in anatomy. See *LEVATOR Scapulae*.

**PATONCE**, in heraldry—a *Cross PATONCE*, is a cross flory at the ends: from which it only differs in this, that the ends instead of turning down like a flower-de-luce, are extended somewhat in the patee form. — *Vid. Tab. Herald. fig. 78*. He bears gules a cross *patonce*, argent, by the name of Latimer.

**PATRES conscripti**, in antiquity, a denomination given to the senators of Rome. See *SENATOR*, *PATRICIAN*, &c.

The first hundred senators appointed by Romulus, were called simply *patres*; fathers; another hundred being added by Romulus and Tatius, upon the union of the two people; these latter were called *patres minorum gentium*, and the former *majorum gentium*.

At length Tarquinius Priscus making up the number three hundred, the two latter classes were called *patres conscripti*; because, *adscripti*, were wrote down to the former.

Those afterwards chosen from among the knights, were called *patres adlecti*.

*Gloria PATRI*. See the article *GLORIA*.

*Dower ex assensu PATRIS*. See the article *DOWER*.

**PATRIARCH**, *PATRIARCHA*, one of those first fathers who lived towards the beginning of the world; and who became famous by their long lines of descendants.

Abraham, Isaac, Jacob, and his twelve sons, are the *patriarchs* of the Old Testament: Seth, Enoch, &c. were antediluvian *patriarchs*. The number of children is the benediction and character of a *patriarch*.

**PATRIARCH** is also used in Christendom for the bishops in possession of some of the grand sees, independent of the papal jurisdiction. See *BISHOP*.

The patriarchate has been always esteemed the supreme dignity in the church: so that, to rise by degrees, the bishop had only under him the territory of the city whereof he was bishop; the metropolitan commanded a province, and had for suffragans the bishops of his province; the primate was the chief of a diocese, and had several metropolitans under him; and the patriarch had under him several dioceses, and primates themselves were under him. — But this order was not always observed. See *METROPOLITAN* and *PRIMATE*.

Usher, Pagi, De Marca, and Morinus, attribute the establishment of the grand *patriarchates* to the apostles. They suppose that the apostles, according to the description of the world then given by geographers, pitched on the three principal cities in the three parts of the known world, *viz.* Rome in Europe; Antioch in Asia; and Alexandria in Africa: and thus formed a trinity of *patriarchs*.

Others, far from attributing this institution to the apostles, maintain, that the name *patriarch* was unknown at the time of the council of Nice; and that for a long time afterwards, *patriarchs* and primates were confounded together; as being all equally chiefs of dioceses, and equally superior to metropolitans, who were only chiefs of provinces. — Hence it is that Socrates gives the title *patriarch* to all the chiefs of dioceses, and reckons ten of them. In effect, it does not appear that the dignity of *patriarch* was appropriated to the five grand sees of Rome, Constantinople, Alexandria, Antioch, and Jerusalem, till after the council of Chalcedon in 451. For when the council of Nice regulated the limits and prerogatives of the three *patriarchs* of Rome, Antioch, and Alexandria, it did not give them the title of *patriarchs*, though it allowed them the pre-eminence and privileges thereof. Thus when the council of Constantinople adjudg'd the second place to the bishop of Constantinople, who, till then, was only a suffragan of Heraclea, it said nothing of his *patriarchate*.

Nor is the term *patriarch* found in the decree of the council of Chalcedon, whereby the fifth place is assigned to the bishop of Jerusalem; nor did these five *patriarchs* govern all the churches.

# P A T

There were still many independent chiefs of dioceses, who, far from owning the jurisdiction of the grand *patriarchs*, called themselves *patriarchs*; such as that of Aquileia; nor was Carthage ever subject to the *patriarch* of Alexandria.

The authority of the *patriarchs* grew by insensible degrees, till at length all affairs of moment, within the compass of their *patriarchate*, came before them; either at first hand, or by appeal from the metropolitans.

They consecrated bishops, appointed the time of Easter, &c. Nothing, in short, was done without consulting them; and their decrees were executed with the same respect as those of princes. The Latin church was unacquainted with *patriarchs* till the sixth century; and the churches of Gaul, Britain, &c. were never subject to the authority of the *patriarch* of Rome, whose authority only extended to the suburbicary provinces.—There was no primacy, no exarchate, or *patriarchate* owned here; but the bishops, with the metropolitans, governed the church in common.

Indeed, after the name *patriarch* became frequent in the west, it was attributed to the bishops of Bourges and Lyons; but it was only in the first signification, *viz.* as heads of dioceses.—Du Cange adds, that there have been some abbots, who have bore the title of *patriarchs*. See ABBOT.

**PATRIARCH** is also applied to the chiefs of several churches in the east, who live out of communion with the Roman church: Such are the *patriarch* of the Armenians, residing in the monastery of St. Gregory; the *patriarch* of the Abyssinians, called *Abuna*; the *patriarchs* of the Copti, the Jacobins, &c. See ARMENIANS, COPTI, JACOBINS, &c.

**PATRIARCHAL**, in heraldry. — A *Patriarchal cross*, is that where the shaft is twice crossed, the lower arms or traverses being longer, and the upper shorter. — Such a cross is said to belong to *patriarchs*, as the triple cross does to the pope.

**PATRICIAN**, **PATRICIUS**, in ancient Rome, a title given to the descendants of the hundred, or, according to others, of the two hundred first senators chosen by Romulus, and by him called *patres*, fathers. See SENATOR, **PATRES**, &c.

*Patricians*, therefore, were then the ancient nobility; in opposition to the plebeians. See PLEBEIAN.

But the cognizance and character of these ancient families being almost lost and extinguished, by a long course of years, and frequent changes in the empire; a new kind of *patricians* were set on foot, who had no pretensions from birth; but their title depended wholly on the emperor's favour.

This new *patriciate*, Zosimus tells us, was erected by Constantine, who conferred the quality on his counsellors; calling them *patricii*, not because descended from the ancient fathers of the senate, but because they were the fathers of the republic, or of the emperor.

This dignity, in time, became the highest of the empire; Justinian calls it *summam dignitatem*: in effect, the *patricians* seem to have had the precedence of the *consulares*, and to have taken place before them in the senate; though F. Faber asserts the contrary. What embroils the question is, that the two dignities often met in the same person; for that the *patriciate* was only conferred on those who had gone through the first offices of the empire, or had been consuls.

Pope Adrian made Charlemagne take the title of *patrician*, ere he assumed the quality of emperor; other popes have given the title to other kings and princes by reason of its eminence.

**PATRICIAN**, **PATRICIUS**, is also a title of honour frequently conferred on men of the first quality in the time of our Anglo-saxon kings. See THANE.

**PATRICIANS**, in ecclesiastical writers, denote ancient sectaries, who disturbed the church in the beginning of the third century: thus called from their founder *Patricius*, preceptor of a Marcionite called Symmachus.

His distinguishing Tenet was, that the substance of the flesh is not the work of God, but that of the devil; on which account his adherents bore an implacable hatred to their own flesh; which sometimes carried them so far as to kill themselves.

They were also called *Tatianites*; and made a branch of the Encratites. See TATIANITE.

**PATRIMONY**, **PATRIMONIUM**, a right or estate, which a person inherits from his ancestors. See HEREDITARY and INHERITANCE.

The name *patrimony* was also anciently given to the effects, or revenues wherewith a church or religious house was endowed. In which sense we still say, the *patrimony* of the church of Rimini, of Milan, &c. The duchies of Urbino and Spoleto are called St. Peter's *patrimony*. The church of Rome had *patrimonies* in several countries, in France, Africa, the Alps, Sicily, &c.

To make what belonged to the churches the more respected, they usually gave their *patrimonies* the names of the saints they held in the highest veneration.

Thus the church of Ravenna called its inheritance the *patrimony* of St. Apollinaris; that of Milan the *patrimony* of St. Ambrose, &c. as is observed by Fra. Paolo.

**PATRIPASSIANS**, **PATRIPASSIANI**, a name given to the Sabellians, because they did not believe it was the son, but the father himself, that suffered and was crucified\*. See SABELLIAN.

\* The council of Antioch held by the Eusebians in 345, says, that those whom the Romans call *Patripassians*, the Eastern people

# P A T

called *Sabellians*: it adds the reason of the name *Patripassians*, in their condemnation; *viz.* that, by the incarnation of the father, they rendered him comprehensible and passible.

The *Patripassian* heresy was first broached by Praxeas, who was seconded by Victorinus, at the beginning of the third century.—They confessed Christ to be God, and that God suffered and died for us; but confounded the divine persons, and denied in effect the trinity; meaning by father, son, and spirit, not three persons, but one person under three names. So that he who suffered for us is as much father as son. Tertullian wrote expressly against Praxeas.

Hermogenes espoused the error of the *Patripassians*, whence they came to be denominated *Hermogenians*.—Afterwards Novetius gave into it, which occasioned them the Name of *Novetians*.—His disciple Sabellius the Libyan followed, about the year 250, whence they were called *Sabellians*.—Lastly, because Sabellius was of Pentapolis, and the heresy spread much there, called the *Pentapoltan doctrine*.

**PATROL**, or **PATROUILLE**, anciently **PATROUL**, in war, around or march made by the guards, or watch, in the night-time; to observe what passes in the streets, and to secure the peace and tranquillity of the city or camp. See GUARD, ROUNDS, &c. The *patrol* consists generally of a body of five or six men detached from a *corps de guard*, and commanded by a serjeant.

**PATRON**, **PATRONUS**, a term used in various acceptations, though all reducible to the relation of a protector, or guardian. In the church of Rome, a saint, whose name a person bears, or under whose protection he is put, and whom he takes particular care to invoke; or a saint in whose name a church, or order is founded; or a person who first established it, and who is chosen protector, are called *patrons* thereof.

Thus St. Peter and St. Paul are the *patrons* of the church of St. Genevieve, St. Dionysius the *patron* of the city of Paris, St. George of England, St. Benedict the *patron* of the Benedictines, St. Michael of the Armourers, St. Ignatius of the Jesuits, &c.

**PATRON**, **PATRONUS**, among the Romans, was an appellation given to a master, who had freed his slave. See SLAVE and MANUMISSION.

And hence, as the right and relation of master expired, that of *patron* commenced. See MASTER.

For the Romans, in giving their slaves their freedom, did not despoil themselves of all rights and privileges in them: the law still subjected the freed-men to considerable services and devoirs toward their *patrons*, the neglect whereof was severely punished. The principal right which *patrons* had, was that of being the legal heirs of their freedmen, if they died without lawful issue born after their enfranchisement, and intestate.

By the Paphian law it was further provided, that if the estate of the freed-man were 100000 sesterces, and he had three children, the *patron* should have a child's portion. See LIBERTUS.

**PATRON** was also a name which the people of Rome gave to a person of power, under whose protection they put themselves. The common people usually chose some person of eminence and authority, to whom they paid all kinds of honour and respect, denominating themselves his *clients*; and the *patron*, on his side, granted them credit and protection.

By this reciprocal relation was the *patron* bound to his client, and the client to his *patron*. See CLIENT.

**PATRON**, in the canon and common law, denotes a person who founds, or endows a church or benefice, and reserves to himself the right of patronage. See PATRONAGE.

The king is *patron paramount* of all ecclesiastical benefices in England. See KING, PARAMOUNT, &c.

**PATRON**, in navigation, is a name given in the Mediterranean to the person who commands the vessel and seamen; sometimes to the person who steers it; the former, in other places, called *master*; the second pilot. See MASTER and PILOT.

**PATRONAGE**, **PATRONATUS**, the right of giving or disposing of a church or benefice, properly belonging to the founder or endower thereof. See PATRON.

*Patronage* consists in having the nomination, or presentation to the benefice by him founded or endowed; in having the honourable rights of the church, in being interred in the chancel, &c. See BENEFICE.

Of *patronages*, some are lay, others ecclesiastical.

**Lay PATRONAGE** is a right attached to the person, either as founder, or as heir of the founder; or as possessor of a fee to which the *patronage* is annexed.

**Ecclesiastical PATRONAGE** is that which a person is entitled to by virtue of some benefice which he holds.

If an ecclesiastic have a right of *patronage* on his own account, independent of his ecclesiastical capacity; this is still *lay-patronage*. *Lay-patronage* again is *real* or *personal*.

**Real PATRONAGE** is that attached to the glebe, or to certain lands and hereditaments.

**Personal PATRONAGE** is that belonging immediately to the founder of the church, and transmissible to his children and family, without being annexed to any fee.

*Personal patronage* cannot be alienated or sold; *real may*, together with the glebe to which it is annexed. There must ever be some body or matter to fix it to, in order to its being transferred to another.

## P A V

The origin of the right of *patronage*, we find in the 10<sup>th</sup> canon of the council of Orange: where it is expressed that a founder may present to the diocesan the clerks he thinks proper for his church. By a law of Justinian it is ordained, that the founders of churches may not put clerks in them on their own authority, but only present them to the bishop.

Some canonists look on the right of *patronage* as a kind of ecclesiastical servitude. — The right of *patronage* sleeps, but is not lost, while a person is out of the communion of the church.

*Arms of PATRONAGE*, in heraldry, are those, a top whereof are some marks of subjection and dependance. — Thus the city of Paris bears three flower-de-luces in chief, to shew her subjection to the king.

The cardinals, on the tops of their arms, bear those of the pope, who gave them the hat, to shew that they are his creatures. See *ARMS*.

**PATRONYMIC\***, ΠΑΤΡΟΝΥΜΙΚΟΣ, among grammarians, is applied to those names which the Greeks gave to the race, or lineage; and which were taken from him who was the chief, or founder thereof. See *NAME*.

\* The word is formed from the Greek πατήρ, father, and ὄνομα, name.

Thus the descendants of Æacus were called Æacidæ; and those of Hercules, Heraclidæ. See *HERACLIDÆ*.

These *patronymic* names the Romans called *gentilitia*, which amount to much the same with our *sur-names*. See *SUR-NAME*. Thus those of the present reigning family in France we call the Bourbons; those of the late in England, the Stuarts, &c.

**PATROON-galley**. See the article *GALLEY*.

**PATROUILLE**. See the article *PATROL*.

**PATTES**, in heraldry, the paws of a beast. See *PAW*.

**PAVAGE**, PAVAGIUM, in our old law-books, money paid towards the paving of streets, or highways. See *PAVEMENT*.

**PAVAN**, or PAVANE, a grave kind of dance, borrowed from the Spaniards, wherein the performers make a kind of wheel, or tail before each other, like that of a peacock; whence the name. See *DANCE*.

The *pavane* was anciently in great repute; and was danced by gentlemen with cap and sword; by those of the long robe with their gowns, by princes with their mantles, and by the ladies with their gown tails trailing on the ground.

It was called the *grand ball*, from the solemnity wherewith it was performed. — To moderate its gravity, it was usual to introduce several flourishes, passades, capers, &c. by way of episodes. — Its tablature or score is given at large by Thoinot Arbeau in his *Orchesographie*.

**PAVEMENT\***, a layer or stratum of stone, or other matter serving to cover and strengthen the ground of divers places, for the more commodious walking on, or the passage of carriages.

\* The word is formed from the Latin *pavimentum*, of *pavire*, to beat down the earth, in order to make it firm and strong.

In England the *pavements* of the grand streets, &c. are usually flint, or pebble; courts, stables, kitchins, halls, churches, &c. are paved with tiles, bricks, flags, or fire-stone; sometimes a kind of free-stone and rag-stone. See *STONE*.

In some cities, *e. gr.* Venice, the streets, &c. are paved with brick; churches sometimes with marble, and sometimes with Mosaic work, as the churches of St. Mark at Venice. — In France the public roads, streets, courts, &c. are paved with gres or grit, a kind of free-stone.

In Amsterdam, and the chief cities of Holland, they call their brick pavement the *burgher-masters pavement*, to distinguish it from the stone or flint pavement, which usually takes up the middle of the street, and which serves for carriages; the brick which borders it being destined for the passage of people on foot.

*Pavements* of free-stone, flint, and flags, in streets, &c. are laid dry, *i. e.* in a bed of sand; those of courts, stables, ground-rooms, &c. are laid in a mortar of lime and sand; or in lime and cement, especially if there be vaults and cellars underneath. Some masons, after laying a floor dry, especially of brick, spread a thin mortar over it, sweeping it backwards and forwards to fill up the joints. — Thirty-two statute bricks laid flat pave a yard square; sixty-four of edge-wise.

The square tiles used in paving, called *paving-bricks*, are of various sizes, from 6 to 12 inches square. See *BRICK*.

*Pavements* of churches, &c. frequently consist of stones of several colours; chiefly black and white, and of several forms, chiefly square, and lozenge, artfully disposed. — Indeed there needs no great variety of colours to make a surprizing diversity of figures and arrangements. M. Truchet, in the memoirs of the French academy, has shewn, by the rules of combination, that two square stones, divided diagonally into two colours, may be joined together chequerwise sixty four different ways: which appears surprizing enough; since two letters or figures can only be combined two ways.

The reason is, that letters only change their situation with regard to first and second; the top and bottom remaining the same: but in the arrangement of these stones, each admits of four several situations, in each whereof the other square may be changed 16 times, which gives 64 combinations.

Indeed, from a further examination of these 64 combinations, he found, there were only 32 different figures; each figure be-

## P A U

ing repeated twice in the same situation, though in a different combination; so that the two only differed from each other by the transposition of the dark and light parts. See *COMBINATION*.

**PAVEMENT of terrace**, is that which serves for a covering in manner of a platform; whether it be over a vault, or a wooden floor. See *TERRACE* and *PLATFORM*.

Those over vaults are usually stones squared, and bedded in lead. — Those on wood, called by the Latins, *pavimenta contignata*, are either stones with beds for bridges, tiles for cieling of rooms, or lays of mortar made of cement and lime, with flints or bricks laid flat; as is still practised by the eastern and southern people a-top of their houses. See *PLATFORM*. All those *pavements* which lie open, are called by the Latins, *pavimenta subdialia*.

**Mosaic PAVEMENT**. See the article *MOSAIC work*.

**Tessellated PAVEMENT**. See the article *TESSELLATED*.

**Projection, or perspective of a PAVEMENT**. See *PERSPECTIVE*.

**PAVILLION\***, in architecture, signifies a kind of turret, or building usually insulated, and contained under a single roof; sometimes square, and sometimes in form of a dome: thus called from the resemblance of its roof to a tent.

\* The word comes from the Italian *padiglione*, tent, and that from the Latin *papilio*.

*Pavillions* are sometimes also projecting pieces, in the front of a building, marking the middle thereof. — Sometimes the *pavillion* flanks a corner, in which case it is called an *angular pavillion*. — The Louvre is flanked with four *pavillions*; *pavillions* are usually higher than the rest of the building.

There are *pavillions* built in gardens, popularly called *summer-houses*, pleasure-houses, &c. — Some castles or forts consist only of a single *pavillion*.

**PAVILION**, in war, denotes a tent raised on posts to lodge under in the summer time. See *TENT*.

**PAVILLION** is also applied to flags, colours, ensigns, standards, banners, &c. all which authors usually confound with one another. See *FLAG*, *ENSIGN*, *STANDARD*, &c.

The custom of bearing *pointed pavillions*, as at present, first came from the Mahometan Arabs, at the time when they conquered Spain. — Till then, all colours were stretched on cross pieces like church banners; whence they were called in Latin, *vexilla quasi velilla*, a diminutive of *vela*, sails.

The pirates all along the coasts of the Atlantic and Barbary, bear hexagonal *pavillions*, gules, charged with a little Turk, dressed in his turban; though contrary to their law, which prohibits the making any image of a man; from an opinion that those who make the figure here, will be obliged to furnish a soul for it at the day of judgment, or, in default thereof, be damned.

But this portrait, it seems, is that of Hali Sulicar, Mahomet's son-in-law, to whose party the Africans adhere: and who appointed his picture to be represented on their banners; imagining himself so terrible to the Christians, that the mere sight of his image would put them to flight, as we are told by Leunclavius.

**PAVILLION**, in heraldry, denotes a covering in form a tent, which invests, or wraps up the armories of divers kings and sovereigns, depending only on God and their sword.

The French heralds hold, that none but sovereign monarchs may bear the *pavillion* intire, and in all its parts.

The *pavillion* consists of two parts: the top, which is the chapeau, or coronet, and the curtain which makes the mantle. — Those who are elective, or have any dependance, say the heralds, must take off the head, and retain nothing but the curtains. See *MANTLE*. The use of *pavillions* and mantles in armories is derived from the ancient lambrequins, which are sometimes found stretched out in form of coverings, and tucked back on either side.

Others will have it derived from the ancient tournaments, wherein were exposed the arms of the knight in rich tapestry work, on tents and *pavillions* which the chiefs of the quadrils planted to shelter themselves, till the time of entering the lists.

**PAVIOUR's level**. See the article *LEVEL*.

**PAUL's art**. See the article *ART*.

**Hermits of St. PAUL**. See the article *HERMIT*.

**PAULIANISTS, PAULIANISTÆ**, a sect of hereticks, so called from their founder Paulus Samosatenus, a native of Samosata, elected bishop of Antioch in 262.

This Heresiarch denied the distinction of persons in the trinity, with Sabellius; and taught, with Artemonius, that the Word descended into Jesus; and that, after having performed by him what he purposed to do, he re-ascended to his Father.

He distinguished two persons in J. C. the Word, and the Christ: The latter, according to him, was only God in regard of his holiness; accordingly he did not baptize in the name of the Father, and the Son, &c. For which reason the council of Nice ordered those baptized by him to be rebaptized.

Being condemned by Dionysius Alexandrinus in a council, he abjured his errors, to avoid deposition; but soon after resumed them, and was actually deposed by another council in 270.

**PAULICIANS\***, a branch of the ancient Manichees; so called from their chieftain, one Paulus, an Armenian, in the seventh century. See *MANICHEE*.

\* They were also called *publicani*, *populicani*, and *publicani*.

The *Paulicians*, by their number, and the countenance of the emperor,

emperor Nicephorus, became formidable to all the east. To the other opinions of the Manichees, they are said to have added an abhorrence of the cross; and to have employed it in the most servile offices, out of despite.

The empress Theodora, tutress of the emperor Michael in 845, would oblige them either to be converted, or to quit the empire: Upon which several of them were put to death, and more retired among the Saracens; but they were not all exterminated. Towards the end of the IX<sup>th</sup> century, they were able to maintain war against the emperor Basil; and even preached long after this in Bulgaria; whence they spread into several other parts of Europe.

PAVO, in astronomy. See the article PEACOCK.

PAUPER, in law. See FORMA *pauperis*, and DISPAUPER.

PAUSARY, PAUSARIUS, in ancient Rome, an officer, who in the solemn pomps, or processions of the goddess Isis, directed the stops, or pauses. See PAUSE.

In these ceremonies, there were frequent stands at places prepared for the purpose; wherein the statues of Isis and Anubis were set down; much after the manner of resting places in the procession of the holy sacrament in the Romish church.—These rests were called *mansiones*; the regulation whereof was the office of the *pausarii*.

From an inscription quoted by Salmasius it appears that the Romans had a kind of college, or corporation of *pausaries*. See COLLEGE.

PAUSARY, PAUSARIUS, was also a name given to an officer in the Roman galleys, who gave the signal to the rowers, and marked the times and pauses; to the end they might act in concert and row all together. See GALLEY.

This was done with a musical instrument: Hyginus says, that in the ship Argo, Orpheus did the office with his lute.

PAUSE\*, a stop, or cessation of speaking, singing, playing, or the like. See REST.

\* The word is formed from the Latin *pausa*, which we find in Lucretius and Plautus in the same sense.

The use of pointing, in grammar, is to make proper *pauses* in certain places. See POINTING.

There is a *pause* in the middle of each verse: in a hemistich it is called the rest, or repose. See CAESURE.

*Pauses* or silences are the same in poetry as the odd rests in music, which serve to make the odd notes even 10. St. Austin instructs us how these pauses are to be made according to the laws of music.

PAUSE, in music, a character of silence, and rest; called also by some, a *mute figure*, because it shews that some part or person is to be silent, while the others continue the song.

*Pauses* are used either for the sake of some fugue or imitation, or to give a breathing time, or to give room for another voice, &c. to answer what this part sung; as in dialogues, echoes, &c.

The ancients had two kinds of *pauses*: the one called by the Italians, *initial pauses*; because first placed at the beginning of the piece, though sometimes after, and regularly before the circle O, or the semi-circle C.—They had also *pauses* to mark silences, after the characters of the measure, and in the course of the piece.

General PAUSE denotes a general cessation, or silence of all the parts.

Demi PAUSE, a cessation for the time of half a measure.

They also say, *pause of a minim*, *pause of a semibreve*, *long pause*, *pauses of a croma*, and *semi-croma*; which are names given by the Italians, to express the different values, or durations of *pauses*. See REST.

For the signs or characters of *pauses*. See CHARACTER.

PAW, PATTE, in heraldry, the fore-foot of a beast cut off short.—

If the whole leg be cut off, it is called *Gambe*.—Lions' paws are much used in harmony.

PAWN-broker. See the article BROKER.

PAWNAGE. See the article PANNAGE.

PAX Dei. See the article PEACE of God.

PAX Ecclesie. See the article SANCTUARY.

PAX Regis\*. See the article PEACE of the king.

\* *Longe debet esse Pax Regis a parte sua, ubi residens fuerit, a quatuor partibus loci illius, hoc est quatuor milliaria & tres quarentena, & novem acra latitudine, & novem pedes, & novem palmae, & novem grana bordei, &c.* Leg. Edv. Confess.

Ad PACEM reddere, to restore to the peace, is to reverse an outlawry; whereby a person is restored to the benefit of the king's peace\*. See OUT-LAWRY.

\* *Rex potest dare quod suum est, hoc est pacem suam, quam utlagatus amisit.* Bracton. Lib. 3.

PAYMENT, the discharge of a debt, either by money really told, or by bills of exchange, &c. See DEBT, &c.

Prompt PAYMENT, a popular term in England and Amsterdam, is when a debtor acquits what he owes before the expiration of the term granted by the creditor.

The ordinary discount for *prompt payment* on most merchandizes is 1 per cent. See DISCOUNT, REBATE, &c.

PAY, in the sea language. The seamen say, *pay more cable*, i. e. let out more cable. See CABLE.

*Pay cheap*, is used in turning the anchor out of the boat, to denote, turn it out faster.

VOL. II. N<sup>o</sup> CXIII.

PEACE, Pax, in its general signification, stands in opposition to war. See WAR.

PEACE in our law-books, &c. is restrained to a quiet, and inoffensive carriage towards the king, and his people. Lamb. *Eirenarch*.

Where any man stands in danger of harm from another, and makes oath thereof before a justice of the peace; he must be secured by good bond, which is called *binding to the peace*, &c. See SURETY and FRANK-PLEDGE. See also CONSERVATOR, and JUSTICE of the peace.

Time of PEACE is when the courts of justice are open, and the judges and ministers of the same may by law protect men from wrong and violence, and distribute justice to all. See Coke on Litt. See also TERM.

PEACE of the king, *Pax Regis*, mention'd in the Stat. 6 Ric. II. &c. is that security which the king promises his subjects, and others taken into protection; both for life and goods. See PROTECTION.

PEACE of God and the church, *Pax Dei & ecclesie*, mentioned in our ancient law books, is that rest and cessation which the king's subjects had from trouble and suit of law, between the terms. See VACATION.

PEACE of the plough, that whereby the plough, plough-tackle, and plough-cattle are secured from distresses. See Fitzh. *Nat. Br.* Thus fairs may be said to have their *peace*, because no man may be troubled in them for any debt contracted elsewhere.

Homage of PEACE. See the article HOMAGE.

Clerk of the PEACE. See CLERK of the Peace.

PEACH-Water. See the article WATER.

PEACOCK, PAVO, in astronomy, a constellation of the southern hemisphere, unknown to the ancients; and not visible in our northern parts of the world. See CONSTELLATION.

PEACOCK'S-Tail. See the article TAIL.

PEAN, in heraldry, is when the field of a coat of arms is sable, and the powderings, or. See FUR.

PERCH fishing. See the article FISHING.

PEARL, PERLA, or MARGARITA, in natural history, a hard, white, shining body, usually roundish, found in a testaceous fish, resembling an oyster; and ranked in the number of Gems or precious stones. See PRECIOUS Stone, and GEM.

The fish wherein the *pearls* are found, is three or four times the size of the common oysters; and is called by naturalists, *pinna marina*.

Each *pinna* ordinarily yields ten or twelve *pearls*; though an author, who treats of their production, pretends to have seen an hundred and fifty in the same fish; but those in different degrees of perfection. The most perfect still drop first; the rest remaining at the bottom of the shell.

The formation of *pearls* has puzzled both ancient and modern naturalists; and given occasion to a great number of hypotheses, many of them wild and extravagant enough. The ancients, Pliny, Solinus, &c. will have them to be formed of the dew: the fish, say they, rises every morning to the surface of the water, and there opens its shell, to imbibe the dew of heaven; which, like a liquid *pearl*, insinuating into the body of the *pearl*-oyster, fixes its salts, and there assumes the colour, hardness, and form of *pearl*; as some liquors are converted into crystals in the earth; or the juice of flowers into honey and wax in the body of the bee. But this, how plausible soever, is apparently false: for the *pearl*-oysters grow fast to the rocks, and no body ever yet saw any of them appear on the surface of the water.

Others will have *pearls* to be the eggs of the fishes they are found in: but neither does this consist with the phenomena. For *pearls* are found throughout the whole substance of the oyster, in the head, the coat that covers it, the circular muscles that terminate in it, the Stomach, and in general in all the fleshy and musculous parts; so that there is no appearance that *pearls* should be in the oysters, what the eggs and spawn are in fowls and fishes. For, beside that there is no particular place destined for their formation; anatomists have not been able to find any thing that bears any relation to what passes in this respect in other animals.—This indeed may be said, that as in a hen there is an infinity of little eggs, in form of seed; some whereof grow and ripen, whilst the rest continue nearly in the same state; so in each oyster is usually found one *pearl* much larger, and that ripens much faster than the rest. This *pearl* sometimes grows big enough to hinder the oyster from shutting, in which case the fish rots and dies.

Others, with M. Geoffroy the younger, rank *pearls* among the bezoards; as comprehending under that class all stones formed in layers or strata in the bodies of animals. See BEZOARD.

M. Reaumur, has a very curious piece on the subject of the formation both of the shells and *pearls*, in the memoirs of the French academy, anno 1717. He observes, that *pearls* are formed like other stones in animals, as those e. gr. in the bladder, kidneys, &c. and that they are apparently the effects of a disease of the fish.—In effect, they are all formed of a juice extravasated out of some broken vessels, and detained, and fixed among the membranes.

To evince the possibility of this, he shews that the shells of sea-fishes, as well as those of snails, &c. are wholly formed of

a glutinous stony matter, ouzing out of the body of the animal. (See SHELL.) Now it is no wonder that an animal, which has vessels wherein circulate a sufficient quantity of stony juice to build, thicken, and extend a shell, should have enough to form stones, in case the juice, destined for the growth of the shell shall chance to overflow, and burst forth in any cavity of the body, or among the membranes.

To confirm this system he observes, that the inner surface of the common *pearl*-muscle, found on the coasts of Provence, is of a *pearl*, or mother of *pearl* colour, from one part of its extent, which he determines, to another; after which it becomes reddish: now there are *pearls* of two colours found in the shell, and the colours of the *pearls* are precisely the same with those of the shell; nay, more, each kind of coloured *pearl* is found in the corresponding coloured part of the shell; which shews, that in the same place wherein the transpiration of a certain juice had formed and would have continued to form a coat, or layer of shell of a certain colour; the vessels which conveyed that juice being broke, there is formed a little mass or collection of the juice, which hardening, becomes a *pearl* of the same colour with the part of the shell to which it corresponds.

Add to this, that the silver, or *pearl*-coloured part of the shell is formed of strata, or lays over one another, like an onion; and the reddish part of little cylindrical, short fibres applied against one another. The *pearls* of the two colours have this difference of texture; not but they are both composed of concentric couches; but those of the reddish *pearls* are much less sensible, and, besides, have threads, which, like radii, proceed from their centre to their circumference.—These circumstances seem effectually to determine the formation of *pearls*, and to establish the new system beyond contradiction.

As to the formation of the *pearl*-fish, though it is the most natural opinion, that this fish, like all others, produces eggs or spawn, whose exterior surface at first is soft and viscous, but changes and hardens by degrees into shell; yet we must not leave unmentioned the popular hypothesis of the Paravas, viz. that in rainy weather the brooks of the neighbouring lands that empty themselves all along the coasts, run near two leagues on the surface of the sea without mixing therewith. For a while, the suspended water retains its natural colour and sweetness; but at length, the heat of the sun condensing it, forms it into a kind of light transparent froth; this done, it presently divides into an infinity of parts, each whereof appears as if animated; moving this way and that, like little insects. The fishes sometimes catch at them as they pass by; but soon abandon them. By degrees their skin thickening and hardening, they at length become heavy enough to sink to the bottom, and assume the figure of oysters. The perfection of *pearls*, whether round, in form of pears, or olives, or irregular, consists chiefly in the lustre and clearness of the colour; which they call the *water*. There are some whose water is white; which are those most esteemed in Europe. The water of others borders on the yellow, which some Indians and Arabs prefer to the white. Others are of a lead-colour, others border on black, and others are quite black.

They are all liable to change with wearing: in 80 or 100 years they usually become of little value; especially the white ones, which turn yellow, and spoil in 40 or 50 years time.

The difference of colour doubtless arises from the different parts of the oyster wherein they are formed. When the seed happens to be thrown into the mesentery or liver, or the parts corresponding thereto, it is no wonder if the impurities of the blood change the natural white.

In Europe, *pearls* are sold by the carat-weight, the carat containing four grains.—In Asia, the weights used for *pearls* are different in different states. See CARACT.

The term *pearl* is only properly applied to what grows independent of the shell.—The shell itself is rather call'd *naker* of *pearl*. Those pieces which have grown thereto, and have been since separated by the address of the workman, are called *wens* of *pearls*; which are in effect nothing but roundish excrescences, or pieces of the shell, though frequently used for real shell.

*Pearls*, F. Bouhours observes, have this advantage over precious stones dug out of rocks, &c. that the latter owe their lustre to the industry of men; nature only, as it were, hews them out, and leaves the finishing of them to art: but the former are born with that beautiful water which gives them their value. They are found perfectly polished in the abysses of the sea; and nature has put the last hand to them ere they are separated from their mother.

*Pearls* of unusual figures, i. e. neither round, nor in the pear form, are called *baroquas*, or *Scotch-pearls*: those of unusual sizes are called *parangons*; as that of Cleopatra valued by Pliny at centies HS. or 80000 l. sterling; that brought in 1574 to Philip II. of the size of a pigeon's egg, valued at 14400 ducats; that of the emperor Rudolph, mentioned by Boetius, called *la peregrina*, or the incomparable, of the size of a mulcade pear, and weighing 30 carats; and that mentioned by Tavernier, in the hands of the emperor of Persia, in 1633, bought of an Arab for 32000 tomans, which, at 3 l. 9 s. the toman, amounts to 110400 l. sterling.

*Pearls* are of some use in medicine; but it is only the small-

est sort, called *seed of pearls*, that is there used. The quality required is, that they be white, clear, and transparent: and truly oriental. They serve to make cordial potions, formerly much valued, but now fallen much from their ancient reputation, and scarce owned by any but charlatans.

The ladies also use certain preparations of *pearls*, as they are made to believe, for their complexions; such as the whites of *pearls*, flowers, essences, spirits, tinctures, &c. of *pearls*; but they are all apparently deceits.

Ounce PEARLS. See the article OUNCE.

PEARL-fisheries.—*Pearls* are caught in the seas of the East-Indies, in those of America, and in some parts of Europe. See FISHERY.

PEARL-fisheries of the East are,—1°. The island of Bahren, or Baharem, in the Persian gulph. This the Portuguese were masters of while they held Ormus and Mascata; but it has been returned to the Sophi of Persia, since the time that Prince, with the assistance of the English, took from them Ormus; and the Arabs Mascata.

2°. The fishery of Catifa, on the coast of Arabia Felix, over against Bahren.

3°. That of Manar, a sea-port in the isle of Ceylon. The *pearls* here fished are the finest in all the east for their water and roundness; but they seldom exceed four carats.

Lastly, there are *pearls* fished on the coast of Japan; but they are coarse and irregular, and little minded.

The *pearls* of Bahren and Catifa, are those commonly sold in the Indies; they border a little on the yellow, but the eastern people do not value them the less for it; they esteem it the sign of their being ripe and mature, and are persuaded, that those which have this yellowish tincture naturally, never change their colour; and that, on the contrary, their white water does not hold above 30 years, ere the *pearl* assumes a filthy yellow colour, by reason of the heat of the climate, and the sweat of the persons who wear them.

American PEARL-fisheries are all in the great gulph of Mexico, along the coast of the Terra-firma. There are five of them—

1°. The fishery of Cubagna, an island five leagues from New Andalusia, in 10 deg.  $\frac{1}{2}$  north lat.

2°. That of the island Marguerites, or *Pearl island*.

3°. That of Comogote near the Terra-firma.

4°. That of the river De la Hach, called *la Remcheria*.

5°. That of St. Martha, sixty leagues from the river De la Hach.

The *pearls* of these three last fisheries are usually of a good weight; but ill formed, and of a livid water. Those of Cubagna seldom exceed 5 carats; but are found in abundance. But the greatest quantity, and the finest, both with regard to weight and water, are these of the island Marguerites.

PEARL-fishery in Chinese Tartary is near the city Nipehoa, situate on a lake of the same name: the *pearls* here are less beautiful than those of Baharem, and the fishery less plentiful. It was this fishery that occasioned the war between the Chinese and Muscovites, terminated towards the end of the last century by the jesuites Pereira and Gerbillon; when the lake, which is of great extent, was divided between the two nations, each whereof had pretended to the whole.

There are some *pearl*-fisheries in the South-Sea, but they are very inconsiderable.

PEARL-fisheries of Europe are in some places on the coasts of Scotland, and in a river of Bavaria: but the *pearls* found here are no ways comparable to those of the East-Indies, or of America; though they serve for necklaces, sold sometimes for a thousand crowns, and upwards.

Manner of fishing for PEARLS in the East-Indies.—There are two seasons of *pearl*-fishing in the year; the first in March and April, the second in August and September: the more rain falls in the year, the more plentiful are the fisheries.

In the opening of the season, there appear sometimes two hundred and fifty barks on the banks. In the larger barks are two divers, in the smaller, one. Each bark puts off from shore ere sun-rise, by a land-breeze, which never fails; and returns again by a sea-breeze, which succeeds it about noon.

As soon as the barks are arrived, and have cast anchor, each diver binds a stone, six inches thick and a foot long, under his body; which is to serve him as ballast, and prevent his being driven away by the motion of the water; and to enable him to walk more steadily across the waves.

Beside this, they tie another very heavy stone to one foot, whereby they are sunk to the bottom of the sea in a moment. And as the oysters are usually strongly fastened to the rocks, they arm their fingers with leathern mittens, to prevent their being wounded in scraping them violently off; and some even carry an iron rake for the purpose.

Lastly, each diver carries down with him a large net, in manner of a sack, tied to his neck by a long cord, the other end whereof is fastened to the side of the bark. The sack is intended for the reception of the oysters gathered from the rock, and the cord to pull up the diver when his bag is full, or he wants air. In this equipage he precipitates himself, sometimes above 60 foot under water. As he has no time to lose there, he is no sooner arrived at the bottom, than he begins to run from side to side,

side, sometimes on sand, sometimes on a clayey earth, and sometimes among the points of rocks; tearing off the oysters he meets withal, and cramming them into his budget.

At whatever depth the divers be, the light is so great, that they easily see whatever passes in the sea, with the same clearness as on land. And, to their consternation, they sometimes see monstrous fishes, from which all their address, in mudding the water, &c. will not save them, but they become their prey; and, of all the perils of the fishery, this is one of the greatest and most usual.

The best divers keep under water for half an hour, the rest do not stay less than a quarter. During which time they hold their breath without the use of oils, or any other liquors. See DIVING.

When they find themselves straitened, they pull the rope to which the bag is fastened, and hold fast by it with both hands; when the people in the bark, taking the signal, heave them up into air, and unload them of their fish, which are sometimes five hundred oysters, sometimes not above fifty.

Some of the divers need a moment's respite to recover breath; others jump in again instantly, continuing this violent exercise, without intermission, for many hours.

On the shore they unload their barks, and lay their oysters in an infinite number of little pits, dug four or five foot square, in the sand; raising heaps of sands over them to the height of a man, which, at a distance, look like an army ranged in battle. In this condition they are left, till the rain, wind, and sun, have obliged them to open, which soon kills them. Upon this, the flesh rots and dries; and the pearls, thus disengaged, tumble into the pit upon taking the oysters out.

The flesh of the fish is excellent, and, if what some naturalists maintain, be true, viz. that the pearls are stones, formed there by the ill constitution of the body, as sometimes happen in men, and in the bezoard; this disease does not alter the humours: at least the Paravas, who eat them, do not find any difference between those that have pearls, and those that have none.

After clearing the pits of the grosser filth, they sift the sand several times, to separate the pearls. But what care soever they take herein, they always lose a great many. After cleaning and drying the pearls, they are passed through a kind of sieve, according to their sizes. The smallest are sold for seed of pearls; the rest are put up by auction, and sold to the highest bidder.

**Manner of fishing for PEARL in the West Indies.**—The season for fishing is usually from October to March. In this time there set out from Carthage ten or twelve barks, under the convoy of a man-of-war called Larmadilla. Each bark has two or three slaves for divers.

Among the barks there is one called Capitana; to which all the rest are obliged to bring at night what they have caught in the day, to prevent frauds. The divers never hold long, by reason of the great hardships they sustain; continuing sometimes under water above a quarter of an hour. — The rest is the same as in the East-India fisheries.

The Indians knew the value of their pearls before the discovery of America; and when the Spaniards arrived there, they found great quantities stored up, which the Americans set great value on. But they were almost all imperfect, and their water yellow and smoky, by reason they used fire in opening the fishes. In the *Dictionnaire de commerce* is a table of the value of pearls, communicated to the author by an able hand. As pearls make a very curious article in commerce, and as their value is a thing little known among us; we shall here give the Reader an abridgement of the same, reduced to our money on the foot of 1 s. 6 d. sterling the French livre, or 4 s. 6 d. the French crown.

*Value of all kinds of PEARLS, with regard to their different weights.*

<i>Seeds of Pearls</i>	<i>l.</i>	<i>s.</i>	<i>d. per oz.</i>
Seeds of pearls not perforated, fit for grinding, are worth	00	09	
Fine seed of pearls perforated for small necklace, or embroidery,	01	01	
Ditto a little larger,	01	16	
<i>Ragged or irregular Pearls.</i>			
Of 500 to the ounce, are worth	03	00	
300	06	00	
150	11	02	
100	18	00	
60	33	15	
30	75	00	
<i>Regular round Pearls.</i>			
One of $\frac{1}{2}$ a grain is worth	00	00	2 $\frac{1}{2}$
Of a grain	00	00	4 $\frac{1}{2}$
Of a grain and half	00	01	0
Of 2 grains	00	02	0
Of 2 grains and half	00	04	6
Of 3 grains	00	07	6

	<i>l.</i>	<i>s.</i>	<i>d. per oz.</i>
Of 4 grains, or one carat	00	18	0
Of 5 grains	01	10	0
Of 6 grains	02	05	0
Of 7 grains	03	01	0
Of 8 grains, or two carats	04	10	0
Of 9 grains	06	00	0
Of 10 grains	08	05	0
Of 11 grains	09	15	0
Of 13 grains	13	05	0
Of 15 grains	21	00	0
Of 17 grains	27	10	0
Of 20 grains, or 5 carats	37	10	0
Of 22 grains	52	10	0
Of 24 grains, or 6 carats	82	10	0
Of 26 grains	99	00	0
Of 28 grains, or 7 carats	150	00	0
Of 32 grains, or 8 carats	225	00	0
Of 36 grains, or 9 carats	262	10	0
Of 40 grains, or 10 carats	300	00	0

As to pearls in form of pears, though equally perfect, and of equal weight with the round ones, their value is much inferior: however, when two are found that match well, their value is less but by one third.

**False PEARLS** are counterfeit, or factitious pearls, resembling the true ones in water or colour; popularly called *beads*.

These anciently were only made of glass, with a kind of tincture of quick-silver within; afterwards they used wax, covered over with a fine brilliant fish-glue.

There has since been invented in France another manner of making them, so near the natural ones in lustre and water, that they deceive a good eye. These are what the ladies now generally wear in defect of true pearl; small necklaces whereof they despise, and the large ones being generally too dear.

**Method of making false PEARLS.**—This curious invention is owing to the Sieur Janin; and is the more to be valued, in that it is not only very simple, but prevents the ill effects of those false pearls made with quick-silver within, or fish-glue without.

That ingenious artist having observed, that the scales of a little fish called the *bleak*, found plentifully in the river Marne, had not only all the lustre of the real pearl; but that after beating them to powder in water, or iceing-glass, they returned to their former brilliant upon drying; he bethought himself of setting a piece, or little mass thereof, in the cavity of a bead, or grain of girasol, which is a kind of opal or glass, bordering much on the colour of pearl. The difficulty was to get it in there, and when in, to spread it equally throughout the bead.

A little glass tube six or seven inches long, and a line and half in diameter, but very sharp at one end, and a little crooked, served for the introducing of the matter, by blowing it with the mouth, after having taken up a drop with the pointed extremity of the tube; and to spread it throughout the inner circumference, he contented himself to shake it gently a long time, in a little osier basket lined with paper.

The pulverized scales, fastened by this motion in the inside of the bead, return their lustre as they dry. To increase this lustre, in winter they lay their beads in a hair sieve, or a bolting-cloth, which they suspend to the ceiling, and under, at six foot distance, lay heaps of hot ashes. In summer they suspend them in the same manner, but without any fire.

The pearls, thus well dried, become very brilliant; and nothing remains but to stop up the aperture, which is done by melted wax, conveyed into it with a tube like that used in introducing the dissolved scales.

After clearing off the superfluous wax, they perforate the pearls with a needle, and string them; and thus they commence necklaces.

**Mother of PEARL** is the shell, not of the pearl oyster, but of the *auris marina*, a small sea-fish of the oyster kind.

This shell within-side is very smooth, and polished, and of the whiteness and water of pearl itself; and it has the same lustre without-side, after the first laminæ, or leaves which make the outer coat of this rich shell-fish, have been cleared off with *aqua fortis* and the lapidaries drill. It is used in inlaid works, and in several toys, as snuff-boxes, &c.

**Wens of PEARL**, are certain excrescences, or prominent places, in form of half pearls; sometimes found in the bottoms of the pearl shells.

The lapidaries have the address to saw off these protuberances, to join them together, and to use them in several works of jewelry, as if they were really pearls.

PEARL, in heraldry, is used by such as blazon with precious stones instead of colour, and metals, for argent, or white. See ARGENT.

PEARL, *pin*, or *web*, in medicine, an unnatural speck, or thick film over the eye. See PANNUS and UNGUIS.

PEARLED crowns. See the article CROWN.

PEARS. See the articles FRUIT and DWARF pears.

PECCANT, in medicine, an epithet given to the humours of the body, when they offend either in quantity or quality, i. e. when they are either morbid, or in too great abundance. See HUMOUR.

Most

Most diseases arise from *peccant* humours, which are either to be corrected by alteratives and specifics, or evacuated. See DISEASE, &c.

**PECK**, a measure, or vessel used in measuring grains, pulse, and the like dry measures. See MEASURE.  
The standard, or Winchester *peck*, contains two gallons; each gallon weighing about eight Pound Troy. See GALLON.  
Four *pecks* make a bushel; four bushels a comb or carnock, &c. See BUSHEL.  
Besides the general, or Winchester *pecks*, there are local *pecks*, containing some more, some less; as the Lancaster *peck*, containing six gallons, &c.

**PECQUET'S duct**, in anatomy, the thoracic duct; thus called from its discoverer Pecquet. See THORACIC DUCT.

**PECTEN arboris**, in botany, is the grain of the wood of any tree. See WOOD and TREE.

**PECTEN**, in anatomy, is used, by some authors, for the pubes, or lower part of the hypogastrium, usually covered with hair. See PUBES and PECTINIS.

**PECTINEUS**, or **PECTINÆUS**, in anatomy, the third of the fifteen muscles of the thigh; so called, because it has its origin in the fore part of the *os pectinis*. — See Tab. Anat. (Myol.) fig. 2. n. 35.  
Its insertion is in the thigh, under the left trochanter. The *pectineus*, with the *psoas* and *iliacus*, draw the thigh forwards, and, of consequence, bend it.

**PECTINIS os**, in anatomy, the same with *os pubis*. See os PUBIS.

**PECTORAL**, something relating to the breast, *pectus*. See BREAST.  
In the Romish church, bishops, and regular abbots wear a *pectoral cross*, i. e. a little cross of gold, hanging from the neck down the breast.

**PECTORAL medicines**, or simply **PECTORALS**, are remedies proper to strengthen and relieve the breast; or medicines against diseases of the breast and lungs.  
Their ordinary intention is either to attenuate, or thicken the humours of those parts, which cause coughing, &c. and render them fit to be expectorated, or spit out. See BECHIC.

**PECTORAL wine**. See the article WINE.

**PECTORALE**, or **PECTORAL**, in the Jewish law. See RATIONALE.

**PECTORALIS**, in anatomy, a muscle which possesses almost the whole breast, and moves the arm forwards.  
It arises by a fleshy and semicircular beginning from the clavicle, sternum, and cartilages of the six superior ribs; and covering a great part of the breast, is inserted by a short, but strong and broad tendon into the upper and inner part of the humerus, between the biceps and deltoides. See Tab. Anat. (Myol.) fig. 1. n. 22.  
Its fibres, near their insertion, decussate one another. Those which come from the clavicle, or first ribs, are on the lower side of the tendon, and those from the inferior ribs on the upper side of the tendon.  
Naturalists observe a special mark of providence in the size and strength of the *pectoral* muscle in different animals. It is by the action of this muscle, that the flying of birds is chiefly performed; accordingly it is much larger and stronger in birds than in any animals not made for flight. See BIRD.  
Borelli observes, that, in men, the *pectoral* muscles are small; scarce the 50<sup>th</sup> or 70<sup>th</sup> part of all the other muscles; but in birds they are vastly large, equalling, nay, exceeding in bulk and weight all the other muscles of the bird together. See FLYING.

**PECTORALIS internus**. See TRIANGULARIS.

**PECTORALIS triangularis**. See the article TRIANGULARIS.

**PECTORIS os**, the same as *sternum*. See STERNUM.

**PECULATE**, **PECULATUS**, in the civil law, the crime of pilfering the public money, by a person who has the management, receipt, or custody thereof; so called, *quasi pecunie ablatio*.  
Civil lawyers use *peculate* for any theft of a thing either sacred, religious, public, or fiscal. — *Peculate* is prosecuted even on the criminal's heir. See THEFT and SACRILEGE.

**PECULIAR**, in the canon law, a particular parish, or church, which hath jurisdiction within itself, or probate of wills, &c. exempt from the ordinary, and the bishop's courts.  
There are *royal peculiars*, and *archbishop's peculiars*.  
The king's chapel is a *royal peculiar*, exempt from all spiritual jurisdiction, and reserved to the visitation and immediate government of the king himself, who is supreme ordinary. See CHAPEL.  
It is an ancient privilege of the see of Canterbury, that whatsoever any manors or advowsons do belong to it, they forthwith become exempt from the ordinary, and are reputed *peculiars*. In the province of Canterbury are fifty seven such *peculiars*.  
**Court of PECULIARS**, is a court where the affairs of *peculiars* are transacted. See COURT.

**PECULIUM**\*, the stock which a person, in the power or property of another, as a slave, a minor, or the like, may acquire by his own industry, without any advance or assistance from his father or master, but merely by their permission.

\* The word is usually derived à *pecunia* & *pecoribus*; because the whole estate anciently consisted in money and cattle. See MONEY.

**PECULIUM** is also used, among the Romanists, for what each monk or religious reserves and possesses to himself.  
Some say, that the *peculium* of a religious, when preferred to a cure, does not cease to belong to the monastery; and that the property thereof never absolutely resides in the religious. See PROPERTY.

**PECUNIA**, money. See the article MONEY.

**PECUNIA**, in our old law books, is sometimes used for cattle; and sometimes for other goods, as well as money. See CHATTEL.  
In the emendation of the laws of Edward the Confessor by William the first, it is ordered that no *viva pecunia*, living money, i. e. cattle, be bought or sold, except within cities, and that before three sufficient witnesses.  
So, in Domesday, *pecunia* is frequently used *pro pecude*; as pasture *ad pecuniam villæ*.

**PECUNIA ecclesiæ** was anciently used for the estate of the church.

**PECUNIA sepulchralis**, was money formerly paid to the priest at the opening of the grave, for the good and behoof of the deceased's soul; and which our Saxon ancestors called *soul-scot*, and *animæ symbolum*.

**PEDAGE**, **PEDAGIUM**, *Toll*, or a local due exacted on persons, goods, and carriages passing through certain places. See TOLL.  
*Pedage* is usually levied for the repairing of roads, bridges, cause-ways, the paving of streets, &c. Anciently those who had the right of *pedage*, were to keep the roads secure, and answer for all robberies committed on passengers between sun and sun; which is still observed in some parts of England, and in Italy, where there are guards called *Stationarii*, established for the security of merchants, particularly at Terracina, on the road between Rome and Naples.

**PEDAGOGUE**\*, or **PEDAGOGUE**, ΠΑΙΔΑΓΩΓΟΣ, a tutor or master, to whom is committed the discipline and direction of a scholar, to be instructed in grammar, and other arts.  
\* The word is formed from the Greek παιδαγωγος, *puerorum ductor*, leader of boys.  
M. Fleury observes, that the Greeks gave the name *pedagogus* to slaves appointed to attend their children, lead them, and teach them to walk, &c. The Romans gave the same denomination to the slaves who were intrusted with the care and instruction of their children.

**PEDALS**, the large pipes of an organ, so called, because played and stopped with the foot. See ORGAN.  
The *pedals* are the largest pipes in the machine, they are made square, and of wood; usually thirteen in number.—They are of modern invention, and serve to carry the sounds an octave deeper than the rest.

**PEDANEUS**, in the civil law, a petty judge, who has no formal seat of justice, but hears causes standing, and without any tribunal. See JUDGE.  
The word seems formed from *stans in pedibus*; and is used among the ancients by way of opposition to those magistrates, who were seated in the curule chair, in *fella curuli*, or had a tribunal or bench raised on high.  
The Roman *pedanei*, therefore, were such as had no tribunal, nor prætorium, but rendered justice *de plano*, or *plano pede*.  
From the eighty second novel it appears, that the emperor Zeno established these *pedanei* in the see of every province; and that Justinian erected seven of them at Constantinople, in manner of an office; granting them power to judge in any sum as high as three hundred crowns.

**PEDANT**, a school-master, or pedagogue, who professes to instruct and govern youth, teach them the humanities, and the arts. See PEDAGOGUE.

**PEDANT** is also used for a rough, unpolished man of letters, who makes an impertinent use of the sciences, and abounds in unseasonable criticisms and observations.  
Dacier defines a *pedant*, a person who has more reading than good sense. See PEDANTRY.  
*Pedants* are people ever armed with quibbles and syllogisms; breath nothing but disputation and chicanry, and pursue a proposition to the last limits of logic.  
Malebranche describes a *pedant* as a man full of false erudition, who makes a parade of his knowledge, and is ever quoting some Greek or Latin author, or hunting back to a remote etymology.  
St. Evremont says, that to paint the folly of a *pedant*, we must represent him as turning all conversation to some one science or subject he is best acquainted withal.  
There are *pedants* of all conditions, and of all robes. Wicquefort says, an ambassador, always attentive to formalities and decorums, is nothing else but a political *pedant*.

**PEDANTRY**, or **PEDANTISM**, the quality or manner of a *pedant*. See PEDANT.  
To swell up little and low things, to make a vain show of science, to heap up Greek and Latin without judgment, to tear those to pieces who differ from us about a passage in Suetonius, or the etymology of a word, to stir up all the world against a man

a man for not admiring Cicero enough, to be interested for the reputation of an ancient, as if he were our next of kin, is what we properly call *pedantry*.

**PEDESTAL\***, in architecture, the lowest part of an order of columns; being that which sustains the column, and serves it as a foot or stand. See COLUMN.

\* The word is formed from the Latin *pes pedis*, foot, and *συλκς*, column.

The *pedestal*, called by the Greeks, *Stylobates* and *Stereobates*, consists of three principal parts; viz. a square trunk or dye, which makes the body; a cornice, the head; and a base, the foot of the pedestal. See DYE, CORNICE, and BASE.

The *pedestal* is properly an appendage to a column; not an essential part thereof; though M. le Clerc thinks it is essential to a complete order. See ORDER.

The proportions and ornaments of the *pedestal* are different in the different orders; Vignola, indeed, and most of the moderns, make the *pedestal* and its ornaments in all the orders, one third of the height of the column, including the base and capital: but some deviate from this rule.

M. Perrault makes the proportions of the three constituent parts of *pedestals* the same in all the orders, viz. the base one fourth of the *pedestal*; the cornice an eighth part; and the socle or plinth of the base two thirds of the base itself. The height of the dye is what remains of the whole height of the *pedestal*.

**Tuscan PEDESTAL**, is the simplest, and the lowest.—Palladio and Scamozzi, make it three modules high; Vignola 5. Its members in Vignola, are only a plinth for a base, the dye, and a talon crown'd for a cornice.—It has rarely any base. See TUSCAN.

**Doric PEDESTAL**, Palladio makes four modules, five minutes high, Vignola five modules four minutes.—In the antique, we not only do not meet with any *pedestals*; but even, not with any base in the doric order.—The members in Vignola's doric *pedestal*, are the same with those in the tuscan, with the addition of a mouchette in its cornice. See DORIC.

**Ionic PEDESTAL**, in Vignola and Serlio, is six modules high; in Scamozzi five; in the temple of Fortuna Virilis it is seven modules twelve minutes.—Its members and ornaments are mostly the same with those of the doric, only a little richer. The *pedestal* now usually followed, is that of Vitruvius; though we do not find it in any work of the antique.—Some in lieu hereof use the attic base, in imitation of the ancient. See ATTIC.

**Corinthian PEDESTAL** is the richest and most delicate. In Vignola it is seven modules high, in Palladio five modules one minute, in Serlio six modules fifteen minutes, in the Coliseum four modules two minutes.

Its members in Vignola are as follows: in the base are a plinth for a socle, over that a tore carved; then a reglet, a gula inverted and enriched, and an astragal.—In the dye are a reglet, with a conge over it, and near the cornice a reglet, with a conge underneath.—In the cornice is an astragal, a frieze, fillet, astragal, gorge, talon, and a fillet. See each under its proper article.

**Composite PEDESTAL**, in Vignola, is of the same height with the corinthian, viz. seven modules, in Scamozzi six modules two minutes, in Palladio six modules seven minutes, in the goldsmiths arch seven modules eight minutes.

Its members in Vignola, are the same with those of the corinthian; with this difference, that, whereas these are most of them enriched with carvings in the corinthian, they are all plain in the composite.—Nor must it be omitted, that there is a difference in the profiles of the base and cornice in the two orders.

The generality of architects, Daviler observes, use tables or pannels, either in relievo or creux, in the dyes of *pedestals*; without any regard to the character of the order. Those in relievo, he observes, only fit the tuscan and doric; the three others must be indented; which, he adds, is a thing the ancients never practised, as being contrary to the rules of solidity, and strength.

**Square PEDESTAL**, is that whose height and width are equal—as, that of the arch of the lions at Verona, of the corinthian order; and such, some followers of Vitruvius, as Serlio, Philander, &c. have given to their tuscan orders.

**Double PEDESTAL**, is that which supports two columns, and is more in width than height.

**Continued PEDESTAL**, is that which supports a row of columns without any break or interruption; such is that which sustains the fluted ionic columns of the palace of the Tuileries on the side of the garden.

**PEDESTALS of statues**, are those serving to support figures or statues. See STATUE.

Vignola observes, there is no part of architecture more arbitrary, and wherein more liberty may be taken than in the *pedestals* of statues; there being no laws prescribed by antiquity: nor any even settled by the moderns.

There is no settled proportion for these *pedestals*; but the height depends on the situation, and the figure they sustain. Yet, when on the ground, the *pedestal* is usually two thirds, or two fifths of that of the statue: but the more massive the statue, the stronger the *pedestal*.

Their form, character, &c. are to be extraordinary and inge-

nious, far from the regularity and simplicity of the *pedestals* of columns. The same author gives us a great variety of forms, oval, triangular, multangular, &c.

**PEDESTRIAN statue**. See the article STATUE.

**PEDICLE\***, **PEDICULUS**, in botany, *foot stalk*; that little stalk whereby the leaf, fruit, or flower is sustained, and connected to its branch, or stem. See FLOWER, LEAF, &c.

\* The word is a diminutive of the Latin, *pes*, foot,

Flowers will keep fresh a long time after gathering, by immersing their *pedicles* in water. The great secret of preserving fruits for the winter, is to seal up their *pedicles* with wax. Cherries with the shortest *pedicles*, are esteemed the best. The pistil of the flower frequently becomes the *pedicle* of the fruit. See PISTIL.

**PEDIÆAN** ΠΕΔΙΑΙΟΣ, in antiquity.—The city of Athens was anciently divided into three different quarters; one on the descent of a hill; another on the sea-shore; and a third in a plain between the other two.

The inhabitants of the middle region were called Πεδιαίοι\*, *Pediæans*; or, according to Aristotle, *Pediaci*: those of the hill, *Diacrians*; and those of the shore, *Paralians*. See DIACRIAN.

\* The word is formed from the Greek, *παιδιον* plain, flat.

These quarters usually composed so many different factions: Pisistratus made use of the *Pediæans* against the *Diacrians*.

In the time of Solon, when a form of government was to be chosen, the *Diacrians* would have it Democratic; the *Pediæans* demanded an Aristocracy; and the *Paralians* a mixed government.

**PEDIÆUS**, in anatomy, is the second of the extensor muscles of the foot, *pes*; whence its name. See FOOT.

It has its origin in the lower part of the perone, and annular ligament; and is divided into four tendons, which are inserted into the external part of the first articulation of the four toes.

Its use is to extend the foot together with the first of the extensors, called *extensor communis*. See EXTENSOR.

**PEDICULARIS\*** *morbus*, in medicine, the lousy distemper; a disease arising from some uncommon corruption in the body, which generates infinite quantities of lice on the skin. See PHTHIRIASIS.

\* The word comes from the Latin *pediculus*, louse.

Herod is said to have died of the *pedicular* disease.

**PEDIGREE**, a descent or genealogy. See DESCENT and GENEALOGY.

**PEDIMENT**, in architecture, a kind of low pinnacle; serving to crown an ordonnance, or finish a frontispiece; and placed as an ornament over gates, doors, windows, niches, altars, &c.—See Tab. Architect. fig. 24. See also CROWNING, &c.

The pinnacles of the ancient houses, Vitruvius observes, gave architects the first idea of this noble part; which still retains the appearance of its original. See PINNACLE.

The parts of the *pediment* are, the tympanum, and its cornice. The first is the pannel, naked, or area of the *pediment*, represented by *e*, in Tab. Architect. fig. 34. enclosed between the cornice *f, f*, which crowns it, and the entablature, which serves it as a base or socle.

Architects have taken a deal of liberty in the form of this member: nor do they vary less as to the proportion of the *pediment*.—The most beautiful, according to Daviler, is that where its height is about one fifth of the length of its base.

It is described thus: divide the line *ab* (Tab. Architect. fig. 34.) which is the length of the base, into two equal parts, in the point *c*, by means of the perpendicular *fd*; in this perpendicular, take the part *ed*, equal to *ac*; and from the point *d*, as a centre, describe the arch *aeb*. The point of the perpendicular cut in *e*, will be the top of the *pediment aeb*; and the cornice, and the triangular space included therein, the tympanum. Vitruvius calls the *pediment*, *fastigium*; a word which signifies a roof raised or pointed in the middle, which form among the Romans was peculiar to temples. All their dwelling-houses were covered in the plat-form manner: Salmastius on Solinus observes, that Caesar was the first who obtained leave to roof his house with a ridge, after the manner of temples. See PLAT-FORM.—Pliny tells us, that *pediments* were first made to place statues upon, whence they were called *plastæ*. See STATUE, &c.

The *pediment* is usually triangular, and sometimes an equilateral triangle, called also a *pointed pediment*.—Sometimes it is circular; though Felibien observes, that we have no instance of round *pediments* in the antique, beside those in the chapels of the Rotondo.

Sometimes its upper cornice is divided into three, or four sides, or right lines: sometimes the cornice is cut, or open atop; which is an abuse introduced by the moderns, particularly Michael Angelo. For the design of this part, at least over doors, windows, &c. being chiefly to shelter those underneath from the rain, to leave it open in the middle, is to frustrate its end.

Sometimes the *pediment* is formed of a couple of scrolls, or wreathes, like to consoles, joined together. See CONSOLE.

Sometimes again the *pediment* is without a base, or its lower cornice is cut out, all but what is bestowed on two columns or pilasters, and on these an arch or sweep raised, in lieu of an entablature: of which Serlio gives an instance in the antique, in a

corinthian gate a Foligny, in Umbria; and Daviler, a more modern one, in the church of St. Peter at Rome.

Under this kind of *pediments*, do also come those little arched cornices, which form *pediments* over doors and windows, supported by two consoles, in lieu either of entablature or columns. Sometimes the *pediment* is made double, *i. e.* a less *pediment* is made in the tympanum of a larger, on account of some projection in the middle; as in the frontispiece of the church of the great Jesus at Rome: but this repetition is an abuse in architecture, though authorized by very good buildings; as the large pavillion of the Louvre, where the caryatides support three *pediments* one in another.

Sometimes the tympanum of the *pediment* is cut out, or left open, to let in light; as we see under the portico of the capital at Rome. Lastly, this open *pediment* is sometimes triangular, and enriched with sculpture, as roses, leaves, &c. as we find in most of the gothic churches.

M. Le Clerc observes, that the modillions in the cornice of the *pediment* should always answer exactly over those of the entablature. Indeed, Vitruvius says, the ancients did not allow any modillions at all in *pediments*. See MODILLION.

The same M. Le Clerc observes, that the cornice which serves the *pediment* as a base, should have no cymatium; by reason the cymatium of the rest of the entablature, when it meets the *pediment*, passes over it.

This change of determination occasions a considerable difficulty; the cymatium, in this case, appearing too broad in the turn of the angle. To remedy which, the architects have recourse to several expedients.

A pointed *pediment* may crown three arches; but a circular *pediment* can only crown one agreeably.

One would never use above two *pediments* over each other in the same frontispiece; and even where there are two, it would be proper to have the lower circular, the upper pointed.

**PEDIS** *abscissio*, cutting off a foot; a punishment anciently inflicted among us: as appears by the laws of William the conqueror. *Interdicimus ne quis occidatur, vel suspendatur, pro aliqua culpa, sed eruantur oculi, abscindantur pedes, vel testiculi, vel manus, &c. Leg. Will. cap. 1.*—So *In gulphus, sub pœna perditionis dexteri sui pedis, &c.*

**PEDIS** *minimi digiti abductor*  
*Adductor pollicis PEDIS*  
*Dorsum PEDIS*  
*Flexor pollicis PEDIS*  
*PEDIS interossei*  
*PEDIS perforans*  
*PEDIS perforatus*  
*PEDIS transversalis*  
*Transcriptio PEDIS finis*  
*PEDITUM arraiatio*

**PEDO-BAPTISM.** See *PEDO-Baptism*.

**PEDOMETER\***, or *PODOMETER*, way-wiser; a mechanical instrument, in form of a watch; consisting of various wheels with teeth, catching in one another; all disposed in the same plane; which by means of a chain or string fastened to a man's foot, or the wheel of a chariot, advance a notch each step, or each revolution of the wheel; so that the number being mark'd on the edge of each wheel, one may number the paces, or measure exactly the distance from one place to another. See PERAMBULATOR.

\* The word is formed from the Greek *πῆς*, *pes*, foot; and *μέτρον*, measure.

**PEDOMETER**, is sometimes, also, used for a surveying wheel, an instrument chiefly used in measuring roads; popularly called the *way-wiser*. See PERAMBULATOR.

**PEDRERO**, *PETERERO*, or *PATERERO*, a small piece of ordnance, used on board ships for the discharging of nails, broken iron, or partridge shot on an enemy attempting to board. See ORDNANCE and MORTAR.

They are generally open at the breech, and their chamber made to take out, to be loaded that way, in lieu of the muzzle. See CHAMBER.

**PEDUNCULI**, in anatomy, two medullary processes of the cerebellum, whereby that part is joined to the medulla oblongata. See CEREBELLUM and MEDULLA.

Willis, who first gave them the name, observed in them three distinct processes on either side, the two first whereof go to the testes, the second directly from the cerebellum to the medulla oblongata, decussing the former, and fastening the process annularis. The third, springing from the hind process of the cerebellum, is inserted into the medulla oblongata; looking like an additional chord to it.

**PEEK**, in the sea language, a term used in various senses.—*E. gr.* an anchor is said to be *a-peek*, when the ship being about to weigh, comes over her anchor, so as the cable hangs perpendicularly between the haufe and the anchor; the bringing of a ship into which position they call *heaving a-peek*.

A ship is said to *ride a-peek* when lying with her main and fore-yards hoisted up, one end of her yards is brought down to the shrouds, and the other raised up an end; which is chiefly done when the lies at rest in rivers, lest other ships, falling foul on her, should break her yards.

To *ride a broad-peek*, denotes much the same, excepting that the yards here are only raised to half the height.

To *peek the missen*, is to put the missen-yard perpendicular by the mast. **PEEK** is also used for the room in the hold, from the bits forward to the stem, where men of war keep their powder, and merchant men their victuals.

**PEER**, *PAR*, primarily denotes an equal, or one of the same rank and condition.—Hence, in some councils or assemblies, we find, with the consent of our peers, bishops, abbots, &c.

**PEER**, afterwards was applied to the vassals, or tenants of the same lord, who were obliged to serve, and attend him in his courts.

They were called *peers*, *pares*, because equal in function; and *peers in fiefs*, or *fees*, because holding fees of the lord, or because their business in court was to sit and judge under their lord of disputes arising on fees.

The number of *peers* required to sit in court, was at least four; and when there happened to be too many *peers* in the same lordship, the lord usually chose out twelve who had the title of *peers* by way of distinction and eminence. See VASSAL.

There are also instances of women who have assisted at judgments, on account of their tenements, not of their being wives of *peers*. The origin of these *peers* of fees is as ancient as that of the fees they were appointed to judge of; from these we derive our common juries, and our peers of the realm. See *PAR regni*, *JURY*, and *PEER of the realm*.

**PEER of the Realm**, denotes a noble lord, or person who has a seat, and vote in the upper-house of parliament; hence called the *house of peers*. See NOBLE, &c.

The house of lords have a right to take cognizance, originally, of all public accounts; and to enquire into any misapplication, or default in the distribution of public monies, or of any other mismanagement whatsoever. *Vide* Life of qu. Ann. p. 85.

There are five degrees of peerage, or nobility, *viz.* that of a duke, marquis, earl, viscount, and baron. See each under its proper article DUKE, MARQUESS, EARL, &c.

It is the king confers the *peerage*, by honouring the person with some of those titles by patent. See NOBILITY, BARON, &c.

**PEERS**, *PAIRS of France*, are the 12 grand lords of that kingdom, the institution of these *peers* is very uncertain; some refer it to Hugh Capet, at the time when the dukes and counts changed the offices they then held of the king into perpetual fiefs. But this is impossible; Champagne not being then erected into a county. Indeed Pasquier observes, that it is an old tradition there have been 12 *peers* in all ages.

Of these *peers*, six are dukes, and six counts, *comites*; of these again, six are ecclesiasticks, and six lay-men. The archbishops of Rheims, bishops of Laon, and Langres are dukes and *peers*: the bishops of Noyons, Chalon on the Marne, and Beauvais, are counts and *peers*.

The dukes of Burgundy, Normandy, and Aquitain were lay *peers* and dukes; and the counts of Flanders, Champagne, and Tholouse, lay *peers*, and counts.

These lay *peers* still assist at the coronation of the kings in ceremony, and by way of representatives; where each performs the functions attached to his respective dignity: though their peerships be in reality all, except Flanders, reunited to the crown. Six lords of the first quality are chose to represent them.—The ecclesiastical *peers* usually assist in person.

At present, the title *peer*, in France, is bestowed, as in England, on every lord or person, whose fee is erected into a lordship or peership.

The word *peer*, according to Pasquier, is derived from patricius, the first dignity in the eastern empire, on the model whereof he supposes these *peers* to have been instituted. But others with more probability derive the title from the *pares curiæ*, or of fees, because of their being equal to each other.

These *pares curiæ*, on whose model they suppose the peers of Realms to have been erected, were a kind of vassals depending all on the same lord, whom they obliged to attend and assist in court.

All feudal matters or disputes among vassals relating to their fees or dependences, were terminated by the superior lord of the two contending parties, and by their *peers* in fee.

If the process were between the lord and the vassal, the lord took no cognizance of it, and the *peers* alone judged it.

Hence all lords or nobles being *pares nobilitate*, *i. e.* all equally entitled to the privileges of nobility, are denominated *pares regni*, *peers* of the realm.

Some authors attribute the first institution of *peers* of the realm to Charlemagne; but with little probability, since most of the fiefs, which bear the names of duchies, &c. or give titles to the *peers*, were not erected into duchies, &c. till long after.

The *dukes*, &c. in those days being no more than simple governors of provinces, without any other title or privileges. See DUKE.

The more probable opinion is, that *peers* were first instituted by Philip the young, of France, about the year 1179; and that they first acted in capacity of *peers* at the coronation of his son.

**PEER**, or *PIER*\*, in building, denotes a massive of stone, &c. opposed, by way of fortress, against the force of the sea, or a great river, for the security of ships that lie at harbour in any haven. See PORT, &c.

\* The word, in this sense, is formed from the French, *pierre*, stone. See PIEDROIT. Such

# P E G

Such is the *peer* of Dover described by Camden, *Brit.* The haven and *peer* of great Yarmouth, mentioned 22 Car. II.

PEERS are also used, in architecture, for a kind of pilasters or buttresses, raised for support, strength, and something for ornament. See *PIEDROIT* and *PARASTATA*.

PEERAGE, the dignity of a *peer* attached to a duchy, earldom, barony, or the like. See *PEER*.

The Kings of England and France confer *peerage* at pleasure. His late majesty of England offered his parliament to resign that branch of his prerogative, and to have the number of *peers* limited.

The reason insisted on, was the inconvenience accruing to the state from an arbitrary and immoderate use thereof, the prince having it hereby in his power to throw what number of his creatures he pleases into the upper-house of parliament.

The twelve *peers* created at once in the late reign, was a main argument in behalf of the *peerage* bill. — It is recorded as a saying of King Charles, that if his friends could but secure him a house of commons, he would put his whole troop of guards into the upper house, but he would have the *peers*.

To hold land in *PEERAGE*, in the ancient customs, was a tenure which obliged the person to assist the lord's bailiff in his judgments; as all the ancient vassals, called *peers*, did. See *PEER* and *VASSAL*. See also *TENURE*.

PEGASUS, among the poets, a horse imagined to have wings; being that whereon Bellerophon was fabled to be mounted when he engaged the Chimæra. See *CHIMERA*.

The opening of the fountain Hippocrene, on mount Helicon, is ascribed to a blow of *Pegasus's* hoof.—It was feigned to have flown away to heaven; where it became a constellation. Hence

PEGASUS, in astronomy, the name of a constellation of the northern hemisphere, in form of a flying horse. See *CONSTELLATION*.

The stars, in this constellation in Ptolemy's catalogue are 20, in Tycho's 19, in the Britannic catalogue 93. Whole longitudes, latitudes, magnitudes, &c. are as follow:

PEGMATES, or rather PEGMARES, in antiquity, a name given to certain gladiators, as well as artificers, among the Romans.				
The ancients sometimes exhibited shews of a sort of moving machines, called <i>pegmata</i> : these were scaffolds variously adorned, somewhat after the manner of those now raised for fire-works.				
These scaffolds being made to play, and rise aloft, either threw up into the air the matters wherewith they were charged; and, among the rest, men, who were thus sacrificed to afford the people diversion; or they precipitated them into holes dug in the ground, where they lighted their funeral piles; or into the dens of wild beasts.				
Now both the miserable people thus sacrificed, and the workmen that made and played the machines, were called <i>pegmates</i> , or <i>pegmares</i> .				
According to Casaubon, fire was set to the scaffold; and the <i>pegmates</i> were to save themselves through the flames, and the wreck of the machine.				
Lipius only says, that the <i>pegmates</i> were such gladiators as fought on scaffolds erected for that purpose. — They were also called <i>petauristæ</i> , q. d. flyers in the air. See <i>GLADIATOR</i> .				
PELAGIÆ *, in natural history, a term used to express such sea-shells and fishes as never, or very rarely, are found near the shoars;				

moars; but always reside in the deep, or in those parts of the bottom of the sea which are most remote from land. See SHELL.

\* The word is formed from the Greek *πῆλαγος*, marine, belonging to the sea.

**PELAGIANS**, **PELAGIANI**, ancient hereticks, well known in the church by the writings of St. Augustin. See HERETIC. The author of this sect, *Pelagius*, properly called *Morgan*, was a monk of Bangor; but the learned are at a loss whether it was the monastery of Bangor in Wales, or that of the same name and order in Ireland. But he was cotemporary with St. Jerom and St. Augustin, and quitted his country to go and live in the east, according to the custom of the monks of those days, who were not attached to particular houses like those of our time. Pelagius absolutely denied all original sin, which he held to be the mere invention of St. Augustin, and taught that men are entire masters of their actions, perfectly free creatures; in opposition to all predestination, reprobation, election, &c. See ORIGINAL SIN, PREDESTINATION, and SEMI-PELAGIANS. He owned indeed, that the natural power of man needed to be assisted by the grace of God, to enable him to work out his own salvation; but, by this grace, he only meant outward assistance, viz. the doctrines of the law and of the gospel. See GRACE.

Though when pressed by those words of St. Paul, *deus est enim, qui operatur in nobis*, &c. he owned, that it is God, in effect, that makes us will what is good, when he warns and excites us by the greatness of the glory we are to obtain, and by the promises of rewards, when he makes us love him by revealing his wisdom, &c.

These are Pelagius's own words, as cited by St. Augustin, who confutes him; and shews, that, besides these exterior graces, there are required other real and interior ones.

Pelagius owned further, that the will of man is indeed aided by a real grace; but added, that this grace is not absolutely necessary in order to live well, but only helps us to do well with the more ease.

Julian, one of his adherents, went further yet, and owned, that the assistance of grace was absolutely necessary to enable us to do perfect works.

In effect, the grand doctrine of the *Pelagians* was, that a man might accomplish all the commands of God by the mere power of nature; and that the gifts of grace were only necessary to enable him to act more easily and more perfectly.

**PELLECAN**. See the article **PELLICAN**.

**PELECOID angle**. See the article **ANGLE**.

**PELECOIDES\***, in geometry, a figure in form of a hatchet.

\* Whence its name from the Greek *πῆλκος*, hatchet, and *ειδος*, form. Such is the figure *BCDA*, *Tab. Geometry, fig. 45.* contained under the two inverted quadrantal arcs *AB* and *AD*, and the semi-circle *BCD*.

The area of the *pelecoides* is demonstrated to be equal to the square *AC*; and that, again, to the rectangle *EB*. — It is equal to the square *AC*, because it wants of the square on the left hand the two segments *AB* and *AC*, which are equal to the two segments *BC* and *CD*, by which it exceeds on the right hand.

**PELLETS**, in heraldry, a name given those roundlets which are black. — Called also *ogresses* and *gun stones*.

**PELLICAN**, or **PELLECAN**, among chymists, a kind of double vessel, ordinarily of glass; used in distilling liquors by circulation. See **DOUBLE VESSEL** and **CIRCULATION**.

**PELLICAN** also denotes an instrument used by surgeons, &c. to draw teeth.

**PELLICAN**, again, is the name of an ancient piece of ordnance, carrying a ball of six pounds; by the French made eight feet and half, and by the Dutch nine feet long. See **CANNON**, **ORDNANCE**, **GUN**, &c.

**PELLICLE**, **PELLICULA\***, a thin film, or fragment of a membrane or skin. See **MEMBRANE**.

\* The word is a diminutive of *pellis*, skin.

The epiderma, or cuticula, is a little *pellicle* covering the *derma*, *cutis*, or skin. See **CUTICLE**.

The valves of the veins and arteries are insensible *pellicles*, which open and shut to promote the circulation. See **VALVE**.

When any chymical solution is evaporated in a gentle heat 'till a thin skin or film arises atop, it is called an evaporation to a *pellicle*, wherein there is but just liquor enough left to keep the salts in fusion. See **EVAPORATION**.

**PELLS**, *Clerk of the Pells*. See **CLERK of the pells**.

*Comptrollers of the Pells*. See **COMPTROLLER**.

**PELLUCID\***, a term of the same import with diaphanous, or transparent. See **TRANSPARENT**, &c.

\* The word is formed of the Latin *pelluceo*, or *perluceo*, I shine through.

*Pellucid* hands opposed to opaque. See **OPAQUE**.

**PELLUCIDITY**, diaphaneity, or transparency. See **TRANSPARENCY**, &c.

**PELTA**, **HEATH**, in antiquity, a kind of buckler, used among the ancients. See **BUCKLER**.

The *pelta* was small, light, and more manageable than the *parma*. See **PARMA**.

It appears from Virgil, and other authors, that the *pelta* was the buckler used by the Amazons; and Xenophon observes, that the *pelta* of the Amazons was shaped like a leaf of ivy. See **AMAZON**. — Pliny, speaking of the Indian fig-tree, says, its leaves are the width of the Amazonian *pelta*. — Servius, on the *Æneid*, says, the *pelta* resembled the moon in her first quarter.

**PELVIS**, in anatomy, the lower part of the cavity of the abdomen; thus called from its resemblance to a balon, or ewer, called in Latin, *pelvis*. See **ABDOMEN**.

The *pelvis* is always much larger in women than in men, to give room for the growth, &c. of the fœtus. See **MATRIX**. It is well fortified with bones, to screen the contents from external injuries. — The *ossa ileum*, *coxendicis*, *pubis*, and *sacrum*, comprehend or environ the *pelvis*.

**PELVIS of the kidneys** is a large membranous sinus, or cell in the concave part of the kidneys. — See *Tab. Anat. (Splanchn.) fig. 4. litt. e. dd. &c.* See also **KIDNEY**.

From the twelve *papillæ* of the kidneys arise twelve canals, called *fistulæ membranaceæ*. These at length are collected into three large branches, which, being at last united into one, form the *pelvis*; and this again, contracting itself, terminates in a membranaceous pipe, called the *ureter*. See **PAPILLÆ** and **URETER**.

The urine, then separated from the blood by the urinary pipes, conveyed to them by the *papillæ*, and taken up by the *fistulæ membranaceæ*, is brought into the *pelvis*, and thence discharged into the ureters, thence into the bladder, &c. See **URINE**.

**PEN** according to Camden, originally signifies a high mountain, which was thus called among the ancient Britains, and even Gauls. — And hence that tall range, which parts Italy and France, is called *Apennines*. See **MOUNTAIN**.

**PEN** is also a little instrument, usually formed of a quill, and serving to write withal. See **WRITING**.

**Dutch PENS** are those made of quills, which have been passed through hot ashes, to take off the grosser fat and moisture thereof. See **QUILL**.

**Fountain PEN**. See the article **FOUNTAIN pen**.

**PEN stock**, a sort of sluice or flood-gate placed in the water of a mill-pond, or the like, to retain or let it go at pleasure. See **SLUICE**.

**PENAL action**. See the article **ACTION**.

**PENALTIES negative**. See the article **NEGATIVE**.

**PENANCE**, **POENITENTIA**, is properly the exercise of *penitence*; and may be defined a punishment, either voluntary, or imposed by legal authority, for the faults a person has committed. See **PUNISHMENT**.

The Romanists define *penance* a sacrament, wherein a person who has the requisite dispositions, receives absolution, at the hands of the priest, of all sins committed since baptism. See **SACRAMENT**.

To a legitimate *penance* they require three things, contrition, absolution, and satisfaction. See **CONTRITION**, **ABSOLUTION**, &c. Their priests receive a power of administering the sacrament of *penance*, when they receive the priesthood; but to exercise this power, it is required they have the jurisdiction of an ordinary, i. e. that they have a benefice, either original or delegated, with the approbation of the bishop to hear confessions.

**PENANCE** is particularly used, in the Romish church, for the penalty which a confessor imposes, for satisfaction of the sins whereof a person is absolved. See **CONFESSION** and **ABSOLUTION**.

The ancient discipline, Du Pin observes, was very severe on the head of *penance*; for great crimes people were excluded the communion of the church, expelled the assemblies of the faithful, obliged to fast, and to mortify themselves publicly, even at the church door, cut their hair, go always on foot, &c.

He adds, that those who had done public *penance*, were never admitted into the clergy; and that public *penance* was never granted more than once. Those who fell a second time were never to be reconciled to the church, and were to look for pardon only at the hands of God.

**PENANCE**, in our canon-law, is an ecclesiastical punishment, chiefly adjudged to the sin of fornication. See **FORNICATION**.

The punishment is thus prescribed by the canons: the delinquent to stand in the church-porch on some Sunday bare-head and bare-foot, in a white sheet, with a white wand in his hand; here bewailing himself, and begging every one to pray for him. Then to enter the church, falling down, and kissing the ground, and, at last, placed on an eminence in the middle of the church, against the minister, to declare the foulness of his crime, odious to God, and scandalous to the congregation.

If the crime be not notorious, the canons allow the punishment to be commuted, at the party's request, for a pecuniary mulct, for the benefit of the poor, &c.

**PENATES**, in the ancient mythology, a term applied to all the domestic gods, whom the ancients adored in their houses; whence they are ordinarily confounded with the *lares*. See **LAES**.

Authors are not at all agreed about the origin of the *dii penates*, who were properly the tutelary gods of the Trojans, and were only adopted by the Romans, who gave them the title of *penates*.

De Meziriac, in his notes on Dido's epistle to Æneas, relates at large what he has met withal in the ancient writers on this subject: Dionysius Halicarnassæus tells us that Æneas first lodged these gods in the city Lavinium; and that his son Ascanius, afterwards, upon building the city Alba, translated them thither; but that they returned twice miraculously to Lavinium. The same author adds, that in Rome is still seen a dark temple, shaded by the adjacent buildings, wherein are the images of the Trojan gods, with the inscription *Denas*, which signifies *penates*. See *DENATES*.

These images represent two young men sitting, each of which holds a lance. I have seen, adds Dionysius, several other statues of the same gods in ancient temples; who all appear like young men dressed in a habit of war.

Varro fetches these *penates* from Samothrace to Phrygia, to be afterwards transported by Æneas into Italy.—Macrobius, who relates this from Varro, adds, that they were called *penates* from the Latin words *per quos penitus spiramus*, which seems a mere subtilty. But the real etymology must be sought in the Phrygian, not the Latin tongue.

Cicero, in Aulus Gellius, derives the name hence, *quod penes nos nati sunt*. Yet in his book *de Nat. Deor.* he says, it is formed from *penus*, provision; or, perhaps, adds he, *quod penitus insident*; others say, *quia coluntur in penetralibus*.

Rosinus distinguishes among the *penates*: he makes an order of *penates* of the heavens, such as Pallas in the ethereal region, Jupiter in the middle region, and Juno in the lowest; besides *penates* of cities, *penates* of private families, &c.—On which footing the *dii penates* were the guardian or tutelary gods of every thing. See *TUTELARY*.

It is a popular question among the learned, who were the *penates*, of Rome? some say Vesta, others Neptune and Apollo; Vives says Castor and Pollux, with whom agrees Vossius, who adds that the reason of their chusing Castor and Pollux in quality of *penates*, might be the important service they did the Romans in the war against the Latins.

Nor are authors more unanimous on the subject of the *penates*, which Æneas brought into Italy. Some say they were Neptune and Apollo, who built the walls of Troy; others Jupiter, Juno, and Minerva; others Cœlus and Terra.

**PENCE**, *Peter-PENCE*. See the article *PETER-pence*.

**Pitching-PENCE**. See the article *PITCHING-pence*.

**PENCIL\***, an instrument used by painters, for the application of their colours. See *COLOUR* and *PAINTING*.

\* The word comes from the Latin, *peniculus*, *penicillus*, or *penicillum*, which signify the same, formed by diminution of *penis*, tail.

There are *pencils* of various kinds, and made of various matters; the most usual are of badgers and squirrels hair, those of swans down, and those of boars bristles; which last are bound on a stick bigger, or less, according to the uses they are destined for; and when large, are called *brushes*.—The others are inclosed in the barrel of a quill.

The ancients, M. Felibien observes, had *pencils* made of little pieces of sponge; whence, doubtless, the story of the painter, who, not able to express the foam of a dog, succeeded by throwing his sponge at the picture.

**PENCIL case**. See the article *PORT craion*.

**PENCIL of rays**, in opticks, is a double cone, or pyramid of rays, joined together at the base; one of which hath its vertex in some point of the object, and has the crystallin humour, or the glass *GLS* (*Tab. Opticks*, fig. 39.) for its base; and the other has its base on the same glass, or crystallin, but its vertex in the point of convergence; as at C. See *RAY*, &c.

Thus *BGSC* is a *pencil* of rays; and the line *BLC* is called the *axis of that pencil*. See *AXIS* and *RAY*.

**Optic PENCIL**. See the article *OPTIC*.

**PENDANT**, *Ear-ring*, an ornament, of some precious matter wore by the ladies; hung by a hole made for that purpose through the ear; and frequently enriched with diamonds, pearls, and other precious stones. See *DIAMOND*, *PEARL*, &c.

The *pendants* of the European ladies are nothing in comparison with those wore by the East-Indians, both men and women; among whom it is the fashion to lengthen out the ears, and to enlarge the hole, by putting in *pendants* of the size of saucers set with stones.

The queen of Calicut, Pyrard tells us, and other ladies of her court, have their ears, by this means, weighed down as low as their breasts, and even lower; imagining this a main point of beauty; and the holes large enough to pass the fist through.

The Moncois, who are the common people, are not allowed to wear their ears so long as the Naires, who are the nobility, three fingers length are the utmost stretch allowed the former.

In the West-Indies, Columbus named a certain coast Oreja, by reason he found people with holes in their ears big enough to pass an egg through. See *EAR*.

They make holes too in their lips and nostrils, and hang *pendants* at them; which is also practised by the Mexicans and other nations. See *NOSE*.

**PENDANT**, in heraldry, a term applied to the parts hanging down

from the label, to the number of three, four, five, or six at most. See *LABEL*.—These must be specified in blazoning, when there are more than three.—They resemble the drops at the bottom of the triglyphs in the doric freeze. See *LABEL*, *DROP*, &c.

**PENDANT barometer**. See the article *BAROMETER*.

**PENDANT feathers**, in falconry, are those feathers, which grow behind the thighs of an hawk. See *FEATHER*.

**PENDANTS**, among florists, a kind of seeds, growing on stamina, or chives. Such are those in the middle of tulips, lillies, &c. See *APICES*, *STAMINA*, &c.

**PENDANTS of a ship**, are those long colours, or streamers, cut pointing out towards the end, and there divided into two parts; hung out at the heads of masts, or at the yard-arm ends. See *COLOUR* and *FLAG*.

The *pendants* are chiefly used for shew, though sometimes for distinction of squadrons.—See *Tab. Ship*, fig. 1. n. 80.

**PENDANT**, or **PENNANT**, is also used for a short rope, which at one end is fastened to the head of the mast, or to the yard, or the clew of the sail, and at the other end, hath a block and shiver, to reeve some running rope into.

The *pendant* of the tackle is made fast to the head of the mast; and the *pendants* of the back-stays are fastned to, and hang down on the inside of the shrouds.—All the yard-arms, except the mizen, have of these *pendants*, into which the braces are reeved.

**PENDENTIVE**, in architecture, the whole body of a vault, suspended out of the perpendicular of the walls, and bearing against the arc-boutants. See *VAULT*.

Daviler defines it, a portion of a vault between the arches of a dome, usually enriched with sculpture: Felibien, the plane of the vault, contained between the double arches, the forming arches, and the ogives. See *OGIVE*.

The *pendentives* are usually of brick, or soft stone; but care must be taken that the joints of the masonry be always laid level, and in right lines proceeding from the sweep whence the rise is taken.

The joints too must be made as small as possible, to save the necessity of filling them up with slips of wood, or of using much mortar.

**PENDULOUS**, *hanging down*; a name which botanists give to those heads of flowers which hang downwards; the stalk not being able to sustain them upright. See *FLOWER*.

**PENDULUM**, in mechanicks, any heavy body so suspended as that it may vibrate, or swing backwards and forwards, about some fixed point, by the force of gravity. See *VIBRATION*.

The vibrations, or alternate ascent and descent, of the *pendulum* are called its *oscillations*. See *OSCILLATION*.—The point on which it vibrates, is called the *centre of suspension or motion*. See *CENTRE* and *SUSPENSION*.—And a right line passing through the centre, parallel to the apparent horizon, is called the *axis of oscillation*. See *AXIS*.

The vibrations of a *pendulum* are all isochronal, or effected in spaces of time perfectly equal. See *ISOCHRONAL*.

And hence the *pendulum* becomes the most accurate chronometer, or instrument for measuring time, in the world. See *TIME* and *CHRONOMETER*.

And hence also its vibrations are proposed as an invariable and universal measure of lengths for the most distant countries and ages. See *MEASURE*.

For, a vibration being once found, precisely equal to a second of time of the sun's mean motion; if, *v. gr.* the horary foot (as M. Huygens calls the third part of his second *pendulum*) compared to the English standard foot, be as 392 to 360; it will be easy, by calculation, to reduce all the other measures of the world to these feet; the lengths of *pendulums*, reckoned from the point of suspension, to the centre of the ball, being to each other, as the squares of the times wherein the several oscillations are performed; and therefore reciprocally as the squares of the numbers of oscillations performed in the same time.—On this same principle M. Mouton, canon of Lyons, has a pretty treatise, *De mensura posteris transmittenda*.

M. Huygens lays down the length of a *pendulum* that shall swing seconds, to be three feet, three inches, and two tenths of an inch; according to Sir J. Moor's reduction; which agrees perfectly with M. Mouton's *pendulum* eight inches one tenth long, to vibrate one hundred and thirty two times in a minute: so that this may be relied on as a sure measure.—Note, the lengths of *pendulums* are usually measured from the centre of motion. The first who observed this noble property, the isochronism of *pendulums*, and made use thereof in measuring time, Sturmius tells us, was Ricciolus; after him Tycho, Langrenus, Wendeline, Merfenne, Kircher, and others hit on the same thing; though without any intimation of what Ricciolus had done.—Huygens first applied the *pendulum* to clocks. See *pendulum CLOCK*.

*Pendulums* are either *simple* or *compound*.

**Simple PENDULUM**, is that consisting of a single weight, as A, considered as a point, and an inflexible right line, as AC, considered as void of gravity, suspended on a centre C, and voluble about it. (*Tab. Mechanicks*, fig. 36.)

**Compound PENDULUM**, is that which consists of several weights,

so fixed as to retain the same distance both from one another, and from the centre about which they vibrate. See COM-  
POUND.

*Doctrine and laws of PENDULUMS.*—1° A *pendulum* raised to B, through the arch of the circle BA; will fall, and again rise, through an equal arch, to a point equally high, D; and thence fall to A, and again rise to B; and thus continue rising and falling reciprocally, for ever.

For suppose HI a horizontal line, and BD parallel thereto; if the ball A, which we here consider as a point, be raised to B; the line of direction BH, being perpendicular from the centre of gravity B to the horizontal line HI, falls without-side the base, which is in the point C.—The ball therefore cannot rest, but must descend. See DESCENT.

But being retained by the thread BC, from falling perpendicularly through BH; it will fall through the Arch BA. Consequently, when the centre of gravity arrives at the bottom, A has the same force it would have acquired in falling from K; and will therefore be able to rise equally high as if it had, *i. e.* in descending through the first half of its vibration, it acquires a velocity by the continual acceleration of its fall: and as this velocity is always proportionable to the height whence it falls, as being in some measure the effect thereof; it is still able to make it remount to the same height, supposing, according to the system of Galileo, that the velocities are always the square roots of the heights. See ACCELERATION.

Since then the thread prevents the *pendulum* going off in the tangent AI, it must ascend through the arch AD, equal to that AB.

All the force therefore which it had acquired by falling, being exhausted; it will return by the force of gravity through the same arch AD, and again rise from A to B; and thus for ever. See GRAVITY.

Experience confirms this theorem, in any finite number of oscillations; but if they be supposed infinitely continued, there will arise a difference. For the resistance of the air, and the friction about the centre C, will take off part of the force acquired in falling; whence it will not rise precisely to the same point whence it fell.

Thus, the ascent continually diminishing, the oscillation will be at last stopped, and the *pendulum* hang at rest. See RESISTANCE and FRICTION.

2° If the *simple pendulum* be suspended between two semi-cycloids CB and CD (*Tab. Mechanicks, fig. 37.*) whose generating circles have their diameter CF equal to half the length of the thread CA; so as the thread in oscillating be wound about them; all the oscillations, however unequal in space, will be isochronal, or performed in equal times; even in a resisting medium.

For since the thread of the *pendulum* CE, is wound about the semi-cycloid BC; the centre of gravity of the ball E, which is here considered as a point, by its evolution, will describe a cycloid BEAD; as is shewn from the doctrine of infinites; but all ascents and descents in a cycloid are isochronal, or equal in time: therefore the oscillations of the *pendulum* are also equal in time. See CYCLOID.

Hence, if with the length of the *pendulum* CA, a circle be described from the centre C; since a portion of the cycloid near the vertex A, is almost described by the same motion; a small arch of the circle will almost coincide with the cycloid.

In little arches of a circle, therefore, the oscillations of *pendulums* will be isochronal as to sense, however unequal in themselves; and their ratio to the time of perpendicular descent through half the length of the *pendulum*, is the same with that of the circumference of a circle to its diameter.

Hence, also, the longer the *pendulums* are, that oscillate in arches of a circle; the more oscillations are isochronal; which agrees with experiment: for in two *pendulums* of equal lengths, but oscillating in unequal arches, provided neither arch be very great, you will scarce discern any inequality in an hundred oscillations.

Hence, also, we have a method of determining the space which a heavy body, falling perpendicularly, passes over in a given time. For the ratio which the time of one oscillation has to the time of the fall through half the length of the *pendulum*, being thus had; and the time of the several vibrations of any given *pendulum* being found; we have the time of the fall through half the length of the *pendulum*, and hence may collect the space it will pass over in any other time.

The whole doctrine of *pendulums* oscillating between two semi-cycloids, both theory and practice, we owe to the great Huygens; who first published the same in his *Horologium Oscillatorium, sive demonstrationes de motu pendulorum, &c.*

3° The action of gravity is less in those parts of the earth where the oscillations of the same *pendulum* are slower, and greater where they are swifter.

For the time of oscillation in the cycloid, is to the time of perpendicular descent through the diameter of the generating circle, as the periphery of the circle to the diameter.

If then the oscillations of the same *pendulum* be slower, the perpendicular descent of heavy bodies is likewise slower, *i. e.* the motion is less accelerated, or the force of gravity is less; and conversely. See GRAVITY.

Hence, as it is found by experiment, that the oscillations of the same *pendulum* are slower near the equator, than in places less remote from the pole; the force of gravity is less towards the equator than towards the poles. And consequently the figure of the earth is not a just sphere, but a spheroid. See EARTH and SPHEROID.

This M. Richer found by an experiment made in the island Cayenna, about four degrees from the equator; where a *pendulum* 3 foot, 8 lines  $\frac{2}{3}$  long, which at Paris vibrates seconds, was to be shortened a line and a quarter to reduce its vibrations to seconds.

M. des Hayes, in a voyage to America, confirms the observation of Richer; but adds, that the diminution, established by that author, appears too little.

M. Couplet the younger, upon his return from a voyage to Brasil and Portugal, falls in with M. des Hayes, as to the necessity of shortening the *pendulum* towards the equator more than Richer has done. He observed, that even at Lisbon the *pendulum* which swings seconds, must be two lines  $\frac{1}{2}$  shorter than that of Paris, which is shorter than that of Cayenna, as fixed by Richer; though Cayenna be in 24 degrees less latitude than Lisbon.

The truth is, this diminution does not proceed regularly: Mess. Picart and De la Hire found the length of the *pendulum*, which beats seconds, exactly the same at Bayonne, at Paris, and at Uranibourgh in Denmark, though the first be in  $43^{\circ} \frac{1}{2}$  of latitude, and the last in the latitude  $55^{\circ} 3'$ .

Hence M. de la Hire takes occasion to suspect, that the diminution is only apparent; and that, *e. gr.* the iron yard, wherewith M. Richer measured his *pendulum*, might be lengthened by the great heats of the isle of Cayenna; not the *pendulum* shortened by the approach towards the line.

To confirm this, he tells us he found, by very careful experiments, that an iron bar, which, exposed to the frost, was 6 foot long, was lengthened  $\frac{2}{3}$  of a line by the summer's sun. See DILATATION, HEAT, THERMOMETER, &c.

4° If two *pendulums* vibrate in similar arches, the times of the oscillations are in the subduplicate ratio of their lengths.

Hence the lengths of *pendulums* vibrating in similar arches, are in a duplicate ratio of the times wherein the oscillations are performed.

5° The numbers of isochronal oscillations performed in the same time by two *pendulums*, are reciprocally as the times wherein the several oscillations are performed.

Hence the lengths of *pendulums*, vibrating in similar and small arches, are in the duplicate ratio of the numbers of oscillations performed in the same time, but reciprocally taken.

6° The lengths of *pendulums*, suspended between cycloids, are in a duplicate ratio of the times wherein the several oscillations are performed.

And hence they are in a duplicate ratio of the numbers of oscillations performed in the same time, but reciprocally taken: and the times of oscillations in different cycloids are in a subduplicate ratio of the lengths of the *pendulums*.

7° To find the length of a *pendulum*, which shall make any assigned number of vibrations in any given time.

Let the number of vibrations required be 50 in a minute, and the length of the string, counted from the point of suspension to the centre of oscillation, or round ball at the end of it, be required: it is a fixed rule that the lengths of *pendulums* are to each other, as the squares of the vibrations and contrarywise: now it is agreed that a *pendulum* vibrating seconds (or 60 times in a minute) is 39 inches, and  $\frac{2}{5}$  of an inch; say therefore as the square of 50 (which is 2500) to the square of 60, (which is 3600) so is 39, 2, to the length of the *pendulum* required: which will be found 56 inches  $\frac{4}{5}$ .

Note, In practice, since the product of the mean time will always be 1411200 (that is the product of the square of 60, multiplied by 39, 2.) that is  $3600 \div 39, 2$ . you need only divide that number by the square of the number of vibrations assigned; and the quotient will give the length of a *pendulum*, which shall vibrate just so many times in a minute.

8° The length of a *pendulum* being known, to find the number of vibrations it will make in a given time.

This being the reverse of the former; say, as the length given, suppose, 56, 4, is to the length of the standard *pendulum* swinging seconds, *viz.* 39, 2; so is the square of the vibrations of the standard *pendulum* in the given time, *v. gr.* a minute, to the square of the vibrations sought: that is, as 56, 4: 32, 2:: 3600: 2500.—And the square root of 2500 will be 50, the number of vibrations sought.

But for use, here, (as in the former problem) you need only divide 1411200 by the length; and it gives the square of the vibrations; as there you divided by the square of the vibrations to find the length.

On these principles, Mr. Derham has constructed a table of the vibrations

# P E N

vibrations of *pendulums* of different lengths in the space of a minute.

Pend. length in inches.	Vibrat. in a Minute.	Pend. length in inches.	Vibrat. in a Minute.
1	375.7	30	68.6
2	265.6		
3	216.9	39.2	68.0
4	187.8		
5	168.0	40	59.5
6	153.3	50	53.1
7	142.0	60	48.5
8	132.8	70	44.9
9	125.2	80	42.0
10	118.8	90	39.6
20	84.0	100	37.5

Note, These laws, &c. of the motion of *pendulums*, will scarce hold strictly, unless the thread, that sustains the ball, be void of weight, and the gravity of the whole weight be collected in a point.

In practice, therefore, a very fine thread, and a small ball, but of a very heavy matter, are to be used. A thick thread, and a bulky ball disturb the motion strangely; for, in that Case, the *pendulum*, of simple, becomes compound; it being much the same as if several weights were applied to the same inflexible rod in several places.

The use of *pendulums*, in measuring time in astronomical observations, and on other occasions where a great degree of preciseness is required, is too obvious to need a description. Either the length of the *pendulum* may be adjusted before its application, and made to vibrate the desired time, *v. gr.* seconds, half seconds, &c. by article VI, or it may be taken at random, and the times of the vibrations afterwards determined from article VIII.

For the use of the *pendulum* in measuring remote, inaccessible distances, &c. by means of sound, &c. See SOUND.

**PENDULUM clock**, a clock which derives its motion from the vibration of a *pendulum*.

It is controverted between Galileo and Huygens, which of the two first applied the *pendulum* to a clock. For the pretensions of each, see CLOCK.

After Huygens had discovered, that the vibrations made in arches of a cycloid, however unequal they were in extent, were all equal in time; he soon perceived, that a *pendulum* applied to a clock, so as to make it describe arches of a cycloid, would rectify the otherwise unavoidable irregularities of the motion of the clock; since, though the several causes of those irregularities should occasion the *pendulum* to make greater or less vibrations; yet, in virtue of the cycloid, it would still make them perfectly equal, and the motion of the clock, governed thereby, would be preserved perfectly equable. See CYCLOID.

But the difficulty was, to make the *pendulum* describe arches of a cycloid; for, naturally, the *pendulum* being tied to a fixed point, can only describe arches of circles about the same.

Here M. Huygens hit on a secret which all the world is now the better for; the iron rod or wiew, which bears the bob or bottom, he tied atop to a filken thread, placed between two cycloidal cheeks, or two little arches of a cycloid, made of metal. Hence the motion of vibration, applying incessantly from one to the other of those arches, the thread, which is extremely flexible, easily assumes the figure thereof; and by means hereof it is demonstrated, that the weight, suspended at the other end of the rod, will describe a just arch of a cycloid.

This is doubtless one of the most useful and ingenious inventions many ages have produced; by means whereof we have clocks which will not err a single second in several days.

It is true, the *pendulum* is liable to its irregularities, how minute soever they may be; and M. De la Hire thinks there is still room to improve it.

The silk thread by which it is suspended, he observes, shortens in moist weather, and lengthens in dry; by which means the length of the whole *pendulum*, and consequently the times of the vibrations are varied.

To obviate this inconvenience, M. de la Hire, in lieu of a silk thread, used a little fine spring; which was not indeed subject to shorten and lengthen; but which he found grew stiffer in cold weather, and made its vibrations faster than in warm.

He had therefore recourse to a stiff wire or rod, firm from one end to the other. Indeed by this means he renounced the advantages of the cycloid; but he found, as he says, by experience, that the vibrations in arches of circles are performed in times as equal, provided they be not of too great extent, as those in cycloids. But the experiments of Sir J. Moor, and others, have demonstrated the contrary.

The ordinary causes of the irregularities of *pendulums*, Mr. Derham ascribes to the alterations in the gravity and temperature of the air; which increase and diminish the weight of the ball, and by that means make the vibrations greater and less; an ac-

# P E N

cession of weight in the ball being found by experiment to accelerate the motion of the *pendulum*.

A weight of six pound added to the ball, Mr. Derham found, made his clock gain 13 seconds every day.

A general remedy against the inconveniences of *pendulums*, is to make them long, the bob heavy, and to vibrate but a little way; this is the usual means in England, the cycloidal cheeks being generally overlooked.

To correct the motion of **PENDULUM clocks**, the usual method is to screw and let down the ball; but a very small alteration here having a very great effect, Mr. Derham prefers Huygens's method, which is to have a small weight or bob to slide up and down the rod above the ball, which is to be immovable: though he improves on the method, and recommends having the ball to screw up and down, to bring the *pendulum* near its gage; and the little bob to serve for the nicer corrections, as the alteration of a second, &c.

Mr. Huygens orders the weight of this little corrector to be equal to that of the wiew, or 50' of that of the great ball: he adds a table of the alterations, the several shiftings thereof will occasion in the motion of the *pendulum*; wherein it is observable, that a small alteration towards the lower end of the *pendulum*, makes as great an alteration in time, as a greater rising or falling does when higher.

**PENDULUM Royal**, a name given among us to a clock, whose *pendulum* swings seconds, and goes eight days: shewing the hour, minute, and second. See CLOCK.

The numbers of such a piece are thus calculated; first cast up the seconds in twelve hours, and you will find them to be  $43200 = 12 \times 60 \times 60$ . The swing wheel must be 30 to swing 60 seconds in one of its revolutions: now let  $\frac{1}{2} 43200 = 21600$ , be divided by 30, and you will have 720 in the quotient, which must be broken into quotients; the first of them must be 12 for the great wheel which moves round once

in twelve hours. 720 divided by 12, gives 60 8) 96 (12 which may also be conveniently broken into two 8) 64 (8 quotients, as 10 and 6, or 5 and 12, or 8 and 7 $\frac{1}{2}$ ; 8) 60 (7 $\frac{1}{2}$  which last is most convenient: and if you take all your pinions 8, the work will stand 30 thus.

According to this computation, the great wheel will go about once in twelve hours, to shew the hour; the second wheel once in an hour, to shew the minutes; and the swing wheel once in a minute, to shew the seconds. See MOVEMENT and CLOCK-WORK.

**PENDULUM level.** } See the articles { **LEVEL.**  
**PENDULUM watch.** } **WATCH.**

**PENETRABILITY.** See the article **IMPENETRABILITY.**

**PENETRATION, PENETRATIO**, the act whereby one thing enters another, or takes up the place already possessed by another.

The school-men define *penetration*, the co-existence of two or more bodies; so as one is present, or has its extension in the same place as the other. See EXISTENCE and BODY. See also MATTER, SOLIDITY, &c.

Philosophers hold the *penetration* of bodies absurd, *i. e.* that two bodies should be, at the same time, in the same place; accordingly impenetrability is laid down as one of the essential properties of matter. See IMPENETRABILITY.

What we popularly call *penetration*, only amounts to the matter of one body's being admitted into the vacuity of another. See VACUUM, PORE, DIMENSION, &c. Such is the *penetration* of water through the substance of gold. See WATER, GOLD, &c. See also HARDNESS.

**PENICILLA\***, in pharmacy, a lozenge, or form of medicine made round by rolling. See LOZENGE.

\* It is thus called from *penicillus*, a Pencil, which it is supposed to resemble in shape.

**PENICILLUS**, among surgeons, is used for a tent, to be put in wounds or ulcers. See TENT and TURUNDA.

**PENIDIUM**, in pharmacy, *barly-sugar*; a preparation of sugar made by boiling it up with a decoction of barley, till it become brittle; which done, it is turned out upon a marble anointed with oil of sweet almonds, kneaded with the hands like paste; and, while yet hot, drawn out into sticks twisted like cords. See SUGAR.

*Penidia* are good against colds, to moderate the acrimonies of the breast, promote expectoration, &c.

Dr. Quincy used *Penidium* for a kind of clarified sugar, with a mixture of starch made up into bolus's.

**PENINSULA\***, in geography, a portion, or extent of land, joining to the continent by a narrow neck, or isthmus; the rest encompassed with water. See ISTHMUS.

\* The word is compounded of the Latin *pene* and *insula*; *q. d.* almost island, which the French, pertinently enough, render *presque isle*.

Such is Peloponnesus, or the Morea; such also are Africa, Jutland, &c.

*Peninsula* is the same with what is otherwise called *Chersonesus*. See CHERSONESUS.

**PENIS**, in anatomy, a part of the body, from its form, called also

also the *yard*; and, by way of eminence, the *member*, or *virile member*, as being one of the principal organs of generation in the male kind. — See *Tab. Anat. (Splanchn.) fig. 1. litt. z. fig. 8. litt. e. b. &c. fig. 10. litt. d. fig. 15. litt. e. e. n. n. (Angeiol.) fig. 1. n. 67.* See also GENERATION and MALE.

It is fastened to the lower part of the *os pubis*, and the upper part of the *ischion*; its body consists of the two *corpora cavernosa*, the *corpus cavernosum urethrae*, and the *urethra* itself.

The *corpora cavernosa* of the *penis* called also *corpora nervosa* & *spongiosa*, &c. have two distinct origins in the *os pubis*; whence they proceed, growing both in bulk and thickness, till they meet the *corpus cavernosum* of the *urethra*, where they join, leaving an interstice or channel for its passage along them; and thus continue their progress, connected together by a membranous body called the *septum*, and terminating at length in the glans. See CAVERNOSA corpora penis.

The *cavernous body* of the *urethra* includes the *urethra* or urinary passage. Its form, contrary to that of the other cavernous bodies, is largest at the two extremes, and smallest in the middle. That part included between the two origins of the cavernous bodies of the *penis*, Mr. Cowper calls the *bulb* of the *urethra*; its other extremity being dilated, forms the body called the *glans*. See URETHRA, GLANS, &c.

The *penis* receives arteries from the internal iliac branches, and umbilical arteries; and these at length subdividing into innumerable branches, from the capillary extremities thereof arise so many veins, in whose channels are apertures corresponding to so many cells, which, communicating with each other, empty themselves into larger venous ducts, running on the superior surface of the *penis*; some whereof join the veins of the prepuce, others make one large trunk called *vena penis*, which marching on the dorsum *penis* to the *prostate*, there divides and enters the internal iliac on either side.

The *penis* has nerves from a trunk composed of a coalescence of the third of the *os sacrum*, and a branch of the great crural; these ascending the cavernous bodies, expand themselves over the upper surface thereof, and are thence distributed to all parts of the *penis*.

It has lymphæducts very numerous on its surface under the skin, which discharge themselves into the *glandulae inguinales*. See SEED and URINE.

The *penis* has two pair of muscles, and an odd one; the odd muscle is called *accelerator urinæ*: its upper part, which covers the bulb, serves to streighten the veins passing through it from the *corpus cavernosum* of the *urethra*, and thus hinders the reflux of the blood in erection; and, by repeated contractions, drives the blood into the bulb towards the glans. Its elongation serves to compress the channel of the *urethra*, and to force out the contained seed or urine. See ACCELERATOR urinæ.

The first pair of muscles are called the *erectores penis*. By their action the *penis* is sustained, and drawn towards the pubes; and, by the assistance of the suspensory ligament of the *penis*, the *vena penis* is applied to the transverse ligament of the *ossa pubis*, and the reflux blood hindered from passing that way; whereby the *corpora cavernosa* become distended. See ERECTOR COLLATERALIS.

The last pair of muscles are the *transversales penis*, which vary in various subjects, and are sometimes wanting; their use is to dilate that part of the cavernous body of the *urethra*, to which they are fastened. See TRANSVERSALES penis.

The *penis* has also three glands, first discovered by Mr. Cowper; these all empty themselves into the *urethra*, and from the tenacity of the liquor they separate, are called the *mucous glands*. See MUCOUS glands.

The whole compages of the *penis* is invested with a cellulous membrane of admirable texture; which again is covered with a firm nervous coat; and that with a cuticula and cutis: the duplicature of the cutis on the glans makes the prepuce. See PREPUCE.

It is tied to the lower part of the glans by a ligament called the *frænum*. See FRÆNUM. — By another ligament, called *suspensorium*, the *penis* is held up to the *ossa pubis*. See LIGAMENT. The use of the *penis* is for evacuating the seed and urine. — Indeed Dr. Drake, from a view of its structure, thinks it originally intended for the former only; and that the conveyance of the urine was not considered by nature in the mechanism of this part. See SEED and URINE.

He adds another use, *viz.* the incitement to venery, and the propagation of the species. — In effect, without such an instrument, the seed of the most perfect animals could not be conveyed to the place of procreation: add to this, that an alternation of erection and flaccidity is absolutely necessary; the first for the performance of its office, the second for the security of the part.

Without an erection it were impossible to emit and lodge the seed where it ought to be; and, with a constant one, almost as impossible to secure the part from injuries; not to mention the loss of intigitation, which would be the consequence of constant erection. See PRIAPISM, &c.

The cause of the erection of the *penis* is the blood distending the *corpora cavernosa*, as is evident from many experiments;

among the rest, from tying the *Penis* of a dog *in coitu*, in which nothing is found but blood. And hence, in the bodies of criminals that hang long after death, the *penis* becomes erected, by the blood's falling to the inferior parts, and stopping there. — The cavernous body of the *urethra* is erected by the *musculi acceleratores* embracing the veins of its bulb. See ERECTION.

PENITENCE, POENITENTIA, is sometimes used for a state of repentance, and sometimes for the act of repenting. See REPENTANCE and IMPENITENCE.

PENITENCE is also used for a discipline, or punishment attending repentance; more usually called *penance*. See PENANCE.

PENITENCE also gives the title to several religious orders, consisting either of converted debauchees, and reformed prostitutes; or of persons who devote themselves to the office of reclaiming them. See PENITENCE. Of this latter kind is the

Order of PENITENTS of St. Magdalen, established about the year 1272, by one Bernard, a citizen of Marseilles, who devoted himself to the work of converting the courtezans of that city.

Bernard was seconded by several others; who, forming a kind of society, were at length erected into a religious order by pope Nicholas III, under the rule of St. Augustin.

F. Gesnay adds, that they also made a religious order of the *penitents*, or women they converted, giving them the same rules and observances which they themselves kept.

Congregation of PENITENCE of St. Magdalen at Paris, owed its rise to the preaching of F. Tisseran, a Franciscan, who converted a great number of courtezans about the year 1492. Louis, duke of Orleans, gave them his house for a monastery; or rather, as appears by their constitutions, Charles VIII gave them the Hotel, called *Bochaigne*, whence they were removed to St. George's chapel in 1572. By virtue of a brief of pope Alexander, Simon bishop of Paris, in 1497, drew them up a body of statutes, and gave them the rule of St. Augustin.

To qualify a woman for admission, it was required that she had committed the sin of the flesh. — None were admitted above 35 years of age.

Till the beginning of the last century, none but *penitents* were admitted; but, since its reformation by Mary Alvequin, in 1616, none have been admitted but Maids: who, however, still retain the ancient name *penitents*. See PENITENTS.

PENITENTS, an appellation given to certain fraternities, or societies of persons who assemble together for prayers, make processions bare-footed, their faces covered with linen, and give themselves discipline, &c.

There are *white penitents* in Italy, at Avignon, and at Lyons. — There are also *blue penitents* and *black penitents*, which last assist criminals at their death, and give them burial.

Mabillon tells us, that at Turin there are a set of *penitents* kept in pay, to walk through the streets in procession, cut their shoulders with whips, &c.

PENITENTS, or converts of the name of Jesus, a congregation of religious at Seville; consisting of women, who had led a licentious life, founded in 1550. See PENITENCE.

This monastery is divided into three apartments: one for professed religious, another for novices, a third for those under correction.

When these last give signs of a real repentance, they are removed into the quarter of the novices; where, if they do not behave themselves well, they are remanded to their correction. They observe the rule of St. Augustin.

PENITENTS of Orvieto, are an order of nuns instituted by Anthony Simoncelli, a gentleman of Orvieto. — The monastery he built, was at first destined for the reception of poor girls, abandoned by their parents, and in danger of losing their virtue.

In 1662 it was erected into a monastery, for the reception of such as, having abandoned themselves to impurity, were willing to take up and consecrate themselves to God by solemn vows. — Their rule is that of the Carmelites.

These religious have this in peculiar, that they undergo no noviciate. All required is, that they continue a few months in the monastery in a secular habit: after which they are admitted to the vows.

PENITENTIAL, POENITENTIALE, an ecclesiastical book, retained among the Romanists; wherein is prescribed what relates to the imposition of penance, and the reconciliation of *penitents*. See PENANCE and PENITENCE.

In the capitulars of Charlemagne, the priests are enjoined to study well their *penitential*. — There are various *penitentials*; the Roman *penitential*, that of venerable Bede, that of pope Gregory III, &c.

PENITENTIARY, POENITENTIARIUS, an office or tribunal in the court of Rome; wherein are examined and delivered out the secret bulls, graces, or dispensations relating to conscience, confession, &c. See BULL, PENANCE, &c.

The expeditions of the *penitentiary* are sealed up with red wax, and sent clove; directed to the confessors.

PENITENTIARY is also an officer or dignitary in some cathedrals, vested with power from the bishop to absolve cases reserved to him; on which account he is also called the *bishop's ear*. See ABSOLUTION.

In some places there is a *grand penitentiary*, and a *sub-penitentiary*. Anastasius says, that pope Simplicius chose some among the Roman priests to preside over penances.

At present the pope has his *grand penitentiary*; who is a cardinal, and the chief of the other *penitentiary* priests established in the patriarchal churches of Rome, who consult him in difficult cases. He presides in the *penitentiary*, dispatches dispensations, absolutions, &c. and has under him a regent, and twenty four professors, or advocates of the sacred *penitentiary*.

PENNA. See the article PINNA.

PENNATA *folia*, winged leaves, among botanists, are such leaves of plants, as grow directly one against another, on the same rib or stalk: as those of ash, walnut-trees, &c. See LEAF, PLANT, &c.

PENNON, or PENON, a standard with a long tail; anciently belonging to a simple gentleman; properly used as a guidon, to place over a tent. See GUIDON, &c.

It is opposed to the *banner*, which was square; and hence, when any one was to be made a banneret, the ceremony consisted in cutting off the tail of his *penmon*, and thus converting it into a banner. See BANNERET.

PENNY, or PENY\*, in commerce, an ancient English coin, which had formerly considerable course; but is now generally dwindled into an imaginary money, or money of account. See MONEY and COIN. See also PENCE.

\* Camden derives the word from the Latin *pecunia*, money. See PECUNIA.

The ancient English *penny*, *penig*, or *pening*, was the first silver coin struck in England; nay, and the only one current among our Saxon ancestors: as is agreed by Camden, Spelman, Dr. Hicks, &c.

The *Penny* was equal in weight to our three-pence; five of them made one shilling, or scilling saxon; thirty a mark or mancuse, equal to our 7s. 6d. See MARK, &c.

Till the time of king Edward I. the *penny* was struck with a cross so deeply indented in it, that it might be easily broke, and parted, on occasion, into two parts; thence called *half-pennies*; or into four, thence called *fourthings*, or *farthings*.—But that prince coined it without indenture; in lieu of which he first struck round half-pence and farthings. See FARTHING.

He also reduced the weight of the *penny* to a standard; ordering that it should weigh thirty two grains of wheat, taken out of the middle of the ear.—This *penny* was called the *penny sterling*.—Twenty of these pence were to weigh an ounce; whence the *penny* became a weight, as well as a coin. See STERLING and PENNY-WEIGHT.

The *penny sterling* is now high disused as a coin, and scarce subsists, but as a money of account, containing the twelfth part of a shilling, or the two hundred and fortieth part of a pound. See SHILLING and POUND.

The course of exchange between England and France is settled on the foot of so many pence sterling, for a French crown of three livres. See EXCHANGE.

The French *penny*, or *denier*, is of two kinds; the Paris *penny*, called *denier Parisis*; and the *penny* of Tours, *denier Tournois*. See DENIER.

The Dutch *penny*, called *pennink*, is a real money, worth about one fifth more than the French *penny Tournois*.—The *pennink* is also used as a money of account, in keeping books by pounds, florins and patards; twelve *penninks* make the patard; and twenty patards the florin. See FLORIN.

At Hambourg, Nuremberg, &c. the *penny* or *pfennig* of account is put equal to the French *penny Tournois*. Eight of them make the krieux, and sixty the florin of those cities; and ninety the French crown, or 4s. 6d. sterling.

PENNY, in ancient statutes, &c. is used for all silver money.

And hence the *ward-penny*, *aver-penny*, *hundred-penny*, *tithing-penny*, and *brothal-penny*. See PENCE, &c.

Bord half-PENNY

Half-PENNY

Rete PENNY

Schar PENNY

Ward PENNY

See the article

BORD half-penny.

HALF-penny.

RETE penny.

SCHAR penny.

WARD penny.

PENNY-WEIGHT\*, a Troy weight, containing twenty four grains; each grain weighing a grain of wheat gathered out of the middle of the ear, well dried. See WEIGHT and GRAIN.

\* The name took its rise hence, that this was actually the weight of one of our ancient silver pennies. See PENNY.

Twenty of these *penny weights* make an ounce Troy. See OUNCE.—A *penny-weight* of gold bullion standard is worth four shillings; and of silver bullion, three-pence. See GOLD and SILVER.

PENNY POST. See the article penny-POST.

PENON. See the article PENNON.

PENSA *libra*, in our ancient customs, a pound of money paid by weight, not by tale. See POUND and LIBRA.

PENSION, PENSIO, a yearly appointment, or sum of money paid any one for services, or considerations already past. See PENSIONARY.

That which in the two temples is called a *parliament*, and in Lincoln's-Inn a *council*, is in Gray's-Inn termed a *pension*; viz.

VOL. II. CXIV.

an assembly of the members of the society, to consult of the affairs of the house. See INN, &c.

PENSIONS, also denote certain annual payments of each member to the house, for certain occasions.

When a *pension writ* is issued, none sued thereby in the inns of court shall be discharged, or permitted to come into commons, till all duties be paid.

Hence a *pension order* in the same inn, is a peremptory order against such of the society as are in arrear for *pensions*, and other duties.

PENSIONARY, or PENSIONER, a person who has a *pension*, appointment, or yearly sum, payable during life, by way of acknowledgment; charged on the estate of a prince, company, particular person or the like.

In the Romish countries it is frequent to have *pensions* on benefices: these were anciently granted with a great deal of ease, under pretence of infirmities, poverty, &c.—But since the XII<sup>th</sup> century, these pretences were carried so far, that the incumbents, or titularies of benefices were little more than farmers. This obliged the spiritual powers to fix the causes, and the quantities of *pensions*.—*Pensions* are now only creatable by the pope; and are never to exceed one third of the revenue; two thirds being still to remain to the incumbent.

PENSIONARY, is also the appellation of the first minister of the states of the province of Holland. See STATES.

The *pensionary* is chairman in assemblies of the states of that province; he proposes the matters to be consulted on, collects the votes, forms and pronounces the resolutions of the states, opens letters, confers with foreign ministers, &c.

He is charged with inspecting the finances, preserving the rights of the province, maintaining the authority of the states, and seeing to the observation of the laws, &c. for the good of the state. He assists in the college of deputy counsellors of the province, who represent the sovereignty in the absence of the states; and is perpetual deputy of the states general of the United Provinces. His commission is only given for five Years; after which it is deliberated whether or no it shall be renewed. Indeed, there is no instance of its having been revoked. Death only puts a period to the functions of this important minister. Formerly, he was called the *advocate of the province*: the title *pensionary* was only given at the time Barnevelt had the office: Grotius calls him in Latin *adversor jurisperitus*; Merula *advocatus generalis*; Matthæus, professor at Leyden, *consiliarius pensionarius*, which is the quality the states give him in their instruments.

PENSIONARY, is also the first minister of the regency of each city, in the province of Holland. See PROVINCE.

His office is to give his advice in matters relating to the government, either of the city in particular, or of the states in general; and in assemblies of the states of the province is speaker in behalf of his city.

Yet the function of these *pensionaries* is not alike every where: In some cities they only give their advice; and are never found in assemblies of the magistrates, except when expressly called thither: in others they attend constantly; and in others they even make the propositions on the part of the burgher masters, draw up their conclusions, &c.—They are called *pensionaries*, because they receive an appointment or *pension*.

Gentlemen PENSIONERS, a band of gentlemen, whose business is to guard the king's person in his own house; and who for that end wait in the presence chamber.

They were first set on foot by king Henry VII. The number is forty; and each obliged to keep three double horses and a servant, who is to be armed: so that they properly make a troop of guards; and have accordingly been mustered by their own officers: but this part of duty, to which they are sworn, the king usually dispenses with.

Their officers are a captain, lieutenant, standard-bearer, and clerk of the cheque.—Their ordinary arms are gilt pole-axes, with which they attend the king to and from the chapel-royal; receiving him in the presence chamber, or coming out of his private lodging; as also at all great solemnities. Their *pension* 100 l. per annum.

PENSTOCK. See the article PEN.

PENTACHORD\*, an ancient musical instrument with five strings.

\* Whence the name of πνλ, five, and χορδν, string.

The invention of the *pentachord* is referred to the Scythians: the strings were of bullocks leather, and were struck with a plectrum made of goats horn.

PENTACROSTICK, a set of, or series of verses so disposed, as that there are always found five acrosticks of the same name, in five divisions of each verse. See ACROSTICK.

PENTAGON\*, in geometry, a figure of five sides, and five angles. See FIGURE.

\* The word comes from the Greek πνταγωνος, *quinquangulus*, compounded of πνλ, five, and γωνια, angle. See POLYGON.

If the five sides are equal, the angles are so too, and the figure is called a *regular pentagon*, as fig. 47. Tab. Geometry.—Most citadels are regular *pentagons*. See CITADEL.

The most considerable property of a *pentagon* is, that one of

its sides, *v. g.* DE, is equal in power to the sides of a hexagon, and a decagon inscribed in the same circle ABCDE; that is, the square of the side DE is equal to the sum of the squares of the sides Da and Db.

Pappus has also demonstrated, that twelve regular pentagons contain more than twenty triangles inscribed in the same circle. *lib. 5. probl. 45.*

The dodecahedron, which is the fourth regular body, consists of twelve pentagons. See DODECAHEDRON.

*Projection or perspective of a* PENTAGON. See PERSPECTIVE.

PENTAGRAPH, an instrument whereby designs, prints, &c. of any kind, may be copied in any proportion, without a person's being skilled in drawing. See DESIGN, REDUCTION, &c. The instrument is otherwise called a *parallelogram*. See PARALLELOGRAM.

The common *pentagraph* (represented *Tab. Miscel. fig. 6.*) consists of four brass or wooden rulers, two of them from fifteen to eighteen inches long, the other two half that length. At the ends, and in the middle of the longer rulers, as also at the ends of the shorter, are holes, upon the exact fixing whereof the perfection of the instrument chiefly depends. Those in the middle of the long rulers are to be at the same distance from those at the ends of the long ones, and those of the short ones; so that when put together they may always make a parallelogram.

The instrument is fitted together for use by several little pieces, particularly a little pillar, N° 1. having at one end a screw and nut, whereby the two long rulers are joined; and at the other a little knot for the instrument to slide on. The piece N° 2. is a rivet with a screw and nut, wherewith each short ruler is fastened to the middle of each long one. The piece N° 3. is a pillar, one end whereof being hollowed into a screw, has a nut fit to it. At the other end is a worm to screw into the table; when the instrument is to be used, it joins the ends of the two short rulers. The piece N° 4. is a pen, portcraion, or pencil, screwed into a little pillar. Lastly, the piece N° 5. is a brass point, moderately blunt, screwed likewise into a little pillar.

*Use of the PENTAGRAPH or parallelogram.* — 1. To copy a design in the same scale or bigness as the original, screw the worm N° 3. into the table; lay a paper under the pencil N° 4. and the design under the point N° 5. This done, conducting the point over the several lines and parts of the design, the pencil will draw or repeat the same on the paper.

2. If the design be to be reduced — *e. gr.* into half the space; the worm must be placed at the end of the long ruler N° 4. and the paper and pencil in the middle. In this situation conduct the brass point over the several lines of the design as before; and the pencil at the same time will draw its copy in the proportion required, the pencil here only moving half the lengths that the point moves.

Hence, on the contrary, if the design be to be enlarged by one half, the brass point, with the design, must be placed in the middle at N° 3. the pencil and paper at the end of the long ruler, and the worm at the other.

3. To enlarge or reduce in other proportions, there are holes drilled at equal distances on each ruler, *viz.* all along the short ones, and half way the long ones; in order for placing the brass point, pencil, and worm in a right line therein; *i. e.* if the piece carrying the point be put in the third hole, the two other pieces must be put in its third hole.

If then the point and design be placed at any hole of the great rulers, and the pencil with the paper at any hole of the short ruler, which forms the angle therewith; the copy will be less than half the original. On the contrary, if it be placed at one of the holes of that short ruler, which is parallel to the long ruler, the copy will be greater than half the original.

The construction of this instrument requires a degree of accuracy, which most of our instrument-makers are strangers to; for which reason there are very few of the instruments that succeed. Few will do any thing tolerably but strait lines; and many of them not those.

PENTAMETER\*, in poetry, a kind of verse consisting of five feet or metres. See VERSE and FOOT.

\* The word is derived from the Greek *πενταμετρος*, *q. d.* five Measures.

The two first feet of a *pentameter* may be either dactyls or spondees, the third always a spondee, and the two last anapæsts.

It is usually joined to hexameters, in elegies, epistles, epigrams, and other little pieces. There is no work of *pentameters* alone. See HEXAMETER.

PENTAPETALOUS plants are such whose flower consists of five leaves. See PLANT.

PENTAPOLIS, ΠΕΝΤΑΠΟΛΙΣ, in geography, &c. a country wherein are five cities.

The name *pentapolis* has been given to several countries, particularly the valley wherein stood the five infamous cities destroyed by the shower of fire and brimstone in the time of Abraham. It is commonly supposed this country was the place where now stands the lake Asphaltites, or Dead sea: Sanfon places it in the neighbourhood of this lake, but without any proof. D'Herbelot calls this the *pentapolis of the sodomites*.

The most celebrated was the *pentapolis cyrenaica*, or *pentapolis*

of Egypt, whose five cities were Berenice, Arsinoe, Ptolemais, Cyrene, and Apollonia.

Among the ancient geographers and historians we likewise read of the *pentapolis* of Libya, now called *Mesrata*; the *pentapolis* of Italy, and the *pentapolis* of Asia minor.

PENTAPTOTON, in grammar, a noun which has only five cases. See APTOTE and CASE.

PENTASTICH, PENTASTICHON, in poetry, a stanza, or division of a poem, consisting of five verses. See STANZA.

PENTASTYLE, in architecture, a work wherein are five rows of columns. See COLUMN.

Such was the portico begun by the emperor Gallienus, and which was to have been continued from the Flaminian gate to the bridge Milvius, *i. e.* from the Porto del popolo to the Ponte-mole.

PENTATEUCH\*, in the sacred learning, the five books of Moses, at the head of the old testament, *viz.* Genesis, Exodus, Leviticus, Numbers, and Deuteronomy. See BIBLE.

\* The word is formed from the Greek *πεντατευχος*, which signifies the same, compounded of *πεντε*, five, and *τευχος*, volume.

Pere Simon, in his *Hist. Crit. du V. Test.* produces a good number of passages, to prove that Moses was not wholly the author of the *Pentateuch*, as we now have it. Indeed those apparent interpolations at the end are sufficient to determine the point; it being absurd to suppose Moses the author of the account of his own death and burial, and of the comparison between him and the succeeding prophets in Israel.

These interpolated passages are usually attributed to Esdras; who, on his return from the Babylonish captivity, is supposed to have published the old testament, or at least a part of it corrected and enlarged. See CANON.

There are two famous *Pentateuchs*, or editions of the *Pentateuch*, which have a long time disputed the preference, both as to antiquity, and as to character; *viz.* that of the Jews, called the *Jewish* or *Hebrew Pentateuch*, wrote in the Chaldean, or Assyrian character, and that of the Samaritans, wrote in the Samaritan or Phœnician character.—Each is maintained to be the ancient Hebrew; though the generality of the critics give it in behalf of the latter. See HEBREW.

Indeed, as to the point of matter, they are generally pretty conformable to each other, each has all the interpolated passages above-mentioned, though the Samaritan has one or two more, not in the Hebrew: the first, a passage in Deut xxvii. 4. where an altar is enjoined to be built, and sacrifices to be offered on mount Ebal, or rather mount Gerizzim; which passage was doubtless foisted in to countenance the Samaritan worship, and represent it of equal antiquity with that of the temple of Jerusalem. See SAMARITANS.

Mr. Whiston, however, declares he sees no reason to accuse the Samaritan of corruption in these points, but rather the Jewish; and earnestly contends, that the former is an uncorrupted copy of the books of Moses, originally derived from the first separation of the ten tribes themselves, in the days of Jeroboam.—The contrary whereof is apparent from the mere confessed interpolations ascribed to Esdras, who lived several hundred years after the time of Jeroboam.

But the grand difference is in the letter or character; the Jewish being in the Chaldean or Assyrian character, and the Samaritan in the Phœnician, *i. e.* the Canaanitish character; this latter seems to have an advantage over the vulgar Jewish *Pentateuch*.—Yet is Prideaux of opinion, the latter is only a transcript from the former, out of the Chaldean into the old Hebrew character. One great reason he gives, is, that there are many variations in the Samaritan, manifestly occasioned by mistaking the similar letters in the Hebrew alphabet; which letters having no similitude in the Samaritan character, it is evident the variations must have arisen in transcribing from the vulgar Hebrew into Samaritan, not the contrary way.

Add to this, that Simon, Allix, and many other learned men, take the Chaldean or Assyrian character to have been the character always in use among the Jews; and the Samaritan or Canaanitish, or, as it is also called, the *old Hebrew* character, to have never been used by the Jews before the captivity, in any manner, either in books, or on medals. See CHARACTER.

Hence the *Pentateuch* must have been transcribed into that character; and that, probably, to render it legible to the inhabitants of Samaria, who, upon the first introduction of the *Pentateuch*, might probably be versed in no other character.

Usher takes the Samaritan *Pentateuch* to have been compiled by Dositheus a Samaritan, mentioned by Origen to have adulterated the *Pentateuch*.—Du Pin supposes it the work of some modern Samaritan, whom he imagines to have compiled it chiefly out of the different copies of the Palestinian and Babylonian Jews, and the Septuagint; because it sometimes agrees with one and sometimes with another.

PENTATHLON, ΠΕΝΤΑΘΛΟΝ, in antiquity, the five exercises performed at the Grecian games, and for which prizes were proposed. See EXERCISE, GAME, &c.

These exercises were wrestling, boxing, leaping, running, and quoit-playing.—He who bore away the prize in them all, was called *pentathlus*; by the Latins, *quingertio*; as the five exercises themselves were, by those latter people, called *quingertium*.

PENTA-

# P E N

**PENTATONON**, in the ancient music, a concord, by us called the redundant sixth. See **SIXTH**.

It consists of four tones, and a major and minor semitone; whence the name, *pentatonon*, *q. d.* five tones.

**PENTECONTERUS**, ΠΕΝΤΗΚΟΝΤΕΡΟΣ, a vessel with fifty oars. See **GALLEY**, &c.

**PENTECOST**\*, ΠΕΝΤΗΚΟΣΤΗ, Whitsuntide; a solemn feast of the church, held in commemoration of the descent of the Holy Ghost on the apostles, as described in the acts. See **WHITSUNTIDE**.

\* It has its name from the Greek πενήκοντος, *q. d.* quinquagesimus, 50<sup>th</sup>, because held on the fiftieth day after Easter. See **EASTER**.

In the ancient church, *Pentecost* finished the paschal time, or easter-season; wherein, as Tertullian, St. Jerom, &c. observe, Hallelujah was sung every where, the office celebrated standing, no fasting allowed, &c.

The Jews likewise had a feast they called *Pentecost*, or *quinquagesimus*; solemnized in memory of the law's being given to Moises 50 days after their departure out of Egypt.

**PENTECOSTALS**, **PENTECOSTALIA**, anciently, were pious oblations made at the feast of *Pentecost*, by the Parishioners to their parish priest; and sometimes by inferior churches or parishes to the principal or mother church. See **OBLATION**.

These parish *Pentecostals* were also called *Whitsun-farthings*; and their sum was divided into four parts, of which one went to the priest, one to the poor, one towards the repair of the church, and one to the bishop of the diocese. See **WHITSUN-FARTHING**.

**PENTESYRINGUS**, in antiquity, a sort of pillory, with five holes; wherein were fastened the legs, arms, and heads of criminals, to prevent their stirring. See **PILLORY**.

**PENTHEMIMERIS**\*, in the Greek and Latin poetry, part of a verse consisting of two feet and a long syllable.

\* The word is Greek, πενθεμιμερις, compounded of *peni*, five, *himeris*, half, and *meros*, part.

**PENULTIMA**\*, or **PENULTIMATE**, in grammar, denotes the syllable, or foot, immediately before the last.

\* The word is formed from the Latin, *pene* and *ultimus*, almost last. Hence *antepenultimate* is that before the *penultimate*, or the last but two. See **ANTEPENULTIMA**.

**PENULTIMATE**, in music. M. Brossard will have it the same with what the Greeks called *paranete*; though others will not allow the *paranete* to be the *penultimate* chord, but the next thereto.

**PENULTIMATE** of the *separate*, *paranete diazeugmenon*, is a name the ancients gave to one of the chords of their lyre or system, corresponding to the *d*, *la*, *re*, of the third octave of the modern system.

**PENULTIMATE** of the *acute*, *paranetehyperboleon*, a chord of the ancient system, answering to the *g*, *re*, *sol*, of the third octave of the modern system.

**PENUMBRA**, in astronomy, a faint or partial shade, observed between the perfect shadow and the full light in an eclipse. See **SHADOW**.

The *penumbra* arises from the magnitude of the sun's body: were he only a luminous point, the shadow would be all perfect; but, by reason of the diameter of the sun, it happens that a place which is not illuminated by the whole body of the sun, does yet receive rays from a part thereof.

Thus suppose *S* the sun (*Tab. Astron. fig. 47.*) and *T* the moon, and the shadow of the latter to be projected on a plane as *GH*; the true proper shadow of *T*, viz. *GH*, will be encompassed with an imperfect shadow, or *penumbra*, *HL* and *GE*, each portion whereof is illuminated by an entire hemisphere of the sun.

The degree of light or shadow of the *penumbra* will be different in different parts, as those parts lie open to the rays of a greater or lesser part of the sun's body: thus from *L* to *H*, and from *E* to *G* the light continually diminishes; and, in the confines of *G* and *H*, the *penumbra* becomes lost and confounded with the total shade; as, near *E* and *L*, it is confounded with the total light.

A *penumbra* must be found in all eclipses, whether of the sun, the moon, or the other planets, primary or secondary; but it is most considerable with us in eclipses of the sun; as in the case here referred to.

In eclipses of the moon, the earth is encompassed indeed with a *penumbra*; but it is only sensible to us on the earth near the total shadow; an observer placed on a plane, whereon the shadow falls, might observe the whole *penumbra*, as in eclipses of the sun. Thus an eye placed at *I* or *F*, would only see the semi-diameter of the sun, the rest being hid behind the moon. Going from *I* towards *H*, more and more of the sun is hid, 'till it be lost in the shadow itself, &c.

Hence we have eclipses of the sun when the shadow never touches the earth, provided the *penumbra* do but reach it; and hence there is a difference observed in eclipses of the sun, as the shadow itself, or a greater or less degree of the *penumbra* passes over a place.—But eclipses of the moon appear the same in all places where they are visible. See **MOON**.

When the shadow itself falls on the earth, the eclipse is said to

# P E P

be total or central; when only the *penumbra* falls on it, the eclipse is said to be partial. See **ECLIPSE**.

The *penumbra* extends infinitely in length, inasmuch as to each point of the diameter of the sun, there answers a space infinite in length into which no rays enter from that point, though there do from others. Two rays drawn from the two extremities of the earth's diameter, and which proceed still diverging, form the two edges of the *penumbra*; which, of consequence, is continually growing in width, and is infinite also in this sense.—All that infinite space is the *penumbra*, except the triangle of the shadow included in it.

The figure of this space comprehending the shadow, is a trapezium, one of whose sides is the diameter of the earth; the opposite side parallel thereto is an infinite line, i. e. the width of the *penumbra* projected to infinity, and the two other sides two rays drawn from the two extremities of the diameter of the sun, through those of the diameter of the earth, and which prolonged back beyond the sun, will intersect in a certain point, making an angle equal to the apparent diameter of the sun; which angle may be called the *angle of the penumbra*.

Now the *penumbra* will be the greater as this angle, or, which is the same thing, as the star is greater, the planet remaining the same; and if the diameter of the planet be increased, the star remaining the same, it will be the same as if the diameter still receded from the angle of the *penumbra*.

M. de la Hire examines the different degrees of the *penumbra*, and represents them geometrically by the ordinates of a curve, which shall be among themselves, as the several parts of the sun's disk, wherewith a body placed in the *penumbra* is enlightened.

**PENY**. See the article **PENNY**.

**PEP** and **PEPIA**. See the article **PIP**.

**PEPASMUS**, ΠΕΠΑΣΜΟΣ, in medicine, the digesting and ripening of morbid humours. See **MATURATION**, **DIGESTION**, &c.

**PEPASTIC**\*, or **PEPTIC**, ΠΕΠΑΣΤΙΚΟΣ, or ΠΕΠΤΙΚΟΣ, in medicine, a kind of medicament of the consistence of an em-plaster; proper to bring vitious and corrupt humours to a head, and dispose them for suppuration. See **RIPENER** and **DIGESTIVE**.

\* The words are formed from the Greek *pepaimi*, to digest or ripen. Butter, roots of mallows, of flowers-de-lis, onions, and leaves of oxylapathum are esteemed good *pepastics* or maturatives.

**PEPPER**, **PIPER**, an aromatic fruit, or berry, of a hot, dry quality; chiefly used in the seasoning of meats. See **SPICE**. It is the product of a shrub growing in several parts of the East-Indies, chiefly Java, Sumatra, Malacca, and the coasts of Malabar. The plant is very weak, and of the reptile kind, and for that reason usually planted at the foot of the larger trees, as the areca, cocoa, &c.

*Pepper* grows in bunches or clusters, at first green; as the grains ripen, they grow red, and at last, after being exposed a while to the sun, become black, in the condition we see them.

The fruit is gathered in November. It must be chosen large, full, not wrinkled, without dust, with a good many white grains in it; and care be taken, the largest berries have not been picked out to make white *pepper*.

**White PEPPER**, *Piper album*, is the fruit of the same plant with the black, and is prepared from it by moistening it with the seawater, and then exposing it to the sun, and casting away the outer bark, which, abandoning the grains, leave it white. See **WHITE**.

Indeed M. Dellon, a late traveller, says, they strip off the skin, by beating it before it be quite dry; or by soaking it in water after it has dried, and then beating it.

Many authors, and, among the rest, Pomet, will have the *white pepper* to be natural, and the fruit of a different plant from the black; but M. Dellon, who expressly declares the contrary from his own long experience, seems to put the matter past doubt.

**White PEPPER** must be chosen after the same manner as black; with this further care, that it hath not been dyed white.—*Pepper* that is sold ground, is very apt to be sophisticated; the black with burnt crust of bread, &c. the white with beaten rice.

**Long PEPPER**, *Piper longum*, is denominated from its form, which in length and thickness equals a child's finger; it consists of an assemblage of grains or berries joined close to one another, of a brownish colour, bordering without on red, and within on black; and grows by a long pedicle to a plant, like that of the black *pepper*, but lower, and its leaves smaller and greener.—Its taste resembles that of the former, but less sharp.

There are three kinds of this *pepper*, that of the East-Indies, that of America, and that of Ethiopia, called also grain of Zelim; though the first alone is the proper *long pepper*, the rest resembling it but little.

It must be chosen new, large, heavy, well filled, hard to break, without dust or mixture; its chief use is in medicine, where it enters several galenical compositions, among the rest Venice treacle.

**Guinea PEPPER**, *Piper indicum*, is a reddish *pepper*, of a coral colour, much esteemed by the Americans, from among whom it

is brought, and by them called *chile*, by the Spaniards *pimenton*, and the French, *garden coral*.

It is now cultivated pretty commonly in France, especially in Languedoc; used in making vinegar, and likewise comfited with fugar. It must be chosen new, in large pods, dry, entire, and red.

There are four kinds; the first called by the Americans *chilchotes*; the second, very small, *chilterpin*; both of a very pungent taste; the third, *tonalchiles*, moderately hot, and eaten by the natives like other fruit with bread, the fourth, *chilpelagua*, moderately pungent, much used by the Spaniards in the preparation of chocolate; there is also a fifth kind called *agy*, growing in Peru.

**Jamaica PEPPER**, called by the Dutch *amomi*, by the Spaniards *pimenta de Jamaica*, is the fruit of the tree that yields the Indian wood, growing plentifully in Jamaica, and other American islands.

It is a real aromatic, and may supply the defect of cloves, nutmeg, and cinnamon; whence it is called also by the English, *all-spice*. The French call it the *round clove*, from its taste's resembling that spice.

**PEPSIS\***, in medicine, the coction or digestion of foods, or humours in the body. See COCTION and DIGESTION.

\* The word is Greek, *πεισις*, which signifies *boiling*.

**PEPTIC**, in medicine. See PEPASTIC.

**PEPUZIAN**s, a sect of ancient hereticks, otherwise called *Phrygians*, or *Cataphrygians*. See CATAPHRYGIAN.

They had their name *Pepuzians* from a pretence that Jesus Christ appeared to one of their prophetesses in the city *Pepuza* in Phrygia, which was their holy city. See QUINTILIANS.

**PER accidens**. See the article ACCIDENS.

**PERACUTUM menstruum**. See MENSTRUUM.

**PERAMBULATION of the forest**, the surveying or walking about a forest, or the limits of it, by justices or other officers thereto appointed, to set down the metes and bounds thereof, and what is within the forest, and what without. See PURLIEU and FOREST.

**PERAMBULATIONE facienda**, is a writ commanding the sheriff to make *perambulation*, and set down the bounds of two or more manors, whose limits are not so well known.

The writ *de perambulatione facienda*, is only issued where the lords of both manors agree to have such perambulation. If one of them refuse, the other must seek his remedy by a writ *de rationabilibus divisis*. See RATIONABILIBUS.

**PERAMBULATOR**, in surveying, an instrument for the measuring of distances; called also *pedometer*, *way-wiser*, and *surveying wheel*. See PEDOMETER and WAY-WISER.

Its advantages are its handiness and expedition: its contrivance is such, that it may be fitted to the wheel of a coach; in which it performs its office, and measures the road without any trouble at all.

There is some difference in its make; that now most usual, as most convenient, is as follows:

*Construction of the PERAMBULATOR or way-wiser.*—The *perambulator* (represented *Tab. Survey. fig. 23.*) consists of a wheel two feet seven inches and a half in diameter; consequently half a pole, or eight foot and three inches in circumference. On one end of the axis is a nut three quarters of an inch in diameter, divided into eight teeth, which, upon moving the wheel round, fall into the eight teeth of another nut *c*, fixed on one end of an iron rod *Q*, and thus turn the rod once round, in the time the wheel makes one revolution. This rod, lying along a groove in the side of the carriage of the instrument, has, at its other end, a square hole, into which fits the end *b* of the little cylinder *P*. This cylinder is disposed under the dial-plate of a movement, at the end of the carriage *B*, in such manner as to be moveable about its axis. Its end *a* is cut into a perpetual screw, which falling into the thirty two teeth of a wheel perpendicular thereto; upon driving the instrument forward, that wheel makes a revolution, each sixteen pole. On the axis of this wheel is a pinion with six teeth, which, falling into the teeth of another wheel of sixty teeth, carries it round every hundred and sixtieth pole, or half mile.

This last wheel then carrying a hand or index round with it, over the divisions of the dial-plate, whose outer limb is divided into one hundred and sixty parts, corresponding to the one hundred and sixty poles, points out the number of poles passed over. Again, on the axis of this last wheel is a pinion containing twenty teeth, which, falling into the teeth of a third wheel that has forty teeth, drives it once round in three hundred and twenty poles, or a mile. On the axis of this wheel is a pinion of twelve teeth, which, falling into the teeth of a fourth wheel that has seventy two teeth, drives it once round in twelve miles.

This fourth wheel carrying another index, over the inner limb of the dial-plate, divided into twelve, for miles, and each mile subdivided into halves, quarters, and furlongs, serves to register the revolutions of the other hand, and to keep account of the half miles, and miles passed over, as far as twelve miles.

*Use of the PERAMBULATOR, or way-wiser.*—The application of this instrument is obvious from its construction. Its proper

office is the surveying of roads, and large distances, where a great deal of expedition, and not much accuracy, is required.—It is evident, that driving it along, and observing the hands, has the same effect as dragging the chain, and taking account of the chains and links. See therefore the article CHAIN.

**PER ARSIN**, and *thesin*, in music. — *Per* is a Latin preposition, signifying by, during; *arsis* and *thesis* are Greek words, the first whereof signifies elevation or rising; the second, position or setting down. See MEASURE and TIME.

*Per thesin* then signifies in falling, or during the latter time of the measure; *per arsin*, in rising, or in the first time of the measure. A long, counter-point, fugue, &c. are said to be *per thesin*, when the notes descend from acute to grave; on the contrary they are *per arsin*, when the notes ascend from grave to acute. See ARSIS. *Fugue per ARSIN* and *thesin*. See FUGUE.

**PERCEPTION**, *PERCEPTIO*, in philosophy, the act of *perceiving* or apprehending a thing; or that simple idea which we conceive of a thing, without making any affirmation or negation. See IDEA and APPREHENSION.

If that idea exhibit any image to the mind, it is called *imagination*; if it exhibit none, it retains the general name of *perception*. See IMAGINATION.

Thus when we hear the word *tree*, the idea we then form in the mind, is called an *imagination*. But when we hear of a thing whereof no image can be framed, as of doubting, the idea we then have is a mere *perception*. See SENSATION.

The faculty or power of *perception* constitutes what we call the *understanding*. See POWER, FACULTY, and UNDERSTANDING.

It may be observed, that the Ideas we receive by *perception* are often altered by the judgment, without our taking notice of it; thus a globe being set before our eyes, the idea thereby imprinted is a flat circle, variously shadowed; but being accustomed to perceive what kind of appearances convex bodies are wont to make in us, the judgment alters the appearances into their causes; and from that variety of shadow or colour, frames to itself the *perception* of a convex figure of one uniform colour. See JUDGMENT.

This, in many cases, by a settled habit, is performed so readily, that we take that for the *perception* of our senses, which is but an idea formed by the judgment; so that one serves only to excite the other, and is scarce taken notice of itself; as a man who reads or hears with attention, takes little notice of the characters or sounds, but of the ideas which are excited in him thereby.

The faculty of *perception* seems to be that which puts the distinction between the animate and inanimate parts of the creation. Vegetables, some of them, have some degree of motion, and, upon different applications of other bodies, alter their figures and motions, so as hence to obtain the name of *sensitive* plants; which, however, is the result of mere mechanism, and no otherwise produced than the shortening of a rope by the effusion of water. But *perception* is a metaphysical principle, and found in some degree in all animals, and in them alone. See ANIMAL, &c.

**PERCH**, *pole*, or *rod*, a long measure much used in surveying and measuring of land. See MEASURE.

Among the old Romans, and still among geometricians, the *pertica*, perch, is ten foot; and they otherwise call it the *catena*, *funis*, and *decempeda*. See DECEMPEDA.

In England the statute *perch* contains sixteen foot and a half; and, for coppice-woods, &c. eighteen foot. — Forty square *perches* make a rood, and one hundred and sixty an acre. See ROOD and ACRE.

The customary *perch* is various in various counties: in Staffordshire it is twenty four foot; in the forest of Sherwood twenty one, the foot there being eighteen inches, the measure whereof is marked in the chancel-wall of Edwinstow, and in the church of St. Mary in Nottingham. See FOOT.

In Herefordshire a *perch* of walling is sixteen foot and a half; a *perch* of ditching twenty one foot, &c. — In France the *perch* is from eighteen to twenty three, and even twenty seven of their feet.

**PERCH-fishing**. See the article FISHING.

**PERCHANT**, among fowlers, a decoy-bird which the fowler has fastened by the foot, and which flutters about the place where it is tied, to draw other birds to it, and give the fowler an occasion of catching them. See DECOY.

**PERCOLATION**. See FILTRATION.

**PERCUSSION**, in physics, the impression a body makes in falling or striking upon another; or the shock or collision of two moving bodies; which, meeting, alter each other's motion. See MOTION and COLLISION.

*Percussion* is either *direct* or *oblique*.

*Direct* PERCUSSION is where the impulse is given in the direction of a right line perpendicular to the point of contact.

In spheres, therefore, the *percussion* is *direct*, when the line of direction passes through both their centres.

*Oblique* PERCUSSION is where the impulse is given in the direction of a line oblique to the point of contact. See OBLIQUE.

In bodies either perfectly hard, or perfectly soft, and so void of all elasticity, the laws of *percussion* are easily determined: but since even the hardest bodies have their share of elasticity, and in elastic bodies the laws are very different, and much more intricate, having been first ascertained in the *Philosophical Transactions*, by Sir Ch. Wren, Dr. Wallis, and Mr. Huygens; we shall lay down each apart.

*Laws of PERCUSSION in bodies not elastic.*—1°. If a body in motion, as A (*Tab. Mechanicks, fig. 40.*) strike directly against another at rest, B; the first will lose just as much of its motion as it communicates to the second: so that the two will proceed thence with an equal velocity, as if collected into one mass.

If A therefore be triple of B, it will lose one fourth of its motion; so that if before it moved through a line of twenty four foot in a minute, it will now only move eighteen.

2°. If a moving body, A, strike against another already in motion, B; the first will increase the velocity of the latter; but will lose less of its own motion than if the latter had been at rest: since all here required, is that some degrees of motion be added to those the latter already had, to make them both proceed with an equal velocity.

Suppose, *e. gr.* the body A, with twelve degrees of motion, to strike against the other B, less by half, and at rest: the first will transfer four degrees of its motion to the latter, and retain eight to itself: but if it strike with twelve degrees of motion on the other already moving with three degrees, it will only communicate two degrees; for A being double of B, this needs only half the motion to make it proceed with the same velocity.

3°. If a moving body, A, strike on another, B, either at rest, or moving more slowly, and either in the same direction, or in a contrary one; the sum of the momenta, if the bodies move in the same direction, or their difference, if they move in a contrary one, will be the same after the *percussion* as before.

4°. If two equal bodies A and B meet each other with equal velocities; after the congress, they will both remain at rest.

5°. If a body, A, strike directly on another at rest, B; its celerity after the stroke is to its celerity before it, as the weight of A is to the sum of the weights of A and B: if therefore the weights were equal, the celerity after the shock would be half of that before it.

6°. If a body in motion, A, strike directly on another moving more slowly, but in the same direction; the velocity after the shock will be equal to the sum of the momenta divided by the sum of the weights.

7°. If two equal bodies moving with different velocities, strike directly against each other; after the conflict, they will proceed with the semi-difference of the velocities wherewith they were moved before it.

8°. If two bodies A, and B, meet directly with velocities that are reciprocally as their weights; after the conflict, they will both remain at rest.

9°. If two bodies, A and B, meet directly with the same velocity, the celerity after the impulse will be to that before it, as the difference of the weights to their sum.

10°. If two bodies meet directly with any velocity whatever, the celerity after the stroke will be equal to the semi-difference of the momenta, divided by the sum of the weights.

To determine the momentum lost by the conflict: multiply the celerity, which the body had before the conflict, into its mass: thus have you the momentum before the conflict. In like manner, multiply the celerity after the conflict into the mass: thus have you the momentum after the conflict. The latter moment therefore being subtracted from the former, leaves the loss. Hence may the magnitudes of the strokes be estimated.

11°. A direct or perpendicular stroke is to an oblique one, as the whole sine is to the sine of the angle of incidence.

*Laws of PERCUSSION in elastic bodies.*—In bodies perfectly elastic, the force of elasticity is equal to the force wherewith they are compressed; that is, the collision of two such bodies on each other is equivalent to the motion which either of them would acquire, or lose, by mere simple impulse. This force exerting itself contrary ways, a motion equivalent thereto must be subtracted from the motion in the impelling body, and added to that in the body impelled by mere impulse, to find their velocities after *percussion*. See ELASTICITY.

12°. If a body strike directly on an immoveable obstacle, either one or both of them being elastic, the body will be reflected with the same velocity wherewith it struck, and in the same line. For if the elasticity were away, the whole force of the striking body would be spent in overcoming the resistance of the obstacle; and consequently all the motion cease: it follows that the whole force is employed in compressing the elastic body; by which means it acquires an elastic force equal thereto: since then the elasticity, when the compressing force is spent, reduces the body into its former state; it repels the other with the same force wherewith it struck; consequently it will rebound with the same velocity. And because an elastic body restores itself in the same direction wherein it was compressed (there being no reason why it should change its direction) the body will rebound in the same right line.

13°. If an elastic body strike obliquely on an immoveable obstacle, it will rebound in such manner as to make the angle of reflection equal to the angle of incidence. See REFLECTION.

. Vol. II. No 114.

14°. If an elastic body, A, strike directly against another at rest, B; after *percussion*, A will remain at rest, and B proceed with the same velocity which A had before the shock, and in the same direction.

For if the bodies were not elastic, each would proceed after the stroke in the same direction, and with half the velocity; but since the elastic force acts in the same direction wherein the compression is made, and is equal to the compressing force; it repels A with half its velocity, and therefore stops its motion; but it drives B further, with half its velocity, and therefore accelerates its motion. It is therefore carried after the shock with the whole celerity wherewith A was carried before it, and A remains at rest.

Hence, since A (*Tab. Mechan. fig. 41.*) transfers all its force to B, B in like manner will transfer it to C; C again to D, and D to E. Wherefore if there be several equal elastic bodies, mutually touching each other, and A be struck against B; all the intermediate ones remaining at rest, the last alone, E, will be moved; and that with the velocity wherewith A struck against B.

15°. If two equal elastic bodies A and B meet directly, and with equal velocity; each will rebound with the same velocity wherewith it struck, and in the same direction.

For, setting aside the elasticity, both would remain at rest: their whole force therefore is spent in the compression; but their elastic force, whereby they rebound in the former direction, is equal thereto: this force therefore acting equally on each body, A and B, will produce the same celerity in each; and that, equal to the former. So that they will rebound with the celerity wherewith they struck.

16°. If two equal elastic bodies, A and B, strike directly against each other with unequal velocities, after the shock they will rebound with interchanged velocities.

For suppose the bodies to concur with the velocities  $C + c$  and  $C$ : if they meet with the same velocity  $C$ , after the shock, they would both move with the same velocity  $C$ . If B were at rest, and A should strike upon it with the celerity  $c$ , after the shock, A would remain at rest, and B be moved with the celerity  $c$ . Therefore the excess of celerity  $c$ , wherewith A is carried, is transferred wholly by the conflict to B: A therefore is moved with the celerity  $C$ , and B with the celerity  $C + c$ .

Hence, after *percussion*, they recede from each other with the same velocity as before they concurred.

17°. If an elastic body, A, strike on another equal one, indued with a less degree of motion, B; after *percussion*, both will proceed in the same, *viz.* the former, direction, and with interchanged velocities.

For suppose A to strike with the velocity  $C + c$ , upon B moving with the velocity  $C$ ; since by reason of the equal velocities  $C$  and  $C$ , there arises no impulse; it is the same thing as if A struck on B with the sole celerity  $c$ , on B at rest. But in that case A would remain at rest, and B move with the velocity  $c$ : therefore, after *percussion*, A will move with the sole celerity  $C$ ; and B with the celerity  $C + c$ , both according to the former direction, there being nothing to change that direction.

18°. If a moving body A strike on another B; the stroke will be the same as would be made by the body A striking on B at rest, with the difference of their velocities.

Hence, since the elastic force is equal to the *percussion*; it acts on the bodies A and B with the difference of the velocities they had before the congress.

19°. To determine the velocities of any two elastic bodies A and B, after striking directly on each other with any velocities.—If the elastic body A strike on B, either at rest, or moving faster than A; the velocity *v. gr.* of A after *percussion*, is found thus: as the sum of the weights is to double of either of them, suppose, in this case, of B; so is the difference of the velocities before the congress, to a velocity, which subtracted from the velocity of A before the impulse (in the other case added to it) leaves the velocity of A after the congress.

If the two elastic bodies A and B meet each other; the velocity of A after the impulse is found thus: as the sum of the weights is to the double of either of them, suppose of B; so is the sum of the velocities before collision, to a velocity which subtracted from the velocity of A before collision, leaves its celerity after collision.

20°. If an elastic body A strike directly on another at rest, B; its velocity after *percussion* will be to its velocity before it, as the difference of weights is to their sum: but the velocity it communicates to B, is to the same, as double the weight of A to the sum of the weights.

After *percussion*, therefore, the velocity of A is to the velocity of B as the difference of weights to the double of A.

21°. If two elastic bodies, A and B, strike directly on each other with velocities that are reciprocally proportional to their weights; after collision, they will rebound with the same velocity wherewith they met.

22°. In the direct collision of bodies the same respective velocity is preserved, *i. e.* in a direct concurrence, the difference of velocities is the same before and after the shock; and in a direct mutual encounter, the difference of velocities after the shock is the same with their sum before it.

Hence they retire from each other after the impulse, with the same velocity wherewith they met.

23°. In the collision of elastic bodies there is not always preserved the same momentum, or, as the Cartesians express it, the same quantity of motion; but it is sometimes increased, and sometimes diminished.

It is a mistake therefore of Cartes and his followers, that the same quantity of motion is still preserved in the world. See CARTESIAN.

24°. If two elastic bodies, A and B, meet, or overtake each other directly; the sum of the factums of the masses into the squares of the velocities remains the same before and after the congress. Hence the same quantity of force is likewise preserved in the congress.

25°. To determine the motion of two bodies A and B, (fig. 42) striking obliquely against each other, whether they be elastic, or not elastic. — The motion of the body A along AC is resolvable into two others, in the directions AE and AD; and the motion of B along BC into two others according to BF and BG; and the velocities through AD and BF are to the velocities through AC and BC, as the right lines AD, BF, AC, BC; now, since the right lines AE and BG are parallel, the forces acting according to these directions are not mutually opposite, and must therefore be considered in the congress. But since the lines AD and BF, or, which is the same, EC and GC, constitute the same right line perpendicular to DC; it is the same as if the bodies A and B should meet directly with velocities that are as EC and GC. Find therefore the velocity of A and B according to the rules above laid down.

Suppose, *e. gr.* the velocity of the rebounding body A to be as CH; since the motion along AE is not changed by the congress, make CK = AE, and compleat the parallelogram HCKI; the diagonal CI will represent the motion of A after congress: for after *percussion*, the body will move according to the direction CI, and with a velocity as CI. In the same manner it will be found that the rebounding body B will move along the diagonal of the parallelogram CM; in which LM = BG. The velocities therefore after *percussion* are as CI to CM.

Center of PERCUSSION, is that point wherein the shock or impulse of the percussive bodies is the greatest. See CENTER.

The centre of *percussion* is the same with the center of oscillation, if the percussive body revolve round a fixed axis. See OSCILLATION.

If all the parts of the percussive body be carried with a parallel motion, or with the same velocity; the center of *percussion* is the same with the center of gravity. See GRAVITY.

PER deliquium. See the article DELIQUIMUM.

PER descensum, by descent, in chymistry, a particular manner of distillation. See DISTILLATION.

PERDONATIO utlagaria, in law, a pardon for one who is outlawed. See PARDON and OUTLAWRY.

PERDUE\*, a soldier placed in a dangerous, and almost desperate post. — Thus we say, *enfants perdus*, for the forlorn hope of an army. See FORLORN and ENFANS.

\* The word is French, and literally signifies lost.

To lye *perdue*, is to lye flat on the belly, to lye closely in wait.

PEREGRINARY, PEREGRINARIUS, in the ancient monasteries, a monk to whom was committed the care of receiving and entertaining strangers, or visitors.

PEREGRINE, PEREGRINUS a term applied among astrologers to a planet, when found in a sign where it has none of its five essential dignities.

PEREMPTORY, in law, an epithet applied to an action, exception, &c. signifying them to be absolute, final, and determinate; not to be altered, renewed, or restrained.

Thus in our law-books we find *peremptory action*, *peremptory nonsuit*, *peremptory exemption*, &c. See ACTION, EXCEPTION, &c.

PERENNIAL, in botany, is applied to those plants whose roots will endure many years. See PLANT, ROOT, ANNUAL, &c.

*Perennials* are of two kinds; the one retain their leaves all the winter, called *ever-greens*. See EVER-GREEN.

The other cast the leaves in winter, called *deciduous* or *perdefols*.

PERENNIAL Winds. See the article WIND.

PERFECT, something to which nothing is wanting; or that has all the requisites of its nature and kind. See PERFECTION.

PERFECT, in arithmetic. *Perfect NUMBER* is that, all whose aliquot parts added together, make the same number with the number whereof they are such parts. See NUMBER.

PERFECT, in grammar. *Preter* or *preterit-perfect tense*, is an inflection, marking a time perfectly past; as *I have heard*: *plusquam-perfect*, is an inflection, expressing a time more than perfectly past; as *I had heard*, &c. See TENSE.

PERFECT, in music, denotes something that fills, and satisfies the mind, and the ear. — In which sense we say, *perfect cadence*, *perfect concord*, &c. See CONCORD, CADENCE, &c.

The ancients had two kinds of modes, the major and minor; and each of these again was either *perfect*, or *imperfect*. See MODE.

The word *perfect*, when joined with the words *mode*, and *time*, usually expresses triple time, or measure; in opposition to double time, which they called *imperfect*. See TIME, TRIPLE, &c.

PERFECT, in physiology. A *perfect animal* is used by some writers for that which is born by univocal generation; in opposition to insects, which they pretend to be produced by equivocal

generation. See GENERATION, UNIVOCAL, EQUIVOCAL, &c. PERFECT flowers are such as have petals, pistils, stamina, and apices. See FLOWER.

PERFECT mixts. } See the articles { MIXTS.  
PERFECT plants. } PLANTS.

PERFECTION, the state or quality of a thing perfect. See PERFECT. — This is of divers kinds: *physical*, *moral*, and *metaphysical*.

*Physical* or *natural* PERFECTION is that, whereby a thing has all its powers, or faculties, and those too in their full vigour; all its parts both principal and secondary, and those in their due proportion, constitution, &c. — In which sense a man is said to be *perfect*, when he has a sound mind in a sound body.

This *perfection* is, by the schoolmen, frequently called *energeticon*, by reason a thing is hereby enabled to perform all its operations.

*Moral* PERFECTION is an eminent degree of virtue, or moral goodness, to which men arrive by often repeated acts of piety, beneficence, &c.

This some subdivide into absolute or *inherent*, which is actually in him to whom we attribute it; and *imputative*, which exists in some other, and not in him it is attributed to.

*Metaphysical*, or *transcendental*, or *essential* PERFECTION is the possession of all the essential attributes, or of all the parts necessary to the integrity of a substance; or it is that whereby a thing has, or is provided of every thing belonging to its nature. See ESSENCE.

This is either *absolute*, where all imperfection is excluded, such is the *perfection* of God; or *secundum quid*, and in its kind. See GOOD.

PERFECTISSIMATE, PERFECTISSIMATUS, a quality or dignity, whereof we find mention made in the code. — *Perfectissimi* were those to whom the emperors trusted the presidency of any province. — Alciat imagined the name had been only given to the governors of Hispania Tarraconensis, and Noricum; but Calvin has shewn the contrary in his *Lexicon juridicum*.

The *perfectissimi* were inferior to the *clarissimi*, though the former word implies most perfect.

PERFIDIA, in musick, a term borrowed from the Italians, signifying an affectation of doing always the same thing, of pursuing the same design, continuing the same motion, the same song, the same passage, and the same figures of notes. See PASSAGE, &c.

Such are the stiff or constrained basses, as those of chacones, and I know not how many others, because depending wholly on the caprice of the composer.

PERFORANS manus, in anatomy, a muscle of the hand; call'd also, from its action, *flexor tertii internodii digitorum manus*. See Tab. Anat. (Myol.) fig. 2. n. 18. See PERFORATUS.

It arises fleshy from the fore and upper part of the ulna, and the ligament which joins that and the radius; and after forming a pretty thick fleshy body, is split into four round tendons; which passing under the annular ligament, and through the slits in the tendons of the former, are inserted into the third bone of each finger. See FINGER.

PERFORANS pedis, in anatomy, a muscle of the foot, called also *profundus*; and, from its action, *flexor tertii internodii digitorum pedis*, and *flexor magnus*.

It rises from the upper and back-part of the tibia, and passing under the inner ancle and ligament that ties the tibia and os calcis together, divides into four tendons, which, passing the holes of the perforatus, are inserted into the third phalanx of the lesser toes.

There is a *massa carnea*, or fleshy substance that arises from the os calcis, and which joins the tendons of this muscle where the lumbricales begin. See MUSCLE.

PERFORATIVE. See TREPANUM.

PERFORATUS manus, in anatomy, a muscle of the fingers, thus called from the perforations of its tendons by those of the perforans; sometimes *flexor secundi internodii*, from its action; and sometimes *sublimis*, from its situation. See Tab. Anat. (Myol.) fig. 2. n. 17.

It arises tendinous from the internal protuberance of the humerus, and the upper part of the radius before; and, being parted into four, passes under the annular ligament; whence it sends several tendons into the upper part of the phalanx of each finger: every tendon having, at the first internode, a slit or perforation for the admission of the tendons of the perforans.

PERFORATUS pedis, in anatomy, a muscle of the foot, called also *flexor pedis*, and *sublimis*.

It arises from the inner and lower part of the calcaneum, and sends a tendon to every bone of the second phalanx of each of the four lesser toes. — In this, as the *perforates* of the hand, there is a slit in each tendon about the first joint, which lets through the tendon of the perforans.

PERFUME, an agreeable artificial odour, striking the sense, or organ of smelling. See SMELL.

The generality of perfumes are made, or composed of musk, ambergreese, civet, rose, and cedar-woods, orange-flowers, jessamine, jonquils, tuberoles, and other odoriferous flowers.

Therein also enter storax, frankincense, benzoin, cloves, mace, and other like drugs, commonly called *aromatics*. See AROMATIC. — Some perfumes are also composed with aromatic herbs,

herbs, or leaves, as lavender, marjoram, sage, thyme, hyssop, &c.

*Perfumes* were anciently much in use; particularly those where-in musk, ambergreese, and civet enter; they are now generally disused, since people have become sensible of the harm they do the head.—In Spain and Italy they are still a-la-mode.

**PERFUMES**, *suffitus*, in pharmacy, &c. are topical or external medicines, composed of certain powders and gums, which, being mixed together, and thrown on the coals, produce a vapour, or smook, salutary in several diseases. See **SUFFITUS**. Fits of the mother are cured by the *perfume*, or fume of partridge feathers, old leather, &c. Burnt mercury is sometimes applied by way of *perfume*, called *fumes of cinnabar*.

There are dry *perfumes* made up in troches, pills, &c. of olibanum, mastic, aloes, &c. and moist viscous ones of the juices of herbs, &c.

**PERIANTHIUM**\*, or **PERIANTHÆUM**, in botany, the little green leaves which compals the bottom of a flower, called by Dr. Grew the *empalement*, and by others the *calyx*. See **CALYX** and **FLOWER**.

\* The word is formed from the Greek *περι*, about, and *ανθος*, flower. The use of the *perianthium* is to be a support, security, and, as it were, bands to the other parts of the flower. — Mr. Ray observes, that flowers, whose leaves or petala are strong, as tulips, have no *perianthium*, as needing none. Carnations, &c. whose petala are long and slender, have their *perianthium* of one piece; others, as the knap-weed, &c. have it of several pieces, and in divers rounds, and all with a counterchangeable respect to each other, for the greater strength and security of themselves and the petala, &c. they include.

**PERIAPTON**, *periapton*, a kind of medicine, otherwise called *periamma*, or *amulet*; which, being tied about the neck, is supposed to prevent, or cure diseases. See **AMULET**. See also **PHYLACTERY**.

**PERICARDIARY**, an epithet given to worms generated in the pericardium, or capula of the heart. See **WORMS** and **PERICARDIUM**.

M. Andry makes these one of the twelve kinds of worms engendered in the human body; they sometimes occasion convulsions, the paroxysms whereof last but a little while, but return incessantly.

These worms are accompanied with a frightful paleness of the face, a low pulse, violent pains of the stomach and breast.—They sometimes occasion a palpitation of the heart. See **PALPITATION**. M. Andry adds, that they have been known to occasion sudden death.

**PERICARDIUM**\*, *perikardiaion*, in anatomy, a membranous capula, or pouch, which includes the heart. See **HEART**.

\* The word is formed from the Greek *περι*, about, and *καρδια*, heart. The *pericardium* consists of a double membrane; the inner arising from the coats of the vessels of the heart, and the outer from the mediastinum. Its figure resembles that of the heart, conoidal; and it embraces the heart laxly, allowing room for its pulsation.

It is connected either immediately, or by vesiculae emitted from it, to the sternum, back, jugulum, and, in human bodies, to the tendinous part, or center of the diaphragm; whereas in brutes it is loose.

Its use is supposed to be to defend the heart; as likewise to contain a soft serous humour, which serves to lubricate and moisten the heart, and prevent any inflammation that might probably arise from the dry friction of the heart and its capula. But this latter use is controverted; for some take the humour found in it to be unnatural; and will have it forcibly separated by the convulsive agonies supervening in the article of death. In effect, anatomists are puzzled to find whence it should come, or from what vessels it is secreted.

Dr. Keil, in his treatise of animal secretion, shews that the liquor in the *pericardium* must be the most fluid of any separated from the blood, because its particles unite first, and are secreted first. For those particles which unite first, will have the greatest attractive force, consequently their particles must be the most spherical and most solid; and therefore their contact the least of any, therefore the most fluid. See **FLUIDITY**. In the memoirs of the French academy, M. de Mortal gives an instance of a *pericardium*, which, being opened, the liquor contained therein, was found congealed into a consistence fit to be cut with a knife, and two square fingers thick about the heart.

**PERICARPIA**\*, *perikarpia*, a name sometimes given to medicines that are applied to the wrist; otherwise called *epicarpia*. See **EPICARPIUM**.

\* The word is compounded of *περι*, about, and *καρπος*, carpus, the wrist.

**PERICARPUS**, or **PERICARPIUM**\*, in botany, a pellicle, or thin membrane, encompassing the fruit or seed of a plant. See **FRUIT**, **SEED**, &c.

\* The word is formed of the Greek *περι*, about, and *καρπος*, fruit.

**PERICHORUS**\*, in antiquity, a name given by the Greeks to their profane games and combats, i. e. to such as were not consecrated to any of the gods. See **GAMES**.

\* The word is formed from the Greek *περι*, about, and *χωρα*, country.

*Perichorus* in the original signifies near or neighbouring; apparently, because none but the people of the neighbourhood attended at these obscure exercises.—The champions did not fight in honour of any god, or hero, as in the others; but only for the prize sake.

**PERICRANIUM**\*, *perikranion*, in anatomy, a thick, solid coat or membrane, covering the out-side of the cranium or skull. See **CRANIUM**.

\* The word is formed from the Greek *περι*, about, and *κρανιον*, head or skull.

Some call it by the general name of *periosteum*, because of its adhering to the bone; others divide it into two membranes, the under whereof, immediately investing the skull, they call *periosteum*, and the upper the *pericranium*. In effect, it is one double membrane, consisting, as most others do, of two coats. It is supposed to have its origin from the *dura mater*; which, passing through the sutures of the skull by means of several filaments, forms this thick membrane; at least it is found connected to the *dura mater* by fibres transmitted from it to the membrane through the sutures.

About the origin of the temporal muscles the two coats of the *pericranium* part; the outer passing over those muscles, and the inner still adhering close to the cranium. See **PERIOSTEUM**.

**PERIDROME**, **PERIDROMUS**, in the ancient architecture, the space or isle, in a perptere, between the columns and the wall. See **PERIPTERE**.

Salmasius observes, that the *peridromes* served for walks among the Greeks.

**PERIEGETES**, *periegetes*, a Greek term, signifying a person who leads or conducts another about a thing, to shew it him, &c.

It is applied in antiquity to geographers, especially to those who described the sea-coasts: thus Dionysius is styled *periegetes*, for publishing a geography in hexameter verses, which Eustathius has commented on; both in Greek.

The name *periegetes* was also given to those who conducted strangers about in cities, to shew them the antiquities, monuments, curiosities, &c. thereof.—These were the same with what they now call antiquaries in Italy. See **ANTIQUARY**.

**PERIGÆUM**, **PERIGEE**, in astronomy, that point of the Sun's or Moon's orbit, wherein they are at their least distance from the earth. See **EXCENTRIC**.

In which sense *perigee* stands opposed to *apogee*. See **APOGEE**.

**PERIGEE**, in the ancient astronomy, denotes a point in a planet's orb, wherein the centre of its epicycle is at the least distance from the earth.

**PERIHELIMUM**\*, in astronomy, that point of the orbit of a planet or comet, wherein it is at its least distance from the sun. See **PLANET**, **COMET**, **SUN**, &c.

\* The word is formed from the Greek *περι*, about, and *ήλιος*, sol, sun.

*Perihelium* stands opposed to *aphelium*. The ancient astronomers, in lieu hereof, used *perigæum*; because they placed the earth in the centre. See **PERIGÆUM**.

**PERIMETER**\*, in geometry, the ambit or extent that bounds a figure or body. See **FIGURE**.

\* The word is formed from the Greek *περι*, about, and *μετρον*, measure.

The *perimeters* of surfaces or figures are lines; those of bodies are surfaces. See **SUPERFICIES**.

In circular figures, &c. instead of *perimeter* we say circumference or periphery. See **PERIPHERY**.

**PERINÆUM**, or **PERINEUM**, in anatomy, the space between the pudendum and the fundament; properly the ligamentous seam which connects those two parts, called by the Latins, *interfamineum*.

\* The word is Greek *περινησιον*, or *περινηος*, formed from *περι*, and *νησιον*, to inhabit.

**PERINDE** *valere*, in the canon law, a dispensation granted a clerk, who, being legally incapable of a benefice or other ecclesiastical function, is *de facto* admitted to it. See **DISPENSATION**.

The *perinde valere* is a kind of writ, thus called from two words therein, signifying the dispensation to be equivalent or tantamount to a legal capacity.

**PERIOCHA**, *perioche*, an argument indicating the sum of a discourse. See **ARGUMENT**.

**PERIOD**, *periodes*, in astronomy, the time taken up by a star or planet in making a revolution; or the duration of its course till it return to the same point of the heavens. See **REVOLUTION**.

The sun's, or rather the earth's *period* is three hundred and sixty five days, five hours, forty nine minutes. That of the moon twenty seven days, seven hours, forty three minutes, &c. See **SUN**, **MOON**, &c. The *periods* of the comets are now, many of them, pretty well ascertained. See **COMET**.

There is a wonderful harmony between the distances of the planets from the sun and their *periods* round him; the great law whereof is, that the squares of the periodic times are ever proportional to the cubes of their mean distances from the sun. See **PLANET**.

The several *periods* and mean distances of the several planets are as follow.

	Days	h.	'	"	mean Dist.
Saturn	10579	6	36	26	953800
Jupiter	4332	12	20	35	520110
Mars	686	23	27	30	152369
Earth	365	6	9	30	100000
Venus	224	16	49	24	72333
Mercury	87	23	15	53	38710

**PERIOD**, in chronology, denotes an epocha, or interval of time, by which the years are accounted; or a series of years whereby, in different nations, and on different occasions, time is measured. See **TIME**.

Such are the *Calippic* and *Metonic periods*, two different corrections of the Greek calendar; the *Julian period* invented by Joseph Scaliger; the *Victorian period*, &c.

**Calippic PERIOD** is a series of seventy six years, returning in a perpetual circle; which elapsed, the new and full moons are supposed to return to the same day of the solar year.

The *Calippic period* is an improvement on the *Metonic* of nineteen years, which proving inaccurate, Calippus the Athenian multiplied it by four, and thus arose the *Calippic period*. See **CALIPPIC**.

**Constantinopolitan PERIOD**. See **Julian PERIOD**.

**Dionysian PERIOD**. See **Victorian PERIOD**.

**Hipparchus's PERIOD** is a series of three hundred and four solar years, returning in a constant round, and restoring the new and full moons to the same day of the solar year, according to the sentiment of Hipparchus.

This *period* arises by multiplying the *Calippic period* by four.

Hipparchus assumed the quantity of the solar year to be 365 days, 5 hours, 55' 12". And hence concluded that in one hundred and four years Calippus's *period* would err a whole day. He therefore multiplied the *period* by four, and from the product cast away an entire day. But even this does not restore the new and full moons to the same day throughout the whole *period*; but they are sometimes anticipated 1 day, 8 hours, 23' 29" 20".

**Julian PERIOD**, a series of seven thousand nine hundred and eighty Julian years, arising by the multiplication of the cycles of the moon, the sun, and indictions into one another, commencing from the first day of January in the Julian year. See **JULIAN**.

The *Julian period* is also produced by multiplying the *Victorian period* by fifteen. Since every year in the *Julian period* has its particular cycles of the moon, sun, and indictions: *e. gr.* only the first has the moon's cycle one, the sun's cycle one, and the cycle of indictions one; all the years of this *period* are accurately distinguished from each other.

This *period* was invented by Scaliger, as a common receptacle of epochas, to facilitate the reduction of years of a given epocha to those of another epocha likewise given. It agrees with the Constantinopolitan epocha, or *period* used by the Greeks, except in this, that the cycles of the sun, moon, and indictions are reckoned differently; and in that the first year of the Constantinopolitan *period* differs from that of the *Julian period*.

**Metonic PERIOD**, or *cycle*, called also the *cycle of the moon*, is a series of nineteen years, which elapsed, the new and full moons are supposed to return to the same day of the solar year: it was thus called from its inventor Meton. See **METONIC**. See also **CYCLE**.

**Victorian PERIOD**, an interval of five hundred and thirty two Julian years, which elapsed, the new and full moons return on the same day of the Julian year, according to the sentiment of Victorinus or Victorius, who lived in the time of pope Hilary.

Some ascribe this *period* to Dionysius Exiguus; and hence call it the *Dionysian period*: others call it the *great paschal cycle*; because invented for computing the time of Easter.

The *Victorian period* is produced by multiplying the lunar cycle nineteen by the solar cycle eighteen; the product of which is five hundred thirty two. But neither does this restore the new and full moons to the same day throughout its whole duration, by one day, 19 hours, 58' 59" 40".

**PERIOD**, in grammar, denotes a little compass of discourse, containing a perfect sense; distinguished at the end by a point or full stop (.) and its members or divisions marked by commas, colons, &c. See **SENTENCE**, **POINT**, &c.

De Colonia defines *period* a short, but perfect sentence, consisting of certain parts or members depending one on another, and connected together by some common vinculum.

That celebrated definition of Aristotle is, A *period* is a discourse which has a beginning, a middle, and an end, all visible at one view.

The *periods* allowed in oratory are three: a *period* of two members, called by the Greeks *dicolos*, and the Latins, *bimembris*: a *period* of three members, *tricolos*, *trimembris*; and a *period* of four, *quadrimembris*, *tetracos*.

A strict oratorical *period* does not allow of either more or fewer than these: it is possible indeed to introduce a *period* of one member, called by Aristotle, *monocolos*, or *simple period*; but it will be reputed a flaw, and is a thing never practised by the masters.

The *period* may be likewise prolonged to five or six members; but then it changes its name: and, instead of *period*, commences what they call a *periodical discourse*.

A *period* of two members Cicero supplies us with: *Ergo & mihi meae pristinae vitae consuetudinem, C. Caesar, interclusam aperuisti; & his omnibus ad bene de republica sperandum quasi signum aliquod sustulisti.*

A *period* of three members the same Cicero gives us in the exordium of his *Manilian oration*: *Nunc cum antea, per aetatem, hujus auctoritatem loci contingere non auderem; statueremque nihil huc nisi perfectum ingenio, elaboratum industria, afferri oportere; omne meum tempus amicorum temperibus transmittendum putavi.*

A *period* of four members he gives us in that admirable description of the punishment of parricides. *Ita vivunt, ut ducere animam de caelo non queant: ita moriuntur, ut eorum ossa terra non tangat: ita jactantur fluctibus, ut nunquam abluantur: ita postremo ejiciuntur, ut ne ad saxa quidem mortui conqueant.*

The laws and measures of *periods* are pretty strictly regarded by orators, at least by the ancient ones: in ordinary discourse, and in the modern tongues, authors are much less severe.

In oratory, the members of *periods* are to be equal, or nearly equal; that the pauses or rests of the voice at the close of each member may be nearly equal; but in writing no ways intended for rehearsal, this is disregarded.

Common discourse allows of *periods* both longer and shorter than oratory; which admits of none less than two members, nor greater than four. Short, mutilated *periods* break the stream, and check the course of the sublime; and long ones embarrass and keep the mind too long in suspense; and even strain the voice, which is never to stop but at the ends of *periods*. Phalereus, Hermogenes, Terence, &c. confine the just *period* (called by the Latins, *Ambitus* and *Circuitus*) to four members; agreeable to the distich,

*Quatuor e membris plenum formare videbis*

*Rhetora circuitum, five ambitus ille vocetur.*

Of which sentiment is Cicero, who, in his *Orator*, says, *Constat ille ambitus & plena comprehensio e quatuor fere partibus, quae membra dicuntur, ut & aures impleat, & ne brevis sit quam satis sit, neque longior.* — An instance of a periodical discourse the same author gives us in the opening of his oration for Archias the poet: *Si quid in me sit ingenii, judices, quod sentio quam sit exiguum; aut si qua exercitatio dicendi, in qua me non inficior medicriter esse versatum; aut si hujus rei ratio aliqua ab optimarum artium studiis & disciplina profecta, a qua ego confiteor nullum aetatis meae tempus abhorruisse; earum rerum omnium vel in primis hic A. Licinius fructum a me repetere prope suo jure debet.*

*Periods* are said to be either *rotundi*, round, or *quadrati*, square, according to their different economy and cadences.

**Square PERIOD** is that consisting of three or four equal members, formerly distinguished from each other; as that of Cicero on the punishment of parricides.

**Round PERIOD** is that whose members or parts are so connected, and fitted into each other, as that the junctures or commissures are scarce seen; but the whole slides equally round, without any notable stops or inequalities. — Such are the *dicolos* and *tricolos* of Cicero abovementioned.

**PERIOD** is also used for the character (.) wherewith the *periods* of discourse are terminated and expressed; popularly called a *full-stop* or *point*. See **POINTING**.

Father Buffier observes two difficulties in the use of the *period*, or *point*; *i. e.* in distinguishing it from the colon, or double point; and in determining justly the end of a *period*, or perfect sentence.

It is observed, that the supernumerary members of a *period*, separated from the rest by colons and semicolons, usually commence with a conjunction. (See **COLON**.) Yet it is certain these same conjunctions sometimes rather begin new *periods* than supernumerary members of old ones. It is the sense of things, and the author's own discretion, that must make the proper distinction which of the two in effect it is. No rules will here be of any service, unless this be admitted as one, that when what follows the conjunction is of as much extent as what precedes it, it is usually a new *period*, otherwise not.

The second difficulty arises hence, that the sense appears perfect in several short detached phrases, wherein it does not seem there should be *periods*: a thing frequent in free discourse; as, *we are all in suspense: make your proposals immediately: you will be to blame for detaining us longer.* Where it is evident that simple phrases have perfect senses like *periods*, and ought to be marked accordingly; but that the shortness of the discourse making them easily comprehended, the pointing is neglected.

**PERIOD**, in numbers, is a distinction made by a point or comma after every sixth place, or figure; and is used in numeration, for the reader distinguishing and naming the several figures or places: which see under **NUMERATION**.

**PERIOD**,

**PERIOD**, in medicine, is applied to certain diseases which have intervals, and returns, to denote an entire course, or circle of such disease; or its progress from any state through all the rest, till it return to the same. See **DISEASE**.

Galen describes *period* as a time composed of an intension and remission; whence it is usually divided into two parts, paroxysm, or exacerbation, and remission. See **PAROXYSM** and **REMISSION**.

In intermitting fevers the *periods* are usually stated and regular; in other diseases, as the epilepsy, gout, &c. they are vague, or irregular. See **FEVER**.

**PERIOD** is also used, by some writers, for the state of a distemper or disease.

**PERIOD of the blood**, **PERIODUS sanguinis**, the circle of the blood, or the tour it makes round the body for the support of life. See **CIRCULATION**.

**PERIODEUTA**, ΠΕΡΙΟΔΕΥΤΗΣ, a church-officer among the Greeks, established by the council of Laodicea in towns, &c. where there were no bishops.

The *Periodeutæ* were a kind of rural deans, so called, according to Zonaras, because always on the road, going from one quarter to another, to keep the people in their duty. See **RURAL**.

Hence Gregory of Thessalonica calls them *ambulantes*, *walkers*. Balsamon calls them *exarchæ*; by which name they are known among the Greeks at this day. See **EXARCH**.

**PERIODIC**, **PERIODICAL**, something that terminates and comprehends a period. See **PERIOD**.

A *periodical month* is the space of time wherein the moon dispatches her period, or *periodic motion*, viz. 27 days, 7 hours, 43 minutes, in which time she returns to the same point of the zodiac, wherein she was when she left the sun. See **MONTH**.

**PERIODICAL diseases** are such as decline, and rise again with similar symptoms alternately. See **DISEASE** and **PERIOD**.

In the *Philosophical Transactions* Dr. Musgrave gives us an instance of a *periodic palsy*; Dr. Cole an instance of a *periodic convulsion*. See **CONVULSION**, **PALSY**, &c.

**PERIODIC**, in grammar, is applied to a style or discourse that has numbers, or which consists of just and artful *periods*. See **NUMBERS**.

**PERIODICAL winds**. See the article **WIND**.

**PERIOECI**\*, ΠΕΡΙΟΙΚΟΙ, in geography, such inhabitants of the globe as have the same latitudes, but opposite longitudes; or live under the same parallel and the same meridian, but in different semi-circles of that meridian, or opposite points of the parallel. See **GLOBE**.

\* The word is formed from the Greek περί, about, and οἰκίζω, I inhabit. These have the same common seasons throughout the year, and the same phenomena of the heavenly bodies; but their hours, or times of the day, are opposite to each other. When, v. gr. with the one it is mid-day, with the other it is mid-night. See **DAY** and **SEASON**.

**PERIOPHTHALMIUM**\*, in natural history, a thin skin which birds can draw over their eyes, to defend them, without shutting their eye-lids. — The same with the nictitating membrane. See **NICTITATING membrane**.

\* The word is compounded of the Greek περί, about, and ὀφθαλμός, eye.

**PERIOSTEUM** or **PERIOSTIUM**, in anatomy, a membrane pretty tough, and extremely sensible, covering the whole exterior surface of all the bones of the body, the teeth only excepted. — See *Tab. Anat. (Splanchn.) fig. 13. litt. g. g.* See also **BONE**.

\* The word is originally Greek, περιόστιον, formed of περί, about, and ὀστέον, bone.

The *periosteum* is derived from the *dura mater*, and consists principally of fibres detached thence; besides which it receives other fibres from the *membrana communis* of the muscles, or, as Dr. Havers imagines, from the fleshy fibres of the belly of the muscles which intersect the former. — That part of it which covers the cranium or skull is, by a peculiar name, called the *pericranium*. See **PERICRANIUM**.

The *periosteum* is very thin every where, though not every where alike. It adheres closely to the bone; and, in some places, is observed to send fibres into the very substance thereof.

Its principal use is to defend the muscles and tendons from being fretted in their action by the attrition of the hard substance of the bones; and to give notice, by its sensibility, of any thing that might annoy the bones. Indeed this last use is controverted; some of the latest anatomists maintaining, that the *periosteum* is insensible.

**PERIPATETIC philosophy**, the system of philosophy taught and established by Aristotle, and maintained by his followers the *peripateticks*. See **PERIPATETICKS**, **PHILOSOPHY**, and **PHYSICKS**.

A specimen of the *peripatetic philosophy* see under **ARISTOTELIAN**.

**PERIPATETICKS**, ΠΕΡΙΠΑΤΗΤΙΚΟΙ, a sect of philosophers, the followers of Aristotle, or the maintainers of the *peripatetic philosophy*; called also *Aristotelians*. See **ARISTOTELIAN**.

Cicero tells us, that Plato left two excellent disciples, Xenocrates and Aristotle, who founded two sects, which only differed in name; the former taking the appellation of *academics*, who were those that continued to hold their conferences in the

academy, as Plato had done before: the others, who followed Aristotle, were called *peripateticks*; from περιπατῶ, I walk, because they disputed walking in the Lyceum. See **ACADEMY** and **LYCEUM**.

Ammonius fetches the name *peripatetic* from Plato himself, who only taught walking; and adds, that the disciples of Aristotle, and those of Xenocrates, were equally called *peripateticks*; the one *peripateticks* of the academy, the other *peripateticks* of the lyceum; but that at length the former quitted the title *peripatetic* for that of academic, on occasion of the place where they assembled, and the latter retained simply that of *peripatetick*. See **ACADEMIC**.

The greatest and best part of Aristotle's Philosophy he borrowed from his master Plato: Serranus affirms confidently, and says, he is able to demonstrate it, that there is nothing exquisite in any part of Aristotle's philosophy, dialectics, ethics, politics, physics, or metaphysics, but is found in Plato. And of this opinion are many of the ancient authors, Clemens Alexandrinus, &c. See **PLATONISM**.

Gale endeavours to shew, that Aristotle borrowed a good deal of his philosophy both physical about the first matter, and metaphysical about the first Being, his Affections, truth, unity, goodness, &c. from the sacred books; and adds from Clearchus, one of his (Aristotle's) scholars, that he made use of a certain Jew, who assisted him therein.

Aristotle's philosophy preserved itself in *puris naturalibus*, a long time; none of his followers or commentators having dared to make any innovations therein till the beginning of the XIII<sup>th</sup> Century, when it began to be new modelled. — A reformed system of *peripateticism* was first introduced into the schools, in the university of Paris; from whence it soon spread throughout Europe, and has subsisted in the universities to this day under the name of *school philosophy*. See **SCHOLASTIC**, &c.

The foundation hereof is Aristotle's doctrine, frequently misunderstood, oftner misapplied; whence the retainers thereto may be denominated *reformed peripateticks*.

Out of these have sprung, at several times, several branches, the chief are the Thomists, Scotists, and Nominalists; see each under its proper Article, **THOMIST**, **SCOTIST**, and **NOMINAL**.

**PERIPETIA**, ΠΕΡΙΠΕΤΕΙΑ, in the drama, that part of a tragedy wherein the action is turned, the plot unravelled, and the whole concludes. See **TRAGEDY**.

\* The word comes from the Greek περιπίπτω, something falling into a different state, formed of περί, about, and πίπτω, cadō, I fall.

The *peripetia* is properly the change of condition, whether happy or unhappy, which the principal person or persons undergo: arising from some discovery or incident, which gives a new turn to the action.

The *peripetia*, therefore, coincides with the catastrophe, or unravelling; unless we make the *peripetia* to depend on the catastrophe, &c. as an effect on its cause. See **CATASTROPHE**.

The *peripetia* is sometimes induced by remembrance or discovery, as in the Oedipus, where the messenger, sent from Corinth to invite Oedipus to the Crown, informs him that Polybus and Merope were not his father and mother; which begins a discovery, that Laius, whom he had killed, and Jocasta, whom he had then to wife, were his father and mother, and throws him into the deepest distress. — This instance Aristotle calls a *double peripetia*. See **DISCOVERY**.

The qualities of the *peripetia* are, that it be probable and necessary; in order to which it must be the natural result, at least the effect, of the foregoing actions, or of the subject itself; not start out from any foreign or collateral cause.

Sometimes the *peripetia* is occasioned without any discovery; as in the Antigone of Sophocles, where the change in Creon's fortune is produced by the effect of his own obstinacy; and sometimes by a mere change of the will, which, though the least artful, yet, Mr. Dryden observes, may be so managed as to become exceedingly beautiful.

These two cases Aristotle calls *simple peripetias*; in these the change only consists in a passage out of trouble and action, into tranquillity and rest. See **FABLE**, **ACTION**, &c.

**PERIPHERY**\*, in geometry, the circumference or bounding-line of a circle, ellipsis, parabola, or other regular curvilinear figure. See **CIRCUMFERENCE**, **CIRCLE**, &c.

\* The word is formed from the Greek περιφέρω, circumfero, I surround; of περί, about, and φέρω, I bear or carry.

The *periphery* of every circle is supposed to be divided into 360 degrees, which are again subdivided, each into 60 minutes, the minutes into seconds, &c. See **DEGREE**, **MINUTE**, &c.

The divisions of degrees, therefore, are fractions, whose denominators proceed in a sexagesuple ratio; as the minute  $\frac{1}{60}$ , second  $\frac{1}{3600}$ , third  $\frac{1}{216000}$ . See **SEXAGESIMAL**.

But these denominators being troublesome; in their stead are used the indices of their logarithms; hence the degree, being the integer or unit, is marked by °, the minute by ', second by ", &c. See **MINUTE**, **SECOND**, &c.

Geometricians demonstrate, that a circle is equal to a triangle, whose base is equal to the *periphery*, and altitude to the radius. See **TRIANGLE**.

Hence it follows, that circles are in a ratio compounded of  
8 Q their

their peripheries and radii. But they are also in the duplicate ratio of their radii; therefore the *peripheries* of circles are to each other as their radii: and since the *periphery* of one circle is to its radius as the *periphery* of any other to its radius; the ratio of the *periphery* to the diameter is the same in all circles.

*Angle at the PERIPHERY.* See the article ANGLE.

**PERIPHRAISIS\***, in rhetoric, *circumlocution*; a circuit or tour of words, much affected by orators, to avoid common and trite manners of expression. See CIRCUMLOCUTION, FIGURE.

The word, in the original Greek, περιφρασις, signifies *circumlocution*; formed of περι, about, and φράζω, I speak.

The *periphrasis* is of good use on many occasions; and we are frequently forced to have recourse to it, to make things be conceived, which it is not proper to name.

It is a piece of politeness to suppress the names, and only intimate or design them. These turns of expression are particularly serviceable in oratory; for the sublime admitting of no direct citations, there must be a compass taken to insinuate the authors, whose authority is borrowed. A *periphrasis*, by turning round a proper name to make it understood, amplifies and raises the discourse; but care must be taken it be not too much swelled, nor extended *mal à propos*, in which case it becomes flat and languid.

**PERIPLUS**, ΠΕΡΙΠΛΟΥΣ, a voyage or navigation round a certain sea, or sea-coast. See NAVIGATION.

Arrian has described all the coasts of the Black-sea, after having inspected them in quality of general of the emperor Adrian, to whom he dedicates the description under the title of *Periplus of the Euxine sea*.

**PERIPNEUMONIA\***, ΠΕΡΙΠΝΕΥΜΟΝΙΑ, in medicine, an inflammation of some part of the thorax, properly of the lungs; attended with an acute fever, and a difficulty of breathing. See LUNGS, &c.

\* The word is formed from the Greek, περι, about, and πνεύμων, lungs.

The *peripneumonia* is distinguished into *vera*, or *true*; and *notha* or *spurious*.

The *true PERIPNEUMONY* is a real inflammation of the substance of the lungs, attended with a symptomatical fever, and a cough; by the former of which it is distinguished from an asthma, and by the latter from a pleurisy. See ASTHMA and PLEURISY. Its usual causes are, want of exercise, hard study, suppression of natural evacuations, a moist air, or the like. — When it arises from a phlegmon, the patient spits pure blood; when it is erysipelatous, the sputum is yellow, and not much tinged with red. In this last, the breast is not so much contracted, but the fever more violent.

The *peripneumonia* is more dangerous, though less painful than a pleurisy: its usual way of going off is by expectoration of well concocted reddish, yellow, or white matter. The flowing of the menses, or any hæmorrhage, a diarrhœa, abscesses about the ears, or other parts, are also good prognostics. — The medicines prescribed are mostly the same that obtain in asthmatick and pleuritick cases.

*Spurious* or *bastard PERIPNEUMONY* is a disease of the lungs, arising from a heavy, pituitous matter generated throughout the whole mass of blood, and discharged upon the lungs.

It is known by the viscidness, paleness and slowness of the blood, ropiness of the saliva, paleness and want of scent of the urine, swellings and obstructions in the minuter vessels, short breath, oppression in the thorax, &c. Worn out, phlegmatic, cold, phthitick, catarrhus constitutions are most liable to it. It begins with a feebleness, indolence, weariness, difficulty of breathing, oppression of the breast, feverishness; and goes on without any great appearance of danger to death itself, without any prognostic thereof in the urine, pulse, &c. It is cured by blood-letting, clysters, thin diet, diluters, abstersgents and aperients.

**PERIPTERE\***, ΠΕΡΙΠΤΕΡΟΣ, in the ancient architecture, a building encompassed on the out-side with a series of insulate columns, forming a kind of isle or portico all around.

\* The word is formed of the Greek περι, circum, about, and πτερον, ala, wing, q. d. winged on every side.

Such were the basilica of Antonine, the septizon of Severus, the portico of Pompey, &c.

*Peripteres* were properly temples, which had columns on all the four sides; by which they were distinguished from *prostyles*, and *amphiprostyles*, the one of which had no columns before, and the other none on the sides. See TEMPLE, PROSTYLE, &c.

M. Perrault observes, that *periptere*, in its general sense, includes all the species of temples which have portico's of columns all around; whether the columns be diptere, or pseudo-diptere, or simply *periptere*, which is a species that bears the name of the genus, and which has its columns distant from the wall by the breadth of an intercolumnation. — For the difference between *periptere* and *peristyle*, see PERISTYLE.

**PERISCII\***, ΠΕΡΙΣΚΙΟΙ, in geography, those inhabitants of the earth, whose shadows do, in one and the same day, successively turn to all the points of the horizon. See SHADOW.

\* And hence the name, from the Greek περισκιος, q. d. circumumbres; of περι, about, and σκιά, shadow.

Such are the inhabitants of the frozen zones, or those who live within the compass of the arctic and antarctic circles; for, as the sun never goes down to them after he is once up, but always round about, so do their shadows; inso much, that in the same day they have their shadows on all sides. See ZONE.

**PERISKYTISM\***, or PERISKYPHISM, in chirurgery, an operation performed by the ancients on the cranium. See CRANIUM.

\* The word is formed from the Greek περι and σκυν, to flay, or cut skin.

The *periskytism* is an incision which they made under the coronal suture, reaching from one temple across to the other, and penetrating to the bone of the cranium: its intention was to separate the pericranium from the skull. See PERICRANIUM.

**PERISSACHOREGIA**, a term found in the code, about the meaning whereof authors are much divided.

Alciat, and some others, will have it to be the name of an office, viz. that of curator of the annona or provisions, from περισσισια, abundance, and χορηγία, to lead, or bring — Others take it to be the office of a magistrate who was to look to the augmentation of the annona, and the distribution of the same.

Dom. Macri will have it to signify a donative, or distribution made to the soldiers, over and above their pay. See DONATIVE.

**PERISTALTIC**, ΠΕΡΙΣΤΑΛΤΙΚΟΣ, in anatomy, a motion proper to the intestines, wherein the several parts are successively contracted from above downwards, or from the pylorus to the anus; in manner somewhat resembling the creeping of a worm: whence it is also called the *vermicular motion*. See INTESTINES.

\* The word is formed from the Greek περιεσθλω; and literally implies something *driven* or *pressed all round*.

The *peristaltic* motion is performed by the contraction of the circular and longitudinal fibres, whereof the fleshy coat of the intestines is composed. It is by means hereof that the chyle is driven into the orifices of the lacteal veins, and the excrements pressed downwards, and at last expelled. See CHYLE and EXCREMENT.

When this motion comes to be depraved, and its direction changed, so as to proceed from below upwards, it produces what we call the *iliac passion*. See ILIAC passion.

M. Perrault in an express treatise on the *peristaltic motion*, observes, that though it is ordinarily only attributed to the intestines; yet, it is really an action common to all the parts of the body which alter, prepare, concoct the several humours and spirits, which are the matter and instruments of animal action. — In effect, he gives the name to all the motions whereby the cavities of the body are pressed, or compressed. See MUSCLE.

**PERISTAPHYLINUS**, in anatomy, a name which some give to the muscle of the uvula, more properly denominated *pterygo-staphylinus*. See UVULA and PTERYGOSTAPHYLINUS.

**PERISTYLE**, ΠΕΡΙΣΤΥΛΟΣ, in the ancient architecture, a place or building, encompassed with a row of columns on the inside; by which it is distinguished from the periptere, where the columns are disposed without-side. See PERIPTERE.

\* The word is formed from the Greek περι, about, and στυλος, column.

Such was the hypæthre temple of Vitruvius; and such are now some basilica's in Rome, several palaces in Italy, and most cloisters of religious.

**PERYSTYLE** is also used by modern writers for a range of columns, either within, or without a building.

Thus we say, the corinthian *peristyle* of the portail of the Louvre, &c.

**PERISYSTOLE**, ΠΕΡΙΣΥΣΤΟΛΗ, in anatomy, the pause or interval between the two motions of the heart, or pulse, viz. that of the systole or contraction, and that of the diastole or dilatation. See SYSTOLE and DIASTOLE. See also PULSE and HEART.

**PERITONÆUM\***, or PERITONEUM, in anatomy, a thin soft membrane, covering and containing all the viscera of the lower belly. — See Tab. Anat. (Splanchn.) fig. 1. lit. u u. fig. 3. lit. b b. See also VISCERA and ABDOMEN.

\* The term is Græc περιτοναιον, or περιτονειον, derived from the verb περιτείνω, circumtendo, I stretch all around.

The figure and size of the *peritonæum* answer to those of the lower belly, which it lines throughout; its internal surface is smooth, and lined with an unctuous humour, serving to prevent its wounding the intestines, and other parts it touches, as well as to lubricate and facilitate their motion; when the glands which furnish it are obstructed, the *peritonæum* grows thick, as is frequently found in dropsies.

The external surface is fibrous and unequal, that it may adhere more firmly to the muscles of the abdomen, linea alba, ossa pubis, ischium, ilium, sacrum, and the vertebræ lumbares, to which it is fastened; and from the last whereof many suppose it to have its origin.

It is also connected to the inferior or convex surface of the liver, which it suspends; and the part employed in this action, is called the *ligamentum suspensorium hepatis*.

The *peritonæum* is double every where, but most apparently so from the navel to the os pubis, and near the lumbar vertebræ; as appears

appears not only from its extraordinary thickness in both, but from its spontaneous parting in the latter, to receive the kidneys. It is perforated in the upper part to give passage to the œsophagus, aorta, and cava; in the under, for the fundament, the neck of the matrix, and the vessels that go to the thighs; and, in the fore-part, to give passage to the umbilical vessels.

Its exterior coat has two processes; which, in men, fall down into the scrotum, wrap up the spermatic vessels, and, dilating, make the *tunica vaginalis* of the testicles; in women they form a cover for the round ligament of the womb.

The *peritonæum* receives veins and arteries from the mammarizæ, diaphragmaticæ, epigastricæ, sacrae, and lumbares: nerves from the os sacrum and loins. Ol. Rudbeckius pretends to have likewise discovered lymphaticks, which, being scarce visible, except in hydropic cases, are not much taken notice of.

In morbid cases great quantities of serum have been found between the duplicatures of this membrane, when there was none in the cavity of the abdomen; which constitutes the true tympany. See *TYMPANY*.

The use of the *peritonæum* is to contain, and keep in their place the viscera of the abdomen; this is so manifest, that whenever this membrane happens to be broke, or extraordinarily dilated, some of the parts are apt to fall down, and to form those tumors called *hernias*, or *ruptures*. See *HERNIA*.

**PERITROCHIUM**, in mechanicks, a wheel, or circle, concentric with the base of a cylinder, and moveable together with it, about an axis. — Such is the wheel AB, *Tab. Mechanicks*, fig. 44, moveable on the axis EF.

The axis, with the wheel, and levers fixed therein to move it, make that mechanical power, called *axis in peritrochio*. See *axis in peritrochio*.

*Axis in peritrochio*, in mechanicks, one of the six mechanical powers, or simple machines, contrived for the raising of weights. — See its structure, doctrine, application, &c. under the article *AXIS in peritrochio*.

**PERJURY**, **PERJURIUM**, in law, the crime of swearing falsely in a lawful oath, administered by one who has authority, in any matter relating to an issue, or cause in question; whether it be of the person's own accord, or by subornation of another. See *OATH*. If a man calls me *perjured*, I have my action upon the case. If he calls me *forsworn*, no action lies, because the forswearing may be extra-judicial. — *Perjury* is usually excepted out of general acts of grace.

The punishment of *perjury* is collistrigium, the pillory, or burning the criminal in the forehead with a P, rooting up his trees, and confiscating his goods. See *PILLORY*, &c.

**PERMANENT air**. } See the articles { *AIR*.

**PERMANENT quantity**. } See the articles { *QUANTITY*.

**PERMEABLE** denotes a body considered as its pores are capable of letting somewhat pass through them. See *PORE*.

**PER MINIMA**, in medicine, denotes a perfect mixture of the smallest particles of several bodies or ingredients. See *MIXTURE* and *MINIMA*.

**PER MINIMA**, in pharmacy, denotes an intimate and perfect mixture of natural bodies; wherein their very *minima*, i. e. their atoms, or first component particles are supposed to be accurately blended together. See *MIXTION*.

If silver and lead be melted together, they will mingle *per minima*. See *SILVER*, *LEAD*, *METAL*, &c.

**PERMITTIT** — *quare non* **PERMITTIT**. See the article *QUARE*.

**PERMUTATION**, the truck or exchange of one thing for another. See *EXCHANGE*.

The commerce of the ancients was performed wholly by way of *permutation*. See *COMMERCE*.

**PERMUTATION**, in the canon law, a real and actual exchange of two benefices. See *BENEFICE*.

*Permutation* is a means of bringing benefices into commerce without simony. See *SIMONY*.

The conditions required to a canonical *permutation* are: 1°. That there be benefices *permuted* on either side, though the revenues be unequal, and, in case of inequality, no compensation to be made in money; but only a pension charged on the bigger. 2°. That each of the *permutants* quit his benefice, and make a procuracy *ad resignandum*. 3°. That the *permutation* be followed by a collation of the ordinary. 4°. That the ordinary be informed of the cause of the *permutation*. 5°. That those to whom the presentation or election to the benefices belongs, give their consent; or, in case of their refusal, that the consent of the diocesan be had.

The chief rules of *permutation* are, that if one of the *compermutants* cannot enjoy, he re-enters with full right into the benefice he has quitted; and that if he die ere he have accomplished the *permutation* on his part by the taking of possession, the *compermutant* who has accomplished, retains both benefices, unless they fall into the regale.

**PERMUTATION of quantities**, in algebra, the changes, alternations, or different combinations of any number of quantities. See *COMBINATION*.

**PERMUTATIONE archidiaconatus & ecclesiæ eidem annexæ cum ecclesiâ & prebenda**, is a writ issued to an ordinary, commanding him to admit a clerk to a benefice upon exchange made with another. *Reg. of Writs*.

**PER MY & per tout** — A joint tenant is said to be seized of the land he holds jointly, *per my & per tout*, i. e. he is seized by every parcel, and by the whole, *totum tenet, & nihil tenet*; *sc. totum conjunctim, & nihil separatim*. Bract. See *JOINTENANT* and *COPARCENER*.

**PERNANCY**, in law, the taking or receiving any thing — from the French, *prendre*, to take. See *PERNOR*.

Tithes in *pernancy* are tithes taken, or which may be taken, in kind. See *TITHES*.

**PERNIO**, in medicine, a disease afflicting the hands and feet in winter-time, popularly called a *kibe*, or *chilblain*. See *CHILBLAIN*.

The parts affected swell, inclining from a white to a bluish colour, itch and ache; yet the tumour vanishes without any exulceration, upon anointing the part with petrol.

**PERNOR of profits**, he who takes or receives the profits of any thing — from the French, *preneur*, taker. See *PERNANCY*.

**PERONE**, in anatomy, a bone of the leg, more usually called *fibula*. See *FIBULA*. Hence

**PERONEUS anticus**, *longus* or *primus*, a muscle of the leg, arising fleshy and tendinous from the head to the middle of the perone; whence, running as in a pulley through the channel on the hind part of the outer ankle-bone, it is inserted into the upper end of the bone of the metatarsus, which joins the great toe. The office of this muscle is to draw the foot upwards. See *Tab. Anat. (Myol.) fig. 1. n. 76. fig. 2. n. 46. fig. 6. n. 43. fig. 7. n. 28.*

**PERONEUS posticus**, *brevis* or *secundus*, a muscle sometimes also called *semifibularis*, arising fleshy and sharp on the back part of the perone; whence, continuing down the outer side of the bone till below the middle, it forms a smooth, strong, flat tendon, which runs through the same channel at the bottom of the malleolus externus, with the longus, to the out-side of the os metatarsi of the little toe. Its office is to pull the foot upwards. See *Tab. Anat. (Myol.) fig. 1. n. 76. fig. 6. n. 44. fig. 7. n. 28.*

**PERORATION**, **PERORATIO**, in rhetoric, the epilogue, or last part of an oration; wherein what the orator had insisted on through his whole discourse, is urged afresh with greater vehemence and passion. See *ORATION*.

The *peroration* consists of two parts: 1. recapitulation, wherein the substance of what was diffused throughout the whole speech, is collected briefly and cursorily, and summed up with new force and weight. See *RECAPITULATION*.

2. The moving the passions, which is so peculiar to the *peroration*, that the masters of the art call this part, *sedes affectuum*. See *PASSIONS*.

The passions to be raised in the *peroration* are various, according to the various kinds of orations: in a panegyric, love, admiration, emulation, joy, &c. In an invective, hatred, contempt, &c. In a deliberation, hope, confidence, or fear.

The qualities required in the *peroration* are, that it be vehement and passionate, and that it be short; because, as Cicero observes, tears soon dry up.

The *peroration* was Cicero's master-piece, here that great orator not only set his Judges and auditors on fire, but even seemed to burn himself; especially when he was to raise pity and commiseration towards the accused, where, as he himself tells us, he frequently filled the Forum with weeping and lamentation. He adds, that where there were several orators to speak for the same person, the *peroration* was always reserved to Cicero; and subjoins, that if he excelled herein, it was not owing to genius, but the grief himself shewed. — This is abundantly evident in his *Milonian peroration*; where he says, *sed finis sit: neque enim præ lachrymis jam loqui possum; & hic se lachrymis defendi vetat*; — and in that for *Rabirius Posthumus*; *sed jam, quoniam, ut spero, fidem quam potui tibi præstiti, Posthume, reddam etiam lachrymas quas debeo — jam indicat tot hominum fletus quam sis carus tuis, & me dolor debilitat, includitque vocem.*

**PERPENDICULAR**, in geometry, a line falling directly on another line, so as to make equal angles on each side; called also a *normal* line. See *LINE*.

Thus the line IG (*Tab. Geometry fig. 57.*) is *perpendicular* to the line KH. i. e. makes right and equal angles therewith.

From the very notion of a *perpendicular*, it follows: 1. That the *perpendicularity* is mutual; i. e. if a line, as IG, be *perpendicular* to another KH; that other is also *perpendicular* to the first.

2. That only one *perpendicular* can be drawn from one point in the same place.

3. That if a *perpendicular* be continued through the line it was drawn *perpendicularly* to; the continuation will also be *perpendicular* to the same.

4. That if there be two points of a right line, each of which is at an equal distance from two points of another right line; that line is *perpendicular* to the other.

5. That a line which is *perpendicular* to another, is also *perpendicular* to all the parallels of the other. See *PARALLEL*.

6. That a *perpendicular* line is the shortest of all those which can be drawn from the same point to the same right line.

Hence the distance of a point from a line, is a right line, drawn from the point *perpendicular* to the line or plane; and hence the

the altitude of a figure is a *perpendicular* let fall from the vertex to the base. See DISTANCE.

To erect a PERPENDICULAR GI on any given point G, in a right line ML: one foot of the compasses being in G, with any interval at pleasure, cut off equal parts on each side GH and GK; from the points K and H, with an interval greater by half than KH strike two arches intersecting in I; the right line GI is *perpendicular* to ML.

*Perpendiculars* are best described in practice by means of a square; one of whose legs is applied along that line to or from which the *perpendicular* is to be let fall or raised. See SQUARE.

To erect a PERPENDICULAR on the end of a given line, suppose at P; open your compasses to any convenient distance, and setting one foot in C, describe the arch RPS; lay a ruler from S through C, it will find the point R in the arch, whence draw PR, which is *perpendicular* to PM.

To let fall a PERPENDICULAR on a given line, MP; from a given point L, fig. 57. n. 2: set one foot of the compasses in L, and with the other cross the given line in the points M and G. Then setting the compasses in G and M, strike two arches intersecting each other in a: then lay a ruler from L to a, and the Line KL described thereby is the *perpendicular* required.

A line is said to be *perpendicular* to a plane, when it is *perpendicular* to more than two lines drawn in that plane.

A plane is said to be *perpendicular* to another plane, when a line in one plane is *perpendicular* to the other plane. See PLANE.

PERPENDICULAR to a parabola, is a right line cutting the parabola in the point in which any other right line touches it, and is also itself *perpendicular* to that tangent. See PARABOLA.

PERPENDICULARITY of plants, is a curious phenomenon in natural history, first observed by M. Dodart, and published in an express essay on the affectation of *perpendicularity* observable in the stems or stalks of all plants, in the roots of many, and even in the branches as much as possible. See PLANT.

The matter of fact is, that though almost all plants rise a little crooked, yet the stems shoot up *perpendicularly*, and the roots sink down *perpendicularly*; even such as, by the declivity of the soil, come out inclined, or such as are diverted out of the *perpendicular* by any violent means, again redress or streighten themselves, and recover their *perpendicularity*, by making a second and contrary bend or elbow, without rectifying the first. A common eye looks on this affectation without any surprize; but a man that knows what a plant is, and how formed, finds it a subject of astonishment.

In effect, each seed contains a little plant, already formed, and needing nothing but to be unfolded: the little plant has its little root; and the pulp, which is usually separated into two lobes, is the foundation of the first food the plantule draws, by its root, when it begins to germinate. See Seed, RADICLE, &c.

Now if a seed in the earth be so disposed, as that the root of the little plant be turned downwards, and the stem upwards, and even *perpendicularly* upwards; it is easy to conceive that the little plant coming to unfold itself, its stalk and root need only follow the direction they have to grow *perpendicularly*. But it is known the seeds of plants, whether sown of themselves, or by the help of man, fall in the ground at random; and, among an infinite number of situations with regard to the stalk of their plant, the *perpendicular* one upwards is but one. See SEMINATION.

In all the rest, therefore, it is necessary the stalk redress or rectify itself, in order to get out of the ground; but what force is it that effects this change, which is certainly a violent action? is it that the stalk, finding a less load of earth above it, goes naturally that way where it finds the least obstacle? were this so, the little root, when it happens to be uppermost, must for the same reason follow the same direction, and mount on high.

M. Dodart, therefore, to account for two such different actions, has recourse to another system: he supposes that the fibres of the stalks are of such a nature, as that they contract and shorten by the heat of the sun, and lengthen out by the moisture of the earth; and, on the contrary, that the fibres of the roots contract by the moisture of the earth, and lengthen by the heat of the sun.

When then the plantule is inverted, and the root a-top; the fibres, which compose one of the branches of the root, are not equally exposed to the moisture of the earth, the lower part is more exposed than the upper. The lower therefore must contract the most; which contraction is again promoted by the lengthening of the upper, whereon the sun acts with the greatest force. Of consequence therefore this branch of the root must recoil towards the earth, and, insinuating through the pores thereof, get underneath the bulb, &c.

By inverting this reasoning, it is easy to shew how the stalk comes to get uppermost.

In a word, we may imagine, that the earth attracts the root to itself, and that the sun contributes to its descent; and, on the contrary, that the sun attracts the stem, and the earth, in some measure, sends it towards the same.

As to the second streightening, viz. that of the stalks in the open air, he takes it to arise from the impression of external

causes, particularly the sun and rain. For the upper part of a stalk that is bent, is more exposed to the rain, dew, and even sun, &c. than the under. Now both these causes, in a certain structure of the fibres, tend equally to streighten the part most exposed, by the shortening they successively occasion in it; for moisture shortens by swelling, and heat by dissipating. Indeed what that structure is, which gives the fibres such different qualities, or whereon it depends, is still a mystery.

M. de la Hire accounts for the *perpendicularity* of the stems or stalks of plants thus: he imagines, that in plants the root draws a coarser and heavier juice; and the stem and its branches a finer and more volatile one. And, in effect, most naturalists conceive the root as the stomach of the plant, where the juices of the earth are subtilized, so as to become able to rise through the stem to the extremity of the branches. This difference of juices supposes larger pores in the roots than the stalk, &c. and, in a word, a different contexture; which difference must be found even in the little invisible plant inclosed in the seed: in this plantule, therefore, we may conceive a point of separation; such as that all on one side, e. gr. the root shall be unfolded by the grosser juices, and all, on the other side, by the more subtil juices.

Suppose now the plantule, when its parts begin to unfold, to be entirely inverted; the root a-top, and the stalk below: the juices, which enter the root, will still be coarsest, and when they have opened and enlarged the pores, so as to admit juices of a determinate weight, those juices still pressing the root more and more, will drive it downwards, and this the more, as the root is more extended or enlarged; for the point of separation being conceived as the fixed point of a lever, they will act by the longer arm. At the same time the volatile juices having penetrated the stalk, will tend to give it a direction from below upwards; and, by reason of the lever, will give it more and more every day. Thus is the little plant turned on its fixed point of separation till it be perfectly erect.

The plant thus erected, the stalk, we know, should continue to rise *perpendicularly*, to give it the more firm bidding, and enable it to withstand the effort of wind and weather.

The manner wherein this is effected, M. Parent lays down thus: the nutritious juice, being arrived at the extremity of a rising stalk, if it evaporate, the weight of the air which encompasses it on all sides, will make it ascend vertically; and if it do not evaporate, but congeal, and remain fixed to that extremity whence it was ready to go off, the weight of the air will give it the same direction; so that the stalk will have acquired a very little new part, vertically laid over it; just as in a candle held any how obliquely to the horizon, the flame still continues vertical by the pressure of the atmosphere. The new drops of juice that succeed, will follow the same direction; and as all together from the stalk, that mult of course be vertical, unless some particular circumstance intervene.

As to the branches, which are at first supposed to proceed laterally out of the stalk in the first embryo of the plant, though they should even come out in a horizontal direction, yet must they raise themselves upwards by the constant direction of the nutritious juice; which at first scarce meets any resistance in a tender, supple branch; and even afterwards, though the branch grow more firm, yet will it act with the more advantage, since the branch, being become longer, furnishes it with a longer arm of lever. The slender action of a little drop becomes very considerable by its continuity, and by the assistance of such favourable circumstances. Hence may be accounted for, that regular situation and direction of the branches, which all, and always nearly make the same constant angle of 45° with the stem and one another. See BRANCH.

M. Astruc accounts for the *perpendicularity* of the stems, and their redressing themselves, on these two principles. 1° That the nutritious juice arises from the circumference of the plant, and terminates in the pith. 2° That fluids contained in tubes, either parallel or oblique to the horizon, gravitate on the lower part of the tubes, and not at all on the upper.

From hence it easily follows, that, in a plant posited either obliquely or parallel to the horizon, the nutritious juice will act more on the lower part of the canals than the upper, and by this means insinuate more into the canals communicating therewith, and be collected more copiously therein; thus the parts on the lower side will receive more accretion, and be more nourished than those on the upper; the consequences whereof must be, that the extremity of the plant will be obliged to bend upwards.

The same principle brings the seed into its due situation at first: in a bean planted upside down, the plume and radicle are easily perceived with the naked eye, to shoot at first directly for about an inch; but thenceforth they begin to bend, the one downward, and the other upward. The like is seen in a heap of barley to be made into malt, in a quantity of acorns laid to sprout in a moist place, &c. each grain of barley in the first case, and each acorn in the second, has a different situation; and yet all the sprouts tend directly upward, and the roots downward, and the curvity or bend they make is greater or less as their situation approaches more or less to the direction wherein no curvature at all would be necessary. Now, two such

opposite motions cannot arise without supposing some considerable difference between the two parts: the only one we know of, is, that the plume is fed by a juice imported to it by tubes parallel to its sides; whereas the radicle imbibes its nourishment at all the pores in its surface. As oft, therefore, as the plume is either parallel, or inclined to the horizon, the nutritious juice feeding the lower parts more than the upper, will determine its extremes to turn upward, for the reasons already assigned. On the contrary, when the radicle is in the like situation, the nutritious juice penetrating more copiously through the upper part than the under, there will be a greater accretion of the former than the latter; and consequently the radicle will be bent downwards. And this mutual curvity of the plume and radicle must continue till such time as their sides are nourished alike, which cannot be till they are perpendicular. *Memoires de l'Acad. Royale des Sciences*, an. 1708.

**PERPETUAL**, something that endures always, or that lasts for ever. See **ETERNITY**.

**PERPETUAL** is sometimes also used for a thing that lasts or holds during a person's life.

Thus offices, &c. held *durante vita* are sometimes called *perpetual* offices.—In this sense M. Fontenelle is said to be *perpetual* secretary of the royal academy of sciences. Hence the French call him absolutely, *M. le Perpetuel*.

**PERPETUAL action**. See the article **ACTION**.

**PERPETUAL glands**, in anatomy, are those which are natural: thus distinguished from the adventitious ones. See **GLAND**.

**PERPETUAL Lamp**. See the article **LAMP**.

**PERPETUAL motion**, in mechanics, is a motion which is supplied and renewed from itself, without the intervention of any external cause; or, it is an uninterrupted communication of the same degree of motion from one part of matter to another in a circle, (or other curve returning into itself) so as the same momentum still returns undiminished upon the first mover. See **MOTION**.

To find a *perpetual* motion, or to construct an engine, &c. which shall have such a motion, is a famous problem that has employed the mathematicians of two thousand years; though none perhaps have prosecuted it with attention and earnestness equal to those of the present age.

Infinite are the schemes, designs, plans, engines, wheels, &c. to which this longed for *perpetual* motion has given birth; it were as endless as impertinent to give a detail of them all.

Nor does any of them deserve particular mention, since they have all equally proved abortive. It would rather be of the nature of an affront than a compliment, to distinguish the pretenders hereto; when the very thing they are commemorated for, carries with it so disagreeable an idea.

In effect, there seems but little in nature to countenance all this assiduity and expectation; among all the laws of matter and motion we know of none yet, which seems to lay any principle or foundation for such an effect. See **NATURE**.

Action and re-action are allowed to be ever equal; and a body which gives any quantity of motion to another, loses just so much of its own: but under the present state of things, the resistance of the air, the friction of the parts of machines, &c. do necessarily retard every motion. See **RESISTANCE**.

To keep the motion on foot, therefore, either 1<sup>st</sup> there must be a supply from some foreign cause; which, in a *perpetual* motion is excluded.

Or, 2<sup>dly</sup>, all resistance from the friction of the parts of matter must be removed, which implies a change in the nature of things. See **MATTER** and **FRICTION**.

For, by the second law of nature, the changes made in the motions of bodies are always proportional to the impressed moving force, and are produced in the same direction with it; no motion then can be communicated to any engine greater than that of the first force impressed. See **COMMUNICATION** and **PERCUSSION**.

But, on our earth, all motion is performed in a resisting fluid, and must therefore of necessity be retarded; consequently a considerable quantity of its motion will be spent on the medium. See **MEDIUM**.

Nor is there any engine or machine wherein all friction can be avoided; there being in nature no such thing as exact smoothness, or perfect congruity; the manner of the cohesion of the parts of bodies, the small proportion the solid matter bears to the vacuities between them, and the nature of those constituent particles not admitting it. See **FRICTION**.

This friction, therefore, will also in time sensibly diminish the impressed or communicated force; so that a *perpetual* motion can never follow, unless the communicated force be so much greater than the generating force, as to recompense the diminution made therein by all these causes; but *nil dat quod non habet*, the generating force cannot communicate a greater degree of motion than it hath itself.

The whole business of finding a *perpetual* motion, therefore, comes to this, *viz.* to make a weight heavier than itself, or an elastic force greater than itself. See **MACHINE**.

Or 3<sup>dly</sup> and lastly, there must be some method of gaining a force equivalent to what is lost, by the artful disposition and combination.

tion of mechanic powers: to which last point then all endeavours are directed; but how, or by what means such force should be gained, is still a mystery!

The multiplication of powers or forces, it is certain, avails nought; for what is gained in power is still lost in time, so that the quantity of motion still remains the same.

All mechanics cannot really make a little power equal, or superior to a larger; and wherever a less power is found in equilibrium with a larger, *v. gr.* twenty-five pounds with a hundred, it is a kind of deception of the sense: the equilibrium is not strictly between one hundred and twenty five; but between one hundred pounds, and twenty five moving, or disposed to move four times as fast as the one hundred.

To consider the weights, one hundred, and twenty five, as fixed and immoveable, the twenty five may seem, some how, raised beyond themselves; which is one of the sham miracles of mechanics that have deceived millions; but which is easily dissipated by considering the four degrees of velocity, which are to be given to the twenty five pounds, and which require a force equal to the excess of one hundred above twenty five pounds. A power of ten pounds moved with ten times the velocity of the one hundred pounds, would have equalled them in the like manner; and the same may be said of all the possible products equal to one hundred. But, in fine, there must still be one hundred pounds of power on each side, what way soever they be taken, whether in the matter, or in the velocity.

This is an inviolable law of nature; by which nothing is left to art, but the choice of the several combinations that may produce the same effect. See **LAW OF NATURE**.

**PERPETUAL occultation**. See the article **OCCULTATION**.

**PERPETUAL pills**, *pillule PERPETUÆ*, among physicians, are pills made of regulus of antimony; which being swallowed, and voided fifty times, will purge every time with undiminished force. See **ANTIMONY** and **PILL**.

**PERPETUAL**, or *endless screw*. See **SCREW**.

**PERPETUAL Virginity**. See the article **VIRGIN**.

**Circle of PERPETUAL apparition**. See the article **CIRCLE**.

**PERPETUITY**, **PERPETUITAS**, in the canon law, the quality of a benefice that is irrevocable, or whose incumbent cannot be deprived, except in certain cases determined by law. See **BENEFICE**.

It is asserted with reason, that the *perpetuity* of benefices is established by the ancient canons, and that priests are inseparably attached to their churches, as by a spiritual marriage. It is true by the corruption of the times, the secular priests being fallen into great disorder, and even contempt, the bishops anciently called the religious to their assistance, and committed to them the cure of souls, and the administration of parishes; still remanding them back again to their cloisters, when they thought fit, and revoking them *ad nutum*.

But this vague and uncertain administration only lasted to the XII<sup>th</sup> century, when benefices return'd to their essential *perpetuity*.

**PER QUÆ servitū** is a writ judicial, issuing on the note of a fine; and lies for the cognize of a manor, seignory, chief rent or other services, to compel the tenant of the land, at the time of the fine levied, to attourn to him.

**PERQUISITE**, **PERQUISITUM**, any thing gotten by a man's own industry, or purchased with his own money.—In contradistinction to that which descends to him from his father, or ancestors.

**PERQUISITES of courts** are those profits which arise to a lord of a manor by virtue of his court-baron, over and above the certain yearly profits of his lands; as fines of copy-holds, heriots, amerciaments, waives, strays, &c.

**PERRIWIG**. See the article **PERRUKE**.

**PERRON**, in architecture, a stair-case lying open, or without-side the building; properly the steps before the front of the building, which lead into the first story when raised a little above the level of the ground. See **STAIR-CASE**.

*Perrons* are made of different forms and sizes, with regard to the space and height they are to lead to.—Sometimes the steps are round, or oval, more usually square.

**PERRUKE\***, or **PERRIWIG**, was anciently used for a long head of natural hair; such, particularly, as there was care taken in the adjusting and trimming of. See **HAIR**.

\* Menage derives the word, by a long detour, from the Latin *pilus*, hair. The several stages of its passage, according to the critic, are *pilus*, *pelus*, *pelutus*, *peluticus*, *pelutica*, *perutica*, *perruca*, *perruque*.

The Latins called it *coma*; whence part of Gaul took the denomination of *Gallia comata*, from the long hair which the natives wore as a sign of freedom. An ancient author says, that Absalom's *perruque* weighed two hundred shekels.

**PERRUKE** is now used for a set of false or borrowed hair, curled, buckled, and sewed together on a frame or cawl; anciently called *capillamentum*, or *false perruque*. See **HAIR**.

It is doubted whether or no the use of *perruques* was known among the ancients. It is true, they used false hair; Martial and Juvenal make merry with the women of their time, for making themselves look young with their borrowed hair; with the men who changed their colours according to the seasons;

and the dotards, who hoped to deceive the destinies by their white hair.  
 But these seem to have scarce had any thing in common with our *perrukes*, and were at best composed of hair painted and glued together; nothing can be more ridiculous than the description Lampridius gives of the emperor Commodus's *perruke*: it was powdered with scrapings of gold, and oiled (if we may use the expression) with glutinous perfumes for the powder to hang by.  
 In effect, the use of *perrukes*, at least on their present footing, is not an hundred years old: the year 1629 is reckoned the epocha of long *perrukes*; at which time they began to appear in Paris; whence they spread by degrees throughout the rest of Europe.  
 At first it was reputed a scandal for young people to wear them; by reason the loss of their hair, at that age, was attributed to a disease, the very name whereof is a reproach: but at length the mode prevailed over the scruple, and now all ages and conditions wear them; foregoing, without any necessity, the conveniences of their natural hair.  
 It was some time, though, ere ecclesiasticks came into the fashion: the first who assumed the *perruke* were some of the French clergy, in the year 1660; nor is the practice yet well authorized. The cardinal Grimaldi in 1684, and the bishop of Lavaur in 1688, prohibited the use of the *perruke* to all priests without a dispensation and necessity. M. Thiers has a treatise express, to prove the *perruke* indecent in an ecclesiastic, and directly contrary to the decrees and canons of councils. A priest's head embellished with artificial hair curiously adjusted, he esteems a monster in the church; nor can he conceive any thing so scandalous as an abbot with a florid countenance, heightened with a jolly *perruke*.  
**PERRY**, a drink made of pears, after the like manner as cider from apples. See CIDER.  
 The best fruit for this use are such as are least fit for eating; *e. gr.* the borbery-pear, horse-pear, boreland-pear, and choak-pear: and still the redder they are the better.  
 The method of preparing *perry*, is perfectly the same with that of cider.—Only note, that the fruit must be perfectly ripe. Some mix crabs with them to mend the liquor.  
**PER SE**, in the schools, is sometimes opposed to *per accidens*.—In which sense, a thing is said to agree with another *per se*, when the agreement is not owing to any accidental event, but is found in the intrinsic principles of things themselves.  
**PER SE** is sometimes also opposed to *per aliud*.—In which sense God alone is said to have a being *per se*, as not deriving it from any other, but having it necessarily and of himself.  
**PER SE**, again, sometimes signifies as much as, of its own nature or in virtue of its own entity.—Thus the sun is said to give light *per se*; and quantity is extended *per se*.  
**PER SE** among logicians—A thing is said to be known *per se*, *per se notum*, when we immediately perceive it upon the first proposing of the terms.—As, that the whole is greater than its parts. See AXIOM.  
 Philosophers go so far as to consider the mode of a thing existing *per se*, or that which constitutes its existence such; which they call *per seity*, *per seitas*. See EXISTENCE.  
**Object PER SE**. See the article OBJECT.  
**PER SE**, in chymistry. When a body is distilled singly, and without the usual addition of any other matter to raise it, it is said to be distilled *per se*. See DISTILLATION.  
 The genuine spirits of harts-horn, are those raised *per se*, in opposition to those distilled with the addition of chalk.  
**PERSECUTION**, **PERSECUTIO**, literally imports any pain, affliction, or inconvenience, which a person designedly inflicts on another.  
**PERSECUTION**, as a term, is restrained to the sufferings of christians, in behalf of their religion; particularly to those of the primitive christians, under the heathen emperors Nero, Decius, Dioclesian, &c. See MARTYR.  
 We usually reckon ten of these persecutions; Nero lighted the first.  
 Lactantius has wrote the history of the deaths of *persecutors*; though some question whether that work be really his or not: bishop Burnet, who has turned it into English, makes no great doubt of it.  
**PERSEVERANCE**, in theology, a christian virtue, whereby we are enabled to persist in the way of salvation to the end. The final *perseverance* of the saints is an article much controverted between the Arminians and Calvinists: the latter of whom maintain it impossible for grace to be lost; and therefore make *perseverance* to the end a necessary consequence thereof: which the former deny; believing the most confirmed believers never out of a possibility of falling. See GRACE, CALVINISM, &c.  
**PERSEUS**, in astronomy, a constellation of the northern hemisphere; whose stars, in Ptolemy's catalogue, are twenty nine; in Tycho's as many; in the Britannic catalogue sixty seven, the longitudes, latitudes, magnitudes, &c. whereof are as follow.

Names and situation of the stars.	Sign.	Longit.	Latitude, North.	Magnit.
In Andromeda's foot, according to Ptolemy and Tycho; according to Bayer in Perseus.	♈	8 08 36	35 23 45	4
In the middle of the sword		10 18 13	36 49 13	5

**PERSIAN**, or the **PERSIAN tongue**, one of the living oriental languages; spoke in the empire of Persia. See LANGUAGE.  
 The *Persian* has two particularities not found in any of the other eastern tongues, the one that it has an auxiliary verb, answering to the verb *εἶμι* of the Greeks; the other, that it has an Aorist.

ristus.—Both these it borrowed from the Macedonians, after the conquest of Alexander. See GREEK.

**PERSIAN Wheel**, in agriculture, is a machine for raising a quantity of water sufficient to overflow lands bordering on the banks of rivers, &c. where the stream is too low to do it alone. See WHEEL.

**PERSIAN** or **PERSIC**, in architecture, a name common to all statues of men, serving instead of columns, to support entablatures.—See *Tab. Architect.* fig. 37. See also **STATUE** and **COLUMN**.

They only differ from *caryatides*, in that those represent statues of women. See **CARYATIDES**.

The *Persian* is a kind of order of columns first practised among the Athenians, on occasion of a victory their general Pausanias obtained over the *Persians*. As a trophy of this victory, the figures of men dressed in the *Persian* mode, with their hands bound before them, and other characters of slavery, were charged with the weight of doric entablatures, and made to do the office of doric columns. See *Tab. Architect.* fig. 37. See also the article **ORDER**.

*Persian* columns, M. le Clerc observes, are not always made with the marks of slavery; but are frequently used as symbols of virtues, vices, of joy, strength, and valour, &c. as when made in the figures of Hercules to represent strength, of Mars, Mercury, Fauns, Satyres, &c.

**PERSIAN Era**, and **Year**. See **EPOCH** and **YEAR**.

**PERSIAN Bible**. } See the article { **BIBLE**.

**PERSIAN Coins**. } See the article { **COINS**.

**PERSIAN Money**. } See the article { **MONEY**.

**PERSON**, **PERSONA**, an individual substance, of a rational or intelligent nature. See **SUBSTANCE** and **INDIVIDUAL**.

The father and son are reputed, in law, as the same *person*; an ambassador represents the *person* of his prince. See **EMBASSADOR**.

In theology the godhead is divided into three *persons*; but here the word *person* carries a peculiar idea, very different from that attached to it every where else; being only used for want of another term more pertinent and expressive. See **TRINITY**.

The word *person*, *persona*, is said to be borrowed à *personando*, from *personating* or counterfeiting, and is supposed to have first signified a mask; by reason, says Boethius, in *larva concava sonus voluatur*; and hence the actors, who appeared masked on the stage, were sometimes called *larvati*, and sometimes *personati*.

The same author adds, that as the several actors represented each their single individual man, viz. Oedipus, or Chremes, or Hecuba, or Medea; for this reason, other people, who were also distinguished by something in their form, character, &c. whereby they might be known, came also to be called by the Latins *personæ*, and by the Greeks *ὑποκρίματα*.

Again, as those actors rarely represented any but great and illustrious characters; the word came at length to import the mind, as being a thing of the greatest regard and dignity among human matters.—And thus men, angels, and even God himself, were called *persons*.

Things merely corporeal, as a stone, a plant, or a horse, were called *hypostases*, or *supposita*; but never *persons*. See **HYPOTASIS**, &c.

Hence also the learned imagine, the same name *person* came to be used to signify some dignity, whereby a *person* is distinguished from another; as a father, husband, judge, magistrate, &c.

In which sense we are to understand that of Cicero: Cæsar never speaks of Pompey but in terms of honour and respect; but he does many hard and injurious things against his *person*. See **PERSONALITY**.

This for the name *person*.—As for the thing, we have already defined *person*, an individual substance of a reasonable nature; which is the same as Boethius's definition.

Now a thing may be individual two ways: 1. Logically, as it cannot be predicated of any other; as Cicero, Plato, &c. 2. Physically, in which sense a drop of water separated from the ocean may be called an individual. *Person* is an individual nature in each of these senses: Logically, says Boethius, since *person* is not ipoke of universals, but only of singulars and individuals: we do not say the *person* of an animal or a man, but of Cicero and Plato; and physically, since Socrates's hand or foot are never considered as *persons*.

This last kind of individual is denominated two ways; positively, as when the *person* is said to be the whole principle of acting; for whatever thing action is attributed to, that do the philosophers call a *person*, and negatively, as when we say, with the Thomists, &c. that a *person* consists in this, that it does not exist in another as a more perfect being.

Thus a man, though consisting of two very different things, viz. body and spirit, is not two *persons*; since neither part alone is a whole principle of action; but one *person*, since the manner of his consisting of body and spirit, is such as constitutes one whole principle of action; nor does he exist in any other as a more perfect being, as, e. gr. Socrates's foot does in Socrates, or a drop of water in the ocean.

So Christ, though consisting of two different natures, viz.

the divine and human, is not two *persons*, but one divine *person*; the human nature, in him, not being a whole principle of action, but existing in the other more perfect one. By the union of the divine and human nature one individual, or whole is constituted; that is, one principle of acting: for whatever Christ's humanity does, that does his divinity joined therewith; so that there is but one *person* in Christ, and one operation, which is called *theandric*. See **THEANDRIC**.

**PERSON**, in grammar, is a term applied to verbs and pronouns, which, being conjugated, are applicable to three different *persons*. See **VERB**, &c.

*I love*, is a verb used in the first *person*; *thou lovest*, designates the second *person*; *he loveth*, marks the third; and thus in the plural number. See **NUMBER**.

*I, thou, he*, are pronouns of the first, second, and third *persons*. See **PRONOUN**.

Verbs agree with their nouns in tense, number, and *person*. See **CONSTRUCTION** and **CONCORD**.

**PERSON**, **PERSONA**, in dramatic poetry, the name and part of an actor, or of him presented by the comedian. See **ACTOR**.

At the head of dramatic pieces come the *dramatis personæ*, the list of actors and characters that are to appear on the stage.

The ancient tragedy was only a simple chorus: Thespis was the first who introduced a *person* to relieve the chorus; Æschylus added a second. See **TRAGEDY**. See also **CHORUS**.

F. Bossu observes, that in the epic and dramatic poem, the same *person* must reign throughout, i. e. must sustain the chief part through the whole piece, and the characters of all the other *persons* be subordinate to him. See **CHARACTER**. See also **HERO**.

*Quod PERSONA nec prebendarii*, &c. See the article **QUOD**.

**PERSON**, **PERSONA**, in law. See **PARSON**.

**PERSONABLE**, **PERSONABILIS**, in law, implies the being able to hold or maintain a plea in Court. See **ABILITY**.

That is, as the civilians would express it, *habere personam standi in judicio*.

Thus they say, the defendant was judged *personable* to maintain this action: old *Nat. Brev.* 142.

The tenant pleaded, that the demandant was an alien, born in Portugal, without the ligeance of the king; and judgment was asked, whether he should be answered? the plaintiff said, he was made *personable* by parliament, *Kitch. fol. 124*.

**PERSONABLE** is also used, to signify a capacity to take any thing granted or given. See **CAPACITY**.

**PERSONAL**, something that concerns, or is restrained to the *person*. See **PERSON**.

In disputes among the learned there is ever something *personal* intermixed; in ethics it is a maxim, that all faults are *personal*, i. e. do not pass to our descendants.

**PERSONAL action**, in law, is that levied directly, and solely against the *person*, in opposition to a real or mixed action. See **ACTION**.

**PERSONAL goods** or *estate*, is that consisting of money, moveables, &c. which every *person* has in his own disposal.—In opposition to lands and tenements, which are called *real estate*. See **ESTATE** and **GOODS**.

There is defined a felonious taking away another man's moveable or *personal goods*. See **THEFT**.

**PERSONAL tithes** are tithes paid of such profits as come by the labour and industry of a man's *person*; as by buying and selling, gains of merchandice, handicraft, &c. See **TITHES**.

**Pronoun PERSONAL**, or **Verb PERSONAL**, in grammar, a verb, or pronoun, conjugated in all the three persons. See **VERB**, **CONJUGATION**, and **PRONOUN**.

In opposition to *impersonals*, which have only the third person. See **IMPERSONAL**.

**PERSONALITY**, **PERSONALITAS**, in the schools, the quality of *person*, or that which constitutes an individual in the quality of *person*. See **PERSON**.

The philosophers, being used to consider matter and form in every other thing, do the same in *person*.—The matter of *person*, according to them, is a singular substance, endued with reason. For substance may, at the pleasure of God, either be, or not be a *person*; inasmuch as the human nature in Christ is not a *person*. The form of *person* which they call *subsistency*, *suppositality*, and *personality*, is that by which the foresaid substance becomes individual.

The school-divines are divided about what it is that distinguishes the several *personalities* in the trinity: some will have it to be only the different relations; others, as Floravennius, contend for some incommunicable substance; S. Bonaventure, and St. Thomas, take it to be different origins that distinguish the *personalities*, which opinion is the most followed. See **IDENTITY**.

**PERSONALITY**, or **PERSONALTY**, in law.—An action is said to be in *personality*, when it is brought against the right person.

**PERSONATI**, among botanists, denote such flowers as express the gaping mouths of certain living creatures. See **FLOWER**.

**PERSONIFYING**, or **PERSONALIZING**, the feigning a *person*, or attributing a *person* to an inanimate being, or giving it the figure, sentiments, and language of a *person*. See **PERSON**. The poets have *personified* all the passions, and made divinities of them, which were worshipped by the heathens; as the goddesses of persuasion, the god sleep, the furies, envy, discord, fame, fortune, victory, &c. See **GOD**. See also **MACHINE**, **PASSIONS**.

*Personifying* is essential to poetry, especially the epopœia. See **POETRY**, **EPIC**, **FABLE**, &c.

**PERSPECTIVE**, the art of delineating visible objects on a plain surface, such as they appear at a given distance or height, upon a transparent plane, placed perpendicular to the horizon between the eye and the object. See **DESIGNING**. This we particularly call

**Linear PERSPECTIVE**, as regarding the position, magnitude, form, &c. of the several lines or contours of objects, and expressing their diminution\*.

\* This is a branch of mathematics; some make it a member of optics, others a rivulet therefrom; its operations are all geometrical. See **OPTICS**.

**Aerial PERSPECTIVE**, which regards the colour, lustre, strength, boldness, &c. of distant objects, considered as seen through a column of air, and expresses the diminutions thereof\*.

\* This is a part of painting, and consists wholly in the conduct of the colours, their different tints or degrees, force, weakness, &c. See **COLOUR** and **COLOURING**.

A third kind of **PERSPECTIVE**, called **Specular PERSPECTIVE**, which represents the objects in conical, spherical, or other mirrors, erect and clear; whereas on lawn, and other planes, they appear confused and irregular. See **MIRROR**. But to return to the doctrine of

**Linear PERSPECTIVE**: Suppose a glass-plane HI (*Tab. Perspect. fig. 1.*) raised perpendicular on an horizontal plane: and the spectator S, directing his eye O, to the triangle ABC: if now we conceive the rays AO, OB, OC, &c. in their passage through the plane, to leave their traces or vestigia in *a, b, c*, &c. on the plane; there will appear the triangle *abc*; which, as it strikes the eye by the same rays *aO, bO, cO*, by which the species of the triangle ABC is carried to the same; it will exhibit the true appearance of the triangle ABC, though the object should be removed; the same distance and height of the eye being preserved. See **VISION**, **POINT**, **PLANE**, **LINE**, &c.

The business of *perspective* then is to shew, by what certain rules the points *a, b, c*, &c. may be found geometrically; and hence also we have a mechanical method of delineating and object very accurately. See **DESIGNING**.

*Perspective* is either employed in representing the *Ichnographies* and ground-plots of objects, as projected on *perspective* planes. See **ICHOGRAPHY**.

Or in *Scenographies*, and representations of the bodies themselves. See **SCENOGRAPHY**.

The general laws of each are subjoined; in order to which it is necessary to premise the following

**Lemmas**: 1. That the appearance of a right line is ever a right line; whence, the two extremes being given, the whole line is given. 2. That if a line FG (*fig. 12.*) be perpendicular to any right line NI drawn on a plane, it will be perpendicular to every other right line through the same point G drawn on the same plane. 3. That the height of the point appearing on the plane, is to the height of the eye as the distance of the objective point from the plane, to the aggregate of that distance and the distance of the eye.

**Laws of the projection of plane figures, or ICHNOGRAPHIC PERSPECTIVE**, are as follows:

To exhibit the **PERSPECTIVE** appearance, *h*, of an objective point, H, (*fig. 2.*) From the given point draw HI perpendicular to the fundamental line DE. From the fundamental line DE cut off IK=IH: through the point of sight F draw a horizontal line FP; and make FP equal to the distance of the eye SL: lastly, from the point I to the point of sight F draw FI; and from K to the point of distance P, the line PK. The intersection *h* is the appearance of the objective point. Hence, 1. Since the appearance of the extreme points of a right line being given, the appearance of the whole line is given; the *ichnographic* projection of any rectilinear figure may be had by this method. And, 2. Since any number of points of a curve line may by this means be projected on the *perspective* plane; the projection of curve lines may likewise be effected after the same manner. See **CURVE**. And, 3. therefore this method will suffice for mixilinear figures, and is consequently universal. There are indeed other methods delivered by other authors, but this is the most usual.—To conceive its *force and effect*, it will be proper to illustrate it with some examples.

To find the **PERSPECTIVE** appearance of a triangle ABC, (*fig. 3.*)

*n. 2.*) whose base AB is parallel to the fundamental line DE. To the fundamental line DE draw a parallel at an interval equal to the altitude of the eye. Assume a fundamental point V, opposite to this either directly or obliquely, as the case requires. Transfer the distance of the eye from V to K. From the several angles of the triangle ACB, let fall perpendiculars A<sub>1</sub>, C<sub>2</sub>, B<sub>3</sub>: set off these perpendiculars upon the fundamental line DE opposite to the point of distance K. From 1, 2, 3 draw right lines to the fundamental or principal point V<sub>1</sub>, V<sub>2</sub>, V<sub>3</sub>. From the points A, B and C of the fundamental line DE draw other right lines AK, BK, CK to the point of distant K. Since *a, b* and *c* are the appearances of the points A, B and C; the right lines *ca, ab* and *bc*, being drawn, a *c b* will be the appearance of the triangle ACB.

After the same manner is a triangle projected on a plane, where the vertex C is opposed the eye: all here required is, that its situation on the geometrical plane be changed, and the vertex C turned towards the fundamental line DE.

To exhibit the **PERSPECTIVE** appearance of a square ABCD; (*fig. 4.*) seen obliquely, and having one of its sides AB in the fundamental line. The square being viewed obliquely, assume the principal point V in the horizontal line HR, in such manner: as that a perpendicular to the fundamental line may fall without the side of the square AB, at least may not bisect it, and make VK the distance of the eye. Transfer the perpendiculars AC and BD to the fundamental line DE; and draw the right lines KB, KD, as also AV and VC. Then will A and B be their own appearances, and *c* and *d* the appearances of the points C and D. Consequently *A c d B* is the appearance of the square ABCD. If the square ACBD should be at a distance from the fundamental Line DE, which yet rarely happens in practice, the distances of the angles A and B must likewise be transferred to the fundamental line; as is evident from the preceding problem. And since even the oblique view is not very common, in what follows we shall always suppose the figure to be posited directly opposite to the eye; unless where the contrary is expressly mentioned.

To exhibit the appearance of a square ABCD (*fig. 5.*) whose diagonal AC is perpendicular to the fundamental line. Continue the sides DC and CB till they meet the fundamental line in 1 and 2. From the principal point V set off the distance of the eye to K and L. From K to A and 1 draw right lines KA and K 1; and from L to A and 2, the right lines LA, L 2. The intersections of these lines will exhibit the appearance of the square ABCD viewed angle-wise.

To exhibit the appearance of a square ABCD (*fig. 6.*) wherein another, IMGH, is inscribed; the side of the greater, AB, being in the fundamental line; and the diagonal of the less, perpendicular to the fundamental. From the principal point V, set off, each way, on the horizontal line HR, the distances VL and VK; draw VA and VB, and KA and LB; then will *A c d B* be the appearance of the square ACDB. Produce the side of the inscribed square IH, till it meet the fundamental line in 1, and draw the right lines K 1, and KM; then will *i b g M* be the representation of the inscribed square IHGM. Hence is easily conceived the projection of any figures inscribed in others.

To exhibit the **PERSPECTIVE** of a pavement, consisting of square stones, viewed directly. Divide the side AB (*fig. 7.*) transferred to the fundamental line DE into as many equal parts as there are square stones in one row. From the several points of division, draw right lines to the principal point V; and from A to the point of distance K, draw a right line AK; and from B to the other point of distance L, draw another LB. Through the points of the intersections of the corresponding lines draw right lines on each side, to be produced to the right lines AV, and BV. Then will *A f g B* be the appearance of the pavement AFGB.

To exhibit the **PERSPECTIVE** of a Circle.—If the circle be small, circumscribe a square about it. Draw diagonals and diameters *ba* and *de* (*fig. 8.*) intersecting each other at right angles; and draw the right lines *fg* and *bc* parallel to the diameter *de* through *b* and *f*; as also through *c* and *g* draw right lines meeting the fundamental line DE in the points 3 and 4. To the principal point V draw right lines V<sub>1</sub>, V<sub>3</sub>, V<sub>4</sub>, V<sub>2</sub>; and to the points of distance L and K, draw the right lines L<sub>2</sub> and K<sub>1</sub>. Lastly, connect the points of intersection, *a, b, d, f, h, g, e, c*, with arches *ab, bd, df, &c.* Thus will *abdfbg e c a* be the appearance of the circle.

If the circle be large on the middle of the fundamental AB (*fig. 9.*) describe a semi-circle; and from the several points of the periphery C, F, G, H, I, &c. to the fundamental line, let fall perpendiculars C<sub>1</sub>, F<sub>2</sub>, G<sub>3</sub>, H<sub>4</sub>, I<sub>5</sub>, &c. From the points A, 1, 2, 3, 4, 5, &c. draw right lines to the principal point V, as also a right line from B to the point of distance L; and another from A to the point of distance K. Through the common intersections draw right lines as in the preceding problem; thus shall we have the points *c, f, g, h, i*, which are the representations of these A, C, F, G, H, I, which, being connected as before, give the projection of the circle. Hence appears not only how any curvilinear figure may be projected

jected on a plane; but also how any pavement, consisting of any kind of stones, may be delineated in *perspective*.

Hence also appears what use the square is of in *perspective*; for even in the second case we use a square divided into certain areolæ, and circumscribed about the circle; though it be not delineated on the geometrical plane in the diagram.

To exhibit the PERSPECTIVE of a regular pentagon, having a broad limb, terminated by lines parallel thereto.—1° From the several angles of the exterior pentagon A, B, C, D, E, (fig. 10.) to the fundamental line TS, let fall perpendiculars A o, B 1, C 2, D 3, E 4, which, as in the former, transfer to the fundamental line. Connect the points 1, 2, 3, 4 to the principal point V; and the points 1, 2, 3, 4 to the point of distance K. Thus will the common intersections represent the appearance of the exterior pentagon. 2. If now, from the inner angles G H L I, the perpendiculars G o, H 5, K 6, I 7, L 8, be in the like manner let fall; and the rest be done as in the former, we shall have the representation of the inner pentagon. The pentagon A B C D E, therefore, with its limb, is represented in *perspective*.

This problem is added for the sake of an instance of the projection of a figure that has a broad limb or edge.

It must be here observed, that if the magnitudes of the several parts of an object be given in numbers, together with the height and distance of the eye; its figure is to be first constructed by a geometrical scale, and the fundamental point, with the point of distance, to be determined by the same.

Nor is it always necessary, that the object be delineated under the fundamental line; in the projection of squares and pavements it is best let alone. But where it is necessary, and space is wanting, draw it a-part; find the divisions in it, and transfer them to the fundamental line in the plane.

Threads being hung in the principal point, and the point of distance, and stretched to the points of the divisions of the fundamental line; the common intersection of the threads will give the projection of the several points without confusion; a thing much to be feared from the multiplicity of lines to be drawn.

Scenographic PERSPECTIVE, or the projection of bodies on a plane.—

On a given point, C, (fig. 1. n. 2.) to raise a perspective altitude answerable to the given objective altitude P Q. On the fundamental line raise a perpendicular P Q, equal to the given objective altitude. From P and Q to any point, as T, draw right lines P T and Q T. From the given point C draw a line C K parallel to the fundamental line D E, and meeting the right line Q T in K. In K erect a perpendicular to K C, viz. I K; this I K is the scenographic altitude required.

To exhibit the PERSPECTIVE of a solid.—Find the projection of its base in the ichnographic *perspective*; and in the several points thereof erect the *perspective* altitude. Thus will the scenography of the solid be finished, except for what relates to the shadow; which must be superadded from the laws of shadows delivered under the article SHADOW.—For an example,

To exhibit the scenographic PERSPECTIVE of a cube viewed angle-wise.—Since the base of a cube viewed angle-wise, and standing on a geometrical plane, is a square viewed angle-wise; draw a square on the *perspective* plane after the manner laid down above; raise the side of the square H I (fig. 2. n. 2.) perpendicularly in some point of the fundamental line D E; and to any point V, of the horizontal line H R, draw right lines V I and V H. From the angles *d*, *b*, and *c*, draw *c* 1, *d* 2 parallel to the fundamental line D E. From the points 1 and 2 raise L 1 and M 2 perpendicular to the same. Lastly, since H I is the altitude to be raised in *a*, L 1 in *c*, and *b* and M 2 in *d*; in *a* raise *f* a perpendicular to *a* E; and in *b* and *c* raise *b* g and *c* e perpendicular to *b* c 1; and lastly raise *d* b perpendicular to *d* 2; and let *a* f be equal to H I, *b* g = *c* e = L 1, and *b* d to M 2; if then the points *g*, *h*, *e*, *f* be connected by right lines, the scenography will be finished.

This method is general; but its application is not equally obvious in every case: see it further illustrated under the article SCENOGRAPHY.

PERSPECTIVE of building, &c.—In the practice hereof great regard is had to the height of the horizontal line: all above the horizontal being seen in the upper part, and all below it in the under part; whence *perspective* becomes divided into the *high* and *low sight*; both which may be illustrated by what follows.

To represent a building (v. gr. palace, college, &c.) in *perspective*. 1. Take the ichnography, or ground-plot of the building; its lengths, breadths, and depths, by actual measuring. (See ICHNOGRAPHY.) and take its altitude with a quadrant. See ALTITUDE and QUADRANT.

2. Make a scale divided into two or three hundred equal parts, either actually, or so as that each division signify ten parts: by this scale lay down the ground-plot, as in fig. 13.

This done, having a long rule and square, which, by sliding on the rule, helps you to draw your perpendiculars easilier, reduce it into *perspective* in its scenographic appearance.

Then having drawn a line towards the bottom of the paper for the front or base line as F L, (fig. 14.) divide it into as many equal parts as you find the building has in the ichnography, or more if you please; this will serve for a scale to determine the several heights, &c. and to these divisions, with a black lead

pencil draw lines from the centre, when you have chosen it; which choice requires judgment on two accounts.

For, if the centre be too nigh the front line, then the depth of the whole building will fore-shorten too much; if too far off, it will not fore-shorten enough. This may be illustrated thus, set an open tankard, or the like, on a stand, so as that it be a little lower than your eye; if you be at a great distance from it, you can see very little or nothing into it; if you come nigher to it by degrees, you will perceive the farther edge seem to be raised a little higher than that next you, so that you may see a little way into it; if you come very nigh it, you see too deep into it, more than can well be expressed in picture. We shall therefore find some one place, which we must conclude the most convenient for the draught, and which may be in general determined to be as far off the front-line as the front-line is long; this rule, though it has just grounds, yet we sometimes dispense with it, *pro re nata*, that we may express things with the better appearance.

4. Consider how to place this centre with such advantage as that you may express those things most, which are chiefly designed; for as to the bottom and top-lines of the sides of the building that run from us in or nigh the direct line to the centre, though you see the upper part very well, yet the sides that fall between the ground-line and top, fall so very near one another, that it would be very difficult to express particulars in them; so that the centre must be well chosen in reference to this.

Those buildings, therefore, you would see most of, must be placed as far off as you think convenient from the direct line that runs to the centre; and the farther they are, the plainer they will be.

Place than those things you would see least of nighest the direct line, and see whether the others fall according to your mind; but this must be done after you have drawn your diagonal, which is the next thing.

5. Having pitched on your centre, and having from it drawn lines to every division of the front-line, you are to determine your diagonal, A R, thus: having with a pair of compasses measured the length of the front-line, take your compasses, and, putting one foot in the centre, see where the other will reach in the horizon: (on both sides if you please) where it rests, from that point draw a thwart line to the last division of the front; and this will be truly drawn, or pretty nigh to the truth. That it is so, you may consider how it falls in respect of the two last centre-lines; for if where the next line from the last is intersected by the diagonal, you draw a parallel to the front between them, as at A 10, you will have a rhombus; if then all the sides be pretty equal, you may be sure you are nigh the right; but if the sides that run towards the centre be too long, then things will not fore-shorten enough; if the sides be not long enough, they will fore-shorten too much.

6. After the front-line is thus divided, the centre fixed, and the diagonal placed, take the breadth of the chapel A B, which in the ichnography is shewn to be twenty parts; because this line is perpendicular, it must run toward the centre, therefore reckon twenty in the diagonal, and the rule laid parallel to the front in that point, will give you a point in the centre-line, which will give the breadth of the chapel; consequently a line drawn from A to B puts it into the ichnographic *perspective*. The length of the chapel being seventy divisions in the front-line; reckon seventy from B, parallel to the front-line, and there you will have a point at C.

The depth of the building, from the chapel northward, being one hundred and fifteen from the chapel, I reckon from D (where it cuts the diagonal at ten) onwards in the diagonal; and at one hundred and fifteen in the diagonal, with my rule as before parallel in this place in the front, I have the point Z in the central-line. Its breadth being thirty, I reckon three divisions, and there is the just breadth there; and so on in every particular part.

Having placed the ichnography in *perspective*, you may then give every thing its proper height thus:

7. The height of the chapel being thirty, I reckon thirty on the front-line, and with this length by a square clapt to the front-line, I drop a perpendicular to that height; and so where the other side of the chapel is placed, having reckoned the height upon a supposed parallel, there I draw another line in that height; then joining these several heights by several lines, you have the profiles of each building.

To diversify these several lines that they confound you not, make the ichnography, when you lay it into *perspective*, in discontinued crooked lines, the heights in pricked lines, and the tops of each building in continued lines, as the centre-lines are in the table. You will likewise find the centre, though it is not here expressed, as likewise the point of distance, by continuing the diagonal up to the supposed horizon where it and the eye are placed.

Having done thus, your art must be employed for the particular expressions of things, by drawing and shadowing, which is the life of this half-formed figure, which we leave to the painter.

## P E R

It remains that we speak of the low-sight: And here we suppose the horizontal line just at the height of the eye, about five foot from the basis; though it is generally placed higher, even to a third part of the height of the building, that the side-building may be expressed more gracefully.

The diagonal is best determined by dividing the last division of the basis-line into five parts at G, taking four of these, sometimes the whole five, because we determined before, that the length of the front-line was the distance of the eye in the horizon to the point of distance; but here we take four, and then make this the distance in the horizon between the eye and the point of distance. You may then either graduate the plan at the several intersections of the diagonal with the centre lines, or else suppose it so; and then raise the buildings as you will find by *perspectives* enough of this sort every where to be met with.

**PERSPECTIVE** is also used for a kind of picture or painting, frequently seen in gardens, and at the ends of galleries; designed expressly to deceive the sight by representing the continuation of an alley, a building, landscape, or the like.

**PERSPECTIVE** *aerial*,  
Alley in **PERSPECTIVE**,  
Architecture in **PERSPECTIVE**,  
} See the article { **AERIAL**.  
} **ALLEY**.  
} **ARCHITECTURE**.

**PERSPECTIVE** *Plan*, or *Plane*, is a glass, or other transparent surface, supposed to be placed between the eye and the object, perpendicular to the horizon, unless the contrary be expressly mentioned. See **PLAN**, **PLANE**.

Such is the plane HI (fig. 1.) between the eye O, and the object ABC cutting the optic rays in *a*, *b*, *c*.

This some call the *section*, some the *table*, and others the *glass*. See **SECTION**.

**PERSPIRATION**, **PERSPIRATIO**, in medicine, the action of evacuating the superfluous juices of the body through the pores of the skin. See **EVACUATION**, **PORE**, and **SKIN**.

When this evacuation is copious enough to be perceived by the senses, as in sweat, the *perspiration* is said to be *sensible*; where it escapes the notice of the senses, as is the case in the ordinary state of the body, the *perspiration* is said to be *insensible*. See **SWEAT**.

The word *perspiration* used simply, and without any adjective, is understood of *insensible perspiration*.

This evacuation was known to the ancients, Hippocrates, Galen, &c. but it was Sanctorius, the famous Paduan physician, who first brought it under any stated rules. To him we owe both the invention and perfection of the doctrine of *insensible perspiration*.

The vessels through which the *perspiration* is performed, lie obliquely open under the squamæ or scales of the cuticle, or scarf-skin. They are inconceivably small: from a calculation of Lewenhoeck it appears, that the mouths of one hundred twenty-five thousand of them may be covered with a common grain of sand. See **CUTICLE**, **MILIARY gland**, &c.

Through these vessels is continually transuding a subtle humour from every point of the body, and throughout the whole expanse of the cuticle.

The matter evacuated this way is found, by sure experience, to be more than equal to that evacuated all the other ways, *i. e.* by stool, urine, &c. Sanctorius found in Italy, under the circumstances of a moderate diet, middle age, and easy life, that the matter insensibly perspired was  $\frac{1}{2}$  of that taken in for food; so that there only remained  $\frac{1}{2}$  for nutrition, and the excrements of the nose, ears, intestines, bladder, &c. See **EXCREMENT**.

The same author shews, that as much is evacuated by *insensible perspiration* in one day, as by stool in fourteen days; particularly, that in a night's time about sixteen ounces is ordinarily sent out by urine, four ounces by stool, and above forty ounces by *insensible perspiration*.

He also observes, that if a man eat and drink eight pound in a day, five pound of it is spent in *insensible perspiration*; and adds, as to the times, that within five hours after eating there is *perspired* about one pound, from the fifth to the twelfth hour about three pound, and from the 12<sup>th</sup> to the 16<sup>th</sup> scarce half a pound. The benefits of *insensible perspiration* are so great, that, without it, Borelli says, animal life could not be preserved.

The great subtilty, equability, and plenty of the matter thus *perspired*, its increase after sleep, &c. constitute the grand symptoms of a perfect state of health, and the chief means of preserving the same. On the contrary, the departing from these is the first sure sign, and perhaps cause of disease. See **HEALTH** and **DISEASE**.

*Perspiration* is performed, preserved, and increased by the viscera, vessels, fibres; by motion or exercise as far as the first appearance of sweat, by moderate use of venery, sleep of seven or eight hours, the body well covered, yet not loaded with bed-cloaths, cheerfulness, light fermented, yet solid food, not fat; pure, cold, heavy air, &c.—The contraries of all these, as also the increase of the other excretions, diminish, prevent, and deprave it.

Hence we see the cause, effect, &c. of this *perspirable* matter, its use in preserving the parts soft and flexible, in supplying what's lost, but chiefly in preserving the nervous papillæ moist,

## P E S

fresh, lively, fit to be affected by objects, and to transmit their impressions. See **NERVE**, **SENSATION**, &c.

Too much *perspiration* occasions weakness, swoonings, sudden death; too little, or none at all, occasions the capillary vessels to dry, wither, and perish. Hence also the larger emunctories come to be obstructed; hence the circulation is disturbed, sharp humours retained; hence putridity, crudity, fevers, inflammations, imposthumes. See **DISEASE**.

To determine the state and conditions of the *perspiration*, so necessary for judging of those of the body, Sanctorius invented a weighing chair, whereby he examined the quantity, degree, &c. of *perspiration* in several circumstances of the body, under several temperatures of the air, in the several intervals of eating, drinking, sleeping, &c. See **WEIGHING chair**.

Some of the more extraordinary phenomena observed herewith are, that, for some time after eating, the *perspiration* is least of all: that, between the fifth and twelfth hour after meals, *perspiration* is greatest; that riding either on horseback, in a coach or ship, &c. brisk motion on the ice, &c. but, above all, a brisk friction of the skin, promote *perspiration* surprisingly. That, in sweating, the *perspiration* is much less than at other times; and that *perspiration* is always much less in women than men.

**PERTICATA**\*, or **PARTICATA** *terra*, in our old law books, is the fourth part of an acre, or a piece of ground containing one perch in breadth, and forty in length. See **ROOD** and **PERCH**.

\* *Continet in integra superficie 40 perticas.* See **PERCH**.

**PERU**—*Balsam of PERU*. See the article **BALSAM**.

**PERVIGILIUM**, in medicine, excessive waking or watching. See **WAKEFULNESS**.

**PERVISE**, or **PARVISE**, a term in our old law books signifying, according to Selden, in his notes on Fortescue, an afternoon's exercise, or moot, which the pleaders held for the instruction of the younger students, bearing originally the same name with the *parvisæ* in Oxford. See **MOOT**.

M. Somner says, that **PERVISE** signifies *palatii atrium vel area illa a fronte aula Westmonasteriensis, hodie, the Palace-yard*. See **PARADISUS**.

Spelman thinks, that the lawyers turned thither to meet their clients, not to hold moots.

**PERUVIAN bark**. See **CORTEX Peruvianus**.

**PERUVIAN Emerald**. See the article **EMERALD**.

**PES**, a long measure, in English better called a *foot*. See **FOOT**.

**PES forestæ**, the forest foot containing eighteen inches\*.

\* *Notandum est, quod pes forestæ, usitatus tempore Ric. Ossfel in arrentatione vassallorum, factus est signatus & sculptus in pariete cancellæ ecclesiæ de Edwynstone & in ecclesiâ B. Mariæ de Nottingham, & dictus pes continet in longitudine octodecim pollices, & in errantatione quorundam vassallorum pertica 20, 21, & 24 pedum usa fuit, &c.*

**PES monetæ**, in ancient records, signifies a true and reasonable adjustment of the real value of all current coin. See **STANDARD** and **COIN**.

**PESA**, an old law term, for a weigh, or certain weight of cheese, wool, &c. See **WEIGH**.

**PESADE**, or **PESATE**, in the manage, that action taught a horse, wherein he rises with his fore feet, and bends them up to his body, without stirring his hind feet.

The *pesade* is the first lesson taught a horse, in order to bring him to curvets, &c. unless he perform this well, he will never go well in any air; yet is he not to be taught it at the first riding.

**PESAGE**, **PESAGIUM**, a custom or duty paid in certain markets, &c. for weighing of merchandises, or wares. See **WEIGHING**.

**PESATE**. See the article **PESADE**.

**PESSARY**\*, or **PESSUS**, in medicine, a solid medicament of the length and thickness of the finger, but a pyramidal form; conveyed into the natural parts of a woman, to provoke, or to put a stop to the menses, to prevent a descent of the matrix, or on other occasions of those parts.

\* The word is formed from the Greek, *πessagon*, or *πιστος*, which signifies the same.

The *peffary* consists of cork, or other light wood, or of a little linnen bag full of powders, incorporated with wax, oil, and cotton, crammed close together, to make it solid enough for intromission.

At one end it is fastened to a little ribbon, by which it may be drawn out at pleasure.

**PESTILENCE**\*, in medicine, an epidemical, malignant, and contagious disease, usually mortal, popularly known under the name of *plague*. See **PLAGUE**.

\* The word is formed from the Latin *pestis*, which signifies the same.

**PEST-house**, a lazaretto or infirmary, where goods, persons, &c. infected, or suspected to be infected with some contagious disease, are disposed and provided for. See **LAZARETTO**.

**PESTILENTIAL fevers**, among physicians, are such as do not only afflict the patient with a vehement heat, but also with some malignant and venomous quality. See **FEVER** and **MALIGNANT**.

**PESTIS**. See the article **PLAGUE**.

**PETALA**,

# P E T

**PETALA\***, in botany, the leaves of a flower; so called to distinguish them from the leaves of the plant. See LEAF.

\* The word is formed from the Greek *πτελον*, a leaf, which, in that language, serves indifferently for the leaves of the plant and the flower.

By flower is properly meant that assemblage of parts, called *stamina* and *pistil*, which serve for the propagation of the kind. See FLOWER.

The coloured leaves, called *petala*, which encompass those parts, are in reality no more than cases or covers to secure and screen the generative parts; unless, as Mr. Bradley conjectures, they may also serve to secrete some fine juice for the nourishment of the seed. See GENERATION of plants.

The most easy division of flowers is into simple flowers, i. e. those formed of stamina and pistil are encompassed with *petala*, called by Dr. Grew the *foliation*, and Mr. Ray *folia*. See FOLIATION.

Compound flowers, again, are either encompassed with a single *petalum*, or piece, or with several pieces; the first of which are called *monopetalous*, the second *polypetalous* flowers. See MONOPETALOUS, &c.

Again, from the regular or irregular configuration of the *petala*, M. Jussieu makes another division of flowers into classes; as regular and irregular *monopetalous*, regular and irregular *polypetalous*, &c. See POLYPETALOUS.

Nature shews a world of art in the folding up of the *petala* in the perianthium, before they begin to blow or expand: of these foldings Dr. Grew notes the following varieties, viz. the close couch, as in roses; the concave couch, as in *blattaria flore albo*; the single plait, as in pease-blossoms; the double plait, as in blue-bottles; the couch and plait together, as in marigolds, &c. the rowl, as in ladies bower; the spire, as in mallows; and, lastly, the plait and spire together, as in *convolvulus doronici folio*. The calyx or perianthium sometimes serves in lieu of *petala*. See CALYX and PERIANTHIUM.

**PETALISM**, **PETALISMUS**, **ΠΕΤΑΛΙΣΜΟΣ**, in antiquity, a kind of exile or banishment for the term of five years. See BANISHMENT.

The *petalism* at Syracuse was nearly the same thing as the *ostracism* at Athens, except that the latter was for ten years, and the former only for five. See OSTRACISM.

The *petalism* was performed by the people's writing the name of the person condemned on a leaf; whence the name, from *πτελον*, leaf.

**PETALODES**, **ΠΕΤΑΛΩΔΗΣ**, a name given to urine, when it seems to have little leaves, flakes, or scales in it. See URINE.

**PETAMINARIUS\***, in antiquity, a name given to certain persons who performed extraordinary feats of activity, took perilous leaps, vaults, &c.

\* The word is formed from the Greek *πτεμαμαι*, volo, I fly.—Some authors write it *petiminarius*, and derive it from *petimen*; which, according to Servius, signifies the bunch of a camel, alluding to the manner, wherein these operators bend the body in exhibiting postures, &c. See POSTURE.

**PETARD**, in war, a kind of engine of metal, somewhat in shape of a high-crowned hat; serving to break down gates, barricades, draw-bridges, or the like works which are intended to be surprized.

The *petard* may be considered as a piece of ordnance, very short, narrow at the breech, and wide at the muzzle, made of copper mixed with a little brass, or of lead with tin, usually about seven inches long, and five broad at the mouth, weighing from forty to fifty pound. See ORDNANCE.

Its charge is from five to six pounds of powder, which reaches to within three fingers of the mouth; the vacancy is filled with tow, and stopped with a wooden tampon; the mouth being strongly bound up with cloth tied very tight with ropes.—It is covered up with a madrier or wooden plank, that has a cavity cut in it to receive the mouth of the *petard*, and fastened down with ropes after the manner expressed in *Tab. Fortification*, fig. 5.

Its use is in a clandestine attack, to break down gates, bridges, barriers, &c. to which it is hung; which it does by means of the wooden plank.—It is also used in countermines to break through the enemies galleries, and give vent to their mines.

Some, instead of gun-powder for the charge, use one of the following compositions, viz. gun-powder seven pounds, mercur. sublimat. one ounce, camphor eight ounces; or gun-powder six pound, mercur. sublimat. three ounces, and sulphur three; or gun-powder six, beaten glass  $\frac{1}{2}$  an ounce, and camphor  $\frac{1}{4}$ .—*Petards* are sometimes also made of wood, bound round with iron hoops.

The invention of *petards* is ascribed to the French Huguenots in the year 1579; their most signal exploit was the taking the city Cahors by means hereof, as we are told by d'Aubigne.

**PETECHIÆ**, spots in the skin, like flea-bites, which come out in some fevers, hence called *petechial*, or *spotted fevers*. See PETECHIAL.

**PETECHIAL**, an appellation given to a malignant, epidemical

# P E T

kind of fever; wherein the skin breaks out in *petechiæ*, or purple spots. See PETECHIÆ and FEVER.  
The *petechial fever* is also called *febris lenticularis* and *pulicaris*.

**PETERERO**. See the article PEDRERO.

**PETER-pence**, an ancient levy, or tax of a penny on each house throughout England, paid to the pope. See TAX.

It was called *Peter-pence*, because collected on the day of St. Peter ad vincula; by the Saxons it was called *Rome feoh*, i. e. the fee of Rome, and also *Rome-scot*, and *Rome-penny*, because collected and sent to Rome; and lastly, it was called *Hearth-money*, because every dwelling-house was liable to it, nay, and every religious house; the abbey of St. Albans alone excepted. This *Peter-pence* was at first given, as a pension or alms, by Ina king of the West Saxons, in the year 725, being then in pilgrimage at Rome; and the like was done by Offa king of the Mercians, throughout his dominions in 794.

It was not intended as a tribute to the pope, but chiefly for the support of the English school or college at Rome; the pope, however, went halves with the college, and at length swallowed almost the whole.

At first it was only an occasional contribution, but became at last a standing tax; being established by the laws of king Canute, Edward the Confessor, the Conqueror, &c.

The bishops, who were charged with the collecting it, employed the rural deans and archdeacons therein.

Edward the III<sup>d</sup> first forbade the payment; but it soon returned and continued till the time of king Henry VIII, when Polydore Virgil resided here as the pope's receiver-general. It was abolished under that prince, and restored under Philip and Mary; but finally prohibited under queen Elizabeth.

**PETIT Cape**. See the article CAPE.

**PETIT Serjeanty**. See the article SERJEANTY.

**PETIT Jury**. See the article JURY.

**PETITA Terra**. See the article SUMMONS.

**PETITIO Induciarum**, in the civil law, the same as *imparlance* in common law. See IMPARLANCE.

**PETITIO Principii**, in logic, a begging the question, or a precarious supposing a thing to be true, or taking it for granted, when it really remains either dubious, or else is expressly denied. See FALLACY, ERROR, &c.

**PETITION**, **PETITIO**, a supplication in form made by an inferior to his superior; especially to one having jurisdiction. See SUPPLICATION.

**PETRA lana**, in our ancient customs, a stone of wool. See STONE.

**PETRARIA**, in ancient writers, is sometimes taken for a quarry of stone. See QUARRY.

In other places *petraria* is used for a sort of engine of war where-with stones were cast on the enemy, chiefly used in sieges, &c.

**PETRE oil**, **ΠΕΤΡΕΑΙΟΝ**, the same as *petroleum*. See PETROL.

**PETRIFICATION\***, or **PETRIFICATION**, in physiology, the act of converting fluids, woods, and other matters into stone. See STONE and LAPIDIFICATION.

\* The word is formed from the Greek *πετρα*, stone, and the Latin *facio*, or *facio*, to become, to do.

The faculty of PETRIFYING wood is ascribed to several springs, lakes, &c. The ancient naturalists mention a river, whose waters turned bodies into marble by mere contact; nay, which, being drunk, petrified the viscera of the drinker.

*Flumen habent Cicones, quod potum saxea reddit viscera, quod tactis inducit marmora rebus.*

Seneca relates, that the mud of this river is of such a nature as to harden and glue together the parts of bodies. As, says he, the dust of Puzzuoli, by barely touching water becomes stone; so this water, by touching any solid, sticks, and grows to it: whence things cast into it, are immediately taken out stones. Pliny adds very well, that wood, cast into this river, is presently found covered with a stony bark or rind, and subjoins the names of several other rivers which do the same; particularly the river Silarus near Tarentum, whose waters are nevertheless found very wholesome.—To Pliny's list we might add many more among ourselves, particularly the lake Lohmond in Scotland, &c. But, in effect, there does not seem any real transmutation of the woody nature into the nature of stone in any of these cases; all that is done is this, the stony particles which before floated in the liquor are now lodged and deposited in the pores of these substances, in such manner, and in such plenty, as to leave little else but the appearance of a stone.

*Petrifications* too are frequently nothing else but incrustations of stony particles, which surround the bodies immersed, as salts shoot upon and adhere to them. See INCrustATION.

Varenus has a conjecture, that waters only petrify woods by means of certain minute, sharp, and pointed particles lodged therein, which cut the longitudinal fibres of the wood in an infinite number of points; and thus destroy the form by which they were distinguished from stone.

Near Nacivan is a little river, whose water the people turn off into

into little canals; where, in a little time, it *petrifies*, and of this *petrified* water is built a large caravanera in the neighbourhood.

*Petrifications* of waters, or juices of the earth, are incontestable. In the place called *les Caves Goutieres* in France, the water falling from the upper parts of the cave to the ground, immediately hardens into little stones, of such figures as the drops falling either singly, or upon one another, chance to exhibit.

Of this kind of caves we have several in England: Pool's-hole is one of the most remarkable. Mr. Derham mentions another on the top of Bredon-hill in Worcestershire; to which we may add another called the *Elve-hole* in Witherlack in Westmoreland, lined a-top with these stalactical stones, hanging like icicles; which are manifestly nothing else but exsudations or exfiltrations of some *petrifying* juices out of the rocky earth there. See *STALACTITES*. See also *LABYRINTH*.

**PETROBRUSSIANS**, a religious sect which arose in France, and the Netherlands, about the year eleven hundred and twenty six; so called from their leader, *Peter Bruys*, a provincial.

The chief of Bruys's adherents was a monk, one Henry; from whom the *Petrobrussians* were also called *Henricians*.—Peter, the venerable abbot of Clugny, has an express treatise against the *Petrobrussians*; in the preface to which he reduces their opinions to five heads.

1. They denied that children, before the age of reason, can be justified by baptism; in regard it is our own faith that saves by baptism. 2. They held that no churches are to be built, but those that already are, to be pulled down; an inn being as proper for prayer as a temple, and a stable as an altar. 3. That the cross ought to be pulled down and burned, in regard we ought to abhor the instruments of our Saviour's passion. 4. That Jesus Christ is not in the eucharist, and that this sacrament is vain. 5. That sacrifices, alms, prayers, &c. do not avail the dead.

F. Langlois objects manicheism to the *Petrobrussians*; and says, they maintained two gods, the one good, the other evil; but this we rather esteem an effect of his zeal for the catholic cause, which determined him to blacken the adversaries thereof, than any real sentiment of the *Petrobrussians*. See *ALBIGENSES*.

**PETROJOANNITES**, the followers of Peter John, or Peter Joannis, *i. e.* Peter the son of John, who lived in the XII<sup>th</sup> century, whose doctrine was not known till after his death; when his body was taken out of his grave, and burnt.—His opinions were, that he alone had the knowledge of the true sense wherein the apostles preached the gospel: that the reasonable soul is not the form of man; that there is no grace infused by baptism, that Jesus Christ was pierced with a lance on the cross ere he expired.

**PETROL** *PETROLEUM*, *q. d.* *petra-oleum*, oil of petre, or rock oil, an oleaginous juice, supposed to issue out of the clefts of rocks, and found floating on the waters of certain springs. See *OIL*.

Beside artificial and vegetable oils, *i. e.* those drawn from plants, &c. by expression, there are also natural and mineral oils issuing of themselves from the entrails of the earth, called by a common name *petrols*, or *petrolea*.

These, according to all appearance, must be the work of subterraneous fires, which raise, or sublime the more subtle parts of certain bituminous matters that lie in their way. These parts being condensed into a liquor by the cold of the valts of rocks, are there collected, and ooze thence through clefts and apertures, which the disposition of the ground furnishes them withal. *Petrol* then is a black liquid bitumen, only differing by its liquidity from other bitumens, as asphaltum, jet, &c. See *BITUMEN*.

The naphtha, which is either a liquid, or at least a very soft bitumen, is much the same with *petrol*. See *NAPHTHA*.

Hitherto there has been little *petrol* found, except in hot countries. Olearius says, he saw above thirty springs of it near Scamachia in Persia: there are also *petrols* in the southern provinces of France; but the best are those in the duchy of Modena, first discovered by Ariosto a physician in 1640, in a very barren valley, twelve leagues from the city of Modena.

There are three canals dug with great expence in the rock; by which three different kinds of *petrol* are discharged into little basons or reservoirs; the first as white, clear, and fluid as water, of a brisk penetrating smell, and not disagreeable; the second, of a bright yellow, less fluid, and a less brisk smell than the white; the third, a blackish red, of a thicker consistence, and a smell more approaching that of bitumen.

M. Boulduc has made several experiments on the *petrol*, described in the *Hist. of Acad. of Scienc. an.* MDCCXV. He observes, that he could not raise from it any phlegm or saline spirit by any distillation, either in balneo mariæ, or in a sand heat; all that would rise was oil; at the bottom of the pelican remained an exceeding small quantity of a thickish, brownish matter.

Hence, to use *petroleum* in medicine, it must be prescribed just as it is. It is a remedy nature has prepared to our hands; it is found very warm and penetrating, and commended in many

outward complaints, rheumatick and arthritick pains and paralytick limbs.

**PETRONEL**, a sort of harquebus or hand-gun. See *HARQUEBUSS*.

**PETROSA** *ossa*, in anatomy, a denomination given to the fifth and sixth bones of the skull, called also *ossa temporum*, because they shew the age of man; the hairs thereon turning grey before any of the rest. See *CRANIUM* and *TEMPLES*.

Their upper part is squamous, or scaly, the lower *petrous*, *i. e.* hard or stony, and hence they come here to be more particularly denominated *petrosa*.

The *ossa petrosa* are the smallest proper bones of the cranium: their upper part is semi-circular, and their lower of a rocky make. They are situated in the lateral and lower parts of the head; bounded a-top by the squamous suture, which joins them to the parietalia; behind by the lamboides, which joins them to the occipital, and connects them to the os sphenoides.

Each has two sinus's before and behind the sphenoides: the exterior lined with a cartilage, receiving the process of the lower jaw; the interior receives the lower part of the sinus lateralis of the dura mater.

Each again has four processes; three external, and one internal; of the external, the first is called *zygomaticus* or *os jugale*; the second, *mastoides* or *mamillaris*; the third, *styloides*, each whereof see under its proper article, *ZYGOMATICUS*, &c.

The internal process is properly called the *os petrosam*; this is pretty long and large, containing the whole meatus auditorius and cavity of the tympanum. See *TYMPANUM* and *EAR*.

**PETTEIA**, ΠΕΤΤΕΙΑ, in the ancient music, a Greek term, to which we have no corresponding one in our language.

The *melopœia*, *i. e.* the art of arranging sounds in succession, so as to make melody, is divided into three parts, which the Greeks call *lepsis*, *mixis*, and *chresis*; the Latins *sumptio*, *mixtio*, and *usus*; and the Italians *presa*, *mescolamento*, and *uso*.—The last is also called by the Greeks, *πρῆμα*, *petteia*, and by the Italians *pettia*.

*Petteia*, or *pettia*, then is the art of making a just discernment of all the manners of ranging or combining sounds among themselves, so as they may produce their effect, *i. e.* may express the several passions intended to be raised: thus, *e. gr.* it shews what sounds are to be used, and what not, how often any of them are to be repeated, with which to begin, and with which to end, whether with a grave sound to rise, or an acute one to fall, &c.

It is the *petteia* that constitutes the manners of the music; it being this that chuses out this or that passion, this or that motion of the soul to be awakened, and whether it be proper to excite it on this or that occasion.—The *petteia* therefore is in music what the manners are in poetry. See *MANNERS*.

We do not see whence the denomination could have been taken by the Greeks, unless from *πρῆμα*, their game of chess; the musical *petteia* being a sort of combination and arrangement of sounds, as chess is of pieces, called *πρῆμα*, *calculi*, chess-men.

**PETTY** *bag*, an office in chancery, the three clerks whereof record the return of all inquisitions out of every shire, make all patents of customers, gaugers, comptrollers, &c. See *CLERK*.

**PETTY** *fogger*\*, a little stickling solicitor, or jobber in law disputes, without either skill or conscience.

\* The word is formed from the French, *petit*, little; and the Saxon, *fogere*, suiter or woer.

**PETTY**, or *PETIT larceny*, in law, small theft; or the stealing of things under the value of twelve-pence. See *LARCENY*.

The punishment anciently was sometimes the loss of an ear, sometimes cudgelling; after Edward III. it was for a long time whipping, but is now transportation.

**PETTY** *orders*. See the article *ORDERS*.

**PETTY** *patees*, among confectioners, a sort of small pies made of march pane, and filled with sweet meats.

**PETTY** *singles*, among falconers, are the toes of a Hawk. See *HAWK*.

**PETTY** *tally*, in the sea language, a competent allowance of victuals, according to the number of the ship's company.

**PETTY**, or *PETIT treason*, in law, the crime of a servant's killing his master, a wife's killing her husband, a child's killing his parent, or a clergyman's killing his prelate to whom he owes obedience. See *TREASON*.

The punishment of *petty treason* is, that the criminal shall be drawn on a sledge or hurdle to the gallows, and there hanged. The punishment of *petty treason* in a woman is the same with that of high-treason, *viz.* drawing and burning alive. See *PUNISHMENT*.

**PETUM** *nicotiana*, or tobacco. See *TOBACCO*.

**PEVET**. See the article *PIVOT*.

**PEVETS**, in a watch, the ends of the spindle of a wheel in a watch.—The holes into which they run are called *pevet holes*. See *WATCH*.

**PEWTER**, a factitious metal used in domestic utensils; its basis is tin, which is converted into *pewter* by the mixture of six pound of brass, and fifteen pounds of lead, to an hundred weight of tin. See *METAL*.

Beside

Beside this composition which makes the common *pewter*, there are others for other occasions; compounded of tin, mixed with regulus of antimony, tin-glass, and copper, in several proportions. See **TIN**.

*Pewter* has occasionally served for money. In the philosophical transaction. M. Putland informs us, that K. James II. turned all the *pewter* vessels, &c. of the protestants in Ireland he could seize, into money; half-crowns were somewhat bigger than half-pence, and other pieces in proportion. See **MONEY** and **COIN**. He ordered it to be current in all payments: whence, our author observes, people absconded for fear of being paid their debts: he mentions crown-pieces of this metal, with this legend on the rim, *melioris tessera fatis*.

**PHENOMENON**\*, ΦΑΙΝΟΜΕΝΟΝ, in physics, an extraordinary appearance in the heavens, or on earth; either discovered by observation of the celestial bodies, or by physical experiments: and whose cause is not obvious. See **OBSERVATION**, **EXPERIMENT**, &c.

\* The word is formed from the Greek φαίνω, I appear.

Such are meteors, comets, uncommon appearances of stars, and planets, earthquakes, &c. such also are the effects of the magnet, phosphorus, &c. See **METEOR**, **COMET**, **STAR**, **PLANET**, **EARTHQUAKE**, **MAGNET**, &c.

The *phenomena* of comets are inconsistent with the solidity of the heavens, supposed in the ptolemaic hypothesis, and with the plenitude of the heavens asserted by the cartesians. See **PTOLEMAIC**, **PLENUM**, &c.

That hypothesis is best which solves most *phenomena*. See **HYPOTHESIS**.—Sir I. Newton shews, that all the *phenomena* of the heavenly bodies follow from the attraction of gravity, which intercedes those bodies; and almost all the *phenomena* of the lesser bodies from the attraction and repulsion between their particles: so simple is nature. See **GRAVITATION**, **ATTRACTION**, **COHESION**, **PARTICLE**, &c.

*Parallax of a PHENOMENON*. See **PARALLAX**.

**PHAGEDÆNA**\*, in chirurgery, &c. a deep, bloated ulcer, which eats, and corrodes the neighbouring parts. See **ULCER**.

\* The word is Greek, φαγιδαινα, formed of φαγω, to eat.

**PHAGEDÆNIC medicines**, such as are used to eat off fungous, or proud flesh. See **EPULOTIC**, **SARCOTIC**, **CAUSTIC**, &c.

**PHAGEDÆNIC ulcer**. See **PHAGEDÆNA**, and **ULCER**.

The ephemerides of the academy of the *curiosi naturæ*, relate that *phagedænic* ulcers have been frequently cured with sheeps dung.

**PHAGEDÆNIC water**, in chymistry, denotes a water drawn from quick-lime; so called from its efficacy in the cure of *phagedænic* ulcers. See **LIME**, and **WATER**.

To prepare this water; they put two pounds of fresh quick lime in a large earthen-pan, and pour upon it about ten pounds of rain-water; these they let stand together two days stirring them frequently: at last leaving the lime to settle well, they pour off the water by inclination, filtrate it, and put it up in a glass bottle, adding to it an ounce of corrosive sublimate in powder; which, of white becomes yellow, and sinks to the bottom of the vessel. The water being settled, is fit for use, in the cleansing of wounds and ulcers, and to eat off superfluous flesh: especially in gangrenes; in which case may be added a third or fourth part of spirit of wine. See **GANGRENE**.

**PHALANX**, ΦΑΛΑΓΞ, in antiquity, a huge, square, compact battalion, formed of infantry set close to one another, with their shields joined, and pikes turned cross-ways; inasmuch that it was almost impossible to break them.

It consisted of eight thousand men: Livy says, that this sort of battalion was invented by the Macedonians, and that it was peculiar to them; whence, among writers, it is sometimes called the *Macedonian phalanx*.

St. Evremont observes, that the Macedonian *phalanx* had the advantage of valour and strength over the Roman legion. See **LEGION**.

**PHALANX**, **PHALANGES**, is also applied by anatomists, to the three rows of small bones which form the fingers. See **FINGER**. The uppermost *phalanx* next the wrist is the longest and largest; the second less, but longer and larger than the third *phalanx*.

**PHALEUCUS**, or **PHALÆCIUS**, in poetry, a kind of verse, in use among the Greeks and Latins; consisting, like the sapphic, of five feet, the first a spondee, the second a dactyl, the three last trochees. See **VERSE**, **FOOT**, **SPONDEE**, &c.

The *phaleucus* is very proper for epigrams. Catullus excelled in it. Its author is not known.

**PHALLICA**, ΦΑΛΛΙΚΑ, in antiquity, feasts, or sacrifices celebrated at Athens, in honour of Bacchus. See **FEAST**.

The *phallica* were instituted on the following occasion: one Pegasus, a citizen of Eleutheris, having carried some statues of Bacchus to Athens; drew the laughter and contempt of the Athenians.—Soon after, this people were seized with an epidemic disease; and upon consulting the oracle how to get free of it, were answered that there was no way but to receive Bacchus in pomp: they did it, and thus instituted the *phallica*; wherein, besides the statues and trophies of the god, they bore figures of the parts affected tied to thyrsi.

**PHALLOPHORI**\*, ΦΑΛΛΟΦΟΡΟΙ, in antiquity, a name given at Sicyon to certain mimes, who ran about the streets smutted

with black, clothed in sheeps skins, bearing baskets full of various herbs, as chervil, branca ursina, violet, ivy, &c. They danced in cadence and were crowned with ivy, in honour of Bacchus: carrying the phallus before them as the ensign of their office.

\* The word is formed the Greek, φαλλος, a pole, at the end of which was fastened the figure of a human penis made of leather; and φέρω, I bear.

**PHANATIC**, **PHANATICUS**, a visionary; one who fancies; or thinks, he sees spectres, spirits, apparitions, or other imaginary objects, even when awake; and takes them to be real. See **PHANTASY** and **FANATIC**.

Such are phrenetics, necromancers, hypochondriac persons, lycanthropi, &c. See **PHRENETIC**, **HYPOCHONDRIAC**, **LYCANTHROPY**. See also **WITCHCRAFT**, **IMAGINATION**, &c. Hence the word is also applied to enthusiasts, pretenders to revelation, new lights, prophecies, &c. See **ENTHUSIAST**.

**PHANTASM**, ΦΑΝΤΑΣΜΑ, **PHANTOM**, a species of an object perceived by an external sense, and retained in the phantasy. See **SPECIES** and **PHANTASY**.

**PHANTASTICK**, in music.—*PHANTASTICK style*, is a free, easy manner of composition; proper for instruments. See **STYLE**, and **COMPOSITION**.

**PHANTASTICAL colours**, is a denomination given by the peripateticks to those colours exhibited by the rainbow, or a prism; as supposing them not to be real colours, but only phantoms or deceptions of the sight. See **COLOUR**.

But many experiments of the moderns, and particularly those of Sir Isaac Newton, demonstrate the contrary; and prove them as real as any other colours in nature. See **PRISM**, and **RAIN-BOW**.

**PHANTASY**, or **FANCY**, the *imagination*; the second of the powers, or faculties of the sensitive or rational soul; by which the species of objects received by the common sense, are retained, recalled, further examined, and either compounded, or divided. See **IMAGINATION**.

Others define the *phantasy* to be that internal sense or power, whereby the ideas of absent things are formed, and presented to the mind as if they were present. See **SENSE**.

The seat or organ of this sense is vulgarly supposed to be the middle part of the brain; and its objects, all the species communicated to it by the common sense, by the comparing of which it frames infinite others to itself. See **IMAGE**.

In melancholic and mad men this faculty is very strong, representing many extravagant and monstrous things; and framing its images as lively as those of sensation: whence the visions and deceptions those persons are liable to. See **PASSION**, **DELIRIUM**, **MANIA**, &c.

In poets and painters, that same faculty is to be the predominant one; to enable them to feign, and pursue and execute their fictions or fables with more strength, consistency, &c. See **FABLE**, **POETRY**, &c.

In men it is supposed to be subject to reason, but in brutes it has no superior: this being the *ratio brutorum*, or what we call reason in brutes. See **REASON** and **BRUTE**.

The *phantasy* is free from the ligature, or suspension of sleep; witness our dreams, &c. See **SLEEP** and **DREAM**.

Some philosophers use the word *phantasy* in a more general signification, viz. for what we usually call *sensus communis*, the common sense. See **COMMON SENSE**, and **SENSORY**.

**PHARISEES**\*, a celebrated sect among the ancient Jews; so called, say some, because separated from the rest by the austerity of their life, by their professing a greater degree of holiness, and a more religious observation of the law.

\* This is the import of the word *pharis*. in the Hebrew, or rather Chaldean tongue; whence is formed the Greek φαρισαίος, and the Latin *phariseus*.—St. Jerom, and several of the Rabbins maintain this etymology; which is very agreeable to the state and character of the *pharisees*; who were not only distinguished from the rest by their manner of life, but by their habit.

It is very difficult to fix the precise origin of the *pharisees*. The jesuit Serrarius places their first rise about the time of Esdras; because it was then the Jews first began to have interpreters of their traditions. Maldonat, on the other hand, will not have this sect to have rose among the Jews, till a little before the time of Christ. Others, perhaps with more probability, refer the origin of the *pharisees* to the time of the Maccabees.

Be this as it will, *pharisaism* is still the prevailing doctrine in the Jewish religion; that huge number of traditions in the Talmud which bear so great a sway among the Jews, coming all from the *pharisees*. See **TRADITION** and **TALMUD**.

Josephus, who describes their dogmata, says, that they attributed all to destiny, and to God; so, however, as not to deprive man of his free agency; which Sixtus of Sienna thus explains: The *pharisees* believed that all things were done by destiny, i. e. with God's foreknowledge, and in consequence of his immutable decree; the will of man still remaining free and unaffected: *fato, hoc est Dei præscientia & immobili decreto omnia geri; manente tamen libero humanæ libertatis assensu*.

They owned the immortality of the soul, and a future state; but admitted at the same time a kind of metempsychosis, or transmigration of souls. See **METEMPSYCHOSIS**.

# P H A

The *pharisees* were great sticklers for the allegorical or mystical sense of the scriptures; whence most of the converts made to christianity among the Jews were of the *pharisees*. See ALLEGORY, &c.

In effect, the *pharisees* were in every thing directly opposite to the sadducees. See SADDUCEES.

**PHARMACEUTICA**, ΦΑΡΜΑΚΕΥΤΙΚΗ, that part of physick which directs the preparation, and application of medicines. See PHARMACY.

**PHARMACOLOGY**, a treatise of medicines; of the art of preparing them, judging of them, &c. See PHARMACY.

**PHARMACOPŌEIA**, a dispensary; or a treatise describing the preparations of the several kinds of medicines, with their uses, manner of application, &c. See DISPENSARY.

\* The word is formed from the Greek φάρμακον, remedy, and πωλλω, *facere*, to make.

We have various *pharmacopœia's*; as those of Bauderon, Quercetan, Zwelfer, Charas, Bates, Salmon, Lemery, &c.—The latest, and most rational, and that in most esteem, is Quincy's *pharmacopœia officinalis & extemporanea*.

**PHARMACOPOLA**, or *pharmacopœus*, an *apothecary*; or a person who prepares, and sells medicines. See APOTHECARY.

\* The word is seldom used but by way of ridicule. It is formed from the Greek φάρμακον and πωλλω, *vendere*, to sell.

**PHARMACUM**, ΦΑΡΜΑΚΟΝ a medicament, or medicine; whether of a salutary, or poisonous quality. See MEDICINE and POISON, and TETRAPHARMACUM.

**PHARMACY**, ΦΑΡΜΑΚΕΙΑ, that branch of medicine which teaches the choice, preparation, and mixture of medicines. See MEDICINE.

\* The word is derived from the Greek φάρμακον, remedy.

*Pharmacy* is divided into galenical and chymical.

**Galenical PHARMACY**, called also simply *pharmacy*, is that derived to us from the ancients; consisting in the knowledge, and management of the several parts of the materia medica, now in the hands of the apothecaries. See GALENICAL.

**Chymical PHARMACY**, called also *spagyric* and *hermetical*, is that introduced by Paracelsus, who calls it *ars distillatoria*; consisting in the resolving of mixed bodies into their component parts, in order to separate the useless and ill, and collect and exalt the good. See CHYMISTRY.

One of the chief obstacles in the way of the improvement of physick, is the physicians neglecting of *pharmacy*.—Simples, vulgar, familiar, easily prepared, readily procured simples, Pliny well observes, were the only remedies intended by nature: when fraud was got into the world, and men began to live by their wits, shops were soon set up; and life offered every man to sale. Straight, innumerable compositions, endless, inexplicable mixtures, are cried up; Arabia and India are crowded into a draught, and a plaister for a little ulcer fetched from the red sea. Whereas the proper remedies are those the poor every day feed on.—*Hist. Nat. lib. 24. c. 1.*

*Characters in PHARMACY.* See CHARACTER.

**PHAROS**, PHARE, a *light-house*; a pile raised near a port, where a fire is kept burning in the night to guide and direct vessels near at hand.

The *pharos* of Alexandria, built in a small island at the mouth of the Nile, was anciently very famous, inasmuch as to communicate its name to all the rest—The Colossus of Rhodes served as a *pharos*.

Ozanam says, *pharos* anciently signified a streight; as the *pharos* or *pharo* of Messina. See STREIGHT.

**PHARSANG**, or PARASANG. See PARASANG.

**PHARYNX**, ΦΑΡΙΓΞ, in anatomy, the upper opening of the oesophagus or gullet, situate at the bottom of the mouth; and called also *fauces*. See OESOPHAGUS and MOUTH.

The *pharynx* is that part more particularly called the *gula*, or gullet; in which the action of deglutition commences; and where it is chiefly performed.

It is assisted by three pair of muscles which chiefly compose the *pharynx*. See DEGLUTITION.—The first called the *stylopharyngæus* serves to draw up and dilate the *pharynx*: the second the *pterygopharyngæus* serves to constrict it: the third, which is called the *oesophagæus*, serves to close it; see each under its proper article, STYLOPHARYNGÆUS, &c.

**PHASES**\*, ΦΑΣΕΙΣ, in astronomy, the several appearances, or quantities of illumination of the moon, venus, mercury, and the other planets; or the several manners wherein they appear illuminated by the sun. See PLANET.

\* The word is formed from the Greek φαίνω, I appear, I shine upon.

The variety of *phases* in the moon is very remarkable; sometimes she increases, sometimes wanes, sometimes is bent into horns, and again appears like a semi-circle, at other times is gibbous, and presently resumes a full circular face. See CRESCENT, FALCATED, GIBBOUS, &c.

For the theory of the *lunar phases*, See MOON.—As to the *phases* of venus, the naked eye does not discover any diversity; but the telescope does: Copernicus anciently prophesied, that after-ages would find that Venus underwent all the changes of the moon; which prophecy was first fulfilled by Galileo, who directing his telescope to Venus, observed her *phases* to emulate

# P H I

those of the moon; being sometimes full, sometimes horned, sometimes gibbous. See VENUS.

And Mercury does the same—all the difference between these, and those of the moon, is, that when these are full, the sun is between them and us; whereas, when the moon is full, we are between her and the sun. See MERCURY.

Saturn puzzled the astronomers a long time with his strange variety of *phases*: Hevelius and others found him, 1. Monospherical. 2. Trispherical. 3. Spherico-anfated. 4. Elliptico-anfated. 5. Spherico-cuspidated: but Huygens shews, that those monstrous *phases* are all owing to the imperfection of their telescopes. That great author assisted by the best telescopes noted three principal *phases*; viz. Jan. 16, 1656 he was round, Octob. 13, brachiated, and Decemb. 17, 1657 anfated. See SATURN.

**PHASES of comets.** See the article COMET.

To determine the PHASIS of an eclipse for any given time.—Find the moon's place in her visible way for that moment; and thence, as a centre, with the interval of the moon's semi-diameter, describe a circle. Find in like manner the sun's place in the ecliptic, and thence, with the semi-diameter of the sun describe another circle: the intersection of the two circles shews the *phases* of the eclipse, the quantity of obscuration, and the position of the cusps or horns. See ECLIPSE.

**PHASMATA**, in physiology; certain appearances arising from the various tinctures of the clouds by the rays of the heavenly luminaries, especially the sun and moon. See METEOR, RAINBOW, &c. These are infinitely diversified by the different figures and situations of the clouds and the appulses of the rays of light, and together with the occasional flashings and shootings of different meteors, have, no doubt, occasioned those prodigies of armies fighting in the air, &c. of which we have such frequent accounts in most sorts of writers\*. V. Maccab. ii. 5. Melancth. meteor. 2. Snell. de comet. ann. 1618. See also AURORA Borealis.

\* Kircher, and his imitator Schottus, have endeavoured to explain the phenomenon from the reflexion of terrestrial objects made on opake and congealed clouds in the middle region of the air, which, according to them, have the effect of a mirror.—So that, according to these authors, the armies pretended by several historians to have been seen in the skies, were no other than the reflexion of the like armies placed on some part of the earth. Vid. *Hist. Acad. R. Scienc. an. 1726. p. 405, & seqq.*

**PHEONS**, in heraldry, the barbed heads of darts, arrows, or other weapons.

*Pheons* are represented as in *Tab. Heraldry, fig. 79.*—Sable, a fesse ermine between three *pheons*, by the name of Egerton.

**PHIAL**, PHIALA\*, a small thin glass-bottle; popularly called a *vial*. See GLASS.

\* The word is formed of the Greek φιάλη, which signifies the same.

**PHIDITIA**, or PHILITIA, in antiquity, feasts celebrated with great frugality at Lacedæmon.

The *phiditia* were held in the public places, and in the open air: rich and poor assisted at them alike, and on the same footing; their design being to keep up peace, friendship, and a good understanding, and equality among all the citizens great and small. Bernegger says, they who attended at this feast, brought each a bushel of flower, eight measures of wine, called *corus*, and five minæ of cheese, and as much figs.

The *phiditia* of the Greeks were much the same with the *charistia* at Rome. See CHARISTIA.

**PHILADELPHUS**, ΦΙΛΑΔΕΛΦΟΣ, in antiquity, a title, or sur-name, borne by several ancient kings; formed from the Greek φίλος friend, lover, and αδελφός brother; *q. d.* one who loves his brother, or brethren.

Ptolemy *Philadelphus*, erected a library at Alexandria, and furnished it with 400000, others say 700000 volumes, by the advice, and with the assistance of Demetrius Phalerus. See LIBRARY.

It was the same *Philadelphus*, that procured the Greek version of the books of Moses, called the *Septuagint*. See SEPTUAGINT. Father Chamillart has a medal of the queen of Comagene, which bears the title of *Philadelpia*, without any other name.—M. Vailant tells us that Philip king of Syria had the title *Philadelphus*.

**PHILANTHROPY**, ΦΙΛΑΝΘΡΩΠΙΑ, love of mankind; a general benevolence toward the species. See MISANTHROPY.

**PHILAUTIA**, ΦΙΛΑΥΤΙΑ, in the schools, *self-love*; a vicious fondness and complaisance for a man's self.

\* The word is formed from the Greek φίλος, *amicus*, and αὐτός, *ipse*.

**PHILIPPICKS**, PHILIPPICÆ, ΦΙΛΙΠΠΙΚΟΙ ΛΟΓΟΙ, in literature, a name given to the orations of Demosthenes against Philip king of Macedon. See ORATION.

The *philippicks* are esteemed the master-pieces of that great orator: Longinus quotes abundance of instances of the sublime from them; and points out a thousand latent beauties therein. In effect, that pathetic wherein Demosthenes excelled, the frequent interrogations and apostrophe's wherewith he attacked the indolence of the Athenians, where could they be better employed? How much delicacy soever there be in the oration against Leptinus, the *philippicks* have yet the advantage over it, were it only on account of the subject, which gives Demosthenes so fair a field to display his chief talent, we mean with Longinus, that of moving and astonishing.

Dionysius Halicarnassensis ranks the oration on the Halonese among the *philippicks*, and places it the eighth in order; but though the authority of that great critic be of no small weight; yet,

yet, that force and majesty whereby Cicero characterises the *philippicks* of Demosthenes, seems to exclude the oration on the Halonese out of the number; and authorise the almost universal opinion of the learned, who reject it as spurious. Libanius, Photius, and others; but, above all, the languidness of the style, and the lowness of the expressions which reign throughout the whole, rather it on Hegesippus.

M. Tourreil has given an excellent French translation of the *philippics* of Demosthenes.—It is an extraordinary thing to see so much spirit in a translation; so much of the strength and energy of Demosthenes in a modern tongue, and that too so weak a one as the French.

**PHILIPPICK** is also applied to the fourteen orations of Cicero against Marc Antony.—It was Cicero himself that gave them this title in his epistles to Brutus; and posterity have found it so just, that it has been perpetuated down to our times.

Juvenal calls the second the *divine philippick*, and witnesses it to be of great fame, *conspicua divina philippica fama*. That orator's entitling his last and most valued orations after the *philippicks* of Demosthenes, shews the high opinion he had of them. Cicero's *philippicks* cost him his Life; Marc Anthony having been so irritated with them, that, when he was arrived at the triumvirate, he procured Cicero's murder, cut off his Head, and stuck it up in the very place whence the orator had delivered the *philippicks*.

**PHILIPPISTS**, a sect or party among the Lutherans, the followers of Philip Melancthon. See **LUTHERANISM**.

That reformer having strenuously opposed the Ubiquists, who arose in his time; and the dispute growing still hotter after his death, the university of Wittemberg, who espoused Melancthon's opinion, were called by the Flaccians, who attacked it, *Philippists*. See **UBQUIST**.

**PHILITIA**. See the article **PHIDITIA**.

**PHILIZERS**, or **FILAZERS**. **FIZALER**.

**PHILO**, a term originally Greek, formed of *φίλος*, *amicus*, friend, lover; used in composition in several words in our language: As **PHILELEUTHERUS**\*, *φιλελευθερος*, a lover of liberty.

\* The word is formed of *φίλος* and *λευθερος*, *liber*, free.

**PHILOLOGY**, *φιλολογία*, a science, or rather assemblage of several sciences, consisting of grammar, rhetoric, poetry, antiquities, history, and criticism. See **SCIENCE**.

\* The word is formed from the Greek *φίλος* and *λογος*, *q. d.* lover of discourse.

*Philology* is a kind of universal literature conversant about all the sciences, their rise, progress, authors, &c. See **POLYMATHE**. *Philology* makes what the French call the *belles lettres*. In the universities it is also called *humanitas*, or *humaniores literæ*. Anciently *philology* was only a part of grammar. See **GRAMMAR** and **GRAMMARIAN**.

Erastosthenes, library-keeper at Alexandria, was the first who bore the splendid title of *philologus*, according to Suetonius; or that of *critick*, according to Clemens Alexandrinus. He lived under Ptolemy Philadelphus, and died in the 146<sup>th</sup> Olympiad. See **CRITICISM**.

**PHILOMATHES**\*, *φιλομαθης*, a lover of learning or science. See **SCIENCE**, **KNOWLEDGE**, &c.

\* The word is formed from the Greek *φίλος*, lover, and *μαθαιω*, *disco*, I learn.

**PHILONIUM**, in pharmacy, an opiate or electuary, whereof there are two kinds, the Roman and the Persian. See **OPIATE**. The Roman, called also the great *philsinium*, took its name from the physician Philo, who invented it. It consists of the seeds of henbane, pepper, opium, and other ingredients. It is used to promote sleep, against colds, colicks, &c.

The Persian *Philonium* consists of several ingredients, among which are opium, terra sigillata, lapis hæmatites, castor, and saffron. It is used to stop hæmorrhages, dysenteries, &c.

**PHILOPATOR**\*, *φιλοπατωρ*, in antiquity, a title or surname, assumed by several of the kings of Egypt and Syria; importing lover of one's father.

\* The word is formed from the Greek *φίλος*, lover, and *πατης*, father.

Ptolemy *Philopator* succeeded Ptolemy Euergetes; and had for his successor Ptolemy Philometer. See **EUERGETES**.—The Syrians had their Seleucus *Philopator*, Antiochus *Philopator*, &c.

**PHILOSOPHER**, *φιλοσοφος*, a person well versed in philosophy; or who makes profession of, or applies himself to the study of nature and morality. See **PHILOSOPHY**.

The sects of *philosophers* are very numerous; and their dogmata or tenets very contradictory. See **SECT**.

Helmont, and some of the chymists, denominate themselves *philosophers by fire*. See **CHYMISTRY**.

The alchymists and adepts are frequently denominated the *philosophers*, by way of eminence. See **ALCHYMI**, &c.

**PHILOSOPHERS Lotion**. See the article **LOTION**.

**PHILOSOPHERS Stone**, the great object of alchymy, is a long-sought-for preparation, which is to transmute or exalt impure metals, as tin, lead, and copper, into gold and silver. See **TRANSMUTATION**.

There are three ways whereby the alchymists have attempted to arrive at the making of gold: the first, by separation; for every metal yet known, contains some quantity of gold; only in most

the quantity is so little, that it won't defray the expence of getting it out. See **METAL** and **GOLD**.

The second, by maturation; for the alchymists hold *mercury* to be the basis and matter of all metals; that quicksilver, purged from all heterogeneous bodies, would be much heavier, denser and simpler than the native quicksilver; and that by subtilizing, purifying, and digesting it, with much labour and long operations, it may be converted into pure gold. See **MERCURY**.

This method of maturation is only for mercury; the other metals it is ineffectual for, on two accounts: 1<sup>o</sup>. Because their matter is not pure mercury, but has other heterogenous bodies adhering to it: and 2<sup>o</sup>, by reason the digestion whereby mercury is turned into gold would not succeed in other metals, in regard these had not been long enough in the mines. Weight is the individual and inimitable character of gold, &c. Now mercury has ever some impurities in it, and those impurities are lighter than mercury. Could those be purged quite out, as it does not appear impossible but they might, mercury would be as heavy as gold; and what is as heavy as gold is gold, or at least might very easily be made gold. See **WEIGHT**.

The third method is, that of transmuting, or of turning of all metals readily into pure gold, by melting them in the fire, and casting a little quantity of a certain preparation into the fused matter; upon which the fæces immediately retire, are volatilized and burnt, and so carried off, and the rest of the mass turned into pure gold—Now that which works this change in the metals is called the *philosopher's stone*. See **TRANSMUTATION**.

Whether this third method be possible or not, is very hard to say: we have so many testimonies of persons, who, on all other occasions, speak truth, that it is somewhat hard to say they lie in this, that they have been masters of the secret. All required is, to do that by art which nature does in many years and ages. For lead and gold do but differ little in weight. Therefore there is not much in lead beside mercury and gold. Now if I had any body which would so agitate all the parts of lead, as to burn all that is not mercury therein, and had some sulphur to fix the mercury; would not the mass remaining be converted into gold? there is nothing in nature so heavy as lead, gold and mercury only excepted. It is evident, therefore, there is something in lead that comes very near to gold. But in lead there is some heterogeneous matter different both from mercury and gold. If now nineteen ounces of lead be dissolved by the fire, and eight ounces be thus destroyed, we shall have good gold; the ratio of lead to gold being as eleven to nineteen. If then the *philosopher's stone* can purify the mercurial matter in lead, so as nothing shall remain but the pure mercurial body, and you can fix and coagulate this, by means of sulphur, out of nineteen ounces of lead you will have eleven of gold. Or, if you reduce the lead from eleven to fourteen, you will then have converted it into mercury; and if you further purify this mercury from fourteen to nineteen, you will have gold; provided you have but a sulphur to fix and coagulate it withal. Such is the foundation of the *philosopher's stone*, which the alchymists contend to be a most subtle, fixed, concentrated fire, which, as soon as it melts with any metal, does, by a magnetic virtue, immediately unite itself to the mercurial body of the metal, volatilizes and cleanses off all that is impure therein, and leaves nothing but a mass of pure gold. See **ELIXIR**, **PROJECTION**, **METAL**, **MERCURY**, &c.

**PHILOSOPHERS Tree**, a chymical preparation, called also *arbor dianae*, *diana's tree*. See **ARBOR DIANA**.

**PHILOSOPHICAL**, something that relates to *philosophy*. See **PHILOSOPHY** and **PHILOSOPHER**.

Thus we say a *philosophical thesis*, a *philosophical principle*, a *philosophical definition*, &c.

**PHILOSOPHICAL Æther**. See **ÆTHER**.

**PHILOSOPHICAL Criticism**. See **CRITICISM**.

**PHILOSOPHICAL Egg**, among the chymists, is a thin glass body, or bubb'e, of the shape of an egg, with a long neck or stem, used in digestions. See **DIGESTION**.

**PHILOSOPHICAL Month**. } See { **MENSTRUUM**, **MONTH**.

**PHILOSOPHICAL Transactions**. } See { **TRANSACTIONS**.

**PHILOSOPHICAL Tree**. } See { **TREE**.

**PHILOSOPHIZING**, the act of considering some object of our knowledge, examining its properties, and the phenomena it exhibits, enquiring into their causes and effects, and the laws thereof; the whole conducted according to the nature and reason of things, and directed to the improvement of knowledge. See **SCIENCE**, **METHOD**, **KNOWLEDGE**, **TRUTH**, &c.

*Rules of PHILOSOPHIZING*, *regulæ PHILOSOPHANDI*, as established by sir Isaac Newton are: 1. That no more causes of a natural effect be admitted than are true, and suffice to account for the phenomena thereof.

This agrees with the sentiments of most philosophers, who hold that nature does nothing in vain; and that it were vain to do that by many things which might be done by fewer.

2. Natural effects, therefore, of the same kind, proceed from the same causes. Thus, *e. gr.* the cause of respiration is one and the same in man and brute; the cause of the descent of a stone, the same in Europe as in America; the cause of light, the same in culinary fire as in the sun; the cause of reflection, the same in the planets as the earth.

3. Those

3. Those qualities of bodies which are not capable of being heightened and remitted, and which are found in all bodies where experiments can be made, must be looked on as universal qualities of all Bodies. See QUALITY.

Thus the extension of body is only perceived by our senses, nor is it perceived in all bodies; but since it is found in all that we have perception of, it may be affirmed of all. So we find that several bodies are hard; and argue, that the hardness of the whole only arises from the hardness of the parts; whence we infer, that the particles, not only of those bodies which are sensible, but of all others, are likewise hard. Lastly, if all the bodies about the earth gravitate towards the earth, and this according to the quantity of matter in each; and the moon gravitates towards the earth also according to its quantity or matter, and the sea again gravitates towards the moon; and all the planets and comets gravitate towards each other: it may be affirmed universally, that all bodies in the creation gravitate towards each other.—This rule is the foundation of all natural philosophy. See PHYSICS, GRAVITY, NEWTONIAN, &c.

**PHILOSOPHY**, ΦΙΛΟΣΟΦΙΑ, the knowledge or study of nature and morality, founded on reason and experience. See KNOWLEDGE.

Philosophy owes its name to the modesty of Pythagoras, who refused the titles, σοφός, *wise*, given to his predecessors, Thales, Pherecydes, &c. as too assuming; and contented himself with the simple appellation of φιλοσοφός, *quasi* φίλος της σοφίας, a friend, or lover of wisdom.

Chauvin rather derives the name from φιλία, desire or study, and σοφία, *q. d.* *studium sapientiæ*: Pythagoras conceiving, that the application of the human mind ought rather to be called *study* than *science*, set aside the appellation *wise*, and, in lieu thereof, took that of *philosopher*.—For having discoursed with great judgment and learning before Leontius king of the Phliasii, that prince asked him what art he professed; or in what points his wisdom chiefly lay? To which he answered, that he neither understood any art, nor was he σοφός, but φιλοσοφός. Which title St. Augustin observes, took so well with other authors, that whoever excelled in any thing relating to wisdom or knowledge had no other appellation. Accordingly Socrates, Plato, &c. ever refrained from the swelling title of *sophos*. See SOPHIST.

**PHILOSOPHY** is a term used in various significations among ancient and modern writers. In its laxer sense, it signifies the love of truth; thus Plato frequently calls it *pilateia*. See TRUTH. In other places it signifies the knowledge of many things: thus, Zeno calls *philosophy* καταληψις, comprehension; because comprehending all truth.—Agreeable to which is Cicero's definition of a philosopher, that he is one who studies to know the natures and causes of all things human and divine, and to attain to every good rule and method of life.

**PHILOSOPHY**, in a narrower sense, is frequently confined to some one science, or branch of science: *v. gr.* to Logic, as we find it in Plato and Aristotle.—To Physics, or the knowledge of nature; in which sense it was chiefly used in the Ionic school.—And to Ethics, or the rules of morality: thus it is Clemens of Alexandria relates, that, among the Greeks, there are philosophers who hold disputes about virtue.

Agreeable to this last application, Pythagoras defines *philosophy*, a meditation on death; by which, according to Plato and Clemens, is meant an abstraction or retirement from the body, which Apuleius thus explains: A philosopher is to study nothing so much as to set his soul at liberty from its correspondence with the body: thus Cicero calls *philosophy*, *ars vitæ*, and Seneca, *lex vitæ*; and thus Plutarch—constancy, fidelity, and a sound mind are the real *philosophy*; all the other parts of wisdom, tending any other way, are prettinesses and curiosities; and in this sense it was, that *philosophy* chiefly flourished in the school of Socrates, afterwards called the *academic school*, and among the Stoics. See ACADEMIC and STOIC.

**PHILOSOPHY** again is frequently used by Pythagoras and Plato for Metaphysics, or the knowledge of God, which Plato calls the *true philosophy*, others the *prima philosophia*; and, in respect whereof, the Platonists call all other *philosophy*, *nocturnal*, νυκτερινή φιλοσοφία. See METAPHYSICKS and GOD.

Gale includes the several notions hitherto delivered, under this one general definition: *philosophy* is the knowledge of things natural, moral, supernatural and notional, first granted by God to our first parents, and transmitted to us for the honour of the Creator, and the good of the universe. See KNOWLEDGE.

That definition of Epictetus is also pretty comprehensive: *philosophy* consists in three things, the practice of precepts, the reason of precepts, and the proof of precepts.

Some have given the following appellations to the ancient *philosophy* under its several stages: *Philosophy*, say they, became *impious* under Diagoras, *vicious* under Epicurus, *hypocritical* under Zeno, *impudent* under Diogenes, *covetous* under Demochares, *voluptuous* under Metrodorus, *fantastical* under Crates, *scurrilous* under Menippus, *licentious* under Pyrrho, *quarrelsome* under Cleanthes, &c.

The several dogmata maintained by the several philosophers, are infinite: Cicero makes no scruple to aver, that there is nothing in the world, how absurd soever, but has been maintained by one *philosopher* or other.

From the first broachers of new opinions, and the first founders of schools, *philosophy* is become divided into innumerable sects: some ancient, others modern: such are the Platonists, Peripatetics, Epicureans, Stoicks, Pyrrhonians, and Academicks; and such are the Cartesians, Newtonians, &c. See the rise, doctrines, &c. of each sect under its proper article, PLATONIST, PERIPATETIC, EPICUREAN, STOIC, PYRRHONIAN, ACADEMIC, CARTESIAN, NEWTONIAN, &c.

*Philosophy* may be divided into two branches, or considered under two habitudes, *Theoretical* and *Practical*.

*Theoretical* or *speculative* PHILOSOPHY is that employed in mere contemplation, and which terminates therein.—Such is Physics, which is a bare contemplation of nature and natural things. See PHYSICKS.

*Theoretical philosophy*, again, is usually subdivided into three, *viz.* Pneumatics, Physics or Somatics, and Metaphysics or Ontologia.

The first considers Being, abstracted from all matter, its objects are spirits, their nature, properties, effects, &c. See SPIRIT and PNEUMATICS.

The second considers matter and material things; its objects are spirits, their properties, laws, &c. See BODY and PHYSICS. The third extends to each indifferently; its objects are either body or spirit. See METAPHYSICKS.

In the order of our discovery, or arrival at the knowledge of them, Physics is first, then Metaphysics; the first arises from the two considered together; after an acquaintance with God, ourselves, and natural bodies, we come to consider what is common to them all, or the attributes that agree to all; and thus form a sort of universal *philosophy*, or doctrine *de ente* in general. See ONTOLOGY, ENS, ESSENCE, &c.

But in teaching, or laying down these several branches to others, we observe a contrary order, beginning with the most universal, and descending to the more particular. And hence we see why the Peripatetics call Metaphysics, and the Cartesians Pneumatics, the *prima philosophia*.

Others prefer the distribution of *philosophy* into four parts, *viz.* 1. Pneumatics, which considers and treats of spirits. 2. Somatics, of bodies. The third compounded of both. Anthropology, which considers man, in whom both body and spirit are found. The 4. Ontology, which treats of what is common to all the other three.

*Practical* PHILOSOPHY is that which lays down the rules of virtuous and happy life, and excites us to the practice thereof. *Practical philosophy* is properly Ethics, alone, or the method of leading a virtuous and happy life.—Yet most authors divide it into two, answerable to the two sorts of human actions to be directed thereby, *viz.* 1°. Logics, which govern the operations of the understanding. See LOGICS and UNDERSTANDING.

2°. Ethics, properly so called, which direct those of the will. See ETHICS, WILL, and MORALITY.

*Natural* PHILOSOPHY. } See the articles { NATURAL.  
*Moral* PHILOSOPHY. } MORAL.

PHILOSOPHY is also frequently used for the particular doctrine, or system of opinions, broached by some considerable philosopher, and espoused and adhered to by his followers. See SYSTEM and HYPOTHESIS.

In this sense we say the

Aristotelian	} PHILOSOPHY. See {	PERIPATETIC.
Cartesian		CARTESIAN.
Epicurean		EPICUREAN.
Hermetical		HERMETICAL.
Newtonian		NEWTONIAN.
Platonic		PLATONIC.
Socratic		SOCRATIC.

PHILOSOPHY is also used for a certain manner of philosophizing, or certain principles, upon which all the enquiries thereby made, do turn. See PHILOSOPHIZING.

In this sense we say,

Corpuscular or Atomical PHILOSOPHY.	} See {	CORPUSCULAR and
Mechanical PHILOSOPHY.		ATOMICAL.
Experimental PHILOSOPHY.		MECHANICAL.
		EXPERIMENTAL.

PHILOSOPHY, again, is considered with regard to the age, or the place wherein it was taught.

In this sense we say,

Scholastic or School PHILOSOPHY. See SCHOLASTIC.  
New PHILOSOPHY, &c. See EXPERIMENTAL, MECHANICAL, &c.  
FILTER, PHILTRE, PHILTRUM, in pharmacy, &c. a strainer, or filter. See FILTER.

FILTER\*, ΦΙΑΤΡΟΝ, is also used for a drug, or preparation, which, it is pretended, will excite love. See CHARM.

\* The word is formed from the Greek, φίλω, I love, or φίλος, lover.

*Philters* are distinguished into true and spurious: the spurious are spells or charms, supposed to have an effect beyond the ordinary laws of nature by some magick virtue; such are those said to be given by old women, witches, &c. See MAGIC and WITCHCRAFT.

The true *philters* are those supposed to work their effect by some natural and magnetical power.—There are many grave authors who

who believe the reality of these *philters*; and alledge matter of fact in confirmation of their sentiments: among the rest, Van-Helmont, who says, that upon holding a certain herb in his hand for some time, and taking afterwards a little dog by the foot with the same hand, the dog followed him wherever he went, and quite deserted his former master.

He adds that *philters* only demand a conformation of mumia; and on this principle accounts for the phenomena of love transplanted by the touch of an herb; for, says he, the heat communicated to the herb, not coming alone, but animated by the emanations of the natural spirits, determines the herb towards the man, and identifies it to him: having then received this ferment, it attracts the spirit of the other object magnetically, and gives it an amorous motion. See MUMIA and TRANSPLANTATION.—But this is mere cant; and all *philters*, whatever facts may be alledged, are mere chimera's.

Naturalists ascribe an effect somewhat of kin to that of a *philter* to cantharides taken inwardly; these, it is true, tend to excite love, or rather lust: but it is lust in the general, not determined to any particular object; and they do it no otherwise than by irritating the fibres of the nerves and muscles, by whose action the emissio feminis is effected. See CANTHARIDES.

**FILTRATION**, or **FILTRATION**, the separation of the finer parts of a fluid from the coarser; by passing it through a filter, viz. a linnen cloth, shammy skin, brown paper, or the like. See FILTRATION.

**PHIMOSIS**\*, ΦΙΜΩΣΙΣ, in medicine, a disease of the penis, wherein the præputium is glued, or strongly constricted upon the glans; so as not to be capable of being drawn back to uncover the glans. See GLANS, PREPUCE, and PARAPHIMOSIS.

\* The word is Greek, and properly signifies a ligature with packthread, Φιμωσις denoting packthread.

Sometimes a *phimosi*s conceals shankers on or about the glans; and sometimes is so violent as to prevent the flowing out of the matter, whence it causes an inflammation or mortification of the part.

The cure of a paraphimosi in no wise differs from that of a *phimosi*, except in the use of injections; and in both cases, if they still prove obstinate, the prepuce must be cut, in order to reduce it to its natural state or situation. See PARAPHIMOSIS.

**PHIMOSIS**, is also used for a disease of the eyes, wherein the eyelids are so bound together by the mediation of some glutinous matter, as not to be opened.

**PHLEBOTOMY**\*, ΦΛΕΒΟΤΟΜΙΑ, in medicine and chirurgery, *bleeding*; or the art, or operation of letting blood. See BLOOD.

\* The word is compounded of the Greek φλεψ, vein, and τεμνω, to cut.

*Phlebotomy* is a species of evacuation of the utmost importance in medicine; an idea of its effects, with the reason of its use, may be conceived from what follows.

It is evident the blood thrown out of the heart, while it strikes upon the antecedent blood, and drives it forwards, transfers to it part of its own motion, and is therefore so much retarded in its own motion. Hence, if blood be drawn out of the basilic vein of the right arm, the succeeding blood, or that carried by the axillary artery, or right subclavian, will be less hindered in its motion, than it was before that vein was opened: for part of the blood being taken away by the opening of that vein, there remains behind a lesser quantity in the axillary vein, or less is contained between the farther extremity of the axillary artery and the heart, than was before: therefore the blood being let out by the vein, the remainder in the artery will be less impeded in its motion than before. See PULSE.

Hence the blood of that artery which communicates with the vein that is opened, will flow with a greater velocity after the aperture is made than before. Consequently, while the blood is flowing out of the vein in the arm, that thrown out of the heart into the aorta, will find less resistance in the ascending trunk than in the descending; and will therefore flow faster in the ascending than in the descending trunk: and thence too it will find less resistance in the right subclavian artery than in the left.

Lastly, it hence appears, that the blood being let out of a vein in the right arm, the remaining blood in the right axillary artery runs with a greater velocity into the artery of that arm, that is contiguous to it, than through the thoracic artery, or the right scapulary, which is likewise contiguous to it; because, when the blood is not supposed to be drawn out from any vein corresponding to the thoracic artery or into which this discharges itself, there is proportionably a greater impediment to the motion of the blood in the thoracic artery than in that of the arm. But because the velocity of the blood in the subclavian artery, or the right axillary, is greater than in the left; the velocity in the right thoracic will also be greater than in the left thoracic artery. Hence it is manifest, that the blood being let out of a vein in the right arm, the greatest velocity of the remaining blood will be in the artery of that arm, because it immediately empties its blood into the vein that is opened; and the next greatest velocity will be in the thoracic artery, or scapulary of the same side, going out from the axillary artery. But the velocity of the blood

will be far less in the brachial, axillary, and thoracic artery on the left and opposite side, and least of all in the arteries arising from the descending trunk of the aorta.

On this view it may easily be gathered, what is to be done in the several circumstances of blood-letting: for instance, if we would prevent the increase of any humour from the blood stagnating in the left leg, or bring it about, that as little blood as possible should flow to that leg in any given space of time; first, blood is to be taken from the arm or leg of the right side: because this is truly making what is called a *revulsion*.

Again, if blood be drawn away on the same side, and from some vein that receives the blood from a branch of that trunk which transmits it to the swelled part; it will occasion a greater derivation of blood to that limb.

As to what relates to the whole habit; in all lentors and viscidities, if there be a due strength and elasticity remaining in the solids, *phlebotomy* will make the remaining blood circulate the faster, and become thinner and warmer; but in a plethora, from a debauch, and too large quantities of spiritous nourishment, or from a diminution of perspiration, where the blood yet retains its natural fluxility, *phlebotomy* will make the remaining mass circulate slower, and become cooler.

In the former case, a diminution of the resistance in the blood-vessels will increase the contractile powers of those vessels, and make them beat faster, and circulate their contents with greater velocity; but in the latter case a diminution of the quantity of a spiritous blood will lessen the quantity of spirit secreted in the brain, the consequence of which will be, that the heart and arteries will not contract so often nor so strongly as before, and therefore the blood will move slower, and become cooler. See HEART and ARTERY.—And on these things depends the whole doctrine of blood-letting. See EVACUATION.

**PHLEGM**, ΦΛΕΓΜΑ, in chemistry, an aqueous and insipid fluid, supposed to be found in all natural bodies: coinciding with what the other philosophers call *water*. See WATER.

*Phlegm* makes the fourth of the chemical elements, or elementary principles. See PRINCIPLE and ELEMENT.

In the distillation of vinegar, as also of all minerals and inodorous vegetables, *phlegm* comes out first; in that of wine last. See DISTILLATION.

This *phlegm* is supposed to be the common vehicle and diluter of all solid bodies; and in proportion to its quantity in the mixture, are the other parts more languid and disabled in their attractions: yet, on the chemists principles, *phlegm* should be a principle of action; as being necessary to the dissolution of the salt in bodies, without which the salt must remain inactive. See SALT.

It is much to be questioned, whether this *phlegm* can ever be procured without some mixture of other matters; that which has the least must come nearest to the nature of a principle; and on that account rain-water should afford it most.

*Phlegm*, Boerhaave observes, drawn by distillation from vegetables, does always carry with it somewhat of the smell of the vegetable, which it derives partly from the oil, and partly from the spirit residing therein. The same *phlegm*, by frequently reiterated distillations, lays aside most of this smell, and approaches nearer to pure water, but never becomes perfectly such. Add, that the purest distilled water, if exposed a few days to the sun, is much changed, and rendered turbid.

That *phlegm* is not an elementary body, Mr. Boyle argues from its different powers and properties: the *phlegm* of wine, and most liquors, have qualities that make them differ from mere water, and from one another; the *phlegm* of vitriol, that author observes, is an effectual remedy against burns, and a valuable nostrum for discussing hard tumours; that of vinegar will extract a saccharine sweetness out of lead, and even dissolve corals with long digestion; and that of sugar of lead is said to dissolve pearls.

In effect, the characters which serve to denominate a fluid, *phlegm*, or water, among the chemists, are insipidity and volatility; yet, quick-silver has both these, which no body pretends to be *phlegm*. Add, that it appears from several experiments, that water itself, by repeated distillations, may be converted into earth. Yet water, the same author observes, has a much fairer pretence to be an element, than any of the *tria prima*.

Add, that as to the qualities which occasion that name to be given any visible substance, viz. its being fluid, insipid, and inodorous; we have never yet seen any of these separated substances, which the chemists call *phlegm*, perfectly destitute both of taste and smell.

Common salt, and several other saline bodies distilled ever so dry, will each yield a large quantity of *phlegm*, which can no other way be accounted for, but from this, that among the various operations of the fire, on the matter of a concrete, several particles of that matter are reduced to a shape and size requisite to compose such a liquor as the chemists call *phlegm*, or water.

**PHLEGM**, in the animal œconomy, is one of the four humours, whereof the ancients supposed the mass of blood to consist. See HUMOUR, and BLOOD.

*Phlegm* is the same that is otherwise called *pituita*. See PITUITA.

**PHLEGMAGOGUE\***, ΦΛΕΓΜΑΓΩΓΟΣ, a medicine proper to purge *phlegm* or *pituita*. See **PURGATIVE**.

\* The word is formed from the Greek, φλεγμα, *pituita*, and αγω, to drive, or draw.

Agaric, hermodactyls, turbit, &c. are reputed *phlegmagogues*.

**PHLEGMATIC**, ΦΛΕΓΜΑΤΙΚΟΣ, a temperament wherein *phlegm*, or *pituita*, is the prevailing humour. See **TEMPERAMENT** and **PHLEGM**.

*Phlegmatic* constitutions are subject to rheums, defluxions, &c. See **CONSTITUTION** and **COMPLEXION**.

**PHLEGMON\***, ΦΛΕΓΜΟΝΗ, in medicine, a general name for all hot or inflamed tumours, formed in the fleshy or bloody parts of the body. See **TUMOR**.

\* The word is formed from the Greek, φλεγειν, to burn, or inflame.

An inflammation, attended with a considerable swelling of the part, constitutes a *phlegmon*. See **INFLAMMATION**.

If the blood be good, and laudable, and only peccant in quantity, it is called a *true phlegmon*.

When corrupted and adulterated with bile, or *pituita*, it is called a *bastard phlegmon*; in which case it participates of the erysipelas, œdema, or schirrus.

The blood here extravasated produces a heat, redness, tension, renitency, pulsation, and great pain.—The bubo, carbuncle, furuncle, pustules, and other tubercles arising from the blood, are all reducible to the *phlegmon*. See **BUBO**, **CARBUNCLE**, &c.—The ophthalmia, parotides, squinancy, and even pleurisy and peripneumony, are species of the *phlegmon*. See each under its proper article, **OPHTHALMIA**, &c.

**PHLOGOSIS**, ΦΛΟΓΩΣΙΣ, in medicine, sometimes denotes a degree of the ophthalmia.

When the inflammation of the eye is light and gentle, it is called a *phlogosis*; when very severe, *chemosis*. See **OPHTHALMIA**.

**PHLYACOGRAPHIA\***, among the ancients, a merry and burlesque imitation of some grave and serious piece; particularly a tragedy travestied into a comedy. See **TRAVESTY**.

\* The word is formed from the Greek, φλυαζειν, *nugari*, to trifle, or φλυαξ, trifle, of φλυω, *nugor*.

The *phlyacography* was the same thing with the *hilarody*, or *hilarotragedy*. See **HILARODIA**, &c.

There were several kinds of *phlyacography*; which had their several names. See **Salmasius** on **Solinus**.

The parodies which have been made of some parts of the best poets, as the *Virgil travesty* of Scarron, and Cotton; the *Rival queens* of Cibber, from the *Rival queens* of Lee; some pieces of opera's, the musick whereof is applied to low and ridiculous words, come under the notion of *phlyacographies*.

**PHLYCTÆNÆ**, ΦΛΥΚΤΑΙΝΑΙ, little white itching pimples or vesiculæ, arising on the skin, chiefly between the fingers, and about the wrist; and full of a limpid serum.

They sometimes degenerate into the itch, and sometimes into tetters. See **ITCH**, &c. They are cured like other cutaneous eruptions. See **PSORA** and **PUSTULE**.

**PHLYCTÆNÆ** also denote little ulcerous vesicles, arising sometimes on the adnata, sometimes on the cornea, of the eye, like so many little bladders full of water; popularly called *blifters in the eyes*.

They appear like grains of millet; and when produced by a sharp corroding humour, occasion violent pain: the pustules on the adnata are red; those on the cornea blackish, if near to the surface, but whiter if deeper. They are cured by excutients and dryers.

**PHLYSTÆNA**, in medicine, a disease which produces bubo's full of a serous humour. See **BUBO**.

\* The word is formed from the Greek, φλυω, φλυζω, *ebullio*, I boil, bubble, &c.

The *phlystæna* is a kind of pox.—The bubo's it occasions are sometimes big, livid, pale, black, or any colour different from that of the natural flesh.—When pierced, the flesh frequently appears ulcerated under them.

They are usually occasioned by a hot, sharp humour, and arise on all parts of the body; but are most dangerous on the cornea of the eye.

**PHOENICIAN Character**. See the article **CHARACTER**.

**PHOENIGMUS\***, ΦΟΙΝΙΓΜΟΣ, a medicine which produces redness, with blisters, on the places it is applied to. See **VESICATORY**, &c.

\* The word is formed from the Greek, φοινξ, red.

Such are mustard-seed, pepper, vesicatories, &c. See **VESICATORY**, **SINAPISM**, &c.

*Phœnigma's* are used to draw the humour to the part they are applied on, and divert it from the part affected. See **RE-VULSION**.

**PHOENIX**, ΦΟΙΝΙΞ, in astronomy, a constellation of the southern hemisphere; unknown to the ancients, and invisible in our northern parts. See **CONSTELLATION**.

It took its name, and form, from that of a bird famous among the ancients; but generally looked upon by the moderns as fabulous.

The naturalists speak of it as single, or the only one of its kind: they describe it as of the size of an eagle; its head finely

crested with a beautiful plumage; its neck covered with feathers of a gold colour, and the rest of its body purple: only the tail white intermixed with carnation, and its eyes sparkling like stars.—They hold that it lives five or six hundred years in the wilderness: that when thus advanced in age, it builds itself a funeral pile of wood and aromatic gums, then it lights it with the wafting of its wings, and thus burns itself: and from its ashes arises a worm, which in time grows up to be a *phœnix*. Hence the Phœnicians gave the name *phœnix* to the palm-tree, by reason when burnt down to the very root, it rises again fairer than ever.

**PHONASCIA\***, ΦΩΝΑΣΚΙΑ, the art of forming the human voice. See **VOICE**.

\* The word is derived from the Greek, φωνη, voice.

In ancient Greece, there were combats, or contests, established for the voice, as well as other parts of the gymnastics. See **GYMNASTICKS**.

These combats continued to be held in the time of Galen; and it was these that brought the *phonaschia* into vogue.

Hence the masters of this art, and those who taught the art of managing the voice, were called *phonaschi*, φωνασκοι, under whose tutorage were put all those destined to be orators, singers, comedians, &c.

**PHONICKS\***, ΦΩΝΙΚΗ, the doctrine, or science, of sounds; otherwise called *acousticks*.

\* The word is derived from the Greek, φωνη, voice, sound.

*Phonicks* may be considered as an art analagous to opticks; and may be divided, like that, into *direct*, *refracted* and *reflected*. These branches the bishop of Ferns, in allusion to the parts of opticks, denominates *phonicks*, *diaphonicks*, and *cataphonicks*.

*Phonicks* is improvable both with regard to the object, the medium, and the organ.

As to the object, sound, it may be improved both with regard to the begetting, and the propagating of sounds.

The first, in speaking, or pronouncing, in whistling, or singing, or hollowing, or luring; which are all distinct arts and all improvable.—The second by the position of the sonorous body. With regard to the medium, *phonicks* may be improved by the thinness and quiescency thereof, and by the sonorous body being placed near a smooth wall, either plain or arched, especially cycloidally or elliptically: whence the theory of whispering places. See **WHISPERING**.

Add to these, that by placing the sonorous body near water, its sound is mollified; that by placing it on a plain, the sound is conveyed to a greater distance than on uneven ground, &c. See **SOUND**.

As to the organ, the ear: it is helped by placing it near a wall, (especially at one end of an arch, the sound beginning at the other;) or near the surface of water, or of the earth.

And by instruments, as the stentorophonicon, or speaking-trumpet. See **SPEAKING-TRUMPET**.

Also by an instrument to help weak ears, as spectacles do eyes; by an instrument to take in vastly remote sounds, as telescopes do objects; by a microphone, or magnifying ear-instrument; by a polyphone or multiplying ear-instrument. See **EAR**, &c.

*Cataphonicks*, or reflected hearing, may be improved by several kinds of artificial echoes; for in general, any sound falling either directly or obliquely, on any dense body of a smooth surface, whether plain or arched, is beat back again, or reflected, i. e. does echo more or less. See **ECHO**, and **HEARING**.

**PHONICUM** *centrum*  
**PHONOCAMPTICUM** *centrum*. } See { **CENTRUM**.  
**PHOSPHORICAL** *columm*. } { **CENTRUM**.  
 } { **COLUMN**.

**PHOSPHORUS\***, ΦΩΣΦΟΡΟΣ, a matter which shines, or even burns, spontaneously, and without the application of any sensible fire. See **FIRE** and **LIGHT**.

\* The word is formed from the Greek, φως, light, and, φερω, I bear.

*Phosphorus* is either *natural* or *artificial*.

*Natural PAOSPHORI*, are matters which become luminous at certain times, without the assistance of any art, or preparation. Such are the glow-worms frequent in cold countries; flies, and other shining insects, in hot countries; rotten wood; the eyes, blood, scales, flesh, sweat, feathers, &c. of several animals; diamonds when rubbed after a certain manner; sugar and sulphur when pounded in a dark place; sea-water, and some mineral-waters when briskly agitated; a cat's or horse's back, duly rubbed with the hand, &c. in the dark; nay, Dr. Croon tells, that upon rubbing his own body briskly with a well warmed shirt, he has frequently made both to shine; and Dr. Sloane adds, that he knows a Bristol gentleman and his son, both whose stockings will shine after much walking.

All natural *phosphori* have this in common, that they do not shine always, and that they never give any heat. See **NOCTILUCA**.

But that which of all natural *phosphori* has occasioned the most speculation, is the

*Barometrical* or *mercurial PHOSPHORUS*.—M. Picard first observed that the mercury of his barometer, when shaken in a dark place, emitted light; with this circumstance, that in shaking the mercury

cury with rapidity, sometimes above and sometimes below its equilibrium with the air, the light was only seen when below it, where it appeared as if adhering to the upper surface. But this light is not found in the mercury of all barometers, which occasions a great difficulty.

M. Bernoulli, upon examining the circumstances of this phenomenon, invented a solution of the same: he imagines that, upon the mercury's descending, the vacuum in the tube increasing, there issues out of the mercury, to fill up this excess of vacuity, a very fine subtile matter before dispersed throughout the pores of this mineral; and that, at the same time, there enters through the pores of the tube another finer matter: thus, the first matter emitted from the mercury, and collected over its surface, striking impetuously against that received from without, has the same effect with Des-Cartes's first element against the second; that is, produces the motion of light. See LIGHT.

But why then is not the phenomenon common to all barometers? to this he answers, that the motion of the subtile matter out of the mercury may be weakened, and prevented by any heterogeneous matter collected on its upper surface into a kind of pellicle; so that the light should never appear but when the mercury is perfectly pure.

This reasoning was confirmed from the experiments of several barometers which he made according to this plan; but the royal academy of sciences, who repeated experiments with barometers made after the same manner, did not meet with the same success; the light being found in some, not in others.

M. Homberg therefore conjectured, that the difference consisted in the different qualities of the quick-silver; in some, he observed, they used quick-lime to purify it; in others, steel-filings. The mercury then rising in the distillation, and passing through the lime, might take away parts thereof, capable, by their extreme smallness, to lodge in its interstices. Hence, as quick-lime always retains some fiery particles, it is possible, in a place void of air, where they swim at liberty, they may produce this lustre.

Mr. Hauksbee has several experiments on the mercurial *phosphorus*.—Passing air forcibly through the body of quick-silver placed in an exhausted receiver, the parts were violently driven against the side of the receiver, and gave all around the appearance of fire; continuing thus till the receiver was half full again of air.

From other experiments he found, that though the appearance of light was not producible by agitating the mercury in the same manner in the common air; yet that a very fine medium nearly approaching to a vacuum was not at all necessary.

And, lastly, from other experiments he found, that mercury enclosed in water, which communicated with the open air, by a violent shaking of the vessel wherein it was enclosed, emitted particles of light in great plenty like little stars.

By including the vessel of mercury, &c. in a receiver, and exhausting the air, the phenomenon was changed; and, upon shaking the vessel, instead of sparkles of light, the whole mass appeared one continued circle of light.

Artificial PHOSPHORI are such as owe their luminous quality to some art or preparation.

Of these there are three kinds: the first *burning*, which consumes every combustible it touches; the other two have no sensible heat, called the *bononian* and *hermetic phosphorus*.

The *burning PHOSPHORUS* may be made of urine, blood, hairs, and generally of any part of an animal that yields an oil by distillation.—The matter it is most easily drawn from is human urine. It is of a yellowish colour, and of the consistence of hard wax, in the condition it is left by the distillation; and in this state is called *phosphorus fulgurans*, from its coruscations; and *phosphorus smaragdinus*, because its light is frequently green or blue, especially in places that are not very dark; and *solid phosphorus* from its consistence.

It dissolves in all kinds of distilled oils; and, in that state, is called *liquid phosphorus*.

It may be ground in all kinds of fat pomatums; in which case it makes a luminous unguent.

So that the *phosphorus fulgurans*, *smaragdinus*, *solid* and *liquid phosphorus*, and *luminous unguent*, are all the same drug under different circumstances.

It was invented by Mr. Kunkel, chymist to the elector of Saxony; brought into France by M. Kraft, a physician of Dresden, by whom it was communicated to Mr. Boyle.

In 1676 Mr. Elzholt published a treatise expressly on it at Berlin; and in 1680 Mr. Boyle published another in English under the title of *Noctiluca*. See NOCTILUCA.

M. Homberg first made of it at Paris in 1679, and communicated the method of preparation to the public.

*Preparation of solid PHOSPHORUS, or PHOSPHORUS of urine.*—Evaporate a good quantity of urine of beer-drinkers to the consistence of honey. Cover it up in an earthen vessel, and set it three or four months in a cellar to ferment and putrify.—Mix a double quantity of sand, or powder of pot-sherds with one part of this urine; put it into a retort, fitted to a long-necked receiver, with two or three quarts of water.—Distil it in a naked fire in a reverberatory furnace; at first gently; after two hours augment the fire gradually, till all the black fetid oil be drawn

off.—Raise the fire to the highest degree; upon which white clouds will come into the receiver, and fix by little and little on one side, in form of a yellowish skin; and another part will precipitate to the bottom in powder.—Keep the fire thus violent for three hours till no more fumes arise.—Let all cool, and unloose the vessels; and, throwing more water into the receiver, shake all well about, to loosen what sticks to the sides.—Pour the whole into a glass-vessel to settle.

The volatile salt will now dissolve in the water, and the *phosphorus* and oil sink to the bottom; pour off the water, and, gathering the remaining matter together, put it into a glass-vessel with a little fresh water, and digest it in a sand-heat, stirring it from time to time with a wooden spatula.

By this means the *phosphorus* will separate from the oil, and sink to the bottom; pour off the oil, and make up the *phosphorus*, while hot, into sticks for use.

Boerhaave gives us other ways of preparing *phosphorus*. Recent urine, he observes, digested three or four days in a tall glass, with a heat no greater than that of a healthy man, grows ruddy, fetid, and cadaverous: this digested urine being put to distil in a retort, yields a clear fetid liquor, then a yellow volatile salt, which evaporated to the consistence of a sapa, and mixed with four times its weight of dry sand, and the distillation continued in a covered retort; there successively comes over, by greater and greater degrees of fire, a fetid brown oil, bluish fumes, and a gross shining matter which sinks in water, and is the solid *phosphorus*.

To make it more directly, and to the best advantage, it may be proper to take a sufficient quantity of human urine, afforded by a person not much given to drink wine, and exhale it away in an open vessel to a rob, or the consistence of honey; then set it to putrify for half a year, and upon distillation it will afford a large proportion of salt; after which, if six times its own quantity of sand, or brick-dust, be added to the remainder, and the distillation be continued, as in the case last mentioned, the *phosphorus* will fall into the water.—Or it may commodiously be prepared, by suffering the rob of urine to digest for two years in an open vessel in the open air; during which time a slimy, fæulent, unctuous, earthy matter will fall to the bottom; which, being frequently washed with pure water, wherein it will not dissolve, will leave a white matter behind it, neither of an alkaline, acid, saline, or terrestrial, nor scarce of an unctuous nature; and this is of itself a proper matter for the making of *phosphorus* by distillation with sand.

*Properties of solid PHOSPHORUS.*—1<sup>o</sup> With this *phosphorus*, one may write on paper as with a pencil, and the letters appear like flame in the dark; yet in the light nothing appear but a dim smoky.

2<sup>o</sup> A little piece rubbed between two papers, takes fire instantaneously.—If care be not taken in the management of it, there is danger of burning the fingers, the *phosphorus* being exceedingly inflammable. See FIRE.

3<sup>o</sup> Its burning is very vehement, and penetrates deeper into the flesh than common fire; and it is very difficult to be extinguished.

M. Cassini happening to press a piece in a cloth between his fingers, the cloth immediately took fire; he endeavoured to put it out with his foot; but his shoe caught the flame, and he was obliged to extinguish it with a brais-ruler, which cast forth rays in the dark for two months after.

The solid *phosphorus* never spoils, provided it be kept in a phial full of water: that in form of an unguent does not keep so well; and the liquid *phosphorus* worst of all.

The liquid *phosphorus* is made by digesting in horse-dung a little bit, or some scrapings of the solids, for two days in oil, or essence of cloves, oil of turpentine, or the like. After dissolution the oil will be so impregnated with it, that, upon opening the bottle, the matter will appear on a flame.

*Experiments with liquid PHOSPHORUS.*—By washing the face, hands, or the like, with the liquid *phosphorus*, Dr. Slare tells us they will be made to shine very considerably in the dark, and the lustre thereof be communicated to adjacent objects, yet without any offence to the skin.

As soon as a candle is brought in, the shining disappears, and no change perceivable.

This *phosphorus* emits frequent flashes like lightning, even when close stopped, especially in warm weather. Hence Mr. Boyle takes occasion to draw a parallel between lightning and *phosphorus*.

*Bononian PHOSPHORUS.*—The second kind of artificial *phosphorus* is a preparation of a stone called the *Bononian stone*, from a city of that name in Italy, nigh which it is found.

The first who undertook to make this stone luminous, was a chemist of that city called *Vincenzo Casciariolo*.—Poterus, Licetus, &c. have described the process, but mistakenly: M. Homberg, who made a journey to Italy expressly to learn the preparation, first communicated the same to Mr. Lemery, who published it in the seventh edition of his chemistry. See the article BONONIAN stone.

This *phosphorus* has not any sensible heat, and only becomes luminous after being exposed to the sun, or the day-light, in which state it resembles a burning coal, and preserves its light five or six minutes

minutes in the dark, during which time it dwindles; and, to recover its light, must be exposed afresh to the air.

**Hermetic PHOSPHORUS**, or **PHOSPHORUS Balduini**, which makes the third kind, is a preparation of English chalk, with aqua fortis or spirit of nitre, by the fire.

This makes a body considerably softer than the Bononian stone; but it has all the qualities thereof. — It has its name from its inventor Baldwin, a German chemist, call'd *Hermes* in the society of the *naturæ curiosorum*, whence its other name *Hermetic*.

**New PHOSPHORUS**. — Some of the late chemists have hit on other sorts of *phosphori*. — Monf. Homberg, in a process upon the fecal matter, happening to calcine it with allum, accidentally produced a new *phosphorus*, in form of a powder, the least quantity of which taken out of a close vessel, and exposed to the air upon a piece of paper, in a moment's time would take fire, and set the paper a smoking, and presently burn it or any combustible matter it came near.

This it would do equally by night and day, and without rubbing, or heating, or mixing with any other thing to promote the inflammation; in which, he observes, it differed from all the artificial *phosphori* hitherto known. For that, *e. gr.* of urine, requires a small degree of warmth to enable it to shine, or take fire; and the Bononian stone, and *phosphorus Balduini* only shine by day-light.

In effect, M. Lemery the younger has at length discovered, that there is scarce any animal or vegetable matter but will afford *phosphorus*. — This he experienced in the seeds, farinæ, honey, sugar, leaves, flowers, woods, roots, and oils of divers plants; the blood and flesh of calves, sheep, flies, worms, the yolks of eggs, &c. the human skull, bones, fat, nails, and the dung of all animals. The principal thing added to all these matters to make *phosphorus* of them, is allum, which is indispensably requisite; nor can any other salt, how near a-kin soever hereto, even though it yield the very same principles, be substituted hereto. As to the means, or the operation whereby it is to be made, calcination appears to be the essential part.

**Rationale of the effects of PHOSPHORUS**. It may be observed, that in most of the natural *phosphori*, there is a brisk attrition or friction concerned; which we may suppose either to give the minute parts of the substance the proper motion and agitation necessary to convert them into fire, if fire be so producible, (as Bacon, Boyle, Newton, and the generality of the English philosophers have supposed it is) or to expel and emit the particles of fire naturally contained in them. See **FIRE**, **FLAME**, **FRICTION**, **ATTRITION**, &c.

In the factitious sorts we may note, that a long process by fire is usually required, wherein the matter undergoes divers coctions, torrefactions, calcinations, distillations, &c. in the course whereof a considerable quantity of fire must necessarily be imbibed, and may possibly be retained therein.

In that, *e. g.* prepared of the fecal matter, M. Homberg observes, the aqueous part of the substance must necessarily have all been evaporated, with the greatest part of the oil and volatile salt; leaving pores or vacuities in the places they possessed; so that what remains is a spongy tissue of earth and fixed salt, having nothing in its loculi or cavities, but some of the matter of the fire which has been arrested and detained therein, much as in quick-lime.

This being supposed, we know that the fixed salt, which is here pretty copious, will readily absorb the moisture of the contiguous air; and the sudden introduction of such moisture into the pores of the powder must produce a friction, which may excite a small degree of heat; and this joined with what fire was there already laid up, may make a heat sufficient to give fire to the small remains of oils too closely linked with the salt to have been carried off by the calcining fire; so that we have here every thing necessary to heat and light. See **HEAT**, &c.

What confirms this doctrine is, that, if the powder be kept in a vessel not sufficiently close, the air, insinuating by degrees, moistens and saturates the powder, but so slowly, as not to produce friction enough to set it on fire; so that it is spoiled, and disabled from taking fire ever after; much as quick-lime, which after it has lain some time in the air, ceases to grow hot, even by the affusion of water.

The reason why quick-lime, which contains a deal of particles of fire, as well as our powder, does not conceive heat by the access of the air, or the ingress of its moisture into the pores thereof, but that water must be thrown thereon, is, that the quick-lime, being more thoroughly calcined, retains too little fixed salt to imbibe the moisture readily and copiously enough to excite the necessary friction.

And the reason why quick-lime does not produce a flame, as the powder does, even when water is cast on it, is, that it did not retain enough of the oily matter to afford flame; for if oil be mix'd with it, a flame will readily ensue. *Mem. de l'Acad. an. 1711.*

**PHOSPHORUS**, in astronomy, is the morning-star, or the planet Venus, when she goes before the sun. See **VENUS**.

The Latins call it *Lucifer*; the French, *étoile de berger*; the Greeks, *phosphorus*, from *φως*, light, and *φέρω*, I bear, bring.

**PHOTOSCIATERICA**, a term which some authors use for the art of dialling. See **DIALLING**.

The name is derived hence, that the art not only shews the hours by the shadow of a gnomon, whence it is called *sciaterica*, from *σκια*, shadow; but sometimes also by means of the sun's light, as in spot-dials, reflecting-dials, &c. from *φως*, *lux*, light. See **DIAL** and **NODUS**.

**PHOTINIANS**, a sect of ancient hereticks, who denied the divinity of Jesus Christ. See **HERETIC**.

They took their name from *Photinus* their chief, bishop of Sirmium, and disciple of Marcellus. — He maintained, as Leo tells us in one of his sermons, that Jesus Christ was true man, but not true God, nor born before all ages; that he only began to be Christ when the Holy Ghost descended upon him; and that he was called *only Son* for no other reason but because the virgin had no other. — He was convicted of his error, and deposed by a synod of Arians held at Sirmium in 351. — His error has been since revived by Socinus. See **SOCINIAN**.

**PHRASE**, **PHRASIS**, **ΦΡΑΣΙΣ**, in grammar, an elegant turn or manner of speech, peculiarly belonging to this or that occasion, this or that art, or this or that language.

Thus we say, an Italian *phrase*, an eastern *phrase*, a poetical *phrase*, a rhetorical *phrase*. See **IDIOM**.

A few elegant *phrases*, pertinently applied, are an ornament of discourse; but if they come too thick they have an ill effect, and make the style savour of affectation. See **STYLE**.

**PHRASE** is sometimes also used for a short sentence, or small set or circuit of words constructed together. See **SENTENCE**.

In this sense father Buffier divides *phrases* into *complete* and *incomplete*.

**PHRASES** are *complete* where there is a noun and a verb, each in its proper function, *i. e.* where the noun expresses a subject, and the verb the thing affirmed of it.

*Incomplete PHRASES* are those where the noun and the verb together only do the office of a noun; consisting of several words without affirming any thing, and which might be expressed in a single word.

Thus; *that which is true*, is an *incomplete phrase*, which might be expressed in one word, *truth*: as that which is true satisfies the mind, *i. e.* *truth* satisfies the mind.

**PHRASEOLOGY**, **PHRASEOLOGIA**, **ΦΡΑΣΕΟΛΟΓΙΑ**, a collection of the *phrases*, or elegant expressions, in any language. See **PHRASE**.

**PHRENES**, **ΦΡΕΝΕΣ**, in anatomy, the diaphragm. See **DIAPHRAGM**.

It was thus called by the ancients, from *φρον*, mind; as imagining this the seat of the rational soul. Hence

**PHRENESIS**, **PHRENSY**, or distraction. See **PHRENITIS** and **PARAPHRENESIS**.

**PHRENETIC nerves**, called also *diaphragmatic* and *stomachic nerves*, are nervous branches derived from the cervical nerves, which, joining in a trunk, run through the mediastinum undivided, till, arriving near the diaphragm, they again divide, and send off divers branches, some into the muscular, others into the tendinous part thereof. See **NERVE** and **DIAPHRAGM**.

**PHRENIC vessels**, an appellation given to a vein, and some arteries of the human body; from their passing through the diaphragm. See **DIAPHRAGM**.

The *phrenic* artery arises out of the descending aorta, and distributes itself into the diaphragm and pericardium. See *Tab. Anat. (Angeiol.) fig. 1. n. 40.* See also **ARTERY**, **AORTA**, &c.

The *phrenic* veins are two veins which the descending cava receives immediately after its piercing the diaphragm. — See *Tab. Anat. (Angeiol.) fig. 6. litt. qq.* See also **VEIN** and **CAVA**.

**PHRENITIS**\*, **PHRENESIS**, or **PHRENSY**, in medicine, a constant and vehement delirium or distraction, accompanied with an acute fever, raving, waking, &c. See **DELIRIUM**.

\* It has its name *φρενιτις*, from *φρον*, *mens*, the understanding; or, as some will have it, from *φρεν*, the diaphragm, in regard the ancients supposed it to have its seat in that part. See **DIAPHRAGM**.

It differs from the *mania* and *melancholy*, in that these are without fevers. See **MANIA**, &c.

Physicians generally make the *phrenitis* to consist in an inflammation of the meninges of the brain; and distinguish it from the *paraphrenitis*, which they suppose to be an inflammation of the diaphragm. See **PARAPHRENITIS**.

Willis will have them the same disease, and both to consist in an inflammation of the animal spirits. He only distinguishes them as the inflammation arises from the cerebrum alone, or from the cerebrum and cerebellum together; and concludes, that they both arise after a fever, from the boiling blood's throwing its adult recrements into the brain.

Boerhaave makes the *phrenitis* either *true*, wherein the cerebrum, or meninges, or both, are inflamed; or *symptomatic*, where the matter of a fever is translated into the cerebrum.

The true one either kills on the third, fourth, fifth, or seventh day; or changes into a mania, lethargy, comus, &c. Tremors, gnashing of the teeth, grumous blood distilling from the nose, are prognostics of death.

The disease is oftentimes the effect of inflammatory or malignant fevers; though it sometimes arises from a suppression of the natural evacuations, as the menses, &c.

The cure is the same as of an apoplexy; but where the evacuations are

# P H T

are concerned, they must first be rectified. See APOPLEXY.

**PHRENSY.** See the article PHRENITIS.

**PHRYGIAN** *mode*, in music. See *MODE*.

**PHRYGIANS, PHRYGES, or PHRYGASTES**, as St. Epiphanius calls them, were ancient heretics, a branch of the Montanists; so called from *Phrygia*, a country where they abounded. See *CATAPHRYGIAN*.

They esteemed Montanus their prophet; and looked on Maximilla and Priscilla as great prophetesses. See *MONTANISTS*.

This spirit of prophecy, or rather enthusiasm, was their distinguishing character. In the business of the trinity they were orthodox.

**PTHIRIASIS\***, ΦΘΙΡΙΑΣΙΣ, in medicine, the morbus pedicularis, or lousy disease, wherewith children, and even sometimes adults are afflicted. See *PEDICULARIS*.

\* The word is formed from the Greek, φθίρε, louse.

Its cause is in the seeds of that vermine laid in the cuticle, which here happening to prove a proper nidus, cherishes and fosters the seed so as to hatch it. See *WORMS*.

The linnen cloths used by goldsmiths to wipe their vessels with after gilding, are excellent against the *pthiriasis*, by reason of the mercury they contain, when applied by rubbing the child's head.

**PTHISIS**, ΦΘΙΣΙΣ, in its general sense, denotes any kind of consumption of the body, in what part soever it be seated, or from what cause soever it arise. See *CONSUMPTION*, and *ATROPHY*.

Thus we have a nervous *pthisis*, renal *pthisis*, dorsal *pthisis*, pulmonary *pthisis*, &c.

**PTHISIS**, in its proper sense, is restrained to a pulmonary consumption, or a consumption arising from an ulcer, or other disorder of the lungs, accompanied with a slow hectic fever, which wastes, extenuates, and consumes the muscular flesh. See *LUNGS*, &c.

Sydenham observes, that the hectic *pthisis* usually has its origin in the winter's cold; from a sharp humour trickling down upon the lungs, where, like a catarrh, it irritates them so as to raise a cough. See *COUGH* and *CATARRH*.

This by degrees brings on other symptoms; as a spitting, first of a viscid pituita, then a heavy fetid pus, then of pure blood, and sometimes of the very substance of the lungs rotted by a long exulceration; with night-sweats, falling off of the hair, and a colliquative flux, which is soon followed by death. — The same author adds, that the *pthisis* kills two thirds of those who die of chronic diseases. See *CHRONIC*.

In the last stage of the *pthisis*, the nose appears sharp, the eyes hollow, the temples fallen, the ears cold and contracted, the skin about the forehead hard and dry, and the complexion greenish, or livid, &c. which is called the *facies hippocratica*. See *FACE*.

Among the causes of this disease may be reckoned intemperance, as it brings on a plethora or cacochymia, peripneumonies, asthma's, pleuritis, &c. Morton adds, that the *pthisis* frequently arises from an ill conformation of the breast; which is either natural, as when the breast is too narrow, the neck too long, &c. or accidental, where there happens a curvity or distortion of the breast; — among the symptoms he reckons a nausea, or retching, with a heat in the palms of the hands, and redness in the cheeks, all after eating.

For the cure — Sydenham orders the defluxion on the lungs, in the first stage, to be abated by blood-letting, &c. and pectorals to be used, accommodated to the various states of the disease, viz. Infracassants, attenuants to assuage the hectic, &c. with emulsions, asses-milk, &c. and balsamics, to cure the ulcer.

But the chief assistance in this disease is from riding constantly on horse-back, where the patient need not confine himself to any laws of diet, &c. This alone, he adds, is almost as sure a cure for a *pthisis*, as the cortex for an intermitting fever. See *EXERCISE*.

Dr. Baynard recommends butter milk as an admirable succedaneum to asses-milk. Sylvius says, he knows of no medicine, either internal or external, so good against fresh ulcers of the lungs, as balm of sulphur, especially when prepared with oil of anise. See *SULPHUR*.

Etmuller observes, that the cough of *pthysical* people is at first only stomachal; at length it becomes pulmonary. He adds, that vomitories are good in a beginning *pthisis*, purgatives by all means to be avoided; and commends the use of medicines made of tobacco, not only as they promote expectoration, but as vulnerary.

It is a common observation, that in those countries where they burn turf, people are rarely affected with the *pthisis*; which Willis ascribes to the sulphur abounding therein, and recommends tincture of sulphur as the best remedy he knows of in any cough without a fever; adding, that a suffumigation, or smother, of sulphur and arsenic has frequently proved a cure in the most desperate *pthisis*.

Bonetus holds the *pthisis* to be contagious; and that there are frequently instances of its being communicated by cloaths, linnen, beds, &c.

Pitcairn recommends mercurius dulcis, in the beginning of a

# P H Y

*pthysis*. And Barbrette and Colbatch assert, that, contrary to the opinion of most authors, they have frequently used acids with success in the *pthysis*. See *HECTIC*, &c.

**PHYGETHLON\***, ΦΥΓΕΘΛΩΝ, in medicine, is defined by Celsus, a hard flat tumor, somewhat resembling a pustle; occasioning an intense pain, and sometimes a fever. See *TUMOR*.

\* The word is derived from the Greek, φύν, I breed, engender.

The *phygethlon* only differs from the *phyma*, in that it does not rise so high; it ripens very slowly, and produces but little pus. See *PHYMA*.

The Latins call it *panis*, or *panus*, and sometimes *panicula* — Gorræus defines the *phygethlon*, a phlegmon arising on the glandulous parts, especially about the neck, armpits, and inguen; which last is called a *bubo*. See *PHLEGMON*, &c.

The *phygethlon* has the same causes, and the same symptoms with the common *bubo*. See *BUBO*. — It frequently arises after fevers, and pains of the belly, and is cured like other inflammations.

**PHYLACTERY**, ΦΥΛΑΚΤΗΡΙΟΝ, in church-history, a slip of parchment, wherein was wrote some text of holy scripture, particularly of the decalogue; which the more devout people among the Jews wore on the forehead, the breast, or the neck, as a mark of their religion. See *FRONTAL*.

**PHYLACTERY**, in the general, was a name given by the ancients to all kinds of charms, spells, or characters, which they wore about them, as amulets, to preserve them from dangers or diseases. See *CHARM*, *AMULET*, &c.

The primitive christians also gave the name *phylacteries* to the cases wherein they inclosed the relics of their dead. See *RELICK*.

**PHYMA**, ΦΥΜΑ, in medicine, a roundish pointed tumor, arising on the glandular parts, especially under the lower jaw. See *TUMOR*.

The *phyma* is smaller and smoother, less red and painful, than the *phygethlon*. See *PHYGETHLON*.

It is easily cured in children; more difficultly in adults, but in those it is more rare. It is remedied by assisting nature in the work of maturation; as by a suppurating cataplasm, &c. — It is supposed to have its rise from pituitous blood; and is most common in children, where it frequently arises from too tight bandages.

Gorræus observes, that some make *phyma* a general name for all tumors, or aposthumes, that mature and suppurate readily, of what kind soever, or in whatsoever glandulous part they arise.

**PHYSIC**, or **PHYSICK**, ΦΥΣΙΚΗ, the art of healing; properly called *medicine*.

\* The word is formed from the Greek φυσικ, nature; in regard medicine consists principally in the observation of nature. See *PHYSICS*.

For the rise, progress, division, &c. of *physic*. See *MEDICINE*.

**HERMETICAL PHYSIC.** } See the articles } **HERMETICAL.**  
**Bachelor of PHYSIC.** } **BACHELOR.**

**PHYSICAL**, ΦΥΣΙΚΟΣ, something belonging to, or really existing in nature. See *PHYSICS*.

In this sense we say a *physical* point, in opposition to a mathematical one, which only exists in the imagination. See *POINT*.

A *physical* substance, or body, in opposition to spirit, or metaphysical substance, &c. See *SUBSTANCE*, &c.

**PHYSICAL**, or sensible horizon. See *HORIZON*.

**PHYSICIAN**, a person who professes medicine, or the art of healing. See *MEDICINE*.

The ancients distinguished their *physicians* into various classes, or sects: — As,

**Rational PHYSICIANS**, those who proceeded in a certain regular method, founded upon reason; deducing consequences therefrom, to particular cases.

**Methodical PHYSICIANS.** See the article *METHODICAL*.

**Dogmatical PHYSICIANS**, those who laid down principles, and reasoned from those principles, and from experience. See *DOGMATIC*.

**Empirical PHYSICIANS**, those who kept wholly to experience, and excluded all use of reason in medicine. — Such were Sorapion, Apollonius, Glaucus, &c. See *EMPIRICAL*.

**Clinical PHYSICIANS** were those who visited their patients a-bed to examine their cases. See **CLINIC**.

In opposition to the *empirics*, who sold their medicines in the streets, &c.

They had also their astrological *physicians*, botanical *physicians*, anatomical *physicians*, surgical *physicians*, pharmaceutical *physicians*, &c. besides gymnastical *physicians*, iatraliptæ or those who applied external unctions, and frictions, &c. — Cosmetick *physicians* for the complexion; ophthalmic *physicians* for the eyes; vulnerary *physicians* for wounds, &c.

Among the moderns, a *general physician* includes almost all these several kinds. — Regular **PHYSICIANS** are contra-distinguished from empirical *physicians*, who prescribe at random; having some one or two remedies which serve in all diseases. See **EMPIRICAL**.

**Galenical PHYSICIANS** are those who prescribe gentle, natural, and ordinary medicines. See **GALENICAL**.

**Spagyric** or *chymical PHYSICIANS* are those who prescribe violent medicines drawn from minerals, &c. by fire. See **SPAGYRICAL** and **CHYMICAL**.

**College of PHYSICIANS**. See the article **COLLEGE**.

**PHYSICKS**, **PHYSICA**, ΦΥΣΙΚΗ, sometimes also called *physiology* and *natural philosophy*; is the doctrine of natural bodies, their phenomena, causes, and effects, with the various affections, motions, operations, &c. thereof. See **PHILOSOPHY** and **NATURE**.

\* The word is derived from the Greek φύσις, nature. See **PHYSIOLOGY**. Mr. Locke would likewise have God, angels, and spirits, come under *physicks*, which are more usually referred to metaphysicks. See **METAPHYSICKS**.

The origin of *physics* is referred by the Greeks, to the barbarians, viz. the brachmans, magi, and the Hebrew and Egyptian priests. See **BRACHMANS**, **MAGI**, &c.

From these it was derived to the Greek sages or sophi, particularly Thales, who is said to have first professed the study of nature in Greece. See **SOPHIST**.

Hence it descended into the pythagoric, platonic, and peripatetic schools; whence it was propagated into Italy, and thence through the rest of Europe: though the druids, bards, &c. had *physics* of their own. See **PYTHAGOREAN**, **PLATONIC**, and **PERIPATETIC**; see also **DRUID**, **BARD**, &c.

*Physics* may be divided, with regard to the manner wherein it has been handled, and the persons by whom, into

**Symbolical PHYSICS**, that couched in symbols: such was that of the old Egyptians, Pythagoreans and Platonists, who delivered the properties of natural bodies under arithmetical and geometrical characters, and hieroglyphics. See **SYMBOL**, **GEOMETRY**, **HIEROGLYPHICS**, &c.

**Peripatetical**, or that of the Aristotelians, who explained the nature of things by matter, form, and privation, elementary and occult qualities, sympathies, antipathies, attractions, &c. See **ARISTOTELIAN**, &c.

**Experimental**, which enquires into the reasons and natures of things from experiments; such as those in chemistry, hydrostatics, pneumatics, optics, &c. See **EXPERIMENT**, &c.

This has been much cultivated since the time of my lord Bacon; and continues to be so, with good success.

The experiments of the academists of Cimento, of the royal society, of the royal academy, and even of private persons, particularly Mr. Boyle, Sir Is. Newton, Mr. Hauksbee, &c. have been of infinite service in *physics*; and it is to these, in great measure, that the advantage of the modern philosophy above the ancient is due. See **EXPERIMENTAL**.

**Mechanical** or **Corpuscular**, which explains the appearances of nature from the matter, motion, structure, and figure of bodies, and their parts; all according to the settled laws of nature and mechanicks. See **CORPUSCULAR** and **MECHANICAL**.

**PHYSIOGNOMICS**, a term used by some physicians and naturalists for such signs as are taken from the countenance to judge of the state, disposition, &c. of the body and mind. See **SIGN** and **PHYSIOGNOMY**.

**PHYSIOGNOMY**, ΦΥΣΙΟΓΝΟΜΙΑ, the art of knowing the humour, temperament, or disposition of a person, from observation of the lines of his face, and the characters of its members, or features. See **FACE**, &c.

\* The word is formed from the Greek φύσις, nature, and γινωσκω, I know.

Baptista Porta and Robert Fludd are the top modern authors on *physiognomy*. — The ancient ones are the sophist Adamantius, and Aristotle; the *physiognomy* of which last we have translated into Latin by de Lacuna.

There seems to be something in *physiognomy*, and it may perhaps bear a much purer philosophy than what these authors were acquainted withal. This, at least, we dare say, that of all the fanciful arts of the ancients, diffused among the moderns, there is none has so much foundation in nature as this.

There is an apparent correspondence between the face and the mind; the features and lineaments of the one are directed by the motions and affections of the other: there is even a peculiar arrangement of the members of the face, a peculiar disposition

of the countenance to each particular affection, perhaps to each particular idea of the mind. See **PASSION**.

In effect, the language of the face, *physiognomy*, is as copious, nay, perhaps, as distinct and intelligible as that of the tongue, speech. — Thanks to bounteous nature, she has not confined us to one only method of conversing with each other, and of learning each other's thoughts; we have several: we do not wholly depend on the tongue, which may happen to be bound; and the ear, which may be deaf; but in those cases we have another resource, the countenance and the eye, which afford us this further advantage, that, by comparing the reports of the tongue (a member exceedingly liable to deceive) with those of the face, the prevarications of the former may be detected.

The foundation of *physiognomy* is this: the different objects that present themselves to the senses, nay, the different ideas that arise in the mind, do each make some impression on the spirits; and each an impression correspondent or adequate to its cause; therefore each a different impression.

If it be asked how such an impression should be effected? It is easy to answer that it follows from the oeconomy of the creator, who has fixed such a relation between the several parts of the creation; to the end we may be apprized of the approach or recess of things useful or hurtful to us.

If this be not philosophical enough, take the manner in the Cartesian language, thus: the animal spirits moved in the organ by an object, continue their motion to the brain; whence that motion is propagated to this or that particular part of the body, as is most suitable to the design of nature; having first made a proper alteration in the face, by means of its nerves, especially the pathetici and oculorum motorii.

The face here does the office of a dial-plate; the wheels and springs within-side the machine actuating its muscles, shew what is next to be expected from the striking part. — Not that the motion of the spirits is continued all the way by the impression of the object; the impression probably terminates in the medulla of the brain, the common fund of spirits: the rest Dr. Gwither imagines may be effected much after the same manner as the air is conveyed into the pipes of an organ, which being uncovered, the air rushes in, and when the keys are let go, stopped again. See **CONSENT of parts**.

Now, if by repeated acts, or the frequent entertaining of a favourite passion, or vice, which natural temperament has hurried, or custom dragged one to, the face is often put in that posture which attends such acts; the animal spirits will make such patent passages through the nerves (in which the essence of a habit consists. See **HABIT**;) that the face is sometimes unalterably set in that posture (as the Indian religious are by a long continued sitting in strange postures in their pagods) or at least falls insensibly and mechanically into that posture, unless some present object distort it therefrom, or dissimulation hide it. See **FAVOUR**.

This reasoning is confirmed by observation: thus we see great drinkers with eyes generally set to the nose; the adducent muscles being oft employed to put them in that posture, in order to view their loved liquor in the glass in the time of drinking; whence those muscles are also denominated *bibitory muscles*.

Thus also lascivious persons are remarkable for the *oculorum mobilis petulantia*, as Petronius calls it. — Hence we may account for the quakers expecting face, waiting the spirit, the melancholy face of most sectaries, the studious face of men of great application of mind, &c.

Were our observation a little more strict and delicate, we might doubtless not only distinguish habits and tempers, but even professions. — In effect, does there need much penetration to distinguish the fierce look of the veteran soldier, the contentious look of the practised pleader, the solemn look of the minister of state, &c.

**PHYSIOLOGY** \* ΦΥΣΙΟΛΟΓΙΑ, the doctrine of nature, or natural bodies; called also *physicks* and *natural philosophy*. See **PHYSICKS**, &c.

\* The word is formed of φύσις, nature, and λόγος, discourse, reason. **PHYSIOLOGY** properly denotes only an internal reasoning or discoursing, which stops or terminates in the speculation, or abstract contemplation of its object, viz. natural appearances, their causes, &c. and does not direct or prescribe rules for the making of natural things, e. gr. stones, plants, &c.

In which view chemistry does not properly belong to *physiology*; but is a kind of counter-part thereto, as imitating or mimicking nature, rather than considering and explaining her. See **CHYMISTRY**.

**PHYSIOLOGY** is more particularly used for a branch of medicine, which considers nature with regard to the cure of diseases, particularly the human body, its parts, structure, health, life, functions, oeconomy, &c. See **MEDICINE**.

*Physiology*, in this sense, amounts to much the same with what we otherwise call the doctrine of the *animal oeconomy*. See **OECONOMY**.

**PHYTOLOGY** \*, ΦΥΤΟΛΟΓΙΑ, a discourse upon plants; or a description of their forms, kinds, properties, &c. See **PLANT**.

\* The word is compounded of the Greek, φυτόν, plant, and λόγος, discourse, or λέγω, I describe, rehearse.

**PIA mater**, in anatomy, called also *mater tenuis*, and *meninx tenuis*, a fine coat, or membrane, immediately investing the brain.—See *Tab. Anat. (Osteol.) fig. 4. lit. a, a, a.* See also **MATER, MENINGES, and BRAIN.**

**PIACHE, PIAZZA**, a covered arched walk, or portico. See **PORTICO and PIAZZA.**

**PIASTER**, a Spanish money, more ordinarily called *piece of eight*. See **PIECE of eight.**

**PIAZZA**, in building, popularly called *piache*, an Italian name for a portico, or covered walk, supported by arches. See **PORTICO.**

The word literally signifies a broad open place or square; whence it also became applied to the walks or portico's around them.

**PICA**, in medicine, *malacia*; or a depravation of appetite, which makes the patient absurdly covet things unfit for food, or incapable of nourishing, as coals, ashes, plaister, salt, lime, chalk, vinegar, pepper, &c. See **APPETITE.**

The *pica* is frequent in girls and women with child; men are more rarely affected with it.—The disorder is seldom original; but usually an effect of an hypochondriacal infirmity in men; and a chlorosis, stoppage of the menses, or their eruption about the second month of pregnancy in women; sometimes it is hereditary in children from some cause affecting the mother. See **MONSTER.**

The disease is usually supposed to have its rise from a vitious ferment of the stomach; to which may be added, disorders of the imagination, occasioned by ill examples and ridiculous prejudices. See **IMAGINATION.**

In the *Philosophical Transactions* Dr. Fairfax gives us an instance of a woman in Stow-market, who was invited by her *pica* to suck the wind out of bellows; which, as often as she could, she took into her body with open mouth, forcing it in by blowing with both hands the bellows inverted.—He adds, he knew another in the same circumstances, whom nothing would satisfy but crackling cinders under her feet.

Something like this has also been found in brutes.—The last mentioned author mentions a greyhound-bitch, which, five or six days before casting her whelps, longed for another bitch's whelps, and eat them all up, and would have eat the bitch herself. Thus it is that fows are sometimes known to eat up whole litters of pigs.—The usual remedies in the *pica* are bleeding, purging, vomiting, and chalybeats.

**PICA**, in printing. See **printing LETTER.**

**PICARDS**, a religious sect who arose in Bohemia in the XV<sup>th</sup> century; so called from their author, one Picard.

He drew after him a great number of men and women, pretending he would restore them to the primitive state of innocence wherein Adam was created; and accordingly himself assumed the title of the new Adam. See **ADAMITES.**

Under this pretence he taught his followers to abandon themselves to all impurity; making them believe that therein consisted the liberty of the sons of God; and that all those not of their sect were in bondage.

He first began in Germany and the Low-countries, persuading many to go naked, and giving them the name of *Adamites*.—After this, seizing an island in the river Laufnech, a few leagues from Thabor, the head quarters of Zisca, he fixed himself and his followers therein; appointed his women to be common, but allowed none to enjoy them without his permission. So that when any man desired a woman, he carried her to Picard, who gave him leave in these words: *Go, increase, multiply, and fill the earth.*

At length, Zisca, the great general of the Hussites, so famous for his victories over the emperor Sigismund, struck with their abominations, marched against them; and, making himself master of their island, put them all to death except two, whom he spared to inform himself of their doctrine.

**PICATUM Vinum.** See the article **VINUM.**

**PICKAGE, or PICCAGE, PICCAGIUM**, an ancient custom or duty paid at fairs and markets, for breaking the ground, and pitching up stalls, or standings.

This profit of *pickage* was usually given or granted in charters for holding a fair or market.

**PICKEERING and PICKEROONING.** See the article **PICQUEERING.**

**PICKET, PICQUET, or PIQUET**, in fortification, a stake sharp at one end, and usually shod with iron; used in laying out the ground, to mark the several measures and angles thereof.

There are also larger *pickets* drove into the earth, to hold together fascines or faggots in any work cast up in haste.

**PICKETS** are also stakes drove into the ground by the tents of the horse, in a camp, to tie their horses to; and before the tents of the foot, where they rest their muskets or pikes about them in a ring.

When an horseman hath committed any considerable offence, he is often sentenced to stand on the *picket*; which is to have one hand drawn up as high as it can be stretched, and thus to stand on the point of a *picket* or stake, only with the toe of his opposite foot; so that he can neither stand nor hang well, nor ease himself by changing feet.

**PICKETS** are also stakes with notches towards the top, to which

are fastened the cordages of tents.—Thus, to plant the *pickets*, is to encamp.

**PICKET**, in gaming. See the article **PIQUET.**

**PICKLE**, a brine or liquor, ordinarily composed of salt, vinegar, &c. sometimes with the addition of spices, &c. wherein meats, fruits, &c. are preserved and seasoned.

**PICKLE** is also used substantively for a fruit, root, leaf, or other vegetable matter, prepared in *pickle*, to be used by way of sauce, &c. See **SALLET, &c.**

They *pickle* artichokes, mushrooms, ashen-keys, barberries, asparagus, beans, &c.—Broom-buds, capers, and olives are *pickled* with oil and vinegar. See **CAPERS, &c.**

**PICKLED fish.** See the article **FISH.**

**PICQUEERING, PICKEERING, or PICKEROONING**, a little flying war, or skirmish, which the soldiers make when detached from their bodies, for pillage, or before a main battle begins. See **SKIRMISH.**

**PIQUET, or PICKET**, a celebrated game at cards, much in use throughout the polite world. See **GAME and CARDS.**

It is played between two persons, with only thirty two cards; all the dukes, threes, fours, fives, and sixes, being set aside.

In reckoning at this game every card goes for the number it bears, as a ten for ten; only all court-cards go for ten, and the ace for eleven: and the usual game is one hundred up.—In playing, the ace wins the king, the king the queen, and so down.

Twelve cards are dealt around, usually by two and two; which done, the remainder are laid in the middle: if one of the gamesters finds he has not a court-card in his hand, he is to declare he has *carte blanche*, and tell how many cards he will lay out, and desire the other to discard, that he may shew his game, and satisfy his antagonist, that the *carte-blanc* is real; for which he reckons ten.

Each person *discards*, i. e. lays aside a certain number of his cards, and takes in a like number from the stock.—The first, of the eight cards, may take three, four or five; the dealer all the remainder, if he pleases.

After discarding, the eldest hand examines what suit he has most cards of; and reckoning how many points he has in that suit; if the other have not so many in that, or any other suit, he tells one for every ten of that suit.—He who thus reckons most is said to win the *point*.

The point being over, each examines what *sequences* he has of the same suit, viz. how many tierces, or sequences of three, quarte or fours, quintes or fives, sixiemes or six's, &c. For a tierce they reckon three points, for a quarte four, for a quinte fifteen, and for a sixieme sixteen, &c. And the several sequences are distinguished in dignity by the cards they begin from: thus ace, king and queen are called *tierce major*; king, queen, and knave, *tierce to a king*; knave, ten, and nine, *tierce to a knave*, &c. and the best tierce, quarte, or quinte, i. e. that which takes its descent from the best card, prevails; so as to make all the others in that hand good, and destroy all those in the other hand.—In like manner a quarte in one hand sets aside a tierce in the other.

The sequences over, they proceed to examine how many aces, kings, queens, knaves, and tens each holds; reckoning for every three of any sort, three: but here too, as in sequences, he that with the same number of threes, has one that is higher than any the other has, e. gr. three aces, has all his others made good hereby, and his adversary's all set aside.—But four of any sort, which is called a *quatorze*, always sets aside three.

All the game in hand being thus reckoned, the eldest proceeds to *play*, reckoning one for every card he plays above a nine, and the other follows him in the suit; and the highest card of the suit wins the trick.—Note, unless a trick be won with a card above a nine, (except the last trick) nothing is reckoned for it; though the trick serves afterwards towards winning the cards; and that he who plays last does not reckon for his cards, unless he wins the trick.

The cards being played out, he that has most tricks reckons *ten* for *winning the cards*.—If they have tricks alike, neither reckons any thing.—The deal being finished, and each having marked up his game, they proceed to deal again as before, cutting as fresh each time for the deal.

If both parties be within a few points of being up, the *carte blanche* is the first thing that reckons, then the point, then the sequences, then the quatorzes or threes, then the tenth cards. He that can reckon thirty in hand by *carte blanche*, points, quintes, &c. without playing, ere the other has reckoned any thing, reckons ninety for them;—and this is called a *repique*;—if he reckons above thirty, he reckons so many above ninety. If he can make up thirty, part in hand, and part play, ere the other has told any thing, he reckons for them sixty.—And this is called a *pique*. Whence the name of the game.

He that wins all the tricks, instead of ten, which is his right for winning the cards, reckons forty,—and this is called a *capot*.

**PICRA—Hiera PICRA.** See the article **HIERA.**

**PICTA Toga.** See the article **TOGA.**

**PICTS Wall**, in antiquity, a famed piece of Roman work, begun by the emperor Adrian, on the northern bounds of England, to prevent the incursions of the Picts and Scots. See **WALL.**

# P I E

At first it was made only of turf, strengthened with pallisadoes, till the emperor Severus, coming in person into Britain, built it with solid stone, reaching eight miles in length, from the Irish to the German sea, or from Carlisle to Newcastle; with watch-towers, garrisoned at the distance of a mile from each other. It was ruined several times by the Picts, and often repaired by the Romans. — At last Ætius, a Roman general, rebuilt it of brick; and the Picts ruining it the year following, it was no longer regarded but as a boundary between the two nations. The wall was eight foot thick, and twelve high from the ground; it run on the northside of the rivers Tyne and Irthing, up and down several hills; the tract or remains of it are to be seen this day in many places both in Cumberland and Northumberland.

PICTURE, PICTURA, a piece of painting, or a subject represented in colours on canvas, wood, or the like, and inclosed in a frame. See PAINTING.

PIECE, in commerce, signifies sometimes a whole, and sometimes only a part of the whole.

In the first sense we say, a piece of cloth, of velvet, &c. meaning a certain quantity of yards regulated by custom, being yet entire, and not cut. See CLOTH.

In the other signification we say, a piece of tapestry, meaning a distinct member wrought apart, which, with several others, makes one hanging. See TAPESTRY.

A piece of wine, of cyder, &c. is a cask full of those liquors.

CHIMNEY.

DETACHED.

MASTER.

EASEL.

PIECE, in matters of money, signifies sometimes the same thing with species; as, when we say, this piece is too light, &c. See SPECIES and COIN.

Sometimes by adding the value of the pieces, it is used to express such as have no other particular name; as a piece of eight rials, a piece of twenty five sols, &c.

In England the piece absolutely is sometimes used for twenty shillings sterling, and sometimes for a guinea. See GUINEA, POUND, and STERLING.

By 6 G. II. c. 25. Broad-pieces of five and twenty, or three and twenty shillings value, or any halves or quarters thereof, are called in.—And all persons are forbid to receive or utter them in payment by tale.

PIECE of eight, or piaſtre, is a silver money, first struck in Spain, afterwards in other countries, and now current in most parts of the world. See COIN.

It has its name piece of eight, or rial of eight, because equal to eight silver rials. See RIAL.

Its value is nearly on the same foot with the late French crown, viz. four shillings and six-pence sterling.—In 1687 the proportion of the simple rial to the piaſter was changed; and, in lieu of eight rials, they give ten. — At present the reduction is on the ancient standard.

There are two kinds of piaſters or Spanish crowns, the one struck at Porosi, the other at Mexico; these latter are a little matter heavier than the former; but, in return, they are not quite so fine.

The piece of eight has its diminutions, viz. the demi-piaſter, or piece of four rials; the quarter, or piece of two; the half quarter, and the sixteenth.—The exchange between Spain and England is made in pieces of eight. See EXCHANGE.

PIECE is also a kind of money of account, or rather a manner of accounting used among the negroes on the coast of Angola in Africa. See MONEY.

The price of slaves, and other commodities, here negotiated, as also the duties paid the petty kings, are estimated on both sides in pieces. Thus those barbarians requiring ten pieces for a slave; the Europeans, in like manner, value the money or merchandice to be given in exchange in pieces. See COMMERCE.

E. gr. ten Anabastes are one piece; a barrel of powder of ten pounds, one piece; a piece of blue falempouris, four pieces; ten brals basons, one piece.

PIECE, in heraldry, denotes an ordinary, or charge. See ORDINARY and CHARGE.

The honourable pieces of the shield are the chief, fess, bend, pale, bar, cross, saltier, chevron; and, in general, all those which may take up one third of the field, when alone, and in what manner soever it be.

PIECES, in the military art, include all sorts of great guns and mortars. See GUN, CANNON, and MORTAR.

These are also called pieces of ordnance, or artillery. See ORDNANCE, &c.

Field PIECES are a smaller sort, carrying balls of ten or twelve pounds. See FIELD pieces.

Battery PIECES are the larger sort of guns used at sieges for making of breaches. — Such are the twenty four pounders, and the culverin; the one carrying twenty four, and the other eighteen pound of ball.

Poisoning a PIECE.

Elevation of a PIECE.

Quadrating a PIECE.

POISON.

ELEVATION.

QUADRATING.

PIEDOUCHE\*, in achitecture, a little stand or pedestal, either oblong or square, enriched with mouldings; serving to

# P I E

support a bust, or other little figure. See PEDESTAL, BUST, &c.

\* The word is French, formed from the Italian, *peduccio*, foot.

PIEDROIT, in achitecture, a peer, or a square kind of pillar, part whereof is hid within a wall. See PEER and PARASTATA.

The only thing wherein it differs from a *pilaſter*, is, that the latter has a regular base, and capital, which the other wants. See PILASTER.

PIEDROIT is also used for a part of the solid wall annexed to a door or window; comprehending the door-post, chambranle, tableau, leaf, &c. See DOOR, WINDOW, &c.

PIE-POUDER-Court, an ancient court mentioned in many of our statutes, to be held in fairs, for the rendring of justice to buyers and sellers; and the redress of grievances arising therein. See FAIR.

It had its name, either because most ordinarily held in summer, and that the suiters hereat were chiefly country clowns, with dusty feet, called by the French, *pieds poudreux*, or from the expedition intended in the hearing of causes proper thereto, 'ere the dust went off the plaintiff and defendant's feet.

The Saxons called it *ceapung-gemot*, i. e. a court of merchandise; or for the decision of disputes relating to buying and selling.—Doctor and student observe that it is only held during the continuance of the fairs, &c.

PIER. See the article PEER.

PIERCED, PERCE', in heraldry, is when an ordinary is perforated, or struck through, shewing, as it were, a hole in it.

This *piercing* is to be expressed in blazon, as to its shape: thus, if a cross have a square hole, or perforation in the center, it is blazoned, *square pierced*, which is more proper than *quarter pierced*, as Ligh expresses it; and accordingly the French call it *percé en quarre*. — When the hole, or perforation is round, it must be expressed *round pierced*; which Gibbon in Latin calls *perforata*, because all holes made with piercers or augres, are round.—If the hole in the center be in the shape of a lozenge, it is expressed *pierced lozenge-ways*.

All piercings must be of the colour of the field, because piercing implies the shewing of what is under the ordinary, or bearing. — Though when such figures appear on the center of a cross, &c. of another colour, the cross is not to be supposed *pierced*, but that the figure on it is a charge, and must be accordingly blazoned. See CROSS, &c.

PIERCING, among farriers. — To pierce a horse's shoe lean, is to pierce it too near the edge of the iron. — To pierce it fat, is to pierce it further in.

PIES, in our ancient law-books. — *Freres Pies* were a sort of monks, so called, because they wore black and white garments, like magpies; the same, we suppose, with those since called *Carmelites*: who, for a like reason, were anciently called by the French *Freres Barrez*. See CARMELITE.

They are mentioned by Walsingham, p. 124. *In quodam veteri cœmeterio, quod fuerat quondam fratrum, quos freres pies veteres appellabant.*

PIESTRUM, PIEETPON, an instrument wherewithal to beat in pieces the bones of the head, in drawing a child out of the womb; called also *embryothlastes*. See EMBRYOTHLASTES.

PIETANTIA, or PITTANCE, a portion of victuals distributed to the members of a college, or other community, upon some great festivals. See PITTANCE.

PIETANTIARIUS. See the article PITANCIARIUS.

PIETISTS, a religious sect lately sprung up among the protestants of Germany, seeming to be a kind of mean between the quakers of England, and the quietists of the Romish church. See QUIETISM and QUAKERS.

Their author was Spenerus, from whom they learnt to despise all ecclesiastical polity, all school theology, all forms and ceremonies; and to give themselves up to contemplation, and the mystick theology. See MYSTIC.

The *Pietists* are esteemed *Adiaphorists*, or *Indifferentists*, i. e. in the German way of talking, they receive and allow of all sects among protestants, particularly the calvinists, contrary to the practice of other Lutherans.—Hence a Lutheran of Dantzic defines *pietism*, an assemblage of the hypotheses, or systems of Anabaptists, Schwencfeldians, Weigelians, Rathmannians, Labadists, and Quakers, who, under pretence of a new reformation, and in hopes of better times, set aside the Augsburg confession. See ADIAPHORIST.

The same author charges the *Pietists* not only with schism, but with heresy: in that they believe, with the Donatists, that the effect of the sacraments depends on the piety and virtue of the minister; that creatures are emanations from the substance of God; that a state of grace is a real possession of the divine attributes, and a true deification; that one may be united to God, though he deny the divinity of Jesus Christ; that all error is innocent, provided the will be but sincere; that the preventing grace is natural, and that the will begins the work of salvation; that one may have faith without any supernatural assistance; that all love of the creature is original sin; that a christian may avoid all sin; that one may enjoy the kingdom of God in this world. These things we find charged on the *Pietists* in a book intituled, *Manipulus observationum Antipietisticarum*. Indeed, this looks

looks like polemical exaggeration; at least it is certainly so with regard to a good part of them.

In effect there are *Pietists* of several kinds: some are in gross illusions, and carry their errors to the overturning a great part of the christian doctrine; others are only visionaries; and others very honest and good people, who, disgusted with the coldness and formality of other churches, and charmed with the frequent piety of the *Pietists*, are attached to their party, without giving into the grossest of their errors.

**PIETY**—*Mounds of PIETY.* See the article MOUNT.

**PIG of lead**, the eighth part of a fother, amounting to about 250 l. weight.

**PIGER** *Henricus*, slothful Harry, a slow distilling chymical furnace; called alio *athanor*. See **ATHANOR** and **FURNACE**.

**PIGMENTS**, **PIGMENTA**, preparations used by painters, dyers, &c. to impart colours to bodies, or to imitate particular colours. See **COLOUR**.

When glass is stained, or coloured, as in painting on glass, or for counterfeiting gems, or precious stones; the *pigment* is usually of a metalline, or a mineral nature. See **ENAMEL**; see also *painting on GLASS*.

**PIGMY**, or **PYGMY**. See the article **PYGMY**.

**PIGNE**. See the article **PINEA**.

**PIKE**\*, an offensive weapon, consisting of a shaft of wood, twelve or fourteen foot long; headed with a flat pointed steel, called the *spear*. See **ARM**.

\* The name *pike* is said to be derived from a bird called by the French *pie*, by us wood-pecker, whose bill is so sharp as to pierce wood like an auger. — Du Cange derives it from the base Latin *pica*, or *picca*, which Turnebus supposes to have been so called *quasi spica*, because resembling a kind of ear of corn: Octavio Ferrari derives it *à spicula*. M. Fauchet says, it is the *pike* gave name to the Picards, and Picardy, which he will have to be modern, and to have been framed on occasion of that people's renewing the use of the *pike*, the etymology whereof he fetches from the French *piquer*, to prick: others will have the name *picard* to have been given that people by reason of their readiness to pick quarrels, called in French *piques*.

The *pike* was a long time in use in the infantry, to enable them to sustain the attack of the cavalry; but is now taken from them, and the bayonet, which screws on at the end of the carbine, substituted in its place. See **BAYONET**.

Yet the *pike* still continues the weapon of foot-officers, who fight *pike* in hand, salute with the *pike*, &c.

Pliny says the Lacedæmonians were the inventors of the *pike*. — The Macedonian phalanx was a battalion of *pikemen*. See **PHALANX**.

**PIKE**, in commerce—To treat at the **PIKE**, or *pike's end*, *à la pique*, denotes a kind of commerce which the Europeans hold with certain savage nations, wherein they are to keep on their guard, and as it were sword in hand. — Thus it is we treat with the savages of Canada, &c. and some negro nations on the coast of Africa.

*Treating at the pike*, also denotes a kind of prohibited traffic which the English, French and Dutch maintain in several parts of the Spanish West Indies, near the colonies which those nations have in the Caribbee Islands.

Perhaps it should rather be called *treating at pike*, i. e. with the vessel at anchor; in regard this commerce, which is prohibited on pain of death, is only practised in roads where vessels lie at anchor, waiting for the Spanish merchants, who sometimes by stealth, more frequently with the connivance of the governors, &c. come to exchange their gold, pieces of eight, cochineal, &c. for the European merchandizes.

Others will have it treating at the pike, i. e. at a *pike's length*, or *distance*; by reason of the distance strangers are obliged to keep at. See **COMMERCE**.

**PIKE fishing**. } See the articles { **FISHING**.

**Huxing of PIKE**. } See the articles { **HUXING**.

**PILA** or **PILE**, among our ancient writers, denotes the arms-side of a piece of money. See **MONEY** and **COIN**.

The denomination arose hence, that anciently this side bore an impression of a church built on piles. See **PILE**.

*Fleta, lib. 1. cap. 39.* He who brings an appeal of robbery or theft against another, must shew the certain quantity, quality, price, weight, number, measure, valorem & *pilum*; where *pilum* signifies *figuram monetæ*.

**PILA**\*, **PEER**, in building, a massive of masons work in manner of a pillar, usually hexagonal. See **PEER**.

\* The word comes from the Latin, *pila*, used in the same sense by Vitruvius; and this, probably, from *πῖλον, cogo, coarcto*.

Such are those serving as fulcra, to separate and support the arches of a stone-bridge, or the beams of a wooden-bridge.

The *peers* of a stone-bridge are not to be less than one sixth part of the arch, nor more than a fourth. See **BRIDGE**.

Evelyn observes, that *pilæ* and their quadras, as we see them on ancient altars and monuments, were used for inscriptions; but the shorter and more massy served for arches and buttresses to solid work. They were sometimes made semi-circular: but the ancients preferred those pointed at right angles, as best able to resist the current.

**PILASTER**, in architecture, a square column, sometimes insulated, but more frequently let within a wall, and only project-

VOL. II. N° 116

ing with a fourth or fifth part of its thickness. See **COLUMN**. The *pilaster* is different in different orders; it borrows the name of each order, and has the same proportions, and the same capitals, members, and ornaments, with the columns themselves. See **ORDER**.

*Pilasters* are usually without either swelling or diminution, as broad at top as at the bottom; though some of the modern architects, as M. Mansard, &c. diminish them at top, and even make them swell in the middle, like columns; particularly when placed behind columns. See **DIMINUTION**.

*Pilasters*, M. Perrault observes, like columns, become of different kinds, according to the different manner wherein they are applied to the wall. — Some are wholly detached, called by Vitruvius, *parastata*; others have three faces clear out of the wall; and others two; and others only one; all called by Vitruvius, *antæ*. See **ANTA** and **PARASTATA**.

Insulate *pilasters* are but rarely found in the antique. — The chief use they made of *pilasters* was at the extremities of portico's, to give the greater strength to the corners.

There are four principal things to be regarded in *pilasters*, viz. their projecture out of the wall, the diminution, the disposition of the entablature when it happens to be common to them and to a column, and their flutings and capitals.

1°. Then, the projecture of *pilasters* which have only one face out of the wall, is to be one sixth of their breadth; at most not above one eighth. When they receive impost against their sides, their projecture may be a quarter of their diameter. See **PROJECTURE**.

2°. *Pilasters* are but seldom diminished, when they have only one face out of the wall. — Indeed where they stand in the same line with columns, and the entablature is continued over both, without any break, the *pilasters* are to have the same diminution with the columns; that is to say, on the face respecting the column; the sides being left without any diminution.

3°. *Pilasters* are sometimes fluted, though the columns they accompany be not; and, on the other hand, the columns are sometimes fluted, when the *pilasters* that accompany them are not.

The flutings of *pilasters* are always odd in number, except in half *pilasters*, meeting at inward angles; where four flutings are made for three, &c. See **FLUTE**.

4°. The proportions of the capitals of *pilasters* are the same as to height with those of columns, but differ in width; the leaves of the former being much wider; because *pilasters*, though of equal extent, have only the same number of leaves for their girt, viz. eight—Their usual disposition is to have two in each face, in the lower row, and in the upper row one in the middle, and two halves in the angles, in the turns whereof they meet. — Add to this, that the rim of the vase or tambour is not so strait as the lower part is, but a little circular and prominent in the middle. See **CAPITAL**, &c.

In *pilasters* that support arches, the proportions, Palladio shews, must be regulated by the light they lie in; and at angles, by the weight they are to sustain. For which reason, says Sir Henry Wotton, a rustic superficies best becomes them.

**PILASTER brick**. See the article **BRICK**.

**PILCHARD fishing**. See **Pilchard FISHING**.

**PILE**, in antiquity, a pyramid built of wood, whereon were laid the bodies of the deceased, to be burnt. See **BUSTUM**; see also **FUNERAL**, **BURNING**, &c.

**PILE** is also used in building, for a great stake rammed into the earth for a foundation to build upon in marshy ground. See **FOUNDATION**; see also **PALLIFICATION**.

Amsterdam, and some other cities are wholly built upon *piles*.

The stoppage of Dagenham-breach is effected by dove-tail *piles*, i. e. *piles* mortised into one another, by a dove-tail joint. See **PALE**, and **DOVE-TAIL**.

**PILE** is also used, among architects, for a mass, or body, of building. See **BUILDING**.

**PILE**, **PILA**, in coinage, denotes a kind of punchion, which, in the old way of coining with the hammer, contained the arms, cross, or other figure and inscription, to be struck for the reverse of the species. See **COIN** and **SPECIES**.

Accordingly, we still call the arms side of a piece of money, the *pile*, and the head the *cross*; because in the ancient monies, a cross usually took the place of the head in ours. See **COINING**. Hence also the game of *cross* and *pile*.

Some will have it called *pila*, because on this side, in our ancient coins, there was an impression of a church built on *piles*. Scaliger, with more probability, derives it from the old French word, *pilé*, a ship. Vide prima Scaligeriana, in voc. *Nummus Ratitus*, p. 115. — In some ancient writings *pila* is used to signify the particular figure or impression of money. — Thus Fleta; he who brings an appeal of robbery, or theft, against another, must shew the certain quantity, quality, price, weight, number, measure, value, and *pila*. See **PILA**.

**PILE**, in heraldry, is an ordinary, in form of a point inverted, or a stake sharpened; contracting from the chief, and terminating in a point towards the bottom of the shield, somewhat in manner of a wedge. — See *Tab. Herald. fig. 80*.

It is formed probably in imitation of the Roman *pilum*, which was a tapering dart about five feet long, and sharpened at the point with steel.

# P I L

The *pile* is born inverted, engrailed, &c. like other ordinaries, and issues indifferently from any point of the verge of the escutcheon.—He beareth a *pile gules*, by the name of Chandois.

**PILES**, in medicine, a disease by physicians called *hæmorrhoids*. See **HÆMORRHOIDS**.

**PILETTUS\***, in our ancient forest laws, an arrow which had a round knob a little above the head, to hinder it from going far into the mark.

\* From the Latin *pila*, which signifies any round thing like a ball. *Et quod forestarii sui non portabunt sagittas barbatus sed pilettas.* Charta Rogeri de Quincy.

**PILGRIM\***, one who travels through foreign countries to visit holy places, and to pay his devotion to the reliques of dead saints. See **RELICS**, **JUBILEE**, &c.

\* The word is formed from the Flemish, *pelgrim*, or Italian *pelegrino*, which signifies the same; and those originally from the Latin *peregrinus*, a stranger, or traveller.

The humour of going on pilgrimage anciently prevailed exceedingly; particularly about the time of the croisades. See **CROISADE** and **CROISE**.

Several of the principal orders of knighthood were established in favour of *pilgrims* going to the Holy Land, to secure them from the violences and insults of the Saracens and Arabs, &c. Such were the order of the knights Templars, the knights Hospitallars, knights of Malta, &c. See **ORDER**, **TEMPLAR**, **MALTA**, &c.

**PILLAGE**, among builders, is sometimes used for a square pillar, standing behind a column to bear up the arches; having a base and capital as a pillar has. See **PILLAR**.

**PILLAR**, in architecture, a kind of irregular column, round and insulate; but deviating from the proportions of a just column. See **COLUMN**.

*Pillars* are always either too massive or too slender for a regular architecture. In effect, *pillars* are not restrained to any rules: their parts and proportions are arbitrary.

Such, e. gr. are the *pillars* which support Gothic vaults and other buildings, &c.

A square *pillar* is a massive work, called also a *peer* or *piedroit*, serving to support arches, &c. See **PEER** and **PIEDROIT**.

*Butting pillar*, is a butment or body of masonry, raised to prop or sustain the thrust of a vault, arch, or other work. See **BUTTRESS** and **BUTMENT**.

**PILLAR**, in the manage, signifies the centre of the volta, ring, or manage-ground, round which a horse turns; whether there be a wooden *pillar* placed therein, or not. See **MANAGE**.

There are also other *pillars* in manages on the circumference, or side; placed at certain distances, by two and two.—To distinguish these from that of the centre, they are called the *two pillars*. When these latter are spoken of, it is usual to say, *work the horse between the two pillars*.—When the former, it is called *working round the Pillar*.

The use of the *pillar* in the centre, is for regulating the extent of ground, that the manage upon the volts may be performed with method, and justness, and that they may work in a square by rule and measure upon the four lines of the volts; and also to break unruly high mettled horses, without endangering the rider.

The *two pillars* are placed at the distance of two or three paces one from the other.—The horse is put between these, to teach him to rise before, and yerk out behind; and put himself upon raised airs, &c. either by the aids, or chastisement.

*Ropes of two PILLARS*. See the article **ROPE**.

**PILLE** of *Foddray*, or **PILE** of *Fouldrey*, in the county of Lancaster, a defence built on a creek of the sea; called *pille*, by the idiom of the county, for a *pile*, or fort built for the safe-guard or protection of any place.

This *pile* was erected there by the Abbot of Fournesse, in the first year of Edward III. *Brit. Rex—Dedimus Henrico comiti Northumb. insulam, castrum, pelam & dominium de Man, &c.* Rot. Pat. 1 Hen. IV.

**PILLORY** was anciently a post erected in a cross road, by the lord, as a mark of his seignory, with his arms on it, and sometimes a collar to tie criminals to.

**PILLORY**, at present, is a wooden machine, whereon certain criminals, as perjurers, &c. are fastened, and exposed to the public derision. See **PUNISHMENT**, **PERJURY**, &c.

In the laws of Canutus, it is called *healfesbang*—Sir Henry Spelman says, it is *supplicii machina ad ludibrium magis quam pœnam*. It was peculiarly intended for the punishment of bakers who should be caught faulty in the weight or fineness of their bread. In old charters it is called *collistrigium*.

The *Pillory* in Paris is in the middle of a round tower, with openings on every side.—It is moveable on an axis, or arbor, round which the executioner gives the criminal the number of turns appointed in court; stopping him at each opening to shew him to the people.—It was intended for several kinds of criminals, particularly fraudulent bankrupts; and all who made a cession or surrender of their effects to their creditors, were obliged to take some turns round the pillory on foot, with a green cap on. See **BANKRUPT**, **CESSION**, &c.

# P I N

**PILL**, **PILLULA**, in pharmacy, a form of medicine, taken dry; resembling a little ball; invented in favour of such as cannot well take medicinal draughts; as also to keep in readiness for occasional use without decaying. See **CATAPOTIUM**.

*Pills* are of various kinds, anodyne, somniferous, laxative, aperitive, hystERIC, antinephritic, &c. but principally cathartic.

The basis of *pills* is usually aloes; with which are mixed agaric, turbith, hermodactyls, fenna, rhubarb, mercury, storax, &c.

*Pills* are usually wrapped up in leaf-gold, in sugar, or the like, to prevent the ill taste being perceived.

**Perpetual PILLS**, **PILLULÆ perpetuæ**, are regulus of antimony made up into pills; thus called, because being swallowed and voided fifty times, they will purge every time with undiminished force. See **ANTIMONY** and **PERPETUAL**.

The *aloephangine* or *aromatic PILLS* of Mesue, made of aloes, scammony, troches of alhandal, and saffron, are called *polychrestæ*, as being supposed to collect the humours from all parts, to enable nature to cast them out more easily.

**Bechic PILLS**, are a sort of *pills* good against coughs, so called from the Greek, *βήχης*, cough.—They are also called *hypoglottides*, because left to dissolve under the tongue.

**PILLULÆ Diarrhodon**. See the article **DIARRHODON**.

**PILOT\***, a person retained on board a ship to conduct it into a road, or harbour; or over bars, sands; or through serpentine, and intricate channels, or the like.

\* *Menage* derives the word *pilot* from *prorita*, q. d. he who governs the prow, or head. Others fetch it from the old French, *pilè*, ship.

*Pilots* are no constant and standing officers on board our vessels: but are mostly called in occasionally on coasts and shoars unknown to the master.—And having done their parts in piloting the vessel, return to shoar where they reside.

Among the French, *pilot* is also used for the steersman; or an officer on board a ship, who watches her course, and directs it. See **COURSE**, **SAILING**, &c.

There are two kinds of *pilots*; the one a *coasting pilot*, well acquainted with the coasts, ports, roads, bars, sands, &c. and who commands in fight thereof. See **COASTING**.

The other an officer who makes observations and takes altitudes out at sea, uses the quadrant, fore-staff, watches the compass, &c. See **OBSERVATION**, **ALTITUDE**, &c.

The *pilot* is always the second person in the ship; whether it be a man of war, or a merchant man.—In the former the captain is the first, the *pilot* the second. In a merchant-ship, the master is the first, the *pilot* after him.

The *pilot* is also the steersman, who stands at the helm, and manages the rudder. See **STEERING**, **HELM**, and **RUDDER**.

**PILY Barry**. See the article **BARRY Pily**.

**PIMENTO**, **PIMENTA**, *all-spice*; a kind of aromatic berry, called also *guinea-pepper*. See **PEPPER**.

**PIN**, in commerce, a little necessary implement chiefly used by the women, in adjusting their dress.

The form and application of this little moveable need no description; but its consumption, and the number of hands it employs, are too considerable to be passed by unnoted.

*Pins* are now altogether made of brass-wire blanched: formerly they likewise made them of iron-wire, which being blanched like the others, passed for brass: but the ill effects of those *pins* has quite discarded their use.—The French however could not be driven off from them without several arrears of parliament. By a sentence of the lieutenant de police, July 1695, the seizure of some millions of those *pins* was confirmed, and the *pins* condemned to be burnt by the common executioner.

The *pins* most esteemed in commerce are those of England; those of Bourdeaux are next, then those made at Rugle, Naigle, and some places in Normandy.

The perfection of *pins* consists in the stiffness of the wire, and its blanching, in the heads being well-turned, and the points filed. The London pointing and blanching are in most repute; because after forming the points on the stone, our pin-makers smooth them again on the polisher; and in blanching use fine tin well calcined, and sometimes silver leaves prepared by the gold-beaters; whereas in other parts they use a mixture of tin, lead, and quick-silver, which not only blanches worse than the former, but is also dangerous, by reason of the ill quality of that mineral, which renders a puncture with a *pin* thus blanched very difficult to cure.

The consumption of *pins*, and the number of artificers employed in the manufacture thereof are incredible. In Paris alone there were anciently above 1000 people employed in it, at present there are none; yet there is every year sold above 50,000 crowns worth of the *pin-wire*, to the pin-makers of the neighbouring places, all brought thither from Stockholm.—In the little town of Rugle in Normandy, there are computed at least 500 workmen employed in the *pin* manufacture; the whole town being peopled therewith.

Notwithstanding that there is scarce any commodity cheaper than *pins*, there is none that passes through more hands ere they come to be sold.—They reckon twenty-five workmen successively employed on each *pin*, between the drawing of the brass-wire, and the sticking of the *pin* in the paper.

*Pins*

*Pins* are distinguished by numero's; the smaller called from N° 3, 4, 5, thence to the 14th, whence they are only accounted by two to two, viz. N° 16, 18, and 20, which is the largest size.

Besides the white *pins*, there are also black ones made for mourning from N° 4, to N° 10.—These are usually of iron-wire.

Lastly, there are *pins* with double heads of several numero's, used by the ladies to fix the buckles of their hair for the night, without danger of being disturbed by their pricking &c.

One of the articles of the statutes of the ancient pin-makers of Paris, was, that no master should open more than one shop for the sale of his wares, except on new-year's-day, and the eve thereof: this we mention in an age of luxury and profusion, to recollect the agreeable simplicity of our fore-fathers, who contented themselves with giving *pins* for new-years gifts.

Hence the custom of still giving the name *pins*, or *pin-money*, to certain presents which accompany the most considerable bargains; in which it is usual to give something towards the *pins* of the wife, or children, of the person with whom the bargain is struck.

Hook PINS } See the articles { HOOK.

Protracting PIN } See the articles { PROTRACTING.

*Ad PINNAS bibere*, a method of drinking anciently used among the Danes in England.—The custom was to fix a *pin* in the side of the wooden cup or wassal bowl; which *pin* each guest was to drink bare, upon penalty of forfeiting.

*PIN-and-Web*, a horny induration of the membranes of the eye not much unlike a cataract. See CATARACT.

The *pin* and web is the same with what we otherwise call *pannus*, *unguis*, *pterygium*, &c. See PANNUS, PTERYGIUM, &c.

*PIN-wheel*, of a clock, the same with the striking wheel. See WHEEL and CLOCK.

*PINCHING*, in gardening, a sort of pruning, performed by nipping or breaking off the branches, or sprigs of a plant, or tree, between the nails of two fingers. See PRUNING.

Most gardeners hold, that *pinching* contributes to the abundance of the fruit, as well as of the branches; and say, that young shoots, thus lopped, are less apt to grow black and die, than when cut with a pruning knife.

The season for *pinching* is chiefly in April or May, sometimes it is also practised in June and July.—The fruits it is practised on are chiefly melons, cucumbers, &c. Quintiny also prescribes it for fruit-trees.

It is chiefly to be practised on the large branches towards the top of the tree, which are useless, and yet consume a great quantity of good sap. It must rarely be employed on the large branches below; which ought always to be preserved for the winter's pruning, that they may yield others, the following year, fit to fill the empty places.—Nor must the operation of *pinching* be performed on the tender shoots; because having only just sap enough for themselves, when they come to put forth more branches in the place where they are *pinched*, the small flock of sap allotted them being divided, will starve them.—The operation is performed within two or three eyes of the branch they grow out of.

The effect of *pinching* is, that, instead of one useless, perhaps hurtful wood-branch, a vigorous tree will put forth two or three at the eyes remaining; and the sap being thus divided, the branches may be less, and fit for wood and fruit.

*PINCHING*, in the manage, is when, the horse standing, the rider holds him fast with the bridle-hand, and applies the spurs just to the hairs of his sides, without pricking him.

*Pinching* is accounted an aid, spurring, chastisement or correction. See AID.

*PINDARIC*, in poetry, an ode formed in imitation of the manner of *Pindar*. See ODE.

The *Pindaric* manner is distinguished by the boldness and height of the flights, the suddenness and surprizingness of the transitions, and the seeming irregularity, wildness, and enthusiasm of the whole. See DITHYRAMBUS.

*Pindar*, whence the manner takes its name, was of Thebes: he flourished about four hundred and seventy eight years before Christ, and was contemporary with Æschylus: what we have remaining of his is a book of odes, all in praise of the victors at the Olympian, Pythian, Nemean, and Isthmian games; whence the first is entitled the *Olympians*, the second the *Pythians*, the third the *Nemeans*, and the fourth the *Isthmians*.

*Pindar* is full of force and fire; his thoughts sententious, his style impetuous; his fallies daring, and frequently running as it were at random: he affects a beautiful disorder, which yet is said to be the effect of the greatest art.

The supposed irregularity of his numbers has made several of his imitators imagine themselves *pindaric* poets, by the mere wildness and irregularity of their verses.—None of our writers seem to have succeeded in the *pindaric* character better than Cowley.

In a *pindaric* ode, the plan of the whole is to be drawn first, and the places marked out where the elegant fallies and wanderings may best be, and how the returns may be justly made to the subject.

*PINEA*, or *PIGNE*, in commerce, a term used in Peru and Chili, for a kind of light, porous masses, or lumps formed of a mixture of mercury and silver-dust from the mines. See SILVER.

The ore, or mineral of silver, being dug out of the veins of the mine, is first broke, then ground in mills for the purpose, driven by water with iron pestles of two hundred pound weight.

—The mineral thus pulverized, is next sifted, then worked up with water into a paste, which, when half dry, is cut into pieces, called *cuerpo's*, a foot long; weighing each about two thousand five hundred pounds.

Each *cuerpo* is again kneaded up with sea-salt, which dissolving incorporates with it.—They then add mercury, from ten to twenty pounds for each *cuerpo*, kneading the paste a fresh until the mercury be incorporated therewith. This office being exceedingly dangerous, by reason of the noxious qualities of the mercury, is the lot of the poor Indians. See MERCURY.

This amalgamation is continued for eight or nine days: some add lime, lead, or tin ore &c. to forward it; and, in some mines, they are obliged to use fire.—To try whether or no the mixture and amalgamation be sufficient, they wash a piece in water, and if the mercury be white, it has had its effect; if black, it must be further worked.

When enough, it is sent to the lavatories, which are large basons that empty successively into one another.—The paste, &c. being laid in the uppermost, the earth is then washed from it into the rest by a rivulet turned upon it; an Indian all the while stirring it up with his feet, and two other Indians doing the like in the other basons. See LAVATORY.

When the water runs quite clear out of the basons, they find the mercury and silver at bottom incorporated.—This matter they call *pella*, and of this they form the *pineas* by expressing as much of the mercury as they can; first by putting it in woollen bags, and pressing and beating it strongly; then by stamping it in a kind of wooden mould of an octagonal form, at bottom whereof is a brass-plate pierced full of little holes.

The matter being taken out of the mould is laid on a trivet, under which is a large vessel full of water; and the whole being covered with an earthen head, a fire is made around it.

The mercury still remaining in the mass, is thus reduced into fumes, and at length condensing, is precipitated into the water, leaving behind it a mass of silver-grains of different figures, which only joining or touching at the extremes, render the matter very porous and light.

These then are the *pineas* or *pignes*, which the workmen endeavour to sell secretly to the vessels trading to the South Sea; and from which those who have ventured to engage in so dangerous a commerce, have made such vast gains.—Indeed the traders herein must be very careful; for the Spanish miners are errant knaves, and, to make the *pignes* weigh the more, make a practice of filling the middle with sand or iron. See COMMERCE, PIKE, &c.

*PINEAL*, *PINEALIS*, in anatomy, a name which Des Cartes gives to a small gland in the third ventricle of the brain, from its resemblance to a pine-apple. See GLAND and BRAIN.

This gland he makes the sensorium, or seat of the reasonable soul. See SENSORIUM.—Other authors call it *conoides* and *conarium*. See CONARIUM.

*PINGUEDO*, in anatomy, the Latin term for fat. See FAT. Some restrain *pinguedo* to that soft kind of humid fat found in animals next under the skin. See FAT and ADEPS.

*PINION*, in mechanicks, an arbor or spindle, in the body whereof are several notches, which catch the teeth of a wheel that serves to turn it round.

Or a *pinion* is a lesser wheel, which plays in the teeth of a larger. See WHEEL.

In a watch, &c. the notches of a *pinion* (which are commonly 4, 5, 6, 8, &c.) are called *leaves*, and not teeth as in other wheels. See WATCH.

*PINION of report*, is that *pinion* in a watch which is commonly fixed on the arbor of the great wheel, and which in old watches used to have but four leaves; it drives the dial-wheel, and carries about the hand. See WATCH-WORK.

The quotient, or number of turns to be laid upon the *pinion* of report, is found by this proportion: as the beats in one turn of the great wheel are to the beats in an hour; so are the hours of the face of the clock (viz. 12 or 24) to the quotient of the hour-wheel, or dial-wheel divided by the *pinion* of report, that is, by the number of turns which the *pinion* of report hath in one turn of the dial-wheel: which in numbers is 26928: 20196:: 12: 9.

Or rather thus: as the hours of the watch's going are to the numbers of the turns of the fusey; so are the hours of the face to the quotient of the *pinion* of report.—If the hours be 12, then 16: 12:: 12: 9. But if 24, the proportion is 16: 12:: 24: 18.

This rule may serve to lay the *pinion* of report on any other wheel, thus: as the beats in one turn of any wheel are to the beats in an hour; so are the hours of the face, or dial-plate of the watch, to the quotient of the dial-wheel, divided by the *pinion* of report fixed on the spindle of the aforelaid wheel. See BEATS, TURN, &c.

Flying

*Flying* PINION. See the article FLYING.

PINK, a vessel used at Sea, masted and rigged like other ships; only that she is built with a round stern; the bends and ribs compassing so, as that her sides bulge out very much. See VESSEL.

This disposition renders the *pinks* difficult to be boarded; and also enables them to carry greater burdens than others.—Whence they are often used for store-ships and hospital-ships in the fleet.

PINK, among painters, denotes a sort of yellow colour. See YELLOW and PAINTING.

PINNA, or PENNA, a Latin word signifying a feather. See FEATHER.

It is also used figuratively in divers arts, to express things which bear some resemblance, in form, to feathers; as the fins of fishes, &c. See FIN.

PINNA *auris*, in anatomy. See EAR and AURICLE.

PINNA *nasi*, is the same as *ala nasi*. See NOSE and ALA.

PINNACE, a small vessel, with a square stern, having sails and oars, and carrying three masts; chiefly used as a scout for intelligence, and for landing of men. See VESSEL.

One of the boats belonging to a great man of war, serving to carry the officers to and from the shoar, is also called the *pinnace*. See BOAT.

PINNACLE\*, in architecture, the top, or roof of a house, terminating in a point. See ROOF.

\* The word comes from the Latin *pinna*, or *pinnaulum*.

This kind of roof among the ancients was appropriated to temples; their ordinary roofs were all flat, or in the plat-form way. See PLATFORM.

It was from the *pinnacle*, that the pediment took its rise. See PEDIMENT.

PINNATA *folia*, in botany, are such leaves of plants as are deeply jagged, cut, or indented, resembling a feather in shape. See LEAF.

PINNING, in building, the fastening of tiles together with pins of heart of oak, for the covering of a house, &c. See TILES and COVERING.

PINT\*, PINTA, a vessel, or measure used in estimating the quantity of liquids, and even sometimes of dry things. See MEASURE.

\* Budæus derives the word *pint* from the Greek *πινθα*; others from the German *pint*, a little measure of wine; Nicod from the Greek *πινθη*, to drink.

The English *pint* is twofold; the one for wine-measure, the other for beer and ale-measure.

The wine *pint* contains a full pound, avoir-du-pois, of common running water; two *pints* make a quart, two quarts a pottle, two pottles a gallon, &c. See GALLON, QUART, &c.

The Paris *pint* is estimated one sixth of the ancient congius, and contains two pounds of common water; it is divided into chopines, which some call septiers; the septiers into two demi-septiers, the demi-septier into two poissons, each poisson containing six cubic inches.—Two *pints* make a quart, quarteau, which some call a pot: the *pint* of S. Denis is almost double that of Paris.

PINTLE, among gunners, an iron which serves to keep the cannon from recoiling. See CANNON, ORDINANCE, RECOIL, &c.

PINTLES, in a ship, are hooks by which the rudder hangs to the stern-post. See RUDDER, &c.

PIONEER\*, in war, a labourer employed in an army, to smooth the roads, pass the artillery along, dig lines and trenches, mines, and other works.

\* Menage derives the word from the Latin *peditores*, a diminutive of *pedites*; Bochart deduces it from the *Pæones*, a people of Asia, whose principal employment was to dig the earth in mines, &c.

PIP, or PEP, PEPIA, a disease among poultry, consisting of a white, thin skin, or film, that grows under the tip of the tongue, and hinders their feeding.

It usually arises from want of water, or from drinking puddle-water, or eating filthy meat.—It is cured by pulling off the film with the fingers, and rubbing the tongue with salt.—Hawks are particularly liable to this disease, especially from feeding on stinking flesh. See HAWK.

PIPE, in building, &c. a canal or conduit for the conveyance of water, and other liquids. See CANAL.

Pipes for water, water-engines, &c. are usually of lead, iron, earth, or wood.—Those of timber are commonly either oak, or alder. See TIMBER.

Those of iron are cast in the forges; their length about two foot and a half; several of which are pieced together by means of four screws at each end, with leather, or old hat between them to stop the water.

Those of earth are made by the potters.—These are fitted into one another, one end being always made wider than the other.—To join them the closer, and prevent their leaking, they are covered with pitch and tow.—Their length is usually about the same with that of the iron *pipes*.

The wooden *pipes* are bored with large iron augres of different

sizes, succeeding one another from less to larger; the first pointed, the rest formed spoon-wise, increasing in diameter from one inch to six.—They are fitted into the extremities of each other, and are sold by the foot.

Leaden *pipes* are of two kinds; the one soldered, the other not soldered: for the construction of each kind whereof, see PLUMBERY.

For the PIPES of organs. See the article ORGAN.

Bag-PIPE. See the article BAG-PIPE.

PIPE is also a popular machine used in the smoking of tobacco; consisting of a long, slender tube made of earth or clay; having at one end a little vase, or furnace, called the *bowl*, for the reception of the tobacco; the fumes whereof are drawn by the mouth through the other end. See TOBACCO.

Pipes are made of various fashions, long, short, plain, worked, white, varnished, unvarnished, of various colours, &c.—The Turks use *pipes* three or four foot long, made of rushes, or of wood bored; at the end whereof they fix a kind of nut, of baked earth, which serves as a bowl, and which they take off after smoking.

PIPE\* also denotes a vessel, or measure, for wine, and things measured by wine-measure. See MEASURE.

\* The word is formed from the barbarous Latin *pepa*, a vessel, cask, &c.

The *pipe*, or butt, contains two hogsheds, four barrels, or one hundred and twenty six gallons; and is computed to weigh about nine hundred, two quarters and seventeen pounds. See HOGSHEAD &c.

The *pipe* is little used in France, except in Anjou and Poitou, where it consists of two boisseaux, equal to a muid and half of Paris; the muid consisting of thirty six septiers, and the septier of eight pints. See MUID.

PIPE, PIPA, in law, is a roll in the exchequer, called also the *great roll*. See ROLL and EXCHEQUER.

PIPE office is an office wherein a person called the *clerk of the pipe*, makes out leases of crown-lands by warrant from the lord-treasurer, or commissioners of the treasury, or chancellor of the exchequer.

*Clerk of the pipe* makes up all accounts of sheriffs, &c. and gives the accomptants their quietus est. To this office are brought all accompts which pass the remembrancer's office, and remain there; that if any stated debt be due from any person, the same may be drawn down into the great roll of the pipe; upon which the comptroller issues out a writ, called the *summons of the pipe* for recovery thereof. And, if there be no goods or chattels, the clerk draws down the debts to the lord treasurer's remembrancer, to write estreats against their lands.

All tallies, which vouch the payment of any sum contained in such accompts, are examined, and allowed by the chief *secondary of the pipe*. See TALLY.

Besides the clerk, in this office are eight attorneys, or sworn clerks, and a comptroller.

PIQUET. See the articles PICKET and PICQUET.

PIRATE, or PYRATE, PIRATA, *rover*; a person, or vessel, that robs on the high seas, or makes descents on the coast, &c. without the permission or authority of any prince or state. See PRIVATEER.

When *pirates* are caught, they are usually hanged up without remission, or any formal trial; sometimes in the next port, sometimes on board the vessel that takes them.

In different parts they are differently denominated; as in the West-Indies, *buccaneers*, *free-booters*, &c.—In the Mediterranean, *corsairs*, &c. See BUCCANEER, CORSAIR, &c.

Alexander reproaching a *pirate* with his condition, was answered: If I am a *pirate*, it is because I have only a single vessel; had I a fleet, I should be a mighty conqueror.

PIRATE was also anciently used for the person to whose care the mole or peer of a haven, in Latin *pera*, was intrusted. See PEER.

PIRATE was sometimes too, according to Spelman, used for a sea-captain, or soldier. Usser, in the life of king Alfred, tells us, *jussit naves longas fabricari, impositisque piratis in illis vias maris custodiendas commisit*.

PIROUETTE\*, or PYROET, in the manage, a turn or circumvolution which a horse makes without changing his ground.

\* The word is French, and literally signifies *whirligig*.

*Pirouettes* are either of one tread or *piste*, or of two.—The first is an entire short turn which the horse makes upon one tread, and almost in one time; in such manner as that his head comes to the place where his tail was, without putting out his haunches.—In the *pirouette* of two treads, or *pistes*, he takes a small compass of ground, almost his length; and marks both with the fore-part and the hind. See PISTE.

PISCARY, PISCARIA, in our ancient statutes, the liberty of fishing in another man's waters. See FISHING and GAME.

PISCES, in astronomy, the twelfth sign, or constellation of the zodiac. See SIGN and CONSTELLATION.

The stars in *pisces*, in Ptolemy's catalogue are 38. In Tycho's 33. In the Britannic catalogue 109.—The longitudes, latitudes, magnitudes, &c. whereof are as follow.

PISCINA *, in antiquity, a large bafon, in an open publick place; or square; where the Roman youth learnt to swim; and which was furrounded with a high wall, to prevent the casting of filth into it. See SWIMMING.				
* The word is formed from the Latin <i>piscis</i> , fish; because men here imitated fishes in swimming; and because fishes were actually kept in some of them.				
PISCINA was also used for the square bafon in the middle of a bath. See BATH.				
PISCINA <i>probativa</i> , was a pool, or reservoir of water, near the court of Solomon's temple; so called from the Greek <i>πρωβατιον</i> , sheep, because they here washed the cattle destined for sacrifice. See SACRIFICE.				
By this <i>piscina</i> it was that our Saviour wrought the miraculous cure of the paralytic.—Davies observes, there are still remaining five arches of the portico, and part of the bafon of this <i>piscina</i> .				
PISCINA, or <i>lavatory</i> , among the Turks, is a large bafon in the middle of the court of a mosque, or under the portico's that encompass it. See MOSQUE.				
Its form is usually a long square, built of stone or marble, furnished with a great number of cocks; wherein the Mussulmans wash themselves before they offer their prayers; as being persuaded that ablution effaces sin. See ABLUTION.				
PISCIS <i>australis</i> . See the article AUSTRALIS.				
Piscis <i>volans</i> , in astronomy, is a small constellation of the southern hemisphere, unknown to the ancients, and invisible to us in these northern regions. See CONSTELLATION.				
PISSASPALTUM *, or PISSASPALTUS, ΠΙΣΣΑΣΦΑΛΤΟΣ, in natural history, denotes a native, solid bitumen; found in the Ceraunian mountains of Apollonia: of an intermediate nature between pitch and asphaltum. See BITUMEN.				
* The word is compounded of <i>πισσα</i> , pitch, and <i>ασφαλτης</i> , bitumen.				
PISSASPALTUM is also a name given to a factitious substance compounded of pitch, and asphaltus or bitumen Judaicum. See ASPHALTUM.				
The coarseness of the black colour, and the fetidness of the smell distinguishes it from the true asphaltum.				
PISSASPALTUM is also used by some writers to denote the Jewish pitch, or simple asphaltum. See ASPHALTUM.				
PISSÆLÆUM, ΠΙΣΣΕΛΑΙΟΝ, <i>oleum</i> PICINUM, or oil of pitch, a medicament compounded of oil and pitch.				
PISSÆLÆUM <i>Indicum</i> , among modern writers, denotes a bituminous substance brought from the West-Indies, popularly called Barbadoes tar.				

8 Z

It

# P I S

It has a strong smell not unlike the common tar, and is not very pleasant to sight or taste. It is accounted a good balsamick, and where the stomach can dispense with it, will do great services in many disorders of the breast, which has also been experienced of common tar. See TAR.

**PISTACHIA** \*, or **PISTACH** *nut*, a fruit brought from several parts of Asia, chiefly Aleppo and Persia.—When wrapt in all its coats, it is of the size of a green almond; but when stript of all but its shell, it resembles a small nut. The kernel is red without and green within, its taste very agreeable.

\* The word is formed from the Latin *pistacium*, of the Greek *πίσταιον*; whence according to Menage the city Pistacium took its name.

The tree that produces it is a kind of turpentine tree: the nuts are to be chosen new, heavy, and full; as to those that are broken, such as have kept their colours best are to be preferred; for as to the size it is a fancy.

*Pistachias* are aperitive, proper to give vigour, and are used in emulsions, &c. in phthical and nephritical cases. They also enter several ragouts; are comfited, made into conserves, &c. There is likewise a kind of false *pistachia*, brought from the Caribbee islands, which some confound with the real ones, though very different, both with regard to the plants that produce them, and their quality. The spurious *pistachia* plant does not rise above a foot high. Nor does the fruit grow on the branches, but is found in pods adhering to the root.—The pod sometimes only contains a single nut, which resembles an olive; but usually, several; and in that case they are irregular. The substance is white, compact and heavy.

This fruit is rarely eat raw, because of the ill effects it produces; it is usually roasted or comfited; is used in ragouts, and to make ratafia's.

**PISTE** \*, in the manage, the track or tread, which a horse makes upon the ground he goes over.

\* The word is French, and literally signifies a track.

The *piste* of a horse may be either *single*, or *double*.

If the rider make him go but an ordinary gallop, in a circle, or rather square, he will make but a *single piste*: if he either make him gallop with his haunches in, or go terra à terra, he will make two *pistes*, one with the fore-part, another with the hind.—And the same if the rider make him passage, or go side ways, either in a strait line, or upon a circle.

**PISTIL**, **PISTILLUM**, in botany, a little upright part in the middle of the calyx, or the leaves of flowers; called also the *style*. See STYLE.

The *pistil* is an essential part of a flower; and the principal female organ of generation; it being in this that the seeds or young plants are formed. See FLOWER.

It arises from the pedicle of the flower, or the centre of the calyx, and at length becomes the young fruit, which is sometimes hid in the calyx, and sometimes quite out. See FRUIT, CALYX, &c.

The figure of the *pistil* is very different in different flowers: sometimes it is a little stalk, which enlarges at the two ends like a pestle; sometimes it is a mere stamen or thread: sometimes it is round, sometimes square, triangular, oval, &c. Almost all *pistils* are furnished at top, either with fine hairs, which make a kind of velveting; or with little filaments disposed in plumes; or are beset with little vesicles full of a glutinous juice.

Some flowers have several *pistils*; or rather the *pistils* terminate in several branches, or horns, which have their rise from as many young fruits, or as many different capsulæ, containing seeds.

All these *pistils*, whatever form they be in, have certain apertures at their tops, or certain clefts continued the whole length, to the base or embryo of the fruit.—This is very visible in the lilly, daffodil, and melon, by cleaving the *pistils* length-wise, or cutting them transversely.—If after cutting the *pistil* of the lilly, you immerse one extremity in water, and suck through the other end, the water will rise through it, as through a pipe.

By opening the *pistils* in their different states of growth, it appears evidently, that it is these form the young fruits, and contain within them the embryo's of the seeds; whether those seeds be diffused through the whole length of the *pistil*; or whether they be all inclosed in its base; and that they are always open a-top, and perforated, either more or less sensibly, to the bottom: though this cavity is frequently effaced as the young fruit grows; and sometimes a part of the *pistil*, which Malpighi calls the *style*, or bodkin, dries and falls off.

The *pistil*, we have observed, is the female organ of generation; its base does the office of the uterus, or womb, in women, and its length that of the vagina. See MATRIX and VAGINA.

It is encompassed with the stamina, the apices whereof are full of a fine dust, called *farina fecundans*; which bursting its vesiculæ, or apices, when mature, is shed on the upper part of the *pistil*, and thence conveyed by the cavity thereof to the base or uterus; where being fed with a fine juice, secreted by the petala, it grows, expands, and thus forms the embryo of a new fruit. See STAMINA, FARINA, &c.—For a more di-

# P I T

stinct account of the office of the *pistil* in the generation plants. See PLANT.

**PISTOL**, a little fire-arm, borne at the saddle-bow, the girdle, or in the pocket. See FIRE-ARM.

The *pistol* is said to have taken its name from *Pistoya* a city in Italy; where as Faucher tells us, it was first made.—Borel derives the word from *fistula*, pipe; the barrel of this piece bearing some resemblance to a flute, &c.

**PISTOLE**, *Doblon*, in commerce, a gold coin, struck in Spain, and several parts of Italy, Switzerland, &c. See COIN.

It has its augmentations and diminutions; which are *quadruple pistoles*, *double pistoles*, and *half pistoles*.

The *pistole* is about the same weight, fineness, and value, with the French louis d'or, viz. equal to sixteen shillings and six pence, sterling. See LOUIS.

In Spain the *pistole* is accounted equal to four pieces of eight, or thirty two rials, or a thousand and eighty eight maravedis; or a thousand three hundred and sixty maravedis of billon: the old money current at Seville and Cadiz, in Andalusia, &c. being 25 per cent better than the money they reckon by at Madrid, Bilboa, &c. which augmentation was made by Charles II. in 1686. to prevent the exportation of money out of the kingdom. See MONEY.

Most of the exchanges in Italy are made on the foot of the *pistole*. See MONEY and EXCHANGE.

**PISTON**, a part or member in several machines, particularly pumps, air-pumps, syringes, &c. called also *embolus*, and popularly the *sucker*. See EMBOLUS.

The *piston* of a pump is a short cylinder of metal, fitted exactly to the cavity of the barrel or body; and which being worked up and down alternately therein, raises the water; and when raised, presses it again, so as to make it force up a valve where-with it is furnished, and so escape through the nose of the pump. See PUMP.

The *pistons* of air-pumps, syringes, &c. See described under AIR-PUMP, and SYRINGE.

**PIT** and *gallows*, in our ancient customs. See FURCA and FOSSA.

**Coal PIT.** } See the articles { **COAL pit.**  
**Cock PIT.** } **COCK pit.**

**PIT saw.** See the article SAW.

**PIT**, of a theatre, all that space between the amphitheatre, or galleries, and theatre or stage; called by the ancients *orchestra*, and by the French *parterre*. See THEATRE, &c.

This being the most commodious part, it was here the Roman senate was placed. See ORCHESTRE.—It has its name *pit*, in Latin *cavea*, from its being sunk below the level of the stage. See STAGE.

**PITANCIARIUS**, **PIETANCIARIUS**, or **PIETANTIARIUS**, an officer in the ancient monasteries, whose business it was to provide and distribute the pittances of herbs and meat, amongst the monks. See PITTANCE.

**PITCH**, **Pix**, a tenacious kind of juice or gum, drawn from fatty woods, chiefly pines and firs; used in shipping, in medicine, and various other arts.

*Pitch* is properly a juice of the bark of the *pieces*, or pitch-tree; and is conceived to be no other than the oil thereof inspissated, and turned black, farther than in the balsom. See BARK and BALSOM.

The method of drawing, or procuring it, is by cleaving the tree into little billets, which lay in a furnace having two apertures, through one of which the fire is put, and through the other the *pitch* is gathered; which oozing from the wood runs along the bottom of the furnace into basons or receptacles placed for the purpose.—The smoak which is here very thick, gives it the black colour we find it withal.—Some will have our common *pitch* to be only the last running, and tar to be the first. See TAR.

Wheeler gives us another manner of drawing *pitch*, used in the Levant.—A pit is dug in the ground two ells in diameter a-top, but contracting as it goes deeper: this they fill with branches of pine, cloven into shivers.—The top of the pit is then covered over with fire, which burning down to the bottom, the *pitch* distils and runs out at a hole made therein.

*Pitch* acquires different names according to its different preparations, colours, and qualities. As it distils from the wood it is called *barras*, but afterwards assumes a double name; the finest and clearest being called *galipot*, and the coarser, *marbled barras*.

Of the *galipot* is made what they call *white pitch*, or *burgundy pitch*, which is nothing but the *galipot* melted with oil of turpentine; though some will have it a native *pitch*, distilling from a resinous tree growing in the mountains of Franche-Comte. Of the same *galipot* is likewise prepared what we call *rosin*; by boiling the *pitch* to a certain consistence, and making it up in cakes. See ROSIN.

The black *pitch*, which is what we properly call *pitch*, some say, is the liquid *galipot* burnt and reduced into the form and consistence we see it in, by mixing tar with it while hot.

The best is that brought from Sweden and Norway.—Its goodness consists in its being of a glossy black colour, dry, and brittle. **Naval PITCH**, **Pix navalis**, is that drawn from old pines, ranged and

# P I T

and burnt like charcoal.—This, with a mixture of tow or beaten cables, serves for the pitching of vessels.

**Naval PITCH**, is also a denomination given to that scraped from off the sides of old vessels, and which is supposed to have acquired an astringent virtue, by means of the salt water.—It serves to make plaisters; though it is certain the apothecaries usually substitute the common *black pitch* in its stead.

**Greek PITCH**, or *Spanish PITCH*, is that boiled in water till it have lost its natural smell: upon which it becomes dry and pliable.

The ancients called it *colophony*, from Colophon, a city in Greece, whence great quantities were brought. See **COLOPHONY**.

**Oil of PITCH**, *oleum PICINUM*, is an oil procured from pitch, by separating the aqueous matter that swims a-top of the melted pitch.—This, for the great virtues attributed to it, is also called *balsam of pitch*.

**PITCH**, in building, denotes the angle, a gable end, and consequently the whole roof of a building, is set to. See **GABLE**.

If the length of each rafter be  $\frac{1}{2}$  of the breadth of the building, the roof is said to be *true pitch*.

If the rafters be longer, it is said to be a *high or sharp pitched roof*; if shorter, which seldom happens, it is said to be a *low or flat pitched roof*. See **ROOF**, **RAFTER**, &c.

**PITCH** is also a sea term.—When a ship falls with her head too much into the sea, or beats against it so as to endanger her top-masts, they say, she will *pitch her masts by the board*.

**PITCHING-pence**, a duty, commonly of one penny, paid for pitching or setting down every sack of corn, or pack of merchandize, in a fair or market.

**PITCHT**—*shoulder PITCHT*. See **SHOULDER pitcht**.

**PITH**, the inward, central part of a tree, or plant; answering to the medulla, or marrow, of an animal. See **PLANT**, **TREE**, &c.

Some will have the circulation of the sap to be effected by means of the *pith*; others by the bark; and others by the wood. See **SAP**, **CIRCULATION**, &c.

**PITHIA**, and **PITHIAN**. See the articles **PYTHIA**, and **PYTHIAN**.

**PIT**. See the article **PIT**.

**PITTACIUM**, *πῖττακιον*, in chirurgery, a name which some authors give to a piece of cloth spread with a salve, to be laid on a part affected.

**PITTANCE**, **PIETANTIA**, the commons, or allowance of meat, be it fish, flesh, or the like, stately eaten at meals, besides bread.

The word is not much used except among religious, and those who live in college, or community.—Du Cange derives it from *pietantia*, used in the lower Latin for a monachal portion given to two monks in the same dish, consisting of something better than pulse.

Hence we sometimes also find it denote a meal, or commons better than ordinary; such as is allowed in communities on feast-days.

Others derive the word *à pietate*; and others, with Salmasius, from *pittacia*, a mess, or portion allowed the soldiers, mentioned in several laws of the Theodosian code.—It is added, that the word *pittacia* properly signified a title, or written label, added a-top of the vessel, to shew what was within-side, or how it was intended.

**PITUITA**, one of the four humours found in the bodies of animals, on which their temperament is commonly supposed to depend. See **HUMOUR**, and **TEMPERAMENT**.

The *pituita*, called also *phlegm*, is properly the most viscid, and glutinous part of the blood, separated in the largest glands, where the contortions of the arteries are greatest, and give the greatest retardation to the blood's velocity; as in the glands about the mouth and head. See **SECRETION**, and **PHLEGM**.

The class of phlegmagogues, as *manna*, &c. are supposed to purge *pituita*. See **PHLEGMAGOGUE**, **PURGATIVE**, **MANNA**, &c.

Physicians give several epithets to the *pituita*, according to its conditions or qualities, as *saline*, *vitreous*, *gypseous*, *acid*, &c. *Pituita* is supposed to be the prevailing humour in cold, heavy, flow people, inclined to seriousness and study; as the bile in those inclined to war, &c. See **PHLEGMATIC**.

The *pituita*, discharged at the nostrils, is separated in the membrane that lines the cavities of the nose, cheeks, &c. See **MUCUS**, and **NOSE**.

Its use is, to keep that membrane soft, and defend it from injuries of extraneous bodies, especially those of the air, which passes this way in inspiration when the mouth is shut.

**PITUITARY gland**, is a gland in the brain, somewhat difficult to be seen without removing it out of its place.—See *Tab. Anat. (Angeiol) fig. 1. lit. 6*. See also **BRAIN**.

It is of the size of a very large pea, in the sella of the os sphenoides, under the infundibulum, wherewith it communicates; receiving from it a lymph, or juice, which the infundibulum derives from the plexus choroides and pineal gland; and from this lymph does the gland itself take its name. See **GLAND**, &c.

It also filtrates a juice itself, separating from the blood a white liquor, very subtle, and apparently very spirituous. See **SPIRITS**.

# P L A

M. Littre observes a sinus, or reservoir, of blood, which touches this gland; and which is open to it in the place of contact, so that the gland lies partly in the blood.—This, that author takes to do the office of a *balneum mariae*, in keeping the gland of the degree of warmth necessary for the discharge of its functions.

This gland is found in all quadrupeds, fishes, and fowls, as well as in men.—M. Littre gives an instance of a tedious disease, and at length death, arising from an obstruction and inflammation of the *pituitary gland*.

**PIVOT**, or **PEVOT**, a foot, or shoe of iron, or other metal, usually conical, or terminating in a point; whereby a body, intended to turn round, bears on another fixed at rest, and performs its circulations.

The *pivot* usually bears or turns round in a sole or piece of iron or brass, hollowed to receive it.

Large gates, &c. usually turn on *pivots*.—The ancients tell us, they had theatres in Rome that held eighty thousand people; which yet turned on a single *pivot*. See **THEATRE**, and **AMPHITHEATRE**.

**PLACARD**, or **PLACART**, **PLACAERT**, a foreign term, frequent in gazettes, signifying a leaf, or sheet of paper, stretched and applied upon a wall, or post.—Edicts, regulations, &c. are to be made publick in *placards*.

The word *placard* is also used for a libel, or lampoon.—At Rome, *placards* against the pope are frequently fixed in the night-time to the statue of Pasquin. See **PASQUINADE**.

**PLACARD**, in architecture, denotes the decoration of the door of an apartment; consisting of a chambrane, crowned with its trife or gorge, and a cornice sometimes supported by consoles. See **DOOR**.

**PLACARD**, in our customs, denotes a licence whereby a person is permitted to shoot in a gun, or to use unlawful game. See **GAME**.

**PLACE**, *locus*, in philosophy, that part of immoveable space which any body possesses. See **BODY**, and **SPACE**.

Aristotle, and his followers, divide *place* into *external* and *internal*.

**Internal PLACE**, is that space or room which the body contains.

**External PLACE**, is that which includes or contains the body; which is also called by Aristotle, the first or concave and immoveable surface of the ambient body.

It is controverted in the schools, whether *internal place* be a real entity, or only an imaginary being; i. e. whether it be any thing intrinsically, or only an aptitude and capacity of receiving bodies.

Some maintain it a positive being, incorporeal, eternal, independent, and infinite; and assert it even to constitute the immensity of the godhead. See **GOD**.

The Cartesians, on the contrary, hold *internal place*, abstractedly considered, to be no other than the very extension of the bodies contained therein; and therefore in no wise different from the bodies themselves. See **MATTER**.

The schoolmen likewise dispute whether *external place* be moveable or immoveable? Its immobility is argued from this consideration, that what moves must necessarily leave its *place*, which it cannot do, if it go along with the moveable. Others charge an absurdity on this opinion of Aristotle, viz. that hence it follows, that a body really at rest is continually shifting *place*; a tower, for instance, on a plain, or a rock in the middle of the sea, in regard the one and the other are continually inclosed with new air, or new water, must be said to be in motion, or to change *place*.

To solve this difficulty, and ward off the absurdity which follows from Aristotle's laying down *external place* as immoveable; infinite expedients have been had recourse to.—The Scots contend for *place's* being only immoveable, by equivalence.—Thus, when the wind blows, the air which inveted the surface of the tower does indeed recede, but then other similar and equivalent air takes *place*.—The Thomists chuse to deduce the immobility of *external place*, from its keeping the same distance from the centre, and the cardinal points of the world:—The Nominalists, from a correspondence with certain virtual parts of the divine immensity.

The Cartesians deny *external place* to be either a surrounding surface, or a body surrounded, or a mean term between the two; and conceive it to be the situation of a body among adjacent bodies considered as at rest.—Thus the tower shall be deemed to remain in the same *place*, though the ambient air be changed, since it retains the same situation; with regard to the neighbouring hills, trees, and other parts of the earth. See **MOTION**.

Sir Isaac Newton better, and more intelligibly, distinguishes *place* into absolute and relative.

**Absolute and primary PLACE**, is that part of infinite and immoveable space which a body possesses. See **ABSOLUTE**.

**Relative or secondary PLACE**, is the space it possesses, considered with regard to other adjacent objects.

Dr. Clarke adds another kind of *relative place*; which he calls *relatively common place*, and defines it that part of any moveable or measureable space which a body possesses; which *place* moves together with the body. See **MOTION**.

**PLACE**, Mr. Locke observes, is sometimes likewise taken for that portion

portion of infinite space possessed by the material world; tho' this, he adds, were more properly called extension. See EXTENSION.

The proper idea of *place*, according to him, is the relative position of any thing, with regard to its distance from certain fixed points; whence we say, a thing has or has not changed *place*, when its distance is not altered with respect to those bodies.—For the vision of *PLACE*, see VISION, and VISIBLE.

*PLACE*, in opticks, or *optical PLACE*, is the point to which the eye refers an object. See OPTIC.

Thus the points D and E (*Tab. Optics*, fig. 68.) to which two spectators in d and e refer the object C, are called *optic places*. See VISION.

Here, if a right line joining the optic *places* D and E, be parallel to a right line passing through the eyes of the spectators d, e; the distance of the optic *places* D, E, will be to the distance of the spectators d and e, as the distance of one of the optic *places* from the *place* of the object E C, to the distance of the other spectator from the same object d C.

*Optic PLACE* of a star, is a point in the surface of the mundane sphere, as C or B, (*Tab. Astronomy*, fig. 27.) wherein a spectator in E, or T, sees the centre of the star S. See STAR, and PLANET.

This is divided into *true* and *apparent*.

*True*, or *real optic PLACE*, is that point of the surface of the sphere B, wherein a spectator, placed in the centre of the earth, sees the centre of the star, or phenomenon.—Or a point among the fixed stars, determined by a line drawn from the centre of the earth, through that of the star, and terminated in B among the stars. See SPHERE, and TRUE.

*Apparent*, or *visible optic PLACE*, is that point of the surface of the sphere wherein a spectator, placed on the surface of the earth in E, sees the centre of the star S.—Or a point C, found by a line passing from the spectator's eye through the star, and terminated in the sphere of the stars. See APPARENT.

The distance between the two optic *places* makes what we call the *Parallax*. See PARALLAX.

*PLACE*, of the sun, a star, or planet, simply, denotes the sign and degree of the zodiac which the luminary is in. See SUN, STAR, &c.

Or, it is that degree of the ecliptic, reckoning from the beginning of Aries, which the planet's or star's circle of longitude cuts: and therefore coincides with the longitude of the sun, planet, or star. See LONGITUDE.

As the sine of the sun's greatest declination,  $23^{\circ} 30'$ : to the sine of any present declination given or observed, *v. gr.*  $23^{\circ} 15'$ : :: so is radius, 10: to the sine of his longitude  $81^{\circ} 52'$ ; which if the declination were north, would give  $20^{\circ} 52'$  of Gemini; if south,  $20^{\circ} 52'$  of Capricorn, for the sun's *place*. See PLANET.

*Astronomical PLACE*. See the article ASTRONOMICAL.

*Moon's PLACE*, is that point of her orbit wherein she is found at any time. See MOON, and ORBIT.

This, by reason of the great inequalities in the lunar motions, which render a number of equations and reductions necessary ere the just point be found, is of various kinds; *viz.* her *fictitious place*, which is the moon's *place* once equated; her *place nearly true*, which is her *place* twice equated; and the moon's *true place*, which is her *place* thrice equated. See EQUATION.

*Excentric PLACE* of a planet in its orbit, is the *place*, or point of its orbit, wherein a planet would appear, if seen from the sun. See EXCENTRIC.

Thus, suppose NEOR (*Tab. Astron.* fig. 25.) the ecliptic, NPOQ the planet's orbit, the sun in S, the earth in T, and the planet in P: the right line SP expresses the *excentric place* in the orbit.

*Heliocentric PLACE*, of a planet, or its *place* reduced to the ecliptic, or the *excentric place* in the ecliptic, is that point of the ecliptic to which a planet, viewed from the sun, is referred. See HELIOCENTRIC.

This coincides with the longitude of a planet viewed from the sun. See LONGITUDE.

Thus the right line RS indicates the *heliocentric place*, or *place* reduced to the ecliptic.

*Geocentric PLACE*, is that point of the ecliptic to which a planet viewed from the earth is referred. See GEOCENTRIC.

Thus, NEOR representing the ecliptic, &c. TR will represent the *geocentric place*.

*Computation of a planet's PLACE*. See the article PLANET.

*PLACE* of radiation, in opticks, is the interval, or space in a medium, or transparent body, through which any visible object radiates. See RADIATION, &c.

*PLACE*, in geometry, is a line used in the solution of problems; more usually called by the Latin name, *locus*.

See the doctrine of geometrical *places*, under the article LOCUS; see also GEOMETRICAL, and PLAIN.

*PLACE*, in war, is a general name for all kinds of fortresses, where a party may defend themselves. See FORTRESS.

In which sense it may be defined to be a *place* so disposed, as that the parts which encompass it, defend and flank one another. See FORT, FORTIFICATION, and WAR.

*Strong*, or *fortified PLACE*, is a *place* flanked and covered with bastions. See BASTION, and FORTIFIED.

*Regular PLACE*, is that whose angles, sides, bastions, and other parts are equal; and is usually denominated from the number of its angles; as a pentagon, a hexagon, &c. See PENTAGON, HEXAGON, &c. see also REGULAR.—Palma nova, built by the Venetians, is a dodecagon. See DODECAGON.

*Irregular PLACE*, is that whose sides and angles are unequal. See IRREGULAR.

*PLACE of arms*, in fortification, is a strong city, or town, pitched upon for the chief magazine of an army.—See *Tab. Fortif.* fig. 21. *lit. gg. &c.* See also ARMS.

*PLACE of arms*, in a city, or garrison, is a large open spot of ground, usually near the centre; where the grand guard is commonly kept, and the garrison holds its rendezvous at reviews, and in cases of alarm, to receive orders from the governor. See GARRISON.

*PLACE of arms*, of an attack, in a siege, is a spacious place covered from the enemy, by a parapet or epaulment, where the soldiers are posted ready to sustain those at work in the trenches, against the soldiers of the garrison.

*PLACE of arms particular*, in a garrison, is a place near every bastion, where the soldiers, sent from the grand place to the quarters assigned them, relieve those that are either upon the guard, or in fight.

*PLACE of arms without*, is a place allowed to the covert way, for the planting of cannon, to oblige those who advance in their approaches to retire.

*PLACE of arms*, in a camp, is a large space at the head of the camp, for the army to be ranged in, and drawn up in battalia. There is also a *place* for each particular body to assemble in. See CAMP.

*PLACE of arms*, of a troop, or company, is the spot of ground on which the troop, or company, draws up. See TROOP, &c.

*Face of a PLACE*.

*Fire of the PLACE*.

*Tenaille of the PLACE*.

*View of a PLACE*.

*PLACE*, among logicians, and orators, denotes the seat or source of an argument; or that from which it is taken. See ARGUMENT, and TOPIC.

There are two sorts of *places*, *viz.* *inartificial* and *artificial*.—The first is the *place* of testimony, authority, &c. The second, that of reason: as when we argue from universals, *e. gr.* from genus, and species; or from causes, as the end, efficient, matter, form, &c.

*Common PLACE*. See the article COMMON *place*.

*PLACE of units, tens, &c.* See UNIT, and NUMERATION.

*Hylegial PLACES in astrology*.

*Whispering PLACE*.

*Additions of PLACE*.

*Unity of PLACE*. See the article UNITY.

*PLACENTA*, in anatomy, a softish roundish mass, found in the womb of a pregnant woman; wherein the ancients supposed the blood was purified and prepared for the nourishment of the foetus.—See *Tab. Anat.* (Splanchn) fig. 16. *lit. aa.* See also FOETUS.

Hence they also called it *hepar uterinum*, the liver of the womb; as if it did the office of a liver in preparing the blood. See LIVER.—It is called by the moderns *placenta*, *q. d.* womb-cake, because in form of a cake.

The *placenta* is supposed by some to be only a mass of coagulated blood; for in the pressing, or washing it, it dissolves; and its real use to be, to serve as a pillow for the umbilical vessels to rest on. See UMBILICAL.

Its figure is not unlike that of a plate without brims; three quarters of a foot over, and sometimes a foot. It is round, and generally concave or convex. The concave side adheres to the uterus, and is uneven, having divers protuberances and pits, by which it makes impressions upon, and receives others from the uterus.—Its *place* in the uterus, whatever some pretend, is not certain.

In women, unless in case of twins, &c. there is but one *placenta*; however, the number generally answers the number of the foetus.—In some brutes, especially oxen or sheep, they are very numerous, sometimes near an hundred, even for one foetus; but small, and resembling pretty large conglomerate glands.

From the external or concave side, which likewise has its protuberances, though covered with a smooth membrane, issue the umbilical vessels, which are in great plenty distributed through the whole substance of it.

Some even imagine this part to be no more than a plexus of the veins and arteries, by whose extremities opening into the sides of the hypogastrick vessels, the circulation is performed between the mother and the foetus; for that side of the *placenta* which adheres to the womb, appears to be nothing but the extremities of an infinite number of small threads, which, in labour, dropping out of the pores in the sides of the hypogastrick blood-vessels, into which they had insinuated themselves, is the occasion of the flowing of the lochia, till the uterus collapses, or the pores, by the natural elasticity of the vessels, contract by degrees. See LOCHIA, CIRCULATION, &c.

It

It is a great dispute among the anatomists of the royal academy of Paris, whether the *placenta* have any external coat, whereby it is connected to the womb?—M. Mary maintains it has none, and that nothing hinders the blood of the mother from passing out of the womb into the *placenta*, and thence to the foetus: In which opinion he is seconded by M. Robault. Mess. Vieussens and Winslow maintain the contrary. In a subsequent memoir, M. Robault endeavours to shew, that the *placenta* is no particular part, but only a portion of the chorion condensed or thickened. See CHORION.

PLACITA, PLEAS, a term frequent in our laws, and customs. See PLEA.

Originally, *placita* signified certain publick assemblies, of all degrees of men, wherein the king presided, and where the great affairs of the kingdom were consulted upon.

These assemblies were called *placita generalia*; because *generalitas universorum majorum tam clericorum quam laicorum ibidem conveniebat*—And hence, the decrees, ordinances, sentences, &c. of this assembly were also called *placita*.

Sim. Dunelmensis tells us, they were held in the open fields; for, says he, *nullam oportet regem in literis assignare curiam, quia ubi rex judicat in aperto, ibi est curia sua*. See COURT and CURIA.

Some will have these *placita generalia*, and *curie regis*, to be much the same with what we now call a *parliament*. See PARLIAMENT.

The lords courts came hence also to be called *placita generalia*, though oftener *curie generales*; because all their tenants and vassals were obliged to appear in them. See LORD, VASSAL, &c.

We also meet with *placitum nominatum*, for the day appointed a criminal to appear in, and make his defence. Leg. Hen. I.—And *placitum fractum*, i. e. when the day is lapsed.

My lord Coke derives the word *placitum à placendo*, *quia bene placitare super omnia placet*: Indeed, this seems a very fanciful etymon; and others have more reason in deriving the word from the German *platz*, or the Latin *plateis*, fields, or streets, where these assemblies were originally held.

PLACITARE \*, in the old law-books, signifies to plead causes. See PLEADING.

\* *Mos placitandi, ante conquestum, fuit coram aldermanno, & proceribus, & eorum hundredariis, sc. baronibus, majoribus, melioribus, senioribus & urbanis*. Misc. in Bibl. Cott. sub Tit. Vitellius.

Hence, *placitator*, a pleader.—Ralph Flambard is recorded to be *totius regni placitator*, in William the second's time.

PLACITUM, in law, a sentence of the court; or an opinion, ordinance, or decree. See SENTENCE, DECREE, CANON, &c. Custos PLACITORUM Coronæ. See the article CUSTOS.

PLAFOND, or PLATFOND, in architecture, the ceiling of a room, whether it be flat or arched; lined with laths and plaster, and sometimes also enriched with paintings, &c. — See Tab. Archit. fig. 10. See also CEILING.

PLAFOND is also more particularly used for the bottom of the projecture of the larmier of the corniche; called also *sosist*. See SOFIT and LARMIER.

PLAGIARY, in philology, *author-theft*; or the practice of purloining other peoples works, and putting them off for a man's own.

Among the Romans, *plagiarius* was properly a person who bought, sold, or retained a freeman for a slave; so called, because the Flavian law condemned such a person *ad plagas*, to be whipped. See SLAVE.

Thomasius has an express treatise *de plagio literario*; wherein he lays down the laws and measures of the right which authors have to one another's writings. — Dictionary-writers, at least such as meddle with arts and sciences, seem exempted from the common laws of *meum* and *tuum*; they do not pretend to set up on their own bottom, nor to treat you at their own cost.

Their works are supposed, in great measure, compositions of other people's; and what they take from others they do it avowedly, and in the open sun. — In effect, their quality gives them a title to every thing that may be for their purpose, wherever they find it; and if they rob, they do not do it any other-wise, than as the bee does, for the publick service. Their occupation is not pillaging, but collecting contributions; and if you ask them their authority, they will produce you the practice of their predecessors of all ages and nations.

PLAGUE, PESTILENCE, PESTIS, a very acute, destructive, malignant, and contagious disease; usually proving mortal. See DISEASE.

The *plague* is commonly defined by a malignant fever; but Diemerbroek thinks the two ought to be distinguished; the fever not being the essence, but only a symptom, or effect of the *plague*. See FEVER and MALIGNANT.

The *plague* is reckoned by Dr. Lister, and many others, as an exotic disease, never bred or propagated in England, but always imported from abroad, and particularly from the Levant, the coasts of Asia the lesser, Egypt, &c. where it is familiar.—Sydenham observes, that it rarely infects England oftener than once in forty years; but through the mercy of God, it is now upwards of sixty years since we have been visited.

VOL. II.

The origin and cause of the *plague* has been a celebrated subject of controversy among physicians.—The disorder is generally supposed to be communicated by the air; but how, and in what manner the air becomes thus deadly, is the question. Some will have infected the cause of *plagues*, as of blights; which being brought in swarms from other parts by the winds, are taken into the lungs in respiration, mix with the blood and juices, and attack and corrode the viscera. See BLIGHT.

Mr. Boyle attributes *plagues* principally to the effluvia or exhalations breathed into the atmosphere, from noxious minerals. See AIR, EXHALATION, &c.

The air, in effect, is depraved in far more places than improved, by being impregnated with subterraneous expirations.—Indeed among the minerals known to us, there are many more noxious than wholesome; and the power of the former to do mischief, is more efficacious than of the latter to do good, as we guess by the small benefit men receive in point of health, by the effluvia of any mineral or other known fossil, in comparison of the great and sudden damage often done by the expirations of orpiment, sandarach, and white arsenic. See POISON.

Amongst the various sorts of particles wherewith the atmosphere is replete, some may be so small, and solid, or so conveniently shaped, as to enter many of the numerous orifices of the minute glandules of the skin, or at other pores thereof. Thus, though neither paper, nor bladder, be pervious to the elastic parts of the air; yet may either of them be easily penetrated by other corpuscles of the atmosphere; and Mr. Boyle has prepared a dry body, which being inclosed in either, would, without wetting or discolouring or any ways sensibly altering them, pass in a trice through the pores thereof, in such plenty, as to exert a manifest operation on bodies placed at some distance beyond them. This is confirmed from the sudden check almost every summer given to the *plague* at Grand Cairo: for since morbid causes operate more effectually than curative ones, it seems more than probable, that exhalations ascending from under ground, may produce pestilential fevers, and the *plague* itself; since the corpuscles which impregnate the Egyptian air upon the swelling of the Nile, put a speedy stop not only to the contagion, but to the malignity of the *plague*, assisted even by the summer's heat, which there is excessive.

It is possible there may be noxious minerals in a country, that are not often able to produce pestilencies; they may be in strata, or beds, so deep, that even a small earthquake shall not effect them, though a more violent shock may. See STRATA, EARTHQUAKE, &c.

And hence may we account for the *plague's* raging in some parts of Africa once in thirty, or once in a hundred years; since there may be periodical paroxysms, or grand and vehement commotions in the subterranean parts, though not yet observed in them. It is probable, peculiar kinds of venomous exhalations may sometimes be emitted, especially after earthquakes; and thus occasion mortal diseases in animals of one kind, and not of another; and in this or that place, and not elsewhere. — Fernelius gives us an account of a *plague*, or murrain, in 1514, which invaded none but cats. Dionysius Halicarnassensis mentions a *plague*, which attacked none but maids: and that which raged in the time of Gentilis killed scarce any women, and very few but lusty men. Boterus mentions another *plague*, which assailed none but the younger sort; and we have instances of the same kind of a later standing. Cardan speaks of a *plague* at Basil, with which the Switzers, and not the Italians, Germans, or French were infected; and Joh. Utenhovius takes notice of a cruel *plague* at Copenhagen, which, though it raged among the Danes, spared the Germans, Dutch and English, who went with all freedom, and without the least danger, to the houses of the infected.

The *plague*, according to Sydenham, usually begins with a chilliness, and shivering, like the access of an intermitting fever; then comes on a nausea, with vehement vomitings, an intense pain about the region of the heart, as if pinched in a press; and a burning fever, which continually preys on the patient, till either death, or the eruption of some bubo, parotis, or other tumor, in the inguina or axillæ, or behind the ears, relieve him, and discharge the matter of the disease. Sometimes, indeed, it attacks without any fever; purple spots appearing all at once, the certain signs of present death: but this rarely happens except at the beginning of some terrible *plague*. It has also been known to make its first appearance in tumours, without any fever, or other violent symptom.

Heaviness, pain in the stomach, head, and back, cardialgy, broken sleep, anxiety, alteration in the look, difficulty of breathing, hiccough, syncope, delirium, convulsive twichings, diarrhoea, eyes sunk or inflamed, tongue black and dry, vehement drought, fetid breath, carbuncles, spots livid, purple, green, &c. are also symptoms usually attending this disease.

A great deal depends on the circumstances of the tumours, or *plague-sores*: as they appear, and increase, the fever abates; and as they sink, or diminish, renews again. When they happen about the time of the crisis, and suppurate kindly, they are good prognosticks of a happy recovery. See CRISIS.

In acute diseases, says Hippocrates, prognosticks are ever fallacious. However, in the terrible *plague* at Nimeguen, Diemer-

broek, who attended the sick through the whole progress thereof, relates, that those taken ill about new and full moon rarely escaped; that faintings, swoonings, and palpitations of the heart, were usually deadly signs; an intermitting pulse always mortal; drowiness, sneezings, tremulous motions, dotings, sore throat, &c. were ill omens: pleuritis always mortal; costiveness a good sign; a diarrhoea almost constantly fatal: bloody stools or urines always presaged ill.

As to the cure, physicians are much divided. It is generally attempted with alexipharmics and cardiacs, with the assistance either of sudorifics, or phlebotomy, or both—Many eminent physicians, both ancient and modern, highly commend blood-letting; Sydenham particularly says, that if used copiously, and in time, it never yet did harm; but that sudorifics often prove pernicious: Diemerbroek, on the contrary, with other very experienced writers, protest against phlebotomy, as very dangerous, and often deadly; the chief hopes they built in diaphoretics and sudorifics; emetics and purgatives are absolutely forbid: and yet Dr. Sayer used the former with good success, in the beginning of the disease in the plague at London, *Ann.* 1640. See ALEXIPHARMIC, &c.

The juice of lemons is commended as of singular efficacy in the plague, and pestilential fevers: Piso relates that it is the principal remedy of the Indians, and protests he never knew any thing come up to it. Dr. Harris observes, that the same is what the Turks have principally recourse to.—Camphor is also much extolled: this, Etmuller assures us, was the basis of Heintius's antipestilential oil, who had a statue erected to him when dead, in the city of Verona, for the service he had done hereby.—It was prepared of equal quantities of camphor, citron-bark, and amber.—The viperine salt and rob of elder-berries are also commended.

For preservatives against the plague, they are usually summed up in that popular distich:

*Hæc tria labificam tollunt adverbia pestem,  
Mox, longe, tarde, cede, recede, redi.*

Cauteries, and especially issues, and setons in the inguina, are found of great service in preserving from infection. A piece of myrrh held in the mouth in contagious places, is also commended. But Diemerbroek assures, that there is nothing better in this intention, than smoking tobacco; but he adds, that it was only so to such as had not made the practice familiar to them. The other preservatives used by that author, were the rad. helenii, cardamums, white-wine vinegar, and chearfulness; and when he found his spirits low, as if the disease were taking possession, a cup of generous wine, sometimes even to a degree of ebriety.

PLAGUE-water, *aqua epidemica*, is one of the compound waters of the shops. See WATER.

PLAIN, PLANUS, an epithet applied to various things, generally importing them to be smooth, even, level, or superficial, or simple, or obvious, or the like. See PLANE.

In which sense the words stand opposed to rough, solid, laboured, enriched, &c.

It is a maxim in heraldry, that the *plainer* the coat, the nearer to antiquity.—*Plain* coats are such as are least encumbered with figures, or charges, and which have nothing in them but what is natural. See COAT, CHARGE, &c.

PLAIN figure, in geometry, is an uniform surface, from every point of whose perimeter, right lines may be drawn to every other point in the same. See FIGURE, PLANE and SURFACE.

PLAIN angle is an angle contained under two lines, or surfaces. See ANGLE.

It is so called in contradistinction to a *solid* angle. See SOLID.

PLAIN triangle, is a triangle included under three right lines, or surfaces; in opposition to a *spherical*, and a *mixt* triangle. See TRIANGLE.

PLAIN trigonometry is the doctrine of plain triangles, their measures, proportions, &c. See TRIGONOMETRY.

PLAIN glass, or *mirrour*, in optics, is a glass or mirrour whose surface is flat, or even.—See the phenomena and laws of *plain* mirrours, under the article MIRROR.

*Plain* mirrours amount to what we popularly call *looking-glasses*; see the manner of grinding, polishing, and preparing them, under the articles LOOKING-glass and GRINDING.

PLAIN tyle. See the article TYLE.

PLAIN scale, is a thin ruler, whereon are graduated the lines of chords, sines, tangents, secants, leagues, rhumbs, &c. of ready use in most parts of the mathematics, chiefly in navigation. See LINE, &c.

See its description and use under the article SCALE.

PLAIN chant, in music. See the article CHANT.

PLAIN descendant. See the article DESCANT.

PLAIN chart, in navigation, is a sea-chart, wherein the meridians and parallels are represented by parallel straight lines; and where, of consequence, the degrees of longitude are the same in all the parallels of latitude.

See the properties, construction, &c. of this chart under the article CHART.

PLAIN sailing, in navigation, is the art of working the several cases and varieties in a ship's motion, on a plain chart. See *plain* CHART.

*Plain sailing* is founded on the supposition of the earth being a plane, or flat; which though notoriously false, yet places being laid down accordingly, and a long voyage broke into many short ones, the voyage may be tolerably performed by it, near the same meridian. See SAILING.

In *plain sailing* it is supposed, that by the rhumb-line, meridian, and parallel of latitude, there always will be formed a right-angled triangle; and that so posited, as that the perpendicular side may represent part of the meridian, or north and south line, containing the difference of latitude: the base of the triangle represents the departure; and the hypotenuse the distance sailed.—The angle at the vertex is the course, and the angle at the base the complement of the course; any two of which, with the right-angle being given, the triangle may be protracted, and the other three parts found. See TRIANGLE.

For the doctrine of *plain sailing*, see SAILING.

PLAIN table, in geometry, &c. an instrument used in the surveying of land; whereby the draught, or plan, is taken on the spot, without any future protraction, or plotting. See SURVEYING, PLOTTING, &c.

The *plain table* represented *Tab. Surveying, fig. 31. n. 1.* consists of a parallelogram of wood, about fifteen inches long and twelve broad; round this goes a boxen jointed frame, by means whereof a sheet of paper is fastened tight to the table, so as lines may be conveniently drawn upon it.

On each side the frame, which may be put on either side upwards, towards the inward edge, are scales of inches, subdivided, for the ready drawing of parallel lines.—Beside which, on one side are projected the 360 degrees of a circle, from a brass centre in the middle of the table, (each degree halved) with two numbers to every tenth degree, the one expressing the degree, the other its complement to 360, to save subtraction: on the other side are projected the 180 degrees of a semi-circle, from a brass centre in the middle of the table's length, and at  $\frac{1}{4}$  of its breadth; each degree halved, and every tenth noted with two numbers, *viz.* the degree and its complement to 180°.

To one side of the table is fitted a compass, for placing the instrument by; and the whole is fixed by a socket, upon a three-legged staff for a stand, on which it is turned round, or fastened by a screw, as occasion requires.—Lastly, to the table belongs an index, which is a ruler at least sixteen inches long, and two broad; usually graduated with scales, &c. and having two sights perpendicularly placed on its extremities. See SIGHT, STAFF, BALL and socket, &c.

Use of the *PLAIN table*.—To take an angle by the *plain table*: or to find the distance of two places accessible from the same third.

Suppose DA, DB, (*Tab. Surveying, fig. 32. n. 2*) the sides of the angle required; or AB the distance required. Place the instrument horizontally, as near the angle as possible; and assume a point in the paper on the table, *v. gr. c.* To this point apply the edge of the index, turning it about this and that way, till through the sights you see the point B, and in this situation of the ruler, draw by its edge the line c e indefinitely. After the same manner turn about the index, on the same point, till through the sights you see the point A; and draw the right line c d indefinitely.—Thus have you the quantity of the angle laid down.

Measure the lines DA, DB, with a chain; (see CHAIN) and from a scale, set off the measures thus found, (see SCALE) on the respective lines; which suppose to reach from c to b, and from c to a.—Thus will c b and c a be proportional to DB and DA.

Transfer the distance a b to the same scale, and find its length; the length thus found, will be the length, or distance, of AB required.

2° To find the distance of two places, one whereof is inaccessible, by the *plain table*.—Suppose the distance required AB; (*fig. 33.*) and A the accessible point. 1° place the *plain table* in C; look through the sights till you see A and B; and draw a c and c b. Measure the distance from your station to A; and set it off from the scale, upon c a. 2° Remove the table to A, where place it so, as that the point a representing A, and the index laid along the line a c, you see backwards, the former station C. (Note, in this fixing the instrument, lies the use of the compass; for the needle will hang over the same degree of the card in the first and the second case; so that some set the instrument by the needle alone; others only use it to shorten the trouble, by bringing the instrument nearly to its due position by means thereof; and then fixing for good by the back sight.) 3° The instrument fixed, turn the sights to B; and draw the line a b. 4° On the scale, measure the interval a b; which will be the distance of AB required.

3° To find the distance of two inaccessible places by the *plain table*.—Suppose the distance of AB (*Tab. Surveying, fig. 34.*) required. 1° Choosing two stations in C and D; in the first C, place the *plain table*; and through the sights look to D, B, and A: drawing by the edge of the index, the lines c d, c b, c a.—2° Measure the distance of the stations CD; and set this off, from a scale,

scale, on c d.—3° Removing the table from C, fix it in D; so as the point d hanging over the place D, and the index lying along the line c d, through the sights you see the former station C. The instrument thus fixed, direct the sights to A and B, and draw the right lines d a and d b. Lastly, find the distance of a b, on the scale; this will be the distance of A B required. After the same manner, may the distance of any number of places be found from two stations; and thus may a field, part of a country, &c. be surveyed.

4° To take the plot of a field from one station, whence all the angles may be seen; with the plain table.—Placing the instrument in the station, assume a point in the paper, to represent the same; v. gr. C, (fig. 21.) laying the edge of the index to this point; direct it to the several angles of the field, A B, C D, E F, &c. and draw indefinite lines by its edge, towards every angle, viz. C a, C b, C c, &c. measure the distance of each angle from the station, viz. C A, C B, C C, C D, &c. and from a scale set these off from C on their corresponding lines; the extremities hereof will give points, which being connected by lines will represent the field.

5° To take the plot of a field, wood, or the like, by going round the same; with the plain table.—Place the instrument horizontally at the first angle, v. gr. A. The needle on the meridian of the card; assuming a point on the paper, to represent it, to that point lay the index, directing it till through the sights you see a mark in the angle B. And draw an indefinite line along it; measure the distance of A and B, and from a scale set it off on the line thus drawn; the extremity of this distance will represent the point B. Remove the instrument to B, where set it so as that the needle hang over the meridian of the card; and so as the index lying along the line last drawn, you see the former station A through the sights: here fasten it, lay the index to the point B, and turn it, till through the sights you see the next angle C; in this situation draw a line as before, measure the distance B C, and set it off from a scale on the line.—Remove the instrument to C, where, fixing it by the needle, and the back sight, as before, turn the index on the point C, till you see the next angle D; draw the line, measure, and set off the distance C D as before, and remove the plain table to E; where fix it, as before, look to the next angle F, draw the line, measure, and set off the distance, &c.

In this manner having compassed the whole field, you will have its whole perimeter plotted on the table; which may be now cast up, and its contents found, as in the article of SURVEYING.

Manner of shifting paper on the plain table.—When in large parcels of ground, the plot is found to exceed the dimensions of the plain table, and to run off from the paper; the sheet must be taken off the table, and a fresh one put on: the way of managing which shifting, is as follows.—Suppose H, K, M, Z, (fig. 35.) the limits of the plain table; so that having laid down the field from A to B, thence to C and D, you want room, the line D E running off the paper: draw as much of the line D E as the paper will well hold, viz. D O. And by means of the divisions on the edge of the frame, draw the line P Q through O, parallel to the edge of the table H M; and through the point of intersection O, draw O N parallel to M Z. This done, take off the frame, remove the sheet, and clap a fresh one (fig. 36.) in its stead; drawing on it a line R S near the other edge parallel thereto. Then lay the first sheet on the table, so as the line P Q lie exactly on the line R S, to the best advantage, as at O. Lastly, draw as much of the line O D, on the fresh sheet, as the table will hold; and from O continue the remainder of the line D to E. From E proceed with the work as before to F, G, and A.

Use of the plain table, as a theodolite, semi-circle, or circumferentor.—The great inconvenience of the plain table is, that its paper renders it impracticable in moist weather. Even the dew of the morning and evening is found to swell the paper considerably, and of consequence to stretch and distort the work.—To avoid this inconvenience, and render the instrument useful in all weathers; by leaving off the paper, and setting up a pin in the centre, it becomes a theodolite, a semi-circle, or a circumferentor, and applicable like them.

The plain table stripped of its paper, becomes either a theodolite, or a semicircle, as that side of the frame which has the projection of the degrees of a circle, or a semi-circle, is turned upwards. If it be to serve for a theodolite; the index, which as a plain table turns on any point as a centre, is constantly to turn about the brass centre hole in the middle of the table.

If for a semi-circle, it must turn on the other brass centre hole; in both cases it is done by means of a pin raised in the holes.

When the plain table is to serve as a circumferentor, screw the compass to the index, and both of them to the head of the staff, with a brass screw-pin fitted for the purpose; so as the staff and table standing fixed, the index, sights, &c. may be turned about, and vice versa.

To take an angle by the plain table, considered as a theodolite.—Suppose the quantity of the angle E K G (fig. 20.) required. Place the instrument at K, the theodolite side of the frame upwards, laying the index on the diameter. Turn the whole instrument about, the index remaining on the diameter, till through the

sights you spy E. Screw the instrument fast there, and turn the index on its centre, till through the sights you spy G.

The degree here cut on the frame by the index, is the quantity of the angle sought; which may be laid down on paper by the rules of common protraction. See PROTRACTOR.

Thus may you proceed to do every thing with the plain table, as with the common theodolite. See THEODOLITE.

To take an angle with a plain table, considered as a semi-circle.—Proceed in the same manner with the instrument considered as a semi-circle, as when considered as a theodolite; only laying the semi-circular side upwards, and turning the index on the other centre-hole in the middle of the length, and at about  $\frac{1}{2}$  of the breadth of the table. See SEMI-CIRCLE.

To take an angle with the plain table, considered as a circumferentor.—Suppose the former angle E K G required. Place the instrument at K, the flower-de-luce towards you. Direct the sights to E, and observe the degree cut by the south end of the needle, which suppose 296. Turn the instrument about, the flower-de-luce still towards you, and direct the sight to G, noting the degree cut by the other end of the needle, which suppose 182. Subtract the less from the greater, the remainder 114° is the quantity of the angle sought. If the remainder chance to be more than 180°, then it must be again subtracted from 360. This second remainder will be the angle required; which may be protracted, &c. as under the article PROTRACTOR.

Thus you may proceed to do every thing with the plain table, as with the common circumferentor. See CIRCUMFERENTOR.

PLAIN number, is a number that may be produced by the multiplication of two numbers into one another.—Thus 20 is a plain number, produced by the multiplication of 5 into 4. See NUMBER, and SIMILAR.

PLAIN place, in geometry, locus PLANUS, or locus ad PLANUM, is a term which the ancient geonetricians used for a geometrical locus, when it was a right line, or a circle—in opposition to a solid place, which was an ellipsis, parabola, or hyperbola.

These plain loci the moderns distinguish into loci ad rectam, and loci ad circumulum. See LOCUS.

PLAIN problem, in mathematics, is such an one, as cannot be solved geometrically, but by the intersection either of a right line and a circle; or of the circumferences of two circles. See PROBLEM.

Such is the problem following—Given, the greatest side, and the sum of the other two sides, of a right-angled triangle; to find the triangle.—Such also is this, to describe a trapezium that shall make a given area of four given lines.

Such problems can only have two solutions, in regard a right line can only cut a circle, or one circle cut another in two points.

PLAIN, in heraldry, is sometimes used for the point of the shield, when couped square; a part remaining under the square, of a different colour or metal from the shield.

This has been sometimes used as a mark of bastardy, and called *champaigne*: for when the legitimate descendants of baltards have taken away the bar, fillet, or traverse borne by their fathers, they are to cut the point of the shield, with a different colour called *plain*. See BASTARD, DIMINUTION.

PLAIN, used substantively, in perspective, mechanics, astronomy, &c. See PLANE.

Oblique PLAINS. See the article OBLIQUE.

PLAINT, PLAINTÉ, in law, the propounding or exhibiting any action, real or personal, in writing. See ACTION.

Hence, the party making this *plaint* is called plaintiff. See PLAINTIFF.

PLAINTÉ, in the ancient customs of France, was a request, or petition, presented to the king, against the judges of the provinces, and afterwards against bailiffs and seneschals, for denying justice, or for rendering judgment contrary to the laws of the realm. See REQUEST.

For in those days there was no appeal from their decisions; but they all pronounced in the dernier resort: so that the *plainte* was not directed against the party, but against the judge; who was cited to see his own sentence declared null.

This was a kind of supplement to the way of appeals, which was then shut up. These *plaintes*, in the capitulars of Charlemaign, are called *blasphemæ*. See APPEAL.

PLAINTIFF, in law, he that sues, or complains, in an affize, or in an action personal; as, in an action of debt, trespass, deceit, detinue, and the like. See ACTION.

Plaintiff stands opposed to defendant. See the article DEFENDANT.

PLASTER, in building. See the articles PLASTER, MORTER, &c.

Casting in PLASTER. See the article CASTING.

PLASTER, in medicine. See the article EMPLASTER.

PLASTERED walls. See the article WALL.

PLAN, a representation of something, drawn on a plane. See PLANE.

Such are maps, charts, ichnographies, &c. See PLANISPHERE, MAP, CHART, &c.

PLAN, in architecture, is particularly used for a draught of a building; such as it appears, or is intended to appear, on the ground; shewing the extent, division, and distribution of its area

# PLA

area into apartments, rooms, passages, &c. See BUILDING. The *plan* is the first device or sketch the architect makes; it is also called the *ground-plot*, *plat-form*, and *ichnography* of the building. See ICHNOGRAPHY, &c.

**Geometrical PLAN**, is that wherein the solid and vacant parts are represented in their natural proportion.

**Raised PLAN**, is that where the elevation or upright is shewn upon the geometrical plan, so as to hide the distribution. See ELEVATION.

**Perspective PLAN**, is that conducted and exhibited by degradations, or diminutions, according to the rules of perspective. See PERSPECTIVE.

To render *plans* intelligible, it is usual to distinguish the masses with a black wash. The projections on the ground are drawn in full lines, and those supposed over them in dotted lines. The augmentations or alterations to be made, are distinguished by a colour different from what is already built; and the tints of each *plan* made lighter as the stories are raised.

In large buildings it is usual to have three several *plans* for the first three stories.

**PLANCHIER**, or **PLANCERE**, in architecture, the under part of the corona, or drip; making the superior part of the cornice, between two cymatiums. See CORONA, CORNICHE, &c.

**PLANE**, **PLANUM**, in geometry, denotes a *plain* figure; or a surface, lying evenly between its bounding lines. See PLAIN.

Wolfius defines *plane*, a surface from every point of whose perimeter a right line may be drawn to every other point in the same. See SUPERFICIES.

As the right line is the shortest extent from one point to another; so is a *plane* the shortest extension between one line and another. See LINE, and SPACE.

**Parallel PLANES**. See the article PARALLEL.

**PLANES** are frequently used in astronomy, &c. for imaginary surfaces, supposed to cut, and pass through solid bodies; and on this foundation it is that the whole doctrine of conic sections, and of the sphere, turns. See SECTION.

When a *plane* cuts a cone parallel to one of its sides, it makes a parabola; when it cuts the cone parallel to its base, it makes a circle. See CONICS.

The sphere is wholly explained by *planes*, imagined to cut the celestial luminaries, and to fill the areas or circumferences of their orbits. See SPHERE and CIRCLE.

Astronomers shew, that the *plane* of the moon's orbit is inclined to the *plane* of the earth's orbit, or the ecliptic, by an angle of about 5 degrees, and passes through the centre of the earth. See ORBIT.

The intersection of this *plane* with that of the ecliptic, has a proper motion of 3' 11" each day, from east to west; so that the nodes answer successively to all the degrees of the ecliptic, and make a revolution round the earth in about nineteen years. See NODE.

The *planes* of the orbits of the other planets, like that of the ecliptic, pass through the centre of the sun.—The *plane* of the orbit of Saturn, is inclined to the ecliptic by 20° 33' 30", and cuts it, at present, in the 22<sup>d</sup> degree of Cancer and Capricorn. See INCLINATION, MOON, and PLANET.

The centre of the earth, then, being in the *plane* of the moon's orbit, the circular section of that *plane* in the moon's disk is represented to us in form of a right line passing through the centre of the moon.—This line is inclined to the *plane* of the ecliptic by 5° when the moon is in her nodes: but this inclination diminishes as that planet recedes from the nodes; and at three degrees distance, the section of the moon's orbit in its disk, becomes parallel to the *plane* of the ecliptic. The same appearances attend the primary planets, with regard to the sun.

But the case is very different in the planets as seen from one another, especially from the earth.—The *planes* of their orbits only pass through the centre of the earth when they are in their nodes: in every other situation, the *plane* is raised above the orbit of the planet, either to the north or the south. And the circular section of the *plane* of the orbit on its disk, or in the orbit of one of its satellites, does not appear a right line, but an ellipsis, broader or narrower as the earth is more or less elevated above the *plane* of the orbit of the planet.

**PLANE**, in mechanics.—A *horizontal PLANE*, is a *plane* level or parallel to the horizon.—See HORIZON, and HORIZONTAL.

The determining how far any given *plane*, &c. deviates from an horizontal one, makes the whole business of levelling. See LEVELLING.

**Inclined PLANE**, in mechanics, is a *plane* which makes an oblique angle with an horizontal plane. See OBLIQUE, and INCLINED.

The doctrine of the motion of bodies on *inclined planes* makes a very considerable article in mechanics\*; the substance whereof is as follows:

\* A machine has been contrived for measuring the acceleration of a ball down an inclined plane, and comparing it with that found in bodies falling at liberty. See its description in *Mem. de l'acad. roy. des scienc.* 1699. p. 343.

**Laws of descent of bodies on inclined PLANES**.—I. If a body be placed on an *inclined plane*, its relative gravity will be to its absolute gravity, as the length of the *plane*, e. gr. AB (Tab. Mechan. fig. 58.) to its height AC. See GRAVITY.

# PLA

Hence, 1<sup>o</sup> Since the ball D only gravitates on the *inclined plane*, with its relative gravity; the weight L, applied in a direction parallel to the length of the *plane*, will retain or suspend it, provided its weight be to that of the ball, as the altitude of the *plane* BA is to its length AC.

2<sup>o</sup> If the length of the *plane* CA be taken for the whole sine; AB will be the sine of the angle of inclination ACB.—The absolute gravity of the body, therefore, is to its respective gravity applied on the *inclined plane*, and therefore, also the weight D to the weight L acting according to the direction DA which sustains it, as the whole sine to the sine of the angle of inclination.

3<sup>o</sup> Hence the respective gravities of the same body on different *inclined planes*, are to each other as the sines of the angle of inclination.

4<sup>o</sup> The greater therefore the respective gravity is, the greater is the angle of inclination.

5<sup>o</sup> As, therefore, in a vertical *plane*, where the inclination is greatest, viz. perpendicular, the respective gravity degenerates into absolute; so in an horizontal *plane*, where there is no inclination, the respective gravity vanishes.

II. To find the sine of the angle of inclination of a *plane*, on which a given power will be able to sustain a given weight.—Say, as the given weight is to the given power, so is the whole sine to the sine of the angle of inclination of the *plane*. Thus, suppose a weight of 1000 be to be sustained by a power of 50, the angle of inclination will be found 2° 52'.

III. If the weight L descend according to the perpendicular direction AB, and raise up the weight D in a direction parallel to the *inclined plane*; the height of the ascent of D will be to that of the descent of L, as the sine of the angle of inclination C, to the whole sine.

Hence, 1<sup>o</sup> The height of the descent CD of the weight L, is to the height of ascent DH of the weight D, reciprocally as the weight D to the equivalent weight L.

2<sup>o</sup> Since then CD.L=DH.D, and the actions of the equponderating bodies D and L are equal; the moments of the weights D and L are in a ratio compounded of their masses, and the altitudes through which they ascend or descend in a *plane*, either inclined or perpendicular.

3<sup>o</sup> The powers that raise weights through altitudes reciprocally proportional to them, are equal.—This Des Cartes assumes as a principle whereby to demonstrate the powers of machines. Hence we see why a laden waggon is drawn with more difficulty on an inclined than an horizontal *plane*; as being pressed with a part of the weight which is to the whole weight in a ratio of the altitude of the *plane*, to its length.

IV. Weights E and F, (fig. 53. n. 2.) equponderating upon *inclined planes* AC and CB of the same height CD, are to each other as the lengths of the *planes* AC and CB.

S. Stevinus gives a very pretty demonstration of this theorem, which, for its easiness and ingenuity, we shall here add.—Put a chain, whose parts do all exactly weigh in proportion to their length, over a triangle, GIH (fig. 59.): it is evident the parts GK and KH do balance each other. If then IH did not balance GI, the preponderating part would prevail; and there would arise a perpetual motion of the chain about GIH: but this being absurd, it follows, that the parts of the chain IH and GI, and consequently all other bodies which are as the lengths of the *planes* IH and IG, will balance each other.

V. A heavy body descends on an *inclined plane*, with a motion uniformly accelerated. See MOTION, and ACCELERATION.

Hence, 1<sup>o</sup> The spaces of descent are in a duplicate ratio of the times, and likewise of the velocities; and therefore in equal times increase according to the unequal numbers, 1, 3, 5, 7, 9, &c.

2<sup>o</sup> The space passed over by a heavy body descending on an *inclined plane*, is subduple of that which it would pass over in the same time, with the velocity it has acquired at the end of its fall.

3<sup>o</sup> Heavy bodies, therefore, descend by the same laws on *inclined planes*, as in perpendicular *planes*. Hence it was, that Galileo, to find the laws of perpendicular descent, made his experiments on *inclined planes*, in regard of the motions being slower in the latter than the former; as in the following theorem.

VI. The velocity of a heavy body descending on an *inclined plane*, at the end of any given time, is to the velocity which it would acquire in falling perpendicularly, in the same time, as the height of the *inclined plane* is to its length.

VII. The space passed over by a heavy body on an *inclined plane* AD, (fig. 60.) is to the space AB, it would pass over in the same time in a perpendicular *plane*, as its velocity on the *inclined plane* is to its velocity in the perpendicular descent, at the end of any given time.

Hence, 1<sup>o</sup> The space passed over on the *inclined plane*, is to the space it would descend in the same time in the perpendicular *plane*, as the altitude of the *plane* AB to its length AC; and therefore as the sine of the angle of inclination B, to the whole sine.

2<sup>o</sup> If, then, from the right angle B, a perpendicular be let fall to AC; AC:AB::AB:AD. So that in the same time wherein the body would fall perpendicularly from A to B; in an *inclined plane* it will descend from A to D.

3<sup>o</sup> The space, therefore, of perpendicular descent being given in

in the altitude of the *plane* AB; by letting fall a perpendicular from B to AC, we have the space AD to be passed over in the same time on the *inclined plane*.

4° In like manner, the space AD, passed over on the *inclined plane*, being given, we have the space AB, through which it would descend perpendicularly in the same time, by raising a perpendicular meeting the side of the *plane* in B.

5° Hence in the semi-circle CDEF, *fig. 61.* the body will descend through all the *planes* AD, AE, AF, AC, in the same time; *viz.* in that time wherein it would fall through the diameter AB, supposing that perpendicular to the horizontal *plane* LM. VIII. The space AD, *fig. 60.* passed over in an *inclined plane* AC, being given; to determine the space which would be passed over in any other *inclined plane* in the same time.

From the point D erect a perpendicular DB, meeting the altitude AB in B; then will AB be the space, through which the body would fall perpendicularly in that time. Wherefore if from B a perpendicular BE be let fall to the *plane* AF; AE will be the space in the *inclined plane* which the body will pass over, in the same time wherein it falls perpendicularly from A to B; and consequently AD will be the space in the other *inclined plane* AC, which it passes through in the same time.

Hence, since AB is to AD, as the whole line to the sine of the angle of inclination C; and AB is to AE as the whole line to the sine of the angle of inclination F; the spaces AD and AE, which the body will pass over in the same time on different *inclined planes*, are as the sines of the angles of inclination, C and F, and reciprocally as the respective gravities on the same *planes*. And consequently, also, reciprocally as the lengths of *planes* equally high, AC and AF.—Whence the problem may be resolved various ways by calculation.

IX. The velocities acquired in the same time on different *inclined planes*, are as the spaces passed over in the same time—Hence, also, they are as the lines of the angles of inclination C and F; reciprocally as the respective gravities on the same *planes*; and reciprocally as the lengths of equally high *planes*, AC and AF.

X. A body descending on an *inclined plane* AC, when it arrives at the horizontal line CB, has acquired the same velocity which it would have acquired in a perpendicular descent AB, to the same horizontal line CB.

Hence, 1° a heavy body descending through different *inclined planes*, AC, AG, AF, has acquired the same velocity when it arrives at the same horizontal line CF.

Hence also a body continuing its descent through several contiguous *inclined planes*, acquires the same velocity which it would acquire in descending perpendicularly to the same horizontal *plane*.

XI. The time of descent along an *inclined plane* AC, is to the time of perpendicular descent through AB, as the length of the *plane* AC, to its altitude AB: but the times of descent through different *inclined planes* equally high AC and AG, are as the lengths of the *planes*.

XII. If the diameter of a circle AB (*fig. 61.*) be perpendicular to the horizontal line LM; a body will descend from any point of the periphery DE, or Q to B, along an *inclined plane* DB, EB, and CB, in the same time wherein it will descend through the diameter AB. Hence,

XIII. The descents of a body through a semicycloid DEF, (*fig. 62.*) and through any arch thereof DG, are always isochronal, or performed in the same time; on which principle is built the doctrine of pendulums vibrating in a cycloid. See CYCLOID and PENDULUM.

**Laws of ascent of bodies on inclined PLANES.**—I. If a body ascend in a medium void of resistance, in any direction, whether perpendicular, or along an *inclined plane*; its motion will be uniformly retarded. See RETARDATION.

Hence, 1° a body ascending either perpendicularly or obliquely, in such a medium, passes over a space which is subduple of that it would pass over in the same time on a horizontal *plane*, with an uniform celerity equal to that it has at the beginning of its motion.

2° Such spaces, therefore, performed in equal times, decrease in a retrograde order, as the uneven numbers 7, 5, 3, 1: and therefore the ascent is so much impeded; consequently, when the impressed force is exhausted, the body will descend again by the force of gravity.

3° They are therefore, inversely, as the spaces described in the same times by a body descending through the same altitude.—For, suppose the time divided into four parts; in the first moment, the body A descends through the space 1, and B ascends through 7; in the second, A descends through 3, B ascends through 5, &c.

4° Hence, a body rising with an impressed force, ascends to that altitude, from which it must fall to acquire that velocity in falling, wherewith it ascended.

5° Hence, by falling it acquires a force to rise again to the height whence it fell. See PENDULUM.

II. The time wherein a body ascends to a given altitude, being given; to determine the space passed over each moment.—Suppose the same body to descend from the same altitude in the same time; and find the spaces passed over each moment. (See

VOL. II.

MOTION). These, taken inversely, are the same with the spaces of ascent required.

Suppose, *v. gr.* a body projected perpendicularly, to ascend through a space of 240 feet in four seconds; and the spaces of ascent performed in the several times required; if now, the body had descended, the descent in the first minute had been 15 feet, in the second 45, in the third 75, in the fourth 105, &c. The descent therefore will be in the first moment 105, in the second 75, &c.

III. If a body descend either perpendicularly through AD, (*fig. 62.*) or in any other surface FED, and with the velocity it has there acquired, again ascend along another surface DC; at points equally high, *e. gr.* at GH, and Q, it will have the same force and the same velocity.

Hence, if a body descend along any surface, FED, and again ascend along another similar and equal surface DGC; it is the same as if it passed over the several parts of the same line twice.

Whence, the times of ascent and descent through equal spaces are equal.

On this principle is founded the construction and use of pendulums. See PENDULUM and OSCILLATION.

**PLANE of gravity, or gravitation,** is a plane supposed to pass through the centre of gravity of the body, and in the direction of its tendency; that is, perpendicular to the horizon. See GRAVITY and GRAVITATION.

**PLANE of reflection** in catoptrics, is a plane which passes through the point of reflection; and is perpendicular to the plane of the glass, or reflecting body. See REFLECTION.

**PLANE of refraction** is a plane drawn through the incident and refracted ray. See REFRACTION.

**Perspective PLANE,** is a plain pellucid surface, ordinarily perpendicular to the horizon, and placed between the spectator's eye and the object he views; through which the optic rays, emitted from the several points of the object, are supposed to pass to the eye, and in their passage to leave marks that represent them on the said plane. See PERSPECTIVE.

Such is the *plane* HI; (*Tab. Perspect. fig. 1.*) some call it the *table*, or *picture*, because the draught, or perspective of the object, is supposed to be thereon; others, the *section*, from its cutting the visual rays; and others, the *glass*, from its supposed transparency.

**Geometrical PLANE,** in perspective, is a plane parallel to the horizon, whereon the object to be delineated is supposed to be placed.

Such is the *plane* LM. (*Tab. Perspect. fig. 1.*)—This *plane* is usually at right angles with the *perspective plane*.

**Horizontal PLANE,** in perspective, is a plane passing through the spectator's eye, parallel to the horizon, cutting the perspective *plane* when that is perpendicular to the geometrical one, at right angles.

**Vertical PLANE,** in perspective, a plane passing through the spectator's eye, perpendicular to the geometrical *plane*; and usually parallel to the perspective *plane*. See VERTICAL.

**Objective PLANE,** in perspective, is any plane situate in the horizontal *plane*, whose representation in perspective is required. See OBJECT.

**PLANE of the horopter,** in optics, is a plane that passes through the horopter, AB, (*Tab. Optics fig. 67.*) and is perpendicular to a plane passing through the two optic axes IC and CH. See HOROPTER.

**PLANE of the Projection,** in the stereographic projection of the sphere, is the same with the *perspective plane*, which see. See also PROJECTION, &c.

**PLANE of a dial, or dial-PLANE,** the surface whereon a dial is drawn. See DIAL.

We have *horizontal, vertical, inclining, declining, reclining, de-inclining, direct, &c. dial-planes*. See DECLINER, RECLINER, DIRECT, &c.

**Declination of a PLANE.** See the article DECLINATION.

**PLANE glass, mirror, figure, number, problem, &c.** See PLAIN glass, mirror, number, figure, problem, &c.

**PLANE,** in joinery, &c. denotes an edge instrument, used to pare, or shave woods smooth, even, &c.

It consists of a piece of wood, very smooth at bottom, serving as a stock, or shaft; in the middle whereof is an aperture, through which passes a steel edge, or chissel, obliquely placed, and very sharp, which takes off the inequalities of the wood it is slid along.

The *plane* acquires various names according to its various forms, sizes, and uses; as, the—*Fore-plane*, which is very long, and is that commonly first used: the edge of its iron is not ground straight, but rises with a convex arch in the middle, to bear being set the ranker; its use being to take off the greater irregularities of the stuff, and to prepare it for the *smoothing plane*. *Smoothing plane* is short and small, its iron fine; it takes off the greater irregularities left by the *fore-plane*, and prepares the wood for the *jointer*.

*Jointer* is the longest of all; its edge very fine, not standing out above a hair's breadth; it comes after the *smoothing-plane*, and is chiefly intended to shoot the edge of a board perfectly straight for jointing smooth tables, &c.

*Strike block* is like the *jointer*, but shorter; its use, to shoot short joints, &c.

*Rabbit-plane* is used to cut the upper edge of a board, strait or square, down into the stuff, so as the edge of another, cut after the same manner, may join in with it on the square: it is also used to strike fascia's in mouldings. Its iron is full as broad as its stock, that the angle may cut strait; and it delivers its shavings at the sides, not, like the others, at the top.

The *plow*, a narrow rabbit-plane, with the addition of two flaves, whereon are shoulders, and on the shoulders a fence.—Its use is to plow a narrow square groove on the edge of a board, &c.

*Moulding-planes*; of these there are various kinds, accommodated to the various forms and profiles of the mouldings. See **MOULDING**.

Such are the *round plane*, the *hollow*, the *OG*, the *snipe's bill*, &c. which are all of several sizes, from half an inch to an inch and half.

To use the *moulding-planes* on soft wood, as deal, pear-tree, &c. they set the iron to angle of 45° with the base or sole of the plane. On hard wood, *v. gr.* ebony, box, &c. they set to an angle of 80°; sometimes quite upright. To work on hard wood, the edge or basil is ground to an angle of 18 or 20°; on soft wood to an angle of about 12°. For the more acute the basil, the smoother the iron cuts; but the more obtuse, the stronger.

**PLANE**, among fowlers.—To **PLANE**, is to fly or hover as a bird does, without moving its wings. See **FLYING**, **HAWK**, and **HAWKING**.

**PLANET**, *PLANETA* \*, in astronomy, a celestial body, revolving round the sun as a center, and continually changing its position, with respect to the other stars.

\* Whence its name *πλανήτης*, wanderer; in opposition to a star which remains fixed. See **STAR**.

The planets are usually distinguished into *primary*, and *secondary*.

**Primary PLANETS**, called also simply and by way of eminence, *planets*, are those which move round the sun as their proper centre.—Such are Saturn, Jupiter, Mars, the Earth, Venus, and Mercury. See **PRIMARY**.

**Secondary PLANETS** are such as move round some *primary planet*, as their respective centre, in the same manner as the *primary planets* do round the sun.—Such as the Moon moving round our earth; and those others moving round Saturn and Jupiter, properly called *satellites*. See the doctrine of *secondary planets*, under the article **SATELLITES**, and **SECONDARY**.

The *primary planets* are in number six; which are again distinguished into *superior* and *inferior*.

**Superior PLANETS** are those further off the sun than our earth is.—Such are Mars, Jupiter, and Saturn.

**Inferior PLANETS** are those nearer the sun than our earth is, and situate between the earth and sun.—Such are Venus and Mercury.—See the order, position, &c. of the planets, in *Tab. Astron. fig. 44*.

The planets are represented by the same characters as the chemists use to represent their metals by, on account of some supposed analogy between those celestial and subterraneous bodies. See **METAL** and **CHARACTER**.

Saturn is represented by the character ♄.—This planet, by reason of its great distance, appears to the eye with a feeble light.—It performs its revolution round the sun in about thirty years. See **SATURN**.

Jupiter, marked ♃, is a bright refulgent star, finishing its course round the sun in about twelve years. See **JUPITER**.

Mars, characterised ♄, is a ruddy fiery coloured planet, finishing its course in about two years. See **MARS**.

Venus, ♀ is the brightest of all the planets, constantly attending the sun, and never distant from him above 47 degrees.—It finishes its course in about seven months. See **VENUS**.

When it goes before the sun, it is called *phosphorus*, and *lucifer*; and when it follows him *hesperus*. See **PHOSPHORUS**, &c.

Mercury, ☿, a light bright planet, the sun's constant companion, from whose side it never departs above 28°, and by that means usually hid in his splendor.—It performs its course in about three months. See **MERCURY**.

To which we now add, Tellus, the earth, marked ⊕, or ♁, performing its course about the sun, between Mars and Venus, in the space of a year. See **EARTH**.

From these definitions, a person may easily distinguish all the planets.—For if after sun-set he sees a planet nearer the east than the west, he may conclude it is neither Mercury nor Venus; and may determine whether it is Saturn, Jupiter, or Mars, by the colour and light: by which also he may distinguish between Mercury and Venus.

**Nature of the PLANETS**—From the several phases and appearances of the planets, they are found to be all perfectly like the moon; which we have shewn to be perfectly like our earth; whence it follows, that the planets too are dark, opaque, spherical, &c. bodies, like our earth. See **MOON**.

This may be shewn almost to be a demonstration.—1° Venus, observed with a telescope, is rarely found full, but with variable phases like those of the moon; her illuminated part still turned

towards the sun, *viz.* towards the east when she is the morning-star, and the west when the evening-star.—And the like phases are observed in Mercury and Mars.

2° Gassendus first, and after him others, have observed Mercury on the face of the sun, a cross which he appeared to pass like a black round spot. See **TRANSIT**.—Horrox in 1639, also observed Venus in the sun; where she made the same appearance.

3° De la Hire, in 1700, with a telescope of sixteen foot, discovered mountains in Venus, larger than those of the moon. See **MOUNTAIN**.

4° Cassini observed two spots in Venus; four in Mars, likewise observed by Campani; and several, at several times, in Jupiter: and from his observations of these spots found that they had a rotation round their axes: He even determined the velocity of that rotation, or the period wherein it was effected, *v. gr.* That of Jupiter, 9 hours 56'. That of Mars 24 hours 40'. And that of Venus, 24 hours. See **SPOT**.—And since the Sun, Moon, Jupiter, Mars, Venus, and the earth, are found to revolve on their axes, *i. e.* to have a diurnal rotation: no doubt Mercury and Saturn have the same; though the great nearness of the former to the sun, and the great distance of the latter, prevent any spots from being observed on them, whence that rotation might be demonstrated.

5° In Jupiter are observed two swaths, or belts, brighter than the rest of his disk, and moveable; sometimes found in one part, sometimes in another; sometimes broader, sometimes narrower. See **BELT**.

6° In 1609 were first observed three little stars, or moons, moving about Jupiter, by Sim. Marius; and in 1610 the same were observed by Galileo: These are now frequently observed to disappear in a clear sky, when Jupiter happens to be diametrically interposed between them and the sun.—Whence it appears they are void of light, at such time when the sun's rays, intercepted by Jupiter, cannot be propagated to them in right lines; and hence also, that, like the moon, they are opaque bodies, illuminated by the sun; and hence again, since Jupiter does not illuminate his satellites when placed behind him, he himself, in that part turned from the sun, may be argued to be void of light.

7° When Jupiter's moons are diametrically interposed between Jupiter and the Sun, there is seen a round spot on Jupiter's disk, which is sometimes larger than the satellite itself.—Whence it appears, that the satellites are opaque bodies, illuminated by the sun, that they project a shadow upon the sun, and that the round spots seen in Jupiter are the shadows of the satellites. Whence also, the intersection of that shadow being found to be a circle, the shadow must be conical; and therefore the figures of the satellites, at least as to sense, is spherical.

8° The earth being between Jupiter and the sun; if, at the same time, any of the satellites happen to be between Jupiter and the sun, it is lost in Jupiter's light; though sometimes appearing like a black spot.—This phenomenon has been frequently observed by Cassini and Maraldi, who have likewise noted very considerable alterations in the apparent magnitudes of the satellites; for which no reason could be given from the distance of Jupiter, the sun, or the earth: *e. gr.* That the fourth, which is usually seen the smallest, is sometimes the largest; and the third, which is usually the largest, sometimes the smallest.—Hence, as the satellites are illuminated by the sun, even then when emerged in Jupiter's light, yet do appear obscure, there must be some alteration in their atmospheres, to prevent the sun's rays being equally reflected from every part of their surface; which must likewise be the cause why their shadow is sometimes larger than themselves.

Now, to sum up the evidence.—1° Since in Venus, Mercury, and Mars, only that part of the disk illuminated by the sun, is found to shine; and, again, Venus and Mercury, when between the earth and the sun, appear like dark spots or maculae, on the sun's disk; it is evident, that Mars, Jupiter, and Mercury, are opaque bodies, illuminated with the borrowed light of the sun. And the same appears of Jupiter, from its being void of light in that part to which the shadow of the satellites reaches, as well as in that part turned from the sun; and that his satellites are opaque, and reflect the sun's light, is abundantly shewn. Wherefore, since Saturn, with his ring and satellites, do only yield a faint light, fainter considerably than that of the fixed stars; though these be vastly more remote; and than that of the rest of the planets: it is past doubt, he too, with his attendants, are opaque bodies.

2° Since the sun's light is not transmitted through Mercury and Venus, when placed against him; it is plain they are dense opaque bodies; which is likewise evident of Jupiter, from his hiding the satellites in his shadow; and therefore, by analogy, the same may be concluded of Saturn.

3° From the variable spots in Venus, Mars, and Jupiter, it is evident those planets have a changeable atmosphere; which changeable atmosphere may, by a like argument, be inferred of the satellites of Jupiter; and therefore, by similitude the same may be concluded of the other planets.

4° In like manner, from the mountains observed in Venus; the same may be supposed in the other planets.

5° Since

5° Since then Saturn, Jupiter, both their satellites, Mars, Venus, and Mercury, are opaque bodies, shining with the sun's borrowed light, are furnished with mountains, and encompassed with a changeable atmosphere; they have, of consequence, waters, seas, &c. as well as dry land, and are bodies like the moon, and therefore like the earth. Q. E. D.

And hence, nothing hinders but that the *planets* may also be concluded to be inhabited.—Huygens, in his *Cosmotheoros*, argues very plausibly for the existence of planetary inhabitants, from the similitude of the *planets* with our earth; those, like this, being opaque, dense, uneven, round, heavy, illuminated and warmed by the sun; having night and day, summer and winter, &c.

Wolfius deduces something relating hereto from arguments of another kind.—Thus, *e. gr.* It is scarce to be doubted, that the inhabitants of Jupiter are much larger than those of the earth; and, in effect, of the giant kind. For it is shewn in optics, that the pupil of the eye contracts in a strong light, and dilates in a weak one; wherefore, since in Jupiter the sun's meridian light is much feebler than on the earth, by reason of Jupiter's greater distance from the sun; the pupil will need to be much more dilatable in the inhabitants of Jupiter, than in those of the earth. But the pupil is observed to have a constant proportion to the ball of the eye, and the eye to the rest of the body; so that in animals, the larger the pupil, the larger the eye, and the larger the body.

To ascertain the size of these jovial inhabitants, it may be observed, that the distance of Jupiter from the sun, is to the earth's distance from the same, as 26 to 5; the intensity of the sun's light in Jupiter, is to its intensity on the earth, in a duplicate ratio of 5 to 26; but it is found by experience, that the pupil dilates in a ratio greater than that wherein the intensity of light decreases; otherwise, a body at a great distance might be seen as clearly as a nearer: the diameter, therefore, of the pupil in its greatest dilatation, in Jupiter, is to its diameter in the like state in the earth, in a ratio greater than that of 5 to 26.—If then we put it, as 10 to 26, or as 5 to 13: since the ordinary stature of the inhabitants of the earth is computed at 5 English feet, 4 inches and  $\frac{3}{4}$  (which Wolfius tells us is his own height); the ordinary stature of Jupiter's inhabitants will be found 14 feet  $\frac{2}{3}$ , which is very nearly the size of the giant Og, mentioned by Moses, whose iron bed was 9 cubits long, and its breadth 4. See GIANT.

*Motion of the PLANETS.*—That the *planets* do all revolve round the sun as their centre, and not round the earth, is evident from a thousand phenomena.—1° The orbit wherein Venus, *e. gr.* moves, does certainly encompass the sun, and therefore in describing that orbit, the *planet* must turn round the sun. See ORBIT.

That her orbit includes the sun, appears hence, that she is sometimes above the sun, sometimes below it, sometimes beyond it, and sometimes on this side; all which are evident from the circumstances of her phases. See PHASES.

That she does not move round the earth, is no less apparent, from her being ever observed in the same quarter with the sun, never receding from him above 45°.—She never therefore comes to be in opposition to the sun; no, not to be in a quadrantal aspect, or to have a quarter of the heavens between them; both which, like the earth, she must frequently have, did she attend and move round the earth.

2° That Mercury revolves round the sun, appears in like manner from his phases, which resemble those of Venus and the moon; and from its neighbourhood to the sun, from whom Mercury never recedes so far as Venus does.

3° That the orbit of Mars includes the sun, is evident from that *planet's* being found both in conjunction and opposition with the sun; and in both cases shining with a full face.—Indeed, from the same circumstances it appears, that the orbit of Mars encompasses the earth; but then, it follows, likewise, from Mars's diameter appearing seven times as big when in opposition, as when in conjunction, that he is seven times nearer the earth, in the former than the latter position. The earth therefore is far from being the centre of Mars's *motion*; but Mars is ever nearly at the same distance from the sun.—Again, Mars viewed from the earth moves very irregularly; is sometimes seen to proceed slower, sometimes faster; sometimes stands still, sometimes goes backward (the reasons whereof, see under the article *OPTIC INEQUALITY*); but viewed from the sun, will ever appear to move with the same constant uniform tenor; whence it is evident, he respects the sun, not the earth, as the centre of his *motion*.

4° The same appearances whence Mars is shewn to revolve round the sun as a centre, are likewise observed in Jupiter and Saturn; whence the same conclusion may be made of them.

Lastly, That the earth revolves round the sun, as a centre, is evident from her place, which we have observed to be between the orbits of Mars and Venus; and from the phenomena of the superior *planets* viewed therefrom.—If the earth stood still, we should never see those *planets* either stationary or retrograde; the earth therefore moves, but it is still found between the orbits of Mars and Venus, which encompass the sun; therefore the earth too encompasses the sun.

To this astronomical demonstration may be added a physical

demonstration of the earth's motion, from Sir Isaac Newton.—It appears from abundant observation, that either the earth turns round the sun; or the sun round the earth, so as to describe equal areas in equal times: but he demonstrates, that bodies revolving about one another according to such law, do of necessity gravitate towards each other. (See GRAVITATION.) Whence, if the sun gravitate to the earth, action and re-action being still equal, the earth will likewise gravitate toward the sun. (See RE-ACTION.) But he proves, further, that two bodies gravitating towards each other, without directly approaching one another in right lines, must both of them turn round the common centre of gravity of both.—The sun and earth, therefore, do both revolve round one common centre.—But the earth being but a point in comparison of the sun, the common centre of gravity of the two will be within the sun's body, and not far from its centre.—The earth, therefore, revolves round a point, within the body of the sun; and therefore round the sun. See EARTH and SUN.

The orbits of the *planets* are all ellipses; one of whose foci is in the sun.—This Kepler first found from Tycho's observations; before him all astronomers took the planetary orbits for eccentric circles. See ORBIT, ELLIPSIS, EXCENTRIC.

The planes of these orbits do all intersect in the sun; nor are their extremities far apart.—In effect, they are but little inclined to one another; and the greatest angle any of them makes with the plane of the earth's orbit, *i. e.* of the ecliptic, is that of Mercury, which lies at an angle of 6° 52'; that of Venus is 3° 23'; that of Mars 1° 52'; that of Jupiter 1° 20'; and that of Saturn 2° 30'.

The line wherein the plane of each orbit cuts that of the earth, is called the *line of the nodes*; and the two points wherein the orbits themselves touch that plane, the *nodes*. See NODE.

The distance between the centre of the sun, and the centre of each orbit, is called the *eccentricity of the planet*. See EXCENTRICITY.

And the angle at which each plane cuts that of the ecliptic, the *inclination of the plane*. See PLANE, INCLINATION, and ECLIPTIC.

To account for the *motion of the planets* about the sun, there needs nothing but to suppose an uniform projectile *motion*, in straight lines, at first given them; and a power of attraction or gravitation, such as we observe in all the great bodies in our system.—For a body A, (*Tab. Astron. fig. 66. n. 2.*) proceeding uniformly along the line AB, will, by the intervention of the attracting body C, be every moment diverted out of its rectilinear, and bent into a curvilinear path, according to the laws of central forces. See CENTRAL force.

If, then, the projectile *motion* be perpendicular to a line, CA, drawn from the attracting body C; and its velocity be so proportioned to the force of attraction of A, as that the centripetal and centrifugal forces are equal, *i. e.* that the centatus do fall to the central body C, in a right line, AC, and that to proceed in the direction of the tangent, AB, balance each other: the body will revolve in a circular orbit,  $\alpha, \beta, \gamma, \delta$ , &c. See CENTRIPETAL, and CENTRIFUGAL.

It is not improbable, that, at the beginning, this was the state of things; and that the velocities impressed on the several *planets* were so combined with their respective masses and distances from the sun at which they were to roll, as that their momenta should counterbalance the sun's attractive force, and be precisely counterbalanced thereby: whence the primitive orbits must have been perfect circles, from which they do not even now deviate very far; the eccentricity of the earth's orbit being only  $\frac{1}{1000}$  of its semidiameter. See EXCENTRICITY.

If the *planet's* projectile *motion* be not perfectly adjusted to the sun's attraction, the orbit described will be an ellipsis.—If it be too swift, the orbit will be greater than a circle, and the nearer focus coincide with the central body; if too slow, the orbit will be less than a circle, and the further focus coincide with the central body.

Indeed the form of the planetary orbits does not only depend on the adjustment of the first projectile velocity with the sun's attraction, but also on the direction wherein that motion was originally impressed.—If that direction were according to the tangent AB, as above supposed, and the central forces exactly balanced, the orbit would be circular; but if that direction were oblique, in any manner, whether ascending to or descending from the sun, the orbit of the *planet*, notwithstanding any adjustment of its velocity to the attraction, would be an ellipsis. See PROJECTILE.

The *motions of the planets* in their elliptic orbits are not equal, by reason the sun is not in their centre, but their focus.—Hence they move, sometimes faster, and sometimes slower, as they are nearer or further from the sun; but yet these irregularities are all certain, and follow according to an immutable law.

Thus, suppose the ellipsis BEP, &c. (*Tab. Astron. fig. 61. n. 2.*) the orbit of a *planet*; and the focus S, the sun's place: AP, the axis of the ellipsis, is called the *line of the apsides*; the point A, the *higher apsis*, or *aphelion*; P the *lower apsis*, or *perihelion*; SC the *eccentricity*; and ES the *mean distance of the planet from the sun*. See APSIS, APHELION, PERIHELION, &c.

Now

Now the *motion* of the *planet* in its perihelion, is swiftest; in its aphelion, slowest; at E the *motion*, as well as the distance, is mean, *i. e.* such as would describe the whole orbit in the same time it is really described in.

The law whereby the *motion* is regulated in every point of the orbit, is, that a line, or radius, drawn from the centre of the sun to the centre of the *planet*, and thus carried along, with an angular *motion*, does always describe an elliptic area proportional to the time.—Suppose, *e. gr.* the *planet* in A, and thence in a certain time to proceed to B; the space or area the radius S A describes, is the triangle A S B: when, at length, the *planet* arrives at P, if from the centre of the sun S there be drawn S D, in such manner as that the elliptic area P S D is equal to that A S B; the *planet* will here move thro' the arch P D in the same time wherein it moved thro' the arch A B; which arches are unequal, and nearly in a reciprocal proportion to their distance from the sun. For from the equalities of the areas it follows, that the arch P D must exceed A B as much as S A exceeds S P.

This law was first demonstrated by *Kepler*, from observation; and is since accounted for by Sir I. Newton from physical principles: and to this all astronomers now subscribe, as of all others that which best solves the planetary phenomena.

*Computation of a PLANET's motion and place.*—As to the periods and velocities of the *planets*, or the times wherein they perform their courses; they are found to have a wonderful harmony with their distances from the sun, and with one another; the nearer each *planet* is to the sun, the quicker still being its motion, and its period the shorter.—The great law they here all immutably observe is, that the squares of their periodical times are as the cubes of their distances from the centres of their orbits. See PERIOD, DISTANCE, &c.

This law we owe to the sagacity of *Kepler*, who found it to obtain in all the primary *planets*; as astronomers have since found it to do in the secondary ones. See SATELLITE.

*Kepler* deduced this law merely from observation, and comparison of the several distances of the *planets* with their periods: the glory of investigating it from physical principles, is due to Sir Isaac Newton, who has demonstrated, that, in the present state of things, such a law was inevitable. See GRAVITATION.

A *planet's* motion or distance from its apogee, is called the *mean anomaly* of the *planet*; and is measured by the arch, or area it describes in the time.—When the *planet* arrives at the middle of its orbit, or the point G, the distance or time is called the *true anomaly*.—When the *planet's* motion is reckon'd from the first point of Aries, it is called its *motion in longitude*, which is either mean, *viz.* such as the *planet* would have, were it to move uniformly in a circle; or true, which is that where-with the *planet* actually describes its orbit, and measured by the arch of the ecliptic it describes. See ANOMALY, LONGITUDE, &c.

Hence may the *planet's* place in its orbit for any given time after it has left the aphelion, be found.—For suppose the area of the ellipse so divided by the line S G, that the whole elliptic area may have the same proportion to the area A S G, as the whole periodical time wherein the *planet* describes its orbit, has to the time given: in this case G will be the *planet's* place in its orbit. See PLACE.

The phenomena of the inferior PLANETS, are their conjunctions, elongations, stations, retrogradations, phases, and eclipses. See CONJUNCTION, ELONGATION, STATION, RETROGRADATION, &c. under their respective articles.

Phenomena of the superior PLANETS, are the same with those of the inferior; with an additional one, *viz.* opposition. See OPPOSITION, &c.

The particular phenomena, circumstances, &c. of each PLANET, see under the name of the respective *planet*, &c. JUPITER, MARS, &c.

The general proportions, diameters, surfaces, solidities, distances, gravities, degrees of light, &c. of the several *planets*; see under the articles SOLAR SYSTEM, DIAMETER, SEMIDIAMETER, &c.

Configuration of the PLANETS } See { CONFIGURATION.  
Theories of the PLANETS. } THEORY.

PLANETARY, something that relates to the *planets*. See PLANET.

In this sense we say, *planetary* worlds, *planetary* inhabitants, &c. Huygens and Fontenelle bring several probable arguments for the reality of *planetary* worlds, and animals, plants, men, &c.—The former, in his ΚΟΣΜΟΘΕΩΡΟΣ, *sive de terris caelestibus*: the latter in his dialogues, *sur la pluralité des mondes*.

PLANETARY system, is the system, or assemblage of the *planets*, primary and secondary, moving in their respective orbits, round their common centre, the sun. See SOLAR SYSTEM.

PLANETARY hours, in chronology. See HOUR.

PLANETARY days.—Among the ancients, the week was shared among the seven *planets*, each *planet* having its day. This we learn from Dion Cassius and Plutarch, *Sympos. l. 4. q. 7*. Herodotus adds, that it was the Egyptians who first discovered what god, that is, what *planet* presides over each day, for that among this people the *planets* were directors. And hence it is, that in most European languages, the days of the week are still denominated from the *planets*; Sunday, Monday, &c. See WEEK.

PLANETARY years, the periods of time where the several *planets* make their revolutions round the sun, or earth. See YEAR, REVOLUTION, &c.

As from the proper revolution of the sun, the solar year takes its original; so from the proper revolutions of the rest of the *planets* about the earth, so many sorts of years do arise, *viz.* the saturnian year, which is defined by 29 Egyptian years, 174 hours, 58 minutes, equivalent in a round number to 30 solar years.—The jovial year, containing 317 days, 14 hours, 59 minutes.

—The Martial year, containing 321 days, 23 hours, 31 minutes.

—For Venus and Mercury, as their years, when judged of with regard to the earth, are almost equal to the solar year; they are more usually estimated from the sun, the true centre of their motions: in which case, the former is equal to 224 days, 16 hours, 40 minutes; the latter to 87 days, 23 hours, 14 minutes. See SATURN, JUPITER, MARS, &c.

PLANETARY dials, those whereon the *planetary* hours are inscribed. See DIAL, and HOUR.

PLANETARY squares, the squares of the seven numbers from 3 to 9 disposed magically. See MAGIC square.

Corn. Agrippa, in his famous book of magic, has given the construction of the seven *planetary* squares: M. Poignard, canon of Brussels, in his treatise of sublime squares, gives new, easy, and general methods for making the seven *planetary* squares, and all others to infinity, by numbers in all sorts of progressions.

PLANIFOLIOUS flowers. See the article FLOWER.

PLANIMETRY, PLANIMETRIA, that part of geometry which considers lines and plain figures; without any consideration of heights or depths. See GEOMETRY; see also LINE, and FIGURE.

*Planimetry* is particularly restrained to the mensuration of planes, or surfaces; in opposition to *stereometry*, or the mensuration of solids. See MEASURING.

*Planimetry*, or the art of measuring the surfaces and planes of things, is performed with the squares of long measures, as square feet, square inches, square yards, square perches, &c. that is, by squares whose sides are an inch, a foot, a yard, a perch, &c. so that the area or centre of any surface is said to be found, when we know how many such square inches, feet, yards, &c. it contains. See AREA, SUPERFICIES, FIGURE, SQUARE, &c.

PLANISPHERE, a projection of the sphere, and the several circles thereof, on a plane; as, upon paper, or the like. See PLANE, SPHERE, and PROJECTION.

In this sense, maps of the heavens and the earth, wherein are exhibited the meridians, and other circles of the sphere, are called *planispheres*. See MAP.

PLANISPHERE is sometimes also considered as an astronomical instrument, used in observing the motions of the heavenly bodies; consisting of a projection of the celestial sphere upon a plane, representing the stars, constellations, &c. in their proper situations, distances, &c.—Such is the *astrolabe*, which is a common name for all such projections. See ASTROLABE, &c.

In all *planispheres*, the eye is supposed to be a point viewing all the circles of the sphere, and referring them to a plane whereon the sphere is, as it were, flattened.—This plane is called the *plane of the projection*. See PLANE.

A perspective plane is only a plane of projection placed between the eye and the object, so as to contain all the points which the several rays drawn from the object to the eye impress thereon, (See perspective PLANE).—But in *planispheres*, or astrolabes, the plane of the projection is placed beyond the object; which is the sphere.—The plane of the projection is always some of the circles of the sphere. See CIRCLE.

Among the infinite number of *planispheres*, which the different planes of projection, and the different positions of the eye, would furnish; there are two or three that have been preferred to the rest.—Such are that of Ptolemy, where the plane of projection is parallel to the equator.—That of Gemma Frisius, where the plane of projection is the colure, or solstitial meridian, and the eye the pole of the meridian.—That of John de Royas, a Spaniard, whose plane of projection is a meridian, and the eye placed in the axis of that meridian, at an infinite distance. This last is called the *Analemma*. See ANALEMMA.

The common defect of all these projections is, that they distort and alter the figures of the constellations, so as it is not easy to compare them with the heavens; and that the degrees in some places are so small, that they afford no room for operation.

All these faults M. de la Hire has provided against in a new projection, or *planisphere*; where it is proposed the eye shall be so placed, as that the divisions of the circles projected shall be sensibly equal in every part of the instrument.—The plane of his projection is that of a meridian.

Nautical PLANISPHERE. See the article NAUTICAL.

PLANO-concave glass, or lens, is that, one of whose surfaces is concave, and the other plain. See GLASS, and CONCAVE.

The concavity is here supposed to be spherical, unless the contrary be expressed.—For the properties, grinding, &c. of *plano-concave* lenses, see LENS, GRINDING, &c.

PLANO-convex glass, or lens, is that, one of whose surfaces is convex, and the other plain. See CONVEXITY.

The convexity is supposed to be spherical, unless the contrary be expressed. For the properties, grinding, &c. of *plano-convex* lenses, see LENS, &c.

PLANT,

**PLANT, PLANTA**, an organical body, consisting of a root, essentially, and probably too, a seed; and producing usually leaves, a stem, branches, and flowers. See **ROOT**, &c.

A *plant* may be defined, in Boerhaave's manner, to be an organical body composed of vessels and juices; to which body belongs a root, or part whereby it adheres to some other body, and particularly the earth, from which it derives the matter of its life and growth. See **VEGETABLE**.

A *plant* is distinguished from a fossil by its being organical, and consisting of vessels and juices (see **FOSSIL**); and from an animal, by its adhering to another body, and deriving its nourishment therefrom. See **ANIMAL**.

*Plant* is a general name, under which are comprized all vegetable bodies, as trees, shrubs, and herbs. See **TREE**, **SHRUB**, and **HERB**.

From the observations of Malpighi, Dr. Grew, M. Reneaume, Bradley, and others, there appears a great similitude between the mechanism of *plants*, and animals; the parts of the former seem to bear a constant analogy to those of the latter; and the vegetable and animal oeconomy appear both formed on the same model.—To give an idea hereof, it will be necessary to describe the parts whereof *plants* consist.

**The parts of PLANTS are**.—1. The root, a spongy body, whose pores are disposed to admit certain humid particles prepared in the ground: on the size of the vessels and pores of the root, the quality of the root is found much to depend.—Boerhaave considers the root as composed of a number of absorbent vessels, analogous to the lacteals in animals. And M. Reneaume takes it to do the office of all the parts in the abdomen which minister to nutrition; as the stomach, intestines, &c. See **ROOT**.

2. The wood, which consists of capillary tubes, running parallel from the root throughout the stalk.—The apertures of these tubules are ordinarily too minute to come under the cognizance of the eye, unless in a piece of charcoal, cane, or the like. These tubes Mr. Bradley calls arterial vessels; it being through these that the sap rises from the root. See **WOOD**.

3. Beside these, are other larger vessels, disposed on the outside of the arterial vessels between the wood and the inner bark, and leading down to the covering of the root.—These the same author calls the venal vessels, and supposes them to contain the liquid sap found in *plants* in the spring, &c. See **VEIN**, **SAP**, &c.

4. The bark, which is of a spongy texture, and by many little strings passing between the arteries, communicates with the pith. See **BARK**.

5. The pith, or pecten, which consists of little transparent globules, chained together somewhat like the bubbles that compose the froth of liquor. See **PITH**.

Add, that the trunk and branches of a tree bear a resemblance to the exterior members or limbs of an animal, which it may subsist without, though their rotting and mortification frequently occasion a total destruction thereof.—Accordingly, we find the like effects from the wounding or lopping of a tree, as that of a limb, viz. an extravasation, callus, &c.

**Oeconomy or use of the parts of PLANTS**.—The root having imbibed the saline and aqueous juices of the earth, and filled itself therewith for the nourishment of the tree; those are put in motion by heat, i. e. are made to evaporate into steam, which from the root enters the mouths of the arterial vessels, and mounts to the top with a force answerable to the heat that puts it in motion.—By this means it gradually opens the minute vasculæ rolled up in the buds, and expands them into leaves.—Now, as all vapours, upon feeling the cold, naturally condense; so this, when arrived at the extreme parts of the arteries, i. e. the buds of the tree, meeting the cold air, condenses into a liquor, in which form it returns by its own weight, through the venal vessels, to the root; leaving behind it such parts of its juice as the texture of the bark will receive, and requires for its sustenance.

Thus does the juice continue to circulate; till the winter's cold congealing it into the consistency of a gum, it stagnates in the vessels; in which state it remains till the fresh warmth of the succeeding spring puts it in motion again: upon which it renews its former vigour, pushes forth branches, leaves, &c.

This short view of the vegetable oeconomy will bear some further illustration, there being several curious points here couched, and, as it were, folded up in *semine*.—The principle, then, whereby the root, after imbibing its food, determines it to mount upward, contrary to its natural gravity, is somewhat obscure: Some will have it effected by means of the pressure of the atmosphere, in the same manner as water is raised in pumps: But this is precarious, as being founded on a supposition, that the absorbent tubules are void of air; besides, that the atmosphere could not raise the juice above 32 foot high; whereas there are trees much higher. See **ATMOSPHERE**.—Others have recourse to the principle of attraction, and suppose the power that raises the sap in vegetables to be the same with that whereby water ascends in capillary tubes, or in heaps of sand, ashes, or the like; but neither will this alone suffice to raise water to the tops of trees. See **ATTRACTION**, **ASCENT**, **CAPILLARY**, &c.

One would suspect, therefore, that the first reception of the food, and its propagation through the body, were effected by different means; which is confirmed by the analogy of animals. See **FOOD**, **HEART**, **NUTRITION**, &c.

The motion of the nutritious juices of *plants* is produced

much like that of the blood in animals, by the action of the air; in effect, there is something equivalent to respiration throughout the whole *plant*. See **RESPIRATION**.

The discovery of this we owe to the admirable Malpighi, who first observed, that vegetables consist of two series or orders of vessels.—1. Those abovementioned, which receive and convey the alimental juices; answering to the arteries, lacteals, veins, &c. of animals.—2. Tracheæ, or air-vessels, which are long hollow pipes, wherein air is continually received and expelled, i. e. inspired and expired; within which tracheæ, the same author shews, all the former series of vessels are contained. See **TRACHEA**.

Hence it follows, that the heat of the year, nay, of a day, of a single hour, or minute, must have an effect on the air included in these tracheæ, i. e. must rarefy it, and consequently dilate the tracheæ; whence also must arise a perpetual spring, or source of action, to promote the circulation in *plants*. See **HEAT**, **RAREFACTION**, &c.

For, by the expansion of the tracheæ, the vessels containing the juices, are pressed; and by that means the juice contained is continually propelled, and so accelerated; by which same propulsion the juice is continually comminuted, and rendered more and more subtil, and so enabled to enter vessels still finer and finer; the thickest part of it being at the same time secreted and deposited into the lateral cells or loculi of the bark, to defend the *plant* from cold, and other external injuries. See **BARK**.

The juice having thus gone its stage, from the root to the remote branches, and even the flower; and having in every part of its progress deposited something both for aliment and defence; what is redundant passes out into the bark, the vessels whereof are inoculated with those wherein the sap mounted; and through these it redescends to the root, and thence to the earth again.—And thus is a circulation effected. See **CIRCULATION of the sap**.

Thus is every vegetable acted on by heat during the day-time, especially while the sun's force is considerable; and the sap-vessels thus are squeezed and pressed, and the sap protruded, and raised, and at length evacuated, and the vessels exhausted: And in the night again, the same tracheæ being contracted by the cold of the air, the other vessels are eased and relaxed, and so disposed to receive fresh food for the next day's digestion and excretion.—And thus *plants* may be said to eat and drink in the night-time. See **NUTRITION**.

The vessels, or containing parts of *plants*, consist of mere earth, bound or connected together by oil, as a gluten; which being exhausted by fire, air, age, or the like, the *plant* moulders, or returns again into its earth, or dust.—Thus in vegetables burnt by the intensest fire, the matter of the vessels is left intire, and indissoluble by its utmost force; and, consequently, is neither water, nor air, nor salt, nor sulphur, but earth alone. See **EARTH**.

The juice, or sap, of a *plant*, is a humour furnished by the earth, and changed in the *plant*; consisting of some fossil parts, other parts derived from the air and rain; and others from putrified animals, plants, &c. consequently, in vegetables are contained all kind of salts, oil, water, earth; and probably all kinds of metals too, inasmuch as the ashes of vegetables always yield somewhat which the loadstone attracts. See **IRON**, **MAGNET**, &c.

This juice enters the *plant* in form of a fine and subtle water, which the nearer it is to the root, the more it retains of its proper nature; and the further from the root, the more action it has sustained, and the nearer it approaches to the nature of the vegetable. See **DIGESTION**.

Consequently, when the juice enters the root, the bark whereof is furnished with excretory vessels fitted to discharge the excrementitious part; it is earthy, watery, poor, acid, and scarce oleaginous at all. See **JUICE**.

In the trunk and branches it is further prepared; though it still continues acid, as we see by the tapping or perforating of a tree in the month of February, when it distils a watery juice apparently acid. See **TAPPING**.

The juice being hence carried to the germs, or buds, is more concocted; and here having unfolded the leaves, these come to serve as lungs for the circulation and further preparation of the juice.—For those tender leaves being exposed to the alternate action of heat and cold, moist nights, and hot scorching days, are alternately expanded and contracted; and the more on account of their reticular texture. See **LEAF**.

By such means the juice is still further altered and digested; as it is further yet in the petala, or leaves of the flowers, which transmit the juice, now brought to a further subtilty, to the stamina.—These communicate it to the farina, or dust in the apices; where having undergone a farther maturation, it is shed into the pistil; and here having acquired its last perfection, it gives rise to a new fruit or *plant*. See **PETALA**, **STAMINA**, **APICES**, **FARINA**, **PISTIL**, &c.

The generation of *PLANTS* does also bear a close analogy to that of some animals; particularly such as want local motion; as mussels, and other immoveable shell-fish, which are hermaphrodites, and contain both the male and female organs of generation. See **HERMAPHRODITE**.

The flower of the *plant*, for all its finery, is found to be the pudendum, or principal organ of generation; but the use of so

much mechanism, and so many parts, has been but little known.—We shall instance in a tulip.

Its flower consists of six petals, or leaves; from the bottom whereof, at the middle, arises a kind of tube called the *pistil*; and around this are disposed pretty fine threads called *stamina*, arising likewise from the bottom of the flower, and terminating in little bunches a-top, called *apices*, replete with a fine dust called *farina*.—For the further explanation of the parts of generation, see *PISTIL*, *STAMEN*, *FARINA*, &c.

This is the general structure of the flower of *plants*, though diversified infinite ways, and to such degree, that some have no sensible pistil, others no stamina; others have stamina without any apices; and what exceeds all the rest, some *plants* have no flowers.—But, allowing the structure now represented to be, as in effect it is, the most common; and that these parts which seem wanting are usually only less apparent; the generation of *plants*, in general, may be well accounted for. The fruit is usually at the basis of the pistil, so that when the pistil falls, with the rest of the flower, the fruit appears in its stead.—Indeed, frequently, the pistil is the fruit itself; but still they have both the same situation in the centre of the flower, whose leaves disposed around the little embryo, only seem destined to prepare a fine juice in their little vessels, for its support, during the little time they last, and it requires: though Mr. Bradley takes their chief use to be to defend the pistil, &c. The apices of the stamina are little capsulæ, or bags full of a farina or dust, which upon the capsulæ growing ripe, and bursting, fall out.

M. Tournefort took this dust to be only an excrement of the food of the fruit, and the stamina to be no more than a kind of excretory ducts, which filtrated this useless matter, and thus discharged the embryo *plant*. But Mr. Morland, M. Geoffroy, and others, find nobler uses for this dust.—According to their system, it is this dust that falling on the pistil fecundifies the grain or fruit inclosed therein; and hence they call it the *farina fecundans*.—Thus the farina should be the male part of the plant, and the pistil the female.

Mr. Bradley, at the bottom of the pistil of the lily, observes a vessel, which he calls the *uterus*, or womb, wherein are three ovaries filled with little eggs, or rudiments of seed, like those found in the ovaria of animals; which, he adds, always decay and come to nothing, unless impregnated by the farina of the same *plant*, or some other of the same kind.—The stamina, he says, serve for the conveyance of the male seed of the *plant*, to be perfected in the apices; which when ripe, bursting forth in little particles like dust, some of them fall into the orifice of the pistil, and are either conveyed thence into the utericle, to fecundify the female ova, or lodged in the pistil, where, by their magnetic virtue, they draw the nourishment from the other parts of the *plant* into the embryo's of the fruit, making them swell, grow, &c.

The disposition of the pistil, and the apices about it, is always such, as that the farina may fall on its orifice. It is usually lower than the apices; and when we observe it to be grown higher, we may conjecture the fruit has begun to form itself, and has no further occasion for the male dust. Add to this, that as soon as the work of generation is over, the male parts, together with the leaves, fall off, and the tube leading to the uterus begins to shrink. Nor must it be omitted, that the top of the pistil is always either covered with a sort of velvet tunicle, or emits a gummy liquor, the better to catch the dust of the apices.—In flowers that turn down, as the acanthus, cyclamen, and the imperial crown, the pistil is much longer than the stamina; that the dust may fall from their apices in sufficient quantity on the pistil.

This system favours much of that admirable uniformity found in the works of nature; and carries with it all the seeming characteristics of truth; but it is experience alone must determine for it.—Accordingly M. Geoffroy tells us, that in all the observations he had ever made, the *plant* was rendered barren, and the fruits became abortive, by cutting off the pistils before the dust could impregnate them; which is since confirmed by other experiments of Mr. Bradley.

In many kinds of *plants*, as the willow, oak, pine, cypress, mulberry-tree, &c. the flowers are sterile, and separate from the fruit. But these flowers, M. Geoffroy observes, have their stamina and apices, whose farina may easily impregnate the fruits, which are not far off.

Indeed there is some difficulty in reconciling this system to a species of *plants* which bear flowers without fruits, and another species of the same kind and name which bear fruits without flowers; hence distinguished into male and female: of which kind are the palm-tree, poplar, hemp, hops, &c.—For how should the farina of the male, here, come to impregnate the seed of the female?

M. Tournefort conjectures, that the fine filaments, tomentum, or down, always found on the fruits of these *plants*, may serve instead of flowers, and do the office of impregnation.—But M. Geoffroy rather takes it, that the wind, doing the office of a vehicle, brings the farina of the males to the females.

In this opinion he is confirmed by a story in Jovianus Pontanus; who relates, That in his time there were two palm-trees, the one male, cultivated at Brindisi; the other female, in the wood of Otranto, 15 leagues apart; that this latter was several years without bearing any fruit; till at length rising above

the other trees of the forest, so as it might see (says the poet) the male palm-tree at Brindisi, it then began to bear fruit in abundance.

Here, M. Geoffroy makes no doubt, the tree then only began to bear fruit, because in a condition to catch on its branches the farina of the male, brought thither by the wind.

For the manner wherein the farina fecundifies, M. Geoffroy advances two opinions:—1. That the farina being always found of a sulphurous composition, and full of subtile penetrating parts, (as appears from its sprightly odour) falling on the pistils of the flowers, there resolves; and the subtilest of its parts, penetrating the substance of the pistil and the young fruit, excite a fermentation sufficient to open and unfold the young *plant* inclosed in the embryo of the seed.—In this hypothesis the seed is supposed to contain the *plant* in miniature, and only to want a proper juice to unfold its parts, and make them grow.

The 2d opinion is, that the farina of the flower is the first germ, or bud of the new *plant*, and needs nothing to unfold it, and enable it to grow, but the juice it finds prepared in the embryo's of the seed.

These two theories of vegetable generation, the reader will observe, bear a strict analogy to those two of animal generation; viz. either that the young animal is in the semen masculinum, and only needs the juice of the matrix to cherish and bring it forth; or that the animal is contained in the female ovum, and needs only the male seed to excite a fermentation, &c. See *CONCEPTION*, *GENERATION*, &c.

M. Geoffroy rather takes the proper seed to be in the farina; inasmuch as the best microscopes do not discover the least appearance of any bud in the little embryo's of the grains, when examined before the apices have shed their dust.—In leguminous *plants*, if the leaves and stamina be removed, and the pistil, or that part which becomes the pod, be viewed with the microscope, ere yet the flower be opened; the little green transparent vesiculæ, which are to become the grains, will appear in their natural order; but still shewing nothing else but the mere coat, or skin of the grain. If the observation be continued for several days successively, in other flowers, as they advance, the vesiculæ will be found to swell, and by degrees to become replete with a limpid liquor; wherein, when the farina comes to be shed, and the leaves of the flower to fall, we observe a little greenish speck, or globule, floating about at large.—At first there is not any appearance of organization in this little body; but in time, as it grows, we begin to distinguish two little leaves like two horns. The liquor diminishes insensibly, as the little body grows, till at length the grain becomes quite opaque; when, upon opening it, we find its cavity filled with a young *plant* in miniature; consisting of a little germ of *plumula*, a little root, and the lobes of the bean or pea.

The manner wherein this germ of the apex enters the vesicula of the seed, is not very difficult to determine.—For, besides that the cavity of the pistil reaches from the top, to the embryo's of the grains, those grains, or vesiculæ, have a little aperture corresponding to the extremity of the cavity of the pistil, so that the small dust, or farina, may easily fall through the aperture into the mouth of the vesicula, which is the embryo of the grain.—This cavity, or cicatricula, is much the same in most grains; and it is easily observed in pease, beans, &c. without the microscope. The root of the little germ is just against this aperture, and it is through this it passes out when the little grain comes to germinate.

The process of nature in the generation of vegetables, and the apparatus she has contrived for that purpose, are so curious, and withal so little and so lately known among us, that we shall illustrate them further with figures; taking the melon for our example, in regard the parts of generation are here very distinct.

By the way it must be observed, that though the melon contains both sexes, yet the disposition of the organs differs, here, from the general one above rehearsed in the instance of the tulip: in effect, in the melon are two distinct flowers, or blossoms, the one doing the male office, the other the female; which we shall therefore call the *male* and *female* flower.

In *Tab. Nat. Hist. fig. 13.* is represented the male flower or blossom of the pumpkin, the leaves being stripped from off the circle FF.—A B E represent the head, placed in the centre of the flower, and formed of the circumvolutions of the apices B, and sustained by four columns G G G G.—The part B of the head represents the circumvolutions of the apices while yet shut; and the part E represents them open, and covered with the farina, which they before contained, but which is diffused on the outside when the *plant* arrives at maturity. Each apex forms a kind of canal separated by a partition into two. A grain of the farina is represented by D. H represents the pedicle that sustains the flower, and which in the male flower produces nothing.

*Fig. 15.* represents the female flower, or blossom of the pumpkin, or that which bears the fruit.—The leaves are stripped off the circle FF, as before, the better to shew the other parts. The knot of the flower, or the embryo of the fruit, is represented by A. The pistil is represented by BB; and is only a continuation of the embryo of the fruit A. The top of the pistil spreads in BB into several oblong bodies, each separable into two lobes. These bodies are very rough, furnished with hairs and little vesicles proper to catch the dust of the male flower, and to conduct them to the mouths of the canals, which communicate as far

far as the cells of the grains contained in the young fruit. Upon cutting the pistil transversely in its smallest part, we find as many canals as there are divisions in its head; which canals correspond to as many little cells, each including two orders of grains, or seeds, ranged in a spongy placenta.

This doctrine of generation affords us a hint how to alter, improve, &c. the taste, form, flowers, quality of fruits, &c. viz. by impregnating the flower of one with the farina of another of the same class.

To this accidental coupling and intermixing it is, that the numberless varieties of new fruits, flowers, &c. produced every day, with many other phenomena in the vegetable kingdom, are to be ascribed. See MULE.

The affectation of perpendicularity observed in the stalks or stems of plants, as well as in their branches and roots, makes a fine speculation. --- It is a phenomenon never attended to till very lately. The cause is very subtle, and has employ'd the wits of several of the present set of philosophers, particularly Astruc, de la Hire, Dodart, and Parent: see their several systems under the article PERPENDICULARITY.

Now is that constant parallelism observed in the tufts of trees, to the soil or ground they grow upon, a circumstance to be overlooked. See PARALLELISM.

For the fecundity of PLANTS, &c. see FECUNDITY, &c.

PLANTS may be divided, with regard to the manner of their generating, into

*Male*, or such as bear no fruit or seed, and have only the male organ of generation, viz. the farina—Of this kind are the *Male* palm-tree, willow, poplar, hemp, nettle, and hop-tree.

*Female*, or such as bear fruit, and have the female organ, viz. the pistil, or uterus, but want the farina. --- Such are the *female* palm, willow, poplar, &c.

*Hermaphrodites*, or such as have both male and female parts, the farina and pistil.

These are again subdivided into (1.) those, in whose flower both sexes are united; as the lily, gilliflower, tulip, and much the greater part of the vegetable species; whose pistil is surrounded by the stamina. And (2.) those whose male and female parts are distinct, and at a distance from each other; such is the rose, whose uterus is beneath the petals; the melon, and all of the cucumber kind, which have their male and female flowers apart; and all fruit, nut, and mast-bearing trees, as the apple, plum, gooseberry; the walnut, hazle, philbud, oak, beech, pine, cypress, cedar, juniper, mulberry, plantain, &c. which have catkins.

Plants may be again distinguished, with regard to their food, and the element they live in, into

*Terrestrial*, which are those that live only on land; as oaks, beech, &c.

*Aquatic*, which live only in water; either in rivers, as the water-lily, water-plantain, &c. or in the sea, as the fucus, coral, coralline, &c.

*Amphibious*, which live indifferently either in land or water; as the willow, alder, mints, &c.

Plants are again distributed, with regard to their age or period, into *Annual*, which are those whose root is formed and dies in the same year; such are the leguminous plants, wheat, rye, &c.

*Bisannuals*, which only produce flowers and seeds, the second or even third year after their being raised, and then die; such are fenel, mint, &c.

*Perennial*, which are those that never die after they have once borne seed; of these some are ever-greens, as the asarabacca, violet, &c. others lose their leaves one part of the year, as fern, colts-foot, &c.

Plants again are distinguished with regard to their magnitude, &c. into,

*Trees*, arbores; as the oak, pine, fir, elm, sycamore, &c.

*Shrubs*, suffrutices; as the holly, box, ivy, juniper, &c. and

*Herbs*, as mint, sage, sorrel, thyme, &c. See TREE, SHRUB, HERB, &c.

With regard to certain remarkable qualities, into

*Sensitive*\*, such as give some tokens of sense.

\* On which account they were called by the ancients *aschynomous* plants (from *aschynomous*, to be bathful) by the moderns, *living* or *mimic* plants.

But this division is rather popular, than just and philosophical. The Botanists give us more accurate and minute arrangements, or distributions, of the vegetable kingdom, into classes, genera, species, &c. with regard to their nature, characters, &c. --- It is a point they are not well agreed upon from what consideration the division into genera is best taken; some, as Gesner, Columna, Tournefort, &c. chusing the flower and fruit; and others taking in the roots, leaves, stems, &c. See farther under the article GENUS.

Our ingenious Mr. Ray distributes *Plants* into 25 genera, or classes, under the following denominations.

1. *Imperfect* PLANTS, which are such as appear to want the flower and seed—Such are, corals, sponges, fungus's, truffles, moss. See CORAL, SPONGE, MUSHROOM, TRUFFLE, and MOSS.
2. PLANTS producing an imperfect flower, and whose seed is too small to be discerned by the naked Eye;—such are fern, polypody, &c. See FLOWER.
3. Those whose flowers want petala;—such are hops, hemp, nettles, docks. See PETALA, HOPS, &c.
4. Those with a compound flower, and which emit a milky juice

when cut or broke; as lettuce, dandelion, succory, &c. See compound FLOWER.

5. Those with a compound flower of a discous form, and whose seed is winged with down; as colts-foot, flea-bane, &c. See WINGED.

6. *Herba capitate*, or those whose flower is composed of long fistulous flowers gathered into a round head, and covered with a scaly coat; as the thistle, great burdock, blue-bottle, &c.

7. *Corymbiferous* PLANTS with a discous flower, but no down; as the daisy, yarrow, corn-marygold, &c. See CORYMBUS.

8. PLANTS with a perfect flower, but only one seed to each flower; as valerian, agrimony, burnet, &c.

9. *Umbelliferous* PLANTS, with a flower of five petals, and two seeds to each flower. See UMBELLÆ --- This being a large genus is subdivided into seven species, viz. those with a broad flat seed like a leaf, as wild garden parsnip: with a longish and larger seed, swelling in the middle, as cow-weed, and wild chervil: with a shorter seed, as angelica: with a tuberous root, as the earth-nut: with a small striated seed, as caraways, saxifrage, and burnet: with a rough hairy seed, as parsley, and wild carrot: with incise leaves subdivided into jags, as fennel, and thorough-wax.

10. *Stellate* PLANTS, whose leaves grow round the stalks, at certain intervals, in form of stars; as mug-weed, madder, &c. See STELLATE.

11. *Rough-leaved* PLANTS, which have their leaves placed alternately, or in no certain order along the stalks; as hounds-tongue, mouse-ear, &c.

12. *Suffrutices*, or *verticillate* PLANTS, whose leaves grows by pairs, on their stalks, one leaf right against another, the flower being monopetalous, and usually in form of a helmet; as thyme, mint, pennyroyal, vervain, &c. See VERTICILLATE.

13. *Polypermous*, or those with many naked seeds, at least five, succeeding their flower; as crows-foot, marsh-mallows cinquefoil, strawberries, &c. See POLYSPERMIOUS.

14. *Bacciferous* PLANTS, or such as bear berries; as briony, honeysuckle, Solomon's-seal, lily of the valley, nightshade, asparagus, &c. See BACCIFEROUS, BERRY, &c.

15. *Multisiliquous*, or *corniculate* PLANTS, which after each flower produce several long slender siliques, or cases wherein their seed is contained; as orpine, navel-wort, bears-foot, columbines, &c. See MULTISILIQUEOUS, &c.

16. *Vasculiferous* PLANTS with a *monopetalous* flower, and which, after each flower, have a vessel beside the calyx, containing the seed; as henbane, bindweed, rampions, fox-glove, eye-bright, &c. See VASCULIFEROUS, &c.

17. Those with an *uniform tetrapetalous* flower, bearing their seeds in oblong siliquous cases; as stock-gilliflower, mustard, radish, &c.

18. *Vasculiferous* PLANTS with a *seeming tetrapetalous* flower, but of an anomalous or uncertain kind, and in reality only monopetalous, falling off altogether in one; as speedwell, fluellin, plantain, yellow and wild poppy, &c.

19. *Vasculiferous* PLANTS with a *pentapetalous five-headed* flower; as maiden-pinks, campions, chickweed, St. John's-wort, flax, primrose, wood-sorrel, &c.

20. *Leguminous* PLANTS, or such as bear pulse, with a papilionaceous flower, consisting of four parts joined at the edges; as pease, beans, vetches, tares, lentils, liquorice, trefoil, &c. See LEGUMINOUS.

21. PLANTS with a true bulbous root; as garlick, daffodil, hyacinth, saffron, &c. See BULB.

22. Those whose roots approach nearly to the bulbous form; as flower-de-luce, cuckoo-pint, bastard hellebore, &c.

23. *Culmiferous* PLANTS, with a grassy leaf, and an imperfect flower, having a smooth hollow jointed stalk, with a long sharp pointed leaf at each joint, and the seeds contained in a chaffy husk; as wheat, barley, rye, oats, and most kinds of grass. See CULMIFEROUS.

24. PLANTS with a grassy leaf, but not culmiferous, with an imperfect or staminate flower; as rushes, cats-tail, &c.

25. PLANTS whose place of growth is uncertain; chiefly water-plants, as the water-lily, milk-wort, mouse-tail, &c.

For the transmutation of one species of PLANTS into another, see TRANSMUTATION, DEGENERATION, &c.

The properties and virtues of plants have been observed by some naturalists to bear an analogy to their forms. --- In the Philosophical Transactions, we have a discourse of Mr. James Pettiver, to shew, that plants of the same or like figure, have the same or like virtues and uses. --- Thus, the umbelliferous tribe, he observes, have all a carminative taste and smell, are powerful expellers of wind, and therefore good in all flatulent disorders. --- The galeate or verticillate kind, are a degree warmer, and more powerful than the last; and therefore may be reputed aromatic, being proper for nervous disorders. --- The tetrapetalous kind are not like the two former, but exert their power in a different way, viz. by a diuretic volatile salt, which makes them of use in chonical diseases, obstructions, cacochymias, &c.

PLANTA, in anatomy, the lowest part, or sole of the foot of man; comprehended between the tarsus and the toes. See FOOT.

PLANTAGENET, in history, an addition, or surname, borne by many of our ancient kings. See SURNAME, &c.

The term *Plantagenet* has given infinite perplexity to the critics and antiquaries, who could never settle its origin and etymology.

---If

—It is allowed it first belonged to the house of Anjou, and was brought to the throne of England by Henry II. where his male posterity preserved it till the time of Henry VII. a space of above 400 years.

It is disputed who it was that first bore the name. Most of our English authors conclude, that our Henry II. inherited it from his father Geoffrey V. earl of Anjou, son of Fulk V. king of Jerusalem, who died in 1144.—This Geoffrey they will have the first of the name; and our Henry II. the issue of Geoffrey by Maud only daughter of Henry I. the second.

Yet Menage will not allow Geoffrey to have bore the name; and in effect the old annalist of Anjou, J. Bourdigne, never calls him so.—The first Menage adds, to whom he gives the appellation, is Geoffrey third son of this Geoffrey V.

Yet must the name be much more ancient than either of these princes, if what Skinner says of its origin and etymology be true.—That author tells us, that the house of Anjou derived the name from a prince thereof, who having killed his brother to enjoy his principality, took to repentance, and made a voyage to the Holy Land to expiate his crime; disciplining himself every night with a rod made of the plant *genêt*, *genista*, broom; whence he became nick-named *Planta-genêt*.

Now, it is certain that our Geoffrey made the tour of Jerusalem; but then he did not kill his brother; nor did he go thither out of penance, but to assist king Amauris his brother.—Who then should this prince of the house of Anjou be? Was it Fulk IV? It is true he dispossessed his elder brother Geoffrey, and clapt him in prison, but did not kill him; nay, Bourdigne observes, he was even released out of the same by his son Geoffrey V. already mentioned.

Further, this Fulk did make a journey to Jerusalem, and that, too, partly out of a penitential view; we are assured by Bourdigne, he did it out of apprehension of the judgments of God, and eternal damnation, for the great effusion of christian blood in the many mortal battles he had been in.—The annalist adds, that he made a second voyage; but it was to return God thanks for his mercies, &c. To which we may add, that Fulk was never called *Plantagenet*; so that what Skinner advances appears to be a fable.

There is another common opinion, which appears no better founded; and it is this, that the name *Plantagenet* was common to all the princes of the house of Anjou, after Geoffrey V. whereas in fact, the name was only given to a few; and that, as it should seem, to distinguish them from the rest. Thus Bourdigne never applies it to any but the third son of Geoffrey V. and distinguishes him by this appellation from the other princes of the same family.—Though it is certain it was likewise given to the elder brother, Henry of England, as before observed.

**PLANTARIS**, in anatomy, a muscle which has a fleshy beginning, from the back part of the external protuberance of the thigh-bone, and descending a little way between the gemellus and soleus, becomes a long and slender tendon, which marches by the inside of the great tendon over the os calcis to the bottom of the foot, and expands itself under the sole, upon the musculus perforatus, to which it adheres closely, as the palmaris does in the hand. See *Tab. Anat. (Myol.) fig. 1. n. 68.* and also see **FOOT**, **PALMARIS**, &c.

Some reckon this among the extenders of the foot. See **EXTENSOR**.

**PLANTATION**, in the islands and continent of America, a spot of ground which some planter, or person arrived in a new colony, pitches on to cultivate and till for his own use. See **COLONY**.

**PLANTING**, in agriculture and gardening, the setting of a tree, or plant, taken up from its former place, in a new hole or pit proportionable to its bulk; throwing fresh earth over its root, and filling up the hole to the level of the other ground. See **PLANT**, **TRANSPLANTING**, **GARDENING**, &c.

**PLANTING an orchard.** See **ORCHARD**.

**PLANTING of forest-trees.** See **NURSERY**, **TREE**, &c.

**PLANTING of wall-fruit-trees.**—After two years growth in the nursery, stone-fruit, being first inoculated or grafted, are ready for removal; which is best done in October or November.

To prepare the soil for its new guest; a hole is dug two foot deep; or, if the soil be not very good, the pit is made shallower, and earth raised above it.—With the soil dug up, they frequently mix either a rich soil from elsewhere, or a manure, so as the mixture be at least as rich as the soil out of which the plant came.

The hole being half filled up with this compost, it is trodden down, to afford a firm rest to the root; all the extremities whereof are cut off, and the tree fitted to the wall by cutting off such branches as grow directly either towards or from-wards the wall, and leaving only the side branches, which are to be nailed to it.

This done, the tree is set in its hole, as far from the wall as is consistent with the head's spreading thereon; that the root may have the more room backwards: and the hole then filled up with the compost.

If the soil be poor, it is proper to manure round the tree; and in the end of February, to cover it with fern or straw.—It will be necessary to prune and nail the tree to the wall, at least twice or thrice every year. See **WALLS**.

**Inverse PLANTING** is a method of planting, wherein the ordinary position of the plant, or shoot, is inverted; the branches being set in the earth, and the roots reared into the air.

Agricola mentions this monstrous way of *planting*, which he assures us succeeds very well in most or all sorts of fruit-trees, timber-trees, &c. foreign and domestic.

Bradley affirms to have seen a lime-tree in Holland growing with its first roots in the air, which had shot out branches in great plenty, at the same time that its first branches were turned into roots, and fed the tree.

The industrious Mr. Fairchild has practised the same at home; and gives us the following directions for the performance thereof.

Chuse a young tree of one shoot, of alder, elm, willow, or any other tree that takes root readily by laying. Bend the shoot gently down till the extreme part be in the earth, and so let it remain till it has taken good root.—This done, dig about the first root, and gently take it up out of the ground till the stem be nearly upright; in which state stake it up.

Then prune the roots, now erected in the air, from the bruises and wounds they received in being dug up; and anoint the pruned part with a composition of four parts of bees-wax, two of resin, and two of turpentine, melted together and applied pretty warm.

—Then prune off all the buds or shoots upon the stem, and dress the wounds with the same composition, to prevent any collateral shootings; and leave the rest to nature. See **FECUNDITY**.

**PLANTING**, in architecture, denotes the laying the first courses of stone on the foundation, according to the measures, with all the exactness possible. See **FOUNDATION**, **BUILDING**, **HOUSE**, &c.

**PLASM**, **PLASMA**, is sometimes used for a mould, wherein any metal, or such-like running matter, which will afterwards harden, is cast, to receive its figure. See **MOULD**; see also **PLASTIC**.

**PLASTER**, or **PLAISTER**, in building, a composition of lime, sometimes with hair, sometimes with sand, &c. to parget, or cover the nudities of a building. See **PARGETING**.

**PLASTER of Paris**, is a fissile stone, of the nature of a lime-stone; serving many purposes in building; and used likewise in sculpture, to mould and make statues, basso-relievo's, and other decorations in architecture. See **STONE**, **STATUE**, &c.

It is dug out of quarries, in several parts of the neighbourhood of Paris; whence its name.—The finest is that of Montmartre.

This plaster is of two kinds, *viz.* *crude*, or in the stone; and *burnt*, or beaten.

The *crude* is the native plaster, as it comes out of the quarry; in which state it is used as shards in the foundations of buildings.

The *burnt plaster* is a preparation of the former, by calcining it like lime in kiln or furnace, and then beating it into powder, and diluting and working it. See **LIME**, &c. In this state it is used as mortar or cement in buildings. See **MORTAR**.

This, when well sifted and reduced into an impalpable powder, is used to make figures and other works of sculpture; and is besides of some use in taking out spots of grease, &c. in stuffs and silks. See **FIGURE**, **SCULPTURE**, &c.

In the plaster quarries is also found a kind of false talc, where-with they counterfeit all kinds of marble. See **MARBLE**, **GYP-SUM**, **STUC**, &c. See also **PLASTICE**.

**PLASTIC**, *πλαστικόν*, imports as much as *formative*, or a thing endued with a faculty of forming, or fashioning a mass of matter after the likeness of a living being.

\* The word comes from the Greek, *πλαστικός*, of *πλατύνω*, or *πλατύνω*, *tingo*, *I fashion*, *form*, &c.

Some of the ancient Epicureans, and perhaps the Peripatetics too, imagined a *plastic* virtue to reside in the earth, or at least to have anciently resided therein; and that it was by means hereof, and without any extraordinary intervention of a Creator, that it first put forth plants, &c. See **EARTH**, **WORLD**, &c.

Nay, some of them, whether seriously or not, we do not undertake, taught, that animals, and even man, were the effect of this *plastic* power. See **PLATONIST**, **PERIPATETIC**, &c.

**PLASTICE**, *πλαστική*, the **PLASTIC art**; a branch of sculpture, being the art of forming figures of men, birds, beasts, fishes, plants, &c. in plaster, clay, stuc, or the like. See **SCULPTURE**, **PLASTER**, **POTTERY**, &c.

The workmen concerned herein are also called *plastæ*, *πλασται*.

*Plastice* differs from carving, in that here the figures are made by addition of what wants; but in carving always by subtraction of what is superfluous. See **ENGRAVING**.

The *plastic art* is now chiefly used among us in fret-work-ceilings; but the Italians apply it also to the mantlings of chimnies with great figures. See **FRET-WORK**, **CEILING**, &c.

**PLAT**, a popular term among mariners, &c. for a sea-chart. See **CHART**.

**PLATA**, **PLATE**, in commerce, a Spanish term, signifying silver; as vellon, which they pronounce vellion, signifies copper. See **SILVER**, **COIN**, &c.

These two terms are not only used to express the species of those metals struck in Spain, but also to distinguish between several of their monies of account.—Thus they say a ducat of *plata*, and a ducat of vellon; a rial of *plata*, and a rial of vellon; which denominations augment and diminish the value by almost one half; 34 maravedis of *plata* being equal to 63 of vellon; and the piece of eight being only 272 maravedis of *plata*, but 510 of vellon. See **DUCAT**, **PIECE of eight**, **RIAL**, and **MARAVEDIS**.

**PLATE**, in commerce, denotes gold or silver wrought into vessels for domestic uses. See **GOLD**, **SILVER**, **MARK**, **PUNCHION**, &c.

**PLATE**, in heraldry, is a round, flat piece of silver, without any impression; but, as it were, formed ready to receive it.

The

# PLA

The term is used only by English heralds.—In other nations they are known by the name of *bezants argens*. See **BEZANT**.

**PLAT-BAND**, in gardening, a border, or bed of flowers, along a wall, or the side of a parterre; frequently edged with box, &c. See **PARTERRE**, **EDGING**, &c.

**PLAT-BAND**, in architecture, is any flat square moulding, whose height much exceeds its projecture.—See *Tab. Archit. fig. 28. lit. n.* and also see **MOULDING**.

Such are the faces or fasciæ of an architrave, and the *plat-band* of the modillions of a cornich. See **ARCHITRAVE**, **CORNICH**, &c.

The *plat-band* is signified in Vitruvius, and others, by the words *fascia*, *tænia*, and *corfa*. See **FASCIA**, **TÆNIA**, &c.

**PLAT-BAND** of a door or window, is used for the lintel, where that is made square, or not much arched. See **LINTEL**.

These *plat bands* are usually crossed with bars of iron, when they have a great bearing; but it is much better to ease them by arches of discharge built over them. See **DOOR**, **WINDOW**, &c.

**PLAT-BANDS** of flutings, the lists or fillets between the flutings of columns. See **FLUTING**.

**PLAT-FORM**, in war, an elevation of earth, on which cannon is placed to fire on the enemy. See **RAMPART**, **BATTERY**, &c.

Such are the mounts on the middle of the curtains.—On the rampart is always a *plat-form*, where the cannon are mounted.

It is made by the heaping up of earth on the rampart, or by an arrangement of madriers, rising insensibly for the cannon to roll on; either in a casemate, or on an attack in the out-works.

**PLAT-FORM**, in architecture, is a row of beams, which support the timber-work of a roof, and lie on the top of the wall, where the entablature ought to be raised.

**PLAT-FORM** is also used for a kind of terrace, or broad smooth open walk on the top of a building, from whence we may take a fair prospect of the adjacent country.

Hence an edifice is said to be covered with a *plat-form*, when it is flat a-top, or has no ridge. See **ROOF**.

Most of the oriental buildings are thus covered, as were all those of the ancients.—Cæsar was the first among the Romans who procured leave to build his house with a ridge, or pinnacle. See **PINNACLE**.

**PLAT-FORM**, or *orlop*, in a man of war, is a place on the lower deck, abaft the main-mast, between it and the cock-pit, and round about the main capitan; where provision is made for the wounded men, in time of service. See *Tab. Ship, fig. 2. lit. 7.*

**PLATONIC**, something that relates to Plato, his school, philosophy, opinions, or the like. See **PLATONISM**.

**PLATONIC bodies**, are the same with what we otherwise call *regular bodies*. See **REGULAR bodies**.

**PLATONIC love**, denotes a pure, spiritual affection, subsisting between the different sexes, abstracted from all carnal appetites, and regarding no other object but the mind, and its beauties; or even a sincere disinterested friendship, subsisting between persons of the same sex, abstracted from any selfish views, and regarding no other object but the person.

The term took its rise from the philosopher Plato, a strenuous advocate for each kind. See **PLATONISM**.

The world has a long time laugh'd at Plato's notions of love and friendship.—In effect, they appear arrant chimera's, contrary to the intentions of nature, and inconsistent with the great law of self-preservation; which love and friendship are both ultimately resolvable into. See **PASSION**.

**PLATONIC year**, or the *great year*, is a period of time determined by the revolution of the equinoxes; or the space wherein the stars and constellations return to their former places, in respect of the equinoxes. See **YEAR**, **STAR**, **PRECESSION of the equinoxes**, &c.

The *Platonic year*, according to Tycho Brahe, is 25816; according to Ricciolus 25920; according to Cassini 24800 years.

This period, which is more than five times the age of the world, once accomplished, it was an opinion among the ancients, that the world was to begin anew, and the same series of things to turn over again. See **PERIOD**, **PALINGENESIA**, &c.

**PLATONISM**, the doctrine and sentiments of Plato and his followers, with regard to philosophy, &c. See **PHILOSOPHY**.

The founder of this system of philosophy, Plato, the son of Aristot, was an Athenian; born about the year of the world 3625; who, after having spent his youth in exercises of the body, painting, and poetry, became a disciple of Socrates.—After his master's death, he applied himself to Cratylus and Hermogenes; till being a master of the Greek philosophy, he travelled into Italy, where he learnt that of the Pythagoreans. See **PYTHAGOREAN**.

Thence he proceeded into Egypt; where, in several years residence, he became fully acquainted with the secrets of the Egyptian priests. See **SYMBOL**.

At his return to Athens he began to retail the stock of learning he had collected, among his countrymen; philosophizing daily in the academy, a delicious villa in the neighbourhood of that city. See **ACADEMY**—And hence his disciples were called *Academics*.

In physics, he chiefly followed Heraclitus; in ethics and politics, Socrates; in metaphysics, Pythagoras.

After his death, two of the principal of his disciples, Aristotle and Xenocrates, continuing his office, and teaching, the one in the academy, the other in the lyceum, form'd two sects under different names, though in other respects the same; the

VOL. II.

# PLA

one retaining the denomination or *Academics*; see **ACADEMIC**: The other assuming that of *Peripatetics*. See **PERIPATETIC**.

In after-times, about the first ages of the Christian church, the followers of Plato quitted the title of *Academics*, and took that of *Platonists*.

It is supposed to have been at Alexandria in Egypt that they first assumed the new title, after having restored the ancient academy, and re-established Plato's sentiments; which in process of time had many of them been laid aside.

Porphyry, Plotin, Iamblichus, Proclus, and Plutarch, are those who acquired the greatest reputation among the Greek Platonists; and among the Latins, Apuleius, and Chalcidius.—Among the Hebrews, Philo Judæus.—The modern Platonists own Plotin the founder, at least the reformer of their sect.

The *Platonic philosophy* appears very consistent with the Mosaic; and a great party of the primitive fathers follow the opinions of that philosopher, as being favourable to Christianity.—Justin is of opinion, Plato could not learn many things he has said in his works, from mere natural reason; but thinks he might have learnt them from the books of Moses, which he read when in Egypt.

Hence Numenius, the Pythagorean, expressly calls Plato the *Attic Moses*; and upbraids him with plagiarism, in that he stole his doctrine about the world and God, from the books of Moses. Theodoret says expressly, that he has nothing good and commendable about the Deity, and his worship, but what he stole from the Hebrew theology; and Clemens Alexandrinus calls him the *Hebrew philosopher*.

Gale is very particular in his proof of the point, that Plato borrowed his philosophy from the scriptures, either immediately, or by means of tradition; and, beside the authority of ancient writers, brings some arguments from the thing itself.—As, *e. gr.* Plato's confession that the Greeks borrowed their knowledge of the one infinite God, from an ancient people, better and nearer to God than they; by which people, our author makes no doubt, he meant the Jews: from his account of the state of innocence; as, that man was born of the earth, that he was naked, that he enjoyed a truly happy state, that he conversed with brutes, &c.

—In effect, from an examen of all the parts of Plato's philosophy, physical, metaphysical, and ethical; this author finds, in every one, evident characters of its sacred original.

As to the manner of the creation, Plato teaches that the world was made according to a certain exemplar, or idea, in the divine Architect's mind. And all things in the universe, in like manner, he shews, do depend on the efficacy of eternal ideas.

This ideal world is thus explain'd by Didymus: "Plato supposes certain patterns or exemplars of all sensible things, which he calls ideas; and as there may be various impressions taken off from the same seal, so is there a vast number of natures existing from each idea." This idea he supposes to be an eternal essence, and to occasion the several beings in nature to be such as itself is: and that most beautiful and perfect idea, which comprehends all the rest, he maintains to be the world. See **IDEA**.

Further, Plato teaches that the universe is an intelligent animal, consisting of a body and a soul. See **ANIMA MUNDI**.

The first matter whereof this body was formed, he observes, was a rude indigested heap, or chaos: Now, adds he, the creation was a mixed production; and the world is the result of a combination of necessity and understanding, *i. e.* of matter, which he calls necessity, and the divine wisdom.

The principles, or elements, which Plato lays down, are fire, air, water, and earth. See **ELEMENT**.

He supposes two heavens; the *empyrean*, which he takes to be of a fiery nature, and to be inhabited by angels, &c. and the *starry heaven*, which he teaches is not adamantine or solid, but liquid and spirable. See **HEAVEN**.

His physics, or doctrine *de corpore*, is chiefly laid down in his *Timæus*; where he argues on the properties of body, in a geometrical manner; which Aristotle takes occasion to reprehend in him.—His doctrine *de mente* is delivered in his tenth book of *laws*, and his *Parmenides*.

St. Augustin commends the *Platonic philosophy*; and even says, that the *Platonists* were not far from Christianity: He adds, that the generality of the new *Platonists* of his time embraced the faith.

Justin Martyr professes, that Plato's doctrine was of the utmost advantage to him, in helping him to believe the mysteries of the Christian faith.—To which it may be added, that it was in good measure by Plato's help that Origen confuted Celsus. See **TRINITY**, &c.

Indeed the late author of *Platonisme dévoilé* carries things to an extravagant length, when he contends, that the dogmata of our religion are only the opinions of Plato; that the fathers give us nothing of the mysteries thereof, but what they learnt from him; and that Christianity is only *Platonism* veiled, or covered over. To which opinion, however, M. le Clerc seems a little inclined. See **GOD**, **FATHERS**, &c.

**PLATONISTS**. See **PLATONISM**, and **ACADEMICS**.

**PLATTOON\***, or **PLOTTOON**, in war, a small, square body of 40 or 50 men, drawn out of a battalion of foot, and placed

\* The word is formed, by corruption, of the French *peloton*, a bottom, or clue of thread.

# P L E

between the squadrons of horse, to sustain them; or in ambuscades, streights, and defiles, where there is not room for whole battalions or regiments. See BATTALION, &c.

*Plattoons* are also used, when they form the hollow square to strengthen the angles. See MUSQUETEER.

The grenadiers are generally posted in *plattoons*. See GRENA-DIER.

PLATTS, on board a ship, are flat ropes made of rope-yarn, and woven one in another. See ROPE, &c.

Their use is to save the cable from galling in the haul; or to wind about the flukes of the anchors, to save the pendant of the fore-sheer from galling against them.

PLATYSMA, *Myoides*. See MUSCLE.

PLAY, *Lusus*. See GAME, and GAMING.

PLAY, in Poetry, &c. See DRAMA, TRAGEDY, COMEDY, &c.

PLAY-HOUSE. See THEATRE, AMPHITHEATRE, &c.

PLEA, PLACITUM, in law, that which either party alledgeth for himself in court, in a cause then depending to be tried. See PLACITA, ACTION, and COURT; see also PLEADING, &c.

*Pleas* are either of the crown, or common *pleas*.

PLEAS of the crown, are all suits in the king's name, for offences committed against his crown and dignity, or against his crown and peace.—Such are treasons, felonies, misprisions of either, and mayhem. See TREASON, FELONY, &c.

Edward I. enfeoffed Walter de Burgo in the land of Ulster in Ireland, &c. excepting the *pleas* of the crown, viz. rape, wilful firing, and treasure-trove. *Cam. tit. Ireland.*

Common PLEAS, are those agitated between common persons; though, by the division above laid down, they should comprise all others except those there enumerated, notwithstanding the king be a party. See ABATEMENT.

*Pleas* may farther be divided into as many branches as *action*; inasmuch as they are in reality the same thing. See ACTION.

There is also *foreign plea*, whereby matter is alledged in any court, that ought to be tried by another.—As if one lay bastardy to another in a court baron. See FOREIGN.

PLEAS of the sword.—Ranulph earl of Chester, 2 Hen. III. granted to his barons of Cheshire, an ample charter of liberties, *exceptis placitis ad gladium meum pertinentibus*.

The reason of the exception was, that William the Conqueror gave the earldom of Chester to his half-brother Hugh, commonly call'd Lupus, ancestor of this Ranulph, *Tenere ita libere ad gladium; sicut ipse rex tenuit Angliam ad coronam*.

Accordingly, in all indictments for felony, murder, &c. in the county Palatine, the form was, *Contra pacem domini comitis, gladium & dignitatem suam; or contra dignitatem gladii Cestrie*.—Such were the *pleas* for the dignity of the earl of Chester. See GLADIUS.

Court of common PLEAS, called also *common bench*. See Common PLEAS.

PLEADING, PLACITATIO, a discourse spoken at the bar, in defence of the cause of a party. See PLEA.

From the time of the conquest, all *pleading* was performed in French, till the time of Edward III. when it was appointed that the *pleas* should be *pleaded* in English, but to be entered or recorded in Latin. See LATIN.

At Athens, and even in France and England, it was prohibited to have any formed or prepared *pleading*, or to amuse the court with long artificial harangues; only, in important matters, it was the settled custom to begin the *pleadings* with a passage in holy scripture.

It is but of late years that eloquence was admitted to the bar; and it may be said, there is scarce any nation in Europe, where it is less practised or encouraged, than among us.—The elocution of the bar, like that of the pulpit, despises the rules of rhetoric. See ACTION, ELOQUENCE, ORATORY, &c.

PLEADINGS, in a stricter sense, are all the allegations of the parties to a suit, made after the count, or declaration, till issue is joined. See DECLARATION.

In this sense the *pleadings* express what is contained in the bar, replication, and rejoinder; and not what is in the declaration itself.—Hence defaults in the matter of declaration, are not comprised within the *mispleading*, or insufficient *pleading*, which only extends to that committed in the bar, replication or rejoinder. See BAR, REPLICATION, and REJOINDER.

PLEASURE, the effect of a sensation or perception agreeable to the mind, or of the gratification of some appetite. See APPE-TITE, SENSATION, &c.

*Pleasures* may be distinguish'd into two kinds.—The first, those which anticipate, or go before the reason; such are all agreeable sensations.—These are popularly called *pleasures of sense*, or of the body. See SENSE.

The second are those which do not precede or anticipate either the senses or reason.—These we call *pleasures of the mind*.—Such is the joy arising from a clear perception of some future good, or confused sensation of a present one. See MIND.

For an instance of each:—A man frequently finds *pleasure* in eating a fruit he was before unacquainted withal: This is *anticipating pleasure*, which he feels ere he knows the fruit to be good. On the other hand, a hungry hunter expects, or perhaps actually finds, vicinals; where the joy he conceives, is a *pleasure* that follows from the knowledge of his present or future good. See PAIN. *Pleasure* and *pain* seem to be no other than engines in nature's

# P L E

hand; whereby we are directed to consult our own preservation, and avoid our ruin.—To things that may contribute to the one, as food, venery, &c. she has annexed *pleasure*; and to those that may conduce to the other, as hunger, diseases, &c. pain: She durst not leave it to our discretion, whether we would preserve and propagate the species or not; but, as it were, constrains us to both: Were there no *pleasure* in eating, nor pain in hunger, what numbers would be starved through negligence, forgetfulness, or slothfulness? What is it induces people to the office of generation, but *pleasure*? Without this the world had scarce subsisted to this time.

Among the multiplicity of things to be done, and to be avoided, for the preservation of animal life, &c. how should we have distinguished between the one and the other, but for the sensations of *pleasure* and pain? These are not only spurs, to urge us on, but also guides, to direct us whither we are to go. Where-ever nature has fixed a *pleasure*, we may take it for granted, she there enjoins a duty; and something is to be there done, either for the individual, or the species.

Hence it is that our *pleasures* vary at different stages of life; the *pleasures*, e. gr. of a child, a youth, a grown man, an old man, &c. all tending to those particular things required by nature in that particular state of life, either for the preservation, simply, or for that and propagation, &c.

Hence, from the different constitutions of the body, at different ages, it were very easy to account for all the particular tastes and *pleasures* thereof: Not by deducing the *pleasures* mechanically from the disposition of the organs in that state; but by considering what is necessary for the perfection and well-being of the individual in that state, and what it is to contribute to that of the species.—In a child, e. gr. mere preservation in the present state is not enough; it must likewise grow: to bring this to pass, nature has made the returns of hunger, &c. more frequent, as well as more acute; and the *pleasures* of feeding more exquisite. And that the excess of aliment in proportion to the bulk of the body may be dispensed withal, she has made one of the great *pleasures* of that state to consist in a series of sportive exercises, by means whereof the parts of the body come to be opened and expanded, and arrive at maturity. This done, the *pleasures* that conducted thereto disappear; and others, suited to the new state, succeed. See NATURAL inclination; see also PASSION.

For the PLEASURES of beauty, music, &c. See BEAUTY, MUSIC, &c.

PLEBANUS, was anciently the title of a rural dean. See RURAL dean.

The denomination arose hence, that these deanries were then affixed to the *plebania*, or chief mother-church, within such a district, which at first was usually ten parishes.

PLEBANUS seems also to have been used for a parish-priest, of such a large mother-church, as was exempt from the jurisdiction of the ordinary; so that he had the authority of a rural dean committed to him by the archbishop, to whom the church was immediately subject.

PLEBEIAN, PLEBEIUS, a person of the rank of the populace, or common people. See COMMONS.

The term is chiefly used in speaking of the ancient Romans, who were divided into *senators*, *knights*, and *plebeians* or *commons*. See SENATOR, KNIGHT, &c.

PLEBISCITUM, among the Romans, a law enacted by the common people, at the request of the tribune, or some other plebeian magistrate, without the intervention of the senate. See LAW.

PLEBISCITUM is more particularly applied to the law which the people made, when, upon a misunderstanding with the senate, they retired to the Aventine mount. See CIVIL law.

PLEDGE, PLEGIUS, in common law, a surety; or gage, either real or personal, which the plaintiff or demandant is to find for his prosecuting the suit. See GAGE, and VADARI.

The word is sometimes also used for *frank pledge*, which see. See also PLEDGERY.

To PLEDGE, in drinking, denotes to warrant, or be surety to one, that he shall receive no harm while he is taking his draught.

The phrase is referred by our antiquaries, to the practice of the Danes, heretofore in England, who frequently used to stab, or cut the throats of the natives, while they were drinking.

PLEDGERY, or PLEGGERY, suretiship, or an undertaking or answering for another. See SURETY, and PLEDGE.

The appellant shall require the constable and marshal to deliver his pleggs, and to discharge them of their *pleggers*; and the constable and marshal shall ask leave of the king to acquit his *pleggs*, after that the appellant is come into the lists to do his *devoir*. *Orig. Jur. ex Vet. Cod. MS. in Bibl. Selden.*

PLEDGET, in chirurgery, a kind of flat tent, made, not to enter a wound, but to be laid upon it, to imbibe the superfluous humours, and keep it clean and dry. See TENT, and WOUND.

PLEGIIS *acquietandis*, a writ that lies for a surety, against him for whom he is surety, in case he pay not the money at the day. *Fitz. Nat. Brev.*

PLEIADES, Πλειάδες, in astronomy, an assemblage of seven stars, in the neck of the constellation Taurus. See STAR. They are thus called from the Greek πλεω, *navigare*, to sail; as being terrible to mariners, by reason of the rains and storms that frequently rise with them.

The

# PLE

The Latins call them *Vergiliae*, from *Ver*, spring; because of their rising about the vernal equinox. See *VERGILIAE*.  
The largest is of the third magnitude, and is called *Lucida Pleiadum*. See their several longitudes, latitudes, magnitudes, &c. under the article *TAURUS*.

**POETICAL PLEIADES**, is a name which the Greeks gave to seven celebrated poets, flourishing under the reign of Ptolemy Philadelphus. In imitation of the Greeks, Ronfard formed a *Pleiades* of French poets, under the reign of Henry II.—It consisted of Daurat, Ronfard, du Bellay, Belleau, Baif, Tyard, and Jodelle. On the same model, some of their authors are projecting a new *Pleiades* of the Latin poets of the present time; but they are not yet agreed about the names of those that are to compose it; much less on him who shall be the *Lucida Pleiadum*.—M. Baillet has named F. Rapin, F. Commire, F. de la Rue, M. de Santeuil, M. Menage, M. du Perier, and M. Perit.

**PLENARTY**, in law, a term used in ecclesiastical matters; to denote that a benefice is full, or possessed of an incumbent. See *BENEFICE*.

In which sense it stands opposed to *vacancy*. See *VACANCY*, *VACATION*, &c.

Institution, by six months, is a good *plenarty* against a common person, but not against the king, without induction. See *INDUCTION*, and *INDUCTION*.

**PLENARY\***, something complete, or full.—Thus, we say, the pope grants *plenary indulgences*, i. e. full and entire remissions of the penalties due to all sins. See *INDULGENCE*.

\* The word is formed of the Latin *plenarius*, of *plenus*, full.

**PLENILUNIUM\***, in astronomy, that phasis or state of the moon popularly called the *full moon*. See *MOON*.

\* The word is a compound of the Latin *plenus*, and *luna*.

**PLENIPOTENTIARY\***, a person who has full power, and commission to do any thing.

\* The word is compounded of *plenus*, full, and *potentia*, power.

The word is chiefly understood of the ministers or ambassadors sent from princes or states, to treat of peace, marriages, and other important matters. See *MINISTER*, *AMBASSADOR*, &c.  
The first thing done in conferences of peace, is, to examine the powers of the *plenipotentiaries*. See *TREATY*.

**PLENITUDE**, *PLENITUDO*, the quality of a thing that is full, or that fills another. See *FULL*.

In physic, it is chiefly used for a redundancy of blood and humours. See *REPLETION*.

Physicians reckon two kinds of *plenitude*.—The one called *ad vires*, when the abundance of the blood oppresses the patient's strength.

The other *ad vasa*, when it fills the vessels too much; swelling to a degree of bursting. See *PLETHORA*.

**PLENUM**, in physics, a term used to signify that state of things, wherein every part of space, or extension, is supposed to be full of matter. See *MATTER*, and *SPACE*.

In opposition to a *vacuum*, which is a space supposed devoid of all matter. See *VACUUM*.

The Cartesianians adhere firmly to the doctrine of an absolute *plenum*.—This they do on this principle, that the essence of matter consists in extension; from whence, indeed, the consequence is very easy, that where-ever there is space or extension, there is matter. See *EXTENSION*.

But this principle we have shewn to be false; and therefore the consequence drawn from it falls to the ground. See *MATTER*.

But that there is a real vacuum in the nature of things, is likewise demonstrated by arguments *a posteriori*, under the article *VACUUM*.

**PLEONASM\***, *PLEONASMUS*, in rhetoric; a figure of speech, whereby we make use of words seemingly needless or superfluous, in order to express a thought with the greater force and energy.

\* The word is formed from the Greek *πλεονασμος*, q. d. *superabundancy*.

Such is, *I saw it with my own eyes*; or, *He heard it with his ears*, &c. See *FIGURE*.

The *pleonasm* is called by the Latins, *redundantia*. See *REDUNDANCY*.

*Pleonasm*, by grammarians, is usually defined a fault in discourse, wherein we say more than needs.

M. Vaugelas will not allow the phrase, *I saw it with my own eyes*, to be a *pleonasm*; inasmuch as there are no superfluous words in it; none but what are necessary to give a stronger assurance of the thing affirmed.—It is sufficient that one of the phrases say somewhat more than the other, to avoid the imputation of a *pleonasm*.

In effect, though we give the name *pleonasm* to any thing that is not necessary, or that enters the discourse independently of the sense or construction; yet there are frequently words which in that view would be pertinent, yet are used to good purpose to give a greater force, or grace to discourse.

*He spoke with his mouth*, is a *pleonasm* in English; it is none in Latin: Virgil says, *sic ore locutus*. Some French authors deny *unir ensemble*, to unite together, to be a *pleonasm*.

**PLEROTICS\***, *πληρωτικά*, in medicine, a kind of remedies, otherwise called *incarnatives*, and *sarcotics*. See *INCARNATIVE*, and *SARCOTIC*.

\* The word is formed from the Greek *πληρωω*, I fill.

**PLETHORA**, *πληθωρα*, in medicine, such an abundance of any

# PLE

good and laudable humour, as proves hurtful to the animal functions. See *HUMOUR*, &c.

*Plethora* is chiefly understood of the blood, though sometimes of the other humours. See *BLOOD*.

The *plethora* is the consequence of a good chylification, sanguification, &c. attended with a too sparing discharge by perspiration, &c.

It is usually described as either *ad vires*, or *ad vasa*. See *PLENITUDE*.

The *plethora* is chiefly produced in a body whose organs of digestion are strong, blood-vessels lax, diet full of good juice, temperament sanguine, mind at ease and indolent, of a middle age; and in a moist air.—It renders heat and motion intolerable, stretches the great vessels, and compresses the smaller. And hence stiffness, and heaviness, and on the least occasion, ruptures in the vessels, suffocations, &c. See *DISEASE*.

Dr. Freind makes the catamenia, or menses, the mere result of a *plethora*; and will have them only an evacuation for relief against the quantity of the blood, which he supposes to be natural to women, from the humidity of their temperature, the smallness of their vessels, &c. Hence a coacervation in the blood-vessels, of a superfluity of aliment remaining over and above what is excreted by the common ways. See *MENSES*.

**PLEVIN**, *PLEVINA*, in law, a warrant or assurance; the same with pledge. See *PLEDGE*, *REPLEVIN*, &c.

**PLEURA\***, *πλευρα*, in anatomy, a membrane which lines the inside of the cavity of the breast, and incloses all the parts contained therein, being of the same figure and extent as the thorax itself, and of the same substance with the peritonæum. See *THORAX*.

\* The word is derived from the Greek *πλευρα*, which primarily signifies *side*. The Latins call it *succingens*.

It is very fine and thin, yet manifestly double; thickest about the back, where it is fastened to the ligaments of the vertebræ.—

In the middle of the thorax it is doubled, which duplicature forms what we call the *mediastinum*, which divides the thorax longitudinally into two parts. See *MEDIASTINUM*.

The use of the *pleura* is to defend the inside of the thorax, and render it smooth, that the lungs may not be hurt in their motion. See *LUNGS*.

**PLEURISY**, *PLEURESIS*, *PLEURITIS*, *πλευριτις*, in medicine, a violent pain in the side, attended with an acute fever, a cough, and a difficulty of breathing.

The *pleurisy* arises from an inflammation of some part of the pleura, to which is frequently joined that of the exterior and superficial part of the lungs. See *INFLAMMATION*, and *PLEURA*.

It usually arises upon cooling too hastily, after violent heat; as by drinking cold water, lying open to the air, &c.

This inflammation seizes any part of the integuments of the thorax, viz. either the pleura or mediastinum; and therefore the pricking pain may be felt in any part of the thorax: but the place it most ordinarily infects is the side; sometimes the right, sometimes the left, sometimes higher, sometimes lower.

This makes what we call the *pleuritis vera*, or true or internal *pleurisy*; in opposition to the *notha*, or spurious or external *pleurisy*, which is a pain in the side, without any fever, and frequently without any cough; and is supposed to arise from a sharp serosity lodged in the pleura, of higher among the intercostal muscles.

The great remedy in the true *pleurisy* is copious and repeated bleeding. In adults, Sydenham observes, it is seldom cured with less than the loss of forty ounces of blood.—By omitting phlebotomy the patient is frequently suffocated.

The *pleurisy* sometimes succeeds another fever, occasioned by a precipitation of the febrile matter upon the pleura.

When it rises to an imposthume, it is called *empyema*. See *EMPHYEMA*.

When it happens in the mediastinum, or diaphragma, it is called *paraphrenitis*. See *PARAPHRENITIS*.

Etmuller recommends sudorifics in the *pleurisy*; and observes, that much more regard is to be had to the sputum that attends the cough, than the urine.—Baglivi notes, that *pleuritis* are frequently occult; and gives this method of discovering them.—Make the patient lie on his right or left side, and bid him breathe strongly, and cough: If he feel any pain or heaviness after it, he is certainly *pleuritic*.—The same author adds, that a hard pulse is a certain attendant of the *pleurisy*.

Riverius gives us instances of notable cures performed herein by cupping and scarification.

**PLEXUS**, in anatomy, a name common to several parts in the body, consisting of bundles of little vessels interwoven in form of net-work. See *VESSEL*.

The nerves, in their progress, form several *plexus's*, especially the par vagum, or eighth pair, the intercostals, and the fifth. See *NERVE*.

The par vagum, at its intersection with the intercostal nerve, forms the *plexus ganglioformis* superior and inferior. See *GANGLIOFORMIS*.—A branch of this nerve joining near the heart, with others from the intercostals, form the *plexus cardiacus superior*. See *CARDIACUS*.—A little further it sends off several branches, which, reuniting, form the *plexus pneumonicus*. See *NERVES*.—In each trunk of the intercostal before it arrives at the thorax, are two *plexus ganglioformes*, called *plexus cervicales*.—When arrived in the thorax, it receives

ceives three or four twigs from the vertebral nerves, together with which it constitutes the *plexus intercostalis*; whence descending into the abdomen, it forms that famous piece of network, called on the right side *plexus hepaticus*, and on the left *plexus splenicus*.—From the hepatic *plexus* arise a number of branches, proceeding some to the liver, others to the pancreas, others to the capsula or glisson, and other larger ones to the right kidney.—The splenic *plexus* sends out branches to the left part of the ventricle and pancreas, the spleen, the left atrabiliary capsula, and left kidney.—Lastly, several branches both from the hepatic and splenic *plexus*, passing along the mesenteric arteries, especially the upper, to which they serve as a kind of cover, form the mesenteric *plexus*, which bears some resemblance to a fan, from the circumference whereof proceed several little branches or threads in manner of rays, continued thence to the intestines; though still accompanying the arteries. See MESENTERIC, &c.

**PLEXUS choroides**, is a wonderful contexture of small arteries and veins, and, as some say, lymphatics, in the brain, on each side of the thalami nervorum opticom, and just over the pineal gland. See CHOROIDES, and BRAIN.

It is sometimes also called *plexus reticularis*, from its net-like structure. See RETICULARIS.

**PLICA**, in medicine, a disease of the hair, almost peculiar to Poland, and hence denominated *Polonica*; though there are instances of it in Hungary, Alsatia, Switzerland, &c. See HAIR.

The *plica* is a severe, malignant, and dangerous disease, wherein the hair of the head is matted and glued together beyond all possibility of being extricated; attended with a grievous disorder of all the limbs of the body; and before the hair become complicated, a violent pain; a sweat usually attending it.

An unseasonable cutting off the hair in this case is dangerous; nor is there any proper and adequate remedy for the disease yet discovered.

**PLIGHT**, in our old law-books, a term which signifies the estate, with the quality of the land; though sometimes it extends also to the rent-charge, and the possibility of a dower. *Coke's Inst. fol. 221.*

**PLINTH**, in architecture, a flat square member, in form of a brick; sometimes also called the *slipper*.—See *Tab. Archit. fig. 26. lit. n. fig. 24. lit. u. fig. 49. lit. k.*

\* The word comes from the Greek *πλινθος*, brick.

The *plinth* is used as the foot, or foundation of columns; being that flat square table, under the mouldings of the base and pedestal, at the bottom of the whole order; seeming to have been originally intended to keep the bottom of the primitive wooden pillars from rotting. See BASE, PEDESTAL, COLUMN, &c.

The *plinth* is also called *orle*, or *orlo*. See ORLO.

Vitruvius also calls the Tuscan abacus, *plinth*, from its resembling a square brick. See ABACUS.

**PLINTH of a statue**, &c. is a base, or stand, either flat, round, or square; serving to support a statue, &c. See STATUE, &c.

**PLINTH of a wall**, is a term for two or three rows of bricks advancing out from the wall; or, in the general, for any flat high moulding, serving in a front wall to mark the floors, or to sustain the eaves of a wall, and the larmier of a chimney. See WALL, &c.

**PLOCE**, in rhetoric, a figure whereby a word is repeated, by way of emphasis; in such manner as not only to express the subject, but the quality thereof.

Cruelty! yes, cruelty beyond all example. His wife's a wife indeed. See REPETITION.

**PLOK-PENIN**, a term used in the public sales at Amsterdam, for a little sum given to the last bidder.

The *plok-penin* is a kind of earnest, whereby it is signified, that the commodity is adjudged to him. See EARNEST.

The *plok-penin* differs according to the quality of the commodity, and the price of the lot.—Sometimes it is arbitrary, and depends on the pleasure of the buyer; and sometimes regulated by the ordinances of the burgo-masters.

For instance, the *plok-penins* of French wines are fixed at two florins; those of Frontignac at 20 sols; those of Rhenish at two florins; those of vinegar at 20 sols, and those of brandy at 30.

There are also merchandizes where there are no *plok-penins*; and others where it is double what we have mentioned.

**PLOT**, or **PLOTT**, in gardening. See the article GRASS-plot, &c.

**PLOT**, in dramatic poetry, the fable of a tragedy or comedy; or the action represented therein. See FABLE, and ACTION.

**PLOT** is more particularly used for the knot or intrigue, which makes the difficulty and embarrass of a piece. See KNOT, and INTRIGUE.

The unravelling puts an end to the *plot*. See CATASTROPHE.

**PLOT**, in surveying, the plan, or draught, of any parcel of ground, e. gr. a field, farm, or manor, surveyed with an instrument, and laid down in the proper figure and dimensions. See PLOTTING.

**PLOTTING**, among surveyors, the art of describing, or laying down on paper, &c. the several angles and lines of a tract of ground surveyed by a theodolite, or the like instrument, and a chain. See SURVEYING.

In surveying with the plain-table, the *plotting* is saved; the several angles and distances being laid down on the spot as fast as they are taken. See PLAIN table.

But in working with the theodolite, semicircle, or circumferentor, the angles are taken in degrees; and the distances in chains and links. See THEODOLITE, CIRCUMFERENTOR, &c.

So that there remains an after-operation, to reduce those num-

bers into lines; and so to form a draught, plan, or map. See MAP.—This operation is called *plotting*.

*Plotting*, then, is performed by means of two instruments, the protractor, and *plotting scale*.—By the first, the several angles observed in the field with a theodolite, or the like, and entered down in degrees in the field book, are protracted on paper in their just quantity. See PROTRACTOR.

By the latter, the several distances measured with the chain, and entered down, in like manner, in the field-book, are laid down in their just proportion. See PLOTTING scale.

Under those two articles, are found, severally, the use of those respective instruments in the laying down of angles and distances: We shall here give their use conjointly, in the *plotting* of a field, surveyed either with the circumferentor, or theodolite.

*Method of PLOTTING, from the circumferentor*.—Suppose an inclosure, e. gr. A B C D E F G H K, (*Tab. Surveying, fig. 21.*) to have been surveyed; and the several angles, as taken by a circumferentor in going round the field, and the distances as measured by a chain, to be found entered in the field-book, as in the following table:

	Deg.	Min.	Cha.	Link.		Deg.	Min.	Cha.	Link.
A	191	00	10	75	F	324	30	7	54
B	297	00	6	83	G	98	30	7	54
C	216	30	7	82	H	71	00	7	78
D	325	00	6	96	K	161	30	8	22
E	12	24	9	71					

1. On a paper of the proper dimensions, as L M N O, (*fig. 31.*) draw a number of parallel and equidistant lines, representing meridians, expressed in dotted lines.—Their use is, to direct the position of the protractor; the diameter whereof must always be laid either upon one of them, or parallel thereto; the semicircular limb downwards for angles greater than 180°, and upwards for those less than 180°.

The paper thus prepared, assume a point on some meridian, as A, whereon lay the centre of the protractor, and the diameter along the line.—Consult the field-book for the first angle, i. e. for the degree cut by the needle at A, which the table gives you, 191°.

Now since 191° is more than a semicircle, or 180°, the semicircle of the protractor is to be laid downwards; where, keeping it to the point, with the *protracting-pin*, make a mark against 191; through which mark, from A, draw an indefinite line A B.

The first angle thus protracted, again consult the book, for the length of the first line A B. This you find 10 chains 75 links.—From a convenient scale therefore, on the *plotting scale*, take the extent of 10 chains 75 links, between the compasses; and setting one point in A, mark where the other falls in the line A B, which suppose in B: draw therefore the full line A B, for the first side of the inclosure.

Proceed then to the second angle, and laying the centre of the protractor on the point B, with the diameter as before directed, make a mark, as c, against 297°, the degrees cut at B; and draw the indefinite line B c.—On this line, from the *plotting scale*, as before, set off the length of your second line, viz. 6 chains 83 links; which extending from B to the point C, draw the line B C, for the second side.

Proceed now to the third angle or station: Lay then the centre of the protractor, as before, on the point C; make a mark, as d, against the number of degrees cut at C, viz. 216, draw the indefinite line C d, and thereon set off the third distance, viz. 7 chains 82 links; which terminating, e. gr. at D, draw the full line C D, for the third side.

Proceed now to the fourth angle, D; and laying the centre of the protractor over the point D, against 325°, the degree cut by the needle, make a mark e; draw the dry line D e, and thereon set off the distance 6 chains 96 links, which terminating in E, draw D E for the fourth line: And proceed to the fifth angle, viz. E.

Here the degrees cut by the needle being 12° 24', (which is less than a semicircle) the centre of the protractor must be laid on the point E, and the diameter on the meridian, with the semicircular limb turned upwards.—In this situation make a mark, as before, against the number of degrees, viz. 12° 24', cut by the needle at E; draw the dry line E f, on which set off the fifth distance, viz. 9 chains 71 links; which extending from E to F, draw the full line E F, for the fifth side of the inclosure.

After the same manner proceeding orderly to the angles F, G, H, and K; placing the protractor, making marks against the respective degrees, drawing indefinite dry lines, and setting off the respective distances, as above, you will have the *plot* of the whole inclosure A B C, &c.

Such is the general method of *plotting* from this instrument; but it must be observed, that in this process, the stationary lines, i. e. the lines wherein the circumferentor is placed to take the angles, and wherein the chain is run to measure the distances, are, properly, the lines here *plotted*.—When, therefore, in surveying, the stationary lines are at any distance from the fence or boundaries of the field, &c. off-sets are taken, i. e. the distance of the fence from the stationary line is measured at each station; and even at intermediate places, if there prove any considerable bends in the fence.

In *plotting*, therefore, the stationary lines being laid down, as above, the off-sets must be laid down from them, *i. e.* perpendiculars of the proper lengths let fall at the proper places from the stationary lines. The extremes of which perpendiculars, being connected by lines, give the *plot* desired.

If, instead of going round the field, the angles and distances have been all taken from one station; the process of *plotting* is obvious, from the example above: All here required, being to protract, after the manner already described, the several angles and distances, taken from the same stationary point in the field; from the same point or centre on the paper.—The extremities of the lines thus determined, being then connected by lines, will give the *plot* required.

If the field have been survey'd from two stations, the stationary line, to be first *plotted*, as above; then, the angles and distances taken from each, to be laid down from each respectively.

The method of *PLOTTING*, where the angles are taken by the theodolite, *i. e.* by *back-sight* and *fore-sight*, (as it is call'd) is somewhat different.—To prepare the angles for *plotting*, the quantity of each must first be found; by subtracting the degrees of the *fore-sight* and *back-sight* from each other: the remainder is the angle to be protracted. See *THEODOLITE*.

The use of parallel lines is here excluded; and instead of laying the protractor constantly on, or parallel to, meridians, its direction is varied at every angle.—The practice is thus:

Suppose the former inclosure to have been survey'd with the theodolite, after the manner of *back sight* and *fore-sight*; and suppose the quantity of each angle to be found by subtraction. An indefinite line is drawn at random, as A K, (*fig. 31.*) and on this the measured distance, *e. gr.* 8 chains, 22 links, set off, as in the former example: If now the quantity of the angle A have been found 140° the diameter of the protractor is to be laid on the line A K, with the centre over A; and against the number of degrees, *viz.* 140, a mark made, an indeterminate dry line drawn through it, and the distance of the line A B laid down from the scale thereupon.

Thus we gain the point B; upon which laying the centre of the protractor, the diameter, along the line A B, the angle B is protracted, by making a mark against its number of degrees, drawing a dry line, and setting off the distance B C, as before.

Then proceed to C; laying the diameter of the protractor on B C, the centre on C protracts the angle C, and draw the line C D: Thus proceeding, orderly, to all the angles and sides, you will have the *plot* of the whole inclosure A B C, &c. as before.

*PLOTTING scale*, a mathematical instrument, usually of wood, sometimes of brass, or other matter; and either a foot, or half a foot long. See *SCALE*.

It is denominated from its use in *plotting* of grounds, &c. See *PLOTTING*.

On one side of the instrument (represented *Tab. Survey. fig. 32.*) are seven several scales, or lines, divided into equal parts.—The first division of the first scale is subdivided into ten equal parts, to which is prefix'd the number 10, signifying that 10 of those subdivisions make an inch; or that the divisions of that scale are decimals of inches.

The first division of the second scale is likewise subdivided into 10, to which is prefix'd the number 16, denoting that 16 of those subdivisions make an inch.—The first division of the third scale is subdivided in like manner into 10, to which is prefix'd the number 20.—To that of the fourth scale is prefix'd the number 24; to that of the fifth 32; that of the sixth 40; that of the seventh 48; denoting the number of subdivisions equal to an inch, in each, respectively.

The two last scales are broken off before the end, to give room for two lines of chords mark'd by the letters *c. c.* See *CHORD*.

On the back-side of the instrument is a diagonal scale, the first of whose divisions, which is an inch long, if the scale be a foot, and half an inch, if half a foot, is subdivided, diagonally, into 100 equal parts.—At the other end of the scale is another diagonal subdivision, of half the length of the former, into the same number of parts, *viz.* 100. See *DIAGONAL*.

Next the scales, is a line divided into hundredth parts of a foot, numbered 10, 20, 30, &c. and a line of inches subdivided into tenth parts, mark'd 1, 2, 3, &c.

Use of the *PLOTTING scale*.—1. Any distance being measured with the chain, to lay it down on paper.—Suppose the distance to be 6 chains, 50 links. Draw an indefinite line; set one foot of the compasses at figure 6 on the scale, *e. gr.* the scale of 20 in an inch, and extend the other to 5 of the subdivisions, for the 50 links: This distance being transferred to the line, will exhibit the 6 chains, 50 links, required.

If it be desired to have 6 chains, 50 links, take up more or less space, take them off from a greater or lesser scale, *i. e.* from a scale that has more or fewer divisions in an inch.

To find the chains and links contained in a right line, *e. gr.* that just drawn, according to any scale, *e. gr.* that of 20 in an inch.—Take the length of the line in the compasses, and applying it to the given scale, you will find it extend from the number 6 of the great divisions, to 5 of the small ones: hence the given line contains 6 chains, 50 links.

*PLOUGH*, or *Plow*, in agriculture, a popular machine for the breaking up of ground; consisting of a train or carriage, with two large irons; the one pointed, the other edged; serving to cut

and open the ground, and draw furrows therein. See *AGRICULTURE*, *PLOWING*, &c.

The parts of the plough are, the *plough-beam*, the *handle*, *tail*, *stilt*, *hales* or *staves*, *neck* or *share-beam*, *earth-board*, *mould-board*, *breast-board*, *furrow-board*, *shield-board*, &c. the *sheath*, *share-iron*, *coulter*, *plough-pin* and *collar-links*, *plough-pillow* and *bolster*, and sometimes *wheels*.

The structure and contrivance of the *plough* is various in various kinds of grounds: A particular description of all would be endless.—The most usual are the

*Double-wheeled PLOUGH*, used throughout Hertfordshire, &c.—

This is apparently one of the best, strongest, and of easiest draught, of any; and suits all kinds of lands, except miry clays in winter; which are apt to clog the wheels, which are about 18 or 20 inches high, and the furrow-wheel sometimes larger than the other.

*Lincolnshire PLOUGH* is singular in its shape, and very good for marl or fenny lands, subject to weeds and sedges, but free from stones; by reason of its coulter, and the largeness of its share, which is often a foot broad, and very sharp.

*Suffex single-wheel PLOUGH* is of a clumsy make, very wide in the breech; so that the draught of it must be very hard.—It is chiefly remarkable for its shape.

*Caxton or trenching PLOUGH*, invented to cut drains about Caxton in Cambridgeshire, in stiff miry clay grounds.—It is larger than ordinary, and has two coulters, one before the other; which bending inwards, cut each side of the trench.—The mould-board is three times the usual length, to cast the turf a great way off from the trench.

It cuts a trench a foot wide at bottom, a foot and half at top, and a foot deep; and is drawn with twenty horses.

*Dray PLOUGH* is the most common.—It is made without either wheel or foot; of an easy draught; best in winter, for miry clays, where the land is soft.

*Spanish PLOUGH* varies much in its make from our common *ploughs*. It is a kind of semicircle, pitch'd on one end, with the convex side turned to the plowman, and the concave side (a little inclined) to the horse. Its tail is in a right line with the share.

With this *plough* and one horse the Spaniards plough two or three acres of their light ground in a day.

*Colchester PLOUGH* is a fine light-wheel *plough*, with which two horses will cut up two acres of their light land in a day.—It is peculiar for its iron earth-board made rounding, which turns the turf better than any other *plough* yet invented.

*One-wheel PLOUGH* may be used in almost any kind of ground; being lighter and nimbler than other wheel *ploughs*.

*Double PLOUGH*. In this, there is one *plough* fix'd to the side of another; so that by means of four horses and two men a double furrow is plowed, the one by the side of the other.

Add to these another kind of *double plough*, whereby two furrows are plowed at once, one under another, by which the earth is stirr'd up 12 or 14 inches depth, which is of great benefit.

*PLOUGH*, among book-binders, is a tool wherewith they cut the leaves of books smooth. See *BOOK-BINDING*.

*PLOUGH*, or *plow*, in navigation, an ancient mathematical instrument, made of box, or pear-tree, used to take the height of the sun or stars, in order to find the latitude. See *HEIGHT*, *LATITUDE*, &c.

It admits of the degrees to be very large, and is much esteem'd by many artists; tho' now generally disused among us. See *ALTITUDE*.

*Plow-land*, or *plough-land*, *carucata terra*, in our ancient customs the same with *hida*, or, a hide of land. See *HIDE*.

In a more modern sense, as used in respect of repairing highways, a *plough-land* is estimated at 50 s. per annum.

*Plow-ALMS*, a duty anciently of a penny, paid to the church for every *plough-land*, or hide of land. See *HIDE*.

*De qualibet carucata juncta inter pascha & pentecosten unum denarium, qui dicitur plou-almes.* *Monast. Aug.*

*PLOUGH-MONDAY*, the next monday after twelfth-day, when the ploughmen in the north-country draw a *plough* from door to door, and beg *plough* money to drink.

*PLOUGHING*, or *PLOWING*, one of the principal operations in agriculture, performed with the *plough*. See *PLOUGH*, and *TILLING*.

*Ploughing* is principally either that of *lays*, or of *fallows*.

*PLOUGHING of lays* is the first cutting up of grass-ground for corn; which is usually done in January, when the earth is wet, and the turf tough, so as to hold turning without breaking; in which the perfection of this kind of *ploughing* consists.

*PLOUGHING of fallows*, called also *fallowing*, is a preparing of land by *ploughing*, long before it be *ploughed* for seed.—This is a considerable benefit to lands, few of which will bear above two crops successively without such respite. Hence landlords use to bind their tenants to it once in three years.

When this is done twice, it is called *twisfallowing*; when thrice, *trifallowing*, &c.

The first is as soon as the husbandman has done sowing his corn; and this is to be very shallow, well turned, and clapped close together.—The second is in June, when they go the full depth.—

The third, about the beginning of August.—If it rise full of clods, they harrow it down; but soon strick-size, or *plough* it up again into ridges.

# PLU

In Staffordshire, beside the three summer fallowings, they usually give their land a winter fallowing. Pliny commends the *ploughing* of lands four times; and so does Virgil:

*Illa seges demum votis respondet avari  
Agricolæ, bis qua solem, bis frigora sensit.*

Georg. lib. i.

This is an ancient piece of husbandry; Xenophon, Pindar, and Virgil, recommend it: witness those verses of Virgil:

*Altiernis idem sonfas cessare novaleis,  
Et segnem patiere situ durefcere campum.*

Georg. lib. i.

**PLUG**, a large wooden peg wherewith to stop the bottom of a cistern, cask, pipe, or the like.

**PLUMAGE**, the feathers, or covering of birds.—*For the mechanism* whereof, see **FEATHER**.

**PLUMAGE**, in falconry, is particularly understood of the feathers under a hawk's wing. See **HAWK**.

The falconers also give their hawks parcels of small feathers to make them cast; and these they call *plumage*. See **CASTING**.

**PLUMB**, or **PLUM**, in matters of spicery. See **CURRANS**, and **RAISINS**.

**PLUMB-LINE**, a term among artificers for a *perpendicular line*. See **PERPENDICULAR**.

It is thus called, because usually described by means of a plummet. See **PLUMMET**.

**PLUMBAGO**, in metallurgy, a metallinecrement, separated in the purification of gold or silver with lead, and sticking to the sides of the furnace. See **REFINING**, **GOLD**, **SILVER**, &c.

This is otherwise called *molybdæna*; and has the same virtue with litharge. See **LITHARGE**.

**PLUMBAGO** seems also to have been used, among the ancients, for black lead, used in making pencils for designing, &c. See **Black LEAD**.

Pomet adds, that *plumbago* was also the sea-lead, *plumbum marinum* of the ancients; who, he notes, took that drug for a production of the sea, not a mineral, as it really is; but this is scarce credible.

**PLUMBERY\***, the art of casting, preparing, and working lead; and of using it in buildings, &c. See **LEAD**.

\* The word is formed of the Latin *plumbum*, lead.

The lead used in *plumbery* is furnished from the lead-works in large ingots, or blocks, called pigs of lead, ordinarily weighing about an hundred pounds a-piece.

As this lead melts very easily, it is easy to cast figures hereof, of any kind, by running it into moulds of brass, clay, plaster, &c. See **FOUNDRY**, and **STATUE**.

But the chief article in *plumbery*, is the sheets, and pipes of lead.—It is these make the basis of the plumbers work in building; the process of these, therefore, we shall give a description of.

*Method of casting large sheets of lead.*—The lead destined for this use is melted in a large caldron or furnace, usually built with free-stone and earth, fortified on the outside with a mass of bricks and plaster. At the bottom hereof is a place sunk lower than the rest, wherein is disposed an iron pot, or pan, to receive what may remain of the metal after the sheet is run. The furnace is so raised above the area of the floor, as that the iron pot just rests thereon.

To use the furnace, they heat it with wood laid within it; that done, they throw in the lead, pell-mell with the burning coals, to melt.

Near the furnace is the table, or mould, whereon the lead is to be cast.—It consists of large pieces of wood, well jointed, and bound with bars of iron at the ends. Around it runs a frame, consisting of a ledge or border of wood two or three inches thick, and one or two high from the table, called the *sharp*. The ordinary width of the tables is from three to four foot; and their length from 18 to 20 foot.

The table is covered with fine sand; prepared, by moistening it with a watering-pot, then working it with a stick; and at last, to render it smooth and even, beating it flat with a mallet, and plaining it with a slip of brass or wood.

Over the table is a strike or rake of wood, which bears and plays on the edges of the frame by means of a notch cut in either end thereof; and so placed, as that between it and the sand is a space proportionable to the intended thickness of the sheet.—The use of this strike is to drive the matter, while yet liquid, to the extremity of the mould.

A-top of the table is a triangular iron peel or shovel, bearing, before, on the edge of the table itself, and behind, on a trestle somewhat lower than the table.—Its use is in conveying the metal into the mould; and the design of its oblique disposition is, that it may by that means be able to retain the metal, and keep it from running off at the fore-side, where it has no ledge.—Some of these peels are big enough to hold fifteen or sixteen hundred weight of lead, and even more.

Things being thus disposed, with a large iron ladle they take out the melted lead, coals and all, out of the furnace; and with this, mixed as it is, fill the iron peel.—When full, they take out the coals, and clear the lead with another iron spoon pierced after the manner of a scummer.

This done, they hoist up the lower part of the peel by its handle; upon which the liquid matter running off, and spreading itself on

# PLU

the mould, the plumber conducts and drives it to the extremity of the table by means of the strike, which the workman passes along the ledges, and thus renders the sheet of an equal thickness. The sheets thus cast, there remains nothing but to edge them, i. e. to planish the edges on both sides, in order to render them smooth and strait.

*Method of casting thin sheets of lead.*—The table or mould here used is of a length and breadth at discretion, only ledged on one side.—Instead of sand they cover it with a piece of woollen stuff, nailed down at the two ends to keep it tight; and over this lay a very fine linen cloth.—The feet of the table are uneven, so that it does not stand horizontal, but moderately inclined.

Great regard is had to the lead while melting, that it have the just degree of heat, so as it may run well, yet not burn the linen.—This they judge of by a piece of paper; for if the paper take fire in the liquid lead, it is too hot; and if it be not shrunk and scorched a little, it is not hot enough.

Being then in its just degree, they have a strike, but different from that described in the former article; as serving both for peel and strike, to contain, and to conduct the liquid lead.—It is, in effect, a wooden case without any bottom, only closed on three sides. It is pretty high behind, but the two sides, like two acute angles, still diminish to the tip, from the place where they are joined to the third or middle piece, where they are of the same height therewith, viz. 7 or 8 inches high.—The width of the middle makes that of the strike, which again makes that of the sheet to be cast.

The strike is placed a-top of the table, which is before covered in that part, with a pasteboard that serves as a bottom to the case, and prevents the linen from being burnt while the liquid is pouring in. The strike is so disposed on the table, as that the highest part looks to the lower end of the table, and the two sloping sides to the higher end.

The strike is now filled with lead according to the quantity to be used; which done, two men, one at each side the table, let the strike descend down the table, or else draw it down with a velocity greater or less, as the sheet is to be more or less thick; the thickness of the sheet still depending on the promptitude wherewith the strike slides down the inclining mould.

These fine smooth sheets of lead are sometimes used between the joints of large stones in great buildings, &c.

*Method of casting pipes, without soldering.*—To make these pipes, they have a kind of furnace, consisting of a large iron furnace or caldron, supported on a pretty high iron stand. The caldron is encompassed with a mass of bricks and loam; only leaving a mouth or passage for the conveyance of wood underneath, and lighting the fire; and another little aperture behind, to serve as a vent-hole.

In this furnace they melt the lead, after first heating it with a fire underneath: To forward the fusion, they put in burning faggots along with the metal.—The metal is skimmed and laden off with the instruments mentioned above.

Near the surface is a bench, furnished at one end with a little mill, with arms or levers to turn it withal.—A strong girt, armed with an iron hook at one extremity, is fastened by the other to the axis of the mill, around which it turns when in motion. On this bench the moulds of the pipes are placed horizontally, and the mill and the girt serve to draw out the iron core after the pipe is cast.

The moulds of these tubes are of brass, and consist of two pieces, which open and shut by means of hooks and hinges; their inner caliber, or diameter, is according to the size of the pipe to be made; their length is usually two foot and a half.

In the middle is placed a core, or round piece of brass or iron, somewhat longer than the mould, and of the thickness of the inner diameter of the pipe.—This core is passed through two copper rundles, one at each end of the mould, which they serve to close; and to these is joined a little copper tube about two inches long, and of the thickness the leaden pipe is intended to be of.—By means of these tubes the core is retained in the middle of the cavity of the mould.

The core being in the mould, with the rundles at its two ends, and the lead melted in the furnace; they take it up in a ladle, and pour it into the mould by a little aperture at one end, made in form of a funnel.

When the mould is full, and the metal cold, they pass the hook of the girt into a hole at the end of the core; and turning the mill with the hand, draw out the core.—They then open the mould, and take out the pipe.

If they desire to have the pipe lengthened, they put one end thereof in the lower end of the mould, and pass the end of the core into it; then shut the mould again, and apply its rundle and tube as before, the pipe just cast serving for rundle, &c. at the other end.

Things thus replaced, they pour in fresh metal into the mould; thus repeating the operation, till they have got a pipe of the length required.

*Pipes made of sheet-lead foldered.*—The plumbers have wooden cylinders, or rollers, of the length and thickness required; and on these they form their pipes, by wrapping the sheet around them; foldering up the edges all along, thus:—After grating the lead well with a grater, they rub resin over the part thus grated; then

then pour on it some solder melted in a ladle, or else melt it with a hot soldering iron, smearing those parts where they would not have the solder catch, with chalk, or the soil of the hand.

The solder which the *plumbers* use, is a mixture of two pounds of lead with one of tin. See *SOLDER*; see also *TIN*, and *TINNING*.

**PLUMBUM.** See the article *LEAD*.

**PLUMBUM ustum.** See *Burnt LEAD*.

**PLUME-ALUM,** *alumen plumosum.* See *ALUM*.

**PLUME,** a set or bunch of ostrich-feathers, pulled out of the tail and wings, and made up to serve for ornament in funerals, &c.

**PLUME\***, in falconry, is the general colour or mixture of the feathers of a hawk, which shews her constitution. See *HAWK*.

\* The word is formed of the Latin *pluma*, feather.

When a hawk seizes her prey, and dismantles it of its feathers, she is said to *plume* it.

**PLUME, or PLUMULE,** in botany, a little member of the grain or seed of a plant; being that which in the growth of the plant becomes the stem, or trunk thereof. See *SEED*, and *STEM*.

The *plume* is inclosed in a cavity formed in the lobes, on purpose for its reception.—It is almost of the same colour with the radicle, or little root, on the basis whereof it is sustained. See *RADICLE*.

The *plume* is the first part that appears out of the earth; as, in effect, it is the part that first appears out of the membrane or cover of the seed; there being a hole over-against it in the membrane, thro' which it makes its escape.

It is the appearance of the *plume* without the cavity of the grain, that makes what we call the *bud* or *germ* of a plant. See *GERMINATION*; see also *PLANT*.

The *plume* is so called, because consisting of several pieces bound together in manner of a feather.—In corn, the *plume* is that which, after the radicle is shot forth, shoots out towards the smaller end of the seed; whence some call it the *acrospire*. See *ACROSPIRE*, *MALT*, &c.

**PLUMMET, PLUMB-RULE, or PLUMB-LINE,** an instrument used by masons, carpenters, &c. to draw perpendiculars withal; in order to judge whether walls, &c. be upright, planes horizontal, and the like. See *PERPENDICULAR*.

It is thus called from a piece of lead, *plumbum*, fastened to the end of a thread or cord, which usually constitutes this instrument. Sometimes the string descends along a ruler of wood or metal raised perpendicularly on another; in which case it becomes a level. See *LEVEL*.

At sea the *plummet* is used by the pilot to sound the depth of the sea. See *SOUNDING*.

**PLURAL, PLURALIS,** in grammar, a particular inflexion of nouns and verbs, whereby they come to express a plurality, or number, of things. See *NUMBER*.

The Latins, English, &c. have only two numbers, *singular* and *plural*; the Greeks and Hebrews have three, *singular*, *dual*, and *plural*. See *DUAL*.

In Latin, &c. both nouns and verbs have usually distinct terminations to their different numbers; in English, nouns substantives usually become *plural* by the addition of an *s* or *es* to the singular. See *SINGULAR*.

Nouns adjective are the same in both numbers; and in verbs, the number is distinguished by that of the pronouns. See *NUMBER*, *ADJECTIVE*, *VERB*, *PRONOUN*, &c.

**PLURALITY, PLURALITAS,** a discrete quantity, consisting of two, or a greater number. See *UNITY*.

A *plurality of worlds* is a thing which Mr. Huygens has endeavoured to prove in his *Cosmotheoros*.—The same is likewise contended for in a very pretty treatise of M. Fontenelle, under that title.

See the chief argument for a *plurality of worlds*, under the articles *MOON*, *PLANET*, and *EARTH*.

The greatest absurdity in the pagan theology, is, the *plurality of gods*. See *GOD*.

**PLURALITY of benefices or livings,** is where the same clerk is possessed of two or more spiritual preferments, with cure of souls. See *BENEFICE*.

*Plurality of benefices* is a thing tolerated in the church, but never approved of. See *BENEFICE*.

It was the smallness of some benefices that first gave occasion to *pluralities*; for an ecclesiastic, not being able to subsist on a single one, was allowed to hold two: at length the number increased without bounds.

The abuse was endeavoured to be remedied at the council of Lateran under Alexander III. and Innocent III. when the holding more than one benefice was expressly forbid by a canon; but the same canon granting the pope a power to dispense with it in favour of persons of distinguished merit, there were so many found a title to this merit, that the prohibition became useless.

In Germany the pope grants dispensations for possessing a *plurality of benefices*, on pretence that the ecclesiastic princes there need large revenues to bear up against the protestant princes.

**PLUS,** in algebra, a term commonly used for *major*, or *magis*, more. Its character is +. See *CHARACTER*.

Thus  $4 + 10 = 14$ , is read, four, *plus*, or more, 10, is equal to 14. See *QUANTITY*; see also *ADDITION*, &c.

**PLUSH,** in commerce, &c. a kind of stuff having a sort of velvet knap or thag on one side; composed regularly of a woof

of a single woollen thread, and a double warp, the one wool, of two threads twisted, the other goats or camels hair; tho' there are also *plushes* intirely of worsted, and others composed wholly of hair.

*Plush* is manufactured like velvet, on a loom with three treadles.—Two of these separate and depress the woollen warp, and the third raises the hair-warp; upon which the workman, throwing the shuttle, passes the woof between the woollen and hair-warp; and, afterwards, laying a brass broach, or needle, under that of the hair, he cuts it thereon with a knife destined for that use, conducting the knife on the broach, which is made a little hollow, all its length; and thus gives the surface of the *plush* an appearance of velvet. See *VELVET*.

Some ascribe the invention of *plush* to the English; others say, it was first made in Holland, and particularly at Haerlem.—Be this as it will, it is certain, the French are the people who make the most of it; there being several very considerable *plush* manufactures at Amiens, Abbeville, and Compeigne.

There are other kinds of *plush*, all of silk, some of which have a pretty long knap on one side, some on both.

**PLUSH,** among botanists, is a name given to the middle of roses, anemones, &c. called also *thrum*, or *thrummy heads*; by others, *hairy heads*, *buttons*, *bos*, *rufi*, or *wort*.

**PLUVIAL, PLUVIALE,** anciently signified a hood, or cloak, which ecclesiastics, chiefly religious, wore in the country, to shelter themselves from the rain; by the Latins called *pluvialis lacerna*.

The word is now used in the Romish church, for a large hood worn by the chantor and sub-deacon, at mass and vespers, &c.—It covers the whole man, and is fixed before with two clasps.

**PLUVIUS,** in antiquity, an attribute of Jupiter; implying him the author of rain; *q. d.* he that sends rain. See *RAIN*.

Among the basso relievo's of the *Antonine* column, in the place where the miracle of the thundering legion is represented, we see a flying man in the air, his arms spread out, and with a very long beard, which seems to dissolve into rain.—The learned take this to be a representation of Jupiter *Pluvius*. See *THUNDERING legion*.

**PNEUMATICS, PNEUMATICE,** called also *PNEUMATOLOGY* and *PNEUMATOSOPHY*, the doctrine and contemplation of spirits, and spiritual substances. See *SPIRIT*.

The word is formed of the Greek, *πνευμα*, *spiritus*, breath; whence, from the different acceptations of that word, either as an incorporeal substance, or as air, there arise two sorts of *pneumatics*.

**PNEUMATICS,** in the schools, is frequently used for the doctrine of spirits; as *GOD*, angels, and the human mind. See *SPIRIT*, *GOD*, *ANGEL*, *SOUL*, &c.

In this sense *pneumatics* coincide with what we otherwise call *metaphysics*. See *METAPHYSICS*.

**PNEUMATICS** is more commonly used among us, for the doctrine of the air; or the laws wherein that fluid is condensed, rarefied, gravitates, &c. See *AIR*.

Some make *pneumatics* a branch of mechanics; because it considers the air in motion, with the effects thereof.—It is certainly a sister of hydrostatics; the one considering air in the same manner that the other does water. See *MECHANICS*, and *HYDROSTATICS*.

Wolffius, in lieu of *pneumatics*, uses the word *aerometry*, *q. d.* the art of measuring the air. See *AEROMETRY*.

The doctrine and laws of *pneumatics* will be found under the articles, *AIR*, *ATMOSPHERE*, *ELASTICITY*, *GRAVITY*, *COMPRESSION*, *CONDENSATION*, *RAREFACTION*, *EXPANSION*, &c.

**PNEUMATIC engine, machina or autia PNEUMATICA,** denotes the *air-pump*. See *AIR-PUMP*.

**PNEUMATOCELE\***, *πνευμαστοκελη*, in medicine, a flatulent or windy hernia; or a tumor of the membranes of the scrotum or navel, proceeding from pent-up vapours, and attended with a tensile pain. See *HERNIA*.

\* The word is formed from the Greek *πνευμα*, wind, and *κελη*, tumor.

Sometimes one of the testes only is thus inflated, sometimes both, and sometimes likewise the scrotum. See *TESTICLE*.

This *hernia* is of all others the lightest, and least dangerous.—It is cured by discutients internally, and fomentations and cataplasms externally.

**PNEUMATOMACHI**, *πνευματομαχοι*, ancient heretics, so called, because they opposed the divinity of the Holy Spirit; placing him in the number of creatures. See *SEMI-ARIANS*.

**PNEUMATOSIS**, *πνευμασις*, a term which some authors use for the generation or formation of animal spirits in the brain. See *SPIRIT*, and *BRAIN*.

**PNEUMONICS\***, *πνευμονικα*, medicines proper in diseases of the lungs, where respiration is affected. See *LUNGS*, *RESPIRATION*, &c.

\* The word is formed from the Greek, *πνεμων*, lungs, or *πνευμα*, *spiritus*, breath.

Of this number are sulphur, lungwort, hyssop, ground-ivy, and colt's-foot; used in phthises, asthma's, peripneumonies, pleurifies, &c. See *ASTHMATIC*, *ANTIPHTHISIC*, &c.

**POCK.** See the article *Pox*.

# P O E

**POCKET** of wool, is half a sack. See **SACK** of wool.  
**POD**, the shell or husk of any pulse. See **SILIQUA**.  
**PODAGRA**\*, *ποδάγρα*, in medicine, the gout in the feet. See **GOUT**.

\* It is thus called from the Greek, *πῦς*, foot, and *ἀσείξ*, *captura*, seizure.

**PODAGRA dentium**, sometimes, tho' with impropriety enough, is used for the *tooth-ach*. See **ODONTALGIA**, and **TOOTH-ACH**.

**PODESTA**, or **POTESTA**, a magistrate, or officer of justice and policy, in a free city.

The name is originally Italian, *podesta*; and is chiefly applied to certain magistrates of Venice and Genoa, whose function is to administer justice in those republics.

The *podesta* in Venice corresponds to the prætor in ancient Rome, though appeals lie from his decisions, to the new auditors, or the new civil guaranty. See **QUARANTIA**.

**PODEX**, in anatomy, &c. the same with *anus*, or *fundament*. See **ANUS**.

**PODOMETER**, or **PEDOMETER**. See **PEDOMETER**.

**POEM**, **POEMA**, *ποίημα*, a composition in verse, of a due length and measure. See **VERSE**, and **POETRY**.

**POEMS**, *carmina*, are of various kinds; some denominated from the persons who first invented, or most used them; as the *Archilochian*, *Sapphic*, &c.—Others from their composition, as the *monocolon*, consisting of one kind of verse; *dicolon*, of two; and *tricolon*, of three kinds—Others from their intireness or deficiency; as *brachycatalectus*, which wants two syllables; *catalectus*, which wants one; *acatalectus*, none; and *hypercatalectus*, which has a syllable too much, which if cut off at the beginning of the next verse, the verse is said to be *hypermeter*. See **ACATALECTIC**, &c.—Others are denominated from the subject-matter; as the *apobaterion*, *epibaterion*, *epinicion*, *epithalamium*, *genethliac*, *propemptic*, *elegiac*, *satiric*, *epicedion*, *epitaph*, *threnas* or *lamentation*, *encomiastic*, *panegyric*, *soteric*, *lyric*, *pastoral*, &c.—Others from the manner of narration; as *exegetic*, which relates a thing under the author's own person, *dramatic*, and *epic*. See each under its proper head, **EPIC**, **DRAMA**, &c.—To these may be added, odes, eclogues, idylliums. See **ODE**, &c.—To this head must also be referred several other poetical compositions of a less serious kind, which the idly-labouring vein of little poets has produced into the world, and which, though frequently admired by persons of a low taste, are justly ranked by Mr. Addison in the class of false wit.—Such are the acrostic, enigma, anagram, cento, chronogram, proteus, echo, &c. See **ACROSTIC**, **ANAGRAM**, &c.

**POESY**\*, **POESIS**. See the article **POETRY**.

\* The word is formed from the Greek *ποιέω*, of *ποιέω*, *facio*, *fabrator*, *ingo*, *I make*, *I frame*, *I invent*.

Hence alchymy, or the art of making gold, was anciently called *poesy*, *chrysopoesy*, &c. See **ALCHYMY**, &c.

**POET**, **POETA**, an author who composes poems, or discourses in verse. See **POETRY**, and **VERSE**.

Cicero relates it as a saying of Democritus and Plato, that there could be no good poet *sine afflatu furoris*, without a tincture of madness; and Aristotle calls poets expressly, *maniaci*, maniacs, madmen. See **ENTHUSIASM**.

M. Spanheim tells us, that the Arab authors are more poetically given, than those of any other people; and adds, that there are more verses among the Arabians, than among all the other nations put together.

The Greek word *ποιητής*, poet, signifies *maker*, from *ποιέω*, *facio*, *I make*; whence the poets were anciently also called *fabrists*.—The name they were properly denoted by among the Romans, was *vates*, which signifies *prophet*. See **PROPHET**.

By a law of the emperor Philip, inserted in the *code*, l. 10. t. 52. poets are expressly excluded from the immunities granted the professors of all other sciences.

Homer, Virgil, Milton, and Tasso, are the chief, almost the only epic poets.—Sophocles, Euripides, Shakespeare, Otway, Corneille, and Racine, the best tragic poets.—Aristophanes, Menander, Plautus, Terence, Fletcher, Johnson, Moliere, &c. the chief comic poets.—Horace, Cowley, and Malherbe, excelled as lyric poets.—Juvenal, Persius, Regnier, Boileau, Dryden, and Oldham, as satiric poets. See **EPIC**, **TRAGIC**, **COMIC**, &c.

**POETICAL**, *ποιητικός*, something that relates to poetry or poets. See **POETRY**, and **POET**.

In this sense we say, a poetical genius, a poetical phrase, poetical licence, poetical fury, &c.

Most languages have their poetical words, which are never used on other occasions.—These prove of great advantage to the poets, who are hereby enabled to raise the style and diction into the poetical character, with the greater ease.

The French lament the want of a set of such words in their language; for want whereof their poetry appears in a too familiar garb, not sufficiently distinguished from the common language. It is too reserved; not being allowed any boldnesses, or flights, but what might pass in prose. To this, in good measure, is attributed the little success their authors have met withal in the epic way. See **FRENCH**, **EPIC**, &c.

**POETICAL justice**, is chiefly used in respect of the drama, to denote a distribution of rewards and punishments to the several persons, at the catastrophe or close of the piece, answerable to the several characters they have appeared in. See **CHARACTER**.

# P O E

Whatever difficulties and distresses the virtuous and innocent may labour under, and how prosperously soever it may go with the wicked, in the course of the piece; the poet usually takes care to give each of them their due ere he parts with them.—It is controverted whether this piece of justice be indispensable, and whether it may not be allowed to leave virtue oppressed, and vice flourishing. See **TRAGEDY**, &c.

**POETICAL rising and setting**. See **RISING**, and **SETTING**.

The ancient poets, referring the rising, &c. of the stars to that of the sun, make three kinds of rising and setting, viz. *cosmical*, *acronical*, and *heliacal*. See each under its proper article, **COSMICAL**, &c.

**POETICS**, **POETICE**, *ποιητική*, the doctrine of poetry, or the laws and rules of conducting pieces or compositions of poetry. See **POETRY**.

Aristotle's *poetics* is a work infinitely valued; and M. Dacier's comment thereon is one of his best pieces.—Horace, Vieta, Vossius, and Scaliger, have likewise published *poetics* in Latin; the duke of Buckingham, in English; and Menardiere, Hedelin, and Despreaux, in French.

**POETRY**\*, **POESY**, the art of composing poems, or pieces in verse. See **POEM**, and **VERSE**.

\* The word is formed from the Greek *ποίησις*, of *ποιέω*, *facio*, *I make*. See **POESY**.

If a verse be considered as a mere series of just six feet following one after another in the same line; poetry and versification will appear two very different things: But Bosiu, in his idea of verse, includes cadencies, peculiar constructions, arrangements and expressions unknown in common discourse; and above all, a certain noble, bold, elevated, metaphorical turn and manner of diction.—These, he observes, are so essential to poetry, that without them the most exact arrangement of long and short syllables, makes little else but a kind of measured prose; whereas these, in a discourse that has no poetical feet or measures, do yet give it the poetical character, and make it a kind of *unmeasured poetry*. The rules of poetry and versifying are taught by art, and acquired by study; but this force and elevation of thought, which Horace calls *something divine*, and which alone makes the poetry of any value, must be derived from nature; or, according to Aristotle, from some happy transports, to which that author gives the name of madness:—*Εὐφροσύνη ἢ ποιντικὴν ἢ μανίαν*.—But there must ever be conceived a just solid judgment at the head of this fury of the poet's imagination.

Hence the critic concludes, that the end of poetry is to please; its cause, either the excellence of the poet's genius, or a poetical fury, and transport of the soul, manageable by the judgment; its matter, long and short syllables, and feet computed hereof, with words furnished by grammar; and its form, the arrangement of all these things in just and agreeable verse, expelling the thoughts and sentiments of the author after the manner already mentioned.

But, after all, how narrow are these bounds, if we consider poetry in the light wherein the works of Homer and Virgil have set it? What is here laid down pretends to no praise, which a mere translator may not rise to, and which the war of Catiline might not merit, if turned out of the prose of Sallust.—It is with reason, therefore, that we distinguish the *low* and *simple* from the *greater poetry*; by giving the former the title of *versification*: and that we make poetry and versification two distinct arts. In effect, there is not more difference between grammar and rhetoric, than between the art of making verses, and that of inventing poems. See **VERSIFICATION**.

The *greater poetry*, then, consists principally in fiction, or the invention of fables; in the expressing of things by allegories and metaphors; and in the inventing of actions, under which the truths which the poet has to teach, may be agreeably disguised. See **FABLE**.

In this view, scarce any poems retain the nature and essence of the grand poetry, but the *epopœia*, *tragedy* and *comedy*: the rest, be they elegies, satires, song, or what they will, come under *versification*.

The ancient eloquence, it is observed, was full of mysteries and allegories.—The truth was by them usually disguised under those ingenious inventions called *μύθοι*, fables, *q. d.* words; as if there were as much difference between these fabulous discourses of the learned, and the common language, as between the speech peculiar to man, and the voice of brutes. See **FABLE**.

At first, fables were chiefly used in treating of the divine nature, after the manner they then conceived of it: this occasioned the first poets to be called *divines*, and poetry the *language of the gods*.—The divine attributes they separated into a number of persons; by reason the weakness of the human mind could not conceive so much power, and so much action, in a simplicity so strict and indivisible as that of God. See **GOD**.

Nor could they speak of the operation of this almighty cause, without speaking likewise of its effects.—They therefore added physics to their theology, handling both after the same manner, without quitting their veils or allegories. See **ALLEGORY**.

Now, man being the most considerable of all the works of the Deity, and there being nothing so proper for poets, or of such general use to mankind, as such a subject; they therefore added ethics to the former, and treated the doctrine of manners in the same way as they had done divinity and physiology.—And hence arose the *epopœia*, or epic poem. See **EPIC**. The

The epic poets have done, with regard to morality, just the contrary of what the divine poets did for their theology.—As the too great diversity of divine actions and perfections, so little proportionate to our understanding, occasion'd the latter to divide the single idea of the simple essence of God into several persons under different names; as Jupiter, Juno, Neptune, &c. so, on the contrary, the nature of moral philosophy, which never gives any rules for particular things, occasioned the epic poets to unite in one single idea, in the same person, and even in a single action, whatever of the like kind occurs in different persons, and different actions. See ACTION, CHARACTER, HERO, &c.

Thus, says Aristotle, *poetry* teaches moral philosophy, not by reciting historically what Alcibiades has done or suffered; but by proposing what such a person, whom the poet calls by any name he pleases, would necessarily or probably have done or said on the like occasion.—It is in this manner it represents either the unhappy consequences of designs ill concerted, of wicked actions, &c. or the reward of good actions, and the pleasure reaped from a design laid in virtue, and conducted by prudence.

Thus, according to our critic, the poetical actions and persons are all feigned, allegorical, and universal; not historical and singular.—This is likewise the sentiment of Horace, who adds, that poets teach morality as well as philosophy; but the preference herein he gives to Homer. See MANNERS.

This advantage of the poets over mere philosophers arises hence, that all *poetry* is an imitation.—Now imitation is a thing extremely natural; and hence this manner of proposing things becomes better fitted to engage the auditors. Again, imitation is an instruction given by examples; and examples are the more proper to persuade, in regard they prove the thing possible.—In effect, imitation is so much the nature of *poetry*, that Aristotle tells us, it is to this the art owes its rise.

But the poets, by becoming philosophers, did not cease to be divines; on the contrary, the morality they taught obliged them frequently to introduce the deity in their works; and the share so august a being had in the action, obliged the poet to make it grand, important, and conducted by persons of kings and princes. See MACHINE.

Add to this, that it likewise obliged the poet to think and speak after a manner elevated above the common pitch of men, and to equal, in some measure, the divine persons he introduced; and to this purpose served the poetical, figurative language, and the majesty of heroic verse.

To convey their truths to the best advantage, and adapt them to the particular purposes they were intended for; poets found out various forms.—Hence the *epopœia* and drama.

Epic *poetry* is more for the manners and habits, than the passions; these last rise all at once, and their violence is but of a short duration; but the habitudes are cooler and more gentle, and rise and fall more slowly. See HABIT.

The epic action, therefore, could not be restrained to a day or two, as that of the drama; a longer and a juster space was required for this, than for tragedy, which is only for the passions.—And hence arose a still greater difference between tragedy and the *epopœia*.

For the tragic violence required a stronger and more lively representation than the epic; and accordingly it consists wholly in the action; the poet never speaking, as he does in the *epopœia*, where there are no actors.

The laws of epic and dramatic POETRY, see under EPIC, CHARACTER, INVOCATION, DRAMATIC, THEATRE, TRAGEDY, COMEDY, ACT, SCENE, CHARACTER, SENTIMENT.

For the lower sorts of POETRY, see each under its proper article, ODE, SONG, EPIGRAM, ELEGY, SATYR, &c.

POINT\*, is a term used in various arts.

\* The word is derived from the Latin *punctum*, which is formed from *pungere*, to prick.

POINT, in geometry, according to Euclid, is a quantity which has no parts, or which is indivisible. See QUANTITY, PART, INDIVISIBLE, &c.

Wolfius defines it, that which terminates itself on every side; or which has no terms or boundaries distinct from itself. See TERM.

This is what we otherwise call the *mathematical point*; and is only conceived by the imagination; yet is it in this that all magnitude begins and ends; the flux or motion of the point generating a line, that of a line a surface, &c. See MAGNITUDE; see also LINE, &c.

Hence some define a *point* to be inceptive of magnitude. See INCEPTIVE, &c.

A line can only cut another in a *point*.—Any three *points* being given out of a right line; a circle, or part of a circle, may be drawn that shall pass through them all. See CIRCLE.

To draw a parallel line, a perpendicular, a tangent, &c. to a given point, are popular problems in geometry. See PERPENDICULAR, PARALLEL, TANGENT, &c.

Proportion of mathematical POINTS.—It is a current maxim, that all infinities, whether infinitely great or infinitely small, are equal; yet is the maxim false in both cases.—Dr. Halley shows several infinite quantities, which are in a finite proportion to one another; and some infinitely greater than others. See Infinite QUANTITY.—The like, the Hon. Mr. Roberts shews of infinitely small quantities, viz. *mathematical points*.

VOL. II. N° 119.

He demonstrates, for instance, that the points of contact between circles, and their tangents, are in a subduplicate proportion to the diameters of the circles; that the *point* of contact between a sphere and a plane is infinitely greater than that between a circle and a tangent; and that the *points* of contact in spheres of different magnitude are to one another as the diameters of the spheres. See CONTACT, &c.

POINT of contrary flexure, in the higher geometry, is a *point* of a curve, wherein it is bent or inflected towards a part contrary to that it before tended towards: so, e. gr. as to turn its convexity towards its axis, or any other fix'd point, which before it turned its concavity towards. See CURVE.

If the curve turn back again towards the *point* whence it first set out, the *point of the flexure* is particularly called the *point of regression*, or *retrogradation*. See RETROGRADATION of curves.

Wolfius illustrates the use of the calculus differentialis in finding the *point of contrary flexion* in various kinds of curves. See CURVE.

POINT, PUNCTUM, in physics, is the smallest or least sensible object of sight, marked with a pen, point of a compass, or the like. See OBJECT.

This is what we popularly call a *physical point*; which in reality has parts, though those parts are not here regarded.—Of such *points* does all physical magnitude consist. See MAGNITUDE.

This *physical point* coincides with what Mr. Locke calls the *point sensible*, and which he defines to be the least particle of matter, or space, we can discern.—He adds, that to the sharpest eye this is seldom less than 30 seconds of a circle, whereof the eye is the centre. See VISION.

POINT, in grammar, is a character used to mark the divisions of discourse. See CHARACTER, and POINTING.

The *point* proper, is what we otherwise call a *full stop*, or period, and serves to denote the sense complete, and the period ended. See PERIOD.

Two *points* usually mark the middle of a period, and shew a construction complete, and the sense to be perfect; yet intimating something to come after it: this we call a *colon*. See COLON.

A *point* with a comma, called a *femicolon*, marks a sense less complete than the colon; though authors seem to use them indifferently: nor are grammarians agreed about their precise difference. See SEMICOLON.

The comma, or virgula, marks a subdivision of a member of a period. See COMMA.

A *point of interrogation*, ? marks something to be pronounced in a higher tone, as intimating a question ask'd. See INTERROGATION.

A *point of admiration* ! marks a sudden surprize and wondering. See ADMIRATION.

Our *points* and accents were intirely unknown to the ancients. In the ancient Greek manuscripts, the whole discourse seems wrote with the same stroke of the pen; the words and letters being join'd throughout.

In after-times, *points* were invented, and added a-top of the letters, to shew when the sense was finished: hence the grammarians, coming to retouch the old manuscripts, thought fit to add the *points* and accents.—Salmatius affirms, that he has even observed, plainly, where they have been added, by the difference of hands. See ACCENT.

POINTS, or vowel POINTS, in the Hebrew learning, are certain characters, which, in the writings of that language, serve to mark the vowels. See VOWEL, and HEBREW.

The antiquity of the *points* in the Hebrew tongue makes the subject of a celebrated controversy among the learned; some maintaining their origin to be the same with that of the Hebrew language; and others asserting them to have been first introduced by Eldras, after the Babylonish captivity, when he compiled the canon, transcribed the books into the present Chaldee character, and restored the purity of the Hebrew text. See CANON.

Others will have them invented by the doctors of the school of Tiberias, usually called the Massorettes, five or six hundred years after Christ.—The rabbin Elias Levita was the first who started this question in the last century; and maintained them to have been an invention of the Massorettes, for the ease of those who were to learn the Hebrew tongue. See MASSORETES.

This sentiment was espoused by Capella, to whom adhered Luther, Calvin, Casaubon, Scaliger, &c. Buxtorf attacked Capella violently on this article, and gained a great number of divines on his side, who took the alarm, imagining it a grievous wound to the holy text, to allow the *vowel-points* to have been added by the Massorettes, and not to have been found in the ancient text; because, without these, it is very difficult to fix the reading thereof.—Yet in the Samaritan text there is no *point* or vowel, nor in many of the most ancient Hebrew manuscripts. See HEBREW, &c.

POINT, in music, is a mark or note anciently used to distinguish the tones. See NOTE.

Hence we still call it simple *counter-point*, when a note of the bass answers precisely to that of the treble; and figurative *counter-point*, when a note is syncopated, and one of the parts makes several inflexions of the voice or tone, while the other only makes one. See COUNTER-POINT, and FIGURATE.

We still use a *point* to raise the value of a note, and prolong its time by one half, *e. gr.* a *point* added to a semibreve, instead of two minims, makes it equal to three. See TIME, and CHARACTERS in music.

POINT, in astronomy, is a term applied to certain parts or places marked in the heavens, and distinguished by proper epithets.

The four grand *points* or divisions of the horizon, *viz.* the *east*, *west*, *north*, and *south*, are called *cardinal points*. See CARDINAL; & also EAST, WEST, &c. each under its proper article. The zenith and nadir are the *vertical points*. See VERTICAL, ZENITH, and NADIR.

The *points* wherein the orbits of the planets cut the plane of the ecliptic, are called the *nodes*. See NODE.

The *points* wherein the equator and ecliptic intersect, are called the *equinoctial points*. See EQUINOCTIAL.—Particularly, that whence the sun ascends towards the north pole, the *vernal point*; see VERNAL: And that by which he descends to the south pole, the *autumnal point*. See AUTUMNAL.

The *points* of the ecliptic where the sun's ascent above the equator, and descent below it, terminate, are called the *solstitial points*; see SOLSTITIAL.—Particularly, the former of them the *estival* or *summer point*; see SUMMER: The latter, the *brumal* or *winter point*; see WINTER, &c.

POINT, in navigation and geography.—POINTS of the horizon, or of the compass, are certain *points* formed by the intersections of the horizon with vertical circles. See HORIZON.

The number of these *points*, therefore, is really the same with that of the *points* conceived in the horizon, *i. e.* infinite; tho' in practice we only distinguish 32 of them. See COMPASS.

Some use *point*, for the intersection of a vertical circle with a circle parallel to the horizon; and even some, for the segment of a vertical intercepted between the meridian and horizon, or a circle parallel thereto.

The *points* are shewn by right lines drawn from a *point* assumed in a horizontal plane.

A *point* of the compass is popularly taken for a 32d part of the whole; or for an arch of 11 degrees, 15 minutes: half of which, *viz.* 5° 37' ½, is called a *half point*: and half of that, or 2° 48' ¼, a *quarter point*. See COMPASS.

These *points* of the compass are divided into cardinal and collateral.

Cardinal POINTS are the intersections of the horizon and meridian, called the *north* and *south points*; and the intersections of the horizon with the prime vertical, called the *east* and *west*. See NORTH, SOUTH, &c.

These coincide with what the Latins call *cardines mundi*; and are a quadrant, or 90 degrees, distant from each other. See CARDINAL.

Collateral or intermediate POINTS, are those lying between the cardinal *points*,—which are either *primary*, *viz.* those equidistant from the two cardinals, as north-east, south-west, &c.

Or *secondary*, which are again, either of the *first order*, *viz.* such as are equidistant from a cardinal and the next primary, as north-north-east; or of the *second order*, *i. e.* equidistant between a cardinal or primary, and first secondary, as north-east by north.

The *primary collateral points*, therefore, are 45° distant from the cardinals; the first secondaries 22° 30' from the cardinal and next primary collateral; and the secondaries of the *second order* 11° 15' from a cardinal, or first collateral, and a second. See COLLATERAL.

POINT, among seamen, is also used for a cape, or head-land, jutting out into the sea. See CAPE.

They say, two *points* of land are *one in another*, when they are so in a right line against each other, as that the innermost is hindered from being seen by the outermost.

POINT, in perspective, is a term used for various parts or places, with regard to the perspective plane. See PERSPECTIVE plane. Such are, the

POINT of sight, or of the eye, is a point F, on the plane H I, (Tab. Perspective, fig. 12.) marked out by a right line O F, drawn from the eye, perpendicular to the plane—This is also called the *principal point*. See VISION; see also PRINCIPAL.

This *point* is in the intersection of the horizontal and vertical planes. See PLANE.

Some authors call this the *principal point*; and give the name *point of sight*, or *vision*, to the point wherein the eye is actually placed, and where all the rays terminate, as O. See hereafter POINT of view.

POINT of distance, is a *point*, *v. gr.* P, or Q, in the horizontal line P Q, at the same distance from the principal *point* F, as the eye O is from the same. See DISTANCE.

Third POINT is a *point* taken at discretion in the line of distance, wherein all the diagonals drawn from the divisions of the geometrical plane, concur.

Objective POINT, a *point* on a geometrical plane, whose representation is required on the perspective plane.

Accidental POINT. See the article ACCIDENTAL.

Visual POINT. See the article VISUAL.

POINT, in optics.—The POINT of concurrence, or concurrence, is that wherein converging rays meet, more usually called the *focus*. See FOCUS.

POINT of dispersion, is that wherein the rays begin to di-

verge; usually called the *virtual focus*. See VIRTUAL. POINT of incidence, is a *point* on the surface of a glass, or other body, wherein a ray falls. See INCIDENCE.

POINT of view, with regard to building, painting, &c. is a *point* at a certain distance from a building, or other object, wherein the eye has the most advantageous view or prospect of the same. This *point* is usually at a distance equal to the height of the building.—For an instance:—To consider with judgment the whole of the famous church of the invalids at Paris; we must not stand at above 340 foot distance from it, which is nearly its height. To be able to judge of the ordonnance of its façade or frontispiece, and the regularity of its order, the eye should only be as far off as the frontispiece is high, *viz.* 100 feet.

But to examine the correctness of its profiles, and the spirit of its ornaments, the eye should only be distant the height of the Doric order, which is about 40 feet; if it be nearer, the parts too much shortened, will appear out of proportion.

A vague or indeterminate *point* has a different effect from the *point of view*; in that, in looking at a building from an indeterminate *point*, the eye can only form an idea of the magnitude of its mass, by comparing it with other buildings adjacent to it.

POINT of reflexion, is a *point* on the surface of a glass, or other body, whence a ray is reflected. See REFLEXION.

POINT of refraction, is a *point* in the surface of a glass, or other refracting surface, wherein the refraction is effected. See REFRACTION.

Radiant POINT. See the article RADIANT.

POINTS, in heraldry, are divisions of the escutcheon into several squares, sometimes to the number of 9, sometimes to 15; some whereof are of one colour or metal, the others of another; called also *equipollent points*.

There is also another, and that more frequent division of the escutcheon into *points*, which have several names and values, according to their several places.

There are nine principal *points* in an escutcheon, as marked in Tab. Herald. fig. 38. A represents the *dexter chief point*—B the *middle chief point*.—C the *sinister chief*.—D the *honour point*.—E the *fejs point*, called also the *centre*.—F the *nombril* or *navel point*.—G the *dexter base*.—H the *sinister base*.—I the *precise middle base*. See DEXTER, SINISTER, HONOUR, &c.

Colombiere makes the *points* and their situations symbolical.—As the several bearings in an escutcheon are so many types representing the commendable actions of the person they are given to; so the escutcheon itself represents the body of the man that performed them; and the *points*, or parts, signified by these letters, the principal parts of his body.—Thus, A, B, C, represent the head, in which the three great faculties reside: D, the neck, where ornaments are chiefly borne: E, the heart, &c. See ESCUTCHEON.

POINT is also the name of an ordinary, something like the pile, rising frequently from the bottom of the escutcheon to the top, very narrow; and only taking up two thirds of the *point* of the escutcheon. See PILE.

When the *point* arises from the base, it is peculiarly called *point-in-point*.

POINT inverted, is when it descends from the chief downwards; possessing two thirds of the chief, but diminishing as it approaches the point of the escutcheon, though without touching it.

POINT in bend, or *point in bar*, is when the *point* is placed transverse, in the situation of a bend or bar.

When it comes from the sides of the escutcheon, it is also called a *point dexter* or *sinister*, according to its situation.

The *point dexter* is commonly reputed an abatement due to a braggadocio.—*Point-champion-ten* due for killing a prisoner after quarter demanded.—*Point-in-point*, a diminution belonging to a coward.—*Point-plane*, an abatement belonging to a liar, &c. See ABATEMENT, DIMINUTION, &c.

POINT is also used in heraldry, for the lowest part of the escutcheon, which usually terminates in a *point*. See ESCUTCHEON.

POINT-champain. See the article CHAMPAIN.

In the French arms the fleur-de-lys's are two in chief, and one in *point*.

POINT is also an iron or steel instrument, used with some variety in several arts.

Engravers, etchers, wooden-cutters, stone-cutters, &c. use *points* to trace their designs on the copper, wood, stone, &c. See ENGRAVING, ETCHING, &c.

Statuaries, &c. have likewise *points* in manner of little chisels, used in the first forming or sketching out their work. See STATUE, FOUNDERY, &c.

Turners work or fashion their common works between two *points* fastened to the puppets.—Lapidaries have iron *points*, to the ends whereof are fastened pieces of diamonds, serving to pierce the precious stones withal. See TURNING, LAPIDARY, &c.

POINT, in the manufactories, is a general term used for all kinds of laces wrought with the needle.

Such are *point de Venice*, *point de France*, *point de Genoa*, &c. which are distinguished by the particular œconomy and arrangement of their *points*.

POINT is sometimes also used for lace woven with bobbins, as *English point*, *point de Malines*, *point de Havre*, &c.

POINT,

# POI

**POINT**, in architecture.—*Arches of the third POINT.* See ARCH.  
*Arches of the fourth POINT.* See the article ARCH.

**Gauge-POINT.** See the article GAUGE.

**POINT**, in poetry, denotes a brisk lively turn, or conceit, usually found or expected at the close of an epigram. See EPIGRAM.

**POINT-BLANK**, in gunnery, denotes the shot of a gun, levelled horizontally, without either mounting or sinking the muzzle of the piece.

In shooting *point-blank*, the shot or bullet is supposed to go directly forward, in a straight line, to the mark; and not to move in a curve, as bombs and highly elevated random shots do. See MORTAR, PROJECTILE, GUNNERY, &c.

**POINTED crowns.** See the article CROWN.

**POINTED roof.** See the article ROOF.

A *cross* **POINTED**, among heralds, is that which has the extremities turned off into points by straight lines. Colombiere calls it *aiguille*, q. d. *sharpened*. See CROSS, and COUNTER-POINTED.

**POINTING**, PUNCTUATION, in grammar, the art of dividing a discourse, by points, into periods and members of periods, in order to facilitate the pronunciation and understanding thereof. See PUNCTUATION.

**POINTING**, among seamen, the marking on the chart in what point or place the vessel is. See CHART, RHUMB, &c.

All the difficulty in *pointing* a chart arises from our ignorance of the longitude.—The pilot easily finds the latitude by taking the height of the pole; but for the longitude, there is no coming at it but by computation, which is ever uncertain. See LONGITUDE, LATITUDE, SAILING, &c.

**POINTING the cable**, is a sea term, denoting the untwisting it at the end, and lessening the yarn, and twisting them again, making all fast with a piece of marling, to keep it from raveling out. See CABLE.

**POINTING**, in war, the levelling or directing a cannon, or mortar-piece, so as to play against any certain point. See QUADRATING, CANNON, ORDNANCE, MORTAR, PROJECTILE, &c.

This is done by means of a quadrant with a plummet. See *Gunnery* QUADRANT.

**POISE.** See the articles COUNTERPOISE, WATERPOISE, &c.

**POISON\***, in medicine, a malignant quality in some animal, vegetable, or mineral body, which renders it hurtful, and even mortal, to those who take it even in a small quantity.

\* The word is derived from the Latin *poisio*, draught; and was anciently used in an innocent sense. See PORTION.

Some define *poison* to be any thing taken inwardly, whose properties are contrary to those of food, or to what they should be in order to nutrition. See FOOD.

*Poisons* are of various kinds, and operate in various manners; some by dissolving the blood, others by coagulating it, and others by corroding and destroying the solid parts. See BLOOD, DISSOLUTION, COAGULATION, CORROSION, &c.

Some attack, equally, all the parts; some only a particular one.—Thus the *lepus marinus* is an enemy to the lungs, cantharides to the bladder, &c.

Some again, which prove *poison* to man, serve for food to other animals.—Thus, mandragora and jusquiannus feed hogs, kill man; and thus that deadly *poison* hemlock is wholesome for goats, bustards, and, as Galen says, for starlings too. The cassavi plant, Sir Hans Sloane tells us, *poisons* unprepared; but prepared, is the very bread of the West Indies, particularly Jamaica and the hotter parts; and is used to victual ships.

Nay, what is more, some *poisons* are not only food, but even physic, to other animals.—In the *Philos. Transact.* we have an instance of a horse troubled with the farcy, which could not be cured by the most famed remedies, which yet cured himself in a short time, by feeding greedily on hemlock.—Fontanus tells us of a woman who eat hemlock for some time to procure sleep, and with very good effect, though repeated doses of opium had no operation.

Dr. Tanc. Robinson, in a letter to Mr. Ray, gives an account of several poisonous plants, which, if truly corrected, or exactly dosed, he says, may prove the most powerful remedies known.

—Thus the hellebores, incorporated with a sapo, or alkaly-salts alone, are successful in epilepsies, vertigo's, palsies, lethargies, and mania's: dose from  $\mathfrak{ss}$ . to  $\mathfrak{ss}$ . The roots of cicuta, asarum, and napellus, in agues and periodical pains: dose  $\mathfrak{ss}$ . to  $\mathfrak{ss}$ . The hyoscyamus in hæmorrhages, violent heats and inflammations: dose  $\mathfrak{ss}$ . to  $\mathfrak{ss}$ . The semen stramoniz is a good anodyne, useful in vigilia's, rheumatisms, hysteric cases, &c. dose  $\mathfrak{ss}$ . to  $\mathfrak{ss}$ . Elaterium, soldanella and gratiola, in hydropic cases. Opium corrected loses its narcotic quality, and is safely given in great doses in convulsive cases, fluxes, catarrhs, &c.

Physicians distinguish three kinds of *poisons*.

**Animal POISONS**, those drawn from animals; as, the viper, aspic, scorpion, *lepus marinus*, &c. See VIPER.

**Vegetable POISONS**, as aconite, cicuta, or hemlock, hellebore, napellus, &c. See ACONITE, CICUTA, HELLEBORE, &c.

**Mineral POISONS**, as arsenic, corrosive sublimate, cerusse, orpiment, realgal, &c. See ARSENIC, &c.

The theory of the effects, operations, &c. of *animal poisons*, is very accurately and mechanically delivered by Dr. Mead, in those remarkable cases, the bites of a viper, tarantula, and mad

# POL

dog. See his doctrine under the respective articles, TARANTULA, VIPER, and HYDROPHOBIA.

The operation of *vegetable poisons*; see deliver'd under the article OPIATES.

As to *mineral poisons*, they all bear so much analogy to that made of quicksilver in the common sublimate, that their operation will easily be conceived from what we have already laid down under the heads MERCURY, and SUBLIMATE.

They are all more or less dangerous, as their salts receive a greater or less force from the metallic particles; and hence, as the most virulent may be mitigated by breaking the points of the saline crystals, the most innocent minerals may become corrosive by combining them with salts, as is seen in the preparations of silver, antimony, iron, &c. See MEFPHITES, GROTTO, &c.

The general remedies against *poisons* are known by the name of *antidotes*, *alexipharmics*, *alexiterials*, &c. See ANTIDOTE, ALEXIPHARMIC, &c.

**COUNTER POISON.** See the article COUNTER *poison*.

To **POISON a piece**, among gunners, is the same as to clog and nail it up. See NAILING.

**POISONING**, in law, the crime of administering poison to a person, whereby he dies. See POISON.

This, by a law of Henry VIII. was made a sort of treason; and the punishment doomed for it was, to be put alive into a caldron of water, and boiled to death.—At present it is only murder, or felony without benefit of clergy, if the party dies of the poison within a year and a day. See PUNISHMENT.

**POISONOUS waters.** See the article WATER.

**POLAR**, something that relates to the poles of the world. See POLE, and CIRCUMPOLAR.

In this sense we say, *polar virtue*, *polar tendency*, &c. See POLARITY.

**POLAR circles**, are two lesser circles of the sphere, parallel to the equator, at the distance of 23 deg. from each pole; serving to mark the beginning of the frigid zones. See CIRCLE, and ZONE. The *polar circles* are particularly denominated from their respective neighbouring poles, the *arctic* and *antarctic*. See ARCTIC, and ANTARCTIC.

**POLAR dials**, are those whose planes are parallel to some great circle passing thro' the poles, or to some one of the hour-circles; so that the pole is neither elevated above, nor depressed below the plane.

Such dial, therefore, can have no centre, and consequently its style, sub-style, and hour-lines, are parallel. See PLANE.

This, therefore, will be an horizontal dial to those who live under the equator, or line.

To *construct a POLAR dial.* See the article DIAL.

**POLAR projection**, is a representation of the earth, or heavens, projected on the plane of one of the polar circles. See PROJECTION, MAP, PLANISPHERE, &c.

**POLARITY**, the quality of a thing consider'd as having poles. See POLE.

By heating an iron bar, and letting it cool in a vertical posture, it acquires a *polarity*.—The lower end becomes the north end, the upper the south. See IRON.

Iron bars acquire a *polarity*, by being kept a long time in an erect posture, even without heating.—Thus the bars of windows, &c. are frequently found to have poles. Nay, a rod of iron acquires a *polarity*, by the mere holding it erect; the lower end in that case attracting the south end of a magnetic needle, and the upper the north end.—But these poles are mutable, and shift with the situation of the rod. See MAGNET, and MAGNETISM.

**POLE\***, POLUS,  $\pi\omicron\lambda\omicron\varsigma$ , in astronomy, one of the extremities of the axis, whereon the sphere revolves. See AXIS, and SPHERE.

\* The word is formed from the Greek  $\pi\omicron\lambda\omicron\varsigma$ , *vertens*, to turn.

These two points, each 90 deg. distant from the equator, are called, by way of excellence, the *poles of the world*. See WORLD. Wolfius defines the *poles*, those points on the surface of the sphere through which the axis passes; such are the points I and K, (*Tab. Astron. fig. 21.*)—whereof, that visible to us, or raised above our horizon, I, is called the *arctic* or *north pole*; and its opposite, K, the *antarctic* or *south pole*. See ARCTIC, and ANTARCTIC.

**POLE**, in geography, is the extremity of the earth's axis, or one of the points on the surface of our globe, through which the axis passes. See EARTH.

Such are the points P, Q, (*Tab. Geogr. fig. 1.*) whereof that elevated above our horizon is call'd the *arctic* or *north pole*; and its opposite, Q, the *antarctic* or *south pole*. See GLOBE.

Dr. Halley shews, that the solstitial day, under the *pole*, is as hot as under the equinoctial, when the sun is in the zenith; in regard all the 24 hours of that day under the *pole*, the sun-beams are inclined to the horizon in an angle of 23½ degrees; whereas, under the equinoctial, though he becomes vertical, yet he shines no more than 12 hours, and is absent 12 hours;—besides that for 3 hours, 8 minutes, of that 12 hours, he is above the horizon there, he is not so much elevated as under the *pole*. See HEAT.

The *altitude*, or *elevation of the pole*, is an arch of the meridian intercepted between the *pole* and the horizon. See ALTITUDE, ELEVATION, and DEPRESSION.

To find this elevation, is a very popular problem in astronomy, geography, and navigation; this, and the latitude of the place, being always the same. See LATITUDE.

To observe the altitude of the POLE.—With a quadrant, observe both the greatest and least meridian altitude of the pole star. See MERIDIAN.

Subtract the least from the greatest, and divide the difference by two; the quotient is the star's distance from the pole; which, added to the lesser altitude found, gives the elevation of the pole required.

Thus M. Couplet the younger, at Lisbon, in 1697, in the end of September, observed the greatest meridian altitude  $41^{\circ} 5' 40''$ ; the smallest  $36^{\circ} 28' 0''$ ; the difference whereof is  $4^{\circ} 37' 40''$ ; one half whereof,  $2^{\circ} 18' 50''$ , added to the less, gives  $38^{\circ} 46' 50''$ ; the altitude of the pole of Lisbon. See ALTITUDE.

The altitude of the pole, together with the meridian line, being the basis of all astronomical observations; to determine it with the greater accuracy, the meridian altitudes must be corrected from the doctrine of refractions, hereafter delivered. See REFRACTION, MERIDIAN, &c.

By means hereof, M. Couplet, subtracting  $1' 25''$  in the proposed example, leaves the corrected altitude  $38^{\circ} 45' 25''$ .

Hence, 1. The altitude of the pole being subtracted from  $90^{\circ}$ , leaves the altitude of the equator. See EQUATOR.

2. If the greatest meridian altitude of this star exceed the altitude of the equator, the latter subtracted from the former, leaves the declination of the star northward; if the altitude of the star be less than that of the equator, the former subtracted from the latter leaves the star's declination southward. See DECLINATION.

Dr. Hook, and some others, imagined the height of the pole, and the position of the circles in the heavens, in respect of those on the earth, to be changed from what they anciently were: But M. Cassini thinks there is no ground for such surmise; but that all the difference we now find in the latitudes of places, &c. in respect of the ancient accounts, arises from the inaccuracies of the ancient observations.

Indeed, it is no wonder they should err in their observations, considering what instruments they used. He adds, it is probable there may be some variation in the height of the pole; but thinks this never exceeds two minutes; and that even this will vanish, after it is arrived to its highest difference. See EQUATOR, &c.

POLE, in spherics, is a point equally distant from every part of the circumference of a greater circle of the sphere; as the centre is in a plain figure. See CENTRE.

Or, pole is a point  $90^{\circ}$  distant from the plane of a circle, and in a line passing perpendicularly through the centre, called the axis. See CIRCLE.

The zenith and nadir are the poles of the horizon.—The poles of the equator are the same with those of the sphere or globe. See ZENITH, NADIR, &c.

POLES of the ecliptic, are two points on the surface of the sphere,  $20^{\circ} 30'$  distant from the poles of the world, and  $90^{\circ}$  distant from every part of the ecliptic. See SPHERE, ECLIPTIC, &c.

POLES, in magnetics, are two points in a load-stone, corresponding to the poles of the world; the one pointing to the north, the other to the south. See MAGNET.

If the stone be broken in ever so many pieces, each fragment will have its two poles.—If a magnet be bisected by a line perpendicular to the axis; the two points before joined will become opposite poles, one in each segment.

To touch a needle, &c. that part intended for the north end is touched with the south pole of the magnet, and that intended for the south end with the north pole. See NEEDLE.

A piece of iron acquires a polarity, by only holding it upright, &c. See POLARITY. But its poles are not fixed, but shift, and are inverted as the iron is.—A fixed north pole may be made all the ways a fixed south pole is made, but not vice versa; and whatever way we get a fixed south pole, it is always weaker than a fixed north pole got the same way. Fire destroys all fixed poles, but strengthens the mutable ones. See FIRE.

The end of a rod being heated, and left to cool northward, Dr. Gilbert says, becomes a fixed north pole; if southward, a fixed south pole: yet this doth not hold in all cases.—If the end be cooled, held downward, or to the nadir, it acquires somewhat more magnetism than if cooled horizontally towards the north. But the best way is to cool it a little inclined to the north. Repeated ignitions do not avail more than a single one.

Dr. Power says, that if we hold a rod northwards, and hammer the north end in that position, it will become a fixed north pole; and, contrarily, if you hammer the south end.—What is said of hammering, is to be likewise understood of filing, grinding, sawing; nay, a gentle rubbing, provided it be continued long, will produce poles. See FRICTION.

The more heavy the blows are, ceteris paribus, the magnetism is the stronger.—A few hard blows do as much as many. Old drills and punches have fixed north poles, because almost constantly used downwards. New drills have either mutable poles, or weak north poles. Drilling with such a one southward horizontally, it is a chance if you produce a fixed south pole, much less if you drill south downwards; but if you drill south upwards, you make a fixed south pole.

A weak fixed pole may degenerate into a mutable one in a day, nay, in a few minutes, by holding it in a position contrary to its pole. The load-stone itself will not make a fixed pole in any iron. It is required the iron have a length, if it be thick. Mr.

Ballard tells us, that in six or seven drills made before his face, the bit of each became a north pole, merely by hardening.

POLE of a glass, in optics, is the thickest part of a convex, or the thinnest of a concave glass. See CONVEX, and CONCAVE.

If the glass be truly ground, the pole will be exactly in the middle of its surface. See OPTIC glass, GRINDING, &c.

This is sometimes also called the vertex of the glass. See VERTEX.

POLE, in surveying, is a measure containing 16 feet and an half; called also perch, and sometimes rod. See PERCH.

POLE STAR, or POLAR STAR, is a star of the second magnitude; the last in the tail of ura minor, or the little bear. See URSA MINOR.

Its longitude, Mr. Flamsteed makes  $24^{\circ} 14' 41''$ , its latitude,  $66^{\circ} 04' 11''$ .

The nearness of this star to the pole, whence it happens, that it never sets, renders it of vast service in navigation, &c. for determining the meridian line, the elevation of the pole, and consequently the latitude of the place, &c. See POLE; see also MERIDIAN, and LATITUDE.

POLEIN, in our ancient customs, a sort of shoe, sharp or picked at the point.

This fashion was first taken up in the time of king William Rufus; the picks being made so long, that they were tied up to the knees with silver or golden chains.

They were forbidden by stat. an. 4. Edw. IV. cap. 7.—*Tunc fluxus crinium, tunc luxus vestium, tunc usus calceorum cum arcuatis aculeis inventus est.* Malmesb. in Will. II.

POLEMICAL\*, *πολεμικός*, an epithet applied to books of controversy, especially those in divinity.

\* The word comes from the Greek, *πολεμος*, war, battle.—Scaliger's exertions against Cardan make a pure polemical book.

Hence also we say, polemical divinity, for controversial, &c. See THEOLOGY.

POLESCOPE, in optics, an oblique kind of prospective glass, contriv'd for the seeing of objects that do not lie directly before the eye.

It was invented by Hevelius, in 1637, who gave it this name, from the Greek *πολεμος*, battle; because it may be of use in war, in engagements, duels, &c.

Something of this kind are those now known among us under the name of ogling-glasses, or opera-glasses, through which one sees a person in appearing to look at another.

Construction of the POLESCOPE.—Any telescope will be a polemoscope, if the tube be but crooked, like a rectangular syphon ABD M (Tab. Opt. fig. 70.); and between the object-glass AB and first eye-glass GH (if there be several) be placed a plain mirror, in such manner as that the mirror is inclin'd to the horizon at an angle of  $45^{\circ}$ , and its reflected image found in the focus of the eye-glass GH.

For, by this means, objects situate over-against the lens AB, will appear the same as if the mirror K were away, and the object-glass, with the objects, were directly opposite to the eye-glasses.

If it be desired to look in at O, not at M, another plain mirror, N, must be added. See TELESCOPE.

POLETA, in our ancient law-books, signifies the ball of the foot.—*Tres orilli scindantur de pede anteriori sine poleta*, Mat. Par. anno 1215. See EXPEDITATE.

POLEY, in medicine. See the article POLIUM.

POLICY\*, or POLITY, *πολιτεία*, the laws, orders, and regulations prescrib'd for the conduct and government of states and communities. See GOVERNMENT.

\* The word is of Greek original; being derived from the Greek *πολις*, civitas, city, or state.

In the general, policy is used in opposition to barbarism.—Different states have different kinds of policy; thus the policy of Athens differ'd from that of Sparta.

Loyseau observes, that policy properly signifies the course and administration of justice in a city.—The direction of the policy of London is in the hands of the lord-mayor. See MAYOR.

At Paris they have a chamber of policy, where people are verbally accused for contraventions or policy.

Some divide policy into two parts, *agoronomy*, that relating to affairs of merchandize; and *astynomy*, that concerning the civil and judiciary government of the citizens. Some add a third branch, viz. what relates to the ecclesiastical government. See ECCLESIASTICAL.

Ric. Hooker has a fine treatise of the laws of ecclesiastical policy.

POLICY of insurance, or assurance, of ships, is a contract or convention, whereby a person takes upon himself the risks of a sea-voyage; obliging himself to make good the losses and damages that may befall the vessel, its equipage, tackle, victualing, lading, &c. either from tempests, shipwrecks, pirates, fire, war, reprisals, &c. in part or in whole; in consideration of a certain sum of seven, eight, or ten per cent. more or less, according to the risque run; which sum is paid down to the assurer by the assured, upon his signing the policy. See ASSURANCE.

There are some assurances for the going, some for the returning, and some for both; or for a limited time; though some maintain that the time ought never to be limited, in that the contract thereby becomes usury.

The

The *policy* is to contain the name and dwelling of the person assured; his quality, whether as proprietor or agent; the effects, name of the vessel, and of the master; those of the place where the goods are to be laden or unloaded; the port whence and whither; the time, the risks, and the conditions.

If the vessel or merchandises assured be lost, the assured must notify the same by an act in form; declaring he surrenders the whole to the assurer, on his paying the sums in the time expressed.

The origin of these assurances is ascribed to the Jews, at the time they were expelled France, in 1182. who are said to have used this as a means to facilitate the transporting of their effects.

The term *policy* is Spanish, and comes from *poliza*, schedule; but the practice comes from the Italians, and the Lombards, who, again, derived it originally from the Latin *pollicitatio*, promise.--- Some say, the merchants of Marseilles were the first who set on foot this kind of commerce.

Anciently, *policies* were given by word of mouth, called *policies of credit*; it being supposed the assurer would enter them in his ledger: but of late, that honesty is become less frequent among traders, they have been constantly in writing.

The grand mart for the assurance of ships is the city of Amsterdam. It is here not only the Dutch traders insure their vessels; but, what is infinitely more considerable, such are the riches, reputation, &c. of the inhabitants, as to engage the generality of merchants of other countries to prefer them to their own countrymen, and to assure with the Dutch, when it would be much easier for them to find assurers at home, or in the ports where the vessels are laden.

The number of insurers at Amsterdam is not above fifty or sixty persons; yet is their wealth and character such, that a man never fails of an assurer, be the countries or ports what they will, the cargo ever so rich, or the dangers ever so imminent.

**POLICY of insurance or assurance of houses** is an instrument formed on the model of that for vessels; whereby a person, or community of persons, take on themselves the risks and damages that may befall houses, their furniture, in whole or in part, &c. from fire; on consideration of a certain sum or sums, to be paid by the assurer, according to the terms of the agreement. See ASSURANCE.

The insurance from fire is now a popular piece of commerce; and we have a number of societies erected into corporations for that very purpose.

**POLICY of insurance of lives** is an instrument whereby a society of persons erected into a corporation, &c. oblige themselves to pay a certain sum of money, *e. gr.* an hundred pounds upon the death of a person whose life they assure, in consideration of a sum of money, *e. gr.* one guinea, paid quarterly, to the assurers during the life of the said person assured.

The *policy* is under the seal of the office, and intitles the person in whose favour it is granted, to make good his claim, according to the tenor of the articles or by-laws of the society.

There have also been lately set on foot, *policies* of assurance of horses, from death, damages in travelling, diseases, being stolen, &c. in which cases the assurers are to make them good to the assureds, &c.

**Officers of POLICY.** See the article OFFICER.

**POLICY**, in letter-foundry, is sometimes used for a rule that regulates the number of letters of each kind in a complete font; *i. e.* to determine how many, in proportion to the whole set, there are to be of each particular kind. See LETTER, FONT, &c.

For instance, in a font of an hundred thousand characters, there are to be eight thousand for *e*, five thousand for *a*, three thousand for *m*, thirty only for *k*, as many or a little more for *x*, *y*, and *z*; and in proportion for the other letters, the great and small capitals, the initial letters, points, comma's, double letters, &c. See LETTER FOUNDRY.

**POLIOPTERUM**, or **POLYOPTERON**, in optics. See POLYOPTERON.

**POLISH coins, measures, &c.** See the articles COIN, MONEY, MEASURE, &c.

**POLISHER**, an instrument called also a *burnisher*, used for polishing and burnishing gold, silver, and other metals, when gilt or silvered; and matters of other kinds proper to take a polish. See BURNISHING, and POLISHING.

The *polisher* is different in the different arts and manufactures.---The gilders use an iron *polisher* to prepare their metals before gilding, and the blood-stone to give them the bright polish after gilding. See GILDING.

The *polisher* used by the makers of spurs, bits, &c. is part iron, part steel, and part wood.---The instrument consists of an iron bar, with a wooden handle at one end, and a hook at the other, to fasten it to another piece of wood held in the vice, while the operator is at work. In the middle of the bow, within-side, is what they properly call the *polisher*, which is a triangular piece of steel with a tail, whereby it is riveted to the bow.

What the cutlers call their *polishers*, are a kind of wooden grindstones, (if we may be allowed the word) made of walnut-tree, an inch thick, and of a diameter at pleasure. They are turn'd by the great wheel; and it is on these they polish and smooth their works with emery and putty.

The *polishers* used in the manufacture of glass are very different from all these.---They consist of two pieces of wood, the one flat, cover'd with old hat; the other long, and half-round, is

fastened on the former, whose edge it exceeds on both sides by some inches, which serve the workman to take hold of, and to work it backwards and forwards by. See GLASS.

The *polishers* used by spectacle-makers are pieces of wood a foot long, seven or eight inches broad, and an inch and half thick, covered with old castor-hair, whereon they polish the shell and horn frames their spectacle-glasses are to be set in. See SPECTACLES.

**POLISHING**, the art of giving a gloss, or lustre, to a thing; particularly a precious stone, marble, glass, mirror, or the like. See LUSTRE, &c.

**POLISHING of glasses, lens's, &c.** succeeds the grinding thereof. See GRINDING; see also GLASS, LENS, &c.

The *polishing* of a mirror is the last preparation given it, with emery or putty. See MIRROR.

For the *polishing* of diamonds, &c. see LAPIDARY, &c.

**POLITICAL** \*, πολιτικόν, something that relates to policy, or civil government. See POLICY, and GOVERNMENT.

\* The word is formed from the Greek πολις, civitas, city.

In this sense we say, *political* interests, *political* views, *political* discourses, &c.

**POLITICAL arithmetic**, is the application of arithmetical calculations to *political* uses and subjects; as, the public revenues, number of people, extent and value of lands, taxes, trade, commerce, manufactures, or whatever relates to the power, strength, riches, &c. of any nation or commonwealth. See ARITHMETIC.

The chief authors who have attempted calculations of this kind, are Sir William Petty, Major Grant, Dr. Halley, Dr. Davenant, and Mr. King; and the principal points settled by them are as follow:

According to Sir William Petty's computations, though the land of Holland and Zealand be not above 1000000 acres, nor that of France less than 8000000, yet the former are near a third part as rich and strong as the latter.---That the rents of lands in Holland, are to those in France as 7 or 8 to 1.---That the people of Amsterdam are  $\frac{1}{4}$  of those of Paris or London; which, according to him, do not differ above a 20th part from one another.---That the value of the shipping of Europe is about two millions of tons, whereof the English have 500000, the Dutch 900000, the French 100000; the Hamburgers, Danes, Sweedes, and Dantzickers, have 250000; and Spain, Portugal, Italy, &c. about as much.---That the value of goods exported yearly from France into all parts, was quadruple of that exported into England alone, and consequently, in all, about 5000000 *l.* What was then exported out of Holland into England, was worth 300000 *l.* and what was exported thence into all the world, 1800000 *l.*---That the money yearly raised by the French king, in time of peace, is about 6 $\frac{1}{2}$  millions sterling; and that the moneys raised in Holland and Zealand, are about 2100000 *l.* and in all the provinces together, about 3000000 *l.*---That the people of England are about 6000000, and their expences at 7 *l.* per annum a head, 42000000 *l.* or 800000 *l.* a week.---That the rent of the lands is about 8 millions, and the interests and profits of the personal estates as much.---The rent of houses in England 4000000 *l.*---That the profits of the labour of all the people is 26000000 *l.* yearly.---That in Ireland the people amount to about 1200000 *l.* That the corn spent in England, at 5 *s.* the bushel for wheat, and 2 *s.* 6 *d.* for barley, amounts to ten millions per annum.---That the navy of England (then) required 36000 men to man it, and other trade and shipping, about 48000.---That in France, to manage the whole shipping trade, there were required 1500 men.---That the whole people of France are about thirteen millions and an half; and those of England, Scotland, and Ireland, together, about nine millions and a half.---That in the three kingdoms are about 20000 churchmen; and in France above 270000.---That in the dominions of England are above 40000 seamen, and in France not above 10000.---That in England, Scotland, and Ireland, and all other dominions depending thereon, there was then about 60000 tun of shipping, which is worth about four millions and a half in money.---That the sea-line round England, Scotland, and Ireland, and the adjacent isles, is about 3800 miles.---That in the whole world are about 300 millions of people; whereof those with whom the English and Dutch have any commerce, are not above 80 millions.---That the value of commodities traded for in the whole, is not above 45000000. That the manufactures exported out of England, amount to about 5000000 *l.* per annum. Lead, tin, and coals, to 500000 *l.* per annum.---That the value of the French commodities (then) brought into England, did not exceed 1200000 *l.* per annum.---That the whole cash of England, in current money, was then about 6000000 *l.* sterling.

Dr. Davenant gives some good reasons, why many of Sir Wm. Petty's numbers are not to be intirely depended upon; and therefore advances others of his own, founded on the observations of Mr. Greg. King.

Some of the particulars are,---That the land of England is 39 millions of acres.---That the number of people, according to his account, is about 5545000 souls, they increasing about 9000 every year, allowances being made for plagues, &c. wars, shipping, and the plantations.---The people in London he reckons at 530000: Those in the other cities and market-towns in England, 870000; and those in the villages and hamlets, at 4100000. The yearly rent of the land he accounts to be

1000000 *l.*--- That of the houses and buildings 2000000 *l.* *per annum.*--- The produce of all kinds of grain he reckons to be worth 9075000 *l.* in a year moderately plenty.--- The rent of the corn-lands annually 2000000 *l.* and their near produce, above 9000000 *l.*--- The rent of the pasture, meadows, woods, forests, commons, heaths, &c. 7000000 *l.*--- The annual produce by cattle, in butter, cheese, and milk, he thinks, is about 2500000 *l.*--- The value of the wool yearly shorn, about 2000000 *l.*--- Of horses yearly bred, about 250000 *l.*--- Of the flesh yearly spent as food, about 3350000 *l.*--- Of the tallow and hides, about 600000 *l.*--- Of the hay yearly consumed by horses, about 1300000 *l.*--- Of hay consumed by other cattle, 1000000 *l.*--- Of the timber yearly felled for building, 500000 *l.*--- Of the wood yearly spent in firing, &c. about 500000 *l.*--- The land of England to its inhabitants is now about 7½ acres *per head.*--- The value of the wheat, rye, and barley, necessary for the sustenance of England, amounts to at least 6000000 *l.* *sterl per annum.*--- The value of the woollen manufacture made here is about 8000000 *l.* *per annum*; and our exports of all kinds of the woollen manufacture amount to above 2000000 *l.* *per annum.*--- The annual income of England, on which the whole people live and subsist, and out of which taxes of all kinds are paid, is now about 43000000 *l.*--- that of France 81000000 *l.* and that of Holland 18250000 *l.*

Major Grant, in his observations on the bills of mortality, computes, that there are 39000 square miles of land in England.--- That in England and Wales there are 4600000 souls.--- That the people of London are about 640000; one fourteenth part of the people of England.--- That in England and Wales are about 10000 parishes.--- That there are 25 millions of acres in England and Wales, *viz.* about 4 acres to every head.--- That but 64 out of 100 of the children born, are living at 6 years old.--- That but 40 of 100 are alive at 16 years end.--- That but 25 of 100 at 26 years end.--- That but 16 at 36 years end.--- That but 10 out of 100 at 46 years end.--- That but 6 out of 100 at 56 years end.--- That but three out of 100 at 66 years end.--- And that but 1 out of a 100 at 76 years end:--- And that London doubles itself in about 64 years.

Sir William Petty, in his discourse about duplicate proportion, further tells us, that it is found by experience, that there are more persons living between 16 and 26, than of any other age; and laying down that as a supposition, he infers, that the square roots of every number of mens ages under 16 (whose root is 4) shew the proportion of the probability of such persons reaching the age of 70 years.

Thus, it is 4 times more likely, that one of 16 years of age lives to be 70, than a child of one year old.--- It is thrice as probable, that one of 9 years lives to be 70, as such a newborn child, &c.--- That the odds is five to 4, that one of 25 dies before one of 16 years.--- That it is 6 to 5, (still as the square roots of the ages) that one of 36 years old dies before one but of 25 years of age: and so on according to any declining age to 70, compared with a number between 4 and 5; which is the root of 21, the law-age.

Dr. Halley has made a very exact estimate of the degrees of the mortality of mankind, from a curious table of the births and burials, at the city of Breslau, the capital of Silesia; with an attempt to ascertain the price of annuities upon lives.--- From a table which he has calculated thence, published in the *Philos. Transact.* he derives the following uses:

1. To find in any multitude or body of people, the proportion of men able to bear arms, which he reckons from 18 to 56 years old; and accounts about ¼ of the whole.--- 2. To shew the different degrees of morality, or rather vitality, in all ages; by which means he finds the odds there is, that any person of any age doth not die in a year's time, or before he attains such an age.--- 3. To shew of what number of years it is an even lay that such a person shall die; and finds, for instance, that it is an even lay, that a man of thirty years of age lives between twenty-seven and twenty-eight years.--- 4. To regulate the price of insurance upon lives:--- 5. And the valuation of annuities upon lives.--- 6. How to value two or three lives after the same manner. See ANNUITY.

From the whole, he makes two very good observations: 1. How unjustly we use to complain of the shortness of our lives; for that it appears, that one half of those that are born, do not live above seventeen years.

2. That the growth and increase of mankind is not so much stunted by any thing in the nature of the species, as it is from the curious difficulty most people make of venturing on the state of marriage: and therefore that celibacy ought to be every way discouraged by all wise governments; and those who have numerous families of children to be countenanced and encouraged by good laws; such as the *jus trium liberorum*, &c. among the Romans.

Farther particulars relating to the number of births and burials, the proportion of males and females, &c. see under the articles MARRIAGE, MORTALITY, &c.

POLITICAL criticism. See the article CRITICISM.

POLITICS\*, POLITICE, *πολιτικη*, the first part of oeconomy, or ethics, consisting in the governing and regulating of states, for the maintenance of the public safety, order, tranquillity, and good morals. See ETHICS, PHILOSOPHY, GOVERNMENT, &c.

\* The word is form'd from the Greek *πολις*, *civitas*, state.

My lord Bacon divides *politics* into three parts with regard to the three grand ends thereof, or the three offices incumbent on those who have the administration, *viz.* the *preservation* of the state, the *happiness* and *flourishing* of the state, and the *enlargement* of its bounds, &c.

The two first parts, he observes, are well handled by several authors; but about the third there is a deep silence.--- He ranks this therefore in the number of the *desiderata*, and gives us a specimen of an essay to supply it.

We have several systems of *politics* by Aristotle, Machiavel, Doria, Lipsius, &c. in which last there is nothing but particles and conjunctions of the author's own, the body of the book being all quotations.

Academy of POLITICS. See the article ACADEMY.

POLITY, or POLICY. See the article POLICY.

POLIUM\*, POLEY, a medicinal plant, which makes an ingredient in the treacle of Andromachus. See TREACLE.

\* It has its name from the Greek *πολιον*, *white*, in regard the heads of the *polium* of the ancients, according to Dioscorides, and the leaves, according to Pliny, were white.

It grows in mountainous places, and is thence denominated *montanum*.--- The tops of its flowers are esteemed cephalic, proper to promote urine, and the menses, and to prevent putrefaction.

POLL, a term used in ancient writings for the head. See HEAD.

The word is doubtless formed from *pole*; this part being, as it were, the pole of the microcosm. See POLE.

Hence, *to poll*, is to enter down the names of persons who give their votes or voices at an election. See VOTE, VOICE, SUFFRAGE, ELECTION, &c.

POLLARD, among hunters, a stag, or male deer, which has cast its head. See HEAD, HUNTING, &c.

POLLARD, or POLLENGER, in agriculture, is applied to such trees as have been frequently polled or lopped; by which they are contradistinguished from timber-trees. See TREE, TIMBER, and HORN.

POLLEX, in anatomy, denotes either the thumb, or great toe, according as either manus, or pedis, is added to it. See FINGER, and TOE.

POLLICIS abductor. See the article ABDUCTOR.

POLLICIS adductor. See the article ADDUCTOR.

Extensor POLLICIS brevis, and longus. See the article EXTENSOR.

Flexor POLLICIS brevis, and longus. See the article FLEXOR.

POLL-MONEY, or *capitation*, a tax imposed by authority of parliament on the person or head; either on all indifferently, or according to some known mark of distinction, as quality, calling, &c. See TAX, and CAPITATION.

Thus, by the statute 18 Car. II. every subject in the kingdom was assessed by the *head*, or *poll*, according to his degree; every duke 100 *l.* marquis 80 *l.* baronet 30 *l.* knight 20 *l.* esquire 10 *l.* &c. and every single private person 12 *d.*

This was no new tax, as appears by former acts of parliament; particularly that anno 1380. where, *quilibet tam conjugatus quam solutus, utriusq; sexus, pro capite suo solvere cogebatur.* Walling.

Camden, in his remains, of coins, says, there was anciently a personal tribute, called *capitatio*, or *poll-silver*, imposed on the *poll*, or person, of every one; on women from the age of 12 years, and on men from 14.

POLLUTION, POLLUTIO, the act of profaning a temple, or other holy place. See PROFANATION.

The Romanists hold a church to be polluted by the effusion of blood, or of seed, therein; and require its being consecrated anew.

The Jews were held polluted by the touching of a dead body, or of the menses of women; and were to be purified in form. See the laws hereof in *Leviticus*.

The Indians are so superstitious on the head of *pollution*, that they break all the vessels which those of another religion have drank out of, or even touched; and drain all the water out of a pond a stranger has bathed in.

POLLUTION, or *self POLLUTION*, is also used for the abusing or defiling of one's own body, by means of lascivious frictions and titillations, raised by art, to produce an emission. See EMISSION.

We read, in scripture, that Onan, and, as some critics also think, Er, were severely punished for having polluted themselves by spilling their seed on the ground; whence the crime has been denominated by some empirics, *Onania*. See ONANIA.

Of *pollutions*, some are *voluntary*, others *involuntary*, and *nocturnal*.

Nocturnal POLLUTION is an involuntary emission of seed, from a too great turgescency of the seminal vessels, or from the seed's being too sharp and irritating, or from a weakness of the parts. See SEED, and GONORRHOEA.

The Romish church puts up prayers, in the clove of the evening-office, to be preserved from nocturnal *pollutions*.

POLLUX, in astronomy, the hind twin, or posterior part of the constellation gemini. See GEMINI.

POLLUX is also a fixed star, of the second magnitude, in the constellation gemini, or the twins. See GEMINI.

Its place is in the head of the hind-twin, named *pollux*.—Its longitude  $18^{\circ} 56' 09''$ . Its latitude  $6^{\circ} 39' 27''$  N.

POLLUX is also used in meteorology. See CASTOR.

POLTROON, or POLTRON, a coward, or dastard, wanting courage to perform any thing great or noble. See COWARD.

The word we borrow from the French, who, according to Salmassius, derive it a *pollice truncato*; because anciently those who would avoid going to the wars, cut off their thumbs.

But Menage, with more probability, derives it from the Italian, *poltrone*, and that from *poltro*, a bed; because timorous, pusillanimous people, take pleasure in lying a-bed.—He adds, that the Italian, *poltro*, is again derived from the German, *polster*, a pillow, or cushion.

Others chuse to derive the word from the Italian, *polstro*, colt; because of that creature's readiness to run away.

POLTROON, in falconry, is a name given to a bird of prey, when the nails and talons of his hind-toes are cut off, wherein his chief force and armour lay; in order to intimidate him, and prevent his flying at great game. See HAWK, and HAWKING.

POLYACOUSTICS\*, instruments contrived to multiply sounds; as multiplying-glasses, or polyscopes, do images of objects. See PHONICS, SOUND, &c.

\* The word is compounded of the Greek *πολυς*, much, and *ακουω*, audio, I hear. See ACOUSTICS.

POLYANTHEA\*, a famous collection of common-places, in alphabetical order; of great service to orators, preachers, &c. of the lower class. See COMMON-PLACE.

\* The word is formed from the Greek *πολυς*, much, and *ανθος*, flower; and is much of the same significancy with *anthology*, or *florilege*. See ANTHOLOGY.

The first author of the *polyanthea* was Dominic Nanni de Mirabello, whose labour has been improved on by Barth. Aman-tius, and Franc. Tortius, and since by Jos. Langius, under the title of *polyanthea nova*, 1613.

POLYANTHUS\*, or POLYANTHIUM, is used to denote a plant which bears or produces several or many flowers. See PLANT, and FLOWER.

\* The word is compounded of *πολυς*, multus, much, and *ανθος*, flos, flower.

POLYCHREST\*, *πολυχρεστος*, in pharmacy, a medicine that serves for many uses, or that cures many diseases. See PANACEA.

\* The word is compounded of the Greek *πολυς*, multus, much, and *χρεστος*, utilis, useful.

SAL POLYCHREST is a compound salt, made of equal parts of salt-petre and sulphur, laid on a crucible first heated red-hot for the purpose. See SALT.

POLYEDRON. See the article POLYHEDRON.

POLYGAMY\*, *πολυγαμία*, a plurality of wives, or husbands, held by the same man, or woman, at the same time. See WIFE, and HUSBAND.

\* The word is formed from the Greek *πολυ*, multum, and *γαμη*, uxor, wife.

*Polygamy* is prohibited among Christians, but was allowed by divine appointment among the Jews; as it is still among the Mahometans.

Major Grant observes, that the males and females brought into the world are nearly on a balance; only abating for a little excess on the side of the males, to make up for the extraordinary expence thereof in war, and at sea: whence it follows, that nature only intends one wife, or one husband, for the same person; since, if they have more, some others must go without any at all. Hence he concludes, that the Christian law, which prohibits, is more agreeable to the law of nature than the Mahometan; and we may add, than the Jewish law, which tolerates *polygamy*. See MARRIAGE.

Yet Selden has proved, in his *uxor Ebraica*, that plurality of wives was allowed of, not only among the Hebrews, but almost among all other nations, and in all ages.—It is true, the ancient Romans were more severe in their morals; and never practised it, though it was not forbid among them: and Mark Antony is mentioned as the first who took the liberty of two wives. See CONCUBINE.

From that time it became pretty frequent in the empire, till the reigns of Theodosius, Honorius, and Arcadius, who first prohibited it by express law in 393.—After this the emperor Valentinian, by an edict, permitted all the subjects of the empire to marry several wives: nor does it appear from the ecclesiastical history of those times, that the bishops made any opposition to this introduction of *polygamy*.

In effect, there are some even among the Christian casuists, who do not look on *polygamy* as in itself criminal. Jurieu observes, that the prohibition of *polygamy* is a positive law, from which a man may be exempted by sovereign necessity.—Baillet adds, that the example of the patriarchs is the most pressing argument in favour of *polygamy*.

At London we had some years ago an artful treatise published in behalf of a plurality of wives, under the title of *polygamia triumphatrix*; the author whereof assumes the name of *Theophilus Aletheus*; but his true name was *Lyferus*, a native of Saxony.—It has been answered by several.

POLYGAMY is also used in the canon law for a plurality of wives, though only had successively, or one at a time. See WIFE.

In the Romish church this still disqualifies a man for the episcopate. See BIGAMY.

POLYGLOTT\*, *πολυγλωττος*, among divines and critics, chiefly denotes a bible printed in several languages. See BIBLE.

\* It is thus called from the Greek *πολυ*, and *γλωττα*, tongue, language.

The first *polyglott* bible is that of cardinal Ximenes, printed in 1515. at Alcalá de Henares; and commonly called the *bible of Complutum*, or *Complutensium bible*.

It contains the Hebrew text, the Chaldee paraphrase on the pentateuch, the Greek version of the LXX. and the ancient Latin version. See PENTATEUCH, PARAPHRASE, &c.

In this *polyglott* there is no other Latin version from the Hebrew beside this last; but there is added another literal one from the Greek septuagint.—The Greek text of the new testament is here printed without accents, to bring it nearer to the original of the apostles, or, at least, to the most ancient copies, wherein there are no accents found. See ACCENT.

At the end is added an apparatus of grammars, dictionaries, and indices or tables.—The chief author, Ximenes de Cineros, cardinal and archbishop of Toledo, in his dedication to pope Leo X. observes, that it was necessary to give the holy scriptures in their originals; there being no translation, how perfect soever, that can render them perfectly.

The second *polyglott* is that of Philip II. printed by Plantin at Antwerp, in 1572. and the care of the edition imposed on Arias Montanus.

In this, besides every thing in the bible of Complutum, are added the Chaldee paraphrases on the rest of the old testament beside the pentateuch, with a Latin translation of those paraphrases. In this *polyglott* is likewise a very literal Latin version of the Hebrew text, for the use of those who have a mind to learn the Hebrew language.

As to the new testament, beside the Greek and Latin of the bible of Alcalá, in this edition is added an ancient Syriac version, both in Syriac and Hebrew characters, with points, to facilitate the reading thereof to those accustomed to read Hebrew.—To the Syriac is likewise added a Latin one, composed by Guy le Fevre, who had the care of the Syriac version of the new testament.

Lastly, in the *polyglott* of Antwerp is added a more copious apparatus of grammars, dictionaries, &c. than in that of Complutum; with several little treatises judged necessary for clearing up the more difficult passages in the text.

The third *polyglott* is that of M. le Jay, printed at Paris in 1645. which has this advantage over that of Philip II. that it has the Syriac and Arabic versions of the old testament with Latin interpretations.—In the pentateuch it has likewise the Hebrew and Samaritan text; and the Samaritan version in Samaritan characters.

As to the new testament, beside every thing in the *polyglott* of Antwerp, here is added an Arabic translation, with a Latin interpretation.—But here wants the apparatus, and the grammars and dictionaries, which are in both the former *polyglotts*, which renders this great work very imperfect.

The fourth *polyglott* is that of London, printed in 1657. call'd *Walton's polyglott*, from the author of the edition, Dr. Brian Walton, afterwards bishop of Winchester.

This is indeed less magnificent than that of M. le Jay, with regard both to the size of the paper, and the beauty of the characters; but is in all other respects preferable; being both much more ample, and more commodious.

In this, the vulgate is printed according to the revised and corrected edition of Clement VIII. which is not done in that of Paris, where the vulgate is printed as it stands in that of Antwerp before the correction. See VULGATE.

It likewise contains an interlineary Latin version of the Hebrew text; whereas the Paris edition has no other Latin version from the Hebrew beside the common vulgate: again, the Greek septuagint printed in this *polyglott* is not the same with that printed in the bible of Complutum, which was retained in the editions of Antwerp and Paris, but the Greek text of the edition of Rome: to which are added, the various readings of another very ancient Greek copy called the *Alexandrian*, because brought from Alexandria. See SEPTUAGINT.

The Latin version of the Greek of the LXX. is that published by Flaminius Nobilius, by authority of pope Sixtus V. Add, that in this *polyglott* are found some parts of the bible in the Ethiopic and Persian, nothing whereof appears in any of the rest.

Lastly, this edition has the advantage of preliminary discourses, call'd *prolegomena*, on the text both of the originals and versions; with a volume of various readings of all the different editions.

To the number of *polyglotts* may likewise be added the two pentateuchs printed by the Jews of Constantinople, in four languages; but all in Hebrew characters.

In one of these pentateuchs, printed in 1551. is found the Hebrew text in large characters; on one side whereof is the Chaldee paraphrase of Onkelos in middling characters; and on the other side a paraphrase in the Persian, composed by a Jew, one Jacob de Tous, so called from the city where he lived.—Beside these three columns, the Arabic paraphrase of Saadias Gaon is printed in small characters at-top of the pages; and at bottom is added the commentary of Raleh.

The other *polyglott* is printed at Constantinople in 1547, in three columns like the former.—The Hebrew text of the law is in the middle, a translation into the vulgar Greek on one side, and a Spanish translation on the other. These versions are both in Hebrew characters, with points to determine the pronunciation. At-top of the page is added the Chaldee paraphrase of Onkelos, and at the bottom the commentaries of Rasch. To these may be added, as a seventh *polyglott*, the Pfalter published by Aug. Justinian, a Dominican, and bishop of Nebio, at Genoa, 1515. containing the Hebrew, Greek, Arabic, and Chaldee, with Latin interpretations and glosses. See PSALTER. There are various other editions of the bible either in whole or in part, which might be ranged under the article of *Polyglotts*; though they are not so denominated.—Such are the *Hexapla* and *Octapla* of Origen. See HEXAPLA, and OCTAPLA. And the bible of Hutter, printed at Hambourg, in Hebrew, Chaldee, Greek, Latin, German, Saxon, Italian, French, Slavonic, Danish, &c. See BIBLE.

**POLYGON\***, *πολυγωνος*, in geometry, a multilateral figure, or a figure whose perimeter consists of more than four sides and angles. See FIGURE, PERIMETER, &c.

\* The word is formed from the Greek *πολυς*, many, and *γωνια*, angle.

If the sides and angles be equal, the figure is called a *regular polygon*. See REGULAR. For *similar polygons*, see SIMILAR. *Polygons* are distinguished according to the number of their sides.—Those of five sides are called *pentagons*; those of six, *hexagons*; those of seven, *heptagons*; those of eight, *octagons*, &c. The particular properties, &c. of each whereof, see under its proper article, PENTAGON, HEXAGON, &c.

**General properties of POLYGONS.**—Euclid demonstrates these which follow.—1. That every *polygon* may be divided into as many triangles as it hath sides. See TRIANGLE.

This is done by assuming a point, as F, (*Tab. Geom. fig. 28.*) any-where within the *polygon*, and thence drawing lines to every angle F a, F b, F c, F d, &c.

2. The angles of any *polygon*, taken together, make twice as many right ones, abating four, as the figure hath sides. See ANGLE.

Thus, if the *polygon* have five sides; the double of that is 10; whence subtracting 4, there remain 6 right ones.

3. Every *polygon* circumscribed about a circle is equal to a rectangled triangle, one of whose legs is the radius of the circle, and the other the perimeter or sum of all the sides of the *polygon*.

Hence, every regular *polygon* is equal to a rectangled triangle, one of whose legs is the perimeter of the *polygon*, and the other a perpendicular drawn from the centre to one of the sides of the *polygon*. See TRIANGLE.

Hence also every *polygon* circumscribed about a circle is bigger than it; and every *polygon* inscribed, less than the circle.—The same likewise appears hence, that the thing containing is ever greater than the thing contained.

And hence again, the perimeter of every *polygon* circumscribed about a circle is greater than the circumference of that circle; and the perimeter of every *polygon* inscribed, less: whence it follows, that a circle is equal to a right-angled triangle, whose base is the circumference of the circle, and its height the radius; since this triangle is less than any *polygon* circumscribed, and greater than any inscribed. See CIRCUMSCRIBING.

Nothing therefore is to be desired to the quadrature of the circle, but to find a right line equal to the circumference of a circle. See CIRCLE, CIRCUMFERENCE, QUADRATURE, &c.

**To find the area of a regular POLYGON.**—Multiply a side of the *polygon*, as AB, by half the number of the sides, *e. gr.* the side of a hexagon by 3. Again, multiply the product by a perpendicular let fall from the centre of the circumscribing circle to the side AB; the product is the area required. See AREA.

Thus, suppose AB 54; and half the number of sides 2½; the product or semiperimeter is 135. Supposing then the perpendicular Fg 29; the product of these two, 3915, is the area of the pentagon required.

**To find the area of an irregular POLYGON, or Trapezium.**—Resolve it into triangles; find the several areas of the several triangles; see TRIANGLE. The sum of these is the area of the *polygon* required. See TRAPEZIUM.

**To find the sum of all the angles in any POLYGON.**—Multiply the number of sides by 180°: From the product subtract 360; the remainder is the sum required.

Thus in a pentagon, 180 being multiplied by 5, gives 900; whence subtracting 360, there remain 540; the sum of the angles of a pentagon.

Hence, if the sum found be divided by the number of sides, the quotient will be the angle of a regular *polygon*.

Or, the sum of the angles is more speedily found thus: Multiply 180 by a number less by two than the number of sides of the *polygon*; the product is the quantity of the angles required: thus 180 being multiplied by 3, a number less by 2 than that of its sides, the product is 540, the quantity of angles as before.

The following table exhibits the sums of the angles in all rectilinear figures, from a triangle to a dodecagon; and is of good use both for the describing of regular figures, and for proving

whether or no the quantity of angles have been truly taken with an instrument. See REGULAR, FIGURE, &c.

Numb. Sides.	Sum Ang.	Ang. of Reg. Fig.	Numb. Sides.	Numb. Angl.	Ang. of Reg. Fig.
III	180°	60°	VIII	1080°	135
IV	360	90	IX	1260	140
V	540	108	X	1440	144
VI	720	120	XI	1620	147½
VII	900	128½	XII	1800	150

**To inscribe a regular POLYGON in a circle.**—Divide 360 by the number of sides in the *polygon* required, to find the quantity of the angle EFD. Set off the angle at the centre, and apply the chord thereof ED, to the periphery, as often as it will go.—Thus will the *polygon* be inscribed in the circle.

The resolution of this problem, though it be mechanical, yet is not to be despis'd, because both easy and universal.—Euclid, indeed, gives us the construction of the pentagon, decagon, and quindecagon; and other authors give us those of the heptagon, enneagon, and hendecagon; but they are far from geometrical strictness.

Renaldinus lays down a catholic rule for the describing of all *polygons*, which many other geometricians have borrow'd from him; but Wagnerus and Wolfius have both demonstrated the falsity thereof.

**On a regular POLYGON to circumscribe a circle:** or, to circumscribe a regular POLYGON upon a circle.—Bisect two of the angles of the given *polygon* A and E, by the right lines AF and EF, concurring in F; and from the point of concurrence with the radius EF describe a circle.

To circumscribe a *polygon*, &c. divide 360 by the number of sides required, to find *e Fd*; which set off from the centre F, and draw the line *e d*; on this construct the *polygon*, as in the following problem.

**On a given line, ED, to describe any given regular POLYGON.**—Find an angle of the *polygon* in the table; and in E set off an angle equal thereto, drawing EA=ED; through the three points AED describe a circle. See CIRCLE. In this apply the given right line as often as it will go.—Thus will the required figure be described.

**To inscribe or circumscribe a regular POLYGON trigonometrically.**—Find the sine of the arch produced by dividing the semiperiphery 180 by the number of sides of the *polygon*: the double of this is the chord of the double arch; and therefore the side AE to be inscribed in the circle.—If then the radius of a circle, wherein, *e. gr.* a pentagon is to be inscribed, be given in any certain measure, *e. gr.* 345, the side of the pentagon is found in the same measure by the rule of three, thus: as radius 1000 is to 1176; so is 345 to 4057, the side of the pentagon.—With the given radius therefore describe a circle; and therein set off the side of the *polygon* as often as it will go; thus will a *polygon* be inscribed in the circle.

To save the trouble of finding the ratio of the side of the *polygon* to radius, by the canon of sines; we shall add a table expressing the sides of *polygons* in such parts whereof radius contains 100000000. In practice, as many figures are cut off from the right-hand, as the circumstances of the case render needless.

Numb. Sides.	Quantity Side.	Numb. Sides.	Quantity Side.
III	17320508	VIII	7653668
IV	14142135	IX	6840402
V	11755705	X	6180339
VI	10000000	XI	5634651
VII	8677674	XII	5176380

**To describe a regular POLYGON, on a given right line, and to circumscribe a circle about a given polygon, trigonometrically.**—Taking the ratio of the side to the radius, out of the table; find the radius in the same measure wherein the side is given. For the side and radius being had, a *polygon* may be described by the last problem. And if with the interval of the radius, arches be struck from the two extremes of the given line, the point of intersection will be the centre of the circumscribing circle.

**POLYGON**, in fortification, denotes the figure or perimeter of a fortress, or fortified place. See FORTIFICATION.

**Exterior POLYGON** is a right line drawn from the vertex or point of a bastion, to the vertex or point of the next adjacent bastion. See BASTION.

Such is the line CF, *Tab. Fortification, fig. 1.*

**Interior POLYGON** is a right line drawn from the centre of one bastion to the centre of another.—Such is the line GH.

**Line of POLYGONS** is a line on the French sectors, containing the homologous sides of the first 9 regular *polygons* inscribed in the same circle, *i. e.* from an equilateral triangle to a dodecagon. See SECTOR.

**POLYGONAL column.** See the article COLUMN.

**POLYGONAL number**, in algebra, is the sum of a rank of numbers in arithmetical progression, beginning from unity:—thus called, by reason the units of which it consists, may be so dispos'd as to represent the figure of several equal sides and angles. See SERIES, NUMBER, PROGRESSION, &c.

*Polygonal*

**Polygonal numbers** are divided, with respect to the number of their terms, into *triangular*, which are those whose difference of terms is 1; *quadrangular* or *square*, where it is 2; *pentagonal*, where 3; *hexagonal*, where 4; *heptagonal*, where 5; *octagonal*, where 6, &c.

They have their names from the geometrical figures, into which points corresponding to their units may be dispos'd; *e. gr.* three points corresponding to the three units of a triangular number, may be dispos'd into a triangle; and so of the rest. See TRIANGULAR, &c.

The genesis of the several kinds of *polygonal* numbers from the several arithmetical progressions, may be conceiv'd from the following examples.

Arithmetical progression	1, 2, 3, 4, 5, 6, 7, 8
Triangular numbers	1, 3, 6, 10, 15, 21, 28, 36
Arithmetical progression	1, 3, 5, 7, 9, 11, 13, 15
Square numbers	1, 4, 9, 16, 25, 36, 49, 64
Arithmetical progression	1, 4, 7, 10, 13, 16, 19, 22
Pentagonal numbers	1, 5, 12, 22, 35, 51, 70, 92
Arithmetical progression	1, 5, 9, 13, 17, 21, 25, 29
Hexagonal numbers	1, 6, 15, 28, 45, 66, 91, 120

**Side of a POLYGONAL number**, is the number of terms of the arithmetical progression that compose it: and the number of angles is that which shews how many angles that figure has, whence the *polygonal* number takes its name.

The number of angles, therefore, in triangular numbers, is 3, in tetragonal 4, in pentagonal 5, &c. Consequently the number of angles exceeds the common difference of terms, by two.

To find a POLYGONAL number, the side and number of its angles being given. The canon is this:—The *polygonal* number is the semi-difference of the factums of the square of the side into the number of angles diminish'd by two units; and of the side itself into the number of angles diminish'd by four units.

The sums of *polygonal* numbers collected in the same manner as the *polygonal* numbers themselves are, out of arithmetical progressions, are call'd *pyramidal numbers*. See PYRAMIDAL.

**POLYGRAPHY\***, POLYGRAPHIA, or POLYGRAPHICE, the art of writing in various unusual manners or cyphers; as also of decyphering the same. See WRITING.

\* The word is formed from the Greek πολυ, *multum*, and γραφω, *scriptura*, writing.

The word is usually confounded with *steganography* and *cryptography*. See STEGANOGRAPHY, and CRYPTOGRAPHY.

The ancients seem to have been very little acquainted with this art; nor is there any mark of their having gone beyond the Lacedæmonian scytala. See SCYTALA.

Trithemius, Porta, Vigenere, and father Nicéron, have written on the subject of *polygraphy* or cyphers. See CYPHER.

**POLYHEDRON\***, or POLYEDRON, πολυεδρον, in geometry, a body comprehended under many rectilinear sides or planes. See BODY, and SOLID.

\* The word is formed from the Greek πολυ, *much*, and εδρα, *seat*.

If the sides of the *polyhedron* be regular polygons, all similar and equal; the *polyhedron* becomes a regular body, and may be inscrib'd in a sphere; that is, a sphere may be drawn round it, so as its surface shall touch all the solid angles of the body. See REGULAR BODY, &c.

**Gnomonic POLYHEDRON**, is a stone with several faces, whereon are projected various kinds of dials. See DIAL.

Of this kind that in the Privy-Garden, London, now gone to ruin, was anciently the finest in the world.

**POLYHEDRON**, or POLYSCOPE, in optics, is a glass or lens consisting of several plain surfaces, dispos'd into a convex form; popularly call'd a *multiplying-glass*. See LENS, and MULTIPLYING-GLASS.

The phenomena of the *polyhedron* are as follow:—If several rays, as EF, AB, CD, (Tab. Optics, fig. 71.) fall parallel on the surface of a *polyhedron*, they will continue parallel after refraction. See RAY, and REFRACTION.

If then the *polyhedron* be suppos'd regular, LH, HI, IM, will be as tangents cutting the spherical convex lens in F, B, and D; consequently, rays falling on the points of contact intersect the axis.—Wherefore, since the rest are parallel to these, they also will mutually intersect each other in G.

Hence, if the eye be placed where parallel rays decussate; rays of the same object will be propagated to it still parallel from the several sides of the glass. Wherefore, since the crystalline humour, by its convexity, unites parallel rays, the rays will be united in as many different points of the retina, a, b, c, as the glass has sides.

Consequently, the eye, through a *polyhedron*, sees the object repeated as many times as there are sides.—And hence, since rays coming from remote objects are parallel; a remote object is seen as often repeated through a *polyhedron*, as that has sides.

2. If rays, AB, AC, AD, (fig. 72.) proceeding from a radiant point A, fall on several sides of a regular *polyhedron*; after refraction they will decussate in G, and proceed on a little diverging.

Hence, if the eye be placed where the rays coming from the several planes decussate, the rays will be propagated to it from the several planes a little diverging, *i. e.* as if they proceeded

VOL. II.

from different points. But since the crystalline humour, by its convexity, collects rays from several points into the same point; the rays will be united in as many different points of the retina, a, b, c, as the glass has sides; consequently, the eye being placed in the focus G, will see even a near object repeated as often through the *polyhedron*, as that has sides.

Thus may the images of objects be multiplied in a camera obscura, by placing a *polyhedron* at its aperture, and adding a convex lens at a due distance therefrom.—And it really makes a very pleasant appearance, if a prism be applied so as the coloured rays of the sun refracted therefrom be received on the *polyhedron*: for by this means they will be thrown on a paper or wall near at hand in little lucid specks, much exceeding the brightness of any precious stone; and in the focus of the *polyhedron*, where the rays decussate, (for in this experiment they are receiv'd on the convex side) will be a star of surprising lustre.

If images be painted in water-colours in the areolæ or little squares of a *polyhedron*, and the glass applied to the aperture of a camera obscura; the sun's rays passing through it, will carry with them the images thereof, and project them on the opposite wall.

This artifice bears a resemblance to that other, whereby an image on paper is projected on the camera, *viz.* by wetting the paper with oil, and straining it tight on a frame; then applying it to the aperture of the camera obscura, so as the rays of a candle may pass thro' it upon the *polyhedron*. See CAMERA.

To make an *anamorphosis*, or deformed image, which through a POLYHEDRON or multiplying-glass shall appear regular and beautiful.—At one end of a horizontal table erect another at right angles, whereon a figure may be design'd; and on the other end erect another, to serve as a fulcrum or support, moveable on the horizontal one.—To the fulcrum apply a plano-convex *polyhedron*, consisting, *e. gr.* of 24 plain triangles; let the *polyhedron* be fitted in a draw tube, whereof that end towards the eye to have only a very small aperture, and a little further off than the focus.—Remove the fulcrum from the other perpendicular table, till it be out of the distance of the focus; and that more, as the image is to be greater.—Before the little aperture place a lamp; and trace the luminous areolæ projected from the sides of the *polyhedron*, with a black lead pencil, on the vertical plane, or a paper applied thereon.

In these several areolæ, design the several parts of an image, in such manner as that, when join'd together, they may make one whole, looking afresh every now and then through the tube, to guide, correct, &c. the colours, and to see that the several parts match aptly together.

The intermediate space fill up with any figures or designs at pleasure, contriving it so, as that to the naked eye the whole may exhibit some appearance very different from that intended to appear through the *polyhedron*.

The eye now looking through the little aperture of the tube, will see the several parts and members dispers'd among the areolæ to exhibit one continued image, all the intermediate ones disappearing. See ANAMORPHOSIS.

**POLYMATHY\***, POLYMATHIA, πολυμαθια, the knowledge of many arts and sciences; or, an acquaintance with a great number of different subjects. See ENCYCLOPÆDIA.

\* The word comes from the Greek πολυ, *multum*, and μαθησθαι, *disco*, I learn.

Lipsius, Scaliger, Kircher, Petavius, Grotius, Salmasius, Leibnitz, &c. were famous for *polymathy*.—Among the ancients, such as were eminent this way were call'd *polyhystores*.

*Polymathy* is frequently little more than a confus'd heap of useless erudition, occasionally detail'd, either pertinently or impertinently, for parade.—The genuine *polymathy* is an extensive erudition, or a knowledge of a great number of things, well digested, and applied to the purpose, and never but where they are necessary.

**POLYMYTHY**, POLYMYTHIA, in poetry, a multiplicity of fables, in an epic or dramatic poem; in lieu of an unity, or a single one. See FABLE, UNITY, &c.

*Polymythia* is a great fault.—It consists in joining a number of distinct actions or fables into one complex body. See ACTION. Such a work Bossu compares to the barrachomyomachia, or one of the fables of Æsop: And such would be the idea of a Theſeid, an Heracleid, an Achilleid, or the like poems, which should comprehend all the actions of those heroes, compar'd with the Iliad or Æneid. See HERO, EPIC, &c.

**POLYNOMIAL**, or *multinomial roots*, in mathematics. See MULTINOMIAL, and ROOT.

**POLYOPTRUM\***, in optics, a glass through which objects appear multiplied, but diminish'd. See MULTIPLICATION.

\* The word is formed from the Greek πολυ, *much*, many, and οπτομαι, *I see*.

The *polyopttrum* differs both in structure and phenomena from the common multiplying-glasses, call'd *polyhedra*. See POLYHEDRON.

**Construction of the POLYOPTRUM**.—In a glass, plain on both sides, AB, (Tab. Optics, fig. 73.) and about three fingers thick, cut out spherical segments, scarce a fifth part of a digit in diameter.

If then the glass be remov'd from the eye, till you can take in all the cavities at one view, you will see the same object, as if through so many several concave glasses, as there are cavities, and all exceedingly small.

Fit this, as an object-glass, in a tube ABCD, whose aperture AB is equal to the diameter of the glass, and the other CD equal to that of an eye-glass, *e. gr.* about a finger's breadth. The length of the tube AC to be accommodated to the object and eye-glass, by trial.

In CD fit a convex eye-glass, or in lieu thereof a meniscus, having the distance of its principal focus a little larger than the length of the tube; so that the point from which the rays diverge after refraction in the object-glass, may be in the focus.—If then the eye be applied near to the eye-glass, a single object will be seen repeated as often as there are cavities in the object-glass, but still diminish'd.

**POLYPETALOUS\***, in botany, a flower consisting of several petals, or leaves. See PETALA.

\* The word comes from πολυ, *multum*, and πέταλον, *petalum*.

The covers or defences of flowers consist either of a single continued petal, whence they are call'd *monopetalous*; or of several distinct pieces, hence call'd *polypetalous*. See FLOWER, and MONOPETALOUS.

*Polypetalous* flowers are either *regular* or *irregular*.

**Regular POLYPETALOUS flowers**, according to some botanists, are either those consisting of two pieces, as the cercis; or of four, thence call'd *cross-flowers*, as the clove-tree; or of five, call'd *umbelliferous*, as fenel; or of six, as the white lily, thence call'd the *lily-kind*. See UMBELLIFEROUS, &c.

Those exceeding this number, in any quantity, equal or unequal, form a new class of *polypetalous* flowers, call'd the *rose-kind*; among which are ranked all those of three, four, five, or six pieces, whose fruits differ so from the rest, that it is required they be distinguish'd from them.

Such is the flower of the water plantain, which, though it has only three leaves, yet, by the relation of its seed with that of the ranuncula, is rang'd in this last class.—Such also is the flower of tormentil; which, by reason of the difference of its fruit from the silique or siliculæ of the cross-flowers, cannot be ranged among them.—Such also is the pink, which, though consisting of five pieces, yet is excluded the class of umbelliferous plants, because its fruit is not divided into two parts.—Such, *lastly*, are the flowers of some ranuncula's, house-leek, and anemones; which, though they have six petals, yet never produce fruits divided into three lodges, as those of the lily-kind; and therefore cannot belong to their class.

**Irregular POLYPETALOUS flowers** are so call'd from the odd figure and disposition of their petals, what number of them soever they have.

Such are those in two pieces resembling two chaps, as in fumitory; or those of five pieces resembling butterflies, common to all leguminous plants.

**POLYPODY\***, **POLYPODIUM**, in botany, a plant of the parasitical kind, popularly call'd *many-feet*; of considerable use in medicine, &c. See PARASITE.

\* The word is formed from the Greek πολυς, and πους, *foot*, in regard the root of the plant clings to walls and trees, by a great number of little fibres like claws.

There are two kinds:—*Common polypody*, and *polypody of the oak*. The first usually grows on old walls in the country, among moss, &c. the latter, call'd also *oak-fern*, from the resemblance it bears to fern, grows on the branches of that tree, in the places where they shoot or spread out, feeding on a little earth, collected there from the dust blown about with the wind, and water'd with the rain.

*Polypody of the oak*, *polypodium quercinum*, is much the better of the two.—It must be chosen new, well-fed, dry, brittle, of a tan-red without, green within, of a sweet taste resembling liquorice.

The root is what is chiefly used in medicine, being esteem'd cathartic; though Dr. Quincy says it is no more than a common detergent: in which capacity it is much prescrib'd in medicated ales against the jaundice, scurvy, obstructions of the viscera, hypochondriacs, &c.

**POLYPTOTON**, πολυπτότων, in rhetoric, a figure wherein the same word is repeated in different cases, genders, or numbers, *i. e.* with different terminations. See FIGURE.

Such is that of Cicero, *pro Arch. Sed pleni sunt omnes libri, plena sapientum voces, plena exemplorum vetustas*. So Virg. *Æn. l. 4. v. 28.*

*Littora littoribus contraria, fluctibus undas*

*Imprecor, arma armis pugnent.*

**POLYPUS**, πολυψς, or πολυπος, in medicine, a fleshy tumour or excrescence arising on the inside of the nostrils, prejudicial to respiration and speech; call'd also, by way of distinction, *polypus narium*. See NOSE, EXCRESCENCE, &c.

This *polypus* arises by several roots from the os cribrosum, and hangs down, sometimes as low as the lip; growing likewise backwards, so as to stop the hole of the palate, whereby the air and puita descend out of the nose down into the throat; and by this means strangles the patient.

It has its name from the resemblance it bears to the fish *polypus*, call'd in English, *pourcontrel*, or *many-feet*.—Though some derive the name from the resemblance its substance bears to that of the *polypus*; and others, from the resemblance its many roots bear to the many feet of that fish.

It it have no roots, or only one continu'd root, it is call'd a *sarcoma*; which is only a beginning *polypus*. See SARCOMA.

*Polypus's* are chiefly found in scrophulous or cancerous consti-

tutions, along with venereal cases, ulcers, ozenas, &c.—Cautistics, emollient fomentations, extirpation, and disfective powders and lotions, are the usual remedies.

**POLYPUS** is also used for a morbid excrescence in the heart; consisting of a tough concretion of grumous blood lodg'd therein. See HEART.

Malpighi gives a very accurate description of this *polypus*. In the right ventricle of the heart, he observes, it is usually larger, and of a paler colour, like puita, with reddish or blackish streaks; in the left ventricle it is smaller, blacker and denser.—He adds, that it seems to have a sort of organism, and appears like a congeries of pellicles stretch'd over one another, which form a kind of nervous compages.

*Polypus's* are often found upon opening the bodies of persons dying apoplectic; and are doubtless frequently the occasion of sudden death.—They are seldom discover'd till they have dispartch'd the patient.

It is a dispute among physicians, whether *polypus's* be produc'd any considerable time before, or always immediately after death?—Mr. Gould has an express discourse in the *Philos. Transf.* to evince the former.

**POLYPUS of the lungs**.—In *Philos. Transf.* Dr. Rob. Clarke gives us a very odd instance of a patient, who cough'd up, at times, several hundred *polypus's of the lungs*.

They seem'd to have some organization, and were all perfectly alike.—The patient said, though they had no life, he had frequently press'd a slimy matter out of the body.

Dr. Lister observes, that such *polypus's* are form'd in the remoter and deeper branches of the aspera arteria, whence they are very difficult to get up.—The patient above-mention'd never brought them up till after a continu'd coughing of half a day and night.

He adds, that they are nothing but viscid excretions of the small glands, hard baked in those glands whose form they receive.—M. Buisiere observes, they are frequently mistaken for pieces of the blood-vessels or lungs.

**POLYPYRENEOUS\*** *fruits*, in botany, are such as contain several kernels or seeds. See FRUIT.

\* They are thus called from the Greek πολυ, *much*, and πυρη, *kernel*, or *berry*. See POLYSPERMOUS.

**POLYSCOPE**, a multiplying-glass, *i. e.* a glass which represents one object to the eye as if it were many; call'd also *polyhedron*. See MULTIPLYING glass, and POLYHEDRON.

**POLYSPASTON\***, πολυσπαστον, in mechanics, a machine so denominated by Vitruvius, consisting of an assemblage of several pulleys, used for raising of huge weights in a little time. See MACHINE.

\* The word comes from the Greek πολυ, and σπασω, *traho*, I draw, *q. d.* that may be drawn many ways.

The multiplication of pulleys in the *polyspaston* is to very good purpose; it being demonstrated in mechanics, that the force requir'd to sustain a weight by means of a *polyspaston*, is to the weight itself, as unity to the number of ropes, or of the pulleys; those ropes or pulleys being suppos'd parallel to each other. See PULLY.

Hence, the number of pulleys, and the power being given; the weight that will be sustain'd thereby is easily found; *viz.* by multiplying the power by the weight.

*E. gr.* Suppose the power 50 pounds, and the number of pulleys 5, the weight they will balance is 250 pounds.

In like manner, the number of pulleys being given, together with the weight sustain'd, the power is found by dividing the weight by the number of pulleys: Thus, if the weight be 900 pounds, and the number of pulleys 6, the power will be 150 pounds.

Dechales observes, that it is found by experience, that a moderate man, standing barely on the ground, will lift 150 pounds; whence the same man, by means of a *polyspaston* consisting of 6 pulleys, will be able to sustain 900 pounds.

The power of the pulleys will be still exceedingly increas'd by joining several *polyspastons*.

To find the number of pulleys a *polyspaston* is to consist of, to raise a given weight by a given power.—Divide the weight by the power; the quotient is the number requir'd.

Suppose, *e. gr.* the weight 600 pounds, and the power 150; the pulleys will be 4; whose diameters are to be all equal, supposing two of them upper and two lower, moveable on the same common axes.

**POLYSPERMOUS\***, πολυσπερμος, in botany, is applied to such plants as have more than four seeds succeeding each flower, without any certain order or number. See PLANT.

\* The word is formed from the Greek πολυ, and σπερμα, *seed*.

These Mr. Ray makes a distinct kind of herbs, calling them *herbæ semine nudo polyspermae*; where, by *semine nudo*, are meant such seeds as do not put off spontaneously the integuments or coverings which they either have, or appear to have, but fall off cover'd from the mother-plant. See SEED.

*Polyspermous herbs* are subdivided into, 1. Such as have a calyx or perianthium, consisting either, first, of *three leaves*, and the flower tripetalous, as the plantago aquatica, and the sagittaria, both water-plants; or the flower polypetalous, and the calyx falling with it, as the chelidonium minus; or remaining after the flower is dropped, as in the hepatica mobilis. Secondly, of *five leaves*, in some deciduous with the flower, as in the ranunculus; in others perennial, as in the helleborus niger ferulaceus; or annual, as in the flos Adonis. Thirdly, of *eight leaves*,

# P O M

*leaves*, as the malva and alcea. Fourthly, of *ten leaves*, as the caryophylla, fragaria, pentaphyllum, tormentilla, argentina, althæa, and pentaphylloides.

2. Such as have no calyx, or perianthium; as the clematis, filipendula, ulmaria, anemone nemorum, pulsatilla, &c.

**POLYSTYLE** *colonnade*. See the article COLONNADE.

**POLYSYLLABICAL** *echoes*, those which repeat many syllables or words. See ECHO.

**POLYSYLLABLE\***, πολυσυλλαβος, in grammar, a word consisting of more than three syllables. See WORD, and SYLLABLE.

\* The word comes from the Greek πολυ, *much*, and συλλαβος, *syllable*.

A word of one syllable is called a *monosyllable*; one of two, *disyllable*; one of three, *trisyllable*; one of four or more, *polysyllable*. See MONOSYLLABLE, &c.

**POLYSYNDETON**, πολυσυνδετον, in rhetoric, a figure consisting in the abundance, or even superfluity, of conjunctions copulative. See FIGURE, and CONJUNCTION.

Such is, *me præ ceteris & colit, & observat, & diligit*.—In opposition to this stands *asyndeton*. See ASYNDETON.

**POLYTHEISM\***, the doctrine or belief of a plurality of gods. See GOD.

\* The word comes from the Greek πολυ, *much*, and θεος, *Dems*. See IDOLATRY, &c.

**POMADA**, an exercise of vaulting the wooden horse, by laying one hand over the pommel of the saddle.

**POMATUM**, or POMADO, a composition of apples, with lard and rose-water; used by way of unguent on many occasions, particularly for diseases of the skin, pimples, scurfs, &c. to soften the hands, render the skin smooth, the complexion fresh, &c. See UNGUENT.

*Pomatums* are occasionally made with jessamins, oranges, jonquils, tuberose, &c. i. e. they are perfumed with the odours of those flowers.

The best is said to be that prepared of kid's grease, pippins, an orange sliced, with a glass of rose-water, and half a glass of white-wine, boiled and strained, and at last sprinkled with oil of sweet almonds.

The unguentum *pomatum*, prescribed in the college dispensatory, consists of hog's lard, sheep's suet, the apple called pome-water, rose-water, and orrice root, boiled till the apples are soft, strained and perfumed with oil of rhodium.

Dr. Quincy observes, that the apple is of no significance at all in the recipe; and that the common *pomatum* sold in the shops is only lard beat into a cream with rose-water, and scented with lemons, thyme, or the like.

**POME**, among gardeners.—To POME, is to grow or knit into a round head, somewhat like an apple.

Thus, they say, a cabbage begins to pome, &c.—They sometimes use the term, to cabbage, in the same sense.

**POMEGRANATE\***, malus Punica, or granata, a medicinal fruit, in form of an apple or quince; full of seeds or kernels, inclosed within a reddish pulp, sometimes sweet, sometimes acid. See FRUIT.

\* It is denominated from the abundance of its grains or kernels; q. d. *pomum granatum*, a kernelled apple; or from the country where it was anciently produced, viz. Granada.

The pomegranate tree is of two kinds, the one wild, which produces a kind of flowers used in pharmacy, called *balaustia*. See BALAUSTIA.

The other, cultivated in gardens, whereof there are again two kinds; the one only bearing flowers; the other, both flowers and fruit.—The flowers of each, called *cystini*, are inclosed in an oblong purple calyx, resembling a bell.

The trees never grow high; their branches are a little prickly; their leaves resemble those of the greater myrtle; and their fruit, which is composed of a great number of red angular grains, sometimes sweet, sometimes sour, and sometimes vinous, according to the quality of the tree, are all inclosed in little distinct cells, and covered, in common, with a thick brownish rind. Over this grows a kind of crowning, of the same nature with the rind, formed of a production of the calyx.

In the general, *pomegranates* are not only agreeable to the taste, but good for the stomach, and of considerable use in medicine.

Of the kernels are made syrups and conserves; and the peel or rind, which is called *malicorium*, held very astringent, is an ingredient in several remedies and ptisans, for dysenteries, diarrhoea's, lenteries, hæmorrhages, and relaxations of the gums.—The ancients used the rind as the moderns do sumac, in the preparation of leather.

The rind ought always to be dried, after the grains are taken out; that dried without scouping always tasting musty, and more likely to increase distempers, than cure them.

As to the conserve, there is but little of the true sold; being very difficult to make.—That which ordinarily passes for it is only sugar melted down; to which they give the colour and sharp taste, with cochineal, cream of tartar, and alum.

**POMEIS**, in heraldry, are green roundles; so called by the English heralds, who express different coloured roundles by distinct names.

The French, who content themselves to denote the different colour of the roundle, call the *pomeis*, *tortéaux vers*. See TORTEAUX.

**POMIFEROUS\***, apple-bearing, in botany, a name given to

# P O N

those plants which have the largest fruit, and are covered with a thick hard rind; by which they are distinguished from the bacciferous, which have only a thin skin over the fruit. See PLANT, and BACCIFEROUS.

\* The word is formed from *pomum*, apple, and *fero*, I bear.

The *pomiferous* kind have a naked monopetalous flower, divided into five partitions, and growing on the top of the succeeding fruit.—They are divided into

1. *Capreolate*, or those creeping along the ground, &c. by means of tendrils; as the cucurbita, melo, cucumis, cepo, balsamina; anguria, and colocynthis. See CAPREOLI.

2. Without *capreoli*, or *tendrils*, as the cucurbita clypeata, or melo-cepo clypeiformis. See TREE, FRUIT, &c.

**POMME**, or POMMETTE, in heraldry,—a cross *pommé*, or *pommetté*, called also *tropée*, is a cross with a ball or knob, like an apple, at each end. See CROSS.

**POMMEL**, or PUMMEL, in the manage, a piece of brags or other matter a-top and in the middle of the saddle-bow, to which are fastened the holsters, stirrup-leathers, &c. See SADDLE.

**POMMEL** is also a round ball of silver, steel, or the like, fixed at the end of the guard and grasp of a sword; to serve, in some measure, as a counterpoise.

Balzac observes, that there are still extant charters and privileges granted by Charlemagne, and sealed with the *pommel* of his sword, which, ordinarily, he promises to defend with the same sword. See SEAL, SIGNATURE, &c.

**POMMETTE**, See the article POMME.

**POMP**. See the articles CIRCUS, CAVALCADE, &c.

**POMPHOLYX\***, πεμφολυξ, in pharmacy, a sort of metalline flower; being a white, light and friable substance, found adhering to the lid or convercle of the crucibles or furnaces, wherein copper is melted with calamine stone, for the making of brags. See BRASS, CALAMINE, &c.

\* The word is Greek, where it literally denotes a bubble arising on water.

It is esteemed deterfive and deficcative, though only applied externally; and much used in divers kinds of fevers: though its violence requires its being used with great precaution.

The apothecaries sometimes call it *nil*, or *nihil album*, and sometimes *white tutty*, in regard of its resemblance to tutty in virtue. See TUTTY.

**POMUM Adami**, in anatomy, a protuberance in the fore-part of the throat. See THROAT.

Some fancy it is thus called upon a strange conceit, that a piece of the forbidden apple, which Adam eat, stuck by the way, and was the occasion of it.

In reality, it is only the convex part of the first cartilage of the larynx, called *scutiformis*. See LARYNX, and SCUTIFORMIS.

**POND**, in geography, a little lake, which neither receives nor emits any river. See LAKE, and RIVER.

*Fish Ponds*. See the article FISH ponds.

**PONDERARE**, in our ancient customs, a method of curing sick children, by weighing them at the tomb of some saint; counterpoising or balancing the scale with money, wheat-bread, or any other thing the parents were willing to offer to God, his saints, or the church.

But a sum of money was always to make part of the counterbalance. By this means the cure was effected.—*Ad sepulchrum sancti, nummo se ponderabat*.—

**PONDUS**, *weight*. See the article WEIGHT.

**PONDUS**, in ancient records, denotes a duty paid to the king, according to the weight of merchandizes. See POUNDAGE.

**PONDUS regis**, the standard-weight, anciently appointed by the king; being that which we now call *Troy-weight*. See STANDARD, and TROY-WEIGHT.

*Ad PONDUS omnium*. See the article AB.

*Temperamentum ad PONDUS*. See TEMPERAMENTUM.

**PONE**, a writ, whereby a cause depending in the county, or other inferior court, is removed to the common-pleas, or sometimes the king's-bench. See WRIT, COURT, &c.

**PONE**, *per vadium*, is a writ commanding the sheriff to take surety of one for his appearance at a day assigned. See SURETY, VADIMONIUM, &c.

**PONIARD\***, a little pointed dagger, very sharp edged; borne in the hand, or at the girdle, or hid in the pocket.

\* The word is formed from the French *poignard*, and that from *poignée*, handful.

The *poniard* was anciently in very great use, but is now in good measure set aside, except among assassins. See ASSASSIN.

Sword and *poniard* were the ancient arms of duellists; and are said to continue still so among the Spaniards.—The practice of sword and *poniard* still make a part of the exercise taught by the masters of defence.

**PONS varoli**, or *varoli*; or **PONS cerebri**, in anatomy, the upper part of a duct in the third ventricle of the brain, situate in the cerebellum, and leading to the infundibulum.—See Tab. Anat. (Ofcol.) fig. 5. lit. g. g.: See also BRAIN, VENTRICLE, INFUNDIBULUM, &c.

It is thus called from its discoverer, Variolus, an Italian physician, who flourished in the university of Padua about the year 1572.

**PONTAGE**, PONTAGIUM, a contribution towards the maintenance, repairing, and rebuilding of bridges. See BRIDGE.

This was, anciently, one of the three general national charges, whence no person of any degree whatever was exempted.

The three things called *trinoda necessitas*, whence, Ingulphus tells us, *nulli possunt laxari*, were, the expedition to the wars, the building of castles, and the building and repairing of bridges. See **TRINODA**.

Mr. Selden, in his notes on Eadmerus, observes, that *ne quidem episcopi, abbates, & monachi immunes erant*.—And Mat. Paris adds, *anno 1244*, that in all grants of privileges to the monasteries, those three things were always excepted, for the public good, and that the people might be better able to resist any enemy.

**PONTAGE**, is also a due anciently belonging to the lord of the fee, for persons or merchandizes, that pass over rivers, bridges, &c. called in the later Latin *pontagium*, or *pontonagium*, pontage.

**PONTIBUS reparandis**, a writ directed to the sheriff, commanding him to charge one or more persons to repair a bridge, to whom it belongs.

**PONTIFEX**, **PONTIF**, *high-priest*, a person who has the superintendence and direction of divine worship; as the offering of sacrifices, and other religious solemnities. See **PRIEST**, **SACRIFICE**, &c.

The Romans had a college of *pontifs*, and over those a sovereign *pontif*, or *pontifex maximus*, instituted by Numa; whose function it was to prescribe the ceremonies each god was to be worshipped withal, compose the rituals, direct the Vestals; and for a good while to perform the business of augury; till on some superstitious occasions he was prohibited intermeddling therewith. See **AUGUR**.

He consecrated the statues of the gods, ere they were put up in the temples; blessed the figures of some of Jove's thunderbolts, to preserve the people from harms; and compiled their statutes. See **ANNALS**.

The Jews too had their *pontif* or high-priest; and among the Romanists the pope is still styled the *sovereign pontif*. See **POPE**. Authors differ about the origin of the word *pontifex*. Some derive it from *posse facere*, that is, from the authority the *pontifs* had to sacrifice; others, as Varro, from *pons*, because they built the Sublician bridge, that they might go and offer sacrifice on the other side of the Tiber.

**PONTIFICAL**, **PONTIFICALIA**, a book of the rites and ceremonies belonging to pontifs, bishops, popes, &c. See **RITUAL**, and **CEREMONIAL**.

**PONTIFICALIA**, the robes and ornaments wherein a bishop performs divine service. See **EPISCOPALIA**.

**PONTIFICATE**, **PONTIFICATUS**, the state or dignity of a pontif, or high-priest. See **PONTIFEX**.

Cæsar reformed the calendar in the time of his *pontificate*. See **CALENDAR**.

**PONTIFICATE** is more peculiarly used in modern writers for the reign of a pope. See **POPE**.

The concordat was passed in the *pontificate* of Leo X. See **CONCORDAT**.

There was a *pontificate* that only lasted twenty-four hours.

**PONTON**, or **PONTOON**, in war, a little floating bridge, made of boats and planks. See **BRIDGE**.

The *ponton* is a machine consisting of two vessels, at a little distance, joined by beams, with planks laid cross, for the passage of the cavalry, the canon, infantry, &c. over a river, an arm of the sea, &c.

The late invented *ponton* is of copper, furnished with an anchor, &c. to fix it.—To make a bridge, several of these are disposed two yards asunder, with beams across them, and over those, boards or planks.

They are also linked to each other, and fastened on each side the river, by a rope run through a ring in each of their heads, and fix'd to a tree or stake on either shore.—The whole makes one firm, uniform bridge, over which a train of artillery may pass.

Cæsar and Aulus Gellius both mention *pontons*; but theirs were no more than a kind of square flat vessels, proper for the carrying over of horse, &c. Ours however take their names from them; those authors call them *pontones*, of *ponto*.

**PONT volant**, *flying bridge*, a kind of bridge used in sieges; made of two small bridges laid one over another, and so contrived by means of cords and pulleys placed along the sides of the under-bridge, that the upper may be push'd forwards, till it join the place where it is designed to be fixed: the whole length of both not to be above five fathom, lest they should break with the weight of the men. See **BRIDGE**.

**POOL**, is properly a reservoir of water, supplied with springs, and discharging the overplus by sluices, defenders, weirs, and other cause-ways. See **POND**, **SLUICE**, &c.

**Mill POOL** is a stock of water, by whose force, &c. the motion of a mill is effected. See **MILL**.

**Whirl POOL**. See the article **WHIRL pool**.

**POOP**, **PUPPIS**, *stern*; the highest or uppermost part of a ship's hull a-stern.—See *Tab. Ship, fig. 2. lit. P*. See also **STERN**, and **SHIP**.

**POPE**, **PAPA**, the bishop of Rome; being the head or patriarch of the Roman-catholic church. See **PONTIFEX**.

Father le Cointe in his annals observes, from St. Jerom, St. Cyprian, St. Gregory, St. Augustin, and Sidonius Apollinaris, that the title *pope* was anciently given to all bishops. See **BISHOP**.

They were also addressed under the term *holiness*, and *beatitude*;

and their churches called *apostolical sees*. See **HOLINESS**, **APOSTOLICAL**, &c.

He adds, that it was only in the eleventh century, that Gregory VII. first appointed, in a synod held at Rome, that the title *pope* should be restrained to the bishop of Rome, as a particular distinction and prerogative.

In the council of the Lateran, held under Innocent III. the *pope* was declared *ordinary of ordinaries*. See **ORDINARY**.

The *pope* is chosen by the cardinals, out of their own body. See **ELECTION**, **CARDINAL**, &c.

His see is at Rome, whence he issues out his orders, called *briefs* and *bulls*, throughout the catholic world. See **BULL**, &c.

History mentions a pope's, Joan.—The reality hereof has been opposed and defended by many learned men.—The tradition might possibly take its rise from the weakness of pope John VIII. in restoring Photius to his communion, and owning him as true patriarch: for he hence got the appellation of woman; as that prince called *king Mary* did, by leaving himself to be governed by Q. Mary his wife. See **KING**, and **QUEEN**.

M. Spanheim, professor of theology at Leyden, has lately written very amply on the subject; and shews it to be a question *de facto*, scarce determinable at this time of day.

**POPE**, **POPA**, among the Romans, was a name given to certain inferior officers, or ministers of sacrifice. See **SACRIFICE**.

The business of the *pope* was, to whet the sacrificing knife, to bind the victim, prepare the water, and other necessities, to smite the victim, &c.

They did their office naked to the girdle, and crowned with laurel.

**POPLES**, in anatomy, the inner part of the juncture whereby the thigh-bone is articulated with the tibia; popularly called the *ham*. See **THIGH**, and **TIBIA**.

**POPULICANI**, **POPULICANI**, or **PUBLICANS**, a name given in the west to the Manichees; or rather to a particular branch thereof, called in the east *Paulicians*. See **MANICHEE**, and **PAULICIAN**.

**POPLITÆUS**, or **SUB-POPLITÆUS**, a muscle which arises from the external and inferior protuberance of the thigh-bone, and passing over the joint obliquely, is inserted into the superior and internal part of the tibia.—It assists in bending of the leg, and turns it inwards.—See *Tab. Anat. (Myol.) fig. 7. n. 27. 27.* See also **LEG**.

**POPLITEA**, in anatomy, is a name given to the third vein of the leg. See **VEIN**.

It arises from the heel, where it is formed out of several branches coming both from the heel and ankle.

It lies pretty deep in the flesh; and ascending up to the ham, terminates in the crural vein. See **CRURAL**, &c.

**POPPY**, **PAPAYER**, a medicinal plant, famed for its narcotic quality. See **NARCOTIC**.

There are divers kinds; some wild, some cultivated, white, purple, scarlet, &c.—Those most used, are the white, *papaver hortenense semine albo*; and black, *papaver hortenense semine nigro*.

The heads of these plants are of singular virtue to promote sleep, assuage pain, &c. They stop diarrhoea's, hæmorrhages, &c.

Of the juice of the white *poppy*, is prepared the opium sold in the shops; and of the juice of the leaves, meconium. See **OPIUM**, and **MECONIUM**.

**POPPY water**. See the article **WATER**.

**POPULAR**, **POPULARIS**, something that relates to the common people. See **COMMON**.

The Roman nobility was distinguished into two factions; the *optimates*, who adhered strenuously to the ministry, the senate, &c. in opposition to the people.—And the *populares*, who favoured the rights and pretensions of the people, in opposition to the noblesse.

**POPULAR action**. See the article **ACTION**.

**POPULAR diseases**, are such as become common, and run through the body of the people; called also *endemic* and *epidemic diseases*. See **EPIDEMIC**, and **ENDEMIC**.

Hippocrates has written expressly, *de morbis popularibus*. See **DISEASE**.

**POPULAR errors**, are such as people imbibe from one another, by custom, education, and tradition, without having considered the reason or foundations thereof. See **ERROR**.

**POPULEUM**, or **POPULNEUM**, in pharmacy, an unguent prepared of the buds of black poplar, violet leaves, navel-wort, and lard bruised and macerated; to which are added bramble-tops, leaves of black poppies, mandragora, henbane, night-shade, lettuce, and burdock, boiled in rose-water, and strained.

It is much used as a cooler, in burns, scalds, and all sorts of inflammations, and to assuage arthritic pains.

**POPULICANI**. See the article **POPULICANI**.

**POPULNEUM**. See the article **POPULNEUM**.

**PORCELAIN\***, or **PURCELAIN**, a fine sort of earthen-ware, chiefly manufactured in China, and thence also called *china*, or *china-ware*; but brought into Europe from other parts of the east, especially Japan, Siam, Surat, and Persia. See **POTTERY**.

\* The Chinese call it *se-ki*. The word *porcelain* is but little known there; except among a few workmen and merchants; and seems derived from the Portuguese, *porcelana*, a cup.

Scaliger and Cardan, though generally of contrary sentiments, are yet agreed, that what the Romans called *vasa murrina*, *murrina*

*murrina* and *murrea*, which were first seen at Rome in Pompey's triumph, and afterwards became so very precious, were the *porcelain* of our times. See MURRHINE.

This may be true: but if the opinion be only founded on Pliny's description of those vessels\*, one would rather take them for a kind of precious stones, of a whitish colour, but variously vein'd and variegated; found in some parts of Parthia.

\* Oriens murrina mittit. Inveniuntur enim ibi in pluribus locis, nec insignibus maxime Parthici regni: præcipue tamen in Carmania. Humorem putant sub terra calore densari. Amplitudine nusquam parvos excedunt abacos: crassitudine raro, quanta dictum est vasi potorio. Splendor his sine viribus: nitorque verius quam splendor. Sed in pretio varietas colorum, subinde circumagentibus se maculis in purpuram candoremque, & tertium ex utroque ignescentem, veluti per transitum coloris, in purpura aut rubescente lacteo. Sunt qui maxime in iis laudant extremitates, & quosdam colorum repercussus, quales in cœlesti arcu spectantur. His maculæ pingues placent. Translucere quidquam aut pallere, vitium est. Item sales, verrucæque non eminentes, sed ut in corpore etiam pleurumque fessiles. Aliqua & in odore commendatio est. Plin. Hist. Nat. l. 37. c. 2.

Be this as it will, it is certain, that both Cardan and Scaliger are mistaken, when they tell us, that *porcelain* is made of eggs and sea-shells beaten small, and buried under-ground for 80 or 100 years. The account we shall here give will put that matter out of all question.

It is not known who was the inventor of *porcelain*: the Chinese annals, which use to contain every thing in any wise memorable, are perfectly silent about it; nor do we know much more of the time of its invention: only it is certain it must have been before the beginning of the fifth century, the annals of Feuliang relating, that from the second year of the reign of the emperor Tam, about the year of Christ 442. the workers in *porcelain* of that province had alone furnish'd the emperors therewith.

*Porcelain* is made chiefly, some say wholly, at Kingteching, a large town in the province of Kyangsi.

There is some indeed made in the provinces of Kantón and Fokyen; but it is of little account, being far inferior in beauty and value to the *porcelain* of Kingteching. That of Fokyen is perfectly white, without either gloss or painting. Attempts have been made to remove the manufacture from Kingteching to Peking, and other places, but in vain; the *porcelain* made in the new manufactories never coming up to that of the old: So that Kingteching has the honour of supplying the greatest part of the world with this commodity. F. du Halde assures us, that even the Japanese come to China for it.

**Manufacture of PORCELAIN.**—*Porcelain* makes a very curious article in commerce, and even natural history. Its manufacture has hitherto pass'd for a mystery in Europe; and that in spite of all the endeavours of the Jesuit missionaries to penetrate into the secret. The veil, however, is at length drawn; and in a letter of F. d'Entrecolles to F. Orry, from Jauchew, dated September the first, 1712. and lately publish'd in French, the whole process is describ'd in all its circumstances; with an extract whereof we shall here gratify the curious reader.

In the manufacture of *porcelain* there are four principal things to be consider'd, viz. the matter it is made of; the art of forming the vessels, and other works; the colours wherewith it is painted; and, lastly, the baking, or giving it the proper degree of fire.—Each of which will make the subject of a several article.

**Materials of PORCELAIN.**—There are two kinds of earths, and as many kinds of oils, or varnishes, us'd in the composition of *porcelain*. The first earth, call'd *kaulin*, is beset with glittering corpuscles; the second, call'd *petunse*, is a plain white, but exceedingly fine, and soft to the touch. They are both found in quarries twenty or thirty leagues from Kingteching; and hither these earths, or rather stones, are brought in an infinite number of little barks, incessantly passing up and down the river Jauchew, for that purpose. The *petunses* are brought in form of bricks; having been so cut out of the quarries, where they are naturally pieces of a very hard rock. The white of the best *petunse* is to border a little on green.

The first preparation of these bricks is, to break and pound them, first, into a coarse powder with iron mallets, then in mortars with pestles that have stone heads, arm'd with iron, and wrought either with the hand, or with mills.

When the powder is render'd almost impalpable, they throw it in a large urn full of water, stirring it briskly about with an iron instrument. After the water has rested a little while, they skim off from the top a white substance form'd there, of the thickness of four or five fingers, and dispose this scum or cream in another vessel of water. They then stir again the water of the first urn, and again skim it, and thus alternately, till there remain nothing but the gravel of the *petunses* at bottom; which they lay afresh under the mill, for a new powder.

As to the second urn, wherein are put the skimmings of the first; when the water is well settled, and become quite clear, they pour it off; and with the sediment, collected at bottom in form of a paste, fill a kind of moulds: whence, when almost dry, they take it out, and cut it into square pieces, which are what they properly call *petunses*; reserving them to be mix'd with the *kaulin* in the proportion hereafter assign'd.

VOL. II. N<sup>o</sup> 120.

These squares are sold by the hundred, but it is very rare to meet with them unsully'd. The workmen, who, like the rest of the Chinese, are arrant knaves in their dealings, usually mixing refuse along with them; so that they are commonly oblig'd to purify them ere they can be employ'd.

The *kaulin*, which is the other earth us'd in *porcelain*, is much softer than the *petunse*, when dug out of the quarry; yet is it this, which, by its mixture with the other, gives the strength and firmness to the work. F. d'Entrecolles observes, that some English or Dutch, having procur'd some *petunses* to be bought privately; upon their attempting to make *porcelain* at their return into their own country, could not succeed for want of raking *kaulin* along with it: which the Chinese being apprisd of, said, drolling, "That the Europeans were wonderful people, to go about to make a body, whose flesh was to sustain itself without bones."

The mountains whence the *kaulin* is dug, are cover'd without side with a reddish earth. The mines are deep, and the matter is found in glebes or clods, like the chalk in ours. The author is of opinion, that the white earth of Malta is not much different from the *kaulin*, except that it wants the silver'd particles. The preparation of *kaulin* is the same with that of the *petunses*, except that the matter being less hard, less labour is requir'd.

The oil or varnish, which makes the third ingredient in *porcelain*, is a whitish liquid substance, drawn from the hard stone, whereof the *petunses* are form'd; that which is whitest, and whose stains are the greenest, being always chosen for this purpose.

The manner of preparing the oil, is thus: The *petunses*, being wash'd, undergo the same preparations as for making the squares, excepting that the matter of the second urn is not put in moulds, but the finest part of it taken to compose the oil. To an hundred pounds of this matter they cast a mineral stone call'd *shekau*, resembling our alum: This stone is first heated red-hot, and thus reduc'd in a mortar into an impalpable powder; and serves to give the oil a consistence; which, however, is still to be kept liquid.

The oil of lime makes the fourth ingredient; the preparation whereof is much more tedious and circumstantial. They first dissolve large pieces of quick lime, and reduce it to a powder, by sprinkling water on it; on this powder they lay a couch of dry fern, and on the fern another of the slak'd lime, and thus alternately, till they have got a moderate pile; which done, they set fire to the fern: the whole being consum'd, they divide the ashes that remain on new couches of dry fern; setting them on fire as before. And this they repeat five or six times successively, or even more; the oil being still the better, as the ashes are oftener burnt.

In the annals of Feuliang 'tis said, instead of fern they anciently us'd the wood of a kind of medlar-tree; and that 'twas this gave the ancient *porcelains* that admirable hue, which the moderns cannot come up to for want of that wood. 'Tis certain, however, the quality of the fern and lime contribute very much to the goodness of the oil.

A quantity of these ashes of fern and lime are now thrown into an urn full of water; and to an hundred pounds of ashes is added a pound of *shekau*, which dissolves therein. The rest being perform'd after the same manner as in preparing the earth of the *petunses*; the sediment found at the bottom of the second urn, and which is to be kept liquid, is what they call the *oil of lime*; which the Chinese esteem as the soul of the former oil, and which gives the *porcelain* all its lustre. This oil is easily sophisticated by adding water to increase the quantity; adding at the same time proportionably of the same *shekau* to maintain the consistence. Ten measures of oil of *petunse* usually go to one of lime: to have the mixture just, the two oils should be equally thick.

**Forming of PORCELAIN vessels.**—The first thing is, to purify the *petunse* and *kaulin*; which, for the first, is done after the manner already describ'd in preparing the squares. For the second, as its softness makes it dissolve easily, 'tis sufficient, without breaking it, to plunge it in an urn full of water in an open basket. The dregs that remain are perfectly useless, and are emptied out of the work-house, when a quantity is got together.

The work-houses are properly vast yards wall'd round, with sheds, and other conveniences for the workmen to work under; as well as other buildings for them to live in. It is almost inconceivable what number of persons are employ'd in these works; there being scarce a piece of *porcelain* but passes through above twenty hands, ere it comes to the painter's work-house; and above sixty, ere it be brought to perfection.

To make a just mixture of *petunse* and *kaulin*, regard must be had to the fineness of the *porcelain* to be made: for the finer *porcelains*, they use equal quantities; four parts of *kaulin* to six of *petunse*, for moderate ones; and never less than one of *kaulin* to three of *petunse*, for the coarsest.

The hardest part of the work is the kneading and tewing the two earths together; which is done in a kind of large basins, or pits, well pav'd and cemented. wherein the workmen trample continually with their feet, relieving one another, till the mass be well mix'd, grow hard, and become of the consistence requir'd to be us'd by the potter.

The earth, when taken out of the basins, is kneaded a second time, but piece-meal, and with the hands, on large slates for the purpose; but on this preparation, in effect, it is, that the perfection

fection of the work depends; the least heterogeneous body remaining in the matter, or the least vacuity that may be found in it, being enough to spoil the whole. The smallest grain of sand, nay, sometimes a single hair, shall make the *porcelain* crack, splinter, run, or warp.

The *porcelain* is fashion'd or form'd either with the wheel, like earthen ware, or in moulds. See POTTERY. Smooth pieces, as cups, urns, dishes, &c. are made with the wheel. The rest, *i. e.* such as are in relieve, as figures of men, animals, &c. are form'd in moulds, but finish'd with the chissel.

The large pieces are made at twice; one half of the piece is rais'd on the wheel by three or four workmen, who hold it till it have acquir'd its figure; which done, they apply it to the other half, which has been form'd in the same manner; uniting the two with *porcelain* earth, made liquid by adding water to it, and polishing the juncture with a kind of iron spatula.

After the same manner it is that they join the several pieces of *porcelain* form'd in moulds, or by the hand; and after the same manner they add handles, &c. to the cups, and other works form'd with the wheel.

The moulds are made after the manner of those of our sculptors, *viz.* of divers pieces, which severally give their respective figure to the several parts of the model to be represented; and which are afterwards united to form a mould for an intire figure. The earth they are made of is yellow and fat, dug out of its proper quarries, whereof there are abundance about Kingteching. It is kneaded like potters earth, and when sufficiently mellow, fine, and moderately dry, beating it stoutly, they form it into moulds, according to the works requir'd, either by hand, or on the wheel. These moulds are sold very dear, but last a long time. See MOULD.

All the works made in moulds are finish'd by the hand, with several instruments proper to dig, smooth, polish, and to touch up the strokes that escape the mould; so that 'tis rather a work of sculpture than of pottery. There are some works whereon relievo's are added, ready made, as dragons, flowers, &c. others that have impressions in creux; which last are engraven with a kind of puncheons. In the general, all *porcelain* works are to be shelter'd from the cold; their natural humidity making them liable to break when they dry unequally.

To conceive the number of hands each piece of *porcelain* passes through ere perfect, we shall close this article with what F. d'Entrecolles instances of a common tea-cup, ere it be fit for the painter. The cup begins with the potter, who has the management of the wheel, where it acquires its form, height, and diameter. This operator has not a farthing sterling for a plate furnish'd with twenty-six cups; accordingly, they go out of his hands exceedingly imperfect, especially towards the feet, which are only uniform'd lumps of earth, to be afterwards cut with the chissel, when the cup is dry. When it comes from the wheel, the cup is receiv'd by a second workman, who fits it to its base. A third takes it immediately from him, and applies it on a mould to bring it to its true form. This mould is on a kind of lathe. A fourth workman polishes the cup with a chissel, especially about the edges, and brings it to the thinness necessary to make it transparent; in doing which, he moistens it from time to time, lest its dryness should make it break. When of its proper thickness, another workman turns it gently on a mould, to smooth its inside; taking a deal of care it be done equably, lest any cavity be form'd, or it warp. Other workmen add some ornaments in relieve; others, impressions in creux; others, only handles; as the quality of the cup requires. At last, they round and hollow the foot on the inside with a chissel; which is the function of a particular artist, who does nothing else.

This multiplicity of workmen, so far it is from retarding the work, that it is found, by experience, to go on the faster for it; as well as to be the better done; each workman, by a continual attention to the same thing, becoming very dextrous at it: besides saving the time of changing instruments, &c.

**Painting of PORCELAIN.**—The Chinese painters, especially those that meddle with human figures, our author observes, are all sorry workmen: he adds, that the defect is scarce any-where so sensible as in the whapey, or *porcelain* painters, among whom, setting aside flowers and landships, which are sometimes tolerable, the greatest masters are not to be compar'd to ordinary apprentices among the Europeans, for the beauty and justness of design. But it is otherwise with the colours these whapey use; which are so exceeding lively and brilliant, that there are but little hopes our workmen should ever come to vie with them. The painting work is distributed among a great number of workmen, in the same laboratory: to one it belongs to form the colour'd circle about the edges of the *porcelain*; another traces out flowers, which another paints: this is for waters and mountains alone; that for birds and other animals; and a third for human figures.

There are *porcelains* made of all colours; both with regard to the grounds, and to the representations thereon. As to the colour of landships, &c. some are simple; such are all blues, which are those most usually seen in Europe; others are mix'd up of several teints; and others, again, heighten'd with gold.

The blue is made of lapis lazuli, prepar'd by burning it the space of twenty-four hours, in a kiln, where it is buried up in gravel, to the height of half a foot; when burnt, they reduce it

into an impalpable powder in *porcelain* mortars, not varnish'd, and with pebbles of the same matter.

For the red, they use copperas, which they call *tsausan*; a pound of this they put in a cover'd crucible, in the lid whereof is left a little aperture, through which the matter on occasion may be seen. The crucible is heated with a reverberatory fire, till the black smoke cease to ascend, and a fine red one succeeds it. A pound of copperas yields four ounces of red liquor, which is found at the bottom of the crucible, though the finest part is that usually adhering to the lid and sides of the crucible.

The powder of flint is likewise an ingredient in most of the other colours; *e. gr.* for green, to three ounces of tongwhapeen, or scoria of beaten copper, they use half an ounce of powder of flint, and an ounce of ceruse. Violet is made by adding a dose of white to the green already prepar'd; the more green is added, the deeper is the violet. For yellow, they use seven drachms of white, and three of the copperas-red.

Most of these colours are mix'd up with gum-water, for application; a little saltpetre, sometimes ceruse or copperas, but more usually copperas alone, being first dissolv'd in the water. Indeed, for *porcelains* that are to be quite red, the colour is usually applied with oil; *i. e.* with the common oil of the *porcelain*, or another made of the white flints.

There is also another red, call'd *blown red*, because in reality apply'd by blowing with a pipe, one of whose orifices is cover'd with a very fine gauze. The bottom of this tube is lightly apply'd to the colour wherewith the gauze is smear'd; when, blowing against the *porcelain*, it becomes all sprinkled over with little points. This *porcelain* is very rare, and of great price.

Black *porcelain*, which they call *umian*, has likewise its beauty: this colour has a leady cast, like our metal-burning mirrors; and is usually heighten'd with gold. It is made of three ounces of lapis lazuli, with seven of the common oil of stone; though that proportion is varied, as the colour is design'd to be more or less deep. The black is not given the *porcelain* till it be dry, nor must the work be put to the fire till the colour be dry.

The gold is not apply'd till after the baking, and is rebak'd in an oven for the purpose. To apply the gold, they break and dissolve it in water at the bottom of a *porcelain*, till a thin gilded cloud arise on the surface: it is us'd with gum-water, and to give it a body, they add three parts of ceruse to thirty of gold.

There is likewise a kind of marbled *porcelain*, which is not made by applying the marblings with the pencil, but for oil to varnish it withal, using that of white flints, which hatches and cuts the work with a thousand humorous strokes, in manner of Mosaic work. The colour this oil gives, is a white, somewhat ashy. The *porcelain* is call'd *tswiki*.

There are several other kinds of *porcelain*; but they are such as are rather for curiosity than use: the prettiest are the magic *porcelains*, whose colours only appear when fill'd with some liquor. These are made double: the outside is white, and all laid out in compartments; the inside is a solid cup, of colour'd *porcelain*; though the cup is sometimes of glass, which has a better effect than *porcelain*. The secret of these magic *porcelains*, which the Chinese call *kiatfim*, is almost lost; yet F. d'Entrecolles has furnish'd us with the following account.

The *porcelain* to be painted thus, must be very thin; and the colours, which in other *porcelains* are apply'd on the outside, are here apply'd on the inside. When the colour is dry, they lay over it a light couch of a size made of the *porcelain* earth; by which means the colour is inclos'd between two earthen laminæ. When the size is dry, they throw oil within the *porcelain*; and when it has enough, they return it to the mould, and the wheel, to render it as thin and transparent as possible. When dry, it is bak'd in the common furnace. The colours here us'd are always the finest, and the figures painted are fishes; as the most suitable to the liquor put within them, and in which they seem to swim.

The several kinds of *porcelains* above-mention'd, being quite painted, with their several colours, and all the colours dry, are to be polish'd, to prepare them to receive the oil or varnish; which is done with a pencil of very fine feathers, moisten'd with water, and pass'd lightly over, to take off even the smallest inequalities.

The oiling or varnishing is the last preparation of the *porcelain*, before it be carry'd to the oven: this is apply'd more or less thick, and seldomer or oftener repeated, according to the quality of the work. For thin, fine *porcelains*, they give two very thin couches, to others one; but that one equivalent to the other two. There is a deal of art in applying the varnish; both that it be done equally, and not in too great quantity. The couches on the inside are given by aspersions, *i. e.* by casting in as much varnish as is necessary: those on the outside, by immersion, or by plunging the pieces in a vessel of oil.

It must be observ'd, that the foot is not yet form'd, but continues in a mere mass, till the work has been varnish'd: it is at length finish'd on the wheel; and when hollow'd, a little circle is painted in it, and sometimes a Chinese letter. This painting being dry, the foot is varnish'd, and the work now carry'd to the oven to be bak'd.

Our curious author omits nothing, not even the dexterity of the people, who carry the *porcelain* to the bake-house. He has been

been frequently surpris'd, he tells us, to see a man pass through several streets full of people, with two very long, narrow boards, rang'd with *porcelains* on his shoulders, still preserving the equilibrium so accurately, as not to do any damage to so frail a commodity.

**Baking or nealing of PORCELAIN.**—There are two kinds of ovens us'd in baking of *porcelain*: large ones, for works that are only to come to the fire once, which is the common way; and small ones for such as require a double baking. The large ones are two Chinese fathoms deep, and almost four wide. They are form'd of a mixture of three earths; one whereof, yellow and common, make the basis; the two others are scarcer, and dug out of deep mines, wherein people can only work in winter. One of them, call'd *lantou*, is a very strong, stiff earth; the other, *youtou*, oily.

The sides and roof of the ovens are so thick, that one may lay the hand on them, when the fire is at its height, without danger of burning. At the top of the dome, which is in form of a tunnel, is a large aperture to give vent to the flames and smoke, which mount up incessantly, as soon as fire is once set to the oven. Beside the principal aperture, there are four or five small ones around; which, by being open'd and shut, serve to augment or diminish the heat: like the holes in the chymists furnaces, call'd *registers*. The hearth, which takes up the whole breadth of the oven, is placed in front, precisely against the opening of the door, and is two or three feet deep, and two broad; people passing over it on a plank, to go into the furnace to range the *porcelain*.

As soon as the fire is lighted, the door is wall'd up; only leaving an aperture for the conveyance of wood. Lastly, the bottom of the oven is cover'd with sand, wherein part of the first *porcelain* cases are buried. The oven itself is usually placed at the extremity of a long, narrow vestibule, which serves in lieu of bellows, the cold air and wind being thus driven directly in the face of each oven.

Each piece of *porcelain* of any note, is dispos'd, in the furnace, in its separate case, or coffin. Indeed, as to tea-dishes, &c. the same case serves for several. The cases are all of the same matter with the oven: they have no lids; but serve each other mutually, the bottom of a second case fitting into the aperture of the first; and thus successively, to the top of each column. Each coffin, which is usually of a cylindrical form, that the fire may communicate itself more equably to the *porcelains* inclos'd, has, at bottom, a little lay of very fine sand, cover'd over with dust of kaolin, that the sand may not stick to the work; and care is taken, that the *porcelain* may not touch the sides of the case. In the larger cases, which hold the small pieces, they leave the middle vacant, in regard *porcelains* placed there would want the necessary heat. Each of these little pieces is mounted on a little massive of earth, the thickness of two crowns cover'd with powder of kaolin.

F. d'Entrecolles observes, that the *porcelains* are put in cases, to prevent any diminution of lustre from the too violent effect of a naked fire; adding, that it is owing to these thick veils, that the beauty, or, as he calls it, the complexion of the *porcelains*, is not tann'd by the heat of the fire.

As fast as the cases are fill'd, a workman ranges them in the cavity of the furnace; forming them into piles or columns, whereof those in the middle are at least seven feet high. The two cases at the bottom of each column are left empty; because being partly sunk in the sand, the fire has the less effect on them; and for the same reason, the uppermost one is left empty. In this manner is the whole cavity of the oven fill'd with columns, excepting that part precisely under the grand aperture.

In ranging the cases, they observe always to place the finest piles of *porcelain* in the centre; the coarsest at the bottom; and those that are high-colour'd, and consist of as much petunse as kaolin, and wherein the worst oil is us'd, at the mouth.

These piles are all placed very near one another, and are bound together, at top, at bottom, and in the middle, by pieces of earth; in such manner, as that the flame may have a free passage among them, and insinuate equally on all sides: in which a great part of the workman's art lies, and on which the perfection of the *porcelain* much depends. Another thing to be observ'd, is, that an oven must never be set altogether with new coffins; but half one, half the other: the old ones at the bottoms and tops of the pile, and the new ones in the middle. Indeed it were better to have them all burnt in an oven apart, ere they come to be us'd for *porcelain*; as was anciently done. The cases, our author observes, are brought ready prepar'd from a large village on the river, a league distant from Kingteching. Ere burnt, they are yellow; and afterwards of a dark red.

When the oven is fill'd, they wall up the door; only leaving a little aperture for the throwing in of little pieces of wood, a foot long, but very slender, to keep up the fire. It is then heated, by degrees, for the space of a day and night; after which two men, who relieve one another, continue to throw in wood without any interruption. To know when the *porcelain* is bak'd enough, they open one of the lesser holes of the oven, and with a pair of tongs take off the lid of one of the piles. If the fire appear very brisk and clear, and the piles equally inflam'd; and especially if the colours of the *porcelains* that are uncover'd, dart forth a noble lustre; the coction is

sufficient, they discontinue the fire, and wall up what remain'd of the door of the furnace.

If the oven be only fill'd with small *porcelains*, they take them out twelve or fifteen hours after the fire is extinct: if it be fill'd with larger, they defer opening it for two or three days. In this the modern practice differs from the ancient; wherein the door was not open'd till after ten days for the large pieces, and five for the small ones.

One thing very surprising, and almost inconceivable, F. d'Entrecolles observes, is, that there are never found any ashes on the hearth of the oven, what quantity of wood soever is consum'd. He adds another thing, which with him passes for equally strange, that the workmen employ'd about the furnaces, slake their thirst, by continually drinking hot tea, with salt dissolv'd in it.

The Chinese make another kind of *porcelain*, which they paint and bake twice; and for this second baking they have a kind of little ovens on purpose. When very small, they are made of iron; otherwise, of a kind of bricks an inch thick, a foot high, and half a foot broad, made of the same earth with the *porcelain* cases. The biggest of these ovens does not exceed five foot in height, and three in diameter; and being made much in form of bee-hives, the bricks are arch'd a little, to form the curvity the better. The hearth is of earth half a foot high, form'd of two or three ranges of bricks; and on this massive is the oven built. Around the oven, at the distance of about half a foot, is rais'd a shell of common bricks, join'd to the oven itself, by a kind of arc-boutant of earth, which serves to strengthen it. They usually build four or five of these ovens at equal distances from each other. At the bottom of the shell are holes to give air to the fire when lighted: a-top is an aperture, which they cover up with a piece of the bak'd earth, when the *porcelains* are laid in the oven.

The *porcelains*, here, are not inclos'd in coffins, as in the common ovens; the oven itself serving that purpose, and being so exactly clos'd, that they receive no other impression of the fire, but that of the heat of the charcoal dispos'd in the hearth, at the bottom of the oven, as well as at-top of the vault, and in the interval between the oven and the shell, or brick-wall.

To prepare the *porcelains* for a second baking, they must have had their varnish in the common manner, and have pass'd the great oven. In this state they are painted with various colours, after which, without giving them any new varnish, they are rang'd in piles in the little oven; setting the little ones over the larger, in form of pyramids.

This second baking is sometimes intended to preserve the lustre of the colours the better, and at the same time to give them a kind of relievo. But, more usually, its design is to hide defective places, by covering them over with colours: but the artifice is easily found out, by passing the hand over them.

When the workman judges his *porcelains* enough bak'd, he takes off the piece that covers the aperture; and if the works appear glittering, and the colours glowing, he takes out the charcoal; and when the oven is cold, the *porcelain* too.

How beautiful soever the modern *porcelain* may be, the taste for antiquity, which reigns in China, as well as in Europe, gives the ancient *porcelain* a value far above that of the modern. It must be own'd, the ancient seems finer as to the matter, more perfect as to the baking, and of a more pleasant cast, both as to the white of the ground, and the other colours; yet it is certain, the most able and discerning may be deceiv'd herein: and there are workmen who make it their business to counterfeit the ancient *porcelain*, call'd *kutong*, in the modern.

The matter of these false *kutong* is a yellowish earth, found near Kingteching. There is nothing particular in the first part of the process, except that they are made thicker; and that they are varnish'd with an oil drawn from the yellow stone, mix'd with the common oil, which gives them a kind of sea-green hue. When taken out of the oven, they throw it into a fatty broth, made of capons, &c. in which they boil it a second time; they then bury it in the filthiest sink they can find, for a month or six weeks, or more, according as they would give it the greater appearance of antiquity. Besides their thickness and their colour, these false antiques resemble the true ones in this, that they do not resound when struck, nor even give the least buz, when held to the ear.

Notwithstanding the vast quantity of *porcelains* made in almost all the provinces of the empire of China, they still continue very dear; though not near so dear as anciently. The Chinese annals tell us of times wherein a single urn cost ninety or an hundred crowns on the spot. What chiefly occasions the extraordinary price of this commodity, especially in Europe, is, beside the great profits of the merchants in Europe, and their factors in China, that it rarely happens an oven succeeds throughout; that it is frequently quite spoilt, so that upon opening it, in lieu of fine *porcelains*, is found a hard unform'd mass, into which both the *porcelains*, and their coffins, are converted, either by excess of heat, or some ill qualities in the matter.

Another reason of the dearness of *porcelain* is, that the ingredients it is made of, and the wood wherewith it is burnt, grow more and more scarce. One may add a third reason for the ex-

cessive

expensive price of *porcelains* to the Europeans; and it is this, that most of those sent to Europe are form'd on new models, frequently very capricious, and difficult to succeed in; which, yet, for the smallest defects, are turn'd on the manufacturer's hands: and he not being able to dispose of them to the Chinese, because not to their taste, nor to their use, is forced to charge the *porcelain* he delivers, the higher, to pay himself for those refus'd.

The French have been these fifteen years attempting to imitate *porcelain*. The first essays, made at Rouen, are said to have succeeded tolerably well; and M. Savary tells us, are now carried to such a point in the manufactories at Passy and St. Cloud, that the French *porcelains* want nothing to make them of equal value with the Chinese, but to be brought five or six thousand leagues. In effect, for the fineness of the grain of the matter, the beauty and turn of the vessels, the exactitude of the design, and the lustre of the colours, at least the blues, the French are not much behind the Chinese.—But their grand defect is in the white of the ground, which is usually dingy and dull, and easily distinguishes itself from the pure sprightly white of the Chinese.

But the Saxons seem to have exceeded the French. There is a manufacture at Missen, the capital of Misnia, which the baron de Pollnitz assures us, produces *porcelains* painted and enamell'd in such perfection, that they are more beautiful, as well as dearer, than those of China itself. The invention is owing to an alchymist, who being clapp'd up in the castle of Konigstein, by the late king of Poland, on a suspicion of being master of the secret of the philosophers stone, had leisure enough, not indeed to make gold, but to invent a ware, which by the great vent of it considerably enriches the country.

**PORCELAIN** also denotes a kind of little white sea-shell, found along with the sponges; and current in several parts of Asia, Africa, and America, by way of money. See **COIN**.

Authors have hitherto been of opinion, that these shells were the matter whereof the *porcelain*, or China ware, was made. They are of some use in medicine, and are prescrib'd pounded or broken, in manner of pearls. See **PEARL**.

**PORCH**, *atrium*, a kind of vestibule, supported by columns; much us'd at the entrance of the ancient temples, halls, churches, &c. See **VESTIBULE**.

In the ancient architecture, *porch* was a vestibule, or a disposition of insulated columns, usually crown'd with a pediment, forming a covert place before the principal door of a temple, or court of justice.—Such is that before the door of St. Paul's, Covent-garden, the work of Inigo Jones.

When it had four columns in front, it was call'd a *tetrastyle*; when six, *hexastyle*; when eight, *octastyle*; when ten, *decastyle*, &c.—Vitruvius calls it *prona*; Pollux *προσφυον*, *prododomos*: when finer than ordinary, the ancients call'd it also *propylaum*. See **PROPYLAEUM**.

**PORE**\*, a little interstice between the particles of matter which constitute bodies; either empty, or fill'd with some insensible medium. See **BODY**, and **MATTER**.

\* The word *pore* is formed from the Greek *πορος*, aperture, or duct, through which a thing passes.

Condensation and rarefaction are only perform'd by closing and opening the *pores*. See **RAREFACTION**, and **CONDENSATION**.

The transparency of bodies is usually suppos'd to arise from their *pores* being directly opposite to one another. See **TRANSPARENCY**.

The matter of insensible perspiration is convey'd through the *pores* of the cutis. See **PERSPIRATION**.

Sir Isaac Newton shews, that bodies are much more rare and porous, than is commonly believ'd: water, *e. gr.* is 19 times lighter, and consequently rarer, than gold; and gold itself is so rare, as very readily, and without the least opposition, to transmit magnetic effluvia, and easily to admit quicksilver into its *pores*, and to let water pass through it: for a concave sphere of gold hath, when fill'd with water, and solder'd up, upon pressing with a great force, let the water squeeze through it, and stand all over its outside, in multitudes of small drops like dew, without bursting or cracking the gold. Whence it may be concluded, that gold has more *pores* than solid parts; and by consequence that water hath above forty times more *pores* than parts. See **GOLD**.

The magnet transmits its virtues without any diminution or alteration, through all cold bodies that are not magnetic; as gold, silver, brass, glass, water, &c. See **MAGNET**.

The rays of light, let them be either bodies actually coming to us from the sun, or only motions or impressions upon the medium, move in right lines, and are hardly ever, unless by great chance, reflected back again in the same right line, after their impingence upon objects; and yet we see, that light is transmitted to the greatest distances through pellucid bodies, and that in right lines. See **RAY**, &c.

Now how bodies should have *pores* sufficient for these effects, may be difficult to conceive, but not impossible: for Sir Isaac shews, that the colours of all bodies arise from their particles being of such a determinate size or magnitude. Wherefore, if we conceive those particles to be so dispos'd, as that there is as much porosity, as there is of matter; and in like manner those particles to be compos'd of others much less, and that have as

much interspers'd vacuity or space, as their quantity of matter amounts to; and so on, till we come to solid particles without *pores*: then, if in any body there be (for instance) three of these sizes of particles, and that the last be of the solid, or least sort; that body will have seven times as much vacuity as solid matter: if four such degrees, and the last be least and solid, that body will have fifteen times as much porosity as solidity: if five such degrees, it will have thirty-one times as much space as solidity: and if six degrees, then it will have sixty-three times as much vacuity, as solid matter.

And perhaps in the wonderful conformation and fabric of natural bodies, there may be other proportions of space to matter, to us wholly unknown; whence it is possible, there may be yet farther great quantities of interspers'd vacuity. See **VACUUM**.

**PORES**, in anatomy, are certain permeable spaces, between the parts of the skin; whereby we sweat, or perspire, &c.—See *Tab. Anat. (Myol.) fig. 8. lit. d d, fig. 9. lit. a a and c.* See also **CUTIS**, and **PERSPIRATION**.

The *pores* are most remarkable in the hands and feet. By viewing the palm of the hand with a moderate glass, after washing it well, we perceive innumerable little ridges, of equal size and distance, running parallel to each other; especially on the tips and joints of the fingers, &c. where they are regularly dispos'd into spherical triangles and ellipses.

On these ridges stand the *pores*, in even rows, big enough to be seen by a good eye without a glass; but with one, every *pore* looks like a little fountain; and the sweat may be seen to stand therein, clear as rock-water; and as often as it is wip'd off, springs up again. See **SWEAT**.

The *pores* are plac'd on the ridges, not in the furrows between them; that they might be less liable to be stopp'd by compression: for the same reason, the *pores* of the hands and feet are larger than the rest; those parts being more us'd and press'd than the rest: and hence again, there are no ridges on other parts.

These *pores* are a very convenient out-let for the more noxious parts of the blood, which by the continual use of the hands and feet, are plentifully brought into them: whence, in hypochondriac and hysteric people, there is a continual burning in the palms and soles.

In the stoppage or constriction of the *pores* of the skin, that disease we popularly call'd a *cold*, is commonly suppos'd to consist; tho' Dr. Keill maintains a quite contrary opinion, in a dissertation at the end of his *medicina statica Britannica*. See **COLD**.

In the philosophical transactions, we have an instance of a student near Leyden, much addicted to astronomy, who, spending many nights in star-gazing, had, by the nocturnal wet and cold, so obstructed the *pores* of his skin, that little or nothing exhal'd from his body; as appear'd hence, that the shirt he had worn five or six weeks, was then as white as if it had only been worn one day. In the mean while, a water was collected under the skin, whereof he was afterwards cur'd.

**Bilary PORE**. See the articles **BILARY**, and **POROUS**.

**PORIME**\*, **PORIMA**, in geometry, a theorem, or proposition, so easily demonstrated, that it is almost self-evident. See **AXIOM**.

\* The word is formed from the Greek *πορευω*, pervious, a thing easy to penetrate or conceive, and which opens the way to something more difficult.

Such, *e. gr.* is this, that a chord is wholly within the circle.

*Porime* stands oppos'd to *aporime*, which denotes a proposition so difficult, as to be almost impossible to be demonstrated.—Such as the quadrature of the circle is now, and as the squaring of any assign'd portion of Hippocrates's lunes formerly was. See **APORIME**.

The *porime* coincides nearly with the lemma, or assumption. See **LEMMA**.

**PORISM**\*, **PORISMA**, in mathematics, a general theorem, or canon, deduced from a geometrical locus, and serving for the solution of other general and difficult problems. See **THEOREM**, and **LOCUS**.

\* Proclus derives the word from the Greek *πορευω*, I establish and conclude from something already done and demonstrated; and accordingly defines *porisma*, a theorem drawn occasionally from some other theorem already demonstrated.—In which sense it coincides with what we otherwise call corollary.

**PORISTIC method**, in mathematics, is that which determines when, by what means, and how many different ways, a problem may be solved. See **PROBLEM**, and **RESOLUTION**.

**PORPHYRIANA arbor**. See the article **ARBOR**.

**PORPHYRIANS**, a name given to the Arians, in the fourth century, by authority of Constantine. See **ARIANS**.

That prince, publishing an edict against Arius and his writings, declares, that as Arius has imitated Porphyry in composing books against religion, he deserves to be noted with his infamy; and that as Porphyry is become the reproach of posterity, and his writings suppress'd; so he wills, that Arius and his followers be call'd *Porphyrians*, &c.

The propriety of the name seems to consist in this, that the Arians endeavour'd to restore idolatry: for in saying that the son, whom they call a *begotten God*, is a creature, they put a creature in the rank of God; and only differ from the Heathens in this, that the one give the quality of God to one creature, the other to a great many.

**POR-**

# P O R

**PORPHYROGENITUS**, in antiquity, an appellation given to the children of the eastern emperors: implying as much as, *born in purple*. See **PURPLE**.

Cedrenus will have the word to signify, *born in the purple palace*, or the *palace of porphyry*, a palace so called in Constantinople; wherein the emperors used to lie in. Others derive the appellation hence, that the imperial children, as soon as born, were wrapped in purple; others from this, that the chamber wherein they were born was hung with purple hangings.

**PORPHYRY**, **PORPHYRITES**, in natural history, &c. a precious kind of stone, or marble, of a brownish-red colour; frequently interspersed with white stains; anciently brought from Egypt, and exceeding all others in hardness. See **MARBLE**. There are three famous *porphyry* pillars, or obelisks, in Egypt; one near Cairo, and the other two at Alexandria. The Franks call them *aguglia's*, the English *Cleopatra's needles*. See **OBELISK**.

'Tis difficult to conceive whence they should have been brought; for Dr. Huntingdon assures us, that there is no quarry or rock of such stone in all the lower parts of Egypt; so far as the Nile overflows being perfect soil. *V. Ray's trav. T. 2. p. 461.*

The art of cutting *porphyry*, practised among the ancients, is lost. In effect, it is hard to conceive what kind of tools they must have used for the fashioning of these huge columns, and other *porphyry* works found in some of the antique buildings in Rome.

One of the most considerable pieces, now remaining intire, is a tomb of Constantia, daughter of the emperor Constantine, in the church of St. Agnes without the walls; ordinarily called, *the tomb of Bacchus*, because of several boys represented herein, playing among the vine-leaves. Add to this Apollo's, and the busts of twelve emperors, all in *porphyry*, in the palace of the Tuilleries.

Some of the ancient pieces appear to have been wrought with the chissel, others with the saw, others with wheels, and others ground by degrees with emery. Yet the modern tools will scarce touch *porphyry*: either the ancients, therefore, had the secret of tempering steel better than we; or, as some incline to think, they had the art of softening the *porphyry*: though it is more probable, that time and air have contributed to increase its hardness.

Mr. Addison tells us, he saw a workman at Rome employed in the cutting of *porphyry*; but his advances were exceedingly slow, and almost insensible.

All the way the Italian sculptors have to work the pieces of old *porphyry* columns still remaining, (for the *porphyry* quarries are long since lost) is with a brass saw without any teeth. With this, together with emery and water, they rub and wear, with infinite patience. See **EMERY**.

Yet have many excellent persons endeavoured to retrieve the ancient art, particularly Leon Baptista Alberti; who, searching for the necessary temper, says, he found goats blood the best of any: yet even this availed but little; for in working with chissels tempered herein, sparks of fire came much more plentifully than pieces of the stone. By means hereof, the sculptors were able to make a flat or oval form; but could never attain to any thing like a figure. See **TEMPERING**.

It is true, in 1555. Cosmo de Medicis is said to have distilled a water from certain herbs, wherewith his sculptor Francesco Tadda, gave his tools such an admirable hardness and temper, as that he performed some fine works with them; particularly, our Saviour's head in demi-relievo, Cosmo's head, and his duchess's. Even the very hair, and beard, how difficult soever, are here well conducted; and there is nothing of the kind better in all the works of the ancients: but the secret seems to have died with him.

The French have lately found another method of cutting *porphyry*, viz. with an iron saw without teeth, and *grez*, a kind of free-stone pulverized, and water. The authors of this invention pretend, they could form the whole contour of a column hereby, had they matter to work on.

**PORRACEOUS** \*, in medicine, a term applied to the bile, feces, &c. when their colour is green, approaching that of a leek. See **BILE**.

\* The word is formed from the Latin *porrum*, leek.

**PORRETANI**, a religious sect, the followers of Gilbert de la Porree, bishop of Poitiers, condemned in the twelfth century, for admitting a physical distinction between God and his attributes; or, as Marham says, for having written too curiously on the subject of the Trinity: for his real sentiments we are not over-well acquainted withal.

However, he gave occasion for those suspicions, by maintaining that this proposition, *Deus est bonitas*, is not true, unless reduced to this, *Deus est bonus*. And there are some passages noted by St. Bernard, who wrote warmly against him, wherein he seems to admit a real distinction between the nature of God and his attributes.—The *Porretani* are set in opposition to the *Nominals*. See **NOMINAL**.

**PORT**, *haven*, or *barbour*, a commodious place situate on the sea-coast, or at the mouth of a river, with depth of water sufficient for ships of burden, and convenient bottom for anchorage; where vessels lie by, to load or unload; screened from the wind, and safe from any enterprize of enemies; either by the disposition of the place, or by means of a mole, or dike, or

Vol. II.

# P O R

the like, with a chain and light-house. See **HARBOUR**, **PHAROS**, &c.

*Ports* are either *natural* or *artificial*.

**Natural PORTS** are those which providence seems to have formed for the communication of commerce.

**Artificial PORTS** are those formed with moles, or projectures into the sea. See **MOLE**.

The English coasts are exceedingly thin of *ports*. France has the advantage of all other countries in the number and excellence of *ports*: that of Brest is the finest natural *port* in the world, as that of Dunkirk was lately the strongest artificial one.

**Bar PORTS**, *PORTS de barre*, are such as can only be entered with the tide, as that of Goa.

**Close PORTS**, are those within the body of a city; as those of Rhodes, of Venice, Amsterdam, Rochel, Bayonne, and St. John de Luz.

**Free PORT**, in commerce, a *port* open and free for merchants of all nations to load and unload their vessels in, without paying any duties or customs. See **FREE**, and **DUTY**.

Such are the *ports* of Genoa and Leghorn.—The emperor, since his being in possession of the states in Italy, formerly belonging to Spain, has seemed determined to establish a *free port* in some of the cities he possesses on the Adriatic sea.—Marseilles was declared a *free port* by an edict of Louis XIV, bearing date 5th March 1669.

**Free PORT** is also used for a total exemption and franchise, which any set of merchants enjoy, for goods imported into a state, or those of the growth of the country exported.

Such was the privilege the English enjoyed for several years after their discovery of the *port* of Archangel; and which was taken from them on account of the regicide in 1648.

**Cinque PORTS**. See **CINQUE ports**, **BARON**, **GUARDIAN**, and **WARDEN**.

**PORT** is also sometimes used for the burden of a ship. See **SHIP** and **BURDEN**.

The capacity of a vessel is estimated in tuns; each whereof may contain about two thousand pounds weight of sea-water. When then we say, a vessel is of the *port* or burden of a thousand tuns; it is not meant, as some imagine, that it bears so many casks full of merchandize; but that the sea-water, which would be contained in the space which the capacity of the vessel possesses in the sea, weighs a thousand tuns, which, at the rate of 200 pounds each, is as much as to say, it bears a burden of two millions weight. See **TUN**.

**PORT** is also used for the palace of the grand signior, or emperor of the Turks. See **SERAGLIO**.

**PORT** is also used for a strong wine brought from Oporto, or Port-a-port in Portugal; whence its name. See **WINE**.

**PORT of the voice**, in music, the faculty and habit of making the shakes, passages, and diminutions; wherein the beauty of a song, or piece of music, consists; and which the Italians comprehend under the terms *trilli*, *gruppi*, *stracini*.

**PORT**, among sailors, denotes the larboard, or left side of the ship. See **LARBOARD**.

*To port the helm*, is to put the helm on the left side of the ship, that the ship may go to the right, or the starboard. See **HELM**.

**PORTA**, in anatomy, or *vena PORTA*, a very considerable vein, employed in bringing the blood from several parts, by an infinite number of branches, which it is divided into, to the liver, through the whole substance whereof it is disseminated. —See *tab. anat. (angeiol.) fig. 4. lit. a. (splanch.) fig. 5. lit. i.* See also **VEIN** and **LIVER**.

The *vena porta* is formed of two large veins; the mesenteric and splenic; which are again formed of several other minuter veins coming from the stomach, intestines, spleen, epiploon, &c. See **MESENTERIC** and **SPLENIC**.

The ancients gave it the name *porta*, as imagining it to bring the chyle, by its mesenteric branch, from the intestines to the liver; but some of the moderns have found another use for it. It is remarkable of the *porta*, that, after the manner of the arteries, it shoots itself from a trunk into branches; and being at last lost in capillaries, it delivers the blood into the cava, by which it is immediately reconveyed to the heart. See **CAVA**.

The *porta* is formed out of the concurrence of divers veins, which, meeting together, make one of the most considerable venous trunks of the body, as to its bulk; though, contrary to the course of other veins, it runs not far in a trunk, but is, as before observed, soon distributed again, by ramifications, into the liver.

This vein is vulgarly divided into *branches without the liver*, and *branches within*, and a *trunk intermediate*: but this division is not very clear, the *branches*, as they are called, without the liver, not being so properly branches as roots; which have, by anatomists, been dignified with distinct names from the parts whence they come.

The veins which conspire towards the formation of this trunk, which having been described in their proper places, or being to be described there, we shall not here enlarge upon, are, from the placenta uterina, in a foetus, the *vena umbilicalis*; from the gall-bladder, the *cysticæ gemellæ*; from the upper part of the stomach, the *pylorica*, or *gastrica dextra*, which goes to the trunk; the *gastrica major*, and *minor sinistra*, from the stomach (of which the major is formed out of the coronaria

9 H

ventriculi);

ventriculi); the epiplois sinistra and postica, from the omentum; the vas, or vasa brevia, from the stomach; the splenica, from the spleen: all which join to form the *left*, or *splenic branch of the porta*.

The *right*, or *mesenteric branch*, consists of the gastrica and epiploica dextra, from the stomach and omentum; the duodena, from the duodenum and jejunum; the hæmorrhoidalis interna, from the intestinum rectum and colon; the mesaraics, from the mesentery.

By means of all these vessels, the *porta* receives the blood from most of the viscera of the abdomen; and, after the coalescence of its branches, enters the liver in a trunk; immediately under the surface whereof, having first formed a kind of sinus, it is divided into two principal branches, and those again into five, which scatter innumerable ramifications through the whole substance of the liver.

The true use of this vein, hitherto unknown, Dr. Keill thinks he has discovered: and it is this: The bile, says he, being to be mixed with the chyle, as it comes out of the stomach into the duodenum, could no-where be so conveniently secreted from the blood, as where the liver is placed: but if all the branches of the coeliac artery carried all the blood to the liver, from which the gall was to be separated; it is evident, considering the nearness of the liver to the heart, and the intestine motion of the blood, that so viscid a secretion as the gall is, could never have been formed. See GALL.

Nature therefore is forced to alter her constant method of sending the blood to all parts of the body by arteries: she here forms a vein, by which she sends the blood from the branches of the mesenteric and coeliac arteries to the liver.

By this means the blood is brought a great way about, ere it arrive at the liver; so that its celerity being diminished, all the corpuscles that are to form the gall, may have time to attract one another, and unite ere they come to their secreting vessel. Keill's *anim. secret.* p. 36, &c. See SECRETION.

**PORTABLE**, something easy of carriage. See CARRIAGE.

Books in 12mo are valued for their being *portable*; easily put in the pocket. This machine is the better, as being *portable*. Armies carry with them *portable* bridges, *portable* mills, boats, ovens, forges, &c.

**PORTABLE barometer**, is a barometer so contrived as that it may be carried from place to place without being disordered. See BAROMETER.

A *portable barometer* was an extraordinary thing a little while ago: at present they are made *portable* of all sorts; being so contrived, as that the mercury may be screwed quite up to the sealed end of the tube; by which means it is secured from swagging, and so endangering the breaking of the tube. A contrivance for which we are indebted to Mr. Patrick!

**PORTAIL**, in architecture, the face or frontispiece of a church, viewed on the side wherein is the great door.

*Portail* is also used for the great door itself of a palace, castle, &c.

**PORTAL** \*, in architecture, a term used for a little square corner of a room, cut off from the rest of the room, by the wainscot; frequent in the ancient buildings, but now disused.

\* The word seems a diminutive of the French, *port*, door, gate; it being through this that they entered into the room.

**PORTAL** is sometimes also used for a little gate, *portella*; where there are two gates of a different bigness. See GATE.

**PORTAL** is sometimes also used for a kind of arch of joiner's work before a door.

**PORTATE**, in heraldry—A *cross PORTATE* is a cross which does not stand upright, as crosses generally do; but lies athwart the escutcheon, in bend, as if it were carried on a man's shoulder. See CROSS.

Colombiere tells us, it is by some called *porté*, that is, carried; because, when our Saviour went to suffer death, he was obliged to carry his cross, which is always thus represented sloping, and inclined after this manner.

**PORT-CRAION**, a *pencil-case*, an instrument serving to inclose a pencil, and occasionally also used as a handle for holding it. See PENCIL.

It is usually four or five inches long, and contrived so as the pencil may be slid up and down it by means of a spring and button. Its outside is filed into eight sides or faces, whereon are drawn the sector-lines; its inside, round: sometimes it is made round or cylindrical both without-side and within, and has its length divided into inches and parts of inches.

**PORTCULLICE**, called also *berse* and *sarrasin*, in fortification, an assemblage of several great pieces of wood laid or joined across one another, like an harrow; and each pointed at the bottom with iron. See HERSE and SARRASIN.

These formerly used to be hung over the gate-ways of fortified places, to be ready to let down in case of a surprize, when the enemy should come so quick, as not to allow time to shut the gates.

But now-a-days, the orgues are more generally used, as being found to answer the purpose better. See ORGUES.

**PORT-DIEU**, among the French, is a parish-priest, whose business is to carry the viaticum, or sacrament, to sick people. See VIATICUM.

**PORTER**, in the circuit of justices, is an officer who carries a verge, or white rod, before the justice in eyre; so called a *portando virgam*. See VERGER.

**PORTER of the door of the parliament-house**, is a necessary officer belonging to that high court; who enjoys the privileges accordingly. *Comp. jurisd.*

**Groom PORTER**. See the article GROOM porter.

**PORT-FIRE**, a paper-tube, about ten inches long, filled with a composition of meal-powder, sulphur and salt-petre, rammed moderately hard; used to fire guns and mortars instead of match. See MATCH.

**PORT-GLAIVE**, *sword-bearer*, an order of knights in Poland, called by the Latins *ensiferi*. See KNIGHT.

It was confirmed by pope Innocent III. and by him sent into Livonia to defend the preachers of the gospel against the infidels at the first conversion of that country. Being too weak to effect that business, they united themselves with the Teutonic or Marian knights, by the pope's authority; and instead of knights of the sword, were called, *knights of the cross*.—They separated again under Univus, their great master, anno 1541.

The Teutonic knights being then dispossessed of Prussia, and the *port glaives* going into Luther's opinions, soon dwindled away; for in the year 1557. they fell out with the bishop of Riga, of the house of Brandenburg, because he would not embrace their notions; and he, to secure his own estate, put Riga into the hands of the Polanders.

Afterwards, the knights having most of Livonia taken from them by the Muscovites, they put themselves under the protection of Sigismund Augustus, king of Poland, anno 1559. but William of Furstembourg, their great master, being betrayed by his own mercenaries into the hands of the Muscovites, Gothard Ketler his successor, following the example of Albert, the great master of Prussia, transacted with the aforesaid Sigismund for the whole estate, which he surrendered to his own use in the castle of Riga, together with his cross, the seal of the order, the charters and grants of the several popes and emperors, which concerned the same; as also the keys of the city and castle of Riga, the office of great master, the rights of coinage, and all the powers and privileges appertaining to it; receiving back again from Radzivil, the king's commissioner, the dukedom of Courland to him and his heirs for ever.

**PORT-GREVE** \*, or PORTGRAVE, was anciently the principal magistrate in ports and other maritime towns.

\* The word is formed from the Saxon *port*, a port or other town; and *gerefa*, a governor.--- It is sometimes also written *port-reve*. See REVE.

Camden observes, that the chief magistrate of London was anciently called *port-greve*; instead of whom, Richard I. ordained two bailiffs; and soon afterwards king John granted them a mayor for their yearly magistrate. See MAYOR.

The charter of William the conqueror to the city of London runs thus: "William king, grete William bishop, and Godfrey *porte-greve*, and all the burgeois within London, French and English. I grant you that I will that ye be all your law-worth that ye were in Edward's day the king. And I will that each child be his fader's eyer, and I will not suffer that ony man you any wrongs breed, and God you keepe."

**PORT-HOLES**, in a ship, are the embrasures, or holes in the sides of the vessel, through which the muzzles of the canons are put. See EMBRASURE.

Large ships have three rows of *port-holes*, or batteries; each usually consisting of fifteen *port-holes*.

In storms, they use to shut up the *port-holes*, to prevent the water's driving through them.

In English, Dutch, and French ships, their valves or casements are fastened a-top of the apertures; in Spanish vessels aside of them.

**PORTICO**, in architecture, a kind of gallery on the ground; or a piazza encompassed with arches supported by columns, where people walk under covert. See PIAZZA.

The roof is usually vaulted, sometimes flat. The ancients called it *lacunar*. See LACUNAR, VAULT, &c.

Though the word *portico* be derived from *porta*, gate, door; yet it is applied to any disposition of columns which form a gallery, without any immediate relation to doors or gates.

The most celebrated *portico's* of antiquity were those of Solomon's temple, which formed the atrium or court, and encompassed the sanctuary: that of Athens, built for the people to divert themselves in, and wherein the philosophers held their disputes and conversations; which occasioned the disciples of Zeno to be called *stoics*, from the Greek *soa*, *porticus*: and that of Pompey at Rome, raised merely for magnificence, consisting of several rows of columns supporting a plat-form of vast extent: a draught whereof, Serlio gives us in his antique buildings.

Among the modern *portico's*, the most celebrated is the piazza of St. Peter of the Vatican.--- That of Covent-Garden, London, the work of Inigo Jones, is also much admired.

**PORTIO**, **PORTION**, a part, or division of any thing. See PART and DIVISION.

**PORTION**, in the canon law, is that allowance, or proportion, which a vicar ordinarily has out of a rectory, or impropriation; be it certain or uncertain. See VICAR and IMPROPRIATION.

**PORTIO dura**, and *mollis*, in anatomy, a partition of the fifth pair of nerves of the brain; which, before its egress out of the dura mater, is apparently divided into two branches; the one pretty tough and firm, called *portio dura*; the other soft and lax, called *portio mollis*. See NERVE. **POR-**

**PORTIONER, PORTIONARIUS.** Where a parsonage is serv'd sometimes by two, sometimes by three ministers, alternately; as Bromyard, Burford, &c. in Shropshire; the vicars or incumbents are call'd *portioners*, because they have but their portion or proportion of tythes, or profits of the living.

**PORTLAND stone.** See the article **STONE**.

**PORT-LAST**, in a ship, denotes the gun-wale. See *Tab. Ship*, fig. 2. n. 19.

When a yard is down on the dock, they say, *The yard is down a port-laft*.

**PORTMANNIMOTE**, in old records, the port-mens court, held in any city or town. See **PORT-MEN**.

**PORT-MANTEAU**, a piece of joiners work, fasten'd to the wall, in a wardrobe, armory, &c. proper for the hanging on of cloaks, hats, &c.

**PORT-MANTEAU** is also us'd for a cloak-bag, of cloth, leather, or the like, wherein the cloak and other habiliments of travellers are dispos'd, and laid on the horse's crupper. See **SADDLE**.

**PORT-MANTEAU** is also an officer under the king of France, whereof there are twelve: their business is to keep the king's hat, gloves, cane, sword, &c. to take them from him, and to bring them to him again when wanted.

The Dauphin has also his *port-manteau*. Answerable to these are the cardinals caudataries, or rail-bearers.

The Romish bishops have also their *port-croix*, *port-mitres*, &c. i. e. crozier-bearers, mitre-bearers, &c.

**PORT-MEN**, the twelve burgeses of Ipswich; thus call'd in the stat. 13 Eliz.

Camden adds, that the name was common to the inhabitants of all the cinque-ports. See **QUINQUE portus**.

**PORTMOTE\*** signifies a court kept in port or haven towns; as swani-mote in the forest.—It is sometimes also call'd the *portmote court*. See **PORT**, and **COURT**.

\* The word is formed from the Saxon, *port*, port, and *gemot*, convention, meeting; q. d. *portgemot*.

*Portmotes* are also held in some inland towns, as at Knolst in Cheshire.

**PORT-NAILS**, in a ship, such as are us'd to fasten the hinges to the ports. See **NAIL**.

**PORTRAIT, POURTRAIT, OR POURTRAITURE**, in painting, the representation of a person, and especially a face, done from the life. See **PAINTING**.

In this sense, we say, *portrait-painting*, in opposition to history-painting, where all resemblance of person is disregarded.

*Portraits* are usually painted in oil-colours, sometimes in water; sometimes in miniature, with crayons, pens, pastels, &c. See **LIMNING, MINIATURE, &c.**

It was said of a great painter, who never succeeded in the likeness, (Sir Peter Lely, if we mistake not) that he made a great many fine pictures, but all poor *portraits*.

**PORT-ROPES**, in a ship, those which serve to haul up the ports of the ordnance.

**PORT-ROYAL**, a term that makes a considerable figure in the republic of learning.—Its origin is this:

Philip Augustus, wandering from his company in hunting near Chevreule, westward of Paris, found a little chapel, where he put up, expecting some of his attendants might meet him. This happening accordingly, he gave the place the name of the *king's port*, *Port du roi*, or *Port-royal*; and to give thanks for his deliverance, resolv'd to erect a monastery there.

Odo, bishop of Paris, apprised of his intention, prevented him; and, with the concurrence of Mathilda, wife of Matth. Montmorenci, first lord of Marly, built a nunnery in 1204, filling it with Cistercians, who continu'd under the jurisdiction of the general of that order till the year 1627. when they were remov'd to a house given them in the Fauxbourg St. Jaques at Paris.

In 1647. they quitted the habit of Cistercians, and embraced the institution of the perpetual adoration of the sacrament. The same year the archbishop of Paris allow'd them to remand some of their religious to their former abbey, and to re-establish the same. Some time after, the formulary of Alexander VII. being appointed to be subscrib'd throughout the kingdom, the religious of *Port-royal* in the city sign'd it; those remitted to the former abbey scrupled it extremely, and at last only sign'd it with great restrictions.

Still persisting in the same sentiments, the king finding no way to reduce them but by dispersing them, that was executed in 1709. and the revenues given to the other monastery.

Upon this evacuation, several ecclesiastics, and others, who had the like sentiments with regard to the subscription as the religious, retir'd to *Port-royal*, and had apartments there; and there publish'd several books both on the subject of this dispute, and other topics;—whence all that adher'd to that party, took the name of *Port-royalists*, and their books, *books of Port-royal*.

Hence we say, the *writers of Port-royal*, *Messieurs de Port-royal*, the translations of *Port-royal*, the Greek and Latin methods of *Port-royal*, which are grammars of that language.

**PORT-SALE**, a public sale of goods to the highest bidder. See **AUCTION**.

*Port-sale*, in the stat. an. 35 Hen. 8. cap. 7. denotes the sale of fish presently upon its arrival in the port or haven. See **PORT-MEN**.

**PORT-SOKEN\***, or **PORT-SOKA**, the suburb of a city; or a place within the liberties and jurisdiction thereof.

\* The word is formed from the Saxon, *port*, city; and *soka*, jurisdiction.—*Concessi quod nullus de civitate, vel port-soka sua capius*, &c. Somn. Garvelkind.

**PORTUGUESE coins.** See the article **COINS**.

**PORTUGUESE measure.** See the article **MEASURE**.

**Quinque PORTUS.** See the article **QUINQUE Portus**.

**PORT-VENT**, in an organ, is a wooden pipe, well clos'd, which serves to convey the wind from the bellows to the sound-board of the organ. See **ORGAN**.

**PORUS bilarius, bilary PORE, or hepatic duct**, in anatomy, a duct, which, with the cystic, or choledoc, forms the common canal of the bile. See **BILE**.

Fallopian was mistaken in imagining, that the *porus bilarius* carried the bile into the gall-bladder. Its office is to convey it into the intestines by the ductus communis; for in blowing into it, that intestine is found to swell. See **BILARY**, and **DUCTUS communis**.

**POSE**, in heraldry, denotes a lion, horse, or other beast standing still, with all four feet on the ground; to denote thereby, that it is not in a moving posture.

**POSITION**, in physics, *site*, or *situation*; an affection of place; which expresses the manner of any body's being therein. See **BODY**, **PLACE**, &c. see also **DISPOSITION**, **INTERPOSITION**, **JUXTAPOSITION**, and **TRANSPPOSITION**.

**POSITION**, in architecture, denotes the situation of a building, with regard to the points of the horizon. See **BUILDING**.

Vitruvius directs the *position* of a building to be such, as that the four corners point directly to the four winds.

**POSITION**, in astronomy. The *position* of the sphere is either right, parallel, or oblique; whence arises the inequality of our days, difference of seasons, &c. See **SPHERE**.

**Circles of POSITION**, are six great circles passing through the intersection of the meridian and horizon, and dividing the equator into twelve equal parts. See **CIRCLE**.

The spaces included between these circles, are what the astrologers call the *twelve houses*; and which they refer to the twelve triangles mark'd in their themes. See **THEME**.

These circles are represented on the globe by the semicircle of *position*. See **GLOBE**.

**POSITION**, in dancing, the manner of disposing the feet, with regard to each other.

There are four regular *positions*: the first, when the feet are join'd in a line parallel to the shoulders: the second, when the heels are perpendicularly under the shoulders; and of consequence, the width of the shoulders apart: the third, when one foot is before the other, in such manner, as that the heel is in the cavity form'd by the rotula and carpus of the foot: the fourth, when one foot is the width of the shoulders apart from the other, the heel still answering to the cavity above-mention'd, which is the only regular manner of walking.

**POSITION**, in arithmetic, a rule, so call'd, for *supposition*.—The rule of *false position*, or of *falsehood*, consists in calculating on several false numbers, taken at random, as if they were the true ones; and from the differences found therein, determining the number sought.

*Position* is either *single* or *double*.

**Single POSITION** is, when there happens in the proposition some partition of numbers into parts proportional; in which case, the question may be resolv'd at one operation by this rule.

Imagine a number at pleasure, and work therewith according to the tenour of the question, as if it were the true number: and what proportion there is between the false conclusion and the false *position*, such proportion the given number has to the number sought.

Therefore the number found by argumentation shall be the first term of the rule of three; the number suppos'd, the second term; and the given number, the third. See **GOLDEN rule**.

**Double POSITION** is, when there can be no partition in the numbers to make a proportion.

In this case, therefore, you must make a supposition twice; proceeding therein according to the tenour of the question.

If neither of the suppos'd numbers solve the proposition, observe the errors, and whether they be greater or lesser than the resolution requires; and mark the errors accordingly, with the signs + and —.

Multiply, contrariwise, the one *position* by the other error; and if the errors be both too great, or both too little, subtract the one product from the other, and divide the difference of the products by the difference of the errors.

If the errors be unlike, as the one +, and the other —, add the products, and divide the sum thereof by the sum of the errors added together. For the proportion of the errors is the same with the proportion of the excesses or defects of the numbers suppos'd, to the numbers sought.

**POSITION**, in geometry, is a term sometimes us'd in contradistinction to *magnitude*.—Thus, a line is said to be *given in position*, *positione data*, when its situation, bearing, or direction, with regard to some other line, is given: on the contrary, a line is given in *magnitude*, when its length is given, but not its situation. See **GIVEN**, and **SUB-CONTRARY**.

Sir Isaac Newton shews how to find a point, from which three lines, perpendicularly let fall to three other lines *given in position*, have any given ratio, &c.

**POSITION** is also us'd for a thesis or proposition maintain'd in the schools. See **THESIS**.

**Traiterous POSITION.** See the article **TRAITEROUS**.

**POSITIVE**, a term of relation sometimes oppos'd to *negative*. See **NEGATIVE**, and **AFFIRMATIVE**.  
Thus, we say, the commandments are some of them *positive*, others *negative*. See **DECALOGUE**.

**POSITIVE quantity**, in algebra, a real or affirmative quantity; or a quantity greater than nothing;—thus call'd, in opposition to a privative or negative quantity, which is less than nothing. See **QUANTITY**.  
*Positive quantities* are design'd by the character + prefix'd to them, or suppos'd to be prefix'd. See **CHARACTER**.

**POSITIVE** is also us'd in opposition to *relative*, or *arbitrary*. See **RELATIVE**.  
Thus we say, beauty is no *positive* thing, but depends on the different tastes of the people. See **RELATIVE**.

**POSITIVE** is also us'd in opposition to *natural*. See **NATURAL**.  
Thus we say, a thing is of *positive* right, meaning, it is founded on a law which depends absolutely on the authority of him who made it.  
The prohibition of eating certain beasts, under the old law, was of *positive* right; the command to honour father and mother, of *natural* right. See **RIGHT**.

**POSITIVE degree**, in grammar, is the adjective in its simple signification; without any comparison. See **DEGREE**.  
Or, *positive degree* is that termination of an adjective, which expresses its subject simply and absolutely, without comparing it with any other.  
Thus, good, *bonus*, fair, *pulcher*, &c. are in the *positive degree*; better, fairer, in the comparative. See **COMPARATIVE**.

**POSITIVE theology**, is that which consists in the simple understanding or explication of the dogma's and articles of faith, as contain'd in the holy scriptures, or explain'd by the fathers and councils, clear of all disputes and controversies. See **THEOLOGY**.  
In this sense, *positive* theology stands oppos'd to *scholastic* and *polemical* theology. See **SCHOLASTIC**, and **POLEMICAL**.

**POSITIVE**, in music, denotes the little organ usually behind, or at the foot of the organist, play'd with the same wind, and the same bellows, and consisting of the same number of pipes with the large one, though those much smaller, and in a certain proportion. See **ORGAN**.  
In the organs of the Jesuits, the *positive* is in the grand body.

**POSITIVE levity.** See the article **LEVITY**.

**POSITIVE cold.** See the article **COLD**.

**POSITIVE modes.** See the article **MODE**.

**POSSE comitatus**, **POWER of the county**, a phrase in law, signifying the aid and attendance of all knights, gentlemen, yeomen, labourers, servants, apprentices, villains, and others, above the age of fifteen years, within the county; because all above that age are bound to have harness by the statute of Winchester: only women, ecclesiastical persons, and such as are decrepit and infirm, are excus'd.

It is us'd where a riot is committed, a possession kept upon a forcible entry, or any force of rescue us'd, contrary to the command of the king's writ, or in opposition to the execution of justice. *Stat. 2 Hen. 5.*

**POSSESSION**, **POSSESSIO**, in law, *quasi pedis positio*; an action whereby we hold or occupy any thing, either *de jure*, or *de facto*. See **OCCUPANCY**.

**POSSESSION de facto**, is when there is an actual and effectual enjoyment of the thing. See **DE FACTO**.

**POSSESSION de jure**, or in law, is the title a man has to enjoy a thing, though it be sometimes usurp'd, and in the actual *possession* of another.

**Unity of POSSESSION** makes what the civilians call *consolidation*.  
*E. gr.* If a lord purchase a tenancy, held of himself by heri-  
ot service; the service becomes extinct by *unity of possession*, *i. e.* by the seignory and tenancy's coming into the same hand. See **CONSOLIDATION**, and **UNITY**.  
Long *possession* beyond the memory of man begets a right. See **PRESCRIPTION**.  
By the French laws, a *possession* of three years, in matters personal, begets a right; and in real estates, a *possession* of ten years, among persons living near the premises, and twenty years among those that live elsewhere.

**Annual POSSESSION** is the *usucapio*, which gives a right to moveables; a triennial and peaceable *possession* of a benefice is sufficient to maintain it; provided it be founded on a plausible title. A *possession* of an estate for ten years by a person present, and of twenty years by one absent, with a title, or of thirty years without any, gives a full right. See **PRESCRIPTION**.  
Centenary *possession* constitutes *possession* immemorial; the best and most indisputable of all titles.

**POSSESSION** is sometimes also us'd for the act of taking *possession*, which is perform'd with certain formalities, whereby a person is justified to be in the enjoyment of any thing. See **LIVERY**, and **SEISIN**.  
Anciently, upon buying an estate, *possession* was taken with a deal of ceremony: in some places, by a stick, a branch, or a straw, put into the hands of the buyer by the seller. See **INVESTITURE**.

**POSSESSION of a benefice**, in some customs, is taken by entering the church, kneeling down, kissing the altar, and ringing the bell. See **INDUCTION**, &c.

In some cases, *possession* is taken by the sight of the steeple. The emperors anciently put prelates in *possession*, by giving them a ring and a staff. See **INVESTITURE**.

**POSSESSION** is also us'd for the state of a person *possessed* by the devil. See **DÆMONIAC**.  
*Possession* differs from *obsession*, in that in the former the devil acts inwardly; and in the latter outwardly. See **OBSESSION**.

**POSSESSIVE**, in grammar, is apply'd to pronouns, which denote the enjoyment or possession of any thing, either in particular, or in common. See **PRONOUN**.  
Thus, *mine*, *thine*, *his*, *ours*, &c. are pronouns *possessive*.

**POSSIBILITAS**, **POSSIBILITY**, in our old law-books, is sometimes us'd for a thing done wilfully or wittingly.  
In which sense it stands oppos'd to *impossibilitas*, a thing done against the will. *Si autem oculos asnasset, reddat weram ejus, & impossibilitatis accusetur in eo facto.* Leg. Alfred. Again, *—Si quis agat impossibilitate, non est omnino simile ac si voluntarie faciat.* Leg. Canut. c. 6.

**POSSIBILITY**, **POSSIBILITAS**, denotes a non-repugnance to existing in a thing that does not any way exist. See **POSSIBLE**.  
This non-repugnance to existing is no other than the producibility of any thing; which consists in this, that there are sufficient causes actually existing, or at least possible, whereby the thing may be produced, or be brought to exist; principally as there is a God, or an almighty cause. See **EXISTENCE**.  
So that *possibility* does not imply any thing in the thing possible, but is a mere extrinsic denomination taken from the power of the cause, and principally of God.  
In effect, if a creatable thing had any intrinsic *possibility*, it would follow, that such a thing must exist even without the cause.  
And yet we may allow an intrinsic *possibility* of a thing, if by *possibility* we do not understand its producibility, or its non-repugnance to exist; but only the non-repugnance of the attributes contain'd in its idea. But such *possibility* is merely logical.

**POSSIBLE**, **POSSIBILE**, is sometimes oppos'd to real existence, and understood, in the schools, of a thing, which, though it does not actually exist, yet may exist;—as, a new star, another world, &c. which are particularly said to be *physically possible*.  
It is also oppos'd to *impossible*. See **IMPOSSIBLE**. In which sense it is applicable to any thing that does not contradict itself, or involve contradictory predicates; whether it actually exist or not: as a man, fire, &c.—These are also said to be *logically possible*.  
It is a great point of controversy among the school philosophers, whether and how far things may be said to have any entity, while only in a state of *possibility*? See **POSSIBILITY**.  
*Possibles* are ordinarily conceiv'd to be three-fold; *future*, *potential*, and *merely possible*.

**Future POSSIBLE**, is that whose production is decreed and ascertain'd;—*v. gr.* the futurition of all those events fix'd by the immutable decree, or the immutable will, of the Almighty.

**Potential POSSIBLE**, is that which is contain'd or lies hid in its causes:—as, the tree in the seed, the fruit in the tree, &c.

**Mere POSSIBLE**, is that which might exist, though it never shall. Others distinguish *possibles* into *metaphysical*, *physical*, and *ethical*.

**Metaphysical POSSIBLE**, is that which may at least be brought to being by some supernatural and divine power,—as, the resurrection of the dead.  
In which sense the word is oppos'd to an *impossible* even to God himself; as, a crooked straightness, a square circle, an infinitely perfect creature, a mortal God.

**Physical POSSIBLE**, is that which may be effected by a natural power;—as, to overturn the Turkish empire.  
In opposition to such things as cannot be produced by any finite power; as, to restore the dead, &c.

**Ethical POSSIBLE**, is that which may be done by prudent persons, using all the proper means they have for the same.—Again, it is us'd for any thing done according to right reason, and consistently with the laws.  
In the first sense, it is *possible* for the Venetians to beat the Turks at sea: In the second, whatever is right and just, is *possible*.

**POSSIBILITY of issue extinct.** See **TAIL**.

**POST**\*, in the military art, is any spot of ground capable of lodging soldiers.  
\* The word is formed from the Latin, *positus*, placed; some derive it from *potestas*, power.  
A *post* denotes any ground or place, fortified or not, where a body of men may make a stand, and fortify themselves, or remain in a condition to fight an enemy.  
Hence they say, the *post* was reliev'd, the *post* was quitted, the *post* was taken sword in hand, &c.  
A spot of ground seiz'd by a party to secure the front of an army, and to cover the *posts* that are behind, is call'd an *advance post*.  
The advance guard, or the right of the two lines of an army, &c. is call'd the *post of honour*, and is always given to the eldest regiments.

POSTS, in building, pretty big pieces of timber, placed upright in houses, &c. See **TIMBER**, **HOUSE**, &c.  
The corner posts are call'd the *principal posts*;—the posts fram'd into bressummers between principal posts for strengthening the carcase of the house, are call'd the *prick-posts*.  
An excellent method to preserve posts from rotting, is, to burn the ends that are to be set in the ground, the outside to a very coal.

**Crown Post**. See the article **CROWN post**.

**Post\***, also denotes the dispatch a courier or letter-carrier makes, by changing horses from time to time. See **COURIER**.

\* The name is borrowed hence, that the horses are *posti*, placed, posted, or disposed from distance to distance.

The word is also apply'd to the person himself; the houses where he takes up, and lays down his charge; and the stages, or distances between house and house.—Hence the phrases, *post-boy*, *post-horse*, *post-house*, &c.

We find mention made of *post-horses* in the Theodosian Code, *de cursu publico*; but these were very different from the present establishment, and were only public horses first appointed by Trajan; till whose time, the messengers seiz'd any horses that came in their way.

Lewis Hornigk has an express treatise on *posts*, whereof he makes four kinds; viz. on *horseback*, in *chariots*, in *boats*, and on *foot*: which last kind is in use in Italy, Turkey, and Peru.

Herodotus ascribes the origin of *posts* to Cyrus, or Xerxes; but the *posts* instituted by those princes were no more than couriers. See **COURIER**.

In effect, *posts* on the present footing are but a modern invention; though some go back as high as Charlemaign.—It is certain it was the policy, or rather the diffidence, of Louis XI. of France that they ow'd their rise to; that uneasy prince first settling them by an ordinance of the 19th of June, 1464. to be the sooner, and the more surely, advertis'd of what pass'd in his own kingdom, and in the neighbouring states.

From France, the institution propagated itself, by degrees, through the several other parts of Europe. In Germany, Hornigk observes, *posts* were first settled by the count de Taxis at his own expence; in acknowledgment whereof, the emperor Matthias, in 1616. gave him, in fief, the charge of *post-master* under him and his successors.

In England, *posts* were first establish'd by act of parliament 12 Car. 2. which enabled the king to settle a *post-office*; and appoint a governor.

The English *post-office* is now manag'd by two commissioners, who have under them about forty other officers, of their own appointing, who are all sworn, and give security for their faithful discharge, &c. as the *receiver*, *comptroller*, *accountant*, *six clerks* of the several roads, a *window-man*, and sixteen *sorters*, for the inland office. For the foreign office, are a *comptroller* and *alphabet-keeper*, *six clerks*, and a foreign officer; besides solicitors and clerks, and sixty-seven letter-carriers.

From this office letters and packets are dispatch'd every Monday, to France, Spain, Italy, Germany, Sweden, Kent, and the Downs; every Tuesday to all parts of England, Scotland, and Ireland; also to Holland, Germany, Sweden, &c. every Wednesday to Kent only, and the Downs; every Thursday to all parts of England and Scotland, as also to France, Spain, and Italy; every Friday to Flanders and Holland, Germany, Sweden, Kent, and the Downs; and every Saturday to all parts of England, Scotland, and Ireland.

Again, letters are return'd to London from all parts of England and Scotland, Wales only excepted, every Monday, Wednesday, and Friday: from Wales every Monday and Friday; and from Kent and the Downs every Day.

On this grand office depend 182 *post-masters* in England and Scotland, who keep regular offices in their stages, and *sub-post-masters* in their branches.

Though the number of letters in England was anciently very inconsiderable; yet it is now so increas'd, that this office, before the addition of the *penny-post*, was farm'd at 50000 *l. per annum*. The charge of a letter of a sheet of paper 80 miles, is 3 *d.* of two sheets, 6 *d.* for above 80 miles, a sheet 4 *d.* two, 8 *d.* An ounce of letters for 80 miles, 1 *s.* for above, 1 *s.* 6 *d.*

Note, The *post* travels at the rate of 120 miles in 24 hours. For those who chuse to travel with the *post*, horses are ready, at the rate of 3 *d.* per mile, and 4 *d.* to the boy every stage.

The Great Mogul performs part of his *postage* by pigeons, kept in several places, for the conveyance of letters on extraordinary occasions. They will carry them from one end of that vast empire to another. The same vehicles have been us'd by the Dutch in sieges. And at this day, Tavernier observes, the consul of Alexandretta sends news daily to Aleppo, in five hours time, by means of pigeons; though those two places are three days journey on horseback apart.

**Penny Post**, a *post* establish'd for the benefit of London, and the parts adjacent; whereby any letter or parcel, not exceeding sixteen ounces weight, or ten pounds value, is speedily and safely convey'd to and from all parts within the bills of mortality, to most towns and villages within ten miles of London, for one penny each packet, letter, &c.

This office is manag'd by a comptroller; under whom are an accountant, collector, six sorters, seven sub-sorters, and above an hundred messengers.

POSTS, in sculpture, &c. denote ornaments form'd after the manner of rolls, or wreathings; thus call'd, because they seem to run after one another. See **FRETT**.

Some are simple; others enrich'd, or flourish'd.

**Post**, *after*, is also a Latin preposition, us'd in composition with several English words, and generally implying a relation of *posteriority*. See **POSTERIOR**.

**Post-Book**. See the article **BOOK**.

**Post-Communion**, a prayer which the priest recites after the communion. See **COMMUNION**.

**Post-Date**. See the article **DATE**.

**Post Diem**, a fee, by way of penalty, on a sheriff, for his neglect in returning a writ after the day assign'd. See **RETURN**.

For this the custos brevium has four-pence; whereas he has nothing, if it be return'd at the day. See **WRIT**.

**Post-Disseisin**, a writ given by the statute of Westminster, for him who having recover'd lands or tenements, by præcipe quod reddat, upon default or redition, is again dispossess'd by the former disseisor. See **DISSEISIN**.

**POSTEA**, in law, a return or certificate of the proceedings by nisi prius into the court of Common-pleas, after a verdict; and there afterwards recorded. See **NI SI PRIUS**.

**POSTERIOR**, a term of relation, implying something behind, or that comes after another.—In which sense it is us'd in opposition to *prior* and *anterior*. See **ANTERIOR**, &c.

The back and hips are the *posterior* parts of man. Aristotle has given *prior* and *posterior* analytics. A date is *posterior* to another, when it is later or fresher. See **DATE**.

**Ramus POSTERIOR**. See the article **RAMUS**.

**POSTERIORITY**, in law, a term of comparison, and relation in tenure, opposite to *priority*. See **PRIORITY**.

A man holding lands or tenements of two lords, holds of his ancestor lord by *priority*, and of his later lord by *posteriority*.

**POSTERN**, in fortification, a small gate, usually made in the angle of the flank of a bastion, or in that of the curtain, or near the orillon, descending into the ditch; whereby the garison can march in and out, unperceiv'd by the enemy, either to relieve the works, or to make private sallies, &c. See **GATE**.

The word is also us'd in the general for any private, or back-door.—*Potestas habere posternam in omni curia penitus inhibetur, sed unicus sit ingressus*, &c. Fleta.

**POST-FINE**, a duty belonging to the king for a fine formerly acknowledged before him, in his court; paid by the cognizee after the fine is fully pass'd, and all things touching the same accomplish'd.

The rate is so much, and half so much, as was paid to the king for the *pre-fine*; and is collected by the sheriff of the county where the land lies, and to be answer'd by him into the Exchequer. See **FINE**.

**POSTHUMUS\***, or **POSTHUMOUS**, a child born after the death of his father, or even of his mother.

\* The word is composed of the Latin, *post*, and *humus*, ground.

Among the Romans, *posthumus* was also us'd for a child born after the making of a testament, which occasion'd the testator to alter it.

**POSTHUMOUS** is also apply'd figuratively to the works of an author that were not publish'd till after his death, or interment.

**POSTICUS** *peroneus*, *ferratus* **POSTICUS**, *tibialis* **POSTICUS**. See the articles **PERONEUS**, **SERRATUS**, **TIBIALIS**.

**POSTIL**, **POSTILLA**, a name anciently given to a note, or remark, written in the margin of the bible; afterwards also to a note written in any other book posterior to the text.

Trivet in his chronicle, speaking of St. Langton, archbishop of Canterbury, says, *Super bibliam postillas fecit, & eam per capitula, quibus nunc utuntur moderni, distinxit*: That Alexander, bishop of Chester, *super psalterium postillas scripsit*.—Knighton, another of our historians, speaking of one Hugo, a Dominican and cardinal, says, *Totam bibliam postillavit*.

**POSTING**, among merchants, the putting an account forward from one book to another; particularly, from the journal or waste-book into the ledger. See **BOOK-KEEPING**.

**POSTIQUE\***, in architecture, &c. An ornament of sculpture is said to be *postique*, when it is superadded after the work itself is done.

\* The word is formed from the Italian, *posticio*, added.

A table of marble, or other matter, is also said to be *postique*, when it is incrustated in a decoration of architecture, &c.

**POSTLIMINIUM**, **POSTLIMINY**, among the Romans, the return of one who had gone to sojourn elsewhere, or had been banish'd, or been taken by the enemy, to his own country and state.

It was thus call'd, according to Aul. Gellius, from *post*, *after*; and *limen*, threshold, *q. d.* a return to the same bounds, or threshold:—though others, after Amm. Marcellinus, will have it so denominated, because persons were restor'd into the house through a hole in the wall, *post limen*, not by going over the threshold, which was esteem'd ominous.

**POSTLIMINIUM** was also a law, or action, whereby one recover'd an inheritance, or other matter, that had been lost, from a stranger or enemy.

**POST-NATI**, in our statutes, is particularly us'd for such persons as were born in Scotland, after the accession of king James I. to the crown of England.

7 Jac. 1. it was by all the judges solemnly adjudg'd, that such persons were no aliens in England; as, on the contrary, the *ante-nati*, or those born in Scotland before that accession, were aliens here in respect to the time of their birth. See ALIEN.

POST-NATUS is also us'd by Bracton, Fleta, Glanville, &c. for the second son, as distinguish'd from the eldest.

Thus in Brompton, lib. 2. *Est consuetudo in quibusdam partibus, quod post-natus praeferatur primogenito*. See PRIMOGENITURE, and BURGH ENGLISH.

POSTPONING, the putting any thing after, or behind another, with regard either to the order of time or place.

Sometimes it is taken in an ill part; as when we say, the book-binder has *postponed* a sheet, &c. of a book.

POSTSCENIUM, in the ancient theatre. See PARASCENIUM.

POSTSCRIPT, an after-thought, or article added to a letter or memoir; containing something learnt or recollected after the subscription or conclusion of the piece.

It is usually mark'd thus, P. S. The *Spectator* observes, that a woman's mind is ever better learnt from her P. S. than her letter.

POST-PREDICAMENTS, in logic, are certain general affections, or properties, arising from a comparison of predicaments with each other; or modes following the predicaments, and often belonging to many. See PREDICAMENT.

Such, according to Aristotle, are *oppositum*, *prius*, *simul*, *motus*, and *habere*; the three first of which are in all *predicaments*.

POST-TERM, or POST-TERMINUM, a fee, or penalty, taken by the custos brevium of the court of Common-pleas, for the return of a writ, not only after the day, but after the term or time in which such writs are returnable.—For which the custos brevium has twenty-pence. See WRIT.

POSTULATE, POSTULATUM, in mathematics, a clear, evident proposition; wherein it is affirmed, or denied, that some thing may, or may not be done. See PROPOSITION.

A thing immediately deduced from the consideration of one single definition, if it expresses something to agree or disagree to another, is call'd an *axiom*.—If it affirm, that something may or may not be done, it is call'd a *postulate*.

Thus, *e. gr.* from the genesis of a circle, it is evident, that all right lines drawn from the centre to the circumference, are equal; since they only represent one and the same line, in a different situation: this proposition, therefore, is esteem'd an axiom. See AXIOM.

But, since it is evident from the same definition, that a circle may be describ'd with any interval, and from any point; this is accounted a *postulate*.

Axioms and *postulates*, therefore, seem to have nearly the same relation to each other that theorems and problems have. See THEOREM, &c.

POSTULATION, POSTULATIO, in the canon law, the nomination of a person to a dignity in the church, to which, by the canons, he cannot be elected; as, for want of age, of birth, because already possess'd of a benefice incompatible therewith, or the like impediment.

Thus the formal election of such a person being faulty, they are oblig'd to proceed by way of *postulation*; that is, the chapter beseeches the person to whom the confirmation of the election belongs, to approve of it, though it be not canonical. See ELECTION.

The person to whom the supplication is made by the Protestants in Germany, is the emperor; by the Papists, the pope.

Wicquefort observes, that when a part of the chapter elects, and another *postulates*, the number of *postulants* must be twice as great as that of the electors, to bring the matter to a *postulation*.

POSTURE, in painting and sculpture, the situation of a figure with regard to the eye, and of the several principal members thereof with regard to one another, whereby its action is express'd. See ATTITUDE.

A good part of the painter's art consists in adjusting the *postures*; in giving the most agreeable *postures* to his figures; in accommodating them to the characters of the respective figures, and the part each has in the action, and in conducting and pursuing them throughout.

*Postures* are either *natural*, or *artificial*.

Natural POSTURES are such as nature seems to have had a view to in the mechanism of the body; or rather, such as the ordinary actions and occasions of life lead us to exhibit while young, and the joints, muscles, ligaments, &c. flexible.

Artificial POSTURES are those which some extraordinary views or occasions lead us to exhibit.—Such, *e. gr.* are those of our *balance* and *posture-masters*.

A painter would be strangely puzzled with the figure of Clark, (the late famous *posture-master* of Pall-mall) in a history-piece. This man, we are told in the *Philos. Transact.* had such an absolute command of his muscles, &c. that he could disjoint almost his whole body; so that he impos'd on that great surgeon, Mullens, who look'd on him in such a miserable condition, he would not undertake his cure. Though a well-made man, he would appear with all the deformities imaginable; hunch-backed, pot-bellied, sharp-breasted, &c. He disjointed his arms, shoulders, legs, and thighs; and render'd himself such an object of pity, that he has frequently extorted money, in

quality of a cripple, from the same company he had the minute before been in, in quality of a comrade. He would make his hips stand a considerable way out from his loins; and so high as to invade the place of his back. Yet his face was the most changeable part about him, and shew'd more *postures* than all the rest. Of himself he could exhibit all the uncouth odd faces of a Quaker's meeting.

Hotch POT. See the article HOTCH pot.

White POT. See the article WHITE.

POTABLE, POTABILIS, something that may be taken, or swallow'd, by way of drink. See DRINK.

The chymists talk much of *potable* gold, *aurum potabile*. See AURUM, and GOLD.

POT-ASHES are properly the lixivious ashes of certain vegetables, us'd in the making of glass and soap. See ASHES, and LIXIVIOUS. Such are the ashes of the herb kali, call'd also salt-wort, glass-weed, &c. from its great use in glass-making. See GLASS.

*Pot-ashes* are also call'd *tineres clavellati*, and make the basis of salt of tartar, and most of the lixivial salts, as our chymists of late manage them for cheapness. See KALI, &c.

The English and Dutch make a considerable commerce of *pot-ashes*, which they bring from about the Black sea; using great quantities thereof in the preparation of their cloths, &c. those ashes being found excellent to scour withal. See FULLING, and DYEING.

POT-ASHES is also a denomination popularly applied to all kinds of wood-ashes bought up and down the country, and mix'd together, for the making of green glass.—The best of English *pot-ashes* are those made of the smaller common high-way thistle; though all thistles are good. Fern also makes excellent *pot-ashes*.

POTENT, or POTENCE, in heraldry, a term for a kind of a cross, whose ends all terminate like the head of a crutch. See CROSS, and COUNTERPOTENT.

This is otherwise call'd the *Jerusalem cross*; and is represented in *Tab. Herald. fig. 47*.

He beareth fable, a cross *potent*, or, by the name of *Aleyn*.

POTENTIA, POWER, that whereby a thing is capable either of acting, or being acted upon. See POWER.

Hence it is of two kinds, *active* and *passive*.

POTENTIA *activa*, or *active* POWER, call'd also by a barbarous, but significant school-term, *operativitas*, is the efficacy or faculty of any being, in virtue whereof something arises, or is produced by it.—Such is the power of speaking in man.

POTENTIA *passiva*, *vel receptiva*, *passive*, or *receptive* POWER, is a capacity of receiving some act; *e. gr.* of knowing a man.

This is also call'd *subjectiva potentia*, subjective power.

To exist in POTENTIA, is us'd among school-writers, to denote that existence which a thing has in a cause capable of producing it, but which has not actually produc'd it.—In which it stands oppos'd to existence *in actu*. See POSSIBILITY, EXISTENCE, and ACT.

POTENTIAL, POTENTIALIS, in the schools, is us'd to denote and distinguish a kind of qualities, which are suppos'd to exist in the body *in potentia* only; by which they are capable, in some manner, of affecting and impressing on us the ideas of such qualities, though not actually inherent in themselves. See QUALITY, POTENTIA, and POSSIBLE.

In this sense we say, *potential heat*, *potential cold*, &c. Brandy and pepper, though cold to the touch, are *potentially* hot.

POTENTIAL *cold* is a relative term, by which we mean, that such a thing is not actually cold to the touch, but in its effects and operations, if taken inwardly. See COLD.

This quality is suppos'd to arise from the size, shape, &c. of the component particles of a body, which give some check or retardation to the blood's motion, whereby it is less agitated, and upon which the sensible parts of the body are not so briskly struck by it; the perception of which diminution or change of motion in the organs of feeling, is call'd *cold*.

Hence every thing that lessens the blood's motion, with relation to the sensation before made, is *cold*;—and every thing which increases it, may be call'd *potentially hot*. See HEAT.

POTENTIAL, in medicine, &c.—Cauteries are either actual, *viz.* a button of red-hot iron; or *potential*, as lime, and other caustic drugs. See CAUTERY.

POTENTIAL calcination. See the article CALCINATION.

POTENTIAL fire. See the article FIRE.

POTENTIAL is also us'd by schoolmen, for something that has the quality of a genus. See GENUS.

A *potential* whole is that which has its parts under it, as a genus has its species; to distinguish it from an *actual* whole, which has its parts in itself; as a body compos'd of matter and form.

Grotius, with a view hereto, uses the phrase, *potential parts of a state*, in opposition to the *subjective parts*. See PART.

By *potential*, he means those parts possess'd of the sovereign power; by *subjective*, those subject thereto; which are that, with regard to the sovereign power, that several species are with regard to the genus whereof they are the subjective parts.

Grotius maintains, that though the sovereign power be one and indivisible, yet it may have several *potential* parts: for, as in the Roman empire there have been two *potential* heads, the one ruling in the east, the other in the west; yet the imperial authority, all the while, single and indivisible: so is it possible, the subjective parts combining to give away their sovereignty, may not give it intire, but reserve a part of it for certain emergencies.

gencies. In which case the subjective part becomes *potential*: and thus there are two *potential* parts, yet the sovereignty single.

POTENTIAL, in grammar, gives the denomination to one of the moods of verbs. See MOOD.

The *potential* mood is the same in form with the subjunctive; but differs from it in this, that it hath always implied in it, either *possum*, *volo*, or *debeo*: as, *roget*, that is, *rogare potest*, the man may ask. See SUBJUNCTIVE.

It is sometimes call'd the *permissive* mood, because it often implies a permission or concession to do a thing: as, *Habeat, valeat, vivat, cum illa*. Terent.

POTERII *antihæcticum*. See the article ANTIHÆCTICUM.

POTION, POTIO, a liquid medicine, in the quantity of a draught, to be taken at one time.

A *potio* only differs from a *julap*, or a *mixture*, in the quantity; as being confin'd to one dose.

There are purging *potions*, emetic *potions*, diaphoretic, pectoral, cephalic, cardiac, stomachic, hyfteric, vulnerary, carminative, &c. *potions*.

POTTERY, the art of making earthen pots and vessels; or, the manufacture of earthen ware. See EARTH, and CLAY.

The wheel and lathe are the chief, almost the only instruments us'd in *pottery*; the first for large works, the second for small: though, in reality, they are much the same as to the manner of using them.

The potter's *wheel* consists principally in its nut, which is a beam or axis, whose foot or pivot plays perpendicularly on a free-stone soal or bottom. From the four corners a-top of this beam, which does not exceed two feet in height, arise four iron bars, call'd the *spokes* of the wheel; which forming diagonal lines with the beam, descend, and are fasten'd at bottom to the edges of a strong wooden circle, four feet in diameter, perfectly like the fellows of a coach-wheel; except that it has neither axis nor radii; and is only join'd to the beam, which serves it as an axis, by the iron bars. The top of the nut is flat, of a circular figure, and a foot in diameter. On this is laid a piece of the clay or earth, to be turn'd and fashion'd.

The wheel thus dispos'd, is encompass'd with four sides of four different pieces of wood, sustain'd on a wooden frame: the hind-piece, which is that whereon the workman sits, is made a little inclining towards the wheel: on the fore-piece are placed the pieces of prepar'd earth: lastly, the side-pieces serve the workman to rest his feet against; and are made inclining, to give him more or less room, according to the size of the vessel to be turn'd. By his side is a trough of water, wherewith from time to time he wets his hands, to prevent the earth's sticking to them.

To use the wheel.—The potter having prepar'd his clay or earth, and laid a piece of it suitable to the work he intends, on the top of the beam, sits down; his thighs and legs much expanded, and his feet rested on the side-pieces, as is most convenient.

In this situation he turns the wheel round, till it has got the proper velocity; when, wetting his hands in the water, he bores the cavity of the vessel, continuing to widen it from the middle; and thus turns it into form, turning the wheel afresh, and wetting his hands from time to time.

When the vessel is too thick, they use a flat piece of iron with a hole in the middle, and somewhat sharp on one edge, to pare off what is redundant. Lastly, when the vessel is finish'd, they take it off from the circular head by a wire pass'd underneath the vessel.

The potter's *lathe* is also a kind of wheel, but simpler and slighter than the former. Its three chief members are an iron beam or axis, three feet and an half high, and two inches in diameter; a little wooden wheel all of a piece, an inch thick, and seven or eight in diameter, placed horizontally a-top of the beam, and serving to form the vessel on; and another larger wooden wheel, all of a piece, three inches thick, and two or three feet broad, fasten'd to the same beam at bottom, parallel to the horizon. The beam or axis turns by a pivot at bottom, in an iron stand.

The workman gives the motion to the lathe with his feet, by pushing the great wheel alternately with each foot; still giving it a greater or lesser degree of motion, as his work requires.

They work with the lathe, with the same instruments, and after the same manner, as with the wheel.

But neither the one nor the other serve for any more than forming the body of the vessel, &c. The feet, handles, and ornaments, if there be any, beside the mouldings, being to be made and set on by hand; if there be any sculpture in the work, it is usually done in earthen or wooden moulds, prepar'd by a sculptor, unless the potter have skill enough to do it himself, which is very rare.

As to the glazing, or varnishing of the work, it is usually done with sand, litharge or lead-ashes, wood-ashes and salt, melted into a cake. See LEAD.

For the Chinese POTTERY, see the article PORCELAIN.

POTTLE, an English measure, containing two quarts. See MEASURE.

Two of these *pottles*, in the liquids, make a gallon; but in dry measure three go to a gallon. See GALLON.

POUDER. See the article POWDER.

Pie POUDER court. See the article PIE powder court.

POULTICE, or POULTIS, a form of medicine, call'd also *cataplasma*. See CATAPLASMA.

POULTRY. See the article FOWL.

POUNCE\*, among artificers, a little heap of charcoal-dust, inclos'd in some open stuff; to be pass'd over holes prick'd in a work, in order to mark the lines or designs thereof on a paper placed underneath; to be afterwards finish'd with a pencil, a needle, or the like.

\* The word is formed from the French, *ponce*, pumice-stone; in regard they anciently used pumice-stone powdered for this purpose. See PUMICE.

*Pounce* is much us'd by embroiderers, to transfer their patterns upon their stuffs; by lace-makers, and sometimes also by engravers, and writing-masters.

POUNCES, in falconry, the talons or claws of a bird of prey.

POUND\*, LIBRA, a weight of a certain proportion, much us'd as a standard for determining the gravities and quantities of bodies. See WEIGHT.

\* The word is derived from the Saxon, *pund*, or *pond*, *pondus*, weight.

We have two different *pounds* in England; the *pound troy*, and the *pound avoirdupoise*.

The *Pound troy* consists of 12 ounces, each ounce of 20 penny-weights, and each penny-weight of 24 grains; so that 480 grains make an ounce, and 5760 grains a *pound*. See OUNCE, &c.

This *pound* is us'd in the weighing of silver, gold, precious stones, all kinds of grains, &c.

It is also us'd by the apothecaries, though differently divided: among them 24 grains make a scruple, 3 scruples a drachm, 8 drachms an ounce, and 12 ounces a *pound*. See SCRUPLE, &c.

The *Pound avoirdupoise* consists of 16 ounces; but then the *avoirdupoise* ounce is less by 42 grains than the *troy* ounce, which amounts to nearly a 12th part of the whole; so that the ounce *avoirdupoise* only contains 438 grains, and the *troy* ounce 480.

The difference whereof is nearly as that of 73 to 80; i. e. 73 ounces *troy* make 80 ounces *avoirdupoise*. 112 *avoirdupoise* pounds make the hundred weight, or quintal. See QUINTAL.

By this *pound* are weighed all large and coarse commodities, flesh, butter, cheese, iron, hemp, lead, steel, &c.

An *avoirdupoise pound* is equal to 14 ounces  $\frac{1}{2}$  of a Paris *pound*; so that 100 of the former *pounds* make 91 of the latter.

The French *Pound* contains 16 ounces; but one French *pound* is equal to one *pound* one ounce  $\frac{1}{2}$  of an *avoirdupoise pound*; so that 100 Paris *pounds* make 109 English *avoirdupoise pounds*.

The Paris *pound* is divided in two manners; the first division is into two *marcs*, the *marc* into eight ounces, the ounce into eight gros, the gros into three deniers, the denier into twenty-four grains, each weighing a grain of wheat.

The second division of the *pound* is into two *half-pounds*; the *half-pound* into quarters; the quarter into two demi-quarters; the demi-quarter into two ounces; the ounce into two half ounces, &c.

The first division is usually follow'd in weighing gold, silver, and other precious wares; and the latter in those of less value.

At Lyons the *pound* is 14 ounces.—One hundred Paris *pounds* make 116 Lyons *pounds*.—At Venice, the *pound* is equal to eight ounces three quarters of the French *pound*, &c.

For the several pounds of the several cities and countries, their proportion, reduction, division, &c. see WEIGHT.

POUND also denotes an imaginary money us'd in accounting; containing more or less, according to the several names added to it, and the several countries it is us'd in. See MONEY.

Thus in England we say a *pound sterling*; in France, a *pound*, or *livre tournois* and *Paris*; in Holland and Flanders, a *pound*, or *livre de gros*, &c.

The term took its rise hence, that the ancient *pound sterling*, though it only contain'd 240 pence, as ours does, yet each penny being equal to five of ours, the *pound* of silver weigh'd a *pound troy*. See PENNY.

The *pound sterling*, or English *pound*, contains twenty shillings, the shilling twelve pence, and the penny four farthings. See SHILLING, PENNY, &c. see also COIN.

Anciently there were three ways of paying a *pound* of money into the exchequer: 1. The payment of a *pound de numero*, which was just twenty shillings in tale. 2. *Ad scalam*, which was 6d. over and above the 20s. 3. *Ad pensam*, which was giving the full weight of twelve ounces.

The French *Pound*, or *livre tournois*, contains twenty sols or shillings, and the sol 12 deniers or pence *tournois*; which was the value of an ancient French coin call'd *franc*, a term still synonymous with *livre*. See FRANC.

The *pound*, or *livre tournois*, contains, in like manner, 20 sols or shillings, and the sol 12 deniers or pence *Paris*. Each sol *Paris* is equal to 15 deniers *tournois*; so that a *pound Paris* is equal to 25 sols *tournois*. See LIVRE, and PAR.

The *Pound*, or *livre de gros*, of Holland, is divided into 20 shillings *gros*, and the shilling into 12 pence *gros*. It is equal to six florins; the florin valued at 24 sols *tournois*; supposing the exchange on the footing of 100 pence *gros* for a French crown of 3 livres *tournois*; so that the *pound gros* amounts to 10 shillings and 11 pence farthing *sterling*.—The *pound gros* of Flan-

dars

ders and Brabant is divided like that of Holland; and like that too, is equal to six florins: but the florin is equal to 25 sols tournois; so that the Flanders pound is equal to 7 livres, 10 sols tournois, or 11 s. 3 d. sterling.

Merchants, factors, bankers, &c. use characters, or initial letters, to express the several kinds of pounds of account, as *L.* or *L. St.* pounds sterling. *L. G.* pounds gros; and *L.* or *fl.* pounds tournois.

**POUND nails.** See the article NAILS.

**POUND, PARCUS,** is also an inclosure, or strong place, where cattle distrained, or caught in any trespass, are put, till they are replevied or redeemed. See TRESPASS, REPLEVY, &c.

The pound is either *overt*, or *covert* and *close*.

**POUND overt**, is an open pound, built upon the lord's waste: and thence also call'd, the *lord's pound*; because he provides it for the use of himself, and his tenants.

**Pound overt** also includes back-fides, court-yards, pasture-grounds, or any place whatever, to which the owner of beasts impounded may come to give them meat and drink, without offence or trespass. See PARCO.

**POUND covert or close**, on the contrary, is such a one as the owner cannot come to for the said purpose without trespass or offence; as some close house, castle, fortress, &c.

**POUNDAGE**, a subsidy granted to the king upon all manner of merchandize imported or exported, by all merchants, natives, denizens, and aliens. See DUTY, and CUSTOMS.

It is called *poundage*, because fix'd at the rate of so much per pound, viz. one shilling in every pound, or twenty shillings; and for English commodities exported by aliens, one shilling more.

It was first granted to Edward VI. for term of his life; and afterwards to K. Charles II. *anno 12 Car. 2.* See TUNNAGE.

**POUP**, or POOP, PUPPIS, in navigation, the hind-part of a vessel, or that where the helm is fix'd, call'd also *stern*. See STERN, ABAFT, and SHIP.

The French frequently call it *queue*, tail; because the rudder here applied serves the same purposes in a ship, as the tail does to fishes. See RUDDER, and HELM.

It is divided into three or four stories, which, all together, form the *poup-castle*, or hind-castle; the outside whereof is richly adorn'd with balconies, galleries, pilasters, trophies, the arms of the prince, &c.

To have the *wind in poup*, is to have it behind, or favourable. See WIND.

**POOP** is more particularly us'd among us for the floor, or deck over the round-house, or master's cabin; being the highest part of a ship's hull a-stern.—See *Tab. Ship, fig. 2. lit. P.*

**POURALLEE.** See the article PURLUE.

**POUR-PARTIE**, or POUR-PARTY, in law, a term us'd in opposition to *pro indiviso*, denoting the share or part of an estate first held in common by parceners; which is by partition allotted to any of them. See COPARCENER, and PARTITION.

To make *pour-partie*, is to divide and sever the lands that fall to parceners; which, before partition, they held jointly and *pro indiviso*. See PRO INDIVISO.

**POURPLE.** See the article PURPURE.

**POUR-PRESTURE**, or PURPRESTURE, POURPRESTURA, in law, is defin'd by Glanville to be, when any thing is unjustly occupied, that properly belong'd to the king; as in encroaching on his grounds, obstructing the high-ways, diverting public rivers from their proper course, or building any thing over the high-streets of a city; and in the general, where any thing is done to the prejudice of the king's tenements, highways, or cities. See ENCROACHMENT.

Crompton in his *Jurisd.* says, *pour-presture* is properly when a man takes to himself, or encroaches any thing which he ought not; whether it be in jurisdiction, in land, or in franchise; and, generally, where any thing is done to the nuisance of the king's tenants.

Some authors divide *pour-presture* into three kinds: the first against the king, the second against the lord, the third against a neighbour.

**Pour-presture against the king**, *lib. nig. in scacc. fol. 38.* is that happening through the negligence of the sheriff, or the long continuance of wars, &c. when those that have lands near the crown-lands, inclose part of them, or lay them to their own.

**Pour-presture against the lord**, is when the tenant neglects to perform what he is bound to do for the chief lord, or deprives him of his right.

**Pour-presture against a neighbour**, is a nuisance against a neighbour, &c. mention'd in the *Monast. tom. 1.* See NUISANCE.

**POURSUIVANT\***, or PURSUIVANT, a messenger, anciently attending the king, in his wars, or at council-table, or in the exchequer; to be dispatch'd upon any occasion or message: as, for the apprehension of a person suspected, or accus'd, &c.

\* The word is formed from the French *poursuivre*, to pursue. Many of the nobility too had their *poursuivants*: a knight banneret was allow'd a *poursuivant*, with the consent of a herald. Upton, *de re militari*, calls the *poursuivants*, *milites linguæ*; because, says he, their chief honour was in *custodia linguæ*. He divides them into foot and horse *poursuivants*, *cursores equitantes* & *prosecutores*.

There were also *poursuivants* particularly employ'd in martial causes, call'd

**POURSUIVANTS at arms**, a term anciently applied to gentlemen who attended the heralds, and aspired to their office; to which they could not rise, till after seven years apprenticeship pass'd in this quality. See HERALD.

They were intirely dependent on the heralds, and assist'd at their chapter; officiating for them in preparing and assigning tournaments, and all other parts of their ministry.

They were baptiz'd at solemn feasts with some gallant name; as Jolicœur, Verluifant, Sansmentir, &c.

Their coats of arms were different from those of the heralds, and they bore plain staffs without ornament.

Of the great number of *poursuivants* anciently on foot, there are now only four remaining; viz. *blue-mantle*, *rouge-crois*, *rouge-dragon*, and *portcullice*; who are the lowest order of officers belonging to the college of arms.

Their business is to attend with the heralds in marshalling and ordering public solemnities, funerals, interviews, cavalcades, &c. See COLLEGE of arms.

Stow, speaking of Richard the third's end, has these words: "His body was naked to the skin; not so much as one clout about him; and was truss'd behind a *poursuivant* at arms, like a hog, or a calf."

**POURTRAIT**, or POURTRAITURE. See the article PORTRAIT.

**POURVEYANCE**, or PURVEYANCE, the providing of corn, victuals, fuel, and other necessaries for the king's house. See POURVEYOR.

By a stat. 12 Car. 2. no person, under colour of *pourveyance*, shall take any timber, cattle, corn, or other matter, from any subject, without his free consent.

**POURVEYOR**, or PURVEYOR, an officer of the household, who provides and buys in corn, and other victuals, &c. for the king's house; mention'd in *magna charta*, and several statutes. *Purveyor* became a term so odious in times past, that by stat. 36 Edw. 3. the heinous name *purveyor* was chang'd into that of *achator*, or *buyer*.—The office itself was much restrain'd by the stat. 12 Car. 2. See POURVEYANCE, and ACHAT.

**POWDER**, or POUDEUR, in pharmacy, a dry medicine pulveriz'd, or prepar'd, by being broken and reduced into almost imperceptible atoms, either in a mortar, or by chymical operations, &c. See PULVERIZATION.

We say, a *styptic powder*, a *sympathetic powder*, &c. See STYPTIC, SYMPATHETIC, &c.—*Viper powder*, *pulvis viperinus*, has of late days come much in request, under the denomination of animal bezoard. See VIPER, and BEZOARD.

**POWDER for the hair**, is flour of wheat, or beans, well sifted and prepar'd, to give it an agreeable odour.

That wherein starch grounds is mix'd, is the worst. See STARCH.

**Jesuits POWDER**, *pulvis patrum*. See the article CORTEX Peruvianus.

**GUN POWDER.** See the article GUN powder.

**POWDER CHESTS**, in the sea-language, are boards join'd in form of a triangle, and fill'd with gun-powder, pebbles, &c. which they set fire to, when the ship is boarded by an enemy, and soon make all clear before them.

**Cornachine POWDER.** See the article CORNACHINE.

**Emetic POWDER.** See the article EMETIC.

**Flux POWDERS.** See the article FLUX.

**POWDER of projection.** See the article PROJECTION.

**POWDERINGS**, in building, a term sometimes us'd for devices serving to fill up vacant spaces, in carv'd works: as also in escutcheons, writings, &c.

**POWDERINGS**, in heraldry. See the article FUR.

**POWER**, POTENTIA, in physics, a natural faculty of doing or suffering any thing. See POTENTIA.

Mr. Locke explains the origin of our idea of *power* to the following effect: The mind being daily inform'd by the senses, of the alterations of the simple ideas of things without, and reflecting on what passes within itself, and observing a constant change of its ideas, sometimes by the impressions of outward objects upon the senses, and sometimes by the determinations of its own choice; and concluding from what it has so constantly observ'd to have been, that the like changes will for the future be made in the same things, by the same agents, and by the like ways; considers, in one thing, the possibility of having any of its simple ideas chang'd; and in another, the possibility of making that change: and so comes by that idea which we call *power*.

Thus we say, fire has a *power* to melt gold, and make it fluid; and gold a *power* to be melted.

*Power*, thus consider'd, is twofold, viz. as able to *make*, or able to *receive* any change: the one may be call'd *active*, the other *passive power*. See ACTIVE, and PASSIVE.

Of *passive power*, all sensible things abundantly furnish us with ideas; nor have we of *active power* fewer instances: since whatever change is observ'd, the mind must suppose a *power* somewhere able to make that change. See CAUSE.

Yet, if we attentively consider it, bodies, by our senses, do not afford us so clear and distinct an idea of *active power*, as we have from reflection on the operations of our minds: for all *power* relating to action, and there being but two sorts of action,

action, viz. thinking and motion, it may be considered whence we have the clearest ideas of the *powers* which produce those actions.

Of thinking, body affords us no ideas at all; it is only from reflection that we have that: neither have we from body any idea of the beginning of motion. A body, at rest, affords us no idea of any active *power* to move; and when it is set in motion itself, that motion is rather a passion, than an action in it. The idea of the beginning of motion, we have only by reflection on what passes in ourselves; where we find by experience, that barely by willing it, we can move the parts of our bodies, which before were at rest.

We find in ourselves a *power* to begin or forbear, continue or end, several actions of our minds, and motions of our bodies, barely by a thought or preference of the mind. This *power*, which the mind has, thus to order the consideration of any idea, or the forbearing to consider it, or to prefer the motion of any part of the body to its rest, and *vice versa*, in any particular instance, is what we call the *will*.—And the actual exercise of that *power*, is that which we call *volition*, or willing. See WILL.

The forbearance or performance of that action, consequent to such order or command of the mind, is called *voluntary*: and whatsoever action is performed without such a thought of the mind, is called *involuntary*. See VOLUNTARY.

The *power* of perception is what we call the *understanding*. See UNDERSTANDING.

Perception, which we make the act of the understanding, is of three sorts: the perception of ideas in our minds; the perception of the signification of signs; and the perception of the agreement or disagreement of any distinct ideas. See PERCEPTION.

These *powers of the mind*, viz. of perceiving, and preferring, are usually called by another name; and the ordinary way of speaking is, that the *understanding* and *will* are two faculties or *powers* of the mind. A word proper enough, if used so as not to breed any confusion in mens thoughts, by being supposed (as there is room to suspect it has been) for some real beings in the soul, that perform those actions of understanding and volition. See FACULTY.

From the consideration of the extent of the *power* of the mind over the actions of the man, which every one finds in himself, arise the ideas of liberty and necessity.

So far as a man has a *power* to think, or not to think; to move or not to move, according to the preference or direction of his own mind; so far is a man free. See LIBERTY.

Where-ever any performance or forbearance are not equally in a man's *power*; where-ever doing or not doing will not equally follow upon the preference of his mind; there he is not free, though perhaps the action may be voluntary. See NECESSITY.

So that the idea of liberty is the idea of a *power* in any agent, to do or forbear any action, according to the determination or thought of the mind, whereby either of them is preferred to the other: where either of them is not in the *power* of the agent to be produced by him according to his volition, there he is not at liberty; that agent is under necessity. So that liberty cannot be where there is no thought, no volition, no will: but there may be thought, there may be will, there may be volition, where there is no liberty. Thus a tennis-ball, whether in motion by the stroke of a racket, or lying still at rest, is not by any one taken to be a free agent; because we conceive not a tennis-ball to think, and consequently not to have any volition, or preference of motion to rest, or *vice versa*. So a man striking himself or his friend by a convulsive motion of his arm, which is not in his *power* by volition, or the direction of his mind, to stop or forbear; nobody thinks, he has liberty in this; every one pities him, as acting by necessity and constraint. Again, suppose a man be carried, whilst fast asleep, into a room, where there is a person he longs to see, and be there locked fast in, beyond his *power* to get out; he awakes, and is glad to see himself in so desirable company, which he stays willingly in; that is, he prefers his staying to going away: Is not this stay voluntary? Nobody will doubt it; and yet being locked fast in, he is not at liberty to stay, he has not freedom to be gone.

Liberty, therefore, is not an idea belonging to volition, or preferring; but to the person having the *power* of doing, or forbearing to do, according as the mind shall chuse or direct.

As it is in the motions of the body, so it is in the thoughts of our minds. where any one is such, that we have *power* to take it up, or lay it by, according to the preference of the mind, there we are at liberty.

A waking man is not at liberty to think, or not to think, no more than he is at liberty, whether his body shall touch any other or no: but whether he will remove his contemplation from one idea to another, is many times in his choice; and then he is, in respect of his ideas, as much at liberty, as he is in respect of bodies he rests on. He can at pleasure remove himself from one to another.

Yet some ideas to the mind, like some motions to the body, are such, as in certain circumstances it cannot avoid, nor obtain their absence, by the utmost effort it can use: thus a man on the rack is not at liberty to lay by the idea of pain, and entertain other contemplations.

Where-ever thought is wholly wanting, or the *power* to act or forbear according to the direction of thought, there necessity

VOL. II. No 121.

takes place. This, in an agent capable of volition, when the beginning or continuation or any action is contrary to the preference of his mind, is called *compulsion*; when the hindering or stopping any action is contrary to his volition, it is called *restraint*. Agents that have no thought, no volition at all, are in every thing necessary agents.

POWER, in mechanics, denotes a force, which being applied to a machine, tends to produce motion; whether it actually produce it or not. See MACHINE.

In the former case, it is called a *moving power*; in the latter, a *sustaining power*.

If the *power* be a man, or a brute, it is called an *animate power*; if the air, water, fire, gravity, or elasticity, an *inanimate power*; See MECHANICS.

Attractive POWER. See the article ATTRACTIVE.

Conspiring POWER. See the article CONSPIRING.

Repelling POWER. See the article REPELLING.

POWER is also used in mechanics, for any of the six simple machines; viz. the lever, balance, screw, axis in peritrochio, wedge, and pulley; which are particularly called the *mechanic powers*. See MECHANIC power.

See also each *power* under its proper article, LEVER, BALANCE, &c.

POWERS, in pharmacy, the result of a combination or union of the essential oils with the spirit of a plant; wherein, it is supposed, are contained all the principal virtues thereof: whence the name.

The *powers* of scabious and mullein are prepared by beating and incorporating the expressed juices of these plants when green, with lard, and exposing them several days to the sun: such beating and insolation being several times repeated at due distances.

POWER, in the feudal jurisprudence, a right which the lord has to re-unite to his fief, a dependent fee held of him, when the vassal has alienated it, upon reimbursing the money given for it, with the legal costs. See FEE.

The lord is to exercise his *power* over the fee, within a year after he has notice of the fall; otherwise he loses it.

The word is also used for the right a lord has to seize a dependent fee, to compel the payment of all dues, services, &c.

POWERS, *potentia*, is also used among the fathers, &c. for the sixth order in the hierarchy of angels, reckoning from Seraphim. See HIERARCHY and SERAPHIM.

These they suppose to be the spirits who bridle and restrain the *power* of the devils; preside over inferior causes; and prevent contrary qualities from disturbing the oeconomy of the world. See ANGEL.

POWER, in optics.—The *Power of a glass* is used by some for the distance of the convexity from its solar focus. See FOCUS.

POWER, in arithmetic, the produce of a number, or other quantity, multiplied into itself. See NUMBER.

Thus the produce of the number 3, multiplied by itself, viz. 9, is the second *power* of 3; the factum of 9, multiplied by 3, viz. 27, is the third *power*; and the product of 27, again multiplied by 3, viz. 81, is the fourth *power*; and so on to infinity. —In respect hereof, the first number, 3, is called the *root*, or *first power*. See ROOT.

The second *power* is called the *square*; with respect to which, 3 is the square-root. See SQUARE.

The third *power*, 27, is called the *cube*; with respect to which, the 3 is the cube-root. See CUBE.

The fourth *power*, 81, is called the *biquadrate*, or *quadrato-quadratum*; with respect to which, 3 is the biquadratic root. See BIQUADRATIC.

The number which shews how oft the root is multiplied into itself, to form the *power*; or how oft the *power* is to be divided by its root, to come at the root, is called the *exponent of the power*. See EXPONENT.

The moderns, after Des Cartes, are contented to distinguish most of their *powers* by the exponents; as, *first, second, third*, &c.

The particular names of the several *powers* were introduced by the Arabs; viz. *square, cube, quadrato-quadratum* or *biquadrate, surdesolid, square of the cube, second surdesolid, quadrato-quadrato quadratum, cube of the cube, square of the surdesolid, third surdesolid*, &c.

The names given by Diophantus, followed by Vieta and Oughtred, are, the *side* or *root, square, cube, quadrato-quadratum, quadrato-cubus, cubo-cubus, quadrato-quadrato-cubus, quadrato-cubo-cubus, cubo-cubo-cubus*, &c.

The characters wherewith the several *powers* are denoted, both in the Arabic and Cartesian notation, are as follow:

	2	4	8	16	32	64	128	256	512	1024
Arab.	R	q	c	bq	s	qc	Rf	sq	bc	sq
Cartes.	a	a <sup>2</sup>	a <sup>3</sup>	a <sup>4</sup>	a <sup>5</sup>	a <sup>6</sup>	a <sup>7</sup>	a <sup>8</sup>	a <sup>9</sup>	a <sup>10</sup>

Hence, to raise a quantity to a given *power* or dignity, is the same as to find the factum arising upon its being multiplied a given number of times into itself: e. gr. to raise 2 to the 3d *power*, is the same as to find the factum 8; whose factors are 2, 2, 2. See SQUARE, CUBE, &c.

*Powers* of the same degree are to one another in the ratio of the roots as manifold as their exponent contains units: thus, squares are in a duplicate ratio; cubes in a triplicate ratio; quadrato-quadrata, or fourth *powers*, in a quadruple ratio. See RATIO.

The *powers* of proportional quantities are also proportional to one another. See PROPORTION.

From a given power to extract the root, or side, is the same as to find a number, *e. gr.* 2, which multiplied any number of times, *e. gr.* twice, produce the given power, *e. gr.* the 3d power, or 8. See ROOT and SIDE.

To multiply or divide any power by another of the same root, 10 For multiplication, add the exponents of the factors; the sum is the exponent of the factum. Thus:

$$\text{Factor} \begin{cases} x^3 & y^m & z^n & a^m & x^n \\ x^4 & y^m & z^n & a^r & x^s \end{cases}$$

$$\text{Prod. } x^7 \quad y^{2m} \quad z^{m+n} \quad a^{m+r} \quad x^{n+s}$$

20. For division, subtract the exponent of the power of the divisor, from the exponent of the dividend; the remainder is the exponent of the quotient. Thus:

$$\text{Divid. } x^7 \left( x^3 \parallel y^{m+n} \right) \parallel z^{m+n} \left( a^{m-r} x^{n-s} \right)$$

$$\text{Divif. } x^4 \left( x^3 \parallel y^n \right) \parallel z^m \parallel a^r \parallel x^s$$

M. de la Hire gives us a very odd property common to all powers: M. Carre had observed with regard to the number 6, that all the natural cubic numbers, 8, 27, 64, 125, whose root is less than 6, being divided by 6, the remainder of the division is the root itself: and if we go farther, 216, the cube of 6, being divided by 6, leaves no remainder; but the divisor 6, is itself the root. Again; 343, the cube of 7, being divided by 6, leaves 1; which, added to the divisor 6, makes 7 the root, &c.

M. de la Hire, on considering this, has found that all numbers, raised to any power whatever, have divisors, which have the same effect with regard thereto, that 6 has with regard to cubic numbers.

For the finding of these divisors, he discovered the following general rule:

If the exponent of the power of a number be even, *i. e.* if the number be raised to the 2d, 4th, 6th power, &c. it must be divided by 2; the remainder of the division, in case there be any, added to 2, or to a multiple of 2, gives the root of this number, corresponding to its power, *i. e.* the 2d, 6th, &c. root.

If the exponent of the power be an uneven number, *i. e.* if the number be raised to the 3d, 5th, 7th, &c. power; the double of this exponent will be the divisor, which has the property mentioned.

Thus is it found in 6, double of 3, the exponent of the power of all the cubes: thus, also, 10 is the divisor of all numbers raised to the 5th power, &c.

Commensurable in POWER. See COMMENSURABLE.

POWER, of an hyperbola, in conics, is the square of the right line CI, or AI. (*tab. conics, fig. 20.*)

The power of the hyperbola is the fourth part of the square of the conjugate semiaxis; or the sixteenth part of the square of the conjugate axis. See HYPERBOLA.

POWER of the county. See POSSE comitatus.

POX, in medicine, a disease, whereof physicians admit several kinds: as, *small pox*, *French pox*, *chicken pox*, *swine pox*, &c.

*Small POX*, *variola*, is a contagious disease appearing on the cutis, which it covers with pustules, or ulcerous eruptions, that leave eschars behind them. Or, it is a general eruption of particular pustules tending to suppuration, and attended with a fever. See PUSTULE, SUPPURATION, and FEVER.

The origin of the disease is uncertain: we find no mention of it before the Arab physicians.---It bears a great resemblance to the measles; so that for the two or three first days it is difficult to distinguish them. they both arise from an impure blood, and corrupt humours; with this difference, that in the *small pox* the peccant matter is more thick and viscid; in the measles more subtiler, hot, and bilious; and neither of them are known to return after having passed them once. See MEASLES.

Dolæus says, that the cause of the *small pox* is brought into the world with us, and lies hid till it find an opportunity of bursting forth: he adds, that there is scarce one in many thousands that escapes it all his life.

Dr. Drake observes, that the *small pox*, not being founded in any permanent habitual disposition, has its period within a limited time necessary for the extrusion of the peccant matter out of the pores of the skin. For the salt serum of the blood being in this disease, by an accidental fever, thrown out in great quantities on the glands of the skin, acts much after the manner of the lepra Arabum; but when the blood is despumated, the scales dry, and fall off. So that he thinks it would be no great impropriety to call the *small pox*, a temporary, critical lepra. See LEPROSY.

The *small pox* are of two kinds: the *distinct*, where the pustules stand apart; and the *confluent*, where they run into one continued cake.

The *distinct*, or *regular small Pox*, Sydenham observes, begin with a shuddering and chilliness, which is succeeded by an intense heat, violent pain of the head and back, vomiting, drowsiness, especially in children, and sometimes epileptic fits; which shew the *pox* to be ready to burst forth, and that they will be mild.

The eruptions are usually on the fourth day; upon which the feverish symptoms vanish, except that adults are prone to sweat. The pustules first appear in the face, then the neck, &c. They are at first reddish, by degrees swell and grow whiter; on the eleventh day the swelling and inflammation of the face vanish, and the pustules begin to wither. If ever this kind kill, it is on the fourteenth or fifteenth day.

The symptoms of the *distinct small pox*, as enumerated by Dr. Shaw, are, 1. A pain in the head, back, and scrobiculum cordis. 2. A fever, which decreases as the eruptions increase, with redness of the eyes. 3. Nausea and retchings. 4. Little reddish spots, or beginning pustules, appearing on the neck, face, breast, &c. about the third or fourth day inclusive, from the beginning of the illness. 5. Restlessness. 6. About the seventh or eighth day, other little red spots usually appear between the growing pustules. 7. The pustules about the ninth day are at their state; being then generally as big as a large pea, the matter in them well concocted, of a whitish colour inclined to yellow; at which time, 8. The patient is usually light-headed and feverish. 9. About the tenth day the pustules begin to dry on the face. 10. And about the fifteenth they appear shrunk, and begin to scale off; and now the danger is esteemed to be over.

The *distinct* kind is here considered unattended with a looseness, and other symptoms, which sometimes happen in it, as well as in the other.

The *confluent*, or *flux small Pox* have the same symptoms with the *distinct*, only in a more violent degree: they usually come out on the third day; not separate, as in the *distinct* kind, but spread into one another; and at length appear all like one whitish pellicle, over the whole skin. After the eighth day, the pellicle darkens. In adults this kind is attended with a salivation; in children with a diarrhoea. The salivation frequently succeeds immediately after eruption; the diarrhoea later. The *confluent* kind usually kill on the eleventh day.

The symptoms of the *confluent* kind, according to Dr. Shaw, are, 1. Violent pain in the head, back, and scrobiculum cordis. 2. Nausea and retching, with a fever, which rather increases than decreases after the eruption. 3. In children a diarrhoea, which usually precedes the eruption, and attends the distemper throughout. 4. A pryalismus in adults, and but seldom a diarrhoea. 5. Deliria, convulsions, hoarseness, difficulty of breathing, fixedness of the eyes, and restlessness; which may also in a lesser degree attend the *distinct* sort. 6. The spots are here more red, thick, and close, than in the *distinct*; and the spaces between them more inflamed and swelled; purple or livid spots also often appear in these spaces: whence the *small pox* with purples. At other times in these spaces, or on the heads of the eruptions, appear bladders full of clear water, vulgarly called the *white hives*. Lastly, these eruptions are frequently depressed in the middle, and there turn black; whence the *black small pox*.

The eruptions often rise and sink in the progress of the distemper. They usually first appear about the fourth or fifth day, and come to their state about the fifteenth.

Morton divides the disease into four stages: the *apparatus* or preparation, from the time of the first infection to the eruption of the pustules. The *eruption*, which comprehends three states; *eruption*, *maturation*, and *declension*, wherein the pustules are first incrustated with a scab, then wither and dry off.

When the eruptions are very round, distinct, encompassed with a red margin, &c. they are said to be *benign*; otherwise *malignant*.

There are four degrees of malignancy: *viz.* when the pustules are universally confluent; particularly confluent; distinct, but very small and coherent; and distinct, with petechiae and miliary eruptions. See PETECHIAE, &c.

Dr. Freind, Dr. Cade, &c. recommend purging and phlebotomy after an imperfect crisis of the *small pox*; *i. e.* where the fever remains after the pustules decline: many oppose it: indeed reason seems on its side; but prescription is against it. Alfabaravius, in the first stage of the *small pox*, prescribes phlebotomy, even to a swooning, and great quantities of cold water to be drank. In the malignant *small pox*, Dr. Lister found the blood, when cold, excessively tender and friable, so as the softest feather would easily divide its globules. Etmuller says there is nothing to be more regarded than the breath and voice; where these are good, it is an excellent sign. He adds that horse-dung is an admirable medicine, in that it promotes sweat, saves the throat, &c.

A method of managing the *small pox*, lately introduced from abroad, is by inoculating them. For the reason, process, and advantages whereof, see INOCULATION.

Why the *small Pox* scarce ever visit a person above once, is a famous problem; long canvassed, and with little success! Dr. Drake accounts for it very plausibly from the alteration made in the skin by that disease. For the distention the glands and pores of the skin suffer therein is so great, that they scarce ever recover their tone again, so as to be able any more to arrest the matter in its course outwards long enough, or in quantity enough, to create those ulcerous pustules which are the diagnostics of the disease. For though the same feverish disposition should arise again in the blood, yet the passages through the skin being more open, the matter will never be stopped, so as to exhibit the appearance of the *small pox*.

Accordingly we find, that in persons severely handled with this disease, the face (which is usually the fullest, from the extraordinary obstruction the matter meets with by the great constipation of the pores) seldom returns to its former dimensions; which enlargement he accounts for from the dilatation of the areolæ of the glands and pores of the skin, not from any augmentation of the substance itself.

What

What confirms this hypothesis, is, that nurses, &c. who attend persons sick of the *small pox*, are frequently a little affected with it, and have now-and-then two or three eruptions: that they have no more, seems to follow from the free course of the matter through the skin. With this, too, agrees that constant observation, that people of coarse skins, in whom the pores are largest, are always more favourably treated by this distemper than others; and that it constantly leaves fine skins coarser than it found them.

This solution would seem more probable, were it not that some have so very few of these eruptions, perhaps not above twenty or thirty; which cannot fairly be allowed so far to enlarge the pores of the skin, as to prevent any return.

Others hold, that in a genuine eruption, the cause of the distemper is so far evacuated, as scarce to leave a possibility of a return; and that if part of the original cause did remain behind, it might, when the air favours it, or when by other accidents it is secreted from the blood, appear in the form of eruptions, and so prove to be the measles, chicken pox, &c.

It may, indeed, be objected, that these last-mentioned often happen before the *small pox*: but whatever be the cause of the *small pox*, the separating power must be in such a determined proportion, or it will fail to cause a regular *small pox*, and so acting proportionably, may produce any of the other distempers just mentioned.

The *occasional causes* of the *small Pox* may be, 1. Some alteration in the air; since they happen most frequently about the spring-season; and both in Europe, and elsewhere, are more epidemical and mortal at particular times. 2. From fear; which appears more evident, than easy to explain. 3. From surfeits, as by eating any thing too chilling to the blood, as cucumbers, oranges, &c. in hot seasons; or when the body is heated by motion, the drinking of cold liquors. 4. From too plentiful feeding. 5. From any over-heating the blood, or too suddenly cooling it after it is heated, whereby a sudden check is given to perspiration; and this more especially, if the air favours such an eruption.

As to *prognostic signs* of the *small Pox*; 1. The sooner they appear in the spring, and the more the air is disposed to favour the distemper, the more fatal they prove. 2. The confluent species both in adults and children, is dangerous; and the more so, if attended with a suppression of urine, nausea, retching, delirium, purple spots, crystalines, bloody urine, &c. after the eruption; but the blackness of them is not dangerous before the crisis. 3. Diarrhoeas in the confluent kind are not so bad in children as in adults. 4. A pyatismus is a regular attendant of the confluent kind in adults from the sixth or seventh day till after the crisis; and is so necessary, that if it stop suddenly, and return not for twenty-four hours, the patient is supposed to be in great danger. 5. A quincy here is highly dangerous. 6. The eruption swelling, and sinking suddenly, are bad signs. 7. The danger is not over till about the twentieth day in the confluent species. But if the eruptions be distinct, few, round, plump, rise full, and grow up sharp at the top; if the sickness, vomiting, &c. go off, or remit upon the appearance of the eruptions, and the patient be under no dreadful apprehensions; the danger is usually over about the tenth day in the distinct kind. Convulsions attending the first symptoms of the *small pox* in children, are said to forebode the appearance of eruptions within twelve hours; which then generally prove distinct, and the patient does well. The *small pox* succeeding a debauch in liquors, or happening upon an irregular course of life, is usually mortal.

*Chicken Pox*, a cutaneous disease, frequent in children, wherein the skin is covered with pustules like those of the *small pox* as to figure and magnitude; and only distinguishable therefrom, in that those of the *small pox* appear with a redness and inflammation, and those of the *chicken pox* whiter, resembling vesiculæ full of a serous humour; which in three days time burst, and dry away, without any danger, and usually without any fever.

The *chicken pox* and *swine pox* seem to be the *small pox* in a less degree, though they sometimes precede, and sometimes succeed the *small pox*. The pustules appear to be of the same kind; only in the *swine pox* they are much larger, and in the *chicken pox* somewhat less than in the *small pox*. There commonly appear five or six, sometimes twenty or thirty, on the face, and but very few on the body.

The patient is very little indisposed, either before, at, or after their appearance; though the sudden sinking of them often causes some disorder; but it is presently relieved by a little sack and saffron, or a dose of treacle-water.

Grown persons seldom keep within doors for either; and upon that account the eruptions may continue the longer, because the cold air is supposed to hinder their ripening; so that it is sometimes three weeks or a month before they totally disappear.

*French Pox*, a contagious disease, contracted by a poisonous humour, usually in coition; and manifesting itself in ulcers and pains. See *VENEREAL disease*.

The French call it *mal de Naples*, the Neapolitan disease, because first observed among the soldiery at the siege of Naples under Charles VIII. The Italians call it *mal Francese*, and we the *French disease*, because first caught by the French. The

Spaniards call it *las bubas*, or *farva des Indias*, because first brought from the West-Indies. Trev.
