It bears the name *scale* (*q. d.* ladder) by reason it represents a kind of ladder, by means whereof the voice rises to acute, or descends to grave; each of the six syllables being as it were one step of the ladder.

**SCALE** is also used for a series of sounds rising or falling towards acuteness or gravity, from any given pitch of tune to the greatest distance that is fit or practicable, through such intermediate degrees as make the succession most agreeable and perfect, and in which we have all the harmonical intervals most commodiously divided.

This *scale* is otherwise called an *universal system*, as including all the particular systems belonging to musick. See **SYSTEM**.

**Origin and construction of the SCALE of musick**.—Every concord or harmonical interval, is resolvable into a certain number of degrees or parts; the octave, for instance, into three greater tones, two less tones, and two semi-tones; the greater sixth, into two greater tones, one less tone, and two semi-tones; the less sixth, into two greater tones, one less tone, and two semi-tones; the fifth, into two greater tones, one less tone, and one semi-tone; the fourth, into one greater tone, one less tone, and one semi-tone; the greater third, into one greater tone, and one less tone; and the less third, into one greater tone, and one less tone. It is true, there are variety of other intervals or degrees, besides greater tones, less tones, and semi-tones, into which the concords may be divided; but these three are preferred to all the rest, and these alone are in use.—For the reason whereof, see **TONE**. Further, it is not any order, or progression, of these degrees, that will produce melody; a number, for instance, of greater tones will make no musick, because no number of them is equal to any concord, and the same is true of the other

other degrees: there is a necessity, therefore, of mixing the degrees to make musick; and the mixture must be such, as that no two of the same kind be ever next each other.

A natural and agreeable order of these degrees Mr. Malcolm gives us in the following division of the interval of an octave; wherein (as all the lesser concords are contained in the greater) the divisions of all the other simple concords are contained.—Under the series are the degrees between each term, and the next.—In the first series, the progression is by the less third; in the latter by the greater third.

	great 2 <sup>d</sup>	gr. 3 <sup>d</sup>	4 <sup>th</sup>	5 <sup>th</sup>	6 <sup>th</sup>	7 <sup>th</sup>	8 <sup>th</sup>

Key or fund.	great tone.	less tone.	semi-tone.	great tone.	less tone.	great tone.	semi-tone.

great second.

	great 2 <sup>d</sup>	gr. 3 <sup>d</sup>	4 <sup>th</sup>	5 <sup>th</sup>	6 <sup>th</sup>	7 <sup>th</sup>	8 <sup>th</sup>
1	2	3	4	5	6	7	8
Key or fund.	great tone.	less tone.	semi-tone.	great tone.	less tone.	great tone.	semi-tone.

Now, the system of octave, containing all the original concords; and the compound concords being only the sums of octave and some less concord; it is evident, that if we would have the series of degrees continued beyond octave, they are to be continued in the same order through a second as through the first octave, and so on through a third and fourth octave, &c. and such a series is what we call the *Scale of musick*.

Of this, there are two different species; according as the less or greater 3<sup>d</sup>. or the less or greater 6<sup>th</sup>. are taken in; for both can never stand together in relation to the same key or fundamental, so as to make an harmonical *scale*. But if either of these ways, we ascend from a fundamental or given sound, to an octave, the succession will be melodious; though the two make two different species of melody.—Indeed, every note is discord with regard to the next; but each of them is concord to the fundamental, except the 2<sup>d</sup>. and 7<sup>th</sup>.

In continuing the series, there are two ways of compounding the names of the simple interval with the octave: thus, a greater or lesser tone or semi-tone above an octave, or two octaves, &c. or to call them by the number of degrees from the fundamental, as 9<sup>th</sup>, 10<sup>th</sup>, &c.

In the two *scales* above, the several terms of the *scale* are expressed by the proportionable sections of a line, represented by 1, the key or fundamental of the series.—If we would have the series expressed in the whole numbers, they will stand as follows; in each whereof the greatest number expresses the longest chord, and the other numbers the rest in order: so that if any number of chords be in these proportions of length, they will express the true degrees and intervals of the *scale* of musick, as contained in an octave concinnously divided in the two different species abovementioned.

540	480	432	405	360	324	288	270

great tone.	semi-tone.	less tone.	great tone.	semi-tone.	great tone.	less tone.	

This *scale* the ancients called the *diatonic scale*, because proceeding by tones and semi-tones. See *DIATONIC*.

The moderns call it, simply, *The scale*, as being the only one now in use; and sometimes, *The natural scale*, because its degrees and their order are the most agreeable and concinnous, and preferable, by the consent both of sense and reason, to all other divisions ever instituted.—Those others, are the *chromatic* and *enharmonic scales*, which, with the *diatonic*, made the three *scales*, or *genera* of melody of the ancients. See *GENERA*: See also *ENHARMONIC*, and *CHROMATIC*.

*The Design of the SCALE of Musick*, is to shew how a voice may rise and fall less than any harmonical interval, and thereby move from the one extreme of any interval to the other, in the most agreeable succession of sounds.—The *scale*, therefore, is a system, exhibiting the whole principles of musick; which are either harmonical intervals (commonly called *concords*) or concinnous intervals: the first are the essential principles, the other subservient to them, to make the greater variety. See *CONCORD* and *INTERVALS*.

Accordingly, in the *scale*, we have all the concords, with their concinnous degrees, so placed, as to make the most perfect succession of sounds from any given fundamental or key, which is supposed to be represented by 1. It is not to be supposed, that the voice is never to move up and down by any other more immediate distances than those of the concinnous degrees: for though that be the most usual movement, yet to move by harmonical distances, as concords, at once, is not excluded, but is even absolutely necessary. In effect, the degrees were only invented for variety sake, and that we might not always move up and down by harmonic intervals, though those are the most perfect, the others deriving all their agreeableness from their subserviency to them. See *DEGREE*.

Add that, besides the harmonical and concinnous intervals, which are the immediate principles of musick, and are directly applied in practice; there are other discord relations, which happen unavoidably in musick, in a kind of acciden-

tal and indirect manner: for, in the succession of the several notes of the *scale*, there are to be considered not only the relations of those that succeed others immediately; but also of those betwixt which other notes intervene. Now the immediate succession may be conducted so, as to produce good melody; and yet among the distant notes there may be very gross discords, that would not be allowed in immediate succession, much less in consonance.—Thus in the first series, or *scale* above delivered, though the progression be melodious, as the terms refer to one common fundamental; yet are there several discords among the mutual relations of the terms; *e. gr.* from 4<sup>th</sup> to 7<sup>th</sup> is 32 : 45, and from the greater 2<sup>d</sup> to the greater 6<sup>th</sup> is 27 : 40, and from the greater 2<sup>d</sup> to 4<sup>th</sup> is 27 : 32, which are all discords; and the same will happen in the second series. See *DISCORD*.

From what we have observed here, and under the article *KEY*, it appears, that the *scale* supposes no determinate pitch of tune; but that being assigned to any key, it marks out the tune of all the rest, with relation to it; shews what notes can be naturally joined to any key, and thereby teaches the just and natural limitations of melody: and when the song is carried through several keys, yet it is still the same natural *scale*, only applied to different fundamentals.—If a series of sounds be fixed to the relations of the *scale*, it will be found exceedingly defective; but this imperfection is not any defect in the *scale*, but follows accidentally from its being confined to this condition, which is foreign to the nature and office of the *scale* of musick.

This is the case in musical instruments; and in this consists their great deficiency.—For, suppose a series of sounds, as those of an organ or harpsicord, fixed in the order of this *scale*; and the lowest taken at any pitch of tune; it is evident, 1<sup>o</sup>. that we can proceed from any note, only by one particular order of degrees: since from every note of the *scale* to its octave, is contained a different order of the tones and semi-tones. Hence, 2<sup>o</sup>. we cannot find any interval required from any note upwards or downwards; since the intervals from every note to every other, are also limited. And hence, 3<sup>o</sup>. a song may be so contrived, that, beginning at a particular note of the instrument, all the intervals, or other notes, shall be found exactly on the instrument or in the fixed series; yet were the song, though perfectly diatonic, begun in any other note, it would not proceed. In effect, it is demonstrable, there can be no such thing as a perfect *scale* fixed on instruments; *i. e.* no such *scale* as from any note upwards or downwards, shall contain any harmonical or concinnous interval required.

The only remedy for this defect of instruments whose notes are fixed, must be by inserting other notes and degrees betwixt those of the diatonic series.—Hence some authors speak of dividing the octave into 16, 18, 20, 24, 26, 31, and other number of degrees; but it is easy to conceive, how hard it must be to perform on such an instrument. The best on it is, we have a remedy on easier terms: for a *scale* proceeding by twelve degrees, that is, thirteen notes, including the extremes, to an octave, renders our instruments so perfect, that we have little reason to complain.—This, then, is the present *scale* for instruments, *viz.* between the extremes of every tone of the natural *scale* is put a note, which divides it into two unequal parts, called *semi-tones*; whence the whole may be called the *semitonic scale*; as containing twelve semi-tones, betwixt thirteen notes, within the compass of an octave. See *SEMITONE*.

And to preserve the diatonic series distinct, these inserted notes take either the name of the natural note next below, with the mark # called a *sharp*; or the name of the natural note next above, with this mark ♭ called a *flat*. See *FLAT* and *SHARP*.

For the *SCALE* of semi-tones, For *Guido's SCALE*, commonly called the *Gammut*, For the *SCALE* of the ancients, commonly called the *Diatonic*, See SEMITONIC SCALE. GAMMUT. DIAGRAM.

SCALED, SCALE, or SCALENUS triangle, in geometry, a triangle, whose sides and angles are all unequal. See *TRIANGLE*.

\* The word is formed from the Greek σκαλπος, which signifies oblique, unequal, &c.

A cylinder or cone, whose axis is inclined to its base, is also said to be *scalenus*. See *CONE* and *CYLINDER*.

SCALED, or SCALENUS, in anatomy, a name given to three pair of muscles, from their form; all of them serving to draw the ribs upwards, in conjunction with the serratus superior posticus, &c.—See *Tab. Anat. (Myol.) fig. 2. n. 5. fig. 1. n. 16*.

SCALED *Primus*, springs, fleshy, from the transverse processes of the second, third, and fourth vertebrae of the neck, where descending laterally, it is inserted into the first rib, which it helps to draw upwards.

SCALED *Secundus*, arises from the same processes, as likewise from those of the fifth vertebra of the neck; and is inserted into the second rib, and sometimes into the third.

SCALED *Tertius*, arises from the same processes with the former,

former, and from those of the sixth vertebra of the neck; and is inserted into the first rib.

**SCALLOP** *Tyles*. See the article **TYLES**.

**SCALPEL**, **SCALPELLUM**, in surgery, a kind of knife chiefly used in dissections; but which may be occasionally used in many other operations, as in amputations, and to cut off the flesh and membranes that are between the two bones of an arm or leg, before the limb be sawed off.

There are two kinds of *scalpels*: the first cuts on both sides, and is fixed in an ebony or ivory handle, which being very flat and thin at the extremity, serves to part the membranous and fibrous parts in anatomical preparations.

The other has a back, that is, it only cuts on one side; it is crooked, and very commodious for stripping the flesh off the bones in embalming, making skeletons, &c.

Scultetus, in his *Arsenal*, describes several other kinds of *scalpels*; as, a deceitful *scalpel*, thus called, because it deceives the patient by hiding its blade. It was much used by the ancients, in opening and dilating of sinews; but as it is apt to deceive the surgeon itself, and is besides very slow, it is better using a syringotomus.—A *scalpel*, sharp on both sides for setons.—A little crooked *scalpel* for separating the coherence of the eyelids.—A sharp, double-cutting *scalpel*, with a bone-handle, for the cutting off an ægilops.—*Scalpels* like scolopomachærians, &c. Even the scolopomachærian itself is a kind of *scalpel*. See **SCHOLOPOMACHÆRION**.

**SCALPER**, **SCALPRUM**, or **SCALPING-Iron**, a surgeon's instrument wherewith to rasp, and scrape foul, carious bones.

**SCALPTOR Ani**, in anatomy. See **LATISSIMUS Dorsi**.

**SCAMILLI** *Impares*, in the ancient architecture, a term much contended about among the critics; though, in effect, it signify no more than certain zocco's or blocks, serving to raise the rest of the members of an order, column, statue or the like, and prevent their being lost to the eye, which may chance to be placed below their level; or below the projecture of some of the ornaments thereof.

These *Scamilli* are well enough represented by the pedestals of statues. See **PEDESTAL**.

**SCAMMONY**, **SCAMMONIUM**, in pharmacy, an insipidated juice, of the root of a plant of the same name, growing in the Levant, particularly about Aleppo and St. John de Acre.

The juice flows from an incision made in the root; and is afterwards thickened by the sun, as it was pretended, but in reality by the fire. The tree is much like an ivy, its leaves in form of hearts, its flowers white, and it creeps on the ground or climbs on other trees, walls, &c.

The good and genuine *scammony* of Aleppo, is to be grey, tender, friable and resinous; the taste bitter, and the smell faintish, and disagreeable.

The *scammony* of Smyrna, and that of the East-Indies, are less valued; the first as being more heavy, hard and black; the latter, though light, friable, &c. is in reality only a composition of common rosin with some other violent purgatives. Pomet asserts, that both kinds are rather poisons than remedies.

The true *scammony* is one of the surest purgatives; but, at the same time, one of the most violent they have: hence, it is seldom used without correcting it by some preparation with sulphur, quince or the like. See **DIAGRYDIUM**.

From the juice is drawn a resin of more virtue than the *scammony* itself. They also make a syrup of it, which is found a very gentle purgative.

The *scammony* now in use, must be very different from that of the ancients, at least in the preparation; by reason the ancients gave it in much larger doses: hence Fallopius conjectures, the modern *scammony* to be adulterated with spurge.

Some give the name of American *scammony* to Mechoacan. See **MECHOACAN**.

**SCANDAL**, \* **ΣΚΑΝΔΑΛΟΝ**, in the scripture language, denotes any thing that may draw us aside, or solicit us to sin.

\* The word is formed from the Greek *σκανδαλον*, or the Latin *scandalum*, which, according to Papias, was originally used for a sudden, extemporary quarrel, *quæ subito inter aliquos scandit vel oritur*.

In which sense, the word is used promiscuously with *offence*, and *stumbling-block*.

*Scandal* is either *active* or *passive*.

Active *scandal* is a real induction to sin; passive *scandal* is the impression which an active *scandal* makes on the person induced to sin.

**SCANDAL**, in the popular language, is some action, or opinion contrary to good manners, or to the general sense of a people. See **ABSURD**.

**SCANDAL** also denotes a disadvantageous rumour, or report; or an action whereby any one is affronted in publick.

*Stone of SCANDAL*, *Lapis Scandali*, or *Vituperii*, a stone raised in the great portal of the capitol in Rome; whereon was engraven the figure of a lion; upon which bankrupts or cessionaries being seated bare-breeched, cried with a loud voice, *Cedo bonis*, I surrender my effects; when, squatting their

breech violently, three times on the stone, they were acquitted. See **CESSION**.

It was called the *Stone of Scandal*, because thence-forward the cessionary became intestable, and incapable of giving any evidence.

Julius Cæsar introduced this form of surrender, after abrogating that article of the laws of the twelve tables, which allowed the creditors to cut their insolvent debtors in pieces, and take each his member; or at least to make a slave of him. See **BANKRUPT**.

**SCANDALUM Magnatum**, in law, denotes a scandal or wrong done to any high personage of the land, as peers, prelates, judges, or other great officers, by false or slanderous news or tales, whereby any debate or discord between them and the commons, or any scandal to their persons, might arise.

This offence has also given name to a writ granted to recover damages thereupon.

**SCANNING** \*, **SCANSIO**, in poetry, the measuring of a verse, to see what number of feet and syllables it contains, and whether or no the quantities, that is, the long and short syllables, be duly observed. See **QUANTITY**, **MEASURE**, **FOOT**, &c.

\* The word is formed from the Latin, *scandere*, to climb.

The term is chiefly used with regard to Greek and Latin verses; the quantities not being well settled and observed in the verses of the modern languages. See **VERSE**.

Hexameters are *scanned* one way, iambicks another, sapphicks another. See **HEXAMETER**, &c.

**SCANTLING** \*, a measure, size, or standard, whereby the dimensions, &c. of things are to be determined.

\* The word is formed from the French, *eschantillon*, a pattern or specimen. See **STANDARD**.

**SCAPHISM** \*, **SCAPHISMUS**, in antiquity, a kind of torture or punishment formerly in use among the Persians. It consisted in locking the criminal close up within the trunk of a tree bored to the dimensions of his body, only with five holes for his head, arms, and legs to come through. In this state he was exposed to the sun, and the parts thus appearing anointed with honey and milk, to invite the wasps and flies.

\* The word is Greek, *σκαφισμός*; formed of *σκαφω*, digging, of *σκαπη*, I dig, hollow.

To increase the torment, they forced the criminal to eat abundantly, till his excrements, close pent up in the wood, rotted his body. Some authors observe, that persons ordinarily lived forty days in this condition.

This invention is ascribed to Parisatis queen of Persia, and mother of Artaxerxes Mnemon, and the young Cyrus. It is added, she first ordered it to be practised on the person who brought the tidings of the death of Cyrus.

**SCAPHOIDES** \*, **ΣΚΑΦΟΕΙΔΗΣ**, in anatomy, a bone of the foot; called also *Naviculare*. See **NAVICULARE**.

\* The word is formed of the Greek, *σκαφη*, a boat, or bark; of *σκαπη*, I hollow (because boats were originally made of trunks of trees hollowed, as are still the canoes of several savages) and *ειδος*, form.

**SCAPULA**, in anatomy, *omoplate*, or *shoulder-blade*; a large, broad bone, representing a scalenous triangle, situate on each side of the upper and back part of the thorax.—*V. Tab. Anat. (Osteol.) fig. 7. n. 6, 6.*

The substance of the *scapula* is thin, but solid and firm; its outside is somewhat convex, and its inside concave; its upper edge is called *costa superior*, and its lower, *costa inferior*; its broad end is called its *basis*, which, with the two edges, make the upper and lower angles. See **OMOPLATE**.

The *scapulae* have each three processes, of which the first runs all along the middle of their outside, and is called their *spine*.—*Fig. 3. n. 4, 4. & fig. 7. n. 7, 7.* That end of the spine, which receives the extremity of the clavicle, is called *Acromium*.—The second process is a little lower than the acromium; it is short and sharp, like a crow's bill, therefore called *Coracoides*; these two processes are tied to one another by a strong ligament, which serves to keep the head of the humerus in the cavity of the third process, which is called *Cervix*. This process is the extremity of the *scapula*, which is opposite to its basis. It has a round sinus, tipped about its brim with a cartilage, which receives the head of the humerus.

The use of the *scapula* is to receive the extremities of the clavicle and humerus, for the easier motion of the arm, and to give rise to the muscles, which move the arm.

**SCAPULAR**, **SCAPULARIS**, in anatomy, an epithet given to two arteries, and as many veins of the body.

The **SCAPULARIS interna & externa**, or inner and outer *scapular* arteries, arise out of the subclavian, and are spread over the *scapula*. See **ARTERY**.

The **Inner and Outer SCAPULAR Veins** discharge themselves into the axillary, or vein of the arm-pits. See **VEIN**, and **SUBSCAPULARIS**.

**SCAPULAR** \*, or **SCAPULARY**, also denotes part of the habit of several orders of religious, worn over the gown, as a badge of peculiar veneration for the virgin.

\* The word is formed from the French, *scapulaire*, which signifies the same; and that from the Latin, *scapula*, the shoulder-blade.

The *scapular* consists of two narrow breadths or slips of cloth, covering the back and the breasts, and hanging down to the feet of the professed religious, and to the knees of the lay-brothers, &c.

The common opinion concerning the introduction of the *scapular*, is, that it was first given by the virgin herself, in an apparition she made to F. Stock, general of the Carmelites, in the thirteenth century.—Which account of its origin is asserted, or at least supposed, in several bulls of the popes. See CARMELITE.

M. de Launoy, however, maintains, in an express treatise on the subject, that the apparition was false, and the sabbatine bull, which approves of the *scapular*, a counterfeit. In effect, the Carmelites themselves did not begin to wear the *scapular* till several years after it is pretended the virgin gave it to father Stock.

There is also a *Friery*, or *Fraternity of the SCAPULAR*; consisting of lay-brothers, who profess a particular devotion to the virgin, and who, in honour of her, wear a little *scapular*, in manner of a bracelet, or otherwise, representing the great one.—They are obliged to certain prayers, and to observe certain rules in their manner of life.

SCAPUS, in architecture, the fust or shaft of a column. See FUST.

SCAPUS, in botany, denotes the strait stalk, or stem of a plant, standing upright like a pillar, or column. See STEM.

SCAR. See the article ESCHAR.

SCARIFICATION \*, SCARIFICATIO, in chirurgery, an operation whereby several incisions are made in the skin, with a lancet or other instrument proper for that purpose. See SCARIFICATOR.

\* Salmasius will have us write *scarisatio*, not *scarificatio*, in regard the word is derived from the Greek, *σκαρῖσσις*. See his notes on Solinus, p. 519. where he thus corrects the reading of *Plin.* lib. XVII. F. Hardouin lets the old reading *scarificatio* stand; though he owns the MSS. have it *scaripatio*; but adds, that Theod. Priscian writes *scarificatio*.

*Scarificatio* is chiefly practised in cupping. See CUPPING. It acts by stimulating and evacuating.

SCARIFICATOR, a chirurgical instrument used in *scarification*. See SCARIFICATION.

The *scarificator* is made in form of a box, wherein are fitted 10, 12, or 15 lancets, all perfectly in the same plane; which being, as it were, cocked, by means of a spring, are all discharged at the same time, by pulling a kind of trigger, and driven equally within the skin.—Till of late, they used little sharp cutting wheels instead of lancets.

The use of the *scarificator* is to evacuate the blood, and other humours, spread under the skin, by making a great number of apertures, or outlets, therein; which being thus all struck at once, gives much less pain than when struck successively.

SCARLET \*, in dying, one of the seven kinds of good reds. See RED, COLOUR and DYING.

\* Menage derives the word from the barbarous Latin, *scarleta*, or *scarletum*; which he deduces further from the German *scharlach*, or the Flemish *scarlaken*: whence the English have formed *scarlet*, the Italians *scarlato*, and the French their *escarlate*.—Others derive it from the Celtic, *sqarlera*: Dalechamps will have it called *scarlatum*, by corruption, for *cafculatum*, a barbarous word introduced into Spain; others fetch it from the Arabic *yxquerlate*.

There are two kinds of *scarlets*; the one given with *kermes*, or *scarlet-grain*; the other with *cochineel*. See COCHINEEL, KERMES, &c.

SCARLET-GRAIN, is a dyer's drug, used for giving a *scarlet* colour; and commonly taken for the grain of a plant.

This imaginary grain, called by the Arabs, *kermes*, is found on a kind of ilex, growing in great plenty in the uncultivated parts of Provence, Languedoc, Spain and Portugal.—That of Languedoc passes for the best, being big, and of a very bright red; that of Spain is the worst, being very small, and of a blackish red; it is to be gathered when ripe, and is only good while new, that is, within the compass of the year, after which time a kind of insect is found in it, that eats out the heart thereof.

F. Plumier has made some particular discoveries on the subject of *scarlet-grain*: the Arabic term *kermes*, which signifies *little worms*, he observes, agrees perfectly with the nature of this drug; which is the work of a worm, and not the grain or seed of a tree, as is generally supposed.—The shrub it is found on, is the ilex aculeata cocci-glandifera; on the leaves, and little shoots whereof, appear, in the spring time, a kind of little vesiculæ, at first no bigger than grains of millet, occasioned by the puncture of an insect, which deposits its eggs therein.—In proportion as these grow, they become covered with a kind of ash-coloured down, which hides the red colour underneath: and when arrived at maturity, which those who gather them know very well, they are taken from the tree, in form of little galls.

The husk, or skin of these galls, is very light, and brittle, covered with a fine membranous pellicle all around, except at the place where it grows to the leaf: a second skin, under the first, is full of a dust, partly red, and partly white.

As soon as the galls are gathered, the juice, or pulp is ex-

VOL. II. No. CXXXVIII.

pressed from them; and they are washed in vinegar, to destroy the little insects within-side, which, without such precaution, would grow, feed on the dust, and, at last, be hatched, and leave only empty shells.

The *scarlet-grain* is also of considerable use in medicine, where it is better known under its Arabic name of *kermes*. See KERMES and CONFECTION.

SCARLETINA *Febris*, SCARLET-FEVER, the same as purple-fever. See PURPLE and FEVER.

SCARP, in fortification, the interior slope of the ditch of a place; that is, the slope of that side of a ditch which is next to the place, and faces the campaign. See DITCH.

The *scarp* commences from the liziere or foot of the rampart. The *scarp* is opposite to the *counter-scarp*, which is the other side of the ditch. See COUNTERSCARP.

SCARP, is also a term in heraldry, probably derived from the French *escharpe*; signifying the scarf, which military commanders wear for ornament.

It is borne something like a battoon sinister, but is broader, and is continued out to the edges of the field; whereas the battoon is cut off at each end.—He beareth argent, a *scarp* azure.—*V. Tab. Herald. fig. 44.* See also BATTOON.

SCAVAGE, SCHEVAGE, SCHEWAGE, or SHEWAGE, in our ancient customs, a kind of toll or custom, exacted by mayors, sheriffs, &c. of merchants-strangers, for wares shewed, or offered to sale within their liberties. This custom is prohibited by Stat. 19 Hen. VII. c. 7. though the city of London still retains the benefit of it. See OSTENSIO.

SCAVANT \*, or SAVANT, a term purely French, signifying *learned*; little used in our language, except in the phrase, *journal des savans*, denoting, a journal of the works of the learned published monthly at Paris; being the first work of that kind; and that from which all the rest were taken. See JOURNAL.

\* Menage derives the word from the Latin *supere*, to be wise, and on that footing will have it wrote *savant*; others, from *scire*, to know, and for that reason write it *scavant*.—The latter etymology, and orthography, are followed by the academy; though all the ancient MSS. have it *savant*, *savoir*, &c.

SCAVENGERS \*, two officers chose yearly in each parish in London, and the suburbs, whose business it is to hire persons, called *rakers*, and carts to cleanse the streets, and carry away the dirt and filth thereof.

\* The word is derived from the Saxon *scæfda*, or Dutch *schaven*, to scrape or shave away.

The *scavengers* are much the same with what were anciently called *street-wards*.—The Germans call them *drecksinners*, from one Simon a famed *scavenger* of Marburg.

SCELOTYRBE \*, ΣΚΕΛΟΤΥΡΒΗ, weakness and pains in the legs; generally attending scorbutick habits.

\* The word is compounded of *σκελε*, leg, and *τυρβη*, tumult, or uproar.

*Scelotyrbē* is also used for the scurvy itself; and sometimes applied to medicines contrived against such disorders. See SCORBUS.

SCENE \*, SCENA, in its primary sense, denoted a theatre, or place where dramatic pieces, and other publick shews, were represented. See THEATRE.

\* The word is originally Greek, Σκηνή, signifying a tent, hut, booth, or the like, where dramatic pieces were anciently performed.

According to Rosinus, the *scene* in its proper, and original sense, was a series of trees disposed against each other, so as to form a continued arch, and shade, σκηνή, to defend those underneath it from the injuries of the weather: for in such places it was, that, in ancient times, ere theatres were built, they acted their plays. Thus also Cassiodorus derives the word *scene*, from the close shade of the grove, where, in the spring-time, the ancient shepherds used to sing and play.

SCENE, was more particularly used for the decorations of a stage, or theatre. See DECORATION.

The ancients, we are informed by Vitruvius, had three sorts of *scenes*, or scenical decorations in their theatres.—That in common use was a spacious front or range of building adorned with columns and statues; in which were three large openings, through which other buildings appeared in perspective, viz. a palace for tragedies, houses and streets for comedies, and forests for pastorals.

These decorations were either *versatile*, i. e. they turned on pivots, as described by Vitruvius; or *ductile*, i. e. slid along grooves, as those in our theatres.—And, as this or that side, or representation, was turned towards the spectators, the *scene* was called a *tragic*, a *comic*, or a *pastoral scene*. See several curious remarks on the ancient *scene* in M. Perrault's notes on Vitruvius, lib. 5. cap. 6.

SCENE, is also used for the place represented, or that where the action is conceived to have passed. See ACTION.

One of the grand laws of the drama, is, to observe the unity of the *scene*, which we more usually call the *unity of place*. See UNITY.

In effect, to keep close to nature and probability, the *scene* should never be shifted from place to place, in the course of the play. The ancients were pretty severe in this respect,

spect, particularly Terence: in some of his plays, the *scene* never shifts at all, but the whole is transacted before the door of an old man's house, whither, with inimitable art, he brings all his actors, occasionally.

The French too are very strict in this respect: but the English plead for a dispensation from the rule; which they think confines them to too narrow bounds, and precludes them from that variety of adventures and intrigues, which an English audience will never be satisfied without.

However, the more judicious and accurate of our writers are very moderate in the use of this licence; and take care not to deviate too far from probability, by shifting the *scene* between the acts, much farther than the persons concerned may be supposed to have gone in the interval. Hence they seldom carry the *scene* out of the same town.—Though others, who own no subjection to the ancient rules, take otherguise liberties: with some of these it is nothing, when a fancied *scene's* in view, to skip from Covent-Garden to Peru.—The great Shakespear is exceedingly faulty in this respect, in almost all his plays.

SCENE, is also a part, or division, of a dramatic poem, determined by a new actor's entering.

Plays are divided into *acts*, and acts subdivided into *scenes*. See ACT.

In most of our printed plays, a new *scene* is never expressed to begin, but when the place is supposed to be changed by shifting, or drawing, the moveable *scene*; but this must be esteemed an oversight, since on our stage, the *scene* is, properly, the persons present at, or concerned in, the action on the stage at such time. Whenever, therefore, a new actor appears, or an old one disappears, the action is changed into other hands, and therefore a new *scene* then commences.

It is one of the laws of the stage, that the *scenes* be well connected: that is, that one succeed another, in such manner, as that the stage is never quite empty till the end of the act. See CONNECTION.

The ancients did not allow of above three persons on the stage at the same time, excepting in the chorus's, where the number was not limited: the moderns have but little regard to this restriction.

SCENIC Games, *Ludi SCENICI*, among the ancients, were entertainments exhibited on the *scena*, or theatre; including what we now call *plays* of all kinds, with dancing, and other theatrical performances. See THEATRE, GAME, &c. The Romans were 400 years without any *scenic games* at all: Livy observes, that they were first instituted in the year of Rome 392, under the consulate of C. Sulpitius Peticus, and C. Licinius Stolo. But the critics have observed a trip here in Livy; the consulate of those persons falling in the year 389, which, therefore, is held the æra of the introduction of *scenic games*. See SATYR.

At first, some actors were sent for out of Hetruria; who, without reciting any thing, danced about to the sound of instruments: so that thus far was no more than a ball, or rather what the French call a *ballet*.—At length they began to rehearse verse. See ATELLAN, FESCENNINE, &c.

Thus, by degrees, growing more and more perfect, their *scenical* shews were at last represented with a justness, and magnificence, beyond any thing the world ever saw.—The fathers, in their writings, cry out loudly against the *scenical games*.

SCENOGRAPHY\*, in perspective, a representation of a body on a perspective plane; or, a description thereof in all its dimensions, such as it appears to the eye. See PERSPECTIVE.

\* The word is formed from the Greek, *σκηνη* scene, and *γραφον* description.

The ichnography of a building, &c. represents the plan, or ground-work of the building. See ICHNOGRAPHY. The orthography, the front, or one of the sides. See ORTHOGRAPHY. And the *scenography*, the whole building, front, sides, height and all, raised on the geometrical plan.

To exhibit the SCENOGRAPHY of any body.—1°. Lay down the basis, ground-plot, or plan of the body, in the perspective ichnography, according to the method laid down under the article PERSPECTIVE. 2°. Upon the several points of the plan raise the perspective heights: thus will the *scenography* of the body be compleated; excepting that a proper shade is to be added. The method of raising the heights is as follows.

On any point given as C, *Tab. Perspect. fig. 1. N°. 2.* to raise a perspective altitude, answerable to an objective altitude P Q.—On the terrestrial line raise a perpendicular P Q, equal to the given objective altitude. From P and Q, to any point, as T, draw right lines P T and Q T. From the given point C draw a right line C K, parallel to the terrestrial line D E, meeting the right line Q T in K. In the point K, upon the line K C, erect a perpendicular I K. This I K is the *scenographic* altitude required.

The application of this general method of drawing the *scenography* of a body, is not so obvious, in every case, but that it may be necessary to illustrate it a little by a few examples.

To exhibit the SCENOGRAPHY of a cube, viewed by an angle.—

1°. As the basis of a cube viewed by an angle, standing on a geometrical plane, is a square viewed by an angle; draw a square, viewed angular-wise, on the perspective table, or plane. 2°. Raise the side H I (*fig. 2. N°. 2.*) of the square perpendicularly on each point of the terrestrial line D E; and to any point, as V, of the horizontal line H R, draw the right line V I and V H. 3°. From the angles d, b and c, draw c 1, d 2, &c. parallel to the terrestrial line D E. 4°. From the points 1 and 2, raise L 1, and M 2, perpendicular to the same. Lastly, since H I is the height to be raised in a, L I in c and b, and M 2 in d; in a, raise the line f a perpendicular to a E; in b and c, raise b g and c e perpendicular to b c 1; and lastly, raise d h, perpendicular to d 2: and make a f = H I, b g = e c = L 1, and h d = M 2: if then the points g, h, e, f be connected by right lines, the *scenography* will be compleat.

To exhibit the SCENOGRAPHY of a hollow quinquangular prism.

—1°. Since the base of a hollow quinquangular prism, standing on a geometrical plane, is a pentagon, with a limb or breadth of a certain dimension; find the appearance of this pentagon on a table, or plane. See PERSPECTIVE. 2°. On any point, as H, of the terrestrial line D E (*fig. 3.*) raise a perpendicular H I, equal to the objective altitude; and to any point, as V, of the horizontal line H R, draw the lines H V and I V. 3°. From the several angles a, b, d, e, c, of the perspective ichnography, both the internal and external ones, draw right lines, as b 2, d 3, &c. parallel to the terrestrial line; and from the points 1, 2, 3, raise perpendiculars to the same, as L 1, M 2, n 3. If these, then, be raised in the correspondent points of the ichnography, as in the preceding article, the *scenography* will be compleat.

To exhibit the SCENOGRAPHY of a cylinder.—1°. Since the base of a cylinder, standing on a geometrical plane, is a circle; seek the appearance of a circle. In the points, a, b, d, f, h, g, e, c, (*fig. 8.*) raise the apparent altitudes, as in the preceding articles. If now their upper lines be connected by curve lines, as in the base, a, b, d, f, g, h, e, c, the *scenography* of the circle will be compleat.

It is evident that those lines are to be omitted, both in the plan and in the elevation, which are not exposed to the eye; though they are not to be disregarded, from the beginning, as being necessary for the finding of other lines.—E. gr. In the *scenography* of the cube, viewed angle-wise, the lines b d and d c, (*fig. 2. N°. 2.*) in the base, and d h in the elevation, are hid from the eye, and are therefore omitted in the description. But since the upper point h is not to be found unless the point d be had in the ichnography; nor can the lines g h and d e be drawn without the height d h; the appearance of the point d is as necessary to be determined in the operation, as the height h d.

To exhibit the SCENOGRAPHY of a pyramid, standing on its base.

—Suppose, e. gr. it were required to delineate a quadrangular pyramid, viewed by an angle. 1°. Since the base of such pyramid is a square seen by an angle, draw such a square. 2°. To find the vertex of the pyramid, i. e. a perpendicular let fall from the vertex to the base, draw diagonals mutually intersecting each other in e (*fig. 5. N°. 2.*) 3°. On any point, as H, of the terrestrial line D E, raise the altitude of the pyramid H I; and drawing the right lines H V, and I V to each point of the horizontal line H R; produce the diagonal a b, till it meet the line V H in h. Lastly, from h draw h i parallel to H I. This being raised on the point e, will give the vertex of the pyramid K; consequently, the lines d k, k a, and k b, will be determined at the same time.

After the like manner is the *scenography* of a cone delineated.

To exhibit the SCENOGRAPHY of a truncated pyramid.—Suppose the truncated pyramid quadrangular; 1°. then, If from the several angles of the upper base be conceived perpendiculars let fall to the lower base, we shall have a pentagon, with another inscribed therein, whose sides are parallel to those of the former. This coincides with a pentagon, furnished with a rim or breadth, &c. and may therefore be delineated in the same manner.—2°. Raising the altitude of the truncated pyramid I H (*fig. 6. N°. 2.*) determine the *scenographic* altitudes, to be raised in the points a, b, c, d, e. If now the points higher f, g, h, i, k, be connected by right lines, and the lines l k, f m, g n, h o, be drawn, the *scenography* will be compleat.—By drawing two concentric circles in a geometrical plane, and doing every thing else, as in this problem, the *scenography* of a truncated cone will be drawn.

To exhibit the SCENOGRAPHY of walls, columns, &c. or to raise them on the pavement.—1°. Suppose a pavement AFHI (*fig. 7. N°. 2.*) represented in a plan, together with the bases of the columns, &c. if there be any. 2°. Upon the terrestrial line set off the thickness of the wall B A and 1 3. 3°. Upon A and B, as also upon 3 and 1, raise perpendiculars A D and B C, as also 3, 6, and 1, 7. 4°. Connect the points D and 6 with the principal point V, by the right lines D V and 6 V. 5°. Upon F and H raise perpendiculars H G and E F. Thus will all the walls be delineated.

Now

Now to raise the pillars, &c. there needs nothing but, from their several bases (whether square, or circular) projected on the perspective plan, to raise indefinite perpendiculars; and on the fundamental line, where intersected by the radius F A passing through the base, raise the true altitude A D: for D V being drawn as before, the *scenographical* altitudes will be determined.

*To exhibit the SCENOGRAPHY of a door in building.*—Suppose a door required to be delineated in a wall D E F A; 1°. Upon the fundamental line set off its distance A N from the angle A, together with the breadths of the posts N I and L M, and the breadth of the gate itself L I. 2°. To the point of distance K, from the several points N, I, L, M, draw right lines K N, K I, K L, K M, which will determine the breadth of the door I i. and the breadths of the posts i n and m l. 3°. From A to O, set off the height of the gate A O, and from A to P, the height of the posts A P. 4°. Join O and P with the principal point, by the right lines P V and O V. 5°. Then, from n, i, l, m, raise perpendiculars, the middle ones whereof are cut by the right line O V in o, and the extremes, by the right line V P in p. Thus will the door be delineated, with its posts. If the door were to have been exhibited in the wall E F G H, the method were nearly the same. For, 1°. Upon the terrestrial line, set off the distance of the door from the angle, and thence also the breadth of the door R T. 2°. From R and T, draw right lines to the principal point V, which give the breadth r t in the perspective plan. 3°. From r and t, raise indefinite perpendiculars to F H. 4°. From A to O, set off the true height A O. Lastly, from O, to the principal point V, draw the right line O V, intersecting E F in Z, and make r r and t t equal to F Z.—Thus is the door r r, t t, drawn; and the posts are easily added, as before.

*To exhibit the SCENOGRAPHY of windows in a wall.*—When you know how to represent doors, you will find no difficulty in adding windows; all that is here further required, being to set off the height of the window from the bottom of the ground. The whole operation is as follows. 1°. From 1 to 2, set off the thickness of the wall at the window; from 3 to 4, its distance from the angle 3; and from 4 to 5 its breadth. 2°. From 4 and 5, to the point of distance L, draw the right lines L 5 and L 4, which will give the perspective breadth 10, 9 of the window. 3°. From 10 and 9 raise lines perpendicular to the pavement, i. e. draw indefinite parallels to 6, 3. 4°. From 3 to 11 set off the distance of the window from the pavement 3, 11; and, from 11 to 12, its height 11, 12. Lastly, from 11 and 12, to the principal point V, draw lines V 11 and V 12; which intersecting the perpendiculars 10, 13, and 9, 14, in 13 and 14, as also in 15 and 16, will exhibit the appearance of the window.

From these examples, which are all no more than applications of the first grand general rule, it will be easily perceived what method to take to delineate any other thing, and at any height from the pavement.

For a mechanical method of exhibiting the SCENOGRAPHY of any object, see DESIGNING.

SCENOPEGIA\*, ΣΚΗΝΟΠΗΓΙΑ, a feast among the Jews, more usually called *feast of tabernacles*, instituted after the people of Israel were in possession of the land of Canaan, in memory of their having dwelt under tents in the wilderness.

\* The word is Greek, formed of σκηνή, scene, tabernacle, tent; and πηγῆμι, figo, I fix.

The *scenopegia* was held for eight days successively, commencing on the fifteenth of September. The last day was much the most solemn; both on account of the conflux of persons, and of the extraordinary tokens they gave of their joy.—It is of this eighth day, St. John must be understood to speak, when he tells us, our Saviour was at the feast of tabernacles, on the last and great day.

When the holy scripture says absolutely, *the feast*, it is usually to be understood of the *scenopegia*.

SCEPTER\*, SCEPTRUM, a royal staff, or battoon, borne, on solemn occasions, by kings, as a badge of their command and authority. See KING, and REGALIA.

\* Nicod derives the word from the Greek, σκηπτρον, which, he says, originally signified a javelin, which the ancient kings usually bore as a badge of their authority, in regard that instrument was in very great veneration among the heathens.—But σκηπτρον does not properly signify a javelin, but a staff to rest upon, from σκηπτω, innitor, I lean upon.

The *scepter* is an ensign of royalty of greater antiquity than the crown. The Greek tragic, and other poets, put *scepters* in the hands of the most ancient kings they ever introduce.

Justin observes, that the *scepter*, in its original, was a *hasta*, or spear: he adds, that in the most remote antiquity, men adored the *hasta*, or *scepters*, as immortal gods; and, that it was upon this account, that even in his time, they still furnished the gods with *scepters*.—Neptune's *scepter* is his trident. See TRIDENT.

Tarquin, the elder, was the first who assumed the *scepter* among the Romans.—Le Gendre tells us, that in the first race of the French kings, the *scepter* was a golden rod, al-

most always of the same height with the king who bore it, and crooked at one end like a crozier.—Frequently, instead of a *scepter*, kings are seen on medals with a palm in their hand.

SCEPIER, SCEPTRUM, in astronomy, one of the six new constellations of the southern hemisphere, consisting of 17 stars; one of the 4th magnitude, 8 of the 5th, and as many of the 6th. See STAR and CONSTELLATION.

SCEPTICISM, the doctrine and opinions of the scepticks; called also *Pyrrhonism*, from the name of its author. See SCEPTICKS and PYRRHONISM.

The ancient *scepticism* consisted in doubting of every thing, in affirming nothing at all, and in keeping the judgment in suspense on every thing. Sextus Empiricus makes *scepticism* to consist in a faculty of opposing all appearances, of making all, even contrary things, equally probable, and of proceeding first to an *εποχή*, suspense of mind, and then to an intire undisturbedness or tranquillity. See ACADEMY and ACADEMICKS.

Hence these great maxims of theirs: Οὐ μάλ' ὅτι οὐκ ἔστιν, this no more than that: Πάντι λόγῳ λόγῳ, &c. every reason has another against it; and Οὐδὲν εἰζώ, I determine nothing.

The proper character then of *scepticism*, is an *ακαταlepsία*, neutrality, or such a disposition of mind as does not, upon any occasion, incline to any thing more than the contrary thing. See ACATALEPSIA.

This hesitancy of the scepticks is well described by Aristotle in Euseb. *de præpar. evan.* All things are equally indifferent, uncertain and undeterminate: neither our senses, nor our opinions give us either truth or falsehood: therefore, neither the one, nor the other are to be credited; but all things to be left on a level, without admitting any opinion, inclination or motion of the mind at all.—It is added, that the scepticks carried this suspense of theirs so far, as to deny, that any thing is either good or evil, just or unjust, true or false; or that any thing is this, more than that: See EVIL, GOOD, &c.

It is from this *acatalepsia* of the scepticks, that Des Cartes seems to have borrowed his great principle of doubting of all things; as is owned by many of his followers.—It must be owned, there is some difference between the doubting of the scepticks, and that of the Cartesians. In physical matters, it is true, there does not seem a great deal of difference; and Des Cartes, in that respect, may, without much injustice, be deemed a sceptick: but this may be said in his favour, that the great Socrates was so far a sceptick himself; physical and sensible things, he held, were all dubious, and, at best, but probable. See CARTESIANISM.

The origin of *scepticism* is somewhat obscure. Pyrrho, who lived under Alexander the Great, and made the tour of India in his retinue, is usually reputed the author; whence Pyrrhonians and scepticks are ordinarily used indifferently. See PYRRHONIAN.

It must be owned, however, that the great dogma of the scepticks had been countenanced, and even cultivated before Pyrrho, by Democritus, Heraclitus, &c.—Sextus Empiricus says, expressly, that all that Pyrrho did, was to improve, illustrate and enforce the dogma, and form the retainers thereto into a sect.

Democritus's philosophy was near akin to *scepticism*; for upon his observing, that honey seemed sweet to some, and bitter to others, he concluded, that it was neither sweet nor bitter; and thereupon, pronounced *μᾶλλον, non magis*, which is pure *scepticism*.—Yet the same Sextus adds, that Democritus was no sceptick.

Though Plato argues very strenuously against the *acatalepsy* of the scepticks; yet it is certain that dogma received a great part of its encouragement from Socrates's school, and Plato's academy. Nay, it was a great controversy among the ancients, whether Plato himself were a sceptick or dogmatist? Indeed Plato's decisive way of speaking, in many cases, seems to leave no great room for such a doubt; but it is certain, his followers of the new academy founded by Arcesilas, gave much into this way; and *nihil scitu*, was held by them a principle. See ACADEMY, PLATONIC, &c. Sextus Empiricus observes, that Socrates himself had a tincture of *scepticism*; some even make him the author of it, from that customary saying of his, *I know nothing but this, that I know nothing*. If this were the origin of *scepticism*, it must be owned, it was mightily improved afterwards, as Metrodorus said, *I know nothing, not even this, that I know nothing*. The same Sextus however adds, that Plato, introducing his master in his gymnastick dialogues, disputing with the sophists, makes him act the part of a sceptic. See SOCRATIC.

Some have even charged Job, and Solomon, with *scepticism*; from their proposing a great number of questions, without deciding any of them. The philosopher of Kiel, who has published a dissertation on *scepticism*, fetches its origin still higher: he will have the devil the author thereof, who made our first parents doubt of the word of God himself; and drew them in, the first proselytes to *scepticism*. See DOUBTING.

SCEP-

**SCEPTICKS\***, **SCEPTICI**, a sect of ancient philosophers, founded by Pyrrho, whose distinguishing tenet was, that all things are uncertain and incomprehensible; contraries equally true; that the mind is never to assent to any thing; but to keep up an absolute hesitancy or indifference. See **SCEPTICISM**.

\* The term *sceptick*, in its original Greek, *σκηπτικος*, properly signifies *considerative*, and *inquisitive*; or a man who is ever weighing the reasons on one side and the other, without ever deciding between them: it is formed from the verb *σκηπτομαι*, I consider, look about, deliberate.

Laertius notes, that the followers of Pyrrho had various denominations: from their master, they were called *Pyrrhonians*: from their dogma, *aporetici*, that is, doubters, of *απορειν*, to doubt.—From their suspension and hesitation, *ephetici*, of *επηχ*, to flay, to keep back.—And from their never getting beyond the search of truth, *zetetici*, seekers.

Plato refutes the great principle of the *scepticks* thus: when you say, that all things are incomprehensible, do you comprehend or conceive that they are thus incomprehensible, or do you not? if you do, then something is comprehensible; if you do not, there is no reason we should believe you, since you do not comprehend your own assertion. See **ACATALEPSY**.

**SCHAR-PENNY**, **SCARN-PENNY**, or **SCHORN-PENNY**.—It appears from our old books, that some customary tenants were obliged to pen up their cattle at night in the pound or yard of their lord, for the benefit of their dung, or *scarn*, as the Saxons called it.—In defect of this, they were to pay a small compensation; hence called *schar-penny*.

**SCHEAT**, or **SEAT**, in astronomy, a fixed star of the second magnitude in the juncture of the leg with the left shoulder of Pegasus. See **PEGASUS**.

Some call it *scheat alphas*, and some *scheat Pegasi*.—Its longitude, according to Mr. Flamsteed, is  $25^{\circ} 2' 13''$ , its latitude  $31^{\circ} 8' 6''$  north.

**SCHEDULE\***, **SCHEDULA**, a scroll of paper, or parchment, annexed to a will, lease, or other deed; containing an inventory of goods, or some other matter, omitted in the body of the deed. See **CODICIL**.

\* The word is a diminutive of the Latin *scheda*, or Greek *σχηδ*, a leaf or piece of paper.

**SCHEITER**, fortification. See **FORTIFICATION**.

**SCHEMATISM**, **ΣΧΗΜΑΤΙΣΜΟΣ**. See the articles **FIGURE** and **TROPE**.

**SCHEME\***, a draught, or representation of any geometrical, or astronomical figure, or problem, by lines sensible to the eye; or of the celestial bodies in their proper places for any moment. See **FIGURE** and **DIAGRAM**.

\* The word is formed from the Greek, *σχημα*, habitus.

**SCHEME arches**. See the article **ARCH**.

**SCHEVAGE**. See the article **SCHEWAGE**.

**SCHIPPER**. See the article **SHIPPER**.

**SCHIREMOTE**, or **SCYREMOT**. See **SCYREMOT**.

**SCHISM\***, **SCHISMA**, in the general, signifies *division*, or *separation*; but it is chiefly used in speaking of separations happening through diversity of opinions, among people of the same religion, and faith.

\* The word is formed from the Greek, *σχισμα*, cleft, fissure.

Thus, we say, the *schism* of the ten tribes of Israel, from the two tribes of Juda and Benjamin; the *schism* of the Persians, from the Turks and other Mahometans, &c.

Among ecclesiastical authors, the *great schism of the west*, is that which happened in the times of Clement VII. and Urban VI. which divided the church for forty or fifty years, and was at length ended by the election of Martin V. at the council of Constance.

The Romanists number thirty-four *schisms* in their church.—They bestow the name, *English schism* on the reformation of religion in this kingdom.—Those of the church of England again apply the term *schism* to the separation of the non-conformists, viz. the presbyterians, independents, and anabaptists, who contend for a further reformation.

Some call the separation of the protestants from the church of Rome, a *passive schism*, because that church cut them off from her communion.

**Negative SCHISM**. See the article **NEGATIVE**.

**SCHOENOBATES\***, **ΣΧΟΙΝΟΒΑΤΗΣ**, a name which the Greeks gave to their rope-dancers: by the Romans called *funambuli*. See **ROPE-DANCER** and **FUNAMBULUS**.

\* The word is formed from the Greek, *σχον*, a rope; and *βασι*, I walk.

The *schoenobates* were slaves, whose masters made money of them, by entertaining the people with their feats of activity.—Mercurialis *de arte gymnastica*, lib. III. gives us five figures of *schoenobates* engraven after ancient stones.

**SCHOLARUM domesticus**. See **DOMESTICUS**.

**SCHOLASTIC**, **ΣΧΟΛΑΣΤΙΚΟΣ**, something belonging to the schools; or that is taught in the schools. See **SCHOOL**.

**SCHOLASTIC**, **SCHOLASTICUS**, was a long time a title of honour; at first only given to such as distinguished themselves by their eloquence, in declaiming, &c. See **ORATOR**, **SOPHIST**, **RHETOR**, &c.

After Nero, the appellation **SCHOLASTICUS** was also given to the advocates; and among others, to Socrates and Eusebius,

the ecclesiastical historians, who were advocates at Constantinople. Constant. Harmenopolus also bore it in the twelfth century, with several others. See **ADVOCATE**, **ADVOCATE**, and **DEFENDER**.

Afterwards, **SCHOLASTICUS** became restrained to such as had the government of the ecclesiastical schools, established under the first race of French kings, who instructed the clerks of each church, first in the humanities, then in the theology and the liturgy.—These were also called *primiciers escolastres*, and *theologaux*: if the church were situated in a city, the *scholasticus* was called the *chancellor*.

Among the Greeks, **SCHOLASTICUS**, *Σχολαστικος*, was also the name of an office, or dignity; answering to our *divine* or *theologue*.—Indeed, Genebrard observes, it was only properly applied to people of general learning, and fine parts, and who were well known to the world in that character.

Thus, St. Jerom mentions, that Serapion was surnamed *Scholasticus*, by reason of the delicacy of his wit: Walafrid Strabo, calls the poet Prudentius, *scholasticus*: Fortunatus was called *scholasticissimus*.

**SCHOLASTIC divinity**, is that part or species of divinity which clears, and discusses questions, by reason, and arguments. See **THEOLOGY**.

In which sense, it stands, in good measure, opposed to *positive* divinity, which is founded on the authority of fathers, councils, &c. See **POSITIVE**.

The *school divinity*, like Plato's school, has had its three several ages, or periods: the *ancient*, the *middle*, and the *new*.

The *ancient* began under Lanfrank, archbishop of Canterbury, or, more properly, under Peter Lombard, the master of the sentences; and held about 200 years; ending under Albertus Magnus.

This was succeeded by the *middle school divinity*, which lasted about 100 years, to the time of Thomas Aquinas; during which time the peripatetic philosophy was raised to its utmost reputation. See **PERIPATETIC**.

The third age began under Durandus, who set himself up against Thomas, the chief of the *middle* age. After his time people's wits became more and more subtle; and the school began to be wholly taken up in frivolous questions. They disputed, with great heat, about mere formalities; and even raised phantoms on purpose to combat withal.

The *school divinity* is now fallen into the last contempt; and is scarce regarded any where, but in some of the universities, where they are still obliged by their charters to teach it.

**SCHOLIAST**, **ΣΧΟΛΙΑΣΤΗΣ**, *commentator*; a grammarian, who writes *scholia*, that is, notes, glosses, &c. upon ancient Greek authors. See **SCHOLIUM**.

**SCHOLIUM**, **ΣΧΟΛΙΟΝ**, a note, annotation, or remark occasionally made on some passage, proposition, or the like. See **GLOSS**, **COMMENTARY**, **ANNOTATION**, &c.

The term is much used in geometry, and other parts of mathematics; where, after demonstrating a proposition, it is frequent to point out how it might be done some other way; give some advice, or precaution, in order to prevent mistakes; or add some particular use or application thereof.

Wolffius has given us abundance of curious and useful arts, and methods, a good part of the modern philosophy, the description of mathematical instruments, &c. all by way of *scholia* to the respective propositions in his *Elementa Mathematicos*.

**SCHOOL\***, **SCHOLA**, a publick place, wherein the languages, humanities, or other arts and sciences are taught.

\* The word is formed from the Latin, *schola*, which according to Du Cange signifies *discipline*, and *correction*: he adds, that it was anciently used, in the general, for all places, where several persons met together, either to study, to converse, or do any other matter. Accordingly, there were *scholae palatinae*, being the several posts wherein the emperor's guards were placed; *schola scutariorum*, *schola gentilium*, &c. At length the term passed also to civil magistrates; and accordingly in the code, we meet with *schola chartulariorum*, *schola agentium*, &c. and even to ecclesiasticks; as, *schola cantorum*, *schola sacerdotum*, &c.

Thus we say, a grammar *school*, a writing *school*, a *school* of natural philosophy, &c.

**SCHOOL**, is also used for a whole faculty, university, or sect: as Plato's *school*, the *school* of Epicurus, the *school* of Paris, &c. The *school* of Tiberias was famous among the ancient Jews; and it is to this we owe the *massora*, and *massorettes*. See **MASSORETES**.

**SCHOOL**, in painting, is used to distinguish the different manners of places, and persons. See **MANNER**, &c.

Thus we say, the Roman *school*, the Venetian *school*, the Flemish *school*, &c. Raphael's *school*, Titian's *school*, da Vinci's *school*, &c. meaning their disciples, pupils, &c. See **PAINTING**.

**SCHOOL of Athens**, is the name of a celebrated piece of Raphael, now in the Vatican.—It contains a great number of figures, representing philosophers, mathematicians, and other persons engaged in the arts, and sciences.

Several authors have wrote of this painting, and given different explications thereof: Vafari will have it to be, the

agreement of philosophy, and astronomy, with theology.—The engravers, by the inscription they add at the bottom of the print thereof, shew, that they take it for a painting of St. Paul preaching at Athens.—An Augustin of Venice takes the philosopher who is writing, for St. Mark; and he at his knees, for the angel Gabriel.

M.de Piles rejects all these explications of the *school of Athens*, and especially the last: his opinion is, that it is nothing more than an image of philosophy, which Raphael here represents under all the philosophers he has painted.

In behalf of the Venetian engravers it may be said, that they do not pretend to explain the painting, but have only copied such of the figures as they thought proper to represent, St. Mark, St. Gabriel, &c.

SCHOOL philosophy, theology, &c. the same with *scholastic*. See SCHOLASTIC and THEOLOGY.

Charity SCHOOLS. See the article CHARITY.

SCHOOUBIAH, a sect among the mussulmen, whose distinguishing tenet it is, that the Sunnites are not a whit preferable to the Shiites or Rafadhites, i. e. the orthodox to the heterodox; but that both the one and the other are equally true believers.

The *Schooubiah*, therefore, should be properly, the Latitudinarians of Mahometanism: yet are not they regarded by either party, as much better than Gentiles, or Heathens, as their name imports. See DEISM, &c.

There are abundance among the mussulmen, who give into this sect, only secretly; Mahometanism, like all other false religions, being an avowed enemy to toleration. See MAHOMETANISM, TOLERATION, LIBERTY of conscience, &c.

SCHORN-PENNY. See the article SCHAR-PENNY.

SCIAGRAPHY, or SCIOGRAPHY, the profile, or section of a building, to shew the inside thereof. See SECTION and PROFILE.

SCIAGRAPHY, in astronomy, &c. is a term some authors use for the art of finding the hour of the day or night, by the shadow of the sun, moon, stars, &c. See DIAL.

SCIAMANTIA \*, SCIAMANCY, or SCIOMANCY, a kind of divination, otherwise called *psychomancy*.—*Sciamancy* among the ancients, was the art of raising and calling up the manes or souls of deceased persons, to give intelligence of things to come. The witch who conjured up the soul of Samuel, to foretel Saul the event of the battle he was about to give, did it by *sciamancy*.

\* The word is formed from the Greek, *σκια*, shadow, used metaphorically for the soul, and *μαντια*, divination. See DIVINATION.

SCIATICA, in medicine, the gout in the hip. See GOUT.

SCIE.—*Feuille de scie*. See FEUILLE de scie.

SCIENCE \*, in philosophy, a clear and certain knowledge of any thing, founded on self-evident principles, or demonstration. See KNOWLEDGE.

\* The word is formed from the Latin, *scientia*, of *scire*, to know.

In this sense, *doubting* is opposed to *science*; and *opinion* is the middle between the two. See DOUBTING and OPINION.

The scepticks profess to deny, that we have any such thing as *science*; that is, any clear, certain notices of any thing, capable of producing absolute conviction. See SCEPTICISM. Divines suppose three kinds of *science* in God: the first, *science of mere knowledge*, whereby God knows himself, and all things possible.—The second, *science of vision*, whereby he knows all things he has resolved to do, or to permit, in the same order wherein he has resolved to do, and to permit them.—The third, a *mediate or intermediate science*, whereby he knows what angels and men will do, in certain cases and certain circumstances, if he resolve to bring them about.

It is greatly disputed among school divines, whether or no there be such a mediate *science* in God? the reason why some call it in question is, because it does not consist well with their particular schemes of prescience, &c. See LIBERTY, NECESSITY, &c.

SCIENCE of conditionals. See CONDITIONAL.

SCIENCE, is more particularly used for a formed system of any branch of knowledge; comprehending the doctrine, reason and theory of the thing, without any immediate application thereof to any uses or offices of life.

In which sense, the word is used in opposition to *art*. See ART.

Indeed, the precise notion of an art, and *science*, and their just, adequate distinction, do not seem to be yet well fixed. See the PREFACE to this work.

As to the number, and division of the *sciences*, Mr. Locke limits them thus: all that can fall within the compass of human understanding, is, first, either the nature of things, their relations, and their manner of operation: or, secondly, that which man himself ought to do as a voluntary and rational agent, for the attainment of any end, especially happiness: or, thirdly, the ways and means, whereby the knowledge of both of these is attained and communicated: whereupon, *science* may be properly divided into these three sorts.

VOL. II. N°. CXXXVIII.

First, the knowledge of things, their constitutions, properties and operations, whether material or immaterial.—This, in a little more enlarged sense of the word, may be called, *φυσικη*, or *natural philosophy*.—The end of this is bare speculative truth, and whatsoever can afford the mind of man any such, falls under this branch; whether it be God himself, angels, spirits, bodies, or any of their affections; as number, figure, &c. See PHYSICS and PHILOSOPHY.

Secondly, *πρακτικη*, the skill of right applying our own powers, and actions for the attainment of things good and useful.—The most considerable under this head, is *ethicks*, which is the seeking out those rules and measures of human actions, which lead to happiness, and the means to practise them. The end of this is not bare speculation; but right, and a conduct suitable thereto. See ETHICKS and MORALITY.

Thirdly, *σημειωτικη*, or the doctrine of signs.—The most usual being words, it is aptly enough termed *logick*; the business whereof is to consider the nature of signs which the mind makes use of for the understanding of things, or conveying its knowledge to others. Things are represented to the mind by ideas; and mens ideas are communicated to one another by articulate sounds or words. The consideration then of ideas and words, as the great instruments of knowledge, makes no despicable part of their contemplation who would take a view of human knowledge in the whole extent of it. See WORD, LANGUAGE, &c.

This seems the first, and most general, as well as natural division of the objects of our understanding: for a man can employ his thoughts about nothing, but either the contemplation of things themselves for the discovery of truth; or about the things in his own power, which are his actions, for the attainment of his own ends; or the signs the mind makes use of, both in the one and the other, and the right ordering of them, for its clearer information.—All which three, viz. things as they are in themselves knowable; actions, as they depend on us in order to happiness; and the right use of signs in order to knowledge, being *totò cœlo*, different, they seem to be the three great provinces of the intellectual world, wholly separate and distinct one from another. See KNOWLEDGE.

Academy of SCIENCES. See the article ACADEMY.

SCIENTIFIC, or SCIENTIFICAL, something relating to the pure, sublimer sciences; or, that abounds in science, or knowledge. See SCIENCE, KNOWLEDGE and FAITH.

A work, a method, &c. is said to be *scientific*, when it is founded on the pure reason of things, or conducted wholly on principles thereof. See METHOD.

In which sense, the word stands opposed to narrative, arbitrary, opinionative, positive, tantative, &c.

SCILLA, or SQUILLA, *squill*, the *sea-onion*; a medicinal plant, of the onion-kind, but very large; chiefly brought from Spain: used only in infusion, and that generally in vinegar, which it renders emetic.

There are two kinds of *squills*, *male* and *female*: the *male* are whitish, and the *female* reddish; whence they are also distinguished by the appellations of *white squills*, *scillæ albæ*, and *red squills*, *scillæ rubræ*.

Their infusion, when boiled to the consistence of a syrup, with honey, is called *oxymel scylliticum*, in the shops, and retains the same properties.

*Squills* powerfully deterge, and scour off the viscid adhesions in the bowels, and gently irritate the stomach to ejection. They are also, as all of the onion-kind are, very diuretick, and therefore in great esteem, with some, in dropsies: if their infusion be mixed with cinnamon-water, they will seldom vomit, but work downwards, and very forcibly, by urine: in asthma, and all obstructions, or infractions of the lungs, which are to be removed by deterfives and expectoration, there is scarce any thing more effectual. They are also esteemed alexipharmick, and upon that account have a place in the theriaca Andromachi.

SCILLITICUM *vinum*. See the article VINUM.

SCIOPTICK, a sphere or globe of wood, with a circular hole or perforation wherein a lens is placed.—It is so fitted, that, like the eye of an animal, it may be turned round every way; to be used in making experiments of the darkened room. See CAMERA OBSCURA.

SCIRE-FACIAS, a judicial writ, most commonly used to call a man to shew cause to the court whence it issues, why execution of a judgment passed, should not be made out? This writ is not granted, till a year and a day be elapsed after a judgment given.

*Scire-facias*, upon a fine, lies only after a year and a day after the fine levied.—Otherwise, it is the same with the writ of *habere facias seisinam*. See HABERE facias, &c.

SCIRRHUS \*, *σκίρρος*, in medicine, a hard, indolent tumor, formed gradually, in the soft, glandulous parts of the body; sometimes internal, and sometimes external.

\* The word is Greek, formed of *σκιρ*, a piece of marble.

There are two kinds of *scirrhus*'s; the one only beginning, and frequently painful when pressed by the fingers; the other, confirmed and senseless.

The *scirrhus* arises from a thick, viscid, probably gritty matter,

matter, detained and indurated in the pores and other minute passages of the parts affected.

There are some *scirrhus's* as hard as stones; some are even painful in their confirmed state, and partake of the nature of a cancer.

SCITE. See the article SITE.

SCLAVONIC, the language of the Sclavi, an ancient people of Scythia Europæa; who, about the year 518, quitting their native country, ravaged Greece and established the kingdoms of Poland and Moravia, and at last settled in Illyria: which thence took the name of *Sclavonia*. See LANGUAGE.

The *Sclavonic* is held, after the Arabic, the most extensive language in the world: it is spoke from the Adriatic to the north sea, and from the Caspian to Saxony, by a great variety of people, all, the descendants of the ancient Sclavi, viz. the Poles, Muscovites, Bulgarians, Carinthians, Bohemians, Hungarians, Prussians, Suabians, &c. each of whom, however, have their particular dialect; only the *Sclavonic* is the common mother of their several languages, viz. the Polish, Russian, Hungarian, &c.

By a Latin chronicle of the Sclavi, composed by Helmold, a priest of Bosow, and Arnold abbot of Lubec, and corrected by M. Leibnitz, it appears, that the Sclavi anciently inhabited the coasts of the Baltic sea, and were divided into eastern and western: in the latter whereof, were the Russians, Poles, Bohemians, &c. And in the former, the Vandals.

Dom. Maur. Orbinus Rauser, abbot of the order of Malta, in an Italian history of the Sclavi, intitled, *Il regno de gli Slavi*, printed in 1601, will have them to be originally of Finland in Scandinavia. Laur. Pribevo, a Dalmatian, in an express discourse on the origin of the Sclavi, maintains them to be originally of Thrace, and the same with the Thracians, the posterity of Thiras, seventh son of Japhet. Theod. Polycarpowitz, in a Greek, Latin and *Sclavonic* dictionary, printed at Moscow in 1704, observes, that the word *Sclava*, whence *Sclavonic* is formed, signifies in their language, *glory*.

SCLEROPHTHALMIA, ΣΚΛΗΡΟΦΘΑΛΜΙΑ, a kind of ophthalmia, wherein the eye is dry, hard, red and painful; and the eyebrows likewise; so as not to be opened after sleep, without great pain. See OPHTHALMIA.

SCLEROTICA \*, in anatomy, one of the common membranes of the eye, situate between the adnata and the uvea; it is very firm and opaque behind; but transparent before.—Though in strictness, it is only the hind-part is called *sclerotica*; the fore-part being properly called the *cornea*. See CORNEA.

\* The word is formed from the Greek, σκληρός, hard, whence also *scleroticus*. See SCLEROTICKS.

The *sclerotica* is a segment of a larger sphaeroid than the cornea. See EYE.

SCLEROTICKS, medicines, proper to harden and consolidate the flesh, &c. of parts they are applied to.

Such are purslain, house-leek, flea-wort, garden night-shade, &c.

SCOLDING.—The punishment allotted by our laws for *scolds* or *scolding* women, is, to be set in a trebuchet, commonly called a *cucking-stool*, placed over some deep water, into which they are to be let down, and plunged thrice, under water, to cool their heat and choler. See CUCKING-STOOL.

SCOLOPOMACHÆRION, ΣΚΟΛΟΠΟΜΑΧΑΙΡΙΩΝ, in chirurgery, a kind of scalpel, thus called, by the Greeks, from its resembling a woodcock's bill. See SCALPEL.

Its use is to open, and dilate narrow wounds of the breast, abscesses, &c.—Aquapendente recommends it for tapping in dropsies.

It is usually furnished with a little button at the point, that it may be used to open wounds of the breast without danger of wounding the lungs.

SCONCES, small forts, built for defence of some pass, river, or other place. See FORT.

Some *sconces* are made regular, of four, five, or six bastions; others are of smaller dimensions, fit for passes, or rivers; and others for the field.—Such are

1. Triangles with half bastions; which may be all of equal sides, or they may be something unequal. However it be, divide the sides of the triangle into three equal parts, one of these three parts will set off the capitals and the gorges; and the flanks, being at right angles with the sides, make half of the gorge.—2. Square, with half bastions; whose sides may be betwixt 100 and 200 feet, and let one third of the side set off the capital and the gorges, but the flank (which raise at right angles to the side) must be but one half of the gorge or capital, that is, on the sixth part of the side of the square.—3. Square with half bastions and long.—4. Long squares.—5. Star redoubt of four points.—6. Star redoubt of five or six points.—7. Plain redoubts, which are either small, or great. The small are fit for court of guards in the trenches, and may be squares of 20 feet to 30. The middle sorts of redoubts may have their sides from 30 to 50 feet; the great ones from 60 to 80 feet square.

The profiles (that is, the thickness and height of the breast-works) to be set on these several works, and the ditches, are to be accommodated to the occasion. See REDOUBT, FORTIFICATION, FORTIFIED place, &c.

SCOPER-HOLES, or SCUPER-HOLES, in a ship, are holes made through the sides close to the deck, to carry off the water that comes from the pump, or any other way.

These holes in the lower or covert deck, have round leathers nailed over them, to keep the sea-water from coming up into the ship, which are called *scoper-leathers*.

And the short nails, with broad heads, which fasten these leathers down, are called *scoper-nails*, or *scuper-nails*.

SCORBUTUS, or SCORBUTUM, the *scurvy*; a disease very frequent in the northern countries, particularly in fenny, wet, humid places, exposed to the north, &c.

It is accompanied with a great variety of symptoms, attacking the several parts of the body all at once: hence Willis says, it is not any particular disease, but a legion of diseases.

—The most usual symptoms are bleeding, coughing, vomiting, difficulty of breathing, looseness, a relaxation of the parts, sweating, a foetid smell of the gums, a falling of the teeth, stinking breath, reddish or yellow livid spots, pains of the arms and legs, weariness, faintings, head-ach, &c.

Some distinguish the *scurvy* into *hot* and *cold*; but there is little foundation for such a distinction, as the cause is the same in all, viz. according to Barbette and Decker, a too thick pituitous lymph; whence various symptoms in various temperaments.

Charleton observes, that it arises chiefly from sharp, saline particles, taken in by inspiration, from salt and corrupted meats eaten, from bad waters drank, from nastiness, deep chagrins, &c. He adds, that it is contagious.

Dr. Quincy will have the *scurvy* to consist in such a constitution, wherein the blood is unequally fluid: and hence he observes, it is best remedied by stimuli, exercise, and such means as promote sanguification.

The cure is very difficult; and when the disease is rooted, next to impossible. It sometimes goes off in a flux by stool, sometimes by the hæmorrhoids, and sometimes by urine; but more often degenerates into a dropsy, atrophy, apoplexy, epilepsy, or convulsions.

A very exact diet is held of more effect than the best medicines; without this, it becomes incurable. Bleeding does not avail; strong purgatives are hurtful: so is sugar, and all sugared things: mercurius dulcis used internally, so as not to salivate, but only raise a sweating, is found excellent. Do-læus undertakes to cure any *scorbutus* in twelve days time, by the use of this alone; only the patient to drink nothing all that time, but a proper decoction, and to abstain from acids, and hog's flesh. Charleton recommends a continued use of milk, particularly milk emulsions of sweet almonds, decoctions of china, broths and other anti-acids and analepticks. Etmuller makes the basis of the cure of the *scorbutus* and hypochondriacal disease the same, viz. copious vomiting. Strong catharticks, he observes, are prejudicial; but gentle ones good; for the body is to be still kept open. He adds, that vinegar is hurtful, and yet the acid juices of fruits and vegetables, wholesome. Accordingly the use of lemon-juice is much recommended by Lister. Milk, and all milky things, while the stomach is yet able to digest, are excellent. So are martials. Etmuller, instead of mercurials, recommends antimonials.

Thus much in the general: for the particular symptoms, particular medicines adapted thereto, are to be used; only mixing antiscorbuticks with them all.

The chief simple antiscorbuticks are, horse-radish, sorrel, butter-bur, scorzonera, sow-thistle, zedoary, polypody, elecampane, guaiacum, saffraas, mustard-seed, nasturtium aquaticum, trifolium paludosum, oranges, lemons, juniper-berries, cream of tartar, tartarum vitriolatum, &c.

SCORDIUM, } See the articles { DIASCORDIUM.  
SCORDIUM water, } WATER.

SCORE, in musick, denotes *partition*, or the original draught of the whole composition, wherein the several parts, viz. treble, second treble, bass, &c. are distinctly *scored*, and marked. See PARTITION and MUSICK.

SCORPIO, SCORPION, in astronomy, the eighth sign of the zodiac; denoted by the character, ♏. See SIGN.

The stars in *scorpio*, in Ptolemy's catalogue, are 20; in that of Tycho 10; in that of M. Flamsteed 49: the longitudes, latitudes, magnitudes, &c. whereof, are as follow;

Names and situations of the stars.	Sign.	Longitude	Latitude.	Magn.
In the first south foot	♏	26 48 50	5 26 33 A	6
Subseq. in the first foot		27 18 08	4 54 13 A	5
Contiguous to this		27 30 49	4 46 19 A	7
That preced. south of forehead		27 55 46	5 43 48 A	6
In third south foot		28 48 52	8 33 25 A	4 3

That following ophiuchus's foot, n. ♌		20 46 23	1 28 55 B	6

**SCORPION, SCORPIO**, is also the name of an ancient, military engine, used chiefly in the defence of walls, &c. Marcellinus describes the *scorpio*, as consisting of two beams bound together by ropes. From the middle of the two, rose a third beam, so disposed, as to be pulled up and let down at pleasure; and on the top of this, were fastened iron hooks, where was hung a sling, either of iron or hemp. Under the third beam lay a piece of hair-cloth full of chaff, tied with cords.

To use the engine, a round stone was put into the sling, and four persons on each side, loosening the beams bound by the ropes, drew back the erect beam to the hook: when, the engineer standing on an eminence, giving a stroke with a hammer on the cord to which the beam was fastened with its hook, set it at liberty; so that hitting against the soft hair-cloth, it struck out the stone with a vast force.

It had its name *scorpio*, because when the long beam or tillar was erected, it had a sharp top, in manner of a sting.—More modern times have given it the name *onager*, wild ass, because that animal, when hunted, flings back stones.

**SCORIA, ΣΚΟΡΙΑ**, the recement, or dross of any metal, remaining after melting, or refining the same. See METAL, REFINING, &c.

The *scoria* of iron, is the scum taken from that metal in forges where it is melted. See SCUM.

The *scoria* of iron, is the sulphurous part of the iron; which uniting with the sulphurous part of the charcoal, makes together, those porous masses, resembling sponges, frequently seen in the smiths forges. See IRON.

**SCORTUM**. See the article SCROTUM.

**SCOT, SCOTTA, or SCOTTUS**, a customary contribution laid upon all subjects, according to their ability.

Whoever are assessed to any contribution, though not by equal portions, are said to pay *scot and lot*. See TAX.

**Church SCOT**. See the article CHURCH *scot*.

**SCOTIA \***, in architecture, a semi-circular cavity or channel between the torcs, in the bases of columns.—See Tab. Archit. fig. 4. See also BASE.

\* The *scotia* is a concave, dark moulding; whence its name, viz. from σκωτος, obscurity, darkness.

The *scotia* has an effect just opposite to that of the quarter-round.—Our workmen frequently call it the *casement*.

It is also called *trochilus*, partly from its form. See TROCHILUS.

In the Ionic and Corinthian base, there are two *scotias*, the upper whereof is the smaller.—V. Tab. Archit. fig. 32. lit. b, c, and fig. 26. lit. i, k.

According to Felibien, the cavetto is a fourth part of the *scotia*. See CAVETTO.

**SCOTISH terms**. See the article TERMS.

**SCOTISTS**, a sect of school divines and philosophers; thus called from their founder, J. Duns Scotus, a Scottish, or as others say, Irish cordelier; who maintained the immaculate conception of the virgin, or that she was born without original sin; in opposition to Thomas Aquinas and the Thomists. See THOMIST.

As to philosophy, the *Scotists* were, like the Thomists, peripateticks; only distinguished by this, that in each being, as many different qualities as it had, so many different formalities did they distinguish; all distinct from the body itself; and making, as it were, so many different entities: only those metaphysical, and, as it were, superadded to the being. See FORMALITY, &c.

**SCOTOMIA, or SCOTOMA**, in medicine, a dizziness, or swimming in the head, wherein the animal spirits are so whirled about, that external objects seem to turn round. See VERTIGO.

**SCOTTA, or SCOTTUS**. See the article SCOT.

**SCRATCHES**, among farriers, a distemper incident to horses, consisting of dry scabs, chops or rifts, that breed between the heel and the pattern joint.

There are various kinds of *scratches*, distinguished by various names, as crepances, rats-tails, mules, kibes, pains, &c. which are all so many species of the same malady; engendered from some dry humour falling on the legs, or from the fumes of the beast's own dung lying under his heels, or near them; or for want of rubbing his heels, especially after a journey, from over-hard riding, &c.

The disorder begins first, with dry scabs in the pattern joint, in several forms. It is known by the staring, dividing and curling of the hair on the spot.

**SCRATCH-WORK, *sgraffata***, a way of painting in fresco, by preparing a black ground, on which is laid a white plaister; which white being taken off with an iron bodkin, the black appears through the holes, and serves for shadows. See SGRAFFIATA.

This kind of work is lasting; but being very rough, is unpleasant to the sight.

**SCREW, or SCRUE, cochlea**, in mechanicks, one of the five mechanical powers; chiefly used in pressing or squeezing bodies close, though sometimes also in raising weights. See MECHANICAL power, MACHINE, &c.

The *screw* is a right cylinder, as A B, (Tab. Mechanicks, fig. 11.) furrowed spiral-wise: it is generated by the equable motion of a right line F G, around the surface of a cylinder; while, at the same time, the point I, descends equably from F towards G.

If the furrowed surface be convex, the *screw* is said to be male; if concave, it is female.

Where motion is to be generated, the male and female *screw* are always joined; that is, whenever the *screw* is to be used as a simple engine, or mechanical power.—When joined with an axis in peritrochio, there is no occasion for a female; but in that case, it becomes part of a compound engine. See AXIS.

**Doctrine of the SCREW.**—1°. If, as the compass described by the power in one turn of the *screw*, is to the interval or distance between any two immediate threads or spiral windings, as B I (measured according to the length of the *screw*) so is the weight or resistance, to the power; then the power and the resistance will be equivalent one to the other: and, consequently, the power being a little increased, will overcome the resistance.

For it is evident, that in one turn of the *screw*, the weight is so much lifted up, or the resistance so much removed, or the thing to be pressed, is squeezed so much closer together, as is the distance between two immediate spirals; and in the same time, the power to be moved is so much, as is the compass described by the said power in one turn of the *screw*. Wherefore the velocity of the weight (or whatsoever answers thereto) will be to the velocity of the power, as is the said distance between the spirals to the compass described by the power, in one revolution or turning round of the *screw*: so that the gaining in power, is here recompensed by the loss in time.

2°. As the distance between two threads, B I, is less; the power required to overcome the said resistance is less; therefore the finer the thread, the easier the motion.

3°. If the male *screw* be turned in the female, at rest, a less power will be required to overcome the resistance, as the lever or scytala, B D (fig. 12.) is the longer.

4°. The distance of the power from the centre of the *screw*, C D, the distance of two threads I K, and the power to be applied in D, being given, to determine the resistance it will overcome: or, the resistance being given, to find the power necessary to overcome it:

Find the periphery of a circle described by the radius C D: then to the distance between the two threads, the periphery just found, and the given power: or, to the periphery found, the distance of the two threads, and the given resistance, find a fourth proportional. This in the former case will be the resistance that will be overcome by the given power; and in the latter, the power necessary to overcome the given resistance.

E. gr.

*E. gr.* Suppose the distance between the two threads, 3, the distance of the power from the centre of the screw *CD*, 25, and the power 30 pounds; the periphery of the circle to be described by the power, will be found 157. Therefore, as 3, 157 : 30, 1570, the weight to which the resistance is equal.

5°. The resistance to be overcome by a given power, being given; to determine the diameter of the screw, the distance of two threads *IK*, and the length of the scytala or handle: the distance of the threads, and the diameter of the screw may be assumed at pleasure, if the male be to be turned in the female by a handle. Then, as the given power is to the resistance it is to overcome, so is the distance of the threads to a fourth number, which will be the periphery to be described by the handle *CD*, in a turn of the screw. The semi-diameter of this periphery, therefore, being sought, we have the length of the handle *CD*. But if the female screw be to be turned about the male, without any handle; then the periphery and semi-diameter found, will be very nearly those of the screw required.

*E. gr.* Suppose the weight 6000, the power 100, and the distance of the threads 2 lines; for the periphery to be passed over by the power, say, as 100, 6000 : 2, 120; the semi-diameter of which periphery being  $\frac{1}{2}$  of 120 = 60 lines will be the length of the handle, if any be used; otherwise the side of the female screw must be 40 lines.

**Endless SCREW.** If a screw be so fitted as to turn a dented wheel *DF* (fig. 13.) it is called an *endless*, or *perpetual screw*; in regard it may be turned for ever, without coming at an end. From the scheme, it is evident enough, that while the screw turns once round, the wheel only advances the distance of one tooth.

**Doctrine of the endless SCREW.**—1°. If the power applied to the lever, or handle of an *endless screw* *AB*, be to the weight, in a ratio compounded of the periphery of the axis of the wheel *EH*, to the periphery described by the power, in turning the handle, and of the revolutions of the wheel *DF*, to the revolutions of the screw *CB*; the power will be equivalent to the weight.

Hence, 1°. as the motion of the wheel is exceedingly slow; a small power may raise a vast weight, by means of an *endless screw*: for this reason, the great use of the *endless screw*, is either where a great weight is to be raised through a little space; or, where a very slow, gentle motion is required. On which account it is very useful in clocks and watches.

2°. The number of teeth, the distance of the power from the centre of the screw *AB*, the radius of the axis *HF*, and the power, being given; to find the weight it will raise:

Multiply the distance of the power from the centre of the screw *AB*, into the number of teeth: the product is the space of the power passed through, in the time the weight passes through a space equal to the periphery of the axis. Find a fourth proportional to the radius of the axis, the space of the power now found, and the power. This will be the weight the power is able to sustain. Thus, if *AB* = 3, the radius of the axis *HF* = 1; the power 100 pounds; number of teeth of the wheel *DF* 48; the weight will be found 14400: whence it appears, that the *endless screw* exceeds all others, in increasing the force of a power.

**Archimedes's SCREW**, or the *spiral pump*, is a machine for the raising of water, invented by Archimedes. See **PUMP** and **SPIRAL**.

Its structure is as follows: a leaden tube is wound round a cylinder *AB* (*Tab. Hydraulicks*, fig. 1.) after the same manner as the spiral thread is drawn in the common screw above described. This cylinder is inclined to the horizon, in an angle of about 45 degrees, and the orifice of the tube *B* immersed under water.—If then, the screw be turned about by the handle *I*, against the water; the water will rise up the spiral, and at length be discharged in *A*.

This machine, with a very little strength, is able to raise a great quantity of water: whence it is found of good use, in the emptying of lakes, &c.

If the water be to be raised to any considerable height, one screw will not suffice; but the water drawn up by one, is to be taken by another, and so successively.

**SCRIBE, SCRIBA**, a principal officer in the Jewish law, whose business was to write, and interpret scripture.

We find no mention of *scribes*, in the Old Testament, before Esdras; whence some learned men have concluded, that the office was brought from Chaldaea, and Assyria, and first established by the Jews after their return from the Babylonish captivity.

The *scribes* were in great credit and esteem among the Jews, and had even the precedence of the priests and sacrificers.—Indeed, there were three kinds of *scribes*, whereof those just mentioned, properly called *scribes of the law*, were the first, and most considerable: the decisions of these were received with the same respect as the law of God itself.

The second kind, properly called *scribes of the people*, were a sort of magistrates, among the Greeks, as well as among the Jews. See the following article.

The third kind were public notaries, or secretaries of the council: these were the least considerable.

**SCRIB, SCRIBA**, was also the title of an officer, among the Romans, who wrote decrees, or acts, and made out authentic copies thereof. See **CLERK**, **ACTS**, &c.

Every magistrate had his *scriba*, or secretary, so that there were *scribae adilitii, praetorii, quaestorii*, &c.

The *scribae* were not admitted to the management of the principal offices of the republic, unless they relinquished their profession.

In the time of the emperors, they were also called *notarii*, because they made use of abbreviations, and short notes in writing. See **NOTARY**.

**SCRIBING**, in joinery, &c. a term used, when one side of a piece of stuff being to be fitted to the side of some other piece, which last is not regular; to make the two join close together all the way, they *scribe* it.

That is, they lay the piece of stuff to be *scribed* close to the other piece they intend to *scribe* to, and open their compasses to the greatest distance the two pieces any where stand from each other; then, bearing one of the legs against the side to be *scribed* to, with the other point they draw a line on the stuff to be *scribed*.—Thus have they a line on the irregular piece parallel to the edge of the regular one; and if the stuff be wrought away exactly to the line, when the two pieces are put together, they will seem a joint.

**SCRIPTORIUS calamus.** See the article **CALAMUS**.

**SCRIPTURARY**, among the Jews. See **CARAITES**.

**SCRIPTURE**, or **SCRIPTURES**. See **BIBLE**.

**SCROBICULUS cordis**, the same as *anticardium*. See **ANTICARDIUM**.

**SCROLL.** See the article **ESROLL**.

**SCROPHULÆ**\*, in medicine, scirrhous tumours, arising usually about the neck, and sometimes on other glandulous parts; called also *strumæ*, and popularly, the *king's evil*, or simply, the *evil*. See **EVIL**.

\* The word is Latin, formed by diminution, from *scropha*, sow.

**SCROTUM**, or **SCORTUM**, in anatomy, the common capula or membrane wherein the testicles are contained; thus called from its resembling a pouch or purse of leather, called by the ancients *scortea*. See **TESTICLE**.

The *scrotum* consists of two membranes; the exterior whereof is only a production of the cuticula or cutis, which is here very thin, and without any fat underneath it.

The inner, called *dartos*, is only an expansion of the panniculus carnosus, which, together with the cutis, is drawn into the figure of a purse externally: it is divided longitudinally into two parts, right and left, by a line, called the *seam of the scrotum*; answering to which inwardly is a membrane, called the *septum*, which divides the cavity into two parts; being only the production of the *dartos*.

It is divisible into lamellæ, and the testicles are on each side loosely connected to it by means of their outer proper tunic.—Its use is to sustain them, prevent their collision, as also their falling too low, and to promote the corrugation of the *scrotum*. See **DARTOS**.

**SCROTUM cordis**, the same as *pericardium*. See **PERICARDIUM**.

**SCROWLS**, or **SCROLLS**, in architecture. See **VOLUTES**.

**SCRUE.** See the article **SCREW**.

**SCRUPLE, SCRUPULUS, SCRUPULUM, or SCRIPULUM**, the least of the weights used by the ancients; which amongst the Romans was the twenty-fourth part of an ounce, or third part of a dram. See **OUNCE** and **DRACHM**.

**SCRUPLE** is still a weight among us, containing the third part of a dram, or 20 grains. See **GRAIN**.

Among goldsmiths, the *scruple* is 24 grains. See **WEIGHT**.

**SCRUPLE**, in chronology.—The Chaldee **SCRUPLE** is  $\frac{1}{15}$  part of an hour, called, by the Hebrews, *belakim*. These *scruples* are much used by the Jews, Arabs, and other eastern people in computations of time.

**SCRUPLES**, in astronomy.—**SCRUPLES eclipsed**, that part of the moon's diameter which enters the shadow, expressed in the same measure wherein the apparent diameter of the moon is expressed. See **DIGIT**.

**SCRUPLES of half duration**, an arch of the moon's orbit, which the moon's centre describes from the beginning of the eclipse to its middle. See **ECLIPSE**.

**SCRUPLES of immersion**, or *incidence*, an arch of the moon's orbit, which her centre describes from the beginning of the eclipse, to the time when its centre falls into the shadow. See **IMMERSION**.

**SCRUPLES of emersion**, an arch of the moon's orbit, which her centre describes in the time from the first emersion of the moon's limb, to the end of the eclipse. See **EMERSION**.

**SCRUTINY, SCRUTINIUM**, in antiquity, an examination, or probation, practised in the last week of lent, on the catechumens, who were to receive baptism on Easter-day. See **CATECHUMEN** and **BAPTISM**.

The *scrutiny* was performed with a great many ceremonies: exorcisms and prayers were made over the heads of the catechumens.—On palm-sunday, the Lord's prayer and creed were given them; which they were afterwards made to rehearse.

The process was called *scrutinium, scrutiny*; because hereby

the hearts of the catechumens were scrutinized, or searched, that the priests might understand who were fit to be admitted to baptism.

This custom was more in use in the church of Rome, than any where else: though it appears, by some missals, to have been likewise used, though much later, in the Gallican church. It is supposed to have ceased about the year 860.

SCRUTINY is also used, in the canon law, for a ticket, or little paper billet, wherein, at elections, the electors write their votes privately, so as it may not be known for whom they vote.

Among us, SCRUTINY is chiefly used for a strict perusal, and examination of the several votes hastily taken at an election; in order to find out any irregularities committed therein, by unqualified voters, &c.

SCRUTORE, or SCRUTOIR (from the French *escritore*) a kind of cabinet, with a door or lid opening downwards, for convenience of writing on, &c.

SCULK, amongst hunters, denotes a company; as, a *sculk* of foxes.

SCULPTURE, SCULPTURA, the art of cutting or carving wood, stone, or other matter, and forming various figures or representations therein; as also, of fashioning wax, earth, plaster, &c. to serve as models, or moulds, for the casting of metalline figures.

*Sculpture*, in its latitude, includes both the art of working in creux, properly called *engraving*; and of working in relieve, which is what we strictly call *sculpture*. See ENGRAVING.

The antiquity of this art is past doubt; as the sacred writings, the most ancient and authentic monuments we have of the earliest ages, mention it in several places: witness Laban's idols stolen away by Rachel, and the golden calf which the Israelites set up in the desert, &c. But it is very difficult to fix the original of the art, and the first artists, from prophane authors; what we read thereof, being intermixed with fables, after the manner and taste of those ages.

Some make a potter of Sicyon, named Dibutades, the first sculptor: others say, the art had its origin in the isle of Samos, where one Ideocus, and Theodorus, performed works of this kind, long before Dibutades's time. It is added, that Demaratus, father of Tarquin the elder, first brought it into Italy upon his retiring thither; and that by means of Eucirapus and Eutygrammus, two excellent workmen herein, who communicated it chiefly to the Tuscans; among whom it was afterwards cultivated with great success. They add, that Tarquin sent for Taurianus, one of the most eminent among them, to Rome, to make a statue of Jupiter, &c. of baked earth; for the frontispiece of the temple of that deity.

About this time, there were many sculptors, both in Greece and Italy, who wrought altogether in earth: some of the most noted, are, Chalcosthenes, an Athenian, who made himself and his house famous, by the great number of earthen figures he adorned it withal; and Demophilus and Gorfanus, two painters, who enriched the temple of Ceres with great variety of painting and earthen images. In effect, all the first statues of the heathen deities, were either of earth, or wood; and it was not so much any frailty of the matter, or unsuitness for the purpose, as the riches and luxury of the people, that first induced them to make images of marble, and other more precious stones.

Indeed, how rich soever the matter were, whereon they wrought, yet they still used earth, to form models thereof: and to this day, whether they be for cutting marble statues with the chissel, or for casting them in metal, they never undertake the one or the other, without first making a perfect model thereof in earth. Whence, doubtless, arose the observation of Praxiteles, that the art of moulding earthen figures, was the natural mother of that of making marble and metalline figures; which last never appeared in perfection, till about 300 years after the building of Rome; though the first was at its height long before.

Phidias of Athens, who came next, surpassed all his predecessors, both in marble, in ivory and metals: and about the same time, appeared several others, who carried *sculpture* to the highest perfection it ever arrived at; particularly, Polycletus at Sicyon; then Myron; Lysippus, who alone was allowed the honour of casting Alexander's image in brass: Praxiteles and Scopas, who made those excellent figures, now before the pope's palace at Montecavallo: Briaxis, Timotheus and Leochares, who, with Scopas, wrought at the famous tomb of Mausolus king of Caria; Cephissodotus, Canachus, Dædalus, Buthicus, Niceratus, Euphranor, Theodorus, Xenocrates, Pyromachus, Stratoniscus, Antigonus, who wrote on the subject of his art; the famous authors of the Laocoon, viz. Agésander, Polydore, and Athenodorus, and infinite others, the names of some whereof have passed to posterity; those of others have perished with their works: for though the number of statues in Asia, Greece, and Italy, was so immense, that in Rome alone, as we are informed, there were more than there were living persons, yet we have but few now left, at least very few of the finest.

VOL. II. N°. CXXXVIII.

When Marcus Scaurus was ædile, his office obliging him to provide what was requisite towards the publick rejoicings, he adorned the stately theatre which he erected, with 3000 brazen statues; and though L. Mummius, and Lucullus, brought away a great number out of Asia and Greece, yet, there were still above 3000 remaining in Rhodes, as many at Athens, and more at Delphos.

But what is most extraordinary, was the bigness of the figures, which those ancient artists had the courage to undertake: amongst those Lucullus brought to Rome, there was one of Apollo, 30 cubits high; the Colossus, of Rhodes, made by Cares of Lyndos, the disciple of Lysippus, far exceeded it; Nero's statue, made by Xenodorus, after that of Mercury, was also of an extraordinary size, being 110 feet high. See COLOSSUS and STATUE.

*Sculpture*, however, did not continue above 150 years, after Phidias's time, till it began insensibly to decline; not but that there were still some fine pieces of workmanship both in Greece and Italy, though not performed with so good a fancy, and such exquisite beauty as some of the former works. Besides that the Greek statues are most esteemed for the workmanship; there is a special difference between them, and those of the Romans, in that the greatest part of the first are naked, like those who wrestle or perform some other bodily exercise, wherein the youth of those times placed all their glory; whereas, the others are clad or armed, and particularly have the toga on, which was the greatest mark of honour amongst the Romans. See STATUE.

To perform any thing in the way of SCULPTURE, they begin with making a model of earth, or wax.—For earthen models, they use but few instruments: their hands and fingers do almost the whole.—For waxen models, to a pound of wax they put half a pound of colophony; some add turpentine, melting the whole with oil of olive; some add a little vermilion, or other matter, to give it a colour. It is wrought and molded with the fingers, like earthen models.

For SCULPTURE in wood, which we properly call *carving*, the first thing required, is, to chuse a wood proper for the particular kind of work.—If it be any thing large, and require a deal of strength and solidity; the hardest and most durable wood is to be chosen, as oak, or chefnut: for smaller works they use pear-tree, and service-tree. But as these woods are very hard, for little delicate works, they use softer woods, only close, and of a fine grain: such is the linden-tree, which the chissel is found to cut more easily, and cleanly, than any other wood.

As to statues, we find the ancients have made them of almost all kinds of wood: at Sicyon was an image of Apollo in box; at Ephesus, that of Diana was in cedar. As these two kinds of wood are very hard, and even held incorruptible, especially cedar; Pliny observes, they were judged particularly suitable for representations of the deities. In a temple, on mount Cyllenius, dedicated to Mercury, was an image of that god formed of the wood of the lemon-tree: others there were of the palm-tree, olive-tree, ebony, and even of the vine.

For large works, if it be only single figures, it is better they consist of several pieces, than of a single one, by reason of the liableness of the latter to warp; for every large piece may probably not be dried to the heart, however it may appear without side.—Observe, that the wood will not be fit for working, till after it have been cut at least ten years.

SCULPTURE in marble and stone.—The first thing they do, is out of a great block of marble to saw another of the size required, which is performed with a smooth steel saw without teeth, casting water and sand thereon, from time to time: then they fashion it, by taking off what is superfluous with a stubbed point, and a heavy mallet; after this, bringing it near the measures required, they reduce it still nearer with another finer point.—They now use a flat cutting instrument, having two notches in its edge, or three teeth; then a chissel to take off the scratches the former has left.—This last instrument they use with a deal of delicacy, giving thereby a softness, and tenderness to their figure; till, at length, taking rasps of different degrees of fineness, by degrees they bring their work into a condition for polishing.—To polish, or make the parts smooth and sleek, they use pumice-stone, and smalt; then tripoli, and when a still greater lustre is required, a skin and burnt straw.

When any considerable work is undertaken, as a statue, basso relievo, or the like, they always make a model, before-hand, of clay; but as this shrinks in drying, and easily cracks and breaks, they only use it to make a mould of plaster, or stucco, wherein they make a figure of the same matter, which serves them thenceforth for a model, and by which they adjust all their measures and proportions.

To proceed the more regularly; on the head of the model, they place an immoveable circle, divided into degrees, with a moveable ruler, or index fastened in the centre of the circle, and divided likewise into equal parts. From the end of the ruler hangs a thread with a plummet, which serves to take all the points to be transferred thence to the block of marble, from whose top hangs another plummet like that of the model.—See *Tab. Miscell. fig. 2.*

double turn about the end of the helm with a single rope; the ends being laid to the ship-sides, by means whereof they guide the helm. See HELM.

SEAL, *figillum*, a puncheon, or piece of metal, or other matter, usually either round or oval; whereon is engraven the arms, device, &c. of some prince, state, community, magistrate, or private person, with a legend or inscription: the impression whereof in wax serves to make acts, instruments, &c. authentick. See SIGNATURE.

The king's *great-seal* is that whereby all patents, commissions, warrants, &c. coming from the king, are sealed. The keeping hereof is in the hands of the lord high chancellor, who is hence also denominated *lord-keeper*.—Indeed, there is some difference between the lord chancellor and lord keeper; not in office, but in the manner of creation, the latter being made by the delivery of the *great-seal* to him by the king; but the former having likewise a patent. See CHANCELLOR and KEEPER.

The king's *privy-seal*, is a *seal* usually first set to grants that are to pass the *great-seal*. See PRIVY-SEAL, CLERK, and HALF-SEAL.

The use of *seals* is very ancient: in Daniel, chap. xiii. we read that Cyrus set his *seal* on the temple of Bel: but *seals* are still older; for Jezebel, in 1 Kings, chap. xxi. *seals* the orders she sent for Naboth's death with the king's ring.—In effect, as the ancient *seals* were all engraven on the collets, stones, &c. of rings, and as the original use of rings, it is asserted, was only to be in a readiness for the sealing of acts, instruments, &c. *seals* should be as ancient as rings themselves. See RING.

These *sealing-rings*, called *annuli signatorii*, *figillares*, *cirographi* or *cerographi*, it is said in ancient authors, were first invented by the Lacedæmonians, who, not content to shut their chests, armories, &c. with keys, added *seals* to them: and to this end, at first, made use of worm-eaten wood, the impressions whereof they took on wax, or soft earth: but they at length found the art of engraving figures, or rings, the impressions of which they took in the same manner.—This, however, must be granted, that even in Moses's time, the art was known of engraving, not only on metals, but also on precious stones. See ENGRAVING.

Indeed, it does not appear that the ring had any other use among the primitive Jews besides ornament: but at length it was used to *seal* instruments, contracts, diplomas, letters, &c. instances whereof we have in the third book of Kings, xxi. 8. Esther viii. 10. Xenophon. Hellen. lib. I. Quint. Curt. lib. vi. Just. lib. xliii. cap. iii. where we learn, the keeping of the emperor's *seal* was become a particular office.—Lucian adds, that Alexander gave his to Perdicas, thereby appointing him his successor.

Pliny observes, that in his time there were no *seals* used any where but in the Roman empire: at Rome, he tells us, they were become of absolute necessity, inasmuch that a testament was null without the testator's *seal*, and the *seals* of seven witnesses: but it does not appear that the Romans had any such things as public *seals*; nor that their edicts, and contracts, were *sealed*, not even in the times of the emperors.

In France the custom anciently was, instead of signing their instruments, &c. only to *seal* them; as appears from an infinity of ancient charters, which are not signed at all: the reason whereof was, that in those days very few people were then able to write; no body could read and write but clerks. In England, the first *sealed* charter we find extant, is that of Edward the confessor, upon his founding of Westminster-Abbey: yet, we read of *seals* in the MS. history of king Offa.

Before the time of William the conqueror, the English did not *seal* with wax, but only made a golden cross on the parchment, and sometimes an impression on a piece of lead, which hung to the grant with a filken string, and was deemed an abundant authorizing of the grant itself, without either signing or witnesses.—The colour of the wax wherewith the king's grants were *sealed*, was usually green, to signify that the act continued for ever fresh, and of force. The usual impression on all laymens *seals*, till the year 1218, was a man on horseback, with a sword in his hand; afterwards, they began to engrave their coats of arms on their *seals*: only the archbishops, and bishops, by a decree of cardinal Otto, who was legate here in 1237, were to bear in their *seals*, their title, office, dignity, and even their proper names.

Du Chesne observes, that none below the dignity of a knight had any right to a pendent *seal*, called *authentickum*.

The emperors long *sealed* all their acts of importance with a golden *seal*; and the golden bull of Charles IV. for the

election of an emperor, takes its name from the gold *seal* hanging to it, which is called *bull*. See BULL.

The pope has two kinds of *seals*: the first used in apostolical briefs, and private letters, &c. called, the *fisherman's ring*.—This is a very large ring, wherein is represented St. Peter, drawing his net full of fishes. See BRIEF.

The other is used in bulls, representing St. Peter's head on the right, that of St. Paul on the left, with a cross between the two: on the reverse is sometimes the pope's name, and arms. See BULL.

The impressions of the first *seal* are taken in red wax, those of the second, in lead.

Theod. Hopingk, a German lawyer, has furnished the world with a learned and curious work on the subject of *seals*: it consists of sixteen chapters, the 1<sup>st</sup>. whereof treats of the name *seal*, *figillum*. 2<sup>d</sup>. Of the antiquity of the *sealing-rings*, mentioned in Genesis, their inventors, the reasons of bearing them, their kinds, and differences, forms, ornaments, hieroglyphicks, ends, uses, effects, and abuses. 3<sup>o</sup>. Of bulls, in the same method, and under the same circumstances. 4<sup>o</sup>. Of different kinds of *seals*; which he divides into *public* and *private*, *proper* and *foreign*, *formed* and *unformed*, *ordinary* and *extraordinary*, *known* and *unknown*, *true* and *false*; and lastly, *ratificative* and *confirmative*, of *authority*, *solemnity*, *testimony* and *consent*. 5<sup>o</sup>. Of such as have a right to bear *seals*. 6<sup>o</sup>. Of the keeping of *seals*. 7<sup>o</sup>. Of things *seals* are put to. 8<sup>o</sup>. Of the images, figures, arms, characters, inscriptions, &c. the places where *seals* are to be put, and the order to be observed therein. 9<sup>o</sup>. Of the number and multitude of *seals*, and the advantage they bring. 10<sup>o</sup>. Of their use, end, effects, force, &c. 11<sup>o</sup>. Of the proof of *seals* in general, and particular, publick and private. 12<sup>o</sup>. Of the verifying of *seals*. 13<sup>o</sup>. Of the manner of censuring and disputing *seals*. 14<sup>o</sup>. Of subscriptions that have a regard to *seals*. 15<sup>o</sup>. Of other particulars that have a regard thereto; as the signatures of emperors, kings, chancellors, secretaries, and notaries, all in the same order and method. The book was printed in 1642, at Nurembergh, in quarto, under the title, *De sigillorum prisco et novo jure, tractatus practicus*, &c.—We have another work of the like kind, by Heineccius, in folio, printed at Francfort, and Leipzig, in 1709, under the title, *De veteribus Germanorum aliorumque nationum sigillis, eorumque usu et præstantia, syntagma historicum*.

Hermetical SEAL. See the article HERMETICAL.

SEAL is also used for the wax or lead, and the impression thereon, affixed to the thing *sealed*.

The manufacturers *seal* frequently applied to their stuffs, &c. is to be of lead. That of knights by the French law is to be of hard wax; that of agents, of soft wax.

Some *seals* are stamped on the paper or parchment itself; others hung by filken strings.

The French *seal* their edicts with green wax, arrets with yellow wax; expeditions for Dauphine with red wax. The letters of the French academy are *sealed* with blue wax. See WAX.

SEALER, an officer in chancery, appointed by the lord chancellor, or keeper of the great-seal, to seal the writs and instruments there made in his presence.

SEALING, in architecture, the fixing a piece of wood or iron in a wall, with plaister, mortar, cement, lead, or other solid binding.

For staples, hinges, and joints, plaister is very proper.

SEALING wax. See the article WAX.

SEAM or SEME of corn, is a measure of eight bushels.

SEAM of glass, is the quantity of 120 pounds, or 24 stone, each five pound weight.—Of wood, an horse-load.

Monks SEAM. See the article MONK.

SEARCE. See the article SIEVE.

SEARCHER. See the article ALNAGER.

SEAR-CLOTH\*, or CERE-CLOTH, in chirurgery, denotes a form of external remedy, somewhat harder than an unguent, yet softer than an emplaster; though it is frequently used, both for the one, and the other. See CERE-RATE and SPARADRAP.

\* The word *sear-cloth* is supposed to be a corruption of *cere-cloth*, and to be derived originally from the Greek κεράς wax.

The *sear-cloth* is supposed to have wax in its composition, which distinguishes, and even denominates it. In effect, when a liniment or unguent has wax in it, it does not differ from a *sear-cloth*. See UNGUENT, &c.

*Sear-cloths* are a kind of substitutes to friction, and are sometimes used for raising a salivation: they are usually compounded of resolvent drugs, as saffron, myrrh and aloes, incorporated with wax and gums, as galbanum, gum ammoniac, and sagapenum: the whole tempered with wine.

SESE. See the article SEIZE.

SEASONING of timber. See TIMBER.

SEASONINGS, in the West-Indies, a kind of aguish distemper, which foreigners are much subject to at their first coming.

SEASONS\*, in cosmography, certain portions or quarters of the year, distinguished by the signs which the sun then enters, or by the meridian altitudes of the sun; consequent on

on which, are different temperatures of the air, different works in tillage, &c. See YEAR, SUN, ECLIPTIC, OB-LIQUITY, &c.

\* The word is formed from the French, *saison*, which Menage derives from the Latin, *statio*, whence the Italians have formed *stagione*: Nicod derives it from *satio*; *tempus sationis*, sowing time.

The year is divided into four *seasons*, spring, summer, autumn, and winter. The beginnings and endings of each whereof, see under its proper article, SPRING, &c.

It is to be observed, the *seasons* anciently began differently from what they now do: witness the old verses,

*Dat Glemens byemem; dat Petrus uer cathedratus;*

*Estuat Urbanus; autumnat Barthobmaus.*

SEAT, in astronomy. See the article SCHEAT.

SEAT, in medicine. See the article ANUS.

SEAZE. See the article SEIZE.

SEBACEÆ *glandulae*. See the article GLANDULÆ.

SEBESTEN, SEBESTENA, *myxa*, in pharmacy, &c. a fruit resembling a little plumb or prune; which when ripe, is of a deep red colour, bordering on black; very sweet, and the flesh, or pulp, glutinous, or sticky. See DIASEBESTEN. The Syrians make a kind of glue or birdlime, of the *sebestens*, called *birdlime of Alexandria*. The fruit is esteemed pectoral, cooling, and emollient; though not much used in medicine. The stone within it is triangular.—It brought its name from Arabia, whence Pliny observes it came in his time into Italy.

SEBUÆI, a sect among the ancient Samaritans; whom St. Epiphanius accuses of changing the time expressed in the law, for the celebration of the great annual feasts of the Jews. See FEAST and SAMARITAN.

Serrarius conjectures, that they were thus called, from their celebrating the feast of the passover on the seventh month, called by the Hebrews *seba*, seventh.—Drusius rather takes them to have been denominated from *Sebaia*, the leader of a sect among the Samaritans; as the followers of Dositheus, were denominated *Dosithei*; which two sects, some Jewish doctors suppose to have subsisted at the same time.—Scaliger derives the name from the Hebrew, *seba*, week; as who should say, *Hebdomadites*, because of their celebrating every second day of the seven weeks, between Easter and Whitsuntide. Yet the same Scaliger, in his answer to Serrarius, gives a different explication.—In effect, all that has hitherto been advanced on the point, is mere conjecture.

SEBURAI\*, SEBURÆI, a name which the Jews give to such of their rabbins or doctors, as lived and taught some time after the finishing of the talmud.

\* The word is derived from סבור, *sebur*; I think, whence סבור, *sebur*, opinion, sentiment; and thence סבורי, *seburai*, or *seburai*, opinionative.

The reason of this appellation, say the rabbins, is, that the Talmud being finished, published, and received in all the schools and synagogues, these doctors had nothing to do, but dispute for, and against, the Talmud and its decisions. Others say, it was because their sentiments were not received as laws, or decisions; as those of the Mischnic and Gemaric doctors were; but were held as mere opinions. Others, as the author of *Scalscheleth Hakkabala*, or chain of tradition, tells us, that the persecution, the Jews underwent in those times, not allowing them to teach quietly in their academies, they only proposed their opinions on the composition of the Mischna.

The first and chief of the *Seburai*, was R. Josi, who began to teach in the year 787 of the æra of contracts; which, according to R. David Gautz, falls on the year of the world 4236; and who, according to R. Abraham, was 38 years president of the Jewish academy.

This æra of contracts is the same with that of the *Seleucidæ*, the 787th year whereof, falls on the year of Christ 476, which of consequence, is the æra of the origin of the *Seburai*; whose reign did not hold long: Buxtorf says, not above 60 years; but R. Abraham and others, not 50. The last of them was R. Simona.—They were succeeded by the Gaons or Geonim.

SECANT, in geometry, a line that cuts another, or divides it into two parts. See LINE, &c.

Thus the line AM (*Tab. Geometry, fig. 12.*) is a *secant* of the circle AED, &c. as it cuts the circle in B.

It is demonstrated by geometers; 1°. That if several *secants* MA, MN, ME, &c. be drawn from the same point M, that passing through the centre MA, is the greatest, and the rest are all so much the less, as they are more remote from the centre. On the contrary, the portions thereof without the circle MD, MO, MB, are so much the greater, as they are further from the centre. The least, is that of MA, which passes through the centre.

2°. That if two *secants* MA and ME, be drawn from the same point M; the *secant* MA, will be to ME, as MD to MB. See TANGENT.

SECANT, in trigonometry, denotes a right line, drawn from the centre of a circle, which cutting the circumference, proceeds, till it meets with a tangent, to the same circle. See CIRCLE and TANGENT.

Thus the line FC (*Tab. Trigonometry, fig. 1.*) drawn from the centre C, till it meet the tangent EF, is called, a

*secant*; and particularly, the *secant of the arch* AE, to which EF is a tangent.

The *secant* of the arch AH, which is the complement of the former arch to a quadrant, is called the *co-secant*, or *secant of the complement*. See CO-SECANT.

The sine of an arch, AD, being given; to find the *secant* thereof FC, the rule is, as the co-sine ADC is to the sine AD, so is the whole sine EC, to the *secant* CF.

To find the logarithm of the *secant* of any arch, the sine of the complement of the arch being given; multiply the whole sine of the logarithm by two, and from the product subtract the logarithm of the sine complement; the remainder is the logarithm of the *secant*. See LOGARITHM.

Line of SECANTS. See the article SECTOR.

SECK.—Rent SECK. See the article RENT *seck*.

SECOND, in anatomy. See SECUNDI *generis*.

SECOND, in geometry, astronomy, &c. the sixtieth part of a prime, or minute; either in the division of circles, or in the measure of time. See PRIME and MINUTE.

A degree, or an hour, are each divided into 60 minutes, marked thus': a minute is sub-divided into 60 *seconds*, marked thus"; a *second* into 60 thirds, marked thus"', &c.

See DEGREE.

We sometimes say a *second minute*, a *third minute*, &c. but more usually, simply, *second*, *third*, &c. See MINUTE.

A pendulum three feet three inches, and two tenths of an inch long, vibrates *seconds*, according to Sir Jonas Moor's reduction of Huygens's three feet eight lines and a half of Paris measure, to English measure. See PENDULUM.

SECOND, in musick, denotes one of the musical intervals; being only the distance between any sound, and the next sound, whether higher or lower. See INTERVAL.

As in the compass of a tone, there are reckoned nine sensibly different sounds, which form those little intervals, called *commas*; one might, in strictness, say, there are eight kinds of *seconds*. But as these minute intervals, though sensible, are not yet so far so, as to contribute much to the harmony; they usually only distinguish four sorts.

The first, called the *diminished second*, containing four commas; being the difference, for instance, of a natural *ut*, and an *ut* raised four commas higher.

The second, called *lesser second*, contains five commas, and is made either naturally, as from *mi* to *fa*, or from *si* to *ut*; or accidentally, by means of *b*, as from *la* to *si*, *b flat*; or from *fa diesis* to *sol*; otherwise called a *major semitone*, or *imperfect sound*, by the Italians, *semitono*. See SEMITONE.

The third is the *greater second*, containing the nine commas, which compose the tone. This the Italians call *tono* or *perfect sound*.

The fourth is the *redundant second*, composed of a whole tone and a minor semi-tone. See TONE, SEMI-TONE, &c.

SECOND captain, is a reformed captain, who acts as lieutenant of another, into whose company he is incorporated. See CAPTAIN.

SECOND cause. See the articles CAUSE and EFFICIENT.

SECOND flank,

SECOND notion,

SECOND order of curves,

SECOND rate,

SECOND sight, an odd qualification, which many of the inhabitants of the western islands of Scotland are said to be possessed of.—The thing is attested by so many credible authors (the latest of whom is Mr. Martin, author of the natural history of these islands, and a member of the royal society) that, notwithstanding the quaintness of it, there scarce seems room to call it in question.

The *second sight*, then, is a faculty of seeing things to come, or things doing at a great distance, represented to the imagination as if actually visible, and present.

Thus if a man be dying, or about to die, his image shall appear distinctly in its natural shape, in a shroud, and with other funeral apparatus, to a *second-sighted* person, who, perhaps, never saw his face before: immediately after which, the person so seen, certainly dies.

This quality of *second-sightedness*, is not hereditary: the person who has it, cannot exert it at pleasure: nor can he prevent it, or communicate it to another; but it comes on him involuntarily, and exercises itself on him arbitrarily: And often, especially in the younger *second seers*, to their great trouble and terror.

There are a great number of circumstances attend these visions; by observation whereof, the particular circumstances as to time, place, &c. of the death of the person, are learnt.—

The method of judging of them, or interpreting them, grows into a kind of art; which is very different in different persons. *Second-sightedness* is held a discredit in the country; so that none will counterfeit it; many conceal and dissemble it.

SECOND terms, in algebra, those where the unknown quantity has a degree of power less than it has in the term where it is raised to the highest. See TERM.

The art of throwing these *second terms* out of an equation; that is, of forming a new equation, where they have no place, is one of the most ingenious and useful inventions in all algebra. See REDUCTION of equations.

**SECOND tide.** See the article **TIDE**.

**SECONDARY, or SECONDARY,** an officer who acts as second, or next to the chief officer. See **OFFICER** and **PRINCIPAL**.

Such are the *secondaries* of the fine-office.—The *secondaries* of the compters, who are next the sheriffs of London in each of the two compters.—*Secondary* of the office of the privy seal.—Two *secondaries* of the pipe.—*Secondary* to the remembrancers, &c. See **REMEMBRANCER**, &c.

**SECONDARY**, is more frequently used in an adjective sense, by way of opposition to primary or principal. See **PRIMARY**, and **PRINCIPAL**.

**SECONDARY actors,** } See the articles } **ACTOR**.

**SECONDARY affections,** } See the articles } **AFFECTION**.

**SECONDARY circles,** of the ecliptick, are circles of longitude of the stars; or circles which passing through the poles of the ecliptick, are at right angles to the ecliptick. See **CIRCLE** and **SPHERE**.

By the help of these, all points in the heavens are referred to the ecliptick; that is, any star, planet or other phenomenon, is understood to be in that point of the ecliptick, which is cut by the *secondary* semi-circle, which passes through such star or phenomenon. See **ECLIPTICK**, **LONGITUDE**, &c. If two stars be thus referred to the same point of the ecliptick, they are said to be in conjunction; if in opposite points, they are said to be in opposition: if they be referred to two points at a quadrant's distance, they are said to be in quartile aspect; if the points differ a sixth part of the ecliptick, they are said to be in sextile aspect. See **ASPECT**, &c.

In the general, all circles which intersect one of the six greater circles of the sphere at right angles, may be called *secondary circles*.—As, the azimuth or vertical circles in respect of the horizon, &c. the meridian in respect of the equator, &c. See **AZIMUTH**, **VERTICAL**, &c.

**SECONDARY collateral points,** } See } **COLLATERAL**.

**SECONDARY dials,** } See } **DIAL**.

**SECONDARY fever,** is that which arises after a crisis, or the discharge of some morbid matter: as, after the declension of the small-pox, or measles. See **FEVER**, **Small-Pox**, &c.

**SECONDARY motion,** } See the articles } **MOTION**.

**SECONDARY place,** } See the articles } **PLACE**.

**SECONDARY planets,** those moving round other planets, as the centres of their motion, and along with them round the sun. See **PLANET**.

Saturn, Jupiter, and the Earth, are each attended with *secondary planets*: Jupiter with four, and Saturn with five, called the *satellites* of those two planets. See **SATELLITES**. The earth has one *secondary planet*, called the *moon*. See **MOON**. The motion of the primary planets, is very simple and uniform, as being compounded only of a projectile motion, forward in a right line, which is a tangent to the orbit; and a gravitation towards the sun at the centre. Add, that being at such vast distances from each other, the effects of their mutual gravitation towards one another are insensible.—But, the matter is far otherwise, in respect of the *secondary planets*; for every one of these, though it chiefly gravitate towards its respective primary one, as towards its centre, yet at equal distances from the sun, is attracted towards him with equally accelerated gravity, as the primary one is towards him; but at a greater distance with less, and at a nearer distance with greater: from which double tendency towards the sun, and towards their own primary planets, the motion of the satellites, or *secondary planets*, comes to be mightily compounded, and affected with many inequalities: as for instance,

1. The satellite shall be continually accelerated in its motion, from the time of its quadrature with the sun, to the next following conjunction or opposition; but contrary-wise from the syzygies to the quadratures, it shall be retarded; and therefore will not always move swifter in or near the syzygies, and slower near the quadratures. From whence will follow that,

2. The orbits of these *secondary planets* will be of a figure more circular in the quadratures than in the syzygies, where the swiftness of the motion will make the figure of the orbit more rectilinear, and therefore the satellite will run farther from its primary planet at the quadratures, than at the syzygies: so that the orbit will be a little elliptical, having the primary planet for its centre, and the longer diameter will coincide with the line of the quadratures, and the shorter with that of the syzygies.—Which irregularities will arise, if the sun's power of disturbing the motion of the satellite be excluded, and the orbit be concentrick with that of the primary planets: for if the orbit be excentrick, it may happen that the satellite shall be farther off from the primary one in the syzygies, and so move slower than it does at the quadratures: and when this is the case, that the satellite's orbit is not a circle concentrick to the primary orbit, but an ellipse, in one of whose focus's the primary planet is placed, then, the motion of the satellite will be so disturbed by the sun, that as it proceeds in its orbit, the apses of the orbit shall be moved sometimes in *consequentia*, and sometimes in *antecedentia* (whereas the nodes and apses of the primary planets are at rest.) See **APSES** and **NODES**.

3. When the plane of the satellite's orbit is inclined to the

VOL. II. N<sup>o</sup>. CXXXIX.

plane of the primary orbit, the line of the nodes of the *secondary* orbit will be moved in *antecedentia*, with an angular motion, and an unequal velocity; for it will recede most swiftly, when the nodes are in quadrature to the sun; after which, it will move slower; and at the time of the nodes being in the syzygies, will be perfectly at rest.

4. The inclination also of the plane of the *secondary* orbit, to the primary one, will be continually varying, and will be greatest, when the nodes are in the syzygies with the sun, and less, *ceteris paribus*, when they are in the quadratures; and from the time of the nodes being in the syzygies, to the quadratures, it will be always decreasing, and from the time of their being in the quadratures to the syzygies, it will be always increasing: and all those irregularities, whether in any excentrick or concentrick orbit, will always be something greater, when the satellite is in conjunction with the sun, than when he is in opposition to him. See **PLANET**, **QUADRATURE**, **SYZYG**, **GRAVITY**, &c.

**SECONDARY qualities,** } See the articles } **QUALITY**.

**SECONDARY rainbow,** } See the articles } **RAINBOW**.

**SECONDINE.** See the article **SECUNDINE**.

**SECRETARY**, an officer, who, by order of his master, writes letters, dispatches, and other instruments, which he renders authentick by his signature. See **CLERK**.

Of these there are several kinds, as *secretary of state*, *secretary of war*, *secretary of the treasury*, *secretary of the admiralty*, *secretary of the lord chancellor*, &c.

**SECRETARIES of state**, are officers attending the king, for the receipt and dispatch of letters, grants, petitions, and many of the most important affairs of the kingdom, both foreign and domestick. See **OFFICER**.

The king's *secretaries* were anciently called the *king's clerks*, and *notaries*, *regi a commentariis*.—For the name *secretary*, it was at first applied to such as being always near the king's person, received his commands, and were called *clerks of the secret*; whence was afterwards formed, the word *secretary*, *regi a secretis*: and as the great lords began to give their clerks the quality of *secretaries*, those who attended the king, were called, by way of distinction, *secretaries of the commands*, *regi a mandatis*. This continued till the reign of our Henry VIII. 1559; when, at a treaty of peace between the French and Spaniards, the former observed, that the Spanish ministers, who treated for Philip II. called themselves *secretaries of state*. Upon which the French *secretaries des commandements*, out of emulation, assumed the same title; which thence passed into England.

'Till the reign of king Henry VIII. there was only one *secretary of state*: but then business increasing, that prince appointed a second *secretary*; both of equal power and authority, and both stiled *principal secretaries of state*.—Before queen Elizabeth's time, the *secretaries* did not sit at the council-board; but that prince admitted them to the place of privy-counsellors; which honour they have held ever since, and a council is never, or at least very seldom, held without one of them.—On the union of England and Scotland, queen Anne added a third *secretary*, on account of the great increase of business, which, as to Britain, is equally and distinctly managed by all the three, although the last is frequently stiled *secretary of state for North Britain*.

They have under their management and direction, the most considerable affairs of the nation, and are obliged to a constant attendance on the king: they receive and dispatch whatever comes to their hands, be it for the crown, the church, the militia, private grants, pardons, dispensations, &c. as likewise petitions to the sovereign, which, when read, are returned to the *secretaries* for answer; all which they dispatch according to the king's command and direction.

As to foreign affairs, they are divided into two provinces, or departments, comprehending all the kingdoms and nations which have any intercourse or business with Great Britain; each *secretary* receiving all letters and addresses from, and making all dispatches to, the several princes and states comprehended in his province: which division still subsists, notwithstanding the addition of a third *secretary*.—Ireland and the plantations are under the direction of the elder *secretary*, who has the southern province.

Of these three principal *secretaries*, the two for South Britain, have each two *under secretaries*, and one chief clerk; and the other for North Britain one *under secretary*, and one chief clerk, with an uncertain number of other clerks and translators, all wholly depending on them.

The *secretaries of state* have the custody of that seal, properly called the *signet*, and the direction of the signet-office; wherein are four clerks employed, who prepare such things as are to pass the signet, in order to the privy, or great seal. All grants signed by the king are returned hither, which, transcribed, are carried to one of the principal *secretaries of state*, and sealed, and then called *signets*, which being directed to the lord privy-seal, are his warrant. See **SIGNET**, &c.

On the *secretaries of state*, is likewise dependant another office, called the *paper-office*, wherein all publick writings, papers, matters of state, &c. are preserved. See **PAPER-OFFICE**.

All the *under secretaries* and clerks are in the choice of the

II L

secretary

*secretary of state*, without reserve to any person: the *under secretaries* receive orders and directions from them, for writing dispatches, foreign and domestick, which they give to the chief clerk, who distributes them to the under-clerks.

**SECRETARY of an embassy**, is a person attending an ambassador, for the writing of dispatches relating to the negotiation.

There is a deal of difference between the *secretary of the embassy*, and the ambassador's *secretary*; the last is a domestick or menial of the ambassador's; the first a servant or minister of the prince. See **EMBASSADOR**.

**SECRETION, SECRETIO**, in medicine, the act whereby the several juices, or humours in the animal body, are separated from the blood, by means of the glands. See **HUMOUR, BLOOD, ANIMAL, &c.**

In the bodies of animals, we observe a great number of juices of different natures, *viz.* the blood, lymph, saliva, stomach-liquor, intestinal juices, pancreatic juice, bile, urine, &c.—Now, the blood is the general source of all; and from it they are all secreted by particular organs, called *glands*. See **GLAND**.

The manner wherein this *secretion* is effected, has been greatly enquired into in these last ages; though not with the greatest success. The ancient physicians, indeed, contented themselves to assert certain particular virtues, or faculties inherent in the several viscera; whereby they were determined to separate one liquor rather than another; without troubling themselves much about the manner wherein it was done. But the moderns, according to the genius of their philosophy, must have this point cleared, and the modus of *secretion* rendered intelligible.—Hence, as the exceeding smallness of these organs prevented any regular search, they have imagined various manners of explaining them.

Some, full of the effects they have observed from fermentations, maintain, that there are ferments in the several parts; by aid whereof, certain kinds of particles mixed in the blood, are separated therefrom; after the same manner as we see in must, or new wine, from which, while fermenting, certain parts are detached in form of froth.—But this opinion has so many inconveniencies to grapple withal, that it is almost universally abandoned. See **FERMENT**.

Others consider the glands as kinds of sieves, whose holes having different figures, will only let pass certain particles or molecules, whose figures resemble those of the holes.—But the falsity of this hypothesis was soon found out; and it was thought sufficient to fix some proportion between the diameters of the pores and of the molecules that were to pass through them, to account why very subtile parts should pass through the glands, through which the coarser could not pass.—Yet this opinion was not found perfectly satisfactory: for on this supposition, the most subtile parts of the blood must pass in such quantity through the largest pores, that there would not be enough left to furnish the little ones with what they needed: and for the same reason, those parts whose pores are biggest, ought to furnish liquors much fuller of subtile parts, than those whose pores are smaller; which yet is contrary to experience. For the serosity separated in the kidneys, under the name of *urine*, consists of parts much subtile and smaller than the bile separated in the liver: why then does not this serosity escape in the liver? the pores whereof must be much greater than those of the kidneys. See **BILE**.

This inconvenience, many naturalists being aware of, has made them have recourse to *imbibition* (if the word may be allowed us for want of a better.) They maintain, then, that besides the different diameters of the pores, it is required that the several parts be already imbued or moistened with a liquor like to that they are to filter.—This opinion is rather the result of reason than of experiment, and the maintainers hereof, well pleased they had something to satisfy their reason withal, never troubled themselves whether it were true: till M. Winslow fell into it.

Dr. Keil, whose theory prevails most in England, accounts for *secretion*, from the joint consideration of the different diameters of the vessels, the different velocity of the blood, the different angles the ducts make with the arteries, and the different attraction of the different parts under all these different circumstances.—His theory see at length, under the article **ANIMAL secretion**.—But even in this, there is something arbitrary and conjectural: besides, the reasoning is carried such a length, that, in a thing, the principles whereof are so obscure, the parts or organs so imperfectly known, and the whole process carried on out of sight, the mind can scarce safely acquiesce in it.

M. Winslow, of the royal academy of sciences at Paris, seems to have taken a better course for the discovery of this important action of *secretion*. He does not take up with conjectural principles, nor draw a plausible scheme of reasoning therefrom through the dark; but applies himself to experiment, and investigates, in nature herself, and the structure of the parts, the manner *secretion* is performed in. From a strict examination of the several kinds of glands, both in men and other animals, he finds, with some other anatomists, that the glands are only bundles or plexus of

vessels: but the vessels peculiar to the gland, and which constitute the principal part thereof, M. Winslow first discovered to be tubes, furnished, on the inside, with a kind of down or lanugo, or rather a very fine, spongy tissue, which fills the whole cavity of those vessels like a pith or marrow. This he finds in all glands, of all animals: in different glands, it appears of different colours, and this different colour is even found in the different glands of fœtus's themselves.

The gland, then, is, at least its main part, a compound of those downy or spongy vessels, which, from their office, we will call *secretory vessels*, or *ducts*, and which frequently do, almost of themselves, form what we call a *gland*, or *glandulous body*: though beside these vessels, we usually remark four other kinds, *viz.* arteries, veins, excretory ducts and nerves. The *secretory* ducts we distinguish from the excretory ones; in that the former, by the peculiar texture of their down, serve to separate a particular liquor; and that the latter only serve to receive the liquor thus *secreted*, and to carry it to the place it is destined for. For a more particular account of the structure and organization of the glands, see **GLAND**.

For the manner wherein the glands act, in separating the several liquors from the body, M. Winslow lays it down thus: it is a thing well known by physicians and chymists, that a piece of brown paper, which is only an assemblage of small fibres impacted close to each other, having once imbibed oil or water, will never let any other liquor pass through it, but of the same kind with what it is impregnated withal. All others it stops. And the like is observed of a wick of cotton or other matter, which having first imbibed its fill of oil or water, and being then dipped at one end, in a vessel full of oil and water together; the wick that had imbibed the oil, will only raise and distil oil, and that with water, only water. Now, in the *secretory* ducts of the glands, we find a parallel structure; an assemblage or plexus of fine threads or filaments bound close together, much as in brown paper, or a cotton-wick; only differently disposed. This plexus, then, having once imbibed a certain juice, will not let pass any of the liquors which arrive at the orifices of these ducts, but that it had first imbibed.—The cause of this phenomenon is, doubtless, to be referred to the great principle of attraction, which is found stronger between the homogeneous than the heterogeneous parts of the same fluid. But this is an enquiry that belongs to another place. See **ATTRACTION and REPULSION**.

As the blood, now, is not a homogeneous liquor; but a compound of an infinity of different parts or molecules, some oily, others mucilaginous, aqueous, saline, subtile, gross, &c. in its motion along the arteries of the gland, it becomes divided into all the little ramifications thereof; by which means its velocity is exceedingly abated, and its molecules obliged to go off one by one, through the narrow passage of the artery into the vein, and of consequence to pass over the orifices of the *secretory* ducts of the glands, whose down is already tinged with a juice of a certain nature. Such of the molecules therefore, as are found of the same nature with the juice they meet withal at the entrance of the *secretory* duct, join themselves to them, and enter the ducts, driven on by others that follow them. Thus they pass, successively, through the whole vessel, and at length go out of it into the excretory duct; while the rest, which are of a different kind, run over the orifice of the *secretory* vessel, without ever mixing with the juice thereof, and thus arriving in the vein, are carried back to the heart.

All that remains, is, to explain how these parts should have first imbibed the particular juices necessary for their respective *secretions*: how, for instance, the bile should come to be separated in the liver, for the first time, preferable to any other liquor? To this M. Winslow answers, that having observed the glands of the smallest fœtus's to be coloured much as in adults; it appears highly probable they had been imbued with the juices they were to filtrate, at the first formation of the animal; or at the same time when the solid parts of the fabric themselves were framed.

**SECT, SECTA**, a collective term, comprehending all such as follow the doctrines or opinions of some famous divine, or philosopher, &c. See **HERESY** and **SCHISM**.

The *sects* of philosophers among the ancients, particularly in Greece, were numerous; as Pyrrhonians, Platonists, Epicureans, Stoicks, Peripateticks, Academicks, &c. See each under its proper article, **PERRHONIAN, PLATONIST, ACADEMICK, &c.**

At present the *sects* of philosophy are chiefly reducible to three, *viz.* the Cartesian, Peripateticks, and Newtonians. See **CARTESIAN, &c.**

In theology, the *sects* are much more numerous; yet the ancients had legions now extinct; as, Manichees, Gnosticks, Montanists, &c. See **MANICHEE, GHOSTICK, &c.**

The principal now on foot, are the Lutherans, Calvinists, Anabaptists, Arians, Socinians, Arminians, &c. The rise, progress, and fate, with the distinguishing characters and opinions of each, see under its respective head, **LUTHERAN, CALVINIST, &c.**

**Ionic SECT,** } See the articles } **IONIC.**  
**Italic SECT,** } **ITALIC.**  
**SECTA,** in law. See the article **SUIT.**  
**Hundred SECTA.** See the article **HUNDRED.**  
**SECTIO Casarea.** See the article **CÆSAREAN section.**  
**SECTION** \*, **SECTIO**, a part of a thing divided; or the division itself. See **DIVISION** and **DISSECTION.**

\* The word is formed from the Latin *seco*, I cut. Such, particularly, are the sub-divisions of chapters, by others called *paragraphs*, and sometimes *articles*.—The mark of a *section* is §. See **PARAGRAPH.**

The ancients neglected to divide their books into chapters, and *sections*; that was a task left for future editors, and critics. See **CHAPTER.**

**SECTION**, in geometry, denotes a side or surface appearing of a body, or figure cut by another; or the place wherein lines, planes, &c. cut each other. See **BISSECTION**, **INTERSECTION**, and **TRISSECTION.**

The common *section* of two planes is always a right line, being the line supposed to be drawn by the one plane in its cutting or entering the other. See **PLANE.**

If a sphere be cut in any manner, the plane of the *section* will be a circle, whose centre is in the diameter of the sphere. See **SPHERE.**

The *sections* of the cone are four, viz. a circle, parabola, hyperbola and ellipsis. See each under its proper article. See also **CONE.**

**Conic SECTIONS.** See the article **CONIC section.**

**Axis of a conic SECTION,**

**Center of a conic SECTION,**

**Diameter of a conic SECTION,**

**Tangent of a conic SECTION,**

} See } **AXIS.**  
 } **CENTER.**  
 } **DIAMETER.**  
 } **TANGENT.**

Following **SECTIONS**, *sectiones sequentes*, in conics, may be thus conceived: suppose two right lines, as AB, CD (*Tab. Conics*, fig. 5.) mutually intersecting one another in E, which point E is supposed to be the common centre of the opposite hyperbolic *sections* FG, HI, and whose common asymptotes, the proposed lines AB, CD also are.—In this case, the *sections* GF and HI, are called *sectiones sequentes*, because they are placed following one another in the contiguous angles of two intersecting right lines.

If the determinate diameter HG, of one of the *sectiones sequentes* (which is coincident with the supposed indeterminate diameter of its opposite) be equal to the vertical tangent KL, applied between the asymptotes in the point G, of the diameter GF, then, Apollonius calls such *sections*, *conjugate sections*.

**Opposite SECTIONS,** } See the articles } **OPPOSITE.**

**Similar SECTIONS,** } **SIMILAR.**

**SECTION of a building,** denotes its *profile*; or a delineation of its heights and depths raised on the plan; as if the fabrick was cut asunder, to discover the inside. See **PROFILE** and **ORTHOGRAPHY.**

**Horizontal SECTION.** See the article **ICHOGRAPHY.**

**SECTOR**, in geometry, a part of a circle comprehended between two radii, and the arch. See **CIRCLE** and **ARCH.**

Thus the mixt triangle ACD (*Tab. Geometry*, fig. 13.) comprehended between the radii AC and CD and the arch AD, is a *sector of the circle.*

It is demonstrated by geometricians, that the *sector* of a circle, as ACD, is equal to a triangle, whose base is the arch AD, and its altitude the radius AC.

If from the common centre of two concentric circles, be drawn two radii, to the periphery of the outer, the two arches included between the radii, will have the same ratio to their peripheries; and the two *sectors*, the same ratio to the areas of their circles.

To find the area of a *sector* DCE; the radius of the circle CD, and the arch DE being given. To 100, 314 and the radius AC, find a fourth proportional number; this will be the semi-periphery. Then to 180°, the given arch DE, and the semi-periphery just found, find another fourth proportional; this will give the arch DE in the same measure in which the radius AC is given. Lastly, multiply the arch DE into the semi-radius, the product is the area of the *sector*.

**SECTOR** also denotes a mathematical instrument, of great use in finding the proportion between quantities of the same kind, as between lines and lines, surfaces and surfaces, &c. whence the French call it the *compass of proportion*.

The great advantage of the *sector* above the common scales, &c. is, that it is made so as to fit all radius's, and scales.—By the lines of chords, sines, &c. on the *sector*, we have lines of chords, sines, &c. to any radius betwixt the length and breadth of the *sector* when opened. See **SCALE** and **LINE.**

The *sector* is founded on the fourth proposition of the 6th book of Euclid, where it is demonstrated, that similar triangles have their homologous sides proportional: an idea of its foundation may be conceived thus.—Let the lines AB, AC (fig. 14.) represent the legs of the *sector*, and AD, AE two equal *sections* from the centre. If now the points CB and DE be connected, the lines CB and DE will be parallel; therefore the triangles ADE, ACB similar; and consequently the sides AD, DE, AB and BC proportional: that is, as AD:DE:AB:BC; whence if AD be the half, third or fourth part of AB; DE will be a half, third

or fourth part of CB: and the same holds of all the rest. If, therefore, AD be the chord, sine, or tangent of any number of degrees to the radius AB; DE will be the same to the radius BC. See **CHORD**, **SINE**, &c.

**Description of the SECTOR.**—The instrument consists of two equal rules, or legs of brass or other matter, rivetted together; but so as to move easy on the rivet. See its figure, *Tab. Geometry*, fig. 15. On the faces of the instrument are placed several lines; the principal are the line of equal parts, line of chords, line of sines, line of tangents, line of secants, and line of polygons.

The *line of equal parts*, called also *line of lines*, marked L, is a line divided into 100 equal parts; and, where the length of the leg will allow it, each is sub-divided into halves and quarters. It is found on each leg, on the same side; and the divisions numbered 1, 2, 3, 4, &c. to 10, which is near the extremity of each leg. Note, in practice, 1 is taken for 10, or 100, or 1000, or 10000, &c. as occasion requires; in which cases 2 represents 20, or 200, or 2000, &c. and so of the rest. The line of chords, marked C on each leg, is divided after the usual manner, and numbered 10, 20, 30, &c. to 60. See **CHORD**. The line of sines, denoted on each leg by the letter S, is a line of natural sines, numbered 10, 20, 30, &c. to 90. See **SINES**. Line of tangents, denoted on each leg by the letter T, is a line of natural tangents, numbered 10, 20, 30, &c. to 45: besides which, is another little line of tangents on each leg, commencing at 45°, and extending to 75°, denoted by the letter t. See **TANGENT**. Line of secants, denoted on each leg by the letter S, is a line of natural secants, numbered 10, 20, 30, &c. to 75, and commencing, not from the centre of the instrument, but at two inches distance therefrom. See **SECANT**. Line of polygons, denoted by the letter P on each leg, is numbered 4, 5, 6, &c. to 12, which falls 3 inches short of the centre of the instrument. See **POLYGON**.

Beside these lines, which are essential to the *sector*, there are others placed near the outward edges on both faces, and parallel thereto, which are in all respects, the same as in Gunter's scale, and used after the same manner. Such are the line of artificial sines marked S; the line of artificial tangents; a line of 12 inches, marked in; and Gunter's line of numbers, marked N. For the uses of all which, see **Gunter's SCALE**. There are sometimes, other lines placed, to fill the vacant spaces, as the lines of hours, latitudes, and inclinations of meridians, which are used the same as on the common scales. See **SCALE**.

The lines found by the *sector* are of two kinds, lateral and parallel. The first are such as are found by the sides of the *sector*, as AB, AC, fig. 14. The latter, such as go across from one leg to the other, as DE, CB. Note, the order of the lines in the newer *sectors*, is different from what it is in the old ones; for the same line is not now put at the same distance from the edge on both legs; but the line of chords, *e. gr.* is innermost upon the one, and the line of tangents on the other. The advantage hereof is, that when the instrument is set to a radius for the chords, it serves also for the sines and tangents without stirring it; for the parallel betwixt 60 and 60 of the chords, 90 and 90 of the sines, and 45 and 45 of the tangents, are all equal.

**Use of the line of equal parts on the SECTOR.**—1°. To divide a given line into any number of equal parts, *e. gr.* seven. Take the given line in your compasses, and setting one foot in a division of the line of equal parts, that may easily be divided by 7, *e. gr.* 70, whose seventh part is 10; open the *sector* till the other point fall exactly on 70 in the same line, in the other leg. In this disposition, applying one point of the compasses to 10 in the same line; shut them till the other fall in 10 in the same line of the other leg. This aperture will be the 7th part of the given line. Note, if the line to be divided be too long to be applied to the legs of the *sector*, only divide one half, or one fourth by 7, and the double or quadruple thereof will be the 7th part of the whole.

2°. To measure the lines of the perimeter of a polygon, one of which contains a given number of equal parts. Take the given line in your compasses, and set it over, upon the line of equal parts, to the number of parts on each side expressing its length. The *sector* remaining thus, set off the length of each of the other lines parallel to the former; and the numbers each of them falls on will express their lengths.

3°. A right line being given, and the number of parts it contains, *e. gr.* 120, to take from it a less line, containing any number of the same parts, *e. gr.* 25. Taking the given line in your compasses, open the *sector* till the two feet fall on 120 on each leg; then, the distance from 25 to 25 gives the line required.

4°. To find a third proportional to two given lines, and a fourth to three. For the first, take the length of the first given line in your compasses, and lay it off on the line of equal parts from the centre, to find the number where it terminates: then open the *sector*, till the length of the second line be included in the aperture of the extreme of the first: the *sector* remaining thus, lay off the length of the second line on one of the legs, from the centre; and note the number where it terminates; the distance between that number

ber on the two legs, gives the third proportional.—For the second, take the second line in your compasses, and opening the *sector*, apply this extent to the ends of the first, laid off from the centre on both legs. The *sector* thus opened, lay off the third line from the centre, and the extent between the number whereon it terminates on both legs, is the fourth proportional.

5°. To divide a line in any given proportion, *e. gr.* into two parts, which shall be to each other as 40 to 70. And the two numbers together, their sum is 110. Then, between your compasses take the line proposed, which suppose 165, and open the *sector* till this distance reach from 110 to 110 on both legs. The *sector* thus opened, take the extent from 40 to 40, as also from 70 to 70; the first will give 60, the last 105, which will be the parts proposed, for 40:70:60:105.

6°. To open the *sector*, so as the two lines of equal parts may make a right angle: find three numbers that may express the sides of a right-angled triangle, as 3, 4 and 5, or their equimultiples, as 60, 80 and 100. Take then, in your compasses, the distance from the centre to 100; and open the *sector*, till one point set upon 80, the other fall upon 60 in the other leg; then do the two lines of equal parts include a right angle.

7°. To find a right line equal to the circumference of a circle. The diameter of a circle being to the circumference, nearly as 50 to 157, take the diameter in your compasses, and set it over on the legs of the *sector*, from 50 to 50. The *sector* thus opened, take the distance from 157 to 157 in your compasses. This will be your circumference required.

*Use of the line of chords on the SECTOR.*—1°. To open the *sector*, so as the two lines of chords may make an angle of any number of degrees, *e. gr.* 40. Take the distance from the joint to 40, the number of degrees proposed, on the line of chords; open the *sector*, till the distance from 60 to 60, on each leg, be equal to the foresaid distance of 40; then does the line of chords make the angle required.

2°. The *sector* being opened, to find the degrees of its aperture. Take the extent from 60 to 60, and lay it off on the line of chords from the centre: the number, whereon it terminates, shews the degrees of its opening.—By applying sights on the line of chords, the *sector* may be used to take angles, as a surveying instrument.

3°. To make an angle of any given number of degrees, with a given line. On the given line describe a circular arch, the centre whereof is the point whereon the angle is to be made. Set off the radius from 60 to 60; and the *sector* remaining thus, take the distance of the two numbers on each leg, expressing the proposed degrees, and lay it from the line upon the arch described. Lastly, drawing a line from the centre, through the end of the arch, it will make the angle proposed.

4°. To find the degrees a given angle contains. About the vertex describe an arch, and open the *sector*, till the distance from 60 to 60 on each leg, be equal to the radius of the circle: then taking the chord of the arch between the compasses, and carrying it on the legs of the *sector*, see what equal number, on each leg, the points of the compasses fall on: this is the quantity of degrees, the given angle contains.

5°. To take an arch, of any quantity, from off the circumference of a circle. Open the *sector*, till the distance from 60 to 60 be equal to the radius of the given circle: then take the extent of the chord of the number of degrees, on each leg of the *sector*, and lay it off, on the circumference of the given circle. By this use may any regular polygon be inscribed in a given circle, as well as by the line of polygons.

*Use of the line of polygons on the SECTOR.*—1°. To inscribe a regular polygon in a given circle. Take the semi-diameter of the given circle, in the compasses, and adjust it to the number 6, on the line of polygons, on each leg of the *sector*: then the *sector* remaining thus opened, take the distance of the two equal numbers, expressing the number of sides the polygon is to have. *E. gr.* The distance from 5 to 5 for a pentagon, from 7 to 7 for a heptagon, &c. These distances carried about the circumference of the circle, will divide it into so many equal parts.

2°. To describe a regular polygon, *e. gr.* a pentagon, on a given right line. Take the length of the line in the compasses, and apply it to the extent of the number 5, 5, on the lines of polygons. The *sector* thus opened, upon the same lines take the extent, from 6 to 6, this will be the semi-diameter of the circle the polygon is to be inscribed in. If, then, with this distance, from the ends of the given line, you describe two arches of a circle, their intersection will be the centre of the circle.

3°. On a right line, to describe an isosceles triangle, having the angles at the base, double that at the vertex. Open the *sector*, till the ends of the given line fall on 10 and 10 on each leg; then take the distance from 6 to 6. This will be the length of the two equal sides of the triangle.

*Use of the lines of sines, tangents, and secants, on the SECTOR.*—By the several lines disposed on the *sector*, we have scales to several radius's; so that having a length, or radius, given, not exceeding the length of the *sector* when opened, we find the chord, sine, &c. thereof. *E. gr.* Suppose the chord, sine, or tangent, of 10 degrees, to a radius of 3 inches, required: make 3 inches the aperture, between 60 and 60, on the

lines of chords of the two legs; then will the same extent reach from 45 to 45 on the line of tangents, and from 90 to 90 on the line of sines on the other side; so that to whatever radius the line of chords is set, to the same are all the others set. In this disposition, therefore, if the aperture between 10 and 10, on the lines of chords, be taken with the compasses, it will give the chord of 10 degrees. If the aperture of 10 and 10 be in like manner taken on the lines of sines, it will be the sine of 10 degrees. Lastly, if the aperture of 10 and 10 be in like manner taken on the lines of tangents, it gives the tangent of 10 degrees.

If the chord, or tangent, of 70 degrees were required; for the chord, the aperture of half the arch, *viz.* 35, must be taken, as before; which distance, repeated twice, gives the chord of 70°. To find the tangent of 70° to the same radius, the small line of tangents must be used, the other only reaching to 45: making, therefore, 3 inches the aperture between 45 and 45 on the small line; the extent between 70 and 70 degrees, on the same, will be the tangent of 70° to 3 inches radius.

To find the secant of an arch, make the given radius the aperture between 0 and 0 on the line of secants: then will the aperture of 10 and 10, or 70 and 70, on the said lines, give the tangent of 10°, or 70°.

If the converse of any of these things were required; that is, if the radius be required, to which a given line is the sine, tangent, or secant, it is but making the given line, if a chord, the aperture on the line of chords, between 10 and 10, and then the *sector* will stand at the radius required; that is, the aperture between 60 and 60, on the said line, is the radius. If the given line were a sine, tangent or secant, it is but making it the aperture of the given number of degrees; then will the distance of 90 and 90 on the sines, of 45 and 45 on the tangents, of 0 and 0 on the secants, be the radius.

*Use of the SECTOR in trigonometry.*—1°. The base and perpendicular of a rectangled triangle being given, to find the hypotenuse. Suppose the base A C (*Tab. Trigonomet. fig. 2.*) 40 miles and the perpendicular A B 30; open the *sector* till the two lines of lines make a right angle: then for the base, take 40 parts on the line of lines on one leg; and for the perpendicular 30 on the same line on the other leg: then the extent from 40 on the one, to 30 on the other, taken in the compasses, will be the length of the hypotenuse, which line will be found 50 miles.

2°. The perpendicular A B of a right-angled triangle A B C, being given, 30, and the angle B C A, 37°, to find the hypotenuse B C. Take the given side A B, and set it over, on each side, upon the sine of the given angle A C B; then the parallel distance of radius, or of 90 and 90, will be the hypotenuse B C; which will measure 50 on the line of sines.

3°. The hypotenuse and base being given, to find the perpendicular. Open the *sector*, till the two lines of lines be at right angles; then lay off the given base on one of those lines from the centre. Take the hypotenuse in your compasses, and setting one foot in the point of the given base, let the other fall on the line of lines, on the other leg: the distance from the centre to the point where the compasses fall, will be the length of the perpendicular.

4°. The hypotenuse being given, and the angle A C B, to find the perpendicular. Make the given hypotenuse a parallel radius, *i. e.* make it the extent from 90 to 90 on the lines of sines; then will the parallel sine of the angle A C B be the length of the side A B.

5°. The base and perpendicular A B given, to find the angle B C A. Lay off the base A C on both sides the *sector*, from the centre, and note its extent: then take the given perpendicular, and to it open the *sector*, in the terms of the base; the parallel radius will be the tangent of B C A.

6°. In any right-lined triangle, two sides being given, with the included angle, to find the third side. Suppose the side A C 20, the side B C 30, and the included angle A C B 110°; open the *sector*, till the two lines of lines make an angle equal to the given angle, *viz.* 110°. Lay off the given sides of the triangle from the centre of the *sector*, on each of the lines of lines; the extent between their extremes is the length of the side A B sought.

7°. The angles C A B and A C B given, and the side C B, to find the base A B. Take the given side C B, and turn it into the parallel sine of its opposite angle C A B; and the parallel sine of the angle A C B will be the length of the base A B.

8°. The three angles of a triangle being given, to find the proportion of the sides. Take the lateral sines of the several angles, and measure them in the line of lines; the numbers answering thereto, give the proportion of the sides.

9°. The three sides being given, to find the angle A C B. Lay the sides A C, C B, along the line of lines, from the centre; and set over the side A B in their terms: so is the *sector* opened, in these lines, to the quantity of the angle A C B.

10°. The hypotenuse A C (*fig. 3.*) of a right-angled spherical triangle A B C given, *e. gr.* 43°, and the angle C A B 20°; to find the side C B. The rule is: As radius is to the sine of the given hypotenuse 43°, so is the sine of the given

given angle  $20^\circ$  to the sine of the perpendicular CB. Take, then,  $20^\circ$  from the centre, along the line of sines, in your compasses, and set the extent, from 90 to 90, on the two legs; and the parallel sine of  $43^\circ$ , the given hypotenuse, will, when measured from the centre on the line of sines, give  $13^\circ 30'$ , the side required.

11°. The perpendicular BC, and the hypotenuse AC given, to find the base AB. As the sine complement of the perpendicular BC is to radius, so is the sine complement of the hypotenuse to the sine complement of the base.—Therefore, make the radius a parallel sine of the given perpendicular, *e. gr.*  $76^\circ 30'$ ; then the parallel sine of the complement of the hypotenuse, *e. gr.*  $47^\circ$  measured along the line of sines, will be found  $49^\circ 25'$ , the complement of the base required: consequently the base itself will be  $40^\circ 35'$ .

*Particular uses of the SECTOR in geometry, &c.*—1°. To make a regular polygon, whose area shall be of any given magnitude. Let the figure required be a pentagon whose superficial area is 125 feet: extract the square root of  $\frac{1}{5}$  of 125, it will be found 5. Make a square, whose side is 5 feet; and, by the line of polygons, as already directed, make the isosceles triangle CGD (*Tab. Geom. fig. 14. N<sup>o.</sup> 2.*) so as that CG being the semi-diameter of a circle, CD may be the side of a regular pentagon inscribed therein, and let fall the perpendicular GE. Then continuing the lines EG and EC, make EF equal to the side of the square before made: and from the point F, draw the right line FH parallel to GC; then a mean proportional between GE and EF will be equal to half the side of the polygon sought, which doubled, will give the whole side. The side of the pentagon thus had, the pentagon itself may be described, as above directed.

2°. A circle being given, to find a square equal thereto. Divide the diameter into 14 equal parts, by the line of lines, as above directed: then will 12.4 of those parts found by the same line, be the side of the square sought.

3°. A square being given, to find the diameter of a circle equal thereto. Divide the side of the square into 11 equal parts, by means of the line of lines; and continue that side to 12.4 parts; this will be the diameter of the circle required.

4°. To find the side of a square, equal to an ellipsis whose transverse and conjugate diameters are given. Find a mean proportional between the transverse and conjugate diameters; which, being divided into 14 equal parts; 12.4 thereof, will be the side of the square required.

5°. To describe an ellipsis in any given ratio of its diameter; the area whereof shall be equal to a given square. Suppose the proportion of the transverse and conjugate diameters be required, as 2 to 1; divide the side of the given square into 11 equal parts: then, as 2 is to 1, so is  $11 \times 14 = 154$  to a 4th number; the square whereof is the conjugate diameter sought. Then, as 1 to 2, so is the conjugate diameter to the transverse. Now,

6°. To describe an ellipsis, by having the transverse and conjugate diameters given. Suppose AB and ED (*Tab. Con. fig. 21.*) to be the given diameters; take AC in your compasses, and to the extent thereof open the sector, till the distance from 90 to 90, on the lines of sines, be equal thereto. Then may the line AC be divided into a line of sines, by taking the parallel extents of the sine of each degree on the legs of the sector, in your compasses, and laying them off from the centre C. The line thus divided into sines (in the figure it is only done into every 10th sine) from each raise perpendiculars both ways; then, find points in those perpendiculars through which the ellipsis must pass, thus: take the extent of the semi-conjugate diameter CE between your compasses, and open the sector, till the aperture of 90 and 90 on the lines of sines be equal thereto: then take the parallel sines of each degree of the lines of sines of the sector, and lay them off on those perpendiculars drawn through their complements in the lines of sines AC; thus will you have two points in each perpendicular, through which the ellipsis must pass. *E. gr.* The sector still remaining the same, take the distance from 80 to 80 on the lines of sines, in your compasses, and setting one foot in the point 10, on the line AC, with the other, make the points *a* and *m* in the perpendiculars passing through that point: then will *a* and *m* be the two points in the perpendicular, through which the ellipsis must pass. All the other points, found after the same manner, being connected, will give the semi-ellipsis DAE; and the other half will be drawn after the same manner.

*Use of the SECTOR in surveying.*—The bearings of three places, as A, B, C, (*Tab. Surveying, fig. 4. N<sup>o.</sup> 2.*) to each other, *i. e.* the angles ABC, BCA and CAB, being given; and the distance of each, from a fourth standing among them, as, D, *i. e.* BD, DC, and AD being given; to find the distances of the several places A, B, C, from each other, *i. e.* the lengths of the sides AB, BC, AC. Having drawn the triangle EFG (*fig. 4. N<sup>o.</sup> 3.*) similar to ABC, divide the side EG in H, so as that EH may be to HG, as AD to DC, after the manner already directed: and, after the like manner must EF be divided in I, so as EI may be to IF, as AD to BD. Then continuing the sides EG, EF, say, as EH—HG is to HG, so is EH+HG to GH; and as EI—IF is to

VOL. II. N<sup>o.</sup> CXXXIX.

IF, so let EI+IF be to FM; which proportions are easily wrought by the line of lines on the sector. This done, bisect HK and IM, in the points L, N; and about the said points as centres, with the distances LH and IN, describe two circles intersecting each other, in the point O; to which, from the angles E, F, G, draw the right lines EO, FO, and OG, which will have the same proportion to each other, as the lines AD, BD, DC: now, if the lines EO, FO, and GO, be equal to the given lines AD, BD, DC, the distances EF, FG, and EG, will be the distances of the places required. But if EO, OF, OG, be less than AD, DB, DC, continue them, till PO, OR, and OQ be equal to them: then the points P, Q, R, being joined, the distances PR, RQ and PQ, will be the distances of the places sought. Lastly, if the lines EO, OF, OG, be greater than AD, DB, DC, cut off from them lines equal to AD, BD, DC, and join the points of section by three right lines; the lengths of the said three right lines will be the distances of the three places sought. Note, if EH be equal to HG, or EI to IF, the centres L and N, will be infinitely distant from H and I; that is, in the points H and I, there must be perpendiculars raised to the sides EF, EG, instead of circles, till they intersect each other; but if EH be less than HG, the centre L will fall on the other side of the base continued; and the same is to be understood of EI, IF.

The sector is of especial use for facilitating the projection of the sphere, both orthographic and stereographic. See PROJECTION and STEREOGRAPHIC.

SECULAR, something that is *temporal*: in which sense, the word stands opposed to *ecclesiastical*. See TEMPORAL and ECCLESIASTICAL.

Thus we say, *secular power, secular arm, secular jurisdiction*. See POWER, ARM, JURISDICTION, &c.

SECULAR, is more peculiarly used for a person who lives at liberty in the world; not shut up in a monastery, nor bound by vows, or subjected to the particular rules of any religious community. See VOW, RULE, MONASTIC, MONK and ORDER.

In which sense the word stands opposed to *regular*. See REGULAR.

The Romish clergy is divided into *regular* and *secular*. See CLERGY.

The *regulars* pretend their state is much more perfect than that of the *seculars*. *Secular* priests may hold abbeys and priories both simple and conventual, though not regularly, but only in *commendam*. See ABBOT and COMMENDAM. It is a maxim, in their canon law, *secularia secularibus, i. e.* *secular* benefices are only to be given to *secular* persons; regular to regular. See BENEFICE.

SECULAR corporation. See the article CORPORATION.

SECULAR games, *ludi SECULARES*, in antiquity, solemn games, held among the Romans, once in an age; or, in a period deemed the extent of the longest life of man, called by the Greeks, *αιων*, and the Latins, *seculum*. See AGE and GAME.

The *secular games* were also called *Terentine games, ludi Terentini*, either by reason Manius Valerius Terentinus gave occasion to their institution; for that having been warned, in a dream, to dig in the ground in a place near the Campus Martius, called *Terentum*, he there found an altar inscribed to Dis, or Pluto and Proserpine: upon which, as had been foretold him in his dream, three of his children born blind, recovered their sight; and he, in gratitude, performed sacrifices, on the same altar, for three days and three nights successively.—Or by reason here was an altar of Pluto buried deep under ground, because the water of the Tyber *terram tereret*, eat into the ground in this place.

The *secular games* lasted three days, and as many nights; during which, sacrifices were performed, theatrical shews exhibited, with combats, sports, &c. in the circus.

Their origin, and institution, is delivered at length by Val. Maximus: the occasion thereof, according to this writer, was, to stop the progress of a plague.—The first who had them celebrated at Rome, was Valerius Publicola, the first consul created after the expulsion of the kings, in the year of Rome 245.—The ceremonies to be observed therein were found prescribed in one of the books of the Sibyls.

At the time of the celebration of the *secular games*, heralds were sent to invite all the world to a solemnity no body had ever yet seen, nor was ever to see again.

Authors are not agreed as to the number of years wherein these games returned; partly, because the quantity of an age or *seculum* among the ancients is not known; and partly on other accounts: some will have it, that they were held once every hundred years, and that the *seculum*, or age, was our century.—This Varro and Livy seem to express in very plain terms; yet others will have it, that *seculum* comprehended 110 years, and that the *secular games* only returned in that period, that is, at the beginning of every 111th year; which opinion is countenanced by Horace, in his *secular poem*, v. 21.

Be this as it will, it is certain they sometimes did not stay for the 111th, nor even for the 100th year, for the celebration of these games. Augustus, for instance, held them in the

111 M

year

year of Rome 736; and Caligula again in the year of Rome 800, and of Christ 38, viz. 64 years after the former; and Domitian, again, in still less time, viz. in the year of Christ 87, at which Tacitus assisted in quality of quindecimvir, as he himself tells us, *Annal. lib. xi. c. 11*. This was the seventh time that Rome had seen them from their first institution. The emperor Severus exhibited them the eighth time 110 years after those of Domitian: Zosimus says, these were the last; but he is mistaken, for in the year of Rome 1000, fifty years after those of Severus, the emperor Philip had them celebrated with greater magnificence than had ever been known.—We find them represented on medals.

**SECULAR poem.** See the article **SECULARE carmen**.

**SECULAR year**, the same with **JUBILEE**. See **JUBILEE**.

**SECULARE carmen**, **SECULAR poem**, a poem sung, or rehearsed, at the *secular games*. See **SECULAR games**.

Of this kind we have a very fine piece among the works of Horace: it is a Sapphic ode, which usually comes at the end of his epodes.—In some editions, the twenty-first ode of the first book, is called *carmen seculare*.

**SECULARIZATION**, the action of *secularizing*, or of converting a regular person, place, or benefice, into a secular one. See **REGULAR** and **SECULAR**.

Almost all the cathedral churches were anciently regular, i. e. the canons were to be religious; but they have been most of them *secularized*. See **CATHEDRAL** and **CANON**.

For the *secularization* of a regular church there is required the authority of the pope, that of the prince, the bishop of the place, the patron, and even the consent of the people.—In France all this must be confirmed by parliament.

Religious, that want to be released from their vows, obtain briefs of *secularization* from the pope.

**SECUNDA aqua**, among chymists, &c. denotes aqua-fortis which has been already used to dissolve some metal, &c. See **AQUA-FORTIS** and **DEPART**.

**SECUNDARY**, or **SECONDARY**. See **SECONDARY**.

**SECUNDI generis**, in anatomy, a distinction among the lacteal vessels.—There are two kinds of lacteals, viz. *primarij*, or those of the first kind, *primi generis*: and *secundi generis*, *secundary*, or of the second kind.

The first carry the chyle from the intestines into glands dispersed in great numbers throughout the mesentery.—The second carry it from these glands, after its being diluted there with lymph, into the common receptacle. See **LACTEAL**.

**SECUNDI internodii pollicis extensor**. See **EXTENSOR**.

**SECUNDINE**, or **SECUNDINES**, **SECUNDINÆ**, in medicine, the several coats or membranes wherein the foetus is wrapped up, in the mother's womb; as the chorion and amnios, with the placenta, &c.—See *Tab. Anat. (Splanchn.) fig. 16. lit. bb.* See also the articles **FOETUS**, **CHORION**, **AMNIOS**, &c.

They are thus called, because they come out in the second place, i. e. after the child, in delivery.—The matrons and midwives call them the *after-birth*, as being esteemed a second burthen, whereof the mother is freed. Others call them, the *delivery*, because when these are out, the woman is reckoned to be perfectly delivered.

The *secundine* must never be left in the matrix; it is a foreign body, which would destroy the mother: it is dangerous even to have a piece of it left behind.

Hippocrates observes, that twins have always the same *secundine*. See **TWINS**.

Dr. Grew, in his anatomy of plants, applies the term *secundine* to the fourth and last coat or cover of seeds; by reason this performs nearly the same office in plants, that the membranes investing the foetus do in animals. Indeed Pliny, Columella, Apuleius, &c. have used *secundine* in the same sense.

**SECUNDO**.—*Propositio de SECUNDO adjacente*. See the article **PROPOSITION**.

**SECUNDUS peronæus**, } See the articles { **PERONÆUS**.  
**SECUNDUS scalenus**, } { **SCALENUS**.

**SECURITATE pacis**, a writ, which lies for one who is threatened with death, or danger; against the person who so threatens him.—It is taken out of chancery, directed to the sheriff. See **SURETY** and **PEACE**.

**SECUTORES**\*, in antiquity, a kind of gladiators among the Romans, who fought against the retiarii. See **GLADIATOR**.

\* The word is formed from the verb *sequi*, to follow; because the *secutores* used to pursue the retiarii. See **RETIARIUS**.

The *secutores* were armed with a sword, and a buckler, to keep off the net, or noose, of their antagonist, and wore a cask on their head.—Some confound the *secutores* with the mirmillones, because both had nearly the same weapons.

**SECUTORES** was also a name given to such gladiators, as took the place of those killed in the combat; or, who fought the conqueror. This post was taken by lot.

In ancient inscriptions we also meet with *secutor tribuni*, *secutor ducis*, *secutor Cæsaris*, &c. who were officers attending the tribunes, and generals; perhaps like our aids de camp.

**SE-DEFENDENDO**, a plea for him who is charged with

the death of another; alledging, that he was forced to do what he did, in his own defence, the other so assaulting him, that had he not done as he did, he must have been in danger of his own life. See **MANSLAUGHTER**.

To have this plea admitted, the danger must appear inevitable.—Though the party justify its being done *se-defendendo*, yet he is driven to procure his pardon of course from the lord-chancellor, and forfeits his goods to the king.

**SEDER OLAM**, in philology, a Hebrew term, literally signifying, *order of the world*; being the title of two chronicles in that language.

They are both very short, though the one more so than the other; for which reason the one is called *seder olam rabba*, that is, the *great seder olam*; and the other, *seder olam zuta*, i. e. *little seder olam*.

The *great SEDER OLAM* commences at the creation of the world, and comes down as low as the war of the pseudo-messiah Barchochabas, under Adrian, 52 years after the destruction of the temple of Jerusalem, and, of consequence, to the 122d year of Christ.—It is almost all taken from the scripture, excepting the end. It is the work of R. Josa, son of Hhelpeta of Tisippora, who lived in the second century, about the year 130, and was master of the famous R. Juda Hakkadosch, the compiler of the Mishna.

The *lesser SEDER OLAM* is an abridgment of the former, brought down as far as Mar Sutra, who lived 450 years after the destruction of the temple, or 522 years after Christ.—F. Morin, continually bent upon diminishing the antiquity of the principal books of the Jews, endeavours to prove it to have been wrote about the year of Christ 1124, as indeed it is expressed at the beginning: but R. Dav. Gantz. has overthrown this opinion in his *Tsemahh David*, and shewn, that the date, in the beginning, is an interpolation.

The two chronologies were first printed at Mantua in 1514, quarto; again, at Basil, by Frobenius in 1580, octavo: at Venice in 1545, quarto: at Paris, with a Latin version of Genebrard, in 12°.—They have been since re-printed at Amsterdam, in 1711.

**SEDIMENT**\*, the settlement, or dregs, of any thing; or that gross, heavy part of a fluid body, which, upon resting, sinks to the bottom of the vessel. See **HYPOSTASIS**.

\* The word is formed from the Latin, *sedimentum*, which Matthias Sylvaticus derives à *diuturna sede*.

Some physicians pretend to discover much of the nature of the disease, from the *sediment* of the urine. See **URINE**.

Dr. Woodward maintains, that at the deluge, the whole terrestrial globe was dissolved into one uniform mass, and that the new world arising thence was perfectly spherical, and without any inequalities, consisting of several strata, which the earthy *sediment* gradually produced, as it drained. See **DELUGE**, **STRATA**, &c.

**SEDR**, or **SEDRE**, the high priest of the sect of Ali, among the Persians. See **MAHOMETANISM**.

The *sedr* is appointed by the emperor of Persia, who usually confers the dignity on his nearest relation.

The jurisdiction of the *sedr* extends over all effects destined for pious purposes, over all mosques, hospitals, colleges, sepulchres, and monasteries. He disposes of all ecclesiastical employments, and nominates all the superiors of religious houses.—His decisions, in matters of religion, are received as so many infallible oracles: he judges of all criminal matters, in his own house, without appeal, and is, without contradiction, the second person in the empire.

The *sedr*, however, has not any indelible character, but frequently quits his post, for another purely secular one.—His authority is balanced by that of the mudschid, or first theologian of the empire.

**SEED**, **SEMEN**, a matter prepared by nature, for the reproduction, and conservation of the species, both in men, animals, and plants. See **GENERATION**, **ANIMAL**, **PLANT**, &c.

Some naturalists add, that even stones, minerals, and metals themselves have each their proper *seed* in their mines, and are produced and perpetuated thereby. See **MINERAL**, **STONE**, &c.

**SEED**, **SEMEN**, in the animal œconomy, is a white, liquid matter, or humour, the thickest of any in the body, separated from the blood in the testicles, and reserved in proper vessels, to be the means of generation.—By chymical analysis it is found to consist almost intirely of oil, and volatile salts blended together by the mediation of a little phlegm. Its activity Dr. Drake takes to be derived from the salts, wherewith it abounds, far more than any other animal liquor. See **HUMOUR**.

The parts concerned in the preparation of the *seed* are the spermatic arteries, which bring the blood to be secreted into the testicles; the testicles, and parastatæ, where the secretion itself is chiefly effected; the vasa deferentia, which convey the secreted matter out of the testicles; and the vesiculæ seminales, which receive and preserve it to be emitted in coition. See each of these parts described under its proper article **TESTICLE**, &c.

The blood received, in small quantities, into the spermatic arteries, and there, by the particular structure of the parts, much

much diminished of its velocity, is yet farther retarded about the corpus pyramidale, or varicosum, and its redder, and thicker parts, carried off by canals opening into the veins. Thus rendered paler, and slower, it is received into the winding recesses of the testicles, where, almost stagnating, it assumes an ash-colour, and is further prepared, thickened, &c. in the ductus Highmorianus, whence, slowly driven into the epididymidæ, or parastatæ, it is further prepared and elaborated in the folds and complications thereof, and, at length, creeps slowly into the vasa deferentia, or ejaculatoria. These consist, at first, of a thick fungous matter, and are very narrow, but growing sensibly wider, and then again narrower, in the winding meanders hereof the humour is collected, its motion abated, further elaborated, and concocted, and at last driven into the vesiculæ seminales, in the various cells and meatus's whereof it is received, laid up, fixed, thickened, whitened, and raised to its last perfection; in which state it is called *seed*.

It is observable, that no humour in the body is generated so slowly, meets with so many means to retard it, or to elaborate, and concoct it, when at rest, as the *seed*. Some imagine that, in its whole retarded progress, besides what is apparent, there is something still added to it from the minute nervous vesicles; and something taken away, by the various lymphatics, and discharged thereby into the venous vesicles of the corpus pyramidale, and the little veins of the vesiculæ seminales, and thence into the humours of the whole body: Boerhaave takes both the one and the other to be very probable.

The *seed*, or humour, thus formed in the testicles, parastatæ, vasa deferentia, and vesiculæ seminales, being, when new, diluted with a little warm water, and viewed with a good microscope, seems to consist of innumerable, little, oblong, living, eel-like animalcula floating in the other part of this humour.—This is said to be always observed in the seed of all men, quadrupeds, birds, fishes, amphibious animals, and insects. See ANIMALCULE.

Upon comparing this with the bulk, figure, place, change, &c. of the carina of the chick described by Malpighi, and with the known law of nature observed in the generation of frogs; it appears highly probable, that the animalcula of the male *seed*, contain the rudiments, or stamina, of the future human body; and the more so, since, whenever the testicles, or this humour is wanting, there is always sterility on the side of the male.

M. Leewenhoeck, the first discoverer of these animalcula, and many after him, make no scruple to call them true *fœtus's*, little men; and some have even pretended to discover somewhat of the human figure therein.—But Verheyen, and others after him, deny the existence of any such animalcula; maintaining, that it is only the intestine motion of the parts of the *seed* kept on foot by the warmth thereof, that exhibits this appearance, which fanciful persons have improved into frisking animalcula; and urging, in confirmation hereof, that no sooner is the warmth gone, than all appearance of animals ceases.—But this notwithstanding, the doctrine of the animalcula in semine, seems now pretty generally received. See GENERATION.

Some admit of four several kinds of *seed*: the *seed* of the testicles, that of the vesiculæ seminales, that of the prostates, and that of the glands of the penis.—The two first, which we have described as one and the same humour, only in different stages, those authors take to be different, as not being able to find any strict communication between the deferentia and the vesiculæ; but that communication is fully shewn by Dr. Drake, so that nothing needs further, to shew the *seeds* the same.—The liquor of the prostates, and that of the glands of the penis, are generally allowed not to be any true *seed*, no more than that emitted by women: nor is there any good reason why either of them should be called so, as their appearance is very different, and as other sufficient uses are assigned for them, viz. to line and lubricate the parts, that the *seed*, urine, &c. may pass more freely, and without adhering. See PROSTATES.

The seminal liquor, however, such as emitted for use, is a mixture of several fluids, poured at the same time into the common canal of the urethra, either from the glands that have secreted them, of the reservoirs that have kept them.—M. du Verney observes, that in different species, the number and structure of these organs is different. In man, the principal are the vesiculæ seminales, and the prostates, besides what was discovered by Mr. Cowper, viz. a number of new glandulous bodies on each side the urethra, whose excretory ducts open into the urethra, towards the root of the yard. See MUCOUS GLANDS. M. du Verney has found, that the same are likewise in most other animals, and placed in the same manner.

It is controverted, whether or no the liquor filtrated hereby, be necessary to generation? M. du Verney thinks it is; and his chief reason is, that in animals that have been castrated, these glands, as well as all the other sources of generation, are found dried up, and decayed.—M. Littre objects to this, that the vesiculæ seminales, and prostates, having little cells, where their filtrated liquor is deposited, it is easily conceived

that their humours may wait some time, for an occasion of being emitted; but that these new prostates, or glands, of Mr. Cowper, having no such reservoirs, their liquor must ooze out into the cavity of the urethra, in proportion, as it is separated, and be destined for some continual, not a momentary, or occasional use. He adds, that as the excretory ducts of these glands traverse the spongy body of the urethra, for two inches, ere they penetrate into its cavity, and that in the sole moments when the liquor should be discharged, to assist in generation, that spongy body is extremely dilated, and its sides in a state of compression, the liquor must be then less disposed to a discharge than ever. See ERECTION.

For the fate of the *seed* when lodged in the uterus: see CONCEPTION, GENERATION, &c.

SEED, in botany, is the last product of a plant, whereby the species is propagated. See PLANT.

The *seed* is frequently the fruit of the plant, as is the case in most herbs. See FRUIT.

Sometimes it is only a part inclosed in the fruit, and that in form, either of grain, kernel, or berry. See GRAIN, NUCLEUS, ACINUS, &c.

The *seed* is the natural offspring of the flower, and that for whose production all the parts of the flower are intended; so that when this is once well formed, the several parts of the flower dwindle, and disappear. See FLOWER.

It is produced from the farina of the apices, let fall on the head of the pistil, and thence forwarded to an uterus at the bottom thereof, divided into several cells; where, coming to receive the nutritious juice of the plant, it is first softened, then swelled, increased both in matter and bulk, and at length comes to its state of maturity.—For a more particular account of the manner of the generation of the *seed*, see GENERATION.

That the whole plant is contained in the *seed*, is an opinion as old as Empedocles, and is still the prevailing doctrine among the generality of naturalists. Experience, the microscope, and the modern philosophy, give it great countenance. In effect, by the use of good microscopes, we discover, in the *seed*, several of the parts of the future tree, only in miniature; particularly a little root, called the *radicle*, and the stem called the *plumule*. See RADICLE and PLUMULE.

In Malpighi's life, we have a debate between him and seignior Triumphetti, provost of the physic garden at Rome, whether the whole plant be actually contained in the *seed*? The affirmative is maintained by Malpighi, with cogent arguments; among which this is one, that in a kidney bean ere sown, the eye, assisted with a microscope, easily discovers leaves, a bud, and even the knots, or implantations of the leaves on the stem. The stem itself is very conspicuous, and plainly consists of woody fibres, and series's of little utricles.—And whereas seignior Triumphetti had objected, that by poverty, transplantation, &c. several plants degenerate into others, particularly wheat into tares, and tares again into wheat; in answer to this, which is one of the strongest objections against that opinion, Malpighi replies, that he is not fully satisfied as to the truth of the objection; for that both himself, and his friends, making the experiment, no metamorphosis of the wheat succeeded: but granting the metamorphosis, it is the soil, or the air, or the culture, is in the fault. Now, from a morbid, and monstrous condition of nature, there is no inferring her genuine and permanent state. See DEGENERATION.

To the same effect, Mr. Leewenhoeck, after a nice observation of an orange-kernel he had made to germinate in his pocket, &c. concludes, "Thus we see how small a particle, no bigger than a coarse sand, is increased, &c." A plain demonstration, that the plant, and all that belongs to it, was actually in the *seed*, viz. the body, root, &c.—Mr. Derham adds, that of all the *seeds* he has viewed, except the maple, the plant appears the plainest to the naked eye in the nux vomica.

The fecundity of plants, in the production of *seeds*, is very surprizing. M. Dodart, in the memoirs of the French academy of sciences, computes, that an elm, living 100 years, ordinarily produces of itself 33000000 grains; and adds, that had its crown, or head, been cut off, it would have put forth as many branches, within half an inch of the place where it was cut, as it had before; and that at whatever height it were cut off, the effect would have been still the same.—Hence he concludes, that the whole trunk, from the ground to the rise of the branches, is full of the principles, or little embryo's of branches, which, it is true, cannot all appear at once, but which being conceived, as separated by circular rims, half an inch high, compose so many sets of branches, each whereof is ready to appear, and will really appear, if the head be lopped off just over it.

Now these invisible branches exist as really as those which appear: for whence else should they come? the trunk cannot produce them, as being itself no more than a packet of fibres, destitute of all action: nor can the sap, which, like the blood, is fit to nourish the parts, but not to form any new ones.—The branches thereof existed before the tree was lopped;

topped; and if they had appeared, would have bore an equal number of *seeds* as those which did. These *seeds*, therefore, they must already contain in little.

On which footing, the tree may be said actually to contain in itself 1584000000 *seeds*, wherewith to multiply itself as many times.—But what shall we say, if each *seed*, or grain of a tree, contain in itself another tree, containing the same number of *seeds*? and, if we can never come either at a *seed* which does not contain trees, nor at a tree which does not contain *seed*? by this means we shall have an increasing geometrical progression, the first term whereof is 1, the second 1584000000, the third, the square of 1584000000; the fourth, its cube, &c. to infinity. See **FECUNDITY**.

Several species of plants have been always supposed to be destitute of *seed*, in regard no observation, no microscope, no anatomy had discovered any thing like them: such are the capillaries, the several kinds of fuci, sea-plants, mosses, &c. —But the happy industry of the present age has discovered the *seeds* of some of them; and has left us out of all doubt, that the rest are not without the same.

The *seeds* of fern, and the capillary-plants, were first discovered by Cæsius; and since, more fully and critically by Mr. W. Cole. The *seeds* of some sea-plants, were discovered by the Count de Marfigli, and those of others, by M. Reaumur, the first mentioned in the history of the French academy for the year 1712, and the latter for the year 1711. The *seeds* of some kinds of fuci have been discovered by Mr. Samuel Doody: those of coralloid shrubs, by Dr. Tanc. Robinson, as also, those of several fungi, particularly truffles, and crepitus lupi's, or puff-balls; and those of some other by Dr. Lister. See **MUSHROOM**: under which article, a new theory of the propagation of these apparently *seedless* plants is laid down.

*Echinate SEEDS*, } See the articles { **ECHINATE**.  
*Naked SEEDS*, } { **NAKED**.  
*Winged SEEDS*, } { **WINGED**.

**SEEDS**, in gardening, and agriculture.—Mr. Bradley observes, that the *seeds* of plants, though exceedingly good, will degenerate from the mother-plant, if they be sown on the same ground, whence they were gathered; so that there is a great necessity for a yearly change of *seeds* of forest trees, as acorns, mast, &c. If the place be too cold to sow them when gathered in August, they may be kept barrelled, or potted up, in moist sand or earth, *stratum super stratum*, during the winter; at the end of which they are found sprouted, and if gently sown, will be as forward as if sown in autumn, besides their missing the vermin to which the winter *seed* is much exposed.

The *seed* is not to be chosen from the most fruitful trees, so much as from the most solid and fair; nor are we to covet the largest acorns, but the most weighty, clean, and bright. Porous, insipid, mild sorts of *seed*, are to be sown as soon as ripe: hot, bitter *seeds* to be kept a year before sown.

The shape and weight of *seeds*, direct how they are to be set: most of them, when they fall, lie on one side, with the small end towards the earth, which shews that posture to be best to set any stone or nut in: if they be heavy, sow them the deeper. Acorns, peaches, &c. to be sown two or three inches deep. See **SEMINATION** and **PERPENDICULARITY**.

**SEEDS**, in pharmacy, &c.—The medicinal *seeds*, especially those imported from the Indies, Levant, &c. are severally described under their respective articles, which see.

Among those cultivated at home, the principal are the four *greater hot*, and the four *greater cold seeds*, as they are called.—The first are those of annice, fennel, cummin, and caraway: the latter, those of gourd, citrul, melon, and cucumber.

The chief use of the four cold *seeds*, is for the making of emulsions, cool refreshing drinks, pasts for the hands, and oils used by the ladies for the complexion.

*Amber SEED*, } See the articles { **AMBER seed**.  
*Anise SEED*, } { **ANISE seed**.  
*Line SEED*, } { **LINE seed**.  
*Mustard SEED*, } { **MUSTARD seed**.  
*Worm SEED*, } { **WORM seed**.

**SEED of pearls**. See the article **PEARL**.

**SEEDLINGS**, among gardeners, denote such roots of gilliflowers as come from seed sown.—Also, the young tender shoots of any plants, that are newly sowed.

**SEEING**, the act of perceiving objects by the organ of sight; or the sense we have of external objects, by means of the eye. See **SIGHT**.

For the apparatus, or disposition of the parts necessary to *seeing*, see **EYE**.—For the manner wherein *seeing* is performed, and the laws thereof, see **VISION**.

Our best anatomists differ greatly as to the cause why we do not *see* double with the eyes?—Galen, and others after him, ascribe it to a coalition or decussation of the optic nerve behind the os sphenoides. But whether they discussate or coalesce, or only barely touch one another, is not so well agreed. The Bartholines and Vesalius say expressly, they are united by a perfect confusion of their substance: Dr. Gibson allows

them to be united by the closest conjunction, but not confusion of their fibres. See **OPTIC nerve**.

Des Cartes, and others, account for the effect another way, viz. by supposing that the fibrillæ constituting the medullary part of those nerves, being spread in the retina of each eye, have each of them corresponding parts in the brain; so that when any of those fibrillæ are struck by any part of an image, the corresponding parts of the brain are affected thereby.—Somewhat like which is the opinion of Dr. Briggs; who takes the optic nerves of each eye to consist of homologous fibres, having their rise in the thalamus nervorum opticorum, and thence continued to both the retinae which are composed of them: and farther, that those fibrillæ have the same parallelism, tension, &c. in both eyes; consequently, when an image is painted on the same corresponding, sympathizing parts of each retina, the same effects are produced, the same notice carried to the thalamus, and so imparted to the soul.—Hence, that double vision ensuing upon an interruption of the parallelism of the eyes; as when one eye is depressed by the finger, or their symphony interrupted by disease. But Dr. Briggs maintains, that it is but in few subjects, there is any discussion; in none, any conjunction more than mere contact.

Whence it is that we *see* objects erect, when it is certain, the images thereof are painted invertedly on the retina, is another difficulty in the theory of *seeing*!—Des Cartes accounts for it hence; that the notice the soul takes of the object, does not depend on any image, nor on any action coming from the object, but merely on the situation of the minute parts of the brain, whence the nerves arise. *E. gr.* the situation of a capillament of the optic nerve, corresponds to a certain part of the brain, which occasions the soul to *see* all those places lying in a right line therewith.

But Mr. Molyneux gives us another account: the eye, he observes, is only the organ, or instrument: it is the soul that *sees*. To enquire, then, how the soul perceives the object erect by an inverted image, is to enquire into the soul's faculties. Again, imagine that the eye receives an impulse on its lower part, by a ray from the upper part of an object; must not the visive faculty be hereby directed to consider this stroke as coming from the top rather than the bottom of the object, and consequently, be determined to conclude it the representation of the top? See **SIGHT**, **VISIBLE**, &c.

**SEEING faith**. See the article **FAITH**.

**SEELING**. A horse is said to *seel*, when he begins to have white eye-brows; that is, when there grows on that part about the breadth of a farthing of white hairs, mixed with those of his natural colour; which is a mark of old age. See **AGE**.

It is said a horse never *seels* till he is fourteen years old, and always before he is sixteen.—The light sorrel and black, sooner *seel* than any other.

Horse-jockeys usually pull out those hairs with pincers; but if there be so many that it cannot be done, without making the horse look bald and ugly, then they colour their eye-brows, that they may not appear old.

**SEEM**, or **SEME**. See the article **SEAM**.

**SEGMENT of a circle**, in geometry, a part of a circle comprehended between an arch and the chord thereof.—Or, it is a part of a circle comprehended between a right line less than a semi-circle and a part of the circumference. See **CIRCLE**, **ARCH**, **CHORD**, &c.

Thus the portion AFB (Tab. Geometry, fig. 23.) comprehended between the arch AFB, and the chord AB, is a *segment* of the circle ABED, &c. a *segment* of so many degrees.

As it is evident every *segment* of a circle must either be greater or less than a semi-circle; the greater part of the circle cut off by a chord, i. e. the part greater than a semi-circle, is called the *greater segment*, as ADEB; and the lesser part, or the part less than a semi-circle, the *lesser segment*, as AFB, &c.

The angle which the chord AB, makes with a tangent LB, is called the *angle of a segment*. See **ANGLE**.

Some also call the two mixt angles comprehended between the two extremes of the chord, and the arch, *angles of the segment*.

*Angle in the SEGMENT*. See the article **ANGLE**.

*Similar SEGMENTS*. See the article **SIMILAR**.

The height of a **SEGMENT** DE, fig. 22, and half its base or chord AE, being given, to find the area of the *segment*. Find the diameter of the circle. See **DIAMETER**. On this describe a circle, and draw the base of the *segment* AB; draw the radii AC, BC; and find the number of degrees of the arch ADB. From the diameter had, and its ratio to the periphery, find the periphery itself; and from the ratio of the periphery to the arch ADB, and the periphery itself, find the length of the arch ADB. This done, find the area of the sector ADBCA. See **SECTOR**. And that of the triangle ACB. See **TRIANGLE**. Lastly, subtract the triangle from the sector, the remainder is the area of the *segment*. See **SINE**.

If the area of the greater *segment* BFA, were required, the triangle ACB must be added to the sector ADEBC.

**SEGMENT**

**SEGMENT** of a sphere, is a part of a sphere terminated by a portion of its surface, and a plane which cuts it off; passing somewhere out of the centre. See SPHERE.

This is more properly called a *section of a sphere*. See SECTION.

The base of such a *segment*, it is evident, is always a circle whose centre is in the centre of the sphere.

The solid content of a *segment* of a sphere is found, by multiplying the surface of the whole sphere by the altitude of the *segment*, and then dividing the product by the diameter of the sphere, and to the quotient adding the area of the base of the *segment*.—Or, if it be less than a hemisphere, thus; take the altitude of the *segment* from the radius of the sphere, and by the difference multiply the area of the base of the *segment*; and subtract this product, from that which will arise by multiplying the semi-axis of the sphere into the convex surface of the *segment*; then divide the remainder by 3, and the quotient is the solidity sought.

This latter method supposes the axis of the sphere to be given; if not, it may be found thus: let the altitude of the *segment* be called  $a$ , and its semi-diameter  $s$ , then will  $a : s :: s : \frac{ss}{a}$ ; add  $\frac{ss}{a}$  to  $a$ , and that shall give the axis sought.

**Resistance of a SEGMENT.** See the article RESISTANCE.

**SEGMENT** is sometimes also extended to the parts of ellipses, and other curvilinear figures. See ELLIPSIS, CURVE, &c.

**Line of SEGMENTS.** On Gunter's sector there are usually two lines, called *lines of segments*; they are numbered with 5, 6, 7, 8, 9, 10, and lie between the lines of sines, and those of superficies. They represent the diameter of a circle, so divided into 100 parts, as that a right line drawn through those parts, and normal to the diameter, shall cut the circle into two *segments*, of which the greater shall have that proportion to the whole circle, which the parts cut have to 100. See SECTOR.

**SEGMENT leaves**, a denomination given by botanists to those leaves that are cut and divided into many threads, or slices; as fennel, &c. See LEAF.

**SEGMOIDAL valves**, in anatomy, are little valves of the pulmonary artery; thus called from their resembling segments of circles; but more usually semilunar valves. See SEMILUNAR.

**SEGREANT**, is the herald's word for a griffon, when drawn in a leaping posture, and displaying his wings, as if ready to fly.

**SEJANT**, is a term used in heraldry, when a lion, or other beast, is drawn in an escutcheon, sitting like a cat, with his fore-feet streight.

**SEIGNEUR**, or SEIGNOUR, *lord*. See SIRE, SIEUR, MONSEIGNEUR, LORD, &c.

**SEIGNORAGE**, or SEIGNOURAGE, a right or due belonging to a seigneur, or lord. See LORD.

**SEIGNORAGE** is particularly used for a duty belonging to the prince for the coining of money, called also *coinage*; in the baser Latin, *monetarium*. See COINAGE.

This duty is not always the same; but changes according to the pleasure of the prince, and the occasions of state. It is in some measure for the discharge of this duty that alloy was invented; that is, the mixture of other metals with gold and silver. See ALLOY.

Under our ancient kings, for every pound of gold brought in the mints to be coined, the king's duty was five shillings; one shilling, and sometimes eighteen-pence whereof went to the master of the mint. Under Edward III. the *seignorage* of every pound weight of silver, was eighteen-penny weight, which was then equivalent to a shilling. Under Henry V. the king's *seignorage* for every pound of silver was fifteen-pence.—At present, the king claims no *seignorage* at all, but the subject has his money coined at the publick expence: nor has the king any advantage therefrom, but what he has by the alloy.

In France, under Philip Augustus, the *seignorage* was one third of the profit made by the coining: St. Louis fixed it at one fifteenth part of the value of the money coined: king John at three livres the mark of gold: Charles VII. by reason of the distressed state of his finances, raised it to three fourths of the value: Louis XIII. fixed it at six livres the mark, or eight ounces of gold, and ten sols the mark of silver.—Louis XIV. took away the right of *seignorage* in 1679; though it was re-established in 1689, on the foot of seven livres, ten sols the mark of gold, and twelve sols, six deniers the marks of silver.

It must be observed, that for the levying of this duty of *seignorage*, the just value of the money is augmented by the value of the duty.

**SEISIN**, SEISINA, in law, signifies possession. See POSSESSION.

In this sense we say, *primer seisin*, for the first possession, &c. See PRIMI.

*Seisin* is two-fold; *seisin in fact*, and *seisin in law*.

**SEISIN in fact**, is, when an actual and corporal possession is taken.

**SEISIN in law**, is, when something is done, which the law accounteth a *seisin*; as an inrollment.

VOL. II. N°. CXXXIX.

This in law gives a right to lands and tenements, though the owner be by wrong disseized of them.—He who hath but an hour's possession quietly taken, hath *seisin de droit*, & *de claime*, whereof no man may disseize him by his own force, or subtilty, without process of law. See DISSEISIN. The civilians call the latter *civilem possessionem*, the former *naturalem*. See POSSESSION.

**SEISINAM habere facias.** See the article HABERE.

**SEISOR.** See the article DISSEISOR.

**SEIZE**, SEAZE, or SEASE, in the sea language, is to make fast, or bind; particularly to fasten two ropes together, with rope-yarn.

The *seizing*, *seafing*, or *seafon* of a boat, is a rope tied to a ring, or little chain in the fore-ship of the boat, by which means it is fastened to the side of the ship.

**SEIZING**, in falconry, is when an hawk gapes her prey, or any thing else fast between her claws.

**SEIZURE**, in commerce, an arrest of some merchandize, moveable, or other matter, either in consequence of some law, or of some express order of the sovereign.

Contraband goods, those fraudulently entered, or landed without entering at all, or landed at wrong places, are subject to *seizure*. See CONTRABAND.

In *seizures*, among us, one half goes to the *seizer*, or informer, and the other half to the king.—In France, half the painted linens, &c. seized, used to be burnt, and the other half sent abroad: but in 1715, by an arret of council, the whole was ordered to be burnt.

**SELENITE**\*, SELENITES, in natural history, *moon-stone*; a stone said to be still found in China, which has this remarkable property, that it increases and decreases, as the moon waxes and wains.—There are some of these *selenites* preserved in the palace of Peking, valued at an incredible rate. Martinus.

\* The word is formed from the Greek, *σεληνη*, moon.

**SELENITES**, among the ancient naturalists, denotes a white, or transparent figured stone; thus called from its representing the moon as in a glass. It was also denominated *lapis specularis*. See SPECULARIS.

Some give the same appellation to Muscovy-talc, from an opinion, that its brightness increases and diminishes with the moon. See TALC.

**SELENOGRAPHY**\*, a branch of cosmography, which describes the moon, and all the parts and appearances thereof; as geography does those of the earth.

\* The word is formed from *σεληνη*, moon, and *γραφη*, description.

Since the invention of the telescope, *selenography* is vastly improved. We have now distinct names for most of the regions, seas, lakes, mountains, &c. visible in the moon's body. Hevelius, a celebrated astronomer and burgher-master of Dantzick, who published the first *selenography*, named the several places of the moon from those of the earth; Ricciolus, from the names of the celebrated astronomers and philosophers.—Thus what the one calls *mons Porphyrites*, the other calls *Aristarchus*. What the one calls *Ætna*, *Sinai*, *Atlas*, *Apenninus*, &c. the other calls *Copernicus*, *Puffidonus*, *Tycho*, *Gassendus*, &c. See MOON.

At the royal observatory at Paris, they continue to make *selenographic maps*. M. Cassini has published a work called *Instructions Seleniques*.

**SELEUCIANS**, SELEUCIANI, a sect of ancient hereticks, called also *Hermiani*. See HERMIANS.

Seleucus and Hermias joining forces, and dogmatizing together, taught, that God was corporeal; that the elementary matter was co-eternal with him, and that the human soul was formed by the angels, of fire and air.—They also denied that Jesus Christ sat at the right hand of God; asserting, that he had quitted that right, and had removed his throne into the sun. See ASCENSION.

**SELEUCIDÆ**, in chronology.—Æra of the SELEUCIDÆ, or the Syro-Macedonian æra, is a computation of time, commencing from the establishment of the *Seleucidæ*, a race of Greek kings, who reigned as successors of Alexander the Great in Syria; as the Ptolemy's did in Egypt. See EPOCHÆ.

This æra we find expressed in the book of Maccabees, and on a great number of Greek medals struck by the cities of Syria, &c.—The Rabbins and Jews call it, the *æra of contracts*, because being then subject to the kings of Syria, they were obliged to follow their method of computing in all contracts.

The Arabs call it *therik dikharnain*, æra of two horns, which some say signifies the æra of Alexander the Great; by reason that prince bore two rams horns on medals, in imitation of Jupiter Ammon, whose son he would needs be.—But others understand it much better of the two kingdoms of Syria and Egypt, which were now cloven or divided; and of one single empire parted into two monarchies.

The grand point, is to know the year wherein the separation was made; or, which is the same thing, when Seleucus Nicanor, one of Alexander's captains, and the first of the *Seleucidæ*, established his throne in Syria.—Without detailing the various sentiments of various authors, it may suffice to observe, that, according to the best accounts, the first year

of this æra falls in the year 311 before Christ, which was 12 years after Alexander's death. See EPOCHÆ.

SELF *abuse*, } See the articles } ABUSE.  
SELF *examination*, } EXAMINATION.

SELL, in building, is of two kinds, *viz.*—*Ground-sell*, which denotes the lowest piece of timber in a timber-building, and that whereon the whole superstructure is raised.

*Window-sell*, called also *window-soil*, is the bottom piece in a window-frame. See WINDOW.

SELLA *equina*, *turcica*, or *sphenoides*, is a name given the four apophyses of the os sphenoides, or cuneiforme, in the brain; in regard of their forming a resemblance of a saddle, which the Latins call *sella*. See SPHENOIDES and BRAIN. They are sometimes also called by the Greek name *clinoides*. Herein is contained the pituitary gland, and in some beasts, the *rete mirabile*. See PITUITARY and RETE.

SEMBIANI, SEMBIANS, a sect of ancient hereticks, denominated from their leader, *Sembius* or *Sembianus*, who condemned all use of wine, as evil of itself; persuaded his followers, that the wine was a production of Satan and the earth; denied the resurrection of the dead, and rejected most of the books of the Old Testament. Jovet.

SEMBRADOR, an engine, invented by Don Jos. de Lucatello, for the evenly sowing of seeds; described in the Philosophical Transactions, under the title of the *Spanish Sembrador*. See SEED and SEMINATION.

The perfection of agriculture is allowed to consist much in setting plants at proportional distances, and giving sufficient depth to the roots, that they may spread, and receive their necessary nourishment: yet is very little care taken in the practice of this important part of husbandry; but all sorts of grains sown by handfuls, cast at random; by which means four parts in five of the seed are lost.—To remedy this inconvenience, the *sebrador* or sower is invented, which being fastened to the plough, the whole business of plowing, sowing, and harrowing is done at once; the seed-man's trouble saved, and the grain spread at equal distances, and equally deep at the bottom of the furrow.

An experiment hereof was made before the emperor Leopold in the fields of Laxemburgh in Austria, where the land usually yields four or five-fold; but the crop from the ground sowed by this instrument, was sixty-fold; as appears by a certificate of the emperor's officer, appointed to see the experiment: signed Vienna, August 1, 1663.

A figure of the *sebrador*, we have in the Transactions, No. 60. by the earl of Castlemain.

SEME, or SEEME. See the article SEAM.

SEMEIOSIS, ΣΗΜΕΙΩΣΙΣ, in medicine. See SEMEIOLOGICA, DIAGNOSIS, and PROGNOSIS.

SEMEIOLOGICA \*, ΣΗΜΕΙΩΤΙΚΗ, that part of medicine which considers the signs, or indications of health, and diseases; and enables the physician to judge what is, was, or will be the state, degree, order and effect of health or sickness. See SIGN and INDICATION; see also MEDICINE.

\* The word is formed from the Greek, σημιωτική, of σημιωσις, sign, symptom.

SEMEN *sanctum*, or *santonicum*. See WORM-SEED.

SEMENTINÆ *feriæ*, in antiquity, feasts held annually among the Romans, to obtain of the gods a plentiful harvest. See FERIÆ.

They were celebrated in the temple of Tellus, or the earth; where solemn sacrifices were offered to Tellus and Ceres.

The time of the celebration was about seed time, usually in the month of January; for Macrobius observes, they were moveable feasts.—They had their name from *semen*, seed.

SEMETs, SUMMETS, or SUMMITS, in botany, are used by Dr. Grew, and others, for the apices of the attire of plants. See APICES.

SEMI, a word borrowed from the Latin, signifying *half*; but only used in composition with other words, as in the following articles.

The French, instead of *femi* frequently use *demi*; the Greeks *hemi*. See HEMI and DEMI.

In music, *femi* has three several usages: first, when prefixed to the name of a note, it expresses a diminution of half its value; as in *femi-breve*, &c. See SEMI-BREVE.

Secondly, when added to the name of an interval, it expresses a diminution, not of half, but of a lesser semi-tone, or four commas in the whole compass; as in *femi-diapente*, &c.

Thirdly, it sometimes also signifies an imperfection: thus, *femicirculo* or *circulo mezzo*, signifies an imperfect circle, which is the mark of imperfect time, that is, of double time; whereas, the circle, being a character of perfection, marks triple time.

SEMI-ARIANS, a branch of the ancient Arians; consisting, according to Epiphanius, of such as, in appearance, condemned the errors of that heresiarch, but yet acquiesced in some of the principles thereof; only palliating and hiding them under softer, and more moderate terms. See ARIANS.

It is true, they separated from the Arian faction; but yet could never be brought to acknowledge, that the Son was homoiousios, that is, consubstantial, or of the same sub-

stance with the Father.—They would only allow him to be homoiousios, that is, of a like substance with the Father. See HOMOOUSIAN, &c.

Though, as to expression, they only differed from the orthodox by a single letter; yet were they, in effect, in the error of the Arians, as they placed the Son in the rank of creatures.—It did not avail the teaching, that there was no other creature of the same class with him; since by denying him consubstantial with God, they effectually precluded him from being truly God.

Yet some, even among the orthodox, use the word homoiousios, in speaking of the Son; applying such an idea to it, as, it seems, is consistent with orthodoxy. See CONSUBSTANTIAL.

But the name *femi-arians* is given by the second general council to another branch of Arians, who believed orthodoxly of the Father and Son, but denied the deity of the Holy Ghost; thus rejecting that part of the Arian heresy relating to the Son, but still retaining that which related to the Holy Ghost.

As the zeal of the Arians was chiefly levelled against the second person in the trinity, that of the *femi-arians* was bent against the third; whence as the former were sometimes called *χριστομαχοι*, the latter were denominated *πνευματομαχοι*. Macedonius, bishop of Constantinople made an innovation in this sect in 360, and gave rise to a new branch of Macedonian *femi-arians*, or *pneumatomachi*; who allowed the Son not to be *ὁμοούσιος*, of the same substance, but *ὁμοιός*, of like substance, with the Father; and at the same time openly asserted the Holy Ghost to be a creature.

SEMI-BREVE, in music, a note, or measure of time, comprehending the space of two minims, or four crotchets, or half a breve. See NOTE, MEASURE, and CHARACTERS of music.

The *femi-breve* is accounted one measure or time; or the integer, in fractions and multiples whereof the time of the other notes is expressed. See TIME.

Thus the minim is expressed by  $\frac{1}{2}$ ; a crotchet by  $\frac{1}{4}$ , &c. i. e. by  $\frac{1}{4}$  of a measure or *femi-breve*. A breve by 2; a long by 4, that is, by 4 measures or *femi-breves*. See MINIM, CROTCHET, BREVE, &c. See also SEXTUPLE.

The character of the *femi-breve* is O.

SEMI-CIRCLE, in geometry, a figure comprehended between the diameter of a circle, and half the circumference. See CIRCLE, ANGLE and CENTRE.

Two *femi-circles* can only cut each other in one point.

SEMI-CIRCLE, is also an instrument in surveying, sometimes called *graphometer*. See SURVEYING.

It consists of a *femi-circular* limb, as FIG (Tab. Surveying, fig. 16.) divided into 180 degrees, and sometimes subdivided, diagonally or otherwise, into minutes. This limb is subtended by a diameter FG, at the extremities whereof are erected two sights. In the centre of the *femi-circle*, or the middle of the diameter, is fixed a box and needle. On the same centre is fitted an alidade or moveable index, carrying two other sights, as HI. The whole is mounted on a staff with a ball and socket.

The *femi-circle*, then, is nothing else but half a theodolite; with this only difference, that whereas the limb of the theodolite, being an intire circle, takes in all the 360° successively; in the *femi-circle* the degrees only going from 1 to 180, it is usual to have the remaining 180°, or those from 180° to 360°, graduated in another line on the limb, within the former.

To take an angle with a SEMI-CIRCLE.—Place the instrument in such manner, as that the radius CG may hang over one leg of the angle, to be measured, and the centre C over the vertex of the same. The first is done by looking through the sights F and G at the extremities of the diameter, to a mark fixed up in one extremity of the leg: the latter is had by letting fall a plummet from the centre of the instrument. This done, turn the moveable index HI on its centre towards the other leg of the *femi-circle*, till through the sights fixed on it, you see a mark in the extremity of the leg. Then, the degree which the index cuts on the limb, is the quantity of the angle.

For further uses of the *femi-circle*, they are the same with those of the theodolite. See THEODOLITE.

SEMICIRCULAR *arches*, } See the articles } ARCH.

Canals SEMICIRCULARES, } CANALES.

SEMI-COLON, in grammar, one of the points or stops, used to distinguish the several members of sentences from each other. See SENTENCE and POINT.

The mark or character of the *femi-colon* is ( ; )—It has its name, as having a somewhat less effect than a colon, or as demanding a shorter pause.

The use of the *femi-colon*, the grammarians generally say, is, to mark a sense less compleat than the colon, and more compleat than the comma; but this only conveys a very obscure idea. In effect, the precise office of the *femi-colon*, or what office it is distinguishes it from the colon, is a thing very little known in the world. Our best authors seem to use them promiscuously. See COLON.

Mr. Ward, professor at Gresham, we believe, is the first who

who settled the just use of the *femi-colon*. His position is, that the *femi-colon* is properly used to distinguish the conjunct members of sentence.—Now, by a conjunct member of a sentence, he means, such a one as contains at least two simple members. See SENTENCE.

Whenever, then, a sentence can be divided into several members of the same degree, which are again divisible into other simple members, the former are to be separated by a *femi-colon*.

For an instance: If fortune bear a great sway over him, who has nicely stated and concerted every circumstance of an affair; we must not commit every thing, without reserve to fortune, lest she have too great a hold of us. Again, *Si quantum in agro locisque desertis audacia potest, tantum in foro atque judiciis impudentia valeret; non minus in causa cederet Aulus Cæcinnæ Sextæ Ebutii impudentiæ, quam tum in vi facienda cessit audaciæ*. An instance in a more complex sentence we have in Cicero. *Res familiaris primum bene parta sit, nulloque turpi quæstu; tum quam plurimis, modo dignis, se utilem præbeat; deinde augeatur ratione, diligentia, parsimonia; nec libidini potius luxuriæque, quam liberalitati & beneficentiæ pareat*.

But though the proper use of the *femi-colon*, be to distinguish conjunct members, it is not necessary that all the members divided hereby, be conjunct. For upon dividing a sentence into great and equal parts, if one of them be conjunct, all those other parts of the same degree are to be distinguished by a *femi-colon*.—Thus: Whoever is overtaken with poverty; the same will find, that coldness, contempt, injuries, &c. are not far behind: or thus: *Nihil est tam molle, tam tenerum, tam aut fragile, aut flexibile; quam voluntas civium*. Sometimes also it happens, that members that are opposite to each other, but relate to the same verb, are separated by a *femi-colon*: thus Cicero. *Ex hac parte pudor, illinc petulantia; hinc fides, illinc fraudatio; hinc pietas, illinc scelus*, &c. Hither likewise may be referred such sentences, where the whole going before, the parts follow: as, The parts of rhetoric are four; invention, disposition, elocution, and pronouncement.

SEMI-CROMA, *sextuple of*. See the article SEXTUPLE.

SEMI-CUPIUM, a half bath, wherein the patient is only up to the navel. See INSESSUS and BATH.

SEMI-DIAMETER, a right line drawn from the centre of a circle or sphere, to its circumference; the same with what we otherwise call *radius*. See DIAMETER, CIRCLE and RADIUS.

The distances, diameters, &c. of the heavenly bodies, are usually estimated by astronomers in *femi-diameters* of the earth. See EARTH; see also SUN, PLANET, &c.

To find the *femi-diameters* of the primary planets in *femi-diameters* of the earth.—Since the sun's true *femi-diameter* is 152 *femi-diameters* of the earth; and we have the ratio of the diameters of the primary planets to that of the sun (see DIAMETER) their *femi-diameters* are easily found by the rule of three.—Thus, the *femi-diameter* of Saturn will be found  $\frac{2}{3}$ ; that of his ring  $45 \frac{3}{4}$ ; that of Jupiter  $27 \frac{3}{4}$ ; that of Mars  $\frac{1}{4}$ ; that of Venus  $\frac{1}{4}$ ; and that of Mercury  $\frac{1}{2}$ . See PLANET.

SEMI-DIAPANTE, in music, a defective fifth, called usually by the Italians, *falsa quinta*, and by us a *falsa fifth*. See FIFTH.

SEMI-DIAPASON, in music, a defective octave; or an octave diminished by a lesser semi-tone, or four commas. See DIAPASON.

SEMI-DIATESSARON, in music, a defective fourth, called, properly, a *falsa fourth*. See FOURTH.

SEMI-DIATONE, *diapason*, } See DIAPASON.

Dis-Diapason SEMI-DITONE, } See DIS-DIAPASON.

SEMI-DOUBLE, in the Romish breviary, a term applied to such offices and festivals as are celebrated with less solemnity than the double ones; but yet with more than the single ones.

The *femi-double* office has double vespers, and nine lessons at matins; but the anthems are not redoubled.—It is performed on Sundays, on the octaves, and on feasts marked for *femi-double* in the calendar.

SEMI-FISTULAR flowers. See the article FLOWERS.

SEMI-LUNAR valves, in anatomy, are three little valves or membranes of a *femi-lunar* figure, placed in the orifice of the pulmonary artery; to prevent the relapse of the blood into the heart at the time of its dilatation.—See Tab. Anat. (Angeiol.) fig. 1. lit. a. See also the article VALVE.

SEMINAL, SEMINALIS, in medicine, spermatic, or something belonging to the semen, or seed. See SEED and SPERMATIC.

SEMINARY, a place appointed for the instruction of young persons destined for the sacred ministry, in the duties, ceremonies, and offices thereof; first instituted, as Thomassin tells us, by St. Augustin. See CANON, CLERGY, ACADEMY, &c.

Of these *feminaries* there are many abroad, furnished with halls for the assemblies of the exercitants, and little chambers, or cells, where each person retires, studies, and prays apart.—Such is the *feminary* of St. Sulpitius at Paris.

The council of Trent decrees, that children exceeding 12 years of age, be taken, brought up, and instructed in common, to qualify them for the ecclesiastical state; and that there be a *feminary* of such belonging to each cathedral, under the direction of the bishop.

In France, the establishment of *feminaries* is somewhat different from the decree of the council: none are taken in but young people ready to study theology, and be ordained: so that the *feminaries* are a kind of houses of probation where the vocation of clerks is examined, and they are prepared to receive orders.

For the subsistence of these *feminaries*, there are several unions of benefices, or else the clergy of the diocese are obliged to contribute to maintain them.

Pope Pius IV. having established a *feminary* at Rome, in consequence of the decree of the council of Trent; by advice of the cardinal, it was given to the Jesuits, who have made good use thereof.

Among the canons of St. Augustin, SEMINARY is used for a kind of college, or school, where pensioners are kept, and instructed in the classical, and other learning.

The houses of the society *de propaganda fide*, established for the preparing of ecclesiasticks for missions among infidels and hereticks, are also called *feminaries*.—The principal whereof is that at Rome, called, the *apostolical college*, *apostolical feminary*, *pastoral feminary*, *feminary of the propaganda*, &c. See SOCIETY.

SEMINATION, SEMINATIO, in natural history, &c. the act of sowing, or shedding seed; particularly that of vegetables. See SEED and SEMBRADOR.

As soon as the seed is ripe, Dr. Grew observes, nature takes several methods for its being duly sown; not only by the opening of the uterus, but in the make of the seed itself.—Thus, the seeds of many plants, which affect a peculiar soil or seat, as arum, poppy, &c. are heavy and small enough, without farther care, to fall directly down to the ground. Others, that are large, are light enough to be exposed to the wind, are often furnished with one or more hooks to stay them from straying too far from their proper place; thus, the seeds of avens have a single hook; those of agrimony and goose-grass, many; both the former loving a warm bank, and the last a hedge for its support.

On the contrary, many seeds are furnished with wings, or feathers, partly with the help of the wind to carry them, when ripe, off the plant, as those of ash, &c. and partly to enable them to make their flight more or less abroad, that they may not, by falling together, come up too thick; and, that if one should miss a good soil or bed, another may hit.—So the kernels of pines have wings, though short ones, whereby they do not fly in the air, but only flutter on the ground. But those of typha, dandelion, and most of the pappous kind, have numerous long feathers, by which they are wafted every way.

Others are sown by being laid in springy elastic cases, which, when they crack and burst, dart their seed at convenient distances: thus, wood-forrel having a running root, nature sees fit to sow the seed at some distance, the doing of which is effected by a white, sturdy, tendinous cover, which beginning to dry, bursts open on one side in an instant, and is violently turned inside outwards. The seed of harts-tongue, and coddled arsmart, is flung, or shot away, by means of a spring, wound or girt round the seed-case. When the spring is become stark and tense enough, it suddenly breaks the case into two halves, like little cups, and so flings the seed.

Divers notable means of *femination* are observed by other authors: a quantity of fern-seed, Mr. Ray tells us, laid in a lump, on a paper, the seminal vesiculæ are heard to crackle, burst, and, by a microscope, the seeds are seen to be projected to a considerable distance from each other.—Dr. Sloane observes, that the gentianella flore caruleo, or spirit leaf, requiring wet weather to be sown in, as soon as the least drop of rain touches the end of the seed-vesiels, with a smart noise, and a sudden leap, it opens itself, and, with a spring, scatters it seed.

The plants of the cardamine family, throw their cods open, and dart out their seed upon a slight touch of the hand. Nay, Mr. Ray adds, that the pods of the cardamine impatient not only burst upon the slightest touch, but even by an approach of the hand to touch them, without any real contact.

Other plants sow their seeds by inviting birds, by their agreeable taste and smell, to feed of them, swallow them, and carry them about; thereby also fertilizing them, by passing through their bodies.—In such manner are nutmegs and mistletoe, sown and propagated. See NUTMEG and MISSELTOW.

SEMI-ORDINATES, in geometry, the halves of the ordinates or applicates. See ORDINATE.

SEMI-PARABOLA, in geometry, a curve defined by the equation,  $ax^{m-1} = y^m$ ; as  $ax^2 = y^2$ ,  $ax^{\frac{1}{2}} = y^{\frac{1}{2}}$ . See PARABOLA and CURVE.

In *femi-parabolas*  $y^m : v^m :: ax^{m-1} : az^{m-1} = x^{m-1} : z^{m-1}$ , or the powers of the *femi-ordinates* are as the powers of the abscissæ

scissles one degree lower; *e. gr.* in cubical *semi-parabolas*, the cubes of the ordinates  $y^3$  and  $v^3$  are as the squares of the abscissles  $x^2$  and  $z^2$ .

**SEMI-PELAGIANS**, a name anciently, and even at this day, given to such as retain some tincture of Pelagianism. See **PELAGIANS**.

S. Prosper, in a letter to St. Augustin, calls them *reliquia Pelagii*.

Many learned men, principally in the Gauls, who could not come into St. Augustin's doctrine of grace, &c. were accused of *Semi-pelagianism*: they were also called *Maffilians*, or *priests of Marseilles*, in regard their errors had their first rise in that city.

Cassian, who had been a deacon of Constantinople, and was afterwards a priest at Marseilles, was the chief of these *Semi-pelagians*: S. Prosper, who was co-temporary with him, and who attacked him very vigorously, tells us, that Cassian endeavouring to keep I know not what medium between the Pelagians and the orthodox, did not agree either with the one or the other.

The *Semi-pelagians*, with the orthodox, allowed of original sin; but denied, that man's free agency could be so wounded by this sin, that he could not of himself do something which might induce God to afford his grace to one man more than another.—They also taught, that the grace which saves men, was not given them of the mere will of God, but according to his eternal prescience, whereby he foresaw who they were that would believe in him.—They owned, that the vocation or call to the gospel, was gratuitous; but added, at the same time, that it was common to all, inasmuch as God desired all should be saved.—As to election, they held, that it depended on our perseverance; God only choosing such to eternal life, as should persevere in the faith.

**SEMI-PROOF**, an imperfect proof. See **PROOF**.

In the French law, the depositions of a single evidence only make a *semi-proof*. See **WITNESS**.

The testament of a person deceased, is deemed a *semi-proof*.—In enormous cases, the *semi-proof* frequently determines them to try the torture. See **TORTURE**.

**SEMI-QUARTILE**, or **SEMI-QUADRATE**, is an aspect of the planets, when distant from each other 45 degrees, or one sign and an half. See **ASPECT**.

**SEMI-QUAVER**, in music. See the article **QUAVER**.

**SEMI-QUINTILE**, is an aspect of the planets, when at the distance of 36 degrees from one another. See **ASPECT**.

**SEMI-SEXTILE**, or **SEMI-SEXTUS**, or **S. S.** an aspect of two planets, wherein they are distant from each other, one twelfth part of a circle, or 30 degrees. See **ASPECT**.

The *semi-sextile* was added to the ancient aspects by Kepler; and, as he says, from meteorological observations.

**SEMI-SPINATUS**, in anatomy. See **TRANSVERSALIS dorsii**.

**SEMITA luminosa**, a name given to a kind of lucid tract in the heavens, which, a little before the vernal equinox, may be seen about six a clock at night, extending from the western edge of the horizon, up towards the pleiades.

The phenomenon has been taken notice of by Cassini and Facio, who both evince, that this light comes diffused from both sides of the sun.—Its brightness is much the same with that of the *via lactea*, or the tail of a comet: it is seen plainest with us about the beginning of October, or the latter end of February.

Facio conjectures, that the bodies, or rather the congeries or aggregate of bodies, which occasion this light, conforms to the sun like a lens; and takes it to have ever been the same; but Cassini thinks it arises from a vast number of small planets, which encompass the sun, and give this light by reflexion; esteeming it also not to have existed long before he observed it.

**SEMI-TEINTS**. See the article **TEINTS**.

**SEMI-TONE**, in music, one of the degrees, or concinnous intervals of concords. See **DEGREE** and **CONCORD**.

There are three degrees, or lesser intervals, by which a sound can move upwards and downwards successively from one extreme of any concord to the other, and yet produce true melody; and, by means whereof, several voices and instruments are capable of the necessary variety in passing from concord to concord.—These degrees are the greater and lesser tone, and the *semi-tone*. The ratio of the first is 8:9; that of the second 9:10. See **TONE**.

The ratio of the *semi-tone* is 15:16, its compass is five commas; which interval is called a *semi-tone*, not that it is geometrically the half of either of the tones, for it is more; but because it comes somewhat near it. It is also called the *natural semi-tone*, and the *greater semi-tone*, because greater than the part it leaves behind, or its complement to a tone, which is four commas.—The Italians also call it *seconda minore*, or a lesser second. See **SECOND**.

Every tone of the diatonic scale is divided into a *greater* and *less*, or a *natural* and *artificial semi-tone*. Mr. Malcolm observes, it was very natural to think of a division of each tone, where 15:16 should be one part in each division, in regard this being an unavoidable and necessary part of the natural scale, would readily occur as a fit degree, and the

more, as it is not far from an exact half-tone. In effect, the *semi-tones* are so near equal, that, in practice, at least, on most instruments, they are accounted equal, so that no distinction is made into *greater* or *less*.

These *semi-tones* are called *fictitious notes*, and, with respect to the natural ones, are expressed by characters called *flats* and *sharps*. See **FLAT** and **SHARP**.

Their use is to remedy the defects of instruments, which having their sounds fixed, cannot always be made to answer to the diatonic scale. See **SCALE**.

By means of these we have a new kind of scale, called the **SEMI-TONIC scale**, or the *scale of semi-tones*: a scale or system of music, consisting of 12 degrees, or 13 notes, in the octave, being an improvement on the natural or diatonic scale, by inserting between each two notes thereof, another note, which divides the interval or tone into two unequal parts, called *semi-tones*. See **SCALE** and **SEMI-TONE**.

The use of this scale is for instruments that have fixed sounds, as the organ, harpsicord, &c. which are exceedingly defective on the foot of the natural or diatonic scale.—For the degrees of the scale being unequal, from every note to its octave there is a different order of degrees; so that from any note we cannot find any interval in a series of fixed sounds: which yet is necessary, that all the notes of a piece of music carried through several keys, may be found in their just tune, or that the same song may be begun indifferently at any note, as may be necessary for accommodating some instruments to others, or to the human voice, when they are to accompany each other in unison.

The diatonic scale, beginning at the lowest note, being first settled on an instrument, and the notes thereof distinguished by their names *a. b. c. d. e. f. g.*; the inserted notes, or *semi-tones*, are called *fictitious notes*, and to take the name or letter below with a  $\sharp$  as *c*  $\sharp$  called *c sharp*; signifying, that it is a *semi-tone* higher than the sound of *c* in the natural series, or this mark  $\flat$  called a *flat*, with the name of the note above, signifying it to be a *semi-tone* lower. See **FLAT** and **SHARP**.

Now  $\frac{1}{2}$  and  $\frac{1}{4}$  being the two *semi-tones* the greater tone is divided into; and  $\frac{1}{8}$  and  $\frac{1}{16}$ , the *semi-tones* the less tone is divided into; the whole octave will stand as in the following scheme, where the ratios of each term to the next, are wrote fraction-wise between them below.

Scale of **SEMI-TONES**.

*c. c*  $\sharp$  . *d. d*  $\sharp$  . *e. e*  $\sharp$  . *f. f*  $\sharp$  . *g. g*  $\sharp$  . *a. a*  $\flat$  . *b. b*  $\flat$  . *c. c*

For the names of the intervals in this scale it may be considered, that as the notes added to the natural scale are not designed to alter the species of melody, but leave it still diatonic, and only correct some defects arising from something foreign to the office of the scale of music, *viz.* the fixing and limiting the sounds: we see the reason why the names of the natural scale are continued, only making a distinction of each into a *greater* and *less*.—Thus an interval of one *semi-tone* is called a *lesser second*; of two *semi-tones*, a *greater second*; of three *semi-tones*, a *less third*; of four, a *greater third*, &c.

A second kind of *semitonic-scale* we have from another division of the octave into *semi-tones*; which is performed by taking an harmonical mean between the extremes of the greater and less tone of the natural scale, which divides it into two *semi-tones* nearly equal.—Thus the greater tone 8:9 is divided into 16:17, and 17:18; where 17 is an arithmetical division, the numbers representing the lengths of chords; but if they represent the vibrations, the lengths of the chords are reciprocal, *viz.* as 1:16:2, which puts the greater *semi-tone*  $\frac{1}{2}$  next the lower part of the tone, and the lesser  $\frac{1}{4}$  next the upper, which is the property of the harmonical division.—After the same manner the lesser tone 9:10 is divided into the two *semi-tones* 18:19 and 19:20, and the whole octave stands thus:

*c. c*  $\sharp$  . *d. d*  $\sharp$  . *e. e*  $\sharp$  . *f. f*  $\sharp$  . *g. g*  $\sharp$  . *a. a*  $\flat$  . *b. b*  $\flat$  . *c. c*

This scale, Mr. Salmon tells us, in the Philosophical Transactions, he made an experiment of, before the royal society, on chords, exactly in these proportion, which yielded a perfect comfort with other instruments, touched by the best hands.—Mr. Malcolm adds, that having calculated the ratios thereof, for his own satisfaction, he found more of them false than in the preceding scale; but their errors were considerable less, which made amends.

**SENA**, or **SENN**, in medicine, a purgative leaf, much used in draughts and compositions of that intention.

The shrub which bears it, is cultivated in several parts of the Levant, and grows five or six foot high: it puts forth woody branches, furnished with leaves on one side: its flowers are yellow, its fruit a greenish flat pod, containing several lodges or cells of seeds, resembling grape-stones.—These pods some physicians prefer to the leaves themselves.

There is also a kind of *sena* growing about Florence; but it is inferior to that of the Levant, as is owned by the Italians themselves. Father Plumier mentions a third kind growing in the Antilles islands.

M. Lemery distinguishes three sorts of *sena* of the Levant: the

the first brought from Seyda, called *senā of Apalto*, that is, *custom-sena*, by reason of the custom paid the grand seignior, for the privilege of exporting it: the second comes from Tripoli: the third is called *senā of Mocha*.

The best of these kinds is the first, which Pomet directs us to chuse, in narrow leaves, of a moderate size, shaped like the end of a pike, of a pale green colour, a pungent smell, soft to the touch, &c.

The *senā* of Tripoli holds the second rank in goodness: its difference from that of Seyda, consists in its colour, which is green; its smell, which is very weak; and in a certain harshness, or roughness, which it discovers upon a touch.

Besides these three kinds of *senā*, and their pods, the drug-gists sell the dust found at the bottom of the bales, which is a very poor commodity, and yet much better than what they call the *small senā*, which comes with it in the bales, by way of package, and which many hold to be a plant of no virtue, put in by chance, or, at best, to increase the weight.

The best *senā*, ordinarily found in our shops, Dr. Quincy observes, is that which is sharpest leaved, and smells freshest: the brightness of its colour, and quickness of its flavour, are also indications of its goodness; for when it has lost its scent, and grows dusky, it is good for little.

*Sena*, at first taking, is apt to nauseate the stomach; and therefore, if a little cinnamon, or a dram or two of its distilled water, be added, it passes through with less sickness. This is exactly conformable to the sentiments of Ludovicus, who says, that the purgative quality of this herb resides in a mucilaginous or gummy juice; which, the more it is divided, gripes the less in its operation.

Rulandus imagined a sudorific quality in *senā*; and accordingly ordered it in some compositions of that intention.

**SENATE, SENATUS**, an assembly or council of senators; that is, of the principal inhabitants of a state, who have a share in the government. See **SENATOR**.

Such were the *senates* of Rome, of Carthage, &c. among the ancients; and such are the *senates* of Venice, of Genoa, &c. among the moderns. See **REPUBLIC**.

The *senate* of ancient Rome, was, of all others, the most celebrated, during the splendor of the republic. The Roman *senate* exercised no contentious jurisdiction: it appointed judges either out of the *senate*, or among the knights; but never stooped to judge any processes in a body.—The *senate* concerted matters of war; appointed who should command the armies; sent governors into the provinces; took order, and disposed of the revenues of the commonwealth.—Yet did not the whole sovereign power reside in the *senate*: it could not elect magistrates, make laws, nor decide of war and peace: but in all these cases, they were to consult the people.

Under the emperors, when the *senate* became despoiled of most of its other offices, they began to hear causes. For those of less consequence they appointed particular judges; the rest, principally criminal causes, they reserved for their own cognizance, to be judged by them in a body, and that frequently in the emperor's presence. This was to keep their heads from state affairs. Nero further committed to the *senate*, the judgment of all appeals: but this did not hold long; nor do we find any footsteps thereof any where but in the 62d novel.

The *senate* assembled on certain stated days, *viz.* ordinarily on the calends, nones and ides of each month: their extraordinary meetings were on any other days; when the consul, dictator, or tribune, thought fit to call them. Their place of meeting, was either the temple of Concord at the Capuan gate, or in the temple of Bellona.—The consul presided as chief of the *senate*. See **CONSUL**.

Till Augustus's time, the *senate* was always opened with a sacrifice: but that prince, in lieu thereof, appointed, that each senator, ere he took his place, should offer wine and incense on the altar of the god in whose temple they were met; and take an oath, that he would give his vote according to his conscience.

Halicarnassensis, and other authors, mention it as a great defect in the authority of the Roman *senate*, that they had none under their command, to execute their orders. Hence the least tribune had it in his power to obstruct their decrees; and hence it is, that when they gave their orders to the consuls, and prætors, they did it with a kind of submission, *si eis ita videtur*; if they think fit.

**SENATOR**, a member of a senate. See **SENATE**.

There were two orders, or degrees, among the Roman nobility; that of the *senators*, and that of the *knights*: after the two, came the people.—The first hundred *senators* were appointed by Romulus, and called *patres*, fathers.—Upon the union with the Sabines, Romulus, or as others say, Tullus, added a second hundred, called *patres majorum gentium*, to distinguish them from a third hundred added by the elder Tarquin, and called *patres minorum gentium*, fathers of the lower rank. See **PATRES**, and **CONSCRIPT**.

The number of *senators* was not fixed: in the time of Gracchus they were 600; during the civil wars, they were reduced to 300. Julius Cæsar augmented that number to 800

VOL. II. N<sup>o</sup>. CXL.

or 900; and Augustus brought them back again to 600.

The choice of *senators* belonged at first to the kings, then to the consuls, then to the censors, who in their census or survey every fifth year, appointed new *senators* in lieu of those dead or degraded: at length it fell to the emperors.

Though, for a long time, none were raised to the dignity of *senators*, but those most conspicuous for their prudence, &c. yet some regard was afterwards had to their estate, lest the dignity should become debased by poverty.—To hold the *senatorial* dignity, a yearly revenue of 800,000 sesterces was required, which amounts to nearly 6000 pounds of our money. Half as much was required for the knights. The *senators* who sunk below this revenue, were discarded, and expunged out of the list by the censor.

The *senators* were ordinarily chose from among the knights, or among such as had bore the principal offices.—At first the magistrates were taken wholly from among the *senators*; whence Tacitus calls the senate, the *seminary of all dignities*: but after the people had been admitted to magistratures, *senators* were taken from among such as had discharged those offices, though, before, plebeians.

The *senators* carried their children with them to the senate, to inform them betimes of affairs of state: though their children had not admittance till 17 years of age. See **AGE**.

Some make a distinction among the *senators*: besides the *senators* who were allowed to speak, and were asked their opinions, there were others, who, without speaking, or being ever asked their judgment, were only to follow the opinion of those they thought the most reasonable, and were hence called *pedarii*. A. Gellius gives us another notion of the *pedarii*, and says, those were thus called, who having never bore the office of curule magistrate, were obliged to go to the senate on foot.

The *senators* alone were allowed to wear the habit called *latus clavus*. See **LATUS CLAVUS**.—They had a right to sit, and be carried in curule chairs, to assist at plays and shews, in the orchestra; at feasts of the gods, &c. All which privileges were reserved to such as Augustus (in the reform he made of the too numerous senate of Julius Cæsar) set aside.

They had the name *senators*, *q. d. old men*, given them in imitation of the Greeks, who called their senate *synusia*. So when the Athenians assembled the people to consult about the affairs of the public, the officers summoned none but such as were fifty years old. The Egyptians and Persians followed the same example, after the Hebrews. The Lacedæmonians and Carthaginians received none but such as were sixty years of age.

**SENATUS-CONSULTUM**, a vote, or resolution of the Roman senate, pronounced on some question, or point of law proposed to it. See **SENATE**.

The *senatus-consulta* made a part of the Roman law, when passed. They were deposited in the temple of Ceres, under the custody of the ædiles, and at last carried, by the censor, to the temple of Liberty, and put up in an armory called *tabularia*. See **CIVIL LAW**.

**SENEGA**. See the article **GUM senega**.

**SENECHAL, SENESCALLUS**, a name anciently used for a steward or majordomo; formed from the German *find*, house or family, and *scal*, servant. See **MAJORDOMO**.

Thus the *seneschal* of a lord or a baron, is his steward or bailiff, who holds his courts, and manages his demesne lands: *sub-seneschal*, his under steward.

*High seneschal* of England, is the high steward of England: *high seneschal del hotel du Roi*, the steward of the king's household.

The ancients used the term *senescallus* indifferently with that of *dapifer*, whence we are sure it signifies *steward*. See **STEWARD** and **DAPIFER**.

**SENNA**. See the articles **SENA** and **DIASENNU**.

**SENOBLE**. See the article **SINOBLE**.

**SENSATION**, the act of perceiving external objects, by means of the organs of sense. See **SENSE** and **PERCEPTION**.

To conceive the manner wherein *sensation* is effected; observe, that all the organs consist of little filaments, or nerves which have their origin in the middle of the brain, are diffused thence throughout all the members which have any sense, and terminate in the exterior parts of the body: that when we are in health, and awake, one end of these nerves cannot be agitated or shaken, without shaking the other; by reason they are always a little stretched; as is the case of an extended chord, one part of which cannot be stirred without a like motion of all the rest.

Observe, further, that these nerves may be agitated two ways, either at the end out of the brain, or that in the brain.—If they be agitated from without, by the action of objects and their agitation be not communicated as far as the brain; as frequently happens in sleep, when the nerves are in a state of relaxation; the soul does not then receive any new *sensation*.—But if the nerves happen to be agitated in the brain, by the flux of the animal spirits, or any other cause; the soul perceives something, though the parts of those nerves, that are out of the brain, diffused through

the several parts of the body, remain at perfect rest: as likewise is frequently the case in sleep.

Lastly, observe, that experience tells us, we may sometimes feel pain in parts of the body that have been entirely cut off; by reason the fibres in the brain corresponding to them, being agitated in the same manner, as if they were really hurt; the soul feels a real pain in those imaginary parts.

All these things seem to shew, that the soul resides immediately in that part of the brain wherein the nerves of all the organs of sense terminate: we mean, it is there it perceives all the changes that happen with regard to the objects that cause them, or that have been used to cause them; and, that it only perceives what passes out of this part, by the mediation of the fibres terminating in it. See NERVE, FIBRE, SOUL, BRAIN, SENSORY, &c.

These things premised, it will not be difficult to explain how *sensation* is performed: the manner whereof may be conceived from what follows. When the point of a needle, for instance, is thrust against the hand, that point stirs and separates the fibres of the flesh; which fibres are extended from that place to the brain, and when we are awake, are in such a degree of tension, as that they cannot be stirred without shaking those of the brain. If then the motion of the fibres of the hand be gentle, that of the fibres of the brain will be so too; and if the first be violent enough to break any thing in the hand, the last will be stronger and more violent in proportion.—In like manner, if the hand be held to the fire; the little particles of the wood it throws off in great numbers, and with a great deal of violence, striking against these fibres, and communicating a part of their agitation thereto; if the action be moderate, that of the extremities of the fibres of the brain corresponding to those of the hand, will be moderate likewise: if it be violent enough to separate any of the parts of the hand, as it happens in burning; the motion of the fibres in the brain will be proportionably more violent. This is what befalls the body, when objects strike upon it.—We are now to consider how the mind is affected.

The mind, we have observed, resides principally, if we may be allowed to say so, in that part of the brain where all the fibres of the nerves terminate. It attends here, as its sensory, or office, to look to the preservation of all the parts of the body; and, of consequence, must be here adverted to all the changes that happen, and must be able to distinguish between those agreeable to the constitution of the body, and those hurtful thereto. Any other absolute knowledge, without a relation to the body, were useless.—Thus, though all the changes in our fibres, do, in reality, consist in motions, which ordinarily only differ as to more and less; it is necessary the soul should consider them as changes essentially different; for though in themselves they differ but very little, yet, with regard to preservation of the body, they are to be looked on as essentially different.

The motion, for instance, which causes pain, frequently differs exceeding little from that which occasions a pleasing titillation: it is not necessary there should be an essential difference between these two motions; but it is necessary there be an essential difference between the pain and the tickling, which those two motions occasion in the soul; for the agitation of the fibres, which accompanies the titillation, informs the soul of the good state of the body, that it is able to resist the impression of the objects, and that it need not apprehend its being hurt: but the motion which occasions pain, being somewhat more violent, is capable of breaking some of the fibres of the body; wherefore it is necessary the soul be adverted hereof by some disagreeable *sensation*, that it may provide against it.

Thus, though all the motions which pass in the body only differ in themselves, as to more or less, yet, when considered with regard to the preservation of life, they may be said to be essentially different: for this reason it is, that the soul does not perceive the shakes, or motions themselves, which objects excite in the fibres of the flesh: it would be useless to perceive them; and she would never be able, thence, to learn whether the objects were capable of doing hurt or good. But she perceives herself affected with *sensations*, which differ essentially, and which shewing precisely the qualities of the objects, as they regard the body, make her perceive distinctly, whether or no those objects are capable of hurting it.

In effect, from a strict examination of the several senses, it appears, that sensible objects act no otherwise upon the body, for the producing of *sensation*, than by exciting a change in the extreme surface of the fibres of the nerves: the quality of which change depends on the figure, bulk, hardness, and motion of the object; so that according to all appearance, the most different objects, which should agree in these four circumstances, would produce the same *sensation*.

From the various texture of the object, the diversity of the nerve affected, the different fabric of the organ of sense, the different place in the medulla of the brain where the nerve arises, and the different degree of motion wherewith the action of the object is applied, arise various *sensations*, and ideas, in the mind; none of which represent any thing

in the action of the object, or in the passion of the organ. And yet the same action of the same object, on the same organ, always produces the same *sensation* or idea: and the same ideas necessarily follow the same disposition of the same sensible organ, in the same manner as if the idea perceived, were the natural and necessary effect of the action on the organ. See IDEA, KNOWLEDGE, &c.

SENSE, a faculty of the soul, whereby it perceives external objects, by means of some action or impression made on certain parts of the body, called *organs of sense*, and propagated by them to the sensory. See SENSATION and SENSORY.

Some use the word *sense* in a greater latitude; and define it a faculty whereby the soul perceives ideas or images of objects, either conveyed to it from without, by the impression of objects themselves, or excited within by some effort of the soul of the sensory itself.

Under which notion, *sense* becomes distinguishable into two kinds, *external* and *internal*: corresponding to the two several manners wherein the images of the objects perceived, are occasioned, and presented to the mind, *viz.* either immediately from without, or from within; that is, either by what we commonly call the *five external senses*, hearing, seeing, &c. or by the *internal ones*, imagination, memory, and attention; to which some add hunger and thirst.

But as these *internal senses* are not ordinarily considered in the notion of *senses*, nor implied under the word *sense*; but are thus only denominated by analogy; we shall wave them to be further considered, under their respective articles, IMAGINATION, MEMORY, &c.

External SENSES, or, simply, the SENSES, in their general signification, are the means whereby the soul apprehends, or takes cognizance of external objects: the means, we mean, both on the part of the mind, and of the body.

The means, on the part of the mind, are always the same; it being one and the same faculty, whereby we see, hear, &c.—The means, on the part of the body, are different; as different as are the objects we are concerned to perceive: for the being, and well-being of the animal, being the end, nature had in view in giving him any perception of external bodies; by this, the measure and manner of that perception is regulated: and we have so many ways of perceiving, and of perceiving so many things, as the relation we bear to external bodies renders necessary for the preservation, &c. of our being.

Hence those several organs of *sense*, called *eye*, *ear*, *nose*, *palate*, and the universal one *cutis*; each of which is so disposed as to give some representation and report to the mind, of the state of external things, the nearness, convenience, hurtfulness, and other habitudes; and each of them a different one, according to the degree, and immediateness, &c. of the danger, or conveniency. And hence the several exercise of those organs, hearing, seeing, smelling, tasting, and feeling. See ORGAN, &c.

A late excellent author gives us a more ingenious, extensive, and philosophical notion of *sense*.—On his principle, *sense* is defined, a power of perception, or, a power of receiving ideas; if what is absolutely passive may be properly called a power. See POWER and FACULTY.

On some occasions, instead of power, he chuses to call it, a determination of the mind to receive ideas.—The ideas thus perceived, or raised in the mind, he calls *sensations*. See IDEA and SENSATION.

*Sense*, he considers, either as natural or moral: and the natural, either as external or internal: though the distribution is chiefly founded on the common ways of conceiving; for, in reality, they appear to be all natural, and necessary: some reasons, however, for the distinction, will be shewn under the several articles thereof.

External SENSES, then, are powers of perceiving ideas, upon the presence of external objects.—On such occasions, we find the mind is merely passive, and has not power directly to prevent the perception, or idea, or to vary it at its reception; as long as the body is continued in a state fit to be acted upon by the external object.

When two perceptions are intirely different from each other, or agree in nothing but the general idea of sensation; the power of receiving those different perceptions, is called *different senses*. Thus seeing and hearing denote the different powers of receiving the ideas of colours, and sounds. And though colours, as well as sounds, have vast differences amongst themselves; yet is there a greater agreement among the most opposite colours, than between any colour and a sound: and hence all colours are deemed perceptions of the same *sense*.

All the several *senses* seem to have their distinct organs, except feeling, which is, in some degree, diffused over the whole body. See ORGAN and FEELING.

Internal SENSES, are powers, or determinations of the mind, to be pleased with certain forms, and ideas, which occur to our observation, in objects perceived by the external *senses*.

Of these there are two different species, distinguished by the different objects of pleasure, *viz.* pleasurable or beautiful forms of natural things, and pleasurable or beautiful actions,

or

or characters of rational agents: whence the internal *senses* become divisible into natural and moral; though what we call the *internal natural sense*, our author calls simply, and by way of eminence, the *internal sense*.

In reflecting on our external *senses*, we plainly see, that our perceptions of pleasure, and pain, do not depend directly on our will. Objects do not please us according as we incline they should: the presence of some objects necessarily pleases us, and the presence of others as necessarily displeases us; nor can we, by our will, any otherwise procure pleasure, or avoid pain, than by procuring the former kind of objects, and avoiding the latter. By the very frame of our nature, the one is made the occasion of delight, and the other of dissatisfaction. In effect, our sensitive perceptions are pleasant, and painful, immediately, and without any knowledge of the cause of this pleasure and pain, or of the manner how they excite it, or are occasions of it, or without seeing to what further advantage, or detriment, the use of such objects might tend. Nor would the most accurate knowledge of these things vary either the pleasure, or the pain, of the perception; however it might give a rational pleasure distinct from the sensible; or might raise a distinct joy, from prospect of further advantage in the object, or aversion, from apprehension of evil. There is scarce any object, which our minds are employed about, but is constituted the necessary occasion of some pleasure or pain. Thus we shall find ourselves pleased with a regular form, a piece of architecture, or painting, a composition of notes, a theorem, an action, an affection, a character; and we are conscious that this pleasure naturally arises from the contemplation of the idea then present in the mind, with all its circumstances, though some of those ideas have nothing of what we call sensible perception in them; and in those which have, the pleasure arises from some uniformity, order, arrangement, imitation; and not from the simple ideas of colour, or sound, or mode of extension separately considered.

It seems hence to follow, that when instruction, education, or prejudice of any kind, raise any desire or aversion toward an object; this desire, or aversion, is founded on an opinion of some perfection, or deficiency, in those qualities, for perception whereof we have the proper *senses*. Thus, if beauty be desired by one who has not the *sense* of sight; the desire must be raised by some apprehended regularity of figure, sweetness of voice, smoothness, softness, or some other quality perceivable by the other *senses*: without relation to the ideas of colour.

The only pleasure of *sense*, which our philosophers seem to consider, is that which accompanies the simple ideas of sensation; but there are vastly greater pleasures in those complex ideas of objects, which obtain the names of beautiful and harmonious.—The power, then, whereby we receive ideas of beauty, and harmony, has all the characters of a *sense*. It is no matter, whether we call these ideas of beauty and harmony, perceptions of the external *senses* of seeing and hearing, or not: we should rather chuse to call these ideas an *internal sense*, were it only for the convenience of distinguishing them from other sensations of seeing and hearing, which men may have without perception of beauty and harmony. See PLEASURE, BEAUTY and HARMONY.

**Moral SENSE**, is a determination of the mind, to be pleased with the contemplation of those affections, actions, or characters of rational agents, which we call *good* or *virtuous*. See MORAL.

This moral *sense* of beauty, in actions, and affections, may appear strange at first view: some of our moralists themselves are offended at it in my lord Shaftsbury, as being accustomed to deduce every approbation, or aversion, from rational views of interest. Our gentlemen of good taste can tell us of a great many *senses*, tastes and relishes for beauty, harmony, imitation in painting and poetry; and may we not find, too, in mankind, a relish for a beauty in characters, in manners? The truth is, human nature does not seem to have been left quite indifferent in the affair of virtue, to form to itself observations concerning the advantage or disadvantage of actions, and accordingly to regulate its conduct. The weakness of our reason, and the avocations arising from the infirmity and necessities of our nature, are so great, that very few of mankind could have framed those long deductions of reason, which may shew some actions to be, in the whole, advantageous, and their contraries pernicious. The author of nature has much better furnished us for a virtuous conduct, than our moralists seem to imagine; by almost as quick and powerful instructions, as we have for the preservation of our bodies; he has made virtue a lovely form, to excite our pursuit of it, and has given us strong affections, to be the springs of each virtuous action. See VIRTUE.

For the general manner wherein our SENSES act; or, more properly, the manner wherein we become *sensible*, that is, perceive external objects; see SENSATION.

For the particular SENSES, or, more properly, the particular manners wherein we become sensible, by the particular organs of *sense*; see HEARING, SEEING, SMELLING, &c.

For the several organs of SENSE, ministering to the several

manners of sensation; see EYE, EAR, NOSE, &c.

Pliny observes, that of all the *senses*, feeling and tasting are those which man enjoys in the greatest perfection.—As to seeing, he is excelled by the eagle, &c. as to smelling, by the vulture, &c. and as to hearing, by the mole, even when hid under ground. *Nat. Hist. lib. 10.*

The *senses* have been sometimes found greatly sharpened and improved by diseases: Mr. Boyle mentions a gentleman, who, during a distemper he had in his eyes, had his organs of sight brought to be so sensible, that when he waked in the night, he could, for a while, plainly see and distinguish colours, and other objects; and the same author gives an instance of another person, who, after getting half-fuddled with claret, if he waked in the night, could see, for some time, to read a moderate print.

Grimaldi affirms, that some women of Megara were able, by their eyes alone, to distinguish between eggs layed by black hens, and those by white ones. *Grimald. de Lum. & Col.*

In the Philosoph. Transf. N°. 312. we have an account of Dan. Frazer, who continued deaf and dumb, from his birth to the 17th year of his age; when, upon recovering from a fever, he perceived an uneasy motion in his brain, after which he began to hear, and, by degrees, to speak.

**SENSIBLE horizon**, } **HORIZON.**  
**SENSIBLE point**, } See the articles **POINT.**  
**SENSIBLE qualities**, } **QUALITY.**  
**SENSITIVE or SENSIBLE soul**, the soul of brutes, or that which man is supposed to have in common with brutes. See SOUL.

It is thus called, as intimating its utmost faculty, to be that of sensation; or, perhaps, because it is supposed to be material, and to come under our senses.

My lord Bacon asserts, that the *sensible* or brute soul, is plainly no more than a corporeal substance, attenuated by heat, and thus rendered invisible; or a kind of aura or vapour partly of an aerial, and partly a fiery nature; endued with the softness of air, to be fit to receive impressions, and with the vigour of fire to communicate its action; sed partly with oily matters, and partly with aqueous ones; inclosed in the body, and in the more perfect animals, principally in the head; moving along the nerves; and restored and repaired by the spirituous blood of the arteries. *Bac. de Augment. Scient. lib. IV.* See LIFE.

**SENSITIVE plants**, a species of plants, called by the ancients *æschynomænos*, and by us *sensitive*, *living* or *mimic plants*, as giving some tokens of sense. See ÆSCHYNOMENOUS.

These are such whose frame and constitution is so nice and tender, that at the touch, or least pressure of one's hand, they will contract their leaves and flowers, as if *sensible* of the contact.

Botanic writers mention many kinds hereof; some of which contract with the hand, or a stick; others with heat, others with cold.—The truth is, many, if not most, vegetables expend their flowers, down, &c. in warm, sun-shiny weather, and again close them towards evening or in rain, &c. especially at the beginning of flowering, whilst the seed is yet young and tender: as is very evident in the down of dandelion, &c. and in the flower of the pimpernel, the opening and shutting whereof are the country-man's weather-wiser; whereby, Gerard says, he foretels what weather shall follow next day: for if the flowers be close shut up, it betokens rain and foul weather; if they be spread abroad, fair weather. *Ger. Herb. lib. II.* See SEMINATION.

**SENSORY**, **SENSORIUM commune**, the seat of the common sense; or that part or place where the sensible soul is supposed more immediately to reside. See SOUL and SENSE.

The *sensory* is supposed to be that part of the brain wherein the nerves from all the organs of sense, terminate: which is generally allowed to be about the beginning of the medulla oblongata: Des Cartes will have it in the conarion, or pineal gland. See CONARION.

Sir Isaac Newton describes the *sensory* of animals as the place to which the sensible species of things are carried through the nerves and brain, that they may be there perceived by their immediate presence to the soul.—The organs of sense are not for enabling the soul to perceive the species of things, in its *sensory*: but only for conveying them thither. See SENSE and ORGAN.

The same great author considers the universe, as the *sensory* of the godhead. See GOD, UNIVERSE, NATURE, &c.

**SENTENCE**, in law, *doom*: a judgment passed in court by the judge, upon some process, either civil, or criminal. See JUDGE and JUDGMENT.

*Sentences* are either *definitive*, *interlocutory*, *contradictory*, &c. There are *sentences* of absolution, excommunication, &c. Superior judges either confirm or annul the *sentences* of inferior ones. See APPEAL.

Three conformable SENTENCES, *tres SENTENTIÆ conformes*: in the Romish ecclesiastical law, it is allowed to appeal three times; so that there must be three conformable sentences ere the decisions of the judges can take effect.—The first degree of jurisdiction is in the bishop's official: from him an appeal lies to the metropolitan; and from the metropolitan

to the primate, or immediately to the pope. If the appeal come from the metropolitan to the pope, the pope is obliged to delegate judges *in partibus*; and then if the three sentences passed in these three stages be *conformable*, there is no further appeal: but if one of them annul another, new judges are to be required of the pope for a fourth sentence; and thus they sometimes proceed to a sixth, or seventh sentence.—Such a number of jurisdictions is found infinitely prejudicial to the public, and vexatious to private persons.

**SENTENCE**, in grammar, denotes a period; or a set of words comprehending some perfect sense, or sentiment of the mind. See **PERIOD**.

Every sentence comprehends at least three words. See **PROPOSITION**.

The business of pointing, is to distinguish the several parts and members of sentences, so as to render the sense thereof the clearest, aptest, and fullest possible. See **PUNCTUATION**. In every sentence there are two parts necessarily required; a noun for the subject, and a definite verb, whatever is found more than these two, affects one of them, either immediately, or by the intervention of some other, whereby the first is affected. See **NOUN** and **VERB**.

Again, every sentence is either simple or conjunct: a *simple sentence* is that consisting of one single subject, and one finite verb.—A *conjunct sentence* contains several subjects and finite verbs, either expressly or implicitly.

A simple sentence needs no point or distinction; only a period to close it: as, *A good man loves virtue for itself*.—In such a sentence, the several adjuncts affect either the subject or the verb in a different manner. Thus the word *good*, expresses the quality of the subject, *virtue* the object of the action, and, *for itself*, the end thereof.—Now none of these adjuncts can be separated from the rest of the sentence: for if one be, why should not all the rest? And if all be, the sentence will be minced into almost as many parts as there are words.

But if several adjuncts be attributed in the same manner either to the subject or the verb, the sentence becomes conjunct, and is to be divided into parts.

In every conjunct sentence, as many subjects, or as many finite verbs as there are, either expressly, or implied, so many distinctions may there be. Thus, *My hopes, fears, joys, pains, all centre in you*: and thus Cicero, *Catilina abiit, excessit, evasit, erupit*.—The reason of which pointing is obvious; for as many subjects or finite verbs as there are in a sentence, so many members does it really contain. Whenever, therefore, there occur more nouns than verbs, or contrariwise, they are to be conceived as equal. Since, as every subject requires its verb, so every verb requires its subject, wherewith it may agree: excepting, perhaps, in some figurative expressions.

Indeed, there are some other kinds of sentences which may be ranked amongst the conjunct kind, particularly the absolute *ablative*, as it is called: Thus, *Physicians, the disease once discovered, think the cure half wrought*: where the words, *disease once discovered*, are equivalent to, *when the cause of the disease is discovered*.—So also in nouns added by apposition; as, *The Scots, a hardy people, endured it all*; so also in vocative cases, and interjections; as, *This, my friend, you must allow me*: And, *What, for heaven's sake, would he be at?*

The case is much the same, when several adjuncts affect either the subject of the sentence, in the verb, in the same manner; or at least something, whereby one of them is affected: as, *A good, wise, learned man, is an ornament to the commonwealth*: where the several adjectives denoting so many qualities of the subject, are to be separated from one another.—Again, when I say, *Your voice, countenance, gesture terrified him*: the several nominative cases denote so many modes of the verb, which are likewise to be distinguished from each other. The case is the same in adverbs; as, *He behaved himself modestly, prudently, virtuously*.—In the first example, the adjuncts immediately affect the subject; in the third, the verb; in the following one, another adjunct: as, *I saw a man laden with age, sickness, wounds*.

Now, as many such adjuncts as there are, so many several members does the sentence contain; which are to be distinguished from each other, as much as several subjects, or finite verbs: and that this is the case in all conjunct sentences, appears hence, that all these adjuncts, whether they be verbs or nouns, &c. will admit of a conjunction copulative, whereby they may be joined together.—But, where-ever there is a copulative, or room for it, there a new member of a sentence begins.—For the other partitions, &c. of sentences, see **COLON**, **SEMICOLON**, **PERIOD**.

**SENTENCE**, is also used in rhetoric and poetry, for a short, pithy remark, or reflection, containing some sentiment of use in the conduct of life. See **APOPTHEGM**, **ADAGE**, **PROVERB**, &c.

Such are, *Discite justitiam metiti, & non temnere divos*; or, *A teneris assuescere multum est*, &c.

Sentences, farther Bossu observes, render poems useful; and, besides, add I know not what lustre and spirit, which please. But there is no virtue which is not accompanied with some dangerous vice. Too many sentences give a poem

too philosophical an air, and sink it into a kind of gravity; that is less fit for the majesty of a poem, than the study of a learned man, and the quaintness of a dogmatist. Such thoughts not only contain, but inspire, a certain calm wisdom, which is directly opposite to the passions; it cools them, both in the hearers and in the speaker. Lastly, the affectation of speaking sentences, leads a person to trifling and impertinent ones; instances whereof we have, in abundance, in Seneca's tragedies.—Petronius recommends it to authors, to disguise their sentences, that they may not stand glaring above the thread or ground of the discourse. See **ELLIPSIS**.

**SENTIMENTS**, in poetry, and particularly dramatic, are the thoughts which the several persons express; whether they relate to matters of opinion, passion, business or the like. See **THOUGHT**.

The manners form the tragic action, and the sentiments explain it; discovering its causes, motives, &c.—The sentiments are to the manners, what those are to the fable. See **MANNERS**.

In the sentiments, regard is to be had to nature and probability; a madman, for instance, must speak as a madman; a lover as a lover; a hero as a hero.—The sentiments, in great measure, are to sustain the character. See **CHARACTER**, **DICTION**, **HERO**, &c.

**SENTINEL**\*, **CENTINEL**, or **SENTRY**, in war, a private soldier taken out of a corps de garde of foot, and placed in some post to watch any approach of the enemy, to prevent surprizes; and to stop such as would pass without orders, or without discovering who they are.

\* The word is modern: it is not long since they said, *To be on the scout*, in the same sense as we now say, *To stand sentry*. &c. Menage derives the word à *sentiendo*, from perceiving.

*Sentinel perdu*, is a sentinel placed at some very advanced and dangerous post, whence it is odds he never returns. See **PERDU**.

The sentinel's word, when he challenges, is, *Who is there?* *Qui vive*, or *Qua va la?* *Stand!* *Demeure la!*

**SEPARABLE** *modes*. See the article **MODE**.

**SEPARATE** *affection*. See the article **AFFECTION**.

*Penultimate of the SEPARATE*. See **PENULTIMATE**.

**SEPARATION**, in navigation, the same with what we more usually call *departure*. See **DEPARTURE**.

**SEPARATION of man and wife**. See **DIVORCE**.

*Waters of SEPARATION*. See the article **WATER**.

**SEPARATISTS**, a religious sect in England, denominated from their setting up a *separate church*, in opposition to that established by law. See **DISSENTERS**, &c.

At present, *separatists*, is rather the name of a collection of sects, than of any particular one; but nearer their original, there was that agreement among them, that one name served them all. Their division into presbyterians, anabaptists, independants, &c. is a modern thing. See **NONCONFORMIST**, **PRESBYTERIAN**, &c.

The *separatists*, Hornius tells us, *Hist. Eccl.* are such as under Edward VI. Elizabeth and James I. refused to conform to the church of England: and who were first called *puritans*, then *separatists*, and lastly *nonconformists*. See **PURITAN**.

The first leader of the *separatists*, was Bolton; who, upon quitting the party he had formed, was succeeded by Robert Brown, from whom the *separatists* were called *Brownists*, a name they long retained: though Brown himself deserted the sect, and, in imitation of Bolton, abjured his errors. See **BROWNIST**.

He was succeeded by Barrow, who was hanged at the instigation of the bishops: their fourth chief was Johnson, who set up a church at Amsterdam; which afterwards divided into several sects, at the head of one whereof was Johnson's brother, who excommunicated him, and was reciprocally excommunicated by him. Soon afterwards, a fifth, named Smith, erected a like church at Leyden, but it dwindled away after his death: and *separatism* was brought very low, when Robinson appeared, and raised its head.—He softened the dogma's of Brown, and set on foot a good understanding among them; but was not able to unite the whole sect. Part of them still adhered to the rigid opinions of their old master Brown, and part of them followed Robinson. The first retained the old name of *separatists*, the latter assumed that of *semi-separatists*, and at length degenerated into *independants*, which is the name whereby they are now usually called, both in New and Old England. See **INDEPENDANTS**. Hornius mentions another order of *separatists*, called *sesqui-separatists*, that is, *separatists and a half*. Some will have these to be a distinct sect; others, the same with the *semi-separatists*: for it is added, that the *semi-separatists*, under pretence of taking a medium between the Brownists and the church of England, went further even than the Brownists themselves, and under the name of *separatists* degenerated into *separatists and a half*.

**SEPIUM**, **SEPIÆ** *os*, or *testa*, cuttlefish bone; is a white, spongy, testaceous substance, growing on the back of the cuttle-fish; and seeming almost to be calcined by the sun. It is rough and absterfve, and chiefly used in medicine as a dentrificer.

**SEPTA**,

SEPTA, in antiquity, were inclosures, or rails, made of boards; through which they went in, to give their votes, in the assemblies of the Romans. See OVILIA.

SEPTEMBER, the ninth month of the year, reckoned from January; and the seventh, from March: whence its name, viz. from *septimus*, seventh. See MONTH and YEAR.

The Roman senate would have given this month the name of *Tiberius*; but that emperor opposed it: the emperor Domitian gave it his own name *Germanicus*: the senate under Antoninus Pius gave it that of *Antoninus*: Commodus gave it his surname *Hercules*; and the emperor Tacitus, his own name, *Tacitus*.—But these appellations are all gone into disuse.

SEPTEMVIR, in antiquity. See QUINQUEVIR, QUINDECIMVIR, EPULO, &c.

The Germans sometimes use the word *septemvirate*, for the seven electors of the empire. See ELECTOR.

SEPTEMTRIO\*, or SEPTENTRIONES, in astronomy, a northern constellation of stars, more usually called *ursa minor*, or the little bear; and by the people, *Charles's wain*. See URSA minor.

\* The word is formed from the Latin, *septem*, seven; and *trionus*, bullocks, which, in the ancient constellation, were yoked to the plough.

SEPTENTRIO, in cosmography, the same with north; thus called from the ancient constellation *septentrio*, one of whose stars is the pole-star. See NORTH, POLE-STAR, &c.

Hence also SEPTENTRIONAL, SEPTENTRIONALIS, something belonging to the north; as *septentrional signs*, *septentrional parallels*, &c. those on the northern side of the equator.

SEPTIER or SETIER, a French measure, differing according to the species of the things measured. See MEASURE. For liquors, the *septier* is the same thing with the chopine or half-pint. See CHOPINE.

For dry measure, the *septier* is very different, in different places and different commodities; as not being any vessel of measure, but only an estimation of several other measures.

—At Paris, the *septier* of wheat consists of two mines, the mine of two minots, and the minot of three bushels. See BUSHEL.

Twelve *septiers* make the mine.—The *septier* of oats is double that of wheat.

SEPTIZON, SEPTIZONIUM, in the ancient architecture, a term almost appropriated to a famous mausoleum of the family of the Antonines; which Aur. Victor tells us, was built in the tenth region of the city of Rome: being a large insulated building, with seven stages or stories of columns. The plan was square; and the upper stories of columns falling back much, rendered the pile of a pyramid form; terminated a-top, with the statue of the emperor Septimius Severus, who built it.

It had its name *septizon*, *septizonium*, from *septem* and *zona*, q. d. seven zones or girdles, by reason of its being girt with seven rows of columns.

Historians make mention of another *septizon*, more ancient than that of Severus, built near the Thermæ of Antoninus.

SEPTUAGESIMA\*, in the calendar, denotes the third Sunday before lent; or before quadragesima; as quinquagesima is the next before quadragesima, then sexagesima, and *septuagesima*: being all days appropriated by the church to acts of penance and mortification, by way of preparation for the devotion of the lent ensuing. See QUADRAGESIMA.

\* It is supposed by some to take its name from its being about 70 days before Easter: pope Telephorus first made it a feast day, and appointed lent to commence from it. See LENT.

The laws of king Canutus ordained a vacation from judicature, from *septuagesima* to *quindena paschæ*. See QUINQUAGESIMA. From *septuagesima* to the octaves after Easter, marriage is forbidden by the canon-law.

SEPTUAGINT\*, LXX, or the SEVENTY, a term famous among divines and critics, for a version of the Old Testament, out of Hebrew into Greek, performed by seventy-two Jewish interpreters, in obedience to an order of Ptolemy Philadelphus. See BIBLE.

\* The word is formed from the Latin, *septuaginta*, seventy.

The ancients, till Jerom's time, universally believed, that the *seventy* were inspired persons, not mere translators; grounding their belief on a fabulous history of this version, given by Aristeas: who tells us, that the high-priest Eleazer, chose six doctors out of each tribe for this office, which made the number of seventy-two; and that these being shut up, each in his several cell, each translated the whole; and without seeing what any of the rest had done, they were all found to agree to a letter.

Chronology of the SEPTUAGINT, or SEVENTY, is an account of the years of the world, very different from what is found in the Hebrew text, and the vulgate; making the world 1466 years older than it is found in these latter. See AGE, CHRONOLOGY, EPOCH, &c.

The critics are much divided, as to the point of preference. Baronius prefers the account of the *seventy*: and H. Vossius makes an apology for it.—The two latest and most strenuous

V. O. L. II. N°. CXL.

advocates, are father Pezron, a Bernardine, and father le Quien, a Dominican; the first of whom defends the chronology of the *septuagint*, and the latter that of the Hebrew text.

SEPTUM, in anatomy, a term literally signifying an inclosure or partition; applied to several parts of the body, which serve to separate one part from another.

SEPTUM *lucidum*, or *pellucidum*, is a partition separating the two upper ventricles of the brain; thus called, as being transparent. See BRAIN.

SEPTUM *medium*, or *cordis*, is a separation between the two ventricles of the heart.—It is about a finger thick, fleshy, and of the same substance with the heart itself; consisting of muscular fibres, which assist it in its motions. Some have imagined it to be perforated with a great number of holes; but mistakenly. See HEART and VENTRICLE.

SEPTUM *transversum*, is the separation of the two bellies, or venters, called also *diaphragm*. See DIAPHRAGMA.

SEPTUM *narium*, the partition of the nostrils. See NOSE.

SEPTUM *bulbi*, divides the bulb of the urethra lengthwise. See URETHRA.

SEPTUM *gallinaginis*. See CAPUT GALLINAGINIS.

SEPTUM *clitoridis*, a membranous partition running all along between the two corpora cavernosa, from the glans to its divarication at the os pubis. See CLITORIS.

SEPTUM *auris*. See the article EAR.

SEPTUM *testium*. See the article TESTICLE.

SEPULCHRAL, SEPULCHRALIS, something belonging to sepulchres or tombs. See SEPULCHRE.

SEPULCHRAL *inscriptions* are the surest monuments we have of antiquity. See INSCRIPTION, EPITAPH, MONUMENT, &c.

SEPULCHRAL *lamps*, are those said to have been found burning in the tombs of several martyrs, and others. See LAMP.

SEPULCHRAL *column*, is a column erected over a tomb, with an inscription on its shaft. See COLUMN.

SEPULCHRAL, or SEPULCHRALIS, is also the appellation of a sect; thus called, from their principal error, which was, that by the word *hell*, whither the scripture tells us Jesus Christ descended after his death, they understood his grave or sepulchre. See HELL.

The *sepulchrales*, or *sepulchral* hereticks, maintained, that Jesus Christ only descended into hell according to the flesh; that this hell was nothing else but the grave where he was laid, and wherein his soul could not rest. Prateolus.

SEPULCHRALIS *pecunia*. See the article PECUNIA.

SEPULCHRE, SEPULCHRUM, a tomb, or place destined for the interment of the dead. See INTERMENT.

The term is chiefly used in speaking of the burying-places of the ancients: those of the moderns we usually call *tombs*. See TOMB, COEMETERIUM, &c.

Besides the usual *sepulchres* for the interment, either of the whole body, or of the ashes of the body burnt, the ancients had a peculiar kind, called *cenotaphia*; being empty *sepulchres*, made in honour of some person, who, perhaps, had no burial at all; from a superstitious opinion, that the souls of those who wanted burial, wandered an hundred years, ere they were admitted to pass into the Elysian fields. See CENOTAPH, FUNERAL, &c.

The pyramids were built to serve as *sepulchres* for the kings of Egypt. See PYRAMID. And the obelisks had generally the same intention. See OBELISK.

*Sepulchres* were held sacred, and inviolable; and the care taken thereof deemed a religious duty; grounded on the fear of God, and the belief of the soul's immortality. Those who searched or violated them, were odious to all nations, and severely punished.

The Egyptians called their *sepulchres*, *eternal houses*, in contradistinction to their houses and palaces, which they called *imms*; by reason of the short sojourn we have in the one, in comparison of the long stay in the other.

The eastern pilgrimages are all made with design to visit the holy *sepulchre*, that is, the tomb of Jesus Christ. Nobody enters here but bare-footed, and with a world of ceremonies. The Turks exact 24 crowns of each pilgrim, whom devotion carries to the holy *sepulchre*. See PILGRIM.

St. SEPULCHRE, or the holy SEPULCHRE, gives the denomination to an order of regular canons, anciently instituted in Jerusalem, in honour of the holy *sepulchre*. See CANON.

They ascribe their institution to Godfrey of Boulogne; who, they say, upon his taking Jerusalem in the year 1099, placed canons in the patriarchal church of the holy *sepulchre*; which, indeed, is true; but then they were not regulars.—In effect, it was Arnoul, who, of archdeacon of the church of Jerusalem, got himself elected patriarch thereof, that in 1114, first obliged his canons to live in community, and to follow the rule of St. Augustin.

From the holy land, numbers of these canons were brought into Europe, particularly into France by Louis the younger; into England by king Henry; into Poland by Jaxa, a Polish gentleman; and into Flanders by the counts thereof.

But the order was afterwards suppressed by Innocent VIII.

and its effect given to that of our lady of Bethlehem, which itself ceasing, they were bestowed in 1484, on that of the knights of St. John of Jerusalem.—But the suppression did not take place in Poland, nor in several provinces of Germany, where they still subsist: their general is in Poland: their habit, father Helyot observes, was different in different places.

**St. SEPULCHRE**, or the *holy SEPULCHRE*, is also the name of a military order, established in Palestine.

Most writers who mention this order, carry its institution as far back as the time of the apostle St. James, bishop of Jerusalem, or at least to that of Constantine; pretending that Godfrey of Boulogne, and Baldwin, were only the restorers thereof: but this antiquity is chimerical. It is not even certain, that it was founded so early as Godfrey of Boulogne, or his successor Baldwin; though Favyn and de Belloy attribute it to this latter.

It is certain, there was nothing but canons in the church of St. Sepulchre, till the year 1114; and it is more than probable, the knights were only instituted upon the ruins of the canons 400 years after, and that by pope Alexander VI. in order to excite rich and noble persons to visit the holy places, by giving them the title of *knights of the holy sepulchre*, and to this end, instituting an order under that name, whereof he reserved the quality of master to himself and his successors.—Leo X. and Clement VII. granted to the guardian of the religious of St. Francis, in the holy land, the power of making these knights; which power, first granted *viva voce*, was afterwards confirmed by a bull of Pius IV.

In 1558, the knights of this order in Flanders, chose Philip II. king of Spain, their master; and afterwards his son; but the grand master of the order of Malta prevailed on him to resign; and when afterwards the duke of Nevers assumed the same quality in France, the same grand master, by his interest and credit, procured a like renunciation of him, and a confirmation of the union of this order to that of Malta. See **MALTA**.

**SEPULCHRI pretium**. See the article **PETIUM**.

**SEQUEL**, **SEQUELA**, in logic, a consequence drawn from some preceding proposition. See **CONSEQUENCE** and **CONCLUSION**.

As, if I say, *The human soul is immaterial; and therefore immortal*, the last member of the sentence is a *sequel* of the first.

**SEQUENCE**, in gaming, a series or set of cards immediately following each other in the same suit, or colour.

We say, a *sequence* of four cards, of five, &c.—At picquet, these are called tierces, quarts, quints, &c. See **PICQUET**.

**SEQUESTRATION**, **SEQUESTRATIO**, in common law, the act of separating a thing in controversy, from the possession of both parties, till the right be determined by course of law.

This is of two sorts; *voluntary* and *necessary*.

*Voluntary SEQUESTRATION*, is that which is done by consent of both parties.

*Necessary SEQUESTRATION*, is that which the judge doth by his authority, whether the parties will, or not.

**SEQUESTRATION**, in the civil law, is the act of the ordinary, disposing of the goods and chattels of one deceased, whose estate no man will meddle with.

A widow is also said to *sequester*, when she disclaims having any thing to do with the estate of her deceased husband.

Among the Romanists, in questions of marriage, where the wife complains of impotency in the husband, she is to be *sequestered* into a convent, or the hands of matrons, till the process be determined.

**SEQUESTRATION**, is also used for the act of gathering the fruits of a benefice void, to the use of the next incumbent.

In the time of the civil wars, *sequestration* was used for a seizing of the estates of delinquents, for the use of the commonwealth.

**SEQUIN**\*, **ZECHIN**, **ZECCHINO**, a gold coin struck at Venice, and in several parts of the grand seignior's states, particularly Cairo; which last are called *Turkish sequins*, or *cherifs*. See **COIN** and **MONEY**.

\* Ablancourt derives the word from *cizicum*, or *cizicenicum*; as supposing the *sequin* first struck at *Cizicum*: Menage, from the Italian *zecchino*, of *zecca*, the name of the mint at Venice.

At Constantinople, the ducats struck in several parts of Germany, are called *Hungarian sequins*. See **DUCAT**.

The value of these *sequins* is different; those of Venice exceeding those of Turkey and Germany, by one fifteenth. In the East-Indies the difference is still more sensible: the Venetian *sequin* being current for four rupees, and six pellas, or 9 s. 4 d. sterling, and the Turkish *sequin* only for four rupees, or 9 s.

**SERAGLIO**, among the Levantines, the palace of a prince, or lord. See **PALACE**.

At Constantinople, they say, the *seraglio* of the ambassador of England, of France, &c.—The word is originally Persian, where it has the same signification.

The **SERAGLIO** is used by way of excellence for the palace of the grand seignior at Constantinople, where he keeps his

court, and where his concubines are lodged, and where the youth are trained up for the chief posts of the empire.

It is a little triangle about two miles round, wholly within the city, at the end of the promontory Chrysoceras, now called the *seraglio* point.—The buildings run back to the top of the hill, from whence are gardens that reach to the edge of the sea.—The outward appearance, du Loir tells us, is not beautiful, in regard the architecture is irregular, being cantoned out into separate edifices and apartments, in manner of pavillions and domes. No stranger has ever yet been admitted to the inmost parts of the *seraglio*.

The old *seraglio* is the place where the emperor's old mistresses are kept.

Balzac observes, that the *seraglio* at Constantinople, is only a copy of that which Solomon anciently built at Jerusalem, for his wives and concubines.

**SERAPH**, or **SERAPHIN**, in the hierarchy of angels, a spirit of the first, or highest rank. See **ANGEL** and **HIERARCHY**.

The *seraphs*, or rather *seraphim*, make that class of angels supposed to be the most inflamed with divine love, by their nearer and more immediate attendance on the throne; and communicate their heat to the inferior, and remoter orders.—Hence their name, which is formed from the Hebrew root, שרף, to burn, inflame.

**SERAPHICK**, something belonging to the seraphim. See **SERAPH**.

Mr. Boyle has a treatise of *seraphick love*, i. e. of divine love, or the love of God.

In the schools, St. Bonaventure is called the *seraphick doctor*, from his abundant zeal and fervour. See **DOCTOR**.

St. Francis, founder of the Cordeliers and Franciscans, is called the *seraphick father*, in memory of a vision he saw on mount Alverna, after a fast of forty days, accompanied with many other severities: when, falling into an ecstasy, he saw a seraph glide rapidly from heaven upon him; which impressed on him certain stigmata or marks, representing the wounds which the nails and the spear made in our Saviour's body, at his crucifixion. See **FRANCISCAN**.

**SERAPHIM**. See the article **SERAPH**.

**SERENADE**, **SERENATA**, a kind of concert given in the night-time by a gallant, at his mistress's door, or under her window.

Sometimes it consists wholly of instrumental musick; sometimes voices are added; and the pieces composed or played on these occasions, are also called *serenades*.

We do not know whence the word should be derived, unless from the French, *serain*, the dew falling in the night-time.

**SERENA gutta**, in medicine, the same as *amaurosis*. See **GUTTA serena** and **AMAUROSIS**.

**SERENE**, **SERENUS**, a quality or title of honour given to certain princes, and chief magistrates of republicks. See **TITLE** and **QUALITY**.

The king of England is stiled, *the most serene*: the same term is also applied to the doge of Venice.—The pope, and the sacred college writing to the emperor, to kings, or the doge, give them no other title but that of *most serene*. Indeed the Venetians set the title of *serenity* above that of highness. See **HIGHNESS**.

In 1646, Wicquefort observes, there was a clashing between the courts of France and Vienna; because the emperor refused the king of France any other title than that of *serene*.—Bishops anciently were addressed under the title of *serens*.

The kings of France of the first and second race, speaking of themselves, use no other quality, but *notre serenité*. The emperor gives no other title to the king of England, nor even to any other king, excepting the king of France. The king of Poland, and other kings, give it to the electors. The emperor, writing to the electors or other princes of the empire, only uses the term *dilection*; but in treating with them, uses *electoral serenity* to the electors; and *ducal serenity* to the other princes. See **ELECTOR**, &c.

**SERGE**, in commerce, a woollen quilted stuff, manufactured on a loom with four treddles, after the manner of rateens, and other stuffs, that have the whale. See **RATEEN**, &c. The goodness of *serges* is known by the quilting, as that of cloths by the spinning. See **CLOTH**.

Of *serges* there are various kinds, denominated either from the different qualities thereof, or from the places where they are wrought.—The most considerable is the *London serge*, now highly valued abroad, particularly in France, where the manufacture is carried on with good success, under the title of *serge de façon de Londres*.

*Manufacture of London SERGES*.—For wool, the longest is chosen for the warp, and the shortest for the woof. Ere either kind is used, it is first scoured, by putting it in a copper of liquor, somewhat more than luke-warm, composed of three quarts of fair water, and one of urine. After having stayed long enough therein to dissolve, and take off the grease, &c. it is stirred briskly about with a wooden peel; taken out of the liquor; drained and washed in a running water; dried in the shade; beaten with sticks on a wooden rack, to drive out the coarser dust and filth; and then picked clean

clean with the hands.—Thus far prepared, it is greased with oil of olives, and the longest part, destined for the warp, combed with large combs, heated in a little furnace for the purpose.—To clear off the oil again, the wool is put in a liquor composed of hot water, with soap melted therein: whence being taken out, wrung, and dried, it is spun on the wheel.

As to the shorter wool, intended for the woof, it is only carded on the knee, with small fine cards, then spun on the wheel, without being scoured of its oil.—Note, the thread for the warp is always to be spun much finer, and better twisted, than that of the woof.

The wool, both for the warp, and the woof, being spun, and the thread divided into skains; that of the woof is put on spools (unless it have been spun upon them) fit for the cavity or eye of the shuttle; and that for the warp wound on a kind of wooden bobbins, to fit it for warping. When warped, it is stiffened with a kind of size, whereof, that made of the shreds of parchment is held the best; and when dry, is put on the loom.

When mounted on the loom; the workman raising and falling the threads (which are passed through a reed) by means of four treadles placed underneath the loom, which he makes to act transversely, equally, and alternately, one after another, with his feet, in proportion as the threads are raised and lowered, throws the shuttle across from one side to the other; and each time that the shuttle is thrown, and the thread of the woof crossed between those of the warp, strikes it with the frame to which the reed is fastened through whose teeth the threads of the warp pass; and this stroke he repeats twice, or thrice, or even more, till he judges the crossing of the *serge* sufficiently close: thus he proceeds, till the warp is all filled with woof.

The *serge* now taken off the loom is carried to the fuller, who fulls, or scours it, in the trough of his mill, with a kind of fat earth, for the purpose, first purged of all stones and filth. After three or four hours scouring, the fuller's earth is washed out in fair water, brought by little and little, into the trough, out of which it is taken when all the earth is cleared: then, with a kind of iron pincers, or plyers, they pull off all the knots, ends, straws, &c. sticking out on the surface, on either side: then return it into the fulling trough, where it is worked with water somewhat more than luke-warm, with soap dissolved therein, for near two hours. It is then washed out, till such time as the water becomes quite clear, and there be no signs of soap left: then it is taken out of the trough, the knots, &c. pulled off, and then put on the tenter to dry, taking care, as fast as it dries, to stretch it out both in length and breadth, till it be brought to its just dimensions. When well dried, it is taken off the tenter, dyed, shorn, and pressed. See DYING, PRESSING, and SHEERING.

**SERGEANT**, or **SERJEANT**, a term in our law, applied to sundry offices.—**SERGEANT at law**, or *of the coif*, is the highest degree taken in the common law, as that of doctor is in the civil law. See **DEGREE** and **DOCTOR**.

*Sergeants* were anciently called *servientes ad legem*, and *servientes narratores*: Mr. Selden adds, that they were also called *doctores legis*; though others are of opinion, that the judges are, more properly, the *doctores legis*, and *sergeants*, the bachelors of law.—Spelman observes, that however a *sergeant* may be richer than all the doctors of the commons, yet a doctor is superior in degree to a *sergeant*; for the very name of a doctor is magisterial, but that of a *sergeant* ministerial. Hence the doctors are seated and covered when they plead; but the *sergeants* stand uncovered at the bar, excepting for their coif.

As these are supposed the most learned and experienced; there is one court appropriated to plead in by themselves, which is the common-pleas, where the common law of England is most strictly observed.—But they are not prohibited pleading in other courts, where the judges (who must first be *sergeants*) call them *brothers*. See **COURT** and **COMMON-PLEAS**.

They are called by the king's mandate, or writ, directed to them; commanding them to take upon them that degree, by a day assigned.

Out of these, one is made the king's *sergeant* (more may be) to plead for him in all causes, especially treason.

**SERGEANT at arms**, is an officer appointed to attend the person of a king, to arrest traitors, and persons of quality offending, and to attend the lord high-steward, when he sits in judgment on any traitor.

Of these by statute there are not to be above 30 in the realm.—There are now eight at court, at 100 l *per annum* salary each: they are called the king's *sergeants at arms*, to distinguish them from others: they are created with great ceremony; the person kneeling before the king, his majesty lays the mace on his right shoulder, and says, *Rise up, sergeant at arms, and esquire, for ever*.—They have, besides, a patent for the office, which they hold for life.

They have their attendance in the presence-chamber, where the band of gentlemen-pensioners wait; and receiving the king at the door, carry the maces before him to the chapel-

door, whilst the band of pensioners stand foremost; and make a lane for the king; as they also do when the king goes to the house of lords.

There are four others created in the same manner; one, who attends the lord chancellor; a second, the lord treasurer; a third, the speaker of the house of commons; and a fourth, the lord mayor of London, on solemn occasions.

They have a considerable share of the fees of honour, and travelling charges allowed them, when in waiting, viz. five shillings *per day*, when the court is within ten miles of London, and ten shillings when twenty miles off London: they are in the lord chamberlain's gift.

**SERGEANT**, or **SERJEANT**, in war, is an inferior officer in a company of foot, or troop of dragoons; armed with a halbard, and appointed to see discipline observed, to teach the soldiers the exercise of their arms, to see due distances kept, to order, straiten, form ranks, files, &c. See **OFFICER**.

**SERGEANTY**, or **SERJEANTY**, a service anciently due to the king for lands held of him; and which could not be due to any other lord. See **TENURE** and **SERVICE**.

It is divided into *grand* and *petty serjeanty*.

*Grand SERGEANTY*, is where one holds land of the king by service which he ought to do in his own person; as to bear the king's banner, or spear, assist at his coronation, or do some office in his court.

*Petty SERGEANTY*, is where a man holds land of the king to yield him yearly some small thing towards his wars; as a sword, dagger, bow, spurs, &c.

Coke, on Littleton, tells us, that Sir Richard Rockefly held lands at Seaton, by *grand serjeanty*, to be *vantrarius regis*, i. e. the king's fore-footman, when he went into Gasconne, till he had worn out a pair of shoes of the price of fourpence.

By the statute, 12 Car. II. all tenures of any honours, manors, lands, &c. are turned into free and common soccage; but the honorary service of *grand serjeanty* are thereby continued. See **TENURE**.

**SERIES**, a continued succession of things in the same order, and which have some relation or connection with each other. See **CLASS**, **ORDER**, &c.

Medals are formed into *suites* or *series's*, both with regard to the metal, and to the subject. The different metals of medals, constitute three different *series's*, in the cabinets of the curious; we mean, as to the order and arrangement of the several medals.—The gold *series*, for instance, of imperials, amounts to about 1000 or 1200; that of silver may amount to 3000; and that of copper, in all the three sizes, great, middle, and small, to 6 or 7000.—Of these, the *series* of middle copper is the most compleat and easily formed, as it may be brought down to the fall of the empire in the west, and the time of the Palæologi in the east.

The *series's* of medals are usually formed from the side called the *head*: in the first class, is disposed the *series* of kings: in the second, that of Greek and Latin cities; in the third, the Roman consular families; in the fourth, the imperial; in the fifth, the deities: to which may be added a sixth *series*, consisting of medals of illustrious persons.

There are also *series's* of modern medals: that of the popes only commences from Martin V. in 1430. From that time we have a *series* of papal medals, tolerably compleat, to the number of 5 or 600.—One might likewise have a *series* of emperors from Charlemagne; provided one took in the current coins: but, in practice they commonly commence with Frederick II. in 1463.—The *series* of kings of France is the most numerous and most considerable of all the modern kings. See **MEDAL**.

**SERIES**, in algebra, denotes a rank or progression of quantities, increasing or decreasing in some constant ratio; which, in its progress, approaching still nearer and nearer some sought value, is called a *converging series*; and if infinitely continued, becomes equal to that quantity: whence its usual appellation of *infinite series*. See **CONVERGING**, &c.

Thus  $\frac{1}{2}$ ,  $\frac{1}{4}$ ,  $\frac{1}{8}$ ,  $\frac{1}{16}$ , &c. make a *series*, which always converges, or approaches to the value of 1, and infinitely continued, becomes equal thereto. See **INFINITE**, **APPROXIMATION**, &c.

The doctrine and use of *infinite series's*, one of the greatest improvements of the present age, we owe to Nic. Mercator of Holstein, who, however, seems to have taken the first hint of it from Dr. Wallis's arithmetick of *infinities*.—It takes place principally in the quadratures of curves; where, as we frequently fall upon quantities, which cannot be expressed by any precise definite numbers, such as is the ratio of the diameter of a circle to the circumference; we are glad to express them by a *series*, which, infinitely continued, is the value of the quantity required. See **CIRCLE**, **QUADRATURE**, &c.

*Nature, origin, and use of infinite SERIES's*.—Though arithmetic furnish us with very adequate and intelligible expressions for all rational numbers, yet it is very defective as to irrational ones; which are infinitely more numerous than the other; there being, for instance, an infinity of them between 1 and 2. Were it now required to find a mean proportional between 1 and 2, in rational numbers, which alone

alone are clearly intelligible, (the root of 2 being certainly a very obscure idea) we could still approach nearer and nearer to the just value of the quantity required, but without ever arriving at it: thus, if for the mean proportional between 1 and 2, or the root of 2, we first put 1, it is evident we have not put enough; if we add  $\frac{1}{2}$  we put too much, for the square of  $1 + \frac{1}{2}$  is greater than two. If then we take away  $\frac{1}{4}$ , we shall find we have taken away too much, and if we return  $\frac{1}{16}$ , the whole will be too great: thus may we proceed, without ever coming at the just quantity sought.—These numbers thus found, and those found after the same manner to infinity, being disposed in their natural order, make what we call an *infinite series*. See NUMBER and SURD.

Sometimes the *series's* do not proceed by alternate additions and subtractions, but by simple additions, or an infinity of subtractions; according to the position of the first term. In all these *infinite series's* it is visible, that as all the terms are only equal to a finite magnitude, they must be still decreasing; and it is even convenient that they be so, as much as possible, that one may take only a certain number of the first terms for the magnitude sought, and neglect all the rest.

But it is not irrational numbers only, that are expressed in rational ones, by *infinite series's*. Rational numbers themselves may be expressed in the same manner: 1, for instance, being equal to the *series*  $\frac{1}{2} + \frac{1}{4} + \frac{1}{8} + \frac{1}{16} + \frac{1}{32} + \frac{1}{64} + \frac{1}{128} + \frac{1}{256} + \frac{1}{512} + \frac{1}{1024} + \frac{1}{2048} + \frac{1}{4096} + \frac{1}{8192} + \frac{1}{16384} + \frac{1}{32768} + \frac{1}{65536} + \frac{1}{131072} + \frac{1}{262144} + \frac{1}{524288} + \frac{1}{1048576} + \frac{1}{2097152} + \frac{1}{4194304} + \frac{1}{8388608} + \frac{1}{16777216} + \frac{1}{33554432} + \frac{1}{67108864} + \frac{1}{134217728} + \frac{1}{268435456} + \frac{1}{536870912} + \frac{1}{1073741824} + \frac{1}{2147483648} + \frac{1}{4294967296} + \frac{1}{8589934592} + \frac{1}{17179869184} + \frac{1}{34359738368} + tient will be found  $1-2+4-8+16-64+128$ , &c. One term, 1 exceeds  $\frac{1}{2}$  by an excess of  $\frac{1}{2}$ ; two terms comes short by  $\frac{1}{4}$ ; three terms exceeds by  $\frac{1}{8}$ ; four fall short by  $\frac{1}{16}$ , &c. If the series be supposed terminate in  $-8$ ; then

will  $\frac{1}{1+2} = 1-2+4-8+\frac{1}{2}$ . But  $1-2+4-8$

$= -5 = -\frac{1}{2}$ . Therefore,  $\frac{1}{1+2} = \frac{1}{2} - \frac{1}{2} = \frac{1}{2}$ . Suppose the general series to terminate in  $-c$ ; then will

$= 1 - c + c^2 - c^3 + \frac{1}{c^4} =$

$\frac{1+c}{1+c} = 1$

To find an infinite series by extracting of roots. To find an infinite series by a presupposed series, See QUADRATURE of the circle.

To extract the roots of an infinite series, See EXTRACTION of roots.

Reversion of SERIES. See the article REVERSION.

SERMOLOGUS, SERMOLOGUE, an ecclesiastical book composed of sermons, or homilies of popes, and other persons of eminence and sanctity, formerly read at the feasts of the confessors, the Purification, All Saints, and on every day from Christmas to the octave of the Epiphany. See HOMILY.

SERMON, funeral. See the article FUNERAL.

SERMONES, the title which Horace gives his satyrs. See the article SATYR.

Criticks are divided about the reason of the name: the opinion of father Bossu seems best grounded. A mere observance of feet, and measure, such as we find in Terence, Plautus, and in Horace's satyrs, he thinks, is not sufficient to constitute verse, to determine the work to be poetical, or to distinguish it from prose: unless it have some further air, or character of poetry; somewhat of the fable, or the sublime. See POETRY.

Hence it is, that Horace calls his satyrs, *prose sermones*.—His odes have quite another air, and are therefore called, *poems, carmina*. See POEM, PROSE and VERSIFICATION.

SERMONIUM, in old records, a kind of interlude or historical play, which the inferior orders of clergy, assisted by boys, &c. used to act in the body of the church, suitable to the solemnity of some festival or high procession day.

This is supposed to have been the origin of the modern drama. See COMEDY.

SERON of almonds, is the quantity of two hundred weight; of anise-seeds, from 3 to 400; of cattle-soap, from 200 and a half, to 300 and 3 quarters.

SEROSITY, in medicine, an aqueous liquor, or lymph, found in the blood and other humours. See LYMPHA.

Degori defines it, a sharp, bilious juice, approaching nearly the nature of blood; but which, being extravasated, does not coagulate like the blood. See SERUM.

Disorders of the spleen are attended with *serosities*: the kidneys help to purge off *serosities*.

SERPENS, in astronomy, a constellation in the northern hemisphere, called more particularly *serpens ophiuchi*.

The stars in the constellation *serpens*, in Ptolemy's catalogue are 17; in Tycho's 19; in the Britannic catalogue 59. The longitudes, latitudes, magnitudes, &c. whereof are as follow.

SERPENT, a musical instrument, serving as a basis to the cornet, or small shawm, to sustain a chorus of fingers in a large edifice.

It has its name *serpent*, from its figure; as consisting of several folds or wreaths, which serve to reduce its length, which would otherwise be six or seven feet.

It is usually covered with leather; and consists of three parts; a mouth-piece, a neck, and a tail.—It has six holes by means whereof it takes in the compass of two octaves.

SERPENTARIA, a medicinal plant, called by the ancients *pistolochia*, and *dracunculus*; by us properly, *snake-root*, and *dragon's wort*.

The ancients were only acquainted with two kinds of this plant; the *great* and the *small*: but since the discovery of America, botanists have added several others; as, the *serpentaria Virginiana*, or *Virginia snake-root*: besides that of Canada, and that of Brasil.

They are all supposed to be alexipharmicks, or counter-poisons; and as such are ingredients in Venice-treacle. The *great serpentaria*, called by the ancients *dracunculus major*, has its stem very straight, smooth, and marked with red spots, like the skin of a serpent; whence, probably, as much as from its virtues, it is, that it takes its name.—Its root is big, round and white, covered with a thin skin.

The *smaller serpentaria* has its stalk much like that of the larger, only its leaves are like those of ivy; whereas those of the larger are folded in one another, after the manner of bastard rhubarb.—Its root is round and bulbous.

The *serpentaria of Virginia*, called also *colubrina Virginiana*, *asarum Virginianum*, *serpentaria nigra*, and *contrayerva of Virginia*, has its leaves green and large, almost in figure of a heart; its fruit round, and its root, which is of a very strong aromatick smell, has, at bottom, an infinite number of long small filaments, representing a kind of beard.

It was first brought into Europe from Virginia by the English; where it is esteemed a sovereign antidote against the bite of the rattle snake.—We are told by travellers, that this root not only cures the bite of the rattle snake but that that animal lies the smell thereof: for which reason the Indian, and other travellers, always carry it with them on the end of a staff, to present towards the snake, when, by chance, they meet it.

SERPENTARIUS, in astronomy, a constellation of the northern hemisphere, called also *Ophiuchus*, and anciently *Æsculapius*. See CONSTELLATION.

The stars in the constellation *serpentarius* in Ptolemy's catalogue are 29; in Tycho's 25; in the Britannic catalogue 69. The longitudes, latitudes, magnitudes, &c. whereof are as follow.

SERPENTINE *verses*, are such as begin and end with the same word.—As,

*Ambo florentes atatibus, Arcades ambo.*

SERPENTINE, in chymistry, a worm, or pipe of copper, or pewter, twisted into a spiral, and ascending from the bottom of the alembick to the capital, and serving as a refrigerator in the distillation of brandy and other liquors. See REFRIGERATORY and DISTILLATION.

SERPENTINE *marble*, or *stone*, a kind of marble called by the antients *ophites*, from the Greek *ophis*, *serpent*, as being speckled like a serpent's skin. See MARBLE and STONE. The ground of the *serpentine* is blackish; but it is beset with green and yellowish stains, streaks, &c. being withal exceeding hard, precious and antique.

The scarceness of the *serpentine* is such as only allows it to be used by way of incrustation.—The largest pieces we know of, are some tables in the compartments of the attic of the Pantheon; and two columns in the church of St. Laurence in Lucina at Rome.

There is also a kind of *serpentine* brought from Germany, used to make vessels of, but not in building.

SERPENTINE *column*. See the article COLUMN.

SERPI *grotta dei*. See the article GROTTA.

SERPIGO, in medicine, a kind of herpes, popularly called a *letter* or *ring-worm*. See HERPES.

It consists of a number of very small pustules, rising close to each other, sometimes in a circular form, with great pain and itching. It never comes to digestion, and is not cured without difficulty. For after it appears to have been quite extinguished, it frequently breaks forth again at certain seasons of the year.—The common people use to anoint it with ink: but where the disease is fixed, some universals should be first applied. See LICHEN, IMPETIGO, &c.

SERRATUS, in anatomy, a name given to several muscles, from their resemblance in shape, to a saw. Such are the SERRATUS *anticus minor*, which arises thin and fleshy from the second, third, fourth, and fifth superior ribs, and ascending obliquely, is inserted fleshy into the process coracoides of the scapula, which it draws forward. It also helps in respiration.—See *Tab. Anat. (Myol.) fig. 2. n. 10.*

SERRATUS *anticus major*, comes from the whole basis of the scapula, and is inserted into the seven true ribs, and first of the false ribs, by so many distinct portions, representing the teeth of a saw.—See *Tab. Anat. (Myol.) fig. 7. n. 15. 15. fig. 1. n. 42. fig. 2. n. 26.*

SERRATUS *posticus superior*, arises by a broad and thin tendon, from the two inferior spines of the vertebræ of the neck, and the three superior of the back, and growing fleshy, is inserted into the second, third, and fourth ribs, by so many distinct indentations.—See *Tab. Anat. (Myol.) fig. 7. n. 31.*

These two help to draw the ribs upwards, and bring them to right angles with the vertebræ; and, consequently, make the cavity of the thorax wider and shorter.

SERRATUS *posticus inferior*, arises by a broad and thin tendon from the three inferior spines of the vertebræ of the back, and from the two superior of the loins: its fibres, ascending obliquely, grow fleshy, and are inserted by four indentations, into the four last ribs.

SERVAGE. See the article SERVICE.

SERVANT, SERVUS, a term of relation signifying a person who owes and pays a limited obedience for a certain time, to another, in quality of master. See MASTER.

The Romans, besides their slaves, whom they also called *servi*; had another kind of *servants* whom they called *nexi* and *addicti*, who were such as being in debt, were delivered up to their creditors by the prætor, to work out their debt; after which they were again at liberty. See SLAVE.

The pope, out of his wonderful humility, calls himself in his bulls, *the servant of the servants of God, servus servorum Dei*. The first who used the appellation, as Diaconus tells us, were pope Damasus and Gregory the great; which last is said to have used it to check, by his modesty, the arrogance of John, patriarch of Constantinople, who took the title of *æcumenical*.—Du Cange adds, that the title *servant* has been assumed by some bishops, some kings, and some monks.

SERVETISTS, the disciples or followers of Michael Servetus, the ring-leader of the antitrinitarians of these last ages. See ANTITRINITARIAN.

In reality, however, Servetus had not any disciples; as being burnt, together with his books, at Geneva, in 1553, before his dogma's had time to take root.—But the name *Servetists* is given to the modern antitrinitarians, because they follow the footsteps he had marked out.

Sixtus Senensis calls the anabaptists, *Servetists*, and seems to use the two terms indifferently. The truth is, in many things, the ancient anabaptists in Switzerland, &c. chimed in with Servetus. See ANABAPTIST.

As the books that he wrote against the trinity are very rare, his real sentiments are but little known: M. Simon, who had a copy of the first edition, delivers them at large in his critical history.

Though Servetus uses many of the same arguments against the trinity, as the Arians, yet he professes himself very far from their sentiments. He also opposes the Socinians in some things; and declares his dissent from the opinions of Paulus Samosatenus; though Sandius mistakenly charges him with having the same sentiments. In effect, he does not seem to have had any fixed regular system of religion, at least not in the first edition of his book against the trinity, published in 1531, under the title, *de trinitatis erroribus, libri septem, per Michaelum Servetum, alias Reves, ab Arragonia Hispanum*.

The year following he published his dialogues on the mystery of the trinity. In the preface to which last work, he declares himself dissatisfied therewith.—It was on this account he undertook another on the same subject, of much greater extent; which did not appear till the year 1553, a little before his death. Those of Geneva having seized the copies of this edition, had it burnt; nor were there above two or three that escaped; one of which was kept at Basil, where the book was printed, but is now in the college library at Dublin.

It was lately put to the press, secretly, in England; but being discovered, the impression was seized and destroyed.

**SERVICE**, or **SERVAGE**, **SERVITIUM**, in law, a duty which the tenant, by reason of his fee, owes to the lord. See **FEE**.

Ancient law-books make divers divisions of *service*, viz. into *personal*, *real* and *mixed*; *military* and *base*; *intrinsic* and *extrinsic*, &c. But since the statute 12 Car. II. whereby all tenures are turned into free and common soccage; much of that learning is set aside.—Yet it may not be amiss to mention how the several kinds of *service* are described in our ancient law-books.

**Personal SERVICE**, is that to be performed by the person.—Such is that due from a slave to his master.

**Real SERVICE**, is either *urbane* or *rustic*; which two kinds differ, not in the place, but the thing.—The first is that due from a building or house, in whatever place situate, whether city or country; as the keeping a drain, a vista, or the like.

**Rustic SERVICES**, are those due for grounds where there is no building; such is the right of passage through ways, &c.

**Mixed SERVICE**, is that due from the person, by reason of the thing, as an usufruct, &c. See **SERGEANTRY**.

Our ancient law-books tell us of lands held of the king, by the tenant's letting a fart before the king on new year's-day; others, by furnishing the king with whores whenever he travelled that way; others, by bringing the king a mess of pottage at his coronation feast, &c.

There are also **natural SERVICES**.—For instance, if a man cannot gather the produce of his lands without passing through his neighbour's grounds, the neighbour is obliged to allow a passage, as a *natural service*.

**Forensic**, or **extrinsic SERVICE**, **SERVITIUM forensicum**, &c. was a *service* which did not belong to the chief lord, but to the king.

It was called *forensic* and *extrinsic*, because done *foris*, out of doors; and *extra servitium*.—We meet with several grants in the monasticon, of all liberties, with the apurtenances, *salvo forensi servitio*.

**Intrinsic SERVICE**, **SERVITIUM intrinsicum**, that due to the chief lord alone, from his vassals within his manor.

**Frank SERVICE**, **SERVITIUM liberum**, a *service* done by the feudatory tenants, who were called *liberi homines*, and distinct from vassals: as likewise was their *service*; for they were not bound to any base *services*, as to plough the lord's lands, &c. but only to find a man and horse to attend the lord into the army or court.

<b>Suit of SERVICE,</b>		<b>SUIT.</b>

**SERVIENTES virgatores**. See **VIRGATORES**.

**SERVITES**, an order of religious, denominated from their vowing a peculiar attachment to the service of the virgin.

The order was founded by seven Florentine merchants, who, about the year 1233, began to live in community on mount Senar, two leagues from Florence. In 1239, they received from the bishop, the rule of St. Augustin; with a black habit, in lieu of a grey one which they had wore before.—In 1251, Bonifacio Monaldi, one of the seven, of simple prior of mount Senar, was named general.

The order was approved of by the council of Lateran, notwithstanding the decree it had passed to prevent the multiplication of religious orders. And it was again approved by cardinal Raynerius, legat of pope Innocent IV; who put it under the protection of the holy see. The succeeding popes have granted it a great many favours, particularly Alexander IV. and Innocent VIII.—It has also undergone some reforms.

At present it consists of twenty-seven provinces. It is become famous in Italy, by the history of the Council of Trent, of Fra. Paolo, a Venetian, who was a religious *servite*. M. Hermant gives this order the name of the *annunciate*, doubtless from this mistake, that in some cities of Italy, they are called *religious of the annunciate*, because in those cities, their church is dedicated under that name. F. Archang. Giani derives the name *servites*, servants of the holy virgin, from hence; that when they appeared for the first time in the black habit given them by the bishop, the sucking children cried out; *Behold the servants of the virgin*.—There are also nuns of this order.

**SERVITIA**.—Per *qua* **SERVITIA**. See the article **PER**.

**SERVITIIS consuetudinibus**. See **CONSUETUDINIBUS**.

**SERVITOR**, in the university of Oxford, a scholar or student, who attends or waits on another for his maintenance there.

**SERVITORS of bills**, denote such servants or messengers of the marshal of the king's-bench, as were sent abroad with bills or writs, to summon men to that court.—They are now

commonly called *tip-slaves*. See **TIP-STAVES**, **MARSHAL**, &c.

**SERVITUDE**, the condition of a servant, or rather slave. See **SLAVE** and **SERVANT**.

Under the declension of the Roman empire, a new kind of *servitude* was introduced, different from that of the ancient Romans: it consisted in leaving the lands of subjugated nations to the first owners, upon condition of certain rents, and servile offices, to be paid in acknowledgment.—Hence the names of *servi censiti*, *adscriptitii* and *addicti glebæ*: some whereof were taxable at the reasonable discretion of the lord; others at a certain rate agreed on; and others were mainmortal, who, having no legitimate children, could not make a will to above the value of five-pence, the lord being heir of all the rest: others were prohibited marrying, or going to live out of the lordship. Most of which services still subsist in one province or other of France; though all abolished in England.—Such was the original of our *tenures*, &c. See **TENURE**, **VASSAL**, **VILLAIN**, &c.

**SERUM**, a thin, transparent, watry liquor, somewhat saltish, which makes a considerable part in the mass of blood. See **HUMOUR** and **SEROSITY**.

The blood consists of two kinds of parts; the *crur*, or red part; and the *serum*, or wheyish, limpid part. See **BLOOD**. Mr. Boyle, and some others, have taken the *serum* to be more ponderous than the *crur*; but Dr. Jurin, in the Philosophical Transactions, from repeated experiments, assures us of the contrary. See **CRUR**.

The *serum* is, in reality, the same with the lymph: it is carried by the arteries throughout the several parts of the body; whence it returns partly in the veins, and partly in the lymphatick vessels. See **LYMPHA**.

The use of the *serum* is to nourish the parts of the body; and to render the chyle and blood more fluid. See **NUTRITION**.

Urine and sweat, are nothing but *serum* drained of their nutritious parts, by repeated circulations, and secreted from the blood in the glands of the kidneys and skin. See **URINE** and **SWEAT**.

The redundancy and other vices in the *serum*, are the cause of various diseases. See **DISEASE**.

**SESAMOIDEA ossa**, in anatomy, several very small bones, placed between the joints of the fingers and toes, to fortify them, and prevent dislocations. See **FINGER** and **TOE**.

They have their name from their resemblance in figure and size, to a grain of sesamum: from *sesamum*, and *ωσ*, *form*.

**SESQUI**, a Latin particle, signifying a whole and a half; which, joined with *altera*, *terza*, *quarta*, &c. is much used in the Italian musick, to express a kind of ratio's; particularly several species of triples. See **RATIO**.

The ratio expressed by *sesqui*, is the second ratio of inequality, called also *super-particular ratio*; and is, when the greater term contains the less, once, and some certain part, over: as 3 : 2; where the first term contains the second once, and unity over; which is a quota part of two.

Now, if this part remaining, be just half the less term, the ratio is called *sesqui-altera*: if the remaining part be a third part of the lesser term, as 4 : 3, the ratio is called *sesqui-tertia*, or *sesqui-terza*: if a fourth part, as 5 : 4, the ratio is called *sesqui-quarta*; and thus to infinity, still adding to *sesqui* the ordinal number of the smaller term.

In English, we sometimes say, *sesqui-alteral*, or *sesqui-alterate*, *sesqui-ibird*, *sesqui-fourth*, &c.—Though this is a little hybrid. As to the kinds of triples expressed by the particle *sesqui*, they are these.—The *greater perfect* **SESQUI-ALTERATE**, which is a triple, where the breve is three measures, or semi-breves, and that without having any point or dot annexed to it.

*Greater imperfect* **SESQUI-ALTERATE**, which is where the breve, when pointed, contains three measures, and without any point, two.

*Lesser perfect* **SESQUI-ALTERATE**, which is where the semi-breve contains three measures, and that without any point.

*Lesser imperfect* **SESQUI-ALTERATE**, a triple, where the semi-breve, with a point, contains three measures, and two without.

According to Buontempi, one may likewise call the triples  $\frac{6}{4}$  and  $\frac{12}{8}$ , *sesqui-alterates*.

**SESQUI-OCTAVE**, is a kind of triple, marked C  $\frac{3}{2}$ , called by the Italians, *nonupla di crome*, where there are 9 quavers in every measure or bar, in lieu of 8.

**Dupla SESQUI-QUARTA**, is a kind of triple, marked C  $\frac{3}{4}$ , called by the Italians, *nonupla di semiminime*, where there are 9 crotchets in each measure, instead of 4; that is, three crotchets to each time.

**SESQUI-ALTERATE**, in geometry and arithmetic, is a ratio between two lines, two numbers, or the like, where one of them contains the other once, with the addition of an half. See **RATIO**.

Thus 6 and 9 are in a *sesqui-alterate* ratio; since 9 contains 6 once, and 3, which is half of 6, over: and 20 and 30 are in the same; as 30 contains 20, and half 20 or 10.

**SESQUIDITONE**, in music, a concord resulting from the sounds

sounds of two strings, whose vibrations, in equal times, are to each other in the ratio of 5 to 6. See DITONE.

**SESQUI-DUPLICATE ratio**, is, when of two terms, the greater contains the less twice, with half another over: as 15 and 6; 50 and 20. See RATIO.

**SESQUIQUADRATE**, an aspect, or position, of the planets, when at the distance of four signs and an half, or 135 degrees, from each other. See ASPECT.

**SESQUIQUINTILE**, an aspect of the planets, when 108 degrees distant from each other. See QUINTILA and ASPECT.

**SESSION**, *sessio*, denotes each sitting, or assembly, of a council. See COUNCIL.

In quoting councils, we say, in such a *session*, such a canon, &c.

**SESSION of Parliament** is the season, or space, from its meeting to its prorogation, or dissolution. See PROROGATION and PARLIAMENT.

**SESSION**, in law, denotes a sitting of justices in court, upon their commission.—As, the *session of oyer and terminer*, &c. *Quarter-sessions*, called *general-sessions*, or *open-sessions*, stand opposite to *special*, otherwise called *privy-sessions*, which are procured upon some special occasion, for the more speedy dispatch of justice. See QUARTER-SESSIONS.

*Petit-sessions*, or *statute-sessions*, are kept by the high-constable of every hundred, for the placing of servants. See STATUTE.

**Kirk Sessions**. See the article KIRK.

**SESTERCE**, *sestertius*, a silver coin, in use among the ancient Romans, called also *nummus*, and sometimes *nummus sestertius*. See COIN and NUMMUS.

The *sesterce* was the fourth part of the denarius, and originally contained two as's and an half; estimated in English money, at somewhat above one penny half-penny farthing. The *sesterce* was at first denoted by L L S; the two L's signifying two librae, and the S half. But the librarii, afterwards, converting the two L's into an H, expressed the *sesterce* by HS.

The word *sestertius* was first introduced by way of abbreviation for *sestertius*, which signifies two, and a half of a third, or literally, only half a third; for in expressing half a third, it was understood, that there were two before. Some authors make two kinds of *sesterces*; the less, called *sestertius*, in the masculine gender; and the great one, called *sestertium* in the neuter: the first, that we have already described; the latter containing a thousand of the other, or 81. 1 s. 1 d.  $\frac{1}{2}$  of our money.—Others will have any such distinction of great and little *sesterces*, unknown to the Romans: *sestertius*, say they, was an adjective, and signified as *sestertius*, or two as's and a half: and when used plurally, as in *quingenta sestertia*, or *sestertia*, it was only by way of abbreviation, and there was always understood *millia* thousands: this last is the more probable opinion.

To be qualified for a Roman knight, an estate of four hundred thousand *sesterces* was required; and, for a senator, eight hundred thousand.

Authors also mention a copper *sesterce*, worth about  $\frac{1}{3}$  of a penny English.

**SESTERCE**, *sestertius*, was also used in antiquity, for a thing containing two wholes and a half of another: as as was taken for any whole, or integer. See AS.

**SESTUPLO**, in music. See the article SEXTUPLE.

**SETHIANS**, or *SETHINIANS*, *SETHIANI*, or *SETHINIANI*, a branch of the ancient gnosticks; thus called, because of their pretending to fetch their origin from Seth, son of Adam, whom they called Jesus and Christ; from an opinion, that Seth and Jesus were the same person, who came down from heaven two several times.

As the *Sethians* had the same philosophy with the other gnosticks, they had numerous other fables in their system. See GHOSTICKS.

They pretended to have several books of the ancient patriarchs; particularly, seven of their great master Seth: besides one of Abraham, full of manifest falsities, which yet they called *apocalypse*, or *revelation*. The book called the *little Genesis*, anciently very common in the churches of the east, was borrowed from them. From this book they learned the name of Seth's wife, who, they say, was called *Horea*.—Some imagine, they borrowed a great many of their fictions from the Hellenist Jews.

**SETIER**. See the article SEPTIER.

**SETON**, *setaceum*, in chirurgery, &c. a kind of topical remedy, used like a cautery, or an issue, to divert defluxions from the eyes; by making a wound in the skin of the hind-part of the neck, which is kept suppurating, by means of a little skain of silk, or cotton, passed through it.

*Setons* are also applied to such as are apt to fall into epileptic fits.—They are of more efficacy than a common issue, but are prescribed with much the same intention. See ISSUE.

The like operation is frequently practised on horses, &c. and called, by the farriers, *rowelling*. See ROWEL.

*Setons* evacuate with a gentle pain; shake the nervous kind; discharge serum, and give vent to repletions and coarctations of humours.

**SETTER**, among farmers.—To *setter*, is to cut the dew-lap of an ox or cow, and into the wound to put helleboraster, whereby an issue is made, for all humours to vent themselves. See ISSUE and SETON.

**SETTING**, in astronomy, the withdrawing of a star or planet; or its sinking below the horizon. See RISING.

Astronomers and poets make three different kinds of *setting* of the stars: *cosmical*, *acronycal*, and *heliacal*.—The first, when the star *sets* with the sun. See COSMICAL. The second, when it *sets* at the time the sun rises. See ACRONYCAL. The third, when it is immersed, and hid, in the sun's rays. See HELIACAL.—To find the times of the *setting* of the sun and stars. See GLOBE.

**SETTING**, in sea language.—To *set the land or the sun by the compass*, is to observe how the land bears on any point of the compass; or, on what point of the compass the sun is.

Also, when two ships sail in sight of one another, to mark on what point the chased bears, is termed, *setting the chase by the compass*.

**SEVENTH**, *septima*, in music, an interval, called by the Greeks *heptachordon*; whereof there are four kinds.

The first, the *defective* or *diminished seventh*, consisting of three tones, and three greater semi-tones, as from *ut* sharp to *fi* flat.

The second, called by Zarlino and the Italians, *semi-ditono con diapente*, or *settimo minore*; is composed diatonically of seven degrees, and six intervals, four whereof are tones, and the rest greater semi-tones, as from *de* to *ut*; and chromatically of ten semi-tones, six whereof are greater, and four less: it takes its form from the *ratio quadripartiens quintas*, 9 to 5.

The third, called by the Italians, *il ditono con diapente*, or *settimo maggiore*, is composed diatonically, like the former, of seven degrees, and six intervals, six whereof are full tones, and a single one a greater semi-tone; so that only one greater semi-tone is wanting of the octave: as from *ut* to *fi*; and chromatically of eleven semi-tones, six whereof are greater, and five lesser. It takes its origin from the ratio of 15 to 8.

The fourth, is the *redundant seventh*, composed of five tones, a greater semi-tone, and a lesser; as from *fi* flat to *la* sharp: so that it only wants a comma of an octave; that is, so much as it wants to render its second semi-tone a greater. Hence many confound it with the octave itself; maintaining, with good reason, that only the three first *sevenths* can be of any use. See OCTAVE.

**SEVENTH pair of nerves**. See the article NERVE.

**SEVERAL tail**, in law, is that whereby land is given, and entailed *severally* to two: *e. gr.* to two men and their wives, and the heirs of their bodies begotten. See TAIL.

The donees, here, have joint estate for their two lives, yet they have *several* inheritance; for the issue of the one shall have his moiety, and that of the other, the other.

**SEVERANCE**, in law, the *singling*, or *severing* two or more that join, or are joined, in the same writ, or action.

As if two join in a writ, *de libertate probanda*, and the one be afterwards non-suited; here, *severance* is permitted, so, as notwithstanding the non-suit of the one, the other may *severally* proceed.

There is also *severance of the tenants* in an assize; when one, two, or more disseisees appear upon the writ, and not the other. And—*Severance in debt*, where two executors are named plaintiffs, and the one refuses to prosecute.—We also meet with *severance of summons*, *severance in attainments*, &c.

**SEVERIANS**, *SEVERIANI*.—There were two sects of hereticks thus called: the first, who are as old as the beginning of the third century, were an impure branch of gnosticks; thus called from their chief, *Severus*. See GHOSTICK.

The second, by some called *Severites*, were a sect of acephali, or Eutychians: their leader, *Severus*, was preferred to the see of Antioch in 513, where he did his utmost to set aside the council of Chalcedon. See EUTYCHIAN and MONOTHELITES.

**SEWER** \*, in the household, an officer who comes in before the meat of a king, or nobleman, to place and range it on the table.

\* The word is formed from the French, *esuyer*, esquire, gentleman or usher. See ESQUIRE.

**SEWERS**, in building, are shores, conduits, or conveyances, for the suillage and filth of a house. See CLOACA.

Sir Henry Wotton advises, that art imitates nature in these ignoble conveyances, and separate them from sight (where there wants a running water) into the most remote, lowest and thickest part of the foundation, with secret vents passing up through the walls, to the wide air, like tunnels; which all the Italian architects commend for the discharge of noisom vapours, though elsewhere little practised.

*Clerk of the SEWERS*. See the article CLERK.

**SEX**, *sexus*, something in the body, which distinguishes male from female. See MALE and FEMALE.

The number of persons, of the two *sexes*, are exceedingly well balanced; so that every man may have his wife, and every woman her husband. See MARRIAGE.

Hermaphrodites have both the *sexes* in one. See HERMAPHRODITE.

**PHRODITE.**—It is expressly forbid by the law of Moses, to disguise the *sex*.

**SEXAGENARY, SEXAGENARIUS**, something relating to the number sixty: more particularly, a person arrived at the age of sixty years.

Some casuists dispense with *sexagenarius* for not fasting: the Papian law prohibits *sexagenarii* from marriage; because, at that age, the blood and humours are frozen.

**SEXAGENARY arithmetick.** See **SEXAGESIMAL** and **ARITHMETIC**.

**SEXAGENARY tables**, are tables of proportional parts, shewing the product of two *sexagenaries* that are to be multiplied; or the quotient of two to be divided.

**SEXAGESIMA**, the second Sunday before lent, or the next to shrove-Sunday.—So called, as being about the sixtieth day before Easter. See **LENT**.

*Sexagesima*, is that which follows septuagesima, and precedes quinquagesima. See **SEPTUAGESIMA**, &c.

**SEXAGESIMAL, or SEXAGENARY arithmetick**, a method of computation, proceeding by sixties. See **ARITHMETIC**.

Such is that used, in the division of a degree into 60 minutes; of the minute, into 60 seconds; of the second, into 60 thirds, &c. See **DEGREE**.

**SEXAGESIMALS, or SEXAGESIMAL fractions**, are fractions, whose denominators proceed in a sexagecuple ratio; that is, a prime, or the first minute =  $\frac{1}{60}$ , a second =  $\frac{1}{3600}$ , a third,  $\frac{1}{216000}$ . See **DEGREE**.

Anciently there were no other than *sexagesimals* used in astronomical operations, and they are still retained in many cases; though decimal arithmetic begins to grow in use now in astronomical calculations.

In these fractions, which some also call *astronomical fractions*, the denominator being always 60 or a multiple thereof, is usually omitted, and the numerator only written down; 4°, 59', 32", 50"', 16''', is to be read, 4 degrees, 59 minutes, 32 seconds of a degree, or both part of a minute, 50 thirds, 16 fourths, &c. See **FRACTIONS**.

**SEXTANS, SEXTANT**, a sixth part of certain things.

The Roman divided their *as*, which was a pound of brass, into 12 ounces: the ounce was called *uncia*, from *unum*; and two ounces *sextans*, as being the sixth part of the pound. See the article **A S**.

**SEXTANS** was also a measure, which contained two ounces of liquor, or two cyathi.—Hence, *Sextantes, Calliste, duos infunde Falerni*.

**SEXTANT**, in mathematicks, denotes the sixth part of a circle; or an arch, comprehending 60 degrees. See **ARCH** and **DEGREE**.

**SEXTANT** is more particularly used for an astronomical instrument, made like a quadrant; excepting that its limb only comprehends 60 degrees.

The use and application of the *sextant*, is the same with that of the quadrant. See **QUADRANT**.

In the observatories of Greenwich, and Pekin, are very large and fine *sextants*. See **OBSERVATORY**.

**SEXTARIUS**, an ancient Roman measure, containing two cotylæ, or two heminæ. See **MEASURE, COTYLA** and **HEMINA**.

**SEXTILE, SEXTILIS**, the position or aspect of two planets, when at 60 degrees distant; or at the distance of two signs from one another.—It is marked thus (\*). See **ASPECT** and **SEMISEXTILE**.

**SEXTON**, a church officer, thus called by corruption of the Latin *sacrista*, or Saxon *segerstane*, which denotes the same. His office is to take care of the vessels, vestments, &c. belonging to the church; and to attend the minister, churchwardens, &c. at church.—He is usually chose by the parson only.

The office of *sexton* of the pope's chapel is appropriated to the order of the hermits of St. Augustin.—He is generally a bishop, though sometimes the pope only gives a bishoprick, *in partibus*, to him he confers the post on.—He takes the title of *prefect of the pope's sacristy*; has the keeping of the vessels of gold and silver, the relics, &c.

When the pope says mass, the *sexton* always tastes the bread and wine first. If it be in private he says mass, his holiness, of two wafers, gives him one to eat; and if in public, the cardinal, who assists the pope in quality of deacon, of three wafers, gives him two to eat. When the pope dies, he administers to him the sacraments of extreme unction, &c. and enters the conclave, in quality of first conclavist.

**SEXTUPLE, SESTUPLO**, in music, denotes a mixed sort of triple time, which is beaten in double time. See **TRIPLE**.

This, the Italians call *sestuplo*; the French sometime call it *sixth time, mesure a six temps*; though improperly: according to M. Broffard it ought rather to be denominated *triple binary time*. See **TIME**.

Authors usually make mention of three species hereof; to which M. Broffard adds two more, *viz.*

**SEXTUPLE of the semi-breve**, by the French called *triple* of 6 for 1, as being denoted by those two numbers,  $\frac{3}{2}$ ; or because  
V O L. II. N°. CXLI.

here are required six semi-breves to a measure, in lieu of one, *viz.* three rising and three falling.

**SEXTUPLE of the minim**, called by the French triple of 6 for 2, as being denoted by  $\frac{3}{2}$ , which shew that six minims are here required to a measure, instead of 2.

**SEXTUPLE of the crotchet**, called by the French triple of 6 for 4, because denoted by  $C \frac{3}{2}$ , or  $\frac{3}{2}$ , which shew that there must be 6 crotchets to a measure, in lieu of 4.

**SEXTUPLE of the chroma**, by the French called triple of 6 for 8, as being denoted by  $\frac{3}{2}$ ; which shew that 6 quavers here make the measure or semi-breve, instead of 8.

**SEXTUPLE of the semichroma**, or triple of 6 for 16; so called, because denoted by  $\frac{3}{2}$ , which shews, that 6 quavers are here required to a measure, instead of 16.

**SEXTUS, SIXTH**, in the canon law, denotes a collection of decretals, made by pope Boniface VIII. usually thus called from the title, which is *liber sextus*; as if it were a sixth book added to the five books of decretals, collected by Gregory IX. See **DECRETAL**.

The *sextus* is a collection of papal constitutions, published after the collection of Gregory IX. containing those of the same Gregory, Innocent IV. Alexander IV. Urban IV. Clement IV. Gregory X. Nicholas III. and Boniface VIII. by whose order the compilation was made.—The persons employed in making of it were Will. de Mandegot, archbishop of Ambrun; and Berenger, bishop of Beziers, and Richard of Sienna. See **CANON law**.

**SGRAFFIT, SGRAFFIATA**, in painting, denotes *scratch-work*; a method of painting in black and white only, not in fresco, yet such as will bear the weather.

*Sgraffit* performs both the design and the painting, all in one.—It is chiefly used to embellish the fronts of palaces, and other magnificent buildings. See **SCRATCH-WORK**.

**SHACK**, in ancient customs, a liberty of winter-pasturage.

In the counties of Norfolk and Suffolk, the lord of the manor has *shack*, i. e. a liberty of feeding his sheep at pleasure upon his tenants lands, during the six winter months.

In Norfolk, *shack* also extends to the common for hogs, in all mens grounds, from the end of harvest, till seed-time.—Whence, to go *a-shack*, is to feed at large.

**SHADOW, SHADE**, a plane where the light is weakened by the interposition of some opaque body before the luminary. See **LIGHT**.

The *shadow* of yew, cypress, and walnut-tree, are held dangerous to men: the *shadow* of ash is deadly to serpents; for which reason serpents are never found under its *shade*.

The doctrine of *shadows* makes a considerable article in opticks and geography, and is the foundation of dialling. See **DIAL** and **DIALLING**.

**SHADOW**, in opticks, is a privation of light, by the interposition of an opaque body.

As nothing is seen but by light, a mere *shadow* is invisible: when therefore we say, we see a *shadow*, we mean partly, that we see bodies placed in the *shadow*, and illuminated by light, reflected from collateral bodies; and partly, that we see the confines of the light. See **LIGHT**.

If the opaque body, that projects the *shadow*, be perpendicular to the horizon, and the place it is projected on, be horizontal; the *shadow* is called a *right shadow*.—Such are the *shadows* of men, trees, buildings, mountains, &c.

If the opaque body be placed parallel to the horizon, the *shadow* is called a *versed shadow*; as the arms of a man stretched out, &c.

*Laws of the projection of SHADOWS from opaque bodies.*—1°. Every opaque body projects a *shadow* in the same direction with its rays; that is, towards the part opposite to the light. Hence, as either the luminary, or the body changes place, the *shadow* likewise changes.

2°. Every opaque body projects as many *shadows*, as there are luminaries to enlighten it.

3°. As the light of the luminary is more intense, the *shadow* is the deeper. Hence the intensity of the *shadow* is measured by the degrees of light that space is deprived of.

4°. If a luminous sphere be equal to an opaque one it illumines, the *shadow* this latter projects, will be a cylinder; and, of consequence, will be propagated still equal to itself, to whatever distance the luminary is capable of acting: so that, if it be cut in any place, the plane of the section will be a circle equal to a great circle of the opaque sphere.

5°. If the luminous sphere be greater than the opaque one, the *shadow* will be conical. If therefore the *shadow* be cut by a plane parallel to the base, the plane of the section will be a circle, and that so much the less, as it is at a greater distance from the base.

6°. If the luminous sphere be less than the opaque one, the *shadow* will be a truncated cone: consequently it grows still wider and wider: and therefore, if cut by a plane parallel to the section, that plane will be a circle so much the greater, as it is further from the base.

7°. To find the length of the *shadow*, or the axis of the shady cone, projected by a less opaque sphere, illumined by a larger; the semi-diameters of the two, as C G, and I M, Tab. Opticks, fig. 12. and the distances between their centers G M being given.

Draw  $FM$  parallel to  $CH$ ; then will  $IM = CF$ ; and therefore  $FG$  will be the difference of the semi-diameters  $GC$  and  $IM$ . Consequently, as  $FG$ , the difference of the semi-diameters is to  $GM$ , the distance of the centers; so is  $CF$ , the semi-diameter of the opake sphere, to  $MH$ , the distance of the vertex of the shady cone, from the center of the opake sphere. If then, the ratio of  $PM$  to  $MH$  be very small; so that  $MH$  and  $PH$  do not differ very notably,  $MH$  may be taken for the axis of the shadowy cone: otherwise the part  $PM$  must be subtracted from it; which to find, seek the arch  $LK$ ; for, this subtracted from a quadrant, leaves the arch  $IQ$ ; which is the measure of the angle  $IMP$ . Since then, in the triangle  $MIP$ , which is rectangular at  $P$ , besides the angle  $IMQ$ , we have the side  $IM$ ; the side  $MP$  is easily found by plain trigonometry. *E. gr.* If the semi-diameter of the earth  $MI = 1$ ; the semi-diameter of the sun, according to Ricciolus, will be  $= 33$ ; and therefore  $GF = 32$ ; and of consequence  $MH = 228 \frac{1}{2}$ ; since then,  $MP$  is found by calculation to bear a very small ratio to  $MH$ ;  $PH$  may be taken to be  $288 \frac{1}{2}$  semi-diameters of the earth.

Hence, as the ratio of the distance of the opake body, from the luminous body  $GM$ , to the length of the shadow  $MH$ , is constant; if the distance be diminished, the length of the shadow must be diminished likewise. Consequently, the shadow continually decreases as the opake body approaches the luminary.

8°. To find the length of the shadow projected by an opake body,  $TS$ , *fig. 13*; the altitude of the luminary, *e. gr.* of the sun above the horizon, *viz.* the angle  $SVT$ , and that of the body being given.—Since, in the rectangle triangle  $STV$ , which is rectangular at  $T$ , we have given the angle  $V$ , and the side  $TS$ ; the length of the shadow  $TV$  is had by trigonometry. See TRIANGLE.

Thus, suppose the altitude of the sun  $37^\circ 45'$ , and the altitude of a tower 187 feet;  $TV$  will be found  $241 \frac{1}{4}$  feet.

9°. The length of the shadow  $TV$ , and the height of the opake body  $TS$ , being given; to find the altitude of the sun above the horizon.

Since, in the rectangle triangle  $STV$ , rectangular at  $T$ , the sides  $TV$  and  $TS$ , are given; the angle  $V$  is found thus: as the length of the shadow  $TV$ , is to the altitude of the opake body  $TS$ , so is the whole sine to the tangent of the sun's altitude above the horizon. Thus, if  $TS$  be 30 foot, and  $TV$   $45'$ ;  $TVS$  will be found  $33^\circ 41'$ .

10°. If the altitude of the luminary, *e. gr.* the sun above the horizon  $TVS$ , be  $45^\circ$ , the length of the shadow  $TV$  is equal to the height of the opake body.

11°. The lengths of the shadows  $TZ$  and  $TV$  of the same opake body  $TS$ , in different altitudes of the luminary, are as the co-tangents of those altitudes.

Hence, as the co-tangent of a greater angle is less than that of a less angle; as the luminary rises higher, the shadow decreases: whence it is, that the meridian shadows are longer in winter than in summer.

12°. To measure the altitude of any object, *e. gr.* a tower  $AB$  (*fig. 14*) by means of its shadow projected on a horizontal plane.

At the extremity of the shadow of the tower  $C$ , fix a stick, and measure the length of the shadow  $AC$ ; fix another stick in the ground of a known altitude  $DE$ , and measure the length of the shadow thereof  $EF$ . Then, as  $EF$  is to  $AC$ , so is  $DE$  to  $AB$ . If therefore,  $AC$  be 45 yards, and  $ED$  5 yards;  $AB$  will be  $32 \frac{1}{4}$  yards.

13°. The shadows of equal opake bodies have their lengths proportionable to their distances from the same luminaries equally high. Hence, as the opake approaches to the luminary, or the luminary to the opake body, the length of the shadow is increased; and as either of them recedes, is diminished. Hence, from the different lengths of shadows of the same opake bodies at the same height of the Sun, Moon, Jupiter, Venus, &c. we may gather their different distances from the earth; though not accurately enough for astronomical purposes. See DISTANCE.

14°. The right shadow is to the height of the opake body, as the co-sine of the luminary, to the sine.

15°. The altitude of the luminary being the same in both cases, the opake body  $AC$  (*fig. 15*) will be to the versed shadow  $AD$ , as the right shadow  $EB$ , to its opake body  $DB$ . Hence, 1°. The opake body is to its versed shadow, as the co-sine of the altitude of the luminary to its sine; consequently, the versed shadow  $AD$  is to its opake body  $AC$ , as the sine of the altitude of the luminary to its co-sine.—2°. If  $DB = AC$ ; then will  $DB$  be a mean proportional between  $EB$  and  $AD$ ; that is, the length of the opake body is a mean proportional between its right shadow and versed shadow, under the same altitude of the luminary.—3°. When the angle  $C$  is  $45^\circ$ , the sine and co-sine are equal; and therefore the versed shadow equal to the length of the opake body.

16°. A right sine is to a versed sine of the same opake body, under the same altitude of the luminary, in a duplicate ratio of the co-sine to the sine of the altitude of the luminary. Right and versed shadows, are of considerable use in measuring; as by their means we can commodiously enough

measure altitudes, both accessible and inaccessible, and that too when the body does not project any shadow. The right shadow we use, when the shadow does not exceed the altitude; and the versed shadow, when the shadow is greater than the altitude. On this footing, is made an instrument called the *quadrat*, or *line of shadows*, by means whereof the ratios of the right and versed shadow of any object, at any altitude, are determined. This instrument is usually added on the face of the quadrant. Its description and use, see under the article QUADRAT.

SHADOW, in geography.—The inhabitants of the globe are divided, with respect to their shadows, into *ascii*, *amphiscii*, *heteroscii*, and *periscii*. The first are such as at a certain season of the year have no shadows at all, while the sun is in the meridian. See ASCII. The second are such, whose meridian shadow, at one season of the year looks to the north and at another to the south. See AMPHISCII. The third are such, whose shadows constantly tend either to the north or south. See HETEROSCII. The last are those, whose shadows, in one and the same day, successively turn to all the points. See PERISCII.

SHADOW, in painting, denotes an imitation of a real shadow, effected by gradually heightening, and darkening the colours of such figures as by their disposition cannot receive any direct rays from the luminary supposed to enlighten the piece. The management of the shadows and lights, makes what painters call the *clair obscure*: the laws whereof see under the article CLAIR-OBSCURE.

SHADOW, in perspective.—The appearance of an opake body, and a luminous one, whose rays diverge (*e. gr.* a candle, lamp, &c.) being given; to find the just appearance of the shadow according to the laws of perspective.—The method is this. From the luminous body, which is here considered as a point, let fall a perpendicular to the perspective plane or table; *i. e.* find the appearance of a point upon which a perpendicular drawn from the middle of the luminary, falls on the perspective plane; and from the several angles, or raised points of the body let fall perpendiculars to the plane. These points whereon the perpendiculars fall, connect by right lines, with the point upon which the perpendicular let fall from the luminary, falls. And continue the lines to the side opposite to the luminary. Lastly, through the raised points, draw lines through the center of the luminary, intersecting the former; the points of intersection are the terms or bounds of the shadow.

*E. gr.* Suppose it required to project the appearance of the shadow of a prism,  $ABCFED$  (*Tab. Perspective, fig. 8. N. 2.*) scenographically delineated: since  $AD$ ,  $BE$ , and  $CF$ , are perpendicular to the plane, and  $LM$  is likewise perpendicular to the same; (for the luminary is given, if its altitude  $LM$  be given) draw the right lines  $GM$  and  $HM$ , through the points  $D$  and  $E$ . Through the raised points  $A$  and  $B$ , draw the right lines  $GL$  and  $HL$ , intersecting the former in  $G$  and  $H$ . Since the shadow of the right line  $AD$  terminates in  $G$ ; and the shadow of the right line  $BE$  in  $H$ ; and the shadows of all the other right lines conceived in the given prism are comprehended within these terms;  $GDEH$  will be the appearance of the shadow projected by the prism.

Genesis of Curves by SHADOWS. See the article CURVE.

SHAFT, in building: the shaft of a column, is the body thereof; thus called from its straightness: but by architects more frequently the *fust*.—See *Tab. Archit. fig. 24, 26, 28, 30, 32.* See also FUST and COLUMN.

SHAFT, is also used for the spire of a church-steeple.—And for the flank or tunnel of a chimney. See CHIMNEY, TUNNEL, &c.

SHAFT of a mine, is the hollow entrance or passage into a mine, sunk or dug to come at the ore. See MINE and ADIT. In the tin-mines, after this is sunk about a fathom, they leave a little, long, square place, which is called a *shamble*.

SHAGREEN, or CHAGREEN, a kind of grained leather, chiefly used in the covers of cases, books, &c. It is very close and solid, and covered over with little roundish grains, or papillæ. It is brought from Constantinople, Tauris, Tripoli, Algiers, and some parts of Poland.

There is a dispute among authors what the animal is whence the shagreen is prepared? Rauwolf assures us it is the onager, which according to him and Bellonius is a kind of wild ass. V. Ray Synopf. An. Quad. p. 63.

It is added, that it is only the hard part of the skin is used for this purpose. Borel says it is a sea-calf; others a kind of fish called by the Turks *shagrain*, whose skin is covered with grains; and those so hard that they will rasp and polish wood.

There is also a sort of shagreen made of the skin of the squatina, in English the monk or angel fish. V. Willoughby Ichth. p. 80.

Manner of preparing SHAGREEN.—The skin being just flead off, is stretched out, covered over with mustard-seed, and the seed bruised on it; and thus exposed to the weather for some days; then tanned.

The best is that brought from Constantinople, of a brownish colour; the white is the worst. It is extremely hard, yet, when steeped in water, becomes very soft and pliable; whence it becomes of great use among case-makers. It takes any

any colour that is given it; red, green, yellow, black. It is frequently counterfeited by maroquin formed like *shagreen*; but this last is distinguished by its peeling off, which the first does not. See MOROCCO.

**SHALLOP, SHALLOOP, or SLOOP**, is a small light vessel with only a small main-mast, and fore-mast, and lug-sails, to hale up, and let down, on occasion.

*Shallops* are commonly good sailers; and are therefore often used as tenders upon men of war.

**SHAMADE**, in war. See the article **CHAMADE**.

**SHAMMY, or CHAMMY, CHAMOIS**, a kind of leather, either dressed in oil, or tanned; much esteemed for its softness, pliancy, &c.

It is prepared from the skin of the *chamois*, or *flamois*, a kind of rupi-capra, or wild goat, called also *ifard*; inhabiting the mountains of Dauphine, Savoy, Piedmont, and the Pyreneans.

Besides the softness and warmth of the leather, it has the faculty of bearing soap without damage, which renders it very useful on many accounts.

In France, &c. some wear the skin raw, without any preparation: it is also used for the purifying of mercury; which is done by passing it through the pores of this skin, which are very close. See MERCURY.

The true *chamoise leather* is counterfeited with common goat-kid, and even sheep-skin; the practice of which makes a particular profession, called by the French *chamoisire*. The last, though the least esteemed, is yet so popular, and such vast quantities prepared, especially about Orleans, Marseilles and Tholouse, that it may not be amiss to give the method of preparation.

**Manner of SHAMOISING, or of preparing sheep, goat, or kid-skins in oil, in imitation of SHAMMY.**—The skins being washed, drained, and smeared over with quick-lime on the fleshy side, are folded in two, length-wise, the wool outwards, and laid on heaps; and so left to ferment eight days; or, if they had been left to dry after fleaing, 15 days.

Then they are washed out, drained, and half dried; laid on a wooden leg, or horse, the wool stripped off with a round staff for the purpose, and laid in a weak pit, the lime whereof had been used before, and had lost the greatest part of its force.

After 24 hours they are taken out, and left to drain 24 more; then put in another stronger pit. This done, they are taken out, drained, and put in again, by turns; which begins to dispose them to take oil: and this practice they continue for six weeks in summer, or three months in winter; at the end whereof they are washed out, laid on the wooden leg, and the surface of the skin on the wool-side peeled off, to render them the softer; then, made into parcels, steeped a night in the river, in winter more; stretched, six or seven over one another, on the wooden leg; and the knife passed strongly on the flesh-side, to take off any thing superfluous, and render the skin smooth.

Then they are stretched, as before, in the river; and the same operation repeated on the wool-side; then thrown into a tub of water with bran in it, which is brewed among the skins till the greatest part stick to them; and then separated into distinct tubs, till they swell, and rise of themselves above the water.

By this means, the remains of the lines are cleared out: they are then wrung out, hung up to dry on ropes, and sent to the mill, with the quantity of oil necessary to scour them: the best oil is that of stock-fish.

Here, they are first thrown in bundles into the river for 12 hours, then laid in the mill-trough and felled without oil till they be well softened; then oiled with the hand, one by one, and thus formed into parcels of four skins each, which are milled and dried on cords a second time, then a third; then oiled again and dried.

This process is repeated as often as necessity requires: when done, if there be any moisture remaining, they are dried in a stove, and made up into parcels wrapped up in wool: after some time they are opened to the air, but wrapped up again as before, till such time as the oil seems to have lost all its force, which it ordinarily does in 24 hours.

The skins are then returned from the mill to the *chamoiser*, to be scoured; which is done by putting them in a lixivium of wood-ashes, working and beating them in it with poles, and leaving them to steep till the lye have had its effect; then they are wrung out, steeped in another lixivium, wrung again, and this repeated till all the grease and oil be purged out. When this is done, they are half dried, and passed over a sharp-edged iron instrument, placed perpendicular in a block, which opens, softens, and makes them gentle: lastly, they are thoroughly dried, and passed over the same instrument again, which finishes the preparation, and leaves them in form of *shammy*.

Kid and goat skins are *shamoised* in the same manner as those of sheep; excepting that the hair is taken off, without the use of any lime; and that when brought from the mill, they undergo a particular preparation, called *ramalling*; the most delicate and difficult of all the others.

It consists in this, that as soon as brought from the mill,

they are steeped in a fixt lixivium; taken out, stretched on a round wooden leg, and the hair scraped off with the knife; this makes them smooth, and, in working, cast a kind of fine nap. The difficulty is in scraping them evenly.

**SHANKER**, in medicine, a malignant ulcer, which gnaws and eats the flesh; usually occasioned by some venereal disorder. See CARCINOMA.

**SHARP**, in music, a kind of artificial note or character, (thus formed #) which being prefixed to a note, shews that it is to be sung or played a semi-tone, or half a note higher than the natural note would have been without. See SEMI-TONE.

When the semi-tone takes the name of the natural note next above it, it is marked with a character called a *flat*. See FLAT.

It is indifferent, in the main, which of the two be used, though there are sometimes particular reasons for the one rather than the other.

The use of flats and sharps, is by way of remedy to the deficiencies of the fixed scales of instruments. See SCALE.

**SHARP nails.** See the article NAIL.

**SHARPING corn**, a customary present of corn, which at every Christmas, the farmers, in some parts of England, make to their smith, for sharpening their ploughing-irons, harrow-tines, &c.

**SHEADING**, a riding, tything, or division in the Isle of Man: the whole island being divided into six *sheadings*, in every one of which, is a coroner or chief constable, appointed by the delivery of a rod at the annual convention.

**SHEARING.** See the article SHEERING.

**SHEATHING of a ship**, is the casing that part of her hull, which is to be under water, with something to keep the worms from eating into her planks.

It is usually done by laying tar and hair mixed together all over the old plank, and then nailing on thin new boards.—But this hinders a ship's sailing; and therefore of late some have been *sheathed* with milled lead, which is much smoother, and consequently better for sailing, and also more cheap and durable than the other way. It was first invented by Sir Philip Howard, and major Watson.

**SHEER hooks, or SHEAR-hooks**, are large iron hooks, used when a ship designs to board another.

**SHEER-shanks, or SHEAR-shanks**, a kind of knots by which they tie up and shorten a runner when it is too long.

**SHEERING, or SHEARING**, in the woollen manufactures, the cloth-worker or *sheerman's* craft or office; or the cutting off, with large *sheers*, the too long and superfluous nap, or shag found on the surface of woollen stuffs, sustians, cottons, &c. in order to make them more smooth and even.—Stuffs are *shorn* more or fewer times, according to their quality and fineness. See CLOTH.

Some use the phrase *sheering of hats*, for the passing of hats made of wool, over the flame of a clear fire made of straw, or spray, to take off the long hairs. Others call this *flaming*, and others *findging*. Other hats, as castors, semi-castors, &c. are *shorn*, by rubbing them over with pumice-stone. See HAT.

**SHEERING, or SHEARING**, is also a sea term for the motion of a ship when she goes in an out, and not right forward; either by reason she is not steered steadily, or on account of the swift running of the tide, &c. in which case she is said to *sheer*, or go *sheering*.

When she lies at anchor, near port, &c. by reason of the swift running of a tide-gate, &c. she is said to be in danger of *sheering home her anchor*, or *sheering a-shore*.

**SHEETING nails.** See the article NAIL.

**SHEKEL, SHEKLE, SHECKLE, SICLUS**, an ancient Hebrew coin, equal to four Attick drachms, to four Roman denarii, or to 2 s. 3 d.  $\frac{1}{4}$  sterling.

In the Bible, the *shekel* is sometimes also rendered *solidus*, and sometimes *stater*.

The Jewish doctors are in great doubt about the weight of the *shekel*; and it is only by conjecture, and by the weight of the modern *shekel*, that the ancient one is judged equal to four Attick drachmas.

Father Souciet has described several of these *shekels*, in his dissertation on the Hebrew medals. By the way he observes, that the third and fourth parts of a *shekel*, described by *Waserus de Ant. Num. Heb.* are counterfeits of that author.

The Hebrew *shekel*, according to F. Merfenne, weighs 268 grains, and is composed of 20 oboli, each obolus weighing 16 grains of wheat. This, he says, is the just weight, as he found by weighing one in the French king's cabinet. He adds, that such as come short of this weight have been filed or clipped. Bishop Cumberland tells us, he has weighed several, and always found them near the weight of a Roman semuncia, or half-ounce.

Some are of opinion, that the Hebrews had two kinds of *shekels*: the common or prophane *shekel*, called *didrachma*; and the *shekel of the sanctuary*, which last they will have to be double the former.—By this expedient they think we may get clear of some difficulties occurring in scripture, where things are mentioned as of incredible weight; particularly that passage where it is said, that every time Absalom cut off his hair, the weight whereof used to incommode him, he cut off the weight of 200 *shekels*. But

But Villalpandus will not hear of such a distinction; nor does bishop Cumberland, M. Morin, &c. take the opinion to have any foundation. The *prophane shekel*, or *shekel* of four drachmas, they agree, was the same with the *sacred shekel*; and it was only called by this last name in regard the standard thereof was kept in the sanctuary, by the priests. See SANCTUARY.

It is maintained by several, that the Jews had also a gold *shekel*, *sidus aureus*, of the same weight with the silver one, and valued at 1 l. 16 s. 6 d. sterling.

The *shekel* is supposed to have been first struck in the desert, on the footing of 100 to the Attick mina, weighing 160 grains of wheat, and current for 10 geratis or oboli. But afterwards they were struck of double that weight.

Some will have the *shekel* to be the oldest piece of money in the world, as being in use in Abraham's time; but this was not coined, or stamped; nor had any other value besides its intrinsic worth. See MONEY.

Xenophon mentions *shekels*, as current in Arabia: Du Cange speaks of others struck and current in England.

SHELF, is what the miners, especially in tin mines, call the *fast-country*; by which they mean, an imaginary surface of the earth, which, at the concussion of the waters at the deluge, was never moved; and to the *shelf*, they think, all the loads or mineral veins at first lay even, and parallel; though after the flood, some were elevated, some depressed.

By *shelf*, they now mean that hard surface, or coat of the earth which lies under the mould, usually about a foot deep; for they suppose, that since the flood, the earth hath gotten a new coat of vegetable earth, or such as is made by the corruption of vegetables and animals. See DELUGE, STRATA, FOSSIL, MINE, &c.

SHELL, *Concha*, in natural history, a hard crust, serving to cover, and inclose a kind of animals, hence called *testaceous*. See TESTACEOUS.

Naturalists have been generally mistaken as to the manner of the formation of *shells*. The animal and its *shell* have been always supposed to arise from the same egg. But M. Reaumur has shewn the supposition to be false. He has found, by certain experiments, that the *shells* of garden snails are formed of a matter which perspires from their bodies, and hardens and condenses in the air.

It is certain, that all animals perspire, and are encompassed with a kind of cloud or atmosphere, which exhales from them, and, in all probability, assumes pretty nearly their external figure. Snails have nothing peculiar in this respect; unless that the atmosphere of their perspiration, condenses and hardens about them, and forms a visible cover, whereof the body is the mould or model; whereas that of other animals is evaporated and lost in air. This difference arises from the different substance perspired; that coming from snails, is viscous and stony.—This is no supposition; but a matter of fact, which M. Reaumur has well proved by experiments.

On this principle, though the *shell* serve the animal as an universal bone, yet it does not grow like a bone, nor like any of the other parts, by vegetation; that is, by a juice circulating within itself; but by an external addition of parts laid one over another; as is commonly supposed of stones.

But, to consider the thing more particularly; it is to be remembered, that the snail's head is always at the aperture of the *shell*, and its tail in the tip or point of the *shell*; and that its body is naturally turned into a spiral form, the different spires or circumvolutions whereof are in different planes.

—This supposed: take the snail just hatched; as the matter it perspires petrifies around it, there must be first formed a little cover, proportioned to the bigness of its body; and as its body is yet too little to make a circumvolution of a spiral, at least a whole one; this cover will only be the centre, or, at most, the first beginning of a little circle of a spiral. But the animal grows: if, then, it ceased to perspire, it is evident, all that is added to its body, would remain naked: but as it continues to perspire, it makes itself a cover in proportion as it needs it.—Thus is an entire circumvolution of a spiral formed; and thus is a second and a third; and still every new spire is bigger than the last; in regard the animal grows in thickness, at the same time as it grows in length. When the animal ceases to grow, yet it does not cease to perspire; accordingly, the *shell* continues to grow thicker, though not longer.

SHELLS, *Conchæ* and *Cochleæ*, make a considerable article in the cabinets of the curious: the finest and rarest are these that follow, viz.—The *papal crown*, *tiara pontificia*, which takes its name from its form, and which is all streaked with red on a white ground.—The *feather*, *pluma*, whose whiteness, with its carnation stains, have an admirable effect.—The *Hebraica*, which, on a ground as white as snow, has spots as black as jet, much resembling Hebrew characters.—The *Chinese snail*, *limax Sinicus*, which has a green and black embroidery, on a dark brown ground.—The *cloth of gold*, *textile aureum*, remarkable for an admirable tissue of yellow, brown and black.—The *cloth of silver*, *textile argenteum*, which does not come behind that of gold in beauty.—

The *leopard*, *pardus*, which is all speckled.—The *tyger*, *tigris*, seu *concha cinericea*, whose spots exceed those of the leopard.—The *hart's horn*, *cornu cervinum*, which has black stains on a white ground.—The *purse*, *crumena*, thus called from its figure; it is embroidered with three or four colours.

—The *sun-dial*, *solarium manuarium*.—The *caterpillar*, *crucica*, both denominated from their forms.—Add the *nerites*, *white nautilus*, *lepas*, *lepasia*, *apporays*, *tuba*, *galea*, &c.

In Aldrovand, Gesner and Fabius Columna, we have all that the ancients have said on the subject of *shells*.—In 1692, Dr. Lister published a natural history of *shells*, in folio, full of cuts, representing the various kinds of *shells*.—Under the first class, he ranges the terrestrial or land *shells*: in the second, the fresh-water *shells*, both those called *turbinata*, and those *bivalvia*: in the third, he disposes all the sea *shells*, the *bivalvia* and *multivalvia*: and in the fourth, he divides, into several classes, the sea *shells*, called *turbinata*. See BIVALVE, TURBINATED, &c.

SHELLS, are frequently found under ground, in places far remote from the sea, in mines, and even on the tops of mountains: but how they should come there, is a thing the naturalists are greatly divided about.—The most usual and easy opinion is, that those parts have been formerly sea, or at least have been overflowed thereby; and many even go as high as the grand deluge. See DELUGE.

But others take these to be the natural places of their birth or formation; some of them being found little other than rude clay; others of the same texture with the rock where-to they grow; and others of as absolute a *shelly* substance, as any in the sea.—In effect, these may be only so many different gradations of nature, which can as well produce *shells* in mines, as in the sea; there being no want of saline or earthy particles for the purpose; nor is there any great difference between some sort of spars, and sea *shells*. See SPAR, PETRIFICATION, &c.

Dr. Lister judges, that the *shells* found in stone-quarries, were never any part of an animal; and gives this reason for it, that quarries of different stone, yield quite different species of *shells*; different not only from one another, but from any thing in nature besides, which either sea or land does yield. See FOSSIL.

Littoral SHELLS. See the article LITTORAL.

SHELL gold. See the article GOLD.

SHELL silver. See the article SILVER.

Tortoise SHELL. See the article TORTOISE.

SHELL-FISH, a collective name for all fishes naturally inclosed in *shells*. See TESTACEOUS.

SHELTERS *horizontal*. See the article HORIZONTAL.

SHERIFF \*, or SHIRE-REVE, an officer in each county of England, whose business is to see the execution of the king's orders, particularly of all writs directed to him out of the king's courts; to impanel juries; bring causes and criminals to trial; take care of the dispatch of affairs both civil and criminal; collect the revenues, imposts, fines, confiscations, &c. arising in his county, for which he accounts to the exchequer; and to attend and assist the itinerant judges. See COUNTY, &c.

\* The word is formed from the Saxon, *scir*, province, shire, and *gereaf*, grave, reve or perfect; or rather from *sciran*, to divide; the *sheriff* being denominated from the first division of the kingdom into counties. See GRAVE and REVE.—In Latin he is called *vice-comes*. See VISCOUNT.

The *sheriff* is, as it were, the soul of the policy of the county, and the preserver of the peace thereof. His office only lasts one year.

He was anciently chose by the people in the county-court, as knights now are for parliament; but he is now nominated by the king: in order to which the itinerant judges every year nominate six persons for each county; whereof the lord chancellor, treasurer, privy-council, &c. assembled in the exchequer-chamber, make choice of three; out of which number, the King choses one.—Only the county of Middlesex has two *sheriffs*, chose, as anciently, by the citizens of London: and Durham, Westmoreland, and Cumberland, none.

The *sheriff*, besides his ministerial office, of executing processes and precepts of the courts, and making returns of the same, has a judicial office, whereby he holds two several kinds of courts; the one called the *sheriff's turn*, held in divers places of the county, to enquire of all offences against common law not prohibited by any statute.—The other called the *county court*, wherein he hears and determines all civil causes of the county, under forty shillings. See COURT and TURN.

Appoal of SHERIFFS. See the article APPOAL.

SHEWAGE. See the article SCAVAGE.

SHIDES. See the article SHINGLES.

SHIELD, an ancient weapon of defence, in form of a light buckler; born on the arm to fend off lances, darts, &c. See BUCKLER.

The form of the *shield* is represented by the escutcheon in coats of arms. See ESCUTCHEON.

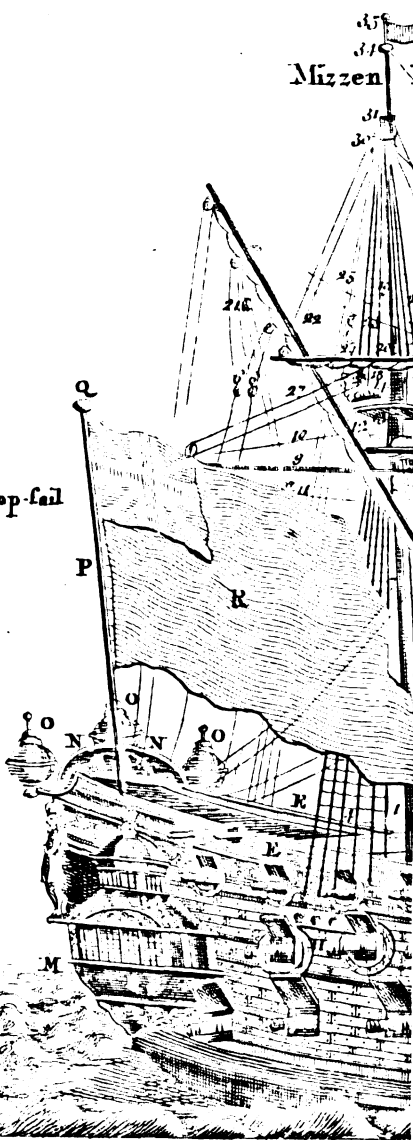

SHIELD, in heraldry, denotes the escutcheon or field whereon the bearings of an armory are placed. See FIELD.

**SHILLING** \*, an English silver coin, equal to twelve-pence, or the 20th part of a pound. See **POUND** and **PENNY**.

\* Freherus derives the Saxon *scilling*, whence our *shilling*, from a corruption of *siliqua*; proving the derivation by several texts of law, and among others by the XXI. law, *de annis legatis*. Skinner with more probability deduces it from the Saxon *scild*, shield; by reason of the escutcheon of arms thereon. See **CORN**.

It is observed, there were no *shillings* or twelve-penny-pieces coined in England till the year 1504; and these, Stow calls *groats*, though Fabian mentions them under the name of *shillings*, 34 Hen. VIII.

The Dutch, Flemish, and Germans have likewise their *shilling*; called *schelin*, *schilling*, *schelling*, *scalin*, &c. But these not being of the same weight or fineness with the English *shilling*, are not current on the same foot.—The English *shilling* is worth about 23 French sols; those of Holland and Germany about eleven sols and a half. Those of Flanders about nine. The Dutch *shillings* are also called *sols de gros*, because equal to 12 gros. The Danes have copper *shillings*, worth about  $\frac{1}{4}$  of a farthing sterling.

**SHINGLES**, or **SHIDES**, in building, small pieces of wood, or quartered oaken boards, sawed to a certain scantling, or more usually cleft to about an inch thick at one end, and made like wedges, four or five inches broad, and eight or nine inches long. They are used in covering, especially churches and steeples, instead of tiles, or slates.

This covering is dear; yet where tiles, &c. are very scarce, and a light cover required, is preferable to thatch. If made of good oak, and cleft, not sawed, and well seasoned, *shingles* make a sure, light, and durable covering.

The building is first to be covered all over with boards, and the *shingles* nailed thereon. See **COVERING**.

**SHINGLES**, in medicine, a kind of herpes, called also the *miliary herpes*. See **HERPES** and **MILIARY**.

It consists of innumerable little pustules breaking out in various parts of the body, viz. the neck, breast, loins, thighs, &c.—The place affected is somewhat inflamed, and the patient a little feverish.—White pustules arise and suppurate, and are succeeded by little round scabs resembling millet-seeds.

It is to be attacked with discutients; and the higher-pustules cut off with scissars, and a cerate of oil and wax to be applied.

Wiseman observes, that the *shingles* come near the nature of a psora, and are therefore to be cured with mercurial catharticks. See **PSORA**.

**SHIP**, a general name for all great vessels with sails, fit for navigation on the sea; excepting galleys, which go with oars and smack-sails.—See *Tab. SHIP*, fig. 1 and 2. See also the articles **GALLEY**, **VESSEL**, **BOAT**, &c.

The Sieur Aubin, defines a *ship*, a timber-building, consisting of various parts and pieces, nailed and pinned together with iron and wood, in such form as to be fit to float, and to be conducted by wind and sails, from sea to sea. See **SAIL**, **SAILING**, &c.

The invention of *ships* is very ancient, and, at the same time very uncertain: mythologists attribute it to Dædalus; and pretend, that the wings he invented to save himself withal from the labyrinth of Crete, were nothing but sails, which he first gave to vessels, and wherewith he eluded the vigilance and pursuit of Minos. Others give the honour to Janus, on the credit of some ancient Greek and Latin coins, on one side whereof is represented his double face, and on the reverse a *ship*. Lastly, others, and those who go on the surest grounds, look on Noah as the first *ship-builder*. See **ARK** and **NAVIGATION**.

**SHIPS** are usually divided into three classes: *ships of war*, *merchant ships*, and an intermediate kind, half war, half merchant; being such, as though built for merchandize, yet take commissions for war.

*Ships of war* are again divided into several orders, called *rates*. See **RATE**.

*Merchant ships* are estimated by their burthen, that is, by the number of tuns they bear; each tun reckoned at two thousand pounds weight.—The estimate is made by gauging the hold, which is the proper place of loading. See **BURDEN**.

The most celebrated *ships of antiquity* are, that of Ptolemy Philopater, which was 280 cubits long, 38 broad, and 48 high; it carried 400 rowers, 400 sailors, and 3000 soldiers. That which the same prince made to sail on the Nile, we are told, was half a stadium long.—Yet these were nothing in comparison with Hiero's *ship*, built under the direction of Archimedes; on the structure whereof, Moschion, as we are told by Snellius, wrote a whole volume. There was wood enough employed in it to make fifty galleys. It had all the variety of apartments of a palace; banqueting-rooms, galleries, gardens, fish-ponds, stables, mills, baths, a temple of Venus, &c. It was encompassed with an iron rampart, eight towers, with walls and bulwarks, furnished with machines of war; particularly one, which threw a stone of 300 pounds, or a dart 12 cubits long, the space of half a mile; with many other particulars related by Athenæus.

VOL. II. N°. CXLI.

Among modern *ships*, one of the most considerable is a first rate *ship of war*, built at Woolwich in 1701; the dimensions whereof, whence those of other rates may be deduced, are as follow: the length 210 foot; number of guns 110: number of men 1250: number of tuns 2300: draught of water 22 foot; the main-sail in length 54 yards, depth 19: main-mast in length 39 foot; in diameter 38 inches: weight of the anchor 82 hundred, 1 quarter, 14 pound: cable in length 200 yards: diameter of the cable 22 inches.—The expence of building a common first rate *ship*, with guns, tackling and rigging, is computed at 60,000 l. sterling. See **NAVY**, **FREIGHT**, **CHARTER-PARTY**, **POLICY of assurance**, &c.

To give the reader an idea of the several parts and members of a *ship*, both internal and external, with their respective denominations in the sea language (the principal whereof are explained in the respective places of this dictionary) we here give him two draughts: the one, a section of the body of a first rate; to shew its construction, the disposition of its inside, &c.—The other, the same *ship* entire, with the sails, rigging, &c.

For the most convenient form of **SHIPS**; or that wherein they shall meet with the least resistance from the water; see **VESSEL** and **RESISTANCE**.

**SHIP-MONEY**, an imposition anciently charged upon the ports, towns, cities, boroughs, and counties of the realm; by writs commonly called *ship-writs*, under the great seal of England, for the providing and furnishing certain ships for the king's service.

This imposition was revived by king Charles I. in the years 1635 and 1636; but by stat. 17. Car. I. it was declared to be contrary to the laws and statutes of the realm, claim of right, liberty of the subject, &c.

**SHIPPER**, **SKIPPER**, or **SCHIPPER**, a Dutch term, signifying the master of a ship. See **MASTER**.

We also use the word popularly for any common seamen.

**SHIPWRACK**. See the article **WRACK**.

**SHIRE** \*, **SCYRA**, a part or portion of the land, called also *county*. See **COUNTY**.

\* The word is originally Saxon, *scir* or *scire*, formed from *scyr*, to divide.

King Alfred first divided the land into *satrapias*, which we now call *shires*, and those into *centurias*, which we now call *hundreds*. See **HUNDRED**. And those again into *decennias*, which we call *tithings*. See **TITHING**.

The assizes of the *shire*, or assembly of the people of a county, was called by the Saxons, *scyrgemot*. See **SCYRGEMOT**.

**SHIRE reve**, } See the articles } **SHERIFF.**  
*Knights of the SHIRE,* } **KNIGHT.**

**SHOAL**, in the sea phrase, is the same as *shallow*, and is applied to flats in the water.

They say, it is *good shoaling*, when a ship sailing towards shore, they find by her sounding, it grows shallower and shallower by degrees, and not too suddenly; for then the ship goes in safety.

**SHOALED**, the miners term in the tin mines, for those fragments of ore, which by rains, currents of water, &c. are torn off from the load, or veins of ore.—These are washed down from the mountains; and by finding them, they guess where to look for a load of ore. Sometimes it is called *squad*, and *squod*. Harris.

**SHOAR**, or **SHORE**, a prop or counterfort, set up to support any thing of weight, which leans on one side. See **BUTTRESS**.

**SHOE**, a covering for the foot, usually of leather.

Its structure, though the object of a particular art, is too popular to need explaining. See **CORDWAINER**.

Its history is more obscure: Bened. Baudoin, a *shoe-maker* by profession, has a learned treatise of the ancient *shoe*, *de solca veterum*; where the origin, matter, form, &c. thereof, are particularly enquired into.

Baudoin maintains, that God, in giving Adam skins of beasts

beasts to cloath him, did not leave him to go bare-footed ; but gave him *shoes* of the same matter. That after raw skins, men came to make their *shoes* of rushes, broom, paper, flux, silk, wood, iron, silver, gold : so different has their matter been.—Nor was their form more stable, with regard either to the shape, colour, or ornaments : they have been square, high, low, long, and quite even, cut, carved, &c.

Pliny, lib. 7. c. 56. tells us, that one Tychius of Bœotia was the first who used *shoes*.—M. Nilant, in his remarks on Baudoin, observes, that he quotes Xenophon in vain, to shew, that even in his time they still wore *shoes* of raw skins. Xenophon relates, that the ten thousand Greeks, who had followed the young Cyrus, wanting *shoes*, in their retreat, were forced to cover their feet with raw skins, which occasioned them great inconveniencies. Nilant will not even allow, that the *shoes* of the country people, called *carbatinae*, and *peroneæ*, were of crude skin, without any preparation.

The patricians among the Romans, wore an ivory crescent on their *shoes* : Heliogabalus had his *shoes* covered over with a very white linen ; in conformity to the priests of the sun, for whom he professed a very high veneration : this kind of *shoe* was called *udo*, *udo*, or *odo*. Caligula wore *shoes* enriched with precious stones. The Indians, like the Egyptians, wore *shoes* made of the bark of the papyrus. The Turks put off their *shoes*, and leave them at the doors of the mosques.

**Horse SHOE**, } See the articles } **HORSE**.  
**Horse SHOE head**, } **HORSE-SHOE head**.

**SHOE housing**. See the article **HOUSING**.

**SHOOTING**. See **GUNNERY** and **PROJECTILE**.

**SHOOTING of bombs**. } **BOMB**.

**SHOOTING with air**, } See the articles } **WIND-GUN**.

**SHOOTING—Hot SHOOTING**, } See the articles } **HOT**.

**Water SHOOT**, } **WATER**.

**SHOP-LIFTER**, a person, who on pretence of buying goods, or otherwise, takes an opportunity to steal them.

**SHORE**, or *common SHORE*, a corruption of *sewer*. See **SEWERS** and **CLOACA**.

**SHORN velvet**. See the article **VELVET**.

**SHORT accent**, in grammar, a mark which shews, that the time of pronouncing a syllable is to be *short*.—It is wrote thus (˘). See **ACCENT**.

**SHORT sails**, in a man of war, are the same with *fighting-sails* ; being the fore-sail, main-sail, and foretop-sail, which are all that are used in fight, lest the rest should be fired, and spoiled ; besides the trouble of managing them when a ship gives chase to another.

If a chase have a mind to fight, they say, the chase *strips into her short sails*, i. e. puts out her colours in the poop, her flag at the main-top, and her streamers, or pendants, at the yard's arms ; furls her sprit-sail, peeks her mizzen, and flings her main-yard.

**SHORT-SIGHTEDNESS**, *myopia*, a fault in the conformation of the eye, wherein the crystallin, &c. being too convex, the rays reflected from different objects are refracted too much, and made to converge too fast, so as to unite ere they reach the retina ; by which means the vision is rendered dim, and confused. See **MYOPIA**.

The ordinary remedy, for *short-sightedness*, is a concave lens, held before the eye ; which making the rays diverge, or at least, diminishing much of their convergency, makes amends for the too great convexity of the crystallin. See **LENS**.

Dr. Hook suggests another remedy : finding, that many *short-sighted* persons are but little helped by concaves ; he recommends a convex glass, placed between the object and the eye ; by means whereof the object may be made to appear at any distance from the eye, and consequently, all objects may be thereby made to appear at any required distance from the eye ; so that the *short-sighted* eye shall contemplate the picture of the object, in the same manner, as if the object itself were in the place.—It is true, the image will appear inverted ; but we have expedients to remedy this too : for, in reading, there needs nothing but to hold the book upside down.—To write, the best will be for the person to learn to read upside down. For distant objects, the doctor asserts, from his own experience, that, with a little practice in contemplating inverted objects, one gets as good an idea of them, as if seen in their natural posture.

**SHOT**, in the military art, includes all sorts of ball or bullets for fire-arms, from the cannon to the pistol. See **BULLET**, **FIRE-ARM**, **CANNON**, &c.

Those for cannon are of iron ; those for musquets, carbines and pistols, are of lead.

**SHOT**, for ordnance, especially in the sea service, are of several sorts ; as—**Round SHOT**, bullets fitted to the bore of the piece.

**Bar SHOT**, is two bullets, or rather half bullets, joined together by an iron bar ; serving to cut down masts, sails, &c.

**Case SHOT**, } **CASE shot**.  
**Chain SHOT**, } **CHAIN shot**.  
**Langrel SHOT**, } See the articles } **LANGREL shot**.  
**Random SHOT**, } **RANDOM shot**.  
**Trundle SHOT**, } **TRUNDLE shot**.

**SHOT**, for fowling, is otherwise called *bail*, by reason of its figure and size.

The method of casting it is as follows. The lead being melted, stirred, and skimmed, a quantity of powdered yellow orpiment is strewed in it ; as much as will lie on a shilling, to 12 or 15 pounds of lead. The whole being well stirred, the orpiment will flame. To judge whether there be orpiment enough in, a little of the lead is dropped into a glass of water, and if the drops prove round, and without tails, there is orpiment enough, and the degree of heat is as it should be.

This done, a copper-plate, hollow in the middle, and three inches in diameter, bored through with 30 or 40 small holes, according to the size of the *shot*, is placed on an iron frame, over a tub of water, four inches above the water : the hollow part is to be very thin. On this plate are laid burning coals, to keep the melted lead in fusion. The lead is now poured gently, with a ladle, on the middle of the plate, and it will make its way through the holes in the bottom of the plate into the water, in round drops.—Great care is taken to keep the lead on the plate in its proper degree of heat : if too cold it will stop the holes ; and if too hot, the drops will crack and fly.

The *shot*, thus made, are dried over a gentle fire, always stirring them that they do not melt : this done, the greater are separated from the smaller, by passing them through sieves for that purpose.

**Fresh SHOT**, } **FRESH shot**.  
**Hip SHOT**, } See the articles } **HIP shot**.  
**Water SHOT**, } **WATER shot**.

**SHOT FLAGON**, a sort of *flagon* somewhat bigger than ordinary ; which in some counties, particularly Derbyshire, it is the custom for the host to serve his guests in, after they have drank above a shilling.

**SHOTTEN herrings**, } See the articles } **HERRING**.  
**Blood SHOTTEN**, } **BLOOD shotten**.

**SHOULDER-BLADE**, a bone of the shoulder, of a triangular figure, covering the hind part of the ribs ; called by anatomists, *scapula* and *omoplata*. See **SCAPULA**.

**SHOULDER BONE**. See the article **HUMERUS**.

**SHOULDERING**, in fortification. See **EMULEMENT**.

**SHOULDERING-PIECE**, in building. See **BRACKET**.

**SHOULDER-PITCH**, is a disease in a horse, when the pitch or point of the shoulder is displaced, which makes the horse halt downright.

**SHOULDER-SPLAIT**, or **SHOULDER-TORN**, is a hurt which befalls a horse by some dangerous slip, whereby the shoulder is parted from the breast.

**SHOULDER-WRENCH**, is a strain in the shoulder.

**SHOWER**, a cloud resolved into rain, and discharged on a certain tract of ground. See **RAIN**.

In natural history we meet with abundance of instances of extraordinary and præternatural *showers* : as, *showers of blood*, mentioned by Gallendus, and others ; a *brimstone shower*, mentioned by Wormius ; *showers of frogs*, mentioned by Pliny, and even Dr. Plott ; a *shower of millet-seed*, in Silesia, mentioned in the Ephem. German. *showers of ashes*, frequent in the Archipelago : a *shower of wheat*, in Wiltshire : a *shower of whittings*, mentioned in the Philosophical Transactions.—The natural reasons of many whereof may be seen under the article **RAIN**.

**SHRINE** \*, a case to hold the relics of some saint. See **RELICKS**.

\* The word is formed from the Latin *scrinium*, a desk or cabinet.

**SHROUDS**. See the article **SHROUDS**.

**SHROVE-TIDE**, the time immediately before lent ; thus called by our ancestors, because employed in *shriving*, that is, in confessing their sins to the priest ; in order to a more devout keeping the ensuing lent fast.

*Shrove-tuesday* is the day next before the first of lent. See **LENT**.

**SHROWDING of trees**, the cutting or lopping off the top branches ; only practised to trees that are not fit for timber, but designed for fuel, or some other present use. See **PRUNING**. Such trees the husbandmen find much preferable to copse ; as they need no fence to secure them, because standing in no danger of the browzings and rubbings of cattle, which too, have the benefit of grazing under them.

For the time of *shrowding*, it is not to be practised till the trees have stood three or four years ; either at the beginning of the spring, or the end of autumn.

The harder sort are not to be lopped above once in ten or twelve years, and that at any time in the winter. The pithy and softer woods are best *shrowded* in the spring.—The stumps left, should always be cut aslope, and smooth, in order to cast the water off, and prevent its sinking in and rotting the tree.

**SHROUDS** or **SHROUDS**, are great ropes in a ship, which go up on both sides of all masts, except the bowsprit. See **MAST**, &c.

They are fastened below by chains to the ship's sides, and aloft, over the head of the mast ; their pennants, fore-tackle, and swifters, being first put under them ; and they are served there, to prevent their galling the mast.—The top-mast *shrouds*

figure of the crystallin, and its distance from the retina, objects are seen very differently; inasmuch, as we are not sure, that there are any two persons in the world, who see them equally big.—It is even very rare, that the same person sees the same object equally big with both eyes; as both eyes are very seldom perfectly alike: on the contrary, we generally see things bigger with the left than the right eye; of which we have some very good observations in the journal of the learned at Rome, for the year 1669. See VISION.

Short SIGHT, } See the articles } MYOPIA.  
Second SIGHT, } SECOND sight.  
Point of SIGHT, } VIEW and POINT.

SIGHTS, in mathematicks, denote two thin pieces of brass raised perpendicularly on the two extremes of an alidade or index of a theodolite, circumferentor, or other like instrument: each whereof has an aperture or slit up the middle, through which the visual rays pass to the eye, and distant objects are seen.—Their use is for the just direction of the index to the line of the object. See TELESCOPE, CIRCUMFERENTOR, ALIDADE, &c.

Sometimes the slits or apertures have glasses, or lenses fitted into them; in which case they are called *telescopic sights*: by way of distinction from the former, which in respect hereof are denominated *plain sights*. See TELESCOPE, LENS, &c. Mr. Flamsteed and Dr. Hook, absolutely explode the use of *plain sights* in astronomical observations. The errors in Tycho's latitudes of the stars, Mr. Flamsteed ascribes wholly to his using *plain sights*; and suspects, that Hevelius using the same kind of *sights*, will fall into the like errors.—Hevelius, on the contrary, in a paper in the Philosophical Transactions, vindicates the use of *plain sights*, and prefers them to *telescope* ones: the main objection he makes to the latter, is, that no observation can be safely taken with them, without first examining and rectifying them: in which examination, many and gross mistakes are liable to be committed.—To which he adds, that in sextants, octants, azimuth quadrants, &c. he does not see how such examination can be made, at all times, without much loss of time. See ASTRONOMICAL.

SIGILLARIA, a solemn feast held among the ancient Romans; thus called from a custom which obtained therein, of sending little presents from one to another, consisting of seals, little figures, and sculptures, made of gold, silver, brass, or even earthen ware, and of devoting them to Saturn as an atonement for themselves and friends.

The *sigillaria* followed immediately after the saturnalia, and held two days; which, with the five days of the saturnalia, made a solemnity of seven days. See SATURNALIA.

Some derive the origin of *sigils* and figures in this solemnity from the argei or rushan figures of men thrown annually into the Tiber, from the Pons Sublicius, by the vestals, on the ides of March. Vid. Macrob. Saturn. l. i. c. 7, 10 and 11. See also ARGEA.

SIGILLATA terra, a kind of earth, or bole, dug in the isle of Lemnos; and thence also called *Lemnian earth*; of considerable use in painting, and medicine. See LEMNIAN earth.

It is of different colours, but most commonly red; heavy, soft, and friable; held very astringent, and, as such, used in hemorrhages; as also against the plague and poisons.—Pliny attributes several other virtues, which experience does not justify; nor is it in that esteem it anciently was; yet it is still an ingredient in Venice-treacle.

It was anciently found in a mountain, in the neighbourhood of the city Hephæstia; where Diana's priests went at certain times, with great ceremony, to dig it up. After a little preparation, they made it up into troches, and sealed them with Diana's seal; whence the appellation of *sigillata*, sealed.

It is now brought from Constantinople in little flat cakes, round on one side, flat and sealed on the other. See BOLE.

SIGILLUM, a seal or signet. See SEAL and SIGNET.

SIGN, SIGNUM, a sensible mark or character, denoting something absent, or invisible. See CHARACTER and MARK.

Anciently, the monks, in all religious houses, were not allowed to speak; nor to express their minds otherwise than by *signs*, which they learned in their novitiate. C. Rhodiginus and Porta have wrote of the ancient *signs*, and ciphers, used in speaking, and writing.

SIGN, in algebra, denotes a symbol, or character. See CHARACTER, ALGEBRA, &c.

Like SIGNS, } See the articles } LIKE.

Radical SIGNS, } RADICAL.

SIGN, in medicine, denotes some appearance in the body, distinguishable by the senses; whence, by just reasoning, is inferred the presence, nature, state, event of health, a disease, or death. See INDICATION.

Those which denote the present condition of a body, whether sick or well, dying or the like, are called *diagnostic signs*. See DIAGNOSTIC.

Those which foretel the future state thereof, are called *prognostic signs*. See PROGNOSTIC.

That *sign* which is peculiar to the disease, and inseparable from it, as arising from the nature thereof, is called a *pathognomonic sign*. See PATHOGNOMONIC.

As all *signs* are effects produced by the cause of the disease, the disease itself, and its symptoms; they usually note the present condition of the matter which first produced the disease, and even of that produced by the disease: on which footing, the *signs* are all reducible to these three classes, viz. *signs* of the crudity and coction of the disease; of its event, whether in health, sickness, or death; and of its secretion and excretion: which last *signs* are called *critical* ones. See CRUDITY, DIGESTION, &c. each under its proper article. See also HEALTH and DISEASE.

Antecedent SIGN. See the article ANTECEDENT.

SIGN, in astronomy, a twelfth part of the ecliptic, or zodiac; or a portion containing thirty degrees thereof. See ZODIAC.

The zodiac was divided by the ancients into twelve segments, called *signs*; commencing from the point of intersection of the ecliptic and equinoctial: which *signs* they denominated from the twelve constellations which, in Hipparchus's time possessed those segments.—But, the constellations have since so changed their places, by the precession of the equinox, that aries is now got out of the *sign* called *aries*, into taurus, taurus into gemini, &c. See PRECESSION, ECLIPTIC, EQUINOX, &c.

The names of the twelve *signs*, and their order, are as follow; *aries, taurus, gemini, cancer, leo, virgo, libra, scorpio, sagittarius, capricornus, aquarius, pisces*: each of which, with the stars thereof, see under its proper article, ARIS, TAURUS, &c.

The *signs* are distinguished with regard to the season of the year, when the sun is in them, into *vernal, æstival, autumnal*, and *brumal*. See AUTUMNAL and VERNAL.

The *vernal*, or *spring* SIGNS, are aries, taurus, gemini.

The *æstival*, or *summer* SIGNS, are cancer, leo, and virgo.

The *autumnal* SIGNS, are libra, scorpio, and sagittarius.

The *brumal*, or *winter* SIGNS, are capricornus, aquarius, and pisces.

The *vernal* and *summer* *signs*, are also called *northern* *signs*.

—And the *autumnal* and *brumal* *signs*, *southern* *signs*. See NORTHERN, &c.

Ascending SIGNS, } See the articles } ASCENDING.

Fixt SIGNS, } FIXT.

Masculine SIGNS, } MASCUINE.

SIGN manual, the setting one's hand and seal to a writing. See SIGNATURE.

Among the Saxons, before the invention of seals, a + was a common *sign* or *signum*, prefixed to the names of most subscribing witnesses in charters and other deeds; as + *signum Roberti Episcop. Lond. &c.*

SIGNAL, a certain sign agreed upon for the conveying of intelligence whither the voice cannot reach. See SIGN.

*Signals* are given for the beginning of a battle, or an attack; usually with drums, and trumpets: at sea, they are given by cannon or musket-shot, by lights, sails, flags, &c. See SALUTATION.

*Signals* have been in use in all ages. The ancients who had no regular couriers or posts, made use thereof to convey intelligence of what passed at a great distance. For which purpose they placed centinels on the eminences, from space to space; some mention whereof, we find made by Homer himself. Iliad. Æ. v. 553, &c. Odyss. z. v. 261. Those people thus disposed, lighted fires, or flambeaux in the night-time. In the Agamemnon of Æschylus, that prince at his departure for Troy, promises Clytemnestra, that the very day the city should be taken, he would apprise her of his victory by fires lighted express. He keeps his word, and tidings are brought the prince, that Troy is taken, and that Agamemnon's *signals* are seen. Frontinus observes, they were in use among the Arabs; and Bonaventura Vulcanius, in his Scholia on Aristotle's book *de mundo*, adds, that while the Moors were masters of the greatest part of Spain, they built on the tops of the mountains, an infinity of turrets, or watch-houses, called in the Arabic, *atalayas*, a word the Spaniards still retain; whence, by fires, they could immediately alarm the whole kingdom. Indeed the custom was much more ancient than the Moors in Spain. Q. Curtius observes, it was very frequent among the Asiatics, in the time of Alexander. Livy and Cæsar both mention it as used among the Romans. Polydore Virgil shews it of great antiquity in England; and Boethius adds, that in several places in England, there are the remains of huge poles that have served for this purpose. See BEACON.

SIGNALS at sea, are signs made by the admiral or commander in chief of a squadron of ships, either in the day or by night, whether for sailing, for fighting, or for the better security of the merchant ships, under their convoy.

These *signals* are very numerous and important; being all appointed and determined by order of the lord high admiral, or lords of the admiralty; and communicated in the instructions

Instructions sent to the commander of every ship of the fleet or squadron before their putting out to sea.

**SIGNALS by day.**—When the commander in chief would have them prepare for sailing, he first looses his fore-top-sail, and then the whole fleet are to do the same. When he would have them unmoor, he looses his main-top-sail, and fires a gun, which in the royal navy is to be answered by every flag-ship. When he would have them weigh, he looses his fore-top-sail, and fires a gun, and sometimes haws home his sheats: the gun is to be answered by every flag-ship, and every ship to get to sail as soon as it can. If with the leeward-side, the stern-most ship is to weigh first. When he would have the weather-most, and head-most ships to tack first, he hoists the union-flag at the fore-top-mast-head, and fires a gun, which each flag-ship answers; but if he would have the stern-most and leeward-most ships to tack first, he hoists the union flag at the mizen-top-mast-head, and fires a gun; and when he would have all the whole fleet tack, he hoists an union, both on the fore, and mizen-top-mast-heads, and fires a gun. When in bad weather, he would have them wear, and bring to the other tack, he hoists a pendant on the ensign-staff, and fires a gun: and then the leeward-most and stern-most ships are to wear first, and bring on the other tack, and lie by, or go on with an easy sail, till he comes a-head: every flag is to answer with the same signal. If they are lying by, or sailing by a wind, and the admiral would have them bear up and sail before the wind, he hoists his ensigns, and fires a gun, which the flags are to answer: and then the leeward-most ships are to bear up first, and to give room for the weather-most to wear, and sail before the wind with an easy sail, till the admiral comes a-head. But if it should happen when the admiral hath occasion to wear and sail before the wind, that both jack and ensign be abroad, he will hawl down the jack, before he fires the gun to wear, and keep it down till the fleet is before the wind. When they are sailing before the wind, and he would have them bring to, with the star-board tacks aboard, he hoists a red flag at the flag-staff, on the mizen-top-mast-head, and fires a gun. But if they are to bring to, with the lar-board tack, he hoists a blue flag at the same place, and fires a gun, and every ship to answer the gun. When any ship discovers land, he is to hoist his jack and ensign, and keep it abroad, till the admiral or commander in chief answer him, by hoisting his; on sight of which, he is to hawl down his ensign. If any discovers danger, he is to tack and bear up from it, and to hang his jack abroad from the main-top-mast cross-trees, and fire two guns: but if he should strike or stick fast, then, besides the same signal with his jack, he is to keep firing, till he sees all the fleet observe him, and endeavour to avoid the danger. When any sees a ship or ships more than the fleet, he is to put abroad his ensign, and there keep it, till the admiral's is out, and then to lower it, as often as he sees ships, and stand in with them, that so the admiral may know which way they are, and how many; but if he be at such a distance, that the ensign cannot well be discovered, he is then to lay his head towards the ship or ships so descryed, and to brail up his low sails, and continue hoisting and lowering his top-sails, and making a wait with his top-gallant sails, till he is perceived by the admiral. When the admiral would have the vice-admiral, or he that commands in the second post of the fleet, to send out ships to chase, he hoists a flag, striped white and red on the flag-staff, at the fore-top-mast head, and fires a gun. But if he would have the rear admiral do so, he then hoists the same signal on the flag-staff, at the mizen-top-mast-head, and fires a gun. When the admiral would have any ship to chase to windward, he makes a signal for speaking with the captain, and he hoists a red flag in the mizen throwds, and fires a gun: but if to chase to leeward, a blue flag; and the same signal is made by the flag, in whose division that ship is. When he would have them give over chase, he hoists a white flag on his flag-staff at the fore-top-mast-head, and fires a gun: which signal is to be made also by that flag-ship which is nearest the ship that gives chase, till the chasing ship sees the signal. In case of springing a leak, or any other disaster, that disables their ship from keeping company, they are to hawl up their courses, and fire two guns. When any ship would speak with the admiral, he must spread an English ensign, from the head of his main, or fore-top-mast, downwards on the throwds, lowering his main, or fore-top-sail, and firing guns, till the admiral observe him; and if any ship perceive this, and judgeth the admiral doth not, that ship must make the same signal, and make the best of his way to acquaint the admiral therewith, who will answer by firing one gun. When the admiral would have the fleet to prepare to anchor, he hoists an ensign, striped red, blue, and white on the ensign-staff, and fires a gun, and every flag-ship makes the same signal. If he would have the fleet moor, he hoists his mizen-top-sail, with the clew-lines hawled up, and fires a gun. If he would have the fleet cut or slip, he looses both his top-sails, and fires two guns; and then the leeward ships are to cut or slip first, to give room to the weather-most to come to sail. So if he would have any particular ship to cut or slip, and

to chase to windward, he makes the signal for speaking with that ship, hoists a red flag in the mizen throwds, and fires a gun: but if the ship is to chase to leeward, he hoists a blue flag as before. If he would have the fleet exercise their small arms, he hoists a red flag on the ensign-staff, and fires a gun; but if the great guns, then he puts up a pendant over the red flag.

**SIGNALS by night.**—To be observed at an anchor, weighing anchor, and sailing, are as follow. When the admiral would have the fleet to unmoor, and ride short, he hangs out three lights, one over another in the main-top-mast throwds, over the constant light in the main-top, and fires two guns, which are to be answered by flag-ships; and each private ship hangs out a light in the mizen-throwds. Note, That all guns, fired for signals in the night, must be fired on the same side, that they may make no alteration in the sound. When he would have them weigh, he hangs a light in the main top-mast throwds, and fires a gun, which is to be answered by all the flags, and every private ship must hang out a light in his mizen-throwd. When he would have them tack, he hoists two flags on the ensign-staff, one over another, above the constant light in his poop, and fires a gun, which is to be answered by all the flags; and every private ship is to hang out a light extraordinary, which is not to be taken in, till the admiral takes in his. After the signal is made, the leeward-most, and stern-most ships must tack as fast as they can, and the stern-most flag-ship, after he is about on the other tack, is to lead the fleet, and him they are to follow, to avoid running through one another in the dark. When he is upon a wind, and would have the fleet veer, and bring to on the other tack, he hoists up one light at the mizen-peek, and fires three guns, which is to be answered by all the flag-ships, and every private ship must answer, with one light at the mizen-peek. The stern-most, and leeward-most ships, are to bear up so soon as the signal is made. When he would have them, in blowing weather, to lie a try, short, or a hull, or with the head-sails braced to the mast, he will form lights of equal height, and fire five guns, which are to be answered by the flag-ships, and then every private ship must shew four lights; and after this, if he would have them to make sail, he then fires ten guns, which are to be answered by all the flags, and then the head most, and weather-most ships, are to make sail first. When the fleet is sailing large, or before the wind, and the admiral would have them bring to, and lie by with their star-board tacks aboard, he puts out four-lights in the fore-throwds, and fires six guns; but if with the lar-board tacks aboard, he fires eight guns, which are to be answered by the flag-ships; and every private ship must shew four lights. The wind-most ships must bring to first. Whenever the admiral alter his course, he fires one gun, (without altering his lights) which is to be answered by all the flag-ships. If any ship hath occasion to lie short, or by, after the fleet hath made sail, he is to fire one gun, and shew three lights in his mizen throwds. When any one first discovers land, or danger, he is to shew as many signs as he can, to fire one gun, and to tack, or bear away, from it: and, if any one happen to spring a leak, or any be disabled from keeping company with the fleet, he hangs out two lights of equal height, and fires guns till he is relieved by some ship of the fleet. If any one discovers a fleet, he is to fire guns, make false fires, put one light out on the main-top, three on the poop, to steer after them, and to continue firing of guns, unless the admiral call him off, by steering another course, and fire two or three guns; for then he must follow the admiral. When the admiral anchors, he fires two guns, a small space of time one from the other, which are to be answered by the flag-ships; and every private ship must shew two lights. When the admiral would have the fleet to moor, he puts a light on each top-mast-head, and fires a gun, which is to be answered by the flag-ships, and every private ship is to shew one light. If he would have them lower their yards and top-masts, he hoists one light upon his ensign-staff, and fires one gun; which is to be answered by the flag-ships; and every private ship must shew one light. And when he would have them hoist their yards and top-masts, he puts out two lights, one under the other, in the mizen-top-mast-throwds, and fires one gun; which is to be answered by the flag ships; and each private ship must shew one light in the mizen-throwds. If any strange ship be discovered coming into the fleet, the next ship is to endeavour to speak with her, and bring her to an anchor, and not suffer her to pass through the fleet. And if any one discovers a fleet, and it blow so hard that he cannot come to give the admiral notice timely, he is to hang out a great number of lights, and to continue firing gun after gun, till the admiral answers him with one. When the admiral would have the fleet to cut or slip, he hangs out four lights, one at each main-yard-arm, and at each fore-yard-arm, and fires two guns, which are to be answered by the flag-ships, and every private ship is to shew one light.

**SIGNALS used, when a fleet sails in a fog.**—If the admiral would have them weigh, he fires ten guns; which every flag ship is to answer. To make them tack, he fires four guns,

guns, which are to be answered by the flag-ships; and then the leeward-most, and stern-most ships must tack first, and after they are about, to go with the same sail they tacked with, and not to lie by, expecting the admiral to come a-head: and this is to avoid the danger of running through one another in thick weather.

When the admiral brings to, and lies with his head-fails to the mast; if with the star-board tack aboard, he fires six guns; but if with the lar-board tack, he fires eight guns, which the flag-ships are to answer. And after this, if he makes sail, he fires ten guns, which the flag-ships must answer, and then the head-most and weather-most ships are to make sail first. If it grow thick and foggy weather, the admiral will continue sailing, with the same sail set, that he had before it grew foggy, and will fire a gun every hour, which the flag-ships must answer, and the private ships must answer, by firing of muskets, beating of drums, and ringing of bells. But if he be forced to make either more or less sail than he had, when the fog began, he will fire a gun every half hour, that the fleet may discern, whether they come up with the admiral, or fall a-stern of him; and the flags and private ships are to answer as before. If any one discovers danger, which he can avoid, by tacking and standing from it, he is to make the *signal* for tacking in a fog; but if he should chance to strike and stick fast, he is to fire gun after gun, till he thinks the rest have avoided the danger. When the admiral would have the fleet to anchor, he fires two guns, which the flags are to answer; and after he hath been half an hour at an anchor, he will fire two guns more, to be answered by the flags, as before; that all the fleet may know it.

**SIGNALS for calling officers on board the admiral.**—When the admiral puts aboard an union-flag in the mizen throwds, and fires a gun, all the captains are to come aboard him: and if, with the same *signal*, there be also a waft made with the ensign, then the lieutenant of each ship is to come on board. If an ensign be put aboard in the same place, all the masters of the ships of war are to come on board the admiral. If a standard on the flag-staff be hoisted at the mizen-top-mast-head, and a gun fired, then all the flag-officers are to come aboard the admiral. If the English flags only; then a standard in the mizen-throwds; and fire a gun: if the flags, and land general officers; then the admiral puts aboard a standard at mizen-top-mast-head, and a pendant at mizen-peek, and fires a gun. If a red flag be hoisted in the mizen-throwds, and a gun fired; then the captains of his own squadron are to come aboard the admiral; and if, with the same *signal*, there be also a waft with the ensign, the lieutenant of each ship must come aboard. If he hoists a white flag, as before, then the vice-admiral, or he that commands in the second post, and all the captains of his squadron, are to go on board the admiral: if a blue flag, &c. then the rear-admiral, and the captains of his squadron, must come on board; and if a waft, as before, the lieutenants. When a standard is hoisted on the ensign-staff, and gun fired, the vice and rear-admirals must come on board the admiral's ship. When the admiral would speak with the captains of his own division, he will hoist a pendant on the mizen-peek, and fire a gun; and if with the lieutenants, a waft is made with the ensign, and the same *signal*: for whenever he would speak with the lieutenants of any particular ship, he makes the *signal* for the captain, and a waft also with the ensign. When the admiral would have all the tenders in the fleet come under his stern, and speak with him; he hoists a flag, yellow and white, at the mizen-peek, and fires a gun. But if he would speak with any particular ship's tender, he makes a *signal* for speaking with the captain she tends upon, and a waft with the jack. If all the pinnaces and barges are to come on board, manned and armed, the *signal* is a pendant on the flag-staff, hoisted on the fore-top-mast-head, and a gun fired; and if he would have them chase any ship, vessel, or boat, in view, he hoists the pendant, and fires two guns. The *signal* for the long-boats to come on board him, manned and armed, is the pendant hoisted on the flag-staff, and the mizen-top-mast-head, and a gun fired; and if he would have them chase any ship, vessel, or boat, in open view, without coming on board him, he hoists the pendant, as aforesaid, and fires two guns. When the admiral would have all the boats in the fleet come on board him, manned and armed, he hoists a pendant on the flag-staff, both on the fore-top-mast, and mizen-top-mast-head, and fires one gun; but if he would have them chase, he hoists his pendants, as before, and fires two guns. When the admiral would speak with the victualler, or his agent, he puts an English ensign in the mizen-top-mast throwds; and when with him that hath the charge of the gunner's stores, he will spread an ensign at his main-top-sail-yard-arm.

**SIGNALS for managing a sea-fight.**—When the admiral would have the fleet form a line of battle, one ship a-head of another, he hoists an union flag at the mizen-peek, and fires a gun; and every flag-ship does the like. But when they are to form a line of battle, one a-breast of another, he hoists a pendant with the union-flag, &c. When he would have the admiral of the white, or he that commands in the second

post, to tack, and endeavour to gain the wind of the enemy, he spreads a white flag under the flag at the main-top-mast-head, and fires a gun; and when he would have the vice-admiral of the blue do so, he doth the same with the blue flag. If he would have the vice-admiral of the red do so, he spreads a red flag from the cap, on the fore-top-mast-head, downward on the back-stay: if the vice-admiral of the blue, he spreads a blue flag, &c. and fires a gun. If he would have the rear-admiral of the red do so, he hoists a red flag at the flag-staff, at the mizen-top-mast-head; if the rear-admiral of the white, a white flag; if the rear-admiral of the blue, a blue flag, and under it a pendant of the same colour, with a gun. If he be to leeward of the fleet, or any part of it, and he would have them bear down into his wake or grain, he hoists a blue flag at the mizen-peek, and fires a gun. If he would be to leeward of the enemy and his fleet, or any part of it to be to leeward of him; in order to bring these ships into the line, he bears down with a blue flag at the mizen-peek, under the union-flag (which is the *signal* for battle) and fires a gun; and then those ships, that are to leeward of him, must endeavour to get into his wake or grain, according to their station in the line of battle. When the fleet is sailing before the wind, and he would have him, who commands in the second post, and the ship of the star-board quarter, to clap by the wind, and come to the star-board tack, he hoists a red flag at the mizen-top-mast-head: but a blue one, if he would have ships of the lar-board quarter, come to the lar-board tack, with a gun. If the van are to tack first, he spreads the union-flag at the flag-staff, on the fore-top-mast-head, and fires a gun, if the red flag be not abroad; but if it be, then he lowers the fore-top-sails a little; and the union-flag is spread from the cap of the fore-top-mast downwards; and every flag-ship doth the same. If the rear be to tack first, he hoists the union-flag on the flag-staff, at the mizen-top-mast-head, and fires a gun; which all the flag-ships are to answer. If all the flag-ships are to come into his wake or grain, he hoists a red flag at his mizen-peek, and fires a gun; and all the flag-ships must do the same. If he would have him that commands in the second post of his squadron to make more sail (though he himself shorten sail) he hoists a white flag on the ensign-staff. But if he that commands in the third post be to do so, he hoists a blue flag, and fires a gun, and all the flag-ships must have the same *signal*. Whenever he hoists a red flag on the flag-staff at the fore-top-mast-head, and fires a gun; every ship in the fleet must use their utmost endeavour to engage the enemy, in the order prescribed them. When he hoists a white flag at his mizen-peek, and fires a gun; then all the small frigates of his squadron, that are not of the line of battle, are to come under the stern. If the fleet by sailing by a wind in the line of battle, and the admiral would have them brace their head-fails to the mast, he hoists up a yellow flag, on the flag-staff, at the mizen-top-mast-head, and fires a gun; which the flag-ships are to answer: and then the ships in the rear must brace first. After this, if he would have them fall their head-fails, and stand on, he hoists a yellow flag on the flag-staff of the fore-top-mast-head, and fires a gun, which the flag-ships must answer, and then the ships in the van, must fall first, and stand on. If, when this *signal* is made, the red flag at the fore-top-mast-head be abroad, he spreads the yellow flag under the red. If the fleets being near one another, the admiral would have all the ships to tack together, the sooner to lie in a posture to engage the enemy; he hoists an union-flag on the flag-staves at the fore and mizen-top-mast-heads, and fires a gun; and all the flag-ships are to do the same. The fleet being in a line of battle, if he would have the ship that leads the van, hoist, lower, set, or hawl up any of the sails, he spreads a yellow flag, under that at his main-top-mast-head, and fires a gun, which *signal* the flag-ships are to answer; and then the admiral will hoist, lower, set, or hawl up the sail, which he would have the ship that leads the van, do; which is to be answered by the flag-ships of the fleet. When the enemies run, and he would have the whole fleet follow them, he makes all the sail he can after them himself, takes down the *signal* for the line of battle, and fires two guns out of his fore-chase, which the flag-ships answer; and then every ship is to endeavour to come up with, and board the enemy. When he would have the chase given over, he hoists a white flag at the fore-top-mast-head, and fires a gun. If he would have the red squadron drawn into a line of battle, one a-breast of another, he puts abroad a flag, striped red and white, on the flag-staff at the main-top-mast-head, with a pendant under it, and fires a gun: if the white or second squadron is to do so, the flag is striped red, white and blue: if the blue or third squadron is to do so, the flag is a Genoese ensign and pendant: but if they are to draw into a line of battle, one a-head of another, the same *signals* are made without a pendant. If they are to draw into the line of battle one a-stern of another, with a large wind, and he would have the leaders go with the star-board tacks, a-board by the wind; he hoists a red and white flag at the mizen-peek, and fires a gun: but if they should go with the lar-board tacks aboard, by the wind, he hoists a Genoese flag

flag at the same place; which *signals*, like others, must be answered by the flag-ships.

**SIGNATURE**, **SIGNATURA**, *signing*, a subscription or putting of one's name at the bottom of an act, or deed, in one's own hand-writing. See **SUBSCRIPTION**.

Anciently, when very few people could write, they dispensed with the use of *signatures*; and contented themselves with the party's seal. See **SEAL**.

**SIGNATURE** of the court of Rome, is a supplication answered by the pope, whereby he grants a favour, dispensation, or collation to a benefice, by putting the *fiat* at the bottom thereof, in his own hand; or the *concessum est* wrote in his presence.—This *signature*, at the bottom of the supplication, gives the name to the whole instrument.

The *signature* contains the clauses, derogations, and dispensations wherewith the pope grants the favour, or the benefice; with a commission for the execution thereof, either in forma dignum, or in gracious form.

A *signature* of the pope's own hand, whereby he answers, *fiat ut petitur*, is preferred to another answered by the prefect, in his presence, in these words, *concessum uti petitur in presentia D. N. papæ*. Sometimes in *signatures* with the *fiat*, the pope adds, *proprio motu*; which clause gives them still further force.

There are three kinds of *signatures*; one in *forma gratiosa*, dispatched on an attestation of the ordinary; another in *forma dignum antiqua*, dispatched for canonicates; the third in *forma dignum novissima*, which is a kind of second *signature*, or executorial letter granted where, upon the ordinary's failing to execute the first within thirty days, the nearest other ordinary is enjoined to execute it.

**SIGNATURE**, in printing, denotes a mark at the bottom of each sheet, to facilitate the gathering and binding of the book; and to shew the order and number of the quires and sheets. See **PRINTING**.

The *signatures* consist of the capital letters of the alphabet; and change in every sheet. If there be more sheets than letters in the alphabet; to the capital letter, they add a small one of the same sort, i. e. a little a after a great A, &c. which they repeat, as often as is necessary.

**SIGNATURE**, **SIGNATTRA**, is also used by some naturalists for the resemblance a vegetable or mineral bears to any part of the human body; supposed to afford an indication of its virtues and use.

**SIGNET**, one of the king's seals, used for sealing his private letters, and signing all grants which pass his majesty's hand by bill. See **SEAL**.

The *signet* is always in the custody of the king's secretaries: on whom attend four clerks of the *signet-office*. See **SECRETARY** and **CLERK**.

**SIGNIFICATION**, the sense or meaning of a sign, word, phrase, emblem, devise or the like; that is, the thing denoted by such sign, word, figure, &c. See **SIGN**, **WORD**, **EMBLEM**, **DEVISE**, &c.

We are perfectly at a loss as to the *signification* of the hieroglyphic characters of the ancients. See **HIEROGLYPHIC**.

**SIGNIFICATION**, in law, is the notification of an act, &c. made to the opposite party, by a copy, &c. thereof, given and attested by a proper officer.

Some *significations* are to be made to the person himself; or, at least, at his house: for others, it is enough they be made to the party's attorney, or agent.

**SIGNIFICAVIT**, a writ which issues out of chancery, upon a certificate given by the ordinary, of a man that stands obstinately excommunicate for the space of forty days; for the laying him up in prison, without bail or mainprize, till he submit himself to the authority of the church. See **EXCOMMUNICATION**.

**SIGNING**. See **SIGNATURE** and **COUNTER-signing**.

**SILENCIARY**, **SILENTIARIUS**, an officer among the ancient Roman slaves; being, according to some authors, a slave placed over the rest, to prevent any noise and din, and keep them silent.

Seneca, in his epistles, mentioning the great care taken to keep the slaves mute, has given occasion to Lipsius, Popma, and some others, to suppose, that the *silenciary* was established in his time: but others, as Pignorius, think no such conclusion can be drawn from Seneca's words; nor any thing, but that they were, even then, very severe in preventing any noise among the slaves.—As to the name and office of the *silenciary*, it was not established till about the time of Salvian; who is the first author that mentions it.

There were also *silentiarii* established in the emperor's court, called *quietis ministri*, and *silentiarii palatii*; and honoured with the further titles of *clarissimi*, *speciatibiles*, *devotissimi*, and in Greek, *ταπεινωτατοι*, q. d. most admirable.

There were a great number of them; but only thirty ordinarily officiated; who were divided into three bands, each whereof had its *decurio*.—The council of Chalcedon, call the body of *silentiaries*, *schola devotissimorum silentiariorum*.

**SILENI**, in antiquity, a sort of heathen demi-gods, the same with *satyrs*, which were called *sileni* when they came to be advanced in age. See **SATYR**.

Yet was there one principal *Silenus* elder than any of the

rest.—Diod. Siculus says, he was the master, or tutor of Bacchus, whom he disciplined nobly, and followed him to the wars. He quotes an ancient poet named Thymætas, who relates, that the *sileni* assisted Bacchus in the war he waged against the Titans; adding, that the first *Silenus* reigned in an island made by the river Triton in Lybia.—He is represented, as having a long tail hanging behind; which is likewise an attribute of all his posterity.—The poets always mount him on an ass.

Nonnus makes *Silenus* a son of Tellus; and gives him three sons, *Astræus*, *Maron* and *Lenæus*. Servius, on Virgil's eclogue, makes *Silenus* \* the son of Mercury; others, the son of Pan, and a nymph: others will have him born of the drops of the blood of Cælus, father of Saturn.

\* Bochart, in his *Canaan*, will have *Silenus* to take his name from שִׁילָה; or שִׁילָה, *Silo*; whence שִׁילָה, *Silan*, the name of the Messiah. He adds, that all attributed to this imaginary deity, is taken from what the prophets have foretold of Jesus Christ.—Thus, whereas it is said, the Messiah shall be the instructor of the people; *Silenus* is made preceptor of Bacchus. Because it is said, that our Saviour shall bind his ass to the vine, and his colt to the young vine; *Silenus* is made to ride on an ass. Because our Saviour washed his garments in blood, as those who trod the wine-press; *Silenus* was made to preside over those who pressed the vintage. Because, it is added, his eyes were red by reason of wine; *Silenus* was made always fuddled. Bochart, however, advances all this with a deal of distrust, as he has reason; it having no warrant: he adds, that the devil invented the fable of *Silenus*, to turn the mysteries of our religion into ridicule. But it must be a very ignorant devil, to take *rubent illi oculi ex vino*, & *dentes ejus ex lacte albescent*, in the sense he has done; as if the words signified any thing more, in the propriety of the Hebrew tongue, than, His eyes are redder than wine; his teeth whiter than milk. We may add, that no-body, before Bochart, neither christian nor idolater, ever saw any thing of Jesus Christ in the fable of *Silenus*.

**SILIQUEA**, in botany, the seed-vessel, husk, pod, or shell of a plant of the leguminous kind.—Whence

**SILIQUEOUS plants**, those which produce *siliques*, or seed-pods. See **PLANT** and **SEED**.

**SILK**, **SERICUM**, a very soft, fine, bright, delicate thread; the work of an insect, called *bombyx*, or the *silk-worm*.

The ancients were but little acquainted with the use and manufacture of *silk*: they took it for the work of a sort of spider, or beetle, who spun it out of its entrails, and wound it with its feet about the little branches of trees.—This insect they called *ser*, from *Seres*, a people in Scythia, who kept it; whence the *silk* itself they called *sericum*.—But the *ser* has very little affinity with our *silk-worm*, *bombyx*: the former living five years; but the latter dying annually, enveloped in a yellowish bag, or ball; which, wound out into little threads, makes what we call *silk*.

It was in the isle of Cos, that the art of manufacturing *silk* was first invented; and Pamphila, daughter of Platis, is honoured as the inventor.—The discovery was not long unknown to the Romans. *Silk* was brought them from *Serica*, where the worm was a native. But so far were they from profiting by the discovery, that they could not be induced to believe so fine a thread should be the work of a worm; and thereupon formed a thousand chimerical conjectures of their own.

This temper rendered *silk* a very scarce commodity among them for many ages: it was even sold weight for weight with gold; inasmuch, that Vopiscus tells us, the emperor Aurelian, refused the empress, his spouse, a suit of *silk*, which she solicited of him with much earnestness; merely on account of its dearness.—At length, two monks, coming from the Indies to Constantinople in 555, brought with them great quantities of *silk-worms*, with instructions for the hatching of their eggs, rearing and feeding the worms, drawing out the *silk*, spinning and working it. Upon this, manufactures were set up at Athens, Thebes and Corinth. About the year 1130, Roger king of Sicily, established a *silk* manufactory at Palermo, and another in Calabria; managed by workmen, who were part of the plunder brought from Athens, Corinth, &c. wherefore that prince made a conquest in his expedition to the holy land.—By degrees, Mezeray adds, the rest of Italy and Spain learned from the Sicilians and Calabrians, the management of the *silk-worms*, and the working of *silk*: and at length the French, by right of neighbourhood, a little before the reign of Francis I. began to imitate them.

The great advantage the new manufacture turned to, made our King James I. very earnest for its being introduced into England: accordingly, it was recommended several times from the throne, and in the most earnest terms, to plant mulberry-trees, &c. for the propagation of *silk-worms*; but, unhappily, without effect: though from the various experiments we meet withal in the Philosophical Transactions, and other places, it appears, that the *silk-worm* thrives and works as well, in all respects, in England, as in any other part of Europe.

The *silk-worm* is an insect, not more remarkable for the precious

precious matter it furnishes for divers stuffs, than for the many forms it assumes, before and after its being enveloped in the rich cod or ball it weaves itself. From a small egg about the size of a pin's head, which is its first state, it becomes a pretty big worm, or maggot, of a whitish colour, inclining to yellow. In this state it feeds on mulberry-leaves, till being come to maturity, it winds itself up into a *filken* bag, or case, about the size and shape of a pidgeon's egg; and becomes metamorphosed into an aurelia: in this state it remains without any signs of life, or motion: till at length it awakes, to become a butter-fly; after making itself a passage out of its *filken* sepulchre. And, at last, dying indeed, it prepares itself, by an egg, or seed it casts, for a new life; which the warmth of the summer-weather assists it in resumming. See INSECT.

As soon as the *silk-worm* is arrived at the size and strength necessary for beginning his cod; he makes his web: for it is thus they call that slight tissue, which is the beginning, and ground of this admirable work. This is his first day's employment. On the second, he forms his folliculus or ball, and covers himself almost over with *silk*. The third day, he is quite hid; and the following days employs himself in thickening and strengthening his ball: always working from one single end, which he never breaks by his own fault; and which is so fine, and so long, that those who have examined it attentively, think they speak within compass, when they affirm, that each ball contains *silk* enough to reach the length of six English miles.

In ten days time, the ball is in its perfection; and is now to be taken down from the branches of the mulberry-tree, where the worms have hung it.—But this point requires a deal of attention; for there are some worms more lazy than others; and it is very dangerous waiting till they make themselves a passage, which usually happens about the fifteenth day of the month.

The first, finest and strongest balls, are kept for the grain; the rest are carefully wound: or, if it is desired to keep them all, or if there be more than can be well wound at once; they lay them for some time in an oven moderately hot, or else expose them, for several days successively, to the greatest heats of the sun, in order to kill the insect; which, without this precaution, would not fail to open itself a way to go and use those new wings abroad, it has acquired within.

Ordinarily, they only wind the more perfect balls. Those that are double, or too weak, or too coarse, are laid aside; not as altogether useless, but that, being improper for winding, they are reserved to be drawn out into skains. The balls are of different colours; the most common are yellow, orange-colour, isabella, and flesh-colour.—There are some also of a sea-green; others of a sulphur-colour, and others white: but there is no necessity for separating the colours and shades to wind them apart; as all the colours are to be lost in the future scouring and preparing of the *silk*.

To wind the *SILK* from off the balls. Two machines are necessary; the one a furnace, with its copper; the other a reel, or frame, to draw the *silk*.—The winder, then, seated near the furnace, throws into the copper of water over the furnace (first heated and boiled to a certain degree, which custom alone can teach) a handful or two of balls, which have been first well purged of all their loose furry substance. He then stirs the whole very briskly about with birchen rods, bound and cut like brushes; and when the heat and agitation have detached the ends of the *silks* of the pods, which are apt to catch on the rods, he draws them forth; and joining ten or twelve, or even fourteen of them together, he forms them into threads, according to the bigness required to the works they are destined for: eight ends sufficing for ribbands, and velvets, &c. requiring no less than fourteen. The ends thus joined into two or three threads, are first passed into the holes of three iron rods, in the fore-part of the reel, then upon the bobbins, or pullies, and at last are drawn out to the reel itself, and there fastened; each to an end of an arm or branch of the reel. Thus disposed, the workman, giving motion to the reel, by turning the handle, guides his threads; substitutes new ones, when any of them break, or any of the balls are wound out; strengthens them where necessary, by adding others; and takes away the balls wound out, or that having been pierced, are full of water.

In this manner, two workmen will spin and reel three pounds of *silk* in a day; which is an otherguise dispatch than is made by the spinning-wheel, or distaff.—Indeed, all *silks* cannot be spun and reeled after this manner: either by reason the balls have been perforated by the *silk-worms* themselves, or because they are double, or too weak to bear the water; or because they are coarse, &c. Of all these together, they make a particular kind of *silk* called *floretta*: which being carded, or even spun on the distaff, or the wheel, in the manner it comes from the ball, makes a tolerable *silk*.

As to the balls, after opening them with scissars, and taking out the insects (which are of some use for the feeding of poultry) they are steeped three or four days in troughs, the water whereof is changed every day to prevent their stinking.

When they are well softened by this scouring, and cleared of that gummy matter, the worm had lined the inside withal, and which renders it impenetrable to the water, and even to air itself, they boil them half an hour in a lye of ashes, very clear and well strained: and after washing them out in the river, and drying them in the sun, they card and spin them on the wheel, &c. and thus make another kind of *floretta*, somewhat inferior to the former.

The several preparations which *silks* undergo, to fit them to be used in the manufacture of *filken* stuffs, are the spinning, reeling, milling, bleaching and dying.—The two first we have already spoke of, as they are concerned in drawing the *silk* from off the balls.—As to the spinning and reeling of raw *silks* off the balls, such as they are brought hither from Italy, the Levant, &c. the first is chiefly performed on the spinning-wheel; and the latter, either on hand-reels, or on reels mounted on machines, which serve to reel several skains at the same time.—As to the milling, they use a mill composed of several pieces, which may mill two or three hundred bobbins at once, and make them into as many skains. See MILLING. For the bleaching and dying, see BLEACHING and DYING.

*Silk* is distinguished by different names according to its different states.—Thus,

**Raw SILK**, is that taken from the ball, without fire, and wound without any coction: such as is most, if not all, that is brought into England from the Levant.

In the French *silk-works*, the greatest part of this raw *silk* passes for little better than a kind of fine *floretta*; yet, when spun, it makes a bright thread, and serves for the manufacture of stuffs of moderate value and lustre. But the raw *silks* of the Levant, whence most of ours come, are exceeding fine and beautiful.—This difference arises hence, that in France the best balls are spun and wound in boiling water, and only the refuse made into raw *silk*: whereas, in the Levant, there is no such thing as spinning and winding on the fire; but the *silks* are all sent in bales or packs, as they are drawn from off the balls: so that they are only distinguished by their quality of fine, middling, and coarse.

**Boiled SILK**, is that which has been boiled in water, to facilitate the spinning and winding.—This is the finest of all the sorts of *silk* manufactured in France, and is seldom used, but in the richest stuffs; as velvets, taffaties, damasks, brocades, &c.

There is also another kind of *boiled silk*, which is prepared by boiling, to be milled; and which cannot receive that preparation, without being first passed through hot water.

By the laws of France, it is prohibited to mix raw with *boiled silk*; both as such a practice spoils the dying, and as the raw *silk* corrupts and cuts the boiled.

**Thrown or twisted SILKS**, are such, as, beside their spinning and winding, have received their milling or throwing.

This they receive in a different degree, as they are passed oftener, or seldomer, over the mill: properly, however, *thrown silks*, are those wherein the threads are pretty thick thrown, and are twisted several times.

**Slack SILKS** are such as are not twisted, but are prepared, and dyed, for tapestry, and other works, with the needle.

**Eastern, or East-Indian SILK**.—That particularly thus called, is not the work of the *silk worms*, but comes from a plant that produces it, in pods, much like those of the cotton-tree. The matter this pod contains is extremely white, fine, and moderately glossy: it spins easily, and is made into a kind of *silk*, that enters the manufacture of several Indian and Chinese stuffs.

**French SILKS**.—It is only in the most southern provinces of France, that *silk* is cultivated, mulberry-trees planted, and worms bred. The principal are those of Languedoc, Dauphine, Provence, Avignon, Savoy and Lyons.—This last place, indeed, furnishes very few *silks* of its own growth; but is the great staple whence the merchants of Paris and the other cities are to fetch them: at least, they are obliged to have them pass through Lyons, if they bring them from elsewhere, either by land or sea.

There are computed to enter Lyons, *communibus annis*, 6000 bales; the bale valued at 160 pound weight: of which 6000 bales, there are 1400 from the Levant, 1600 from Sicily, 1500 from Italy, 300 from Spain, and 1200 from Languedoc, Provence and Dauphine.

At the time when the manufactures of Lyons were in their prosperity, there were reckoned 18000 looms employed in the *silk* manufacture; but they are so fallen, that even in 1698, there were not reckoned 4000.—The decay is not less notable at Tours: they had formerly 700 mills for winding and preparing the *silks*; 8000 looms to weave them, and 40,000 persons employed in the preparation and manufacturing thereof; which are now reduced to 70 mills, 1200 looms, and 4000 persons.

**Sicilian SILKS**.—The commerce of the *silks* of Sicily is very considerable; and the Florentines, Genoese and Luccefe, are the people who chiefly make it. Great quantities are yearly brought thence, especially from Messina; part whereof they use in their own manufactures, and sell the rest to their neighbours, the French, &c. with profit.—The Italians have this

this advantage, especially the Genoese, over other people, that having large establishments in the island, they are reputed as natives, and pay no duty for the export. Part of the *Sicilian silks* are raw; the rest spun and milled; of which last kind, those of St. Lucia and Messina, are the most valued.—The raw, unwrought *silks* are always sold for ready money; the others, sometimes, in exchange for other goods.

*Italian Silks*.—The *silks* brought from Italy are partly wrought, and partly raw, and unwrought. Milan, Parma, Lucca and Modena, furnish none but the latter kind; Genoa most of the former; Boulogna affords both kinds.

*Spanish Silks*, are all raw; and are spun, milled, &c. in England, according to the several works they are to be used in.

*Turky Silks*, are all raw.—One advantage we have in the commerce of the Levant, in *silks*, wanting in those of Sicily, is, that the latter are confined to a particular season of the year; whereas the former are bought at all times. They are brought from Aleppo, Tripoli, Sayda, from the isle of Cyprus, Candia, &c.—But the principal place of commerce, especially for the *silks* of Persia, is Smyrna. The *silks* are brought hither in caravans, from the month of January to September. The caravans in January, are laden with the finest *silks*; those of February and March bring indifferent ones; the rest, the coarsest.

They all come from the several Provinces of Persia, chiefly those of Quilan and Schirvan, and the city of Schamachia, situate near the edge of the Caspian sea; from which three places, a Dutch author assures us, there do not come less than 30,000 bales of *silk* in a year.—Ardeuil or Ardebil, another city of Persia, not far distant from these *silk* countries, is the place where the *silks* are laid up, and whence the caravans set out for Smyrna, Aleppo and Constantinople; and it is this city, with Schamachia, that have always been esteemed the centre of the *silk* trade; which has been several times attempted to be removed from Smyrna and the Mediterranean, in favour of Archangel and the white sea, by carrying them across Muscovy, by the Volga and Dwina, two rivers that traverse the principal provinces of that vast empire.

This new course of the Persian *silks* into Europe, was first proposed by Paolo Centurio, a Genoese, to the czar Basil, under the pontificate of Leo X. The French had the same design in 1626. The duke of Holstein, in 1633, sent ambassadors to the court of Persia purely with the same view: and in 1668, the czar Alexis Michael attempted the thing himself; but was disappointed by the rebellion of the Cossacks, and the surprize of Astracan.

In 1688, the commerce of Persian *silks* had like to have been removed from Smyrna, by an earthquake, which almost overturned the whole city: and, doubtless, the removal had been effected, but for the vigorous means used by the Turks to prevent it.—Smyrna, however, still remains in her ancient possession; and the several nations of Europe continue every year to send their fleets, to fetch away the *silks*; and matters are like to remain so, unless the conquests made by the late czar, along the Caspian sea, enable his successors, as it is certain he himself had such a thing in view, to put this great design in execution.

*China, Japan and Indian Silks*.—Several provinces of China are so fertile in mulberry trees, and their climate so agreeable to the nature of *silk-worms*, that the quantity of *silk* here produced is incredible: the single province of Tchekiam might supply all China, and even a great part of Europe, with this commodity. The *silks* of this province are the most esteemed, though those of Nanquin and Canton be excellent.

The *silk* trade is the principal in China, and that which employs the most hands: but the European merchants, who deal in it, especially in wrought *silks*, are to be careful of the spinning, &c. the waste being usually very great, as the French East-India company lately found to their cost.

Japan would not afford fewer *silks* than China; but that the Japanese, a barbarous and distrustful people, have interdicted all commerce with strangers, especially with Europeans; excepting with the Dutch; who are said to be admitted on certain impious terms, related by Tavernier, but which we must own we cannot credit. Accordingly, the Dutch have endeavoured to vindicate themselves by the pens of several famous writers.

The *silks* of the states of the great mogul, are brought almost wholly from Kafem-bazar, a mediterranean place, whence they are conveyed by a canal of fifteen leagues into the Ganges, by which, they are forwarded fifteen leagues further, to the mouth of the famous river of Indostan.—The *silk* of Kafem-bazar is yellowish; as are also those of Persia and Sicily; there being none, that we know of, naturally white, but that of Palestine. The Indians, however, whiten it with a lye made of the Ashes of a tree, called *Adam's fig-tree*; but as the tree is pretty scarce, the Europeans are forced to take the greatest part of their *silks* in the native yellow.

Kafem-bazar alone, is computed to furnish every year twenty-two thousand bales of *silk*, each bale weighing 100 pounds.

The Dutch buy it almost all up; not to bring it into Europe, no more than they do that of Japan; but to exchange it for other rich merchandizes; particularly bars of silver, &c.

*Spider SILK*.—Within a few years the secret has been found in France, of procuring and preparing *silk* of the webs of spiders; and using it in several manufactures. This discovery is owing to M. Bon, in 1710, who published a dissertation on the subject; whence what follows is extracted. See *Spider-Web*.

Spiders are usually distinguished, either with regard to their colour; as, into black, brown, yellow, white, &c. or with regard to the number, or arrangement, of their eyes; some having 6, others 8, others 10.—But with regard to the *silk-spider*, M. Bon reduces them all to two kinds, those with long legs, and those with short: which last, are those which furnish the raw *silk*.

The *silk-spider* makes a *silk*, every whit as beautiful, glossy, and strong as the *silk-worm*: it spins it out of the anus, around which are five papillæ, or small nipples, and behind these, two others; all muscular, and furnished with sphincters.—These nipples serve, as so many wire-drawing-irons, to form and mould a viscous liquor, which, when dried in the air, after being drawn through them, makes the *silk*.

Each of these nipples, M. Reaumur observes, consists of a number of lesser and insensible ones; which one may be convinced of, by pressing a spider's belly between the fingers, to oblige the liquor to flow into the nipples; for by this means, applying the finger against the anus, several distinct threads will be drawn out through the several perforations of the nipples.—The threads are too fine to be told with any certainty; but M. Reaumur reckons, each larger nipple may send forth six or seven.

Hence we see, how the spiders make their threads bigger, or smaller: for as, before they begin to spin, they always apply more or fewer of these six nipples, against the body whence the web is begun; or as they apply each more or less strongly, so as more or fewer of the minuter nipples come to take; the thread thus spun, will be a compound of more or fewer of the single threads. Indeed, as the threads come from the anus, all joined together, they appear to be single; but M. Bon has distinguished one of the single ones to consist of 15 or 20 distinct threads.

The threads are of two kinds: the first is weak, and only serves for that kind of web wherewith they catch flies.—The second is much stronger, and serves to wrap up their eggs in; which by this means, are sheltered from the cold, as well as from insects, which might otherways gnaw and spoil them. These threads they wind very loosely round the eggs, resembling the balls or bags of *silk-worms*, that have been prepared and loosened for the distaff.

The spider-bags are of a grey colour when new; but turn blackish when long exposed to the air: indeed, one might find other spider-bags of other colours, and which would afford a better *silk*, but their scarcity would render the experiment difficult; for which reason we confine ourselves to the bags of the commonest spiders, which are the short-legged kind.—These always find out some place secure from the wind and rain, to make their bags; as, hollow trees, the corners of windows, or vaults, or under the eaves of houses.

By collecting a quantity of these bags, a new *silk* is made, inferior in nothing to the common *silk*. It takes all kinds of dyes, and may be made into all kinds of stuffs.—M. Bon had stockings and gloves made of it, which he presented to the academy; and others to the royal society.

For the manner of preparing the bags to get the *silk*, it is thus: after having gathered 12 or 13 ounces of these bags, M. Bon had them well beaten for some time, with the hand, and a stick, to get out all the dust: he then washed them, in luke-warm water, till they left the water very clean: after this, he laid them to steep, in a large vessel, with soap and salt petre, and gum-arabic. The whole was left to boil over a gentle fire, for three hours. The bags were next washed, in warm water, to get out the soap; and, after all, laid to dry some days, to fit them for carding; which was performed by the common *silk-carders*, but with cards much finer than ordinary.—By this means, he had a *silk*, of a very particular ash-colour, which was easily spun, and the thread spun from it, both stronger and finer than that of common *silk*; which shews, that all sorts of works may be made of it: nor is there any reason to fear, but it will stand any trials of the loom, after having passed that of the stocking weavers.

The only difficulty, now, is in procuring a sufficient quantity of spiders bags to make any considerable work of it: which M. Bon observes, would be no difficulty at all, had we but the art of breeding them as they do *silk-worms*. For they multiply much more; every spider laying 6 or 700 eggs, whereas the *silk-worms* do not lay above 100; yet are these last so tender, &c. that one half die without making

any bags, or are hindered by some little accident, from mazing their bags: whereas the spiders hatch of themselves, without any care, in the months of August and September, in fifteen or sixteen days after they are laid; the old spiders that lay them, dying soon after. The young ones thus bred, live ten or twelve months without eating, and continue in their bags without growing, till the hot weather putting their viscid juices in motion, forces them to come forth, spin and run about to seek food.—Were a way, therefore, found of breeding young spiders in rooms, they would, doubtless, furnish a much greater quantity of bags than *silk-worms* do. For of seven or eight hundred young spiders, which M. Bon kept, scarce one died in a year; whereas of one hundred *silk-worms*, not forty lived to make their bags. M. Bon having ordered all the short-legged spiders that could be found in the months of August and September, to be brought to him, shut them up in paper coffins, and pots; covering the pots with papers, which he pricked full of pin-holes, as well as the coffins, to give them air. He fed them with flies, and found sometime afterwards the greatest part of them had made their bags.—The same excellent person found that spiders bags, with regard to their weight, afford much more *silk* than those of the *silk-worms*: as a proof hereof, he observes, that thirteen ounces yield near four ounces of clear *silk*, two ounces whereof will make a pair of stockings; whereas stockings of common *silk* weigh seven or eight ounces.

Nor is there any venom in the *silk*, or even in the spider, as many have imagined. M. Bon has been bit by them several times, without any manner of harm; and as for the *silk* it is used with very good success, to stop bleeding and cure wounds, the natural gluten thereof acting as a kind of balsom.—It likewise yields, by distillation, several specific medicines, particularly great quantities of spirit, and volatile salt, which being prepared after the same manner as that drawn from the bags of *silk-worms*, in making the guttæ Anglicanæ, or English drops, so famous over all Europe; may serve to make other drops of greater efficacy, which M. Bon calls *drops of Montpellier*, to be used in all sleepy diseases. See GUTTÆ.

M. Reaumur being appointed by the royal academy, to make a further enquiry into this new *silk-work*, has raised several objections and difficulties against it; which are found in the memoirs of the academy for the year 1710. The sum of what he has urged, amounts to this.—The natural fierceness of the spiders, renders them unfit to be bred and kept together: four or five thousand being distributed into cells, 50 in some, 100 or 200 in others; the big ones killed and eat the less, so that in short time, there were scarce left one or two in each cell: and to this inclination of mutually eating one another, M. Reaumur ascribes the scarcity of spiders, considering the vast number of eggs they lay.

But this is not all: he even affirms, that the spider's bag is inferior to that of the *silk-worm*, both in lustre and strength; and that it produces less matter to be manufactured. The thread of the spider's web only bears a weight of two grains without breaking; that of the bag bears 36. The latter, therefore, in all probability, is eighteen times thicker than the former; yet is it weaker than that of the *silk-worm*, which bears a weight of two drams and a half. So that five threads of the spider's bag must be put together to equal one thread of the *silk-worm's* bag.

Now, it is impossible these should be applied so justly over one another, as not to leave little vacant spaces between them, whence the light will not be reflected; and of consequence, a thread thus compounded, must fall short of the lustre of a solid thread. Add to this, that the spider's thread cannot be wound off, as that of the *silk-worm* may; but must, of necessity, be carded; by which means being torn in pieces, its evenness, which contributes much to its lustre, is destroyed. In effect, this want of lustre was taken notice of by M. de la Hire, when the stockings were presented to the academy.

Again, spiders furnish much less *silk* than the worms: the largest bags of these latter, weigh four grains; the smaller three grains; so that 2304 worms, produce a pound of *silk*. The spiders bags do not weigh above one grain: yet, when cleared of their dust and filth, lose two thirds of their weight. The work of 12 spiders, therefore, only equals that of one *silk-worm*; and a pound of *silk* will require at least 27648 spiders. But, as the bags are wholly the work of the females, who spin them to deposit their eggs in; there must be kept 55296 spiders, to yield a pound of *silk*. Yet will this only hold of the best spiders, those large ones ordinarily seen in gardens, &c. scarce yielding a twelfth part of the *silk* of the others. 280 of these, he shews, would not do more than one *silk-worm*; and 663552 of them would scarce yield a pound.

**SILLON**, in fortification, an elevation of earth made in the middle of the moat, to fortify it, when too broad. See DITCH.

The *sillon* is more usually denominated *envelope*. See ENVELOPE.

**SILVER**, a white, rich sort of metal; being the finest, pur-

est, most ductile, and most precious of all metals, except gold. See METAL.

There are *silver mines* in all the four quarters of the world. Europe has its share; nor is our own island quite destitute thereof, though it has none of much value.

The mines of Peru, and some other parts of America, are much the richest, and most abundant; they appear almost inexhaustible; particularly those of Potosi, which continue to be dug with equal advantage as when first discovered; with this only difference, that the veins which were then almost in the surface of that famous mountain, are now sunk to prodigious depths, the workmen going into them by a painful descent of four or five hundred steps.—Many millions of Indians have perished in them; and prodigious numbers continue to be destroyed yearly.

The ores, or mineral stones they dig, are not all of the same quality, consistence, or colour: some are white, or ash-coloured, spotted with red, or blue; and called *plata blanca*: others are black, and called *plomo-ronco*: these last are the richest, and the easiest wrought; no mercury being here needed; nor any thing, but to put them in the fire: where the lead evaporating, leaves the *silver* pure. The Indians, who, till the arrival of the Spaniards, knew nothing of the use of mercury, melted none but of this kind of mineral.—The *rossiller*, is another black mineral distinguished by whetting and rubbing it against iron, which turns it red. It is very rich and, the metal it yields, of the best sort. The *zoroché* burns like talc, and looks as if *silvered*; though it does not yield much. The *paco* is a yellow red, very soft, and found almost broke in pieces; it is not rich. The *cobrisso* is green, and half friable. Though the *silver* of this be visible, yet it is exceedingly difficultly drawn from it, by reason of the copper wherewith it is intermixed. Lastly, the *arannea*, which is only found in Potosi, and that only in the mine of Cotamito, consists of threads of pure *silver*, interwove like a *silver* galloon, that has been burnt to get out the silk. The *silver veins*, of what quality soever, are usually richer in the middle, than towards the extremes: but the richest places are those where the veins intersect.—It is reckoned a great addition to the richness of a mine to be near a river, for the advantage of mills to grind ore. At Lipes and Potosi, for instance, the caxon of ore must yield ten marks to defray expences; whereas, at Tanava, there need not above five.

The most usual way of separating the *silver* from the ore, is by what they call *pinca's*. See PINEA.—Sometimes, however, they use nothing but fire frequently repeated: or aqua fortis.

What renders the working of the mines exceedingly dangerous, is the exhalations arising from them; which are even felt on the out-side; and make an impression on animals grazing in the neighbourhood; but in the in-side, stupify the miners, none of whom can bear so poisonous an air above a day together. Sometimes it is so fatal, that it kills on the spot; and obliges them to stop up the veins again, whence it exhales.—The mines of Potosi, are much the least subject to them; and yet, without the herb paraguay, the infusion whereof is taken by the miners, as we do that of tea, those mines must be soon abandoned.

Though the mines of Potosi and Lipes, still keep up their reputation, yet are there several discovered within these few years, that exceed them much in richness: such are the mines of Oruro, eight leagues from Arica, and those of Ollachea, near Cusco, opened in 1712.—It is remarkable, that most of the mines in America, are found in cold and barren places.

The method of separating *silver* from the ore, in Europe, is the same as that of gold: that is, by means of quick-silver; with this difference, that for *silver*, to every fifty hundred weight of ore, is added one hundred weight of rock-salt, or some other natural salt.—That curious operation may be seen at length under the article GOLD.

To separate the *silver* from the mercury, wherewith it is amalgamated; they have a furnace open a-top; and the aperture covered with a kind of capital made of earth, of a cylindrical form; that may be clapped on, or taken off at pleasure.—The mass of *silver*, and mercury, being laid in the furnace, the capital applied, and the fire lighted underneath; the quick-silver raised by the action of the fire, in form of vapour, is caught in the capital, and taken thence, to be used in a second operation.

The standard of fine *silver* is 12 penny-weights, each consisting of 24 grains. When it is below this, it must be raised to it by refining; which is usually performed by means of lead.—In order to this, a coppel is filled with a mixture of brick-ashes, and ashes of a bullock's or other bones. It is set on the fire, and heated red hot; in which state the lead is put in, and when this is melted, the *silver*, in the proportion of a pound of lead to four or five ounces of *silver*, and even somewhat more lead, if the *silver* be very coarse. As these two metals melt together, the copper, before mixed with the *silver*, dissipates in smoke, or goes away with the scum and litharge; and so does the lead itself; leaving the *silver* alone in the coppel, in its proper degree of fineness. See LITHARGE.

In

In this method of refining, wherein 6 or 7000 pounds may be refined at once; the metal is drawn out of the coppel two ways; the one by plunging in it, while still liquid, a thick bar of iron, round which, the *silver* sticks in form of a shell, or crust; repeating this again and again: the other, is by letting the coppel stand till it be cold; in the bottom whereof, the *silver* fixes in form of a cake.

Besides the refining of *silver* with lead, there is another manner of doing it with salt-petre; which see under the article **REFINING**.

But both the one and the other are tedious and troublesome; when performed on large quantities. This occasioned M. Homberg to endeavour to shorten the operation; which he effected with good success.—His method is; to calcine the *silver* with half its weight of common sulphur; and after melting the whole together, to cast a quantity of steel filings upon it at several times: upon this, the sulphur quits the *silver*, and joins itself to the iron, and both are converted into scoria, which swim on the *silver*; and the metal itself is found pure at the bottom of the crucible.

The essay of *silver* is also made by the coppel, in the same manner as the refining by lead. If the *silver*, after this essay, preserve its weight, it is standard; if it lose, the grains, or even penny-weights of its diminution, are accounted. See **ESSAY**. See also **STANDARD**.

**SILVER wire**, is *silver* drawn through the holes of a wire-drawing-iron, and by this means reduced to the fineness of a thread or hair.—The manner of drawing it, see under the article **GOLD-WIRE**. See also **WIRE** and **DRAWING**.

**SILVER leaf**, is that which the gold-beaters have reduced into fine, thin leaves, to be used by gilders, &c. See **GOLD-LEAF**.

**Shell SILVER**, is made of the threads of *silver* leaves, or of the leaves themselves: used in painting, and *silvering* certain works.—It is prepared after the same manner as shell-gold. See **GOLD**.

**SILVER**, in chymistry, is called *luna*, moon; and several preparations are made from it: particularly, a

**Tincture of SILVER**, made by dissolving thin *silver* plates, or *silver* shot in spirit of nitre; and pouring the dissolution in another vessel full of salt-water. By this means, the *silver* is immediately precipitated in a very white powder, which they wash several times in spring-water. This powder they put in a matras; and pour rectified spirit of wine, and volatile salt of urine upon it. The whole is left to digest in a moderate heat for fifteen days; during which, the spirit of wine assumes a beautiful sky-blue colour, and becomes an ingredient in several medicines.—This is also called *potable silver*, *argentum potable*.

*Silver* is likewise converted into crystals, by means of the same spirit of nitre; and it is this is called *vitriol of silver*. See **CRYSTAL**.

The *lapis infernalis argenteus* is nothing but the crystals of *silver* melted with a gentle heat in a crucible; and then poured into iron moulds.

<i>Alc SILVER,</i>	} See	<i>Alc silver.</i>
<i>Herring SILVER,</i>		<i>HERRING.</i>
<i>King's SILVER,</i>		<i>KING's silver.</i>
<i>Rep SILVER.</i>		<i>REP silver.</i>
<i>White hart SILVER,</i>		<i>WHITE HART silver.</i>

*Quick SILVER.* See the article **MERCURY**.

**SILVERING**, the covering of any work with silver-leaf. See **SILVER-leaf**.

It is usual to silver metals, wood, paper, &c. which is performed either with fire, oil, or size. Metal-gilders silver by the fire: painter-gilders, all the other ways. See **GILDING**.

**SILVESTRIS**, or **SYLVESTRIS**, a red grain or seed used by some to dye in scarlet. See **DYING** and **SCARLET**.

The tree that produces it, is peculiar to the province of Guatimala in New Spain: it is not unlike that which produces the cochineel, only in this, that the fruit containing the grain is somewhat longer than that of the cochineel-tree.—When the fruit of the former is ripe, it opens of itself, and casts out its seed upon a gentle shaking; and the Indians gather it in earthen plates set under the tree for the purpose.

Eight or ten of these fruits do not yield above an ounce of seed; whereas four of the cochineel fruits yield an ounce of insects.—The two drugs are much like one another, as to the eye, but prove very different; the tincture of cochineel being infinitely more beautiful than that of the *silvestris*. See **COCHINEEL**.

**SIMA**, or **CYMA**, in architecture, a term used by Wolfius, and some other writers, for what we otherwise call *cymatium* or *simatium*. See **CYMA** and **CYMATIUM**.

**SIMATIUM**, or **SIMATISE**, in architecture. See **CYMATIUM**.

*Simatium* and *cymatium*, are generally confounded together; yet they ought to be distinguished: the latter being the genus and the former the species.—*Simatium* of *lima*, camous, according to Felibien, is the last and uppermost member of grand corniches, called particularly the great *doucine*, or *gula recta*; and by the Greeks, *epistheta*.

In the antique buildings, the *simatium*, a-top of the Doric cornice, is generally in form of a cavetto, or semi-scotia; as we see particularly in the theatre of Marcellus.—This, some modern architects have imitated; but in the Ionic order, the *simatium* is always a *doucine*.

The *simatium*, or *doucine*, then, is distinguished from the other kinds of *cymatia*, by its being camous, or flat-nosed. See **DOUCINE**.

**SIMELIUM**\*, a Latin term, used by some to signify a table, with ranges of little cavities therein, for the disposing of medals in chronological order. See **MEDAL** and **SERIES**.

\* The word is but ill wrote: it should rather be *cimelium*; as being formed of the Greek *κειμηλιον*, curiosities, or a cabinet of precious things.

We more usually say, a cabinet of medals, than a *simelium*. **SIMILAR**, in arithmetic and geometry, the same with *like*. See **LIKE**.

Those things are said to be *similar*, or *like*, which cannot be distinguished but by their com-presence; that is, either by immediately applying the one to the other, or some other third to them both. So that there is nothing found in one of the *similar* things, but is equally found in the other.

Thus, if you note all the things in A, which may be discerned and conceived, without assuming any other; and, in like manner, note all the things in B, which may be thus conceived: and A be *similar* to B; all things in A will be the same with those in B.

Since a quantity cannot be understood, otherwise, than by assuming some other quantity to refer it to; *similar* things notwithstanding their similitude, may differ in quantity: and since, in *similar* things, there is nothing wherein they differ, beside the quantity; quantity itself is the internal difference of *similar* things. See **SIMILITUDE**.

In mathematicks, *similar* parts, as A a, have the same ratio to their wholes B b; and if the wholes have the same ratio to the parts, the parts are *similar*.—*Similar parts* A a, are to each other as their wholes B b. See **PART**.

**SIMILAR angles**, are also equal angles.—In solid angles, when the planes, under which they are contained, are equal both in number, and magnitude, and are disposed in the same order; they are *similar*, and consequently equal. See **ANGLE**.

**SIMILAR rectangles**, are those which have their sides about the equal angles, proportional. See **RECTANGLE**.

Hence 1°. All squares must be *similar rectangles*. See **SQUARE**.

—2°. All *similar rectangles* are, to each other, as the squares of their homologous sides.

**SIMILAR triangles**, are such as have all their three angles respectively equal to each other. See **TRIANGLE**.

Hence 1°. All *similar triangles* have their sides about the equal angles, proportional.—2°. All *similar triangles* are, to each other, as the squares of their homologous sides.

In *similar triangles*, and parallelograms, the altitudes are proportional to the homologous sides; and the bases are cut proportionably by those sides. See **TRIANGLE**, &c.

**SIMILAR polygons** are those, whose angles are severally equal, and the sides about those angles proportional.

And the like of other *similar* rectilinear figures. See **POLYGON** and **RECTILINEAL figure**.

Hence, all *similar polygons* are, to each other, as the squares of the homologous sides.

In all *similar figures*, the homologous angles are equal; and the homologous sides proportional. All regular figures, and *similar* irregular ones, are in a duplicate ratio of their homologous sides. Circles, and *similar* figures, inscribed in them, are, to each other, as the squares of the diameters. See **FIGURE**.

**SIMILAR arches**, are such as contain like, or equal parts of their respective circumferences. See **ARCH**.

**SIMILAR segments of circles**, are such as contain equal angles. See **SEGMENT**.

**SIMILAR conic-sections**, are those where the ordinates to a diameter in one are proportional to the correspondent ordinates to the *similar* diameter in the other; and where the parts of *similar* diameters between the vertices and ordinates in each section are *similar*. See **CONIC**.

The same definition also agrees to *similar* segments of conic sections. See **SEGMENT**.

**SIMILAR plain numbers**, are those which may be ranged into *similar* rectangles; i. e. into rectangles, whose sides are proportional: as 6 multiplied by 2, and 12 by 4; the product of one whereof is 12, and the other 48, are *similar numbers*.

**SIMILAR solid numbers**, are those whose little cubes may be so ranged, as to make *similar* and rectangular parallelepipeds.

**SIMILAR disease**, in medicine, denotes a disease of some simple, solid part of the body.—As of a fibre, with regard to its tension, or flaccidity; of a membrane; a nervous canal, or the like. See **DISEASE**.

**SIMILAR parts**, in anatomy, are those parts of the body which, at first sight, appear to consist of like parts, or parts of the same nature, texture and formation. See **PART**.

Of these we usually reckon ten, viz. the bones, cartilages, ligaments,

ligaments, membranes, fibres, nerves, arteries, veins, flesh, and skin: each of which see under its proper article.

Dr. Grew, in his anatomy of plants, observes, that these have, likewise, their *similar*, and organical parts. See PLANT, &c.

**SIMILE**, or **SIMILITUDE**, in rhetoric, a comparison of two things, which, though different in other respects, yet agree in some one.—As, He shall be like a tree planted by the water-side, &c.

The difference between a *simile* and a *comparison*, consists in this; that the *simile* properly belongs to what we call the quality of the thing, and the comparison to the quantity. See COMPARISON.

**SIMILITUDE**, in arithmetic, geometry, &c. denotes the relation of two things similar to each other; or which are only distinguishable by com-presence. See SIMILAR.

The notion of *similitude*, which now makes some figure in geometry, &c. is owing to M. Leibnitz: it will be rendered easy by the following instance.—Suppose two watches perfectly alike; the one belonging to Caius, the other to Gracchus. If, now, Caius pull out his watch in presence of Gracchus; the latter will be surprized, and fancy it his own; but he will perceive it different from his own, upon pulling out his own: that is, Gracchus distinguishes Caius's watch from his own, by their com-presence; or, by applying the one immediately to the other.

Euclid, and after him most other authors, demonstrate every thing in geometry from the sole principle of congruity.—Wolffius, in lieu hereof, substitutes that of *similitude*; which, he tells us, was communicated to him by M. Leibnitz, and which he finds of very notable use in geometry, as serving to demonstrate many things directly, which are only demonstrable from the principle of congruity, by an ambages. See CONGRUITY.

**SIMONIACAL**, is applied to a person guilty of simony; that is, of purchasing a benefice, or other sacred matter, with money. See SIMONY.

A *simoniacal* person convicted, is infamous, and incapable of holding any benefice. See BENEFICE, DISABILITY, &c.

**SIMONIANS**, a sect of ancient hereticks, the first that ever disturbed christianity; if they might be said to do so, who were little more than mere philosophers, and chiefly made profession of magic. See HERESY and MAGIC.

Simon Magus, so often mentioned in the Acts, was their leader, and died under the emperor Nero; St. Peter still surviving: so that Clemens Alexandrinus is mistaken, when he makes Simon posterior to Marcion.

St. Epiphanius says expressly, that the first heresy was set on foot by Simon the magician, born in a little city of Samaria, who pretended to be the great virtue and power of God, sent from heaven to earth. Among the Samaritans he made himself pass for God the Father; and among the Jews, for the Son.—He patched up a kind of medley system, out of the philosophy of Plato, the religious fables of the heathens, and christianity: particularly, from the Platonists he borrowed abundance of things relating to the worship of angels, which he perverted to magical uses; pretending, there was no salvation, but by the invocation of angels, who were, as it were, the mediators between God and man: to which superstitious worship of angels it is that St. Paul seems to allude in his epistle to the Colossians.

The gnosticks, whereof the same Simon was the father, adopted the same practice of worshipping angels, and even improved on it. See Gnosticks.

**SIMONY**\*, **SIMONIA**, the crime of trafficking with sacred things; particularly of purchasing a benefice with money. See BENEFICE.

\* The word is borrowed from Simon Magus, who is mentioned in the Acts of the apostles, as offering to buy the power of working miracles with money.

By the English canons, Anno 1229, *simony* is not only committed by an agreement for money in hand, or to be paid yearly; but by any other profit or emolument; any reward, gift, or benefit, directly or indirectly; or by reason of any promise, grant, bond, &c. and this, either in the acceptance of a living, or in an exchange or resignation.

The penalty, by our laws, is, that the corrupt patron shall forfeit the next presentation to the king, and two years value of the living; and the corrupt incumbent, be for ever disabled to hold the living.

**SIMONY** is also committed by buying, or selling the sacrament, baptism, ordination, or absolution; as well as by the nomination and collation to a benefice, a place in a monastery, or the like.

Some have pretended it to be sufficient to avoid the charge of *simony*, if only the ordination were gratuitous, though the revenues were bought and sold as a temporal thing.—But the canons of several councils have condemned this subtle distinction; since the revenues are attached to an ecclesiastical office purely spiritual.

Casuits distinguish three kinds of *simony*, viz.

**Mental SIMONY**, is that which sticks in the mere will, and inclination, without ever breaking forth into act. As when

a present is made to a collator, without taking any notice that we expect a benefice from him.—This kind of *simony* is only punishable in *foro conscientiae*.

**Conventional SIMONY** is where there is an express act, and a formal bargain, though it never come to an execution.

**Real SIMONY**, is where the convention is executed on both sides; which last is the most criminal of all.—The canonical penalty of *simony* is deposition in a clerk, and excommunication in a layman.

It is a maxim among the Romish canonists, that there is no *simony* in the court of Rome; in regard, the pope acts there as an absolute sovereign: they also say, that resignations *in favorem*, are not to be admitted but by the pope, as favouring a little of *simony*. On these occasions, however, the parties swear, that there has been no deceit, collusion, *simony*, or other illegal covenant.

Peter Damain distinguishes three kinds of *simony*: that of money, that of the tongue, and that of services.

**SIMONY of money**, or *per munus, a manu*, is where money is really paid down for a benefice: he adds, that the same is likewise committed, by expending money to live at court to obtain a benefice.

**SIMONY of the tongue**, or *per munus a lingua*, consists in flattering the collator, or making one's self agreeable by complaisance and commendation.

**SIMONY of services**, or *per munus ab obsequio*, consists in the doing them good offices to obtain a benefice.

It was agreed, by all the Justices, *Trin. oct. Jac. primi*, that if the patron presented any person to a benefice with cure, for money; such presentation, &c. is void, though the presentee were not privy to it: and the statute gives presentation to the king; but this is now repealed.

**SIMPLARY**, **SIMPLARIS**, in antiquity, a Roman soldier, who had only single pay.—Thus called, in opposition to the *duplares*, or such as had double pay.

**SIMPLE**, **SIMPLEX**, something not mixed, or compounded: in which sense it stands opposed to *compound*. See COMPOUND. The elements are *simple* bodies, from the composition whereof all mixed bodies result. See ELEMENT and BODY.—Hence also

SIMPLE affection,	} See the articles	AFFECTION.
SIMPLE form,		FORM.
SIMPLE modes,		MODE.
SIMPLE necessity,		NECESSITY.
SIMPLE opposition,		OPPOSITION.
SIMPLE taste,		TASTE.
SIMPLE vision.		VISION.

In geometry we say, the most *simple* demonstrations are the best: the *simplest* machines are the most esteemed. See MACHINE, &c.

In pharmacy there are *simple* remedies, and compounds; the former of which are usually preferable to the latter. See REMEDY and MEDICINE.

SIMPLE diachylon,	} See the articles	DIACHYLON.
SIMPLE diacodium,		DIACODIUM.
SIMPLE diamorum,		DIAMORUM.
SIMPLE diaprurnum,		DIAPRURNUM.
SIMPLE dropax,		DROPAX.
SIMPLE fomentations,		FOMENTATION.
SIMPLE hydromel,		HYDROMEL.
SIMPLE oxymel,		OXYMEL.
SIMPLE waters.		WATER.

In grammar, we have *simple* words, or primitives; and compounds, which have some particle added to them. See WORD, PRIMITIVE, &c. See also SENTENCE.

In jurisprudence, they say, a *simple* donation, in opposition to a mutual or reciprocal one: a *simple* sale, in opposition to that made with a reservation of the faculty of redemption: *simple* homage, in opposition to liege homage. See HOMAGE, &c.

SIMPLE average,	} See the articles	AVFRAGE.
SIMPLE benefice,		BENEFICE.
SIMPLE charter,		CHARTA.
SIMPLE church,		CHURCH.
SIMPLE deposit,		DEPOSIT.
SIMPLE estate,		ESTATE.
SIMPLE fee,		FEE.
SIMPLE force,		FORCE.
SIMPLE resignation,		RESIGNATION.
SIMPLE vassalage,		VASSALAGE.

**SIMPLE**, in botany, is a general name given to all herbs and plants; as having each its particular virtue, whereby it becomes a *simple* remedy.

The *simples* brought from the Levant, and the East-Indies, were not known among us till about the year 1200.

**SIMPLE flowers**. See the article FLOWER.

SIMPLE anomaly,	} See the articles	ANOMALY.
SIMPLE fossils,		FOSSIL.
SIMPLE glands,		GLAND.
SIMPLE ulcer,		ULCER.

**SIMPLE equation** in algebra, is an equation where the unknown quantity is only of one dimension.—E. gr.  $x = (a + b) : 2$ . See EQUATION.

SIMPLE

**SIMPLE flank,**  
**SIMPLE fraction,**  
**SIMPLE motion,**  
**SIMPLE pendulum,**  
**SIMPLE quadratics.** See the article **QUADRATIC**.  
**SIMPLE quantities,** in algebra, are such as have but one sign: as,  $2a$ , or  $-2b$ .

By which they stand opposed to compound quantities, which have several signs: as,  $a+b$ ; or  $d-a+b$ . See **COMPOUND**.

**SIMPLE surd,**  
**SIMPLE tenaille,**  
**SIMPLE wheel,**

See the articles } **SURD.**  
 } **TENAILLE.**  
 } **WHEEL.**

**SIMPLE,** in music, is chiefly used in opposition to *double*; sometimes to a compound of several parts, or figures of different values, &c. See **DOUBLE** and **COMPOUND**.

**SIMPLE cadence,** is that where the notes are all equal through all the parts. See **CADENCE**.

**SIMPLE concords,** are those, wherein we hear at least two notes in consonance; as a third and fifth; and of consequence, at least three parts. See **CONCORD**.—This is either done immediately, and called the *harmonical triad*; or in a more remote manner; that is, when the sounds, that are not bass, are one or two octaves higher.—This distance has no ill effect in the third; but in the fifth it has; and generally speaking, the nearer or more immediate the concords are, the better.

They also say, *C simple* or plain, in opposition to *c accented*.

**SIMPLE counter-point,** is a harmonical composition, wherein note is set against note; in opposition to figurative counter-point. See **COUNTER-POINT**.

**SIMPLE diess.** See the article **DIESIS**.

**SIMPLE fugue,** or **SIMPLE imitation,** is, when one part imitates the singing of another for some measures. See **IMITATION** and **FUGUE**.

**SIMPLE harmony,**  
**SIMPLE interval,**  
**SIMPLE sounds,**  
**SIMPLE triple,**  
**SIMPLE fencing,**  
**SIMPLE history,**  
**SIMPLE style,**

See the articles } **HARMONY.**  
 } **INTERVAL.**  
 } **SOUND.**  
 } **TRIPLE.**  
 } **FENCING.**  
 } **HISTORY.**  
 } **STYLE.**

**SIMPLIFYING,** in ecclesiastical matters, is the taking away of a cure of souls from a benefice, and dispensing the beneficiary from residence. See **BENEFICE** and **CURE**.

Several benefices, which have been *simplified*, now require residence; and an infinity of others, which required residence, have been *simplified*.

Some use the word in a more extensive signification, viz. for the shortening a relation, &c. or retrenching every thing not precisely necessary: when the matter or fact shall be *simplified* and stripped of its vain circumstances, the court will see, &c.

**SIMPLUDIARIA\***, in antiquity, a kind of funeral honours paid to the deceased at their obsequies. See **FUNERAL**.

\* The word is formed from the Latin *simplex* and *ludus*, whence *simpludiaria* or *simpliludaria*, q. d. simple games.

Some will have *simpludiaria* to be the funerals, at which games were exhibited: such is the sentiment of Paulus Diaconus. Festus says, they were those, in the games whereof nothing was seen but dancers, and leapers, called *corvitores*; who, according to M. Dacier, were persons who run along the masts and yards of vessels or boats, called *corbes*.

In other respects, those two authors agree as to the kind of funerals, called *simpludiaria*, viz. that they were opposite to those call *indictiva*; wherein, besides the dancers and leapers, observed in the *simpludiaria*, there were desultores, or people who vaulted on horses; or, perhaps, horse-races, wherein the cavaliers leaped from horse to horse at full speed. See **GAME**, **DESULTER**, &c.

**SIN,** a breach, or transgression of some divine law, or command. See **LAW** and **TRANSGRESSION**.

Plato defines *sin* to be something void, both of number, and measure: by way of contradiction to *virtue*, which he makes to consist in musical numbers, &c. See **VIRTUE**, **RHYTHMUS**, **NUMBER**, **MEASURE**, &c.

Agreeably hereto, Suarez observes, that an action becomes sinful, by its wanting a due commensuration; for as every thing measured refers to some rule, from which if it deviate, it becomes incommensurate; and as the rule, of man's will is the law of God: so, &c.—Suarez adds, that all evil actions are prohibited by some divine law; and that this is required to the perfection of the divine providence.

Simplicius, and, after him, the schoolmen assert, that evil is not any positive thing, contrary to good; but a mere defect and accident. See **EVIL**.

*Sins* are distinguished into *original* and *actual*. See **ORIGINAL** and **ACTUAL**.

The Romish casuists again distinguish *actual sins* into *mortal*, which are such as make us lose the grace of God; and *venial*, which alone are pardoned, as being only *sins* of infirmity, not of malice. See **VENIAL**.

Divines are not yet agreed what the *sin* against the Holy Ghost is.

VOL. II. N<sup>o</sup>. CXLII.

**SINAI,** knights of. See **CATHARINE**.

**SINAPISM\***, ΣΙΝΑΠΙΣΜΟΣ, in pharmacy, an external medicine, in form of a cataplasm; composed chiefly of mustard-seed pulverized, and mixed up with the pulp of figs; or with briony, garlick, onion, nasturtium, euphorbium, ranunculi, or the like.

\* The word is formed from the Latin, *sinapi*, or Greek *σινάπι*, mustard-seed.

*Sinapisms* excite a redness, heat, itching tumour, and sometimes a blister on the place they are applied to.

They were anciently in great request; and still continue in use for inveterate diseases of the head; long continued de-fluxions, &c.

**SINCIPUT,** or **SYNCIPUT,** is the fore part of the head, reaching from the fore-head to the coronal suture.—See *Tab. Anat. (Osteol.) fig. 2. lit. a. fig. 7. n. 1.* See also **BREGMA** and **CRANIUM**.

**SINDON,** in chirurgery, a little round piece of linnen or silk, or lint, used in dressing the wound after trepanning. See **TREPANNING**.

The first thing usually done after the operation of trepanning, is to pour a few drops of white balm on the dura mater: then a spoonful of mel-rosatum, being warmed with a little balsam, a *sindon* is dipt in it, of fine linnen cloth; this is immediately applied upon the dura mater; and, being greater than the hole in the skull, its circumference is thrust all round between the cranium and the membrane: then pledgits of lint are applied, and the hole quite stopped therewith. The next morning, when the dressing is taken off, the brain is never left bare; but as soon as the former *sindon* and lint are removed, new ones are clapped in their room.

**SINE** or **Right SINE,** in trigonometry, a right line drawn from one extremity of an arch, perpendicularly upon the radius drawn from the other extremity; or the *sine* is half the chord of twice the arch. See **ARCH**.

Thus the line AD (*Tab. Trigonom. fig. 1.*) which is half the chord AB, of the double arch, AEB, is the right *sine*; or, simply, the *sine* of the arch AE.

**Whole SINE,** *sinus totus,* is the *sine* of the quadrant HE, or of 90 degrees; that is, the whole *sine* is the same with the radius HC. See **RADIUS**.

**Verfed SINE,** is a part ED of the whole *sine* or radius, intercepted between the right *sine* AD, and the arch AE. See **VERSED** and **COVERSED**.

It is demonstrated, 1<sup>o</sup>. That the right *sine* AD, being perpendicular to the radius EC; all *sines* drawn to the same radius, are parallel to each other.

2<sup>o</sup>. Since the arch AE is the measure of the angle ACE, and AI the measure of the contiguous angle ACI; and the quadrant HE the measure of the right angle; AD is also the right *sine*, and ED the verfed *sine* of the angles ACE and ACI; and the whole *sine* is the *sine* of the right angle.

3<sup>o</sup>. Two angles contiguous, as ACE and ACI, have the same *sine*.

4<sup>o</sup>. The *sines* of obtuse angles are the same with those of their complements to two right angles.

5<sup>o</sup>. All *sines* of similar arches have the same ratio to their radii.

**SINE-Complement,** or **Co-SINE,** is the *sine* of an arch AE, which is the complement of another arch AH, to a quadrant. See **CO-SINE**.

Thus also the *sine* of the arch AH, is called the *sine-complement*, of the arch AE.

In estimating the quantity of *sines*, &c. we assume radius for unity; and determine the quantity of the *sines*, tangents, and secants in fractions thereof.—From Ptolemy's *Almagest*, we learn, that the ancients divided the radius into 60 parts, which they called degrees, and thence determined the chords in minutes, seconds, and thirds; that is, in sexagesimal fractions of the radius, which they likewise used in the resolution of triangles. See **SEXAGESIMAL**, **DEGREE**, &c.—The *sines*, or half chords, for ought appears, were first used by the Saracens. See **CHORD**.

Regiomontanus, at first, with the ancients, divided the radius into 60 degrees; and determined the *sines* of the several degrees in decimal fractions thereof. But he afterwards found it would be more commodious to assume radius for 1; and thus introduced the present method into trigonometry.

In the common tables of *sines* and tangents, the radius is conceived, divided into 1000000 parts; beyond which we never go in determining the quantity of the *sines* and tangents.—Hence, as the side of a hexagon subtends the sixth part of a circle, and is equal to radius; the *sine* of 30<sup>o</sup> is 500000.

1<sup>o</sup>. The **SINE AD** being given; to find the *sine-complement*.—From the square of the radius AC subtract the square of the *sine* AD: the remainder will be the square of the *sine-complement* AG: whence, the square root being extracted, gives the *sine-complement*. E. gr. Supposing AC, 1000000, and AD 500000, AG will be found 8660254, the *sine* of 60<sup>o</sup>.

2<sup>o</sup>. The **SINE AD** of the arch AE being given; to find the *sine* of the half arch, or half of AE.—Find the chord of the arch AE (see **CHORD**;) for half of this is its *sine*. Thus, supposing

supposing DG and AD, as in the preceding problem; we shall find the *sine* of the half arch AE, or the *sine* of  $15^{\circ} = 2588190$ .

3°. The *SINE* DG, of the arch DF being given; to find the *sine* DE, of the double arch DB (fig. 7).—Since the angles at E and G are right angles; and the Angle B is common to each triangle BCG and DEB; we shall have BC : CG :: BD : DE : wherefore CG being found by the second problem, and BD being double of DG; DE is found by the rule of proportion.

4°. The *SINES* FG and DE (fig. 8.) of the arches FA and DA, whose difference DF is greater than 45 minutes, being given; to find any intermediate *sine*, as IL.—To the difference FD of the arches, whose *sines* are given: the difference of the arch IF, whose *sine* is required, and the difference of the given *sines* DH; find a fourth proportional: this added to the less given *sine* FG; the aggregate will be the *sine* required.

5°. To find the *SINE* of 45 degrees.—Let HI (fig. 1.) be a quadrant of a circle; then will HCI be a right angle: consequently the triangle, rectangular; therefore  $HI^2 = HC^2 + CI^2 = 2HC^2$ ; wherefore, since HC the whole *sine*, is 10000000; if from  $2HC^2$  squared, 20000000000000, be extracted the square root 14142136; we shall have the chord HI, whose half 7071068 is the *sine* of  $45^{\circ}$  required.

6°. The *SINE* of a minute or 60" FG (fig. 8.) being given; to find the *sine* of one or more seconds MN.—Since the arches AM and AF are very small; AMF may be taken for a right line, without any sensible error in the decimal fraction of the radius wherein the *sine* is expressed; that is, the arches AM and AF may be taken proportional to their chords. Wherefore, since MN is parallel to FG; we shall have AF : FG :: AM : MN: Therefore AF, FG and AM being given, MN is easily had.

To construct a canon of *SINES*.—The *sines* of  $30^{\circ}$   $15^{\circ}$   $45^{\circ}$  and  $36^{\circ}$  (which we have already shewn how to find) being had; we can thence construct a canon of all the *sines* to every minute, or every second. For from the *sine* of  $36^{\circ}$  we find those of  $18^{\circ}$   $9^{\circ}$   $4^{\circ}$   $30'$  and  $2^{\circ}$   $15'$ , by the second problem: the *sines* of  $54^{\circ}$   $72^{\circ}$   $81^{\circ}$   $85^{\circ}$   $30'$  and  $87^{\circ}$   $45'$ , &c. by the first problem. Again, from the *sine* of  $45^{\circ}$ , and the *sine*  $22^{\circ}$   $30'$   $11^{\circ}$   $15'$ , &c. From the *sines* of  $30^{\circ}$ , find the *sines* of  $54^{\circ}$ , find the *sine* of  $12^{\circ}$ . From the *sine* of  $12^{\circ}$ , find the *sines* of  $6^{\circ}$   $30'$   $35'$   $78'$ , &c. From the *sine* of  $15^{\circ}$ , find the *sine* of  $7^{\circ}$   $30'$   $45'$ , &c. till you have 120 *sines* succeeding each other orderly, at an interval of 45 minutes. Between these, find the intermediate *sines* by the 5th problem: thus will the canon be complete.

From the *SINE* of an arch given; to find the tangent and secant. See TANGENT and SECANT.

To find the logarithm of a given *SINE*, see LOGARITHM.

In every triangle, the sides are as the *sines* of the opposite angles. See TRIANGLE.

The *SINE* BC (fig. 9.) and the versed *sine* AB, being given in common measure, not in parts of the radius; to find the arch FC in degrees.—Find the semi-diameter AD. Then in the triangle DBC, besides the right angle B, by the sides AC and DC, we find the angle ADC, which shews the number of degrees in the arch; the double whereof is the arch FC.—This problem is of use in finding the segment of a circle. See SEGMENT.

Artificial *SINE*, denotes the logarithm of a *sine*. See LOGARITHM.

Line of *SINES*, a line on the sector, Gunter's scale, &c. the description and use whereof see under the articles SECTOR and GUNTER'S scale.

*SINE-CURES*, are ecclesiastical benefices without cure of souls. See BENEFICE and CURE.

No church, where there is but one incumbent, can properly be a *sine-cure*: and though the church being down, or the parish being become destitute of parishioners, the incumbent may be thereby necessarily acquitted from the actual performance of publick duty, yet he is still under an obligation to do it, whenever a church shall be built, and there are a competent number of inhabitants; and in the mean while, if the church be presentative, as most such churches are, the incumbent is instituted into the cure of souls.—Such benefices are rather depopulations than *sine-cures*, and it will be proper for the new incumbent to read the 39 articles, and the liturgy in the church-yard, &c. and to do what other incumbents usually do.

But a rectory, or portion of it, may properly be a *sine-cure*, if there be a vicar under him endowed and charged with the cure: in which case it does not come within the statute of pluralities, 21 Hen. VIII. c. 13.

Here therefore no dispensation is necessary to hold the *sine-cure* with a former living: nor need the incumbent read the articles or divine service, as required by 13 Eliz. c. 12, which extends only to a benefice with cure.

A *sine-cure* donative wants no institution and induction; but one presentative must have both; especially if it consist in glebe and tythes, and not in a portion of money; but institution must not run in *curam animarum*, but in *rectoriam*, *sive portionem rectoriae* de AB, &c.

By the above-mentioned statute 21 Hen. VIII. not only prebends, and rectories with vicarages endowed, but deaneries and archdeaconries, are declared to be benefices without cure.

*SINE-DIE*, in law.—When judgment is given against the plaintiff, he is said to be in *miseria pro falso clamore suo*; and for the defendant, it is said, *eat inde sine die*, i. e. he is dismissed the court.

The phrase is also used in parliament, for the adjournment of any debate, without fixing the day when it shall come on again; which is looked upon as a genteeler dismissal of the thing in question.

*SINEW*, properly denotes what we call a *nerve*; though in common speech it is rather used for a *tendon*. See NERVE, TENDON, &c.

*SINGING*, the act of making divers inflexions of the voice, agreeable to the ear, and even correspondent to the notes of a song or piece of melody. See SONG and MUSIC.

The first thing done in learning to *sing*, is to raise a scale of notes by tones and semi-tones, to an octave; and descend again by the same notes; and then to rise and fall by greater intervals, as a 3d, 4th, and 5th; and to do all this by notes of different pitch. See NOTE, SCALE and GAMMUT.

Then these notes are represented by lines and spaces, to which the syllables *fa, sol, la, mi*, are applied, and the pupil taught to name each line and space thereby; whence this practice is usually called *sol-fa-ing*. The nature, reason, defects, &c. whereof, see under the article SOL-FA-ING.

SINGLE echo,	} See the articles	ECHO.
SINGLE <i>sine</i> ,		FINE.
SINGLE position,		POSITION.
SINGLE proposition,		PROPOSITION.
SINGLE rafters,		RAFTER.
SINGLE tenaille,		TENAILLE.

*SINGLES*. See the article PETTY singles.

*SINGULAR number*, in grammar, the first manner of declining nouns, and conjugating verbs; used when we only speak of a single person, or thing. See NUMBER.

The Latins, French, English, &c. have no number but the *singular*, and plural; the Greeks and Hebrews have likewise a dual. See PLURAL, DUAL, &c.

*SINGULAR history*. See the article HISTORY.

*SINGULTUS*, in medicine, a convulsive motion of the midriff, commonly called *hiccup*. See HICUP.

*SINICAL quadrant*, a kind of quadrant furnished with an index, and two sights to take altitudes, &c. by; and, besides, its side, or face, covered over with *sines*, drawn from each side, intersecting each other; whereby the seamen can solve, by inspection, any problem in plain sailing. See SAILING.—Its construction and use, see under the article QUADRANT.

*SINISTER\**, something on, or towards, the left-hand. See HAND and DEXTER.

\* Hence some derive the word *sinister*, *a sinendo*; because the gods, by such auguries, permit us to proceed in our designs. See AUGURY.

*SINISTER* is ordinarily used among us for unlucky.—Though in the sacred rites of divination, the Romans used it in an opposite sense.—Thus *avis sinistra*, or a bird on the left-hand, was esteemed a happy omen: whence in the law of the twelve tables, *Ave sinistra populi magister esto*.

*SINISTER*, in heraldry. The *sinister* side of an escutcheon is the left-hand side. See ESCUTCHEON and POINT.

*SINISTER chief*, is the left angle of the chief. See CHIEF.

*SINISTER base*, is the left-hand part of the base. See BASE.

*SINISTER bend*. See the article BEND.

*SINISTER aspect*, among astrologers, is an appearance of two planets, happening according to the succession of the signs: as, Saturn in Aries, and Mars in the same degree of Gemini. See ASPECT.

*SINISTRI*, a sect of ancient hereticks; thus called, because they held the left hand in abhorrence, and made it a point of religion, not to receive any thing therewith.

What in us, is a piece of civility; in them was a superstition.—Balsamon observes, that they were likewise called *jabbathians* and *novatians*. See SABBATHIANS and NOVATIANS, &c.

*SINON OMNES*, a writ of association, whereby, if all in commission cannot meet at the day assigned; it is permitted, that two, or more of them may finish the business. See ASSOCIATION.

*SINOPER*, *SINOPIS*, in natural history, a native red stone or ruddle. See RUDDLE.

*SINOPE\**, or *SENOPE*, in heraldry, denotes *vert*, or the green colour in armories.—Thus called by the ancient heralds; though Pliny and Liidore, by *color prasinus*, or *sino-ple*, mean a brownish red, such as that of our ruddle. See VERT.

\* F. Menestrier derives the word from the Greek, *prasinakopla*, green armories; by corruptedly retrenching the first syllable, *pra*; which is no new thing among oriental words, witness Salonica for Thessalonica.

*Sinople* is supposed to signify love, youth, beauty, rejoicing and liberty; whence it is, that letters of grace, abolition, legiti-

mation,

timation, &c. are used to be sealed with green wax. See GREEN.

SINOVIA. See the Article SYNOVIA.

SINUOSITY, a series of bends and turns in arches or other irregular figures; sometimes jetting out, and sometimes falling in.—Such is the motion of a serpent, &c.

It is the *sinuosity* of the sea-coasts that forms bays, ports, capes, &c. Du Loir observes, that the course of the river Meander, creeping in a thousand agreeable *sinuosities*, served Dædalus as a model to form his labyrinth by. See LABYRINTH.

SINUOUS ulcers. See the article ULCER.

SINUS, in chirurgery, a little cavity or sacculus, frequently formed by the side of a wound, or ulcer; wherein pus is collected. See Pus.

A *sinus* is properly a cavity in the middle of a fleshy part, formed by the stagnation and putrefaction of the blood or humours, and which has wrought itself some vent or exit.

Deep *sinus's* that slope downwards, Scultetus observes, are difficult to heal: yet that surgeon undertakes to cure any *sinus* in a week, by the medicaments he describes, page 338, and an agglutinative bandage. He adds, that he never comes to the incision, till he finds that the pharmaceutic applications are ineffectual; and that for the dilatation of *sinus's*, he does not use the deceitful scalpel; as being more apt to deceive the operator than the patient.

SINUS, in anatomy, denotes a cavity in certain bones, and other parts, the entrance whereof is very narrow, and the bottom wider and more spacious. See BONE.

Of these *sinus's*, we find several in the divers parts of the body; particularly in the basis of the skull, on the ossa petrosa, where the ancients imagined their use was to render the bones more light.—In several of the joints of the body, they serve to receive the epiphyses of the other bones.

SINUS is also an appellation given to the duplicatures of the dura mater. See DURA MATER.

These *sinus's*, Dr. Drake observes, are venous channels, formed for the re-conveyance of the blood. There are four chiefly considerable, viz. the *sinus longitudinalis*, which running along the middle of the convex part of the brain, sends out a branch on each side, between the brain and cerebellum, called the *lateral sinus's*, and the torcular herophili, formed out of a confluence of the *lateral sinus's*, and pineal gland.—They are all formed of the several venous branches, which return the blood from the brain and cerebellum, and deliver their contents into the jugular veins; whereof they are, as it were, the roots. Their coats are furnished with strong fibres, by means whereof they are dilated by the influx of the venal blood, and again contracted with a reciprocal motion, like the pulse of an artery.—See *Tab. Anat. (Osteol.) fig. 4. lit. bb. cc.* See also the article BRAIN.

SION COLLEGE. See the Article COLLEGE.

SIPHON, or SYHON, in hydraulicks, a crooked tube, one leg or branch whereof is longer than the other; used in the raising of fluids, emptying of vessels, and in various hydrostatical experiments.

The word in the original Greek, *σιφων*, signifies, simply, *tube*; whence some apply it to common tubes or pipes.—Wolfius, particularly describes two vessels under the name of *siphons*; the one cylindrical in the middle, and conical at the two extremes, the other globular in the middle, with two narrow tubes fitted to it, axis-wise; both serving to take up a quantity of water, &c. and to retain it when up.

But the most useful and celebrated *siphon* is that which follows. A crooked tube ABC (*Tab. Hydraulicks, fig. 2.*) is provided, of such a length, and with such an angle, as that when the orifice A, is placed on an horizontal plane, the height of AB, may not exceed 30 foot. For common uses, a foot, or half a foot high, suffices.—If, now, the less arm AB, be immersed in water, or any other liquid, and the air be sucked out of it by the aperture C, till the liquor follow; the liquor will continue to flow out of the vessel, through the tube BC; as long as the aperture A is under the surface of the liquor.

Note, instead of sucking out the air, the event will be the same, if the *siphon* be at first filled with the fluid, and the aperture C stopped with the finger, till the aperture A be immersed.

The truth of the phenomenon is known by abundance of experiments: nor is the reason of part of it far to seek. In sucking, the air in the tube is rarified, and the equilibrium destroyed; consequently the water must be raised into the lesser leg AB, by the preponderating pressure of the atmosphere.

The *siphon* being thus filled, the atmosphere presses equally on each extremity thereof; so as to sustain an equal quantity of Water in each leg: but the air not being able to sustain all the water in the longer leg, unless it exceed 32 feet in height; it will be more than able to sustain that in the shorter leg; with the excess of force, therefore it will raise new water into the shorter leg; which new water cannot make its way, but by protruding the first before it. By this means is the water continually driven out at the longer leg, as it is continually raised by the shorter. See FLUID.

But Wolfius, and some other authors assert, that the water continues to flow through the *siphon*, even when placed under a receiver, and the air exhausted from it. The reason of this, if it be true, is very difficult to account for.

Some will have it, that there is still air enough left in the evacuated receiver, to raise the water to an inch or two. But as both mercury and water are found to fall entirely out of the Torricellian tube, *in vacuo*; the pressure of the thin remaining air, can never be the cause of the ascent, both of mercury and water, in the less leg of the *siphon*.

Hence, as the height of the *siphon* is limited to 31 foot; for this only reason, that air cannot raise water higher; it does not appear, whether or no we are in the right in rejecting Hero's method of carrying water, by means of a *siphon*, over the tops of mountains, into an opposite valley.—For Hero only orders the apertures of the *siphon* to be stopped, and water to be poured through a funnel into the angle or meeting of the legs, till the *siphon* be full; when, shutting the aperture in the angle, and opening the other two, the water will continue to flow.—Now, if there only need air for the first rise of the water into the less leg, nor for the continuation of the motion; it were possible to raise the water much higher than the height of the atmosphere would carry it.

The real cause, therefore, of this extraordinary, though well-known phenomenon, needs some further disquisition: this is certain, that a *siphon* once set a running, will persist in its motion, though removed into the most perfect vacuum our air-pumps will make: or, if the lower orifice of a full *siphon* be shut, and the whole be thus placed in a receiver, with a contrivance for opening the orifice when the air is exhausted; the water will be all emptied out of the vessel, as if it had been in open air. See VACUUM, AIR-pump, &c.

This, too, is remarkable enough, that the figure of the *siphon* may be varied at pleasure (see *fig. 3. &c.*) provided only the orifice C be below the level of the surface of the water to be drawn up; but, still, the further it is distant from it, the faster will the fluid be carried off.—And if, in the course of the flux, the orifice A be drawn out of the fluid; all the liquor in the *siphon* will go out at the lower orifice C: that in the leg CB, dragging, as it were, that in the shorter leg AB after it.

If a filled *siphon* be so disposed, as that both orifices A and C be in the same horizontal line: the fluid will remain pendant in each leg; how unequal soever the length of the legs may be.—Fluids, therefore in *siphons*, seem, as it were, to form one continued body; so that the heavier part descending, like a chain, pulls the lighter after it.

Lastly, it must be observed, that the water will flow out, even through a *siphon* that is interrupted, by having the legs AD and FC joined (*fig. 4.*) together, by a much bigger tube full of air.

The *SIPHON Wirtembergicus*, is a very extraordinary machine of this kind, performing divers things which the common *siphon* will not reach.—*E. gr.* In this, though the legs be in the same level, yet the water rises up the one, and descends through the other: the water rises, even though the aperture of the less leg be only half immersed in water: the *siphon* has its effect after continuing dry a long time: either of the apertures being opened, the other remaining shut for a whole day, and then opened, the water flows out as usually. Lastly, the water rises and falls indifferently through either leg. The project of this *siphon*, was laid by Jordanus Pelletier, and executed at the expence of prince Frederick Charles, administrator of Wirtemberg, by his mathematician, Schackard, who made each branch 20 feet long, and 18 feet apart: the description thereof was published by Reifelius, the duke's physician.

This gave occasion to M. Papin to invent another, that did the same things, described in the philosophical Transactions; and which Reifelius, in another paper in the Transactions, ingeniously owns to be the very same with that of Wirtemberg.—Its structure will appear from its figure; which is represented, *Tab. Hydraulicks, fig. 5.*

SIRE\*, a title of honour in France, now given to the king only, as a mark of sovereignty.—In all placets and petitions, epistles, discourses, &c. to the king, he is addressed under the title of *fire*.

\* Some derive the word from the Latin, *herus*, master: of which opinion seems Budæus, who, in speaking to king Francis I. always calls him *here*, q. d. master, or *fire*: others derive it from the Greek, *κυριος*, lord; of which opinion is Pasquier, who adds, that the ancient Franks gave the same title to God, calling him *beau fire diex*: others fetch the word from the Syriac, and maintain, it was first given to the merchants who traded to Syria: Menage will have it come from *senior*, elder; whence *seigneur*, then *seignior*, and *fire*.

SIRE was likewise anciently used in the same sense with *seignior* and *seigneur*; and applied to barons, gentlemen and citizens. See SIEUR.

The *fire* de Joinville has wrote the history of St. Louis.

SIREN, ΣΕΡΗΝ, in antiquity, *mermaid*; a name given to a kind of fabulous beings represented by Ovid, &c. as sea-monsters, with womens faces and fishes tails; and by others decked

decked with a plumage of various colours. See **MERMAID**. They are supposed to have been the three daughters of the river Achelous; and called *Parthenope*, *Ligea*, and *Leucosia*. Homer only makes mention of two  *sirens* ; but others reckon five. Virgil places them on rocks, where vessels are in danger of splitting. Pliny makes them inhabit the promontory of Minerva, near the island Capreae. Others fix them in Sicily, near Cape Pelorus. Claudian says, they inhabited harmonious rocks; that they were charming monsters; and that sailors were wrecked on their rocks without regret, and even expired in rapture: *dulce malum pelago siren*.

This description is, doubtless, founded on a literal explication of the fable, that the  *sirens*  were women who inhabited the shores of Sicily, and who, by all the allurements of pleasure, stopped passengers, and made them forget their course. Some interpreters of the ancient fables, will have the number and the names of the three  *sirens* , to have been taken from the triple pleasure of the senses; wine, love and music; which are the three most powerful means of seducing men: and hence so many exhortations to avoid the  *sirens*  fatal song.

Probably it was hence, that the Greeks fetched their etymology of  *siren* , viz. from  *σίρα* , a chain, as if there was no getting free of their enticement.

Others, who do not look for so much mystery in the fable, maintain, that the  *sirens*  were nothing but certain freights in the sea, where the waves whirling furiously around, seized and swallowed up vessels that approached them too near.

Lastly, others hold the  *sirens*  to have been certain shores and promontories, where the winds, by the various reverberations and echo's, cause a kind of harmony that surprizes and stops passengers.—This, probably, might be the origin of the  *sirens*  song; and the occasion of giving the name of  *sirens*  to these rocks.

Sculptors and painters usually follow Ovid's description of the  *sirens* ; but on some medals, we find them represented with the upper parts of women, and the lower of birds.

**SIRIUS**, ΣΕΡΙΟΣ, in astronomy, the  *dog-star* ; a very bright star of the first magnitude in the mouth of the constellation  *canis major* , or the great dog. See **CANIS**.

The Arabs call it  *aschere* ,  *elschere* ,  *scera* ; the Greeks,  *siri-us* ; and the Latins,  *canicula* , or  *canis candens* . See **CANICULA** and **CANICULAR**.

Its longitude, according to Mr. Flamsteed, is  $9^{\circ} 49' 1''$ ; its latitude  $39^{\circ} 32' 8''$  south.

**SIRNAME**. See the article **SURNAME**.

**SISTROID angle**. See the article **ANGLE**.

**SISTRUM**, or **CISTRUM**, an ancient kind of musical instrument used by the priests of Isis, and Osiris. See **MUSIC**. Spon describes it as of an oval form, in manner of a racket, with three sticks traversing it breadth-wise, which playing freely, by the agitation or beating of the instrument, yielded a kind of sound, which to the ancients seemed melodious. Mr. Malcolm takes the  *sistrum*  to have been no better than a kind of rattle. Jer. Bosius has an express treatise on the  *sistrum* , intitled,  *Ificus de sistro* .

Oisilius observes, that the  *sistrum*  is found represented on several medals; and also on Talismans.—Osiris on some medals, is painted with a dog's head and a  *sistrum*  in his hand.

**SITE**, or **SCITE**, **SITUS**, denotes the situation of a house, messuage, &c.—And sometimes the ground-plot, or spot of earth it stands on.

**SITE**, **SITUS**, in logic, one of the predicaments, declaring a subject to be so and so placed. See **PLACE** and **SITUS**.

**SITOPHYLAX**\*, ΣΙΤΟΦΛΑΞ, in antiquity, an Athenian magistrate, who had the super-intendence of the corn, and was to take care that no body bought more than was necessary for the provision of his family.

\* The word is formed from Greek, σίτος, corn, and φυλάξ, keeper.

By the attic laws, particular persons were prohibited buying more than fifty measures of wheat a man; of those measures, we mean, called  *πορμυς* : and the  *sitophylax*  was to look to the observation of this law.—It was a capital crime to prevaricate in it.

There were fifteen of these  *sitophylax* 's; ten for the city, and five for the Pyraeus.

**SITUS**, in geometry and algebra, denotes the situation of lines, surfaces, &c.—See **POSITION**, &c.

Wolfius gives us some things in geometry, which are not deduced from the common analysis; particularly matters depending on the  *situs*  of lines, and figures.—M. Leibnitz has even invented a particular kind of analysis, called  *analysis situs* , and built a peculiar kind of calculus thereon, called  *calculus situs* . See **ANALYSIS** and **CALCULUS**.

**SIXAIN**\*, **SIXTH**, **SEXAGENA**, in war, an ancient order of battle, wherein six battalions being ranged in one line, the second and fifth are made to advance, to form the vanguard; the first and sixth to retire, to form the rear-guard; the third and the fourth remaining on the spot, to form the corps, or body of the battle.

\* The word is French, where it signifies the same thing.

**SIX-CLERKS**, officers in chancery of great account, next

in degree below the twelve masters; whose business is to enrol commissions, pardons, patents, warrants, &c. which pass the great seal. See **CLERK** and **CHANCERY**.

They were anciently  *clerici* , and forfeited their places if they married: they are also attorneys for parties in suits depending in the court of chancery.

Under them were formerly 60 clerks, who with the under-clerks, did the business of the office; which number was afterwards increased to 90.—At present the number is indefinite; an order having been made, for reducing them to their ancient number of 60; by not filling up the vacancies that may happen by death, &c. till they are fallen to that standard.

**SIXHINDEMEN**. See the article **SYXHINDEMEN**.

**SIXTH**, **SEXTA**, in music, one of the simple original concords, or harmonical intervals. See **CONCORD**.

The  *sixth*  is of two kinds;  *greater*  and  *lesser* ; and hence it is esteemed one of the imperfect concords; though each of the two species arises from a division of the octave. See **OCTAVE** and **SCALE**.

The  *greater sixth* , called by the Greeks  *hexachordon majus* , is the concord resulting from a mixture of the sounds of two strings that are to each other as 5 to 3.

The  *lesser sixth* ,  *hexachordon minus* , results from two strings, which are to each other as 8 to 5. See **SCALE**.

The  *lesser sixth*  is composed diatonically of six degrees, whence its name; and of five intervals, three whereof are tones, and two semi-tones; chromatically of eight semi-tones; five whereof are greater, and three less.—It has its form or origin from the  *ratio super-tri-partiens quintas* ; as of 8 to 5.

The  *greater sixth*  is composed diatonically, like the  *less* , of six degrees and five intervals; among which are four tones, and a semi-tone: and chromatically of nine semi-tones; five whereof are greater, and four less; of consequence it has a lesser semi-tone more than the former.—It has its origin from the  *ratio super-bi-partiens tertias* ; as 5 to 3.

Anciently the  *sixth*  had only one repetition, which was the 13th; but in the modern system, it has several, as the 20th, 27th, &c. all marked indifferently in the thorough bass, by the figure 6. And even the  *sixth*  itself, both greater and lesser, when natural, is not expressed any otherwise than by a simple 6. But when it is greater or less by accident; to the 6 is added the mark of a sharp, or a flat: as may be seen in M. Broffard.

Besides the two kinds of  *sixths*  here described, which are both good concords; there are two others that are vicious and dissonant.

The first is the  *defective sixth* , composed of two tones and three semi-tones, or of seven semi-tones, five whereof are greater, and two less.

The second is the  *redundant sixth* , composed of four tones, a greater semi-tone, and a less. Whence some call it  *pentatonon* , as comprehending five tones.

These two being both discords, should never be used in melody, and very rarely in harmony.

As to the two consonant  *sixths* , they were anciently used very sparingly: at present they are allowed to be used as often as one pleases; as is the case with thirds; the  *sixths*  being in reality, no other than inverted thirds: but care is usually taken, that the first  *sixth*  that occurs be a lesser, and the last a greater; and that from the greater, we rise to the octave, and from the less, fall to the fifth.

**SIXTH**, in the military art. See the article **SIXAIN**.

**SIXTH pair of nerves**, } See the articles } **NERVE**.

**SIXTH rates**, } See the articles } **RATE**.

**SIZE**, an instrument used to find the weight of fine round pearls withal. See **PEARL**.

It consists of five thin pieces or leaves, about two inches long, and half an inch broad; fastned together at one end by a rivet. In each of these, are several round holes drilled, of different diameters. Those in the first leaf serve for weighing pearls from  $\frac{1}{2}$  a grain to seven grains. Those of the second, for pearls from eight grains or two carats, to five carats, &c. and those of the fifth, for pearls from  $6\frac{1}{2}$  to  $8\frac{1}{2}$ .

**SKELETON**\*, ΣΚΕΛΕΤΟΝ, in anatomy, an assemblage or arrangement of all the bones of a dead animal, dried, cleaned, and disposed in their natural situation: and kept in that disposition by means of wires, &c.—See *Tab. Anat. (Osteol.) fig. 3, 7*.

\* The word is formed from the Greek, σκελλω, I dry.

*Skeletons* serve to good purpose, in learning the osteology. See **OSTEOLOGY**.—For the several bones a  *skeleton*  consists of, see **BONE**.

**SKIFF**, or **SQUIFF**, the less of two ship-boats; serving chiefly to go ashore in, when the ship is in harbour. See **BOAT**.

**SKIN**, in anatomy, a large thick membrane, spread over the whole body, serving as the external organ of feeling, and as a cover and ornament of the parts underneath.

The  *skin*  consists of three parts; the external one, called the  *cuticle* ,  *epidermis* , or  *skarf-skin* . See **CUTICLE**.—The middle-most is called the  *corpus reticulare* , because pierced through with a great number of holes, like a net or sieve. See **RETICULARE corpus**.—The innermost, called the  *cutis* , is a fibrous

fibrous substance, wove out of the extremities of arteries, veins, nerves, tendons, &c. Whence also arise abundance of little eminences, called *papillæ pyramidales*.—See *Tab. Anat.* (Myol.) *fig. 8.* See also *CUTIS* and *PAPILLÆ*. It is likewise set with an infinity of glands, called *miliary glands*, each whereof has its excretory duct passing along with the pyramidal papillæ, through the holes of the corpus reticulare, and terminating at the cuticle.

The papillæ are held by the moderns to be the organ of feeling; and the excretory vessels serve to carry off the matter of perspiration, which is separated from the blood in the miliary glands. See *MILIARY glands*, *PERSPIRATION* and *FEELING*.

Nutrition, M. Perrault observes, is sometimes taken in throughout the whole body of animals, at the pores of the skin. The subtle substances of nutritious matters applied externally to those bodies, are found to penetrate them, to mix with the blood and juices, and are there assimilated. On this account, he adds, it is, that butchers dogs, turnspit-dogs, &c. are generally very fat, and even butchers, cooks, &c. themselves. M. Dodart takes it, that plants receive a great part of their food by the external bark, not all by the root. See *ROOT*.

**SKIN**, in commerce, is particularly used for this membrane stripped off the animal, to be prepared by the tanner, skinner, currier, parchment-maker, &c. and converted into leather, &c. See *TANNING*, *CURRYING*, &c.

The use of skins is very ancient; the first garments in the world being made thereof. The Danes and other northern nations, have a long time dressed in skins.—Morocco's are made of the skins of a kind of goats. See *MOROCCO*.

Parchment is usually made of sheep skins; sometimes of goat skins. See *PARCHMENT*.—Velom is a kind of parchment made of the skin of an abortive calf, or at least of a sucking calf. See *VELOM*.

The true shammy, is made of the skin of an animal of the same name; though frequently counterfeited with common goats and sheep skins. See *SHAMMY*.

Shagreen is prepared at Constantinople, of the hind-part of the skin of a mule, or rather ass of that country, prepared and tanned, and when soft and manageable, stretched on a frame, and exposed to the sun.—This done, they sprinkle mustard-seed on the skin; taking care to rub it several times over with the hand. By means hereof, and the heat of the sun, the grain of the leather is raised up, and there hardened. See *SHAGREEN*.

**SKINKER**, a cup-bearer or butler. See *ARCH-butler*.

**SKIPPER**. See the article *SCHIPPER*.

**SKIRMISH**\*, in war, a disorderly kind of combat, or encounter, in presence of two armies between small parties, or persons who advance from the body for that purpose, and introduce, or invite to a general, regular fight.

\* The word seems formed from the French, *escarmouche*, which signifies the same, and which Nicod derives from the Greek *xappon*, which signifies at the same time, both light, combat and joy: Menage derives it from the German, *schirmen* or *skermen*, to fence or defend: De Cange, from *scaramuccia*, a light engagement, of *scara* and *muccia*, a body of soldiers hid in ambush; in regard most *skirmishes* are performed by persons in ambuscade.

**SKULL**, in anatomy. See the article *CRANIUM*.

**SKY**, the blue expanse of air or atmosphere. See *AIR*, *ATMOSPHERE*, and *HEAVEN*.

The azure colour of the sky, Sir Isaac Newton attributes to vapours beginning to condense therein, which have got consistence enough to reflect the most reflexible rays, viz. the violet ones; but not enough to reflect any of the less reflexible ones. See *REFLEXIBILITY*.

M. de la Hire attributes it to our viewing a black object, viz. the dark space beyond the regions of the atmosphere, through a white or lucid one, viz. the air illumined by the sun: a mixture of black and white always appearing blue. See *BLUE*.—But this account is not originally his; it is as old as Leonardo da Vinci. See *COLOUR*, &c.

**SKY rocket**. See the article *ROCKET*.

**SLAB**, an outside fappy plank or board sawed off from the sides of a timber-tree.

**SLATE**, a blue fissile stone, very soft when dug out of the quarry, and on that account easily cut or sawed into thin long squares or escallops, to serve in lieu of tiles for the covering of houses: sometimes also to make tables of, and to pave withal. See *COVERING*, &c.

The ancients were unacquainted with the use of slate, and instead thereof covered their houses with shingle, as we read in Pliny. Besides the blue slate, we have in England a greyish slate, called also *Horsham stone*, from a town in Sussex of that name, where the greatest quantities of it are found.

The blue slate is a very light, lasting, and beautiful covering, but chargeable withal, in regard the roof must be first boarded over, the slates hung on tacks, and laid with finer mortar than tiles. The grey slate is chiefly used in the covering of churches, chapels, chancels, &c.

It is dearer than tiles, but far more durable. The timber of the roof needs to be very strong for these grey slates, it being

VOL. II. N. CXLII.

almost double the weight of tiles. **TYLE**.

To judge of the goodness of slate, Mr. Colepress, in the *Philosophical Transactions*, orders it to be knocked against any hard body, to make it yield a sound; if the sound be good and clear, the stone is firm and good; otherwise, it is crazy.

Another method of proving its goodness, is, by weighing it exactly, then letting it lie six or eight hours under water, and wiping it very clean; if it weights now more than it did before, it is of that kind that soaks in water, and therefore will not long endure, without rotting the lath or timber. Another method of trial is, by placing a slate half a day perpendicularly in a vessel of water, so as to reach a considerable height above the level thereof: if the slate be firm and close, then it will not draw water, that is, the water will not have ascended above half an inch above the level of that in the vessel, nor that perhaps any where but at the edges, the texture whereof might be loosened by hewing; but a bad stone will have drawn the water to the very top, be it as high as it will.

There are slates in several places, which the most experienced slaters, or coverers, conjecture to have continued on houses several hundreds of years, and are yet as firm as when first put up.

M. Leibnitz informs us, in the history of the French academy, that in several parts of the dutchy of Brunswick, particularly about Osteroda, &c. there are horizontal veins of slate, wherein are found very exact and finished representations of various kinds of fishes and plants, appearing in their natural breadth and length, but without any thickness.—The same impressions are also frequently found even in a mixture of copper and silver.

M. Leibnitz accounts for this appearance, by supposing the lakes and meadows of these places to have been covered over with a kind of earth, which has buried the fishes and plants; or that some very muddy water, much impregnated with earth, has covered them up, or carried them away.—This earth he takes to have since hardened into slate; and length of time, or some other cause, to have consumed the delicate matter of the fish, &c. much as the bodies of flies or ants, which are found enclosed in amber, are quite dissipated, and nothing left but a mere delineation.

The matter of the fish, or plant, thus consumed, has left its form impressed in the slate, by means of the cavity remaining therein; which cavity has been at length filled up with a metallic matter: whether by reason that the subterranean fire, in baking the earth into slate, has separated a metal therefrom; or that a metallic vapour penetrating the slate has become fixed in these cavities.

**SLAVE**\*, a person in the absolute power of a master, either by war or conquest. See *SERVANT*.

\* Menage, and Vossius derive the word from *Sclavus*, the name of a Scythian people, whom Charlemagne condemned to perpetual imprisonment; whence the Italians made their *schlavo*, the Germans their *schlave*, the French their *esclave*, and we *slave*: the Italians, and other nations used to buy these *Sclavi* or *Sclavonians* to make drudges of; whence the proper name of a nation, in time, became the name of a state or condition. See *SCLAVONIC*.

The Romans called their slaves, *servi*, from *servare*, to keep, save; as being such as were not killed, but saved, to yield money either by sale, or by their work. Though other authors are of opinion, that the Roman name *servi* might come from that of *Serbi*; as that of *slaves*, from *Sclavi*, a people.

We find no mention of slaves before the deluge; but immediately after, viz. in the curse of Canaan, Gen. ix. 25. whence it is easily inferred, that servitude commenced soon after that time: for in Abraham's days we find it generally established.—Some will have it to have commenced under Nimrod, because it was he who first began to make war, and of consequence to make captives; and to bring such as he took either in his battles, or irruptions, into slavery.

Among the Romans, when a slave was set at liberty, he changed his name into a surname; took the nomen or præ-nomen of his master; to which he added the cognomen or nick-name he had been called by when a slave. See *NAME*. By the civil law, the power of making slaves is esteemed a right of nations, and follows as a natural consequence of captivity in war. The Lacedæmonians, say some, or as others say, the Assyrians, first introduced the practice; which the Romans not only approved of, but even invented new manners of making slaves: for instance, a man born free, among them, might sell his freedom, and become a slave.—This voluntary slavery was first introduced by a decree of the senate, in the time of the emperor Claudius, and at length abrogated by Leo.

The Romans had power of life and death over their slaves, which no other nations had: but this severity was afterwards moderated by the laws of the emperors; and by one of Adrian, it was made capital to kill a slave without a cause.—The slaves were esteemed the proper goods of their masters, and all they got belonged to them: but, if the masters were too cruel in his domestick corrections, he was obliged to sell his slave at a moderate price.

11 Y

As

As *slavery* was not abolished by the gospel, the custom of keeping *slaves* lasted a long time in Christendom.—In the time of Louis the Gros they were so numerous in Egypt, that it was found a difficult matter to quell a body of them who had made head against their masters: yet Bartolus, who lived in 1300, observes, there were none left in his days. *Slavery* is absolutely abolished in England, and France, as to personal servitude: our servants are not *slaves*, but only subject to certain determinate services. It is said, that the moment a *slave* steps on English ground, he becomes free. See SERVANT.

SLAVES make a very considerable article of the traffick in America. The English South-Sea company have the sole privilege of furnishing the Spanish West-Indies with *slaves*, by treaty. See NEGRO.

SLAUGHTER. See MANSLAUGHTER, HOMICIDE, MURDER, BUTCHER, &c.

SLEASY *holland*, a kind of holland thus called, because made in Silesia in Germany; and which, from its slightness, occasions all thin, slight, ill-wrought hollands to be called *sleasy*. See HOLLAND.

SLEDGE, a kind of carriage, without wheels, for the conveyance of very weighty things, as huge stones, bells, &c. See CARRIAGE.

The Dutch have a kind of *sledge*, whereon they can carry a vessel of any burthen by land. It consists of a plank a foot and a half broad, and the length of the keel of a moderate ship, raised a little behind, and hollow in the middle; so that the sides go a little aslope, and are furnished with holes to receive pins, &c. The rest is quite even.

SLEEP, that state wherein the body appearing perfectly at rest, external objects move the organs of sense as usually, without exciting the usual sensations. See WAKEFULNESS.

*Sleep*, according to Rohault, consists in a scarcity of spirits; which occasions that the orifices or pores of the nerves in the brain, whereby the spirits used to flow into the nerves, being no longer kept open by the frequency of the spirits, shut of themselves. For this being supposed, as soon as the spirits, now in the nerves, shall be dissipated, the capillaments of those nerves, having no supplement of new spirits, will become lax, and cohere as if cemented together; and so be unfit to convey any impression to the brain: besides, the muscles being now void of spirits, will be unable to move, or even sustain the members: thus will sensation, and motion, be both destroyed. See SENSATION, MUSCULAR motion, SPIRITS, &c.

*Sleep* is broke off unnaturally, when any of the organs of sense are so briskly acted on, that the action is propagated to the brain: for upon this, the few spirits remaining in the brain, are all called together, and unite their forces to unlock the pores of the nerves, &c. But if no object should thus affect the organ, yet *sleep* would in some time be broke off naturally; for the quantity of spirits generated in *sleep* would at length be so great, that, stretching out the orifices of the nerves, they would open themselves a passage.

With regard to medicine, *sleep* is defined, by Boerhaave, to be that state of the medulla of the brain, wherein the nerves, do not receive so copious, nor so forcible an influx of spirits, from the brain as is required to enable the organs of sense, and voluntary motion, to perform their offices.

The immediate cause hereof appears to be the scarcity of animal spirits, which being spent, and requiring some time to be recruited, the minute vessels, before inflated, become flaccid and collapse: or else, it is owing to such a pressure of the thicker blood against the cortex of the brain, as that the medulla, becoming likewise compressed by its contiguity with the cortex, the passage of the spirits is obstructed.

The natural cause of *sleep*, then, is any thing that may contribute to these two.—And hence its effects may be understood: for in *sleep* several functions are suspended, their organs and muscles are at rest, the spirits scarce flow through them, therefore there is a less consumption of them; but the solid villi and fibres of the nerves are but little changed, and an equilibrium obtains throughout; there is no difference of pressure on the vessels, nor of velocity in the humours: the motion of the heart, lungs, arteries, viscera, &c. is increased. The effects of which are, that the vital humours circulate more strongly and equably through the canals, which are now freer, laxer, and opener, as not being compressed by the muscles. Hence the blood is driven less forcibly, indeed, into the lateral vessels, but more equably; through the greater vessels, both more strongly, and more equably. Thus are the lateral fibres sensibly filled, as being less traversed, and at length remain at rest, with the juices they have collected: hence the lateral adipose cells become filled and distended with an oily matter.

By this means the circulation, being almost wholly performed in the larger blood-vessels, becomes gradually slower, and at length scarce sensible, if the *sleep* be too long continued: thus, in moderate *sleep*, is the matter of the chyle best converted into serum; that, into thinner humours; and those, into nourishment. The attrition of the solid parts is less considerable; the cutaneous secretion is increased, and all the

rest diminished. The parts wore off are now best supplied, as an equable, continual repletion, restores the humours, and repairs the solids, the preventing and disturbing causes being then at rest. In the mean time, while the nutritious matter is best prepared; there is an aptitude in the vessels to receive, and in the humours to enter, and the means of application, and consolidation, are at liberty: hence, a new production, and accumulation of animal spirits, in all the humours, as to matter, and in the minutest vessels as to repletion: the consequence of which is, an aptitude for waking, and an in-aptitude for *sleep*; so that upon the first occasion the man awakes. See NUTRITION, &c.

Some of the more extraordinary phenomena of *sleep* yet to be accounted for, are: that when the head is hot, and the feet cold, *sleep* is impracticable: that spirituous liquors first bring on drunkenness, then *sleep*: that perspiration, during the time of *sleep*, is twice as great as at other times: that upon *sleeping* too long, the head grows heavy, the senses dull, the memory weak, with coldness, pituitousness, an indisposition of the muscles for motion, and a want of perspiration. That much *sleeping* will sustain life a long time, without either meat or drink: that upon a laudable *sleep*, there always follows an expansion of all the muscles, frequently a repeated yawning, and the muscles and nerves acquire a new agility; that *fœtus*'s always *sleep*; children often; youth more than grown persons, and they more than old men; and that people, recovering from violent distempers, *sleep* much more than when perfectly at health.

SLEEVE *Hippocrates*'s. See the article HIPPOCRATES.

SLIDING, in mechanics, *superincensus radens*, is, when the same point of a Body, moving along a surface, describes a line on that surface. See MOTION, FRICTION, &c. Such is the motion of a parallelepiped, protruded along a plane. See ROLLING, RESISTANCE, &c.

SLIDING rule, a mathematical instrument, serving to work questions in gauging, measuring, &c. without the use of compasses; merely by the *sliding* of the parts of the instrument one by another, the lines and divisions whereof give the answer, by inspection. See RULE.

This instrument is variously contrived, and applied by various authors; particularly Everard, Coggeshal, Gunter, Hunt, and Partridge; but the most usual and useful ones, are those of Everard and Coggeshal; the description, and uses whereof, are as follow.

Everard's SLIDING rule is principally used in gauging; being ordinarily made of box, a foot long, an inch broad, and  $\frac{1}{2}$  of an inch thick.—It consists of three parts: a rule, on each side whereof, *ab*, and *cd* (*Tab. Surveying*, fig. 18.) is a groove; and two small scales, or *sliding* pieces, *m*, *n*, *slide* in the grooves.—When both these pieces are drawn out to their full extent, the instrument is three foot long. On the first broad face of the instrument *ab*, are four lines of numbers; for the properties, &c. whereof, see GUNTER'S line. The first marked A, consisting of two radius's numbered 1, 2, 3, 4, 5, 6, 7, 8, 9, 10; and then 2, 3, 4, 5, &c. to 10. On this line are four brass centre-pins, two in each radius; one in each whereof is marked MB, to signify that the number it is set against, 2150.42 is the cubic inches in a malt-bushel; the other two are marked with A, to signify that the numbers they are set against, viz. 282, are the cubic inches in an ale-gallon.—The second and third lines of numbers, are on the *sliding* pieces, and are exactly the same with the first. Close to the figure 7, in the first radius, is a dot marked *Si*, set exactly over .707. denoting .707 to be the side of a square inscribed in a circle, whose diameter is unity. Close to 9 is another dot, marked *Se*, set over .886, which is the side of a square, equal to the area of a circle, whose diameter is unity. Another dot, nigh W, is set over 231, the number of cubic inches in a wine-gallon: and another near C, is set over 3.14 the circumference of a circle, whose diameter is unity.—The fourth line of numbers, marked MD, to signify *malt depth*, is a broken line of two radius's numbered 2, 10, 9, 8, 7, 6, 5, 4, 3, 2, 1, 9, 8, 7, &c. the number 1 being set directly against MB on the first radius.

On the second broad face, marked *cd*, are 1°. A line of numbers of one radius, numbered 1, 2, 3, &c. to 10. noted by the letter D. On this are four centre-pins; the first, marked WG, is the gauge-point for a wine-gallon, i. e. the diameter of a cylinder, whose height is an inch, and content 231 cubic inches, or a wine-gallon, which is 17.15 inches: the second centre-pin AG stands at the gauge-point for an ale-gallon, which is 18.95 inches. The third MS stands at 46.3 the side of a square, whose content is equal to the inches in a solid bushel. The fourth MR is the gauge-point for a malt-bushel, which is 52.32 inches.—2°. Two lines of numbers on the *sliding* piece, which are exactly the same as those on the *sliding* piece on the other side. Close to the division 8 is a dot marked *c*, which is set to .795, the area of a circle whose diameter is unity; and another marked *d*, stands at .785, the area of a circle, whose diameter is unity.—3°. Two lines of segments, each numbered 1, 2, 3, to 100; the first, for finding the ullage of a cask, taken as the middle frustum of a spheroid, lying with its axis parallel to the

the horizon; and the other, for finding the ullage of a cask standing.

Again, on one of the narrow sides, noted *e*, are  $1^{\circ}$ . A line of inches, numbered 1, 2, 3, &c. to 12, each sub-divided into ten equal parts.  $2^{\circ}$ . A line, by which, with that of inches, we find a mean diameter for a cask, in the figure of a middle frustum of a spheroid: it is numbered 1, 2, 3, &c. to 7, and marked *spheroid*.  $3^{\circ}$ . A line for finding the mean diameter of a cask, in the figure of the middle frustum of a parabolic spindle, which gaugers call the *second variety of casks*; it is numbered 1, 2, 3, &c. and noted *second variety*.  $4^{\circ}$ . A line, by which we find the mean diameter of a cask of the third variety, *i. e.* of a cask in the figure of two parabolic conoids, abutting on a common base; it is numbered 1, 2, 3, &c. and noted *third variety*.

On the other narrow face, marked *f*, are  $1^{\circ}$ . A foot divided into 100 equal parts, marked FM.  $2^{\circ}$ . A line of inches, like that before-mentioned, noted IM.  $3^{\circ}$ . A line for finding the mean diameter for the fourth variety of casks, which is the middle frustum of two cones, abutting on a common base. It is numbered 1, 2, 3, &c. and noted FC, signifying frustum of a cone.

On the backside of the two *sliding* pieces are a line of inches, from 13 to 36, when the two pieces are put endwise; and against that, the correspondent gallons, or hundred parts, that any small tub, or the like open vessel (from 13 to 36 inches diameter) will contain at one inch deep.

*Use of Everard's SLIDING rule.*— $1^{\circ}$ . To multiply one number by another. Suppose 4 required to be multiplied by 6: set 1 on the line of numbers B, to 4 on the line A; then, against 6 upon B is 24, the product sought upon A. Again, to multiply 26 by 68, set 1 on B to 26 on A; then, against 68 on B is 1768 on A, the product sought.

$2^{\circ}$ . To divide one number by another. Suppose 24 to be divided by 4: set 4 on B to 1 on A; then against 24 on B is 6 on A, which is the quotient. Again to divide 952 by 14; set 14 on A to 1 on B, and against 952 on A you have on B, 68, which is the quotient.

$3^{\circ}$ . To work the rule of three. If 8 give 20, what will 22 give? set 8 on B, to 20 on A, then against 22 on B stands 55 on A; the number sought.

$4^{\circ}$ . To find a mean proportional between two numbers, suppose between 50 and 72: set 50 on C to 72 on D; then against 72 on C you have 60 on D, which is the mean required.

$5^{\circ}$ . To extract the square root of a number. Apply the lines C and D to one another, so as 10 at the end of D be even with 10 at the end of C; then are these two lines a table, shewing the square root of any number less than 1000000 by inspection: for against any number on C, the number answering to it on D, is the square root thereof. Note, If the given number consist of 1, 3, 5, or 7 places, seek it on the first radius, on the line C, and against it is the root required at D.

$6^{\circ}$ . Either the diameter, or circumference of a circle, being given; to find the other. Set 1 on the line A against 3, 141 (to which is writ C) on the line B; and against any diameter on the line A, you have the circumference on B; and contrariwise: thus, the diameter being 20 inches, the circumference will be 62.831 inches; and the circumference being 94.247, the diameter will be 30.

$7^{\circ}$ . The diameter of a circle given, to find the area in inches, or in ale or wine-gallons. Suppose the diameter 20 inches, what is the area? set 1 upon D, to .785 (noted *d*) on C; then against 20 on D is 314.159 the area required. Now to find that circle's area in ale-gallons, set 18.95 (marked AG) upon D, to 1 on C; then against the diameter 20 upon D, is the number of ale gallons on C, *viz.* 1.11. The same may serve for wine-gallons, regard only had to the proper gauge-point.

$8^{\circ}$ . The two diameters of an ellipsis being given, to find the area in ale-gallons. Suppose the transverse diameter 72 inches, and the conjugate 50; set 359.05 the square of the gauge-point on B, to one of the diameters (suppose 50) on A; then against the other diameter 72 on B, you will have the area on A, *viz.* 10.02 gallons, the content of this ellipsis at one inch deep. The like may be done for wine-gallons, if instead of 359.05 you use 249.11 the square of the gauge-point for wine-gallons.

$9^{\circ}$ . To find the area of a triangular surface in ale gallons. Suppose the base of the triangle 260 inches, and the perpendicular let fall from the opposite angle 110 inches: set 282 (marked A) upon B to 130, half the base on A; then against 110 on B is 50.7 gallons on A.

$10^{\circ}$ . To find the content of an oblong in ale-gallons. Suppose one side 130 inches, and the other 180; set 282 on B to 180 on A; then against 130 upon B is 82.97 ale-gallons, the area required.

$11^{\circ}$ . To find the content of a regular polygon in ale-gallons, one of the sides being given. Find the length of the perpendicular let fall from the centre to one of the sides: this multiplied by half the sum of the sides, gives the area. For an instance: suppose a pentagon, whose side is 1 inch; here, the perpendicular will be found .837, by saying, as the sine

of half the angle at the centre, which in this polygon is  $36^{\circ}$  is to half the given side .5, so is the sine of the complement of  $36^{\circ}$ , *viz.* .54 to the perpendicular afore said. Whence the area of a pentagon, whose side is unity, will be found 1.72 inches, which divided by 282, give .0061, the ale-gallons in that polygon.

$12^{\circ}$ . To find the content of a cylinder in ale-gallons. Suppose the diameter of the base of the cylinder 120 inches, the perpendicular height 36 inches: set therefore the gauge-point (AG) to the height, 36 on C; then against 120, the diameter on D, is found 1443.6, the content in ale-gallons.

$13^{\circ}$ . The bung and head-diameters, of any cask, together with its length, being given; to find its content in ale, or wine-gallons.— $1^{\circ}$ . Suppose the length of a cask taken (as the middle frustum of a spheroid, which is the first case or variety) be 40 inches, its head-diameter 24 inches, and bung-diameter 32 inches: subtract the head-diameter from that of the bung; the difference is 8. Look, then, for 8 inches on the line of inches, on the first narrow face of the rule; and against it, on the line *spheroid* stands 5.6 inches, which added to the head-diameter 24, gives 29.6 inches for that cask's mean diameter: set therefore the gauge-point for ale (marked AG) on D, to 40 on C; and against 29.6 on D, is 97.45, the content of the cask in ale-gallons. If the gauge-point for wine (marked WG) be used instead of that for ale; you will have the vessel's content in wine-gallons.— $2^{\circ}$ . If a cask, of the same dimensions as the former be taken (as the middle frustum of a parabolic spindle, which is the second variety) see what inches, and parts, on the line marked second variety, stand against the difference of the bung and head-diameters, which in this example is 8; and you will find 5.1 inches, which added to 24, the head-diameter makes 29.1 inches, the mean-diameter of the cask: set therefore the rule, as before, and against 29.1 inches, you will have 94.12 ale-gallons, for the content of the cask.— $3^{\circ}$ . If the cask taken be the middle frustum of two parabolic conoids, which is the third variety; against 8 inches, the difference of the head and bung-diameters, on the line of inches, you will find 4.57 inches on the line called *third variety*; this added as before to 24, gives 28.57 for the cask's mean diameter: proceeding as before you will find the content 90.8 gallons.— $4^{\circ}$ . If the cask taken be the frustums of two cones, which is the fourth variety, against 8 inches on the line of inches, you will find on the line marked FC, 4.1 inches to be added to 24 inches: the rest, carried on as before, gives the content of the cask 87.93 ale-gallons.

$14^{\circ}$ . A cask partly empty, lying with its axis parallel to the horizon; to find the quantity of liquor therein. Find its whole content, as above; which suppose 97.455 gallons, and suppose the inches left dry, 8, and the bung diameter 32: then, as the bung-diameter on C is to 100 on the line of segments L, so are the dry inches on C to a fourth number on the line of segments: and as 100 upon B is to the cask's whole content on A, so is that fourth number to the liquor wanting to fill up the cask; which, subtracted from the whole contents of the cask, gives the liquor remaining therein. *E. gr.* Set 32, the bung-diameter on C, to 100 on the segment line L; then against 8, the dry inches on C, stands 17.6 on the segment line: set therefore 100 on B, to the cask's whole content on A; and against 17.6 on B, you have 16.5 gallons on A; subtracting therefore the said gallons from 97.45, the vessel's whole content; the liquor in the cask will be 80.95 gallons.

$15^{\circ}$ . A cask standing upright, or with its axis perpendicular to the horizon, to find the liquor therein. Suppose the length of the cask 40 inches, and 10 of them dry; set 40 inches, on the line C, to 100 on the segment line S; and against 10, the dry inches, on the line C, stands 24.2 on S the segment line. Set, then, 100 on B, to 97.455, the cask's whole content on A; and against 24.2 on B, you will have 23.5 gallons, which is what is wanting to fill up the cask: this therefore, subtracted from the whole content 97.455, gives 73.955 gallons, for the quantity of liquor remaining in the cask.

$16^{\circ}$ . To find the content of any right-angled parallelepiped (*e. gr.* a cistern, uting-fat, or the like) in malt-bushels. Suppose the length of the base 80 inches, the breadth 50, and depth 9 inches: set the breadth 50 on B, to the depth 9 on C; then against the length 80 on A, stand 16.8 bushels on B, the number required.

*Coggeshal's SLIDING rule* is principally used in measuring of the superficies, and solidity of timber, &c. See MEASURING &c. It consists of two rulers, each a foot long, which are framed or put together, various ways; sometimes they are made to slide by one another, like glazier's rules: sometimes a groove is made in the side of a common two-foot joint-rule, and a thin *sliding* piece put in, and Coggeshal's lines added on that side: but the most usual and commodious way, is to have one of the rulers slide along the groove made along the middle of the other, as it is represented in *Table Surveying*, fig. 18.

On the *sliding* side of the rule are four lines of numbers, three

three whereof are double, that is, are lines to two radius's and one, a single broken line of numbers: the three first, marked A, B, C, are figured 1, 2, 3, &c. to 9; then 1, 2, 3, &c. to 10. Their construction, use, &c. are the same as those on Everard's *sliding rule*. The single line, called the *girt-line*, and noted D, whose radius is equal to the two radius's of any of the other lines, is broke for the easier measuring of timber, and figured 4, 5, 6, 7, 8, 9, 10, 20, 30, &c. from 4, to 5. It is divided into ten parts, and each 10<sup>th</sup> subdivided into 2, and so on from 5 to 10, &c.

On the back-side of the rule, are, 1°. A line of inch-measure, from 1 to 12; each inch being divided and subdivided. 2°. A line of foot-measure; consisting of one foot, divided into 100 equal parts, and figured 10, 20, 30, &c. The back-side of the sliding piece is divided into inches, halves, &c. and figured from 12 to 24; so that when slid out, there may be a measure of two foot.

*Use of Coggeshall's SLIDING rule, in measuring plain superficies.*

—1. To measure a square. Suppose, *e. gr.* the sides be each 5 feet: set 1 on the line B, to 5 on the line A; then against 5 on the line B, is 25 feet; the content of the square on the line A.

2. To measure a long square. Suppose the longest side 18 foot, and the shortest 10: set 1 on the line B, to 10 on the line A; then against 18 foot, on the line B, is 180 feet, the contents on the line A.

3. To measure a rhombus. Suppose the side 12 feet, and the length of a perpendicular let fall from one of the obtuse angles, to the opposite side, 9 feet: set 1, on the line B, to 12, the length of the side, on the line A; then against 9, the length of the perpendicular on the line B, is 108 feet, the content.

4. To measure a triangle. Suppose the base seven feet, and the length of the perpendicular let fall from the opposite angle to the base, 4 feet: set 1 on the line B, to 7 on the line A: then against half the perpendicular, which is 2, on the line B, is 14 on the line A, for the content of the triangle.

5. To find the content of a circle, its diameter being given. Suppose the diameter 3.5 feet: set 11 on the girt-line D, to 95 on the line C; then against 3.5 feet on D is 9.6 on C, which is the content of the circle in feet.

6. To find the content of an oval or ellipsis. Suppose the longest diameter 9 feet, and the shortest 4. Find a mean proportional between the two, by setting the greater 9 on the girt-line, to 9 on the line C; then against the less number 4, on the line C, is 6; the mean proportional sought. This done, find the content of a circle, whose diameter is 6 feet; this, when found, by the last article, will be equal to the content of the ellipsis sought.

*Use of Coggeshall's SLIDING rule, in measuring timber.*—1°. To measure timber the usual way. Take the length in feet, half feet, and, if required, quarters; then measure half way back again; there girt the tree with a small cord or line; double this line twice, very evenly, and measure this fourth part of the girt or perimeter, in inches, halves, and quarters. The dimensions thus taken, the timber is to be measured as if square, and the fourth of the girt taken for the side of the square, thus; set 12 on the girt-line D, to the length in feet on the line C, then against the side of the square, on the girt-line D, taken in inches, you have, on the line C, the content of the tree in feet.

For an instance: suppose the girt of a tree, in the middle, be 60 inches, and the length 30 feet, to find the content: set 12 on the girt-line D, to 30 feet on the line C; then against 15, one fourth of 60, on the girt-line D, is 46.8 feet; the content on the line C. If the length should be 9 inches, and the quarter of the girt 35 inches; here, as the length is beneath a foot, measure it on the line of foot-measure, and see what decimal part of a foot it makes, which you will find .75. Set 12, therefore, on the girt-line to 75 on the first radius of the line C, and against 35 on the girt-line is 6.4 feet on C, for the content.

2°. To measure round timber the true way. The former method, though that generally in use, is not quite just. To measure timber accurately, instead of the point 12 on the girt-line, use another, *viz.* 10.635; at which there should be placed a centre-pin. This 10.635 is the side of a square equal to a circle, whose diameter is 12 inches. For an instance: suppose the length 15 feet, and  $\frac{1}{4}$  of the girt 42 inches: set the point 10.635 to 15 the length; then against 42 on the girt-line is 233 feet for the content sought; whereas by the common way, there arises only 184 feet. In effect, the common measure is only to the true measure, as 11 to 14. See **TIMBER**.

3°. To measure a cube. Suppose the sides to be 6 feet each; set 12 on the girt-line D, to 6 on C; then against 72 inches (the inches 6 feet) on the girt-line, is 216 feet on C, which is the content required.

4°. To measure unequally-squared timber; that is, where the breadth and depth are not equal. Measure the length of the piece, and the breadth and depth (at the end) in inches: then find a mean proportional between the breadth and depth of the piece. This mean proportional is the side

of a square, equal to the end of the piece; which found, the piece may be measured as square timber. For an instance: let the length of the piece of timber be 13 feet; the breadth 23 inches, and the depth 13 inches: set 23 on the girt-line D, to 23 on C; then against 13 on C is 17.35 on the girt-line D, for the mean proportional. Again, setting 12 on the girt-line D, to 13 feet, the length on the line C; against 17.35 on the girt-line, is 27 feet, the content.

5°. To measure taper timber. The length being measured in feet, note one third of it; which is found thus: set 3 on the line A, to the length on the line B; then against 1 on A, is the third part on B: then if the solid be round, measure the diameter at each end in inches, and subtract the less diameter from the greater; add half the difference to the less diameter; the sum is the diameter in the middle of the piece. Then set 13.54 on the girt to the length of the line C, and against the diameter in the middle, on the girt-line, is fourth number on the line C. Again, set 13.54 on the girt-line to the third part of the length on the line C; then against half the difference on the girt-line, is another fourth number on the line C, these two fourth numbers added together, give the content. For an instance: let the length be 27 feet (one third whereof is 9) the greater diameter 22 inches, and the lesser 18; the sum of the two will be 40, their difference 4, and half the difference two, which added to the less diameter, gives 20 inches for the diameter in the middle of the piece. Now set 13.54 on the girt-line, to 27 on the line C, and against 20 on D, is 58.9 feet. Again, set 13.54 of the girt-line to 9 on the line C; and against 2 on the girt-line (represented by 20) is .196 parts; therefore, by adding 58.9 feet to .196 feet, the sum is 59.096 feet the content.

If the timber be square, and have the same dimensions; that is, the length 27 feet, the side of the greater end 22 inches and that of the lesser 18 inches, to find the content: set 12 on the girt-line to 27, the length on the line C, and against 20 inches, the side of the mean square on the girt-line, is 75.4 feet. Again, set 12 on the girt-line to 9 feet, one third of the length, on the line C, and against 2 inches, half the difference of the sides of the squares of the ends on the girt-line, is .25 parts of a foot, both together make 75.65 feet, the content of the solid.

The girt or circumference of a tree, or round piece of timber given; to find the side of the square within, or the number of inches of a side, when the round timber is squared. Set 10 on A to 9 on B, then against the girt on A, are the inches for the side of a square on the line B.

**SLING**, *funda*, a string-instrument, serving for the casting stones with the greater violence.

Pliny, *l.* 76. c. 5. attributes the invention of the *sling* to the Phœnicians: Vegetius ascribes it to the inhabitants of the Balearic islands, who were famous in antiquity, for the dextrous management thereof. Florus and Strabo say those people bore three kinds of *slings*; some longer, others shorter, which they used according as their enemies were nearer or more remote. Diodorus adds, that the first served them for a head-band, the second for a girdle, and that the third they constantly carried with them in the hand.

**SLINGING**, is used variously at sea; but chiefly for the hoisting up casks, or other heavy things, with slings, *i. e.* contrivances of ropes spliced into themselves at either end, with one eye big enough to receive the cask, or other thing to be slung.

**SLIPPING**, among gardeners, the pulling off a sprig from a branch, or a branch from an arm of the tree.—And so a *slip* may have its rents double and treble *slipped*, or its stalk ragged.

**SLIT grafting**. See the article **ENGRAFTING**.

**SLOOP**, a sort of floating vessel, otherwise called *shallop*. See **VESSEL** and **SHALLOP**.

In our navy, *sloops* are tenders on the men of war; and are usually about 60 ton, and carry about 30 men. See **NAVY**.

**SLOPING alley**. See the article **ALLEY**.

**SLOT**.—*Drawing on the SLOT*. See **DRAWING**.

**SLOUGH**, a deep muddy place.—The cast skin of a snake, the damp of a coal-pit, and the scar of a wound, are also called by the same appellation.

**SLOUGH of a wild boar**, is the bed, soil, or mire, wherein he wallows, or in which he lies in the day-time.

**SLOUTH**, or **SLOUGHT**, in hunting, is used for a company of some sorts of wild-beasts.—As a *slout* of bears.

**SLOW fevers**, } See the articles } **FEVER**.

**SLOW pulse**, } See the articles } **PULSE**.

**SLUICE**, a frame of timber, stone, or other matter, serving to retain and raise the water of a river, &c. and, on occasion, to let it pass.

Such is the *sluice* of a mill, which stops and collects the water of a rivulet, &c. to let it fall at length, in the greater plenty upon the mill-wheel: such also are those used as vents or drains to discharge water off land.—And such are the *sluices* of Flanders, &c. which serve to prevent the waters of the sea overflowing the lower lands, except when there is occasion to drown them.

Sometimes there is a kind of canal inclosed between two gates

gates or *fluices*, in artificial navigations, to save the water, and render the passage of boats equally easy, and safe, upwards and downwards; as in the *fluices* of Briare in France, which are a kind of massive walls built parallel to each other, at the distance of 20 or 24 feet, closed with strong gates, at each end, between which is a kind of canal or chamber, considerably longer than broad, wherein a vessel being inclosed, the water is let out at the first gate, by which the vessel is raised 15 or 16 foot, and passed out of this canal into another much higher. By such means a boat is conveyed out of the Loire into the Seyne, though the ground between them rise above 150 feet higher than either of those rivers.

The word *fluice* is formed of the French, *excluse*, which Menage derives from the Latin, *exclusa*, found in the Salic law in the same sense.—But this is to be restrained to the *fluices* of mills, &c. for as to those serving to raise vessels, they were unknown to the ancients.

**SMACK**, is a small vessel with but one mast. See **VESSEL** and **MAST**.

Sometimes they are employed as tenders on a man of war; and are also used for fishing upon the coasts, &c.

**SMALL apparatus**, } See the articles { **APPARATUS**,  
**SMALL intestine**, } **INTESTINE**.

**SMALL-POX**, *variola*. See **POX** and **VARIOLÆ**.

**SMALL repeat**. See the article **REPEAT**.

**SMALT**, a kind of mineral matter, prepared and purified abroad, and brought hither, sometimes in form of a blue powder, and sometimes in cakes; chiefly used along with starch, to give linens the finer and clearer cast; and best known by the name of *stone* or *powder-blue*. See **BLUE**.

The preparation of *smalt*, as practised in Hermunduria, we find described in the Philosophical Transactions by Dr. Krieg; who tells us, that the matter it is made of, is the mineral stone, called cobalt or cadmia, which being pulverized, and the lighter stuff washed away, the remainder is laid on a furnace, and by a fire, underneath and aside it, the flames whereof are reverberated over it, a matter is separated from it in form of a smoak, which sticking to the walls, makes what we call *arsenic*. See **ARSENIC**.

When the cobalt has done smoaking, it is cooled, mixed with pot-ashes and powder of white flint-stones, the mixture put in pots, and melted for five or six hours in a furnace. By this means, the matter is formed into a blue glass, which being put in cold water, cracks and grows tender, and is at length powdered by an engine, the finest part separated by a sieve, put into a mill, and ground in water, into the finest powder, which by washing is still further separated from the coarser, then dried in warm chambers, barrelled up, and sent away.

**SMARAGD**, ΣΜΑΡΑΓΔΟΣ, a precious stone of a green colour, very beautiful and brilliant, but brittle: called also *emerald*. See **EMERALD**.

The oriental *smaragds* are the most in esteem, as being the hardest, and their splendor the most vigorous; so as even to tinge the ambient air with their greenness.

Great virtues are ascribed to the *smaragd*, or emerald: Cardan and others say, it resists plagues, poisons and dysenteries; that it refreshes the spirits, &c. See **GEM**.

**SMECTYMNUUS**, a term that made some figure in the time of the civil wars, and during the inter-regnum.—It was formed of the initial letters of the names of five eminent presbyterian ministers of that time, viz. Stephen Marshall, Edmund Calamy, Thomas Young, Matthew Newcomen, and William Spurstow, who, together, wrote a book against episcopacy, in the year 1641; whence they and their retainers, were called *smectymnuans*.

**SMELL**, *odor*, with regard to the organ, is an impression made on the nose, by little particles continually exhaling from odorous bodies. See **NOSE**, &c.

**SMELL**, with regard to the object, is the figure and disposition of odorous effluvia, which sticking on the organ, excite the sense of *smelling*. See **SMELLING**.

**SMELL**, with regard to the soul, is the perception of the impression of the object on the organ; or the affection in the soul resulting therefrom. See **SENSE**.

The chymists teach, that sulphur is the principle of all *smells*, and that these are more or less strong, as the sulphur in the odorous body, is more or less dried and exalted. Sulphur, they say, is the foundation of odours, as salt is of flavours, and mercury of colours. See **SMELLING**.

*Smell*, like taste, consists altogether in the arrangement, composition and figure of the parts; as appears from the following experiments of Mr. Boyle:

1°. From a mixture of two bodies, each whereof is, of itself, void of all *smell*; a very urinous *smell* may be drawn: that is, by the grinding of quick-lime with sal-ammoniac.

2°. By the admixture of common water, which of itself is void of *smell*, or inodorous; another inodorous body may be made to emit a very rank *smell*.—Thus camphor dissolved in oil of vitriol, is inodorous; yet mixed with water, immediately exhales a very strong *smell*.

3°. Compound bodies may emit *smells*, which have no similitude to the *smells* of the simples they consist of.—Thus oil

of turpentine, mixt with a double quantity of oil of vitriol, and distilled; after distillation, there is no *smell* but of sulphur; and what is left behind in the retort, being again urged by a more violent fire, yields a *smell* like oil of wax.

4°. Several *smells* are only to be drawn forth by motion, and agitation.—Thus glass, stones, &c. which even when heated, yield no *smell*, yet when rubbed and agitated in a peculiar manner, emit a strong *smell*; particularly beechwood in turning, yields a kind of rosy *smell*.

5°. A body that has a strong *smell*, by being mixed with an inodorous one, may cease to have any *smell* at all.—Thus if aqua-fortis, not well dephlegmated, be poured on salt of tartar, till it cease to ferment; the liquor, when evaporated, will yield inodorous crystals, much resembling salt of nitre: yet when burnt, will yield a most noisom *smell*.

6°. From a mixture of two bodies, one whereof *smells* extremely ill, and the other not well; a very pleasant aromatic odor may be gained, viz. by a mixture of aqua-fortis, or spirit of nitre, with an inflammable spirit of wine.

7°. Spirits of wine, by mixing with an almost inodorous body, may gain a very pleasant, aromatic *smell*.—Thus inflammable spirits of wine, and oil of Dantzic vitriol, mixed in equal portions, then digested, and at last distilled, yield a spirit of a very fragrant *smell*.

8°. A most fragrant body may degenerate into a foetid one, without the admixture of any other body.—Thus, if the spirit, mentioned in the former experiment, be kept in a well-closed receiver, it will soon turn to the rankness of garlic.

9°. From two bodies, one whereof is inodorous, and the other foetid; a very pleasant *smell* may arise, much resembling musk, viz. by putting pearls into spirit of vitriol: for when dissolved, they yield a very agreeable *smell*.

**SMELLING**, the act whereby we perceive *smells*, or whereby we become sensible of odorous bodies, by means of certain effluvia thereof, which striking on the olfactory organ, briskly enough to have their impulse propagated to the brain, excite a sensation in the soul. See **SENSE**, **SENSATION**, and **SMELL**.

The principal organs of *smelling*, are the nostrils, and the olfactory nerves; the minute ramifications of which latter are distributed throughout the whole concave of the former: their descriptions, see under their proper heads.

*Smelling* is performed by the odorous effluvia floating in the air, being drawn into the nostrils, in inspiration, and struck with such force against the fibrillæ of the olfactory nerves, which the figure of the nose, and the situation of the little bones, render opposite thereto, as to shake them, and give them a vibratory motion; which action being communicated thence to the common sensory, occasions an idea of a sweet, or foetid, or sour, or an aromatic, or a putrid object, &c. The matter in animals, vegetables, fossils, &c. which chiefly affects the sense of *smelling*, Boerhaave observes, is that subtle substance inherent in the oily parts thereof, called *spirit*: for that when this is taken away from the most fragrant bodies, what remains has scarce any *smell* at all; but this poured on the most inodorous bodies, gives them a fragrancy. *Instit. cap. de Olfac.*

Willis observes, that brutes have, generally, the sense of *smelling* in much greater perfection than man; as by this, alone, they distinguish the virtues and qualities of bodies unknown before; hunt out their food at a great distance, as hounds, and birds of prey; or hid among other matters, as ducks, &c.

Man having other means of judging of his food, &c. did not need so much sagacity in his nose: yet have we instances of a great deal, even in man.—In the *Histoire des Antilles*, we are assured, there are negroes who, by the *smelling* alone, can distinguish between the footsteps of a Frenchman and a negro.

It is found that the laminae, wherewith the upper part of the nostrils is fenced, and which serve to receive the divarications of the olfactory nerves, are always longer, and folded up together in greater number, as the animal has this sense more accurate: the various windings and turnings of these laminae, detain and fether the more of the odoriferous particles.

**SMELTING**, among metallists, the melting of a metal in the ore, in a *smelting* furnace; in order to separate the metallic from the earthy and other parts. See **METAL**, **FURNACE**, &c.

*Smelting*, in propriety, is restrained to large works, wherein ores from the mines are melted down and separated.—In speaking of works in a lesser way, we do not say *smelting*, but melting. See **FUSION**, **REFINING**, &c.

**SMINTHEAN**, SMINTHEUS, ΣΜΙΝΘΕΥΣ, in antiquity, an epithet given to Apollo, from the Greek, σμινθη, a rat. There are two different accounts of the origin of this appellation: the first, that in the city of Chrysa in Mysia, was a priest of Apollo, called *Crinis*, with whom that God being offended, sent a herd of rats to spoil all his lands. But *Crinis* appeasing the deity, he came in person to his assistance, took up his lodgings with *Crinis's* shepherd, told him who he was, and destroyed all the rats with his arrows: in memory whereof, *Crinis* built a temple to his deliverer, under the name of *Apollo Smintheus*.

Clemens Alexandrinus, in his exhortation to the Greeks, gives us a different story: the Cretans, says he, intending to send out a Colony, consulted the Oracle of Apollo as to the place: the answer was, that they should fix their colony where those born of the earth should oppose them.—Upon their arrival in the Hellespont, the rats, in the night-time, gnawed asunder all the strings of their bows: this they deemed an accomplishment of the oracle, and built a city called *Smintha*.

**SMOKE**, or **SMOAK**, *fumus*, a humid matter, exhaled in form of vapour, by the action of heat, either external or internal. See **FIRE**, **VAPOUR**, &c.

*Smoke*, Sir Isaac Newton observes, ascends in the chimney by the impulse of the air it floats in: for that air being rarified by the fire underneath, has its specific gravity diminished; thus, being determined to ascend itself, it carries up the *smoke* along with it.—The tail of a comet, that great author takes to ascend from the nucleus after the same manner. See **COMET**.

*Smoke* of fat unctuous woods, as fir, Beech, &c. makes what we call *lamp-black*. See **BLACK**.

There are various inventions for preventing, and curing *smoking* chimneys; as the æolipiles of Vitruvius, the ventiducts of Cardan, the wind-mills of Bernard, the capitals of Serlio, the little drums of Paduanus, and several artifices of de Lorme, &c. See **CHIMNEY**.

In the Philosophical Transactions, we have the description of an engine invented by Monsieur Dalefine, which consumes the *smoke* of all sorts of wood, and that so totally as the most curious eye cannot discover it in the room, nor the nicest nose smell it, though the fire be made in the middle of the room.—It consists of several iron hoops, four or five inches diameter, which shut into one another; and is placed on a trevet.—A brand taken out of the fire *smokes* instantly; but ceases as soon as returned. The most foetid things, as a coal steeped in cat's-piss, which stinks abominably when taken out of the fire, yet in it makes not the least ill scent; no more than red herrings broiled, &c.

*Smoke* *farthings*, were the pentecostal or customary oblations offered by the inhabitants within any dioceses, when they made their processions to the cathedral church; which came by degrees into an annual, standing rent, called *smoke-farthings*. See **PENTECOSTAL**, &c.

**SMOOTHING plane**. See the Article **PLANE**.

**SMUGGLING**, a cant term for the running of goods; or the clandestine landing them without paying custom. See **CUSTOM**, **DUTY**, &c.

**SMUT**, a disease in corn, whereby the pulp or meal thereof is damaged, and its natural taste, colour, &c. altered. See **DISEASES of plants**.

The *smut* is usually ascribed by the husbandmen to the excessive fatness and rankness of the soil; to the manuring the land with rotten vegetables, as straw, hawm and fern; and to the sowing *smutty* seed.

Mr. Bradley makes no doubt to call the *smut* a *blight*, and to account for it on the same principle as the blights befalling other plants, particularly fruit trees, viz. from innumerable insects, brought, or at least hatched by the eastern winds, which prey on and devour the native juices of the corn, and poison them with a mixture of their own. See **BLIGHT**.

An approved method to prevent the *smut*, the same Mr. Bradley gives us, as follows: the wheat, for seed, to be washed in three or four waters, stirring it well round, and with great force, each time, and skimming off all the light wheat swimming a-top. This done, it is to be steeped in a liquor thus prepared: into a sufficient quantity of water, put as much salt, as, when stirred about, will make an egg swim; and to this add as much more salt; stir the whole well, and to the brine, put two or three pound of alum beaten fine. In this mixture, lay the wheat to steep, at least, thirty or forty hours. Take it out the night before it is to be sown, and sift some slacked lime on it; this dries and fits it for sowing.

Note, many steep their wheat in brine, yet have plenty of *smutty* corn: the reason is, that they do not either make their brine strong enough, or do not let the wheat stay long enough therein. It is a common notion among them, that steeping it so long, rots the grain; but experience shews the contrary.

**SNAKE root**. See **SERPENTARIA radix**.

**SNEEZING**, *sternutation*, a convulsive motion of the muscles of the breast used in expiration; wherein, after suspending the inspiration begun, the air is repelled from the mouth and nose with a momentary violence and noise. See **RESPIRATION**.

The cause, is an irritation of the upper membrane of the nose, which communicates with the intercostal nerve by means of the twigs that it detaches to it.

This irritation is performed either externally, by strong smells, as marjoram, roses, &c. or by dust floating in the air, and taken in by inspiration; or by sharp, pungent medicines, as cretels and other sternutatories, which vellicate the membrane of the nose; or internally, by the acrimony of the lymph

or mucus, which naturally moistens that membrane. See **STERNUTATIVE**, **PTARMIC**, **ERRHINE**, &c.

The matters cast forth in *sneezing*, come primarily from the nose and throat; the pituitary membrane continually exuding a mucus thither; and, secondarily, from the breast, the trachea, and the bronchia of the lungs.

F. Strada, in an express treatise on *sneezing*, has discovered the original of the custom of saluting those who *sneeze*. He shews it to be a relick of paganism; though he owns it was in use among the Jews as well as among the Romans.—From an epigram in the anthology, it appears, that among the ancients, a person after *sneezing*, made a short prayer to the gods; as *Zeus sôze, Jupiter save me*.

**SNOW**, *nix*, a meteor formed in the middle region of the air, of vapour raised by the action of the sun or subterraneous fire; there congealed, its parts coagulated, its specific gravity increased, and thus returned to the earth in form of little white villi, or flakes. See **METEOR** and **VAPOUR**.

The *snow* we receive, may properly enough be ascribed to the coldness of the atmosphere, through which it falls. When the atmosphere is warm enough to dissolve the *snow* before it arrives at us, we call it *rain*: if it preserve itself undissolved, it makes what we call *snow*. See **RAIN**.

Dr. Grew, in a Discourse of the nature of *snow*, observes, that many parts thereof are of a regular figure, for the most part so many little rowels or stars of six points, and are perfect and transparent ice, as any we see on a pond, &c. Upon each of these points are other collateral points, set at the same angles, as the main points themselves: among which there are divers other irregular, which are chiefly broken points, and fragments of the regular ones. Others also, by various winds, seem to have been thawed, and froze again into irregular clusters; so that it seems as if the whole body of *snow* were an infinite mass of icicles irregularly figured.—That is, a cloud of vapours being gathered into drops, the said drops forthwith descend; upon which descent, meeting with a freezing air as they pass through a colder region, each drop is immediately froze into an icicle, shooting itself forth into several points; but these still continuing their descent, and meeting with some intermitting gales of warmer air, or in their continual wastage to and fro, touching upon each other, some of them are a little thawed, blunted, and again froze into clusters, or intangled so as to fall down in what we call flakes.

The lightness of *snow*, although it is firm ice, is owing to the excess of its surface, in comparison to the matter contained under it; as gold itself may be extended in surface, till it will ride upon the least breath of air. See **ICE** and **FREEZING**.

The uses of *snow* must be very great, if all be true Bartholin has said in its behalf, in an express treatise, *de nivis usu medico*: he there shews, that it fructifies the earth, (which, indeed, is a very old and general opinion) preserves from the plague, cures fevers, cholicks, tooth-aches, sore eyes, and pleurifies (for which last use, his countrymen of Denmark use to keep *snow-water* gathered in March.) He adds, that it contributes to the prolongation of life; giving instances of people in the Alpine mountains that live to great ages: and to the preserving of dead bodies; instances whereof, he gives in persons buried under the *snow* in passing the Alps, which are found uncorrupted in the summer when the *snow* is melted.

He observes, that in Norway, *snow-water* is not only their sole drink in the winter; but *snow* even serves for food; people having been known to live several days, without any other sustenance.

Indeed the generality of these medicinal effects of *snow*, are not to be ascribed to any specific virtue in *snow*; but to other causes. It fructifies the ground, for instance, by guarding the corn or other vegetables, from the intenser cold of the air, especially the cold, piercing winds. And it preserves dead bodies, by coagulating and binding up the parts, and thus preventing all such fermentations or internal conflicts of their particles, as would produce putrefaction. See **COLD**. It is a popular error, that the first *snow* that falls in the year, has particular virtues. In Italy, they cool their wines all the summer with *snow-water*.

Signior Sarotti, in his Philosophical Transactions, mentions a *red* or *bloody snow*, which fell on the mountains la Langhe, near Genoa, on St. Joseph's day.—This *snow*, when squeezed, yielded a liquor of the same red colour.

**SNUFF**, a preparation of tobacco, made by reducing it into a powder, fit to be taken at the nose; in order to purge or clear the head of pituita. See **TOBACCO**, **STERNUTATIVE**, **ERRHINE**, &c.

Ordinarily, tobacco is the basis of *snuff*; other matters being only added to give it a more agreeable scent, &c. The kinds of *snuff*, and their several names, are infinite; and new ones are daily invented; so that it would be difficult, nor to say impossible, to give a detail of them. We shall only say, that there are three grand sorts; the first granulated; the second an impalpable powder; and the third the bran or coarse part remaining after sifting the second sort.

SOAP,

**SOAP**, or **SOPE**, a kind of paste, sometimes hard and dry, and sometimes soft and liquid; much used in washing, and whitening lincens, and for various other purposes, by the dyers, perfumers, hatters, fullers, &c. See **BLEACHING**, **HAT**, **FULLING**, &c.

The principal *soaps* of our manufacture, are the *soft*, the *hard*, and the *ball-soap*.—The *soft soap*, again, is either *white* or *green*: the process of making each kind, is as follows.

**Green soft SOAP**.—The chief ingredients used in making this, are lyes drawn from pot-ash and lime, boiled up with tallow and oil.—First, the lye and tallow are put into the copper together, and when melted, the oil is put to it, and the copper made to boil; then the fire is damp't or stop't up, while the ingredients lie in the copper to knit or incorporate; which done, the copper is set on boiling, being fed or filled with lyes as it boils, till there be a sufficient quantity put therein: then it is boiled off with all convenient speed, and put into casks.

**White soft SOAP**.—One sort of white *soap* is made after the same manner as *green soft soap* is, oil excepted, which is not used in white.—The other sort of *white soft soap*, is made from lyes of ashes of lime boiled up at twice with tallow.

First, a quantity of lyes and tallow are put into the copper together, and kept boiling; being fed with lyes as it boils, until it grains, or is boiled enough; then the lyes are separated or discharged from the tallowish part, which part is removed into a tub, and the lyes thrown away: this is called the first *half-boil*.—Then the copper is charged again with fresh tallow and lyes, and the first half-boil put out of the tub into the copper a second time; where it is kept boiling with fresh lyes and tallow, till it comes to perfection.—It is then put out of the copper into the same sort of casks as are used in green soft *soap*.

**Hard SOAP** is made with lyes from ashes and tallow, and most commonly boiled at twice: the first, called a *half-boiling*, hath the same operation as the first half-boil of soft white *soap*.—Then the copper is charged with fresh lyes again, and the first half-boil put into it, where it is kept boiling, and fed with lyes as it boils, till it grains, or is boiled enough; then the lye is discharged from it, and the *soap* put into a frame to cool and harden.

Note, There is no certain time for bringing off a boiling of any of these sorts of *soap*: it frequently takes up part of two days.

**Ball SOAP**, commonly used in the north, is made with lyes from ashes and tallow.—The lyes are put into the copper, and boiled till the watery part is quite gone, and there remains nothing in the copper but a sort of nitrous matter (the very strength or essence of the lye) to this the tallow is put, and the copper kept boiling and stirring for above half an hour, in which time the *soap* is made; and then it is put out of the copper into tubs or baskets with sheets in them, and immediately (whilst soft) made into balls.—Note, it requires near twenty-four hours to boil away the watery part of the lye.

*Soaps*, both *dry* and *liquid*, are held of some use in medicine: the *liquid* against fevers; to be applied by rubbing the soles of the patient's feet therewith: and the *dry*, dissolved with spirit of wine, in the cure of cold humours.—Besides its being used in suppositories, and in the composition of a kind of plaister, commonly called *emplast. de sapone*.

**SOAP-EARTH**, *sealites*, a smooth unctuous kind of earth, found in the Levant, and used as a *soap*. See **EARTH**.

The *soap-earth*, Dr. Smith tells us, is only had in two places near Duraclea, six leagues to the east of Smyrna. It is, in effect, of itself, a fine *soap*, boiling and shooting up out of the earth.

It is gathered always before sun-rise, and in mornings when there falls no dew; so that a stock must be laid up in the summer months, to serve all the year.

In some places, it comes up an inch or two above the surface of the ground: but the sun rising on it, makes it fall again. Every morning there returns a fresh crop.

**SOC**, or **SOK**, **SOKA**, in law, denotes jurisdiction; or a power or privilege to administer justice, and execute laws.

The word is also used for the shire, circuit, or territory wherein such power is exercised by him endued with such jurisdiction. See **JURISDICTION**.

Hence also the law Latin *soca*, used for a seignory or lordship, enfranchised by the king, with liberty of holding a court of his *soc-men* or *socagers*, that is, his tenants, whose tenure is hence called *socage*. See **SOCAGE**.

This kind of liberty still subsists in several parts of England, under the name of *soka*, or *soken*.—Skene defines *sok* to be *sesta de hominibus suis in curia secundum consuetudinem regni*.—Brady makes mention of these liberties: *soc*, *sac*, *tol*, *team*, *infangthes* and *utfangthes*. See **SAC**, &c.

In the laws of Henry I. *soca* is also used as synonymous with franchise, for a privileged place, refuge, asylum or sanctuary, &c. From the Saxon, *socn* or *socne*. See **FRANCHISE**, **SANCTUARY**, **ASYLUM**, &c.

**SOCAGE**\*, or **SOCAGE**, a tenure, by which men held their lands on condition of ploughing those of their respec-

tive lords, with their own ploughs, and doing other inferior offices of husbandry at their own charges. See **SERVICE**, **VASSAL**, **TENURE**, &c.

\* Bracton thus describes it: *dici poterit socagium a focco & inde tenentes socmanni, eo quod deputati sunt, ut videtur, tantummodo ad culturam, & quorum custodia & maritagia ad proprios quiores parentes jure sanguinis pertinebunt, &c.*

This slavish tenure was afterwards, by the mutual agreement of lord and tenant, turned into the payment of a certain sum of money, which is hence called *liberum socagium*, free or common *socage*. Whereas the other was *villanum socagium*, or *base socage*: inasmuch as those who held lands by this tenure, were not only bound to plough their lords' lands, but took the oath of fealty to them, *sicut villani*. See **FEALTY** and **VILLAIN**.

*Socage* was a tenure of that extent, that Littleton tells us, all the lands in England, which were not held by knight's-service, were held in *socage*: so that it seems the land was divided between the two tenures, which, as they were of different natures, so the descent of the land was in a different manner. For the lands held in knight's-service, descended to the eldest son; but those held in *villano socagio*, equally among all the sons. Yet if there was but one messuage, the eldest son was to have it; but so, as that he was to pay the rest the value of their shares.

Skene defines *socage*, a tenure of lands, whereby a man is infeoffed freely, without wardship and marriage, paying to his lord some small rents, &c. which is called *free socage*, &c. Several divisions of *socage* we meet withal in law-writers, as *socage in capite*, &c.—But by stat. 12. Car. II. all tenures from and after the 24th of February, 1645, shall be adjudged and taken for ever, to be turned into *free* and *common socage*. See **TENURE**.

**SOCUS**, **SOCK**, in antiquity, a kind of high shoe, reaching above the ankle, worn by the actors in the ancient drama, in representing of comic persons. See **COMEDY**.

The *soccus* was much lower than the cothurnus; and was the distinguishing wear of the comedians; as the cothurnus was of the tragedians: hence *soccus* is frequently used for comedy itself. Comedy, says M. Fenelon, must talk in an humbler stile than tragedy; the *sock* is lower than the buskin. See **BUSKIN**.

**SOCIETY**, **SOCIETAS**, an assemblage, or union of several persons in the same place, for their mutual assistance, security, interest, or entertainment. See **COMMUNITY**, **CORPORATION**, **COLLEGE**, **COMPANY**, **ACADEMY**, &c. Of *societies* we have a great many kinds, distinguished by the different ends proposed by them: *civil societies*, *trading societies*, *religious societies*, *literary societies*, &c.

**SOCIETY**, in trade, is a contract or agreement between two or more persons, whereby they bind themselves together for a certain time, and agree to share equally in the profits or losses which shall accrue in the affairs for which the *society* or co-partnership is contracted.

We have several very considerable *societies* of this kind; as the Merchant Adventurers, the Turkey, East-India, Muscovy, Eastland, Greenland, Spanish, African, South-Sea and Hudson's Bay companies. The institutions, policies, &c. whereof, see under the article **COMPANY**.

By the Roman law, the social contract needs no other solemnity, but the sole consent of parties, without any writing at all: but among us, articles of co-partnership are required.

—There is no contract wherein probity is more required than in *society*; inasmuch as the laws pronounce those null, that are made contrary to equity, and with design to deceive.

The French distinguish three kinds of mercantile *society*: *ordinary society*, called also *collective* and *general*: *society in commendam* or *commandity*: and *anonymous society*, called also *momentary* and *inconnue*.

The first is, where several merchants act alike in the affairs of the *society*, and do all under their collective names, which are public and known to every body.

**SOCIETY** in *commendam*, &c. is that between two persons, one of whom only puts his money into stock, without doing any other office of a co-partner; the other, who is called the *complementary* of the *society*, dispatching all the business under his own name.—This *society* is very useful to the state; inasmuch as all kinds of persons, even nobles and men of the robe, may contract it; and thus make their money of service to the public: and those who have no fortune of their own to trade withal, hereby find means of establishing themselves in the world, and of making their industry and address serviceable.

**Anonymous SOCIETY**, is that, where all the members are employed, each particularly, in the common interest, and each accountable for profits, &c. to the rest; but without the public's being informed thereof; so that the seller has only an action against the particular buyer, no other name appearing.

It is also called *momentary*, because frequently made on particular occasions, and ceasing with them; as in the making a purchase, the selling any commodity, &c.

Of this they distinguish four kinds: *society by participation*, which

which is usually formed by letters from one city to another, where a merchandise is to be bought or sold.—The second is, when two or three persons go together to fairs to buy goods.—The third, when two or three persons agree to buy up the whole of some commodity, in any country; to sell it again at their own price.—And the fourth is, when three or four persons make a journey together, to buy and sell the same commodity. Beside merchants, people of quality, &c. are admitted into these anonymous societies.

**Religious SOCIETIES**, are parties of persons formed, either to live regularly together; or to promote the interest of religion; or to cultivate it in themselves.

Of the first kind, are all congregations of religious; particularly the Jesuits, who are called the *society* of Jesus; though they more usually call themselves the *company* of Jesus. See **JESUITS**.—The *society* of the Sorbonne. See **SORBONNE**.

—The *society* of St. Thomas de Villeneuve, instituted in 1660, by F. Ange le Proust.—The *society* of St. Joseph, instituted in 1638.—The *society* of Bretagne, a reform of Benedictines in 1606.—And the *society* of Jesus, a religious military order, instituted by Pius II.

Of the second kind are, the

**SOCIETY for reformation of manners**, and putting in execution the laws against immorality and prophaneness.—It was set on foot above forty years ago, by five or six private persons in London; but is since exceedingly increased, by numbers of members of all denominations: a particular body of the most considerable hereof, bear the expences of prosecutions, &c. without any contribution from the rest: these chiefly apply themselves to the prosecuting persons for swearing, drunkenness, and prophaning the sabbath.—Another body of about 50 persons, apply themselves to the suppressing lewdness; and by them above 500 lewd houses have been actually suppressed.—A third body consists of constables.—A fourth, of informers.

Besides these, are eight other regular, mixed bodies of housekeepers, and officers, who inspect the behaviour of constables and other officers, assist in searching disorderly houses, &c. seizing offenders, giving information, &c.

There are several other societies of this kind at Bristol, Canterbury, Nottingham, &c.

**SOCIETY for propagating the gospel in foreign parts**, was instituted by king William, in 1701, for securing a maintenance for an orthodox clergy, and making other provisions for the propagation of the gospel in the plantations, colonies, factories, &c.—To that end, he incorporated the archbishops, several bishops, and other of the nobility, gentry and clergy, to the number of 90, into a body, with privilege to purchase two thousand pounds a year inheritance, and estates for lives or years, with other goods, to any value.

They meet yearly on the third Friday in February, to chuse a president, vice-president, and other officers; and the third Friday in every month to transact business, depute fit persons to take subscriptions for the said uses; and of all monies so received, to give account to the lord chancellor, &c.—They have a standing committee at the Chapter-house, to prepare matters for the monthly meeting, which is held at St. Martin's library.

**SOCIETY for propagating christian knowledge**, was begun in 1699 by some persons of worth, &c. Its original design was to propagate religion in the plantations, to secure the pious education of the poor at home, and to reclaim those that err in the fundamentals of christianity.

In the year 1701, they had procured considerable charities, and had transmitted the same to the plantations, in libraries, bibles, catechisms, &c. with a voluntary maintenance for several ministers, to be employed in the plantations.—But the society for propagating the gospel in foreign parts, being then instituted, they were incorporated by charter into the same; and thus discharged, as a particular society, from the further pursuit of that branch of their original design; whereupon they wholly turned themselves to the other; and are now very considerable, by great accessions from among the clergy and laity.

They meet weekly, to concert measures for raising charity for education of poor children, and setting up schools for that purpose; as also for the more regular disposal of pious books and catechisms; for instruction of the ignorant, erroneous, &c.—By the assistance of members of other religious societies, they have procured subscriptions for the education of above three thousand children, who are placed out in schools about London, and taught reading, writing, psalmody, &c.—They have dispersed great numbers of books among the poor, in the fleet, army, &c. and have procured several to be translated into Welch and other foreign languages, and dispersed accordingly. See **CHARITY school**.

Of the third kind, are divers religious societies, properly thus called; first set on foot in London about the year 1678, by a few young men, who agreed to meet weekly, for prayer, psalmody and spiritual conference.—They are now increased to forty distinct bodies, who have set up public prayers in many churches where it was not, procured frequent administrations of the sacrament; and maintain lectures on that subject, in one church or another almost on every Sunday-evening.

**SOCIETY of the cord**. See the article **CORD**.

**Royal SOCIETY**. See the article **ROYAL society**.

**SOCINIANS**, a modern sect of antitrinitarians, who, in these ages, have revived some of the errors of Paulus Samosatenus, Photinus and Arius; whence they are also occasionally called *Arians*, *Photinians*, &c. though in many respects different from them all. See **ARIAN**, **PHOTINIAN**, **ANTITRINITARIAN**, &c.

Faustus Socinus, a gentleman of Sienna, whence they take their name, was not the first author of the sect: he himself affirms, in his letter to Martin Vodau, wrote in 1548, that he advances no dogma but what had been published by others before him, even in Poland, ere he came to settle there. The truth is, he may be rather said to have refined, by his subtilties, on the notions that already prevailed there in his time, than to have invented a new system.

In his life, wrote by a Polish knight, we read, that he had not applied himself to the study of philosophy and divinity, nor had studied any thing but logic, till 35 years of age: but had spent the greatest part of his life at the court of the great duke of Tuscany. Upon his retiring thence, he began to think of religion; and, prepossessed as he was with the writings of his uncle Lælius Socinus, he formed a system thereon.—Lælius had explained the first words in the gospel of St. John, *in principio erat sermo*; by these, *in principio evangelii erat sermo*; as if the beginning, there spoke of, were only the beginning of the gospel.

This interpretation, never heard of in all antiquity, is followed by Faustus, in his comment on the fourteen first verses of that gospel.—He adds, that he who is called *Verbum*, had not been from all eternity, nor even before the creation of the world; but that by Word, must be meant the man Jesus Christ, God born of the virgin, under the emperor Augustus. But this is a paradox, which all his followers do not equally come into.—However, they all deny, not only the divinity of Jesus Christ, but the existence of the Holy Ghost, the mystery of the incarnation, original sin, and grace.

Their sentiments are explained at large, in their catechism, printed several times, under the title of *Catechesis ecclesiarum Polonicarum, unum Deum patrem illiusque filium unigenitum, una cum sancto spiritu ex sacra scriptura consentientium*. See **UNITARIAN**.

The Socinians are divided on several articles: some of them leave Socinus, as to what regards the worship offered to Jesus Christ; not being able to conceive how divine worship should be given a mere man.

The heresy of the Socinians spread exceedingly in Poland, Lithuania, Transilvania, and the neighbouring places. Racow was their chief school; and there all their first books were published.—But they were exterminated out of Poland in 1655: since which time they have chiefly sheltered in Holland; where, however, their public meetings have been prohibited: but they find means to conceal themselves under the names of Arminians and Anabaptists. See **ARMINIAN**, **ANABAPTIST**, &c.

**SOCK**. See the article **Soccus**.

**SOCKET**.—Ball and socket. See the article **BALL**.

**SOCLE**\*, or **ZOCLE**, in architecture, a flat, square member under the bases of pedestals, of statues, vases, &c. which it serves as a foot, or stand. See **PEDESTAL**, **STATUE**, **ZOCLE**, &c.

\* The word is French, formed from the Italian *zoccolo*, or the Latin *soccus*, the shoe of the ancient comic actors.—Vitruvius calls it *quadra*; we frequently *plinth*. See **PLINTH**.

**Continued SOCLE**, is a kind of continued stand, or pedestal, without either base, or cornice, ranging round the whole building; called by Vitruvius, *stereobata*, and the French, *soubassement*. See **STEREOBATA**.

**SOCOME**, in our law-books, &c. a custom of grinding corn at the lord's mill. See **MILL**.

There is *bond socome*, where the tenants are bound to it; and *love socome*, where they do it freely, out of affection to the lord. See **MOLTA**.

**SOCRATIC philosophy**, the doctrines and opinions, with regard to morality and religion, maintained, and taught by Socrates. See **PHILOSOPHY** and **PHILOSOPHER**.

By the character of Socrates, left us by the ancients, particularly his scholar Plato, Laertius, &c. he appears to have been one of the best, and the wisest persons in all the heathen world.—To him is ascribed the first introducing of moral philosophy; which is what is meant by that popular saying, *Socrates first called philosophy down from heaven to earth*; that is, from the contemplation of the heavens and heavenly bodies, he led men to consider themselves, their own passions, opinions, faculties, duties, actions, &c. See **MORALITY**, **ETHICKS**, &c.

While young, he was exceedingly fond of natural knowledge, as he witnesses of himself in Plato: but in his older age, he cast aside this part of philosophy as obscure, uncertain, impracticable, and even useless and impertinent; and applied himself wholly to moral or active philosophy.

It was he, first, who when all the other philosophers boasted they knew all things, owned, ingenuously, he knew nothing, but this, that he knew nothing. Which Pyrrho, the father of

of the sceptic philosophy, improved on, when he said he knew nothing; not even this, that he knew nothing. Yet in an answer of the oracle, it was pronounced; *Ἀνδρῶν ἀπαντῶν Σωκράτης σοφώτατος*. That Socrates was the wisest of all men. See PYRRHONIAN, ACADEMY, and SCEPTIC.

He was accused by Anytus, Melitus and Lycon, three persons, whose hatred he had incurred, by his severe declamations against the poets, of which number two of the first were, and the third an actor. His accusation was, that he corrupted the Athenian youth, and broached new superstitions. He was condemned to drink cicuta, by 281 votes, as we are told by Quintilian.

After his death, his fellow-citizens repented to that degree, that the gymnasia, courts of Justice, &c. were all shut up; Melitus put to death, Anytus banished, and a statue erected to Socrates.

He wrote nothing himself; yet almost all the Grecian sects of philosophers refer their origin to his discipline; particularly the Platonists, Peripateticks, Academicks, Cyrenaicks, Stoicks, &c.—But the greatest part of his philosophy, we have in the works of Plato. See PLATONISM; see also ACADEMIC, PERIPATETIC, STOIC, &c.

**SODALES** *Augustales*. See the article AUGUSTALES.

**SODDER**, or **SODER**, } See the articles { **SOLDER**.

**SODDERING**, } **SOLDERING**.

**SODOMY**, the unnatural crime of buggery; thus called from the city of *Sodom*, which was destroyed by fire for the same. See BUGGERY.

The Levitical laws adjudged those guilty of this execrable evil to death, Lev. xviii. 22, 23. xx. 15, 16; and the civil law assigns the same punishment. Our laws also make it felony.

**SOFA**, in the east, a kind of alcove, raised half a foot above the floor of a chamber, or other apartment; and esteemed the place of state, where visitors of distinction are received.

Among the Turks, the whole floor of their state-rooms is covered with a kind of tapestry, and on the window-side is raised a *sofa* or *sepha*, laid with a kind of matras, covered with a carpet much richer than the other.—On this carpet the Turks are seated, both men and women, like the taylors in England, cross-legged, leaning against the wall which is bolstered with velvet, fatten, or other stuff, suitable to the season. Here they eat their meals; only laying a skin over the carpet, to serve as a table-cloth, and a round wooden board over all, covered with plates, &c.

The ambassadors of France stood out a long while, and refused to visit the grand vizier, unless he would receive them on the *sofa*: at length he granted them the *sofa*.

**SOFE**. See the article SOPHI.

**SOFFITA**\*, **SOFFIT**, or **SOFIT**, in architecture, any timber ceiling, formed of cross beams, or flying cornices; the square compartments, or pannels whereof are enriched with sculpture, painting, or gilding.

\* The word is Italian, and signifies the same with the Latin, *lacunar* and *laquear*; with this difference, that *lacunar* is used for any ceiling with square, hollow pannels, called *lacus*; and *laquear* for compartments interlaced with platbands, after the manner of knots or *laquei*.

Such are those we see in the basilics and palaces of Italy, in the apartments at Luxembourg, at Paris, &c.—See *Tab. Archit. fig. 10*. See also CIELING.

**SOFFITA**, or **SOFFIT**, is also used for the under side or face of an architrave; and more particularly for that of the corona or larmier, which the ancients called *lacunar*, the French *plafond*, and we usually, *drip*. See PLAFOND, LARMIER, &c.

It is enriched with compartments of roses; and in the Doric order has 18 drops, disposed in three ranks, six in each, placed to the right of the guttæ, at the bottom of the triglyphs. See GUTTÆ, DORIC, ARCHITRAVE, &c.

**SOFI**, or **SOPHI**. See the article SOPHI.

**SOFIT**. See the article SOFFIT.

**SOFT** *pulse*, } **PULSE**.

**SOFT** *roe*, } See the articles { **ROE**.

**SOFT** *soap*, } **SOAP**.

**SOFTENING**, in painting, the mixing and diluting of colours with the brush, or pencil. See COLOUR.

To *soften* designs in black and white, made with the pen, &c. signifies to weaken the teint.

To *soften* a portrait, according to Felibien, is to change some of the strokes, and give a greater degree of sweetness and *softness* to the air thereof, which before had something rough and harsh in it.

**SOIL**, **SOLUM**, in agriculture and gardening, denotes earth, or ground, considered with regard to the quality of its mould, for the production and growth of vegetables. See EARTH, MOULD, VEGETABLE, &c.

Mr. Bradley reduces all *soils* to three heads, or kinds, viz. *sand*, *loam*, or *mother-earth*, and *clay*.

Gravels and all the open *soils*, till we come at loam, are of the sandy race; and the binding earths, from loam down to the stiffness of chalk, may be ranged under the clay kind. See SAND and CLAY.

Loam or mother-earth, is the medium between the two,

VOL. II. N°. CXLIII.

and includes all the intermediate kinds. See LOAM.

Each of these *soils* tends alike to vegetation; and each has its salts proper thereto; but in different proportions: a peck of clay having twice as much salts in it as the same quantity of loam; and four times as much sand.

Now, it is found to be the salts or juices of the *soil*, not the earth itself, that plants are fed and subsisted by. For in many experiments of vegetation, where plants of fifteen or twenty pound weight have been produced, there has been no sensible diminution in the weight of the earth. See VEGETATION.

Hence, at first sight, it might seem, that clay were the most proper, and sand the least proper *soil* to promote the growth of plants; which is contrary to experience. The reason is, that the parts of clay being close wrought together, do not so easily give out their salts; nor can the tender fibres of many plants make their way through it, in search of their food. But if its parts be well opened, by digging and breaking it into very small pieces, and those parts be kept open by a mixture of some sharp sand, or other like matter, that author adds, we shall see the effects of its vigour. Sand, on the other hand, giving its salts readily, puts forth its plants very early, and will make them germinate a full month sooner than clay; but as it is hasty, it is soon spent. The sun's warmth calls up all its salts early in the spring, and there is but little left for them to subsist long on, if the heat continue.

Each kind has its peculiar plants, which will not grow in the other; but the peculiar plants of both the other two will grow in loam, as partaking equally of the qualities of both. Loam, then, must be allowed the best and most beneficial *soil*, where it can be had: and where it cannot, if, by a mixture of other earths, we can make a compost to resemble it; we have more to expect from it, especially in plantations of durable trees, than from a composition of dung or other forcing ingredients, which, like excess of high, temperate foods and liquors, though they give a hasty growth, yet make the thing short-lived. The composition or *soil* here meant, is equal quantities of sand and clay well mixed. See COMPOST; see also HOT-BED.

Generally, a mixture of two or three *soils*, is better than any simple *soil*; especially where the hot and dry are mixed with the cold and moist. Clay laid on sand or gravel, or sand on clay, is the better manure. See MANURING.

But it is not the nature of the *soil* alone; but its depth is also to be regarded, and what *soil* is underneath. For the best *soil*, if it be not above a foot deep, and lie on a stiff clay, or hard cold stone, is not so fertile as a leaner *soil* of greater depth, or lying on a warm lime-stone; sand or gravel, through which the superfluous moisture may descend, and not stagnate on the clay or stone, to chill the roots of plants. Indeed, regard is to be had to the climate; for even in England, cold, moist clays are more fruitful in the south than the north.

Some general rules with respect to *soils*, are as follow.

1°. All land that moulders to dust with frost, with all sorts of warm lands, black mould, yellow clay, (if not too wet) and that turns black after rain, are good for corn.

2°. Lands bringing forth large trees and weeds, black-thorn, thistles, rank grass, &c. generally prove fruitful.

3°. Straw-berries, betony, thyme, &c. give indication to wood, and camomile to a mould disposed for corn.

4°. All land that binds after frost and rain, and turns white and full of worms, that is extremely moist, bears holly, yew, box, broom, heath, moss, &c. is of a cold temperature.

5°. Black, dun and yellow sand, and hot, stony gravel, are generally unfruitful. See GARDEN, ORCHARD, &c.

**SOIT** *fait comme il est désiré*, be it done as it is desired: a form used when the king gives the royal assent to a private bill preferred in parliament. See ASSENT and PARLIAMENT.

**SOK**, **SOKE**, **SOC**, in ancient customs. See SOC.

The word is sometimes also used for the privilege of tenants excused from customary impositions.

Also, for a quit-rent, or payment made to the lord by his tenant, for acting in quality of *sec-man* or freeholder. See SOCAGE.

The rent-gatherer in the *sok*, or *soken*, was called *seke-reeve*. See REEVE.

**SOL**, in music, the fifth note of the gammut: ut, re, mi, fa, *sol*, la. See NOTE, GAMMUT and MUSIC.

**SOL**\*, or *Sou*, *shilling*, a French coin, of billon, i. e. copper with a little silver mixed; equal to twelve deniers, or French pence; and the 20th part of the livre, or pound. See SHILLING; see also DENIER and LIVRE.

\* The word is formed from the Latin, *solidus*, shilling. Bodin is mistaken, when he derives it à *sole*, by reason of the sun struck on it.

The French *sol* is now worth upwards of an English half-penny, or the 23d part of an English shilling. See COIN, PENNY, &c.

The *sol* was first struck on the foot of 12 deniers tournois, whence it was also called *denzain*, a name it still retains, though its ancient value be changed; the *sol* having been

since augmented by three deniers, and struck with a punch of a flower de lys, to make it current for 15 deniers. —Soon after, the old *fol*s were coined over again, and both old and new indifferently made current for 15 deniers. —In 1709, the value of the same *fol*s was raised to 18 deniers. —Towards the latter end of the reign of Louis XIV. the *fol*s of 18 deniers were again lowered to 15, where they now stand.

The Dutch have also two kinds of *fol*s: the one of silver, called *fol de gros*, and likewise *schelling*: the other of copper, called also *stuyver*.

In old authors we read of gold *fol*s, which were different at different times. In the time of the Salic law, the gold *fol* was forty deniers; and thus it continued till the time of king Pepin, when it was reduced to twelve. —Some have also imagined, that the French had anciently silver *fol*s.

SOL, in astrology, &c. signifies the sun. —Sol in aries, &c. See SUN.

SOL, *sun*, in chymistry, is gold; thus called from an opinion, that this metal is, in a particular manner, under the influence of that luminary. See GOLD.

What should have been the principal inducement of torturing this metal, with so much violence, to obtain from it some medicinal virtues, Dr. Quincy observes, is not easy to be guessed; unless it was to keep up the authority of an ill-deserved regard, and a jealousy that they could not be well in the common opinion for physicians, who could not do extraordinary things in their profession with a metal, which had such a prodigious influence on other accounts. Many, indeed, there have been, who have honestly opposed this artifice; but the contrary side has a long time prevailed, and to such a degree, that this metal itself has not only been transformed into all the shapes imaginable for medicinal purposes; but even its name has been transferred to do honour to, and enhance the price of many other worthless preparations, that bore any resemblance to its sensible qualities.

Hence many tinctures of a yellow colour, are presently the golden tincture of something or other.

Most, indeed, acknowledge, that gold in substance, or reduced into the smallest particles by the hammer, as in the leaf-gold, is not digestible in the stomach, so as to be transmitted into the blood, and be of any efficacy there. But there are nevertheless, many, who are confident of its doing extraordinary matters, if reduced into a powder, by amalgamation with mercury, and by evaporating the mercury afterwards.

Zacutus Lusitanus, is one of the smartest pleaders on this side the controversy, against Musa, Picus Mirandola and Platerus; who, besides many instances of its efficacy, urges the authority of Avicen, Serapion, Geber, and many of the Arabian physicians, with those of other countries, and of later date. Quercetan, Schroder, Zwelfer and Etmuller, with many other more modern, practical physicians, fell into the same opinion. But which side soever is in the right, the present practice rejects all pretensions to medicine from it.

SOL, in the hermetical philosophy signifies sulphur. See SULPHUR.

SOL, in heraldry, denotes *or*; the golden colour in the arms of sovereign princes. See OR and METAL.

SOLAR, something belonging to the sun. See SUN.

Thus we say, SOLAR fire, in contradistinction to culinary fire. See FIRE.

SOLAR civil month, } See the articles { MONTH.

SOLAR cycle, } CYCLE.

SOLAR eclipse, is a privation of the light of the sun, by the interposition of the opaque body of the moon. See ECLIPSE.

SOLAR month, } See the articles { MONTH.

SOLAR rising, } RISING.

SOLAR spots, } SPOTS.

SOLAR system, the order and disposition of the several heavenly bodies, which revolve round the sun as the centre of their motion, viz. the planets, primary and secondary, and the comets. —For a scheme of the solar system, see SYSTEM.

The SOLAR year, consists of 365 days, 5 hours, 49 minutes; in opposition to the lunar year, which only consists of 354 days. See YEAR.

The solar year, is either tropical, or sidereal.

SOLAR tropical year, is the space of time, wherein the sun returns again to the same equinoctial or solstitial point: which is always equal to 365 days, 5 hours, and about 49 minutes.

SOLAR sidereal year, is the space wherein the sun comes back to any particular, fixed star; which is about 365 days, 8 hours, and 9 minutes. See SIDERIAL, &c.

SOLDAN. See the article SULTAN.

SOLDER\*, SODDER, or SODER, a metallic or mineral composition, used in soldering or joining together other metals. See SOLDERING.

\* The word is formed from the French, *souder*, of the Latin, *solidare*, to strengthen.

Solders are made of gold, silver, copper, tin, bismuth, and lead; always observing, that in the composition, there be some of the metal to be soldered, mixed with some higher and finer metals.

Goldsmiths usually make four kinds of *solder*, viz. *solder* of eight; where, to seven parts of silver there is one of brass or copper. *Solder* of six, where only a sixth part is copper. *Solder* of four: and *solder* of three. —It is the mixture of copper in the *solder* that makes raised plate always come cheaper than flat.

The *solder* used by plumbers, is made of two pounds of lead to one of block-tin. Its goodness is tried by melting it, and pouring the bigness of a crown-piece on a table; for, if good, there will arise little, bright, shining stars therein. See PLUMBERY.

The *solder* for copper is made like that of the plumbers; only, with copper and tin: for very nice works, instead of tin, they sometimes use a quantity of silver. See COPPER.

*Solder* for tin, is made of two thirds of tin, and one of lead; but where the work is any thing delicate, as in organ-pipes, where the juncture is scarce discernible, it is made of one part of tin glass, and three parts of pewter. See TIN.

The duke of Florence's nail, anciently so much admired, as being half iron and half gold, when as those two metals were deemed irreconcilable; was joined by a kind of *solder*, made by Turneisser, an ingenious chymist of Venice: the secret whereof, was never discovered till published by Tachenius. The *solder* is nothing but a little copper or cyprus vitriol put between the gold and the iron. For, naturally, the great acidity of the gold, reduces the iron into a scoria or rust, when the two are applied immediately over one another; but this inconvenience is removed, by the interposition of a little copper, be it in the smallest quantity imaginable.

SOLDERING, or SODDERING, among mechanicks, the joining and fastening together of two pieces of the same metal, or of two different metals, by the fusion and application of some metallic composition on the extremities of the metals to be joined. See SOLDER.

Goldsmiths *solder* with gold, silver and brass or copper mixed together: plumbers with lead and tin. See PLUMBERY, &c. Copper is usually *soldered* with tin; sometimes, according to the work, with a mixture of copper and silver. —In the *soldering* of all these metals, they generally use borax in powder, and sometimes rosin.

As to iron, it is sufficient that it be heated red-hot; and the two extremities, in this state, hammered together. —By this means they become incorporated together. See BRAZING.

SOLDIER\*, a military man, lifted to serve a prince or state, in consideration of a certain daily pay. See MILITARY.

\* The word is formed from the Italian, *soldato*, and that from the Latin, *solida*, or *solidata*, of *solidus*, the *solde*, or *pay*: though Pasquier chuses to derive it from the old Gaulish *souldoy*, a *soldier*; and Nicod from *soldurius*. See SOLDURI.

The *soldier* is he who takes pay; the vassal he who is obliged to serve at his own expences; the volunteer he who serves at his own expence, and of his own accord. See VASSAL, CADET, &c.

Du Cange observes, that the ancient *soldiers* were not to be short of five foot and a half; and that this measure was called *incoma*, or *incommia*.

Band of SOLDIERS. See the article BAND.

SOLDURII, in antiquity, a kind of military clients, or retainers to the great men in Gaul, particularly Aquitania; mentioned by Cæsar. See SOLDIER.

The *soldurii* were people, who shared all the good and ill fortune of their patrons; to whom, if any disaster happened, they either underwent the very same, or killed themselves: and Cæsar assures us, that no one had ever been known to refuse the alternative, *Lib. III. de Bel. Gal.*

Vegenere takes them to have been more than common soldiers; and even Gentlemen in pension, or appointment. —Athenæus calls them *συναποθησκοντες*, *q. d.* dying together, or with their masters.

SOLECISM\*, SOLOECISMUS, in grammar, a gross impropriety in speech, contrary to the use of language, and the rules of grammar, either in respect of declension, conjugation, or syntax.

\* The word is Greek, *σολοικισμός*, derived from the *Soli*, a people of Attica, who being transplanted to Cilicia, lost the purity of their ancient tongue, and became ridiculous to the Athenians for their improprieties therein.

An actor on the Roman theatre having made a wrong gesture, the audience immediately cried out, he had committed a *solecism* with his hand. Ablanc.

*Solecisms*, on some occasions, are pardonable: *impetratum est a ratione ut peccare suavitatis causa liceret*: Vaugelas is frequently repeating that of Quintilian; *aliud est Latine, aliud grammaticè loqui*. —Balthasar Stolberg has a Latin treatise of the *solecisms* and barbarisms falsely attributed to the New Testament. See BARBARISM.

SOLEIL.—Ombre de SOLEIL. See the article OMBRE.

SOLEMN, SOLENNIS, something performed with much pomp, ceremony and expence. —Thus we say, *solemn feasts*, *solemn funerals*, *solemn games*, &c. See FEAST, GAME, FUNERAL, &c.

SOLEMN,

**SOLEMN**, in law, signifies something authentic, or that is clothed in all its formalities. See **AUTHENTIC**.

**SOLEMN testament**, in the civil law, is to be attested by seven persons, and sealed with their seals. See **TESTAMENT**.

**SOLEMN marriage**, is that performed in one's own parish-church, after publication of the bans, and in presence of witnesses. See **MARRIAGE**.

**SOLEMN acceptance**. See the article **ACCEPTANCE**.

**SOLE-TENANT**, in law, he or she, who holds lands only in his or her own right, without any other person joined. See **TENANT**.

*E. gr.* If a man and his wife hold land for their lives, the remainder to their son; here, the man dying, the lord shall not have heriot, because he dies not *sole-tenant*.

**SOLEUS**, in anatomy, a muscle called also *gastrocnemius internus*.—See *Tab. Anat. (Myol.) fig. 1. n. 67. fig. 2. n. 49. fig. 6. n. 42.* See also **GASTROCNEMIUS**.

**SOL-FA-ING**, in musick, the naming and pronouncing of the several notes of a song, by the syllables *sol, fa, la, &c.* in learning to sing it. See **NOTE** and **MUSICK**.

Of the seven notes in the scale, *ut, re, mi, fa, sol, la, si*; only four are in use among us, *viz. fa, sol, la, mi*. Their office is principally in singing; that by applying them to every note of the scale, it may not only be pronounced more easily; but chiefly, that by them, the tones and semi-tones of the natural scale, may be better marked out and distinguished. See **SCALE** and **GAMMUT**.

This design is obtained by the four syllables, *fa, sol, la, mi*; thus, from *fa* to *sol* is a tone; also from *sol* to *la*, and from *la* to *mi*, without distinguishing the greater or lesser tone; but from *la* to *fa*, also from *mi* to *fa*, is a semi-tone.

If, then, these be applied in this order, *fa, sol, la, fa, sol, la, mi, fa, &c.* they express the natural series from *c*; and if that be to be repeated to a second or third octave, we see by them how to express all the different orders of tones and semi-tones in the diatonic scale; and still above *mi*, will stand *fa, sol, la*; and below it, the same reversed, *la, sol, fa*; and one *mi* is always distant from another by an octave; which cannot be said of any of the rest, because after *mi* ascending, comes always *fa, sol, la, fa*, which are repeated invertedly, descending.

To conceive the use of this: it is to be remembered, that the first thing in teaching to sing, is to make one raise a scale of notes by tones and semi-tones to an octave, and descend again by the same notes, and then to rise and fall by greater intervals, at a leap, as a third, fourth, fifth, &c. And to do all this, by beginning at notes of different pitch.—Then, these notes are represented by lines and spaces, to which those syllables are applied, and the learner taught to name each line and space, by its respective syllable; which makes what we call *sol-fa-ing*; the use whereof is, that while they are learning to tune the degrees and intervals of sound, expressed by notes set on lines and spaces; or learning a song, to which no Words are applied; they may do it the better, by means of an articulate sound: but, chiefly, that by knowing the degrees and intervals expressed by these syllables, they may more readily know the true distance of notes. See **SINGING**.

Mr. Malcolm observes, that the practice of *sol-fa-ing*, common as it is, is very useless and insignificant, either as to the understanding or practising of music; yet exceedingly perplexing: the various applications of the several names, according to the various signatures of the clef, are enough to perplex any learner: there being no less than 72 different ways of applying the names *sol, fa, &c.* to the lines and spaces of a particular system. See **SCALE**.

**SOLID**, in physics, a body whose minute parts are connected together, so, as not to give way, or slip from each other upon the smallest impression. See **SOLIDITY**.

The word is used in this sense, in contradistinction to *fluid*. See **FLUID**, **FLUIDITY**, and **FIRMNESS**.

*Atmosphere of SOLID bodies*. See **ATMOSPHERE**.

For the laws of gravitation of **SOLIDS** immersed in fluids specifically either lighter or heavier than the *solids*; see **GRAVITY** and **FLUID**.

To find the specific gravity of **SOLIDS**, and its ratio to that of fluids; see **SPECIFIC gravity**.

For the laws of the resistance of **SOLIDS** moving in fluids; see **RESISTANCE**.

**SOLID**, in geometry, is a magnitude endued with three dimensions; or extended in length, breadth and depth. See **DIMENSION**.

Hence, as all bodies have these three dimensions, and nothing but bodies; *solid* and *body* are frequently used indiscriminately. See **BODY**.

A *solid* is terminated, or contained under one or more planes or surfaces; as a surface is under one or more lines. See **SURFACE** and **LINE**.

From the circumstances of the terminating lines; *solids* become divided into *regular* and *irregular*.

**Regular SOLIDS**, are those terminated by regular and equal planes. See **REGULAR**.

Under this class comes the tetraëdron, hexaëdron or cube, octaëdron, dodecaëdron and icosaëdron. See **TETRAEDRON**, **CUBE**, &c.

**Irregular SOLIDS**, are all such as do not come under the definition of regular ones.—Such are the sphere, cylinder, cone, parallelogram, prism, pyramid, parallelepiped, &c. See **SPHERE**, **CYLINDER**, **CONE**, &c.

The geneses, properties, ratios, constructions, dimensions, &c. of the several *solids*, regular and irregular, spherical, elliptical, conical, &c. see under each respective article.

*Measure of a SOLID*. See the article **MEASURE**.

*Cubature, or cubing of a SOLID*, is the measuring of the Space comprehended under a *solid*, i. e. the solidity or *solid* content thereof. See **CUBATURE** and **SOLIDITY**.

*SOLID of the least resistance*. See **RESISTANCE**.

**SOLID angle**, is that formed by three or more plain angles meeting in a point. See **ANGLE**.—Or more strictly, a *solid angle*, as *B*, (*Tab. Geometry, fig. 30.*) is the inclination of more than two lines, *AB, BC, BF*, which concur in the same point *B*, and are in different planes.

Hence, for *solid angles* to be equal, it is necessary they be contained under an equal number of equal planes, disposed in the same manner.

And as *solid angles* are only distinguishable by the planes under which they are contained; and as planes thus equal, are only distinguishable by compresence, they are similar; and consequently similar *solid angles* are equal, and *vice versa*. See **SIMILAR**.

The sum of all the plain angles constituting a *solid angle*, is always less than  $360^\circ$ ; otherwise they would constitute the plane of a circle, and not a *solid*. See **ANGLE**.

*Like SOLID figures*. See the article **LIKE**.

**SOLID bastion**, } See the articles { **BASTION**.

**SOLID place**, } See the articles { **LOCUS**.

**SOLID foot**. See the article **FOOT**.

**SOLID numbers**, are those which arise from the multiplication of a plain number, by any other whatsoever.

Thus 18 is a *solid number* made of 6 (which is plain) multiplied by 3; or of 9 multiplied by 2. See **NUMBER** and **SIMILAR**.

**SOLID problem**, in mathematics, is one which cannot be geometrically solved, but by the intersection of a circle, and a conic section; or by the intersection of two other conic sections, besides the circle.

Thus, to describe an isosceles triangle on a given right line, whose angle at the base, shall be triple to that at the vertex; is a *solid problem*, resolved by the intersection of a parabola and a circle. See **PROBLEM**.

**SOLID theorem**. See the article **THEOREM**.

**SOLID phosphorus**, } See the articles { **PHOSPHORUS**.

**SOLID sulphur**, } See the articles { **SULPHUR**.

**SOLIDITY**, in physics, a property of matter or body, whereby it excludes every other body from the place itself possesses. See **SOLID**.

*Solidity* is a property common to all bodies, whether solid, or fluid. See **MATTER**.—It is usually called *impenetrability*; but *solidity* expresses it best; as carrying somewhat more of positive with it than the other, which is a negative idea. See **IMPENETRABILITY**.

The idea of *solidity*, Mr. Locke observes, arises from the resistance we find one body make to the entrance of another into its own place.—*Solidity*, he adds, seems the most extensive property of body; as being that whereby we conceive it to fill space: it is distinguished from mere *space*, by this latter not being capable of resistance or motion. See **SPACE**. It is distinguished from *hardness*, which is only a firm cohesion of the solid parts, so as they may not easily change their situation. See **HARDNESS**.

The difficulty of changing situation, gives no more *solidity* to the hardest body than the softest; nor is a diamond a jot more solid than water.—By this we distinguish the idea of the extension of body, from that of the extension of space: that of body, is the continuity or cohesion of solid, separable, moveable parts; that of space, the continuity of unsolid, inseparable, immoveable parts. See **EXTENSION**.

The Cartesians however, will, by all means, deduce *solidity*, or, as they call it, *impenetrability*, from the nature of extension; and contend, that the idea of the former, is contained in that of the latter; and hence argue against a vacuum.—Thus, say they, one cubic foot of extension cannot be added to another, without having two cubic feet of extension; for each has in itself, all that is required to constitute that magnitude. And hence they conclude, that every part of space is solid, or impenetrable; inasmuch as of its own nature it excludes all others. But the conclusion is false, and the instance they give follows from this, that the parts of space are immoveable; not from their being impenetrable or solid. See **VACUUM**, **PLENUM**, &c.

**SOLIDITY**, in geometry, the quantity of space contained in a solid body; called also the *solid content*, and the cube thereof. See **CUBATURE**.

The *solidity* of a cube, prism, cylinder, or parallelepiped, is had by multiplying its basis into its height. See **CUBE**, **PRISM**, **CYLINDER**, &c.

The *solidity* of a pyramid or cone, is had by multiplying either the whole base into a third part of the height; or the whole

whole height into a third part of the base. See PYRAMID and CONE.

To find the SOLIDITY of any irregular body.—Put the body in a hollow parallelepiped, and pour water or sand upon it, and note the height of the water or sand A B (*Tab. Geometry, fig. 32.*) then, taking out the body, observe at what height the water (or sand when levelled) stands, as A C. Subtract A C from A B; the remainder will be B C. Thus is the irregular body reduced to a parallelepiped, whose base is F C G E; and altitude B C. To find the *solidity* whereof, see PARALLELEPIPED.

Suppose, *e. gr.* A B to be 8, and A C, 5; then will B C be 3: suppose again, D B, 12, D E, 4; then will the *solidity* of the irregular body be found 144.

If the body be such, as that it cannot be well laid in such a kind of channel; *e. gr.* if it be required to measure the *solidity* of a statue, as it stands; a quadrangular prism or parallelepiped is to be framed over it: the rest as before.

To find the SOLIDITY of a hollow body.—If the body be not comprized in the number of regular bodies; its *solidity* is found as in the preceding problem. If it be a parallelepiped, prism, cylinder, sphere, pyramid or cone; the *solidity*, first of the whole body, including the cavity, then that of the cavity, which is supposed to have the same figure with the body itself, is to be found, according to the respective methods delivered under PARALLELEPIPED, PRISM, &c.—For the latter being subtracted out of the former, the remainder is the *solidity* of the hollow body required.

SOLIDITY, in architecture, is applied both to the consistence of the ground whereon the foundation of a building is laid; and to a mass of masonry, of extraordinary thickness, without any cavity within.—The *solidity* of the Egyptian pyramids is inconceivable. See PYRAMID.

SOLIDS, in anatomy, &c. denote all the continuous, and continent parts of the body; thus called, in opposition to the *fluids* or parts contained therein. See BODY, PART and FLUID.

Of the *solid* kind, are the bones, cartilages, ligaments, membranes, fibres, muscles, tendons, arteries, veins, nerves, glands, lymphæducts and lacteals. See BONE, CARTILAGE, LIGAMENT, &c.

Notwithstanding the great number and appearance of the *solids* of the body; we find from the microscope, injections, vesicatories, atrophies, &c. that the *solid* parts are exceedingly small and inconsiderable, in comparison of the *fluids*. Nay, it is almost demonstrable, from a consideration of the rise and generation of the vessels, and the resolution of the greatest vessels into their smallest constituent ones, that the whole mass of *solids* in the body, consists merely of fibres, as their common elements. See FIBRE and STAMINA.

In effect, the whole mass of *solids* as well as *fluids*, a minute stamen or animalcule only excepted, arose from a very subtle fluid colliquament, not unlike the nervous juice; as is shewn by Malpighi, in his treatise *de Ovo Incubato*. See EGG.

The white of the egg never nourishes, till, from its natural thickness, it have been brought, by incubation, through innumerable degrees of fluidity, to become subtle enough to enter the minute vesicles of the stamen or seed. The first, soft, tender *solids* arising from this subtle humour pass through infinite, intermediate degrees, ere they arrive at their utmost *solidity*. See GENERATION.

All the *solids*, therefore, in our bodies (unless any one will be so nice as to except the first stamen) only differ from the *fluids*, out of which they arise, by their rest, cohesion and figure; and a fluid particle will become fit to form a part of a *solid*, as soon as there is a force sufficient to effect its cohesion with the other *solid* parts. See NUTRITION.

SOLIDUS. See the article AUREUS.

SOLILOQUY, SOLILOQUIUM, a reasoning or discourse, which a man holds with himself. See MONOLOGUE.

Papias says, that *soliloquy* is properly a discourse by way of answer to a question that a man has proposed to himself.

*Soliloquies* are become very common things on the modern stage; yet can nothing be more inartificial or more unnatural, than an actor's making long speeches to himself, to convey his intentions, &c. to the audience.

Where such discoveries are necessary to be made, the Poet should rather take care to give the dramatic persons such confidants, as may necessarily share their inmost thoughts; by which means, they will be more naturally conveyed to the audience.—Yet is even this a shift, an accurate poet would not be found to have occasion for.

The use and abuse of *soliloquies*, is well delivered by the duke of Buckingham, in the following lines:

*Soliloquies had need be very few,  
Extremely short, and spoke in passion too.  
Our lovers talking to themselves, for want  
Of others, make the pit their confidant:  
Nor is the matter mended yet, if thus  
They trust a friend, only to tell it us.—*

SOLIS *via*. See the article VIA.

SOLITARY, SOLITARIUS, something retired, or in private; remote from the company, or commerce of others of the same species. See MONK, HERMIT, ANACHORET, RECLUSE, &c.

SOLITARY column, is a column that stands alone in any public place; as the Trajan column. See COLUMN.

SOLITARY worm, SOLIUM, *tania*, or *lumbicus latus*, is a worm sometimes found in the intestines, and which is always the only one of the kind; as commencing from the pylorus, and extending thence, the whole length of the intestines; so that there is no room for another. See WORM.

SOLITARIES, is also a denomination of the nuns of St. Peter of Alcantara, instituted in 1676, by cardinal Barberini; when abbot of Notre dam de Farsa, in that city.

The design of their institute is to imitate the severe, penitent life of St. Peter of Alcantara; keep a continual silence, never open their mouths to any body but themselves; employ their time wholly in spiritual exercises, and leave the temporal concerns to a number of maids, who have a particular superior in a separate part of the monastery.—They always go bare-footed, without sandals, gird themselves with a thick cord, and wear no linen.

SOLITAUROLIA, in antiquity. See SUOVETAUROLIA.

SOLICITOR, or SOLICITOR, SOLLICITATOR, a person employed to follow, and take care of other persons suits depending in courts of law, or equity; formerly allowed only to nobility, whose menial servants they were; but now frequently used to others, to the great increase of champerty, and maintenance. See ATTORNEY.

The king has a SOLICITOR general, who holds his office by patent, during the king's pleasure.—The attorney general, and he, had anciently a right to their writs of summons, to sit in the lords house on special occasions, till the 13 Car. II. since which, they have almost constantly been chosen members of the house of commons.

The *solicitor* general has the care and concern of managing the king's affairs, and hath fees for pleading, besides other fees arising by patents, &c. He hath his attendance on the privy council; and the attorney general, and he, were anciently reckoned among the officers of the exchequer: they have audience, and come within the bar in all other courts.

SOLICITATION of gravity, } See { PARACENTRIC.  
SOLICITATION of levity,

SOLSTICE, SOLSTITIUM, in astronomy, the time when the sun is one of the *solstitial* points; that is, when he is at his greatest distance from the equator, which is 23 degrees and a half: thus called, because he then appears to stand still, and not to change his place in the degrees of the zodiac, any way: an appearance owing to the obliquity of our sphere, and which those who live under the equator are strangers to. See SOLSTITIAL and POINTS.

The *solstices* are two, in each year; the *estival* or *summer solstice*, and the *hyemal* or *winter solstice*.

The *summer* SOLSTICE, is when the sun is in the tropic of cancer; which is on the 11th of June; when he makes the longest day. See TROPIC and DAY.

The *winter* SOLSTICE, is when he enters the first degree of capricorn; which is on the 11th of December; when he begins to return towards us, and makes the shortest day.

This is to be understood, as in our northern hemisphere; for in the southern, the sun's entrance into capricorn, makes the *summer solstice*, and that into cancer, the *winter solstice*. See ECLIPTIC, SUMMER, WINTER, &c.

SOLSTITIAL points, are those points of the ecliptic, whereby the sun's ascent above the equator, and his descent below it, are terminated. See ECLIPTIC, SUN, &c.

The first point, which is in the beginning of the first degree of cancer, is called the *estival* or *summer point*; and the later, which is in the beginning of the first point of capricorn, the *winter point*. See SOLSTICE.—The *solstitial points* are diametrically opposite to each other. See POINT.

SOLSTITIAL colure, is that which passes through the *solstitial* points. See COLURE.

SOLUBLE, in medicine, *loose*, or apt to go to stool. See LAXATIVE, STOOL, &c.

SOLUBLE tartar, is a kind of salt chymically prepared, by boiling eight ounces of cream of tartar, with four of fixed salt of tartar. See TARTAR.

SOLVENT, the same with *dissolvent*. See DISSOLVENT.

SOLUTIO continui, or SOLUTION of continuity, a term used by physicians, &c. to express a disorder common to the solid parts of the body, wherein their natural cohesion is separated: as by a wound, or other cause. See CONTINUUM, &c.

If this happen to a simple, similar part of the body; it is called, simply, *solutio continui*.—If to a compound, or organical part, it acquires a particular denomination, from the nature of the part, the difference of the cause, or the manner of application; as, a wound, rupture, fracture, puncture, fissure, contusion, ulcer, corrosion, dilaceration, exfoliation, caries, &c. See WOUND, RAPTURE, FRACTURE, &c.

SOLUTION, SOLUTIO, in algebra and geometry, is the answering of a question; or resolving any problem proposed. See RESOLUTION, PROBLEM, &c.

The *solution* of the problem of the quadrature of the circle, and that of the duplicature of the cube, by right lines, are held impossible. See QUADRATURE and DUPLICATION.

SOLU-

**SOLUTION** of continuity, in chirurgery. See **SOLUTIO** *continui*.

**SOLUTION**, in physicks, the reduction of a solid, or firm body, into a fluid state, by means of some menstruum. See **MENSTRUUM**.

*Solution* is frequently confounded with what we otherwise call *dissolution*; but there is a difference. See **DISSOLUTION**.

**SOLUTION**, in chymistry, is sometimes used for the analysis, or reduction of a natural body into its chymical principles. See **PRINCIPLE** and **ANALYSIS**.

In this sense, *solution* is the same with what we otherwise call *resolution*. See **RESOLUTION**.

**SOLUTIVE**, *loosening*, or *laxative*. See **LAXATIVE**.

**SOLUTIVE** *diaprunum*. See the article **DIAPRUNUM**.

**SOMNAMBULI**\*, or **SOMNAMBULONES**, an appellation given to people, who walk in their sleep; more usually called *noctambuli*. See **NOCTAMBULI**.

\* The word is formed from the Latin, *somnus*, sleep, and *ambulo*, I walk.

**SOMNIFEROUS**. See the article **SOPORIFEROUS**.

**SOMNOLENTUM** *coma*. See the article **COMA**.

**SON**, a relative term, applied to a male child, considered in the relation he bears to his parents. See **FATHER**.

The children of the king of England, are called *sons* and *daughters* of England. See **KING**. The eldest *son* is born duke of Cornwall, and created prince of Wales. See **PRINCE**.

The younger *sons* are called *cadets*. See **CADET**.

The king of France's children were anciently called *filis*, and *filles de France*, *sons* and *daughters* of France; and the grand-children, *petits fils*, and *petites filles de France*. At present, the daughters are called *mes-dames*, and the grand-daughters, *mes-demoiselles de France*.

**Natural SON**, } See the articles { **BASTARD**.

**Adoptive SON**, } See the articles { **ADOPTIVE**.

**SON of God**, is a term used in various senses, in holy scripture, as 1°. For the Word, or second person in the blessed trinity; who is thus called, with respect to the manner of his generation: as being begotten of the Father. See **GENERATION**, &c.

Him, the orthodox believe to be co-eternal, and co-equal with the Father; and to have been with him, the eternal principle and source of the Holy Spirit. See **TRINITY**, &c.

The appellation *Son*, is applied to him, both before and after his incarnation.—Thus we say, The *Son* of God created the world; the *Son* of God was incarnate, and lived 33 years on earth, &c.

2°. Several creatures are also called *Sons of God*; not as being so by nature and generation, but on divers other accounts.—Thus the angels are called *sons of God* by Job; in respect of their creation, adoption, &c. And great men are called *sons of God* in the psalms; as being his lieutenants; or, the depositaries of his authority. Good men, and particularly the elect, are also called *sons of God*, in various places of the sacred writings.

**SON of man**, is frequently used in scripture, to signify *man*; as expressing not only the nature of man, but his frailty.

The expression is very usual among the Hebrews and Chaldeans: Daniel, Ezekiel, and Jesus Christ, are particularly thus called; the first once, and the two latter frequently.

Sometimes, the phrase *son of man*, is also used for the wicked and reprobate: in contradistinction to those called *sons of God*.

**SONATA**, **SUONATA**, in music, a piece or composition of music, wholly executed by instruments; and which is, with regard to the several kinds of instruments, what the *cantata* is in respect of voices. See **CANTATA**.

The *sonata*, then, is properly a grand, free, humorous composition, diversified with a great variety of motions and expressions, extraordinary and bold strokes, figures, &c. And all this purely according to the fancy of the composer; who, without confining himself to any general rules of counterpoint, or to any fixed number or measure, gives a loose to his genius, runs from one mode, measure, &c. to another, as he thinks fit.

We have *sonatas* of 1, 2, 3, 4, 5, 6, 7, and even 8 parts; but usually they are performed by a single violin, or with two violins and a thorough bass for the harpsicord, and frequently a more figured bass for the bass-viol, &c.

There are a thousand different species of *sonatas*: but the Italians usually reduce them to three kinds.

*Suonate da chiesa*, that is, *sonatas* proper for church-music, which usually begin with a grave, solemn motion, suitable to the dignity and sanctity of the place and the service; after which they strike into a brisker, gayer and richer manner.—These are what they more peculiarly call *sonatas*.

*Suonate da camera*, or *sonatas* for the chamber, are properly series's of several little pieces, for dancing; only composed to the same tune.—They usually begin with a prelude, or little *sonata*, serving as an introduction to all the rest: afterwards come the allemand, pavane, courant, and other serious dances; then jigs, gavots, minuets, chacons, passacailles and other gayer airs: the whole composed in the same tone or mode.

**SONG**, in poetry, a little composition, consisting of simple, Vol. II. N°. CXLIII.

easy, natural verses, set to a tune, in order to be sung. See **SINGING**.

Each stanza of a *song*, is called a *couplet*. See **STANZA** and **COUPLET**.

The *song* bears a deal of resemblance to the madrigal; and more to the ode, which is nothing but a *song* according to the ancient rules. See **MADRIGAL** and **ODE**.

Its object is usually either wine or love; whence M. le Brun defines a modern *song*, to be either a soft and amorous, or a brisk and bacchic thought, expressed in a few words.

Indeed, this is to restrain it to too narrow bounds; for we have devout *songs*, satirical *songs*, and panegyric *songs*.

But, be the *song* what it will, the verses are to be easy, natural, flowing, and to contain a certain harmony, which neither shocks the reason nor the ear; and which unites poetry and music agreeably together.

Anciently, the only way of preserving the memory of great and noble actions, was, by recording them in *songs*; and in America there are still people, who keep their whole history in *songs*. See **DRUID**.

**SONG**, in music, is applied in the general, to any single piece of music, whether contrived for a voice, or instrument. See **MUSIC** and **COMPOSITION**.

A *song*, Mr. Malcolm observes, may be compared to an oration: for, as in this latter, there is a subject, viz. some person or thing the discourse is referred to, and which is always to be kept in view throughout the whole; so, in every truly regular and melodious *song*, there is one note which regulates all the rest; wherein the *song* begins, and at last ends, and which is, as it were, the principal matter, or musical subject, to be regarded in the whole course of the *song*.—And, as in the oration, there may be several distinct parts, which refer to particular subjects, yet must they have an evident connection with the principal subject, which regulates the whole; so in melody, there may be several sub-principal subjects, to which the different parts of the *song* may belong: but these are, themselves, under the influence of the principal subject, and must have a sensible connection with it.—This principal or fundamental note, is called the *key* of the *song*. See **KEY**.

**Responsary SONG**. See the article **RESPONSARY**.

**SONNA**\*, a book of Mahometan traditions, wherein all the orthodox mussulmen are required to believe. See **MAHOMETANISM**, **TRADITION**, &c.

\* The word signifies, in Arabic, the same with *mishna* in the Hebrew, that is, *second law*, or, as the Jews call it, *oral law*. See **MISHNA**.

The adherents to the *sonna* are called *sonnites*: and as among the Jews, there is a sect of Caraites, who reject the traditions as fables invented by the rabbins; there are also sectaries among the Mahometans, called *Shiites*, who reject the traditions of the *Sonnites*; as being only founded on the authority of an apocryphal book, and not derived to them from their legislator. See **CARAITE**, **RABBINIST**, &c.

There is the same enmity between the *Sonnites* and *Shiites*, as between the rabbinist Jews and the Caraites. The *Shiites* reproach the *Sonnites* with obtruding the dreams of their doctors, for the word of God: and the *Sonnites*, in their turn, treat the *Shiites* as hereticks, who refuse to admit the divine precepts, have corrupted the Alcoran, &c.

**SONNET**, **SONETTO**, in poetry, a kind of composition, contained in fourteen verses, viz. two stanzas or measures of four verses each, and two of three; the eight first verses being all in two rhymes.

The *sonnet* is of Italian origin, and Petrarch is allowed to be the father: it is held the most difficult and artful of all poetical compositions; as requiring the last accuracy and exactness. It is to end with some pretty, ingenious thought: the close to be particularly beautiful, or the *sonnet* is naught.

In Malherb, and some other French poets, we meet with *sonnets*, where the two first stanzas are not in the same rhyme; but they are held irregular; and, in effect, great part of the merit of these pieces, consists in a scrupulous observation of the rules.

Ronsard, Malherb, Maynard and Gombaut, have composed abundance of *sonnets*; but among two or three thousand, there are scarce two or three worth much.

Pasquier observes, that du Bellai was the first who introduced *sonnets* into France. But du Bellai himself says, that Melin de S. Gelais, first converted the Italian *sonnets* into French.

**SOOP**. See the article **SOUP**.

**SOOT**, an earthy, volatile matter, arising from wood, coals, and other fuel, along with the smoak, by the action of fire; or rather, it is the smoak itself, fixed and gathered on the sides of the chimney. See **SMOAK** and **FIRE**.

*Soot* is found an excellent manure for corn lands, especially where the soil is cold. See **MANURING**.

The dyers make considerable use of *soot*, for a kind of dun colour, which, it is true, has no agreeable smell; but, in return has the property of saving cloaths and other stuffs, from moths. See **DYING**.

**SOOT of frankincense**, is the smallest and finest part of the incense, called *alibanum*, or *male incense*; burnt after the manner of rosin to make lamp-black. See **FRANKINCENSE**.

Dioscorides shews how to make a *foot* of butter, which has several uses in medicine.—The *foot* found in the furnaces of glass-houses, is used by painters.

**SOPE.** See the article SOAP.

**SOPHI\***, or **SOFI**, a title or quality given to the emperor of Persia; importing as much as wise, sage or philosopher.

\* The title is by some said to have taken its rise from a young shepherd thus named, who attained to the crown of Persia in 1370; others derive it from the *sopboi* or sages, anciently called *mazi*.—Vossius gives a different account of the word: *sopbi*, in Arabic, he observes, signifies *wool*; and adds, that it was applied by the Turks out of derision to the kings of Persia, ever since Ishmael's time, because, according to their scheme of religion, he is to wear no other covering on his head, but an ordinary, red, woollen stuff; whence the Persians are also called *kezelbaschi*, q. d. *red-heads*.—But Bochart assures us, that *sopbi*, in the original Persian language, signifies one that is pure in his religion, and who prefers the service of God in all things; and derives it from an order of religious, called by the same name. See **SOPHI'S**.

The *sopbi's* value themselves, and with some reason, of their illustrious extraction; the race being second to none in the east. They are descended in a right line from Houssein, second son of Ali, Mahomet's cousin, and Fathima, Mahomet's daughter.

There is no prince in the world, whose authority is more absolute than that of the *sopbi* of Persia: his power is not even limited by any laws he himself can make; but he suspends, changes, and annuls them at pleasure.

**SOPHI'S\***, or **SOFEE'S**, a kind of order of religious among the Mahometans in Persia, answering to what are otherwise called *deruises*, and among the Arabs and Indians, *faquirs*. See **DERVISE** and **FAQUIR**.

\* Some will have them called *sopfi's*, from a kind of coarse camblet which they wear, called *Souf*, from the city *Souf* in Syria, where it is principally manufactured.

The more eminent of those *sopbi's* are complemented with the title *scheik*, that is reverend; much as in Romish countries, religious are called *reverend fathers*.

*Scheik sopbi*, who laid the first foundation of the grandeur of the royal house of Persia, was the founder, or rather the restorer of this order: Ishmael, who conquered Persia, was, himself, a *sopbi*, and valued himself on his being so. He chose all the guards of his person from among the religious of this order; and would have all the great lords of his court *sopbi's*. The king of Persia is still grand master of the order; and the lords continue to enter into it, though it be now fallen under great contempt.

The vulgar *sopbi's* are now chiefly employed as ushers, and attendants of the court; and even as executioners of justice; the emperor last reigning, would not allow them, according to custom, to gird the sword on him.

This neglect, into which the *sopbi's* are sunk, has occasioned the late emperors to disuse the title of *sopbi*, or *sofi*: however, M. de la Croix is mistaken, when he says, that they never bore it.

**SOPHISM**, ΣΟΦΙΣΜΑ, in logic, a captious, and fallacious reasoning; or an argument, which with some subtilty, carries much appearance of truth, but little solidity. See **FALLACY**.

A *sophism* is, properly, an argument false at bottom, and only invented to amuse and embarrass the person to whom it is used. See **SOPHIST** and **ELENCHUS**.

**SOPHISMS**, or **SOPHISTICAL arguments**, among logicians, are more particularly such as are not in form, or are founded on equivocal.

As: *You have every thing you have not lost; but you have not lost horns: therefore you have horns.*

**SOPHIST\***, ΣΟΦΙΣΤΗΣ, a person who frames sophisms; that is, uses subtle arguments, with design to deceive those he would persuade or convince. See **SOPHISM** and **GYMNOSOPHIST**.

\* The word is formed from the Greek, σοφῖς, wife; or rather from σοφιστής, impostor, deceiver.

The term *sophist*, which is now reproachful, was anciently honourable; and carried a very innocent idea. St. Augustin observes, it signified a rhetor, or professor of eloquence: such as were Lucian, Athenæus, Libanius, &c.

Suidas, and after him, Olar, Celsius, in an express dissertation on the Greek *sophists*, tells us, that the appellation was applied indifferently to all who excelled in any art, or science; whether divines, lawyers, physicians, poets, orators, or musicians.—But this seems to be stretching the sense of the word without all measure: it is possible a rhetor might have made verses, &c. but that it was on account of his poetical talent, that he was denominated *sophist*, is what we see no reason to apprehend.—However, Solon is the first who appears to have ever bore the appellation; which is given him by Hicrates: afterwards, it was scarce ever given, but to philosophers, and declaimers.

The title *sophista* was in great credit among the Latins in the XIIIth century, and in the time of St. Bernard; but it began to lose ground in Greece, as early as Plato's time; on account of Protagoras and Gorgias, who made a sordid traffic thereof, by selling eloquence for money.—Hence Seneca calls the *sophists*, *quacks* or *empirics*.

Cicero says, that the title *sophista* was given to such as professed philosophy with too much ostentation, in order to make a trade of it, by running from town to town, to retail their deceitful science.—A *sophist*, therefore, was then, as now, a rhetor, or logician, who makes it his business to enslave and perplex people, by frivolous distinctions, vain reasonings and captious discourses.

Nothing has conduced more to the increasing of the number of *sophists*, than the contentious school philosophy: people are there taught to puzzle and obscure the truth, by barbarous, unintelligible terms; as antipredicaments, great and little logicals, quiddities, &c.

The title *sophist* was given to Rabanus Maurus, by way of eminence.—John Hinton, a modern English scholastic writer, endeavoured also to procure the splendid title of *sophist*.

**SOPHISTICATION**, in chymistry, alchymy, &c. a term particularly applied to the counterfeit works of fraudulent alchymists, who use indirect means of whitening copper, gilding silver, and giving other superficial tinctures; as also of making augmentations by divers mixtures, and other illegal operations, to delude those, at whose expence they are employed. See **ALCHYMY**, **ALCHYMIST**, **TRANSMUTATION**, **PROJECTION**, **PHILOSOPHER'S stone**, &c.

Hence the term is also applied to merchandizes, and other goods adulterated, mixed or altered by the deceit of the seller. See **ADULTERATION**.

Musc, at present, is almost all *sophisticated*, as well as Bezoard, balm of Gilead, lapis lazuli, and other valuable drugs.—Canary wines are *sophisticated* on the place, before ever they come near our ports.

**SOPORIFIC\***, or **SOPORIFEROUS**, a medicine that has the faculty of procuring sleep. See **SLEEP**.—Such are opium, laudanum, &c. See **OPIUM**, **LAUDANUM**, &c.

\* The word is formed from the Latin, *sopor*, sleep.—The Greeks, in lieu hereof, use the word *hypnotic*. See **HYPNOTIC**.

**SOPOROUS**, *sleepy* or *drowsy diseases*, are the coma or cataphora, lethargy and carus, which rather appear to differ in respect of more or less, than as to their essence.—In this they all agree, that they induce a morbid sweat. See **COMA**, **CARUS**, **LETHARGY**, &c.

**SORBON**, or **SORBONNE**, the house or college of the faculty of theology, established in the university of Paris. See **UNIVERSITY**, **FACULTY**, &c.

It was founded in 1252, by St. Louis, or rather by Robert de Sorbon his confessor and almoner; first, canon of Cambray, and afterwards of the church of Paris; who gave his own name to it; which he himself took from the village of Sorbon, or Serbon, near Sens, where he was born.

The foundation was laid in 1250; queen Blanche, in the absence of her husband, furnishing him with a house which had formerly been the palace of Julian the apostate, whereof some remains are still seen.—Afterwards, the king gave him all the houses he had in the same place, in exchange for some others in another.

The college has been, since, magnificently rebuilt by the cardinal de Richelieu. The design of its institution, was for the use of poor students in divinity.

There are lodgings in it for 36 doctors, who are said to be of the *society of the Sorbonne*. Those admitted into it without being doctors, are said to be of the *hospitality of the Sorbonne*.

—Six regent doctors hold lectures every day, for an hour and half each: three in the morning, and three in the afternoon. See **DOCTOR**.

**SORBON** is also used in the general, for the whole faculty of theology at Paris; in regard the assemblies of the whole body are held in the house of the Sorbon: and that the bachelors of the other houses of the faculty, as the house of Navarre, &c. come here to hold their *sorbonnique*, or act, for being admitted doctor in divinity. See **FACULTY**.

**SORCERY**, the crime of witchcraft, or divination by the assistance of evil spirits. See **MAGIC**, **WITCHCRAFT** and **DIVINATION**.

Some hold *sorcery* to be properly what the ancients call *fortilegium*, or divination by means of *sortes* or *lots*. See **Sortes**.

My lord Coke, 3d Inst. fol. 44. describes a *forcerer*, *qui utitur sortibus & incantationibus demonum*. *Sorcery* is felony, by stat. 1<sup>o</sup> Jac. In the mirror, *sorcery* is said to be a branch of heresy; and by stat. 12. Car. II. it is excepted out of the general pardons.

*Sorcery* was a thing formerly very common; at least the credulity of those ages made it pass for such; and people suffered frequently for it. In a more knowing and less believing age, it is out of doors.

In effect, the most probable opinion is, that the several glaring instances of *sorcery* we meet withal, in our old law-books and historians, if well enquired into, would be found, at bottom, no other than artful poisonings. See **FASCINATION**.

**SORDID ulcers**. See the article **ULCER**.

**SORITES\***, ΣΩΠΕΙΤΗΣ, in rhetoric, &c. a kind of argument, wherein a number of propositions are gradually, and minutely laid

laid together; and something inferred from the whole.—Whence Cicero calls it *sylogismus acervatus*, an accumulative syllogism.

The word is formed from the Greek *σῶμα*, cumulus, heap. Such was that merry argument of Themistocles, to prove, that his little son, under ten years old, governed the whole world.—Thus: my son governs his mother; his mother me; I the Athenians; the Athenians the Greeks; Greece commands Europe; Europe the whole world: therefore my son commands the whole world.

This method of disputing prevailed much among the stoicks; especially with Zeno, and Chrysippus. But it is very captious, and sophistical.

**SORRANCES**, among farriers, signify two things, viz. either an ill state or habit of a horse's body, arising from some part diseased: or, a loosening and solution of the continuity of the parts, which according to the various circumstances thereof, acquires various names, as *fracture*, *wound*, *ulcer*, *rupture*, *convulsion*, *cramp*, *excoriation*, &c.

**SORTES**, in antiquity, *lots*; a method of deciding dubious cases, where there appears no ground for a preference, by referring the decision to chance: as in casting of dice, drawing of tickets, &c. See **CHANCE**.

The ancient *sortes* or *lots*, were instituted by God himself; and in the books of the Old Testament, we meet with divers standing and perpetual laws, and divers particular commands, prescribing and regulating the use thereof. Thus the scripture informs us, that the *lot* fell on St. Matthias, when a successor to Judas in the apostolate was to be chosen. And our Saviour's garment itself, was cast *lots* for. *Sortiti sunt Christi vestem*.

The **SORTES Prænestinae**, were famous among the Greeks. The method of these was to put a great number of letters, or even whole words into an urn; to shake them together, and throw them out; and whatever should chance to be made out in the arrangement of letters, &c. composed the answer of this oracle.

In what repute soever, this method of divination might, anciently, have been, M. Dacier observes, that in Cicero's time its credit was low; inasmuch that none but the credulous populace had recourse to it.

In lieu of this, another kind of *sortes* was introduced into Greece and Italy, which was to take some celebrated poet, as Homer, or Euripides, or Virgil, to open the book, and whatever first presented itself to the eye upon opening, was taken for the ordinance of heaven. This made what they called the *sortes Homericae*, and *sortes Virgilianæ*; which succeeded to the use of the *sortes Prænestinae*.

This superstition passed hence into christianity; and the Christians took their *sortes* out of the books of the Old and New Testament. The first passage that presented itself, upon opening a book of scripture, was esteemed the answer of God himself.

If the first passage did not happen to be any thing to the purpose for which the *sortes* were consulted, another book was opened; till a passage were met withal, that might be taken for an answer. This was called *sortes sanctorum*.

St. Augustin does not disapprove of this method of learning futurity, provided it be not used for worldly purposes; and owns he has practised it himself.

Gregory of Tours adds, that the custom was, first to lay the Bible on the altar, and to pray the Lord, that he would discover by it what was to come to pass.

Instances of the use of the *sortes sanctorum* are very frequent in history. Heraclius, Mr. Fleury tells us, in his war against Cosroes, to learn where he should take up his winter-quarters, purified his army for three days, and then opened the gospels, and found the place appointed for his winter-quarters, was in Albania.

Gilbert of Nogent, informs us, that in his time, that is, about the beginning of the XIIth century, the custom was at the consecration of bishops, to consult the *sortes sanctorum*, to learn the success, fate, &c. of their episcopate.

The practice is founded on a supposition, that God presides over the *sortes*; and on *Prov. xvi. 33. The lot is cast into the lap; but the disposing thereof is of the Lord.*

In effect, many divines hold, that the *lot* is conducted in a particular manner by providence; that it is an extraordinary manner wherein God declares his will by a kind of immediate revelation.—The *sortes sanctorum*, however, were condemned by the council of Agda in 506, at the time they were beginning to take footing in France, &c.

**SORTILEGE**, **SORTILEGIUM**, a kind of divination by *sortes*, or *lots*. See **SORCERY** and **SORTES**.

**SOTERIA**\*, in antiquity, sacrifices offered to the gods, in gratitude for their having delivered a person from danger. See **SACRIFICE**.

\* The word is formed from the Greek, *σῶτηρ*, saviour.

The term is also applied to poetical pieces composed for the same end. Orpheus is the first, who appears to have composed *soteria*.

Our Latin poets give the same name to poems in Latin verse, wrote to give thanks to God or the saints, for having preserved them on any occasion: F. Petavius being delivered

from a dangerous disease, by the intercession, as he supposed, of St. Genevieve, composed that fine piece in honour of that saint, still extant under the title of *soteria*.

**SOU**. See the article **SOL**.

**SOVERAIGN**, *supreme*; the chief and highest Being; or the Almighty: a term, in strictness, only applicable to God. The word is French *seigneurain*, which Pasquier derives further from the Latin, *superior*, the first in any thing, or he who is superior to the rest.—Hence

In the ancient French customs, we meet with *seigneurain* master of the household; *seigneurain* master of the forests; *seigneurain* master of the treasury.—Under Charles VI. the title *seigneurain* was given to bailiffs and seneschals, with regard to their superiority over prevots, and chatelains.

**SOVERAIGN**, with regard to men, is applied to kings, and princes who are supreme and independent, and hold of none but God, and their sword. See **KING**, **PRINCE**, &c.

The authority of a *seigneurain* is only bounded by the laws of God, of nature, and the fundamental laws of the state.

**SOVERAIGN** is also a title given to such as are invested with certain rights and prerogatives, which belong only to *seigneurains*: as, the power of coining money; sending agents to diets, to treat of war and peace, &c.

In which sense, the feudatories of the empire, and the tributaries of the grand seignior, are called *seigneurains*.

**SOVERAIGN** is also applied to courts and judges, who have a power from a prince, to decide the processes of his subjects without appeal, or in the last resort.

At Paris there are five *seigneurain* companies; the parliament, the chamber of accounts, the court of aids, the grand council, and the court of monies.

In England, we have but one *seigneurain* court; the house of lords. See **COURT**, **PEER**, &c.

**SOUL**, *anima*, a spirit inclosed in an organized body. See **SPIRIT** and **BODY**.

Many of the ancient philosophers asserted an *anima mundi*, a *soul* which moved and animated the machine of the universe, and gave action to all natural causes. This doctrine, Plato handles very fully in his *Timæus*. See **ANIMA MUNDI**.

Others have given particular *souls* to all the heavenly bodies, the sun, stars, earth, &c. to regulate their motions. See **ANIMAL**, **SUN**, **STAR**, **PLANET**, **EARTH**, &c.

The philosophers, many of them, allow of two, and others of three kinds of *souls*, viz. a

**Rational SOUL**, which they hold to be divine, and infused by the breath of God. See **REASON**.

**Irrational or sensitive SOUL**, which man has in common with brutes, and which is formed out of the elements. See **SENSITIVE**.

**Vegetative SOUL**, which we have in common with plants; and which, as the first is the principal of reason and understanding, or that in us which thinks and understands; and the second, the principle of life; so this third is the principle of growth, nutrition and vegetation. See **VEGETATIVE**, &c.

The Epicureans took the substance of the *soul*, we mean of the rational *soul*, to be a subtle air, composed of their atoms, or primitive corpuscles. See **ATOM**.

The stoicks held it to be a flame or portion of heavenly light. See **FIRE**, **LIGHT**, **FLAME**, **HEAT**, &c.

Spinoza and his followers, allowing only of one kind of substance, viz. matter, maintain the *soul* to be of the same substance with the body, viz. material. See **SUBSTANCE** and **SPINOSISM**.

The Cartesians make thinking the essence of the *soul*; and from this principle, deduce its immateriality and immortality.—But the principle is false; nor is there any need to define the *soul* a substance that thinks, to prove it immortal. It is enough, that the *soul* be capable of thinking; and that it produce its own thoughts, without making thinking its essence. It is no more essential to the *soul* to think than to will: for a thing I can conceive the *soul* without, cannot be its essence. See **THOUGHT**, &c.

Again, if thought be the essence of the *soul*; as a thing cannot produce itself, its own being, or essence; the *soul* does not produce its own thought, nor its own will: and thus is it brought to the condition of brutes, or even of inanimate bodies, without any action, any liberty, &c.

If the Cartesians only mean this of the faculty of thinking; they do wrong even to call this the essence of the *soul*. It is no more its essence, than the faculty of willing is. And we conceive something in the *soul*, prior to both those faculties. See **THINKING** and **CARTESIAN**.

The *soul* is a spiritual substance, proper to inform, or animate a human body, and by its union with this body, to constitute a reasonable animal, or man. This is its essence; and this its definition.

It must be owned, the Cartesians prove the spirituality and immortality of the *soul*, from its thinking exceedingly well: but they are not to have the honour of this proof, as their own invention. All the great philosophers used it before them, and use it still. See **IMMORTALITY**.

The philosophers are not at all agreed, as to the manner wherein the *soul* resides in the body. Some hold it equally diffused throughout

throughout every part thereof. Others say it influences, and acts on every part of the body, though it has its principal residence in some particular part, called the *sensory*. See **SENSORY**.

This principal part, Des Cartes maintains, is the pineal gland of the brain, where all the nerves terminate, &c. See **PINEAL gland**.

Borri, a milanese physician, in a letter to Bartholine, *de ortu cerebri & usu medico*, asserts, that in the brain is found a certain, very subtle, fragrant juice, which is the principal seat or residence of the reasonable *soul*; and adds, that the subtilty and fineness of the *soul*, depends on the temperature of this liquor, rather than on the structure of the brain, to which it is usually ascribed. This liquor, we conceive, must be the same with what is usually called the *nervous juice*, or *animal spirits*. The constitution whereof, is, doubtless, of great importance, with regard to the faculties of the *soul*. See **SPIRIT**.

Mr. Locke distinguishes two principal faculties or powers of the rational or human *soul*, viz. *perception* and *willing*. See **POWER** and **FACULTY**.

To these, other philosophers add others; as *sensation*, *liberty*, *memory*, *imagination*, and *habit*. See **UNDERSTANDING**, **WILL**, **SENSATION**, **LIBERTY**, &c.

The mystic divines distinguish two principal parts in the *soul*: the *superior part*, which comprehends the understanding and the will; and the *inferior part*, which comprehends imagination and sensation. Thus, say they, Jesus Christ was happy on the cross in his *upper part*, and suffered in his *lower part*. The lower part did not communicate to the upper, either its troubles, or its failings; nor the upper to the lower, its peace or beatitude. From this distinction, the quietists take in hand to maintain, that whatever passes contrary to good morals, in the lower part of the *soul*, is not contrary to the purity of the upper part, inasmuch as the will has no share therein.

As to the *soul* of brutes, the Cartesians, and some others, deny its existence, in the common sense of the word *soul*; that is, they strip it of all the properties or faculties of the human *soul*: and the Peripateticks, on the contrary, invest it with the greatest part of them.

In man, a particular agitation of the fibres of the brain is accompanied with a sensation of heat; and a certain flux of animal spirits towards the heart, and viscera, is followed by love or hatred.

Now the Peripateticks maintain, that brutes feel the same heat, and the same passions, on the same occasions: that they have the same aversion for what incommodes them, and, in the general, are capable of all the passions, and all the sensations we feel.

The Cartesians deny they have any perceptions or notices at all; that they feel any pain or pleasure; or love or hate any thing. The ground of their opinion is, that they allow of nothing in brutes, but what is material, and that they deny sensations, and passions to be any properties of matter. Some of the Peripateticks, on the other hand, maintain matter, when subtilized, framed, ranged and moved in a certain manner, to be capable of sensation and passion; that beasts may feel and perceive, by means of the animal spirits, which are a matter thus modified; and that the human *soul* itself, only becomes capable of sensation and passion, by means thereof. See **SENSATION** and **PASSION**.

But we must own it very difficult, to reconcile the idea we have of matter, with what we have of thought; to conceive that matter figured in any manner, whether in a square, a sphere, or an oval, should be pleasure, pain, heat, colour or smell; or to conceive that matter, however agitated, whether in a circle, a spiral, parabola or ellipsis, should be love, hatred or joy,—surpasses our endeavours.

The maintainers of the contrary opinion, urge that appearance of sense, of fear, caution, love for their young, admirable sagacity, both for their own preservation and that of their species, visible through the whole brute creation. And, it is true, all the actions of beasts plainly express an understanding; for every thing that is regular, expresses it; even a machine or watch expresses it: and a plant much more; the radicle of the seed turning downwards, and the stem upwards, whatever situation the seed is sown in: the young plant, knitting from space to space, to strengthen it; its putting forth prickles, &c. to defend it, &c. mark a great understanding. All the motions of plants and brutes plainly discover an intelligence; but the intelligence does not reside in the matter thereof: it is as distinct from the beast or plant, as that which ranged the wheels of the watch, is distinct from the watch itself. See **UNDERSTANDING**, &c.

For, in effect, this intelligence appears infinitely great, infinitely wise, infinitely powerful; and the same which formed us in our mother's womb, which gave us our growth, &c. Thus, in brutes, there is not either understanding or *soul*, in the sense we generally use the word: they eat without pleasure, cry without pain, grow without knowing it. They fear nothing; know nothing; and if they act in such manner, as shews understanding; it is because God having made them, to preserve them, has formed their bodies so as to avoid whatever might hurt them, mechanically.

Otherwise it might be said, that there is more understanding in the vilest insect, nay, in the smallest grain, than in the most knowing of men; for it is evident, either of them contains more parts, and produces more regular motions and actions, than we are capable of understanding. Thus does the great F. Malebranche argue against the *souls* of brutes. *Recherche de la verite*, liv. 6.

Cure of SOULS, } See the articles } CURE.  
Migration of SOULS, } MIGRATION.

SOUL's cheat, a legacy anciently bequeathed at their deaths, by our scrupulously pious ancestors, to the parish priest, to compensate for any tithes that might have been forgot in their lives. See **TITHE**.

SOUND, SONUS, a perception of the soul, communicated by means of the ear; or, the effect of a collision of bodies, and a tremulous motion consequent thereon, communicated thence to the circumambient fluid, and propagated through it to the organs of hearing. See **EAR** and **HEARING**.

To illustrate the cause of *sound*; we observe, first, that a motion is necessary in the sonorous body, for the production of *sound*. Secondly, that this motion exists, first, in the small and insensible parts of the sonorous bodies, and is excited in them by their mutual collision, and percussion against each other, which produces that tremulous motion so observable in bodies that have a clear *sound*, as bells, musical chords, &c. Thirdly, that this motion is communicated to, or produces a like motion in the air, or such parts of it, as are fit to receive and propagate it; inasmuch as no motion of bodies at a distance, can affect our senses, without the mediation of other bodies which receive those motions from the sonorous body, and communicate them immediately to the organ. Lastly, that this motion must be communicated to those parts that are the proper and immediate instruments of hearing.

Further, that motion of a sonorous body, which is the immediate cause of *sound*, may be owing to two different causes; either the percussion between it and other hard bodies: as in drums, bells, chords, &c. or the beating and dashing of the sonorous body and the air, immediately against each other: as in wind instruments, as in flutes, trumpets, &c.

But in both cases, the motion, which is the consequence of the mutual action, and the immediate cause of the sonorous motion which the air conveys to the ear, is an invisible, tremulous or undulating motion in the small and insensible parts of the body.

To explain this; all sensible bodies are supposed to consist of a number of small and insensible parts or corpuscles, which are of the same nature in all bodies, perfectly hard and incompressible. See **CORPUSCLE**.

Of these, are composed others, somewhat greater, but still insensible; and these different, according to the different figures and union of their component parts. These, again, constitute other masses bigger and more different than the former; and of the various combinations of these last, are those gross bodies composed, that are visible, tangible, &c. The first and smallest parts, we have observed, are absolutely hard; the others are compressible, and united in such manner, that being compressed by an external impulse, they have an elastic or restitutive power, whereby they restore themselves to their natural state. See **ELASTICITY**.

A shock, then, being made by one body upon another, the small particles, by their elastic principle, move to and again with a very great velocity, in a tremulous, undulating manner, somewhat like the visible motions of grosser springs; as we easily observe in the chords of musical instruments. And this is what we may call the *sonorous motion*, which is propagated to the ear: but observe, that it is the insensible motion of those particles next the smallest, which is supposed to be the immediate cause of *sound*; and of these, only those next the surface, communicate with the air: the motion of the whole, or of the greater parts, being no further concerned, than as they contribute to the other.

To apply this theory; strike a bell with any hard body, and you easily perceive a sensible tremor in the surface, spreading itself over the whole; and that more sensibly, as the shock is greater. Upon touching it in any other part, the motion and the *sound* too, are stopped. Now this is apparently a motion of the small and insensible parts, changing their situations, with respect to one another, which being so many, and so closely united, we cannot perceive their motions separately and distinctly; but only a trembling, which we reckon to be the effect of the confusion of an infinite number of little particles, closely joined, and only moving in infinitely little lines.

Mr. Perrault adds, that the visible motion of the parts, contributes no otherwise to *sound*, than as it causes the invisible motion of the smaller parts, which he calls *particles*, to distinguish them from the sensible ones, which he calls *parts*, and from the smallest of all, which we call *corpuscles*.

This he supports from the instance of a chord, which being struck, and the *sound*, and sensible undulations at rest again, if you approach the chord softly with the finger, you will find a small tremulous motion, which is the remains of the vibrations

vibrations of the whole chord, and the parts. Now the parts vibrate without any *sound*; but no sooner is the vibration felt by the finger, than the *sound* is heard again; which he ascribes to this, that the motion of the parts being insufficient to move the particles, whose motion is the first that ceases, requires some assistance from dashing against the finger, whereby to become enabled to give the particles the motion necessary for the producing of *sound*. He finishes his proof, by the instance of flutes; which when made of different matters, as wood, metal, &c. whose parts are very different, but their particles nearly the same, if their lengths and bores be the same; there is very little sensible difference in their *sounds*.

The sonorous body having made its impression on the contiguous air, that impression is propagated from one particle to another, according to the laws of pneumatics.

A few particles, for instance, driven from the surface of the body, drive their neighbouring particles into a less space; and the medium, as it is thus rarified in one place, becomes condensed in the other: but the air thus compressed, in the second place, is, by its elasticity, returned back again, both to its former place, and its former state; and the air, contiguous to that, is compressed: and the like obtains, when the air less compressed expanding itself, a new compression is generated. From each agitation of the air, therefore, there arises a motion of the air, analogous to the motion of a wave on the surface of the water; which we call a *wave* or *undulation* of air. See *UNDULATION*.

In each wave, the particles go and return back again through very short, but equal spaces; the motion of each particle is analogous to the motion of a vibrating pendulum, while it performs two oscillations; and most of the laws of the pendulum, with very little alteration, are applicable thereto. See *PENDULUM*.

*Sounds* are as various, as are the means that concur to their production.—The principal varieties result from the figure, constitution, quantity, &c. of the sonorous body, the manner of percussion, with the velocity, &c. of the vibrations consequent thereon; the state and constitution of the medium; the disposition, distance, &c. of the organ; the obstacles between the organ and the sonorous object, and the adjacent bodies.—The most notable distinctions of *sounds*, arising from the various degrees and combinations of the conditions mentioned, are into *loud* and *low* (or strong and weak) into *grave* and *acute* (or sharp and flat, or high and low) and into *long* and *short*. The management whereof, makes the office of music. See *SOUND in music*.

The velocity of *sound* is the same, with that of the aerial waves; and does not differ much, whether it go with the wind or against it. By the wind, indeed, a certain quantity of air is carried from one place to another; and the *sound* is accelerated, while its waves move through that part of the air, if their direction be the same as that of the wind. But as *sound* moves vastly swifter than wind, the acceleration it will hereby receive, is inconsiderable. In effect, the most violent winds we know of, have their celerity to that of *sound*, only as 1 to 33; and all the effect we can perceive from the wind, is, that it increases and diminishes the space of the waves; so that by help thereof the *sound* may be heard to a greater distance than otherwise it would.

That the air is the ordinary medium of *sound*, appears from various experiments, in rarified and condensed air.—In an unexhausted receiver, a small bell may be heard some distance; but when exhausted, it can scarce be heard at the smallest distance. If the air be condensed, the *sound* will be louder proportionably to the condensation, or quantity of air crowded in: of which we have many instances in Mr. Hauksbee's experiments; and this does not only succeed in forced rarefactions, &c. but in such also, as are natural; as is evident from Fredlicius's story of his journey to the top of mount Carpatas in Hungary.

But it is not the air alone, that is capable of the impressions of *sound*; but water also; as is manifest, by striking a bell under water, the *sound* of which may plainly enough be heard, only not so loud, and also a fourth deeper, by the ear of some good judges in musical notes. Indeed Merfenne says, a *sound* made under water, is of the same tone or note, as if made in air, and heard under water.

The velocity of *sound* is variously reported by various authors.—Sir Isaac Newton makes its progress, in a second of time, to be 968 feet; the honourable Mr. Francis Roberts 1300 feet; Mr. Boyle 1200 feet; Dr. Walker 1338 feet; Merfenne 1474 feet; Mr. Flamsteed and Dr. Halley 1142 feet; the Florentine academy 1148 feet; the royal academy of Paris, 1172. The reason of which variety, Mr. Derham ascribes partly to some of those gentlemen using strings and plummets instead of regular pendulums; partly to there not being distance enough between the sonorous body and the place of observation; and partly, to there being no regard had to the winds.

Some of the most considerable queries, relating to the laws of *sounds*, the same author proposes; and answers several of them accurately, from experiments made for that purpose by himself, as follows:

VOL. II. N<sup>o</sup>. CXLIV.

How far does a *sound* move in a second of time?—*Sound* moves 1142 seconds in a second, which is just an English mile in  $9\frac{1}{4}$  or 9.25 half seconds; two miles in  $18\frac{1}{2}$ ; three miles in  $27\frac{3}{4}$ , &c.

Does the report of a gun, discharged with its mouth towards us, come sooner than when the muzzle is from the observer?—By repeated experiments, it appears, there is no difference in the *sound*, from this different direction.

Do *sounds* move in the same time, the same spaces, in all states of the atmosphere, and heights of the barometer, by day and by night, in summer and in winter, in snowy and in clear weather, in this or that climate?—By repeated experiments, it does not appear there arises any difference from any of these different circumstances.

Do the winds affect the motion of *sounds*?—By repeated experiments, it appears, there is some, though a very small difference in the velocity of *sounds*, with or against the wind; which is also augmented, or diminished, by the strength or weakness of the wind.

Do a great and intense *sound*, and a small or languid one, move with the same velocity?—It appears that they do.

Does the *sound* of a gun move equally swift at all elevations of the gun?—It does.

Do different quantities or strength of gun-powder, occasion any difference, as to the velocity of the *sound*?—None.

Does *sound* move in a right line, the nearest way; or does it sweep along the earth's surface? And is there any difference in the time, if the piece be discharged in an acclive and a declive position?—*Sound* moves the nearest way; and the velocity appears to be the same in acclivities as in declivities.

Have all kinds of *sounds*, as those of guns, bells, &c. the same velocity? And are *sounds* equally swift in the beginning of their motion, and in the end?—There appears no inequality in either of these respects.

For the reflection, refraction, &c. of sound; see *ECHO* and *PHONICKS*.

*Articulate SOUNDS*. See the article *ARTICULATE*.

*SOUND*, in music, denotes a quality in the several agitations of the air, considered as their disposition, measure, &c. may make music or harmony. See *MUSIC* and *HARMONY*.

*Sound* is the object of music; which is nothing but the art of applying *sounds*, under such circumstances of time and time, as to raise agreeable sensations. See *TUNE*, &c.

The principal affection of *sound*, whereby it becomes fitted to have this end; is that, whereby it is distinguished into *acute*, and *grave*. See *GRAVITY*, &c.

This difference depends on the nature of the sonorous body; the particular figure and quantity thereof; and even, in some cases, on the part of the body where it is struck; and is that which constitutes what we call *different tones*. See *TONE*.

The cause of this difference appears to be no other than the different velocities of the vibrations of the *sound*ing body. In effect, the tone of a *sound*, is found, by abundance of experiments, to depend on the nature of those vibrations, whose differences we can conceive no otherwise, than as having different velocities: and since it is proved, that the small vibrations of the same chord, are all performed in equal time; and that the tone of a *sound*, which continues for some time after the stroke, is the same from first to last: it follows, that the tone is necessarily connected with a certain quantity of time in making each vibration, or each wave; or that a certain number of vibrations or waves, accomplished in a given time, constitute a certain and determinate tone.—From this principle, are all the phenomena of *tune* deduced. See *TUNE*.

From the same principle, arise what we call *concord*s, &c. which are nothing but the results of frequent unions and coincidences of the vibrations of two sonorous bodies, and consequently of the waves and undulating motions of the air, occasioned thereby. See *CONCORD*.

On the contrary, the result of less frequent coincidences of those vibrations, is what we call a *discord*. See *DISCORD*.

Another considerable distinction of *SOUNDS*, with regard to music, is that, whereby they are denominated *long* and *short*; not with regard to the sonorous body's retaining a motion once received, a longer or a less time, though gradually growing weaker, but to the continuation of the impulse of the efficient cause on the sonorous body, for a longer or a shorter time, as in the notes of a violin, &c. which are made longer and shorter, by strokes of different length or quickness.

This continuity, is, properly, a succession of several *sounds*, or the effect of several distinct strokes, or repeated impulses on the sonorous body, so quick, that we judge it one continued *sound*; especially if it be continued in the same degree of strength: and hence arises the doctrine of *measure* and *time*. See *TIME*.

*Sounds*, again, are distinguished, with regard to music, into *simple* and *compound*; and that two ways.—In the first, a *sound*

*sound* is said to be *compound*, when a number of successive vibrations of the sonorous body and the air, come so fast upon the ear, that we judge them the same continued *sound*; as in the phenomenon of the circle of fire, caused by putting the fired end of a stick in a quick, circular motion: where, supposing the end of the stick in any point of the circle, the idea we receive of it there, continues till the impression is renewed by a sudden return.

A *simple SOUND*, then, with regard to this composition, should be the effect of a single vibration, or of so many vibrations as are necessary to raise in us the idea of *sound*.—In the second sense of composition, a *simple sound* is the product of one voice, or one instrument, &c.

A *compound SOUND*, consists of the *sounds* of several distinct voices or instruments all united in the same individual time and measure of duration, that is, all striking the ear together, whatever their other differences may be.—But in this sense, again, there is a two-fold composition; a natural and artificial one.

The natural composition, is that proceeding from the manifold reflexions of the first *sound* from adjacent bodies, where the reflexions are not so sudden, as to occasion echo's; but are all in the same tune with the first note. See *RESONANCE*.

The artificial composition, which alone comes under the musician's province, is, that mixture of several *sounds*, which being made by art, the ingredient *sounds* are separable, and distinguishable from one another.—In this sense, the distinct *sounds* of several voices or instruments, or several notes of the same instrument, are called *simple sounds*; in contradistinction to the *compound* ones, wherein, to answer the end of music, the simples must have such an agreement in all relations, chiefly as to acuteness and gravity, as that the ear may receive the mixture with pleasure. See *COMPOSITION*.

Another distinction of *SOUNDS*, with regard to music, is that, whereby they are said to be *smooth* and *even*, or *rough* and *harsh*, also *clear* and *hoarse*; the cause of which differences, depends on the disposition and state of the sonorous body, or the circumstances of the place: but the ideas of the differences must be sought from observation.

*Smooth* and *rough sounds* depend, principally, on the *sounding* body; of these we have a notable instance in strings that are uneven, and not of the same dimension or constitution throughout.

M. Perrault, to account for roughness and smoothness, maintains, there is no such thing as a *simple sound*; but that the *sound* of the same chord or bell, is a compound of the *sounds* of the several parts of it; so that where the parts are homogeneous, and the dimensions, or figure uniform, there is always such a perfect mixture and union of all the *sounds*, as makes one uniform and smooth *sound*: contrary conditions, produce harshness. In effect, a likeness of parts and figure, makes an uniformity of vibrations, whereby a great number of similar and coincident motions conspire to fortify and improve each other, and unite, for the more effectual producing of the same effect.

This account he confirms, from the phenomenon of a bell, which differs in tone, according to the part it is struck in; and yet strike it any where, there is a motion over all the parts. Hence, he considers the bell as composed of an infinite number of rings, which, according to their different dimensions, have different tones; as chords of different lengths have; and when struck, the vibrations of the parts immediately struck, specify the tone, being supported by a sufficient number of consonant tones in other parts. This must be allowed, that every note of a stringed instrument, is the effect of several *simple sounds*: for there is not only the *sound* resulting from the motion of the string; but that from the motion of the parts of the instrument, which has a considerable effect in the total *sound*, as is evident from hence, that the same string on different violins, *sounds* very differently.

But Perrault affirms the same of every string in itself, and without considering the instrument. Every part of the string, he says, has its particular vibrations, different from the gross and sensible vibrations of the whole; and these are the causes of different motions and *sounds* in the particles, which uniting, compose the whole *sound* of the string, and make an uniform composition, wherein the tone of the particular part struck, prevails; and all the others mix under a due subordination with it, so as to make the composition smooth and agreeable. If the parts be unevenly, or irregularly constituted, the *sound* is harsh; which is the case in what we call *false strings*, and various other bodies; which, for this reason, have no certain and distinct tone, but a composition of several tones, which do not unite and mix, so as to have one predominant, to specify the total one.

As to clear and *hoarse sounds*, they depend on circumstances that are accidental to the sonorous body: thus a voice or instrument will be hollow and hoarse, if raised within an empty hoghead; that yet is clear and bright out of it: the effect is owing to the mixture of other and different *sounds*, raised by reflexion, which corrupt and change the species of the primitive *sound*.

For *sounds* to be fit to obtain the end of music, they ought to be smooth and clear, especially the first; since without this, they cannot have one certain and discernible tone, capable of being compared to others, in a certain relation of acuteness, of which the ear may judge; and of consequence can be no part of the object of music.

Upon the whole, then, with Mr. Malcolm, we call that an *harmonic* or *musical sound*, which being clear and even, is agreeable to the ear, and gives a certain and discernible tune; (hence called *tunable sound*) which is the subject of the whole theory of harmony. See *HARMONY*.

*Harmonical SOUND*. See the article *HARMONY*.

*SOUND*, in geography, denotes a freight, or inlet of the sea, between two capes or head-lands. See *STREIGHT*.

The *SOUND* is used, by way of eminence, for that famous freight, which joins the German sea to the Baltic.

It is situate between the island of Zealand and the coast of Schonen. It is about sixteen leagues long, and generally five broad, excepting against the castle of Cronenberg, where it is but one: so that there is no passage for vessels, but under the cannon of the fortress.

This has given occasion to the Danes to settle a toll on all vessels, which is said to be one of the best revenues of the crown of Denmark; and to forbid all pilots from passing through the great and little belt, which are two other inlets into the Baltic, though somewhat less commodious than the former.

All nations who traffic into this part of the North, are subject to this right; the Swedes, indeed, were exempted from it by the treaty of 1644; but by the treaty of 1720, they are excluded the privilege; and put on the same footing with their neighbours.

By the treaty of Spire made between the Danes and Charles V. the toll for this passage was fixed at two rose nobles for a ship of 200 tons: yet in the year 1640 the same was risen to upwards of 500 rix dollars.

The connivance of our King James I. who had married a daughter of Denmark, and the wars which the Hollanders had been long engaged in for their liberty, furnished the occasion for so grievous an exaction.—Of late years the toll has been reduced to an easier footing.

Cromwell was bent on extorting this passage from the Danes; and had, probably, effected it, but that ere the fleet he sent for the purpose arrived there, he died.

The origin and progress of this imposition (which from an easy contribution voluntarily paid by merchants for maintaining lights on certain places of the coast, and whereof the K. of Denmark was only treasurer or trustee, grew at length to be a heavy burthen on trade, as well as a kind of servile acknowledgment of his sovereignty of these seas) is given in the account of Denmark, c. 3. p. 11. *seqq.*

*SOUND-BOARD*, the principal part of an organ, and that which makes the whole machine play. See *ORGAN*.

The *sound-board* or *summer*, is a reservoir, into which the wind drawn in by the bellows, is conducted by a port-vent, and hence distributed into the pipes placed over the holes of its upper part. This wind enters them by valves, which open by pressing upon the stops or keys, after drawing the registers, which prevent the air from going into any of the other pipes, but those it is required in.

Organs, whose longest blind pipes are four foot, have their *sound-board* from five to six feet. Organs of 16 feet have two *sound-boards*, which communicate the wind from one to the other, by a pewter port-vent.

*SOUNDING*, in navigation, the act of trying the depth of the water, and the quality of the bottom, by a line and plummet, or other artifice.

There are two kinds of lines occasionally used in *sounding* the sea; the *sounding line* and the *deep sea line*. See *DEEP sea line*.

The *SOUNDING line*, is the thickest and shortest, as not exceeding 20 fathom in length; and marked at two, three, and four fathoms, with a piece of black leather between the strands; and at five, with a piece of white leather.

The *sounding line* may be used when the ship is under sail, which the deep sea-line cannot.—The plummet is usually in form of a nine-pin, and weighs 18 pounds; the end is frequently greased, to try whether the ground be sandy or rocky, &c.—Near banks, shores, &c. they are to be *sounding* continually.

Dr. Hook has invented a manner of *sounding* the depth of the deepest sea, without any line; only by a wooden globe, lighter than water, to which, at a little distance is a piece of lead or stone fixed, by means of a springing wire in the first, fitted into a staple in the second. The whole being let gently down, with the stone or lead foremost, as soon as that arrives at the bottom, it will stop; but the ball, by the impetus it has acquired in descending, will be carried a little lower after the weight is stopped; by which means the springing wire will be enabled to fly back, and disengaging itself, will re-ascend.—By observing, then, the time of the ball's stay under water by a watch or pendulum, and the help of some tables, the depth of the sea is found.

In some experiments made in the Thames with a maple globe,

globe,  $5\frac{1}{2}$  inches in diameter, and weighing 4 pound and a half, lined with pitch; and a conical weight 11 inches long, the sharp end downwards; at the depth of 19 feet, there passed six seconds; and at the depth of 10 feet  $3\frac{1}{2}$  seconds between the immersion and emergence of the ball. From these numbers given, the depths, at any other fays, may be computed by the rule of three.

**SOUP\***, or **SOOP**, a kind of pottage made of bread, and broth, or the juice of flesh, or other matters; usually served at the beginning of a meal.

\* The word is French, formed from the Italian *zuppa* or *suppa*, of the Latin, *sapa*, wine boiled away to a third part. Others derive it from the Celtic, *suben*, which signifies the same.

*Soup* is deemed essential to a French dinner. Sometimes they heighten the relish by the addition of onions, or leeks, or cabbage, or turnips, &c.

**SOURCE**. See the article **SPRING**.

**SOUTH direct dials**. See the article **DIAL**.

**SOUTH sea company**. See the article **COMPANY**.

**SOUTHERN hemisphere**, } See { **HEMISPHERE**.

**SOUTHERN ocean**, } See { **OCEAN**.

**SOUTHERN signs**. See the article **SIGN**.

**SOWING**. See **SEMINATION** and **SEMBRADOR**.

**SOWNE**, a term used in the exchequer; seeming to be a corruption from the French *souvenu*, remembered.

Such estreats and casualties as the sheriff by his industry cannot get or levy, are said to be estreats that *sowne* not, that is, are not to be remembered, or are not in demand.—On the contrary, estreats that *sowne*, are such as he may gather. See **ESTREAT**.

**SPA**, a town in the bishoprick of Liege in Germany, famous for its mineral waters. Those of the Pouhon spring in *Spa* are preferred, by our chief physicians\*, to any others in or near the country of Liege; particularly to the waters of Bru; which they complain have been imposed on the public, to their and their patients frequent disappointment.

\* Broxholme, Burton, Hawys, Hollings, Lee, Mead, Pellet, Robinson, Shadwell, Sloane, Stuart, West: who were pleased to recommend Mr. Eyre, for his integrity, as a proper person to be entrusted with the patent granted him by the prince and bishop of Liege, empowering him to impress his highness's arms in glass on the neck of each flask, which he should fill with the true Pouhon water.

**SPAAD**, or **SPALT**, **SPATUM**, a species of English talc or gypsum; being a white, fibrous, scaly, shining stone, sometimes used to promote the fusion of metals. See **TALC**.

It is found pretty frequently in England and Germany; and sometimes brought from the Levant: the best is in long scales, very soft, and easily pulverized.—The English *spalt* is generally very hard.

**SPACE**, **SPATIUM**, a simple idea, the modes whereof, are distance, capacity, extension, duration, &c. See **MODE**, **EXTENSION**, **DURATION**, &c.

*Space*, considered barely in length between any two bodies, is the same idea which we have of distance. See **DISTANCE**.

If it be considered in length, breadth, and thickness, it is properly called *capacity*. See **CAPACITY**.

When considered between the extremities of matter, which fills the capacity of *space* with something solid, tangible and moveable, it is then called *extension*. See **EXTENSION**.

So that extension is an idea belonging to body only; but *space*, it is plain, may be considered without it. See **BODY** and **VACUUM**.

*Space*, therefore, in the general signification, is the same thing with distance considered every way, whether there be any solid matter in it, or not.

Each different distance is a different modification of *space*; and each idea of any different *space*, is a simple mode of this idea. Such are an inch, foot, yard, &c. which are the ideas of certain stated lengths, which men settle in their minds for the use, and by the custom of measuring.—When these ideas are made familiar to mens thoughts, they can in their minds repeat them as often as they will, without joining to them the idea of body, and frame to themselves the ideas of feet, yards, and fathoms, beyond the utmost bounds of all bodies; and by adding these still to one another, enlarge their idea of *space*, as much as they please.

From this power of repeating any idea of distance, without being ever able to come to an end, we come by the idea of immensity. See **IMMENSE** and **INFINITE**.

Another mode, or modification of *space*, is taken from the relation of the parts of the termination of extension, or circumscribed *space* amongst themselves; and this is what we call *figure*.—This, the touch discovers in sensible bodies, whose extremities come within our reach; and the eye takes, both from bodies and colours whose boundaries are within its view; where, observing how the extremities terminate, either in straight lines, which meet at discernible angles; or in crooked lines, wherein no angles can be perceived; by considering these as they relate to one another in all parts of the extremities of any body or *space*, it acquires

the idea we call *figure*: which affords to the mind infinite variety. See **FIGURE**.

Another mode belonging to this head, is that of *place*. Our idea of it is nothing but the relative position of any thing, with reference to its distance from some fixed and certain points: whence we say, that a thing has, or has not changed place, when its distance either is, or is not altered with respect to those bodies, with which we have occasion to compare it. That this is so, we may easily gather from hence; that we can have no idea of the place of the universe: we can of all its parts. See **PLACE**.

Another mode of *space*, is the idea which we get from the fleeting, and perpetually perishing parts of succession, which we call *duration*. The simple modes of it are any different lengths of it, whereof we have distinct ideas, as hours, days, years, &c. time, and eternity. The idea of succession is got by reflecting on that train of ideas, which constantly follow one another in our minds, as long as we are awake. See **SUCCESSION**.

The distance between any parts of this succession is what we call *duration*: and the continuation of the existence of ourselves, or any thing else commensurate to the succession of any ideas in our minds, is what we call *our own duration*, or that of another thing co-existing with our thinking.

A man having once got this idea of duration, can apply it to things which exist while he does not think: and thus we measure the time of our sleep, as well as that wherein we are awake. See **DURATION**.

*Space* is usually divided into *absolute* and *relative*.

**Absolute SPACE**, is that considered in its own nature, without regard to any thing external; which always remains the same, and is infinite and immoveable.

**Relative SPACE**, is that moveable dimension, or measure of the former, which our senses define by its positions to bodies within it; and this the vulgar use for immoveable *space*.

Relative *space*, in magnitude and figure, is always the same with absolute; but it is not necessary it should be so numerically: as if you suppose a ship to be, indeed, in absolute rest, then the places of all things within her, will be the same absolutely and relatively, and nothing will change its place: but, suppose the ship under sail, or in motion, and she will continually pass through new parts of absolute *space*: but all things on board, considered relatively, in respect to the ship, may be, notwithstanding, in the same places, or have the same situation and position, in regard to one another.

Proper and absolute motion, is defined to be the application of a body to different parts of absolute, that is, of infinite and immoveable *space*. See **PLACE**, **MOTION** and **REST**.

The Cartesians, who make extension the essence of matter, assert, that the *space* any body takes up, is the same thing with the body itself; and that there is no such thing as mere *space*, void of all matter, in the universe: but this see disproved under the article **VACUUM**.

**SPACE**, in geometry, denotes the area of any figure; or that which fills the interval or distance between the lines that terminate it. See **AREA** and **FIGURE**.

The *parabolic space*, is that included in the whole parabola. See **PARABOLA** and **PARABOLIC**.

The *conchoidal space*, and the *cissoidal space*, are what are included within the cavities of the conchoid and cissoid.

By the new methods now introduced, of applying algebra to geometry, it is demonstrated, that the conchoidal and cissoidal *spaces*, though infinitely extended, are yet finite magnitudes. See **CONCHOID** and **CISSOID**.

**Cycloidal SPACE**, } See the articles { **CYCLOIDAL**.

**Elliptical SPACE**, } See the articles { **ELLIPTICAL**.

**SPACE**, in mechanics, the line a moveable body, considered as a point, is conceived to describe by its motion. See **MOTION**.

**SPADE**.—**Turfing SPADE**, } See the articles { **TURFING**.

**SPADING**, } See the articles { **SPAYING**.

**SPARGYRIC\***, an epithet given to chymistry; which is called the *spagyric art*, or *medicina spagyrica*; and to chymical physicians, who are also called *spagyrist*s. See **CHYMISTRY** and **CHYMIST**.

\* Vossius derives the word from the Greek, *σπαραν*, to extract and *αγειν*, *congregare*, to collect; which are the two principal offices of chymists.—Paracelsus first introduced the word.

**SPAGYRICAL physicians**. See the article **PHYSICIAN**.

**SPAHIS**, horse-men in the Ottoman army; chiefly raised in Asia.

The great strength of the grand seignior's army consists in the janizaries, who are the foot, and the *spahis*, who are the horse. See **JANIZARY**, &c.

The aga or commander of the *spahis*, is called *spahi agasi*. See **AGA**.

**SPAN**, a measure taken from the space between the thumb's end, and the tip of the little finger, when both are stretched out. See **PALM**.

The *span* is estimated at three hand's-breadths, or nine inches. See **MEASURE**.

**SPANISH**,

SPAR, in natural history, a shining, stony, mixt substance, compounded of crystal, incorporated with lac lunæ, or other mineral, earthy, stony, or metallic matter; frequently found in caves and grotto's, and in the clefts of rocks, lead-mines, &c. See STONE, GROTTO, MINERAL, CRYSTAL, &c. Mr. Beaumont, in the Philosophical Transactions, endeavours to account for the origin and growth of *spar*; which he makes to be a kind of rock-plant.

*Spar*, he observes, may be formed three ways; either from steams alone; or from steams coagulating dew, as it falls on the ground, or waters issuing from the joints of rocks: or, it may grow from earths and clays. To say nothing of the account we have from Switzerland, viz. that snow, by long lying and continual frosts, becomes hardened into *spar*.

We have instances of the first kind in many grotto's where *spars* produced from steams, hang like icicles; lead ore being often found to grow in the same manner. And as this *spar* grows downwards; so in many places, from the sides of it, issue little plants of *spar*, shooting upwards, contrary to the tendency of the others. An instance of the second, we have in a certain place in Italy, where crystals (which are a sort of *spars*) are produced in clear evenings, from a coagulation of dew falling on nitrous stones. But hereof we have instances enough nearer home. See STALACTITES.

For the third kind of generation of *spar*, never before taken notice of by naturalists; Mr. Beaumont gives us instances of it in Mendip hills, and other mines, wherein are subterraneous vaults or grotto's. In the bottoms of some of these, is a steam incumbent thereon. From this earth, shoot up spires of various heights, &c. from the first buddings out of it, till it become as high as a man's finger; the biggest ordinarily an inch in diameter. These spires have all irregular ridges and furrows; and some sooner, some later, begin on the tops to be congealed into *spar*; and so gathering a crust downwards by degrees, are all at last, turned into an absolute white *spar* or stone. See PETRIFICATION.

SPARADRAP, SPARADRAPUM, in pharmacy, &c. an ancient name for a kind of scar-cloth; or a linen cloth smeared on both sides with some kind of plaister, or unguent. See SEAR-CLOTH and CERATE.

The *sparadrap* is sometimes also called *tela Gualteriana*, or *tela Gualteri*; sometimes, *tela implastica*.

It is prepared by melting a sufficient quantity of some plaister or unguent, and dipping a linen cloth therein, till such time as it have imbibed its fill. It is then taken out, cooled and polished on a marble.

There are as many different kinds of *sparadraps*, as there are of plaisters for the cloth to be dipped in.

SPARRING, among cock-fighters, is the fighting a cock with another to breathe him.—In *sparring*, they put hots on their spurs, that they may not hurt one another.—To *spar the cock*, imports in general, to breathe him, in order to embolden him to fight.

SPASM, SPASMA, or SPASMUS, ΣΠΑΣΜΑ, or ΣΠΑΣΜΟΣ, a Greek term, of equal import with the Latin, *convulsio*, and English, *convulsion*. See CONVULSION.

A *spasmus* happening after the taking of hellebore, or any other violent purgative, is mortal.—There are *spasms* peculiar to certain members, and distinguished by particular names: that of the mouth is called *spasmus cynicus*; that of the penis, *satyriasis*, &c. See PRIAPISMUS, CYNICUS, &c.

Cardan distinguishes two kinds of *spasms*: the first consisting in a constant contraction of the muscles, which renders the members rigid, and inflexible. The second, in sudden, unnatural motions and palpitations, frequently intermitting and beginning again.

Accidental *spasms* are of short continuance: there are some arising from flatulencies; others from bites of venomous beasts, from the puncture of a nerve, the acrimony of the humours vellicating the stomach, excessive cold, hysteric vapours, &c.

SPASMODIC, something belonging to a *spasm*, or convulsion; as a *spasmodic medicine*, *spasmodic disease*, &c. See SPASM and CONVULSIVE.

Hunger, according to M. Hecquet, is a *spasmodic* affection of the fibres of the stomach; unless it arise from the fibres being too much moistened by the liquor thereof, so as to incapacitate them for their office. See HUNGER.

SPATULA\*, or SPATHULA, an instrument used by surgeons, and apothecaries; made flat at one end, and round at the other: serving to spread their plaisters, and unguents withal.

\* The word is formed from the Latin, *spatula*, of the Greek, *σπάτιον*, which signifies the same.

The surgeons have little steel *spatula's*.—The apothecaries have also large ones of wood, to stir their drugs in diluting, tempering, or boiling them.

SPAVIN\*, a disease in a horse; being a swelling, or stiffness usually in the ham, which causes him to halt.

\* The word is formed from the French, *esparvin*, which signifies the same.

There are two kinds of *spavins*, viz. the

*Ox-SPAVIN*, which is a callous tumour, at the bottom of the ham, on the inside; hard as a bone, and very painful.—While it is yet young, some horses only halt with it, at the first coming out of the stable.

*Dry-SPAVIN*, which is more easily perceived by the horse's raising one of his hind-legs, with a twitch, higher than the other: sometimes it is found on both legs.

This kind, which some also call *string-halt*, frequently degenerates into the *ox-spavin*; for which there is no remedy, but to apply the fire; which, however, is not always successful. See STRINGHALT.

There are two other kinds of *spavin*, which have their seat in the hoof, viz. the

*Blood SPAVIN*, a soft tumour which grows through a horse's hoof, and is usually full of blood.

*Bone SPAVIN*, a crusty substance growing on the inside of the hoof under the joint.

SPAWS, mineral waters arising out of the earth; tinged with nitre, sulphur, alum, bitumen, copperas, or other mineral matter in passing through the strata thereof; and hence endowed with some medicinal qualities, cathartic, diuretic, emetic, alterant, or the like. See SPA, WATER, SPRING, MINERAL, &c.

SPAYING, or SPADING, the operation of castrating the females of several kinds of animals, as sows, bitches, &c. to prevent any further conception, and promote their fattening. See CASTRATION.

It is performed, by cutting them in the mid flank, on the left side, with a sharp knife or lancet, taking out the uterus and cutting it off, and so stitching up the wound, anointing the fore with tar, and keeping the animal warm for two or three days.

The usual way, is to make the incision a-slope, two inches and a half long, that the fore-finger may be put in towards the back, to feel for the ovaries, which are two kernels as big as acorns on both sides the uterus, one of which is drawn to the wound, the string thereof cut, and thus both taken out.

SPEAKER of the house of commons, a member of the house elected by a majority of the votes thereof, to act as chairman, or president, in putting questions, reading briefs or bills, keeping order, reprimanding the refractory, adjourning the house, &c. See COMMONS.

The first thing done by the commons upon the first meeting of a parliament, is to chuse a *speaker*; who is to be approved of by the king; and who upon his admission, begs his majesty, that the commons, during their sitting, may have *free access to his majesty*; *freedom of speech in their own house*, and *security from arrests*.

The *speaker* is not allowed to persuade or dissuade, in passing of a bill; but only to make a short and plain narrative; nor to vote, unless the house be equally divided. See PARLIAMENT.

The lord chancellor, or keeper, is usually *speaker of the house of lords*. See CHANCELLOR.—The *speaker of the convocation*, is called the *prolocutor*. See PROLOCUTOR.

SPEAKING, the art or act of expressing one's thoughts in articulate sounds or words. See WORD and VOICE; see also SPEECH and GRAMMAR.

Pliny, Aelian, Plutarch and other authors, make mention of several beasts that have *spoke*: and Pliny himself, speaks with assurance, in his history, of an ox that *spoke*. Philostratus, in his life of Apollonius, gives the like privilege to an elm, and even to ships. Homer makes Xanthos, one of Achilles's horses, speak; wherein he has been followed by Oppian. But these are all fabulous: we have much better authority for a serpent, and an ass's *speaking*. See LANGUAGE.

SPEAKING-trumpet. See TRUMPET and STENTOROPHONIC.

SPECIAL, something that is particular, or has a particular designation; from the Latin, *species*.—In opposition to general, of genus. See GENERAL, PARTICULAR, SPECIES and GENUS.

The king in his letters, frequently says, of our *special grace*, full power and royal authority.

SPECIAL assize,	} See the articles {	ASSISE.
SPECIAL attorney,		ATTORNEY.
SPECIAL fee tail,		FEE tail.
SPECIAL issue,		ISSUE.

SPECIAL.

**SPECIAL tail.** See the article **TAIL**.

**SPECIAL verdict, &c.** See the article **VERDICT**.

**SPECIALTY**, in law, is most commonly taken for a bond, bill, or other the like instrument in writing. See **DEED**, **WRITING**, &c.

Sometimes it is also used for a special or particular acquaintance.

**SPECIES**, an idea, which relates to some other more general one; or is comprized under a more universal division of a genus. See **GENUS**.

The word is Latin, formed from the ancient verb, *specio*, I see; as if a *species* of things were a collection of all the things seen at one view.

*Species* is a mere term of relation: and the same idea may be a *species*, when compared to another more general one; and a genus, with regard to a more particular one.—Thus body is a genus, with regard to an animate and inanimate body; and a *species*, with regard to substance.

The last *species*, is that which can only be divided into individuals. See **INDIVIDUAL**.

Animal is a *species*, with regard to body; and man is a *species* with regard to animal. God destroyed mankind by the deluge; but he preserved the *species*. See **DELUGE**.

**SPECIES**, in logic, is one of the five words, called by Porphyry, *universals*. See **UNIVERSAL**.

**SPECIES**, in rhetoric, is a particular thing, contained under a more universal one.

The orators also call it *hypothesis*: *E. gr.* virtue is to be loved, is the *genus* or *thesis*. Temperance is to be preserved here, at this time, is the *species* or *hypothesis*. See **THESIS**.

**SPECIES**, in the ancient music, denotes a sub-division of one of the genera. See **GENUS**.

The genera of music were three, the *enharmonic*, *chromatic*, and *diatonic*: the two last of which were variously subdivided into *species*: nor was the first without *species*, though those had not particular names as the *species* of the other two had.—These *species* were also called the *chroai*, colours of the genera.

**SPECIES**, in optics, the image painted on the retina by the rays of light reflected from the several points of the surface of an object, received in at the pupilla, and collected, in their passage through the crystallin, &c. See **VISION**.

Philosophers have been in great doubt, whether the *species* of objects, which give the soul an occasion of seeing, are an effusion of the substance of the body; or a mere impression which they make on all ambient bodies, and which these all reflect, when in a proper distance and disposition; or, lastly, whether they are not some other more subtle body, as light, which receives all these impressions from bodies, and is continually sent and returned from one to another; with the different figures and impressions it has taken.—But the moderns have decided this point by their invention of artificial eyes, wherein the *species* of objects are received on a paper or linen cloth in the same manner as they are received in the natural eye. See **EYE**.

The ancients have distinguished the *species*, whereby objects become visible, into *impressa* and *expressa*.

**Impressed SPECIES**, are such, as come from without; or are sent from the object to the organ: such are those we have already been speaking of.

**Expressed SPECIES**, are those, on the contrary, which proceed from within; or that are sent from the organ to the object.

Le Clerc, in his system of vision, by one of those revolutions very frequent in philosophical opinions, has called upon the stage again the *species expressa*, of the ancient philosophers. For, according to him, it is not by *species* or images impressed on the optic nerve, that the soul sees objects; but by rays, which she herself directs to them, and which she uses as a blind man does his staff, to grope out objects.

The Peripateticks account for vision, from a kind of *intentional SPECIES*, thus: every object, say they, expresses a perfect image of itself on the air next to it. This expresses another lesser one on the air next to that; and this a third still less. Thus are the images continued from the object to the crystallin, which these philosophers hold the principal organ of seeing. These they call *species intentionales*; and to account the better for their generation, affirm, that objects exhibit them in the same manner, as mirrors do a man's face. See **VISION**.

**SPECIES**, in theology, denotes the appearances of the bread and wine in the sacrament, after consecration.—Or, as the Romanists define them, the accidents remaining in the bread and wine, whereby they become sensible to us, after their substance is destroyed. See **TRANSUBSTANTIATION**.

The *species* of the bread, &c. are its whiteness, quantity, figure, friableness, &c.—Of wine, its flavour, quickness, specific gravity, &c.

The generality of Romish divines, hold, that the *species* are absolute accidents.—And the Cartesians, who are bound to deny any such things as absolute accidents, are greatly puzzled to explain the *species*, without incurring the censure of heresy. F. Magnan is forced to assert, that the *species* are mere delusions and appearances, which God impresses on our senses. See **absolute ACCIDENT**.

VOL. II. N°. CXLIV.

**SPECIES**, in commerce, are the several pieces of gold, silver, copper, &c. which having passed their full preparation, and coinage, are current in public. See **COIN**.

**SPECIES decried**, or *cried down*, are such as the sovereign has forbidden to be received in payment.

**Light SPECIES**, are those which fall short of the weight prescribed by law.

**False SPECIES**, are those of different metal or alloy from what they should be, &c.

**SPECIES**, in algebra, are the symbols, or characters, whereby quantities are represented. See **CHARACTER**.

**SPECIFIC**, in philosophy, that which is proper and peculiar to any thing; or that characterizes it, and distinguishes it from every other thing. See **PROPER**, &c.

Thus the attracting of iron is *specific* to the load stone, or a *specific* property of the load-stone: a just definition should contain the *specific* notion of the thing defined, or that which specifies and distinguishes it from every thing else. See **DEFINITION**.

**SPECIFIC**, in medicine, a remedy, whose virtue and effect is peculiarly adapted to some certain disease; is adequate thereto; and exerts its whole force immediately thereon.

Thus quinquina, or the Jesuits bark, is held a *specific* for intermitting fevers or agues; mercury for the venereal disease, &c. See **QUINQUINA**.

Authors make mention of three kinds of *specific* medicines.—1°. Such as are eminently and particularly friendly to this or that part; as to the heart, the lungs, the brain, the stomach, &c.

2°. Such as seem to attract, expel, or evacuate some determinate humour, by a kind of specific power they are endowed withal; as jalap is supposed to purge watery humours; rhubarb, bile, &c. See **PURGATIVE**.

3°. Such as remove the cause of a disease, by some sudden property, without our knowing how or why; or the manner of whose operations we are intirely ignorant of, and have only learnt their effects by experience.

In the use of these last, there is no enquiry into the nature of the disease; no regard had to the symptoms or phenomena: nor is the medicine to be at all adapted to the particular circumstances thereof. All that we regard, is the name of the disease, and that of the remedy: as, immediately, upon finding an intermitting fever, we prescribe the bark; to alluage pain, opium; to expel poison, some particular antidote.

On this footing, a *specific* medicine seems to stand in opposition to a *scientific*, or *methodic* medicine. See **MEDICINE**.

The mild operation of some alterant medicines by insensible perspiration, sweat and urine, may have led some men into this notion of *specific* alteratives, or the transmutation of poisonous into innocent juices. Physicians are apt to think they cure diseases specifically, when they do not bleed, purge, vomit, or salivate. But it is certain, mercury when it cures the lues without salivation, does not act specifically any more than when the highest salivation is raised by it; when it does not salivate, it infallibly and sensibly passes off by the cutaneous and venal glands.

Several mineral and metalline substances, especially the compositions of sulphur and mercury, as the æthiops and cinabar, may indeed cure many diseases; but then they do it by acting as evacuates, by attenuating, dissolving, and carrying off the viscid concretions and foulnesses of the stomach and intestines, and thus cleansing the foul passages, and restoring them to their natural action: not by any alterative or *specific* operation.

**SPECIFIC waters.** See the article **WATER**.

**SPECIFIC gravity**, in hydrostatics, denotes that gravity, or weight peculiar to each species, or kind of natural body; and whereby it is distinguished from all other kinds. See **WEIGHT**.

In this sense, a body is said to be *specifically heavier* than another, when under the same bulk it contains a greater weight than that other; and that other, is said to be *specifically lighter* than the first.—Thus, if there be two equal spheres, each a foot in diameter; only the one wood, the other lead: since the leaden one is found heavier than the wooden one, it is said to be *specifically* or in *specie*, heavier; and the wooden one, *specifically lighter*.

This kind of gravity, some call *relative*; in opposition to *absolute gravity*, which increases in proportion to the quantity or mass of the body. See **GRAVITY**.

**Laws of the SPECIFIC gravity and levity of bodies.**—1. If two bodies be equal in bulk, their *specific gravities* are, to each other, as their absolute gravities. Thus a body is said to be twice as heavy, *specifically*, as another, if it have twice its gravity under the same bulk.

Hence, the *specific* gravities of equal bodies, are as their densities. See **DENSITY**.

2. The *specific* gravities of bodies of the same weight, are in the reciprocal ratio of their bulks. Hence, the masses of two bodies of the same weight, are in a reciprocal ratio of their bulks.

3. The *specific* gravities of two bodies are, in a ratio, compounded of the direct ratio of the absolute gravities, and the reciprocal

reciprocal one of their bulks.—Hence, again, the *specific gravities* : re as the densities.

4. A body *specifically* heavier than a fluid, loses so much of its weight therein, as is equal to a quantity of the fluid of the same bulk.

For, suppose a cubic inch of lead immersed in water : a cubic inch of water will, thereby, be expelled from its place : but the weight of this water was sustained by the resistance of the ambient water. Therefore, such a part of the weight of the leaden cube, must be sustained by the resistance of the ambient water, as is equal to the weight of the water expelled. The gravity of the body immersed, therefore, must be diminished by so much.

Hence, 1°. Since a fluid *specifically* heavier, has a greater weight, in the same bulk, than a lighter ; the same body will lose a greater part of its weight in a fluid, *specifically* heavier, than in the lighter : and therefore it weighs more in a lighter than a heavier.

2°. Equal homogeneous bodies weighing equally in air, lose their equilibrium if one of them be immersed in a heavier fluid ; the other in a lighter.

3°. Since the *specific gravities* are as the absolute gravities under the same bulk ; the *specific gravity* of the fluid, will be to the gravity of the body immersed, as the part of the weight lost by the solid, to the whole weight.

4°. Two solids equal in bulk, lose the same weight in the same fluid : but the weight of the *specifically* heavier body, is greater than that of the *specifically* lighter ; therefore, the *specifically* lighter, loses a greater part of its weight, than the *specifically* heavier.

5°. Since the bulks of bodies equal in weight, are reciprocally as the *specific gravities* ; the *specifically* lighter, loses more weight in the same fluid than the heavier ; wherefore, if they be in *equilibrium* in one fluid, they will not be so in another ; but the *specifically* heavier, will preponderate, and that the more, as the fluid is denser.

6°. The *specific gravities* of fluids, are as the weights lost by the same solid immersed in the same.

To find the *SPECIFIC gravity* of a fluid.—On one arm of a balance suspend a leaden globe ; and to the other, fasten a weight, which is in *equilibrium* therewith in the air. Immerse the globe successively in the several fluids, whose *specific gravities* are to be determined, and observe the weight which balances it in each. These several weights, subtracted, severally, from the first weight, the remainders are the parts of the weight lost in each fluid. Whence the ratio of the *specific gravity* of the fluids is seen. See HYDROSTATICAL balance.

Hence, as the densities are as the *specific gravities* ; we find the ratio of the densities of the fluids at the same time.

This problem is of the utmost use ; as by it, the degree of purity or goodness of fluids, is easily found ; a thing, not only of service in natural philosophy ; but also in common life, and in the practice of physic.

At different seasons of the year, the *specific gravities* of the same fluids, are found different. *Joan. Casp. Eifenschmidius*, in his *disquisitio nova de ponderibus*, &c. gives us variety of experiments relating hereto : the principal whereof, to save the trouble of too frequent experiments, we shall here subjoin.

Table of *SPECIFIC gravities* of several fluids.

A cubic inch Paris measure.	In summer O. D. G.	In winter O. D. G.
Of mercury	7 1 66	7 2 14
Oil of vitriol	7 59	7 71
Spirit of vitriol	5 33	5 38
Spirit of nitre	6 24	6 44
Spirit of salt	5 40	5 55
Aqua fortis	6 23	6 35
Vinegar	5 15	5 21
Distilled vinegar	5 11	5 15
Burgundy wine	4 67	4 75
Spirit of wine	4 32	4 42
Pale ale	5 1	5 9
Brown ale	5 2	5 7
Cows milk	5 20	5 25
Goats milk	5 24	5 28
Urine	5 14	5 19
Spirit of urine	5 45	5 53
Oil of tartar	7 27	7 43
Oil of olives	4 53	Is froze in winter
Oil of turpentine	4 39	4 46
Sea water	6 12	6 18
River water	5 10	5 13
Spring water	5 11	5 14
Distilled water	5 8	5 11

That the *specific gravity* may be found the more accurately ; the weight of the thread not immersed in the fluid, is to be subtracted from the weight of the solid in the air ; and the force necessary to make the thread subside (if it be *specifically* lighter) is to be added to the weight lost. But if the thread that sustains the solid be heavier than the fluid ; the whole weight of the thread in the air is to be subtracted from the weight of the solid in air ; and the weight the thread loses from the weight lost in the fluid. Indeed, this precaution may be spared, if in examining the *specific gravity* of several

fluids, care be taken that the same thread be immersed to the same depth in each.

6. To determine the ratio which the *specific gravity* of a fluid has to the *specific gravity* of a solid that is *specifically* heavier than the fluid.

Weigh any mass of the solid in a fluid, and note the just weight therein : the *specific gravity* of the fluid will be to that of the solid, as the part of the weight lost by the solid, is to its whole weight.

7. The *specific gravities* of equally heavy bodies, are reciprocally as the quantities of weight lost in the same fluid. Hence we find the ratio of the *specific gravities* of solids, by weighing masses thereof, that are equal in air, in the same fluid ; and noting the weights lost by each.

The *specific gravities* of various solids, have been determined by many authors. Marin Ghetaldus, particularly tried the *specific gravities* various bodies had, especially metallic ones ; which were borrowed thence by Oughtred. In the Philosophical Transactions, we have ample tables of *specific gravities*, by various authors.

It will be sufficient for us to give those of some of the more usual bodies, as determined with great care and accuracy by M. Petit ; and published by F. Merfenne ; and from him by several others.

Table of the *SPECIFIC gravities* of several solids.

An hundred pound weight of gold is equal in bulk to

71 $\frac{1}{2}$ of mercury	38 $\frac{1}{4}$ of fine tin
60 $\frac{1}{2}$ of lead	26 of load stone
54 $\frac{1}{2}$ of silver	21 of marble
47 $\frac{1}{3}$ of copper	14 of stone
45 of brass	12 $\frac{1}{2}$ of sulphur
42 of iron	5 of wax
39 of tin	5 $\frac{1}{2}$ of water.

8. A body *specifically* heavier, descends in a fluid *specifically* lighter, with a force equal to the excess of its weight, over that of an equal quantity of the fluid.

Hence, 1°. The force which sustains a *specifically* heavier body in a fluid, is equal to the excess of the absolute gravity of the body, above that of the fluid, under the same bulk : *e. gr.* 47  $\frac{1}{3}$  pound of copper loses 5  $\frac{1}{3}$  pounds of its weight in water ; therefore a power of 42 pounds is able to sustain it.

2°. Since the excess of the weight of a solid over the weight of a fluid *specifically* heavier, is less than that over the weight of a *specifically* lighter fluid under the same bulk ; it will descend with less force in a *specifically* heavier fluid than in a lighter ; and, consequently, will descend more slowly in the former than in the latter.

9. A *specifically* lighter body, sinks in a heavier fluid, till the weight of a quantity of the fluid, equal in bulk to the part immersed, be equal to the weight of the whole body.

Hence, 1°. Since the *specific gravities* of bodies of the same weight, are reciprocally as their bulks ; and the bulks of fluids equal in weight, are as the parts of the same solid immersed therein ; the *specific gravities* of fluids are reciprocally as the parts of the same body immersed therein.

2°. A solid, therefore, immerses deeper in a lighter fluid than a heavier ; and deeper as the proportion of the *specific gravity* of the solid to that of the fluid is greater.

3°. If a body be of the same *specific gravity* with a fluid ; the whole body will be immersed ; and it will remain in any given place of the fluid.

4°. If a *specifically* lighter body be wholly immersed in a fluid ; it will be urged by the collateral columns of the fluid, to ascend with a force equal to the excess of the weight of the fluid, bulk for bulk, over the weight of the solid.

5°. A body, therefore, *specifically* lighter, lying on the bottom of a vessel, will not be raised up, unless the heavier fluid rise above such a part, as is equal in bulk to a quantity of the fluid of the same weight with the whole solid.

10. The *specific gravity* of a solid is to the *specific gravity* of a lighter fluid, wherein it is immersed, as the bulk of the part immersed, is to the whole bulk.

11. The *specific gravities* of equal solids, are as their parts immersed in the same fluid.

12. The weight and bulk of a *specifically* lighter body, and the weight of the *specifically* heavier fluid, being given, to find the force required, to keep the solid wholly immersed under the fluid.

As this force is equal to the excess of the weight of the fluid, beyond that of an equal bulk of the solid ; from the given bulk of the solid, and the weight of a cubic foot of water, find, by the rule of three, the weight of a bulk of water, equal to that of the body. From this, subtract the weight of the solid ; the remainder is the force required. *E. gr.* Suppose the force necessary to detain a solid eight feet in bulk, and 100 pounds in weight, under water, required : since a cubic foot of water is found to weigh 70 pound, the weight of water under the bulk of eight feet, is 560 ; whence, 100 pound, the weight of the solid, being subtracted ; the remainder 460 pound, is the force necessary to detain the solid under water.

Hence, since a *specifically* lighter body ascends in a heavier fluid, with the same force that would prevent its ascent : by the present problem, we can likewise find the force where-with a *specifically* lighter body ascends in a heavier.

13. The weight of a vessel, to be made of a *specifically* heavier matter; and that of a *specifically* lighter fluid, being given: to determine the cavity the vessel must have, to swim on the fluid.

The weight of a cubic foot of the fluid being given; the bulk of the fluid equal to the weight of the vessel, is found by the rule of three. If, then, the cavity be made a little bigger than this, the vessel will have less weight under the same bulk, than the fluid, and will therefore be *specifically* lighter than the same, and consequently, will swim. *E. gr.* Suppose it required to make an iron ball of 30 pounds weight, so as shall swim upon water. Since the weight of a cubic foot of water is 70 pound, the quantity of water equal to 30 pounds, will be found  $728'' 571'''$ ; and therefore the cube of the diameter of the sphere  $1392174''$ , whence the cube root being extracted  $1' 1'' 1'''$  is the diameter of a sphere of water of 30 pounds. If, therefore, the diameter of the cavity be made a little bigger, *e. gr.*  $1 \frac{1}{2}$  or 2 feet; so much less of the ball will be immersed as the diameter is increased.

14. The force employed to retain a *specifically* lighter solid, under a heavier fluid; and the weight lost by a heavier solid in a lighter fluid, are each added to the weight of the fluid, and weigh together with it.

The several theorems here delivered, are not only all demonstrable from the principles of mechanicks; but are conformable to experiment. In effect, experience is here found to answer exactly to calculation, as is abundantly evident from the courses of philosophical experiments, now frequently exhibited; where the laws of *specific* gravitation are well illustrated.

**SPECILLUM**, or **SPECULUM**, an instrument, wherewith surgeons search and dilate wounds, &c. See **SPECULUM**.

**SPECIOUS arithmetic**, is that branch which is conversant in quantities denoted by *species*, that is, by the letters of the alphabet.—In contradistinction to that, where the quantities are expressed by numbers, which is called *numerous arithmetic*. See **ARITHMETIC** and **CHARACTER**.

*Specious arithmetic*, is what we more usually call *algebra*. See **ALGEBRA** and **CALCULUS**.

**SPECTACLE**, **SPECTACULUM**, *shew*; some extraordinary object, which draws the view and attention; and is not beheld without some emotion, or passion of the mind.

The term is chiefly used by the ancients, for theatrical and amphitheatrical performances: for comedies, combats of gladiators, of beasts, and even for solemn processions, as those of the circus, &c. See **GAME**, **THEATRE**, **AMPHITHEATRE**, **SCENE**, **GLADIATOR**, &c.

The people of Rome were extremely fond of *spectacles*; and the Roman historians observe, there was no surer way of gaining their affections, and making parties to introduce tyranny and oppression, than by the use of *spectacles*.

**SPECTACLES**, an optic machine, consisting of two lens's set in horn, or other matter; and applied on the nose; to assist in defects of the organ of sight. See **LENS**.

Old people and all presbyters, use *spectacles* of convex lens's, to make amends for the flatness of the eye, which does not make the rays converge enough to have them meet in the retina. See **PRESBYTER**.

Short-sighted people, or myopes, use concave lens's, to keep the rays from converging so fast, through the great roundness of the eye, as to make them meet ere they reach the retina. See **MYOPS** and **MYOPIA**.

In Spain, and at Venice especially, *spectacles* are used with a different view: all the people of note and fashion there, have them continually on their noses; a folly, that has its source in the natural pride of those people, who value themselves on a profound wisdom; and affect to stare very near at every thing; as if their eyes were weakened, and wore out with excess of attention. *Vign. de Marv.*

F. Cherubin, a capuchin, describes a kind of *spectacle* telescopes, for the viewing of remote objects with both eyes; hence called *binoculi*. Though F. Rheita had mentioned the same before him, in his *Oculus Enoch* and *Eliæ*. See **TELESCOPE**.—The same author invented a kind of *spectacles*, with three or four glasses, which performed extraordinarily. *Spectacles* were certainly unknown to the ancients; yet are they not of so late a date as the telescope. Francisco Redi, in a very learned treatise on *spectacles*, will have them to have been invented in the 13th century, between the years 1280 and 1311; and adds, that Alexander Despina, a monk of the order of Predicants of St. Catherine at Pisa, first communicated the secret, which was of his own invention; upon learning, that another person had it as well as himself. This history is wrote in the chronicles of that convent.

The same author tells us, that in an old manuscript still preserved in his library, composed in 1299, *spectacles* are mentioned as a thing invented about that time: and that a famous Jacobin, one Jourdon de Rivalto, in a treatise composed in 1305, says, expressly, that it was not yet 20 years, since the invention of *spectacles*. He likewise quotes Bernard Gordon in his *Lilium medicinarum*, wrote the same year, where he speaks of a collyrium, good to enable an old man to read without *spectacles*.

Du Cange, however, carries the invention of *spectacles* far-

ther back; assuring us, that there is a Greek poem in manuscript in the French king's library, which shews, that *spectacles* were in use in the year 1150: nevertheless, the dictionary of the academy *della Crusca*, under the word *occhiale*, inclines to Redi's side; and quotes a passage from Jourdon's sermons, which says, that *spectacles* had not been 20 years in use: now Salviani has observed, that those sermons were composed between the years 1330 and 1336.

**SPECTATOR**, a person present at a spectacle. See **SPECTACLE**.

Among the Romans, **SPECTATORS**, **SPECTATORES**, more particularly denoted a kind of gladiators, who had received their discharge; and were frequently hired to be present, as *spectators*, at the combats of gladiators, &c. the people were entertained withal. See **GLADIATOR**.

**SPECULARIA**, the art of preparing, and making *specula*, or mirrors.—Or, the laws of mirrors, their phenomena, causes, &c. called also *catoptricks*. See **CATOPTRICKS**, **MIRROR**, &c.

**SPECULARIS lapis**, in natural history, is a kind of fissile stone, clear as glass; whence it is also called *Muscovy glass*; and used in several countries where it is found, for window-lights, &c. See **GLASS**.

The *lapis specularis* is a species of talc; splits easily into thin laminæ or plates; and is sometimes calcined to make a fine plaister. See **TALC**.

**SPECULATION**.—*Certitude of SPECULATION*. See **CERTITUDE**.

**SPECULATIVE geometry**, } See { **GEOMETRY**.  
**SPECULATIVE mathematics**, }  
**SPECULATIVE music**, } { **MATHEMATICS**.  
**SPECULATIVE philosophy**, } { **MUSIC**.  
**SPECULUM**, *mirror*, in optics, any polished body, im-

pervious to the rays of light: such as water in wells and deep rivers, polished metals, and glasses lined with mercury or other opaque matter, popularly called *looking-glasses*. See **LOOKING-GLASS**.

For the several kinds and forms of *specula*, plain, concave, and convex, with their theory, and phenomena, and the methods of preparing, grinding them, &c. see **MIRROR**, **GRINDING**, &c.

For the laws and effects of *specula* of various forms, see **REFLECTION**, **BURNING-GLASS**, &c.

**SPECULUM**, among surgeons, the same with *specillum*. See **SPECILLUM**.—More particularly,

**SPECULUM ani**, is an instrument, wherewith they dilate the fundament, examine sores, extract bones, or let out any peccant matter that may be there lodged.

**SPECULUM matricis**, is an instrument used to examine and dress corrupted places in the privy parts of women.—Its form is the same with that of the *speculum ani*.

**SPECULUM oris**, is an instrument serving to examine disorders in the mouth.—There are two kinds: the one common; the other bigger and stronger, fit not only to keep down the tongue; but also the lower jaw; while the mouth is surveyed, to the very extremity of the throat, and the necessary remedies applied.

**SPEECH**, the act, or art of expressing a man's thoughts, by certain signs invented for that purpose. See **SIGN**.

These signs are principally sounds made by the voice, and letters. See **VOICE**, **SOUND** and **LETTER**.

**SPEECH**, in grammar, denotes an assemblage of several words ranged in order. See **LANGUAGE**.

The grammarians generally make *eight parts of speech*; i. e. eight kinds of words used in discourse, viz. *noun, pronoun, verb, participle, adverb, conjunction, preposition, and interjection*; each of which see under its proper article, **ADVERB**, **NOUN**, **PRONOUN**, &c. See also **PART**.

F. Buffier, one of the last and best writers on grammar, only admits of three parts of speech, viz. *noun, verb* and *modificative*; which last includes the *adverb, conjunction* and *preposition*. See **MODIFICATIVE**.

**SPELL**, a kind of charm, to drive away a disease, by hanging a word or sentence on a paper about the neck. See **CHARM** and **PHYLACTERY**.

**SPELL**, in the sea language. To **SPELL**, is to let go the sheat and bowlings of a sail, and brace the weather-brace, that the sail may lie loose in the wind.

To do a **SPELL**, is to do any thing by turns, for a short time, and then leave it.

To give a **SPELL**, is to be ready to work in such a one's room.

Fresh **SPELL**, is when fresh men come to work; especially when the rowers are relieved with another gang. See **FRESH**.

**SPELLING**, that part of grammar properly called *Orthography*. See **ORTHOGRAPHY**.

Dr. Jones gives the following rules, or maxims of *spelling*.

1°. That all words were originally pronounced, as *spelt*.

2°. That in all words, whose sounds have been since altered (the origin of the difficulty of *spelling*) the alteration was made for the sake of ease, and pleasure.

And hence, 3°. All words that can be written several ways, must be *spelt* according to the hardest, harshest, and most unusual sound. See **PRONUNCIATION**.

**SPELTER**, or **SPELTRE**, *zink*; a kind of imperfect metal, which

which some mistakenly confound with bismuth, and others with spaat: others making it a sort of antimony ore. See BISMUTH, SPAAT, &c.

*Spelter* is a kind of crude, mineral lead, very hard, white and brilliant; which though not perfectly malleable, yet stretches a little under the hammer: and is otherwise called *zink*, and sometimes *tutanag*. See ZINK.

It is found in great quantity in the mines of Gosselaar in Saxony; and is ordinarily sold in large, square, thick cakes, whence one would judge it to have been melted as it came out of the mines, and cast into that figure.

It is used to purge and whiten tin, in making of pewter; much as lead is used to purify gold and silver. See TIN and PEWTER.

Those who imagine that the *spelter* is put in to increase the weight, are mistaken; since in melting five or six hundred weight of tin, they scarce put in a pound of *spelter*, and that mixed with turmeric. See ZINK.

SPERM, SPERMA, ΣΠΕΡΜΑ, the seed whereof an animal is formed. See SEED.

SPERMA-CETI, or *parma-fitty*, in pharmacy, is a whitish, flaky substance, prepared from an oil found in the head of a cetaceous fish, called by some, the *male whale*, by others *cachelot*, and by the Latins *orca*; distinguished from the common whale, by its having teeth, in lieu of whale-bone; and by a bunch on its back. See WHALE.

The ancients were great strangers to the nature of this preparation; inasmuch, that Schroder seems in doubt, whether to reckon it an animal, or mineral substance.

It had its name *sperma-ceti*, seed or sperm of whale, given it, no doubt, to raise its value, by a notion of its scarcity: the oil it is made from, is found in a large trunk four or five foot deep, and ten or twelve long, filling almost the whole cavity of the head, and seeming to supply the office of brain and cerebellum.

The method of preparing it, is a secret in the hands of a very few: the process is said to be thus.—The oil or brain being taken out of the animal, is melted over a gentle fire, and put into moulds, like those wherein sugar-loaves are formed. When cold, and drained, it is taken out and melted over again; and this they continue to do till it be well purified, and become white. It is then cut with a knife for the purpose, and reduced into flakes, such as we have it from the druggists. It must be chosen white, clear, and transparent, of a sweetish smell, which some fancy to partake of that of the violet: some sophisticate it with wax; but the deceit is discovered, either by the smell of the wax, or by the dulness of the colour. Some also sell a preparation of oil gained from the tail of the whale, instead of that from the brain; which last kind turns yellow, as soon as opened to the air. In the general, there is no merchandize that should be kept closer from the air than *sperma-ceti*.

*Sperma-ceti* is of great use in medicine. Dr. Quincy says, it is a noble remedy in the asthma, &c. though chiefly used in bruises, inward hurts, and after delivery. But it is certain, its greatest property, and that which makes it so much in vogue, is its softening the skin, and resolving tumours of the breast. Whence it comes to be used by the ladies in pastes, washes, &c.

*Sperma-ceti candles*, are of modern manufacture: they are made smooth, with a fine gloss, free from rings and scars, superior to the finest wax-candles in colour and lustre; and, when genuine, leave no spot or stain on the finest silk, cloth, or linen.

SPERMATIC, ΣΠΕΡΜΑΤΙΚΟΣ, in anatomy, something belonging to the sperm or seed. See SEMINAL.

The ancients made a general division of the parts of the animal body into *spermatic*, and *sanguineous*.—*Spermatic parts*, are those, which by their colour, &c. bear some resemblance to seed; and were supposed to be formed thereof: such are the nerves, membranes, bones, &c.—*Sanguineous* are those supposed to be formed of the blood, after conception.

But the moderns, with much better reason, hold all the parts to be *spermatic* in this sense, and either formed of the ovum of the female, or of the semen of the male. See GENERATION.

M. Andry speaks of *spermatic worms* in the human body. See WORMS.

SPERMATIC vessels, called also *vasa preparantia*, are certain vessels appointed for bringing the blood to the testicles, &c. to be secreted and prepared into seed; and for carrying back again the blood, remaining after the secretion is effected. See SEED, TESTICLE, &c.

The *spermatic vessels* are two arteries, and as many veins.

The SPERMATIC arteries arise from the fore-part of the trunk of the aorta, below the emulgents.—V. Tab. Anat. (Angeiol.) fig. 1. n. 51. (Splanchn.) fig. 1. lit. p. p. &c.

Their structure is very singular, in that, contrary to the fabric of all other arteries, which are largest at their exit from the trunk, these are smallest at their origin, and grow bigger in their progress towards the testes. By this means, the blood receives a check at its first going off for those parts, which disposes it for the future changes, &c. it is to pass.—The same end is answered in quadrupeds, by having these arteries curled and contorted in their passage like a screw.

The reason why nature has taken another method in man, Mr. Cowper observes, is, that in that case, the abdominal muscles must have been larger than they are; by which means, the intestines would have been frequently let down into the scrotum; an inconvenience which quadrupeds are secured from, by the horizontal position of their bodies.

The *spermatic arteries*, in their progress, meeting with the *spermatic veins*, enter together with them the inner lamella of the peritonæum, where, insinuating into the duplicature of the process, and being clothed therewith, they pass on to within three or four fingers breadth of the testicles, where they divide into two unequal branches; the biggest of which goes to the testicle, and is distributed therein (see TESTICLE.) And the less in the parastrata or epididymis. See PARASTATA.

The SPERMATIC veins take the same course with the arteries; only a little above the testicles, they split into several branches, which uniting, form a plexus, called *corpus varicosum pampiniforme*, or *pyramidale*. The blood returned by the *spermatic veins*, is delivered on the right side to the cava, and on the left, into the emulgent vein.—See Tab. Anat. (Angeiol.) fig. 6. n. 2.

SPERMATOCELE, in medicine, a kind of rupture, occasioned by a distention of the seminal vessels, whereby they are let fall into the scrotum.

SPHACELUS\*, or SPHACELISMUS, in medicine, a total corruption or mortification of any part, occasioned by an interception of the blood, and spirits. See MORTIFICATION.

\* The word is Greek, σφακελῶ, formed perhaps, of σφαττω. I kill.—It is sometimes, also, called *neerosis*, and sometimes *sideratio*. See NECROSIS and SIDERATIO.

*Sphacelus* is distinguished from *gangrene*, which is only a mortification begun, and, as it were, the road to a *sphacelus*, which is the state and perfection thereof. See GANGRENE. The *sphacelus* is distinguished by the lividness or blackness of the part affected; its softness, insensibility, and cadaverous smell.

Other causes of the *sphacelus*, are close ligatures, excessive colds, great inflammations, bites of mad dogs, &c.

A *sphacelous* foot, according to Aquependente, ought to be cut off in the mortified part, near the live part. When the foot is off, the dead flesh left behind, is to be consumed by the application of an actual cautery, repeated several times, till the patient feel the heat of the fire. Scultet.

SPHÆRISTERIUM, ΣΦΑΙΡΙΣΤΗΡΙΟΝ, in antiquity, the seventh part of the ancient gymnasium; being that wherein the youth practised tennis-playing. See GYMNASIUM and GYMNASTICKS.

The *sphæristerium* or tennis-court, was between the place, named *palæstra*, and that where they run races, which was between the portico's and the outer wall: though Vitruvius does not make mention of it in the description he gives of the ancient gymnasium.

The exercise here performed was called σφαίρισις, *sphæristica*, and σφαίρομαχία, *sphæromachia*, which some will have to have differed from the modern tennis; but it is not known wherein the difference consisted.

The Milesians were particularly averse to this exercise; and the Athenians as remarkably fond of it.—These latter frequently gave the freedom of their city to the *sphæristæ*, or masters in this art, by way of compliment.

SPHENOIDAL future, in anatomy, a future thus called, from its encompassing the os sphenoides, which it separates from the os frontis, the os petrosum and os occipitis. See SUTURE, CRANIUM, SPHENOIDES, &c.

SPHENOIDES, in anatomy, os cuneiforme; a bone of the head, common to the cranium, and upper jaw. See CRANIUM and MAXILLA.

It is situate in the lower part of the skull, whereof it is, as it were, the basis, and is connected to all the other members thereof, by the *sphenoidal future*.—See Tab. Anat. (Osteol.) fig. 7. n. 5.

Its form is irregular, and not easy to be described; whence some have called it *multiforme*.

It has its name *sphenoides*, from the Greek, σφην, *cuneus*, wedge; by reason of the manner of its insertion into the other bones of the skull.

In adults, it is one continued bone; but in young children, sometimes consists of three, and sometimes of four distinct pieces.

SPHENOIDES sella. See the article SELLA.

SPHENOPHARYNGÆUS, in anatomy, a pair of muscles, called also *pterygopharyngæus*, *cephalopharyngæus*, &c. See PTERYGOPHARYNGÆUS.

SPHENOSTAPHYLINUS, in anatomy, a muscle of the larynx. It descends from a round, fleshy origination, near the root of a process of the os sphenoides, and is implanted into the posterior part of the uvula, where it joins its partner.—It serves to draw the uvula upwards and backwards; and hinders the masticated aliment from passing into the foramina narium in deglutition.

SPHERE, SPHÆRA, ΣΦΑΙΡΑ, in geometry, a solid body contained under one single surface, and having a point in the middle.

middle, called the *centre*, whence all lines drawn to the surface, are equal. See SOLID, &c.

The *sphere* is supposed to be generated by the revolution of a semi-circle, A B C (*Tab. Geometry, fig. 34.*) about its diameter A C, which is also called the *axis of the sphere*, and the extrem points of the axis, A and C, the *poles of the sphere*. See CENTER, CIRCUMFERENCE, AXIS, POLE, &c. See also HEMISPHERE and PLANISPHERE.

**Properties of the SPHERE.**—1°. A *sphere* is equal to a pyramid, whose base is equal to the surface, and its height to the radius of the *sphere*.

Hence a *sphere* being esteemed such a pyramid, its cube or solid content, is found like that of a pyramid. See PYRAMID.

2°. A *sphere* is to a cylinder, standing on an equal basis, and of the same height, as 2 to 3. Hence, also, may the cube or content of the *sphere* be found. See CYLINDER.

3°. The cube of the diameter of a *sphere*, is to the solid content of the *sphere*, nearly as 300 to 157: and thus, also, may the content of the *sphere* be measured.

4°. The surface of a *sphere* is quadruple the area of a circle described with the radius of the *sphere*.—For since a *sphere* is equal to a pyramid, whose base is the surface, and its altitude the radius of the *sphere*: the surface of the *sphere* is had, by dividing its solidity by a third part of its semi-diameter. If, now, the diameter of the circle be 100, the area will be 7850; consequently, the solidity 1570000; which divided by a third of the semi-diameter, 100, the quotient is the surface of the *sphere* 31400; which is manifestly quadruple the area of the circle.

**The diameter of a SPHERE being given, to find its surface and solidity.**—Find the periphery of the circle described by the radius of the *sphere*. See PERIPHERY.

Multiply this, found, into the diameter; the product is the surface of the *sphere*. Multiply the surface by a sixth part of the diameter, the product is the solidity of the *sphere*.

Thus, supposing the diameter of the *sphere* 56, the periphery will be found 175; which multiplied by the diameter, the product 9800 is the surface of the *sphere*; which multiplied by one sixth part of the diameter, gives the solidity 919057. Or, thus;

Find the cube of the diameter 175616; then to 300157, and the cube found, find a fourth proportional, 919057. See PROPORTIONAL. This is the solidity of the *sphere* required.

For segments and sectors of *spheres*, see SEGMENT and SECTOR.

**Doctrine of the SPHERE,** } See the articles { SPHERICKS.  
**Projection of the SPHERE,** } PROJECTION.

**SPHERE of activity** of any body, is that determinate space or extent, all round about it, to which, and no farther, the effluvia continually emitted from that body, do reach, and where they operate according to their nature. See EFFLUVIA, ATMOSPHERE, &c. See also ACTIVITY.

Thus we see the magnetical effluvia have certain bounds and limits, beyond which they will have no influence to turn, or attract the needle: but where-ever a needle is placed, so as it may be moved by a load-stone, it may be said to be within the *sphere* of activity of the stone. See MAGNET.

**SPHERE**, in astronomy, that concave orb or expanse, which invests our globe, and in which the heavenly bodies, sun, stars, planets and comets, appear to be fixed, at an equal distance from the eye. See HEAVENS.

This is also called the *sphere of the world*; and is the subject of the spherical astronomy. See SPHERICAL astronomy.

This *sphere*, as it includes the fixed stars, whence we also occasionally call it, the *sphere of the fixed stars*, is vastly great. The diameter of the earth's orbit is so small, in respect of the diameter hereof, that the centre of the *sphere* is not sensibly changed by any alteration of the spectator's place in the several parts of the orbit: but still, in all the points of the earth's surface, and at all times, the inhabitants have the same appearance of the *sphere*; that is, the fixed stars seem to possess the same points in the surface of the *sphere*.

—For our way of judging of the places, &c. of the stars, is to conceive right lines drawn from the eye or the centre of the earth, through the centres of the stars, and continued thence, till they cut the foresaid *sphere*; the points where these lines terminate therein, are the apparent places of those stars. See PLACE and PARALLAX.

The better to determine the places of the heavenly bodies in the *sphere*, several circles are imagined to be described in the surface thereof; hence called *circles of the sphere*. See CIRCLE of the sphere.

Of these, some are said to be *greater*, as the ecliptic, meridian, equator, &c. others *less*, as the tropicks, parallels, &c. See GREAT, &c.

Of these, again, some are moveable, or owe their origin to the motion of the earth, &c. such are the ecliptic, secondaries of the ecliptic, &c. See each circle under its proper head; as EQUATOR, ECLIPTIC, HORIZON, &c.

**SPHERE**, in geography, &c. denotes a certain disposition of the circles on the surface of the earth, with regard to one another; which varies in various parts thereof. See EARTH.

VOL. II. N°. CXLIV.

The circles originally conceived on the surface of the *sphere* of the world, are almost all transferred, by analogy, to the surface of the earth; where they are conceived to be drawn directly underneath those of the *sphere*, or in the same planes therewith; so that were the planes of those of the earth continued to the *sphere*, they would coincide with the respective circles thereon.—Thus it is we have a horizon, meridian, equator, &c. on the earth. See HORIZON, &c.

As the equator in the heavens divides the *sphere* into two equal parts; the one north and the other south; so does the equator on the surface of the earth, divide the globe in the same manner. See EQUATOR.

And as the meridians in the heavens, pass through the poles of the horizon; so do those on the earth, &c. See MERIDIAN.

With regard, then, to the position of some of these circles in respect of others, we have a *right*, a *parallel*, and an *oblique sphere*.

**Right SPHERE**, is that where the equator cuts the horizon of the place at right angles: for the particular phenomena, &c. whereof, see RIGHT *sphere*.

**Parallel SPHERE**, is where the equator is parallel to the sensible horizon, and in the plane of the rational. See PARALLEL *sphere*.

**Oblique SPHERE**, is where the equator cuts the horizon obliquely. See OBLIQUE *sphere*.

**Armillary, or artificial SPHERE**, is an astronomical instrument, representing the several circles of the *sphere*, in their natural order; serving to give an idea of the office and position of each thereof, and to solve various problems relating thereto.

It is thus called, as consisting of a number of fasciæ or rings of brass, or other matter, called by the Latins, *armillæ*, from their resembling of bracelets, or rings for the arm.

By this, it is distinguished from the *globe*, which, though it have all the circles of the *sphere* on its surface; yet is not cut into armillæ or rings, to represent the circles simply and alone; but exhibits also the intermediate spaces, between the circles. See GLOBE.

**Armillary spheres**, are of different kinds, with regard to the position of the earth therein; whence they become distinguished into *Ptolemaic* and *Copernican spheres*: in the first whereof, the earth is in the centre; and in the latter near the circumference, according to the position which that planet obtains in those systems. See SYSTEM.

The **Ptolemaic SPHERE**, is that commonly in use, and is represented (*Tab. Astronomy, fig. 21.*) with the names of the several circles, lines, &c. of the *sphere*, inscribed thereon. See PTOLEMAIC.

In the middle, upon the axis of the *sphere*, is a ball, T, representing the earth; on whose surface are the circles, &c. of the earth. The *sphere* is made to revolve about the said axis, which remains at rest: by which means, the sun's diurnal and annual course about the earth, are represented according to the Ptolemaic hypothesis: and even by means hereof all problems relating to the phenomena of the sun and earth, are solved, as upon the celestial globe; and after the same manner; which see described under the article GLOBE.

The **Copernican SPHERE**, represented (*fig. 22.*) is very different from the Ptolemaic, both in its constitution and use; and more intricate in both. Indeed the instrument is in the hands of so few people, and its use so inconsiderable, except what we have in the other more common instruments, particularly the globe and Ptolemaic *sphere*, that we shall be easily excused the not filling up room, with any description thereof.

**Harmony of the SPHERES,** } See the articles { HARMONY.  
**Obliquity of the SPHERE,** } OBLIQUITY.  
**Rectifying of the SPHERE,** } RECTIFYING.

**Dialling SPHERE.** See the article DIALLING.

**SPHERICAL angle**, is the mutual inclination of two planes, whereby a sphere is cut. See PLANE and ANGLE.

Thus the inclination of the two planes, C A F and C E F (*Tab. Trigonometry, fig. 9.*) forms the *spherical angle* A C E. See SPHERE.

The measure of a *spherical angle*, A C E, is an arch of a great circle A E, described from the vertex C, as from a pole, and intercepted between the legs C A and C E.

Hence, 1°. Since the inclination of the plane C E F, to the plane C A F, is every where the same; the angles in the opposite intersections C and F, are equal.

2°. Hence the measure of a *spherical angle* A C E, is described with the interval of a quadrant A C or E C, from the vertex C between the legs C A, C E.

If a circle of the sphere, A E B F (*fig. 8.*) cut another C E D F, the adjacent angles, A E C and A E D are equal to two right ones; and the vertical angles A E C and D E B equal to one another. The former likewise holds of several angles formed on the same arch C E D, at the same point E. Hence, any number of *spherical angles*, as A E C, A E D, D E B, B E C, &c. made on the same point E, are equal to four right angles. See SPHERICAL triangle.

**SPHERICAL triangle**, a triangle comprehended between three  
H E e arches

Arches of great circles of a sphere, intersecting each other in the surface thereof. See TRIANGLE.

*Properties of SPHERICAL triangles.* — 1. If in two spherical triangles, (*Tab. Trigonometry, fig. 10.*)  $ABC$  and  $abc$ ,  $A=a$ ,  $BA=ba$  and  $CA=ca$ : then will  $B$  and the sides, including the angles, be respectively equal, the whole triangles are equal: that is,  $BC=bc$ ,  $B=b$  and  $C=c$ .

Again, if in two spherical triangles  $A=a$ ,  $C=c$ , and  $AC=ac$ ; then will  $B=b$ ,  $AB=ab$  and  $BC=bc$ . Lastly, if in two spherical triangles  $AB=ab$ ,  $AC=ac$ , and  $BC=bc$ , then will  $A=a$ ,  $B=b$  and  $C=c$ ; the demonstrations whereof, coincide with those of the like properties in plain triangles. The theorems of the congruency of rectilinear triangles, extending to all other curvilinear, circular, parabolical, &c. provided their sides be similar. See TRIANGLE.

2. In an equicrural triangle  $ABC$  (*fig. 11.*) the angles at the base,  $B$  and  $C$ , are equal; and if in any triangle, the angles  $B$  and  $C$ , at the base  $BC$ , are equal; the triangle is equicrural.

3. In every spherical triangle, each side is less than a semi-circle: any two sides taken together are greater than the third; and all the three sides together are less than the periphery of a great circle: and a greater side is always opposed to a greater angle, and a less side to a less angle.

4. If in a spherical triangle  $BAC$  (*fig. 12.*) two legs  $AB$  and  $BC$  taken together, be equal to a semi-circle; the base  $AC$  being continued to  $D$ ; the external angle  $BCD$  will be equal to the internal opposite one  $BAC$ .

If the two legs together, be less than a semi-circle, the external angle  $BCD$ , will be greater than the internal opposite one  $A$ : and if the legs be greater than a semi-circle, the external angle  $BCD$ , will be less than the internal opposite one  $A$ ; and the converse of all these holds, viz. if the angle  $BCD$  be equal to, greater, or lesser than  $A$ ; the sides  $AB$  and  $BC$  are equal to, greater, or lesser than a semi-circle.

5. If in a spherical triangle  $ABC$ , two sides  $AB$  and  $BC$ , be equal to a semi-circle; the angles at the base  $A$  and  $C$ , are equal to two right ones: if the sides be greater than a semi-circle, the angles are greater than two right ones; and if less, less. And, conversely.

6. In every spherical triangle, each angle is less than two right ones; and the three together, less than six right angles, and greater than two.

7. If in a spherical triangle  $BAC$  (*fig. 13.*) the sides  $AB$  and  $AC$  be quadrants; the angles at the base,  $B$  and  $C$  will be right angles. And, if the intercepted angle  $A$  be a right angle,  $BC$  will be a quadrant: if  $A$  be obtuse,  $BC$  will be greater than a quadrant; and if acute, less. And, conversely.

8. If in a spherical rectangular triangle, the side  $BC$  (*fig. 14.*) adjacent to the right angle  $B$ , be a quadrant; the angle  $A$  will be a right angle; if  $BE$  be greater than a quadrant, the angle  $A$  will be obtuse; and if  $BD$  be less than a quadrant, the angle  $A$  will be acute. And, conversely.

9. If in a spherical rectangular triangle, each leg be either greater or lesser than a quadrant; the hypotenuse will be less than a quadrant. And, conversely.

10. If in a spherical triangle  $ABC$  (*fig. 15.*) rectangular only at  $B$ , one side  $CB$  be greater than a quadrant, and the other side  $AB$  less; the hypotenuse  $AC$  will be greater than a quadrant. And, conversely.

11. If in a spherical obliquangular triangle  $ACB$  (*fig. 16.*) both angles at the base,  $A$  and  $B$ , be either obtuse or acute; the perpendicular  $CD$  let fall from the third angle  $C$  to the opposite side  $AB$ , falls within the triangle; if one of them,  $A$ , be obtuse; and the other,  $B$ , acute; the perpendicular falls without the triangle.

12. If in a spherical triangle  $ACB$ , all the angles  $A$ ,  $B$  and  $C$  be acute; the sides are each less than a quadrant. Hence, if in an obliquangular spherical triangle, one side be greater than a quadrant, one angle is obtuse, viz. that opposite to this side.

13. If in a spherical triangle  $ACB$ , two angles  $A$  and  $B$ , be obtuse, and the third  $C$  acute; the sides  $AC$  and  $CB$  opposite to the obtuse sides, are greater than a quadrant; and that opposite to the acute side  $AB$ , less than a quadrant. Hence, if the two sides be less than a quadrant, the two angles are acute.

14. If in a spherical triangle, the several sides be each greater than a quadrant; or only two of them greater, and the third equal to a quadrant; the several angles are obtuse.

15. If in an obliquangular spherical triangle, two sides be less than a quadrant, and the third greater; the angle opposite to the greatest will be obtuse, and the rest acute.

*Resolution of SPHERICAL triangles.* See TRIANGLE.

*SPHERICAL astronomy*, that part of astronomy which considers the universe, such as it appears to the eye. See ASTRONOMY.

Under *spherical astronomy*, then, come all the phenomena and appearances of the heavens and heavenly bodies, such as we perceive them; without any enquiry into the reason, the theory, or the truth thereof.—By which it is distinguished from *theoretical astronomy*, which considers the real structure of the universe, and the causes of those phenomena.

In the *spherical astronomy*, the world is conceived to be a concave, spherical surface, in whose centre is the earth, or rather the eye, about which the visible frame revolves, with stars and planets fixed in the circumference thereof. And on this supposition all the other phenomena are determined.

The *theoretical astronomy* teaches us, from the laws of opticks, &c. to correct this scheme, and reduce the whole to a juster system. See SYSTEM.

*SPHERICAL compasses.* See the article COMPASSES.

*SPHERICAL geometry*, the doctrine of the sphere; particularly of the circles described on the surface thereof, with the method of projecting the same on a plane; and measuring their arches and angles when projected. See SPHERICKS and PROJECTION.

*SPHERICAL trigonometry*, the art of resolving spherical triangles, i. e. from three parts of a spherical triangle given, to find the rest.—*E. gr.* From two sides and one angle; to find the other two angles, and the third side. See SPHERICAL triangle and TRIGONOMETRY.

*SPHERICITY*, the quality of a sphere; or that whereby a thing becomes spherical or round. See SPHERE.

The *sphericity* of pebbles, fruits, berries, &c. also of drops of water, quick-silver, &c. and of bubbles of air under water, &c. Dr. Hook takes to arise from the incongruity of their particles with those of the ambient fluid, which prevents their coalescing; and by pressing on them, and encompassing them all round equally, turns them into a round form. See DROP.

This, he thinks, appears evidently, from the manner of making small round shot of several sizes, without casting the lead into any moulds; from drops of rain being formed, in their fall, into round hail-stones; and from drops of water falling on small dust, sand, &c. which strait produce an artificial round stone; and from the small, round, red-hot balls, formed by the collision or fusion of flint and steel, in striking fire.

But all these cases of *sphericity* seem better accounted for, from the great principle of attraction; whereby the parts of the same fluid drop, &c. are all naturally ranged as near the centre as possible, which necessarily induces a spherical figure: and, perhaps, a repelling force between the particles of the drop, and of the medium, contribute not a little thereto. See ATTRACTION and REPULSION.

*SPHERICKS*, the doctrine of the sphere, particularly of the several circles described on the surface thereof; with the method of projecting the same in plano. See SPHERE, GEOMETRY, CIRCLE, &c.

The principal matters shewn herein, are as follow:

1. If a sphere be cut in any manner, the plane of the section will be a circle, whose centre is in the diameter of the sphere.

Hence, 1°. The diameter  $HI$  (*Tab. Trigonometry, fig. 17.*) of a circle, passing through the centre  $C$ , is equal to the diameter  $AB$  of the generating circle; and the diameter of a circle, as  $FE$ , that does not pass through the centre, is equal to some chord of the generating circle.

Hence, 2°. As the diameter is the greatest of all chords, a circle passing through the centre, is the greatest circle of the sphere; and all the rest are lesser than the same.

Hence also, 3°. All great circles of the sphere are equal to one another.

Hence also, 4°. If a great circle of the sphere pass through any given point of the sphere, as  $A$ ; it must also pass through the point diametrically opposite thereto, as  $B$ .

Hence also, 5°. If two great circles mutually intersect each other, the line of section is the diameter of the sphere, and therefore two great circles intersect each other in points diametrically opposite.

Hence also, 6°. A great circle of the sphere, divides it into two equal parts or hemispheres.

2. All great circles of the sphere, cut each other into two parts; and, conversely, all circles, that thus cut each other, are great circles of the sphere.

3. An arch of a great circle of the sphere, intercepted between another arch  $HIL$  (*fig. 18.*) and its poles  $A$  and  $B$ , is a quadrant.

That intercepted between a less circle  $DEF$ , and one of its poles  $A$ , is greater than a quadrant; and that between the same, and the other pole  $B$ , less than a quadrant; and, conversely.

4. If a great circle of the sphere pass through the poles of another, that other passes through the poles of this. And if a great circle pass through the poles of another, the two cut each other at right angles; and, conversely.

5. If a great circle, as  $AFBD$ , pass through the poles  $A$  and  $B$  of a lesser circle  $DEF$ , it cuts it into equal parts; and at right angles.

6. If two great circles  $AEBF$  and  $CEDF$  (*fig. 19.*) intersect each other in the poles  $E$  and  $F$  of another great circle  $ACBD$ ; that other will pass through the poles  $H$  and  $h$ ,  $I$  and  $i$  of the circles  $AEBF$  and  $CEDF$ .

7. If two great circles  $AEBF$  and  $CEDF$ , cut each other mutually; the angle of obliquity  $AEC$ , will be equal to the distance of the pole  $HI$ .

8. All

8. All circles of the sphere, as GF and LK (fig. 20.) equally distant from its centre C, are equal; and the further they are removed from the centre, the less they are. Hence, since of all parallel chords, only two, DF and EK, are equally distant from the centre; of all the circles parallel to the same great circle, only two are equal.

9. If the arches FH and KH, and GI and IL, intercepted between a great circle IMH, and the lesser circles GNF and LOK, be equal, the circles are equal.

10. If the arches FH and GI of the same great circle AIBH, intercepted between two circles GNF and IMH, be equal, the circles are parallel.

11. An arch of a parallel circle IG (fig. 9.) is similar to an arch of a great circle AE; if each be intercepted between the same great circles CAF and CEF.

Hence, the arches AE and IG, have the same ratio to their peripheries; and, consequently, contain the same number of degrees. And hence the arch IG is less than the arch AE.

12. The arch of a great circle, is the shortest line which can be drawn from one point of the surface of the sphere to another: and the lines between any two points on the same surface, are the greater, as the circles whereof they are arches, are the less.

Hence, the proper measure, or distance of two places on the surface of the sphere, is an arch of a great circle intercepted between the same.

**SPHEROID**\*, *SPHÆROIDES*, ΣΦΑΙΡΟΕΙΔΗΣ, in geometry, a solid approaching to the figure of a sphere, though not exactly round, but oblong; as having one of its diameters bigger than the other; and generated by the revolution of a semi-ellipsis about its axis.

\* The word is formed from *σφαῖρα*, *sphæra*, and *εἶδος*, *shape*.

When it is generated by the revolution of the semi-ellipsis about its greater axis, it is called an *oblong spheroid*.—And when generated by the revolution of an ellipsis about its less axis, an *oblate spheroid*.

The contour of a dome, Daviler observes, should be half a *spheroid*. Half a sphere, he says, is too low to have a good effect below. See *DOMES*.

For the solid dimensions of a *spheroid*, it is  $\frac{2}{3}$  of its circumscribing cylinder: or it is equal to a cone, whose altitude is equal to the great axis, and the diameter of the base to four times the less axis of the generating ellipsis.

Or a *spheroid* is to a sphere described on its greater axis, as the square of the less axis to the square of the greater: or it is to a sphere described on the lesser axis, as the greater axis to the less.

**SPHINCTER**\*, in anatomy; a term applied to a kind of circular muscles, or muscles in form of rings, which serve to close and draw up several orifices of the body, and prevent the excretion of the contents. See *MUSCLE*.

\* The word is formed from the Greek *σφικτήρ*, *sphictor*, or *σφιγνῆρ*, something that binds and constricts a thing very closely; these muscles having an effect much like that of a purse-string.

**SPHINCTER ani**, is a circular muscle, serving to shut the anus, and keep the excrements from coming away involuntarily. See *ANUS* and *EXCREMENTS*.

It is near two inches broad, and hangs down below the rectum, near an inch. It is fastened on the sides to the bones of the coxendix, and behind to the os sacrum: before, in men, to the accelerator urinæ, and in women, to the vagina uteri. Some would have it to be two muscles, and some three; but without much reason.

**SPHINCTER gulæ**, } See the articles { *OESOPHAGÆUS*.

**SPHINCTER labiorum**, } *CONSTRUCTOR*.

**SPHINCTER vaginae**, a constructory muscle, serving to hinder the reflux of the blood from the clitoris, &c. in coition. See *VAGINA* and *CLITORIS*.

**SPHINCTER vesicae**, is a muscle consisting of circular fibres, placed at the exit of the bladder, to prevent the perpetual dripping of the urine.—See *Tab. Anat. (Splanchn.) fig. 9. lit. A*. See also *URINE* and *BLADDER*.

It keeps the bladder constantly shut; and is only opened, when by the contraction of the abdominal muscles, the bladder is compressed, and the urine forced out.

**SPHINX**, ΣΦΙΓΞ, in sculpture, &c. a figure or representation of a monster of that name, famed among the ancients; now mostly used as an ornament in gardens, terraces, &c.

It is represented with the head and breasts of a woman, the wings of a bird, the claws of a lion, and the rest of the body like a dog.

It is supposed to have been engendered by Typhon, and sent by Juno, to be revenged on the Thebans. Its office was to propose dark, enigmatical questions to all passers-by, and if they did not give the explication thereof, to devour them.

It made horrible ravages on a mountain near Thebes, and could not by any means be destroyed, till after Oedipus had solved the following riddle: What animal is it, that in the morning walks on four legs, at noon on two, and at night on three. See *ÆNIGMA*.

Among the Egyptians, the *sphinx* was the symbol of religion, by reason of the obscurity of its mysteries. And on the same account, the Romans placed a *sphinx* in the pronæe or porch of their temples. See *MYSTERY*.

**SPICA virginis**, a star of the first magnitude in the constellation virgo. See *VIRGO*.

Its place is in the more southerly hand. Its longitude, according to Mr. Flamsteed, is  $19^{\circ} 31' 22''$ ; its latitude  $2^{\circ} 1' 59''$  south.

**SPICE**, any kind of aromatic drug, that has hot and pungent qualities: such are pepper, nutmeg, ginger, cinnamon and cloves. See *AROMATIC*, *PEPPER*, *NUTMEG*, &c.

Some also apply the word to divers medicinal drugs brought from the east; as fenna, cassia, frankincense, &c. See each under its proper article, *SENA*, *CASSIA*, &c.

*Garbler of SPICES*. See the article *GARBLER*.

**SPIDERS** *filt.*, } See the articles { *SILK*.

**SPIDERS** *web*, } *WEB*.

**SPIKENARD**, *nardus*, or *SPICA nardi*, a kind of vegetable ear growing even with the ground, and sometimes in the ground; warm, spicy, cordial and alexipharmic; and as such used in the composition of Venice-treacle. See *THERIACA*. The ear or *spica*, is about the length and thickness of a finger; very light, covered with long, reddish hairs, of a strong smell, and a bitterish, sharp taste. There rise several of these ears from the same root. The stem is small, and the root the thickness of a quill.

The *spica-nardi*, is usually reckoned in the number of roots.

—It is also called *nardus Indica*; because brought from the East-Indies.

It is accounted a stomachic, nephritic and carminative, proper to strengthen the stomach, promote the discharge of urine, and disperse flatulencies.

There is also another kind, called *spica-celtica*, growing in the Pyreneans, and the mountains of Tirol: it has much the same virtues with valerian; and is by no means of equal esteem with the former.

**SPIKING up the ordnance**, a sea phrase, used for fastening a quoin with *spikes* to the deck, close to the breech of the carriages of great guns; that they may keep close and firm to the ship's sides, and not get loose when the ship rolls, and by that means endanger the breaking out of the butt-head of a plank. See *QUOIN*.

**SPINA ventosa**, in medicine, &c. denotes a caries or rottenness of a bone. See *CARIES*.

**SPINAL marrow**. See the article *MEDULLA spinalis*.

In the history of the royal academy of sciences, for the year 1714, we have an instance of a foetus born without either brain, cerebel, or *spinal marrow*, though perfectly well formed in other respects. It had gone its natural time; lived two hours; and even gave signs of life, upon sprinkling the baptismal water on its head.—Instances of this kind, as this is not the only one we meet withal, furnish a terrible objection against the existence of the animal spirits, which should be generated in the brain, or at least in the cerebel or *spinal marrow*; and which are generally allowed of such absolute necessity in the animal œconomy. See *SPIRIT*.

**SPINAL nerves**. See the article *NERVE*.

**SPINALS**, in anatomy, a muscle on the side of the neck, arising from the five superior processes of the vertebræ of the thorax, and the inferior of the neck; and which in its ascent, becoming more fleshy, is inserted into the inferior part of the vertebræ of the neck, laterally. It serves to draw the neck backwards.

*Medulla SPINALIS*. See the article *MEDULLA*.

**SPINDLE**, in the sea language, is the smallest part of a ship's capstan, which is betwixt the two decks.

The *spindle* of the jeer capstan hath whelps to heave the viol. See *CAPSTAN*.

The axis of a wheel of a watch or clock, is also called the *spindle*, and its ends the *pevets*. See *CLOCK*, &c.

**SPINE**\*, *SPINA dorsæ*, in anatomy, the series or assemblage of vertebræ, or bones of the back, which sustain the rest of the body, and to which are connected the ribs.—See *Tab. Anat. (Osteol.) fig. 3. lit. A A. fig. 7. lit. A A*. See also the article *VERTEBRÆ*.

\* It has its name *spine*, by reason the hind part thereof is edged, or *spiny*.—Some call it the *canalis sacro*.

The *spine* is usually divided into four parts; the neck, which contains seven vertebræ; the back twelve; the loins five; and the os sacrum four. See *NECK*, *LOINS*, &c.

The *spine* includes a kind of medulla, much resembling that of the brain, hence called *medulla spinalis*, or *spinal marrow*. See *MEDULLA*.

**SPINET**, or *SPINNET*, a musical instrument, ranked in the second or third place among harmonious instruments. See *MUSIC*.

It consists of a chest or belly, made of the most porous and resinous wood to be found; and a table of fir glued on slips of wood called *summers*, which bear on the sides. On the table is raised a little prominence, wherein are placed as many pins as there are strings to the instrument.

The instrument is played by two ranges of keys, the foremost range being in the order of the diatonic scale; and the other range set backwards in the order of the artificial notes or semi-tones. See *SCALE*.

The keys are so many long, flat slips of wood, which when touched and pressed down at one end, make the other raise

a jack, which sounds the strings by means of the end of a crow's quill, wherewith it is armed. The thirty first strings are of brass, the other more delicate ones of steel or iron wires. They are all stretched over two bridges glued to the table.

The figure of the *spinnet* is a long square, or parallelogram a foot and half broad.—Some call it a *harp couched*, and the harp, an *inverted spinnet*.

The *spinnet* is generally tuned by the ear; which method of the practical musicians, is founded on this supposition, that the ear is a perfect judge of an octave and fifth. The general rule, is to begin at a certain note, as *c*, taken towards the middle of the instrument, and tuning all the octaves up and down, and also the fifths, reckoning seven semi-tones to each fifth, by which means the whole is tuned. Sometimes to the common or fundamental play of the *spinnet*, which is the great octave, is added another similar one in unison, and a third in octave to the first; to make the harmony the fuller. They are played either separately or together, which is called the *double* or *triple spinnet*. Sometimes a play of violins is added, by means of a bow, or a few wheels parallel to the keys, which press the strings, and make the sounds last as long as the musician pleases; and heighten and soften them, as they are more or less pressed. The harpsicord is a kind of *spinnet*, only with another disposition of the keys. See *HARPSICORD*.

The instrument takes its name from the little quills ends, wherewith the strings are drawn, which are supposed to resemble *spinae*, thorns.

**SPINIS.**—*Attachamenta de SPINIS & loris.* See *ATTACHAMENTA*.

**SPINNING**, in commerce, the act or art of reducing flax, flax, hemp, wool, hair, or other matter into thread. See *FLAX, HEMP, WOOL, &c.*

*Spinning*, is either performed on the wheel, or with a distaff and spindle, or with other machines proper for the several kinds of working.—Hemp, flax, nettles and other like plants are to be wet in *spinning*: silks, wools, cottons, &c. are spun dry, and do not need water; yet there is a way of *spinning* silk as it comes off the cases or balls, where hot, and even boiling water is to be used. See *SILK*.

**SPINOSISM.** See the article *SPINOZISM*.

**SPINOUS fish.** See the article *FISH*.

**SPINOZISM**, or *SPINOSISM*, the doctrine of *Spinoza*; or, atheism and pantheism proposed after the manner of *Spinoza*. See *ATHEIST*.

The great principle of *Spinozism* is, that there is nothing properly and absolutely existing, but matter, and the modifications of matter; among which are even comprehended, thoughts, abstract and general ideas, comparisons, relations, combinations of relations, &c. See *MATTER, SUBSTANCE, &c.*

Benedict *Spinoza*, or *Espinosa*, was a man well known in Holland. He was born a Jew at Amsterdam; but did not make profession of any religion, either the Jewish or Christian.—He composed several books in Latin; the most celebrated whereof, is his *Tractatus Theologico-Politicus*, wherein he overturns the foundation of all religion: the book, accordingly, was condemned by a publick decree of the states; though it has since been sold publicly, and even reprinted, both in Latin and French, in that country, and lately in English at London.

*Spinoza*, here, intimates, that all religions are only political engines, calculated for the publick good; to render the people obedient to magistrates, and to make them practise virtue and morality.

He does not here lay down his notion of the Deity openly; but contents himself with suggesting it.—In his *Ethicks*, published among his posthumous works, he is more open and express; maintaining, that God is not, as we imagine him, an infinite, intelligent, happy and perfect Being; nor any thing, but that natural virtue, or faculty, which is diffused throughout all creatures. See *NATURE*.

Numbers have undertaken to refute *Spinoza's* doctrine; but all very weakly, except what we have in Dr. Clarke's sermons at Boyle's lecture.—Witfius in Holland, Majus in Germany, and de la Mothe in England, wrote against his *Tractatus*: but Bredenbourg, according to M. Bayle, succeeded best on the subject; who, however, is said to have afterwards been a convert to *Spinozism*, and to have written a demonstration of the truth of it.—The writers against *Spinoza's Ethicks*, are Velthuyfius, in his *Tractatus de cultu naturali & origine moralitatis*: de Verfe, in *P Impie convaincu, ou dissertation contre Spinoza*: Poiret in *Fundamenta atheismi eversa*: Wittichius in *Anti-Spinoza*; Lami in *Nouvel atheisme renversé*; Jaquelot in *Dissertations sur l'existence de Dieu*: Jens in *Examen Philosophicum sextæ definitionis partis primæ Ethicæ Bened. Spinozæ*. Besides many others enumerated in Colerus's life of *Spinoza*, p. 132. Jenichen's *Hist. Spinozismi Leenhofian*, p. 58. seqq. Buddeus's *Theses de Atheismo & Superstitione*, cap. 1. § 26. and Fabricius's *Syllab. Script. de veritate religionis christianæ*, p. 357. seqq.

*Spinoza*, in his *Tractatus* above-mentioned, is very full on the subject of the authors of the scriptures; and endeavours to shew, that the Pentateuch is not the work of Moses;

contrary to the common opinion, both of the Jews, and Christians. He has also his particular sentiments, as to the authors of the other books.—This part of the work has been answered by M. Huet, in his *Demonstratio Evangelica*; and by M. Simon, in his *Hist. Crit. du vieux Test.* See *PENTATEUCH*.

*Spinozism* is a species of naturalism, or pantheism, or hylotheism, as it is sometimes called, i. e. of the dogma which allows of no other God but nature, or the universe; and therefore, makes matter to be God.—Accordingly, Buddeus, in a dissertation *de Spinozismo ante Spinozam*, proves at large, that *Spinoza's* doctrine of God and the world, is far from being his own invention, but that it had been held by many philosophers of different sects, both among the Chaldeans and Greeks.—It is certain, the opinion of the Stoicks, and those who held an *anima mundi*, was not far from it. See *ANIMA mundi*. Lucan introduces Cato discoursing thus:

*Estne Dei sedes nisi terra, & pontus, & air,  
Et cælum, & virtus? superos quid quærimus ultro!  
Jupiter est quodcumq; vides, quocumq; moveris.*

Luc. Pharf. l. 9. v. 578.

Strato likewise, and others among the Peripateticks, maintained something very like it; and what is more, though no ancient sect seems farther removed from *Spinozism* than the Platonic, as they attributed the greatest freedom to God, and carefully distinguished him from matter; yet Gundlingius has proved at large, that Plato gave matter much the same origin with *Spinoza*.—But the sect that approached nearest to *Spinozism*, was that which taught that all things were one, as Xenophanes the Colophonian, Parmenides Melissus, and especially Zeno Eleates, whence it obtained the name of the *Eleatic system of atheism*.—To the same may also be reduced the opinion of those, who held the first matter for God, as Amariacus and David of Dinantum. Add that the sect of Foe in China and Japan, that of the Soufi in Persia, and that of the Zindikites in Turkey, are found to philosophize much after the manner of *Spinoza*.

The chief articles in *Spinoza's* system are reducible to these.—That there is but one substance in nature; and that this only substance is endued with an infinite number of attributes, among which are extension and cogitation.—That all the bodies in the universe are modifications of this substance considered as it is extended; and that all the souls of men are modifications of the same substance considered as cogitative.—That God is a necessary and infinitely perfect being, and is the cause of all things that exist, but is not a different being from them.—That there is but one being and one nature; and that this nature produces within itself, by an immanent Act, all those which we call creatures.—And that this being is at the same time both agent and patient, efficient cause and subject; but that he produces nothing but modifications of himself.

Thus is the Deity made the sole agent as well as patient in all evil, both physical and moral, that called *malum pœnæ*, as well as *malum culpæ*: a doctrine fraught with more impieties than all the heathen poets have published concerning their Jupiter, Venus, Bacchus, &c.—What seems to have led *Spinoza* to frame this system, was the difficulty of conceiving either that matter is eternal, and different from God, or that it could be produced from nothing, or that an infinite and free being could have made a world such as this is.—A matter that exists necessarily, and which nevertheless is void of activity, and subject to the power of another principle, is an object that startles our understanding; as there seems no agreement between the three conditions.—A matter created out of nothing is no less inconceivable, whatever efforts we make to form an idea of an act of the will that can change what before was nothing, into real substance. Besides its being contrary to that known maxim of philosophers, *ex nihilo nihil fit*.—In fine, that an infinitely good, holy, free Being, who could have made his creatures good, and happy, should rather chuse to have them wicked, and eternally miserable, is no less incomprehensible; and the rather as it seems difficult to reconcile the freedom of man with the quality of a being made out of nothing.

These appear to have been the difficulties which led *Spinoza* to search for a new system, wherein God should not be distinct from matter, and wherein he should act necessarily, and to the extent of all his power, not out of himself [*act extra*] but within himself.—But it is certain, if the new system rescue us from some difficulties, it involves us in others much greater.—For,

1°. It is impossible the universe should be but one substance; since every thing that is extended must necessarily have parts; and what has parts must be compounded. And as the parts of extension do not subsist in each other, it follows, either that extension in the general is not substance, or that every part of extension is a different substance. Now, according to *Spinoza*, extension in general is an attribute of substance. And he allows, with other philosophers, that the attributes of substance do not differ really from the substance itself. He must therefore allow, that extension in general is substance: whence it will follow, that every part of extension is a particular substance: which overturns the whole system.

If it be objected, that *Spinoza* does not consider different bodies, as different parts of extension, but as different modifications of it: the distinction between *part* and *modification*, we doubt will hardly save him. For let him avoid the word *part* as much as he please, and substitute that of *modality* or *modification* for it, the doctrine will amount to much the same: the characters of diversity are not less real and evident, when matter is divided into modifications, than when it is divided into parts. The idea of the universe will still be that of a compound being, or an aggregate of several substances.

For proof of this, it may be observed, that modalities are beings which cannot exist without the substance which modifies them; whence it follows, that the substance must be found where-ever its modalities are found; and even that the substance must be multiplied in proportion as the number of incompatible modifications is multiplied: so that where-ever there are five or six of these modifications, there must be five or six substances. It is evident, that a square figure, and a circular figure are incompatible in the same piece of wax. Whence it follows, that the substance modified by the square figure cannot be the same substance with that modified by the round figure. So when I see a round and a square table in a room, I may safely assert, that the extension which makes the subject of the round table is a distinct substance from the extension which is the subject of the square table: since otherwise it would follow, that the square and round figures might be found in the same subject at the same time. —The subject, therefore, that is modified by two figures, must be two substances.

2°. If it be absurd to make God extended, as this robs him of his simplicity, and makes him be composed of parts; it is still worse to reduce him to the condition of matter, the lowest of all beings, and that which most of the ancient philosophers ranked immediately above nothing: matter! the theatre of all sorts of changes, the field of battle of contrary causes, the subject of all corruptions and generations; in a word, the being most incompatible with the immutability of the Deity!

The *Spinozists*, indeed, maintain, that it is not susceptible of any division; but the argument they alledge in proof of it, we have elsewhere shewn to be false: it is, that for matter to be divided, it is necessary that one of the parts be separated from the other by a void space, which is impossible: since there is no vacuum in nature. See *VACUUM*.

3°. If *Spinozism* appear extravagant when we consider God as the subject of all the mutations, corruptions and generations in bodies; it will be found still worse, when we consider him as the subject of all the modifications of thinking. It is no small difficulty, to unite extension and thinking in the same substance; since it is not an union like that of two metals, or of water and wine, that will serve the purpose: these last require only juxtaposition; whereas to combine thinking and extension requires an identity; thinking and extended are two attributes identified with the substance; and consequently are identified with each other, by the fundamental rule of all logic.

Again, when we say, that a man *denies this, affirms that, likes that, &c.* we make all those attributes fall on the substance of his mind, not on his thoughts, which are only accidents or modifications of it. If therefore what *Spinoza* advances be true, that men are modalities of God; it would be false to say, *Peter denies, likes, wills, &c.* since in reality, on this system, it is God that denies, wills, &c. and consequently all the denominations which arise from the thoughts, desires, &c. of men, fall properly and physically on the substance of God. From whence it also follows, that God affirms and denies, loves and hates, wills and nills the same thing, at the same time, and under the same conditions: contrary to the great principle of reasoning: *opposita sunt quæ & neg; de se invicem, neg; de eodem tertio secundum idem, ad idem, eodem modo atq; tempore verè affirmari possunt*; which must be false, if *Spinozism* be true: since it cannot be denied but some men love and affirm what others hate and deny, under all the conditions expressed in the rule.

4°. But if it be physically absurd, to say the same subject is modified at the same time with all the different thoughts of all men; it is horrible when we consider it in a moral light. Since it will follow, that the infinite, the all-perfect Being is not constant, is not the same one moment, but is eternally possessed even with contrary passions; all the uniformity in him in this respect, will be, that for one good and wise thought he will have twenty foolish and wicked ones. He will not only be the efficient cause of all the errors, iniquities and impurities of men, but also the passive subject of them, the *subjectum inhaerens*. He must be united with them in the closest manner that can be conceived, even by a penetrative union, or rather an identity, since the mode is not really distinct from the substance modified.

**SPINSTER**, in law, an addition usually given to all unmarried women, from the viscount's daughter downwards. See *ADDITION*.

Yet Sir Edward Coke says, *generosa* is a good addition for a gentlewoman; and that if such a person be named *spinster*

VOL. II. N°. CXLV.

in any original writ, appeal or indictment, she may abate and quash the same. See *GENTLEMAN*.

Spelman says, that anciently, even queens used the distaff and spindle; whence *spinster* became a common appellation for all women. See *WOMAN*.

**SPIRACLE**. See the article *VENT*.

**SPIRAL**, in geometry, a curve line, of the circular kind, which in its progress recedes from its centre; as in winding from the vertex, down to the base of a cone. See *SPIRE*. It is called from its inventor, *Archimedes's spire*, or *helix*; and is thus described. — Divide the periphery of a circle *A P p A* (*Tab. Geometry, fig. 39.*) into any number of equal parts, by a continual bisection in the points *p*. Into the same number of parts divide the radius *CA*, and make *CM* equal to one part, *Cm* to two parts, &c. — Then will the points *M m, m, &c.* be points in the *spiral*, which connected, will give the *spiral* itself.

This is more particularly called the *first spiral*, and the space included between its centre, and the point *A*, the *spiral space*. This first *spiral* may be continued to a *second spiral*, by describing another circle with double the radius of the first; and the second may be continued to a *third*, by a third circle, &c.

Hence, 1°. *AP* is to the periphery, as *Cm* to the radius. Wherefore, if the periphery be called *p*, the radius *AC=r*, *AP=x*, *PM=y*; then will *CM=r-y*: consequently as *p:r::x:r-y*, we shall have *pr-py=rx*.

2°. If *CM=y*; then will *rx=py*. Which equation the *spiral* has in common with the quadratrix of *Dionysius*, and that of *Tschirnhausen*; and therefore *r^n x^n = p^n y^n* will serve for infinite *spirals* and quadratrices. See *QUADRATRIX*.

3°. The lines *M m, M m, &c.* are to one another as the arches of the circle, intercepted between *MA* and those lines: and when continued, making equal angles with the first and second *spiral*, are in arithmetical proportion.

4°. Lines drawn from *M* to the second *spiral*, are to each other as the said arches, together with the whole periphery added on both sides.

*Quadrature of SPIRALS*, } See { *QUADRATURE*.  
*Logistic SPIRAL*, } See { *LOGISTIC*.

**SPIRAL**, in architecture and sculpture, denotes a curve that ascends, winding about a cone or spire; so as all the points thereof continually approach the axis. See *AXIS*.

By this it is distinguished from the *helix*, which winds after the same manner, around a cylinder. — Ignorant architects confound the two: but the more knowing distinguish them carefully. See *HELIX*.

The *spiral* line may be conceived to be thus generated. — If a right line, as *AB* (*Tab. Geometry, fig. 40.*) having one end fixed at *B*, be equally moved round, so as with the other end *A*, to describe the periphery of a circle; and at the same time, a point be conceived to move forward, equally from *B* towards *A* in the right line *AB*, so as that the point describes that line, while the line generates the circle: Then will the point, with its two motions, describe the curve *B, 1, 2, 3, 4, 5, &c.* which is called a *spiral line*, and the plain space contained between the *spiral line*, and the right line *BA*, is called the *spiral space*.

Again, if the point *B* be conceived to move twice as slow as the line *AB*; so that it shall get but half way along *BA*, when that line shall have formed the circle; and if then, you imagine a new revolution to be made of the line carrying the point, so that they shall end their motion at last together; there will be formed a double *spiral line*; as in the figure: from the manner of which, may be easily drawn these corollaries.

1. That the lines *B 12, B 11, B 10, &c.* making equal angles with the first and second *spiral* (as also *B 12, B 10, B 8, &c.*) are in arithmetical proportion.

2. The lines *B 7, B 10, &c.* drawn any how to the first *spiral*, are to one another as the arches of the circle intercepted betwixt *BA*, and those lines: because whatever parts of the circumference the point *A* describes, as suppose 7, the point *B* will also have run over 7 parts of the line *AB*.

3. Any lines drawn from *B* to the second *spiral*, as *B 18, B 22, &c.* are to each other, as the aforesaid arches, together with the whole periphery added on both sides: for at the same time that the point *A* runs over 12, or the whole periphery, or perhaps 7 parts more, shall the point *B* have run over 12, and 7 parts of the line *AB*, which is now supposed to be divided into 24 equal parts.

*Proportional SPIRALS*, are such *spiral* lines as the rhumb lines on the terrestrial globe, which, because they make equal angles with every meridian, must also make equal angles with the meridians in the stereographic projection on the plane of the equator; and therefore will be, (as Dr. Halley observes) *proportional spirals* about the polar point. — From whence he demonstrates, that the meridian line, is a scale of log-tangents of the half meridian complements of the latitudes. See *RHUMB* and *LOXODROMIC*.

*SPIRAL stairs*, in building. See *STAIRS*.

**SPIRATION**. See *EXPIRATION*, *INSPIRATION*, *PER-SPIRATION*, *RESPIRATION* and *TRANSPIRATION*.

**SPIRE**\*, **SPIRA**, in the ancient architecture, is sometimes used for the base of a column; and sometimes for the astragal or tore. See **BASE**, **ASTRAGAL** and **TORE**.

\* The word is formed from the Latin, *spira*, the folds of a serpent, which when laid, bear some resemblance thereto; or from the Greek, *σπῖρα*, the coil of a rope.

**SPIRIT**, **SPIRITUS**, in medicine, the most subtle and volatile part, or juice of the body; by means whereof, all the functions, and operations thereof are supposed to be performed. See **BODY**, **PART**, **FLUID**, &c.

The ancients made a four-fold division of *spirits*; into *vital*, *animal*, *natural* and *genital*: whereof, the first they placed in the heart; the second in the brain; the third in the stomach and liver; and the last in the testicles: but as this division is founded on a false hypothesis, it is now deservedly set aside.

The moderns usually divide *spirits* into *vital* and *animal*.

**Vital SPIRITS**, are only the finest, and most agitated parts of the blood; whereon its motion, and heat depend. See **BLOOD** and **VITAL**.

**Animal SPIRITS**, are an exceedingly thin, subtle, moveable fluid juice or humour separated from the blood in the cortex of the brain, hence received into the minute fibres of the medulla, and by them discharged into the nerves, by which it is conveyed through every part of the body, to be the instrument of sensation, muscular motion, &c. See **SENSATION**, **MUSCULAR motion**, &c. See also **ANIMAL**.

The *animal spirits*, called also *nervous spirits* and *nervous juice*, only differ from the *vital spirits*, in that these last are still mixed and blended with the grosser parts of the blood, and circulate along with it: whereas, the *animal spirits* are secreted thence by the glands whereof the cortical substance is composed; and have a motion, circulation, &c. peculiar to themselves. See **CIRCULATION**.

Dr. Willis conceives, that the *animal spirits* are prepared by a proper distillation of the subtlest part of the arterial blood, brought by the carotides into the cortex of the brain; and shews, that the blood contained in the sinus's of the dura mater, acts in this distillation in the same manner as fire does in the chymical distillations performed by defluxion, where being placed over the matter to be distilled, it makes the subtlest parts thereof descend.

The existence of the *animal spirits* is controverted: but the infinite use they are of in the animal œconomy, and the exceedingly lame account we should have of any of the animal functions without them, will still keep the greatest part of the world on their side. And, in effect, the learned Boerhaave has gone a good way towards a demonstration of their reality.

The blood brought to the brain by the carotides, and vertebral arteries, he shews, is wonderfully prepared, secreted, elaborated and changed from its natural state, ere it arrives there; inasmuch as, contrary to the nature of the rest, instead of cohering by fire, it immediately resolves wholly into a thin vapour, without any fæces behind. And is thus exceedingly well fitted for the formation of so extraordinary a fluid.

He shews further, that the *animal spirits* are not formed from the cruor, but the serum of the blood, which Malpighi's history of the growth of the fœtus in an incubated egg, shews to be divisible into parts or corpuscles inconceivably smaller than the cruor.

He adds, that the nature of this juice is such, as that no salts or oils in the body can contribute any thing to it; and that in all appearance, it is only a most subtle, pure water; which liquor is found to resemble these *spirits* in its extraordinary miscibility, mobility, solidity, softness, simplicity and want of elasticity.

The same author shews further, from the magnitude of the carotides and vertebrals, their streight uninterrupted course, the great quantity of blood they bring, the bulk of the cortex, &c. that there must be a very great quantity of this liquor; that there is fresh prepared every moment of life; and that it is driven, every moment, by the action of heat, &c. from the brain and cerebel, to all the parts of the body furnished with nerves; which motion, he shews from the exceeding fineness, crookedness, &c. of the ramifications, must be very gentle, equable and constant, one part continually driving before it another.

Upon the whole, it is no wonder this fluid escapes the notice of our senses; and that no ligatures, wounds, punctures, injections or the like, make either it or the apertures of the nerves through which it flows, visible: nor does it avail, what some who allow the existence of the *animal spirits*, urge against their being any coherent juice or liquor, viz. that we should find it ooze out and wet the adjacent parts, upon cutting a nerve, as we do in cutting a lymphatic, &c. or that upon binding a nerve, the upper-part would swell; that the agitations which objects make on the filaments, would be deadened, &c. that it is impossible a liquor should have two opposite motions at the same time; and that the velocity of the sensations, and rapidity of the motions of man, prove, that the *animal spirits* are rather an aura or even light than a liquor. *Mem. de Trev.*

For the secretion of the *animal SPIRITS* from the blood, and

the apparatus in order thereto. See **BRAIN** and **SECRETION**.

—For the course of the *animal SPIRITS*, and the vessels through which they are carried, see **NERVE** and **CIRCULATION**.—For the office of the *animal SPIRITS* in muscular motion and sensation, see **MUSCULAR** and **SENSATION**.

**SPIRIT**, **SPIRITUS**, in the Newtonian physicks, denotes a most subtle, penetrative substance, which pervades all, even the densest bodies, and lies hid therein; by the force and action whereof, the particles of bodies attract each other, at very small distances, and when contiguous, cohere: and by which electrical bodies act at greater distances, both attracting and repelling the neighbouring corpuscles; and light is emitted, reflected and inflected, and warms bodies; and all sensation is excited; and the members of animals moved at the instance of the will, viz. by vibrations of this *spirit*, propagated through the solid capillaments of the nerves, from the external organs of sense to the brain, and from the brain to the muscles. See **MEDIUM**, **NEWTONIAN**, **HEAT**, **LIGHT**, **VACUUM**, **ATTRACTION**, **SENSATION**, &c.

**SPIRIT**, in chymistry, is one of the principles of natural bodies; called also *mercury*. See **PRINCIPLE** and **MERCURY**.

The chymical principle *spirit*, is a fine, subtle, volatile, penetrating, pungent liquor, which rises ordinarily before the phlegm or water, and sometimes after it.

The great properties of this liquor are, that it penetrates and opens solid bodies, corrodes, breaks, and even dissolves certain mixt bodies, coagulates others, and produces an infinity of other effects, many of them even contrary to one another.

In the general, the chymists give the denomination *spirits* to all the fine, subtle, not-aqueous particles, raised from bodies by heat, and reduced into liquors by distillation.—Such are *spirit of vitriol*, of nitre, of salt, &c.

They also apply the name *spirits*, to those aqueous liquors which are drawn by liquefaction, when they are impregnated with salts, or other active principles, raised, together with them, by the violence of the fire.

These, when they excite any sensation of heat on the tongue, are particularly called *acid*, or *sharp spirits*. See **ACID**.

When they make any erosion on the tongue, they are called *corrosive spirits*. See **CORROSIVE**.

Such as taste somewhat like common salt, are called *saline spirits*. See **SALT**.

Such as partake of the taste of common sulphur, *sulphurous spirits*. See **SULPHUR**.

And when this taste is very strong, *urinous spirits*. See **URINOUS**.

Such as take fire readily, *inflammable* or *ardent spirits*. See **INFLAMMABLE** and **ARDENT**.

Such where the acid predominates, though qualified with a little sulphur, &c. are called *mixt spirits*.

In this sense, the chymists are said to draw a *spirit* from sulphur, salt and other bodies, when they extract the essence, or the subtlest part thereof, by distillation or otherwise. See **DISTILLATION**, &c.

**SPIRITS**, is also a general name among distillers, for all distilled liquors that are neither oil, nor phlegm. See **DISTILLATION**, &c.

**SPIRIT of wine**, is only brandy rectified once or more times, by repeated distillations. See **BRANDY** and **RECTIFIED**.

One may likewise make a perfect rectification of brandy into *spirit of wine*, at one single distillation, by using a chymical instrument consisting of several cucurbites, described by Glafer. See **RECTIFICATION**.

*Spirit of wine* is used in dying, as a non-colouring drug, and though giving no colour itself, serving to prepare the stuffs to receive other colours. See **DYING**.—Its consumption is also very considerable in several other works and manufactures; particularly the making of varnish. See **VARNISH**.

**Ætherial SPIRIT of wine**, (called by some *vegetable æther*, or the *æther of plants*) is a denomination given, by some modern chymists, to a liquor endued with very extraordinary properties; prepared from spirit of wine, and oil of vitriol.

Dr. Frobenius, who first brought it into England, describes it as the purest fire, yet at the same time a most fluid water. Being poured on the hand, it feels cold; yet is so inflammable, that it catches fire and kindles even at a considerable distance from a candle. It is extremely light, and miscible with water, yields an aromatic smell, and is so volatile, and evaporates so fast, that it scarce seems to wet the finger dipped in it. *Vid. Phil. Trans. n. 413. p. 283. Mem. Acad. R. an. 1734, p. 56.*

Phosphorus being dissolved in this liquor, and the solution poured into a tub of warm water, a blue flame is produced, with smoke, and a small degree of warmth.

Some of this *ætherial spirit of wine*, being poured into a tub of cold water, is set on fire and yields a copious flame by the touch of the point of the operator's sword\*.—After the deflagration, the water is found cold. *Vid. Phil. Trans. n. 428, p. 55, 58.*

\* But it must be observed, that the sword is first privately warmed,

ed, and in applying it, the point is dexterously rubbed against a bit of phosphorus lodged for the purpose on the side of the tub.—What pity to see chymistry debased with legerdemain!

**SPIRIT of sulphur**, is a spirit drawn from sulphur set on fire; the most subtle part whereof, is converted into a liquor, by sticking to a glass bell suspended over it, whence it falls drop by drop, into a trough, in the middle whereof is placed the stone pot wherein the sulphur is burnt. See SULPHUR.

This spirit is held specific for the same diseases as spirit of vitriol. See SPIRIT of vitriol.

**SPIRIT of salt**, is a yellow liquor drawn, by chymistry, from sea salt. See SALT.

The best, is that prepared in England. It is much used in medicine; but has not, perhaps, all the virtues ascribed to it. The common spirit of salt, being very corrosive, may be dulcified, by letting it digest three days in a gentle sand heat, with an equal quantity of spirit of wine mixed therewith. See DULCIFYING, FRESH-water, &c.

**SPIRIT of vitriol**, is vitriol dried in the sun, or in defect thereof, by the fire, and then distilled by chymical operations several times repeated; first by a reverberatory fire, and then in balneo Mariæ. See VITRIOL.

It is held excellent against the epilepsy, as well as against burning and malignant fevers.—The last spirit drawn from vitriol, and which is improperly called oil of vitriol, is used in the dissolution of metals and minerals.

**SPIRIT of amber**, } See the articles } AMBER.

**SPIRIT of sal armoniac**, } See the articles } ARMONIAC.

**SPIRIT**, is also used for any incorporeal being, or intelligence.—In which sense, God is said to be a spirit: angels are spirits; the devil, an evil spirit. See GOD, ANGEL, DEVIL, &c.

In this sense, the human soul is also called a spirit, from its thinking and reflecting powers, which cannot be conceived to reside in any thing material. See SOUL.

F. Malebranche observes, it is extremely difficult to conceive what it is, should make the communication between the body and the spirit; for if the spirit have no material parts, it cannot move the body: but the argument must be false some how or other; for we believe that God can move bodies, and yet do not attribute any material parts to him.

**SPIRIT**, in theology, is used by way of eminence, for the third Person in the holy trinity: called the Spirit, Holy Spirit, or Holy Ghost. See TRINITY and PERSON.

The Macedonians, &c. deny the divinity of the Spirit: the Socinians his existence: the Arians his co-equality with the Father. See ARIANS, SOCINIANS, &c.

Divines express the manner wherein the Spirit was produced, by an active spiration or breathing of the Father and the Son; whence the denomination *spiritus*, q. d. breath.

**Order of the holy SPIRIT**. See HOLY Ghost.

**SPIRIT**, is also used among divines, for the divine power, and virtue; and the communication thereof to men.

In this sense, the Spirit is said to have gone out on the face of the deep, Gen. i. 2. And the prophets to have been possessed with the Spirit of God.—Providence, in this sense, is that universal Spirit whereby God makes all nature to act. Thus the holy virgin is said to have conceived of the Spirit.

**Private SPIRIT**, is a term that made a great figure in the controversies of the two last centuries. It signifies the particular sense or notion each person has of the dogmata of faith, and the truths of religion, as suggested by his own thoughts, and the persuasion he is under with regard thereto.

The first reformers denying strenuously any infallible interpreter of the scripture, or any settled judge of controversies; maintained, that every person was to interpret and judge of revealed truths, by his own light, assisted by the grace of God; and this was what they called *private spirit* or judgment. Against this, the arguments used by the Romanists are, that revealed truths being one and the same for all believers; the rule God has given us for judging of them, ought to represent them to us uniformly and the same; but the *private spirit* informs Luther one way, and Zuinglius another. It divides Oecolompadius, Bucer, Osiander, &c. And the doctrine it discovers to the Confessionites, is quite different from that it shews the Anabaptists and Mennonites, in the very same passage of scripture.

**SPIRIT**, *Spiritus*, is also used in prosody, to signify the greater, or less degree of breath employed in the pronunciation of the initial Greek vowels, and of the letter  $\varsigma$ . See ASPERATE.

In founding the vowels we may observe, every vowel has its sound by a simple conformation of the mouth; wherein the breath has little or no concern, as being confined in the arteria aspera: The spirits or breaths, which are placed on the initial vowels in words, are to denote the force this initial vowel is to have from the breath, when the word is pronounced. If the sound of this vowel be smooth, as all the sounds of the vowels naturally are, this is termed *spiritus lenis*, a mild breath; but, if this vowel be to be pronounced with a more vehement expulsion of the air, this is termed *spiritus asper*, or a rough breath or asperate; and when the asperate and acute are in the same syllable, the mark of the breath in this initial vowel only signifies that the vowel is

to be pronounced with a stronger breath than the initial mild vowels; for asperates do not alter the tone of any syllable, but only strengthen, increase and swell the tone.

**Art of SPIRITS**, } See the articles } ART.

**Modes of SPIRIT**, } See the articles } MODE.

**SPIRITUALITIES** of a bishop, are such profits as arise to him from the benefit of his jurisdiction in his diocese, and not as a baron of parliament. See BISHOP and TEMPORALITIES.

Such are those of his visitations, institutions, ordinations, presentation money, &c. See VISITATION, &c.

**Guardian of the SPIRITUALITIES**. See GUARDIAN.

**SPIRITUALIUM custos**. See the article CUSTOS.

**SPIRITUALIZATION**, in chymistry, the action of extracting spirits from natural bodies. See SPIRIT.

*Spiritualization*, is an operation that belongs principally to fermented salts; then to fermented juices and liquors; the fermentation rendering the spirits volatile and inflammable. See FERMENTATION.

Spirit of wine is sometimes *spiritualized* to that degree, that upon throwing a quantity into the air, not a drop shall fall down; but the whole evaporate and be lost.

**SPIRITUS aceti**, See the article ACETUM.

**SPITTLE**. See the article SALIVA and SPUTUM.

**SPITTLE**, a corruption of the word *hospital*. See HOSPITAL.

**SPLAIT shoulder**; see the article SHOULDER.

**SPLANCHNOLOGY**\*, in anatomy, a discourse, or explication of the viscera.—See *Tab. Anat.* p. 3. where the object of this branch is represented; see also VISCERA.

\* The word is formed from the Greek, *σπλᾶγχνον*, viscus, intestine, and *λογία*, discourse.

Sarcology is divided into three parts, viz. *splanchnology*, *myology*, and *angiology*. See SARCOLOGY.—*Splanchnology*, is that which treats of the internal parts, and particularly the viscera.

**SPLEEN**, ΣΠΛΗΝ, *lien*, in anatomy, a soft, spongy, viscus, of a darkish red, or rather livid, colour, ordinarily resembling the figure of a tongue, though sometimes triangular, and sometimes roundish.—See *Tab. Anat.* (Splanchn.) fig. 1. lit. m.

The spleen is usually single, though sometimes there are two, and sometimes three found. It is situate in the left hypochondrium, between the spurious ribs and the stomach; is somewhat convex on the side towards the former, and concave towards the latter. Its ordinary length is six inches; breadth three, and thickness one. It is connected to the omentum, and, by means of that and the blood vessels, to the stomach and left kidney, and sometimes to the diaphragm.

It is covered with two tunics; the external derived from the peritonæum, and connected to the internal only by intervention of the blood vessels. The inner consists of fibres very curiously interwoven. From this, probably, are derived those innumerable cells or little bladders, which make up the main bulk of the spleen: though Malpighi rather takes them to arise from the venous duct. The cells communicate with each other, and discharge themselves into the trunk of the splenic vein. Their inside, according to Malpighi, is furnished with various minute glands adhering together; six, seven, or eight whereof form a kind of small conglomerate glands, wherein the arteries and veins seem to terminate.

Its blood vessels are the splenic artery, which furnishes it with blood, from the cœliac; and the splenic vein, which carries it thence, by the porta, to the liver. See SPLENIC.

Its nerves come from the plexus lienaris, near the bottom of the stomach. The vessels are all, so soon as they enter the spleen, wrapt up in one common capsula or membrane, and plentifully distributed together throughout the substance of the spleen. Besides these, are lymphatics in great abundance. The anastomoses between the arteries and veins of the spleen, are more apparent than in any other part of the body. And this viscus is observed to be furnished with a greater proportion of blood than any other parts. See ANASTOMOSIS.

The use of the spleen has been disputed in all ages; both, as no immediate use thereof appears from dissection, and as we find, that animals from whom it has been cut, live very well without it. All the effects, *e. gr.* following the cutting it from a dog, are, that the animal grows more salacious than usual; that it urinates more frequently; is more hungry than ordinary; and for the first days is troubled with a vomiting and nausea. It is added, that it is necessary the part be taken away to make a good runner.

Hence some have imagined that the spleen only served to make a balance in the weight of the body; others, that it was only intended for the sake of symmetry; others hold it an useless load, and one of nature's redundances; others, a pit, or common-shore, to discharge the fæces of the blood into; others a fire, by the heat whereof, the action of the stomach is animated.

Many of the ancients took it to be the receptacle of the atrabilis, or melancholic humour; for which reason, some of them

them call it the *organ of laughter*. See LAUGHTER, HYPOCHONDRIAC, &c.

Mr. Cowper, from the great quantity of blood, and the apparent inoculations of the *spleen*, draws a very natural conjecture of the use thereof; at least of the peculiar mechanism. He takes, then, the *spleen* to be only a subordinate organ, ministering to the circulation; and thinks, that by this congress of the arterial and venal blood, an impetus is communicated to the latter; by which its progress through the ramifications of the porta to the cava, is promoted, which would otherwise be so broke by the double ramifications of the porta, as to want strength sufficient to carry to the heart. See CIRCULATION.

The action or effect of the *spleen*, according to Dr. Boerhaave, is to receive the fresh arterial blood, prepare it in its glands, and pour it into its cells; to return what blood is left from this action, to the little veins, and thence to the splenic vein; to mix the humour thus prepared, with the nervous juice, and to prepare, attenuate, and more intimately unite them together into one humour.

Malpighi, and afterwards Dr. Keil, and some others, take the *spleen* to be a viscus assistant to the liver, in the secretion, &c. of the bile. We have observed, that by reason of the nearness of the liver and heart, and the swift motion of the blood in the aorta, a humour consisting of particles that combine so slowly as those of the bile do, could not be prepared but by bringing the blood round about through the stomach, intestines and omentum, &c. to the liver, to abate its velocity.

Now Dr. Keil conjectures, that those parts were not sufficient to receive all the blood necessary to be sent to the liver; therefore nature framed the *spleen*, into whose cavities the blood being poured from a small artery, moves at least as slowly as any that passes otherwise to the liver; by which means the particles that compose the bile in the blood which passes through the ramus splenicus, by so long and slow a circulation, have more chances for uniting than otherwise they would, had they been carried by the branches of the coeliac directly to the liver; consequently without the *spleen*, such a quantity of bile as is now secreted, that is, as nature requires, could not have been separated by the liver. See BILE; see also LIVER.

SPLEEN is also used for a disease, by physicians more usually called the *hypochondriac disease*. See HYPOCHONDRIAC, and VAPOURS; see also SPLENETIC.

SPLENETIC, ΣΠΛΗΝΙΚΟΣ, a person affected with opilations and obstructions of the spleen. See SPLEEN.

In *splenetic* people, the spleen is swelled beyond the natural bulk, or hardened so as to shew a scirrhus tumour thereon.

*Splenetic* people are distinguished by a livid, lead-coloured complexion; their character is to be very prone to laughter; which is an expedient nature is supposed to make use of, to evacuate the too redundant humour the spleen is charged withal: whence it is that the ancients made the spleen the organ of laughter; and hence that popular saying of a person laughing heartily, that he *vents his spleen*. See LAUGHTER.

SPLENETIC waters; see the article WATER.

SPLENIC vessels, a large artery, and vein of the spleen. See SPLEEN.

The SPLENIC artery, *arteria SPLENICA*, is a trunk of the left coeliac, serving to bring the blood from that artery to the spleen, to be there secreted, prepared, &c. Its progress is very much contorted; and after its arrival at the surface of the spleen, it is diffused through the substance thereof in small branches, which seem to terminate in the cells.

The SPLENIC vein, *vena SPLENICA*, is formed out of the several minute veins of the spleen, uniting as they quit the surface thereof. It carries the blood secreted, &c. in the spleen, to the left branch of the vena porta, to be thence conveyed to the liver, there to be further prepared and converted into bile. See LIVER and BILE.

The *splenic vein* and artery manifestly communicate with each other: for water being poured into one of them, presently discharges itself by the other. See SPLEEN.

SPLENI, in anatomy, a pair of muscles, called also from their form *triangulares*.—See *Tab. Anat. (Myol.) fig. 2. \*. fig. 6. n. 5. fig. 7. n. 6.*

They arise from the four upper spines of the vertebræ of the back, and from the two lower of the neck, and ascending obliquely, adhere to the upper transverse processes of the vertebræ of the neck, and are inserted into the upper part of the occiput. They pull the head backwards to one side, and are called *spleni*, from a supposed resemblance to an ox's spleen.

SPLINT, or SPLINT, among farriers, a callous, insensible excrescence, or gristle, that sometimes sticks to an horse's shank bone; generally on the inside, below the knee.

If there be one opposite thereto on the outside, it is called a *pegged or pinned splint*, because it does, as it were, pierce the bone, and is extremely dangerous: some call this a *double splint*, and others a *thorough splint*.

SPLENTS, in surgery, pieces of wood used in binding up broken limbs. See FERULA.

The word is also used for the pieces of a fractured bone.

SPLICE, at sea.—They say, a cable or rope is *spliced*, when the ends of two pieces being untwisted, the several strands are wrought into one another by a fidd.

Also, when an eye is to be made at the end of a rope, the ends of the strands, are, by a fidd, drawn into the ends of the other rope strands; and this is called a *splice*.

To SPLICE, among gardeners, is to graft the top of one tree into the stock of another, by cutting them sloping, and fastening them together. See ENGRAFTING.

SPLINT. See the article SPLENT.

SPODIUM, in pharmacy, a kind of metalline calx, or ashes, esteemed cardiac, and by some held to have the same virtues with coral. See CORAL.

The *spodium* of the ancient Greeks was a greyish kind of recrement, found in form of ashes on the hearths of furnaces wherein brass was made; called by them σπ. διορ, which literally signifies *ashes*.

*Spodium* is a metalline powder, nearly z-kin, both in origin and use, to tutia and pompholyx; only heavier than either. See TUTTY and POMPHOLYX.

The *spodium* of the Arabian physicians, as Avicenna and others, was made of the burnt roots of rushes, and reeds.

Some moderns also make a *spodium* of ivory burnt and calcined to a whiteness.—It is sometimes counterfeited by burning bullocks or dogs bones; but these are of no value.

The *anti SPODIUM*, which the ancients substituted for their *spodium*, was made of myrtle leaves, galls, and some other ingredients, calcined.

SPOILS, SPOLIA, whatever is taken from an enemy in war. Among the Greeks, the *spoils* were divided in common among the whole army; only the general's quota was the biggest.

By the military discipline of the Romans, the *spoils* belonged to the republic; particular persons had no title to them; and such of the generals, as valued themselves on their probity, always carried them to the public treasury.—Sometimes, indeed, the pillage was distributed by the general among the soldiery, to encourage them, or to reward them: but this was not done without a world of prudence and reservedness, otherwise it came under the crime of Peculate.

The consuls Romulus and Veturius, were condemned for having sold the *spoils* taken from the Æqui. Livy, lib. 8.

SPONDAULA\*, ΣΠΟΝΔΑΥΛΗΣ, in antiquity, a player of the flute, or other wind instrument of that kind, who, during the offering of sacrifice, performed some suitable air in the priest's ear to prevent his hearing any thing that might distract him, or lessen his attention. See SACRIFICE.

\* The word is formed from the Greek σπονδή, libation, and αὐλῆ, flute.

SPONDEE, SPONDÆUS, in the Greek and Latin prosody, a foot of verse, consisting of two long syllables.—As *ver-tunt*. See FOOT, QUANTITY, and DISPONDEE.

The *spondee* is a grave measure: all Greek and Latin hexameters regularly end with a *spondee*. See VERSE, and MEASURE.

There are also *spondaic verses*; that is, verses composed wholly of *spondees*, or at least that end with two *spondees*, as, *Constitit atque oculis Phrygia agmina circumspexit*.

SPONDYLUS, ΣΠΟΝΔΥΛΟΣ, a term anciently used for a vertebra of the spina dorsa. See VERTEBRA, &c.

SPONGE. See the article SPUNGE.

SPONGIOSA, in anatomy, an epithet given to several parts of the body, by reason of their texture, which is porous and cavernous, like that of the sponge: as

*Corpora SPONGIOSA penis*, called also, *corpora cavernosa* and *nervosa*. See CAVERNOSA corpora.

*Ossa SPONGIOSA* of the nose, called also *ossa turtinata* and *cribriformia ossa*. See CRIBRIFORME.

SPONTANEOUS\*, SPONTANEUS, in the schools, a term applied to such motions of the body, and mind, as we perform of ourselves, without any constraint. See VOLUNTARY, and MOTION.

\* The word is formed from the Latin adverb, *sponte*, of one's own accord.

Thus, in morality, those actions performed from an inward and natural principle, conformable to our own inclinations, excluding all constraint, but not excluding necessity; are called *spontaneous actions*. See NECESSITY.

In medicine, an evacuation effected without any application for that purpose, is called a *spontaneous evacuation*.—And a lassitude or weariness, not occasioned by any preceding fatigue, is called a *spontaneous weariness*.

It is held a grievous and dangerous error, with regard both to religion and morality, to hold that human liberty only consists in *spontaneity*: M. le Clerc has been very harshly treated, for making St. Augustin of this opinion. See LIBERTY, and FREEDOM.

SPONTANEOUS generation. See EQUIVOCAL generation.

SPONTANEOUS precipitation. See PRECIPITATION.

SPOONING, or SPOOMING, in the sea language. When a ship being under sail, in a storm at sea, cannot bear it; but is forced to put right before the wind; the seamen say, she *spoons*.

And when in such a case, there is danger lest she should bring her masts by the board, with her rolling about, or feel under water, and so founder, they usually set up the fore-sail to make her go the steadier, especially if there be sea-room enough: this they call *spooring with the fore-sail*.

**SPORADES**, in astronomy, a name which the ancients gave to such stars as were not included in any constellation. See **STAR**.

These, the moderns more usually call *informes* or *extraconstellary stars*. See **INFORMES**, and **CONSTELLATION**.

Many of the *sporades* of the ancients have been since formed into new constellations: e. gr. of those between leo and ura major, Hevelius has formed a constellation, called *leo minor*; of those between ura minor and auriga, the same person has formed another constellation called *lynx*: of those under the tail of ura major, another called *canis venaticus*, &c. See **CONSTELLATION**.

**SPORADIC**\*, ΣΠΟΡΑΔΙΚΟΣ, in medicine, an epithet given to such diseases as have some special or particular cause, and are dispersed here and there, affecting only particular constitutions, ages, &c. See **DISEASE**.

\* The word is formed from the Greek σποράς, dispersed, spread, of σπείρω, I sow, strew, &c.

*Sporadic* stand in opposition to *epidemic* diseases, which are those arising from a general cause, and that are common to all kinds of persons, of what complexion and quality soever. See **EPIDEMIC** and **ENDEMIC**.

**SPORTULA**, in antiquity, a dole or largess, either of meat or money, given by princes or great men, to the people or poor. See **ALMS**.

The *sportula* was properly the panier, or basket wherein the meat was brought; or wherewith the poor went to beg it: thence the word was transferred to the meat itself; and thence to money sometimes given in lieu of it.

*Sportula* was also frequently used in opposition to *recta coena*, a formal or plentiful meal; as in Martial—*promissa est nobis sportula, recta data*.

St. Cyprian gives the denomination, *sportulantes fratres*, to such clergymen as then received gifts, or gratuities, for their maintenance, like our prebends. See **ALMS**, &c.

**SPOTS**, in astronomy, dark places observed in the disks or faces of the sun, moon, and planets. See **SUN**, **MOON**, &c.

The *spots* in the sun are only visible through a telescope: some distinguish them into *maculae* or dark spots, and *faculae* or bright spots; but there seems little foundation for any such division. See **MACULÆ** and **FACULÆ**.

The *solar spots* have not been long observed. They are very changeable, as to number, form, &c. are sometimes in a multitude, and sometimes none at all.

Some imagine they may become so numerous, as to hide the whole face of the sun; at least the greatest part of it; and to this ascribe what Plutarch tells us, viz. that in the first year of the reign of Augustus, the sun's light was so faint and obscure, that one might look steadily at it with the naked eye. See **ECLIPSE**.

To which Kepler adds, that in 1547, the sun appeared reddish, as when viewed through a thick mist; and hence conjectures, that the *spots* in the sun are a kind of dark smoke or clouds floating on the surface thereof.

Others will have them stars or planets transiting the body of the sun.—But it is much more probable they are opaque bodies, in manner of crufts, formed like the scums on the surface of liquors. See **SUN**.

The *lunar spots* are fixed. Some will have them the shadows of the mountains, or uneven places of the moon's body; but their constancy discredits this opinion.—The more general and probable opinion is, that the *spots* in the moon, are seas, lakes, morasses, &c. which absorbing part of the sun's rays, reflect the fewer to us; so as to appear in form of dark spots: whereas the earthy parts, by reason of their solidity, reflect all their light, and thus appear perfectly bright.—M. Hartsoeker has another opinion, and takes the *spots* in the moon, many of them at least, for forests, groves, &c. the leaves and branches whereof, intercept the rays reflected from the ground, and send them elsewhere.

The astronomers reckon about forty-eight *spots* on the moon's face; to each whereof they have given names. The twenty-first is one of the most considerable, and is called *Tycho*.

*Planetary spots*.—Astronomers find that the planets are not without their *spots*. Jupiter, mars, and venus, when viewed through a telescope, shew several very remarkable ones; and it is by the motion of these *spots*, that we conclude the rotation of the planets round their axes, in the same manner as that of the sun is deduced from the motion of his maculae. See **PLANET**, **SUN**, **PHASES**, &c.

**SPOUT**, or *Water-SPOUT*, in natural history, an extraordinary meteor, or appearance at sea, and sometimes at land, very dangerous to ships, &c. ofteneft observed in hot, dry weather; called by the Latins, *typho*, and *sipho*; by the French, *trompe*, &c. See **METEOR**.

Its first appearance is in form of a deep cloud, the upper part whereof is white, and the lower black. From the lower part of this cloud hangs, or rather falls down, what we properly call the *spout*, in manner of a conical tube, biggest at

VOL. II. N<sup>o</sup>. CXLV.

top. Under this tube is always a great boiling, and flying up of the water of the sea, as in a jet d'eau. For some yards above the surface of the sea, the water stands as a column or pillar; from the extremity whereof it spreads and goes off, as in a kind of smoke. Frequently, the cone descends so low, as to touch the middle of this column, and continue for some time contiguous to it; though sometimes it only points to it, at some distance, either in a perpendicular or oblique line. See *Tab. Nat. Hist. fig. 20*.

Frequently it is scarce distinguishable, whether the cone or the column appear the first, both appearing all of a sudden against each other. But sometimes the water boils up from the sea to a great height, without any appearance of a *spout* pointing to it; either perpendicularly or obliquely. Indeed, generally, the boiling or flying up of the water, has the priority, this always preceding its being formed into a column. Generally, the cone does not appear hollow, till towards the end; when the sea-water is violently thrown up along its middle, as smoke up a chimney. Soon after this, the *spout* or canal breaks and disappears; the boiling up of the water, and even the pillar, continuing to the last, and for some time afterwards; sometimes till the *spout* form itself again, and appear a-new; which it sometimes does, several times in a quarter of an hour.

M. de la Pyme, from a near observation of two or three *spouts* in Yorkshire, described in the *Philosophical Transactions*, gathers, that the *water-spout*, is nothing but a gyration of clouds by contrary winds, meeting in a point or centre; and there, where the greatest condensation and gravitation is, falling down into a pipe or great tube, somewhat like Archimedes's spiral screw; and in its working and whirling motion, absorbing and raising the water, in the same manner as the spiral screw does; and thus destroying ships, &c.

Thus, June the 21st, he observed the clouds mightily agitated above, and driven together; upon which they became very black, and were hurried round, whence proceeded a most audible whirling noise, like that ordinarily heard in a mill. Soon after, issued a long tube or *spout*, from the center of the congregated clouds, wherein he observed a spiral motion, like that of a screw; by which the water was raised up. Again, August 15, 1687. the wind blowing at the same time out of several quarters, created a great vortex and whirling among the clouds; the center whereof, every now and then, dropt down, in shape of a long, thin, black pipe, wherein he could distinctly behold a motion like that of a screw, continually drawing upwards, and screwing up, as it were, wherever it touched. In its progress it moved slowly over a grove of trees, which bent under it like wands in a circular motion. Proceeding, it tore off the thatch from a barn, bent a huge oak tree, broke one of its greatest branches, and threw it to a great distance. He adds, that whereas it is commonly said, the water works and rises in a column, before the tube comes to touch it; this is doubtless a mistake, owing to the fineness and transparency of the tubes, which do most certainly touch the surface of the sea, before any considerable motion can be raised therein; but which do not become opaque and visible, till after they have imbibed a considerable quantity of water.

The dissolution of *water-spouts*, he ascribes to the great quantity of water they have glutted; which by its weight impeding their motion, whereon their force, and even existence depends, they break and let go their contents; which use to prove fatal to whatever is found underneath.

A notable instance hereof, we have in the *Philosophical Transactions*, related by Dr. Richardson. A *spout* in 1718, breaking on Emott-moor, nigh Coln, in Lancashire, the country was immediately overflowed; a brook, in a few minutes, rose six feet perpendicularly high; and the ground whereon the *spout* fell, which was sixty-six feet over, was tore up to the very rock, which was no less than seven feet deep; and a deep gulf made for above half a mile; the earth, being raised on either side in vast heaps.

In Pliny's time, the seamen used to pour vinegar into the sea, to alluage and lay the *spout*, when it approached them: our modern seamen think to keep it off, by making a noise with filing and scratching violently on the deck; or, by discharging great guns to disperse it.

**SPOUTING fountain**. See the article **FOUNTAIN**.

**SPRAIN**. See the article **STRAIN**.

**SPRING**, *fons*, in natural history, a fountain, or source of living water arising out of the ground. See **WATER** and **FOUNTAIN**.

The origin of *springs* or fountains, is a thing much controverted among our latest naturalists.—Mess. Mariotte and Perrault ascribe it to rains: their doctrine is, that the rain-water penetrates the earth till such time as it meets a clayey soil or stratum; which proving a sufficient solid bottom, to sustain and stop their descent, they glide along it that way to which the earth declines, till they meet with a place or aperture in the surface, through which they may escape, and make the head of a river. See **STRATUM**.

Now, that the rain is sufficient for this effect, appears hence; that upon calculating the quantity of rain and snow which falls yearly on the tract of ground, that is to furnish, for instance,

II G g

staner, the water of the Seine; it is found, that river does not take up above one sixth part of it. See RAIN.

*Springs* ordinarily arise at the feet of mountains: the reason, say they, is, that mountains collect the most waters, and give them the greatest descent the same way: and that if we sometimes see springs on high grounds, and even on the tops of mountains; they must be brought from other remoter places, considerably higher, along beds of clay or clayey ground, as in their natural channels.—If then, there happen to be a valley between a mountain, on whose top is a *spring*, and the mountain that is to furnish it with water, the *spring* must be looked on as a water conducted from a reservoir of a certain height through a subterraneous channel, to make a jet of an equal or somewhat less height. See RAIN.

This theory M. de la Hire has taken under examination, in its most essential article, and that where the authors seem to have been the least distrustful.—He has endeavoured to find, by experiment, whether rain or snow water could penetrate the earth as low as the clayey stratum: the result of his enquiry, is, that they do not penetrate even sixteen inches deep, in a quantity sufficient to form the smallest collection of water on a solid bottom. Nay, this he found when the earth he made his experiment on, was quite naked of all herbs and plants; but as soon as ever any of these came up, and were grown to any bulk, so far was the rain that fell, from being able to gather itself at the depth of sixteen inches, that it was not sufficient even to feed the plants, but there was a necessity for watering them. For the quantity of water expended in the ordinary support of plants, see VEGETATION.

Dr. Halley refers the origin of *springs* merely to vapours raised by the heat of the sun, or of subterraneous fires, from the sea, lakes, rivers, &c. These vapours thus raised, he supposes, are by the winds, carried over the low-lands, to the several mountains and ridges of mountains, and are there compelled, by the stream of air, to mount with it to the tops, where the atmosphere being very rare and cold, retains but a small part of them; the rest is condensed into dew, which presently precipitates, gleeting down by the crannies of the stones; and part of it entering the caverns of the hills, is gathered therein, as in an alembic; which being once full, the overplus must run down at the lowest part of the reservoir, and breaking out by the side of the hills, form single *springs*, many of which running down by the vallies or guts between the ridges of the hills, and at length uniting, form rivulets, and many of these meeting in a common channel form rivers. See RIVER.

Now to shew that vapour is a sufficient fund, to supply all our *springs*, rivers, &c. the same excellent author makes an estimate of the quantity of vapour raised from the sea, by the action of the sun: the result of an experiment he made to that purpose was, that the thickness of water evaporated from the surface of the sea, in the space of two hours, in summer-time, is one fifty-third part of an inch; which for the ease of calculation, being only supposed to be  $\frac{1}{50}$ ; the quantity of  $\frac{1}{50}$  of an inch will be found exhaled in twelve hours.—On this principle, every mile square will be found to evaporate, in twelve hours, 6914 tuns of water, and every square degree, thirty-three millions of tuns. The area of the Mediterranean then being estimated at 160 square degrees, it will lose in vapour, in a summer's day 5280 millions of tuns.

Yet the quantity of vapour thus raised, great as it is, is only the remains of what is raised another way, viz. by the winds, which sometimes sweep the water off faster than the sun takes it up. See EVAPORATION.

To find now, the quantity of water the Mediterranean receives, allow the most considerable rivers it receives, viz. the Iberus, Rhone, Tyber, Po, Danube, Neister, Boristhenes, Tanais, and the Nile, each to furnish ten times as much water as the Thames; not that any of them are, in reality so great, but so to allow for the lesser rivulets: but the Thames is found, by calculation, to evacuate 20300000 tuns of water daily. All the nine rivers abovementioned, therefore, will only evacuate 1827 millions of tuns in a day, which is little more than a third of what is raised in that time in vapour. See VAPOUR.

After all that can be said in favour, both of rain and vapour, it must be owned, they are both still pressed with great difficulties; and there is still room to look out for a better theory. The perpetuity of divers *springs*, always yielding the same quantity of water, when the least rain or vapour is afforded, as well as when the greatest, is a strong objection to both. Mr. Derham mentions one in his own parish of Upminster, which he could never perceive by his eye to be diminished in the greatest droughts, even when all the ponds in the country, as well as an adjoining brook, have been dry for several months together; nor ever to be increased in the most rainy seasons, excepting, perhaps, for a few hours, or at most for a day, from sudden and violent rains. Had this *spring* its origin from rain or vapour, there would be found an increase and decrease of its water corresponding to those of its causes; as we actually find in such temporary *springs*, as have undoubtedly their rise from rain and vapour: add to this, another considerable thing in this Upminster *spring*, and thousands of others, viz. that it breaks out of so inconsiderable

able a hillock or eminence, as can have no more influence in the condensation of the vapours or stopping the clouds, than the lower lands about it have. The very highest ground in the country, he finds is not above 133 yards above the level of the sea; and what is such an inconsiderable rise of land, to a perennial condensation of vapours, fit to afford so considerable a *spring*? or the high-lands of the whole country, to the maintaining all its fountains and rivulets?

Other naturalists, therefore, have recourse to the sea, and derive the origin of *springs* immediately thence; but how the sea-water should be raised up to the surface of our earth, and even to the tops of the mountains, is a difficulty they cannot agree upon. See MOUNTAIN.

Some fancy a kind of hollow, subterranean rocks to receive the watery vapours from the bottom of the earth, and to act the part of alembics, in condensing and converting them into water.—Others, as M. de la Hire, &c. set aside the necessity of alembics, and think it enough that there be large subterranean reservoirs of water at the height of the sea, whence the warmth of the bottom of the earth, or even the central fire (if there be such a thing) may raise vapours, which pervading not only the intervals and fissures of the strata, but the bodies of the strata themselves, at length arrive near the surface; where, being condensed by the cold, they glide along on the first bed of clay they meet withal, until an aperture in the ground lets them out. M. de la Hire adds, that the salts of stones and minerals may contribute to the detaining and fixing the vapours, and converting them into water. But we have a still more natural and easy way of exhibiting the rise of the sea-water up into mountains, &c. by putting a little heap of sand, ashes, a loaf of bread, or the like, in a basin of water: in which case, the sand, &c. will represent the dry land, or an island; and the basin of water, the sea about it.—Here, the water in the basin will rise to, or near the top of the heap, in the same manner, and from the same principle, as the water of the sea, lakes, &c. rise in the hills.—The principle of ascent in both, is, doubtless, the same with that of the ascent of liquids in capillary tubes, or between contiguous planes, or in a tube filled with ashes; all which are now generally accounted for from the doctrine of attraction. See ASCENT, CAPILLARY, ATTRACTION, &c.

**SPRING, Ver.** in cosmography, denotes one of the seasons of the year; commencing in the northern parts of the world, on the day the sun enters the first degree of aries, which is about the 10th day of March, and ending when the sun leaves gemini. See SEASON.

Or, more strictly and generally, the *spring* begins on the day, when the distance of the sun's meridian altitude from the zenith, being on the increasing hand, is at a medium between the greatest and least.—The end of the *spring* coincides with the beginning of summer. See SUMMER.

**SPRING, Elater.** in physics, denotes a natural faculty, or endeavour of certain bodies to return to their first state, after having been violently put out of the same by compressing, bending them, or the like.

This faculty, the philosophers usually call *elastic force*, or *elasticity*. See ELASTIC and ELASTICITY.

Fleas only jump to those excessive heights, by means of a *springy* membrane, easily visible by a microscope, and whereof we have a curious figure in Dr. Hook's Micrography. By the elastic force of this *spring*, they are enabled to leap 200 times the height of their own body. See FLEA.

Nature has provided for the regular sowing of the seeds of several kinds of plants, by furnishing them with a *spring*, which is wound sometimes round the outside, and sometimes round the inside of the case wherein the seeds are contained. This *spring*, when stretched to a certain pitch by the full growth and maturity of the seed, suddenly, either breaks in two, as when on the outside, and tears the case along with it; or else, by its vehement effort to unbend itself, as when in the inside, it bursts the case into two parts like cups, and disperses the seeds. See SEMINATION.

**SPRING**, is more particularly used in the mechanic arts for a piece of tempered steel put in several machines to give them motion, by the endeavour it makes to unbend itself. See MACHINE and AUTOMATON.

In watches, it is a fine piece of well-beaten steel, coiled up in a cylindrical case or frame, which by stretching itself forth, puts the wheels and the whole movement in motion. See WATCH.

The *spring* of a lock, pistol or the like, is a piece of steel violently bent, which beats back the bolt, or strikes down the cock, when set at liberty. See LOCK.

**SPRING compasses.** See the article COMPASSES.

**SPRING of the air**, or its elastic force. See AIR and ELASTICITY.

**SPRING a mast.**—So the seamen call it, when a mast is cracked, but not quite broken, in any part. See MAST.

**SPRING-tide**, is the increasing of a *tide* after a dead neap. See TIDE.

The *spring-tides* happen about three days before the full or change of the moon; but the top or highest of the *spring-tides*, is three days after the full or change; then the water runs

runs highest with the flood, and lowest with the ebb, and the tides run more strong and swift, than in the neaps. See NEAP, FLUX, &c.

SPRINGE, a snare or device made of twisted wire, to catch birds or small beasts.

SPRINGY, or elastic bodies, are such, as having had their figure changed by the stroke or percussion of another body, can recover again their former figure; which bodies, that are not elastic, will not do. See RESTITUTION.

Thus if a piece of steel be bent any way, it will recover again its former straightness; but a piece of lead will stand bent in any form. See ELASTIC bodies.

SPUNGE, or SPONGE, SPONGIA, a kind of sea fungus, or mushroom found adhering to rocks, shells, &c. on the sea-shore. See MUSHROOM.

The ancients distinguished two kinds, *male* and *female*: but the moderns make only one kind; which, however, they distinguish with regard to its texture, into *coarse* and *fine*. Naturalists have been embarrassed in all ages, whether to range *sponge* in the animal, mineral or vegetable family? Some would have it a concretion formed of the sea-mud; and others an animal, at least a zoophyte from its motion of contraction and dilatation. See ZOOPHYTE.

The greatest part of our *sponges* are brought from the Mediterranean, especially from Nicaria, an island thereof, near the coast of Asia.

The diving or fishing for *sponges* is there reckoned the top qualification in the youth, who all get the better wives as they excel more herein. To this proof, the maids refer the preference among several suitors; placing themselves on the brink of the sea, to be witnesses of the address of each; and giving themselves as a prize to the conqueror. See DIVING.

The fine or small *sponges* are the most esteemed; and usually come to us from Constantinople. Their goodness consists in their being very white, light, and the holes small and close; the larger and coarser come from the coasts of Barbary, particularly Tunis and Algier.

The *sponge* is a very useful matter in the arts. In physic it serves to foment parts inflamed. By analysis, it yields a deal of volatile, sharp salts, like other sea-plants. Taken inwardly it choaks; and is for that reason cut small, and fried or dipped in honey, and given to quadrupeds to kill them, which it seldom fails to do, by swelling and preventing the passage of the food into the intestines.

In *sponges* are found a kind of stones called *cystolithi*, held good for the worms in young children, and taken in powder.

Pyrotechnical SPUNGES, are made of the large mushrooms or fungous excrescences growing on old oaks, ashes, firs, &c. which being boiled in common water, then dried and well beaten, are put in a strong lye, prepared with salt-petre, and again dried in an oven.

These make the black match or tinder brought from Germany, used to receive and sustain the fire struck from a flint and steel, &c.

SPUNGE, is also used in gunnery, for a long staff or rammer, with a piece of sheep or lamb-skin wound about its end, to serve for scouring great guns when discharged, before they be charged with fresh powder. See SPUNGING, ORD-NANCE, &c.

SPUNGING, in gunnery, the clearing a gun's inside with a sponge, in order to prevent any sparks of fire from remaining in her, which would endanger the life of him who should load her again. See CANNON, SPUNGE, CHARGE, &c.

SPUN-YARN, among sailors, the yarn of untwisted ropes, whose ends are scraped and beaten thin, in order to be let into the ends of other ropes, and so made long as occasion shall require.

SPUR\*, was anciently a piece of the armour of a cavalier, fastened to the talary, that is, the hind-part of that piece of a complete armour, which covers the legs and feet.

\* The word is derived from the German, *spohr*, or rather the Saxon *spora*, or Danish *spor*, which all signify the same.

At present, the *spur* is a piece of iron, or other metal, consisting of two branches encompassing the cavalier's heel, and a rowel in form of a star, advancing out behind, to prick the horse.

Louis le Debonnaire forbid ecclesiasticks the profane fashion of wearing *spurs*.—Anciently the difference between the knight and esquire was, that the knight wore gilt *spurs*, whence the appellation of *eques auratus*, and the esquire silvered ones. See KNIGHT and ESQUIRE.

SPURIOUS diseases, are such as in some symptoms cannot be brought under any distinct head, and therefore are called by the name of others, with which they most agree.—Whence, also, they are often denominated *bastards*, *nothi*.

As, a *spurious* or bastard pleurisy, a *spurious* peripneumony, a bastard quinty; and the like. See PLEURISY, PERIPNEUMONY, &c.

SPURIOUS flesh, is an appellation by some given to the flesh of the lips, gums, glands, &c. See FLESH, GINGIVA, GLANDS, &c.

SPURIOUS medals, } See the articles { MEDALS.  
SPURIOUS ribs, } { RIBS.  
SPURIOUS suture, } { SUTURE.

SPUR-WAY, a horse-way through a man's grounds, through which one may ride, by right or custom.

SPUTUM, in medicine, &c. the spittle or excrement voided at the mouth. See SALIVA.

An examen of the *sputum*, is of great consequence in phthi-fical cases, and Bennet in his *Theatrum tabidarum*, applies himself in a particular manner thereto. — The *sputum sanguinis*, is a very dangerous symptom in that disease. See PHTHISIS.

SPY, a person paid to watch the actions, motions, &c. of another; particularly as to what passes in an army.

When a *spy* is found in a camp, he is immediately hanged. — Wicquefort says, an ambassador is an honourable *spy*, under protection of the law of nations. See EMBASSADOR.

SQUADRON\*, a body of horse, whose number of men is not fixed, but is usually from one hundred to two hundred. See ARMY.

\* The word is formed from the Italian *squadron*, of the Latin *squadra*, used by corruption for *quadro*: in regard, at first, the *squadrons* were always square, and called also by the Latins, *agmina quadrata*.

The *squadron* usually consists of three troops; and each troop of fifty men: it never exceeds two hundred, because a greater number cannot be advantageously posted, nor have room to act in narrow grounds, woods, marshes, defiles, &c. See TROOP.

The eldest troop takes the right of the *squadron*, and the second the left, the youngest being in the centre.

A *squadron* is always drawn up three deep, or in three ranks, with the length of an horse between each rank. — The standard is always bore in the centre of the first rank. See DEPTH.

SQUADRON of ships, a division, or part of a fleet, commanded by a vice or rear admiral, or some other commander or commodore. See FLEET, ADMIRAL, &c.

The number of ships in a *squadron* is not fixed: a small number of vessels, if they be in a body, and have the same commander, may make a *squadron*.

If there be a great number, they are usually divided into three *squadrons*. And if the *squadrons* be numerous, each *squadron* is divided into three divisions, distinguished by their flags and colours.

SQUAMMOUS, SQUAMMOSUS, in anatomy, an epithet given to the spurious or false sutures of the skull; because composed of *squamme*, or scales, like those of fishes, or like tiles laid so as to reach over one another. See SUTURE.

The *sutura squamosa*, are also called *mendosa*, and *temporales* from their terminating the temples, or ossa temporis.

SQUARE, *Quadratum*, in geometry, a quadrilateral figure, both equilateral and equiangular. See FIGURE, QUADRILATERAL, EQUIANGULAR, &c.

To find the area of a SQUARE: seek the length of one side; multiply this by itself; the product is the area of the *square*. See AREA.

Thus, if the length of a side be 345, the area will be 119025: and if the side of a *square* be 10, the area will be 100.

Since, then, a decempeda contains 10 feet, a foot 10 digits, &c. a *square* decempeda contains 100 *square* feet, a *square* foot 100 *square* digits, &c.

The properties of a SQUARE, are, that its angles are all right, and, consequently, its sides perpendicular; that it is divided into two equal parts, by a diagonal; that the diagonal of a *square* is incommensurable to the side. See DIAGONAL, &c.

For the ratio of SQUARES: they are to each other in the duplicate ratio of their sides. — E. gr. a *square* whose side is double another, is quadruple of that other *square*.

SQUARE of the cube, } See the article { POWER.  
SQUARE of the surdsolid, }

SQUARE number, the product of a number multiplied by itself. See NUMBER.

Thus 4, the product of 2 multiplied by 2; or 16 the product of 4 multiplied by 4, are *square* numbers.

Such number is called a *square* number, because it may be ranged into the form of a *square*, by making the root, or factor of the side of the *square*. See ROOT.

The difference of two *square* numbers, whose roots are not unity, is an uneven number, equal to double the root of the less, increased by unity.

Hence we have an easy method of constructing *square* numbers for a number of roots proceeding in the natural series; the double of the root of the antecedent increased by unity, being continually to be added to the preceding *square*.

Thus, if  $n=1$ ;  $2n+1=3$ : if  $n=2$ ; then will  $2n+1=5$ : if  $n=3$ ; then will  $2n+1=7$ : if  $n=4$ ; then will  $2n+1=9$ , &c. Thus by a continual addition of the uneven numbers, arise the *square* numbers.

SQUARE root, a number considered as the root of a second power or *square* number; or a number by whose multiplication into itself, a *square* number is generated. See ROOT.

Thus the number 2, being that by whose multiplication into itself, the *square* number 4 is produced; is, in respect hereof, called a *square* root, or the *square* root of 4.

Since,

Since, as unity is to the *square* root, so is the root to the *square* number; the root is a mean proportional between unity and the *square* number.

A *square* root consisting of two parts, is called a *binomial*; as  $20+4$ . See BINOMIAL.

If it consists of three, a *trinomial*, as  $6+2-1$ . See TRINOMIAL.

Now, every *square* number of a binomial root, is demonstrated to be compounded of the *square* of the first part, the product of double the first into the second, and of the *square* of the other part.

To extract the *SQUARE* root out of any given number; see EXTRACTION of roots.

*SQUARE*, *norma*, is also an instrument made of wood or metal, serving to describe and measure right angles withal; such is LEM, (*Tab. Geom.* fig. 42.)

It consists of two rules or branches fastened perpendicularly at one of their extremes. — When the two branches are moveable on a joint, it is called a *bevel*. See BEVEL.

To examine whether or no a *square* be exact, describe a semicircle AEF, of any length, at pleasure; and therein, from each extreme of the diameter A and F, draw right lines to a point taken at pleasure in the periphery, as E: to the sides of the angle AEF, apply the *square*, so as its vertex may fall on F. If this be possible, that *square* is just.

*Geometrical SQUARE*, a compartment frequently added on the face of the quadrant, called also *line of shadows*, and *quadrat*. See QUADRAT.

*Magic SQUARES*. See MAGIC *square*.

*SQUARE* battle, or *battalion* of men, is one that hath an equal number of men in rank and file. See BATTALION.

To form any number of men into a *square* battle, as suppose 500, extract the nearest *square* root of 500, which is in integers 22, and what will give the number of men for rank and file.—There will be a remainder of 16 men, who may be disposed of, as the commander thinks best.

*Hollow SQUARE*, in the military art, is a body of foot drawn up with an empty space in the middle, for the colours, drums and baggage; faced and covered by the pikes every way to keep off horse.

SQUINTING,		STRABISMUS.

ST, an indeclinable term, chiefly used to command silence.

The Romans had these two characters wrote over the doors of their eating rooms, as who should say, *sed tace*, or *silentium tene*.

Porphyry observes, the ancients made a point of religion of it, not to speak a single word in passing in or out of the doors.

STABLESTAND, in the forest law, is when a person is found at his stand in the forest, with a cross-bow, or long-bow, ready to shoot at a deer, or else standing close by a tree with greyhounds ready to slip.

This is one of the four evidences, or presumptions, by which a man is convicted of intending to steal the king's deer; the other three being back-berond, bloody-hand, and dog-draw. See FOREST, &c.

STACK of wood, among husbandmen, is a pile of wood three foot long, as many broad, and twelve foot high.

STACTE, STAKTH, in pharmacy, a fatty resinous liquid matter, drawn from fresh myrrh, pounded or pressed with a little water. See MYRRH.

This liquor is very odoriferous, and held mighty precious; making, alone, the perfume, called by Dioscorides, *stacte*, and which smells finely, though very bitter to the taste.

We have none of it now, but what is sophisticated; and what the apothecaries call *stacte*, is no more than liquid storax. See STORAX.

STADIUM\*, STADION, an ancient Greek long measure, containing 125 geometrical paces, or 625 Roman feet; corresponding to our furlong. See MEASURE and FURLONG.

\* The word is formed from the Greek, *stasis*, station; and it is said, on this occasion, that Hercules, after running so far at one breath, stood still. The Greeks measured all their distances by *stadia*, which they call *stadia*.

Eight *stadia* make a geometrical or Italian mile; and 20, according to M. Dacier, a French league: according to others, 24 make the league. See MILE and LEAGUE.

Guilletiere observes, that the *stadium* was only 600 Athenian feet, which amount to 625 Roman, 566 French royal feet,

or 604 English feet: so that the *stadium* should only have been 113 geometrical paces.—It must be observed however, that the *stadium* was different in different times, and places.

STADIUM was also the course or career, wherein the Greeks run their races. See GYMNASIUM.

Vitruvius describes it as an open space 125 paces long, terminated at the two extremes with two posts, called *carcer* and *meta*. See PALÆSTRA.

Along it was built a kind of amphitheatre, where the spectators were pleased to see the athletes exercise running, wrestling, &c.

There were *stadia* likewise, covered over, and encompassed with colonnades and porticoes, serving for the same exercises in ill weather.—Captive children used to run the *stadium*. Ablanc. See GYMNASTIC.

A more natural derivation of the word *stadium*, from *stasis*, *station*, than that popular one mentioned in the last article, may be drawn from the athletes stopping and resting, when at the end of this course: whence the name might be applied to the same distance, measured in any other place.

STADTHOLDER\*, STADTHOUDER, or STATHOLDER, a governor, or lieutenant of a province, in the United NETHERLANDS; particularly that of Holland: where the word is most used, by reason of the superior importance of the government of that province.

\* Menage derives the word from *stadt*, state; and *houder*, holding *q. d.* lieutenant of the states: others will have it compounded of *stad*, or *stede*, *stead*, or place, and *houder*, holding, in regard this officer held the place of the counts, and represented them in their absence.

The *stadtholder*, i. e. the *stadtholder* of Holland, is the first member of the republic: he is chief of all the courts of justice; and may preside therein when he pleases. All sentences, judgments, &c. are dispatched in his name.—When an office becomes vacant in any of the courts, the states propose three persons to the *stadtholder*, who is to chuse one of them.

He can even pardon criminals, which is a sovereign prerogative; and has the choice of scabines, or chief magistrates in each city; to which end the council of the city present him two persons, one of which he appoints.

In several cities, he has the same right of nominating the burgo-masters, and counsellors; as at Rotterdam, Dort, &c. He has also a power to cashier the magistrates, and put others in their room, when he finds it necessary for the public good; upon giving a reason for the same.

By article VI. of the union of Utrecht, the states constitute him arbiter of all the differences that may arise between the states of the several provinces; or between the cities and the members of the states of the province. See STATES. To the dignity of *Stadtholder*, is inseparably annexed, that of captain, and admiral-general of the province; in which quality, he names all the officers, and disposes of all military posts.—It is he takes care of the execution of the ordinances of the states; and his authority gives him a right to receive and give audience to ambassadors from foreign princes, and even to send ambassadors on his own private affairs.

The office of *stadtholder* is very ancient: the counts not being able to reside in Holland, appointed *stadtholders* to command in their absence, in the several provinces; besides a governor general of all the seventeen provinces of the Netherlands.

William I. prince of Orange, was *stadtholder* of Holland and Zeeland, at the time when the Dutch shook off the Spanish yoke; which enabled him to contribute greatly to that happy event.

In 1567, the states thought fit to suppress the office of *stadtholder*, by edict; and resolved it should never be conferred on any person for the future: but in 1672, William III. prince of Orange, afterwards king of England, being elected captain and admiral-general by the states; some months afterwards they revoked the edict of suppression in favour of that prince, who was declared *hereditary stadtholder*; an honour never conferred before.

STAFF, *baculus*, an instrument ordinarily used to rest on in walking.—Card. Bona observes, in his treatise of liturgies, that anciently, those who used a *staff* in the church to lean on, were obliged to lay it by, and to stand alone, firm and upright, while the gospel was a reading; to testify their respect, by their posture, and to shew they were ready to obey Jesus Christ, and to go wheresoever he should command them.

The *staff* is also frequently used as a kind of natural weapon, both of offence and defence.—The Lacedæmonians never wore any swords in time of peace; but contented themselves with a thick, crooked *staff*, which was peculiar to them.

Among the Romans, M. St. Evremond observes, blows with a *staff* were the gentlest correction they gave their slaves; inasmuch as they received them over their cloaths.

Among the masters of honour and arms, it is held a greater affront to be beaten with a *staff*, than with a sword; because the sword is the instrument of war, the *staff* the instrument of outrage.

Blows

Blows with a *staff* are very severely punished by the French laws: by a regulation of the marshals of France, in 1653, for reparations and satisfactions of honour, it is adjudged, that a person who shall strike another with a *staff*, shall be imprisoned a whole year; unless six months be moderated, upon paying 3000 livres, applicable to the nearest hospital; beside which, the offender is to ask pardon of the offended on his knees, &c. ready to receive from him a like number of blows with a *staff*; which, on some occasions, the latter may be obliged to give; if he have too much generosity not to do it of himself.

By another regulation of the marshals in 1679, he who strikes with a *staff*, after receiving blows with the fist in the heat of a fray, is condemned to two years imprisonment; and to four, if he struck first with the fist.

Jacob's STAFF,		

STAFF, in music, five lines, on which, with the intermediate spaces, the notes of any song or piece of music are marked. See MUSIC.

Guido Aretin, the great improver of the modern music, is said to be the first who introduced the *staff*; marking his notes, by setting points (.) up and down them, to denote the rise and fall of the voice; and each line and space he marked at the beginning of the *staff*, with Gregory's seven letters, a, b, c, d, e, f, g. See NOTE.

But others will have the artifice of an older date; and Kircher particularly affirms, that in the Jesuits library at Messina, he found an old Greek M.S. book of hymns, above seven hundred years old; wherein some hymns were written on a *staff* of eight lines, marked at the beginning with eight Greek letters. The notes or points were on the lines, but no use made of the spaces. See SCALE, GAMMUT, SOLFAING, &c.

STAFF, in heraldry. See the article BATTOON.

STAFF, in surveying, a kind of stand, whereon to mount a theodolite, circumferentor, plain table, or the like, for use. It consists of three legs of wood, joined together at one end, whereon the instrument is placed; and made pecked at the other, to enter the ground.—Its upper end is usually fitted with a ball and socket. See BALL, and socket, and THREE-LEGGED.

STAGE, in the modern drama, the place of action and representation; included between the pit, and the scenes.

The *stage* answers to the proscenium or pulpitum of the ancient theatre. See THEATRE, PULPITUM, PROSCENIUM, &c.

Laws of the STAGE, are the rules and decorums to be observed, with regard to the oeconomy and conduct of a dramatic performance to be exhibited on the *stage*.—These relate, principally, to the unities, the disposition of the acts and scenes, the unravelling, &c. See UNITY, ACT, SCENE, CATASTROPHE.

STAGGERS, or STAVERS, in the manage. See STAGGERS.

STAIRCASE, an ascent inclosed between walls, or a ballustrade, consisting of *stairs* or steps, with landing places and rails; serving to make a communication between the several stories of a house. See STAIR.

The construction of a complete *staircase*, is one of the most curious works in architecture. The common rules to be observed therein are as follow,

- 1°. That it have a full, free light, to prevent accidents of slipping, falling, &c.
- 2°. That the space over head be large and airy, which the Italians call *un bel sfocato*, good ventilation, in regard a man spends much breath in mounting.
- 3°. That the half paces, or landing places, be conveniently distributed for reposing in the way.
- 4°. That to prevent rencounters, &c. the *staircase* be not too narrow; but this last is to be regulated by the quality of the building.
- 5°. That care be taken in placing the *staircase*, so as the stairs may be distributed, without prejudice to the rest of the building.

The kinds of *staircases* are various: in some, the stairs are straight, in others winding; in others both ways, or *mixt*. Again, of *straight stairs*, called also *flyers*, some fly directly forwards; others are square; others triangular; others called *French Flights*.

Of *winding stairs*, called also *spiral*, or *cockle stairs*, some are square, some circular, and some elliptical.—And these again are various; some winding round a solid, and others an open newel.

VOL. II. N°. CXLV.

Lastly, of *mixed stairs*, some are called *dog legged*: others both wind about a solid newel, and fly about a square open newel.

Straight STAIRS, are such as always fly, that is, proceed in a right line; and never wind: whence their denomination. See FLYERS.—Of these there are several kinds; as,

*Direct flyers*, or *plain flyers*, which proceed directly from one floor to another, without turning either to the right or left; seldom used, except for garret or cellar stairs.

*Square flyers*, which fly round the sides of a square newel, either solid or open; having at every corner of the newel, a square half step, taking up  $\frac{1}{4}$  of a circle. So that they fly from one half step to another, and the length of the *stairs* is perpendicular to the side of the newel.

*Triangular flyers*, which fly round by the sides of a triangular newel, either solid or open, having at each corner of the newel a trapezial half step, taking up  $\frac{1}{3}$  of a circle: so that they fly from one half step to another; and their length is perpendicular to the side of the newel.

*French flyers*, which fly, first directly forwards, till they come within the length of a *stair* of the wall; and then have a square half pace, from which you immediately ascend to another half pace, from which the *stairs* fly directly back again, parallel to their first flight.

Winding STAIRS, are such as always wind, and never fly; of these there is great variety; as,

Circular winding STAIRS, whereof there are four kinds, viz. such as wind about a solid newel, the fore edge of each being in a right line, pointing to the centre of the newel; commonly used in church steeples, and great old houses: such as wind round an open newel, the fore side of each being in a right line, pointing to the centre of the newel; as those in the Monument, London: such as wind round a solid newel, only the fore side of each, an arch of a circle, either concave or convex, pointing near to the circumference of the newel: and such as resemble the last, in all other respects, save that they have an open newel.—Any of these winding *stairs* take up less room than other kinds.

In *stairs* that wind round a solid newel, architects make the diameter of the newel either  $\frac{1}{2}$  or  $\frac{1}{3}$  or  $\frac{1}{4}$  of that of the *staircase*, according as that is in bigness.—If very small, the newel is but  $\frac{1}{2}$ , and if large,  $\frac{3}{4}$ , &c.

In *stairs* that wind round an open newel, Palladio orders the newel to be  $\frac{1}{2}$  the diameter of the *staircase*; though there does not appear any reason why the newel here should not be proportioned to the *staircase*, as in the former.

As to the number of *stairs* in each revolution; Palladio orders, that in a *staircase* of 6 or 7 foot diameter, the *stairs* in each revolution be 12; if the diameter be 8, the *stairs* to be 16; if 9 or 10, the *stairs* to be 20; and if 18, to be 24.

Elliptical winding STAIRS, whereof there are two kinds: the one winding round a solid, the other round an open newel, they are much of the same nature as circular stairs, excepting, that in the one, the newel is a circle, and in the other an ellipsis.

Square winding STAIRS, are such as wind round a square newel, either solid or open; the fore side of each square being in a right line, pointing to the centre of the newel.

Triangular winding STAIRS, are such as wind round a triangular newel; the fore side of each being a right line, pointing to the centre of the newel.

Columinated winding STAIRS: Palladio mentions a *staircase* in Pompey's portico at Rome, set on columns, so, as that the light they receive from above may distribute itself to all parts alike.

Double winding STAIRS: Scamozzi mentions a *staircase* in this form, made by Piedro del Bergo, and Jean Coffin, at Sciamburg in France, in the king's palace.—It is so contrived, as that two persons, the one ascending, and the other descending, shall never meet.

Dr. Grew describes a model of this kind of *staircase*, kept in the museum of the Royal Society. The foot of one of the *staircases*, he says, is opposite to that of the other, and both make a parallel ascent, and within the same cylinder. The newel in the middle is hollow, and built with long apertures, to convey light from candles placed at the bottom, and on the sides of the newel, into both cases.

Quadruple winding STAIRS: Palladio mentions a *staircase* of this form, in the castle of Chambor near Bloys. It consists of four *staircases*, carried up together, having each its several entrance, and going up one over another, in such manner, as that being in the middle of the building, the four serve to lead to four apartments: so that the people of the one need not go up and down the *stairs* of the other; yet being open in the middle, they all see each other pass.

Mixt STAIRS, are such as partly fly, and partly wind; whence some call them *flyers and winders*.—Of these there are several kinds, as,

Dog legged STAIRS, which first fly directly forwards, then wind a semi-circle, and then fly directly backwards, parallel to that.

Square flyers and winders, have a square newel, either solid or open, and fly by the sides of the newel, winding a quadrant of a circle at each corner.

*Solid and open newelled flyers and winders*, are of two kinds; the one winds a quadrant of a circle about a solid newel, then flies by the side of a square open newel; then winds again, by the side of a solid newel, then flies again, and so alternately.—The other flies first, then winds, and then flies again, alternately.

**STAIRS**, in building, the steps whereby we ascend and descend, from one story of a house to another. See **BUILDING**. The dimensions of *stairs* are differently assigned by different authors: in this however they agree, that they must not be more than six, nor less than four inches high; nor more than eighteen, nor less than twelve inches broad; nor more than sixteen, nor less than six foot long, each *stair*.—But these measures have only regard to fine buildings; ordinary houses are excepted: yet even in these, the *stairs* are not to exceed eight inches in height; nor be less than nine inches in breadth; nor three feet in length.

To reduce the dimensions of *stairs* to some natural, or at least geometrical standard, Vitruvius borrows the proportions of the sides of a rectangle triangle, which the ancient school expressed by the numbers 3, 4, and 5. The first for the perpendicular height; the second for the horizontal breadth; and the third for the whole slope or inclination, from the edge of one *stair* to that of another.

But this rule is set aside, and with good reason, by the modern builders. For, on this principle, the lower the *stairs*, the narrower they must be; and *stairs*, for instance, four inches high (such as we find mentioned in ancient architects) must be but  $5\frac{1}{4}$  inches broad.

One rule to be regarded in the making of *stairs*, is, that they be laid according to the Italian phrase, *con un tantino da scarpia*, i. e. somewhat sloping, or a little highest behind, that the foot may, as it were, both ascend and descend at once; which, though observed by few, is found a secret and delicate deception of the pains in mounting.

**STALACTITES**, **STALAGMITES**, or **STAGONITES**, in natural history, a stony, sparry sort of icicles, which hang down from the tops or arches of grotto's, and subterranean caverns; and from the roofs of buildings, and capitals of pillars of such places as are built over hot springs, &c. See **STONE** and **SPAR**.

Of this kind are the *sal*, *alumen*, and *vitriolum stalaeticum*; the *minera ferri stalaetica*, the *vitriolum capillare*, the *alumen capillare*, &c.

The *stalaetites*, which incrustate, or line the tops and sides of caves, &c. are manifestly formed of exsudations or exstillations of petrifying juices out of the neighbouring rocky grounds. Those in the cave on the top of Bredon hill, Mr. Derham fancies, might be formed by the rains soaking through, and carrying with it impregnations from the stones; the hill, there, being all rocky.

**STALE**, the urine of cattle. See **URINE**.

**STALE** also denotes a living fowl, put in any place to allure and bring others where they may be taken. See **DECOY**.

For want of these, a lark, or any other bird, shot, his entrails taken out, and dried in an oven, in his feathers, with a stick thrust through to keep him in a convenient posture, may serve as well as a live one.

**STALK**, in botany, the stem, or stock of a plant. See **STEM**.

*Stalks* are distinguished into several kinds, viz. the *naked stalk*, which has no leaves on.—*Crested stalk*, which has furrows, or ridges.—*Winged stalk*, which has leaves on both sides.—*Striped stalk*, which is of two or more colours, &c.

*Fruticose stalk*. See the article **FRUTICOSE**.

**STALKING**, a term of considerable import in fowling; applied to a kind of screen, or device to hide the fowler, and amuse the game, while he gets within shot.

Of such devices there are several kinds, viz.

A **STALKING hedge**, which is an artificial hedge, two or three yards long, and a yard and half high, made with small wands, to be light and portable, yet bushed out like a real hedge, with stakes to support it, while the fowler takes his aim.

**STALKING horse**, is an old jade trained up for the purpose, which will gently walk up and down as you would have him, in water, &c. beneath whose fore-shoulder, the sportsman shelters himself and gun. When thus got within shot, he takes aim from before the fore-part of the horse; which is much better than shooting under his belly.

To supply the defect of a real *stalking horse*, an artificial one is frequently made, of old canvas, shaped in form of a horse, with his head bent down, as if grazing; stuffed with any light matter, and painted.—In the middle it is fixed to a staff shod at the foot, to stick into the ground while aim is taken.—For change, when the fowls begin to be used to the *stalking horse*, and to know it, some *stalk* with an ox, cow, deer or the like.

Others use a *stalking-tree*, and others a *stalking-bush*.

**STAMINA**\*, in botany, those fine threads, or capillaments growing up within the flowers of tulips, lilies and most other flowers, around the style or pistil. See **FLOWER** and **PISTIL**.

\* The word is Latin, and literally signifies threads.

On the tops of the *stamina*, or chives, grow those little capsule or knobs, called *apices*, which M. Tournefort makes

essential to the *stamina*; whence M. Reaumur, who assures us in the memoirs of the French academy, that he could never discover any apices on the threads of the fucus marinus, refuses to call them *stamina*; though he adds, one may suppose that the apices fall as soon as the threads or *stamina* begin to be unfolded. See **APICES**.

In some tubular flowers, as the narcissus, digitalis, &c. M. Geoffroy observes the *stamina* are exceedingly short; and in some flowers there are no *stamina* at all, as in the long aristolochia, wherein the apices are immediately fastened on the capsula which incloses the fruit. In some other flowers, as those of thistles, lettuce, chicory, &c. the apices are inclosed in the *stamina*; several of which uniting form a little tube in manner of a scabbard, in the inside whereof are the apices furnished with their farina; the rest of the cavity being taken up by the pistil; which is a little thread placed on the embryo of the seed.

M. Tournefort takes the use of the *stamina* to be, as it were, so many excretory canals, for discharging the growing embryo of its redundant juices; and of these excrements of the fruit, he takes that farina or dust, found in the apices, to be formed. See **FARINA**.

But M. Geoffroy, Mr. Bradley, and other late writers on plants, as well as some former, assign the *stamina* a nobler use. These authors, explaining the generation of plants, in a manner analogous to that of animals, maintain the use of the *stamina* to be to secrete, in their fine capillary canals, a juice, which being collected, hardened and formed into a farina or dust in the tips or apices, is thence, when the plant arrives at maturity, discharged, by the bursting of the apices, upon the top of the pistil; whence is a passage for it to descend into the uterus, where being received, it impregnates and fecundifies the plant.

On this principle, it may be said, that the same flower contains both sexes, which contribute each their part to the generation: that the *stamina* are the male part; and the farina, which is always found of an oily, glutinous nature, the seminal liquor; and that the pistil is the female part, which conducts the semen to the ova or embryo's. See **GENERATION** of plants.

**STAMINA**, in the animal body, are those simple, original parts, which existed first in the embryo, or even in the seed; and by whose distinction, augmentation, and accretion by additional juices, the human body, at its utmost bulk is supposed to be formed. See **EMBRYO**, **BODY**, &c.

All that is essential to the animal, are the *stamina*, which exist *in ovo*; the rest being foreign, additional and even accidental.

The *stamina* seem to coincide with the solids, which are surprizingly small in quantity. See **SOLID**.

**STAMINEOUS flowers**, among botanists, are such as are so far imperfect, as to want those coloured leaves, we call *petala*; and which only consist of a pistil surrounded by *stamina*. See **FLOWER**, **STAMINA**, &c.

Such plants as bear *stamineous* flowers, Mr. Ray makes to constitute a large genus which he calls *herbæ flore imperfectæ, sive apetalæ, stamineæ*.—And these he divides into such as,

1. Have their fruit or seed totally divided from the flower; which are such plants as are said to be of different sexes; the reason of which is, that from the same seed, some plants shall arise with flowers, and no fruit; and others, with fruit, and no flowers: as hops, hemp, stinging-nettles, spinach, mercurialis and phyllon.

2. Such as have their fruit only a little disjoined from their flowers; as the ambrosia, bardana minor, ricinus, and the heliotropium tricocon.

3. Such as have their fruit immediately contiguous, or adhering to their flower: and the seed of these is either, 1. Triangular; of which sort, some are lucid and shining, as the lapathum, rhabarbarum, and bistorta, to which also may be added the persicaria: others are rough and not shining; as the helleborus albus, fegopyrum, convolvulus niger, and the polygonum. 2. Such as have a roundish seed, a little flattened or compressed, or of any other figure but the former triquetrous or triangular one; and these have their flower, or the calyx of the flower, adhering to the bottom or basis of the seed or fruit; as the potamogeton, blitum sylvestre, parietaria, atriplex, blitum sativum, amaranthes hoclocerieus, and the saxifraga aurea. 3. Such whose flowers adhere to the top of the seed; as the beta, asarum, archimilla. And to these kind of plants, Mr. Ray reduces also the kali geniculatum, sedum fruticosum, the scoparia or belvidere of the Italians.

**STAMPING-mill**, or *knocking-mill*, an engine used in the tin-works, to bruise the ore small. See **TIN**.

**STANCHEONS**, in building. See **PUNCHION**.

**STAND**, *Stable STAND*. See **STABLESTAND**.

**STANDARD**\*, in war, a sort of banner or flag, bore as a signal for the joining together of the several troops belonging to the same body. See **FLAG**, &c.

\* Du Cange derives the word from *standarum* or *stantarum*, *standardum*, or *standale*, words used in the corrupt Latin, to signify the principal flag of an army. Menage derives it from the German, *ständer*, or the English, *stand*.

The *standard* is usually a piece of silk, a foot and half square, on which is embroidered the arms, device, or cypher of the prince, or the colonel.—It is fixed on a lance, eight or nine foot long, and carried in the centre of the first rank of a Squadron of horse. See SQUADRON.

The *standard* is used for any martial ensign of horse; but more particularly for that of the general; or the royal *standard*.—Those born by the foot are rather called *colours*. See COLOUR, FLAG, and ENSIGN.

The ancient kings of France bore St. Martin's hood for their *standard*. The Turks preserve a green *standard* born by Mahomet, with a world of devotion; as believing it to have been brought down by the angel Gabriel. Every time it is displayed, all who profess the Mahometan faith, are obliged to take arms; those who refuse, are to be deemed as infidels. STANDARD, in commerce, the original of a weight, measure, or coin, committed to the keeping of the magistrate, or deposited in some public place, to regulate, adjust, and try the weights used by particular persons in traffic. See MEASURE, WEIGHT, &c.

The justness of weights and measures, is of that consequence to the security and good order of trade, that there is no civilized nation but makes it part of their policy to preserve the equality thereof by means of *standards*. The Romans and Jews even seem to have affixed a kind of religious worship to these *standards*, by laying them up in their temples, as it were under the eye of their deities.

The *standards* of weights and measures in England, are appointed by Magna Charta, to be kept in the Exchequer, by a special officer, called the *clerk*, or *comptroller of the market*. See CLERK of the market.

The *standard* of gold coin is 22 carats of fine gold, and 2 carats of alloy in the pound weight troy; and the French, Spanish, and Flemish gold, are nearly of the same fineness.—The pound weight is cut into forty-four parts and a half, each current for 21 shillings. See GUINEA, COINAGE, ALLOY, CARAT, &c.

The *standard* of silver is 11 ounces and two penny weight of silver, and 18 penny weight of alloy of copper. Whether gold or silver be above or below *standard*, is found by assaying. See ASSAY.

STANDARDS, or STANDELS, in husbandry, are young trees, reserved at the felling of woods, for growth of timber.

STANNARIES, STANNARIA, the mines and works, where tin is dug, and purified; as in Cornwall, Devonshire, &c. See TIN.

There are four courts of the *stannaries* in Devonshire, and as many in Cornwall; and several liberties granted to them by several acts of parliament, in the time of Edward I. &c. though somewhat abridged under Edward III. and 17 Car. I. c. 15.

STANZA\*, in poetry, a certain stated number of grave verses, containing some perfect sense, terminated with a rest, or pause.

\* The word is Italian, and literally signifies a stand or station, because of the pause to be made at the end of each *stanza* or complete sense.

What the *couplet* is in songs, and the *strophe* in odes, the *stanza* is in the greater and graver pieces, as epic poems, &c. See COUPLET and STROPHE.

Indeed the Italians scarce write any poems, but they divide them into *stanza's*.—There are *stanza's* of four, six, eight, ten, twelve verses, and sometimes of an uneven number of verses, as five, seven, &c. but these last are somewhat more difficult to execute, by reason of the three verses to one rhyme. The French lay it down as a rule, that if the first *stanza* begin with a masculine, or a feminine verse, the second is to begin and end with the same.

Every *stanza* ought not only to contain a perfect sense, but to be terminate with some lively and ingenious thought, or some just and pertinent reflexion.

*Stanza's* were first introduced from the Italian into the French poetry, about the year 1580, and thence transferred into the English.

The use of *stanza's* in tragedy, or comedy, is condemned by all the best critics: for though we speak verse on the stage, it is still presumed we are speaking prose. *Stanza's* shew a degree of ingenuity on the part of the poet, which has nothing of nature in it on the part of the actor. Add to this, that *stanza's* are not fit to express every thing: wrath, threatening, &c. sit very ill on a regular *stanza*: though irresolution, reveries, and every thing that leads the actor to think on what he is to resolve, agrees well enough with the unequal cadence of the *stanza*.

STAPES, in anatomy, a little bone situate in a cavity of the fenestra ovalis; thus called from its resembling a stirrup. See EAR.

The *stapes* is one of the four little bones fastened to the tympanum of the ear, first discovered and published, as Fallopius tells us, by Jo. Phil. ab Ingrassia, a physician of Sicily. Its use is in stretching, or relaxing the membrana tympani. See TYMPANUM; see also HEARING and EAR.

STAPHYLINUS. See PALOTOSTAPHYLINUS, PERISTAPHYLINUS, PTERYGOSTAPHYLINUS, and SPHENOSTAPHYLINUS.

STAPLE\*, STAPULA, primarily signifies a public place, or market, whither merchants, &c. are obliged to bring their goods to be bought by the people: as the Greve, or the places along the Seine, for the wines and corns at Paris; whither the merchants of other parts are obliged to bring those commodities. See MARKET.

\* Vossius and Menage derive the word from *staplar*, which is found in the Ripuary laws, signifying a place where justice is administered. Others derive it from the German *stapel*, or Latin *stapula*, which Boethornius derives further, from the German *stapelen*, to put in a heap.

STAPLE, also signifies a city or town, where merchants jointly agree to carry certain commodities, as wool, cloth, lead, tin, &c. in order to their being commodiously sold by the great. In England, *staples* were settled and appointed to be constantly kept at York, Lincoln, Newcastle upon Tyne, Norwich, Westminster, Canterbury, Chichester, Winchester, Exeter, and Bristol; to which places merchants and traders were to carry goods to sell in those parts.

The *staple* commodities of England, were chiefly wool, leather, cloth, tin, lead, &c. though by *staple goods*, is now generally meant any proper saleable commodities, not easily subject to perish. See WOOL, &c.

The principal *staples* now existing, are Amsterdam for all goods from the East-Indies, Spain, the Mediterranean, and the Baltic: Flushing for those of the West-Indies; Middleburgh for French wines; Dort for Rhenish wines and English cloth; Verre in Zeland for Scotch merchandizes, &c.

The *staples* in the Levant, called by the French, *Eschelles*, i. e. *scales*, are such cities where the English, French, Dutch, Italians, &c. have consuls, factors, and magazines; and whither they send vessels regularly each year.—The principal of these are Smyrna, Alexandretta, Aleppo, Seyda, Cyprus, Salée, Alexandria, Cairo, Tunis, Algiers, Tripoli, the Morea, Candia, and the islands of the Archipelago. See FACTORY.

Statute STAPLE, } See the articles { STATUTE.  
Law of the STAPLE, } LAW.

STAR, STELLA, in astronomy, a general name for all the heavenly bodies. See HEAVEN.

The *stars* are distinguished, from the phenomena of their motion, &c. into *fixed* and *erratic*.

Erratic, or wandering STARS, are those whose distances and places, with regard to each other, are continually changing. These are what we properly call *planets*. See PLANET.

Though, to the same class, may likewise be referred, what we popularly call *blazing stars* or *comets*. See COMET.

Fixt STARS, called also, by way of eminence, *stars*, are those which continually keep the same distance, with regard to each other. See FIXT.

The principal points that have come under the consideration of astronomers concerning the *fixt stars*, are their *distance*, *magnitude*, *number*, *nature*, and *motion*.

Distance of the *fixed STARS*.—The *fixed stars* are bodies exceedingly remote from us; so remote, that we have no distances in the planetary system to compare to them. See DISTANCE.

Their immense distance is argued hence, that they have no sensible parallax: that is, that the diameter of the earth's orbit bears no sensible proportion thereto; but they are seen the very same in all the points thereof. Mr. Flamsteed, indeed, seems to have discovered a small parallax: *fiurus*, e. gr. he finds to have a parallax of twenty seconds. Admitting this, we have data enough to determine their distance, a thing hitherto despaired of.

For thus, the sun's parallax being had, and his mean distance being 34377 semi-diameters of the earth, the distance of *fiurus* from the earth will be found to be 35477064 semi-diameters of the earth. See PARALLAX.

Mr. Huygens attempts the distance of the *stars* by another method, viz. by making the aperture of a telescope so small, as that the sun through it appears no bigger than *fiurus*. In this state he found the sun's diameter to be as 1 to 27664 of his diameter, when seen with the naked eye. Were the sun's distance, then, 27664 times as great as it is, it would be seen of the same diameter with *fiurus*; so that allowing *fiurus* to be equal in magnitude with the sun (which is a very reasonable supposition) the distance of *fiurus* from the earth, will be found to be to that of the sun from the earth, as 27664 to 1. On which principle, *fiurus* will be 951005328 semi-diameters of the earth distant from our earth.

If it be urged, that these methods are too precarious, to conclude any thing from them, yet this we can demonstrate, that the *stars* are remoter than saturn; nay, that they are vastly more remote than saturn, as saturn has a great parallax, and the *stars* scarce any at all. See SATURN.

The *magnitudes* of the *fixed STARS*, appear to be very different; which difference probably arises, not from any diversity in their real magnitudes, but from their distances, which are different. From this difference, the *stars* become distributed into seven several classes, called *magnitudes*. See MAGNITUDE.

The first class, or *stars* of the first magnitude, are those nearest us, and whose diameters are, therefore, biggest. Next these,

these, are those of the second magnitude, and so on to the sixth, which comprehends the smallest *stars* visible to the naked eye. All beyond, are called *telescopic stars*. See TELESCOPICAL. Not that all the *stars* of each class appear justly of the same magnitude; there is a great latitude in this respect; and those of the first magnitude, appear almost all different in lustre and size. Other *stars* there are, of intermediate magnitudes, which astronomers cannot refer to this, rather than the next class, and therefore place them between the two.

Procyon, for instance, which Ptolemy makes of the first magnitude, and Tycho of the second, Mr. Flamsteed lays down as between the first and second.

Thus, instead of six several magnitudes, we have really six times six.

Some authors assert, that the *stars* of the first magnitude, subtend an angle of at least a minute; but the earth's orbit seen from the *fixed stars*, we have observed only subtends an angle of twenty seconds; and hence they conclude, that the diameter of the *stars* is vastly greater than that of the earth's whole orbit.

Now a sphere, whose semi-diameter only equals the distance between the sun and earth, is ten millions of times greater than the sun; consequently, the *fixed stars* must be much more than ten millions of times greater than the sun.

But here is a mistake; for the diameters, even of the largest *stars* viewed through a telescope, which magnify, *e. gr.* a hundred times, subtend no sensible angle at all, but are mere lucid points.

The *stars* are likewise distinguished, with regard to their situation, into *asterisms* or *constellations*, which are nothing but assemblages of several neighbouring *stars*, considered as constituting some determinate figure, as of an animal, &c. and denominated therefrom: a division as ancient as the book of Job; wherein we find mention of orion and the pleiades, &c. See CONSTELLATION.

Besides the *stars* thus distinguished into magnitudes and constellations, there are others not reduced to either. Those not reduced into constellations, are called *informes*, or *unformed stars*; of which kind, several so reputed by the ancients, have been since formed into new constellations by the modern astronomers; as *cor Caroli* by Dr. Halley, *scutum Sobiesci*, by Hevelius, &c. See INFORMES.

Those not reduced to classes or magnitudes, are called *nebulous stars*, being such as only appear faintly, in form of little lucid nebulae or clouds. See NEBULOUS.

The number of STARS appears to be vastly great, almost infinite; yet have astronomers long ago ascertained the number of those visible to the eye; which are found vastly fewer than one would imagine.—Hipparchus 125 years before the incarnation, on occasion of a new *star* then appearing, made a catalogue of the *stars*, i. e. an enumeration thereof, with an exact description of their magnitudes, situations, longitude, latitude, &c. that it might be known, if any the like change should happen for the future in the heavens. Hipparchus made the number of visible *stars* 1022. These were reduced into forty-eight constellations, and he laid it down, that if there sometimes appeared more in winter nights, it was owing to a deception of the sense.—Ptolemy added four *stars* to Hipparchus's catalogue, and made the number 1026.—In the year 1437, Ulug Beigh, grandson of Tamerlane, in a new catalogue he made, only gave 1017.

But in the seventeenth century, when astronomy began to be retrieved, their number was found to be much greater.—To the forty-eight constellations of the ancients, were added twelve new ones, discovered towards the south-pole, and two towards the north; besides several others not universally admitted, as the flower de lis, the royal oak, &c. See CONSTELLATION.

Tycho Brahe published a catalogue of 777 *stars*, from his own observations; which Kepler, from Ptolemy and others, increased to 1163, Ricciolus, to 1468, and Bayer, to 1725: Dr. Halley added 373 observed by him, within the antarctic circle.—Hevelius, from his own observations, and those of Dr. Halley, and the ancients, made a catalogue of 1888 *stars*: and Mr. Flamsteed has since made a catalogue of no less than 3000 *stars*, all from his own most accurate observations. See CATALOGUE.

Of these 3000, it is true, there are many only visible through a telescope; nor does a good eye scarce ever see more than an hundred at the same time in the clearest heaven: the appearance of innumerable more, frequent in clear winter nights, arises from our sight's being deceived by their twinkling, and from our viewing them confusedly, and not reducing them to any order. Yet for all this, the *stars* are really almost infinite. Riccioli makes no scruple to affirm, in his new *Almagest*, that a man who should say there are above twenty thousand times twenty thousand, would say nothing improbable.

For a good telescope directed almost to any point of the heavens, discovers numbers that are lost to the naked sight: particularly in the milky way, which is nothing but an assemblage of *stars*, too remote to be singly seen, but so closely disposed, as to give a luminous appearance to that part of the heavens where they are. See GALAXY.

In the single constellation of the pleiades, instead of six or seven *stars* seen by the best eye, Dr. Hook, with a telescope twelve foot long, told seventy-eight; and with larger glasses many more of different magnitudes. F. de Rheita, a capuchin, affirms, that he has observed above 2000 *stars* in the single constellation of orion.

The same author found above 188 in the pleiades. And Huygens looking at the *star* in the middle of orion's sword; instead of one, found it to be twelve. Galileo found eighty in orion's sword; twenty-one in the nebulous *star* of his head; and thirty-six in the nebulous *star*, praesepe.

The changes that have happened in the STARS, are very considerable; contrary to the opinion of the ancients, who held, that the heavens and heavenly bodies were incapable of any change, the matter thereof being permanent and eternal, infinitely exceeding the hardness of diamonds, and not susceptible of any different form. And, in effect, till the time of Aristotle, and even two hundred years afterwards, there had no change been observed.

The first, was in the year 125, before the incarnation; when Hipparchus discovering a new *star* to appear, was first induced to make a catalogue of the *stars*, that posterity, as we have observed, might perceive any future changes of the like kind.

In the year 1572, Tycho Braise, observed another new *star* in the constellation cassiopeia, which was, likewise, the occasion of his making a new catalogue. Its magnitude, at first, exceeded that of the biggest of our stars, jurius and lyra; it even equalled that of venus, when nearest the earth; and was seen in fair day-light. It continued sixteen months; towards the latter part whereof, it began to dwindle, and at last totally disappeared, without any change of place in all that time.

Leovicius tells us of another *star* appearing in the same constellation, about the year 905, which resembled that of 1572; and quotes another ancient observation, whereby it appears, that a new *star* was seen about the same place in 1264.

Dr. Keil takes those to have been all the same *star*; and does not know but it may make its appearance a-new 150 years hence.

Fabricius discovered another new *star* in the neck of the whale, which appeared and disappeared several times in the years 1648 and 1662. Its course and motion, are described by M. Bouillaud.

Simón Marius discovered another in andromeda's girdle, in 1612 and 1613; though M. Bouillaud says, it had been seen before, in the 15th century. Another was observed by Kepler in serpentarius. Another of the third magnitude in the constellation cygnus, near the bill, in the year 1601, which disappeared in 1626, and was observed again by Hevelius in 1659, till the year 1661, and again in 1666 and 1671, as a *star* of the sixth magnitude.

It is certain, from the ancient catalogues, that many of the ancient *stars* are not now visible. This is particularly notorious in the pleiades, or seven *stars*, whereof only six are now visible to the eye; a thing long ago observed by Ovid: witness the verse, *Quæ septem dici, sex tamen esse solent.*

M. Montanere, in his letter to the Royal Society in 1670, observes, that there are now wanting in the heavens, two *stars* of the second magnitude, in the stern of the ship argo and its yard; which had been seen till the year 1664. When they first disappeared it is not known; but he assures us, there was not the least glimpse of them in 1668. He adds, he has observed many more changes in the *fixed stars*, even to the number of an hundred.

For the nature of the fixt STARS, their immense distance leaves us greatly at a loss about it. What we can gather for certain from their phenomena, is as follows:

1°. That the fixt *stars* are greater than our earth. This is demonstrable thus: suppose two *stars* C and D (*Tab. astronomy*, fig. 7.) the one in the eastern horizon, and the other in the western. As soon as D arrives in C; C will appear in D. But since both move with the same velocity, while C describes the arch CHD; the *star* D describing an arch equal to CDH, will appear in F: wherefore, if the *stars* C and D be less than the earth, the *star* C will not be seen in the eastern horizon, when the other, D, is arrived at the western: But as this is contrary to experience, it follows, that the *stars* being in L and S, and there seen at the same time by spectators in A and B, are greater than the earth A B.

2°. The fixt *stars* are farther distant from the earth, than the farthest of the planets. For we frequently find the fixt *stars* hid behind saturn's body, the highest of the planets.

3°. The fixt *stars* shine with their own light: for they are much farther from the sun than saturn, and appear much smaller than saturn; but since, notwithstanding this, they are found to shine much brighter than saturn, it is evident they cannot borrow their light from the same source as saturn does, viz. the sun: but since we know of no other luminous body beside the sun, whence they might derive their light; it follows, that they shine with their own native light. Hence 1°. we deduce, that the fixt *stars* are so many suns; for they have all the characters of suns. See SUN.

2°. That in all probability, the *stars* are not smaller than our sun,

3°. That

3°. That it is highly probable, each *star* is the centre of a system, and has planets or earths revolving round it, in the same manner as round our sun, *i. e.* has opaque bodies illuminated, warmed and cherished by its light. See SYSTEM.

How immense then, does the universe appear! Indeed it must either be infinite, or infinitely near it. See UNIVERSE.

Kepler, it is true, denies, that each *star* can have its system of planets as ours has; and takes them all to be fixed in the same surface or sphere; urging, that were one twice or thrice as remote as another, it would appear twice or thrice as small, supposing their real magnitudes equal; whereas there is no difference in their apparent magnitudes, justly observed, at all. But to this we oppose, that Huygens has not only shewn that fires and flames are visible at distances where other bodies, comprehended under equal angles, disappear; but it should likewise seem, that the optic theorem about the apparent diameters of objects being reciprocally proportional to their distances from the eye, does only hold while the diameter of the object has some sensible ratio to its distance.

4°. The *stars* which appear and disappear by turns, being always found to increase in magnitude at their first appearance, and to decrease as they begin to disappear, and being likewise still visible through telescopes, for some time after they are lost to the naked eye (of which we have various instances in the *Philosophical Transactions*) seem to be no more than planets performing their periods about the fixed *stars*, as their respective suns; unless any person should rather incline to Dr. Keil's opinion, *viz.* that the *stars* lose their brightness, and disappear, by their becoming covered with maculæ or spots, such as are frequently found to overspread the sun. See SPOTS.

5°. Those temporary *stars*, which, upon their disappearing, have never been found to return again; are probably conjectured to be of the number of comets, which make long excursions from their suns, or the centers of the upper planetary systems, *i. e.* from the fixed *stars*; returning too seldom to have their return perceived. See COMET.

**Motion of the STARS.**—The fixed *stars* have two kinds of motions; one called the *first*, *common* or *diurnal motion*, or the *motion of the primum mobile*: by this they are carried along with the sphere or firmament wherein they appear fixed, round the earth, from east to west, in the space of twenty-four hours.

The other, called the *second* or *proper motion*, is that whereby they go backwards from west to east round the poles of the ecliptic, with an exceeding slowness, as not describing above a degree of their circle in the space of seventy-one or seventy-two years, or 51 seconds in a year.

Some have imagined, I do not know on what grounds, that when they are got round to the points, whence they first departed, nature will have finished her course, and the *stars* having performed their career, the heavens will remain at rest, unless the being, who first gave them motion, appoint them to begin another circuit.

On the footing of this calculation, the world should last about 30000 years, according to Ptolemy; 25816 according to Tycho; 25920 according to Riccioli; and 24800 according to Cassini. See PRECESSION of the equinox.

In effect, the latitudes of the fixed *stars*, we find, by comparing the observations of the ancient astronomers with those of the moderns, continue still the same; but their longitude is by this second motion always increasing.

Thus *e. gr.* the longitude of cor leonis, was found by Ptolemy, *A. D.* 138, to be  $2^{\circ} 30'$ ; in 1115 it was observed by the Persians to be  $17^{\circ} 30'$ ; in 1364, by Alphonsus  $20^{\circ} 40'$ ; in 1586 by the prince of Hesse,  $24^{\circ} 11'$ ; in 1601 by Tycho,  $24^{\circ} 17'$ ; and in 1690 by Mr. Flamsteed  $25^{\circ} 31' 20''$ ; whence the proper motion of the *stars*, according to the order of the signs in circles parallel to the ecliptic, is easily inferred.

It was Hipparchus first suspected this motion, upon comparing the observations of Tymocharis and Aristyllus with his own. Ptolemy, who lived three centuries after Hipparchus, demonstrated the same by undeniable arguments. See LONGITUDE.

Some, it is true, have imagined a change in the latitudes of the *stars*; but such an opinion has little countenance from observation. See LATITUDE.

Tycho Brahe makes the increase of longitude in a century  $1^{\circ} 25'$ ; Copernicus  $1^{\circ} 23' 40'' 12'''$ ; Flamsteed and Riccioli  $1^{\circ} 23' 20''$ ; Bullialdus  $1^{\circ} 24' 54''$ ; Hevelius  $1^{\circ} 24' 46'' 50''$ ; whence, with Flamsteed, the annual increase of the longitudes of the fixed *stars* may be well fixed at  $50''$ .

From these data, the increase of the longitude of a *star* for any given time, is easily had; and hence the longitude of a *star* for any given year, being given, its longitude for any other year is readily found: *e. gr.* the longitude of sirius in Mr. Flamsteed's tables for the year 1690 being  $9^{\circ} 49' 1''$ ; its longitude for the year 1724 is found, by multiplying the interval of time, *viz.* 34 years by  $50''$ , the product  $1700''$  or  $28' 2''$  added to the given longitude, will give the longitude required,  $10^{\circ} 17' 3''$ .

The principal phenomena of the fixed *stars*, arising from

VOL. II. N°. CXLVI.

their common and proper motion, besides their longitude, are their altitudes, right ascensions, declinations, occultations, culminations, risings and settings; which see under their proper articles, ALTITUDE, ASCENSION, DECLINATION, OCCULTATION, &c.

The several *stars* in each constellation, *e. gr.* in taurus, bootes, hercules, &c. their longitudes, latitudes, magnitudes, names, places, &c. as fixed by Mr. Flamsteed in the *Britannic Catalogue*; see under the proper article of each constellation, TAURUS, BOOTES, HERCULES, &c.

To learn to know the several fixed *stars* by the globe; see GLOBE.

The parallax and distance of the fixed *stars*, see under PARALLAX and DISTANCE.

Circumpolar STAR, } See { CIRCUMPOLAR.  
Morning STAR, } MORNING.  
Place of a STAR, } PLACE and APPARENT.  
Pole STAR, } POLE.

STAR, in fortification, a little fort, with five or more points, or salient and re-entrant angles, flanking one another, and their faces 90 or 100 foot long. See FORT.

Formerly, *star* forts were frequently made in lines of circumvallation, after two or three redoubts. See REDOUBT and SCONCE.

STAR, in pyrotechny, a composition of combustible matters, which being born or thrown aloft into the air, exhibits the appearance of a real *star*.

*Stars* are chiefly used as appendages to rockets, a number of them being usually inclosed in a conical cap or cover at the head of the rocket, and carried up with it to its utmost altitude, where the *stars* taking fire, are spread around, and exhibit an agreeable spectacle. See ROCKET.

To make STARS; mix three pounds of salt petre, eleven ounces of sulphur, one of antimony, and three of gunpowder dust: or twelve ounces of sulphur, six of salt petre, five and a half of gunpowder dust, four ounces of oilibum, one of mastic, camphir, sublimate of mercury, and half a one of antimony and orpiment.

Moisten the mass with gumwater, and make it into little balls, of the size of a chestnut, which dry either in the sun or the oven. These set on fire in the air, will represent *stars*.

STAR, in heraldry, denotes a charge frequently born on the shield, and the honourable ordinaries, in the figure of a *star*. It differs from the *mullet*, or *spur-rowel*, in that it is not pierced as this last is. See MULLET.

It usually consists of five rays or spokes. When it has six or eight, as among the Germans and Italians, particular mention must be made thereof in blazoning.

On medals, STARS are marks of consecration and deification, being intended as symbols of eternity.—F. Joubert says, they sometimes express the children of princes reigning; and sometimes the children dead, and placed in the rank of deities. See DEIFICATION.

STAR, is also a badge of the honourable orders of the garter and bath. See GARTER.

Order of the STAR, or our lady of the STAR, an order of knighthood instituted by king John of France in the year 1352, denominated from a *star* they wore on the stomach. At first there were but thirty knights; but the order in time became depreciated by the multitude of persons admitted, without any distinction. For which reason, Charles VII. when grand-master thereof, quitted it, and gave it the chevalier du Guet, knight of the watch at Paris, and his archers, who still wear a *star* on their coats. But this account is contradicted by others; who will have the order instituted by king Robert in 1022 in honour of the holy virgin, and to have fallen into disregard during the wars of Philip de Valois.

Justiniani mentions another order of the *star*, at Messina in Sicily, called also the order of the crescent. It was instituted in the year 1268, by Charles of Anjou, brother of St. Louis, king of the two Sicilies.

Others will have it instituted in 1464, by Renatus duke of Anjou, who took the title of king of Sicily. At least, it appears from the arms of this prince, that he made some alteration in the collar of the order; for instead of flower-de-luces and *stars*, he only bore two chains, whence hung a crescent, with the old French word *loz*, which in the language of Rebus, signified *loz in a crescent*.

The order being dropt into obscurity, was raised again by the people of Messina, under the name of the noble academy of the knights of the *star*; reducing the ancient collar to a single *star* placed on a forked cross, and the number of knights to sixty-two. Their device was, *monstrant regibus astra viam*,

M R

which they expressed by the four initial letters \* with

A V

the *star* in the middle.

STAR, in the manage.—White STARS in the forehead, are esteemed good marks in all horses, except white and grey ones: where nature fails to produce this good criterion, our jockies have frequent recourse to art. See HORSE.

The method of making *stars*, practised among the Dutch, is to roast a large onion in hot ashes, and when near tho-

II I i

roughly

roughly done, to divide it in two, and dip it in scalding hot walnut oil. This done, they immediately apply the flat side thereof to the place the *star* is to be on, and keep it there half an hour. After taking it off, they anoint the scalded place with ointment of roses: in a short time, the scarf skin falls off, and white hairs grow up in its room; but the middle always continues bare of hair, which is the certain characteristic of an artificial *star*.

The method most used among us, is to shave the hair from the place it is to be made on; then to apply a little oil of vitriol with a feather, or the like, passing it lightly over the bald place. This eats away the roots of the former hair, which will be succeeded by white. The sore is healed up with copperas and green ointment.

To make a *black star*, on a white or other coloured horse; wash the place to be changed, frequently, with fern roots and sage boiled in lye; and it will breed black hairs. The same may be done, by beating four milk, galls and rust together, and anointing the part therewith.

A *red star* is made with an ounce of aqua-fortis, a pennyworth of aqua-vitæ, and silver to the value of eighteenpence, all heated together in a glass, and the place anointed therewith. This immediately turns the hair to a perfect red; but it lasts no longer than till the horse casts his coat; when it is to be renewed.

**STARBOARD**, denotes the right hand side of a ship: as larboard does the left. See **LARBOARD**.

They say, *starboard the helm*, or *helm a starboard*, when the man at the helm should put the helm to the right side of the ship. See **HELM**.

**STARCH**, a fecula, or sediment, found at the bottom of vessels wherein wheat has been steeped in water; of which fecula, after separating the bran from it, by passing it through sieves, they form a kind of loaves, which being dried in the sun, or an oven, is afterwards broke into little pieces, and so sold.

The best is white, soft, and friable, easily broke into powder. Such as require very fine *starch*, do not content themselves, like the *starch-men*, with refuse wheat, but use the finest grain. The process is as follows;

*Method of making STARCH of wheat.*—The grain being well cleaned, is put to ferment in vessels full of water, which they expose to the sun when in its greatest heat; changing the water twice a day, for the space of eight or twelve days, according to the season. When the grain bursts easily under the finger, they judge it sufficiently fermented. The fermentation perfected, and the grain thus softened; it is put, handful by handful, in a canvas bag, to separate the flour from the husks, which is done by rubbing and beating it on a plank, laid across the mouth of the empty vessel that is to receive the flour.

As the vessels are filled with this liquid flour, there is seen swimming a-top, a reddish water, which is to be carefully skimmed off from time to time, and clean water put in its place; which, after stirring the whole together, is all to be strained through a cloth or sieve, and what is left behind, put into the vessel with new water, and exposed to the sun for some time; and as the sediment thickens at the bottom, they drain off the water four or five times, by inclining the vessel, but without passing it through the sieve. What remains at bottom, is the *starch*, which they cut in pieces to get out, and leave it to dry in the sun. When dry, it is laid up for use.

To use *starch*, they take as much as is needed, and steep it in water over night, changing the water four or five times. The *starch-men* using the refuse of wheat, only observe a part of all these things in their process; but their *starch* falls far short of this.

*Starch* is used along with smalt, or stone blue, to stiffen and clear linen. The powder thereof is also used to whiten, and powder the hair.

It is also used by the dyers to dispose their stuffs to take colours the better.

**STAR-CHAMBER**, *camera stellata*, was a chamber at Westminster, so called, from its roof being painted with gilt stars. See **CHAMBER**.

**STAR-FORT**, or *redoubt*, in fortification, is a work with several faces, generally composed of from five to eight points, with salient and re-entrant angles flanking one another; every one of its sides containing from twelve to twenty-five fathoms. See **FORT**, and **REDOUBT**.

**STARTING**, among brewers, the putting of new beer, or ale, to that which is decayed, to revive it again.

**STATE**, or *estate*, an empire, kingdom, province, or extent of country under the same government. See **ESTATE**, **EMPIRE**, **PROVINCE**, &c.

The *state*, or *states* of the king of England, include the British islands, and the West India plantations, as Virginia, Carolina, Maryland, &c. to which may be added the dutchies of Brunswick-Lunenbourg, Bremen, &c.

*Free STATE*. See the article **FREE**.

**STATE** is also used for the policy or form of government of a nation.—Hence, ministers of *state*; reasons of *state*, &c. See **GOVERNMENT**, **MINISTER**, **RATIO status**, &c.

Politicians distinguish several forms of *state*, viz. the *monarchic*, as that of England; see **MONARCHY**: the *democratic*, as that of Rome and Athens; see **DEMOCRACY**: the *oligarchic*, as that of Venice; see **OLIGARCHY**: and the *aristocratic*, as that of Sparta; see **ARISTOCRACY**, &c.

**STATE** of a disease, the same with *acme*. See **ACME**.

**STATED winds**. See the article **WIND**.

**STATER**, an ancient coin, weighing four Attic drachms: it was either of silver, or gold; the former worth about two shillings four-pence sterling. See **COIN**.

**STATERA Romana**, or *stilyard*, a name given to the Roman balance. See **STILYARD**.

**STATES**, a term applied to the several orders, or classes of a people, assembled to consult of matters for the publick good. See **ESTATES**.

**STATES-GENERAL**, the name of an assembly, consisting of the deputies of the seven United Provinces.

In this assembly, the deputies of each province, what number soever they be, have only one voice, and are esteemed as but one person; the votes being given by provinces. Each province presides at the assembly in its turn, according to the order settled among them; Guelderland presides first, then Holland, &c.

This assembly is the representative of the sovereignty of the union, which resides properly in the general assembly of the states themselves of all the provinces: but as that assembly ordinarily consists of seven or eight hundred persons, it was resolved, after the departure of the earl of Leicester, in order to avoid expence, and the confusion of so numerous a body, that the provincial estates should, for the future, be ordinarily represented by their deputies, under the name of the *states-general*, who were always to reside at the Hague, and who alone are now called *states-general*.

Since that new regulation, there have been but two general assemblies of the *states* of the provinces; the former held in 1600 at Berg-op-Zoom, to confirm the truce agreed on with the arch-duke Albert, with the greater solemnity: and the latter in 1651.

**STATES of Holland**, an assembly consisting of the deputies of the councils, or colleges of each city; wherein resides the sovereignty of that province.

Originally, none but the nobility and the six principal cities had seats, or voices in the *states*.—At present there are the deputies of eighteen cities.—The nobility have the first voice, The other provinces of the union have likewise their *states*, representing their sovereignty: deputies from which constitute what they call the *states-general*. See **STATES-GENERAL**.

**STATHOLDER**. See the article **STADTHOLDER**.

**STATICAL baroscope**. See **BAROSCOPE**, and **BAROMETR**.

**STATICKS**, **STATICE**, a branch of mathematics, which considers weight or gravity, and the motion of bodies arising therefrom. See **MOTION**, and **HYDROSTATICKS**.

Those who define mechanics, the science of motion, make *statics* a member thereof, viz. that part which considers the motion of bodies arising from gravity. See **GRAVITY**.

Others make them two distinct doctrines; restraining mechanics to the doctrine of motion and weight in reference to the structure and power of machines; and *statics* to the doctrine of motion considered merely as arising from the weight of bodies, without any immediate respect to machines.—On which footing, *statics* should be the doctrine or theory of motion; and mechanics the application thereof to machines. See **MECHANICS**.

For the laws of **STATICKS**, see **GRAVITY**, **DESCENT**, &c.

**STATICKS**, **STATICI**, in medicine, a kind of epileptics, or persons seized with epilepsies. See **EPILEPSY**.

*Statics* differ from *cataleptics*, in that, these last have no sense of external objects, nor remember any thing that passes at the time of the paroxysm: whereas the *statici* are all the while taken up with some very strong lively idea, which they remember well enough, out of the fit. See **CATALEPSIS**.

**STATION**, in geometry, &c. a place pitched upon to make an observation, take an angle, or the like.

An inaccessible height or distance is only to be taken, by making two *stations*, from two places, whose distances are known.—In making maps of provinces, &c. *stations* are fixed on all the eminences, &c. of the country, and angles taken thence to the several towns, villages, &c.

In surveying, the instrument is to be adjusted by the needle, to answer the points of the horizon, at every *station*; the distance from the last *station* to be measured, and an angle to be taken to the next *station*: which includes the whole business of surveying. See **SURVEYING**.

In levelling, the instrument is rectified, that is placed level, at each *station*, and observations made forwards and backwards. See **LEVELLING**.

*Line of STATION* in perspective. See the article **LINE**.

**STATION**, in astronomy, the position or appearance of a planet in the same point of the zodiac for several days. See **PLANET**.

As the earth, whence we view the motions of the planets,

is out of the centre of their orbits, the planets appear to proceed irregularly; being sometimes seen to go forwards, that is from west to east, which is called their *direction*; sometimes to go backwards, or from east to west, which is called their *retrogradations*. See *DIRECTION* and *RETROGRADATION*.

Now between these two states, there must be an intermediate one, wherein the planet neither appears to go backwards nor forwards, but to stand still and keep the same place in her orbit; which is called her *station*. See *STATIONARY*.

*STATION*, *STATIO*, in church history, is applied to the fasts of the fourth and sixth days of the week; that is, Wednesday and Friday; which many among the ancients observed with much devotion, till three of the clock in the afternoon. See *FAST*.

S. Peter of Alexandria, in his *Canonical Epistle*, can. 15. observes, that it was appointed conformably to ancient tradition, to fast weekly on those days: on Wednesday, in memory of the counsel the Jews took to put our Saviour to death; and on Friday, on account of his passion.—Some regard to which is still had by the church of England. See *ABSTINENCE*.

*STATION* is also used in the church of Rome, for a church where indulgences are to be had on certain days. See *INDULGENCE*.

It was St. Gregory that fixed the *stations* at Rome, i. e. the churches where the office was to be performed each day of Lent, and on solemn feast days. These *stations* he marked down in his *Sacramentary*, as they now stand in the *Roman Missal*; appropriating them chiefly to the patriarchal and titular churches: but though the *stations* were fixed, the archdeacon did not fail at each *station*, to publish to the people the following *station*.

*STATION* is also a ceremony in the Romish church, wherein the priests or canons go out of the choir to sing an anthem before the crucifix, or the image of our lady.—This ceremony is ascribed to S. Cyril.

*STATIONARY*, in astronomy, the state of a planet when it seems to remain immoveable in the same point of the zodiac. See *STATION*.

The planets having sometimes a progressive and sometimes a retrograde motion; there will be some point wherein they appear *stationary*. Now a planet will be seen *stationary*, when the line that joins the earth's and planet's center, is constantly directed to the same point in the heavens; that is, when it keeps parallel to itself.—For all right lines drawn from any point of the earth's orbit, parallel to one another, do all point to the same star; the distance of those lines being insensible, in comparison of that of the fixed stars.

Saturn is seen *stationary*, at the distance of somewhat more than a quadrant from the sun; jupiter at the distance of 52°, and mars at a much greater distance.

Saturn is *stationary* eight days, jupiter four, mars two, venus one and a half, and mercury an half; though the several *stations* are not always equal. See *SATURN*, &c.

*STEATOCELE*, *ΣΤΕΑΤΟΚΗΛΗ*, in medicine, a rupture, or tumour of the scrotum, consisting of a fatty substance resembling suet collected therein. See *HERNIA*.

*STATUARY*, *STATUARIA*, a branch of sculpture, employed in the making of statues. See *STATUE*.

*Statuary* is one of those arts wherein the ancients surpassed the moderns: indeed it was much more popular, and more cultivated among the former than the latter. See *SCULPTURE*.—It is disputed between *statuary* and painting, which of the two is the most difficult and the most artful. See *PAINTING*.

The invention of *statuary* was at first very coarse. Leon Battista Alberti, who has an express treatise on statues, imagines that it took its rise from something casually observed in the productions of nature, that, with a little help, seemed disposed to represent the figure of some animal.—The common story is, that a maid, full of the idea of her lover, made the first essay, by the assistance of her father's implements, who was a potter. This, at least, is pretty certain, that earth is the first matter *statuary* was practised upon. See *POTTERY*.

*STATUARY* is also used for the artificer, who makes statues. Phidias was the greatest *statuary* among the ancients, and Michael Angelo among the moderns.

*STATUARY column*, } See the articles { *COLUMN*.  
*STATUARY fountain*, } { *FOUNTAIN*.

*STATUE*, *STATUA*, a piece of sculpture in full relief, representing a human figure. See *FIGURE*, and *IMAGE*.

Daviler more scientifically defines *statue* a representation in high relief and insulate, or some person distinguished by his birth, merit, or great actions; placed as an ornament in a fine building, or exposed in a public place to preserve the memory of his worth.

In strictness, the term *statue* is only applied to figures on foot; the word being formed from the Latin, *statura*, the size of the body; or from *stare*, to stand.

*Statues* are formed with the chisel, of several matters, as stone, marble, plaster, &c. See *STONE*, *MARBLE*, *CHISEL*, &c.

They are also cast of various kinds of metal, particularly gold, silver, brass, and lead.—For the method of casting *statues*, see *FOUNDRY of statues*.

Dædalus, the son of Eupalmus, who lived not only before the siege of Troy, but even before the expedition of the Argonauts, among many other notable contrivances ascribed to him, is said to have been the inventor of *statues*.—And yet it is certain, there were statuary before him; only it was he who first found how to give them action and motion, and to make them appear as if alive. Before him, they made them with the feet joined together, never intending to express any action. He first loosened the feet of his, and gave them the attitudes of people walking and acting.—The Phœnicians are said to have been the first who erected *statues* to the gods. See *IDOL*.

The Greeks succeeded in their *statues* beyond the Romans; both the workmanship and the fancy of the Roman *statues* were inferior to the Grecian. Indeed we have very few remaining, that have escaped the injuries of time.

*Statues* are usually distinguished into four kinds.—The first, are those less than the life: of which kind we have several *statues* of men, of kings, and gods themselves.

The second, those equal to the life: in which manner it was, that the ancients, at the publick expence, used to make *statues* of persons eminent for virtue, learning, or the services they had done.

The third, those that exceed the life: among which, those which surpassed the life once and a half, were for kings and emperors; and those double the life, for heroes.

The fourth kind, were those that exceeded the life twice, thrice, or even more; and were called *colossus's*. See *COLOSSUS*.

Every *statue* resembling the person it is intended to represent, is called *statua iconica*.

*Allegorical STATUE*, that which, under a human figure, or other symbol, represents something of another kind, as a part of the earth, a season, age, element, temperament, hour, &c.

*Caryatic STATUE*, } See the articles { *CARYATIDES*.  
*Colossal STATUE*, } { *COLOSSUS*.

*Curule STATUES*, those which are represented in chariots drawn by bigæ, or quadrigæ, that is, by two, or four horses: of which kind there were several in the Circus's, Hippodromes, &c.—or in cars, as we see some with triumphal arches on antique medals. See *CURULE*.

*Equestrian STATUE*, that representing some illustrious person on horseback—as that famous one of Marcus Aurelius at Rome; and that of king Charles I. at Charing-cross.

*Greek STATUE*, denotes a figure that is naked and antique; it being in this manner the Greeks represented their deities, athletes of the olympic games, and heroes.

The reason of this nudity, whereby the Greek *statues* are distinguished, is, that those who exercised wrestling, wherein the Greek youth placed their chief glory, always performed naked. See *ATHLETA*, *GYMNASIUM*, &c.

The *statues* of heroes were particularly called *Achillean statues*, by reason of the great number of figures of that prince, in most of the cities of Greece.

*Hydraulic STATUE*, any figure placed as an ornament of a fountain, or grotto; or that does the office of a jet d'eau, a cock, spout, or the like, by any of its parts, or by any attribute it holds.—The like is to be understood of any animal serving for the same use.

*Pedestrian STATUE*, a *statue* standing on foot—as that of king Charles II. in the Royal Exchange, and that of king James II. in the Privy Gardens.

*Persian STATUE*. See the article *PERSIAN order*.

*Roman STATUES*, is an appellation given to such as are clothed, and which receive various names from their various dresses.

Those of emperors with long gowns over their armour, were called *statue paludata*; those of captains and cavaliers, with coats of arms, *thoracata*; those of soldiers, with cuirasses, *loricata*; those of senators and augurs, *trabeata*; those of magistrates with long robes, *togata*; those of the people with a plain tunic, *tunicata*; and, lastly, those of women with long trains, *stolata*.

The Romans had another division of *statues*, into *divine*, which were those consecrated to the gods; as Jupiter, Mars, Apollo, &c.—*Heroes*, which were those of the demi-gods; as Hercules, &c.—and *Augusti*, which were those of the emperors; as those two of Cæsar and Augustus, under the portico of the capitol.

*Foundry of STATUES*, } See the articles { *FOUNDRY*.  
*Pedestal of STATUES*, } { *PEDESTAL*.

*Plinth of STATUES*, } { *PLINTH*.  
*Repairing a STATUE*. See the article *REPAIRING*.

*STATURE*, the size or height of a man.—From the Latin, *statura*, of *stare*, to stand.

The *stature*, or pitch of a man, is found admirably well adapted to the circumstances of his existence. Had man, observes Dr. Grew, been a dwarf; he could scarce have been a reasonable creature: For, to that end, he must have had a jolt-head; and then he would not have had body and blood to supply his brain with spirits: or if he had had a small, proportional

portional head, there would not have been brain enough for his business.—Again, had man been a giant, he could not have been so commodiously supplied with food: for there would not have been flesh enough of the best edible beasts to supply his turn; or if the beasts had been made proportionably bigger, there would not have been grass enough, &c. See DWARF, GIANT, &c.

It is a common opinion, however, and has been so ever since Homer's time, that people in the earliest ages of the world, much surpassed the moderns in *stature*; and it is true, we read of men, both in sacred and profane history, whose pitch appears surprising: but then it is true, they were esteemed giants.

The ordinary *stature* of men, Mr. Derham observes, is, in all probability the same now, as at the beginning; as may be gathered from the monuments, mummies, &c. still remaining. The oldest monument in the world, is that of Cheops, in the first pyramid of Egypt, which Mr. Greaves observes, scarce exceeds the measure of our ordinary coffins. The cavity, he says, is only 6.488 feet long, 2.218 feet wide, and 2.160 deep: from which dimensions, and those of several embalmed bodies, taken by him in Egypt, that accurate writer concludes, there is no decay in nature; but that the men of this age are of the same *stature* as those three thousand years ago.

To these we have other and later instances to add from Havelock: the tombs at Pisa, which are some thousands of years old, are no longer than ours. The same may be said of Athelstan's in Malmesbury church; Sheba's in Paul's, of the year 693, &c.

The like evidence we have from the ancient armour, shields, vessels, &c. dug up at this day, *e. gr.* the brass helmet dug up at Metaurum, fits one of our men; yet it is allowed to have been left there at the overthrow of Afrubal. Add, that Augustus was five foot nine inches, which was the measure of our queen Elizabeth; only the queen exceeded the emperor by two inches, allowance being made for the difference between the Roman and our foot.

**STATUS** *de manerio*, in ancient records, denotes all the tenants and legal men within the lands of a manor, assembled in their lord's court, to do their customary suit, and enjoy their rights and privileges. See MANOR, &c.

**STATUTE**, **STATUTUM**, in its general sense, signifies a law, ordinance, decree, &c. See LAW, DECREE, &c.

**STATUTE**, in our laws and customs, more immediately signifies an act of parliament, made by the three estates of the realm; and having the force of a law. See LAW, and PARLIAMENT.

*Accessory by STATUTE*, } See the articles { **ACCESSORY.**  
*Action upon the STATUTE*, } **ACTION.**

**STATUTE sessions**, called also *petit sessions*, are meetings in every hundred, to which constables repair, and others, both masters and servants, for deciding differences between masters and servants, rating of wages, bestowing people in service, who being fit to serve, either refuse to seek, or cannot get masters. See SESSIONS.

**STATUTE merchant**, is a bond of record acknowledged before one of the clerks of the *statutes* merchant and mayor or chief warden of the city of London, or two merchants of the said city for that purpose assigned, or before the mayor, chief warden, or master of other cities or towns, or other sufficient men for that purpose appointed; sealed with the seal of the debtor and of the king, which is of two pieces, the greater to be kept by the mayor, chief warden, &c. and the lesser by the said clerks. Its effect is, that if the obligor pay not the debt at the day, execution may be awarded against his body, lands, and goods; and that the obligee shall hold the same till the debt be levied.

*Tenant per STATUTE merchant.* See TENANT.

**STATUTE staple**, is a sort of *statute* merchant, relating to merchants, and merchandizes of the staple. See STAPLE.

The *statute* staple is of two kinds; *proper*, and *improper*.

*Proper* is a bond of record, acknowledged before the mayor of the staple, in the presence of one or more constables of the staple; by virtue of which the creditor may forthwith have execution of the body, lands, and goods of the debtor, on non-payment.

*Improper* is a bond of record, founded upon the *statute* 23 Hen. VIII. c. 6. of the nature of a proper *statute* staple as to the force and execution of it, and acknowledged before one of the chief justices; or in their absence, before the mayor of the staple, and recorder of London.

**STAVERS**, or **STAGGERS**, among farriers, a giddiness in a horse's head, which ends in madness.

It is frequently occasioned, by turning out a horse to grass too soon, before well cold; where, by hanging down his head to feed, ill vapours and humours are generated, which oppressing the brain, are the next cause of this disease.—Sometimes it comes by over exercise in hot weather, which inflames the blood, &c. and sometimes by noisome smells in the stable, excessive eating, &c.

The signs of it, are dimness of sight, reeling, and staggering, watery eyes, &c. At length, for very pain, he beats his head against the wall, thrusts it into the litter, rises and lies down with fury, &c.

The methods of cure are various; but they all begin with bleeding.

**STAVES**, **Flag STAVES**, } See { **FLAG staves.**  
*Levelling STAVES*, } **LEVELLING staves.**  
*Tip STAVES*, } **TIP staves.**

**STAY**, in the sea language, a big, strong rope, fastened to the top of one mast, and the foot of that next before it, towards the prow, serving to keep it firm, and prevent its falling astwards, or towards the poop.—See *Tab. Ship. fig. 1. n. 29, 33, 78, 85, 120.* See also the article MAST.

All masts, top-masts, and flag-staves, have their *stays*; except the sprit-sail top-masts. That of the main-mast is called the *main stay*.

The main-mast, fore-mast, and those belonging to them, have also *back stays*, to prevent their pitching forwards, or over-board; as going on either side her. See BACK stays.

To **STAY** a ship, or bring her on the STAYS, is to manage her tackle and sails, so as that she cannot make any way forwards, which is done in order to her tacking about.

**STEADY**, a word of command at sea, for the man at the helm to keep the ship *steady* in her course, and not to make angles (or *yaws* as they call them) in and out. See HELM.

**STEATOMA**, **ΣΤΕΑΤΩΜΑ**, a kind of swelling, or abscess; consisting of a matter much like suet; soft, without pain, and without discolouring the skin; contained in a cystis, and easily turned out upon incision. See TUMOR.

**STEEL**, a kind of iron refined, and purified by the fire, with other ingredients; which renders it whiter, and its grain closer, and finer than common iron. See IRON.

*Steel*, of all other metals, is that susceptible of the greatest degree of hardness, when well tempered; whence its great use in the making of tools and instruments of all kinds. See TEMPERING.

The true method of making *steel* has been greatly concealed, and the public long abused by counterfeit ones.—The following method we have from Agricola; and is affirmed by Kircher to be that practised in the island of Ilya; a place famous in all ages for the manufacture of good *steel*, from the time of the Romans to ours.

Heat a quantity of iron red hot, cut it into small pieces, mix it with a sort of stone that easily melts. This mixture put by little and little into a crucible, first filled with charcoal-dust, and heated red hot; when melted off, three, four, or more pieces of iron are to be put in the middle of it; there boil them five or six hours with a strong fire. The workman is to stir the melted matter often, that the pieces of iron may soak in the smaller particles of the melted matter; which particles consume, and thin the grosser ones of the iron pieces, and are, as it were, a ferment to them, and make them tender. One of the pieces is now taken out of the fire, and put under the great hammer, to be drawn out into bars, and wrought; and hot as it is, plunged into cold water.—Thus tempered, it is again worked upon the anvil; then breaking it, it is considered, whether in any part it looks like iron; or whether it be wholly condensed, and turned into *steel*.

*Damascus STEEL*, } See the articles { **DAMASCUS.**  
*Engraving on STEEL*, } **ENGRAVING.**  
*Faggot of STEEL*, } **FAGGOT.**  
*Nealing of STEEL*, } **NEALING.**

**STEEL**, in medicine. See the article CHALYBEAT.

**STEEL Wine.** See the article WINE.

**STEELYARD**, or **STILYARD**, in mechanics, a kind of balance called also *statera Romana*, or the *Roman balance*; by means whereof, the gravity of different bodies are found by the use of one single weight. See BALANCE.

*Construction of the STEELYARD.*—It consists of an iron beam AB (*Tab. Mech. fig. 35.*) wherein a point is assumed at pleasure, as C, and on this perpendicular raised CD. On the shorter arm AC, is hung a scale or balon to receive the bodies weighed: the weight I is shifted this and that way on the beam, till it be a counter-balance to one, two, three, four, &c. pounds placed in the scale; and the points are noted wherein I weighs as one, two, three, four, &c. pounds. From this construction of the *steelyard*, the manner of using it is apparent. But the instrument being very liable to deceit, is therefore not to be countenanced in commerce.

**Spring STEELYARD**, is a kind of portable balance, serving to weigh any matter, from about one to forty pounds.

It is composed of a brass tube, into which goes a rod, and about that is wound a spring of tempered steel in a spiral form. On this rod are the divisions of pounds and parts of pounds, which are made by successively hanging on to a hook fastened to the other end, one, two, three, four, &c. pounds.

Now the spring being fastened by a screw, to the bottom of the rod; the greater weight is hung on the hook, the more will the spring be contracted, and, consequently, a greater part of the rod will come out of the tube; the proportions of which greater weights are indicated by the figures appearing against the extremity of the tube.

**STEEPLE**, an appendage generally raised on the western end of a church to hold the bells. See CHURCH, and BELL.

*Steeple*s are denominated from their form, either *spires*, or *towers*.—The first, are such as ascend continually diminishing either conically or pyramidically.

The latter are mere parallelepipeds, and are covered a-top, plat-form like.

In each kind, there is usually a sort of windows or apertures to let out the sound; and so contrived, at the same time, as to drive it down.

Mafius, in his treatise of bells, treats likewise of *steeples*. The most remarkable in the world, is that at Pisa, which leans all on one side, and appears every moment ready to fall; yet is in no danger. This odd disposition, he observes, is not owing to a shock of an earthquake, as is generally imagined; but was contrived so at first by the architect; as is evident from the cielings, windows, doors, &c. which are all in the level.

**STEER**, *Hog* **STEER**. See the article **HOG**.

**STEERAGE**, the act of steering. See **STEERING**.

The word is also used for a place in a ship, next below the quarter-deck, before the bulk-head of the great cabin; where the steers-man stands and lodges.—See *Tab. Ship*. fig. 2. n. 102.

**STEERING**, in navigation, the directing a vessel from one place to another, by means of the helm and rudder. See **HELM** and **RUDDER**.

He is held the best *steers-man*, who uses the least motion in putting the helm over to and again, and who keeps the ship best from making yaws; that is, from running in and out. See **YAWS**.

There are three methods of *steering*, 1°. By any mark on the land, so as to keep the ship even by it.—2°. By the compass, which is by keeping the ship's head on such a rhumb or point of the compass, as best leads to port.—3°. To steer as one is bidden or coned; which, in a great ship, is the duty of him that is taking his turn at the helm. See **COND**.—For the theory and effect of *steering*; see **SAILING**, **COURSE**, &c.

**STEGANOGRAPHY**, ΣΤΕΓΑΝΟΓΡΑΦΙΑ, the art of secret writing, or of writing in cyphers; known only to the persons corresponding. See **CIPHER**.

One *Aeneas Tacitus*, two thousand years ago, as we are told by Polybius, had invented twenty different manners of writing, so as no body, but those let into the secret, could understand any thing of the matter.

But now-a-days, hardly any thing can be written by this art, but what may be decyphered, and the meaning discovered. And to this art of decyphering, that excellent mathematician, Dr. Wallis, hath contributed much. See **DECIPHERING**.

**STEGNOSIS**, ΣΤΕΓΝΟΣΙΣ, an obstruction of any natural discharge, especially that by the pores. See **PERSPIRATION**.

**STEGNOTICKS**\*, ΣΤΕΓΝΟΤΙΚΑ, in medicine, remedies proper to close, and stop the orifices of the vessels, or emunctories, when relaxed, stretched, lacerated, &c. See **STYPTICK** and **ASTRINGENT**.

\* The word is formed from the Greek στεγνω, *impedio, constipo*, I hinder, close.

Such are pomegranate leaves, red roses, plantain leaves, tormentil roots, &c.—*Stegnoticks* are proper in the hæmorrhoids, and other fluxes of blood.

**STELLA**, } See the articles { **PSEUDO** *Stella*.  
**STELLAR**, } **INTER** *Stellar*.

**STELLATE** plants, such as have their leaves growing on the stalks, at certain distances, in the form of a star with beams; or, such flowers as are star-like, or full of eyes resembling stars, in the thrum and pendants. See **PLANT**.

Mr. Ray makes this the tenth genus of English plants; of which kind is cross-wort, mollugo, wild madder, asperula, or woodruff, gallium or ladies bed-straw, aparine or cleavers, rubia tinctorum or dyers madder.—To which he adds, as a-kin to this genus, the nasturtium Indicum, Indian cressie, or yellow lark-spur.

**STELLIONATE**\* **STELLIONATUS**, in the civil law, a kind of crime committed by a fraudulent bargain, where one of the parties sells a thing for what it is not.

\* Cujas says the word comes from *stellio*, a very subtle kind of lizzard.—We find mention hereof in the *code*, leg. ix. tit. 34. As, if I sell an estate for my own, which belongs to another; or convey a thing as free and clear, which is already engaged to another; or put off copper for gold, &c.

The Romans frequently used *stellionatus* to express all kinds of crimes that had no proper names.

**STEM**, in botany, that part of a plant arising out of the root, and which sustains the leaves, flowers and fruits. See **PLANT**.

In trees, the *stem* is called the *trunk*, or *stock*; in Latin *caudex* and *truncus*. See **STOCK**, &c.

In herbs, it is ordinarily called the *stalk*; by the Latins, *caulis* and *scapus*, when streight like a column. See **STALK**.

When slender, and creeping on the ground, as that of nummulary, some authors call it *viticulus*.

In the several kinds of corn and plants of that kind, it is more properly called *culmus*. See **CULMUS**.

VOL. II. N°. CXLVI.

The *stem* of the plant, according to Dr. Grew, is no more than the cutis or skin which at first covers the two lobes, and the plume of the seed, and which is further dilated as the plant grows. See **PLUME**, **SEED**, &c.

**STEM** of a ship, is that main piece of timber which comes bending from the keel below, where it is *scarfed* as they call it, that is pieced in; and rises compassing right before the fore-castle.

This *stem* it is, which guides the rake of the ship; and all the butt-ends of the planks forwards, are fixed into it.

This in the section of a first rate ship, is called the *main stem*.—See *Tab. Ship*. fig. 1. lit. b. fig. 2. n. 1.

**STENCH**. See the article **STINK**.

**STENTOROPHONIC** tube, a speaking trumpet; thus called from *stentor* (a person mentioned in the fifth book of the Iliad, who could call louder than fifty men) and *phōnē*, voice. The *stentorophonic* horn of Alexander the Great is famous; with this he could give orders to his army at the distance of 100 stadia; which is above twelve English miles. See **SPEAKING trumpet**.

**STEP**. See the articles **PACE**, **STAIR**, &c.

**STEP and Leap**, in the manage, one of the seven airs or artificial motions of a horse; consisting, as it were, of three airs; viz. the pace or step which is terra a terra; the raising, which is a curvet; and the whole finished with a fault or leap. See **AIR** and **SALTS**.

The *step*, properly, puts a horse on the hand, and gives him a rise to leap; like one that runs before he leaps, that he may go the higher, or the further.

For leaps of all kinds, the rider is not to give any aids or helps with his legs; only to hold the horse well up with the bridle-hand when he rises before, that he may rise the higher behind: when he begins to rise behind, he is to put the bridle-hand a little forwards to hold him before, and stay him there on the hand, as if he hung in the air; timing the motion of the bridle-hand so, as to take him like a ball on the bound, which is the great secret in leaping.

**STEPHENS's water**. See the article **WATER**.

**STERCORARIANS**\*, or **STERCORANISTÆ**, a name which those of the Romish church anciently gave to such as held that the host was liable to digestion, and all its consequences, like other food. See **HOST**.

\* The word is formed from the Latin, *stercus*, dung.

Card. Humbert in his answer to Nicetas Pectoratus treats him as a *stercoranist*, merely for holding, that the eucharist breaks the fast; which opinion he imagined led directly into *stercoranism*.

**STEREOBATA**\*, or **STEREOBATES**, in the ancient architecture, the basis or foundation, whereon, a column wall or other piece of building is raised. See **BASE**.

\* The word is formed from the Greek στερεοβατες, *solid prop*.

This answers pretty well to the continued socle or basement of the moderns. See **SOCLE**.

Some confound it with the ancient *stylobata*, or pedestal; but in effect, the *stereobata* is that to the *stylobata* which the *stylobata* is to the *spira* or base of the column. See **PEDESTAL**.

**STEREOGRAPHIC** projection of the sphere, is that where-in the eye is supposed to be placed in the surface of the sphere. See **PROJECTION of the sphere**.

*Stereographic projection* is, the projection of the circles of the sphere on the plane of some one great circle; the eye being supposed placed in the pole of that circle. See **CIRCLE**, **SPHERE** and **PERSPECTIVE**.

The method and practice of this projection, in all the principal cases, viz. on the planes of the meridian, equinoctial and horizon, is as follows:

**STEREOGRAPHIC projection on the plane of the meridian**.—Let **ZQNE** (*Tab. Perspect.* fig. 22.) be the meridian, Z and N the poles, as also the zenith and nadir; E Q the equinoctial and horizon; ZN the equinoctial colure, and prime vertical circle: Z 15 N, Z 30 N, Z 45 N, &c. are hour-circles or meridians, and also azimuths, because the pole is in the zenith. To describe these circles, find the points, 15, 30, 45, 60, &c. in the equinoctial, by setting the half-tangent of their distance from  $\gamma$ ; and then their centers are found by setting their co-secants, both ways, from their points of intersection with the equator:  $\alpha$ ,  $\omega$ , and  $\nu$ ,  $\nu$ , are the northern and southern tropics, which are described by setting the half tangent of 23 degrees 30 minutes from  $\gamma$  each way; then the tangent of its complement, viz. 66 degrees 30 minutes, each way from thence on the colure produced, gives their centres. By this method, all parallels of declinations may be drawn.—Or you might have set the co-secant of the parallel from the centre of the primitive, which would also have found the same point for the centre of the parallel, whose radius is equal to the tangent of its distance from its pole.

The parallels in this projection, are also almacaners, or parallels of altitude;  $\alpha$ ,  $\nu$  is the ecliptic, which must be divided from the division on the scale of half tangents; but denominated according to the signs of the zodiac, reckoning 30 degrees to each sign.

**STEREOGRAPHIC projection on the plane of the equinoctial**.—  
II K k Let

Let SC (fig. 23.) be the meridian, and solstitial colure; EN the equinoctial colure, and hour-circle of 6; P the north pole;  $\infty$   $\infty$ , the northern tropic; E  $\infty$  N the northern half of the ecliptic (whose centre is found by setting off the secant of 23 degrees 30 minutes from  $\infty$ ) and its pole is at  $a$  the intersection of the polar circle and meridian, being the place through which all circles of longitude must pass; and EZN the horizon of London, which is described thus: set the half tangent of the co-latitude, from P to Z; then the tangent of the same, set from P to O, or its secant from Z to O, gives its centre; and its pole will be at  $b$  38 degrees 30 minutes, (in the half tangents) distant from F, where  $b$  is at the zenith.

To draw any other circles in this projection; 1. For circles of longitude, which must all pass through  $a$ , and the several degrees of the ecliptic; set the tangent of 66 degrees, 30 minutes, from  $a$  downwards, on the meridian produced; which will find a point, through which a perpendicular, drawn to the meridian, shall contain in it the centers of all the circles of longitude, whose distances set off to the radius P  $x$ , shall be the tangents of the degrees of their distances from the meridian SPC (which is that belonging to 180 degrees.)—2. All parallels of declination are drawn by setting the half tangents of their distances from P.—3. All azimuths or vertical circles must pass through  $b$  at the zenith: since, therefore, the zenith is 38 degrees 30 minutes distant from P, set the co-secant of that (or the secant of 51 degrees 30 minutes) from  $b$  on the meridian extended below, and that will find the point  $x$ , the centre of the azimuth of east and west, viz. E  $b$  N; and the centres of all the rest are in a line, that is perpendicular to the meridian, and drawn through  $x$ .—4. Circles of altitude or almucanters, are lesser circles, whose poles are not in the plane of the projection; thus the circle O  $c$ , is a parallel of altitude 50 degrees above the horizon.—5. All hour-circles are straight lines from the center to the limb.

**STEREOGRAPHIC projection on the plane of the horizon.**—First draw a circle representing the horizon, and quarter it with two diameters; then will  $z$  be the zenith of the place, 12  $z$  12 the meridian; 6  $z$  6 the prime vertical, or azimuth of east and west; (fig. 24.) make  $z$  P=half tangent of 38° 30'. (or tangent of 19° 15') P shall be the pole of the world. Make  $z$  E=half tangent of 51° 30' (or tangent of 25° 45') and E  $\infty$ =secant

$\left. \begin{array}{l} \text{of 38 degrees 30 minutes; then} \\ z \infty = \text{tangent} \end{array} \right\}$  shall  $\infty$  be the center of the equinoctial 6  $\infty$  6.

In this projection, almucanters are all parallel to the primitive circle: and azimuths are all right lines passing through  $z$  the centre of the primitive, to the equal divisions in the limb. Parallels of declinations are all lesser circles, and parallel to the equinoctial, and their intersections with the meridian are found, by setting the half-tangent of their distance from the zenith, southward or northward, or both ways from  $z$ .—Their centres are found, by bisecting the distance between those two points; for the middle will be the center of the parallel. Thus  $z \infty$  = half tangent of 20° 00' = distance of the tropic of  $\infty$  from the

zenith - - - - - } to the southward, or downward from  $z$ ,  
And  $z \infty$  = half-tangent of 75° = }  
distance of the tropic of  $\infty$  from the zenith - - - - - }

and the intersection again with the north of the meridian, is at 105° 30' } for {  $\infty$  } to the northward, or upward from  $z$ .  
152° 30' }

For the hour-circles make  $z c$  = tangent of 51° 30', or P  $c$  = secant of 51° 30', draw GCT perpendicular to the produced meridian: then, if from  $c$  with the radius  $z c$ , you set off the tangents of 15° 30' 45', &c. both ways, you will have the centres of the several hour-circles, 7 and 5, 8, 4, &c.

Note, in all *stereographic* projections, all diameters are measured on the scale of half-tangents; and this is the ground of all dialling, or the true projection of the hour-circles of the sphere on any given plane. See SPHERICKS, DIALLING, &c.

**STEREOGRAPHY\***, the art of drawing the forms or figures of the solids upon a plane. See SOLID.

\* The word is formed from the Greek στερεο, solid, and γραφω, I describe.

**STEREOMETRY\***, ΣΤΕΡΕΟΜΕΤΡΙΑ, that part of geometry, which teaches how to measure solid bodies, i. e. to find the solidity, or solid content of bodies; as globes, cylinders, cubes, vessels, ships, &c. See SOLID and SOLIDITY.

\* The word is formed of the Greek στερεο, solid; and μετρο, measure.

The methods hereof, see under the respective bodies, as GLOBE, SPHERE, CYLINDER, &c. See also GAUGING.

**STEREOTOMY\***, the art or act of cutting solids, or making sections thereof; as walls and other members in the profiles of architecture. See SECTION.

\* The word is formed from στερεο, and τομω, section.

**STERILITY\***, the quality of a thing that is barren; in opposition to *fertility*. See FECUNDITY.

The word is formed from the Latin *sterilitas*, of *sterilis*, barren.

*Sterility* was held a grievous affliction by the wives of the ancient patriarchs.—Nature has annexed *sterility* to all monstrous productions, that the creation might not degenerate. Hence the *sterility* of mules, &c. See MONSTER, MULE, &c.

Women frequently become *sterile* after a miscarriage or a difficult labour, by reason the uterus or some other of the genital parts are injured thereby. See ABORTION, &c.

The *sterility* of mercury, say the alchymists, resembles that of women who are too cold and moist; and who, by being purged and heated, would be cured of their *sterility*, as mercury is when purged according to the rules of art.

**STERLING**, a term frequent in the English commerce. A pound, shilling, or penny sterling, signifies as much as a pound, shilling or penny of lawful money of England, as settled by public authority. See POUND, SHILLING, &c.—Antiquaries and critics are greatly divided, as to the origin of the word *sterling*. Buchanan fetches it from the castle of Striveling or Sterling in Scotland, where a small coin was anciently struck, that in time, according to him, came to give name to all the rest.—Camden derives the word from *easterling* or *esterling*; observing, that in the reign of King Richard I. money coined in the east parts of Germany, began to be of especial request in England, by reason of the purity thereof, and was called *easterling money*, as all the inhabitants of those parts were called *Easterlings*; some of whom, skilled in coinage, were soon after sent for over to perfect the English money, which was thenceforwards denominated from them, *sterling*, for *easterling*, or *esterling*: not, says Camden, from Striveling in Scotland, nor from *stella*, a star which some dream to have been coined thereon; for in old deeds, the English species are always called *nummi easterlingi*, which implied as much as good and lawful money, &c.—Somner, again, derives the word from the Saxon, *stære*, a rule or standard; intimating, that this, as to weight and fineness, was to be the common standard of all current money.

In Stow, and some other of our ancient writers, *sterling*, or *easterling* is also used for a certain coin, amounting nearly to our silver-penny: and on some occasions we find the same word *sterling* used in the general for a piece of money; it being observable, that, for a good while together, there was no other coin but pennies, with which *sterlings* or *easterlings* were become synonymous: much as among the ancients, the words *denarius* and *nummus* were used. See PENNY, MONEY, COIN, &c.

**STERN** of a ship, usually denotes all the hindermost part of her; but properly, is only the outmost part abaft. See SHIP, ABAFT, &c.

**STERN**, among hunters, is the tail of a wolf, or a grey-hound. See TAIL.

**STERN Chase**. See the article CHASE.

**STERNOHYOIDEUS**, in anatomy, a pair of muscles arising from the upper and internal part of the bone of the sternum, and part of the clavicle, and adjoining part of the first rib, with a broad origin; and running from the aspera arteria, glandulae thyroideae, and cartilago scutiformis, terminates in the base of the os hyoides. It draws the bone straight downward.—See Tab. Anat. (Myol.) fig. 2. n. 7, 8.

**STERNOTHYROIDEUS**, in anatomy, a pair of muscles of the larynx; arising in the sternum, or breast-bone, and terminating in the cartilago thyroides. They serve to draw down that cartilage.

**STERNUM**, ΣΤΕΡΝΟΝ, the breast-bone, a cartilaginous sort of bone which makes the forepart of the breast, and into which the ribs are fitted.—See Tab. Anat. (Osteol.) fig. 3. n. 11. See also the article BONE.

In adults, it consists of one single piece; but in infants, of several, according to the diversity of age. Kerkringius tells us, he has never seen more than six. They continue cartilaginous until seven years of age; and are not very solid afterwards, but spongy. See CARTILAGE.

At the lower extremity of the sternum, is a cartilage, called *xiphoides* or *ensiformis*, because resembling the point of a sword. See XIPHOIDES, &c.

The use of the sternum is to defend the heart, and to receive the extremities of the true ribs. See RIB.

**STERNUTATION**. See the article SNEEZING.

**STERNUTATIVE**, or STERNUTATORY, a medicine proper to produce sneezing. See SNEEZING.

*Sternutatives*, called also *ptarmicks*, are of two kinds, gentle and violent. Of the first kind are betony, sage, marjoram, tobacco, and the whole fashionable tribe of snuffs. See SNUFF.

Of the latter kind are euphorbium, white hellebore, peltitory, &c. See PTARMICKS.

*Sternutatives* operate by their sharp, pungent parts vellicating the inner membrane of the nose, which is exceedingly sensible, and occasioning the serous matter contained in the glands of the nose, and in several sinusses situate in the base of the cranium, and the os frontis, to be expelled. See NOSE, PITUITA, &c.

STEW,

**STEW**, a small kind of fish-pond, the peculiar office whereof is, to maintain fish, and keep them in readiness, for the daily uses of a family, &c. See **FISH-POND**.

The fish bred in the large ponds, are drawn and put in here. For two large ponds of three or four acres a-piece, it is advisable to have four *stews*, each two rods wide, and three long. The *stews* are usually in gardens, or at least near the house, to be more handy, and the better looked to.

The method of making them, is to carry the bottom in a continual decline from one end, with a mouth to favour the drawing with a net. See **POND**.

**STEW**s \*, or **STUES**, were also places anciently permitted in England, to women of professed incontinency, for the proffer of their bodies to all comers.—These were under particular rules, and laws of discipline, appointed by the lord of the manor.

\* The word is probably borrowed from the French, *estuves*, hot baths, in regard wantons are wont to prepare themselves for venereal acts, by bathing.

**STEW**ARD, or **SENE**SCHAL, an officer, whereof there are various kinds; thus called from the Saxon, *steda*, stead, place, or room, and *ward*, keeper, *q. d.* a deputy, or person appointed in the place of another. See **SENE**SCHAL.

**Lord High STEW**ARD of *England*, is the first and highest officer of the crown; as having the power of what we call a *vice-roy*, the Danes, &c. *stadtholder*, and the Swedes, *reichs drofset*, *q. d.* *vice rex*. Chamberlayne. See **LORD**.

Common lawyers call him *magnus Angliæ senescallus*. His office, as expressed in an ancient record, is to supervise and regulate the whole kingdom, both in time of peace and war, immediately under the king and after him; an authority so very great, that it was not judged safe, to trust it any longer in the hands of any subject.

The office was hereditary and permanent in the family of the dukes of Lancaster, till the time of Henry IV. since whom it has only been made *pro hac vice*, occasionally: as to officiate at a coronation; at the arraignment and trial of some nobleman for treason, or other great crime.—During his stewardship, he bears a white staff in his hand; and the trial, &c. ended, he breaks his staff, and with it, his commission expires.

**Lord STEW**ARD of the household, is an officer to whom the state of the king's house is committed; to be ruled and guided at his discretion. See **LORD** and **HOUSEHOLD**.

He has authority over all officers and servants of the king's house, except those of the chapel, chamber, and stable; which are under the lord chamberlain, master of the horse, and dean of the chapel. See **Chamberlain**, &c.

**STEW**ARD of a ship, is he who receives all the victuals from the purser; and is to see it well stowed in the hold: all things of that nature belonging to the ship's use, are in his custody: he looks after the bread, and distributes out the several messes of victuals in the ship.

He hath an apartment for himself in the hold, which is called the *steward's room*.—See *Tab. Ship. fig. 2. lit. Y.*

**STIG**MATA, **ΣΤΙΓΜΑΤΑ**, in natural history, denotes points, or specks usually seen on the sides of the bellies of insects; particularly the sphondylium, where they are very apparent. See **INSECT**.

They are nothing but the extremities of certain vessels terminating in the sides at each nodus or incisure, and serving them for lungs.

**STIG**MATA, in antiquity, certain marks impressed on the left shoulder of the soldiers, when listed. See **MARK**.

**STIG**MATA, were also a kind of notes, or abbreviations; consisting only of points, disposed various ways, as in triangles, squares, crosses, &c. See **ABBREVIATION** and **NOTE**.

**STIG**MATA, is also a term introduced by the Franciscans, to express the marks, or prints of our Saviour's wounds, impressed by him on the body of their seraphic father, St. Francis. It was one morning, about the feast of the Exaltation, in the year 1224, that St. Francis, being at prayers on mount Alvernus, whither he had retired to pass the Michaelmas Lent; saw a seraph with six burning wings, in other respects like a man; with his hands and his feet stretched upon a cross. With two of the wings he covered his body, two were raised over his head, and with two he flew swiftly down. Five rays proceeded from the five wounds of the person crucified, and were directed to the correspondent five parts of the body of the faint.

Upon the vision's disappeared, he saw the marks of the nails, &c. on his own hands and feet; the same as he had seen them in the image of the crucifix. His hands and feet were found pierced with nails in the middle; the heads of the nails were plainly seen within the flesh on one side, and the points clenched on the other. On his right side appeared a red scar, as from the wound of a spear, which frequently run with blood, and stained his gown, &c.

The good man, we are told, took a world of pains to hide the *stigmata*; but those of his hands and feet were seen in his life-time, maugre all his endeavours, by several of the brotherhood, who affirmed it upon oath, and by some cardinals, says St. Bonaventure, who attested the miracle both by word and writing, and expressed it in the hymns, anthems, &c. composed in honour of St. Francis.

After his death, they were seen by fifty of his religious, as well as by St. Clara and her nuns, and an infinite number of seculars; many of whom felt them with their hands, to be the more certain.

A solemn feast was hereupon appointed to be annually celebrated, in memory of the miracle, called *the feast of the stigmata of St. Francis*; and a peculiar mass or office composed for the same.

An archi-confraternity was erected on the same occasion, by Frid. Pizzi, a Roman chirurgion, in the year 1594.

**STIBIUM**, **ΣΤΙΒΙ**, or **ΣΤΙΜΜΙ**, an ancient name for antimony, now seldom used. See **ANTIMONY**.

**STILE** and **STILUS**. See the article **STYLE**.

**STILES**, in carpentry, denote the upright pieces which go from the bottom to the top in any wainscot, or the like.

**STILL**ATITIOUS oils, are such as are procured by distillation,—in opposition to those got by infusion, expression, &c. See **OIL** and **DISTILLATION**.

**STILLYARD**, **STILYARD**, or **STEELYARD**, in commerce.—The company of the **STILLYARD** was a community, or corporation of foreign merchants, established at London; thus called, from the place where they had their residence, called the *Stillyard*, near the bridge, which was assigned them by act of parliament; and which, in some records, is called *Guldbalda Teutonicorum*; being, as some write, a broad place, or yard, where much steel had used to be sold.

This company was created in the year 1215, under Hen. III. in favour of the free cities of Germany, who had been assiduous to him in his wars against France. See **COMMERCE**. It had rendered itself mistress of all the English manufactories, particularly those of cloth; which it was allowed not only to sell throughout the kingdom, but also to transport abroad. See **WOOLEN**.

The prejudice these privileges did, by which the company frequently abused the nation, occasioned its being broke, by sentence of the judges, under Edward IV. But it redeemed its rights, and lasted to the year 1552, when it was suppressed by Edward VI. See **HANSE**.

**STIMULATING**, **STIMULANS**, a property in angular or sharp bodies, whereby they vellicate, and cause vibrations and inflections of the fibres of the nerves, and a greater derivation of nervous fluid into the part affected.

*Stimulants* produce pain, heat, redness, &c.—They may be reduced to violent penetrating depilatories, gentle sinapisms, vesicatories, and caustics. See **SINAPISM**, **VESICATORY**, &c.

**STING**, *aculeus*, an apparatus in the body of certain insects, in form of a little spear; serving them as a weapon of offence. See **INSECT**, **ARMS**, &c.

The *sting* of a bee, or wasp, is a curious piece of mechanism: it consists of a hollow tube, at the root whereof is a bag full of sharp, penetrating juice, which, in stinging, is injected into the flesh through the tube.

Within the tube, Mr. Derham has observed, there lie two small sharp-bearded spears: in the *sting* of a wasp, he told eight beards on the side of each spear, somewhat like the beards of fish-hooks. See *Tab. Nat. Hist. fig. 29 & 30*.

One of these spears in the *sting*, or sheath, lies with its point a little before the other; to be ready, as should seem, to be first darted into the flesh: which once fixed, by means of its foremost beard, the other then strikes in too; and so they alternately pierce deeper and deeper, their beards taking more and more hold in the flesh: after which, the sheath or *sting* follows, to convey the poison into the wound; which, that it may pierce the better, is drawn into a point, with a small slit below that point, for the two spears to come out at.

By means of these beards it is, that the animal is forced to leave its *sting* behind it, when disturbed, before it can have time to withdraw the spears into their scabbard.

**STINK**, or **STENCH**, a disagreeable smell exhaling from a corrupted, or other body; and which is prejudicial to the nose and brain. See **SMELL**.

A *stinking* breath is usually the result either of diseased lungs, or of scorbutic gums, &c. See **FOETOR**.

A *stinking* nose, *factor naris*, is the result of a deep ulcer within the nose, whence arise fetid scabs, &c.—Its cause, according to Galen, is a sharp, putrid humour falling from the brain, on the processus mamillares.—This is reckoned by the civilians, one of the legal causes of annulling marriage.

**STIPEND**, **STIPENDIUM**, among the Romans, signified the same with *tribute*; and hence *stipendiarii* were the same with *tributarii*. See **TRIBUTE**.

**STIPITE**, *Nativi de STIPITE*. See **NATIVI**.

**STIPULATION**, in the civil law, the act of stipulating; that is, of treating, and concluding terms, and conditions to be inserted in a contract. See **TREATY** and **CONTRACT**. *Stipulations* were anciently performed at Rome, with abundance of ceremonies; the first whereof was, that one party should interrogate, and the other answer, to give his consent and oblige himself.

By the ancient Roman law, no body could stipulate, but for himself; but as the tabelliones were public servants, they were

were allowed to *stipulate* for their masters; and the notaries succeeding the tabelliones have inherited the same privilege. —The *stipulation* had its origin in the *lex aquilia*, and another law of the emperor Arcadius.

The word is formed from the Latin, *stipula*, a straw; because, in making a sale, a straw was given the purchaser, in sign of a real delivery. Which custom is still retained in some parts of France, particularly at Verdun. The custom always has been on this occasion, for the two parties to break a straw between them, and each take his moiety; which they afterwards joined again, to recognize their promise.

**STIRROP**, or **STIRRUP**, a rest or support for the horseman's foot; serving to keep him firm in his seat, and enable him to mount. See **SADDLE**.

The great art of a cavalier in the ancient tournaments, was to make his antagonist lose his *stirrop*, that is, slip the foot out of it.

For combating, it is a rule to have the right foot *stirrop* somewhat shorter than the other.

*Stirrups* are allowed a modern invention: Menage observes, that St. Jerom is the first author who mentions them.—Matthiolus relates, that the Turks have a knack of poisoning their *stirrups*, with so subtle and penetrating a poison, that it makes its way through the boots, and kills the rider. F. le Comte tells us, that the Tartars ride cross-legged, and with their *stirrups* exceedingly short.

**STOCK**, in gardening, &c. the stem or trunk of a tree. See **STEM**.

For **STOCKS** of fruit trees; the best to graft on, are those raised of kernels of wildings, and crabs of the most thriving trees. Though the fruit always take after the graft; yet the *stock* has some influence. A wild *stock* is always found to enliven a dull apple. See **ENGRAFTING**.

To have a quantity of *stocks* to graft on; old trees are to be cut down within two inches of the ground, which will cause a multitude of suckers to rise from the roots. When these are risen half a yard, they are to be covered up with good earth a foot thick, and as soon as they have put forth roots, in winter, are to be conveyed into the nursery, where, in a year or two, they will be ready to graft. Cherry *stocks*, plumb *stocks*, and pear *stocks*, may be thus raised from suckers, as well as from stones or seeds; but those raised this latter way are preferred. See **FRUIT-tree**, &c.

**Brokers STOCK**, } See the articles { **BROKER**.  
**Capital STOCK**, } **CAPITAL**.  
**Pen STOCK**, } **PEN stock**.

**STOCKFISH**, or **STOCKFISCH**, in commerce, a kind of dried, salted fish; of a greyish ash-colour, only the belly somewhat whiter. See **FISH**.

The commerce of *stockfish* is very considerable in Holland, both from the great consumption thereof in the country, and from their victualling their vessels therewith. It is said to take its name from being as hard as a *stock*, or from its needing to be beaten with a stick, to fit it for eating. See **FISHERY**.

**STOCKING**, that part of the cloathing of the leg and foot, which immediately covers their nudity, and screens them from the rigor of the cold. See **SHOE**.

Anciently, the only *stockings* in use, were made of cloth, or milled stuffs sewed together; but since the invention of knitting and weaving *stockings* of silk, wool, cotton, thread, &c. the use of cloth *stockings* is quite out of doors.

The modern *stockings*, whether wove or knit, are a kind of plexus's formed of an infinite number of little knots, called *stitches*, *loops*, or *masbes*, intermingled in one another.

**Knit STOCKINGS** are wrought with needles made of polished iron, or brass wire, which interweave the threads, and form the *masbes* the *stocking* consists of.

This operation is called *knitting*; the invention whereof it were difficult to fix precisely; though it is commonly attributed to the Scots, on this ground, that the first works of this kind came from thence.—It is added, that it was on this account, that the company of *stocking* knitters established at Paris 1527, took for their patron St. Fiace; who is said to have been the son of a king of Scotland.

**Woven STOCKINGS** are ordinarily very fine: they are manufactured on a frame or machine made of polished iron; the structure whereof is exceedingly ingenious, but withal exceedingly complex, so that it were very difficult to describe it well, by reason of the diversity and number of its parts; nor is it even conceived, without a deal of difficulty, when working before the face.

The English and French have greatly contested the honour of the invention of the *stocking loom*; but the matter of fact, waving all national prejudices, seems to be this, that it was a Frenchman first invented this useful and surprizing machine; who, finding some difficulties in procuring an exclusive privilege, which he required, to settle himself at Paris, went over into England, where his machine was admired, and the workman rewarded according to his merit.

The invention thus imparted to the English, they became so jealous hereof, that for a long time it was forbid, under pain of death, to carry any of the machines out of the island, or communicate a model thereof to foreigners.—But, as it

was a Frenchman first enriched our nation with it, so a Frenchman first carried it abroad; and by an extraordinary effort of memory and imagination, made a loom at Paris, on the idea he had formed thereof, in a voyage he made to England. This loom, first set up in the year 1656, has served for the model of all those since made in France, Holland, &c.

**Fulling of STOCKINGS**. See the article **FULLING**.

**STOCKS**, in ship carpentry, a frame of timber and great posts made a-shore, to build pinnaces, ketches, boats, and such small craft, and sometimes small frigates upon. See **SHIP** and **VESSEL**.

Hence we say, a *ship is on the stocks*, when she is building.

**STOICAL fate**. See the article **FATE**.

**STOICISM**, the doctrines and opinions of Zeno's followers, called *stoicks*. See **STOICKS**.

**STOICKS**, a sect of ancient philosophers, the followers of Zeno; thus called from the Greek, *στοα*, portico, in regard Zeno used to teach under a portico, or piazza. See **POR-TICO** and **PHILOSOPHY**.

The author of this sect, Zeno, was of Cittium, a town in Cyprus, inhabited by a colony of Phœnicians; whence he is supposed to have borrowed many of his dogmata from the Phœnician philosophy, which many learned men maintain was, itself, borrowed from the Jewish: though it must be allowed, there appear as many things in the *stoick* philosophy, borrowed from Plato's and Socrates's school, as from that of Moses.

Zeno making a trading voyage from Cittium to Athens, richly freighted with Tyrian purple, was shipwrecked not far from port; upon which, we are told, consulting the oracle how he should best spend the rest of his life, he was answered, *εὐχρησίζετο τοῖς νεκροῖς*, by becoming of the same colour with the dead: upon which he applied himself to the study of the ancient philosophers; and became a hearer of Crates the Cynic.—But Laertius tells us, he had too much natural modesty to give into the Cynic impudence.

From Crates, he had recourse to Xenocrates, then to Polemon; and at length began to think of instituting a new sect.

—To this purpose, a *στοα*, portico, called from the pictures of Polignotus therein, the *painted portico*, was pitched on. Here, using to walk and philosophize; he was soon attended by a great number of disciples, hence called *στοικοι*, *Stoici*. He became exceedingly revered at Athens, for the probity and severity of his life and manners, and the consistency thereof with his doctrine; inasmuch that the Athenians decreed him, when living, a golden crown, and used in dubious times to deposit the keys of the city with him: and after his death, consecrated an altar to him.

One of his chief followers was Cleanthes, who was succeeded by Chrysippus, and he by Diogenes Babylonius, Antipater, Panætius, and Posidonius among the Greeks; and by Cato, Varro, Cicero, Seneca, the emperor Antoninus, &c. among the Romans; and by Pantenus, and Clemens Alexandrinus, among the Christians.

The *Stoicks* cultivated logics, physics, metaphysics, &c. but chiefly ethics.—The principle of their dogmata of the former kinds, are as follows.

That there are certain *καταλήψεις*, *comprehensions*, (which others call *κοιναι εννοιαι*, *common notions*, or *innate ideas*, or *principles*, and Cicero, *inchoata intelligentiæ*, beginnings of understanding) naturally found in the mind: that God is the seminal cause of the universe: that the world is an animal; which opinion the *Stoicks* maintained in common with the Platonists, by reason of God's inhabiting and informing every part thereof, in quality of an anima mundi. See **ANIMA**.

That nature is an artificial fire, tending to generation: and, that the world is to be destroyed at last by a conflagration. See **CONFLAGRATION**.

For the morality of the *Stoicks*, it was couched much in paradoxes: as, that a wise man is void of all passion or perturbation of mind: that pain is no real evil; but that a wise man is happy in the midst of the severest torture: that a wise man is always the same, and always joyful: that none but a wise man is free; all others are slaves: that none but a wise man is rich: that none but a wise man ought to be esteemed a king, magistrate, poet, or philosopher: that all wise men are great: that all things are a wise man's, who is contented with himself: that wise men are the only friends, and the only lovers: that nothing ever happens to a wise man beyond expectation: that all virtues are inviolably connected together: that all good things are equal, and equally to be desired; and that goodness admits of no increase or diminution.

Whether virtue might be lost or no, was hotly disputed among them? Chrysippus held it might, by drunkenness and atrabilis; Cleanthes, that it could not, by reason of the firmness of the *καταλήψεις*, *comprehensions*.

They owned but one God; whom, however, they called by various names, as *Mind*, *Fate*, *Jupiter*, &c. by which they did not mean various things; but various powers and relations of the same things. Providence, they expressed under the name of *Fate*, which Chrysippus defines to be a natural series or composition of things mutually following each other

by

by an immutable nexus or tie, fixed from all eternity. Lastly, they held, that the human soul survived the body. See FATE, &c.

**STOLE**\*, **STOLA**, a sacerdotal ornament, wore by the Romish parish priests over the surplice, as a mark of superiority in their respective churches.

\* The word is Greek, *σολη*, signifying a long robe, or vestment.

The *stole* is worn by other priests over the alb, at celebrating of mass; in which case, it goes across the stomach: and by deacons over the left shoulder, scarf-wise.

The *stola* is a broad swath, or slip of cloth or stuff, hanging from the neck to the feet, with three crosses thereon.—The bishops anciently pretended, that the parish priests were never to appear before them, but in their *stoles*. In Flanders and Italy, they always preach in *stoles*. It is supposed to be a representation of the borders of the long robe worn by the Jewish high priests.

The *stola* of the ancient Romans, &c. was very different from that now in use: the former was a kind of robe fitter for women than men; though it was held a robe of honour among all nations. Kings themselves sometimes used it, and sometimes bestowed it as a reward of virtue.

**Groom of the STOLE**, the eldest gentleman of his majesty's bed-chamber; whose Office and honour it is, to present and put on his majesty's first garment or shirt every morning; and to order the things in the chamber. See **BED-chamber**.

**Order of the STOLE**, an order of knights instituted by the kings of Arragon; though as to the particular author, or time of the institution, we are in the dark. The first time we hear of it, is under Alphonfus V. who mounted the throne in 1416. Justiniani takes it to have been instituted about the year 1332.

**Order of the golden STOLE**, a military order at Venice; thus called from a golden *stole* which the knights wear over the left shoulder, reaching to the knee, both before and behind, a palm and a half broad. None are raised to this order but the patricians or noble Venetians. Justiniani observes, that the time of the institution of this order is unknown.

**STOMACH**, **ΣΤΟΜΑΧΟΣ**, *ventriculus*, in anatomy, a hollow, membranous, organical part of an animal, destined to receive the food after deglutition, and convert it into chyle.—See *Tab. Anat. (Splanchn.)* fig. 2. lit. d. d. h. See also **FOOD**, **DIGESTION**, **CHYLE**, &c.

Its form is longish, compared by some to a gourd, by others to a bag-pipe. It is situate in the epigastrium, declining a little further to the left than the right. Its upper part is connected to the diaphragm, the bottom to the cawl; the right side to the duodenum, and the left to the spleen.

It has two orifices, one at each end. The left orifice is properly called *σφαγίτης*, from *σφαγή*, mouth; and also *καρδία*: this is joined to the oesophagus, of which it seems to be only a continuation.—By this orifice, the aliments enter the stomach, where being digested, they ascend obliquely to the pylorus, or right orifice, which is united to the first of the intestines.—See *Tab. Anat. (Splanchn.)* fig. 2. lit. 6. See also **OE SOPHAGUS**, and **PYLORUS**.

The *stomach* consists of four membranes or coats: the first and inmost is formed of short fibres, which stand perpendicularly upon the fibres of the next coat, and are to be seen plainly towards the pylorus: when the *stomach* is distended with meat, these fibres become thick and short. Whilst they endeavour to restore themselves by their natural elasticity, they contract the cavity of the *stomach* for the attrition and expulsion of the aliments.—This coat is much larger than the rest, being full of plaits and wrinkles, and chiefly about the pylorus: these plaits retard the chyle, that it runs not out of the *stomach* before it be sufficiently digested.—In this coat, there are also a great number of small glands which separate a liquor, which besmeares all the cavity of the *stomach*, and helps the concoction of the aliments; for which reason this coat is called the *tunica glandulosa*.—See *Tab. Anat. (Splanchn.)* fig. 2. lit. i.

The second is much finer and thinner; it is altogether nervous; is of an exquisite sense, and is called *nervosa*.—See *Tab. Anat. (Splanchn.)* fig. 2. lit. k.

The third is muscular, being made of straight and circular fibres: the straight run upon the upper part of the *stomach*, between its superior and inferior orifices; and the circular run obliquely from the upper part of the *stomach* to the bottom. Of these, the innermost descend towards the right side, and the outermost towards the left; so that by their action, both ends of the *stomach* are drawn towards its middle, and the whole is equally contracted: by their contraction and continual motion, the attrition and digestion of the aliments is in great measure performed.

The fourth tunic is common; it comes from the peritonæum. The *stomach* sends veins to the porta, and branches to the gastrepiploica, accompanied with others of the cœliac; all lying immediately under the fourth coat.

The eight pair of nerves gives two considerable branches to

VOL. II. N<sup>o</sup>. CXLVI.

the *stomach*, which are spread much about the upper orifice; by which it is rendered very sensible: whence also proceeds the great sympathy betwixt the *stomach*, head, and heart; on account whereof, Van Helmont thought, that the soul had its seat in the upper part of the *stomach*.

For the motion of the **STOMACH**; Dr. Pitt, in the *Philosophical Transactions*, acquaints us, that in dissecting a dog, he found the peristaltic motion of the guts continued through the *stomach*; the pylorus, which is usually found as high as the diaphragm, being, in every undulation, brought below the very bottom of the *stomach*; so that he could manifestly observe a constriction in the middle of the *stomach*, at every motion downwards, passing it in so as to be able to compress whatever was contained in its cavity. These motions, he observes, were as regular as any he ever observed in the guts; and adds, that he has since observed the same in three others; whence one may safely enough conclude it holds of all. See **PERISTALTIC**.

Hence, we easily see the reason of the quick distribution of the nourishment; the food being no sooner opened by the drink and spittle, &c. than it has a free motion through the pylorus into the intestines, from this compression in the middle of the *stomach*. See **INTESTINES**.

Ruminating animals have four *stomachs*; yet it is observed that some of these, which have four in Europe, have only two in Africa, probably by reason the herbs in Africa are more nourishing. See **RUMINANT**.

Birds that live ordinarily of seeds covered with a tough rind, have a kind of *stomach*, called the *crop*, or *gizzard*, consisting of four large muscles without-side, and a hard callous membrane within.—Such as live on flesh, as eagles, vultures, &c. have only one. See **CARNIVOROUS**, **GRANIVOROUS**, &c.

**STOMACHIC**, **ΣΤΟΜΑΧΙΚΟΣ**, a medicine that strengthens the *stomach*; and promotes the office of digestion. See **STOMACH**, and **DIGESTION**.

Of this kind are wormwood, rhubarb, mint, mastic, aloes, pepper, cinnamon, and aromatic bitters: good wine is also a *stomachic*.

**STOMACHIC**, in anatomy, is applied to the arteries, veins, &c. of the *stomach*; called also *gastric*. See **GASTRIC**.

The *stomachic* veins terminate in the trunk of the vena porta, and the splenic vein. See **VEIN**.—The *stomachic* arteries arise from the cœliac. See **ARTERY**.—The *stomachic* nerves come from the eighth pair. See **NERVE**.

**STOMACHIC coronary**, } See the articles } **CORONARY**.  
**STOMACHIC water**, } **WATER**.

**STONE**, in natural history, a hard, solid body, neither malleable, fusible by fire, nor soluble in water; formed by succession of time, in the body of the earth. See **Fossil**.

For the origin and formation of **STONES**, M. Tournefort, on his return from the east, in the year 1702, proposed to the royal academy, a new theory.

On a curious survey of the famous labyrinth of Crete, he observed, that several people had engraven their names in the living rock, whereof its walls are formed; and, what was very extraordinary, the letters whereof they consisted, instead of being hollow, as they must have been at first (being all cut with knife-points) were prominent, and stood out from the surface of the rock, like so many basso-relievo's. See **LABYRINTH**.

This is a phenomenon no otherwise accountable for, than by supposing the cavities of the letters filled insensibly, with a matter issuing from out of the substance of the rock; and which even issued in greater abundance than was necessary for filling the cavity. Thus is the wound made by the knife healed up, much as the fracture of a broken bone is consolidated by a callus, formed of the extravasated nutritious juice, which rises above the surface of the bone: and this resemblance is the more just; as the matter of the letters was found whitish, and the rock itself greyish.

Something very like it is observed in the barks of trees, wherein letters have been cut with the knife; so that the poet had reason to say, that the characters grew as the trees themselves grew: *crescent illæ, crescetis amores*.

M. Tournefort supports his opinion by similar callus's apparently formed in several other *stones*, which had re-united after, by accident, they had been broken.

From these observations, it follows, that there are *stones* which grow in the quarries, and of consequence that are fed; that the same juice which nourishes them, serves to rejoin their parts when broken; just as in the bones of animals, and the branches of trees, when kept up by bandages; and, in a word, that they vegetate. See **VEGETATION**.

There is, then, no room to doubt but that they are organized; or that they draw their nutritious juice from the earth. This juice must be first filtrated and prepared in their surface; which may be here esteemed as a kind of bark; and hence it must be conveyed to all the other parts.

It is highly probable, the juice which filled the cavities of the letters, was brought thither from the bottom of its roots;

nor is there any more difficulty in conceiving this, than in comprehending how the sap should pass from the roots of our largest oaks, to the very extremities of their highest branches.

It must be owned, the heart of these trees is exceedingly hard; and yet those of Brasil, called *iron wood*, guaiacum, and ebony, are much harder. Coral is as hard in the sea as out of it; and sea mushrooms, which every body allows to grow, are true *stones*, and so, like the common *stones*, are used in America to make lime of.

None, we believe, ever doubted that shells grow by means of a nutritious juice; and yet this juice is conveyed along the narrow canals of these excessively hard bodies, as well as through those of plants, which are much less hard. See SHELL.

Some *stones*, then, must be allowed to vegetate and grow like plants: but this is not all; probably they are generated in the same manner; at least there are abundance of *stones*, whose generation is inconceivable, without supposing they come from a kind of seeds, wherein the organical parts of the *stones* are wrapped up in little; as those of the largest plants are in their grains.

The *stones*, called *cornu Ammonis*, *lapis Judaicus*, *astroites*, those of Bologna, and Florence, the several kinds of pyrites, sea mushrooms, crystals of the rock, and an infinity of other *stones*, suppose their several seeds; as much as mushrooms, truffles, and various kinds of mosses, whose seeds were never yet discovered. See MUSHROOM, CRYSTAL, CORAL, &c.

How should the *cornu Ammonis*, which is constantly in figure of a volute, be formed without a seed, containing that same structure in little? who moulded it so artfully? and where are the moulds? Far from this, these kinds of *stones* are found in the earth, like common flints. Nor were either moulds, or any thing like them, ever discovered. See CORNU AMMONIS.

M. Tournefort examines the several kinds of *stones* above-mentioned, and finds them under the same necessity of seed. Again, that immense quantity of flints, wherewith the Crau of Arles is covered, is a strong argument in behalf of this theory.

The country there, for twenty miles round, is full of roundish flints; which are still found in equal abundance, to whatever depth you dig. M. Peirefc, who first proposed the generation of *stones* by means of seeds (though he took the word *seed* in a very different sense from M. Tournefort) first brought this extraordinary campagne as a proof thereof. In effect, how could so many similar flints be formed? There is no saying they are coeval with the world, without asserting at the same time, that all the *stones* in the earth were produced at once; which were to go directly contrary to the observations above-mentioned.

Among the seeds of *stones*, M. Tournefort observes, there are some, which do not only grow soft by the juices of the earth, but even become liquid. These, then, if they penetrate the pores of certain bodies, grow hard, petrify, and assume the figure or impression of the body: thus what we call *petrinites*, *conchites*, *mytilites*, *ostracites*, *nautilites*, *echinites*, &c. are real *stones*, the liquid seeds whereof have insinuated into the cavities of the shells called *peten*, *concha*, *mytilus*, *ostrea*, *nautilus*, *echinus*.

On the contrary, if those liquid seeds fall on flints, on shells, sand, &c. they inclose those several bodies, and fixing between them, form a kind of cement, which yet grows like other *stones*. It is highly probable that such rocks as are only an assemblage of masticated flints, have been formed by a number of these liquid seeds; in like manner as the quarries full of shells: unless the rocks have enveloped these bodies in their growth.

He adds, that there are seeds of real *stones* inclosed in the spawn of certain shell-fish; as well as that hard solid matter destined to the forming their shells.

There is a particular kind of shell-fish, called *pholas*, which is never found any where but in the cavities of flints, which are always found exactly fitted to receive them. Now, it is highly improbable the fish should come and dig such a niche to spawn in; it is much more likely, the *stones* they are found inclosed in, were at first soft; and that the matter they are formed of, was originally found in the spawn, in like manner as the matter which forms the egg-shell, is really found in the seed thereof.

From the whole, he concludes, that the seed of *stones*, and even of metals, is a kind of dust which probably falls from them while they are alive, *i. e.* while they continue to vegetate as above. This dust may be compared to the seeds of several plants, as those of ferns, capillaries, mosses, truffles, &c. which no microscope ever yet discovered; though their existence is not at all to be doubted. See SEED.

Probably, flints and pebbles are among *stones*, what truffles are among plants: nor is this opinion new; Pliny assures us, that Theophrastus and Mutianus believed, that *stones* produced *stones*: and Gregory Nazianzen adds, that there were authors who even believed that *stones* made love,

For *και αλληλοι γαμοι και δεσμος αμωτος*, *Poem. de Virgin.* M. Geoffroy accounts for the origin and formation of *stones*, in a different manner.—He lays it down as a principle, that all *stones*, without exception, have been fluid; or at least a soft paste, now dried and hardened: witness the *stones* wherein are found foreign bodies; witness, also, figured *stones*, &c.

On this principle, he examines the formation of the different kinds of *stones*; and shews, that the earth alone suffices for the same, independent of all salts, sulphurs, &c. The metallic particles contained in flints, give them their colour; but these are only accidents: for proof of which, he instances the sapphires and emeralds of Auvergne, which lose all their colour by a moderate fire consuming their metallic parts; but without any damage to their transparency; they being hereby rendered mere crystals.

To view rock crystal, indeed, one would not take it for earth; and yet earth it must be, not water congealed, as the ancients imagined. See CRYSTAL.

M. Geoffroy conceives two kinds of primitive particles in the earth.—Those of the first kind, are exceedingly fine, thin lamellæ, equal to each other, or nearly so. Now, when these meet together, from any cause whatever, in a sufficient quantity; the regularity and equality of their figures determines them to range themselves equally and regularly; and thus to form a homogeneous compound, which is very hard, from the immediate contact of the parts; and very transparent, by reason of their regular disposition, which leaves a free passage to the rays of light every way: and this is crystal. See CRYSTAL.

The parts of the second kind have all sorts of irregular figures; and must accordingly form assemblages that are much opaker and less hard. Now crystal is formed wholly of parts of the first kind; and all other *stones* of a mixture of the two kinds of parts together: this mixture is absolutely necessary, in order to unite and bind together the parts of the second kind, and give them a hardness and consistence, without which they would only make a sand or dust. Water, now appears the fittest vehicle, to carry the parts of the first kind. This is seen from several petrifying springs, which incrustate the pipes through which their waters are conveyed, or even solid bodies laid in them for some time. The Water does not dissolve those earthy parts; it only keeps them in fusion, as it does the juices wherewith plants are fed.

This water, thus charged with earthy particles of the first kind, M. Geoffroy calls the *stone*, or *crystalline* juice, whereof those bodies are primarily formed.

STONES are of various kinds, with regard to the places they are produced in: the most ordinary are under ground; others in the bodies of men, and other animals; others seem to be generated by the sea, as pumice, &c. and others, the effect of a petrifying virtue in certain waters. See PETREFACTION, &c. Of these, some serve simply for magnificence, and ornament; as all those called,

Precious STONES; which make the commerce of lapidaries and jewellers. See PRECIOUS stone, and GEM.

Others, much usefuller, if one might credit all the virtues attributed to them, are used in medicine; such as bezoards, Jews stone, eagles stone, &c. See BEZOARD, ETITES, JUDAICUS, &c.

Others, again, are used in painting; either to prepare colours from, by calcining and grinding them, or to be used as crayons or pencils for designing: of which number are the Armenian stone, black lead, ruddle, &c. See ARMENIAN, RUDDLE, &c.

Lastly, much the greatest quantity, and those too of the most immediate and common use, are those employed in building; such as free stone, marble, lime stone, fire stone, &c. See MARBLE, &c.

For Free STONE, that dug in the peninsula of Portland, and thence called *Portland stone*, is much used; being softer and whiter than Purbec stone, and is commonly raised out of the quarries in bigger blocks than that.

Some also call Ryegate, or fire stone, *free stone*. See FIRE.

Mr. Boyle observes, that a competent knowledge of the nature of the sap or juice found in *stones* used in building, is of the last importance; the same stone dug out of the same quarry at one season, being found to moulder away in a few winters, which dug at another season, will brave the weather for many ages: and there are others, which, though dug at the proper season, yet make but ruinous building, if used at an improper season.

The same author adds, that as there are some sorts of *stones* which will decay in a few years, there are others will not have attained their full hardness in thirty or forty years, or even much more. See PORPHYRY.

STONES are divided by bishop Wilkins into *vulgar*, *middle priced*, and *precious*.

1. *Vulgar* STONES, or such as are of little price, are distinguishable by their different magnitudes, uses, and consistence, into the

- Greater magnitudes of *stone*, used either about Buildings, whether of Walls; chiefly being of a softer consistence, whether natural or factitious,
- 1 { *free stone*, *brick*.
  - harder consistence; not easily yielding to the tool of the workman, growing either in great masses,
  - 2 *ragg*.
  - lesser masses; whether such as are for their figure, more knobbed, and unequal; used for the striking of fire, either the more common, which is less heavy; or less common, which is more heavy, as having something in it of a metalline mixture,
  - 3 { *flint*, *marcasite*, *fire stone*.
  - more round and even,
  - 4 *pebble*, *thunderbolt*.
  - Roof, or pavement, being of a laminated figure, either natural, or factitious,
  - 5 { *slate*, *tile*.
  - Metals, either for the sharpening, or trying of them,
  - 6 { *whet stone*, *touch stone*.
  - polishing, or cutting of them; being either of a more spongy and soft, or of a more hard consistence,
  - 7 { *pumice*, *emery*.
  - lesser magnitudes, either more, less, or minute,
  - 8 { *sand*, *gravel*.

2. *Middle priced STONES*, are either of a shining politure, or capable of it; whether of a simple white colour, and more soft consistence,
1. *alabaster*.
  - sometimes white, sometimes black or green, and sometimes variegated with veins, growing in greater or lesser masses,
  - 2 { *marble porphyry*, *agat*.
  - spotted with red, upon a greenish colour, or with spots of gold colour upon blue,
  - 3 { *jaspis*, *heliotrope*, *lazul*, *azure stone*.
  - Transparency, either brittle; whether natural or factitious,
  - 4 { *crystal*, *glass*.
  - split into flakes, either greater or lesser,
  - 5 { *selenite*, *Muscovia glass*, *ising glass*, *spar*, *talc*.
  - Relation to metals, attracting iron, or making of bras,
  - 6 { *load stone*, *cadmia calaminaris*.
  - Incombustible nature,
  - 7 *amiantus*, *asbestus*.
  - Strange original; not being properly minerals, though usually reckoned amongst them; but either a submarine plant, or supposed to proceed from a liquid bitumen,
  - 8 { *coral*, *coralline*, *amber*.

### 3. *Precious STONES*; which see under the article *PRECIOUS stone*.

*STONE*, also denotes a certain quantity, or weight of some commodities. See *WEIGHT*.

A *stone* of beef at London, is the quantity of eight pounds: in Herefordshire, twelve pounds; in the North, sixteen pounds.—A *stone* of glass is five pounds; of wax, eight pounds.

A *stone* of wool (according to the statute of 11 Hen. VII.) is to weigh fourteen pounds; yet in some places it is more, in others less; as in Gloucestershire, fifteen pounds; in Herefordshire, twelve pounds.

Among horse-couriers, a *stone* is the weight of fourteen pounds.

*CASTING in STONE*. See the article *CASTING*.

*STONE*, in medicine, is the denomination of a disease, called also *calculus*, and *lithiasis*; and, occasionally, the *gravel*. See *CALCULUS*, *GRAVEL*, &c.

It consists of a stoney concretion, formed either in the bladder or kidneys; which prevents the discharge of urine, and occasions violent pains. See *BLADDER*, and *KIDNEYS*.

The *stone*, Etmuller says, is not a disease, but the product of a disease: the disease, properly, is the *lithiasis*, or the disposition of the kidneys and bladder to generate *stones*.

The *stone* is generated, according to some authors, of the earthy viscid parts of the blood, hardened, in course of time, by the heat of the kidneys; much after the manner as brick is baked in a kiln.—Dr. Quincy supposes it generated of the harder parts of the urine, pent up by the streightness of the ducts, and brought into contact and cohesion.—Etmuller ascribes the *stone*, sometimes to the stoney and metallic particles of our foods and drinks, which the reins, through weakness and relaxation thereof, cannot eject; but more usually to the unequal strength of the kidneys: whence it is that we see one kidney breeds *stones*, the other remaining sound.

The *stone* in the bladder, is first formed in the pelvis of the kidneys; whence falling into the bladder, it becomes augmented by new lamellæ or coats. See *PELVIS*.

The diagnostic signs of the *stone in the kidneys*, are, 1° A fixed, obtuse pain in the region of the loins, appearing like a weight loading the reins. As the *stone* falls out of the pelvis into the ureter, the pain is exceedingly acute and racking, which holds till either the *stone* be got into the bladder, or returned again to the pelvis. 2° An inflexibility of the spina dorsa, from the extension and compression of the nerves. 3° A stupor of the thigh and leg of that side, from the consent of parts. 4° A retraction of the testicle. 5° A very small quantity of urine, either thin and limpid, or bloody. But as soon as the *stone* is got into the bladder, the urine becomes thick, turbid, blackish, and in great quantity.

The diagnostics of the *stone in the bladder*, are a sense of heaviness in the perinæum and inguinal region, a perpetual and troublesome desire of making water, which is followed with a sharp pain, principally in the glans of the penis, whence a prolapsus of the anus. But the surest way of finding it, is by the touch, viz. by thrusting the finger or a catheter up the anus.

The cure of the *stone*, is either by a liquor that will dissolve or break the concrete *stone*; so as it may be evacuated piecemeal: which is called a *lithontriptic*; or by enlarging the capacity of the vessels; or by the operation of cutting, called *lithotomy*.

We have yet no assured lithontriptic known, how many soever may pretend to it; the most noted, are Daffey's elixir, Tipping's liquor, and Rogers's powder. See *LITHONTRIPTIC*.

The most usual cure is by cutting; the various manners whereof, see under *LITHOTOMY*.—In some desperate cases, the *stone* has been known to make itself a way through the spinal muscles.

Dr. Lister observes, that *stones* are found, not only in the bladder and kidneys, but also in the pituitary ducts, the brain, liver, lungs, stomach, intestines, and joints of the hands and feet; to which may be added, that in the *Philosophical Transactions*, we have likewise accounts of *stones* in the pineal gland, the heart, gall-bladder, &c.

*Stones* are distinguished into three kinds, *white*, *red*, and *yellow*; which last are the most usual.

Deckers recommends calcined egg-shells as excellent in all suppressions of urine; Hamilton, linseed oil; and Mr. Boyle, the herb *arsenart*.

*STONE-BLUE*, a mineral preparation, properly called *smalt*. See *SMALT*.

*STONEHENGE*, in antiquity, a famed pile or monument of huge stones on Salisbury plain, six miles distant from that city. It consists of the remains of four ranks of rough *stones*, ranged one within another, some of them, especially in the outermost and third rank, twenty foot high, and seven broad; sustaining others, laid across their heads, and fastened by mortises: so that the whole must have anciently hung together.

Antiquaries are divided, as to the origin, use, structure, &c. of this wonderful fabric. Most of them take the *stones* to be artificial, and to have been made on the spot; which seems the more probable, as we are pretty well assured the ancients had the art of making *stones* with sand, and a strong lime or cement; and as the *stones* seem too big for land-carriage; and yet are in a plain, which for some miles round scarce affords any *stones* at all.—Inigo Jones, however, a better judge than most antiquaries, is positive that the *stones* are all natural; and there is hardly any architect or naturalist who examines the grain of them exactly, but will be of his

his mind.—As to their unweildiness, which is brought as an argument against their being portable, it is without foundation; they being merely but trifles compared to many other *stones* which are known to have been thus carried.

The legends give us various other accounts; some will have them brought miraculously by St. Patrick, from Ireland; others, &c.

As to its use, some antiquaries take it to have been an ancient temple of the Druids\*; others, of the Romans, dedicated to Coelus; in which they are confirmed by its having been open a-top. Others, reading the name, *stone-hengist*, maintain it to have been a monument erected in memory of Hengist, the first general of the Saxons in England: others will have it a funeral monument, raised to that brave Romano-Briton, Aurelius Ambrosius; to which opinion, some circumstances of his actions, the still remaining Latin name of the place (Mons Ambrosii) and that very ancient Welsh proverb, *Mal gwaith Emrys*, Like the work of Ambrose, give some countenance.

\* Antiquaries are now pretty well agreed, that it was a British temple; and Dr. Langwith thinks it might easily be made probable, at least, that it was dedicated to the sun and moon. V. Stukel. *Stone-benge*, a temple restored to the British Druids.—Inigo Jones has given a fine scheme of the work, and strives hard to persuade the World, that it was Roman: but Dr. Langwith, who took his measures on the spot, assures us, he could by no means reconcile them with that scheme.

**STOOL**, *alvus*, in medicine. A thing is said to be voided by *stool*, when it is discharged by the anus, or fundament. See **ANUS**.

In the Philosophical Transactions, we have instances of sick persons voiding facitious stones, balls, &c. by *stool*. See **EXCREMENT**.

**Cucking STOOL**. See the article **CUCKING**.

**STOOMING** of wine, the putting bags of herbs, or other ingredients into it. See **WINE**, **NODULE**, **SACCULUS**, &c.

**STOOPING**, in falconry, is when a hawk being upon her wings, at the height of her pitch, bends down violently to take the fowl.

**STOPS**, } in grammar. See { **POINTS**.  
**STOPPING**, } **PUNCTUATION**.

**Saturday STOP**. See the article **SATURDAY**.

**STORAX**, or **STYRAX**, a resinous, odoriferous gum, brought from Syria; whereof there are two, or three kinds: *red storax*, *storax calamita*, and *liquid storax*.

*Red or dry STORAX*, called also *Jews incense*, is a gum or resin oozing out at an incision made in the trunk and biggest branches of a tree, called *storax*, not unlike our quince-tree. Its fruit is of the size of a filberd, and contains a white, oily kernel, of a smell perfectly like *storax*.

It must be chosen in a mass, of a reddish colour, soft and fat, and of an agreeable smell, bearing no resemblance to liquid *storax*.—That in cakes, in balls, &c. is all sophisticated; and only a wretched composition of liquid *storax*, and the impurities of the true red *storax*, and other drugs. That in powder is still worse.

Red *storax* is of some use in medicine; and is also used by the perfumers, and often substituted for frankincense. See **FRANKINCENSE**.

**STORAX calamita**, thus called from the rushes or quills, in Latin, *calami*, it was anciently brought in, is, by some, held to be only a composition of several excellent drugs; and among the rest, of red *storax*, whence its name: though authors have generally taken it for a natural gum, different from the red *storax*. Hoffman's conjecture is, that it only differs from the other in age; the *storax* growing higher coloured with keeping.

It must be chosen in fine white tears, very dry, and not bitter; sometimes it is in reddish masses, full of these whitish tears, only mixed with a ruddy substance.

These two kinds are esteemed excellent pectorals, stomachics, and cephalics.

**Liquid STORAX**, is a kind of facitious resin, of a greyish colour, compounded of true *storax*, common resin of the pine oil, and wine, beaten with water, into the consistence of an unguent.

The druggists also call it *stacte*, to distinguish it, and sell it for the better price. See **STACTE**.

The best is that of Holland. It is easily kept in a cellar, by pouring water on it from time to time. It is an ingredient in an unguent which experience has shewn to be excellent against the scorbutus, and gangrene.

**STORE**. *Bill of STORES*. See the article **BILL**.

**STORGE**, **STOPH**, a Greek term, frequently used by naturalists, to signify that paternal instinct, or natural affection, which all, or most animals bear their young. See **INSTINCT**.

The *storge* is an admirable principle implanted by the all-wise Creator throughout the animal world, for the preservation thereof; and is governed by such rules as make it best contribute thereto. By means of this, with what care and alacrity do animals nurse their young? and what dangers will they avoid for their security? even the most timorous creatures, which at other times fly the face of men, dogs, &c. will, for the sake of their young, expose themselves.

Thus hens, instead of flying from, will assault such as meddle with their brood; and partridges, before their young can fly, will frequently drop down before the dogs, first at less, then at greater distances, to dodge, and draw them off, from pursuing their young. With what concern do others lead about their young in places of safety? and some even admit them for shelter into their bowels.

Thus the opossum, Dr. Tyson observes, has a curious bag on purpose for the securing and carrying about her young; and some say, the teats lie in it. The same author adds, from Oppian, that the dog-fish, upon any storm or danger, receives her young into her belly, which come out again when the fright is over. The squatina and glaucus do the like.

With what tenderness do others seek and prepare the food for their young, teach them to suck, cherish, or lull them to rest, &c. like so many nurses, deputed by the Creator to take care of his creatures? and still in proportion, as they grow up and become fit to look to themselves, this *storge* abates; and, at length, when no longer needed, becomes extinct. Mr. Ray observes, that young doves are fed with meat first eat by the dam, and sodden a-while in her prolobe. And Clusius observes, that the old female Ethiopian takes no food but from the male, after this manner.

The returns made by the young to the parent animal, when grown old, are not less considerable. Pliny says of rats, that they nourish their aged parents with eminent piety.

St. Ambrose, and after him Olaus Magnus, observe of the crane, that when the parents, through old age, are bereft of their feathers, and left half naked, their offspring stand around them, and cherish them with their own feathers; that they seek food for them; and when nature, as it often happens, repairs their decays, and restores them to strength again, they take them up by turns, on their wings, and habituate their unpractised limbs to their ancient art of flying.

**STORM**, in the military art. See **ASSAULT**.

**STOVE**, in building, a hot house or room. See **HYPocaustum**, **SUDATORY**, **FIRE**, **CHIMNEY**, &c.

Palladio observes, that the ancients used to warm their rooms with certain secret pipes, which came through the walls, conveying heat to several parts of the house, from one common furnace. Whether this were a common custom, says Sir Henry Wotton, or a curiosity, we cannot determine; but it was certainly, both for profit and use, far beyond the German *stoves*.

**STOVE**, among confectioners, denotes a little closet well closed on all sides, wherein are several stories or rows of shelves made of wiares one above another, for the drying of sweetmeats.

**STOWAGE**, in the sea language, the putting of goods orderly into the hold of a ship; the most ponderous and heavy next the ballast. See **HOLD**.

**STRABISMUS**, **ΣΤΡΑΒΙΣΜΟΣ**, a disorder of the eye, makes it look a-quist, either upwards, downwards, or awry. The *strabismus* consists in a retraction of the ball of the eye, towards one side; occasioned by a convulsion, or a palsy of one of its muscles.

Children are apt to acquire it through the carelessness of their nurses, in placing them always on the same side the light, or of any other remarkable object that occasions them to turn their eyes that way.

To remedy it, care is to be taken, that the light, or other notable body, be placed on the other side of them; or else a mask put on them, the holes whereof are so disposed, as that to see through them, the child be obliged to turn his eyes the opposite way.

**STRAIGHT**, **STREIGHT**, or **STRAIT**, in hydrography, a narrow sea, or gut, shut up between lands on either side, and affording a passage out of one great sea into another. See **SEA** and **OCEAN**.

The most celebrated *straight* in the world, is that of Gibraltar, which is about one hundred and thirty miles long and twelve broad, joining the Mediterranean sea, with the Atlantic ocean.

The *straights* of Magellan, discovered in 1520, by F. Magellan, were used some time, as a passage out of the north into the south sea; but since the year 1616, that the *straight* of le Maire has been discovered, the former has been disused; both because of its length, which is full three hundred miles, and because the navigation thereof is very dangerous, from the waves of the north and south seas meeting herein, and clashing.

The *straight* at the entrance of the Baltic, is called the *Sound*. See **SOUND**.—That between England and France, *Le pas de Calais*, or the *channel*.—The *straights* of Babel-mandel, of Weigats, of Jesso, of Anian, of Davis, and Hudson, &c.

**STRAIGHT** is also used in geography, for an isthmus, or neck of land between two seas; preventing the communication thereof. See **ISTHMUS**.

**STRAIGHT arches**, } See the articles { **ARCH**.  
**STRAIGHT stairs**, } **STAIRS**.

**STRAIN**, or **SPRAIN**, a violent extension of the sinews or tendons of some muscle. See **TENDON**.

**STRAINED**

**STRAINED** *sugar*. See the article **SUGAR**.

**STRAINING** \*, is the clarification of a liquor, by passing it through a sieve, or filtre. See **FILTRATION**.

\* The word is derived from the French, *estreindre*; which is formed from *ex*, out of; and *stringere*, to press.

**STRAIT**. See the article **STRAIGHT**.

**STRAND** and *stream*, in ancient customs, a freedom from all impositions upon goods or vessels by land or water.

**STRANDED** \*, is when a ship is by tempest, or ill steerage, run on ground, and so perishes.

\* The word is formed from the Saxon *strand*, a shore or bank of the sea, or a great river.

**STRANGER**, in law, denotes a person who is not privy, or party, to an act.

Thus a *stranger* to a judgment, is he to whom a judgment does not belong: in which sense the word stands directly opposed to *party*, or *privy*. See **PARTIES** and **PRIVY**.

**STRANGURY** \*, *ΣΤΡΑΓΓΟΥΡΙΑ*, in medicine, a disease occasioning a frequent and involuntary emission of urine, in very small quantities, and, as it were, drop by drop; with an intense pain. See **URINE**.

\* The word is formed from the Greek, *στραγγίζω*, *gutta*, drop, and *ουρά*, urine.

The *strangury* arises from the too great acrimony of the urine, which vellicating the nervous parts of the bladder, occasions a continual inclination to urine.

New beer, and other liquors, not well fermented, usually occasion the *strangury*—The extreme sharpness of the urine in the *strangury*, sometimes produces an ulcer in the bladder. Some authors confound the *strangury*, which the Latins call *urinæ stillicidium*, with the *urinæ incontinentia*.—The difference between them consists in this, that in the former, the urine comes away with pain, in the latter without. The former proceeds from the acrimony of the urine; and the latter from a relaxation or palsy of the sphincter of the bladder, which cannot keep the neck thereof close shut. See **URINE**.

**STRAP**, among surgeons, a sort of band used to stretch out members in the setting of broken, or disjunct bones. See **BANDAGE**.

**STRAPADO** \*, or **STRAPPADO**, a kind of military punishment, wherein the criminal's hands being tied behind him, he is hoisted up with a rope, to the top of a long piece of wood, and let fall again almost to the ground; so that by the weight of his body in the shock, his arms are dislocated.—Sometimes he is to undergo three *strapado's*, or more.

\* The word is formed from the French *estrade*, which signifies the same; and which is supposed to come from the old proverb *estreper*, to break, extirpate; or from the Italian *strappata*, of the verb *strappare*, to wrest by force.

**STRATA**, in natural history, the several beds, or layers of different matters, whereof the body of the earth is composed. See **EARTH**.

The *strata* include all the layers of earths, minerals, metals, stones, &c. lying under that upper tegument or stratum, the turf, or mould. See **FOSSIL**, **MINERAL**, **METAL**, &c.

The time when those several *strata* were laid, was, doubtless, at the creation; unless, with some great naturalists, as Steno, Dr. Woodward, &c. we suppose the globe of the earth to have been dissolved by the flood. See **DELUGE**.

At that time, says Mr. Derham, whenever it was that the terrestrial globe was in a chaotic state, and the earthy particles subsided, then these several beds were repositied in that commodious order, wherein they are now found; and that, as is asserted, according to the laws of gravity; the lower still heavier than the upper.

But Dr. Leigh, in his *Natural History of Lancashire*, speaking of the coal-pits, denies the *strata* to lie according to the laws of gravitation; observing that the *strata* there, are first a bed of marle, then free-stone, next iron-stone, then coal, or channel mire, then some other *strata*, then coal again, &c. This determined Mr. Derham to make a nicer enquiry into the matter; accordingly, in 1712, he caused divers places to be bored, laying the several *strata* by themselves; and afterwards determined very carefully their specific gravity. The result was, that in his yard, the *strata* were gradually specifically heavier and heavier, the lower and lower they went; but in another place in his fields, he could not perceive any difference in the specific gravities.

Acquainting the Royal Society therewith, their operator Mr. Hauksbee, was ordered to try the *strata* of a coal-pit, which he did to the depth of thirty *strata*: the thickness and specific gravity of each whereof, he gives us in a table in the *Philosophical Transactions*; and from the whole makes this inference, that it evidently appears, the gravities of the several *strata* are in no manner of order; but purely casual, as if mixed by chance. See **VEIN** and **COAL**.

**STRATARITHMOMETRY** \*, in war, the art of drawing up an army, or any part of it, in any given geometrical figure; and of expressing the number of men contained in such a figure, as they stand in array, either near at hand, or at any distance assigned. Harris.

\* The word is formed from the Greek, *στρατός*, army, *αριθμός*, number, and *μέτρον*, measure.

**STRATEGEM** \*, *ΣΤΡΑΤΗΓΗΜΑ*, a military wile; or a

device in war, for the surprizing, or deceiving an enemy.

\* The word is formed from the Greek, *στρατηγός*, I lead or command an army.

The ancients dealt mightily in *strategems*; the moderns wage war more openly, and on the square.—Frontinus has made a collection of the ancient *strategems* of war.

**STRATEGUS**, *ΣΤΡΑΤΗΓΟΣ*, in antiquity, an officer among the Athenians, whereof there were two chosen yearly, to command the troops of the state. See **CAPTAIN**, **GENERAL**, &c. See also **ARCHISTRATEGUS**.

Plutarch says, there was one chose from out of each tribe, but Pollux seems to say, they were chose indifferently out of the people. It was the people themselves made the choice; and that on the last day of the year, in a place called *Pnyx*.

The two *strategi* did not command together; but took their turns, day by day; as we find from Herodotus and Cornelius Nepos. Sometimes, indeed, as when a person was found of merit vastly superior, and exceedingly famed in war, the command was given to him alone: but it was ever a rule, not to put any person in the office, but whose estate was in Attica, and who had children, that there might be some hostages, and securities for his conduct and fidelity.

**STRATIFICATION**, **STRATIFICATIO**, in chymistry, the arrangement of different matters, in several strata or layers, alternately; called also by the Latins, *stratum super stratum*; and marked in books of chymistry with SSS.

This operation is used in calcining of minerals or metals with salts or other matters. See **CALCINATION**.

To purify gold by cæmentation, they *stratify* laminæ, or plates of gold in a crucible, with a dry paste called *cæment*. See **CÆMENT** and **CÆMENTATION**.

**STRAY**. See the article **ESTRAY**.

**STREAM-anchor**, is a small anchor made fast to a *stream-cable*; for a ship to ride by in gentle *streams*, and in fair weather. See **ANCHOR**.

**STREAM-works**, are certain works in the tin-mines, when the miners follow the veins of metal, by cutting trenches, &c. See **TIN**.

**STREIGHT**. See the article **STRAIGHT**.

**STRENÆ**, in antiquity, *new years gifts*; presents made out of respect on new-year's day; as a happy augury for the ensuing year. See **NEW YEAR's day**.

The ancient lawyers derive the word hence, That these presents were only given *viris strenuis*; Symmachus adds, that the use hereof was first introduced by king Tatius, Romulus's colleague, who received branches of vervain gathered in the sacred grove of the goddess Surenia, as a happy presage of the beginning year.

Anciently, a pound of gold was given to the emperors every new-year's day, by way of *strena*.—Du Cange observes, that *stirina*, or *strinna*, denoted a kind of tribute which the people of Dalmatia or Croatia payed to the Venetians, or to the kings of Hungary, whom they obeyed voluntarily.

**STRENGTH**, *vis*. See **FORCE** and **POWER**.

The *strengths* of different animals of the same species, or of the same animal at different times, are demonstrated to be in a triplicate proportion of the quantities of the mass of their blood: the whole *strength* of an animal, is the force of all the muscles taken together; therefore, whatever increases *strength*, increases the force of all the muscles, and of those serving digestion, as well as others. See **MUSCLE**.

Yet, notwithstanding the truth of this, the quantity of blood may be increased in such circumstances, as to abate the *strength*. The equilibrium between the blood and vessels being destroyed, wonderfully lessens the *strength*. The sudden suppression of perspiration, though it increases the quantity of the blood, as it must considerably do, by Sanctarius's calculation, yet it lessens the *strength*; because the retained matter, being what ought to be evacuated, so alters the texture of the blood, as to make it unfit for muscular motion. Suppose the increase of quantity to be connected with an extraordinary viscosity, the quantity of small separable parts decreasing, as the viscosity increases, the quantity of animal spirits separated in the brain, will be less; and the tension of the fibres being in proportion to the animal spirits forced into them, they will not be able to counterpoise the great weight of the blood, and so the *strength* will be diminished.

Bellini proves, that if the blood be so vitiated, as to increase or diminish *strength*; it amounts to the same as if the blood were in a natural state, but its quantity increased or diminished in the same proportion: so that the blood, when vitiated, may so impair the *strength* of the muscles, as even to spoil digestion; and yet in some cases, it may be so vitiated, as to help digestion, and increase *strength*.

M. de le Hire, in a calculation of the *strength* of a man in drawing and bearing, shews, that the *strength* of an ordinary man walking in a horizontal direction, and with his body inclining forwards, is only equal to twenty-seven pounds; which is much less than one would have imagined.

He adds, that this force would be much greater, if the man were to walk backwards; and that it is for this reason, the watermen fetch their oars from before, backwards: and though he observes, the gondoliers of Venice fetch them the contrary way, yet this is, because they chuse to lose the advantage

vantage of *strength*, to have that of seeing the place they are going to, in the numerous turns and canals they there meet withal.

It is known by experience, that a horse draws, horizontally, as much as seven men; consequently, his *strength* will be 189 pounds. A horse, as to pushing forwards, has a great advantage over a man, both in the *strength* of its muscles, and the disposition of the whole body; but the man has the advantage over the horse in ascending. M. de la Hire shews, that three men laden with 100 pounds a-piece, will ascend a pretty steep hill with more ease and expedition, than a horse laden with 300 pounds.

Hakewell furnishes us with abundance of instances of extraordinary *strength*: Clunher, provost of the great church of Mesnia in 1522, carried a pipe of wine out of the cellar, and laid it in the cart.—Mayolus saw one hold a marble pillar in his hand three foot long, and one in diameter, which he tossed in the air, and caught again like a ball.—A little man of Mantua, called *Rodamas*, could break a cable.—Ernando Burgh fetched up stairs, an ass laden with wood, and threw both into the fire. At Constantinople, in 1581, one lifted a piece of wood which twelve men could scarce raise; then lying all along, bore a stone which ten could but just roll on him.—G. of Fronsbergh, baron of Mindleheim, could raise a man off his seat with his middle finger, and shove a cannon out of its place.—Cardan saw a man dance with two men in his arms, two on his shoulders, and one on his neck. Patacona, captain of the Cossacks, could tear an horse-shoe; and the same is reported of the late Augustus king of Poland.—On Putney Common, is a stone with an inscription, mentioning a man, who in that place out-drew five horses in his own team.—A gigantic woman of the Netherlands, could lift a barrel of Hamburg beer.—Mr. Carew had a tenant that could carry six bushels of wheat in meal (of fifteen gallons measure) with the lubber a-top of it. And J. Roman of the same country, could carry the carcass of an Ox. See Hakewell's *Apology*, p. 238.

**STRENGTHENERS**, *corroborants*, such medicines as add to the bulk and firmness of the solids. See SOLIDS and STRENGTH.

**Strengtheners** differ from *cordials*, as a bandage does from a flesh-bruise: the latter are such as facilitate and drive on the vital actions; but the former, such as confirm the stamina, and maintain the solids in such a condition, as to exert themselves into action on all proper occasions, with the greatest force and vigour. See **CORDIAL**.

The continual waste, which constant motion makes in the constitution, were it not for frequent and proper supplies, would soon wear the body quite out. The attritions and abrasions of the circulating fluids, would quickly carry away the canals in which they circulate, were not somewhat furnished in their composition, which is suited to fall into, adhere with, and recruit that which is washed off. And those particles must be much more disposed so to do, whose adhesions are greatest, when once they come into contact; such are those of bodies we call *glutinous*, and which easily form themselves into jellies, and such like consistences: for the parts of such bodies are very light, by the over-proportion of their surfaces to their solidities, whereby their motions are both more languid, when in circulation; and when they stop, their cohesions will be much the stronger, with whatsoever they happen to fall into contact. See NUTRITION. Medicines of this tribe, are therefore of great service in hectic; where the swift motion of a thin, sharp blood, wears away the substance of the body, instead of nourishing it: for they not only retard the inordinate motion, but give such a weight and consistence to the juices, as fits them also for nourishment.—There are likewise other causes, which may weaken the solids, by admitting, or occasioning them to relax too much.

Whatsoever therefore acts as a stimulus, and crimps and corrugates the fibres into a more compacted tone, which most austere and pointed bodies do, will remove such weakness, and increase strength: and as too much moisture may also contribute to such a relaxation, what has no other quality but that of absorbing, and drying up such superfluous humidities, may deserve, though accidentally, to come under this denomination. See FIBRE, &c.

**STRETCH.**—When at sea, they are going to hoist the yard, or hale the sheet; they say, *stretch forward the sheets*: meaning, that the part which the men are to hale by, should be put into their hands, in order to their haling.

**STRIAE**, in the ancient architecture, the lifts, fillets or rays which separate the striges or flutings of columns. See **STRIGES** and **FLUTING**.

**STRIÆ**, among naturalists, denote the small grooves or channels in the shells of cockles, scollops, &c.

STRICTOR, in anatomy, the same as *sphincter*. See SPHINCTER.

**STRIGES**, in the ancient architecture, are what in the modern we call *flutings*. See **FLUTING**.

They were thus denominated, as being supposed to have been originally intended to imitate the folds or plaits in womens robes; which the Latins call *strigæ*.—The fillets or spaces between them, were called *fria*. See STRIÆ.

**STRIKE**, or **STRYKE**, a measure, containing four bushels; two of which make a quarter. See **BUSHEL** and **QUARTER**.

A **STRIKE of flax**, is as much as can be heckled at one handful.

**STRIKE**, is a sea word variously used.—When a ship in a fight, or upon meeting with a man of war, lets down, or lowers her top-fails, at least half-mast high; they say, *she strikes*: meaning, she yields or submits, or pays her devotion to that man of war, as she passes by. See **FLAG**.

When a top-mast is to be taken down, they say, *strike the top-mast*.

And when any thing is let down or lowered into the hold, they call it *striking down into the hold*.

Also, when a ship touches ground in a shoal-water, they say, *she strikes*.

**STRIKE** *a hull.* See the article HULL.

**STRIKING.**—The punishment appointed by our laws, for *striking within the king's court*, whereby blood is drawn, is, that the criminal shall have his right-hand struck off, in a most sad and solemn manner.

For *striking in Weßmiesler-Hall*, while the courts of justice are sitting, the punishment is imprisonment for life, and forfeiture of one's estate.

**STRIKING watch.** See the article WATCH.

**STRING**, in music. See the article CHORD.

If two *strings* or chords of a musical instrument only differ in length; their tones, that is, the number of vibrations they make in the same time, are in the inverse ratio of their lengths.

If they only differ in thickness, their tones are in the inverse ratio of their diameters.—As to the tension of *strings*, to measure it regularly, they must be conceived stretched or drawn by weights; and then, *cæteris paribus*, the tones of two *strings* are in a direct ratio of the square roots of the weights which stretch them, that is, *e. gr.* the tone of a *string* stretched by a weight, 4, is an octave above the tone of a *string*, stretched by the weight 1.

It is an observation of an old standing, that if a viol or lute-  
*string* be touched with the bow, or hand, another *string* on  
the fane, or another instrument, not far from it, if in uni-  
son to it, or in octave, or the like, will at the same time  
tremble of its own accord. See UNISON.

But it is now found, that not the whole of that other *string* doth thus tremble; but the several parts, severally, according as they are unisons to the whole, or the parts of the *string* so struck. Thus supposing

A B to be an upper octave to *a c*, and  
therefore an unison to each half of it  
stopped at *b*.

I    b    2

If while  $A B$  is open,  $A B$  be struck, the two halves of the other, that is  $a b$  and  $b c$  will both tremble; but the middle point will be at rest; as will be easily perceived, by wrapping a bit of paper lightly about the *string*  $a c$ , and removing it successively from one end of the *string* to the other. In like manner, if  $A B$  were an upper twelfth to  $a c$ , and consequently, an unison to its three parts  $a 1$ ,  $1 2$  and  $2 c$ ; if  $a c$  being open,  $A B$  be struck, its three parts  $a 1$ ,  $1 2$  and  $2 c$  will severally tremble; but the points  $1$  and  $2$  remain at rest. This, Dr. Wallis tells us, was first discovered by Mr. William Noble of Merton college; and after him by Mr. T. Pigot of Wadham college, without knowing that Mr. Noble had observed it before. To which we may add, that M. Sauveur, long afterwards, proposed it in the Royal Academy at Paris, as his own discovery, as it is like enough it might: but upon his being informed, by some of the members then present, that Dr. Wallis had published it before, he immediately resigned all the honour thereof.

**STRINGENT**—*Line of Defence* **STRINGENT**. See **LINE**.

**STRING-HALT**, a sudden twitching or snatching up of an horse's hinder leg, much higher than the other, as if he trod on needles; generally befalling only the best mettled horses, and ranked in the number of spavins. See SPAVIN. It frequently happens upon taking cold, after hard riding, or fore Labour; especially upon washing him when too hot, which chills the blood, and so benumbs the sinews, as to take away the sense and feeling of the member.

To cure it, the middle vein is taken up above and underneath the thigh; under which is found a *string*, which is to be cut away, and the part anointed with butter and salt.

STRIPED *stalk*, } See the articles { STALK.  
STRIPED *velvet*, } VELVET.

**STROAKING**, a method of cure which some people have given into, in certain diseases, consisting in a mere application of the hand to the part affected, in the way of friction or rubbing. See EVIL.

That friction has very considerable uses in many diseases, is allowed. See FRICTION.

But, as to the particular efficacy of the *stroke* of particular persons; we see little foundation for it in nature. Experience, indeed, seems to afford some; to which we do not well know what to object.

Mr. Thoreby, in the *Philosophical Transactions*, gives several remarkable instances of cures performed by that famous *stroaker*, M. Greatrix. Mr. Thoreby's own brother being seized with a violent pain in his head and neck; Mr. Greatrix

trix coming accidentally thither, gave immediate ease to his head, by only *stroaking* it with his hand: he then fell to *stroak* his back; whence the pain immediately fled to his right thigh: then he pursued it with his hand to the knee, from thence to the leg, ankle, foot, and at last to the great toe, where it grew more violent; but upon rubbing there, it vanished.

Another relation of the same author having great pain and weakness in her knees, which occasioned a white swelling; that had hung to her several years, in spite of all means; the same *stroaker* rubbing both her knees, gave her present ease; the pain flying downwards from his hand, till he drove it out of the toes: after which the swelling soon went absolutely away.

Mr. Thoresby gives various other like instances, all among his acquaintance; and adds, that when Mr. Greatrix *stroaks* only for pains, he uses nothing but his hand; but that for ulcers, or running sores, he uses spittle on his hand or fingers.

**STROBILITES** *vinum*. See **VINUM**.

**STROPHE**, in the Greek and Latin poetry, a stanza, or certain number of verses including a perfect sense; succeeded by another, consisting of the same number and measure of verses, and in the same disposition and rhythmus, called *antistrophe*. See **ANTISTROPHE**.

What the couplet is in songs, and the stanza in epic poetry; *strophe* is in odes. See **COUPLET** and **STANZA**.

The word is Greek, *στροφή*, formed from *στροφή*, I turn; because at the end of the *strophe*, the same measures returned again; or rather, as the term related principally to the music or dancing, because at first coming in, the chorus, or the dancers turned to the left, and that measure ended, they turned back again to the right.

**STRONG** *place*, } See the articles { **PLACE**.  
**STRONG** *pulse*, } { **PULSE**.

**STRUCTURE**, in architecture. See **BUILDING**.

**STRUMÆ**\*, in medicine, tumours arising most usually on the neck and throat; called also *scrophulæ*, and, popularly the *evil*, or *king's evil*. See **EVIL**.

\* The word is Latin, formed, as some will have it, a *struendo*, because they grow insensibly, *struunt affurgunt*.—The Greeks call them *γαστράδες*, sores.

**STRYKE**. See the article **STRIKE**.

**STUC**\*, or **STUCCO**, in building, a composition of white marble pulverised and mixed with plaister or lime; the whole sifted, and wrought up with water; to be used like common plaister. See **PLAISTER**, &c.

\* This is what Pliny means by *marmoratum opus* and *albarium opus*. See **MOSAIC**, &c.

Of this are made statues, busts, basso relievo's, and other ornaments of architecture. See **STATUE**, &c.

**STUES**. See the article **STEW**.

**STUFF**, in commerce, a general name for all kinds of fabrics of gold, silver, silk, wool, hair, cotton or thread, manufactured on the loom; of which number are velvets, brocades, mohair, sattins, taffetys, cloths, serges, &c. See **CLOTH**, **VELVET**, **BROCADE**, &c.

**STUFF** is particularly used, for certain kinds of slight woollen stuffs, used principally for linings and womens wear; as linseys, rateens, &c.

**Bleaching of STUFFS**, } See { **BLEACHING**.  
**Cross-grained STUFF**, } { **CROSS-GRAINED**.  
**Fulling of STUFFS**, } { **FULLING**.

**STUM**, the flower of wine set a working. See **WINE**, **MUST**, **FERMENTATION**, &c.

Hence to *stum*, is to put certain ingredients into sick and decayed wine, in order to revive it, and make it brisk.

**STUMBLING**, in the manage, &c. a vice in a horse, either *natural* or *accidental*.

The *natural* arises from the sinews of the fore-legs being somewhat too straight, which cramps the horse, and prevents his using his legs with the necessary freedom and nimbleness.—The way to cure them, is to cut him of the cords, *i. e.* to make a slit on the top of his nose, and with a corner, to raise up the great sinews, to cut them asunder, and heal them up again with a proper salve.

The *accidental* arises from a splint, wind-gall, being foundered, pricked, flubbed, gravelled, &c.

**STUNG**.—**Adder STUNG**. See the article **ADDERSTUNG**.

**STUPA**. See the article **STUPHA**.

**STUPEFIERS**, in medicine, the same as narcotics, and opiates. See **NARCOTIC** and **OPIATE**.

**STUPHA**, **STUPA**, **STUPE** sometimes denotes a fomentation. See **FOMENTATION**.

**STUPOR**, a numbness, occasioned by any accidental bandage that stops the motion of the blood and nervous fluids, or by a decay in the nerves, as in a palsy, &c.

**STYGIAN liquors**; a term which some chymists apply to the corrosive acid spirits, as aqua regia, from their efficacy in destroying or dissolving mixt bodies. See **SPIRIT**, **AQUA REGIA**, &c.

**STYLE**, **ΣΤΥΛΟΣ**, a kind of bodkin, wherewith the ancients wrote on plates of lead, or on wax, &c. and which is still used to write on ivory leaves, and paper prepared for that purpose, &c. See **WRITING**.

This is the origin of all the other significations of the same word in English.

**STYLE**, **STYLUS**, in surgery, denotes a long steel instrument, which goes diminishing to a point at one end, so as to be of a conical form; serving either to expand and open, or to be thrust into a part.

The *style* is frequently used to be thrust in red-hot, in canulæ, and to be pulled out again, immediately: it is put in and drawn out successively, as often as is necessary. In order to do this, it is good to have two *styles*, to be put in alternately. See **CANNULA**.

**STYLE**, in dialling, denotes the gnomon or cock of a dial, raised in the plane thereof, to project a shadow. See **GNOMON**.

**STYLE**, **STYLUS**, in botany, the part rising up in the middle of a flower, and bearing, by its lower part, on the rudiment of the fruit, or seed.

This, we more usually call the *pistil*: though Bradley makes a distinction; calling it *style* when it is only joined or contiguous to the seed or fruit; and *pistil* when it contains the seed or fruit within it; as the ovary does the egg. See **PISTIL**.

**STYLE**, in matters of language, is a particular manner of delivering a man's thoughts in writing, agreeably to the rules of syntax; or, as F. Buffier more accurately defines it, the manner wherein the words constructed according to the laws of syntax, are arranged among themselves, suitably to the genius of the language. See **LANGUAGE**.

This definition fixes the notion of *style*, to something determinate, which before was very vague and arbitrary; whence many authors, even of note, confounded it with syntax itself. See **SYNTAX**.

From the definition, it appears, that *style* supposes or includes the syntax; and that syntax does not extend so far as *style*: for the syntax may be very just, where the *style* is wretched, were it only in this example: "God always rewards with great fidelity, and greater liberality, the just:" or this, "There is no body, who more than I honour you."

The regimens and terminations of each word, are perfectly just in each of these phrases: there is no fault then, in the syntax; but there is something wanting in the arrangement of the words, to suit them to the genius of the language; there is a fault then, in the *style*.

Indeed, against what particular rule of grammar the fault is committed, it is scarce possible to determine precisely; the taste and use of a language being so exceedingly delicate and precarious. It is true, a fault in *style*, is not less a fault against grammar, than is a fault in *syntax*; only the former is less precise and palpable than the latter.

A very common error in grammarians, F. Buffier adds, is to confound two kinds of *styles* in one: the *grammatical style*, or that directed by the rules of grammar; and the *personal style*, which depends less on the grammar, than on the person that writes; whether with regard to his particular taste and genius, or with regard to his matter, or the kind or character of his work.

There are a great many differences between the two; the most essential is, that the one may be diversified an infinite number of ways, and the other cannot.—In effect, the *personal style* is naturally variable, according to the different genius's, humours, and complexions.

It is the imagination that acts, that conceives, that proposes, and that expresses things, according to its character, which is different in all men, and which is to be varied, according to the particular kind of the work.

Hence arises the gay, the grave, the florid, the jejune, the copious, the concise, the poetical, the epistolary, the burlesque *styles*. See **FLORID**, **BURLESQUE**, &c.

These *personal styles* are all independant on the grammatical; and we have authors, who excel in the one, yet are miserably defective in the other. The *personal style* is not under the direction of grammar; but of the imagination, or rather of rhetoric, that art having to do directly with our thoughts, as grammar with our words.

This, however, may be said, that grammar is far from being able to vary the same words of a phrase with equal perfection; and that generally there is but one way of delivering them in the taste and genius of the language. Thus, the grammatical *style* is invariable in the following phrase, and proportionably in others. "Death is a law, which all men are to undergo." For you cannot well range the words otherwise than they here are, without going out of the bounds of grammar. Would you say, "A law is death, which all men," &c. or "law is a death, which," &c. But in the *personal style*, where the imagination comes to be concerned, this sentence might be varied infinite ways, according to the kind of the writing, whether oratorical, poetical, &c. As, "Death neither spares the prince nor the peasant. Death knocks equally at the monarch's palace and the beggar's hut," &c.

**STYLE**, in oratory and poetry, is restrained wholly to what F. Buffier calls the *personal style*.

Language refers principally to the matter of the discourse, *viz.*

*viz.* the words; elocution to the particular members or parts thereof; and *style* to the whole composition.

The masters of the art, reduce the kinds of *style* to three; the *sublime*, the *low*, and the *intermediate*, or *equable style*.

**Sublime STYLE**, is that consisting in magnificent words and sentences; which by its noble boldness, ravishes the hearers, and extorts admiration even from the unwilling. See **SUBLIME**.

**Low or simple STYLE**, is that ordinarily used in smaller and humbler works; as epistles, dialogues and common discourse. The chief virtues hereof are perspicuity, smoothness, easiness, and cleanness; it must be very sparing in the use of tropes and figures, especially the more violent ones, as the *protopœia*, apostrophe, &c.

**Intermediate, or equable STYLE**, partakes of the magnificence of the *sublime*, and the simplicity of the *low*. It neither rises to the majesty of the one in words and sentences; nor yet is smartly pointed like the other: but, as Tully excellently expresses it, *Est stylus quidam interjectus, intermedius, & quasi temperatus; nec acumine inferioris, nec fulmine utens superioris, vicinus amorum, in neutro excellens, utriusque particeps*.

The same author calls it the *florid* and *polish'd style*; it being in this that all the graces and beauties of language are principally to be used.

For the choice of *style*, in the general, the matter is to determine it. Such *style*, says Cicero, is to be chosen, as expresses great things magnificently, middle things moderately, and low things subtly: but more particularly, as there are three branches of the duty of an orator, to teach, to delight, and to move; the *simple style* is used to teach, the *middle* to delight, and the *sublime* to move.

Again, the *simple* or *low style* is fit for comedy, the *sublime* for tragedy; and the *middle* for history.—Cæsar, it is true, rather used the *simple* than the *intermediate style*; but then he wrote commentaries, not a history, as is observed by Tully.

Again, the *simple style* is fit for bucolics, and eclogues; the *intermediate style* for georgics; and the *sublime* for epics: which triple difference we easily descry in Virgil, though he sometimes mixes them all in the *Æneid* itself, using the *simple style* in the fifth book, where he describes games, and the *intermediate* in the beginning of the poem. Care is still to be taken, that the *style* be not flat and dull, on pretence of being *simple*.

M. Boileau observes, that in all languages a mean thought expressed in noble terms, is better liked than the noblest thought expressed in mean terms: the reason he gives, is, that every body cannot judge of the force and justness of a thought: but scarce any body but perceives the meanness of words. The latter we find by our senses, the former by our reason.

He adds, that the words in different languages do not always answer justly to one another; and that a noble Greek term cannot frequently be expressed in another language, but by a very mean one.

This we see in the words *afinus* in Latin, *ane* in French, and *ass* in English, which are the meanest imaginable, in those three languages; yet the word expressing that animal, has nothing mean in it, either in Greek or Hebrew, but is used in the finest and noblest passages.

Add to this, that languages are exceedingly capricious on this head: a bull, a heifer, a goat, a boar, &c. may be used in the sublimest passages, without debasing the *style*; but a cow, a sheep, a hog, a sow, &c. would be intolerable. Shepherd and herdsman, are fine words; hog-keeper and cow-ward, which carry the same ideas, vicious to the last degree. The chief faults in *style* are, its being *tumid* and *swollen*; or *cold* and *puerile*, or *stiff*, or *loose*, or *dry* and *jejune*.

**A tumid STYLE** is that immediately stuffed with big words and sentences; such are those verses of the emperor Nero, ridiculed by Persius.

*Torva mimalloneis implerunt cornua bombis  
Et raptum vitulo caput ablatura superbo  
Bassaris, & lyncem mœnas flexura corymbis, &c.*

**Frigid, or puerile STYLE**, is that which affects certain trifling ornaments, insipid jests, remote and strained allusions, redundant descriptions, &c.—Such, *e. gr.* as, a centaur's riding himself, more golden than gold, &c.—Of this vice, that passage of Virgil seems guilty,

*Num capti potuerunt capi? Num incensa cremavit  
Troja viros?*

And that in Plutarch, and Dion Cassius; “It was no wonder Diana's temple should be burnt the night Alexander was born; as that goddess, attending at so great a birth, could not be in the way to extinguish the flames.”—And that in Plautus, where a person is represented so exceedingly covetous, that he would invoke heaven and earth, if he saw but a grain of smoke escape out of his cottage. See **FRIGID**.

**Loose STYLE**, is that which wanting articles, numbers, &c. fluctuates here and there, not connected or joined together. This is a fault so frequent, especially in young writers, that we shall spare giving instances of it.

**Dry, jejune STYLE**, is that which is destitute of ornament,

spirit, &c. The ancients made a notable distinction of *style*, into *Laconic*, and *Asiatic*.

**Asiatic STYLE**, is that which is very diffusive and prolix; or where abundance of words are used to express a little matter: thus called, by the Greeks, from the people of Asia, who affected such redundances; in opposition to the

**Laconic STYLE**, which is distinguished by its exceeding conciseness; and by comprehending a deal of matter under a few words. See **LACONICISM**.

Such, *e. gr.* is that answer returned by the Lacedæmonians, to a long epistle of an enemy, threatening to destroy them with fire and sword; *u, fi, if*; that is, *do if you can*: or, that returned by the same people to king Philip, demanding some extravagant thing of them, *u, non, no*. Or that of Cleomenes, the Spartan general, to the ambassador of Samos; “As to what you have said, the first part I do not remember; the middle I do not understand; the last I do not approve.” Or that epistle of Archidamus to Elei, who were preparing war against him; Archidamus to the Eleans: “It is good to be quiet.” Or that of Cæsar to the Roman senate, after his conquering Pharnaces, king of Pontus: *veni, vidi, vici*; I came, I saw, I conquered.

**Marotic STYLE**. See the article **MAROTIC**.

**STYLE**, in jurisprudence, the particular form, or manner of proceeding in each court or jurisdiction, agreeable to the rules and orders established therein.—Thus we say, the *style* of the court of Rome, of the court of chancery, of parliament, of the privy council. See **CHANCERY**, &c.

**STYLE**, in music, denotes a peculiar manner of composing, or singing.

The *style* is, properly, the manner each person has, either of composing, of performing, or teaching; which is very different; both in respect of the different genius's of countries and nations, and of the different matters, places, times, subjects, expressions, &c.

Thus we say, the *style* of the Charissimi, of Lully, of Lambert; the *style* of the Italians, the French, the Spaniards; &c. The *style* of gay pieces of music, is very different from that of serious pieces: the *style* of church music is very different from theatrical music. The *style* of the Italian compositions, is poignant, florid, expressive; that of the French compositions, natural, flowing, tender, &c.

Hence, the various epithets, given to distinguish these various characters; as, the ancient and modern *style*, the Italian and German *style*, the ecclesiastical and dramatic *style*, the gay, grave, majestic, natural, soft, familiar, gallant, low, sublime *styles*, &c.

**STYLO recitativo, or dramatico**, in the Italian music, is a *style* fit to express the passions. See **RECITATIVE**.

**STYLO ecclesiastico** is full of majesty, very grave, and fit to inspire devotion.

**STYLO motetico**, is a various, rich, florid *style*, capable of all kinds of ornaments, and of consequence, fit to express various passions, particularly admiration, grief, &c.

**STYLO madrigalesco**, is a *style* proper for love, and the other softer passions.

**STYLO hyperchematico**, is a *style* proper to excite mirth, joy, darning, &c. and of consequence, full of brisk, gay motions.

**STYLO symphonico**, is a *style* fit for instrumental music: but as each instrument has its particular effect, there are as many different symphonical *styles*.—The *style* of violins, for instance, is usually gay; that of flutes, melancholy and languishing; and that of trumpets, sprightly, and animated.

**STYLO melismatico**, is a natural, artless *style*, which any body, almost, may sing.

**STYLO phantastico**, is a free, easy, humorous manner of composition, far from all constraint, &c.

**STYLO choraico**, is the *style* proper for dancing; and is divided into as many different kinds, as there are dances; as the *style* of sarabands, of minuets, of gavots, rigadoons, &c.

**STYLE**, in chronology, denotes a particular manner of accounting time, with regard to the retrenchment of ten days from the calendar, in the reformation made thereof under pope Gregory XIII.

*Style* is either *old* or *new*.

**Old STYLE** is the Julian manner of computing, which obtains in England, and some other protestant states, who refused to admit of the reformation. See **JULIAN**.

**New STYLE**, is the Gregorian manner, followed by the catholics, and others, in consequence of that reformation. See **GREGORIAN**.

Hence, there has arisen a difference of ten days, between the *old style* and the *new*, the latter being so much beforehand with the former: so that when the catholics, *e. gr.* reckoned the 21st of May, we only reckoned the 11th.

This difference of ten days, was increased in the year 1707, to eleven days, by reason that year was not the Bissextile in the *old style*, but was in the *new*: so that the 10th day of the one, corresponded to the 21st of the other.

There are several places, however, where the *new style* has begun to obtain, even among protestants; and it is not unlikely, that the *old style* may, in time, dwindle quite away.—At the Diet of Ratibon in 1700, it was decreed, by the body

body of protestants of the empire, that eleven days should be retrenched from the old *style*, to accommodate it for the future to the new. And the same regulation has since passed into Sweden and Denmark. England holds out, almost alone, for the old *style*. See CALENDAR.

**STYLES of hunting.** See the article HUNTING.

**STYLET, STYLETTO**, a small, dangerous kind of poniard, which may be concealed in the hand; chiefly used in treacherous assassinations. See PONIARD.

The blade is usually triangular, and so slender, that the wound it makes, is almost imperceptible.—The *styletto* is strictly prohibited in all well disciplined states.

**STYLITES, ΣΤΥΛΙΤΗΣ**, an appellation given to a kind of solitaries, who spend their life seated on the tops of columns, to the better disposed for meditation, &c. See HERMIT, ANACHORET, &c.

Of these, we find several mentioned in ancient writers, and even as low as the eleventh century. The founder of the order was St. Simeon *Stylites*, a famous anachoret in the fifth century; who first took up his abode on a column six cubits high; then on a second of twelve cubits; a third of twenty two; and at last on another of thirty six, where he lived several years.

The extremities of these columns were only three foot in diameter, with a kind of rail or ledge about, that reached almost to the girdle, somewhat resembling a pulpit. There was no lying down in it.—The faquirs, or devout people of the east, imitate this extraordinary kind of life to this day. See FAQUIR.

**STYLOIDES**, in anatomy, an apophysis of the os petrosi, thus called from its resembling a style or stylet.—See *Tab. Anat. (Osteol.) fig. 13. lit. e.* See also the articles GRAPHOIDES and PETROSUS Os.

**STYLOGLOSSUS**, in anatomy, a pair of muscles, running off sharp and fleshy, from the processus styloides; whence descending obliquely forwards, they are inserted into the root of the tongue.—They serve to pull the tongue up in the action of deglutition.

**STYLOHYOIDEUS**, in anatomy, a pair of muscles springing from the processus styloides, and inserted into the basis and horns of the os hyoides; which it draws laterally upwards.

**STYLOPHARYNGEUS**, in anatomy, a pair of muscles arising round and fleshy, from the processus styloides; and which, in its oblique descent becomes thicker, and is afterwards expanded on the back parts of the fauces.—It serves to draw up, and dilate the pharynx.

**STYPTIC, ΣΤΥΠΤΙΚΟΝ**, in medicine, *astringent*; a remedy that has the virtue of stopping blood, or of binding up the aperture of a wounded vessel. See BLOOD and ASTRINGENT.

The service, nettle, Solomon's seal, &c. are *styptics*.—There are various *styptic* waters, and powders of great efficacy, in most of which, vitriol is the principal ingredient. See VITRIOL and WATER.

The usual *styptic* water is made of colcothar calcined, or vitriol dissolved with burnt allum, sugar-candy, the urine of a young man, &c.

Dr. Colbatch's *styptic* powder has been famed; though Mr. Cowper, in the *Philosophical Transactions*, gives us a number of instances, wherein it was applied with very little or ill success in human subjects: but he gives us others made in dogs, where it answered well.

M. Tournefort observes, from the analysis he has made of *styptic* and astringent plants, that acids and earths prevail therein; though some of them yield an urinous spirit. On this principle, he asserts, that their salt is analogous to allum, and that there is somewhat of sal ammoniac in their texture.—But Chomel notes, that this does not hold universally.

**STYRAX, ΣΤΥΡΑΞ**, in medicine. See STORAX.

**SUB**, a Latin preposition signifying *under*, or *below*; frequently used, in composition, in our language.—*E. gr.*

**SUB-BRIGADIER**, an officer in the cavalry, who commands under the brigadier; assisting him in the discharge of his functions. See BRIGADIER.

**SUB-CHANTOR**, an officer in the choir, who officiates in the absence of the chantor, &c. See CHANTOR.

**SUB-DEAN**, a dignity in certain chapters beneath the dean. See DEAN.

**SUB-PRIOR**, a claustral officer, who assists the prior, &c. See PRIOR.

**SUB-DEACON**, an inferior minister, who anciently attended at the altar, prepared the sacred vessels, &c. and was invested with the first of the holy orders. See ORDER.

According to the canons, a person must be twenty two years of age, to be promoted to the order of *sub-deacon*. See DEACON.

It is disputed among the Romanists, whether the *sub-deaconhood* be a sacrament or not; in regard *sub-deacons* are ordained without imposition of hands, and that there is no mention made of them in scripture. Yet Bellarmine holds the affirmative side of the question.

By the papal canons, a married man may be ordained *sub-*

VOL. II. N. CXLVII.

*deacon*; upon condition his wife consent to it, make a vow of continence, and shut herself up in a monastery.

**SUBALTERN**\*, a subordinate officer, or one who discharges his post under the command, and direction of another. See OFFICER.

\* The word is formed from the Latin, *sub*, and *alter*, another. Such are lieutenants, sub-lieutenants, cornets and ensigns, who serve under the captain. See LEUTENANT, &c.

We also say, *subaltern* courts, jurisdictions, &c.—Such are those of inferior lords, with regard to the lord paramount; hundred courts, with regard to county courts, &c.

For the *subaltern* persons in an epic poem, F. Boschi observes, there is no necessity to be very strict in preserving every one's character. See CHARACTER and PERSON.

The patriarchs, M. St. Evremont tells us, had several wives, who did not all hold the same rank; but there were several *subaltern* to the principal wife.

**SUBALTERN genus.** See the article GENUS.

**SUBCLAVIAN, SUBCLAVIUS**, is applied to any thing under the arm-pit, or shoulder; whether artery, nerve, vein, or muscle.

**SUBCLAVIUS**, more particularly denotes a muscle which arises from the lower side of the clavicle, near the acromium; and descends obliquely to be inserted into the upper part of the first rib, near the sternum.—See *Tab. Anat. (Myol.) fig. 2. n. 9.*

**SUBCONTRARY position**, in geometry, is when two similar triangles are so placed, as to have one common angle, V, (*Tab. Geom. fig. 44.*) at the vertex, and yet their bases not parallel.

If the scalenous cone BVD be so cut by the plane CA, as that the angle at C=∠D; the cone is then said to be cut *subcontrarily* to its base BD.

**SUBCUTANEUS**, in anatomy, a thin membranous muscle, running under the skin, called also *quadratus genæ*, and *platysma myoides*. See QUADRATUS.

It arises with a pretty broad origin, from the hind part of the neck, and from the pectoral muscle below the clavicle. It adheres firmly to the panniculus carnosus; from which it is not separated without difficulty, and therefore was not anciently distinguished from it; and is inserted, obliquely, on each side, into the lower jaw-bone near the skin, lips, and sometimes the bottom of the nose; all which parts it draws downwards and a-wry.

A convulsion herein is called a *spasmus cynicus*.—In some persons, it reaches to the ears; and in others not; which is the reason some folks have a faculty of moving their ears, which others want. See EAR.

**SUBDUCTION**, in arithmetic, the same as subtraction. See SUBTRACTION.

**SUBDUPE ratio**, is when any number or quantity is contained in another, twice.—Thus 3 is said to be *subdupe* of 6, and 6 is dupe of 3. See RATIO and DUPE.

**SUBJECT, SUBDITUS**, a person under the rule and dominion of a sovereign prince, or state. See GOVERNMENT, &c.

Of *subjects*, some are so by birth, others by acts of naturalization. See NATIVE, ALIEN, DENIZEN, NATURALIZATION, &c.

Anciently the lords called, abusively, those who held lands or fees of them, or owed them any homage, *subjects*. See VASSAL.

**SUBJECT, SUBJECTUM**, is also used for the matter of an art, or science; or that which it considers, or wherein it is employed.—Thus the human body is the *subject* of medicine. See OBJECT.

In this sense, anatomists call the body they are dissecting, and whereon they read lectures, their *subject*. See BODY, &c.

The *subject* of logic, is thinking, or reasoning; but more particularly, in a syllogism, one of the terms of a proposition is called the *subject*, and the other the *attribute*. See PROPOSITION, ATTRIBUTE, &c.

In poetry, the *subject* is the matter treated of; the event related, or set to view, and enriched with ornaments.

**SUBJECT** also denotes the substance or matter to which an accident is added. See ACCIDENT.

It is a maxim, that two contraries can never subsist in the same *subject*.

**SUBJECTIVE part.** See the article PART.

**SUBJUNCTIVE**, in grammar, the fourth mood, or manner of conjugating verbs; thus called, because usually subjoined to some other verb, or at least to some other particle, as, *If I loved: though this were true*, &c. See MOOD.

The Greek is almost the only language that properly has any *subjunctive* mood; though the French, Spanish, and Italian, have some shew thereof.—In all other languages, the same inflexions serve for the optative, and the *subjunctive* moods: for which reason, the *subjunctive* mood might be retrenched from the Latin, and those other grammars; it not being the different ways of signifying, which may be very much multiplied, but the different inflexions, that constitute the different moods. See OPTATIVE, &c.

**SUBLAPSARY**, or *Infralapsary*, in theology, a term applied to such as hold, that God having foreseen the fall of Adam,

Adam, and in consequence thereof, the loss of mankind; resolved to give a grace sufficient for salvation to some, and to refuse it to others. See GRACE and SUPRALAPSARY.

*Sublapsary* is used as synonymous with *infralapsary*; in opposition to *supralapsary*. See INFRALAPSARY, and SUPRALAPSARY.

**SUBLIMATE**, a chymical preparation, the basis whereof is mercury, or quicksilver. See FLOWERS, and SUBLIMATION.

There are two kinds of *sublimate*, *corrosive* and *sweet*; which see under the article MERCURY.

*Refining of gold by SUBLIMATE*. See REFINING.

**SUBLIMATION**, **SUBLIMATIO**, in chymistry, an operation which differs little from distillation, excepting, that in distillation, only the fluid parts of bodies are raised; but in *sublimation*, the solid and dry: and that the matter to be distilled may be either solid or fluid; but *sublimation* is concerned only about solid substances. See DISTILLATION.

There is also another difference, namely, that rarefaction, which is of very great use in distillation, has hardly any room in *sublimation*; for the substances which are to be sublimed; being solid, are incapable of rarefaction; and so it is only impulse can raise them.

However, it may not be improper to inquire a little more nicely into the reason of such a diversity in the elevation of bodies; why some do ascend with a gentle heat, and others are not to be raised by the most vehement fire: and such an enquiry will more properly come in here, because this head contains all the business of volatility and fixation. See VOLATILITY, and FIXITY.

The cause of this elevation, and ascent in the particles of bodies, is to be ascribed to the fire; not only on account of impulse, but of another property the fire has; namely, to insinuate itself into all the interstices of these bodies, and thereby break the cohesion of their parts, so that at last they become divided into very small parts, if not into the smallest that art can reduce them into. See PARTICLE.

Particles thus separated and divided, lose much of their gravity. For the gravity of the same particle decreases in the same proportion as the cube of the diameter is lessened. Suppose, therefore, a body, whose diameter is 12: if, then, its diameter be made less by 1, viz. 11, the gravity of that body will be only  $9\frac{1}{4}$ , or thereabouts: a body, therefore, by being divided into very minute corpuscles, becomes easy to be sublimed.

Add, that the surface of a body decreases in a very different manner from gravity, only as the square of the diameter is lessened. Where the gravity decreases, in such a series, as is expressed by the numbers 1728, 1331, 1000, the diminution of the surface will observe this proportion, viz. 144, 121, 100; and when, upon reducing the diameter to 6, the gravity becomes less than 2, the surface will still amount to 36.

How much this contributes to a quick ascent, will appear from the *sublimation* of camphire, benzoin, and arsenic; whose particles, as they cohere but loosely, are, for that reason, diffused into a larger surface; upon which account they are the easiest to be sublimed of any: nay, these solid particles, upon account of their surface, will sooner ascend than some fluids.

So flower of sulphur rises sooner than oil, not only than that of vitriol, but any other, though ever so light.

By this contrivance of nature, viz. that the gravity of bodies decreases in a triplicate, but their surface in a duplicate proportion of their diameters; it comes to pass, that bodies, which have a very different gravity, may be raised with the same force. Thus the salts of animals, as of harts-horn, human blood, of vipers, &c. being composed of very minute corpuscles, as is found by experience, in distilling them, do easily ascend; because the surface in them is not lessened so much as the gravity is; and the salts of vegetables, as of tartar, balsam, &c. which are of a more close texture, by reason of their larger surfaces, are without much difficulty raised.

The corpuscles also of minerals and metals, though very compact and heavy, do, in some measure, give way to the fire, and are capable of being sublimed. In all these instances, the breadth of the surface, which exposes the particles more to the impetus of the fire, is the reason why they are raised with as much ease, as if their gravity had been lessened, by diminishing their surface: so that particles, though ever so different in weight, may be equally raised by the same degree of heat, if the proportion of their gravity be reciprocal to that of their surfaces.

**SUBLIME**, in discourse, something extraordinary, and surprising, which strikes the soul, and makes a sentiment or composition ravish and transport.

This is what Longinus, who has wrote expressly on the subject, means by *sublime*.—The definition, indeed, is not his, but M. Boileau's; for the author writing his book after another of Cecilius on the same subject, employed almost wholly in shewing what the *sublime* is, declined defining it, as supposing it well known.

By the definition, it may appear, that the *sublime* is a very different thing from what the orators call the *sublime style*. See STYLE.

The *sublime* style necessarily requires big and magnificent words; but the *sublime* may be found in a single thought, a single figure, a single turn of words. A thing may be in the *sublime* style, and yet not be *sublime*, i. e. have nothing extraordinary and surprising.

For instance: "The Almighty Author of the universe, with "a single word, created light." This, now, is in the *sublime* style, yet it is not *sublime*, there being nothing extraordinary in it, which another person might not easily hit on. But in "God said, let there be light, and there was light;" so extraordinary a turn of expression, which shews the obedience of the creature to the orders of his creator, is truly *sublime*, and has something more in it than human.

Longinus makes five sources of the *sublime*. The first, a certain elevation of mind, which makes us think happily. The second, is the pathetic, or that natural vehemence and enthusiasm, which strikes and moves us: these two are owing almost wholly to nature, and must be born with us; whereas the rest depend, partly, on art. The third is, the turning of figures in a certain manner, both those of thoughts and of speech. The fourth, nobleness of expression, which consists of two parts, the choice of words, and the elegant, figurative diction. The fifth, which includes all the rest, is the composition and arrangement of the words in all their magnificence and dignity. See PATHETIC, &c.

**SUBLIME geometry**. See the article GEOMETRY.

**SUBLIMING pots**. See the article ALUDELS.

**SUBLINGUAL glands**, in anatomy, two glands under the tongue, placed one on each side thereof. See TONGUE.

These, called also *hypoglossides*, filtrate a serous humour, of the nature of saliva, which they discharge by little ducts near the gums, into the mouth. See HYPOGLOSSIDES.

**SUBMULTIPLE**, in geometry, &c.—A *submultiple* number or quantity, is that which is contained a certain number of times in another; and which therefore repeated a certain number of times, becomes exactly equal thereto.

Thus 3 is a *submultiple* of 21.—In which sense, a *submultiple* coincides with an aliquot part. See ALIQUOT part.

**SUBMULTIPLE ratio**, is that between the quantity contained, and the quantity containing.—Thus the ratio of 3 to 21 is *submultiple*. See RATIO.

In both cases, *submultiple* is the reverse of multiple: 21, e. gr. being a multiple of 3, and the ratio of 21 to 3 a multiple ratio. See MULTIPLE.

**SUBMULTIPLE subsuperparticular**. } See RATIO.

**SUBMULTIPLE subsuperbipartiens**. }

**SUBNORMAL**, in geometry, a line which determines the point in the axis of a curve, where a normal or perpendicular, raised from the point of contact of a tangent to the curve, cuts the axis. See CURVE.

Or, the *subnormal* is a line, which determines the point wherein the axis is cut by a line falling perpendicularly on the tangent in the point of the contact.

Thus TM (*Tab. Conics*, fig. 19.) being a tangent to a curve in M; and MR a normal or perpendicular to the tangent; the line PR intercepted between the semiordinate PM and the normal MR, is called the *subnormal*.

Hence, 1<sup>o</sup>. In a parabola, as AM, &c. the *subnormal* PR is to the semiordinates PM, as PM is to PT, and MR to TM. 2<sup>o</sup>. In the parabola, the *subnormal* PR is subduple the parameter; and, consequently, an invariable quantity.

**SUBORDINATED**, and **SUBORDINATING affections**. See AFFECTIONS.

**SUBORDINATION**, a relative term, expressing the degree of inferiority between one thing and another.

There is a series of *subordinations* running throughout all nature. In the church there are several degrees of *subordination*, as of deacons to priests; priests to prelates, &c.—The like are observable in the secular state; in offices of war, justice, &c. and even

In the sciences, trigonometry is *subordinate* to geometry; and in the virtues, abstinence and chastity are *subordinate* to temperance: in music, some call the plagal tones, *subordinate tones*. See TONE.

**SUBORNATION**, **SUBORNATIO**, a secret or underhand preparing, instructing or bringing in, a false witness; or corrupting or alluring a person to do such a false act. See WITNESS, EVIDENCE, &c.

Hence, the *subornation* of perjury, mentioned in the act of general pardon, 12 Car. II. c. 8. is the alluring or disposing to perjury. See PERJURY.

**SUBPŒNA**\*, a writ, whereby any person under the degree of peerage, is called to appear in chancery, in cases where the common law hath made no provision.

\* The name is taken from the words in the writ, which charge the party summoned to appear at the day and place assigned, *sub pœna centum librarum*, on the penalty of an hundred pounds.

The peers, in the like cases, are called by the lord chancellor's letter, giving notice of the suit intended against them, and requiring them to appear.

There

There is also a *subpœna ad testificandum*, for summoning of witnesses in other courts, as well as in chancery.

There is also a *subpœna* in the exchequer, as well in the court of equity there, as in the office of pleas.

**SUBPOPLITÆUS**, in anatomy. See **POPLITÆUS**.

**SUBREPTION**\*, **SUBREPTIO**, the act of obtaining a favour from a superior by surprize, or a false representation. See **SUBREPTITIOUS**.

\* The word is formed from the Latin, *sub*, under, and *repo*, I creep.

*Subreption* differs from *obreption*, in that the latter denotes a false expression of the quality of a thing, or fact, &c. And *subreption*, a want of expression, or a fraudulent reticency or concealment of a thing, which would have rendered the obtaining of the favour more difficult. See **OBREPTITIOUS**.

**SUBREPTITIOUS** or **SURREPTITIOUS**, a term applied to a letter, licence, patent, or other act, fraudulently obtained of a superior, by concealing some truth, which had it been known, would have prevented the concession or grant. See **SUBREPTION**.

The benefit of letters, licences, &c. is forfeited, when they are found contrary to the informations given; they being then reputed *subreptitious*.

Papal bulls and signatures are null and *subreptitious*, when the true state of the benefice, the manner of the vacancy, and other necessary matters, are not justly signified to the pope.

**SUBROGATION**, or **SURROGATION**, in the civil law, the act of substituting a person in the place, and intitling him to the rights of another. See **SURROGATE** and **SUBSTITUTION**.

In its general sense, *subrogation* implies a succession of any kind; whether of a person to a person, or of a person to a thing.

There are two kinds of *subrogation*; the one *conventional*, the other *legal*.

**Conventional SUBROGATION**, is a contract, whereby a creditor transfers his debt, with all appurtenances thereof, to the profit of a third person.

**Legal SUBROGATION**, is that which the law makes in favour of a person, who discharges an antecedent creditor; in which case there is a legal translation of all rights of the ancient creditor to the person of the new one.

This the civilians more usually call *succession*, as being wholly the work of the law, and to distinguish it from the conventional *subrogation*, which they also call *cession*. See **CESSION**.

—The word is formed from the Latin, *subrogatio*, of the verb *rogare*, which, among the ancient Romans, signified to ask, to interrogate; whence it was, that they called the laws themselves *rogationes*, in regard the people made them, upon being asked by the magistrates.—And as laws made by the people could not be changed without their consent, and without being asked a-new; if they thought good to have the law wholly abolished, *lex abrogabatur*; if only a part of it were to be abolished, *lex derogabatur*; and if any clause or amendment were added to it, *lex subrogabatur*.

The new magistrates were also *subrogated* in the place of the old ones: for during the time of the republic, no magistrate could be, but by consent of the people, nor, of consequence, but by law; since whatever the people thought good, was law.—This is what occasioned Salmasius to say, that *subrogare* and *substituere per legem*, were reciprocals.

**SUBSCAPULARIS**, in anatomy, a muscle arising from the basis and side of the scapula; and, spreading itself under the whole convex, or under side of it, is inserted by a semi-circular tendon, into the neck of the os humeri, and draws it down to the side of the trunk.—See *Tab. Anat. (Myol.) fig. 1. n. 16.*

**SUBSCRIPTION**, the signature put at the bottom of a letter, writing, or instrument. See **SIGNATURE**.

In church history, we meet with instances of *subscriptions* wrote in the blood of Jesus Christ. Nicetas, in the life of Ignatius, speaking of the *subscriptions* made at the council, wherein that patriarch was deposed, says, they *subscribed*, not with common ink, but what strikes a man with horror, with a pen dipped in the blood of Christ. The historian Theophanes, tells us, that pope Theodore mixed the blood of Christ with the ink, wherein he wrote the deposition of Pyrrhus.

**SUBSCRIPTION**, in the English commerce, is used for the share, or interest, which particular persons take in a public stock, or a trading company, by writing their names, and the shares they require, in the books or register thereof. See **COMPANY**, **BUBBLE**, **FUND**, &c.

The French have likewise adopted the word *subscription*; using it in speaking of the actions of their India company.

A *subscription* differs from an *action*; in that the first is properly only an action begun, or an engagement, by making the first payment, to acquit the rest in the time limited; and that the other is the whole action, performed in all its parts. See **ACTION**.

**SUBSCRIPTION**, in the commerce of books, signifies an engagement to take a certain number of copies of a book go-

ing to be printed; and a reciprocal obligation of the book-seller or publisher, to deliver the said copies, on certain terms. The usual conditions of these *subscriptions* are, on the part of the book-seller, to afford the books cheaper to a subscriber than to another, by one third or one fourth of the price; and on the part of the latter, to advance half the money in hand, and to pay the rest on the delivery of the copies: an agreement equally advantageous to the one and the other; as the book-seller is hereby furnished with money to carry on works, which would otherwise be above his stock; and the subscriber, receives, as it were, interest for his money, by the moderate price the book stands him in.

*Subscriptions* had their rise in England, and it is but very lately that they are got into other countries. They were first set on foot, in the middle of the last century, for the printing of Walton's *Polyglott bible*, which is the first book ever printed by way of *subscription*.

From England, they passed a few years ago into Holland, and are just now introduced into France. F. Montfaucon's *collection of antiquities*, is the first book there published by *subscriptions*, which were so very numerous, that great numbers were refused. The same method has been since proposed, for the publication of S. Chrysostom by the Benedictines; but not with equal success.

All the other books since printed in France by *subscription*, are M. Dacier's *Translation of Plutarch's lives*; the *Description of Versailles*, and F. Daniel's *History of the French militia*. In England, they are become exceedingly frequent; and their frequency has rendered them liable to some abuses, which begin to discredit them.

**SUBSEQUENT**, something that comes after another, particularly with regard to the order of time. See **POSTERIOR**, &c.

When two festivals happen on the same day, the principal one is celebrated; and the other transferred to the *subsequent* day. *i. e.* to the morrow.

**SUBSESQUIALTERATE**. See the article **RATIO**.

**SUBSIDY**, **SUBSIDIUM**, in law, any aid, tax, or tribute granted, by authority of parliament, to the king, on pressing occasions of the state; levied on the subjects, according to their several abilities, or the yearly produce of their lands, goods, &c. See **TAX**.

Such is the land tax, or royal aid, as it is called; which is usually at the rate of two, three, or four shillings in the pound, for lands; and of two shillings and eight pence for goods, and personal estate, when of four shillings for lands. See **AID**, &c.

The ancient Saxon kings had no *subsidies* collected after the manner of ours; but in lieu thereof, had several customs, whereby they levied money or personal service on the people, for the repairing of cities, castles, bridges, military expeditions, &c. which they called *burgbote*, *brigbote*, *heresfare*, *hersegeld*, &c.

But upon the land's becoming oppressed by the Danes, king Ethelred in the year 1007, agreed to pay them yearly 10000 *l.* for redemption of peace; which sum was afterwards increased to 36000 *l.* and at length to 48000 *l.* which was called *Danegeld*, and was levied on land; each hide, or ploughland, that of the church only excepted, being cessed 12 *d.* See **DANEGELD**.

Hence the tribute came to be called *hidage*, a name that afterwards became common to all taxes and *subsidies* imposed on lands; as those on cattle were called *hornegeld*. See **HIDAGE**.

Both these the Normans sometimes called *taxes*, from the Greek *ταξις*, order; sometimes from their own language, *tailage*; and sometimes, according to the custom beyond-sea, *subsidia*, and *auxilia*. See **AUXILIUM**.

After the conquest, these *subsidies* seem to have been granted differently from what they now are; as every ninth lamb, every ninth fleece, every ninth sheep, &c. Sometimes the rate was every tenth, and sometimes every fifteenth, &c. See **FIFTEENTH**, &c.

In France, the king alone, by his own authority, imposes *subsidies* on his people, at his own discretion. What Grotius says, that those who pay *subsidies* to other sovereigns, to engage them in their defence against powerful enemies, by so doing, acknowledge their own weakness, and that such an acknowledgment diminishes somewhat of their dignity; must be understood of such states as are too weak to defend themselves, and who, in respect hereof, render themselves in some measure, tributary; not of such as subsisting by their own strength, give *subsidies* to their weaker neighbours, to prevent their being over-run by others.

Such, *e. gr.* as the kings of England and France, are with regard to Sweden and several other princes; to whom they generally grant *subsidies* in the treaties they conclude with them. In the list of English duties, or impositions, are divers kinds of *subsidies*: old *subsidy*, additional imposition to the old *subsidy*, new *subsidy*, third *subsidy*, two-thirds *subsidy*. See **DUTY**, **CUSTOM**, &c.

**SUBSTANCE**, **SUBSTANTIA**, something that we conceive to subsist of itself, independantly of any created being, or any particular mode or accident. See **ENS**.

Thus

Thus a piece of wax is a *substance*; because we can conceive it as subsisting of itself, and of its own nature, without any dependance on any other created nature, or without any particular mode, form, colour, &c. See *MODE*. Spinoza maintains, that there is but one only *substance* in nature, whereof all created things are so many different modifications; and thus he makes the soul of the same *substance* with the body. The whole universe, according to him, is but one *substance*; which *substance*, he holds endowed with an infinity of attributes, in the number of which are thinking and extension. All bodies are modifications of this *substance*, considered as extended; and all spirits modifications of the same *substance*, considered as thinking. See *BODY* and *THINKING*. See also *SPINOSISM*. Mr. Lock's philosophy of *substances*, is more orthodox: our ideas of *substance*, that great author observes, are only such combinations of simple ideas, as are taken to represent distinct things, subsisting by themselves; in which the confused idea of *substance*, is always the chief. Thus the combination of the ideas of a certain figure, with the powers of motion, thought, and reasoning, joined to *substance*, make the ordinary idea of man; and thus the mind observing several simple ideas to go constantly together, which being presumed to belong to one thing, or to be united in one subject, are called by one name; which we are apt, afterwards, to talk of and consider as one simple idea. See *IDEA*. We imagine the simple ideas do not subsist by themselves; but suppose some substratum, wherein we subsist, which we call *substance*. The idea of pure *substance*, is nothing but the supposed, yet unknown support of those qualities which are capable of producing simple ideas in us. See *QUALITY*. The ideas of particular *substances* are composed out of this obscure and general idea of *substance*, together with such combinations of simple ideas, as are observed to exist together, and supposed to flow from the internal constitution, and unknown essence of that *substance*. Thus we come by the ideas of man, horse, gold, &c. Thus the sensible qualities of iron, or a diamond, make the complex idea of those *substances*, which a smith, or a jeweller, commonly knows better than a philosopher. See *DEFINITION*. The same happens concerning the operations of the mind, viz. thinking, reasoning, &c. which we concluding not to subsist by themselves, nor apprehending how they can belong to body, or be produced by it, we think them the actions of some other *substance*, which we call *spirit*; of whose *substance* or nature we have as clear a notion, as of that of body; the one being but the supposed substratum of the simple ideas we have from without; as the other of those operations, which we experiment in ourselves within: so that the idea of corporeal *substance* in matter, is as remote from our conceptions, as that of spiritual *substance*. Hence we may conclude, that he has the perfect idea of any particular *substance*, who has collected most of those simple ideas which exist in it; among which, we are to reckon its active powers and passive capacities, though not strictly simple ideas. *Substances* are generally distinguished by secondary qualities; for our senses fail us in the discovery of primary ones, as the bulk, figure, texture, &c. of the minute parts of bodies, on which their real constitutions and differences depend. See *PARTICLE*.—And secondary qualities are nothing but powers, with relation to our senses. The ideas that make our complex ones of corporeal *substances*, are of three sorts: First, the ideas of primary qualities of things, which are discovered by our senses; such as bulk, figure, motion, &c. Secondly, the sensible secondary qualities, which are nothing but powers to produce several ideas in us, by our senses. Thirdly, the aptness we consider in any *substance*, to cause or receive such alterations in its primary qualities, as that the *substance* so altered, should produce in us different ideas from what it did before. Besides the complex ideas we have of material *substances*, by the simple ideas taken from the operations of our own minds, which we experiment in ourselves, as thinking, understanding, willing, knowing, &c. co-existing in the same *substance*; we are able to frame the complex idea of a spirit: and this idea of an immaterial *substance*, is as clear, as that we have of a material. See *SPIRIT*. By joining these with *substance*, of which we have no distinct idea, we have the idea of spirit: and by putting together the ideas of coherent solid parts, and a power of being moved, joined with *substance*, of which likewise we have no positive idea; we have the idea of matter. See *MATTER*. Further, there are other ideas of *substances*, which may be called *collective*, which are made up of any particular *substances*, considered as united into one idea; as a troop, army, &c. which the mind does by its power of composition. These collective ideas, are but the artificial draughts of the mind, bringing things remote, and independent, into one view, the better to contemplate and discourse of them united into one conception, and signified by one name. For there are no things so remote, which the mind cannot, by this

art of composition, bring into one idea; as is visible in that signified by the name *universe*. See *COMPOSITION*. Such is the generally received doctrine of *substance*: but Bp. Berkeley, in his *Principles of human knowledge*, and Mr. Collier, in his *Clavis Universalis*, have made great refinements thereon. See *BODY*, *EXISTENCE* and *EXTERNAL*. **SUBSTANTIAL**, or **SUBSTANCIAL**, in the schools, something belonging to the nature of *substance*. See *SUBSTANCE* and *CONSUBSTANTIAL*. It is generally disputed, whether or no there be such things as *substantial* forms? i. e. forms independant of all matter; or forms that are substances themselves. See *FORM*. **SUBSTANTIAL** is also used in the same sense with *essential*; in opposition to *accidental*: in which relation it gives room for abundance of distinctions. See *ESSENTIAL* and *ACCIDENTAL*. **SUBSTANTIVE**, in grammar, is a quality ascribed to a noun or name, when the object it denotes is considered simply, and in itself, without any regard to its qualities. See *NOUN*. When the object is considered, as clothed with certain qualities, the noun is said to be *adjective*. See *ADJECTIVE*. For a more palpable criterion; all nouns, to which one cannot add the word *thing*, are *substantives*; and all those to which *thing* may be added, are *adjectives*. F. Buffier observes, it is a common mistake in grammarians, to define a noun *substantive*, to be that which denotes a substance.—The mistake arises hence, that finding all substances expressed by *substantives*, they have called all kinds of nouns, *substantives*. But it does not follow, that all nouns design substances; witness the nouns *accident*, *lightness*, &c. which are far from expressing substances, and yet are true nouns *substantives*.—Perhaps grammarians mean nothing here by *substance*, but the subject spoke of: if so, the definition is not amiss. Nouns *substantives* sometimes become *adjectives*; and nouns *adjectives* become *substantives*. In effect, the nature of the adjective being to express the quality of an object; if that quality be the object itself spoke of, then, on the foot of our definition, it becomes a *substantive*.—If, I say, a *good prince*, the word *good* is apparently an adjective, because it represents the prince as clothed with the quality of goodness. But if I say, the *good* ought to be preferred to the bad; it is evident, *good* is the subject spoke of, and, consequently, a *substantive*. Indeed, custom does not allow us to use all adjectives indifferently, as *substantives*; nor all *substantives*, as *adjectives*. The laws observed herein are as follow: All nouns either signify an individual, as Socrates, Alexander, &c. or a species; as man, horse, &c. or an essential quality, as rational, material, &c. or an accidental one, as black, white, good, fair, &c. or a dignity, office, art, &c. as king, president, philosopher, &c. Thus have we four kinds of nouns; whereof the first is very rarely taken adjectively; for as they signify individuals or particular beings, they can scarce be applied to any thing but the thing they properly signify: yet we have sometimes known the name of Cato taken adjectively; as, “this is to be Cato, indeed.” Nor does Malherbe scruple to say in French “plus Mars que le Mars de la Thrace.” Add that proper names are sometimes converted into the name of dignities, &c. as Cæsar, Augustus, &c. In which case, they may be considered, in the same light, as nouns of the fourth kind.—Nouns of the second kind, are also sometimes taken adjectively, as “he is much a man,” &c. The third kind are adjectives of themselves. For the fourth kind, all grammarians rank them among *substantives*; excepting F. Buffier who will have them to be adjectives; or, to use his own term, *modificatives*. Be that as it will, they are frequently used adjectively, “he is more a king, and more a philosopher, than any of his predecessors.” Now for adjectives taken *substantively*, 1° Participles passive, are very rarely thus taken; though we sometimes say, “the loved are less happy than the lovers; the taught have the advantage of the untaught: the besieged made a fallacy,” &c. And, 2° Participles active are taken still more rarely for *substantives*. We scarce ever, e. gr. say “the loving, the reading;” but “the lover, the reader:” yet we say, “the student, the protestant, the tenant, the appellant, the opponent,” &c.—3° For nouns adjectives, those applied to men are not only used *substantively*, but are even become *substantives* by use; whether they be such as regard religion; as “christian, pagan, mahometan,” &c. or opinion; as “stoic, peripatetic, cartesian,” &c. or country; as “the English, French, Italians:” or temperament; as “the melancholic, phlegmatic, choleric,” &c. Under the same rule, are likewise comprehended abundance of adjectives, signifying a number of people agreeing in some common attribute; as, “the learned, the great, the devout, the brave, the dissolute,” &c. But use is here to be regarded; for we do not say “the elegant,” as we say “the learned;” but “elegant writers,” &c. It is custom, and the ear alone, that are to decide about these differences. Again, adjectives taken *substantively*, for other things beside men, are either so used, to signify a number or set of things that

that have some common quality; or to express an abstract quality. In both which, as in those of men, there are some authorized by custom, and others formed every day on their model.

With regard to which last, use, again, and the ear, are to decide. Here all the adjectives of colours, are used *substantively*; as "the white, black, green," &c. Some of those of qualities; "as the cold," &c. those of time; as "the past, present, future:" and many of other matters; as "the agreeable, the sublime, the principal," &c. Nor is it only in the positive, but also in the comparative and superlative degrees, that adjectives are used *substantively*; as "the better of the two: the best of it," &c.

**SUBSTANTIVE verb.** See the article **VERB**.

**SUBSTITUTE**\*, **SUBSTITUTUS**, a person appointed to officiate for another, in case of absence, or other legal impediment. See **ATTORNEY**, and **SURROGATE**.

\* The word is formed from the Latin, *sub*, under, and *status*, I appoint, establish.

In the French law, the procureurs, or proctors, are obliged to name two of their brethren for *substitutes*, whose names are wrote after theirs in the list; to receive significations and summons's made in their absence. See **PROCURATOR**, &c.

**SUBSTITUTE**, in medicine, denotes a drug, or remedy that may be used in lieu of another; or that supplies the place of another of like virtue, which is not to be had: called also *succedaneum*. See **SUCCEDANEUM**.

The root of the great centaury, and sometimes the rhaponticum, are used as *substitutes* to rhubarb. See **RHUBARB**.

**SUBSTITUTION**, in grammar, the using of one word for another; or one mode, state, person or number of a word for another.—This the grammarians otherwise call *syllipsis*. See **SYLLEPSIS**.

**SUBSTITUTION**, in the civil law, a disposition of a testator, whereby he substitutes one heir to another, who has only the usufruct, and not the property of the thing left him.

*Substitution* is a kind of fiduciary inheritance, called also *fidei commissio*, in regard the immediate inheritor has only the use or produce of the thing; the body thereof being substituted and appropriated to certain persons, who are likewise to have the usufruct in their turns, but never the property.

In some countries, *substitution* is perpetual; in France, it only holds to the fourth generation.—*Substitution* answers to *remainder*, in common law. See **REMAINDER**.

Among the Romans, there were abundance of these fiduciary heirs; who enjoyed inheritances, till they returned them into the hands of the right heir: and the reason why they did not likewise restore the fruits, or that the fruits were not deemed to make a part of the inheritance, but only of the thing, was, that the fiduciary or trustee was obliged to run the risks, and to stand the charge of the culture of the land.

**SUBSTITUTION**, in algebra, &c. is the putting in the room of any quantity in an equation, some other quantity, which is equal to it, but expressed after another manner. See **QUANTITY**, and **EQUATION**.

**SUBTRACTION**, or **SUBTRACTION**, in arithmetic, the second rule, or rather operation, in arithmetic; whereby we deduct a less number from a greater, to learn the precise difference:

Or, more justly, *subtraction* is the finding a certain number from two homogeneous ones given; which, with one of the given numbers, is equal to the other. See **ARITHMETIC**.

The doctrine of *subtraction* is reducible to what follows:

To **SUBTRACT** a less number from a greater.—1° Write the less number under the greater, in such manner, as that homogeneous figures answer to homogeneous, *i. e.* unites to unites, tens to tens, &c. as directed under **ADDITION**. 2° Under the two number, draw a line. 3° *Subtract*, severally, unites from unites, tens from tens, hundreds from hundreds; beginning at the right-hand, and proceeding to the left; and write the several remainders in their correspondent places, under the line. 4° If a greater figure come to be *subtracted* from a less; borrow an unite from the next left-hand place; this is equivalent to 10, and added to the less number, the *subtraction* is to be made from the sum: or if a cypher chance to be in the next left-hand place, borrow the unite from the next further place. By these rules, any number may be *subtracted* out of another greater. For example;

If it be required, from  
To *subtract*

9800403459  
4743865263

The remainder will be found 5056538196

For, beginning with the right-hand figure, and taking 3 from 9, there remains 6 unites, to be wrote underneath the line: going then to the next place, 6 I find, cannot be taken from 5; wherefore, from the place of hundreds 4, I borrow 1, which is equivalent to 10, in the place of tens; and from the sum of this 10 and 5, *viz.* 15, *subtracting* 6, I find 9 tens remaining, to be put down under the line.

VOL. II. N°. CXLVII.

Proceeding to the place of hundreds, 2 with the 1 borrowed at the last, make 3, which *subtracted* from 4, leave 1. Again, 5 in the place of thousands, cannot be *subtracted* from 3; for which reason, taking 1 from 4, in the place of hundreds of thousands, into the empty place of tens of thousands, the cypher is converted into 10 tens of thousands, whence one 10 being borrowed, and added to the 3, and from the sum 13 thousand, 5 thousand being *subtracted*, we shall have 8 thousand to enter under the line: then *subtracting* 6 tens of thousands from 9, there remain 3. Coming now to take 8 from 4; from the 8 further on the left, I borrow 1, by means whereof, the two cyphers will be turned each into 9. And after the like manner is the rest of the *subtraction* easily performed.

If heterogeneous numbers be to be *subtracted* from each other; the unites borrowed are not to be equal to ten; but to so many as there go of unites of the less kind, to constitute an unite of the greater: for example;

l.	s.	d.
45	16	6
27	19	9

17 16 9

For since 9 pence cannot be *subtracted* from 6 pence; of the 16 shillings, one is converted into 12 pence; by which means, for 6 we have 18 pence; whence 9 being *subtracted*, there remain 9. In like manner, as 19 shillings cannot be *subtracted* from the remaining 15; one of the 45 pounds is converted into 20 shillings, from which, added to the 15, 19 being *subtracted*, the remainder is 16 shillings. Lastly, 27 pounds *subtracted* from 44 pounds, there remains 17.

If a greater number be required to be *subtracted* from a less, it is evident the thing is impossible.—The less number, therefore, in that case, is to be *subtracted* from the greater; and the defect to be noted by the negative character. *E. gr.* If I am required to pay 8 pounds, and am only master of 3; when the 3 are paid, there will still remain 5 behind; which are to be noted,—5.

*Subtraction* is proved, by adding the remainder to the subtrahend, or number to be *subtracted*: for if the sum be equal to the number whence the other is to be *subtracted*, the *subtraction* is justly performed.—For example;

l.	s.	d.
9800403459	156	11 3 1/4
4743865263 subtrahend	21	17 2 1/4 subtrahend
5056538196 remainder	134	14 0 3/4
9800403459	156	11 3 1/4

**SUBTRACTION**, in algebra, is performed by connecting the quantities with all the signs of the subtrahend changed; and at the same time uniting such as may be united; as is done in addition. See **ALGEBRA**, **QUANTITY**, **CHARACTER**, and **ADDITION**.

Thus  $+7a$  *subtracted* from  $+9a$ , makes  $+9a - 7a$ , or  $2a$ .

In the *subtraction* of compound algebraic quantities; the characters of the subtrahend, are to be changed into the contrary ones, *viz.*  $+$  into  $-$ ; and  $-$  into  $+$ . See **QUANTITY**.

To **SUBTRACT** *specious numbers, or quantities from one another; both those affected with the same, and those with contrary characters.*—1° If the quantities designed by the same letter have the same signs; and the less to be *subtracted* from the greater; the *subtraction* is performed as in common arithmetic, *e. gr.*

$$\begin{array}{r} 5b+4d-f = 5b.+4p.-\frac{1}{2} \\ 2b+d-f = 2b.+1p.-\frac{1}{2} \end{array}$$

$$3b \quad 3d-0 \quad 3b.+3p. \quad 0$$

2° If a greater quantity be to be *subtracted* out of a less; the less must be *subtracted* out of the greater, and to the remainder must be prefixed the sign  $-$ , if the quantities be affected with the sign  $+$ ; or the sign  $+$ , if they be affected with  $-$ .

$$\begin{array}{r} 16a+2b-9d=16\text{ lib.}+2\text{ sh.}-9\text{ d.} \\ 19a+3b-11d \quad 19 \quad +3 \quad -11 \end{array}$$

$$-3a-1b+2 \quad -3 \quad -1 \quad +2$$

3° If the quantities have different signs; the *subtraction* is converted into addition, and to the aggregate is prefixed the sign of the quantity, whence the *subtraction* is to be made; for example;

$$\begin{array}{r} 8a-5c+9d = 8\text{ lib.}-5+9\text{ d.} \\ 6a-8c-7d = 6 \quad -8-7 \end{array}$$

$$2a+3c+16d = 2\text{ lib.}+3+16$$

4° If the quantities be expressed in different letters, they must be connected; only the characters of the subtrahend must be changed into the contrary ones; for example;

$$\begin{array}{r} a+b-c \quad a+d \\ d-e+f \quad c-e-g \end{array}$$

$$\begin{array}{r} a+b-c-d+e-f \quad a+d-c+e+g \\ 11 \quad 0 \quad 0 \end{array}$$

SUB-

SUBTRACTION of *logarithms*, } See LOGARITHM.  
 SUBTRACTION of *vulgar fractions*, } See FRACTIONS.  
 SUBTRACTION of *decimals*, } See DECIMALS.  
 SUBSTRUCTION, in building, denotes underpinning, ground-selling, &c. See FOUNDATION.

SUBSTYLAR line, in dialling, a right line, whereon the style or gnomon of a dial is erected. See GNOMON and LINE.

In polar, horizontal, meridional, and northern dials, the *substylar* line is the meridional line, or line of 12 a clock; or the intersection of the plane, whereon the dial is delineated, with that of the meridian. See MERIDIAN.

In easterly and westerly dials, the *substylar* line, is the line of 6 a clock; or the intersection of the plane, whereon the dial is delineated, with the prime vertical. See DIAL.

SUBSUPERPARTICULAR, } See RATIO.  
 SUBSUPERPARTIENS, }

SUBTANGENT of a curve, the line that determines the intersection of a tangent with the axis; or, that determines the point wherein the tangent cuts the axis, prolonged. See CURVE and TANGENT.

Thus, in the curve AM, &c. (*Tab. Anal. fig. 10.*) the line TP intercepted between the semiordinate PM, and the tangent TM, is the *subtangent*. And PR is to PM, as PM to PT; and PM to PT, as MR to TM.

It is a rule in all equations, that if the value of the *subtangent* comes out positive, the point of intersection of the tangent and axis, falls on that side of the ordinate, where the vertex of the curve lies: as in the parabola and paraboloides.

If it come out negative, the point of intersection will fall on the contrary side of the ordinate, in respect of the vertex or beginning of the abscissa: as in the hyperbola, and hyperboliform figures.

And universally, in all paraboliform, and hyperboliform figures, the *subtangent* is equal to the exponent of the power of the ordinate, multiplied into the abscissa.

Thus in the common parabola, whose property is  $p \propto y^2$ . The *subtangent* is in length, equal to  $x$ , the abscissa multiplied by 2, the exponent of the power of  $y$ , the square of the ordinate; that is, it is equal to twice the abscissa; and by the former rule for paraboliform figures, it must be taken above the ordinate, in the axis produced.

Thus, also, in one of the cubical paraboloids, where  $p \propto y^3$ ; the length of the *subtangent* will be  $\frac{2}{3}$  of the abscissa.

In the parabola, the *subtangent* PT is double the abscissa AP; and the subnormal is PR subduple of the parameter. See NORMAL.

SUBTENSE\*, in geometry, a right line opposite to an angle, and presumed to be drawn between the two extremities of the arch which measures that angle. See ANGLE and ARCH.

\* The word is formed from the Latin, *sub*, under, and *tendo*, I stretch.

The *subtense* of the angle coincides with the chord of the arch. See CHORD.

In every rectangle triangle, the square of the *subtense* of the right angle, is equal to the squares of the *subtenses* of both the other angles; by the 47th prop. of Euclid. This wonderful property of that triangle, was first discovered by Pythagoras; who, in the transport of joy hereby occasioned, sacrificed a hecatomb. See TRIANGLE and HYPOTHENUSE.

SUBTERRANEAN, or SUBTERRANEAN, something under-ground. See FOSSIL.

Naturalists talk much of *subterranean* fires, as the cause of volcano's. See FIRE and VOLCANO.—*Subterranean* winds, as the cause of earthquakes. See EARTHQUAKE.

Mr. Boyle gives us an instance, from the dissertation *de admirand. Hungar. aquis*, of a huge *subterranean* oak dug out of a salt mine in Transylvania, so hard, that it could not easily be wrought on by iron tools; which yet, being exposed to the air out of the mine, became so rotten, that in four days it was easy to be broken and crumbled between one's fingers. Mr. Derham adds, that the trees turned out of the earth, by the breaches at West Thurrock and Dagenham, though probably no other than alder, and interred many ages ago, in a rotten, oozy mould, were so exceedingly tough, hard, and sound, at first, that he could make but little impression on them with the strokes of an ax; yet being exposed to the air and water, soon became so rotten, as to be crumbled between the fingers. See WOOD.

SUBTILE, in physics, intimates a thing exceedingly small, fine, and delicate: such as the animal spirits, the effluvia of odorous bodies, &c. are supposed to be. See SPIRITS, EFFLUVIA, &c.

One kind of matter is only more *subtile* than another, in that being divided into smaller parts, and those, too, more agitated; on the one hand, it makes less resistance to other bodies; and on the other, insinuates itself more easily into their pores. See MATTER, PARTICLE, ATOM, &c.

The Cartesians suppose a *subtile* matter for their first element. See CARTESIAN and ELEMENT.

This they lay down as so exceedingly fine, that it penetrates

the minute pores of glass, and other solid bodies; and from this they account for most of the phenomena of nature. See VACUUM, PLENUM, SUCTION, &c.

Yet they do not pretend to prove the existence of this matter, otherwise than by consequence. See MATERIA *subtilis*.

SUBTILIZATION, SUBTILISATION, the act of subtilizing, or rendering any thing smaller and subtiler; particularly, the dissolving or changing a mixt body into a pure liquor, or a fine powder, by separating the grosser parts therefrom. See PULVERIZATION, ATTENUATION, &c.

SUBTRIPLE ratio, is when one number or quantity is contained in another three times. See RATIO.

Thus, 2 is said to be *subtriple* of 6, as 6 is triple of 2.

SUBURBICARY\*, SUBURBICARIUS, an epithet given to those provinces of Italy, &c. which composed the ancient diocese, or patriarchate of Rome. See PROVINCE.

\* The term is formed from the Latin, *sub*, under, and *arbis*, city.—They were also sometimes called *urbicary* provinces.

Authors usually reckon ten of these *suburbicary* provinces; whereof Italy, from the Po to the heel made seven, and the isles of Sicily, Sardinia, and Corsica, the other three.

Yet Salmasius will have the *suburbicary* provinces confined to those four in the neighbourhood of Rome, to which the authority of the præfect of Rome extended; and these he makes the limits of the diocese of ancient Rome. See DIOCESE.

F. Sirmond takes the other extreme, and comprehends all the west under the name of *suburbicary* provinces.—Rufinus, who lived in the age of the council of Nice, explains the power ascribed to the pope, in the sixth canon of that council, by saying, that he had the care and superintendence of the *suburbicary* provinces. Hence the different sentiments of authors, with regard to the *suburbicary* provinces; some only considering the pope as bishop of Rome; others, as patriarch of the west, &c. See POPE.

SUCCEDANEUM\*, in pharmacy, a remedy substituted in the place of another first prescribed, when the ingredients are wanting, necessary for the composition of that other. See SUBSTITUTE.

\* The word is formed from the Latin *succedo*, to succeed, to come after.

*Substitute* and *succedaneum*, are of equal import; unless, with some authors, we chuse to use *substitute*, where a simple of like virtue is put for another; and *succedaneum*, where a compound is used with the same intention.

SUCCENTURIATI *renes*, in anatomy. See RENES *succenturiati*.

SUCCENTURIATION, the act of substituting. See SUBSTITUTION.

SUCCENTURIATUS, in anatomy, a muscle, called also *pyramidalis*. See PYRAMIDALIS.

SUCCESSION, SUCCESSION, in philosophy, an idea which we get by reflecting on that train of ideas constantly following one another in our minds when awake. See IDEA and MODE.

The distance between any parts of this *succession*, is what we call *duration*. When this *succession* of ideas ceases, we have no perception of time, or of the duration thereof; but the moment we fall asleep, and that wherein we awake, seem connected. See DURATION.

They, who think we get the idea of *succession* from our observation of motion by our senses, will come into Mr. Lock's sentiment, above, when they consider that motion produces an idea of *succession* no otherwise, than by producing a continued train of distinguishable ideas.

A man that looks on a body moving, perceives no motion, unless that motion produces a constant train of successive ideas. But where-ever a man is, though all things be at rest about him, if he thinks, he will be conscious of *succession*. See MOTION.

SUCCESSION, in astronomy. The SUCCESSION of the signs, is the order wherein they follow each other, and according to which, the sun enters, successively, into one, then into another, called, also, *consequentia*. See SIGN.

This order is expressed in the two following technical verses:

*Sunt Aries, Taurus, Gemini, Cancer, Leo, Virgo,  
 Libraque, Scorpius, Arcitenens, Capre, Amphora, Pisces.*

When a planet is direct, it is said to go according to the order and *succession* of the signs, or in *consequentia*; that is, from Aries to Taurus, &c. When retrograde, it is said to go contrary to the *succession* of the signs, or in *antecedentia*; viz. from Gemini to Taurus, then to Aries, &c. See PLANET, DIRECT, RETROGRADATION, &c.

SUCCESSION, in the civil law, implies a right to the whole effects left by a defunct. See INHERITANCE and DESCENT.

Of this there are several kinds, *ab-intestate*, *intestate*, &c.

SUCCESSION *ab-intestate*, is that which a person has a right to by being next of kin, which is, what we call, being *next heir at law*. See AB-INTESTATE.

Testamentary SUCCESSION, is that which a person comes to by virtue of a will. See TESTAMENT.

SUCCESSION in the direct line, is that, coming from ascendants or descendants. See DIRECT.

Collateral

**Collateral SUCCESSION**, is that, coming by uncles, aunts, or other collaterals. See **COLLATERAL**.

**Adjacent, or abandoned SUCCESSION**, is a burthenome or vexatious one, which no body will accept of.

There is no real *succession* in benefices; for here, no body inherits. See **BENEFICE**.

In effects that cannot be divided, as kingdoms, &c. the *succession* falls on a single head; which is usually the eldest son of the deceased, as being supposed the indivisible representative of his father.

In effects that are divided, all the children represent their father. It was on this principle, M. Courtin observes, that each of the sons of Jacob had his share assigned him in the Land of Promise. It is true, Manasseh and Ephraim, the two sons of Joseph, had likewise their shares; but this was because a double portion had been allotted their father, wherein he was treated as elder brother, in consideration of the great services he had done his father and brethren. See **PRIMOGENITURE**.

**SUCCESSIVE action**. See the article **ACTION**.

**SUCCESSOR**, a person who holds the place which another held before him; whether he arrived at it by election, collation, inheritance, or otherwise. See **SUCCESSION**.

Our historians tell us, that queen Elizabeth could never bear to hear of a *successor*. The king of the Romans is presumptive *successor* to the empire. See **HEIR**, &c.

The canonists say, a coadjutor is a necessary *successor* to a prelature; a resignee to the resignant. See **COADJUTOR**, **RESIGNATION**, &c.

Civilians say, a titular usufructuary can do nothing to the prejudice of his *successor*.

**SUCCINUM**, in pharmacy, *karabe*, or *amber*; a bituminous juice or resin, which from a fluor grows hard and brittle. See **AMBER**.

The whitest, and most transparent, is accounted best: it is of no great use in medicine, *per se*, as its texture seems too compact to open and yield to the natural concoctions; though some have a great opinion of it, as a balsamic, and give it in gonorrhoea's particularly.—But it is certain, that what pharmacy extorts from it, is of great efficacy; especially in nervous cases.

**SUCCISA**, a medicinal alexipharmic herb; called also *morfus diaboli*, or the *devil's bit*. See **MORSUS DIABOLI**.

It is a powerful sudorific, inasmuch that Sir Theodore Mayerne observes, in the *Philosophical Transactions*, laying a person sick of a plague, or other malignant fever, on a bed thereof, moderately hot, he shall sweat till they take him off; and much more, if he drink of the decoction or juice of the herb. But the *succisa* is now little used.

**SUCCOTRINE aloes**. See the article **ALOES**.

**SUCCUBUS**, or **SUCCUBA**, a term used by some visionary writers, to signify a *dæmon*, or spirit, who assumes the shape of a woman, and, as such, lies with a man. See **DÆMON**, &c.

Some authors use *incubus* and *succubus*, indiscriminately; but they ought to be distinguished; *incubus* being only properly used, where the *dæmon* is supposed to be in form of a man, and, as such, lies with a woman.

**SUCCULA**, in mechanics, a bare axis, or cylinder, with staves in it to move it round; but without any tympanum, or peritrochium. See **AXIS**, and **PERITROCHIMUM**.

**SUCCUS pancreaticus**, } See { **PANCREATIC JUICE**.

**SUCCUS nervosus**, } See { **NERVOUS JUICE**.

**SUCKERS**, *off-sets*, in agriculture, and gardening, young shoots proceeding from the root of a tree; being of the same kind with the tree from which they spring: for that such as grow from trees raised by grafting or inoculation, follow the nature of the stock. See **ROOT**, **ENGRAFTING**, &c.

They sometimes spring forth near the body of the mother-plant; but other *suckers* at a greater distance from it are better: yet the former removed when there is least sap in the top, and preserving what fibrous roots are upon them, often prosper.

When they are taken up, the ground is to be well opened, and if they grow from the body of the tree, or great roots, they must be cut off close to the stem, and set presently. See **STOCK**.

It forwards much the springing out of *suckers*, to bare the roots of trees, and slip them in some places. See **ABLAQUEATION**.

**SUCKING pump**. See the article **PUMP**.

**SUCTION**, **SUCTIO**, the act of sucking, or of drawing up a fluid, as air, water, or the like, by the mouth, and lungs. Air is sucked in at the mouth, by the muscles of the thorax and abdomen distending the cavity of the lungs and abdomen, by which means the air included therein is rarified, and ceases to be a counterbalance to the external air, which, of consequence, is driven in by the pressure of the atmosphere through the mouth and nostrils. See **RESPIRATION**.

Air is sucked through a pipe, in the same manner as with the naked mouth: it being here all one as if the mouth were extended the length of the pipe.

The *suction* of heavier liquors is performed after the same

manner, *e. gr.* in lying prone to drink out of a spring, &c. the lips are applied close to the surface of the water, so as to prevent any passage of the air between them; then the cavity of the abdomen, &c. being distended as before, the pressure of the air incumbent on the surface of the water without the circumference of the mouth, prevailing over that upon the water within the same, the fluid is raised, from the same principle as water in a pump. See **PUMP**.

In sucking a heavy liquor, as water, through a pipe, the longer the pipe is, the greater difficulty is found in the *suction*; and the bigness or diameter of the pipe, makes a further alteration therein. The reason of this arises from that great principle in hydrostatics, that fluids press in the compound ratio of the bases and perpendicular altitudes. See **FLUID**.

From what we have said, it evidently enough appears, that what we call *suction*, is not performed by any active faculty in the mouth, lungs, &c. but is performed by the mere impulse and pressure of the atmosphere. See **AIR**, and **ATMOSPHERE**.

A very curious and intelligent person distinguishes two different sorts of *suction* perform'd after two quite different manners; a distinction which however hitherto overlooked by authors, seems absolutely necessary in order, I think, to give a just account of the nature of this phenomenon.

*Suction*, then, according to him, is perform'd either, 1<sup>o</sup>, By the dilatation of the thorax; or, 2<sup>o</sup>, By that of the cavity of the mouth.

In the former case the lungs are kept continually distended; for if the breath be let go, ever so little, the liquor in the tube will begin to subside.

On the contrary, when *suction* is performed by enlarging the cavity of the mouth, we may suck with our utmost force, and yet breathe freely through the nostrils at the same time. This is the true and proper *suction*: the other ought rather to be call'd supping, than sucking through a tube.

Note, The cavity of the mouth is enlarg'd by being a little open'd, while the lips are close shut, the tongue being at the same time contracted, and drawn backwards towards the throat.

**SUCULA**, in mechanics. See the article **SUCCULA**.

**SUDAMINA**, little heat-pimples in the skin, like millet grains, frequent in youth; especially those of a hot temperament, and that use much exercise. See **SWEAT**.

**SUDATORY**, **SUDATORIUM**, a name given by the ancient Romans to their hot or sweating rooms; sometimes also called *laconica*. See **BATH**, and **GYMNASIUM**.

The *sudatory* was a species of their hypocausta, or stoves. See **HYPOCAUSTUM**, &c.

**SUDOR**, in medicine. See the article **SWEAT**.

**SUDOR Anglicanus**, the *English sweat*, or *sweating sickness*; is the name of an epidemic disease, first perceived in England, in 1485. It was properly, a sort of plague; thus called, because attended with an extraordinary kind of sweat. It made its return four times in the space of sixty-six years, *viz.* in 1506, 1517, 1528, and 1551.

It began with a sweat, which never ended, but either with the death of the patient, or his recovery. If he survived twenty-four hours he was safe. Few people escaped of it at first; too much care, and too little, were found equally destructive.

The patient was to wait, without stirring, either in his bed, or in his clothes, according to the condition nature was surprised in; without burthening him either with remedies or with foods; without cloathing either too much or too little; and, if possible, without either eating or drinking. The sweat to be kept up, without either promoting it, by any extraordinary heat, or checking it by the least cold.

This was what was found by experience; and which was at length practised, with happy success. The disease was first felt on the 21<sup>st</sup> of September, and in the same day spread itself all over England; where, after a great mortality, it stopped all at once, towards the end of October.

Its ravages were so great, that in some parts it took off a third part of the people in a very little time.

At its return under Henry VIII. in 1506, it was as general, and as dangerous as before, and again disappeared all at once. At the third attack, in 1528, it was less fatal; inasmuch that Bellay, bishop of Bayonne, then ambassador in England, who sweated like the rest, tells us, that of forty thousand souls, seized with it in London, only two thousand died. In 1534, it passed over into Ireland, where it killed great numbers.

**SUDORIFIC**, in medicine, a remedy that causes, or promotes sweat. See **SWEAT**.

*Sudorifics* only differ from *diaphoretics* in the degree of their action; the one promoting sensible perspiration, the other insensible. See **DIAPHORETICS**.

To the class of *sudorifics* belong, 1<sup>o</sup>. All things that moving violently through the body, attenuate the humours, and accelerate their motion.

2<sup>o</sup>. Such things, as at the same time diminish the resistance in the sudatory vessels about the cutis.

To which some add a third kind, *viz.* such as absorb the acidities of the blood, and thus set at liberty the matter of the sweat.

The

The first intention is chiefly effected by a copious drinking of very hot waters; by acids drawn from vegetables by fermentation and distillation; or those of fossils, attenuated by repeated distillations, especially if these be drunk mixed with hot water; by alkali's both volatile and fixt, diluted with hot water; by all compound salts, dissolved in water; by sapa's, metallic crystals, or the attenuated parts of metals themselves, as stibium diaphoreticum, fixt sulphur of Tachenius, bezoardic mineral, diaphoretic mercury, diaphoretic gold, &c. by sharp, subtil, acrimonious aromatics: as ablynthium, abrotonum, opium, asparagus, anis, asclepias, aristolochia, gum ammoniac, carduus benedictus, caraways, cinnamon, camomile, saffron, capillus veneris, china, dittany, eupatorium, gentian, hyssop, laurel, mint, leek, rosemary, sage, favin, fassiafras, scordium, thyme, veronica, nettle, and other medicines compounded hereof, as venice-treacle, mithridate, diafcoridium, orvietan, &c.

The second is chiefly effected by cleansing the skin, by vaporous lotions, baths, and frictions; by relaxing the cutaneous and subcutaneous vessels, which is best done by hot water sprinkled all over the body, the head excepted; by increasing the external heat about the naked body, as by the warmth of a bed, a vapour-bath, &c.

The third is effected by absorbents; as corals, crabs-eyes, diaphoretic antimony, bezoar, &c. See each under its proper article.

**SUET** \*, **SEBUM**, a kind of fat, found in deer, sheep, oxen, hogs, &c. which melted down and clarified, makes what we call *tallow*, used in the making of candles. See **FAT** and **TALLOW**.

\* The word is formed from the Latin, *suedum*, *sebum*, or *sebum*, which signify the same; and these *a sue*, by reason of the fatness of that beast.

Anatomists, &c. distinguish four kinds of fat in the body of an animal. The first, which fixes itself, and after melting, cools into a very firm consistence, they call *suet*.

It is found in greatest abundance in the lower belly, and about the kidneys.

F. le Comte mentions a tree in China, that bears *suet*, or *tallow*. See **TALLOW-tree**.

**SUFFERANCE**, in ancient customs, a delay, or respite of time, which the lord granted his vassal, for the performance of fealty and homage; so as to secure him from any feudal seizure. See **SERVICE**, **VASSAL**, **FEE**, &c.

*Sufferance*, say the customs, is equivalent to fealty and homage, while it holds. See **FEALTY** and **HOMAGE**.

The word is also used for a delay which the lord grants his vassals, to quit their hands of fees or inheritances they have acquired, till they have paid the due of indemnity, &c.

*Bill of SUFFERANCE*. See the article **BILL**.

**SUFFICIENT**, in the school theology. — **SUFFICIENT grace**, denotes a help or assistance which God gives to man, to enable him to act and perform his duty. See **GRACE**.

It is allowed an article of faith, that grace is necessary; and that without grace, nothing that is good, or that can any way intitle us to heaven, can be done: it is allowed too, that God does not refuse the necessary assistances; and it is allowed, that man, frequently, either does not act when he should, or acts what he should not.

From these principles, which are generally admitted by all sects, however different in other respects, it follows, that there is some assistance of God which man resists; some wherewith man does not act, wherewith yet he might act; or some, whereby he does evil, by which he might do good. It is this assistance that is called *sufficient grace*: because sufficing to make us act, though we do not act with it.

**SUFFITUS**, **SUFFIMENT**, or **SUFFUMIGATION**, in medicine, a thickish powder, prepared of odoriferous plants, gums, &c. which being thrown on coals, the vapours or steam thereof, are received by smelling. See **FUMIGATION** and **SUFFUMIGATION**.

**SUFFOCATION**, **SUFFOCATIO**, in medicine, a privation, or obstruction of respiration. See **RESPIRATION**.

*Suffocation* sometimes arises from a too great abundance of blood thrown on the lungs, or the muscles of the larynx, and preventing the ingress of the air; as is the case in quinzies, suffocating catarrhs, peripneumonies, &c. See **QUINZIES**, &c.

The fumes of wines, or strong beers, when boiling, cause *suffocation*, by interrupting the circulation of the blood. And the same may be observed of the fumes of lime, wherewith walls are whitened; and those of charcoal, antimony, sulphur, vitriol, and spirit of nitre.

The *suffocation* under water, is owing partly to the passage of the air being stopped up, and partly to the irruption of the water into the breast. See **DROWNING**.

In France they dispatch their people that are raving mad by *suffocating* them between two pillows: the same is also sometimes practised here in cases of hydrophobia's, &c.

*SUFFOCATION of the womb*, or *matrix*, is a disease pretty frequent in women, called also *fits of the mother*. In this, the patient imagines a malignant vapour rising from the matrix, and so pressing against the lungs and the diaphragm, as to prevent the free motion necessary to respiration.

Its true cause is a convulsion of the muscles of the larynx, which straighten the wind-pipe, and prevent the air's passing into the lungs. Hence it is, that hysterical women feel constrictions in the throat, as if one were strangling them with a cord. See **HYSTERIC**.

**SUFFOCATIVE catarrh**. See the article **CATARRH**.

**SUFFRAGAN**, **SUFFRAGANEUS**, in the ecclesiastical polity, a term applied to a bishop, with respect to his archbishop on whom he depends, and to whom appeals lie from the bishop's official. See **BISHOP**.

In this sense, the archbishop of Canterbury has twenty-one *suffragans*; and the archbishop of York four.

The term was never heard of before the eighth century. — Some derive it hence, that the bishops are to help and assist the archbishop; *quia archiepiscopo suffragari & assistere tenentur*. Others say, it is because ecclesiastical matters are determined by their votes, or suffrages; & *suffraganei dicuntur quia eorum suffragiis causæ ecclesiasticæ judicantur*. Others hold, they are called *suffragans*, because when called by the metropolitan to a synod, they have a right of suffrage, or of voting; or because they could not be consecrated without his suffrage or consent.

**SUFFRAGAN** is also used for a chorepiscopus, or an assistant bishop, or co-adjutor, who has a title *in partibus infidelium*, and assists another in the discharge of his function, or discharges it himself in the absence of that other. See **CHOREPISCOPUS**, **COADJUTOR**, &c.

These are by some also called *subsidiary bishops*. See **BISHOP**.

By statute 26 Henry VIII. every bishop and archbishop is allowed to appoint some one, some two, and some three bishops *suffragans*, under them; the seats, or residences whereof, are fixed by the same statute. The *suffragan* bishop for the diocese of Canterbury, to be at Dover only; for York, at Nottingham and Hull; for London, at Colchester; for Winchester, at Guilford, Southampton, and in the isle of Wight, &c.

Du Cange observes, that the title *suffragan* has also been given to such priests as are subject to the visitation of the arch-deacon: and *suffragans of the pope*, to the bishops of such dioceses, as are immediately subject to the pope.

**SUFFRAGE** \*, **SUFFRAGIUM**, a voice or vote, given in an assembly, where something is deliberated on, or where a person is elected to an office or benefice. See **VOTE**.

\* The word is formed from the Latin, *suffragium*, which anciently signified money, as appears in the eighth novel of Justinian: *ut iudices sine suffragio fiant*; and the sixth novel: *qui emerit præsulatum per suffragium, episcopatu & ordine ecclesiastico excidat*.

*Suffrages* are sometimes given by word of mouth; and sometimes in writing, as at elections liable to a scrutiny. See **SCRUTINY**. The president or chairman of the assembly usually collects the *suffrages*.

*Suffrages of the saints*, in the Romish church, denote the prayers and intercessions which the saints are supposed to make to God, in behalf of the faithful. See **SAINT**.

**SUFFRUTEX**, *under-shrub*; among botanists, a name given to the lowest sort of woody, perennial plants: sending no leaves from their root, and beginning to be branched from the very bottom of the stalk. Such are lavender, rue, sage, &c. See **PLANT**, **TREE**, &c.

**SUFFUMIGATION** \*, **SUFFUMIGATIO**, in medicine, a term applied to all remedies that are received into the body in form of fumes, i. e. of smok, vapour, or perfume. See **SMOAK**, **VAPOUR**, &c.

\* The word is formed from the Latin *sub*, under, and *fumus*, smok.

*Suffumigations* are composed of different matters, according to the nature of the disease. See **SUFFITUS**. Their intentions are to soften sharp, serous humours, to provoke or check the course of the menses, to raise a salivation in venereal evils, &c.

**SUFFUSION**, **SUFFUSIO**, in medicine, an overflowing of some humour, shewing itself in the skin; particularly that of the blood or bile. See **BLOOD**, **BILE**, &c.

That redness ordinarily arising from shame, is only a *suffusion* of blood appearing in the cheeks. See **BLUSHING**.

The jaundice is a *suffusion* of bile over the whole body. See **JAUNDICE**.

**SUFFUSION** is also used for a little film or pellicle, formed in the aqueous humour of the eye, before the pupil; called, also, *cataract*. See **HYPOCHYMA** and **CATARACT**.

**SUGAR**, **SACCHARUM**, a very sweet, agreeable juice, expressed from a kind of canes, or reeds, growing in great plenty in the East and West-Indies; particularly in Madera, Brasil, and the Caribbee islands.

It is a question not yet decided among botanists, &c. whether the ancients were acquainted with this cane, and whether they knew how to express the juice from the same? What we can gather from the arguments advanced on either side, is, that if they knew the cane and the juice, they did not know the art of condensing, hardening and whitening it, and, of consequence, knew nothing of our *sugar*.

Some ancient authors, indeed, seem to mention *sugar*, under the name of *Indian salt*; but they add, that it oozed out of

the cane of itself; and there hardened like a gum; and was even friable between the teeth, like our common salt: whereas *sugar* is expressed by a machine on purpose, and coagulated by the fire.

Theirs, Salmasius tells us, was cooling and loosening, whereas ours, the same writer asserts, is hot, and excites thirst. Hence, some have imagined, that the ancient and modern *sugar* plants were different: but Matthioli, on Dioscorides, c. 75. makes no doubt they were the same; and others are even of opinion, that ours has a laxative virtue, as well as that of the ancients, and that it purges pitta.

The generality of authors, however, agree, that the ancient *sugar* was much better than the modern; as consisting of only the finest and maturest parts, which made themselves a passage, and were condensed in the air.—The interpreters of Avicenna and Serapion, call *sugar*, *spodium*; the Persians, *tabaxir*; and the Indians, *mambu*.

Salmasius assures us, that the Arabs have used the art of making *sugar*, such as we now have it, above 800 years. Others produce the following verses of P. Terrentius Varro Atacinus, to prove that it was known before Jesus Christ.

*Indica non magna nimis arbore crescit arundo,  
Illius extensis premitur radicibus humor,  
Dulcia cui nequeunt succo contendere mella.*

Another question among naturalists is, whether the *sugar* canes be originally of the West-Indies; or whether they have been translated rather from the East?

The learned of these last ages, have been much divided on the point: but since the dissertation of F. Labat, a dominican missionary, published in 1722, there is no longer room to doubt but that the *sugar* cane is as natural to America as India: all that can be said in favour of the latter, is, that the Spaniards and Portuguese first learnt from the orientals, the art of expressing its juice, boiling it, and reducing it into *sugar*.

**Culture of the SUGAR cane.** The reed or cane, whence this useful juice is drawn, resembles those others we see in morasses, and on the edges of lakes; excepting that the skin of these latter is hard and dry, and their pulp void of juice; whereas the skin of the *sugar* reed is soft, and the spongy matter or pith it contains, very juicy, though that in a greater or less degree, according to the goodness of the soil, its exposure to the sun, the season it is cut in, and its age; which four circumstances contribute equally to its goodness and its bulk.

The *sugar* cane usually grows five or six foot high, and about half an inch in diameter; though F. Labat mentions some extraordinary ones in the isle of Tabago, twenty-four foot high. The stem or stalk is divided by knots, a foot and half a part. At the top it puts forth a number of long, green, rusted leaves, from the middle whereof, arise the flower and the seed. There are likewise leaves springing out from each knot; but these usually fall as the cane rises; and it is a sign, either that the cane is naught, or that it is far from its maturity, when the knots are seen beset with leaves.

The ground fit for *sugar* canes, is that which is light, soft, and spongy, lying on a descent proper to carry off the water, and well turned to the sun. They usually plant them in pieces, cut a foot and half below the top of the flower. These are ordinarily ripe in ten months, though sometimes not till fifteen; at which time, they are found quite full of a white succulent marrow, whence is expressed the liquor whereof *sugar* is made. When ripe, they are cut, their leaves cleared off, and they are carried in bundles to the mills. The mills consist of three wooden rollers, covered with steel plates; and have their motion either from the water, the wind, cattle, or even the hands of slaves. See *Sugar-Mill*.

Two rules belonging hereto are, that no canes above four foot, or under two foot and a half long be sent to the mills; and, that no more canes be cut than can be conveniently pressed in twenty-four hours; in regard they will heat, ferment, and turn sour.

**Preparation of SUGAR.**—The juice coming out of the canes, when pressed and broke between the rollers, runs through a little canal into the *sugar*-house; which is near the mill; where it falls into a vessel, whence it is conveyed into the first copper or cauldron, to receive its first preparation, only heated by a slow fire to make it simmer. With the liquor, is here mixed a quantity of ashes and quick-lime; the effect of which mixture, assisted by the action of the fire, is, that the unctuous parts are separated from the rest, and raised to the top, in form of a thick scum, which is kept constantly scumming off; and serves to feed the poultry, &c. withal.

The juice, in the next place, is purified in a second copper; where a brisker fire makes it boil; and all the time the casting up of its scum is promoted by means of a strong lye, composed of lime-water, and other ingredients.

This done, it is purified and scummed in a third boiler, wherein is cast a kind of lye, that assists in purging it, collects together its impurities, and makes them rise to the surface; whence they are taken with a skimmer.

From the third, it is removed to a fourth boiler, where the juice is further purified by a more violent fire: and hence to

VOL. II. N. CXLVIII.

a fifth; where it is brought to the consistence of a syrup. In a sixth boiler, the syrup receives its full coction; and here all the impurities left from the former lyes, are taken away by a new lye, and a water of lime and allom cast into it. In this last copper, there is scarce found one third of what was in the first; the rest being wasted in scum.

By thus passing, successively, a number of coppers, the *sugar* juice is purified, thickened, and rendered fit to be converted into any of the kinds of *sugar* hereafter mentioned. The size of the several coppers always diminishes, from the first to the last; each being furnished with a furnace, to give a heat proportionable to the degree of coction the juice has received. In some large *sugar* works, there are also particular coppers, for the boiling and preparing the scums.

F. Labat mentions several different kinds of *SUGARS*, prepared in the Caribbees, viz. *Crude sugar*, or *moscovado*; *strained* or *brown sugar*; *earthed* or *white sugar*, in powder; *refined sugar*, either in powder or loaves; *royal sugar*; *candied sugar*; *sugar of fine syrup*; *sugar of coarse syrup*; *sugar of the scum*.

*Crude SUGAR*, or *moscovado*, is that first drawn from the juice of the cane, and whereof all the rest are composed.

The method of making it, is that already described as for *sugar* in the general.—We need only add, that when taken out of the sixth copper, it is put in a cooler, where stirring it briskly together, it is let stand to settle, till a crust, of the thickness of a crown piece, be formed thereon. The crust being formed, they stir it up again, then put it into vessels, where it stands to settle, till it be fit to barrel.

*Strained* or *brown SUGAR*, though whiter and harder, does not differ much from the crude *sugar*: though it is held a medium between this last and the earthed *sugar*; which is the white powder *sugar*.

The preparation of this, is the same as that of the *moscovado*, with this difference, that to whiten it, they strain the liquor through blankets, as it comes out of the first copper. The invention of strained *sugar* is owing to the English, who are more careful than their neighbours, in the preparation hereof; for they not only strain it, but when boiled, put it in square wooden forms, or moulds, of a pyramidal figure; and when it has purified itself well, they cut it in pieces, dry it in the sun, and barrel it up.

*Earthed SUGAR*, is that which is whitened by means of earth laid on the top of the forms it is put in, to purge itself.

The making of this *sugar*, is begun after the same manner as that of crude *sugar*; except that they only use the best canes in it; that they work with more care and nicety; that when the liquor is in the first copper, the ashes they put in, are little or nothing mixt with lime, for fear of reddening it; and that they strain it through a blanket, from the first to the second copper.

When it has passed all the six coppers, it is laden out into a cooler; whence it is put into conical moulds or forms, the tips whereof are perforated, but now stopped with linen or other stuff; and these ranged evenly before the furnace. When it has been a quarter of an hour in the forms, it is cut with a *sugar* knife, that is, it is stirred briskly this way, and that, for half an hour.

This serves not only to promote the forming of the grain, and the diffusing it equally throughout; but also to determine the unctuous parts of the *sugar* to mount to the top, that they may be scummed off.

The forms being left to stand fifteen hours in this state, the holes at the bottom are then unstopped, to give a passage to the syrup, and to determine it to take that way. When enough of these forms are filled, to fill a stove, which usually contains five or six hundred forms; they visit the *sugar* in all the forms to examine the quality thereof, and to see if it quit the form easily; that it may either have the earth given it, as the refiner, who visits it, judges proper; or be melted over again, if it do not prove well.

This done, the forms are planted, each on its pot, with the tip of the cone downwards; the top is taken off, and in lieu thereof, they put in some *sugar* in grain, to within an inch of the edge; which space is left for the earth prepared for it.

The earths here used are of various kinds; the good qualities of each whereof, are, that they do not tinge the water, that they let it filtrate easily through, and that they do not imbibe the fatty part of the *sugar*. Before put in the forms, the earth is steeped in water twenty-four hours; and at length applied, in the consistence of a pulp.

As soon as the earth is on the *sugar*, all the windows of the refining room are shut, that the air and heat may not dry the earth. When it is quite dry, which usually happens in nine or ten days time, it is taken off; and after cleaning the surface of the *sugar* with brushes, and raking it up an inch deep, and again laying it level as before, they give it a second earth.

The whiteness of the *sugar* of each form, is seen from the first earth; experience shewing, that a second or third earth do not make the *sugar* any whiter, but only whitens the head of the loaf. When the second earth is taken off, they cleanse the surface of the *sugar* with a brush, and with a knife

knife loosen the edge of it, where it sticks to the form, that neither the form nor the *sugar-loaf* be damaged in taking out the latter. The windows are now opened, and the forms left to stand eight or ten days to dry. While the *sugar* is draining in its forms, a stove is prepared to receive them.

The stove being sufficiently heated, by means of the furnace therein, loaves are taken out of the forms one after another; and such as are white from one end to the other, are carried to the stove, as are, also, the rest, after cutting off what is not white, to be farther refined.

When the loaves are all ranged in the stove, a moderate fire is made for about two days, during which time, they visit every part of the stove very carefully, to see that every thing is in good order, and to repair any thing that may go amiss.

After these two days, they shut the trap-door a-top of the building, and increase the fire. Eight or ten days and nights continued violent fire usually suffice to dry a stove of *sugar*.

When they judge it sufficiently done, they open the trap-door, and chuse a hot dry day to pound the *sugar*, which is performed with huge, hard, heavy wooden pestles; when pounded, it is put up in barrels, and well trodden down as it is put in, that the barrels may hold the more.

**SUGAR of the scum.**—This is all made of the scum of the two last coppers; those of the former being reserved for making of rum.

The scum destined to make *sugar*, is kept in a vessel for that purpose, and boiled every morning in a copper set apart for that use. With the scum, is put into the copper a fourth part of water, to retard the boiling, and give time for its purging: when it begins to boil, the usual lye is put in, and it is carefully scummed: when almost enough boiled, lime and allom-water are thrown in; and when it is ready to be taken out, they sprinkle it with a little powdered allom.

**SUGAR of syrop, or treacle.**—There are three kinds of syrops that run from *sugar*. The first from the barrels of raw *sugar*, which is the coarsest of all: the second, from the forms or moulds, after they are perforated, and before they receive their earth: the third, that coming from the forms after they have had their earth; which last is the best.

The coarse syrops should only be used for rum; but *sugar* being grown dear, endeavours have been used to make some hereof, and that with tolerable success. They are first clarified with lime-water, and, when boiled, are put up in barrels, with a *sugar* cane in the middle, to make them purify themselves. After twenty days, a quantity of coarse earth is thrown in, to make them cast the remainder of their syrop, and fit them to be returned into a crude *sugar*. The Dutch and German refiners first taught the islanders how to turn their treacle into *sugar*.

The second syrop is wrought somewhat differently: after the copper, it is to be boiled in, is half full, eight or ten quarts of lime-water are cast in: It is then boiled with a brisk fire, and carefully scummed: some add a lye, and others none. F. Labat takes the former method to be better, though it requires more trouble and attention. This *sugar* may be earthed alone, or at least, with the heads of loaves, the dried tops, and such other kinds of *sugars* as may not be mixt with the true earthed *sugar*, nor yet with the crude *sugar*.

For the third syrop, after boiling and scumming it as the former, they put it instantly into the coolers, the bottoms whereof are covered half an inch thick with white *sugar* very dry, and well pounded; and the whole is well stirred, to incorporate the two together. This done, they strew the surface over with the same pounded *sugar*, to the thickness of one fifth of an inch; this assisting the *sugar* in forming its grain. When settled, and the crust gathered at the top, a hole is made in the crust five or six inches diameter.

By this aperture, they fill the cooler with a new syrop, poured gently in, which insensibly raises up the former crust. When all the syrops are boiled, and the cooler is full, they break all the crusts; and after mixing them well, put it up in forms or moulds.

The rest is performed in the same manner as for the earthed *sugar*, from which it only differs in that it falls short of its gloss and brightness; being, in reality, sometimes whiter and finer, though of a flatter and duller white.

**Refined SUGAR.**—Crude *sugar*, strained *sugar*, and the heads or tops of loaves that have not whitened well, are the basis or ground of this *sugar*.

In a refinery are usually two coppers, the one serving to clarify, the other to boil the clarified liquor; tho' they sometimes clarify in both, and boil afterwards. For the operation of refining, the same weight of lime-water and of *sugar* are put in the copper; and as the scum is raised by the heat, it is taken off, and when it ceases to rise any more, the syrop is strained through a cloth.

After this, it is clarified; that is, a dozen of eggs is thrown, white, yolk, shell and all; after having first broke and beaten them well in lime-water. When the fat, and other

impurities of the *sugar*, which this composition gathers together on the surface of the syrop, have been scummed off; a few more eggs are thrown in, and it is scummed afresh. This they repeat till the *sugar* be sufficiently clarified; which done, it is again strained through the cloth.

When taken out of this copper, it is boiled in the second; which done, it is put out into coolers, the bottoms whereof are first covered half an inch thick with fine white powdered *sugar*. As soon as it is there, it is briskly stirred about, and the surface strewed over with pounded *sugar*. The rest is performed as in *sugars* of fine syrops, or in earthed *sugar*; only more care and exactness is used. See REFINING.

**Royal SUGAR.**—The basis of this sort ought to be the finest refined *sugar* to be found. This they melt with a weak lime-water; and sometimes, to make it the whiter, and prevent the lime from reddening it, they use allum-water. This they clarify three times, and pass as often through a close cloth, using the very best earth. When prepared with these precautions, it is whiter than snow, and so transparent, that we see a finger touching it, even through the thickest part of the loaf.

**SUGAR-candy, saccharum candum, or crystallinum,**—is *sugar* depurated and crystallized. See CANDY.

This is better made of earthed *sugar*, than refined *sugar*, in regard the former is sweeter.

The *sugar* to be used herein, is first dissolved in a weak lime-water, then clarified, scummed, strained through a cloth, and boiled, and put in forms or moulds that are traversed with little rods, to retain the *sugar* as it crystallizes. These forms are suspended in a hot stove, with a pot underneath, to receive the syrop that drops out at the hole in the bottom, which is half stopped, that the filtration may be the gentler. When the forms are full, the stove is shut up, and the fire made very vehement.

Upon this the *sugar* fastens to the sticks that cross the forms, and there hangs in little splinters of crystal. When the *sugar* is quite dry, the forms are broke and the *sugar* taken out, candied. Red *sugar-candy* they make, by casting into the vessel, where the *sugar* is boiling, a little juice of the Indian fig; and if it is desired to have it perfumed, they cast a drop of some essence in, when the *sugar* is putting into the forms.

This method of making *sugar-candy* is that of F. Labat, practised in the Caribbees: the method in Europe, described by Pomet, is somewhat different.

**White SUGAR-candy** they make of white refined *sugar*, boiled with water into a thick syrop, in a large pan. It is candied in a stove, whither it is carried, inclosed in brags peels, crossed with little rods, about which the crystals fasten as they are formed.

The fire of the stove is kept equable for fifteen days; after which the *sugar* is taken out of the peels to be dried. Red or brown *sugar-candy* is made like the white, except that they only use brown *sugars* and earthen pots.

**Barley SUGAR, saccharum hordeatum,** is a *sugar* boiled till it be brittle, and then cast on a stone anointed with oil of sweet almonds, and formed into twisted sticks, about the length of the hand, and the thickness of a finger.

It should be boiled up with a decoction of barley, whence it takes its name; but in lieu thereof they now generally use common water, to make the *sugar* the finer.—To give it the brighter amber colour, they sometimes cast saffron into it.—It is found very good for the cure of colds and rheums.

**SUGAR of roses, saccharum rosatum,** is white *sugar* clarified, and boiled into a consistence in rose-water: when boiled, they form it into lozenges, sometimes into little grains, of the size of peas, by keeping it stirring till it be cold, and dry.—It is reputed good to soften and allay acrimonies, &c. of the breast. See ROSE.

**Cask of SUGAR,** } See the articles { CASK.

**Chest of SUGAR,** } See the articles { CHEST.

**SUGAR of saturn,** } See the article LEAD.

**SUGAR of lead,** }

**SUGGESTION, SUGGESTIO,** the act of hinting, or furnishing another with a thought, or design, or of insinuating it artfully into his mind.

In the French law, a testament is said to be made by *suggestion*, when it is made by surprize, and contrary to the intention of the testator.

If *suggestion* be proved, the testament becomes null. Articles of *suggestion* are not admissible against a testament wrote with the testator's own hand, which is never suspected. See TESTAMENT.

**SUIT, SUTE, SECTA** in law, (from the French *suite*, a following another) is used in divers senses.—As, **SUIT in law**; which is of two kinds, *real* and *personal*: the same with what we call *real* and *personal actions*. See ACTION.

**SUIT of court, or suit of service**; an attendance which the tenant owes the court of his lord. See SERVICE.

**SUIT covenant**; when your ancestor hath covenanted with mine to sue to his court.

**SUIT custom**; when I and my ancestors owe suit time out of mind.

SUIT

**SUIT** *real*, or *regal*; when men come to the sheriffs turn or leet.

**SUIT** also signifies the following one in chafe; as *fresh suit*. See FRESH-SUIT.

**SUIT**, again, signifies a petition made to the king, or any great person. See PETITION.

**SULPHUR**, in natural history, a fat, unctuous sort of mineral substance, fusible and inflammable by fire, and not dissoluble or miscible in water. See FOSSIL.

This is particularly called *fossil*, or *mineral sulphur*, to distinguish it from the *sulphur of metals*, or of the philosophers. See METAL.

*Sulphurs* make a particular class of fossils, divided into *solid* and *fluid*.

The *solid* SULPHURS are, common *sulphur*, or *sulphur* properly so called, arsenic and amber. See ARSENIC and AMBER.

The *liquid* SULPHURS are, asphaltum, pissasphaltum, bitumen, petroleum, naphtha, and oleum terræ, &c. See BITUMEN, PISSASPHALTUM, PETROLEUM, NAPHTHA, &c.

SULPHUR, properly so called, or *brimstone*, is of two kinds, viz. *vivum*, and *common sulphur*.

**SULPHUR** *vivum*, *native*, or *virgin sulphur*, is that which is dug in this form out of the earth; being opaque, of a yellow or ash-colour; it easily takes fire, and, in burning, casts a strong sulphurous smell.

It is chiefly brought from Sicily; and is but little used, except in some galenical compositions, and to *sulphur* wine, in order to make it keep in carriage.

It is found in great quantities in the neighbourhood of volcanos or burning mountains, as Vesuvius, Ætna, &c. yet *sulphur* has also its particular mines; and we have very good from several parts of Italy and Switzerland, though the best is that of Quitto and Nicaragua in America.

**Common** SULPHUR, or that used in gunpowder, and on divers other occasions, is said by some to be a composition of the native *sulphur* with rosin; rolled up into cylindrical pieces. — Though others assure us, it is procured from the native *sulphur* by means of fire and train oil, which dissolving it, it is poured into moulds; and thus formed into those cylinders we find it in. Savary.

This common *sulphur* is either better or worse, according to the refinery it comes from. That of Holland has a long time had the vogue; the second place has been given to that of Venice; and the third to that of Marseilles: but the order seems to have been since changed, and that from Marseilles is now in the first place.

It is chosen in large thick cylinders, of a golden yellow colour, very brittle, and when broke, appearing all brilliant, as if crystallized.

Beside the use of *sulphur* in the composition of gunpowder, whereof it is one of the three ingredients, and that which makes it take fire so readily, (see GUNPOWDER) it is of some use in medicine, and more in chymistry. It is also used in whitening filken and woollen stuffs; to which end, the vapour thereof is contrived to be received by them. See BLEACHING.

Its vapour also whitens red roses; and even young rooks, taken out of the nest, and exposed thereto, are said to become perfectly white. It has the same effect on gold; which is to be restored to its colour by boiling it in water with tartar.

The chymical analysis of *sulphur* is very difficult; its principles being so volatile, and withal so fast bound together, that they either rise all together, or are dissipated and lost in the separation.

M. Homberg, however, has at length found the secret of separating the principles, and of saving them at the same time. He finds it to consist of an acid salt, an earth, an oily bituminous and inflammable matter, and usually a little metal.

The three first he finds, by a long series of operations, are in pretty equal quantities; but the last, which proves to be copper, inconsiderable. The acid, he adds, is exactly the same with that of vitriol; the oil, which is thick and red as blood, appears to be the inflammable part, and that which constitutes the chymical principle *sulphur*, only that it retains some heterogeneous matter in the operation. The earth is extremely fixt, and unalterable by the strongest fire. M. Geoffroy tried the re-composition of *sulphur* on M. Homberg's principles, and with success. The pure acid salt of *sulphur* being mixed with an equal quantity of the oily matter, and earthy alcali, and a little oil of tartar, and the operation conducted according to the rules of art, the mixture was converted into a pure burning *sulphur*.

This done, he attempted the composition of *sulphur*, not by recomposing it out of the same matters it had been resolved into, but by using matters judged of the same nature. Thus, by substituting oil of vitriol for the acid salt, and oil of turpentine for the inflammable part, he succeeded as before.

Again, he found that fixt salts, as they are acids absorbed in earth, serve for two principles at once, and need nothing but

an inflammable oil to make *sulphur*: and even in lieu of this oil, M. Geoffroy employed, with equal success, char-coal, pit-coal, and other solids.

Indeed Mr. Boyle and Glauber had before made common *sulphur*, and that by mixtures, such as M. Geoffroy describes; but they were both mistaken as to the reason thereof; the one concluding, that the *sulphur* he thus got, had been contained in the fixed salts, and the other in the coal; neither of them dreamed, that it was the mixture of the three principles that produced the mixt.

**Flowers of** SULPHUR, are the purest and finest part of common *sulphur*, gained by evaporating *sulphur*, by sublimation, or burning it in pots made for that purpose; and gathered in the capital of the cucurbit, where the vapour sticks. See FLOWER.

This preparation, as, indeed, *sulphur*, in most of its forms, is found excellent for the lungs. The best flower of *sulphur* is in cakes, or pieces, light, soft, friable, and rather white than yellow. If it be in powder it must be very fine, of a yellow colour, that is, both whitish and gilt at the same time.

Instead of this, we have frequently put upon us a vile *sulphur*, mixed with starch, or wheat flour; and sometimes only *sulphur-dust* well sifted.

By adding fixed nitre, or sal polychrest, to the flowers of *sulphur*, we have the *white flowers of sulphur*.

**Magistery**, *balm*, or *milk of* SULPHUR, is *sulphur* dissolved in a sufficient quantity of water, with salt of tartar; and precipitated by means of spirit of vinegar, or some other acid. See MAGISTERY.

It is called *milk of sulphur* from its whiteness; and *balm of sulphur*, or of the lungs, from its excellent use in diseases of the lungs and breast. See BALSOM, &c.

**Salt of** SULPHUR, is a chymical preparation, very improperly thus called: as being no other than the sal polychreston, impregnated with spirit of *sulphur*, and reduced to an acid salt, by evaporating the humidity thereof. Some hold it a powerful febrifuge. See SALT.

**Spirit of** SULPHUR. See the article SPIRIT.

**SULPHUR of antimony**, is a diaphoretic tincture drawn from antimony and salt of tartar or nitre by divers operations. See ANTIMONY.

That drawn from the fæces of crocus metallorum, is by some called *golden sulphur*. See ANTIMONY.

**SULPHUR metallorum**, or *sulphur of metals*, called also, *sulphur figens*, is used among chymists and alchymists for a peculiar matter, which enters the composition of all metals. See METAL.

Metals are supposed to consist of two essential parts, or principles; mercury, as the basis, or metallic matter; and *sulphur*, as the binder, or cement, which fixes the fluid mercury into a coherent malleable mass. See METAL, and MERCURY.

Some of the latest and best chymists, particularly Monf. Homberg, will have this *sulphur* to be no other than fire. See FIRE, GOLD, and BURNING-glass.

**SULPHURATED wine**. See the article WINE.

**SULTAN**, or **SOLDAN**, a title, or appellation given the emperor of the Turks.

It had its rise under Mahmoud, son of Sebesteghin, the first emperor of the dynasty of the Gaznevites, towards the close of the fourth century of the æra of the Hegira: when that prince going to Segestan to reduce Kalaf, governor of that province, who affected the sovereignty; Kalaf was no sooner advertised of his coming, than he went out to meet him, delivered the keys of his fortrefs, and owned him his *sultan*\*, that is, his lord or commander. The title pleased Mahmoud so well, that he assumed it ever afterwards; and from him it passed to his descendants, and to other Mahometan princes.

\* Vattier will have the word Turkish, and to signify king of kings; adding that it was first given the Turkish princes Angrolipex and Masgud, about the year 1055; others will have it originally Persian, alledging, in proof hereof, an ancient medal of Cosroe; others derive it from *soldanus*, quasi *solus dominus*; others from the Hebrew שָׁלַט, *shalat*, to rule, reign.

In the Roman ceremonial, we also find mention made of a **SOLDAN**, or marshal, who is to attend the pope when he marches in state. He is also to apprehend malefactors.

**SULTANA**, the wife of a sultan. The favourite *sultana* is called *Hafeski-sultana*, i. e. private *sultana*.

The *sultana* queen is the emperor's chief wife. The old *sultana*, mother of the emperor reigning, is called *sultana valide*.

**SULTANA** also denotes a strong Turkish vessel of war.

**SULTZ**, or **SULZ**. See the article SALZ.

**SUM**, **SUMMA**, in mathematics, signifies the quantity that arises from the addition of two or more magnitudes, numbers, or quantities together. See ADDITION.

This is sometimes called the *aggregate*; and, in algebra, is sometimes denoted by the letter **Z**, which stands for *suma*, or *suma*; and sometimes by the letter **S**.

**SUM of an equation**, is when the absolute number being brought over to the other side, with a contrary sign, the whole becomes

comes equal to 0: this Des Cartes calls the *sum of the equation* proposed. See EQUATION.

**SUMACH**, a drug used to dye in green; as also in the preparation of black morocco, and other leather. See MOROCCO.

It consists of the leaves and young branches of a shrub, not unlike the little service-tree: the leaves are longish, pinnated and hairy: the flowers grow in clusters, and are red, like our roses. Its fruit is a kind of grape, of a very astringent quality; and its seed almost oval, and inclosed in capsule of the like figure.

The ancients used them, instead of salt, to season their meat withal; whence the Latins call the tree, *rhbus obsoniorum*: from its use in the dressing of leather, it is also called *rhbus coriaria*.

**SUMMARY**, an abridgment, containing the sum and substance of a thing in a few words. See ABRIDGMENT. The *summary* placed at the head of a book, a chapter, a law, or the like, is very useful to the reader, to facilitate the understanding thereof. See ARGUMENT.

A recapitulation, is to contain a *summary* of the whole preceding discourse. See RECAPITULATION.

**SUMMATORIUS calculus**, the method of summing differential quantities; that is, from any differential given, to find the quantity from whose differencing the given differential results. See DIFFERENTIAL.

This method we more usually call the *inverse method of fluxions*; and foreigners, *integralis calculus*. See CALCULUS, and FLUXIONS.

**SUMMER**, one of the seasons of the year, commencing in these northern regions, on the day the sun enters cancer; and ending when he quits virgo. See SEASON.

Or, more strictly and universally, the *summer* begins on the day when the sun's meridian distance from the zenith is the least. It ends on the day when his distance is a mean betwixt the greatest and smallest. See SUN.

The end of *summer* coincides with the beginning of winter. See WINTER.

**SUMMER flowers**, } See the articles { FLOWERS.

**SUMMER solstice**, } See the articles { SOLSTICE.

**SUMMER \***, in architecture, is a large stone, the first that is laid over columns and pilasters, in beginning to make a cross vault; or it is the stone which being laid over a piedroit or column, is hollowed, to receive the first haunce of a plat-band.

\* The word is formed from the French, *sommier*, which signifies the same thing.

**SUMMER**, in carpentry, is a large piece of timber, which being supported on two stone peers, or posts, serves as a lintel to a door, window, &c.

There are also *summers* used in various engines, &c. serving to sustain the weight, &c.

**SUMMER tree**, denotes a beam into which the ends of joists are fastened, and to which the girders are framed. See BREST-SUMMER, and GIRDER.

**SUMMER** of an organ. See the article SOUND-board.

**SUMMET \***, the vertex, or point of any body, or figure; as of a triangle, a pyramid, a pediment, &c. See APICES, VERTEX.

\* The word is formed from the French, *sommet*, which signifies the same.

**SUMMONER**, **SUMMONITOR**, an apparitor, or petty officer who is to cite persons to appear at a certain time and place, to answer to the charge exhibited against them. See APPARITOR and SUMMONS.

**SUMMONS**, **SUMMONITIO**, in law, a citing or calling a person to any court, to answer a complaint, or even to give in his evidence, &c. See CITATION, and RESUMMONS.

This is the same with the *vocatio in jus*, or the *citatio* of the civilians: hence also our old word *summer*, or *summerer*. See SUMMONER.

**SUMMONS in terra petita**, is that made on the land which the party, at whose suit the summons is sent out, seeks to have.

**SUMMONS ad warrantizandum**, is a process, whereby the vouchee in a common recovery is called. See VOUCHER.

**SUMMONS**, in war.—To *summons* a place, is to send a drum, or trumpet, to command the governor to surrender; or, in defect thereof to protest to make an assault, and to lay all in fire and blood.

**SUMMUM bonum**, in ethics, the chief good of human nature; or that, which, by its enjoyment, renders men truly and compleatly happy. See GOOD.

The schools distinguish this chief good of man, into that which is simply and adequately so, and beyond which there can be no other; and an inferior and subordinate fort, which is in some measure attainable in this imperfect state.

This last they call *felicitas viatorum*; and the former, *felicitas comprehensum*.

**SUMMUM genus**. See the article GENUS.

**SUMPTER horse**, is an horse that carries provisions, and necessities for a journey. Rust.

**SUMPTUARY laws**, *leges SUMPTUARIÆ*, are laws made to restrain excess in apparel, costly furniture, eating, &c. See LAW.

Most ages and nations have had their *sumptuary laws*; and some retain them still, as the Venetians, French, &c. But it is observed, that no laws are worse executed than *sumptuary laws*.

The *sumptuary laws* of that ancient Locrian legislator Zaleucus, are famous: by these it was ordained, that no woman should go attended with more than one maid in the streets, except she were drunk: that she should not go out of the city in the night, unless she went to commit fornication: that she should not wear any gold or embroidered apparel, unless she proposed to be a common strumpet. That men should not wear rings, or tiffues, except when they went a whoring, &c.

The English have had their share of *sumptuary laws*, though all repealed by a statute 1<sup>o</sup> Jac. I. or obsolete.

Under King Henry IV. Camden tells us, pride was got so much into the foot, that it was proclaimed, That no man should wear shoes above six inches broad at the toes. And their other garments were so short, that it was enacted, 25 Ed. IV. That no person under the condition of a lord, should, from that time, wear any mantle or gown, unless of such length, that, standing upright, it might cover his privy members and buttocks.

Among the Romans, the *sumptuary* and cibary laws were very numerous: by the lex Orchia, the number of guests at feasts was limited, though without limitation of the charges thereof. By the Fannian law, made twenty-two years afterwards, it was enacted, That more than ten as's should not be spent at any ordinary feast: for the solemn feasts, as the saturnalia, &c. an hundred as's were allowed; ten of which, Gellius informs us, was the price of a sheep, and an hundred of an ox.

By the Didian law, which was preferred eighteen years after, it was decreed, that the former *sumptuary laws* should be of force, not only in Rome, but throughout Italy: and that for every transgression, not only the master of the feast, but all the guests too, should be liable to the penalty.

**SUN**, **SOL**, in astronomy, the great luminary which enlightens the world, and by his presence constitutes day. See DAY.

The *sun* is usually reckoned among the number of planets; but that he ought rather to be numbered among the fixed stars, will be shewn in its place. See STAR, and PLANET. According to the Copernican hypothesis, which is now generally received, and which has even demonstration on its side, the *sun* is the centre of the planetary and cometary system; round which all the planets and comets, and our earth among the rest, revolve, in different periods, according to their different distances from the *sun*. See this motion illustrated and demonstrated under the article PLANET. But the *sun*, though thus eased of that prodigious motion, whereby the ancients imagined him to revolve daily round our earth; yet is not perfectly a quiescent body.

From the phenomena of his maculæ or spots, it evidently appears, that he has a rotation round his axis; like that of the earth whereby the natural day is measured; only slower. —Some of these spots have made their first appearance near the edge or margin of the *sun*, and have been some time after on the opposite edge; whence, after a stay of about fourteen days, they have re-appeared in their first place, and taken the same course over again; finishing their entire circuit in twenty-seven days time: which is hence deduced to be the period of the *sun's* rotation round his axis. This motion of the spots, is from west to east, whence we conclude that of the *sun*, to which the other is owing, to be from east to west.—For the various appearance of the solar spots, their cause, &c. see MACULÆ, and SPOTS.

For the apparent annual motion of the *SUN* round the earth; it is easily shewn by astronomers, that the annual motion of the earth will occasion such an appearance, though it be demonstrated that there is no such thing.

A spectator in the *sun*, would see the earth move from west to east, for the same reason as we see the *sun* move from east to west. And all the phenomena resulting from this annual motion, in whichever of the bodies it be, will appear the same from either.

Let S, for instance (*Tab. Astron. fig. 39.*) represent the *sun*, ABCD the earth's orbit, which it passes through from west to east, in the space of a year.—Now, a spectator in S, viewing the earth at A, will refer it to the point of the sphere of the stars,  $\alpha$ : when arrived in B, the spectator will see it, as in the point  $\beta$ : when in C, as in the point  $\gamma$ , &c. till after its whole circuit, it will be again seen in  $\alpha$ . Thus will the earth appear to describe the whole ecliptic, and to pass, successively, from sign to sign.

Suppose, now, the spectator removed from the *sun* to the earth, which imagine in C; the distance of the fixed stars, we have shewn, is so vast, that that of the *sun* is but a point to it. The spectator, therefore, now situate on the earth, will see the same face of the heavens, the same stars, &c. as before; the only difference will be, that as before he imagined the earth in the heavens, and the *sun* in the centre; he will now suppose the *sun* in the heavens, and the earth in the centre.

The earth, therefore, being in C, the spectator will see the *sun* in  $\gamma$ ; and the spectator being carried along with the earth, and partaking of his annual motion, will not perceive either his own motion, or that of the earth; but observing the *sun*, when the earth is arrived at D, the *sun* will be seen at  $\epsilon$ . Again, while the earth proceeds to A, the *sun* will seem to have moved through the signs  $\epsilon$ ,  $\theta$ , and  $\kappa$ : and while the earth describes the semi-circle ABC, the *sun* will appear to have moved in the concave surface of the heavens, through the six signs,  $\epsilon$ ,  $\eta$ ,  $\zeta$ ,  $\nu$ ,  $\mu$ ,  $\kappa$ . So that an inhabitant of the earth will see the *sun* go through the same orbit or circle in the heavens, and in the same space of time, as a spectator in the *sun* would see the earth describe the same.

Hence arises that apparent motion of the *sun*, whereby he is seen to advance, insensibly, towards the eastern stars: inasmuch, that if any star near the ecliptic, rise any time with the *sun*; after a few days, the *sun* will be got more to the east of the star, and the star will rise and set before him.

For the several phenomena resulting from the *sun*'s apparent motion, or the earth's real motion, as the diversity of day and night, of seasons, &c. see EARTH.

**Nature, properties, figure, &c. of the SUN.**—1°. As the solar spots are sometimes found to stay three days longer behind the *sun*, than they spend in passing over the hemisphere visible to us; we easily deduce, that they do not adhere to the surface of the *sun*, but are at some distance therefrom.

2°. As the spots frequently rise and vanish, even in the midst of the *sun*'s disk; and undergo several changes, both with regard to bulk, and figure, and density; it follows, that they frequently rise de novo, about the *sun*, and are again dissipated.

3°. Hence it should follow, that they are formed out of the exhalations of the *sun*; and are no other than solar clouds. See VAPOUR, CLOUD, &c.

4°. Since, then, exhalations proceeding from the *sun*, rise above him, and stop at a certain altitude; it is evident there is some fluid incompassing the *sun*, to urge the exhalations to rise: and this fluid must be denser at bottom, and rarer a-top, like our atmosphere. See ATMOSPHERE.

5°. Since the spots frequently dissolve and disappear in the middle of the *sun*'s disk; the matter of the spots, that is, the solar exhalations, fall back again to the *sun*: whence it follows, that there must arise various alterations in the *sun*'s atmosphere, and the *sun* himself. See RAIN, HAIL, METEOR, &c.

6°. Since the revolution of the spots round the *sun* is found very regular, and the spots very near the *sun*; it follows, that the spots do not revolve round the *sun*, but that the *sun*, together with his atmosphere, wherein the maculæ are, move round their common axis, in an interval of about twenty-seven days: and hence it is, that the spots near the limb, being viewed obliquely, appear narrow and oblong.

7°. Since the *sun*, in every situation, appears like a circular disk; its figure, as to sense, must be spherical; though we shall hereafter shew, that it is really spheroidal.

Besides the maculæ or dark spots, several authors make mention of faculæ, or spots brighter than the rest of the *sun*'s disk; and those generally larger, and very different from the maculæ, both in figure, duration, &c.

The faculæ, Kircher, Scheiner, &c. suppose to be eruptions of flames; and hence take occasion to represent the face of the *sun* as full of volcano's, &c. But Huygens, using the best telescopes, could never find any such things, though he has sometimes spied certain places in the maculæ themselves, more lucid than the rest. But these do not seem owing to any kindled matter, which were scarce consistent with their duration, and their frequent change into maculæ; but to the refraction of the *sun*'s rays through the thinner exhalations, when as the grosser, in their neighbourhood, intercept the same. See FACULÆ.

8°. That the substance of the *sun* is fire, we thus prove: the *sun* shines, and his rays, collected by concave mirrors, or convex lens's, burn, consume, and melt the most solid bodies, or else convert them into ashes, or glass. Wherefore, as the force of the solar rays is diminished by their divergency, in a duplicate ratio of the distances reciprocally taken: it is evident, their force and effect is the same, when collected by a burning lens or mirror, as if we were at such distance from the *sun*, where they were equally dense. The *sun*'s rays, therefore, in the neighbourhood of the *sun*, produce the same effects, as might be expected from the most vehement fire; consequently, the *sun* is of a fiery substance. See FIRE.

Hence it follows, that its surface is every where fluid; that being the condition of flame. See FLAME and FLUIDITY. Indeed, whether the whole body of the *sun* be fluid, as some think, or solid, as others; we do not determine: but as there are no other marks, whereby to distinguish fire from other bodies; but light, heat, a power of burning, consuming, melting, calcining, and vitrifying; we do not see what should hinder, but that the *sun* may be a globe of fire, like ours, invested with flame.

9°. Since the maculæ are formed out of the solar exhalations,

Vol. II. N°. CXLVIII.

it appears, that the *sun* is not pure fire, but that there are heterogeneous particles mixed along with it.

10°. The figure of the *sun* is a spheroid, higher under its equator than about the poles. This we prove thus: the *sun* has a motion about its own axis, and therefore the solar matter will have an endeavour to recede from the centres of the circles wherein it moves; and that, with the greater force, as the peripheries of the circles are greater. But the equator is the greatest circle, and the rest, towards the poles, continually decrease; therefore the solar matter, though at first in a spherical form, will endeavour to recede from the centre of the equator, further than from the centres of the parallels. See CENTRAL force.

Consequently, since the gravity whereby it is retained in its place, is supposed to be uniform throughout the whole *sun*; it will really recede from the centre, more under the equator than under any of the parallels. And hence the *sun*'s diameter, drawn through the equator, will be greater than that passing through the poles, i. e. the *sun*'s figure is not perfectly spherical, but spheroidal. See SPHEROID.

For the parallax of the SUN, see PARALLAX.

For the SUN's distance; as the determination thereof depends on that of the parallax, and as the *sun*'s parallax is not found without a long operose calculus; so astronomers do not agree much about either of them.

The mean distance of the *sun* from the earth, some make 7490 diameters of the earth; others 1000, others 12000, others 15000; but allowing M. de la Hire's parallax of 6", the *sun*'s mean distance will be 17188 diameters of the earth; and allowing that of Cassini, only 14182. See DISTANCE.

The apparent diameter of the *sun*, is not always the same. Ptolemy makes it, when greatest, 33' 20"; Tycho 32'; Kepler, 31' 4"; Ricciolus, 32' 8"; Cassini, 32' 20"; de la Hire, 32' 43". Its mean, apparent diameter, according to Ptolemy, is 32' 18"; according to Tycho, 31'; according to Kepler, 30' 30"; according to Ricciolus, 31' 40"; according to Cassini, 31' 40"; according to de la Hire, 32' 10". Its least diameter, Ptolemy makes, 31' 20"; Tycho, 30'; Kepler 30'; Ricciolus, 31'; Cassini, 31' 8"; de la Hire, 31' 38".

The true diameter of the *sun* to that of the earth, is computed to be, as 10000 to 208. See DIAMETER.

For the eclipses of the SUN, see the article ECLIPSE.

Cycle of the SUN. See the article CYCLE.

Meridian altitude of the SUN. See the article MERIDIAN.

**SUNDAY**, the first day of the week; thus called by our idolatrous ancestors, because set apart for the worship of the sun. See DAY and WEEK.

It is now called the *Lord's-day*, *dies dominicus*, because kept as a feast in memory of our Lord's resurrection on this day; and *sabbath-day*, because substituted under the new law, in the place of the sabbath, in the old law. See SABBATH.

In the Breviary, and other offices, we meet with *sundays* of the first and second class.—Those of the first class, are *Palm*, *Easter*, *Advent* and *Whit-sunday*, those of *quasimodo* and *quadragesima*; each whereof see under its proper article.—Those of the second class, are the common *sundays*.

Anciently, each *sunday* in the year had its particular name, which was taken from the introit of the day; which custom has only been continued to some few in Lent: as, *remisere, oculi, latere, judica*.

It was Constantine the Great, who first made a law for the observation of *sunday*; and who, according to Eusebius, appointed it should be regularly celebrated throughout the Roman empire.

Before him, and even in his time, they observed the Jewish sabbath as well as *sunday*; both to satisfy the law of Moses, and to imitate the apostles, who used to meet together on the first day.

Indeed, some are of opinion that the Lord's-day, mentioned in the Apocalypse, is our *sunday*; which they will have to have been so early instituted by the apostles.—Be this as it will, it is certain, a regard was had to this day, even in the earliest ages of the church; as appears from the first apology of Justin Martyr, where he describes the exercise of the day, not much unlike to ours.

By Constantine's laws, made in 321; it was decreed, that for the future, the *sunday* should be kept a day of rest in all cities and towns; but he allowed the country people to follow their work.—In 538, the council of Orleans prohibited this country labour; but in regard there were still abundance of Jews in the Gauls, and that the people gave into a good many superstitious usages in the celebration of the new sabbath, like those of the Jews among that of the old; the council declares, that to hold it unlawful to travel with

horses,

horses, cattle, and carriages, to prepare foods, or to do any thing necessary to the cleanliness and decency of houses or persons, favours more of Judaism than Christianity.

*Quinquagesima* SUNDAY, } See { *QUINQUAGESIMA*,  
Trinity SUNDAY, } TRINITY.

SUNDAY letter. See the article DOMINICAL letter.

SUN-flower. See the article TURNESOL.

SUONATA. See the article SONATA.

SUOVETAURILIA, or SOLITAURILIA, a solemn sacrifice among the ancient Romans; wherein they offered three victims, of three different kinds, viz. a bull, a ram, and a boar.

Livy describing it, calls it *suovetaurilia*, as composed of *sus*, *ovis*, and *taurus*, the names of the three victims sacrificed. Dion. Halicarnassicus describing the same, calls it *solitaurilia* in regard it was required, that the victims were perfect, and without any defect; *solus*, or *solus*, in the language of the Osci, signifying *integer*, entire.

SUPERBIPARTIENS. See the article RATIO.

SUPERCARGO, a person employed by merchants to go a voyage, and oversee their cargo or lading, and dispose of it to the best advantage.

SUPERCILII corrugator. See the article CORRUGATOR.

SUPERCILIUM, in anatomy, the eye-brow. See EYE.

SUPERCILIUM, in the ancient architecture, denotes the uppermost member of the cornice, called by the moderns, *corona*, *crown*, or *larmier*. See LARMIER.

Mr. Evelyn conceives, it should rather have been called *stillicidium*, or *drip*, to denote its office of sheltering the order from rain, &c. See CORONA and CORNICHE.

SUPERCILIUM, is also used for a square member under the upper tore in some pedestals.

Some authors confound it with the tore itself. See TORE.

SUPEREROGATION, in theology, what a man does beyond his duty, or more than he was commanded to do.

The Romanists stand up strenuously for works of *supererogation*; and maintain, that the observance of evangelical councils is such. By means hereof, a stock of merit is laid up; which the church has the disposal of, and which she distributes in indulgences to such as need. See INDULGENCE.

The reformed church do not allow of any work of *supererogation*; but hold with the apostle, That when we have done our best, we are but unprofitable servants. See MERIT.

SUPERFETATION\*, SUPERFOETATIO, in medicine, an after or second conception; happening, when the mother, already pregnant, conceives, of a latter coition; so that she bears at once two foetus's of unequal age and bulk, and is delivered of them at different times. See BIRTH, CONCEPTION, FOETUS, &c.

\* The word is formed from the Latin, *super*, over, and *foetus*, embryo.

We meet with instances of *superfetations* of women in Hippocrates, Aristotle, Pliny, du Laurens, &c.—But they are much more frequent in hares, and sows.

An instance of an extraordinary kind of *superfetation*, we have in Bartholine; who tells us, that a Danish girl was born big with child.

Mentzelius, a German physician, adds, that in 1672, the wife of a physician, in Thuringia, was delivered of a girl big with another; whereof she was delivered in eight days time; and which was baptized, and died a day after her mother.

The naturalists hold, that female rats are frequently born with young rats in their wombs.—In the king of Denmark's cabinet, is seen an egg, in the middle whereof is another egg perfectly formed. See EGG.

We meet with something like a *superfetation* in plants too; there being a kind of lemon found to grow inclosed in the body of another.

In the *History of the royal academy of sciences*, for the year 1709, mention is made of a letter from a very considerable magistrate, to the academy, containing a very remarkable instance of a *superfetation*; a butcher's wife of Aix being delivered in that year of nine children, each about two days after other, all well formed and alive.

SUPERFICIAL content. See SUPERFICIES, AREA and MEASURING.

SUPERFICIES, or SURFACE, in geometry, a magnitude, considered as having two dimensions; or extended in length and breadth; but without thickness or depth. See DIMENSION.

In bodies, the *superficies* is all that presents itself to the eye. See BODY.—A *superficies* is chiefly considered, as the external part of a solid: when we speak of a surface simply, and without any regard to body, we usually call it *figure*. See FIGURE.

Rectilinear SUPERFICIES, is that comprehended between right lines.

Curvilinear SUPERFICIES, is that comprehended between curve lines. See CURVE.

Plane SUPERFICIES, is that which has no inequality, but lies evenly between its boundary lines. See PLANE.

Convex SUPERFICIES, is the exterior part of a spherical or spheroidal body. See CONVEX.

Concave SUPERFICIES, is the internal part of an orbicular or spheroidal body. See CONCAVE.

The measure or quantity of a surface, is called the *area* thereof. See AREA and MEASURING.

The finding of this measure or area, is called the *quadrature* thereof. See QUADRATURE.

To measure the surfaces of the several kinds of bodies, as spheres, cubes, parallelepipeds, pyramids, prisms, cones, &c. see SPHERE, CUBE, PARALLELEPIPED, &c.

Line of SUPERFICIES, a line usually found on the sector, and Gunter's scale.—The description and use hereof, see under the articles SECTOR and GUNTER'S scale.

SUPERFINE, in the manufactories, a term used to express the superlative fineness of a stuff. See FINE.

Thus a cloth, a camlet, &c. are said to be *superfine*, when made of the finest wool, &c. or when they are the finest that can be made.

The term is particularly used among gold wiew-drawers, for the gold or silver wiew which after being drawn through an infinite number of holes, each less and less, is, at length, brought to be no bigger than a hair. See GOLD-wiew.

SUPERINCESSUS radens, } See { SLIDING.

SUPERINCESSUS volvens, } See { ROLLING.

SUPERINSTITUTION, SUPERINSTITUTIO, denotes one institution upon another.—As, if A be admitted and instituted to a benefice upon one title, and B be admitted, instituted, &c. by the presentation of another. See INSTITUTION.

SUPERINTENDENT, in the French customs, an officer who has the prime management and direction of the finances or revenues of the king.

The term is also used for the first officer in the queen's household, who has the chief administration thereof.

They have also a *superintendent* of the buildings, answering to the surveyor of the works among us. See SURVEYOR.

The cardinal de Richelieu made himself *superintendent* of commerce.

SUPERINTENDENT, also denotes an ecclesiastical superior in several reformed churches where episcopacy is not admitted; particularly among the Lutherans in Germany, and the Calvinists in some other places.

The *superintendent* is, in effect, little other than a bishop; only his power is somewhat more restrained than that of our diocesan bishops. See BISHOP.

He is the chief pastor, and has the direction of all the inferior pastors within his district, or diocese.

In Germany they had formerly *SUPERINTENDENTS general*, who were superior to the ordinary *superintendents*.—These, in reality, were archbishops; but the dignity is sunk into disuse; and at present, none but the *superintendent* of Wirtemberg assumes the quality of *superintendent general*.

SUPERIOR, or SUPERIOUR, something raised above another, or that has a right to command another.—Thus an abbot is called the *superior* of an abbey; and a prior the *superior* of a convent. See ABBOT, PRIOR, &c.

The canonists hold, that a perpetual superiority constitutes a title: but a *superior* may be continued by those who constituted him such, yet without the superiority's being rendered, by that means, perpetual.

The church of France allow the superiority and primacy of the pope; not his infallibility, as all the other Romish churches do. See POPE.

SUPERIOR <i>capitis obliquus</i> ,	} See {	OBLIQUUS.
SUPERIOR <i>maxilla</i> ,		MAXILLA.
SUPERIOR <i>oculi obliquus</i> ,		OBLIQUUS.
SUPERIOR <i>planets</i> ,		PLANET.
SUPERIOR <i>posticus ferratus</i> ,		SERRATUS.
SUPERIOR <i>respondeat</i> ,		RESPONDEAT.
SUPERIOR <i>scapularis</i> ,		SUPRASPINATUS.
SUPERIOR <i>labii elevator</i> ,		ELEVATOR.

SUPERJURARE.—Anciently, when a criminal endeavoured to excuse himself by his own oath, or by that of one or more witnesses; and yet the crime was so notorious, that he was convicted by the oaths of many more witnesses; this was called *superjurare*. See OATH, PURGATION, &c.

SUPERLATIVE, in grammar, an inflexion of nouns adjective, serving to augment and heighten their signification, and shew the quality of the thing denoted to be in the highest degree. See DEGREE.

In English, the *superlative* is usually formed by the addition of *est*; as *richest*, *holiest*, &c. rarely by the addition of *issimo*, as *generalissimo*; more frequently by the prefixing of *most*; as *most honourable*, *most amiable*, &c.

The French are generally forced to form their *superlatives*, by prefixing of *le plus*, sometimes of *tres*, and sometimes of *fort*.

The Italians and Spaniards have great advantages over them in this respect; their language abounding with magnificent words to exaggerate things withal, without auxiliary particles: yet the Hebrews are more poor than the French in this respect, as having neither comparatives nor *superlatives*. They use to express these degrees by the particles *joter* and *meod*, sometimes by the preposition *min*, and sometimes by re-doubling the words; of which we find frequent instances in the bible.

SUPER-

**SUPERNATURAL** *grace*. See the article **GRACE**.

**SUPERNATURAL** *theology*. See the article **THEOLOGY**.

**SUPERNUMERARY**, something over and above a fixed number.—In several of the offices are *supernumerary* clerks, to be ready on extraordinary occasions.

There are also *supernumerary* surveyors of the excise, to be ready to supply vacancies when they fall: these have but half pay.

In music, the *supernumerary*, called by the Greeks *proslambanomenos*, is the lowest of the chords of their system; answering to a, mi, la, of the lowest octave of the moderns. See **DIAGRAM**.

**SUPERPARTICULARIS**, } See **RATIO**.

**SUPERPARTIENS**,

**SUPER-PURGATION**, *hypercatharsis*, in medicine, an excessive, over-violent purging. See **PURGATION**.

A man who had taken powder of diacathamum inwardly, was sent by it to stool an hundred times; and was cured of the *supur-purgation* by a pound of capon-broth, an ounce of saccharum rosatum, five grains of laudanum, and the yolk of an egg.—In lieu of laudanum, they sometimes use a drachm and a half of new venice-treacle. Burnet.

**SUPERQUADRIPARTIENS**. See the article **RATIO**.

**SUPERSCAPULARIS** *inferior*, called also *infraspinatus*; a muscle that helps to draw the arm backwards. It covers all the space that is between the spine, and the teres minor; and is inserted into the neck of the humerus.

**SUPERSCAPULARIS** *superior*, in anatomy, a muscle, called also *supraspinatus*. See **SUPRASPINATUS**.

**SUPERSEDEAS**, a writ issued in divers cases, importing, in general, a command to stay, or forbear some ordinary proceedings at law, which, in appearance, ought to be done, or pursued, were it not for the cause, whereon this writ is granted.

Thus, a man, regularly, is to have a surety of peace, against him of whom he will swear he is afraid; and the justice required hereunto cannot deny it him: yet if the party be formerly bound to the peace, either in chancery, or elsewhere, this writ lies, to stay the justice from doing that, which otherwise he ought not to deny.

*Clerk of the SUPERSEDEAS*. See the article **CLERK**.

**SUPERSTITION**, extravagant devotion, or religion wrong directed, or conducted. See **RELIGION**.

It was a piece of *superstition* in the ancient Romans, to observe the flight of birds, the entrails of victims, &c. See **AUGURY**, **AUSPICIUM**, &c.

The Romish priests make a fine penny of the *superstition* of the people: Monsi. Thiers has an express treatise *de superstitions populaires*. Women, he observes, are naturally more inclined to *superstition* than impiety. Plutarch has endeavoured to shew, that *superstition* is worse than atheism. The punishment allotted by several councils for the *superstitious*, is, to fast a month in prison.

**SUPERSTITIOUS** *magic*. See **MAGIC**.

**SUPERVISOR**, signifies a surveyor, or overseer. See **SURVEYOR**, &c.

It was formerly, and still remains a custom among some, especially of the better sort, to make *supervisor* of wills; to overlook the executors, and see their wills truly performed: but it is to little purpose; as being now so carelessly executed. See **WILL**, **EXECUTOR**, &c.

**SUPINATION**, **SUPINATIO**, in anatomy, the action of a supinator muscle; or the motion whereby it turns the hand, so as that the palm is lifted upwards towards heaven. See **SUPINATOR**.

**SUPINATOR**, in anatomy, a denomination given to two muscles of the arm; the one called *supinator longus*, the other *supinator brevis*: both serving to turn the palm of the hand upwards.

The first arises by a fleshy beginning, three or four fingers breadth above the external protuberance of the humerus. It lies along all the radius, to whose inferior and external part it is inserted by a pretty broad tendon.—See *Tab. Anat. (Myol.)* fig. 1. n. 20. fig. 2. n. 19. fig. 6. n. 16. fig. 7. n. 44.

The second comes from the external and upper part of the ulna, and passing round the radius, is inserted into its upper and forepart, below the tendon of the biceps.—See *Tab. Anat. (Myol.)* fig. 7. n. 10, 10. and 45.

**SUPINE**, in the Latin grammar, a part of the conjugation of a verb, of like effect with the infinitive mood. See **VERB**, **MOOD**, &c.

There are two kinds of *supines*, the one in *um*, whose signification is active, and marks a motion, as *dare nuptum*; the other in *u*, having a passive signification; as *horrendum auditu*, &c.—The *supines* have neither number nor person.

They have their name, says Probus, and after him Vossius, *quod ad instar supinorum & otiosorum hominum omnia habent confusa*. Or, according to Priscian, *quod nascantur a participiis passivis, quæ supina appellata sunt, quia in infimo loco sita, totam conjugationis molem suscipiant*.

**SUPLANTALIA**, or **SUPPEDANEA**, among physicians, plaisters, or other medicaments applied to the soles of the feet; generally made of leaven, mustard, horse-radish, salt, soap, gunpowder, &c.

**SUPPLEMENT** of an arch, in geometry or trigonometry, is the number of degrees that it wants of being an entire semicircle: as *complement* signifies what an arch wants of being a quadrant. See **QUADRANT**, **COMPLEMENT**, &c.

**SUPPLEMENT**, in matters of literature, an appendage to a book, to supply what is wanting therein. See **APPENDIX**, and **PARERGON**.

Frenschimius has wrote divers *supplements*, to restore the books of several ancient authors, part whereof had been lost. The French also use the word *supplement* for a kind of tax, or after-payment charged on lands, offices, &c. that are pretended to have been sold beneath their value.

**SUPPLICAVIT**, a writ issuing out of chancery, for taking surety of the peace when one is in danger of being hurt in his body by another. See **SURETY**.

It is directed to the justices of the peace, and sheriff of the county; and is grounded on the statute 1 Ed. III. which appoints, that certain persons shall be assigned by the lord chancellor to take care of the peace. See **PEACE**.

**SUPPORTED**, in heraldry, a term applied to the uppermost quarters of a shield, when divided into several quarters; these seeming, as it were, *supported*, or sustained, by those below. See **QUARTERING**.

The chief is also said to be *supported* when it is of two colours, and the upper colour takes up two thirds of it: in this case it is *supported* by the colour underneath.

**SUPPORTERS**, in heraldry, figures in an achievement, placed by the side of the shield, and seeming to *support*, or hold up the same. See **ACHIEVEMENT**, **ESCUTCHEON**, &c.

*Supporters* are chiefly figures of beasts; figures of human creatures used for the like purpose are more properly called *tenants*. See **TENANT**.

Some make another difference between *tenant* and *supporter*: when the shield is bore by a single animal, it is called *tenant*; when by two, they are called *supporters*.

The figures of things inanimate, sometimes placed aside of escutcheons, but not touching, or seeming to bear them; though sometimes called *supporters*, are more properly called *cotises*. See **COTICE**.

The *supporters* of the English arms are a lion and an unicorn; some of the former kings had a leopard and an unicorn; others griffons; others eagles. See **ARMS**.

The *supporters* of the French arms are angels; which are said to have been first introduced by Philip VI. his device being an angel over-throwing a dragon: the dragon being at that time the device of the king of England.

Those of the Prince of Monaco, are Augustine monks: Those of the family of the Ursini, bears, in allusion to their names.

In England, none below the degree of a banneret are allowed *supporters*, which are restrained to those called the *high nobility*. The Germans permit none but princes and noblemen of rank to bear them. Among the French the use is more promiscuous.

**SUPPOSITI** *medium*. See the article **MEDIUM**.

**SUPPOSITION**, in music, is when one of the parts dwells on a note, while another part makes two or more lesser notes equivalent to it, by conjoint degrees. See **HARMONY**, and **COUNTERPOINT**.

*Supposition* is defined by a late author the using of two successive notes, of the same value, as to time; the one whereof being a discord, *supposes* the other a concord. See **HARMONY**.

The harmony, Mr. Malcolm observes, is always to be full on the accented parts of the bar, or measure, but on the unaccented, discords may transiently pass, without any offence to the ear. This transient use of discords, followed by concords, make what we, after the French, call *supposition*. See **CONCORD**, and **DISCORD**.

There are several kinds of *supposition*: the first is, when the parts proceed gradually from concord to discord, and discord to concord; the intervening discord serving only as a transition to the following concord.

Another kind is, when the parts do not proceed gradually from the discord to the concord, but descend to it by the interval of a third.

A third kind, like the second, is, when the rising to the discord is gradual; but the descending from it to the following concord, is by the distance of a fourth.

A fourth kind, very different from all the rest, is, when the discord falls on the accented parts of the measure, and the rising to it is by the distance of a fourth. In which case it is absolutely necessary to follow it immediately, by a gradual descent into a concord, that has just been heard before the harmony; to make the preceding discord pass without offence, and only seem a transition to the concord.

**SUPPOSITION**, in arithmetic. See **POSITION**.

**SUPPOSITORY**\*, **SUPPOSITORIUM**, in pharmacy, a solid medicine thrust up the fundament, in lieu of a liquid one, or clyster, where that would not be so convenient. See **CLYSTER**.

\* The Latins call it *balanus*, because anciently made in figure of an acorn.

It is usually composed of common honey, mixed up with either soap, or oil, and formed into pieces of the length and thickness of the little finger, only pyramidal.—To the composition is sometimes also added powder of scammony, euphorbium, colocynthis, &c.

On some occasions *suppositories* are only a cut of bacon, the stem of a leek, or the like matter, thrust, like a tent, up the anus, to irritate the sphincter muscle, and oblige it to extrude the excrements.

The *suppository* was invented for the convenience of such as have an aversion to the taking of clysters; or to be used where the disease does not allow thereof. See *CLYSTER*.

**SUPPRESSION**\*, in law, the extinction, or annihilation of an office, right, rent, or the like. See *EXTINGUISHMENT*.

\* The word is formed from the Latin *sub*, and *premo*, I press under.

**SUPPRESSION**, in grammar, denotes an omission of certain words in a sentence, which yet are necessary to a full and perfect construction.—As, “I come from my father’s;” that is, “from my father’s house.” See *ELLIPSIS*.

*Suppression* is a figure of speech very frequent in our language; chiefly used for brevity and elegance. Some rules relating hereto, are as follow:

1°. Whenever a word comes to be repeated in a sentence oftner than once, it is to be suppressed: thus we say, “this is my master’s horse;” not, “this horse is my master’s horse.”

2°. Words that are necessarily implied may be suppressed.

And, 3°. All words that use and custom suppress in other languages, are to be suppressed in English; unless there be particular reasons for the contrary.

**SUPPRESSION**, in medicine, is applied to the humours that are retained in the body by some obstruction or stoppage of the usual out-lets. See *RETENTION*.

We say, a *suppression* of urine, of the menses, &c. See *ISCHURIA*, *URINE*, *MENSES*, &c.

*Fire by SUPPRESSION*, in chymistry. See *FIRE*.

**SUPPURATION**\*, in medicine, the action whereby extravasated blood, or other humours in the body are ripened, or changed into pus. See *PUS*.

\* The word is formed from the Latin, *sub*, under, and *pus*, puris.

The change is begun by a dissipation of the most subtle and spirituous parts of the blood: what is left behind, thickens and purifies by little and little; that is, its salts and sulphurs disengage themselves from the grosser parts wherein they were embarrassed. These parts thus disengaged, and acting on one another, bruise and break each other, and thus excite a fermentation, which increases the heat of the part; whereby the matter is further digested, and a pain and tension produced. At length the blood loses its natural colour, and becomes quite white, by the mixture of its acid, sulphurous and acrimonious particles; as we see happens to sulphurous alkalies, when mixed with acids. See *DIGESTION*.

**SUPPURATIVES**, or *SUPPURATING medicines*, are ripeners, or medicines that promote suppuration. See *SUPPURATION*.

*Suppuratives* are all hot; by which means increasing the warmth of the part, they resolve the humour into a pus. See *DIGESTIVE*.

Such are mallows, melilot, lily-roots, diachylon, pellitory, figs, aromatic gums, meals, &c.

**SUPPUTATION**. See the article *COMPUTATION*.

**SUPRALAPSARY**, in theology, a person who holds that God, without any regard to the good or evil works of men, has resolved, by an eternal decree, to save some, and damn others. See *REPROBATION*.

These are also called *antelapsaries*; and are opposed to *sublapsaries* and *infralapsaries*. See *SUBLAPSARY*.

According to the *supralapsaries*, the object of predestination, is *homo creabilis & labilis*; and according to the *sublapsaries*, *homo creatus & lapsus*. See *PREDESTINATION*.

The *supralapsaries* seem, in one single absolute decree, to confound two several ones which ought to be distinguished: the one, the conditional decree preceding the foresight of man’s obedience, or disobedience to the grace of God; the other, the absolute decree following this foresight. See *PRESCIENCE*.

The predeterminants also, admit an absolute decree prior to the foresight of original sin, in common with the *supralapsaries*; but distinguish themselves from these, as also from the *infralapsaries* and *janseists*, in that their absolute decree includes the offering of a sufficient means of salvation to the reprobate; so that, as to the point of power, nothing hinders but that they might be saved. See *GRACE*.

**SUPRASPINATUS**, in anatomy, a muscle thus called from its fleshy origination at the upper end of the basis of the scapula above the spine, to the upper part whereof it is connected, as also to the superior edge of the scapula; whence marching along the upper interscapulium, or thin part of the scapula, which it fills, it passes under the acromium and articulation of the humerus.—It helps to lift the arm up-

wards. See *Tab. Anat. (Myol.) fig. 7. n. 32.*

**SUPREMACY**, in the English polity, the superiority or sovereignty of the king over the church as well as state of England, whereof he is established head. See *KING*.

The king’s *supremacy* was first established, or, as others say, recovered by king Henry VIII. in 1534, after breaking with the pope.—It is since confirmed by several canons, as well as by the articles of the church of England; and is passed into an oath, which is required as a necessary qualification for all offices and employments both in church and state, from persons to be ordained, from the members of both houses of parliament, &c. See *OATH*.

This right of *supremacy* consists chiefly in the following articles, 1°. That the archbishops of either province cannot summon the bishops and clergy to convocation, nor enact any canons without the king’s express consent, by 25 Hen. VIII. c. 19. Whereas before that act the convocation was often called, and laws made by it for governing the church, without any authority from the crown. See *CONVOCATION*. 2°. In that there lies now an appeal from the archbishop to the king in chancery; and on such an appeal, a commission under the great seal is to be directed to certain persons, whereof commonly half are laymen, and half clergymen, which is called *the court of delegates*, and which finally determine all ecclesiastical causes, by 25 Hen. VIII. c. 19. though sometimes a review is granted. Before this statute, the appeal from the archbishop’s court lay to the pope only. See *DELEGATE*, *APPEAL*, &c.

3°. The king can grant commissions for visiting such places as are exempt from the jurisdiction of bishops, or archbishops; and appeals lie from thence to the king in chancery: whereas before 25 Hen. VIII. the pope only could visit them, and receive appeals from those courts.

4°. Persons in holy orders are not, as formerly, exempt from the king’s temporal laws, any more than laymen. See *EXEMPTION*, *IMMUNITY*, &c.

5°. The bishops and clergy do not swear, or pay any obedience to the pope; but must take the oaths of allegiance and supremacy to the king.

**SURA**, in anatomy, the calf, or fleshy part of the leg.

The word is also used by some for the thin-bone, or fibula. See *FIBULA*.

**SURALIS**. See the article *MUSCLE*.

**SURBATING**, among farriers, is when the sole of a horse’s foot is wore, bruised, or spoiled, by beating the hoof against the ground in travelling without shoes, or going in hot sandy lands, or with a shoe that hurts the sole, lies too flat to it, or the like.

Sometimes it also happens by over-riding a horse while young, before his feet are hardened; and sometimes by the hardness of the ground, and high lifting his feet.

The signs hereof, are his halting on both fore-legs, and going stiffly, and creeping as if half foundered.

In the general, there is nothing better for *surbated* feet than tar melted into the foot; or vinegar boiled with foot to the consistence of a broth, and put into the foot boiling hot, with hurds over it, and splints to keep it in.

**SURCHARGE** of the forest, is when a commoner puts more beasts in the forest than he has a right to. See *FOREST*.

**SURCINGLE**, a girdle, wherewith the clergy of the church of England usually tie their cassocks. See *GIRDLE*.

**SURCOAT**, a coat of arms, to be wore over body armour. See *COAT of arms*.

The *surcoat* is properly a loose thin taffaty coat, with arms embroidered, or painted on it.—Such as are worn by heralds, anciently also used by military men over their armour, to distinguish themselves by. See *ARMS*.

**SURD**, in arithmetic, denotes a number that cannot be expressed; or a number that is incommensurate to unity. See *NUMBER*.

This is otherwise called an *irrational*, or *incommensurable number*. See *IRRATIONAL* and *INCOMMENSURABLE*.

When any number or quantity hath its root proposed to be extracted, and yet is not a true figurate number of that kind; that is, if its square root be demanded, and it is not a true square: if its cube root be required, and itself be not a true cube, &c. then it is impossible to assign, either in whole numbers or in fractions, any exact root of such number proposed. See *ROOT*, *SQUARE*, &c.

And whenever this happens, it is usual in mathematics to mark the required root of such numbers or quantities, by prefixing before it the proper mark of radicality, which is  $\sqrt{\phantom{x}}$ : thus  $\sqrt{2}$  signifies the square root of 2, and

$\sqrt[3]{16}$ , or  $\sqrt[3]{(3) 16}$ , signifies the cubic root of 16: which roots, because they are impossible to be expressed in numbers exactly, (for no effable number, either integer, or fraction, multiplied into itself, can ever produce 2; or being multiplied cubically, can ever produce 16) are properly called *surd roots*.

There is also another way of notation now much in use, whereby roots are expressed without the radical sign, by their indexes:

indexes: thus, as  $x^2$ ,  $x^3$ ,  $x^4$ , &c. signify the square, cube,

and fifth power of  $x$ ; so  $x^{\frac{1}{2}}$ ,  $x^{\frac{1}{3}}$ ,  $x^{\frac{1}{4}}$ , signify the square root, cube, &c. of  $x$ .

The reason of which is plain enough; for since  $\sqrt{x}$  is a geometrical mean proportional between 1 and  $x$ , so  $\sqrt[3]{x}$  is an arithmetical mean proportional between 0 and 1; and therefore as 2 is the index of the square of  $x$ ,  $\frac{1}{2}$  will be the proper index of its square root, &c.

Observe also, that for convenience, or brevity's sake, quantities or numbers, which are not *surds*, are often expressed in the form of *surd* roots. Thus,  $\sqrt{4}$ ,  $\sqrt[3]{27}$ , &c.

$\sqrt{4}$ , &c. signify, 2,  $\sqrt[3]{27}$ , 3, &c.

But though these *surd* roots (when truly such) are inexpressible in numbers, they are yet capable of arithmetical operations, (such as addition, subtraction, multiplication, division, &c.) which how readily to perform, the algebraist ought not to be ignorant.

*Surds* are either *simple* or *compound*.

*Simple SURDS* are those which are expressed by one single term.

—As  $\sqrt{c}$ .

*Compound SURDS* are those formed by the addition or subtraction of simple *surds*: as  $\sqrt{5} + \sqrt{2}$ ,  $\sqrt{5} - \sqrt{2}$ , &c.

$\sqrt{2}$ , or  $\sqrt{7} + \sqrt{2}$ : which last is called an *universal* root, and signifies the cubic root of that number, which is the result of adding 7 to the square root of 2.

To reduce rational quantities to the form of any *SURD* roots assigned.—Involve the rational quantity according to the index of the power of the *surd*, and then prefix before it the radical sign of the *surd* proposed. Thus to reduce  $a=10$ ; to the form of  $\sqrt{15}=b$ , you must square  $a=10$ ; and prefixing the sign, it will stand thus,  $\sqrt{a a}=100$ , which is the form of the *surd* desired.

So also, if 3 were to be brought to the form of  $\sqrt[4]{12}$ , you must raise 3 up to its fourth power, and then prefixing

the note of radicality to it, it will be  $\sqrt[4]{81}$ , or  $81^{\frac{1}{4}}$ ,

which is the same form with  $\sqrt[4]{12}$ .

And this way may a simple *surd* fraction, whose radical signs refers only to one of its terms, be changed into another, which shall respect both numerator and denominator.

Thus  $\frac{\sqrt{2}}{25}$  is reduced to  $\sqrt{\frac{2}{25}}$  and  $\frac{5}{\sqrt{25}}$ , to  $\sqrt[3]{4}$ .

$\frac{125}{\sqrt{25}}$ ; where the radical sign affects both numerator and denominator.

To reduce simple *SURDS*, having different radical signs, (which are called heterogeneous *surds*) to others that may have one common radical sign, or which are homogeneous.—Divide the indexes of the powers by their greatest common divisor, and set the quotients under the dividends; then multiply those indexes cross-ways by each other's quotients, and before the product set the common radical sign  $\sqrt{\quad}$ : with its proper index: then involve the powers of the given roots alternately, according to the index of each other's quotient; and before those products, prefix the common radical sign before found.

To reduce  $\sqrt{a a}$  and  $\sqrt[4]{b b}$

2)  $\sqrt{a a 2}$   $\sqrt[4]{b b}$

$1 \times 2$

$\sqrt[4]{b b}$   $\sqrt[4]{a a a a}$

To reduce *SURDS* to the lowest terms possible.—Divide the *surd* by the greatest square, cube, biquadrate, &c. or any other higher power, which you can discover is contained in it, and will measure it without any remainder; and then prefix the root of that power before the quotient, or *surd*, so divided; this will produce a new *surd* of the same value with the former, but in more simple terms. Thus,  $\sqrt{16 a a b}$ , by dividing by  $16 a a$ , and prefixing the root  $\sqrt[4]{a}$ , will be reduced to this,  $\sqrt[4]{a b}$ , and  $\sqrt{12}$ , will be

depressed to  $2\sqrt{3}$ . Also  $\sqrt[3]{c b^2 r}$  will be brought down

to  $\sqrt[3]{c r}$ .

This reduction is of great use whenever it can be performed: but if no such square, cube, biquadrate, &c. can be found for a divisor, find out all the divisors of the power of the *surd* proposed; and then see whether any of them be a square, cube, &c. or such a power as the radical sign denotes: and if any such can be found, let that be used in the same manner as above, to free the *surd* quantity in part from the radical sign. Thus, if  $\sqrt{288}$  be proposed; a-

VOL. II. N°. CXLVIII.

mong its divisors will be found the squares, 4, 9, 16, 36, and 144; by which, if 288 be divided, there will arise the quotients 72, 32, 18, 8, and 2; wherefore instead of  $\sqrt{288}$ , you may put  $2\sqrt{72}$ , or  $3\sqrt{32}$ , or  $4\sqrt{18}$ , or  $6\sqrt{8}$ , or lastly,  $12\sqrt{2}$ , and the same may be done in species.—But for the entire arithmetic of *surds*, see Kersey's *Algebra*, and others on the same subject.

Commensurable *SURDS*, } See COMMENSURABLE.  
Heterogeneous *SURDS*, } See HETEROGENEOUS.  
Homogeneous *SURDS*, } See HOMOGENEOUS.

*SURDESOLID*. See the article *SURSOLID*.

*SURETY of the peace*, an act whereby a person in danger of hurt from another, is secured by a bond, or recognizance, acknowledged by the other to the king, and bail bound with him, for keeping the peace. See *SUPPLICAVIT*, and *SECURITATE pacis*.

This security, a justice of the peace may command, either as a minister, when commanded thereto by higher authority; or as a judge, when he doth it of his own power, derived from his commission. See *PEACE*, and *JUSTICE*.

It differs from *surety of good behaving*, in that whereas the peace is not broken without an affray, or such like; the *surety de bono gestu* may be broken by the number of a man's company, or by his or their weapon, or harness.

*SURFACE*, in geometry, &c. See *SUPERFICIES*.

*SURFEIT*, an indisposition caused by excess in eating or drinking, that is, by over-charging the stomach: usually attended with eruptions, and sometimes with a fever. See *PLEITUDE*.

*SURFEIT water*, is a water distilled from poppies, and other herbs, proper to cure indigestions. See *WATER*.

*SURGE*. The sailors call a wave, or billow of the sea, a *surge*. See *WAVE*.

Also, when they are heaving at the capstan, if the cable happen to slip back a little, they say, *the cable surges*.

*SURGERY*. See the article *CHIRURGERY*.

*SURMOUNTED*, in heraldry, is when one figure is laid over another. As the pile surmounted of a chevron, in *Tab. Herald.* fig. 48.

*SURNAME*, or *SIRNAME*, a name added to the proper or baptismal name, to denominate the person of such a family. See *NAME*.

It was the Romans first introduced the use of hereditary names; and that on occasion of their league with the Sabines; for the confirmation whereof, it was agreed, that the Romans should prefix Sabine names, and the Sabines, Roman names, to their own.

These new names became family names, or *surnames*, and the old ones continued personal names. The former they called *cognomina*, and *gentilitia nomina*; and the latter *prænomena*. See *PRÆNOMEN*.

When the former came to be used among the French and English, they were called *surnames*, or *sirnames*, not because they are the names of the fire, or father; but, according to Camden, because they are super-added to the personal name; or, rather, with Du Cange, because at first, this family name was wrote over (*Sur*) the other name, thus: de Bourbon

Louis.

In lieu of *surnames*, the Hebrews, to keep up the memory of their tribes, used the name of their father, with the addition of *Ben*, son; as *Melchi Ben-Addi*, *Addi Ben-Cosam*, &c. so the Greek, *Ἰκαρος τῷ Δαίδαλῳ*; *Icarus*, the son of *Dædalus*; *Dædalus*, the son of *Eupalmus*, &c.

So, also, the ancient Saxons, *Ceonred*, *Ceolwadding*, *Ceolwald Cuthing*, that is, *Ceonred*, son of *Ceolwald*, son of *Cuth*: and in the same sense, the Welsh use *ap* for *ma*, son; as, *ap Owen*, *Owen ap Harry*, *Harry ap Rhese*; and the Irish, *Mac*, as *Donald Mac Neal*, *Neal Mac Con*, &c. and the old Normans, *Fitz*, as *John Fitz Robert*, *Robert Fitz Ralph*, &c.

Scaliger adds, that the Arabs used their father's name, or *surname*, without their personal name; as, *Aven-Pace*, *Aven-Zoar*, &c. q. d. son of *Pace*, son of *Zoar*, &c. As, if *Pace* had a son at his circumcision called *Haly*, he would be called *Aven-Pace*, concealing *Haly*; but his son, however he were named, would be called *Aven-Haly*, &c.

The Romans, in time, multiplied their *surnames*: besides the general name of the race, or family, called *gentilitium*; they took a particular one, to distinguish the branch of the family, called also *cognomen*; and sometimes a third, on account of some personal distinction; as that of *Africanus*, by *Scipio*; of *Torquatus*, by *Manlius*.

These three different kinds of *surnames* had also their different names, viz. *nomen*, also *cognomen*, *agnomen*: but these last were not hereditary; being, in effect, a kind of sobriquets, or nick-names, if that word be indifferent with respect to good and evil. See the subject of the Roman names and *surnames* accurately treated of by Spanheim, *de Præst. & usu Numism.* Diss. 10. See also *AGNOMEN*.

In these, too, they have been imitated by later times: thus, in our English history, we find that *Edgar* was called the *Peaceable*; *Ethelred*, the *Unready*; *Edmond*, *Iron-side*; *Harold*, *Hare-foot*; *William*, the *Bastard*; *Henry I.* *Beauclerk*;

II R r

John,

John, Lackland, &c.—But as these names were never bore by the sons, Camden, and others, think it strange, that *Plantagenet* should be accounted the *surname* of the royal family of England, till Henry VII; or *Tydur*, or *Tudor*, that from Henry VII. to king James I. or that of *Steward* from king James I. to king George; or, that *Valois* should be esteemed the *surname* of the late family of French kings; or *Bourbon* of the present; or *Oldenburg* of the kings of Denmark; or *Hapsbourg* of the emperors. See *PLANTAGENET*. Du Chesne observes, that *surnames* were unknown in France before the year 987; when the lords began to assume the names of their demesnes.—Camden relates, that they were first taken up in England, a little before the conquest, under king Edward the confessor: but he adds, they were never fully established among the common people, till the time of Edward II. till then they varied with the father's name; if the father, *e. gr.* was called *Richard*, or *Roger*, the son was called *Richardson*, or *Hodgson*; but from that time they were settled, some say, by act of parliament.

The oldest *surnames*, are those we find in *Domesday-Book*, most of them taken from places, with the addition of *de*: as *Godefridus de Mannevilla*, *Walterus de Vernon*, *Robert de Oily*, &c. others from their fathers, with *filius*, as *Gulielmus filius Osberni*; others from their offices, as *Eudo Dapifer*, *Gulielmus Camerarius*, *Gislebertus Cocus*, &c. But the inferior people are noted, simply, by their christian names; without any *surnames* at all.

In Sweden, till the year 1514, no body took *surnames*; and the common people there, have none to this day; nor even the native Irish, Poles, and Bohemians, &c.—It is very late that the Welsh have had any; and those they have, are generally only formed, by leaving out the *a* in *ap*, and annexing the *p* to their father's name; as in lieu of *Evan ap Rice*, they now say *Evan Price*; for *ap Howel*, *Powel*, &c. Du Tillet maintains, that all *surnames* were originally given by way of sobriquets, or nick-names; and adds, that they are all significant and intelligible to those who understand the ancient dialects of the several countries.—The greatest part of our *surnames*, and those of greatest account, Camden shews, are local, and borrowed from the places in Normandy, &c. where the respective persons, who came over with the conqueror, and first bore them, had their possessions, or their births: such as *Mortimer*, *Warren*, *Albigny*, *Piercy*, *Devereux*, *Tankerville*, *Nevil*, *Tracy*, *Montfort*, &c. He adds, that there is not a village in Normandy, but gives name to some family in England.—Others were taken from places in England, as *Aston*, *Sutton*, *Wotton*, &c.

The Saxon common people generally took their father's or mother's christian name, with the addition of *son*: though many were *surnamed* from their trade, as *Smith*, *Carpenter*, *Taylor*, *Weaver*, *Fuller*, &c. others from their offices, as *Porter*, *Shepherd*, *Carter*, *Cook*, *Butler*, &c. others from their complexions, as *Fairfax*, *i. e.* fair hair; *Blunt* or *Blond*, *i. e.* flaxen, or yellow; others from birds, as *Wren*, *Finch*, &c. others from beasts, as *Lamb*, *Hare*, *Hart*, &c. others from the winds; others from saints, &c.

**SURPLUSAGE**, in common law, signifies a superfluity, or addition of more than needeth; which sometimes is the cause that a writ abateth.—But in pleading it is frequently set aside; the rest remaining good.

**SURPLUSAGE** is sometimes also applied to matters of accounts and denotes a greater disbursement than the charge of the accomptant amounteth to. See *ACCOUNT*.

**SURREBUTTER**, in law, a second rebutter; or the replication of the plaintiff to the defendant's rebutter. See *REBUTTER*.

**SURREJOYNDER**, is a second defence of the plaintiff's declaration; by way of answer to the defendant's rejoinder. See *REJOINDER*.

**SURRENDER**, in common law, an instrument in writing, testifying, that the particular tenant of lands and tenements for life or years, doth sufficiently consent and agree, that he, who has the next or immediate remainder or reversion thereof, shall have the present estate of the same in possession; and that he hereby yields and gives up the same to him. See *REVERSION*, and *REMAINDER*.

There may also be a *surrender* without writing: whence, *surrender* is usually divided into that in *deed*, and that in *law*.

**SURRENDER in deed**, is that which is really made by express words in writing.

**SURRENDER in law**, is that wrought by operation of the law, and which is not actual.—As if a man have a lease of a farm for life, or years; and during the term, he accepts of a new lease: this act is in law, a *surrender* of the former. There is also a customary *surrender* of the copy-hold, as may be seen in Coke sup. Littlelet. sect 74.

**SURREPTITIOUS**. See the article *SUBREPTITIOUS*.

**SURROGATE**, *SURROGATUS*, a person substituted or appointed in room of another; most commonly of a bishop, or bishop's chancellor. See *SUBSTITUTE*, *SUFFRAGAN*, *COMMISSARY*, &c.

**SUROGATION**. See the article *SUBROGATION*.

**SURSOLID**, or *SURDESOLID*, in arithmetic, the fifth

power of a number, or the fourth multiplication of any number, considered as a root. See *POWER*.

The number 2, for instance, considered as a root, and multiplied by itself, produces 4, which is the square, or second power of 2; and 4 multiplied by 2, produces 8, the third power, or cube, or solid number of 2; 8, again, multiplied by 2, produces 16, the fourth power, or quadrato-quadratum of 2; and 16 multiplied once more by 2, produces 32, the fifth power, or *sur-solid*, or *sur-desolid* number of 2.

**SURSOLID problem**, is that which cannot be resolved, but by curves of an higher kind than the conic sections. See *PROBLEM*.

Thus, *e. gr.* to describe a regular endecagon, or figure of eleven sides in a circle, it is required to describe an isosceles triangle on a right line given, whose angles at the base, shall be quintuple to that at the vertex; which may easily be done by the intersection of a quadratrix, or any other curve of the second gender, as they are by some called, but not by any lower curve. See *QUADRATRIX*, *CURVE*, &c.

**SURVEYING**, the art or act of measuring lands; *i. e.* of taking the dimensions of any tract of ground, laying down the same in a map or draught; and finding the content or area thereof. See *MEASURING*, *MAP*, &c.

*Surveying*, called also *geodesia*, is a very ancient art; it is even held to have been the first, or primitive part of geometry, and that which gave occasion to, and laid the foundation of all the rest. See *GEOMETRY*.

*Surveying* consists of three parts or members; the first, is the taking of the necessary measures, and making the necessary observations on the ground itself: the second, is the laying down of these measures and observations on paper: and the third, the finding the area or quantity of the ground thus laid down.

The first is what we properly call *surveying*: the second we call *plotting* or *protracting*, or *mapping*: and the third *casting up*.

The first, again, consists of two parts, *viz.* the making of observations for the angles, and the taking of measures for the distances.

The former of these is performed by some one or other of the following instruments, *viz.* the theodolite, circumferentor, semi-circle, plain-table, or compass: the description and manner of using each whereof, see under its respective article, *THEODOLITE*, *CIRCUMFERENTOR*, *PLAIN-TABLE*, *COMPASS*, &c.

The latter is performed by means either of the chain or the perambulator: the description and manner of applying each whereof, see under its respective article, *CHAIN*, and *PERAMBULATOR*.

The second branch of *surveying* is performed by means of the protractor, and plotting scale: the use, &c. whereof, see under *PROTRACTOR*, *PLOTTING scale*, &c. See also *MAP*.

The third is performed by reducing the several divisions, inclosures, &c. into triangles, squares, trapeziums, parallelograms, &c. but especially triangles; and finding the areas or contents of these several figures, by the rules delivered under the articles *AREA*, *TRIANGLE*, *SQUARE*, &c.

**SURVEYING cross**, is an instrument little known, and less used in England; though in France, &c. it serves in lieu of a theodolite or the like instrument: it consists of a brass circle, or rather a circular limb, graduated, and again divided into four equal parts, by two right lines cutting each other at right angles in the centre. At each of the four extremities of the lines, and in the centre are fixed sights. The whole is mounted on a staff. See *CROSS*.

**SURVEYING quadrant**. See the article *QUADRANT*.

**SURVEYING wheel**. See the article *PERAMBULATOR*.

**SURVEYOR**, one that hath the oversight and care of considerable works, lands, or the like. See *SUPERVISOR*.

Such are the *surveyor* general of the king's manors; *surveyor* of the king's exchange; *surveyor* general of the works; *surveyor* general of the crown lands, &c.

**SURVEYOR of the melting**, is an officer of the mint, whose business is to see the bullion cast out; and that it be not altered after the delivery of it to the melter. See *MINT*, and *COINAGE*.

**SURVEYOR of the navy**, is an officer, whose business is to know the state of all stores, and see the wants supplied; to survey the hulls, masts and yards of ships; to audit the boat-swains and carpenters accounts, &c. See *NAVY*.

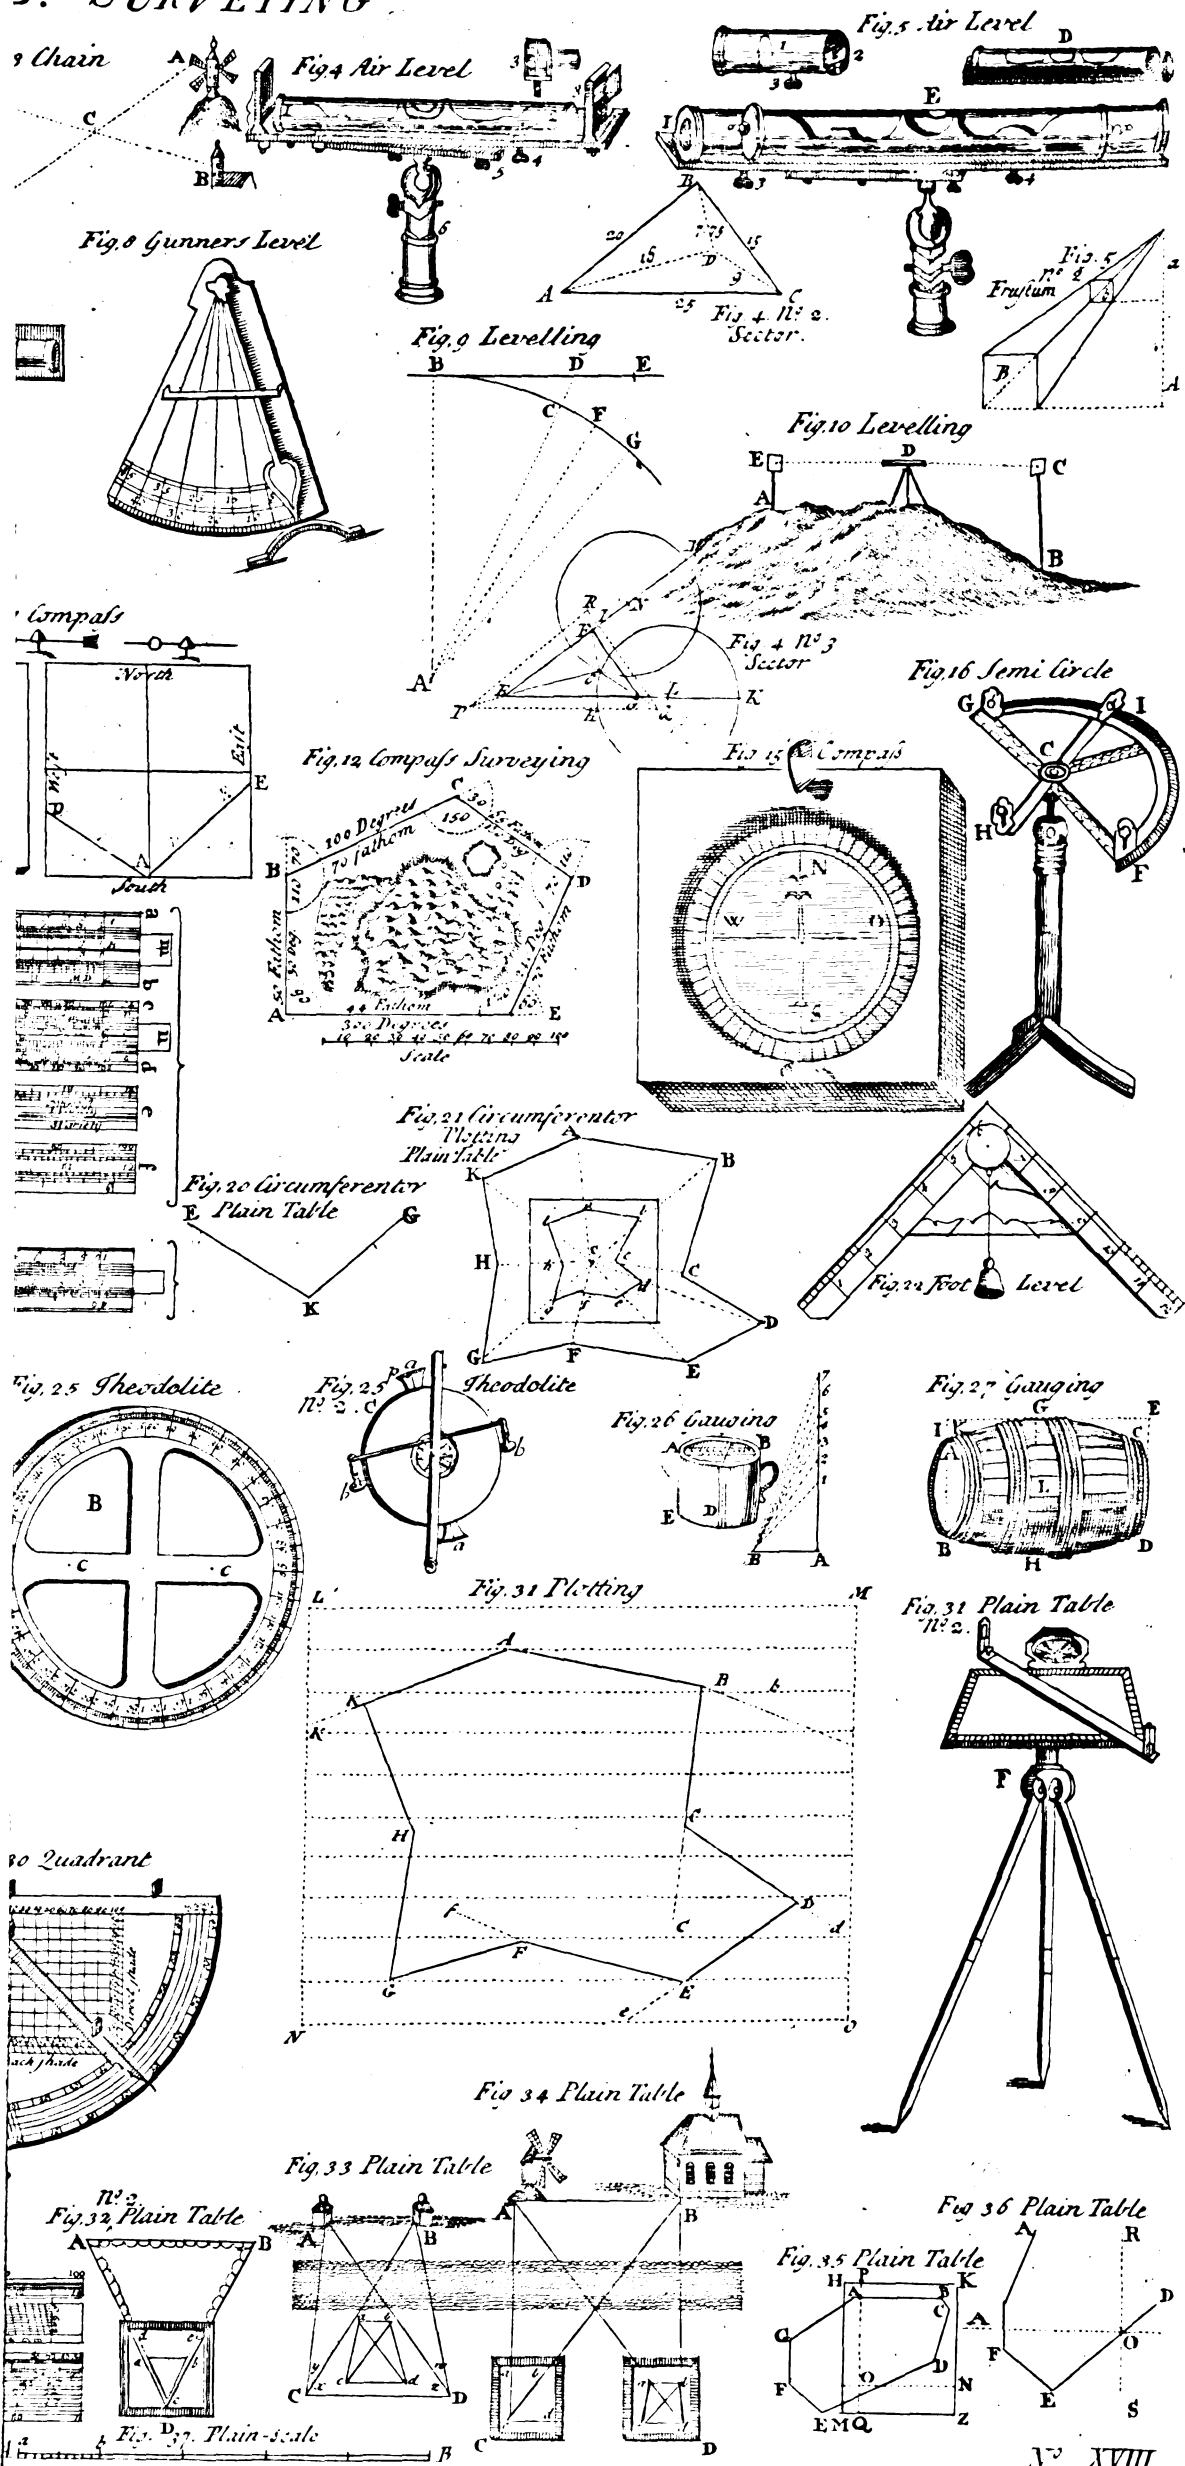

**SURVEYOR of the ordinance**, is an officer, whose charge is to survey all the king's ordinance, stores, and provisions of war, in the custody of the store-keeper of the tower of London; to allow all bills of debts, to keep checks on labourers and artificers works, &c. See *ORDINANCE*.

**SURVEYOR** is also used for a gauger.—And also for a person who measures and makes maps of lands. See *SURVEYING*, and *GAUGING*.

**SURVIVOR**, in law, signifies the longer liver of two joint tenants; or of any two persons joined in the right of any thing.

**SUSPENSE**, *SUSPENSIO*, in common law, denotes a tempo-

# B. SURVEYING

temporary stop or cessation of a man's right for a time. As, when the rent, or other profits of land, by reason of the unity of possession of the rent, and the land out of which it issues, is not *in esse* for a certain time, but *tunc dormit*, or remains asleep: but so as it may be revived or awaked.—By which, *suspension* differs from *extinguishment*, where the right dies for ever. See EXTINGUISHMENT.

**SUSPENSION**, *Suspensio*, the act of preventing the effect, or course of any thing, for a certain time.

The principal point urged in the philosophy of the Scepticks and Pyrrhonians, is a *suspension* of mind. See SCEPTICKS, PYRRHONIANS, ACATALEPSY, &c.

**SUSPENSION of arms**, in war, is a short truce which the contending parties agree on, for the burial of their dead, the waiting for succours, or the order of their masters, &c.

In rhetoric, *suspension* is a keeping the hearer attentive and doubtful, in expectation of what the speaker will conclude in: as, "O God! darkness is not more opposite to light, " tempests to calms, pain to pleasure, or death to life, than " sin to thee."

**SUSPENSION**, in mechanics.—*Points of SUSPENSION* in a ballance, are those points in the axis or beam wherein the weights are applied; or from which they are suspended. See BALLANCE.

**SUSPENSION**, in the common law, is what we otherwise call the *minor excommunication*, viz. a censure inflicted by way of punishment, on an ecclesiastic, for some considerable fault. See CENSURE, and EXCOMMUNICATION.

It is of two kinds, viz. *ab officio*, and *à beneficio*.

**SUSPENSION *ab officio***, is that whereby a minister is, for a time, forbidden to execute the office of a minister.

**SUSPENSION *à beneficio***, is when a minister is, for a time, deprived of the profits of his benefice. See BENEFICIO.

Where the fault is more notorious, the two kinds of *suspension* are sometimes joined; and the person both *suspended ab officio* and *à beneficio*. See DEPRIVATION, &c.

**SUSPENSOR Testiculi**, in anatomy, a muscle called also *cremaster*. See CREMASTER.

**SUSPIRAL**, a spring of water, passing under ground towards a conduit or cistern.—Also a breathing hole, or ventiduct. See VENTIDUCT.

**SUTE**, *SUYTE*, or *suite*. See the article SUITE.

**SUTH-DURE**, in ancient customs, denotes the south door of a church; mentioned in old authors, as the usual place where canonical purgation was performed.—That is, when a fact could not be proved by sufficient evidence, the party accused, came to the south door of the church; and there, in the presence of the people, made oath that he was innocent. See PURGATION.

This was called *judicium dei*.—And it is for this reason that large porches were anciently built at the south doors of churches. See PORCH.

**SUTTON's quadrant**. See the article QUADRANT.

**SUTURE**, *Sutura*, in anatomy, a peculiar kind of juncture, or articulation, of certain bones in the animal body; thus called, as resembling a seam. See ARTICULATION. There are two kinds of *suture*; one called the *true* or *genuine suture*: wherein bones are indented like saws, and reciprocally received into each other.

The other, called *false*, *spurious*, or *squamous suture*; wherein the bones are laid over each other, like the scales of fishes. See SQUAMMOUS.

The bones of the cranium are usually joined by three genuine *futures*: the *coronal*, reaching across from one temple to the other. See *Tab. Anat. (Osteol.) fig. 1. lit. g. fig. 2. lit. h.* and the article CORONAL.—The *sagittal*, joining the *os parietalia*. See *Tab. Anat. (Osteol.) fig. 1. lit. f. fig. 2. lit. i.* and the article SAGITTAL.—And the *lambdoidal*; thus called from its resembling the Greek  $\Lambda$ , lambda. See LAMBDOIDES.

Besides these, is a fourth *suture*, of the spurious or squamous kind, supposed, though falsely, to have no indentures: it joins the *os temporum* to the *os sphenoides*, *occipitis*, &c. and is also called the *temporal suture*.—See *Tab. Anat. (Osteol.) fig. 2. lit. k.* See also SQUAMMOUS.

Natural historians tell us, that in Persia it is frequent to have people without any *futures* at all in the skull; but the whole one solid bone; yet without any apparent inconvenience: and M. Flechier, in his life of cardinal Ximenes, affirms the same of that cardinal: yet it should seem that great disorders must arise therefrom; as the perspiration can be but very imperfectly effected; whence heaviness and swimming in the head. See CRANIUM.

**Sphenoidal SUTURE**. See the article SPHENOIDAL.

**SUTURE**, in chirurgery, denotes a seam made to close the lips of a wound, in order to its healing. See WOUND.

The ancients invented a great variety of *futures*, which they reduced to three kinds; *incarnatives*, *restrictives*, and *conservatives*.

**Incarnative SUTURE**, is thus called, because, by rejoining the edges of a wound, and keeping them together by means of a thread run across them with a needle, they grow together, and incarnate as before. See INCARNATIVE.

This they subdivided into five kinds, viz. the *interrupted*,

*intertwisted*, *penned* or *feathered*, *with clasps*, and the *dry suture*.

Of these five, two are perfectly disused, viz. the *feathered suture*, and the *suture with clasps*, as being too barbarous, and at the same time unnecessary. The first was called *penned*, when little pins were made use of; and *feathered* when the barrels of feathers or quills.

To perform it, two or three needles threaded with a double thread, were passed through the lips of the wound, at a finger's breadth from each other, and a pin or feather put in the stitch; and another pin or feather bound with the ends of the same thread, that the feathers might keep the lips of the wound close together.

To perform the second, they had large, crooked clasps, pointed at each end; one of which they thrust into the upper part of the wound, the other into the lower, to bring the lips together.

These *futures*, cruel as they were, are yet known to be useless; for in the only cases where they should seem serviceable, viz. in deep wounds, where the contraction of the fleshy parts keeps the lips far asunder, and in wounds of tendons; they expose the patient to terrible convulsions and shudderings, which are avoided, by diminishing the dilatation of the wounds, by moderate compressions, and waiting till the fibres relax.

**Restrictive SUTURES**, were those wherewith they endeavoured to stop the flux of blood from large wounds, where any considerable vessels were cut.

To this end, they invented several kinds, in the number whereof, were the *shoe-makers*, *taylors*, *skinners*, and other *seams*, each more impertinent than other. It is evident, the very design of such a *suture* is blameable: for supposing the wound so exactly sewed up, that no blood could escape through the lips thereof; yet will it still flow out of the vessels; and will thus be forced to make its way between the laminæ of the muscles, by which means the part will swell, rot, and gangrene. Yet the *skinners suture*, *sutura pellionem*, is still in use for wounds of the intestines: it is thus called, because the skinners use the like, in sewing up the holes made by the butchers, in fleaving off the skin.

**Conservative SUTURE**, is that kind of ancient *suture*, whereby the lips of large wounds, wherein there was a loss of substance, were prevented from receding too far. But a bandage, now, suffices.

**Intertwisted SUTURE**, is thus called, because the needles being left sticking in the wound, the thread is wound around them; much after the same manner as the taylors do the threaded needles they keep in their sleeves, &c. This *suture* is performed two ways; for either the needles are passed across the wound, or they are stuck on the sides thereof.

All the *futures* hitherto mentioned, are made with needle and thread: beside which, there is another kind called *dry futures*, which are performed with glue or size; or other proper viscous matter.

The *dry SUTURE* is ordinarily made with small pieces of leather, on linnen cloth, indented like a saw, so that the teeth may fall between each other, and the whole row may be closed. The cloth, before it is cut into this form, is spread with some proper plaister, in order to its firm adhesion.

The plaisters thus prepared, being cut into the form, are applied on the firm flesh, according to the length of the wound, reaching from it to the distance of some inches; and after they are dried, or well fastened to the part, the lips of the wound being approached, they may conveniently be held together by the *suture* in that posture.

This kind of *suture* is principally used for wounds in the face, to prevent unsightly scars: it is likewise convenient when the fibres of the muscles are cut across; and where it is difficult or impossible to apply a bandage.

In the other kinds of *futures*, the stitches ought always to be taken of a depth proportionable to that of the wound; care being had to avoid the nerves as much as possible. In long wounds they are best begun at the ends; but in short ones at the middle.

**SWABBER**, the title of an inferior officer on board a man of war, whose office is to take care the ship be kept neat and clean.

In order to this, he is to see her washed well once or twice a week at least; especially about the gun-wales and chains. He ought also to burn pitch, or some such thing, now and then between decks, to prevent infection; and to acquaint the captain with such of the men as are nasty and offensive.

**SWAIN**, } See } BOATSWAIN and COCKSWAIN.  
**SWAINMOTE**, }

**SWALLOWING**. See the article DEGLUTITION.

Among the rarities in the anatomy hall at Leyden, is preserved a knife ten inches long, *swallowed* by a peasant, and cut out of his stomach; after which he lived eight years.

A lady, mentioned by Mr. Greenhill in the *Philosophical Transactions*, got a large and painful tumour in the umbilicus, with *swallowing* prune-stones; which upon the tumour's breaking of itself, came out in great quantity: yet, notwithstanding all imaginable care, she died of it.—A lad, sixteen years of age, near Hall in Saxony, playing with a knife

fix

fix inches and half long, accidentally *swallowed* it. The curiosity of the case led Wolfgang Chriff. Wefenon, physician of the elector of Brandenburg, to take care of him. The knife was felt to have changed its position several times, and in a few months ceased to be very troublesome; and in a year was so much diminished, as scarce to be felt from without. At length it was drawn out (exceedingly diminished every way) through an abscess which its point occasioned, three fingers breadth below the pit of the stomach, and the boy was perfectly well; *Philosophical Transactions*, N°. 219.

"Some people, (says Dr. Sloan, from an instance of an unhappy person who had *swallowed* great quantities of pebbles to ease him of the wind, and which remaining in his stomach to the number of two-hundred, had brought him into a very sad condition,) "from their seeing birds languish, "unless they swallow gravel, or small stones, take up an "opinion, that the *swallowing* of stones helps the stomach to "digest its food; but I have been always against that practice: for though the stomachs, or gizzards of birds (they "wanting teeth to grind their food) are made very strong, "muscular, and defended on the inside with a coat, by the "help whereof, and these stones, their victuals are ground; "yet the stomachs of men being very different, it is not "reasonable to think they should be of use (or even inoffensive) to them.

"I knew, adds he, one Mr. K——, who for many "years swallowed nine or ten stones every day, nearly as "large as walnuts, and without any apparent harm, as they "always passed; but he afterwards died suddenly."

**SWALLOWS-TAIL**, in fortification, a kind of out-work only differing from a single *tenaille*, in that its sides are not parallel as those of the *tenaille*, but narrower towards the fortified place, than towards the country. See *QUEUED'ARONDE*, and *TENAILLE*.

**SWALLOWS-TAIL**, in joinery and carpentry, denotes a particular way of fastening together two pieces of timber, so strongly as they cannot fall asunder. See *DOVE-TAIL*.

**SWANIMOTE**, or *SWAINMOTE*, a court touching matters of the forest, kept, by the charter of the forest, thrice in every year, before the verderers, as judges. See *FOREST*. This court is as incident to a forest, as a court of pie-powder to a fair. See *COURT*.

**SWITH**, *fascia*, among surgeons, a long and broad band to bind up any diseased member, or part. See *BANDAGE*.

**SWEAT**, a sensible moisture issuing out of the pores of the skins of animals, through too much heat, exercise, or weakness; or through the action of certain medicines called *sudorifics*. See *SUDORIFIC*.

*Sweat* is either the consequence of an acceleration of the blood's motion, by stimuli, or exercise; or of a relaxation of the pores of the cutis; by means of either whereof, the matter which before perspired insensibly, is now rendered sensible. See *PERSPIRATION*.—The former is the case in natural and medicinal *sweats*, and the latter in morbid, fainting, and cold *sweats*. See *SUDOR*.

The principal organs of *sweat* are the miliar glands; which are spread over the whole ambit of the body; and furnished, each, with a vein, artery, and nerve, besides an excretory duct, through the orifice whereof the *sweat* is cast out under the cuticle. This duct is covered with a little round valve, lying immediately under the cuticle, whereby the *sweat* is occasionally either retained or transmitted. See *MILIARY gland*.

The *sweat* thus secreted, is various, according to the variety of the weather, soil, sex, age, temperament, emunctory, diet, time of digestion, &c. as in the urine. See *URINE*. In a sound body, *sweat* is scarce ever found, but from a fault in some of the six non-naturals: its immediate effect is always hurtful; by accident sometimes it does good.

The physicians order *sweats* in cold and inveterate diseases, as the palsy, rheumatism, sciatica, and many other diseases. Diseases also frequently have their crises in *sweats*.

Sweating is indicated by the beginning of a critical *sweat*, to carry off the disease; by the tenuity of the morbid matter dispersed through all the vessels, as in the plague, a venomous bite, or the French disease, before yet fixed; by the particular temperature of the patient, and by various obstructions to be removed in the several parts of the body; particularly in subcutaneous diseases, the itch, psores, leprosy, &c.

Matthioli tells us, that the *sweat* of all quadrupedes, as horses, asses, &c. is venomous; and that that of other beasts is unwholesome.—Tachenius adds, that the *sweat* of horses, particularly, is so acid, that it pierces the strongest and firmest boots, which are proof against all water.—Some naturalists affirm, that dogs and cats never *sweat*, how hot soever they be, because they are not found to have any pores in the cuticle. See *PORE*.

*English SWEAT*, or the *SWEATING sickness*. See *SUDOR Anglicanus*.

**SWEDISH allum,**  
**SWEDISH coins,**  
**SWEDISH measures,**

See the articles  
ALLUM.  
COIN.  
MEASURE.

**SWEDISH moneys.** See the article *MONEY*.

**SWEET**, among refiners, the almond furnace. See *ALMOND* and *FURNACE*.

**SWEET**, among goldsmiths, moniers, &c. See *WASHING*.

**SWEET**, in the sea-language.—The seamen call the mould of a ship, when she begins to compass in at the rung-heads, the *sweep* of her, or the *swamp* of the futtock.

**SWEETING** at sea, signifies dragging along the ground, at the bottom of the sea or channel, with a three fluked grapnel, to find some hawser or cable which is slipped from an anchor.

**SWEET almonds,**

**SWEET sublimate of mercury,**

**SWELLED columns,**

**SWELLED hoof,**

**SWELLING**.—*Diameter of the SWELLING*. See *DIAMETER*.

**SWIFTEST**.—*Line of the SWIFTEST descent*. See *LINE*.

**SWIMMING**, the act or art of sustaining the body in water, and of advancing therein by the motion of the arms, legs, &c. See *ANIMAL*.

Man alone learns to *swim*; all other perfect animals seem to take it naturally; though several of the imperfect *swim* not at all.

Among the ancient Greeks and Romans, *swimming* made so essential a part of the discipline of their youth, that to represent a man perfectly rude and uneducated, they used to say proverbially, he had neither learned to read nor to *swim*.

In fishes, it is the tail that is the grand instrument of *swimming*, not the fins, as is generally imagined: for this reason fishes are more strong and muscular in that part, than in all the rest of their body; according as we find it in all other animals; the motive parts whereof are still the strongest, as the thighs of men for walking, the pectoral muscles of birds for flight, &c. See *FLYING*, &c.

The manner wherein fishes row themselves forwards by the tail, is well explained by Borelli *de Motu Animal*. part 1. cap. 23.—The fins of fishes serve only to keep the body well poised and ballanced, and prevent vacillation. See *FIN* and *TAIL*.

M. Thevenot has published a curious piece in French, called *L'Art de Nager*, the art of *swimming* demonstrated by figures. Before him, Everard Digby, an Englishman, and Nicholas Winman, a Dutchman, had laid down the rules of this art: Thevenot has done little more than copy from them.—Had he but read, with half that application, Borelli's treatise *de Motu animalium*, he would scarce have maintained, as he has done, that men would *swim* naturally, like other animals, were they not prevented by fear, which magnifies their danger.

We have abundant experience against this: Throw any brute, newly born, into a river, and it *swims*: throw an infant in, before it is yet capable of fear, and it *swims* not, but is drowned. The reason is, that the human machine differs very notably in its structure and configuration from that of brutes; and particularly, which is very extraordinary, in the situation of its centre of gravity. In man, the head is exceedingly heavy, with regard to the rest of the body; by reason the head is furnished with a very great quantity of brain, and has, besides, a deal of flesh and bones, and no cavities only filled with air: so that the head immersing under water by its own gravity, the nose and ears are soon filled: thus the heavy carrying down the light, the man soon drowns, and is lost.

But in brutes it is otherwise: for the head, here, having but little brain, and there being abundance of sinuses therein; its weight, with regard to the rest of the body, is much less considerable; so that they are easily able to keep their nose above water, and thus respiring freely, are out of danger of drowning, on the principles of statics.

In effect, the art of *swimming*, which is no otherwise to be acquired but by exercise, consists principally in keeping the head above water, so, that the nose and mouth being at liberty, respiration may be carried on: for, as to the feet and hands, it is enough to stir them, and to use them as oars to conduct the vessel.

**SWIMMING-bladder**, popularly called *SWIM*, a vesicle of air inclosed in the bodies of fishes, by means whereof they are enabled to sustain themselves at any depth of water. See *AIR*, and *FISH*.

For the air in that bladder being more or less compressed, according to the depth the fish *swims* at, takes up more or less space; and consequently the body of the fish, part of whose bulk this bladder is, is greater or lesser, according to the several depths; and yet retains the same absolute weight. Now the rule *de insidentibus humido*, is, that a body heavier than so much water as is equal in quantity to the bulk of it, will necessarily sink; a body that is lighter, will *swim*; and a body of equal weight, will rest in any part of the water. See *FLUID*, *SPECIFIC gravity*, &c.

By this rule, if the fish in the middle region of the water be of equal weight with water, bulk for bulk; the fish will rest there without any natural tendency either upwards or downwards.

And if the fish be deeper in the water, its bulk becoming less

less by the greater compression of the bladder; it will still remain commensurate to the gravity of the water in that part.

If the fish be higher than the middle region; the air dilating itself, and the bulk of the fish consequently increasing, but not the weight; the fish will rise upwards, and rest at-top of the water.

It is probable the fish, by some action, can emit air out of its bladder, and take fresh in. Mr. Ray observes, that in most fishes, there is a manifest channel leading from the gullet to the *swimming* bladder, which doubtless serves for the conveyance; and that there is a muscous power in the coat of the bladder, whereby the fish can contract it when it lifts. The same author adds, in confirmation of this doctrine, that it is found, if the *swimming* bladder of any fish be pricked or broke, the fish immediately sinks to the bottom, and can neither support nor raise itself. And that in flat fishes, as soles, plaice, &c. which lie always groveling at the bottom, there is no *swimming* bladder at all.

SWINE-pox. See the article POX.

SWOONING, a kind of lipothymia, or fainting, wherein the patient loses all his strength, as well as sense, and understanding. See LIPOTHYMIA, DELIQUUM, &c.

*Swooning* may be occasioned by any thing that alters, corrupts, or dissipates the vital spirits; as, long watching, violent pains, great and sudden evacuations, putrid vapours arising from abscesses in the noble parts, &c.

SWORD, an offensive weapon, worn at the side, serving either to prick, or cut, or both. See FENCING, ARMS, &c. Its parts are the blade, guard, hand, or grasp, and pommel; to which may be added, the bow, scabbard, hook and chape. —The masters of defence divide the *sword* into the *upper*, *middle*, and *lower* part; or the *fort*, *middle*, and *foible* or small, and weak part.

Anciently, there were a kind of two-handed *swords*, called *spade's*, and which were to be managed with both hands; which in those days they could brandish so nimbly, as to cover the whole body therewith.

The savages of Mexico, when first visited by the Spaniards, had a kind of wooden *swords*, which would do as much execution as ours. —In Spain, *swords* are only allowed of such a length, determined by authority. —The ancient cavaliers gave names to their *swords*; *joyeuse* was that of Charlemagne; *durandal* that of Orlando, &c.

SYCOPHANT\*, ΣΥΚΟΦΑΝΤΗΣ, a Greek term, originally used at Athens, for persons who made it their business to inform against those who stole figs, to the owners; or against those who, contrary to the law which prohibited the exportation of figs, practised the thing, and deceived the officers, the inspectors of the ports, &c.

\* The word is formed from *συκον*, a fig, and *φανω*, *indico*, I show, discover.

At length, the term became used in the general for all informers, tale-bearers, parasites, flatterers, &c. especially those in the courts of princes: and at last, for lyer, impostor, &c.

SYCOPHANTIC plants. See the article PARASITES.

SYLLABIC, in the Greek grammar. —There are two kinds of augments; the first called *syllabic*, which is when the word is increased by a *syllable*; the other *temporal*, which is when a short syllable becomes long. See AUGMENT.

SYLLABLE\*, SYLLABA, in grammar, a part of a word, consisting of one or more letters which are pronounced together. See LETTER and WORD.

\* The word is derived from the Greek, *συλλαβη*, which literally denotes comprehension, or assemblage.

Or, a *syllable* is a complete sound, uttered in one breath, consisting either of a vowel alone, or of a vowel and one or more consonants, not exceeding seven. See VOWEL, CONSONANT, &c.

Scaliger defines a *syllable* to be an element under one tone or accent, that is, which can be pronounced at once.

Priscian, more intelligibly, calls it a comprehension of several letters falling under one accent, and produced at one motion of the breath. —But some grammarians reject this definition, as excluding all *syllables* of one letter.

Another defines *syllable*, a literal or articulate voice, of an individual sound. See VOICE.

In every word, therefore, there are as many *syllables* as there are vocal sounds; and as many vocal sounds, as there are simple or compound vowels; each whereof requires a distinct motion of the pectoral muscles. —Thus, *a, a, a*, make three *syllables*, formed by so many motions, distinguished by small stops betwixt each expiration.

In the Hebrew, all the *syllables* begin with consonants; allowing aleph to be one; nor has any *syllable* more than a single vowel. See VOWEL and POINTS.

From the number of *syllables* in words they become denominated *monosyllables*, *bisyllables*, *trisyllables*, and *polysyllables*, q. d. words of one *syllable*, two *syllables*, three *syllables*, &c.

VOL. II. N<sup>o</sup>. CXLIX.

lables, and many *syllables*. See WORD, MONOSYLLABLE, &c.

As it is the number of *syllables* that constitutes the measure of English verse; it were to be wished, we had fixed and settled rules to determine the precise number of *syllables* in each word: for we have words very dubious in that respect; and there are even some which have more *syllables* in verse, than in prose. Many of the words ending in *ious*, give a deal of embarrass to such as pique themselves on exactness; as odious, precious, &c. See FOOT, QUANTITY, MEASURE, &c.

SYLLABUB, a kind of compound beverage, most affected in the summer-season; ordinarily made of white-wine, and sugar, into which is squirted new milk with a syringe, or wooden cow.

Sometimes it is made of canary, in lieu of white-wine; in which case the sugar is spared, and a little lemon and nutmeg added in lieu of it.

To prepare it the best way, the wine and other ingredients, excepting the milk, are to be mixed over night, and the milk or cream added in the morning. The proportion is, a pint of wine to three of milk. For

Whipt SYLLABUB, to half a pint of white wine or rhenish, is put a pint of cream, with the whites of three eggs. This they season with sugar, and beat with birchen rods. The froth is taken off as it rises, and put into a pot; where, after standing to settle two or three hours, it is fit to eat. Rust.

SYLLEPSIS, in grammar, *conceptio*, a figure whereby we conceive the sense of words otherwise than the words import; and thus make our construction, not according to the words, but the intention of the author.

The *syllipsis*, says an ingenious author, is a figurative construction, which agrees rather with our ideas, than with the words; and expresses rather the sense of our mind, than the sense of the terms themselves.

SYLLEPSIS is also used for the agreement of a verb, or adjective, not with that word next it, but with the most worthy in the sentence: as, *rex & regina beati*.

Some authors call the *syllipsis*, *synthesis*; others *substitution*. See SUBSTITUTION.

It is a figure of considerable use for the well understanding of of authors. —Scioppius divides it into two kinds, *simple* and *relative*.

Simple SYLLEPSIS, is when the words of a discourse either disagree in gender, or number, or both.

Relative SYLLEPSIS, is when the relative is referred to an antecedent which is not expressed; but which we conceive by the sense of the whole period.

SYLLOGISM, ΣΥΛΛΟΓΙΣΜΟΣ, in logic, an argument, or form of reasoning, consisting of three propositions; having this property, that the conclusion necessarily follows from the two premises: so that if the first and second propositions be granted, the conclusion must be granted in like manner; and the whole allowed for a demonstration. See ARGUMENT, PREMISES, CONCLUSION, &c. See also PROSYLLOGISM. If the premises be only probable, or contingent, the *syllogism* is said to be *dialectical*; if they be certain, *apodictical*; if false, under an appearance of truth, *sophistic*, or *paralogistic*. See DIALECTICAL, APODICTICAL, SOPHISM, &c.

As often, as the mind observes any two notions to agree to a third, which is done in two propositions; it immediately concludes that they agree to each other: or if it find that one of them agrees, and the other disagrees, which is likewise done in two propositions; it immediately pronounces that they disagree to each other. —And such is a *syllogism*; which, it hence appears, is nothing but a mental discourse, or reasoning, whereby, from any two propositions granted, a third is necessarily deduced. See PROPOSITION, REASON, &c.

Hence, as the Greeks call it *syllogism*, the Latins call it *collectio*, or *ratiocinatio*, as being a kind of computation, which, either by adding, or subtracting, gathers either the sum or the remainder: for, as if we add two or three, we thence collect five; so if to this proposition, “man is an animal,” you add this, “every animal thinks;” you thence deduce this, “therefore man thinks.” See REASONING.

Of the three propositions whereof a *syllogism* consists; the first is by way of eminence, called the *proposition*, as being proposed for the basis of the whole argument; the second is called the *assumption*, as being assumed to assist in inferring the third: though they are both called *sumptiones*, because assumed for the sake of the third; and both *premises*, as being premised to it; and for the same reason both are called *antecedents*, only the first the *major*, and the latter the *minor*. See ASSUMPTION, PREMISES, MAJOR, MINOR, &c.

The third is called the *conclusion*, as being the close of the whole argumentation; and sometimes *complexio*, as including the two notions, before separately compared; and *consequens*, because it follows from the antecedents; and lastly, *illatio*, because inferred from the premises by means of the illative particle *ergo*, therefore, &c. See CONCLUSION, CONSEQUENCE, &c.

As the conclusion is the principal part of a *sylogism*, it hence arises, that tho' both the proposition and assumption consist each of its subject and attribute; yet the subject and attribute of a *sylogism*, are properly understood of those of the conclusion. See SUBJECT and ATTRIBUTE.

Again, in the instance above-mentioned, *animal* being used both as subject and attribute, it is held a kind of intermediate between the two, and frequently called *medium*; in respect to which, both the subject and attribute, *man* and *thinks* are, called *extremes*, or *terms*; only the subject *the greater extreme*, and the attribute *the less*. See MEDIUM, EXTREME, TERM, &c.

A *sylogism*, whether simple, or compound, may either be *categorical*: as that already instanced, wherein both premises are positive.

Or, *hypothetical*, wherein one or both of the premises are only supposed: as, "if the sun shines, it is day: but the sun does shine, therefore it is day." See HYPOTHETICAL.

Or, *analogical*: as, "the base is to the column; so is justice to the commonwealth: but if the base be withdrawn, the column is overturned; therefore if justice be taken away, the commonwealth is overturned." See ANALOGY.

Or, *diazetic* or *disjunctive*; as, "either they mean to please or to profit, but they do not aim to please; therefore they aim to profit." See DISJUNCTIVE.

The most convenient form of a perfect *sylogism*, is to have the medium in the middle, placed between the subject and the attribute; as in the instance above-mentioned.

Of this form there are two figures,—the one *coherent*, or *conjunct* and *affirmative*; founded on this canon, "that what agrees with any thing, likewise agrees with that wherewith this necessarily agrees."

The other *incoherent* or *disjunct*, and *negative*; founded on this canon, "that what agrees with any thing, disagrees with that wherewith this disagrees."

Of each of these figures there are three modes, *viz.* *general*, *particular*, and *mixed*. See MOOD and FIGURE.

A *sylogism*, wherein one of the premises is suppressed, but so as to be understood; is called an *enthymeme*; *e. gr.* "every animal thinks, therefore man thinks;" wherein the proposition, "man is an animal," is understood. See ENTHYMEME.

The demonstrations of mathematicians, it is observed, are only series's of enthymemes: so that every thing in mathematics is concluded or proved by *sylogism*; only omitting such premises as occur of their own accord, or as are referred to by the citations. See DEMONSTRATION.

For the use SYLLOGISM is of to reason, Mr. Locke observes, that of four things, which reason is employed about, *viz.* the finding out of proofs, the regular disposition of them so as their connexion may appear, the perceiving their connexion, and the making a right conclusion; *sylogism* only assists in one, *viz.* shewing the connexion of the proofs in any instance. Nor is it of any great use even here; since the mind can perceive such connexion, where it really is, as easily, nay, perhaps, better, without it. We see men reason very strongly, who do not know how to make a *sylogism*.

Indeed, *sylogism*, the same author adds, may serve to discover a fallacy in a rhetorical flourish, or by stripping an absurdity of the cover of wit and good language, shew it in its natural deformity. But it only shews the weakness or fallacy of such a discourse by the artificial form it is put into, to those who have thoroughly studied mood, and figure, and have so examined the many ways three propositions may be put together in, as to know which of them does certainly conclude right, and which not, and upon what grounds they do so.

The mind is not taught to reason by these rules: it has a native faculty of perceiving the coherence or incoherence of its ideas, and can range them right, without such perplexing repetitions.—Add, that to shew the weakness of an argument, there needs no more, than to strip it of the superfluous ideas, which, blended and confounded with those on which the inference depends, seem to shew a connexion where there is none; or at least hinder the discovery of the want of it: and then to lay the naked ideas, on which the force of the argumentation depends, in their due order. In this position, the mind taking a view of them, sees what connexion they have, and so is able to judge of their inference, without any need of *sylogism* at all.

Nor must it be admitted, that *sylogisms* are as liable to fallacies, as the plainer ways of argumentation; for which one might appeal to common observation, which has always esteemed these artificial methods of reasoning, more adapted to catch and entangle the mind, than to instruct and inform the understanding. And if it be certain that fallacy can be couched in a *sylogism*, as no body will deny but it may; it must be something else, and not a *sylogism*, that must discover it.

The same author proceeds to shew, that this way of reasoning discovers no new proofs, nor makes any discoveries; but is wholly conversant in the marshalling and ranging those we already have: a man must know, before he be able to prove

*sylogistically*; so that the *sylogism* comes after knowledge, when we have but little need of it. See REASON and LOGIC.

Reduction of SYLLOGISMS. See the article REDUCTION.

SYLLOGISTIC form. See the article FORM.

SYLVA, or SILVA, in poetry, a poetical piece composed, as it were, at a start; in a kind of rapture or transport, without much thought or meditation.—Such are the *sylvæ* of Statius, which, he assures us, were all composed after this manner.

Quintilian extends the use of the word *sylva* to any writing done in haste, and on the spot.

The word is Latin, and literally signifies *forest*; whence its chief use, in our language is, metaphorically, to express certain collections of poetical pieces, of various kinds, and on various subjects; as a forest is an assemblage of trees of different sorts.

SYMBOL\*, SYMBOLUM, a sign, or representation of any moral thing, by the images or properties of natural things. See SIGN, FIGURE, IMAGE, &c.

\* The word is formed from the Greek, *συμβολον*, a mark, sign, or badge, and that from the verb *συμβαλλω*, *conferre*, to compare.

Thus we say, the lion is the *symbol* of courage; the pelican of paternal love, &c.—*Symbols* were in great repute among the ancient Hebrews, and especially among the Egyptians; and served to cover a great part of their moral mysteries; being used not only to represent moral things by natural, but even natural by natural. See HIEROGLYPHIC.

*Symbols* are of various kinds; as types, ænigma's, parables, fables, allegories, emblems, hieroglyphics, &c. each whereof, see under its respective article, TYPE, ÆNIGMA, PARABLE, FABLE, &c.

The Chinese letters are most of them *symbols*, or significative. See LETTER.—The *symbols* in algebra, &c. are arbitrary. See CHARACTER.

Medalists also apply the term SYMBOL to certain marks or attributes peculiar to certain persons, or deities.—The thunder-bolt, for instance, accompanying the heads of certain emperors, is a sign or *symbol* of the sovereign authority, and of a power equal to that of the gods: the trident is the *symbol* of Jupiter; the peacocks, of Juno; a figure seated on an urn, of a river, &c. See ATTRIBUTE.

SYMBOL, among christians, is particularly used for the creed, or the articles of religion which every christian is to know, and believe. See CREED.

Fleury observes, that till the time of St. Gregory, the *symbol* was never used to be rehearsed in the office of the Roman church; in regard that church, having never been infected with any heresy, did not need to make any profession of faith. Suicer notes, that several words and clauses have been occasionally added to the *symbol*, upon the rising of new heresies.

Though it be a common opinion, that the *symbol* is the work of the apostles; and though, on the footing of such opinion, we call it the *apostles creed*; yet, du Pin observes, there are several very cogent arguments to render the opinion highly improbable.

In the emperor's library is a Greek MS of the *symbol* of the apostles, divided into twelve articles, with the names of the respective apostles, who are said to have composed each article. The first is attributed to St. Peter, and the rest successively to Andrew, James major, John, Thomas, James minor, Philip, Bartholomew, Matthew, Simon, Thaddeus, and Matthias.

But the testimony of that MS does not much confirm the opinion, that each apostle composed an article of the *symbol*; yet the opinion is, at least, as old as St. Leo, who seems to have believed it.

Authors are in doubt why the name *symbol* should be given to this compendium of the articles of the christian faith: some say, it is thus called, as being the mark or characteristic of a christian.—Others derive it from an assembly or conference of the apostles, where each expressing his sense of the faith, and what each had chiefly preached, the creed was framed, and called by the Greek word *συμβολον*, which signifies *collation* or *conference*.—It is added, that St. Cyprian is the first who appears to have used the word *symbol* in this sense.

SYMBOLICAL characters,	} See	CHARACTER.

SYMBOLICAL physics,		PHYSICS.

Clemens Alexandrinus, Eusebius, &c. observe, that the Egyptians had two ways of representing their *symbolical* mysteries; one by the virtues of animals, herbs, &c. the other by geometrical figures.—Thus, the sun and moon were represented, in the first manner, by the beetle and Ibis; and in the latter, by their own figures.—Again, the four elements they represented, after the first manner, by four animals which have qualities corresponding thereto; and after the second manner by +. See HIEROGLYPHIC.

SYMMETRY\*, SYMMETRIA, the relation of parity, both

in respect of height, length, and breadth of the parts necessary to compose a beautiful whole.

\* The word is formed from the Greek, *συμ*, with, and *μετρον*, measure.

*Symmetry*, according to Vitruvius, consists in the union and conformity of the members of a work, to their whole, and of the beauty of each of the separate parts to that of the entire work; regard being had to some certain measure: so that the body is framed with *symmetry*, by the due relation which the arm, elbow, hand, fingers, &c. have to each other, and to their whole.

*Symmetry* arises from that proportion which the Greeks call *analogy*, which is the relation of conformity of all the parts of a building, and of their whole, to some certain measure; whereupon depends the nature of *symmetry*. See ANALOGY.

*Uniform SYMMETRY*, in architecture, is that where the same ordonnance reigns throughout the whole pourtour.

*Respective SYMMETRY*, is that where only the opposite sides are equal to each other.

*SYMPATHETIC*, ΣΥΜΠΑΘΗΤΙΚΟΣ, something that has a sympathy; or that acts, or is acted on by sympathy. See SYMPATHY.

*SYMPATHETIC*, is particularly applied to all diseases which have two causes; the one remote, the other near.

In which sense, the word is opposed to *idiopathic*. See IDIOPATHY.

Thus, an epilepsy is said to be *sympathetic* when produced by a remote cause; *i. e.* when the disorder in the brain, embarrassed with blood, is preceded and produced by some other disease. See EPILEPSY.

There is a *sympathetic* palpitation of the heart, and an *idiopathic* one.—There is but one *idiopathic* cause of the palpitation; but there are several *sympathetic* ones. See PALPITATION.

Among chymists and alchymists, the term *sympathetic* is principally applied to a kind of powder, and of ink.

*SYMPATHETIC inks*, are such as can be made to appear and disappear very suddenly, by the application of something which seems to work by sympathy. See INK.

Of these we have some very curious instances and experiments, given us by Lemery and Mr. Boyle; to the following effect.

1°. To two or three parts of unslaked lime put one of yellow orpiment; powder and mix the two, adding fifteen or sixteen times as much water as there was orpiment; stop up the vial with a cork and bladder, and set it in warm embers. Shake the vial now and then for five hours, and warily decant the clear part, or rather filtrate it. In the mean time, burn a piece of cork thoroughly, and when well inflamed, quench it in common water, or rather in brandy. Being thus reduced into a friable coal, grind it with fair water, wherein gum arabic has been dissolved; and it will make a liquor as black as the common ink.

While these are doing, dissolve in three times as much distilled or strong vinegar, over warm embers, a quantity of red lead; or of saccharum saturni, in thrice the quantity of water; for three or four hours, or till the liquor have a sweet taste. This liquor will be as clear as common water.

The liquors thus prepared: write any thing on paper with this last sort, dry it, and nothing will appear. Over the place, write what you please with the second liquor; it will appear as if written with common ink: when dry, dip a small piece of rag or sponge in the first liquor, rub it over the written place, and the black writing will vanish; and that wrote with the invisible ink, appear black and legible. Again, take a book four or five inches thick, and on the first leaf write any thing with the last liquor: turn to the other end of the book, and rub there with a rag, dipt in the first liquor, on that part, as near as you can guess, opposite to the writing; and leave also the rag there, clapping a paper over it; then nimbly shutting the book, strike four or five smart strokes thereon with your hand, and turning the other side uppermost, clap it into a press, or lay it under a good weight for a quarter of an hour, or even half that time: then will the writing done with the invisible ink be found white and legible.

2°. Dissolve white or green vitriol in water, and writing with the solution, nothing will appear. Boil galls in water, and dip a linen rag in the decoction, and with it rub the place before writ, and it will appear black and legible. Rub it over again with spirit of vitriol, or its oil, and the writing will disappear again: rub it over again with oil of tartar per deliquium, the letters will appear again, but of a yellow colour.

*SYMPATHETIC powder*, a powder once very much famed; supposed to have this wonderful property, that if spread on a cloth dipt in the blood of a wound, the wound will be cured, though the patient be any number of miles off. See WEAPON-falve.

This powder, M. Lemery tells us, is nothing but Roman vitriol, opened by the sun-beams penetrating it, and imperfectly calcining it, in the middle of summer. See VITRIOL.

But it is now generally allowed a mere piece of charlatanery, whatever Sir Kenelm Digby, and others before him, and after, plead in its favour.

Sir Kenelm, in an express treatise on the subject, where he gives instances of cures performed by it, accounts for the manner of its operation thus: the sun's rays, says he, attract and draw the spirits of the blood at a great distance; by which means the atoms thereof are driven and dispersed far and near in the air. Now, the spirits of vitriol, incorporated with the blood, fly along with them, and the two together form a kind of train of corpuscles. On the other side there is continually issuing and exhaling from the wound abundance of fiery spirits, which attract the neighbouring air; and this air, by a continued concatenation, attracting still the next air, at length, meets the atoms, with the spirits of the blood and vitriol. Thus the spirits of the blood finding their source again, re-enter into their primitive seat, and being joined with the vitriolic spirits, the wound is comforted and healed, imperceptibly.

But, to the confusion of all this fine reasoning, it is found by experience, that the powder is so far from this effect at a great distance, that it is scarce perceived, if done in the same room with the patient. Though it is possible, as the parts of the vitriol are in continual motion, if the cloth be applied just by the patient, some of the effluvia thereof may enter the wound, and help to stop the bleeding. See VITRIOL.

*SYMPATHY*\*, ΣΥΜΠΑΘΕΙΑ, an agreement of affections and inclinations; or a conformity of natural qualities, humours, temperaments, &c. which make two persons pleased and delighted with each other. See ANTIPATHY.

\* The word is formed from the Greek, *συμ*, with, and *πάθος*, passion, *q. d.* compassion, fellow-feeling.

*SYMPATHY* is also used with regard to inanimate things; intimating some propension they have to unite, or to act on one another. See CONSENT of parts.

In this sense, naturalists say, there is a *sympathy* between the vine and the elm; between the loadstone and iron; the two poles of a loadstone, &c.

Several authors have wrote on the *sympathies* and *antipathies* between animals; but the greatest part of what they say is fabulous: Such, *e. gr.* is that antipathy between chords made of sheeps and wolfs guts; a lute, they say, being strung with these two kinds of chords, they can never be brought into tune with each other: such also is that of eagles feathers, which mixed with those of other birds, are said to devour and consume them. See ANTIPATHY.

The alchymists talk much of the powder of *sympathy*. See SYMPATHETIC powder.

*SYMPATHY*, in medicine, an indisposition befalling one part of the body, through the defect or disorder of another; whether it be from the affluence of some humour, or vapour sent from elsewhere; or from the want of the influence of some matter necessary to its action. See CONSENT of parts.—For the force and effect of *sympathy*, in the production of monsters, see MONSTER.

*SYMPHONIACO style*. See the article STYLE.

*SYMPHONY*\*, ΣΥΜΦΩΝΙΑ, in music, properly denotes a consonance, or concert of several sounds agreeable to the ear; whether they be vocal or instrumental, or both; called also *harmony*. See HARMONY and CONSONANCE.

\* The word is formed from the Greek, *συμ*, with, and *φωνή*, sound.

Some authors restrain *symphony* to the sole music of instruments: in this sense, say they, the recitativo's in such an opera were intolerable, but the *symphonies* excellent. See OPERA.

The *symphony* of the ancients went no further than to two or more voices or instruments set to unison; for they had no such thing as music in parts; as is very well proved by M. Perrault: at least, if ever they knew such a thing, it must be allowed to have been lost. See SYNAULIA.

It is to Guido Aretine we owe the invention of composition: it was he first joined in one harmony several distinct melodies; and brought it even the length of four parts, *viz.* bass, tenor, counter-tenor and treble. See HARMONY and MELODY.

*SYMPHYISIS*\*, in medicine, one of the manners of articulating, or jointing the bones. See ARTICULATION.

\* The word is Greek, *συμφυσις*, and signifies a natural coherence or connexion.

*Symphysis* is a natural union, whereby two separate bones coalesce, and grow together; so as neither retains any proper, distinct motion.

Such are most of the junctures of the epiphyses, and many others of bones, which in children are separate, but with age grow together; as the os ethmoides, the bones of the cranium, os sacrum, &c. See BONE, EPIPHYSES, &c.

The *symphysis*, or natural union of bones, is of two kinds; either with a medium, or without.

*SYMPHYISIS without a medium*, is where two bones unite, and grow together of themselves without the intervention of any third thing.—Such are the *symphyses* of the epiphyses with the principal bones; such also are those of the lower jaw.

This

This union is effected much after the same manner as that of a graft and a tree. See ENGRAFTING.

The **SYMPHYSIS** *with a medium*, is of three kinds, called *synneurosis*, *syssarcosis*, and *synchondrosis*; each whereof see under its proper article, **SYNNEUROSIS**, &c.

**SYMPOSIAC**\*, **ΣΥΜΠΟΣΙΑΚΟΝ**, a conference or conversation of philosophers at a banquet.

\* The word is formed from the Greek, *συμπόσιος*, *convivium*, feast.

Plutarch has nine books which he calls *symposiasts*; or, *symposiac* questions, *q. d.* disputations at table.

**SYMPTOM**, **ΣΥΜΠΤΩΜΑ**, in medicine, is ordinarily confounded with *sign*, and defined an appearance, or assemblage of appearances, in a disease, which shew or indicate its nature and quality; and from which one may judge of the event thereof. See **SIGN**.

In which sense, a delirium is held a *symptom* of a fever.—Pain, waking, drowsiness, convulsions, suppression of urine, difficulties of breathing and swallowing, coughs, distastes, nausea, thirst, swoonings, faintings, looseness, costiveness, drincks, and blackness of the tongue, are the principal *symptoms* of diseases.

Boerhaave gives a more just notion of *symptom*: every preternatural thing arising from a disease, as its cause, in such manner, however, as that it may be distinguished from the disease itself, and from its next cause, is properly a *symptom* of that disease. See **DISEASE**.

If it arise, after the same manner, from the cause of the disease, it is called a *symptom of the cause*. See **CAUSE**.—If it arise from some former *symptom* as its cause, it is properly called a *symptom of a symptom*.

Whatever happens to a disease, from any other causes than those mentioned, is more properly called an *epigenema*.

Hence it appears, that the *symptoms* above-recited are really diseases themselves.—They are various as to number, effect, &c. Though, after the ancients, they may be conveniently enough reduced to faults in the functions, excretions, and retentions.

Under the first come all diminutions, abolitions, increases, and depravations of animal actions, particularly with regard to hunger and thirst, sleeping and waking. See **HUNGER**, **THIRST**, &c.

Under the second come nausea's, vomitings, lenteries, coeliac affections, diarrhoeas, dysenteries, iliac passions, &c.

Under the third come the jaundice, stone, dropsy, fever, ischuria, strangury, asthma, catarrh, &c. Each whereof see under its respective article, **HUNGER**, **NAUSEA**, **LIENTERY**, **DIARRHOEA**, **JAUNDICE**, **DROPSY**, **STONE**, **FEVER**, &c.

**Critical SYMPTOMS**. See the article **CRITICAL**.

**SYMPTOMATICAL**, in medicine, is a term often used to denote the difference between the primary and secondary causes in diseases.—As, a fever from pain is said to be *symptomatical*, because it rises from pain only; and therefore the ordinary means in fevers are not, in such cases, to be had recourse to; but to what will remove the pain; for when that ceases, the fever will cease, without any direct means taken for it. See **FEVER**.

**SYNÆRESIS**, **ΣΥΝΑΙΡΕΣΙΣ**, *contraction*; in grammar, a figure, whereby two syllables are united in one.—As, *vehemens* for *vehemens*. See **CONTRACTION**.

**SYNAGOGUE**\*, **ΣΥΝΑΓΟΓΑ**, a particular assembly of Jews, met to perform the offices of their religion.—Also, the place wherein they meet. See **JUDAISM**.

\* The word is Greek, *συναγωγή*, which literally imports assembly, congregation.

Some authors take the use of *synagogues* to be of no old standing among the Jews; and maintain, that it was not till after their return from the Babylonish captivity, that the opinion first got footing, that the worship of God was not so restrained to the temple at Jerusalem, that it could not be held any where else. The consequence of which new opinion was, that the Jews began to build them *synagogues* in all their cities.

Others hold, that there were *synagogues* even in the time of David.—But be this as it will, no assemblies of the Jews appear to have been called *synagogues* till a little before the coming of Jesus Christ; who is said to have preached in the middle of the *synagogue*.

There were reckoned four hundred and eighty *synagogues* in the single city of Jerusalem.—There are still *synagogues* subsisting at London, Amsterdam, Rotterdam, Avignon, Metz, &c.

**SYNALŒPHA**, **ΣΥΝΑΛΟΙΦΗ**, in grammar, a contraction of syllables, performed principally, by suppressing some vowel or diphthong at the end of a word, on account of another vowel or diphthong at the beginning of the next.—As, *ill' ego*, for *ille ego*, &c. See **ELISION**.

**SYNANCHE**\*, **ΣΥΝΑΡΧΗ**, in medicine, a kind of quinzy, wherein the internal muscles of the fauces, or pharynx, are attacked. See **ANGINA** and **QUINZY**.

\* The word is formed from the Greek, *συν*, with, and *αρχή*, to constrict, suffocate.

When the external muscles of the same part are seized, it is called a *parasyanche*. See **PARASYNANCHE**.

**SYNARTHROIDALIS diarthrosis**. See the article **DIARTHROSIS**.

**SYNARTHROSIS**\*, **ΣΥΝΑΡΘΡΟΣΙΣ**, in anatomy, a kind of articulation, or jointure of the bones of the body; wherein they remain without any, at least apparent motion. See **ARTICULATION**.

\* The word is formed from the Greek, *συν*, with, and *αρθρον*, articulus, joint.

The *synarthrosis* is when the bones are bound so fast together, that they are rendered immoveable with regard to each other.—In which view it stands opposed to *diarthrosis*. See **DIARTHROSIS**.

It is divided into three kinds: the first, *futura*; which is sometimes in form of two combs, or saws, the teeth whereof enter into one another; and sometimes in form of scales, one ledge lapping over the other. See **SUTURE**.

The second kind is called *harmonia*; which is when the bones meet in an even line, whether it be right or circular. See **HARMONIA**.

The third, called *gomphosis*, is when one bone is fixed into another, like a nail or peg into a hole. See **GOMPHOSIS**.

To these three kinds of *synarthrosis*, some add several others, as *symphysis*, *syntenosis*, and *synneurosis*. See **SYMPHYSIS**, &c.

**SYNAULIA**, **ΣΥΝΑΥΛΙΑ**, in the ancient music, a contest of pipes, or flutes, performing alternately, without voices.

Mr. Malcolm, who doubts whether the ancients had properly any such thing as instrumental music, that is, music composed wholly for instruments, without any singing; yet quotes the practice of the *synaulia* from Athenæus. See **SYMPHONY**, **HARMONY**, **MUSIC**, &c.

**SYNCATEGOREMA**, **ΣΥΝΚΑΤΗΓΟΡΗΜΑ**, in logic, denotes a word, which signifying little or nothing of itself, yet when joined with others, adds force thereto: as, *all*, *none*, *certain*, &c. See **CATEGOREMA**.

**SYNCELLUS**\*, or **SINCELLUS**, an ancient officer in the family of the patriarchs, and other prelates of the eastern church.

\* The word, in the corrupt Greek, *συγκλη*, signifies a person who lies in the chamber with another: a chamber-fellow, or chum.

The *syncellus* was an ecclesiastic, who lived with the patriarch of Constantinople, to be a witness of his conduct; whence it is, that the *syncellus* was called the *patriarch's eye*, because his business was to observe and watch.

The other prelates had also their *syncelli*, who were clerks living in the house with them, and even lying in the same chamber, to be witnesses of the purity of their manners.

Afterwards the office degenerated into a mere dignity; and there were made *syncelli* of churches.—At last it became a title of honour, and was bestowed by the emperor on the prelates themselves; whom they called *pontifical syncelli*, and *syncelli augustales*.

There were also *syncelli* in the western church, particularly in France. The sixth council of Paris speaks with a deal of indignation of some bishops who abolished the office of *syncelli*, and lay alone; and strictly enjoins them, that, for the future, to take away all occasion of scandal, they make the office of *syncelli* inseparable from that of bishops.

**SYCHONDROSIS**\*, **ΣΥΤΧΟΝΔΡΩΣΙΣ**, in anatomy, a kind of articulation of the bones of the body; being a species of symphysis. See **SYMPHYSIS**.

\* The word is formed from the Greek, *συν*, with, and *χονδρος*, cartilage. See **CARTILAGE**.

The *synchondrosis* signifies the union of two bones by means of a cartilage: in which manner the ribs are joined to the sternum, and the parts of the os pubis to one another.

**SYNCHRONISM**\*, **ΣΥΤΧΡΟΝΙΣΜΟΣ**, the being or happening of several things in the same time. See **CONTEMPORARY** and **TIME**.

\* The word is formed from the Greek, *συν*, and *χρονος*, time.

The happening or performing of several things in equal times, as the vibrations of pendulums, &c. is more properly called *isochronism*: though some authors confound the two. See **ISOCHRONAL**.

**SYNCOPATION**, in music, denotes a striking or breaking of the time; whereby the distinction of the several times or parts of the measure is interrupted. See **TIME**, **MEASURE**, &c.

**SYNCOPATION**, or **SYNCOPE**, is more particularly used for the connecting the last note of one measure or bar with the first of the following measure; so as only to make one note of both.

A *syncope* is sometimes also made in the middle of a measure.

**SYNCOPATION**, is also used when a note of one part ends or terminates on the middle of a note of the other part.

This is otherwise denominated *binding*.

**SYNCOPATION** is also used for *driving a note*; that is, when some shorter note at the beginning of a measure or half measure is followed by two, three, or more longer notes, before another short note occurs, equal to that which occasioned the driving, to make the number even—*e. gr.* when an odd crotchet comes before two or three minims, or an odd quaver before two, three, or more crotchets.

In

In *syncopated* or driving notes, the hand or foot is taken up, or put down while the note is sounding.

**SYNCOPE** \*, ΣΥΓΚΟΠΗ, in medicine, a deep, and sudden swooning, wherein the patient continues without any sensible heat, motion, sense, or respiration; is seized with a cold sweat over the whole body, and all the parts turn pale, and cold, as if dead. See **DELIQUIUM**.

\* The word is formed from the Greek, *συν*, with, and *κοπῆ*, to cut, or strike.

There are several causes of *syncopes*: 1°. Too great an exhaustion of spirits; as after long diets, excessive evacuations, violent exercises, long bathings, &c.—2°. The irregular motion of the spirits preventing their due influx into the parts; as sometimes happens in fear, wrath, and other violent passions.—3°. Immoderate hæmorrhages.—4°. An ill constitution of blood; as in cacoehymias, or in persons who have taken something that either dissolves or coagulates the blood.—5°. Secret diseases, as abscesses, or polypus's of the heart, worms, &c.

In very numerous, crowded assemblies, people sometimes fall into *syncopes*, through the hot, thick, impure air, they breathe.—Some women are liable to them upon the smell of must, civet, &c.

For *syncopes*, give volatile spirits, and aromatics. Heurnius recommends treacle-water, and cinnamon-water; and Et-muller the volatile salt of vipers, spirit of sal armoniac, oil of amber, and sometimes bleeding.

**SYNCOPE**, in grammar, denotes an elision, or retrenchment of one or more letters, or syllables from a word.

As when we say *virum* for *virorum*; and *manet alta mente repositum*, for *repositum*.

**SYNDESMUS** \*, in anatomy, is sometimes used for a ligament. See **LIGAMENT**.

\* The word in the original Greek, *συνδεσμος*, signifies a joining together.

In grammar, *syndesmus* is used for a conjunction. See **CONJUNCTION**.

**SYNDIC** \*, in government and commerce, an officer in divers countries, intrusted with the affairs of a city, or other community; who calls meetings, makes representations and solicitations to the ministry, magistracy, &c. according to the exigency of the case.

\* The word is formed from the Latin, *syndicus*, and that from the Greek, *συνδικος*, which signifies the same.

The *syndic* is appointed to answer and account for the conduct of the body; makes and receives proposals for the advantage thereof; controuls and corrects the failings of particular persons of the body, or, at least, procures their correction at a public meeting.—In effect, the *syndic* is, at the same time, both the agent and censor of the community. Almost all the companies in Paris, &c. as the university, companies of arts and trades, have their *syndics*; and so have most of the cities of Provence and Languedoc.

**SYNDIC** is also used for a person appointed to solicit some common affair, wherein he himself has a share; as happens particularly among several creditors of the same debtor, who fails, or dies insolvent. See **ADVOCATE**, &c.

The chief magistrate of Geneva is also called *syndic*. There are four *syndics* chose every year; the eldest of whom presides in the council of twenty-five, which is the chief council of the city, wherein all affairs are dispatched both civil and political: thus the other three elect cannot all come at the office till the four years end; so that the syndicate rolls among sixteen persons, all chosen out of the council of twenty-five.

**SYNDROME**, ΣΥΝΔΡΟΜΗ, the concurrence or combination of symptoms in any disease. See **SYMPTOM**.

**SYNECDOCHE** \*, ΣΥΝΕΚΔΟΧΗ, in rhetoric, a kind of figure, or rather trope, frequent among orators, and poets. See **FIGURE**.

\* The word is Greek, formed of *συνεκδοχῆμαι*, I take together.

There are three kinds of *synecdoches*: by the first, a part is taken for the whole; as the point for the sword; the roof for the house; the sails for the ship, &c.

By the second, the whole is used for a part.—By the third, the matter whereof the thing is made, is used for the thing itself; as steel for sword, silver for money, &c.

To which may be added another kind, where the species is used for the genus, or the genus for the species.—As, he bore the sin of many, i. e. of all.

**SYNECPHONESIS**, or **SYMPHONESIS**, in grammar, a coalition, whereby two syllables are pronounced as one. See **SYLLABLE**.

It is much the same thing as *synalæpha*, or *synæresis*. See **SYNALOEPIA**, **SYNÆRESIS**, &c.

**SYNEDRIN**, or **SYNEDRION**. See **SANHEDRIN**.

**SYNEMMENON** note. See the article **NOTE**.

**SYNEUROSI** \*, in anatomy, a kind of articulation, or jointure of the bones. See **ARTICULATION**.

\* The word is formed from the Greek, *συν*, with, and *νευρον*, nerve.

The *syneurosis* is reckoned a branch of the symphysis; and is when the bones are connected together by a ligament: as

VOL. II. N°. CXLIX.

is the os femoris, to the os ischium; the patella to the tibia.

See **SYMPHYSIS**.

**SYNOCHA**, a name given by some to a continual fever, which admits of intentions and remissions. See **FEVER** and **CONTINUAL**.

**SYNOCHUS**, ΣΥΝΟΧΟΣ, denotes a continent fever, which proceeds without any remission to the end. See **CONTINENT** and **FEVER**.

**SYNOD** \*, in astronomy, a conjunction, or concurrence of two or more stars, or planets in the same optical place of the heavens. See **CONJUNCTION**.

\* The word is formed from the Greek, *συνδῶ*, convention, assembly; compounded of *συν*, with, and *δῶ*, *via*, way.

**SYNOD**, **SYNODUS**, in church history, a council; or a meeting, or assembly of ecclesiastics, to consult of matters of religion. See **COUNCIL**.

Of these there are four kinds, viz.

*General*, or *oecumenical*, where bishops, &c. meet from all nations. See **OECUMENICAL**.

*National*; where those of one nation only come together.

*Provincial*; where they of one only province meet. And

*Diocesan*; where those of but one diocese meet. See **CONVOCA-TION**.

**SYNODALS**, or **SYNODIES**, were pecuniary rents (commonly of two shillings) paid to the bishop, or archdeacon, at the time of their Easter visitation, by every parish priest.

They were thus called because usually paid in synods: for that anciently bishops used to visit and hold their diocesan synods at once.—For the same reason, they are sometimes also denominated *synodalia*, but more usually *procurations*. See **PROCURATION**.

**SYNODALES testes**, an appellation anciently given to the urban and rural deans; from their informing against, and attesting the disorders of the clergy and people in the episcopal synod. See **DEAN**.

When these sunk in their authority, in their stead rose another sort of *synodal* witnesses, who were a sort of impanelled jury, consisting of a priest, and two or three laymen for every parish: though at length two for every diocese were annually chosen; till at last the office came to be devolved on the churchwardens. See **CHURCHWARDEN**.

Some think our quest-men, who are assistants to the churchwardens, were called *sidefmen*, quasi, *synodifmen*. See **SIDES-men**, and **QUEST-men**.

**SYNOCALE instrumentum**, a solemn oath or engagement that these synodical witnesses took; as our churchwardens now are sworn to make just presentments.

**SYNODICAL**, ΣΥΝΟΔΙΚΟΣ, something belonging to a synod. See **SYNOD**.

**SYNODICAL epistles**, are circular letters wrote by synods to the absent prelates and churches; or even those general ones directed to all the faithful, to inform them of what had passed in the synod.

In the collection of councils are abundance of these *synodical* epistles. See **COUNCIL**.

**SYNODICAL month**, is the period or interval of time, wherein the moon, departing from the sun at a synod or conjunction, returns to him again. See **MOON**.

Kepler found the quantity of the mean *synodical* month, twenty-nine days, twelve hours, forty-four minutes, three seconds, eleven thirds. See **MONTH**.

This period is also called a *lunation*; in regard, in the course hereof, the moon puts on all her phases or appearances. See **LUNATION**.

**SYNODIES**. See the article **SYNODALS**.

**SYNOD's-men**, *testes synodales*. See **SYNODALES**, and **SIDES-men**.

**SYNOECIA**, ΣΥΝΟΙΚΙΑ, in antiquity, a feast celebrated at Athens, in memory of Theseus's having united all the petty communities of Attica, into one single commonwealth; the seat whereof was Athens; where all the assemblies were to be held.

The feast was dedicated to Minerva; and, according to the scholiast of Thucydides, was held in the month Metagitnion.

**SYNONYMOUS**, **SYNONYMUS**, is applied to a word or term that has the same import, or signification with another. See **SYNONYMY**.

Some severe critics condemn all use of *synonymous* terms in the same period; but this is to condemn all antiquity: so far is the use thereof from being vicious, that it is frequently necessary; as synonyma's contribute both to the force and clearness of the expression. If the first word sketch out the resemblance of the thing it represents, the synonym that follows, is, as it were, a second touch of the pencil, and finishes the image.

Indeed they must be used with a deal of discretion and œconomy. The stile must be raised and brightened, not stuffed or loaded with *synonymous* terms. They must be used as ornaments, and to render the expression the more forcible, without making a shew of the riches thereof, or heaping synonyma's on synonyma's.

But, though *synonymous* words be laudable; *synonymous* phrases

are inexcusable: the reason is, that two *synonymous* phrases keep the mind at rest, and let it flag, and languish.

**SYNONYMY**\*, **SYNONYMIA**, in rhetoric, a figure whereby synonyms, or synonymous terms, that is, various words of the same signification, are made use of, to amplify the discourse. See **SYNONYMOUS** and **AMPLIFICATION**.

\* The word is formed from the Greek, *συν*, with, and *ονομα*, name.

Such is that passage in Cicero, *abiit, evasit, effugit, erupit*, he went off, he escaped, he run away, &c. See **SYNONYMOUS**.

**SYNOVIA**, or **SINONIA**, in medicine, a term used by Paracelsus and his school, for the nutritious juice proper and peculiar to each part. See **NUTRITION**.

Thus they talk of the *synovia* of the joints of the brain, &c. Others use *synovia* for the gout, and other diseases in the joints, arising from a vice in the nutritious juice.

Others restrain it to the oozing out of the nutritious juice through a wounded part; especially a joint.

Van Helmont defines *synovia*, a kind of transparent mucilage, like seed, such as issues from the legs of a calf upon cutting off the feet.

**SYNTAGMA**, **ΣΥΝΤΑΓΜΑ**, the disposing or placing of things in an orderly manner. See **COMPOSITION**.

**SYNTAX**, **ΣΥΝΤΑΞΙΣ**, in grammar, the construction or connexion of the words of a language into sentences, or phrases. See **WORD**, **SENTENCE**, **PHRASE**, &c.

F. Buffier more accurately defines *syntax*, the manner of constructing one word with another, with regard to the different terminations thereof, prescribed by the rules of grammar. See **CONSTRUCTION**.

Some authors, as M. Vaugelas, &c. confound *syntax* with style; but there is a real difference. See **STYLE**.

The office of *syntax*, is to consider the natural suitableness of words with respect to one another; in order to make them agree in gender, number, person, mood, &c. See **CONCORD**. To offend in any of these points, is called to offend against *syntax*: and such kind of offence, when gross, is called a *solecism*; and when more slight, a *barbarism*. See **SOLECISM** and **BARBARISM**.

The several parts of speech, are, with regard to language, what materials are with regard to a building. How well prepared soever they may be, they will never make a house, unless they be placed conformably to the rules of architecture. It is properly the *syntax* that gives the form to language; and it is that on which turns the most essential part of grammar. See **GRAMMAR**, **LANGUAGE**, &c.

There are two kinds of *syntax*; the one of *concord*, wherein the words are to agree in gender, number, case, and person. See **CONCORD**.

The other, of *regimen* or *government*, wherein one word governs another, and occasions some variation therein. See **REGIMEN**.

The first, generally speaking, is the same in all languages, as being the natural series of what is used almost every where, the better to distinguish discourse. Thus, the distinction of two numbers, singular and plural, has rendered it necessary to make the adjective agree with the substantive in number; that is, to make the one singular or plural, when the other is so: for, as the substantive is the subject confusedly, though directly, marked by the adjective; if the substantive expresses several, there must be several subjects expressed in that form by the adjective; and by consequence it ought to be in the plural: as *homines docti*, learned men: but there being no variety of termination in the adjective in English to distinguish the number, it is only implied. See **NUMBER**.

The distinction of masculine and feminine gender, obliges the languages which have distinct terminations, to have a concordance or agreement between the substantive and adjective, in gender as well as number: and for the same reason, the verbs are to agree with the nouns and pronouns in number and person. If at any time we meet with any thing that seems to contradict these rules, it is by a figure of speech, *i. e.* by having some word understood, or by considering the thoughts rather than the words themselves. See **GENDER**.

The *syntax* of government, on the contrary, is generally arbitrary; and, on that account, differs in most languages. One language, for instance, forms their regimen by cases; as the Latin and Greek: others use particles in lieu thereof; as the English, French, Italian, Spanish, &c. See **CASE** and **PARTICLE**.

One or two general rules, however, may be here noted, which obtain in all languages. 1°. That there is no nominative case, but has a relation to some verb, either expressed or understood; since we do not only speak to express what we perceive, but to express what we think of what we perceive, which is done by the verb. See **NOMINATIVE**.

2°. That there is no verb but has its nominative case either expressed or understood; for the office of the verb being to affirm, there must be something to affirm of; which is the subject or nominative case of the verb; except before an in-

finitive, where it is an accusative; as *scio Petrum esse doctum*, I know Peter to be learned. See **VERB**.

3°. That there is no adjective but has a relation to some substantive; in regard the adjective marks confusedly the substantive, which is the subject of the form or quality distinctly marked by the adjective. See **ADJECTIVE**.

4°. That there never comes any genitive case but what is governed by some other noun. See **GENITIVE**.

5°. The government of verbs is frequently taken from various sorts of references, included in the cases, according to the caprice of custom or usage; which yet does not change the specific relation of each case, but only shews that custom has made choice of this or that.—Thus, the Latins say, *juvare aliquem & opitulari alicui*; the French, *servir quelqu'un & servir a quelque chose*; and in the Spanish, the generality of verbs govern indifferently a dative and an accusative case.

**SYNTEXIS**, **ΣΥΝΤΕΞΙΣ**, in medicine, an attenuation or colliquation of the solids of the body; such as frequently happens in atrophies, inflammations of the bowels, colliquative fevers, &c. wherein a fatty uliginous matter is voided with the excrements by stool. See **COLLIQUATION**, **ATTENUATION**, &c.

**SYNTHESIS**\*, **ΣΥΝΘΕΣΙΣ**, composition, or the putting of several things together: as in making a compound medicine of several simple ingredients, &c. See **COMPOSITION**.

\* The word is formed from the Greek, *συν*, with, and *θεσις*, positio.

**SYNTHESIS**, in logic, denotes a branch of method, opposite to analysis. See **METHOD**.

In the *synthesis*, or *synthetic method*, we pursue the truth by reasons drawn from principles before established, or assumed, and propositions formerly proved; thus proceeding by a regular chain, till we come to the conclusion.

Such is the method in Euclid's *Elements*, and most demonstrations of the ancient mathematicians, which proceed from definitions and axioms, to prove propositions, &c. and from those propositions proved, to prove others.

This method we also call *composition*, in opposition to *analysis* or *resolution*. See **COMPOSITION**.

**SYNTHESIS**, in grammar. See **SYLLEPSIS**.

**SYNTHESIS**, in surgery, an operation, whereby divided parts are re-united; as in wounds, fractures, &c.

**SYNTHETIC method**. See **SYNTHESIS** and **METHOD**.

**SYNUSIASTS**\*, **ΣΥΝΥΣΙΑΣΤÆ**, **ΣΥΝΟΥΣΙΑΣΤΑΙ**, a sect of heretics, who maintained, that there was but one nature, and one single substance in Jesus Christ.

\* The word is formed from the Greek, *συν*, with, and *ουσια*, substance.

The *Synusists* denied, that the word assumed a body in the womb of the virgin; but held, that a part of the divine word being detached from the rest, was there changed into flesh and blood.—Thus they taught, that Jesus Christ was consubstantial to the Father, not only as to his divinity, but even as to his humanity and very body.

**SYPHILIS**\*, is a term used by some writers for the lues venerea. See **VENEREAL**.

\* Some derive it from *συν*, cum, with, and *φιλια*, amor, or *amicitia*, love, or friendship; because it proceeds from the infectious intercourse of lovers in coition. Others will have it come from the name of a shepherd so called, who was remarkably afflicted with this disease.—However, divers authors of note use the term; particularly Fracastorius, a famous Italian physician, who uses it for the title of a fine poem, which he wrote upon that distemper.

**SYPHON**, or **SIPHON**. See the article **SIPHON**.

**SYRENS**, **SIRENES**, in antiquity. See **SIREN**.

**SYRIAC bibles**. See the article **BIBLE**.

**SYRIAN year**. See the article **YEAR**.

**SYRINGE**\*, an instrument serving to imbibe, or suck up a quantity of any fluid, and to squirt or expel the same with violence. See **SUCTION**, &c.

\* The word is formed from the Greek, *σφινξ*, or Latin, *syrinx*, pipe.

The *syringe* is made of a hollow cylinder, as ABCD (Tab. *Hydrostatics*, fig. 26.) furnished with a little tube at bottom, EF. In this cylinder, is an embolus, K, made, or at least covered with leather, or other matter that easily imbibes moisture; and so filling the cavity of the cylinder, as that no air or water may pass between the one and the other.

If, then, the little end of the tube F be put in water, and the embolus drawn out; the water will ascend into the cavity left by the embolus: and upon thrusting back the embolus, it will be violently expelled again through the same tube EF: and still, the greater impetus will the water be expelled withal, and to the greater distance, as the embolus is thrust down with the greater force, or the greater velocity.

This ascent of the water, the ancients, who supposed a plenum, attributed to nature's abhorrence of a vacuum: but the moderns, more reasonably, as well as more intelligibly, attribute it to the pressure of the atmosphere on the surface of the fluid. See **AIR** and **VACUUM**.

For, by drawing up the embolus, the air left in the cavity of the cylinder must be exceedingly rarified; so that being no longer a counter-balance to the air incumbent on the surface

face of the fluid; that prevails, and forces the water through the little tube, up into the body of the *syringe*.

In effect, a *syringe* is only a single pump, and the water ascends in it on the same principle, as in the common sucking pump; whence it follows, that water will not be raised in a *syringe*, to a height exceeding thirty-one feet. See PUMP and SUCTION.

*Syringes* are of considerable use in medicine and surgery. By them clysters are administered: injections of medicinal waters, &c. made into wounds, &c. They also serve to inject coloured liquors, melted wax, &c. into the dried vessels of the parts of animals, to shew the disposition, texture, ramifications, &c. thereof. See INJECTION.

**SYROP\***, **SYRUPUS**, or **SIRUPUS**, in pharmacy, an agreeable liquor, or composition of a moderately thick consistence, made of juices, tinctures, or waters of fruits, flowers, or herbs boiled up, and sweetened with sugar, or honey; and taken either for health or pleasure.

\* Menage derives the word from the Arabic, *el-schorab*, potion, formed from the root *scherebe*, to drink.---Others derive it from the Greek, *συρω*, I draw, and *ορ*, juice. Eusthios, from *συρια ορ*, in regard these kind of liquors were much in use among the Syrians, a very delicate people. According to d'Herbelot, the words *syrup*, and *scherbet* or *forbet*, come both from the Arabic, *scharab*, which signifies any kind of drink in the general.

There are various kinds of *syrups*, denominated from the various fruits, &c. they are extracted from; as *syrup* of violets, of elder, of wormwood, of poppies, &c. emetic *syrups*, leniteric, and antinephritic *syrups*, &c. chologogue, phlegmagogue *syrups*, &c.

**SYROP of Sapor**, is an ancient medicament, the base whereof is apples, with juices of bugloss, anise, saffron, &c. thus called from Sapor king of Persia, who overcame the emperor Valerian, supposed to be the inventor thereof.

**SYROP of Sugar**. See the article SUGAR.

**SYSSARCOSIS\***, in anatomy, a particular species of the kind of articulation called *symphysis*. See SYMPHYSIS.

\* The word is Greek, compounded of *συ*, with, and *σαρξ*, flesh.

The *syssarcosis* is a natural union of two bones, by means of flesh or muscles: such is that of the os hyoides, and omoplata.

**SYSTEM\***, **SYSTEMA**, in the general, denotes an assemblage, or chain of principles, and conclusions: or the whole of any doctrine, the several parts whereof are bound together, and follow or depend on each other.

\* The word is formed from the Greek, *συστημα*, composition, compages.

In this sense, we say, a *system* of philosophy; a *system* of motion; a *system* of fevers, &c.—Divines have framed abundance of *systems* of grace: the *systems* of intermediate science, and predetermination, are invented to explain that of grace. See GRACE, &c.

Among physicians, some follow the *system* of alkali and acid; others that of the four qualities, &c.—Dr. Woodward accounts for most things on his *system* of the bile. See HYPOTHESIS, ACID, ALCALI, BILE, &c.

Des Cartes's *system* is held destructive to religion. See CARTESIANISM, CAUSE, OCCASIONAL, &c.—Gassendus renewed the ancient *system* of atoms; which was that of Democritus, followed by Epicurus, Lucretius, &c. See CORPUSCULAR, ATOMIC, &c.—Sir Isaac Newton's doctrine of colours, M. Leibnitz's *protogaea*, and some discourses of M. Jussieu, in the academy of sciences, to shew that there are bodies whose parts are not to be destroyed by any natural agents; are very favourable to the *system* of Gassendi. See ATOM, PARTICLE, HARDNESS, MATTER, &c.

Experiments and observations are the materials of *systems*: an infinity are required to build one. See EXPERIMENT and EXPERIMENTAL.

**SYSTEM**, in astronomy, denotes an hypothesis or supposition of a certain order, and arrangement of the several parts of the universe; whereby astronomers explain all the phenomena or appearances of the heavenly bodies, their motions, changes, &c. See ASTRONOMY, COELESTIAL, STAR, PLANET, &c.

This is more peculiarly called the *system of the world*, and sometimes the *solar system*. See WORLD, SOLAR, &c.

*System* and *hypothesis* have much the same signification; unless, perhaps, hypothesis be a more particular *system*; and *system* a more general hypothesis. See HYPOTHESIS.

Some late authors indeed, furnish a fresher distinction: an hypothesis, say they, is a mere supposition, or fiction; founded rather on imagination, than reason: a *system* is only built on the firmest ground, and raised by the severest rules: it is founded on astronomical observations, and physical causes, and confirmed by geometrical demonstrations.

The most celebrated *systems* of the world, are the *Ptolemaic*, and the *Copernican*; to which may be added, the *Tychonic*: the œconomy of each whereof, is as follows.

**Ptolemaic SYSTEM** places the earth at rest, in the centre of the universe; and makes the heavens revolve round the same from east to west, and carry all the heavenly bodies, stars,

and planets along with them. See PTOLEMAIC.

For the order, distances, &c. of the several bodies in this *system*, see *Tab. Astron. fig. 43*.

The principal asserters of this *system* are Aristotle, Hipparchus, Ptolemy, and many of the old philosophers, followed by the whole world, for a great number of ages; and still adhered to in divers universities, and other places, where free philosophizing is excluded: but the late improvements have put it out of all countenance; and we do not even want demonstration against it. See EARTH, &c.

**Copernican SYSTEM** places the sun at rest, nearly in the centre of the *system*; excepting for a vertiginous motion about his own axis. See SUN.

Around him move, from west to east, in several orbits, first Mercury, then Venus, the Earth, Mars, Jupiter, and Saturn. See PLANET.

About the earth, in a peculiar orbit, moves the moon; accompanying the earth, in its whole progress, round the sun. See MOON.

And after the same manner do four satellites move round Jupiter; and five round Saturn. See SATELLITES.

Atwart the planetary space do the comets move round the sun; only in very excentric orbits, probably parabola's, in one of whose foci is the sun. See COMET.

At an immense distance beyond the planetary and cometary spaces, are the fixed stars, which have all a proper motion from west to east. See STAR.

The *solar*, or *planetary SYSTEM*, is usually confined to narrower bounds: the stars, by their immense distance, and the little relation they appear to bear to us, being reputed no part thereof. It is highly probable, that each star, is, itself, a sun; and the centre of a particular *system*, surrounded with a company of planets, &c. which, in different periods, and at different distances, perform their courses round their respective suns; and are enlightened, warmed, and cherished thereby: hence we have a very magnificent idea of the world, and the immensity thereof: hence also arises a kind of *system of systems*. See UNIVERSE and PLANETARY. The planetary *system*, here described, is the most ancient in the world. It was the first that we know of, introduced into Greece and Italy by Pythagoras; whence, for many ages, it was called the *Pythagorean system*. It was followed by Philolaus, Plato, Archimedes, &c. but lost under the reign of the peripatetic philosophy; till happily retrieved above two hundred years ago by Nic. Copernicus; whence its new appellation of *Copernican system*.—For the œconomy of this *system*, see the scheme thereof, *Tab. Astron. fig. 44*. See also COPERNICAN.

**Tychonic SYSTEM**, in most respects, coincides with the Copernican; except in this, that, supposing the earth to be fixed, its orbit is omitted, and in lieu thereof, the sun's orbit is drawn round the earth, and made to intersect the orbit of Mars; that Mars may be nearer the earth than the sun.—But as there is not any reason, or foundation in nature, for such a manifest shift; and as the author was only led thereto from a superstitious persuasion, that to suppose the sun at rest, and the earth to move, is contrary to scripture; the true *system* is not much prejudiced hereby. See EARTH.—For the order and œconomy of the Tychonic *system*, see the scheme in *Tab. Astron. fig. 45*. See also TYCHONIC.

**SYSTEM**, in poetry, denotes a certain hypothesis, or scheme of religion, from which the poet is never to recede.—*E. gr.* Having made his choice either in the heathen mythology, or in christianity, he must keep the two apart; and never mix such different ideas in the said poem. See INVOCATION, MUSES, &c.

Thus, after invoking Apollo and the Muses, he must bid adieu to the language of christianity, and not confound the two *systems*.—The fabulous stile, indeed, is the richer and more figurative; but a pagan god makes but a miserable figure in a christian poem.—The *system* of poetry, Bouhours observes, is itself wholly fabulous and pagan.

**SYSTEM**, in music, denotes a compound interval; or an interval composed, or conceived to be composed of several lesser.—Such as is the *octave*, &c. See INTERVAL.

The word is borrowed from the ancients; who call a simple interval, *diastem*, and a compound one *system*. See DIASTEM.

As there is not any interval in the nature of things; so we can conceive any given interval, as composed of, or equal to, the sum of several others. This division of intervals, therefore only relates to practice; so that a *system* is properly an interval which is actually divided in practice, and where, along with the extremes, we conceive always some intermediate terms.

The nature of a *system* will appear plain, by conceiving it as an interval whose terms are in practice, taken either in immediate succession; or the sound is made to rise and fall, from the one to the other, by touching some intermediate degrees: so that the whole is a *system* or composition of all the intervals between one extreme and the other.

*Systems* of the same magnitude, and consequently of the same degree of concord and discord, may yet differ in respect of their composition; as containing and being actually divided into more, or fewer intervals: and when they are equal in that

that respect, the parts may differ in magnitude. Lastly, when they consist of the same parts, or lesser intervals, they may differ as to the order and disposition thereof between the two extremes.

There are several distinctions of *systems*; the most remarkable is, into *concinuous* and *inconcinuous*.

**Concinuous SYSTEMS**, are those consisting of such parts as are fit for music; and those parts placed in such an order between the extremes, as that the succession of sounds, from one extreme to the other, may have a good effect. See **CONCINNOUS**.

**Inconcinuous SYSTEMS**, are those, where the simple intervals are inconcinuous, or ill disposed betwixt the extremes.

*Systems*, again, are either *particular* or *universal*.

**Universal SYSTEM**, is that which contains all the particular *systems* belonging to music; and makes what the ancients call the *diagramma*, and we the *scale of music*. See **DIAGRAMMA**, **SCALE**, **GAMMUT**, &c.

The ancients also distinguish *systems* into *perfect* and *imperfect*.

—The *disdiapason*, or double octave, was reckoned the perfect *system*, because within its extremes are contained examples of all the simple and original concords, and in all the variety of order wherein their concinuous part ought to be taken; which variety constitutes what they call the *species*, or *figures of consonances*. See **DISDIAPASON**.—All the *systems*, less than the *disdiapason*, were reckoned imperfect.

The double octave was also called *systema maximum*, and *immutatum*; because they took it to be the greatest extent or difference of time that we could go in making melody; though some added a fifth to it, for the greatest *system*: but the *diapason*, or simple octave, was reckoned the most perfect, with respect to the agreement of its extremes; so that how many octaves soever were put into the greatest *system*, they were all to be constituted or sub-divided the same way as the first: so that when we know how the octave is divided, we know the nature of the *diagramma* or *scale*: the varieties whereof, constituted the genera *melodiæ*, which were subdivided into species. See **GENUS** and **SPECIES**.

**SYSTOLE**, **ΣΥΣΤΟΛΗ**, in medicine, the contraction of the heart of an animal; whereby the blood is driven out of its ventricles into the arteries. See **HEART**, **BLOOD**, **ARTERY**, &c.

The *systole* of the heart is well accounted for by Dr. Lower, who shews, that the heart is a true muscle, the fibres whereof are acted on like those of other muscles, by means of certain branches of the eighth pair of nerves inserted into it, which bring the animal spirits from the brain hither. By a flux of these spirits, the muscular fibres of the heart are inflated, and thus shortened; the length of the heart diminished, its breadth or thickness increased, the capacity of the ventricles closed, the tendinous mouths of the arteries dilated, those of the veins shut up by means of their valves, and the contained juice forcibly expressed into the orifices of the arteries. See **MUSCLE**.

And this we call *συστολή*, or contraction of the heart; the opposite state to which is called the *diastole*, or dilatation of the heart. See **DIASTOLE** and **PULSE**.

Dr. Drake adds to Dr. Lower's account, that the intercostal muscles and diaphragm, contribute to the *systole*, by opening the blood a passage from the right ventricle of the heart to the left through the lungs, to which it could not otherwise pass: by which means, the opposition the blood contained in

that ventricle must necessarily have made to its constriction, is taken off. See **CONTRACTION**.

Lower and Drake make the *systole* the natural state of action of the heart, and the *diastole* the violent one: Boerhaave, on the contrary, makes the *systole* the violent, and the *diastole* the natural state.

**SYXHINDEMEN**, or **SIXHINDEMEN**, a term purely Saxon, literally signifying six-hundred-men, or men worth six-hundred shillings a-piece.

In the time of our ancestors, all men were ranked into three classes; the *lowest*, the *middle*, and the *highest*; and were valued according to their class: that if any injury were done, satisfaction might be made to the value, or worth of the man it was done to. See **HINDENI**.

The *lowest* were called *twyhindemen*, *q. d.* valued at two hundred shillings; the *middle*, *sixhindemen*, *q. d.* valued at six hundred shillings; and the *highest*, *twelvehindemen*, *i. e.* valued at twelve hundred shillings. See **TWYHINDI** and **TWELVEHINDI**.

**SYZYG Y\***, **SYZYGIA**, in astronomy, a term equally used for the conjunction and opposition of a planet with the sun. See **CONJUNCTION** and **OPPOSITION**.

\* The word is formed from the Greek, *σύνζυγια*, which properly signifies *conjunctio*.

On the phenomena and circumstances of the *syzygies*, a great part of the lunar theory depends. See **MOON**.

For, 1°. It is shewn in the physical astronomy, that the force which diminishes the gravity of the moon in the *syzygies*, is double that which increases it in the quadratures: so that in the *syzygies*, the gravity of the moon from the action of the sun is diminished by a part, which is to the whole gravity as 1 to 89, 36; for in the quadratures, the addition of gravity is to the whole gravity as 1 to 178, 73. See **QUADRATURE**.

2°. In the *syzygies*, the disturbing force is directly as the distance of the moon from the earth, and inversely as the cube of the distance of the earth from the sun. And at the *syzygies*, the gravity of the moon towards the earth receding from its centre, is more diminished, than according to the inverse ratio of the square of the distance from that centre. Hence, in the motion of the moon from the *syzygies* to the quadratures, the gravity of the moon towards the earth is continually increased, and the moon is continually retarded in its motion; and in the motion from the quadratures to the *syzygies*, the moon's gravity is continually diminished, and its motion in its orbit accelerated. See **GRAVITY**.

3°. Further, in the *syzygies* the moon's orbit or circle round the earth is more convex than in the quadratures; for which reason the moon is less distant from the earth at the former than the latter. When the moon is in the *syzygies*, her apses go backwards, or are retrograde. See **ORBIT**, **ABSIS**, and **RETROGRADATION**.

When the moon is in the *syzygies*, the nodes move in antecedentia fastest; then slower and slower, till they become at rest when the moon is in the quadratures. See **NODE**.

Lastly, when the nodes are come to the *syzygies*, the inclination of the plane of the orbit is least of all. See **INCLINATION**.

Add, that these several irregularities are not equal in each *syzygy*, but all somewhat greater in the conjunction than the opposition. See **PLANET**, **MOON**, &c.

## T A B

**T**, A consonant, and the nineteenth letter in the alphabet. See LETTER and CONSONANT.

The *T*, in sound, bears a near resemblance to the *D*, for which reason they are often put for each other; and Quintilian even rallies those who made any scruple of writing the one indifferently for the other: as, *at* for *ad*, *set* for *sed*, *haut* for *haud*, &c. See *D*.

The *T* is one of the five consonants which the abbot de Dangeau calls *Palatal*, and which are *D-T*, *G-K*, and *N*: the four first whereof have the same relation to each other, as the labials *B-P* and *V-F* have. *D*, for instance, having the same relation to *T*, that *B* has to *P*, or *V* to *F*.

The *T*, the same author observes, is a letter of a strong sound; so that a feeble one cannot be heard before it: hence, to form the supine of *rego*, the *T* of *tum* changes the *g*, and strengthens it to the sound of a *c*; so that we say *rectum*; as in the preterperfect tense *rex*i, which we pronounce *rek*si.

**T** among the ancients was used as a numeral letter, signifying 160; according to the verse,

*T quoque centenos & sexaginta tenebit.*

When a dash was added a-top, thus, *T̄*, it signified 160 thousand. When the tribunes approved of the decrees of the senate, they testified their consent by subscribing a *T̄*.

**T**, in music, is sometimes used to mark the tenor part or pitch. See TENOR.

**T** is also a mark, or brand, which by statute 4 Hen. VII. every person convicted of any felony, save murder, and admitted to the benefit of the clergy, shall be marked withal, on the brawn of the left thumb. See CLERGY.

**T**, or **TAU**, in heraldry, is a kind of cross potent, or truncated; found in all the armories of the commanders of the order of St. Antony. See CROSS.

The azure *T*, or *Tau*, is seen in arms above 400 years old: its origin, according to some authors, is taken from the Apocalypse; where the same is a mark that the angel impresses on the foreheads of the elect. Others take it to represent a crutch; a symbol proper enough for this order, which was sworn to hospitality. But the truth, F. Menestrier observes, is, that it is the top of a Greek crozier.

The bishops and abbots of the Greek church wear it still; and if it be found on the habit of St. Antony, it is only to shew that he was an abbot.

**TABACCO**. See the article TOBACCO.

**TABBY**, in commerce, a kind of coarse taffety, watered.

It is manufactured like the common taffety, excepting that it is stronger and thicker both in the woof and warp. See TAFFETY.

The watering is given it by means of a calender, the rolls whereof are of iron or copper, variously engraven, which bearing unequally on the stuff render the surface thereof unequal, so as to reflect the rays of light differently. See CALENDER.

**TABBYING**, the passing a stuff under the calender, to make a representation of waves thereon, as on a tabby. See CALENDER, and TABBY.

It is usual to *tabby* mohairs, ribbands, &c.—*Tabbying* is performed without the addition of any water or dye; and furnishes the modern philosophers with a strong proof, that colours are only appearances. See COLOUR.

**TABELLA**, or **TABLET**, **TABULATUM**, in pharmacy, a solid kind of electuary, or confection, made of dry ingredients, usually with sugar, and formed into little flat morules, or squares; more usually called *Lozenges*, and sometimes *Morselli*, *Troches*, &c. See LOZENGE, MORSELLUS, TROCHE, &c.

Powders, fruits, salts, &c. are dissolved in sugar, and made into *Tabulæ*; as those of the juice of liquorice for colds, &c. See CONSERVE, &c.

We have *cordial*, *stomachic*, *aperitive*, and *hepatic Tablets*. Jellies and broths are sometimes reduced into *Tablets*, to be carried in the pocket.

*Tabellæ Manus Christi*, are made of sugar of roses pearled. *Tabellæ Magnanimitatis*, are those taken by feeble old men, when matched with young wives, to assist and bear them out in the affair of generation.

**TABELLIO**, **TABULARIUS**, in the Roman law, a *Scrivener*; a kind of officer often confounded with *notary*, *notarius*. Yet did the two differ in this; that the notaries only drew up, and kept the minutes of acts and instruments on paper, and in notes, or short-hand; whereas the *Tabelliones* delivered them engrossed fair on parchment, in full executory form.—The same also put the seals to contracts, and rendered them authentic. The domestic clerks of these *Tabelliones*, who, at first, wrote under them, in process of time came to be called notaries. See NOTARY.

Pasquier observes, that the *Tabelliones* at Rome were public slaves, appointed for the keeping of contracts made between private persons.—According to Loyseau, a contract wrote by a notary, was not perfect or obligatory, till the *Tabellio* had

VOL. II. N<sup>o</sup>. CXLIX.

## T A B

wrote it fair: after which the parties subscribed, *i. e.* they wrote at bottom that they approved the contents; for signatures were not then in use\*. See SIGNATURE.

\* *Quoniam Tabellionum usus in regno Angliæ non habetur, propter quod magis ad sigilla authentica credi est necesse, ut eorum copia facilius habeatur, statuimus ut sigillum habeant non solum archiepiscopi, & episcopi, sed eorum officiales.* See SEAL.

**TABERNACLE**\*, **TABERNACULUM**, among the Jews, the place wherein the ark of the covenant was lodged; both while they were in tents, during their journey from Egypt; and when fixed in Jerusalem, and the ark kept in the temple. See ARK.

\* The word is formed from the Latin *Tabernaculum*, a tent.

Philo describes the Jewish *Tabernacle* thus: it was a fabric composed of 48 cedar boards, lined with massive gold; under each whereof was a silver stand, or foot, and at the top a capital of gold: it was encompassed with ten pieces of rich tapestry, of different colours, purple, scarlet, hyacinth, &c.—The length of the *Tabernacle* was 30 cubits; its breadth 10, *Josephus* says 12.

The ark was placed in a secret oratory, in the middle of this *Tabernacle*; and was gilt both within side and without: the top whereof, being a kind of lid, was called *propitiatory*, because it appeased the wrath of God. See PROPITIATORY. The *Tabernacle* was encompassed with several veils, or curtains, stretched over it, with hooks, and buckles of gold.

*Fest of TABERNACLES*. See SCENOPEGIA.

**TABERNACLE** is also used of late for a sort of temporary church, or chapel, contrived to serve the immediate purpose of the parishioners, &c. while their proper church is repairing, rebuilding, or the like.

**TABES**, in medicine, a general name for consumptions of all kinds. See CONSUMPTION, PHTHISIS, ATROPHY, MARASMUS, &c.

**TABES Dorsalis**, is a kind, or rather a degree, of consumption, proceeding sometimes from an excessive application to venery. The patient has neither a fever, nor loss of appetite; but a sensation, as if there were a number of pinfires running from the head down the spinal marrow; and when he evacuates, either by urine or stool, there flows a liquid matter like semen. After any violent exercise his head is heavy, and his ears tingle; and at length he dies of a lypyria, *i. e.* a fever, where the external parts are cold, and the internal burn at the same time.

**TABLATURE**, in anatomy, a division or parting of the skull into two tables. See TABLE and CRANIUM.

**TABLATURE**, **TABLATURA**, in music, in the general, is, when, to express the sounds, of notes of a composition, we use letters of the alphabet, or cyphers, or any other characters, not usual in the modern music. See SCORE.

**TABLATURE**, in its stricter sense, is the manner of writing a piece for a lute, theorba, guitarre, bass-viol, or the like—which is done by writing on several parallel lines (each whereof represents a string of the instrument) certain letters of the alphabet; whereof, *A* marks that the string is to be struck open, *i. e.* without putting the finger of the left hand on the head; *B* shews, that one of the fingers is to be put on the first stop; *C* on the second; *D* on the third, &c. See VIOL, THEORBA, &c.

The *Tablature* of the lute is usually wrote in letters of the alphabet; that of the harpsicord in the common notes. See LUTE, HARPSICORD, &c.

**TABLE**, **TABULA**, a moveable, usually made of wood, or stone, supported on pillars, or the like; for the commodious reception of things placed thereon.

*Moses* made a *Table* in the tabernacle, for laying the shewbread upon, described by Philo Judæus as two cubits long, one broad, and one and half high.

Among Christians, the *Table*, or *Lord's Table*, signifies the Sacrament of the Supper. See EUCHARIST.

**Round TABLE**—*Knights of the Round TABLE*, a military order, supposed to have been instituted by Arthur the first king of the Britons, in the year 516. See KNIGHT.

They are said to have been 24 in number; all picked from among the bravest of the nation.

The *Round Table*, which gave them their title, was an invention of that prince, to avoid disputes about the upper and lower end; and to take away all emulation as to places.

Lesly assures us, he has seen the *Table* at Winchester; at least, says he, if we may believe the keepers thereof, who still shew it with a deal of solemnity. He adds, that the names of a great number of knights wrote around it, seem to confirm the truth of the tradition.

Larrey, and several other authors, make no scruple to relate this fable as matter of history: but that it is a fable is certain; F. Papebroch having shewn, that there was no such thing as an order of knights before the VIth century. See KNIGHT, ORDER, &c.

Camden observes, that the *Table* at Winchester is of a structure much more modern than the VIth century. It is added, that Arthur himself is no more than a fabulous prince. In effect, the *Round Table* does not appear to have been any military order, but rather a kind of just, or military exercise, between two persons, armed with lances. Several authors say, that Arthur, duke of Bretagne, renewed it. See Matthew Paris, the abbot Justiniani, and F. Helyot.

Paulus Jovius says, it was under the empire of Frederic Barbarossa, that the knights of the *Round Table* first began to be talked of: others attribute their origin to the factions of the Guelphs and Gibellins.—K. Edward built a house called the *Round Table*, the court whereof was 200 foot in diameter.

**TABLE**, in architecture, a smooth, simple member, or ornament, of various forms; but most usually in that of a long square. See the article **PLATBAND**, &c.

**Projecting TABLE**, is such a one as stands out from the naked of the wall, pedestal, or other matter it adorns.

**Raked TABLE**, is that which is hollowed in the die of a pedestal, or elsewhere, and which is usually encompassed with a moulding. See **RAKING**.

**Raised TABLE**, an embossment in a frontispiece, for the putting an inscription or other ornament in sculpture. This is what M. Perrault understands by *Abacus* in Vitruvius.

**Crowned TABLE**, that covered with a cornice, and wherein is cut a basso relievo, or a piece of black marble incrustated for an inscription.

**Rusticated TABLE**, that which is picked, and whose surface seems rough, as in grotto's, &c.

**Water TABLE**. See the article **WATER**.

**Plain TABLE**, a surveying instrument. See **PLAIN Table**.

**TABLE**, in perspective, denotes a plain surface, supposed to be transparent, and perpendicular to the horizon. See **PERSPECTIVE**.

It is always imagined to be placed at a certain distance between the eye and objects, for the objects to be represented thereon by means of visual rays passing from every point thereof through the *Table* to the eye. See **PERSPECTIVE**.

Whence it is also called *Perspective Plane*. See **PLANE**.

**TABLE**, in anatomy.—The cranium is said to be composed of two *Tables*, or laminæ, *i. e.* it is double, as if it consisted of two bones laid one over another. See **CRANIUM**.

**TABLE of Pythagoras**, called also *Multiplication Table*, is a square, formed of an hundred lesser squares, or cells, containing the products of the several digits, or simple numbers, multiplied by each other. See **MULTIPLICATION**.

As it is absolutely necessary, those who learn arithmetic have the several multiplications contained in this *Table* off by heart, we have thought fit to subjoin it here; with an example, to shew the manner of using it.

*Table of Pythagoras, or Multiplication Table.*

1	2	3	4	5	6	7	8	9	10
2	4	6	8	10	12	14	16	18	20
3	6	9	12	15	18	21	24	27	30
4	8	12	16	20	24	28	32	36	40
5	10	15	20	25	30	35	40	45	50
6	12	18	24	30	36	42	48	54	60
7	14	21	28	35	42	49	56	63	70
8	16	24	32	40	48	56	64	72	80
9	18	27	36	45	54	63	72	81	90
10	20	30	40	50	60	70	80	90	100

*Example*: Suppose it were required to know the product of 6, multiplied by 8, look for 6 in the first horizontal column, beginning with 1; then look for 8 in the first perpendicular column, beginning likewise with 1; the square or cell wherein the perpendicular column from 6, meets with the horizontal one from 8, contains the product required, *viz.* 48.

**Laws of the Twelve TABLES**, were the first set of laws of the Romans; thus called, either by reason the Romans then wrote with a style on thin wooden *Tablets*, covered with wax; or rather, because they were engraven on *Tables*, or plates of copper, to be exposed in the most noted part of the public forum. See **LAW**.

After the expulsion of the kings, as the Romans were then without any fixed, certain system of law; at least had none ample enough to take in the various cases that might fall between particular persons; it was resolved to adopt the best and wisest laws of the Greeks.

One Hermodorus was first appointed to translate them; and the Decemviri afterwards compiled and reduced them into ten *Tables*. After a world of care and application, they were at length enacted and confirmed by the senate, and an assembly of the people, in the year of Rome 303.

The following year they found some things wanting therein, which they supplied from the laws of the former kings of Rome, and from certain customs, which long use had authorized; these being engraven on two other *Tables*, made the *Law of the Twelve Tables*, so famous in the Roman Jurisprudence; the source and foundation of the civil or Roman law. See **CIVIL LAW**.

The laws of the twelve *Tables* were also called *Decemviral Laws*, from the officers entrusted with the composing them. See **DECEMVIR**.

It is great pity, this system of law should have perished through the injuries of time: we have now nothing of it, but a few fragments dispersed in divers authors. J. Gothofred has collected them together, and we have them in Rosinus, and some other authors.—The Latin is very old and barbarous, and remarkably obscure.

**New TABLES**, *TABULÆ Novæ*, an edict occasionally published in the Roman commonwealth, for the abolishing all kinds of debts, and annulling all obligations.

It was thus called, in regard all antecedent acts being destroyed, there were nothing but new ones to take place.

**TABLE**, among jewellers. A *TABLE Diamond*, or other precious stone, is that whose upper surface is quite flat, and only the sides cut in angles: in which sense a diamond cut *Table-wise* is used in opposition to a rose-diamond. See **DIAMOND**.

**TABLE Glass**. See the article **GLASS**.

**TABLE** is also used for an index or repertory, put at the beginning or end of a book, to direct the reader to any passage he may have occasion for.

Thus we say, *Table of Matters*; *Table of Authors quoted*; *Table of Chapters*, &c.—*Tables*, of themselves, sometimes, make large volumes; as that of *Dravitz* on the civil and canon laws.

**TABLES of the Bible**, are called *Concordances*. See **CONCORDANCE**.

**TABLE Rents**. See the article **BORD Lands**.

**TABLE of Houses**, among astrologers, are certain *Tables* ready drawn up for the assistance of practitioners in that art, for the erecting or drawing of figures or schemes. See **HOUSE**, &c.

**TABLES**, in mathematicks, are systems of numbers, calculated to be ready at hand for the expediting astronomical, geometrical, &c. operations. See **CANON**.

**Astronomical TABLES**, are computations of the motions, places, and other phænomena of the planets, both primary and secondary. See **PLANET**, **SATELLITE**, and **MOON**.

The oldest *Astronomical Tables* are the Ptolemaic, found in Ptolemy's *Almagest*; but these no longer agree with the heavens. See **ALMAGEST**.

In 1252, Alphonso XI. king of Castile, undertook the correcting them, chiefly by the assistance of Isaac Hazan, a Jew; and spent 400 thousand crowns therein. Thus arose the *Alphonfine Tables*, to which that prince himself prefixed a preface. But the deficiency of these was soon perceived by Purbachius and Regiomontanus; upon which Regiomontanus, and after him Waltherus and Warnerus, applied themselves to celestial observation, for the further amending them: but death prevented any progress therein.

Copernicus, in his books of the celestial revolutions, instead of the *Alphonfine Tables*, gives others of his own calculation, from the latter, and partly from his own observations.

From Copernicus's observations and theories, Eras. Reinholdus afterwards compiled the *Prutenic Tables*, which have been printed several times, and in several places.

Tycho de Brahe, even in his youth, became sensible of the deficiency of the *Prutenic Tables*; which was what determined him to apply himself with so much vigour to celestial observation. Yet all he did thereby, was to adjust the motions of the sun and moon; though Longomontanus, from the same, to the theories of the several planets published in his *Astronomia Danica*, added *Tables* of their motions, now called the *Danish Tables*; and Kepler likewise, from the same, in 1627, published the *Rudolphine Tables*, which are now much esteemed. These were afterwards, Anno 1650, turned into another form, by Maria Cunitia, whose astronomical *Tables*, comprehending the effect of Kepler's physical hypothesis, are exceedingly easy, and satisfy all the phænomena, without any trouble of calculation, or any mention of logarithms; so that the *Rudolphine* calculus is here greatly improved.

Mercator made a like attempt in his *Astronomical institution*, published in 1676; and the like did J. Bap. Morini, whose abridgment of the *Rudolphine Tables* was prefixed to a Latin version of Street's *Astronomia Carolina*, published in 1705.

Lanbergius, indeed, endeavoured to discredit the *Rudolphine Tables*, and framed *Perpetual Tables*, as he calls them, of the heavenly motions; but his attempt was never much regarded by the astronomers; and our countryman Horrox gave an abundant check to his arrogance, in his defence of the Keplerian astronomy.

Nor was the authority of the *Rudolphine Tables* impaired by the *Philolaic Tables* of Bullialdus, the *Britannic Tables* of Vincent Wing, calculated on Bullialdus's hypothesis; or the *Britannic Tables* of Newton; or the French ones of the count de Pagan,

Pagan, or the *Caroline Tables* of Street, all calculated on Dr. Ward's hypothesis, or the *Novalmagestic Tables* of Ricciolus. Among these, however, the *Philolaic* and *Caroline Tables* are esteemed the best; inasmuch, that Mr. Whiston, by the advice of Mr. Flamsteed (a person of undoubted authority in such cases) thought fit to subjoin the *Caroline Tables* to his astronomical lectures.

The latest *Tables* are the *Ludovician*, published in 1702, by M. de la Hire, wholly from his own observations, and without the assistance of any hypothesis; which, before the invention of the micrometer, telescope, and the pendulum-clock, was held impossible.

Another set of *Tables*, the astronomical world is in daily expectation of from Dr. Halley, astronomer royal, &c. It were needless to prepossess the public in their favour: the author's name, and the present state of astronomy, will leave no doubt on any body but that they will have the last degree of justness and precision, and such as posterity itself shall scarce be able to amend. They have been in the press several years, and what it is retards their publication is not known, unless it be the rendering them more ample. See ASTRONOMY.

*Sexagenary TABLES.* See the article SEXAGENARY.

For *TABLES of the Stars*, see CATALOGUE.

*TABLES of Sines, Tangents, and Secants*, of every degree and minute of a quadrant, used in trigonometrical operations, are usually called *Canons*. See CANON. See also SINE, TANGENT, &c.

*TABLES of Logarithms, Rhumbs, &c.* used in geometry, navigation, &c. See LOGARITHM, RHUMB, SAILING, TRAVERSE, &c.

*Loxodromick TABLES*, are *Tables* wherein the difference of longitude and quantity of the way run in any rhumb, are exhibited to every ten minutes of every degree of the quadrant variation of the latitude. See RHUMB.

*TABLE*, in heraldry. Coats, or escutcheons, containing nothing but the mere colour of the field, and not charged with any bearing, figure, moveable, &c. are called *Tables d'Attente*, *Tables of Expectation*, or *Tabulæ Rasæ*.

*TABLET*, in pharmacy, &c. See TABELLA.

*TABLING of Fines*, is the making a table for every county, where his majesty's writs run; containing the contents of every fine passed each term. See FINE.

It is to be done by the chirographer of fines of the common-pleas, who every day of the next term, after engrossing any such fine, fixes one of the said *Tables* in some open place of the said court, during its sitting; and likewise delivers to the sheriff of each county, a content of the said *Tables* made for that respective county, the term before the assizes, to be affixed in some place in the open court, while the justices sit, &c. See CHIROGRAPHER.

*TABOR*, *TABOURIN*, a small Drum. See DRUM.

*Privilege of the TABOURET*, in France, is a privilege some great ladies enjoy, to sit or have a stool in the queen's presence.

*TABORITES*, or *THABORITES*, a branch or sect of the ancient Hussites. See HUSSITE.

The Hussites, towards the close of the XVth century, dividing into several parties, one of them retired to a little mountain or rock, situate in Bohemia, 15 leagues from Prague, and there put themselves under the conduct of Zisca; building themselves a fort or *castle*, which they called *Tabor*, or *Thabor*, either from the general word *Thabor*, which in the Sclavonic language signifies *castle*; or from the mountain *Tabor*, mentioned in scripture: and hence they became denominated *Thaborites*.

These carried the point of reformation farther than Hufs had done; rejected purgatory, auricular confession, the unction at baptism, transubstantiation, &c.

They reduced the seven sacraments of the Romanists to four, viz. baptism, the eucharist, marriage, and ordination.

They maintained a stout war with the emperor Sigismund. Pope Martin V. was obliged to publish a croisade against them. Nor did this succeed: at length, however, in 1544, their *castle of Thabor* was taken, and they dispersed.

*TABULARIUS*. See the article TABELLIO.

*TABULARUM Apertura*, } See the articles { APERTURA.

*TABULATUM*, } See the articles { TABELLA.

*TACAMAHACA*, or *TACAMACHA*, a kind of resinous gum, distilling from the trunk of a very large tree, growing in New Spain; but, in greatest abundance, in the island of Madagascar. See GUM.

It is not unlike our poplar-tree, only bigger and taller, its leaves small and green, its fruit red, of the size of our wall-nuts, exceedingly resinous, and containing a stone like our peaches.

The wood of the tree makes good timber for ships, and the gum it yields serves for their caulking; though its chief use is in medicine.

There are three kinds of *Tacamahaca*; the *Sublime*, called also *Tacamacha* in the pod; *Tacamacha* in the mafs, and *Tacamacha* in tears.

The first is the natural resin, as it oozes of itself, without any incision made in the tree: the good is dry, reddish, transparent, of a bitter taste, and a strong smell resembling that of lavender. The islanders gather it in little gourds divided in two, and covered with a palm leaf.

The *Tacamacha's* in tears, and in the mafs, are those which flow from the tree by incisions: they must be chosen dry and clear, and their smell resembling that of the first kind.

Gum *Tacamacha* is found good for digesting and resolving tumours, and alluvaging pains.—Burnt upon coals, it is reckoned good for hysteric fits in women, and likewise applied to the belly, in form of a plaister. Some apply it to the temples in the same manner, and to the nape of the neck, for pains in the head, defluxions of rheum upon the throat, and inflammations of the eyes, as also in the tooth-ach. It is of so subtle and penetrating a nature, that it is greatly used in external applications, to suppurate and disperse tumours; and is accounted effectual, even in those which are scrophulous.

It is likewise used externally in arthritical pains, with success; in effect, the Indians use it for all kinds of pains. Schroder affirms, that he has seen intolerable pains in the leg removed by it.

*TACHYGRAPHY*, \* the art of fast, or short writing. See BRACHYGRAPHY.

\* The word is formed from the Greek ταχυς, *swift*, and γραφή, *writing*.

There have been various kinds of *Tachygraphy* invented: among the Romans, there were certain notes used, each whereof signified a word. See NOTE, and NOTARY.

The Rabbins have a kind of *Tachygraphy* formed by abbreviations, which make a kind of technical words; wherein each consonant stands for a whole word, as, רמבם, *Rambam*; which expresses *Rabbi Moses, Son of Maiemon*; רש"י, *Raschi*; which stands for *Rabbi Schelomoh Jarri*. See ABBREVIATION.

In France, &c. the only *Tachygraphy* used is the retrenching of letters, or even whole syllables of words; as in *sdm* for *secundum*, *aut* for *autem*, *d* for *sed*, *o* for *non*, *participaon* for *participation*, &c.

The first printers imitated these abbreviations: at present they are almost laid aside, except among scriveners, &c.

In England, we have great variety of methods of *Tachygraphy*, or short-hand; more by far, and those too, much better, easier, speedier, and more commodious, than are known in any other part of the world: witness Shelton's, Wallis's, Webster's, and Weston's short-hands.

*TACIT Acceptance*, } See the articles { ACCEPTANCE.

*TACIT Community*, } See the articles { COMMUNITY.

*TACK about*, in navigation, a term used at sea when a ship's head is brought about, so as to lie the contrary way.

To effect this, they first make her *stay*; which done, she is said to be *paid*.—They then let *rise*, and *hale*, i. e. let the lee-tack rise, and hale aft the sheets, and so trim all the sails by a wind as they were before.

*TACKLE*, or *TACKLING*, in navigation, includes all the ropes or cordage of a ship, with their furniture, whereby the sails are managed.—See *Tab. Ship. fig. 1*. See also the articles CORDAGE and ROPE.

*TACKLES*, are more particularly used for small ropes running in three parts, having at one end a pendant with a block fastened to them, or else a lannier; and at the other end, a block and hook, to hang goods upon, that are to be heaved into the ship, or out of it.

There are several kinds of these *Tackles*: as the *Boat Tackles*, serving to hoist the boat, &c. in and out: the *Tackles* belonging to the masts, serving as shrouds to keep the masts from straining: the *Gunner's Tackles*, with which the ordnance are hoisted in and out.—See *Tab. Ship. fig. 1. n. 39, 40, 59, 61, 82, 93, and 103*.

*Ground TACKLE*, } See the articles { GROUND.

*Wind TACKLE Blocks*, } See the articles { WIND.

*TACTICKS*, \* the art of disposing forces in form of battle, and of performing the military motions and evolutions. See EVOLUTION.

\* The word is Greek, τακτικά, formed from ταξις, *order*.

The Greeks were very skilful in this part of the military art, having public professors of it, called *Tactici*, who taught and instructed their youth therein. Ælian hath a particular book on this subject; and there is a great deal of it in Arrian, in his history of Alex. M. and in Mauritius, and Leo Imperator. Vossius de scient. *Mathemat.* mentions 24 ancient authors on the subject of *Tacticks*.

*TACTICKS* is also used for the art of inventing, and making machines for throwing of darts, arrows, stones, fire-balls, &c. by means of slings, bows, and counter-poises. See MACHINE. Vegetius, Hero, &c. have wrote on these machines; and we have them described, and figured by Lipsius. See ARIES, BALLISTA, CATAPULTA.

*TACTILE*, or *TANGIBLE*, in the schools, something that may fall under the sense of feeling. See FEELING.

Though atoms be corporeal, yet are they not either *tactile* or visible, by reason of their smallness. See CORPUSCLE.

The

The principal *tangible* qualities are heat, cold, dryness, hardness, and humidity. See each under its proper article, **HEAT**, **COLD**, **HARDNESS**.

**TACTION**, in the schools. See **FEELING**.

**TACTION**, in geometry. See **TOUCHING**, and **TANGENT**.

**TÆNIA**, or **TENIA** \*, in architecture, a member of the Doric architrave, resembling a square fillet, or reglet; and serving in lieu of a cymatium. See **DORIC** and **CYMATIUM**.

\* The word is Greek, *tania*, which literally denotes, a *swath*, *bandage*, *fillet*, or the like.---Barbaro renders it by *listel*: but Palladio uses the old name *Tenia*. See **LISTEL**.

Leon Baptista. Alberti calls the *Tania*, *Regulæ*, and *Fasciolæ*; and Daviler, *Bandelettes*. See **REGLET**, **BANDELET**, &c. Philander says, there are two kinds, *viz.* that above-mentioned, which he calls the *lower*; and an *upper*, which serves as a capital to the triglyphs.

**TAFFAREL**, or **TAFEREL**, in a ship, the uppermost part, frame, or rail, abaft, over the poop.—See *Tab. Ship. fig. 2. n. 97. fig. 1. lit.* See also the article **SHIP**.

**TAFFETY**, or **TAFFATY**, in commerce, a kind of fine, smooth, filken stuff; having, usually, a remarkable lustre, or gloss. See **SILK**, &c.

**ALAMODE**, } the Taffetas Noirs of Lyons,  
**LUSTRING**, }

**TAFFETAS** noir lustré is our Alamode.—Non lustré is our Lustring.

There are *Taffeties* of all colours, some plain, others striped with gold, silver, silk, &c. others chequered, others flowered, others in the Chinese point, others the Hungarian; with various others, to which the mode, or the caprice of the workmen give such whimsical names, that it would be as difficult, as it is useless, to rehearse them; besides that, they seldom hold beyond the year wherein they first rose. The old names of *Taffeties*, and which still subsist, are *Taffeties* of Lyons, of Spain, of England, of Florence, of Avignon, &c. The chief consumption of *Taffeties* is in summer-dresses for women, in linings, scarves, coifs, window-curtains, &c.

There are three things which contribute chiefly to the perfection of *Taffeties*, *viz.* the silk, the water, and the fire. The silk is not only to be of the finest kind, but it must be worked a long time, and very much, before it be used. The watering, beside that it is only to be given very lightly, seems only intended to give that fine lustre, by a peculiar property not found in all waters. Lastly, the fire, which is passed under it to dry the water, has its particular manner of application, whereon the perfection of the stuff depends very much.

Octavio May, of Lyons, is held the first author of the manufacture of glossy *Taffeties*; and tradition tells us the occasion of it.—Octavio, it seems, going backwards in the world, and not able to retrieve himself by the manufacture of *Taffeties*, such as were then made, was one day musing on his misfortunes, and, in musing, chanced to chew a few hairs of silk which he had in his mouth. His reverie being over, the silk he spit out seemed to shine, and on that account engaged his attention. He was soon led to reflect on the reason; and, after a good deal of thought, concluded, that the lustre of that silk must come, *1<sup>st</sup>*, From his having pressed it between his teeth. *2<sup>dly</sup>*, From his having wet it with his saliva, which had something glutinous in it: and, *3<sup>dly</sup>*, From its having been heated by the natural warmth of his mouth. All this he executed upon the next *Taffeties* he made; and immediately acquired immense riches to himself, and to the city of Lyons the reputation it still maintains, of giving the gloss to *Taffeties*, better than any other city in the world.

It will not, we conceive, be less useful than curious, to give here the description of the engine contrived by Octavio to give the gloss to *Taffety*; to add the manner of applying it, and the composition of the water used therein.

The machine is much like a silk loom, except that instead of iron points, here are used a kind of crooked needles, to prevent the *Taffety* from slipping: at the two extremities, are two beams; on one of which is rolled the *Taffety*, to take the gloss; and on the other, the same *Taffety* as fast as it has received it. The first beam is kept firm by a weight of about 200 pounds; and the other turned by means of a little lever passing through mortises at each end. The more the *Taffety* is stretched, the greater lustre it takes; care, however, is to be used it be not over-stretched.

Besides this instrument for keeping the stuff stretched, there is another to give it the fire: this is a kind of carriage, in form of a long square, and the breadth of the *Taffeties*. It moves on trundles, and carries a charcoal fire under the *Taffety*, at the distance of about half a foot.

The two machines prepared, and the *Taffety* mounted, the lustre is given it by rubbing it gently with a ball, or handful of lifts of fine cloth, as it rolls from one beam to the other; the fire, at the same time, being carried underneath it to dry it. As soon as the piece has its lustre, it is put on new beams to be stretched, a day or two; and the oftner this last preparation is repeated, the more it increases the gloss.

For black *Taffeties*, the gloss is given with double beer, and orange or lemon juice; but this last is the least proper, as be-

ing apt to whiten. The proportion of the two liquors is a gallon of orange juice to a pint of beer, to be boiled together to the consistence of a broth. For coloured *Taffeties* they use gourd-water, distilled in an alembic.

**TAIL**, *Cauda*, that part of an animal which terminates its body behind. See **ANIMAL**, &c.

The *Tail* is different both in figure, and use, in the various species: in land-animals, it serves to rid them of flies, and is usually covered with hair, and strengthened with bones: in fishes it is cartilaginous, and serves them as a helm to steer their course withal in swimming. See **FISH** and **SWIMMING**. In birds it is covered with feathers, and greatly assists in all ascents and descents in the air; as also to render their flight steady, by keeping the body upright in that subtle and yielding medium, by its readily turning and answering to every vacillation of the body. See **BIRD**, and **FLYING**.

**TAIL**, in anatomy, is used for that tendon of a muscle which is fixed to the moveable part.—In opposition to which the tendon fixed to the immoveable part is called the *Head*. See **MUSCLE**.

**Dove-TAIL**, or **Swallow's-TAIL**, among carpenters, is one of the strongest manner of jointing; wherein a piece of wood that grows larger towards the end is inserted into another piece; so that it cannot stir out, by reason the hole in the one is narrower than the lower end of the other: as in the figure of a *Dove's-Tail*. See *QUEUE d'Aronde*, *SWALLOW'S-TAIL*, *DOVE-TAIL*, and *COUNTER-SWALLOW-TAIL*.

**Peacock's TAIL**, a term applied to all circular compartments, which go enlarging from the centre to the circumference; imitating, in some measure, the feathers of a peacock's *Tail*, when spread.

**Dragon's TAIL**, *Cauda Draconis*, in astronomy, the descending node of a planet; thus characterized ☿. See **NOEB**. The astrologers take care to put it in all their horoscopes. See **HOROSCOPE**.

**Horse's TAIL**, among the Tartars and Chinese, is the ensign or flag under which they make war. See **ENSIGN**, **FLAG**, &c. Among the Turks it is the standard bore before the grand vizier, the bashaws, and fangiacs; in order to which, it is fitted on the end of a half-pike, with a gold button, and is called *Toug*.

There are bashaws of *one*, others of *two*, others of *three Horse's Tails*.—The *Horse's Tail* placed on a general's tent, is a signal of battle. For the original of this custom, it is related, that in a certain battle, the standard being taken by the enemy, the general of the army, or, as others say, a private horseman, cut off the *Tail* of his horse, and fastening it to the end of a half-pike, encouraged the troops, and gained the victory. In memory of which noble action, the grand signior appointed that standard to be bore for the future, as a symbol of honour. *Ricaut*.

**TAIL**, in heraldry, &c. is particularly used for the tail of an hart; those of several other creatures having peculiar and distinct names.

As, that of a buck, roe, or any other deer, is called the *Single*; of a boar, the *Wreath*; of a fox, the *Bush*; of a wolf, the *Stern*; and of a hare and coney, the *Scut*.

**TAIL of a comet**. When a comet darts his rays forwards, or towards that part of the heavens, whither his proper motion seems to be carrying him, those rays are called its *Beard*: on the contrary, when its rays are shot behind, towards that part from whence it appears to move, the rays are called the *Tail of the Comet*. The various phenomena whereof, with their physical causes, see under the article **COMET**.

**TAIL of the trenches**, in the military art, is the post or place where the besiegers begin to break ground, to cover themselves from the fire of the town. See **APPROACHES**.

The *Tail* of the trench is the first work which the besiegers make at the opening of the trenches; as the head of the attack is that carried on toward the place. See **TRENCH**.

**TAIL**, or **TAILE**, in common law, signifies a limited fee; as opposite to fee-simple. See **FREE**.

It is thus called from the French *tailler*, to cut, by reason such fee is so minced, or parted, as it were, that it is not in the owner's free power to dispose of; but is by the first giver cut, *taille*, and divided from all others, and tied to the issue of the donee.

The limitation of *Tail* is either *general* or *special*.

**TAIL General**, is that whereby lands and tenements are limited to a man, and to the heirs of his body begotten, or to be begotten.

This is called *general*, because how many wives soever the tenant holding by this title shall have, one after another, in lawful marriage, his issue by them all have a possibility to inherit one after another.

**TAIL Special**, is when lands or tenements are limited to a man and his wife, and the heirs of their two bodies together.

It is called *special*, because if the man bury his wife before issue, and take another; the issue by his second wife cannot inherit the land, &c. See **DOCKING**, **FINE**, **RECOVERY**, &c.

Also, if the land be given to a man and his wife, and their son *R.* for ever, this is called *Tail Special*.

**TAIL**,

**TAIL** after possibility of issue extinct, is where land being given to a man and his wife, and the heirs of their two bodies, and the one over-lives the other, without issue between them begotten: upon which the survivor shall hold the land for term of his own life in quality of tenant in *Taille after the possibility of issue extinct*; and notwithstanding he does waite, shall not be impeached of it.—And if he alien, he in the reversion shall not have a writ of entry in consimili casu, but may enter, and his entry is lawful.

**Fee TAIL**, } See the articles { **Fee Tail**.  
**Several TAIL**, } **SEVERAL**.

**TAIL**, or **TAILE**, is also used for what we vulgarly call a *Tally*, *Taille de Bois*, or a cloven piece of wood to nick up an account on. See **TALLY**.

**TAILLE**, or **TAILLEE**, in heraldry. See **TRANCHE**.

**TAILLOIR**, in architecture, a term which some of our writers, after the French, use for *Abacus*. See **ABACUS**.

**TAINT**, in law, signifies either, substantively, a conviction; or, adjectively, a person convicted of felony, treason, &c. See **ATTAINT**.

**TAKE and Leave**, in the sea language.—The sailors say, a ship can *take and leave upon her when she will*; when she fails so well that she can come up with another, or out-fail her at pleasure.

**Thistle-TAKE**, } See the articles { **THISTLE**.  
**TAKERS—Carr-TAKERS**, } **CARR**.

**TALBOT**, a sort of dog, frequent in coat-armour, noted for its quick scent, finding out the tracks, lodgings, and forms of beasts, and pursuing them with open mouth, and continual cry, with such eagerness, that if not taken off by the huntmen he is often spoiled. See **HOUND**, and **HUNTING**.

**TALC**, or **TALK** \*, in natural history, a shining squamous, fissile, species of stone, easily separable into thin transparent scales or leaves. See **STONE**.

\* The word is German, where it signifies the same.

Anciently, *Talc* was only found in Spain; but since, mines thereof have been found in Cyprus, Cappadocia, and since that in Arabia and Africa: at present, they dig it in the Alps and Appennines, several mountains in Germany and even in England, particularly in Northamptonshire.

We usually distinguish two kinds of *Talc*, viz. *White Talc of Venice*, and *Red of Muscovy*: to which may be added *Parget*, or the *English Talc*. See **GYP SUM**, and **PLASTER**.

That from Venice is the most esteemed: it is brought in large shining greenish stones; but becomes white, and exceedingly transparent, when wrought. It appears greasy to the touch, though there is scarce any stone dryer; yet, in spite of its dryness, it pulverizes with difficulty; nor is it easily calcined. Its chief use is as a screen or cover for paintings in miniature and crayons; to which purpose thin slices thereof are used: it is sometimes also used for a focus; in order to which, by reason of the difficulty of pulverizing it, &c. they content themselves to rasp it with the skin of a sea-dog, and to pass the rasping through a sieve.

Pliny, in his *Natural History*, lib. 36. cap. 22. observes, that the Romans not only used it for window-lights, but they also paved the circus with the same. See **SPECULARIS**.

The *Talc* brought from Muscovy is reddish when in the stone; but it seldom comes to us otherwise than in leaves, which are very hard, smooth, glossy, and exceedingly transparent: it is found in quarries in Muscovy and Persia, and is used to make lanterns, to cover paintings, &c.

Some chymists, and other empirics, have held, that *Talc* might be used for many more important purposes; and pretend to draw from it that precious oil, so much boasted of by the ancients, particularly the Arabs, called *Oil of Talc*, which is supposed a wonderful cosmetic, and preserver of the complexion: but the truth is, the word *Talc*, among them, signified no more than an equal disposition of the humours, which keep the body in good temperament and perfect health. Now, as nothing contributes more than health to the preserving of beauty, this has given occasion to the chymists to search this *Oil of Talc*, which is to maintain the body in this disposition, and to engage the ladies to be at the expence of the search.

Some have also pretended, that yellow or ruddy *Talc* contained the seeds of gold, and that a menstruum might be drawn from it to transmute metals into gold or silver, to fix mercury, &c. but this is mere charlatanery.

**TALENT**, **TALENTUM**, a weight, and a coin, both very famous among the ancients; but very different in different countries. See **COIN**, and **WEIGHT**.

The value of the *Talent* is very hard to assign in English money, as being used among all the people throughout the east; and its value, and the manner of computation, different among each. A difficulty abundantly shewn by Budæus, in his learned treatise *de Affe*.

There were various kinds of *Talents*, both with regard to weight and to species; the value of these last still increasing, as the metal wherewith it consisted was purer: tho' the *Talent* weights did all contain the same number of pounds and drachms.

For as the French have a livre parisien, and a livre tournois, each whereof contains alike 20 sols; yet these compared to-

gether, the Paris livre contains 25 sols of the Tournois livre; the Paris sol exceeding that of Tours by one fifth; so all *Talent* weights were equally 60 minæ, and the mina 100 drachmæ; but the drachma of one place exceeding that of another, there hence arose a difference in the *Talents*. See **WEIGHT**.

The Attic drachma, for instance, was 60 Attic oboli, and that of Ægina 10 of the same oboli; whence the Ægean *Talent*, computed on the foot of the Attic weight, was 100 minæ; whereas, reckoned on the foot of its own drachma, it was no more than 60. See **DRACHMA**.

The common Attic *Talent* then (the *Talent* weight we mean) contained 60 Attic minæ, or 62 and half Attic pounds, or 6000 Attic drachmæ; equal, according to Dr. Arbuthnot's reduction, to 56 pounds 11 ounces English Troy weight. Some authors, as Priscian, mention another Attic *Talent* of 100 minæ; but this is to be understood of ancient minæ, as they stood before Solon, each only worth 75 drachmæ.

The Syrian *Talent* contained 15 Attic minæ; that of Alexandria 96 Attic minæ, or 91 lib. Troy. The Babylonian, Persian, and Antiochic *Talents*, were the same with the Ægyptian. Among the Romans there were two kinds of *Talents*, the little, and the great *Talent*: the little was the common *Talent*; and whenever they say, simply, *Talentum*, they are to be understood of this: the little *Talent* was 60 minæ, or Roman pounds; the mina, or pound, estimated at 100 drachmæ, or denarii: it was also estimated at 24 great sesterces, which amounted to 60 pounds.

The great *Talent* exceeded the less by one third part. Budæus computes, that the little *Talent* of silver was worth 75 pounds sterling; and the greater, 99 l. 6 s. 8 d. sterling.—The greater *Talent* of silver he makes worth 99 l. sterling.—The greater of gold worth 1125 l. sterling.

**TALENT**, as a species, or money, among the Hebrews, was sometimes used for a gold coin, the same with the shekel of gold, called also *Stater*, and weighing only 4 drachms. See **SHEKEL**. The Hebrews reckoned by these *Talents* as we do by pounds, &c. Thus a million of gold, or million of *Talents* of gold, among them, was a million of shekels, or nummi; the nummus of gold being the same weight with the shekel, viz. 4 drachms.

Yet the Hebrew *Talent* weight of silver, which they called *Cicar*, was equivalent to that of 3000 shekels, or 113 pounds English Troy weight, according to Arbuthnot's computation.

**TALES**, in law, a supply or addition of men impannelled on a jury of inquest, and not appearing, or at their appearance challenged by either party as not indifferent. See **JURY**.

In such case, the judge, upon motion, grants a supply to be made by the sheriff, of one or more *Tales*, such as are present in court, equal in reputation to those impannelled.—This act of supplying is called a *Tales de circumstantibus*: and the persons thus supplied, *Talesmen*.

He that has had one such *Tales*, either upon default, or challenge, may not have another containing so many as the former: for the first *Tales* must be less than the principal pannel, except in a cause of appeal; and so every *Tales* less than another, till the number be made up of such as are unexceptionable.

**TALIO**, *Lex TALIONIS*, or *Pæna TALIONIS*, a retribution, or punishment, whereby an evil is returned perfectly like that committed against us by another—which is what we usually express by the words *eye for eye, tooth for tooth*.

The *Pæna Talionis* was enjoined by the law of Moses, just as it is in the gospel: it was esteemed a natural piece of justice, and yet the Romans set it aside, inasmuch as such a parity or equality of punishment could not always be observed. For this reason, the prætor allowed such as had suffered any injury to make an estimate thereof in money, that justice might be done him that way; only reserving to himself the power of moderating the same. And this was what was constantly practised, and thus the *Pæna Talionis* became quite disused—except in the case of false witnesses and accusers.

**TALISMANS**, \* magical figures engraven, or cut under certain superstitious observances of the characteristics and configurations of the heavens; to which some astrologers, hermetical philosophers, and other adepts, attribute marvellous virtues, particularly that of calling down celestial influences. See **THERAPHIM**.

\* The word is pure Arabic; though Menage, after Salmasius, thinks it may come from the Greek *ταλίσμα*, operation, or consecration. Borel says, it is Persian, and signifies literally an engraven constellation. Others derive it a *Talamascei literis*, which are mysterious characters, or cyphers used by forerers; thus called from *Talamasca*, a *fantom*, or *illusion*.

The author of a book entitled *Talismans Justifiez*, says, a *Talisman* is the seal, figure, character, or image of a heavenly sign, constellation or planet, engraven on a sympathetic stone, or on a metal corresponding to the star, &c. in order to receive its influences.

The *Talismans* of the Samothracians, so famous of old, were pieces of iron, formed into certain images, and set in rings, &c.

They were held preservatives against all kinds of evils.—There were other *Talismans* taken from vegetables, and others from minerals.

In the general, we use to distinguish three kinds of *Talismans*: *Astronomical*, which are known by the signs, or constellations of the heavens engraven thereon, with other figures, and some unintelligible characters.—*Magical*, which bear very extraordinary figures, with superstitious words and names of angels unheard-of.—And *Mixt*, which consist of signs and barbarous words, but have no superstitious ones, or names of angels.

Some rabbins maintain, that the brazen serpent, raised by Moses in the wilderness, for the destruction of the serpents that annoyed the Israelites, was a *Talisman*.

All the miraculous things wrought by Apollonius Tyanæus are attributed to the virtue and influence of *Talismans*: that wizard is even said to have been the inventor of *Talismans*.

Some authors take several Runic medals, at least medals whose inscriptions are in Runic characters, for *Talismans*; it being notorious, that the northern nations, in their heathen state, were much devoted thereto. M. Keder, however, has shewn, that the medals here spoke of are quite otherguise things than *Talismans*. See *RUNIC*.

**TALK.** See the article *TALC*.

**TALKING.** See *SPEAKING*, *SPEECH*, and *VOICE*.

**TALLAGE**, *TALLAGIUM*, a certain rate, according to which barons and knights were anciently taxed by the king towards the expences of the state, and inferior tenants by their lords, on certain occasions. See *TAX*.

This latter *Tallage* of the customary tenants was sometimes fixed and certain, and sometimes at the pleasure of the lord; and was also sometimes compounded for. See *SUBSIDY*.

*Tallages* were anciently called *Cuttings*; which name is still retained in *Ireland*, though in a different signification.

*Tallage*, says Sir Ed. Coke, is a general name including all taxes. See *TAX*.

**TALLOW**, a sort of animal fat, melted down, and clarified. See *FAT*, and *SUET*.

There are scarce any animals but a sort of *Tallow* may be prepared from; but those which yield the most, and whereof the most use is made, are the horse, bullock, sheep, hog, goat, deer, bear, and viper.—Some of which *Tallows*, or fats, are used in medicine. See *AXUNGIA*.

Most of the rest are used in the making of soap, the dressing of leather; but chiefly in the making of candles. See *SOAP*, *CURRYING*, &c.

For candles, the best composition is half sheeps *Tallow*, and half cows or bullocks *Tallow*, without any mixture of other kinds of fat, which only serve to turn the candles yellow, make them run, and spoil the clearness of their light. See *CANDLE*.

**TALLOW-TREE**, in China, is a tree growing in great plenty in that country, which produces a substance like our *Tallow*, and serving for the same purpose.

It is about the height of a cherry-tree; its leaves in form of a heart, of a deep, shining, red colour, and its bark very smooth. Its fruit is inclosed in a kind of pod, or cover, like a chestnut, and consists of three round white grains, of the size and form of a small nut, each having its peculiar capsula, and within a little stone.

This stone is encompassed with a white pulp, which has all the properties of true *Tallow*, both as to consistence, colour, and even smell: and accordingly the Chinese make their candles of it; which would, doubtless, be as good as those in Europe, if they knew how to purify their vegetable *Tallow*, as well as we do our animal *Tallow*.

All the preparation they give it, is to melt it down and mix a little oil with it, to make it softer, and more pliant.—It is true, their candles made of it yield a thicker smoke, and a dimmer light, than ours; but those defects are owing, in a great measure, to the wicks, which are not of cotton, but only a little rod, or switch of dry light wood, covered with the pith of a rush, wound round it; which being very porous, serves to filtrate the minute parts of the *Tallow*, attracted by the burning stick, which by this means is kept alive.

**TALLY**, or *TALIE*, *TAILLE*, a piece of wood, whereon retail traders use to score or mark, by notches or incisions, the several quantities of goods they deliver out on credit, to save the trouble of writing down so many little articles in books. See *TAIL*.

Each score consists of two pieces of wood, or rather of a single piece cleft length-wise, the parts whereof falling in with one another, the things delivered are scored on both at the same time; the seller keeping one and the buyer the other.

*Tallies* are taken as evidences in courts of justice, as much as books. The ancient way of keeping all accounts was by *Tallies*; the debtor still keeping one part, and the creditor the other. See *ACCOUNT*, and *BOOK-KEEPING*.

There are three kinds of *Tallies* mentioned in our statutes, and long used in the Exchequer—viz.

**TALLIES of Loans**, one part whereof is kept in the Exchequer, and the other part given to particular persons, in lieu of an obligation for the monies they have lent to the government on

acts of parliament.—This last part is called the *Stock*, and the former the *Counter-stock*, or counter-tail. See *TELLER*.

The *Tallies* are numbered, bear the person's name, and the sum lent: thus we say, the *Tallies*, No. have been paid, discharged: *Tallies* are risen, fallen 4, 5, &c.

**TALLIES**, or *TAILLES of Debt*, which are a kind of acquittances for debts paid the king.

E. gr. the university of Cambridge pays yearly 10*l.* for such things as are by charter granted them in fee-farm. He that pays this, receives a *Taille* or *Tally* for his discharge, with which, or a note of it, he repairs to the clerk of the pipe, and there for the *Tally* receives a full discharge on parchment. See *PIPE-Office*.

**TALLIES of Reward**, or allowance, made to sheriffs, for such matters as (to their charge) they have performed in their office, or such money as is by course cast on them in their accounts, but which they cannot levy.

Counter-TALLY,	} See the articles	COUNTER.
Cutter of the TALLIES,		CUTTER.
Petty TALLY,		PETTY.
Writer of TALLIES,		WRITER.

**TALMUD**, or *THALMUD*, a Jewish book, wherein is collected all that relates to the explication of their law. See *JUDAISM*.

The *Talmud* is the body of the Hebrew law; a compilation of expositions of the duties imposed on that people, either in scripture, or by tradition, or by authority of their doctors, or by custom, or even by superstition: to speak more plainly still, it is the course of cases of conscience, or of moral theology, wherein the duties are explained, and the doubts cleared, not by reasoning, but generally by authority, by the custom of the nation, and by the decisions of the most approved of the ancient doctors.

The *Talmud* consists of two general parts: the one called the *Mischna*, the other the *Gemara*; which second part is also frequently called absolutely the *Talmud*, the general name of the whole work. See *MISCHNA*, and *GEMARA*.

The Jews divide their law into *written*, which is that contained in the books of Moses; and *unwritten*, which is that conveyed by tradition.—This latter is, in effect, no other than a gloss or interpretation of the former, given by the ancient Rabbins. See *TRADITION*, and *RABBIN*.

The *Talmud* then contains the traditions of the Jews, their polity, doctrine and ceremonies, which they observe as religiously as the law of God itself: they would never put it in writing till they were compelled to it by the destruction of Jerusalem, and till they saw themselves dispersed throughout the world.

They had two famous schools; the one at Babylon, and the other at Jerusalem: in these they made two several collections of those traditions; the first at Jerusalem, the other at Babylon; but both called *Talmud*, and both exceedingly revered, especially the Babylonian, though full of extravagancies. It was compiled by the Jews of Mesopotamia, about 500 years after Christ.

The *Talmud* of Jerusalem is the least esteemed.—It was compiled by the Jews of that City 300 years after Christ.

The Babylonian *Talmud* consists of two parts; the one the text, the other the gloss or comment; the comment, called the *Gemara*, contains the decisions of the Jewish doctors, and their explications of the text.—This we find stuffed with dreams and chimæra's; a deal of ignorance, and a world of impertinent questions and disputations: the style very coarse.—On the contrary: the text, called the *Mischna*, is wrote in a pretty pure style, and the reasonings generally much more solid.

The Jews pretend it was composed by Rabbi Juda, surnamed the *Saint*; and that God revealed to him the doctrine and the chief mysteries thereof.—But this is only to be understood of the *Mischna*, not of the *Gemara*, the compilation whereof was not begun till the VIth Century after the destruction of the second temple.

Rabbi Juda is said to have composed the *Mischna* under the empire of Antoninus, in the IIId century; but they do not all agree about this antiquity, some carrying it back much further.

It is the *Talmud* of Babylon that is usually read, and most frequently consulted among the Jews; so that when they say simply the *Talmud*, they always mean this: never quoting the other without the addition of Jerusalem.

Rabbi Moses, Son of Maiemon, has made an abridgment of the *Talmud*, which *Scaliger* prefers to the *Talmud* itself; as being purged of many of the fables wherewith the other is full. It is a system of the laws and customs of the Jews, both their civil and their canon law, and the best of their traditions.

About the year 1236, a Jew of Rochel, well versed in the Hebrew, becoming Christian, made a journey to pope Gregory IX. and discovered to him a number of errors in the *Talmud*: these the pope sends, in 39 articles, to the archbishops of France, with a letter, appointing them to seize the books of the Jews, and to burn all such as should contain those errors; in consequence of which order, about 20 cart-loads of Hebrew

Hebrew

Hebrew books were burnt. He wrote to the same effect to the kings of England, France, Arragon, Castile, &c. His successor, Innocent IV. giving commission to his legate Eudes de Chateauroux to examine the *Talmud*, and other Jewish books more carefully, and to tolerate such errors as were not contrary to the Christian religion; the legate wrote to the pope, that to tolerate them was to approve them; and the 15th of May, 1248, he condemned them juridically to the flames.

**TALON**\*, in architecture, a kind of moulding, consisting of a cymatium, crowned with a square fillet; frequently found to terminate ornaments of joiners-work, as those of doors, &c. See **CYMATIUM**.

\* The word is French, and literally signifies *beel*.

The *Talon*, more properly so called, is a moulding concave at the bottom, and convex a-top; having an effect just opposite to the *doucine*.—See *Tab. Archit. fig. 26. lit. p. fig. 28. lit. c. g. n. fig. 32. lit. l. n. fig. 40. lit. d.* See also **DOUCINE**.

When the concave part is a-top, it is called an *Inverted Talon*. See *Tab. Archit. fig. 7*.

The *Talon* is usually called by our English workmen *Ogee*, or *O. G.* and by others an *upright* or *inverted Cymatium*. See **OGE**.

**TALPA**, in medicine and chirurgery, a tumour of the cedematous kind, called also *Testudo*. See **TESTUDO**.

The *Talpa*, and *Nata*, chiefly arise about the head, as the consequence of some venereal disorder. See **NATTA**.

The *Talpa* elevate the skin from the pericranium, and generally denote a foulness in the subjacent bone of the skull.

**TALUS**, in anatomy, a bone of the foot, called also *Astragalus*. See **ASTRAGALUS**, and **FOOT**.

The *Talus*, in its upper part, has a convex head, which is articulated with the two foci of the leg by ginglymus, it being divided by a little sinus, which receives the small protuberance in the middle of the sinus of the tibia.—Without this articulation, we must always, in going, have trode on the heel with our fore-foot, and our toes with the hind-foot. See **TIBIA**.

The fore-part of the *Talus*, which is also convex, is received into the sinus of the os naviculare. See **NAVICULARE**.

Below, towards the hind-part of its under-side, it has a pretty large sinus, which receives the upper and hind-part of the os calcis: and towards the fore-part of the same side it has a protuberance, which is received into the upper and fore-part of the same bone.—Betwixt this sinus, and this protuberance, there is a cavity, which answers to another in the os calcis; in which is contained an oily and mucous sort of substance, for moistening the ligaments, and facilitating the obscure motion of these bones when we go.

**TALUS**, or **TALUT**, in architecture, the inclination or slope of a work; as of the outside of a wall, when its thickness is diminished by degrees, as it rises in height, to make it the firmer. See **TALL**.

**TALUS**, in fortification.—*Talus of a Bastion*, or *Rampart*, is the slope or diminution allowed to such a work; whether it be of earth, or stone; the better to support its weight. See **RAMPART**.

The *exterior Talus* of a work, is its slope on the side towards the country; which is always made as little as possible, to prevent the enemies scalado; unless the earth be bad, and then it is absolutely necessary to allow a considerable *Talus* for its parapet. The *interior Talus* of a work, is its slope on the inside, towards the place.

**TAMARINDS**, **TAMARINDI**, a kind of medicinal fruit, of a tart agreeable taste, brought from the East as well as West-Indies, and called by some *Indian Dates*, and by others the *Indian Acacia*.

The tree which yields it, called by the Indians *Tamarinds*, and the Portuguese *Tamarindos*, is not unlike our ash, or wall-nut-tree; its leaves resemble those of female fern: its flowers are joined eight or ten together, like those of the orange-tree. Its fruit is in a pod the length of a finger, and the thickness of the thumb, covered at first with a green rind, which afterwards becomes brown, and contains a blackish acid pulp, among which are found seeds resembling lupines.—It is this pulp alone that is brought to us, and used in medicine.

*Tamarinds* must be chosen big, of a jet colour, a brisk taste, not too dry, and such as have not been laid in the cellar, nor falsified with molasses of sugar and vinegar.

They are found laxative, cooling, and good to quench thirst. In burning fevers they are prescribed to moisten, and cool the mouth.

**TAMBAC**, or **TAMBAQUA**, a mixture of gold and copper, which the people of Siam hold more beautiful, and set a greater value on, than gold itself.

Some travellers speak of it as a metal found in its peculiar mines; but upon what authority we do not know. The abbé de Choisy, in his *Journal of Siam*, doubts whether it may not be the *electrum*, amber, of Solomon.

The ambassadors of Siam brought several works in *Tambac* to Paris, in the reign of Louis XIV. which were not found so beautiful as was expected.

**TAMBOUR**, in architecture, a term applied to the Corinthian and composite capitals, as bearing some resemblance to a drum, which the French call *Tambour*.—See *Tab. Archit. fig. 22. lit. a.* See also **CAPITAL**, and **COLUMN**. Some chuse to call it the *Vase*, and others *Campana*, or the bell. See **VASE**, &c.

**TAMBOUR** is also used for a little box of timber-work, covered with a cicling, within-side the porch of certain churches; both to prevent the view of persons passing by, and to keep off the wind, &c. by means of folding-doors, &c.

**TAMBOUR** also denotes a round course of stone, several whereof form the shaft of a column, not so high as a diameter.

**TAMPION**, **TOMPION**, **TAMKIN**, or **TOMKIN**\*, a kind of plug or stopple, serving to close a vessel; particularly to keep down the powder in a fire-arm, &c. See **WADDING**.

\* The word is formed from the French, *tampon*, a bung, stopple, &c. Some derive it from the English, *stop*.

In charging a mortar, or the like, over the powder is usually put a thin round piece of wood to keep the shot, ball, shell, or the like, from the gun-powder. This piece is called a *Tampion*, and by means hereof the shot is exploded with the greater vehemence. See **CHARGE**, &c.

**TAN**, the bark of the oak, chopped, and ground, by a tanning-mill, into a coarse powder; to be used in the tanning or dressing of skins. See **BARK**, and **TANNING**.

*New Tan* is the most esteemed; when old and stale, it loses a deal of its effect, which consists in condensing or closing the pores of the skins; so that the longer the skins are kept in *Tan*, the greater strength and firmness they acquire.

In effect, not only the bark, but every part of the oak-tree, of what age or growth soever, all oaken coppice, &c. cut in barking-time, makes good *Tan*; as good, at least, as the best bark.

This, when got, is to be well dried in the sun, housed dry, and kept so. To use it, the greater wood may be shaved small, or cleft, fit to be cut small by a tanning engine for the purpose; which done, it is well dried again on a kiln, and then ground by the mill. See **MILL**.—Where oak is scarce, thorns may supply the defect.

**TANGENT**, in geometry, a right line, which touches a circle, that is, meets it in such manner, as that though infinitely produced, it would never cut the same; that is, never come within the circumference. See **CIRCLE**, and **TOUCHING**. Thus the line *AD* (*Tab. Geom. fig. 50.*) is a *Tangent* to the circle, in *D*.

It is demonstrated in geometry; 1. That if a *Tangent AD*, and a secant *AB*, be both drawn from the same point *A*; the square of the *Tangent* will be equal to the rectangle, under the whole secant *AB*, and that portion thereof *AC*, which falls without the circle. See **SECANT**.

2. That if two *Tangents AD*, *AE*, be drawn to the same circle from the same point *A*, they will be equal to each other.

**TANGENT**, in trigonometry.—A **TANGENT** of an arch, is a right line, raised perpendicularly on the extreme of the diameter, and continued to a point, where it is cut by a secant, that is by a line, drawn from the centre through the extremity of the arch whereof it is a *Tangent*. See **ARCH**.

A *Tangent* of an Arch *EA* (*Tab. Trigonem. fig. 1.*) is a part of a *Tangent* of a circle (that is, of a right line which touches a circle without cutting it) intercepted between two right lines, drawn from the centre *C*, through the extremes of the arch *E* and *A*.

Hence, the *Tangent FE* is perpendicular to the radius *EC*. And hence the *Tangent FE* is the *Tangent of the angle ACE*, as also of that *ACI*; so that two adjacent angles have only the same common *Tangent*.

**Co-TANGENT**, or **TANGENT of the Complement**, is the *Tangent* of an arch which is the complement of another arch to a quadrant. See **COMPLEMENT**.

Thus, a *Tangent* of the arch *AH*, is the *Co-tangent* of the arch *AE*, or the *Tangent* of the complement of the arch *AE*.

To find the length of the **TANGENT** of any arch; the sine of the arch being given: suppose the arch, *AE*; the given sine, *AD*; and the *Tangent* required, *EF*. Since both the sine and *Tangent* are perpendicular to the radius *EC*, they are parallel to each other. Wherefore, as the cosine *DC* is to the sine *AD*, so is the whole sine to the *Tangent EF*. See **SINE**.

Hence, a canon of sines being had, a Canon of *Tangents* is easily constructed therefrom. See **CANON**.

**Artificial TANGENTS**, are the logarithms of the *Tangents* of arches. See **LOGARITHM**.

**Line of TANGENTS**, is a line usually placed on the sector and Gunter's scale; the description and uses whereof, see under the articles **SECTOR** and **GUNTER'S Scale**.

**TANGENT of a Conic Section**, as of a parabola, is a right line, which only touches or meets the curve in one point, and does not cut or enter within the curve. See **CONIC Section**, **CURVE**, &c.

**Method of TANGENTS**, a method of determining the quantity of the *Tangent* of any algebraic curve; the equation defining that curve being given.

This

This method is one of the great results of the *Calculus Differentialis*. See DIFFERENTIAL.

Its use is very great in geometry; because in determining the *Tangents* of curves, we determine at the same time the quadratures of the curvilinear spaces: on which account it well deserves to be here particularly insisted on. See QUADRATURE, and SUB-TANGENT.

To find the SUB-TANGENT in any Algebraic Curve.—Let the semiordinate  $pm$  be infinitely near another  $PM$  (*Tab. Anal. fig. 13.*) then will  $Pp$  be the differential of the absciss; and letting fall the perpendicular  $MR=Pp$ ;  $Rm$  will be the differential of the semiordinate. Draw, therefore, the *Tangent*  $TM$ : the infinitely little arch  $Mm$ , will not differ from a right line; and therefore  $MmR$  will be a right-lined, right-angled triangle, usually called the *Characteristic Triangle of the Curve*, in regard curve lines are distinguished from each other hereby. See CHARACTERISTIC.

Now, by reason of the parallelism of the right lines  $PM$  and  $pm$ ; the angle  $MmR=TMP$ . Wherefore the triangle  $MmR$  is similar to the triangle  $TMP$ . Let therefore  $AP=x$ ,  $PM=y$ , then will  $Pp=MR=dx$ , and  $Rm=dy$ . Consequently,

$$\begin{array}{l} Rm : MR :: PM : PT \\ dy : dx :: y : y dx \end{array}$$

If, then, from the given equation of any curve, you substitute the value of  $dx$  to  $y dx : dy$ , in the general expression of the *Sub-tangent*,  $PT$ ; the differential quantities will vanish, and the value of the *Sub-tangent* come out in common quantities; whence the *Tangent* itself is easily determined.—This we shall illustrate in a few examples:

1° The equation defining the common parabola, is,

$$ax=y^2$$

Hence,  $ax=2ydy$

$$dx=2ydy : a$$

$$PT=y dx : dy=2y^2 dy : a dy=2y^2 : a=2ax : a=2x.$$

That is, the *Sub-tangent* is double the absciss.

2° The equation defining a circle is,

$$ax-xx=yy$$

$$adx-2xdx=2ydy$$

$$dx=2ydy : (a-2x)$$

$$PT=dx : y dy=2y^2 dy : (a-2x) dy=2y^2 : (a-2x) = (2ax-2xx) : (a-2x) = (ax-xx) : (\frac{1}{2}a-x) \text{ that is, } PC:PB::AP:PT.$$

Therefore  $AT=(ax-xx) : (\frac{1}{2}a-x) - x = (ax-xx - \frac{1}{2}ax+xx) : (\frac{1}{2}a-x) = \frac{1}{2}ax : (\frac{1}{2}a-x)$  that is,  $PC:PA::CA:AT$ .

3° The equation defining an ellipsis, is;

$$ay^2=abx-bx^2$$

$$\text{Hence, } 2aydy=abdx-2bx dx$$

$$2aydy : (ab-2bx) = dx$$

$PT=y dx : dy=2ay^2 : (ab-2bx) = (2abx-2bx^2) : ab-2bx = (2ax-2ax^2) : (a-2x)$  that is, as the distance of the semiordinate from the centre, is to the half axis, so is the absciss, to the portion of the *Sub-tangent* intercepted between the vertex of the ellipsis and the *Tangent*.

Lastly, for all algebraic curves, the equation being,

$$ay^m+bx^n+cy^r x^f+d=0$$

$$may^m-1dy+nbx^n-1dx+fcy^r x^f-1dx+rcy^r-1dy-rx^f dy=0$$

$$nbx^n-1dx+fcy^r x^f-1dx=-may^m-1dy-rx^f dy-rcy^r-1dy$$

$$dx=-may^m-1dy-rx^f dy-rcy^r-1dy$$

$$nbx^n-1+fcy^r x^f-1$$

$$PT=y dx=-may^m-rcy^r x^f$$

$$dy nbx^n-1+fcy^r x^f-1$$

Suppose, e. gr.  $y^2-ax=0$ ; then by comparing with the general formula,

$$ay^m=y^2$$

$$bx^n=-ax$$

$$a=1, m=2$$

$$b=-a, n=1$$

$$cy^r x^f=0$$

$$f=0$$

$$c=0, r=0, f=0$$

These values being substituted in the most general formula of the *Sub-tangent*, we have the *Sub-tangent* of the parabola of the first kind,  $(-2 : 1y^2-0 : 0y^0x^0) : (1-ax-1+0 : 0y^0x^0) = -2y^2 : a=2y^2 : a$ .

Suppose  $y^3-x^3 axy=0$ , then will

$$ay^m=y^3 bx^n=-x^3$$

$$a=1 m=3 b=1 n=3$$

$$cy^r x^f=-axy f=0$$

$$c=-ar=1 f=1$$

These values being substituted in the general formula of the *Sub-tangent*, we have the *Sub-tangent* of the curve, whose equation is given,  $PT=(-3 : 1y^3-1 : -axy) : (3 : -1x^3-1+1 : -axy-1) = (-3y^3+axy) : (-$

$3x^3-axy) = (3y^3-axy) : (3x^3+ay)$ . Consequently,  $AT=(3y^3-axy) : (3x^3+ay) - x = (3y^3-axy-3x^3+axy) : (3x^3+ay) = (3axy-2axy) : 3x^3+ay$ . The value of  $y-x^3$ , that is,  $axy : (3x^3+ay)$  being substituted from the equation to the curve.

In the *Philosophical Transactions*, we have the following method of drawing *Tangents* to all geometrical curves, without any labour, or calculation, by M. Sluſius.

Suppose a curve, as  $DQ$  (*fig. 14.*) whose points are all referable to any right line given, as  $EAB$ , whether that right line be the diameter or not; or whether there be more given right lines than one, provided their powers do but come into the equation. In all his equations he puts  $v$  for the line  $DA$ ,  $y$  for  $BA$ ; and for  $EB$ , and the other given lines, he puts  $b, d, \&c.$  that is, always consonants.

Then, supposing  $DC$  to be drawn touching the curve in  $D$ , and meeting with  $EB$  produced in  $C$ ; he calls the sought line  $CA$ , by the name of  $a$ .

To find which, he gives this general method: 1. Reject out of the equation all members, which have not either  $v$  or  $y$  in them; then put all those that have  $y$ , on one side; and all those which have  $v$ , on the other; with their signs  $+$  or  $-$ ; and the latter, for distinction and ease sake, he calls the right, the former, the left side. 2. On the right side, let there be prefixed to each member, the exponent of the power, which  $v$  hath there; or, which is all one, let that exponent be multiplied into all the members. 3. Let the same be done also on the left side, multiplying each member there by the power of the exponent of  $y$ . Adding this moreover, that one  $y$  must, in each part, be changed into  $a$ . This done, the equation thus reformed, will shew the method of drawing the required *Tangent* to the point  $D$ ; for, that being given; as also  $y, v$ , and the other quantities expressed by consonants,  $a$  cannot be unknown. Suppose an equation  $by-y^2=v$ , in which  $EB$  is called  $b$ ;  $BA=y$ ,  $DA=v$ , and let  $a$ , or  $AC$  be required so as to find the point  $C$ , from whence  $CD$  being drawn, shall be a true *Tangent* to that curve  $QD$  in  $D$ . In this example, nothing is to be rejected out of the equation, because  $y$  or  $v$  are in each member: it is also disposed, as required by the rule 1; to each part therefore, there must be prefixed the exponent of the powers of  $y$  or  $v$ , as in rule 2; and on the left side, let one  $y$  be changed into  $a$ , and then the equation will be in this form,  $ba-2ya=2vv$ , which

equation reduced, gives easily the value of  $a = \frac{2vv}{b-2y} = AC$ .

And so the point  $C$  is found, from whence the *Tangent*  $DC$  may be drawn.

To determine which way the *Tangent* is to be drawn, whether towards  $B$  or  $E$ , he directs to consider the numerator and denominator of the fraction. For, 1. If in both parts of the fraction, all the signs are affirmative; or if the affirmative ones are more in number; then the *Tangent* is to run towards  $B$ . 2. If the affirmative quantities are greater than the negative in the numerator, but equal to them in the denominator, the right line drawn through  $D$ , and touching the curve in that point, will be parallel to  $AB$ : for in this case,  $a$  is of an infinite length. 3. If in both parts of the fraction, the affirmative quantities are less than the negative, changing all the signs, the *Tangent* must be drawn now also towards  $B$ : for this case, after the change, comes to be the same as the first. 4. If the affirmative quantities are greater than the negative in the denominator, but in the numerator are less, or *vice versa*, then changing the signs in that part of the fraction where they are less, the *Tangent* must be drawn a contrary way; that is,  $AC$  must be taken towards  $E$ . 5. But whenever the affirmative and negative quantities are equal in the numerator, let them be how they will in the denominator,  $a$  will vanish into nothing: and, consequently, the *Tangent* is either  $AD$  itself, or  $EA$ , or parallel thereto; as will easily be found by the data. This he gives plain examples of, in reference to the circle; thus: let there be a semicircle, whose diameter is  $EB$ ; in which there is given any point; as  $D$ , (*fig. 15.*) from which the perpendicular  $DA$  is let fall to the diameter. Let  $DA=v$ ,  $BA=y$ ,  $BE=b$ : then the equation will be  $by-yy=vv$ , and drawing the *Tangent*  $DC$ , we have  $AC$ , or

$a = \frac{2vv}{b-2y}$ . Now, if  $b$  be greater than  $2y$ , the *Tangent* must

be drawn towards  $B$ ; if less, towards  $E$ ; if it be equal to it, it will be parallel to  $EB$ , as was said in the first, second, and fourth rules.

Let there be another semicircle inverted; as  $NDD$ , (*fig. 16.*) the points of whose periphery are referred to the right line  $BE$ , parallel and = to the diameter. Let  $NB$  be called  $d$ ; and all things else as before; then the equation will be  $by-yy=dd+vv-2dv$ ; which being managed according to his rules,

you have  $a = \frac{2vv-2dv}{b-2y}$ . Now, since  $v$  here is supposed

to be always less than  $d$ ; if  $b$  be greater than  $2y$ , then the *Tangent* must be drawn towards  $E$ ; if equal, it will be parallel to  $BE$ ; if less, changing all the signs, the *Tangent* must be drawn towards  $B$ , as by rules fourth, fifth, and third. But there

there could be no *Tangent* drawn, or at least *EB* would be it, if *NB* had been taken equal to the diameter. Let there be another semicircle, whose diameter *NB* (*fig. 17.*) is perpendicular to *EB*, and to which its points are supposed to be referred. Let *NB* be called *b*, and all things else as above; the

equation will be  $y^2 = b v - v^2$ , and  $a = \frac{2y}{b v - 2 v^2}$ . If,

now, *b* be greater than  $2 v$ , the *Tangent* must be drawn towards *B*, if lesser, towards *E*, if equal, *DA* will be the *Tangent*, as by rules 1, 4, and 5, appears.

*Inverse Method of TANGENTS*, is a method of finding the equation, or the construction, of any curve; from the *Tangent* or any other line whose determination depends on the *Tangent*, given.

This method is one of the great results of the new *Calculus Integralis*. See *CALCULUS*.

Its application we shall give in what follows.—The differential expressions of the *Tangent*, *Sub-tangent*, &c. being delivered under the last article: if you make the given value equal to the differential expression, and either sum up the differential equation, or, if that cannot be, construct it, the curve required, is had.—For example:

1° To find the curve line, whose *Sub-tangent*  $= 2 y y : d$   
Since the *Sub-tangent* of an algebraic line is  $y d x : d y$  we have

$$\begin{aligned} y d x : d y &= 2 y y : a \\ a y d x &= 2 y^2 d y \\ a d x &= 2 y d y \\ a x &= y^2 \end{aligned}$$

The curve sought, therefore, is a parabola; whose construction is shewn under the article *PARABOLA*.

2° To find the curve, whose *Sub-tangent* is a third proportional to *r—x* and *y*.

Since  $r - x : y = y : d x$

$$\begin{aligned} \text{We have } r - x : y &= d y : d x \\ r d x - x d x &= y d y \\ r x - \frac{1}{2} x^2 &= \frac{1}{2} y^2 \\ 2 r x - x x &= y^2 \end{aligned}$$

The curve sought therefore, is a circle.

3° To find a line wherein the *Sub-tangent* is equal to the semi-ordinate.

$$\begin{aligned} \text{Since } y d x : d y &= y \\ y d x &= y d y \\ d x &= d y \\ x &= y \end{aligned}$$

Hence it appears, that the line sought, is a right line, which respects the cathetus of an equicrural triangle, as an axis or the hypotenuse of an equicrural, rectangled triangle. If *x* had been taken for the arch of a circle, the sought line had been a cycloid. See *CYCLOID*.

*TANGERE*—*Noli me TANGERE*. See *NOLI*.

*TANGIBLE*. See the article *TACTILE*.

*TANISTRY*, *TANISTRIA*, an ancient municipal law, or tenure, which allotted the inheritance of lands, castles, &c. held by this tenure, to the oldest and most worthy and capable person of the deceased's name and blood; without any regard to proximity\*.—This, in reality, was giving it to the strongest; which naturally occasioned bloody wars in families: for which reason it was abolished under *K. James I.*

\* Sir John Davis describes it thus; *Quant aſcum perſon moruſt ſeiſte des aſcuns caſtles, manors, terres ou tenements del nature & tenure de tanistry; que donques meſmes les caſtles, &c. doent deſcender, & de temps dont memory ne court ont uſe de deſcender, Seniori & digniſſimo viro ſanguinis & cognominis de ſiel perſon, &c.*

*TANNED Hide*. See the article *HIDE*.

*TANNING*, the preparing of skins or hides in a pit, with *Tan* and water, after having first taken off the hair, by steeping them in lime-water. See *TAN*, *SKIN*, *HIDE*, &c.

*Method of TANNING COWS*, calves, and horse-hides—The skin being flead off the carcass, if it is intended to be kept, it is salted with sea salt and allum, or with a kind of saltpetre, called *natron*; if it is not for keeping, the salting is saved, as being of no use, but to prevent the hide from corrupting before it can be conveniently carried to the *Tan-house*.

Whether the hide have been salted or not, the *Tanner* begins with taking off the horns, the ears, and the tail; after which it is thrown into a running water for about 30 hours, to wash off the blood, and other impurities adhering to the inside.

This done, it is laid over-night in a lime-pit, already used; whence it is taken, and left to drain three or four days on the edge of the pit.

This first and slightest preparation over, it is returned into a strong lime-pit for two days, then taken out for four more; and thus for 6 weeks alternately, taken out and put in, twice a week.

VOL. II. N°. CL.

At the six weeks end, it is put into a fresh pit, where it continues eight days, and is taken out for so many; and this alternately for a year or eighteen months, according to the strength of the leather, or the weather: for in great heats, they put in fresh lime twice a week; and in frost they sometimes do not touch them for three months. Every fresh lime-pit they throw them into, is stronger and stronger.

At four, five, or six weeks ends the *Tanner* scrapes off the hair on a wooden leg, or horse, with a kind of knife for that purpose. And after a year or eighteen months, when the hair is perfectly gone, he carries it to a river to wash, pares off the flesh on the leg with a kind of cutting-knife, and rubs it briskly with a kind of whet-stone, to take off any remains of flesh or filth on the side of the hair.

The skin is now put into *Tan*; that is, covered over with *Tan*, as it is stretched in the pit, and water let in upon it: if the skin be strong, five coverings of *Tan* will be required; for weaker, three or four may suffice. When the skin has not been kept long enough in lime, or the *Tan-pit*, upon cleaving it in the middle, is seen a whitish streak, called the *born*, or crudity of the skin; and it is this is the reason why the soles of shoes, boots, &c. stretch so easily, and take water.

When the hides are sufficiently tanned, they are taken out of the pit, to be dried, by hanging in the air: then the *tan* is cleaned off them, and they are put in a place neither too dry, nor too moist; they are well stretched over one another, with weights a-top, to keep them tight and straight; and in this condition are sold, under the denomination of *bend leather*. This is the method of *tanning* bullocks or oxes hides.

Cows, calves, and horses skins are *tanned* much after the same manner as those of oxen, except that the former are only kept four months in the lime-pit; and that before they be put in the *tan*, there is a preparation required, thus: cold water is poured into a wooden fat or tub, wherein the skins are put, which are kept stirring while some other water is warming in a kettle; and as soon as that water is a little more than lukewarm, it is poured gently into the fat, and upon this is cast a basket of *tan*; during which time, the skins are still kept turning, that the water and *tan* may not scorch them.

After an hour, they are taken out, and cast for a day in cold water, then returned into the former fat, and the same water they had been in before; and here they are left eight days; which expired, they are put in the *tan-pit*, and three coverings of *tan* given them, the first of which lasts five weeks, the second six, and the third two months.

The rest of the process is in all respects the same as that above delivered. In some countries, as in Champagne, &c. the *Tanners* give the first preparation with barley instead of lime.

*TANTAMOUNT*, something that amounts to, or is equivalent to some other. See *EQUIVALENT*.

*TANTUM decies*. See the article *DECIES*.

*TAP*, among hunters:—a hare is said to *tap*, or beat, when she makes a particular noise at rutting-time. See *RUT*.

*TAPASSANT*, among hunters, denotes *lurking* or *squatting*. Hence also, to *tappy*, is to lie hid, as a deer may do.

*TAPER*, *TAPERING*, is understood of a piece of timber, or the like, when broad at one end, and gradually diminishing to the other;—as is the case in pyramids, cones, &c. See *PYRAMID*.

To measure *taper* Timber, &c. See the articles *TIMBER*, *SLIDING-Rule*, &c.

*TAPER-BORED*, is applied to a piece of ordnance, when it is wider at the mouth than towards the breech. See *ORDNANCE*.

*TAPER*, also denotes a kind of tall wax candle, placed in a candlestick, and burnt at funeral processions, and in other church-solemnities. See *CANDLE*.

*Tapers* are made of different sizes: in some places, as Italy, &c. they are cylindrical; but in most other countries, as England, France, &c. they are conical, or *taper*, whence, possibly, the name: unless we rather chuse to derive *taper* in the adjective sense from the substantive *Taper*, in the Saxon, *Tapep*, or *Tapop*, *cereus*, a wax candle.

Both kinds are pierced at bottom, for a pin in the candlestick to enter. See *CANDLE*.

The use of lights in religious ceremonies, is of a long standing: the ancients, we know, used flambeaux in their sacrifices, and particularly in the mysteries of Ceres; and they had *Tapers* placed before the statues of their Gods.

Some suppose, that it was in imitation of this heathen ceremony, that lights were first introduced into the Christian church; others take it, that the Christians borrowed the practice from the *Jews*: but recourse need not be had to the one or the other.

Doubtless, as in the first days of Christianity they had their meetings in obscure subterraneous vaults, there was a necessity for *Tapers*, &c. and there was even occasion for them after they had the liberty of building churches; those being contrived in such manner, as only to receive very little light, that they might inspire the greater awe and respect by the obscurity.

This original of *Tapers* in churches is the most natural; but it is now a long time since the use of *Tapers*, which necessity at first introduced, is become a mere ceremony. St. Paulinus, who lived at the beginning of the fifth century, observes that the Christians of his days were so fond of *Tapers*, that they even painted them in their churches.

There are two ways of making **TAPERS**: the first with the *ladle*, the second by *hand*.

In the first, after the wicks (which are usually half cotton, half flax) have been well twisted, and cut of the due length; a dozen of them are hung, at equal distances, around an iron hoop, directly over a large copper basin full of melted wax.

Then taking an iron ladle-full of the wax, they pour it gently over the wicks, a little below the tops thereof, one after another; so that the wax running down them, they become quite covered therewith, and the surplus returns into the basin, under which is a pan of coals to keep it in fusion.

Thus they continue to cast on more and more wax for ten or twelve times, till the *Tapers* be brought to the required dimensions. The first cast only soaks the wick, the second begins to cover it, and the rest give it the form and thickness; in order to which, they take care that every cast, after the fourth, be made lower and lower below the wicks, to make them *taper*.

The *Tapers* thus formed, are laid, while yet hot, one against another, in a feather-bed folded double to preserve them soft; and taken out thence, one after another, to be rolled on a long smooth table, with an oblong instrument of box, polished at bottom, and furnished with a handle above.

The *Taper* thus rolled and polished, a piece of its big end is cut off, and a conical hole bored therein, with a boxen instrument, into which the pin, or point of the candlestick is to be received.

While the broach is yet in the hole, they use to stamp the maker's name, and the weight of the *Taper*, with a boxen ruler, whereon proper characters are cut. The *Taper* is then hung up to dry, and harden; after which it is fit for use.

**Making of TAPERS by hand.** The wicks being disposed, as in the former manner, they begin to soften the wax by working it in hot water, in a narrow, deep copper vessel. They then take a quantity of this wax out with the hand, and apply it gradually on the wick, which is fastened to a hook in the wall by the end opposite to the wick: so that they begin to form the *Taper* by the big end; and proceed, still lessening the thickness, to the neck or collet.

The rest is performed after the same manner as in *Tapers* made with the ladle, except that they do not lay them in the feather-bed, but roll them on the table as fast as formed.

Two things there are to be observed in the two kinds of *Tapers*: the first, that in the whole process of *Tapers* with the ladle, they use *water* to moisten the table, and other instruments used therein, that the wax may not stick; and that in the other, they use oil of olives or lard for the same end.

**Paschal TAPER**, among the Romanists, is a large *Taper*, whereon the deacon applies five bits of frankincense, in holes made for the purpose, in form of a cross; and which he lights with new fire in the ceremony of Easter Saturday.

The Pontifical makes pope Zosimus the author of this usage; but Baronius will have it more ancient, and quotes a hymn of Prudentius to prove it. That pope he supposes to have only established the use thereof in parish churches; which, till then, had been restrained to the greater churches.

F. Papebroch explains the origin of the paschal *Taper* more distinctly in his *Conatus Chronico-Historicus*, &c. It seems, though the council of Nice regulated the day whereon Easter was to be celebrated, it laid it on the patriarch of Alexandria to make a yearly canon thereof, and to send it to the pope. As all the other moveable feasts were to be regulated by that of Easter, a catalogue of them was made every year, and wrote on a *Taper*, *Cereus*, which was blessed in the church with much solemnity.

This *Taper*, according to the abbot Chastelain, was not a wax candle, made to be burnt: it had no wick: nor was it any thing more than a kind of column of wax, made on purpose to write the list of moveable feasts on, and which would suffice to hold it for the space of a year.

For among the ancients, when any thing was to be wrote to last for ever, they engraved it on marble or steel; when it was to last a long while, they wrote it on Egyptian paper; and when it was only to last a short time, they contented themselves to write it on wax. In process of time, they came to write the list of moveable feasts on paper, but they still fastened it to the paschal *Taper*; which practice is observed to this day at Notre-Dame in Rouen, and throughout the order of Cluny.

—Such is the original of the benediction of the paschal *Taper*.

**TAPESTRY**, or **TAPISTRY**, a curious kind of manufacture, serving to adorn a chamber, or other apartment, by hanging, or lining the walls thereof.

Some use *Tapestry* as a general name for all kinds of hangings, whether woven, or wrought with the needle; and whether filken, woollen, linnen, leathern or of paper; (in which they are countenanced by the etymology of the word, formed from the French *tapisser*, to line, of the Latin *tapes*, a cover of a bed,

&c.) But in the common use of our language, the term is now appropriated to a kind of woven hangings, of wooll and silk, frequently raised and enriched with gold and silver, representing figures of men, animals, landscapes, &c.

The invention of *Tapestry* seems to have come from the Levant; and what makes this the more probable is, that formerly the workmen concerned herein, were called, at least in France, *Sarazins*, or *Sarazinois*.

It is supposed that the English and Flemish, who were the first that excelled therein, might bring the art with them from some of the croisades, or expeditions against the Sarazens. See **CROISADE**.

Be this as it will, it is certain those two nations, particularly the English, were the first who set on foot this noble and rich manufacture in Europe; now one of the finest ornaments of palaces, basilicæ, churches, &c.

Hence, if they be not allowed the inventors, they have, at least, the glory of being the restorers of so curious and admirable an art, as gives a kind of life to woolls and silks, in no respect inferior to the paintings of the best masters.

It was late before the French applied themselves to *Tapestry*: the first establishment of that kind, was under Henry IV. in the year 1607, in the Fauxbourg, S. Michael. But this fell with the death of that prince. Under Lewis XIV. the manufacture was retrieved by the care and address of the great M. Colbert, to whom the establishment of the Gobelins is owing, a royal *Tapestry* manufacture, which has produced works in this kind scarce inferior to the finest English or Flemish *Tapestry*, either with regard to the design, the colours, or the strength. See **GOBELINS**.

The *Tapestry-men* distinguish two kinds of work, viz. *Tapestry* of the *high*, and the *low warp*; though the difference is rather in the manner of working, than in the work itself, which is, in effect, the same in both; only the looms, and consequently the warps, are differently situate: those of the *low warp* being placed flat, and parallel to the horizon; and those, on the contrary, of the *high warp*, erected perpendicularly.

The English anciently excelled all the world in their *Tapestry* of the *high warp*; and they still retain their former reputation, though with some little change: their *low warps* are still admired; but as for the *high ones*, they are quite laid aside in our nation. See **COMMERCE**, **WOOLLEN Manufacture**, &c.

The French have three considerable *Tapestry* manufactures besides that of the Gobelins; the first at Aubusson in Auvergne, the second at Felletin in the Upper Marche, and the third at Beauvois: they were all equally established for the *high* and the *low warp*, but have all laid aside the former, excepting the Gobelins.

There are admirable *low warps* in Flanders, generally exceeding those of France; the chief, and almost only Flemish manufactures, are at Brussels, Antwerp, Oudenard, Lille, Tournay, Bruges, and Valenciennes.

At Brussels and Antwerp they succeed both in human figures, in animals, and landscapes; and that both with respect of the designing, and the workmanship. At Oudenard their landscapes and animals are good, but their human figures naught. Lille, and the other cities named, come behind Oudenard.

The French manufacture of Felletin does tolerably well in landscapes, Aubusson in figures, and Beauvois in both.

The usual widths of *Tapestries*, are from two ells to three ells and half, Paris measure.

The manufacture of *Tapestry* of each kind, is too curious to be here passed over, without a short description.—We shall give each under its separate article.

**Manufacture of TAPESTRY of the high Warp.**—The loom whereon it is wrought, is placed perpendicularly: it consists of four principal pieces; two long planks or cheeks of wood, and two thick rollers or beams. The planks are set upright, and the beams across them, one a-top, and the other at bottom, a foot distance from the ground. They have each their trunnions, by which they are suspended on the planks, and are turned with bars. In each roller is a groove, from one end to the other, capable of containing a long round piece of wood, fastened therein with hooks. Its use is to tie the ends of the warp to. The warp, which is a kind of worsted, or twisted woollen thread, is wound on the upper roller; and the work, as fast as wove, is wound on the lower.

Within-side the planks, which are seven or eight foot high, fourteen or fifteen inches broad, and three or four thick, are holes pierced from top to bottom, in which are put thick pieces of iron, with hooks at one end, serving to sustain the coat-stave: these pieces of iron have also holes pierced; by putting a pin in which, the stave is drawn nearer, or set farther off; and thus the coats, or threads, are stretched or loosened at pleasure. The coat-stave is about three inches diameter, and runs all the length of the loom: on this are fixed the coats, or threads, which makes the threads of the warp cross each other. It has much the same effect here, as the spring-stave and treddles have in the common looms. The coats are little threads fastened to each thread of the warp, with a kind of sliding-knot, which forms a sort of marsh, or ring. They serve to keep the warp open, for the passage of broaches wound with silks, woollens, or other matters used in the piece of *Tapestry*.

Lastly,

Lastly, there are a number of little sticks, of different lengths, but all about an inch diameter, which the workman keeps by him in baskets, to serve to make the threads of the warp cross each other, by passing them a-crofs: and that the threads thus crossed may retain their proper situation, a packthread is run among the threads, above the stick.

The loom thus formed, and mounted with its warp, the first thing the workman does, is to draw, on the threads of this warp, the principal lines and strokes of the design to be represented on the piece of *Tapestry*; which is done by applying cartoons made from the painting he intends to copy, to the side that is to be the wrong side of the piece; and then with a black-lead pencil following and tracing out the contours thereof on the thread of the right side; so that the strokes appear equally both before and behind. As to the original design the work is to be finished by, it is hung, up behind the workman, and wound on a long staff; from which a piece is unrolled from time to time, as the work proceeds.

Besides the loom, &c. here described, there are three other principal instruments required for working the silk, or wooll of the woof within the threads of the warp. These are a broach, a reed, and an iron needle.

The broach is of hard wood, 7 or 8 inches long, and two-thirds of an inch thick, ending in a point, with a little handle. It serves as a shuttle, the silks, woollens, gold or silver, to be used in the work, being wound on it. The reed or comb is also of wood, eight or nine inches long, and an inch thick at the back; whence it usually grows less and less, to the extremity of the teeth, which are more or less a-part, according to the greater or less degree of fineness of the intended work. Lastly, the needle is in form of a common needle, only bigger and longer. Its use is to press close the wooll and silks, when there is any line or colour that does not fit well.

All things being prepared for the work, and the workman ready to begin, he places himself on the wrong side the piece, with his back towards the design; so that he works, as it were, blindfold, seeing nothing of what he does, and being obliged to quit his post, and go to the other side the loom, whenever he would view and examine the piece, to correct it with his pressing-needle.

To put any silk, &c. in the warp, he first turns, and looks at his design: then taking a broach full of the proper colour, he places it among the threads of the warp, which he brings a-crofs each other with his fingers, by means of the coats or threads fastened to the staff: this he repeats every time he is to change his colour.

The silk or wooll being placed, he beats it with his reed or comb; and when he has thus wrought in several rows over each other, he goes to see the effect they have; in order to reform the contours with his needle, if there be occasion.

As the work advances they roll it up on the lower beam, and unroll as much warp from the upper beam, as suffices them to continue the piece: the like they do of the design behind them. When the pieces are wide, several workmen may be employed at once.

We have but two things to add: the first, that this *high warp Tapestry* goes on much more slowly than the *low warp*, and takes almost double the time and trouble. The second, that all the difference the eye can observe between the two kinds consists in this, that in the *low warp* there is a red fillet, about one twelfth of an inch broad, running on each side, from top to bottom; which is wanting in the *high warp*.

**Manufacture of TAPESTRY of the low warp.**—The loom or frame whereon the low warp is wrought, is much like that of the weavers: the principal parts thereof are two strong pieces of wood forming the sides of the loom, and bearing a beam or roller at each end: they are sustained at bottom with other strong pieces of wood, in manner of trestles; and, to keep them the firmer, are likewise fastened to the floor with a kind of buttresses, which prevent any shaking, though there are sometimes four or five workmen leaning on the fore-beam at once.

The rollers have each their trunnions, by which they are sustained: they are turned by large iron pins, three foot long. Along each beam runs a groove, wherein is placed the wick, a piece of wood of above two inches diameter, and almost the length of the roller: this piece fills the groove entirely, and is fastened therein, from space to space, by wooden pins. To the two wicks are fastened the two extremities of the warp, which is wound on the further roller; and the work, as it advances, on the nearer.

A-crofs the two sides, almost in the middle of the loom, passes a wooden bar, which sustains little pieces of wood, not unlike the beam of a balance: to these pieces are fastened strings, which bear certain spring-staves, wherewith the workman, by means of two treddles under the loom whereon he sets his feet, gives a motion to the coats, and makes the threads of the warp rise and fall alternately. Each loom has more or fewer of these spring-staves, and each staff more or fewer coats, as the *Tapestry* consists of more or fewer threads. See **LOOM**.

The design, or painting the *Tapestry-man* is to follow, is placed underneath the warp; where it is sustained from space to space

with strings, by which the design is brought nearer the warp. See **DESIGN**.

The loom being mounted, there are two instruments used in working of it, viz. the reed, and the flute. The flute does the office of the weavers shuttle: it is made of a hard, polished wood, three or four lines thick at the ends, and somewhat more in the middle, and three or four inches long. On it are wound the silks, or other matters to be used as the woof of the *Tapestry*. The comb or reed is of wood, or ivory; it has usually teeth on both sides; it is about an inch thick in the middle, but diminishes each way to the extremity of the teeth: it serves to beat the threads of the woof close to each other, as fast as the workman has passed and placed them with his flute among the threads of the warp.

The workman is seated on a bench before the loom, with his breast against the beam, only a cushion or pillow between them; and in this posture, separating, with his fingers, the threads of the warp, that he may see the design underneath, and taking a flute, mounted with the proper colour, he passes it among the threads, after having raised or lowered them, by means of the treddles moving the spring-staves and coats.

Lastly, to press and close the threads of the silk or yarn, &c. thus placed, he strikes each course (i. e. what the flute leaves in its passing and coming back again) with the reed.

What is very remarkable in the manufacture of the *low warp* and which is common to it with the *high*, is, that it is all wrought on the wrong side; so that the workman cannot see the right side of his *Tapestry*, till the piece be finished and taken off the loom.

**TAPIS.** See **TUNICA**.

**TAPPING**, the act of piercing a hole in a vessel, and applying a tube, or cannula in the aperture, for the commodious drawing off the liquors contained therein.

**TAPPING**, in agriculture, is the making an incision in the bark of a tree, and letting out the juice. See **BARK**.

To tap a tree at the root, is to open it round about the root, See **TREE**, **ROOT**, &c.

Ratray, the learned Scot, affirms that he has found by experiment, that the liquor which may be drawn from the birch in the spring-time, is equal to the whole weight of the tree, branches, roots and all together.

In the tapping of trees, the juice certainly ascends from the root, and after it is concocted and assimilated in the branches, &c. descends like a liquor in an alembic, to the orifice or incision where it issues out.

One of the most effectual ways of tapping, so as to obtain the greatest store of sap in the shortest time, is, not only to pierce the bark, nor yet to cut the body of the tree almost to the pith, with a chisel (as some have directed) but quite through all the circles, and the inner rind itself, on both sides the pith; leaving only the outermost circle, and the bark on the north-east side unpierced.

But this hole is to be bored sloping upwards, as large as the largest augre you can get will make; and that also through and under a large arm, near the ground. So will it not need any stone to keep open the orifice, nor tap to direct the sap into the receiver.

This way, the tree will, in short time, afford liquor enough to brew withal; and with some of this sweet sap, one bushel of malt will make as good ale as four bushel of malt with ordinary water. Sycamore is said to yield the best brewing sap, being very sweet and wholesome.

To preserve the Sap for brewing.—Insolate it by a constant exposure to the sun in glasses or other vessels, till the rest be gathered and ready; otherwise it will contract an acidity: when you have enough, put into it as much very thin cut, and hard toasted rye-bread, as will serve to ferment it; and when it works, take out the bread, and bottle up the liquor. A few cloves in each vessel that receives the sap, as it oozes from the tree, will certainly preserve it a twelve-month. Dr. Tonge in the *Philosophical Transactions*.

**TAPPING**, in chirurgery. See the articles **PARACENTESIS**, **DROPSY**, &c.

**TAP-TOO.** See the article **TAT-TOO**.

**TAR**, or **TARR**, a gross, pitchy liquor, issuing from the trunks of old pines, or firs. See **PITCH**.

When these trees are on the turn, and only fit for burning, they cut off the bark all around towards the root, and through these incisions, there continues flowing, for a considerable time, a blackish liquor, which is the *Tar*.—When this ceases, it is a sure indication the pine is quite dead, and only fit for the fire.

The chief use of *Tar*, is for the coating and caulking of ships. See **CAULKING**, &c.—Of *Tar* is also made rosin. See **ROSIN**.

**TARANTISMUS**, in medicine, the disease or affection of those bit by the *Tarantula*. See **TARANTULA**.

The patients under this malady are denominated *Tarantati*.

Dr. Cornelio, in the *Philosophical Transactions*, represents this as an imaginary disease; and tells us, that the *Tarantati*, or those who think themselves seized with it (excepting such as for particular ends feign themselves so) are most of them young wanton girls, whom the Italian writers call *Donne di sale*, who falling,

falling, from some particular indisposition, into melancholy madness, persuade themselves, according to the vulgar prejudice, that they have been stung by a tarantula. But the evidence on the other side the question, is too strong to be thus overturned, as will appear from the following article.

**TARANTULA**, or **TARENTULA**, in natural history, a venomous insect, whose bite gives name to a new disease. See **TARANTISMUS**.

The *Tarantula* is a kind of spider, denominated from the city of Tarentum, in Apulia, where it is chiefly found: it is about the size of an acorn; and is furnished with eight feet, and as many eyes; its colour various; but it is still hairy: from its mouth arises two horns, or trunks, made a little crooked, with the tips exceedingly sharp, through which it conveys its poison.

These horns, M. Geoffroy observes, are in continual motion, especially when the animal is seeking for food; whence he conjectures they may be a kind of moveable nostrils.

The *Tarantula* is found in several other parts of Italy, and even in the isle of Corsica; but those of Apulia alone are dangerous: even these, when removed thence, are said to become harmless: it is added, that even in Apulia, none but those found on the plains are much to be feared; the air being hotter there, than on the mountains.

M. Geoffroy adds it as an opinion of some, that the *Tarantula* is never venomous but in the coupling season; and Baglivi, that it is never so but in the heat of summer, particularly in the dog-days, when, becoming enraged, it flies on all that pass by.

The bite occasions a pain, which at first appears much like that felt on the stinging of a bee, or an ant: in a few hours, the patient feels a numbness, and the part affected becomes marked with a little livid circle, which soon after rises into a very painful tumour: a little longer, and he falls into a profound sadness, breaths with much difficulty, his pulse grows feeble, his sense fails; at length he loses all sense and motion, and dies, unless relieved. But these symptoms come somewhat differently, according to the nature of the *Tarantula*, and the disposition of the patient. An aversion for black and blue; and, on the contrary, an affection for white, red, and green, are other unaccountable symptoms of this disease.

All the assistance medicine has been able to discover by reasoning, consists in some surgical applications on the wound, cordials, and sudorifics; but these are of little efficacy: a thing that avails infinitely more, is, what reason could never have thought of, music. See **MUSIC**.

As soon as the patient has lost his sense and motion, a musician tries several tunes on an instrument; and when he has hit on that, the tones and modulations whereof agree to the patient, he is immediately seen to make a faint motion: his fingers first begin to move in cadence, then his arms, then his legs, by degrees his whole body: at length he rises on his feet, and begins to dance; his strength and activity still increasing. Some will continue the dance for six hours without intermission.

After this, he is put to bed; and when he is judged sufficiently recruited of his first dance, he is called out of bed, by the same tune, for a second.

This exercise is continued for several days, six or seven at most; in which time the patient finds himself exceedingly fatigued, and unable to dance any longer; which is the characteristic of his being cured: for as long as the poison acts on him, he would dance, if one pleased, without any discontinuation, till he died of the mere loss of strength.

The patient perceiving himself weary, begins to come to himself; and awakes, as out of a profound sleep; without any remembrance of what had passed in his paroxysm, not even of his dance.

Sometimes the patient, thus recovering from his first access, is quite cured; if he be not, he finds a melancholy gloom hanging on him; he shuns the sight of men, and seeks water; and if he be not carefully looked to, throws himself into some river. If he do not die, the fit returns at that time twelvemonth, and he is driven to dancing again. Some have had these returns regularly for 20 or 30 years.

Every *Tarantulus* has his particular and specific tune; but, in the general, they are all very brisk, sprightly tunes, that work cures. See **TUNE**.

This account was given into the royal academy of sciences, by M. Geoffroy, at his return from Italy, in 1702; and confirmed by letters from F. Gouye. The like history is given us by Baglivi, in an express dissertation on the *Tarantula*, published in 1696.

To such extraordinary facts, it is no wonder a few fables should be added; as, for instance, that the patient is no longer affected than while the insect lives; and that the *Tarantula* itself dances, all the while, the same air with the person bitten.

*Theory of the effects of the Tarantula's bite, by M. Geoffroy.*—

The poisonous juice injected by the *Tarantula*, M. Geoffroy conceives, may give the nerves a degree of tension, greater

than is natural to them, or than is proportionate to their functions: and hence arises a privation of knowledge and motion. But, at the same time, this tension, equal to that of some strings of an instrument, puts the nerves in unison to certain tones, and obliges them to shake, after being agitated by the undulations, and vibrations of the air proper to those tones. And hence this wonderful cure by music: the nerves thus restored to their motion, call back the spirits thither, which before had abandoned them. See **UNISON** and **CONCORD**. It may be added, with some probability, and on the same principles, that the patient's aversion for some colours arises hence, that the tension of his nerves, even out of the paroxysm, being still different from what it is in the natural state, the vibrations those colours occasion in the fibres of the brain, are contrary to their disposition, and occasion a kind of dissonance, which is pain.

*Theory of the effects of the Tarantula's bite, by Dr. Mead.*—

The malignity of the poison of the *Tarantula* seems to consist in its great force and energy, whereby it immediately raises an extraordinary fermentation in the whole arterial fluid; by which its texture and crasis is considerably altered: the consequence of which alteration, when the ebullition is over, must necessarily be a change in the cohesion of its parts, by which the globules, which did before with equal force press each other, have now a very differing and irregular nifus, or action; so that some of them do so firmly cohere together, as to compose molecularæ, or small clusters: upon this account, as there is now a greater number of globules contained in the same space, than before, and the impulse of many of these, when united together, differing according to the conditions of their cohesion, as to magnitude, figure, &c. the impetus, with which this fluid is drove towards the parts, will not only be at some strokes greater than ordinary, but the pressure upon the blood-vessels must be very unequal, and irregular; and this will be particularly felt in those which are most easily distended, as those of the brain, &c.

Upon this the nervous fluid must necessarily be put into various undulatory motions, some of which will be like those, which different objects acting upon the organs or passions of the mind do naturally excite in it; whereupon such actions must follow in the body, as are usually the consequences of the several species of sadness, joy, despair, or the like determinations of thought. See **PASSIONS**.

This, in some degree, is a coagulation of the blood, which will the more certainly, when attended with uncommon heat, as is the case in those countries where these creatures abound, produce such like effects as these: because the spirits separated from the blood thus inflamed, and compounded of hard, fixed and dry particles, must unavoidably share in this alteration; that is, whereas their fluid consists of two parts, one more active and volatile, the other more viscid and glutinous, which is a kind of vehicle to the former; their active part will bear too great a proportion to the viscid; consequently they must have more than ordinary volatility and force, and will therefore, upon the least occasion imaginable, be irregularly determined to every part.

Whereupon will follow, tumblings, anger, or fear, upon a light cause; extreme pleasure at what is trivial, as particular colours, or the like: and on the other hand, sadness at what is not agreeable to the sight; nay, laughter, obscene talk and actions, and such like symptoms as attend persons bit; because in this constitution of the nervous fluid, the most slight occasion will make as real a reflux and undulation of it to the brain, and present as lively species there, as the strongest cause and impression can produce in its natural state and condition; nay, in such a confusion, the spirits cannot but sometimes, without any manifest cause at all, be hurried towards those organs, to which at other times they have been most frequently determined; and every one knows which these are in hot countries.

The effects of music on persons touched with this poison, confirms the doctrine above delivered.—For muscular motion, we know, is no other than a contraction of the fibres, from the arterial fluid's making an effervescence with the nervous juice, which, by the light vibration and tremor of the nerve, is derived into the muscle. See **MUSCULAR**.

Thus there is a two-fold effect and operation of the music, that is, upon the body and the mind: a brisk harmony excites lively species of joy and gladness, which are always accompanied with a more frequent and stronger pulse, or an increased influx of the liquor of the nerves into the muscles; upon which suitable actions must immediately follow.

As for the body, since it was sufficient to put the muscles into action, to cause those tremors of the nerves by which their fluid is alternately dropped into the moving fibres, it is all one whether it be done by the determination of the will, or the outward impressions of an elastic fluid.

Such is the air; and that sounds are the vibrations of it, is beyond dispute: these, therefore, rightly modelled, may shake the nerves as really, as the *imperium voluntatis* can do, and consequently produce the like effects.

The benefit of music arises not only from their dancing to it, and so evacuating, by sweat, a great part of the inflammatory fluid; but besides this, the repeated percussions of the air hereby made, by immediate contact shaking the contractile fibres of the membranes of the body, especially those of the ear, which being contiguous to the brain, communicate their tremblings to its membranes and vessels; by these continued succussions and vibrations, the cohesion of the parts of the blood is perfectly broken, and the coagulation prevented: so that the heat being removed by sweating, and the coagulation by the contraction of the muscular fibrillæ, the wounded person is restored to his former condition.

If any one doubts of this force in the air, he may consider, that it is demonstrated in mechanics, that the smallest percussion of the smallest body, may overcome the resistance of any the greatest weight, which is at rest; and that the languid tremor of the air, which is made by the sound of a drum, may shake the vastest edifices.

But besides this, we must allow a great deal to the determinate force, and particular modulation of the trembling percussions; for contractile bodies may be acted upon by one certain degree of motion in the ambient fluid, though a greater degree of it, differently qualified, may produce nothing at all of the like effect: this is not only apparent in two common-stringed musical instruments, tuned both to the same height; but also in the trick which many have of finding the tone or note peculiarly belonging to any wine-glass, and by accommodating their voice exactly to that tone, and yet making it loud and lasting, make the vessel, though not touched, first to tremble, and then to burst; which it will not do, if the voice be either too low, or too high. See SOUND.

This makes it no difficult matter to conceive, why different persons infected with this sort of venom, do require a different sort of music, in order to their cure; inasmuch as the nerves and distractile membranes have different tensions, and consequently are not all alike to be acted upon by the same vibrations.

**TARE** and *Tret* in commerce, any defect, waste or diminution in the weight, the quantity, or the quality of goods. See NEAT.

The seller is usually to account to the buyer for the *Tare* and *Tret*. See TRET.

**TARE** is more particularly used for an abatement, or deduction in the price of a commodity, on account of the weight of chests, casks, bags, frails, &c. See DISCOUNT.

The *Tare* is very different, in different merchandizes: in some there is none at all allowed.—It is a thing much more regarded in Holland than in England, or elsewhere: a modern author, M. Ricard, treating of the commerce of Amsterdam, observes, that the *Tares* are one of the most considerable articles a merchant is to be acquainted withal, if he would trade with security.

Sometimes, the *Tare* is, as it were, regulated by custom; but generally, to avoid all dispute, the buyer and seller make a particular agreement about it. We shall here add, from the fore-mentioned author, some instances of *Tares* allowed at Amsterdam, referring the reader for a more ample account to his *Negociæ d'Amsterdam*, edit. 1722.

Spanish wools are subject to a kind of double *Tare*: for, first, they deduct the *Tare* marked on the bales; and after that, 24 pounds *Tare* for every 175 pound weight, besides the rebate for prompt payment. Indeed, for the common wools, the seller will seldom allow above 14 per cent. for the whole *Tare*; for which reason, the bargain is to be agreed on before.

**TARE** of Roman alum is 4 lib. per sack.  
of Irish, &c. butter, 20 per cent.  
of crude borax, 15 lib. per cent.  
of cinnamon, 17 lib. the burthen.  
of capers, 33 per cent.  
of white pepper, 40 lib. per barrel.  
of black pepper, 5 lib. &c.

**TARENTULA**. See the article TARANTULA.

**TARGET**, a shield; thus called from the Latin, *tergum*, back, because originally made of leather, wrought out of the back of an ox's hide. See SHIELD, BUCKLER, and ESCUTCHEON.

**TARGUM**, in the sacred literature, a name which the Jews give to their Chaldee glosses, and paraphrases on the scripture. See PARAPHRASE.

As the Jews, during their long captivity in Babylon, had forgot their ancient language, the Hebrew; and now understood nothing but the language of their masters, the Chaldeans: there was a necessity of explaining the prophets in that language; and to this necessity, is owing the first beginning of the Chaldee paraphrase to make the sense of the text understood. See HEBREW.

Each doctor made a paraphrase of some part thereof in the vulgar tongue; and as these several interpretations, in time, became very voluminous, certain rabbins undertook to collect them together: and this collection they called the *Targum*.

The Jewish doctors do not agree about the antiquity of the *Targum*; for the more modern Jews having blended their own

VOL. II. No. CL

comments with those of the ancients, no certain age or æra can be fixed for the whole work.

It is commonly believed, that R. Jonathan, who lived under the reign of Herod the Great, made the first Chaldee version of the prophets; and with this version mixed the interpretations borrowed from tradition.—Onkelos, it is certain, translated the pentateuch almost word for word; and without any paraphrase: and another version of the pentateuch is ascribed to Jonathan, but without much certainty. See PENTATEUCH.

For the *Targum* or paraphrase on the other books; we know little of the authors, no more than of those of the *Targum* of Jerusalem, which is another imperfect paraphrase on the five books of Moses: so that in strictness, the *Targum* of Jonathan and Onkelos, is the only paraphrase of any authority. See PARAPHRASE.

The account ascribed to Scaliger, is this: the Hebrew was translated under the reign of Tiberius into Chaldee, by Jonathan; the prophets by Onkelos; and the books of Moses into good old Hierosolymitan, which was then used at Jerusalem, much as Latin is among us.

It is certain, there was a *Targum Hierosolymitanum* still extant: it was wrote in the vulgar tongue; but that being then greatly corrupted, we have now much ado to understand it.

Those *Targumists* might have seen Jesus Christ; it is certain they lived long before the taking of Jerusalem. Scaligerana.

**TARIF**, or **TARIFF**, *book of rates*; a table, or catalogue, drawn, usually, in alphabetical order, containing the names of several kinds of merchandize, with the duties or customs to be paid for the same, as settled by authority, and agreed on between the several princes and states, that hold commerce together. See DUTIES, CUSTOMS, &c.

**TARNISHING**, a diminution of the natural lustre of any thing, especially a metal. See LUSTRE.

Gold and silver, when *tarnished*, resume their brightness, by setting them over the fire with certain lies. Copper, pewter, &c. that are *tarnished*, recover their lustre with tripoli and pot-ashes. The breath of women, under their monthly purgations, Aristotle asserts, *tarnishes* all mirrors, &c. See MENSES.

**TARPAULIN**, or **TARPAWLING**, is a piece of canvass, well pitched and tarred over, to keep off the rain from any place. The term is also used in derision for a person bred at sea, and educated in the mariner's art.

**TARPEIAN**, **TARPEIUS**, in antiquity, an epithet given to a rock in ancient Rome, of considerable height; whence, by the law of the twelve tables, those guilty of certain crimes were precipitated.\*—It was on this rock the capitol was built. See CAPITOL.

\* The *Tarpeian* Rock might formerly be steep enough on one side to break a man's neck; but it could never have been of that surprizing height mentioned by some writers, if any judgment can be formed from its appearance at present. See *Burnet's Letters*, p. 238. and *Misson's N. Voyage*, p. 103.

It took its name from a vestal, called *Tarpeia*, who betrayed the capitol, whereof her father was governor, to the Sabines; on condition they would give her all they bore on their left arms, meaning their bracelets.—But instead of bracelets, they threw their bucklers (which were likewise borne on their left arm) upon her head, and crushed her to death.

Others ascribe the delivery of the capitol to her father, Spurius Tarpeius; and add, that he was precipitated down this rock by Romulus's order; and that this henceforward became the punishment of all criminals of the like kind.

**TARPEIAN Games**, *Ludi TARPEII*, were games instituted by Romulus, in honour of Jupiter Feretrius; and called also *Capitolini Ludi*. See CAPITOLINE.

**TARRACE**, **TARRASS**, or **TERRACE**, a coarse sort of plaister, or mortar, durable in the weather, chiefly used to line basons, cisterns, wells, and other reservoirs of water. See MORTAR, CISTERN, &c. See also TERRACE.

**TARSUS**, **TAPEOE**, in anatomy, is what we vulgarly call the *instep*; being the beginning of the foot, or the space between the ankle and the body of the foot, which is called *Metatarsus*. See FOOT, and METATARSUS.

The *Tarsus* answers to the wrist of the hand.—It consists of seven bones: the first whereof is called *astragalus*, and by the Latins *talus*, and *os balistæ*. See ASTRAGALUS, and TALUS. The second called the *calx*, or *calcæ pedis*, or *calcaneum*; the third *naviculare*, and by the Greeks *scaphoides*; the fourth, fifth and sixth, are generally called *innominata*, but by Fallopius, from their figure, *cuneiformia*: lastly, the seventh, the *cuboides*. See each described under its proper article, CALX, NAVICULARE, INNOMINATA, &c.

**TARSUS** is also a name given by some anatomists to the cartilages which terminate the palpebræ, or eye-lids; and from which the cilia, or hairs arise. See PALPEBRA.

They are exceedingly thin and fine, which makes them light and flexible.—Their form is semicircular: that of the upper eye-lid, is somewhat longer than that of the under: they serve alike to close the eyes. See CILIA.

**TARTANE**, a kind of bark used for fishing and carriage; having neither a raised poop, nor prow; and also using oars.

*Tartanes* are common in the Mediterranean; they have only a mainmast, and a mizzen: their sails are triangular. When they put up a square sail, it is called a *sail of fortune*.

**TARTAR, TARTARUS, or TARTARUM**, in chymistry, a kind of salt which rises from wines, and sticking to the top and sides of the casks, forms a crust, which hardens to the consistence of a stone. See **SALT**, and **CRYSTAL**.

*Tartar*, says an ingenious author, has the juice of the grape for its father, fermentation for its mother, and the cask for its matrix. See **WINE**, &c.

Its goodness rather depends on the number of repeated fermentations, which a succession of new wines in the same cask for several years makes, than on the soil or climate where the wine is produced.

*Tartar* is either *white*, or *red*, according to the colour of the wine it is raised from.—That brought from Germany is the best, as being taken out of those monstrous tuns, some whereof hold a thousand pipes of wine; so that the salt has time to come to its consistence, one of the chief qualities to be regarded in *Tartar*.—That of Montpellier is the next in order; then that of Lyons, Paris, &c.

*White Tartar* is preferred to red, and is really better; as containing less of the drossy, or earthy part.—The marks of good *Tartar* of either kind are, its being thick, brittle, brilliant, little earthy.

*Tartar* is of considerable use among the dyers, as serving to dispose the stuffs to take their colours the better. See **COLOUR**, and **DYING**.

The chymists make abundance of preparations from *Tartar*; as *Cream*, or *Crystal of Tartar*, which is nothing but *Tartar* powdered, and reduced by means of boiling water, a straining bag, and a cellar, into little crystals. See **CREAM of Tartar**.

**Salt of TARTAR** is made of *Tartar* washed, ground, purified, and calcined, by a reverberatory fire; or it is made by pulverizing what remains in the retort after the distillation of *Tartar*, and calcining it as above by a reverberatory fire, to make it yield its salt when put into hot water, &c.—On the one or the other of these preparations, they pour a great quantity of hot water, to make a lye of it; this they filtrate, and evaporate the liquor by a sand heat, till the fixed salt be found at the bottom of the vessel.—This is the alkali, or fixed salt of *Tartar*. See **SALT**.

**Oil of TARTAR**, is the salt of *Tartar* exposed to the air for some days, in an open vessel, in a moist place, till it dissolve into an oil; though it is improperly called an oil, being no more than a dissolved salt. See **DELIQUIUM**.

**Oil of Tartar per deliquium**, is held the best counter-poison to corrosive sublimate. See **ANTIDOTE**, &c.

**TARTAR Chalybeated**. See the article **CRYSTAL**.

**TARTAR Emetic**. See **EMETIC**, and **CRYSTAL**.

**TARTAR Foliated**, is a preparation of *Tartar* with distilled vinegar, which reduces it into white leaves.

**TARTAR Soluble**. See the article **SOLUBLE**.

**TARTAR Vitriolated**, which some call *Magistery of Tartar*, is oil of *Tartar* mixed with rectified spirit of vitriol: upon mixing the two, there arises a great evaporation, by means whereof, of liquids they become solids.

**TARTARIZING**, a term used by some writers, for the act of refining or purifying, by means of salt of *Tartar*. See **TARTAR**.

**TASSEL**, a sort of pendant ornament, at the corners of a cushion, or the like thing.—Also a small ribband or silk sewed to a book, to be put between the leaves.

**TASSELS**, in a building, those pieces of board that lie under the ends of the mantle-trees. See **MANTLE**.

**TASSEL**, or **TIERCELET**, is also used in falconry for a male hawk. See **HAWK**, and **FALCON**.

**TASSELS** are also a kind of hard burrs used by clothworkers in dressing cloth. See **TEAZLE**.

**TASTE**, *Savour*, a sensation, excited in the soul by means of the organ of *Taste*; viz. the papillæ of the tongue, &c. See **SENSATION**, and **TASTING**.

Dr. Grew, in a lecture on the diversity of *Tastes*, before the Royal Society, distinguishes them into *Simple* and *Compound*.

By **Simple TASTES**, he understands such as are simple modes of *Taste*, although mingled with others in the same: thus the *Taste* of a pippin is aci-dulcis; of rhubarb, amar-astringent, and therefore compounded, in both; but yet in the pippin the acid is one simple *Taste*, and the sweet another, as distinct as the bitter and astringent are in the rhubarb.

Two faults, he observes, have here been committed: the first, a defective enumerating of simple *Tastes*; the second, reckoning them indistinctly among such as are compounded.

**Simple Tastes**, of which we usually only reckon six or seven sorts, are at least sixteen: 1. *Bitter*, as in wormwood; whose contrary is, 2. *Sweet*, as in sugar. 3. *Sour*, as in vinegar; whose contrary is, 4. *Salt*. 5. *Hot*, as in cloves; to which is opposite, 6. *Cold*, as in sal prunella; for we may as properly say a cold *Taste*, as an hot one, since there are some bodies which do manifestly impress the sense of cold upon the tongue, though not to the touch. 7. *Aromatick*; to which is contrary, 8. *Nauseous*, or malignant. 9. *Soft*, which are ei-

ther vapid, as in water, starch, whites of eggs, &c. or unctuous, as in oils, fat, &c. 10. *Hard*, of which he reckons four kinds; as, 11. *Penetrant*, which worketh itself into the tongue without any pungency; as is found in the root and leaves of wild cucumber. 12. *Stupeficient*, as in the root of black hellebore, which being chewed, and for some time retained upon the tongue, affects that organ with a numbness, or paralytic stupor. 13. *Astringent*, as in galls: and, 14. *Pungent*, as in spirit of sal armoniac; which two last *Tastes* he makes contrary to the unctuous, as penetrant and stupeficient are contrary to the vapid one.

The **Compound TASTES** are very numerous; but we have words to express but six of them: 1. *Austere*, which is astringent and bitter, as in the green and soft stones of grapes. 2. *Acerb*, properly so called, which is astringent and acid, as in the juice of unripe grapes. 3. *Acrid*, which is pungent and hot. 4. *Muriatick*, which is salt and pungent, as in common salt. 5. *Lixivious*, which is saltness joined with some pungency and heat. 6. *Nitrous*, which is saltness joined with pungency and cold. See **AUSTERE**, **ACERB**, &c.

**TASTE** is also used, in a figurative sense, for the judgment and discernment of the mind. See **JUDGMENT**, and **DISCERNING**.

We talk, and we hear talk, every day, of *Taste*, of *good Taste*, and of *bad Taste*; and yet without well understanding what we mean by the word: in effect, a *good Taste* seems at bottom to be little else but right reason, which we otherwise express by the word *judgment*. See **REASON**.

To have a *Taste*, is to give things their real value, to be touched with the good, to be shocked with the ill; not to be dazzled with false appearances; but, in spite of all colours, and of every thing that might deceive or amuse, to judge soundly.

*Taste* and judgment then should be the same thing; and yet it is easy to discern a difference: the judgment forms its opinions from reflection; the reason, on this occasion, fetches a kind of circuit to arrive at its end: it supposes principles, it draws consequences, and it judges; but not without a thorough knowledge of the case: so that after it has pronounced, it is ready to render a reason of its decrees.—*Good Taste* observes none of these formalities; before it has time to consult, it has taken its resolution: as soon as ever an object is presented it, the impression is made, the sentiment formed; ask no more of it. As the ear is wounded with a harsh sound, as the smell is soothed with an agreeable odor, before ever the reason have meddled with those objects, to judge of them; so the *Taste* is struck at once, and prevents all reflection.

Reflections may come afterwards to confirm it, and discover the secret reasons of its conduct; but it was not in its power to wait for them. Frequently, it happens not to know them at all; and what pains soever it use, cannot discover what it was that determined it to think as it did.

This conduct is very different from that which the judgment observes in its decisions; unless we chuse to say that *good Taste* is, as it were a first motion, or a kind of instinct of right reason, which hurries us on with rapidity, and conducts us more securely than all the reasonings we could use. It is a first glance of thought, which discovers to us the nature and relations of things as it were by intuition.

In effect, *Taste* and judgment are one and the same thing, one and the same disposition and habitude of the soul, which we call by different names, according to the different manners wherein it acts: when it acts by sensation, by the first impression of objects, we call it *Taste*; and when by reasoning, after having examined the thing by all the rules of art, &c. we call it judgment: so that one may say, *Taste* is the judgment of nature, and judgment the *Taste* of reason. See **JUDGMENT**.

*Good Taste*, as defined by Madem. Scudery and Madem. Dacier, in an express treatise of the corruption of *Taste*, is an harmony between the mind, and reason; and a person has more or less of this *Taste*, as that harmony is more or less just.

One might perhaps improve on this hint, and say, that *good Taste* is nothing else but a certain ratio or relation between the mind, and the objects presented to it.

Right reason cannot but be moved and affected with things conformable thereto, and wounded by those contrary: there is, then, a kind of sympathy which unites them as soon as ever they meet; and their union, their good understanding, discover each other.—Make a fine discourse; use only the richest and noblest expressions; if they contain an unhappy thought, or an incoherent reasoning, that thought, this reasoning, will immediately be felt by a person of *Taste*: and the antipathy will shew itself by a movement of aversion, as sudden, as lively, and as natural as that which nature inspires us withal for toads or spiders. See **BEAUTY**, **DEFORMITY**, **SENSE**, &c.

**TASTING**, the sense whereby we distinguish flavours; or the perception which the soul has of external objects, by means of the organ of *Taste*. See **SENSE**, and **TASTE**.

Authors differ much as to the *Organ of Tasting*: Bauhin, Bartholin, Veslingius, &c. place it in the laxer fleshy parts of the tongue;

tongue; Dr. Wharton in the glands at the root of the tongue; Laurentius in the thin tunic covering of the tongue; others in the palate, &c. But the great Malpighi, and after him, all the latest writers, place it in the papillæ chiefly lying about the tip and sides of the tongue. See TONGUE.

These papillæ arise from the corpus nervosum which covers the muscular flesh of the tongue; whence, passing through the corpus reticulare, they stand up under the external membrane of the tongue, erect, covered with vaginæ, or sheaths of the said membrane, to defend them from objects too violent. See PAPILLA.

These vaginæ are porous, and stick out so far, that when the aliment is squeezed, they enter within the same, to receive the object, or the matter of *Taste*.

These papillæ, Boerhaave conjectures to arise from the ninth pair of nerves; and these, he asserts, are the only organ of *Taste*: those others, whether of the tongue, palate, or jaws, &c. he observes, contribute nothing thereto; though probably those of the cheeks next the dentes molares may. See PALATE, &c.

The object of *Tasting*, is any thing, either in animals, vegetables, or minerals, from which salt or oil may be extracted. See SALT.

*Tasting*, then, is performed by the objects being attenuated, and mixed with saliva, warmed in the mouth, and applied to the tongue; where, insinuating into the pores of the membranous vaginæ of the nervous papillæ, and penetrating to the surface of the papillæ themselves, it affects and moves them; by which means a motion is communicated along the capillaments of the nerve to the common sensory, and an idea excited in the mind, of salt, acid, sweet, bitter, hot, aromatic, austere, or the like; according to the figure of the particles that strike the papillæ, or the disposition of the papillæ to receive the impulse. See SENSATION.

**TATH**, in old laws, a privilege which some lords of manors enjoyed, of having their tenants sheep folded at night on their demesne lands, for the improvement of the ground.

**TATIANITES**, **TATIANITÆ**, a sect of ancient heretics; thus called from Tatian, a disciple of Justin Martyr.

This Tatian, who has the character of one of the most learned men of all antiquity, was perfectly orthodox during the life of his master. He was, like him, a Samaritan, by nation, not by religion, as Epiphanius seems to insinuate. They both belonged to those Greek colonies spread throughout the country of the Samaritans.

Justin being dead, Tatian gave into the errors of the Valentinians; and formed a sect called sometimes *Tatianites*, and sometimes *Encratitæ*. See ENCRATITÆ.

**TAT-TOO**, *q. d.* **TAP-TO**, a beat of a drum, at night, to advertise the soldiers to retreat, or repair to their quarters in a garrison, or to their tents in a camp. See DRUM.

**TAU\***, in our ancient customs, signifies a cross. See CROSS.

\* *Tradendo dicto comiti Thau eboreum.* So Mr. Selden, in his notes upon Eadmerus, p. 159. *Ego Eadgisa prædicti regis avia hoc opus egregium crucis Tauate consolidavi.* See Mon. 3. Tom. p. 121.

**TAU**, or **TAW**, in heraldry, an ordinary, in figure of a T, supposed to represent St. Andrew's cross, or a cross potence, the top part cut off. See CROSS.

It is thus called from the name of the Greek T, *tau*. See T.

**TAUGHT**, or **TAU'T**, *Tight*, in the sea language, is the same as stiff, or fast.—Thus they say, *set taught* the shrouds, the stays, or any other ropes, when they are too slack and loose. See WIND-TAUGHT.

**TAUNT**, a sea-term.—When the masts of a ship are too tall for her, the sailors say, she is *taunt-masted*.

**TAURI liberi libertas**.—In some ancient charters, *Taurus liber* signifies a common bull to all tenants within such a manor, or liberty.—*Cum libertate faldia, liberi Tauri, & liberi Apri, &c.*

**TAURUS**, in astronomy, the *Bull*; one of the twelve signs of the zodiac, and the second in order. See SIGN, and CONSTELLATION.

The stars in the constellation *Taurus*, in Ptolemy's catalogue, are 44; in Tycho's catalogue 41; in the Britannic catalogue 135. The longitudes, latitudes, magnitudes, &c. whereof are as follow:

TAURUS, in some ancient customs, signifies a husband \*. See HUSBAND.

\* Leg. H. 1. cap. 7. *Videtur autem matris ejus, cujuscunque Taurus alluferit* —

TAUTOLOGICAL *Echo's*, are such *echo's* as repeat the same sound or syllable many times. See ECHO.

TAUTOLOGY, in grammar, a needless repetition of the same thing in different words. Such, *s. gr.* is that of Virgil;

—*Si fata virum servant, si vespitur aura*

*Etherea, neque adhuc crudelibus occubat umbris.*

Some people, particularly the Jesuits, write and pronounce it *Taftology*. The difference arises from the different pronunciation of the Greek *upsilon* in *tautology*. The modern Greeks it is true, pronounce the *v* as *f*; and it is argued the ancients did the like: but as custom is the standard of a language, this plea avails but little with regard to the English.

TAW. See the article TAU.

TAWING, *Skinning*; the art or manner of preparing or dressing skins in white, to fit them for use in divers manufactures, particularly gloves, purses, &c. See SKIN.

All kinds of skins may be *tawed*; but it is chiefly those of sheep, lambs, kids, and goats, that are used to be dressed this way; as being those fittest for gloves. See GLOVE.

Method of TAWING, or drawing skins in white.—The wool or hair being well got off the skins, by means of lime, &c. (as described under the article SHAMMY) they are laid in a large vat of wood or stone set in the ground, full of water, wherein quick lime has been slacked; wherein they continue a month or six weeks, as the weather is more or less hot, or as the skins are required to be more or less soft and pliant.

While in the vat, the water and lime is changed twice, and they are taken out and put in again every day. When taken out for the last time, they are laid all night to soak in a running-water, to get out the greatest part of the lime; and, in the morning, are laid, six together, on the wooden leg, to get off the flesh, by scraping them stoutly, one after another, on the flesh side, with a cutting two-handed instrument, called a knife; and while this is in hand, they cut off the legs, and other superfluous parts about the extremes.

This done, they are laid in a vat or pit with a little water; where being well filled with wooden pestles for a quarter of an hour, the vat is filled up with water, and the skins rinsed therein. They are next thrown on a clean pavement to drain; which done, they are cast into a fresh pit of water, where being well rinsed, they are taken out, and laid on the wooden leg, six at once, with the hair side outermost, over which they rub a kind of whetstone very briskly, to soften, and fit them to receive four or five more preparations given them on the leg, both on the flesh side and the hair side, with the knife, after the manner above-mentioned.

These over, they are put in a pit with water and wheat-bran, and stirred about therein, with wooden poles, till the bran is

perceived to stick to them; and then they are left; as they rise of themselves to the top of the water by a kind of fermentation, they are plunged down again to the bottom; and, at the same time, fire is set to the liquor, which takes as easily as if it were brandy, but goes out the moment the skins are all covered.

This operation is repeated as often as the skins rise above water; and when they rise no more, they are taken out, laid on the wooden leg, the flesh side outermost, and the knife passed over it to scrape off the bran. The bran thus cleared, the skins are laid in a large basket, where they are laden with huge stones to promote their draining; and when sufficiently drained, their feeding is given them, which is performed after the following manner:

For a hundred large sheep-skins, and for smaller in proportion, they take eight pounds of alum, and three of sea-salt, and melt the whole with water in a vessel over the fire; pouring the dissolution out while yet lukewarm into a kind of trough, wherein is twenty pounds of the finest wheat flower, with eight dozen yolks of eggs; of all which is formed a kind of paste, a little thicker than childrens pap; which, when done, is put into another vessel, to be used in manner following: A quantity of hot water being poured into the trough wherein the paste was prepared, two spoonfuls of the paste is mixed therewith; in order to which, they use a wooden spoon, which contains just what is required for a dozen skins: and when the whole is well diluted, two dozen of the skins are plunged therein: care being taken, by the way, that the water be not too hot, which would spoil the paste, and burn the skins.

Having staid some time in the trough, they are taken out, one after another, with the hand, and stretched out; which is repeated twice: when they have all had their paste, they are put in tubs, where they are filled afresh with wooden pestles. Then they are put in a vat, where they remain five or six days, or more; and are at last taken out in fair weather, and hung out to dry on cords or racks; the quicker they dry the better; for if they be too long a drying, the salt and alum within them, are apt to make them rise in a grain, which is an essential fault in this kind of dressing.

When the skins are dry, they are put up in bundles, and just dipt in fair water; from which being taken out and drained, they are thrown into an empty tub; and, after some time, are taken out, and trampled under foot.

They are then drawn over a flat iron instrument, the top whereof is round like a battledore, and the bottom fixed into a wooden block, to stretch and open them: when opened, they are hung in the air upon cords to dry; and when dry, are opened a second time by repassing them over the same instrument.

Lastly, they are laid on a table, pulled out, and laid smooth; and are thus in a condition for sale, and use.

After the same manner are dressed horses, cows, calves skins, &c. for the saddlers, harness-makers, &c. as also dogs, wolves, bears-skins, &c. excepting that in these the use of the paste is omitted, salt and alum-water being sufficient.

TAWNY, in heraldry. See TENNE.

TAX\*, a tribute settled on every town, after a certain rate; and paid yearly towards the expences of the government. See TRIBUTE, and IMPOST.

\* The word is formed from the Greek, *ταξίς*, order.

The rate, &c. of the Tax was anciently called *Tallage*, from the French *taille*, Tax. See TALLAGE, and TALLY.

The ancient Tax was what the subsidy now is; excepting that the Tax was fixed to a certain sum, *v. gr.* the *fifteenth* part of what the place was anciently valued at, whereas the subsidy is variable according to occasion; and that the Tax was levied on cities and towns, but the subsidy on persons. See SUBSIDY. Anciently, the Tax seems to have been imposed by the king at his pleasure; but Edward I. bound himself, and his successors, from that time forward, not to levy it but by consent of the realm. See FIFTEENTH; see also GILD and BENEVOLENCE.

The people of France were strangers to *Tailles*, or *Taxes*, till the time of St. Louis, when they were first imposed in form of subsidies necessary for the support of the war in the Holy Land. See CROISADE.

They were then extraordinary levies, and were raised by capitation; but were afterwards made perpetual under Charles VII. Philip the Fair, to raise money without disturbing the people, called the people, as a third estate, into the general councils of the realm. See ESTATE.

The name *Taille* is derived from the tally of petty tradesmen; in regard the country people appointed to collect it, not being able to write, scored down what they received, on tallies. See TALLY.

Tax also denotes the tribute which tenants were occasionally to pay their lord. See LORD, and TENANT.

Most lords had a right of *taxing* on four occasions, *viz.* when the lord was taken prisoner in a just war; when he made his eldest son a knight; when he married his eldest daughter to a gentleman; and when he made the voyage of the Holy Land. See AID, and CROISADE.

Naude

Nauve shews the extravagant rise of this kind of *Taxes*: those, he observes, which under Charles VI. only amounted to the sum of 40000 livres, were increased, under Charles VII. to the sum of 1800000 livres; under Louis XI. to 4740000 livres; under Charles VIII. to 6000000; under Louis XII. to 7640000 livres.

*Taxes* were distinguished into *free*, which were those due, in the four cases, by freemen, or those who held free lands; and *servile and base*, which were those due from persons of base condition.

They were also distinguished into *real and personal*. The *personal* were imposed on the head of the servant or man in main-morte, and so followed him where-ever he went. See POLL, CAPITATION, &c.

**TAXERS**, two officers yearly chosen in Cambridge, to see the true gauge of all weights, and measures observed.

The name took beginning from *taxing* and rating the rents of houses, which was anciently the duty of their office.

**TAXIS**, ΤΑΞΙΣ, in the ancient architecture, signifies the same with *Ordonnance*, in the new, and is described by Vitruvius to be that which gives every part of a building its just dimensions, with regard to its use. See ORDONNANCE, PROPORTION, and SYMMETRY.

**TAYL**, in heraldry, &c. See the article TAIL.

**TCHA**. See the article TEA.

**TCHELMINAR**, or TCHILMINAR, or, as we pronounce it, *Chelminar*, one of the most celebrated piles of ruins in the world; being the remains of a palace, supposed to have stood in the middle of the city Estekhar, the ancient Persepolis, capitol of the kings of Persia. See CHILMINAR.

**TEA**, THEA, or as the Japanese call it, TCHA, the leaf of a tree or shrub, growing in several provinces of China, Japan, and Siam; whose infusion is in general use as a drink.

The *Tea* plant affects valleys, and the feet of mountains, and a stony soil. Its seed is usually sown in places exposed to the south; and bears three years after sown. The root resembles that of the peach-tree: the leaves are green, longish at the point, and pretty narrow, an inch and half long, and jagged all around. The flower is much like that of the wild rose. The fruit is of different forms, sometimes round, sometimes long, sometimes triangular; of the ordinary size of a bean; containing two or three peas, of a mouse colour, including each a kernel. These peas are the seeds by which the plant is propagated.

The tree is of various heights, from one foot to an hundred: some there are which two men cannot fathom, while others scarce exceed the feeblest shrub in a garden.

The best time to gather the leaves of *Tea*, is while they are yet small, young, and juicy: when gathered, they are passed over the smook of boiling water to moisten them; then they are laid on copper-plates, which are heated; and thus, the leaves drying, they curl up in the manner they are brought to us.

It is very rare to find *Tea* perfectly pure; the Chinese always mixing other herbs with it, to increase the quantity. Indeed, the price it is sold for among them is moderate enough; usually it is about three-pence a pound sterling, never more than nine-pence.

The Chinese know nothing of *Imperial Tea*, *Flower of Tea*, and many other names, which in Europe serve to distinguish the goodness, and the price of this fashionable commodity; and yet beside the common *Tea*, they distinguish two other kinds, viz. the *Voui* and *Saumblo*, which are reserved for people of the first quality, and sick folks.

We have two kinds of *Tea* in Europe: viz.

**Green TEA**, which is the common *Tea* of the Chinese, &c. F. le Compte calls it *Bing Tea*, and says it is gathered from the plant in April.—It is held very digestive, and a little cortosive: it gives a pale greenish tincture to water; and its leaves are much twisted.—The second is,

**Bohea TEA**, which is the *Voui Tea*, or *Bou Tcha* of the Chinese.—F. le Compte makes this only to differ from the *Green Tea*, by its being gathered a month before it, viz. in March, while in the bud; and hence the smallness of the leaves, as well as the depth of the tincture it gives water. Others take it for the *Tea* of some particular province; the soil being found to make an alteration in the properties of the *Tea*, as much as the season of gathering it.—It is all bought at Nanquin; and it is but lately that the Dutch have introduced it into Europe, where it begins to be much in vogue.

Savory also speaks of a sort of *Red Tea*, or *Tartar Tea*, called *Honan Tcha*, which tinges the water with a pale red, and which is said to be extremely digestive: by means hereof it is that the Tartars are said to be able to feed on raw flesh. Its taste is earthy, and much the least agreeable of them all; but scarce known in England.

*Tea* is to be chosen green, of the briskest smell, as whole as possible; and the greatest care taken that it have not been exposed to the air to pall, and evaporate.

The drink, *Tea*, is made in China, and throughout the greatest part of the east, after the same manner as in Europe; viz. by infusing the leaves in boiling water, and drinking the infu-

sion hot.—Indeed, among us, it is usual to temper its bitterness with sugar, which the orientals use little or none of.

However, the Japanese are said to prepare their liquor a somewhat different way, viz. by pulverizing it, stirring the powder in hot water, and drinking it as we do coffee.

The Chinese are always taking *Tea*, especially at meals: it is the chief treat wherewith they regale their friends. The most moderate take it at least thrice a day; others, ten times, or more: and yet it is computed, the consumption of *Tea* among the English and Dutch is as great in proportion as among the Orientals. In France, the use of *Tea* is much declined, and coffee is now become the prevailing liquor. See COFFEE.

As to the properties of *Tea*, they are strangely controverted: the eastern nations are at least as much possessed with them as the Europeans; but it is, perhaps, because imagination bears as great a sway there as here. The reason why the gout and stone are unknown in China, is ascribed to the use of this plant; which is said further to cure indigestions of the stomach, to carry off a debauch, and to give new strength for drinking; to dispel wind, to cure the vapours, &c.

Sim. Pauli, physician of the king of Denmark, in an express treatise on this plant, endeavours to shew, that these virtues ascribed to it in the East, are local, and do not hold with the inhabitants of Europe. According to him, those past their 40th year should never use it, as being too desiccative: that *Tea* has no other virtues but those of betony: and adds, with Bauhin, that it is only a species of myrtle, found in Europe as well as the Indies.

But this opinion is refuted by Pechlin, in a treatise of *Tea*, intitled, *Theophilus Bibaculus, sive de Potu Theæ Dialogus*; where he maintains, that it is good to prevent scorbutic diseases; that its gentle astringent virtues strengthen the tonic motion of the intestines, &c. But he blames the drinking it with milk, and especially after a full meal, or after much wine.

**TEAM**, THEAM, or THAME, in our ancient customs, signifies a royalty granted by the king's charter to the lord of a manor, for the having, restraining, and judging bondmen, neifs, and villains, with their children, goods, and chattels, in his court.

**TEARS**, *Lachrymæ*, a watry humour, issuing out at the corners of the eye, by the compression of the muscles; serving to moisten the cornea, to express our grief, and even to alleviate it. See LACHRYMAL.

The ancients had an opinion, that the *Tears* of the living were of use, at least of pleasure, to the dead; for which reason they took great care to procure them abundance at their funerals; so much, as to institute a profession or trade of weepers, as judging those of their own families insufficient. See LACHRYMATORY, and FUNERAL.

Deer, when at bay, are commonly said to shed *Tears*: indeed, they ordinarily do yield a sort of *Tears*, which oozing into the two clefts underneath, called *Lachrymatories*, are there condensed into a kind of yellow liquor, or gum; which diluted in white wine or carduus water, is reputed a sovereign remedy for fits of the mother, and the falling-sickness.

Virgil makes the horse of Pallas shed *Tears* at the funeral pomp of his master: this is one of the passages which the modern critics censure as a breach of probability. See PROBABILITY.

**TEAZEL**, or TEASEL, *Carduus Fullonum*, or the *Fullers Thistle*, a kind of plant much used by the fullers, cloth-workers, and stocking-weavers, to card, or draw out the wool or nap from the thread or ground of several kinds of cloths, stuffs, stockings, &c. in order to render them closer, and warmer. See THISTLE.

This plant is cultivated with great care in several parts of France, particularly Normandy; and the exportation thereof prohibited, by reason of the vast use thereof in the woollen manufacture.

The stem of the plant is very high: and its extremity, as also those of its branches, bear an oblong prickly yellowish ball or bur, which is the part used.

The largest burs, and those most pointed, are esteemed the best, and are now called *Male Teazels*, mostly used in the dressing and preparing of stockings and coverlets; the smaller kind, properly called the *Fullers* or *Drapers*, and sometimes the *Female Teazel*, are used in the preparation of the finer stuffs, as cloths, rateens, &c.

The smallest kind sometimes, called *Linnots Heads*, are used to draw out the nap from the coarser stuffs, as bays, &c.

**TECHNICAL**, \* **TECHNICUS**, something that relates to art. See ART.

\* The word is formed of the Greek ΤΕΧΝΙΚΟΝ, *artificial*, of ΤΕΧΝΗ, *art*.

In this sense we say, *Technical Words*, *Technical Verses*, &c.—And in this sense Dr. Harris intitles his dictionary of arts and sciences, *Lexicon Technicum*.

**TECHNICAL**, is more particularly applied to a kind of verses, wherein are contained the rules or precepts of any art, thus digested to help the memory to retain them. See MEMORY.

*Technical Verses* are used in chronology, &c.—Such, *e. gr.* are those expressing the order and measures of the calends, nones, &c. See CALEND.—Those expressing the seasons; see under AUGUST.—Those expressing the order, &c. of the signs; see under SIGN.

F. Labbe has composed a set of *Technical Latin verses*, including all the epochs in chronology; and F. Buffier, after his example, has put both chronology and history in French verse; and since, geography too.

*Technical Verses* are commonly composed in Latin: they are generally wretched ones, and often barbarous; but it is utility is all that is aimed at: to give some idea hereof, we will here add a few instances.—The casuists include all the circumstances which make us partakers with another in a theft, or other crime, in these two *Technical verses*:

*Iussio, concilium, consensus, palpo, recursus,  
Participans, mutus, non obflans, non manifestans.*

The first of F. Buffier's *Technical verses* of the history of France, are these:

*Ses loix en quatre cent Pharamond introduit,  
Clodion Chevelu, qu'Aetius vainquit,  
Merovee; avec lui combatit Attila;  
Gibleric fut chassé, mais on le rapella.*

**TECHNICAL Words**, are what we otherwise call *Terms of Art.* See TERM.

**TECUM Duces.** See the article DUCES.

**TE DEUM**, a kind of hymn, or song of thanksgiving, used in the church; beginning with the words *Te Deum laudamus, We praise thee, O God.*—It is usually supposed to be the composition of St. Augustin, and St. Ambrose.

It is used to be sung in the Romish church with extraordinary pomp and solemnity, upon the gaining a battle, or other happy event; and sometimes even to conceal a defeat.

**TEETH**, *Dentes*, in anatomy. See the article TOOTH.

**Canine TEETH**, } See the articles } CANINE.

**Wolves TEETH**, } See the articles } WOLVES.

**TEGUMENT.** See the article INTEGUMENT.

**TEINTS**, \* and *Semi-TEINTS*, in painting, denote the several colours used in a picture, considered as more or less high, or bright, or deep, or thin, or weakened, and diminished, &c. to give the proper relievo, or softness, or distance, &c. to the several objects. See COLOURING.

\* The word is pure French, where it signifies the same.

**TEIRCE**, or *TEIRS*. See the article TIERCE.

**TEKUPHÆ**, or *THEKUPHÆ*, in the Jewish chronology, are the times wherein the sun proceeds from one cardinal point to the next. See CARDINAL Point.

The term is also applied to the moments wherein the sun enters a cardinal point: these four terms, or *Tekuphæ*, are observed among the Jews with a world of ceremony: the reason, as we are informed by Munster, is this:

That people have a notion, that in each *Tekupha* the sun has a several angel appointed to guard, and direct it; and that in the very point wherein the sun finishes one *Tekupha*, and enters upon another, before the one director has taken place of the other, the devils have a power to exercise all kinds of tyranny in the water.

And hence, they say, that if any body drinks the smallest quantity of water at that time, he will infallibly have a dropsy, or some other grievous distemper.

**TELAMONES**, \* a name given by the Romans to what the Greeks called *Atlantes*, *viz.* the figures of men supporting entablatures, and other projectures. See ATLAS.

\* A late author thinks, that the word *Telamon*, which he deduces from the Greek *ταμων*, a *wretch that bears misfortunes with patience*, does not disagree with those statues, which, in architecture, sustain such loads. See PERSIAN, and CARYATIDES.

**TELESCOPE**, an optical instrument, consisting of several glasses, or lens's, fitted into a tube; through which remote subjects are seen as if nigh at hand. See LENS, and OPTIC Glass.

In *Telescopes*, the lens or glass turned towards the object, is called the *Object-glass*; and that next the eye, the *Eye-glass*; and if the *Telescope* consists of more than two lens's, all but that next the object are called *Eye-glasses*. See OBJECT-Glass, &c.

The invention of the *Telescope* is one of the noblest, and most useful these ages have to boast of: by means hereof, the wonders of the heavens are discovered to us, and astronomy brought to a degree of perfection, which former ages could have no notion of. See ASTRONOMY.

Indeed, the discovery is owing rather to chance, than to thought; so that it is the good fortune of the discoverer, rather than his skill or ability, we are indebted to: on this account it concerns us the less to know, who it was first hit on this admirable invention. It is certain it must be casual, since the theory it depends on was not then known.

Johannes Baptista Porta, a noble Neapolitan, is asserted by Wolfius to be undoubtedly the first that made a *Telescope*; from this passage in his *Magia Naturalis*, printed in 1549:

“If you do but know how to join the two (*viz.* the concave and convex glasses) rightly together, you will see both remote and near objects, much larger than they otherwise ap-

pear, and withal very distinct. In this way we have been of good help to many of our friends, who either saw remote things dimly, or near ones confusedly; and have made them see every thing perfectly.”

But it is certain, Porta did not understand his own invention, and therefore neither troubled himself to bring it to greater perfection, nor ever applied it to celestial observation. What is more, the account Porta gives of his concave and convex lens's is so dark and indistinct, that Kepler, who examined it, by particular command of the emperor Rudolphus, declared to that prince, that it was perfectly unintelligible.

Fifty years afterwards, a *Telescope*, 12 inches long, was made and presented to prince Maurice of Nassau, by a spectacle-maker of Middlebourg; but authors are divided about his name. Sirturus, in a treatise of the *Telescope*, printed anno 1618, will have it to be John Lippersein: and Borel, in an express volume on the inventor of the *Telescope*, published in 1655, shews it to be Zacharis Jansen, or, as Wolfius has it, Hanfen.

Joh. Lapreius, another workman of the same town, passes for a third inventor; having made one in 1610, on the mere relation given him of that of Zachary.

In 1620, James Metius, brother of Adrian Metius, professor of mathematics at Franeker, came with Drebel to Middlebourg, and there bought *Telescopes* of Zachary's children, who had made them public; and yet Adr. Metius has given his brother the honour of the invention; in which he is mistakenly followed by Des Cartes.

But none of these artificers made *Telescopes* of above a foot and half: Simon Marius in Germany, and Galileo in Italy, first made long ones fit for celestial observations.

Le Rossi relates, that Galileo being then at Venice, was told of a sort of optic glass made in Holland, which brought objects nearer: upon which, setting himself to think how it should be, he ground two pieces of glass into form as well as he could, and fitted them to the two ends of an organ-pipe, and shewed, at once, all the wonders of the invention to the Venetian noblesse on the top of the tower of St. Mark. That author adds, that from this time Galileo devoted himself wholly to the improving and perfecting of the *Telescope*; and that he thereby almost deserved all the honour usually done him, of being reputed the inventor of the instrument, and of its being denominated from him *Galileo's Tube*.

F. Mabillon, indeed, relates, in his travels through Italy, that in a monastery of his own order, he saw a manuscript copy of the works of Comestor, written by one Coradus, who lived in the XIIIth century; in the third page whereof, was seen a portrait of Ptolemy viewing the stars through a tube of four joints or draws: but that father does not say that the tube had glasses in it. In effect, it is more than probable, that such tubes were then used for no other purpose, but to preserve and direct the sight, or to render it more distinct, by singling out the particular object looked at, and shutting out all the foreign rays reflected from others, whose proximity might have rendered the image less precise.

This conjecture is verified by experience; we having often observed, that without a tube, by only looking through the hand, or even the fingers, or a pin-hole in a paper, objects shall appear more clear and distinct than otherwise.

Be this as it will, it is certain the optical principles, whereon *Telescopes* are founded, are contained in Euclid, and were well known to the ancient geometricians; and it is for want of attention thereto, that the world was so long without that admirable invention; as, no doubt, there are numerous others lying hid in the same principles, only waiting for reflection or accident to bring them forth.

*Telescopes* are of several kinds, distinguished by the number and form of their lens's, or glasses, and denominated from their particular uses, &c. such are the *Terrestrial* or *Land Telescope*, the *Cælestial* or *Astronomical Telescope*: to which may be added, the *Galilean* or *Dutch Telescope*, the *Reflecting Telescope*, and the *Aerial Telescope*.

*Galileo's*, or the *Dutch TELESCOPE*, is a *Telescope* consisting of a convex object-glass, and a concave eye-glass. See CONCAVE, and CONVEX.

This, of all others, is the most ancient form, being the only kind made by the inventors, Galileo, &c. or known, before Huygens: whence its name. Its construction, perfections, imperfections, &c. are delivered in what follows:

**Construction of Galileo's, or the Dutch TELESCOPE.**—In a tube prepared for the purpose (the structure whereof see under the article TUBE) at one end is fitted a convex object lens, either a plain convex, or convex on both sides, but a segment of a very large sphere: at the other end is fitted an eye-glass, concave on both sides, and the segment of a less sphere: so disposed, as to be the distance of the virtual focus before the image of the convex lens. See FOCUS.

**Theory of Galileo's TELESCOPE.**—Now, in an instrument thus framed, all people, except myopes, or those short-sighted, must see objects distinctly in an erect situation, and increased in the ratio of the distance of the virtual focus of the eye-glass, to the distance of the focus of the object-glass.

But

But for myopes to see objects distinctly through such an instrument, the eye-glass must be set nearer the object-glass. The reason of these effects will appear from what follows:

For, 1° since it is far distant objects that are to be viewed with a *Telescope*, the rays proceeding from the same point of the object, will fall on the object-glass parallel, and consequently by their refraction through the convexity, will be thrown converging on the eye-glass: but by their refraction through the concavity hereof, they will be again rendered parallel, and in such disposition will enter the eye. See RAY, CONCAVITY, CONVEXITY, and CONVERGING.

But all, excepting myopes, see objects distinctly by parallel rays. See VISION, and PARALLEL. Therefore the first point is clear.

2° Suppose A (*Tab. Optics, fig. 41.*) to be the focus of the object-glass; and suppose A C the furthest ray on the right hand of the object that passes through the tube: after refraction, it will become parallel to the axis B I, and consequently after a second refraction through the concave lens, will diverge from the virtual focus. Wherefore since all the rays coming from the same extreme to the eye placed behind the concave lens, are parallel to L E; and those from the middle of the object, parallel to F G (as observed in what went before) the middle point of the object will be seen in the axis G A; and the right extreme, on the right side, viz. in the line L N, or parallel thereto; that is, the object will be erect: which is the second point.

3° Since all right lines parallel to L N cut the axis under the same angle, the semi-diameter of the object will be seen through the *Telescope*, under the angle A F N or E F I: the rays L E and G I entering the eye in the same manner; as if the pupil were placed in F. If now the naked eye were in A, it would see the semi-diameter of the object under the angle c A b or C A B. But since the object is supposed very remote, the distance A F in respect hereto is nothing, and therefore the naked eye, even in F, would see the semi-diameter of the object under an angle equal to A.

The semi-diameter of the object therefore, seen with the naked eye, is to that seen through the *Telescope*, as I M to I E. But it is demonstrated that I M : I E :: I F : A B; that is, the semi-diameter seen with the naked eye, is to that viewed through the *Telescope*; in the ratio of the distance of the virtual focus of the eye-glass F I, to the distance of the focus of the object-glass A B: which was the third point.

Lastly, myopes have their retina too far from the crystalline humour; and diverging rays concur at a greater distance than parallel ones; and those that were parallel become diverging by bringing the eye-glass nearer the object-glass; by means of such approach, myopes will see objects distinctly through a *Telescope*: which is the fourth point.

Hence, 1° to have the whole object visible, the semi-diameter of the pupil must not be less than the distance of the rays L E and G I; and therefore the more the pupil is dilated, the greater field or compass will be taken in by the *Telescope*, and vice versa; so that coming out of a dark place, or shutting the eye for some time before you apply it to the glass, you will take in a greater field at first glance than afterwards, when the pupil is again contracted by the increase of light. See PUPIL.

2° Since the distance of the rays E L and I G is greater, at a greater distance from the lens, the compass taken in by the eye at one view, will be greater as the eye is nearer the concave lens.

3° Since the focus of a plano convex object lens, and the virtual focus of a plano concave eye lens, is at the distance of the diameter; and the focus of an object-glass convex on both sides, and the virtual focus of an eye-glass concave on both sides, is at the distance of a semi-diameter; if the object-glass be plano convex, and the eye-glass plano concave, the *Telescope* will increase the diameter of the object, in the ratio of the diameter of the concavity to that of the convexity; if the object-glass be convex on both sides, and the eye-glass concave on both sides, it will magnify in the ratio of the semi-diameter of the concavity to that of the convexity; if the object-glass be plano convex, and the eye-glass concave on both sides, the semi-diameter of the object will be increased in the ratio of the diameter of the convexity to the semi-diameter of the concavity. And lastly, if the object-glass be convex on both sides, and the eye-glass plano concave, the increase will be in the ratio of the diameter of the concavity to the semi-diameter of the convexity.

4° Since the ratio of the semi-diameters is the same as that of the diameters, *Telescopes* magnify the object in the same manner, whether the object-glass be plano convex, and the eye-glass plano concave, or whether the one be convex on both sides, and the other concave on both.

5° Since the semi-diameter of the concavity has a less ratio to the diameter of the convexity than its diameter has, a *Telescope* magnifies more if the object-glass be plano convex, than if it be convex on both sides.

6° The greater the diameter of the object-glass, and the less that of the eye-glass, the less ratio has the diameter of the object viewed with the naked eye, to its semi-diameter viewed with a *Telescope*; and consequently the more is the object magnified by the *Telescope*.

7° Since the semi-diameter of the object is increased in the ratio of the angle E F I, and the greater the angle E F I is, the less part of the object does it take in at one view; the *Telescope* exhibits so much a less part of the object, as it increases its diameter more.

And this is the reason that determined the mathematicians to look out for another *Telescope*, after having clearly found the imperfection of the first, discovered by chance. Nor were their endeavours vain, as appears from the *astronomical Telescope* hereafter to be described.

If the semi-diameter of the eye-glass have too small a ratio to that of the object-glass, an object through the *Telescope* will not appear sufficiently clear, by reason the great divergency of the rays will occasion the several pencils representing the several points of the object on the retina to consist of too few rays. This too is found, that equal object lens's will not bear the same eye lens's if they be differently transparent, or there be a difference in their polish. A less transparent object glass, or one less accurately ground, requires a more spherical eye-glass than another more transparent, &c.

Hence, though it be found by experience that a *Telescope* is good, if the distance of the focus of the object-glass be six inches, and the diameter of the plano concave eye-glass be one inch and one line, or of one equally concave on both sides one inch and a half; yet is it by no means expedient to recommend to the maker either this, or any particular combination, but to try several eye-glasses, both greater and smaller, with the same object-glass, and take that through which objects appear most clear and distinct.

Hévelius recommends an object-glass convex on both sides, whose diameter is four Dantzick feet; and an eye-glass concave on both sides, whose diameter is  $4\frac{1}{2}$  digits or tenths of a foot. An object-glass, equally convex on both sides, whose diameter is five feet, he observes, will require an eye-glass of five  $\frac{1}{2}$  digits; and adds, that the same eye-glass will also serve an object-glass of eight or ten feet.

Hence, as the distance of the object-glass and eye-glass is the difference between the distance of the virtual focus of the eye-glass, and the distance of the focus of the object-glass; the length of the *Telescope* is had by subtracting that from this. That is, the length of the *Telescope* is the difference between the diameters of the object-glass and eye-glass, if that be plano convex and this plano concave; or the difference between the semi-diameters of the object-glass and eye-glass, if that be convex on both sides, and this concave on both; or the difference between the semi-diameter of the object-glass and eye-glass, if that be convex on both sides, and this concave on both; or the difference between the semi-diameter of the object-glass, and the diameter of the eye-glass, if that be convex on both sides, and this plano concave; or the difference between the diameter of the object-glass, and the semi-diameter of the eye-glass, if that be plano convex, and this concave on both sides.

Thus, e. gr. if the diameter of an object-glass on both sides, be four foot, and that of an eye-glass concave on both sides, be four foot and a half digits or tenths of a foot; the length of the *Telescope* will be one foot eight digits.

*Astronomical TELESCOPE*, is a *Telescope* consisting of an object-glass, and an eye-glass, both convex. See CONVEXITY.

It has its name, from its being wholly used in astronomical observations.

*Construction of the astronomical TELESCOPE*.—The tube being prepared, an object-glass, either plano convex, or convex on both sides, but to be a segment of a large sphere, is fitted in at one end. At the other end, an eye-glass convex on both sides, which is the segment of a small sphere, is fitted into the other end, at the common distance of the foci.

*Theory of the astronomical TELESCOPE*.—Now, an eye placed near the focus of the eye-glass, will see objects distinctly, but inverted, and magnified in the ratio of the distance of the focus of the eye-glass to the distance of the focus of the object-glass.

For 1° since it is very remote objects are viewed through *Telescopes*, the rays from any point of the object fall parallel on the object-glass; and, consequently, after refraction, will meet in a point behind the glass, which point is the focus of the eye-glass. From this point they begin to diverge, and fall diverging on the eye-glass, where being refracted, they enter the eye parallel.

Hence, as all but myopes see distinctly by parallel rays, a *Telescope*, thus disposed, will exhibit remote objects distinctly.

Suppose the common focus of the lens's in F (*Fig. 44.*) and make A B = B F. Since one of the rays A C, proceeding from the right side of the object, passes through A; the ray C E will be parallel to the axis A I, and therefore after refraction in the eye-glass, will fall in with it in its focus G. Since then, the eye is placed near it, and all the other rays proceeding from the same point of the object with E G, are refracted parallel thereto; the point in the right side of the object, will be seen in the right line E G.

After the like manner it appears, that the middle point of the

the object is seen in the axis G B, so that the object appears inverted.

3° From what has been already shewn, it appears that the semi-diameter of the object will be seen through the *Telescope*, under the angle E G I, which to the naked eye placed in A, is seen under the angle b A c. Suppose, now, I F equal to the distance of the focus I G; since the right angles at I are equal, E G F = E F I. Therefore drawing F M parallel to A C, we shall have I F M = B A C. The semi-diameter, therefore, viewed with the naked eye, is to that viewed through the *Telescope*, as I M to I E. Draw K E parallel to F M; we shall have I M : I E :: I F : I K. But by reason of the parallelism of the lens's; C E = B I = B F + F I = A B + F I; and by reason of the parallelism of the right lines C A, and E K; C E = A K, therefore B I = A K, consequently, A B = I K. And therefore I M : I E :: I F : A B; that is, the semi-diameter seen with the naked eye, is to the semi-diameter view'd through the *Telescope*, in the ratio of the distance of the focus of the eye-lens I F, to the distance of the focus of the object-glass A B. Q. e. d.

Hence, 1°, as the *astronomical Telescope* exhibits objects inverted; it serves, commodiously enough, for observing the stars (it mattering little, whether they be seen erect or inverted) but for terrestrial objects, it is much less proper, as the inverting frequently prevents their being known.

2° If between the eye-glass, and its focus G, be a plain well polished metal speculum L N, of the length of an inch, and of an oval figure, inclined to the axis under an angle of 45°, the rays E P and M Q will be reflected in such manner, as that concurring in g, they make an angle P g Q, equal to P G Q; and therefore the eye being placed in g, will see the object of the same magnitude as before, only in an erect situation. By the addition therefore of such a speculum, the *astronomical Telescope* is rendered fit to observe terrestrial objects. See MIRROR.

3° Since the focus of a glass convex on both sides, is distant from the glass itself a semi-diameter; and that of a plano convex glass, a diameter; if the object-glass be convex on both sides, the *Telescope* will magnify the semi-diameter of the object, in the ratio of the semi-diameter of the eye-glass to the semi-diameter of the object-glass; but if the object-glass be a plano convex, in the ratio of the semi-diameter of the eye-glass, to the diameter of the object-glass.

4° Wherefore, since the semi-diameter of the eye-glass has a greater ratio to the semi-diameter of the object-glass, than to its diameter; a *Telescope* magnifies the semi-diameter of the object more, if the object-glass be a plano convex, than if convex on both sides.

5° The ratio of the semi-diameter of the eye-glass, to the diameter or semi-diameter of the object-glass, is the less, as the eye-glass is a segment of a less sphere, and the object-glass of a greater. A *Telescope* therefore magnifies the diameter of the object more, as the object-glass is a segment of a greater, and the eye-glass of a lesser sphere.—And yet the ratio of the semi-diameter of the eye-glass to the object-glass must not be too small; if it be, it will not refract rays enough to the eye from each point of the object; nor will it separate those coming from different points sufficiently: by which means the vision will be rendered obscure and confused. To this may be added, what we have shewn, of the ratio of the object-glass to the eye-glass in the Dutch *Telescope*.

De Chales observes, that an object lens of 2 1/4 feet will require an eye-glass of 1 1/4 digit or tenth of a foot; and an object-glass of eight or ten feet, an eye-glass of four digits; in which he is confirmed by Eustachio de Divinis.

Huygens's great *Telescope*, wherewith Saturn's true face, and one of his satellites were first discovered, consists of an object-glass of 12 feet, and an eye-glass of a little more than three digits. Though he frequently used a *Telescope* of 23 feet long, with two eye-glasses joined together, each in diameter 1 1/2 a digit; so that the two were equal to one of three digits. The same author observes, that an object-glass of 30 foot, requires an eye-glass of 3 1/10 digits; and gives us a table of proportions, for the constructing of *astronomical Telescopes*; an abridgment whereof we shall here give the reader.

Dist. of Foc. of Obj. Glass.	Diam. of Aperture	Dist. of F. of E. Glass.	Mag. Diam.	Dist. of Foc. of Obj. Glass.	Diam. of Aperture	Dist. of F. of E. Glass.	Mag. Diam.
Rhinland Feet.	Digits & Dec.	Digit. and Dec.					
1	0 55 0	61	20	15	2 12 2	33	72
2	0 77 0	85	28	20	2 45 2	70	89
3	0 95 1	05	34	25	2 74 3	01	100
4	1 06 1	20	40	30	3 00 3	30	109
5	1 23 1	35	44	40	3 46 3	56	126
6	1 34 1	47	49	50	3 87 4	26	141
7	1 45 1	60	53	60	4 24 4	66	154
8	1 55 1	71	56	70	4 58 5	04	166
9	1 64 1	80	60	80	4 90 5	39	178
10	1 73 1	90	63	90	5 05 5	56	183
				100	5 48 9	03	199

If in two or more *Telescopes*, the ratio between the object and eye-glass be the same, the object will be magnified the same in both.

Hence some may conclude the making of large *Telescopes* a needless trouble. But it must be remembered, what we have already laid down: an eye-glass may be in a less ratio to a greater object-glass, than to a smaller: thus, e. gr. in Huygens's *Telescope* of 25 feet, the eye-glass is three digits. Now, keeping this proportion in a *Telescope* of 50 feet, the eye-glass should be six digits; but the table shews four and a half are sufficient. Hence, from the same table it appears, that a *Telescope* of 50 feet magnifies in the ratio of 1 : 141; whereas that of 25 feet, only magnifies in the ratio of 1 : 100.

Since the distance of the lens's is equal to the aggregate of the distance of the foci of the object and eye-glasses; and the focus of a glass convex on each side is a semi-diameter's distance, and that of a plano convex, a diameter's distance, from the lens; the length of a *Telescope* is equal to the aggregate of the semi-diameters of the lens's, if the object-glass be convex on both sides; and to the sum of the semi-diameter of the eye-glass, and of the diameter of the object-glass, if the object-glass be a plano convex.

But as the semi-diameter of the eye-glass is very small, in respect of that of the object-glass, the length of the *Telescope* is usually estimated from the distance of the object-glass, i. e. from its semi-diameter, if it be a convex on both sides, or its diameter, if plano convex. Thus a *Telescope* is said to be 12 feet, if the semi-diameter of the object convex-glass on both sides be 12 feet, &c.

Since myopes see near objects best; for them the eye-glass is to be removed nearer the object-glass, that the rays refracted through it may be the more diverging.

To take in the larger field at one view, some use two eye-glasses, the foremost whereof is a segment of a larger sphere than that behind: to this it must be added, that if two lens's be joined immediately together, so as one touch the other, the focus is removed to double the distance which that of one of them would be at.

To shorten the *astronomical Telescope*, i. e. to construct a *Telescope* so, as that, though shorter than the common one, it shall magnify as much:

1° Having provided a drawing tube, fit in an object lens E G (Fig. 43.) which is a segment of a moderate sphere; let the first eye-glass B D be concave on both sides, and so placed in the tube, as that the focus of the object-glass A may be behind it, but nearer to the centre of the concavity G. Then will the image be thrown in Q, so as that G A : G I :: A B : Q I. Lastly, fit in another object-glass, convex on both sides, and a segment of a lesser sphere, so as that its focus may be in Q. This *Telescope* will magnify the diameter of the object, more than if the object-glass were to represent its image at the same distance E Q, and consequently a shorter *Telescope* constructed this way, is equivalent to a longer in the common way. The demonstration may be seen in Wolfius.

Sir Is. Newton furnishes us with another method of contracting the *Telescope*, in his catoptrical or reflecting *Telescope*; the construction whereof see hereafter.

Land *TELESCOPE*, or Day *TELESCOPE*, a *Telescope* consisting of more than two lens's, commonly of a convex object-glass, and three convex eye-glasses; or, a *Telescope* that exhibits objects erect, yet different from that of Galileo.

It has its name from being used to view objects in the day-time, on or about the earth.

To construct a Land or Day *TELESCOPE*.—A tube being provided, fit in an object-glass, which is either convex on both sides, or plano convex, and a segment of a large sphere: to this add three eye-glasses; all convex on both sides, and segments of equal spheres; disposing them in such manner, as that the distance of any two may be the aggregate of the distances of their foci.

Theory of a Land *TELESCOPE*.—Then will an eye applied to the last lens, at the distance of its focus, see objects very distinctly, erect, and magnified in the ratio of the distance of the focus of one eye-glass L K (Fig. 44.) to the distance of the focus of the object-glass A B.

For, 1° the rays, from what has been already said, falling on the object parallel, the image of the object will be represented invertedly at the distance of the principal focus: wherefore, since this image is in the focus of the first eye-glass, the rays, after a second refraction, will become parallel; and thus falling on the third lens, after a third refraction, they exhibit the inverted image invertedly, that is, an erect image of the object. Since then this image is in the focus of the third eye-glass, the rays, after a fourth refraction, will become parallel; and in this disposition the eye will receive them, and consequently there will be distinct vision, and the object will appear erect.

2° If I Q = I K, that is, equal to the distance of the focus of the object-glass, an eye placed in M, will see the semi-diameter of the object increased in the ratio of L M to K I; but the ray A Q, proceeding from the focus Q of the object lens A B, after refraction becomes parallel to the axis I L, consequently the first eye lens C D joins it to the axis in M the distance of a semi-diameter.

And since the focus of the second eye-glass EF, is also in M, the ray FH, after refraction, will be parallel to the axis NO, and therefore the third eye-glass will join it at the axis in P; but the semi-diameters of the lens's GH and CD are supposed equal; therefore PO=LM. Wherefore since the right angles at O and L are equal, as also HO=CL, the angle OPH is equal to CML. The semi-diameter of the object therefore appears the same in P as in M, and is consequently magnified in the ratio of LM, or PO to KI.

Hence, 1<sup>o</sup> an *astronomical telescope* is easily converted into a *land telescope*, by using three eye-glasses for one; and the *land telescope*, on the contrary, into an astronomical one, by taking away two eye-glasses, the faculty of magnifying still remaining the same.

2<sup>o</sup> Since the distance of the eye-glasses is very small, the length of the *telescope* is much the same as if you only used one.

3<sup>o</sup> From the construction, it is evident, that the length of the *telescope* is found by adding five times the semi-diameter of the eye-glasses to the diameter of the object-glass, if a plano convex; or its semi-diameter, if convex on both sides.

Huygens first observed, both in the *astronomical* and *land telescope*, that it contributes considerably to the perfection of the instrument, to have a ring of wood or metal, with an aperture, a little less than the breadth of the eye-glass, fixed in the place where the image is found to radiate upon the lens next the eye; by means hereby the colours, which are apt to disturb the clearness and distinctness of the object, are prevented, and the whole compass taken in at a view, perfectly defined. Some make *land telescopes* of three lens's, which yet represent objects erect and magnified as much as the former. But such *telescopes* labour under very great inconveniences, both as the objects herein are tinged with false colours, and as they are distorted about the margin.

Some again use four lens's, and even more; but since some part of the rays is intercepted in passing every lens, objects are hereby exhibited dim and feeble.

**Reflecting, or catoptric, or cata-dioptric TELESCOPE**, is a *telescope* which, instead of lens's, consists chiefly of mirrors, and exhibits remote objects by reflection, instead of refraction. See CATOPTICS, &c.

This instrument is the invention of the great Sir Is. Newton: what determined him to apply his thoughts this way, was the different refrangibility, which, in his new doctrine of light and colours, he found the rays of light were of. In effect, as he found the ratio between the greatest and least refractions of the different rays to be nearly as 28 to 27, it easily followed, that the rays could never be all refracted parallel from any lens, but would some of them divaricate more, some less; beside that the foci would be disturbed; the focus of the most refrangible rays being nearer the lens than that of the least refrangible ones, by a distance which is the 27th part of the distance between the object-glass, and the focus of the least refrangible ones. See RAY, and REFRACTIBILITY.

Hence he concluded, that refraction was too unequal a principle; and that lens's, of whatever figures, whether spherical, parabolical, or any of the other conic sections, and how truly soever ground, would never suffice for the perfection of *telescopes*.

Upon this he had recourse to another more equable principle, viz. reflection; and made a *telescope*, consisting of specula, or mirrors: the first hint whereof he owns he took from Dr. Gregory's optics.

**Construction of a reflecting TELESCOPE**.—Provide a tube ABCD (Fig. 45.) open in AD, and closed in BC, well blacked within-side, and of a length equal to the distance of the focus from the concave speculum EF. To the bottom BC, is to be fitted a concave metallic speculum *ab*, polished to the greatest possible perfection; or rather, to have the objects clearer, and more distinct, let it be a glass speculum, concave on its fore-side, and equally convex on the hind-side; for unless it be of the same thickness every where, it will reflect the images of objects tinged with a spurious colour, and indistinct. Towards the other end of the tube is fixed an iron piece HL, to which is cemented a plain metallic speculum; or, which is better, a triangular prism of glass or crystal G, whose upper angle G is a right angle, the two others half right; the faces or planes that meet in the angle G to be square, and the third a parallelogram. The prism is to be so disposed, as that a ray reflected from the speculum, passing through the middle of the face GM, may cut it at right angles; but be inclined to the rectangle MN in an angle of 45°. Its distance from the concave speculum EF, is to be such, as that the rays *ac* and *bd* reflected from the concave speculum, may, after a second reflection from the base of the prism, concur in the point *e*; that is, the distance of the focus *e* from the reflecting surface of the prism, and the distance of that from the concave speculum, is to be equal to the distance of the focus from the concave speculum. In I is placed a plano convex lens, whose focus is in *e*, that the reflected rays may enter the eye parallel. Lastly, this lens is covered with a thin brass or leaden plate, having a little round perforation therein, for the eye to look through, by which means all foreign

rays are excluded, which would otherwise occasion confusion. In the first *telescope* of this kind which the inventor made, the semi-diameter of the concave metallic speculum was 12½ digits, or tenths of an inch; from which, therefore, the focus was 6½ digits distant. The diameter of the eye-glass was ¼ of a digit; so that it magnified the diameter of the object in the ratio of 1 to 38: but he found that objects were shewn somewhat obscure hereby; on which account, he afterwards recommended glass specula instead of metallic ones; adding, that there is nothing more required to the perfection of this *telescope*, but that the art of polishing glass be brought to greater perfection; for that some inequalities which do not hurt lens's, are found to affect specula, and prevent objects being seen distinctly.

The same author observes, that if the length of the instrument be 6 feet, and consequently the semi-diameter of the concave speculum 12, the aperture of the speculum is to be 6 inches; by which means the object will be increased in the ratio of 1 to 200 or 300.

If it be longer or shorter, the aperture must be as the cube of the quadrato quadrato root of the length, and its magnifying power as its aperture. The speculum he orders to be an inch or two broader than the aperture.

**Aerial TELESCOPE**, a kind of *astronomical telescope*, the lens's whereof are used without a tube.

In strictness, however, the *aerial telescope* is rather a particular manner of mounting and managing long *telescopes* for celestial observations in the night-time, whereby the trouble of long unweildy tubes is saved, than a particular kind of *telescope*: the contrivance we owe to the noble Huygens.

**Construction of the aerial TELESCOPE**.—1<sup>o</sup> A tall pole or mast AB (Fig. 46. N<sup>o</sup> 2.) the length the tube should be of is fixed perpendicularly in the ground. Before the erecting it, one side is planed smooth, and upon it two rulers fixed parallel to each other an inch and half apart, including a kind of groove or channel between them, reaching from top almost to bottom. At the top of the pole is fixed a little truckle A, moveable on its axis, and over it is drawn a cord Gg, double the length of the pole, and the thickness of the little finger, returning into itself, and furnished with a piece of lead, H, equal in weight to the lens and a moveable arm to be sustained thereby.

Then a wooden lath CD, two foot long, is framed so as that it may slide freely in the channel; and in the middle thereof is affixed a wooden arm E, standing out a foot from the pole, and on its extremity bearing another, Ff, a foot and half long, fixed to it at right angles, both of them parallel to the horizon.

2<sup>o</sup> An object-glass is included in a hollow cylinder IK, three inches long: to this cylinder is fixed a staff KL, near an inch thick, and a foot long, which rests on a brass ball M, that moves freely in its cup or socket underneath: only, on occasion, the ball and socket are fixed by a screw. That the lens thus equally balanced, may be moved with a small force, a weight NI of about a pound, is suspended by a strong wire NF, by bending of which the common centre of gravity of the weight and the lens is easily made to coincide with that of the ball. To the staff KL is fixed a brass style L, which is bent downwards till its point be as much below the centre of the staff, as the centre of the ball is. To the point is tied a fine silken thread LV, which of consequence will be parallel to the staff KL.

3<sup>o</sup> An eye-glass O is included in a short cylinder, and the staff PV fixed to the same. To this is hung a little weight S, sufficient to make a balance. In Q is fixed a handle R, which carries a transverse axis, to be held in the observer's hand, and the staff PV directed towards the object-glass, is tied to the thread LV. The thread passed through a hole V, is wound about a little peg T, fixed in the middle of the staff, by the turning whereof the length of the thread is shortened or prolonged at pleasure.

4<sup>o</sup> That the observer may be able to hold the eye-glass steady, he has a fulcrum or prop under his arm, the structure whereof appears from inspection of the figure. Lastly, to keep off the feeble light flowing from the air upon the eye, it is conveniently covered with a circle Y, perforated in the middle, fitted on to a moveable and flexible arm.

**Binocular TELESCOPE**. See the article BINOCULAR.

**TELESCOPICAL stars** are such as are not visible to the naked eye; but discoverable only by the help of a *telescope*. See STAR.

All stars less than of the sixth magnitude, are *telescopic* to a middling eye.

**TELLER**, an officer in the exchequer, of which there are four; whose business is to receive all monies due to the crown; and thereupon to throw down a bill through a pipe into the tally-court, where it is received by the auditor's clerks, who attend there to write the words of the said bill upon a tally, and then deliver it to be entered by the clerk of the pells, or his clerk. See EXCHEQUER, TALLY, &c.

The tally is then split or cloven by the two deputy-chamberlains, who have their seals, and whilst the senior deputy reads the one part, the junior examines the other part with the other two clerks.

# TEM

The *tellers* places are in the king's gift, and they have, besides their chief clerk or deputy, four other clerks, for the dispatch of business. See EXCHEQUER.

TELLONIUM. See the article TELLONIUM.

TELLUS, *Terras*,  $\delta$ , in astronomy. See EARTH.

TEMPER, in a  $\left\{ \begin{array}{l} \text{physical} \\ \text{musical} \\ \text{mechanical} \end{array} \right\}$  sense. See  $\left\{ \begin{array}{l} \text{TEMPERAMENT} \\ \text{TEMPERAMENT} \\ \text{in music.} \end{array} \right\}$  TEMPERING.

TEMPERAMENT, TEMPERAMENTUM, TEMPERATURE, in physics, that habitude or disposition of a body arising from the proportion of the four primary elementary qualities it is composed of. See QUALITY and ELEMENT.

The notion of *temperament* arises from that of mixture, where different elements, as earth, water, air and fire (or, to speak more justly in the peripatetic way, hot, cold, moist and dry) are blended together; by their opposition, they tend mutually to weaken and encroach on each other: and from the whole arises a sort of temperate crisis, or coalition of them all in this or that proportion; whence, according to the quality that prevails or predominates, we say a *hot* or *cold*, a *moist* or *dry* *temperament*. See MIXTURE, CRISIS, &c.

It is controverted among the school-men, whether the *temperament* properly comprehends all the four primary qualities? or, whether those do not all cease, and a new one, a fifth, simple quality, result from the total alteration made in the other four, by their mutual action on each other?

Authors distinguish two kinds of *temperaments*, viz. *uniform* and *difform*.—The first, wherein all the qualities are mixed in an equal degree.—The second, where in an unequal one.

The uniform *temperament* can only be one; the difform admits of eight different combinations, since either any one, or any two of the qualities may prevail; whence *hot* and *moist*, *cold* and *moist*, &c.—Further, some considering that the qualities which do prevail, may not be in equal degree; and the like of those which do not prevail, make several other combinations or *temperaments*; and add 12 more to the number.—In effect, as there are infinite degrees between the highest and lowest pitch of any one of the elements, the different *temperatures* may be said to be infinite. See DEGREE.

TEMPERAMENT, in medicine, is more particularly understood of the natural habitude and constitution of the body of man, or the disposition of the animal humours in any subject. See CONSTITUTION, and HUMOUR.

The notion of *temperament* arises hence, that the blood flowing in the veins and arteries, is not conceived to be a simple fluid, but a sort of imperfect mixt, or an assemblage of several other fluids: for it does not only consist of the four simple, or primary qualities, but of four other secondary ingredients compounded thereof, into which it is supposed to be resolvable, viz. *choler*, *phlegm*, *melancholy* and *blood*, properly so called. See BLOOD, CHOLER, BILE, PHLEGM, &c.

Hence, as this or that ingredient humour prevails in a person, he is said to be of a choleric, phlegmatic, melancholic, sanguine, &c. *temperament*. See SANGUINE, MELANCHOLY, CHOLERIC, &c.

The ancient physicians brought these animal *temperaments* to correspond with the universal *temperament* above described: thus the *sanguine temperament* was supposed to coincide with *hot* and *moist*, the *phlegmatic* with *cold* and *moist*, the *melancholic* with *dry* and *cold*, &c.

Galen introduced the doctrine of *temperaments* into physic from the peripatetic school, and made it as it were the basis of all medicine. The whole of curing diseases consisted in *tempering* the degrees of the qualities, humours, &c. See GALENICAL, DEGREE, &c.

On the footing medicine now stands, the *temperaments* are much less considered. Dr. Quincy and other mechanical writers pare away the greatest part of the Galenic doctrine, as useless and uncertain, and consider the *temperaments* as no other than those diversities in the blood of different persons, whereby it becomes more apt to fall into certain combinations in one body than another, whether into *choler*, *phlegm*, &c. whence, according to them, people are denounced *choleric*, *phlegmatic*, &c. See BLOOD.

The ancients distinguished two kinds of *temperaments* in the same body: the one *ad pondus*, in respect of weight; the other *ad justitiam*.

TEMPERAMENTUM *ad pondus*, is where the elementary qualities are found in equal quantities, and in equal proportions; such as they are supposed to be in the skin of the fingers, without which those parts would want the power of distinguishing objects with sufficient accuracy.

TEMPERAMENTUM *ad justitiam*, is that which contains unequal portions of those qualities, but yet in such proportion as is necessary for the discharge of the function proper to the part.—Such is the *temperament* in a bone, which contains more earthy than aqueous parts, to make it more hard and solid for its office of sustaining.

Galen observes, that the *temperament ad pondus* is only imaginary; and that though it were real, it could not subsist above one moment.

Dr. Pitcairn looks on the *temperaments*, or constitutions, as so

# TEM

many native diseases; according to him, any one indued with whatever *temperament* has the seeds of a real disease within him; a particular *temperament* supposing that some secretions are in greater proportion than is proper for life indefinitely long.

As the diversities of *temperaments* are no other than diversities of proportion in the liquids, which may be diversified infinite ways; so there may be an infinite number of *temperaments*: though authors have only supposed four. The sanguine, which is usually reckoned a *temperament*, Pitcairn says, is no other than a plethora. See PLETHORA.

TEMPERAMENT, TEMPERAMENTO, in music, denotes a rectifying or mending the false and imperfect concords, by transferring to them part of the beauty of the perfect ones. See CONCORD.

The degrees of the octave, which may be called its *elements*, as being the smallest intervals it is resolvable into, are two greater semitones, two lesser tones, and three greater tones. See TONE, OCTAVE, and DEGREE.

Now the different situation of these elements, with respect to each other, occasions that intervals or concords of the same name, as thirds, fourths, &c. do not consist of the same degrees or elements, though there be always the same number of them: but one fourth, for instance, is agreeable and perfect, and another not.

To mend these imperfect concords, the musicians have be-thought themselves to *temper*, i. e. give them part of the agreeableness of perfect ones. In order to this, they take a medium between the two, and this they call a *temperament*, which necessarily produces a new division of the octave, or, which amounts to the same, new elements.

For instance, whereas naturally its elements are the greater semitone, and the greater and lesser tone; they take a middle tone formed of the greater and the less: and the only elements now are the greater semitone, and this mean tone, which renders the five intervals that are tones equal, and those that are semitones less unequal to these.

One might also divide each of the five tones of the octave into semitones, which, joined to the two it naturally has, make twelve: in which case, the whole octave would be divided into twelve equal parts, which would be mean semitones.

It is easy to form various other kinds of *temperaments*: all the difficulty is to find such as are free from two great inconveniences, i. e. which do not alter either all the concords too much, or, at least, some of them.

All such divisions of the octave are called *tempered*, or *temperative systems*. See SCALE of Music.

TEMPERATE Zone. See the article ZONE.

TEMPERATURE. See the article TEMPERAMENT.

TEMPERING, in the mechanic arts, the preparing of steel and iron, so as to render them more compact, hard and firm; or even more soft and pliant; according to the respective occasions. See IRON, and STEEL.

These metals are *tempered* by plunging them, while red-hot, in some liquor prepared for the purpose: sometimes pure water is used for that purpose; and, in effect, locksmiths, &c. scarce use any other.

Sometimes a composition of divers juices, liquors, &c. is used; which is various, according to the manner and experience of the workman; as vinegar, mouse-ear-water, nettle, or spanish reddish-water, the water oozing from broken glasses, foot, salt, oil, distilled wine, sal armoniac, &c.

To harden and *temper* English, Flemish, and Swedish steel, you must give them a pretty high heat, then suddenly quench them in water to make them hard: but Spanish and Venice steel will need but a blood-red heat before it be quenched. See HEAT.

If the steel be too hard, or brittle for an edge-tool, &c. let it down by rubbing a piece of grindstone or whetstone hard upon the work, to take off the black scurf: then brighten, or heat it in the fire; and as it grows hotter, you will see the colour change by degrees, coming first to a straw, or light goldish colour, then to a darker goldish colour, and at last to a blue colour. Chuse such of these colours as the work requires, then quench it suddenly in water.

The light gold colour is for files, cold chissels, and punches, that punch iron and steel: the dark goldish colour for punches to use on brass, &c. The blue colour gives the *temper* for springs, &c.

The *tempering* of files and needles is performed in a peculiar manner. See FILE, and NEEDLE.

The ancients appear to have had some better method of *tempering* than any of the moderns are acquainted withal; witness their works in porphyry; a stone so hard, that none of our tools make any impression upon it. See PORPHYRY.

TEMPEST, TEMPESTAS, a storm, or violent commotion of the air, with or without rain, hail, snow, &c. See WIND, HURRICANE, WHIRLWIND, WATER-spout, EARTHQUAKE, &c.

TEMPLARS, TEMPLERS, or Knights of the TEMPLE, a religious-military order, first established at Jerusalem, in favour of pilgrims travelling to the Holy Land. See KNIGHT.

The

The original of this order, the first military order in the world, is this: In 1118, some pious noble persons devoted themselves to the service of God, in the presence of the patriarch of Jerusalem; promising to live in perpetual chastity, obedience, and poverty, after the manner of canons.

The two principal persons were Hugo de Paganis, and Geoffrey of St. Omers. Baldwin II. then king of Jerusalem, gave them an apartment in his palace: near the temple, at Jerusalem, nor far from the sepulchre of our Saviour; whence their denomination *Templars*.

Soon afterwards, the canons of the temple gave them a piece of ground hard by the said temple, to build them regular houses on; and the king, the lords, the patriarch, and the prelates, each gave them somewhat out of their revenue, for food and cloaths.

Their first undertaking, and what they had first in view at their institution, was to guard the highway against robbers, &c. chiefly for the safety of pilgrims and croises. See *CROISE*.

The principal articles of their rule were: That they should hear the holy office throughout every day; or, that when their military duties should prevent this, they would supply it by a certain number of pater nosters: that they would abstain from flesh four days in the week, and on Fridays from Eggs and milk-meats: that each knight might have three horses, and one esquire; and that they should neither hunt, nor fowl.

Their first rule was that of St. Bernard. Nine years after their foundation, a particular rule was prescribed them in the council of Troyes.

In every nation they had a particular governor, called *master of the temple*, or of the *militia of the temple*. Their grand master had his residence at Paris.

The order of *templars* was abolished at the beginning of the XIVth century, under Clement V. Edward II. of England, and Philip the Fair of France. In 1607, those in England were all arrested, and seven burnt alive. And in 1312, the order was quite suppressed in the council of Vienne, and 50 burnt alive.

The crimes they were charged withal were apostatizing to the Saracens, and holding correspondence with them. Some authors will have it, these crimes were only pretended; and that the true reason of the suppression of the order, was the immense riches they were possessed of. But though this might be some reason for their suppression, it could be none for burning them alive: add to this, that their effects were given to the hospitallers, or knights of St. John. What then did the kings of England, &c. get by their suppression? And what was it to them which of those orders had the effects? See *HOSPITALLER*.

**TEMPLE, \* TEMPLUM**, a publick building, erected in honour of some deity, either true or false; and wherein the people meet to pay religious worship to the same. See *GOD*, *WORSHIP*, *BUILDING*, &c.

\* The word is formed from the Latin, *templum*, which some derive from the Greek, *temenos*, signifying the same thing; and others from *temno*, *abscindo*, I cut off, I separate, in regard a temple is a place separated from common uses; others with more probability derive it from the old Latin word *templare*, to contemplate. It is certain, the ancient augurs gave the name *templa* to those parts of the heavens which they marked out for the observation of the flight of birds.—Their formula was this: *templa resque sunt*. See *AUGUR*.

Clemens Alexandrinus and Eusebius refer the origin of temples to the sepulchres built for the dead. Herodotus and Strabo will have the Egyptians to have been the first who built temples to the gods. The first, erected in Greece, is ascribed to Deucalion, by Appollonius, *Argonaut. lib. 3*.

In antiquity we meet with many people who would not build any temples to their gods, for fear of confining them to too narrow bounds. They performed their sacrifices in all places indifferently, from a persuasion, that the whole world is the temple of God, and that he requires no other.—This was the doctrine of the magi, followed by the Persians, the Scythians, the Numidians, and many other Nations mentioned by Herodotus, lib. 1. Strabo, lib. 15. and Cicero in his second oration against Verres. See *MAGI*, &c.

The Persians, who worshipped the sun, believed it would wrong his power, to inclose him in the walls of a temple who had the whole world for his habitation: and hence, when Xerxes ravaged Greece, the Magi exhorted him to destroy all the temples he met with.

The Sicyonians would build no temple to their goddess Coronis; nor the Athenians, for the like reason, erect any statue to Clemency, who, they said, was to live in the hearts of men, not within stone-walls.

The Bithynians had no temples, but the mountains to worship on; nor the ancient Germans any other but the woods. See *DRUID*, &c.

Even some philosophers have blamed the use and building of temples, particularly Diogenes, Zeno, and his followers the Stoics.—But it may be said, that if God have no need of temples, men have need of places to meet in for the public offices of religion! Accordingly, temples may be traced back even into the remotest antiquity. See Hespinian, *de Origine Templorum*.

The Romans had several kinds of temples; whereof those built by the kings, &c. consecrated by the augurs, and wherein the exercise of religion was regularly performed, were called, by way of eminence, *templa*, *temples*.—Those that were not consecrated, were called *ædes*.—The little temples, that were covered or roofed, they called *adricula*.—Those open, *facella*.—Some other edifices consecrated to particular mysteries of religion, they called *fana* and *delubra*.

All which kinds of temples, Vitruvius tells us, had other particular denominations, according to the form and manner of their construction; as will be hereafter specified.

Indeed, the Romans out-did all nations in the point of temples: they not only built temples to their gods; to their virtues, to their diseases, &c. but also to their emperors, and that in their life-time; instances whereof we meet withal in medals, inscriptions, and other monuments. Horace compliments Augustus hereupon, and sets him above Hercules, and all the heroes of fable; in that those were only admitted into temples after their death, whereas Augustus had his temples and altars while living\*. See *APOTHEOSIS*, and *CONSECRATION*.

*Præsentis tibi maturos largimur honores;*

*Jarandasque tuum per nomen ponimus Aras.* Epist. ad Aug.

\* Suetonius, on this occasion, gives an instance of the modesty of that emperor, who would allow of no temples being erected to him in the city; and even in the provinces, where he knew it usual to raise temples to the very proconsuls, refused any but those erected in the name of Rome as well as his own. Vid. Suet. in Octav. c. 52.

**TEMPLE**, in architecture.—The ancient temples were distinguished, with regard to their construction, into various kinds; as, **TEMPLE in antæ**, *Ædes in antis*. These, according to Vitruvius, were the most simple of all temples, having only angular pilasters, called *antæ*, or *parastatæ*, at the corners, and two tuscan columns on each side the doors. See *ANTA*, and *PARASTATA*.

**Tetrastyle-TEMPLE**, or simply *tetrastyle*, was a temple that had four columns in front, and as many behind—as, the temple of Fortuna Virilis at Rome. See *TETRASTYLE*.

**Prostyle-TEMPLE**, that which had only columns in its front, or fore-side—as that of Ceres at Eleusis, in Greece. See *PROSTYLE*.

**Amphiprostyle**, or *double prostyle-TEMPLE*, that which had columns both before and behind, and which was also tetrastyle. See *AMPHIPROSTYLE*.

**Periptere-TEMPLE**, that which had four rows of insulated columns around, and was hexastyle, i. e. had six columns in front—as the temple of Honour at Rome. See *PERIPTERE*.

**Diptere-TEMPLE**, that which had two wings, and two rows of columns around, and was also octostyle, or had eight columns in front—as that of Diana at Ephesus. See *DIPTERE*.

**Pseudo Diptere TEMPLE**, } See } **PSEUDO DIPTERE**.

**Hypæthros TEMPLE**, } See } **HYPÆTHROS**.

**Monoptere TEMPLE**, } See } **MONOPTERE**.

**TEMPLES**, among us, denote two inns of court, thus called, because anciently the dwelling-house of the knights-templars. See *TEMPLAR*.

At the suppression of that order, they were purchased by some professors of the common law, and converted into hospitia, or inns. See *INN*.

They are called the *inner* and *middle temple*, in relation to Essex-house, which was also a part of the house of the templars, and called the *outer temple*, because situate without Temple-Bar.

In the *middle temple*, during the time of the templars, the king's treasure was kept: as was also that of the kings of France in the house of the templars at Paris.

The chief officer was the master of the temple, who was summoned to parliament in 49 Hen. III. And from him the chief minister of the temple-church is still called *master of the temple*. See *MASTER*.

**TEMPLERS**. See the article *TEMPLARS*.

**TEMPLES, TEMPORA**, in anatomy, a double part of the head, reaching from the forehead and eyes to the two ears. See *HEAD*.

The temples are chiefly formed of two bones, called *ossa temporis*. See *TEMPORIS Ossa*.

These parts, according to physicians, were called *tempora*, from their shewing the age or time of man, by the colour of the hair, which turns white in this part before any other; which Homer seems to have been aware of, by his calling men *Policrotaphi*, g. d. grey-templed.

**TEMPORAL, TEMPORALIS**, a term frequently used for secular—in which sense it stands opposed to *ecclesiastical*. See *SECULAR*.

Pope Boniface wrote to Philip the Fair of France, that he was subject to him both in spirituals, and temporals.—At present all the doctors on this side the Alps own the supremacy of kings in temporals. See *SUPREMACY*.

**TEMPORAL Action**, } See the articles } **ACTION**.

**TEMPORA Augment**, } See the articles } **AUGMENT**.

**TEMPORALIS**, in anatomy, a muscle, which arises by a semi-circular fleshy beginning, from a part of the os frontis, the

the lower part of the parietale, and upper part of the temporale; from whence going under the zygoma, and gathering together, as in a centre, it is inserted, by a short and strong tendon, into the processus corone of the lower jaw, which it pulls upwards.—See *Tab. Anat. (Myol.) fig. 1. n. 12. fig. 6. n. 2. fig. 7. n. 1.*

This muscle is also called *crotaphytes*, and is covered with a strong tendinous fascia. See *CROTAPHYTES*.

**TEMPORALITIES**, or **TEMPORALTIES**, the temporal revenues of an ecclesiastic; particularly, such lands, tenements, or lay-fees, tithes, &c. as have been annexed to bishops sees by our kings, or other persons of high rank in the kingdom. See *BISHOP*, and *CUSTOS*.

The *temporalities* of a bishop, &c. stand opposed to his spiritualities. See *SPIRITUALITIES*.

The canonists on the other side the Alps anciently gave the pope a power over the *temporalities* of kings. Yet pope Clement V. owned frankly, that his predecessor Boniface VIII. had exceeded the just bounds of his authority, in meddling with the *temporalities* of the king of France. Fevret.

**TEMPORALIUM Custos**, } See { **CUSTOS**.  
**TEMPORALIUM Restitutio**, } { **RESTITUTIONE**.  
**TEMPORARY Fortification**, } { **FORTIFICATION**.  
**TEMPORARY Hours**, } { **HOOR**.

**TEMPORIS Os**, **TEMPLE-Bone**, a bone on each side the head: thus denominated from its situation in the temples. See *TEMPLE*.

The figure of the *os temporis* is nearly circular: the fore and upper parts are very thin, consisting only of one table: the lower and hind parts are thick, hard, and uneven. See *CRAanium*.

It is joined to the *os sincipitis*, by the squamous suture: whence, in that part, it is called *os squamosum*. Its lower part is joined to the *os occipitis*, and *sphenoides*: to which latter, as likewise to the bones of the upper jaw, it is joined by means of certain processes, and in that part is called *os petrosum*.—See *Tab. Anat. (Osteol.) fig. 2. lit. b. & fig. 13. lit. a.* See also the article *PETROSUM*.

Each of the *ossa temporum* has two sinu's; the exterior whereof is lined with a cartilage, and receives the process of the lower jaw; the interior receives the lower part of the sinus lateralis of the dura mater. Each likewise has four processes; the *os jugale*, *processus mamillaris*, *styloides*, and *os petrosum*. See each described under its proper article, *MAMILLARIS*, &c.

**TEMPTATION**, **TENTATIO**, in theology, an induction, or solicitation to evil; whether arising from the world, the flesh, or the devil.

Mystic divines speak of *profitable temptations*, which are those trials the soul is to pass through, before it arrive at the unitive life, and the peace within.—When it surmounts that dryness and darkness it falls into, through a suspension of the effects of divine love, and can resist the world, and all the allurements it presents; those *temptations* are called *tentationes utiles* and *fructuosæ*.

**TEMPTATION**, **TENTATIO**, in our ancient law books, is used for a trial, proof, or assay.—*Tentatio panis fiat bis in anno*. Chart. Edw. I. See *ASSAY*, &c.

**TENABLE**, \* in the military art, something that may be defended, kept, and held against assailants.

\* The word is French, formed from *tenir*; as that from the Latin, *tenere*, to hold.

*Tenable* is little used, but with a negative: when a place is open on all sides, and its defences all beaten down, it is no longer *tenable*. When the enemy has gained such an eminence, this post is not *tenable*.

**TENAILLE**, in fortification, a kind of out-work, consisting of two parallel sides, with a front, wherein is a re-entering angle. See *OUT-WORK*, and *ANGLE*.

In strictness, that angle, and the faces which compose it, are the *tenaille*. See *QUEUE d'aronde*.

The *tenaille* is of two kinds: *simple* and *double*.

*Simple*, or *single* **TENAILLE**, is a large out-work, as *DABCE*, consisting of two faces or sides *AB* and *CB*, including a re-entering angle *B*.—See *Tab. Fortif. fig. 6. & fig. 21. lit. d.*

*Double*, or *flanked* **TENAILLE**, is a large out-work consisting of two simple *tenailles*, or three salians, and two re-entering angles, *FGH* and *HIK*.—See *Tab. Fortif. fig. 7. and 21. lit. e.* See also *FLANKED*.

The great defects of *tenailles* are, that they take up too much room, and on that account are advantageous to the enemy; that the angle *B* is undefended; the height of the parapet hindering the seeing down into it, so that the enemy can lodge there under covert: and that the sides *AD* and *CE* are not sufficiently flanked.

For these reasons, *tenailles* are now excluded out of fortification by the best engineers; and never made, but where there wants time to form a horn-work.

**TENAILLE of the Place**, is the front of the place, comprehended between the points of two neighbouring bastions; including the curtain, the two flanks raised on the curtain, and the two sides of the bastions which face one another. See *BASTION*, *CURTIN*, &c.

So that the *tenaille* is the same with what is otherwise called the *face of a fortress*. See *FACE*, and *FORTIFIED Place*.

**TENAILLE of the Ditch**, is a low work raised before the curtain, in the middle of the foss or ditch. See *DITCH*.

It is of three sorts: the first is composed of a curtain, two flanks, and two faces: the rampart of the curtain, including the parapet and talus, is but five fathom thick, but the rampart of the flanks and faces seven.—See *Tab. Fortif. fig. 21. lit. e.*

The second, which Vauban saith he found to be of very good defence, is composed only of two faces, made on the lines of defence, whose rampart and faces are parallel.

The third sort only differs from the second in this, that its rampart is parallel to the curtain of the place.

All three sorts are good defences for the ditch, and lie so low, that they cannot be hurt by the besiegers cannon, till they are masters of the covert-way, and have planted their artillery there.

**TENANCY**, a habitation or house to live in, or a tenement, or possession held of another. See *TENEMENT*, and *TENANT*.

*Entire* **TENANCY**. See the article *ENTIRE*.

**TENANT**, or **TENENT**, **TENENS**, in law, one that holds or possesses lands and tenements of some lord or landlord, by any kind of right either in fee, for life, years, or at will. See *POSSESSION*, *TENURE*, *LORD*, &c.

The term *tenant* is used with divers additions—thus, *Tenant in dower*, is she that possesses lands by virtue of her dower. See *DOWER*.

*Tenant per statute-merchant*, he that holds land forfeited to him by virtue of a statute. See *STATUTE-MERCHANT*.

*Tenant in frank-marriage*, is he that holds lands or tenements by virtue of a gift thereof made to him upon marriage between him and his wife. See *FRANK-MARRIAGE*.

*Tenant by courtesy*, holds for his life, by reason of a child begotten by him of his wife, being an inheretrix and born alive. See *COURTESY*.

*Tenant by elegit*, holds by virtue of the writ called an *elegit*. See *ELEGIT*.

*Tenant in mortgage*, holds by means of a mortgage. See *MORTGAGE*.

*Tenant by verge*, in ancient demesne, is he who is admitted by the rod in court to lands in ancient demesne. See *VERGE*, and *ANCIENT DEMESNE*.

*Tenant by Copy of court-roll*, is one admitted *tenant* of any lands, &c. within a manour, which time out of mind have been demised according to the custom of the manour. See *COPY-HOLD*.

*Tenant paravail*. See the article *PARAVAIL*.

*Tenant by charter*, is he that holdeth by feoffment in writing or other deed. See *CHARTER*, and *FREEHOLD*.

*Tenant in capite or chief*, holdeth of the king in right of his crown. See *CAPITE*.

*Tenant of the king*, is he that holdeth of the person of the king.

*Joint* **TENANTS**, those who have equal right in lands or tenements by virtue of one title. See *JOINTENANT*.

**TENANTS in common**, those who have equal right, but hold by divers titles.

*Particular* **TENANT**, he that holds only for his term.

*Sole* **TENANT**, is he who hath no other joined with him. See *SOLE*.

*TENANT by execution*, is he who holds by virtue of an execution upon any statute, recognizance, &c.

**Customary** **TENANT**, } See the articles { **CUSTOMARY**,  
**Terre-TENANT**, } { **TERRE-Tenant**,  
**Very** **TENANT**, } { **VERY**.

Anciently, there were also *tenant by knight-service*, *tenant in burgage*, *tenant in socage*, *tenant in frank-fee*, *tenant in villenage*—and there are still *tenant in fee-simple*, *tenant in fee-tail*, *tenant upon sufferance*, &c. See *KNIGHTS SERVICE*, *BURGAGE*, *SOCAGE*, *VILLENAGE*, *FREE-SIMPLE*, *TAIL*, *SUFFERANCE*, &c.

**TENANT**, or **TENAN**, in heraldry, is used for something that sustains, or holds up the shield, or armory; and is generally synonymous with *supporter*. See *SUPPORTER*.

The difference which some authors make between the two is, that *tenants* are single, and *supporters* double, one placed on each side the shield. But the proper distinction seems to consist in this, that *tenants* are human figures, and *supporters* figures of beasts.

There are various forms of *tenants*, as well as of *supporters*, viz. angels, maids, religious, savages, Moors, &c.

The first *tenants*, F. Meneffrier observes, were trunks, or branches of trees; to which the escutcheons were fastened by straps and buckles. Afterwards, the knights were represented as holding their own escutcheons, which were either hung to their neck, or else they leaned on them.

The origin of *tenants* and *supporters* is referred to the ancient tournaments, wherein the cavaliers had their arms bore by servants disguised like savages, Moors, fabulous deities, bears, lions, &c. See *SUPPORTER*.

**TENAR**, in anatomy. See the article *TENAR*.

**TENCH-Fishing**. See the article *Tench-FISHING*.

**TENDER**, in a legal sense, signifies as much, as to offer, or endeavour the performance of any thing, in order to save the penalty or forfeiture incurred by non-performance. See **UNCORE**.

Thus, to *tender rent*, is to offer it at the time and place where and when it ought to be paid: which will save the condition for that time, though the landlord refuse to accept it. See **ACCEPTANCE**.

**TENDER**, in the sea language, is a vessel, attending on some other larger, and more considerable one. See **BOAT**, **SHA-LOOP**, &c.

**TENDINOSUM Centrum**. See the article **CENTRUM**.

**TENDON**, **TENDO**, in anatomy, that hard, white extreme part of a muscle, whereby it is fastened to the bone. See **MUSCLE**.

Most muscles have, at least, two *tendons*, one at each extreme: that fastened to the part toward which the motion is to be performed, is called the *head of the muscle*; and that fastened to the part drawn toward the other, the *tail of the muscle*. See **HEAD**, and **TAIL**.

The fibres, whereof the *tendons* consist, have been supposed to be nervous; but they are now found to be no other than productions of the same fibres, which make the belly or body of the muscle. All the difference between them is, that in the belly of the muscle they are lax, and at a distance from each other; whereas in the *tendon*, they are more closely and firmly connected. See **FIBRE**.

Their whiteness proceeds wholly from the blood's being excluded, by the tightness of their texture: in effect, there is the same difference between them, that there is between a skein of thread, and a cord made of the same thread.

The fibres of the *tendons* undergo no contraction, or dilatation, as those of the belly of the muscle do; they act as mere cords, to draw the parts towards each other.

**Suture of a TENDON**, is a very delicate operation in chirurgery. It had been abandoned a long time, and was not re-established till the last century by J. Bienenstein. See **SUTURE**.

**TENDON of Achilles**. See the article **ACHILLES**.

Mr. Cowper (in the *Philosophical Transactions*) gives us an account of a cure of the *great tendon*, or *tendon of Achilles*, above the heel, after an entire division, by stitching.

**Puncture of a TENDON**. See the article **PUNCTURE**.

**TENEBRÆ**, *Darkness*, in the Romish church, a service performed on the Wednesday, Thursday, and Friday before Easter, in commemoration of the agony of our Saviour in the garden.

**TENEMENT**, **TENANCY**, in law, a house or lands, depending on a manour or lordship: or a fee, or farm, held of a superior lord, and which he may recall, when the term or condition is expired. See **LORD**, **TENANT**, **MESSUAGE**, &c.

**Frank TENEMENT**, is any lands, house, office, or the like wherein a man has estate for life, or in fee. See **FRANK**, &c.

**Base TENEMENT**, is where a man holds lands, &c. at the will of the lord. See **BASE**.

Yet Kitchin, Briton, &c. make *frank tenement* and *base tenement* opposites; on which footing *frank tenement* should be where the tenant is at liberty to quit it when he pleases.

**TENEMENTARY Lands**, among our ancestors, were the outlands of manours, which the Saxon thanes or nobles let out to tenants under arbitrary rents, and services. See **TENANT**.

**TENEMENTIS Legatis**, in law, a writ which lies in London and other places, where the custom is to devise *tenements* by last will, as well as personal goods and chattels, for the hearing of any cause relating thereto.

**TENENT**. See the articles **TENANT**, and **TENET**.

**TENENTES Nativi**. See the article **NATIVI**.

**TENENTIBUS in assisa non onerandis**, a writ which lies for him to whom a disseisor has made-over land, whereof he disseised another; requiring that he be not disturbed in assise for the damages awarded, if the disseisor have wherewithal to satisfy them.

**TENESMUS**, \* **TEINEEMOE**, in medicine, a continual painful inclination to go to stool; yet without voiding any thing, unless, sometimes, a little purulent, bloody slime.

\* The word is formed from the Greek, *τείνω, tendere, to stretch, bend*, in regard those attacked with this disease feel a continual tension in the fundament.

The cause of the *tenesmus* is a sharp, pungent humour, irritating the intestinum rectum, and exciting those troublesome endeavours to evacuate.—Those affected with the stone are also subject to the *tenesmus*, from the communication, or consent between the bladder and the rectum.

The cure of a *tenesmus* depends on proper evacuations and astringents; the former always preceding the latter; such are bleeding, if plethoric; and gentle cathartics, especially of the powder of rhubarb, &c.—An emetic of the Indian root, *specacuanha*, has been found of great service in a long standing *tenesmus*; for the augmenting one evacuation is the lessening of another, and it becomes so much the more serviceable, as they happen to be contraries.

The restringents are such as are of use in other fluxes. See **DIARRHŒA**, **DYSENTERY**, &c.

**TENET**, or **TENENT**, a particular opinion, dogma, or doctrine, professedly held by some divine, philosopher, &c. See **DOGMA**, **OPINION**, &c.

The distinguishing *tenets* of the several sects in religion and philosophy, see under the names of the sects themselves. See also **PHILOSOPHER**, **SECT**, &c.

**TENIA**. See the article **TÆNIA**.

**TENMENTALE**, or **TENMANTALE**, in our ancient customs, originally signifies the number of ten men; which number, in the time of the English Saxons, was called a *decennary*; and ten decennaries made what we call a hundred. See **FRIBURGH**, **FRANK-PLEDGE**, **HUNDRED**, &c.

These ten men were bound for each other to preserve the public peace; and if any of them was found guilty of a breach thereof, the other nine were to make satisfaction, or to bring the criminal before the king. See **DECENNIER**, **TITHING**, &c.

**TENMENTALE** was also used for a duty, or tribute paid to the king, consisting of two shillings for each plough-land; probably thus called, by reason each person of the decennary was bound to see it paid.

**TENNE**, **TENNY**, or **TAWNY**, in heraldry, a bright colour, made of red and yellow mixed; sometimes also called *brusk*, and expressed in engraving by thwart or diagonal strokes or hatches, beginning from the sinister chief, like purple, and marked with the letter T. See **PURPURE**.

In the coats of all below the degree of nobles, it is called *tenny*; but in those of nobles, it is called *hyacinth*; and in princes coats, the *dragon's head*.

**TENON**, in building, &c. the square end of a piece of wood, or metal, diminished by one third of its thickness, to be received into a hole in another piece, called the *mortise*, for the jointing or fastening the two together. See **MORTISE**.

Among joiners, &c. the *tenon* is made in various forms, square, dove-tailed, for double mortises, &c.

Vitruvius calls the *tenons*, *cardines*; dove-tailed *tenons* he calls *subscudes*, or *securiculæ*. See **DOVE-TAIL**.

**TENON-Saw**. See the article **SAW**.

**TENOR**, **TENOUR**, the purport, or contents of a writing, or instrument in law, &c.

Warrants issued for the confirmation of sentences, express, that they shall be executed according to their form, and *tenor*.—It was impossible to retain so long a speech word for word, but the substance, the *tenor* is this.

**TENOR**, **TENORE**, in music, the first mean or middle part; or that which is the ordinary pitch or tenor of the voice, when not either raised to the treble, or lowered to the bass. See **PART**, **MUSIC**, and **COUNTER-TENOR**.

The *tenor* is frequently marked in thorough basses with the letter T.—The *tenor* is a part which almost all grown persons can sing. But as some have a greater compass of voice upwards, others downwards, others are confined to a kind of medium, and others can go equally either higher or lower; hence the French musicians make a variety of *tenors*—as, a *counter tenor*, or *low tenor*; a *mean tenor*, a *natural tenor*, and an *upper tenor*: to which is also added, a *re-acting tenor*, *viol tenor*, *violin tenor*, &c.

The Italians usually distinguish no more than two kinds of *tenors*; viz. *tenore primo*, or P<sup>o</sup> or I<sup>o</sup>, which answers to our *upper tenor*; and *tenore secundo*, or 2<sup>o</sup> or II<sup>o</sup>, which is our *natural tenor*; confounding the *counter tenors*, &c. under the name *baritono*.

**TENOR**, or **TENORISTA**, is also used for a person who sings the *tenor* part in concert—also for an instrument proper to play it.

**TENORE Indictamenti mittendo**, is a writ whereby the record of an indictment and the process thereupon is called out of another court into the King's-bench.

**TENOUR**. See the article **TENOR**.

**TENSE**, **TIME**, in grammar, an inflexion of verbs, whereby they are made to signify, or distinguish the circumstance of time of the thing they affirm, or attribute. See **VERB**.

The affirmations made by verbs are different as to point of time; since we may affirm a thing *is*, or *was*, or *will be*: hence, a necessity of a set of inflexions, to denote those several times; which inflexions, our English grammarians call by a barbarous word *tenses*, from the French *temps*; most other languages call them simply *times*.

There are but three simple *tenses*: the *present*, as *I love, amo*; the *preter*, *preterit*, or *past*, as, *I have loved, amavi*; and the *future*, as, *I will love, amabo*. See **PRESENT**, &c.

But in regard, in the *preter tense* one may either express the thing as just done or past, or indefinitely and barely that it was done: hence, in most languages, arise two kinds of *preterits*; the one *definite*, marking the thing to be precisely done; as, *I have written, I have said*: and the other *indefinite*, or *aorist*, denoting a thing done indeterminately; as, *I wrote, I went*. See **PRETER**, **AORIST**, &c.

The *future tense* admits of the same variety. See **FUTURE**. Beside the three simple *tenses*, others have been invented, called *compound tenses*; expressing the relation of the simple ones to each other.—The first expresses the relation of the *past* to the *present*, and is called the *preterimperfect tense*, because it does not mark the thing simply, and properly as done, but as im-

# T E N

perfect, and present with respect to another thing past: as, *I was at supper when he entered*; *Cum intravit, cœnabam*. See IMPERFECT.

The second compound *tenſe* marks the time past doubly, and is therefore called *plusquamperfect tenſe*; as, *I had supped, cœnaveram*.

The third compound *tenſe* denotes the future with respect to the past; as, *I shall have supped, cœnavero*.

The several *tenſes* or times, it is to be observed, are properly denoted in the Greek and Latin by particular inflexions; in the English, French, and other modern tongues, the auxiliary verbs *to be* and *to have, etre* and *avoir*, are called in.

As to the oriental languages, they have only two simple *tenſes*, the *past* and *future*, without any distinctions of imperfect, more than perfect, &c. which renders those languages subject to abundance of ambiguities which others are free from.

**TENSION**, *TENSIO*, the state of a thing bent, or the effort made to bend it. See DISTENSION.

Animals only sustain and move themselves by the *tension* of their muscles, and nerves. A chord or string gives an acuter or a deeper sound, as it is in a greater or less degree of *tension*. See CHORD, SOUND, &c.

**TENSOR**, in anatomy. See the article EXTENSOR.

**TENT**, \* **TABERNACLE**, a pavilion, or portable lodge, under which to shelter in the open field, from the injuries of the weather. See TABERNACLE.

\* The word is formed from the Latin, *tentorium*, of *tendo*, *I stretch*, in regard *tents* are usually made of canvas stretched out, and sustained by poles, with cords and pegs.

Armies encamp under *tents*: most of the Tartars and Arabs are wandering people, that lodge under *tents*. See HORD, NOMADES, &c.

The Hebrews lodged forty years under *tents* in the desert; which gave occasion to the scenopegy or feast of tabernacles. See SCENOPEGY.

**Dark TENT**. See the article DARK.

**TENT**, **TURUNDA**, in chirurgery, is a roll of lint, made in a particular form, put into wounds whose suppuration is not perfect, or where there is a quantity of matter contained in the tumour, more than what comes out at the first dressing, &c. See WOUND, &c.

*Tents* are used in order to hinder the closing too soon. But several chirurgical writers, and particularly the author of the *Hospital Surgeon*, gives us numerous instances, wherein the use, especially of hard *tents*, has proved prejudicial in protracting the cure, bringing on inflammations, sinu's, mortifications, &c. in wounds and ulcers.—To remedy this, he proposes, that the liniments, &c. be made of a liquid consistence, either naturally, or by warming them; and that where *tents* may seem indispensably necessary, as in large cavities, the orifice may be enlarged, and soft doſils put in instead of them, which will prevent the mischiefs commonly attending *tents*. See ULCER.

**TENTATIVE**, is sometimes used adjectively: thus we say, a *tentative method*, meaning a kind of unartful or indirect method which only proceeds by trying.

**TENTATIVE** is also used substantively, for an essay, or effort, whereby we try our strength, or found an affair, &c. to see whether or no it will succeed.

In the French universities, **TENTATIVE** is the first thesis or act which a student in the theology school holds to shew his capacity: if he answers well, the degree of bachelor is conferred on him. See ACT, THESIS, DEGREE, BACHELOR, &c.

**TENTER**, **TRYER**, or **PROVER**, a machine used in the cloth manufactory, to stretch out the pieces of cloth, stuff, &c. or only to make them even, and set them square. See CLOTH, &c.

It is usually about four feet and a half high, and for length exceeds that of the longest piece of cloth.—It consists of several long square pieces of wood, placed like those which form the barriers of a manege, so, however, as that the lower cross-piece of wood may be raised or lowered, as is found requisite, to be fixed at any height, by means of pins.—Along the cross-pieces, both the upper and under one, are hooked nails, called *tenter-hooks*, driven in from space to space.

To put a piece of cloth on the **TENTER**: while the piece is yet quite wet, one end is fastened to one of the ends of the *tenter*; then it is pulled by force of arms towards the other end, to bring it to the length required: that other end being fastened, the upper list is hooked on to the upper cross-piece, and the lowest list to the lower cross-piece, which is afterwards lowered by force, till the piece have its desired breadth.—Being thus well stretched, both as to length and breadth, they brush it with a stiff hair-brush, and thus let it dry.—Then they take it off; and till they wet it again, it will still retain the width and breadth the *tenter* gave it.

**TENTH**, *Decima*. See the article TITH.

**TENTH pair of Nerves**. See the article NERVE.

**TENURE**, *TENURA*, in law, the manner or condition wherein a tenant holds lands, or tenements of his lord; or the services performed to the lord, in consideration of the use

# T E R

and occupancy of his lands. See TENANT, LORD, &c. See also NON-tenure.

The kinds of service, and consequently of *tenures*, are almost infinite. See SERVICE.

Those for lands held of the king, are either *great*, or *petty serjeanty*, in *capite*, *knights-service*, &c. See SERJEANTY, CAPITE, KNIGHTS-SERVICE, &c.

Those held of the lords were very various, *base*, *frank*, &c. by *homage*, *ſocage*, &c. See BASE, FRANK, &c.—The common *tenures* at this day are fee-simple, fee-tail, by curtesy, in dower, for life, or for years, and by copy of court-roll. See FEE-TAIL, COURTESY, DOWER, COPYHOLD, &c.

*Barons by ancient TENURE*. See the article BARON.

**TEREBINTHINA**, in medicine, natural history, &c. See the article TURPENTINE.

**TEREBRA**. See TREPANUM.

**TERES**, in anatomy, a name given to two muscles of the arms, called also *rotundi*; distinguished by *major*, and *minor*.

**TERES**, or *rotundus major*, arises from the lower angle of the basis of the scapula, and ascending obliquely upwards, in a round smooth body, under the head of the longus, is inserted with a short flat tendon into the neck of the os humeri.—See *Tab. Anat. (Myol.) fig. 1. n. 40.*

**TERES**, or *rotundus minor*, called also *transversalis*, is frequently wanting, or at least, so confounded with the *infraspinatus*, that it is lost therein. It arises from the inferior angle of the scapula, and ascending obliquely in a round fleshy body, passes over the upper head of the longus, and is inserted by a short flat tendon below the os humeri.

**TERES Pronator Radii**. See the article PRONATOR.

**TERGIFŒTOUS Plants**, such as bear their seeds on the backſides of their leaves. See PLANT, and SEED.

Such are the capillaries. See the article CAPILLARY.

**TERM**, **TERMINUS**, the extreme of any thing, or that which bounds and limits its extent. See EXTREME.

**TERM**, in geometry, is sometimes used for a point, sometimes for a line, &c.—A line is the *term* of a superficies: and a superficies, of a solid. See POINT, LINE, SURFACE, &c. This is what the schools call *terminus quantitatis*.

**TERM**, in law, signifies a boundary or limitation of time, or estate.

In this sense we say, a lease for term of life, for term of years, &c. See LEASE, and POST-TERM.

**TERMS**, \* **TERMES**, **TERMINI**, in architecture, denote a kind of statues, or columns adorned a-top with the figure of a man's, woman's, or satyr's head, as a capital; and the lower part ending in a kind of sheath, or scabbord. See COLUMN, &c.

\* Some write the word *thermes*, from *hermes*, a name the Greeks gave the god Mercury; whose statue, made after this manner, was placed in several of the cross-ways in the city of Athens, &c. Others bring the etymology of the word from the Roman god *Terminus*, the protector of land-marks, whose statue (made without hands or feet, that he might not change his place) was used to be planted at the bounds of lands to separate them.

*Terms* are sometimes used as consoles, and sustain entablatures; and sometimes as statues, to adorn gardens. See STATUE.

Of these *termini*, the architects make great variety, viz. *angelic*, *rustic*, *marine*, *double*, in *buſt*, &c.

**Milliary TERMS**, *termini milliaries*, among the ancient Greeks, were the heads of certain divinities, placed on square land-marks of stone, or on a kind of sheath, to mark the several stadia, &c. in the roads. These are what Plautus calls *lares viales*. See VIALES.

They were usually dedicated to Mercury, whom the Greeks believed to preside over the highways.

Some of them were represented with four heads; such as we still see in Rome, at the end of the Fabrian bridge, which is hence called *ponte de quattro capi*. It is known that Mercury was thus represented; and also called by the Latins *Mercurius quadrifons*, as being supposed the first who taught men the use of letters, music, wrestling, and geometry. See HERMES.

**TERMS** are also used for the several times or seasons of the year, wherein the tribunals, or courts of judicature, are open to all who think fit to complain of wrong, or to seek their own by due course of law, or action. See COURT, DAY, LAW, FASTUS, &c.

In contra-distinction to these, the rest of the year is called *vacation*. See VACATION.

Of these *terms* there are four in every year, during which time matters of justice are dispatched, viz. See NON-TERM.

**Hillary Term**, which, at London, begins the 23d day of January; or if it be Sunday, the next day after, and ends the 12th of February following.

**Easter-Term**, which begins the Wednesday fortnight after Easter-day, and ends the Monday next after Ascension-day.

**Trinity-term**, beginning the Friday next after the Trinity-sunday, and ending the Wednesday fortnight after.

**Michaelmas-Term**, which begins the 23d of October, and ends the 28th of November following.

Each of these *terms* have also their returns. See RETURNS.

**Oxford-TERMS**. **Hillary** or **Lent-term** begins January 14, and ends the Saturday before Palm-sunday.—**Easter-term** begins the

the 10th day after Easter, and ends the Thursday before Whit-sunday.—*Trinity-term* begins the Wednesday after Trinity-sunday, and ends after the act, sooner or later, as the vice-chancellor and convocation please.—*Michaelmas-term* begins October the 10th, and ends December the 17th.

**Cambridge-TERMS.** *Lent-term* begins January the 13th, and ends the Friday before Palm-sunday.—*Easter-term* begins the Wednesday after Easter-week, and ends the week before Whit-sunday.—*Trinity-term* begins the Wednesday after Trinity-sunday, and ends the Friday after the commencement.—*Michaelmas-term* begins October the 10th, and ends December the 16th.

**Scottish-TERMS.** In Scotland, *Candlemas-term* begins January the 23d, and ends February the 12th.—*Whitsuntide-term* begins May the 25th, and ends June the 15th.—*Lanmas-term* begins July the 20th, and ends August the 8th.—*Martinmas-term* begins November the 3d, and ends November the 29th.

**Irish-TERMS.** In Ireland the *terms* are the same as at London, except *Michaelmas-term*, which begins October the 13th, and adjourns to November the 3d, and thence to the 6th.

**TERM**, in grammar; denotes some word, or expression, in a language. See **WORD**.

The word *term*, *terminus*, is borrowed metaphorically, by the grammarians and philosophers, from the measurers or surveyors of lands: as a field is defined and distinguished by its *termini*, or limits, so is a thing or matter spoken of by the word or *term* it is denoted by. See **DEFINITION**.

Some of our philosophers complain loudly of the great use, or rather abuse, of vague and general *terms*, which have no precise, definite signification.—To distinguish these, F. Malebranche observes, that every thing that is, (whether it have actual existence, or not) and of consequence every thing that is intelligible, is either a being, or a mode and manner of being: where, by being is meant whatever is absolute, or which may be conceived alone, and without relation to any other thing; and by manner of being, whatever is relative, or which cannot be conceived alone.

Now, there are two kinds of manners of being; the one consisting in the relation of the parts of a whole, to some part of the same whole; the other in the relation of one thing to another: of the first kind is the roundness of a piece of a wax; and of the second, the motion or situation of that same wax. If then, every thing, that is intelligible, be reducible either to beings, or manners of being, it is evident, every *term* which does not signify either of those things, signifies nothing; and that every *term* which does not signify either a being, or a manner of being, is an obscure and confused *term*.

In metaphysics, the use of such *terms* is sometimes necessary and allowable, as in speaking of the divine perfections, &c. But in physics it is always mischievous, and yet nothing more common; *e. gr.* when we say, that bodies tend to their centre, that they fall by their weight, that they rise by their levity, that they move by their nature, that they change successively their forms, that they act by their virtues, qualities, faculties, &c. we use *terms* which signify nothing; and all these propositions are absolutely false in the sense most philosophers understand them.

There is no centre, in the sense commonly meant; and the *terms*, *weight*, *form*, *nature*, *quality*, and the like, do not awaken any idea either of a being, or manner of being: they are *terms* void of sense, and which persons of understanding should always avoid.

*Scientia insensati inenarrabilia verba.*

**TERM**, in the arts, or **TERM of art**, is a word which, besides the literal and popular meaning which it has, or may have in common language, bears a further and peculiar meaning in some art, or science. See **ART**.

Or, a *term* is a word which has one or more meanings beside its grammatical one; or which has a peculiar force or import in the language of some particular science, or art.

A word then becomes a *term*, when its idea is rendered more complex, consists of more parts, and includes more special circumstances on some occasions than on others.

It is this greater complexness, this excess of constituent parts in the idea, that denominates it a *term* in the general.

Further, as the parts of the idea signified by any word are arbitrary, and as one may not only add new parts to those contained in the literal meaning, but also super-add others to them, alter them, extend them, and otherwise modify them at pleasure: hence the same word becomes a *term* of this or that art, or both, as the inventors and improvers of those arts have thought fit to adopt it for the common basis of certain ideas, and to modify and circumstantiate its meaning to the use of their respective arts.

See the nature and office of a *term* further illustrated in the preface to this work. See also the article **DEFINITION**.

Complex TERMS,	} See the articles	COMPLEX.
Equivalent TERMS,		EQUIVALENT.
General TERMS,		GENERAL.
Relative TERMS,		RELATIVE.
Univocal TERMS,		UNIVOCAL.

**TERM in Logic.**—A proportion is said to consist of two *terms*, *i. e.* two principal and essential words, the *subject* and the *attribute*. See **PROPOSITION**.

A syllogism consists of three *terms*, the *major*, *minor*, and *conclusion*. A syllogism containing four *terms*, is vicious. See **SYLLOGISM**.

**TERMS of an Equation**, in algebra, are the several monomes or members of which it is composed, wherein the unknown letter is found, but in different powers and degrees; for if the same unknown letter be found in several members in the same degree or power, they all pass but for one *term*. See **EQUATION**.

Thus in this equation  $aa+ab=R$ , the three *terms* are  $aa$ ,  $ab$ , and  $R$ : and in this  $aa+ab+ac=Rd+dc$ , the *terms* are  $aa$ ,  $ab+ac$ , and  $Rd+dc$ , which are but three, because  $ab+ac$  having  $a$  in the same dimension in both parts, is taken but for one *term*.

The *first term* in any equation, is that where the unknown letter or root hath the highest dimension:—that *term* which hath the root in it of one dimension or power lower, is called the *second term*; and so on.

**TERMS of Proportion**, in mathematics, are such numbers, letters, or quantities as are compared one with another. See **PROPORTION**.

Thus if  $4:8::6:12$  then  $a, b, c, d$ , or  $4, 8, 6, 12$ , are called the *terms* of the proportion: of which  $a$  or  $4$  is called the *first term*,  $b$  or  $8$  the *second term*, &c. See **SECOND**.

$A$  and  $c$  are also called the *antecedents*, and  $b$  and  $d$  the *consequents*. See **ANTECEDENT**, and **CONSEQUENT**.

**TERMS**, or courses, in medicine, the menses, or woman's monthly purgations. See **MENSES**.

**TERMINALIA**, \* in antiquity, feasts celebrated by the Romans, in honour of the god Terminus. See **FEAST**.

\* Varro is of opinion this feast took its name from its being at the *term* or end of the year: but Festus is of a different sentiment, and derives it from the name of the deity in whose honour it was held. See **TERMS**.

In reality, the *terminalia*, or feast of land-marks, was held in honour of Jupiter, considered in the capacity of conservator of land-marks or bounds. Dionysius Halicarnassensis tells us, that it was Numa Pompilius who first consecrated land-marks to Jupiter; and adds, that the same prince appointed an anniversary day, wherein the country people assembling together on the bounds of the lands, should offer sacrifices in honour of the tutelary gods thereof.

The *terminalia* were held on the seventh, or, as Struvius will have it, on the tenth of the calends of March. No animal was to be sacrificed herein, it being deemed unlawful to stain the land-marks with blood: they only offered sacrifices of the first-fruits of the earth, and this in the open air, and on the spot where the land-marks were.

**TERMINANDO & Audiendo.** See the article **AUDIENDO**.

**TERMINATION**, **TERMINATIO**, in grammar, the ending of a word; or the last syllable thereof. See **WORD**, &c.

It is the different *terminations* of one and the same word on different occasions, that constitute the different cases, numbers, tenses and moods, &c. See **CASE**, **NUMBER**, **TENSE**, &c.

**TERMINER**, in law. See the article **OYER**.

**TERMINISTS**, **TERMINISTÆ**, a sect or party among the Calvinists, whose particular tenets are reducible to five points.

1° That there are several persons, both in and out of the church, to whom God has fixed a certain *term* before their death, after which he no longer wills their salvation, how long soever they live afterwards. 2° That God has fixed this fatal *term* of grace by a secret decree. 3° That this *term* once elapsed, he makes them no further offer of repentance or salvation, but takes away from his word all the power it might have to convert them. 4° That Pharaoh, Saul, Judas, most of the Jews, and many of the Gentiles were of this number. 5° That God still bears with several of these sort of people, and even confers benefits on them after the *term* expired; but that he does not do it with any intention they should be converted. See **CALVINISM**, &c.

All the other protestants, and particularly the Lutherans, look on these articles with abhorrence, as repugnant to the goodness of God, as destructive to all Christian virtue, and as contrary to scripture, particularly the following texts, Ezek. xviii. 23, 30, 31, 32. xxiii. 11. 1 Tim. iv. 1, 10. 2 Pet. iii. 9. Acts xvii. 30, 31. Mat. xi. 28. Isa. lxvi. 2. Heb. iii. 7, 13. Rom. ii. 5, &c.

**TERMINUS**, **TEPMA**, signifies a bound or limit.

**TERMINUS a quo**, \* (in metaphysics) denotes the place, from whence any motion commences; in contra-distinction from the other extreme, which is called the *terminus ad quem*.

\* The school-men call privation a *terminus a quo*, in speaking of generation, which they consider as a species of motion.

*Ad TERMINUM qui præterit.* See **AD**.

*Infra TERMINUM quare ejecit.* See **QUARE**.

**TERNARY Measure.** See the article **MEASURE**.

**TERRA**, in geography.

**TERRA**, in chymistry.

**TERRA**, in natural history.

} See **EARTH**.

TERRA *Damnata* } CAPUT MORTUUM & DAMNATA.  
 TERRA *Lemnia* } LEMNIAN.  
 TERRA *Japonica* } See JAPON *Earth & Catechu*.  
 TERRA *Sigillata* } SIGILLATA.  
 TERRA *Merita* } TURMERIC.

TERRA *Petita*. See the article SUMMONS.

TERRA, in our ancient law-books, occurs in the sense of land, or ground, joined with divers additions; as, *Terra Normatorum*, the lands of such Norman noblemen as were forfeited to the crown, by the owners taking part with the French king against king Henry III.—*Terra frusca*, such land as has not been lately ploughed.—*Terra gilliflorata*, land held by the tenure of paying a gilliflower yearly. See SERVICE.—*Terra vestita*, land sown with corn, and the crop still remaining thereon.—*Terra testamentalis*, land held free from feudal services, and devisable by will.—*Terra culta*, land that is tilled and manured, in contra-distinction to *terra inculta*.—*Terra affirmata*, land let out to farm.—*Terra dominica*, or *indominicata*, demain land of a manour. See DEMAIN.—*Terra hydata*, was land subject to the payment of hydage. See HYDAGE.—*Terra lucrabilis*, land that may be gained from the sea, or inclosed out of a waste or common to particular uses.—*Terra wainabilis*, tillage land.—*Terra warecta*, fallow land.—*Terra boscalis*, wood land, &c. See LAND.

TERRA *extendenda*, is a writ directed to the escheator, &c. ordering him to inquire and find out the true yearly value of any land, &c. by the oath of twelve men, and certify the extent in Chancery. See EXTENT.

TERRA *Firma*, in geography, is sometimes used for a continent, in contra-distinction to islands. See CONTINENT. Thus Asia, the Indies, and South America, are usually distinguished into *terra firma's* and islands. See ISLAND.

TERRA *a terra*.—Galleys and other vessels are said to go *terra a terra*, when they never go far from the coasts. See COASTING.

The phrase is also applied in the manage to horses which neither make curvets nor balotades, but run smoothly on the ground on a pressed gallop, only making little leaps or risings with the fore feet.

The *terra a terra* is properly a series of very low, easy leaps, which a horse makes forward, bearing sidewise, and working on two treads.—In this motion he lifts both legs at once; and when those are on the point of descending, they are accompanied by the hind legs with a short and quick cadence, always bearing and staying on the haunches, so that the motions of the hind quarters are very short and quick.

The term is also applied by the French to dancers, who cut no capers, nor scarce quit the ground.

And hence it is also figuratively applied to authors, whose style and diction is low and creeping.

TERRÆ <i>Ager</i>	} See	AGER.
TERRÆ <i>Aratrum</i>		ARATRUM.
TERRÆ <i>Aratura</i>		ARATURA.
TERRÆ <i>Denariatus</i>		DENARIATUS.
TERRÆ <i>Legem Amittere</i>		AMITTERE.
TERRÆ <i>Lex</i>		LEX.
TERRÆ <i>Librata</i>		LIBRATA.
TERRÆ <i>Obolata</i>		OBOLATA.
TERRÆ <i>Quadrantata</i>		QUADRANTATA.
TERRÆ <i>Quadrugata</i>		QUADRUGATA.
TERRÆ <i>Trinoda</i>	TRINODA.	
TERRÆ <i>Uncia</i>	UNCIA.	

TERRÆ-*Filius*, son of the earth, a student in the university of Oxford, formerly appointed in public acts to make jesting and satirical speeches against the members thereof, to tax them with any growing corruptions, &c. See ACT.

TERRACE, or TERRAS, a walk, or bank of earth raised in a garden or court, to a due elevation for a prospect. See WALKS.

The *terrace* is an earth-work usually lined, and breasted with a strong wall, in compliance with the natural inequality of the ground.—Sometimes it is made in talus, or aslope, and covered with turf.

Counter TERRACE, is a *terrace* raised over another to join two grounds, or raise a parterre.

TERRACE is also applied to the roofs of houses that are flat, and whereon one may walk: as also to balconies that project. See ROOF.

The *terrace* is properly the covering of a building which is in plat-form; as that of the peristyle of the Louvre, or that of the observatory, paved with flint and mortar. All the buildings of the oriental nations are covered with *terraces*, to take the fresh air on, and even to lie on. See PLAT-FORM.

TERRACE, or TERRAS, used for mortar. See TARRACE.

TERRAGE, TERRAGIUM, anciently signified a service, in which a tenant or vassal was bound to his lord, to plough and reap the ground for him. See PRECARIÆ.

Others will have it money paid for digging, or breaking the ground in fairs and markets. See PICKAGE.

*Quietii sint de thelonio, pavagio, passagio, lastagio, tallagio, carvagio, prisagio & terragio.*

TERRAQUEOUS, \* an epithet given to our globe or earth, considered as consisting of land and water; which together constitute one mass. See GLOBE, and EARTH.

\* The word, like the thing, is a compound of *terra* and *aqua*, earth and water.

Some philosophers, particularly Dr. Burnet, tax the frame and fashion of the *terraqueous* globe as rude, unartful and disorderly; and conclude it highly absurd to suppose it came thus out of the hands of the Creator, and therefore have recourse to a deluge to make it thus. See DELUGE.

But others can perceive a world of art and conveniency, even in this apparent disorder: Mr. Derham particularly observes, that the distribution of land and water is admirable, the one being laid over the other so skilfully all the world over, that there is a just equipoise or balance of the whole globe.—Thus the northern ocean balances the southern, and the American continent is a counterpoise to the European, African and Asiatic. See OCEAN, &c.

And what some may object, that the waters occupy too great a part of the globe, which they imagine would be of more use were it dry land, he obviates, by shewing that this would deprive the world of a due quantity of vapours and rain: for if the cavities which contain the sea and other waters were deeper, though the quantity of water were the same, and only the surface lesser and narrower, the evaporations would be so much the less, inasmuch as they are made from the surface, and consequently are in proportion thereto. See VAPOUR, CLOUD, RAIN, &c. See also MOUNTAIN, &c.

TERRAR. See the article TERRIER.

TERRAS } See the } TERRACE, and PAVEMENT.

Marble TERRAS } articles } MARBLE.

TERRE-PLEIN, in fortification, the top, plat-form, or horizontal surface of the rampart whereon the cannon are placed, and the defenders perform their office. See RAMPART.

It is thus called, as lying level, having only a little slope outwardly to bear the recoil of the cannon.

It is terminated by the parapet on that side towards the campaign, and by the inner talus on the side towards the place:—its breadth is from 24 to 30 feet. See PARAPET, &c.

TERRE-TENANT, is he who hath the actual possession of the land, otherwise called the *occupant*. See TENANT, and OCCUPANT.

Thus a lord of a manour having a freeholder, who letteth out his freehold to another to be occupied: this occupier, who has the actual possession, is called the *terre-tenant*.

TERRELLA, MIKPOH, *little earth*, is a magnet turned of a just spherical figure, and placed so as that its poles, equator, &c. do exactly correspond to those of the world. See MAGNET.

It was thus first called by Gilbert, as being a just representation of the great magnetic globe we inhabit. See GLOBE.

Such a *terrella*, if nicely poised, and placed in a meridian like a globe, it was supposed, would be turned round like the earth in 24 hours by the magnetic particles pervading it; but experience has shewn this to be a mistake. See MAGNETISM.

TERRESTRIAL <i>Birds</i>	} See	BIRDS.
TERRESTRIAL <i>Globe</i>		GLOBE.
TERRESTRIAL <i>Line</i>		LINE <i>Terrestrial</i> .
TERRESTRIAL <i>Paradise</i>		PARADISE.
TERRESTRIAL <i>Roads</i>		ROAD.

TERRIER, or TERRAR, in our ancient customs, a collection of acknowledgments of the vassals, or tenants of a lordship, containing the rents, services, &c. they owe their lord; and serving as a title or claim for demanding and executing the payment thereof. See MANOUR, &c.

At present, by *terrier* we mean no more than a book or roll, wherein the several lands, either of a private person, or of a town, college, church, &c. are described.

The *terrier* should contain the number of acres, the scite, boundaries, tenants names, &c. of each piece or parcel.

TERRIER also denotes the lodge or hole which foxes, badgers, rabbits, &c. dig themselves under ground, and wherein they save themselves from the pursuit of the hunters.—Hence

TERRIER is also used for a kind of little hound to hunt those animals, which, like a ferret, creeps into the ground, and by that means affrights and bites them; either tearing them with his teeth, or else haling them by force out of their holes. See HOUND.

TERRIS *bonis & catallis rehabendis post purgationem*, a writ for a clerk to recover his lands, goods, or chattels formerly seized, after having cleared himself of a felony, upon suspicion whereof he was convicted, and delivered to his ordinary to be purged.

TERRIS *& catallis tentis ultra debitum levatum*, a writ judicial for the restoring lands or goods to a debtor, who is distrained beyond the quantity of the debt. See DISTRESS.

TERRIS *liberandis*, a writ lying for a man convicted by attain, to bring the record and process before the king, and take a fine for his imprisonment, and deliver him his lands and tenements again, and release him of the strip and waste.

TERRITORY, *Distric*, the extent or compass of land within the bounds, or belonging to the jurisdiction of any state, city, or other division. See DISTRICT.

It is a maxim, that the church has no *territory*, i. e. it has no temporal jurisdiction; so that an ecclesiastical judge cannot arrest any body, not even a priest. Much in this sense, Cujas says, the church has an auditory, but no *territory*.

**TERSION**, \* **TERSIO**, the act of wiping or rubbing a thing. See **ATTRITION**, and **ABRASION**.

\* The word comes of *tero*, I wear.

**TERTIAN**, **TERTIANA**, a fever or ague intermitting every other day; so that there are two fits in three days. See **FEVER**, **AGUE**, &c.

The method of curing *tertians*, as well as other agues, is by the cortex, either given in substance or decoction: this last is best in weak constitutions, and where the fits are not so regular; but the substance more to be depended on as to certainty in other cases. See **AGUE**, &c.

**TERTIARY canons**. See the article **CANON**.

**TERTIATE**, in gunnery.—To *tertiate* a great gun, is to examine the thickness of the metal at the muzzle, whereby to judge of the strength of the piece, and whether it be sufficiently fortified or not. See **GUN**, **CANNON**, **ORDNANCE**, &c. This is usually done with a pair of calliper compasses, and if the piece be home-bored, the diameter less by the height, divided by 2, is the thickness at any place. See **CALIBER**.

**TERTII internodii pollicis extensor** } See **EXTENSOR**.

**TERTIO adjacentis propositio de** } See **PROPOSITION**.

**TERTIUS Scalenus** } See **SCALENUS**.

**TERUNCIUS**, in antiquity, a very small brass coin in use among the Romans. See **COIN**.

The inconvenience of such very small pieces being soon found, the *teruncius* became disused, but its name was still retained in reckoning; and thus it became a money of account. See **MONEY**.

The *teruncius*, at first, was a quarter of the *as*, or *libra*; hence, as the *as* contained 12 ounces, the *teruncius* contained three; whence the name, which is formed of the Latin, *tres unciae*. *Teruncius* was also used for a quarter of the denarius; so that when the denarius was at ten *as*, the *teruncius* was worth two and a half; and when the denarius was risen to 16, the *teruncius* was worth four. See **DENARIUS**.

**TESSELLATED pavement**, *pavimentum TESSELLATUM*, a rich pavement of mosaic work, made of curious small square marbles, bricks or tiles, called *tessellæ*, from the form of dies. See **MOSAIC work**.

*Tessellated pavements* were much used in the tents of the Roman generals. See **PAVEMENT**, &c.

**TESSARA-COSTA**, in our ancient writers. See the article **QUADRAGESIMA**.

**TEST**, \* or **TEST oath**, a form of oath, whereby the doctrine of transubstantiation, the sacrifice of the Mass, the invocation of saints, &c. are abjured. See **OATH**.

\* The word signifies *proof* or *trial*, being formed of the Latin, *testis*, witness; this oath being a mark or evidence that the person is not a Roman catholic.

The *test* oath was first introduced by authority of parliament in 1672; and they who refused to take it, were excluded the privilege of holding any public offices.

**TEST**, among chymists and refiners, the same with *cuppel*, or *coppel*, an instrument used in the purifying gold and silver. See **COPPEL**.

**TESTA sepia**. See the article **SEPIUM**.

**TESTACEOUS**, in natural history, an epithet given to a species of fish, which are covered with a strong, thick shell; as tortoises, oysters, pearl-fish, &c. See **FISH**.

In strictness, however, *testaceous* is only applied to fish whose strong and thick shells are entire and of a piece: those which are soft, thin, and consist of several pieces jointed, as the lobster, &c. being called *crustaceous*. See **SHELL**.

But in medicine, all preparations of shells, and substances of the like kind, are called *testaceous powders*.—Such are powders of crabs claws and eyes, harts-horn, pearl, &c.

Dr. Quincy, and others, suppose the virtue of all *testaceous* medicines to be alike; that they seldom or never enter the lacteals, but that the chief of their action is in the first passages; in which case they are of great use in absorbing acidities. See **ABSORBENT**.

Hence they become of use in fevers, and especially in rectifying the many distempers in children, which generally owe their origin to such acidities. See *Diseases of CHILDREN*.

**TESTAMENT**, \* **TESTAMENTUM**, in law, a solemn and authentic act, whereby a person declares his will, as to the disposal of his estate, effects, burial, &c. See **WILL**.

\* The word is formed from the Latin *testamentum*, which the lawyers usually derive from *testatio mentis*.

A *testament* has no effect till after death, and is always revocable till then. As *testaments* are acts, of all others the most subject to deceits, surprise, &c. it was necessary to use all kinds of precautions to prevent the wills of the deceased from being eluded, and the weakness of dying persons from being abused.

The most ancient *testaments* among the Romans were made *viva voce*, the testator declaring his will in the presence of seven witnesses: these they called *nuncupative testaments*; but

the danger of trusting the will of the dead to the memory of the living, soon abolished them, and all *testaments* were ordered to be in writing. See **NUNCUPATIVE**.

The French legislators thought holographic testaments, i. e. testaments wrote wholly with the testator's hand, an abundant security; but the Roman law, more severe, did not admit of testaments without further solemnity.

The easiest, and most favourable, is the 21st law in the *code de testamentis*, which permits such as are unwilling to trust the secret of their *testaments* to others, to writ it with their own hand, and to close it in the presence of seven witnesses, declaring to them that it is their *testament*, after which it is to be signed by all the seven witnesses.

Otherwise, to make a solemn testament, it was required to be attested by seven witnesses, and sealed with their seals. See **SOLEMN**.

Yet the *military testament* was not subject to so many formalities: the soldier was supposed too much employed in defending the laws, to be subject to the trouble of knowing them. His tumultuary profession excused him from observing all the rules. See **MILITARY**.

Add, that *testaments*, wherein fathers disposed of their estates among their children, had particular privileges, and were dispensed from most of the ordinary formalities.

*Probate of a TESTAMENT*. See the article **PROBATE**.

**TESTAMENTARY adoption** } See **ADOPTION**.

**TESTAMENTARY succession** } See **SUCCESSION**.

**TESTAMENTARY tutorage** } See **TUTORAGE**.

**TESTATOR** or **TESTATRIX**, the person who makes his, or her, will and testament. See **TESTAMENT**.

M. Gillet shews, that a person incapable of a legacy, cannot demand any sum which the *testator* in his testament declares himself indebted to him in; in regard such a declaration of debt is presumed a fraud, against the intention of the law.

**TESTA NEVILLI**, or **TESTA DE NEVIL**, an ancient record kept by the king's remembrancer in the Exchequer, containing the king's fees throughout the greatest part of England, with inquisitions of lands elcheated, and serjeanties.

It was denominated from its compiler, Johan. de Nevil, one of the itinerant justices under king Henry III.

**TESTATUM**, in law, a writ in personal actions; where, if the defendant cannot be arrested on a *capias* in the county where the action is laid, but is returned *non est inventus* by the sheriff, this writ shall be sent into any other county, where such person is thought to be, or to have wherewithal to satisfy the demand.

It is called *testatum*, because the sheriff has before testified, that the defendant was not to be found in his bailiwick.

**TESTE**, a term commonly used in the close of a writ, where the date is contained, which begins with *teste meipso*, if it be an original writ; or if judicial, *teste Mattheo Hale, Mil.* or *Francisco North, Mil.* &c. according to the court whence it comes.—In some ancient formula's, we read *teste custode Angliæ*. See **WRIT**.

**TESTES**, in anatomy, too white, soft, oval bodies, serving for generation; usually called, diminutively, *testicles*. See **TESTICLE**.

**TESTES**, of the brain, are two little, round, hard bodies, between the third and fourth ventricle, near the pineal gland. See **BRAIN**.

**TESTES synodales** } See the articles **SYNODALES**.

**TESTIBUS hiis** } See **HIIS**.

**TESTICLE**, \* *Testis*, a double part in animals of the male kind, serving for the office of generation.—See *Tab. Anat. (Splanchn.) fig. 1. lit. w. w.* See also **GENERATION**.

\* They are called *testicles*, by diminution, of *testes*, witnesses; as giving testimony of virility: they are what we properly call *genitoris, genitalia*.—The Greeks call them *didymi*, or *twins*.

In man, and most animals, the *testicles* are exterior; in some, as fowls, interior. See **GENITAL**.—Some men have only one, ordinarily they have two, some have naturally had three; nay, anatomists assure us they have known four.

The *testicles* are soft, white bodies, of an oval figure, and about the size of a pigeon's egg: they have been thought to be of a glandulous substance, and, according to the present doctrine of the glands, they may be allowed to be so still. See **GLAND**.

They are formed of a convolution of divers kinds of vessels, particularly the spermatic veins and arteries, the latter of which bring the blood whence the seed is to be secreted in the meanders of the *testicles*, and the former return it back again after the secretion made. See **SEED**, and **SPERMATIC**.

The rest of the *testicle* is made up of seed-vessels, which indeed are but one continued series or rope, intricately convoluted and wound up as it were into a bottom, but adhering so laxly, that it is easily drawn out into length, and in rats shaken from its close texture.—These seminal vesicles terminate in the *parastata*. See **PARASTATA**.

The *testicles*, with the *parastata*, are said to be inclosed in three proper coats; the first the *musculosa*, derived from the cremaster muscle; the second the *elythroides*, or *vaginalis*, which is a continuation of the external lamina of the peri-

tonæum; the third the albuginea. See each under its proper article, MUSCULOSA, ELYTHROIDES, &c.

The common capsula or membrane including both *testicles*, is the scrotum, which see described under the article SCROTUM. For the use of the *testicles*, in preparing and secreting the seed. See SEED.

**TESTIMONIAL**, a kind of certificate, signed either by the master and fellow of the college where a person last resided, or by three, at least, reverend divines, who knew him well for three years last past; giving an account of the virtues, uniformity, and learning of the person. See CERTIFICATE. Such a *testimonial* is always required before holy orders are conferred, and the bishop even ordinarily demands one of a priest before he admits him to a benefice. See ORDINATION, &c.

**TESTIMONIAL** is also a certificate under the hand of a justice of peace, testifying the place and time when and where a soldier or mariner landed, and the place of his dwelling, &c. whither he is to pass.

**TESTIMONY**. See EVIDENCE, and WITNESS. See also FAITH, and BELIEF.

For the credibility of human *testimony*, see CERTITUDE.

**TESTUDO**, in natural history. See TORTOISE.

**TESTUDO**, in antiquity, was particularly used among the poets, &c. for the ancient lyre; by reason it was originally made, by its inventor Mercury, of the black or hollow shell of a *testudo aquatica*, or sea tortoise, which he accidentally found on the banks of the river Nile. See LYRE.

Dr. Molyneux has an express discourse, in the *philosophical transactions*, to shew that the tortoise-shell was the basis of the ancient lyre, and that the whole instrument had thence the denomination *testudo*; which account lets some light into an obscure passage in Horace, ode 3. lib. 4. mistaken by all the commentators:

*O, testudinis aureæ*

*Dulcem quæ strepitum, Pieri, temperas;*

*O mutis quoque piscibus*

*Donatura cygni, si libeat, sonum.*

**TESTUDO**, *tortoise*, in the military art of the ancients, was a kind of cover or screen which the soldiers, *e. gr.* a whole company, made themselves of their bucklers, by holding them up over their heads, and standing close to each other.

This expedient served to shelter them from darts, stones, &c. thrown upon them, especially those thrown from above when they went to the assault.

**TESTUDO** was also a kind of large wooden tower which moved on several wheels, and was covered with bullocks hides fixed, serving to shelter the soldiers when they approached the walls to mine them, or to batter them with rams.

It was called *testudo*, from the strength of its roof, which covered the workmen as the shell does the tortoise.

**TESTUDO**, in medicine, denotes a soft broad tumour, or gathering of impure humours between the skull and the skin, called also *talpa*, as resembling the subterraneous windings of a tortoise or mole. See TALPA.

**TESTUDO veliformis quadrabilis**, a hemispherical vault, or ceiling of a church, &c. wherein four windows are so contrived, as that the rest of the vault is quadrable, or may be squared. See VAULT, QUADRATURE, &c.

The determining of these windows was a problem proposed to the great mathematicians of Europe, particularly the cultivators of the new calculus differentialis, in the *acta eruditorum Lipsiæ*, by Sig. Viviani, under the fictitious name of A. D. pio lisci pusillo geometra, which was the anagram of *postremo Galilæi discipulo*.

It was solved by several persons, particularly M. Leibnitz, the very day he saw it: and he gave it in the Leipzig acts in an infinity of manners; as also did M. Bernoulli, the marquis del Hospital, Dr. Wallis, and Dr. Gregory.

**TETANUS**, **TETANOS**,\* in medicine, a kind of tonic spasmus, or convulsion, wherein the fore and hind muscles of the head are rendered rigid and inflexible; so that it can neither bend one way nor the other. See CONVULSION.

\* The word is formed from the Greek *τετανν*, to stretch, strain.

**TETANUS**, or **TETANOS**, is also used, in a more general sense, for an universal convulsion or rigidity seizing the whole body at once.

In this sense, the *tetanus* is sub-divided into *emprosthotonus* and *opisthotonus*. See EMPROSTHOTONOS, and OPISHTHOTONOS.

**TETRACHORD**,\* **TETRACHORDON**, in the ancient music, a concord consisting of three degrees, tones, or intervals, or four sounds or terms; called also by the ancients *διατεσσαρον*, and by the moderns a *fourth*. See FOURTH.

\* The word is formed of the Greek, *τετρα*, of *τετρας*, four times, and *χορδη*, a chord, or string.

This interval had the name *tetrachord* given it with respect to the lyre, and its chords or strings. See CHORD. See also DIATESSARON.

Ancient authors make frequent mention of the *synaphe*, or conjunction; and *diazeuxis*, or disjunction of *tetrachords*.—To conceive their meaning, it must be observed, that two *tetrachords* were said to be *joined*, when the same chord was the

highest of the first, or lowest instrument, and the lowest of the second; as was the case in the two *tetrachords* that compose the ancient heptachord or seventh. See CONJOINT.

But when two *tetrachords* had no common chord; but, on the contrary, had each their different ones to begin and end withal, so that between the two there were two intervals of a tone, then the *tetrachords* were said to be *disjoined*, which was the case in the two *tetrachords* that compose the octachord or octave. See OCTAVE.

**TETRACTYC arithmetic**. See the article ARITHMETIC.

**TETRACTYS**, in the ancient geometry.—Pythagoric *tetractys* is a point, a line, a surface, and a solid.

**TETRADIAPASON**, *quadruple diapason*, a musical chord, otherwise called a quadruple eighth, or a nine and twentieth. See DIAPASON.

**TETRADITÆ**, **TETRADITES**, in antiquity, a name given to several different sects of heretics, out of some particular respect they bore to the number four, called in Greek *τετρας*.

Thus the Sabbathians were called *tetraditæ*, from their fasting on Easter-day, as on the fourth day, or Wednesday. See SABBATHIAN.

The Manichees, and others, who admitted a quaternity instead of a trinity in the Godhead, or four persons in lieu of three, were also called *tetraditæ*. See MANICHEE.

The followers of Petrus Fullensis bore the same appellation of *tetraditæ*, by reason of the addition they made to the trisagion, to countenance an error they held, that in our Saviour's passion it was not any particular person of the Godhead, *e. gr.* the son, that suffered, but the whole Deity. See TRISAGION.

The ancients also gave the name *tetraditæ* to children born under the fourth moon, and these they believed unhappy.

**TETRAEDRON**,\* or **TETRAHEDRON**, in geometry, one of the five regular or platonic bodies, or solids, comprehended under four equilateral and equal triangles. See SOLID.

The *tetraedron* may be conceived as a triangular pyramid of four equal faces. See PYRAMID.—Such is that represented (*Tab. Geomet. Fig. 59.*) See REGULAR Body.

It is demonstrated by mathematicians, that the square of the side of a *tetraedron*, is to the square of the diameter of a sphere wherein it may be inscribed in a subsequal ratio: whence it follows, that the side of a *tetraedron* is to the diameter of a sphere it is inscribed in, as  $\sqrt{2}$  to the  $\sqrt{3}$ , consequently they are incommensurable.

**TETRAGON**,\* **ΤΕΤΡΑΓΩΝΟΣ**, in geometry, a quadrangle, or a figure with four angles. See QUADRANGLE.

\* The word is formed from the Greek *τέτρας*, four, and *γωνία*, angle.

Thus a square, parallelogram, rhombus, and trapezium, are *tetragonal* figures. See SQUARE, &c.

**TETRAGON**, in astrology, denotes an aspect of two planets with regard to the earth, when they are distant from each other a fourth part of a circle, or  $90^\circ$ —as, AD (*Tab. Astron. Fig. 3.*)—See ASPECT.

The *tetragon* is expressed by the character  $\square$ . See QUADRAT.

**TETRAGONIAS**, a name given to a meteor, whose head is of a quadrangular figure, and its tail or train long, thick and uniform; not much different from the trabs or beam. See METEOR.

**TETRAGONISM**, **ΤΕΤΡΑΓΩΝΙΣΜΟΣ**, a term which some authors use to express the quadrature of the circle. See QUADRATURE.

**TETRAGONUS**, in anatomy, a muscle, called also *quadratus genæ*. See QUADRATUS.

**TETRAGRAMMATON**, **ΤΕΤΡΑΓΡΑΜΜΑΤΟΝ**, a denomination given by the Greeks to the Hebrew name of God, יהוה, *Jehova*, because consisting of four letters. See GOD.

**TETRAMETER**,\* in the ancient poetry, an Iambic verse consisting of four feet. See IAMBIC.

\* The word is formed from the Greek *τέτρας*, four, and *μέτρον*, measure, *q. d.* four metres.—We meet with none of these but in the comic poets, as Terence.

**TETRASPASTON**,\* in mechanics, a machine wherein are four pullies. See PULLY.

\* The word is formed from the Greek *τέτρασπαστον*. See POLYSPASTON.

**TETRAPETALOUS**, in botany, an epithet given to flowers that consist of four single petala or leaves placed around the pistil. See PETALA.

These M. Jussieu calls *polypetalous* flowers. See POLYPE-TALOUS.

Mr. Ray, who calls them *tetrapetalous*, makes them constitute a distinct kind, which he divides into

1° Such as have an uniform *tetrapetalous* flower, and their seed-vessels a little oblongish, which he therefore calls *siliquose*; as the keiri or leucium luteum, and the other common leucium, the dentaria, the leucium siliquosum, alysson, viola lunaris, paronychia, hesperis, alliaria, rapa, napus, sinapis, rapistrum, eruca spuria, erysimum, cardamine, turritis, pilosella siliquosa, and the raphanus rusticus and aquaticus.

2° Such as have their vessel shorter, which therefore, for distinction sake, he calls *capsulatae* and *siliculosæ*; as the myagrum, draha, leucium filiqua subrotunda, cochlearia, nasturtium,

tium, lepidium vulgare, thlapfi, brastica marina, glastum, e-ruca marina, &c.

3<sup>o</sup> Such as have a seeming *tetrapetalous* flower, that is, a monopetalous one, divided deeply into four partitions, which he particularly calls *anomalous*; as the papaver, agremony, veronica, tithymallus, plantago, coronopus, psyllium, lysimachia filiquosa, alfine spuria, &c.

**TETRAPHARMACUM**, \* ΤΕΤΡΑΦΑΡΜΑΚΟΝ, in the general, denotes any remedy consisting of four ingredients.

\* The word is compounded of τέτρα, *four*, and φάρμακον, *drug*, or *remedy*.

**TETRAPIA**, \* in church history, a bible disposed by Origen under four columns, in each whereof was a different Greek version, viz. that of Aquila, that of Symmachus, that of the Seventy, and that of Theodotion. See **BIBLE**.

\* The word is formed from the Greek τετραπλη, *quadruplex*, *four-fold*.

Sixtus of Sienna confounds the *tetrapla* with the *hexapla*; but the *tetrapla* is a different work, composed after the *hexapla*, in favour of such as could not have the *hexapla*. See **HEXAPLA**.

Some authors are of opinion, that the order wherein the four versions of the *tetrapla* were ranged, was different from that wherein we have rehearsed them; and particularly that the septuagint was in the first column: but S. Epiphanius says expressly to the contrary, and places it in the third.—He even gives us Origen's reason for putting it there, which was, says he, that the best version might be in the middle, that the others might be the more easily confronted therewith, and corrected from it.

Baronius, however, in his annals for the year 231, takes the septuagint to have been in the third place in the *hexapla*, but the first in the *tetrapla*; yet Epiphanius gives it the same place in both.

**TETRAPTOTE**, ΤΕΤΡΑΠΤΟΤΟΝ, in grammar, a name given to such defective nouns as have only four cases:—such are *astus*, *repetundæ*, &c. See **CASE**, **APTOTE**, &c.

**TETRARCH**, \* ΤΕΤΡΑΡΧΑ, a prince who holds and governs a fourth part of a kingdom.

\* The word is originally Greek τεταρχης, formed of τέτρα, *four*, and αρχη, *rule*, *dominion*.

Such, originally, was the import of the title *tetrarch*; but it was afterwards applied to any petty king, or sovereign, and became synonymous with *ethnarch*, as appears from the following consideration: 1<sup>o</sup> That Pliny makes mention of six *tetrarchies* within the cities of Decapolis. 2<sup>o</sup> That Herod's kingdom was only divided into three parts, which yet were called *tetrarchies*, and the sovereigns thereof, Luke iii. 1. *tetrarchs*. 3<sup>o</sup> Josephus, *Antiq. Jud. lib. 14. c. 23*, tells us, that after the battle of Philippi, Anthony going into Syria, constituted Herod *tetrarch*; and on medals the same Herod is called *ethnarch*. See **ETHNARCHA**.

**TETRASTICH**, ΤΕΤΡΑΣΤΙΧΟΝ, a stanza, epigram, or poem consisting of four verses. See **DISTICH**.

**TETRASTYLE**, \* in the ancient architecture, a building, and particularly a temple, with four columns in its front. See **TEMPLE**.

\* The word is formed from τέτρα, *four*, and στυλ, *column*.

**TETRASYLLABICAL**, a word consisting of four syllables. See **WORD**, and **SYLLABLE**.

**TEUTONIC**, something belonging to the *Teutons*, an ancient people of Germany, inhabiting chiefly along the coasts of the German ocean.

**TEUTONIC language**, is the ancient language of Germany, which is ranked among the mother-tongues. See **LANGUAGE**, and **MOTHER TONGUE**.

The *Teutonic*, now called the *German* or *High-Dutch*, is distinguished into *upper* and *lower*.

The *upper* has two notable dialects, viz. 1<sup>o</sup> the Scandian, Danish, or perhaps Gothic; to which belong the languages spoke in Denmark, Norway, Sweden, and Iceland. 2<sup>o</sup> The Saxon; to which belong the several languages of the English, Scots, Frisian, and those on the north of the Elbe. See **ENGLISH**, &c.

To the *lower* belong the Low Dutch, Flemish, &c. spoke through the Netherlands, &c. See **FLEMISH**.

**TEUTONIC order**, a military-religious order of knights, established towards the close of the XIIth century; and thus called, because consisting principally of Germans, or *Teutons*. See **KNIGHT**, and **ORDER**.

The origin, &c. of this order was thus: the Christians under Guy of Lusignan, laying siege to Acre, or Acon, a city of Syria, on the borders of the Holy Land; at which siege were present, Richard king of England, Philip Augustus of France, &c. some Germans of Bremen and Lubec, touched with compassion for the sick and wounded of the army, who wanted common necessities, set on foot a kind of hospital under a tent, which they made of a ship's sail; and here betook themselves to a charitable attendance on the sick.

This started a thought of establishing a third military order, in imitation of the templars, and the hospitalers. See **TEMPLAR**, and **HOSPITALER**.

The design was approved by the patriarch of Jerusalem, the

archbishops and bishops of the neighbouring places, the king of Jerusalem, the masters of the temple and the hospital, and the German lords and prelates then in the Holy Land, &c. And by common consent, Frederic, duke of Sambia, who was then at their head, sent ambassadors to his brother Henry, king of the Romans, to solicit the pope to confirm the new order.

Calixtus III. who then governed the church, granted it by a bull of the 23d of February, 1192; and the new order was called, *The order of Teutonic knights of the house of St. Mary of Jerusalem*.

The pope granted them all the privileges of the templars, and the hospitalers of St. John; excepting, that they were to be subject to the patriarchs, and other prelates; and that they should pay tithe of what they possessed.

The first master of the order, Henry Walpot, elected during the time of the siege of Acre, after the taking of that city, purchased a garden, wherein he built a church and an hospital, which was the first house of the *Teutonic order*. Such is the account given by Peter of Duisbourg, a priest of this order. Jacques de Vitry differs a little herefrom; and relates, that the *Teutonic order* was established at Jerusalem before the city of Acre was besieged.

These two opinions Hartknoch, in his notes on Duisbourg, reconciles, by saying, that the order was first instituted by a private person, a German, at Jerusalem; that it was confirmed by the pope, the emperor, and the princes, at the siege of Acre; and that after the taking that city, it was become so considerable, that it was known all over the world.

If it be true, that it was a private person who first set on foot the order, and that those people of Bremen and Lubec only joined with them, as some authors assert, we do not know the precise year of its origin.

The order made no great progresses under the three first grand masters; but under the fourth, Herman de Salza, it became very powerful; inasmuch, that Conrad, duke of Mazovia and Cujavia, about the year 1230, sent an embassy to him, to solicit his friendship and assistance, offering him and his order the provinces of Culmes and Livonia, with all the lands they could recover from the idolatrous Prussians, who harassed him exceedingly with their continual incursions, and against whom he intended this new militia; his own knights of the order of *Christ*, or of Dobrin, instituted for the like purpose, being found too weak.

De Salza accepted the donation, and Gregory IX. confirmed it; and to aid the knights in reducing the Prussians, Innocent IV. published a crusade.—With this help, in a year's time, they subdued the provinces of Warmia, Natangia, and Barthia; the inhabitants whereof renounced the worship of idols; and in the course of fifty years more, they reduced all Prussia, Livonia, Samogitia, Pomerania, &c.

In 1204, duke Albert had founded the order of sword-bearers, port-glaives, which now became united to the *Teutonic knights*, and the union was approved by pope Gregory IX. See **PORT-GLAIVE**.

Waldemar III. king of Denmark, sold to the order the province of Estein, the cities of Nerva and Wesslemberg, and some other provinces.

A new union some time afterwards occasioned great divisions and troubles in the order: it was with the bishops and canons of Prussia and Livonia, who hereupon took the habit of the *Teutonic order*, and shared the sovereignty with the knights, in their respective dioceses.

The order, thus master of all Prussia, built the cities of Elbing, Marienbourg, Thorn, Dantzic, Koningsberg, and some others: the emperor Frederic II. permitted them to add to the arms of the order, the imperial eagle; and S. Louis, in 1250, allowed them to quarter the flower-de-luce.

After the city Acre had been recovered by the infidels, the grand master of the *Teutonic order* removed his seat from that city to Marienbourg. As the order grew in power, the knights took more state on them; and at length, instead of friars, brothers, as at first, would be called *lords*. And though the grand master Conrad Zolnera, of Rotensteine, opposed this innovation, his successor Conrad Wallerod not only approved it, but even procured himself to be treated with honours only rendered to the greatest princes.

Divisions being got into the order, the kings of Poland made their advantage of them: the Prussians revolted to them; and after several wars between the knights and the Poles, the former yielded to king Casimire the upper Prussia, and did homage to him for the lower.

Lastly, at the time of the reformation, Albert, marquis of Brandenburg, then grand master, becoming Lutheran, renounced the dignity of grand master, dissolved the commanderies, and drove the knights out of Prussia.

Most of the knights followed his example, and embraced the reformation: the rest transferred the seat of their order to Margentheim, or Mariendal in Franconia, which they still retain.

They there elected Walter of Cromberg their grand master, formed a process against Albert, and the emperor put him to the

the ban of the empire. The order, however, could never recover their domains; but are now little more than the shadow of what they formerly were, having only three or four commanderies, scarce sufficient for the ordinary subsistence of the grand master and his knights.

The officers of the *Teutonic order*, when in its splendour, were the grand master, who resided at Marienbourg; under him were the grand commander; the grand marshal, who had his residence at Königsberg; the grand hospitaler, who resided at Elbing; the draper, who took care to furnish the habits; the treasurer, who lived at the court of the grand master; and several commanders, as those of Thorn, Culme, Brandenburg, Königsberg, Elbing, &c.

They had also their commanders of particular castles, and fortresses; advocates, proveditors, intendants of mills, provisions, &c.

Waiffelius in his annals says, they had 28 commanders of cities, 46 of castles, 81 hospitalers, 35 masters of convents, 40 stewards, 37 proveditors, 93 masters of mills, 700 brothers or knights to take the field, 162 brothers of the choir, or priests, 6200 servitors or domestics, &c.

**TEXT**, a relative term, contra-distinguished to *gloss* or *commentary*; and signifying an original discourse, exclusive of any note or interpretation. See **NOTE**, **ANNOTATION**, &c.

Infinite pains have been taken by the critics, to restore, reconcile, settle, explain, &c. the *text* of the bible, and the classics.

Mr. Whiston accounts for all those misunderstandings between the new and old testament, particularly as to the prophecies in the old, cited as fulfilled in the new, to the corruption of the *text* of the old testament; and to obviate objections made against Christianity on that head, has published an *Essay towards restoring the true text of the Old Testament*, &c. See **QUOTATION**.

This restoration he is to effect from the Samaritan pentateuch, the Roman psalter, the apostolical constitutions, &c. But all our critics take this corruption of the *text* to be imaginary, and look out for other ways of solving those difficulties. See **PROPHECY**.

**TEXT** is particularly used for a certain passage of scripture chose by a preacher to be the subject of his sermon. See **HOMILY**. Anciently, the lawyers began all their pleadings with like *texts* of scripture.

A *text-book*, in several universities, is a classic author wrote very wide, by the students, to give room for an interpretation dictated by the master or regent, to be inserted in the inter-lines. In this sense, the French say, proverbially, *Glose d'Orleans plus obscure que le texte*.

The Spaniards give the name *text* to a kind of little poem, or set of verses, placed at the head of a gloss, and making the subject thereof; each verse being explained, one after another, in the course of the gloss. See **GLOSS**.

**TEXT**, in ancient law-authors, is appropriated to the book of the four gospels, by way of eminence.—This was written in gold letters, and carefully preserved in the churches.

*Codex aurato conceptus grammate scriptus,  
Auctus evangelicum conservat corpore textum.*

**TEXTUARIES**, **TEXTUARI**, a name given the sect of the Caraites, among the Jews. See **CARAITES**.

Hillel shone among the traditionaries, and Schammai among the *textuaries*. See **TRADITIONARY**.

The civil and canon lawyers sometimes also call a book containing the bare text, without any gloss or commentary, a *textuary*, *textuarium*.

**TEXTUS Roffensis**, is an ancient manuscript, containing the rights, customs, tenures, &c. of the church of Rochester, granted by the laws of Ethelbert, Hlothere, Eadred, and Withred, kings of Kent, collected by Ernulf, the venerable bishop of Rochester, about the year 1100. See **LAW**.

**TEXTURE**, \* **TEXTURA**, properly denotes the arrangement and cohesion of several slender bodies or threads interwoven, or intangled among each other; as in the webs of spiders, or in cloths, stuffs, &c. See **WEB**, and **WEAVING**.

\* The word is Latin, formed of *texo*, I weave.

**TEXTURE** is also used in speaking of any union or cohesion of the constituent particles of a concrete body; whether by weaving, hooking, knitting, tying, chaining, indenting, intruding, compressing, attracting, or any other way. See **COHESION**, **PARTICLE**, **BODY**, &c.

In this sense, we say a close, compact *texture*; a lax, porous *texture*; a regular or irregular *texture*, &c. See **PORE**, **RAREFACTION**, **CONDENSATION**, &c.

A great deal depends on the *texture* of the component parts of a body; hence most of its particular properties, its specific gravity, colour, &c. See **COLOUR**, &c.

**THABORITES**, or **TABORITES**. See **TABORITE**.

**THACK Tyles** } See the articles } **TYLES**.

**THAIN**, **THANUS** } See the articles } **THANE**.

**THALAMI nervorum opticomum**, in anatomy, two oblong prominences of the lateral ventricles of the brain; medullary without, but a little cineritious within. See **BRAIN**.

They are thus called, because the optic nerves rise out of them. See **OPTIC**.

**THALMUD**. See the article **TALMUD**.

**THAME**. See the article **TEAM**.

**THANE**, or **THAIN**, **THANUS**, the name of an ancient dignity among the English, or Anglo-Saxons. See **NOBILITY**. Skene makes *thane* to have been a dignity equal with that of the son of an earl: Camden will have it, that *thanes* were only dignified by the offices which they bore.

There were two kinds or orders of *thanes*: the *king's thanes*, and the *ordinary thanes*.—The first were those who attended our English-Saxon kings in their courts, and who held lands immediately of the king: whence, in doomsday-book, they are promiscuously called *thani*, and *servientes regis*.

Soon after the conquest, the name was difused; and instead thereof they were called the *king's barons*, *barones regis*. See **BARON**.

Their origin is referred to king Canutus, who, taking the chief of the Danish nobility, to the number of 3000, for his guard; and arming them with battle-axes and sabres with gilt handles, called them *thing-lith*, from the two Danish words *theing* or *thein*, body of nobility, and *lith*, order of battle.

The ordinary *thanes*, or *thani minores*, were the lords of manours, who had particular jurisdiction within their limits, and over their own tenants. See **LORD**, and **MANOUR**.

These two changed their name for that of barons; and hence their courts are called *courts baron* to this day. See **COURT**, and **BARON**.

In old authors, charters, &c. we also meet with **THANE**, as signifying a nobleman; sometimes a freeman; and sometimes a magistrate.

**THANE-Lands**, were lands granted by charter of the Saxon kings to their *thanes*. See **THANE**.

**THAUMATURGUS**, \* *worker of miracles*; an appellation which the Romanists give to several of their saints, eminent for the number and greatness of their miracles. See **SAINT**, and **MIRACLE**.

\* The word is formed from the Greek, θαυμα, *wonderful thing*, and εργον, *work*.

St. Gregory *Thaumaturgus*, or Gregory of Neocæsarea, was a disciple of Origen, about the year 223, and afterwards bishop of Cæsarea in Pontus; and in that capacity assisted at the first council of Antioch, and at that of Ephesus against Paulus Samosatenus.—St. Leo of Catanea is also called *Leo Thaumaturgus*. He lived in the VIIIth century; and his body is still honoured at Rome in the church of St. Martin de Tours.—St. Francis Paul, and St. Francis Xavier, are the great *thaumaturgi* of these last ages. See **MIRACLE**.

**THAWING**, the resolution of ice into its former fluid state, by the warmth of the air, &c. See **ICE**, and **FREEZING**.

**THEANDRIC**, ΘΕΑΝΔΡΙΚΟΣ, *Dei-virile*; a term signifying divine and human under one—formed from Θεός, *God*, and ανθρωπος, *man*. See **DEI-VIRILE**.

S. Dionysius, bishop of Athens, first used the word *theandric*, to express a double operation, or two operations united in Jesus Christ; the one divine, the other human.\*—The Monophysites afterwards abused it, to signify the one only operation which they admitted in Jesus Christ; in whom they believed there was a mixture of the divine and human nature, whence resulted a third nature, which was a compound of the one and the other, whose operations followed the essence and qualities of the mixture, and were neither divine nor human; but both at once, or, in one word, *theandric*. See **OPERATION**, and **MONOTHELITE**.

\* Θεανδρικὴ ἐνέργεια, *theandric* or *Dei-virile* operation, in the sense of Dionysius and Damascenus, is thus exemplified by Athanasius. When Christ healed the person who was born blind, the spittle, he voided, was human, but the opening of the eyes was done by his divine power. And thus, in raising Lazarus, he called as man, but awaked him from the dead as God.

The term *theandric*, and the dogma of *theandric* operations, were examined with great care and attention, at the council of Lateran, held in 649; where pope Martin solidly refuted the notion of *theandric* operations, and shewed, that the sense wherein St. Dionysius first used the word, was catholic, and quite remote from that of the Monophysites and Monothelites. See **PERSON**, and **TRINITY**.

**THEANTHROPOS**, \* ΘΕΑΝΘΡΩΠΟΣ, *God-man*; a term sometimes used in the schools, to signify Jesus Christ, who is God-man, or two natures in one person. See **PERSON**, and **TRINITY**.

\* The word is formed from the Greek, Θεός, *Deus*, and ανθρωπος, *homo*, *man*.

**THEATER**, \* or **THEATRE**, **THEATRUM**, among the ancients, a public edifice, for the exhibiting of scenic spectacles or shews to the people. See **SPECTACLE**, and **SCENIC**.

\* The word is formed from the Greek, θεατρον, *spectacle*, *show*, of θεωμα, *specto*, *video*, I see.

Under the word *theater* was comprehended, not only the eminence whereon the actors appeared, and the action passed; but also the whole area, or extent of the place, common to the actors and spectators.

In this sense, the *theater* was a building encompassed with portico's, and furnished with seats of stone, disposed in semicircles, and ascending gradually over one another; which encompassed a space called the *orchestra*, in the front whereof

was the proscenium, or pulpitum; whereon the actors performed, and which is what we properly call the *theater*, or stage. See ORCHESTRA, and PULPITUM.

On the proscenium stood the *scena*, a large front, adorned with orders of architecture, behind which was the postscenium, or place where the actors made themselves ready, retired, &c. So that the *scena*, in its full extent, comprehended all the part belonging to the actors. See SCENE, &c.

In the Greek *theaters*, the orchestra made a part of the *scena*; but in the Roman *theaters*, none of the actors ever descended into the orchestra; which was taken up by the seats of the senators.

The most celebrated *theaters* remaining of antiquity, are the *theater* of Marcellus, and that of Pompey; which are also called *amphitheaters*. See AMPHITHEATER.

At Athens are still seen the remains of the temple of Bacchus, which was the first *theater* in the world, and a master-piece in architecture.—All *theaters* were consecrated to Venus and Bacchus.

THEATER, among the moderns, more peculiarly denotes the stage, or place whereon the drama, or play is exhibited: answering to the proscenium of the ancients. See DRAMA, &c. In its full latitude, however, the THEATER includes the whole play-house: in which sense, it is a spacious room, or hall, part whereof is taken up by the *scena*, which comprehends the stage, the decorations, and the machines; and the rest distributed into a space, called the *pit*, or *parterre*, which is covered with seats, boxes, &c. and terminated with an elevation of one or two galleries, disposed into benches ascending over one another. See STAGE; see also COMEDY, TRAGEDY, &c.

THEATER is also used in architecture, chiefly among the Italians, for an assemblage of several buildings, which, by a happy disposition and elevation, represents an agreeable scene to the eye.

Such as are most of the vineyards at Rome; but particularly that of Monte Dragone, at Fiescati; and in France, the new castle of St. Germain en Laye.

Anatomical THEATER, in a school of medicine and surgery, is a hall, with several rows of seats, disposed in the circumference of an amphitheater; having a table, bearing on a pivot, in the middle, for the dissection of bodies.

Such is the anatomical *theater* of the royal garden of plants at Paris, &c.

The THEATER at Oxford is a beautiful building, erected by archbishop Sheldon, for the use of scholastic exercises.

THEATINES, an order of nuns, under the direction of the *Theatines*. See THEATINS.

There are two kinds of *Theatines*, under the title of *sisters of the immaculate conception*, who form two different congregations, the one engaged by solemn vows, and the other only by simple vows.—Their common foundress was Ursula Benincasa. Those who make the simple vows are the most ancient, and are called absolutely *Theatines of the congregation*: they had their rise at Naples, in 1583.

The others are called *Theatines of the hermitage*: the whole business of these is praying in retirement, and an austere solitude, to which they engage themselves by solemn vows.

The *Theatines* of the first congregation take care of the temporal concerns of these last. Their houses stand together, and communicate by a large hall. Their foundress drew up their constitutions, and laid the foundation of their house at Naples, but died before it was finished.

Gregory the XVth, who confirmed the new institute under the rule of St. Augustin, appointed that they should be under the direction of the *Theatines*. Urban VIII. revoked this article by a brief in 1624, and subjected them to the nuncio of Naples; but Clement IX. annulled this brief, and submitted them anew to the *Theatines* by a brief in 1668.

THEATINS, a religious order of regular priests; thus called from their first superior Don John Pietro Caraffa, archbishop of Chiefi, in the kingdom of Naples, which was anciently called *Theate*.

The same archbishop was afterwards pope, by the name of Paul IV. after having been a companion of Gaetan, a Venetian gentleman, the first founder of this order, at Rome, in 1524.

The *Theatins* were the first who assumed the title of *regular clercs*. They have not only no lands, or fixed revenues, either in common or in property; but they do not even ask or beg any thing; but wait for what Providence shall send them for their subsistence.

They employed themselves much in foreign missions; and in 1627 entered upon Mingrelia, where they have an establishment: they have had the like in Tartary, Circassia, and Georgia, which they have since abandoned, by reason of the little fruit they perceived thereof.

Their first congregation appeared at Rome in 1524, and was confirmed the same year by Clement VII.—Their constitutions were drawn up at a general chapter in 1604, and approved by Clement VIII.—They wear the priests habit.

THEATRE. See THEATER, and AMPHITHEATER.

VOL. II.

Nº CLII.

THEBAID, THEBAIS, a famous heroic poem of Statius, the subject whereof is the civil war of Thebes between the two brothers Eteocles and Polynices; or Thebes taken by Theseus. See EPIC, HEROIC, &c.

Statius was twelve years in composing his *Thebaid*, which consists of twelve books: he wrote under Domitian:—He is censured by the best critics, as Bossu, &c. for a vicious multiplicity of fables and actions, for too much heat and extravagance, and for going beyond the bounds of probability. See FABLE, POLYMYTHY, and PROBABILITY.

Several Greek poets had composed *Thebais* before him; the principal were, Antagoras, Antiphanes and Colophon, Menelaus the Ægean, and an anonymous author mentioned by Pausanias, lib. 9.

Aristotle, praising Homer for the simplicity of his fable, opposes to him the ignorance of certain poets, who imagined that the unity of fable or action was abundantly provided for by the unity of the hero, and who composed *Thebais*, *Herculeids*, &c. in each whereof they collected every thing that had ever happened to their principal person. See HERO, ACTION, &c.

THEFT, *Furtum*, in law, an unlawful, felonious taking away another man's moveable and personal goods, against the owner's will, with an intent to steal them. See LARCENY.

It is divided into *theft*, or larceny, properly so called, and *petit theft*, or petty larceny; the former whereof is of goods above the value of 12d. and is deemed felony.—The other, which is of goods under that value, is not felony. See PETTY-LARCENY, FELONY, &c.

Open *theft* from the person, or in presence of the owner, is properly called *robbery*. See ROBBERY.

THEFTBOTE, the receiving a man's goods again from a thief, or other amends by way of composition, and to prevent prosecution, that the felon may escape unpunished; the punishment whereof is imprisonment, and not loss of life, or member. See THEFT.

THEISM. See DEISM, POLYTHEISM, and TRITHEISM.

THEKUPHÆ. See the article TEKUPHÆ.

THELONIUM, TELONIUM, signifies toll. See TOLL.

Breve *essendi quieti de thelonio*, a writ lying for the citizens of a city, or burghesses of a town, that have a charter or prescription to free them from toll; against the officers of any town or market, who would constrain them to pay it, contrary to the said grant or prescription.

THEME, THEMA, a subject or topic, to write or compose on. See SUBJECT, &c.

THEME, among astrologers, denotes the figure they construct when they draw the horoscope; representing the state of the heavens for a certain point, or moment required; i. e. the places of the stars, and planets, for that moment. See HOROSCOPE.

The celestial *theme* consists of 12 triangles, inclosed within two squares, and called the *twelve houses*. See HOUSE.

THENAR, in anatomy, a muscle, whose office is to draw the thumb from the fore-finger; whence it is also denominated *abductor pollicis manus*.

There is a similar muscle belonging to the great toe, sometimes also called *thenar*, or *abductor pollicis pedis*. See ABDUCTOR.

The antagonists to these are called *antithenars*. See ANTI-THENAR.

THENOPSYCHITES. See THNETOPSYCHITES.

THEOCATAGNOSTÆ, \* a sect of heretics, or rather blasphemers, who dared to find fault with certain words and actions of God, and to blame many things in the scriptures.

\* The word is formed from the Greek, Θεός, God, and καταγνωσκω, I judge, or condemn.

Marshall, in his tables, places these heretics in the VIIth century; for what reason we know not; Damascenus being the only author that mentions them, but without taking any notice of the time of their appearance.

Add to this, that in Damascenus's treatise of heresies, we meet with heretics that were not so much the authors of sects subsisting at any certain time, as wicked persons, such as are found in all times, and all ages.

THEOCRACY, \* a state governed by the immediate direction of God alone. See GOVERNMENT.

\* The word is formed from Θεός, God, and κρατία, power, empire.

According to Josephus, the ancient Government of the Jews was *theocratic*; God himself ordering and directing every thing belonging to the sovereign authority. See JUDGE.

This *theocracy* lasted till the time of Saul; when the Israelites, weary thereof, desired they might have a king like other nations: and thenceforward the state became monarchic.

There was also a kind of imaginary *theocracy* at Athens: while the sons of Codrus were disputing the succession, the Athenians, wearied out with the miseries of an intestine war, abolished the royalty, and declared Jupiter the only king of the people of Athens.

THEODOLITE, a mathematical instrument, much used in surveying, for the taking of angles, distances, altitudes, &c. See ANGLE, SURVEYING, &c. See also PLOTTING.

It is made variously; several persons having their several ways of contriving it, each more simple and portable, more accurate and expeditious, than others. The following one is not inferior to any we have seen: it consists of a brass circle, about a foot diameter, cut in form of *Fig. 25. Tab. Surveying*; having its limb divided into 360 degrees, and each degree subdivided either diagonally, or otherwise, into minutes.

Underneath, at *cc*, are fixed two little pillars *bb*, (*fig. 25. n. 2.*) which support an axis, whereon is fixed a telescope, consisting of two glasses, in a square brass tube; for the viewing of remote objects.

On the centre of the circle moves the index *C*, which is a circular plate, having a compass in the middle, whose meridian line answers to the fiducial line *aa*: at *bb* are fixed two pillars to support an axis, which bears a telescope like the former, whose line of collimation answers to the fiducial line *aa*.—At each end of either telescope is fixed a plain sight for the viewing nearer objects. See *SIGHT*.

The ends of the index *aa* are cut circularly, to fit the divisions of the limb *B*; and when that limb is diagonally divided, the fiducial line at one end of the index shews the degrees and minutes upon the limb. The whole instrument is mounted with a ball and socket, upon a three-legged staff.

Most *theodolites* have no telescopes, but only four plain sights, two of them fastened on the limb, and two on the ends of the index.

The use of the *theodolite* is abundantly shewn in that of the semicircle, which is only half a *theodolite*. See *SEMICIRCLE*.

—And in that of the plain-table, which is occasionally made to be used as a *theodolite*. See *PLAIN-Table*.

Note, the index and compass of the *theodolite* likewise serve for a circumferentor, and are used as such. See *CIRCUMFERENTOR*.

**THEOGONY**,\* that branch of the heathen theology which taught the genealogy of their gods. See *GOD*.

\* The word is formed from *Θεός*, *God*, and *γενεα*, *geniture*, *seed*, *offspring*.

Hesiod gives us the ancient *theogony*, in a poem under that title. Among the ancient writers, Dr. Burnet observes, *theogony* and *cosmogony* signified the same thing. In effect, the generation of the gods of the ancient Persians, fire, water, and earth, is apparently no other than that of the primary elements. See *CHAOS*, and *CHAOLGY*.

**THEOLOGICAL Criticism** } See *CRITICISM*.

**THEOLOGICAL Prebend** } See *PREBEND*.

**THEOLOGIUM**,\* in the ancient theater, was a place, or little stage, above that whereon the ordinary actors appeared. See *THEATER*.

\* The word is Latin, formed from *Θεός*, and *λόγος*, *speech*, *discourse*.

The *theologium* was the place where the gods appeared.—It also included the machines whereon they descended, and from which they spoke. See *MACHINE*.

There was a *theologium* required for the representation of the Ajax of Sophocles, the Hippolitus of Euripides, &c. *Scal. Poet. lib. 1. cap. 1.*

**THEOLOGY**,\* *Divinity*; a science which instructs us in the knowledge of God, and divine things; or which has God, and the things he has revealed, for its object. See *GOD*, *DIVINE*, &c.

\* The word is compounded of *Θεός*, *God*, and *λογία*, *discourse*.

*Theology* is a science which shews us what we are to believe of God, and the manner wherein he would be served.—It is divided into two branches, *natural*, and *revealed* or *supernatural*.

**Natural THEOLOGY**, is the knowledge we have of God from his works, by the light of nature, and reason. See *NATURE*, and *REASON*.

**Supernatural THEOLOGY**, is that which we learn from revelation. See *REVELATION*.

**Positive THEOLOGY**, is the knowledge of the holy scriptures, and of the signification thereof, conformably to the opinions of the fathers and councils; without the assistance of any argumentation. Some will have it, that this ought to be called *expositive*, rather than *positive*. See *POSITIVE*.

**Moral THEOLOGY**, is that which teaches us the divine laws relating to our manners and actions. See *MORAL*.

**Scholastic, or School THEOLOGY**, is that which proceeds by reasoning; or that derives the knowledge of several divine things from certain established principles of faith. See *SCHOLASTIC*.

The ancients had a three-fold *theology*; the first, *μυθικη*, *mythic*, fabulous, which flourished among the poets; and was chiefly employed in the theogony, or genealogy of the gods. See *FABIE*, *MYTHOLOGY*, *THEOGONY*.

The second, *πολιτικη*, *political*, which was that chiefly embraced by the politicians, priests, and people, as most suitable and expedient to the safety, quiet, and prosperity of the state.

The third, *φυσικη*, *natural*, chiefly cultivated by the philosophers, as most agreeable to nature and reason.—The physical or natural *theology* acknowledged one only supreme God; to which it added *dæmons*, as mediators between him and man. See *DEMON*.

**Bachelor in THEOLOGY** } See the articles *BACHELOR*.  
**Mystic THEOLOGY** } *MYSTIC*.

**THEOPASCHITES, THEOPASCHITÆ**, a sect of heretics in the Vth century, the followers of Petrus Fullentis, or Peter the Fuller; whence they are sometimes also denominated *Fulloniani*. See *TRISAGION*.

Their distinguishing doctrine was, that the whole trinity suffered in the passion of Jesus Christ. See *PATRIPASSIANS*.

This heresy was embraced by the Eutychian monks of Scythia; who using their utmost efforts to make it obtain, raised great disorders towards the beginning of the following century.

It was condemned, at its first rise, in the councils of Rome and Constantinople, held in 483: it was revived in the IXth century, and again condemned in a council at Rome, held in 862 under pope Nicholas I.

F. le Quien, in his notes on Damascenus, says, that the same error had been taught before Fullentis, by Apollinarius, whose disciples were the first that were called *theopasitæ*, or *theopaschitæ*. See *APOLLINARIAN*.

**THEORBA**,\* **THIORBA**, or **TIORBA**, a musical instrument, made in form of a large lute; except that it has two necks, or juga, the second and longer whereof sustains the four last rows of chords, which are to give the deepest sounds. See *LUTE*.

\* The word is formed from the French, *teorbe*, or *theorbe*, and that from the Italian, *tioba*, which signifies the same; and which some will have to be the name of the inventor.

The *theorba* is an instrument, which for these last sixty or seventy years, has succeeded to the lute, in the playing of thorough-basses: it is said to have been invented in France by the sieur Hotteman, and thence introduced into Italy, &c.

The only difference between the *theorba* and the lute is, that the former has eight bass or thick strings, twice as long as those of the lute; which excess of length renders their sound so exceedingly soft, and keeps it up so long a time, that it is no wonder many prefer it to the harpsichord itself. At least it has this advantage, that it is easily removed from place to place, &c.

All its strings are usually single; though there are some who double the bass-strings with a little octave, or the small strings with an unison; in which case, bearing more resemblance to the lute than the common *theorba*, the Italians call it the *arci-leuto*, or *arch-lute*. See *ARCILEUTO*.

**THEOREM**, in the mathematical method, a proposition which terminates in theory, and which considers the properties of things already made, or done. See *THEORY*, and *PROPOSITION*.

Or, a *theorem* is a speculative proposition, deduced from several definitions compared together.—Thus, if a triangle be compared with a parallelogram standing on the same base, and of the same altitude, and partly from their immediate definitions, and partly from other of their properties already determined, it is inferred, that the parallelogram is double the triangle; that proposition is a *theorem*. See *DEFINITION*, &c.

*Theorem* stands contra-distinct from *problem*. See the article *PROBLEM*.

There are two things to be chiefly regarded in every *theorem*, viz. the proposition and the demonstration: in the first is expressed what agrees to some certain thing under certain conditions, and what does not. See *PROPOSITION*.

In the latter, the reasons are laid down, by which the understanding comes to conceive that it does, or does not agree thereto. See *DEMONSTRATION*.

*Theorems* are of various kinds.

**Universal THEOREM**, is that which extends to any quantity without restriction, universally—as this, that the rectangle of the sum and difference of any two quantities is equal to the difference of their squares.

**Particular THEOREM**, is that which extends only to a particular quantity—as this: in an equilateral right lined triangle, each of the angles is 60 degrees.

**Negative THEOREM**, is that which expresses the impossibility of any assertion—as, that the sum of two biquadrate numbers cannot make a square number.

**Local THEOREM**, is that which relates to a surface—as, that triangles of the same base and altitude are equal.

**Plane THEOREM**, is that which either relates to a rectilinear surface, or to one terminated by the circumference of a circle—as, that all angles in the same segment of a circle are equal. See *PLANE*.

**Solid THEOREM**, is that which considers a space terminated by a solid line; that is, by any of the three conic sections—*gr.* this: that if a right line cut two asymptotic parabolas, its two parts terminated by them shall be equal. See *SOLID*.

**Reciprocal THEOREM**, is one whose converse is true—as, that if a triangle have two equal sides, it must have two equal angles: the converse of which is likewise true, that if it have two equal angles, it must have two equal sides. See *RECIPROCAL*.

**THEORETIC**,\* **THEORETICAL**, or **THEORIC**, something relating to *theory*, or that terminates in speculation.—In which sense it stands opposite to *practical*.

\* The word is formed from the Greek, *θεωρεω*, *I see*, *I view*, *contemplate*.

The sciences are ordinarily divided into *theoretical*, as theology, philosophy, &c. and *practical*, as medicine, law, &c. See *SCIENCE*.

THEORETIC,

**THEORETIC, THEORETICUS**, is an appellation peculiarly given to an ancient sect of physicians contra-distinguished from the *empirics*. See **PHYSICIAN**.

*Theoretic* physicians were such as applied themselves to a careful study and consideration of what relates to health and diseases; the principles of the human body, its structure and parts, with their actions and uses; whatever befalls it either naturally or preternaturally; the differences of diseases, their nature, causes, signs, indications, &c. the textures, properties, &c. of plants, and other medicines, &c.—In a word, the *theoretic* physicians were such as went on the foot of reason, in opposition to the empirical physicians, who went wholly on experience. See **MEDICINE**, and **EMPIRIC**.

**THEORETICAL Arithmetic** } See **ARITHMETIC**.

**THEORETICAL Philosophy** } See **PHILOSOPHY**.

**THEORIC Money**, in ancient authors, was what was raised by way of tax on the people, to defray the expences of theatrical representations, and other spectacles. See **SPECTACLE**. There were particular questors or treasurers of the *theoric money*.—By a law of Eubulus, it was made a capital crime to pervert the *theoric money* to any other use; even to employ it in the occasions of war.

**THEORICAL Astronomy**, is that part of astronomy which considers the true structure and disposition of the heavens and heavenly bodies; and accounts for their various phenomena therefrom. See **ASTRONOMY**.

It is thus called in opposition to that part which considers their apparent structure, or their disposition as viewed by the eye; which is called *spherical astronomy*. See **SPHERICAL**.

The several parts of *theoretical astronomy*, see under **SYSTEM**, **SUN**, **STAR**, **PLANET**, **EARTH**, **MOON**, **SATELLITE**, **COMET**, &c.

**THEORY**, a doctrine which terminates in the sole speculation, or consideration of its object, without any view to the practice, or application thereof. See **SCIENCE**.

To be learned in an art, &c. the *theory* suffices; to be a master of it, both the *theory* and practice are required.—Machines, many times, promise well in the *theory*, yet fail in the practice. See **MACHINE**.

We say, *theory* of the moon, *theory* of the rainbow, of the microscope, the camera obscura, the motion of the heart, the operation of purgatives, &c. See **MOON**, **RAINBOW**, **MICROSCOPE**, **CAMERA**, **HEART**, **PURGATIVE**, &c.

**THEORIES of the Planets**, &c. are systems or hypotheses, according to which the astronomers explain the reasons of the phenomena or appearances thereof. See **HYPOTHESIS**, **SYSTEM**, **PLANET**, &c.

**THEOTOCUS, Deipara**. See **MOTHER of God**.

**THERAPEUTÆ, ΘΕΡΑΠΕΥΤΑΙ**, a Greek term, signifying servants, more especially those employed in the service of God. The Greeks gave the appellation *therapeutæ* to such as applied themselves to a contemplative life, whether it were from the great concern they had for their souls, or from the particular mode and manner of their religion; the word *θεραπευσις*, whence *therapeutæ* signifying the care a physician takes of his patient, and the service any one renders another.

Philo, in his first book of the contemplative life, relates, that there were a people spread throughout most of the known world, but particularly throughout Egypt, and about Alexandria, who renounced their friends, their goods, &c. and who, after discharging themselves of all temporal concerns, retired into solitary places, where they had each their separate mansion, called *semneium*, or monastery. See **MONASTERY**.

He adds, that they there resigned themselves wholly to the exercises of prayer and contemplation, were continually as in the presence of God, prayed mornings and evenings, eat nothing till after sun-set, and many of them not above once in three, or even six days; nor then any thing but a piece of bread seasoned with salt, or, at best, with hyssop.

They carried nothing with them into their *semneium* but the books of Moses, the prophets, the psalms, and other like writings, wherein they sought for mystical and allegorical meanings, from a persuasion that the scriptures were only shadows or figures, the hidden meanings whereof were to be unfolded. They had also some books left them by the founders of their sect.—They met together every seventh day in a large *semneium* to confer together, and partake of the mysteries.

There are two points relating to these *Therapeutæ* exceedingly controverted among critics, viz. 1° whether they were Jews or Christians; and, 2° if they were the latter, whether they were monks or seculars?

As to the first, Scaliger *de Emend. Temp.* maintains, they were Essene Jews; but Valesius on Eusebius rejects this opinion of Scaliger, 1° because Philo never calls them Essenes: 2° because there were no Essenes but in the Holy Land; whereas the *Therapeutæ* were spread through Greece, and all the barbarous nations: 3° because Josephus, who gives a very ample account of the Essenes, does not say one word of the *Therapeutæ*, or the *therapeutic life*. See **ESSENE**.

And yet Valesius allows them to be Jews; and Photius is of his opinion: the chief reasons Valesius gives are what Philo says, that they read nothing but the law, and the prophets. 2° that they had some books of their founders; and how can

this quadrate with the Christians, who were then in their first rife? 3° that they only prayed twice a day, whereas the Christians then prayed much oftener. 4° that the Christians had no hymns or psalms till after the time of Antoninus. Lastly, that the Christians could not be spread over the world.

Nevertheless Eusebius, *lib. II. Hist. Eccles. c. 17*. St. Jerom, Sozomen, Nicephorus, Baronius, Petavius, M. Godeau, Montfaucon, &c. maintain the *Therapeutæ* to have been Christians; urging, that nothing can be more conformable to the practices of the church than the account given of them by Philo; that those books of their founders are the gospels, and other writings of the apostles; and that there are indications even of bishops and other ministers among them.

But M. Bouhier, president of the parliament of Dijon, refuses this opinion; supposing it inconsistent in Philo, a Jew, to write a book expressly in praise of Christians.

Several authors, however, as Cassian, F. Helyot, &c. maintain, that the *Therapeutæ* were not only Christians, but that they were also religious: and, in effect, M. Bouhier allows, that if they were Christians, they must be confessed to have been monks.—As to his argument, that Philo would never have wrote a panegyric on the Christians; it is answered, that they were people of his own nation, Jews, as he himself expresses it; and that he only looked on them as a sect of Jews, who, by their extraordinary virtue, did honour to his nation. But though the Christianity of the *Therapeutæ* appears probable enough; yet their monachism is not made out at all. See **MONK**, &c.

**THERAPEUTICE,\* THERAPEUTICS**, that part of medicine which is employed in seeking out remedies against diseases, and in prescribing and applying them to effect a cure. See **MEDICINE**.

\* The word is Greek, *θεραπευτική*, formed from *θεραπεύω*, to attend, to nurse, cure, &c.

*Therapeutice* teaches the use of diet, pharmacy, chirurgery, and the *methodus medendi*. See **DIET**, **MEDICINES**, **PRESCRIPTION**, &c.

**THERAPEUTICE** is also used figuratively, in speaking of the mind, and of discourses made to correct the errors and defects thereof.

Such is the *Therapeutice* or *Therapeutics* of Theodoret; being a treatise against the errors or unwholesome opinions of the Greeks, i. e. the heathens.

**THERAPHIM, a TERAPHIM**, a Hebrew term, which has given great torture to the critics.—We meet with it 13, or 14 times in scripture, where it is commonly interpreted *idols*: but the rabbins are not contented to have it simply signify idols, but will have it denote a peculiar sort of idols or images for the knowledge of futurity, i. e. oracles.

R. David de Pomis observes, that they were called *theraphim*, from *רפא*, *raphah*, to leave, because people quitted every thing to consult them.—He adds, that the *theraphim* were in human shape; and that, when raised upright, they spoke at certain hours, and under certain constellations, by the influence of the celestial bodies. This is a rabbinical fable, which he has learned from Abenezra.

Others hold, that the *theraphim* were brazen instruments which pointed out the hours and minutes of future events, as directed by the stars.—De Pomis corrects Abenezra, saying, that the *theraphim* being made under a certain constellation, the devil made them speak under the same. See **TALISMAN**.

R. Eliezer tells us the reason why the rabbins will have the *theraphim* to speak, and render oracles: it is, says he, because it is written in the prophet Zachary, x. 2. The *theraphim* have spoken vain things.

The same rabbin adds, that to make the *theraphim*, they killed a first-born child, clove his head, and seasoned it with salt and oil; that they wrote on a plate of gold the name of some impure spirit, laid it under the tongue of the dead, placed the head against the wall, lighted lamps before it, prayed to it, and it talked with them.

Be this as it will, Vorstius observes, that beside the passage of Zachary just quoted, it appears likewise from Ezekiel xxi. 22. that the *theraphim* were consulted as oracles.

De Pomis endeavours to shew, that the *theraphim*, which Michol put in David's bed, were not of this kind, because they were not in the figure of men; but R. Eliezer is of another sentiment.

As to the manner of making the *theraphim*, Vorstius takes it to be a vain tradition of the rabbins, though R. Tanichuma and Jonathan, in his *Targum*, Gen. xxxi. 19. relate it after R. Eliezer.—The chief reason of his disbelief is, that Laban who had not quite lost all notion of the true God, as appears from Gen. xxxi. 53. could not be guilty of so great a cruelty: but Vorstius does not consider, that the custom might not be less real, for its not having been established so early as Laban; and that the Hebrews sometimes burnt their children to Moloch.

F. Kircher directs us to seek the origin of the *theraphim* in Egypt; adding, that the word is Egyptian.—Spencer, in his dissertation on the *urim* and *thummim*, maintains the word to be Chaldee, and to signify the same with *seraphim*; the Chaldeans being frequently known to change the *w* into *n*, that

is, *f* into *t*. He adds, that those images were borrowed from the Amorites, Chaldeans, or Syrians; and that the *serapis* of the Egyptians is the same thing with the *theraphim* of the Chaldeans. See Selden *de diis Syriis*, synt. i. c. 2.

**THERIACA**, ΘΗΡΙΑΚΑ, **TREACLE**, in medicine, a name given by the ancients to various compositions esteemed good against poisons; but now chiefly restrained to what, by way of distinction, we call *theriaca andromachi*, or *venice treacle*. See ALEXIPHARMIC, ANTIDOTE, COUNTER-POISON, &c. This is a compound of no less than 64 drugs, prepared, pulverized and reduced, by means of honey, into a liquid electuary. See ELECTUARY.

The basis, or foundation of the composition, is vipers flesh. M. Charas has wrote a particular history of the animals, plants and minerals, which enter the composition of this famed remedy.

It is found sovereign against the bites of venomous beasts, and in the wind-colic; and is also used in intermitting fevers, and in cases requiring perspiratives and diaphoretics; also in continual fevers, especially such as are malignant, and where the pulse is low and ticking; in the small-pox and measles: and, as most of the ingredients thereof are very hot, in all diseases, where the natural heat is weak and languid.

Andromachus, Nero's physician, passes for the inventor of the *theriaca*; at least, it was he gave the first description thereof in elegiac verses: his son did the same in prose, and Democritus in iambics.

Anciently, the *treacle* made at Venice had all the vogue: and many still retain the ancient prejudice: but it is now prepared at Montpellier, at Paris, and even at London, with as much advantage as at Venice.

There is another vulgar kind of *theriaca*, called *diatessaron*, because only consisting of four ingredients. See DIATESSARON. *Treacle water*, and *treacle vinegar* are found good preservatives against putrid air, whether by being only smelt at, or by rubbing the wrists, temples and nose therewith.

**THERMÆ**, \* ΘΕΡΜΑΙ, in architecture, ancient buildings, furnished with baths, especially of the hot kind. See BATH.

\* The word is formed from the Greek, θερμῶς, hot.

Among the noble monuments of ancient Rome, are reckoned the *thermæ*, or baths of Dioclesian.

*Thermæ*, or hot springs, it is commonly argued, owe their heat to a collocation, or effervescence of the minerals in them. Though Dr. Woodward ascribes it to the subterraneous heat, or fire, which communicates with them by some spiracle or canal, whereby a greater quantity of heat is derived thither than to ordinary springs. See MINERAL, WATER, SPRING, HEAT, &c.

**THERMOMETER**, THERMOMETRUM, an instrument shewing, or rather measuring, the increase and decrease of the heat and cold of the air. See HEAT, AIR, &c.

*Thermometer* and *thermoscope* are ordinarily accounted the same thing: Wolfius, however, makes a difference; but shews withal that what we call *thermometers* are, in reality, no more than *thermoscopes*. See THERMOSCOPE.

There are various kinds of *thermometers*, the constructions, defects, theory, &c. whereof are as follow:

*Construction of a THERMOMETER, depending on the rarefaction of the air.*—In a tube BC, (Tab. Pneumatics, fig. 3. n. 2.) to which is fastened a glass ball AB, is put a quantity of common water mixed with aqua regia, to prevent its freezing; and the mixture tinged with a solution of vitriol to give it a greenness. In filling the tube, care is taken that there be so much air left in the ball and the tube, as, that when at its greatest condensation in the middle of winter, it may just fill the ball; and yet in its greatest rarefaction in summer, may not drive all the liquor out of the tube. To the other extreme of the tube is fastened another glass ball CD, open to the air at D: on each side the tube is applied the scale EF, divided into any number of equal parts.

Now, as the ambient air becomes warmer, the air in the ball and the top of the tube expanding, will drive the liquor into the lower ball; and consequently its surface will descend: on the contrary, as the ambient air grows colder, that in the ball becoming condensed, the liquor will ascend. See RAREFACTION, and CONDENSATION.

*Construction of the mercurial THERMOMETER.*—In the same manner, and with the same caution as before, put a little quantity of mercury, not exceeding the bigness of a pea, into a tube BC (fig. 4. n. 2.) thus bent in wreaths, that, taking up the less height, it may be the more manageable, and less liable to harm; divide this tube into any number of equal parts to serve for a scale.

Here the approaches of the mercury towards the ball A will shew the increases of the degree of heat.—The reason is the same as in the former.

The defect of both these instruments consists in this, that they are liable to be acted on by a double cause: for, not only a decrease of heat, but also an increase of weight of the atmosphere, will make the liquor rise in the one, and the mercury in the other; and, on the contrary, either an increase of heat, or decrease of weight of the atmosphere, will make it descend. See BAROMETER.

*Construction of the Florentine or common THERMOMETER.*—

The academists del Cimento, considering the inconveniences of the *thermometers* just described, attempted another, that should measure heat and cold by the rarefaction and condensation of spirit of wine; though those be vastly less than of air, and consequently the alterations in the degree of heat like to be much less sensible.

The structure of their *thermometer* is this: on some little pieces of turmeric is poured a quantity of rectified spirit of wine, which hereby receives a red tincture; this done, the spirit of wine is filtrated again and again through a brown paper, that the coarser particles of the root may be separated therefrom. With the spirit thus tinged and prepared, they fill a glass ball AB (fig. 5. n. 2.) and a tube BC; and that all the spirit may not descend in winter into the ball, it is convenient to put the ball into a lump of snow, mixed with salt: or, if the instrument be to be made in summer, into spring-water impregnated with salt-petre, that the condensed spirit may shew how far it will retire in the extreme cold.

If it rise to too great a height from the ball, part of it is to be taken out; and that the tube may not be made longer than needs, it is convenient to immerge the ball, filled with its spirit, in boiling water, and to mark the furthest point to which the spirit then rises.

At this point the tube is to be hermetically sealed by the flame of a lamp; and at the sides is to be added a scale, as in the former *thermometer*.

Now, spirit of wine rarifying and condensing very considerably; as the heat of the ambient air increases, the spirit will dilate, and consequently will ascend in the tube; and as the heat decreases, the spirit will descend: and the degree or quantity of ascent and descent will be seen in the scale. Yet as the ratio of yesterday's heat to to-day's is not hereby discovered, this instrument is not strictly a *thermometer*, no more than the former.

It is to be here observed, 1°. that as the natural gravity of the liquor makes it tend downwards, so it resists its ascent out of the ball into the tube; and that the more, as it rises higher: for which reason, it were best to have the tube BC horizontal. 2°. Since there must of necessity be some air left in the void part of the tube over the liquor, that air, by its elasticity, will tend downwards, and of consequence will resist the rise of the liquor, and be compressed by it as it does rise: its elasticity therefore is thus increased.

3°. Since it is found from experience, that a less degree of heat is communicated more easily to the spirit of wine in the ball than a greater, the rarefactions of the spirit of wine are not proportionable to their producing causes; especially since a greater degree of heat finds more liquor in the tube than a less does, to which, notwithstanding, the heat may be more easily communicated than to that stagnating in the ball.

On these accounts, the Florentine *thermometer*, though that commonly in use, is far from being an accurate measure of heat, &c. to which may be added what Dr. Halley observes in the *philosophical transactions*, that he has learned from those who have kept spirit of wine long, that it loses part of its expansive force in course of time.

Another great defect of these, and other *thermometers*, is, that their degrees are not comparable with each other. They mark, indeed, the different degrees of heat and cold, but each marks only for itself, and after its own manner; for that they do not proceed from any point of heat, or cold, that is common to them all. It is with them as with two clocks, which for want of having been first set to the same hour by the sun, will, indeed, mark that one, two, or more hours are passed, but not what hour it is by the day.—Nor can we be assured, that when the liquor is risen a degree in two different *thermometers*, they have both suffered the same impression of an equal additional heat: since the spirit of wine may not be the same in both, and in proportion as this spirit is more or less rectified, it will rise more or less high by the same heat.

Nor is this all: for in graduating *thermometers* they take equal lengths of the tube for equal ascents of the spirit; whereas, supposing the diameters of the tube equal throughout, which very rarely happens, there are so many irregularities within-side, that a certain length of tube sometimes requires double the quantity of liquor to fill it, that the same length in another tube of the same diameter requires. All which arises from the unequal thicknesses of the parietes of tubes in different places; and from accidental prominences and cavities, always found in the inner surfaces of tubes; and especially from their being almost always bigger at one end than the other.

Hence it is, that the comparison of *thermometers* becomes so precarious and defective.—Yet the most curious and interesting use of *thermometers* is, what ought to arise from such comparison. It is by this we should know the heat or cold of another season, of another year, another climate, &c. what is the greatest degree of heat or cold that men and other animals can subsist in.

M. de Reaumur has contrived a new *thermometer* for this purpose; wherein the inconveniences above recited are remedied. See its description at large in *Mem. de l'Acad. R. des Scien. an. 1730*, p. 645. *hist. p. 15. item, an. 1731*, p. 354. *hist. p. 7*. Various

Various methods have been proposed by various authors, for finding a fixed point, or degree of heat and cold, from which to account the other degrees, and adjust the scale; that so observations made at the same or different times, in different places, may be compared together.

Some note the place the liquor is at in winter, when water begins to freeze; and again, that in summer, when butter placed near the ball of the thermometer, melts: the intermediate space they divide into two equal parts, the middle point whereof answers, in their graduation, to temperate heat; and each moiety they sub-divide into ten degrees, adding four other equal degrees on each of the two extremes. But this method supposes the same degree of heat and cold to answer to the freezing of all water, and the melting of all butter; as also, that all *thermometers* receive the same impressions from the same degree of heat; all which are contrary to experience.

Others advise the ball of the *thermometer* to be put in a quantity of snow and salt, and the point the liquor is at to be noted. Thence the *thermometer* is to be removed into a deep cave, or cellar, where no external air reaches; so that the liquor receiving the action of a temperate air, may shew the degree of temperate heat. Lastly, they divide the intermediate space into 15, or more equal parts, which they continue beyond each extreme: but this method is liable to the same inconveniences as the former.

Dr. Halley assumes that for a fixed degree of heat wherein spirit of wine begins to boil; but there is reason to suspect this too of being precarious: though after him, M. Amontons retains the degree of heat answering to boiling water, for the graduating his mercurial *thermometer*. But as the different specific gravities of water argue a difference of mass and texture, it is highly probable that heat of all boiling waters is not the same; so that the point is yet undetermined.

**THERMOSCOPE**,\* an instrument shewing the changes happening in the air with respect to heat and cold. See AIR, WEATHER, &c.

\* The word *thermoscope* is generally used indifferently with that of *thermometer*. There is some difference, however, in the literal import of the two; the first signifying an instrument that shews, or exhibits the changes of heat, &c. to the eye, formed from θερμ, *heat*, and σκοπεω, *video*, *I see*; and the latter an instrument that measures those changes, from θερμ, *heat*, and μετροω, *to measure*: on which foundation the *thermometer* should be a more accurate *thermoscope*, &c. This difference the excellent Wolfius taking hold of, describes all the *thermometers* in use as *thermoscopes*; shewing that none of them properly measure the changes of heat, &c. none of them do more than indicate the same. Though their different heights yesterday and to-day shew a difference of heat, yet since they do not discover the ratio of yesterday's heat to to-day's, they are not strictly *thermometers*. See THERMOMETER.

In the *Acta erudit. Lips.* we have a method of graduating the common *thermometers* so, as that the unequal divisions thereof shall correspond to equal degrees of heat, whereby the ratio of to-day's heat to yesterday's will be measured, and consequently the *thermoscope* be improved into a *thermometer*.

The method is that of Car. Renaldinus, and is described by the Leipzig editors thus: take a slender tube about four palms long, with a ball fastened to the same; pour into it spirit of wine, enough just to fill the ball when surrounded with ice, and not a drop over. In this state, seal the orifice of the tube hermetically, and provide six vessels, each capable of containing a pound of water, and somewhat more; and into the first pour 11 ounces of cold water, into the second 10 ounces, into the third 9, &c. This done, immerse the *thermometer* in the first vessel, and pour into it one ounce of hot water; observing how high the spirit rises in the tube, and noting the point with unity: then remove the barometer into the second vessel, into which is to be poured two ounces of hot water, and note the place the spirit rises to with 2. By thus proceeding till the whole pound of water is spent, the instrument will be found divided into 12 parts, denoting so many terms or degrees of heat; so that at 2, the heat is double to that at 1, at 3 triple, &c.

But the method, though plausible, Wolfius shews is deceitful, and is built on false suppositions: for it takes for granted, that we have one degree of heat, by adding one ounce of hot to 11 of cold water; two degrees, by adding two ounces to 10, &c. It supposes that a single degree of heat acts on the spirit of wine in the ball with a single force, a double with a double force, &c. Lastly, it supposes that if the effect be produced in the *thermometer* by the heat of the ambient air, which is here produced by the hot water, the air has the same degree of heat with the water.

But none of these suppositions is true: for, as to the first, allowing the heat of the hot water, equally distributed through the cold, one degree of heat will then be distributed through 11 parts, two through 10, three through 9, &c. Taking therefore equal bulks of the water, *e. gr.* a twelfth part of each, the heat will not be double in one, triple in another, quadruple in another, &c.

The first supposition therefore is erroneous, and so is the second; for neither is the heat of the hot water equally diffused

throughout the cold, nor does the heat of the hot water act uniformly on the spirit of wine, *i. e.* not with the same force during all the time of its action.

For the third supposition, the heat of the ambient air acts not only on the spirit of wine in the ball, but also on that in the tube; and therefore this as well as that will be changed.

**THESEA**, or **THESÆA**, ΘΗΣΕΙΑ, in antiquity, feasts celebrated by the Athenians, in honour of Theseus. See FEAST. In spite of the important services that hero had done his country, in delivering it from a shameful tribute of so many youths of either sex sent yearly to be devoured by the Minotaur in Crete (as the fable has it) or sent as slaves to Minos king of Crete, as the histories have it; from which he freed them, by overcoming Taurus, Minos's general: he was banished for some time, and retired to Scyro, under the protection of Lycomedes, king of that island, who slew him out of jealousy.

The gods revenged this treatment Theseus received from the Athenians, by afflicting them with a famine, which the oracle assured them should not cease till they had avenged his death.

—Upon this they slew Lycomedes, brought Theseus's bones to Athens, placed them in a temple erected to him, and appointed *thesæa* to be held every eighth day of each month, wherein largesses were distributed to the people, and the day spent by the rich in feasting and rejoicing.

**THESIN**,—*Per Arsin* & **THESIN**. See *PER ARSIN*.

**THESIS**,\* in the schools, a general proposition which a person advances, and offers to maintain. See PROPOSITION.—See also ECTHESIS, METATHESIS, PARATHESIS, PARENTHESES, SYNTHESIS, &c.

\* The word is pure Greek, θέσις, *position*; formed from τιθεμαι, *pono*, *I put*, or *lay down*.

In the colleges it is frequent to have placards, containing a number of these *theses*.—There are *theses* in theology, in medicine, in philosophy, in law, &c.—The maintaining a *thesis*, is a great part of the exercise a student is to undergo for a degree. See DEGREE.

**THESIS**, in logic, &c.—Every proposition may be divided into *thesis*, and *hypothesis*; *thesis* contains the thing affirmed or denied, and *hypothesis* the conditions of the affirmation or negation. See HYPOTHESIS.

Thus, in Euclid, If a triangle and parallelogram have equal bases and altitudes, (is the *hypothesis*) the first is half of the second, the *thesis*.

*Arts and THESIS*. See the article ARSIS.

**THEURGY**,\* ΘΕΟΤΕΡΓΙΑ, a name which the ancients gave to that sacred part of magic, which we sometimes call *white magic*, or the *white art*. See MAGIC.

\* The word is formed from the Greek θεός, *God*, and εργον, *work*, *g. d.* the art of doing divine things, or things which God alone can do, or the power of working extraordinary and supernatural things by invoking the names of God, saints, angels, &c.

Accordingly, those who have wrote of magic in the general, divide it into three parts; the first whereof is called *theurgy*, as operating by divine or celestial means; the second, *natural magic*, performed by the powers of nature; and the third, *necromancy*, which proceeds by invoking dæmons. See NECROMANCY, &c.

**THICK Intestines**. See the article INTESTINES.

**THIGH**, a part of the body of men, quadrupeds, and birds, between the leg and the trunk. See LEGS, &c.

The several parts of the *thigh* have different names: the fore and upper-part is joined to the groin, or *inguen*; the side makes the hanch, or hip, *coxa*, *coxendix*; the upper hind-part the buttock, *clunis*; the lower and hind-part the ham, *poples*, of *post* and *plico*, because it bends backwards; and the fore-part the knee, *genu*, of the Greek γων, which signifies the same.

The bone of the *thigh* is the largest and strongest in the whole human body, as being to bear the whole burthen thereof: whence its name *femur*, of *fero*, *I bear*. See FEMUR.

**THINKING**, *Cogitation*, a general name for any act or operation of the mind. See MIND, and THOUGHT.

Chauvin, with the Cartesians, will have *thinking* to consist in a certain native, inherent motion, or agitation of the human mind, whereof itself is conscious.—*Native* and *inherent*, since he conceives it no other than the very essence of the mind itself, or, at least, its principal and fundamental property:—an *agitation*, since there is a new modification or change made in the mind, which we scarce know how to conceive without motion; add, that the origin and etymology of the word *cogitation*, according to Varro and Festus, implies as much; *cogito* being used for *coagito*. See THOUGHT.

When the mind turns its view inwards, upon itself, the first idea that offers, says Mr. Locke, is *thinking*; wherein it observes a great variety of modifications, and thereof frames to itself distinct ideas: thus the perception annexed to any impression on the body made by an external object, is called *sensation*. See SENSATION.

When an idea recurs without the presence of the object, it is called *remembrance*. See MEMORY.

When sought after by the mind, and brought again in view, it is called *recollection*. See RECOLLECTION.

When held there long under attentive consideration, it is *contemplation*. See CONTEMPLATION.

When ideas float in the mind without regard or reflection, it is called a *revery*: when they are taken express notice of, and, as it were, registered in the memory, it is *attention*: and when the mind fixes its view on any one idea, and considers it on all sides, it is *study* and *attention*. See ATTENTION, &c.

These are the most obvious modes of *thinking*; but there are several others which we know of; and, doubtless, the mind is capable of infinite others, whereof we have no notion at all. See MODE.

The school philosophers usually divide *thinking*, with regard to the objects it is employed about, into understanding, *intellectio*; and willing, *volitio*. See UNDERSTANDING, and WILL.

—And hence, those are said to be the two powers or faculties of the human mind. See POWER, and FACULTY. Intellectual *thinking* is farther subdivided into divers kinds: the first, when the mind merely apprehends or takes notice of a thing, called *perception*: the second, when it affirms or denies a thing, called *judgment*: the third, when it gathers or infers a thing from others given, called *reasoning*: the fourth, when the mind disposes its own thoughts or ideas in order, called *method*. See PERCEPTION, JUDGMENT, REASONING, and METHOD.

Volitive *thinking*, or volition, admits of infinite different modifications, or new determinations. See WILL.

Some authors extend the idea of *thinking* further; and consider it in God, angels, men, brutes, &c. whence a new division of *thinking* into divine, angelical, human, and animal or sensitive. But the two first we know little or nothing of. See GOD, and ANGEL.—The third is that we have already been treating of.—As to the last, viz. animal or sensitive thought, it is defined to be an action of the soul attending to an external object, effected by means of the animal spirits duly agitated in the brain, to excite an idea. See SPIRITS, KNOWLEDGE, THOUGHT, &c.

The Cartesians maintain, that *thinking* is essential to the human soul; and, consequently, that there is no time when the soul does not *think*: but this doctrine is overturned by Mr. Locke, who shews, that in sleep without dreaming, there is an entire cessation of all the modes of *thinking*. See IDEA.

*I think, cogito*, according to des Cartes, is the first, and most certain of all truths; from which alone we draw this consequence, *therefore I am, or exist, sum*.—One might also say, *cogito, ergo Deus est; I think, therefore there is a God*. See EXISTENCE, CARTESIAN, &c.—Logic is defined the art of *thinking* justly. See LOGIC.

THIRD, *Tertius*. See NUMBER, and NUMERATION.

THIRD, in music, a concord resulting from a mixture of two sounds containing an interval of two degrees. See CONCORD. It is called *third*, as containing three terms, or sounds between the extremes. See INTERVAL.

The *third*, in Italian *terza*, in French *tierce*, in Latin *tertia*, has no general name in the Greek: it is the first of the imperfect concords, i. e. of such as admit of majority and minority, without ceasing to be concords.—And hence it is, that it is distinguished into two kinds.

The first, which the Italians call *ditono* (from the Greek *ditonos*) or *terza maggiore*, and we *greater third*, is composed diatonically of three terms, or sounds, containing two degrees, or intervals; one whereof, in the ancient system, is a greater tone, and the other a lesser tone: but in the modern temperate system they are both equal, as *ut, re, mi*; or *ut, mi*. See DEGREE, TONE, SEMITONE, &c.

Chromatically it is composed of four semitones; two whereof are greater, and the *third* less: it takes its form from the ratio sesqui-quarta 4:5.

The second *third*, which the Italians call *trihemituono*, or *semi-ditono*, or *terza minore*, and we *lesser third*, is composed, like the former, of three sounds, or terms, and two degrees, or intervals: but these degrees, diatonically, are only a greater tone, and a semitone.

Chromatically it is composed of three tones, two greater, and one less; as *re, mi, fa*; or *re, fa*.

It takes its form from the ratio sesqui-quinta 5:6.

Both these *thirds* are of admirable use in melody; and make, as it were, the foundation and life of harmony. See CONCORD, MELODY, and HARMONY.

They are used agreeably both ascending and descending; and that either running over all the degrees, as *ut, re, mi*; or *re, mi, fa*; or skipping the middle degree, as *ut, mi*; or *re, fa*.

But it is to be observed, the *greater third* has somewhat gay and sprightly in rising, and somewhat heavy and melancholic in falling: the *lesser third*, on the contrary, has somewhat soft and tender in rising, and somewhat brisk in falling.—For the use of the *greater* or *lesser third* in the series of the scale; see SCALE.

There are two other kinds of *thirds* that are dissonant and vicious; the first only composed of two greater semitones, and, by consequence, of a semitone less than the *lesser third*: this they call the *defective third*.

The second, on the contrary, has a semitone more than the *greater third*; and this they call the *redundant third*.

The *defective third* is very frequent in Italian songs, especially those composed for instruments; but is not to be used without necessity, and a deal of discretion. The *redundant third* is absolutely forbidden.

THIRD *Borough*, in our ancient law-books, denotes a constable. See CONSTABLE.

THIRD *Earing*, in husbandry, the tilling or ploughing of the ground a *third* time.

THIRD *Estate*. See ESTATE, COMMONS, &c.

THIRD *Night-awn-hynd*: by the laws of Edward the Confessor, a guest who had lain three nights in an inn, was reputed a domestic, and his host was answerable for what offence he should commit. See HOGENHINE.

For one night he was accounted *uncuth*, for two nights *guest*, and the *third, awn-hynd*. *Prima nocte incognitus, secunda hospes, tertia domesticus censetur*.

THIRD *Order*, a sort of religious order, that observes the same rule, and the same manner of life, in proportion, as some other two orders instituted before. See ORDER.

The *third orders* are not originally religious orders, but associations of secular, and even married persons, who conform, as far as their condition will allow them, to the design, intention, and rules of a religious order which associates and directs them.

The Premonstrantes, Carmelites, Augustines, and Franciscans, dispute among themselves the honour of having first introduced *third orders*: but the pretensions of these last appear to be the best founded.

The first contend, that the *third order* of Premonstrantes began in the life-time of their founder St. Norbert, who died in 1134. See PREMONSTRANTES.

F. Diego de Coria Maldonado, a Spanish Carmelite, who has a particular treatise on the *third order* of Carmelites, derives them immediately, as well as the Carmelites themselves, from the prophet Elijah; and among the great men who have made profession of that *third order*, reckons the prophet Obadiah, who lived 800 years before Christ; and among the women, our Saviour's great grandmother, under the borrowed name of St. Emerentiana. This Obadiah, he says, was controller-general of the house of king Ahab, mentioned in the first book of Kings, chap. xviii. and disciple of the prophet Elijah. After serving that prince, and his successors, he retired to serve God, and entered the prophetic order of Elijah, but without quitting his house, his wife, or children.

The author adds, that he was not properly of the *third order*, but of the second, which consisted of married people, and was called the *order of eunuchs*, under the direction of Elijah. Such, according to him, is the foundation of the *third order* of Carmelites. See CARMELITE.

F. Helyot shews, that this *third order* was not begun till the year 1476, when Sixtus IV. gave permission to the prior and provincials of the Carmelites, to give the regular habit and rule of their order, to people of both sexes, married or unmarried, living at liberty in the world. De Coria reckons St. Louis, king of France, in the *third order* of the Carmelites.

The *THIRD order* of Augustines, if we credit F. Bruno, was instituted by St. Augustin himself: but the arguments he produces are so frivolous, that F. Helyot observes, they are not worth the refuting.

The *THIRD order* of Franciscans was instituted by St. Francis in 1221, in favour of people of both sexes, who being smitten with the preachings of that saint, demanded of him an easy manner of living a Christian life: upon which he gave them a rule, the constitutions whereof are not now extant as wrote by himself, but only as reduced and confirmed by pope Nicholas IV. 68 years afterwards.

The first order of this saint are the monks called *minor friars*, comprehending the cordeliers, capuchins, and recolects; the second comprehends the nuns of St. Clare; and the third, several persons of both sexes, who live at liberty, and these are what we call the *third order*. See FRANCISCAN, &c.

Of this order, which was only established for secular persons, several of both sexes, to attain the greater perfection, have since commenced religious, and formed various congregations, under various names, as *religious penitents of the third order*, &c.

THIRD *Point*, or *TIERCE-point*, in architecture, the point of section in the vertex of an equilateral triangle.

Arches or vaults of the *third point*, called by the Italians *di terzo acuto*, are those consisting of two arches of a circle, meeting in an angle a-top. See ARCH.

THIRD *Point*, in perspective, }  
THIRD *Rate*, } See the articles { POINT.  
THIRD *Subsidy-duty*, } RATE.  
Tithe of the *THIRD year*, } DUTY.  
TITHE.

THIRDINGS, the third part of the corn or grain growing on the ground at the tenant's death, due to the lord for a heriot, within the manour of Turfat, in Herefordshire. See HERIOT.

THIRST, a painful sensation, occasioned by a preternatural vellication of the nerves of the throat or fauces, and producing a desire of drinking. See DRINK.

Rohault accounts for *thirst* thus: the stomach liquor, which ordinarily resolves into a thick vapour, and ascends from the stomach up into the throat, to moisten it; being too much warmed and agitated, either from a want of some other liquor to temper and dilute it, or from any other cause, becoming converted into too thin, subtle, and penetrating a vapour, is so far from moistening and cooling the throat, that, on the contrary, it dries and heats it; and hence that motion in the nerves, the sensation whereof we call *thirst*. See HUNGER. *Thirst* sometimes also arises from a mere dryness of the part; and sometimes from sharp salts, more immediately vellicating the fibres of the throat.

There are various kinds of liquors which quench *thirst*; some by tempering the stomach liquor; others by diluting, and even dissolving the salt; and others by moistening and suppling the fibres.—Acids are peculiarly fitted for that end. See ACID. *Thirst* is sometimes eluded by rolling a leaden bullet or a pebble in the mouth, which occasions an extraordinary issue of saliva to moisten the throat, &c. See SALIVA.

Mr. Boyle mentions a man who could easily abstain from drinking for nine days, and yet his diet nothing more liquid than usual; the secretions of urine, sweat, &c. being performed all the while regularly, and in the same quantity as usual.

In dropical cases, where there is not a right secretion of the urine by the renal glands, and the vessels and parts of the body are loaded with too great a quantity of serous humours, a great moderation in drinking might be attended with good success, provided some liquor could be found out to allay that uneasy sensation: probably this would be best performed by mucilages acidulated with spirit of vitriol or sulphur, or gellies with juice of lemon, &c. and that a small quantity of such a composition now and then used, might be of as much real service in quenching *thirst*, as draughts of liquor which increase the symptoms. See DROPSY.

**THISTLE**, *Carduus*, a name common to divers plants, whose flowers consist of several little, narrow, longish leaves, ranged close together into a sort of head, and whose leaves are usually squamose and prickly.—The most known of these plants are the *blest thistle*. See *CARDUUS Benedictus*.

**Milk THISTLE**, or *our Lady's THISTLE*, *Carduus Mariae*, the decoction whereof is by some recommended against the dropsy, jaundice, and pains of the kidneys.

**Fuller's THISTLE**, or *Teazel*: see under the article TEAZEL.

**Order of the THISTLE**, or of St. Andrew, is a military order in Scotland; instituted, as some say, by Hungus, or Hungo, king of the Picts, after a victory obtained over Athelstan. See KNIGHT.

The legend is, that a cross of St. Andrew (the patron of that kingdom) appearing to him at the time of the engagement, he blessed the happy augury, took the figure thereof into his standard in honour of his protector, and instituted an order of knights, whose collar is of gold interwoven with *thistle* flowers, and sprigs of rue.

From the collar hangs a medal, on which is the image of St. Andrew with his cross on his breast; with this motto, *Nemo me impune lacesset*, Nobody shall provoke me unpunished.

Others give a different account of its origin, and assure us, it was instituted after the conclusion of a peace between Charles VII. of France, and the king of Scotland.

The abbot Justiniani goes up higher, and will have it to have been instituted by Achaius I. king of Scotland, in 809; who, after an alliance made with Charlemagne, took for his device the *thistle*, with the words *nemo me impune lacesset*, which, in effect, is that of the order: he adds, that king James IV. renewed the order, and took St. Andrew for its protector.

The order only consists of twelve knights, besides the king, who is the chief, or sovereign. Their ordinary badge is a green ribbon, to which hangs a *thistle* of gold, crowned within a circle of gold, in which is the forelaid motto.

**Our Lady of the THISTLE**, was also a military order instituted in 1370, by Louis II. duke of Bourbon.—It consisted of 26 knights, whereof that prince and his successors were the chiefs: their badge was a sky-blue girdle; and, on solemn occasions, a mantle of the same colour, with a gold collar, interwoven with flower-de-luces, among which was the word *esperance*, *hope*, in capitals.

**THISTLE-take**, a custom in the honour of Halton, in the county of Chester, whereby, if in driving beasts over the common, the driver permits them to graze, or take but a *thistle*, he shall pay a half-penny a beast to the lord of the fee.

At Fiskerton, in Nottinghamshire, by ancient custom, if a native, or cottager killed a swine above a year old, he paid the lord one penny; which was also called *thistle-take*.

**THLIPSIS**, *ΘΛΙΨΙΣ*, is used by anatomists, for the compression of any vessel, or aperture, whereby its cavity is lessened.

**THNETOPSYCHITES**, \* a sect in the ancient church, who believed the soul of man perfectly like that of brutes; and taught that it died with the body. See SOUL.

\* The word is composed of the Greek *θηνη*, mortal, and *ψυχη*, soul.

We meet with no account of these heretics any where, but in J. Damascenus, *bæres*. 90. unless they be the same with those

Eusebius speaks of, *Hist. Eccles. lib. 9. c. 38*. who relates, that in Origen's time there were heretics in Arabia, who taught, that the soul of man died with the body; but that it should rise again with it at the end of the world. He adds, that Origen refuted them in a numerous council, and reclaimed them from their errors.—St. Augustin and Isidore call them Arabian heretics.

Marshall, in his tables, has disfigured the word, for want of understanding it; he writes it *thetoppsychites*, instead of *thnetoppsychites*: he likewise places them in the VIth century; on what grounds we cannot imagine.

**THOMEANS**, **THOMEANS**, **THOMITES**, or *Christians of St. THOMAS*, a people of the East-Indians, who, according to tradition, received the gospel from the apostle St. Thomas. See CHRISTIAN.

Upon the arrival of the Portuguese at Calcut, in their first voyage to the Indies, they met with ancient Christians, who pretended to be descended from those converted by St. Thomas. The *Thomeans* being informed of a new people arrived among them, who bore a particular veneration for the cross, sent ambassadors to them to make an alliance with them, and to solicit their assistance against the Gentile princes, by whom they were greatly oppressed.

It is certain the *Thomeans* are Indigenæ, or originally of India: they are called *Nazarenes*; but custom has affixed to that name an idea of contempt: their other name *Mappuley*, and, in the plural, *Mappuleymar*, is more honourable.

They form a very considerable clan, or cast; but are always divided with factions, inveterate enmities, &c. The clan extends through all the country from Calcut to Travencor; not that all the tract is possessed wholly by them: sometimes they have a whole town to themselves, and sometimes only a certain quarter in it.

They own themselves strangers in that country, and their tradition is, that they came thither from the country about the city of Meilapur, or St. Thomas, by reason they were persecuted by the prince thereof. But the time of this transmigration nobody knows any thing of; for they keep no monuments.

The *Thomeans* ascribe their conversion, their discipline, &c. to St. Thomas: their breviary adds, that their apostle passed thence into China.

We shall not here enter into the dispute, whether the St. Thomas so famed in the Indies be the apostle, or some other saint of that name; which latter is the opinion of several learned men, and particularly of M. Huet.

But the progress of the history of this church is not less difficult to trace than its origin: our European books mention the patriarch of Alexandria's sending bishops to the Indians, particularly St. Pantæus, St. Frumentius, &c. It may be doubted, whether or no it were to these Indians that they were sent: Baronius, indeed, maintains it was; but the Portuguese author *da Historia d'Ethiopia*, endeavours to prove it was to Ethiopia these ancient missionaries went. All we know for certain is, that the *Thomeans*, for several ages, were furnished with bishops from the side of Babylon, or Syria; and there is a kind of patriarch at Babylon who continues to furnish them.

Whether or no their apostle ordained them any bishops (the order whereof may have been since extinct through want of proper subjects, as F. Bouchet imagines) is a question: all we can say is, that the *Thomean* church, at the first arrival of the Portuguese, was wholly governed by these foreign bishops.

The language they use, *in sacris*, is the Chaldee, some say the Syriac: as to their ordinary language, it is the same with that of their neighbours.

The Chaldee was doubtless brought among them by their bishops: it is added, that at the time the East was infected with Nestorianism, Eutychianism, &c. the bishops likewise carried them those heresies.

Such a mixture of opinions, with a total interruption of pastors, sometimes for several years together, occasioned that horrible chaos their religion was in at the arrival of the Portuguese: for a specimen whereof we shall add their manner of celebrating the Eucharist.

Over the altar was a kind of tribune or gallery; and while the priest was saying the beginning of the office below, a cake of flower of rice was frying in oil or butter above: when enough, the cake was let down in a basket upon the altar, where the priest consecrated it. As to the other species, for wine, they used a kind of brandy variously prepared in that country. Nor was their ordination much more regular; the archdeacon, who was sometimes more respected than the bishop himself, frequently ordained priests.

Their other abuses were infinite: the Portuguese, for these two last centuries, have laboured the reformation of this church; and have employed both the ecclesiastic and secular power therein: for this end they have called the *Thomean* bishops to the councils at Goa, have instructed, charged them, &c. and have even sent them for instruction to Portugal and Rome: but they were still apt to relapse at their return; so that finding no good was like to be done with them, they resolved to exclude them once for all, and to appoint an European bishop in

in their room. These proceedings have rendered the Portuguese infinitely odious to the *Thomæans*.

The person who contributed most to the reform, is Dom Frey Aleixo de Meneses, archbishop of Goa, who governing the Portuguese Indians for some time, in defect of a viceroy, took that occasion to call a synod in the village of Diamper, where abundance of regulations were made, and the *Thomæans* united to the Roman church: he was seconded by the Jesuits.

After the death of the archbishop, a great part of the *Thomæan* church relapsed, and thus still continues, partly Roman, partly *Thomæan*.

**THOMAS**—*Christians of St. THOMAS*, } See { **CHRISTIANS**.  
**THOMAS'S Hospital**, } See { **HOSPITAL**.

**THOMISM**, or **THOMASISM**, the doctrine of St. Thomas Aquinas, and his followers the *Thomists*; chiefly with regard to predestination, and grace.

There is some doubt what the true, genuine *Thomism* is: the Dominicans pretend to hold pure *Thomism*; but there are other authors who distinguish the *Thomism* of St. Thomas from that of the Dominicans. See **DOMINICANS**.

Others again make *Thomism* no other than a kind of Jansenism disguised; but Jansenism we know has been condemned by the pope, which pure *Thomism* never was. See **JANSENISM**.

In effect, the writings of Alvarez and Lemos, who were appointed by their order to lay down and defend before the holy see the dogmata of their school, have since been reputed the rule of pure *Thomism*.

The modern school has abandoned many of the ancient *Thomists*, whose sentiments and expressions appeared to Alvarez and Lemos too hard; and the new *Thomists*, who pass the bounds marked by these two doctors, cannot give their opinions for the sentiments of the school of St. Thomas, which the pope has forbid being censured.

The *Thomism* allowed, is that of Alvarez and Lemos: those two authors distinguish four classes of *Thomists*; the first, which they reject, destroys or takes away liberty; the second and third do not differ from Molina. See **MOLINISTS**.

The last, which Alvarez embraces, admits a physical promotion, or predetermination, which is a complement of the active power, whereby it passes from the first act to the second; that is, from complete and next power to action. See **PRE-DETERMINATION**.

This promotion they hold is offered in sufficient grace: sufficient grace is given to all men; and they have a complete, independent, next power not to act, and even to reject the most efficacious grace. See **SUFFICIENT**, and **GRACE**.

**THOMISTS**, a sect of school divines, who maintain *Thomism*. See **SCHOOL**, and **THOMISM**.

The avowed antagonists of the *Thomists* are the Scotists. See **SCOTIST**.

**THOMITES**. See the article **THOMÆANS**.

**THORACIC**, **THORACICUS**, in anatomy, an epithet given to two branches of the axillary artery, on account of their conveying the blood into some parts of the thorax. See **THORAX**.

The *thoracic* arteries are distinguished into *upper* and *lower*.—There are likewise *thoracic* veins, an *upper* and *under*, for the reconveyance of the blood from the thorax to the axillary vein. See **AXILLARY**.

**THORACIC DUCT**, *Ductus THORACICUS*, or *Chyliferus*, is a little canal arising from, or rather a continuation of, the exit or mouth of the receptaculum chyli. See **RECEPTACLE**. It mounts all along the thorax, whence it takes its name, and ends in the left subclavian vein. It is sometimes called *Pecquet's duct*, or *ductus Pecquetianus*, from M. Pecquet, supposed to be the first discoverer thereof.

Indeed the *thoracic* duct, Dr. Wharton assures us, was observed by Barthol. Eustachio in 1563; but its use, and communication with the receptaculum chyli was unknown. And hence it is that Pecquet, a physician of Dieppe, is commonly held to have first discovered it, in 1651; whence its denomination *ductus Pecquetianus*: tho' the description he gives of its insertion is faulty.—Van Horne confounds it with the receptaculum, or, as he calls it, *cisterna chyli*.

In its progress through the thorax it is furnished with a proper integument from the pleura, besides the membrane it has in common with the receptaculum: at about one third of its way it divaricates, but soon unites again.

Dr. Drake observes, that it has valves in different places of its tract; Eustachio says glands. Its use is to carry the chyle and lymph from the receptaculum into the subclavian, by which it is forwarded to the cava, and thence to the heart. See **CHYLE**.

**THORAX**, \* **ΘΟΡΑΞ**, in anatomy, that part of the human body which forms the capacity of the breast, and wherein are included the heart and lungs.—See *Tab. Anat. (Osteol.) fig. 3. n. 13. 13. fig. 7. n. 15. 15.*—See also **BODY**.

\* It has its name from the Greek *θορεν*, *salire*, to leap; by reason of the continual throbbing motion of the heart, which is contained therein.—Galen calls it *cistara*, and says it contains the parts that excite to love.

The *thorax* is also called the *second* or *middle venter*, and properly the *chest*. See **VENTER**.

It is bounded a-top by the clavicles, and at bottom by the cartilago xiphoides, and the diaphragm.—Its fore-part is called the *sternum*, or *breast-bone*; its side-parts, the *costæ*, or *ribs*; its hind-parts are the *spina dorſi*, and its *vertebræ*, with the *omoplate*. See **RIBS**, **STERNUM**, &c.

Beside the heart and lungs, the *thorax* likewise contains the ascending cava, the aorta, the pulmonary vein and artery, the trachea, œsophagus, &c.

It is lined within-side with a membrane called the *pleura*, and divided in the middle by another called the *mediastinum*. See **PLEURA**, and **MEDIASTINUM**.

**THOROUGH-Bass**, in music, is that which continues quite through the composition. See **BASS**.

**THOUGHT**, *Sentiment*, a general name for all the ideas consequent on the operations of the mind, and even for the operations themselves. See **THINKING**.

As in the idea of *thought* there is nothing included of what we include in the idea of an extended substance; and that whatever belongs to body, may be denied to belong to *thought*: we may conclude that *thought* is not a mode of extended substance, it being the nature of a mode not to be conceived, if the thing whereof it is the mode be denied. Hence we infer, that *thought* not being a mode of extended substance, must be the attribute of some other substance very different. See **MODE**.

F. Malebranche, with the spirit of a Cartesian, denies that a man who thinks seriously on the matter, can doubt but the essence of the mind consists altogether in *thought*, as that of matter does in extension; and that according to the various modifications of *thought*, the mind sometimes wills, sometimes imagines, &c. as, according to the various modifications of extension, matter is sometimes water, sometimes wood, fire, &c. By the way, by *thought* he does not mean the particular modifications of the soul, i. e. such or such a *thought*, but *thought*, or thinking in the general, considered as capable of all kinds of modifications or ideas: as by extension he does not mean such or such an extension, as a square, oval, or the like, but extension in the abstract, considered as susceptible of all kinds of modifications or figures.

He adds, that he takes it to be impossible to conceive a mind which does not think, though it be easy to conceive one which does not feel, or imagine, or will; in like manner as it is impossible to conceive a matter which is not extended, though it be easy to conceive one that is neither earth, nor metal; nor square, nor round; nor that is even in motion.

Hence it may be concluded, that as it is possible there may be matter which is neither earth, nor metal; nor square, nor round; nor even in motion: it is also possible, that a mind may neither perceive heat nor cold; nor joy nor grief; nor imagine any thing, nor will any thing; so that these modifications are not essential to it. Thinking alone, therefore, is the essence of the mind, as extension alone is the essence of matter. See **ESSENCE**, **EXTENSION**, **WILL**, &c.

But this doctrine no longer passes among us. The followers of Sir Isaac Newton, and the new philosophy, deny extension to be the essence of matter (see **MATTER**;) and the followers of Mr. Locke deny *thought* to be the essence of the mind. See **SOUL**.

**THOUSAND**. See the article **NUMERATION**.

**THOUSAND years reign**. See the articles **MILLENNIUM**, and **MILLENNARIES**.

**THRASHING**, or **THRESHING**, in agriculture, the act of beating the corn out of the ears. See **CORN**.

*Thrashing* is performed two ways; or rather there are two ways of separating corn from the ear—the first by beating it with a flail, which is properly what we call *thrashing*.

Some authors will not by any means we should call this by the Roman name *tritura*, or *trituration*, but *flagellatio*, of *flagellum*, a *scourge*, or *flail*.

The other manner, still practised in several countries, as we are informed by Liger, is to make mules or horses trample on it backwards and forwards.—This is properly what the ancients called *tritura* and *trituration*.

But they also used oxen therein; witness the Hebrews, who sometimes yoked four oxen together for this purpose.

Another way was with a kind of sledge made of boards joined together, and laden with stones or iron, upon which a man was mounted, and the whole drawn over the corn by horses: this instrument was called *traba*, or *tribula*.

It is a rule among husbandmen, that the season for *thrashing*, is when the corn has sweated in the heap, or mow.

**THRAVE**, or **THREAVE** of corn, in most parts of England, is twenty-four sheaves, or four shocks of six sheaves to the shock—though in some counties they only reckon twelve shocks to the *thrave*.

King Athelstan, anno 923, gave by charter to St. John of Beverly, four *thraves* of corn for every plough-land in the east-riding of Yorkshire.

*Ya fou threve be beven king,  
Of ilka plough of est-riding.*

**THREAD**, in botany, is understood of those threads usually found in the middle of flowers; as in the lilly, tulip, rose, &c. There are two kinds: those which support apices, are particularly called *stamina*; and those which have none simply *threads*. See **STAMINA**.

**Gold THREAD**, } **GOLD**.  
**Virgins THREAD**, } See the articles } **VIRGIN**.  
**THREADY Marble**, } **MARBLE**.

**THREAVE**. See the article **THRAVE**.

**THREE-Legged Staff**, an instrument consisting of three wooden legs, made with joints, so as to shut all together, and to take off in the middle, for the better carriage; and usually having on its top a ball and socket: its use is to support and adjust instruments for astronomy, surveying, &c. See **BALL** and **SOCKET**.

**THREE Chapters**, } **CHAPTER**.  
**Compasses of THREE Legs**, } See the articles } **COMPASSES**.  
**Ombre by THREE**, } **OMBRE**.  
**Rule of THREE**, } **RULE**.

**THRENGI**, or **THRENGES**, in our ancient customs, a denomination given to vassals, but not of the lowest degree of those who held lands of the chief lord: otherwise called *dren-gi*, and *drenches*. \* See **DRENCHES**.

\* *Quia vero non erant adhuc tempore regis Willielmi milites in Anglia, sed threnges; præcipit rex ut de eis milites fierent ad defendendam terram: fecit autem Lanfrancus threngos suos milites, &c. Somn. Gavelk.*

The name was imposed by the conqueror: for when one Edward Sharnbourn of Norfolk, and others, were ejected out of their lands, they complained to the conqueror; insisting, that they were always on his side, and never opposed him; which, upon inquiry, he found to be true; and therefore he commanded that every one should be restored to their lands, and for ever after be called *drenches*, or *threnges*. Spelm. du Cang.

**THRENODY**, **THRENODIA**, a mournful, or funeral song. See **FUNERAL**.

**THRIHING**, } **TRIHING**.  
**THRINIUM-Gild**, } See the articles } **THRINIUM-Gild**.

**THROAT**, the anterior part of an animal between the head and the shoulders, wherein is the gullet. See **NECK**.

Physicians include under the word *throat*, all that hollow or cavity which may be seen when the mouth is wide open. See **ÆSOPHAGUS**, and **MOUTH**.

It is sometimes also called *isthmus*, by reason it is narrow, and bears some resemblance to those streights called by the geographers *isthmi*. See **FAUCES**.

**THROAT**, in architecture, fortification, &c. See **GORGE**, and **GULA**.

**THRONE**, ΘΡΟΝΟΣ, a royal seat, or chair of state, enriched with ornaments of architecture and sculpture, made of some precious matter, raised one or more steps, and covered with a kind of canopy.

Such are the *thrones* in the rooms of audience of kings, and other sovereigns.

**THROW the Glove**, } **GLOVES**.

**THROWED Silk**, } See the articles } **SILK**.

**THROWS of Women**, the pains of child-birth. See **DELIVERY**, &c.

**THROWSTER**, one who prepares raw silk for the weaver; by cleansing, and twisting it. See **SILK**.

**THUMMIM**, in the scripture learning. See **URIM** and **THUMMIM**.

**THUNDER**, a noise in the lowest region of the air, excited by a sudden kindling of sulphurous exhalations. See **AIR**, **ATMOSPHERE**, **EXHALATION**, &c.

Seneca, Rohault, and other authors, both ancient and modern, account for *thunder*, by supposing two clouds impending over one another, the upper and rarer whereof becoming condensed by a fresh accession of air raised thither by warmth from the lower parts of the atmosphere, or driven upon it by the wind; immediately falls forcibly down upon the lower, and denser cloud: by which fall, the air interposed between the two being compressed, that next the extremities of the two clouds is squeezed out, and leaves room for the extremity of the upper cloud to close tight upon the under: thus a great quantity of air is inclosed, which at length escaping through some winding irregular vent or passage, occasions that noise we call *thunder*. See **CLOUD**, &c.

But this only reaches to the phenomena of *thunder* heard without lightening; and, in effect, we have now a better solution: *thunder* is not occasioned by the falling of clouds, but by the kindling of sulphurous exhalations, in the same manner as the noise of aurum fulminans.

“There are sulphurous exhalations, says Sir Isaac Newton, “always ascending into the air when the earth is dry; there “they ferment with the nitrous acids, and sometimes taking “fire, generate *thunder*, lightening, &c.

That, beside the vapours raised from water, &c. there are also exhalations carried off from sulphur, bitumen, volatile salts, &c. is past all doubt; the vast quantity of sulphurous and bi-

tuminous matter all over the surface of the earth, and the volatile salts of plants and animals, afford such an ample stock thereof, that it is no wonder the air should be filled with such particles, raised higher or lower, according to their greater or less degree of subtilty and activity; and more copiously spread in this or that quarter, according to the direction of the winds, &c. See **SULPHUR**.

Now, the effects of *thunder* are so like those of fired gunpowder, that Dr. Wallis thinks we need not scruple to ascribe them to the same cause: but the principal ingredients in gunpowder we know are nitre and sulphur: charcoal only serving to keep the parts separate, for the better kindling. See **NITRE**, and **GUNPOWDER**.

Hence, if we conceive in the air a convenient mixture of nitrous and sulphurous particles, from the sources above-mentioned; and those, by any cause, to be set on fire; such explosion may well follow, and with such noise and light the two phenomena of *thunder*, as in the firing of gunpowder: and being once kindled, it will run from place to place, this way or that, as the exhalations happen to lead it; much as is found in a train of gunpowder.

This explosion, if high in the air, and remote from us, will do no mischief; but if near us, may destroy trees, animals, &c. as gunpowder would do in the like circumstances.

This nearness or farness may be estimated by the interval of time between the flash, and the noise. Dr. Wallis observes, that ordinarily the difference between the two is about seven seconds; which, at the rate of 1142 feet in a second of time, gives the distance about a mile and half: but sometimes it comes in a second or two, which argues the explosion very near us, and even among us. And in such cases, the reverend doctor assures us, he has more than once foretold the mischiefs that befell.

Upon the whole, that there is in lightening a sulphurous vapour, appears from the sulphur which attends it, and from the sultry heat in the air which usually precedes it; and that there is a nitrous vapour along with it, the same author concludes hence, that we know of no other body so liable to a sudden and violent explosion. And as to the kindling of these materials, we know that a mixture of sulphur and steel filings, with a little water, will break forth into actual flame. Nothing therefore is wanting to the explosion, but some chalybeate, or vitriolic vapour; and among the various effluvia from the earth, the doctor does not doubt, but there must be some of that: but what he leaves as a probability, we can produce a kind of proof of.

In history we meet with instances of its raining iron in Italy, and iron stones in Germany: Jul. Scaliger tells us, he had by him a piece of iron rained in Savoy. Cardan reports 1200 stones to have fallen from heaven, some of them weighing 30, some 40, and one an hundred and twenty pound, all very hard, and of the colour of iron.

The matter of fact is so well attested, that Dr. Lister, in the *Philosophical Transactions*, builds a whole theory of *thunder* and lightening on it; maintaining, that they both owe their matter to the breath or exhalation of pyrites. See **PYRITES**.

That rattling in the noise of *thunder*, which makes it seem as if it passed through arches, or were broken variously, is doubtless owing to the sound being excited among clouds hanging over one another, and the agitated air passing between them.

**THUNDER-BOLT**.—If what we call *lightening*, act with extraordinary violence, and break or shatter any thing, it is called a *thunder-bolt*; which the vulgar, to fit it for such effects, suppose to be a hard body, and even a stone.

But that we need not have recourse to a hard solid body to account for the effects commonly attributed to the *thunder-bolt*, will be evident to any one, who considers those of pulvis fulminans, and of gunpowder. See **FULMINANS**.

The phenomena of the *thunder-bolt* are, that it oftener strikes on high places than on low: that it frequently burns people's cloaths, without touching their bodies: that it sometimes breaks their bones, without hurting their flesh, or their cloaths; that it has even melted the sword without injuring the scabbard, &c.

The first is easily accounted for, from the ordinary height of the clouds, out of which the lightening darts: as to the rest, since exhalations may be very different from one another; some, *e. gr.* coming nearest the nature of sulphur, may only yield a very slight lambent flame, which will only affect such things as take fire the soonest; and others, on the contrary, so subtle and penetrating, as to come near the nature of volatile salts or aqua fortis, which spare soft bodies, and spend their whole force on hard ones.

The chevalier de Louville, of the French academy of sciences, accounts for some of the effects of *thunder* upon a new principle: as to killing of animals, without burning or wounding them, it is naturally enough ascribed to the sulphur, which falling near enough the person, the fumes thereof stop his respiration. As to trees, buildings, &c. split or beaten down, there must be another cause. M. de Louville, therefore, supposes, that when the *thunder* is so high, its flame is dissipated before it arrive at the earth: and that the air being violently

driven along by the impetuous motion of the flame, and of consequence exceedingly condensed, becomes as it were a hard body, capable of producing terrible effects. Places struck with *thunder-bolts*, were held sacred among the ancients. Nigidius has a curious treatise on the *thunder-bolt*.—Marcellus Ficinus, and some others, maintain, that coral dissipates panic fears, and keeps off *thunder-bolts* and hail: Fortunat. Licetus has endeavoured to account for it physically. F. le Brun proves very easily, that those philosophers are mistaken.

On medals, the *thunder-bolt* is sometimes found to accompany the emperors heads; as that of Augustus. In which case, it is a mark of sovereignty, and of a power equal with the gods. Appian informs us, that the *thunder-bolt* was the principal divinity of Seleucia; adding, that it was adored, even in his time, with various hymns and ceremonies. See GOD.

**THUNDERING Legion**, *Legio Fulminans*, was a legion in the Roman army, consisting of Christian soldiers, who in the expedition of the emperor Marcus Aurelius against the Sarmatæ, Quadi, and Marcomanni, saved the whole army, then ready to perish of thirst, by procuring, with their prayers, a very plentiful shower thereon; and, at the same time, a furious hail, mixed with lightening and thunder-bolts, on the enemy. See LEGION.

This is the account commonly given by ecclesiastical historians: and the whole history is engraven in bas-reliefs, on the Antonine column. And hence arose the denomination *thunderers*: though some say, that the legion those Christians were of, was called the *thundering legion* before.

**THURSDAY**, the fifth day of the Christians week, but the sixth of that of the Jews. See DAY, and WEEK.

**Holy THURSDAY**, } See HOLY.

**Maunday THURSDAY**, } See MAUNDAY Thursday.

**THUS**. See the articles INCENSE, and FRANKINCENSE.

**THYMUS**, *θυμος*, in anatomy, a conglobate gland, situated in the upper part of the thorax, under the clavicular, where the cava and aorta divide into the subclavian branches. See GLAND.

The *thymus* is that part which in a breast of veal we call the *sweet-bread*.—This gland is big in infants, but as they grow in age, it becomes less; its arteries and veins are branches of the carotides and jugulars. It has nerves from the par vagum, and its lymphatic vessels discharge themselves into the ductus thoracicus.

The learned Dr. Tyson supposes the use of this gland to be for a diverticulum to the chyle in the thoracic duct of a foetus, whose stomach being always full of the liquor in which it swims, must keep the thoracic duct distended with chyle; because the blood which the foetus receives from the mother, fills the veins, and hinders the free entrance of the chyle into the subclavian veins. See FOETUS.

Mr. Cheselden observes, that where the *thymus* in men is very small, the thyroid glands increase proportionably; but in such brutes as have fallen under his observation, it is just the contrary: from which he is inclined to believe that they belong to the same lymphatics, and that either of them increasing as much as both ought to do, if both increased, answers the same end as if both did; and that the reason why the *thymus* increases rather than the thyroid glands in brutes, is, because the shape of their thorax affords convenient room for it to lodge in; and that in men, the reason why the thyroid glands increase so much, is, because there is no room in that part of the thorax where the *thymus* is seated, for a large gland to be lodged.

**THYMUS**, in medicine, is used for a kind of wart, growing on the natural parts, the fundament, and several other places of the body, with cloven asperities like those of the herb *thyme*, whence its name. See WART, and WEN.

The ordinary method of curing a *thymus*, is by ligature and desiccative lotions, or by caustics; and if large, by incision; taking care first to secure the greater vessels by tying them.

**THYROARYTÆNOIDEUS**, in anatomy, a pair of muscles, situate under the cartilago thyroides; from the fore and back part of which it arises with a very broad head, and terminates in the arytenoides, which it constricts, and shuts the larynx. See ARYTÆNOIDES.

**THYROIDEÆ Glandulæ**, **THYROID Glands**, are two glands of the larynx. See LARYNX.

There are four pretty large glands, which serve to moisten the larynx; two above, and two below.—The two latter are called *thyroideæ*; situate at the bottom of the larynx, aside of the annular cartilage, and of the first ring of the trachea; one on each side.

They are in form of little pears; their colour a little more reddish, their substance more solid, more viscous, and resembling more the flesh of the muscles, than the other glands.

They receive nerves from the recurrens, arteries from the carotides; veins which pass to the jugulars, and lymphatics, and discharge themselves into the thoracic duct.

Their use is to separate a viscid moisture, serving to line and lubricate the larynx, to facilitate the motion of its cartilages, to soften the acrimony of the saliva, and to sweeten the voice.

**THYROIDES**, \* *θυροειδης*, in anatomy, the first and largest of the five cartilages of the larynx; called also *scutiformis*. See SCUTIFORM, CARTILAGE, LARYNX, and HYOTHYROIDES.

\* The word is formed from the Greek, *θυρεος*, buckler, and *ειδος*, form.

In the middle is a prominence, called *pomum adami*. The *thyroides* is usually parted by a line running along its middle; whence some make two of it, though in reality it is very rare that it is found double.

It is near a square, and at each angle is a process: the two uppermost are the longest, and tie it by means of a nervous ligament to the os hyoides: the two lower, and shorter, connect it to the second cartilage, called *cricoides*.

**THYRSUS**, *θυρσος*, in antiquity, the scepter which the ancient poets put in the hand of Bacchus, and wherewith they furnish the Menades in their Bacchanalia. See BACCHANALIA, &c.

The *thyrsus* was originally a lance, or spear, wrapt up in vine leaves; wherewith Bacchus is said to have armed himself, and his soldiers in his Indian wars, to amuse and deceive the unpractised Indians, and make them suspect no hostilities.

Hence it was afterwards borne in the feasts and sacrifices of that god; and as the satyrs, who were Bacchus's soldiers, were supposed to have fought with it, it became a custom to represent them therewith. See SATYR, &c.

**TIARA**, \* *τιαρα*, an ornament or habit, wherewith the ancient Persians covered their head; and which the Armenians, and kings of Pontus still wear on medals; these last, because descended from the Persians.

\* Latin authors call it indifferently *tiara*, and *cidaris*.

Strabo says, the *tiara* was in form of a tower; and the scholiast on Aristophanes's comedy, *Αχαρνες*, act 1. scene 2. affirms, that it was adorned with peacock's feathers.—Some moderns, however, fancy the scholiast is here speaking of the casque which the ancient Persians wore in war; rather than the habit which they wore on the head in the city: but they do not seem to have considered the passage in the poet, to which the scholiast refers: the matter there spoken of, is peace, and ambassadors sent to treat of peace, with habits of pomp and ceremony, *Αχαιοι γαρ, &c.* These ambassadors, these peacocks, all these things of pomp and ostentation, displease me. By these peacocks, says the scholiast, he means the *tiara*, which among the Persians are ornaments of the head, wherein are peacock's feathers, &c.

St. Jerom on Dan. chap. iv. defines the *tiara* a kind of cap, *genus pileoli*, wore by the Persians and Chaldeans: and in another place, he adds, it is like Ulysses's cap.—The ancient scholiast on Juvenal, describes it as a priest's cap, which descending over the cheeks, was tied under the chin: which agrees very well with the form of that which we see Mithridates wear on medals.—Servius on Virgil, lib. 8. *Æneid*. calls the *tiara* a Phrygian cap; and Statius, *Thebaid*, lib. 8. gives it the kings of Parthia, who, doubtless, borrowed it from the Persians.—Justin attributes the long garment and *tiara* of the Persians, to Semiramis's disguise; whereby she passed for Ninus.

The kings of Persia alone had the right of wearing the *tiara* straight and erect: the priests, and great lords wore it depressed, or turned down on the fore-side. Xenophon in his *Cyropædia* says, that the *tiara* was sometimes encompassed with the diadem, at least in ceremonies; and had frequently the figure of a half moon embroidered on it: others are of opinion, that the diadem was in figure of a moon, and that it was hence the *tiara* was called *lunata*: lastly, others think that the *tiara* itself was sometimes in form of a half moon.—From what we have said, it appears, that there were different forms of *tiara's*; and, in effect, Paschalius, *de coronis*, distinguishes no less than five different kinds. See DIADEM.

**TIARA** is also the name of the pope's triple crown; anciently called *regnum*. See CROWN, POPE, &c.

The *tiara* and keys are the badges of the papal dignity; the *tiara* of his civil rank, and the keys of his jurisdiction: for as soon as the pope is dead, his arms are represented with the *tiara* alone, without the keys.

The ancient *tiara* was a round high cap. John XXIII. first encompassed it with a crown. Boniface VIII. added a second crown; and Benedict XII. a third.

**TIBIA**, in anatomy, the bony part of the leg, between the knee and the ankle. See FOOT.

The *tibia* consists of two bones, called *faciles*, the one on the inside the leg, called the *fibula*, or *little facil*. See FIBULA.—

The other on the outside, called by the common name *tibia*, or the *great facil*. See the following article.

**TIBIA** is, properly, the inner and bigger bone of the leg, called also *facile majus*.—See Tab. Anat. (Osteol.) fig. 3. n. 22, 22. & fig. 7. n. 26, 26. See also the article BONE.

The *tibia* is hard and firm, having a pretty large cavity in its middle, to contain the medulla. See MEDULLA.

It is almost triangular; its fore, and sharp edge being called the *shin*: in its upper extremity, it has two large sinusses, tipped with a soft and fine cartilage, from its figure, called *cartilago lunata*;

*lunata*; which runs in between the extremities of the two bones, and grows very thin at its edge; serving to facilitate a small side-motion in the knee, like that in the articulation of the lower jaw.

The sinus's receive the two protuberances of the femur, or thigh-bone; and the production which is between the sinus's of the *tibia*, is received into the sinus which divides these two protuberances of the femur. See FEMUR.

By bending the knee, we bring the leg, in walking, in a strait line forward; which we could not have done without this articulation; but like those who have the misfortune to have a wooden leg, we must have brought our foot about in a semi-circle, in going even upon a plain, but more evidently upon an ascent.

On the side of this upper end, the *tibia* has a small knob, which is received into a small sinus of the fibula; and on its fore-part, a little below the patella, it has another, into which the tendons of the extensors of the leg are inserted. See FIBULA. Its lower extremity, which is much smaller than its upper, has a remarkable process, which forms the inner ankle; and a pretty large sinus, divided in the middle by a small protuberance: the sinus receives the convex head of the astragalus, and the protuberance is received into the sinus, in the convex head of the same bone.—It has another shallow sinus in the side of its lower end, which receives the fibula.

Mr. Chefelden gives an instance of a boy of seven years of age, where both the epiphyses at the upper end of the *tibia*, were so far separated, that not more than half each *tibia* was joined to half the epiphysis; which made his legs wholly useless.—This had been occasioned by the nurse's holding him out to stool by the heels and back, when very young; which is among them (as he observes) too common a practice.

**TIBIÆ Biceps.** See the article BICEPS.

**TIBIALIS**, or **TIBIÆUS**, in anatomy, a name given to two muscles of the leg; distinguished by *anticus*, and *posticus*.

**TIBIALIS anticus** springs from the exterior process of the *tibia*, and becoming gradually broad and fleshy about the middle of the *tibia*, down the fore-part of which it runs, is contracted again into a slender, smooth tendon, which passes under the ligamentum annulare, and is partly inserted into the os cuneiforme majus, and partly into the bone of the metatarsus, that supports the great toe. Its office is to draw the foot up.—See *Tab. Anat. (Myol.) fig. 1. n. 62. fig. 2. n. 44.*

**TIBIALIS posticus** is derived from both bones of the *tibia*, and from the ligament that binds them together; and runs with a smooth, strong tendon through the sinus on the inner malleolus, under the annular ligament, to the inside of the os naviculare.—See *Tab. Anat. (Myol.) fig. 1. n. 69. fig. 2. n. 53. fig. 7. n. 43.*

Its office is to draw the foot inwards: from the use sailors make of it in sailing, it is also called the *nautilus*.

**TICHONIC System**, or *Hypothesis*. See TYCHONIC.

**TIDE**, \* the same with time, or season. See TIME, &c.

\* The word is originally Saxon, *tid*, which signifies the same.

**Shrove-TIDE**, } See the articles { SHROVE.

**Twelfth-TIDE**, } TWELFTH.

**Whitsun-TIDE**, } WHITSUN-TIDE.

**TIDES**, two periodical motions of the waters of the sea, called also the *flux* and *reflux*, or *ebb* and *flow*. See SEA, FLUX, OCEAN, &c.

When the motion of the water is against the wind, it is called a *windward tide*—when wind and tide go the same way, *lee-ward tide*—when it runs very strong, it is a *tide-gate*.

To *tide it over*, or *up* into any place, is to go in with the *tide*, either ebb or flood, as long as that lasts; then to stay at anchor all the time of contrary *tide*; and thus to set in again with the return of the next *tide*.

It is said to *flow tide and half tide* when the *tide* runs three hours in the offing longer than it does by the shore: but, by *longer*, they do not mean more hours; but, that if it be high water abhor at 12, it will not be *to* in the offing till three.—If it ebb and flow longer, they say it runs *half tide* and *half quarter*.

When the moon is in the first and third quarter, *i. e.* when she is new and full, the *tides* are high and swift, and called *spring tides*—when she is in the second and last quarter, the *tides* are lower and slower, and called *neap tides*. See SPRING, NEAP, &c. See also WINDWARD, &c.

**Phænomena of the TIDES.**—The sea is observed to flow, for certain hours, from south towards north; in which motion, or flux, which lasts about six hours, the sea gradually swells; so that entering the mouths of rivers, it drives back the river-waters towards their heads or springs. See RIVER, &c.

After a continual flux of six hours, the sea seems to rest for about a quarter of an hour; after which it begins to ebb or retire back again from north to south, for six hours more: in which time, the water sinking, the rivers resume their natural course. After a seeming pause of a quarter of an hour, the sea again begins to flow as before, and thus alternately.

Thus does the sea ebb twice a day, and flow as often; but not in the same hours thereof. The period of a flux and reflux is 12 hours 50 minutes; so that the *tides* return later and later each day, by 50 minutes, or  $\frac{1}{4}$  of an hour, 5 minutes.

Now, 12 hours 50 minutes is a lunar day; *i. e.* the moon passes the earth's meridian later and later each day by 50 minutes. So that the sea flows as often as the moon passes the meridian, both the arch above, and that below the horizon; and ebbs as often as she passes the horizon, both the eastern and western point thereof. See MOON.

This further agreement we observe between the moon and the sea; that the *tides*, though constant, are not equal: but are greatest, when the moon is in conjunction, or opposition to the sun, and least when in quadrature thereto.

Lastly, those *tides* are the greatest, which happen in the new and full moon, at the times of the equinoxes.

Add, that the same things are observed throughout most of the coasts of Europe; only that the *tides* are so much the less, and happen the later, as the coasts are the more northerly.

These phænomena of the *tides* are admirably accounted for, from the principle of gravitation. All we require to their solution is, that the earth and moon, and every particle thereof, mutually gravitate towards each other; the reasonableness of which assumption, see under the article GRAVITATION.

Indeed the sagacious Kepler, long ago, conjectured this to be the cause of the *tides*: “If, says he, the earth ceased to attract its waters towards itself, all the water of the ocean would rise and flow into the moon: the sphere of the moon's attraction extends to our earth, and draws up the water.” Thus thought Kepler, in his *Introd. ad Theor. Mart.*

This surmise, for it was then no more, is now abundantly verified, in the following theory, deduced by Dr. Halley, from the Newtonian principles.

**Theory of the TIDES.**—1°. As the surface of the earth and sea is naturally globular; if we suppose the moon A (*Tab. Geography, fig. 6.*) perpendicularly over some part of the surface of the sea, as E; it is evident the water E, which is now nearest the moon, will gravitate towards it more than any other part of the earth and sea in the hemisphere FEH.

The water in E therefore must, by this means, be raised towards the moon; *i. e.* it will be lighter than usual, and of consequence will swell in E.

For the same reason, the water in G being the most remote from the moon, will gravitate less towards the same, than any other part of the earth or sea in the hemisphere FGH.

The water here, therefore, must approach less towards the moon, than any other part of the globe; *i. e.* it must be raised the contrary way, as being lighter than usual, and will therefore swell in G.

By this means, the surface of the ocean must necessarily form itself into a spheroidal, or oval figure, whose longer diameter is EG; its shorter FH. And thus, the moon shifting her position in her diurnal motion round the earth, this oval of water must shift with her; by which means are effected those two floods and ebbs, observable every 25 hours.

2°. Since, in the conjunctions and oppositions of the sun and moon, the gravitation of the water to the sun conspires with its gravitation towards the moon; but in the quadratures, the water raised by the sun is depressed by the moon: hence it is that the *tides* are greatest in the syzygies, and least in the quadratures.

In effect, there are two *tides* every natural day, from the action of the sun, as there are in the lunar day from that of the moon; all governed by the same laws: only those caused by the sun are much less than those of the moon: because though the sun be ten thousand times bigger than both the earth and moon, yet he is at so immense a distance, that the earth's semi-diameter bears no proportion thereto.

Hence, the different *tides* depending on the particular actions of the sun and moon are not distinguished, but confounded. The lunar *tide* is somewhat changed by the action of the sun; and this change varies every day, by reason of the inequality between the natural and lunar day. See DAY.

3°. Since the greatest *tides* about the equinoxes (*viz.* those happening in the syzygies) arise from the sun and moon being in the equinoctial; and those about the solstices, from the sun and moon being in the tropics; for this reason, those greatest *tides* about the equinoxes are greater than those about the solstices; since the greater the circle is, wherein the waters move, the greater is their agitation. And if the moon stood still in the pole, the swelling would become immoveable about the pole, and the higher water be fixed therein.

4°. Since the *tides* are somewhat changed by the libration of the waters, which use to retain a motion impressed on them for some time; for this reason, the highest *tides* are not precisely in the very conjunction and opposition of the moon, but two or three *tides* afterwards.

5°. Since the sun is somewhat nearer the earth in winter than in summer; hence it is, that the greatest equinoctial *tides* are observed to be a little before the vernal equinox, and a little after the autumnal one.

6°. Since the greatest of the two *tides* happening in every diurnal revolution of the moon, is that wherein the moon is nearest the zenith, or nadir: for this reason, while the sun is in the northern signs, the greater of the two diurnal *tides* in our climates, is that arising from the moon above the horizon; when

When the sun is in the southern signs, the greatest is that arising from the moon below the horizon.

7°. Such would the *tides* regularly be, if the earth were covered with sea very deep; but by reason of the shoalness of some places, and the narrowness of the straits in others by which the *tides* are propagated, there arises a great diversity in the effect, not to be accounted for, without an exact knowledge of all the circumstances of the places; as the position of the land, and the breadth and depth of the channels, &c. For a very slow and imperceptible motion of the whole body of water, where it is (for example) two miles deep, will suffice to raise its surface 10 or 12 feet in a *tide's*-time; whereas if the same quantity of water were to be conveyed through a channel of 40 fathom deep, it would require a very great stream to effect it in so large inlets as are the channel of England and the German ocean; whence the *tide* is found to set strongest in those places where the sea grows narrowest, the same quantity of water being in that case to pass through a smaller passage.

This is most evident in the straits between Portland and C. de la Hogue in Normandy, where the *tide* runs like a sluice; and would be yet more between Dover and Calais, if the *tide* coming round the island did not check it.

And this force being once impressed upon the water, continues to carry it above the level of the ordinary height in the ocean, particularly where the water meets a direct obstacle, as it does in St. Maloes; and where it enters into a long channel, which running far into the land, grows very strait at its extremity, as it does at the Severn sea at Chepstow and Bristol.

This shoalness of the sea, and the intercurrent continents, are the reasons that in the open ocean high water is not at the time of the moon's appulse to the meridian, but always some hours after it, as it is observed upon all the western coast of Europe and Africa, from Ireland to the Cape of Good Hope; in all which a south-west moon makes high water, and the same is reported to hold in the west of America.

It would be endless to recount all the particular solutions, which are easy corollaries from this doctrine; as, why the lakes and seas, such as the Caspian sea, and the Mediterranean sea, the Black sea and Baltick, have no sensible *tides*: for lakes having no communication with the ocean, can neither increase nor diminish their water, whereby to rise and fall; and seas that communicate by such narrow inlets, and are of so immense an extent, cannot in a few hours time receive and empty water enough to raise or sink their surface any thing sensibly.

To demonstrate the excellency of this doctrine, the example of the *tides* in the port of Tunking in China, which are so extraordinary, and different from all others we have yet heard of, may suffice. In this port there is but one flood and ebb in 24 hours, and twice in each month, *viz.* when the moon is near the equinoctial, there is no *tide* at all, but the water is stagnant; but with the moon's declination there begins a *tide*, which is greatest when she is in the tropical signs; only with this difference, that when the moon is to the northward of the equinoctial, it flows when she is above the earth, and ebbs when she is under, so as to make high water at moon-setting, and low water at moon-rising: but, on the contrary, the moon being to the southward, makes high water at rising, and low water at setting, it ebbing all the time she is above the horizon.

The cause of this odd appearance is suggested by Sir Isaac Newton to arise from the concurrence of two *tides*, the one propagated in six hours out of the great South-Sea along the coast of China, the other out of the Indian sea from between the islands, in twelve hours, along the coast of Malacca and Cambaya. The one of these *tides* being produced in north latitude, is, as hath been said, greater, when the moon being to the north of the equator, is above the earth, and less when she is under the earth. The other of them, which is propagated from the Indian sea, being raised in south latitude, is greater when the moon declining to the south, is above the earth, and less when she is under the earth: so that of these *tides*, alternately greater and lesser, there come always successively two of the greater and two of the lesser together every day, and the high water falls always between the arrival of the two greater floods, and the low water between the times of the arrival of the two lesser floods: and the moon coming to the equinoctial, and the alternate floods becoming equal, the *tide* ceases, and the water stagnates; but when she has passed to the other side of the equator, those floods which in the former order were the least, now becoming the greatest, that which before was the time of the high water, now becomes the low water, and the converse: so that the whole appearance of these strange *tides* is, without any forcing, naturally deduced from these principles, and is a great argument for the certainty of the whole theory.

TIDE-WAITERS, or TIDE-MEN, certain officers belonging to the custom-house, appointed to watch or attend on ships coming from abroad, to see that nothing be landed till the customs be paid. See CUSTOM, &c.

They are thus called, because they go aboard the ships at their arrival in the mouth of the Thames, and come up with the tide.

TIERCE, or TEIRCE, a measure of liquid things, as wine, oil, &c. containing the third part of a pipe, or 42 gallons. See MEASURE, GALLON, &c.

TIERCE, in music. See the article THIRD.

TIERCE, in gaming, a sequence of three cards of the same colour. See SEQUENCE.

TIERCE, in fencing. See the article GUARD.

TIERCE Order. See the article THIRD Order.

TIERCE point. See the article THIRD point.

TIERCED, TIERCE', in heraldry, denotes the shield to be divided by any of the partition lines, party, coupy, tranchy or taily, into three equal parts, of different colours or metals. See QUARTERING.

If the chief and base be of the same colour when divided by a fesse, they blazon it by expressing the colour, and mentioning the fesse; otherwise, they say it is *tiercé in fess*, and mention each of the colours; or *tiercé in pale*, if so divided in pale.

TIERCELET. See the article TASSEL.

TIGE, in architecture, a French term for the shaft or fust of a column, comprehended between the astragal and the capital. See FUST, and COLUMN.

TIGHT. See the article TITE.

TILE. See the article TYLE.

TILLER, or TILLAR, in husbandry, a little young tree left to grow till it be felleable. See TIMBER.

TILLER of a ship, is a strong piece of wood fastened to the rudder; called also the helm.—See *Tab. Ship. fig. 2. n. 105.* See also the article RUDDER.

The name is chiefly given to that which serves for a helm in a boat, and which in a ship would be called the *helm*. See HELM.

TILLING, TILLAGE, in gardening and agriculture, a moving or stirring of the ground with the plough, or spade; which being performed on the surface, enters to a certain depth, and makes the lower and upper parts change place: by which means the goodness of the earth is kept from being spent in feeding ill plants. See PLOUGHING, &c.

The rule, as to gardening in general, is, that hot and dry earth should be *tilled* in summer, either a little before, or while it rains, or soon after; and that neither too often, nor too deep: in hot weather it is not to be performed, unless watered soon after; but for moist, cold and strong earth, it must never be *tilled* in time of rain, but rather in the greatest heats. As to arable lands, that which is clayey, stiff, cold, and moist, is generally thrice *tilled*; in spring, summer, and at seed-time for wheat; and four times for barley.

These repeated ploughings or fallowings are very advantageous to the soil, both as they destroy weeds, and as the ground is hereby laid in ridges, which prevents its being over-drenched in wet seasons, saves it much from blights and bleak weather, and makes the land lighter, and fitter for the seed to take root in, and to imbibe the nitrous dews and influences of the air, &c. See VEGETATION.

TILT. See JUST, TURNAMENT, CARROUSAL, QUADRIL, &c.

TILT-BOAT, a boat covered with a *tilt*, *i. e.* a cloth, or tarpawling, sustained by bails or hoops over the stern, for the sheltering of passengers.—Such is that which carries passengers between London and Gravesend. See BOAT.

TIMAR, a tract or portion of land which the Grand Signior grants to a person on condition of serving him in war, on horseback.

Some define the *timar* a portion of land assigned to a spahi, or other person fit to serve on horseback, to enjoy during life for his subsistence.

Meninski describes it as a stipend or revenue granted to old soldiers who have deserved well, in lands, and possessions of castles, towns, villages, fields, or in tithes, and other fruits and incomes; sometimes with the prefecture, jurisdiction, or signiory of the said places. See BENEFICE, &c.

The *timar* is a kind of fief granted for life. See FEE.—The whole Ottoman empire is divided into sangiackies, or banners, under which all such as hold *timars*, who are called *Timariots*, are bound to lift themselves when summoned upon any expedition. See TIMARIOT.

*Timars* may be resigned as benefices among us, only obtaining the consent of the beglerbey, or governor of the province.—Indeed, for *timars* of above 20000 aspers *per annum*, called *zaim*, the grand vizir alone grants dispensations.

TIMARIOTS, those who enjoy lands on the footing and tenure of *timars*. See TIMAR.

The *timariots* are obliged to serve in war personally, with as many men and horses for service as their *timar*, by the estimate made thereof, contains times 2500 aspers, or about 6 pounds sterling; and to maintain them constantly mounted and armed after their manner, to be ready to march at all hours when commanded, and that on pain of death; nothing, not even sickness itself, being allowed to excuse them.

Besides this service, they likewise pay an acknowledgment of one tenth of their revenue.—If they have any children of age to bear arms, and fit for the service after their decease, or in defect thereof, if they have any relations that have the least interest, the *timar* is used to be continued to them on the same conditions; otherwise it is transferred to others.

If the revenue thus held of the grand signior exceed 15000 aspers, or 36 pounds sterling, they who hold it are not called *timariots*, but *subassi*, or *zaims*, and have the administration of justice in the place, under the sangiac of the province.

The *timariots* have different appointments, from 4 or 5000 aspers, equal to about 12 pounds sterling, to 20000 aspers: but unless their *timar* exceed 8000 aspers, they are never obliged to march, except when the grand signior goes to the army in person, on which occasion none are exempted.

The origin of the *timariots* is referred to the first sultans, who being masters of the fiefs or lands of the empire, erected them into baronies or commanderies, to reward the services of their bravest soldiers; and especially to raise and keep on foot a number of troops without disbursing any money.

But it was Soliman II. that first established the order and discipline among these barons, or knights of the empire; and by his order it was that the number of horsemen each should maintain was regulated.

This body has always been not only exceedingly powerful, but great and illustrious throughout all the empire; but avarice, the ordinary fault of the orientals, has occasioned their declension of late years.

The viceroys and governors of provinces manage their matters so at court, that timars, even out of their jurisdiction, are given to their domestics, or to such as will give the most money for them.

There are two kinds of *timariots*, the one appointed by the Porte, the other by the viceroy of the country; but the revenues of both are less than those of the *zaims*, and their equipage and tents less in proportion. See *ZAİM*.

Those who have their patents from the court, have from 5 or 6000 aspers, to 19999 aspers *per annum*; if they have one asper more, they become *zaims*. Those who receive their patents from the viceroys, have from 3 to 6000 aspers *per annum*.

This cavalry is better disciplined than that properly called the *spahis*, though the *spahis* be the neatest, and briskest. These last only fight in platoons; whereas the *zaims* and *timariots* are divided into regiments, and commanded by colonels, under the direction of *bashaws*.—The *bashaw* of Aleppo, when in the army, is colonel general of this militia.

**TIMBER**, includes all kinds of felled and seasoned woods, used in the several parts of building; as carpentry, joinery, turnery, &c. See *WOOD*, and *BUILDING*.

The kinds of **TIMBER** are numerous: we shall only mention some of the most usual, from Evelyn's *Sylva*, &c.—as,

1°. *Oak*, the uses whereof need no enumerating: to endure all seasons and weathers, there is no wood like it; hence its use in pales, shingles, posts, rails, boards, &c. For water-works it is second to none; and where it lies exposed both to air and water, there is none equal to it.

2°. *Elm*: this felled between November and February, is all spine or heart, and no sap, and is of singular use in places where it is always wet, or dry; its toughness likewise makes it of use to wheel-wrights, mill-wrights, &c. nor must it be omitted, that its not being liable to break and fly in chips, makes it fit for dressers and planks to chop on.

3°. *Beech*: its chief use is in turnery, joinery, upholstery, and the like, as being of a clean, white, fine grain, not apt to bend, nor slit; yet is it sometimes, especially of late, used for building timber, and if it lie constantly wet, is judged to out-last oak.

4°. *Ash*: its use is almost universal; it is good for building, or other occasions where it may lie dry; it serves the carpenter, cooper, turner, plough-wright, wheel-wright, gardener; as also at sea for oars, hand-spikes, &c.

5°. *Fir*, commonly known by the name of *deal*, is of late much used in buildings, especially within doors, for stairs, floors, wainscot, and most works of ornament.

6°. *Walnut-tree* is of universal use, excepting for the out-sides of buildings; none better for the joiners use, it being of a more curious brown colour than beech, and less subject to worms.

7°. *Chesnut-tree*, next to oak, is the timber most sought for by joiners and carpenters: it is very lasting.

8°. *Service-tree*, used in joinery, as being of a delicate grain, and fit for curiosities: it also yields beams of considerable bigness for building.

9°. *Poplar*, *abel*, and *aspen*, differing very little from one another, are much used of late instead of fir: they look as well, and are tougher and harder.

10°. *Alder*, much used for sewers or pipes to convey water: when always wet, it grows hard like a stone, but where sometimes wet and sometimes dry, it rots presently.

**Felling of TIMBER**.—The season usually commences about the end of April, in regard the bark then generally rises the free-liest; so that where a quantity of timber is to be felled, the statute requires it to be done then, for the advantage of tanning. See *TANNING*.

However, the opinions and practices of authors are very different, as to the best season for felling timber: Vitruvius recommends an autumnal fall, others advise December and Ja-

VOL. II. N° CLIII.

nuary: Cato was of opinion, that trees should have borne their fruit before felled, at least their fruit should be first ripe; which falls in with the sentiments of Vitruvius.

In effect, though timber unbarked be most obnoxious to worms, yet we find the wild oak, and many other kinds, if felled too late, when the sap begins to be proud, to be very subject to worms; whereas about mid-winter, it neither casts, rifts, nor twines. It were happy, therefore, if a method of tanning without bark could be invented, that trees being felled more early, the timber might be the better seasoned.

The ancients had a great regard to the age of the moon in the felling their timber.—If their rules avail aught, they are these: fell timber in the wain, or four days after new moon; some say, let it be the last quarter. Pliny orders it to be in the very article of the change, which happening on the last day of the winter solstice, the timber, says he, will be immortal: Columella says from the 20th to the 28th day; Cato, four days after the full; Vegetius, from the 15th to the 25th for ship timber; but never in the increase, trees then abounding with moisture, the only source of putrefaction.

Some even have a regard to the temper and time of the day; the wind to be low, neither east nor west, neither in frosty, wet, nor dewy weather, and therefore never in the forenoon. Lastly, some regard is had to the species: fir is best felled when it begins to spring, both as it then quits its coat best, and as the wood, according to Theophrastus, is by that means rendered wonderfully durable in water. Elm, says Mr. Worlidge, is to be felled between November and January, in which case it will be all heart, at least the sap will be very inconsiderable: this, he adds, is the only season for felling ash.

Some authors add further, that in felling timber, care is to be taken, only to cut it into the pith, and so to let it stand till dry; by which means the moisture is evacuated in drops, which would otherwise occasion putrefaction.

**Seasoning of TIMBER**.—After felling and sawing it, some advise it to be laid up very dry in an airy place, yet out of the wind and sun, at least free from any extremities of either; and that it may not decay, but dry evenly, they order it to be daubed over with cows dung.

It is not to stand upright, but to lie all along, one piece over another, only kept apart by short blocks interposed, to prevent a certain mouldiness, which they are apt to contract in sweating on one another; from which frequently arises a kind of fungus, especially if there be any sappy parts remaining.

Others advise boards, planks, &c. to be laid in some pool, or running stream for a few days, to extract the sap from them, and afterwards to dry them in the sun or air. By this means, it is said, they will be prevented from either chapping, casting or cleaving; but against shrinking there is no remedy. Mr. Evelyn particularly recommends this method for fir.

Others again are for burying them in the earth, others in wheat, and others for scorching and seasoning them in fire, especially piles, posts, &c. that are to stand either in water or earth.

Sir Hugh Platt informs us, that the Venetians burn and scorch their timber in the flaming fire, continually turning it round with an engine, till it has got a hard, black, crusty coal upon it.

**Preserving of TIMBER**.—When boards, &c. are dried, seasoned, and fixed in their places, care is to be taken to defend and preserve them; to which the smearing them with linseed-oil, tar, or the like oleaginous matter, contributes much.

The Dutch preserve their gates, port-culices, draw-bridges, sluices, &c. by coating them over with a mixture of pitch and tar, whereon they strew small pieces of cockle and other shells, beaten almost to powder, and mixed with sea-sand, which incrusts and arms it wonderfully against all assaults of wind and weather.

Timber felled before the sap is perfectly at rest, is very subject to the worms; to prevent or cure which, Mr. Evelyn gives us the following secret, as most approved. Put common sulphur in a cucurbit, with as much aqua-fortis, as will cover it three fingers deep; distil it to a dryness, which is performed by two or three rectifications.

Lay the sulphur remaining at bottom on a marble, or in a glass, and with the oil it dissolves into, anoint the timber. This, he adds, not only infallibly prevents or cures the worminess, but preserves all kinds of woods, and even many other things, as ropes, nets, and masts, from putrefaction, either in air, water, snow, &c.

For such as would go a shorter way to work, two or three anointings with linseed oil may do very well. As to posts, &c. that are to stand in the ground, the burning the out-sides to a coal is a great preservative.

As to the chops or clefts green timber is liable to after working, a very great eye-sore in many fine buildings, they are closed by anointing, suppling, and soaking it with the fat of powdered beef broth, twice or thrice repeated.—Some carpenters use grease and saw-dust mingled for the same purpose.—But the former method is excellent, only it is not to be used while the timber is green.

**TIMBER-trees**, the wood of timber, before it be felled, particularly that of oak, &c.

For the raising, planting, transplanting, pruning, &c. of *timber-trees*, see NURSERY, PRUNING, TRANSPLANTING, &c.

**TIMBER-measure.**—*Timber* is usually measured and estimated by the load or ton, which is a solid measure containing 40 feet of round *timber*, or 50 of hewn *timber*. The denomination of *load*, &c. we suppose arises hence, that 40 or 50 solid feet of such *timber* weighs about a ton, *i. e.* 20 hundred weight, which is usually accounted a cart-load.

1°. For the measuring of round *timber*: the practice is, to gird the tree about, in the middle of the length; and folding the line twice, to take one length or quarter of the whole, and account that for the true side of the square: then for the length, it is counted from the but-end of the tree, so far up as the tree will hold *half a foot girt*, as they call it, *i. e.* so long as the line, twice folded, is half a foot.

The dimensions thus taken, the quantity of *timber* is had, either by multiplying the side of the square into itself, and that product by the length, by the method of cross-multiplication. See CROSS MULTIPLICATION.

Or, more easily and speedily on Gunter's line, by extending the compasses from 12 to the side of the square in inches; for that extent turned twice (the same way) from the length in feet, will reach to the content in feet. See GUNTER'S Scale.

Or, better still, on Coggeshal's sliding-rule, by setting 12 on the girt line D, to the length in feet on the line C. Then against the side of the square, on the girt line D, taken in inches, you have on the line C the content of the *timber* in feet. See Coggeshal's SLIDING-Rule.

Note, 1°. this method of measuring round *timber*, though common, is yet erroneous, and the content found hereby, it is demonstrated, is less than the true content or measure in the ratio of 11 to 14. How to avoid this error, and measure it justly, we have shewn under the use of Coggeshal's sliding-rule.

2°. If the tree have any great boughs that are *timber*, as the phrase is, *i. e.* which will hold foot girt, they are commonly measured, and added to the rest: the solidity of the whole being thus found, they divide it by 40, which brings it into loads.

3°. In measuring round *timber* for sale, they usually cast away an inch out of the square for the bark, if oak; so that a tree 10 inches square, they only account as if 9; but for ash, elm, beech, &c. an inch is too much.

4°. For the measuring hewn or squared *timber*; the practice is, to find the middle of the length of the tree, and there to measure its breadth, by clapping two rules, or other straight things to the sides of the tree, and measuring the distance between them: in the like manner they measure the breadth the other way. If the two be found unequal, they add them together, and take half the sum for the true side of the square.

The dimensions thus taken, the content is found either by cross-multiplication, Gunter's scale, or the sliding-rule, after the manner already directed.

The content divided by 50, gives the number of loads.

Note, if the *timber* be unequally sided, this method of measuring it is erroneous, always giving the content more than the truth; and the more so, as the difference of the sides is greater; yet custom has authorized it.

To measure such *timber* justly, a mean proportional should be found between the unequal sides, and this mean be accounted the side of the square.

For the measuring of taper *timber*, and *timber* of other forms, as cubes, prisms, pyramids, &c. See the article SLIDING-Rule.

Bearing of TIMBER, } See BEARING.

Casing of TIMBER Work, } See CASING.

TIMBER, or TIMMER of furs, \* as ermines, martens, fables, and the like, denotes 40 skins.—Of other skins, six score. *Russ.*

\* *Hæc civitas (sc. Gestræ) nunc reddebat de firma 45 libras & tres timbrias pellium Martenarum* L. L. Edw. Conf.

TIMBERS of ermine, in heraldry, denote the ranks or rows of ermine in noblemen's coats. See ERMINE.

TIMBER, in falconry. To *timber*, is to nestle, or make a nest, as birds of prey do.

TIMBRE, or TIMMER, in heraldry, denotes the crest of an armoury, or whatever is placed a-top of the escutcheon, to distinguish the degree of nobility, either ecclesiastical or secular. See CREST.

Such is the papal tiara, cardinal's hat, the cross, mitre, coronet, mortier, and particularly the casks or helmets, which the ancients called more especially *timbres*, from their resembling a kind of bell without a clapper, which the French call *timbre*, or because they resounded like those *timbres* when struck. This is the opinion of Loiseau, who derives the word from the Latin, *tintinnabulum*. See CASK, and HELMET.

TIME, a succession of phenomena in the universe; or a mode of duration, marked by certain periods and measures; chiefly by the motion and revolution of the sun. See MODE, and DURATION.

The idea of time in the general, Mr. Locke observes, we acquire by considering any part of infinite duration, as set out

by periodical measures: the idea of any particular *time*, or length of duration, as a day, an hour, &c. we acquire first by observing certain appearances at regular, and, seemingly, equi-distant periods.

Now, by being able to repeat those lengths or measures of *time* as often as we will, we can imagine duration, where nothing really endures or exists; and thus we imagine *to-morrow*, *next year*, &c.

Some of the latter school-philosophers define *time* to be the duration of a thing whose existence is neither without beginning nor end: by which *time* is distinguished from eternity. See ETERNITY.

Aristotle and the peripatetics define it *numerus motus secundum prius & posterius*, or a multitude of transient parts of motion, succeeding each other, in a continual flux, in the relation of priority and posterity.

Hence it should follow, that *time* is motion itself, or at least the duration of motion, considered as having several parts, some whereof are continually succeeding to others: but on this principle, *time* or temporal duration would not agree to bodies at rest, which yet no body will deny to exist in *time*, or to endure for a *time*.

To evade this inconvenience, the Epicureans and Corpuscularians made *time* to be a sort of flux, different from motion, consisting of infinite parts, continually and immediately succeeding each other, and this from eternity to eternity; but others directly explode this notion, as establishing an eternal being, independent of God. For how should there be a flux before any thing existed to flow? and what should that flux be, a substance or an accident?

*Time* may be distinguished like place, into *absolute*, and *relative*. See PLACE.

**Absolute TIME**, is *time* considered in itself, and without any relation to bodies, or their motions.—This flows equally, *i. e.* never proceeds either faster or slower, but glides on in a constant, equable tenor.

**Relative or apparent TIME**, is the sensible measure of any duration by means of motion.—For since that equable flux of *time* does not affect our senses, nor is any way immediately cognizable thereby, there is a necessity for calling in the help of some nearly equable motion to a sensible measure, whereby we may determine its quantity, by the correspondency of the parts of this with those of that.

Hence, as we judge those *times* to be equal which pass while a moving body, proceeding with an equable velocity, passes over equal spaces; so we judge those *times* to be equal which flow while the sun, moon, and other luminaries perform their revolutions, which, to our senses, are equal.

But since the flux of *time* cannot be accelerated, nor retarded, whereas all bodies move sometimes faster and sometimes slower, and there is, perhaps, no perfectly equable motion in all nature; it appears hence to follow, that absolute *time* should be something truly and really distinct from motion. For let us suppose the heavens and stars to have remained without motion from the very creation: does it hence follow, that the course of *time* would have been at a stand? or rather, would not the duration of that quiescent state have been equal to the very *time* now elapsed?

Since absolute *time* is a quantity uniformly extended, and in its own nature most simple, it hence comes to be represented by mathematicians, to the imagination, under the most simple, sensible magnitudes, and particularly right lines and circles, with which it bears a near analogy, in respect of genesis, similarity, &c.

It is not, indeed, necessary that *time* should be measured by motion; any constant periodical appearance in seemingly equi-distant spaces, as the freezing of water, the blowing of a plant, &c. returning at set periods, might do as well. In effect, Mr. Locke mentions an American people, who count their years by the coming and going away of birds. See PERIOD.

Some authors distinguish *time* into *astronomical* and *civil*.

**Astronomical TIME**, is that taken purely from the motion of the heavenly bodies, without any other regard.

**Civil TIME**, is the former *time* accommodated to civil uses, and formed and distinguished into *years*, *months*, *days*, &c. See DAY, MONTH, WEEK, YEAR, &c.

*Time* makes the subject of chronology. See CHRONOLOGY.

**TIME**, in music, is an affection of sound, whereby we denominate it *long*, or *short*, with regard to its continuance in the same degree of tune. See SOUND.

*Time* and tune are the great properties of sound, on whose difference or proportions music depends: each has its several charms; where the *time* or duration of the notes is equal, the differences of tune alone are capable to entertain us with endless pleasure. See TUNE.

And of the power of *time* alone, *i. e.* of the pleasures arising from the various measures of long and short, swift and slow, we have an instance in the drum, which has no difference of notes, as to tune. See DRUM, ACCENT, &c.

*Time*, in music, is considered either with respect to the absolute duration of the notes, *i. e.* the duration considered in every

every note by itself, and measured by some external motion foreign to the music; in respect to which the composition is said to be *quick*, or *slow*: or it is considered with respect to the relative quantity or proportion of the notes compared with one another. See **NOTE**.

The signs or characters by which the *time* of notes is represented, are shewn under the article **CHARACTERS in music**, where the names, proportions, &c. are also expressed.

A semi-breve, for instance, is marked to be equal to two minims, a minim to two crotchets, a crotchet to two quavers, and so on, still in a duplicate ratio, *i. e.* in the ratio of 2 : 1. Now, where the notes respect each other thus, *i. e.* where they are in this ratio, the music is said to be in *duple*, *i. e.* *double*, or *common time*.

When the several notes are triple of each other, or in the ratio 3 : 1, that is, when the semi-breve is equal to three minims, the minim to three crotchets, &c. the music is said to be in *triple time*. See **TRIPLE**.

To render this part as simple as possible, the proportions already stated among the notes are fixed and invariable, and to express the proportion of 3 : 1, a point (.) is added on the right side any note, which is deemed equivalent to half of it; and by this means a pointed semi-breve, O. becomes equal to three minims, and so of the rest.

From hence arise several other ratios constituting new kinds of triple time; as 2 : 3 and 3 : 4, &c. but these Mr. Malcolm observes are of no real service, and are not perceived without a painful attention. For the proportions of the *times* of notes, to afford us pleasure, must be such as are not difficultly perceived; on which account the only ratios fit for music, besides that of equality, are the *double* and *triple*.

**Common or duple TIME**, is of two species.—The first, when every bar or measure is equal to a semi-breve, or its value in any combination of notes of a lesser quantity.

The second, where every bar is equal to a minim, or its value in lesser notes. The movements of this kind of measure are various, but there are three common distinctions; the first *slow*, signified at the beginning by the mark C; the second *brisk*, signified by C; the third *very quick*, signified by P.

But what that *slow*, *brisk* and *quick* is, is very uncertain, and only to be learned by practice. The nearest measure we know of, is to make a quaver the length of the pulse of a good watch, then a crotchet will be equal to two pulses, a minim to four, and the whole measure or semi-breve to eight. This may be reputed the measure of *brisk time*; for the *slow*, it is as long again, and the *quick* only half as long.

The whole measure then of common *time* is equal to a semi-breve or a minim; but these are variously sub-divided into notes of less quantities. See **MEASURE**.

Now to keep the *time* equal, we make use of a motion of the hand or foot, thus: knowing the true *time* of a crotchet, we shall suppose the measure or bar actually sub-divided into four crotchets for the first species of common *time*; then the half measure will be two crotchets; therefore, the hand or foot being up, if we put it down with the very beginning of the first note or crotchet, and then raise it with the third, and then down to begin the next measure; this is called *beating of time*.

By practice they get a habit of making this motion very equal, and consequently of dividing the measure or bar into equal parts, up and down; as also of taking all the notes in the just proportion, so as to begin and end them precisely with the beating. In the measure of two crotchets, they beat down the first, and the second up.—Some call each half of the measure in common *time*, a *time*; and so they call this the mode or measure of *two times*, or the *duple* measure.

Again, some mark the measure of two crotchets with a 2 or 4, signifying it to be equal to two notes, whereof four make a semi-breve; and some mark it 8 for quavers.

For *triple TIME*, see the article **TRIPLE-TIME**.

**TIME in Fencing**.—There are three kinds of *time*; that of the sword, that of the foot, and that of the whole body. All the *times* that are perceived out of their measure, are only to be considered as appeals, or feints, to deceive and amuse the enemy. See **FENCING**, **GUARD**, **FEINT**, &c.

**TIMMER**. See the articles **TIMBER**, and **TIMBRE**.

**TIN**, *Stannum*, a whitish metal, softer than silver, yet much harder than lead. See **METAL**.

The chymists, &c. hold *tin* a species of imperfect metal, generated of two different seeds, *viz.* that of silver, and that of lead; which renders it a kind of compound of both; and accordingly it is frequently found both in lead and silver mines. *Tin*, however, has also its proper mines, of which our counties of Cornwall and Devonshire are an abundant evidence:

the greatest part of the *tin* consumed in Europe is procured from thence; and Camden even supposes this abundance of *tin*, in those two provinces, to have given the original denomination *Britain* to the whole country.—In the Syriac language *varatanac* signifies *land of tin*; from which Bochart derives the name *Britain*.

The principal characters or properties of *tin*, enumerated by Boerhaave, are, that it is the lightest of all metals; very little ductile or elastic; the most fusible and volatile of all metals; scarce dissoluble by acids, unless the weaker sorts; and easily and intimately miscible with other metals, the ductility whereof becomes diminished by such mixture.

The same author concludes, that sulphur is a prevailing ingredient in *tin*, and deduces several of its particular properties therefrom. He adds, that could the metal be perfectly purged of this heterogeneous sulphur, it is probable it would be found no other than silver.

Several authors had before noted a great conformity, in divers particulars, between the two metals; as, that both grow bitter when dissolved by acids; that when fused together, there is scarce any separating them again, not even by lead. Add, that Mr. Boyle, and others, give us several instances of silver being actually produced in considerable quantity from *tin* ore. See **SILVER**.

Yet some naturalists judge the analogy greater between *tin* and lead, and contend that *tin* is only lead, under a less degree of cohesion; but if there be some marks of agreement between them, there are as many of disagreement. The calx of lead, for instance, easily fuses and vitrifies, but that of *tin* not without the utmost difficulty: if *tin* and lead be mixed by a vehement fire, a vehement collocation ensues, and they both run into a calx: add, that *tin* is easily revived; but lead with great labour. See **LEAD**.

The method of getting, preparing, &c. the *tin* in the Cornish mines, much the best and most considerable in the world, is given us in the *Philosophical Transactions*.—The working of the *tin* mines is very hard and difficult, not only by reason of the great depth which the veins descend to, even as low as 60 fathom; but also because the rocks, through which passages are frequently to be cut, are often so hard, that the workman cannot dig a foot in a week. Nor is the soft, shaking earth found in the *tin* mines much less inconvenient to the workmen, both by reason of fetid, malignant vapours it exhales, and of the currents of water often met withal therein: all these disadvantages render it impracticable for the workmen to hold it above four hours together.

The mineral stone or ore being dug and drawn out of the mine, is there broke into pieces with large iron mallets; then brought to a stamping-mill, where it is still pounded smaller with stampers, much like those of paper-mills; and the water passing through it washes away the earthy parts, leaving the metallic ones behind: the lotion is repeated twice, to make the better separation. See **TRAMBLING**.

This done, they dry it in a furnace on iron-plates, and grind it very fine in a crasing-mill; then wash it again, and dry it: in this state, the metallic matter is called *black tin*.

To convert it into *tin*, *i. e.* into *white tin*, they carry it to a furnace, or blowing-house; where, by means of a charcoal fire, kept up by huge bellows worked with water, it is smelted; after it has passed all these preparations, and is become cold, they forge it, which is the last thing done to it in the works.

The dross or scoria scummed off the *tin* in fusion, being melted down with fresh ore, runs into metal; and even the *causalty*, *i. e.* the matter washed and separated from the metal in the mill, being thrown up in heaps, after resting six or seven years, they fetch it over again, and it yields as good *tin* as any of that of Germany.

The workmen distinguish several kinds of *tin*; as *moor-tin*, which is the best sort, a fool whereof weighs 80 pounds; and *mine-tin*, which is the next, a fool thereof weighing about 52 or 50 pounds. The *tin* got from the soft, gravelly earth, they call *pryan-tin*, to distinguish it from that got from the stones, which is better by almost half.—Two pounds of black *tin*, when melted, yield about one of white.

There is a curiosity in these Cornish mines, which the lover of natural history will be pleased to hear; and it is this: that in digging, at the depth of 40 or 50 fathoms, they frequently meet with large trees, still entire. See **SUBTERRANEAN**. Childrey, in his *Natural History*, goes back as far as the deluge to place them there; but without having recourse to so great antiquity, they who believe that the mines, when exhausted of their ore or mineral matter, renew and fill again in course of time, will soon solve the difficulty, by supposing, that in the first working of these mines, these trees had been let down to serve as props and pillars. See **DELUGE**.

But there are other people will think this renewal of the mines itself a difficulty as great as the former. However, what the former author adds, *viz.* that in some places in the mines they likewise find pick-axes, &c. with wooden shafts, as also brass nails, and even a medal of Domitian, seems to countenance the opinion. See **MINE**.

**Method of assaying TIN.**—To find whether *tin* be soft and ductile, or harsh and brittle, there are two kinds of assays; the first, is by putting the *tin* in a mould of cast-brass, and there melting it. If the metal be harsh, it will be taken out heavier than before; otherwise it will be lighter. The second, is by casting the melted *tin* into a little mould, made of the thunder-stone. This mould has a little canal of moderate length, which conducts the matter into a cavity, capable of containing half a billiard ball: if the *tin* be harsh, it appears whitish towards the entry of the mould, otherwise it is tinged superficially with a very faint, bluish brown.

For the use of *tin* in the composition of pewter, see PEWTER. The chymists call *tin* by the name *Jupiter*: but from what analogy between the metal and the planet, we leave them to explain. See JUPITER.

By the analyses made of *tin*, they hold it compounded of earth, sulphur, a metallic salt, and mercury.—The chief chymical preparations from it are, *salt of tin*, *flower of tin*, and *diaphoretic of tin*.

**Salt of TIN**, or of *Jupiter*, is *tin* calcined, and distilled vinegar poured thereon; from which, by means of fire, and then of a cool place wherein it is put, a very white salt is drawn. See SALT.

**Flower of TIN**, is a kind of white cosmetic, or paint for the complexion; drawn with sal ammoniac, by means of sublimation. See FLOWER.

**Diaphoretic of TIN**, is fine *tin* and regulus of antimony melted, first together, and then both with salt-petre. Whence, after various lotions, is drawn a powder, held to be sovereign against divers diseases.

**Cerufs of TIN**, is a white powder, procured from *tin*, whereof a *fucus* is made, called *Spanish white*.—This cerufs is not made with vinegar, as that of lead is; but with the urine of a young person: the powder is also used to colour Delft ware.

**Calx of TIN**, is the metal reduced into powder, either by means of fire, or by being dissolved in an acid menstruum, and precipitated with an alkali.

**TIN-Glass**, or **TIN of Glass**, is what we properly call *bismuth*. See BISMUTH.

**TINCTORUM Rubia**. See the article RUBIA.

**TINCTURE**, **TINCTURA**, in pharmacy and chymistry, a separation of the finer and more volatile parts of a mixed body, made by means of a proper menstruum dissolving the same. See MENSTRUUM, and DISSOLUTION.

**TINCTURE** is more particularly used for an extract of part of the substance of a body, especially its virtue and colour, which are hereby communicated to the menstruum. See EXTRACT, and ESSENCE.

We have cephalic *tinctures*, antiscorbutic *tinctures*, stomachic *tinctures*, anticolic *tinctures*, invigorating *tinctures*, &c. *tinctures* drawn from roses, from corals, &c. See EXTRACTION.

To make a *tincture*, the matter is usually bruised, put in a matras, and the menstruum, which commonly is spirit of wine, poured on it, to the height of two or three fingers above it. Then the glass is closed, and set for digestion, in a sand-heat, during five or six days, till the spirit is well impregnated, and has received a high colour. See DIGESTION.

Thus are *tinctures* of odoriferous vegetables, as cinnamon, &c. drawn; and the same menstruum serves for those of metals, and minerals.

The *tinctures* of metals, so much talked of by the chymists and alchymists, are not proper *tinctures*; they are only dissolutions, wherein the metal is divided and attenuated to a greater degree than it is in its natural and ordinary dissolvent.

If the *tincture* were irreducible; that is, if the metal were dissolved to such a degree, as that it could not be brought back again into metal; or, which comes to the same, if the principles which compose it were disunited, it would be what the chymists have so long and so earnestly wished for, and sought with such infinite pains, especially with regard to gold; the irreducible *tincture* whereof is what should be called *aurum potable*. See GOLD.

But no such *tincture* has ever yet been discovered: the potable gold in use among us, being only gold extremely divided; and the case is the same with the *tinctures* of other metals. See METAL, and MINERAL.

The intention of metalline *tinctures* is to rarefy and extend the sulphur of the metal as much as possible, and so render the fixed and earthy parts as subtle and volatile as may be: if they are designed to be of use in medicine, some harmless and agreeable medium is to be used. See STEEL.

The alchymists give the name *grand mineral tincture* to the philosophers stone; from an opinion, that all required to that operation, is to give the colour or *tincture* of gold to fixed mercury. See PHILOSOPHERS Stone.

Marble, alabaster, and bones, receive *tinctures* from lixiviums, and sharp juices; and Mr. Boyle thinks there is reason to hope the same may be done of precious stones: rock crystal, it is certain, is tinged by subterraneous juices; so is sapphire itself. See GEM, &c.

In the memoirs of the French academy, mention is made of certain liquors, *e. gr.* salts drawn from wheat, which will ex-

tract *tinctures* even out of some precious stones. It is added, they are the more capable of producing this effect, as they give a greater degree of redness to the solution of vitriol.

**TINCTURE of Amber**, } See the articles } AMBER.  
**TINCTURE of Cassia**, } CASSIA.

**TINCTURE** is also applied by the heralds to the colours used in escutcheons, or coats of arms; under which may be likewise reduced the two metals, *or* and *argent*, because often represented by yellow and white. See COLOUR, and METAL.

**TINEA**, in medicine, a disease called by the Arab writers *sabafati*, and in English usually a *scald-head*; nearly a-kind to achores. See ACHOR.

The *tinea* is a disease of the leprous kind: authors usually reckon three species of it, *viz.* a *dry*, *moist*, and *lupinous*; which, in reality, are only so many degrees of the same disease. See LEPROSY.

Turner defines the *tinea* an ulcer arising in the heads of children, from a vicious, corrosive, or saline humour, which preying on the cutaneous glands, in time destroys their texture.

It has its name *tinea*, *q. d. moth*, from the similitude it bears to the holes eat by that insect in paper, &c.—In the first stage it is covered with a white, dry, scurfy, or squamous matter: in the second, the subjacent flesh appears granulated: and in the third it is ulcerous.

The internal remedies proper for the *tinea* are, mercurials, proper cathartics, and dietetics, or edulcorants; and sometimes a salivation, especially by unction, has been efficacious, after all other methods have proved vain. The externals are fomentations made of roots of oxylapathum, birth-wort, horse-radish, wormwood, &c. boiled in water, and strained; to which are added, spirits of wine camphorated, &c. liniments of hogs lard, white precipitate mercurial ointments, with powdered brimstone; and sometimes powder of Roman and white vitriol, red precipitate, &c.

**TIN-GLASS**, *Bismuth*, a mineral matter, white, smooth, and as to appearance, resembling *tin*; but hard, brittle, and disposed in shining scales, as if it were pieces of glass, whence its name. See BISMUTH.

**TINGLING of the Ear**. See the article TINNITUS.

**TINNING**, the covering or lining any thing with melted *tin*, or with *tin* reduced to a very thin leaf. See TIN.

Looking-glasses are foliated or *tinned* with thin tables of beaten *tin*, the whole bigness of the glass, applied and fastened thereto by means of quicksilver. See FOLIATING, and LOOKING-GLASS.

Kettles, saucepans, and other kitchen utensils, are *tinned* with melted *tin*; and locks, bits, spurs, &c. with leaf-*tin*, by help of fire.

The plumbers use to *tin* or whiten their sheets of lead; in order to which they have a *tinning* surface, filled with live coal, at the two sides whereof two men are placed, who hold up the sheets over the fire to heat; and the *tin* leaves being laid over them, as fast as the sheets grow hot, and the *tin* melts, they spread it, and make it take by rubbing it with tow and rosin. See PLOMBERY.

**TINNITUS Auris**, **TINGLING or buzzing of the Ear**, a disease pretty frequent in the ear, consisting in the perception of a sound which is not, or, at least, is not external.

This perception is occasioned by the beating of an artery in the ear, by an inflammation, or abscess of the tympanum or the labyrinth, by the admission of foreign bodies, by commotions of the cranium, blows on the ears, &c.—Extraordinary and irregular motions of the animal spirits are also found to occasion the *tinnitus*, as we find in deliriums, phrensies, vertiges, &c.—The *tingling* of the ear is one of the diagnostic signs of the plague.

**TIPSTAVES**, officers appointed by the marshal of the King's-bench, to attend the judges with a rod or staff tipped with silver, and take charge of such prisoners, as are either committed, or turned over at the judge's chambers.

The denomination is also sometimes given to those more frequently called *bastons*; who are the warden of the Fleet's officers, attending the king's courts with a painted staff, for the taking into custody such persons as are committed by the court; and to attend such prisoners as go at large by licence. See BASTON.

**TIRE**, or, as the seamen pronounce it, **TEER**, of *Guns*, is a row of guns placed along a ship's side, either above, upon deck, or below: the former of which are called the *upper tire*, the latter the *lower tire*. See SHIP.

**TITANS**, **TITANES**, **TITANEE**, in the ancient mythology, the sons of Uranus or Cœlus, and Vesta, *i. e.* of heaven and earth, according to Hesiod and Apollodorus; or which comes to the same thing, of Æther and Tellus, according to Hyginus. Apollodorus reckons five *Titans*: Oceanus, Cœus, Hyperion, Crius, and Japetus; all elder brothers of Saturn: Hyginus reckons six, all, except Hyperion, different from the former; their names, Briareus, Gyges, Sterope, Atlas, Hyperion, and Cottus; but he seems to include the hundred-handed giants in the number, which Apollodorus, and the generality of mythologists, distinguish from the *Titans*.

The tradition is, that Cœlus, by the same wife, Vesta, had Briareus, Gyges, and Cottus, the hundred-handed giants, and had chained them up in Tartarus: Vesta, the earth, their mother, resenting this treatment, raised the *Titans* against their father, her husband: all, excepting Oceanus, made war upon him, and dethroned him, setting up Saturn in his place. Saturn, it seems, proved no more favourable to them than his father; but continued the giants in their prison. — Upon this, Jupiter revolted against Saturn; serving him as he had done Cœlus; and rescued the three giants: who afterwards proved of great service to him in the war which the *Titans* waged against him.

This war lasted ten years: but at length the *Titans* were vanquished; Jupiter remained in peaceable possession of heaven, and the *Titans* were buried under huge mountains thrown on their heads.

Hyginus gives another origin of the *Titans*: he derives them from *Titan*, Saturn's eldest brother, by Cœlus and Vesta; who, though presumptive heir of heaven, yet finding his father and mother more inclined for Saturn than for him, surrendered to him his right of succession, on condition he should not bring up any male child, that the empire of heaven might revert to his own issue the *Titans*.

But Jupiter, Neptune, and Pluto having been afterwards saved by the artifice of Ops; *Titan*, and his sons the *Titans*, made war on Saturn, vanquished, and imprisoned him; thus he continued in the power of his enemies, till Jupiter being grown up, made war on the *Titans*, and delivered his father.

F. Pezron, in his antiquity of the Celtæ, makes that people to be the same with the *Titans*; and their princes the same with the giants in scripture. — He adds, that the word *Titan* is perfect Celtic, and derives it from *tit*, earth, and *den* or *ten*, man: and hence it was the Greeks also called them very properly *γαιγενεις*, q. d. *terrigena*, earth-born.

The word *TITAN* is also used by the poets for the sun—in which case it is likewise Celtic, though from another root, being formed from *ti*, house or habitation, and *tan*, fire.

Hesychius observes, that *Titan* is likewise used for sodomite. — He adds, that it is one of the names of antichrist; in which sense it must be wrote *Teitan*, in Greek, to contain the numeral letters of 666; which in the apocalypse xiii. 18. is the number of the beast.

**TITE**, or **TIGHT**—The seamen say a ship is *tite*, when she is so staunch as to let in but very little water.

This is known by the smell of the water pumped out; for if she let in but little, it will always stink; otherwise not.

**TITHES**, **TYTHS**, **TENTHS**, *Decimæ*, or *Dixmes*, the tenth part of all profits or fruits, both predial, personal, and mixt; allotted to the clergy for their maintenance. See **FRUIT**, **CLERGY**, &c.

Of *tithes* there are three kinds, viz. *personal*, *predial*, and *mixt*.

**Personal TITHES**, are those due or accruing from the profits of labour, art, trade, navigation, and industry of man. See **PERSONAL**.

**Predial TITHES**, those which arise either from the fruits of the ground; as corn, hay, underwood, flax, hemp, &c. or from the fruits of trees; as apples, pears, plumbs, cherries; or from the produce of the garden. See **PREDIAL**.

**Mixt TITHES**, are such as arise from beasts, and other animals fed with the fruits of the earth: as cheese, milk, wool, lambs, calves, fowls, &c. See **MIXT**.

*Predial tithes*, again, are either *great* or *small*.

**Great TITHES**, are those of corn, hay, and wood.

**Small TITHES**, are those of flax, &c. which are *predial*; and those of wool, milk, cheese, lambs, ferrets, &c. which are *mixt*. See **PARSON**, **RECTOR**, &c.

The *tithes* of grounds newly broke up and cultivated, are called *decimæ novales*, and always belong to the vicar, as well as the small *tithes*. — The novelty is confined to forty years before the demand. See **VICAR**.

The custom of giving or paying *tithe* is very ancient: in Gen. xiv. 20. Abraham gives Abimelech the tenth of all the spoils he had taken from the four kings he had defeated: in Gen. xxviii. 22. Jacob makes a vow at Bethel, to give the tenth of all the riches he shall gather in that sojourn, to God.

But these *tithes* were free and voluntary; and, beside, differed in divers other respects from what was afterwards called *tithe*: what Melchisedec received, was only the tenth of the spoils, not of Abraham's possessions; and this once, not annually; and beside, not as maintenance, which Melchisedec wanted not, but as homage: add, that this was only from one priest to another; for Abraham had not only a priest in his loins, but was a priest himself. — And as to Jacob, who was also a priest, what he did was the effect of a vow, voluntarily taken, to offer the tenth of all he should possess; not to any other priest, but to God himself upon an altar.

*Tithe* was first legally enjoined by Moses, Lev. xxvii. 30. Num. xviii. 21. Deut. xiv. 21. — That legislator obliged the Israelites to several kinds of *tithes*; as, 1°. The first *tithe*, מעשר הראשון, which was a *tithe* of all the fruits, given to the Levites: this was not taken till after the oblation called תרומה had been made. See **LEVITE**.

2°. The second *tithe* was a tenth part of the nine remaining after payment of the first *tithe*. This *tithe* was set apart in each family; and the master of the family was obliged to carry it to Jerusalem, and to spend it there; or, in case he could not, he was to redeem it, or convert it into money: in which case he was to add a fifth to it, and carry the money to Jerusalem. The Rabbins say, that if he did not redeem it himself, that is, if he did not substitute his own money in lieu of it, but sold it to another, he was only required to carry the bare price to Jerusalem, without any addition.

3°. The *tithe of the tithe*, was the tenth part of all the *tithes* that had been given the Levites by the people: for the Levites, after they had got all their *tithes* of the people, divided it into ten parts; and in their turn, gave a *tithe* to the priests.

This *tithe* the Rabbins call תרומה מעשר, *oblation of the tithe*, מעשר קרשים המקדש, *tithe of things sanctified*. — And this the Levites were obliged to carry to the temple; the rest was reserved for their own subsistence.

4°. The *tithe of the third year*, was another kind of *tithe*, not much different from the second *tithe*, excepting that it was less troublesome, by reason they were not obliged to carry it to Jerusalem. Every seventh year God appointed the ground should lie and rest, nor should the owners even gather the fruits which it produced spontaneously: that year, therefore, they paid no *tithe*, but only the six preceding ones. See **SABBATH**.

Now, every third of these six years, i. e. on the third, and the sixth, they raised, as usually, the first *tithe*; and after that a second. — But this second they did not carry to Jerusalem either in kind or in money; but kept it by them to be spent by the Levites, the strangers, the fatherless, and the widows of the place, Deut. xiv. 28, 29.

This was also called the *tithe of the poor*, and the third *tithe*; and these third years it was paid on, were called the *tithe years*. All these *tithes* amounted to above one sixth of the revenue of each person: for if, for instance, a master of a family reaped 6000 measures of wheat, and 100 were first taken away for the first fruits or oblation, he had only 5900 left: from this 5900, taking away the first *tithe* 590, there remained 5310, the tenth whereof is 531; which being taken for the second *tithe*, leaves 4779 for the proprietor, who consequently has given 1121, viz. 121 more than a sixth of the whole.

Of the 590, which the Levites received for their first *tithe*, 59 went to the priest for the *tithe of tithes*; so that they were left 531 for their own subsistence, and that of their families.

These matters are all further explained in the Talmud, wherein are two books on *tithes*, also in the book of benedictions, ברכות, in the commentaries of Bartenora, Maimonides, R. Schelomoh Jarrhi, in Scaliger, Amama, Selden, Frischmuth, Quenstedt, Varenius, Hottinger, Sigonius, Cunæus, Godwyn, Leidecker, &c.

Under the new law, it is not Jesus Christ that established *tithes*, as it was God himself did it under the old law by the ministry of Moses: the christian priests, and the ministers of the altar of the new covenant, lived at first, wholly of the alms and oblations of the devout. See **ALMS**, **OBLATIONS**, &c.

In after times the laity gave a certain portion of their revenues to the clergy, but voluntarily, and not out of any constraint or obligation: the first instances we have of it, are in the IVth and Vth centuries.

This gift was called *tithe*; not that it was really a tenth part of their income, or near so much: but only in imitation of the *tithes* of the old law.

In the following age, the prelates in their councils, in concert with the princes, made an express law to the purpose; and obliged the laity to give a full tenth part of their revenues, their fruits, &c. to the ecclesiastics.

This the church enjoyed without disturbance for two or three centuries; but in the VIIIth century the laity got hold of part of these *tithes*, either by their own authority, or by grants and donations of the princes; and appropriated them to their own uses. See **REVENUE**.

Some time afterwards they restored them, or applied them to the founding of monasteries or chapters; and the church consented, at least tacitly, to this restitution.

In 1179, the third council of Lateran, held under Alexander III. commanded the laymen to restore all the *tithes* they yet held, to the church.

In 1215, the fourth council of Lateran, held under Innocent III. moderated the matter a little; and, without saying any thing of the *tithes* which the laity already possessed, forbade them to appropriate or take any more for the future.

Fra. Paolo, in his treatise of beneficiary matters, is of opinion, that the custom of paying *tithes* under the new law began in France; and affirms, that there are no instances of it before the VIIIth and IXth centuries: but he must be mistaken; for in the 2d council of Matiscona, held in 585, it is said expressly, that the christians had a long time kept inviolate that law of God, whereby *tithe* of all their fruits was enjoined to be given to holy places, &c.

In effect, Origen, Hom. XI. on Num. thinks, that the old laws of Moses, touching the first fruits and *tithes*, both of

cattle, and of the fruits of the earth, are not abrogated by the gospel; but ought to be observed on their ancient footing. The Vth canon of the council of Matiscona, orders *tithe* to be paid to the ministers of the church according to the law of God, and the immemorial custom of the christians, and that upon penalty of excommunication: which is the first penalty we find imposed on such as would not pay *tithe*.—On which grounds it is that many among the modern clergy hold their *tithes* to be *jure divino*.

Others, on the contrary, plead, that the recompence to be given church ministers, is differently ordained by God, according to the differences he has put between his two great dispensations, the law and the gospel: under the law he gave them *tithes*; under the gospel, having left all things in his church to charity and christian freedom, he has given them only what shall be given them freely, and in charity. That the law of *tithes* is in force under the gospel, all the protestant divines, except some among the English, deny; for though hire to the labourer be of moral and perpetual right, yet that special kind of hire, the *tenth*, can be of no right or necessity, but to the special labour for which God ordained it: that special labour was the levitical and ceremonial service of the tabernacle, Numb. xviii. 21, 31. which was abolished: the right therefore of the special hire must be abolished too.

That *tithes* were ceremonial, is evident from their not being given to the Levites till they had been first offered as a heave offering to the Lord, ver. 24, 28.

He, then, who by the law brings *tithes* into the gospel, brings in likewise a sacrifice, and an altar; without which, *tithes*, by the law, were unsanctified and polluted, ver. 32. And therefore were never thought of in the first christian times, till ceremonial altars and oblations had been brought back.

The Jews themselves, ever since their temple was destroyed, though they have rabbies and teachers of the law, yet pay no *tithes*, as having no proper Levites to whom, nor altar whereupon, to hallow them; which argues, that the Jews themselves never looked on *tithes* as moral, but merely ceremonial. Add, that *tithes* were not allowed to the priests and Levites merely for their labour in the tabernacle; but in consideration of this likewise, that they were not allowed to have any other part or inheritance in the land, ver. 20, 24. and who, by that means, for a tenth, lost a twelfth.

In effect, for the first three hundred years after Christ, no mention is made in all ecclesiastical history of any such thing as *tithes*; though in that time, altars and oblations had been recalled, and the church had miserably judaized in many other things. The churchmen confessedly lived all that time on free-will offerings; nor could the defect of paying *tithe* be owing to this, that there were wanting civil magistrates to injoin it; since christians, having lands, might have given out of them what they pleased; and the first christian emperors, who did all things by advice of the bishops, supplied what was wanting to the clergy, not out of *tithes*, which were never proposed, but out of their own imperial revenues.

The first authority produced, setting aside the apostolical constitutions, which few of the patrons of *tithes* will insist on, is a provincial synod at Cullen in 356, where *tithes* are voted to be God's rent: but before that time, divers other abuses and complaints had got ground, as altars, candles at noon, &c. And one complaint begot another; as it is certain that *tithes* suppose altars.

It is alledged, that *tithes* are of early and solemn force among us; having been paid by statute ever since the Saxon king Athelstan, anno 928: to which it may be answered, that Rome-scot, or Peter-pence, had been likewise paid to the pope by statute above 200 years longer, viz. from the year 725. And by the way it is to be noted, that these ancient *tithes* among our ancestors, kept a nearer analogy to their original in the Mosaic law; for the priests had but a third part, the other two thirds being appointed for the poor, and to adorn and repair the churches, as appears from the canons of Ecbert and Elfric.

The custom of paying *tithe*, or of offering a tenth of what a man enjoys, or of what he reaps from it, has not only been practised under the old and the new law, but we also find something like it among the heathens.

Xenophon, in the 5th book of the expedition of Cyrus, gives us an inscription upon a column near the temple of Diana, whereby the people were warned to offer the tenth part of their revenues every year to that goddess.

The Babylonians and Egyptians gave their kings a tenth of their revenues: see Aristotle in his *Oeconomies*, lib. 2. Diodorus Siculus, lib. 5, and Strabo, lib. 15.—Afterwards, the Romans exacted of the Sicilians a tenth of the corn they reaped; and Appian tells us, that those who broke up, or tilled any new grounds, were obliged to carry a tenth of their produce to the treasury.

The Romans offered a tenth of all they took from their enemies, to the gods; whence the name of Jupiter Prædator: The Gauls, in like manner, gave a tenth to their god Mars, as we learn in the commentaries of Cæsar.—And Festus de *Verb. signif.* assures us, that the ancients used to give *tithe* of

every thing to their gods: *decima quæque veteres diis suis offerebant.*

Authors have been strangely perplexed, to find the original of a custom, established among so many people of different manners and religions, to give a *tenth* to their kings, or their ministers of religion. Grotius takes it to arise hence, that the number ten is the most known and the most common among all nations; by reason of the number of fingers, which is ten. On this account he thinks it is, that the commandments of God were reduced to ten, for people to retain them with greater ease; that the philosophers established ten categories, &c.

**Impropriated and appropriated TITHES**, called also *infeodated tithes*, are those alienated to some temporal or ecclesiastical lord, united to their fee, and possessed as secular goods. See **IMPROPRIATION**.

By the council of Lateran, held under Alexander III. in 1179, the alienation or infeodation of *tithes* is prohibited for the future: whence all infeodations made since that time are generally held by the canonists, illegal.

Some attribute the original of these impropriated *tithes* to Charles Martel; and hold him damned for first giving the revenues of benefices to secular nobles: but Baronius will have this a fable, and refers their origin to the wars in the Holy Land; which is also the opinion of Pasquier.

The tribute, it seems, which the Romans imposed on all the provinces of their empire, was a tenth part of all the fruits: hence several authors observe, that the Franks having conquered the Gauls, and finding the imposition established, they kept it on foot, and gave those *tithes* in fee to their soldiers; and this, say they, was the origin of infeoffed, or impropriated or appropriated *tithes*. See **FEE**, and **BENEFICE**.

But the truth is, they are not so ancient; nor do we find any mention of them before the reign of Hugh Capet; even the very council of Clermont, held in 1097, as hot as it was in the interests of the church, does not say one word of them; which yet would undoubtedly have made loud complaints of such an usurpation, had it been then known.

**Rate-Tithe**. See the article **RATE-Tithe**.

**TITHING**, *Decenna*, or *Decury*; a number or company of ten men, with their families; knit together in a kind of society, and all bound to the king, for the peaceable behaviour of each other. See **FRIBURGH**, **FRANK-PLEDGE**, and **TRIHING**.

In these companies there was one chief person, who from his office was called *teethingman*; and at this day in the west *tithingman*, though now no more than a constable; the old custom of tenmentales, or *tithings*, being long since disused. See **HEAD-BOROW**, **DECENNIER**, **TENMENTALE**, &c.

**TITILLATION**, **TITILLATIO**, the act of *Tickling*, i. e. exciting a sort of pleasurable idea, by a gentle application of some soft body, upon a nervous part; and which usually tends to produce laughter. See **LAUGHTER**.

**TITLE**, **TITULUS**, an inscription put over any thing, to make it known. See **INSCRIPTION**.

The word is more particularly used for the inscription in the first page of a book, expressing the subject thereof, the author's name, &c. See **BOOK**.

What tortures abundance of authors, is to find specious *titles* for their books: a *title* should be simple, and yet clear: these are the two genuine characters of this kind of composition.

Assuming *titles* are a prepossession against the author.

The French are much addicted to fanfaronnades in their *titles*; witness that of M. le Pays, *Amitiez, Amours, Amourettes*; or that improvement hereon, *Fleurs, Fleurons, Fleurettes*, &c.

**TITLE**, **TITULUS**, in the civil and canon law, denotes a chapter or division of a book. See **CHAPTER**, &c.

A *title* is subdivided into paragraphs, &c. See **PARAGRAPH**, &c.—Each of the 50 books of the digest consists of a number of *titles*; some of more, others of less. See **DIGEST**.

**TITLE** is also an appellation of dignity, distinction, or pre-eminence; given to persons possessed of the same. See **NOBILITY**, &c.

The *titles* of order or dignity, Loyseau observes, should always come immediately after the name, and before the *titles* of office. See **NAME**.

The king of Spain has a whole page of *titles*, to express the several kingdoms, and signories he is master of. The king of England takes the *title* of *king of Great Britain, France, and Ireland*: the king of France, the *title* of *king of France and Navarre*: the king of Sweden entitles himself *king of the Swedes and Goths*: the king of Denmark, *king of Denmark and Norway*: the king of Sardinia, among his *titles*, takes that of *king of Cyprus and Jerusalem*: the duke of Lorraine, the *title* of *king of Jerusalem, Sicily*, &c. See **KING**, &c.

The cardinals take *titles* from the names of some churches in Rome: as, of St. Cecilia, St. Sabina, &c. and they are called cardinals of the *title* of St. Cecilia, &c. See **CARDINAL**.

The emperor can confer the *title* of prince, or count of the empire; but the right of suffrage in assemblies of the empire depends on the consent of the estates. See **ELECTOR**, and **EMPIRE**.

The

The Romans gave their Scipio's the *titles* of Africanus, Asiaticus, &c. and to others, they gave the *titles* of Macedonicus, Numidicus, Creticus, Parthicus, Dacicus, &c. in memory of the victories obtained over the people so called.—The king of Spain, after the like manner, gives honourable *titles* to his cities, in recompence for their services, or their fidelity.

**TITLE** is also a certain quality ascribed by way of respect to certain princes, &c. See **QUALITY**.

The pope has the *title* of *holiness*; a cardinal prince of the blood, that of *royal highness*, or *most serene highness*, according to his nearness to the throne; other cardinal princes, *most eminent highness*; an archbishop, *grace* and *most reverend*; a bishop, *right reverend*; abbots, priests, religious, &c. *reverend*. See **HOLINESS**, **EMINENCE**, **GRACE**, **REVEREND**, &c. See also **POPE**, **CARDINAL**, &c.

As to secular powers, to the emperor is given the *title* of *imperial majesty*; to kings, *majesty*; to the king of France, *most christian majesty*; to the king of Spain, *catholic majesty*; to the king of England that of *defender of the faith*; to the Turk, *grand signior*, and *highness*; to the prince of Wales, *royal highness*; to the dauphin of France, *serene highness*; to electors, *electoral highness*; to the grand duke, *most serene highness*; to the other princes of Italy and Germany, *highness*; to the doge of Venice, *most serene prince*; to the republic or senate of Venice, *signory*; to the grand master of Malta, *eminence*; to nuncio's and ambassadors of crowned heads, *excellency*. See **EMPEROR**, **KING**, **PRINCE**, **DUKE**, &c. See also **HIGHNESS**, **SERENITY**, **EMINENCE**, **EXCELLENCY**, &c.

The emperor of China, among his *titles*, takes that of *tien su*, son of heaven. The Orientals, it is observed, are exceedingly fond of *titles*: the simple governor of Schiras, for instance, after a pompous enumeration of qualities, lordships, &c. adds the *titles* of *flower of courtesy*, *nutmeg of consolation*, and *rose of delight*.

**TITLE**, in law, denotes a right which a person has to the possession of any thing. See **RIGHT**, and **POSSESSION**.

It is also an authentic instrument, whereby a man can prove and make appear his right. See **MUNIMENT**, **DOCUMENT**, **INSTRUMENT**, &c.

A prescription of twenty years, with a *title*, is good, and of thirty without a *title*. See **PRESCRIPTION**.

There must be at least a colourable *title* to come into possession of a benefice, otherwise the person is deemed an intruder. See **BENEFICE**.

**TITLE**, in the canon law, is that by virtue whereof a beneficiary holds a benefice:—such is the collation of an ordinary, or a provision in the court of Rome founded on a resignation, permutation, or other legal cause. See **BENEFICE**.

The *title* of a benefice, or beneficiary, is either a true, or a colourable one.—A true or valid *title*, is that which gives a right to the benefice: such is that received from a collator who has a right to confer the benefice on a person capable thereof, the usual solemnities being observed. See **COLLATION**, &c. Colourable *title* is a seeming one; *i. e.* such a one as appears valid, and is not.—Such would that be founded on the collation of a bishop, in case the benefice in question were not in his collation.

By the canons, a colourable *title*, though false, produces two very considerable effects. 1<sup>o</sup>. That after peaceable possession for three years, the incumbent may defend himself by the rule of *triennali possessione*, against such as would dispute the benefice with him. 2<sup>o</sup>. That in case he be prosecuted within three years, and obliged to surrender the benefice, he shall not be obliged to restore the produce of it.

**TITLE** \* is also used in several ancient synods and councils, for the church to which a priest was ordained, and where he was constantly to reside.

\* *Nullus in presbyterum, nullus in diaconum, nisi ad certum titulum ordinetur*, Concil. London. Ann. 1125.

There are many reasons why a church might be called *titulus*, *title*; the most probable, Cowel takes to be this, that in ancient days the name of the saint to whom the church was dedicated was engraven on the porch, as a token that the saint had a *title* to that church: whence the church itself became afterwards to be called *titulus*. See **CLERICAL TITLE**.

**TITLES**, or **TITULAR Churches**, M. Fleury observes, was formerly the denomination of a particular kind of churches at Rome. See **CHURCH**.

In the VI. and VII. centuries, there were four sorts of churches in that metropolis, *viz.* *patriarchal*, *titular*, *diacanal* and *oratorial*.—The *tituli*, *titular*, were, as it were, parishes, each assigned to a cardinal priest, with a certain district or quarter depending thereon, and a font for the administration of baptism in case of necessity. See **PARISH**, **CARDINAL**, &c.

**Clerical or Sacerdotal TITLE**, denotes a yearly revenue or income of the value of 50 crowns, which the candidates for priesthood were anciently obliged to have of their own; that they might be assured of a subsistence. See **ORDERS**, **ORDINATION**, &c.

By the ancient discipline there were no clerics made, but in proportion as they were wanted for the service of the church,

which is still observed with regard to bishops; none being consecrated, but to fill some vacant see. See **BISHOP**, **PRIEST**, &c. But for priests and other clerics, they began to make vague ordinations in the east as early as the Vth century: this occasioned the council of Chalcedon to declare all vague and absolute ordinations null.

Accordingly, the discipline was pretty well observed till towards the end of the XIth century; but then it began to relax, and the number of priests was exceedingly increased; either because the people became desirous of the privileges of the clericate, or because the bishops sought to extend their jurisdiction.

One of the great inconveniencies of these vague ordinations was poverty, which frequently reduced the priests to sordid occupations, and even to a shameful begging. To remedy this, the council of Lateran laid it on the bishops to provide for the subsistence of such as they should ordain without *title*, till such time as they had got a place in the church that would afford them a settled maintenance.

There was also another expedient found out to elude the canon of the council of Chalcedon, and it was appointed that a priest might be ordained on the title of his patrimony; that is, it was not necessary he had any certain place in the church, provided he had a patrimony sufficient for a creditable subsistence. The council of Trent retrieved the ancient discipline in this respect, forbidding all ordinations, where the candidate was not in peaceable possession of a benefice sufficient to subsist him; and allowing no body to be ordained on patrimony or pension, unless where the bishops declare it to be expedient for the good of the church: so that the benefice is the rule, and the patrimony the exception.

But this rule is not regarded, even in some catholic countries, particularly France, where the patrimonial *title* is the most frequent; and the *title* is even fixed to a very moderate sum, about 3*l.* 1*s.* *per annum* sterling. Indeed at Paris, and in some other dioceses, 150 livres are required.

As to religious, the profession they make in a monastery serves them for a *title*, in regard the convent is obliged to maintain them: and as to mendicants, they are maintained upon the *title* of poverty.

Those of the house, and society of the Sorbonne, are also ordained without any patrimonial *title*, and on the sole *title* of poverty, it being supposed a doctor of the Sorbonne can never want a benefice. See **SORBONNE**.

**TITUBATION**, or **TREPIDATION**, in astronomy, a kind of libration or shaking, which the ancient astronomers attributed to the crystallin heaven, to account for certain inequalities, which they observed in the motion of the planets. See **TREPIDATION**.

**TITULAR**, or **TITULARY**, denotes a person invested with a title, in virtue whereof he holds an office or benefice, whether he perform the functions thereof or not. See **OFFICE**, and **BENEFICE**.

In this sense the term is used in opposition to survivor, and to a person only acting by procurator or commission. See **PROCURATOR**, &c.—An officer is always reputed *titular* till he have resigned his office, and the resignation have been admitted.

**TITULAR** is sometimes also applied adjectively to a person who has the title and right of an office or dignity, but without having possession, or discharging the function thereof.

It is sometimes also used abusively for a person who assumes and pretends a title to a thing, without either a right thereto, or a possession thereof.

**TITULAR Churches**. See the article **TITLE**.

**TMESIS**, \* **TMHESIS**, in grammar, a figure whereby a compound word is separated into two parts, and one or more words interposed between them.

\* The word is formed from the Greek, *τεμνω*, *seco*, I cut.

Thus, when Terence says, *quæ meo cunque animo lubitum est facere*, there is a *tmesis*; the word *quæcunque* being divided by the interposition of *meo*.

Lucretius abounds in *tmeses*; as, *sæpe salutantum tactu præterque meantum*: or, *diffiduo potis est se jungi seque gregari*; and, *dispetis disque gregatis*.

**TOBACCO**, or **TABACCO**, a medicinal herb, not known in Europe till after the discovery of America by the Spaniards, and first imported about the year 1560.

The Americans of the continent called it *petun*, those of the islands *yoli*. The Spaniards, who gave it the name *tabaco*, took it from Tabaco, a province of Yucatan, where they first found it, and first learned its use.

The French, at its first introduction among them, gave it various names; as *nicotiana*, or the *embassador's herb*, from John Nicot, then ambassador of Francis II. in Portugal, who brought some of it with him from Lisbon, and presented it to a grand prior of the house of Lorraine, and to queen Catherine de Medicis; whence it was also called *queen's herb*, and *grand prior's herb*.—They also gave it other names, which are now all reduced to the original name *tobacco*, or *tabacco*, from *tabaco*, given it by Hernandez de Toledo, who first sent it into Spain and Portugal.

Cultura

**Culture and preparation of TOBACCO.**—*Tobacco* is cultivated in several parts of America, particularly in the Caribbee Islands, Virginia, &c. where they are forced to mix ashes with the soil, to prevent its rising too thick.—After sowing, they water it every day, and on very hot days cover it up, to prevent its being scorched by the sun.

When it is risen to a convenient pitch, they transplant it, much as we do lettuce, only at a distance of three feet, and in a soil prepared with great care: when replanted, it is kept continually weeding, the stem frequently cleansed, and the lowest leaves and the suckers it puts forth, taken off, that ten or fifteen of the finest leaves may have all the nourishment.

The leaves thus reserved being ripe, which is known by their breaking when bent, the stalks are cut, and left to dry two or three hours in the sun; after which they are tied two by two, and hung up on ropes under a shed to be dried by the air. When the leaves are sufficiently dried, they are pulled from off the stalks, and made up in little bundles; which being steeped in sea-water, or for want thereof, in common water, are twisted in manner of ropes, and the twists formed into rolls, by winding them with a kind of mill around a stick.—In which condition it is imported into Europe, where it is cut by the tobacconists for smoking, formed into snuff, and the like.

Besides the *tobacco* of the West-Indies, there are considerable quantities cultivated in the Levant, the coasts of Greece and the Archipelago, the island of Malta and Italy.—The marks of good twist *tobacco*, are a fine shining cut, an agreeable smell, and that it have been well kept.

*Tobacco* is either taken by way of snuff, as a sternutatory, or as a masticatory by chewing it in the mouth, or by smoking it in a pipe. See PIPE, STERNUTATORY, MASTICATORY, FUMIGATION, &c.

It is sometimes also taken in little longish pellets put up the nose, where it is found to produce very good effects, to attract a deal of water or pituita, unload the head, resolve catarrhs, and make a free respiration; for the subtle parts of the *tobacco* in inspiration are carried into the trachea and lungs, where they loosen the peccant humours adhering thereto, and promote expectoration.

Some have left this *tobacco* in their noses all night; but this is found to occasion vomiting the morrow morning. Another thing charged on this way of application, is, that it weakens the sight.

*Tobacco* is held a first rate narcotic. See NARCOTIC, and OPIATE.—When taken in great quantities in the way of snuff, it is found to prejudice the smelling, greatly diminishes the appetite, and in time gives rise to a phthisis.

That taken in the way of smook, dries and damages the brain. Borghi, in a letter to Bartholine, mentions a person who through excess of smoking had dried his brain to that degree, that after his death there was nothing found in his skull but a little black lump, consisting of mere membranes.

Some people use the infusion of *tobacco* as an emetic; but it is a very dangerous and unjustifiable practice, and often produces violent vomitings, sickness and stupidity.

Bates and Fuller give some receipts, in which *tobacco* is an ingredient, with mighty encomiums in asthmatic cases.—A strong decoction of *tobacco*, with proper carminatives and cathartics, given clyster-wise, sometimes proves of good effect in what is usually called the *stone colic*, and also in the iliac passion. See COLIC, and ILIAC Passion.

A drop or two of the chymical oil of *tobacco* being put on the tongue of a cat, produces violent convulsions, and death itself in the space of a minute; yet the same oil used in lint, and applied to the teeth, has been of service in the tooth-ach; though it must be to those that have been used to the taking of *tobacco*, otherwise great sickness, retchings, vomitings, &c. happens; and even in no case is the internal use of it warranted by ordinary practice.

A strong decoction of the stalks, with sharp-pointed dock and allom, is said to be of good service, used externally, in cutaneous distempers, especially the itch: some boil them for that purpose in urine. The same is said to be infallible in curing the mange in dogs.

Sig. Pauli, physician to the king of Denmark, in an express treatise on *tobacco*, observes that the merchants frequently lay it in bog-houses, to the end that becoming impregnated with the volatile salt of the excrements, it may be rendered the brisker, more foetid and stronger.

Amurath IV. emperor of the Turks, the grand duke of Muscovy, and the emperor of Persia, have prohibited the use of *tobacco* in their states.—Our king James I. wrote a treatise express against it, intitled, *A counter-blast to tobacco*. By a bull of pope Urban VIII. such are excommunicated as take *tobacco* in churches.

**TOD of Wool** is mentioned in the statute 12 Car. II. c. 32. as a weight containing 28 pounds, or two stone. See STONE, WOOL, &c.

Some will have the word derived from the French, *toilet*, a wrapper, within which, by usage, two stone of wool is folded.

**TOES**, by anatomists called *digiti pedis*, are the extreme divisions of the feet; answering to the fingers of the hand. See FOOT.

The *toes* of each foot consist of 14 bones; the great *toe* having two, and the rest three each; they are like the bones of the fingers, but shorter. See FINGER.

In the *toes* are found twelve ossa sesamoidea, as in the fingers. See SESAMOIDEA.—The gout chiefly seizes the great *toe*. See GOUT.

**TOFT, TOFTUM, or TOFTA**, in our law-books, a parcel of land, or a place where a messuage hath stood, but is decayed, or casually burnt, and not re-edified.

**TOGA**, in antiquity, a wide woollen gown, or mantle, without sleeves, used among the Romans, both by men and women. In process of time, none wore the *toga* but lewd women, whence that of Horace.—*In matrona, peccasse togata*.

The *toga* was of divers colours, and admitted of various ornaments: there was that called *toga domestica*, wore within-doors; *toga forensis*, wore abroad; *toga militaris*, used by soldiers, tucked up after the Gabinian fashion; and *toga picta*, or *triumphalis*, wherein the victorious triumphed, embroidered with palms: that without any ornaments, was called *toga pura*. The *toga* was sometimes wore open, called *aperta*; sometimes girt or tucked up, called *præcineta*; and this cincture or girding again, according to Sigonius, was of three kinds; *laxior*, or the loose kind, where the tail trailed on the ground; *adstrictior*, the close kind, wherein it did not reach so low as the feet; and *Gabinia*, where one of the skirts or lappets was girt round the body.

Sigonius distinguishes the several *togæ*, or Roman gowns, into *pura*, *candida*, *pulla*, *picta*, *prætexta*, *trabea*, and *paludamentum*. See PRÆTEXTA, PALUDAMENTUM, &c.—The *toga pura* was also called *virilis*. See VIRILE.

**Jus TOGÆ**, or privilege of the *toga*, was the same with the privilege of a Roman citizen, i. e. the right of wearing a Roman habit, and of taking, as they explain it, fire and water through the Roman empire. See CITIZEN.

**TOILES**, snares, or nets set by hunters for catching of wild beasts; as deer, &c.

**TOILET**, a fine cloth, of linnen, silk, or tapestry, spread over the table in a bed-chamber, or dressing-room, to undress and dress upon.

The dressing-box, wherein are kept the paints, pomatums, essences, patches, &c. the pin-cushion, powder-box, brushes, &c. are esteemed parts of the equipage of a lady's *toilet*.

That of the men consists of a comb-case, brushes, &c. To make a visit to one at his *toilet*, is to come to entertain him while he is dressing or undressing.

Satin, velvet, brocade, point de France, &c. are now ordinarily used for *toilets*: anciently they were made much plainer, whence the name, which is formed from the French, *toilette*, a diminutive of *toile*, any thin stuff.

**TOISE**, a French measure, containing six of their feet, or a fathom. See FATHOM, and MEASURE.

**TOISON d'Or**, a term in heraldry for a golden fleece, which is sometimes borne in a coat of arms. See GOLDEN Fleece.

**TOL**, in law, a term signifying to defeat, or take away.—From the Latin, *tollere*, which signifies the same.

Thus, to *tol* the entry, is to take away the right of entry. See ENTRY.

**TOL-BOOTH, or TOLL-BOOTH**, a place in a city, where goods are weighed, to ascertain the duties or imports thereon.

**TOLERATION**, in religion, a term which has made a great figure in the disputes among protestants, who have been exceedingly divided about the measures of *toleration*, or the degrees to which heretics and schismatics are, or are not to be suffered. See PERSECUTION.

Many of the church of England have zealously opposed the *toleration* of presbytery, &c. nor has the church of Scotland been behind-hand with them in their zeal against episcopacy.\*

\* When a bill was brought into parliament for the toleration of all protestants in the exercise of religious worship; the general assembly of the kirk did most humbly beseech; yea, they were bold in the Lord, and in the name of the church of God, earnestly to obtest his grace [the lord high commissioner] and the most honourable estates, that no such motion of any legal toleration to those of the prelatical principles might be entertained by the parliament. See *Life of Qu. Anne*, p. 95.

But all who have reasoned consistently from the principles of the reformation, have been for *toleration*; as well perceiving they had no right to oblige any body to follow their particular sentiments: but the difficulty is, the setting bounds to this *toleration*. See LIBERTY of Conscience.

M. Basnage and some others distinguish *civil toleration* from *ecclesiastical*.—The latter allows of different, and even opposite sentiments in the church, and the first permits them in civil society.

By *civil toleration* is meant impunity and safety in the state for every sect which does not maintain any doctrine inconsistent with the peace and welfare of the state.—This civil or political *toleration* implies a right of enjoying the benefit of the laws, and of all the privileges of the society, without any regard to difference of religion.

Each-

*Ecclesiastical toleration*, is an allowance of certain opinions, which not being fundamentals, do not hinder those who profess them from being esteemed members of the church.—But as to the quality and number of these fundamental points, they never could, nor in all probability ever will, be agreed upon.

**TOLL**, **TELONIUM**, a Saxon term, though derived originally from the Latin *tollere*, to take away, or rather the Greek *τελος*, tribute, tax.—It has two acceptations, denoting, 1°. a liberty to buy and sell within the bounds of a manour.

**TOLL** is also used for a tax or custom paid for passage, or for vending goods in a market, fair, or the like. See **PASSAGE**, **FAIR**, &c.

Some records make mention of *toll thro*, or *iborough toll*, which is money paid for passage in or through some highways, or over ferries, bridges, &c.—*Toll travers*, for passing or driving cattle over a private man's ground.—*Toll-turn*, or *turn-toll*, paid at the return of beasts from fairs and markets, though they were not sold.

By the ancient law, the buyers of corn and cattle in fairs or markets ought to pay *toll* to the lord of the market, in testimony of the contract these lawfully made in open market, because privy contracts were held unlawful.

Some interpret *toll* a liberty as well to take, as to be free from *toll*; for that they who are enfeoffed with *toll*, are custom free. Of this freedom from *toll*, the city of Coventry boasts an ancient charter, granted them by Leofric or Luriche, earl of the Mercians in Edward the Confessor's time, who, at the importunity of Godeva his lady, granted this freedom to the city.

**TOLLBOOTH**, } See the articles } **TOLBOOTH**,  
**TOLU Balsam**, } **BALSAM**.

**TOMAN**, or **TOUMAN**, a kind of imaginary money used among the Persians in the keeping of their books, and to facilitate the reduction of money in the payment of considerable sums. See **MONEY**.

The *toman* consists of fifty abassi's, or a hundred mamoudi's, or two hundred shabees, or ten thousand dinars, which amount to about three pounds six shillings eight pence sterling.

D'Herbelot derives the word from the language of the Moguls, where it signifies the number ten thousand.—Eben Arabschah says, that the word *touman*, when used to express a weight, or money, contains ten thousand silver Arab drachma's, called *metkhal*; which are a third lighter than the Attic. See **DRACHM**.

The Moguls, &c. frequently use *toman* for ten thousand men; and say, e. gr. that the city Samarcand contains seven *tomans* of people fit to bear arms; and that of Andekhan nine *tomans*.

**TOMB**,\* includes both the grave or sepulchre, wherein a defunct is interred; and the monument erected to preserve his memory. See **SEPULCHRE**, and **MONUMENT**.

\* The word is formed from the Greek, *τομῆς*, *tumulus*, *sepulchre*; or according to Menage, from the Latin, *tumba*, which signifies the same.

Among the Romans none but the emperors, vestals, and persons signalized by great actions, were allowed to have *tombs* in the cities; the rest were all in the country, near the high-roads; whence those common words, *fiste*, & *abi*, *viator*; which are still retained in the inscriptions of our monuments in churches, &c. though the occasion be no more. See **EPI-TAPH**, **INSCRIPTION**, &c.

At Anchiale was anciently seen the *tomb* of Sardanapalus, with this inscription in verse: *Sardanapalus built Anchiale and Tar-jus in one day: go, passenger, eat, drink, and be merry; the rest is nothing*. Vid. Strab. Geog. lib. 14.

The Romans had a kind of empty *tomb*, called *cenotaphium*, an *honorary tomb*, wherein no deceased was laid. It was used to be built in favour of persons perishing at sea, in remote countries, &c. where no sepulture could be had.

The occasion hereof was a superstitious notion, that the souls of those whose bodies were not buried, wandered an hundred years by the banks of the rivers of hell, before they were admitted to pass over.—The *κενοτάφιον* being made, the same ceremonies were practised as at real funerals.

The *cenotaphia* were inscribed with the words *ob honorem*, or *memoriæ sacrum*; whereas other *tombs*, wherein the ashes were really deposited, were inscribed *D. M. S. q. d.* sacred to the manes.—When the words *tacito omine* were added, it declared the ashes inclosed therein infamous for some crime. See **FUNERAL**.

*Characters on Tomb-stone*. See the article **CHARACTER**.

**TOME**, **ΤΟΜΟΣ**, a bound book, or writing that makes a just volume. See **BOOK**.

All the works of such an author are compiled, and reduced into one, or more *tomes*. There are *tomes* in folio, in quarto, in octavo, duodecimo, &c.—The councils printed in the Louvre are in 37 *tomes*. Salmeron has wrote the life of Christ in 12 *tomes*. See **VOLUME**.

**TOMENTUM**, properly signifies flocks, or locks of wool; but by botanists is used for that soft downy matter, which grows on the leaves of some plants, hence denominated *tomentose*; as, *gramen tomentosum*, *carduus tomentosus*, &c.

M. Winflow observes a kind of *tomentum* in the secretory ves-

sels of the glands; and from this accounts for the secretion of the various fluids from the blood. See **GLAND**, and **SECRETION**.

**TON**. See the article **TUN**.

**TOMKIN** and **TOMPION**. See the article **TAMPION**.

**TONDIN**, or **TANDINO**, in architecture. See **TORRE**.

**STONE**, or **TUNE**, in music, a property of sound, whereby it comes under the relation of *grave* and *acute*; or, the degree of elevation any sound has, from the degree of swiftness of the vibrations of the parts of the sonorous body. See **SOUND**, **GRAVITY**, &c.

For the cause, measure, degree, difference, &c. of *tones*, see **TUNE**.—The variety of *tones* in human voices arises partly from the dimensions of the wind-pipe; which, like a flute, the longer and narrower it is, the sharper is the *tone* it gives; but principally from the head of the larynx, or knot of the throat; the *tone* of the voice being more or less grave, as the rima, or cleft thereof is more or less open. See **VOICE**.

**TONS** is more particularly used in music for a certain degree or interval of tune, whereby a sound may be either raised or lowered from one extreme of a concord to the other; so as still to produce true melody. See **INTERVAL**, and **CONCORD**.

Musicians, beside the concords, or harmonical intervals, admit three lesser kinds of intervals, which are the measures and component parts of the greater, and are called *degrees*: the nature, origin, use, &c. whereof, see under the article **DEGREE**.

Of these degrees, two are called *tones*, and the third a *semitone*; their ratio's in numbers are 8:9, called a *greater tone*; 9:10, called a *lesser tone*; and 15:16, a *semitone*.

The *tones* arise out of the simple concords, and are equal to their differences: thus the *greater tone* 8:9 is the difference of a fifth and a fourth; the *lesser tone* 9:10 the difference of a lesser third and fourth, or of a fifth and sixth greater; and the *semitone* 15:16 the difference of a greater third and fourth. See **SEMITONE**.

Of these *tones* and *semitones* every concord is compounded, and consequently is resolvable into a certain number thereof.—Thus the lesser third consists of one *greater tone* and one *semitone*—the greater third of one *greater tone* and one *lesser tone*. See **THIRD**.—The fourth of one *greater tone*, one *lesser tone*, and one *semitone*. See **FOURTH**.—The fifth of two *greater tones*, one *lesser tone*, and one *semitone*. See **FIFTH**, &c.

For the use of these *tones*, &c. in the construction of the scale of music, see **SCALE**.

*Diazeuctic TONE*. See the article **DIAZEUCTIC**.

**TONGUE**, *Lingua*, in anatomy, an oblong member, whose form and situation are sufficiently known, and whose use is to be the organ of taste, and the principal instrument of speech and deglutition. See **SPEECH**, &c.

It is fastened to the os hyoides, the larynx, and to the fauces, by means of a membranous ligament running along the lower side of it, about half way, called the *frænum*. See **OS HYOIDES**, &c.

The main bulk and body of the *tongue* is made up of muscles, which are covered on the upper part with a papillary nervous substance, over which are spread two membranes.—The outer of these membranes is pretty thick and short, and full of papillæ, of a pyramidal figure, especially towards the tip; which papillæ stand pointing towards the root of the *tongue* in a bending posture, which makes their figure to be concavo-convex. These apices, or papillæ are so very minute and slender in men, that they make the coat appear on the upper part to be villous, especially as they approach nearer to the root. The figure of the papillæ, in human *tongues*, is not so plainly discernable to the naked eye as not to need the microscope. In brutes they are generally larger, stiffer, and more conspicuous; and in some almost cartilaginous, as may be felt in the *tongues* of cats, oxen, but more sensibly in lions. On the upper side, at a little distance from the tip, this membrane becomes thin, smooth, and glabrous, and as it were, polished by the lower parts of the mouth whereon it slides.

Under this lies a thin, soft, reticular kind of coat, punched through with innumerable holes, and always lined with a thick and white yellowish mucus. This membrane is so exceeding tender, and full of mucus, that it is not to be examined by the naked eye, unless boiled: by which it grows tough, and easily separable from the external membrane, and from the nervous part of the *tongue* which lies immediately under it. After boiling, it appears like a kind of gawle, between whose threads innumerable holes appear, through which the apices of the papillary body underneath it are exerted. This membrane on the upper side, next the outward, appears white, with a cast towards yellow, but black on the side next the *tongue*.

Many authors do not allow this to be a membrane, and will only have it to be a mucus hardened by boiling; but since it has so much of the resemblance of a membrane, and that authors agree in allowing two membranes to the *tongue*, Dr. Drake does not scruple to number it among them; since there does not appear to be any other second membrane: reckoning with Malpighi, the smooth part under the *tongue* a part of the outer membrane.

Immediately under this appears a nervous papillary body spreading itself to a pretty thickness over the whole surface of the *tongue*. This body, on the under side, is every where level and smooth, except in some few places, where it is connected to the subjacent musculous part by some nervous twigs which it sends into it.—Malpighi distinguishes the papillæ, which make the principal part hereof, into three kinds, from their different magnitudes and figures when observed with the microscope; of which, those seated on the sides and tip are very singular, resembling little round pyramids, with globes on their tips like the horns of snails.—All these papillæ, which are the immediate organs of tasting, send their apices, or extremities, through the mucous membrane, into the pyramidal papillæ of the outer membrane, which are hollow to receive them, and seem to be nothing else but a kind of cases to defend these nervous papillæ from injuries, which the salts and asperities of those bodies which we take into our mouths, might do them. See PAPILLA, TASTING, &c.

The rest, and much the greatest part, of the body of the *tongue* is musculous, consisting of plans of fibres in different directions: the first, or external plan, consists of strait fibres, which cover the *tongue* from one extreme to the other; when these contract, they shorten it. Under this are several other plans, running from the under to the upper side, which serve to make it broad and thin. These two kinds of fibres lie *stratum super stratum*, a plate of the one, and then a plate of the other.

Authors are not agreed about the number of muscles which compose the *tongue*: some confounding those of the os hyoides with those of the *tongue*, reckon eight, others nine, others ten, and more pair. Some number those proper to the *tongue* alone six pair, others five, others four, and some no more than three. Of this last opinion is our accurate Mr. Cowper, who allows no more than three genuine pair of muscles to the *tongue*, viz. the pair *genioglossum*, which pull the *tongue* forwards, and put it out of the mouth; the *ceratoglossum*, which draws it into the mouth, or pulls it on one side; and the *styloglossum*, which draws the *tongue* up in the action of deglutition. See GENIOGLOSSUM, CERATOGLOSSUM, &c.

Besides the muscles, the *tongue* is also moved by a bone situated at its root, and making as it were its basis, called *os hyoides*. See HYOIDES.

Down the middle of the *tongue*, lengthwise, runs a seam, called *linea mediana*, which divides it to the bottom into two equal parts, but not so effectually but that the blood vessels of one side communicate with those of the other.—These vessels are arteries from the carotides and veins called *ranula*, and are very conspicuous about the frænum under the *tongue*, serving to reconvey the blood to the external jugulars. These veins are frequently opened in the angina, and are the last resort of old women in this case.—The nerves of the *tongue* come from the fifth, sixth, and ninth pairs; the two first of which have been called *gustatorii*, and the latter *motorii lingue*. See NERVE.

Howsoever necessary an organ the *tongue* be in speech, &c. yet Jac. Rolandus has published an account of a mouth without a *tongue*, which spake perfectly, and performed its other natural functions; the person he speaks of is Pet. Durand, who losing his *tongue* by a gangreen, could yet speak perfectly, as also taste, swallow, and chew his food; which last, however, he could only do on that side he put it into, being unable to turn it to the other side of his mouth.

TONGUE-grafting, } See the articles } ENGRAFTING,  
TONGUE-tied, } } RANULA.

TONIC, \* ΤΟΝΙΚΟΣ, in medicine, is applied to a certain motion of the muscles, wherein the fibres being extended, continue their extension in such manner, as that the part seems immoveable, though in reality it be in motion. See MUSCLE.

\* The word is formed from the Græek, *τείνειν*, to stretch.

Such is the case of a man standing, of birds plaining or swimming through the air, &c.—Galen says, that the muscles act even when at rest; for after having made any contraction to fix themselves in a certain state or disposition, the preserving of that contraction is what we call the *tonic motion*.

TONICAL Echo. See the article ECHO.

TONNAGE, } See the articles } TUNNAGE,  
Duty of Tonnage, } } DUTY,  
TONNING, } } TUNNING.

TONSILS, TONSILLÆ, in anatomy, two round glands, situate near the root of the *tongue*, on each side the uvula, under the common membrane of the fauces, with which they are covered: called also *amygdalæ*, or almonds of the ears. See ALMONDS.

TONSURE, \* the art or act of cutting the hair, and shaving the head. See HAIR.

\* The word is formed from the Latin, *tondere*, to shave.

The *tonsure* was anciently a mark of infamy in France; in-somuch, that when they would render any prince incapable of succeeding to the crown, they cut off his hair, and shaved him. See further under the article BEARD.

TONSURE, in the Romish church, is used for the entrance, or admission into holy orders. See ORDERS.

In propriety, *tonsure* is the first ceremony used for devoting a person to God and the church, by presenting him to the bishop, who gives him the first degree of the clericate, by cutting off part of his hair, with certain prayers and benedictions. Some hold the *tonsure* a particular order; others, as Loyseau, only the mark and form of ecclesiastical orders in general. The *tonsure* suffices to make a cleric: the rest is only to qualify him for the holding benefices.—A person is capable of the *tonsure* at seven years of age; hence a benefice of simple *tonsure* is such a one as may be enjoyed by a child of seven years old. The *tonsure* is the basis of all the other orders.

TONSURE is particularly used for the corona, which priests, &c. wear, as the mark of their order, and of the rank they hold in the church. See CROWN.

The barbers have the measures and dimensions of the different kinds of *tonsures*, or clerical crowns; to be practised according to the different degrees and orders.—A cleric's *tonsure*, a sub-deacon's *tonsure*, a deacon's *tonsure*, a priest's *tonsure*, are each successively bigger than other.

TOOLS, simple and popular instruments, used in the more obvious operations; and particularly in the making of other more complex instruments. See INSTRUMENT.

Tools are divided into *edge-tools*, *spring-tools*, *pointed-tools*, &c. See STEEL, and TEMPERING.

TOOTH, *Dens*, in anatomy, a little, hard, smooth bone, set in the gums, and serving to masticate or chew the food, to bite, &c.—See Tab. Anat. (Osteol.) fig. 2. lit. d, e, f. See also the articles FOOD, MASTICATION, &c.

Men, and most terrestrial animals, as also some fishes, have two rows of *teeth*, the one in the upper jaw, and the other in the lower. See GUM, and MAXILLA.

In men, the ordinary number of *teeth* is 32; sixteen in each jaw; all fixed in peculiar sockets, called *alveoli*, by the juncture or articulation called *gomphosis*, and by the joiners, *pegging*. See GOMPHOSIS.

They are of three sorts: those in the fore-part of each jaw are called *incisores*, *cutters*; and are four in number in each jaw, broad, thin, and flat: some call them the *primæ*, because they appear the first; others the *adversæ*; and others the *ridentes*, *laughers*, because they shew themselves first in laughing. See INCISIVI.

Behind these, on each side of each jaw, stand two which are a little more prominent, and pointed, called *canini*, by the people *eye-teeth*, because part of the nerve which moves the eyes is inserted into them, whence the danger of pulling them out. See CANINE.

Behind these are five in each jaw, called the *molares*, or *grinders*, being those which in men serve chiefly for mastication. See MOLARES.

The *incisores* have generally only a single root, or twang; the *canini* sometimes two; and the *molares* three or four, especially the hind ones, which are put to the greatest stress.

The *teeth*, according to Peyer, are formed of convolved skins, hardened and bound together by a viscid mucus: and if we view the grinders of deer, horses, and sheep, &c. we shall find great reason to be of his mind.

Others speak of their formation otherwise. The sockets, Dr. Quincy observes, are lined with a thin membrane, upon which are several vessels, through which there passes a thick transparent humour, that, as it increases, hardens in form of *teeth*; and about the seventh or eighth month after birth, they begin to pierce the edge of the jaw, tear the periosteum and gums, which being very sensible, create a violent pain, and other symptoms incident to children in the time of dentition. See DENTITION.

The *teeth* begin not to appear all at a time; but first the *dentes incisivi* of the upper, and then those of the lower jaw appear, because the thinnest and sharpest; after them come out the *canini*, because they are sharper than the *molares*, but thicker than the *incisivi*; and last of all the *molares*, because they are thickest and bluntest.

Of this viscous transparent liquor, which is indurated into the substance of the *teeth*, there are two lays, one below the other, divided by the same membrane which covers all the cavity of the jaw: the uppermost lay forms the *teeth* which come out first; but about the seventh year of age they are thrust out by the *teeth* made of the undermost lay, which then begin to sprout; and if these *teeth* be lost, they never grow again.

If some have been observed to shed their *teeth* twice, they have had three lays of this viscous humour, which hardly ever happens.

About the one and twentieth year, the two last of the *molares* spring up, and are called *dentes sapientiæ*, because they arise when the person is at years of discretion. See SAPIENTIÆ.

The *teeth*, M. de la Hire the younger has found to have all that part which stands out beyond the jaw, covered with a peculiar substance called *enamel*, quite different from the rest of the bone.

This enamel, by some others called the *periosteum*, is composed of an infinity of little fibres, which grow to the bone by their roots, much like nails or horns. See NAIL.

This composition is very discernable in a broken *tooth*, where the origin and situation of the fibres are apparent. M. de la Hire is persuaded, that the growth of these fibres is performed much like that of nails. If by any accident a little part of this enamel be broke of, so that the bone is left bare, that is, if the very roots of the fibres be taken away, the bone, in that part, will grow carious, and the *tooth* inevitably perish; there being no bone in the body that can bear the air. See BONE. Indeed, in some persons the enamel is very much wore and shattered, by rubbing them much with dentrifices, &c. so that the bone appears through, and yet the *tooth* keeps sound; but the reason is, that the bone is not quite bare, but there is still a thin lay of the enamel which preserves it; but this lay being thin enough to be transparent, the yellow bone is seen through it.

Sometimes also a *tooth* breaks, and the bone is left bare, yet the person does not find any pain or aking from it: the reason is, that the hole in the root or twang of the *tooth*, through which a little branch of a nerve enters that renders the *tooth* sensible, being quite stopped up by age, or the like, has pinched off the nerve, and taken away all communication between the *tooth* and the origin of the nerves, and, by consequence, all sensibility.

It also happens in some *teeth*, that the fibres are only in little sheaves, or bundles, whose upper extremities meet, but not their lower; as is the case in most of the grinders, where the separation of the bundles is apparent. Here, if the upper extreme of the fibres chance to be broken, or wore off, the separation between two of the bundles often enlarges itself, so as to admit some hard particle of the food, by which means a little aperture being made through the enamel, the bone is laid bare, and the *tooth* soon rots. This inconvenience is remedied a little by stopping up the hole with lead, which prevents the sharp pungent parts of the food from penetrating to the bone, and there occasioning pain. See ODONTALGY.

What we have said is illustrated by the figures in *Tab. Anat. (Osteol.) fig. 14.* where ACFH expresses the extremity of the jaw the *teeth* are set in; AEC and FGH the roots or twangs of the *teeth* inclosed in the jaw; ADCB and FLHI the enamel, composed of little fibres ranged aside of each other, which cover all that part of the *tooth* without side the jaw; II several threads joined at the upper extremity, but apart at the lower; MM holes through which the nerves enter the roots of the *teeth*; NN a *tooth* closed up.

The *teeth*, Mr. Derham observes, furnish us with a notable instance of the wisdom and goodness of the Creator: their peculiar hardness is very remarkable, considering the tender substance they are formed of. See BONE.

The ancients, and even Riolanus, among the moderns, have held them to be incombustible, and the only part of the body that was so; on which account they were placed with great care in the urns among the ashes of the deceased: but the opinion is false, there having only been two found in the tombs of Westphalia, one of which was half calcined.

Another popular error is, that the *teeth* continue growing for ever, even in old people, to the hour of their death. M. de la Hire observes, it is only the enamel or polish that grows, which is a substance very different from the *teeth*.

The form, disposition, and order of the *teeth*, are admirable: the foremost are weak and far from the centre, as being only preparers to the rest; the others being to grind and mince, are accordingly stronger, and placed near the centre of motion.

Galen puts the case, that the order of the *teeth* should have been inverted, and the grinders, *e. gr.* put in the place of the incisores; and asks, what use the *teeth* had then been of, and what confusion would not there have arose by such a slight oversight in the disposal only? Upon which he argues, that if any person should dispose a company of 32 men, the number of the *teeth*, in a just order, we should judge him an intelligent person: why then should we not judge the same of the Creator, &c? *De usu partium.*

Again, their various forms, in various animals, is no less considerable, being all curiously adapted to the peculiar food and occasions of the several species of animals: thus in the rapacious they are fitted for the catching, holding, and tearing the prey; in herbaceous for the gathering and comminution of vegetables; and in such as have no *teeth*, as birds, the bill supplies the defect.

Add, that the temporary defect of them is no less observable in some: that children, for instance, should have none while they are not able to use them, but to hurt themselves, or the mother; and that at the very age when they can take in the more substantial food, and live without the breast, and begin to need *teeth* for the sake of speech; that then, we say, their *teeth* should begin to appear, and gradually grow as they more and more stand in need of them.

Some persons are born with all their *teeth*, as Marcus Curius Dentatus, and Cneius Papirius Carbo: others have only had one continued *tooth*, reaching the whole length of the jaw, as Pyrrhus king of Epirus, and Prusias son of the king of Bithynia: others are said to have had two or three rows on the same jaw, as Hercules.

Mentzelius, a German physician, assures us, that he saw an old man at Cleves, in 1666, aged 120 years, who had a new set of *teeth* two years before, which cut with great pain; and he saw an Englishman at the Hague, who cut a new set of *teeth* in his 118th year.

A Danish physician, named Hagerup, maintains in certain theses, that one may hear with the *teeth*. See HEARING.

As to animals, there are some fishes have *teeth* on their tongues, as trouts; others have them at the bottom of their gullet, as the cod-fish; some, as the great sea-dog, called *canis carcharias*, have three, four, or five rows of *teeth* on the same jaw; the requiem and crocodile have each three, and those all incisors; vipers have two large crooked canine *teeth*, which are moveable, and ordinarily lie flat, only raised when they would bite. See VIPER, &c. And the sea-frog, or sea-devil, has whole rows of the like moveable *teeth*.—The toad and cuttle-fish have no *teeth*, and yet bite.

Artificial TEETH, are those set in lieu of natural ones which are wanting.—They are usually made of ivory; but in regard ivory, in a little time, grows yellow in the mouth, Fabricius advises them to be made of the shin-bone of a bullock, which preserves its colour.

The custom of wearing ivory *teeth*, and of binding them in with a gold wire, is very ancient: Lucian and Martial speak of it as practised among the Romans.

Guillemeau gives us the composition of a paste for making artificial *teeth*, which shall never grow yellow: the composition is white wax granulated, and melted with a little gum elemi, adding powder of white mastic, coral, and pearl.

TOOTH in the mane.—It is by a horse's *teeth*, chiefly, that his age is known. See HORSE, and AGE.

The *teeth* of a horse are of four kinds, viz. 24 jaw-*teeth*, or grinders, at the bottom of the mouth, beyond the bars; 12 on each side the channel, ranged six above, and as many below.—These never fall, nor are they used for the distinction of age.

Twelve foal-*teeth*, or milk-*teeth*, which come in the fore-part of the mouth at three months old, and are usually cast at two years and half.

Four tushes, placed alone in the bars between the fore-*teeth* and grinders, one on each side below, and as many above. Mares seldom have tushes, and when they have, they are small, and are reckoned an imperfection.

Twelve gatherers, growing before in the place of the foal-*teeth* and grinders, and with which horses draw their fodder, cut grass, &c. These are divided into

Nippers, which are the two foremost *teeth* above, and as many below, which a horse first changes.

Middle *teeth*, or separators, parting the nippers from the corner *teeth*, are the two next the nippers, one on each side of them, both above and below, and are those which change next.

Outward, or corner *teeth*, are those next the tushes above and below, and which are cast last.—They shoot forth from the gum at five years of age, and have a hollow, wherein is a black speck, resembling a bean, called the mark, which continues till seven or eight years of age, and then begins to fill up. See MARK.

TOOTH-ACH, a popular disease, by physicians called *odontalgia*. See ODONTALGY.

The *tooth-ach* usually proceeds from a caries which rots the bone, and eats it hollow. For the causes, &c. of this caries, see TOOTH.

Sometimes it proceeds from a defluxion of a sharp matter upon the gums.—For the *tooth-ach*, a past made of soft bread, and the seed of stramonium, laid on the tooth affected, abates the pain; if the tooth be hollow, and the pain great, a composition of equal quantities of opium, myrrh, and camphire, made up in a paste with brandy or spirits of wine, and about a grain or two put into the hollow place, puts a stop to the caries, and blunts the acute pain of the nerve; by which it often gives immediate relief.

Chymical oils, as those of origanum, cloves, tobacco, &c. are also of service, destroying, by their hot caustic nature, the texture of the sensible vessels of the tooth affected; though, from too liberal an use of them, frequently proceeds a defluxion of humours, and impostumation.

A blister applied behind one or both ears seldom fails to cure the *tooth-ach*, especially when attended with a hot defluxion of humours, and swelling of the gums, face, &c. Liniments of ointment of marshmallows, alder, &c. mixed with rum, brandy, or spirit of wine camphorated, are good, used outwardly, to abate the swelling.

Mr. Cheselden mentions one cured of the *tooth-ach* by applying a small cauterizing iron to the antrum of the ear, after he had undergone bleeding, purging, salivation, setons, &c. to no purpose: the case was very remarkable; for when he was seized with it, a convulsion of that whole side of his face followed, whenever the pain became acute, or he attempted to speak.
